Xamarin Forms is the unified development environment for running all platforms. If you try to run something on an [unsupported platform](#)(see page 0), linking our agent won't allow you to monitor the application, but it also will not cause any errors.

To use the Xamarin Agent for your iOS/Android apps, add the `using` directive at the top of the `App.xaml.cs` file:

```
using Xamarin.Forms;
using AppDynamics.Agent;

namespace <AppName>
{
    public partial class App : Application
    {
        ...
    }
}
```

iOS Solution

To use the Xamarin Agent in iOS apps, add the `using` directive at the top of the `AppDelegate.cs` file:

```
using Foundation;
using UIKit;
using AppDynamics.Agent;

public class AppDelegate : UIApplicationDelegate
```

```
{
  ...
}
```

Android Solution

To use the Xamarin Agent in Android apps, add the using directive at the top of the MainActivity.cs file:

```
using Android.App;
using Android.Widget;
using Android.OS;
using System;
using Android.Content;
using AppDynamics.Agent;

namespace <AppName>
{
    [Activity(Label = "Phoneword", MainLauncher = true, Icon = "@mipmap/icon")]
    public class MainActivity : Activity
    {
        ...
    }
    ...
}
```

Initialize the Agent

To initialize the Xamarin Agent, you use the code below for iOS and Android. Use the EUM app key (enter as a string) that you received after completing [step 2](#) (see page 0).

```
var config = AppDynamics.Agent.AgentConfiguration.Create(<EUM_APP_KEY>);
AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
```

i If you are running an on-premises EUM Server, you need to specify the URL to the EUM Server. See [Point to an On-Premises EUM Server \(Optional\)](#) (see page 2232) to learn how.

Forms Solution

For Forms Solutions, you only need to place the initialize code in the constructor of the App.xaml.cs file for the Xamarin Agent to instrument both Android and iOS applications.

```
public App()
{
    InitializeComponent();
    // This initialization code is used by both iOS and Android apps.
    var config = AppDynamics.Agent.AgentConfiguration.Create(<EUM_APP_KEY>);
```

```

AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
MainPage = new FormsExamplePage();
}

```

If you have application code in the `MainActivity.cs` file for Android or `AppDelegate.cs` for iOS that you want to instrument, however, you should initialize the Xamarin Agent in those files as you would do for [iOS Solutions](#)(see page 2231) and [Android Solutions](#)(see page 2231).

iOS Solution

For iOS apps, you place the initialize code in the `AppDelegate.cs` file in the method `FinishedLaunching` of the class `AppDelegate` as shown below.

```

public class AppDelegate : UIApplicationDelegate
{
    // class-level declarations
    public override UIWindow Window
    {
        get;
        set;
    }
    public override bool FinishedLaunching(UIApplication application, NSDictionary
launchOptions)
    {
        // The two lines below initialize the AppDynamics instrumentation.
        var config = AppDynamics.Agent.AgentConfiguration.Create(<EUM_APP_KEY>);
        AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
        ...
        return true;
    }
    ...
}

```

You may also consider placing it in the `Main.cs` in the method `Main`.

Android Solution

In the `MainActivity.cs` file, place the initialization code in the method `OnCreate`:

```

class MainActivity {

    protected override void OnCreate(Bundle savedInstanceState) {
        // The two lines below initialize the AppDynamics instrumentation.
        var config = AppDynamics.Agent.AgentConfiguration.Create(<EUM_APP_KEY>);
        AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
        ...
    }
}

```

Build the Application

Run and build your application from Visual Studio. From the **Getting Started Wizard**, you should see that the application has [connected and the instrumentation has been verified](#)(see [page 2070](#)).

i For iOS projects with Xamarin Agent 20.10.0 - 21.4.0, you must add the additional `MtouchExtraArgs` argument `--gcc_flags "-ObjC -lz"` for each build configuration, such as the debug and release builds. If the iOS project file is edited directly, the build configuration should contain the `MtouchExtraArgs` element:

```
<PropertyGroup Condition=" '$(Configuration)|$(Platform)' ==
'Debug|iPhoneSimulator' ">
  <DebugSymbols>true</DebugSymbols>
  <DebugType>full</DebugType>
  <Optimize>false</Optimize>
  <OutputPath>bin\iPhoneSimulator\Debug</OutputPath>
  <DefineConstants>DEBUG;ENABLE_TEST_CLOUD;</DefineConstants>
  <ErrorReport>prompt</ErrorReport>
  <WarningLevel>4</WarningLevel>
  <CodesignKey>iPhone Developer</CodesignKey>
  <MtouchDebug>true</MtouchDebug>
  <MtouchFastDev>true</MtouchFastDev>
  <MtouchLink>SdkOnly</MtouchLink>
  <MtouchArch>x86_64</MtouchArch>
  <MtouchHttpClientHandler>HttpClientHandler</
MtouchHttpClientHandler>
  <MtouchTlsProvider>Default</MtouchTlsProvider>
  <DeviceSpecificBuild>false</DeviceSpecificBuild>
  <MtouchExtraArgs>--gcc_flags "-ObjC -lz"</MtouchExtraArgs>
</PropertyGroup>
```

Customize Your Instrumentation (Optional)

The Xamarin SDK has additional classes to allow you to extend the kinds of application data you can collect and aggregate using Mobile RUM. See [Customize the Xamarin Instrumentation](#)(see [page 2233](#)).

Point to an On-Premises EUM Server (Optional)

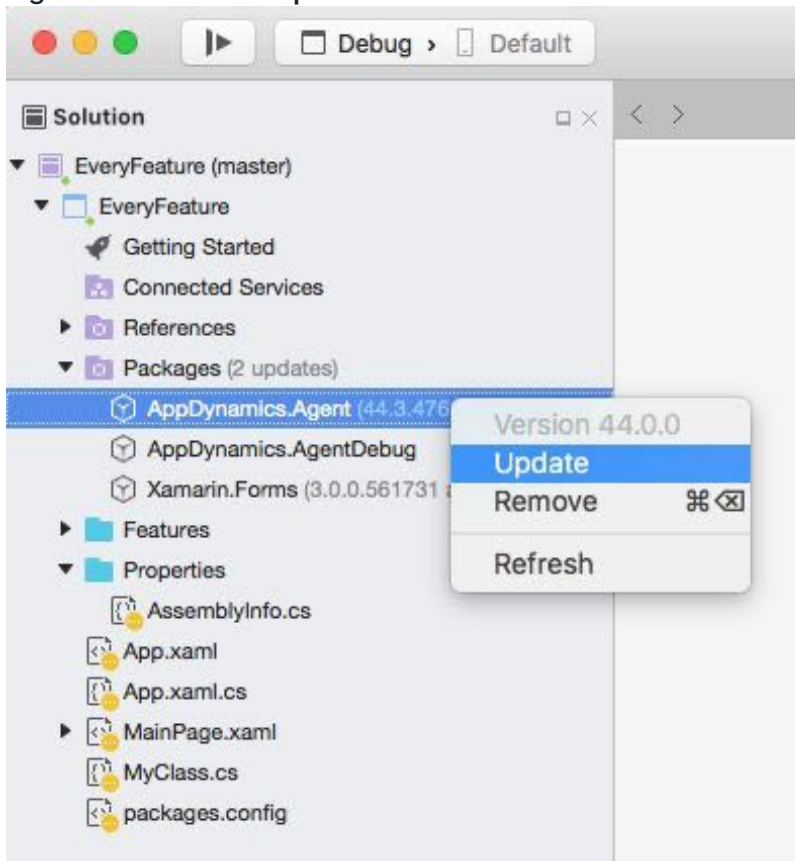

To use an on-premises EUM Server, you pass the URL to the on-premises EUM Server when you initialize the instrumentation with the EUM App Key from [Get Your Application Key](#)(see [page 2229](#)):

```
var config = AppDynamics.Agent.AgentConfiguration.Create(<EUM_APP_KEY>);
config.CollectorURL = <COLLECTOR_URL:PORT>;
AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
```

Upgrade the Xamarin Agent

As new features are added to the agent, you will need to upgrade the Xamarin Agent package in your app.

1. From Visual Studio, open the Xamarin application that has the AppDynamics Agent package.
2. From the **Packages** folder, select the AppDynamics Agent.
3. Right-click and click **Update**.

Customize the Xamarin Instrumentation

- [Xamarin SDK Documentation](#)(see page 2249)

i Because the agent [stores data about events in a local buffer](#)(see page 2067) before reporting the information, you are recommended to use the APIs with discretion.

Track Calls

You can instrument methods to see how often the instrumented a method is invoked and how long it takes to run. To do this, add a call at the beginning and end of the method you'd like to instrument.

In the example below, the code executed in the constructor for the class `ShoppingCart` will be tracked and reported. In your own code, start tracking calls by specifying the class and method in `BeginCall` and then complete the tracking and report the data by calling `ReportCallEnded`.

```
using AppDynamics.Agent;
...
public class ShoppingCart {
    public ShoppingCart() {

        // Code to create the shopping cart
    }
    void CheckOut(int custId, int transactionId) {
        var tracker = Instrumentation.BeginCall("ShoppingCart", "CheckOut", custId,
transactionId);
        // The code placed here will be tracked and reported.
        tracker.ReportCallEnded();
    }
}
```

Timing Events

Sometimes you want to time an event in your application that spans multiple methods. You can do this by calling `StartTimerWithName` when the event starts, and then `StopTimerWithName` when it ends. For example, to track the time a user spends viewing a screen, the instrumentation might look something like the following:

```
using AppDynamics.Agent;
...
async private void StartCapturePreview_Click(object sender, RoutedEventArgs e) {
    capturePreview.Source = captureManager;
```

```

Instrumentation.StartTimerWithName("CapturePreview");
await captureManager.StartPreviewAsync();
}
async private void StopCapturePreview_Click(object sender, RoutedEventArgs e) {
    await captureManager.StopPreviewAsync();
    Instrumentation.StopTimerWithName("CapturePreview");
}

```

Report Metrics

To report other types of data, you can use a metric. The metric name should only contain alphanumeric characters and spaces. Illegal characters are replaced by their ASCII hex value. The metric value must be a long integer.

The snippet below shows how you might report a metric.

```

using AppDynamics.Agent;
...
Instrumentation.ReportMetricWithName("Database Rows", 5123);

```

Add Tracking to HTTP Requests

Semi-automatic HTTP Tracking

The `HttpMessageHandler` handles all the tracking and error handling. It can also include other inner handlers if you are already using a custom `HttpMessageHandler` for other purposes, such as for logging.

To add semi-automatic tracking, instantiate a `HttpClient` and pass the `HttpRequestTrackerHandler`:

```

var client = new HttpClient(new HttpRequestTrackerHandler());

```

Then, all the requests sent using the client will be already instrumented:

```

response = await client.GetAsync(uri);

```

i If you already have `HttpMessageHandler` passed to the `HttpClient` (for example, adding a logging handler), you must instantiate `HttpRequestTrackerHandler` and pass the existing handler to the constructor:

```

var loggingHandler = new MyLoggingHandler();
var client = new HttpClient(new
    HttpRequestTrackerHandler(loggingHandler));

```

Manual HTTP Tracking

You can manually report a network request using the [AppDynamics.Agent.HTTPRequestTracker class](#)¹⁴³⁴.

The example below uses HTTPRequestTracker with the System.Net.Http.HttpClient class. The tracker object synchronously captures and reports the network request as well as any network errors.

```
using AppDynamics.Agent;
...
public async Task<string> Fetch(Uri uri) {
    var client = new HttpClient();
    // Create AppDynamics Tracker
    var tracker = HTTPRequestTracker.Create(uri);
    // Add AppDynamics Server Correlation Headers
    foreach (var header in ServerCorrelationHeaders.Generate) {
        // Each header could have multiple values
        foreach (var value in header.Value) {
            client.DefaultRequestHeaders.Add(header.Key, value);
        }
    }
    HttpResponseMessage response = null;
    try {
        response = await client.GetAsync(uri);
    } catch (Exception ex) {
        // Capture any network errors.
        tracker.Exception = ex;
        tracker.ReportDone();
        throw ex; //you decide to throw it or not
    }
    if (!response.Equals(null)) {
        // Capture request information such as the
        // status code, status message, and headers.
        tracker.ResponseCode = (int)response.StatusCode;
        tracker.StatusLine = response.ReasonPhrase;
        tracker.ResponseHeaderFields = response.Headers;
        tracker.ReportDone();
        return await response.Content.ReadAsStringAsync();
    }
    return null;
}
```

Leave Breadcrumbs

You can leave breadcrumbs to mark interesting events. For example, if your application crashes, the breadcrumbs you left with be displayed in the crash report and could provide context. You can also configure the breadcrumb to appear in sessions.

The following is the method signature for leaving breadcrumbs:

¹⁴³⁴ https://sdkdocs.appdynamics.com/xamarin-sdk/latest/html/class_app_dynamics_1_1_agent_1_1_h_t_t_p_request_tracker.html

```
static void AppDynamics.Agent.Instrumentation.LeaveBreadcrumb(string breadcrumb,
BreadcrumbVisibility mode)
```

You use the mode to set the visibility of the breadcrumb. The visibility defines where you will see the breadcrumb in the Controller UI. The value of mode can be one of the following:

- `BreadcrumbVisibility.CrashesOnly` – The breadcrumb will only appear in crash snapshots.
- `BreadcrumbVisibility.CrashesAndSessions` – The breadcrumb will appear in crash snapshots and sessions.

Thus, you would use the method below to set breadcrumbs that are only reported in crash reports:

```
using AppDynamics.Agent;
...
Instrumentation.LeaveBreadcrumb("GetUserInfo", BreadcrumbVisibility.CrashesOnly);
```

If you would like to see the breadcrumb in crash reports and sessions:

```
using AppDynamics.Agent;
...
Instrumentation.LeaveBreadcrumb("GetUserInfo", BreadcrumbVisibility.CrashesAndSessions);
```

Change the App Key

You can use the Xamarin Agent API to dynamically change the EUM app key. You receive the EUM App Key when creating a mobile app in the Controller UI. See [Set Up and Access Mobile RUM](#) (see page 2068) for information about getting the EUM App Key.

The API to change app keys is available through the `Instrumentation` class.

```
Instrumentation.ChangeAppKey("NEW-APP-KEY");
```

Disable the Agent to Stop Sending User Data to the Collector

You can disable the agent to stop sending all data to the collector while the agent is initialized and running. For example, you can disable the agent if your app has an option for users to opt-out of monitoring for privacy reasons.

shutdownAgent

The `shutdownAgent` call stops outgoing data to the collector, and does not persist data on the device.

```
using AppDynamics.Agent;
...
Instrumentation.shutdownAgent();
```

- The call only stops the traffic out of the agent.
- Once the agent has been initialized, the call cannot be removed, and a license will have been consumed.

- If you want to make this state permanent for a device, add code in `UserDefaults` to save the state and use that flag to conditionally initialize the agent in your code.

restartAgent

To re-enable the agent and reverse `shutdownAgent`, use `restartAgent`.

```
using AppDynamics.Agent;
...
Instrumentation.restartAgent();
```

- This call will respect the server side calls that can remotely shutdown the agent in a similar way.
- The call is only in effect while the app is running.
- The call will be ignored if the agent has been remotely disabled.
- If the call is removed from memory and the app restarts, or the device is rebooted, the agent will be initialized as

Report Errors and Exceptions

You can report exceptions using the method `reportError` from the `Instrumentation` class. Reported exceptions will appear in session details.

You can also set one of the severity levels below for an issue. With the severity level, you can filter errors in the **Code Issues Dashboard** or **Code Issues Analyze**.

- `ErrorSeverityLevel.INFO`
- `ErrorSeverityLevel.WARNING`
- `ErrorSeverityLevel.CRITICAL`

The example below uses the API to report possible exceptions and sets the severity level to `ErrorSeverityLevel.CRITICAL` (critical) when writing to a file

```
using AppDynamics.Agent;
...
try {
    // possible exception //
}
catch (Exception e){
    Instrumentation.ReportError(exception, ErrorSeverityLevel.CRITICAL);
}
```

Report Aggregate Exceptions as Crashes

You can configure the Xamarin Agent to report aggregate exceptions (handled and unhandled) as crashes by setting the boolean property `EnableAggregateExceptionHandlering` to `true`. When the property is set to `false`, only unhandled exceptions are reported. The default value is `false`.

The following code example configures the Xamarin Agent to report aggregate exceptions (handled and unhandled) as crashes.

```
using AppDynamics.Agent;
...
var config = AppDynamics.Agent.AgentConfiguration.Create(<EUM_APP_KEY>);
AppDynamics.Agent.Instrumentation.EnableAggregateExceptionHandler = true;
AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
...
```

Disable Crash Reporting

Crash reporting is enabled by default, but you can manually disable crash reporting through the instrumentation configuration. If you are using other crash reporting tools, you might disable crash reporting to minimize conflicts and optimize the crash report results.

You can disable crash reporting by configuring the instrumentation with the `crashReportingEnabled` property as shown in the following:

```
var config = AgentConfiguration.Create(<EUM_APP_KEY>);
config.CrashReportingEnabled = false;
Instrumentation.InitWithConfiguration(config);
```

Add a Crash Reporting Callback

You may want to make crash report information (that the Xamarin Agent collects) available to other parts of your code, such as to Google Analytics. To enable passing on summary crash information, you can set up a crash report runtime callback:

1. To get a callback when the Xamarin Agent detects and then reports a crash, subscribe to the following event that is a part of the **IAgentConfiguration** interface:

```
event EventHandler<IEnumerable<CrashReportSummary>> OnCrash;
```

The `OnCrash` event is raised during the next initialization of the Xamarin Agent after a crash has occurred. This event is raised on your app's UI thread, so any work should be done on a separate work thread.

2. The Xamarin Agent sends a collection of crash report summaries instead of an individual callback in the event that there is more than one crash, producing multiple crash report summaries. Each `CrashReportSummary` has the following properties:
 - `ExceptionName`: useful for quick identification of the crash
 - `ExceptionReason`: useful for quick identification of the crash
 - `ExceptionId`: useful to look up the crash in the Controller UI

i If you are sending the information to another analytics tool, such as Google Analytics, we recommend to include all three properties:

```
public class CrashReportSummary
{
```

```

public string ExceptionId { get; }
public string ExceptionName { get; }
public string ExceptionReason { get; }
}

```

Example

For example, to print the crash information to the console, you could subscribe to the `OnCrash` event like this:

```

IAgentConfiguration config = AgentConfiguration.Create(appKey);
config.OnCrash += (sender, crashReportSummaries) =>
{
    foreach (var crashReportSummary in crashReportSummaries) {
        Console.WriteLine($"Crash Detected: {crashReportSummary.ExceptionName}:
{crashReportSummary.ExceptionReason} ({crashReportSummary.ExceptionId}");
    }
};
Instrumentation.InitWithConfiguration(config);

```

Programmatically Control Sessions

By default, a mobile session ends after a period of user inactivity. For example, when a user opens your application, the session begins and only ends after the user stops using the app for a set period of time. When the user begins to use the application again, a new session begins.

Instead of having a period of inactivity to define the duration of a session, however, you can use the following API to programmatically control when sessions begin and end:

```

static void AppDynamics.Agent.Instrumentation.StartNextSession()

```

When you call the method `StartNextSession`, the current session ends and a new session begins. The API enables you to define and frame your sessions so that they align more closely with business goals and expected user flows. For example, you could use the API to define a session that tracks a purchase of a product or registers a new user.

Excessive use of this API will cause sessions to be throttled (excessive use is > 10 calls per minute per Xamarin Agent, but is subject to change). When not using the API, sessions will fall back to the default of ending after a period of user inactivity.

Example of a Programmatically Controlled Session

In the example below, the current session ends and a new one begins when an item is bought.

```

using AppDynamics.Agent;
...

```

```

public async Task BuySaleItemAsync(SaleItem item)
{
    try
    {
        bool buySucceeded = await this.MobileService.InvokeApiAsync<SaleItem, bool>("buy",
item);
        if (buySucceeded)
        {
            await UserDialogs.Instance.AlertAsync("Thanks for buying this item");
            Instrumentation.StartNextSession();
        }
    }
    catch (Exception e)
    {
        Debug.WriteLine(@"Unexpected error {0}", e.Message);
    }
}

```

Start and End Session Frames

You can use the `ISessionFrame` API to create session frames that will appear in the session activity. Session frames provide context for what the user is doing during a session. With the API, you can improve the names of user screens and chronicle user flows within a business context.

Use Cases

The following are common use cases for the `ISessionFrame` API:

- One screen performs multiple functions and you want more granular tracking of the individual functions.
- A user flow spans multiple screens or user interactions. For example, you could use the API to create the session frames "Login", "Product Selection", and "Purchase" to chronicle the user flow for purchases.
- You want to capture dynamic information based on user interactions to name session frames, such as an order ID.

ISessionFrame API

The table below lists the two methods and one property you can use with session frames. In short, you start a session frame with `StartSessionFrame` and then use the returned `ISessionFrame` object to rename and end the session frame.

Class	Method/Property	Description
Instrument	Method: <pre>static ISessionFrame StartSessionFrame(string sessionFrameName)</pre>	Use this to start and name session frames. Naming session frames helps you track the frames in the session activity.
ISessionFrame	Property: <pre>string Name</pre>	Rename the session frame. You assign the updated <code>Name</code> property from the <code>ISessionFrame</code> object returned by <code>StartSessionFrame</code> .

Class	Method/Property	Description
ISessionFrame	Method: <pre>static void End()</pre>	End the session frame. You call this method from returned from StartSessionFrame.

Session Frame Example

In the following example, the `ISessionFrame` API is used to track user activity during the checkout process.

```
using AppDynamics.Agent;
...

namespace ShoppingApp {
    public partial class ShoppingCart : ContentPage {
        private ISessionFrame sessionFrame;
        private string orderId;
        ...
        void checkoutCartButtonClicked(object sender, EventArgs e) {
            // The checkout starts when the user clicks the checkout button.
            // This may be after they have updated quantities of items in their cart, etc.
            sessionFrame = Instrumentation.StartSessionFrame("Checkout");
        }
        void confirmOrderButtonClicked(object sender, EventArgs e) {
            // Once they have confirmed payment info and shipping information, and they
            // are clicking the "Confirm" button to start the backend process of checking out,
            // we may know more information about the order itself, such as an order ID.
            sessionFrame.Name = $"Checkout: Order ID {this.orderId}";
        }
        void processOrderCompleted(object sender, EventArgs e) {
            // Once the order is processed, the user is done "checking out" so we end
            // the session frame.
            sessionFrame.End();
        }
        void checkoutCancelled(object sender, EventArgs e) {
            // If they cancel or go back, you'll want to end the session frame also, or else
            // it will be left open and appear to have never ended.
            sessionFrame.End();
        }
    }
}
```

Add User Data

You can set a key/value pair of strings to record important events or information. Below is the method signature for setting user data:

```
static void AppDynamics.Agent.Instrumentation.SetUserData(string key, string value)
```

For example, you might want to log the user ID when the method for logging in the user is called:

```
using AppDynamics.Agent;
...
void LogInUser(UserCredentials) {
    // Log in user
    ...
    // Set user data with the user name.
    Instrumentation.SetUserData("user_id", UserCredentials.ID);
}
```

This information is available in **Network Request Analyze** and is added to any crash snapshots that may be taken. Keys and values are limited to 2048 characters each.

You can also set user data with values of other types (long, boolean, double, DateTime) using the following methods:

- [SetUserDataBoolean](#)¹⁴³⁵
- [SetUserDataDate](#)¹⁴³⁶
- [SetUserDataDouble](#)¹⁴³⁷
- [SetUserDataLong](#)¹⁴³⁸

To remove user data, use the following methods:

- [RemoveUserData](#)¹⁴³⁹
- [RemoveUserDataBoolean](#)¹⁴⁴⁰
- [RemoveUserDataDate](#)¹⁴⁴¹
- [RemoveUserDataDouble](#)¹⁴⁴²
- [RemoveUserDataLong](#)¹⁴⁴³

Set the Logging Level (Optional)

You can set the logging level with the configuration `LoggingLevel` as part of the class `AgentConfiguration`¹⁴⁴⁴.

You can set `LoggingLevel` to one of the levels listed in the table below.

Level	Description
Off	Agent will emit no messages at all.
Error	Only show errors and initial banner. This is the default.
Warn	Warning level messages and above.
Info	Information level messages and above May be useful to the developer.
Debug	Debug level messages and above. Useful for support personnel and developers.
Verbose	Verbose level messages and above. Use verbose logging only for troubleshooting. Be sure to disable for production.
All	All messages.

For example:

```
var config = AppDynamics.Agent.AgentConfiguration.Create("<#Your App Key>");
config.LoggingLevel = AppDynamics.Agent.LoggingLevel.All;
AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
```

Transform URLs for Network Requests

Implement the Network Request Callback

The callback that modifies or ignore specific URLs should be assigned to the `Func` delegate below.

i The callback method `OnNetworkRequest` is synchronous, so we recommend that you return from the function quickly.

```
public Func<IHttpRequestTracker, bool> OnNetworkRequest { get; set; }
```

Transforming URLs

¹⁴⁴⁴https://sdkdocs.appdynamics.com/javadocs/xamarin-sdk/latest/html/class_app_dynamics_1_1_agent_1_1_agent_configuration.html

To transform URLs, the `OnNetworkRequest` method should:

1. Identify specific URLs using techniques such as regex or pattern matching.

i This first step is optional because you can choose to transform the URLs of all network requests.

2. Modify the URL property of the `IHttpRequestTracker` object.
3. Assign a valid URL to the `url` property. Modifying other properties of the `IHttpRequestTracker` object will be ignored.
4. Return `true`.

For example:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
    var maskUrl = new Uri("http://networkrequest-mask.com/");
    tracker.Uri = maskUrl;
    return true;
}
```

Transforming Sensitive URLs

You may want to identify and transform URLs that contain sensitive information.

For example:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
    var urlString = tracker.Uri.ToString();
    if (urlString.Contains("accountInfo"))
    {
        tracker.Uri = new Uri("http://customer-account.com/");
    }
    return true;
}
```

Ignoring URLs

If the `onNetworkRequest` method returns `false`, the beacon is dropped. Generally, the process for ignoring beacons is:

1. Identify specific URLs using techniques such as regex or pattern matching.
2. Return `false`.

To ignore specific URLs, you would identify network requests that you didn't want to monitor and return `false` to ignore the network request.

For example:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
    if (tracker.Uri.ToString().Contains("avatar"))
    {
        //ignore calls for avatars
        return false;
    }
    return true;
}
```

To ignore all network requests, implement the following:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
    return false;
}
```

Register a Network Request Callback

To register a network request callback:

1. Define your own method to handle the callback:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
    return true;
}
```

2. Pass it during the AgentConfiguration initialization phase:

```
IAgentConfiguration config = AgentConfiguration.Create(appKey);
config.OnNetworkRequest += NetworkRequestCallback; //Register the Callback
Instrumentation.InitWithConfiguration(config);
```

3. Or you can use an anonymous function:

```
IAgentConfiguration config = AgentConfiguration.Create(appKey);
config.OnNetworkRequest += (IHttpRequestTracker tracker) =>
{
    return true;
};
Instrumentation.InitWithConfiguration(config);
```

Configure and Take Screenshots

By default, mobile screenshots are enabled on the agent-side but disabled on the Controller-side. These screenshots appear in the Controller in the [Sessions Details](#) (see page 2074) dialog. To programmatically take manual screenshots, you must [enable screenshots in the Controller UI](#) (see page 2083) and add the Screenshot API below.

```
Instrumentation.TakeScreenshot();Disable Screenshots
```

i The `takeScreenshot()` function limits screenshots to a maximum of 1 screenshot per 10 seconds.

Disable Screenshots

You can disable screenshots from the Controller UI or with the Xamarin SDK. To disable screenshots with the Xamarin SDK, set the property `ScreenshotsEnabled` of the `IAgentConfiguration` object to `false`:

```
IAgentConfiguration config = AgentConfiguration.Create(appKey); config.ScreenshotsEnabled = false; Instrumentation.InitWithConfiguration(config);
```

Block and Unblock Screenshots

You can also use the Xamarin SDK to block screenshots from being taken during the execution of a code block. This just temporarily blocks screenshots from being taken until you unblock screenshots. This enables you to stop taking screenshots in situations where users are entering personal data, such as on login and account screens.

The `Instrumentation` class provides the methods `blockScreenshots()` and `unblockScreenshots()` to block and unblock screenshots.

i If screenshots are disabled through the property `ScreenshotsEnabled` of the `IAgentConfiguration` object or through the Controller UI, these methods have no effect. You can also check the `Instrumentation.ScreenshotsBlocked` property to check if screenshots are being blocked.

```
public void LoginUser()
{
    if (!Instrumentation.ScreenshotsBlocked)
    {
        Instrumentation.BlockScreenshots();
    }
    LoginCredentials credentials = UserLogin.GetCredentials();

    if (credentials.Authorized)
```

```
{
    RedirectToProfile(credentials.user);
    Instrumentation.UnblockScreenshots();
}
```

Instrument Xamarin.Forms

You can now instrument Xamarin.Forms elements using AppDynamics.Agent.Forms. To add the NuGet package Xamarin.Forms, see [Instrument Xamarin Applications](#)(see page 2228).

Page Tracking

Using Xamarin.Forms, you can track page usage and see the how your users interacts with your app in a session timeline.

To track pages, you must call TrackPage from the constructor on each page you want to monitor.

```
public partial class MyPage : ContentPage
{
    public MyPage()
    {
        InitializeComponent();
        AppDynamics.Agent.Forms.PageTracker.TrackPage(this);
    }
}
```

Track UI Elements

You can track user interactions with these UI elements:

- Buttons
- Entries
- ListViews

To instrument a UI element:

1. Attach a property to your views:

```
appd:UiInstrumentation.IsInstrumented="True"
```

2. Include the namespace:

```
xmlns:appd="clr-namespace:AppDynamics.Agent.Forms;assembly=AppDynamics.Agent.Forms"
```

Example

Example of an xaml file with instrumented UI elements:

```
<ContentPage
```

```

xmlns:appd="clr-namespace:AppDynamics.Agent.Forms;assembly=AppDynamics.Agent.Forms" >
<StackLayout>
  <Button
    appd:UiInstrumentation.IsInstrumented="True"
    Clicked="OnButtonClicked" />
  <Entry
    appd:UiInstrumentation.IsInstrumented="True" />
  <ListView
    appd:UiInstrumentation.IsInstrumented="True">
    <ListView.ItemsSource>
      <x:Array Type="{x:Type x:String}">
        <x:String>Item 1</x:String>
        <x:String>Item 2</x:String>
      </x:Array>
    </ListView.ItemsSource>
  </ListView>
</StackLayout>
</ContentPage>

```

You can also instrument properties from code behind (i.e. in the xaml.cs file):

```

using AppDynamics.Agent.Forms;

...

var button = new Button();
button.SetValue(UiInstrumentation.IsInstrumentedProperty, true);

```

The `IsInstrumented` property will track the following events:

1. Button - Button clicked
2. ListView - Item selected
3. Entry - Entry focused and entry unfocused

Xamarin SDK Documentation

For the complete SDK API documentation, see the [latest Xamarin SDK documentation](#)¹⁴⁴⁵ or the previous versions listed below:

- <https://sdkdocs.appdynamics.com/xamarin-sdk/21.9/html/>
- <https://sdkdocs.appdynamics.com/xamarin-sdk/21.8/html/>
- <https://sdkdocs.appdynamics.com/xamarin-sdk/21.6/html/>
- <https://sdkdocs.appdynamics.com/xamarin-sdk/21.5/html/>
- <https://sdkdocs.appdynamics.com/xamarin-sdk/21.2/html/>

Instrument Cordova Applications

Related pages:

- [Hybrid Application Support](#)(see page 2314)
- [Customize the Cordova Instrumentation](#)(see page 2255)

¹⁴⁴⁵ <https://sdkdocs.appdynamics.com/javadocs/xamarin-sdk/latest/html/>

- [Update Cordova Agent Configurations](#)(see page 2255)

Follow the steps below to get your EUM App Key and instrument your Cordova-based apps.

- [Check Requirements](#)(see page 2250)
- [Get Your Application Key](#)(see page 2250)
- [Install and Initialize the Cordova Plugin](#)(see page 2250)
- [Customize the Cordova Application Instrumentation](#)(see page 2254)

i For native mobile applications, follow either the iOS Instrumentation or Android Instrumentation instructions. The mobile agents will inject the JavaScript Agent and auto-instrument your mobile application including the auto-instrumentation of the WKWebView.

Check Requirements

To use the AppDynamics Cordova plugin, your hybrid application must be using the following:

- Cordova >= 8.0.0
- npm >= 3.10.10
- Node.js >= 6.11.3
- WKWebView for iOS applications

WKWebView Requirements

By default, the Cordova iOS platform command adds a version of `cordova-ios` that supports UIWebView. AppDynamics does not support UIWebView, so you must manually change this to WKWebView.

1. Run the following command:

```
(ionic) cordova platform add ios
```

2. Verify the log output returns:

```
Using WKWebView
```

3. If the log output returns `Using UIWebView`, you must manually change it to `Using UIWebView`.

Get Your Application Key

After you completed the **Getting Started Wizard**, you were given an EUM App Key. You will need this key when you modify the source code. In some cases, multiple mobile applications can share the same key.

If you have completed the **Getting Started Wizard**, but don't have your EUM App Key, see [Get Your Application Key](#)(see page 2069).

Install and Initialize the Cordova Plugin

The AppDynamics Cordova plugin is certified to work with the Ionic and PhoneGap frameworks. Thus, the installation instructions below are for Ionic and PhoneGap applications. See the plugin installation instructions for your Cordova-based framework.

[Ionic](#) [iOS](#) [Android](#) [PhoneGap](#) [iOS](#) [Android](#)

From the root directory of your Ionic application, run the following commands to install the plugin and build the mobile app. See the [Ionic Cordova plugin documentation](#)¹⁴⁴⁶ for more information.

1. Replace the values in brackets with the configurations for your app and run the command to add the configured plugin.

For SaaS deployments:

```
ionic cordova plugin add appd-plugin-eum-mobile --variable APP_KEY="<#EUM_APP_KEY#>" --variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --save
```

For on-prem deployments, replace the value for the variable COLLECTOR_URL with the URL to your EUM Server and the value for SCREENSHOT_URL with the URL to your on-prem Screenshot Service.

```
ionic cordova plugin add appd-plugin-eum-mobile --variable APP_KEY="<#EUM_APP_KEY#>" --variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --variable COLLECTOR_URL="http(s)://<on-prem_eum_server_url>:<PORT>" --variable SCREENSHOT_URL="http(s)://<on-prem_screenshot_service_url>" --save
```

2. (Optional) You can also disable or set the interaction capture mode ([iOS](#)¹⁴⁴⁷/[Android](#)¹⁴⁴⁸) and set the URL to test the network connectivity of Cordova iOS applications.
 - a. The interaction capture mode is on by default, but you can disable it by setting the variable INTERACTION_CAPTURE_MODE to 0 or specify the desired capture mode for the platform (see the interaction mode values for iOS and Android in the table below). Setting INTERACTION_CAPTURE_MODE only controls capturing of webview interactions. If you set INTERACTION_CAPTURE_MODE to 0, interactions with webviews will no longer be captured. However, interactions with native UI elements, such as UI Buttons under iOS, will still be captured, as they always are captured by the underlying native agent for each platform.

```
ionic cordova plugin add appd-plugin-eum-mobile --variable APP_KEY="<#EUM_APP_KEY#>" --variable INTERACTION_CAPTURE_MODE=<see modes in table below> --variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --variable COLLECTOR_URL="http(s)://<on-prem_eum_server_url>:<PORT>" --variable SCREENSHOT_URL="http(s)://<on-prem_screenshot_service_url>" --save
```

[iOS](#) [Android](#)

[iOS](#) [Android](#)

¹⁴⁴⁶ <https://ionicframework.com/docs/cli/commands/cordova-plugin>

¹⁴⁴⁷ <https://docs.appdynamics.com/display/PRO45/Customize+the+iOS+Instrumentation#CustomizetheiOSInstrumentation-ios-capture-user-interaction>

¹⁴⁴⁸ <https://docs.appdynamics.com/display/PRO45/>

[Customize+the+Android+Instrumentation#CustomizetheAndroidInstrumentation-android-capture-user-interaction](https://docs.appdynamics.com/display/PRO45/Customize+the+Android+Instrumentation#CustomizetheAndroidInstrumentation-android-capture-user-interaction)

- b. By default, the Cordova Plugin will use `http://google.com/` to test the connectivity of Cordova iOS applications. You can, however, use a different URL to test the connectivity by setting the variable `REACHABILITY_HOST` to the URL. In the example below, the Cordova Plugin is configured to use `http://example.com` to test the connectivity of the Cordova iOS application.

```
ionic cordova plugin add appd-plugin-eum-mobile --variable
APP_KEY="#EUM_APP_KEY#" --variable REACHABILITY_HOST="http://example.com" --
variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --save
```

3. Build the mobile app:

```
ionic cordova build [android, ios]
```

[Ionic](#)
[iOS](#)
[Android](#)
[PhoneGap](#)
[iOS](#)
[Android](#)

Capture Mode	Value	Description
Capture None	0	No user interactions are captured.
Button Pressed	1	Button presses are captured.
Table Cell Selected	2	Table cell selections are captured.
Text Field Selected	4	Text field selections are captured.
Text View Selected	8	Text view selections are captured.
All	-1	All user interactions are captured.

List Item Selected	4	Selection of list item is captured.
All	-1	All user interactions are captured.

[Ionic](#)
[iOS](#)
[Android](#)
[PhoneGap](#)
[iOS](#)
[Android](#)

From the root directory of your PhoneGap application, run the commands below to install the plugin. See the [PhoneGap plugin documentation](#)¹⁴⁴⁹ for more information.

1. Replace the values in brackets with the configurations for your app and run the command to add the configured plugin.

For SaaS deployments:

```
phonegap cordova plugin add appd-plugin-eum-mobile --variable APP_KEY="<#EUM_APP_KEY#>"
--variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --save
```

For on-prem deployments, replace the value for the variable COLLECTOR_URL with the URL to your EUM Server and the value for SCREENSHOT_URL with the URL to your on-prem Screenshot Service.

```
phonegap cordova plugin add appd-plugin-eum-mobile --variable APP_KEY="<#EUM_APP_KEY#>"
--variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --variable
COLLECTOR_URL="http(s)://<on-prem_eum_server_url>:<PORT>" --variable
SCREENSHOT_URL="http(s)://<on-prem_screenshot_service_url>" --save
```

2. (Optional) You can also set variables to enable user interaction capture mode ([iOS](#)¹⁴⁵⁰/[Android](#)¹⁴⁵¹) and troubleshoot the network connectivity of Cordova iOS applications.

- a. The interaction capture mode is on by default, but you can disable it by setting the variable INTERACTION_CAPTURE_MODE to 0 or specify the desired capture mode for the platform (see the interaction mode values for iOS and Android in the table below). Setting INTERACTION_CAPTURE_MODE only controls capturing of webview interactions. If you set INTERACTION_CAPTURE_MODE to 0, interactions with webviews will no longer be captured. However, interactions with native UI elements, such as UI Buttons under iOS, will still be captured, as they always are captured by the underlying native agent for each platform.

```
phonegap cordova plugin add appd-plugin-eum-mobile --variable
APP_KEY="<#EUM_APP_KEY#>" --variable INTERACTION_CAPTURE_MODE=<see modes in table
below> --variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6]
--save
```

[iOS](#) [Android](#)

[iOS](#) [Android](#)

- b. By default, the Cordova Plugin will use `http://google.com` to test the connectivity of Cordova iOS applications. You can, however, use a different URL to test the connectivity by setting the

¹⁴⁴⁹ <https://github.com/phonegap/phonegap-docs/tree/master/docs/3-references/plugin-apis>

¹⁴⁵ <https://docs.appdynamics.com/display/PRO45/Customize+the+iOS+Instrumentation#CustomizetheiOSInstrumentation-ios-capture-user-interaction>

¹⁴⁵ <https://docs.appdynamics.com/display/PRO45/>

[Customize+the+Android+Instrumentation#CustomizetheAndroidInstrumentation-android-capture-user-interaction](#)

variable REACHABILITY_HOST to the URL. In the example below, the Cordova Plugin is configured to use `http://example.com` to test the connectivity of the Cordova iOS application.

```
phonegap cordova plugin add appd-plugin-eum-mobile --variable
APP_KEY="#EUM_APP_KEY#" --variable REACHABILITY_HOST=http://example.com --
variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --save
```

3. Build the mobile app:

```
phonegap cordova build [android, ios]
```

Ionic [iOS](#) [Android](#) PhoneGap [iOS](#) [Android](#)

Capture Mode	Value	Description
Capture None	0	No user interactions are captured.
Button Pressed	1	Button presses are captured.
Table Cell Selected	2	Table cell selections are captured.
Text Field Selected	4	Text field selections are captured.
Text View Selected	8	Text view selections are captured.
All	-1	All user interactions are captured.

Ionic [iOS](#) [Android](#) PhoneGap [iOS](#) [Android](#)

Capture Mode	Value	Description
Capture None	0	No user interactions are captured.
Button Pressed	1	Button presses are captured.
Edit Text Selected	2	Selection of edited text is captured.
List Item Selected	4	Selection of list item is captured.
All	-1	All user interactions are captured.

Customize the Cordova Application Instrumentation

See [Customize the Cordova Application](#)(see page 2255) showing how to use the Cordova SDK through examples and brief explanations.

Update Cordova Agent Configurations

To update the configurations set when you first added the Cordova plugin to your application, the suggested practice is to remove the values for configuration values and then add new configuration values.

See the following examples:

- [WkWebView Requirements](#)(see page 2250)
- [Change the App Key](#)(see page 2255)
- [Change the App Name](#)(see page 2255)

Change the App Key

To change the app key for your Ionic or PhoneGap applications:

1. Remove the old value for the variable APP_KEY with the remove command:

```
cordova plugin remove --variable APP_KEY="old-app-key" appd-plugin-eum-mobile
```

2. Add new value for the variable APP_KEY with the add command. Be sure to include the variables that you set when you first added the plugin (represented by <variable_list> below). For example, if you set REACHABILITY_HOST=http://example.com when you first added the plugin, you will need to reset the variable when running the add command again.

```
cordova plugin add --variable APP_KEY="new-app-key" <variable_list> appd-plugin-eum-mobile
```

Change the App Name

To change the name of your Ionic or PhoneGap applications:

1. Remove the old value for the variable APP_NAME with the remove command:

```
cordova plugin remove --variable APP_NAME="old-app-name" appd-plugin-eum-mobile
```

2. Add new value for the variable APP_NAME with the add command. Be sure to include the variables that you set when you first added the plugin (represented by <variable_list> below). For example, if you set REACHABILITY_HOST=http://example.com/ when you first added the plugin, you will need to reset the variable when running the add command again.

```
cordova plugin add --variable APP_NAME="new-app-name" <variable_list> appd-plugin-eum-mobile
```

Customize the Cordova Instrumentation

Related pages:

- [Instrument Cordova Applications](#)(see page 2249)
- [Cordova SDK Documentation](#)(see page 2267)

Once you have [instrumented your Cordova-based application](#)(see page 2249) with the Cordova Plugin, you can also use the APIs to customize the data for your app that appears in the Controller UI. The following sections show you how to use the Cordova Plugin SDK API to customize your instrumentation:

- [Using the Cordova Plugin SDK API](#)(see page 2256)
- [Change the App Key](#)(see page 2257)
- [Collect Additional Types of Data](#)(see page 2257)
- [Programmatically Control Sessions](#)(see page 2262)
- [Start and End Session Frames](#)(see page 2263)
- [Configure and Take Screenshots](#)(see page 2265)
- [Block and Unblock Screenshots](#)(see page 2266)
- [Enable Logging and Set Logging Level](#)(see page 2266)
- [Cordova SDK Documentation](#)(see page 2267)

Using the Cordova Plugin SDK API

Syntax

To call SDK API methods, use the following syntax: `window.plugins.ADEUMMobilePlugin.<method>`

Arguments

The last two arguments for all of the SDK API methods should always be two functions. The first function should handle successful cases and the last method should handle failures.

For example:

```
window.plugins.ADEUMMobilePlugin.changeAppKey("<EUM_APP_KEY>",
  (success) => {
    this.showAlert("changeAppKey return: success");
  },
  (error) => {
    this.showAlert("changeAppKey error:" + error);
  }
);
```

Add Methods to Call SDK APIs

To use the SDK APIs, you are recommended to create class methods that call the SDK APIs as shown below.

```
export class HomePage {
  ...
  someMethod(event) {
    window.plugins.ADEUMMobilePlugin.<method>(<arg1>, <success_function>,
    <failure_function>);
  }
  ...
}
```

Example

Thus, for the `HomePage.js` file, your `HomePage` class could have the method `takeScreenshot` that calls the SDK API method `screenshot` as shown here.

```
export class HomePage {
  ...
  takeScreenshot(event) {
    // Call the Cordova plugin SDK methods
    window.plugins.ADEUMMobilePlugin.screenshot(
      (success) => {
        this.showAlert("crash return: success");
      },
      (error) => {
        this.showAlert("crash error:" + error);
      }
    );
  }
  ...
}
```

Change the App Key

To change the EUM application key, you use the method `changeAppKey` with the parameters below.

Parameter Name	Data Type	Description
<code>appKey</code>	string	The EUM application key.
<code>success</code>	function	A user-defined function that is called when <code>changeAppKey</code> is successful.
<code>error</code>	function	A user-defined function that is called when <code>changeAppKey</code> fails.

For example, you could create a new method that takes a new app key and passed it to the SDK API method `changeAppKey`.

```
changeAppKey(event, newAppKey) {
  window.plugins.ADEUMMobilePlugin.changeAppKey(newAppKey,
    (success) => {
      this.showAlert("changeAppKey return: success");
    },
    (error) => {
      this.showAlert("changeAppKey error:" + error);
    }
  );
}
```

Collect Additional Types of Data

You can use methods available in the `ADEUMMobilePlugin` class to collect five additional types of data:

- [Info points](#)(see page 2258)
- [Custom timers](#)(see page 2258)
- [Custom metrics](#)(see page 2259)
- [User data](#)(see page 2261)
- [Breadcrumbs](#)(see page 2260)

Info Points

Information points allow you to track how your own code is running. You can see how often a method is invoked, and how long it takes to run by calling `beginCall`. When the callbacks success or error are called, the call to track the info point ends.

- `beginCall(name, functionName, args, success, error)`

Parameters

The table below describes the parameters for the two methods:

Name	Type	Description
name	string	The name of the file or module where the info point is being recorded.
functionName	string	The function that is invoking <code>beginCall</code> to track an info point.
success	function	The user-defined callback for successful cases.
error	function	The user-defined callback for failed cases.

Example

For example, you can use create info points with something like the code below to determine how a method is invoked, and how long it takes to run:

```
beginCall(event) {
  window.plugins.ADEUMMobilePlugin.beginCall("home.ts", "callTrackerFunction", "event",
    (tracker) => {
      tracker.reportCallEndedWithReturnValue("Return from home.ts",
        (success) => { console.log("End call with return value success:" +
success);});
      (error) => { console.log("End call with return value error:" + error); });
    },
    (error) => {
      console.log("Begin call error:" + error);
    }
  );
}
```

Custom Timers

You can create custom timers to time any arbitrary sequence of events within your code, even spanning multiple methods. You create the custom timers using the SDK API methods `startTimer` and `stopTimer`.

- `startTimerWithName(name, success, error)`
- `stopTimerWithName(name, success, error)`

Parameters

The two methods take the following parameters:

Name	Type	Description
name	string	The name of the custom timer. Allowed characters are [A-Za-z\s0-9]. Illegal characters are replaced by their ASCII hex value.
success	function	The user-defined callback for successful cases.
error	function	The user-defined callback for failed cases.

Example

For example, to track the time a user spends viewing a screen, the instrumentation could look like this:

```
startTimer(event) {
  window.plugins.ADEUMMobilePlugin.startTimerWithName(data.name,
    (success) => {
      this.showAlert("startTimerWithName return: success");
    },
    (error) => {
      this.showAlert("startTimerWithName error:" + error);
    }
  );
}
stopTimer(event) {
  window.plugins.ADEUMMobilePlugin.stopTimerWithName(data.name,
    (success) => {
      this.showAlert("stopTimerWithName return: success");
    },
    (error) => {
      this.showAlert("stopTimerWithName error:" + error);
    }
  );
}
```

Custom Metrics

You can also report custom metrics.

You create custom metrics with the `reportMetricWithName`:

- `reportMetricWithName(name, value, success, error)`

Parameters

The `reportMetricWithName` method takes the following parameters:

Name	Type	Description
name	string	The name of the custom metric. The metric names must consist of alphanumeric characters. Illegal characters are replaced by their ASCII hex value.
value	number	if value is not a whole number an error will be returned.
success	function	User-defined success callback.
error	function	User-defined error callback.

Example

For example, the following method could be used to report custom metrics:

```
reportMetric(event, data) {
  window.plugins.ADEUMMobilePlugin.reportMetricWithName(data.name, parseInt(data.value),
    (success) => {
      this.showAlert("reportMetricWithName : success");
    },
    (error) => {
      this.showAlert("reportMetricWithName error:" + error);
    }
  );
};
```

Breadcrumbs

Breadcrumbs allow you to situate a crash in the context of your user's experience. Set a breadcrumb when something interesting happens. If your application crashes at some point in the future, the breadcrumb will be displayed along with the crash report. Each crash report displays the most recent 99 breadcrumbs.

You create and leave breadcrumbs with the following SDK API method:

- `leaveBreadcrumb(breadcrumb, mode, success, error)`

Parameters

The method `leaveBreadcrumb` takes the following parameters:

Name	Type	Description
breadcrumb	string	The string to include in the crash report and sessions. Truncated at 2048 characters; empty values are ignored.

Name	Type	Description
mode	number	The mode determining where the breadcrumb will be displayed: <ul style="list-style-type: none"> • 0 - for crashes only • 1 - for crashes and sessions. The mode defaults to crashes if the value is not parseable.
success	function	The user-defined callback for successful cases.
error	function	The user-defined callback for failed cases.

Example

This code example shows how to use the SDK API to leave a breadcrumb:

```

breadcrumb(mode) {
  window.plugins.ADEUMMobilePlugin.leaveBreadcrumb( "breadcrumb1", mode,
  (success) => {
    this.showAlert("leaveBreadcrumb return: success");
  },
  (error) => {
    this.showAlert("leaveBreadcrumb error:" + error);
  }
)

```

Add Custom User Data

You can set and later remove any string key/value pair you think might be useful with the following methods:

- setUserData(key, value, success, error)
- removeUserData(key, success, error)

Parameters

The following table describes the parameters:

Name	Type	Description
key	string	The key identifying the key-value pair.
value	string	The value associated with the key.
success	function	The user-defined callback for successful cases.
error	function	The user-defined callback for failed cases.

Example

The code example below shows how to set and remove user data with the SDK API:

```

setCustomData(event, data) {
  window.plugins.ADEUMMobilePlugin.setUserData(data.name, data.value,
    (success) => {
      this.showAlert("setUserData return: success");
    },
    (error) => {
      this.showAlert("setUserData error:" + error);
    }
  );
};

removeUserData(event, key) {
  window.plugins.ADEUMMobilePlugin.removeUserData(key,
    (success) => {
      this.showAlert("removeUserData return: success");
    },
    (error) => {
      this.showAlert("removeUserData error:" + error);
    }
  );
}

```

Programmatically Control Sessions

By default, a mobile session ends after a period of user inactivity. For example, when a user opens your application, the session begins and only ends after the user stops using the app for a set period of time. When the user begins to use the application again, a new session begins.

Instead of having a period of inactivity to define the duration of a session, however, you can use the following API to programmatically control when sessions begin and end.

```
startNextSession(success, error)
```

When you call the method `startNextSession` from `ADEUMMobilePlugin`, the current session ends and a new session begins. The API enables you to define and frame your sessions so that they align more closely with business goals and expected user flows. For example, you could use the API to define a session that tracks a purchase of a product or registers a new user.

Excessive use of this API will cause sessions to be throttled (excessive use is >10 calls per minute, but is subject to change). When not using the API, sessions will fall back to the default of ending after a period of user inactivity.

Example of a Programmatically Controlled Session

In the example below, the current session ends and a new one begins when the checkout is made.

```

completeCheckout() {
  if (this.validateAddress() && this.validatePayment()){

```

```

let loader = this.loader.create({
  content: "Completing the checkout..."
});
loader.present();
return this.order.create({
  shipping_address: this.address,
  billing_address: this.address,
  cart_id: Number(this.configuration.get('cart_id'))
})
...
window.plugins.ADEUMMobilePlugin.startNextSession(
  (success) => {
    console.log("startNextSession return: success");
  },
  (error) => {
    console.log("startNextSession error:" + error);
  }
);
}

```

Start and End Session Frames

You can use Cordova Plugin to create session frames that will appear in the session activity. Session frames provide context for what the user is doing during a session. With the API, you can improve the names of user screens and chronicle user flows within a business context.

Use Cases

The following are common using session frames:

- One page performs multiple functions and you want more granular tracking of the individual functions.
- A user flow spans multiple pages or user interactions. For example, you could use the API to create the session frames "Login", "Product Selection", and "Purchase" to chronicle the user flow for purchases.
- You want to capture dynamic information based on user interactions to name session frames, such as an order ID.

SessionFrame API

The table below lists the three methods you can use with session frames. In short, you start a session frame with `startSessionFrame` and then use `updateName` and `end` to rename and end the session frame.

Method	Parameters	Description
<code>startSessionFrame(name, success, error)</code>	<ul style="list-style-type: none"> • name (string) - The name of the session frame. • success (function) - The user-defined success callback. • error (function) - The user-defined error callback. 	<p>Use this to start and name your session frame.</p> <p>You call this method from <code>window.plugins.ADEUMMobilePlugin</code>.</p>

Method	Parameters	Description
<pre>updateName(name, success, error)</pre>	<ul style="list-style-type: none"> name (string) - The name of the session frame. success (function) - The user-defined success callback. error (function) - The user-defined error callback. 	<p>Rename the session frame name.</p> <p>You call this method from the <code>ADEUMMobilePlugin</code> object.</p>
<pre>end(success, error)</pre>	<ul style="list-style-type: none"> success (function) - The user-defined success callback. error (function) - The user-defined error callback. 	<p>End the session frame.</p> <p>You call this method from the <code>ADEUMMobilePlugin</code> object.</p>

Session Frame Example

In the following example, session frames are used to track user activity during the checkout process.

```
declare var window: any;
@Component({
  ...
})
export class OrderPage {
  sessionFrame: any;
  ...

  checkoutCartButtonClicked() {
    // The user starting to check out starts when the user clicks the checkout button
    // this may be after they have updated quantities of items in their cart, etc.
    window.plugins.ADEUMMobilePlugin.startSessionFrame("Checkout",
      (sessionFrame) => {
        // The returned object is saved to the class property 'sessionFrame' so
        // the SessionFrame API methods 'updateName' and 'end' can be called from it
        later.
        this.sessionFrame = sessionFrame;
      },
      (error) => {
        console.log("startSessionFrame call error:" + error);
      }
    );
  }
  confirmOrderButtonClicked() {
    // Once they have confirmed payment info and shipping information, and they
    // are clicking the "Confirm" button to start the backend process of checking out
    // we may know more information about the order itself, such as an Order ID.
    this.sessionFrame.updateName("Checkout: Order ID " + this.orderId,
      (success) => {
        console.log("Order has been placed and sessionFrame updated:" + this.orderId)
      }
    );
  }
};
```

```

    },
    (error) => {
      console.log("Order has been placed but sessionFrame couldn't be updated
because of the error " + error);
    }
  );
}
processOrderCompleted() {
  // Once the order is processed, the user is done "checking out" so we end
  // the session frame.
  this.sessionFrame.end(
    (success) => {
      console.log("Order was completed and sessionFrame ended: " + success);
    },
    (error) => {
      console.log("Order was completed but sessionFrame couldn't be ended because
of: " + error);
    }
  );
}
checkoutCancelled() {
  // If they cancel or go back, you'll want to end the session frame also, or else
  // it will be left open and appear to have never ended.
  this.sessionFrame.end(
    (success) => {
      console.log("Order was cancelled and sessionFrame ended: " + success);
    },
    (error) => {
      console.log("Order was cancelled but sessionFrame couldn't be ended because
of: " + error);
    }
  );
}
} // end of export class OrderPage

```

Configure and Take Screenshots

By default, mobile screenshots are enabled on the agent-side but disabled on the Controller-side. These screenshots appear in the Controller in the [Sessions Details](#) (see page 2074) dialog. To programmatically take manual screenshots, you must [enable screenshots in the Controller UI](#) (see page 2083) and add the Screenshot API below.

```

screenshot(event) {
  // make a call to plugin
  console.log("screenshot click handler");
  window.plugins.ADEUMMobilePlugin.takeScreenshot(

  (success) => {

```

```

        this.showAlert("screenshot return: success");
    },
    (error) => {
        this.showAlert("screenshot error:" + error);
    });
}

```

i This will capture everything, including personal information, so you must be cautious of when to take the screenshot.

Block and Unblock Screenshots

You can also block screenshots from being taken during the execution of a code block. This just temporarily blocks screenshots from being taken until you unblock screenshots. This enables you to stop taking screenshots in situations where users are entering personal data, such as on login and account screens.

```

logInScreen(event) {
    // Block Screen while getting user input
    window.plugins.ADEUMMobilePlugin.blockScreenshots(
        (success) => {
            console.log("blockScreenshots return: success");
            this.getUserInput();
            this.submitUserInput();
        },
        (error) => {
            console.log("blockScreenshots error:" + error);
        }
    );
    // Unblock screen and return to home page
    window.plugins.ADEUMMobilePlugin.unblockScreenshots(
        (success) => {
            console.log("unblockScreenshots return: success");
            this.homePage()
        },
        (error) => {
            console.log("unblockScreenshots error:" + error);
        }
    );
}

```

Enable Logging and Set Logging Level

You use the method `loggingLevel` to enable and set the logging level. You can set logging to one of the following levels:

Value	Logging Level	Description
0	None	No logs are displayed. This level disables logging.
1	Error	Only error messages are displayed. This is the default logging level.
2	Warn	Warning and error messages are displayed.
3	Info	Warning, errors, and developer-focused messages are displayed.
4	Debug	Errors, warnings, developer information, and debugging messages are displayed.
5	Verbose	Errors, warnings, developer information, debugging, and troubleshooting messages are displayed.
6	All	All the supported log messages are displayed.

You enable logging by setting the logging level in the instrumentation configuration. For example, in this example, you are enabling logging and setting the logging level to Info:

```

window.plugins.ADEUMMobilePlugin.initWithConfiguration(
  {
    "appKey": "<EUM_APP_KEY>",
    "loggingLevel": 3
  },
  (success) => {
    this.showAlert("initWithConfiguration return: success");
  },
  (error) => {
    this.showAlert("initWithConfiguration error:" + error);
  }
);

```

Cordova SDK Documentation

For the Cordova SDK API reference documentation, see the [latest JSDoc documentation](#)¹⁴⁵² or the previous versions listed below:

- <https://sdkdocs.appdynamics.com/cordova-plugin/21.5/>
- <https://sdkdocs.appdynamics.com/cordova-plugin/21.2/>
- <https://sdkdocs.appdynamics.com/cordova-plugin/20.11/>
- <https://sdkdocs.appdynamics.com/cordova-plugin/20.10/>
- <https://sdkdocs.appdynamics.com/cordova-plugin/20.7/>

Instrument React Native Applications

Related pages:

¹⁴⁵² <https://sdkdocs.appdynamics.com/javadocs/cordova-plugin/1/latest/>

- [Hybrid Application Support](#)(see page 2314)
- [Manually install the React Native Package](#)(see page 2269)
- [Point to an On-Premises EUM Server \(Optional\)](#)(see page 2272)
- [Customize the React Native Instrumentation](#)(see page 2272)

Follow these steps to get your EUM App Key and instrument your React Native application.

- [Requirements](#)(see page 2268)
- [Get Your Application Key](#)(see page 2268)
- [Eject Your React Native Application](#)(see page 2268)
- [Install the React Native Agent](#)(see page 2269)
- [Add Permissions \(Android Only\)](#)(see page 2270)
- [Instrument Your Application Code](#)(see page 2271)
- [Build and Run Your React Native Applications \(Optional\)](#)(see page 2272)

Requirements

- React Native ≥ 0.60

The React Native Agent has been tested and certified to work with React Native ≥ 0.60 . React Native is in rapid development; thereby any minor update to React Native could potentially affect the functionality of the React Native Agent.

- (iOS only): Pod target and Xcode deployment target must both be ≥ 11 . Find the pod target version in the pod file located in `<your_react_native_app>/ios/`.

Get Your Application Key

From the Controller's **Getting Started Wizard**, create either an iOS or an Android application. You will be given an EUM App Key that you will use to instrument your application. In some cases, multiple mobile applications can share the same key.

If you have completed the **Getting Started Wizard**, but don't have your EUM App Key, see [Get Your Application Key](#)(see page 2069).

Eject Your React Native Application

If you created your React Native application with one of the commands in the following table, you will need to eject the application:

Command	Why Ejection Is Needed
<code>create-react-native-app</code>	This command enables you to quickly set up and run a Native React application with no configuration but does <i>not</i> provide the full development environment required by the React Native Agent.
<code>expo init</code>	Expo projects do not currently support the React Native Agent module.

If you created your app with `create-react-native-app`, use `npm` to eject the app. If you used `expo`, run the `expo` command below to eject the app.

From your project directory, run the command appropriate for your use case:

[npm](#) expo

```
npm run eject
```

npm [expo](#)

```
expo eject
```

Install the React Native Agent

This module injects the native AppDynamics agents into your application and offers a JavaScript bridge to the Instrumentation management interface.

1. Install the React Native Agent:

```
npm install --save @appdynamics/react-native-agent
```

2. Build the configuration to enable the build-time instrumentation of your application:

```
node node_modules/@appdynamics/react-native-agent/bin/cli.js install
```

The React Native Agent CLI assumes you've kept the default project structure created with the react-native CLI tools.

3. If the above commands failed, see [manually install the React Native package](#)(see page 2269). Otherwise, proceed to [Add Required Libraries \(iOS Only\)](#)(see page 0) and/or [Add Permissions \(Android Only\)](#)(see page 2270).

Manually Install the React Native Package (Only If Required)

Most users do not have to manually install the package, but the command above may fail if you heavily modified your iOS and Android projects.

Follow these steps to manually install the React Native package:

[Android](#) iOS

1. Add the following line to your android/build.gradle:

```
apply from: '../node_modules/@appdynamics/react-native-agent/android/adeum.gradle'
```

2. Make sure the file `settings.gradle` contains a reference to the Appdynamics agent module as shown below.

```
include ':@appdynamics_react-native-agent'
project(':@appdynamics_react-native-agent').projectDir = new
  File(rootProject.projectDir, '../node_modules/@appdynamics/react-native-agent/
  android')
```

3. Also, `android/app/build.gradle` should contain a reference to the Appdynamics agent module.

```
dependencies {
  implementation project(':@appdynamics_react-native-agent')
  // ...
}
```

Android [iOS](#)

For iOS, confirm that the following files exist:

File	File Location	Example
ADEUMReactNative.xcodeproj	Libraries or node_modules directory	<your_react_native_app>/node_modules/@appdynamics/react-native-agent/ios/ADEUMReactNative.xcodeproj
libADEUMReactNative.a	From Xcode , the file should be listed on the Build Phases > Link Binary With Libraries tab or in the following directory: <your_react_native_app>/ios/build/ <your_react_native_app>/Build/Products/Debug-iphonesimulator/	<your_react_native_app>/ios/build/<your_react_native_app>/Build/Products/Debug-iphonesimulator/libADEUMReactNative.a

Make sure to add `libsqlite3` to your project as explained in [Add Required Libraries \(iOS Only\)](#)(see page 0).

Add Permissions (Android Only)

Add the following permissions to your app's `AndroidManifest.xml` (which should be located under `android/app/src/main/`).

```
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
  package="com.your.application">

  // Add the following:
  <uses-permission android:name="android.permission.ACCESS_NETWORK_STATE"/>

  // ...
</manifest>
```

i The React Native Agent tries to minimize its network footprint. Without this permission, the agent always assumes poor network conditions and some metrics may not get reported.

Instrument Your Application Code

In the `index.js` file of your React application:

1. At the top of the file near the other `import` statements, add the following line of code to import the Native React Agent:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

2. In the same file and in the global scope, initialize the instrumentation with the following, making sure to replace `<EUM_APP_KEY>` with a string containing your [EUM App Key](#)(see page 2268).

```
Instrumentation.start({
  appKey: <EUM_APP_KEY>,
});
```

3. Verify that your `index.js` file looks similar to the following:

```
import {AppRegistry} from 'react-native';
import App from './App';
// == Add the following to import the React Native Agent
import { Instrumentation } from '@appdynamics/react-native-agent';

// Initialize the instrumentation
Instrumentation.start({
  appKey: 'YOUR-APP-KEY',
});

// Create a component
const App = () => (
  // Other components
);

// Register the App component
```

```
AppRegistry.registerComponent('my-application', () => App);
```

- (For older React Native setup builds) If you have `use_frameworks!` defined in your `ios/Podfile`, we recommend adding the following:

```
$ toggleADEUMRNStaticFramework = true
```

Build and Run Your React Native Applications (Optional)

- Run the command to build and run the app for your platform.

[Android](#) [iOS](#)

```
react-native run-android
```

Android [iOS](#)

```
react-native run-ios
```

- From the Controller UI, [verify that the instrumentation was successful](#)(see page 2070).

Point to an On-Premises EUM Server (Optional)

To use an on-premises EUM Server, pass the URL to the on-premises EUM Server when you initialize the instrumentation with the EUM App Key from [Get Your Application Key](#)(see page 2268).

```
Instrumentation.start({
  appKey: <EUM_APP_KEY>,
  collectorURL: <COLLECTOR_URL>
});
```

Customize the React Native Instrumentation

The sections below describe how to use the React Native APIs to customize your instrumentation.

- [Using the React Native Agent APIs](#)(see page 2273)
- [Change the App Key](#)(see page 2273)
- [Collect Additional Types of Data](#)(see page 2274)
- [Report Info Points](#)(see page 2275)
- [Set Custom Timers](#)(see page 2277)
- [Create Custom Metrics](#)(see page 2277)
- [Add Custom User Data](#)(see page 2278)

- [Leave Breadcrumbs](#)(see page 2280)
- [Capture User Interaction](#)(see page 2282)
- [Disable the Agent to Stop Sending User Data to the Collector](#)(see page 2284)
- [Programmatically Control Sessions](#)(see page 2285)

- [Use the Agent with a Custom HTTP Library](#)(see page 2293)
- [React Native API Documentation](#)(see page 2296)

Using the React Native Agent APIs

After you have installed and initialized the React Native Agent, you instrument your application code by importing the class, interface, or enumeration and then calling API methods.

Import Syntax

To access the React Native Agent APIs, use an import statement at the top of the file. The following line imports the class `Instrumentation`:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

API Method Syntax

Once the class, interface, or enumeration has been imported, call the API methods from the imported component. In this example, you set custom user data with `setUserDataBoolean` from the `Instrumentation` class.

```
Instrumentation.setUserDataBoolean("Boolean Key", true);
```

Change the App Key

You can use the React Native API to dynamically change the EUM App Key. You receive the app key when creating a mobile app in the Controller UI. See [Set Up and Access Mobile RUM](#)(see page 2068) for more information about app keys.

Class

The API to change app keys is available through the `Instrumentation` class.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

Methods

The API consists of the following method:

- `changeAppKey(appKey)`

Method Parameters

The `changeAppKey` method takes the following parameter:

Parameter Name	Data Type	Description
<code>appKey</code>	string	The EUM App Key.

Examples

In this example, you create a method that takes a new app key and passes it to the API method `changeAppKey`.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
private updateAppKey(newAppKey) {
  Instrumentation.changeAppKey(newAppKey);
}
```

Collect Additional Types of Data

The React Native APIs have methods that extend the application data types you can collect and aggregate with Mobile RUM. There are six basic kinds of extensions that you can create:

Type of Data	Description	Specifications	Where Data is Displayed
Info points (see page 2275)	How often a method is invoked, and how long it takes to run.	<ul style="list-style-type: none"> Data is numeric Names must consist of alphanumeric characters and/or spaces 	<ul style="list-style-type: none"> Metric Browser(see page 224) Custom Data(see page 2122) Network Request Snapshots(see page 2098) Mobile Sessions(see page 2073) Network Request Analyze(see page 2096)
Custom timers (see page 2277)	Any arbitrary sequence of events within your code timed, even spanning multiple methods.	<ul style="list-style-type: none"> Data is numeric Metric names must consist of alphanumeric characters and/or spaces 	<ul style="list-style-type: none"> Metric Browser(see page 224) Custom Data(see page 2122)
Custom metrics (see page 2277)	Any integer-based data you wish to collect.	<ul style="list-style-type: none"> Data is numeric Metric names must consist of alphanumeric characters and/or spaces 	<ul style="list-style-type: none"> Metric Browser(see page 224) Custom Data(see page 2122)

Type of Data	Description	Specifications	Where Data is Displayed
User data (see page 2278)	Any string key/value pair you think might be useful.	<ul style="list-style-type: none"> Data can be any type Metric names have no restrictions 	<ul style="list-style-type: none"> Network Request Snapshots(see page 2098) Mobile Sessions(see page 2073) Network Request Analyze(see page 2096) Crash Snapshots(see page 2103)
Breadcrumbs (see page 2280)	The context for a crash.	<ul style="list-style-type: none"> Data can be any data type Metric names have no restrictions 	<ul style="list-style-type: none"> Network Request Snapshots(see page 2098) Mobile Sessions(see page 2073) Network Request Analyze(see page 2096) Crash Snapshots(see page 2103)
User interactions (see page 2282)	Capture when users press buttons, click on lists, and select text.	<ul style="list-style-type: none"> Data can be any data type Metric names have no restrictions 	<ul style="list-style-type: none"> Network Request Snapshots(see page 2098) Mobile Sessions(see page 2073) Network Request Analyze(see page 2096)

Report Info Points

Information points allow you to track how your own code is running. Unlike the other React Native APIs that require importing a module and using a method from that module, you add annotations to your code to report info points.

Class/Interface

The API is available through the `InfoPoint` function.

```
import { InfoPoint } from '@appdynamics/react-native-agent';
```

Methods

With the `@InfoPoint` annotation, you only need to provide a function to report info points. The `@InfoPoint` annotation has two signatures:

- `@InfoPoint`
- `@InfoPoint({className: string, fnName: string})`

Method Signatures

Methods	Parameters	Description
@InfoPoint	None	Automatically reports the info points of the method that is being annotated.
@InfoPoint({className: string, fnName: string})	Object <ul style="list-style-type: none"> • className - The name of the file or module where the info point is recorded. • fnName - The function that invokes beginCall to track an info point. 	Manually specify the class and function names to annotate. For example: <pre>@InfoPoint({ className: 'Automobiles', fnName: 'checkInventory' })</pre>

Examples

The following examples show you how to use automatic and manual reporting of info points. We recommended you use automatic reporting if your code will not be minified: it's simpler and reports the same information. If your code will be minified, however, you should manually report the class and function names to avoid reporting the useless class and function names created by minification.

Automatic Reporting

Add the annotation @InfoPoint to automatically create an info point for the method below it. Info point reports how the method is invoked and how long it takes to run.

```
import { InfoPoint } from '@appdynamics/react-native-agent';

class InfoPointsScreen extends Component {

  @InfoPoint
  public infoPointMethod(arg1, arg2, value) {
    console.log("Executing infoPointMethod!");
  }
}
```

Manually Reporting

To create an info point for a specific method in a class (the symbol names), pass an object to the @InfoPoint annotation that specifies the class and method name as shown below.

```
import { InfoPoint } from '@appdynamics/react-native-agent';

class InfoPointsScreen extends Component {

  @InfoPoint({ className: 'MyClass', fnName: 'infoPointMethod' })
```

```

public infoPointMethod(arg1, arg2, value) {
  console.log("Executing infoPointMethod!");
}
}

```

Set Custom Timers

You create custom timers to time any arbitrary sequence of events within your code, even spanning multiple methods.

Class/Interface

The Custom Timers API is accessible through the Instrumentation class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

Methods

You create the custom timers using the following React Native Agent API methods:

- `startTimerWithName(name)`
- `stopTimerWithName(name)`

Method Parameters

Both methods take the following parameter:

Name	Type	Description
name	string	The name of the custom timer. Allowed characters are [A-Za-z\s0-9]. Illegal characters are replaced by their ASCII hex value.

Examples

For example, to track the time a user spends viewing a screen, the instrumentation could look like this:

```

import { Instrumentation } from '@appdynamics/react-native-agent';
...
private startCustomTimer() {
  Instrumentation.startTimer("My timer");
}
private stopCustomTimer() {
  Instrumentation.stopTimer("My timer");
}

```

Create Custom Metrics

The React Native API enables you to report custom metrics. You specify the name of the custom metric that will appear in the Controller UI.

Class

The Custom Metrics API is accessible through the Instrumentation class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

Methods

You create custom metrics with the `reportMetric`:

- `reportMetric(name, value)`

Method Parameters

The `reportMetric` method takes the following parameters:

Name	Type	Requirements	Description
name	string	The metric names must consist of alphanumeric characters. Illegal characters are replaced by their ASCII hex value.	The name of the custom metric.
value	number	The value must be a whole number, otherwise, an error will be returned.	The numeric value associated with the custom metric.

Examples

For example, the following method could be used to report custom metrics:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
private reportMetrics() {
  Instrumentation.reportMetric("Normal metric", 23);
  Instrumentation.reportMetric("Large metric", Number.MAX_SAFE_INTEGER + 1);
  Instrumentation.reportMetric("Small metric", Number.MIN_SAFE_INTEGER - 1);
}
```

Add Custom User Data

Use the Custom User Data API to set and remove key/value pairs of different data types. The key must be unique across your application.

Class

The Custom User Data API is accessible through the Instrumentation class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

Methods

The API provides the following methods for setting and removing custom user data:

Methods for Setting Custom User Data

- `setUserData(key, value)`
- `setUserDataBoolean(key, value)`
- `setUserDataDate(key, value)`
- `setUserDataDouble(key, value)`
- `setUserDataInteger(key, value)`

Methods for Removing Custom User Data

- `removeUserData(key)`
- `setUserDataBoolean(key)`
- `setUserDataDate(key)`
- `setUserDataDouble(key)`
- `setUserDataInteger(key)`

Method Parameters

The following table lists the parameters for the methods for setting custom user data.

Methods for Setting Custom User Data	Parameters	Data Type
setUserData	key	string
	value	string null
setUserDataBoolean	key	string
	value	boolean
setUserDataDate	key	string
	value	Date object
setUserDataDouble	key	string
	value	number
setUserDataInteger	key	string
	value	number

The following table lists the parameters for the methods for removing custom user data.

Methods for Removing Custom User Data	Parameters	Data Type
removeUserData	key	string
removeUserDataBoolean		
removeUserDataDate		
removeUserDataDouble		
removeUserDataInteger		

i The method `removeUserData` is called when setting custom data to the value `null`. For example, the method `Instrumentation.setUserData("name", null)` will call `Instrumentation.removeUserData("name")`.

Examples

The following code example shows how to set and remove user data with the Custom User Data API:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
private setUserData() {
  Instrumentation.setUserData("userId", "AISJ1723871");
  Instrumentation.setUserDataBoolean("isVip", true);
  Instrumentation.setUserDataDate("purchaseDate", new Date(1234567890));
  Instrumentation.setUserDataDouble("monthlyVisits", 1.2345);
  Instrumentation.setUserDataInteger("totalPurchasedItems", 42);
}
private clearUserData() {
  Instrumentation.removeUserData("userId", null);
  Instrumentation.removeUserDataBoolean("isVip", null);
  Instrumentation.removeUserDataDate("purchaseDate", null);
  Instrumentation.removeUserDataDouble("monthlyVisits", null);
  Instrumentation.removeUserDataInteger("totalPurchasedItems", null);
}
```

Leave Breadcrumbs

Breadcrumbs enable you to situate a crash in the context of your user's experience. Set a breadcrumb when something interesting happens. If your application crashes at some point in the future, the breadcrumb will be displayed along with the crash report. Each crash report displays the most recent 99 breadcrumbs.

Class

The Breadcrumb API is accessible through the `Instrumentation` class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

Methods

You create and leave breadcrumbs with the following API method:

- `leaveBreadcrumb(breadcrumb, mode)`

Method Parameters

The method `leaveBreadcrumb` takes the following parameters:

Name	Type	Description
breadcrumb	string	The string to include in the crash report and sessions. Truncated at 2048 characters; empty values are ignored.
mode	Enumeration	<p>The mode determining where the <code>breadcrumb</code>¹⁴⁵³ will be displayed. You can report crashes only or crashes and sessions with the following modes:</p> <ul style="list-style-type: none"> <code>BreadcrumbVisibility.CRASHES_ONLY</code> <code>BreadcrumbVisibility.CRASHES_AND_SESSIONS</code> <p>The default mode is <code>BreadcrumbVisibility.CRASHES_ONLY</code>. If the value is invalid, the default mode will be applied.</p>

Examples

Basic Usage

The following example shows the syntax and usage of the Breadcrumb API.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
private leaveBreadcrumb() {
  Instrumentation.leaveBreadcrumb("Drop a breadcrumb button implementation",
  BreadcrumbVisibility.CRASHES_AND_SESSIONS);
}
```

Extended Use Case

Supposed your React Native app has a wizard that shows different steps of a process sequentially on the same screen. In the case of a crash or an "Application Not Responding" (ANR) error, you would want to know what step of the wizard caused the crash or ANR.

If your app had a wizard engine similar to the one below, you could leave a breadcrumb for each screen to track events and issues.

```
async function wizard(...screens) {
  let currentScreen = 0;
  while (true) {
    const screen = screens[currentScreen];
    if (screen == null) return;
    // Report the current screen with AppDynamics instrumentation
    Instrumentation.leaveBreadcrumb('wizard screen ' + screen.name);
    currentScreen += await screen.action();
  }
}
```

¹⁴⁵³ <https://sdkdocs.appdynamics.com/javadocs/react-native-agent/1/1.0/enums/breadcrumbvisibility.html>

```
}

```

The wizard engine could be used for a checkout:

```
wizard(
  { name: 'review cart', action:reviewCartAction },
  { name: 'chose payment', action:chosePaymentAction },
  { name: 'chose address', action:choseAddressAction },
  { name: 'review order', action:reviewOrderAction },
  { name: 'checkout', action:checkoutAction }
)
```

If you receive an alert that your app is triggering a lot of ANRs, you can diagnose the problem through the mobile sessions where the ANRs occur. In the session, you will see the breadcrumbs associated with the ANRs. For example, you may discover that the breadcrumbs "review cart" and "chose payment" are associated with ANRs, but "chose address" is not. Further investigation of the payment screen could lead to the discovery that the process that is encrypting credit card numbers is running on the main thread and freezing the app.

Capture User Interaction

The React Native Agent can track certain UI events triggered by user interactions. Once user interactions have been captured, you can sort sessions by UI event and view UI events in the timeline of the session waterfall.

Supported User Interactions

You can capture when users do one or all of the following:

- press buttons
- select table cells
- select text fields
- select text views

Security and Privacy Concerns

The interaction capture mode is disabled by default for security and privacy reasons, as user interactions may contain sensitive information. Moreover, this potential security and privacy issue may be compounded if you enable both the capturing of UI interactions and screenshots.

Class

The Interaction Capture Mode API is accessible through the `InteractionCaptureMode` class, but you also need the `Instrumentation` class to start instrumentation with the configured user capture mode.

```
import { Instrumentation, InteractionCaptureMode } from '@appdynamics/react-native-agent';
```

Properties

The following properties are accessed through the `InteractionCaptureMode` class and used to configure the user interaction capture. For example: `InteractionCaptureMode.All`

Property	Description	Platform Support
All	Track all the user interactions.	iOS, Android
ButtonPressed	Track button presses.	iOS, Android
ListViewItemsSelected	Track "List Item" clicks and focus changes for <code>android.widget.AbsListView</code> and its subclasses.	Android
None	Disables the tracking of any user interactions.	iOS, Android
TableCellSelected	Track table cell selection.	iOS
TextFieldSelected	Track text field selection.	iOS, Android
TextViewSelected	Track text view selection.	iOS

Methods

The API methods take an array of user interaction capture modes and return an `InteractionCaptureMode` object that determines which user interactions will be captured. The methods do not mutate the object.

Method	Description
<code>with</code>	Combines the multiple user interaction capture modes.
<code>without</code>	Excludes the specified user interaction modes from being captured.

Examples

Set User Interaction Mode with API Properties

The following example configures the React Native Agent to capture all user interactions.

```
import { Instrumentation, InteractionCaptureMode } from '@appdynamics/react-native-agent';
...
Instrumentation.start({
  appKey: <EUM_APP_KEY>,
  // ...your other configurations

  // Capture all user interactions
  interactionCaptureMode: InteractionCaptureMode.All
})
```

Combine User Interaction Modes

In the following example, the `with` method combines the `ButtonPressed` (button presses) and `TextFieldsSelected` (text field selected) modes with the `None` mode, effectively just enabling those two user interaction modes.

```

import { Instrumentation, InteractionCaptureMode } from '@appdynamics/react-native-agent';
...
Instrumentation.start({
  appKey: <EUM_APP_KEY>,
  // ...your other configurations

  // Only enable "ButtonPressed" and "TextFieldSelected" interaction modes, and disable the
  rest.
  interactionCaptureMode: InteractionCaptureMode.None.with(
    InteractionCaptureMode.ButtonPressed,
    InteractionCaptureMode.TextFieldSelected
  )
})

```

Exclude User Interaction Modes

The following example excludes the user interaction modes `ButtonPressed` (button presses) and `TextFieldSelected` (text field selected) from the mode `InteractionCaptureMode.All` (all user interactions). Effectively, the React Native Agent would be configured to only capture `ListViewItemSelected` ("List Item" clicks), `TableCellSelected` (table cell selection), and `TextViewSelected` (text view selected) modes.

```

import { Instrumentation, InteractionCaptureMode } from '@appdynamics/react-native-agent';
...
Instrumentation.start({
  appKey: <EUM_APP_KEY>,
  // ...your other configurations

  // Include all capture modes except "ButtonPressed" and "TextFieldSelected".
  interactionCaptureMode: InteractionCaptureMode.All.without(
    InteractionCaptureMode.ButtonPressed,
    InteractionCaptureMode.TextFieldSelected
  )
})

```

Disable the Agent to Stop Sending User Data to the Collector

You can disable the agent to stop sending all data to the collector while the agent is initialized and running. For example, you can disable the agent if your app has an option for users to opt-out of monitoring for privacy reasons.

shutdownAgent

The `shutdownAgent` call stops outgoing data to the collector, and does not persist data on the device.

```

import { Instrumentation } from '@appdynamics/react-native-agent';
...

```

```
Instrumentation.shutdownAgent();
```

- The call only stops the traffic out of the agent.
- Once the agent has been initialized, the call cannot be removed, and a license will have been consumed.

restartAgent

To re-enable the agent and reverse shutdownAgent, use restartAgent.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
Instrumentation.restartAgent();
```

- This call will respect the server side calls that can remotely shutdown the agent in a similar way.
- The call is only in effect while the app is running.
- The call will be ignored if the agent has been remotely disabled.
- If the call is removed from memory and the app restarts, or the device is rebooted, the agent will be initialized as normal.

Programmatically Control Sessions

By default, a mobile session ends after a period of user inactivity. For example, when a user opens your application, the session begins and only ends after the user stops using the app for a set period of time. When the user begins to use the application again, a new session begins. Instead of having a period of inactivity to define the duration of a session, however, you can use this API to programmatically control when sessions begin and end.

Class

The API is accessible through the Instrumentation class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

Methods

The API provides the following method for ending the current session and starting a new session:

Method	Description
startNextSession()	When you call the method startNextSession from Instrumentation, the current session ends and a new session begins. The API enables you to define and frame your sessions so that they align more closely with business goals and expected user flows. For example, you could use the API to define a session that tracks a purchase of a product or registers a new user.

i Excessive use of this API will cause sessions to be throttled (excessive use is >10 calls per minute, but is subject to change). When not using the API, sessions will fall back to the default of ending after a period of user inactivity.

Examples

In the following example, the current session ends and a new one begins when the check out is made.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
private checkoutCart(){
  if (currentCartItems!=null && currentCartItems.size()>0){
    CheckoutTask checkoutReq = new CheckoutTask();
    checkoutReq.execute(getEndpoint() + "cart/co");
    currentCartItemsMap.clear();
    convertItemsMaptoList();
    Instrumentation.startNextSession();
  } else {
    displayToast("There are no items in the cart");
  }
}
```

Start and End Session Frames

You can use the React Native Agent API to create session frames that appear in the session activity. Session frames provide context for what the user is doing during a session. With the API, you can improve the names of user screens and chronicle user flows within a business context.

Use Cases

The following are common use cases for session frames:

- One page performs multiple functions and you want more granular tracking of the individual functions.
- A user flow spans multiple pages or user interactions. For example, you could use the API to create the session frames "Login", "Product Selection", and "Purchase" to chronicle the user flow for purchases.
- You want to capture dynamic information based on user interactions to name session frames, such as an order ID.

Class/Interface

The SessionFrame API is accessible through the Instrumentation class.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

To update the name and end a session frame, you would use the [SessionFrame](#)¹⁴⁵⁴ interface.

Methods

The following table lists the three methods you can use with session frames. In short, you start a session frame with `startSessionFrame` and then use `updateName` and `end` to rename and end the session frame.

Method	Description
<code>startSessionFrame(name)</code>	Starts the session frame. You call this method from Instrumentation, and it returns SessionFrame object.

¹⁴⁵⁴ <https://sdkdocs.appdynamics.com/javadocs/react-native-agent/1/1.0/interfaces/sessionframe.html>

Method	Description
updateName(name)	Updates the name of the session frame. You call this method from the <code>SessionFrame</code> object.

Method Parameters

The methods `startSessionFrame` and `updateName` takes the following parameter:

Parameters	Data Type	Description
name	string	The name of the session frame.

Session Frame Example

In the following example, session frames are used to track user activity during the checkout process.

```

let sessionFrame: SessionFrame | undefined;

private onCheckoutCartButtonClicked() {
  // The user starts the checkout by clicking the checkout button.
  // This may be after they have updated the quantities of items in the cart, etc.
  sessionFrame = Instrumentation.startSessionFrame("Checkout");
}
private onConfirmOrderButtonClicked() {
  // Once they have confirmed payment info and shipping information, and they
  // are clicking the "Confirm" button to start the backend process of checking out,
  // we may know more information about the order itself, such as an order ID.
  if (sessionFrame) {
    sessionFrame.updateName("Checkout: Order ID " + orderId);
  }
}
private onProcessOrderCompleted() {
  // Once the order is processed, the user is done "checking out", so we end the session
  // frame.
  if (sessionFrame) {
    sessionFrame.end();
    sessionFrame = null;
  }
}
private onCheckoutCancelled() {
  // If the user cancels or returns to the cart, you'll want to end the session frame also,
  // or else it will be
  // left open and appear to have never ended.
  sessionFrame.end();
  sessionFrame = null;
}
}

```

Configure and Take Screenshots

By default, mobile screenshots are enabled on the agent-side but disabled on the Controller-side. These screenshots appear in the Controller in the [Sessions Details](#) (see page 2074) dialog. To programmatically take manual screenshots, you must [enable screenshots in the Controller UI](#) (see page 2083) and add the Screenshot API below.

Class

The Screenshot API is accessible through the `Instrumentation` class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

Methods

The Screenshot API provides the following methods:

Method	Return Value	Description
<code>takeScreenshot()</code>	None	<p>Asynchronously takes a screenshot of the current screen.</p> <p>This will capture everything, including personal information, so you must be cautious of when to take the screenshot.</p> <p>These screenshots will show up in the Sessions screen for this user.</p> <p>The screenshots are taken on a background thread, compressed, and only non-redundant parts are uploaded, so it is safe to take many of these without impacting the performance of your application.</p>
<code>screenshotsBlocked()</code>	Promise<boolean>	Returns a Boolean indicating whether screenshot capture is blocked.
<code>blockScreenshots()</code>	Promise<void>	Blocks screenshot capture and returns a Promise that resolves when screenshots are effectively blocked.
<code>unlockScreenshots()</code>	Promise<void>	<p>Unblocks screenshot capture if it is currently blocked. Otherwise, this has no effect.</p> <p>If screenshots are disabled through AgentConfiguration.screenshotsEnabled¹⁴⁵⁵ or</p>

¹⁴⁵⁵ <https://sdkdocs.appdynamics.com/javadocs/react-native-agent/1/latest/interfaces/agentconfiguration.html#screenshotsenabled>

Method	Return Value	Description
		<p>through the Controller UI, this method has no effect.</p> <p>If screenshots are set to manual mode in the Controller UI, this method unblocks for manual mode only.</p>

Configure Screenshots

Disable Screenshots

You can [disable screenshots from the Controller UI](#)(see [page 0](#)) or with the React Native API. To disable screenshots, set the property `screenshotsEnabled` to `false` when initializing the Native React Agent.

```
Instrumentation.start({
  appKey: <EUM_APP_KEY>,
  screenshotsEnabled: false,
  ...
});
```

Set On-Prem Screenshot Service

If you have deployed an on-prem EUM Server, you will need to specify the URL to the EUM Server with the property `screenshotURL`.

```
Instrumentation.start({
  appKey: <EUM_APP_KEY>,
  screenshotURL: "https://<COLLECTOR_URL>:<PORT>",
  ...
});
```

Examples

Take Screenshots

You can configure the Controller UI to automatically take screenshots or use the React Native API to manually take a screenshot as shown below:

```
private loadShoppingCart() {
  // Load shopping cart
  this.setState({
    shoppingCart: this.state.cart
  });
  // Manually take screenshot
  Instrumentation.takeScreenshot();
}
```

i This will capture everything, including personal information, so precaution is necessary when taking screenshots

Block and Unblock Screenshots

You can also block screenshots from being taken during the execution of a code block. This just temporarily blocks screenshots from being taken until you unblock screenshots. This enables you to stop taking screenshots in situations where users are entering personal data, such as on login and account screens.

```
private displayCustomerAccount() {
  // Check to see if screenshots are blocked
  if (!Instrumentation.screenshotsBlocked()) {
    // If screenshots aren't blocked, block them before showing customer details
    Instrumentation.blockScreenshots();
  }
  // Code to display customer details

  // After you're done, unblock screenshots
  Instrumentation.unblockScreenshots();
}
```

Enable Logging and Set Logging Level

You enable logging by setting the logging level in the instrumentation configuration. You are recommended to disable logging for production.

Class

The Logging Level API is accessible through the `LogLevel` class:

```
import { LogLevel } from '@appdynamics/react-native-agent';
```

Configuration Properties

You enable and set the logging level with the following configuration property:

- `loggingLevel`

Logging Levels

You can set logging to one of the following levels:

Enumeration	Logging Level	Description
<code>LogLevel.NONE</code>	None	No logs are displayed. This level disables logging.
<code>LogLevel.INFO</code>	Info	Warning, errors, and developer-focused messages are displayed.

Enumeration	Logging Level	Description
LoggingLevel.VERBOSE	Verbose	Errors, warnings, developer information, debugging, and troubleshooting messages are displayed.

Examples

In the following example, logging is enabled and the logging level is set to VERBOSE:

```
private async start() {
  try {
    await Instrumentation.start({
      appKey: this.state.appKey,
      loggingLevel: LoggingLevel.VERBOSE,
      anrDetectionEnabled: true,
      interactionCaptureMode: InteractionCaptureMode.None.with(
        InteractionCaptureMode.ButtonPressed,
        InteractionCaptureMode.ListViewItemSelected,
        InteractionCaptureMode.TableCellSelected,
        InteractionCaptureMode.TextFieldSelected,
        InteractionCaptureMode.TextViewSelected
      )
    })
  }
}
```

Receive a Crash Report Summary for Native Crashes

You can use `CrashReportCallback` to receive a report for native crashes.

Class

The `CrashReportCallback` API is accessible through the `Instrumentation` class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

How to Use

1. Submit the `CrashReportCallback` object as the `crashReportCallback` native agent configuration option.

```
Instrumentation.start({
  crashReportCallback: (summaries: CrashReportSummary[]) => {
    console.log(summaries);
  },
});
```

2. On application restart, you will receive a `CrashReportSummary` for each crash.

```
export type CrashReportSummary = {
  crashId: string;
  exceptionName: string;
  exceptionReason: string;
  signalName: string;
  signalCode: string;
};
```

CrashReportSummary Properties

`CrashReportSummary` has the following properties:

Name	Type	Description
<code>crashId</code>	string	Uniquely defines the crash. Can be used as key to find the full crash report or look up the crash in the Controller UI.
<code>exceptionName</code>	string	The exception name, may be null if no exception occurred.
<code>exceptionReason</code>	string	The exception reason, may be null if no exception occurred.
<code>signalName</code>	string	The exception signal name.
<code>signalCode</code>	string	The exception signal code.

Disable Crash Reporting

Crash reporting is enabled by default, but you can manually disable crash reporting through the instrumentation configuration. If you are using other crash reporting tools, you might disable crash reporting to minimize conflicts and optimize the crash report results.

You can disable crash reporting by configuring the instrumentation with the `crashReportingEnabled` property as shown in the following:

```
import { Instrumentation } from '@appdynamics/react-native-agent';

Instrumentation.start({
  appKey: <#EUM_APP_KEY#>,
  crashReportingEnabled: false
})
```

Report Errors and Exceptions

You can report exceptions using the method `reportError` from the `Instrumentation` class. Reported exceptions will appear in session details.

You can also set one of the severity levels below for an issue. With the severity level, you can filter errors in the **Code Issues Dashboard** or **Code Issues Analyze**.

- `ErrorSeverityLevel.INFO`
- `ErrorSeverityLevel.WARNING`
- `ErrorSeverityLevel.CRITICAL`

The example below uses the API to report possible exceptions and sets the severity level to `ErrorSeverityLevel.CRITICAL` (critical) when writing to a file

```
import { Instrumentation, ErrorSeverityLevel} from '@appdynamics/react-native-agent';
...
try {
  await asyncTask();
} catch (error) {
  Instrumentation.reportError(error, ErrorSeverityLevel.CRITICAL);
}
...
```

Log Silenced Errors

If you use React Native's `ErrorBoundary`, the errors are silently caught, but the agent will not receive and log them. If you want silenced crashes to be logged, we recommend you use `ErrorBoundary` provided in the AppDynamics React Native package:

```
import { ErrorBoundary } from '@appdynamics/react-native-agent'
```

Use the Agent with a Custom HTTP Library

The agent automatically detects network requests when the underlying implementation is handled by `NSURLConnection/NSURLSession` classes (iOS) or `URLConnection/OkHttp` (Android). This covers most network requests, but in some cases, mobile applications use custom HTTP libraries.

To enable the agent to detect requests from a custom library, add request tracking code to your application manually with the `RequestTracker` class.

You must initialize the agent with a valid key using the `Instrumentation.start()` interface before using this method.

RequestTracker Properties

The following properties should be set on the `RequestTracker` object to describe the parameters of the custom call.

Property	Description	Code
error	<p>Javascript error or null</p> <p>An error describing the failure to receive a response, if one occurred. If the request was successful, this should be left null.</p>	<pre>tracker.setError(e);</pre>
statusCode	<p>Number or null</p> <p>The status code of response, if one was received. If a response was received, this should be an integer. If an error occurred and a response was not received, this should remain null.</p>	<pre>tracker.setResponseStatusCode(response.statusCode);</pre>
requestHeaders	<p>Dictionary or null</p> <p>A dictionary representing the keys and values from the client's request header.</p>	<pre>tracker.setRequestHeaders(headers);</pre>
responseHeaders	<p>Dictionary or null</p> <p>A dictionary representing the keys and values from the server's response header. If an error occurred and a response was not received, this should be `null`.</p>	<pre>tracker.setResponseHeaders(headers);</pre>

Track a Custom HTTP Request

To add manual request tracking, you must specify when the request begins, when it ends and what the status of the response is.

1. Create a RequestTracker object immediately before sending the request:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
const tracker = new RequestTracker({ "My_URL" });
```

i "MY_URL" is the URL being called. This parameter must not be null.

2. (Optional) Add your custom headers to the tracker before sending the request:

```
const headers = {
  'Content-Length': '5000',
};
tracker.setRequestHeader(headers);
```

i requestHeaders: A dictionary (or null) representing the keys and values from the request headers.

3. (Optional) Enable correlation between your request and server-side processing. Add specific headers to outgoing requests that the server-side agent can detect and return the headers obtained from the server-side agent in the response to make them available to the agent:

```
tracker.addServerCorrelationHeaders()
```

4. Immediately after receiving a response or an error, set properties on the tracker object based on whether the request finished successfully or ended in error:

```
try {
  const response = await customRequest(url);
  tracker.setResponseStatusCode(response.statusCode);
  tracker.setResponseHeaders(response.headers);
} catch (e) {
  tracker.setError(e);
}
```

6. Call reportDone():

```
tracker.reportDone();
```

⚠ To track another request, instantiate a new tracker object again.

Complete example

```
const tracker = new requestTracker({
```

```
    url: <MY_URL>
  });

const headers = {
  'Content-Length': '5000',
};
tracker.setRequestHeaders(headers);
tracker.addServerCorrelationHeaders();

try {
  const response = await customRequest(url);
  tracker.setResponseStatusCode(response.statusCode);
  tracker.setResponseHeaders(response.headers);
} catch (e) {
  tracker.setError(e);
} finally {
  tracker.reportDone();
}
```

Get More Information about Mobile RUM

Use the following to find out more about Mobile RUM.

- [Mobile RUM Metrics](#)(see page 2298)
- [Mobile RUM Supported Environments](#)(see page 2299)
- [Real User Monitoring Licenses](#)¹⁴⁶²
- [Network Request Limits](#)(see page 2305)

Mobile RUM Metrics

AppDynamics displays key metrics for Mobile RUM on the various dashboards in the Mobile UI and in the **Metric Browser**.

i With the exception of App Crashes per Minute, the crash information displayed in the Controller UI is based on data stored in the Events Store and does not display in the **Metric Browser**.

Crashes

Crash measurements are created using the Analyze event store, and display in the **Crash Dashboard**.

- **Total Crashes:** total number of crashes over the selected time range
- **Total Unique Crashes:** total number of unique crash types over the selected time range
- **Impacted Users:** total number of unique users affected by a crash
- **Crashes by Usage Stats:** percentage of crashes based on device, OS version, carrier, and connection type
- **Crashes by Geo Location:** total number of crashes by origin over the selected time range

Crash Metrics

- **App Crashes per Minute:** arithmetic average number of crashes

HTTP Errors

An HTTP error occurs when an HTTP request is sent and a response is received, but the response status code indicates that an error occurred. These errors suggest that the network is working correctly, but a problem exists on the client side (4xx status codes) or the server side (5xx status codes) that prevented normal handling of the request.

- **HTTP Errors Per Minute:** arithmetic average of errors per minute for errors that return an HTTP response code between 400 and 599
- **HTTP Errors (total):** total number of HTTP errors over the selected time range (shown in the **Geo Dashboard**)

Mobile Device Metrics

See [Mobile Device Metric Collection](#)¹⁴⁶³ for more information.

¹⁴⁶² <https://docs.appdynamics.com/display/PRO21/License+Entitlements+and+Restrictions>

¹⁴⁶³ <https://docs.appdynamics.com/display/PRO21/Mobile+Device+Metric+Collection>

Network Errors

A network error is any occurrence that prevents the HTTP request from being sent or the HTTP response from being received successfully.

- **Network Errors per Minute:** arithmetic average of network errors per minute
- **Network Errors (total):** total number of network errors over the selected time range (shown in the **Geo Dashboard**)

Typical causes of network errors include:

- Host cannot be resolved
- Host refused connection
- Connection timed out
- Device is offline
- General connectivity problems

Network Requests

Network request metrics are reported for each platform and instrumented mobile application.

- **Network Request Time:** arithmetic average interval in milliseconds between the time that a mobile application initiates a request by calling the system API and the time that the system returns the response to the application
- **Requests per Minute:** arithmetic average number of HTTP requests per minute
- **Total Requests:** total of HTTP requests per minute over the selected time range (shown in the **Geo Dashboard**)
- **Request Content Length:** total number of bytes of data in the body of the request. The body is the part that comes after the blank line below the headers
- **Response Content Length:** total number of bytes of data in the body of the response

Mobile RUM Supported Environments

See the following for the list the supported environments for Android, iOS, Xamarin, and Cordova:

- [Android Agent](#)(see page 2299)
- [iOS Agent](#)(see page 2301)
- [Xamarin Agent](#)(see page 2301)
- [Cordova Plugin](#)(see page 2302)
- [React Native Agent](#)(see page 2303)

Mobile RUM Support

Android Agent

Supported Environments	Name	Supported Version(s)
Operating System	Android	>= 2.3.3
Architecture	arm64-v8a, armeabi, armeabi-v7a, mips, mips64, x86, and x86_64	-
Frameworks	Ant	-
	Gradle	>= 0.6.3
	Maven	3.1.1
Crash Reporters	Mobile RUM does not officially support 3rd-party crash reporters.	N/A

Supported Environments	Name	Supported Version(s)
HTTP Libraries	URLConnection/ HttpsURLConnection	-
	HttpClient	-
	OkHttp	2.2.0 - 3.9.0
	ch.boye.httpclientandroidlib	-
	retrofit	-
	retrofit2	-
	Other HTTP libraries can be added by using the agent SDK. See Customize the Android Instrumentation (see page 2197) for more information.	-

Android Gradle Plugin Version	Minimum Android Agent Version
0.6.3	3.8.2.0
0.7.3 - 0.9.2	3.8.3.0
0.10.0 - 0.12.0	3.9.0.0
1.1.2 - 1.1.3	4.0.3.3
1.3.0 - 1.4.0	4.0.7
1.5.0 - 2.2.0	4.2.0*
2.3.0 - 3.4.0 (forces Build Tools 25.0.0 ¹⁴⁶⁴ or higher)	4.2.9
>= 3.4.1	>= 20.7.1

Recommendations for Android Agent Versions

- If your project uses Android Gradle Plugin version < 3.4.1, use Android Agent 20.4.0.
- If your project uses Android Gradle Plugin version >= 3.4.1, use Android Agent >= 20.7.1.

* Android Agent Plugin versions before 4.2.9 are not compatible with Android Build Tools versions >=24 because of the Java 8 bytecode generated in class files.

¹⁴⁶⁴ <https://developer.android.com/tools/revisions/build-tools.html>

iOS Agent

Supported Environments	Name	Supported Version(s)
Operating System	iOS	>= 9
Architecture	Apple 32-bit ARM, Apple 64-bit A7	-
Framework	XCode	>= 8
Crash Reporters	Mobile RUM does not officially support 3rd-party crash reporters.	N/A
Apple WatchKit Extension Environments	watchOS	1
HTTP Libraries	<code>NSURLConnection</code>	-
	<code>NSURLSession</code>	-
	Alamofire ¹⁴⁶⁵ - Initialize the iOS Agent before initializing Alamofire to ensure that network requests are monitored. If you need to make a network request(s) prior to iOS Agent initialization, see Alamofire Guidelines (see page 2304).	-
	Other HTTP libraries can be added by using the agent SDK. See Customize the iOS Instrumentation (see page 2142) for more information.	-

Xamarin Agent

Supported Environments	Name	Supported Version(s)
Operating System	Android	>= 2.3.3
	iOS	>= 9
Architecture	Xamarin.Android Supported CPU Architectures ¹⁴⁶⁶	-
	Apple 32-bit ARM, Apple 64-bit A7 - See 32/64-bit platform considerations ¹⁴⁶⁷ for	-

¹⁴⁶⁵ <http://cocoadocs.org/docsets/Alamofire/4.5.1/>

¹⁴⁶⁶ <https://docs.microsoft.com/en-us/xamarin/android/app-fundamentals/cpu-architectures?tabs=vswin>

¹⁴⁶⁷ <https://docs.microsoft.com/en-us/xamarin/cross-platform/macios/32-and-64/?context=xamarin%2Fios&tabs=vsmac>

Supported Environments	Name	Supported Version(s)
	information regarding the correct architecture for your iOS version.	
Framework	.NET - Mono	>= 4.8
Crash Reporters	Mobile RUM does not officially support 3rd-party crash reporters.	N/A
Apple WatchKit Extension Environments	Not supported	-
HTTP Libraries	N/A - The Xamarin Agent does not support automatic instrumentation for network requests made with any library. You will need to manually instrument HTTP network requests regardless of what library is used.	-

Cordova Plugin

Supported Environments	Name	Supported Version(s)
Operating System	Android	4.4 - 8.1
	iOS	>= 9
Architecture	Android: arm64-v8a, armeabi, armeabi-v7a, mips, mips64, x86, and x86_64	-
	iOS: Apple 32-bit ARM, Apple 64-bit A7	-
Framework	Apache Cordova ¹⁴⁶⁸	>= 7
Crash Reporters	Mobile RUM does not officially support 3rd-party crash reporters.	N/A
Apple WatchKit Extension Environments	Not supported	-
HTTP Libraries	Android: <ul style="list-style-type: none"> • HttpURLConnection/HttpsURLConnection • HttpClient • OkHttp • ch.boye.httpclientandroidlib 	-

¹⁴⁶⁸ <https://cordova.apache.org/>

Supported Environments	Name	Supported Version(s)
	iOS: <ul style="list-style-type: none"> • <code>NSURLConnection</code> • <code>NSURLSession</code> 	-

React Native Agent

Supported Environments	Name	Supported Version(s)
Operating System	Android	>= 4.1 (with React Native Agent >= 20.10.1)
	iOS	>= 11 (with React Native Agent >= 20.10.1)
Architecture	Android: arm64-v8a, armeabi, armeabi-v7a, mips, mips64, x86, and x86_64	-
	iOS: Apple 64-bit A7 (with React Native Agent >= 20.10.1)	-
Framework	React Native ¹⁴⁶⁹	>= 0.60 (with React Native Agent >= 20.10.1) < 0.60 (with React Native Agent 20.7.0)
Crash Reporters	Mobile RUM does not officially support 3rd-party crash reporters.	N/A
Apple WatchKit Extension Environments	Not supported	-
HTTP Libraries	Android: <ul style="list-style-type: none"> • <code>URLConnection/HttpsURLConnection</code> • <code>HttpClient</code> • <code>OkHttp</code> • <code>ch.boye.httpclientandroidlib</code> 	-
	iOS: <ul style="list-style-type: none"> • <code>NSURLConnection</code> • <code>NSURLSession</code> 	-

¹⁴⁶⁹ <https://facebook.github.io/react-native/>

Alamofire Guidelines

If you need to use Alamofire to make a network request(s) prior to initializing the iOS Agent, you can use the following sample code as a guideline for making the necessary changes.

To ensure that Alamofire network requests made after iOS agent initialization will be instrumented, you can initialize a custom instance of `Session` (the principle class defined in Alamofire 5, renamed from previous Alamofire versions). This will create a new instance of `URLSession`, which can be instrumented by the iOS Agent. Any Alamofire network requests made prior to the agent initialization and creation of the `Session` instance cannot be instrumented by the agent.

- The order of operations in this code is very important. See the inline comments.
- This code assumes you are initially creating a customized instance of `Session` (which is common practice). If not, you can eliminate the first usage of customized `Session` and defer its creation until after the iOS agent initialization.
- You can test this code by going to <https://www.google.com/?q=request%202>, which is instrumented because it occurs after the replacement of `mySession` with `instrumentedSession`. The other two requests are not instrumented.

```
import UIKit
import Alamofire
import ADEUMInstrumentation

var mySession:Session? // customized Session singleton

@UIApplicationMain
class AppDelegate: UIResponder, UIApplicationDelegate {

    func application(_ application: UIApplication, didFinishLaunchingWithOptions
launchOptions: [UIApplication.LaunchOptionsKey: Any]?) -> Bool {
    // Override point for customization after application launch.

    // create customized instance of AF Session
    let myConfiguration = URLSessionConfiguration.af.default
    mySession = Session(configuration: myConfiguration)

    let myUrl1 = URL(string: "https://www.google.com/?q=request%201")!
    let urlRequest1 = URLRequest(url: myUrl1)

    // the first network request prior to ADEUMInstrumentation.initWith will not be
instrumented
    mySession?.request(urlRequest1 as URLRequestConvertible).response {
        response in debugPrint(response)

        // initialize iOS agent
        let config = ADEUMAgentConfiguration(appKey: "XX-XXX-XXX-XXX")
        config.loggingLevel = .all
        ADEUMInstrumentation.initWith(config)
    }
}
```

```

        // update our Session instance singleton, instrumentedSession, so that URLSession
will be instrumented
        let myConfiguration = URLSessionConfiguration.af.default
        let instrumentedSession = Session(configuration: myConfiguration)
        // replace mySession with instrumentedSession
        mySession = instrumentedSession

        // subsequent requests use updated mySession from instrumentedSession, so should
be instrumented
        let myUrl2 = URL(string: "https://www.google.com/?q=request%202")!
        let urlRequest2 = URLRequest(url: myUrl2)
        mySession?.request(urlRequest2 as URLRequestConvertible).response {
            response in debugPrint(response)
        }
    }
    // has instrumentedSession been created yet? Indeterminate. If not, this request
won't be instrumented
    let myUrl3 = URL(string: "https://www.google.com/?q=request%203")!
    let urlRequest3 = URLRequest(url: myUrl3)
    mySession?.request(urlRequest3 as URLRequestConvertible).response {
        response in debugPrint(response)
    }
    return true
}
}
}

```

Network Request Limits

The EUM Server (on-premises/SaaS) can process a maximum of 2000 network request types per mobile app group and 500 network requests per mobile application.

If the number of network requests for an application exceeds one of these limits, AppDynamics continues to monitor network requests that have already been discovered, but new network requests will not be discovered. Should a limit be exceeded, a warning appears on the network request list.

You can use these techniques to keep your usage under the two network request limits.

Remove Network Requests Without Load

Removing network request types that have been discovered but are not receiving any load is a good place to start to reduce the number of your registered requests.

i Deleting network requests does not prevent them from being re-discovered in the future if the request once again comes under load. To prevent specific network requests from ever being discovered, you must create exclude rules. See the section "Creating Mobile Exclude Rules" in [Configure Mobile Network Request Naming](#) (see page 2124).

Delete network requests with no load

1. In the **Network Requests** list, uncheck the **With Load** checkbox.

2. Refresh the list.
3. Find the requests that have no load. They are candidates for removal.
4. Select the requests that you want to delete.
5. In the **More Actions** dropdown, click **Delete Request(s)**.

Exclude Requests That Do Not Need to Be Monitored

The Mobile Agent may be detecting network requests types that are not interesting for you to monitor. You have two methods to exclude these types of network requests.

The first method is to add custom exclude rules from **Configuration > Mobile Request Naming, Thresholds, & Percentiles**. See [Creating Mobile Exclude in Rules](#)(see page 2127) for explicit instructions.

Using custom exclude rules, network requests for new data that match the exclude rules will not be registered. The load on the existing network requests that match the exclude rule will drop to zero. To delete any network requests of the excluded type that have already been registered from the network request list, follow the procedure described in [Delete network requests with no load](#)(see page 0).

The second method is to select an existing network request from the **Network Requests** list and then exclude it. This will change the app's exclude rules so that incoming data matching that request will not be tracked. In addition, the historical data for that request will be deleted.

To use the second method for the exclude rules that prevent a network request from being tracked and remove historical data for that network request:

1. From **Network Requests**, select the network request you want to exclude.
2. Click **Actions > Exclude Requests** to open the **Exclude Requests** dialog.
3. Click **Exclude**.

Group Network Requests of Similar Type

Review the default network request naming rule described in [Configure Mobile Network Request Naming](#)(see page 2124). It is possible that the default rule is generating many more network requests types than are desirable.

For example, perhaps your application loads images dynamically and stores them on your server with URLs like `http://myapp.com/image/image1234.jpg`. This would cause a separate network request to be generated for each image, which is probably not what you want. You could create a custom naming rule to group all the image URLs as a single network request. See [Configure Mobile Network Request Naming](#)(see page 2124).

After you have created custom rules to reduce the number of network requests detected, unregister the network requests for those are now covered by the custom rule, following the procedure described in [Delete network requests with no load](#)(see page 2305).

Mobile Agent Version and Deployment Support Matrix

Related pages:

- [Mobile RUM Supported Environments](#)(see page 2299)

Using the AppDynamics Mobile Agents with the following recommended minimum Controller/EUM Server versions will ensure that all features for the specified releases will function correctly and that there will be no unexpected side effects.

For a list of Controller and EUM Server version requirements, see [Maintenance Support for Software Versions](#)(see page 3916).

Mobile Agent	Minimum Agent Version(s)	Download Site
Android Agent	20.3.x	https://mvnrepository.com/artifact/com.appdynamics/appdynamics-injector
Cordova Plugin	20.3.x	https://www.npmjs.com/package/appd-plugin-eum-mobile
iOS Agent	20.3.x	https://cocoapods.org/pods/AppDynamicsAgent
React Native Agent	20.3.1	https://www.npmjs.com/package/@appdynamics/react-native-agent
Xamarin Agent	20.3.x	https://www.nuget.org/packages/AppDynamics.Agent/

Post-release Support for the Mobile Agents

Although Mobile Agents may be compatible with future releases of the Controller and EUM Server, AppDynamics only provides support for Mobile Agent versions with the Controller and EUM Server for one year after the release of the agent.

Deployment Support for Mobile Agent Features

For deployment support for individual mobile features, see:

- [iOS SDK Documentation](#)(see page 2172)
- [Android SDK Documentation](#)(see page 2218)
- [Xamarin SDK Documentation](#)(see page 2249)
- [Cordova SDK Documentation](#)(see page 2267)
- [React Native Agent Documentation](#)(see page 0)

Mobile Agent Feature Support

This table lists the feature support for the Mobile Agents:

- [Native Mobile Agents](#)(see page 2307)
- [Hybrid Mobile Agents](#)(see page 2310)

For instrumentation instructions, see the custom instrumentation pages ([Android](#)(see page 2197), [iOS](#)(see page 2142), [Xamarin](#)(see page 2233), [Cordova](#)(see page 2255), [React Native](#)(see page 2272)).

Hybrid Application Support

AppDynamics supports monitoring for hybrid applications based on the iOS/Android native SDK or any Cordova-based framework.

Hybrid Applications

Hybrid applications are web applications running inside an Android or iOS native shell. The web application can be in the form of an [Android WebView](#)¹⁴⁷⁰, an [iOS WKWebViews](#)¹⁴⁷¹, or a Cordova web application that consists of HTML, CSS, JavaScript, and other resources just like a conventional web application.

Hybrid Use Cases

Mobile RUM supports these two use cases.

- Native Mobile applications that run web applications or web views. Examples of this are Android WebViews and iOS WKWebView.
- Applications written in Cordova-based frameworks, such as Ionic, that provide a native shell for running a web application and an interface for native mobile APIs.

Hybrid Application Instrumentation Requirements

For instrumenting hybrid apps, you are required to:

- Manually instrument the iFrames with the JavaScript Agent. For mobile native applications, the JavaScript Agent is injected into the top-level WebView or WKWebView instance, not in embedded web pages (iFrames).
- Manually report events for Cordova-based applications using the [plugin JavaScript API](#)(see page 2255).

¹⁴⁷⁰ <https://developer.android.com/reference/android/webkit/WebView.html>

¹⁴⁷¹ https://developer.apple.com/documentation/webkit/wkwebview?changes=_6

- Use Android WebViews or iOS WKWebView for hybrid applications with embedded web views. See [Instrument Cordova Applications](#)¹⁴⁷².

Instrumentation Steps

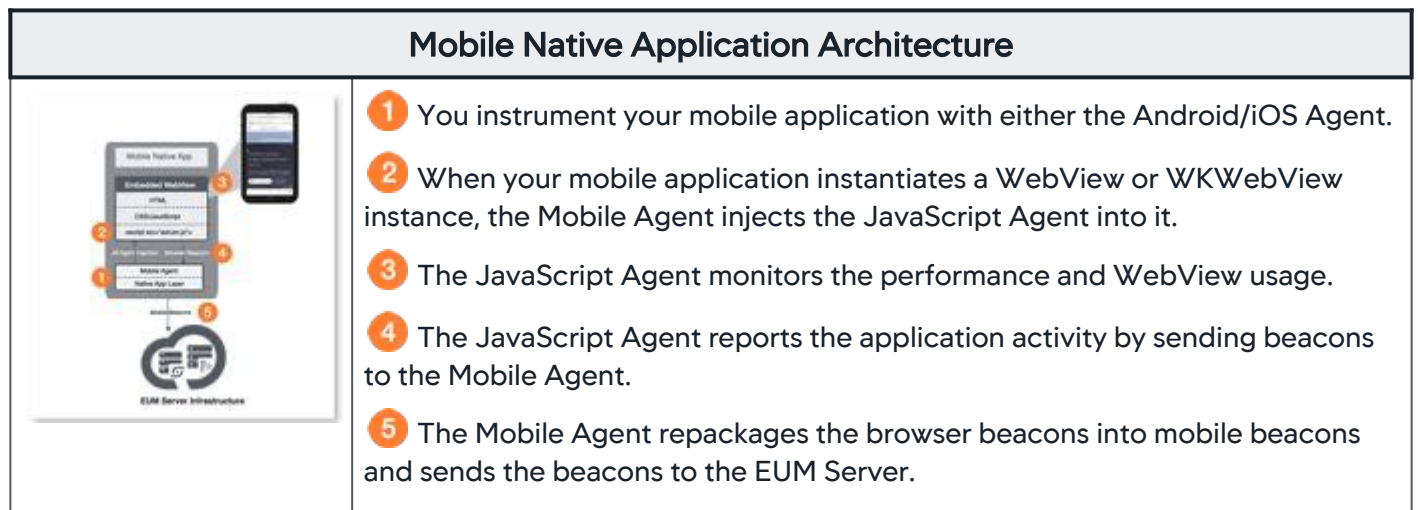

To monitor your hybrid applications, you will need to [set up and access Mobile RUM](#)¹⁴⁷³ and follow the steps below based on your hybrid use case:

Native iOS Application	Native Android Application	Cordova-Based Applications
<ol style="list-style-type: none"> 1. Instrument an iOS Application(see page 2137) 2. Configure Hybrid Support for the iOS Application(see page 2157) 	<ol style="list-style-type: none"> 1. Customize the Android Build(see page 2190) 2. Instrument an Android Application(see page 2185) 3. Configure Hybrid Support for Android Applications(see page 0) 	<ol style="list-style-type: none"> 1. Instrument a Cordova Application(see page 2249) 2. Customize the Cordova Instrumentation(see page 2255)

How it Works

For native Android/iOS applications, the Android Agent or iOS Agent will inject the JavaScript Agent into an [Android WebView](#)¹⁴⁷⁴ or [iOS WKWebView](#)¹⁴⁷⁵. For Cordova-based applications, the AppDynamics plugin will inject the JavaScript Agent into the web application.

The diagrams below provide an overview of how Mobile RUM is used to monitor mobile native applications and Cordova-based applications.

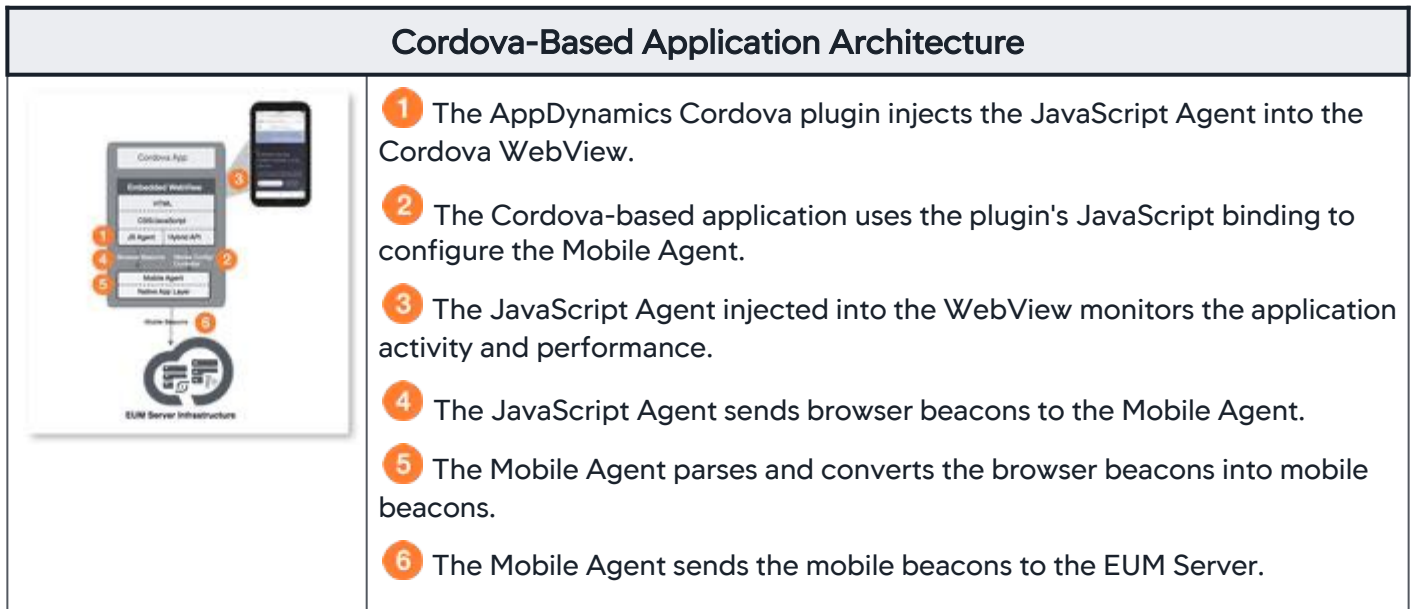

1472 <https://docs.appdynamics.com/display/PRO21/Instrument+Cordova+Applications>

1473 <https://docs.appdynamics.com/display/PRO45/Set+Up+and+Access+Mobile+RUM>

1474 <https://developer.android.com/reference/android/webkit/WebView.html>

1475 https://developer.apple.com/documentation/webkit/wkwebview?changes=_6

Mobile Agent and JavaScript Agent Compatibility

When hybrid app support is enabled, the Mobile Agents use an embedded JavaScript Agent to monitor mobile web pages. If you are already monitoring the same mobile web pages with a browser application, the JavaScript Agent version used to instrument the browser application may be different than the JavaScript Agent version used by the Mobile Agent. If the two versions of the JavaScript Agent are incompatible, the Mobile Agent will not be able to instrument web views or access event notifications from web views.

How to Ensure Compatibility

To ensure compatibility, browser applications should use JavaScript Agent version $\geq 4.5.4$ and mobile applications should use Mobile Agent versions $\geq 4.5.5$. When using compatible versions of the JavaScript Agents, the JavaScript Agent of the browser app will report beacons for a web page, and the embedded JavaScript Agent of the mobile app will be ignored and not report beacons because a web page cannot be instrumented with the JavaScript Agent multiple times.

i If you have disabled the Mobile Agent's hybrid app support, there will be no compatibility issues regardless of the JavaScript Agent version used by the browser application.

Troubleshooting Incompatible JavaScript Agent Versions

If you are using incompatible versions of the JavaScript Agents, do one of the following to correct the problem:

- Upgrade the JavaScript Agent that you are using to instrument the browser application.
- In the mobile instrumentation, disable the hybrid support ([iOS\(see page 2157\)](#)/[Android\(see page 0\)](#)), so that the mobile web pages are only instrumented by the browser application instrumented with the older version of the JavaScript Agent.

Hybrid Application Network Requests

Network calls made in the context of the WebView for Cordova-based applications show up as Ajax calls from the JavaScript Agent.

iOS Data Collection Disclosure

With the iOS 14 release, [Apple introduced a new data collection policy](#)¹⁴⁷⁶. This page describes how Apple's iOS 14 data use policy applies to AppDynamics.

Data Collection with Screenshots

When you use the Mobile Screenshots feature, the iOS Agent captures an image of the your user's screen and may send a copy of the image to the AppDynamics server for the Controller to visualize app usage. These screenshots may capture anything your application displays, including any user data your user submits. It is your responsibility to review the data captured in the screenshots and determine where such captured data falls in Apple's categorization of types of disclosable data. See [Data Collection Details](#)(see [page 0](#)).

Disable Mobile Screenshots

You can use `blockScreenshots()` to temporarily disable screenshots for any screen which may display such data. See [Customize the iOS Instrumentation](#)(see [page 2149](#)).

Data Collection Details

AppDynamics does not enable any targeted advertisements, data broker, or data combination as described in the Apple iOS 14 User Privacy and Data Use Policy. In addition, ID for Vendors (IDFV) as defined under such guidelines is not currently used in any AppDynamics Mobile features.

This table references <https://developer.apple.com/app-store/app-privacy-details/> and describes how AppDynamics does or does not collect data.

¹⁴⁷⁶ <https://developer.apple.com/app-store/user-privacy-and-data-use/>

Mobile Device Metric Collection

This page explains what mobile device metrics are collected, and how to enable collection and view device metrics in the Controller UI. To learn how Apple's iOS 14 data use policy applies to AppDynamics mobile device metric collection, see [iOS Data Collection Disclosure](#)¹⁴⁷⁷.

Mobile agents can capture the following mobile device metrics:

- **Memory (RAM):** total memory of the device (i.e. 8GB total memory) and the resource consumption (i.e. 34% of device memory has been consumed)
- **Disk Space:** total storage capacity of the device (i.e. 64GB total storage capacity) and storage usage (i.e. 65% of device storage has been consumed)
- **Battery:** battery level of the device (i.e. include charging and lower power mode statuses)

i For Android devices, the metrics reported in the UI might not exactly match the Android device metrics. Due to API limitations, the memory value that the Android Agent returns might not include segments on the device's reserved memory. For example, an Android device might have 64GB storage and 8GB memory, but the Android Agent might report only 53GB storage and 6.5GB memory. This discrepancy varies based on device type and manufacturer.

Support

- Available for both SaaS and on-prem deployments
- Controller \geq 20.11.0
- Android Agent \geq 20.10.0
- iOS Agent \geq 20.10.0

Enable and Configure Device Metric Collection

To configure device metric data collection in the Controller UI:

1. Go to a browser application.
2. In the left-hand panel, go to **Configuration > Mobile App Group Configuration > Settings**.
3. Under **Configure Mobile Device Metrics**, enable each option. It may take a few minutes for data to appear on the **Mobile App Dashboard**.
4. Set **Frequency of data collection** to how often device data is collected for the options you enabled. For example, if the frequency is set to 2, every 2 minutes the enabled device data is collected and [shown in the dashboard widgets](#).(see page 2325)

Warning

The maximum frequency is 2 minutes and collects the most data. However, sessions under 2 minutes or temporary metric spikes will not be captured.

Add Device Metric Widgets to the Mobile App Dashboard

You can view device metric widgets on the **Mobile App Dashboard**. To add device metric widgets:

1. Go to the **Mobile App Dashboard**.
2. In the top-left corner, click +.

¹⁴⁷⁷ <https://docs.appdynamics.com/display/PRO21/iOS+Data+Collection+Disclosure>

3. Add the widgets **Device Memory Capacity**, **Device Storage Capacity**, and **Device Battery Capacity**.
4. Click on a widget and view performance and sessions by battery, memory, and storage.

View Sessions with Device Metrics

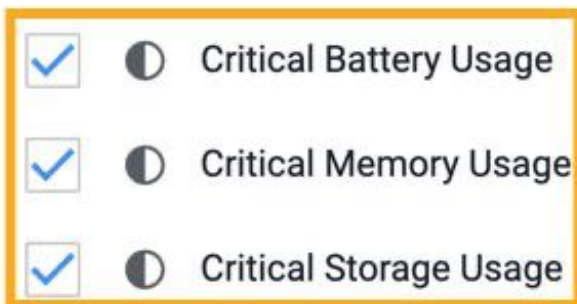

On the **Sessions** dashboard, you can add columns to sort sessions for each device metric. To add device metric columns:

1. Go to **Mobile Session Fields**.
2. Check the fields **Critical Battery Usage**, **Critical Memory Usage**, and **Critical Storage Usage**.

Mobile Session Fields (14)

T Agent Version

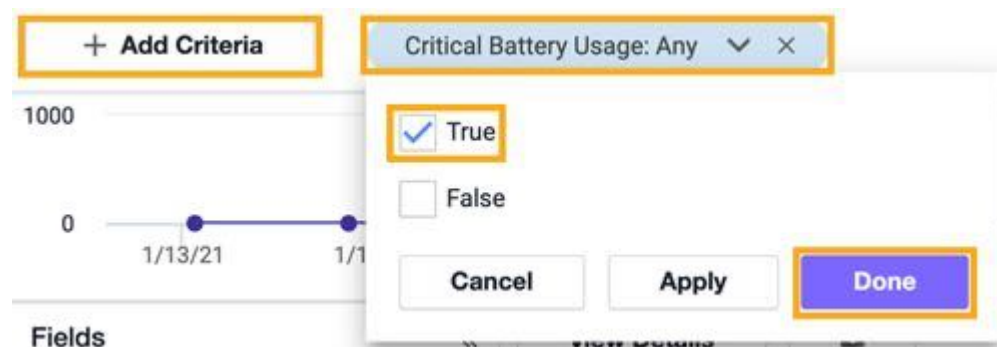

T Country

Filter Sessions by Device Metric Values

You can filter sessions by [critical device states you configured](#)(see page 2327). For example, if you want to look at sessions with over 90% device storage used:

1. Go to **Sessions**.
2. Click **+ Add Criteria**.
3. Select "Critical Battery Usage: Any".
4. Check "True."

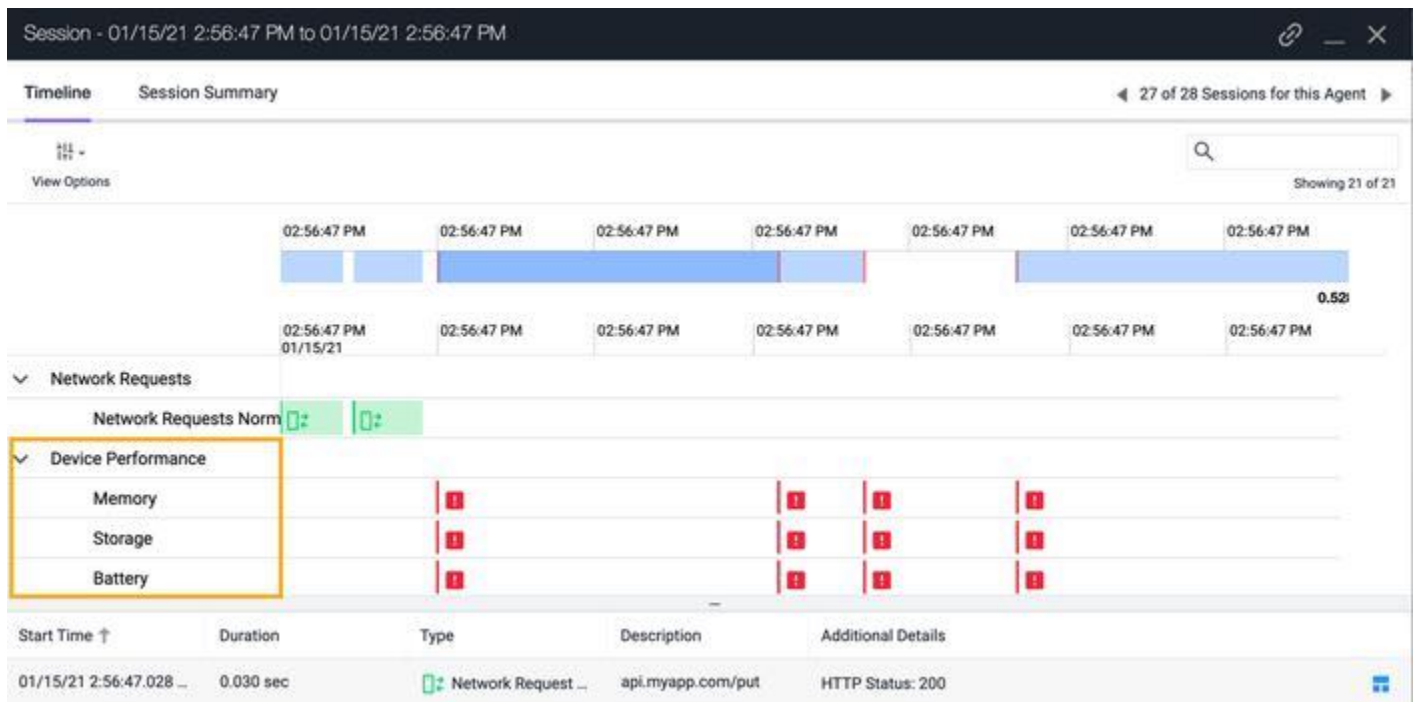

Set Critical Usage Thresholds

You can set the usage threshold to trigger a critical event. To configure what usage percentage triggers a critical event:

1. Go to **Configuration > Mobile App Group Configuration > Settings**.
2. Under **Configure Mobile Device Metrics**, enter a value for each device metric threshold. For example, if you want to capture battery usage below 50%, set **Enable Battery Usage and Capacity Metrics** to 50%. When that configured threshold is reached, the resource consumption (percentage value) is captured by the agent and shown in session data.

When you look at a mobile session, you can see the critical events you configured.

Troubleshoot Mobile Applications

You can use Mobile RUM to investigate two different kinds of problems that can arise with your mobile applications:

- Slow network requests
- Mobile application crashes

Identify Your Slowest Network Request Types

To identify slow network requests:

1. Open the application in which you are interested.
2. In the left navigation bar, click **Network Requests**.
3. Select the Network Requests tab.
4. Click the top of the **Network Request Time (ms)** column, then toggle it to sort the network requests with the slowest ones at the top.
5. Skip over network requests that you expect to run for a long time or that have very little load (low Requests per Minute).

6. Select and double-click one of the slow network requests that you want to investigate.
7. In the network request dashboard, view the **Key Performance Indicators** at the top of the **Network Request Dashboard**. For example:
 - If the value for Network Request Time is large, the request or response body may be too large and is taking a while to transmit, or the data connection might be slow.
 - If the backend server is instrumented and the value for Total Server Time makes up a significant amount of the delay, scroll down to the **Related Business Transactions** section to investigate related business transactions on the server side.

Access Details of Individual Instances of Slow Requests

To investigate the cause of slow requests:

1. Select the Snapshots tab. The **Snapshots List** opens.
2. Click **Filters**.
3. In the **Network Request Names** dropdown under **Network in the Filters** panel, check the check box for the network request that you identified in [Identify your slow network requests](#)¹⁴⁷⁸, then click **Search**. This restricts the list to snapshots for that network request only.
4. Click **Filters** again to close the filters panel.
5. In the list, click the top of the **Network Request Time (ms)** column, then toggle it to sort the network request snapshots with the slowest requests at the top.
6. Select and double-click one of the slow network requests. The network request snapshot displays the details of the slow request.
7. If this request is associated with a server-side application that is also instrumented, scroll down to see if transaction snapshots for this request are available on the server side. If transaction snapshots are available and if most of the time for this network request is spent on the server, click through to the related transaction snapshots to understand what is causing the slow performance on the server. See [Transaction Snapshots](#)¹⁴⁷⁹.

Identify Applications that Crash the Most or Affect the Most Users

To troubleshoot mobile application crashes with crash dashboards and crash snapshots:

1. Open the application in which you are interested.
2. On the left navigation bar, click **Crashes**.
3. Select the Crash Dashboard tab.
4. Check the **Unique Crashes** list.

¹⁴⁷⁸ <https://docs.appdynamics.com/display/PRO45/Troubleshoot+Slow+Network+Requests+from+Mobile+Applications#TroubleshootSlowNetworkRequestsfromMobileApplications-slow>

¹⁴⁷⁹ <https://docs.appdynamics.com/display/PRO45/Transaction+Snapshots>

- Sort either by **Total Crashes** or **Impacted Users**, depending on what you want to know. In the screenshot below, the list is sorted by impacted users.

Unique Crashes

Unique Crash Location	Mobile App Version	Total Crashes	Impacted Users ↓	Status	Runtime
\$IG95DV in promoview	2.1	15,135	1001	open	SDK
\$IG95DV in add	2.0	5,343	1001	open	SDK
\$IG95DV in cartpage	1.0	10,346	1001	open	SDK
\$IG95DV in promoview	2.1	147	138	open	SDK
\$IG95DV in promoview	2.1	145	138	open	SDK
\$IG95DV in add	2.0	144	134	open	SDK
\$IG95DV in cartpage	1.0	137	129	open	SDK
\$IG95DV in cartpage	1.0	136	126	open	SDK
\$IG95DV in add	2.0	138	126	open	SDK
\$IG95DV in cartpage	1.0	15	15	open	SDK
\$IG95DV in cartpage	1.0	13	13	open	SDK
\$IG95DV in add	2.0	11	11	open	SDK
\$IG95DV in promoview	2.1	10	10	open	SDK
\$IG95DV in promoview	2.1	7	7	open	SDK
\$IG95DV in add	2.0	6	6	open	SDK

- View the **Summary Crash Trend** graph to discover particularly problematic time periods.

- To find crashes in the problematic timeframe, click **Analyze** and drag up on the timeline where the most crashes occurred.

- You should see the crash list reduced to those that occurred during the custom time period.

Summary Crash Trend

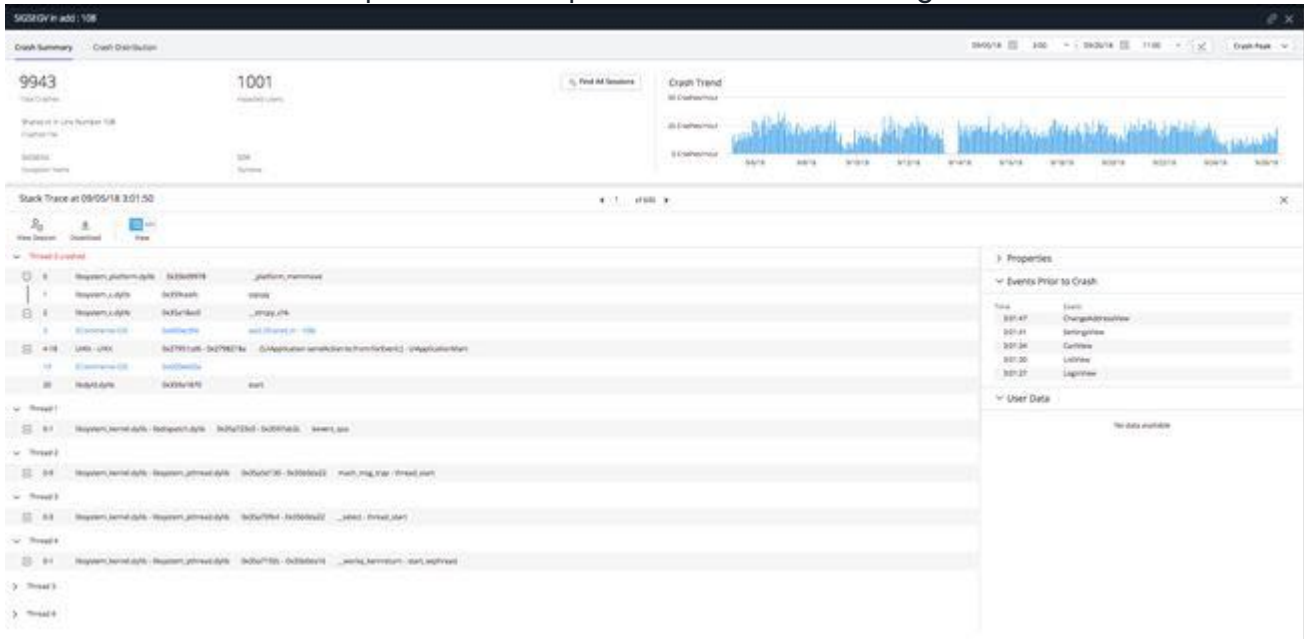

31033 Total Crashes
1001 Impacted Users

15 Total Unique Crashes
6.3% Crash Rate

Unique Crashes

Unique Crash Location	Mobile App Version	Total Crashes	Impacted Users ↓	Status	Runtime
\$IG95DV in cartpage	1.0	10,346	1001	open	SDK
\$IG95DV in promoview	2.1	15,135	1001	open	SDK
\$IG95DV in add	2.0	5,343	1001	open	SDK
\$IG95DV in promoview	2.1	147	138	open	SDK
\$IG95DV in promoview	2.1	145	138	open	SDK
\$IG95DV in add	2.0	144	134	open	SDK
\$IG95DV in cartpage	1.0	137	129	open	SDK
\$IG95DV in add	2.0	138	126	open	SDK
\$IG95DV in cartpage	1.0	136	126	open	SDK
\$IG95DV in cartpage	1.0	15	15	open	SDK
\$IG95DV in cartpage	1.0	13	13	open	SDK
\$IG95DV in add	2.0	11	11	open	SDK
\$IG95DV in promoview	2.1	10	10	open	SDK
\$IG95DV in promoview	2.1	7	7	open	SDK
\$IG95DV in add	2.0	6	6	open	SDK

9. Double-click one of the unique crashes to open the **Crash Details** dialog.

10. From here, you can view the stack trace of the crash snapshot, note the thread and function in which the crash occurred. For some crashes, the crashed line number is also available. Optional: Click **Download** to get a text version of the stack trace to send to your application development team.
11. To access a complete data set for crashes that belong to this crash group, click **Find Sessions**. This opens the [Mobile Sessions](#)¹⁴⁸⁰ view with a filter for this **Crash Group** already selected.

AppDynamics iOS Sample App

AppDynamics offers an iOS Sample App where you can explore an instrumented sample application and look at code snippets to learn how to instrument your own iOS application. The Sample App contains a selection of examples showing how a mobile app on the iOS platform is instrumented with the AppDynamics iOS Agent.

Sample App Features

In the Sample App you can:

- Build and run the Sample App.
- Explore the UI in the Sample App to see examples and code snippets, which helps you learn how to instrument your own app.
- Use the running Sample App to generate events and look at the logs in the Xcode console, which helps you verify and understand the way instrumentation works.
- View the results that show up in the AppDynamics Controller UI, which helps you see how events in the Sample App are reflected in the Controller.

Who Can Use the Sample App

Anyone can use the Sample App to test and demo AppDynamics mobile instrumentation features. You only need the the following:

- Access to an AppDynamics Controller
- Some knowledge of Xcode

¹⁴⁸⁰ <https://docs.appdynamics.com/display/PRO45/Mobile+Sessions>

Get the Sample App

The Sample App is hosted on Github at github.com/CiscoDevNet/AppDynamicsSampleAppiOS¹⁴⁸¹. See the [README file in Github](https://github.com/CiscoDevNet/AppDynamicsSampleAppiOS/blob/main/README.md)¹⁴⁸² for instructions.

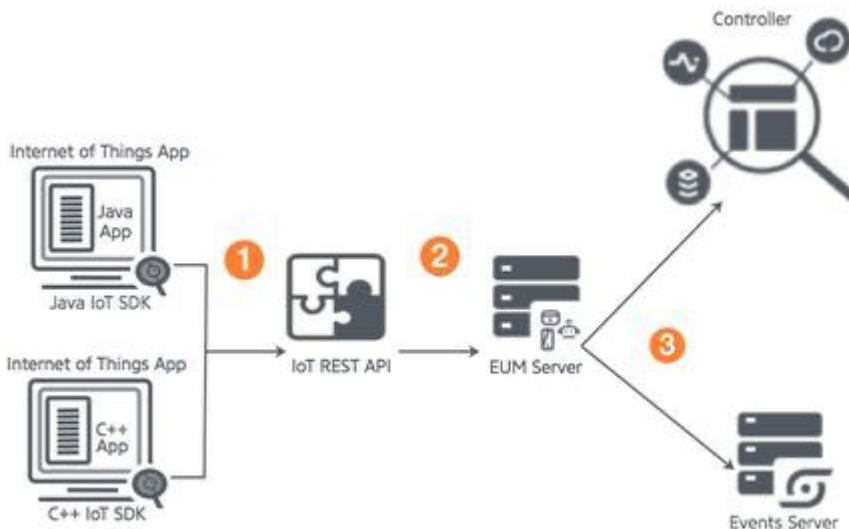

IoT Monitoring

Deployment Support

AppDynamics IoT Monitoring enables you to track and understand the transactions of your IoT applications. Because IoT devices are diverse, both in terms of the platforms they use and their business function, AppDynamics has developed a REST API in addition to language SDKs to provide the maximum flexibility for reporting IoT data. This API can be used from any device that supports HTTPS and is connected to the Internet.

IoT Monitoring requires application developers to instrument their code. To make this process easier, AppDynamics has developed C/C++ and Java SDKs, so that developers using the platforms supporting these languages can leverage the features of the SDK instead of using the REST API. The IoT SDKs **1** use the REST APIs to report IoT Data to the EUM Server **2**, where the data is aggregated and made available to the AppDynamics Controller and the Events Service **3** as shown in this diagram:

1481 <https://github.com/CiscoDevNet/AppDynamicsSampleAppiOS>

1482 <https://github.com/CiscoDevNet/AppDynamicsSampleAppiOS/blob/main/README.md>

Benefits of IoT Monitoring

IoT Monitoring enables you to capture and diagnose network requests, errors, and custom application and domain-specific events for applications running on devices that impact business objectives.

With IoT Monitoring, you can monitor the following for devices:

- Availability
- Network Performance:
 - Slow interaction
 - Latency between the device and backend services
- Usage: User and system behavior and patterns
- Errors and Exceptions

IoT Monitoring Use Cases

IoT applications are typically embedded applications running on connected devices. This section focuses on how IoT Monitoring can collect and report data for the most common categories of IoT applications.

In the tabs below, you can view these IoT app categories and see how a typical example of each would use the three supported IoT Monitoring events to report data.

[Retail](#) [Media](#) [Connected Cars](#) [Smart Homes](#) [Travel](#)

This category of IoT apps process orders, payments, and manage product inventory. Examples include point of sale (PoS) devices, smart shelves, and gateways (local servers that aggregate information within certain geography/region).

Device Example	Device Information	Example Network Requests	Custom Events Examples	Handled Errors	Exceptions/ Crashes
Point of Sale	<ul style="list-style-type: none"> • device ID • app version • hardware versions • firmware versions 	<ul style="list-style-type: none"> • checkout • payment transaction 	<ul style="list-style-type: none"> • total sales • number of items sold • discount applied • total checkout time • total processing time 	<ul style="list-style-type: none"> • credit card declined • unable to read credit card • incorrect pin code 	<ul style="list-style-type: none"> • crashes • reboots • frozen UI • timeouts • null point exceptions

[Retail](#) [Media](#) [Connected Cars](#) [Smart Homes](#) [Travel](#)

IoT apps in this category enable users to seamlessly experience media content across different devices. An IoT app on a [set-top box \(STB\)](#)¹⁴⁸³ can quickly change the channel/content based on what the user was watching or listening to on their computer or phone.

¹⁴⁸³ https://en.wikipedia.org/wiki/Set-top_box

Device Example	Device Information	Example Network Requests	Custom Events Examples	Handled Errors	Exceptions/ Crashes
Audio Streaming	<ul style="list-style-type: none"> • device ID • app version • hardware versions • firmware versions 	<ul style="list-style-type: none"> ◦ media play ◦ pause ◦ stop requests ◦ ad performance 	<ul style="list-style-type: none"> ◦ media downloads ◦ media skips ◦ subscription details ◦ total play time 	<ul style="list-style-type: none"> ◦ play errors ◦ song not available ◦ download errors 	<ul style="list-style-type: none"> • crashes • reboots • frozen UI • timeouts • null point exceptions

[Retail](#)
[Media](#)
[Connected Cars](#)
[Smart Homes](#)
[Travel](#)

Because automotive head units are often computers, IoT apps are used to manage user subscriptions and monitor the user experience.

Device Example	Device Information	Example Network Requests	Custom Events Examples	Handled Errors	Exceptions/ Crashes
Infotainment System	<ul style="list-style-type: none"> • device ID • app version • hardware versions • firmware versions 	<ul style="list-style-type: none"> ◦ media play ◦ pause ◦ stop requests ◦ ad performance 	<ul style="list-style-type: none"> ◦ media downloads ◦ media skips ◦ subscription details ◦ total play time 	<ul style="list-style-type: none"> ◦ application loading errors ◦ connectivity errors ◦ audio errors ◦ launching errors 	<ul style="list-style-type: none"> • crashes • reboots • frozen UI • timeouts • null point exceptions

[Retail](#)
[Media](#)
[Connected Cars](#)
[Smart Homes](#)
[Travel](#)

These IoT apps improve the security as well as reduce the energy and maintenance costs of intelligent buildings and smart homes. Examples include home security devices and smart thermostats, smart keyless locks, and smart lights.

Device Example	Device Information	Example Network Requests	Custom Events Examples	Handled Errors	Exceptions/ Crashes
Home Security	<ul style="list-style-type: none"> • device ID • app version • hardware versions • firmware versions 	<ul style="list-style-type: none"> ◦ home sensor status ◦ communication between gateway devices and sensors ◦ health alerts 	<ul style="list-style-type: none"> ◦ sensor health ◦ number of alerts ◦ connectivity status ◦ total roundtrip time to trigger an alarm ◦ total time to set security status 	<ul style="list-style-type: none"> ◦ device wake-up/ sleep ◦ alarm notification, ◦ connectivity issues 	<ul style="list-style-type: none"> • crashes • reboots • frozen UI • timeouts • null point exceptions

Retail Media Connected Cars Smart Homes [Travel](#)

This category of IoT apps monitors and improves the travel experience. You can find IoT apps used in airport kiosks, luggage tracking devices, and embedded in cabin seats to monitor passenger comfort.

Device Example	Device Information	Example Network Requests	Custom Events Examples	Handled Errors	Exceptions/ Crashes
Airport Kiosk	<ul style="list-style-type: none"> • device ID • app version • hardware versions • firmware versions 	<ul style="list-style-type: none"> ◦ fetching passenger records ◦ payment processing 	<ul style="list-style-type: none"> ◦ number of users completing a transaction ◦ number of issued boarding passes ◦ total user activity time ◦ total time spent on each screen 	<ul style="list-style-type: none"> ◦ passenger records not found ◦ printer error ◦ connectivity issues 	<ul style="list-style-type: none"> • crashes • reboots • frozen UI • timeouts • null point exceptions

IoT SDKs

IoT Monitoring provides SDKs for C/C++ and Java languages. Some of the features of IoT SDKs are:

- APIs for reporting instrumentation data through custom events, error events, and network requests.
- Serialization of all events into JSON format before sending them to EUM Server
- API to plugin application HTTPS stack into SDK which will be used to communicate with EUM Server
- Business Transaction (BT) correlation
- Auto-disable when monitoring is turned off from the Controller UI

For languages other than C++ and Java, you can use the REST API to send custom events, error events, and network requests.

IoT Monitoring UI

IoT Monitoring also provides the following features through the Controller UI:

- Dashboards for monitoring devices, network requests, as well as errors and exceptions
- Predefined and custom widgets to visualize reported application data
- Analytics for device application data through [AppDynamics Application Analytics](#)(see page 3006)
- Configuration for naming and excluding network requests

IoT Monitoring Workflow

The IoT SDKs and REST API enable you to report application data for a large number of different kinds of devices. This flexibility allows for a great deal of customization in the kind of the data you report, the quantity of data you report, and the timing of when the data is sent to the EUM Server.

To monitor customized data, you will need to better understand the data generated by your application and your device instrumentation. The goal of this page is to guide you through the process of understanding your application data, instrumenting your device application, and creating custom dashboards, so you can monitor device performance and activity.

We recommend that you follow this procedure as a guideline to monitor your devices:

1. [Define your monitoring goals](#)(see page 2335).
2. [Identify what data needs to be captured](#)(see page 2335).
3. [Determine which events to use to report the data](#)(see page 2335).
4. [Obtain an EUM App Key](#)(see page 2336).
5. [Report events](#)(see page 2336).
6. [Monitor the availability, usage, and performance of your devices](#)(see page 2336).
7. [Build widgets](#)(see page 2336).
8. [Diagnose problems through filters](#)(see page 2336).
9. [Improve monitoring and troubleshoot](#)(see page 2336).

Define Monitoring Goals

AppDynamics IoT Monitoring enables you to monitor the availability, performance, and usage of your device. You should devise a plan that prioritizes your monitoring goals, considering the needs of all stakeholders (developers, DevOps, business units), and lists the resources that need to be monitored. Also, you should consider who will be instrumenting the device application, who will be performing the monitoring, and the parties who should be notified when something goes wrong.

Identify Data to Capture

Next, you will need to analyze your device to identify what application data can be used to meet your monitoring goals. For example, if your device is a car, you would want to look at network requests to check device availability or report custom data for the wear and tear on its components or road conditions.

Determine Which Event Types to Use to Report Data

You report app data through the three types of events shown in the table below. Based on this information, map the most suitable event types to the data you identified and your monitoring goals.

Event Type	Monitoring Objective
Custom	Usage
	Business
Network Request	Availability
	Performance
	Usage
Error	Performance

Obtain an EUM App Key

Follow the instructions provided in [Get an EUM App Key](#)(see page 2337).

Report Events

You can use the IoT SDKs or REST API to capture and report key data points using one of the event types. If you are using a language other than C/C++ or Java, use the IoT REST API, which gives you the flexibility to report data from any platform.

Follow the getting started instructions to learn how to install the SDK and instrument your IoT application:

- [Instrument Applications with the IoT C/C++ SDK](#)(see page 2341)
- [Instrument Applications with the IoT Java SDK](#)(see page 2348)

Monitor Your IoT Application

To monitor your IoT applications, you will need to understand the function and purpose of the three IoT dashboards. See [Monitor Applications with the IoT Dashboards](#)(see page 2364) for a brief introduction of each dashboard and usage instructions.

Build Widgets Based on Your Data Models

Each dashboard has a set of predefined widgets for basic performance and activity monitoring. You will need to create your own widgets, however, to optimize the monitoring capabilities of **IoT Monitoring**. Based on the events you reported, create custom widgets to monitor device activity and performance. See the section [Build Custom Dashboard Widgets](#)(see page 2370) to learn how to build widgets with the **IoT Widget Builder Wizard**.

Diagnose Problems

When you do discover deviations from expected behavior, you can then add criteria to filter results. This enables you to narrow the results to certain devices or possible causes.

Troubleshoot Issues and Improve Monitoring

For performance issues, you can open the device details to analyze errors and slow network requests. The device details allow you to trace the error event you are interested in and even download the stack trace. The developer can then use this information to determine the root cause of the problem and devise a

possible solution. Going back to our point-to-sale device example, you might discover that most of the failed payments were due to network request errors.

You can use the usage information to improve your monitoring or the devices themselves. For example, an inventory management application indicates that several stores sell a smaller quantity of a certain product. It turns out that this product is often out of stock at these stores. You could improve the monitoring of your IoT app by using custom events to report when a product is sold out and then creating custom widgets to let you know which stores need to restock.

IoT Analytics

All IoT data is processed and stored by the AppDynamics Platform Events Service. A separate product component, [AppDynamics Analytics](#) (see page 3006), has an event type called Connected Device Data. This event type is based on the same Events Service and uses the same data. Viewing this event type from the Analytics UI offers additional capabilities, including:

- Additional predefined widgets, such as the funnel widget
- ADQL for searching the data
- Creating custom widgets
- Manipulating multiple dashboard types
- Longer retention time for data storage

IoT Analytics does *not* require a license separate from the IoT Monitoring license.

To view Analytics data for connected devices, users need **Connected Devices Permissions** for the application (identified by a specific App Key).

IoT Licenses and Limits

Currently, AppDynamics only offers the **IoT PRO** license. To learn about the license entitlements and restrictions, contact your AppDynamics account representative.

Set Up and Access IoT Monitoring

This describes when you should use an IoT SDK or the IoT REST API, get an EUM App Key, and direct you to instructions for capturing and reporting data.

SDKs Versus REST API

The IoT SDKs use the REST API to transmit data to the EUM Server. By handling HTTP requests, serializing JSON, and managing events in memory, the SDKs make it easier to capture and report data, so you can focus on instrumenting your application. For platforms other than C++ or Java, you can take advantage of the wide variety of HTTP(S) and JSON libraries to use the IoT REST API to report data.

Get an EUM App Key

To get an EUM App Key, you need to either create an IoT app manually or use the **Getting Started Wizard**, which is recommended if you are a new user. You will need the EUM App Key to use the IoT REST API or IoT SDKs to report device information and events to the EUM Server. Multiple IoT applications can share the same key.

Create an IoT Application with the Getting Started Wizard

From the Controller:

[New Applications](#) Using Existing Applications

1. Click **User Experience** from the top navigation bar.
2. Select the Connected Devices tab.
3. Click **Get Started**.
4. From the **Create Application** dialog, select **Create an Application using the Getting Started Wizard**.
5. Click **OK**.
6. For step one of the **Getting Started Wizard - Connected Devices** page, select **Create a new Application**.
7. Enter a name for your IoT app.
8. Click **Continue**.
9. From step two, select which method you want to use to report IoT data (Java SDK, C/C++ SDK, REST API).
10. Copy the values for the **App Key** and the **Collector URL**. You'll be using both to report IoT data.

New Applications [Using Existing Applications](#)

1. Click **User Experience** from the top navigation bar.
2. Select the Connected Devices tab.
3. Click **Get Started**.
4. From the **Create Application** dialog, select **Create an Application using the Getting Started Wizard**.
5. Click **OK**.
6. For step one of the **Getting Started Wizard - Connected Devices** page, select **Use an existing Application**.
7. Choose one of the existing applications from the dropdown.
8. From step two, select which method you want to use to report IoT data (Java SDK, C/C++ SDK, REST API).
9. Copy the values for the **App Key** and the **Collector URL**. You'll be using both to report IoT data.

IoT applications created from existing applications cannot be deleted. You would need to delete the existing IoT application that was used to create the application.

Manually Create an IoT Application

From your Controller:

1. Click **User Experience** from the top navigation bar.
2. Select the Connected Devices tab.
3. Click **Get Started**.
4. From the **Create Application** dialog, select **Create an Application manually**.
5. Enter a name for your IoT app.
6. Click **OK**.

7. From the **Connected Devices** tab, select IoT app and click  to copy the App Key to your clipboard.

Report IoT Data

Based on the method you plan on reporting data, use your App Key and follow the instructions for one of these tutorials:

- [Instrument Applications with the IoT C/C++ SDK](#)(see page 2341)
- [Instrument Applications with the IoT Java SDK](#)(see page 2348)
- [Instrument Applications with the IoT REST APIs](#)(see page 2356)

Correlate Business Transactions for IoT Monitoring

Related pages:

- [Correlate Business Transactions for EUM](#)(see page 1648)
- [Business Transactions](#)(see page 1238)

You can correlate IoT network request events with business transactions. The correlation is made between beacons containing network request event information and instances of business transactions (transaction snapshots).

IoT Network Requests Correlation

This procedure outlines how IoT applications correlate network requests with business transactions:

1. The IoT application attaches AppDynamics HTTP headers to a network request to the app server agent. These AppDynamics HTTP headers instruct the app server agent to send back correlation headers.
2. The app server agent:
 - Sends HTTP response headers identifying the business transaction to the IoT application.
 - Aggregates backend metrics and sends them along with the business transaction identifiers to the Controller. This serves as the content for the transaction snapshot.
3. The IoT Agent sends business transaction identifiers (from the HTTP response headers) as part of IoT network request event to the EUM Server. This serves as the content for the network request.
4. The Controller fetches the events and business transaction identifiers from the EUM Server. These business transaction identifiers are used to correlate the network request with the transaction snapshots.

Correlate IoT Network Request Events with Business Transactions

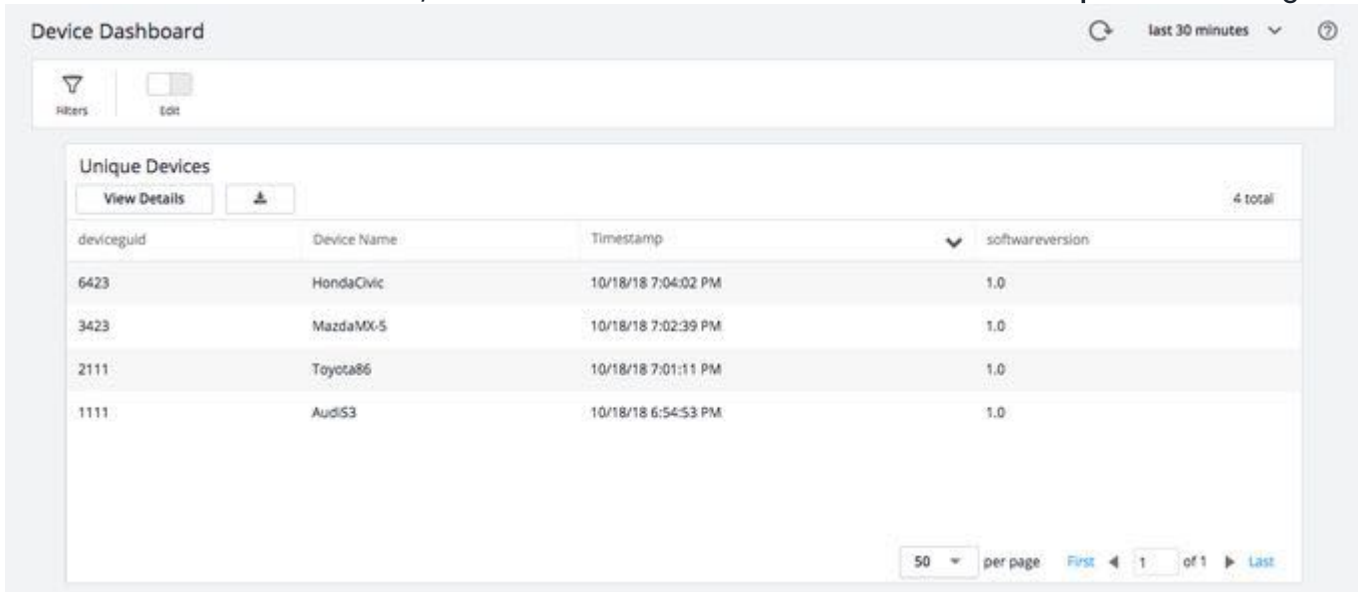

Use the IoT SDKs or the IoT REST API to send the returned response headers from the business application with beacons to report IoT network request events and correlate those events with the business transaction.

For correlation instructions, see "Correlate Business Transactions with Network Requests" for either the [IoT C/C++ SDK](#)(see page 2341), [IoT Java SDK](#)(see page 2348), or the [IoT REST API](#)(see page 2356).

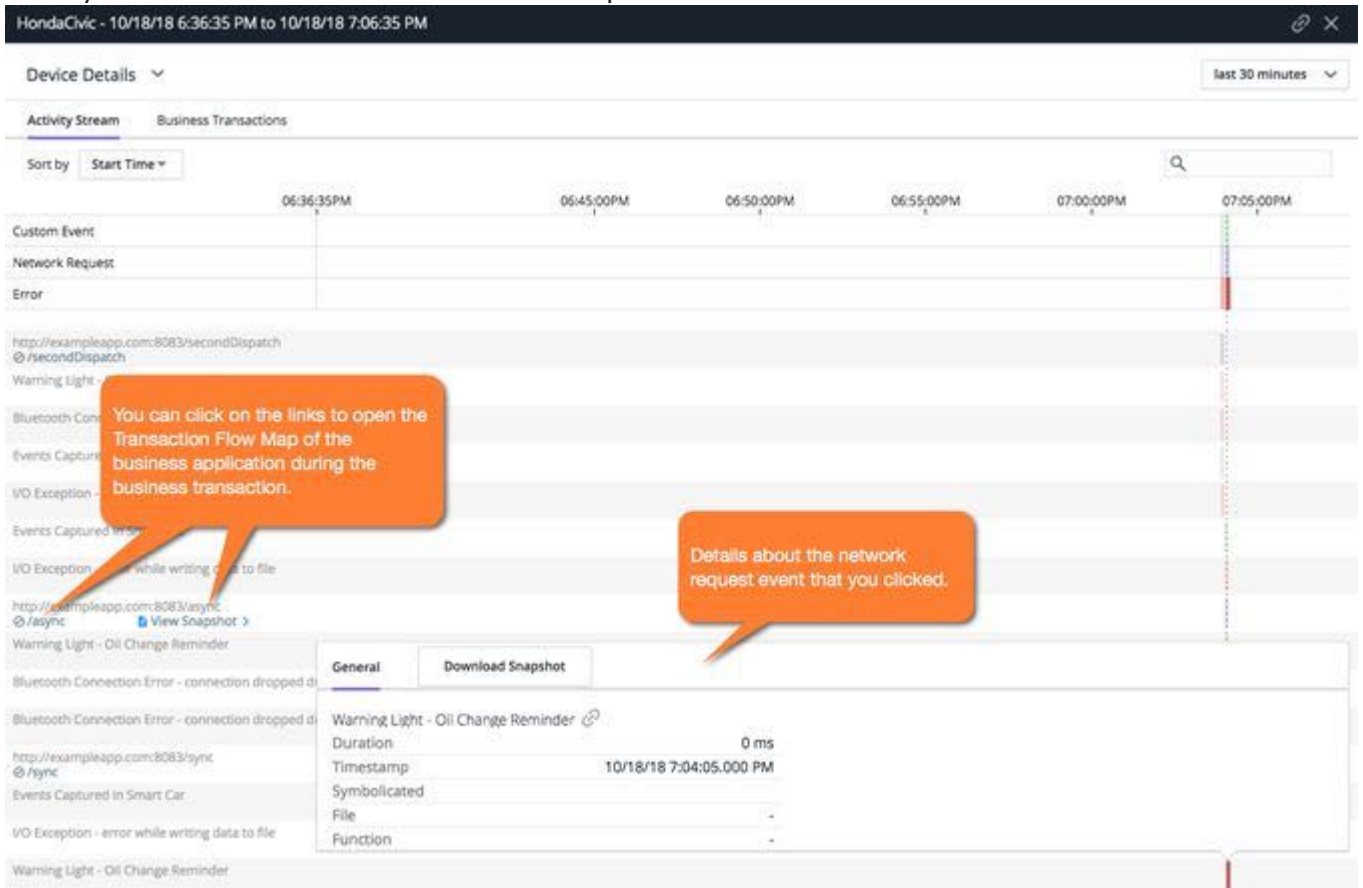

View Business Transactions Correlated with IoT Applications

There are several ways to navigate from a network request snapshot to its correlated business transaction. The following steps show you one possible way.

1. From the **IoT Device Dashboard**, double-click one of the device records in the **Unique Devices** widget:

2. You should now see a list of network requests in the Activity Stream tab. You can click a link in the activity stream to view the transaction flow map for a business transaction.

- Click the Business Transactions tab to view a list of correlated business transactions.

The screenshot shows the AppDynamics interface for a device named 'HondaCivic' with a time range from 10/18/18 5:12:32 PM to 10/18/18 7:12:32 PM. The 'Device Details' dropdown is set to 'last 2 hours'. The 'Activity Stream' is filtered to 'Business Transactions'. The table below shows the following transactions:

Name ↓	Time (ms)
/sync	
/secondDispatch	
/async	71

- You can then click a business transaction to view the **Transaction Flow Map** shown below, which provides a visual representation of the components and activities of the business application during the correlated business transaction.

Instrument Applications with the IoT C/C++ SDK

The IoT C++ SDK provides APIs to instrument C++ applications running on connected devices such as industrial or home gateways, points of sale, smart TVs or car infotainment systems. This getting started will show you how to install the C++ SDK and instrument your IoT application.

Follow these steps to get your EUM App Key and instrument your IoT C/C++ apps.

i If you have ANSI-C application or if your platform is not Linux x86, please contact your AppDynamics account representative.

Learn about the C/C++ SDK

You should know that the C++ SDK:

- Operates within the application thread and doesn't spawn any new threads.
- Keeps all the event data in memory and doesn't persist on disk.
- Provides an API to register for the network interface.
- Uses application's HTTPS stack to communicate with the EUM Server.
- Provides an API to fetch SDK log messages. Application developers have to manage logs by writing the log messages to stderr or to a log file.
- Uses the open-source [json-c](https://github.com/json-c/json-c)¹⁴⁸⁴ library that is statically linked.
- Makes synchronous blocking API calls that are not thread-safe. Application developers are responsible for making thread-safe calls.

Review the Requirements

Before you begin, make sure you meet these requirements:

- GNU C++ Compiler (g++) version 4.2 for 32/64-bit architectures
- Any Linux distribution based on glibc >= 2.20
- HTTPS stack for sending beacons to the EUM Cloud

¹⁴⁸⁴ <https://github.com/json-c/json-c>

- EUM App Key

Get the IoT C++ SDK

You can get the C++ SDK by cloning or downloading the [IoT C++ SDK from GitHub](#)¹⁴⁸⁵. Follow the instructions given in [Installation](#)¹⁴⁸⁶ to build the IoT C++ SDK.

Upgrade the IoT C++ SDK

From the root directory of your clone of the [IoT C++ SDK from GitHub](#)¹⁴⁸⁷:

- Update the repository: `$ git pull origin master`
- Follow the instructions given in [Installation](#)¹⁴⁸⁸ to rebuild the IoT C++ SDK.

Install the C++ SDK in Your Application

The C++ SDK is packaged as a tar zip file and contains the following:

- `include` - directory containing headers for the public API for use with the C++ SDK
- `lib` - the directory containing the shared object files for the C++ SDK

Add the SDK Headers

Copy or move the `include` directory, which contains the SDK header files into your application directory, and include it in your code to access the SDK APIs.

```
#include "appd_iot_interface.h"
....
{
```

Initialize the SDK

You must initialize the C++ SDK by providing the SDK and device configuration as input parameters and then calling the function `appd_iot_init_sdk` as shown below. The SDK configuration takes in parameters for the app key, log level, and the EUM Collector URL. The SDK uses the EUM Collector URL to send data to the EUM Server. The device configuration contains information to identify a unique device.

- i** See [SaaS Domains and IP Ranges](#)¹⁴⁸⁹ for EUM Collector URLs in each geographic region. If the EUM Collector URL is not specified, the default SaaS Collector URL is used.

```
#include "appd_iot_interface.h"
....
{
    // Declare config variables for the SDK and device.
```

¹⁴⁸⁵ <https://github.com/Appdynamics/iot-cpp-sdk>

¹⁴⁸⁶ <https://github.com/Appdynamics/iot-cpp-sdk#installation>

¹⁴⁸⁷ <https://github.com/Appdynamics/iot-cpp-sdk>

¹⁴⁸⁸ <https://github.com/Appdynamics/iot-cpp-sdk#installation>

¹⁴⁸⁹ <https://docs.appdynamics.com/display/PAA/SaaS+Domains+and+IP+Ranges>

```

appd_iot_sdk_config_t sdkcfg;
appd_iot_device_config_t devcfg;
appd_iot_init_to_zero(&sdkcfg, sizeof(sdkcfg));
appd_iot_init_to_zero(&devcfg, sizeof(devcfg));

// Set the initialization configurations for the SDK
sdkcfg.appkey = "<EUM_APP_KEY>";

// Set the device configurations
devcfg.device_id = "1111";
devcfg.device_type = "SmartCar";
devcfg.device_name = "AudiS3";

// Initialize the instrumentation
appd_iot_init_sdk(sdkcfg, devcfg);
}

```

Register Network Interface

The SDK needs an HTTPS interface to send events to the EUM Server. The application developer has to provide callback functions for the SDK to execute the HTTPS request. Refer to [Run the Sample Application](#) (see page 2348) for a sample network interface implementation using `libcurl`.

```

#include "appd_iot_interface.h"
....
{
  appd_iot_http_cb_t http_cb;

  //Callback function triggered by SDK to send http request and receive http response
  http_cb.http_req_send_cb = &your_network_interface_send_cb;

  //Callback function triggered by SDK to indicate completion of http response processing
  http_cb.http_resp_done_cb = &your_network_interface_resp_done_cb;

  //register http interface callbacks
  appd_iot_register_network_interface(http_cb);

  ...
}

```

Add and Send Events

To understand the different types of events, you will work with the sample smart car IoT application given in the sections below.

Custom Events

Custom event to capture technical stats of a "SmartCar".

```
#include "appd_iot_interface.h"
....

{
  appd_iot_custom_event_t custom_event;
  appd_iot_init_to_zero(&custom_event, sizeof(custom_event));

  custom_event.type = "SmartCar Stats";
  custom_event.summary = "Technical Stats of SmartCar";
  custom_event.timestamp_ms = ((int64_t)time(NULL) * 1000);
  custom_event.data = (appd_iot_data_t*)calloc(2, sizeof(appd_iot_data_t));
  appd_iot_data_set_integer(&custom_event.data[0], "Speed mph", 65);
  appd_iot_data_set_double(&custom_event.data[1], "Oil Temperature", 220);

  appd_iot_add_custom_event(custom_event);
  free(custom_event.data);

  ....

  appd_iot_send_all_events();
}
```

Network Request Events

Network Request event to capture the performance of an HTTPS call to get weather information.

```
#include "appd_iot_interface.h"
....

{
  appd_iot_network_request_event_t network_event;
  appd_iot_init_to_zero(&network_event, sizeof(network_event));

  network_event.url = "https://apdy.api/weather";
  network_event.resp_code = 202;
  network_event.duration_ms = 10;
  network_event.req_content_length = 300;
  network_event.req_content_length = 100;
  network_event.timestamp_ms = ((int64_t)time(NULL) * 1000);
  network_event.data = (appd_iot_data_t*)calloc(1, sizeof(appd_iot_data_t));
  appd_iot_data_set_string(&network_event.data[0], "city", "San Francisco");

  appd_iot_add_network_request_event(network_event);
  free(network_event.data);

  ....

  appd_iot_send_all_events();
}
```

Error Events

The Error event below is used to capture Bluetooth errors in the SmartCar app.

```
#include "appd_iot_interface.h"
....
{

  appd_iot_error_event_t error_event;
  appd_iot_init_to_zero(&error_event, sizeof(error_event));

  error_event.name = "Bluetooth Connection Error";
  error_event.message = "connection dropped due to bluetooth exception";
  error_event.severity = APPD_IOT_ERR_SEVERITY_CRITICAL;
  error_event.timestamp_ms = ((int64_t)time(NULL) * 1000);
  error_event.data = (appd_iot_data_t*)calloc(1, sizeof(appd_iot_data_t));
  appd_iot_data_set_integer(&error_event.data[0], "Bluetooth Error Code", 43);

  appd_iot_add_error_event(error_event);
  free(error_event.data);

  ....

  appd_iot_send_all_events();
}
```

Correlate Business Transactions with Network Requests (Optional)

To correlate business transactions (BTs) with network requests, you need to instrument a business application and enabled business transactions in the Controller UI. See [Correlate Business Transactions for IoT Monitoring](#) (see page 2339) to learn more.

The steps below show you how to get the BT response headers and use them to correlate the BT with an IoT Network Request event.

1. Set the AppDynamics HTTP headers ADRUM and ADRUM_1 as part of a network request to your business application.

```
/* Initialize all the data structures for the request and response. */
appd_iot_http_req_t http_req;
appd_iot_http_req_t http_resp;

/* Initialize the request and response. */
appd_iot_init_to_zero(&http_req, sizeof(http_req));
appd_iot_init_to_zero(&http_resp, sizeof(http_resp));

/* Provide the URL to your instrumented business app that is enabled for business
transaction correlation. */
http_req.url = "<url-to-your-business-app-enabled-for-bt>";
```

```

/* Add your other HTTP request parameters here:
...
*/
/* Call the SDK method to get the headers for ADRUM and ADRUM_1. */
const appd_iot_data_t* correlation_headers = appd_iot_get_server_correlation_headers();

for (size_t i = 0; i < APPD_IOT_NUM_SERVER_CORRELATION_HEADERS; i++)
{
  appd_iot_data_set_string(&http_req.headers[i], correlation_headers[i].key,
  correlation_headers[i].strval);
}

/* Make the request, and assign the response to a variable. */
http_resp = http_curl_req_send_cb(&http_req);

```

- The call will return response headers (i.e., ADRUM_*) that contain information for correlating the business transaction. If you were to print these BT response headers, you would see something like the following:

```

ADRUM_0: clientRequestGUID:0f5c7602-9b69-4e40-85a6-e0abf288accf
ADRUM_1: globalAccountName:eum-mobile_4debdbad-3f8e-4f6d-8faf-e5f5781ec0d7
ADRUM_2: btId:3867
ADRUM_3: serverSnapshotType:f
ADRUM_4: btDuration:829

```

- Add these BT response headers to the network event that you send to the EUM Server:

```

/* Create a network event to report to the EUM Server. */
appd_iot_network_request_event_t network_event;
appd_iot_init_to_zero(&network_event, sizeof(appd_iot_network_request_event_t));

/* Add information about the network event that you want to report. */
network_event.url = "<url-to-your-business-app-enabled-for-bts>";
network_event.resp_code = http_resp->resp_code;

/* Assign the returned BT response headers from the call to the business app to the
headers of the request. */
network_event.resp_headers = http_resp->headers;

// Add the network event to beacon to send to the EUM Server. */
appd_iot_add_network_request_event(network_event);
appd_iot_send_all_events();

```

- In the Controller UI, you should be able to [view the correlated business transaction](#) (see page 2339) in the **Device Details** dialog.

Compile and Run Your App with the SDK Library File

- Compile your program. For example, if the driver file is `main.cpp`:

```
$ g++ -c main.cpp -I<appd_iot_sdk_dir>/include
```

2. Create the binary with the object code of your application and linking AppDynamics IoT C++ SDK library.

[Linux](#) [Mac](#)

```
$ g++ main.o <appd_iot_sdk_dir>/lib/libappdynamics_iot.so -o main
```

[Linux](#) [Mac](#)

```
$ g++ main.o <appd_iot_sdk_dir>/lib/libappdynamics_iot.dylib -o main
```

You can combine steps 1 and 2 into one step as below:

```
$ g++ main.cpp -o main -I<appd_iot_cpp_sdk_dir>/include -L<appd_iot_cpp_sdk_dir>/lib  
-lappdynamics_iot
```

3. Set the environment variable `DYLD_LIBRARY_PATH` to the PATH where the SDK library is installed. This will let dynamic linker know the directory to search for shared libraries.

[Linux](#) [Mac](#)

```
$ export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:<appd_iot_cpp_sdk_dir>/lib
```

[Linux](#) [Mac](#)

```
$ export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:<appd_iot_cpp_sdk_dir>/lib
```

4. Run your program. For example:

```
$ ./main
```

Verify the Instrumentation in the Controller UI

See [Confirm the IoT Application Reported Data to the Controller](#)(see page 2363) to verify the instrumentation.

Customize the IoT C++ Instrumentation (Optional)

You can further customize the IoT C++ instrumentation using the IoT C++ SDK. See the [latest IoT C++ SDK documentation](#)¹⁴⁹⁰ or the previous versions listed below:

- <https://sdkdocs.appdynamics.com/javadocs/iot-cpp-sdk/4.5/4.5.0/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-cpp-sdk/4.5/4.5.1/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-cpp-sdk/4.5/4.5.2/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-cpp-sdk/4.5/4.5.4/>

Run the Sample C++ Application

The sample C++ application sends sample data for Custom, Network Request, and Error events. The data mocks a smart car application, capturing usage information, network performance, and errors.

To run the sample app, follow the instructions given in [Sample Application using IoT C++ SDK](#)¹⁴⁹¹.

Instrument Applications with the IoT Java SDK

The IoT Java SDK can be included in IoT Java applications running on an edge device like gateways, points of sale, car infotainment centers. This getting started will show you how to install the Java SDK and instrument your IoT application.

Follow these steps to get your EUM App Key and instrument your IoT C/C++ apps.

- [Review the Requirements](#)(see page 2348)
- [Get the IoT Java SDK](#)(see page 2349)
- [Add the SDK Dependencies to the Gradle Configuration](#)(see page 2349)
- [Add the Instrumentation Code](#)(see page 2349)
- [Add and Send Events](#)(see page 2351)
- [Verify the Instrumentation in the Controller UI](#)(see page 2353)
- [Correlate Business Transactions with Network Requests \(Optional\)](#)(see page 2353)
- [Enable Logging for the SDK \(Optional\)](#)(see page 2355)
- [Customize the IoT Java Instrumentation \(Optional\)](#)(see page 2355)
- [Troubleshooting the IoT Java SDK](#)(see page 2356)

i This Java SDK differs from the AppDynamics Java Agent in that it is a very lightweight library specially designed for lower-end devices. A lot of flexibility is also built into the way event information can be extended and the instrumentation code configured as well as controlled.

Review the Requirements

Before you begin, make sure you meet these requirements:

- A device running one of the following version of Java Runtime:
 - Java SE 7
 - Java SE Embedded 7
 - Java SE 8
 - Java SE Embedded 8
- HTTPS interface to send beacons to the EUM Server
- [EUM App Key](#)(see page 0)

¹⁴⁹⁰ <https://sdkdocs.appdynamics.com/javadocs/iot-cpp-sdk/4.5/latest/>

¹⁴⁹¹ <https://github.com/Appdynamics/iot-cpp-sdk/blob/master/sample/README.md>

Get the IoT Java SDK

You can get the Java SDK by cloning or downloading the [IoT Java SDK from GitHub](#)¹⁴⁹². Follow the instructions given in [Build the SDK](#)¹⁴⁹³ to build the IoT Java SDK.

If you're using the [IntelliJ IDE](#)¹⁴⁹⁴, add the file `lib/appd-iot-sdk.jar` to your project by following the instructions given in [Working with module dependencies](#)¹⁴⁹⁵. Confirm that the JAR file shows up under **External Projects** in your IntelliJ project.

Upgrade the IoT Java SDK

From the root directory of your clone of the [IoT Java SDK from GitHub](#)¹⁴⁹⁶:

- Update the repository: `$ git pull origin master`
- Follow the instructions given in [Build the SDK](#)¹⁴⁹⁷ to rebuild the IoT Java SDK.

Add the SDK Dependencies to the Gradle Configuration

Add the following to your `build.gradle` file:

```
dependencies {
    runtime group: 'org.slf4j', name: 'slf4j-api', version: '1.7.25'
    runtime group: 'com.google.guava', name: 'guava', version: '18.0'
    runtime group: 'com.google.code.gson', name: 'gson', version: '2.8.0'
}
```

Add the Instrumentation Code

Import the IoT SDK

In your application file, add the `import` statement that includes the Java IoT SDK:

```
import com.appdynamics.iot.Instrumentation;
```

Configure the IoT Java Agent

Configure the instrumentation by providing the [EUM App Key](#)(see page 0) and the URL to the EUM Collector. If the EUM Collector URL is not specified, the default SaaS Collector URL is used.

 See [SaaS Domains and IP Ranges](#)¹⁴⁹⁸ for EUM Collector URLs in each geographic region. If the EUM Collector URL is not specified, the default SaaS Collector URL is used.

¹⁴⁹² <https://github.com/Appdynamics/iot-java-sdk/>

¹⁴⁹³ <https://github.com/Appdynamics/iot-java-sdk/#build-the-sdk>

¹⁴⁹⁴ <https://www.jetbrains.com/idea/>

¹⁴⁹⁵ <https://www.jetbrains.com/help/idea/working-with-module-dependencies.html?search=Module%20dependencies>

¹⁴⁹⁶ <https://github.com/Appdynamics/iot-java-sdk/>

¹⁴⁹⁷ <https://github.com/Appdynamics/iot-java-sdk/#build-the-sdk>

¹⁴⁹⁸ <https://docs.appdynamics.com/display/PAA/SaaS+Domains+and+IP+Ranges>

```
import com.appdynamics.iot.AgentConfiguration;
AgentConfiguration.Builder agentConfigBuilder = AgentConfiguration.builder();
AgentConfiguration agentConfig = agentConfigBuilder
    .withAppKey(<EUM_APP_KEY>)
    .build();
```

Set Device Info

You are required to set the name and ID for devices. The name should consist of a short string that identifies the type and model of the device, such as "EV Model 3" or "Thermostat Model Star7". The device ID must be a unique identifier for the device, such as a UUID, the VIN number of a car, or the MAC address of the device.

The example code below sets the device ID to a random UUID and the name to "Smart Shelf".

```
import java.util.UUID;
import com.appdynamics.iot.DeviceInfo;
...
DeviceInfo.Builder deviceInfoBuilder = DeviceInfo.builder("Smart Shelf P1",
    UUID.randomUUID().toString());
DeviceInfo deviceInfo = deviceInfoBuilder.withDeviceName("Smart Shelf").build();
```

Set Version Info

You can set the versions for the firmware, hardware, OS, and software as shown below.

```
import com.appdynamics.iot.VersionInfo;
...
VersionInfo.Builder versionInfoBuilder = VersionInfo.builder();
VersionInfo versionInfo = versionInfoBuilder
    .withFirmwareVersion("2.3.4")
    .withHardwareVersion("1.6.7")
    .withOsVersion("8.9.9")
    .withSoftwareVersion("3.1.1").build();
```

Initialize the Agent

To initialize the agent, pass the `AgentConfiguration` object, the `DeviceInfo` object, and the `VersionInfo` object to the `start` method:

```
Instrumentation.start(agentConfig, deviceInfo, versionInfo);
```

Build and Run the Application

Use your favorite Java IDE or CLI environment to build and run the application. Note that the AppDynamics IoT Java SDK needs to be in build and runtime classpath.

For instructions on adding libraries to the classpath:

- IntelliJ IDE: [Creating a library](#)¹⁴⁹⁹
- Eclipse: [Classpath Variables](#)¹⁵⁰⁰
- Linux/Mac/Windows: [PATH and CLASSPATH](#)¹⁵⁰¹

For instructions to build and run the app:

- IntelliJ: [Building and Running the Application](#)¹⁵⁰²
- Eclipse: [Running your programs](#)¹⁵⁰³
- Gradle: [Building Java Projects with Gradle](#)¹⁵⁰⁴

Add and Send Events

The following sections will show you how to create and send the supported events: Custom, Network Request, and Error.

Create a Basic Custom Event

A custom event can be used to report any performance, device, or business logic data. It is the most general, configurable and flexible data type available.

The Custom Event Builder takes two required parameters.

- Event Type: A short human-readable description of the event, such as "FL Pressure Drop".
- Description: A string describing the event, such as "Front Left Tire Pressure Drop".

To make reporting this event meaningful, it is recommended that you provide a timestamp and at least one kind of datatype.

1. Create a basic custom event.

```
import com.appdynamics.iot.events.CustomEvent;
...
CustomEvent.Builder builder = CustomEvent.builder("FL Pressure Drop", "Front Left Tire
Pressure Drop");
long eventStartTime = System.currentTimeMillis();
long duration = 6000;
builder.withTimestamp(eventStartTime).withDuration(duration);
builder.addLongProperty("PSI Drop", 37);
CustomEvent customEvent = builder.build();
```

Additional information can be added to the CustomEvent. For details, see the CustomEvent class in the [latest Java IoT SDK documentation](#)¹⁵⁰⁵.

2. Add the custom event to the instrumentation (this adds it to the in-memory buffer).

```
Instrumentation.addEvent(customEvent);
```

¹⁴⁹⁹ https://www.jetbrains.com/help/idea/working-with-libraries.html#create_lib

¹⁵⁰⁰ <https://help.eclipse.org/luna/index.jsp?topic=%2Forg.eclipse.jdt.doc.user%2Freference%2Fpreferences%2Fjava%2Fbuildpath%2Fref-preferences-classpath-variables.htm>

<https://help.eclipse.org/mars/index.jsp?topic=%2Forg.eclipse.jdt.doc.user%2FgettingStarted%2Fqs-12.htm>

¹⁵⁰¹ <https://docs.oracle.com/javase/tutorial/essential/environment/paths.html>

¹⁵⁰² <https://www.jetbrains.com/help/idea/building-and-running-the-application.html>

¹⁵⁰³ <https://help.eclipse.org/mars/index.jsp?topic=%2Forg.eclipse.jdt.doc.user%2FgettingStarted%2Fqs-12.htm>

¹⁵⁰⁴ <https://spring.io/guides/gs/gradle/>

¹⁵⁰⁵ <https://sdkdocs.appdynamics.com/javadocs/iot-java-sdk/4.5/latest/>

3. Send all the events to the EUM Server. This is a blocking call, so the application can send it on a separate thread as shown above.

```
Instrumentation.sendAllEvents();
```

Send a Network Event

1. Report a Network Request Event using the `HttpRequestTracker` class. This call automatically adds an event to the in-memory buffer, so you need to explicitly import the class.

```
import com.appdynamics.iot.HttpRequestTracker;
...
String url = "http://ip.jsontest.com/?callback=showMyIP";
// Add a Network Event
try {
    URL thisUrl = new URL(url);
    // [AppDynamics Instrumentation] Get a Tracker
    HttpURLConnection con = (HttpURLConnection) thisUrl.openConnection();
    final HttpRequestTracker tracker = Instrumentation.beginHttpRequest(thisUrl);
    con.setRequestMethod("POST");
    con.setRequestProperty("Accept-Language", "en-US,en;q=0.5");
    int responseCode = con.getResponseCode();
    con.setDoInput(true);
    con.setDoOutput(true);
    DataOutputStream wr = new DataOutputStream(con.getOutputStream());
    wr.flush();
    wr.close();
    System.out.println("Response Code :" + responseCode);
    // [AppDynamics Instrumentation] Retrieve the headers from the response
    Map<String, List<String>> headerFields = null;
    System.out.println("Sending 'POST' request to URL :" + url);
    BufferedReader in;
    String inputLine;
    new InputStreamReader(con.getErrorStream());
    if (responseCode >= 200 && responseCode < 300) {
        in = new BufferedReader(new InputStreamReader(con.getInputStream()));
    } else {
        in = new BufferedReader(
    }
    StringBuffer response = new StringBuffer();
    if (headerFields != null && headerFields.size() > 0){
        while ((inputLine = in.readLine()) != null) {
            response.append(inputLine);
        }
        in.close();
        // [AppDynamics Instrumentation] Initiate adding NetworkRequestEvent
        if (responseCode >= 200 && responseCode < 300) {

tracker.withResponseCode(responseCode).withError(response.toString()).reportDone();
```

```

        .withResponseHeaderFields(headerFields)
        .reportDone();
    } else {
        tracker.withResponseCode(responseCode).reportDone();
    }
} else {
    tracker.withResponseCode(responseCode)
}
// End: Add for AppDynamics Instrumentation - Initiate adding NetworkRequestEvent
} catch (MalformedURLException e) {
    e.printStackTrace();
} catch (Exception ex) {
    ex.printStackTrace();
}

```

2. Send all the events to the EUM Server. This is a blocking call. The application can send it on a separate thread. The recommendation is to batch a number of events together before calling the `sendAllEvents` method.

```
Instrumentation.sendAllEvents();
```

Send an Error Event

1. Report an Error Event using the API.

```

try {
    //Force creating an exception
    float f = (5 / 0);
} catch (Throwable t) {
    Instrumentation.addErrorEvent(t, Instrumentation.Severity.ALERT);
}

```

2. Send all the events to the EUM Server. This is a blocking call. The application can send it on a separate thread.

```
Instrumentation.sendAllEvents();
```

Verify the Instrumentation in the Controller UI

See [Confirm the IoT Application Reported Data to the Controller](#)(see page 2363) to verify the instrumentation.

Correlate Business Transactions with Network Requests (Optional)

To correlate business transactions (BTs) with network requests, you need to have instrumented a business application and enabled business transactions in the Controller UI. See [Correlate Business Transactions for IoT Monitoring](#)(see page 2339) to learn more.

The steps below show you how to get the BT response headers and use them to correlate the BT with an IoT Network Request event.

1. Make a network request that includes the AppDynamics HTTP request headers ADRUM and ADRUM_1 to one of your business applications:

```
import com.appdynamics.iot.HttpRequestTracker;
...
// Create a network request to the business app.
String url = "<url_to_business_application>";
URL thisUrl = new URL(url);
[AppDynamics Instrumentation] Get a Tracker
URLConnection con = (URLConnection) thisUrl.openConnection();
final HttpRequestTracker tracker = Instrumentation.beginHttpRequest(thisUrl);
con.setRequestMethod("POST"); // Some HTTP method: GET, POST, PUT...

// Add the AppDynamics HTTP headers ADRUM and ADRUM_1 to the request.
con.setRequestProperty("ADRUM", "isAjax:true");
con.setRequestProperty("ADRUM_1", "isMobile:true");

// Make the request to your business app.
con.setDoInput(true);
```

2. The call will return response headers that contain information for correlating business transactions. If you were to print these BT response headers, you would see something like the following:

```
{
  ADRUM_1=[globalAccountName:customer1_78203698-278e-428f-8726-bb381219c6cb],
  null=[HTTP/1.1 200 OK],
  ADRUM_0=[clientRequestGUID:2ff45113-6746-4c94-b6d0-4af26055613c],
  ADRUM_3=[btERT:269],
  ADRUM_2=[btId:4423],
  Server=[Jetty(9.4.z-SNAPSHOT)],
  ADRUM_5=[btDuration:327],
  ADRUM_4=[serverSnapshotType:f],
  Content-Length=[514],
}
```

3. Send a beacon containing the BT response headers to the EUM Server:

```
// Fetch the response headers, which will include the BT headers (ADRUM_0, ADRUM_1, ...).
Map<String, List<String>> headerFields = con.getHeaderFields();

// Add the BT response headers to the request body of the Network Request event.
// that you're reporting.
tracker.withResponseCode(responseCode).withError(response.toString()).reportDone();
      .withResponseHeaderFields(headerFields)
      .reportDone();
```

```
// Report the Network Request event to the EUM Server.
Instrumentation.sendAllEvents();
```

4. In the Controller UI, you should be able to [view the correlated business transaction](#)(see page 2339) in the **Device Details** dialog.

Enable Logging for the SDK (Optional)

The IoT Java SDK uses the [Simple Logging Facade for Java \(SLF4J\)](#)¹⁵⁰⁶ as the logging framework. You can use your favorite logging engine that is compatible with SLF4J.

If no binding is found on the classpath, then SLF4J will default to a no-operation implementation and display console messages like the following:

```
SLF4J: Failed to load class "org.slf4j.impl.StaticLoggerBinder".
SLF4J: Defaulting to no-operation (NOP) logger implementation //
SLF4J: See http://www.slf4j.org/codes.html#StaticLoggerBinder
for further details.
```

To use the `java.util` logging engine, add the following line to the `build.gradle` file:

```
dependencies {
    ....
    runtime group: 'org.slf4j', name: 'slf4j-jdk14', version: '1.7.25'
    ....
}
```

To see all the debug messages from the library, append the following line to the bottom of the file `Library/Java/JavaVirtualMachines/<your-jdk-version>/Contents/Home/jre/lib/logging.properties`:

```
com.appdynamics.iot.level = FINEST
```

Customize the IoT Java Instrumentation (Optional)

You can further customize the IoT Java instrumentation using the IoT Java SDK. See the [latest IoT Java SDK documentation](#)¹⁵⁰⁷ or the previous versions listed below:

- <https://sdkdocs.appdynamics.com/javadocs/iot-java-sdk/4.5/4.5.0/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-java-sdk/4.5/4.5.1/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-java-sdk/4.5/4.5.2/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-java-sdk/4.5/4.5.4/>

¹⁵⁰⁶ <https://www.slf4j.org/>

¹⁵⁰⁷ <https://appdynamics.github.io/iot-java-sdk/>

Run the Sample Java Application

The sample Java application sends sample data for Custom, Network Request, and Error events. The data mocks a smart car application, capturing usage information, network performance, and errors.

To run the sample app, follow the [Getting Started instruction](#)¹⁵⁰⁸ given in the [iot-java-sdk](#)¹⁵⁰⁹ GitHub repository.

Troubleshooting the IoT Java SDK

This section provides instructions for debugging common issues.

Unable to Link the IoT Java Agent

If you are getting the following error when trying to link the IoT Java Agent, it's because of a dependency on log4j.

```

loader constraint violation: when resolving method
"org.slf4j.impl.StaticLoggerBinder.getLoggerFactory()Lorg/slf4j/ILoggerFactory;" the class
loader (instance of com/intellij/ide/plugins/cl/PluginClassLoader) of the current class, org/
slf4j/LoggerFactory, and the class loader (instance of com/intellij/util/lang/UrlClassLoader)
for the method's defining class, org/slf4j/impl/StaticLoggerBinder, have different Class
objects for the type org/slf4j/ILoggerFactory used in the signature
java.lang.LinkageError: loader constraint violation: when resolving method
"org.slf4j.impl.StaticLoggerBinder.getLoggerFactory()Lorg/slf4j/ILoggerFactory;" the class
loader (instance of com/intellij/ide/plugins/cl/PluginClassLoader) of the current class, org/
slf4j/LoggerFactory, and the class loader (instance of com/intellij/util/lang/UrlClassLoader)
for the method's defining class, org/slf4j/impl/StaticLoggerBinder, have different Class
objects for the type org/slf4j/ILoggerFactory used in the signature
    at org.slf4j.LoggerFactory.getLogger(LoggerFactory.java:273)
    at org.slf4j.LoggerFactory.getLogger(LoggerFactory.java:241)
    at org.slf4j.LoggerFactory.getLogger(LoggerFactory.java:254)
    at com.appdynamics.iot.Instrumentation.<clinit>(Instrumentation.java:39)
    ...
  
```

To correct the problem, you need to remove the dependency that you added to enable logging. Thus, *remove* the line specifying the group `org.slf4j` shown below from dependencies:

```

dependencies {
    ....
    runtime group: 'org.slf4j', name: 'slf4j-jdk14', version: '1.7.25'
    ....
}
  
```

Instrument Applications with the IoT REST APIs

The IoT REST APIs enable you to report instrumentation data directly to the EUM Server. You can use any platform or language that has support for HTTPS requests and JSON.

¹⁵⁰⁸ <https://github.com/Appdynamics/iot-java-sdk#getting-started>

¹⁵⁰⁹ <https://github.com/Appdynamics/iot-java-sdk>

This page describes how to create a JSON request body, form the resource URI, and make an HTTPS request to the IoT REST APIs to report instrumentation data for the three supported events.

Follow these steps to get your EUM App Key and use the IoT REST API:

- [Review the Requirements](#)(see page 2357)
- [Form the IoT REST URLs](#)(see page 2357)
- [Create the JSON Request Body](#)(see page 2358)
- [Transmit the Beacon Data](#)(see page 2359)
- [Verify the Instrumentation in the Controller UI](#)(see page 2359)
- [Correlate Business Transactions with Network Requests \(Optional\)](#)(see page 2359)
- [Customize the IoT REST API Instrumentation \(Optional\)](#)(see page 2361)
- [Troubleshoot the IoT REST API Instrumentation](#)(see page 2361)

Review the Requirements

Before you begin, make sure you meet these requirements:

- [Get an EUM App Key](#)(see page 0)
- Platform/language that supports HTTPS requests
- JSON support

Form the IoT REST URLs

To form the IoT Monitoring REST resource URL, you will need to know the IoT REST API base URL and port as well as your App Key.

IoT REST API Base URL

The IoT REST API base URL depends on your Controller location.

i See [SaaS Domains and IP Ranges](#)¹⁵¹⁰ for EUM Collector URLs in each geographic region. If the EUM Collector URL is not specified, the default SaaS Collector URL is used.

For example, the IoT base URL for the Americas region would be:

```
https://iot-col.eum-appdynamics.com/eumcollector/iot/v1
```

After creating your IoT Application, use your App Key to test your IoT endpoint and look for a HTTP 200 response. For example, for the Americas region, run the following command:

```
curl -I https://iot-col.eum-appdynamics.com/eumcollector/iot/v1/application/<APPKEY>/enabled
```

IoT Endpoints

With your App Key, you can form the IoT resource endpoints. See the [Summary of the IoT endpoints](#)¹⁵¹¹ for the list of supported resource endpoints and their descriptions.

¹⁵¹⁰ <https://docs.appdynamics.com/display/PAA/SaaS+Domains+and+IP+Ranges>

¹⁵¹¹ <https://sdkdocs.appdynamics.com/javadocs/iot-rest-api/4.5/latest/#swagger--summary-no-tags>

Create the JSON Request Body

You report device information and events in a JSON request body. The JSON includes an array of beacon objects, with each beacon object containing device data and events. The array enables you to transmit data from multiple devices in one request to the EUM Server. You can transmit up to 200 beacons per request.

Save the JSON below to a file (e.g., testBeacon.json) and replace the values for the timestamp properties with integers representing the [UNIX Epoch time](#)¹⁵¹² in milliseconds. The JSON contains the three supported events customEvents, networkRequestEvents, and errorEvents for a smart thermostat. In the next two steps, you will validate and send the JSON as a beacon to the IoT REST API.

 Make sure you save timestamps in milliseconds, and not seconds.

```
[
  {
    "deviceInfo": {
      "deviceType": "Thermostat",
      "deviceId": "4e75d70d-a3f9-474b-bacf-0f4a57fa944c"
    },
    "versionInfo": {
      "hardwareVersion": "Board Rev. 13A",
      "firmwareVersion": "123.5.31",
      "softwareVersion": "9.1.3",
      "operatingSystemVersion": "Linux 13.4"
    },
    "customEvents": [
      {
        "timestamp": <UNIX_Epoch_time_in_milliseconds>,
        "eventType": "Temperature Reading",
        "eventSummary": "Temperature: 25° c",
        "doubleProperties": {
          "celsius": 25.0
        }
      }
    ],
    "networkRequestEvents": [
      {
        "timestamp": <UNIX_Epoch_time_in_milliseconds>,
        "duration": 245,
        "url": "https://api.company.com/v1/temperature",
        "statusCode": 200,
        "requestContentLength": 32,
        "responseContentLength": 0,
        "doubleProperties": {
          "reportedTemperature": 25.0
        }
      }
    ]
  }
]
```

¹⁵¹² https://en.wikipedia.org/wiki/Unix_time

```

    }
  ],
  "errorEvents": [
    {
      "timestamp": <UNIX_EPOCH_time_in_milliseconds>,
      "name": "SQLException",
      "message": "open() failed because db is locked"
    }
  ]
}
]

```

Transmit the Beacon Data

To send the beacon, you post the JSON request body to the /beacons endpoint. Again, in this cURL example, use the JSON you saved to the file testBeacon.json and replace <appKey> with your EUM App Key:

```
curl -v -X POST -d '@testBeacon.json' https://iot-col.eum-appdynamics.com/eumcollector/iot/v1/application/<appKey>/beacons
```

If the beacons were transmitted successfully, the IoT REST API will return the HTTP Status Code 202:

```
< HTTP/1.1 202 Accepted
```

Verify the Instrumentation in the Controller UI

See [Confirm the IoT Application Reported Data to the Controller](#)(see page 2363) to verify the instrumentation.

Correlate Business Transactions with Network Requests (Optional)

To correlate business transactions (BTs) with network requests, you need to have instrumented a business application and enabled business transactions in the Controller UI. See [Correlate Business Transactions for IoT Monitoring](#)(see page 2339) to learn more.

The steps below show you how to get the BT response headers and use them to correlate the BT with an IoT Network Request event.

1. Make a network request that includes the AppDynamics HTTP request headers ADRUM and ADRUM_1 to one of your business applications:

```
curl -H "ADRUM: isAjax:true" -H "ADRUM_1: isMobile:true" -H "Accept: application/json" -H "Content-Type: application/xml" -H "Content-Length: 0" -X GET http://<url_to_business_app>
```

2. The business application will return response headers that contain information for correlating business transactions. If you were to print these BT response headers, you would see something like the following:

```

ADRUM_0: clientRequestGUID:a27ce4da-d4e6-4bf5-bbca-9b1751aa44a4
ADRUM_1: globalAccountName:customer1_78203698-278e-428f-8726-bb381219c6cb
ADRUM_2: btId:4423
ADRUM_3: btERT:267
ADRUM_4: btDuration:368
Content-Length: 469
Server: Jetty(9.4.z-SNAPSHOT)
  
```

3. Create a beacon file `btCorrelation.json` with the returned BT response headers (only those headers that include `ADRUM_*`). You assign the returned `ADRUM_*` response headers from the network event request to the business application to the object `responseHeaders` in the beacon as shown below.

```

[
  {
    'deviceInfo':{
      'deviceId':'1111',
      'deviceName':'AudiS3',
      'deviceType':'SmartCar'
    },
    'versionInfo':{
      'hardwareVersion':'1.0',
      'firmwareVersion':'1.0',
      'softwareVersion':'1.0',
      'operatingSystemVersion':'1.0'
    },
    'networkRequestEvents':[
      {
        'url':'<url_to_business_app>',
        'statusCode':200,
        'responseHeaders':{
          'ADRUM_0':[
            '<value_returned_from_business_app>'
          ],
          'ADRUM_1':[
            '<value_returned_from_business_app>'
          ],
          'ADRUM_2':[
            '<value_returned_from_business_app>'
          ],
          'ADRUM_3':[
            '<value_returned_from_business_app>'
          ]
        },
        'timestamp':1525226857000,
        'duration':0,
        'requestContentLength':0,
        'responseContentLength':457
      }
    ]
  }
]
  
```

```
}
]
```

4. Send the beacon containing the BT headers to the EUM Server with a cURL command similar to the one here:

```
curl -I -H "Content-Type: application/json" -H "Accept: application/json" -X POST -d
@btCorrelation.json -H https://iot-col.eum-appdynamics.com/eumcollector/iot/v1/
application/<appKey>/beacons
```

5. For a successful call, the response headers should be similar to the following:

```
HTTP/1.1 202 Accepted
Cache-Control: private, no-cache, no-store, must-revalidate, max-age=0, proxy-revalidate,
s-maxage=0
Expires: 0
Pragma: no-cache
Vary: *
Transfer-Encoding: chunked
Via: 1.1 sjc12-dmz-wsa-5.cisco.com:80 (Cisco-WSA/X)
Connection: keep-alive
```

6. In the Controller UI, you should be able to [view the correlated business transaction](#)(see page 2339) in the **Device Details** dialog.

Customize the IoT REST API Instrumentation (Optional)

You can further customize the IoT instrumentation using the IoT REST API. See the [latest IoT REST API documentation](#)¹⁵¹³ or the previous versions listed below:

- <https://sdkdocs.appdynamics.com/javadocs/iot-rest-api/4.5/4.5.0/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-rest-api/4.5/4.5.1/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-rest-api/4.5/4.5.2/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-rest-api/4.5/4.5.4/>

Run the Sample Python Application

The sample Python application uses the IoT REST API to send sample data for Custom, Network Request, and Error events. The Network Request events include [correlated business transactions](#)(see page 2359). The data mocks a smart car application, capturing usage information, network performance, and errors.

To run the sample app, follow the instructions given in the GitHub repository [iot-rest-api-sample-apps](#)¹⁵¹⁴.

Troubleshoot the IoT REST API Instrumentation

The sections below provide instructions for troubleshooting your IoT REST API Instrumentation.

Verify Your IoT App Has Been Enabled

Using your App Key, verify that your IoT app has been enabled:

¹⁵¹³ <https://sdkdocs.appdynamics.com/javadocs/iot-rest-api/4.5/latest/>

¹⁵¹⁴ <https://github.com/Appdynamics/iot-rest-api-sample-apps>

```
curl -v -X GET https://iot-col.eum-appdynamics.com/eumcollector/iot/v1/application/<appKey>/enabled
```

If your App Key has been enabled, you should get the following response:

```
< HTTP/1.1 200 OK
< Cache-Control: private, no-cache, no-store, must-revalidate,
max-age=0, proxy-revalidate, s-maxage=0
< Date: Sat, 19 Aug 2017 01:20:39 GMT
< Expires: 0
< Pragma: no-cache
< Vary: *
< Content-Length: 0
< Connection: keep-alive
```

If the App Key does not exist:

```
< HTTP/1.1 403 Forbidden
```

Validate Beacons

You can use the validate beacon endpoint (/validate-beacons) to verify that the beacon's JSON request body complies with the [REST API schema](#).

i You are not required or recommended to validate beacons before transmitting them. You should only use this endpoint in development for testing and troubleshooting.

In this cURL example, you are verifying that the JSON given in the file testBeacon.json is valid. Replace <appKey> with your EUM App Key.

```
curl -v -X POST -d '@testBeacon.json' https://iot-col.eum-appdynamics.com/eumcollector/iot/v1/application/<appKey>/validate-beacons
```

If the JSON request body containing the beacon data is valid, the IoT Monitoring REST API will return the HTTP Status 200:

```
HTTP/1.1 200 OK
```

If the JSON request body is invalid, the IoT REST API will return the HTTP Status 422 and a response body with the description of the error message.

< HTTP/1.1 422 Unprocessable Entity

Verify Timestamps

When you create the JSON body and replace the values for the timestamp properties, make sure the timestamps are in milliseconds, not seconds.

Confirm the IoT Application Reported Data to the Controller

Related pages:

- [Instrument Applications with the IoT C/C++ SDK](#)(see page 2341)
- [Instrument Applications with the IoT Java SDK](#)(see page 2348)
- [Instrument Applications with the IoT REST APIs](#)(see page 2356)

From the **Getting Started Wizard**, you will see your device listed in the table after the IoT application has reported data to the Controller.

If you left the **Getting Started Wizard**, you can always verify the IoT application has been enabled and reported data by doing the following:

1. In the Controller UI, open **User Experience > Connected Devices**.
2. Check the list of registered connected device applications to verify that the application is registered with the Controller. You can also use view some basic information about the app such as the number of

devices, total events, and network request information.

The screenshot shows the 'User Experience' dashboard with the 'Connected Devices' tab selected. It displays a table with the following data:

Name	Devices	Total Events	Network Requests	Avg Network Request Duration...
SmartCar	1	110	27	149
Oculus Go	0	0	0	0
Movie Ticket Kiosk	13	177,978	0	0
Movie Ticket Kiosk V2	13	356,997	119,184	1,914

3. Start monitoring your application. See [Configure IoT Application Monitoring](#)(see page 2373).

Monitor Applications with the IoT Dashboards

IoT Monitoring provides you with three dashboards to view and analyze the performance and usage of your application. Each dashboard provides you with a different aspect of your application's performance. Within each dashboard, you can view data visualized as widgets or detailed records or create custom widgets based on your chosen parameters.

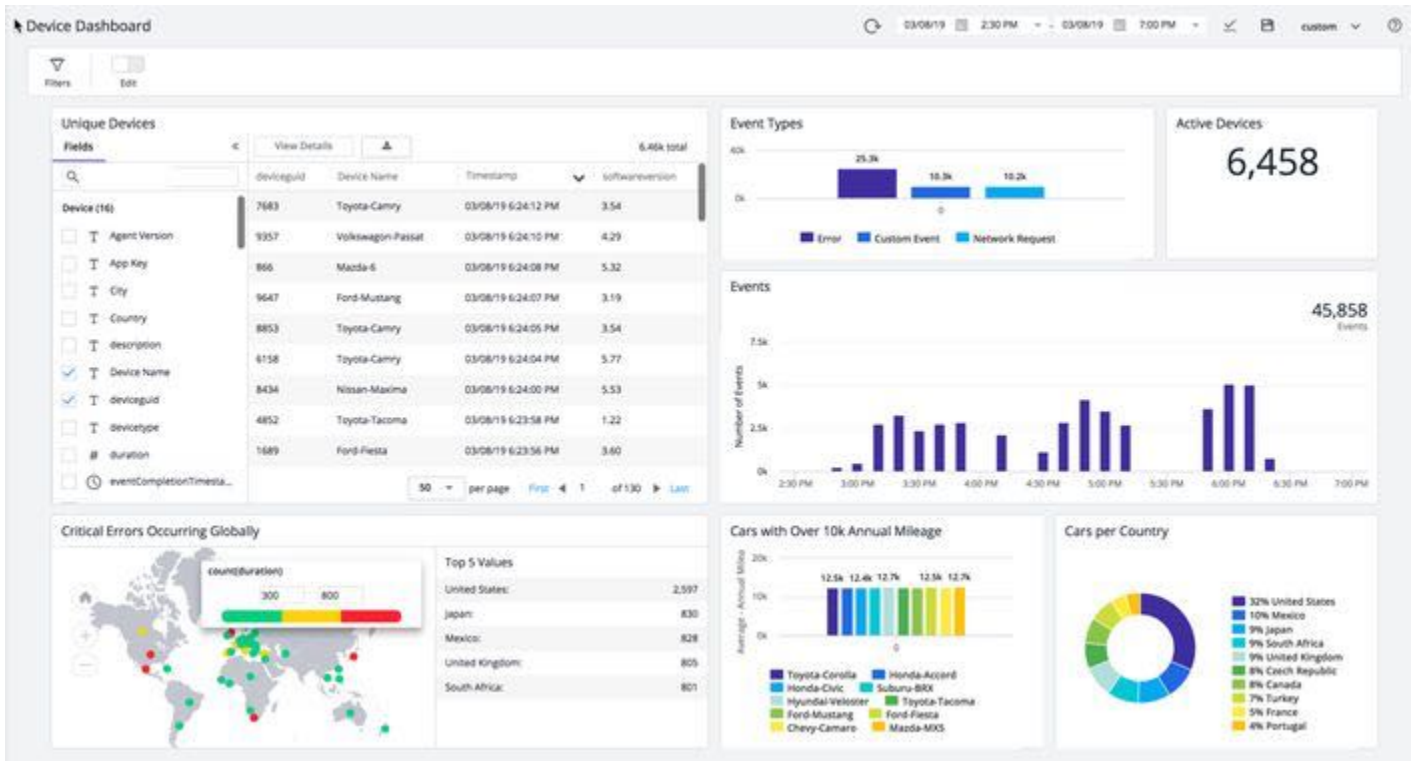

The page introduces the features, functionality, and goal of each of these dashboards:

- [Device](#)(see page 2364)
- [Network Request](#)(see page 2365)
- [Error](#)(see page 2366)

Device Dashboard

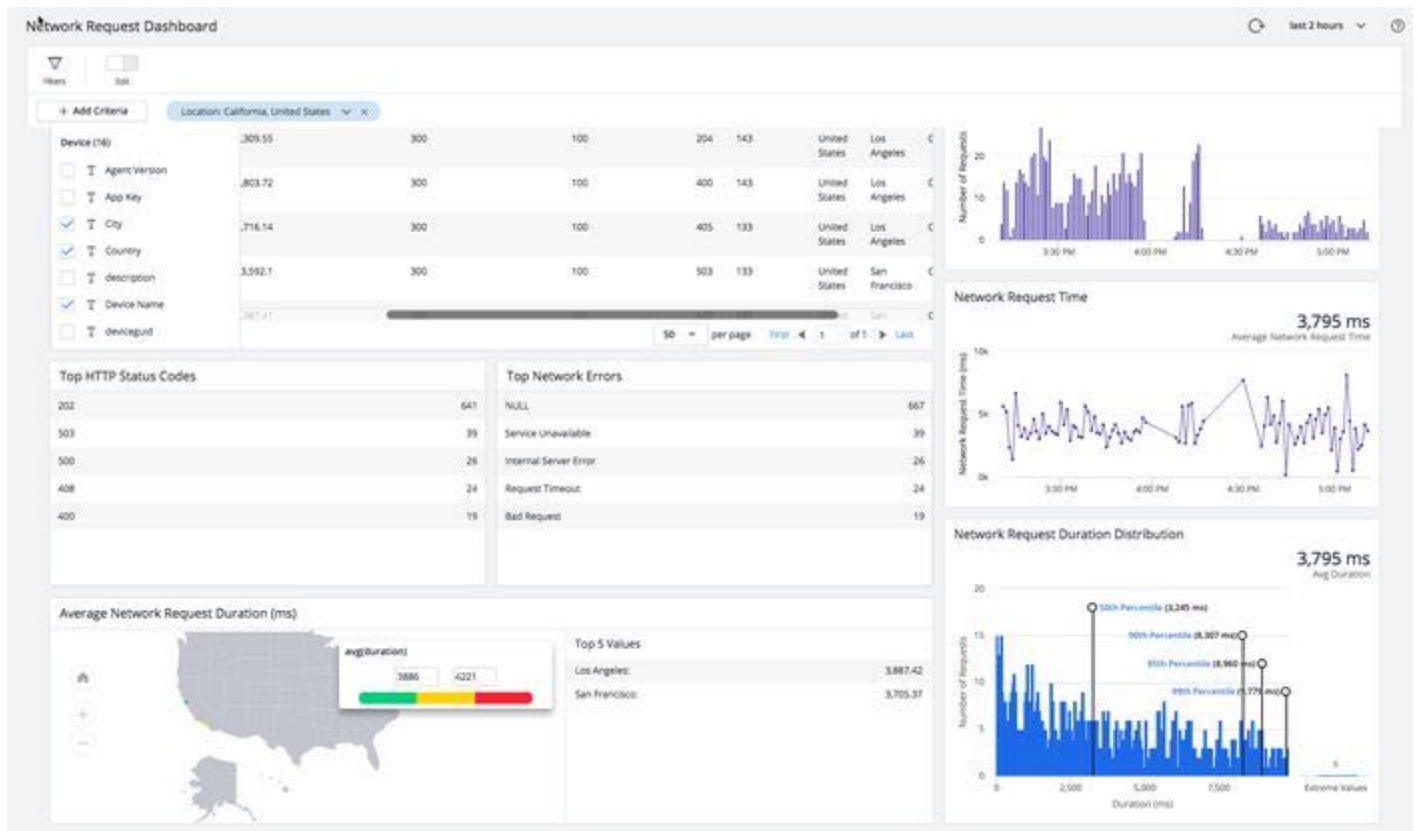

The **Device Dashboard** enables you to monitor your device status, custom information, and custom device application information. You can view summary activity or use filters to drill down to view metrics for a specific device.

Using the **Device Dashboard**, DevOps can ensure that devices are up and running, product managers and business stakeholders can examine device activity and trends, and developers can drill down into results to identify issues affecting single or multiple devices.

Network Request Dashboard

The **Network Request Dashboard** enables you to view outgoing network requests, network request details, and analyze network requests.

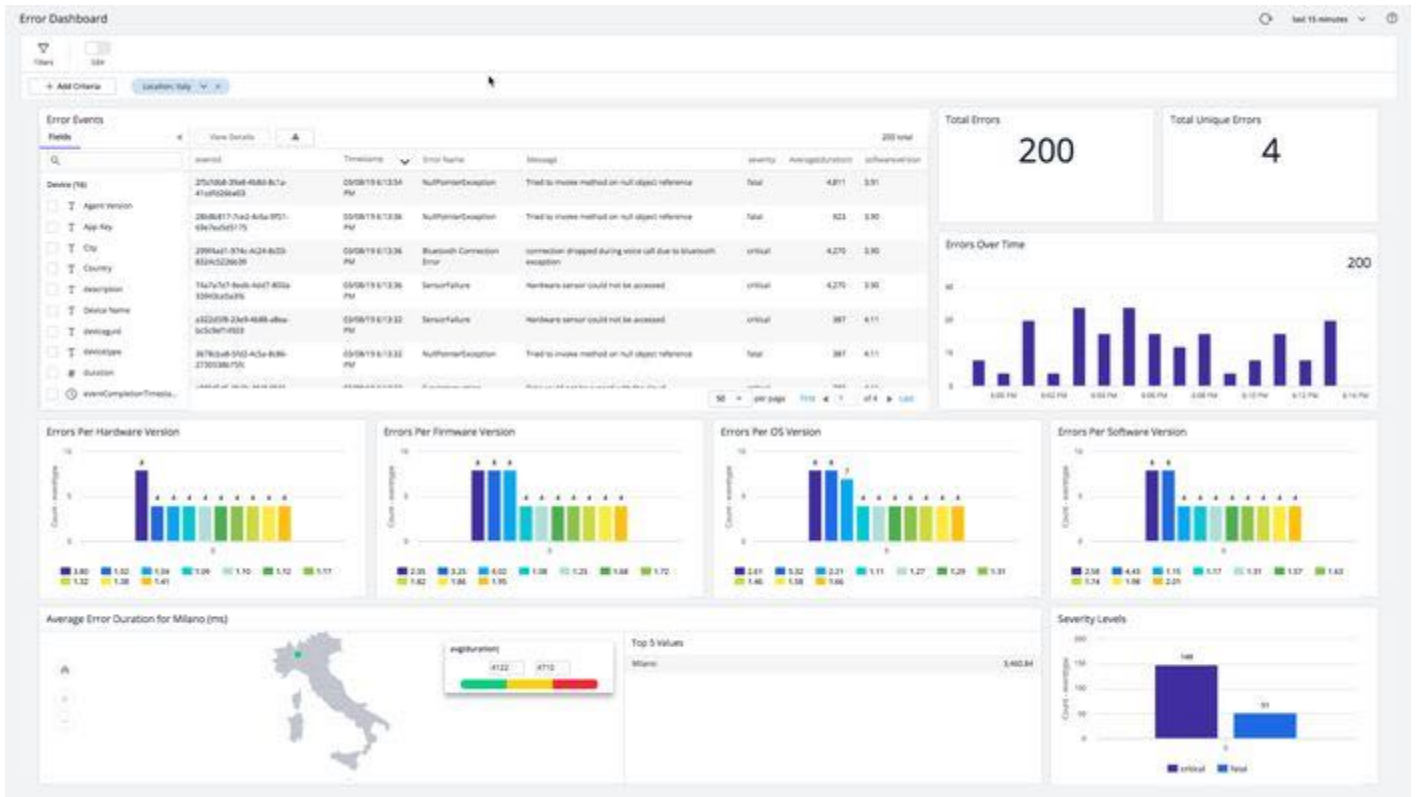

With the **Network Requests Dashboard**, you can:

- Check the availability of a device or service
- Discover slow network requests
- View failed network requests
- Analyze and sort network requests by criteria such as status code, app version, and so on
- Monitor network traffic over time

Error Dashboard

The **Error Dashboard** enables you to view crashes, exceptions, and custom errors, both fatal and non-fatal. DevOps can monitor activity list and notify developers of error events. The developers can select the error event to view details and download the stack trace for debugging.

i The stack trace will only be available if it is reported with the IoT SDKs or through the IoT REST API.

With the Error Dashboard, you can:

- Discover new errors
- Assess the scope and impact of errors, such as how many devices are affected, what type of devices are affected, and how seriously affected are the devices.
- Monitor error patterns
- Download stack traces of errors to debug code
- Discover broken devices (failed hardware)

How to Use IoT Dashboards

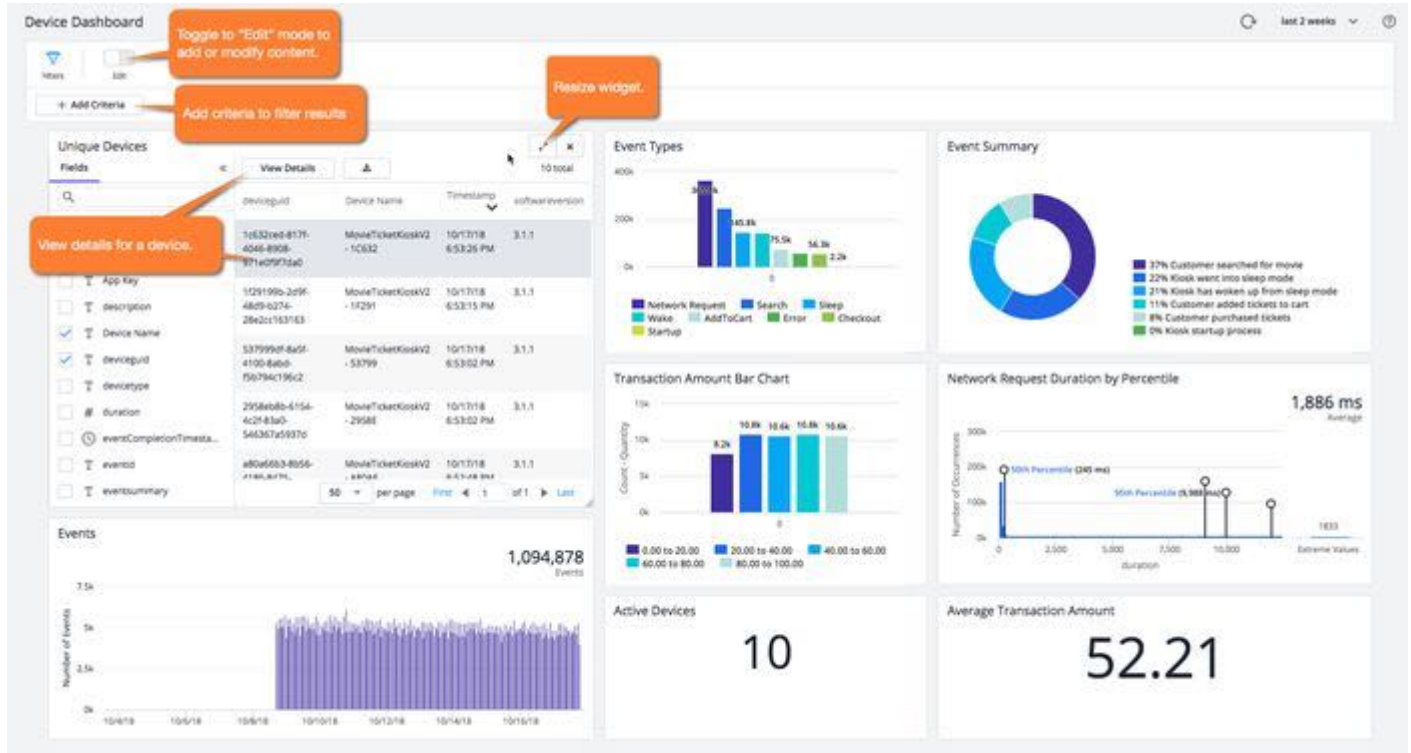

Although each dashboard presents different information, they all have the same UI functionality and features. This page provides an overview of the dashboard functionality to help you get started monitoring your devices.

Access the IoT Dashboards

1. Open the application you want.
2. Select one of the dashboards to view:
 - **Devices**
 - **Network Requests**
 - **Errors**

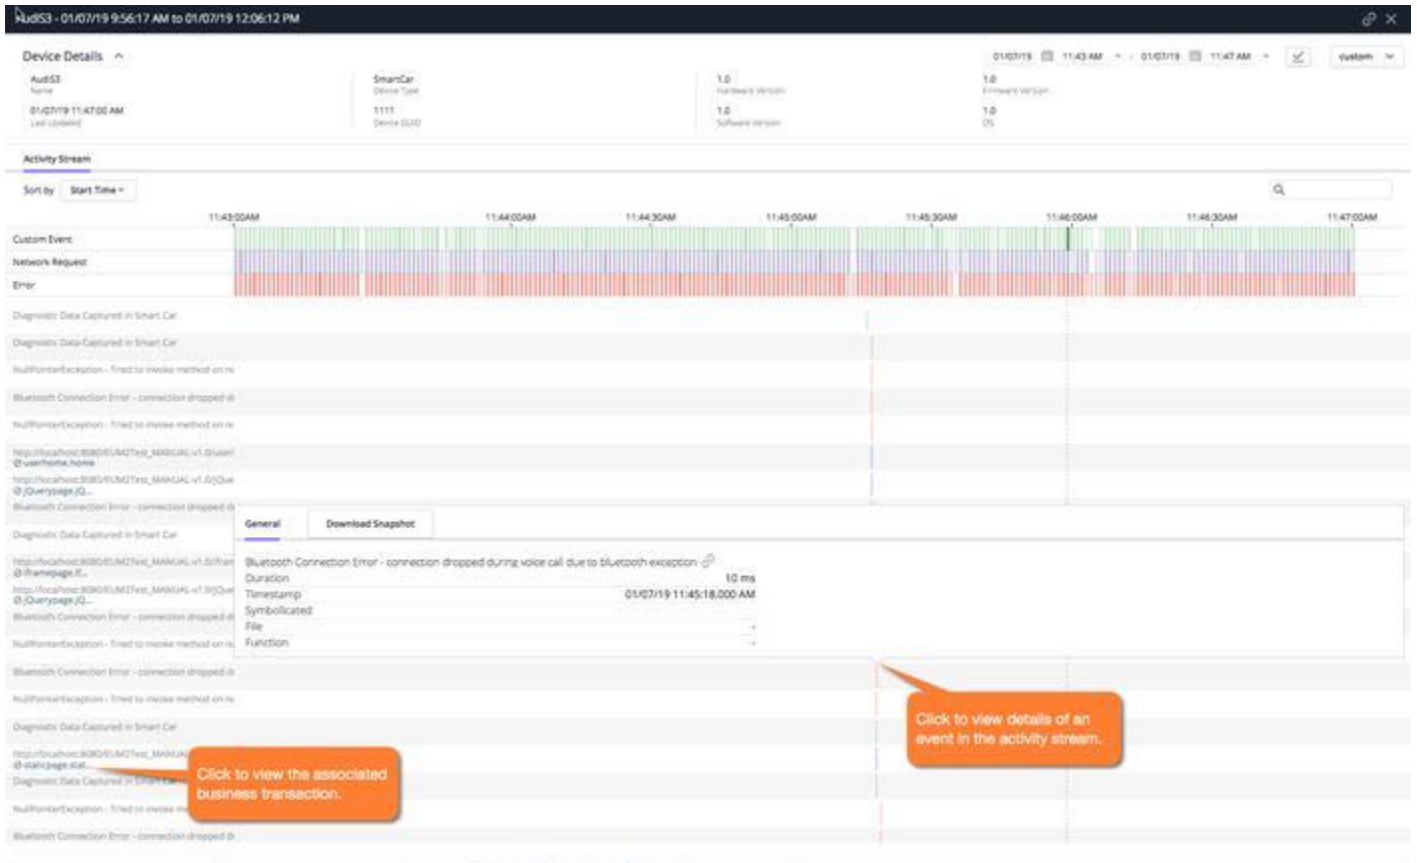

View Dashboard Summaries

From each dashboard, you can view aggregated data in predefined and custom widgets. Each dashboard is in view mode by default, so data is read-only, although you can set filters, view details, and resize widgets.

View Details

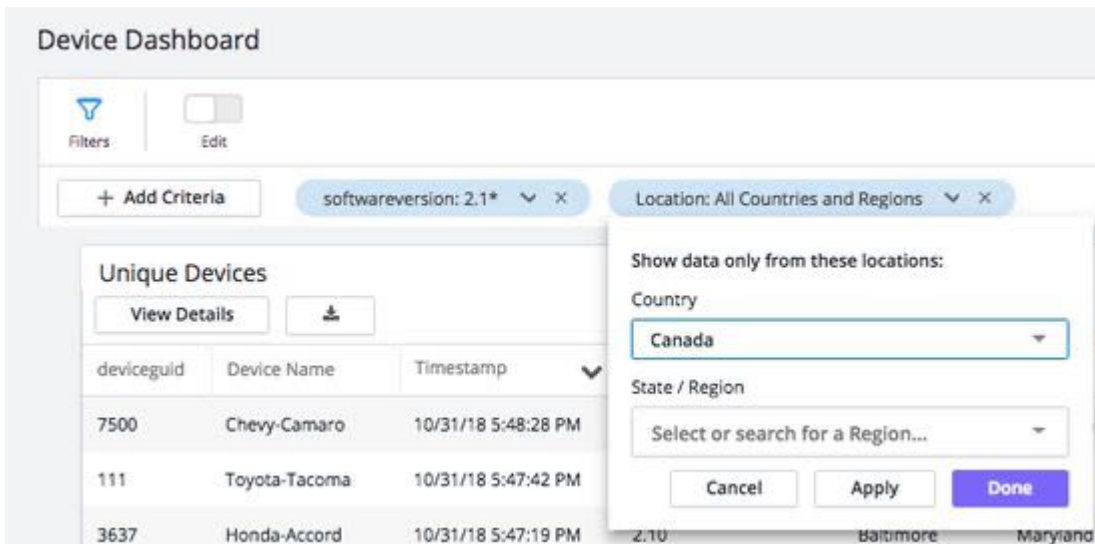

To view details, you select a row in one of the tables and click the **Details** icon. The **Device Details** dialog displays. You can view when the three types of events (Custom Event, Network Request, and Error) occurred on the timeline, or by duration. You can also click on the event bar in the waterfall for more details.

Filter Results

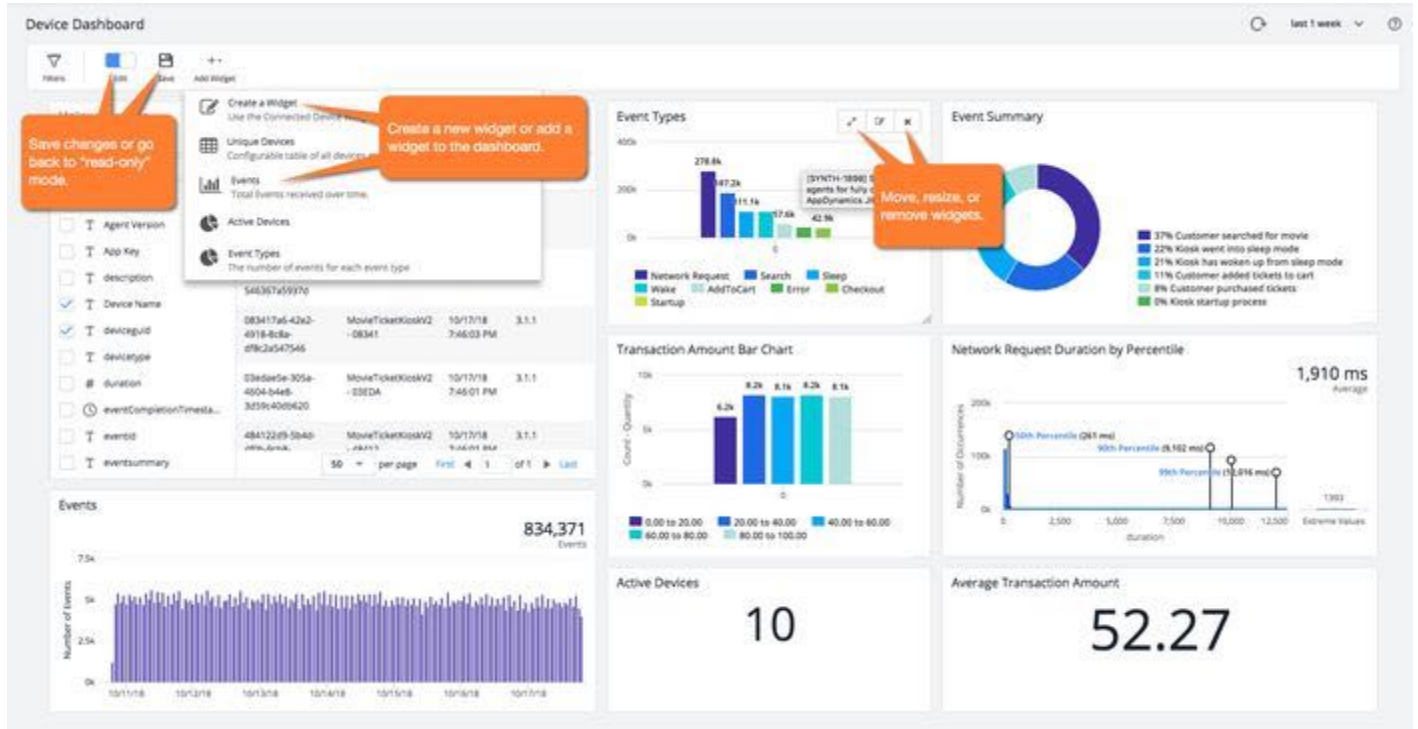

You can filter results by adding criteria. This enables you to focus on factors affecting availability, usage, and performance.

In this screenshot, the criteria **softwareversion** and **Country** are added, which could potentially home in on performance issues caused by a particular software version in a particular country.

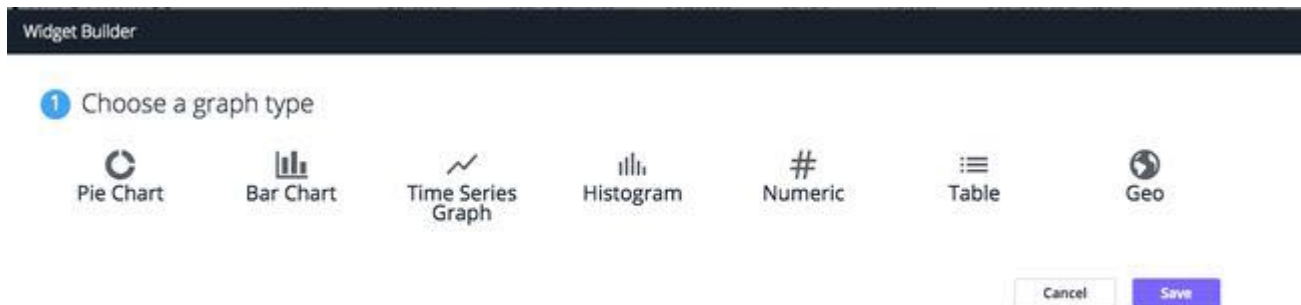

Modify Content and Presentation

To modify the dashboard, you need to be in **Edit** mode. You simply change the toggle to **Edit**, and then you'll be able to add, move, resize, remove, and even create widgets.

Build Custom Dashboard Widgets

Each dashboard has predefined widgets for basic monitoring, but because there are so many different devices and platforms, you will need to create custom widgets with the **Widget Builder**, which guides you through the creation of a widget. This page provides guidance for selecting graph types and using filters when you create widgets.

How to Access the Widget Builder

1. Select a dashboard.
2. Change to **Edit** mode.
3. From the toolbar, click **Add Widget**.
4. From the dropdown, click **Create a Widget**.

Choose the Best Graph Type

The **Widget Builder** allows you to choose from one of six types of graphs, you should try to use the best graph for your data set. The following is a guideline for choosing the graph type:

Graph Type	Graph Properties	Use Case(s)
Pie Chart	<ul style="list-style-type: none"> Field Subfield Filters Name 	<p>Use pie charts to compare parts of a whole.</p> <p>Examples:</p> <ul style="list-style-type: none"> For a retail device, the percentage of sales for each store. For a fitness device, the percentage of different types of activities such as running, bicycling, walking.
Bar Chart	<ul style="list-style-type: none"> Field Subfield Filters Name 	<p>Use bar charts to compare different items within the same category.</p> <p>Examples:</p> <ul style="list-style-type: none"> For an inventory device, the number of items per store. For a smart car, the mileage of different cars.
Time Series	<ul style="list-style-type: none"> Field Filters Name 	<p>Use a time series to measure events over time.</p> <p>Examples:</p> <ul style="list-style-type: none"> network errors sales
Histogram	<ul style="list-style-type: none"> Field Filters Name 	<p>Use histograms to analyze and understand the distribution of large sets of numerical data.</p> <p>Examples:</p> <ul style="list-style-type: none"> The distribution of network request duration. For a smart home device, the distribution of temperatures.
Number	<ul style="list-style-type: none"> Field Filters Name 	<p>Use a number graph to highlight an important data point.</p> <p>Examples:</p> <ul style="list-style-type: none"> active devices sales total network errors

Graph Type	Graph Properties	Use Case(s)
Table	<ul style="list-style-type: none"> • Field • Filters • Name 	<p>Use a table to view detailed data for a list of similar items.</p> <p>Examples:</p> <ul style="list-style-type: none"> • customers • network requests • devices
Geo	<ul style="list-style-type: none"> • Field • Filters • Name 	<p>Use the Geo widget to analyze and understand performance across geographic areas.</p> <p>Examples:</p> <ul style="list-style-type: none"> • Sales in different countries, regions, and cities • Network request durations across countries, regions, and cities • Device errors in different countries, regions, and cities

How to Use Filters

Filters enable you to narrow your results to meaningful information. For example, suppose you wanted to see the total number of items sold at each store, but you were particularly interested in those more expensive items. You could choose a bar graph and use the field **Device Name** and the subfield **Annual Mileage** with the filter **Location: Quebec, Canada** to view the average annual mileage of cars in Quebec, Canada, as shown in the example widget:

Widget Builder ✕

5 Choose a Name

Name:

Visualization

Car Model	Average Annual Mileage (k)
Subaru-BRX	7.8k
Mazda-MX5	6.5k
Toyota-Tacoma	8.8k
Mazda-C3	8.0k
Honda-Accord	8.0k
Ford-Fiesta	7.4k
Ford-Mustang	6.6k
Fiat-Abarth500	7.7k
Honda-Civic	7.2k
Hyundai-Veloster	7.7k

Cancel Save

Configure IoT Application Monitoring

In addition to enabling and disabling **IoT Monitoring**, you can also configure the display names of network requests and exclude network requests matching given criteria from being monitored.

You can:

- Use the AppDynamics default naming rule, which you can leave as is or modify.
- Disable/modify the default naming configuration.
- Create custom include rules to override the default convention.
- Create custom exclude rules to exclude from monitoring network requests that meet certain criteria.

Access the IoT App Configuration

To access connected device configuration:

1. Open the IoT application you want.
2. From the left-hand navigation menu, click **Configuration**.

Enable/Disable IoT Monitoring

From the **Configuration** page, toggle the **Connected Device Monitoring** switch to **ON** to enable monitoring or **OFF** to disable monitoring.

Connected Device Configuration

Connected Device Monitoring ON App Key: XXXXXXXXXX

Network Requests

Save

Exclude Rules First, exclude the Network Request if any of the following are true:

Add

Name	Enabled	Summary
Click the Add button to add a new rule		

Include Rules Then, evaluate these rules in this order to name and monitor the Network Request: ⓘ

Add

Name	Enabled	Summary
Default Naming Confi...	✓	Name the Network Request using: Full-Domain; first 2 segments of the URL.

Save

Name IoT Network Requests

The following sections show you how to modify the default naming configuration for network requests and create include naming rules for network requests.

Access Network Requests Rules

From the **Configuration** page, click the Monitor tab if it's not selected already.

Default Network Request Naming Configuration

By default, AppDynamics names network requests using:

- Hostname
- First two segments of the URL

For example, if an application makes this HTTP request: `http://myapp.com/friends/profiles/12345`

The default name that is displayed in the Controller UI for that request is: `myapp.com/friends/profiles`

If this is adequate for your needs, you can leave the default as is. The naming rules you configure here apply to all the IoT applications that are in the same IoT App Group.

Modify the Default Naming Configuration Rule

You may want to configure a different default rule for naming your network requests to help you visualize the parts of your application more clearly. The task is similar to configuring naming rules for business transactions on the server side. Try to group logically related requests together while keeping unrelated requests in separate groups.

- If the default hostname and first two segments of the URL for all your requests are identical, you might want to name the requests based on the last segments or a selection of non-contiguous segments of the URL to distinguish among requests in the network requests list.
- You can also name the requests based on query parameters. For example, if the request passes an order number, you could specify that the value of the `order-number` query parameter is used in the network request name.
- You can also base the name on a regular expression run on the URL. AppDynamics uses the Java libraries for regular expressions. See:
 - Tutorial: <http://download.oracle.com/javase/tutorial/essential/regex/index.html>
 - Javadoc: <http://download.oracle.com/javase/1.5.0/docs/api/java/util/regex/Pattern.html>

Modify the Default Network Request Naming Rule

The default configuration covers how all your requests are named if you do not customize them further.

1. From the **Network Request** tab, scroll down to the **Include Rules** section.
2. Double-click **Default Naming Configuration**.
3. In the **Include Rule** dialog, select the elements you want to use for your default network request naming.
4. Click **OK**.
5. Click **Save**.

Create IoT Network Request Include Rules

By default, the same request naming rule is applied to every URL that your application requests. If you want to apply different naming rules to different URLs, create include rules.

For example, if some requests call your own in-house server and others call out to a third-party API, you may want to see all the third-party API calls as one network request and use the default naming rules for the calls to your own server. You would create a custom naming rule that matches the third party calls and uses only the host in the default rule name or perhaps also include certain query parameters.

Creating an Include Rule

1. From the **Network Request** tab, scroll down to the **Include Rules** section.
2. Click **Add**.
3. In the **Include Rule** dialog, enter a name for the custom rule that you are creating.
4. Check the **Enabled** checkbox to enable the rule.
5. Select the checkboxes and radio buttons and enter the match criteria for AppDynamics to use to name network requests.
6. Click **OK**.

Sample Include Rule

The following rule creates a custom match rule for requests in which the URL contains "inventory". This rule uses the protocol, the subdomain and the third and fourth segments of the URL in the network request name.

Include Rule
✕

Enabled

Rule Name

Criteria
 This Include Rule applies to any URL that

Name Pages

Show Protocol (Ex: http, https, etc)
 Show Domain (Ex: mywebsite.com)
 Show Full Domain Show Sub-domain

Path Segments
 Don't use path segments
 Use first segments
 Use last segments
 Use segment numbers

Query String Parameters to use in Page Name (Optional)

What part of anchor should be used in Page Name
 Don't use the anchor
 Use first segments
 Use last segments
 Use segment numbers

You can temporarily cancel the application of a custom naming rule by clearing the **Enabled** checkbox in the custom rule configuration. In this case, the default naming rule is applied to requests that would have been named by the disabled custom rule. To remove the rule permanently, select the custom rule in the **Custom Naming Rules** list and click the **Delete** icon.

Exclude IoT Network Requests

If there are certain types of requests that you do not want to monitor, create custom exclude rules for them based on the URL and/or the application name. Excluded network requests are not reported or counted toward the network request limit of 500 requests per controller application.

Create an Exclude Rule

1. From the Network Request tab, scroll down to the **Exclude Rules** section.
2. Click **Add**.
3. In the **Exclude Rule** dialog, enter a name for the exclude rule that you are creating.
4. Check the **Enabled** checkbox to enable the rule.
5. Select the check boxes and radio buttons and enter the match criteria for AppDynamics to use to name network requests.
6. Click **OK**.

You can temporarily cancel the application of an exclude rule by clearing the **Enabled** checkbox in the exclude rule configuration. To remove the rule permanently, select the exclude rule in the **Exclude Rules** list and click the **Delete** icon.

Change Priority of Rules

Rules are evaluated in the order that they appear in the include or exclude list. You can change the priority of the rules by dragging and dropping rules towards the top (higher priority) or towards the bottom of the list (lower priority). Custom rules are always evaluated before the default naming rule, beginning with the custom rule that has the highest priority.

Your IoT app may make various kinds of network requests, and not all of them may be equally important to monitor in detail. For example, any requests to [Google Analytics](#)¹⁵¹⁵ that your app may make are useful but probably aren't as important to analyze as the requests it makes to your backend.

To manage the impact on your overall Events Service usage, you can create rules which specify which of these network requests should be sent on to the Event Service, either by excluding a request entirely, including a particular request or a sample of that request types by percentage, or by simply allowing the request to be sent on.

In general, the behavior follows this pattern:

- If no rules are specified, data on all network requests are sent on.
- If exclude rules are specified, and a network request satisfies a rule, that data is *not* sent on.
- If include rules are specified, any network request that satisfies a rule is sent on, based on sampling defined by the percentage indicated in the rule.
- If both include and exclude rules are specified, a network request that satisfies an include rule but does *not* satisfy an exclude rule is sent on.

IoT Custom Geo Mapping

By default, IoT Monitoring uses public geographic databases to resolve external IP addresses to geolocations. You can instead use IoT custom geo mapping to map internal IP addresses to geolocations for your IoT applications.

With custom geo mapping, you can monitor the performance of devices running in Virtual Private Clouds (VPCs) with internal addresses distributed across different geographies.

Methods to Map IP Addresses

You can map one IP address, a range of IP addresses, or multiple IP addresses with a subnet mask to one geolocation, giving you a wide range of control over how to map internal IP addresses to geographic locations.

Scope of Custom Geo Mapping

You can only use custom geo mapping in SaaS Controllers. You can provide one custom geo mapping for each app key. Each app key can include multiple applications, enabling them to use the custom geo mapping.

¹⁵¹⁵ https://www.google.com/analytics/analytics/#?modal_active=none

Geo Mapping File

The geo-mapping file is an XML file used to map IP addresses to geolocations. You upload this file to the Controller for your IoT application.

File Specification

The geo-mapping file size is limited to 1 GB, but there is no limit to the number of mapped IP addresses.

Default Mapping

If you upload a custom geo-mapping file, IoT Monitoring will only resolve the IP addresses based on your mapped IP addresses and locations. Thus, if you are going to use a custom geo-mapping file, you should configure the default to cover the entire IP range.

IP Addresses and Ranges

You can only specify IPv4 addresses in the custom geo-mapping file.

When using IP address ranges, you must list the addresses in ascending order. For example, if your geo-mapping file specifies the two ranges 1.1.1.1–2.2.2.2 and 2.2.2.2–3.3.3.3, you must list the first range before the second so that they are in ascending order.

Example Geo Mapping Files

The example geo-mapping files below show you the scope of mapping geolocations and provide a general use case for each.

[Single Addresses](#) [Ranges](#) [IP Masking](#)

The simplest configuration maps one IP address to one geolocation.

```
< mappings >
  < mapping >
    < ip-range from="192.168.123.0" to="192.168.123.0" />
    < location country="United States" region="California" city="San Jose" />
  < /mapping >
  < default country="United States" region="California" city="San Francisco" />
< /mappings >
```

[Single Addresses](#) [Ranges](#) [IP Masking](#)

It's more common for a range of IP addresses to represent one geolocation. You can use the range attribute to specify a range of IP addresses.

```
< mappings >
  < mapping >
    < ip-range from='192.168.1.1' to='192.168.1.255' />
    < location country='USA' region='CA' city='Walnut Creek' />
  < /mapping >
```

```
<default country='USA' region='NY' city='New York'/>
</mappings>
```

Single Addresses Ranges [IP Masking](#)

If you have a limited number of IP addresses, you can maximize the network connections by using IP subnet masking to split one IP address into many.

```
<mappings>
  <mapping>
    <subnet from="192.168.1.1" mask="255.255.255.0"/>
    <location country="United States" region="California" city="San Francisco"/>
  </mapping>
  <default country='China' region='Zhejiang' city='Hangzhou'/>
</mappings>
```

Geo Mapping File XML Schema

You can download the XML schema file [custom-geo-mapping.xsd](#) below to validate your geo-mapping XML file.

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<xs:schema version="1.0" xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="mappings" type="config"/>
  <xs:element name="ip-range" type="explicitIpAddressRange"/>
  <xs:element name="subnet" type="subnetIpAddressRange"/>
  <xs:complexType name="config">
    <xs:sequence>
      <xs:element name="mapping" type="mapping" minOccurs="0" maxOccurs="unbounded"/>
      <xs:element name="default" type="geoLocation" minOccurs="0" maxOccurs="1"/>
    </xs:sequence>
  </xs:complexType>
  <xs:complexType name="mapping">
    <xs:sequence>
      <xs:choice>
        <xs:element ref="ip-range"/>
        <xs:element ref="subnet"/>
      </xs:choice>
      <xs:element name="location" type="geoLocation" minOccurs="1"/>
    </xs:sequence>
  </xs:complexType>
  <xs:complexType name="geoLocation">
    <xs:attribute name="country" type="xs:string" use="required"/>
    <xs:attribute name="region" type="xs:string" use="required"/>
    <xs:attribute name="city" type="xs:string" use="required"/>
  </xs:complexType>
  <xs:complexType name="explicitIpAddressRange">
```

```
<xs:attribute name="from" type="xs:string" use="required"/>
<xs:attribute name="to" type="xs:string" use="required"/>
</xs:complexType>
<xs:complexType name="subnetIpAddressRange">
  <xs:attribute name="from" type="xs:string" use="required"/>
  <xs:attribute name="mask" type="xs:string" use="required"/>
</xs:complexType>
</xs:schema>
```

Upload Geo Mapping Files

From your SaaS Controller, you can perform the following actions with your custom geo-mapping file:

- - [Upload New Geo Mapping File](#)(see page 2380)
 - [Overwrite Existing Geo Map File](#)(see page 2380)
 - [Reset Geo Map File](#)(see page 2381)

Upload New Geo Mapping File

1. Navigate to the **Configuration > Custom GeoMap**.
2. From the **Upload Custom GeoMap file** dialog, click **Choose File**.
3. Select a geo-mapping XML file.
4. Click **Upload**.
5. If the upload was successful, you should see the following confirmation.

6. If you see the following error message, see [Troubleshooting the Geo Map File](#)(see page 2381).

i After you have uploaded the geo-mapping file, it may take some time for IoT Monitoring to apply the new custom mapping to your applications.

Overwrite Existing Geo Map File

1. Navigate to the **Configuration > Custom GeoMap**.
2. From the **Upload Custom GeoMap file** dialog, click **Overwrite Current Mapping**.
3. Select a geo-mapping XML file.
4. Click **Upload**.
5. If the upload was successful, you should see the following confirmation.

- If you see the following error message, see [Troubleshooting the Geo Map File](#) (see page 2381).

Reset Geo Map File

- Navigate to the **Configuration > Custom GeoMap**.
- From the **Upload Custom GeoMap file** dialog, click **Reset to Default**.
- From the **Reset Confirmation** dialog, click **Reset**.

View Custom Geo Locations

You can add the **Geo** widget to one or more of the available dashboards to view the geolocation information of your devices. The Geo widget will display geo locations resolved with the public geographic databases or a custom IP address mapping. To view the geolocations from the **Device Dashboard**:

- From your IoT application, navigate to **Devices**.
- Scroll down to the **Geo** widget.
- (Optional) Build a custom **Geo** widget. You can filter the devices by geodata such as city, region, or country.

In addition, you can filter data in the other widgets by geodata based on your geo-mapping file.

Troubleshooting the Geo Map File

Upload Issues

If you get an error message trying to upload the custom geo-mapping file, check the following:

- XML validity: Use an XML validation tool to determine if your XML of your geo-mapping file is valid.
- XML schema: Confirm that your custom geo-mapping file conforms to the XML schema.
- Invalid IP addresses: Confirm your IP addresses are valid.
- File size: Confirm that the custom geo-mapping file is less than 1 GB.

Incorrect Geo Mapping

If IP addresses are not being resolved to the correct geolocations, confirm that the IP addresses and geolocations in your geo-mapping file are correct.

Database Visibility

Database Visibility in AppDynamics provides end-to-end visibility on the performance of your database, helps you troubleshoot problems such as slow response times and excessive load, and provides metrics on database activities, such as:

- SQL statements or stored procedures that are consuming most of the system resources
- Statistics on procedures, SQL statements, and SQL query plans
- Time spent on fetching, sorting, or waiting on a lock
- Activity from the previous day, week, or month

Installation And Administration

Overview of Database Visibility

Related pages:

- [Add Database Collectors](#)(see page 2415)
- [Database Visibility](#)(see page 2381)

Database Visibility provides metrics on the performance of your database and helps troubleshoot performance-related issues.

Components of Database Visibility

AppDynamics Database Visibility consists of four main components:

- Database Agent
- Collector
- Tenant
- Events Service

Database Agent

The AppDynamics Database Agent is a standalone Java program that collects performance metrics about your database instances and database servers. You can deploy the Database Agent on any machine running Java 1.8 or higher. The machine must have network access to the AppDynamics Tenant and the database instance that you want to be monitored.

A database agent running on a typical machine with 16 GB of memory can monitor about 25 databases. On larger machines, a database agent can monitor up to 200 databases. To monitor more than 100 databases, increase the initially allocated heap size for the Database Agent JVM. See [Database Visibility Supported Environments](#)¹⁵¹⁶

¹⁵¹⁶ <https://docs.appdynamics.com/display/PRO45/Database+Visibility+Supported+Environments>

Collector

The Database Agent Collector is the process that runs within the Database Agent to collect performance metrics about your database instances and database servers. One collector collects metrics for one database instance. Multiple collectors can run in one Database Agent.

AppDynamics Database Visibility detects when a database back end has matching credentials with a database server being monitored by a collector. Database Visibility automatically associates the back end with the collector, so you can view its performance with the Application Flow Map, Tier Flow Map, or Node Flow Map.

Tenant

The [Tenant](#) (see page 92) is the central interface where you can see all your database instances and database server performance metrics.

The following types of information are sent to the Tenant:

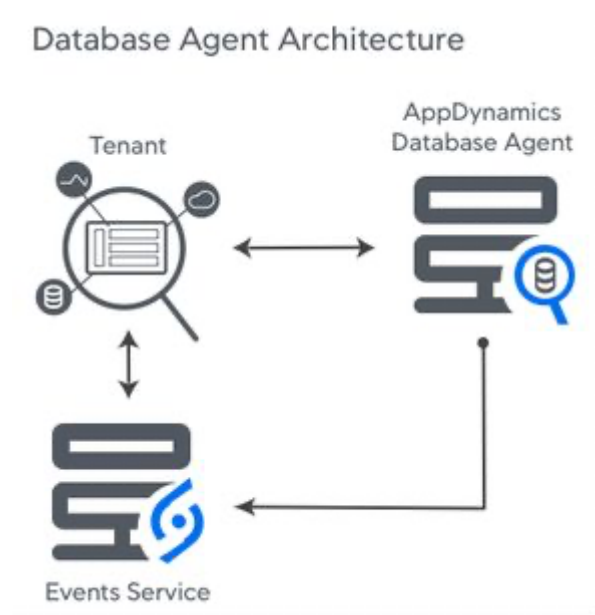

- Database-level metrics, such as the number of queries processed and other database statistics.
- Names and attributes of all sessions, clients, queries, and other objects on the monitored system.

Events Service

Events Service stores high volumes of metric data.

The following types of information are sent to the Events Service:

- The time that each query spends at each wait state.
- Individual query statistics for databases that support it.
- Information about individual execution plans in databases that support it.

Database Visibility Supported Environments

Related pages:

- [Add Database Collectors](#)(see page 2415)
- [Database Visibility](#)(see page 2381)

This page describes the application environments and versions supported by the Database Visibility Agent.

Database Visibility Support

Once Database Visibility is available, you can create collectors that run on the Database Agent to monitor any of these systems:

Database	Supported through Amazon RDS	Version
Apache Cassandra		>= 3.11.4
Datastax Enterprise (DSE) Cassandra		>= 6.7.3
Couchbase		>= 4.5
IBM DB2 LUW		9.x, 10.x, 11.x
MongoDB, MongoDB cluster		>= 2.6
MySQL	Yes	All versions including MySQL Version 8.0, Percona, MariaDB, and Aurora
Microsoft SQL Server	Yes	2005, 2008, 2012, 2014, 2016, 2017, 2019, and SQL Azure
Microsoft SQL Server on Linux		SQL Server on Linux is currently available as a public preview and is not recommended for production use. Database Visibility works well with this preview release, but monitoring results may vary until a stable version of SQL Server on Linux is available.
Oracle, Oracle RAC	Yes	10g (>= 10.2), 11g, 12c, 18c, and 19c
PostgreSQL	Yes	All the versions including Azure Database for PostgreSQL and Aurora
Sybase ASE		>= 15
Sybase IQ		All versions

Operating System	Version
Windows	64-bit i From 20.5 release, 32-bit is unsupported.
Linux	32-bit and 64-bit
Solaris	All versions
AIX	>= 6.1
Amazon RDS	All versions

To avoid metric value errors, use a 64-bit JRE with the 64-bit operating system.

i Recommended

If you use a third-party application along with Database Visibility to monitor Sybase, the data displayed in the controller may not display correctly. For accurate metrics, do not use both a third-party application and Database Visibility to monitor Sybase.

Database Visibility System Requirements

This page describes the hardware and software requirements using Database Visibility.

Hardware Requirements

Hardware requirements vary depending on database activity. If your database activity increases, you may need to adjust your hardware configuration.

The machine running the Database Agent should meet the following hardware requirements:

- 1 GB of heap space and an additional 512 MB of heap space for each monitored database instance. For less busy databases, you may reduce the heap space to 256 MB per monitored database instance.
- 2 GHz or higher CPU.

i Database Instance

A Database instance can be a node in the Oracle RAC, MongoDB, Couchbase cluster, standalone-collector, or a sub-collector.

This table shows sample calculations for heap space allocation:

Number of Database Instances Monitored	Heap Space Allocation
5	(5 x 512 MB) + 1024 MB = 3,584 MB

Number of Database Instances Monitored	Heap Space Allocation
20	$(20 \times 512 \text{ MB}) + 1024 \text{ MB} = 11,264 \text{ MB}$
100	$(100 \times 512 \text{ MB}) + 1024 \text{ MB} = 52,224 \text{ MB}$

AppDynamics Controller Sizing Requirements

The Controller database should meet the following hardware requirements:

- 500 MB of disk space per collector per day
- 500 MB of disk space for the Events Service per day. By default, the Events Service retains data for 10 days.

See [Controller System Requirements](#)¹⁵¹⁷.

Note

The Database Agent requires the [Events Service](#)¹⁵¹⁸. Start Event Service before you start the Database Agent.

Software Requirements

- The Database Agent runs on a Java Virtual Machine. You must have Java ≥ 1.8 .
- The operating systems Linux and Windows are supported.

Network Requirements

- The machine on which the database is running or the machine you want to monitor must be accessible from the machine where the Database Agent is installed and running. This machine must have a network connection, internet, or intranet.
- If your databases are behind a firewall, you must configure the firewall to permit the machine running the Database Agent program access to the databases. The database listener port (and optionally the SSH or WMI port) must be open.
- The network bandwidth used between the agent and the controller is approximately 300 KB per minute per collector for a large database with 200 clients using 50 schemas, processing about 10,000 queries a minute. The actual numbers depend on the type of database server, the number of individual schemas on the server, and the number of unique queries executed daily, and therefore varies.

Administer the Database Agent

Related pages:

- [Database Visibility](#)(see page 2381)
- [Database Agent Configuration Properties](#)(see page 2393)
- [Add Database Collectors](#)(see page 2415)
- [Start the Database Agent Automatically on Linux](#)(see page 2408)
- [Start the Database Agent Automatically on Windows](#)(see page 2409)

¹⁵¹⁷ <https://docs.appdynamics.com/display/PRMY21/.Controller+System+Requirements+v21.5>

¹⁵¹⁸ <https://docs.appdynamics.com/display/PRMY21/.Events+Service+Deployment+v21.6>

The Database Agent is a standalone Java program that collects performance metrics about your database instances and database servers. You can view these performance metrics in the Metric Browser of the AppDynamics Controller UI.

To start monitoring your database, you must first install the Database Agent. You may want to install multiple agents for the following reasons:

- You have databases on multiple networks that are not accessible by one machine.
- You have multiple SQL Server instances that each require different credentials, and you want to connect to them through Windows Authentication.
- You want one or more agents to back up a primary agent. Backup agents ensure that your database instances are continually monitored during agent failure or machine downtime.

Prepare to Install the Database Agent

Related pages:

- [Database Visibility](#)(see page 2381)
- [Database Agent Configuration Properties](#)(see page 2393)
- [Add Database Collectors](#)(see page 2415)
- [Start the Database Agent Automatically on Linux](#)(see page 2408)
- [Start the Database Agent Automatically on Windows](#)(see page 2409)

Database Agent Installation Requirements

Ensure that your environment meets these requirements:

- Java \geq 1.8
- The machine that you install the agent on has network access to the databases that you want to monitor.

Controller Communication Information

If you are installing using the Database Agent downloaded from the **Getting Started Wizard**, the Controller communications information is already configured for you in the agent `controller-info.xml` file.

To complete the **Getting Started Wizard - Databases**, you need:

- Controller Host Name
- Controller Port Number

If you are installing using the agent installation zip file downloaded from the AppDynamics portal, you need:

- Controller Host Name
- Controller Port Number
- Account Access Key

See [Agent-to-Controller Connections](#)(see page 463).

Install the Database Agent

Related pages:

- [Database Visibility](#)(see page 2381)
- [Database Agent Configuration Properties](#)(see page 2393)
- [Add Database Collectors](#)(see page 2415)
- [Enable SSL and SSH for Database Agent Communications](#)(see page 2399)

- [Start the Database Agent Automatically on Linux](#)(see page 2408)
- [Start the Database Agent Automatically on Windows](#)(see page 2409)

This page describes how to manually install the Database Agent. You can alternatively follow the steps in the **Download & Install Wizard**, which you can access from the Home page in the Controller UI. The wizard simplifies the install process.

To avoid permission issues, you should install the Database Agent as the same user who will run the agent, or as an administrator on the host machine. To run the Database Agent, you must have write privileges to the logging output directory and to the `conf` directory, which are located in the agent installation directory.

Install the Agent Software

1. Download the version of the installation package that is appropriate for your OS environment from the AppDynamics Download Center (<http://download.appdynamics.com>).
2. Extract the zip file to the destination directory. Do not use spaces in the agent installation destination directory.
3. Log on as an administrator to the machine where you will be installing the Database Agent.

Windows

Double-click the `dbagent-x.x.x.zip` file and extract the files to `<db_agent_home>`. If necessary, you can unblock the zip file before you extract it as follows: Right-click on the zip file, select **Properties** and choose **unblock**.

 There are two versions of the database agent: one that is 32-bit and one that is 64-bit (*as of 4.5.2*). Choose a version based on your OS requirements.

Linux

Enter the following on the command line:

```
unzip dbagent-x.x.x.zip -d <db_agent_home>
```

Running Multiple Database Agents

You can have multiple Database Agents concurrently running the agent jar in the `<db_agent_home>` directory on the same machine. Some system properties may be required depending on how you'll be using the agents.

Database Agent Licensing (On-premises Only)

Obtain a `license.lic` file with Database Monitoring licensing from your sales or support representative and put the license file in the directory where you installed the Controller. After placing the license in the

directory, the Controller may take a minute or two to detect the new license. [Restarting the Controller](#)¹⁵¹⁹ forces it to detect new licenses.

Configure the Agent

You can [configure properties](#)(see [page 2393](#)) for the Controller host name, port number, and account access key using either the <db_agent_home>/conf/controller-info.xml file or by adding system properties to the Database Agent startup script.

Controller Host Name

Configure using controller-info.xml: <controller_host>

Configure using System Properties: -Dappdynamics.controller.hostName

Required: Yes

Default: None

Controller Port

Configure using controller-info.xml: <controller_port>

Configure using System Properties: -Dappdynamics.controller.port

Required: Yes

Default: For On-premises Controller installations: Port 8090 for HTTP and 8181 for HTTPS communication.
For SaaS Controller service: Port 80 for HTTP and port 443 for HTTPS communication.

Account Access Key

Configure using controller-info.xml: <account_access_key>

Configure using System Properties: -Dappdynamics.agent.accountAccessKey

Required: Yes

Default: None

Optional Configurations:

- Configure the agent to use SSL, see [Enable SSL for Communicating with the Controller](#)(see [page 2399](#)).
- Configure the agent to use Proxy Settings, see [Proxy Settings for the Controller](#)(see [page 2393](#)).
- Configure the agent to run automatically when the Machine starts on [Linux](#)(see [page 2408](#)) or [Windows](#)(see [page 2409](#)).
- Configure the agent to uniquely identify itself to the Controller, such as when you require multiple agents. See [Multiple Agent Environment Properties](#)(see [page 2393](#)).
- Configure the agent to act as a backup to another Database Agent. See [Multiple Agent Environment Properties](#)(see [page 2393](#)).
- Configure the logging level of the Database Agent running on the agent JVM. The [attached log file](#) shows an example of the agent log file when the agent logging is set to INFO level. This is the default. The log files are in <db_agent_home>\logs.

Start the Controller Events Service (On-premises Only)

In an on-premises environment, for monitoring the database you must start the controller events service before starting Database Agent.

Linux

```
bin/platform-admin.sh start-events-service
```

Windows

```
bin\platform-admin.exe start-events-service
```

¹⁵¹⁹ <https://docs.appdynamics.com/display/PRMY21/.Start+or+Stop+the+Controller+v21.5>

Launch the Database Agent using System Properties

The following assumes that all the necessary parameters have been specified in the `controller-info.xml`.

Method 1: Launch Agent with Start Script

You can use a script to start the agent. This is the recommended method.

Linux

```
./start-dbagent -Xms<min_heap_size> -Xmx<max_heap_size> &
```

Windows

```
start-dbagent.bat -Xms<min_heap_size> -Xmx<max_heap_size>
```

Alternatively, you can launch the agent as a Windows Service (*as of 4.5.4*). See [Install the Database Agent as a Windows Service](#) (see page 2409).

Method 2: Launch Agent with Java Command

Alternatively, you can launch the agent with these Java commands:

Linux

```
java -XX:+HeapDumpOnOutOfMemoryError -XX:OnOutOfMemoryError="kill -9 %p" -jar db-agent.jar
```

Windows

```
C:\>java -Djava.library.path="<db_agent_home>\auth\x64" -Ddbagent.name="Scarborough Network Database Agent" -jar <db_agent_home>\db-agent.jar
```

System Properties

Database Agent Name

Configure using System Properties: `-Ddbagent.name=<db_agent_name>`

Type: ASCII string, including spaces. If `<db_agent_name>` contains spaces, you must enclose the entire name in double quotes (" ").

Required: Yes, when you have multiple agents reporting to the same Controller.

Default: Default Database Agent

Java Library Path

Configure using System Properties: `-Djava.library.path=<db_agent_home>\auth\x64`

Type: ASCII string, including spaces. If `<db_agent_home>` contains spaces, you must enclose the entire name in double quotes (" ").

Required: Yes, for Windows only

Specify:

For 64-bit systems: `<db_agent_home>\auth\x64`

For 32-bit systems: `<db_agent_home>\auth\x86`

Increase the JVM Memory

To monitor multiple databases, you may need to increase the JVM memory allocation size. Increased activity on the databases you are monitoring results in increased memory usage.

Use one of the following commands to start the agent, and to initially allocate 1536 MB to the agent instead of the default of 64 MB.

For Windows 64-bit

```
C:\>java -Xmx1536m -Djava.library.path="<db_agent_home>\auth\x64" -jar <db_agent_home>\db-agent.jar
```

For Linux

```
% java -Xmx1536m -jar <db_agent_home>/db-agent.jar
```

Verify the Database Agent Installation

Related pages:

- [Database Agent Configuration Properties](#)(see page 2393)
- [Agent and Controller Compatibility](#)(see page 3918)

Review the Agent Logs

After a successful install, your agent logs, located at <db_agent_home>/logs, should contain this message:

```
Started AppDynamics Database Agent Successfully
```

If the agent log file is not present, the Database Agent may not be accessing the Database Agent command properties. To troubleshoot, check the application server log file where STDOUT is logged. It will have the fallback log messages, useful for troubleshooting the agent.

Verify that the Agent is Reporting to the Controller

1. Click **Settings > AppDynamics Agents**.
2. Click the Database Agents tab.

A list for each Database Agent reporting to the Controller should display. An agent can have one of the following statuses:

- Active: The agent is running
- Passive: The agent is used as a backup for active agents

If you don't see the Database Agent, check your `controller-info.xml` properties to ensure they have specified the correct host properties.

Verify that the Agent is Running

Use the following command to verify that the agent process is running:

Linux:

```
ps -ef | grep db-agent
```

Windows:

1. Open a command-line console.
2. Start the **Task Manager** and click the Processes tab.
3. The agent process should be running. If it is not running, then stop and restart the agent.

Upgrade the Database Agent

Related pages:

- [Database Agent Configuration Properties](#)(see page 2393)
- [Agent and Controller Compatibility](#)(see page 3918)

Important Upgrade Notes

- Before upgrading, ensure that you have all the required user permissions as mentioned in each database collector configuration.
- If you are upgrading the Controller and agents, first upgrade the Controller and then upgrade the Database Agents.
- [Shut down](#)(see page 2408) the Database Agent process before you install the new agent. All Database Agents that are running from the same install location need to be shut down when updating that install location.
- Download the installation package that is appropriate for your OS environment from the [AppDynamics Download Center](https://download.appdynamics.com/download/) (<https://download.appdynamics.com/download/>).
- Back up the <db_agent_home> directory so you can revert to the previous installation if required. To maintain the same configuration information, you will also need the <db_agent_home>\conf\controller-info.xml file.
- If both the old and new agents are >= 4.2, you can keep the old agent running while installing the new agent, allowing you to upgrade the agent with no downtime. Once you see the new agent showing up as "ACTIVE" in the agents page in the Controller, stop the old agent.

Stop the Agent

Stop the agent as described [f](#)(see page 2595)or your specific installation in [Start and Stop the Database Agent](#)(see page 2408).

Back up the Existing Agent Directory

Make a copy of the existing agent directory, <db_agent_home>. Backing up allows you to revert to the previous agent installation if you need to. You can also copy over the controller-info.xml configuration file to the new installation to ensure the agent configuration is maintained.

Install the Agent

Install the Database Agent as described [f](#)(see page 2595)or your specific installation in [Administer the Database Agent](#)(see page 2386).

Copy the controller-info.xml File

To ensure the agent configuration is maintained, copy the <backup_db_agent_home>\conf\controller-info.xml file to the new installation directory, <db_agent_home>\conf.

Start the New Agent

See [Start and Stop the Database Agent](#)(see page 2408).

Verify the Database Agent Installation

See [Verify the Database Agent Installation](#)(see page 2391).

Uninstall the Database Agent

Related pages:

- [Administer the Database Agent](#)(see page 2386)
- [Database Agent Configuration Properties](#)(see page 2393)
- [Manage App Agents](#)(see page 1126)

To uninstall the database agent:

1. Shut down the JVM that the database agent runs on.
2. Delete the installation directory.

If you have the agent installed the agent as a service, you must also [stop the Database Agent](#)(see page 2408) service.

To prevent a Database Agent from connecting to the Controller, ensure that it doesn't start up. This frees the license associated with the agent in the Controller and makes it available for use by another Database Agent.

Configure the Database Agent

Once you have installed and launched the Database Agent, you can further customize the agent.

- [Database Agent Configuration Properties](#)(see page 2393)
- [Enable SSL and SSH for Database Agent Communications](#)(see page 2399)
- [Enable Snapshot Correlation for Oracle](#)(see page 2407)
- [Increasing JVM Memory](#)(see page 2407)
- [Database Agent Logging](#)(see page 2407)

Database Agent Configuration Properties

This page describes how configure a Database Agent.

Related pages:

- [Administer the Database Agent](#)(see page 2386)

Where to Configure Database Agent Properties

You can configure agent properties in the following locations:

- The `controller-info.xml` file located in the `<db_agent_home>/conf` directory
- The system properties (`-D options`) section in the JVM start-up command. The system properties override the settings in the `controller-info.xml` file. System properties are case-sensitive.

```
java -XX:+HeapDumpOnOutOfMemoryError -XX:OnOutOfMemoryError="kill -9 %p" -jar db-agent.jar
```

Alternatively, you can use a script to start the agent.

Windows	<code>start-dbagent.bat -Xms<min_heap_size> -Xmx<max_heap_size></code>
Linux	<code>./start-dbagent -Xms<min_heap_size> -Xmx<max_heap_size> &</code>

Example Database Agent controller-info.xml File

```
<?xml version="1.0" encoding="UTF-8"?>
<controller-info>

  <controller-host>192.10.10.10</controller-host>
  <controller-port>8090</controller-port>
  <account-access-key>165e65645-95c1-40e3-9576-6a1424de9625</
account-access-key>
  <!-- The following attribute enables or disables SSL
communications between the agent and the Controller.-->
  <controller-ssl-enabled>>false</controller-ssl-enabled>

  <!-- The following account-related parameters are necessary
only for SaaS installations-->
  <!--account-name></account-name-->

</controller-info>
```

Example Startup Configuration Using System Properties

A bash example. Note that the system properties are case-sensitive.

```
-Dappdynamics.controller.hostName=192.168.1.20
-Dappdynamics.controller.port=8090
```

Database Agent Properties

This section describes the Database Agent configuration properties, including their controller-info-xml elements and their system property options.

Required System Properties

Path to the Agent jar File

Description: Provides the absolute path to the jar file.

System Property: -jar

Value: <db_agent_home>db-agent-jar

Type: ASCII string, including spaces. If <db_agent_home> contains spaces, you must enclose the entire name in double quotes (" ").

Required: Yes

Example: -jar="D:\AppDynamics\Database Agent\db-agent.jar"

Path to the Java Library

Description: Provides the absolute path to `sqljdbc_auth.dll`.

System Property: `-Djava.library.path`

Value:

- For 64-bit systems: `<db_agent_home>\auth\x64`
- For 32-bit systems: `<db_agent_home>\auth\x32`

Type: ASCII string, including spaces. If `<db_agent_home>` contains spaces, you must enclose the entire name in double quotes (" ").

Required: Recommended. Required for SQL Server Windows Authentication on Windows 64-bit systems.

Example: `-Djava.library.path="D:\AppDynamics\Database Agent\auth\x64"`

Optional System Properties

Disable Retry on Auth Failure

Description: Stops retrying to establish JDBC connection when JDBC authentication fails.

System Property: `-Dretry.on.auth.failure=false`

Default: The system property is set to true.

Type: String

Supported Locales for Parsing Numbers

Description: Specifies which locale to use for parsing numbers. See [Java 7 Supported Locales¹⁵²⁰](#) or [Java 8 Supported Locales¹⁵²¹](#) for valid values. Use the values for the Java version that you are running in your environment.

System Property: `-Ddbagent.language`

Default: The system property is set to `en-US` or `en_US`.

Type: String

Agent-Controller Communication Properties

Controller Host Property

Description: This is the host name or the IP address of the AppDynamics Controller, for example, `192.168.1.22` or `myhost` or `myhost.abc.com`. This is the same host that you use to access the AppDynamics Controller UI.

Element in controller-info.xml: `<controller-host>`

System Property: `-Dappdynamics.controller.hostName`

Environment Variable: `APPDYNAMICS_CONTROLLER_HOST_NAME`

Type: String

Default: None

Required: Yes

¹⁵²⁰ <http://www.oracle.com/technetwork/java/javase/javase7locales-334809.html>

¹⁵²¹ <http://www.oracle.com/technetwork/java/javase/java8locales-2095355.html>

Controller Port Property

Description: This is the HTTP(S) port of the AppDynamics Controller. This is the same port that you use to access the AppDynamics browser-based user interface. If the Controller SSL Enabled property is set to true, specify the HTTPS port of the Controller; otherwise, specify the HTTP port. See **Controller SSL Enabled Property**.

Element in controller-info.xml: <controller-port>

System Property: -Dappdynamics.controller.port

Environment Variable: APPDYNAMICS_CONTROLLER_PORT

Type: Positive Integer

Default: For on premises installations, port 8090 for HTTP and port 8181 for HTTPS are the default ports the Controller listens to.

For the SaaS Controller Service, port 80 for HTTP and port 443 for HTTPS are the default ports the Controller listens to.

Required: Yes

Account Access Key Property

Description: This is the account access key used to authenticate with the Controller.

Element in controller-info.xml: <account-access-key>

System Property: -Dappdynamics.agent.accountAccessKey

Environment Variable: APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY

Type: String

Default: None

Required: Yes. Earlier than 4.1, this property was required only for SaaS and multi-tenant Controllers. The account access key property is now required to authenticate all agent to Controller communications.

Example: -Dappdynamics.agent.accountAccessKey=165e65645-95c1-40e3-9576-6a1424de9625

Multiple Agent Environment Properties

The following properties are useful when you are configuring your system to include more than one Database Agent.

Database Agent Name Property

Description: This property uniquely identifies the Database Agent to the Controller.

System Property: -Ddbagent.name=<db_agent_name>

Type: ASCII string, including spaces. If <agent_name> contains spaces, you must enclose the entire name in double quotes (" ").

Default: Default Database Agent

Required: Required when you have more than one Database Agent reporting to the Controller.

You may want to run multiple **Database Agents** under the following conditions:

- When you have databases spread across multiple networks, and one machine cannot access all the databases on all the networks. In this case, you can have a uniquely named Database Agent in each network that monitors the databases only visible on that network.
- If you have multiple SQL Server instances that each require different credentials, and you want to connect to them via Windows Authentication. When using Windows Authentication, the Database Agent will use the credentials of the currently logged in user.
- When you want one or more agents to back up a primary agent. The database agent names for your backup agents must match the database agent name of your primary agent. The last agent you launch will be the primary agent.

Example: `-Ddbagent.name="Scarborough Network Database Agent"`

Unique Host ID

Description: The Unique Host ID logically partitions a single physical host or virtual machine such that it appears to the Controller that the application is running on different machines. Set the value to a string that is unique across the entire managed infrastructure. The string must not contain any spaces. If you have a machine agent that is running on the same host as that of the database agent, then this property value must be different than that of the machine agent. If you are running multiple database agents from the same host with the same name, then this property value must be different for those agents.

System Property: `-Dappdynamics.agent.uniqueHostId`

Type: String

Default: None

Environment Variable: `APPDYNAMICS_AGENT_UNIQUE_HOST_ID`

Multi-Tenant Mode Properties

If the AppDynamics Controller is running in multi-tenant mode or if you are using the AppDynamics SaaS Controller, specify the account name and account access key for this agent to authenticate with the Controller.

If the Controller is running in single-tenant mode (the default) there is no need to configure these values.

Account Name Property

Description: This is the account name used to authenticate with the Controller.

If you are using the AppDynamics SaaS Controller, the Account Name is in the Welcome email AppDynamics sent to you.

Element in controller-info.xml: `<account-name>`

System Property: `-Dappdynamics.agent.accountName`

Environment Variable: `APPDYNAMICS_AGENT_ACCOUNT_NAME`

Type: String

Default: None

Required:

Yes for AppDynamics SaaS Controller and other multi-tenant users

No for single-tenant users

Proxy Properties for the Controller

These properties route data to the Controller through a proxy.

Proxy Host Property

Description: This is the proxy host name or IP address.

Element in controller-info.xml: Not applicable

System Property: -Dappdynamics.http.proxyHost

Type: String

Default: None

Required: No

Proxy Port Property

Description: This is the proxy HTTP(S) port.

Element in controller-info.xml: Not applicable

System Property: -Dappdynamics.http.proxyPort

Type: Positive Integer

Default: None

Required: No

Proxy User Name

Description: The name of the user that is authenticated by the proxy host.

Element in controller-info.xml: Not applicable

System Property: -Dappdynamics.http.proxyUser

Type: String

Default: None

Required: No

Proxy Password

Description: The absolute path to the file containing the password of the user that is authenticated by the proxy host. The password must be the first line of the file.

If [Use Encrypted Credentials](#)¹⁵²² is false, enter the password in plain text. If [Use Encrypted Credentials](#)¹⁵²³ is true, encrypt the password. See [Encrypt Agent Credentials](#)¹⁵²⁴.

Element in controller-info.xml: Not applicable

System Property: -Dappdynamics.http.proxyPasswordFile

¹⁵²² <https://docs.appdynamics.com/display/PRO45/Java+Agent+Configuration+Properties#JavaAgentConfigurationProperties-useencryptedpassword>

¹⁵²³ <https://docs.appdynamics.com/display/PRO45/Java+Agent+Configuration+Properties#JavaAgentConfigurationProperties-useencryptedpassword>

¹⁵²⁴ <https://docs.appdynamics.com/display/PRO45/Encrypt+Agent+Credentials>

Type: String

Default: None

Required: No

Other Properties

Controller SSL Enabled Property

Description: This property specifies whether the agent should use SSL (HTTPS) to connect to the Controller. If SSL Enabled is true, set the Controller Port property to the HTTPS port of the Controller. See **Controller Port Property**.

Element in controller-info.xml: <controller-ssl-enabled>

System Property: -Dappdynamics.controller.ssl.enabled

Environment Variable: APPDYNAMICS_CONTROLLER_SSL_ENABLED

Type: Boolean

Default: False

Required: No

Enable SSL and SSH for Database Agent Communications

Enable SSL for the Database Agent

This page describes how to configure the Database Agent to connect to the Controller using SSL. It assumes that you use a SaaS Controller or have configured the on-premises Controller to use SSL.

The Database Agent supports extending and enforcing the SSL trust chain when in SSL mode.

Requirements

Gather this information:

- The Controller SSL port.
 - For SaaS Controllers the SSL port is 443.
 - For on-premises Controllers the default SSL port is 8181, but you may configure the Controller to listen for SSL on another port.
- The signature method for the Controller's SSL certificate:
 - A publicly known certificate authority (CA) signed the certificate. This applies for DigiCert, Verisign, Thawte, and other commercial CAs.
 - A CA internal to your organization signed the certificate. Some companies maintain internal certificate authorities to manage trust and encryption within their domain.
 - The Controller uses a self-signed certificate.

Establish Trust for the Controller's SSL Certificate

To establish trust between the Database Agent and the AppDynamics Controller, you must create an agent truststore that contains the root certificate for the authority that signed the Controller's certificate.

 If you secured your on-premises Controller with a self-signed certificate, see [Keystore Certificate Extractor Utility](#) (see page 2401) for instructions to create the agent keystore.

1. Obtain one of the following root certificates:

- DigiCert Global Root CA for the AppDynamics SaaS Controller
- Root certificate for the publicly known certificate authority (CA) that signed the certificate for your on-premises Controller
- Root certificate for the internal CA that signed the Controller certificate for your on-premises Controller

2. Run the Java keytool command to create the Database Agent truststore:

```
keytool -import -alias rootCA -file
<root_certificate_file_name> -keystore cacerts.jks -storepass
<truststore_password>
```

For example:

```
keytool -import -alias rootCA -file /usr/home/appdynamics/
DigicertGlobalRootCA.pem -keystore cacerts.jks -storepass
MySecurePassword
```

i Make note of the truststore password, you need it to configure the Database Agent.

3. Install the agent truststore to the Database Agent configuration directory:

```
<db_agent_home>/conf/
```

Secure the Database Agent Truststore

AppDynamics recommends you take the following security measures to prevent tampering with the Database Agent truststore:

- Secure the truststore file through file system permissions:
 - Make the Database Agent truststore readable by any user.
 - Make the truststore owned by a privileged user.
 - Make the truststore writable only by the specified privileged user.
- Secure the Database Agent configuration files so that they are only readable by the agent runtime user and only writable by a privileged user:
 - Global configuration file: <db_agent_home>/conf/controller-info.xml.

Configure SSL System Properties for the Database Agent

1. Configure the following system properties in the versioned controller-info.xml: <db_agent_home>/<version_number>/conf/controller-info.xml. See "SSL Configuration Properties" on [Database Agent Configuration Properties](#)(see page 2393) for full details on each property.

- **Controller Port:** the SSL port for the Controller. 443 for AppDynamics SaaS.
<controller-port>443</controller-port>
- **Controller SSL Enabled:** true.
<controller-ssl-enabled>>true</controller-ssl-enabled>
- **Controller Keystore Password:** the plain text password for the Database Agent truststore.
<controller-keystore-password>MySecurePassword</controller-keystore-password>

- **Controller Keystore Filename:** path of the Database Agent truststore relative to `<db_agent_home>/<version>/conf`. Required if you use a truststore other than the default `<db_agent_home>/<version_number>/conf/cacerts.jks`.
`<controller-keystore-filename>../../../../conf/cacerts.jks</controller-keystore-filename>`

i You can specify the Controller port and enable SSL for the Controller in the JVM startup script, but you must specify the truststore password and filename in the `controller-info.xml` file.

2. Save your change to the `controller-info.xml` file and restart the Database Agent.

Sample SSL `controller-info.xml` Configuration

```
<?xml version="1.0" encoding="UTF-8"?>
<controller-info>
  <controller-host>mycompany.saas.appdynamics.com</controller-host>
  <controller-port>443</controller-port>
  <controller-ssl-enabled>true</controller-ssl-enabled>
  <controller-keystore-password>MySecurePassword</controller-keystore-password>
  <controller-keystore-filename>../../../../conf/cacerts.jks</controller-keystore-filename>
  ...
</controller-info>
```

Keystore Certificate Extractor Utility

The Keystore Certificate Extractor Utility exports certificates from the Controller's Java keystore for the Database Agent truststore. It installs to the following location:

```
<agent_home>/utils/keystorereader/kr.jar
```

To avoid copying the Controller keystore to a Database Agent machine, you can run this utility from the Controller server. Access the agent distribution on the Controller at the following location:

1. Run the Keystore Certificate Extractor Utility from the Controller:

```
% /<full path to application JRE>/bin/java -jar <controller_home>/appserver/glassfish/
domains/domain1/appagent/<controller_version>/utils/keystorereader/kr.jar
```

2. Enter the following when prompted:

- The full path to the Controller's keystore:

```
Enter input keystore: <controller_home>/appserver/glassfish/domains/domain1/config/
keystore.jks
```

- The truststore output file name. By default the Database Agent looks for `cacerts.jks`.

```
Enter output agent truststore file name: <controller_home>/appserver/glassfish/
domains/domain1/config/keystore.jks
```

The password for the Controller's certificate, which defaults to "changeit". If you don't include a password, the extractor applies the password "changeit" to the output truststore.

◦ **Example command to execute kr.jar**

```
<full path to application JRE>/bin/java -jar kr.jar <controller_home>/appserver/
glassfish/domains/domain1/config/keystore.jks cacerts.jks
<controller_certificate_password>
```

3. Install the agent trust store to the agent configuration directory:

```
<db_agent_home>/conf/
```

Enable SSH for the Database Agent

i For Linux hosts only

Applies only when Database Agent is running on a Linux host.

When the Database Agent is running on Linux and you want to monitor hardware, except to monitor the local host, authentication is required and a password is passed between the Database Agent and the database server.

i SSH port option

The SSH port option does not appear unless the Database Agent is running on Linux.

1. On the agent machine, generate the rsa or dsa key as follows:

Generate rsa key

```
% ssh-keygen -b 1024 -f id_rsa -t rsa
```

or

Generate dsa key

```
% ssh-keygen -b 1024 -f id_dsa -t dsa
```

This will create a rsa or dsa 1024-bit key and put the keys into /home/<user_name>/.ssh/id_rsa and /home/<user_name>/.ssh/id_rsa.pub or /home/<user_name>/.ssh/id_dsa' and /home/<user_name>/.ssh/ida_dsa.pub' files. Do not change the names of these files.

2. Copy the private key, /home/<user_name>/.ssh/id_rsa or /home/<user_name>/.ssh/id_id_dsa into the <db-agent_home>/keys directory.

- On both the monitored machine and the agent machine, verify that you have the correct permissions on the `.ssh` directory, or set them as follows:

.ssh directory permissions

```
% cd /home/<user_name>
% chmod 755 .ssh
```

- On the monitored machine, verify that you have a `/home/<user_name>/.ssh/authorized_keys` file. If you do not have this file, create the `authorized_keys` file on the monitored machine as follows:

Create authorized_keys file

```
% cd /home/<user_name>/.ssh
% touch .ssh/authorized_keys
```

- Verify that you have the correct permissions to the `/home/<user_name>/.ssh/authorized_keys` file, or change the permissions as follows:

authorized_keys file permissions

```
% cd /home/<user_name>/.ssh
% chmod 644 authorized_keys
```

- Append (do not copy) the file `'id_rsa.pub'` or the file `'id_dsa.pub'` to the file, `/home/<user_name>/.ssh/authorized_keys`, such as follows:

Append rsa public key to authorized key

```
% echo /home/<user_name>/.ssh/id_rsa.pub >> /home/<user_name>/.ssh/authorized_keys
```

or

Append dsa public key to authorized key

```
% echo /home/<user_name>/.ssh/id_dsa.pub >> /home/<user_name>/.ssh/authorized_keys
```

- The SSH port of the database Collector is set to 22 by default. You can change it by navigating to the Monitoring Hardware section of the Collector configuration dialog. In the dialog, set the SSH port to the port you require.
- Save your change to the Collector configuration and restart the Database Agent.

Enable SSH via PEM certificate

For Linux, AppDynamics also supports certificate-based authentication via Privacy Enhanced Mail (PEM). To implement certificate-based authentication:

1. Enable the **Use certificate** option in the Monitoring hardware section of the Collector configuration dialog.
2. Copy the PEM file to the <db_agent_home>/keys directory. Note, if the home/<user_home>/ .ssh directory exists, the agent will use the certificate found there.
3. Restart the agent.

Monitor SSL-enabled PostgreSQL on Amazon RDS

To monitor a PostgreSQL instance that uses SSL connections, complete the following steps.

1. Create the .postgresql directory under the system home folder, then create a file, root.crt in the directory.
/home/<name>/.postgresql/root.crt
2. Download PEM file from Amazon and copy to a local directory.
3. Convert the PEM file to a DER file using the following openssl command:

```
openssl x509 -outform der -in rds-combined-ca-bundle.pem -out rds-combined-ca-bundle.der
```

4. Add the certificate to the Java keystore using the following command:

```
sudo keytool -import -noprompt -trustcacerts -alias AmazonRDS -file rds-combined-ca-bundle.der -keystore $JAVA_HOME/jre/lib/security/cacerts -storepass changeit
```

You can verify that the certificate was added by running the following command:

```
keytool -list -keystore $JAVA_HOME/jre/lib/security/cacerts -storepass changeit
```

5. Re-start the dbagent process to register the certificate you added.
6. In the Controller, create a new collector for PostgreSQL.
 - a. In the **Custom JDBC Connection String** field, enter the following JDBC string:
jdbc:postgresql://<RDS-Hostname>:<RDS-Port>/postgres?ssl=true
 - b. In the **ADVANCED OPTIONS** section, select **Connection Properties** and then specify these property details:

Property Name	Property Value
sslrootcert	The location of the downloaded PEM file
sslmode	verify-full

Monitor SSL-enabled MySQL on Amazon RDS

To monitor a MySQL instance that uses SSL connections, enable MySQL in SSL mode, consulting the online documentation appropriate to your deployment.

Download the files shown below as they are required to complete this procedure:

- ca.pem
- server-cert.pem
- server-key.pem
- client-cert.pem
- client-cert.key

Run the following commands at the command line. Substitute URLs and other information from your deployment for the placeholders in the examples.

1. Test your local SSL connection:

```
mysql -h ec2-11-111-111-11.us-west-2.compute.amazonaws.com -u Testssl --ssl-ca=/etc/certs/ca.pem --ssl-cert=/etc/certs/server-cert.pem --ssl-key=/etc/certs/server-key.pem -p
```

2. Verify the remote connection:

```
mysql -h ec2-11-111-111-11.us-west-2.compute.amazonaws.com -u Testssl --ssl-ca=/home/appdynamics/cert/ca.pem --ssl-cert=/home/appdynamics/cert/client-cert.pem --ssl-key=/home/appdynamics/cert/client-key.pem -p
```

3. Import the ca.pem file to the default truststore:

```
sudo keytool -importcert -alias MySQLCACert -file ca.pem -keystore $JAVA_HOME/jre/lib/security/cacerts -storepass changeit
```

- Do not forget the password, as you need it in step 7

4. Convert the client key and certificate files to a PKCS #12 archive:

```
openssl pkcs12 -export -in client-cert.pem -inkey client-key.pem -name "mysqlclient" -passout pass:changeit -out client-keystore.p12
```

5. Import the client key and certificate into a Java keystore:

```
sudo keytool -importkeystore -srckeystore client-keystore.p12 -srcstoretype pkcs12 -srcstorepass changeit -destkeystore $JAVA_HOME/jre/lib/security/cacerts -deststoretype JKS -deststorepass changeit
```

6. Verify that the certificate was added:

```
keytool -list -keystore $JAVA_HOME/jre/lib/security/cacerts -storepass mypassword
```

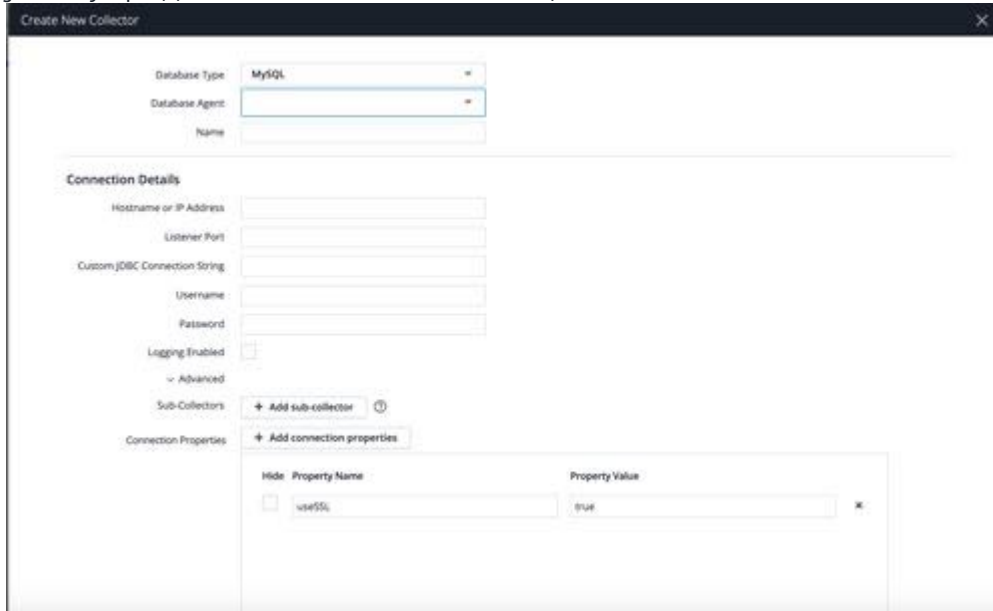

7. Start the db-agent after ensuring that the following properties are added:

```
/<full path to application JRE>/bin/java -jar -Djavax.net.ssl.trustStore=$JAVA_HOME/jre/lib/security/cacerts -Djavax.net.ssl.trustStorePassword=changeit
```

```
-Djavax.net.ssl.keyStore=$JAVA_HOME/jre/lib/security/cacerts
-Djavax.net.ssl.keyStorePassword=changeit db-agent.jar
```

8. In the Controller, create a new collector for MySQL

- In the Configuration panel, add the connection property with Property Name "useSSL" and Property Value "true"
- Alternatively, you can also use the following custom connection string:
jdbc:mysql://<RDS-Hostname>:<RDS-Port>/database?useSSL=true

Monitor SSL-enabled MongoDB

You can configure your MongoDB instance to use SSL connections.

1. Create a keystore on the database agent host.
2. Import the SSL certificates to this keystore using the following command:

```
keytool -importcert -trustcacerts -file <mongodb certificate location> -keystore
<keystore e.g. path/mongo.jks> -storepass <keystore password> -alias <alias>
```

3. Start the database agent with the following flags:

```
java -Ddbagent.name=<DBAgent Name> -Djavax.net.ssl.trustStore=<keystore e.g. path/
mongo.jks> -Djavax.net.ssl.trustStorePassword=<keystore password> -jar db-agent.jar
```

4. Create the mongodb collector with custom URL:

```
mongodb://<mongodb-host>:27017/?ssl=true
```

Enable Snapshot Correlation for Oracle

For the Oracle Collector AppDynamics Database Visibility to collect database queries, sessions, clients, and schemas information that occurred during snapshots captured by the Java Agent, you need to set the `jdbc-dbcam-integration-enabled` App Agent property for the Java Agent.

For information on the `jdbc-dbcam-integration-enabled` property, see [App Agent Node Properties](#) (see page 1137).

For information on snapshot correlation between the Oracle database Collector and a Java business transaction, see [Access Database Visibility from Application Monitoring Views](#) (see page 2467)

Increasing JVM Memory

To monitor multiple databases, you may need to increase the JVM memory allocation size. Increased activity on the databases you are monitoring results in increased memory usage.

Use one of the following commands to start the agent, and to initially allocate 1536 MB to the agent instead of the default of 64 MB.

For Windows 64-bit

```
C:\>java -Xmx1536m -Djava.library.path="<db_agent_home>\auth\x64" -jar <db_agent_home>\db-agent.jar
```

For Linux

```
% java -Xmx1536m -jar <db_agent_home>/db-agent.jar
```

Database Agent Logging

By default, the Database Agent writes log files to the `log` directory.

Configure Agent Logging

You can configure the agent to generate log files.

1. From the agent home directory, navigate to log directory.
2. Open `log4j.xml`.
3. Find `logger name="com"`. Inside this tag, set `level value` to `debug`, as shown below:

```
<logger name="com">
  <level value="debug"/>
</logger>
```

4. Let the agent run for 10 minutes to generate some logs.
5. From the agent home directory, navigate to the `log` directory to view your logs.

Start and Stop the Database Agent

Start the Agent

If you are using an on-premises version of Database Visibility, you must [start the Events Service](#)(see page 2408) before you start the Database Agent. Before starting the agent, you must [configure the properties in this file](#)(see page 2393). You must specify these properties:

- Controller Host Property
- Controller Port Property
- Account Access Key Property

Start the Agent in a Command Shell

The following assumes that all the necessary parameters have been specified in the `controller-info.xml`. The `controller-info.xml` file describes the properties of agent to Controller communications. **Note** that `<db_agent_home>` is the absolute path to the location where the Database Agent is installed. Setting the heap size is recommended as shown below. See [Database Visibility System Requirements](#)(see page 2385).

Windows

```
cd <db_agent_home>
start-dbagent.bat -Xms<min_heap_size> -Xmx<max_heap_size>
```

Linux

```
cd <db_agent_home>
./start-dbagent -Xms<min_heap_size> -Xmx<max_heap_size> &
```

Start the Agent as a Service

See [Install the Database Agent as a Windows Service](#)(see page 2387), [Start the Database Agent Automatically on Windows](#)(see page 2409), and [Start the Database Agent Automatically on Linux](#)(see page 2408).

Stop the Agent

Stop the Agent in a Command Shell

If the Database Agent process is running in the background, you can stop it by simply entering the kill command with the process ID as the argument. If it is running in the foreground in a console, you can press Ctrl+C to shut down the agent.

Stop the Agent Service in Windows

In the Windows Services application, select **AppDynamics Database Agent** and click **Stop**.

Start the Database Agent Automatically on Linux

Related pages:

- [Install the Database Agent](#)(see page 2387)
- [Database Agent Configuration Properties](#)(see page 2393)

To enable the Database Agent to start automatically whenever the machine starts up:

1. Create an initialization script that starts the agent, as in the sample [initialization script](#) that is an attachment to this page.
In your script, set the `JAVA` and `AGENT_HOME` values to the paths for your system. Also, configure agent options and heap size, as needed.
2. Enable execution permissions for the script. For example, given an initialization script named `db-agent`, enter:

```
sudo chmod 775 db-agent
```

3. Place the script in the initialization directory on your system, typically `/etc/init.d`. Alternatively, create a symbolic link to the script from the `init.d` directory to the script if you want to keep it in another location.
4. Add the script as a service as follows:
 - For Red Hat and most Linux Operating Systems, run these commands, replacing `db-agent` with the name of your file or symbolic link:

```
chkconfig --add db-agent  
chkconfig --level 2345 db-agent on
```

- For Ubuntu and Debian Operating Systems, run this command, replacing `db-agent` with the name of your file or symbolic link:

```
update-rc.d -f db-agent start 99 2 3 4 5 .
```

In the command:

- `start` is the argument given to the script (start, stop).
- `99` is the start order of the script (1 = first one, 99 = last one)
- `2 3 4 5` are the runlevels to start
- Be sure to include the dot (.) at the end of the command.

The Database Agent now starts automatically upon machine startup. When setting the agent to automatically start up using Task Scheduler when the machine starts or restarts, ensure the agent runs with the highest privileges available.

Start the Database Agent Automatically on Windows

Related pages:

- [Administer the Database Agent](#)(see page 2386)
- [Database Agent Configuration Properties](#)(see page 2393)
- [Database Visibility](#)(see page 2381)

Most Windows server software runs as a service when the machine boots up. You can create a Windows service to run the Database Agent by executing a script bundled with the product.

Install the Database Agent as a Windows Service

To create the Database Agent as a Windows service, run the following command as an administrator:

```
cscript <db_agent_home>\InstallService.vbs <jvm_options>
```

<db_agent_home> is the path to the install directory.

A Windows service named Appdynamics Database Agent is created.

SilentInstall and serviceName are optional parameters, which can be used along with the preceding command. The following syntax shows how to add these parameters:

```
cscript <db_agent_home>\InstallService.vbs SilentInstall serviceName=<name_of_the_service> <jvm_options>
```

<db_agent_home> is the path to install directory, and <name_of_service> is the name that you want to use for renaming the service.

You can use SilentInstall to create the Database Agent as a Windows service in the silent mode where the script skips user input for installation.

For database Agent>= 20.5, you can add a service with a different name or change the name of the service by using the serviceName parameter. If you do not specify any value for this parameter, the service name is set to Appdynamics Database Agent by default.

To use different Windows service name for different Database Agents, ensure that you run each Database Agent as a service from different install directories.

```
Administrator: Command Prompt
Microsoft Windows [Version 10.0.17134.345]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\WINDOWS\system32>cscript C:\db-agent\InstallService.vbs -Ddbagent.name="Scarborough Network Database Agent"

```

The screenshot below shows the Windows Service Control Manager.

If you choose to use Windows authentication for Microsoft SQL Server, you must change your login credentials and restart the database agent service.

Uninstall the Database Agent as a Service

To uninstall the database agent service, run the following command as an administrator:

```
cscript <db_agent_home>\UninstallService.vbs
```

```

c:\> Select Administrator: Command Prompt
Microsoft Windows [Version 10.0.17134.345]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\WINDOWS\system32>cscript C:\db-agent\UninstallService.vbs

Running the Agent on Windows Using the Task Scheduler

It is recommended to run the Database Agent as a Windows service. However, if you choose to run the agent using Task Scheduler, ensure the agent runs with the highest privileges available. When using Task Scheduler, if the host is restarted, the agent will not start automatically.

Add Database Licenses

Related pages:

- [Add Database Collectors](#)(see page 2415)
- [Observe License Usage](#)¹⁵²⁵

To monitor the databases concurrently, the Controller requires a license for the total number of databases. Though all the versions of the Database Agent are compatible, AppDynamics recommends Database Agent >=21.2 for Infrastructure-based Licensing Model.

For Database Agent license details, see [License Entitlements and Restrictions](#)¹⁵²⁶.

Add New Licenses

To add a new license, see [Apply or Update a License File](#)(see page 213).

Manage Licenses in the Controller

To view and manage license consumption in the Controller, see [Observe License Usage](#)¹⁵²⁷.

Transfer a License Between Databases

A database license is allocated to the first agents that register with the Controller up to the licensed limit.

To transfer a license for the Database Agent to another database, you simply remove the Collector for the old database and then add a new Collector for the database you want to monitor instead. See [Add Database Collectors](#)(see page 2415).

If you disable a collector, it still consumes a license.

Configure Controller Settings for Monitoring Database

You can configure parameters for the controller, such as the number of events sent to the Events Service at a given time.

To change the Controller settings for Database Agents:

1. Log in to the [Administration Console](#)¹⁵²⁸.
2. Click **Controller Settings**.
3. Change the settings as needed and **Save**.

¹⁵²⁵ <https://docs.appdynamics.com/display/PRO216/Observe+License+Usage>

¹⁵²⁶ <https://docs.appdynamics.com/display/PRO21/License+Entitlements+and+Restrictions>

¹⁵²⁷ <https://docs.appdynamics.com/display/PRO216/Observe+License+Usage>

¹⁵²⁸ <https://docs.appdynamics.com/display/PRMY21/.Access+the+Administration+Console+v21.5>

Controller Settings

Property Name	Property Overview	Default	Minimum Value
dbmon.event.publisher.esclient.batch.size	Batch size for each Event Service client used by Database Monitoring.	1500	200
dbmon.event.publisher.queue.size	Maximum measurement queue size maintained by Database Monitoring.	100000	100000
dbmon.config.data.retentionperiod	Number of days to retain database monitoring data (queries, clients, users, sessions, schemas) excluding the current day. Data reported before the retention period might be unrecoverable, even for a momentary update of this property.	10	1
dbmon.config.max.custommetric	Number of custom metrics that can be created per collector.	40	0

Configure the Agent Settings for Monitoring Database

This page provides information about the different agent properties that are used for database monitoring. For configuring the basic agent properties, see [Database Agent Configuration Properties](#)(see page 2393).

You can update the following properties using the `controller-info.xml` file located in the `<db_agent_home>/conf` directory.

The following table includes the property names that can be used for any specific database or for all the databases along with the purpose of the properties.

Agent Properties for Monitoring Relational Databases

Property Name	Database	Purpose	Default Value
-Ddbagent.disable.sybase.ase.system.monitoring	Sybase	This property specifies whether the agent should disable Sybase. You may want to disable Sybase monitoring with Database	false

Property Name	Database	Purpose	Default Value
		<p>Visibility if you are already using other tools to monitor Sybase. Refer to Sybase Database Permissions¹⁵²⁹ for information on configuring Sybase permissions.</p> <p>If an agent is run with the <code>-Ddbagent.disable.sybase.ase.system.monitoring</code> flag, Database Visibility will stop executing <code>sp_sysmon</code> for Sybase databases. As a result, the following metrics might not show reliable data:</p> <ul style="list-style-type: none"> • Calls per Minute (KPI) • All metrics under Server Statistic in the Metric Browser • The Load value on the Sybase dashboard 	
<code>-Ddbagent.sampling.interval</code>	<p>All relational database</p> <div style="border: 1px solid #00aaff; padding: 5px; margin-top: 10px;"> <p> This property can be used for MongoDB and Couchbase.</p> </div>	<p>This is the interval at which queries are sampled. The interval can be 1s, 2s, 5s, 10s, 20s, or 30s. For example, if you have configured the property value as 2, Elapsed Time is displayed for 2s, 4s, 6s, and so on (in the multiples of 2).</p>	1

Agent properties for monitoring Cassandra

Property Name	Purpose	Default Value
<code>dbagent.cassandra.sampling.interval.seconds</code>	The interval at which queries are sampled. According to the sampling interval (between 1 and 60), the sampling threshold is set (between 300 ms and 1000 ms).	10
<code>dbagent.cassandra.max.query.execution.time.seconds</code>	Maximum query execution time. Queries executing for more than this duration are not be sampled.	300
<code>dbagent.cassandra.query.sampling.limit</code>	The maximum number of queries to sample in a single sampling period. If this value is 0, query sampling is disabled.	100,000

¹⁵²⁹ <https://docs.appdynamics.com/display/PRO45/Configure+Sybase+Collectors>

Property Name	Purpose	Default Value
dbagent.cassandra.dse.skip.slow.query.table.for.sampling	Whether to use sampling from query traces instead of the node_slow_log table ¹⁵³⁰ for DSE Cassandra.	false
dbagent.cassandra.apache.sampling.threshold.in.milliseconds	Defines the sampling threshold for Apache Cassandra. In other words, queries taking more than this threshold to execute, are sampled by the database agent. <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p>i This property sets a fixed sampling threshold. To use a dynamic sampling threshold based on the sampling interval set a negative value to this property.</p> </div>	-1

Add Database Collectors

To enable the Database Agent to collect data, you must add and configure a Database Collector for each database that you want to monitor. The Database Collector is the process that runs within the Database Agent to collect performance metrics about your database instances and database servers.

Required Database Permissions

You must have the required permissions to monitor your databases. See [Database Visibility Supported Environments](#)(see page 2383).

AppDynamics Permissions

To add, edit, and create collectors, users need a role with the proper permissions:

- Can Create Collectors
- Can Edit All Collectors
- Can Delete All Collectors

See [Database Permissions](#)(see page 170).

Add a Database Collector

1. Click the Configuration tab in the left panel menu.
2. Click the **Collectors** option.
3. In the Collectors panel, click **Add (+)**.
4. Complete each field of the **Create New Collector** dialog

¹⁵³⁰ https://docs.datastax.com/en/dse/6.0/dse-admin/datastax_enterprise/mgmtServices/performance/diagnosticTableReference.html#diagnosticTableReference__cql-slow-log-table

- If you want to add a sub-collector to be monitored, click **Advanced** >> **+Add sub-collector** to enter host and port details.

 Sub-collectors are applicable only to relational database types.

- Click **OK**. Your database administrator can provide you with the necessary details.

After you have added a collector, you can configure the collector for your database. You can also [link a database](#)(see page 2467) on the application flow maps to a database instance monitored by Database Visibility.

Hardware Monitoring

For information on the fields to complete in order for the Database Agent to monitor the server hardware in addition to the database, see [Configure the Database Agent to Monitor Server Hardware](#)(see page 2461).

Verify Collector Setup

Once the Collector is up and running, in just a short time you can start viewing the historical activity data.

The Collector configuration window now has a collector icon you can click to edit the details of the collector if required. The Collector will also appear in the list of Databases shown in the left navigation menu. It might take a few minutes before the Collector and its metrics are reported.

From the left navigation menu, click **Databases** to see a high-level view of the activity of all the configured Collectors.

Click the name of the database to see more details of the metrics AppDynamics Database Monitoring has captured.

For information on using and interpreting the Collector windows, see [Monitor Databases and Database Servers](#)(see page 2467).

Edit a Database Collector

From the Collectors panel, you can edit any of the details of the collector except the type of database platform to monitor.

For more information on collector fields, see the collector configuration page for your database.

- [Configure IBM DB2 Collectors](#)(see page 2423)
- [Configure Microsoft SQL Server Collectors](#)(see page 2428)
- [Configure Microsoft Azure Collectors](#)(see page 2437)
- [Configure MongoDB Collectors](#)(see page 2440)
- [Configure MySQL Collectors](#)(see page 2443)
- [Configure Oracle Collectors](#)(see page 2445)
- [Configure PostgreSQL Collectors](#)(see page 2453)
- [Configure Sybase Collectors](#)(see page 2455)
- [Configure Sybase IQ Collectors](#)(see page 2459)

Delete a Database Collector

From the Collectors panel, you can delete a database Collector.

Export Database Collector Data

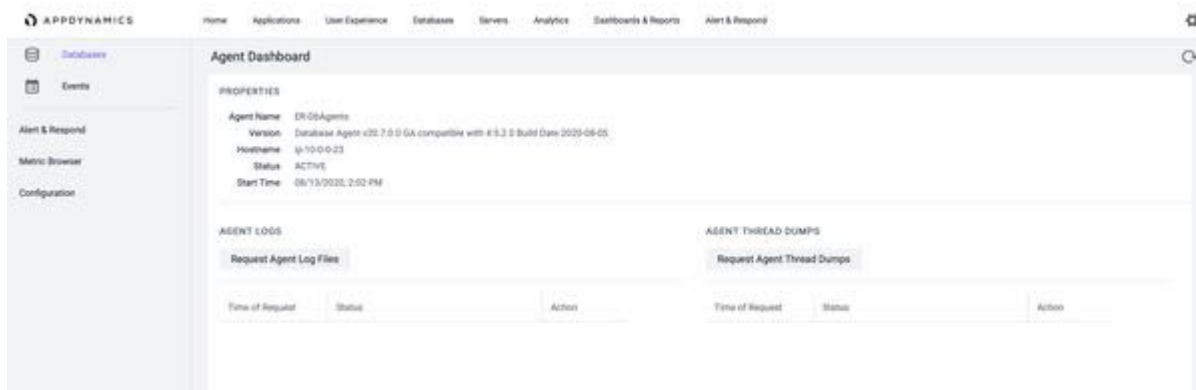

From the Collectors panel, you can click on **Actions > Export Data** to generate a CSV file containing the following data for each collector:

- Collector name
- Host name
- Port number
- Username
- Database type
- Agent name

View Database Agent Properties and Logs

You can view the database agent properties along with the agent logs and thread dumps by accessing **Agent Dashboard**. These logs are required for debugging and troubleshooting the issues.

To access **Agent Dashboard**, click the agent name under **Agent Name** on the **Collectors** page.

You can click **Request Agent Log files** to either download logs from a specific logger by setting a specific log level for a specific duration or download all logs.

You can click **Request Agent Thread Dumps** to download the required number of thread dumps.

See [Agent Log Files](#)¹⁵³¹ and [Request Agent Log Files](#)¹⁵³².

Troubleshooting Collector Problems

Collectors that have not been configured correctly, or that cannot connect to the database for any reason, will show an error on the **Databases** overview page and individual database dashboards. Hovering over the error icon displays the potential reason for the error.

If your Collector isn't reporting any metrics after a few minutes, and you know the database is up and running with activity, check the **Events** panel. [Agent Diagnostic Events](#)(see page 2540) can appear if the password is incorrect or communication errors have occurred. The message summaries on the **Events** panel can help you diagnose and troubleshoot Collector problems.

Check the collector configuration to ensure all the values you entered are correct.

1531 <https://docs.appdynamics.com/display/PRO45/Agent+Log+Files>

1532 <http://docs.appdynamics.com>

Ensure that your Database Agent has network connection to the databases you want to monitor along with the required permissions. See [Database Monitoring Requirements and Supported Environments](#)(see page 2383).

Configure Cassandra Collectors

This page provides configuration details for Cassandra collectors.

Prerequisites

To monitor Cassandra with Database Visibility, you must be running version:

- Apache Cassandra >= 3.11.4
- Datastax Enterprise (DSE) Cassandra >= 6.7.3

Connection Details

	Field	Description
Create New Collector	Database Type	The Database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent.
	JMX Port	The port to remotely connect through JMX (optional for DSE Cassandra). See JMX Configurations (see page 2419).
	JMX Username	The name of the JMX user who is connecting to and monitoring the database using the Database Agent. See JMX configurations (see page 2419).
	JMX Password	The password of the JMX user who is connecting to and monitoring the database through the Database Agent.

	Field	Description
Username and Password	Username	The name of the user who is connecting to and monitoring the database using the Database Agent. The user must have the permissions described in: <ul style="list-style-type: none"> • User Permissions for Apache Cassandra(see page 2421) • User Permissions for DSE Cassandra(see page 2422)
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
Advanced Options	SSL Connection	Click to enable SSL Connection: <ul style="list-style-type: none"> • Truststore Location: Location of the certificate on the DB Agent host. • Truststore Type: Type of SSL Connection. There are two truststore types: PKCS12 (default) SSO: Enables auto-login. If you use SSO, you only need to provide the truststore location and truststore type • Truststore Password: Password for SSL Connection. <p>If you also use client certificate authentication, then click the Enable SSL Client Authentication box.</p> <ul style="list-style-type: none"> • Keystore Location: location of the certificate on the DB Agent host • Keystore Type: type of SSL Connection • Keystore Password: password for SSL Connection
	Monitor Operating Systems	See Configure the Database Agent to Monitor Server Hardware (see page 2461).

Cassandra Configurations

These are the required configurations:

- **Query Capture Configurations**
 - [Apache Cassandra](#)(see page 2421)
 - [DSE Cassandra](#)(see page 2422)
- **JMX Configurations for Apache/DSE Cassandra**
 - a. Open `cassandra-env.sh` file.
 - b. To enable JMX for:
 - i. local connection, under the if [`"$LOCAL_JMX" = "yes"`]; then statement, set:

```
JVM_OPTS="$JVM_OPTS -Dcom.sun.management.jmxremote.authenticate=true"
```

- ii. for remote connection, under the corresponding else statement, set:

```
JVM_OPTS="$JVM_OPTS -Dcom.sun.management.jmxremote.authenticate=true"
```

- c. Set the path to the credentials file, `jmxremote.password`:

```
JVM_OPTS="$JVM_OPTS -Dcom.sun.management.jmxremote.password.file=PATH TO FILE"
```

- d. In the `jmxremote.password` file, set JMX credentials to be the same as that of the database user credentials to be specified in the collector configuration:

```
username password
```

i You may choose to give `ReadOnly JMX` access to the database monitoring user by defining in the `jmxremote.access` file as mentioned in [Enabling JMX authentication and authorization](#)¹⁵³³.

Database Column Families Panel

To see the Top N Queries run on a column family, double-click or single-click the column family, and then click **View Top Queries**. For more details about a query, double-click a query to open the Query Details (see [page 2482](#)) panel.

Access the Column Lists Panel

To access the **Column Lists** panel:

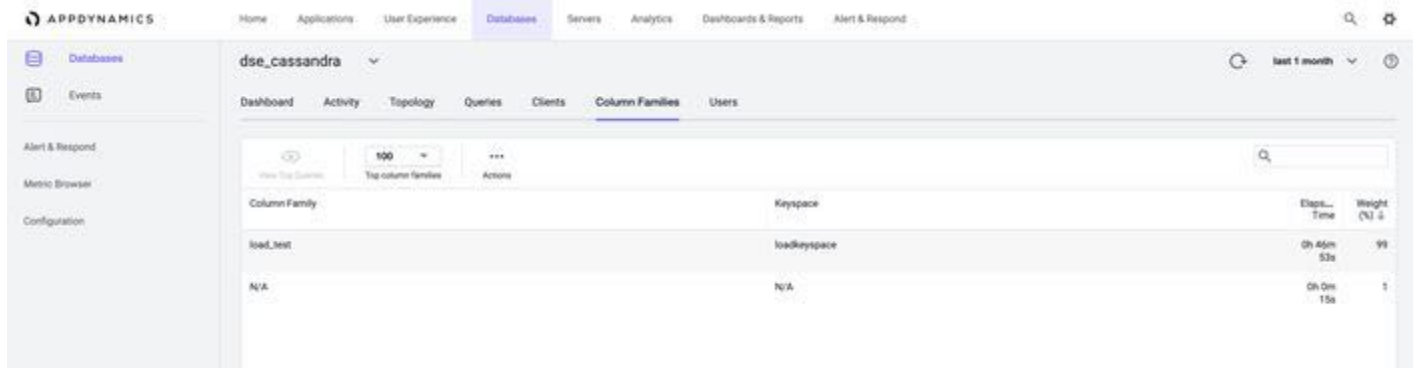

1. Click the name of the database from the list.
2. Click the **Column Families** tab. You may have to click the expand button (**>>**) to see the tab. Use the **Top column families** dropdown to view information for the top 10, 50, 100 or 200 column families sorted by total time spent in the database.

Features of the Column Families Panel

On the **Database Column Families** panel, you can see this information:

- **Column Family:** The names of the column families on which queries have been executed in this database.
- **Keyspace:** The names of the keyspaces on which queries have been executed in this database.
- **Elapsed Time:** Duration of time queries executed in the column family.
- **Weight (%):** Time spent on executing queries on column families as a percentage of the total time spent by all column families.

¹⁵³³ <https://docs.datastax.com/en/cassandra/3.0/cassandra/configuration/secureJmxAuthentication.html>

i Click **Actions** to export the data on this panel in a .csv formatted file that is automatically downloaded to your specified downloads directory.

Enable Cassandra Monitoring

Before you can enable Cassandra monitoring, you must meet these requirements:

- Controller >= 4.5.17
- Database Agent >= 4.5.16
- Set the account level property to "dbmon.cassandra.monitoring.enabled":

To enable Cassandra monitoring :

1. Go to <controller_url>/admin.jsp, then click **Account Settings**. A list of accounts display.
2. Select an account from the list of options to enable Cassandra monitoring, then click **Edit**.
3. Click **+ Add Property**. Two blank fields display.
4. Enter dbmon.cassandra.monitoring.enabled and true in the first and second blank fields, respectively.

5. Select **Save**.

Query Capture Configurations for Apache Cassandra

The Database Agent captures only traced queries. To enable query tracing:

1. [Turn on tracing in the CQLSH prompt](https://docs.datastax.com/en/dse/6.7/cql/cql/cql_reference/cqlsh_commands/cqlshTracing.html)¹⁵³⁴
2. [Enable tracing for the statement/prepared statement in the client application](https://docs.datastax.com/en/drivers/java/2.0/com/datastax/driver/core/Statement.html#enableTracing--)¹⁵³⁵
3. [Enable probabilistic tracing](https://docs.datastax.com/en/dse/6.7/dse-admin/datastax_enterprise/tools/nodetool/toolsSetTraceProbability.html)¹⁵³⁶

Add this configuration to the cassandra.yaml file:

1534 https://docs.datastax.com/en/dse/6.7/cql/cql/cql_reference/cqlsh_commands/cqlshTracing.html

1535 <https://docs.datastax.com/en/drivers/java/2.0/com/datastax/driver/core/Statement.html#enableTracing-->

1536 https://docs.datastax.com/en/dse/6.7/dse-admin/datastax_enterprise/tools/nodetool/toolsSetTraceProbability.html

```
# TTL for different trace types used during logging of the repair process.
tracetype_query_ttl: 300
```

This reduces the persistence of entries in `system_traces` keyspace (sessions and events) from 24 hours to 30 minutes. You may allow longer retention based on the number of queries being traced.

User Permissions for Cassandra

These are the user permissions to configure Cassandra:

```
CREATE ROLE appdynamics_role;
GRANT SELECT ON KEYSPACE system_traces TO appdynamics_role;
GRANT appdynamics_role TO appdynamics;
```

Query Capture Configurations for DSE Cassandra

In the `dse.yaml` file, configure (or uncomment and edit) these parameters:

```
cql_slow_log_options:
  enabled: true
  # When t > 1, log queries taking longer than t milliseconds.
  #   0 <= t <= 1, log queries above t percentile
  threshold: 2000
  # Initial number of queries before percentile filter becomes active
  minimum_samples: 100
  ttl_seconds: 259200
  # Keeps slow queries in-memory only and doesn't write data to the database.
  # WARNING - if this is set to 'false' then set threshold >= 2000, otherwise there will be
  a
  # high load on the database.
  skip_writing_to_db: false
  # The number of slow queries to keep in-memory
  num_slowest_queries: 5
```

 You can adjust all of these parameters, except "enabled" and "skip_writing_to_db", per the monitoring requirements.

User Permissions for DSE Cassandra

```
CREATE ROLE appdynamics_role;
GRANT SELECT ON KEYSPACE system_traces TO appdynamics_role;
GRANT SELECT ON TABLE dse_perf.node_slow_log TO appdynamics_role;
GRANT appdynamics_role TO appdynamics;
```

Configure Couchbase Collectors

To monitor Couchbase with Database Visibility, you must have:

- Couchbase >= 20.x
- Database Agent >= 20.x

Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in User Permissions for Couchbase (see page 2423).
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
Advanced Options	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating Systems	See this page for more details, Configure the Database Agent to Monitor Server Hardware (see page 2461).

User Permissions for Couchbase

The monitoring user must have Full Administrator or Read-only Administrator privileges. Alternatively, if you do not want the monitoring user to have Administrator privileges, you can assign a combination of Data Monitoring and Query System Catalog privileges (available for Couchbase >= 5).

Configure IBM DB2 Collectors

This page describes configuration details for IBM DB2 collectors.

Prerequisites

To monitor IBM DB2 with Database Visibility, you must be running DB2 >= 9.x.

Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Database	The name of the database instance that you want to monitor. <div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;"> <p>i If the database instance hosts multiple databases, ensure to create separate collector for each database.</p> </div>
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent.
	Custom JDBC Connection String	The JDBC connection string generated by the database agent, for example, <code>jdbc:db2://</code> . You can also specify a custom connection string, which is useful for setting custom authentication options. If you are using the connection string for Kerberos authentication, ensure to select the Kerberos option under Advanced Options .
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in User Permissions for IBM DB2 LUW (see page 2426).
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.

Section	Field	Description
	Cyberark	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the JavaPasswordSDK.jar file from the CyberArk web site and rename the file to cyberark-sdk-9.5.jar. Then, you must copy the JAR file to the lib directory of the database agent zip file.
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p>Note</p> <ul style="list-style-type: none"> All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only through the Create Collector API¹⁵³⁷. You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data. </div>

1537 <https://docs.appdynamics.com/display/PRO45/Database+Visibility+API#DatabaseVisibilityAPI-SupportedAPICalls>

Section	Field	Description
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases. For monitoring the database using Kerberos authentication, follow the instructions mentioned at Monitor IBM DB2 Databases Using Kerberos Authentication (see page 2428).
	Kerberos	Click to use Kerberos authentication to manage the database user and host user passwords.
	Monitor Operating System	See Configure the Database Agent to Monitor Server Hardware (see page 2461).

User Permissions for IBM DB2 LUW

The monitoring user needs SYSMON authority and connection privileges to monitor. This user must be a part of the sysmon_group.

To generate an execution plan, you must create the associated EXPLAIN tables in the schema.

DB2 >= 9.7

For complete Database Visibility functionality, the following monitoring switches of the DB2 server need to be enabled: "TIMESTAMP".

To enable the "TIMESTAMP" monitoring switch, enter:

```
update dbm cfg using dft_mon_timestamp on;
update db cfg using mon_act_metrics BASE
```

Privileges

```
grant select on SYSIBMADM.MON_CURRENT_SQL to user DBMon_Agent_User
grant select on SYSIBMADM.MON_LOCKWAITS to user DBMon_Agent_User
grant execute on function SYSPROC.MON_GET_CONNECTION to user DBMon_Agent_User
grant execute on function SYSPROC.MON_GET_PKG_CACHE_STMT to user DBMon_Agent_User
(version 10.5 and above) grant execute on function SYSPROC.MON_GET_TRANSACTION_LOG to
DBAgent_User
(version 10.5 and above) grant execute on function SYSPROC.MON_GET_DATABASE to DBAgent_User
```

Replace DBMon_Agent_User with the user name under which you run the Database Visibility Agent.

DB2 9.5

For complete Database Visibility functionality, the following monitoring switches of the DB2 server need to be enabled: "STATEMENT", and "TIMESTAMP".

To enable these monitoring switches, enter:

```
update dbm cfg using dft_mon_stmt on;
update dbm cfg using dft_mon_timestamp on;
```

Privileges

```
grant select on SYSIBMADM.SNAPSTMT to user DBMon_Agent_User
grant select on SYSIBMADM.SNAPAPPL_INFO to user DBMon_Agent_User
grant select on table SYSIBMADM.ENV_PROD_INFO to user DBMon_Agent_User
```

where DBMon_Agent_User is the user name under which you run the Database Visibility Agent.

User Permissions When restrict_access is Set to YES

If your database has the restrict_access parameter set to YES, you must grant these privileges:

```
grant select on SYSIBMADM.MON_CURRENT_SQL to user DBMon_Agent_User;
grant select on SYSIBMADM.MON_LOCKWAITS to user DBMon_Agent_User;
grant execute on function SYSPROC.MON_GET_CONNECTION to user DBMon_Agent_User;
grant select on SYSIBMADM.SNAPAPPL_INFO to user DBMon_Agent_User;
grant EXECUTE on function SYSPROC.MON_GET_PKG_CACHE_STMT to user DBMon_Agent_User;
grant execute on function SYSPROC.MON_GET_TRANSACTION_LOG to user DBMon_Agent_User;
grant EXECUTE on package NULLID.SQLC2K26 to user DBMon_Agent_User;
grant select on SYSIBM.SYSDUMMY1 to user DBMon_Agent_User;
grant select on SYSIBMADM.ENV_PROD_INFO to user DBMon_Agent_User;
grant select on SYSIBMADM.ENV_SYS_RESOURCES to user DBMon_Agent_User;
grant execute on function SYSPROC.SNAP_GET_STMT(varchar(),Integer) to user DBMon_Agent_User;
grant select on SYSCAT.STATEMENTS to user DBMon_Agent_User;
grant select on SYSIBMADM.DBCFG to user DBMon_Agent_User;
grant execute on function SYSPROC.SNAP_GET_DB(varchar(),Integer) to user DBMon_Agent_User;
grant EXECUTE on package NULLID.SYSSH200 to user DBMon_Agent_User;
grant select on SYSIBMADM.ENV_SYS_RESOURCESto user DBMon_Agent_User;
grant select on SYSCAT.DBAUTH to user DBMon_Agent_User;
grant execute on function SYSPROC.SNAP_GET_DBM(Integer) to user DBMon_Agent_User;
grant select on syscat.schemata to user DBMon_Agent_User;
```

Replace DBMon_Agent_User with the user name under which you run the Database Visibility Agent.

Generate Execution Plans

To generate an execution plan in DB2, the monitoring user ID must have access to the explain_* tables.

1. Create the explain tables one of theses methods:

- Call the SYSPROC.SYSINSTALLOBJECTS procedure:{{}}

```
{{db2 CONNECT TO database-name
db2 }}
```

```
{{CALL SYSPROC.SYSINSTALLOBJECTS('EXPLAIN', 'C',
CAST (NULL AS VARCHAR(128))), CAST (NULL AS VARCHAR(128))}}
```

This call creates the explain tables under SYSTOOLS schema. To create them under a different schema, specify a schema name as the last parameter in the call.

- Run the EXPLAIN.DDL command file:{{}}

```

{{db2 CONNECT TO database-name
db2 -tf EXPLAIN.DDL}}
{{}}
```

i Explain plans will not function properly unless the monitoring user ID is granted SELECT privilege on every table being accessed in the SQL as well as the necessary explain_* tables.

Monitor IBM DB2 Databases Using Kerberos Authentication

For the Database Agent to connect to and monitor the DB2 databases using Kerberos authentication, these settings are required:

- Start the Database Agent using the `Djava.security.krb5.conf=<path of the Kerberos configuration file>`:

```
nohup java -Djavax.security.krb5.conf=<path to Kerberos configuration file>
```

- In the **CONNECTION DETAILS** section of the Collector configuration dialog, specify **Hostname or IP Address, Database, Listener Port, and Custom JDBC Connection String** with Kerberos details:

```
jdbc:DB2:Tds:<hostname>:<portnum>?<Kerberos connection details>
```

- In the **ADVANCED OPTIONS** section of the Collector configuration dialog, ensure to provide these details:
 - Select **Kerberos**.
 - Select **Connection Properties**, then specify these JDBC connection properties:

Property Name	Property Value
securityMechanism	11
kerberosServerPrincipal	<Specify the name of the Kerberos Principal>

Configure Microsoft SQL Server Collectors

This page provides configuration details for Microsoft SQL Server collectors.

i **Prerequisites**
To monitor Microsoft SQL Server with Database Visibility, you must be running the 2005 version or newer.

⚠ To configure an Azure SQL Managed instance, follow the configuration procedures of a Microsoft SQL Server Collector described in this topic.

Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	<p>The hostname or IP address of the machine that your database is running on.</p> <p>To monitor a cluster, specify the hostname or IP address of the listener of the cluster. See Monitor the Microsoft SQL Server Cluster(see page 2431) to enable monitoring the MSSQL cluster.</p>
	Listener Port	<p>The TCP/IP address of the port on which your database communicates with the Database Agent.</p> <p>If you are using a Microsoft SQL Server cluster, specify the listener port of the cluster.</p> <p>To enable monitoring of all the nodes in a cluster, you must enable the monitoring of the cluster. This allows the agent to automatically discover all the nodes present in a cluster. See Monitor the Microsoft SQL Server Cluster(see page 2431)</p>
	Windows Authentication	Click to enable Windows authentication when connecting to the database.
	Custom JDBC Connection String	The JDBC connection string generated by the database agent, for example, <code>jdbc:sqlserver://</code> . You can also specify a custom connection string, which is useful for setting custom authentication options.

Section	Field	Description
User name and Password	User name	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in User Permissions for Microsoft SQL Server(see page 2431).
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the JavaPasswordSDK.jar file from the CyberArk web site and rename the file to cyberark-sdk-9.5.jar. Then, you must copy the JAR file to the lib directory of the database agent zip file.
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div style="border: 1px solid #00aaff; padding: 10px; margin-top: 10px;"> <p>Note</p> <ul style="list-style-type: none"> All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the Create Collector API¹⁵³⁸. You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data. </div>
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.
	Exclude Databases	The databases that you want to exclude, separated by commas.

1538 <https://docs.appdynamics.com/display/PRO45/Database+Visibility+API#DatabaseVisibilityAPI-SupportedAPICalls>

Section	Field	Description
	Monitor Operating System	See this page for more details, Configure the Database Agent to Monitor Server Hardware (see page 2461).

Note

To handle High Availability (Multi-AZ) for Amazon RDS, set the `databaseName` JDBC connection string property to a user database.

Monitor Microsoft SQL Server

You can monitor the SQL Server either using an existing user account or by creating a new user account, with relevant privileges.

Monitor the Microsoft SQL Server Cluster

You can monitor all the nodes in the availability group of an MSSQL database server 2012 or later.

To enable monitoring of all the nodes, you must enable the `dbagent.mssql.cluster.discovery.enabled` property either at the Controller level or at the agent level.

This property is disabled by default.

Authentication Methods

You can monitor the SQL server using either of the following authentication methods:

- Windows authenticated account (if the Database Agent is running on Windows)
- SQL Server authenticated account (if the Database Agent is running on Windows or Linux)

Before you Begin

To connect to the SQL Server database using a Windows authenticated account, perform the following:

- Select **Windows Authentication** checkbox when creating the collector using "Create New Collector" dialog.

Note

Do not specify the username and password when updating database connection details.

- Specify the path to the Database Agent authentication library as follows:

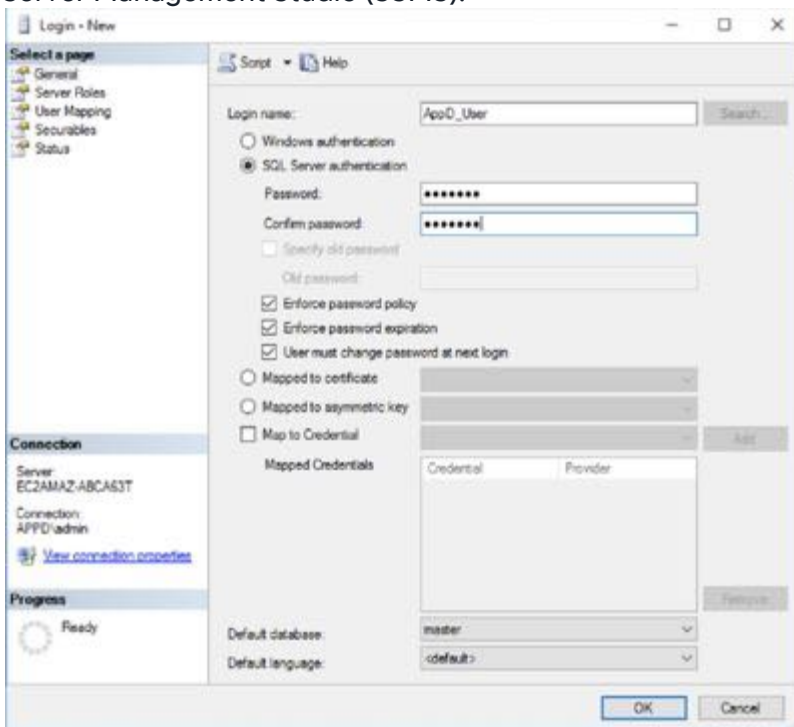

Version Details	Path
Windows 64-bit	<pre>java -Djava.library.path="C:\dbagent_install_dir\auth\x64" -jar db-agent.jar</pre>
Windows 32-bit	<pre>java -Djava.library.path="C:\dbagent_install_dir\auth\x86" -jar db-agent.jar</pre>

- Ensure that the Windows account user has appropriate privileges to authenticate the database server and can start the database agent.
- Change the logon credentials of the service to the Windows account with SQL Server access, if using a Windows service to run the Database Agent.

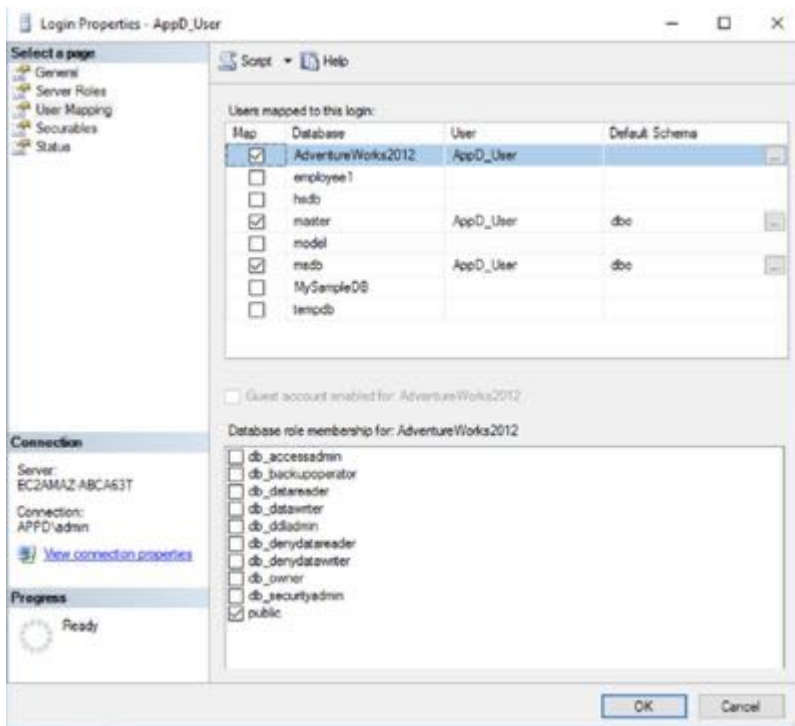

Server Level Permissions for SQL Server Logon

To create a new SQL Server user (with minimum permissions required to monitor), perform the following steps:

1. Create a new login for the AppDynamics SQL Server Database Collector, such as AppD_User, using SQL Server Management Studio (SSMS).

2. To map the new user to "master" and "msdb" databases, click "master" and "msdb" under **Users mapped to this login**.

i User mapping to "master" and "msdb" are mandatory for monitoring. To view object information in the Object Browser screens, additional mapping to other databases is required.

- After creating the login, grant the following privileges to the user by substituting AppD_User with the name you specified on the Login - New window:

```
use master
GRANT VIEW ANY DATABASE TO AppD_User;
GRANT VIEW ANY definition to AppD_User;
GRANT VIEW server state to AppD_User;
GRANT SELECT ON [sys].[master_files] TO AppD_User;
```

Optional Object Permissions for SQL Server

The following object permissions are required for optional screens within the Database (DB) Visibility user interface:

Screen	Object Permissions
Object Browser > Users	<div data-bbox="743 342 1495 428" style="border: 1px solid black; padding: 5px;"> <pre>GRANT execute on sp_helplogins to AppD_User;</pre> </div> <div data-bbox="743 436 1372 575" style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note securityAdmin role is required</p> </div>
Object Browser > Storage	<p data-bbox="743 611 1495 678">To view object storage metadata, user mapping to other databases of interest is required.</p> <div data-bbox="743 695 1372 833" style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note public role is required</p> </div>
Object Browser > Job Status	<div data-bbox="743 892 1495 1075" style="border: 1px solid black; padding: 5px;"> <pre>use msdb GRANT SELECT on dbo.sysjobsteps TO AppD_User; GRANT SELECT on dbo.sysjobs TO AppD_User; GRANT SELECT on dbo.sysjobhistory TO AppD_User;</pre> </div>
Object Browser > Error Log	<div data-bbox="743 1127 1495 1213" style="border: 1px solid black; padding: 5px;"> <pre>GRANT execute on sp_readErrorLog to AppD_User;</pre> </div> <div data-bbox="743 1222 1372 1360" style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> Note securityAdmin role required</p> </div>

Screen	Object Permissions																																				
<p>Object Browser > Database</p>	<p>To view object storage metadata, user mapping to other databases of interest is required e.g. Table/View metadata.</p> <div data-bbox="740 432 1373 569" style="border: 1px solid #add8e6; padding: 5px; margin: 10px 0;"> <p>Note public role required.</p> </div> <p>Following image shows how users are mapped to AdventureWorks2012 database:</p>  <table border="1" data-bbox="951 768 1482 999"> <caption>Users mapped to this login:</caption> <thead> <tr> <th>Map</th> <th>Database</th> <th>User</th> <th>Default Schema</th> </tr> </thead> <tbody> <tr> <td><input checked="" type="checkbox"/></td> <td>AdventureWorks2012</td> <td>AppD_User</td> <td></td> </tr> <tr> <td><input type="checkbox"/></td> <td>employee1</td> <td></td> <td></td> </tr> <tr> <td><input type="checkbox"/></td> <td>hadr</td> <td></td> <td></td> </tr> <tr> <td><input checked="" type="checkbox"/></td> <td>master</td> <td>AppD_User</td> <td>dbo</td> </tr> <tr> <td><input type="checkbox"/></td> <td>model</td> <td></td> <td></td> </tr> <tr> <td><input checked="" type="checkbox"/></td> <td>model</td> <td>AppD_User</td> <td>dbo</td> </tr> <tr> <td><input type="checkbox"/></td> <td>MySampleDB</td> <td></td> <td></td> </tr> <tr> <td><input type="checkbox"/></td> <td>tempdb</td> <td></td> <td></td> </tr> </tbody> </table>	Map	Database	User	Default Schema	<input checked="" type="checkbox"/>	AdventureWorks2012	AppD_User		<input type="checkbox"/>	employee1			<input type="checkbox"/>	hadr			<input checked="" type="checkbox"/>	master	AppD_User	dbo	<input type="checkbox"/>	model			<input checked="" type="checkbox"/>	model	AppD_User	dbo	<input type="checkbox"/>	MySampleDB			<input type="checkbox"/>	tempdb		
Map	Database	User	Default Schema																																		
<input checked="" type="checkbox"/>	AdventureWorks2012	AppD_User

Microsoft SQL Server on AWS RDS Permissions

The user account used for monitoring can be a Windows authenticated account (if the Database Agent is running on Windows) or SQL Server authenticated (if AppDynamics Database Visibility is running on Windows or Linux).

Minimum Permissions Required for SQL Server Logon

You can use the procedure to create a SQL Server user with the minimum permissions required.

Use the following to create a SQL Server logon user that provides the minimal level of permissions required in order to gain full AppDynamics Database Visibility/SQL Server functionality.

i Master users created in the AWS RDS instance are the instance masters. If you want to provide access to a local user for monitoring, use the same master user and create a custom monitoring role and assign the same to the user.

1. Using SQL Server Management Studio, create a new login for the AppDynamics SQL Server Database Collector, such as DBMon_Agent_User.
2. (For users other than master user) Execute these commands as a batch from a query window in Management Studio. This example shows grants to the role assigned to DBMon_Agent_User to monitor the database:

```
USE master
GO
CREATE SERVER ROLE monitoring_role
USE master
GO
ALTER SERVER ROLE DBMon_Agent_User ADD MEMBER Monitoring_User
GRANT CONNECT SQL TO Monitoring_User
GRANT VIEW ANY DATABASE TO Monitoring_User
GRANT VIEW ANY DEFINITION TO Monitoring_User
GRANT VIEW SERVER STATE TO Monitoring_User
```

3. From the User Mapping tab, map the new user to the master and msdb databases.

i **Viewing Object Information**

To view object information on the **Database > Objects Browser**, map the monitoring user to the databases of interest.

4. Once you have created the login, give the following privileges to the user, substituting DBMon_Agent_User with the name you specified on the **Login - New** panel:

i You can execute the following as a batch from a query window in Management Studio. The example shows grants to DBMon_Agent_User; remember to change this if you have set up a different login.

```
use master
ALTER SERVER ROLE processadmin ADD MEMBER DBMon_Agent_User;
GRANT VIEW ANY DATABASE TO DBMon_Agent_User;
GRANT VIEW ANY definition to DBMon_Agent_User;
GRANT VIEW server state to DBMon_Agent_User;
```

where DBMon_Agent_User is the name of the SQL Server user account specified in **Create New Collector, Connection Details, Username** field.

To generate an execution plan on AWS RDS, you need additional permissions. The SHOWPLAN permission must be provided explicitly for each database:

```
USE <DB NAME>
go
GRANT SHOWPLAN to DBMon_Agent_User;
go
```

Configure Microsoft Azure Collectors

To monitor Microsoft Azure with Database Visibility, you must run Microsoft Azure >= 2008.

 To configure an Azure SQL Managed Instance, follow the configuration procedures of a Microsoft SQL Server Collector. See [Configure Microsoft SQL Server Collectors](#)¹⁵³⁹. Procedures in this page are specific to an Azure SQL Database collector and **not** applicable for an Azure SQL Managed Instance.

Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.

¹⁵³⁹ <https://docs.appdynamics.com/display/PRO45/Configure+Microsoft+SQL+Server+Collectors>

Section	Field	Description
Connection Details	Host name or IP Address	The hostname or IP address of the machine that your database is running on.
	Database	The name of the database instance that you want to monitor.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent
	Custom JDBC Connection String	The JDBC connection string generated by the database agent. You can also specify a custom connection string, which is useful for setting custom authentication options.
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in User Permissions for Microsoft Azure (see page 2439).
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the JavaPasswordSDK.jar file from the CyberArk web site and rename the file to cyberark-sdk-9.5.jar. Then, you must copy the JAR file to the lib directory of the database agent zip file.

Section	Field	Description
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div style="border: 1px solid #00a0e3; padding: 10px; margin-top: 10px;"> <p>Note</p> <ul style="list-style-type: none"> All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the Create Collector API(see page 2437). You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data. </div>
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.
	Monitor Operating System	See this page for more details, Configure the Database Agent to Monitor Server Hardware (see page 2461).

User Permissions for Microsoft Azure

The user account used for monitoring can be an SQL Server authenticated account (if AppDynamics Database Visibility is running on Windows or Linux).

Minimum Permissions Required for SQL Server Logon

You can create an SQL Server authenticated login or user with minimal level of permissions. To create a SQL Server login, you must be connected to the primary database from an admin account through SQL Server Management Studio (SSMS) or SQL Editor.

i The read-only access to the master database is required for the user account to monitor the database.

1. Run the command given below to create a login. Specify a secure password in the command.

```
CREATE LOGIN DBMon_Agent_User WITH PASSWORD = 'Password123'
```

2. Run the following command in your Azure SQL database to create a user account for the newly created login:

```
CREATE USER DBMon_Agent_User FOR LOGIN DBMon_Agent_User WITH DEFAULT_SCHEMA = dbo
```

3. While connected to your Azure SQL database, run the command given below to grant the pre-requisite roles and privileges:

```
grant VIEW DATABASE STATE to DBMon_Agent_User
```

Configure MongoDB Collectors

To monitor MongoDB with Database Visibility, you must run MongoDB >= 2.2.

If you are configuring a collector for a MongoDB cluster, you only need to configure one collector for the entire cluster. You can choose any node in the cluster to connect to, and the entire cluster will automatically be detected.

Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent
	Custom Connection String	<p>The connection string generated by the database agent. You can also specify a custom connection string, which is useful for setting custom authentication options.</p> <div data-bbox="267 1465 1230 1585" style="border: 1px solid #007bff; padding: 5px; background-color: #e6f2ff;"> <p> Ensure that you do not specify the username and password in the custom connection string because it can cause a security risk.</p> </div>
	SRV Record	Enable this field to use the SRV record, where the connection string includes <code>mongodb+srv</code> .

Section	Field	Description
User name and password	User name	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in User Permissions for MongoDB (see page 2443).
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the JavaPasswordSDK.jar file from the CyberArk web site and rename the file to cyberark-sdk-9.5.jar. Then, you must copy the JAR file to the lib directory of the database agent zip file.
Advanced configurations	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating System	See Configure the Database Agent to Monitor Server Hardware (see page 2461).

When configuring the collector, ensure that you encode the username and password that uses special characters.

User Permissions for MongoDB

For MongoDB < 2.6.x, the readAnyDatabase and ClusterMonitor built-in roles are required to monitor using AppDynamics Database Visibility. For MongoDB shared clusters, the monitoring user must have access to all shards.

For MongoDB >= 2.6, the clusterMonitor built-in role in addition to read is required.

If you choose to create a new user to monitor MongoDB, the user must be created in the admin database.

You can configure user roles as shown in the sample query below:

```
use admin
db.createUser({ user: "tanujaAdmin",
  pwd: "tanuja123",
  roles: [
    { role: "clusterMonitor", db: "admin" },
    { role: "read", db: "admin" },
  ]
})
```

Configure MySQL Collectors

To monitor MySQL with Database Visibility, you must run MySQL >= 2.2.

Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent
	Custom JDBC Connection String	The JDBC connection string generated by the database agent, for example, jdbc:mysql:///. You can also specify a custom connection string, which is useful for setting custom authentication options.
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in User Permissions for MySQL (see page 2445).

Section	Field	Description
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the JavaPasswordSDK.jar file from the CyberArk web site and rename the file to cyberark-sdk-9.5.jar. Then, you must copy the JAR file to the lib directory of the database agent zip file.
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add the additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p>Note</p> <ul style="list-style-type: none"> All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the Create Collector API¹⁵⁴⁰. You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data. </div>

¹⁵⁴⁰ <https://docs.appdynamics.com/display/PRO45/Database+Visibility+API#DatabaseVisibilityAPI-SupportedAPICalls>

Section	Field	Description
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.
	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating System	See Configure the Database Agent to Monitor Server Hardware (see page 2461).

User Permissions for MySQL

The MySQL user the Database Agent uses to monitor the MySQL database must have "SELECT", "PROCESS", and "SHOW DATABASES" privileges on all databases.

The user must also have the "REPLICATION CLIENT" privilege to collect these metrics:

- Slave_io_running
- Slave_sql_running
- Seconds_behind_master
- SQL_Delay

If you do not have a suitable existing user, you can use the command below to create a new user.

```
GRANT SELECT,PROCESS,SHOW DATABASES on *.* to 'DBMon_Agent_User'@'host' identified by 'password';
GRANT REPLICATION CLIENT ON *.* to 'DBMon_Agent_User'@'host';
FLUSH privileges;
```

Substitute DBMon_Agent_User with the username under which you run the Database Visibility Agent. Substitute host with the hostname or IP address of the machine running the AppDynamics Database Agent, and substitute password with a secure password.

Set the max_allowed_packet parameter to 1073741824 on the server.

Troubleshooting MySQL Permissions

View MySQL Error Logs

To view the error log file, these conditions must be met:

- secure_file_priv is either empty or the name of the folder containing the error log file. You must restart MySQL for changes in the secure_file_priv variable to take effect.
- The error log file is readable to all users.
- max_allowed_packet is larger than the error log file size.
- The user has FILE privileges.

Configure Oracle Collectors

To monitor Oracle with Database Visibility, you must be running Oracle 10g or newer.

If you are configuring a collector for Oracle RAC, you only need to configure one collector for the entire cluster. You can choose any node in the cluster to connect to, and the entire cluster will automatically be detected.

i If you are using Oracle 12c as PDB, the query for system metrics is available from Oracle Database 12c Release 2 (12.2.0.1) onwards. See the Oracle documentation for more information.

Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent
	SID or Service Name	The SID or service name of the Oracle instance you want to monitor. For CDB (container database) monitoring, provide the CDB service name and for PDB (pluggable database) monitoring, provide the PDB service name. For PDB (pluggable database) monitoring, the service name must be present in all the nodes that have PDB so that all the nodes get monitored.
	Custom JDBC Connection String	The JDBC connection string generated by the database agent, for example, <code>jdbc:oracle:thin:@(DESCRIPTION=(ADDRESS=(PROTOCOL=). You can also specify a custom connection string, which is useful for setting custom authentication options. When using connection string for Kerberos, ensure that you select the LDAP/Kerberos option under Advanced Options.</code>
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in User Permissions for Oracle (see page 2448).

Section	Field	Description
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	Cyberark	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the JavaPasswordSDK.jar file from the CyberArk web site and rename the file to cyberark-sdk-9.5.jar. Then, you must copy the JAR file to the lib directory of the database agent zip file.
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p>Note</p> <ul style="list-style-type: none"> All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the Create Collector API¹⁵⁴¹. You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data. </div>

¹⁵⁴¹ <https://docs.appdynamics.com/display/PRO45/Database+Visibility+API#DatabaseVisibilityAPI-SupportedAPICalls>

Section	Field	Description
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases. For monitoring the database using Kerberos authentication, follow the instructions mentioned at Monitor Oracle Databases Using Kerberos Authentication (see page 2452).
	Exclude Schemas	The schemas that you want to exclude, separated by commas.
	SSL Connection	Click to enable the SSL connection. You can use SSL Connection for authentication and signing credentials. <ul style="list-style-type: none"> Truststore Location: location of the SSL certificate that is stored on the DB Agent host Truststore Type: type of truststore used for SSL certificate. There are two truststore types: PKCS12 (default) SSO: enables auto-login. If you use SSO, you only need to provide the truststore location and truststore type. Truststore Password: password for SSL certificate. <p>If the <code>SSL_CLIENT_AUTHENTICATION</code> parameter is set to true in <code>listener.ora</code> and <code>sqlnet.ora</code>, then click the Enable SSL Client Authentication box.</p> <ul style="list-style-type: none"> Keystore Location: location of the SSL certificate on the DB Agent host Keystore Type: type of SSL certificate Keystore Password: password of SSL certificate
	LDAP/Kerberos	Use LDAP/Kerberos authentication to manage the database user and the host user passwords.
	Monitor Operating System	See this page for more details, Configure the Database Agent to Monitor Server Hardware (see page 2461).

User Permissions for Oracle

For versions of Oracle 10g and later

The following permissions are required for the Oracle user:

- CREATE SESSION
- SELECT_CATALOG_ROLE

To create a user with these permissions, you can run the following SQL. In this SQL, change "password" to a safe and secure password, and change the tablespace names, "users" and "temp" to those available in your Oracle instance.

```
CREATE USER DBMon_Agent_User IDENTIFIED BY password
default tablespace users
temporary tablespace temp;

GRANT CREATE SESSION, SELECT_CATALOG_ROLE TO DBMon_Agent_User;
```

where DBMon_Agent_User is the user name under which you run the Database Visibility Agent.

For versions of Oracle 12c and later with Multitenant Container Database Option enabled

The following permissions are required for the Oracle user:

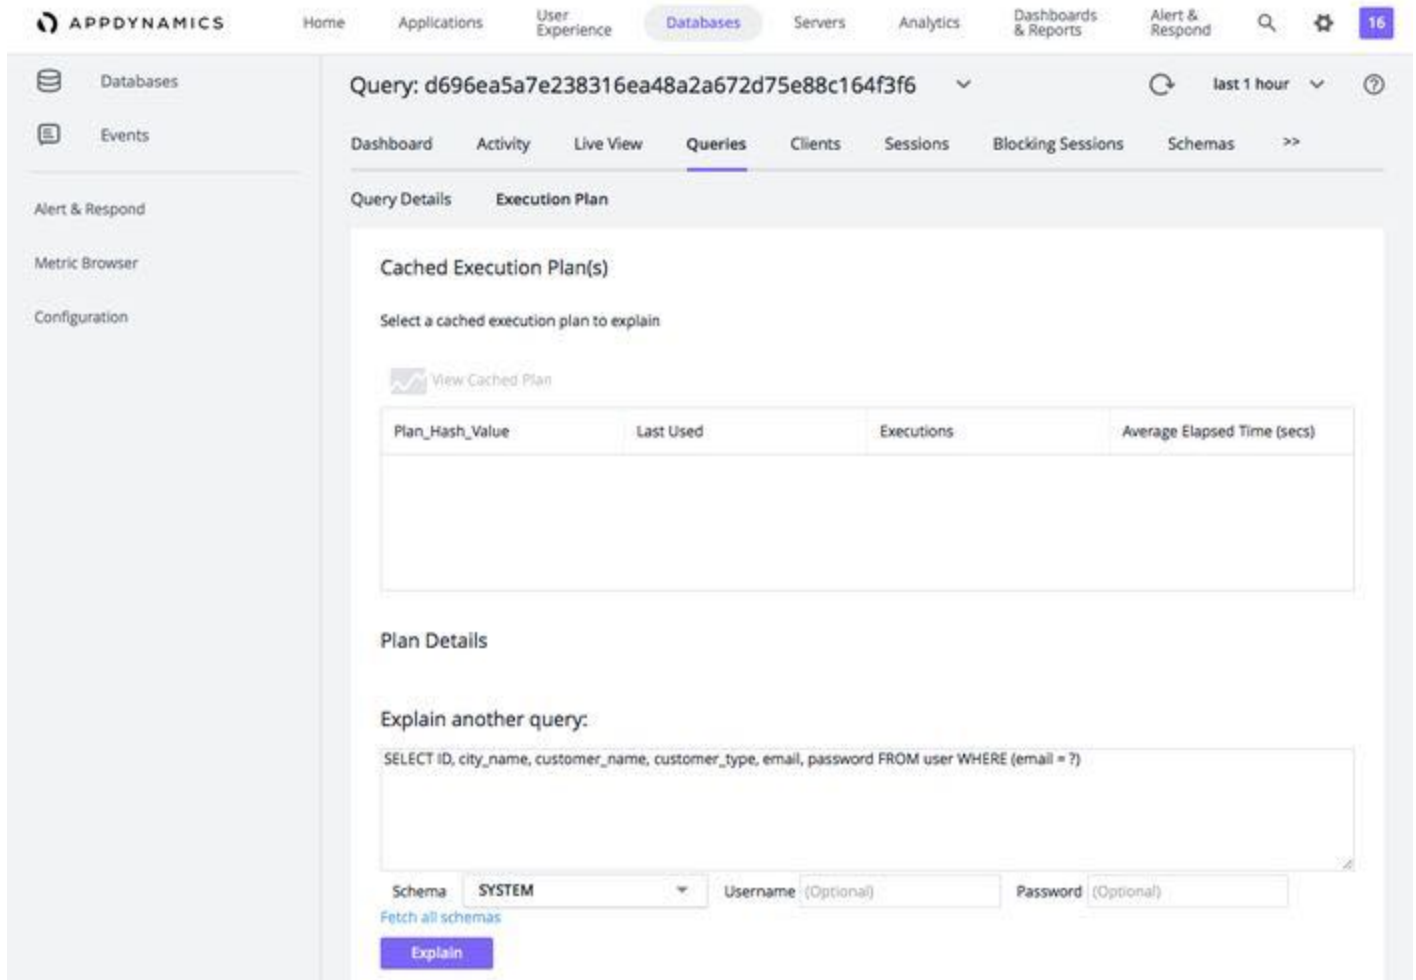

- CREATE SESSION
- SELECT_CATALOG_ROLE

To create a user with these permissions, you can run the following SQL. In this SQL, change "password" to a safe and secure password, and change the tablespace names, "users" and "temp" to those available in your Oracle instance.

```
CREATE USER C##DBMon_Agent_User IDENTIFIED BY password default tablespace users temporary
tablespace temp CONTAINER=ALL;
GRANT CREATE SESSION, SELECT_CATALOG_ROLE TO C##DBMon_Agent_User CONTAINER=ALL;
ALTER USER C##DBMon_Agent_User QUOTA 100M ON USERS;
alter user C##DBMON_AGENT_USER set container_data=all container=current;
```

Permissions Required for Oracle Explain Plans

To generate an execution plan for a specified query, paste the query text into the **Explain another query** box. You must provide a plan table in the AppDynamics monitoring user's schema. You can find a sample output table named PLAN_TABLE in the UTLXPLAN.SQL script. To update or view the plan table, you need INSERT and SELECT privileges. To explain a query, you need access privileges for the tables and views included in that query.

AppDynamics Database Visibility can generate explain plans within its SQL drill-down window. To enable this functionality, you must have a plan table accessible to the AppDynamics Database Visibility schema user. You can create this plan table with the following command from `sqlplus` when logged on as the AppDynamics Database Visibility user:

Windows:

```
@?\rdbms\admin\utlxplan.sql
```

Linux:

```
@?/rdbms/admin/utlxplan.sql
```

Permissions for individual views and tables

You can grant permission to individual views and tables even if the `SELECT_CATALOG_ROLE` permission is not available to your organization.

1. Execute permissions on `dbms_application_info.set_module`.

2. Select permissions on the following privileges:

dba_data_files
dba_ind_columns
dba_indexes
dba_objects
dba_procedures
dba_segments
dba_sequences
dba_synonyms
dba_tab_columns
dba_tables
dba_users
dba_views
gv\$instance
gv\$containers
gv\$parameter
v\$archive_dest
v\$archive_dest_status
v\$database
v\$datafile
v\$event_name
v\$instance
v\$license
v\$log
v\$osstat
v\$parameter
v\$process
v\$session
v\$sesstat
v\$session_wait
v\$sga
v\$sql
v\$sql_plan
v\$sqlstats
v\$sqltext
v\$statname
v\$sysmetric
v\$sysstat
v\$system_event

When you are granting access to v\$ views, you must grant SELECT on the underlying objects, which are named using the v_\$ format, e.g. GRANT SELECT on v_\$archive_dest.

Configure Oracle RAC

Related pages:

- [Database Topology Window](#)(see page 2479)

If you are configuring a collector for Oracle RAC, you only need to configure one collector for the entire cluster. You can choose any node in the cluster to connect to, and the entire cluster is automatically detected.

If you have sub-collectors, it will disable automatic cluster discovery.

When the Database Visibility collector connects to the hostname or IP address defined in the collector configuration, it auto-discovers the RAC instance. Once a successful connection is made to a node within the RAC, then a query on GV\$INSTANCE will be used to return the details of the other member nodes and to populate the [Topology Window](#)(see page 2479).

When monitoring Oracle RAC, the Controller displays the aggregate data for the entire cluster.

User Permissions for Oracle RAC

When you upgrade to 4.3, you may encounter the following error: Network access denied by access control list (ACL). You can resolve the error by enabling ACLs for the monitoring user.

```

begin
dbms_network_acl_admin.create_acl (
acl          => 'Resolve_Access.xml',
description  => 'Resolve Network Access using UTL_INADDR',
principal   => '<DBMON USER>',
is_grant    => TRUE,
privilege    => 'resolve',
start_date  => null,
end_date    => null
);
commit;
end;
/

begin
dbms_network_acl_admin.assign_acl (
acl          => 'Resolve_Access.xml',
host         => '*',
lower_port   => null,
upper_port   => null);
commit;
end;
/
  
```

Monitor Oracle Databases Using Kerberos Authentication

For the Database Agent to connect to and monitor the Oracle databases using Kerberos authentication, these settings are required:

- Start the Database Agent using the property, `java.security.krb5.conf`:

```
nohup java -Djava.security.krb5.conf="<path to Kerberos configuration file>"
```

- In the **CONNECTION DETAILS** section of the Collector configuration dialog, specify the JDBC connection string:

```
jdbc:Oracle:Tds:<hostname>:<portnum>?<Kerberos connection details>
```

- In the **ADVANCED OPTIONS** section of the Collector configuration dialog, ensure to provide these details:
 - Select **LDAP/Kerberos**.
 - Select **Connection Properties**, then specify these JDBC connection properties:

Property Name	Property Value
oracle.net.authentication_services	(KERBEROS5)
oracle.net.kerberos5_mutual_authentication	true
oracle.net.kerberos5_cc_name	"<cache_file_path>" For example: "I:\\Kerberos\\krb5ccFile"

Configure PostgreSQL Collectors

You can monitor any version of PostgreSQL with Database Visibility.

Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent.
	Custom JDBC Connection String	The JDBC connection string generated by the database agent, for example, <code>dbc:postgresql://</code> . You can also specify a custom connection string, which is useful for setting custom authentication options.
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in User Permissions for PostgreSQL (see page 2455).
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.

Section	Field	Description
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the JavaPasswordSDK.jar file from the CyberArk web site and rename the file to cyberark-sdk-9.5.jar. Then, you must copy the JAR file to the lib directory of the database agent zip file.
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the Create Collector API¹⁵⁴².</p> <p>• You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data.</p> </div>
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.
	EnterpriseDB	Click if your PostgreSQL database installation is an EnterpriseDB ¹⁵⁴³ distribution.

1542 <https://docs.appdynamics.com/display/PRO45/Database+Visibility+API#DatabaseVisibilityAPI-SupportedAPICalls>

1543 <http://www.enterprisedb.com/>

Section	Field	Description
	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating System	See Configure the Database Agent to Monitor Server Hardware (see page 2461).

User Permissions for PostgreSQL

The monitoring user must either have a role of superuser or be granted access to the pg_stat_activity table using the technique described below.

The following script allows you to create a SECURITY DEFINER function that is owned by the superuser, and runs the query you want, thus allowing non-superusers to see the contents of pg_stat_activity by calling the get_sa() function and pg_stat_statements by calling the get_querystats() function respectively. The script must be executed by the superuser.

i Ensure that you create the pg_stat_statements extension by using the command, create extension pg_stat_statements.

```
CREATE FUNCTION get_sa()
RETURNS SETOF pg_stat_activity LANGUAGE sql AS
$$ SELECT * FROM pg_catalog.pg_stat_activity; $$
VOLATILE
SECURITY DEFINER;

CREATE VIEW pg_stat_activity_allusers AS SELECT * FROM get_sa();
GRANT SELECT ON pg_stat_activity_allusers TO public;
```

```
CREATE FUNCTION get_querystats()
RETURNS SETOF pg_stat_statements LANGUAGE sql AS
$$ SELECT * FROM pg_stat_statements; $$
VOLATILE
SECURITY DEFINER;
CREATE VIEW pg_stat_statements_allusers AS SELECT * FROM get_querystats();
GRANT SELECT ON pg_stat_statements_allusers TO public;
```

The monitoring user must also be able to connect remotely to the PostgreSQL instance from the AppDynamics for Databases machine.

Configure Sybase Collectors

To monitor Sybase with Database Visibility, you must run Sybase >= 15.

Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent.
	Custom JDBC Connection String	The JDBC connection string generated by the database agent, for example, <code>jdbc:sybase:.</code> . You can also specify a custom connection string, which is useful for setting custom authentication options.
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in User Permissions for Sybase (see page 2457).
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the <code>JavaPasswordSDK.jar</code> file from the CyberArk web site and rename the file to <code>cyberark-sdk-9.5.jar</code> . Then, you must copy the JAR file to the lib directory of the database agent zip file.

Section	Field	Description
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div style="border: 1px solid #0070C0; background-color: #E6F2FF; padding: 10px; margin-top: 10px;"> <p> • All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the Create Collector API¹⁵⁴⁴.</p> <p>• You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data.</p> </div>
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.
	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating System	See Configure the Database Agent to Monitor Server Hardware (see page 2461).

User Permissions for Sybase

For complete AppDynamics Database Visibility functionality, the monitoring user requires the permissions listed in the table below.

¹⁵⁴⁴ <https://docs.appdynamics.com/display/PRO45/Database+Visibility+API#DatabaseVisibilityAPI-SupportedAPICalls>

Permission type	Permission
Role permission	<ul style="list-style-type: none"> sa_role mon_role
Select permission	<ul style="list-style-type: none"> master.dbo.monWaitEventInfo master.dbo.sysconfigures master.dbo.sysmonitors master.dbo.monProcess master.dbo.monProcessLookup master.dbo.monProcessSQLText master.dbo.monProcessProcedures
Execute permission	<ul style="list-style-type: none"> sp_sysmon

If you require to browse the objects of a custom database, use the following command:

```
use [custom-db-name]
sp_adduser <user-name>
```

To create a new dedicated user for AppDynamics Database Visibility, you can use following sample user creation script. Before running the script, change "password" to a more secure value.

```
exec sp_addlogin 'DBMon_Agent_User', 'password', @defdb='master', @deflanguage='us_english',
@fullname='DBMon_Agent_User monitoring account', @auth_mech = 'ANY'
go
exec sp_locklogin 'DBMon_Agent_User', 'unlock'
go
exec sp_role 'grant', 'mon_role', 'DBMon_Agent_User'
go
```

where DBMon_Agent_User is the user name under which you run the Database Visibility Agent.

Also, the following configuration parameters must be set to 1 (true) to monitor the Sybase ASE database with AppDynamics Database Visibility: "enable monitoring", "wait event timing", "SQL batch capture", and "object lockwait timing". You should also set "max SQL text monitored" to at least 8192 (8kB).

Here is an example of the commands required to configure these settings:

```
sp_configure "enable monitoring", 1
go
sp_configure "wait event timing", 1
go
sp_configure "SQL batch capture", 1
go
sp_configure "object lockwait timing", 1
go
sp_configure "max SQL text monitored", 8192
```

```
go
```

If the value for "max SQL text monitored" was previously less than 4096, then increasing this setting will require that you restart the Sybase ASE instance.

To monitor Sybase >= 15.7 without the sa_role permission, run these commands:

```
use sybssystemprocs
grant execute on sp_sysmon to mon_role
```

i If you choose to monitor Sybase using sp_sysmon, you may encounter the following errors:

- Thread utilization is incorrectly reported. View the official report [here](#)¹⁵⁴⁵.
- Timeslice error in mmap64 or mda_flush_iostats. View the official report [here](#)¹⁵⁴⁶.

Configure Sybase IQ Collectors

You can monitor any version of Sybase IQ with Database Visibility.

Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent.
	Custom JDBC Connection String	The JDBC connection string generated by the database agent, for example, jdbc/sybaseiq:. You can also specify a custom connection string, which is useful for setting custom authentication options.
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in User Permissions for Sybase IQ (see page 2461).

¹⁵⁴⁵ <https://apps.support.sap.com/sap/support/knowledge/preview/en/2438941>

¹⁵⁴⁶ <https://apps.support.sap.com/sap/support/knowledge/preview/en/2283459>

Section	Field	Description
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the <code>JavaPasswordSDK.jar</code> file from the CyberArk web site and rename the file to <code>cyberark-sdk-9.5.jar</code> . Then, you must copy the JAR file to the <code>lib</code> directory of the database agent zip file.
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the Create Collector API¹⁵⁴⁷.</p> <p>• You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data.</p> </div>
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.

1547 <https://docs.appdynamics.com/display/PRO45/Database+Visibility+API#DatabaseVisibilityAPI-SupportedAPICalls>

Section	Field	Description
	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating System	See Configure the Database Agent to Monitor Server Hardware (see page 2461).

User Permissions for Sybase IQ

To monitor with a non-DBA account, you need:

- User account with SERVER OPERATOR system privilege.
- Execution privileges on several procedures which can be granted as follows:

```
grant execute on sp_iqconnection to DBMon_Agent_User
grant execute on sp_iqtransaction to DBMon_Agent_User
grant execute on sp_iqcontext to DBMon_Agent_User
grant execute on sp_iqstatus to DBMon_Agent_User
grant execute on sp_iqcolumn to DBMon_Agent_User
grant execute on sp_iqindex to DBMon_Agent_User
```

where DBMon_Agent_User is the user name under which you run the Database Visibility Agent.

- Grant DBA authority to DBMon_Agent_User:

```
grant DBA to DBMon_Agent_User
```

Monitor Sybase Databases Using Kerberos Authentication

For the Database Agent to connect to and monitor Sybase databases using Kerberos authentication, these settings are required:

- In the Connection Details section of the **Collector** configuration dialog, specify the JDBC connection string:

```
jdbc:sybase:Tds:<hostname>:<portnum>?REQUEST_KERBEROS_SESSION=true&SERVICE_PRINCIPAL_NAME=<my server>
```

- Start the Database Agent using the `-Djavax.security.auth.useSubjectCredsOnly=false` option:

```
nohup java -Djavax.security.auth.useSubjectCredsOnly=false /<db_agent_home>/db-agent.jar &
```

Configure the Database Agent to Monitor Server Hardware

Related pages:

- [Monitor Database Server Hardware](#)(see page 2503)

In addition to monitoring the database server, the Database Agent can also monitor the hardware that hosts the database server. To configure the Database Agent to monitor the database server hardware, complete the **Hardware Monitoring** section of the [Collector configuration](#) (see page 2415) dialog.

Click **Databases > Configuration > Collectors** and then choose an existing collector to monitor the hardware for that database server and click **Edit**, or click **Add** to set up a new collector to monitor a different database server and the hardware hosting that server.

Complete the Hardware Monitoring Section

The following describes the fields in the **Collector Configuration** dialog that you must complete if you want to monitor the database server host hardware, in addition to the database server.

i For Oracle database, the **CPU** and the **Memory** metrics are monitored even when hardware monitoring is disabled.

Monitor Operating System: Select if you want CPU consumption metrics collected from the monitored host.

Operating System: Specify the operating system of the monitored host: Windows, Linux, Solaris, AIX, or RDS.

Use Local WMI: Check this box if you want to monitor the machine the Database agent is running on, i.e. localhost. When selected, the authorization fields are not used because no authorization is required.

Domain: For Windows only, specify the name of the domain in which the hardware resides.

SSH Port: For Linux, AIX, and Solaris only, specify the Secure Shell (SSH) port number the Controller should use for encrypted communications with the monitored host. The default port number of 22 will be used if you do not specify a different port number here.

Use certificate: For Linux, AIX, and Solaris only, AppDynamics also supports certificate-based authentication through Privacy Enhanced Mail (PEM). To implement certificate-based authentication, enable the **Use certificate** option and copy the PEM file to the <db_agent_home>\keys directory. Note, if the \$HOME/.ssh directory exists, the agent will use the certificate found there. This option appears only if the agent is running on a machine running Linux, AIX or Solaris.

Username: Specify the name of the user the Database Agent uses to log on to the monitored host. To collect OS metrics from a Windows host, the configured user (or Collector Service user if using Windows Authentication) must be able to establish a WMI connection to the target host and collect Windows Performance Counters.

Password: Specify the password of the user the Database Agent uses to log on to the monitored host. The number of echo characters shown in the password text field should not be interpreted to imply the number of characters stored for the (encrypted) user password.

i

- Windows hardware monitoring is not supported by Database Agent installed on a Linux system. However, Database Visibility can support hardware metrics for SQL server through SQL query collection.
- Database Visibility does not collect hardware metrics for the following database servers because these database servers require SSH connection to collect hardware metrics:

- Apache Cassandra
- Datastax Enterprise (DSE) Cassandra
- Couchbase
- IBM DB2
- MongoDB
- MySQL
- Sybase

You must enable **Monitor Operating System** to collect the hardware metrics for these database servers.

- For Oracle and MSSQL database, hardware metrics can be collected through either SQL query collection or SSH connection. However, Database Visibility does not support collecting hardware metrics using SQL query for the preceding list of database servers.

Resolve Metric Reporter Type Mismatch Problem

Switch from the Java Hardware Monitor to the [Hardware Monitor](#) (see page 0) if you see messages similar to the following in the logs:

```
[Worker-7] 12 Sep 2014 07:27:49,449 WARN MonitorOutputHandler - Metric Reporter type mismatch
for metric [Hardware Resources|Network|Incoming packets/sec]
com.singularity.ee.agent.commonservices.metricgeneration.metrics.MetricReporterTypeMismatchEx
ception: Aggregator of OBSERVATION already exists for metric Metric Identifier[Hardware
Resources|Network|Incoming packets/sec] ID[0]
```

Required Monitored Host Permissions

Database Agent User Permissions

Database Visibility collects the stats from common commands like `vmstat/iostat` or gathering metrics from the file system such as `/proc` and as such the user that runs the Database Agent requires no special permissions, just the ability to run those common commands and write to files in the Database Agent directory.

Database Agent Collector Authentication

When monitoring the database host, Database Visibility must log in to the host system to gather system information. There are three ways to authenticate the Database Collector to access the monitored host:

- Specify a username and password in the Collector configuration dialog
- Place a PEM file or an `id_rsa` file in the `<agent home>/keys` directory
- If the Database Agent is running on LINUX, Solaris or AIX, place SSH keys in the `<home>.ssh` directory of the user running the agent. You can create an SSH key using the same procedure as described for the Controller. See [Configure a Controller SSH Key](#)¹⁵⁴⁸.

Required SSH Permissions

When monitoring the database host, Database Visibility uses SSH on Linux and Windows systems to gather system information. SSH access can be through either an authenticated username/password or a private key.

¹⁵⁴⁸ <https://docs.appdynamics.com/display/PRMY21/.Configure+a+Controller+SSH+Key+v21.5>

You can create an SSH key using the same procedure as described for the Controller. See [Configure a Controller SSH Key](#)¹⁵⁴⁹.

Configure WMI Permissions and Security

Related pages:

- [WMI and the Database Agent on the AppDynamics Community](#)¹⁵⁵⁰

To monitor Windows-based machine hardware with AppDynamics Database Visibility, AppDynamics uses Windows Management Instrumentation (WMI) to remotely gather the metrics. WMI is often complicated to troubleshoot when the Database Agent is running on a Linux or Unix-like machine.

This page describes requirements for the target machine configuration that can help you avoid some problems and pitfalls. It also provides some additional considerations regarding using WMI to monitor a SQL Server database agent and preventing unauthorized remote access to WMI.

Named Windows Account:

The user specified in the collector configuration that the AppDynamics Database Agent uses to connect to the target machine is referred to as <named Windows account>.

The following are required when the Database Agent is hosted on AIX, Linux or Solaris platforms to monitor Windows ≥ 7 systems.

- Ensure that the named Windows account is a member of the local Administrators group.
- [Ensure User Account Meets Minimum Security Requirements When Using WMI](#)(see page 2464)
- [Enable Remote Registry Access](#)(see page 2465)
- [Grant access to WBEM scripting locator](#)(see page 2465)

The following are required when the Database Agent is hosted on AIX, Linux, or Solaris platforms to monitor Windows ≥ 2012 systems.

- [Grant full control permissions to select registry keys](#)(see page 2466)

The following is required when the Database Agent is hosted on Windows.

- Ensure that the named Windows account is a member of the local Administrators group.

Requirements to Monitor Windows ≥ 7 Systems (Agent Running on Unix-like Platform)

The following are required when the Database Agent is hosted on AIX, Linux, or Solaris platforms to monitor Windows ≥ 7 systems.

Ensure User Account Meets Minimum Security Requirements When Using WMI

Enable Security Options for Windows Systems are Part of a Domain

Ensure the named Windows account has the correct permissions for WMI Control.

1. Run the `wmimgmt.msc` program.
2. Right-click the **WMI Control** icon on the left and click **Properties**.
3. Click **Security**.

¹⁵⁴⁹ <https://docs.appdynamics.com/display/PRMY21/.Configure+a+Controller+SSH+Key+v21.5>

¹⁵⁵⁰ <http://community.appdynamics.com/t5/tag/wmi/tg-p/board-id/knowledge-base>

4. Click the root node of the tree, and click **Security**.
5. Ensure that the named user account running the Database Agent has the relevant permissions.

The minimum permissions that your remote Windows account needs for the Database Agent are:

- Execute Methods
- Enable Account
- Remote Enable

If the named Windows account does not have all of these permissions, you may receive an access denied error or the following errors:

Error=800706BA The RPC server is unavailable. SWbemLocator
or

Error=80070005 [Access is denied](#)(see page 0) SWbemLocator

Enable Classic Security Options for Local (Non-Domain) Windows Systems

Applies to Windows computers that are not part of a domain.

1. Open the **Control** panel, and go to **Administrative Tools > Local Security Policy**. The **Local Security Settings** panel appears.
2. Go to **Local Policies > Security Options**.
3. Change the value of **Network access: Sharing and security model for local accounts** to **Classic**.

Enable Remote Registry Access

The Remote Registry service must be running on the target machine. If the Remote register service is off, you will receive the following error:

Message not found for errorCode: 0xC0000034

or

Access is denied

By default Windows >= 7 systems will still deny remote access to the registry, even if the Remote Registry service is started.

To test this:

1. Attempt to access the replica registry using Regedit on another machine.
2. If you get an error similar to `Access is denied`, run PowerShell as an administrator on the replica, and execute `Enable-PSRemoting`.
3. Restart the machine and try launching the replica again.

Grant Access to WBEM Scripting Locator

The Database Agent requires full access to the WBEM Scripting Locator. On the target system, allow full access to the WBEM Scripting Locator as follows:

1. As an Administrator on the target machine, launch Regedit.
2. Locate the registry key:
76A64158-CB41-11D1-8B02-00600806D9B6 in HKEY_CLASSES_ROOT\CLSID
3. Right-click the key and click **Permissions**.

4. Click **Advanced**.
5. Click **Owner** and change the owner to the Administrators group. Click **Apply**.
6. Click **Permissions** and change the permissions for the Administrators group to **Full Control**. Click **Apply**.
7. Close Regedit.
8. Restart the Remote Registry Service, using **Administrative Tools > Services**.

Configure the Firewall

WMI uses RPC which listens on port 135 but then allocates a dynamic port for subsequent communication. Configure your Firewall to always allow the TCP port 135 exception and follow the dynamic RPC ports. If there is a problem with the firewall, port 135 then you will probably see this error:

```
ERROR: Message not found for errorCode: 0xC0000001
```

See [How to configure RPC dynamic port allocation to work with firewalls](#)¹⁵⁵¹.

Additional Requirements to Monitor Windows >= 2012 Systems (Agent Running on Unix-like Platform)

In addition to the requirements described in [Requirements to Monitor Windows >=7 Systems](#)(see page 0), the following are also required when the Database Agent is hosted on AIX, Linux, or Solaris platforms to monitor Windows >= 2012 systems.

Grant Full Control Permissions to Select Registry Keys

For the Database Agent running on AIX, Linux, or Solaris to monitor Windows >= 2012 (64-bit) systems, complete the following changes on the target system.

1. As an Administrator on the target machine, launch Regedit.
2. Change the permissions for both of these registry keys to **Full Control**:
72C24DD5-D70A-438B-8A42-98424B88AFB8
in HKEY_LOCAL_MACHINE\SOFTWARE\Classes\Wow6432Node\CLSID
76A64158-CB41-11D1-8B02-00600806D9B6 in HKEY_CLASSES_ROOT\CLSID
3. Find this registry key:
72C24DD5-D70A-438B-8A42-98424B88AFB8 in
HKEY_LOCAL_MACHINE\SOFTWARE\Classes\Wow6432Node\CLSID
4. Right-click and click **Permissions**.
5. Change the owner to the Administrators group.
6. Change the permissions for the Administrators group to **Full Control**.
7. Change owner back to **TrustedInstaller**. User is <NT Service\Trusted Installer> on the local machine.
8. Repeat steps 4 to 6 above for this registry key:
76A64158-CB41-11D1-8B02-00600806D9B6 in HKEY_CLASSES_ROOT\CLSID.
9. Close Regedit.
10. Restart the Remote Registry service, using **Administrative Tools > Services**.

General Considerations for all Platforms

This information applies to the Database Agent running on Windows systems.

1551 <https://support.microsoft.com/en-gb/help/154596/how-to-configure-rpc-dynamic-port-allocation-to-work-with-firewalls>

Use Windows Authentication for Microsoft SQL Server

To use Windows Authentication for the Database Agent to connect to a Microsoft SQL Server database instance, you must use a command similar to the following to start the Database Agent; specifying the path to the Database Agent authentication library.

Windows 64-bit

```
java -Djava.library.path="C:\dbagent404\auth\x64" -jar db-agent.jar
```

Windows 32-bit

```
java -Djava.library.path="C:\dbagent404\auth\x86" -jar db-agent.jar
```

The Windows account used to start the Database Agent must be a Windows user who can authenticate with the database server.

Access Database Visibility from Application Monitoring Views

Related pages:

- [Monitor Database Performance](#)(see page 2471)
- [App Agent Node Properties](#)(see page 1137)

¹⁵⁵² <https://blog.appdynamics.com/database/top-6-database-performance-metrics-to-monitor-in-enterprise-applications/>

To view the application dashboard of a specific application, click the application on the **Home** page. On the application dashboard, you can view the following:

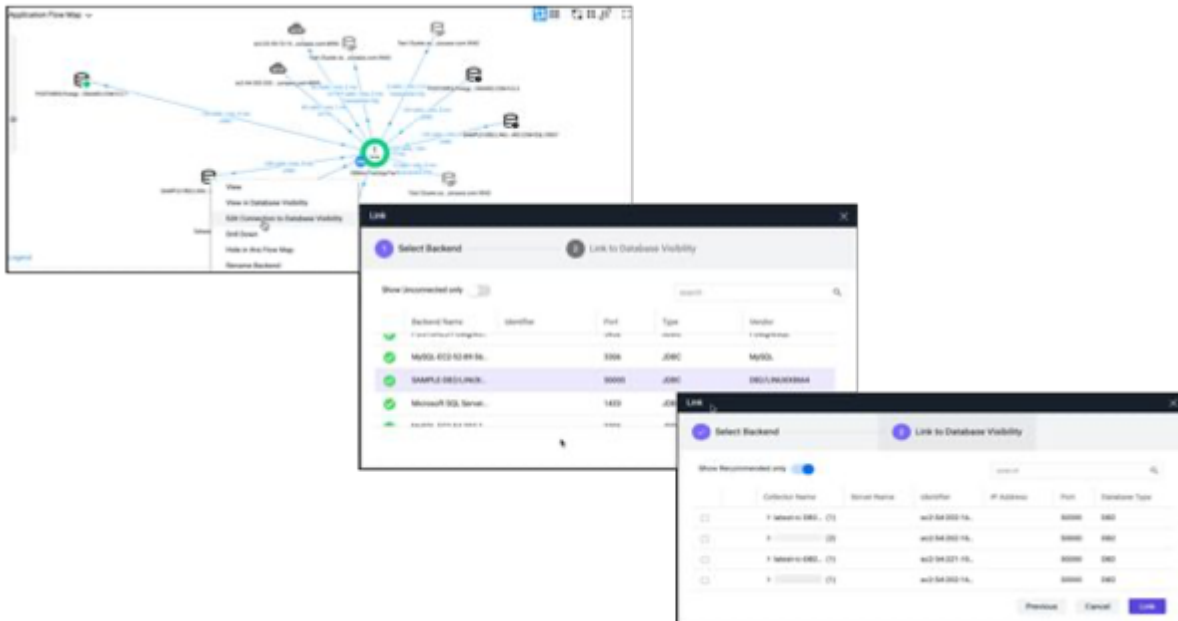

- **Unconnected Backends:** If there are any unconnected backend database servers, the flowmap displays the unconnected database server icon. You can click the icon, then click **Connect** to connect the backend database to the appropriate server or cluster in **Database Visibility**.
- **Status of the Database:** There are different icons to display different states of the database based on the health rule violation. For information about the different icons, see [Database Icons](#)(see page 1317).
- **Quick View of Database Visibility:** If you require to view some of the main metrics without going to the **Database Visibility** UI, you can click the database icon and the quick view of the metrics is displayed. For detailed information, click **View in Database Visibility**.

View Database Activity in Database Visibility

Once you have [configured a database Collector](#)(see page 2415) in AppDynamics Monitoring, you can access Database Visibility either from the AppDynamics Home page or you can link to the Database Visibility database instance Dashboard by right-clicking the database and selecting **View in Database Visibility** on the Application Flow Map, Tier Flow Map or Node Flow Map.

Database backends with the same hostname, port number, and database type as a database server already configured in a database Collector are automatically matched with the Collector, and drilldowns from the Application Flow Map, Tier Flow Map or Node Flow Map to Database Visibility are enabled.

The AppDynamics Database Visibility section in the Application Database Dashboard displays which database Collector is associated with the database. If you require to change this association, right-click the database and then click **Edit Connection to Database Visibility** and choose the appropriate server or cluster that is configured in **Database Visibility**.

View Business Transaction Snapshot Correlated Database Details

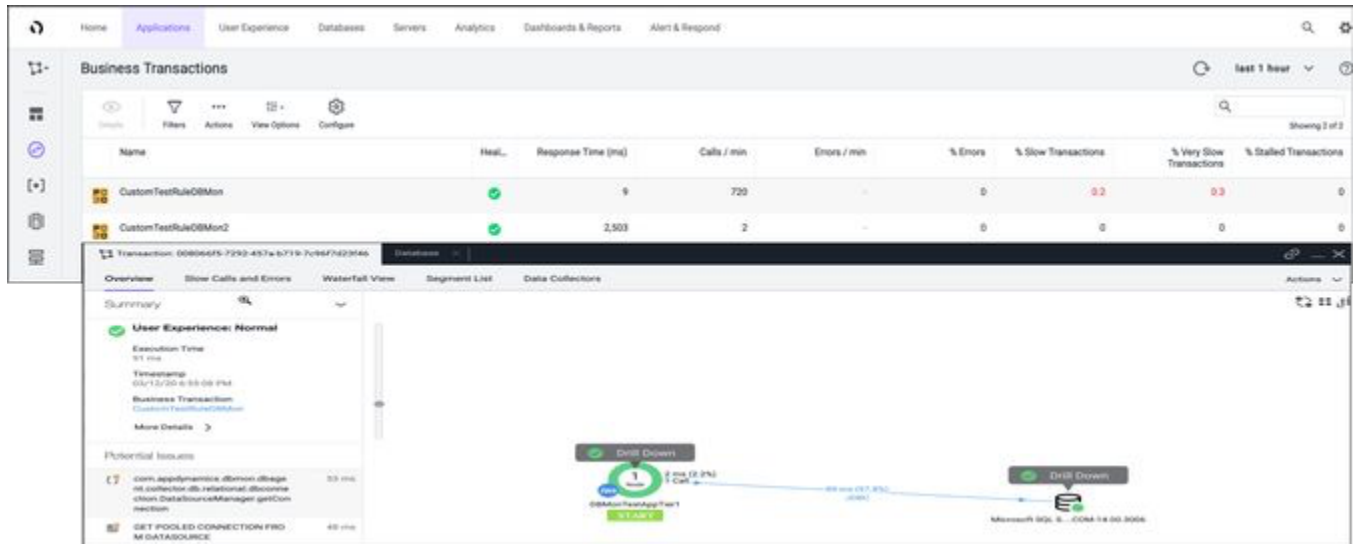

Available for Java, .NET, and PHP applications and their relational database backends, snapshot correlation shows the details of queries executed by the business transaction. It also shows the clients, sessions, and schemas in which those queries were executed.

View Database Details

1. On the [Business Transactions](#)(see [page 1238](#)) page, double click any business transaction to view the queries that are executed in that transaction.
2. Click the DB Queries tab. On this tab, you can view the queries that were issued by this business transaction.

View Correlated Database Details

1. From a list of business transactions with snapshots, choose a long-running business transaction that accesses the database, one that takes a few seconds or more. These are more likely to have captured database details.
2. Double-click **Drill Down** above the database icon. The correlated database details window appears.
3. Click the Queries, Clients, Sessions, and Schema tabs to view details of database activity that occurred around the time when the snapshot was captured. For relational databases, these details reflect the database activity from the transaction snapshot. For non-relational databases, these details reflect the database activity that occurred around the time of the transaction snapshot.

i For Oracle backends only: If you want to list only the queries executed by the Transaction Snapshot in the Transaction Snapshot window, you can enable the `jdbc-dbcam-integration-enabled` node property for the Java Agent.

Discover Normal Database and Server Activity

Related pages:

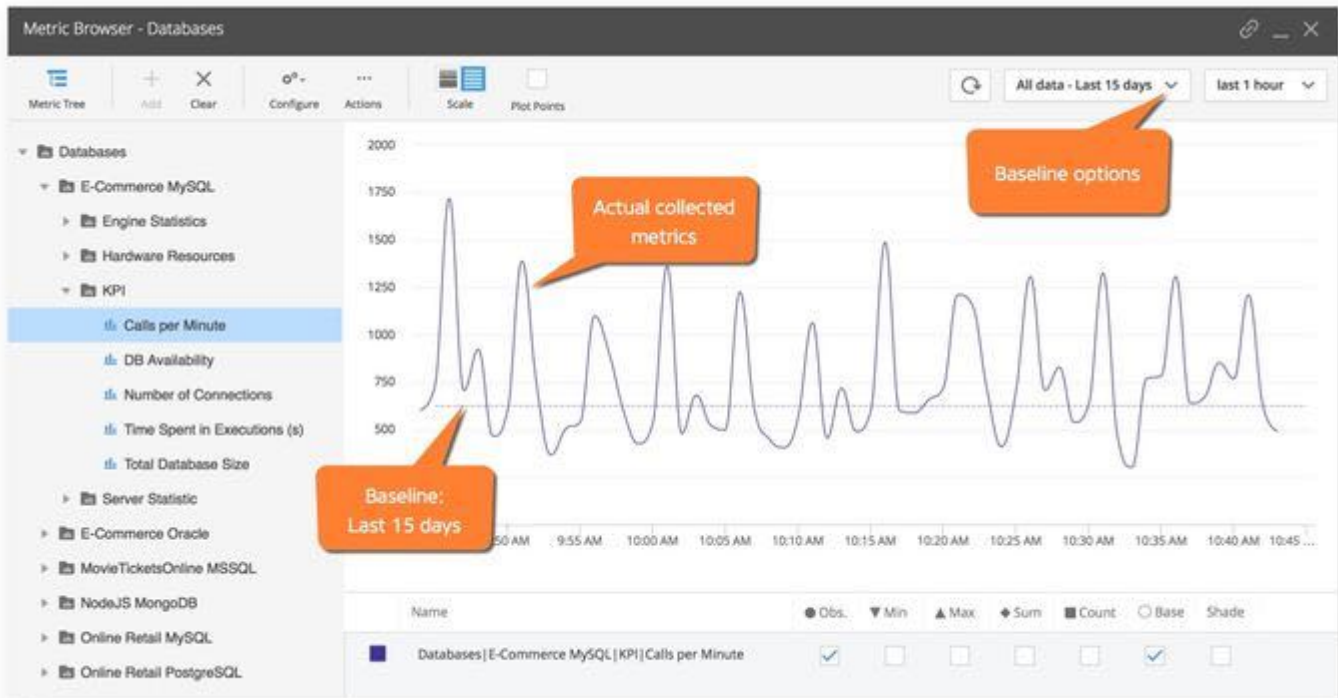

- [Dynamic Baselines](#)(see page 1255)
- [Health Rules](#)(see page 283)

AppDynamics Database Visibility automatically learns to detect performance anomalies using baselines that are specific to your database and database server environments.

AppDynamics creates baselines by collecting metrics from your monitored databases and servers over defined periods of time. This establishes what is normal for your environment. You can also create your own baselines.

View Performance Metrics on the Metric Browser

On the Metric Browser for Database Visibility, you can visualize performance metrics and see how they deviate from expected behaviors established by the baseline.

Monitor Database Performance

Related pages:

Important information

Garbage collection affects all monitored entities, including database queries, sessions, clients, and schemas. Entities that are garbage collected will be displayed as unavailable.

View Overall Database and Server Performance

Related pages:

- [Access Database Visibility from Application Monitoring Views](#)(see page 2467)

Database Visibility provides overall views of your databases that show key performance indicators.

Access the Databases Window

From AppDynamics Home, click **Databases**.

Features of the Databases Window

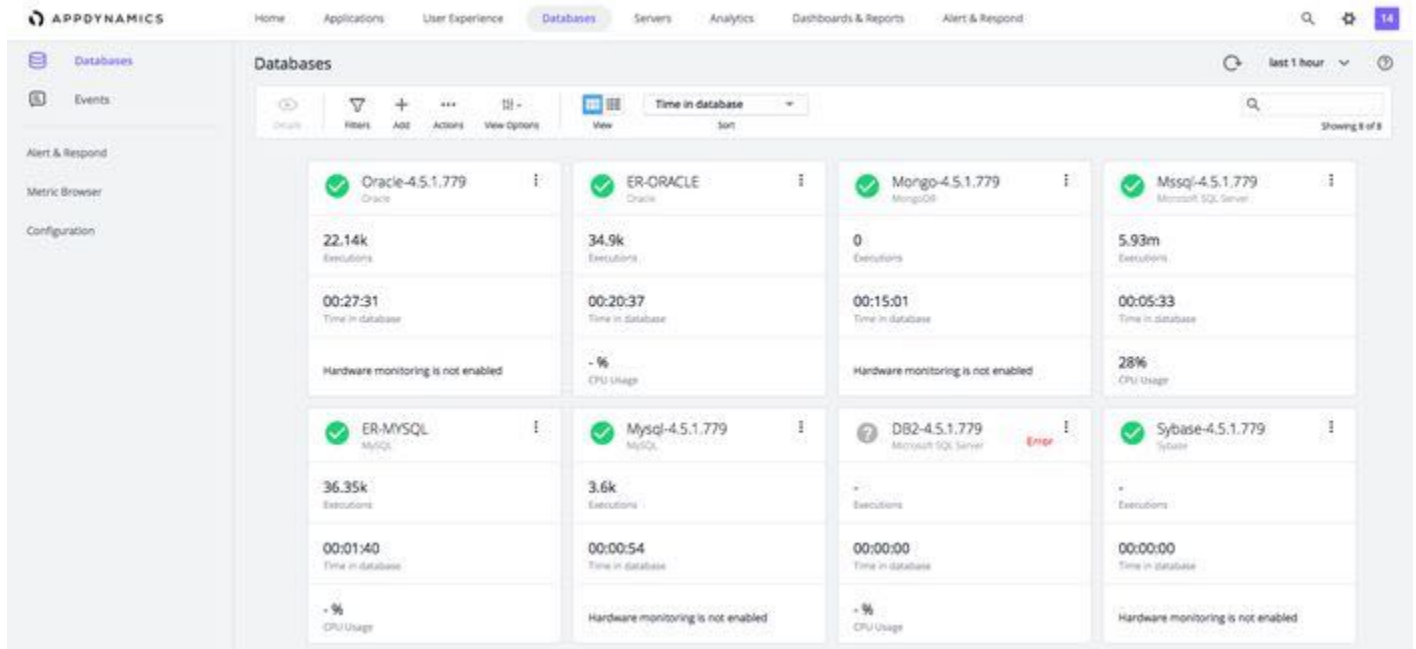

On the views of the Databases window you can:

- Show only databases meeting certain criteria by entering search criteria in the search box on the top right of the page.
- Click **Filters** to show only databases meeting certain search criteria, such as criteria that describes Health, Load, Time in database or Type.
- Click **+** to add a new database Collector.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.
- Click **View** to switch between card and list view.
- See the overall performance of your databases and if there are any critical issues with them. The server health or status indicates whether criteria has been met for normal, warning or critical health rules. The green checkmark indicates that the database is operating within normal conditions, the red exclamation mark indicates that at least one critical health rule has been violated.
- Click the name of the database to switch to the Database Dashboard for that specific database.

Databases Card View

From the Databases card view, you can view:

- The configured collectors along with the database type and the number of nodes used in the database cluster.
- The **Total Executions** graph that provides insight into the total number of calls (transactions for PostgreSQL databases) monitored for the database over the selected time period.
- The **Time in Database** graph that indicates the total time spent executing those calls during the selected time period. This metric is expressed in hours, minutes, and seconds.
- **CPU Usage** metrics that when enabled shows the percentage of CPU capacity consumed by the database.

Databases List View

From the Databases list view, you can:

- View the number of database nodes under the **Nodes** column.
- Click **View Options** to turn the spark charts on and off.
- Get to the databases you want to see quickly if you are monitoring many databases.
- Click on any point in the spark charts to see a metric for that point in time. For example, clicking on a point in the calls Trend shows how many calls were monitored at that time.
- Click on a column name to sort the list on that key.

Database Dashboard

Related pages:

- [Access Database Visibility from Application Monitoring Views](#)(see page 2467)
- [View Overall Database and Server Performance](#)(see page 2472)
- [Discover Normal Database and Server Activity](#)(see page 2470)
- [Database Health Rules and Alerts](#)(see page 2505)
- [Monitor Database Performance](#)(see page 2471)

The dashboard for each individual database provides detailed information about your database.

Permissions

To view database collectors, users need a role with the **Can View All Collectors** permission.

Access the Database Dashboard

You can access the Database Dashboard in one of these ways:

- In AppDynamics Home, on the **Databases** card, click the name of the database for which you want to see the Database Dashboard.
- In the Databases overview panel, click the name of the database for which you want to see the Database Dashboard.

Features of the Database Dashboard

On the Database Dashboard you can:

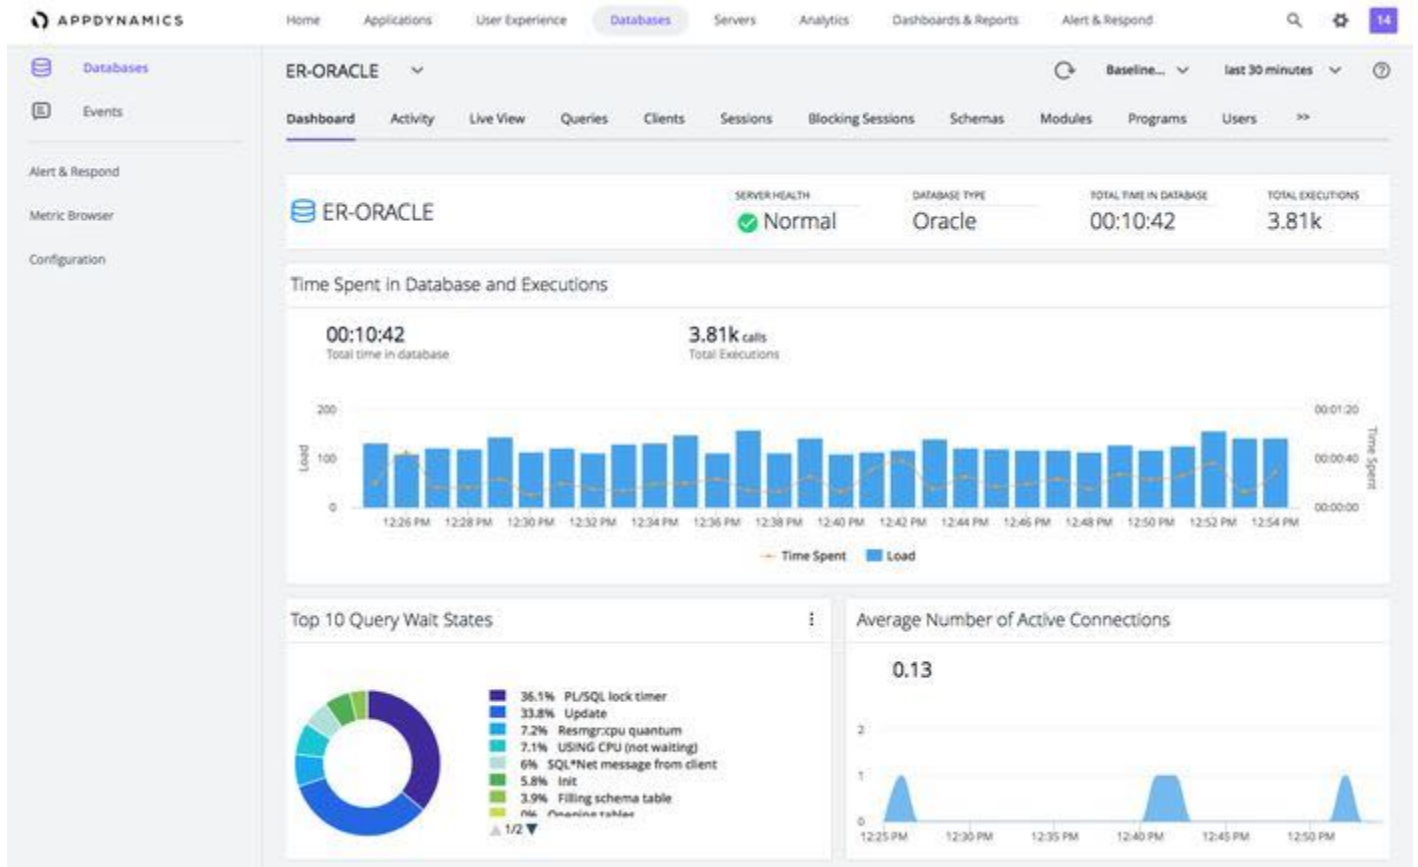

- Click the dropdown arrow next to the database Collector name at the top of the page to choose a database that you want to see the dashboard for.
- (From 21.5 onwards) For a clustered database, click the down-arrow below the collector name to navigate between different nodes of the cluster. By default, **All Nodes** is selected.
- Click the down-arrow next to the clustered database Collector name to navigate between different nodes of the cluster.
- Click the status icon below **SERVERS** in the top section of the dashboard to go directly to **Events** where you can see any recent events.

On the Database Dashboard, you can view:

- **Server Health:** Server Health at the top of this panel indicates the extent to which health rules are being violated:
 - Green - Healthy server
 - Yellow/orange - server with warning-level violations
 - Red - server with critical-level violations
- **Type:** The database type.
- **Time Spent in Database and Executions:**
 - Load - At a glance, you can see the total number of calls (transactions for PostgreSQL databases) during the specified time period and the number of calls for any point in time.
 - Time spent in Database - The total time spent executing SQL statements during the specified time period.
 - Changes - Changes made to the database configuration parameters.
 - Max CPU - It displays the CPU cores present in the database server and is disabled by default. The CPU core count is collected using SQL (for Oracle, DB2, and MSSQL) and Hardware monitoring (if enabled for MySQL, PostgreSQL and Sybase).
- **Top 10 SQL Wait States (not available for Couchbase):** Activities that contribute to the time it takes the database to service the request. The wait states consuming the most time may point to performance bottlenecks. For example, a db file sequential read wait state may be caused by segment header contention on indexes or by disk contention. See your database platform documentation for descriptions of the SQL wait states. For example:
 - Wait State - CHECKPOINT_QUEUE
 - Description - Used by background worker that waits on events on queue to process checkpoint requests.
 - Recommended Action - You should be able to safely ignore this action because it indicates that the checkpoint background worker is waiting for work to do. If you thought you had issues with checkpoints not working or log truncation, you might see if this worker ever "wakes up". Expect higher wait times as this will only wake up when there is work to do.
- **Top 10 Phases (Couchbase only):** The phases that have processed the most documents.
- **Average number of active connections:** This is a derived metric. This calculates the average number of queries that execute every second in the period of one minute.
The metric displays **Number of connections**, which represents the average number of active query execution.
For example: If there are 3 queries running every second for a one-minute duration, then the number of connections is 3.

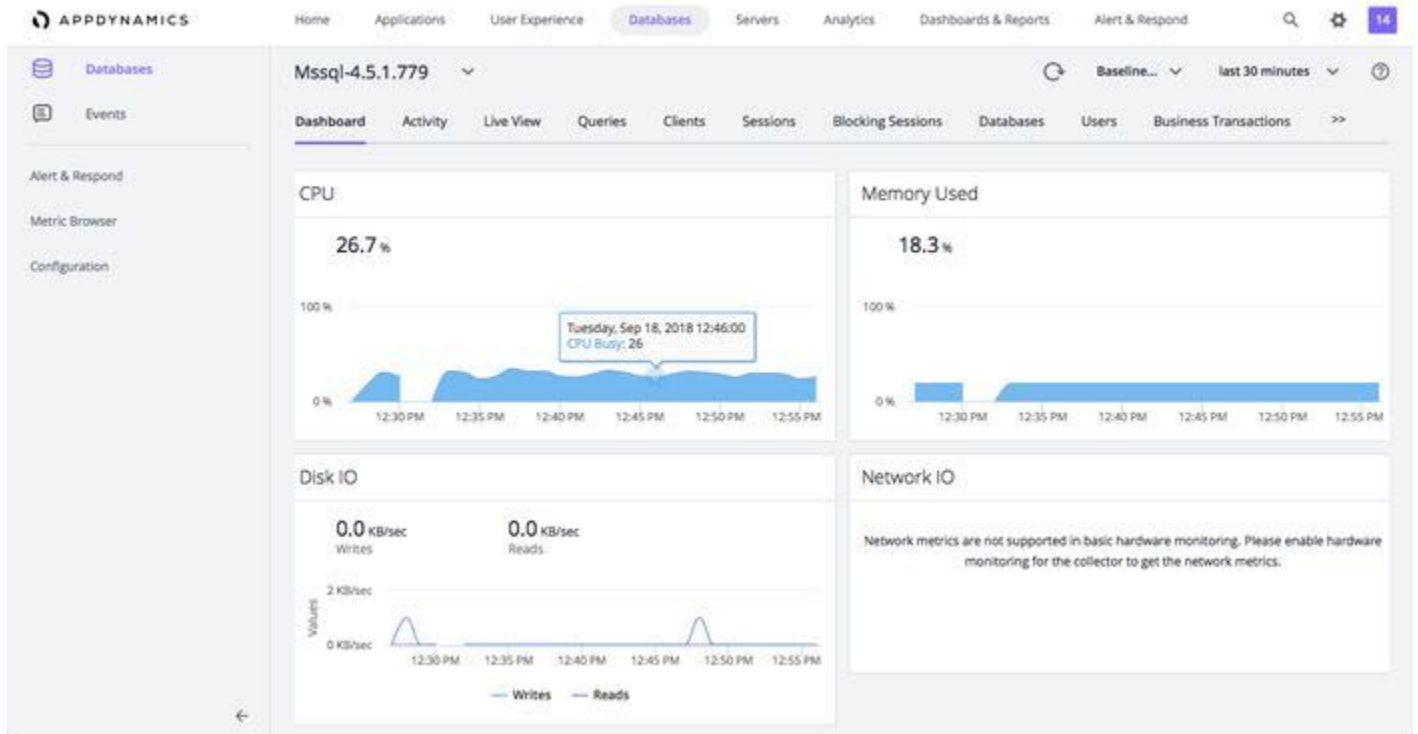

Accessing the Comparison Report

Click on any data point to view the time comparison report, which shows query run times and wait states 15 minutes before, and 15 minutes after the selected time.

The **CPU**, **Memory**, **Disk I/O**, and **Network I/O** graphs display when the Database Agent has been configured to also monitor the database host hardware. See, "Configure the Database Agent to Monitor Server Hardware" on [Add Database Collectors](#)(see page 2415).

- **CPU:** The CPU graph shows the relative percentages of CPU processing time used for handling system and users processes.
- **Memory:** The Memory graph shows the percentage of total memory in use at any point in time.
- **Disk I/O:** The Disk I/O graph shows disk usage, the volume of data read and written.
- **Network I/O:** The Network I/O graph shows network activity, the volume of data sent and received.

✓ Accessing the Metric Browser

To see more information about a specific metric, double click any point on the graph and the Metric Browser opens displaying that metric. You can then hover over a point on the graph in the Metric Browser for more information about the metric. This feature is available for all the graphs except the SQL wait states graph.

Database Activity Window

Related pages:

- [Access Database Visibility from Application Monitoring Views](#)(see page 2467)
- [Database Visibility](#)(see page 2381)
- [Monitor Databases and Database Servers](#)(see page 2467)
- [Monitor Database Performance](#)(see page 2471)

The following describes the reports available in Database Visibility on the Database Activity Window. The reports available depend on the database platform being monitored. The reports are listed in alphabetical order and indicate which database platform supports them.

Access the Database Activity Window

To access the Database Activity window

1. To view a database's activity, click the name of the database.
2. Click the **Activity** tab.

Features of the Database Activity Windows

To view the database reports of different databases, click the down arrow next to the database name at the top of the page. From the list, select the database you want to view or search for the database in the search bar. Click the refresh icon to show only databases that meet that search criterion.

The activity reports available are described below. The reports available are database-dependent. The reports are listed in alphabetical order and indicate which database platform supports them. The reports will only show 10 days of data, which is the Events Service limit.

Wait State

Description: This report displays time-series data on Wait Events (states) within the database. Each distinct wait is color-coded, and the Y-axis displays time in seconds. This report also displays data in a table and highlights the time spent in each wait state for each SQL statement.

Relevance: The wait states consuming the most time may point to performance bottlenecks. For example, db file sequential reads may be caused by segment header contention on indexes or by disk contention.

Platform: IBM DB2, Microsoft SQL Server, MySQL, Oracle, PostgreSQL, Sybase, and Sybase IQ

Max CPU - It displays the CPU cores present in the database server and is disabled by default. The CPU core count is collected using SQL (for Oracle, DB2, and MSSQL) and Hardware monitoring (if enabled for MySQL, PostgreSQL and Sybase).

Phase

Description: This report displays the elapsed time during a phase of query execution. If the Couchbase version < 7 and Database Agent < 21.9, then the report displays the number of documents processed.

To view the elapsed time for the phases instead of document count you require the following:

- Database Agent version >=21.9
- Controller version >=21.11
- Couchbase version >=7

Relevance: The phase processing the most documents may point to performance bottlenecks.

Platform: Couchbase

Top Activity

Description: Display the top time in database SQL statements in a time-series view. This report also displays data in a table and highlights the time spent in the database for each of 10 top SQL statements. Only queries reported by newer agents are grouped; the queries reported by older agents may not appear upon grouping.

Relevance: Use this report to see which SQL statements are using the most database time. This helps to determine the impact of specific SQL statements on overall system performance allowing you to focus your tuning efforts on the statements that have the most impact on database performance.

Platform: IBM DB2, Microsoft SQL Server, MySQL, Oracle, PostgreSQL, Sybase, Sybase IQ, and Couchbase

Time Comparison

Description: This report allows compares the performance of two databases during the same time period based on a specific statistic type. You can click Group Similar to group together queries with the same

number of parameters. Only queries reported by newer agents are grouped; the queries reported by older agents may not appear upon grouping.

Relevance: You may want to compare the performance of your development and production databases before and after you tune the SQL queries or add an index or join. This report can help you determine the effectiveness of any performance tuning procedures you have implemented.

Platform: IBM DB2, Microsoft SQL Server, MySQL, Oracle, PostgreSQL, Sybase, and Sybase IQ

I/O

Description: This report gives information on physical I/O performed by the database instance.

The SQL Server and PostgreSQL I/O reports include the following metrics:

- Time spent in the database
- Query throughput
- CPU usage (if hardware monitoring is enabled)
- Read and Write I/O. This metric is only available for SQL Server.
- Per file statistics (if the agent is run with the `dbagent.mssql.datafile.statistics` property). This metric is only available for SQL Server.
- Per database statistics. This metric is only available for PostgreSQL.

Relevance: Your physical disk I/O may be affecting database performance.

Poor response times may mean one of the following:

- You're doing too much physical I/O and need to adjust your I/O capacity
- You're scanning tables or indexes when you should be doing seeks
- Your database tables are missing indexes
- Your SQL needs to be tuned

Platform: Microsoft SQL Server, Oracle, PostgreSQL

Top Query

Description: This report displays the top 10 SQL statements for the specified statistic in a time-series view.

You can filter queries by command type using the **Command Type** dropdown menu and by statistic type using the **Statistic Type** dropdown menu.

 With the Controller version 21.2.0 and later, some of the unused statistic types under the **Statistic Type** dropdown menu are removed from the list. You can filter queries using the most common statistic types.

Relevance: Use this report to see which SQL statements are using the most database resources. This helps to determine the impact of specific SQL statements on overall system performance allowing you to focus your tuning efforts on the statements that have the most impact on database performance. You can choose one of many statistics to base the report on.

Platform: IBM DB2, Microsoft SQL Server, Oracle

Query Wait State

Description: This report displays the wait times for all queries.

Relevance: Use this report to see how much time queries are spending in different wait states.

Platform: IBM DB2, Microsoft SQL Server, MongoDB, MySQL, Oracle, PostgreSQL, Sybase, and Sybase IQ

Parameter Changes

Description: This report displays changes to the database configuration parameters. You can select a parameter change and click one of the following options:

- **View Event Details:** Displays the parameter change event details, such as comments associated with the parameter change.
- **View Comparison Report:** Compares the query run times and wait states 15 minutes before and 15 minutes after the database parameter was changed. The comparison report is not available for clusters.

Relevance: Use this report to keep track of the changes you make to the database configuration parameters.

Platform: IBM DB2, Microsoft SQL Server, Microsoft Azure, MySQL, Oracle, PostgreSQL, Sybase ASE, and Sybase IQ

BT Activity

Description: This report displays the top (Java or PHP) business transactions that make calls to the database.

Relevance: Use this report to see which business transactions are affected by the database.

Platform: IBM DB2, Microsoft SQL Server, Microsoft Azure, MySQL, Oracle, PostgreSQL, Sybase ASE, and Sybase IQ

Database Topology Window

The Topology view displays current activity for the routing service and shards of a MongoDB database, Oracle RAC server or a custom cluster. The Topology view shows key performance metrics for the routing service and shards or nodes of the database.

Access the Database Topology Window

To access the Database Topology window:

1. To view a database's topology, click the name of the database.
2. Click the Topology tab.

Features of Database Topology Window

This document contains links to MongoDB documentation. AppDynamics makes no representation as to the accuracy of MongoDB documentation because MongoDB controls its own documentation.

From the Database Topology window, you can:

- Select the **Auto Refresh** box. From the **Every** list, you can choose how often the system updates the live view.
- Click the dropdown arrow next to the database Collector name at the top of the page to choose a node or cluster that you want to see the metric views for. You can either select the database Collector name from the list or search for the database Collector by entering text in the search bar and then clicking the refresh icon to show only database Collectors that meet those search criteria.
- Hover over the sections of the trends to see their details.
- Click a column title on the **Topology** name list to sort the topologies using that column as the sort key.

From the Topology window, you can view:

- **Health:** Indicates whether any health rules for the routing service or shards of the replica set or nodes have been violated.
- **Role:** The role performed by the shard. The routing service routes the queries to the shards to balance the load. The members or shards of the replica sets can have either primary or secondary shard role.

For MongoDB, in addition to primary and secondary roles, the following roles are displayed for replica set and shard cluster in the `<role name> replica set` or `<role name> shard` format:

- arbiter
- down
- rollback
- recovering
- routing service
- startup
- standalone
- startup2
- unknown

For more information about these roles, see [MongoDB documentation](#)¹⁵⁵³.

You require Database Agent version >= 21.9 to view these roles.

- **Num Queries:** The number of queries handled.
- **Queries Trend:** The trend of queries handled over time.
- **Time in Database:** The time required for the database to respond to the queries.
- **Time Spent in Database Trend:** The trend of time spent in the database over time.

If you change the port number for a monitored database node, the Topology window shows a new node with the new port number, as well as the original node with the old port number. The original node remains in the Topology window for the duration of the retention period that you specify in [Controller Settings](#)(see page 2412).

¹⁵⁵³ <https://docs.mongodb.com/manual/reference/replica-states/>

Name	Health	Role	Num...	Queries Trend	Time in ...	Time Spent in Database Trend

Database Live View Window

Related pages:

- [Access Database Visibility from Application Monitoring Views](#)(see page 2467)
- [Database Visibility](#)(see page 2381)
- [Monitor Databases and Database Servers](#)(see page 2467)
- [Monitor Database Performance](#)(see page 2471)

The Live View displays current activity for the database server. The live view shows key performance metrics for the last time period, which can be refreshed in a specified time interval between 10 seconds and 5 minutes.

Access the Database Live Window

To access the Database Live window:

1. To view a database's current performance, click the name of the database.
2. Click the **Live View** tab.
3. For clustered databases, select the node to view its details.

Database Live Window Features

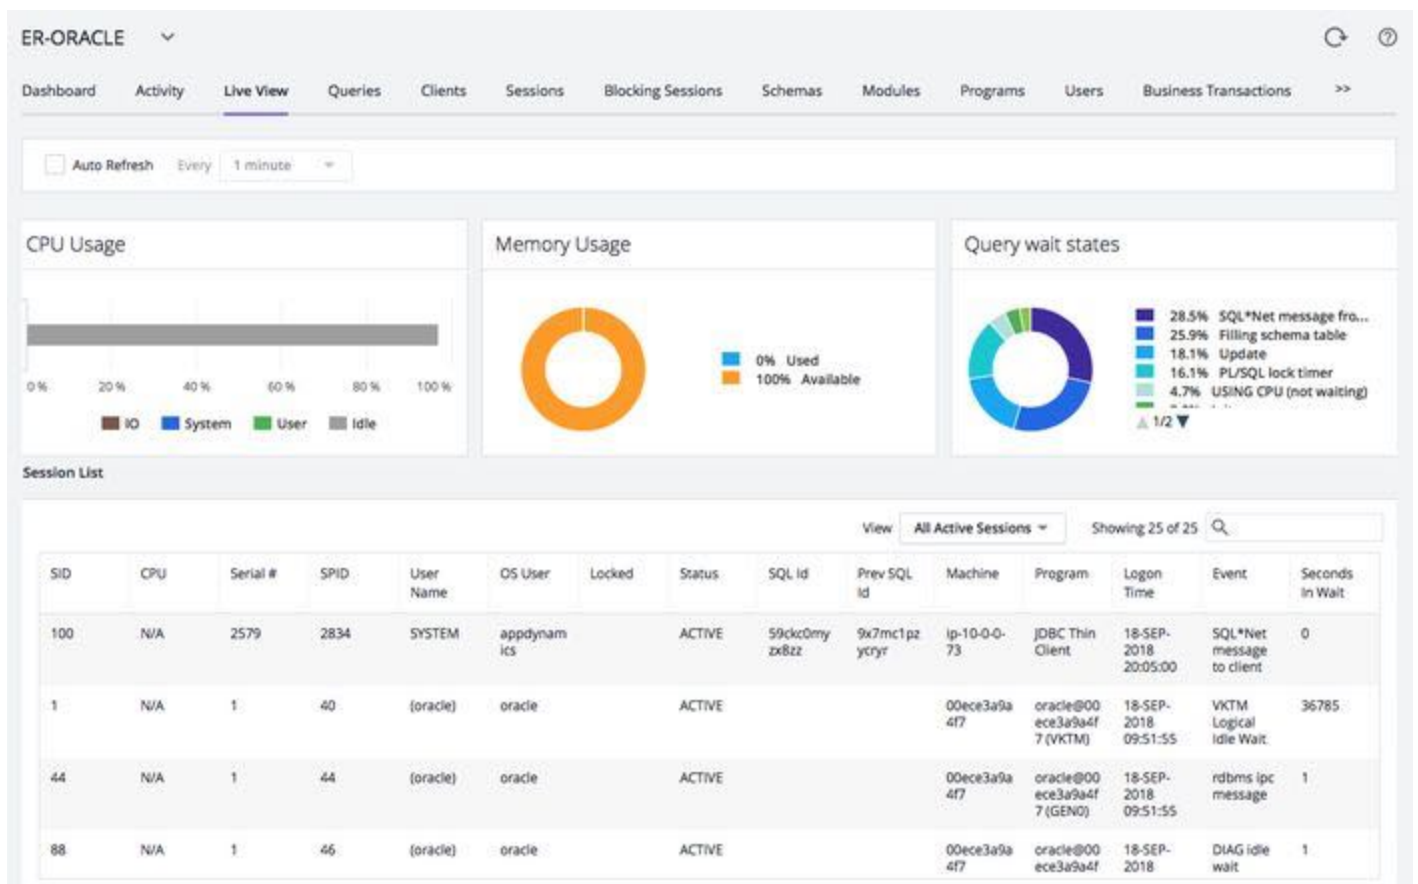

From the Database Live window, you can:

- Select the **Auto Refresh** box and then from the **Every** list, choose how often you want the system to update the live view.
- Click the down arrow next to the database collector name at the top of the page to choose to view the live view of a different database Collector by either selecting the database Collector name from the list or by searching for the database collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Hover over the sections of the charts to see their details.
- Click the **View** list to view **All Active Sessions** or **All Sessions**.

- Click a column title on the **Session List** to sort the Session List using the clicked column as the sort key.

From the Database Live window, you can view:

- **CPU Usage:** If you have enabled Hardware Monitoring for the server the chart shows the percentage of available CPU resources consumed by users and the system and a break down of how the CPU is being used.
 - IO - Disk input and output.
 - System - Database operating system activities.
 - User - User interaction with the database.
- **Memory Usage:** Displays how much memory is in use and how much is available.
- **Query wait states:** Activities that contribute to the time it takes the database to service the request. The wait states consuming the most time may point to performance bottlenecks. For example, database file sequential reads may be caused by segment header contention on indexes or by disk contention.
- **Session List:** A table describing database usage instances and their properties. The database session is the application interaction with the database, a new session is started for each request. The columns displayed are database dependent.
- **Blocking Tree:** A tree showing all the sessions causing blocks. Nested under each blocking session are the sessions being blocked and the corresponding queries and blocked objects.

For SQL Server, the **CPU Usage** and **Memory Usage** statistics are displayed in Live View even when hardware monitoring is disabled.

In the Live View for database clusters, you must select a node from the dropdown menu to view that node's activity.

Database Queries Window

Related pages:

- [Access Database Visibility from Application Monitoring Views](#)(see page 2467)
- [Add Database Collectors](#)(see page 2415)
- [Database Visibility](#)(see page 2381)
- [Monitor Databases and Database Servers](#)(see page 2467)
- [Monitor Database Performance](#)(see page 2471)

The Queries window displays the SQL statements and stored procedures that consume the most time in the database. You can compare the query weights to other metrics such as SQL wait times to determine SQL that requires tuning.

Access the Database Queries Window

To access the Database Queries window:

1. To view database queries, click the name of the database.
2. Click the Queries tab.

Database Queries Window Features

From the Database Queries window, you can:

- View the top N queries. These are the queries that consumed the greatest amount of database time to complete.
- Choose to display the top 5, 10, 100 or 200 queries.
- Click the name of a column to sort the **Query** list using that key.
- Click **Filter by Wait States** to choose wait states to filter the **Query** list. The filtered list only displays queries that caused the selected wait states.

For Couchbase database, click **Filter by Phases** to choose the phases. This filters all the queries based on the selected phase.

- Check the **Group Similar** box to group together queries with the same syntax. Queries that share the same syntax but different 'IN' clause parameters are still grouped together. Query grouping is case-insensitive. Double-click a query group to dive into the Group Details for more information about that query group. Only queries reported by newer agents are grouped; the queries reported by older agents may not appear upon grouping.
- Search for a specific query, by entering text in the search bar that may appear in the Query. This is useful if you found a slow query in the Slow Database calls window of AppDynamics Application monitoring.
- Double-click a query or select a query and click **View Query Details** to dive into the **Query Details** for more detailed information about that specific query. If you see a message saying that query details are unavailable, you may need to update your permissions or extend your query retention period.
- Click the down arrow next to the database Collector name at the top of the page to choose to view the database queries of a different database Collector by either selecting the database Collector from the list or by searching for the database Collector by entering text in the search bar and then clicking the refresh icon to show only database Collectors that meet that search criteria.
- Click **Actions** to:
 - Export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.
 - Rename the selected query so that it is easier to identify. Note that the query name is associated with the query itself. Thus, when a query's retention period expires, both the query and the query name disappear.

From the Database Queries window, you can view:

- **Query Id:** This is the unique ID assigned to the query internally by the database.
- **Query:** The text of the query, custom query name, or, in the case of a stored procedure invocation, the name of the stored procedure. If the user does not have the ANY permission to view the stored procedure name, the definition of the stored procedure is shown instead of the stored procedure name.

For SQL Server, Azure, Oracle, PostgreSQL and DB2 the metrics Number of Executions, Average Response Time and Elapsed Time are inferred from the query index. When you are viewing the queries with Group

Similar checked, the statistics reflect only the queries that have captured query statistics. Queries that do not have query statistics are excluded from the statistic values.

For databases such as MySQL and MongoDB which do not have a query index, no data will appear in the Number of Executions and Average Response Time columns. However, Elapsed Time can be inferred for MySQL and MongoDB databases using the wait state index. Elapsed Time can also be inferred using the wait state index when query statistics for a query run on an SQL Server, Azure, Oracle, PostgreSQL or DB2 database are otherwise not available. When query statistics are not available for a query run on an SQL Server, Azure, Oracle, PostgreSQL or DB2 database, the Number of Executions and Average Response Time statistics cannot be reported and are marked with a hyphen (-). This means that the database did not provide statistics for this query in the selected time range.

- **Elapsed Time:** The total time consumed by all executions of this query. Query statistics such as Number of Executions, Average Response Time and Elapsed time are available for databases supporting the query index, such as SQL Server, Azure, Oracle, PostgreSQL and DB2. For databases where the query index is not available, the elapsed time is inferred from the wait state index or phases.
By default, the query sampling frequency is once every second. If a query takes less than one second and happens to occur in the time between sampling instances, its elapsed time is reported as 0 seconds.
You can configure the sampling frequency by adding the `-Ddbagent.sampling.interval= <value>` property for Database Agent. For information about adding the system properties, see [Database Agent Configuration Properties](#)(see page 2393).
- **Number of Executions:** (supported for SQL Server, Azure, Oracle, DB2, PostgreSQL) The number of times the query ran during the specified time period. If you are monitoring Greenplum, the number of executions appears as 0.
- **Average Response Time (hh:mm:ss):** (supported for SQL Server, Azure, Oracle, DB2, PostgreSQL) The average time required during the specified time period to respond to the query.
- **Weight (%):** The percentage of the total time consumed by the query.

Query Id	Query	Elapsed Time	Number of Execut...	Average Response Time (hh:mm:ss)	Weight (%) ↓
47de1ca0600a1...	/* mysql-connector-java-5.1.33 (Revision: alexander.sokolov@oracle.com-20140908134200-8ukofe1iz0r2b63) */SHOW VARIABLES WHERE Variable_name = ? OR Variable_name = ? OR Variable_name = ? OR Variable_name = ? OR Variable_name = ? OR ...	6814:37:07	6037206	00:00:04.06	42.4
560b7787fea0d1...	INSERT INTO orders (CREATEDON, QUANTITY, ITEM_ID) VALUES (?, ?, ?)	4765:26:44	4309126	00:00:03.98	29.6
bc2tr3h3zfwg	select count(?) count from item it1, item it2	3710:24:56	3480655	00:00:03.84	23.1
ftbq4pkk086y6	SELECT sql_id, executions, cpu_time, elapsed_time, rows_processed, buffer_gets, disk_reads, parse_calls, plan_hash_value, direct_writes, serializable_aborts, fetches, end_of_fetch_count, loads, version_count, invalidations, px_servers_executions, ...	585:47:22	2058563	00:00:01.02	3.6
0	Redo or DDL	70:47:13	644381	00:00:00.40	0.4
a95a0b0f457bc5...	DELETE FROM cart WHERE (user_id = ?)	63:10:52	930975	00:00:00.24	0.4

Once you have identified the statements that are consuming the most resources, you can dig down deeper for details that can help you tune the SQL statement. For in-depth query details, click a SQL statement and then click **View Query Details**. See [Database Query Details Window](#)(see page 2484).

Database Query Details Window

Related pages:

- [Access Database Visibility from Application Monitoring Views](#)(see page 2467)
- [Add Database Collectors](#)(see page 2415)
- [Database Visibility](#)(see page 2381)
- [Monitor Databases and Database Servers](#)(see page 2467)
- [Monitor Database Performance](#)(see page 2471)

Once you have identified the statements on the [Database Queries window](#)(see page 2482) that are spending the most amount of time in the database, you can dig down deeper for details that can help you tune those SQL statements. The database instance Query Details window displays details about the query selected on the [Database Queries window](#)(see page 2482).

Access the Database Query Details Window

To access the Database Query Details window:

1. To view a database's query details, click the name of the database.
2. Click the Queries tab.
3. Select a query and click **View Query Details**.

Database Query Details Window Features

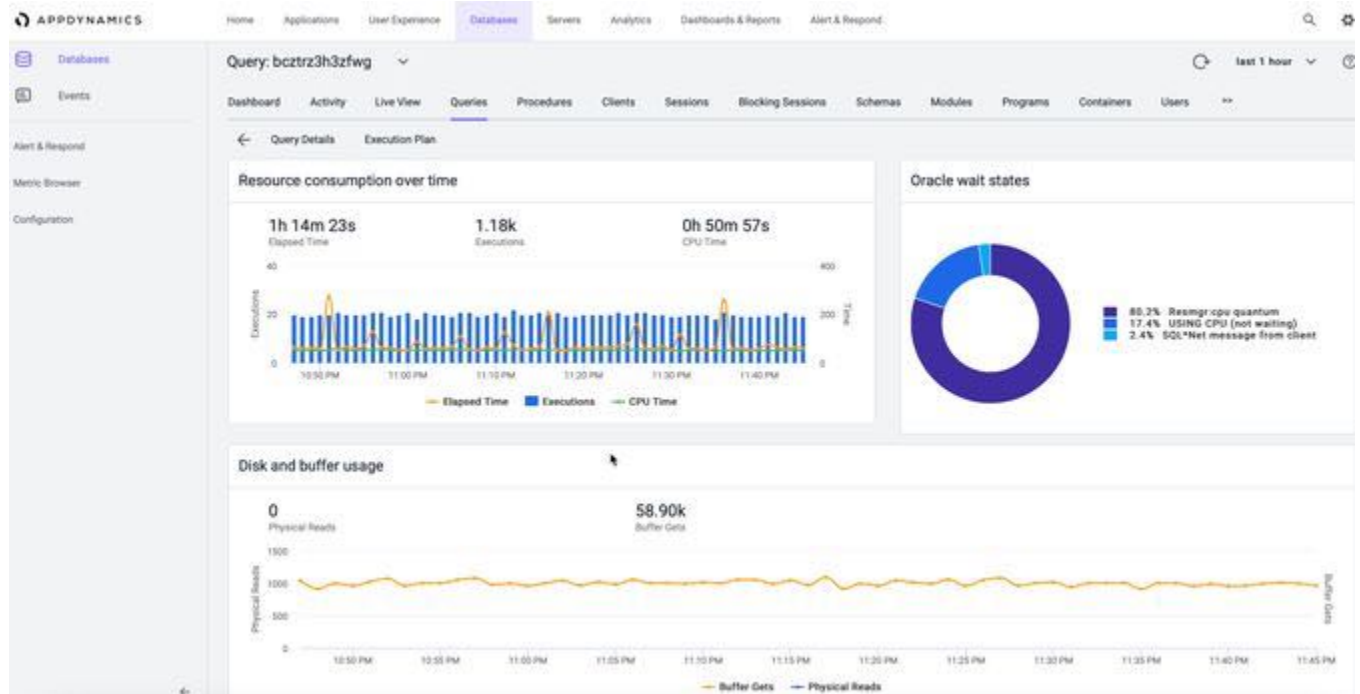

From the Database Query Details window, you can:

- Click **Execution Plan** to view an explanation plan for the query you selected on the Queries window if it was a SELECT query.
- Click on the graphs to see metrics for that specific point in time.
- Click the down arrow next to the database Collector name at the top of the page to choose to view the query details of a different database Collector.
- (From 21.5 onwards) Click the back arrow () icon to return to the top queries view in the **Database Queries** window.

From the **Database Query Details** window, you can view:

- **Resource consumption over time:** For SQL Server, Azure, Oracle, and DB2, shows the amount of time the query spent in the database using resources, the number of executions, and the amount of CPU time consumed. Query statistics are only available for the aforementioned database platforms.
The resource consumption card is also available for query groups. If all queries in the group have query metrics (for example, elapsed time and number of executions), then the aggregate of the group's metrics are shown. If none of the queries in the group have query metrics, then the aggregate elapsed time of the queries in the group, taken from the wait state index, is shown. If some queries in the group have query metrics and others do not, then the aggregate value of the available query metrics is shown.
- **Business Transactions Executing Similar Queries:** Displays the Java or PHP business transactions that execute queries similar to this query.
- **Disk and buffer usage:** Displays data when hardware monitoring is enabled for this database collector. This graph shows at a glance how effectively the database buffer is used. SQL that runs frequently is best kept in the buffer as physical disk reads are much more time-consuming. You may need to optimize your buffer manager if you see that the ratio of physical reads to buffer gets is too high.
- **Clients:** Shows the machines that executed the selected SQL statement and the percentage of the total time required to execute the statement performed by each machine. The table also shows the applications, nodes, and tiers of the machines.
- **<database_type> wait states:** Activities that contribute to the time it takes the database to service the selected SQL statement. The wait states consuming the most time may point to performance bottlenecks. For example, a db file sequential read wait state may be caused by segment header contention on indexes or by disk contention. See your database platform documentation for descriptions of the SQL wait states and recommended actions.
- **Query Active in Database/Schema:** Shows the schemas that have been accessed by this SQL.
- **Query ID (Oracle) SQL Handle (SQL Server):** A unique ID that allows the database server to more quickly locate this SQL statement in the cache.
- **Query:** The entire syntax of the selected SQL statement. You can click the pencil icon in the top right corner of the Query card to edit the query name so that it is easy to identify.
- **Queries in Group (only in Group Details view):** The top 100 queries in the query group
- **Users:** The users that executed this query.

- **Programs/Applications:** The program/application from which this query was executed.
- **Procedures:** The list of procedures for the queries that you monitor.
- **Containers:** The containers on which the query runs.

To see how the SQL was executed internally within the database, click the Execution Plan tab. The statement execution plan is the sequence of operations the database performs to run the statement.

i Oracle Explain Plan Limitations

For Oracle, AppDynamics Database Visibility displays execution plans for only SELECT, UPDATE, INSERT, and DELETE statements because Database Visibility relies on the [Oracle EXPLAIN PLAN](#)¹⁵⁵⁴ statement to obtain the execution plans and the Oracle EXPLAIN PLAN statement only provides the Oracle optimizer's execution plans for SELECT, UPDATE, INSERT, and DELETE statements. See also, [User Permissions for Oracle](#)(see page 2445).

If you have a poorly performing piece of SQL that you are trying to tune, the obvious place to start is to look at the most costly step of the execution plan.

Tuning SQL is a vast topic, but a couple of things to look out for include:

- Index or table scans: May indicate a need for better or additional indexes.
- Bookmark Lookups: Consider changing the current clustered index, using a covering index and limiting the number of columns in the SELECT statement.
- Filter: Remove any functions in the WHERE clause, don't include views in your Transact-SQL code, may need additional indexes.
- Sort: Does the data really need to be sorted? Can an index be used to avoid sorting? Can sorting be done at the client more efficiently?

1554 http://docs.oracle.com/cd/B19306_01/server.102/b14211/ex_plan.htm#i3305

Database Query Execution Plan Window

Related pages:

- [Access Database Visibility from Application Monitoring Views](#)(see page 2467)
- [Add Database Collectors](#)(see page 2415)
- [Database Visibility](#)(see page 2381)
- [Monitor Databases and Database Servers](#)(see page 2467)
- [Monitor Database Performance](#)(see page 2471)

The Database Query Execution Plan window can help you to determine the most efficient execution plan for your queries. Once you've discovered a potentially problematic query, you can run the EXPLAIN PLAN statement to check the execution plan that the database created. A query's execution plan reveals whether the query is optimizing its use of indexes and executing efficiently. This information is useful for troubleshooting queries that are executing slowly.

Access the Database Query Execution Plan Window

To access the Database Query Execution Plan window:

1. To view a query execution plan, click the name of the database.
2. Click the Queries tab.
3. Click a **SELECT** statement to examine and click **View Query Details**.
4. Click the Execution Plan tab.

Database Query Execution Plan Window Features

From the Database Query Execution Plan window, you can:

- Click **Explain** to view the execution plan for a query.
- Click **Schema** to choose a different schema and then explain the execution plan based on that schema. If you want to view the execution plan for a query that belongs to a schema outside the scope of your database account permissions, you can enter a username and password for a different database account that has access to the schema.
- If you want to improve a suboptimal query, you can modify the query and paste it into the **Explain another query** box. Click the **Explain** button to generate the execution plan for your modified query and determine whether the modified query is more efficient.
- Click the down arrow next to the query name at the top of the page to choose to view queries and query execution plans of a different database Collector. You can either select the database Collector name from the list or search for the database Collector in the search bar. Click the refresh icon to show only database Collectors that meet your search criteria.

If you are using SQL Server or Azure you can view the execution plan in one of the following ways:

- Select a cached execution plan and click **View Cached Plan** to view the plan details.
- Double-click a cached execution plan.

If you are using MySQL, you can also:

- Choose to explain the query on another schema. In **Plan Details**, from the list on the right, choose the schema name and then click **Explain**.
- Copy the text in the Parsed SQL output box and paste it into the **Explain another query** box where you can edit it and then explain the edited version of the query.

If you are using MSSQL, you can perform these steps to view the costly operations (the amount of work such as CPU usage, I/O, and memory required to complete the operation) in the execution plan along with the warnings (if any) in the plan:

1. Under **Query Plan Handle(s)**, select a cached execution plan.

2. Click **View Cached Plan**.

You can view the following details:

Top Plan Operations:

Field Name	Description
Operation	The object scan (table or index) operation in the execution plan
Database	The database name of the object
Schema	The schema of the object in the database
Object Name	The name of the object (table or index) that is scanned in the operation
Estimated I/O Cost	The estimated cost of the input/output (I/O) to perform the operation
Estimated CPU Cost	The estimated CPU cost to perform the operation
Estimated number of rows	The estimated number of rows in the object

Warnings: This table includes the warnings in the execution plan related to any issue such as Typecast. This table helps you in understanding the potential performance-degrading activities that happen during the query execution. This table includes these fields:

- **Issue:** The issue description for the warning.
- **Expression:** The query expression used in the execution plan that correlates to the issue.

If you are using Oracle database, you can view the cached execution plan details along with the top plan operations and the referenced objects. To view the details, double click a cached execution plan under **View Cached Plan(s)**. These details are displayed:

Top Plan operations

Field Name	Description
Operation	The name of the internal operation performed in the step (such as, TABLE ACCESS)
Options	A variation on the operation that is described in the Operation column (such as, FULL)

Referenced Objects

Field Name	Description
Tree Node	The step number in sequence used in the execution plan

Field Name	Description
Operation	The object scan operation (table or index) in the execution plan
Object Type	The type of the database object (index or table)
Object Name	The name of the database object

From the Database Query Execution Plan window, you can view:

- **Cached Execution Plan(s)**: identifying details of the cached execution plan, which vary from one database to another. For SQL Server, the execution plan is rendered as a diagram.
- **Plan Details**: execution plan details, showing the step by step procedure the database followed to process the selected query.
- **Referenced Objects**: the database objects accessed by the execution plan.

Database Procedures Window

The Database **Procedures** window is available for Oracle Server.

The Database **Procedures** window shows you the names of the Top N procedures on the database instance based on time. To see the Top N Queries that are executed in a procedure, click a procedure name and then click **View Top Queries**. From the **Procedures** top queries page, to see more details about a query you can double-click a query to open the [Query Details](#)(see page 2482) window.

Access the Database Procedures Window

To access the Database Procedures window:

1. To view a database's procedure, click the name of the database.
2. Click the Procedures tab.

Database Procedures Window Features

From the Database Procedures window, you can:

- Choose to view information for the top 10, 50, 100 or 200 procedures that most frequently access the database server.
- Double click the name of a procedure to view the top queries for one procedure in particular, or select the procedure and then click **View Top Queries**.
- Click the down arrow next to the database collector name at the top of the page to choose to view the procedures of a different Oracle database collector by either selecting the database collector from the list or by searching for the database collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database **Procedures** window, you can view:

- **Procedure:** The name of the procedure run by an active session in the database.
- **Elapsed Time:** The time taken by the procedure.
- **Weight (%):** The percentage of time the procedure was consuming the database resources in comparison with the usage percentage of other procedures.

Procedure	Elapsed Time	Weight (%)
N/A	167h 4m 31s	98
SHERLOCK	2h 11m 6s	1
DBMS_STATS.GATHER_DATABASE_STATS_JOB_PROC	0h 43m 26s	0
DBMS_SPACE.AUTO_SPACE_ADVISOR_JOB_PROC	0h 11m 22s	0

DBMS_SPM.EXECUTE_EVOLVE_TASK	0h 0m 42s	0
DBMS_SCHEDULER.AUTO_PURGE	0h 0m 16s	0
BSLN_INTERNAL.MAINTAIN_STATISTICS	0h 0m 7s	0
MGMT_CONFIG.COLLECT_CONFIG	0h 0m 5s	0
DBMS_AQADM.SYS.REMOVE_ORPHMSG	0h 0m 3s	0
DBMS_JOB.CLEANUP_TASK	0h 0m 2s	0
DBMS_STATS	0h 0m 1s	0

Database Clients Window

Related pages:

- [Access Database Visibility from Application Monitoring Views](#)(see page 2467)
- [Database Queries Window](#)(see page 2482)
- [Database Visibility](#)(see page 2381)
- [Monitor Databases and Database Servers](#)(see page 2467)
- [Monitor Database Performance](#)(see page 2471)

The Database Clients window shows you the hostname or IP addresses of the Top N clients using the database. A database client is any host that accesses the database instance. To see the Top N Queries run by the client, click a client name and then click **View Top Queries**. From the client top queries page, to see more details about a query you can double-click a query to open the [Query Details](#)(see page 2482) window.

Access the Database Clients Window

To access the Database Clients window:

1. To view a database's clients, click the name of the database.
2. Click the Clients tab.

Database Clients Window Features

From the Database Clients window, you can:

- Choose to view information for the top 10, 50, 100 or 200 clients sorted by total time spent in the database.
- Choose to view information for one client in particular.
- Click the down arrow next to the database name at the top of the page to choose to view the database clients of a different database by either selecting the database from the list or by searching for the database by entering text in the search bar and then clicking the refresh icon to show only databases that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Clients window, you can view:

- **Client:** The names of the machines that have connected to the database.
- **Elapsed Time:** The total time spent by the client executing queries.
- **Weight (%):** The percentage of time the client was connected to the database in comparison with connection times of other clients.

Database Sessions Window

Related pages:

- [Access Database Visibility from Application Monitoring Views](#)(see page 2467)
- [Database Visibility](#)(see page 2381)
- [Monitor Databases and Database Servers](#)(see page 2467)
- [Monitor Database Performance](#)(see page 2471)

The **Sessions** window shows you the Session ID of the Top N sessions using the database sorted by time spent. To see the Top N SQL run by a session, click the **Session ID** and then click **View Top Queries**. From the Client top queries page, to see more details about a query, double-click a query to open the Query Details window and from there see the Execution Plan of the query.

Access the Database Sessions Window

To access the Database Sessions window:

1. To view a database's sessions, click the name of the database.
2. Click the Sessions tab.

Database Sessions Window Features

From the Database Sessions window, you can:

- Choose to view information for the top 10, 50, 100 or 200 sessions consuming database resources.
- Double click a **Session ID** to view the queries run in that particular session.
- Click the down arrow next to the database name at the top of the page to choose to view the database sessions of a different database by either selecting the database from the list or by searching for the database by entering text in the search bar and then clicking the refresh icon to show only databases that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Sessions window, you can view:

- **Session ID**: the Session ID of each database instance usage.
- **Weight (%)**: the percentage of time that instance was using the database in comparison with the database usage of other sessions.

Session ID	Client	Elap... Time	Weight (%) ↓
3	ip-10-0-0-33.us-west-2.compute.internal	00:53:00	99.9
787	cjiang-mac.corp.appdynamics.com	00:00:03	0.1
399	ip-10-0-0-91	00:00:01	0.0

Database Blocking Sessions Window

The blocking tree displays a tree view of sessions that are blocking other sessions for Oracle, SQL Server, Sybase ASE, and DB2. You can use the blocking tree to determine the cause of deadlocks.

Access the Database Blocking Sessions Window

To access the Database Topology window:

1. To view a database's blocking sessions, click the name of the database.
2. Click the Blocking Sessions tab.

Database Blocking Tree Window Features

From the Database Blocking Tree window you can expand the tree of a blocking session to see the sessions it is blocking.

From the Database Sessions window, you can view:

- **Session ID:** the Session ID of the sessions causing the block, and the sessions being blocked
- **Client:** the names of the machines where the session is blocked
- **User:** the user of the blocked session
- **Query:** the query that is blocked or causing the block
- **Blocked Object:** the object that is blocked
- **First occurrence of block:** the time that the block first occurred in the specified time range
- **Block Duration:** the amount of time that the session was blocked or causing the block

Database Schemas and Databases Windows

The Database Schemas window is available only for Oracle database servers.

The Database Databases window is available for other database servers.

The database Schemas or Databases window shows you the names of the Top N busiest schemas or databases on the database server. To see the Top N Queries run on a specific Database or Schema, click a name and then click **View Top Queries**. From the Schema or Database top queries page, to see more details about a query you can double-click a query to open the [Query Details](#)(see page 2482) window.

Access the Database Schemas or Databases Window

To access the Database Schemas or Database window:

1. From the AppDynamics Home page, on the **Databases** card, click the name of the database that you want to view the schemas or databases for.
2. Depending on the platform, click either the Schemas or Databases tab.

Database Schemas or Databases Window Features

From the Database Schemas and Databases window you can:

- Choose to view information for the top 10, 50, 100 or 200 schemas or databases containing the most time spent executing queries by the database server.
- Double click the name of a schema or database to view the top queries for one schema database in particular, or select the schema or database and click **View Top Queries**.
- Click the down arrow next to the Database Collector name at the top of the page to choose to view the database schemas or databases of a different database Collector by either selecting the database Collector from the list or by searching for the database Collector by entering text in the search bar and then clicking the refresh icon to show only database Collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Schemas or Databases window, you can view:

- **Schema or database:** The names of the schemas or database on the database server.
- **Weight (%):** The percentage of time the schema or database was used by the database server in comparison with the usage percentage of other schemas or databases.

Oracle-4.5.1.779 last 1 year

Dashboard Activity Live View Queries Clients Sessions Blocking Sessions **Schemas** >>

View Top Queries 100 Top schemas Actions

Schema	Elapsed Time	Weight (%) ↓
SYS	00:56:01	99.9
SYSTEM	00:00:03	0.1

Database Modules Window

The Database Modules window is available only for Oracle database servers. The **Module** field is often identical to the **Program** field unless it has been programmatically set with a call to `DBMS_APPLICATION_INFO`. Some packaged applications, such as Oracle E-Business Suite, automatically set the **Module** field with relevant identifiers.

The Database Modules window shows you the names of the Top N busiest modules on the Oracle database server. To see the Top N Queries run on the database by a module, click a module name and then click **View Top Queries**. From the Modules top queries page, to see more details about a query you can double-click a query to open the [Query Details](#) (see page 2482) window.

Access the Database Modules Window

To access the Database Modules window:

1. To view a database's modules, click the name of the database.
2. Click the Modules tab.

Database Modules Window Features

From the Database Modules window, you can:

- Choose to view information for the top 10, 50, 100 or 200 modules most frequently accessing the database server.
- Double click the name of a module to view the top queries for one module in particular, or select the module and click **View Top Queries**.
- Click the down arrow next to the database collector name at the top of the page to choose to view the modules of a different Oracle database collector by either selecting the database collector from the list or by searching for the database collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Modules window, you can view:

- **Module**: The name of the module run by the active sessions in the database.
- **Weight (%)**: The percentage of time the module was consuming the database resources in comparison with the usage percentage of other modules.

Module	Elapsed Time	Weight (%) ↓
N/A	00:57:00	99.9
JDBC Thin Client	00:00:03	0.1
AppD4DB	00:00:01	0.0

Database Programs Window

The Database Programs window is available for Oracle and SQL Server.

The Database Programs window shows you the names of the Top N programs on the database instance based on time. To see the Top N Queries run on the database by a program, click a program name and then click **View Top Queries**. From the Programs top queries page, to see more details about a query you can double-click a query to open the [Query Details](#)(see page 2482) window.

Access the Database Programs Window

To access the Database Programs window:

1. To view a database's programs, click the name of the database.
2. Click the Programs tab.

Database Programs Window Features

From the Database Programs window, you can:

- Choose to view information for the top 10, 50, 100 or 200 programs most frequently accessing the database server.
- Double click the name of a program to view the top queries for one program in particular, or select the program and click **View Top Queries**.
- Click the down arrow next to the database collector name at the top of the page to choose to view the programs of a different Oracle database collector by either selecting the database collector from the list or by searching for the database collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Programs window, you can view:

- **Program**: The name of the program run by an active session in the database.
- **Weight (%)**: The percentage of time the program was consuming the database resources in comparison with the usage percentage of other programs.

Program	Weight (%)
JDBC Thin Client	51.5
oracle@80c278fc0252 (j000)	48.5
oracle@80c278fc0252 (j001)	0.0
oracle@80c278fc0252 (j002)	0.0

Database Containers Window

The Database **Containers** window is available for Oracle Server.

The **Containers** window displays the names of the Top N containers on the database instance based on time. To see the top N queries run on the container, click a container name and then click **View Top Queries**. From the **Containers** top queries page, to see more details about a query you can double-click a query to open the [Query Details](#)(see page 2482) window.

Access the Database Containers Window

To access the Database Containers window:

1. To view a database's containers, click the name of the database.
2. Click the Containers tab.

Database Containers Window Features

From the Database Containers window, you can:

- Choose to view information for the top 10, 50, 100 or 200 containers most frequently accessing the database server.
- Double click the name of a container to view the top queries for one container in particular, or select the container and click **View Top Queries**.
- Click the down arrow next to the database collector name at the top of the page to choose to view the containers of a different Oracle database collector by either selecting the database collector from the list or by searching for the database collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Containers window, you can view:

- **Container:** The name of the container where queries run in the database.
- **Elapsed Time:** The time taken by the queries to run on the container.
- **Weight (%):** The percentage of time the Container was consuming the database resources in comparison with the usage percentage of other Containers.

Container	Elapsed Time	Weight (%) ↓
CDB\$ROOT	0h 7m 37s	79
CDB	0h 2m 0s	21

Database Users Window

The Database **Users** window shows you the users using the database. To see the Top N Queries run by a user, double-click the User name, or single-click the User name and then click **View Top Queries**. From the User top queries page, to see more details about a query you can double-click a query to open the Query Details(see page 2482) window.

Access the Database Users Window

To access the Database Users window:

1. To view a database's users, click the name of the database.
2. Click the Users tab. You may need to click the expand button (>>) to see the Users tab.

Database Users Window Features

From the Database Users window, you can:

- Use the **Top users** dropdown menu to view information for the top 10, 50, 100 or 200 users sorted by total time spent in the database.
- Click a user to view information for about that user.
- Click the down arrow next to the database name at the top of the page to choose to view the database users of a different database. You can either select the database from the list or search for the database by entering text in the search bar and clicking the refresh icon to show only databases that meet that search criterion.
- Search for the database by entering text in the search bar and then clicking the refresh icon to show only databases that meet that search criterion.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Users window, you can view:

- **User:** The names of the user accounts that have connected to the database.
- **Elapsed Time:** Duration of time that the user spent executing queries.
- **Weight (%):** Time the user spent executing queries as a percentage of the total time spent by all users.

User	Elapsed Time	Weight
APPDY	01:07:51	
WORLD	00:32:58	
SYSTEM	00:00:01	
APEX_040000	00:00:01	

Database Buckets Window

The **Buckets** window is available only for Couchbase collector.

The **Buckets** window shows you the names of the top 200 buckets sorted in descending order based on operations. To see the details of a specific bucket, click a bucket name, and then click **View Bucket Details**.

Access the Buckets Window

1. From the AppDynamics Home page, on the **Databases** card, click the name of the Couchbase collector that you want to view the buckets for.
2. Click the Buckets tab.

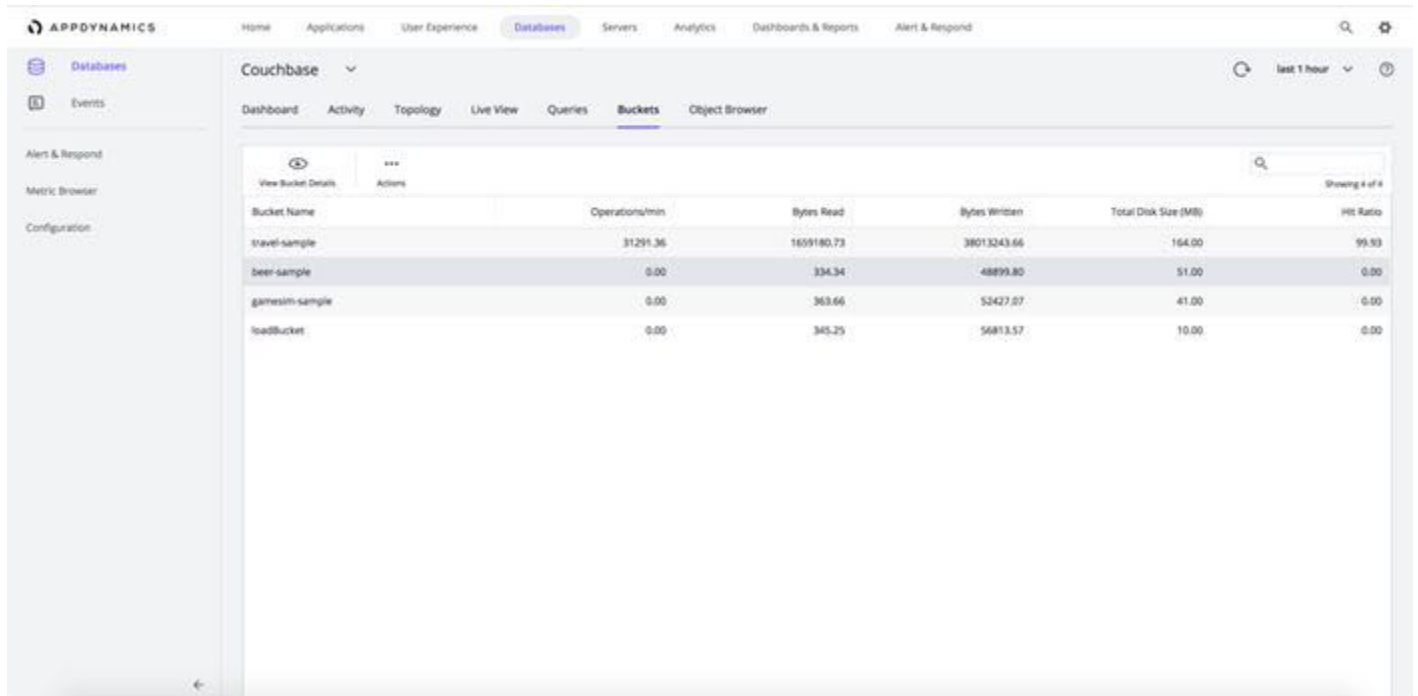

Buckets Window Features

From the Buckets window, you can:

- Double click the name of the bucket to view the bucket statistics for the selected time range.
- Click the down arrow next to the Couchbase collector name at the top of the page to choose to view the buckets of a different Couchbase collector by either selecting the Couchbase collector from the list or by searching for the Couchbase collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Buckets window, you can view statistics for a bucket:

Operations (ops), Bytes Read (bytes_read), Bytes Written (bytes_written), Total Disk Size, in MB (couch_total_disk_size), Hit Ratio (hit_ratio)

Database Business Transactions Window

The Database **Business Transactions** window shows you the top Java or PHP business transactions, ranked by their cumulative execution time on the database. To see the Top N SQL run by a business transaction, click the business transaction and then click **View Top Queries**. From the Business Transaction top queries page, you can double-click a query to open the Query Details window.

Supported Platforms

AppDynamics supports Java as an application framework. Relational databases are supported as backends that need to be mapped on the Java APM to a monitored instance in database visibility. For more information, see [Linking Database with application backend](#)(see page 1316).

Access the Database Business Transactions Window

To access the Top Business Transactions window:

1. To view a database's business transactions, click the name of the database.
2. Click the Business Transactions tab.

Database Business Transactions Window Features

From the Database Business Transactions window, you can:

- Choose to view information for the top 10, 50, 100 or 200 business transactions executing queries on the database.
- Double-click a business transaction to view the queries run in that particular transaction.
- Click the down arrow next to the database name at the top of the page to choose to view the business transactions that access a different database by either selecting the database from the list or by searching for the database by entering text in the search bar and then clicking the refresh icon to show only databases that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Business Transactions window, you can view:

- **Business Transaction:** the business transactions that run the most number of queries on the database.
- **Application:** the application that each business transaction is executing in.
- **Weight (%):** the percentage of time that business transaction took to execute compared to other business transactions.

Business Transaction	Application	Weight (%) ↓
Checkout	ECommerce-Sales-Demo	57.2
Checkout - Mobile	ECommerce-Sales-Demo	42.8

Database Applications Window

The Database **Applications** window is available for Postgres, Sybase ASE, Sybase IQ, and DB2.

The **Applications** window shows you the names of the Top N Applications on the database instance based on time. To see the Top N Queries run on the database by an application, click the name of an application and then click **View Top Queries**. From the Applications top queries page, to see more details about a query you can double-click a query to open the Query Details(see page 2482) window.

Access the Database Applications Window

To access the Database Applications window:

1. To view a database's applications, click the name of the database.
2. Click the Applications tab.

Database Applications Window Features

From the Database Applications window, you can:

- Choose to view information for the top 10, 50, 100 or 200 applications most frequently accessing the database server.
- Double click the name of an application to view the top queries for one application in particular, or select the application and click **View Top Queries**.
- Click the down arrow next to the database collector name at the top of the page to choose to view the applications of a different MongoDB database collector by either selecting the database collector from the list or by searching for the database collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Applications window, you can view:

- **Applications:** The name of the application run by an active session in the database.
- **Weight (%):** The percentage of time the application was consuming the database resources in comparison with the usage percentage of other applications.

Database Object Browser Window

Related pages:

- [Access Database Visibility from Application Monitoring Views\(see page 2467\)](#)
- [Database Visibility\(see page 2381\)](#)

- [Monitor Databases and Database Servers](#)(see page 2467)
- [Monitor Database Performance](#)(see page 2471)

When you detect a problem with database performance, you may be able to correct the problem by adding an index, refusing access to certain users, or creating a new index on a table. You can browse through the database objects to find ways to tune the database, including the indexes that are currently available on the various tables. The contents of the **Database Object Browser** are updated when you access them or click **Refresh**.

 The objects available for browsing are database dependent. For clustered databases, select the node to browse its objects.

Access the Database Objects Window

To access the Database Objects window:

1. To view a database's objects, click the name of the database.
2. Click the Objects tab.

Database Objects Window Features

From the **Database Objects** window you can:

- Click an object type in the tree to see more information about it.
- For Oracle, search for a specific database item.
- Click the down arrow next to the database name at the top of the page to choose to view the database objects of a different database by either selecting the database from the list or by searching for the database by entering text in the search bar and then clicking the refresh icon to show only databases that meet that search criteria.

The screenshot shows the AppDynamics interface for an Oracle database instance. The top navigation bar includes: Dashboard, Activity, Live View, Queries, Clients, Sessions, Blocking Sessions, Schemas, Modules, Programs, Users, Business Transactions, and a refresh icon. The left sidebar contains: Users, Parameters, Current Statistics, System Waits, and Database Objects. The main content area displays the following details for Oracle-4.5.1.779:

Instance Number	1
Instance Name	orcl12c
Host Name	ip-10-0-0-33.us-west-2.compute.internal
Version	12.2.0.1.0
Startup Time	2018-03-26 18:23:03.0
Status	OPEN
Parallel	NO
Thread#	1
Archiver	STOPPED
Log Switch Wait	
Logins	ALLOWED
Shutdown Pending	NO
Database Status	ACTIVE
Instance Role	PRIMARY_INSTANCE
Active State	NORMAL
Blocked	NO
Con Id	0
Instance Mode	REGULAR
Edition	EE
Family	
Database Type	SINGLE

The following are some examples of browsable content.

- Database uptime and version for all platforms
- **Users:** who has access to the database for all platforms (supported for Oracle, MySQL)
- **Job Status:** status of SQL agent job (supported for SQL Server)
- **Parameters:** database initialization parameters (supported for Oracle)
- **Variables:** system variables indicating how the database was configured.
- **Current Statistics:** the current value of statistics collected. The various statistics available are database dependent and are a superset of those shown in the **Database Monitoring - Metric Browser** page.
- **System Waits:** SQL waits experienced by the database
- **Database Objects:** search for specific objects, and browse through database schemas, tables, columns, and indices.

Database Custom Metrics Window

The **Custom Metrics** window displays metrics for the custom queries that you specified for Database Visibility to monitor. See [Configure Custom Metrics](#)(see page 2541).

Access the Database Custom Metrics Window

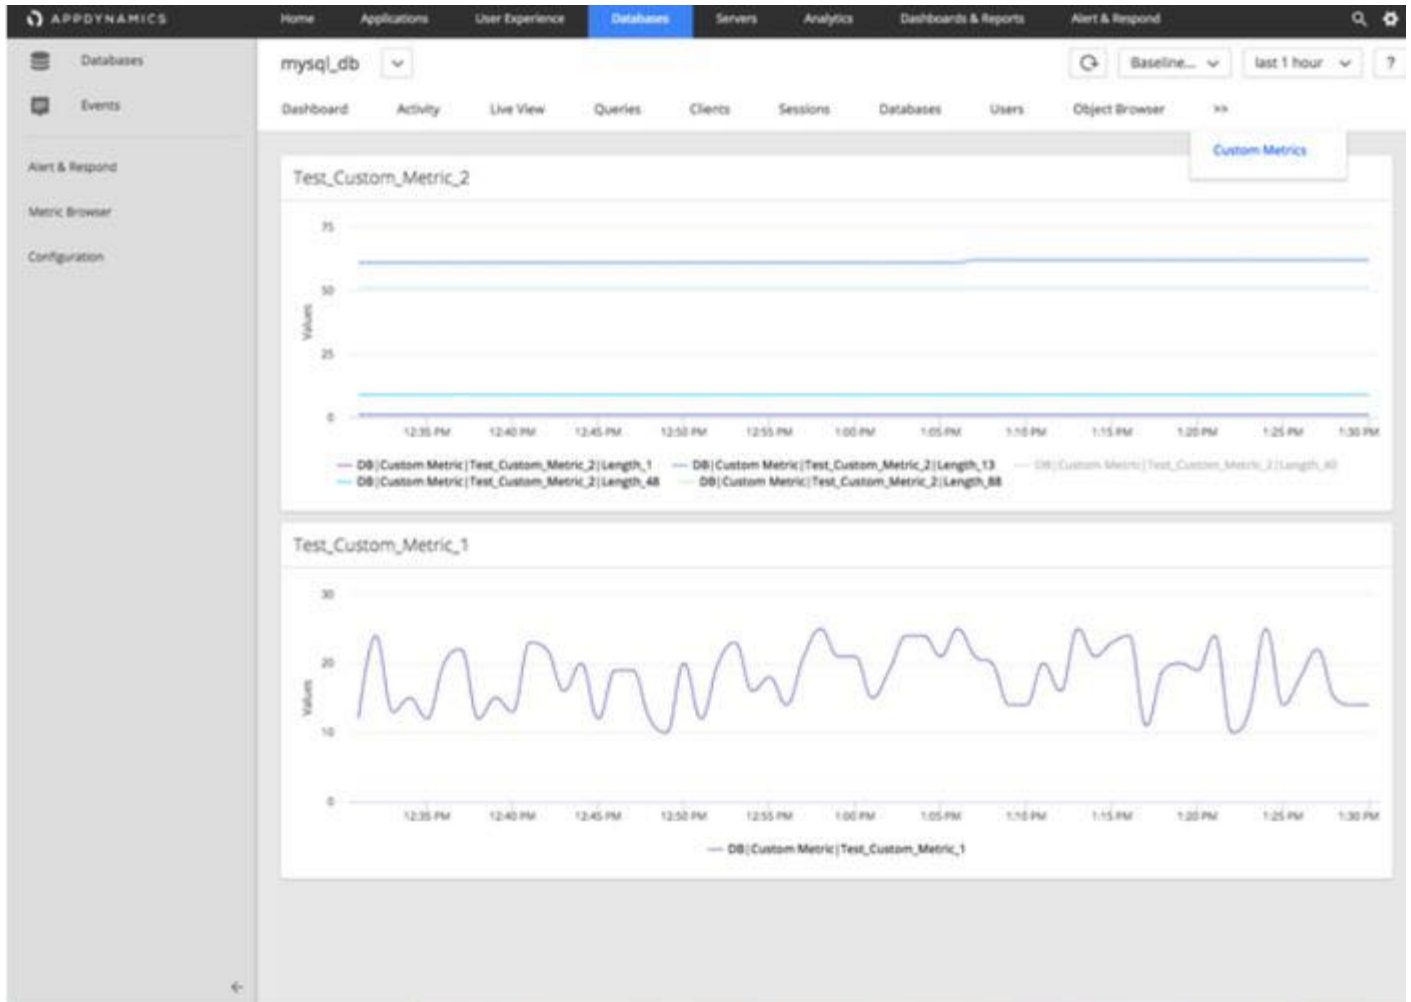

To access the Database **Custom Metrics** window:

1. To view a database's objects, click the name of the database.
2. Click the Custom Metrics tab.

Database Custom Metrics Window Features

From the Database Custom Metrics window, you can:

- View the values for each row of the custom query output. For example, if the query returns four rows, then the graph displays four lines.
- Double-click the graph to view the custom metric in the **Metric Browser**.

Monitor Database Server Hardware

Access the Database Server Hardware Metrics Window

Hardware metrics are reported on:

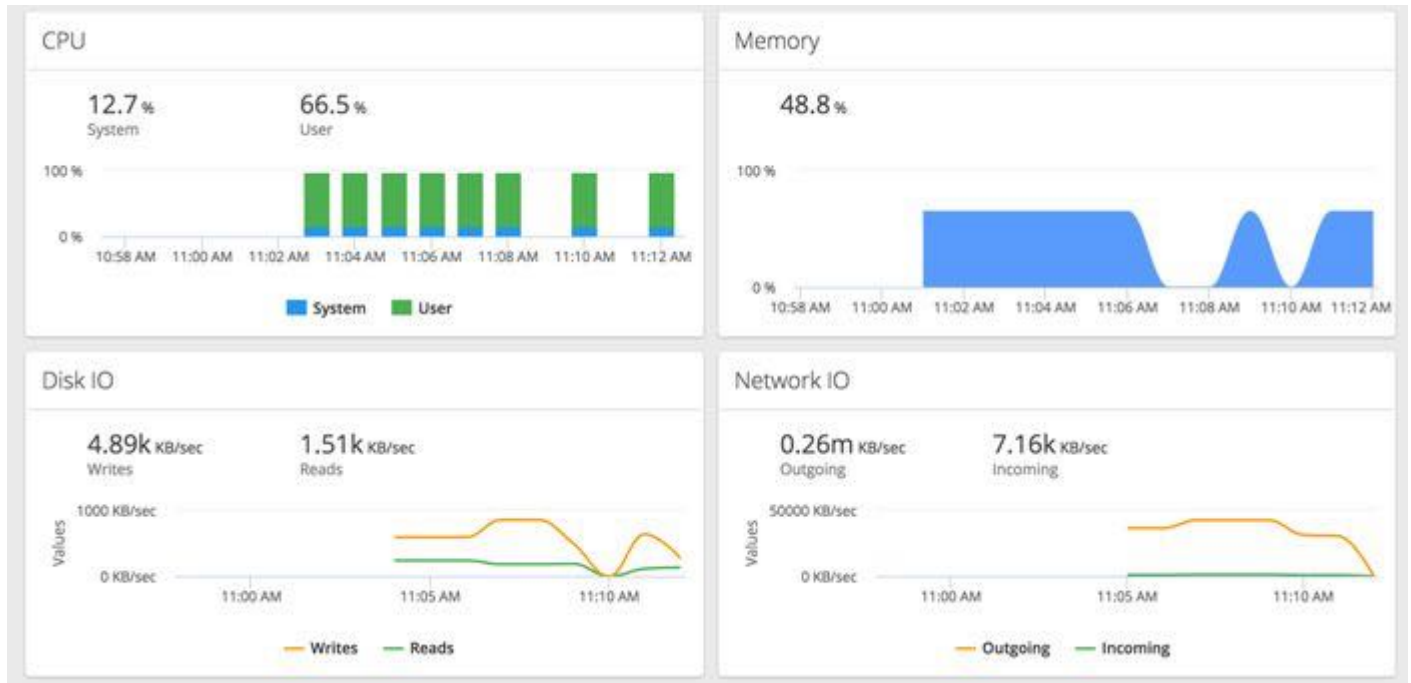

- [Database Dashboard](#)(see page 2473) window
- [Database Live](#)(see page 2481) window
- [Metric Browser](#)(see page 224)

Hardware Metrics Graphs Features

On the hardware metrics graphs, you can:

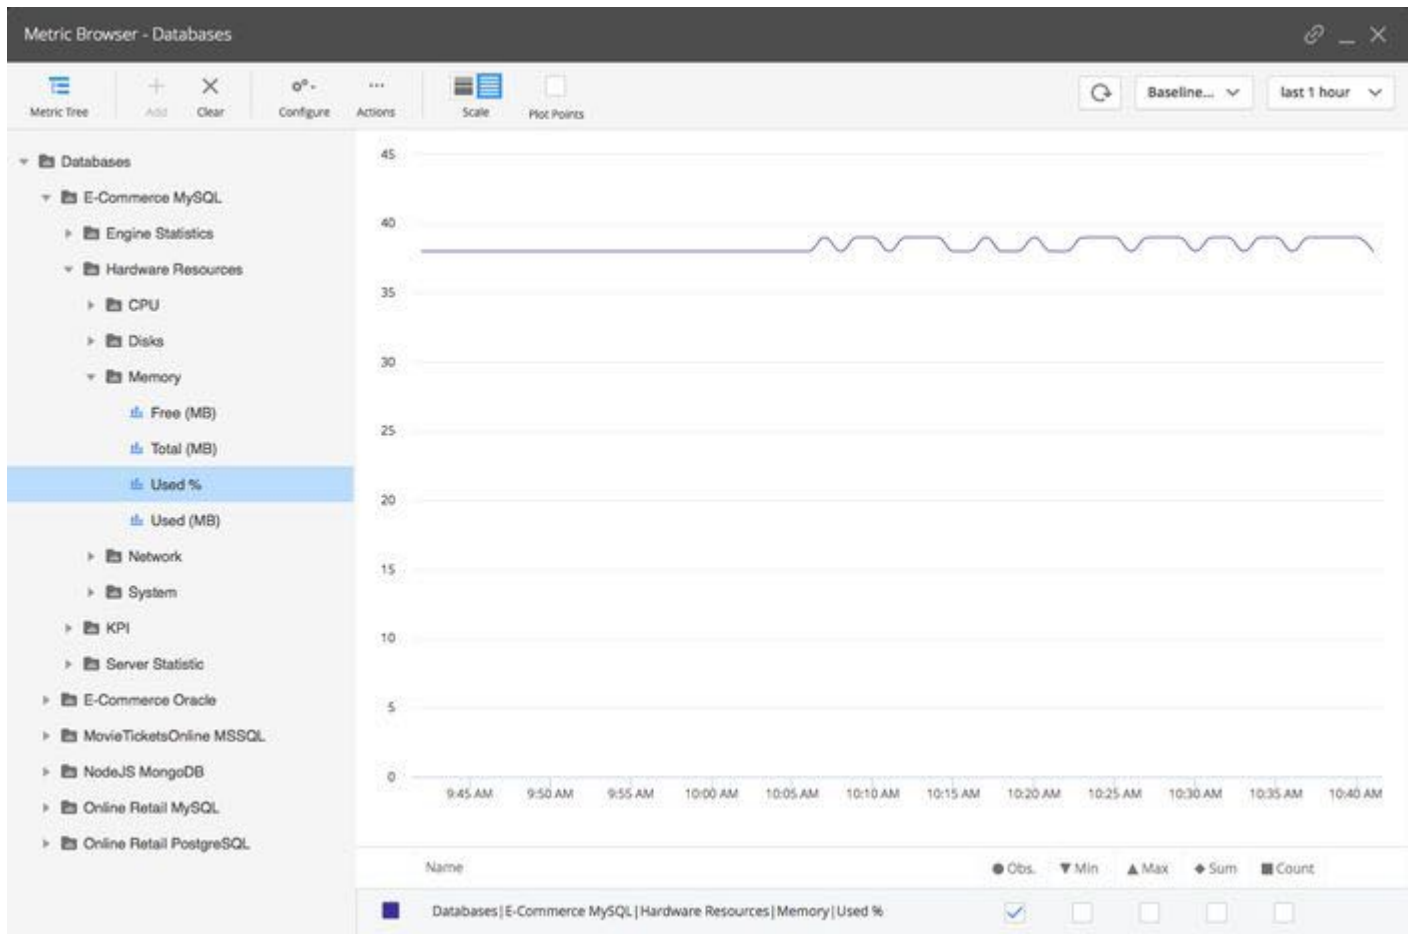

- Click anywhere on the graphs to get details about activity at that point in time.

- Double-click KPI points in the graph to display the Metric Browser showing the selected metric. Metrics are collected by the agent and reported once a minute.

Compare Server and Database Metrics

You can view and compare hardware and database metrics in the [Metric Browser](#) (see page 224). This can help you visualize the effect of server performance on database performance.

Database Health Rules and Alerts

You can configure AppDynamics Database Visibility to alert you when certain conditions are met or exceeded for monitored databases, operating systems, and server hardware. Use the **Getting Started Wizard** to guide you through the process if you are a new AppDynamics Pro user.

You configure [Health Rules](#)(see page 283), [Actions](#)(see page 334), [Policies](#)(see page 260), and Email Digests for monitoring databases almost exactly as you would configure these for monitored applications.

To view the health rules for your databases, click **Alert & Respond > Health Rules** and select **Databases** from the dropdown at the top. Use the Affected Entities tab of the **Create Health Rule** dialog to specify the **Database Health** rules. See [Alert and Respond](#)(see page 255).

In the Affected Entities tab, you can apply a database health rule to all databases, all databases of a specific database type, or to select instances of a specific database type being monitored. You can select the metrics on which to base the health rule. The health rule is violated when specified critical or warning conditions are met.

Similarly, you can create the health rule for Database Agent (**DB Agent Health**) and the Affected Entities tab of the **Create Health Rule** dialog allows specifying the **DB Agent Health** rule. You can apply a Database Agent (**DB Agent Health**) rule to all the Database Agents or specific Database Agents. You can select the required metrics on which to base the health rule. The health rule is violated when specified critical or warning conditions are met.

i Each Health Rule is only evaluated for the subset of databases or database that you currently have permissions for. If your permissions have changed since you created the Health Rule, then your current permissions are applied to the Health Rule evaluation.

Database Policy Actions are limited to email or SMS message notifications, and custom actions that have been uploaded to the Controller.

Once you have defined Health Rules and Actions, you can create a Policy based on a Health Rule to send you an email or an SMS message when a Health Rule is violated.

Database Monitoring Metrics

Related page:

[Metric Browser](#)(see page 224)

This document describes metrics collected by the Database Agent. It shows the path to the metric from the main AppDynamics menu down to the relevant branch of the Metric Browser tree. Some of these metrics are displayed in the Database Visibility user interface and so are also documented with the name of the window, column, section, and metric name.

The Metric Browser window name uses the following format:

- Metric Browser - *application_name*: When you access the Metric Browser from Applications.
- Metric Browser - Database Monitoring: When you access the Metric Browser from Infrastructure.

For most types of metrics in the browser, you can click any of the points in the graph to view more information about the metric observed at that point in time. The information shown includes the metric identifier, date and time of the observation, along with any of the following values relevant to the metric:

- **Obs** (observed value): the average of all data points seen for that interval. For a cluster or a time rollup, this represents the weighted average across nodes or over time.
- **Min**: the minimum data point value seen for that interval
- **Max**: the maximum data point value seen for that interval
- **Sum**: the sum of all data point values seen for that interval.
- **Count**: number of observations aggregated in that one point. For example, a count of 5 indicates that there were 5 1-minute data points aggregated into one point.

Key Performance Indicators (KPI)

These metrics are available for all database platforms supported.

Calls per Minute: The number of SQL calls to the database per minute.

DB Availability: The times when the database is available (has an active connection). If the database is not available, nothing is reported.

Number of Connections: The number of connections established with the database at any point during the selected time period. A connection is a session established between a database client and a server. Since the value displayed is the average number of connections over a time range, it is common to see a very low number or 0 for this metric.

Time Spent in Execution (s): The current amount of time the database spent executing SQL statements.

Total Database Size (PostgreSQL only): The amount of disk space (in MB) that the database is using.

Total Lock Time: Total time the database was in lock state in seconds.

Hardware Memory Metrics

These are the memory metrics that are available when you use hardware monitoring:

Total (MB): The total available memory.

Free (MB): The difference between the total and the used memory.

Used (MB): The amount of the memory used in MB.

i For the Database Agent versions $\geq 21.2 \leq 21.6$, the buffered memory and swap cache memory is a part of the used memory. For Database Agent ≥ 21.7 , the buffered memory and swap cache memory is not a part of the used memory, which is same as the Database Agent versions < 21.2 .

Cassandra Metrics

Metrics	Description
Average Read Write latency (microseconds)	Total Read Write divided Number of Reads Writes
Commands Completed(Only For DSE Cassandra)	Total read repair commands completed since startup.

Metrics	Description
Commands Pending(Only For DSE Cassandra)	A current number of the read repair commands pending.
Compaction Tasks Completed	The number of completed compactions since server start or restart.
Compaction Tasks Pending	The estimated number of compactions remaining to perform.
Disk Load (bytes)	The size (in bytes) of the on-disk data size the node manages.
Dropped Mutations	A dropped Write attempt on a node
Exceptions	The number of internal exceptions caught. Under normal exceptions, this should be zero.
GC Collection Count	The total number of collections that have occurred.
GC Collection Time (ms)	The time (in milliseconds) that Cassandra JVM takes to perform the garbage collection.
Heap Memory Used (bytes)	The heap Memory Used by JVM in bytes.
Key Cache Hit Percentage	The percentage of Key cache(Cache for partition to sstable offsets) hit rate.
Max Partition Size	The size of the largest compacted partition (in bytes).
Memtable Live Data Size (bytes)	The disk space used by SSTables that belongs to this table (in bytes).
Messaging Latency	The latency for inter-node communication.
Non Heap Memory Used (bytes)	The memory used by JVM other than heap memory (in bytes).
Number of Reads Writes	The number of the Reads Write requests.
Prepared Statements Executed	A number of Prepared Statements executed.
Process CPU Load Percentage	The Percentage of the recent cpu usage for the Java Virtual Machine process.
Read Failures	The number of failed Read operations
Read Repair Attempted(Only For DSE Cassandra)	The read repairs attempted since startup.

Metrics	Description
Read Repaired Background(Only For DSE Cassandra)	A number of the read repairs performed asynchronously since startup.
Read Repaired Blocking(Only For DSE Cassandra)	A number of the read repairs performed synchronously since startup.
Read Timeout Exceptions	The number of timeouts encountered for the read request.
Read Unavailability Exceptions	The number of unavailable exceptions encountered for the read request.
Read Write Throughput	Derived from Number of Reads Writes metrics over 1 minute.
Regular Statements Executed	A number of nonprepared statements executed.
Repair Age Percentage	The percentage of the table data that is repaired on disk.
Responses Completed(Only For DSE Cassandra)	The current read repairs completed count.
Responses Pending(Only For DSE Cassandra)	The current read repair responses pending count.
System CPU Load Percentage	The Percentage of the recent cpu usage for the whole system.
ThreadPools Request Active Tasks Authz Stage	The number of tasks being actively worked on by AuthzStage thread pool.
ThreadPools Request Active Tasks Read Repair Stage	The number of tasks being actively worked on by Read Repair Stage thread pool.
ThreadPools Request Active Tasks Request Response Stage	The number of tasks being actively worked on by Request Response Stage thread pool.
ThreadPools Internal Active Tasks Anti Entropy Stage	The number of tasks being actively worked on by Anti Entropy Stage thread pool.
ThreadPools Internal Active Tasks Background IO Stage	The number of tasks being actively worked on by Background IO Stage thread pool.
ThreadPools Internal Active Tasks Gossip Stage	The number of tasks being actively worked on by Gossip Stage thread pool.
ThreadPools Internal Active Tasks Internal Response Stage	The number of tasks being actively worked on by Internal Response Stage thread pool.

Metrics	Description
ThreadPools Internal Active Tasks Migration Stage	The number of tasks being actively worked on by Migration Stage thread pool.
ThreadPools Internal Active Tasks Misc Stage	The number of tasks being actively worked on by Misc Stage thread pool.
ThreadPools Request Pending Tasks Authz Stage	The number of queued tasks queued up by AuthzStage thread pool.
ThreadPools Request Pending Tasks Read Repair Stage	The number of queued tasks queued up by the Read Repair Stage thread pool.
ThreadPools Request Pending Tasks Request Response Stage	The number of queued tasks queued up by Request Response Stage thread pool.
ThreadPools Internal Pending Tasks Anti Entropy Stage	The number of queued tasks queued up by Anti Entropy Stage thread pool.
ThreadPools Internal Pending Tasks Background IO Stage	The number of queued tasks queued up by Background IO Stage thread pool.
ThreadPools Internal Pending Tasks Gossip Stage	The number of queued tasks queued up by Gossip Stage thread pool.
ThreadPools Internal Pending Tasks Internal Response Stage	The number of queued tasks queued up by Internal Response Stage thread pool.
ThreadPools Internal Pending Tasks Migration Stage	The number of queued tasks queued up by Migration Stage thread pool.
ThreadPools Internal Pending Tasks Misc Stage	The number of queued tasks queued up by Misc Stage thread pool.
ThreadPools Request Currently Blocked Tasks Authz Stage	The number of tasks that were blocked due to queue saturation on AuthzStage thread pool.
ThreadPools Request Currently Blocked Tasks Read Repair Stage	The number of tasks that were blocked due to queue saturation on Read Repair Stage thread pool.
ThreadPools Request Currently Blocked Tasks Request Response Stage	The number of tasks that were blocked due to queue saturation on Request Response Stage thread pool.
ThreadPools Internal Currently Blocked Tasks Anti Entropy Stage	The number of tasks that were blocked due to queue saturation on Anti Entropy Stage thread pool.
ThreadPools Internal Currently Blocked Tasks Background IO Stage	The number of tasks that were blocked due to queue saturation on Background IO Stage thread pool.

Metrics	Description
ThreadPools Internal Currently Blocked Tasks Gossip Stage	The number of tasks that were blocked due to queue saturation on Gossip Stage thread pool.
ThreadPools Internal Currently Blocked Tasks Internal Response Stage	The number of tasks that were blocked due to queue saturation on Internal Response Stage thread pool.
ThreadPools Internal Currently Blocked Tasks Migration Stage";	The number of tasks that were blocked due to queue saturation on Migration Stage thread pool.
ThreadPools Internal Currently Blocked Tasks Misc Stage";	The number of tasks that were blocked due to queue saturation on Misc Stage thread pool.
Total Read Write latency (microseconds)	Total Read Write Latency
Write Failures	The number of failed write operations
Write Timeout Exceptions	Number of timeouts encountered for write request.
Write Unavailability Exceptions	Number of unavailable exceptions encountered for write request.

Couchbase Metrics

Gc_num: Number of objects garbage collected

Gc_pause_time: Garbage collection pause time

Gc_pause_percent: Garbage collection pause percentage

Memory_usage: Memory (in GB) currently used by Couchbase

Memory_total: Memory (in GB) used by Couchbase over the total period of time

Memory_system: Memory (in GB) used by the system.

Cpu_user_percent: Percentage of CPU used by the user

Cpu_sys_percent: Percentage of CPU used by the system

Request_completed_count: Number of requests completed

Request_active_count: Number of active requests

Request_per_sec_1min: Requests per second in the last minute

Request_per_sec_5min: Requests per second in the last 5 minutes

Request_per_sec_15min: Requests per second in the last 15 minutes

Request_time_mean: Average request time

Request_time_median: Median request time

Request_time_80: 80th percentile request time

Request_time_95: 95th percentile request time

Request_time_99: 99th percentile request time

Request_prepared: Number of requests prepared

cpu_utilization_rate: Rate of CPU utilization

swap_total: Total amount of swap available

swap_used: Amount of swap used

mem_total: Total available memory

mem_free: Total amount of free memory

cmd_get: Compare and Swap gets

couch_docs_actual_disk_size: The physical memory used in the node

couch_docs_data_size: Data size of couch documents associated with a node

couch_spatial_data_size: Size of object data for spatial views

couch_spatial_disk_size: Amount of disk space occupied by spatial views

couch_views_actual_disk_size: Amount of disk space occupied by Couch views

couch_views_data_size: Size of object data for Couch views

curr_items: Number of active items in memory

curr_items_tot: Total number of items

ep_bg_fetched: Disk reads per second

get_hits: Number of get hits

mem_used: Engine's total memory usage

ops: Spatial operations

vb_replica_curr_items: Number of in memory items

operations per second: The total amount of operations per second (including XDCR) to this bucket (measured from $\text{cmd_lookup} + \text{cmd_set} + \text{incr_misses} + \text{incr_hits} + \text{decr_misses} + \text{decr_hits} + \text{delete_misses} + \text{delete_hits} + \text{ep_num_ops_del_meta} + \text{ep_num_ops_get_meta} + \text{ep_num_ops_set_meta}$)

.

active docs resident %: The percentage of active items cached in RAM in this bucket (measured from $\text{vb_active_resident_items_ratio}$).

gets per sec: The number of reads (get operations) per second from this bucket (measured from cmd_get).

sets per sec: The number of writes (set operations) per second to this bucket (measured from cmd_set).

deletes per sec: The number of delete operations per second for this bucket (measured from delete_hits).

disk creates per sec: The number of new items created on disk per second for this bucket (measured from $\text{vb_active_ops_create} + \text{vb_replica_ops_create} + \text{vb_pending_ops_create}$).

disk updates per sec: The number of items updated on disk per second for this bucket (measured from $\text{vb_active_ops_update} + \text{vb_replica_ops_update} + \text{vb_pending_ops_update}$).

disk reads per sec: The number of reads per second from disk for this bucket (measured from ep_bg_fetched).

disk read failures: The number of disk read failures (measured from $\text{ep_data_read_failed}$).

disk write failures: The number of disk write failures (measured from $\text{ep_data_write_failed}$).

temp OOM per sec: The number of back-offs sent per second to client SDKs due to the out-of-memory situations from this bucket (measured from ep_tmp_oom_errors).

cache miss ratio: The percentage of reads per second to this bucket from disk as opposed to RAM (measured from $\text{ep_bg_fetches} / \text{cmd_lookup} * 100$).

disk queue fill rate: The total number of items per second being put on the disk queue in this bucket (measured from ep_diskqueue_fill).

disk queue drain rate: The total number of items per second being written to disk in this bucket (measured from $\text{ep_diskqueue_drain}$).

disk write queue: The number of items waiting to be written to disk in this bucket (measured from $\text{ep_queue_size} + \text{ep_flusher_todo}$).

DB2 Server Metrics

ACTIVE_SORTS: The number of sorts in the database that currently have a sort heap allocated.

AGENTS_TOP: At the database level, it is the maximum number of agents for all applications.

APPLS_CUR_CONS: The number of applications that are currently connected to the database.

APPLS_IN_DB2: The number of applications that are currently connected to the database, and for which the database manager is currently processing a request.

BINDS_PRECOMPILES: The number of binds and pre-compiles attempted. You can use this element to gain insight into the current level of activity within the database manager. This value does not include the count of `int_auto_rebinds`, but it does include binds that occur as a result of the `REBIND PACKAGE` command.

CONNECTIONS_TOP: The highest number of simultaneous connections to the database since the database was activated.

COORD_AGENTS_TOP: The highest number of coordinating agents. If the peak number of coordinating agents represents too high a workload for this node, you can reduce this upper boundary by changing the `max_coordagents` configuration parameter.

DDL_SQL_STMTS: The number of SQL Data Definition Language (DDL) statements that were executed.

DEADLOCKS: The number of deadlocks that have occurred.

DIRECT_READ_REQS: Use the following formula to calculate the average number of sectors that are read by a direct read: $\text{direct_reads} / \text{direct_read_reqs}$.

DIRECT_READ_TIME: Time spent doing direct read operations.

DIRECT_READS: Direct reads are performed in units, the smallest being a 512-byte sector. They are used when: Reading LONG VARCHAR columns, Reading LOB (large object) columns, Performing a backup.

DIRECT_WRITE_REQS: Use the following formula to calculate the average number of sectors that are written by a direct write: $\text{direct_writes} / \text{direct_write_reqs}$.

DIRECT_WRITE_TIME: Time spent doing direct write operations.

DIRECT_WRITES: Direct writes are performed in units, the smallest being a 512-byte sector. They are used when: Writing LONG VARCHAR columns, Writing LOB (large object) columns, Performing a restore, Performing a load, Allocating new extents for SMS table space if MPFA is enabled (which is the default).

DYNAMIC_SQL_STMTS: The number of dynamic SQL statements that were attempted.

ELAPSED_EXEC_TIME_MS: The total time (in milliseconds) required to execute all the statements for a particular application during the specified time period.

ELAPSED_EXEC_TIME_S: The total time (in seconds) required to execute all the statements for a particular application during the specified time period.

FAILED_SQL_STMTS: The number of SQL statements that were attempted, but failed.

INT_AUTO_REBINDS: The number of commits initiated internally by the database manager.

INT_COMMITS: The number of commits initiated internally by the database manager.

INT_DEADLOCK_ROLLBACKS: The number of forced rollbacks initiated by the database manager due to a deadlock. A rollback is performed on the current unit of work in an application selected by the database manager to resolve the deadlock.

INT_ROLLBACKS: The number of rollbacks initiated internally by the database manager.

INT_ROWS_DELETED: The number of rows deleted from the database as a result of internal activity.

INT_ROWS_INSERTED: The number of rows inserted into the database as a result of internal activity caused by triggers.

INT_ROWS_UPDATED: The number of rows updated from the database as a result of internal activity.

LOCK_ESCALAS: The number of times that locks have been escalated from several row locks to a table lock.

LOCK_LIST_IN_USE: The total number of bytes of lock list memory in use.

LOCK_TIMEOUTS: The number of times that a request to lock an object timed-out instead of being granted.

LOCK_WAIT_TIME: The total elapsed time (in milliseconds) spent waiting for locks.

LOCK_WAITS: The number of times that applications or connections waited for locks.

LOCKS_HELD: The number of locks currently held.

LOCKS_WAITING: The number of agents waiting on a lock.

LOG_HELD_BY_DIRTY_PAGES: The amount of log (in bytes) corresponding to the difference between the oldest dirty page in the database and the top of the active log.

LOG_READ_TIME_NS: The total elapsed time spent by the logger reading log data from the disk. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type.

LOG_READ_TIME_S: At the database level, this is the number of subagents for all applications.

LOG_READS: The number of log pages read from disk by the logger.

LOG_TO_REDO_FOR_RECOVERY: The size of the log (in bytes) that will have to be redone for crash recovery.

LOG_WRITE_TIME_NS: The total elapsed time spent by the logger writing log data to the disk. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type.

LOG_WRITE_TIME_S: At the database level, this is the number of subagents for all applications.

LOG_WRITES: The number of log pages written to disk by the logger.

NUM_ASSOC_AGENTS: At the database level, this is the number of subagents for all applications.

NUM_INDOUBT_TRANS: The number of outstanding indoubt transactions in the database. Indoubt transactions hold log space for uncommitted transactions, which can cause the logs to become full. When the logs are full, further transactions cannot be completed. The resolution of this problem involves a manual process of heuristically resolving the indoubt transactions. This monitor element provides a count of the number of currently outstanding indoubt transactions that must be heuristically resolved.

NUM_LOG_BUFFER_FULL: The number of times agents had to wait for log data to write to disk while copying log records into the log buffer.

NUM_LOG_DATA_FOUND_IN_BUFFER: The number of times log data was read from buffer instead of from disk, which is slower.

NUM_LOG_PART_PAGE_IO: Number of I/O requests issued by the logger for writing partial log data to disk. To determine if the current disk is adequate for logging, use this metric in conjunction with `log_writes`, `log_write_time`, and `num_log_write_io`.

NUM_LOG_READ_IO: Number of I/O requests issued by the logger to read log data from disk. To determine if the current disk is adequate for logging, use this metric in conjunction with `log_reads` and `log_read_time`.

NUM_LOG_WRITE_IO: Number of I/O requests issued by the logger to write log data to disk. To determine if the current disk is adequate for logging, use this metric in conjunction with `log_writes` and `log_write_time`.

POOL_ASYNC_DATA_READ_REQS: Number of asynchronous read requests by the prefetcher to the operating system. These requests are usually large block I/Os of multiple pages.

POOL_ASYNC_DATA_READS: Number of data pages read in from the table space physical containers by asynchronous engine dispatchable units for all types of table spaces. To determine the number of physical read that were performed synchronously, use this metric along with the `pool_data_p_reads` metrics.

POOL_ASYNC_DATA_WRITES: Number of times a buffer pool data page was physically written to disk by either an asynchronous page cleaner or prefetcher. To determine how well the buffer page cleaners are performing, use this metric in conjunction with `pool_data_writes` and `pool_async_data_writes`.

POOL_ASYNC_INDEX_READS: Number of index pages read in from the physical table space containers by asynchronous engine dispatchable units for all types of table spaces. To determine how well the prefetchers are working, compare the ratio of asynchronous reads to total physical reads. Use this information to tune the `num_ioservers` configuration parameter.

POOL_ASYNC_INDEX_WRITES: Number of times a buffer pool index page was physically written to disk by either an asynchronous page cleaner or prefetcher.

POOL_ASYNC_READ_TIME: Total number of milliseconds spent reading in data and index pages from physical table space containers by asynchronous engine dispatchable units for all types of table spaces. Use this metric to analyze the I/O work being performed.

POOL_ASYNC_WRITE_TIME: Total number of milliseconds spent writing data or index pages from the buffer pool to disk by database manager page cleaners. Use this metric to analyze the I/O work being performed.

POOL_DATA_FROM_ESTORE: Number of buffer pool data pages read from the extended storage monitor.

POOL_DATA_L_READS: Number of data pages which have been requested from the buffer pool (logical) for regular and large table spaces. The functionality to record buffer pool information at the statement level is supported for API and CLP snapshot requests.

POOL_DATA_P_READS: Number of data pages read in from the table space containers (physical) for regular and large table spaces. The functionality to record buffer pool information at the statement 7 level is supported for API and CLP snapshot requests.

POOL_DATA_WRITES: Number of times a buffer pool data page was physically written to disk.

POOL_DRTY_PG_STEAL_CLNS: Number of times a page cleaner was invoked because a synchronous write was needed during the victim buffer replacement for the database.

POOL_DRTY_PG_THRSH_CLNS: Number of times a page cleaner was invoked because a buffer pool had reached the dirty page threshold criterion for the database.

POOL_INDEX_L_READS: Number of index pages which have been requested from the buffer pool (logical) for 9 regular and large table spaces. The functionality to record buffer pool information at the statement level is supported for API and CLP snapshot requests.

POOL_INDEX_P_READS: Number of index pages read in from the table space containers (physical) for regular and large table spaces. The functionality to record buffer pool information at the statement level is supported for API and CLP snapshot requests.

POOL_INDEX_WRITES: Number of times a buffer pool index page was physically written to disk.

POOL_LSN_GAP_CLNS: Number of times a page cleaner was invoked because the logging space used had reached a predefined criterion for the database.

POOL_NO_VICTIM_BUFFER: Number of times an agent did not have a preselected victim buffer available.

POOL_READ_TIME: Number of milliseconds spent reading in data and index pages from the physical table space for all types of table spaces.

POOL_TEMP_DATA_L_READS: Number of data pages which have been requested from the logical buffer pool for temporary table spaces.

POOL_TEMP_DATA_P_READS: Number of data pages read in from the physical table space containers for temporary table spaces.

POOL_TEMP_INDEX_L_READS: Number of index pages which were requested from the logical buffer pool for temporary table spaces.

POOL_TEMP_INDEX_P_READS: Number of index pages read in from the physical table space containers for temporary table spaces.

POOL_WRITE_TIME: Number of milliseconds spent physically writing data or index pages from the buffer pool to disk.

PREFETCH_WAIT_TIME: Number of milliseconds spent waiting for an I/O prefetcher server to finish loading pages into the buffer pool.

ROWS_DELETED: Number of row deletions attempted.

ROWS_INSERTED: Number of row insertions attempted.

ROWS_READ: Number of rows read from tables.

ROWS_SELECTED: Number of rows that have been selected and returned to the application.

ROWS_UPDATED: Number of row updates attempted.

SEC_LOG_USED_TOP: The maximum number of bytes of secondary log space used.

SEC_LOGS_ALLOCATED: Number of secondary log files currently being used for the database.

SELECT_SQL_STMTS: The number of SQL SELECT statements that were executed.

SORT_HEAP_ALLOCATED: The number of allocated pages of sort heap space for all sorts at the level chosen and at the current time.

SORT_OVERFLOWS: The number of sorts that ran out of sort heap and may have required disk space for temporary storage.

SORT_SHRHEAP_ALLOCATED: The total amount of shared sort memory allocated in the database.

SORT_SHRHEAP_TOP: Database-wide shared sort memory high-water mark in 4k pages.

STATIC_SQL_STMTS: The number of static SQL statements that were attempted.

TOT_LOG_USED_TOP: The maximum number of bytes used for log space.

TOTAL_APP_COMMITS: Total number of commit statements issued by the client application.

TOTAL_APP_ROLLBACKS: Total number of rollback statements issued by the client application.

TOTAL_CONS: Number of newly opened connections to the database.

TOTAL_LOG_AVAILABLE: Number of bytes of active log space in the database that is not being used by uncommitted transactions.

TOTAL_LOG_USED: Number of bytes of active log space currently used in the database.

TOTAL_SEC_CONS: The number of connections made by a subagent to the database at the node.

TOTAL_SORT_TIME: The total elapsed time (in milliseconds) for all sorts that have been executed.

TOTAL_LOCK_TIME: The total time for which database is in locked state.

TOTAL_SORTS: The number of sorts that have been executed.

TOT_LOG_USED_TOP: The maximum amount of total log space used (in bytes).

UID_SQL_STMTS: Number of SQL UPDATE, INSERT, and DELETE statements that were executed.

UNREAD_PREFETCH_PAGES: Number of pages that the prefetcher read in that were never used.

MongoDB Server Metrics

asserts_msg: The number of message asserts. These are internal server errors that have a well defined text string. Stack traces are logged for these.

asserts_regular: The number of regular asserts raised since this process started.

asserts_user: The number of user asserts. These are errors that can be generated by a user such as out of disk space or duplicate key.

asserts_warning: The number of warnings raised since this process started.

BackgroundFlushing_flushes: The number of times the database has flushed all writes to disk.

BackgroundFlushing_total_ms: The number of milliseconds (ms) that the mongod processes have spent writing (i.e. flushing) data to disk.

Connections_available: The number of unused available connections that the database can provide. Consider this value in combination with the value of current to understand the connection load on the

database, and the UNIX ulimit Settings document for more information about system thresholds on available connections.

Connections_current: The number of connections to the database server from clients. This number includes the current shell session. Consider the value of available to add more context to this datum. This figure will include the current shell connection as well as any inter-node connections to support a replica set or sharded cluster.

Cursor_timedOut: The number of cursors that have timed out since the server process started. If this number is large or growing at a regular rate, this may indicate an application error.

Cursor_totalOpen: The number of cursors that MongoDB is maintaining for clients. Because MongoDB exhausts unused cursors, typically this value small or zero. However, if there is a queue, stale tailable cursors, or a large number of operations this value may rise.

globalLock_ActiveClients: The number of connected clients.

globalLock_CurrentQueue: The number of operations queued waiting for the lock. A consistently small queue, particularly of shorter operations should cause no concern. Also, consider this value in light of the size of queue waiting for the read lock (e.g. readers) and write lock (e.g. writers) individually.

Mem_mapped: The number of megabytes of memory mapped by the database. Because MongoDB uses memory-mapped files, this value will be roughly equivalent to the total size of your databases.

Mem_resident: The amount of RAM, in megabytes (MB), currently used by the database process. In normal use this value tends to grow. In dedicated database servers this number tends to approach the total amount of system memory.

Mem_virtual: The quantity, in megabytes (MB), of virtual memory used by the mongod process. With journaling enabled, the value of virtual is at least twice the value of mapped. If virtual value is significantly larger than mapped (e.g. 3 or more times), this may indicate a memory leak.

Network_bytesIn: The amount of network traffic, in bytes, received by this database. Use this value to ensure that network traffic sent to the mongod process is consistent with expectations and overall inter-application traffic.

Network_bytesOut: The amount of network traffic, in bytes, sent from this database. Use this value to ensure that network traffic sent by the mongod process is consistent with expectations and overall inter-application traffic.

Network_numRequests: The number of distinct requests that the server has received. Use this value to provide context for the bytesIn and bytesOut values to ensure that MongoDB network utilization is consistent with expectations and application use.

OpCounters_command: The number of commands sent to MongoDB.

OpCounters_delete: The number of Delete operations.

OpCounters_getmore: The number of GetMore operations.

OpCounters_insert: The number of Insert operations.

OpCounters_query: The number of Query operations.

OpCounters_update: The number of Update operations.

Oplog_Max_Size (*new in 4.5.4*): The maximum size of the operation log

Oplog_Size (*new in 4.5.4*): The size of the operation log

OplogTimeDiff_in_sec (*new in 4.5.4*): The difference (in seconds) between the first entry in the log and the last entry in the log

Repl_command: The number of Replicated Commands issued to the database.

Repl_delete: The number of Replicated Delete operations.

Repl_getmore: The number of GetMore operations. This counter can be high even if the query count is low. Secondary nodes send getMore operations as part of the replication process.

Repl_insert: The number of replicated insert operations.

Repl_query: The number of Replicated Queries.

Repl_update: The number of Replicated Update Operations.

Replication_MyState (*new in 4.5.4*): An integer between 0 and 10 that represents the replica state of the current member.

Index_missRatio: Ratio of index hits to misses. If there are a lot of index misses then you should look at your queries to see if they are optimally using your indexes. You may need to add new indexes to make the queries run faster. You can explain the query to see which index queries are hitting and the total execution time so you can compare query performance before and after adding the new indexes.

Microsoft SQL Server Metrics

Active cursors: The number of active cursors.

Active Temp Tables: The number of temporary tables/table variables in use.

Active Transactions: The number of active transactions for the database.

AU cleanup batches/sec: The number of batches per second that were completed successfully by the background task that cleans up deferred dropped allocation units.

AU cleanups/sec: The number of allocation units per second that were successfully dropped the background task that cleans up deferred dropped allocation units. Each allocation unit drop requires multiple batches.

Auto-Param Attempts/sec: The number of auto-parameterization attempts per second. Total should be the sum of the failed, safe, and unsafe auto-parameterizations. Auto-parameterization occurs when an instance of SQL Server tries to parameterize a Transact-SQL request by replacing some literals with parameters so that reuse of the resulting cached execution plan across multiple similar-looking requests is possible. Note that auto-parameterizations are also known as simple parameterizations in newer versions of SQL Server. This counter does not include forced parameterizations.

Average Latch Wait Time (ms): Average latch wait time (in milliseconds) for latch requests that had to wait.

Average Wait Time (ms): Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.

Backup/Restore Throughput/sec: Read/write throughput for backup and restore operations of a database per second. For example, you can measure how the performance of the database backup operation changes when more backup devices are used in parallel or when faster devices are used. Throughput of a

database backup or restore operation allows you to determine the progress and performance of your backup and restore operations.

Batch Requests/sec: The number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.

Buffer cache hit ratio: Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups over the last few thousand page accesses. The ratio is displayed as a percentage. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.

Bulk Copy Rows/sec: The number of rows bulk copied per second.

Bulk Copy Throughput/sec: Amount of data bulk copied (in kilobytes) per second.

By-reference Lob Create Count: Count of large object (lob) values that were passed by reference. By-reference lobs are used in certain bulk operations to avoid the cost of passing them by value.

By-reference Lob Use Count: Count of by-reference lob values that were used. By-reference lobs are used in certain bulk operations to avoid the cost of passing them by-value.

Cache Hit Ratio: Ratio between cache hits and lookups. The ratio is displayed as a percentage.

Cache Object Counts: The number of cache objects in the cache.

Cache Objects in use: The number of cache objects in use.

Cache Pages: The number of 8-kilobyte (KB) pages used by cache objects.

Cached Cursor Counts: The number of cursors of a given type in the cache.

Checkpoint pages/sec: The number of pages flushed to disk per second by a checkpoint or other operation that require all dirty pages to be flushed.

CLR Execution: Total execution time in CLR (microseconds)

Connection Memory (KB): Total amount of dynamic memory the server is using for maintaining connections.

Count Lob Readahead: Count of lob pages on which readahead was issued.

Count Pull In Row: Count of column values that were pulled in-row from off-row.

Count Push Off Row: Count of column values that were pushed from in-row to off-row.

Cursor memory usage: Amount of memory consumed by cursors in kilobytes (KB).

Count/sec: Times each type of cached cursor has been used. Cursor memory usage Amount of memory consumed by cursors in kilobytes (KB).

Cursor Requests/sec: The number of SQL cursor requests received by the server. Cursor worktable usage Number of worktables used by cursors. Data File(s) Size (KB) Cumulative size (in kilobytes) of all the data files in the database including any automatic growth. Monitoring this counter is useful, for example, for determining the correct size of Database pages Number of pages in the buffer pool with database content.

Cursor worktable usage: Number of worktables in use by cursors.

Data File(s) Size(KB): Cumulative size (Kb) of all data files in the database including any automatic growth. Monitoring this counter to determine the correct size of tempdb.

Database pages: Number of database pages in use.

DBCC Logical Scan Bytes/sec: The number of logical read scan bytes per second for database console commands (DBCC).

Deferred Dropped rowsets: The number of rowsets created as a result of aborted online index build operations that are waiting to be dropped by the background task that cleans up deferred dropped rowsets.

Dropped rowset cleanups/sec: The number of rowsets per second created as a result of aborted online index build operations that were successfully dropped by the background task that cleans up deferred dropped rowsets.

Dropped rowsets skipped/sec: The number of rowsets per second created as a result of aborted online index build operations that were skipped by the background task that cleans up deferred dropped rowsets created.

Errors/sec: The number of errors/sec.

Event Notifications Delayed Drop: The number of event notifications waiting to be dropped by a system thread.

Extent Deallocations/sec: The number of extents deallocated per second in all databases in this instance of SQL Server.

Extents Allocated/sec: The number of extents allocated per second in all databases in this instance of SQL Server.

Failed AU cleanup batches/sec: The number of batches per second that failed and required retry, by the background task that cleans up deferred dropped allocation units. Failure could be due to lack of memory or disk space, hardware failure, and other reasons.

Failed Auto-Params/sec: The number of failed auto-parameterization attempts per second. This should be small. Note that auto-parameterizations are also known as simple parameterizations in later versions of SQL Server.

Failed leaf page cookie: The number of times that a leaf page cookie could not be used during an index search since changes happened on the leaf page. The cookie is used to speed up the index search.

Failed tree page cookie: The number of times that a tree page cookie could not be used during an index search since changes happened on the parent pages of those tree pages. The cookie is used to speed up the index search.

Forced Parameterizations/sec: The number of successful forced parameterizations per second.

Forwarded Records/sec: The number of records per second fetched through forwarded record pointers.

Free list stalls/sec: The number of requests per second that had to wait for a free page.

Free Space in tempdb (KB): The amount of space (in kilobytes) available in FreeSpace Page.

FreeSpace Page Fetches/sec: Number of pages fetched/second by free space scans. These scans search for free space within pages already allocated to an allocation unit, to address requests to insert or modify record fragments.

FreeSpace Scans/sec: The number of scans per second that were initiated to search for free space within pages already allocated to an allocation unit to insert or modify record fragment. Each scan may find multiple pages.

Full Scans/sec: The number of unrestricted full scans per second. These can be either base-table or full-index scans.

Granted Workspace Memory (KB): Total amount of memory currently granted to executing processes such as hash, sort, bulk copy, and index creation operations.

Guided Plan Executions/sec: The number of plan executions per second in which the query plan has been generated by using a plan guide.

HTTP Authenticated Requests: The number of authenticated HTTP requests started per second. Index Searches/sec Number of index searches per second. These are used to start a range scan, reposition a range scan, revalidate a scan point, fetch a single index record, and search down the index to locate where to insert a new row.

Index Searches/sec: Number of index searches per second. These are used to start a range scan, reposition a range scan, revalidate a scan point, fetch a single index record, and search down the index to locate where to insert a new row.

Latch Waits/sec: The number of latch requests that could not be granted immediately.

Lazy writes/sec: The number of buffers written per second by the buffer manager's lazy writer. The lazy writer is a system process that flushes out batches of dirty, aged buffers (buffers that contain changes that must be written back to disk before the buffer can be reused for a different page) and makes them available to user processes. The lazy writer eliminates the need to perform frequent checkpoints in order to create available buffers.

LobHandle Create Count: Count of temporary lobs created.

LobHandle Destroy Count: Count of temporary lobs destroyed.

LobSS Provider Create Count: Count of LOB Storage Service Providers (LobSSP) created. One worktable created per LobSSP.

LobSS Provider Destroy Count: Count of LobSSP destroyed.

LobSS Provider Truncation Count: Count of LobSSP truncated.

Lock Blocks: Current number of lock blocks in use on the server (refreshed periodically). A lock block represents an individual locked resource, such as a table, page, or row.

Lock Blocks Allocated: Current number of allocated lock blocks. At server startup, the number of allocated lock blocks plus the number of allocated lock owner blocks depends on the SQL Server

Lock Memory (KB): Total amount of dynamic memory the server is using for locks.

Lock Owner Blocks: The number of lock owner blocks currently in use on the server (refreshed periodically). A lock owner block represents the ownership of a lock on an object by an individual thread. Therefore, if three threads each have a shared (S) lock on a page, there will be three lock owner blocks.

Lock Owner Blocks Allocated: Current number of allocated lock owner blocks. At server startup, the number of allocated lock owner blocks and the number of allocated lock blocks depend on the SQL

Lock Requests/sec: The number of new locks and lock conversions per second requested from the lock manager.

Lock Timeouts (timeout > 0)/sec: The number of lock requests per second that timed out, but excluding requests for NOWAIT locks.

Lock Timeouts/sec: The number of lock requests per second that timed out, including requests for NOWAIT locks.

Lock Wait Time (ms): Total wait time (in milliseconds) for locks in the last second.

Lock Waits/sec: The number of lock requests per second that required the caller to wait.

Log Bytes Flushed/sec: Total number of log bytes flushed.

Log Cache Hit Ratio: Percentage of log cache reads satisfied from the log cache.

Log Cache Reads/sec: Reads performed per second through the log manager cache.

Log File(s) Size (KB): Cumulative size (in kilobytes) of all the transaction log files in the database.

Log File(s) Used Size (KB): The cumulative used size of all the log files in the database.

Log Flush Wait Time Total wait time (in milliseconds) to flush the log.

Log Flush Waits/sec: The number of commits per second waiting for the log flush.

Log Flushes/sec: The number of log flushes per second.

Log Growths: Total number of times the transaction log for the database has been expanded.

Log Shrinks: Total number of times the transaction log for the database has been shrunk.

Log Truncations: Total number of times the transaction log for the database has been truncated.

Logical Connections: The number of logical connections to the system.

Logins/sec: Total number of logins started per second. This does not include pooled connections.

Logouts/sec: Total number of logout operations started per second.

Longest Transaction Running Time: The length of time (in seconds) since the start of the transaction that has been active longer than any other current transaction.

Mars Deadlocks: The number of Mars Deadlocks detected.

Maximum Workspace Memory (KB): Maximum amount of memory available for executing processes such as hash, sort, bulk copy, and index creation operations.

Memory Grants Outstanding: Total number of processes that have successfully acquired a workspace memory grant.

Memory Grants Pending: Total number of processes waiting for a workspace memory grant.

Mixed page allocations/sec: The number of pages allocated per second from mixed extents. These could be used for storing the IAM pages and the first eight pages that are allocated to an allocation unit.

Non-atomic yield rate: The number of non-atomic yields per second.

NonSnapshot Version Transactions: The number of currently active transactions that are not using snapshot isolation level and have made data modifications that have generated row versions in the Number of active cursor plans.

Number of active cursor plans: Number of cursor plans.

Number of Deadlocks/sec: The number of lock requests per second that resulted in a deadlock.

Number of SuperLatches: The number of latches that are currently SuperLatches.

Optimizer Memory (KB): Total amount of dynamic memory the server is using for query optimization.

Page compression attempts/sec: The number of pages evaluated for page-level compression. Includes pages that were not compressed because significant savings could be achieved. Includes all objects in the instance of SQL Server. For information about specific objects, see `sys.dm_db_index_operational_stats` (Transact-SQL).

Page Deallocations/sec: The number of pages deallocated per second in all databases in this instance of SQL Server. These include pages from mixed extents and uniform extents.

Page life expectancy: The number of seconds a page will stay in the buffer pool without references.

Page lookups/sec: The number of requests per second to find a page in the buffer pool.

Page reads/sec: The number of physical database page reads that are issued per second. This statistic displays the total number of physical page reads across all databases. Because physical I/O is expensive, you may be able to minimize the cost, either by using a larger data cache, intelligent indexes, and more efficient queries or by changing the database design.

Page Splits/sec: The number of page splits per second that occur as the result of overflowing index pages.

Page writes/sec: The number of physical database page writes issued per second.

Pages Allocated/sec: The number of pages allocated per second in all databases in this instance of SQL Server. These include pages allocations from both mixed extents and uniform extents.

Pages compressed/sec: The number of data pages that are compressed by using PAGE compression. Includes all objects in the instance of SQL Server. For information about specific objects, see `sys.dm_db_index_operational_stats` (Transact-SQL).

Percent Log Used: Percentage of space in the log that is in use.

Probe Scans/sec: The number of probe scans per second that are used to find at most one single qualified row in an index or base table directly.

Processes blocked: The number of currently blocked processes.

Range Scans/sec: The number of qualified range scans through indexes per second.

Readahead pages/sec: The number of pages read per second in anticipation of use.

Repl. Trans. Rate: The number of transactions per second read out of the transaction log of the publication database and delivered to the distribution database.

Safe Auto-Params/sec: The number of safe auto-parameterization attempts per second. Safe refers to a determination that a cached execution plan can be shared between different similar-looking Transact-SQL statements. SQL Server makes many auto-parameterization attempts some of which turn out to be safe and others fail. Note that auto-parameterizations are also known as simple parameterizations in later versions of SQL Server. This does not include forced parameterizations.

Scan Point Revalidations/sec: The number of times per second that the scan point had to be revalidated to continue the scan.

Skipped Ghosted Records/sec: The number of ghosted records per second skipped during scans.

Snapshot Transactions: The number of currently active transactions using the snapshot isolation level. N.B. The SOAP Empty Requests Number of empty SOAP requests started per second.

SOAP Empty Requests: The number of SOAP method invocations passed to the stored procedure (or template) with an empty string as its value (not a NULL value) in order to provide an included input parameter with no value assigned to it.

SOAP Method Invocations: The number of SOAP method invocations started per second.

SOAP Session Initiate Requests: The number of SOAP Session initiate requests started per second.

SOAP Session Terminate Requests: The number of SOAP Session terminate requests started per second.

SOAP SQL Requests: The number of SOAP SQL requests started per second.

SOAP WSDL Requests: The number of SOAP Web Service Description Language requests started per second.

SQL Attention rate: The number of attentions per second. An attention is a request by the client to end the currently running request.

SQL Cache Memory (KB): Total amount of dynamic memory the server is using for the dynamic SQL cache.

SQL Compilations/sec: The number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles caused by statement-level recompilations in SQL Server. After SQL Server user activity is stable, this value reaches a steady state.

SQL Re-Compilations/sec: The number of statement recompiles per second. Counts the number of times statement recompiles are triggered. Generally, you want the recompiles to be low. In later versions of SQL Server, recompilations are statement-scoped instead of batch-scoped recompilations in Microsoft SQL Server 2000. Therefore, direct comparison of values of this counter between SQL Server and earlier versions is not possible.

Stored Procedures Invoked/sec: This counter reports the total number of activation stored procedures invoked by all queue monitors in the instance per second.

SuperLatch Demotions/sec: The number of SuperLatches that have been demoted to regular latches in the last second.

SuperLatch Promotions/sec: The number of latches that have been promoted to SuperLatches in the last second.

Table Lock Escalations/sec: The number of times locks on a table were escalated to the TABLE or HoBT granularity. Target pages Ideal number of pages in the buffer pool.

Target pages: Ideal number of pages in the buffer pool.

Target Server Memory (KB): Total amount of dynamic memory the server can consume.

Task Limit Reached: The number of times that a queue monitor would have started a new task, but did not because the maximum number of tasks for the queue is already running.

Task Limit Reached/sec: The number of times per second that a queue monitor would have started a new task, but did not because the maximum number of tasks for the queue is already running.

Tasks Aborted/sec: The number of activation stored procedure tasks that end with an error or are aborted by a queue monitor for failing to receive messages.

Tasks Running: The number of activation stored procedures that are currently running.

Tasks Started/sec: The number of activation stored procedures started per second by all queue monitors in the instance.

Temp Tables Creation Rate: The number of temporary tables/table variables created per second.

Temp Tables For Destruction: The number of temporary tables/table variables waiting to be destroyed by the cleanup system thread.

Total Latch Wait Time (ms): Total latch wait time (in milliseconds) for latch requests in the last second.

TOTAL_LOCK_TIME: The total time for which database is in locked state.

Total Server Memory (KB): The committed memory from the buffer pool (in kilobytes).

Transactions/sec: The number of transactions started for the database per second.

Unsafe Auto-Params/sec: The number of unsafe auto-parameterization attempts per second. For example, the query has some characteristics that prevent the cached plan from being shared. These are designated as unsafe. This does not count the number of forced parameterizations.

Update conflict ratio: The percentage of those transactions using the snapshot isolation level that have encountered update conflicts within the last second. An update conflict occurs when a snapshot isolation level transaction attempts to modify a row that last was modified by another transaction that was not committed when the snapshot isolation level transaction started.

Update Snapshot Transactions: The number of currently active transactions using the snapshot isolation level and have modified data.

Used leaf page cookie: The number of times a leaf page cookie is used successfully during an index search since no change happened on the leaf page. The cookie is used to speed up the index search.

Used tree page cookie: The number of times a tree page cookie is used successfully during an index search since no change happened on the parent page of the tree page. The cookie is used to speed up the index search.

User Connections: The number of users currently connected to SQL Server.

Version Cleanup rate (KB/s): The rate (in kilobytes per second) at which row versions are removed from the snapshot isolation version store.

Version Generation rate (KB/s): The rate (in kilobytes per second) at which new row versions are added to the snapshot isolation version store.

Version Store Size (KB): The amount of space (in kilobytes) in Version Store unit count The number of active allocation units in the snapshot isolation version store.

Version Store unit creation: The number of allocation units that have been created in the snapshot isolation store since the instance of the Database Engine was started.

Version Store unit truncation: The number of allocation units that have been removed from the snapshot isolation store since the instance of the Database Engine was started.

Workfiles Created/sec: The number of work files created per second. For example, work files could be used to store temporary results for hash joins and hash aggregates.

Worktables Created/sec: The number of work tables created per second. For example, work tables could be used to store temporary results for query spool, lob variables, XML variables, and cursors.

Worktables From Cache Ratio: Percentage of work tables created where the initial two pages of the work table were not allocated but were immediately available from the work table cache. (When a work table is dropped, two pages may remain allocated and they are returned to the work table cache. This increases performance.)

Write Transactions/sec: The number of transactions that wrote to the database and committed, in the last second.

Microsoft SQL Azure Metrics

avg_cpu_percent: Average compute utilization in the percentage of the limit of the service tier.

avg_data_io_percent: Average data I/O utilization in percentage based on the limit of the service tier.

avg_log_write_percent: Average write resource utilization in the percentage of the limit of the service tier.

avg_memory_percent: Average memory utilization in the percentage of the limit of the service tier.

MySQL Server Metrics

Aborted_clients: The number of clients that were aborted (because they did not properly close the connection to the MySQL server). For some applications, this can be OK, but for some other applications you might want to track the value, as aborted connects may indicate some sort of application failure.

Aborted_connects: The number of failed attempts to connect to the MySQL server.

Bytes_received: The number of bytes received from all clients.

Bytes_sent: The number of bytes sent to all clients.

Com_alter_table: The number of times each ALTER TABLE statement has been executed.

Com_create_index: The number of times each CREATE INDEX statement has been executed.

Com_create_table: The number of times each CREATE TABLE statement has been executed.

Com_delete: The number of times each DELETE statement has been executed.

Com_insert: The number of times each INSERT statement has been executed.

Com_optimize: The number of times each OPTIMIZE statement has been executed.

Com_select: The number of times each SELECT statement has been executed.

Com_update: The number of times each UPDATE statement has been executed.

Connections: The number of connection attempts (successful or not) to the MySQL server.

Created_tmp_disk_tables: The number of temporary tables on disk created automatically by the server while executing statements.

Created_tmp_files: How many temporary files mysqld has created.

Created_tmp_tables: The number of in-memory temporary tables created automatically by the server while executing statements. If `Created_tmp_disk_tables` is large, you may want to increase the `tmp_table_size` value to cause temporary tables to be memory-based instead of disk-based.

Handler_delete: The number of times that rows have been deleted from tables.

Innodb_buffer_pool_pages_data: The number of pages containing data (dirty or clean).

Innodb_buffer_pool_pages_dirty: The number of pages currently dirty.

Innodb_buffer_pool_pages_flushed: The number of buffer pool page-flush requests.

Innodb_buffer_pool_pages_free: The number of free pages.

Innodb_buffer_pool_pages_misc: The number of pages that are busy because they have been allocated for administrative overhead such as row locks or the adaptive hash index. This value can also be calculated as `Innodb_buffer_pool_pages_total`.

Innodb_buffer_pool_pages_total: The total size of the buffer pool, in pages.

Innodb_buffer_pool_read_ahead_rnd: The number of random read-aheads initiated by InnoDB. This happens when a query scans a large portion of a table but in random order.

Innodb_buffer_pool_read_requests: The number of logical read requests InnoDB has done.

Innodb_buffer_pool_reads: The number of logical reads that InnoDB could not satisfy from the buffer pool and had to do a single-page read.

Innodb_buffer_pool_wait_free: Normally, writes to the InnoDB buffer pool happen in the background. However, if it is necessary to read or create a page and no clean pages are available, it is also necessary to wait for pages to be flushed first. This counter counts instances of these waits. If the buffer pool size has been set properly, this value should be small.

Innodb_buffer_pool_write_requests: The number writes done to the InnoDB buffer pool.

Innodb_data_fsyncs: The number of `fsync()` operations so far.

Innodb_data_pending_fsyncs: The current number of pending `fsync()` operations.

Innodb_data_pending_reads: The current number of pending reads.

Innodb_data_pending_writes: The current number of pending writes.

Innodb_data_read: The amount of data read so far, in bytes.

Innodb_data_reads: The total number of data reads.

Innodb_data_writes: The total number of data writes.

Innodb_data_written: The amount of data written so far, in bytes.

Innodb_dblwr_pages_written: The number of doublewrite operations that have been performed.

Innodb_dblwr_writes: The number of pages that have been written for doublewrite operations.

Innodb_log_waits: The number of times that the log buffer was too small and a wait was required for it to be flushed before continuing.

Innodb_log_write_requests: The number of log write requests.

Innodb_log_writes: The number of physical writes to the log file.

Innodb_pages_created: The number of pages created.

Innodb_pages_read: The number of pages read.

Innodb_pages_written: The number of pages written.

Innodb_row_lock_current_waits: The number of row locks currently being waited for.

Innodb_row_lock_time: The total time spent in acquiring row locks, in milliseconds.

Innodb_row_lock_time_avg: The average time to acquire a row lock, in milliseconds.

Innodb_row_lock_time_max: The maximum time to acquire a row lock, in milliseconds.

Innodb_row_lock_waits: The number of times a row lock had to be waited for.

Innodb_rows_deleted: The number of rows deleted from InnoDB tables.

Innodb_rows_inserted: The number of rows inserted into InnoDB tables.

Innodb_rows_read: The number of rows read from InnoDB tables.

Innodb_rows_updated: The number of rows updated in InnoDB tables.

Key_blocks_used: The number of used blocks in the key cache. This value is a high-water mark that indicates the maximum number of blocks that have ever been in use at one time.

Key_read_requests: The number of requests to read a key block from the cache. **Key_writes** The number of physical writes of a key block to disk.

Key_reads: The number of physical reads of a key block from disk. If **Key_reads** is large, then your **key_buffer_size** value is probably too small. The cache miss rate can be calculated as $\text{Key_reads} / \text{Key_read_requests}$.

Key_write_requests: The number of requests to write a key block to the cache.

Key_writes: The number of physical writes of a key block from the MyISAM key cache to the physical disk.

Open_files: The number of files that are open. **Open_streams** The number of streams that are open (used mainly for logging).

Open_tables: The number of table cache misses. If the value is large, you probably need to increase **table_cache**. Typically you would want this to be less than 1 or 2 opened tables per second.

Opened_tables: The number of tables that have been opened. The number of tables that have been opened. If **Opened_tables** is big, your **table_cache** value is probably too small.

Qcache_free_blocks: The number of free memory blocks in the query cache.

Qcache_free_memory: The amount of free memory for the query cache.

Qcache_hits: The number of query cache hits.

Qcache_inserts: The number of queries added to the query cache.

Qcache_lowmem_prunes: The number of queries that were deleted from the query cache because of low memory.

Qcache_not_cached: The number of non-cached queries (not cacheable, or not cached due to the **query_cache_type** setting).

Qcache_queries_in_cache: The number of queries registered in the query cache.

Qcache_total_blocks: The total number of blocks in the query cache.

Questions: The number of statements that clients have sent to the server.

Seconds_Behind_Master: The number of seconds that the replica SQL thread is behind processing the primary binary log. This field directly drives MTTR. A high or increased number of Seconds_Behind_Master indicates a slow disk or poorly tuned machine running the database. If this value reaches 45 minutes or more, the ability to recover from a crash, or after a manual failover, is delayed. If this value is tracked by the Machine Agent through the MySQL extension and shows a generally positive slope, it indicates a death spiral.

Select_full_join: Joins performed without keys. This should be zero. This is a good way to catch development errors, as just a few such queries can decrease the system's performance.

Select_full_range_join: The number of joins that used a range search on a reference table.

Select_range: The number of joins that used ranges on the first table. This is normally not a critical issue even if the value is quite large.

Select_range_check: The number of joins without keys that check for key usage after each row. If this is not 0, you should carefully check the indexes of your tables.

Select_scan: Number of queries that performed a full table scan. In some cases these are OK but their ratio to all queries should be constant. If you have the value growing it can be a problem with the optimizer, lack of indexes or some other problem.

Slave_IO_Running: Whether the I/O thread for reading the primary's binary log is running.

Slave_open_temp_tables: The number of temporary tables that the replica SQL thread currently has open.

Slave_SQL_Running: Whether the SQL thread for executing events in the relay log is running.

Slow_launch_threads: The number of threads that have taken more than slow_launch_time seconds to create.

Slow_queries: The number of queries longer than --long-query-time or that are not using indexes. These should be a small fraction of all queries. If it grows, the system will have performance problems.

Sort_merge_passes: The number of merge passes that the sort algorithm has had to do. If this value is large, you should consider increasing the value of the sort_buffer_size system variable.

Sort_range: The number of sorts that were done using ranges.

SQL_Delay: The number of seconds that the replica lags behind the primary

Threads_cached: The number of threads in the thread cache.

Threads_connected: The number of currently open connections.

Threads_created: This should be low. Higher values may mean that you need to increase the value of thread_cache or you have the number of connections increasing, which also indicates a potential problem.

Threads_running: The number of threads that are not sleeping.

Oracle Server Metrics

bytes received via SQL*Net from client: Total number of bytes received from the client over Oracle Net Services

bytes received via SQL*Net from dblink: Total number of bytes received from a database link over Oracle Net Services

bytes sent via SQL*Net to client: Total number of bytes sent to the client from the foreground processes

bytes sent via SQL*Net to dblink: Total number of bytes sent over a database link

CPU used by this session: Amount of CPU time (in 10s of milliseconds) used by a session from the time a user call starts until it ends. If a user call completes within 10 milliseconds, the start and end user-call time are the same for purposes of this statistics, and 0 milliseconds are added.

db block changes: Closely related to consistent changes, this statistic counts the total number of changes that were part of an update or delete operation that were made to all blocks in the SGA. Such changes generate redo log entries and hence become permanent changes to the database if the transaction is committed. This approximates total database work. It statistic indicates the rate at which buffers are being dirtied (on a per-transaction or per-second basis, for example).

db block gets: The number of times a CURRENT block was requested. See Also: consistent gets

db block gets from cache: The number of times a CURRENT block was requested from the buffer cache. This is a subset of db block gets statistics value.

DBWR checkpoint buffers written: The number of buffers that were written for checkpoints

DBWR checkpoints: The number of times the DBWR was asked to scan the cache and write all blocks marked for a checkpoint or the end of recovery. This statistic is always larger than background checkpoints completed.

DML statements parallelized: The number of DML statements that were executed in parallel.

enqueue conversions: Total number of conversions of the state of table or row lock.

enqueue deadlocks: Total number of deadlocks between table or row locks in different sessions.

enqueue releases: Total number of table or row locks released.

enqueue requests: Total number of table or row locks acquired.

enqueue timeouts: Total number of table and row locks (acquired and converted) that timed out before they could complete.

enqueue waits: Total number of waits that occurred during an enqueue convert or get because the enqueue get was deferred

exchange deadlocks: The number of times that a process detected a potential deadlock when exchanging two buffers and raised an internal, restartable error. Index scans are the only operations that perform exchanges.

execute count: Total number of calls (user and recursive) that executed SQL statements.

gc current block receive time: The total time required for consistent read requests to complete. It records the round-trip time for all requests for consistent read blocks.

index fast full scans (direct read): The number of fast full scans initiated using direct read.

index fast full scans (full): The number of fast full scans initiated for full segments.

index fast full scans (rowid ranges): The number of fast full scans initiated with rowid endpoints specified.

lob reads: The number of LOB API read operations performed in the session/system. A single LOB API read may correspond to multiple physical/logical disk block reads.

lob writes: The number of LOB API write operations performed in the session/system. A single LOB API write may correspond to multiple physical/logical disk block writes.

logons current: Total number of current logons. Useful only in V\$SYSSTAT.

Number of Small Reads: The total number of **physical reads** less the number of **physical read total multi block requests**.

Number of Small Writes: The total number of **physical writes** less the number of **physical write total multi block requests**.

opened cursors current: Total number of current open cursors.

Parallel operations not downgraded: The number of times parallel execution was executed at the requested degree of parallelism.

parse count (hard): Total number of parse calls (real parses). A hard parse is a very expensive operation in terms of memory use, because it requires Oracle to allocate a workheap and other memory structures and then build a parse tree.

parse count (total): Total number of parse calls (hard and soft). A soft parse is a check on an object already in the shared pool, to verify that the permissions on the underlying object have not changed.

parse time cpu: Total CPU time used for parsing (hard and soft) in 10s of milliseconds.

parse time elapsed: Total elapsed time for parsing, in 10s of milliseconds. Subtract parse time cpu from this statistic to determine the total waiting time for parse resources.

physical read bytes: Total size in bytes of all disk reads by application activity (and not other instance activity) only.

physical read IO requests: The number of read requests for application activity (mainly buffer cache and direct load operation) which read one or more database blocks per request. This is a subset of physical read total IO requests statistic.

physical read total bytes: Total size in bytes of disk reads by all database instance activity including application reads, backup and recovery, and other utilities. The difference between this value and physical read bytes gives the total read size in bytes by non-application workload.

physical read total IO requests: The number of read requests which read one or more database blocks for all instance activity including application, backup and recovery, and other utilities. The difference between this value and physical read total multi block requests gives the total number of single block read requests.

physical reads: Total number of data blocks read from disk. This value can be greater than the value of physical reads direct plus physical reads cache as reads into process private buffers also included in this statistic.

physical write bytes: Total size in bytes of all disk writes from the database application activity (and not other kinds of instance activity).

physical write IO requests: The number of write requests for application activity (mainly buffer cache and direct load operation) which wrote one or more database blocks per request.

physical write total bytes: Total size in bytes of all disk writes for the database instance including application activity, backup and recovery, and other utilities. The difference between this value and physical write bytes gives the total write size in bytes by non-application workload.

physical write total IO requests: The number of write requests which wrote one or more database blocks from all instance activity including application activity, backup and recovery, and other utilities. The difference between this stat and physical write total multi block requests gives the number of single block write requests.

physical writes: Total number of data blocks written to disk. This statistics value equals the sum of physical writes direct and physical writes from cache values.

physical writes direct: The number of writes directly to disk, bypassing the buffer cache (as in a direct load operation).

physical writes from cache: Total number of data blocks written to disk from the buffer cache. This is a subset of physical writes statistic.

process last non-idle time: The last time this process executed.

queries parallelized: The number of SELECT statements executed in parallel.

Read Percent:

recovery blocks read: The number of blocks read during recovery.

recursive calls: The number of recursive calls generated at both the user and system level. Oracle maintains tables used for internal processing. When Oracle needs to make a change to these tables, it internally generates an internal SQL statement, which in turn generates a recursive call.

recursive cpu usage: Total CPU time used by non-user calls (recursive calls). Subtract this value from CPU used by this session to determine how much CPU time was used by the user calls.

redo blocks written: This is the total number of redo blocks written. This statistic divided by "redo writes" equals the number of blocks per write.

redo buffer allocation retries: Total number of retries necessary to allocate space in the redo buffer. Retries are needed either because the redo writer has fallen behind or because an event such as a log switch is occurring.

redo log space requests: The number of times the active log file is full and Oracle must wait for disk space to be allocated for the redo log entries. Such space is created by performing a log switch.

redo log space wait time: Total elapsed waiting time for redo log space requests in 10s of milliseconds.

redo size: Total amount of redo generated in bytes.

redo synch time: Elapsed time of all redo synch writes calls in 10s of milliseconds

redo write time: Total elapsed time of the write from the redo log buffer to the current redo log file in microseconds.

redo writes: Total number of writes by LGWR to the redo log files. redo blocks written divided by this statistic equals the number of blocks per write.

session cursor cache count: Total number of cursors cached. This statistic is incremented only if `SESSION_CACHED_CURSORS > 0`. This statistic is the most useful in `V$SESSTAT`. If the value for this statistic in `V$SESSTAT` is close to the setting of the `SESSION_CACHED_CURSORS` parameter, the value of the parameter should be increased.

session cursor cache hits: The number of hits in the session cursor cache. A hit means that the SQL statement did not have to be reparsed. Subtract this statistic from parse count (total) to determine the real number of parses that occurred.

session logical reads: The sum of db block gets plus consistent gets. This includes logical reads of database blocks from either the buffer cache or process private memory.

session stored procedure space: Amount of memory this session is using for stored procedures.

Small IO Percent:

sorts (disk): The number of sort operations that required at least one disk write.

sorts (memory): The number of sort operations that were performed completely in memory and did not require any disk writes.

sorts (rows): Total number of rows sorted.

table scan rows gotten: The number of rows that are processed during scanning operations.

table scans (direct read): The number of table scans performed with direct read (bypassing the buffer cache).

table scans (long tables): Long (or conversely short) tables can be defined as tables that do not meet the short table criteria as described in table scans (short tables).

table scans (rowid ranges): During a parallel query, the number of table scans conducted with specified ROWID ranges.

transaction lock background get time: Useful only for internal debugging purposes.

transaction lock foreground wait time: Useful only for internal debugging purposes.

transaction rollbacks: The number of transactions being successfully rolled back.

TOTAL_LOCK_TIME: The total time for which database is in locked state.

user calls: The number of user calls such as login, parse, fetch, or execute

user commits: The number of user commits. When a user commits a transaction, the redo generated that reflects the changes made to database blocks must be written to disk. Commits often represent the closest thing to a user transaction rate.

user rollbacks: The number of times users manually issue the ROLLBACK statement or an error occurs during a user's transactions.

Some of the obsolete metrics were removed and the following metrics are included with 20.11 and later versions of Controller.

DB|Server Statistic|DB time: The sum of CPU consumption of all the Oracle process and the sum of non-idle wait time

DB|Server Statistic|OS System time used: The total CPU time used for system calls

DB|Server Statistic|OS User time used: The total CPU time used for user calls

DB|Server Statistic|SMON posted for instance recovery: The total count or number of times SMON posted for instance recovery

DB|Server Statistic|SMON posted for txn recovery for other instances: The total count or number of times SMON posted for other transactions recovery in an Oracle RAC or a cluster

DB|Server Statistic|java call heap live size: The Java call heap live size

DB|Server Statistic|java call heap total size: The total Java call heap size

DB|Server Statistic|java call heap used size: The Java call heap used size

DB|Server Statistic|non-idle wait count: The total count of non-idle wait events

DB|Server Statistic|non-idle wait time: The total elapsed time for non-idle events

PostgreSQL Server Metrics

blks_hit: Number of times disk blocks were found already in the buffer cache, so that a physical disk read was not necessary. This only includes hits in the PostgreSQL buffer cache, does not include the operating system's file system .cache).

blks_read: Number of disk blocks read from the database.

confl_bufferpin: Number of queries in the database that were canceled because of pinned buffers.

confl_deadlock: Number of queries in the database that were canceled because of deadlocks

confl_lock: Number of queries in the database that were canceled due because of timeouts.

confl_snapshot: Number of queries in the database that were canceled because of old snapshots.

confl_tablespace: Number of queries in the database that were canceled because of dropped tablespaces.

numbackends: Number of backends currently connected to the database.

size_mb:

tup_deleted: Number of rows deleted by queries in the database.

tup_fetched: Number of rows fetched by queries in the database.

tup_inserted: Number of rows inserted by queries in the database.

tup_returned: Number of rows returned by queries in the database.

tup_updated: Number of rows updated by queries in the database.

xact_commit: Number of transactions in the database that have been committed.

xact_rollback: Number of transactions in the database that have been rolled back.

Sybase ASE and IQ Server Metrics

Sybase ASE

Metrics	Description
BytesReceived	The number of bytes received during client/server communications. This value is updated for HTTP and HTTPS connections.
BytesSent	The number of bytes sent during client/server communications. This value is updated for HTTP and HTTPS connections.
Connections	The number of connections to the database.
Deletes	The number of deferred and direct row deletes from the allpages-locked tables.
DiskIOChecks	The number of times the engine checked for asynchronous disk I/O. Modify the frequency of these checks with the i/o polling process count.
DiskIOCompleted	The number of asynchronous disk I/Os completed when the engine polled for outstanding asynchronous disk I/O.
DiskIOPolled	The number of times the engine polled for completion of outstanding asynchronous disk I/O. The polling occurs whenever disk I/O checks indicate that asynchronous I/O is posted but still not complete.
IndexAccesses	The number of pages read that Adaptive Server retrieves using an index.
Inserts	The total number of insert operations executed.
LogicalReads	The number of buffers read from the cache.
MaxOutstandingIOs	The current number of I/O requests initiated by the engine that are not completed.
Merges	The total number of merge operations executed.
PacketsReceived	The number of packets received.
PacketsSent	The number of packets sent.
PhysicalReads	The number of buffers read from disk.

Metrics	Description
PhysicalWrites	The numbers of buffers written to disk from the cache.
Rollbacks	The number of transactions rolled back by the process.
Selects	The total number of select operations executed.
TableAccesses	The number of pages read that Adaptive Server retrieves without using an index.
TempDbObjects	The total number of temporary tables created using the process.
Total Lock Time	The number of times a task waits for a lock and the transaction is rolled back during a session-level or server-level lock timeout.
Transactions	The currently running transaction.
ULCFlushes	The total number of times the user log cache is flushed.
ULCFlushFull	The number of times the user log cache is flushed because it was full.
Updates	The total number of Update operations executed.
WorkTables	The number of Worktables that are automatically created in tempdb by Adaptive Server.
Yields	The number of times a task is completed or yielded after running for the configured amount of time.

Sybase IQ

Metrics	Description
ActiveReq	Returns the number of server threads that are currently handling a request.
ActiveVersionsCount	Count of Active Transaction Versions.
ActiveVersionsCreateMB	Size in Mb of versions for the active transaction.
ActiveVersionsDeleteMB	Size in Mb of versions for active transactions.
BytesReceived	Returns the number of bytes received during client/server communications. This value is updated for HTTP and HTTPS connections.

Metrics	Description
BytesReceivedUncomp	Returns the number of bytes that would have been received during client/server communications if compression was disabled. (This value is the same as the value for BytesReceived if compression is disabled.)
BytesSent	Returns the number of bytes sent during client/server communications. This value is updated for HTTP and HTTPS connections.
BytesSentUncomp	Returns the number of bytes that would have been sent during client/server communications if compression was disabled. (This value is the same as the value for BytesSent if compression is disabled.)
CacheFileDirty	Returns the number of cache pages that are dirty (needing a write).
CacheFree	Returns the number of cache pages not being used.
CacheHits	Returns the number of database page lookups.
CachePanics	Returns the number of times the cache manager has failed to find a page to allocate.
CachePinned	Returns the number of pinned cache pages.
CacheRead	Returns the number of cache reads.
CacheReplacements	Returns the number of pages in the cache that have been replaced.
CacheScavenges	Returns the number of times the cache manager has scavenged for a page to allocate.
Connections	The number of connections to the database.
DiskRead	Returns the number of disk reads.
OtherVersionsCount	Shows count of other db versions. These versions will eventually be dropped when they are no longer referenced or referencable by active transactions.
OtherVersionsMB	Shows space usage in MB of other db versions. These versions will eventually be dropped when they are no longer referenced or referencable by active transactions.
ProcessCPU	Returns CPU usage for the database server process. Values are in seconds. This property is supported on Windows and Unix. This property is not supported on Windows Mobile.

Metrics	Description
ProcessCPUSystem	Returns system CPU usage for the database server process CPU. This is the amount of CPU time that the database server spent inside the operating system kernel. Values are in seconds. This property is supported on Windows and Unix. This property is not supported on Windows Mobile.
ProcessCPUUser	Returns user CPU usage for the database server process. Values are in seconds. This excludes the amount of CPU time that the database server spent inside the operating system kernel. This property is supported on Windows and Unix. This property is not supported on Windows Mobile.
RequestsReceived	Requests received by the server.
TempBufferCapacityCount	Capacity count of Temporary Buffers.
TempBufferCapacityMB	Capacity in Mb of Temporary Buffers.
TempBufferLockedCount	The number of Temporary Buffers that are locked.
TempBufferUsedCount	The number of Temporary Buffers in use.
Total Lock Time	The total time for which database is in locked state.
Transactions	The number of transactions.

Database Agent Events Reference

You can view Database Agent events on the **Database Monitoring > Events** window and in the `<agent_home>/logs/db-agent#.log` files. Database Agent events are of type Agent Diagnostic Event, with case-specific messages attached. See [Monitor Events](#)(see page 231).

Agent Diagnostic Events

Initialize/re-initialize the DB Collector

Summary: Initialize/re-initialize the DB collector

Description: Sent when database collector has successfully started. This happens when you configure a new collector, start/restart the agent process (in which case you'll see this event once for each collector), or when the collector recovers from a failure to communicate with the monitored database (for example, when the database goes down for a while, then comes back).

Severity: Info

Initialize/re-initialize the Hardware Metric Collector

Summary: Initialize/re-initialize the hardware metric collector

Description: Same as the above, but refers to a hardware collector, not a database collector.

This is sent when hardware collector has successfully started. This happens when you configure a new collector, start/restart the agent process (in which case you'll see this event once for each collector), or when the collector recovers from a failure to communicate with the monitored hardware (for example, when the system goes down for a while, then comes back).

Severity: Info

Server Parameter [?] has been Changed from [?] to [?]

Summary: Server parameter [?] has been changed from [?] to [?]

Description: The Database Agent constantly monitors database configuration parameters. When a parameter changes, which generally means a database administrator made a deliberate change, the agent sends this event. AppDynamics Database Visibility users can use these events to track configuration changes in their databases.

Severity: Info

JDBC Driver-related Agent Diagnostic Events

Summary: The text of the message is the error from the vendor's JDBC driver.

Description: When the agent fails to collect data from a monitored database, it sends this event, and goes into sleep mode for one minute. It will then retry contacting the database every minute until it succeeds. Once it succeeds, it will send an Agent Event "initialize/re-initialize" message, as described above. This happens when the database goes down, or when you add a collector with a wrong password, or wrong hostname, etc.

When the Collector is in sleep mode because of an error, you'll see an indicator next to the database on the **Infrastructure** and **Infrastructure > Databases**, on **Configure > Collectors** panel. You will also see the full text of the error in the **Infrastructure > Events** panel.

Severity: Error

Wait State Filtering

Database wait states are pauses or delays in database activity. While Database Visibility collects data on all wait states, you may be more interested in some wait states than others. You can specify which wait states that you want to exclude from being reported by the agent so that you can focus on the critical wait states.

To specify wait states to exclude, navigate to **Configuration > Wait State Filtering**. Check the boxes of the wait states that you want to exclude. The wait states you exclude are no longer displayed in the **Top 10 Query Wait States** metric. In addition, any future queries that experience the wait states you exclude are not reported by the agent.

Configure Custom Metrics

Database Visibility extends monitoring by specifying SQL queries to run on the monitored database and the queries run during normal database activity. You can schedule these custom queries to run on regular intervals and collect the results in a custom metric. See [Database Custom Metrics Window](#)(see page 2502).

To specify custom queries to run:

1. Navigate to **Configuration > Custom Metrics > New**.
2. Complete the following fields:
 - a. **Name:** The name you want to name your custom metric. Once you create a custom metric/event, you cannot change its name.
 - b. **Custom Query Metric Type:** The type of result that you want from the query.
 - i. Select the **Metric** type to generate metrics for which health rules can be defined. Metrics of this type are displayed in the **Metric Browser** or in the Custom Metrics tab of each collector.
 - ii. Select the **Event Data** type to generate custom events whenever the custom query output is non-empty. If you want to be notified when a custom event occurs, you can create a policy that is triggered by that custom event. Custom events are displayed in the Events tab. If the custom query outputs multiple rows, the first 40 rows will be included in the event details. Each row displays a maximum of 5000 characters, including the column separators (|).
 - c. **Database Type:** The database platform that you want to run the metric on.
 - d. **Databases:** The database instances that you want to run the metric on. You can run the metric on all database instances of the specified database type, or on specific database instances that you specify.
 - e. **Schedule:** The time interval at which you want to run the query. For metric type custom queries, the metric value reported in between the specified intervals is the value observed in the previous query execution.

The timeout for configured custom metric depends on the frequency of running the query. This table provides the timeout details based on the time interval:

Interval (minutes)	Timeout (seconds)
1	10
5	15
10	30
30	60
60	120
360	180
720	300
1440	300

- f. **Query Text:** The query that you want to execute. If you are creating a custom metric of Metric type, its query must have one of the following return types:
 - i. Positive integer. For example, the query below returns a positive integer.

```
SELECT COUNT(*) FROM employees
```

- ii. String and positive integer. For example, the query below returns a string and a positive integer.

```
SELECT name, salary FROM employees
```

Custom queries appear for all collectors, but the data only reflects the collector that you created it for. You can test the semantics of the query and also validate the results by clicking the **Test Query** button.

i Custom query results are validated if the Database Agent \geq 4.5.5.

The following points provide information about using limits when configuring custom metrics:

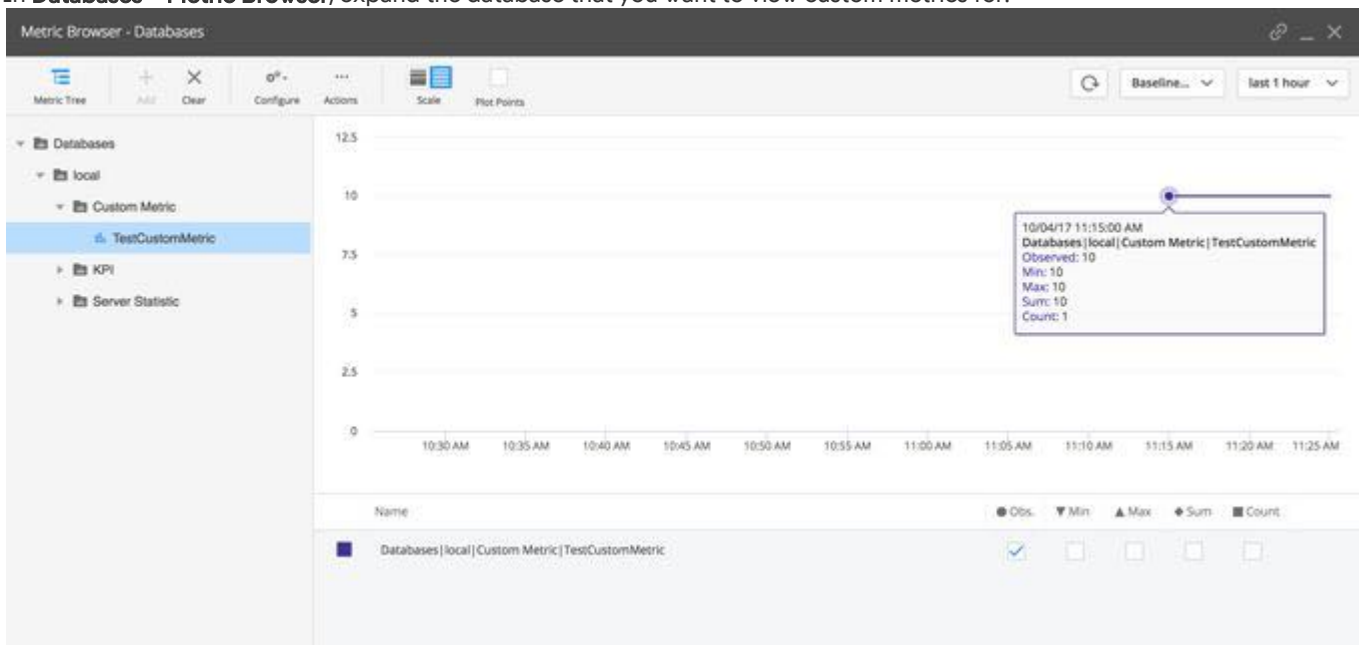

- The total number of custom metrics or events that you can create per account is the product of total number of Collectors and `dbmon.config.max.custommetric`.
By default, the value of `dbmon.config.max.custommetric` is 40. You can adjust the limit up to 150 using the `dbmon.config.max.custommetric` property in the [Controller Settings](#)(see page 2412).
- Up to 150 custom metrics can be reported per collector per minute.
- You can increase the custom metrics limit from the agent configuration properties by using the key, `dbagent.custom.metric.reportable.per.server` and the Max value 150. See [Database Agent Configuration Properties](#)¹⁵⁵⁵ for information about the key value.
- The maximum limit configured in the agent takes precedence and overrides the maximum limit configured at the account level and Controller level. Therefore, the priority order is as following:
 - Agent-level configuration
 - Account-level configuration
 - Controller-level configuration

Custom metrics are supported for all relational databases: MySQL, Microsoft SQL Server, Oracle, PostgreSQL, DB2, and Sybase.

View Custom Metrics

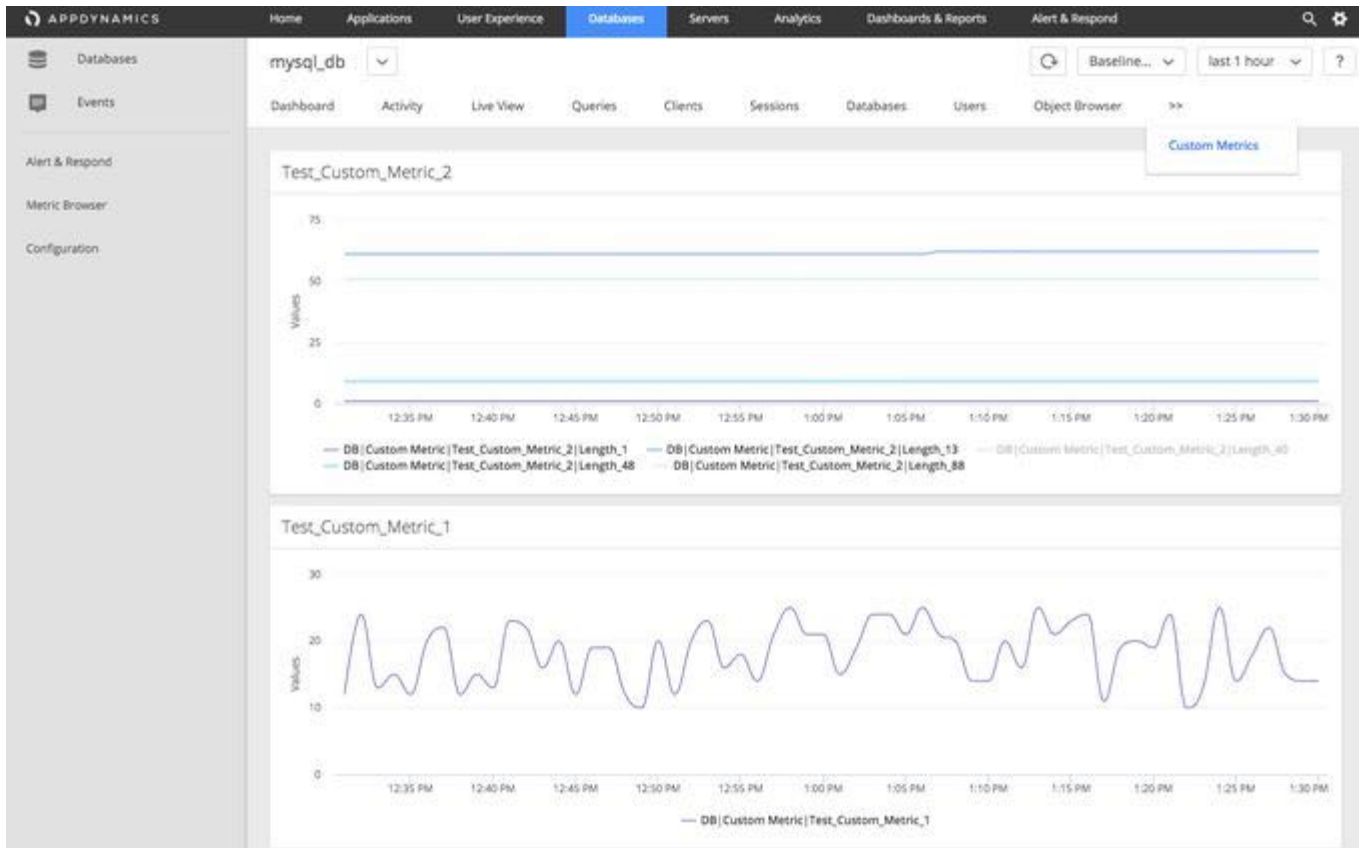

You can view your custom metrics in the following locations:

- In **Databases > Metric Browser**, expand the database that you want to view custom metrics for.

¹⁵⁵⁵ <https://docs.appdynamics.com/display/PRO45/Database+Agent+Configuration+Properties>

- In **Databases**, open a database instance and click the Custom Metrics tab.

Configure Query Literals Security

In SQL, literals are the string or integer values representing data retrieved from the database. By default, literals are removed from SQL queries, as they can contain sensitive user data such as social security numbers, CC numbers, and so on.

To show literals in the queries, you can disable the **Remove literals from the queries** option.

1. Click **Databases**.
2. Click **Configuration**.
3. In the Security section, uncheck **Remove literals from the queries**.

Once you uncheck the option, literals will always be displayed in the queries. You can revert to hiding the literals by checking the option.

i To record the audit logs when this option is enabled or disabled, ensure to configure the Controller audit report with the object name as **Remove Literals** and object type as **DBMON_ACCOUNT_CONFIGURATION**. See [Controller Audit Log](https://docs.appdynamics.com/display/PRMY21/.Controller+Audit+Log+v21.5)¹⁵⁵⁶.

1556 <https://docs.appdynamics.com/display/PRMY21/.Controller+Audit+Log+v21.5>

Integrate Database Visibility with Server Visibility

You can integrate Database Visibility with Server Visibility to capture accurate hardware metric details from the Machine Agent (with Server Visibility) to the Database Visibility dashboard. These metrics display without the need for an SSH connection to the host machine. Additionally, this integration helps the Server Visibility machine to automatically connect to the Database Visibility server when both the Database Agent and the Server Visibility Agent capture the same IP address.

When you integrate Server Visibility with Database Visibility, you can view these metrics on the Database Dashboard:

- **CPU Busy%** instead of CPU System% and CPU User%
- **Memory Used%**
- **Disk IO** (in Ops/sec for Reads and Writes) instead of Disk IO in KB/sec
- **Network IO** (in KB/sec for Outgoing and Incoming)

Requirements

To view the hardware metrics from Server Visibility to the Database Visibility dashboard, you must ensure to meet the following requirements:

- Install and register Machine Agent.
- Enable Server Visibility on the Machine Agent. See [Server Visibility](#)¹⁵⁵⁷.
- Disable the Hardware Monitoring section for the database collector. If you [Configure the Database Agent to Monitor Server Hardware](#)¹⁵⁵⁸, then the Database Agent displays the hardware metrics based on the collector configuration using the SSH connection.

View Hardware Metrics

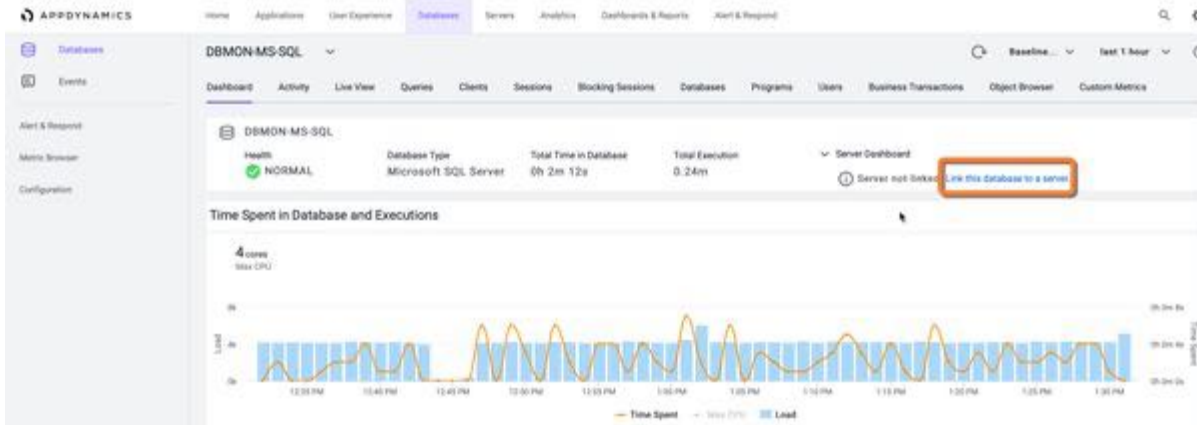

You can view the Server Dashboard section on the Databases dashboard when the Machine Agent and the Database Agents are registered and connected.

You can manually connect or disconnect the Database Visibility Server with the Server Visibility Server by using the URL, **Link this database to a server**, described in the Server Dashboard section. You may require to manually connect the database node to the Server Visibility server in these scenarios:

- The IP addresses do not match and the servers are not connected automatically.
- You want to connect the database server to another Server Visibility machine.
- You do not require connecting a particular database server to a Server Visibility machine.

¹⁵⁵⁷ <https://docs.appdynamics.com/display/PRO45/Server+Visibility>

¹⁵⁵⁸ <https://docs.appdynamics.com/display/PRO45/Configure+the+Database+Agent+to+Monitor+Server+Hardware>

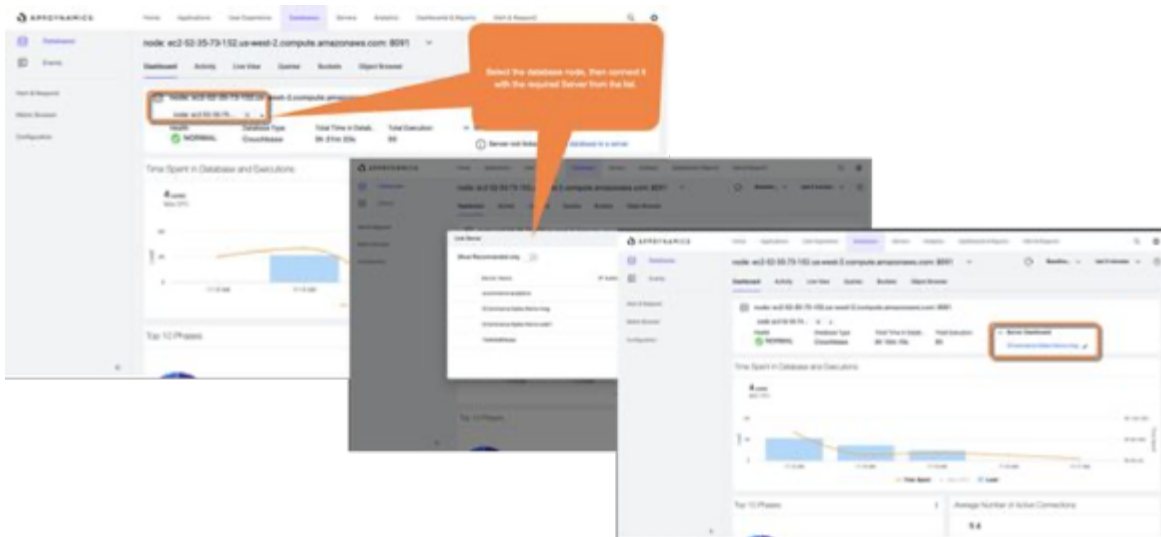

i You can map multiple database nodes to a single Server Visibility machine.

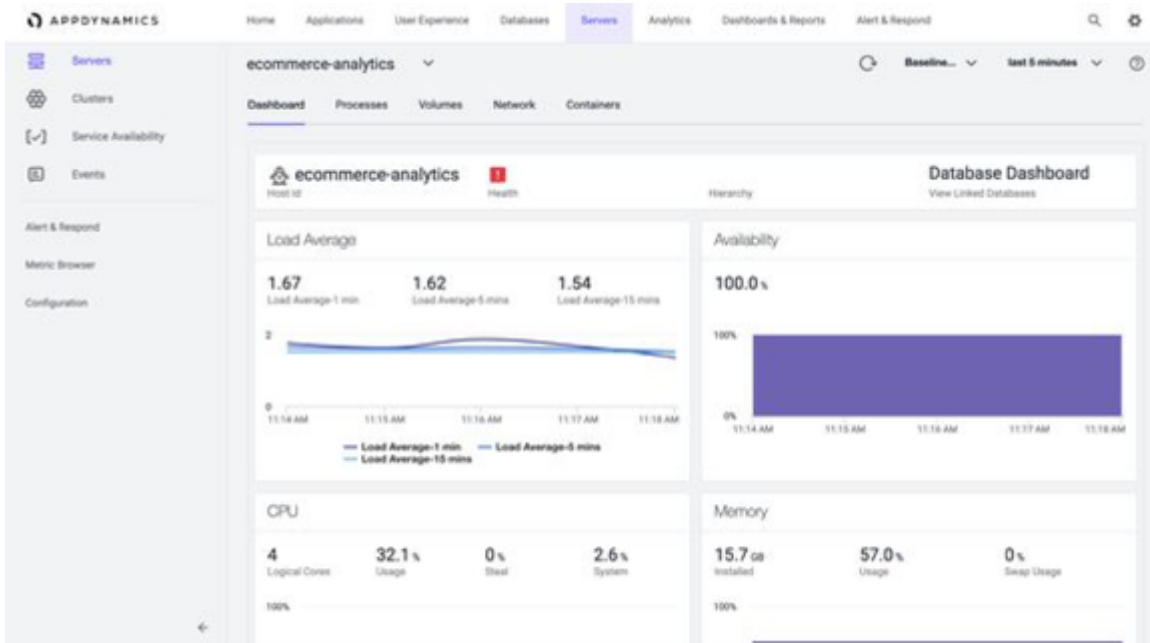

If the servers are connected, then you can find the link to the connected Server Dashboard under the **Server Dashboard** section.

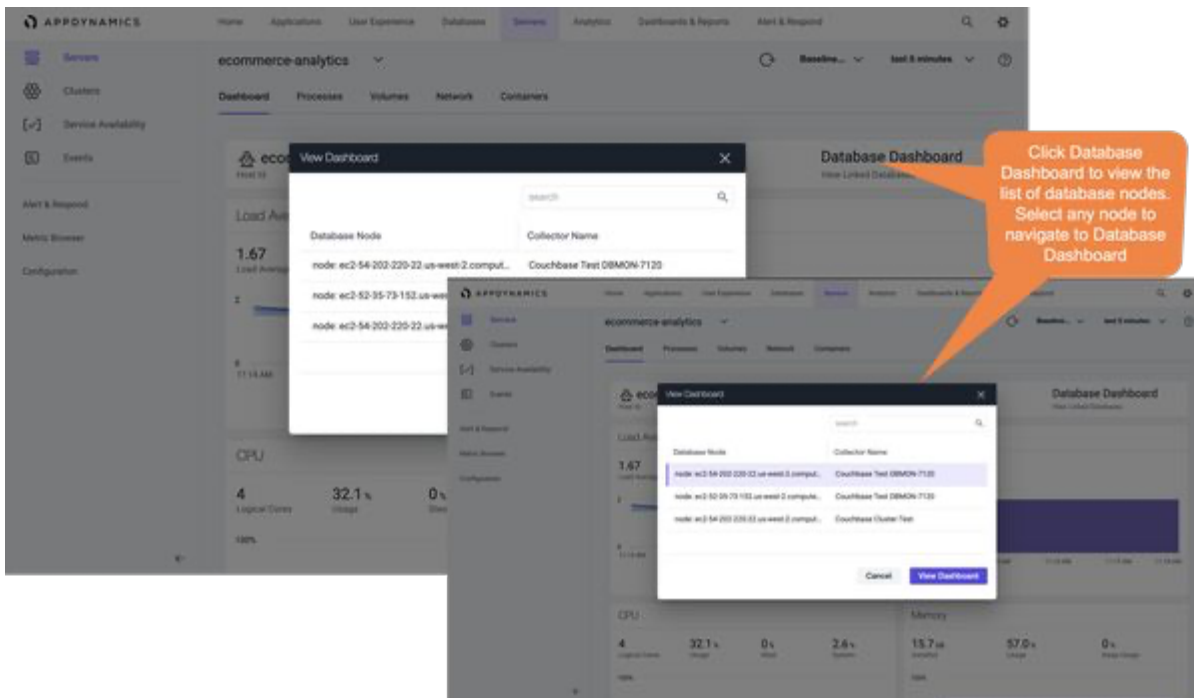

For a database cluster, you can find the link to each Server Dashboard corresponding to each database node.

When you click the connected server under the **Server Dashboard** section, the page redirects to the Server Visibility dashboard with all the hardware metrics.

On the Server Dashboard, you can click the **Database Dashboard**, which displays a dialog that includes the list of database nodes that are connected to the Server Visibility machine. You can select any database node to navigate to the Database Dashboard.

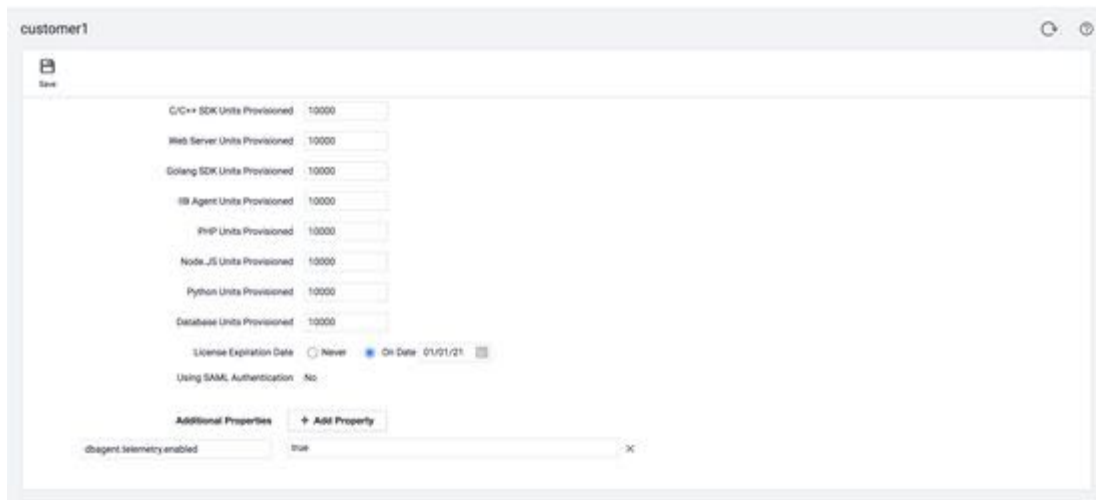

Database Agent Telemetry

You can monitor the Database Agent metrics and configure health rules for the agent. To add a health rule or view the metrics along with the status of the agent, you must enable the agent telemetry property.

Enable Database Agent Telemetry

You can enable the agent telemetry property at the account level on the Controller or at the agent level. If you configure the property on the Controller, all metrics display for each Database Agent. Whereas, if you configure the property in the agent configuration, the metrics display only for the configured agent.

For account level on Controller, use the Administration Console to add the `dbagent.telemetry.enabled` feature flag and set the value to `true`.

Similarly, for only specific Database Agents, start the Database Agent with the `-Ddbagent.telemetry.enabled=true` system properties.

i Each agent is associated with a unique host identifier and name. If two or more agents have the same name and unique identifier, the agents report metrics in the same node. Therefore, start a Database Agent with a different name and unique host identifier.

The unique host identifier is by default the host-name of the Database Agent host machine. You can override the unique host identifier by using the system property

`-Dappdynamics.agent.uniqueHostId=<Some_unique_identifier_name>`
See Unique Host ID at [Database Agent Configuration Properties](#)¹⁵⁵⁹.

To configure a health rule for Database Agent, see [Database Health Rules and Alerts](#)¹⁵⁶⁰.

Monitor Database Agent Metrics

You can view the Database Agent metrics in the **Metric Browser**. After enabling the Database Agent telemetry, the metric tree displays the list of Database Agent names along with its status under **DB Agents**. Each Database Agent name includes the list of Database Agent metrics.

¹⁵⁵⁹ <https://docs.appdynamics.com/display/PRO45/Database+Agent+Configuration+Properties>

¹⁵⁶⁰ <https://docs.appdynamics.com/display/PRO45/Database+Health+Rules+and+Alerts>

JVM and Memory Metrics

This table lists the JVM and Memory metrics of Database Agent:

Metric Name	Description
DB AGENT Memory Heap Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the heap
DB AGENT Memory Heap Current Usage (MB)	Returns the amount of used memory in MB
DB AGENT Memory Heap Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management
DB AGENT Memory Heap Used %	$(\text{Current Usage} / \text{Max Available}) * 100$
DB AGENT Memory Non-Heap Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the non-heap
DB AGENT Memory Non-Heap Current Usage (MB)	Returns the amount of used memory in MB (for non-heap)
DB AGENT JVM Process CPU Burnt (ms/min)	CPU Time in milliseconds (ms) by this process
DB AGENT JVM Process CPU Usage %	<p>CPU Used % in that minute. $(\text{CPU Time in that min} / (\text{Up Time in that min} * \text{number of processors})) * 100$</p> <p>This metric is cumulative</p>

Metric Name	Description
DB AGENT JVM Threads Current No. of Threads	Number of current live threads (including daemon and non-daemon)

Garbage Collections and Memory Pool Metrics

This table lists the Garbage Collections (GC) and the memory pool metrics:

Metric Name	Description
DB AGENT Garbage Collection Major Collection Time Spent Per Min (ms)	Time taken by Major GC at time of the metric collection
DB AGENT Garbage Collection Number of Major Collections Per Min	Major GC Count at time of the metric collection
DB AGENT Garbage Collection Minor Collection Time Spent Per Min (ms)	Time taken by minor GC at time of the metric collection
DB AGENT Garbage Collection Number of Minor Collections Per Min	Minor GC Count at time of the metric collection
DB AGENT Garbage Collection GC Time Spent Per Min (ms)	Major GC Time(if present) + Minor GC Time(if present)
DB AGENT Garbage Collection Memory Pools Code Cache Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the non-heap memory pools
DB AGENT Garbage Collection Memory Pools Code Cache Current Usage (MB)	Returns the amount of used memory in MB for non-heap memory pools
DB AGENT Garbage Collection Memory Pools Code Cache Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for non-heap memory pools
DB AGENT Garbage Collection Memory Pools Compressed Class Space Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the non-heap memory pools
DB AGENT Garbage Collection Memory Pools Compressed Class Space Current Usage (MB)	Returns the amount of used memory in MB for non-heap memory pools
DB AGENT Garbage Collection Memory Pools Compressed Class Space Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for non-heap memory pools

Metric Name	Description
DB AGENT Garbage Collection Memory Pools Metaspace Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the non-heap memory pools
DB AGENT Garbage Collection Memory Pools Metaspace Current Usage (MB)	Returns the amount of used memory in MB for non-heap memory pools
DB AGENT Garbage Collection Memory Pools PS Eden Space Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the heap memory pools
DB AGENT Garbage Collection Memory Pools PS Eden Space Current Usage (MB)	Returns the amount of used memory in MB for heap memory pools
DB AGENT Garbage Collection Memory Pools PS Eden Space Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for heap memory pools
DB AGENT Garbage Collection Memory Pools PS Old Gen Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the heap memory pools
DB AGENT Garbage Collection Memory Pools PS Old Gen Current Usage (MB)	Returns the amount of used memory in MB for heap memory pools
DB AGENT Garbage Collection Memory Pools PS Old Gen Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for heap memory pools
DB AGENT Garbage Collection Memory Pools PS Survivor Space Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the heap memory pools
DB AGENT Garbage Collection Memory Pools PS Survivor Space Current Usage (MB)	Returns the amount of used memory in MB for heap memory pools
DB AGENT Garbage Collection Memory Pools PS Survivor Space Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for heap memory pools

i The listed metrics are for Java HotSpot(TM) 64-Bit Server JVM and 1.8.0_212 Java version. These metrics might change depending on the JVM.

Cache Usage Metrics

The following table lists the cache usage metrics that are accumulated metrics for all collectors that are monitored by the Database Agent.

The following details help in understanding the metrics mentioned in the table:

- entities stores all the entities with its hash and id
- unregQueryCache stores all unregistered query entities till its registration
- unregCaches stores all unregistered entities (except Server, Query, Query Plan) till its registration
- unregQueryPlanCache stores all unregistered query plan entities till its registration
- counters store all the unregistered wait states till they get converted to DTO's and get Uploaded to Controller/ES
- catalog stores all the unregistered query statistics till they get converted to DTO's and get Uploaded to Controller/ES

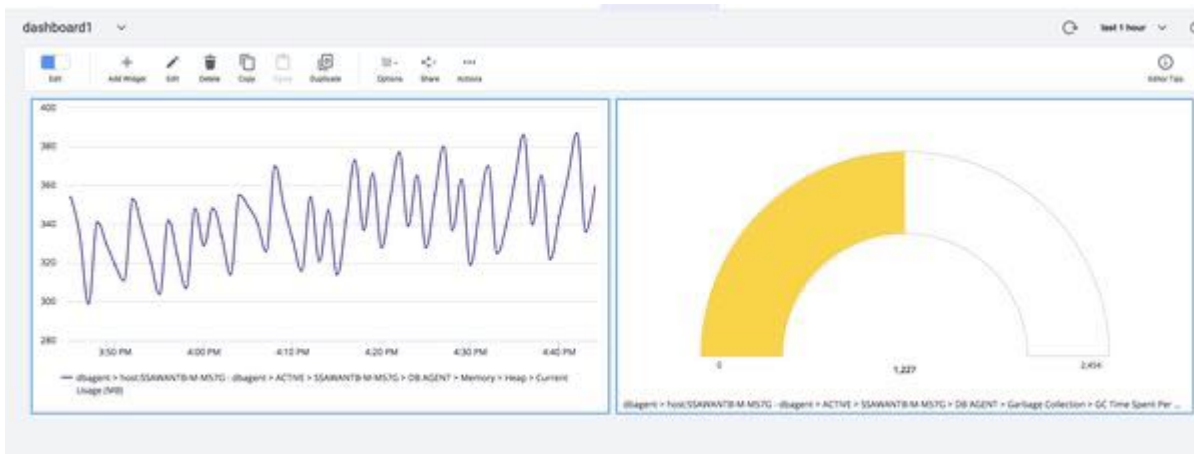

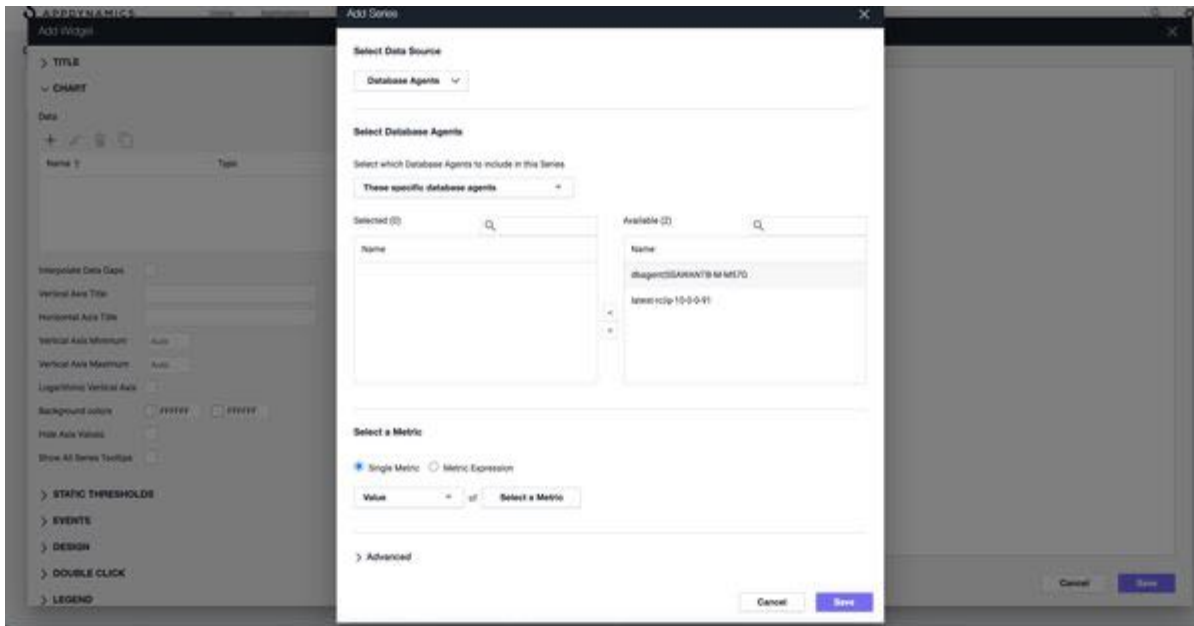

MetricName	Description
DB AGENT Entity Cache Total Entities	The total number of all types of entities stored in EntityCache All entity types are taken into account except Server
DB AGENT Entity Cache Registered Entities	Number of entities registered in that minute All entity types are taken into account except Server
DB AGENT Entity Cache Pending Entities	Number of pending entities waiting in unRegCache, unRegQueryCache, or unRegQueryPlanCache to get registered All entity types are taken into account except Server
DB AGENT Entity Cache Duplicate Entities	Number of entities that are for re-registration All entity types are taken into account except Server
DB AGENT Entity Cache Unregistered Query Cache Size (KB)	Total query size in KB of queries that are present in the cache(unregQueryCache), waiting for registration Only the Query entity type is taken into account.
DB AGENT ES Data Cache Usage Number Of Wait Counters	Number of Wait Counters present in the cache, waiting to get uploaded
DB AGENT ES Data Cache Usage Number of Query Stats	Number of Query Stats present in the cache, waiting to get uploaded
DB AGENT ES Data Successful ES Uploads Number of Wait Counters	Number of Wait Counters uploaded to ES in that min
DB AGENT ES Data Successful ES Uploads Number of Query Stats	Number of Query Stats uploaded to ES in that min

Monitor Database Agent Metrics on Database Custom Dashboard

You can monitor the Database Agent metrics on **Custom Dashboard**.

To create a custom dashboard:

1. Click **Dashboards & Reports > Create Dashboard**.
2. Add a widget.
3. Add the data by selecting the data source as **Database Agents**. See [Custom Dashboards](#)¹⁵⁶¹.

Infrastructure Visibility

AppDynamics Infrastructure Visibility provides end-to-end visibility on the performance of the hardware running your applications. You can use Infrastructure Visibility to identify and troubleshoot problems that can affect application performance such as server failures, JVM crashes, and network packet loss.

¹⁵⁶¹ <https://docs.appdynamics.com/display/PRO45/Custom+Dashboards>

Infrastructure Visibility provides these metrics:

- CPU busy/idle times, disk and partition reads/writes, and network interface utilization (Machine Agents)
- Packet loss, round trip times, connection setup/tear down errors, TCP window size issues, and re-transmission timeouts (Network Visibility, additional license required)
- Disk/CPU/memory utilization, process, and machine availability (Server Visibility, additional license required)

Overview of Infrastructure Visibility

You can determine the root cause of application issues by looking at application, network, server, and machine metrics that measure infrastructure utilization.

For example, the following infrastructure issues may slow down your application:

- Too much time spent in garbage collection of temporary objects (application metric)
- Packet loss between two nodes that results in re-transmissions and slow calls (network metric)
- Inefficient processes that result in high CPU utilization (server metric)
- Excessively high rates of reads/writes on a specific disk or partition (hardware metric)

Infrastructure Visibility enables you to isolate, identify, and troubleshoot these types of issues.

Infrastructure Visibility is based on a Machine Agent that runs with an App Server Agent on the same machine. These two agents provide multi-layer monitoring:

1. The App Server Agent collects metrics about applications and identifies applications, tiers, and nodes with slow transactions, stalled transactions, and other application-performance issues.
2. The Network Agent monitors the network packets sent and received on each node and identifies lost/re-transmitted packets, TCP bottlenecks, high round trip times, and other network issues.
3. The Machine Agent collects metrics at two levels:
 - Server Visibility metrics for local processes, services, and resource utilization.
 - Basic machine metrics for disks, memory, CPU, and network interfaces.

This multi-layer monitoring enables you to determine possible correlations between application issues and service, process, hardware, network, or other issues on the machine.

	This Agent Monitors...	Example Metrics
1 App Agent 	apps app servers JVMs CLR's	Slow Transactions Stalled Transactions Response Times Wait Times Block Times Error %
2 Network Agent 	network packets TCP connections TCP sockets	Performance Impacting Events Packet loss and retransmissions Round Trip Times for data transfers TCP Window Size (Limited or Zero) Connection setup/teardown errors
3 Machine Agent  <i>Server Visibility</i>	processes services caching swapping paging queueing	Hardware/Software Interrupts Virtual memory/swapping Process faults CPU/disk/memory utilization by process
<i>Hardware/OS</i>	disks volumes partitions memory CPU network interfaces	CPU busy times Memory utilization Disk reads/writes JVM crashes

Network Visibility

[Network Visibility](#)(see page 2718) monitors traffic flows, network packets, TCP connections, and TCP ports. Network Agents leverage the APM intelligence of App Server Agents to identify the TCP connections used by each application. Network Visibility includes:

- Detailed metrics about dropped/re-transmitted packets, TCP window sizes (Limited/Zero), connection setup/tear down issues, high round trip times, and other performance-impacting issues
- Network Dashboard that highlights network KPIs (Key Performance Indicators) for tiers, nodes, and network links
- Right-click dashboards for tiers, nodes, and network links that enable quick drill-downs from transaction outliers to network root causes
- Automatic mapping of TCP connections with application flows
- Automatic detection of intermediate load balancers that split TCP connections
- Diagnostic mode for collecting advanced diagnostic information for individual connections

Server Visibility

[Server Visibility](#)(see page 2655) monitors local processes, services, and resource utilization. You can use these metrics to identify time windows when problematic application performance correlates with problematic server performance on one or more nodes.

Server Visibility is an add-on module to the [Machine Agent](#)(see page 2579). With Server Visibility enabled, the Machine Agent provides the following functionality:

- Extended hardware metrics such as machine availability, disk/CPU/virtual-memory utilization, and process page faults
- Monitor application nodes that run inside Docker containers and identify container issues that impact application performance
- The Tier Metric Correlator which enables you to identify load and performance anomalies across all nodes in a tier

- Import and define server tags used to query, filter, and compare related servers using custom metadata
- Monitor internal or external HTTP and HTTPS services
- Support for grouping servers so you can apply health rules to specific server groups
- Support for defining alerts that trigger when certain conditions are met or exceeded based on monitored server hardware metrics

Basic Machine Metrics

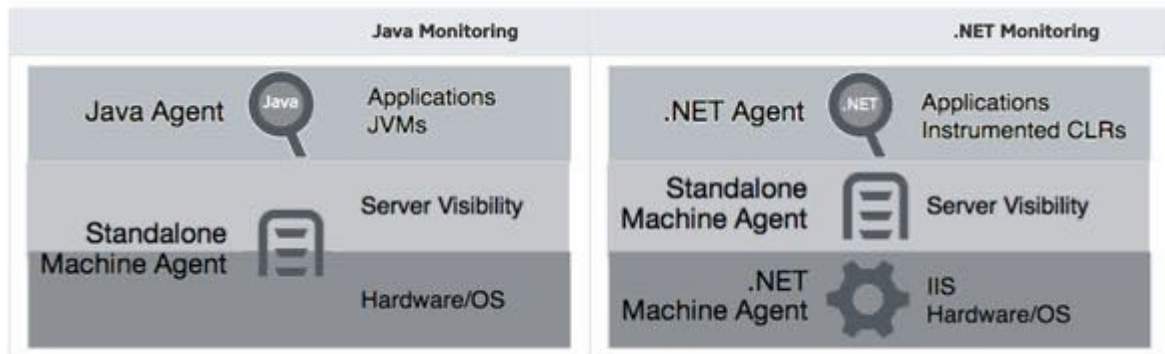

The Machine Agent collects basic hardware metrics from the server's OS and provides the following functionality:

- Basic hardware metrics from the server's OS such as CPU and memory utilization, throughput on network interfaces, and disk and network I/O
- Support for creating extensions to generate custom metrics
- Support for running remediation scripts to automate your runbook procedures. You can optionally configure the remediation action to require human approval before starting the script.
- JVM Crash Guard for monitoring JVM crashes and optionally running remediation scripts

Java and .NET Infrastructure Monitoring

Infrastructure Visibility uses different agents to monitor Java and .NET environments:

- The Java Agent collects metrics for business applications and JVMs. The Machine Agent collects Server Visibility and hardware/OS metrics.
- The [.NET Agent](#) (see page 645) collects metrics for business applications and instrumented CLR's. The .NET Machine Agent includes a .NET Machine Agent that collects IIS and hardware/OS metrics (see [Monitor Windows Hardware Resources](#) (see page 1297)). The Machine Agent collects Server Visibility metrics.

Infrastructure Visibility Strategies

You can use these strategies to locate infrastructure issues that affect application performance:

- Transaction snapshots for slow or stalled transactions – Use snapshots to correlate infrastructure metrics for the specific node so that you can identify the root cause of slow or stalled transactions.
- Metric correlation –
 - One example workflow is to open the Node Dashboard for a mission-critical server with a machine agent installed and then cross-compare data in the following tabs:
 - JVM (application performance)
 - JMX (server performance)
 - Server (hardware resource consumption)
 - The [Network Dashboard](#) (see page 2814) includes right-click dashboards for tiers, nodes, and network links. Use these dashboards to find correlations between application issues and network root causes.
 - The [Tier Metric Correlator](#) (see page 2675) enables you to identify load and performance anomalies in a tier composed of a cluster of nodes running on containers or servers.

- Health rules – Configure health rules on metrics such as garbage collection time, connection pool contention, or CPU usage to catch issues early in the cycle before any impact on your business transactions.
- Infrastructure rules, policies, and alerts –
 - Create health rules on metrics such as garbage collection time, connection pool contention, or CPU usage to catch issues early in the cycle before any impact on your business transactions.
 - Define [policies](#)([see page 260](#)) that trigger [actions](#)([see page 334](#)) (such send an email, start diagnostics, or perform a thread dump) when Infrastructure metrics report a critical level.
 - You can configure alerts for JVM and CLR crashes respectively using [JVM Crash Guard](#)([see page 1288](#)) and the [.NET Machine Agent](#)([see page 1302](#)).
 - Configure the agent to [run scripts](#) ([see page 342](#))in response to critical events (for example, restart an application or JVM in response to a crash).

With the right monitoring strategy in place, you can be alerted to problems and fix them before user transactions are affected.

Hardware Resources Metrics

This page describes the basic hardware metrics collected by the Machine Agent and the additional metrics collected by the Machine Agent for Server Visibility. Not all of the metrics that appear in the Hardware Resources branch of the Metric Browser tree are provided by the Machine Agent; some are collected by the Database Agent and are used in the Database Monitoring UI, while others might be custom metrics added by another extension run by your Machine Agent.

For most metrics in the Metric Browser, you can select any point in the graph to view more information about the metric observed at that point in time. The information includes the metric identifier, date and time of the observation, along with any of the following values relevant to the metric:

- **Obs** (observed value): Average of all data points seen for that interval. For a cluster or a time rollup, this represents the weighted average across nodes or over time.
- **Min**: Minimum data point value seen for that interval
- **Max**: Maximum data point value seen for that interval
- **Sum**: Sum of all data point values seen for that interval. For the Percentile Metric for the App Agent for Java, this is the result of the percentile value multiplied by the Count.
- **Count**: Number of data points generated for the metric in that interval. The collection interval for infrastructure metrics varies by environment. For example:
 - For AIX, HP-UX, Mac OS X and Z/OS: CPU and memory metrics are gathered every two seconds and averaged over a period of one minute. Machine agent network and disk metrics are gathered at one-minute intervals.
 - For Windows, Linux, and Solaris: All metrics are collected at one-minute intervals and aggregated over one-minute intervals.

CPU Metrics

Metric Name	Description	Basic or Server Visibility	Windows	Linux ¹ (see page 2560)	Solaris	AIX	Default Monitoring Mode ³ (see page 2560)
%Idle	Percentage of time the CPU was idle; the CPU had completed its tasks and has nothing to do.	Basic	✓	✓	✓	✓	KPI
%Busy	Percentage of time the CPU was busy processing system or user requests; this metric includes CPU Stolen time.	Basic	✓	✓	✓	✓	KPI
%Stolen ⁴ (see page 2560)	Usually, stolen time is the percentage of time a virtual CPU waits for a real CPU while the hypervisor is servicing another virtual processor.	Basic	✓	✓	✓	✓	KPI
%Nice	Percentage of CPU time spent on low priority processes.	Server Visibility	✗	✓	✗	✗	Advanced
System	Percentage of time the CPU was busy processing kernel code.	Server Visibility	✓	✓	✓	✓	KPI
User	Percentage of time the CPU was busy processing non-kernel code.	Server Visibility	✓	✓	✓	✓	KPI
IOWait	Percentage of CPU time spent waiting for an I/O request.	Server Visibility	✗	✓	✓	✗	KPI

Metric Name	Description	Basic or Server Visibility	Windows	Linux ¹ (see page 2560)	Solaris	AIX	Default Monitoring Mode ³ (see page 2560)
%Irq	Percentage of CPU time spent servicing hardware interrupts.	Server Visibility	✗	✓	✗	✗	Diagnostic
%SoftIrq	Percentage of CPU time spent servicing software interrupts.	Server Visibility	✗	✓	✗	✗	Advanced
%Busy 95th Percentile ² (see page 2560)	The CPU %Busy percentage was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI
IOWait 95th Percentile ² (see page 2560)	The CPU %Busy percentage was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI

¹ See [Linux Kernel Processes](#)(see page 2578).

² See [Percentile Metric Reporting must be Enabled](#)(see page 2576).

³ See [Default Monitoring Mode](#)(see page 2578).

⁴ See [Stolen Times are Reported Differently](#)(see page 2578).

Memory Metrics

Metric Name	Description	Basic or Server Visibility	Windows	Linux ¹ (see page 2562)	Solaris	AIX	Default Monitoring Mode ³ (see page 2562)
Total (MB)	The total amount of memory.	Basic	✓	✓	✓	✓	KPI
Used %	The percentage of memory used.	Basic	✓	✓ ⁴ (see page 2562)	✓	✓	KPI

Metric Name	Description	Basic or Server Visibility	Windows	Linux ¹ (see page 2562)	Solaris	AI X	Default Monitoring Mode ³ (see page 2562)
Used (MB)	The amount of memory used.	Basic	✓	✓ ⁴ (see page 2562)	✓	✓	Advanced
Free %	Percentage of free or unused memory available for processes.	Basic	✓	✓ ⁴ (see page 2562)	✓	✓	Advanced
Free (MB)	The total amount of free or unused memory available for processes.	Basic	✓	✓ ⁴ (see page 2562)	✓	✓	Advanced
Swap Free (MB)	The total amount of free swap space. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	Advanced
Swap Total (MB)	The total amount of allocated swap space. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	KPI
Swap Used (MB)	The amount of swap space used. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	Advanced
Swap Used %	The percentage of available swap space used. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	KPI
Swap Free %	Percentage of free swap space. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	Advanced

Metric Name	Description	Basic or Server Visibility	Windows	Linux ¹ (see page 2562)	Solaris	AI X	Default Monitoring Mode ³ (see page 2562)
Pages Paged In 95th Percentile ² (see page 2562)	The paging-in rate to memory was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI
Pages Paged Out 95th Percentile ² (see page 2562)	The paging-out rate from memory was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI
Pages Swapped In 95th Percentile ² (see page 2562)	The swapping rate of pages from disks was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI
Pages Swapped Out 95th Percentile ² (see page 2562)	The swapping rate of pages to disks was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI

¹ See [Linux Kernel Processes](#)(see page 2578).

² See [Percentile Metric Reporting must be Enabled](#)(see page 2576).

³ See [Default Monitoring Mode](#)(see page 2578).

⁴ See [Configure Free/Used Memory Metric Calculation on Linux](#)(see page 2577).

Disk and Partition Metrics

The agent reports metrics for each disk partition and for disks in aggregate. Only mounted partitions and local partitions are reported.

i SIGAR is not supported on Machine Agent.

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode ¹ (see page 2565)
KB read/sec	The number of KB per second read from all disks and partitions.	Basic	✓	✓	✓	✓	Advanced
KB written/sec	The average amount of data per second written to all disks and partitions.	Basic	✓	✓	✓	✓	Advanced
Reads/sec	Number of read operations per second performed on all disks and partitions.	Basic	✓	✓	✓	✓	KPI
Writes/sec	Number of write operations per second performed on all disk and partitions.	Basic	✓	✓	✓	✓ 5 (see page 2566)	KPI
Avg IO Utilization (%)	The average time spent processing read/write requests on all disks and partitions as a percentage of the total reported time window. Databases often report high disk I/O utilization due to frequent read/write requests. For example, if the agent detects read/write processing in 55 out of 60 seconds, the Avg IO Utilization for that minute is 92%. This metric does not measure the amount of available disk space or read/write request sizes.	Server Visibility	✓	✓	✓	✓	KPI
<partition> %CPU Time	The percentage of CPU processing consumed by a partition during read and write operations.	Basic	✗	✓	✗	✓	Diagnostic

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode ¹ (see page 2565)
<partition> Avg Service Time (ms)	Time in milliseconds spent performing read and write operations across one partition.	Basic	✗	✓	✓	✓	Diagnostic
<partition> Avg Queue Time (ms)	Time in milliseconds that a read or write request is in the queue before it gets processed across one partition.	Basic	✗	✓	✗	✗	KPI
<partition> KB read/sec	The average amount of data per second read from one specific partition.	Basic	✓	✓	✓	✓	Diagnostic
<partition> KB written/sec	The average amount of data per second written to one specific partition.	Basic	✓	✓	✓	✓	Diagnostic
<partition> Reads/sec	Number of read operations per second performed on one specific partition.	Basic	✓	✓	✓	✓	KPI
<partition> Writes/sec	Number of write operations per second performed on one specific partition.	Basic	✓	✓	✓	✓ 5 (see page 2566)	KPI
<partition> Space Available	The amount of unused or free disk space on a specific partition in KB.	Basic	✓	✓ 4(s ee page 2566)	✓	✓	KPI
<partition> Space Used	The amount of used or unavailable disk space on a specific partition in KB.	Basic	✓	✓ 4(s ee page 2566)	✓	✓	Advanced

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode ¹ (see page 2565)
<partition> Avg IO Utilization (%)	The average time spent processing read/write requests as a percentage of the total reported time window. Databases often report high disk I/O utilization due to frequent read/write requests. For example, if the agent detects read/write processing in 55 out of 60 seconds, the Avg IO Utilization for that minute is 92%. This metric does not measure the amount of available disk space or read/write request sizes.	Server Visibility	✓	✓	✓	✓	KPI
<partition> Avg read time (ms)	The average time in milliseconds required to service a read request by all disks or by one specific disk or across one partition.	Server Visibility	✓ ² (see page 2565)	✓	✓	✗	KPI
<partition> Avg write time (ms)	The average time in milliseconds required to service a write request across one partition.	Server Visibility	✓ ² (see page 2565)	✓	✓	✗	KPI
<partition> Queue Time 95th Percentile ³ (see page 2565)	The queue time for read/write requests was this long or shorter 95% of the time for the reported time window.	Server Visibility	✗	✓	✗	✓	KPI

¹ See [Default Monitoring Mode](#)(see page 2578).

² For some versions of Windows Server 2008 and Windows Vista, the Hardware Resources|Disks|<partition>|Avg Read Time (ms) and Hardware Resources|Disks|<partition>|Avg Write Time (ms) metrics will be reported as 0. This is due to a known bug with Windows. To resolve this issue, download the hotfix: <https://support.microsoft.com/en-us/kb/961435>.

³ See [Percentile Metric Reporting must be Enabled](#)(see page 2576).

⁴ See [Configure Disk Usage Metric Collection on Linux](#)(see page 2576).

⁵ See [HardwareMonitor and JavaHardwareMonitor Calculate "Writes/Sec" Differently on AIX Machines](#)(see page 2579)

Volume Metrics

AppDynamics Server Visibility retrieves the volume space metrics on POSIX systems using the `df` command . The volume metrics are reported across all listed volumes and for each volume at a specified mount point, such as `"/boot"`. Only local volumes are reported.

Metric Name	Description	Basic or Server Visibility	Windows	Linux ¹ (see page 2567)	Solaris ² (see page 2567)	AIX	Default Monitoring Mode ³ (see page 2567)
Total (MB)	The amount of storage space available (used and free) across all listed volumes or at the specified mount point. On Linux, the space reserved for root is not counted in the available space.	Server Visibility	✓	✓	✓	✓	KPI
Free (MB)	The amount of unused or free space across all listed volumes or on the selected volume at the specified mount point. On Linux, the space reserved for root is not counted in the available space.	Server Visibility	✓	✓	✓	✓	Advanced (<i>volume</i>)
Used (MB)	The amount of storage space in use across all listed volumes or on the selected volume at the specified mount point.	Server Visibility	✓	✓	✓	✓	Advanced (<i>volume</i>)

Metric Name	Description	Basic or Server Visibility	Windows	Linux ¹ (see page 2567)	Solaris ² (see page 2567)	AI X	Default Monitoring Mode ³ (see page 2567)
Used (%)	The percentage of storage space in use across all listed volumes or on the selected volume at the specified mount point.	Server Visibility	✓	✓	✓	✓	KPI
Count	The number of partitions for which storage space metrics are collected.	Server Visibility				✓	KPI
<partition> Free (MB)	The amount of unused or free space for <partition>.	Server Visibility				✓	KPI
<partition> Total (MB)	The amount of storage space available (used and free) for <partition>.	Server Visibility				✓	KPI
<partition> Used (%)	The percentage of storage space in use for <partition>.	Server Visibility				✓	KPI
<partition> Used (MB)	The amount of storage space in use for <partition>.	Server Visibility				✓	Advanced

¹ Only /dev volumes are monitored on Linux.

² Only /dev/dsk and /rpool volumes are monitored on Solaris.

³ See [Default Monitoring Mode](#)(see page 2578).

Load Metrics

The load metrics are reported for each machine. The CPU % (reported as part of the basic Machine Agent metrics) is the percentage of the CPU consumed by processes that are currently running. Load takes into account processes that are waiting to run. These metrics are shown as percentages in the Server Dashboard and are [scaled by 100 in the Metric Browser](#)(see page 2578).

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AI X	Default Monitoring Mode ¹ (see page 2568)
Last 1 minute	CPU Load, presented as an average over the last 1 minute.	Server Visibility	✓	✓	✓	✓	KPI
Last 5 minutes	CPU Load, presented as an average over the last 5 minutes.	Server Visibility	✓	✓	✓	✓	KPI
Last 15 minutes	CPU Load, presented as an average over the last 15 minutes.	Server Visibility	✓	✓	✓	✓	KPI

¹ See [Default Monitoring Mode](#)(see page 2578).

Machine Metrics

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode ¹ (see page 2569)
Availability	The percentage of time the Machine Agent was reporting to the Controller. In the Server Visibility UI, this provides a percentage with 6 digits of precision (for example, 100.00000) to measure availability. The Machine Agent sends a heartbeat to the AppDynamics Controller once per minute to indicate the agent is reporting. Reported for each machine.	Server Visibility	✓	✓	✓	✓	KPI

¹ See [Default Monitoring Mode](#)(see page 2578).

Network Metrics

The Machine Agent is configured to ignore virtual networks by default. See [Machine Agent Settings for Server Visibility](#)(see page 2692).

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode ¹ (see page 2572)
Incoming KB 2 (see page 2572)	The volume of data received by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Incoming KB/sec	The amount of data per second received by all monitored network devices.	Basic	✓	✓	✓	✓	KPI

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode ¹ (see page 2572)
Incoming packets ² (see page 2572)	The number of packets received by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Incoming packets/sec	The number of data packets per second received by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Outgoing KB ² (see page 2572)	The volume of data sent by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Outgoing KB/sec	The volume of data sent per second by all monitored network devices.	Basic	✓	✓	✓	✓	KPI
Outgoing packets ² (see page 2572)	The number of packets sent by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Outgoing packets/sec	The number of data packets sent per second by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Incoming Errors/min	The number of incoming packet errors the network incurs every minute.	Server Visibility	✓	✓	✓	✓	KPI
Outgoing Errors/min	The number of outgoing packet errors the network incurs every minute.	Server Visibility	✓	✓	✓	✓	KPI

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode ¹ (see page 2572)
Avg Utilization (%)	The average network utilization as a percentage of the maximum possible throughput. This metric is not reported if the agent cannot determine the throughput (not supported for some devices and Linux versions). The percentage is rounded to the nearest integer. Therefore, very low utilization may be reported as 0%. Reported for: <ul style="list-style-type: none"> • Servers • <group> • <network interface> 	Server Visibility	✓	✓	✓	✓	KPI
<network interface> Incoming KB	The volume of data received by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Incoming KB/sec	The volume of data received per second by the selected network interface.	Basic	✓	✓	✓	✓	KPI
<network interface> Incoming packets	The number of data packets received by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Incoming packets/sec	The number of data packets received per second by the selected network interface.	Basic	✓	✓	✓	✓	Advanced

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AI X	Default Monitoring Mode ¹ (see page 2572)
<network interface> Outgoing KB	The volume of data sent by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Outgoing KB/sec	The volume of data sent per second by all monitored network interface.	Basic	✓	✓	✓	✓	KPI
<network interface> Outgoing packets	The number of data packets sent per second by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Outgoing packets/sec	The number of data packets sent per second by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Incoming Errors/min	The number of incoming packet errors the network incurs every minute.	Server Visibility	✓	✓	✓	✓	KPI
<network interface> Outgoing Errors/min	The number of outgoing packet errors the network incurs every minute.	Server Visibility	✓	✓	✓	✓	KPI

¹ See [Default Monitoring Mode](#)(see page 2578).

² The ServerMonitoring and JavaHardwareMonitor extensions calculate unidirectional throughput (packet/KB) metrics differently. ServerMonitoring reports the total number of packets/bytes in the last minute. JavaHardwareMonitor reports the total number of packets/bytes from the time the Machine Agent started.

Process Metrics

The following metrics are aggregated and reported for each process or process class (except Total Process Count, which measures all processes observed by the agent). See [Machine Agent Settings for Server Visibility](#)(see page 2692) to modify the default process monitoring.

Metric Name	Description	Basic or Server Visibility	Windows	Linux ¹ (see page 2575)	Solaris ² (see page 2576)	AI X	Default Monitoring Mode ³ (see page 2576)
Count	The number of processes in this class consuming CPU or memory resources or the total number of processes in this class.	Server Visibility	✓	✓	✓	✓	KPI
CPU Used (%)	Percentage of the CPU bandwidth used by all processes in a process class. A process using 100% CPU is executing on all processors on the system. If there are four cores on the machine and the process is executing four threads, each executing on one core, then the process can use up to 400% CPU. If there are four cores on the machine and the process is executing one thread on one core, then the process can use up to 25% CPU.	Server Visibility	✓	✓	✓	✓	KPI
Major Faults/sec	Number of major page faults caused by all processes in this class.	Server Visibility	✗	✓	✗	✓	Diagnostic
Minor Faults/sec	Number of minor page faults caused by all processes in this class.	Server Visibility	✗	✓	✗	✓	Diagnostic
Memory Used (%)	Percentage of memory consumed by the top 10 consuming processes or the percentage of memory used by all processes in this class.	Server Visibility	✓	✓	✓	✓	KPI

Metric Name	Description	Basic or Server Visibility	Windows	Linux ¹ (see page 2575)	Solaris ² (see page 2576)	AI X	Default Monitoring Mode ³ (see page 2576)
Memory Used (KB)	Amount of memory used by all processes in this class.	Server Visibility	✓	✓	✓	✓	Advanced
Memory Virtual (KB)	Current size of the virtual address space that the process is using. Use of virtual address space does not necessarily imply a corresponding use of either disk or main memory pages. Virtual space is finite and, by using too much, the process can limit its ability to load libraries.	Server Visibility	✓	✓	✓	✓	Advanced
Thread Count	The number of kernel threads used by all processes in this class.	Server Visibility	✓	✓	✓	✓	Diagnostic

Metric Name	Description	Basic or Server Visibility	Windows	Linux ¹ (see page 2575)	Solaris ² (see page 2576)	AI X	Default Monitoring Mode ³ (see page 2576)
Total Process Count	<p>All individual processes observed by the Machine Agent, <i>before</i> it filters out unreported processes and groups the remaining processes into classes. You can use this metric to identify anomalies in the number of processes running on a specific machine. For example, if the average Total Process Count on a machine is usually 200 to 300, and then suddenly rises to 2000 or more, this could indicate a problem on that machine.</p> <p>To collect this metric, the Machine Agent captures the number of processes every 30 seconds and calculates the average number of processes per minute.</p> <ul style="list-style-type: none"> • Observed is the average number of processes per minute. • Min and Max are the 30-second buckets with the least and most processes. • Count and Sum are the number of process captures each minute and the sum of the processes in each capture for that minute (capture1 + capture2). 	Server Visibility	✓	✓	✓	✓	KPI

¹ See [Linux Kernel Processes](#)(see page 2578).

² When collecting Process metrics on Solaris, the Machine Agent observes and captures only the first 80 characters of each process name and argument list. The agent considers only the first 80 characters of each process string when it applies allowlists ("always monitor this process") and blocklists ("never monitor this process") defined in [ServerMonitoring.yml](#)(see page 2692).

³ See [Default Monitoring Mode](#)(see page 2578).

Service Availability Metrics

Reported for each service that is configured.

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AI X	Default Monitoring Mode ¹ (see page 2576)
Response Time (ms)	The elapsed time between sending a request and receiving a response from the monitored service.	Server Visibility	✓	✓	✓	✓	KPI
Response Size (bytes)	The size of the response received from the monitored service.	Server Visibility	✓	✓	✓	✓	KPI
Success Rate (%)	The percentage of successful requests over all requests made to the service.	Server Visibility	✓	✓	✓	✓	KPI

¹ See [Default Monitoring Mode](#)(see page 2578).

Enable Percentile Metric Reporting

You must enable percentile metric reporting on both the Controller and the Machine Agent. By default, reporting is *disabled* on the Controller and *enabled* on the Machine Agent.

- To enable/disable reporting on the Controller, log in to the Controller Administration Console and set the `sim.machines.percentile.percentileMonitoringAllowed` property. See [Controller Settings for Machine Agents](#)(see page 2623).
- To enable/disable reporting on the agent, open the `<machine_agent_home>/extensions/ServerMonitoring/conf/ServerMonitoring.yml` file and set the `percentileEnabled` property. See [Machine Agent Settings for Server Visibility](#)(see page 2692).

Configure Disk Usage Metric Collection on Linux

You can configure the Linux Machine Agent to calculate the following metrics similar to using the Linux `df` command:

- Servers > Volumes > /opt > Disk Usage
- Metric Browser > Disks and Partitions > <partition> > Space Available
- Metric Browser > Disks and Partitions > <partition> > Space Used

Linux includes a mechanism for reserving some disk space to ensure that the system remains functioning even if non-privileged users consume all other disk space. By default, these metrics do not include this reserved space. The total disk space reported by the agent might differ from the total disk space reported by the Linux `df` command or other sources.

To override this default, and to ensure that these metrics include this reserved space, run the agent with the following command-line argument:

```
-Dappdynamics.machine.agent.extensions.calcVolumeFreeAndUsedWithDfCommand=true
```

This feature is supported for Linux versions of the Machine Agent only.

Configure Free/Used Memory Metric Collection on Linux

You can configure how the Machine Agent calculates the amount of free and used memory on Linux machines. By default, the agent calculates any slab-reclaimable memory as used (not free) memory. To configure the agent to calculate slab-reclaimable memory as free (not used) memory, run Machine Agent with the following command-line argument:

```
-Dappdynamics.machine.agent.extensions.countSlabReclaimableAsFreeMem=true
```

This setting affects the following metrics:

- Memory Usage (in Server Dashboard)
- Memory Used %, Memory Used MB, Memory Free %, and Memory Free MB (in Metric Browser)

Viewing Server Visibility Metrics

You can only view Server Visibility metrics in the Server Visibility version of the Metric Browser. You see this when you access the Metric Browser from the Servers tab in the top navigation bar of the Controller UI.

Machine Agent Versus .NET Machine Agent

If a server has both Machine and .NET Agents installed, there may be differences in metric values reported by the Machine Agent and the .NET Agent due to different averaging rates and measurement methods. See [.NET Compatibility Mode](#) (see page 2628).

Streamlined Browsing Mode

The Server Metric Browser includes a Streamlined Browsing option for node metrics. Use this option to browse metrics for tiers that contain multiple nodes.

- With Streamlined Browsing enabled, each node in the browser tree view shows only metrics reported by the Machine Agent on the corresponding node.
- With Streamlined Browsing enabled, the **Hardware Resources** and **Custom Metrics** folders do not display.
- With Streamlined Browsing disabled, each node in the browser tree view also shows metrics for other nodes in the same tier (with no indication of the node that corresponds to which tier group).

This streamlining option is not enabled by default. AppDynamics recommends that you enable this option. To enable this option, go to:

```
http://<controller host>:<port>/controller/admin.jsp and set sim.metrics.metricBrowser.machineMetricMappings.enabled to true.
```

Streamlined Browsing Enabled	Streamlined Browsing Disabled
	

Linux Kernel Processes

The Machine Agent has a [processSelectorRegex](#) (see page 2697) setting that specifies the set of processes monitored by the agent. The default `regex` filters out most kernel processes on Linux machines. The agent considers monitored processes only when it calculates CPU, Memory, and Process metrics. These metrics may differ from metrics reported by other sources such as Linux commands.

Default Monitoring Mode

The **Default Monitoring Mode** column indicates the default category of each metric when [Dynamic Monitoring Mode](#) (see page 2673) (DMM) is enabled. When this mode is enabled, a Machine Agent reports metrics based on the DMM setting on that server:

- KPI – Report Key Performance Indicator metrics only
- Diagnostic – Report KPI and Diagnostic metrics
- Advanced – Report all unfiltered metrics on the Machine Agent.

Load Average Percentages are Scaled by 100 in the Metric Browser

Load Average metrics are shown as float values (such as 0.70 or 1.05) in the [Server Dashboard](#) (see page 2662). In the Metric Browser, these metrics are multiplied by 100 to provide two decimal points of precision. If a server has an average load of 7.67, for example, the Server Dashboard shows the Load Average as 7.67 and the Metric Browser shows the Load as 767. To use one of the metrics in a health rule or custom dashboard, divide the metric by 100.

Stolen Times are Reported Differently

On Windows Machine Agents, if CPU %Stolen is not matching values reported by AppDynamics, it may be because Windows Performance Monitor's (Perfmon) counters operate at a granularity of 100ns for CPU

metrics. For CPU %Stolen, the counters are provided by the Hypervisor, which operates on a granularity of 1ms. Windows Perfmon divides the CPU %Stolen counter (operating on 1ms) directly by time (in units of 100ns), which results in the CPU %Stolen values being reported at a very low percentage (~0.01%).

AppDynamics makes the correction between different units of time, which is why values reported by AppDynamics are greater than Perfmon's values by a factor of 10,000 (time in 1ms * 10,000 = time in 100ns). CPU %Stolen values reported by AppDynamics sometimes exceed 100% under high load. These CPU %Stolen values are a result of multiple cores being used by the guest machine, where %Stolen time is added across multiple cores.

To compute the %Stolen time:

1. On a PowerShell terminal in the monitored guest machine, run `Get-WmiObject Win32_PerfRawData_vmGuestLib_VCPU`.
2. Note the `CpuStolenMs` counter (in ms).
3. Note the `Timestamp_PerfTime` counter (in ms, take a look at `Frequency_Perftime`, this value should be 1000 (in hz)).
4. After a minute, run `Get-WmiObject Win32_PerfRawData_vmGuestLib_VCPU` again and take note of both the counters once more.
5. $\text{CPU \%Stolen} = 100\% * (\text{CpuStolenMS (at T2)} - \text{CpuStolenMs (at T1)}) / (\text{Timestamp_PerfTime (T2)} - \text{Timestamp_PerfTime (T1)})$.

HardwareMonitor and JavaHardwareMonitor Calculate "Writes/Sec" Differently on AIX Machines

The Machine Agent calculates the Disk metric writes/sec on AIX machines differently, depending on whether the HardwareMonitor or the JavaHardwareMonitor extension is used. These extensions assume different block sizes when calculating these metrics. For HardwareMonitor, the block size is 4096 bytes. For JavaHardwareMonitor (based on SIGAR), the block size is 512 bytes. Because the number of writes/sec is calculated as $\text{<kb_written>/<block_size>}$, the HardwareMonitor results are lower than those calculated by JavaHardwareMonitor.

Machine Agent

You use the Machine Agent to collect basic hardware metrics. The Machine Agent is a Java program that has an extensible architecture enabling you to supplement the basic metrics reported in the AppDynamics Controller UI with your own custom metrics. The Machine Agent is also the delivery vehicle for AppDynamics [Server Visibility](#)¹⁵⁷⁵, which provides an expanded set of hardware metrics and additional monitoring capability. See [License Entitlements and Restrictions](#)¹⁵⁷⁶ for a complete list of licenses for Server Visibility and the Machine Agent.

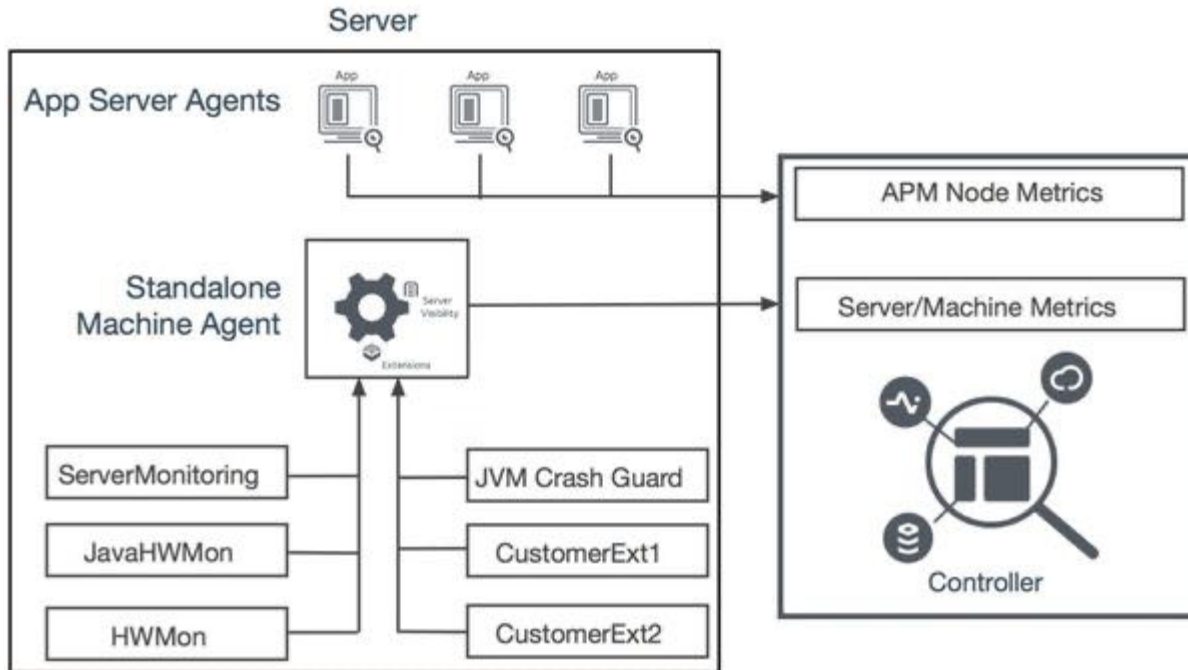

Functionality provided by the Machine Agent includes:

- Reporting basic [hardware metrics](#)(see page 2558) from the server's OS, for example, %CPU and memory utilization, disk and network I/O
- Reporting metrics passed to the Controller by [extensions](#)(see page 2629)
- Running [remediation scripts](#)(see page 342) for policy actions
- Running [JVM Crash Guard](#)(see page 1288)

¹⁵⁷⁵ <https://docs.appdynamics.com/display/PRO21/Server+Visibility>

¹⁵⁷⁶ <https://docs.appdynamics.com/display/PRO21/License+Entitlements+and+Restrictions>

The Machine Agent collects infrastructure metrics from multiple extensions and forwards them to the Controller. You can also use these metrics to find correlations between infrastructure issues on one or more servers and application-performance issues reported by the App Agents.

Machine Agent Requirements and Supported Environments

This page lists the application environments and versions supported by the Machine Agent. Any environments or versions that are not listed are not supported.

Machine Agent Supported Platforms

Supported platforms and environments for the Machine Agent depend on the metric data collection extension and the machine's OS. See [Machine Agent Metric Collection](#)(see page 2584). Machine Agent >= 21.4.0 collects `diskstats` from Linux kernels versions >= 4.18.

The Azul JRE is included as a component in the AppDynamics products and modules. In response to how often Oracle produces and distributes JRE/JDK 8, AppDynamics replaced Oracle JRE with Azul JRE in the 20.5.0 Machine Agent.

JRE Requirements

The Machine Agent requires a Java Virtual Machine (JVM). Downloads for many of the supported operating systems include Azul JRE 1.8.0_262. The Machine Agent should work with most of the [JVMs supported by the Java Agent](#)(see page 493) JRE 1.8. However, it is extensively tested only for the Azul JRE.

- For tested platforms listed in the table, AppDynamics recommends using the latest available Machine Agent release from the [AppDynamics Downloads page](#)¹⁵⁷⁷.
- For Linux Flavors, the Machine Agent is bundled with Azul JRE 11. For Windows and Solaris, the Machine Agent is bundled with Azul JRE 1.8

1577 <https://download.appdynamics.com/download/>

If you upgrade the Linux Machine Agent to 21.1.0, then you must also upgrade all [extensions](#)¹⁵⁷⁸ to their latest versions to support Machine Agent 21.1.0.

- To run the Machine Agent on other platforms (such as AIX or HP-UX), use the unbundled Machine Agent ZIP without the JRE. For these platforms, you must install JRE 1.8 on the Machine Agent host.
- If you are using a 64-bit Operating System, use only a 64-bit JRE.

A 64-bit long has a maximum and minimum value of 9223372036854775807 and -9223372036854775808, respectively. To handle large values for metrics, run the Machine Agent using a 64-bit JDK.

JDK/JRE that is bundled with Machine Agent will work only if it meets the compatibility matrix requirements (JDK/JRE version, OS, architecture) listed here: <https://www.azul.com/downloads/?version=java-8-lts&os=rhel&architecture=x86-64-bit&package=jre>

If bundled JDK/JRE is not compatible with OS and architecture, then we suggest that you install the machine agent supported OS and architecture compatible JDK/JRE to run Machine Agent.

Bash Requirements

Linux and Solaris Machine Agents require Bash >= 3.1.

Required Libraries

Linux systems must include the procps library.

This table provides instructions on how to install the library on some common flavors of Linux operating systems.

Linux Flavor	Command
Red Hat and CentOS	Use yum to install the library, such as: <code>yum install procps</code>
Fedora	Install the library RPM from the Fedora website: <code>yum install procps</code>
Ubuntu	Use apt-get, such as: <code>sudo apt-get install procps</code>
Debian	Use a package manager such as APT to install the library (as described in the previous Ubuntu instructions).
SUSE 12	Use zypper to install the library, such as: <code>zypper install procps</code>

¹⁵⁷⁸ <https://www.appdynamics.com/community/exchange/>

Supported Environments

Tested Platforms

OS	Architecture x64 (64-bit)	Architecture SPARC (64-bit)	Versions
AIX	N/A	N/A	7.2 on IBM Power Systems (64-bit)
Linux / CentOS	Yes	No	6
	Yes	No	7
Linux / Debian	Yes	No	8
	Yes	No	9
Linux / Fedora	Yes	No	28
	Yes	No	29
Linux / openSUSE Leap	Yes	No	42.3
	Yes	No	15.0
Linux / Red Hat Enterprise Linux	Yes	No	6
	Yes	No	7
	Yes	No	8
Linux / SUSE Linux Enterprise	Yes	No	12
	Yes	No	15
Linux / Ubuntu	Yes	No	14.04
	Yes	No	16.04
	Yes	No	18.04
Solaris	Yes	Yes	10
	Yes	Yes	11
Windows	Yes	No	Windows Server 2012 R2
	Yes	No	Windows Server 2016

OS	Architecture x64 (64-bit)	Architecture SPARC (64-bit)	Versions
	Yes	No	Windows 2019

Other Platforms

These other platforms (supported by JRE 1.8), should also be compatible with the Machine Agent. However, AppDynamics has not fully tested them.

- Oracle JRE 1.8
- IBM SDK, Java Technology Edition, Version 8
- HP JDK/JRE 8

You should be able to run the Bundled version of the Machine Agent on machines based on Power Architecture processors, including PowerPC processors, but Server Visibility is not supported on these platforms.

Server Visibility is supported on OS platforms such as AIX or HP-UX. To install Server Visibility on these platforms, AppDynamics recommends using the unbundled Machine Agent ZIP without the JRE. The unbundled Machine Agent ZIP without the JRE works with Power Architecture processors, including PowerPC processors. However, x86_64, AMD64, and Intel 64 architectures are not supported.

Hardware and Sizing Requirements

Agent: One additional GB of RAM.

Controller: Although we recommend that you install the AppDynamics Controller on a dedicated server, in some cases the Machine Agent can co-exist with the Controller on the same system. The exact number of Machine Agents that can be supported depends on whether other agents are reporting to the same Controller and whether the Machine Agents have Server Visibility enabled (more metrics are generated under Server Visibility). See [Controller System Requirements](#)¹⁵⁷⁹.

JVM Memory Requirements

The lightweight Machine Agent consumes minimal resources of your computer.

To accommodate the Machine Agent, AppDynamics recommends these additional heap and PermGen space sizes:

- Maximum heap size (-Xmx): 256 MB
- Maximum PermGen heap size (-XX:MaxPermSize): 20 MB

By default, the JVM maximum heap size is set to 256 MB. To override this setting, you can set this flag through the JAVA_OPTS environment variable on your system. For example, if you enter: `export JAVA_OPTS="-Xms20m -Xmx128m"` on Linux, this sets the initial heap size to 20 MB and the max heap size to 128 MB.

¹⁵⁷⁹ <https://docs.appdynamics.com/display/PRMY21/.Controller+System+Requirements+v21.5>

Extension Considerations

The exact CPU or memory overhead added by the agent can vary based on the extensions used and whether the extensions are Java. Java extensions require more heap space; the amount required depends on how you code the extension. If you start adding extensions, you should increase the maximum heap space to 256 MB or 512 MB. Additionally, you may need to increase the size of the initial memory allocation. Monitor the memory consumption of the agent to ensure that there are sufficient resources allocated to it. You can also enable Garbage Collection logging on the JVM to fine tune the heap size for the extensions.

These are example settings to increase the initial heap size:

Linux and Unix systems: `<machine_agent_home>/bin/machine-agent -Xms64m`

Windows: `cscript <machine_agent_home>\machine-agent.vbs -Xms64m`

Machine Agent Metric Collection

The Machine Agent collects hardware metrics using default extensions appropriate to specific operating systems. The following table lists the metric collection extension and its supported OS information. In some limited cases, you may want to change the default collection extension. The table also lists the most common reasons for changing the default extension.

Supported environments, observation rates, configurability, some metric names, and definitions depend on the extension.

OS	Default Metric Collection Extension	Metrics Collected	Reason to Change the Default Extension	Supported Environments
Microsoft Windows	JavaHardwareMonit or(see page 2585) (if Server Visibility is disabled) ServerMonitoring (if Server Visibility is enabled)	Basic Metrics Server Visibility Metrics	To Customize Metrics for Virtual Disks and External Network Traffic (see page 2586) The HardwareMonitoring extension is not recommended on Windows. See Monitoring Windows Guidelines (see page 2587)	Machine Agent Requirements and Supported Environments (see page 2580)
Linux	ServerMonitoring	Basic Metrics Server Visibility Metrics	To Customize Metrics for Virtual Disks and External Network Traffic (see page 2584)	Machine Agent Requirements and Supported Environments (see page 2580)

OS	Default Metric Collection Extension	Metrics Collected	Reason to Change the Default Extension	Supported Environments
Solaris / SunOS	HardwareMonitor (see page 2586) (if Server Visibility is disabled) ServerMonitoring (if Server Visibility is enabled)	Basic Metrics Server Visibility Metrics	To Customize Metrics for Virtual Disks and External Network Traffic (see page 2584)	Machine Agent Requirements and Supported Environments (see page 2580)
AIX	JavaHardwareMonitOr (see page 2585)	Basic Metrics	SIGAR (System Information Gatherer And Reporter) is not supported for your OS or Linux Distribution	SIGAR
HP-UX	JavaHardwareMonitOr (see page 2584)	Basic Metrics	SIGAR is not supported for your OS or Linux Distribution	SIGAR
Mac OS X	JavaHardwareMonitOr (see page 2584)	Basic Metrics	SIGAR is not supported for your OS or Linux Distribution	SIGAR
Solaris	HardwareMonitor (see page 2586) (if Server Visibility is disabled) ServerMonitoring (if Server Visibility is enabled)	Basic Metrics Server Visibility Metrics	To Customize Metrics for Virtual Disks and External Network Traffic (see page 2584)	Machine Agent Requirements and Supported Environments (see page 2580)

i In case of a time discrepancy issue on a server (not related to daylight savings time), where time is reset manually, the Machine Agent stops reporting. During this interruption, application and server data are not reported. To continue monitoring, you must restart the Machine Agent.

Java Hardware Monitor

The JavaHardwareMonitor is based on SIGAR (System Information Gatherer And Reporter). SIGAR is a legacy method of collecting basic hardware metrics and is used in pre-4.1 versions and for machines running operating systems that are not supported by the ServerMonitoring extension. The following sections list scenarios where you might want to change the extension used to collect the machine metrics.

Customize Metrics for Virtual Disks and External Network Traffic

By default, the Machine Agent reports metrics for network-mounted and local disks only. Additionally, only the external network traffic is aggregated (to ensure backward compatibility with previous versions of AppDynamics). For operating systems using the ServerMonitoring extension, you can change to the JavaHardwareMonitor to configure specific disks and network interfaces to be monitored. See [Configure Metrics for Virtual Disks and External Network Traffic - JavaHardwareMonitor Extension Only](#) (see page 2588) to customize the behavior of the JavaHardwareMonitor metrics

Metric Observation Rate

The JavaHardwareMonitor takes observations of metrics in two distinct ways:

- For disk and network metrics: One observation per minute. When you view the count for these metrics in the Metric Browser, you see the count of 1 per minute. If you select a 15-minute interval, the count would be 15 times 1 = 15 and so on.
- For CPU and memory metrics: One observation every two seconds. When you view the count for these metrics, you see the count of 30 per minute. If you select a 15-minute interval, the count would be 15 times 30 = 450 and so on.

Collect Basic Metrics Using JavaHardwareMonitor

Linux and Windows machines use the ServerMonitoring extension by default to report basic metrics. However if you have Server Visibility enabled, falling back to the JavaHardwareMonitor only affects the collection of the basic hardware metrics. The extended Server Visibility metrics are still collected correctly by the ServerMonitoring extension.

How to Change from ServerMonitoring to JavaHardwareMonitor

1. Stop the Machine Agent.
2. Disable basic ServerMonitoring:
 - a. Edit the `ServerMonitoring.yml` file from `<machine_agent_home>/extensions/ServerMonitoring/conf/`.
 - b. Change the value of `basicEnabled` to "false".
The `basicEnabled` setting controls whether the Machine Agent reports basic hardware metrics through the ServerMonitoring extension. Setting this to `false` enables the JavaHardwareMonitor to report the basic hardware metrics using the legacy SIGAR-based reporting.
 - c. Save the file.
3. Enable JavaHardwareMonitor:
 - a. Edit `monitor.xml` from `<machine_agent_home>/monitors/JavaHardwareMonitor/`.
 - For Linux, remove this line: `<enable-override os-type="linux">false</enable-override>`.
 - For Windows, remove this line: `<enable-override os-type="windows">false</enable-override>`.
 - b. Save the file.
4. Restart the Machine Agent.

Hardware Monitor

The HardwareMonitor extension is a collection of OS-specific scripts. SunOS and Solaris machines use this extension by default. For the operating systems that use the JavaHardwareMonitor by default, you may want to switch to an OS-specific monitor. You can switch to the OS-specific monitors when the JavaHardwareMonitor fails to report statistics and you see error logs similar to the following:

```
[Agent-Scheduler-1] 28 Nov 2013 13:13:55,435 ERROR
SigarMinuteTask - Error fetching network statistics for
interface [eth0:17]. Blacklisting it.
[Agent-Scheduler-1] 28 Nov 2013 13:13:55,435 ERROR
SigarMinuteTask - Error fetching disk i/o statistics for
interface [eth0:17]. Blacklisting it.
```

Collect Basic Hardware Metrics using HardwareMonitor

How to Change from JavaHardwareMonitor to an OS-Specific Monitor

1. Stop the Machine Agent.
2. Disable the JavaHardwareMonitor:
 - a. Locate and edit `monitor.xml` from `<machine_agent_home>/monitors/JavaHardwareMonitor/`.
 - b. Change the value `<enabled>>true</enabled>` to `<enabled>>false</enabled>`.
 - c. Save the file.
3. Enable the HardwareMonitor for the OS you want to monitor:
 - a. Edit `monitor.xml` from `<machine_agent_home>/monitors/HardwareMonitor/`.
 - b. Change `<enabled>>false</enabled>` to `<enabled>>true</enabled>`.
 - c. Save the file.
4. Restart the machine agent.

Modify Free Memory Metric Configuration

If your Machine Agent installation is using an OS-specific HardwareMonitor for metric collection, then by default the agent reports free memory as the memory that is not used by any process nor in an I/O buffer or cache. It is more useful for the free memory metric to include memory that is in an I/O buffer or cache but can be available for new processes.

To include the memory in I/O buffers or cache that can be made available to new processes, modify the HardwareMonitor configuration:

1. Open `<machine_agent_home>/monitors/HardwareMonitor/config.sh`.
2. Set `REPORT_MEMORY_FREE_AS_MEMORY_AVAILABLE` to 1.
3. Restart the agent.

Monitoring Windows Guidelines

When using the Machine Agent on Windows:

- Check the server frequently to ensure that it has the latest Windows updates installed.
- If you have a Server Visibility license, use the ServerMonitoring extension.
- If you do not have a Server Visibility license, or if you want to collect Basic metrics only, use the JavaHardwareMonitor extension.
 - There is a known Windows issue when using the HardwareMonitor extension to collect metrics on Windows 8: [The "Win32_Service" WMI class leaks memory in Windows Server 2008 R2 and in Windows 7¹⁵⁸⁰](#). As a result, AppDynamics does not recommend using the HardwareMonitor extension on Windows. You should use JavaHardwareMonitor instead.
 - However, if you must use the HardwareMonitor extension on Windows, apply this Microsoft hotfix to the server: <https://support.microsoft.com/en-us/kb/981314>

¹⁵⁸⁰ <https://support.microsoft.com/en-us/kb/981314>

Server Visibility on Windows

See [Server Visibility Requirements and Supported Environments](#)(see page 2657).

Running the Machine Agent and .NET Agent on the Same Machine

To collect Machine or Server metrics on a machine with Machine and .NET Agents installed, you must enable .NET Compatibility Mode on both the Controller and the Machine Agent. See [.NET Compatibility Mode](#)(see page 2628).

Configure Metrics for Virtual Disks and External Network Traffic - JavaHardwareMonitor Extension Only

By default, the Machine Agent reports metrics for network-mounted and local disks only. Additionally to ensure backward compatibility with previous versions of AppDynamics, only the external network traffic is aggregated.

You can customize the default behavior by modifying the auto-generated configuration file, `task-template.xml`. The `task-template.xml` file provides information about the current configuration of the Machine Agent and is created when you first start up the agent. It discovers the disks and network hardware on the machine where it is installed that the agent can monitor.

This configuration applies to the JavaHardwareMonitor extension only. The ServerMonitoring extension is recommended if you have a Server Visibility license and the monitored system meets the system requirements. See [Server Visibility Requirements and Supported Environments](#)(see page 2657)

Customize the Default Machine Agent Metric Collection

1. Locate the `task-template.xml` file.
This file is located in the `<machine_agent_home>/monitors/JavaHardwareMonitor/` directory when the Machine Agent starts the first time.
2. Edit the `task-template.xml` file:
 - To enable aggregation operation for localhost (lo) network metrics, change the value of the `aggregate` attribute (for the network element "lo") to "true".
 - To enable monitoring for a virtual disk, set the value of the `enabled` attribute to "true" for that disk.

The following is a sample `task-template.xml` file:

```
<config>
  <disk aggregate="false" enabled="false">sunrpc</disk>
  <disk aggregate="true" enabled="true">/dev/sdb1</disk>
  <disk aggregate="false" enabled="false">proc</disk>
  <disk aggregate="false" enabled="false">none</disk>
  <disk aggregate="false" enabled="false">devpts</disk>
  <disk aggregate="true" enabled="true">/dev/sda1</disk>
  <disk aggregate="false" enabled="false">nfsd</disk>
  <disk aggregate="true" enabled="true">/dev/mapper/saas4-binlog</disk>
  <disk aggregate="false" enabled="false">sysfs</disk>
  <disk aggregate="false" enabled="false">tmpfs</disk>
```

```

<network aggregate="true" enabled="true">lo</network>
<network aggregate="true" enabled="false">sit0</network>
<network aggregate="true" enabled="true">eth0:1</network>
<network aggregate="true" enabled="true">eth0</network>
<network aggregate="true" enabled="false">eth1</network>
</config>

```

3. To prevent the Machine Agent from overwriting the file, rename the `task-template.xml` file to `task.xml`.
4. To monitor a special device that is not enabled, add a file named `task.xml` in the `<machine_agent_home>/monitors/JavaHardwareMonitor/` directory. The format of the `task.xml` file must be exactly the same format as the `task-template.xml` file. Not all disks and networks must be included in the `task.xml` file. If the Machine Agent finds a disk or a network that is not in the `task.xml` file, then it applies the default properties.
5. Restart the Machine Agent.

View Hardware Metrics

Without having to enable Server Visibility, you can view basic machine metrics in these locations:

- **Metric Browser** – Go to **Application Infrastructure Performance > Hardware Resources**.
- **Node** page > Server tab – Go to **Tiers & Nodes**, select the node of interest, and go to the Server tab.
- **Custom Dashboards** – To add CPU metrics to your Custom Dashboard, add the metrics for any node on your target machine. Metrics collected for a node associated with the machine agent are for the server hosting that node. Any machine metrics collected will be the same for nodes that are on the same machine.

Server Visibility provides additional metrics and pages to view basic and server metrics. See [Monitor Your Servers Using Server Visibility](#)(see page 2658).

[Hardware Resources Metrics](#)(see page 2558) describes metrics collected by the Machine Agent.

Customize Default Metrics

You can enable collection of metrics for [virtual disks and external network](#)(see page 2588) traffic.

Add Custom Metrics

You can add [script-based](#)(see page 2630) and [Java-based](#)(see page 2640) custom monitoring extensions to collect additional metrics. For example, the [ehCache monitoring extension](#)¹⁵⁸¹ available from [AppDynamics Exchange](#)¹⁵⁸² can collect metrics to monitor Ehcache performance. The metrics appear in **Application Infrastructure Performance | Custom Metrics** section of the Metric Browser and which you can use on custom dashboards.

You can also send metrics to the Machine Agent using the [HTTP listener](#)(see page 2645). See [Extensions and Custom Metrics](#)(see page 2629).

¹⁵⁸¹ <http://community.appdynamics.com/t5/eXchange-Community-AppDynamics/Ehcache-Monitoring-Extension/idi-p/4851>

¹⁵⁸² <https://www.appdynamics.com/extensions/>

Install the Machine Agent

This page provides requirements, permissions, and a procedure to install the Machine Agent. You can also use the [AppDynamics Agent Installer](#)¹⁵⁸³ to streamline the deployment of the Machine Agent. The Agent Installer simplifies the agent installation process.

To install Machine Agents in Kubernetes, see [Install Infrastructure Visibility with the Cluster Agent Operator](#)¹⁵⁸⁴.

Make sure to thoroughly test your deployment in a staging or test environment before deploying it to production.

JRE Requirements

- JRE 1.8 is required.
- In 4.2, JRE 1.8 is bundled with the OS-specific Machine Agent installation downloads.
- The Machine Agent starts within its own JVM.
- You can use an existing JRE previously installed in your environment.

Permissions

- To avoid permission issues, install the agent as the same user who owns the Machine Agent files or as an administrator on the host machine.
- All files in the <machine-agent-home> installation directory should be readable by the Machine Agent.
- The user that runs the Machine Agent must have write privileges to the logging output directory and to the /conf directory in the agent installation directory.
- If you plan to enable the JVM Crash Guard, review the required permissions for [JVM Crash Guard](#)(see page 1288).
- To create a non-root user to run the Machine Agent, see [Permissions Required to Run the Machine Agent](#)(see page 2608).
- Windows permissions for files and subfolders are inherited by default from the parent folder (<machine_agent_home>). Appdynamics recommends that you restrict permissions to users authorized to start, stop, and configure the Machine Agent:
 - Read and Write permissions to all files and subfolders under <machine-agent-home>.
 - If running as a:
 - Terminal application, then restrict Read, Write, and Execute permissions for the file <machine-agent-home>\bin\machine-agent.vbs.
 - Service, then restrict Start, Stop, and Restart permissions for the Machine Agent service. You only need admin privileges to install the service. The Machine Agent runs under the local system account which has extensive privileges on the local system. However, if WMI access is revoked, then you must run the Machine Agent as Administrator. Typically, users do have WMI access. See [User Account Control and WMI](#)¹⁵⁸⁵.
- Enable Windows Script Host for the Windows Machine Agent.

Installation Directory and Path Name Requirements

The following table lists characters that are not supported for the <machine-agent-home> directory name or in any directory in the path:

¹⁵⁸³ <https://docs.appdynamics.com/display/PRO45/Agent+Installer>

¹⁵⁸⁴ <https://docs.appdynamics.com/display/PRO21/Install+Infrastructure+Visibility+with+the+Cluster+Agent+Operator>

¹⁵⁸⁵ <https://docs.microsoft.com/en-us/windows/win32/wmisdk/user-account-control-and-wmi>

Not Supported on any OS	Not Supported on Linux	Not Supported on Windows
Whitespace characters	% #	% # \ / : * ? " < >
An exclamation point at the end of the directory name		Control characters such as ASCII EOL, CR, etc.

Configuration

The `controller-info.xml` file contains the properties used to specify agent to Controller communications. To specify the Controller host, port, and account access key properties, see [Plan the Machine Agent Configuration](#)(see page 2592). Based on your installation requirements, you may need to configure additional properties.

Installation for New Machine Agent

The following steps are for *new* installations. To upgrade Machine Agent <= 4.3, see [Upgrade the Machine Agent](#)(see page 2651).

1. [Plan the Machine Agent Configuration](#)(see page 2592).
2. From [AppDynamics Downloads](#)¹⁵⁸⁶, download the Machine Agent installation package for your OS environment onto the machine you want to monitor.

i If there is no download bundle for your OS, use the Machine Agent zip file without the JRE, and use a separately downloaded JRE to run it. You need to download a separate JRE if the one already installed on the machine is a version earlier than JRE 1.8.

- [Install Using the Non-JRE Zip File](#)(see page 2594) - Use this for OS environments other than Linux, Solaris, Windows, and Mac OS X.
 - [Linux Install Using the RPM Package](#)(see page 2595)
 - [Linux Install Using ZIP with Bundled JRE](#)(see page 2598)
 - [Solaris Install Using ZIP with Bundled JRE](#)(see page 2601)
 - [Windows Install Using ZIP with Bundled JRE](#)(see page 2602)
3. [Verify the Machine Agent Installation](#)(see page 2605).
 4. Start the Machine Agent by executing `<machine_agent_home>/bin/machine-agent`. If you have `java` or `system` properties, you can add them to the end of the command. To review machine usage, enter `machine-agent -h`.

Machine Agent Installation Scenarios

Related pages:

- [Plan the Machine Agent Configuration](#)(see page 2592)
- [Where to Specify Machine Agent Configuration](#)(see page 2612)
- [Machine Agent Configuration Properties](#)(see page 2613)

This page describes scenarios for new Machine Agent installations.

¹⁵⁸⁶ <https://accounts.appdynamics.com/downloads>

APM Machine Agent Installation Scenario

This scenario contains a host server running one or more instrumented applications and one Machine Agent. When you install the Machine Agent on the same server with any app agent, do not specify the application name and tier name. The one Machine Agent reports the hardware metrics to each node where the app agent and the Machine Agent have matching host IDs.

If you plan to enable Server Visibility on a Windows server where a .NET APM agent is installed, you must enable .NET Compatibility Mode on both the Controller and the Machine Agent. See [.NET Compatibility Mode](#) (see page 2628).

Licensing Note

>= 4.3 includes one Machine Agent license with each APM app agent. You can install this Machine Agent only on the same server with the app agent.

Independent Machine Agent Installation

This scenario contains a host server running only the Machine Agent without app agents. You do not need to specify an application or tier. You can view the Machine Agent metrics from the Servers list or the metric browser. This scenario requires a Server Visibility license.

Licensing Note

>= 4.3 requires a Server Visibility license for a Machine Agent installation.

If you are doing an Independent Machine Agent installation and you want the hardware metrics reported to nodes in an application, then you must configure the application name, tier name, and node name where you want the metrics to appear.

Using the values for the application name, tier name, and node where you want to see the metrics reported, configure these properties:

- Application name
- Tier name
- Node name
- `uniqueHostId` for both the Machine Agent and app agent (use the same value)

Unique Host ID Property

The `uniqueHostId` property is not required. However, if you do not define `uniqueHostId`, then the Machine Agent uses the Java API to retrieve the host ID. The results from the API can be inconsistent. The same JVM may return a different value for the same machine each time you restart the Machine Agent. As a workaround, AppDynamics recommends that you set the value of `uniqueHostId` to the host ID that you want to see in the UI. Use the same value for `uniqueHostId` for the App Agent.

Plan the Machine Agent Configuration

AppDynamics provides multiple ways to configure the Machine Agent. As part of planning your installation, determine which options work best in your environment:

- Controller-info.xml
- System properties
- Environment variables

See [Configure the Machine Agent](#)(see page 2610).

Collect Configuration Information

Determine your configuration requirements and collect the necessary information. See [Machine Agent Configuration Properties](#)(see page 2613).

Planning Item	Description
Determine your installation scenario	<p>For new installations, see Machine Agent Installation Scenarios(see page 2591).</p> <p>For upgrades, see Upgrade the Machine Agent(see page 2651).</p>
Location of the startup script	<p>You add startup arguments and system properties in the startup script.</p> <p>If you are using a Java service wrapper, you need to know the location of the wrapper configuration. See Where to Specify Machine Agent Configuration(see page 2612).</p>
Memory and CPU	See Machine Agent Requirements and Supported Environments (see page 2580).
Connecting the agent to the Controller	<p>You need to know the Controller host, Controller port, and account access key where you want your metrics to be reported. The account access key is generated at the Controller installation time and is located on the AppDynamics Administration Console¹⁵⁸⁷.</p>
(Optional) SSL Communications	<p>If you plan to use SSL to communicate with the Controller, see Enable SSL for Machine Agent(see page 2625).</p> <p>SSL-related properties include:</p> <ul style="list-style-type: none"> • Controller SSL Enabled Property • Controller Keystore Password • Controller Keystore Filename • Force Default SSL Certificate Validation
Proxy Settings	<p>If you plan to connect to the Controller using a proxy server, you need to know the Proxy host, Proxy port, and the path to the Proxy Password file.</p>

1587 <https://docs.appdynamics.com/display/PRMY21/.Access+the+Administration+Console+v21.5>

Planning Item	Description
Multi-tenant mode or SaaS Installations	In addition to the Account Access property, use the Account Name property to configure multi-tenant mode ¹⁵⁸⁸ or SaaS account Information. This information is provided in the Welcome email from the AppDynamics Support Team. You can also locate this information in the <code><controller_home>/initial_account_access_info.txt</code> file.
Deploying from a common directory	See Deploy Multiple Machine Agents From a Common Directory (see page 2604).
Extension considerations	If you plan to use a number of extensions in your environment, see the "Extension Considerations" section in Machine Agent Requirements and Supported Environments (see page 2580).
Enabling Server Availability and Service Availability Monitoring	Server Availability requires a separate license. See Enable Server Visibility (see page 2658).

Install Using the Non-JRE Zip File

This page describes how to install the Machine Agent using the zip file that does not include the JRE. You can use this zip file if your environment already has Java >= 1.8, or when installing on an OS environment that does not have an OS-specific installation package on the AppDynamics download site. The agent uses the JRE specified in the \$JAVA_HOME environment variable or the default JRE for the server (enter which java in a terminal window).

Install the Machine Agent

1. Before installing, review [Install the Machine Agent](#)(see page 2590).
2. Download and unzip the ZIP file. Extract the contents to the agent installation directory, `<machine_agent_home>`.
3. Gather your configuration details and configure the agent by editing the `<machine_agent_home>/conf/controller-info.xml` file or by adding system properties to the JVM startup script file. See [Plan the Machine Agent Configuration](#)(see page 2592).
 - a. *(Required)* Configure the Controller host name, port number, and account access key.
 - b. *(Required for Multi-Tenant Mode or SaaS installations)* Configure the Agent Account Information. See [Multi-Tenant Controller Accounts](#)¹⁵⁸⁹.
 - c. *(Optional)* Review memory requirements. See [Machine Agent Requirements and Supported Environments](#)(see page 2580).
 - d. *(Optional)* Configure the agent to use SSL. See [Enable SSL for Machine Agent](#)(see page 2625).
 - e. *(Optional)* Configure the agent to use proxy settings. See [Machine Agent Configuration Properties](#)(see page 2613).

¹⁵⁸⁸ <https://docs.appdynamics.com/display/PRMY21/.Multi-Tenant+Controller+Accounts+v21.5>

¹⁵⁸⁹ <https://docs.appdynamics.com/display/PRMY21/.Multi-Tenant+Controller+Accounts+v21.5>

- f. (*Optional*) For application and tier name, see [Machine Agent Installation Scenarios](#)(see page 2591) to determine if you need to specify an application name and tier name. If you are installing the Machine Agent on the same server with any APM app agent, do not specify the application name and tier name.

4. Start the Agent:

- Windows in a terminal window: <machine_agent_home>\bin\machine-agent.vbs
- Windows as a service: <machine_agent_home>\InstallService.vbs
- Linux or Unix-like: <machine_agent_home>/bin/machine-agent

Linux Install Using the RPM Package

Related pages:

- [Where to Specify Machine Agent Configuration](#)(see page 2612)
- [Start and Stop the Machine Agent](#)(see page 2606)

This page describes how to install the Machine Agent on Linux systems that support the [RPM Package Manager](#)¹⁵⁹⁰:

- CentOS
- RHEL
- Fedora
- openSUSE
- SUSE Linux Enterprise Server

For Linux systems that do not support RPM, use the [JRE Bundled Zip Archive](#)(see page 2598).

The RPM installer makes these changes to the host machine:

- Creates an appdynamics-machine-agent group and an appdynamics-machine-agent user
- Assigns ownership of certain files in the machine-agent directory to the appdynamics-machine-agent user

These changes are necessary to enable non-root users to configure and run an RPM-installed agent. To use a different user or group for the machine agent service, set the MACHINE_AGENT_USER and MACHINE_AGENT_GROUP environment variables in a shell for RPM installation.

```
sudo MACHINE_AGENT_USER=myuser MACHINE_AGENT_GROUP=mygroup rpm -ivh appdynamics-machine-agent.rpm
```

If the specified user or group does not exist, an error message appears and the RPM installation stops. To continue, you must define users and groups.

If this is an issue in your environment, then you install the agent using the ZIP archive (see [Linux Install Using ZIP with Bundled JRE](#)(see page 2598)).

Install the Machine Agent

1. Before installing, review [Install the Machine Agent](#)(see page 2590).
2. Download and install the RPM Package. With administrative privileges, enter the following CLI code where <pkg-name.rpm> is the name of the package for your environment, such as appdynamics-machine-agent-<version>.x86_64.rpm.

¹⁵⁹⁰ http://en.wikipedia.org/wiki/RPM_Package_Manager

```
sudo rpm -ivh <pkg-name.rpm>
```

The agent files are installed in `opt/appdynamics/machine-agent` and the agent is added as a service.

3. Gather your configuration details and configure the agent by editing `<machine_agent_home>/conf/controller-info.xml` file or by adding system properties to the JVM startup script file. See [Linux Install Using the RPM Package v21.1](#) (see page 2595).
 - a. (*Required*) Configure the Controller host name, port number, and account access key.
 - b. (*Optional*) Review memory requirements. See [Machine Agent Requirements and Supported Environments](#) (see page 2580).
 - c. (*Optional*) Configure the agent to use SSL. See [Enable SSL for Machine Agent](#) (see page 2625).
 - d. (*Optional*) Configure the agent to use proxy settings. See [Machine Agent Configuration Properties](#) (see page 2613).
 - e. (*Required for Multi-Tenant Mode or SaaS installations*) Configure the Agent Account Information. See [Multi-Tenant Controller Accounts](#)¹⁵⁹¹.
 - f. (*Optional*) Determine if you need to specify an application name and tier name. See [Machine Agent Installation Scenarios](#) (see page 2591).
If you are installing the Machine Agent on the same server with any APM app agent, do not specify application name and tier name.
4. Start the Agent. You can start the agent as a service (requires sudo or root user) or from the command line. If `systemd` was detected during installation, you can use the `systemctl` command to start the agent service.
 - Using SysV – `service appdynamics-machine-agent start`
 - Using systemd – `systemctl start appdynamics-machine-agent`
 - From the Command Line – `<machine_agent_home>/bin/machine-agent`
 - From the Launcher – `<machine_agent_home>/etc/init.d/appdynamics-machine-agent start`

RPM Package Function

The RPM package manager installs the agent files to `opt/appdynamics/machine-agent`, creates symbolic links, sets environment variables, and adds the agent as a service.

Symbolic Links

The RPM package manager creates the symbolic links to agent scripts and configuration files in the `/etc` directory. You can edit these links to accommodate a different installation directory, JRE, or system user account running the agent.

Link for SysV Service Script

```
/etc/init.d/appdynamics-machine-agent >> /opt/appdynamics/machine-agent/etc/init.d/appdynamics-machine-agent
```

This script provides these service commands:

- `Start` – Starts the service, runs a script that starts the agent
- `Stop` – Stops the service
- `Restart` – Restarts the service
- `Status` – Returns the status of the service.

For example: `service appdynamics-machine-agent start`

¹⁵⁹¹ <https://docs.appdynamics.com/display/PRMY21/.Multi-Tenant+Controller+Accounts+v21.5>

Link for Environment Variables

SysV –

```
/etc/sysconfig/appdynamics-machine-agent >> /opt/appdynamics/machine-agent/etc/sysconfig/  
appdynamics-machine-agent
```

This script sets up the environment variables:

- `MACHINE_AGENT_HOME=/opt/appdynamics/machine-agent` – Specifies where the agent files are located.
- `JAVA_HOME=/opt/appdynamics/machine-agent/jre` – Specifies the JRE the agent uses. AppDynamics recommends that you use the RPM package installer that contains its own JRE. However, you can use a different JRE as long as it meets the [JRE requirements](#)(see page 2580).
- `MACHINE_AGENT_USER=root` – Specifies the system user for starting the agent (default is root). AppDynamics recommends that you create a non-root user to run the machine agent. The new user needs to have read-access to controller-info.xml and write access to the log file. See [Permissions Required to Run the Machine Agent](#)(see page 2608)

systemd – The environment variables are in the service file:

```
/etc/systemd/system/appdynamics-machine-agent.service >> /opt/appdynamics/machine-agent/etc/  
systemd/system/appdynamics-machine-agent.service
```

"MACHINE_AGENT_USER" variable doesn't exist in the systemd service file. The variable is just User.

Link for Agent to Controller Communication

Sets up a link to the controller-info.xml file containing the properties for agent-to-controller communication.

```
/etc/appdynamics/machine-agent/controller-info.xml >> /opt/appdynamics/machine-agent/conf/  
controller-info.xml
```

Logging Configuration

The log4j.xml file controls the detail of information logged by the agent. By default, the logging level is set to info.

```
/etc/appdynamics/machine-agent/logging/log4j.xml >> /opt/appdynamics/machine-agent/conf/  
logging/log4j.xml
```

Adds the Agent as a Service

After the package is installed, the appdynamics-machine-agent runs `opt/appdynamics/machine-agent/bin/postInstall.sh` to add the agent to the services. The installer either copies the SysV script to add the service or, if systemd is detected, the installer copies the agent unit file `/etc/systemd/system/appdynamics-machine-agent.service` and adds the agent to the services using this unit file.

Installs a systemd Unit File for the Agent Service

If `systemd` is detected on the system when you install the RPM package or run the `postinstall.sh` script, the `systemd` unit file for the agent service is copied to the following location: `/etc/systemd/system/appdynamics-machine-agent.service`

ExecStart: This option in the `systemd` service file points to a script that starts the agent as a daemon. If you did not install the Machine Agent in `/opt/appdynamics/machine-agent`, then change the path to `<machine-agent-home>/scripts/machine-agent-daemon`. If you did not edit the path, then it points to the correct place by default.

You can start and stop the agent service using the relevant `systemctl` commands. For information on all `systemctl` commands, see the [systemctl¹⁵⁹²](#) man pages.

Command	Format
start stop status restart	<code>systemctl <command> appdynamics-machine-agent.service</code>
disable enable (Use the full path)	<code>systemctl <command> /etc/systemd/system/appdynamics-machine-agent.service</code>

Linux Install Using ZIP with Bundled JRE

This page describes how to install the Machine Agent using the Linux ZIP archive that includes JRE 1.8.

It is easier to download and use the RPM package if your Linux distribution supports the [RPM Package Manager¹⁵⁹³](#).

Install the Agent

1. Before installing, see [Install the Machine Agent\(see page 2590\)](#).

 Read/write privileges to the `<machine-agent-home>` installation directory are required.

2. Download and unzip the Agent zip bundle. From the command line, enter:

```
unzip <zip-bundle.zip> -d <machine_agent_home>
```

where `<zip-bundle.zip>` is the name of the zip archive for your environment and `<agent_home>` is the name of the directory where you want to install the agent.

¹⁵⁹² <http://www.freedesktop.org/software/systemd/man/systemctl.html>

¹⁵⁹³ http://en.wikipedia.org/wiki/RPM_Package_Manager

3. Gather your configuration details and configure the agent by editing <machine_agent_home>/conf/controller-info.xml file or by adding system properties to the JVM startup script file. See [.Linux Install Using ZIP with Bundled JRE v21.1](#)(see page 2598).
 - a. (*Required*) Configure the Controller host name, port number, and account access key.
 - b. (*Optional*) Review memory requirements. See [Machine Agent Requirements and Supported Environments](#)(see page 2580).
 - c. (*Optional*) Configure the agent to use SSL. See [Enable SSL for Machine Agent](#)(see page 2625).
 - d. (*Optional*) Configure the agent to use proxy settings. See [Machine Agent Configuration Properties](#)(see page 2613).
 - e. (*Required for Multi-Tenant Mode or SaaS installations*) Configure the Agent Account Information. See [Multi-Tenant Controller Accounts](#)¹⁵⁹⁴.
 - f. (*Optional*) Determine if you need to specify an application name and tier name. See [Machine Agents and Applications](#)(see page 2598).
If you are installing the Machine Agent on the same server with any APM app agent, do not specify application name and tier name.
4. To add the Machine Agent as a service, see [Add the Agent as a Service](#)(see page 2599).
5. Start the Machine Agent by entering: <machine_agent_home>/bin/machine-agent. For example, from the <machine_agent_home> directory:

```
./bin/machine-agent
```

To review Machine Agent usage, enter: machine-agent -h

```
Usage: machine-agent [-dh] [-j JAVA_HOME] [-p pidfile] [-D prop] [-X prop]
Start the machine agent.
    -d                daemonize (run in background)
    -p pidfile        write PID to <pidfile>
    -h
    --help            print command line options
    -D prop           set JAVA system property
    -X prop           set non-standard JAVA system property
```

6. (Optional) Verify the installation. See [Verify the Machine Agent Installation](#)(see page 2598).

Add the Agent as a Service Using SysV

1. Install the [Machine Agent](#)(see page 2598).
2. Create a link to /etc/sysconfig:

```
ln -s <machine-agent-home>/etc/sysconfig/appdynamics-machine-agent /etc/sysconfig/appdynamics-machine-agent
```

3. Copy the machine agent to /etc/init.d. For example:

¹⁵⁹⁴ <https://docs.appdynamics.com/display/PRMY21/.Multi-Tenant+Controller+Accounts+v21.5>

```
cp <machine-agent-home>/etc/init.d/appdynamics-machine-agent /etc/init.d/appdynamics-machine-agent
```

4. Edit the environment variables in `/etc/sysconfig/appdynamics-machine-agent` configuration file:
 - `MACHINE_AGENT_HOME` – Specifies where the Machine Agent files are located.
 - `JAVA_HOME` – Specifies the JRE the agent uses. AppDynamics recommends that you use the Machine Agent bundled with the JRE. However, you can use an existing JRE. (1.8 or later).
 - `MACHINE_AGENT_USER` – Specifies the system user used to start the Machine Agent. By default this is root. AppDynamics recommends that you create a non-root user to run the Machine Agent. The new user needs to have read-access to `controller-info.xml` and write access to the log file. See [Permissions Required to Run the Machine Agent](#)(see page 2608).
5. Add the agent as a service. For example, enter:

```
chkconfig --add appdynamics-machine-agent
```

For Ubuntu, you can use `update-rc.d` or `sysv-rc-conf`. See the Ubuntu documentation for details.

6. Start the agent service: `service appdynamics-machine-agent start`.
7. Verify that the Agent is reporting to the Controller. See [Linux Install Using ZIP with Bundled JRE v21.1](#)(see page 2598).

Add the Agent as a Service Using systemd

1. Install the [Machine Agent](#)(see page 2598).
2. Edit the environment variables and options in the service file as needed: `<machine-agent-home>/etc/systemd/system/appdynamics-machine-agent.service`
 - a. `MACHINE_AGENT_HOME` – Specifies where the Machine Agent files are located.
 - b. `JAVA_HOME` – Specifies the JRE the agent uses. Appdynamics recommends that you use the Machine Agent bundled with the JRE. However, you can use an existing JRE.
 - JRE \geq 1.7 for = 4.3
 - JRE \geq 1.8 for \geq 4.4
 - c. `User` – This option in the service file specifies the system user to use to start the Machine Agent. By default this is root. AppDynamics recommends that you create a non-root user to run the Machine Agent. The new user needs to have read access to `controller-info.xml` and write access to the log files. See [Permissions for Non-Root User to Run the Machine Agent](#)(see page 2608) .
The `systemd` service file does not include the "MACHINE_AGENT_USER" variable.
3. Copy the file:

```
cp <machine-agent-home>/etc/systemd/system/appdynamics-machine-agent.service \  
/etc/systemd/system/appdynamics-machine-agent.service
```

4. Enable the Machine Agent to start at system startup:

```
systemctl enable appdynamics-machine-agent
```

5. Start the agent service:

```
systemctl start appdynamics-machine-agent
```

6. Check the service status:

```
systemctl status appdynamics-machine-agent
```

7. Verify that the Agent is reporting to the Controller. See [.Linux Install Using ZIP with Bundled JRE v21.1](#)(see page 2598).

Solaris Install Using ZIP with Bundled JRE

This page describes how to install the Machine Agent on 64-bit Solaris using the ZIP archive that includes JRE 1.8.

i Adding the Machine Agent as a service is not supported on Solaris.

Install the Agent

1. Before installing, see [Install the Machine Agent](#)(see page 2590).
2. The Machine Agent on Solaris is supported only when you install it in Global zones.
3. The Solaris agent requires that the `nawk` (new `awk`) utility is installed. Verify that the Solaris host has the `nawk` utility installed.
4. Download one of the two installation Machine Agent Bundles for Solaris from the AppDynamics Download Site:
 - For Sparc machines: Machine - Agent Bundle - 64-bit solaris-sparcv9.zip
 - For x86 machine: Machine Agent Bundle - 64-bit Solaris.zip
5. Unzip the agent Zip bundle:

```
unzip <zip-bundle.zip> -d <machine_agent_home>
```

where `<machine_agent_home>` is the install directory.

6. Gather your configuration details and configure the agent by editing `<machine_agent_home>/conf/controller-info.xml` file or by adding system properties to the JVM startup script file. See [Plan the Machine Agent Configuration](#)(see page 2592).
 - a. *(Required)* Configure the Controller host name, port number, and account access key.
 - b. *(Required for Multi-Tenant Mode or SaaS installations)* Configure the Agent Account Information. See [Multi-Tenant Controller Accounts](#)¹⁵⁹⁵.
 - c. *(Optional)* Review memory requirements. See [Machine Agent Requirements and Supported Environments](#)(see page 2580).
 - d. *(Optional)* Configure the agent to use SSL. See [Enable SSL for Machine Agent](#)(see page 2625).
 - e. *(Optional)* Configure the agent to use proxy settings. See [Machine Agent Configuration Properties](#)(see page 2613).

¹⁵⁹⁵ <https://docs.appdynamics.com/display/PRMY21/.Multi-Tenant+Controller+Accounts+v21.5>

- f. (*Optional*) Determine if you need to specify an application name and tier name. See [.Solaris Install Using ZIP with Bundled JRE v21.1](#)(see page 2601).

However, if you are installing the Machine Agent on the same server with any APM app agent, do not specify the application name and tier name.

7. Start the agent from the command line:

```
% <machine_agent_home>/bin/machine-agent
```

8. Verify that the Agent is reporting to the Controller.

Windows Install Using ZIP with Bundled JRE

This page describes how to install Windows using ZIP with bundled JRE.

For some versions of Windows Server 2008 and Windows Vista, the Avg Read and Write Time disk metrics are reported as 0. This is due to a known Microsoft Windows bug. See [Microsoft Knowledge Base](#).¹⁵⁹⁶ If this affects you, download the available hotfix. This refers to the following metrics:

- Hardware Resources|Disks|<mount_point>|Avg Read Time (ms)
- Hardware Resources|Disks|<mount_point>|Avg Write Time (ms)

Install the Agent

1. Before installing, see [Install the Machine Agent](#)(see page 2590).
2. Install all available Windows updates.
3. If you have not restarted your machine recently, you must restart it. Failure to do so may cause your machine to experience a CPU spike when you start the Machine Agent.
4. Download and unzip the Windows ZIP bundle. Extract the contents to the agent installation directory <machine_agent_home>.
5. Gather your configuration details and configure the agent by editing the <machine_agent_home>/conf/controller-info.xml file or by adding system properties to the JVM startup script file. See [Plan the Machine Agent Configuration](#)(see page 2592).
 - a. (*Required*) Configure the Controller host name, port number, and account access key.
 - b. (*Required for Multi-Tenant Mode or SaaS installations*) Configure the Agent Account Information. See [Multi-Tenant Controller Accounts](#)¹⁵⁹⁷.
 - c. (*Optional*) Review memory requirements. See [Machine Agent Requirements and Supported Environments](#)(see page 2580).
 - d. (*Optional*) Configure the agent to use SSL. See [Enable SSL for Machine Agent](#)(see page 2625).
 - e. (*Optional*) Configure the agent to use proxy settings. See [Machine Agent Configuration Properties](#)(see page 2613).
 - f. (*Optional*) Determine if you need to specify an application name and tier name. See [.Windows Install Using ZIP with Bundled JRE v21.1](#)(see page 2602).
However, if you are installing the Machine Agent on the same server with any APM app agent, do not specify the application name and tier name.
6. Start the agent. If no -D options are required on the command line, you can run the following .vbs scripts by selecting them from Windows Explorer.
 - a. As a Windows Service - Administrative privileges are required. You can specify AppDynamics-specific -D options from the command line or edit the controller-info.xml. You can also add other

¹⁵⁹⁶ <https://support.microsoft.com/en-us/kb/961435>

¹⁵⁹⁷ <https://docs.appdynamics.com/display/PRMY21/.Multi-Tenant+Controller+Accounts+v21.5>

JVM properties as needed.

Open a terminal window and enter:

```
cscript <machine_agent_home>\InstallService.vbs <jvm_options>
```

You can now start or stop the AppDynamics Machine Agent service from Windows Services.

b. From an application in the terminal window, enter:

```
cscript <machine_agent_home>\bin\machine-agent.vbs.
```

The usage parameters for machine-agent.vbs are:

Using machine-agent.vbs

```
> machine-agent.vbs -h
Usage: machine-agent.vbs[-h] [-j JAVA_HOME][-Dprop1 ...] [-Xprop2 ...]
Start the machine agent.
    -h                print command line options
    -j JAVA_HOME      set java home for the agent
    -Dprop1           set standard system properties for the agent
    -Xprop2           set non-standard system properties for the agent
```

The following is an example of machine-agent.vbs:

```
> cscript machine-agent.vbs -Dappdynamics.controller.hostName=192.168.1.20
-Dappdynamics.controller.port=8090
```

Unquoted Service Path Enumeration Vulnerability

If you have installed Machine Agent primarily as a Windows service, you may encounter a security vulnerability known as Unquoted Service Path Enumeration Vulnerability.

Unquoted Service Path Enumeration Vulnerability occurs when the remote Windows host has at least one service installed that uses an unquoted service path, which contains at least one whitespace. A local attacker can gain elevated privileges by inserting an executable file in the path of the affected service.

To address this vulnerability, perform either of the following methods.

Method 1

1. Navigate to HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Services\Appdynamics Machine Agent.
2. Change the ImagePath data value to enclose C:\Program Files\AppDynamics\AppD_Infra_Monitoring\bin\MachineAgentService.exe in double quotation marks.

Example:

```
"C:\Program Files\AppDynamics\AppD_Infra_Monitoring\bin\MachineAgentService.exe"
```

Method 2

1. Download the [Windows_Path_Enumerate.ps1](#) script and save it to a folder.
2. To list all vulnerabilities on the machine, open the powershell prompt and execute the following command:

```
<path containing downloaded Windows_Path_Enumerate.ps1>\Windows_Path_Enumerate.ps1  
-FixUninstall -FixEnv -WhatIf
```

3. Fix all vulnerabilities on the machine by executing the following command:

```
<path containing downloaded Windows_Path_Enumerate.ps1>\Windows_Path_Enumerate.ps1  
-FixUninstall -FixEnv
```

Deploy Multiple Machine Agents From a Common Directory

You can deploy the Machine Agent on multiple hosts from one central directory. This setup provides an easier method to update the agent because each agent instance starts from one set of executables in one central location.

Workflow Description

1. Set up the central agent directory:
 - a. Install the Machine Agent executables and config files in a central directory, such as an NFS-mounted shared directory.
 - b. Specify properties common to all remote agents in this central directory.
2. Configure each remote host to start an instance of the agent from this central directory:
 - a. Specify properties that are unique to the agent on that host, either in a startup script or on the command line.
 - b. Configure a startup script to start an instance of the Machine Agent from the central agent directory.

Set Up the Central Agent Directory

1. Download the latest Machine Agent ZIP file. See [Download AppDynamics Software](#)(see page 91).
2. Unzip the downloaded file to the desired root directory (<central-agent-root-directory>) on the central host.
3. Specify the properties common to all Machine Agent instances running on all remote hosts. Examples of common properties include the account name, and the Controller host and port. You specify these properties in <central-agent-root-directory>/conf/controller-info.xml.

Configure Each Remote Host to Start an Agent Instance

On each Machine Agent host, specify the properties unique to that agent such as: runtime directory, application name, tier name, and node name. To specify these properties, configure -D parameters in the

startup script or on the command line. For example, the startup script on a remote host might include the following command:

```
<central_agent_root_directory>/bin/machine-agent
-Dappdynamics.agent.runtime.dir=<agent_runtime_dir>
-Dappdynamics.agent.applicationName=<application_name>
```

You should specify a unique runtime directory for each remote host to ensure that log files for each agent instance are saved to a separate directory. The agent log directory is located under the agent runtime directory, which you specify in the `-Dappdynamics.agent.runtime.dir` system property. The log directory is directly under the runtime directory (`<agent-runtime-dir>/logs`).

- Specify the runtime directory as an absolute path in the startup script on the remote host:

```
-Dappdynamics.agent.runtime.dir=<absolute_path_to_local_agent_runtime_directory>
```

- To change the log directory and file name from the default value, edit the file `<machine-agent-home>/confs/logging/log4.xml`. Change the value of the "FileAppender" > "fileName" and "FileAppender" > "filePattern" parameters to the desired directory and file name.
- The file-system permissions must allow creation of the log directory and file.

Verify the Machine Agent Installation

Related pages:

- [FAQs and Troubleshooting for the Machine Agent](#)(see page 2653)
- [Machine Agent Configuration Properties](#)(see page 2613)

Check Agent Logs

After a successful install, the agent log at `<machine_agent_home>/logs`, should contain the following message:

```
Started AppDynamics Machine Agent Successfully
```

If the agent log file is not present, the Machine Agent may not be accessing the command properties. To troubleshoot, check the application server log file where STDOUT is logged. It has the fallback log messages, which are useful for troubleshooting the agent.

Verify that the Agent is Reporting to the Controller

1. From the Controller Top Navigation Bar, select **Settings > AppDynamics Agents**.
2. Click the Machine Agents tab.
The listing for the Machine Agent displays. If you do not see the Machine Agent listed, check your property settings in `<machine_agent_home>/conf/controller-info.xml`. See [Resolve Machine Agent Installation Problems](#)(see page 2606).

Machine Agent Not Reporting

If it seems that the Machine Agent is not reporting to the Controller, see [Machine Agent Not Reporting](#)¹⁵⁹⁸ article in the Community Knowledge Base.

Resolve Machine Agent Installation Problems

Related pages:

- [FAQs and Troubleshooting for the Machine Agent](#)(see page 2653)
- [Machine Agent Configuration Properties](#)(see page 2613)

Verify That the Agent Process is Running

Use the following command to verify that the agent process is running:

Linux:

```
ps -ef | grep machine
```

Windows:

1. Open a command line console.
2. Start the Task Manager and click the Processes tab.
3. The [agent process](#)(see page 2654) should be running. If it is not running, stop and then restart the agent.

Resolve Agent Connectivity Problems

Make sure you have [configured](#)(see page 2613) the Controller IP address, Controller port number, and Account Access Key in the agent startup command, script or plist, or in the controller-info.xml file.

After configuring, restart the agent and check the behavior. Machine Agent log files may also provide troubleshooting information.

If you start the Machine Agent, and it cannot register with the Controller or associate with the same node in the Controller, then the stack trace may indicate the reason.

For example, the following message in the stack trace may indicate that the application, tier, and node information was not provided during the Machine Agent startup command or in the controller-info.xml file.

```
<execution-output>System agent 239590 not associated with application, metric registration request refused.</execution-output>
```

Start and Stop the Machine Agent

This page contains a summary of the start and stop commands for the Machine Agent. See [Permissions Required to Run the Machine Agent](#)(see page 2608).

Running the Machine Agent with a Non-Bundled JRE

¹⁵⁹⁸ <http://community.appdynamics.com/t5/Knowledge-Base/Machine-Agent-Not-Reporting/ta-p/13983>

To run the Machine Agent with the default JRE on the machine (rather than the JRE bundled with the agent), you should first install a non-JRE version of the Machine Agent, and then run the non-JRE agent instead. See [Install Using the Non-JRE Zip File](#)(see page 2594).

Start the Machine Agent

If you do not use the Machine Agent bundled JRE, you need to specify the Java version and customize the `<path/to/java_location>` using the `-j` parameter and version `JRE >= 1.8`, see [Machine Agent Requirements and Supported Environments](#)(see page 2580) and [Install Using the Non-JRE Zip File](#)(see page 2594). Make certain the path is valid and accessible for all users who start the Machine Agent.

```
<machine_agent_home>/bin/machine-agent -j <path/to/java_location>
```

RPM-based Linux Systems

If you installed using the Linux RPM, start the Machine Agent:

- SysV systems: `service appdynamics-machine-agent start`
- systemd systems: Use the Machine Agent service launcher and enter: `systemctl start appdynamics-machine-agent`

Linux and Solaris Systems

If you installed using the JRE bundled zip archive for Linux and Solaris, run the launcher:

- Linux: `<machine_agent_home>/bin/machine-agent -d -p <machine_agent_home>/pidfile`
- Solaris: `<machine_agent_home>/bin/machine-agent -d -p <machine_agent_home>/pidfile`

Windows Systems

See [Windows Install Using ZIP with Bundled JRE](#)(see page 2602).

Stop the Machine Agent

Non-JRE Bundled Zip Archive

If the Machine Agent process is running in the background, you can stop it by entering the `kill` command with the [process ID](#)(see page 0) as the argument. If it is running in the foreground in a console, press `Ctrl+C` to shut down the agent.

RPM-based Linux Systems

SysV: Use the service launcher:

```
% service /etc/init.d/appdynamics-machine-agent stop
```

systemd: Use the systemd unit file:

```
% systemctl stop appdynamics-machine-agent
```

Linux and Solaris Systems

Running in the Foreground: Press Ctrl+C to stop the agent process.

Running in the Background: Identify the process ID (PID) and use the `kill` command.

1. Identify the agent process: `ps -ef | grep machineagent`.
The output provides the process ID (PID) of the Machine Agent process.
2. Stop the agent process: `kill <machine_agent_PID>`.

Windows

In the foreground in a console window: Use Ctrl+C to shut down the agent.

As a Windows Service: Stop the service using either of these methods:

- In the Windows Services application, select **AppDynamics Machine Agent** and click **Stop**.
- Use the `MachineAgentService` command:

```
C:\> <machine_agent_home>\bin\MachineAgentService.exe /stop
```

Mac OS X

As a background process: Enter the `kill` command with the [process ID](#)(see page 0) as the argument.

As a service: From the bash command line:

```
> sudo launchctl unload -w <machine_agent_home>/com.appdynamics.machineagent.plist
```

Permissions Required to Run the Machine Agent

This page describes the permissions needed to run the Machine Agent. During installation, the default user for running the Machine Agent is set to root. This is because the only user that is standard on a UNIX or Linux system is root and we do not want to create users on your system. We recommend that you create a non-root user, for example `<machine_agent_user>`, and assign the appropriate permissions to that user. See [Install the Machine Agent](#)(see page 2590).

For all environments, create a specific user with the necessary read/write/execute permissions.

- All files in the `<machine-agent-home>` installation directory should be readable by the Machine Agent.
- The user that runs the Machine Agent must have write privileges to the logging output directory and to the `/conf` directory in the agent installation directory.
- Additionally, the user that runs the Machine Agent needs execute access.

Important Notes

- You do not need to run the Machine Agent from a root or administrator account. However, if you enable the [JVM Crash Guard](#)(see page 1288) on a monitored application running from a root or administrator account, then the Machine Agent requires root or administrator privileges to access the monitored application's JVM process and directory listings for crash files.
- You need to run with administrator or root privileges if you want to monitor networks or disks that are only available to the administrator or root user.
- The user that runs the Machine Agent must have write privileges to the `conf` and `logs` directories in the `<machine_agent_home>` directory.

- The Machine Agent implements a shutdown hook, so issuing the `kill` command (or Ctrl+C) from the operating system will cause the agent to perform a graceful shutdown.
- If the Machine Agent is not run by the root user or administrator user, the user that runs the Machine Agent should have permissions to execute the listed commands for the following environments. These commands are the source of metric collection.

AIX

- `awk`
- `cat`
- `cut`
- `date`
- `grep`
- `head`
- `ifconfig`
- `lparstat`
- `lsattr`
- `lsdev`
- `netstat`
- `ps`
- `svmon`
- `tail`
- `tr`
- `oslevel`
- `prtconf`
- `uname`
- `df`
- `iostat`
- `sed`
- `uptime`

Linux

- `awk`
- `basename`
- `cat`
- `df`
- `chroot`
- `date`
- `free`
- `getconf`
- `ip`
- `lsblk`
- `ps`
- `readlink`
- `sed`
- `tail`
- `tr`
- `uname`
- `uptime`
- `vmstat`

Windows

Windows permissions for files and subfolders are inherited by default from the parent folder (`<machine_agent_home>`). You should restrict permissions to users authorized to start, stop, and configure the Machine Agent:

- Read and Write permissions to all files and subfolders under `<machine-agent-home>`

- (If running as a terminal application) Read, Write, and Execute permissions for the file <machine-agent-home>\bin\machine-agent.vbs
- (If running as a service) Start, Stop, and Restart permissions for the Machine Agent service. You only need admin privileges to install the service. The Machine Agent runs under the local system account which has extensive privileges on the local system, so you do not need to run the Machine Agent as Administrator, unless WMI access is revoked. Normal users typically have WMI access. See <https://technet.microsoft.com/en-us/library/cc771551.aspx>.

Mac OS X, AIX, HP-UX, and Z/OS

There are no particular execute privileges required.

Solaris System Utilities

- awk
- cat
- cut
- df
- dladm
- grep
- head
- ifconfig
- iostat
- isainfo
- kstat
- mpstat
- nawk
- netstat
- pagesize
- ps
- psrinfo
- sed
- swap
- tail
- tr
- uname
- uniq
- uptime
- vmstat
- wc
- zpool

JVM Crash Guard

If you plan to enable JVM Crash Guard, see [JVM Crash Guard](#)(see page 1288) for additional required permissions.

Configure the Machine Agent

Related pages:

- [Plan the Machine Agent Configuration](#)(see page 2592)
- [.NET Compatibility Mode](#)(see page 2628)

AppDynamics provides flexibility for configuring the Machine Agent so that you can choose the best fit for your deployment environment.

Not all options are available for all properties. See [Machine Agent Configuration Properties](#)(see page 2613).

Configure the Machine Agent Properties

You can configure the Machine Agent by:

- Editing the `controller-info.xml` file located in the `<machine_agent_home>/conf` directory.
- Adding Agent system properties (`-D<system_property>`) to the Machine Agent start-up script or on the command line.
- Using environment variables. To configure the Agent with environment variables, set the value of the environment variable in the environment where the monitored application runs and restart the Agent. Environment variables exist for most of the Agent settings in the `controller-info.xml` file, but not all settings are configurable through environment variables. For those settings, you need to use system properties or `controller-info.xml`. See [Machine Agent Configuration Properties](#) (see page 2613).

Empty spaces and special characters are not allowed in either the full path to the Machine Agent home directory, or in the directory name itself. If the Machine Agent does not start up, review the path to determine if it contains empty spaces or special characters. For example, the path `/opt/appdynamics/machine agent` is problematic, however, the path `/opt/appdynamics/machine-agent` works correctly.

The JVM system properties and environment variables override the settings in the `controller-info.xml` file. The Agent applies the first non-empty value for a configuration property. The Machine Agent applies configurations using the following sources (in order).

1. Environment variables
2. System properties passed in the start command for the JVM
3. Global configuration file: `<machine-agent-home>/conf/controller-info.xml`

See [Where to Specify Machine Agent Configuration](#) (see page 2612) for OS environment and install package details

Example Configuration

Machine Agent controller-info.xml File

```
<?xml version="1.0" encoding="UTF-8"?>
<controller-info>
  <controller-host>your-controller-host</controller-host>
  <controller-port>your-controller-port</controller-port>
  <account-access-key>your-access-key</account-access-key>
  <controller-ssl-enabled>true</controller-ssl-enabled>
  <enable-orchestration>>false</enable-orchestration>
  <sim-enabled>>false</sim-enabled>
  <unique-host-id>your-host-id</unique-host-id>
  <account-name>your-account-name</account-name>
</controller-info>
```

bash command-line Example

```
<machine_agent_home>/bin/machine-agent -Dappdynamics.controller.hostName=your-controller-host
```

```
-Dappdynamics.controller.port=your-controller-port -Dappdynamics.agent.accountAccessKey=your-access-key -Dappdynamics.agent.uniqueHostId=your-host-id
-Dappdynamics.agent.accountName=your-account-name
```

Where to Specify Machine Agent Configuration

Related pages:

- [Install the Machine Agent](#)(see page 2590)
- [Plan the Machine Agent Configuration](#)(see page 2592)
- [Machine Agent Configuration Properties](#)(see page 2613)

You configure Agent system properties in different ways based on your operating system and whether you are starting the Agent from the command line or as a service.

Linux As a Service

- SysV service launcher:
Specify the Agent system properties in the `<machine_agent_home>/etc/sysconfig/appdynamics-machine-agent` configuration file, and edit the `JAVA_OPTS` environment variable.
- systemd:
Specify the Agent system properties in the `<machine_agent_home>/etc/systemd/system/appdynamics-machine-agent.service` file, and edit the `JAVA_OPTS` environment variable.

Any UNIX-like System

When starting the Agent application on the command line for an UNIX-like system ((Linux, Solaris, Mac, AIX, and so on) using the `machine-agent` command, specify the agent system properties on the command line:

- Run agent in the background:

```
% nohup <machine_agent_home>/bin/machine-agent -D<system_property1>=<value1>
-D<system_property2>=<value2> ... &
```
- Run agent in the foreground:

```
% <machine_agent_home>/bin/machine-agent -D<system_property1>=<value1>
-D<system_property2>=<value2> ...
```

Windows

When installing and starting a Windows service (you need admin privileges), specify AppDynamics-specific `-D` options on the command line or in `controller-info.xml`.

Add other JVM properties on the command line:

```
<machine_agent_home>\cscript InstallService.vbs InstallService.cmd <jvm_options>
```

Mac OS X

Start the Agent service using the `<machine_agent_home>/osx-install.sh` script and specify the Agent system properties on the command line:

```
> sh <machine_agent_home>/osx-install.sh -D<system_property1>=<value1>
-D<system_property2>=<value2> ...
```

When you run the `<machine_agent_home>/osx-install.sh` script, the `<machine_agent_home>/com.appdynamics.machineagent.plist.template` is updated with the installation directory and the java properties set for the Machine Agent.

Machine Agent Configuration Properties

This page describes the Agent configuration properties, including `controller-info.xml` elements, system property options (on the command line or in the startup script), and environment variables (where applicable). You configure Agent system properties based on your operating system and installation package.

The Agent updates dynamically in response to Agent configuration property changes, so you do not need to restart the Agent.

System Property Syntax

- System properties are case-sensitive
- Values that contain spaces must be enclosed with double-quotes

Reference

.NET Compatibility Mode

You must enable this mode if you want to collect and view Machine or Server metrics on a server with Machine and .NET Agents installed. See [.NET Compatibility Mode](#) (see page 2628).

Element in controller-info.xml: `<dotnet-compatibility-mode>`

System Property:

`-Dappdynamics.machine.agent.dotnetCompatibilityMode`

Environment Variable: N/A

Type: boolean

Default: false

Required: This mode is required if you want to collect and view Machine or Server metrics on a server with Machine and .NET Agents installed.

Account Access Key

The account access key used to authenticate with the Controller. This key is generated during installation, and you can locate the key by reviewing the license information in the Controller Settings. See [Observe License Usage](#) (see page 203).

Element in controller-info.xml: `<account-access-key>`

System Property: `-Dappdynamics.agent.accountAccessKey`

Environment Variable: `APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY`

Type: String

Default: None

Required: Prior to version 4.1, this property was required only for SaaS and multi-tenant Controllers. For versions 4.1 and later, the account access key property is required to authenticate all agent to Controller communications.

Example: `-Dappdynamics.agent.accountAccessKey=165e65645-95c1-40e3-9576-6a1424de9625`

Account Name

The account name used to authenticate with the Controller. If you are using the AppDynamics SaaS Controller, the Account Name is provided in the Welcome email sent by AppDynamics.

Element in controller-info.xml: <account-name>

System Property: -Dappdynamics.agent.accountName

Environment Variable: APPDYNAMICS_AGENT_ACCOUNT_NAME

Type: String

Default: None

Required: For AppDynamics SaaS Controller and multi-tenant users, but not for single-tenant mode (the default). When the Agent is registered with an AppDynamics SaaS Controller, features used to run [Remediation Scripts](#)(see page 345) are disabled. If you reconfigure the Agent `controller-info.xml` to register with a non-SaaS or on-premises Controller, the Agent can run local scripts as usual.

Agent Logging Directory

Deprecated. `appdynamics.agent.logs.dir` should be used instead. Behavior identical to Agent Logs

Directory: <appdynamics.agent.logs.dir>/logs/.

System Property: -Dappdynamics.agent.logging.dir

Environment Variable: N/A

Type: String

Default: None

Required: No

Agent Logs Directory

Sets the logs directory for log files for nodes that use this agent installation. If this property is specified, all agent logs are written to <appdynamics.agent.logs.dir>/logs. See [Deploy Multiple Machine Agents From a Common Directory](#)(see page 2604) when deploying multiple Machine Agents from a common directory. This property overrides the directory specified through the `appdynamics.agent.runtime.dir`. If `appdynamics.agent.logs.dir` property is not provided, the logs directory will be created on the same level as the Machine Agent installation folder. No changes are expected in `log4j.xml` file.

System Property: -Dappdynamics.agent.logs.dir

Environment Variable: N/A

Type: String

Default: None

Required: No

Agent Runtime Directory

Sets the runtime directory for all runtime files (such as logs) for nodes that use this Agent installation. If you specify this property, then all Agent logs are written to <agent-runtime-dir>/logs/node-name. Use when

deploying multiple Machine Agents from a common directory. See [Deploy Multiple Machine Agents From a Common Directory](#)(see page 2604).

System Property: -Dappdynamics.agent.runtime.dir

Environment Variable: N/A

Type: String

Default: None

Required: No

Container Process Selector Blacklist Regex

Any container with a process matching this regex is ignored and is not registered in the Controller.

System Property: -Dappdynamics.docker.container.process.selector.blacklist.regex

Environment Variable: APPDYNAMICS_DOCKER_CONTAINER_PROCESS_SELECTOR_BLACKLIST_REGEX

Type: String

Default: None

Required: No

Controller Host

This is the host name or IP address of the AppDynamics Controller, for example: 192.168.1.22 or *myhost* or *myhost.abc.com*. This is the same host used to access the AppDynamics browser-based user interface.

Element in controller-info.xml: <controller-host>

System Property: -Dappdynamics.controller.hostName

Environment Variable: APPDYNAMICS_CONTROLLER_HOST_NAME

Type: String

Default: None

Required: If the Enable Orchestration property is false.

If Enable Orchestration is true, and if the Agent is deployed in a compute cloud instance created by an AppDynamics workflow, do not set the Controller host unless you want to override the auto-detected value. See [Enable Orchestration Property](#)(see page 0).

Controller Keystore Filename

By default, the Agent looks for a Java truststore file named `cacerts.jks` in the `conf` directory in the Agent home. Use this property to enable full validation of Controller SSL certificates with a different Java truststore file. See [.Machine Agent Configuration Properties v21.1](#)(see page 2613).

Element in controller-info.xml: <controller-keystore-filename>

System Property: N/A

Environment Variable: N/A

Type: String

Default: None

Required: No

Controller Keystore Password

The plain text or encrypted value of the Controller certificate password. To encrypt or obfuscate passwords, see [Encrypt Agent Credentials](#)(see page 1123).

Element in controller-info.xml: <controller-keystore-password>

System Property: N/A

Environment Variable: N/A

Type: String

Default: None

Required: No

Controller Port

The HTTP(S) port of the AppDynamics Controller. This is the same port that you use to access the AppDynamics browser-based user interface. If the Controller SSL Enabled property is set to true, specify the HTTPS port of the Controller; otherwise, specify the HTTP port. See [Controller SSL Enabled Property](#)(see page 0).

Element in controller-info.xml: <controller-port>

System Property: -Dappdynamics.controller.port

Environment Variable: APPDYNAMICS_CONTROLLER_PORT

Type: Positive Integer

On-premises Default: port 8090 for HTTP and port 8181 for HTTPS

SaaS Default: For the SaaS Controller Service, use port 443 for HTTPS connections.

Required: If the Enable Orchestration property is false.

If Enable Orchestration is true, and if the Agent is deployed in a compute cloud instance created by an AppDynamics workflow, do not set the Controller port unless you want to override the auto-detected value. See [Enable Orchestration Property](#)(see page 0).

Controller SSL Enabled

Specifies whether the Agent should use SSL (HTTPS) to connect to the Controller. If SSL Enabled is true, set the Controller Port property to the HTTPS port of the Controller. See [Controller Port Property](#)(see page 0).

Element in controller-info.xml: <controller-ssl-enabled>

System Property: -Dappdynamics.controller.ssl.enabled

Environment Variable: APPDYNAMICS_CONTROLLER_SSL_ENABLED

Type: Boolean

Default: false

Required: No

Create Node if Absent

Force the Machine Agent to create an APM node when the Agent registers with the Controller.

Element in controller-info.xml: <create-node-if-absent>

System Property: -Dappdynamics.machine.agent.registration.createNodeIfAbsent

Environment Variable: N/A

Type: Boolean

Default: true

Required: No. If you set the app/tier/node in your controller-info.xml file (existing upgrades or by accident), you can prevent the Machine Agent from creating APM nodes by setting this flag to false. See [Machine Agent Installation Scenarios](#)(see page 2591).

Enable Docker Visibility

To enable [Docker Visibility](#)(see page 2826) on the Agent, manually add the docker-enabled element in controller-info.xml setting, and set the flag to true.

Element in controller-info.xml: <docker-enabled>true</docker-enabled>

System Property: -Dappdynamics.docker.enabled

Environment Variable: APPDYNAMICS_DOCKER_ENABLED

Type: Boolean

Default: false

Required: Yes

Enable HTTP Listener

When set to true, this property enables the Machine Agent HTTP listener. You can send metrics to the Machine Agent using its HTTP listener. You can report metrics through the Machine Agent by making HTTP calls to the Agent instead of piping to the Agent through sysout.

Element in controller-info.xml: N/A

System Property: -Dmetric.http.listener

Environment Variable: N/A

Type: Boolean

Default: false

Required: No

Enable Orchestration

Enables the Machine Agent workflow task execution when set to true. It also enables auto-detection of the Controller host and port when the app server is a compute cloud instance created by an AppDynamics orchestration workflow. In a cloud computing environment, auto-detection is necessary for the Create Machine tasks in the workflow to run correctly. The Machine Agent polls for task executions only when orchestration is enabled. If the host machine on which this Agent resides is not created through

AppDynamics workflow orchestration, this property should be set to `false`. See [Controller Host Property](#)(see page 0) and [Controller Port Property](#)(see page 0).

Element in controller-info.xml: `<enable-orchestration>`

System Property: N/A

Environment Variable: N/A

Type: Boolean

Default: `false`

Required: No

Force Default SSL Certificate Validation

Used to override the default behavior for SSL validation.

This property has three states:

true: Forces the Agent to perform full validation of the certificate sent by the Controller, enabling the Agent to enforce the SSL trust chain. Use this setting when a public certificate authority(CA) signs your Controller SSL certificate.

false: Forces the Agent to perform minimal validation of the certificate. This property disables full validation of the Controller's SSL certificate. Use this setting when full validation of a SaaS certificate fails.

unspecified: The validation performed by the Agent depends on the context:

- If the Agent is connecting to a SaaS Controller, full validation is performed.
- If the Agent is connecting to an on-premises Controller and the `cacerts.jks` file is present, then full validation is performed using the `cacerts.jks` file.
- If the Agent is connecting to an on-premises Controller, and there is no `cacerts.jks` file, then minimal validation is performed

Element in controller-info.xml: N/A

System Property: `-Dappdynamics.force.default.ssl.certificate.validation`

Environment Variable: N/A

Type: Boolean

Default: None

Required: No

Enable Dynamic Monitoring Mode (DMM)

When this option is enabled, the Agent reports metrics based on the Dynamic Monitoring Mode specified for that Agent in the Controller. When this option is disabled, the Agent reports all metrics based on its local configuration; DMM settings on the Controller have no effect. Disabling DMM on an Agent is recommended only for mission-critical servers and other machines for which you are sure you want to collect all available metrics at all times. See [Dynamic Monitoring Mode and Server Visibility](#)(see page 2673).

Element in controller-info.xml: `<dynamic-monitoring-enabled>`

System Property: `appdynamics.machine.agent.dynamicMonitoring.enabled`

Environment Variable: APPDYNAMICS_DYNAMIC_MONITORING_ENABLED

Type: Boolean

On-premises Default: True

SaaS Default: True

Required: No

HTTP Listener Port

To enable the Machine Agent HTTP listener, you must also specify the HTTP listener port.

Element in controller-info.xml: N/A

System Property: -Dmetric.http.listener.port

Environment Variable: N/A

Type: Numeric

Default: 8293

Required: Only if the HTTP listener is enabled.

Log4j

Logging functionality is done via Apache Log4j2. Use this property to provide a custom location for log4j configuration. In this case, you need to ensure that all file destinations are valid and contain absolute paths.

Element in controller-info.xml: N/A

System Property: -Dlog4j.configurationFile

Environment Variable: N/A

Type: Numeric

Default: None

Required: No

Machine Hierarchy

You need a Server Visibility license to use this feature.

This setting enables you to group servers together into arbitrary hierarchies by specifying a hierarchical path to the server. The server hierarchy displays in the Metric Browser and on the Server Dashboard. The server hierarchy is also used to select subgroups of machines for health rules. The last element of the path indicates the server name (a name of your choice). This name appears as the Name on the Servers list. If the path contains spaces, then you must it enclose it in double-quotes. See [Machine Agent Hierarchy](#)(see page 2710).

Element in controller-info.xml: <machine-path>

System Property: -Dappdynamics.machine.agent.hierarchyPath

Environment Variable: APPDYNAMICS_MACHINE_HIERARCHY_PATH

Type: ASCII string with path elements that are separated by a "|" (bar).

Default: The value specified by [Unique Host ID](#)(see page 0). If the last part of the machine hierarchy is empty, the Unique Host ID is the machine name. For example, if machine hierarchy is "Data Center 1|Rack 2|" and Unique host ID is "Host ID 3", then the machine hierarchy will become "Data Center 1|Rack 2|Host ID 3".

Required: No

Limitation: The length of the characters composing the machine-path up to, but not including, the last pipe cannot exceed 95 characters.

Examples:

- *System Properties:* -Dappdynamics.machine.agent.hierarchyPath= "Data Center 1|Rack 2|Machine3"
- *controller-info.xml:*

```
<machine-path>
  "Data Center 1|Rack 2|Machine3"
</machine-path>
```

- *Environment Variable:* APPDYNAMICS_MACHINE_HIERARCHY_PATH="Data Center 1|Rack 2|Machine3"

Proxy Host

The proxy host name or IP address. The HTTP property works for both http and https proxy configuration. Proxy authentication cannot be used with SSL.

Element in controller-info.xml: N/A

System Property:

-Dappdynamics.http.proxyHost

Environment Variable: N/A

Type: String

Default: None

Required: If using a proxy to connect to the Controller; otherwise this is not required.

Proxy Password File

The absolute path to the file containing the password of the user that is authenticated by the proxy host. The password must be the first line of the file.

If `<use-encrypted-credentials>` is set to false, enter the password in plain text. If `<use-encrypted-credentials>` is set to true, encrypt the password. See [Encrypt Agent Credentials](#)(see page 1123).

Element in controller-info.xml: N/A

System Property: -Dappdynamics.http.proxyPasswordFile

Environment Variable: N/A

Type: String

Default: None

Required: No

Example: `-Dappdynamics.http.proxyPasswordField=/path/to/file-with-password`

Proxy Port

The proxy HTTP(S) port. The proxy host name or IP address. The HTTP property works for both http and https proxy configuration. The default ports are 8090 (HTTP) and 443 (HTTPS).

Element in controller-info.xml: N/A

System Property:

`-Dappdynamics.http.proxyPort`

Environment Variable: N/A

Type: Positive Integer

Default: None

Required: Yes, if using a proxy to connect to the Controller. Otherwise, no.

Proxy User Name

The name of the user that is authenticated by the proxy host.

Element in controller-info.xml: N/A

System Property: `-Dappdynamics.http.proxyUser`

Environment Variable: N/A

Type: String

Default: None

Required: No

Server Visibility Enabled

Enable [Server Visibility](#)(see page 2655) on the Agent. This requires a Server Visibility license.

Element in controller-info.xml: `<sim-enabled>`

System Property: `-Dappdynamics.sim.enabled`

Environment Variable: APPDYNAMICS_SIM_ENABLED

Type: Boolean

Default: false

Required: Required to enable Server Visibility. See [Enable Server Visibility](#)(see page 2658).

Service Availability Update Interval

This setting controls the time, in milliseconds, to wait between sending Service Availability periodic events to the Controller. See [Service Availability](#)(see page 2684).

Element in controller-info.xml: `<sam-event-update-interval-millis>`

System Property: `-Dappdynamics.machine.agent.sam.event.updateIntervalMillis`

Environment Variable: N/A

Type: Positive integer

Default: 300000 ms (5 minutes)

Required: No

Unique Host ID

This property logically partitions a single physical host or virtual machine. In the context of installing the Machine Agent, the unique Host ID property is not required. However, if you do not define a unique Host ID, then the Machine Agent uses the Java API to retrieve the host ID. The results from the API can be inconsistent, and may cause the same JVM to return a different value for the same machine, each time the Machine Agent is restarted. To avoid these issues, AppDynamics recommends that you set the value of unique Host ID to the host ID that you want to see in the UI.

Element in controller-info.xml: <unique-host-id>

System Property: -Dappdynamics.agent.uniqueHostId

Environment Variable: APPDYNAMICS_AGENT_UNIQUE_HOST_ID

Type: ASCII string without spaces and must be unique across the entire managed infrastructure.

Default: None

Required: Optional, but recommended.

Use Simple Hostname

By default (unless overridden with the `uniqueHostId` system property), the Agent determines the host name of the OS it is running in using reverse DNS lookup. In some circumstances, this host name may be set as the fully qualified domain name of the host name. If this property is set to `true`, the Agent removes any domain name and uses the simple hostname to identify the host. In cases where the host name is an IP address (which happens if the DNS lookup fails) then the full IP address in string form is used. The host name is used in mapping metrics gathered by the Machine Agent to application nodes. See [Unique Host ID Property](#)(see page 2592).

Element in controller-info.xml: <use-simple-hostname>

Type: Boolean

Default: False

Required: No

For example: If this property is set to true '`server.mydomain.com1599`' becomes 'server'.

Independent Machine Agent Install Scenario

Typically, you only use the following properties if you are installing the Machine Agent on a server that does not have any AppDynamics App Agents installed.

¹⁵⁹⁹ <http://server.mydomain.com>

Application Name

The name of the logical business application that this JVM node belongs to. This is not the deployment name (ear/war/jar) on the application server. If a business application of the configured name does not exist, it is created automatically.

Element in controller-info.xml: <application-name>

System Property: -Dappdynamics.agent.applicationName

Environment Variable: APPDYNAMICS_AGENT_APPLICATION_NAME

Type: String

Defaults: None

Required: No. See [Machine Agent Installation Scenarios](#)(see page 2591).

Node Name

The name of the JVM node. When not specified, this defaults to Node1 for the Machine Agent.

Element in controller-info.xml: <node-name>

System Property: -Dappdynamics.agent.nodeName

Environment Variable: APPDYNAMICS_AGENT_NODE_NAME

Type: String

Defaults: None

Required: No. See [Machine Agent Installation Scenarios](#)(see page 2591).

Tier Name

The name of the logical tier that this JVM node belongs to. This is not the deployment name (ear/war/jar) on the application server. If a tier of the configured name does not exist, it is created automatically.

Element in controller-info.xml: <tier-name>

System Property: -Dappdynamics.agent.tierName

Environment Variable: APPDYNAMICS_AGENT_TIER_NAME

Type: String

Defaults: None

Required: No. See [Machine Agent Installation Scenarios](#)(see page 2591).

Controller Settings for Machine Agents

Related pages:

- [Database Size and Data Retention](#)¹⁶⁰⁰
- [Controller Settings for Server Visibility](#)(see page 2701)

This page describes Controller Admin settings that are specific to the Machine Agent. You need the root user password to change these settings.

¹⁶⁰⁰ <https://docs.appdynamics.com/display/PRMY21/.Database+Size+and+Data+Retention+v21.5>

You can change the amount of Machine Agent data you retain in the Controller database by changing the retention period for Machine Agent snapshots. Lowering the retention settings purges data that is aged out by the new retention setting and reduces the amount of data stored by the Controller on an ongoing basis. Consider the amount of Machine Agent data to retain when tuning the size of the Controller database.

Change the Controller Settings for Machine Agents

1. Log in to the Controller administration console using the root user password. See [Access the Administration Console](#)¹⁶⁰¹.

```
http://<controller host>:<port>/controller/admin.jsp
```

Use the root user password to access the Admin console when the Controller is installed in single- or multi-tenant mode. See [Update the Root User and Glassfish Admin Passwords](#)¹⁶⁰².

2. Select **Controller Settings**.
3. Change the settings as needed, and then select **Save**. Changes to the settings occur the next time you restart the Agent and it connects to the Controller.

Controller Settings Reference for Machine Agent

Property Name	Property Description	Default	Allowed Values
machine.agent.in-progress.actions.timeout	This property determines the length of time the Controller waits for the Agent to perform an IN-PROGRESS action before it stops the action.	864000ms (1 day)	1 to 840 hours (5 weeks)
machine.agent.max.new.actions.per.min	Maximum number of new actions dispatched per minute for each Machine Agent. This is the maximum number of "runbook" actions sent to the Machine Agent. For example, you may request the Machine Agent to run a script because of a health rule violation, if the number of requests in a one minute period is greater than the preset value, then the action is executed the next minute.	15 per minute	1 to 289999

¹⁶⁰¹ <https://docs.appdynamics.com/display/PRMY21/Access+the+Administration+Console+v21.5>

¹⁶⁰² <https://docs.appdynamics.com/display/PRMY21/Update+the+Root+User+and+Glassfish+Admin+Passwords+v21.5>

Property Name	Property Description	Default	Allowed Values
machine.agent.pending.actions.timeout	Determines how long the Controller waits for the Agent to perform a PENDING action before it stops the action.	1800000 ms (12 hrs)	
machine.agent.snapshots.buffer.size	Size in Megabytes of the in-memory buffer storing machine snapshots uploaded from Agents prior to database flush.	50 MB	
machine.snapshots.retention.period	Time in hours to retain server snapshot data.	336 hours (2 weeks)	1 to 840 hours (5 weeks)

Enable SSL for Machine Agent

Related pages:

- [Secure the Platform](#)¹⁶⁰³
- [Controller SSL and Certificates](#)¹⁶⁰⁴
- [Install the Machine Agent](#)(see page 2590)

This page describes how to configure the AppDynamics Machine Agent to connect to the Controller using SSL. It assumes that you use a SaaS Controller or have configured the on-premises Controller to use SSL.

The Machine Agent supports extending and enforcing the SSL trust chain when in SSL mode.

Plan SSL Configuration

Gather this information:

- The Controller SSL port:
 - For SaaS Controllers: SSL port is 443
 - For on-premises Controllers: Default SSL port is 8181, but you may configure the Controller to listen for SSL on another port
- The signature method for the Controller's SSL certificate:
 - A publicly known certificate authority (CA) signed the certificate. This applies for DigiCert, Verisign, Thawte, and other commercial CAs.

¹⁶⁰³ <https://docs.appdynamics.com/display/PRMY21/Secure+the+Platform+v21.5>

¹⁶⁰⁴ <https://docs.appdynamics.com/display/PRMY21/Controller+SSL+and+Certificates+v21.5>

- A CA internal to your organization signed the certificate. Some companies maintain internal certificate authorities to manage trust and encryption within their domain.
- The Controller uses a self-signed certificate.

Establish Trust for the Controller's SSL Certificate

To establish trust between the Machine Agent and the AppDynamics Controller, you must create an agent truststore that contains the root certificate for the authority that signed the Controller's certificate.

1. Obtain one of the following root certificates:
 - DigiCert Global Root CA for the AppDynamics SaaS Controller
 - The root certificate for the publicly known certificate authority (CA) that signed the certificate for your on-premises Controller
 - The root certificate for the internal CA that signed the Controller certificate for your on-premises Controller
2. Run the Java `keytool` command to create the Agent truststore:

```
keytool -import -alias rootCA -file
<root_certificate_file_name> -keystore cacerts.jks -storepass
<truststore_password>
```

For example:

```
keytool -import -alias rootCA -file /usr/home/appdynamics/
DigicertGlobalRootCA.pem -keystore cacerts.jks -storepass
MySecurePassnword
```

i Note the truststore password; you will need this later to configure the Machine Agent.

3. Install the Agent truststore to the Agent configuration directory:

```
<machine_agent_home>/conf/
```

Secure the Machine Agent Truststore

AppDynamics recommends you take the following security measures to prevent tampering with the Machine Agent truststore:

- Secure the truststore file through filesystem permissions:
 - Make the Agent truststore readable by any user
 - Make the truststore owned by a privileged user
 - Make the truststore writable only by the specified privileged user
- Secure the `controller-info` configuration file so that it is only readable by the Agent runtime user and only writable by a privileged user:

```
<machine_agent_home>/conf/controller-info.xml
```

Enable SSL for the Machine Agent

1. Configure the following system properties in the `controller-info.xml`: `<machine_agent_home>/conf/controller-info.xml`. See [Machine Agent Configuration Properties](#)(see page 2613) for full details on each property.
 - *Controller Host*: Should be the same as either the Common Name or the Subject Alternative Name (SAN) in the certificate configured for the Controller.
`<controller-host>common_name_in_certificate.com</controller-host>`
 - *Controller Port*: The SSL port for the Controller. It is 443 for AppDynamics SaaS.
`<controller-port>443</controller-port>`
 - *Controller SSL Enabled*: `true`
`<controller-ssl-enabled>>true</controller-ssl-enabled>`
 - *Controller SSL Password*: The plain text password for the Agent truststore.
`<controller-keystore-password>MySecurePassword</controller-keystore-password>`
If you have enabled the Secure Credential Store, encrypt the password you enter here. See [Encrypt Agent Credentials](#)(see page 1123).
 - *Controller Keystore Filename*: The path of the Agent truststore relative to `<machine_agent_home>/conf`. This is required if you use a truststore other than the default `<machine_agent_home>/conf/cacerts.jks`.
`<controller-keystore-filename>../conf/cacerts.jks</controller-keystore-filename>`

 You can specify the Controller port and enable SSL for the Controller in the Machine Agent startup script, but you must specify the truststore password and filename in the `controller-info.xml` file.

 In JDK ≥ 9 (either JRE bundled with Machine Agent or a standalone JDK/JRE), the default keystore type in the `java.security` file has been changed from JKS to PKCS12. If a JKS truststore is used and the `<controller-keystore-password>` is not provided, the agent will use the JKS truststore. If a PKCS12 truststore is used and the `<controller-keystore-password>` is not provided, the agent will not use the PKCS12 truststore. If you are using a PKCS12 truststore, AppDynamics recommends that that you provide the `<controller-keystore-password>`. If you still want to work with a JKS-based truststore, you can convert a PKCS12 truststore to JKS format.

2. Restart the Machine Agent.

Sample controller-info.xml with SSL and Secure Credential Store Encryption Enabled

```
<?xml version="1.0" encoding="UTF-8"?>
<controller-info>
  <controller-host>mycompany.saas.appdynamics.com</controller-host>
  <controller-port>443</controller-port>
  <controller-ssl-enabled>true</controller-ssl-enabled>
  <!-- Encrypted Controller keystore / agent trust store password -->
  <controller-keystore-password>Tw49bd0hdCMB0Q5pfMMuYA/cA5B4pouVPkv48ovRm6c=</controller-keystore-password>
  <controller-keystore-filename>../conf/cacerts.jks</controller-keystore-filename>
  ...
  <!-- Secure Credential Store configuration -->
  <!-- Enable the Secure Credential Store -->
  <use-encrypted-credentials>true</use-encrypted-credentials>
  <!-- Path to they secure credential keystore -->
  <credential-store-filename>/opt/appdynamics/secretKeyStore</credential-store-filename>
```

```
<!-- Obfuscated secure credential keystore password -->
<credential-store-password>n/8GvAZsKk4gM3Z6g+XQ1w==</credential-store-password>
</controller-info>
```

Keystore Certificate Extractor Utility

The Keystore Certificate Extractor Utility exports certificates from the Controller's Java keystore and writes them to an Agent truststore. You can run this utility with the Agent distribution on the Controller:

```
<controller_home>/appserver/glassfish/domains/domain1/appagent
```

1. Execute `kr.jar` and include the following parameters:

- The full path to the Controller's keystore:

```
<controller_home>/appserver/glassfish/domains/domain1/config/keystore.jks
```

- The truststore output file name. By default, the Machine Agent looks for `cacerts.jks`.
- The password for the Controller's certificate, which defaults to "changeit". If you do not include a password, the extractor applies the password "changeit" to the output truststore.

```
java -jar kr.jar <controller_home>/appserver/glassfish/domains/domain1/config/
keystore.jks cacerts.jks <controller_certificate_password>
```

2. Install the Agent trust store to the Agent configuration directory:

```
<machine_agent_home>/conf/
```

.NET Compatibility Mode

This page explains how to set compatibility mode for the .NET Agent. Compatibility mode allows you to collect and view machine or server metrics on a server with Machine and .NET Agents installed.

Before You Begin

Review the list of requirements and general information about compatibility mode:

- .NET Compatibility Mode is required for metrics from a Machine Agent and a .NET Agent on the same server to be visibly associated with the same node in the Controller UI.
- Differences may exist between metric values reported by the Machine Agent and the .NET Agent due to different averaging rates and measurement methods.
- You must enable .NET Compatibility Mode on the Machine Agent.
- When .NET Compatibility Mode is enabled:
 - Events from Service Availability and Custom Extensions appear in the Servers tab, but are not associated with .NET applications in the Controller UI.
 - The Controller UI may show the server name with "-java-MA" appended to the host ID. Thus, a Machine Agent with a `<unique-host-id>` set to "ABC" might appear as "ABC-java-MA" in the Controller UI. This is expected behavior; the "-java-MA" suffix indicates that the host has a Machine Agent running in .NET Compatibility Mode.
- Do not specify the `<application-name>`, `<tier-name>`, or `<node-name>` properties on the Machine Agent. These properties are used with a Machine Agent on a host that has no other AppDynamics Agents installed.

Enable Compatibility Mode

To enable .NET Compatibility Mode:

1. Enable .NET Compatibility Mode on the Agent using one of two methods:
 - Set these options in `<machine_agent_home>/conf/controller-info.xml`:
 - i. `<dotnet-compatibility-mode>true</dotnet-compatibility-mode>`
You may need to add this line to the `controller-info.xml` file.
 - ii. `<unique-host-id><unique-host-id-of-dot-net-agent></unique-host-id>`
For both Agents to report metrics to the same node, the Machine Agent must use the same case-sensitive Unique Host ID used by the .NET Agent. See [FAQs and Troubleshooting](#) (see page 2653).
 - Set the `./bin/machine-agent` system property to: `./bin/machine-agent -Dappdynamics.machine.agent.dotnetCompatibilityMode=true`
2. Save the `controller-info.xml` file.
3. Start or restart the Machine Agent to apply the changes.

Extensions and Custom Metrics

Using the Machine Agent, you can supplement the existing metrics in the AppDynamics Controller UI with your own custom metrics. There are many extensions currently available on the [AppSphere Community](#)¹⁶⁰⁵ site. Some are created by AppDynamics and some have been created by users.

Similar to built-in metrics, your custom metrics are subject to the following AppDynamics features:

- Automatic baselines and anomaly detection
- Availability to display on custom dashboards
- Availability to use in policies
- Visibility of all metrics in the Metric Browser and on the Infrastructure tab (where you can display external metrics and AppDynamics metrics on the same graph)

Add New Custom Metrics

To create custom metrics, you create a monitoring extension. In your extension, you define the name and path of your metric (where it appears in the metric browser tree), what type of metric it is (sum, average, and so on), and how the data for the metric should be rolled up as it ages. One Agent can run many extensions, although you may need to increase the amount of [memory for the JVM](#) (see page 2407) Agent. You can have multiple copies of the same extension if they are in different directories.

A custom metric can be common across nodes or associated with a specific tier. When you create a metric, you specify the path in which it will appear in the metric tree. To create a common custom metric, use the root tree path Custom Metrics in your metric declaration. To create a tier-specific metric, specify the metric path associated with that component.

If your application uses a large number of AppDynamics extensions with the Machine Agent, you may need to increase the size of the memory allocation:

For Linux and Unix-like Systems

```
% <machine_agent_home>/bin/machine-agent -Xms64m
```

¹⁶⁰⁵ <http://community.appdynamics.com/t5/eXchange-Community-AppDynamics/idb-p/extensions>

For Windows

```
> <machine_agent_home>\bin\machine-agent.cmd -Xms64m
```

 The wildcard feature is not supported for custom metrics.

Monitoring Extension Types

You can implement custom metrics using these mechanisms:

- Using a script:
You can write a shell script (Linux and Unix-like systems) or batch file (Windows) to report custom metrics every minute to the Machine Agent. The Machine Agent passes these metrics on to the Controller. See [Build a Monitoring Extension Using Scripts](#)(see page 2630).
- Using Java:
Your custom metrics may be too complicated to collect using a script. For example, you may need to perform complex calculations or call a third-party API to retrieve the metrics. In this case, you can extend the `JavaServersMonitor` class to collect the metrics and report them to the Machine Agent. Your Java program extends the `JavaServersMonitor` class to provide your custom functionality. See [Build a Monitoring Extension Using Java](#)(see page 2640).
- Using HTTP:
If you enable the Agent HTTP listener, you can post HTTP requests to the Machine Agent to send it custom metrics every minute. To do this, start the Machine Agent with a Jetty HTTP listener. See [Machine Agent HTTP Listener](#)(see page 2645).

Build a Monitoring Extension Using Scripts

Related pages:

- [Extensions and Custom Metrics](#)(see page 2629)
- [Build a Monitoring Extension Using Java](#)(see page 2640)
- [Machine Agent HTTP Listener](#)(see page 2645)

You can write a monitoring extension script (also known as a custom monitor or hardware monitor) to add custom metrics to the metric set that AppDynamics already collects and reports to the Controller. Your script reports the custom metrics every minute to the Machine Agent. The Machine Agent passes these metrics to the Controller.

This page describes the steps for adding custom metrics using a shell script and includes an example.

Review Existing Extensions

Before creating your own extension, review the extensions that have been created and shared among members of the AppDynamics community. New extensions are added continuously. It is possible that someone has already created what you need or something close enough that you can download and use it after making a few modifications.

See the [AppDynamics Exchange](#)¹⁶⁰⁶ for free downloads.

Agent Configuration Requirements

Confirm that you have correctly configured the Machine Agent in the `controller-info.xml` file and on the Agent `start` command on the command line. See [Machine Agent Configuration Properties](#)(see page 2613).

¹⁶⁰⁶ <http://www.appdynamics.com/community/exchange/>

Create a Monitoring Extension

To create a monitoring extension using a script:

1. Create your script. See [Create the Script File](#)(see page 2633).
2. Create a `monitor.xml` configuration file. See [Create the monitor.xml File](#)(see page 2635).
3. Create a subdirectory, `<your_extension_dir>`, in `<machine_agent_home>/monitors`. See [Create a directory under the Machine Agent monitors directory](#)(see page 2633).
4. Copy your script file and the `monitor.xml` file into the new subdirectory.
5. Restart the Machine Agent.

Define Your Metrics

Metric names must be unique within the same metric path but need not be unique for the entire metric hierarchy. AppDynamics recommends using short metric names so that the whole name is visible when displayed in the Metric Browser. Prepend the metric path to the metric name when you upload the metrics to the Controller.

Metric Processing Qualifiers

The Controller has various qualifiers for how it processes a metric regarding aggregation, time rollup, and tier rollup. There are three types of metric qualifiers:

1. Aggregator qualifier
2. Time roll-up qualifier
3. Cluster roll-up qualifier

In the script, specify the metric qualifiers after the name-value pair for the metric. A typical metric entry in the script file has the following structure:

```
name=<metric name>,value=<long value>,aggregator=<aggregator type>, time-rollup=<time-rollup strategy>, cluster-rollup=<cluster-rollup strategy>
```

Aggregator Qualifier

The *aggregator* qualifier specifies how the Machine Agent aggregates the values reported during a one-minute period. Specify the aggregator qualifier as `aggregator="aggregator type"`. This value is an enumerated type. If no value is reported during that minute, no data is reported to the Controller, and an UNCHANGED notice appears in the Machine Agent log for that metric. Valid values are:

Aggregator Type	Description
AVERAGE	(Default) Average of all reported values in that minute
SUM	Sum of all reported values in the minute, causes the metric to behave like a counter
OBSERVATION	Last reported value in the minute

Time Roll-Up Qualifier

The *time-rollup* qualifier specifies how the Controller rolls up the values when it converts from one-minute granularity tables to 10-minute granularity tables, and 60-minute granularity tables over time. The value is an enumerated type. Valid values are:

Roll Up Strategy	Description
AVERAGE	Average of all one-minute values when adding it to the 10-minute granularity table; the average of all 10-minute values when adding it to the 60-minute granularity table
SUM	Sum of all one-minute values when adding it to the 10-minute granularity table; the sum of all 10-minute values when adding it to the 60-minute granularity table
CURRENT	Last reported one-minute value in that 10-minute interval; the last reported 10-minute value in that 60-minute interval

Cluster Roll-Up Qualifier

The *cluster-rollup* qualifier specifies how the Controller aggregates metric values in a tier (a cluster of nodes). The value is an enumerated type. Valid values are:

Roll up Strategy	Description
INDIVIDUAL	Aggregates the metric value by averaging the metric values across each node in the tier
COLLECTIVE	Aggregates the metric value by adding up the metric values for all the nodes in the tier

For example, if a tier has two nodes, Node A and Node B, and Node A has three errors per minute and Node B has seven errors per minute, then the INDIVIDUAL qualifier reports a value of five errors per minute, and COLLECTIVE qualifier reports ten errors per minute. INDIVIDUAL is appropriate for metrics such as % CPU Busy, where you want the value for each node. COLLECTIVE is appropriate for metrics, such as Number of Calls, where you want a value for the entire tier.

Add a Monitoring Extension Script

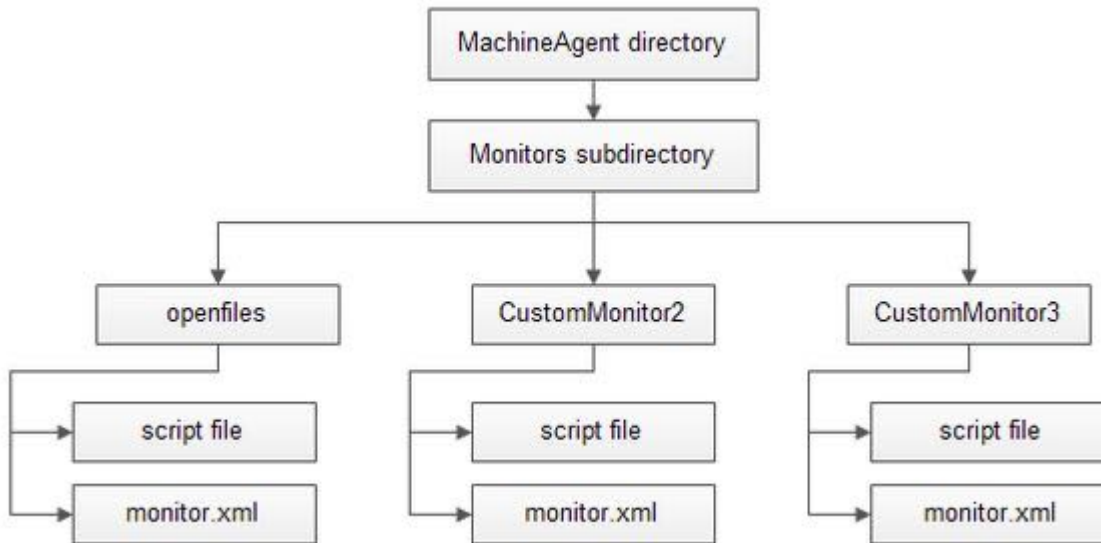

To add a monitoring extension script:

- - [Create a Subdirectory Under the Machine Agent Monitors Directory](#)(see page 2633)
 - [Create the Script File](#)(see page 2633)
 - [Copy the Script File to the Subdirectory Created in Step 1](#)(see page 2635)
 - [Create the monitor.xml File](#)(see page 2635)
 - [Copy the monitor.xml file to the Subdirectory Created in Step 1](#)(see page 2637)
 - [Restart the Machine Agent](#)(see page 2637)
 - [Verify Execution of the Monitoring Extension Script](#)(see page 2637)

Create a Subdirectory Under the Machine Agent Monitors Directory

The `<machine_agent_home>/monitors` directory is the repository for the Machine Agent extensions. For each new extension, create a subdirectory under the `/monitors` directory. The user running the Agent requires read, write, and execute permissions to this subdirectory.

For example to create an extension that monitors open files in the JVM, create a subdirectory named "openfiles" under `<machine_agent_home>/monitors`. The structure looks like:

Create the Script File

A script writes data to STDOUT. The Machine Agent parses STDOUT and sends information to the Controller every minute. Use these instructions to create the script file:

i For Windows custom metrics, PowerShell and VBScript are recommended over .bat files

To generate custom metrics on Windows, AppDynamics recommends that you use PowerShell and VBasic scripts instead of .bat files. When a standard Windows batch (.bat) script echoes metric names, it surrounds the names with quotes. The quotes will cause the Machine Agent to ignore these metrics. PowerShell and VBasic scripts do not have this issue.

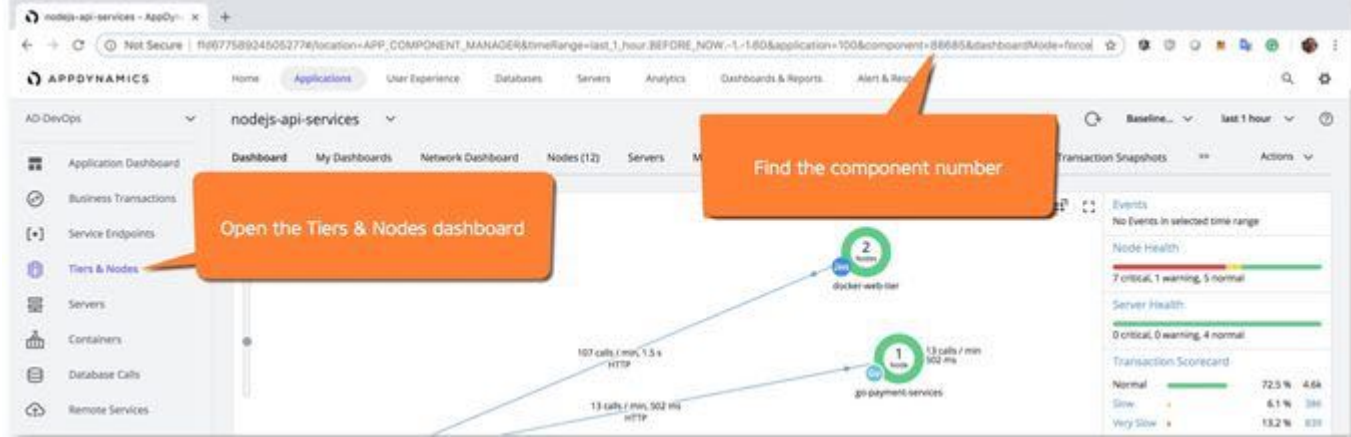

1. Specify a name-value pair for the metrics.
Each metric has a name-value pair that is converted to a java 'long' value. A typical metric entry in the script file has this structure:

```
name=<metric name>,value=<long value>,aggregator=<aggregator type>, time-rollup=<time-rollup strategy>, cluster-rollup=<cluster-rollup strategy>
```

Use the following format:

Form	Format
Standard Form	Hardware Resources Instrument Name=Instrument Value
Fully Qualified Form	Hardware Resources <metric name>,value=<long value>

2. Define the category of the metric, for example:
 - a. Infrastructure (for the default hardware metrics, see [Machine Agent](#)(see page 2579))
 - b. JVM
 - c. Custom Metrics, where Custom Metrics must have the path prefixes:
 - Custom Metrics
 - Server|Component:<tier-name-or-tier-id>
3. Metrics with the Custom Metrics prefix are common across all tiers in your application. Metrics with the Server|Component:<tier-name-or-tier-id> prefix appear only under the specified tier. To find the component ID of a tier, open the dashboard for the tier and review the URL. The ID appears as the component value in the URL:

⚠ The Machine Agent has to be associated with the target or destination for the metrics. If you attempt to publish metrics to a tier that is not associated with the Machine Agent, the metrics are not reported.

The "|" character separates the branches in the metric hierarchy notifying the Controller where the metric should appear in the metric tree:

```
Custom Metrics|Hardware Resources|Disks|Total Disk Usage %
Custom Metrics|Hardware Resources|Disks|Disk 1|Current Disk
Usage %
```

You can insert a custom metric next to an existing type of metric. For example, the following declaration causes the custom metric named `pool usage` to appear next to the JMX metrics:
Server|Component:18|JMX|Pool|First|pool usage

4. You can then use the metric in health rules as would other types of JMX metrics. To monitor multiple metrics with the same script file, edit the script to write a different line for each one to STDOUT. For example:

```
name=Custom Metrics|Hardware Resources|Disks|Total Disk Usage
%, value=23
name=Custom Metrics|Hardware Resources|Disks|Disk 1|Current
Disk Usage %, value=56
```

Copy the Script File to the Subdirectory Created in Step 1

Ensure that the Agent process has execute permissions for the script file and for the contents of the file.

Create the monitor.xml File

For each custom monitoring extension script, create a `monitor.xml` file. The `monitor.xml` file executes the script file created in Step 2. You can edit the following sample file to create your own file:

```
<monitor>
  <name>HardwareMonitor</name>
  <type>managed</type>
  <description>Monitors system resources - CPU, Memory,
Network I/O, and Disk I/O.</description>
  <monitor-configuration>    </monitor-configuration>
  <monitor-run-task>
    <!-- Edit execution-style as needed. -->
    <execution-style>continuous</execution-style>
    <name>Run</name>
    <type>executable</type>
    <task-arguments></task-arguments>
    <executable-task>
      <type>file</type>
      <!-- Use only one file element per os-type. -->
      <file os-type="linux">linux-stat.sh</file>
      <file os-type="mac">macos-stat.sh</file>
```

```

        <file os-type="windows">windows-stat.bat</file>
        <file os-type="solaris">solaris-stat.sh</file>
        <file os-type="sunos">solaris-stat.sh</file>
        <file os-type="aix">aix-stat.sh</file>
    </executable-task>
</monitor-run-task>
</monitor>

```

The `os-type` attribute is optional for the `executable-task` file element when only one `os-type` is specified. One `monitor.xml` file executes one script per `os-type`.

1. Select the execution style: `continuous` or `periodic`.

Execution Style	Description	Example
continuous	Select <code>continuous</code> if you want data collection averaged over time. For example, average CPU usage over a minute. For the monitor to be declared as 'continuous', the script should also run in an infinite loop. This ensures that the script keeps running until the Machine Agent process is terminated.	while [1]; do ... the actual script goes here ... sleep 60 done
periodic	Select <code>periodic</code> to report data from system performance counters periodically. The periodic task runs every minute by default, and the data is aggregated. To specify a different frequency, use the <code>execution-frequency-in-seconds</code> element. The execution frequency must be less than 60. For periodic execution style, you can also specify the timeout setting (shown in the example).	<monitor-run-task> ... <execution-style>periodic</execution-style> <execution-frequency-in-seconds>30</execution-frequency-in-seconds> <execution-timeout-in-secs>30</execution-timeout-in-secs> ... </monitor-run-task>

2. Add the name of your script file to the `<file>` element in the `monitor.xml` file. Be sure to use the correct `os-type` attribute. The `os-type` value should match the value returned from calling `System.getProperty("os.name")`.

```
<file os-type="your-os-type">{script file name}</file>
```

You can use either the relative or absolute path of the script.

Copy the monitor.xml file to the Subdirectory Created in Step 1

Restart the Machine Agent

i Required Agent Properties

Ensure that you have correctly configured the Agent in the `controller-info.xml` file and on the Agent start command on the command line. See [Database Agent Configuration Properties](#)(see page 2393).

After restarting the Machine Agent, you should see following message in your log file:

```
Executing script [<script_name>] on the console to make sure
your changes work with the machine agent.
```

Verify Execution of the Monitoring Extension Script

To verify the execution of extension, wait at least one minute and check the metric data in the [Metric Browser](#)(see page 224).

You can now create alerts based on any of these metrics.

Example: Create a Monitoring Extension for Open Files in UNIX

To create a custom monitor for monitoring all the open files for JVMs:

1. Create a new directory in the custom monitor repository.
2. Create the script file by modifying this UNIX script for the specific process name (for example: Author, Publish, and so on).

```
lookfor="<process name 1>"
pid=`ps aux | grep "$lookfor" | grep -v grep | tr -s " " |
cut -f2 -d' '`
count1=`lsof -p $pid | wc -l | xargs`

lookfor="<process name 2>"
pid=`ps aux | grep "$lookfor" | grep -v grep | tr -s " " |
cut -f2 -d' '`
count2=`lsof -p $pid | wc -l | xargs`

echo "name=JVM|Files|<process name 1>,value="$count1
echo "name=JVM|Files|<process name 2>,value="$count2
```

3. Create the following `monitor.xml` file and point it to the UNIX script shown in Step 2.

```
<monitor>
  <name>MyMonitors</name>
  <type>managed</type>
  <description>Monitor open file count </description>
  <monitor-configuration>
  </monitor-configuration>
  <monitor-run-task>
    <execution-style>continuous</execution-style>
    <name>Run</name>
    <type>executable</type>
    <task-arguments>
    </task-arguments>
    <executable-task>
      <type>file</type>
      <file>openfilecount.sh</file>
    </executable-task>
  </monitor-run-task>
</monitor>
```

Example: Create a Monitoring Extension to Check Process Status in Windows

1. Create a new directory in the custom monitor repository.
2. Create the script file by modifying this Windows PowerShell script for the specific process name (for example: Author, Publish, and so on). The following Windows PowerShell script checks if a process instance is running on the machine.

i To generate custom metrics on Windows, AppDynamics recommends that you use PowerShell and VBasic scripts instead of .bat files. When a standard Windows batch (.bat) script echoes metric names, it surrounds the names with quotes. The quotes will cause the Machine Agent to ignore these metrics. PowerShell and VBasic scripts do not have this issue.

```
$procName='<PROCESS_NAME>'
$procStatus=Get-Process -Name $procName -ErrorAction
SilentlyContinue
if($procStatus) {
  write-output "name=Custom Metrics|Process|$procName|
Running, value=1"
} else {
  write-output "name=Custom Metrics|Process|$procName|
```

```
Running, value=0"
}
```

3. Create the following `monitor.xml` file and point it to the Windows PowerShell script shown in Step 2.

```
<monitor>
  <name>MyMonitors</name>
  <type>managed</type>
  <description>Monitor open file count </description>
  <monitor-configuration>
  </monitor-configuration>
  <monitor-run-task>
    <execution-style>continuous</execution-style>
    <name>Run</name>
    <type>executable</type>
    <task-arguments>
      <argument name="" value="-Command"></argument>
      <argument name="" value="C:\\absolute\\path\\to\\powershell\\script\\
\\mp.ps1"></argument>
    </task-arguments>
    <executable-task>
      <type>command</type>
      <command>C:\\absolute\\path\\to\\powershell\\executable\\powershell.exe</
command>
    </executable-task>
  </monitor-run-task>
</monitor>
```

If you have provided the PowerShell program for the Machine Agent and are unable to see custom metrics, follow these steps:

1. Create a `.bat` file in the same folder where you created the PowerShell script and `monitor.xml` file.

Example .bat file

```
process_checker.bat
```

2. Add the following lines of code into the `.bat` file. Ensure that you are using the correct PowerShell script file name. In this example, the PowerShell script file name is `process_status_checker.ps1`.

```
@echo off
Powershell.exe -executionpolicy remotesigned -File process_status_checker.ps1
```

3. Add the following lines of code to the `monitor.xml` file. Ensure that you are using the correct `.bat` file name. In this example, the `.bat` file name is `process_checker.bat`.

```

<monitor>
  <name>MyMonitors</name>
  <type>managed</type>
  <description>Monitor process status</description>
  <monitor-configuration>
  </monitor-configuration>
  <monitor-run-task>
  <execution-style>periodic</execution-style>
  <execution-frequency-in-seconds>60</execution-frequency-in-seconds>
  <execution-timeout-in-secs>60</execution-timeout-in-secs>
    <name>MyMonitors</name>
    <type>executable</type>
    <task-arguments></task-arguments>
    <executable-task>
      <type>file</type>
      <file os-type="windows">process_checker.bat</file>
    </executable-task>
  </monitor-run-task>
</monitor>

```

Build a Monitoring Extension Using Java

Related pages:

- [Machine Agent Configuration Properties](#)(see page 2613)
- [Build a Monitoring Extension Using Scripts](#)(see page 2630)

You can create Java monitoring extensions that enable the Machine Agent and Server Visibility to collect custom metrics, which you define and provide, and report them to the Controller. This is an alternative to adding monitoring extensions using scripts.

When you capture custom metrics with a monitoring extension, they are supported by the same AppDynamics services that you receive for the standard metrics captured with the AppDynamics application and Machine Agents. These services include automatic baselining, anomaly detection, display in the Metric Browser, availability for display on custom dashboards, and availability for use in policies to trigger alerts and other actions.

This page describes how to create a monitoring extension in Java.

To the Agent, a monitoring extension is a task that runs on a fixed schedule and collects metrics.

Before You Begin

Before creating your own extension from scratch, review the extensions on the [AppDynamics community](#)¹⁶⁰⁷. See [GitHub](#)¹⁶⁰⁸ for a free download of the extensions

New extensions are constantly being added. It is possible that someone has already created what you need, or something close enough, that you can download it and use it after making a few modifications.

¹⁶⁰⁷ <https://www.appdynamics.com/community/exchange/>

¹⁶⁰⁸ <https://github.com/Appdynamics/>

Create a Monitoring Extension in Java

To create a monitoring extension in Java:

1. Create your extension class. See [Create the Monitoring Extension](#)(see page 2641).
2. Create a `monitor.xml` configuration file. See [Create the monitor.xml File](#)(see page 2644).
3. Create a subdirectory (`<your_extension_dir>`) under `<agent_home>/monitors`.
4. Place the extension class file and the `monitor.xml` file (plus any dependent jar files) in `<your_extension_dir>`.
5. Enter the Controller access information and credentials. See [Configure the Machine Agent](#)(see page 2610).

 Make sure that your `controller-info` and command line parameters are correctly configured. Required properties include: Controller name, port number, and account access key.

6. Restart the Machine Agent.

Create the Monitoring Extension Class

Create a monitoring extension class by extending the `AManagedMonitor` class in the `com.singularity.ee.agent.systemagent.api` package. This package is included in the `MachineAgent.jar` file.

The monitoring extension class performs these tasks:

- Populates a hash map with the values of the metrics that you want to add to AppDynamics. You obtain these metrics based on your environment and the source from which you derive your custom metrics.
- Defines the type of metrics to collect using the `MetricWriter` class. See [Metric Processing Qualifier](#)(see page 2642).
- Uploads the metrics to the Controller using the `execute()` method of the `AManagedMonitor` class.

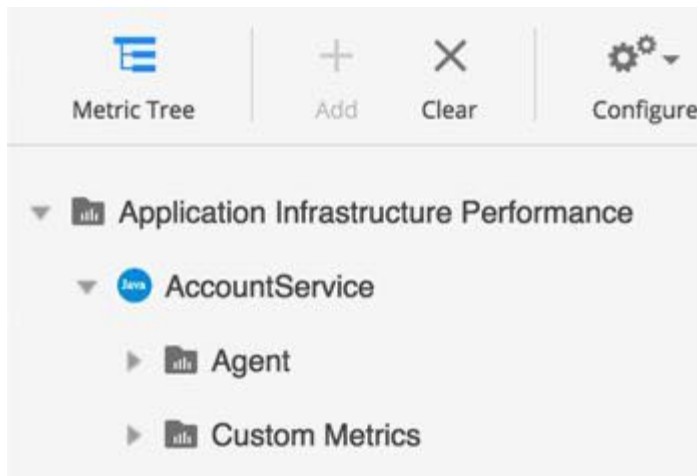

See [Extension_Class_Source.txt](#) for example source code.

Metric Path

All custom metrics processed by the Machine Agent and Server Visibility appear in the **Metric Browser > Application Infrastructure Performance**. Use the "I" character to specify the path from Application Infrastructure Performance to the custom metric. If the metrics apply to a specific tier, use the metric path for the tier, with "Component" followed by a colon ":" and the tier name or tier ID.

For example to associate a metric with tier `AccountService`, you would specify the metric path as: `Server | Component:AccountService | Custom Metrics | Path |`

The metric would then appear under the tree in the Metric Browser:

⚠ You can report a custom metric only to the tier that is associated with the Machine Agent. If you attempt to publish metrics to a different tier, the metrics are not reported.

You can insert a custom metric next to an existing type of metric. For example, the following declaration causes the custom metric named pool usage to appear next to the JMX metrics: `name="Server|Component:<tier-name>|JMX|Pool|First|pool usage",value=10`

You can then use the metric in health rules similar to other types of JMX metrics.

✓ To test the appearance of your custom metric in the Controller API, post the metric data to the Machine Agent's REST API. Pass the path, name type and values of the metric as URL arguments. See [Machine Agent HTTP Listener](#)(see page 2645).

Metric Names

Metric names must be unique within the same metric path but need not be unique for the entire metric hierarchy.

AppDynamics recommends that you use short metric names so that they are visible when they are displayed in the Metric Browser.

Prepend the metric path to the metric name when you upload the metrics to the Controller.

Metric Processing Qualifier

The Controller has various qualifiers for how it processes a metric regarding aggregation, time roll-up, and tier roll-up.

There are three types of metric qualifiers:

- Aggregator qualifier
- Time roll-up qualifier
- Cluster roll-up qualifier

You specify these options with the enumerated types provided by the MetricWriter class.

Aggregation Qualifier

The *aggregator* qualifier specifies how the Machine Agent aggregates the values reported during a one-minute period.

Specify the aggregation qualifier as `aggregator="aggregator type"`

This value is an enumerated type. Valid values are:

Aggregator Type	Description
METRIC_AGGREGATION_TYPE_AVERAGE	Default. Average of all reported values in that minute.
METRIC_AGGREGATION_TYPE_SUM	Sum of all reported values in that minute, causes the metric to behave like a counter.
METRIC_AGGREGATION_TYPE_OBSERVATION	Last reported value in the minute. If no value is reported in that minute, the last reported value is used.

Time Roll-Up

The *time-rollup* qualifier specifies how the Controller rolls up the values when it converts from one-minute granularity tables to 10-minute granularity tables, and 60-minute granularity tables over time.

Roll up Strategy	Description
METRIC_TIME_ROLLUP_TYPE_AVERAGE	Average of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
METRIC_TIME_ROLLUP_TYPE_SUM	Sum of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
METRIC_TIME_ROLLUP_TYPE_CURRENT	Last reported one-minute data point in that 10-minute or 60-minute interval.

Cluster Roll-Up

The *cluster-rollup* qualifier specifies how the Controller aggregates metric values in a tier.

Roll up Strategy	Description
METRIC_CLUSTER_ROLLUP_TYPE_INDIVIDUAL	Aggregates the metric value by averaging the metric values across each node in the tier.
METRIC_CLUSTER_ROLLUP_TYPE_COLLECTIVE	Aggregates the metric value by adding up the metric values for all the nodes in the tier.

For example, if a tier has two nodes, Node A and Node B, and Node A has three errors per minute and Node B has seven errors per minute, the INDIVIDUAL qualifier reports a value of five errors per minute and

COLLECTIVE qualifier reports ten errors per minute. INDIVIDUAL is appropriate for metrics such as % CPU Busy where you want the value for each node. COLLECTIVE is appropriate for metrics such as Number of Calls where you want a value for the entire tier.

Sample Monitoring Extension Class

The NGinXMonitor class retrieves the following metrics from the Nginx Web Server, and adds them to the metrics reported by AppDynamics:

- Active Connections: number of active connections
- Accepts: number of accepted requests
- Handled: number of handled requests
- Requests: total number of requests
- Reading: number of reads
- Writing: number of writes
- Waiting: number of keep-alive connections

The source for the extension class is included as an attachment.

Create monitor.xml

Create a monitor.xml file with a <monitor> element to configure how the Machine Agent executes the extension.

1. Set the <name> to the name of your Java monitoring extension class.
2. Set the <type> to managed.
3. The <execution-style> can be continuous or periodic.
 - Continuous means to collect the metrics averaged over time; for example, average CPU usage per minute. In continuous execution, the Machine Agent invokes the extension once and the program runs continuously, returning data every 60 seconds.
 - Periodic means to invoke the monitor at a specified frequency. In periodic execution, the Machine Agent invokes the extension, runs it briefly, and returns the data on the schedule set by the <execution-frequency-in-seconds> element.

 Do not set the <execution-frequency-in-seconds> greater than 300 seconds (five minutes). The extension must collect metrics at least once every five minutes.

4. If you select periodic for the execution style, set the frequency of collection in <execution-frequency-in-seconds> element. The default frequency is 60 seconds. If you select continuous, this setting is ignored.
5. Set the <type> in the <monitor-run-task> child element to java.
6. Set the <execution-frequency-in-seconds> to the number of seconds before the extension times out.
7. Specify any task arguments required by the Java-based extension in the <task-arguments> element. The argument tag has three parameters: name, default-value, and is_required. is_required is always set to true. The task arguments can be any custom argument. The default arguments that are specified here are the only arguments that the extension uses. They are not set anywhere else.

Example <task-arguments> element:

```
<argument name="password" is-required="true" default-value="welcome" />
```

8. Set the `<classpath>` to the jar file that contains your extension's classes. Include any dependent jar files, separated by semicolons.
9. Set the `<impl-class>` to the full path of the class that the Machine Agent invokes.

Sample monitor.xml Files

This [attached monitor.xml](#) file configures the NGinXMonitor monitoring extension. This extension executes every 60 seconds.

This [attached monitor.xml](#) file configures the MySQLMonitor. This monitor executes every 60 seconds, has four required task arguments and one optional task argument and one dependent jar file.

Machine Agent HTTP Listener

You can send metrics to the Machine Agent using its HTTP listener. You can report metrics through the Machine Agent by making HTTP calls to the Agent instead of piping to the Agent through `sysout`.

Activate the HTTP Listener

The HTTP listener is not enabled by default. To activate the HTTP listener, restart the Machine Agent and set the `metric.http.listener` system property to `true`. Optionally, you can specify the host and port for the listener with system properties.

The `-D` system properties are:

- `metric.http.listener`: Required. Set to `true`.
- `metric.http.listener.port`: Optional. Set to the port to be used, defaults to 8293.
- `metric.http.listener.host`: Optional. This describes which interface to accept requests on. You can set it as follows:
 - If you do not specify the `metric.http.listener.host`, it defaults to `localhost`, which means requests are only accepted from `localhost`.
 - Set to `0.0.0.0` to accept on all interfaces (including from remote clients).
 - Set to the IP address of the specific interface to accept requests on. Not a recommended configuration.

```
<machine_agent_home>/bin/machine-agent -Dmetric.http.listener=true  
-Dmetric.http.listener.port=<port_number> -Dmetric.http.listener.host=0.0.0.0
```

If starting the Agent by invoking the Machine Agent JAR, ensure that you place the options **before** the JAR name in your start up command. For example:

```
java -Dmetric.http.listener=true -jar MACHINE_AGENT_HOME/  
machineagent.jar
```

Create Metrics

Use to post custom metrics to the Machine Agent for uploading to the Controller. Define one or more metrics in the body of the request as JSON data.

URI

POST /api/v1/metrics

Metric Definition Fields

Parameter	Description
metricName	Name for the metric as it will appear in the Controller UI.
aggregatorType	How the metrics should be aggregated. Options are: <ul style="list-style-type: none"> AVERAGE: The average of all one-minute data points when adding it to the 10-minute or 60-minute granularity table. SUM: The sum of all one-minute data points when adding it to the 10-minute or 60-minute granularity table. OBSERVATION: Last reported one-minute data point in that 10-minute or 60-minute interval.
Value	A 64-bit integer value for the metric.

Format

```

POST /api/v1/metrics

[
  {
    "metricName": "Custom Metrics|Test|MetricFromRESTClient1",
    "aggregatorType": "AVERAGE",
    "value": 10
  }
]
  
```

Create Events

Use to post custom events to the Machine Agent for uploading to the Controller. Define one or more events in the body of the request as JSON data.

URI

POST /api/v1/events

Event Definition Fields

Parameter Name	Description
eventSeverity	Severity of the event, from INFO, WARN, ERROR.
type	A string describing the event subtype. The event will be of type CUSTOM, subtype will be the value of this parameter.
summaryMessage	A summary of the event.
properties	Event properties. These properties are retrieved along with events by the Controller in a given query and provide a means for filtering the events. The maximum size of a key is 500 characters and the maximum size of a value is 5000 characters. The values can be a numeric or string value.
details	Arbitrary key-value details for the event; similar in constraints to properties but are retrieved in a separate call. Use this to store details that should only be retrieved when requested by the user, which avoids the expense of retrieving this data in the usual event calls.

Format

```

POST /api/v1/events
[
  {
    "eventSeverity": <event_severity>,
    "type": "<event_type>",
    "summaryMessage": "<event_summary>",
    "properties": {
      "<key>": {
        <user-specified_object>
      },...
    },
    "details": {
      "<key>": "<value>"
    }
  },
  {
    "eventSeverity": <event_severity>,
    "type": "<event_type>",
    "summaryMessage": "event_summary",
    "properties": {
      "<key>": {
        <user-specified_object>
      },...
    },
    "details": {
      "<key>": "<value>"
    }
  }
]

```

```

    }
  },...
]

```

Legacy Machine Agent HTTP APIs

The following API endpoints are supported for backward compatibility, but are not extended or enhanced in future versions.

Upload Metrics

You can use GET or POST to upload metrics to the Metric Browser under **Application Performance > Tier**, where the tier is the one defined for the Machine Agent.

The format for GET is:

```
GET /machineagent/metrics
```

For example:

```
http://host:port/machineagent/metrics?name=Custom Metrics|Test|My
Metric&value=42&type=average
```

The format for POST is:

```
POST /machineagent/metrics
```

with header:

```
Content-Type: application/xml
```

with body content:

```
<?xml version="1.0"?>
<request>
<metric name="[name of metric 1]", type="[aggregation type]", value="[value of metric 1]" />
<metric name="[name of metric 2]", type="[aggregation type]", value="[value of metric 2]" />
...
<metric name="[name of metric n]", type="[aggregation type]", value="[value of metric n]" />
</request>
```

Example:

```
http://host:port/machineagent/metrics
```

Example of body content:

```
<request>
<metric name="Custom Metrics|Test|My Metric 1", type="AVERAGE", value="22" />
<metric name="Custom Metrics|Test|My Metric 2", type="SUM", value="98737" />
<metric name="Custom Metrics|Test|My Metric 3", type="CURRENT", value="93" />
</request>
```

Valid values for type are:

- **AVERAGE**: Average of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
- **SUM**: Sum of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
- **CURRENT**: Last reported one-minute data point in that 10-minute or 60-minute interval.

Upload Events

Send events using HTTP **GET** requests to upload events to the Machine Agent. The format is:

```
GET /machineagent/event
```

For example:

```
http://localhost:8293/machineagent/event?type=<event_type>&summary=<summary_text>
```

Event_type is one of the following:

- error
- info
- warning

Administer the Machine Agent

These pages describe procedures and provide reference material relevant to the AppDynamics Pro Administrator.

- [Manage Machine Agents](#)(see page 2649)
- [Upgrade the Machine Agent](#)(see page 2651)
- [Uninstall the Machine Agent](#)(see page 2652)
- [FAQs and Troubleshooting for the Machine Agent](#)(see page 2653)

Manage Machine Agents

This page describes how to manage Machine Agents.

View Details

Using an AppDynamics Administrator account, click **Settings > AppDynamics Agents > Machine Agents** to see details and manage your installed Machine Agents.

- **Hostname**: Name of the machine on which the Agent is installed.
- **Version**: Version of the installed Machine Agent software.
- **Applications**: Name of the application with which the Agent is associated.
- **Enabled**: Whether the Agent is enabled.

Unique Host ID	Version	Applications	Enabled
WIN-JE86B9GMSJF	4.3.0.0	MovieTicketsGirish	✓
ip-10-0-0-222	Machine Agent v4.5.2.1606 GA compatible with ...	(not associated with any applications)	✓
linuxkit-025000000001	Machine Agent v4.5.0.1270 GA Build Date 2018-...	(not associated with any applications)	✓
RPETTY2-WIN	4.5.2.0 compatible with 4.4.1.0	rpetty	✓

Available Actions

Reset Selected Machine Agent

Restarts the selected Machine Agent and runs it with any updated configuration files on the Agent host, and any changes made on the Controller that affect the Agent. The reset functionality is only available for Machine Agents <= 4.2.

View Machine

Shows summary details about the Machine Agent:

- **Name:** Name of the machine on which the Agent is installed
- **IP Address:** IP address of the machine on which the Agent is installed
- **OS:** Operating system running the Agent
- **Status:** Field displays status information: Initialized
- **Install Time:** Date and time Agent was installed
- **Last Start Time:** Date and time Agent was last restarted

Disable and Enable Agents

Disabling the Agent temporarily suspends its collection of metrics. You can quickly re-enable the Agent when desired.

Permission:

You must have the application-level permission, *configure agent properties*, to enable and disable Agents.

When the Machine Agent is disabled, the Agent stops reporting hardware metrics and metrics from any extensions installed on the Agent until you re-enable it. The disabled Machine Agent no longer reports events and any installed extensions are also stopped. While disabled, the Agent continues to consume a license. The Agent maintains a 'heartbeat' connection to the Controller so that it can be 'enabled' again quickly. The Agent persists its enabled/disabled state even after the Machine Agent is restarted. Once re-enabled, all normal Machine Agent activities resume.

Delete Selected Machine Agent

The delete functionality on the admin page is to delete the underlying machine metadata for an orphaned machine. A machine is considered "orphaned" when it is no longer associated with any APM nodes or with

Server Availability. You cannot delete a machine that is not an orphan. To delete a machine that is not an orphan, you must first delete all nodes on that machine, and then delete the machine from the Servers list. You can select multiple machines to delete.

You can also delete a Machine Agent from the [Servers List](#)(see page 2660).

- Server Visibility Administrator permission is required to delete machines.
- You can delete machines from the Servers list regardless of whether they have Server Visibility enabled. You can select multiple machines to delete.
- Deleting a machine from the Servers list deletes the underlying machine metadata that displays on the AppDynamics Agents Admin page, but only if no APM nodes are currently associated with the same machine.
- Deleting a machine that still has APM nodes currently associated with it removes the entry from the Servers list, but retains the underlying machine metadata. That information continues to display on the AppDynamics Agents admin page.

Upgrade the Machine Agent

This page describes how to upgrade an existing installation of the Machine Agent. The instructions have been tested and certified to work for Machine Agent ≥ 20.1 .

For a new installation, see [Install the Machine Agent](#)(see page 2590).

Perform the Upgrade

1. Do the following (as needed) before you update the Agent:
 - a. Review the [Release Notes](#)(see page 3911) for changes that affect your environment.
 - b. Back up the `<machine_agent_home>` directory to a `<machine_agent_home_BACKUP>` so you can revert to the previous installation, if required.
 - c. *If you are upgrading the Controller as well as the Agents:* [Upgrade the Controller Using the Enterprise Console](#)¹⁶⁰⁹, and then return to this procedure.
 - d. *If you have been collecting Log Analytics data by running the Analytics Agent via the Machine Agent:* Do the following.
 - i. Preserve the old watermark file so that you can copy it to the new `<analytics-agent-home>`.
 Machine Agent location: `<machine-agent-home>/monitors/analytics-agent/conf/watermark`
 Analytics Agent location: `<analytics-agent-home>/conf/watermark`
 - ii. Preserve your pre-existing job files so that you can copy them to the new `<analytics-agent-home>`.
 Machine Agent location: `<machine-agent-home>/monitors/analytics-agent/conf/job`
 Analytics Agent location: `<analytics-agent-home>/conf/job`
2. Download the installer suitable for your OS environment from the [AppDynamics Download Center](#)¹⁶¹⁰.
3. Stop all instances of the Machine Agent that are currently running from the `<machine_agent_home>` that you want to upgrade. See [Start and Stop the Machine Agent](#)(see page 2606)
4. Update your Machine Agent installation:
 - RPM-based Linux installation:
Update the existing package. For example: `sudo rpm -U <package>`
 - RPM-based installation on a systemd Linux system (such as CentOS 7, Ubuntu, newer Fedora Core systems, newer OpenSUSE systems, and newer SUSE Enterprise Linux systems).
If you don't know if your Linux installation is using systemd, do a clean install to avoid issues. Remove the old package and then install the new one.
 - For all other scenarios:
First, delete the `<machine_agent_home>` for the old Agent. Make sure you retain the `<machine_agent_home_BA`

¹⁶⁰⁹ <https://docs.appdynamics.com/display/PRMY21/Upgrade+the+Controller+Using+the+Enterprise+Console+v21.5>

¹⁶¹⁰ <https://download.appdynamics.com/download>

CKUP> you created in Step 1.

Then, install the Machine Agent as described [Linux Install Using the RPM Package](#)(see page 2595) for your specific installation in [Install the Machine Agent](#)(see page 2590).

i If you are running the Analytics Agent as an extension to the Machine Agent, failure to clear out the old directory or use a new location may cause your embedded Analytics Agent to fail to start.

5. Configure the Agent settings in `<machine_agent_home>/conf/controller-info.xml`. See [Machine Agent Configuration Properties](#)(see page 2613)

i The RPM-based Linux installer retains the configuration settings for the previous Agent by default. If you used another installer and want to maintain your previous Agent configuration, copy the `<machine_agent_home_BACKUP>/conf/controller-info.xml` file to the new installation directory.

6. Before you start the updated Agent, perform the following steps (as required):
 - a. *If you are updating on Windows:* When you install the new Machine Agent in the existing directory, you may see two "InstallService" and "UninstallService" files. Use the .vbs files (VbScript) and delete the .cmd files (Windows Command Script), which are leftover from your previous version.
 - b. *If the agent install package includes a new JRE:* Update any related custom scripts that use the Machine Agent JRE.
 - c. Update all users who have the Account Administrator role for the account and add the appropriate SIM roles (SIM admin and SIM user) to other users in the account, as needed.
7. Start the Agent, verify the Agent installation, and verify that the Agent is reporting to the Controller as described for your specific installation in [Install the Machine Agent](#)(see page 2590).

Uninstall the Machine Agent

To uninstall the Machine Agent:

1. Stop the Machine Agent (or service). For the commands for your environment, see [Start and Stop the Machine Agent](#)(see page 2606).
2. If you installed the Machine Agent as a service, delete the service using the commands described on this page.
For Windows and Mac OS X, the commands to remove the service also stop the service cleanly.
3. Delete the `<machine-agent-install>` installation directory.

Remove the Agent Service

Linux RPM

Execute the following command:

```
sudo rpm -ev appdynamics-machine-agent
```

Windows

Execute the following command:

```
> UninstallService.vbs
```

Mac OS X

Execute the following command:

```
sudo launchctl unload -w <machine_agent_home>/com.appdynamics.machineagent.plist
```

Delete Using AppDynamics Manage Agents

If you delete a Machine Agent from the Controller UI (as described in [Manage Machine Agents](#)(see page 2649)), but do not shut down the JVM that the Machine Agent runs on, the Machine Agent reappears in the UI the next time it connects to the Controller. To prevent a Machine Agent from connecting to the Controller, you must remove the Machine Agent settings from the JVM configuration. This frees the license associated with the Agent in the Controller and makes it available for use by another Machine Agent.

FAQs and Troubleshooting for the Machine Agent

Machine Agent and App Agent on the Same Machine, but Report to Different Nodes

Issue

A machine has a Machine Agent and an App Server Agent running together, however, the Agents report to different nodes. When you review the Metric Browser, for example, the application metrics appear under node *abc* but machine metrics appear under node *abc.mydomain.com*.

Resolution

Check if the hostnames match. If they do not match, then:

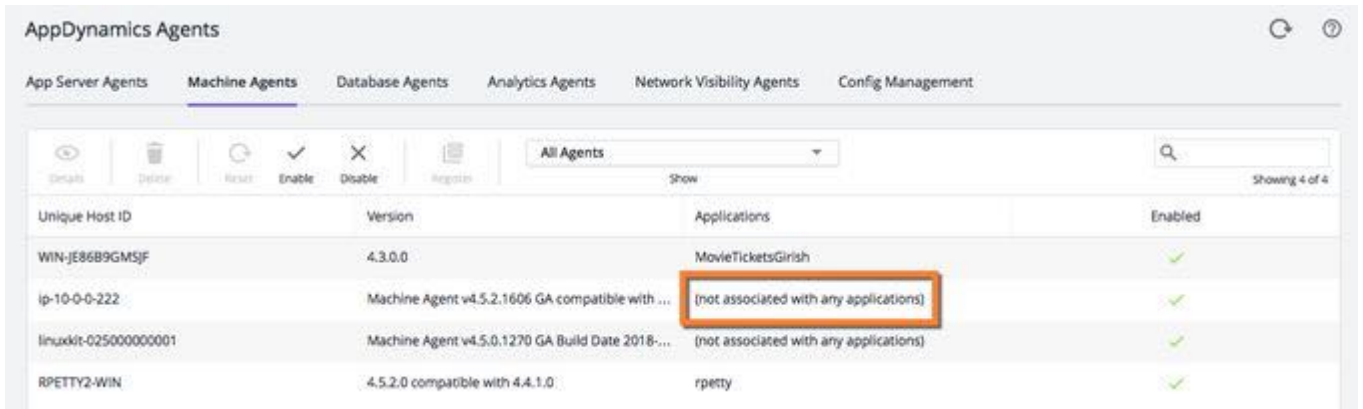

1. Set the `<unique-host-id>`(see page 2622) for the Machine Agent to the same `<unique-host-id>` as the App Server Agent.
2. Restart the Machine Agent to apply the previous changes.

The `<unique-host-id>`(see page 2622) on the Machine Agent and the `<unique-host-id>` for the App Server Agent must match exactly. These settings are case-sensitive and ensure that both Agents report metrics to the same node.

To verify that the hostnames match:

1. Click the gear icon () in the Controller menu and select **AppDynamics Agents**.
2. Select the Machine Agents tab.
3. Review the **Applications** field for the Agent name.

In addition, for consistency in naming in the Servers tab, use the `<machine path(see page 0)>` attribute to set the hostname. By using the machine path, you do not need to use the fully qualified domain name (FQDN) for some Agents, and the hostname for others. The reported hostname is still available to view by checking the option in the Agents Admin view.

4. Review the ID for the App Server Agent:
 - a. Go to the App Server Agents tab.
 - b. Search for the App Server Agent to which you want to associate the Machine Agent.
 - c. Review the **Unique Host ID** field for the App Server Agent installed on that machine.
5. Set the `<unique-host-id>` (see page 2622) for the Machine Agent to the same `<unique-host-id>` as the App Server Agent.
6. Restart the Machine Agent to apply the previous changes. Your Agents will appear as associated after a few minutes

Identify the Machine Agent Process

Linux and Unix-like Systems

To identify which process is running the Machine Agent, enter:

```
ps -ef | grep machine
```

Windows Systems

In the Windows Services Application, search for the AppDynamics Machine Agent service.

Metric Values for Disk and Network are Zero

When a 32-bit JRE is used with a 64-bit operating system, you may see values of zero for disk and network metrics. To solve this problem, use a 64-bit JRE with the 64-bit operating system.

Flow Maps and the Machine Agent

The Machine Agent monitors a particular machine (also called "host server") and not a particular application server; therefore, the Machine Agent can report to multiple nodes running on the same machine. However, a flow map displays the communication between different nodes during application execution, or the business transaction flow from tier to tier. A Machine Agent cannot be a part of the flow and is not shown in the flow map.

Server Health Indicator

Health rule violations based on metrics monitored by the Machine Agent are included in the health indicator on the various application, tier, and node dashboards. The health indicator is driven by health rule violations in the given time period configured on hardware metrics collected by the Machine Agent. Some health rules

are configured by default. To configure additional health rules, see [Configure Health Rules](#)(see page 304) and [Configure Health Rules to Monitor Servers](#)(see page 2699).

Server Visibility

Related pages:

- [Enable Server Visibility](#)(see page 2658)
- [Monitor Your Servers Using Server Visibility](#)(see page 2658)
- [Hardware Resources Metrics](#)(see page 2558)

The AppDynamics Server Visibility module uses the Machine Agent to provide extended hardware metrics. Server Visibility includes additional windows in the Controller UI that enable you to quickly see underlying infrastructure issues impacting your application performance and rapidly troubleshoot hardware performance problems.

Requirements

- Linux, Windows, Solaris, and AIX
- [Server Visibility license](#)(see page 190) for monitored machines
- [Server Visibility enabled](#)(see page 2658) on the Machine Agent

Before you enable Server Visibility:

- Review the [Server Visibility Requirements and Supported Environments](#)(see page 2657).
- Install and configure the Machine Agent on a machine with a supported OS as described in [Install the Machine Agent](#)(see page 2651).

Without having to enable Server Visibility, you can [view basic hardware metrics](#)(see page 2589).

Feature Comparison

Feature	Server Visibility	Machine Agent
Supported Platforms	Linux, Windows, Solaris, AIX	Linux and Unix-like systems, MacOS, Windows, AIX
Extensions and Custom Metrics	Yes	Yes
Monitor Docker container metrics from the Docker host	Yes	No
Tier Metric Correlator	Yes	No
Dynamic Monitoring Mode	Yes	No
JVM Crash Guard	Yes	Yes
Remediation Scripts	Yes	Yes

Feature	Server Visibility	Machine Agent
Graphical User Interface	Yes	Functionality is limited to viewing Machine Agent metrics in the Servers List
Extended Hardware Metrics	Yes	No
Server metrics in transaction snapshots	Yes	No
Server KPIs in application flow map	Yes	No
Health rules for extended hardware metrics	Yes	No
Licensing	Server Visibility (see page 190)	Machine Agent (see page 190)

Permissions

Server Visibility provides two predefined roles, and two related permissions:

- Server Visibility Administrator
- Server Visibility User
- View Server Visibility permission
- Configure Server Visibility permission - enables configuring Service Availability

See [Server Visibility Permissions](#)(see [page 172](#)).

Server Visibility User Interface

The [Servers list](#)(see [page 2660](#)) provides key performance metrics for all your servers on a single panel.

The [Servers > Dashboard](#)(see [page 2662](#)) shows key performance metrics for the selected machine, including the top ten consumers of CPU and memory.

The [Servers > Volumes](#)(see [page 2667](#)) panel displays performance metrics for disks, partitions, and volumes for the selected machine.

The [Servers > Network](#)(see [page 2669](#)) panel shows network performance metrics for network interfaces on the selected machine.

The [Servers > Processes](#)(see [page 2665](#)) panel shows a configurable set of performance metrics for processes.

The [Servers > Containers](#) panel lists the monitored containers used by an application.

Using the Server Visibility UI

The Server Visibility user interface uses many of the same mechanisms that are common to the various panels of the Controller UI. The sample image illustrates these mechanisms.

Search Results and Sorting

Pagination is the default behavior on the **Servers** and **Containers** list pages. The information is retrieved on demand, and additional records are retrieved and displayed as you scroll. Search is only available for the **Name** and **Host ID** columns. Sorting is only available on the **Hostname**, **Container**, **Metric %**, and **Health** fields.

Server Visibility Requirements and Supported Environments

To [enable Server Visibility](#)(see page 2658), review these system requirements guidelines.

System Requirements

Server Visibility requires a supported version of the Machine Agent to be installed on the monitored server. See [Machine Agent Requirements and Supported Environments](#)(see page 2580).

Server Visibility features are available for AIX, Linux, Windows, and Solaris. You need a Server Visibility license to enable and use Server Visibility features. Server Visibility is enabled by default on AppDynamics Controllers. You must explicitly [enable Server Visibility on your Machine Agent](#)(see page 2658) to start sending the expanded set of Server Visibility metrics.

You can install and run Machine Agents on other supported platforms, however, Server Visibility features are not available. For OS platforms like AIX or HP-UX, AppDynamics recommends using the unbundled Machine Agent ZIP without the JRE.

Limitations

- Total number of Machine Agents and containers reporting to a single Controller is 30,000.
- Total number of App Agents reporting to a single Controller is 100,000.

- Monitored servers are considered stale 30 days after they go offline. They are purged from the Controller database when that time limit is reached.
- [Docker Visibility](#)(see page 2833) is supported on Linux only.

Server Visibility on Windows

Review these notes:

- It is good practice to check the server frequently to ensure that it has the latest Windows updates installed. WMI (Windows Management Instrumentation) updates are especially important because the Agent uses WMI to collect Server Visibility metrics.
- The monitored server should have at least four cores or multiple CPUs. WMI processes can be highly resource-intensive, especially on Windows Server 2012.
- If you do not have a Server Visibility license, or to collect Basic metrics only, configure the Agent to use the JavaHardwareMonitor extension. [Server Visibility](#)(see page 2621) should not be enabled on the Agent.
- The Windows Machine Agent uses these extensions by default:
 - JavaHardwareMonitor (for Basic metrics)
 - ServerMonitoring (for Server Visibility metrics)
- The HardwareMonitor extension is not recommended on Windows.
- To enable Server Visibility on a Windows server with a .NET APM Agent installed, you must enable [.NET Compatibility Mode](#)(see page 2628) on both the Controller and the Machine Agent.

Enable Server Visibility

Before you enable Server Visibility:

1. Review the [Server Visibility Requirements and Supported Environments](#)(see page 2657).
2. Install and configure the Machine Agent on a machine with a supported OS as described in [Install the Machine Agent](#)(see page 2590).

Server Visibility License Required

Infrastructure Visibility is an add-on module to the Machine Agent and requires a Server Visibility license on the Agent.

Enable Server Visibility

1. Set the "sim_enabled" property to "true". See [Where to Specify Machine Agent Configuration](#)(see page 2612), and configure the value based on your configuration choice:
 - Element in controller-info.xml: <sim-enabled>
 - System Property: -Dappdynamics.sim.enabled
 - Environment Variable: APPDYNAMICS_SIM_ENABLED
2. Restart the Machine Agent. See [Start and Stop the Machine Agent](#)(see page 2606).

Monitor Your Servers Using Server Visibility

This page describes the Server Visibility panels in the Controller UI:

- [Discover Normal Server Activity](#)(see page 2659)
- [Servers List](#)(see page 2660)
- [Server Dashboard](#)(see page 2662)
- [Server Process Metrics](#)(see page 2665)
- [Server Volumes Metrics](#)(see page 2667)
- [Server Network Metrics](#)(see page 2669)
- [Navigating Between Server and Application Contexts](#)(see page 2670)

Discover Normal Server Activity

Related pages:

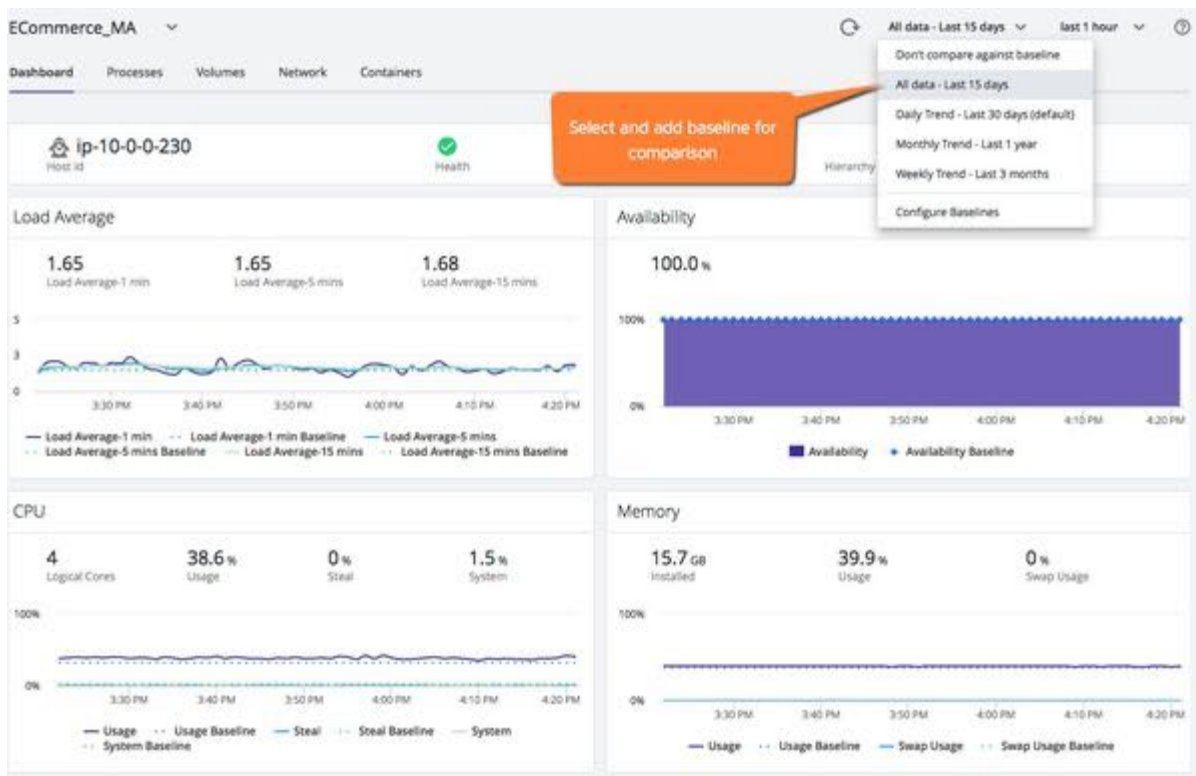

- [Dynamic Baselines](#)(see page 1255)
- [Hardware Resources Metrics](#)(see page 2558)

The Server Visibility module automatically learns to detect performance anomalies using baselines that are specific to your server environments.

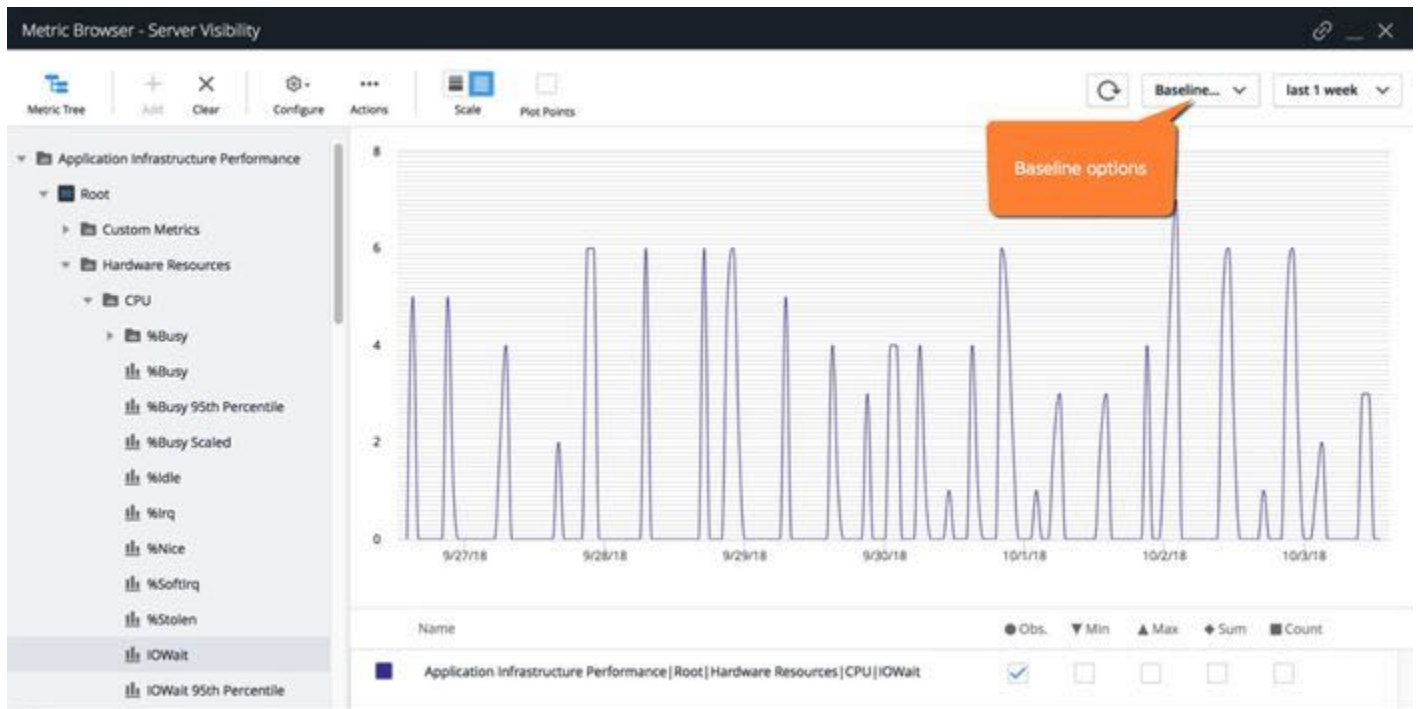

AppDynamics creates baselines by collecting metrics from your monitored servers over defined periods of time. This establishes what is normal for your environment so you can create [health rules](#)(see page 304) to alert you when metric deviations occur from the normal range. You can also create your own baselines.

View Performance Metrics Compared to Baselines

You can compare performance metrics to their dynamic baselines on the Server Dashboard.

You can visualize performance metrics and review deviations from expected behaviors established by the baseline from the **Metric Browser - Server Visibility** panel.

Servers List

To access: AppDynamics Home > **Servers**

The **Servers** list shows all machines registered by a Machine Agent. This list shows metric data for Server-Visibility-enabled machines only. Machines registered with App or .NET Agents, with no Machine Agent running, do not appear in this list.

On the Servers list you can:

- See the complete list of Machine Agents reporting to this Controller. The **Name** is taken from the value in <machine-path> in controller-info.xml. The last string after the last | (pipe) is used. For example, if the value is <machine-path>Group | myName<machine-path>, then the name is myName. For <machine-path>JustName<machine-path>, then the name is JustName.
- Filter the list using the dropdown to show all servers (the default) or just servers with Server Visibility enabled or disabled.
- Use **View Options** to select the columns shown for each server in the table. You can show or hide metrics such as **CPU Steal**, **Load Average**, **Memory Swap Used**, and **Network I/O**. You can also show or hide properties such as Host ID and JVM version.
- See key performance metrics for your monitored servers at a glance.
- Change the time period of the metrics displayed.
- See an overview of the health of the servers, as determined by whether any health rules have been violated. See [View Health Rule Status in the UI](#)(see page 327).
- Click the violations icon () to view health rule violations for a server.
- Click on any point on a spark chart to see the percentage usage at that time.
- Sort the chart by any of the columns.
- Right-click on a set of selected servers to
 - Delete the servers from the Servers list. See "Delete Selected Machine Agent" in [Manage Machine Agents](#)(see page 2649).
 - View and analyze log data for the servers (if you have an Application Analytics license). See [Analytics](#)(see page 3006).
 - Set the **Dynamic Monitoring Mode** on the servers. See [Dynamic Monitoring Mode and Server Visibility](#)(see page 2673).
- See additional details of servers that are enabled for Server Visibility. Double-click a selected server to see server-specific [dashboard](#)(see page 2662), and details of the server's [volumes](#)(see page 2667), [network](#)(see page 2669), and [processes](#)(see page 2665).

- Filter data according to the "liveness" of servers. A Machine Agent that reports metrics from a server is considered live. Eventually, servers can transition to a terminated or unrecoverable state. By specifying a time range in the Server Dashboard, you can filter servers which were live and reporting metrics during that time range. To enable this option for an individual account:
 - a. Log in to the Controller admin page: `<controller-hostname>/controller/admin.jsp`
 - b. From **Accounts**, open the account page of interest.
 - c. Click **Controller Settings > Controller Configurations** and enter:
 - i. Name = `entity.liveness.filter.enabled`
 - ii. value = true
 - iii. Name = `entity.liveness.tracker.enabled`
 - iv. value = true
- Disable automatic sorting of the Servers List table when it first loads. This option is useful if the Controller is monitoring hundreds or thousands of Machine Agents and the table is taking a long time to load. This option disables the ability to sort the table by any metric or metric trend column. To enable this option for an individual account, do the following:
 - a. Log in to the Controller admin page: `<controller-hostname>/controller/admin.jsp`
 - b. From **Accounts**, open the account page of interest.
 - c. Click **+ Add Property** and enter:
 - i. Property = `SIM_DISABLE_MACHINE_SORTING`
 - ii. value = true

Available Metrics in the Servers List

Metric Name	Description
Hierarchy	Specifies the root of the hierarchical path to the server. See the machine hierarchy property in this topic: Machine Agent Configuration Properties (see page 2613).
Health	Indicates if server health rules have been violated on this machine.
Disk Usage % trend	The percentage usage trend over time of storage space in use across all listed volumes, partitions, and disks.
CPU (%)	The percentage of time the CPU was busy processing system or user requests.
CPU Trend	The trend over time of CPU usage.
Memory (%)	The percentage of memory used.
Memory Trend	The trend over time of memory usage.

Metric Name	Description
Disk I/O (%)	The percentage of time spent performing read and write operations across one or more disks, volumes, or partitions.
Disk IO Trend	The trend over time of disk usage.
Network I/O (%)	The average network utilization of network bandwidth for all monitored network devices. The network utilization percentage is the total incoming and outgoing bytes per second, divided by the maximum speed of the network interface. In some cases, if the Network I/O percentage value is too small compared to the network speed (10,000 Mb/s), the value is rounded to zero on the Servers List. In this case, the Network I/O % shows as zero, while the drilled-down details of the machine might show network traffic.
Network Trend	The trend over time of network usage.
Server Visibility Enabled	Indicates if Server Visibility is enabled for this machine. Values=Yes, No, and Not Supported. Not Supported indicates that Server Visibility is not available for that machine OS.
Icon	Representation of the machine's Operating System

Server Dashboard

To access Server Dashboard, select **AppDynamics Home > Servers > Dashboard**.

Select a server from the list and double-click a server name to display its Dashboard. In this Dashboard, you can:

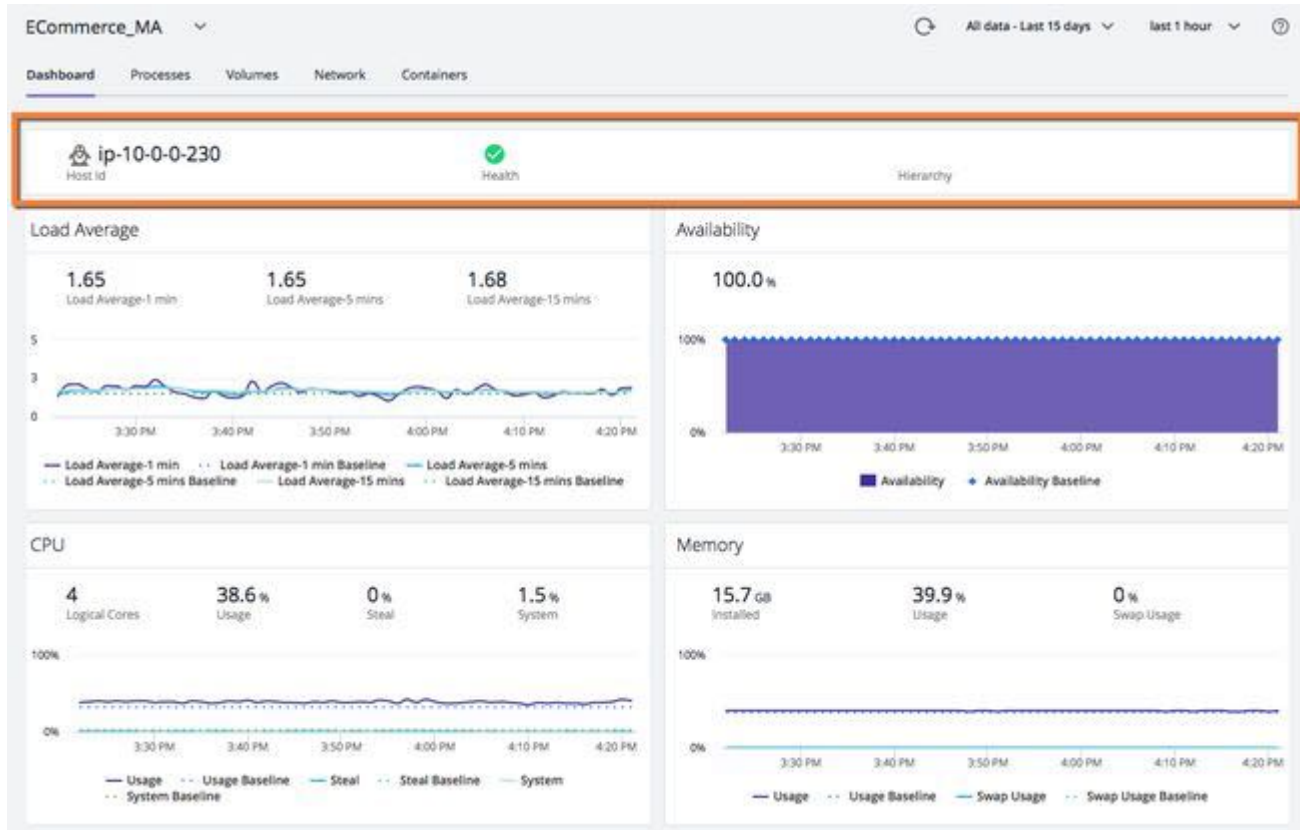

- View charts of key performance metrics for the selected monitored servers:
 - Server availability
 - CPU, memory, and network usage percentages
 - Server properties
 - Disk, partition, and volume metrics
 - Top ten processes consuming CPU resources and memory
- Change the time period of the metrics displayed.
- View an assessment of the overall health of the server based on any health rule violations. See [View Health Rule Status in the UI](#)(see page 327).
- View the hierarchy or grouping of the server as specified in the `controller-info.xml` using the [machine-path](#)(see page 2613) configuration property.
- Click on any point on a chart to see the metric value for that time.
- Sort the chart using any of the columns as a sorting key.
- Find and switch to other Server Dashboards from the dropdown next to server tier.
- View an aggregate of the top ten processes by CPU usage, and top ten processes by memory.

Server Dashboard Metrics

Host ID, Health, Hierarchy (*Top Pane*)

- **Host Id:** This is an ID for the server that is unique to the AppDynamics Controller.

- **Health:** Shows the overall health of the server. Hover over the health icon for details; for example, the following appears when hovering over the exclamation mark (!) in a red box, "There are Critical Health Rule Violations on this machine during the time range."
- **Hierarchy:** This is an arbitrary hierarchy to group your servers together, specified by [Machine Hierarchy Property](#)(see page 2613).

Load Average

The [CPU load](#)(see page 2567) presented as an average over the past 1 minute, 5 minutes, and 15 minutes. The CPU load is the percentage of the CPU consumed by processes that are currently running or that are waiting to run. These metrics are shown as percentages in the Server Dashboard and are [scaled by 100 in the Metric Browser](#)(see page 0).

Availability

- **Availability:** Percentage of time the Machine Agent is able to communicate with the Controller. The Machine Agent sends availability information in the form of a heartbeat to the AppDynamics Controller once a minute to indicate the Agent is alive. The heartbeat may show as available when other functions of the Machine Agent and Server fail. The availability only indicates that the Machine Agent is communicating with the Controller, and does not indicate the overall health of the functions within the Machine Agent.
- **time series chart:** Shows the Machine Agent availability trend over time. There are situations where the Machine Agent is able to communicate with the Controller while other functions of the Machine Agent, or processes on the server, are non-functional. Do not use the time series metric to indicate the overall availability of the server.

CPU

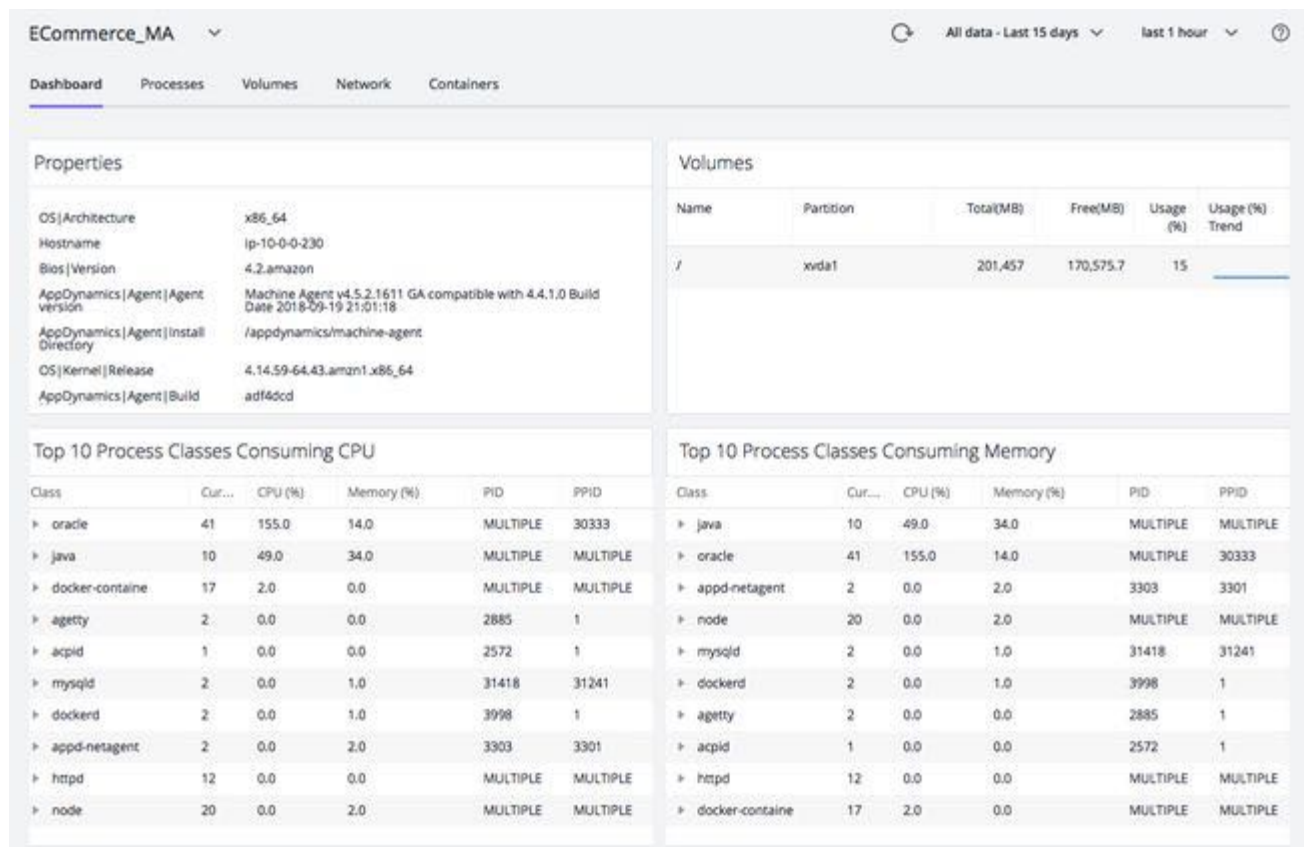

- **CPU Usage:** Average usage of CPU over the chosen time-range.
- **# of Cores:** Number of cores for the CPU.
- **time series chart:** Shows CPU busy percentage trend over time.

Memory

- **Installed:** Total amount of memory, free and used, on the server.
- **Memory Usage:** Percentage of memory used.
- **Swap Usage:** Swap usage tracks the swap file utilization. A swap file enables an operating system to use hard disk space to simulate extra memory. When the system runs low on memory, it swaps a section of RAM being used by an idle program onto the hard disk to free up memory for other executing programs. When the idle, swapped out program begins executing again, it is moved back to RAM, potentially displacing some other idle program. This causes a large amount of hard disk reading and writing that can slow down the system considerably.
- **time series chart:** Shows the memory usage trend over time.

Network

- **Interfaces:** Number of network interfaces on the server.
- **Outgoing:** Kilobytes of data sent per second for all monitored network devices.
- **Incoming:** Kilobytes of data received per second for all monitored network devices.
- **time series chart:** Shows the network incoming and outgoing volume trend over time.

Volumes

- **Total:** Storage space, free and used, on the disk, partition or volume. For Linux systems, this does not include disk space reserved by the kernel.
- **Free:** Total storage space available. For Linux systems, this does not include disk space reserved by the kernel.
- **Usage(%):** Percentage of storage space in use across each disk, partition, and volume.
- **time series chart:** Shows the storage usage trend over time.

Top 10 Processes Consuming CPU

- **Count:** Number of processes in this class.

- **CPU (%)**: Percentage of CPU resources consumed by all processes in this class.
- **Memory (%)**: Percentage of memory consumed by all processes in the class.
- **PID**: Process ID.
- **PPID**: Parent Process ID.

Top 10 Processes Consuming Memory

- **Count**: The number of processes in this class consuming memory resources.
- **CPU (%)**: Percentage of CPU consumed by all processes in this class.
- **Memory (%)**: Percentage of memory consumed by all processes in this class.
- **PID**: Process ID.
- **PPID**: Parent Process ID.

Server Process Metrics

Related pages:

- [Hardware Resources Metrics](#)(see page 2558)
- [Enable Server Visibility](#)(see page 2658)
- [Machine Agent Settings for Server Visibility](#)(see page 2692)

To access Server Process Metrics, select **AppDynamics Home > Servers >** (double-click a server) **> Processes**.

You can configure which processes AppDynamics monitors, how they are grouped, the number of processes to monitor, and how long they must be alive before monitoring them. See [Machine Agent Settings for Server Visibility](#)(see page 2692)

From the Server Processes tab, you can:

- View all the processes active during the selected time period. The processes are grouped by class as specified in the [ServerMonitoring.yml](#)(see page 2692) file.
- View the full command line that began this process by hovering over the process entry in the **Command Line** column.
- Expand a process class to see the processes associated with that class.
- Select **View Options** to configure which columns to display in the chart.
- Change the time period of the metrics displayed.
- Sort the chart using the columns as a sorting key. You cannot sort by CPU Trend or Memory Trend on sparkline charts.
- Review CPU and Memory usage trends.

Class	Class Id	Current Proces...	Command Line	State	Star...	End ...	CPU...	Me...	PID	PPID
acpid	acpid	1	/usr/sbin/acpid	🟢	09/2...	-	0.0	0.0	2572	1
agetty	agetty	1	/sbin/agetty ttyS0 9600 vt...	🟢	09/1...	-	0.0	0.0	2885	1

Metrics for Server Processes

The following information displays for each monitored class and process:

Default Columns

- **Class:** The process class.
- **Count:** The number of processes in this class.
- **Command Line:** The command that began the process.
- **State:** An icon represents the process state: sleeping, running, terminated, zombie or multiple. Hover over the icon to discover its state. The State column displays a question mark  when there is more than one process associated with the class. Expand the class to review the state of the related processes.
- **Effective User:** The name of the user account that started the process.
- **Start Time:** The time, as set on the Controller machine, when the process started.
- **End Time:** The time, as set on the Controller machine, when the process ended.
- **CPU (%):** The percentage of CPU resources by all processes in this class.
- **CPU Trend:** A chart that shows CPU usage over the selected time period.
- **Memory (%):** The percentage of memory resources by all processes in this class.
- **Memory Trend:** A chart that shows memory usage over the selected time period.
- **PID:** Process ID.
- **PPID:** ID of the parent process.

OS-Specific Columns

The column information is specific to processes monitored on a Linux server.

- **pgid:** Process group ID.
- **Real Group:** The process real group ID.
- **Real User:** The process real user ID.
- **Effective Group:** The user ID the kernel uses to determine the process permissions when using shared resources such as: message queues, shared memory, and semaphores.
- **Nice Level:** The priority used to indicate the amount of CPU to afford the process or the process priority, where -20 is the highest priority, and 19 or 20, is the lowest priority.

Windows Process Collection Configuration

When too many processes slow down the performance of the Machine Agent on Windows, you must adjust the system environment variables to accommodate. Specifically, in relation to Windows-based operating systems supported by the AppDynamics platform. See [System Requirements](#) (see page 2657).

Microsoft Windows process collection is enabled by default in the Controller and is missing the Effective User value due to performance issues. To retrieve the Effective User value, set the `APPDYNAMICS_ENABLE_PROCESS_OWNER_INFORMATION` environment variable. Although you can retrieve this information, this will most likely slow your process collection and may lead to additional issues, such as high CPU usage and the failure to report metrics. To disable process collection, set the `APPDYNAMICS_MACHINE_AGENT_STOP_PROCESS_COLLECTION` to speed up your performance at the expense of losing process metrics and metadata.

Windows System Environment Variables

This information is specific to processes monitored on a Windows server.

1. **Default:** Retrieve all Windows processes and metadata. Starting with Machine Agent 4.5.4, Effective User information is excluded by default to improve performance.
2. `APPDYNAMICS_ENABLE_PROCESS_OWNER_INFORMATION`: Retrieve all Windows processes and metadata, including the Effective User, but the Machine Agent may experience performance issues. This is available starting with Machine Agent 4.5.4.

-
3. `APPDYNAMICS_MACHINE_AGENT_STOP_PROCESS_COLLECTION`: Stops all Windows process metrics and metadata collection, but improves Machine Agent performance. If you set this variable, then the `APPDYNAMICS_ENABLE_PROCESS_OWNER_INFORMATION` variable is ignored. This is available starting with Machine Agent 4.4.0.

 These environment variables only need to be set; you do not need to assign a value to the variable.

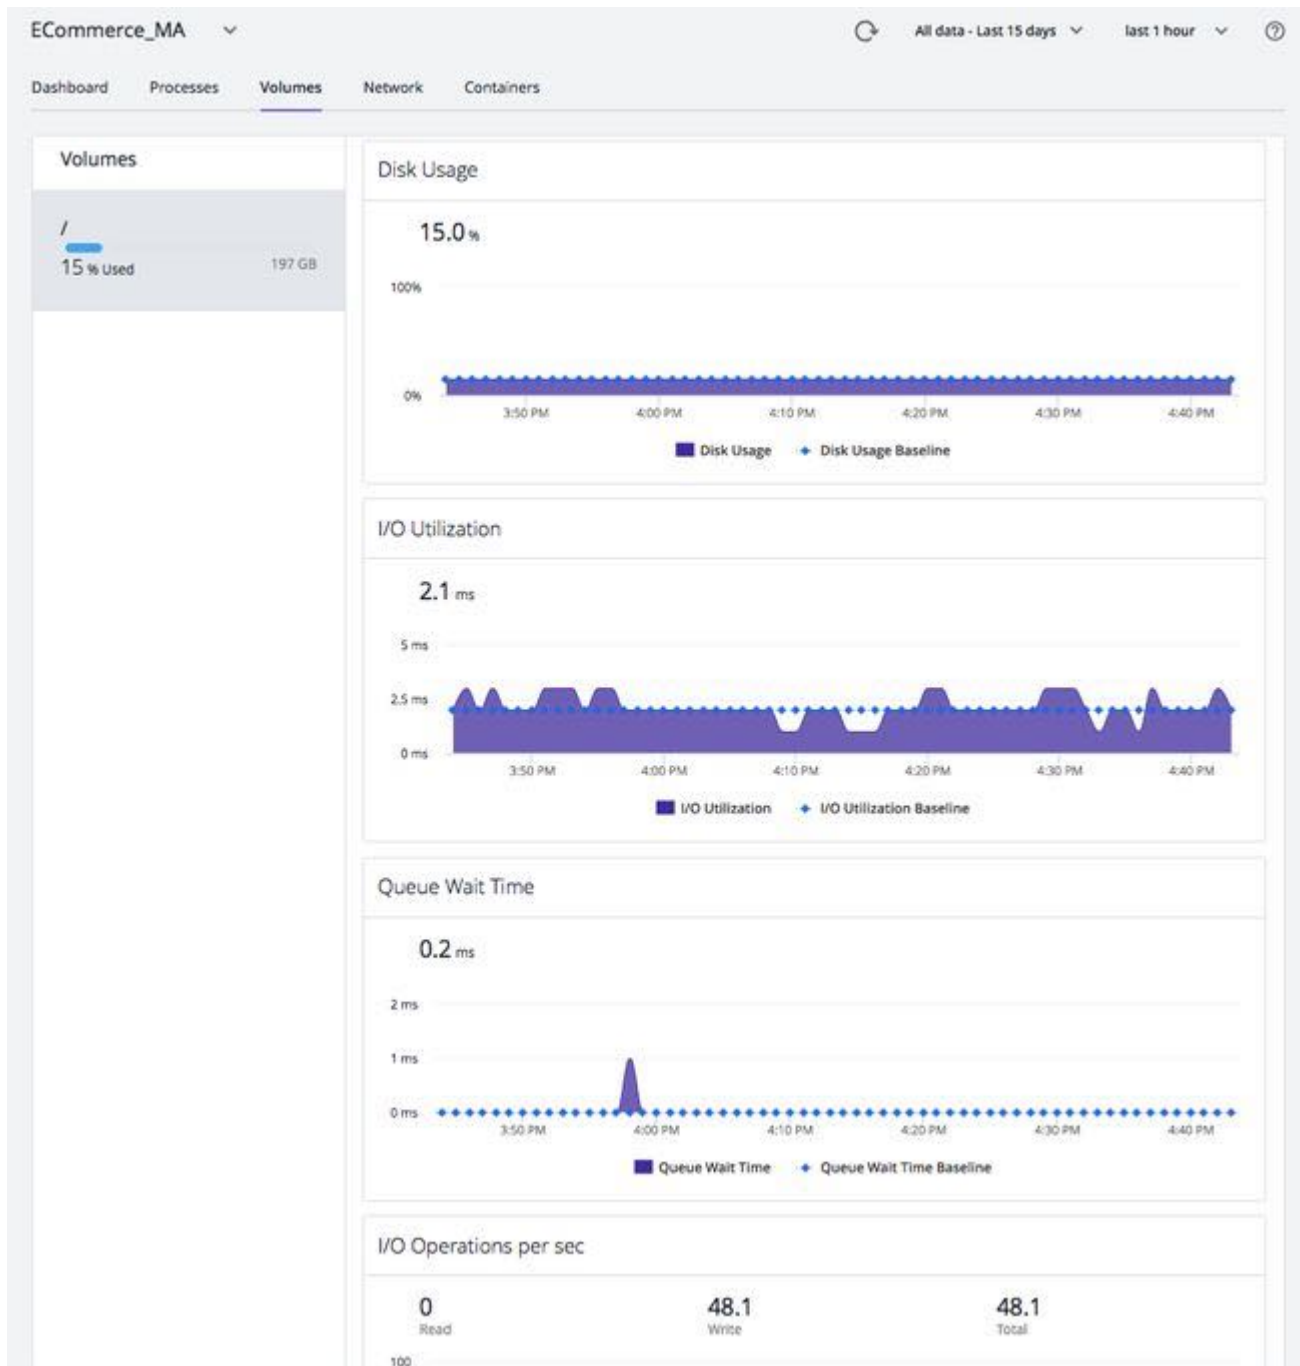

You must restart the Machine Agent for these changes to take effect.

Server Volumes Metrics

To access Server Volumes Metrics, select **AppDynamics Home > Servers > double-click server > Volumes**.

From the Server Volumes tab, you can:

- View the list of volumes, the percentage used, and total storage space available on the disk, partition, or volume
- View disk usage and I/O utilization, rate, operations per second, and wait time
- Change the time period of the metrics collected and displayed
- Click on any point on a chart to review the metric value for that time

Metrics in the Server Volumes Tab

For each selected disk, partition or volume, these columns are available for the **Server Volumes** panel.

- **Disk Usage %:** The percentage of storage space in use (To configure how this metric is calculated on Linux, see [Configure Disk Usage Metric Collection on Linux](#)(see page 2576)).
- **I/O Utilization %:** The percentage of time spent performing read and write operations
- **I/O Rate read:** The number of kilobytes per second of data reads
- **I/O Rate write:** The number of kilobytes per second of data writes
- **I/O Operations per sec read:** The number of read operations per second

- **I/O Operations per sec write:** The number of write operations per second
- **I/O Wait Time read:** The percentage of time the CPU was waiting for read operations to complete
- **I/O Wait Time write:** The percentage of time the CPU was waiting for write operations to complete

- Volume space metrics on POSIX systems are obtained using the "df" command.
- On Linux, the space reserved for root is not counted in the available space.

Server Network Metrics

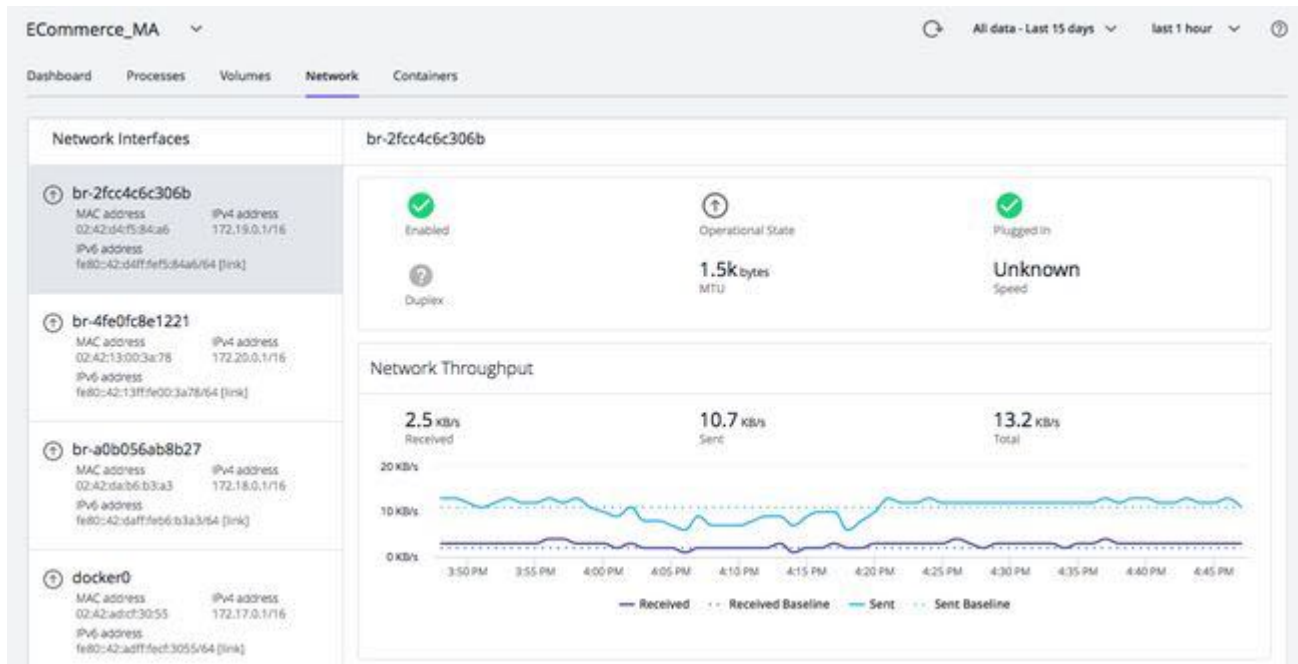

To access Server Network Metrics, select **AppDynamics Home > Servers > double-click server > Network**.

From the Server Network tab, you can:

- View the MAC, IPv4, and IPv6 IP address for each network interface.
- View the state of the network interface:
 - Enabled
 - Functional (its operational state)
 - Equipped with an Ethernet cable that is plugged in
 - Operating in full or half-full duplex mode
- View the maximum transmission unit (MTU) or size (in bytes) of the largest protocol data unit that the network interface can pass
- View the speed of the Ethernet connection in Mbit/sec
- View network throughput in kilobytes/sec and packet traffic
- Change the time period of the metrics displayed
- Hover over any point on a chart to review the metric value for that time

If no metrics display, the network device speed cannot be found for some devices and some Linux versions.

Server Network Metrics

These columns are available for the Server Network panel.

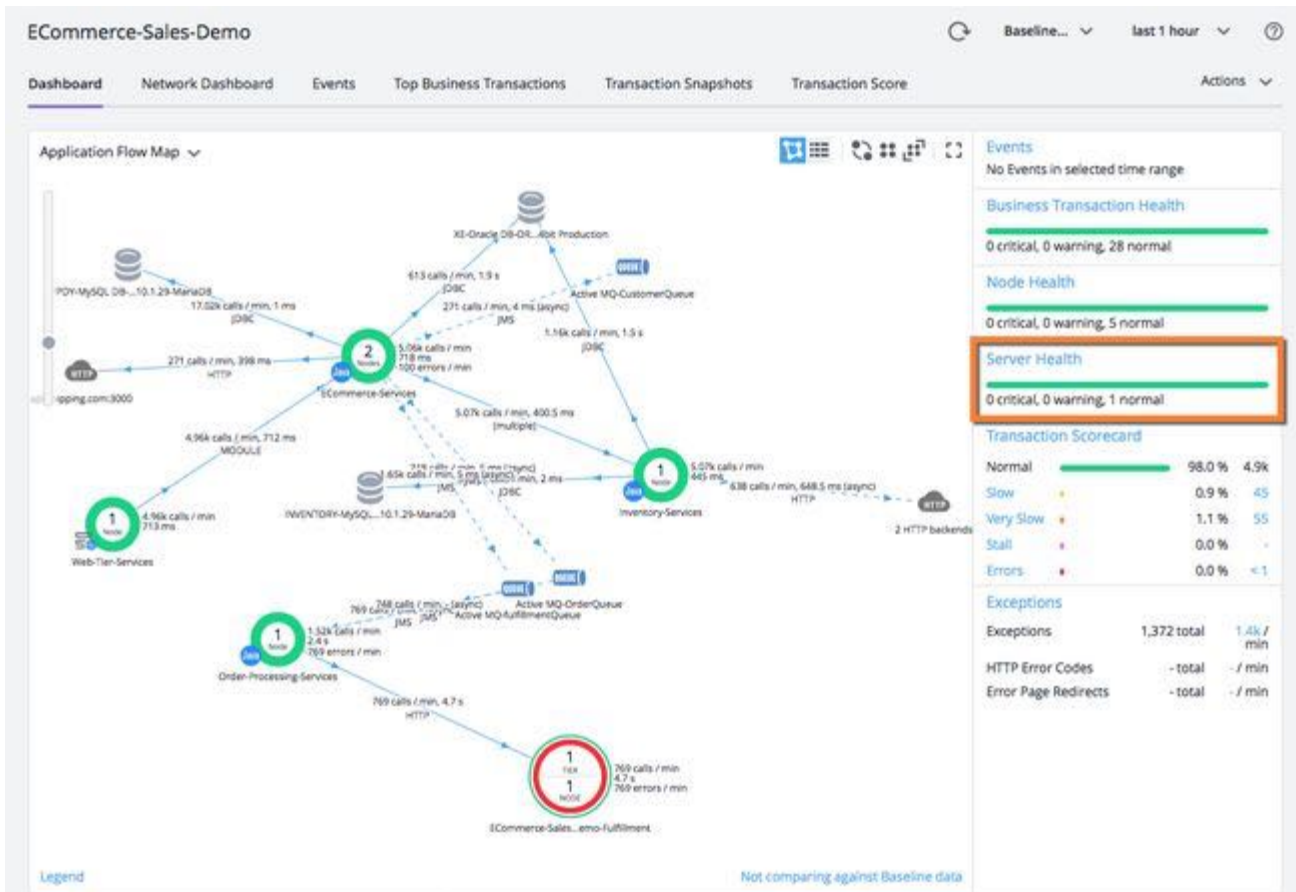

For the selected network interface:

- **Network Throughput received:** The volume of data received per second
- **Network Throughput sent:** The volume of data sent per second
- **Packets per sec incoming:** The number of data packets received per second
- **Packets per sec outgoing:** The number of data packets sent per second

Navigating Between Server and Application Contexts

With Server Visibility enabled, you can access server performance metrics in the context of your applications. See [Monitor Your Servers Using Server Visibility](#)(see page 2658).

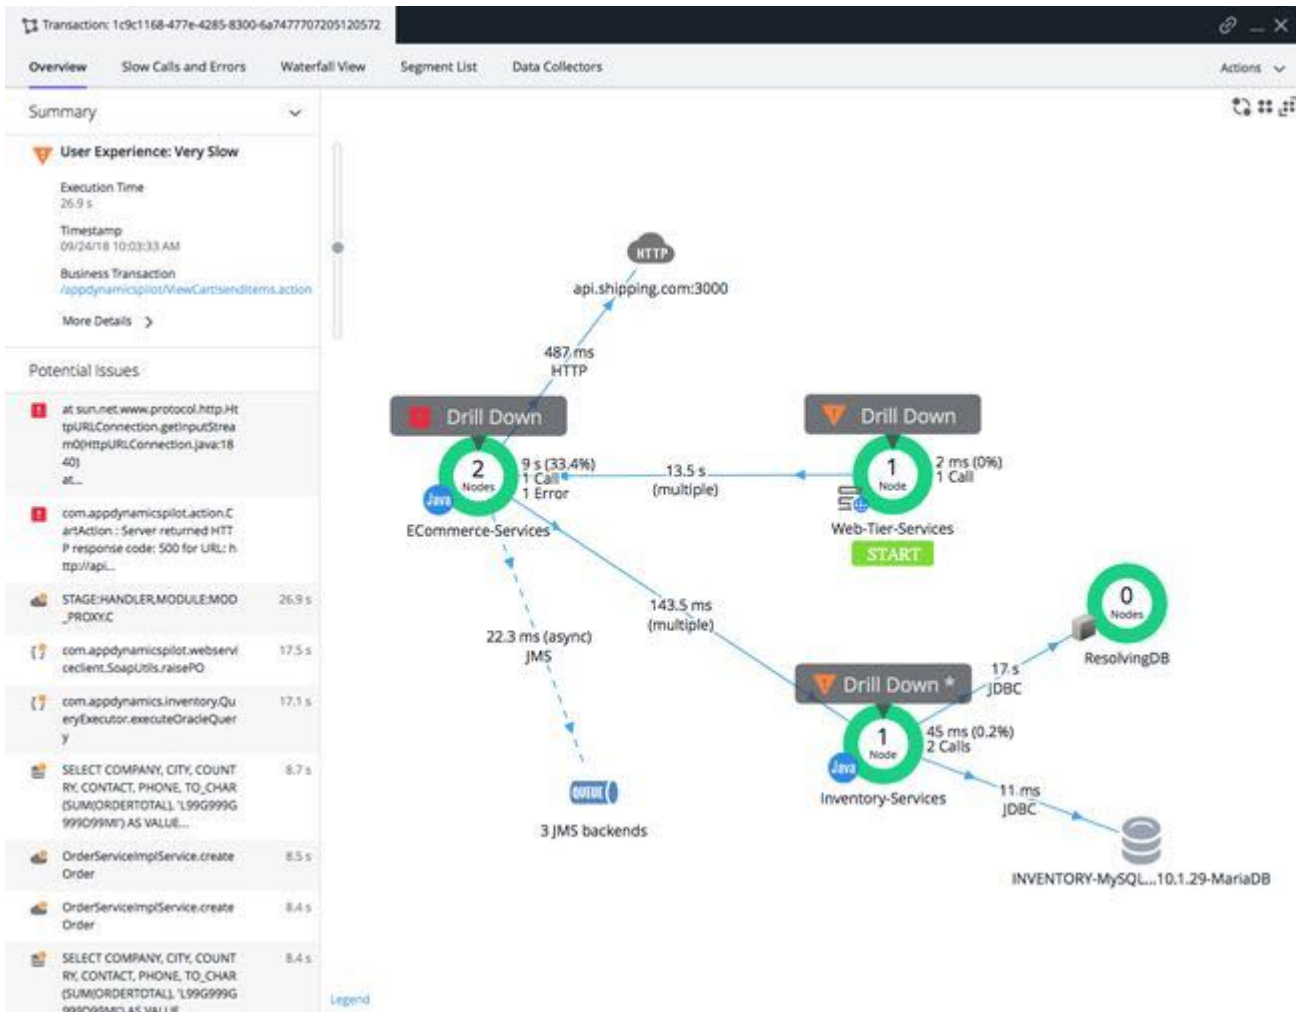

After logging in to the AppDynamics Controller, and locating your application [flow maps](#)(see page 1207), you can drill down to Server metrics for a selected tier or node. The Server health summary shows the number of critical/warning/normal conditions for the application’s servers.

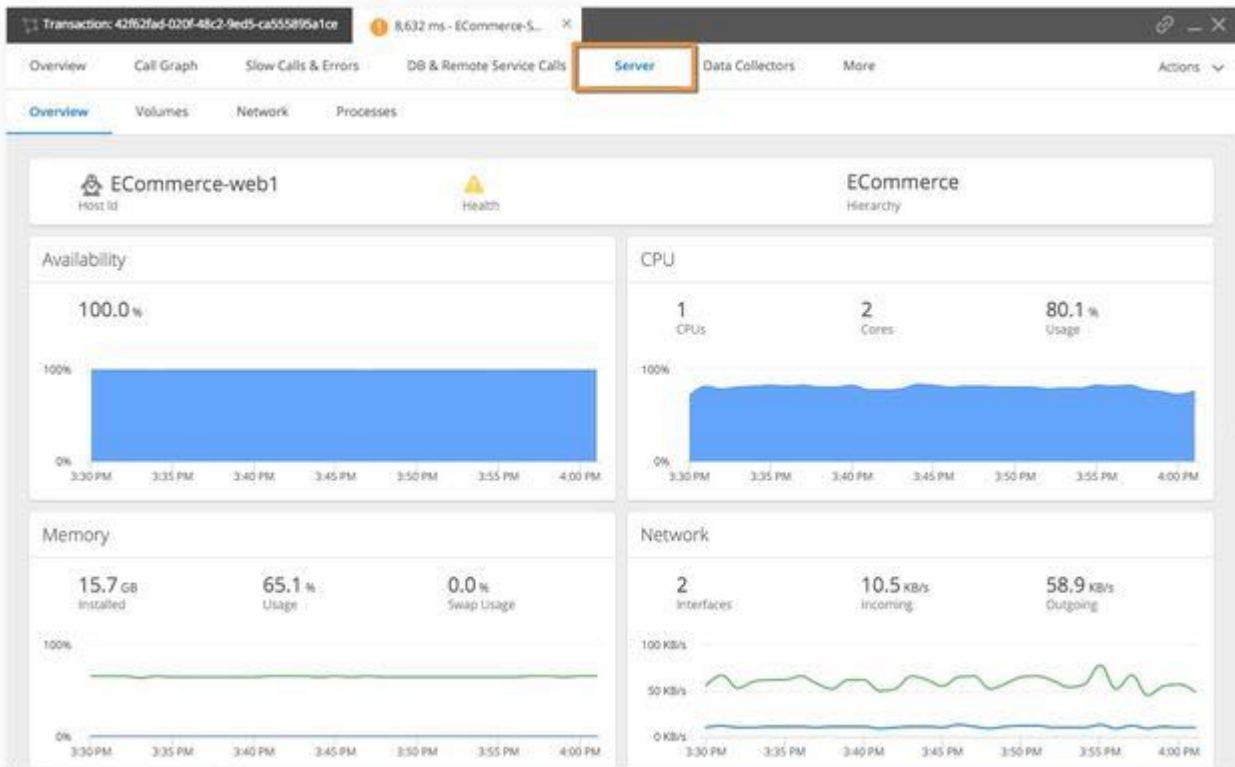

Select a tier, such as in this example, *Inventory-Services*, to review the server details.

Java Inventory-Services								
OS	Name ↑	Hierarchy	Health	CPU (%)	Memory (%)	Disk I/O (%)	Network I/O (%)	Server Visibility Enabled
	ECommerce_MA		✔	39.0	40.0	2.0	0.0	Yes

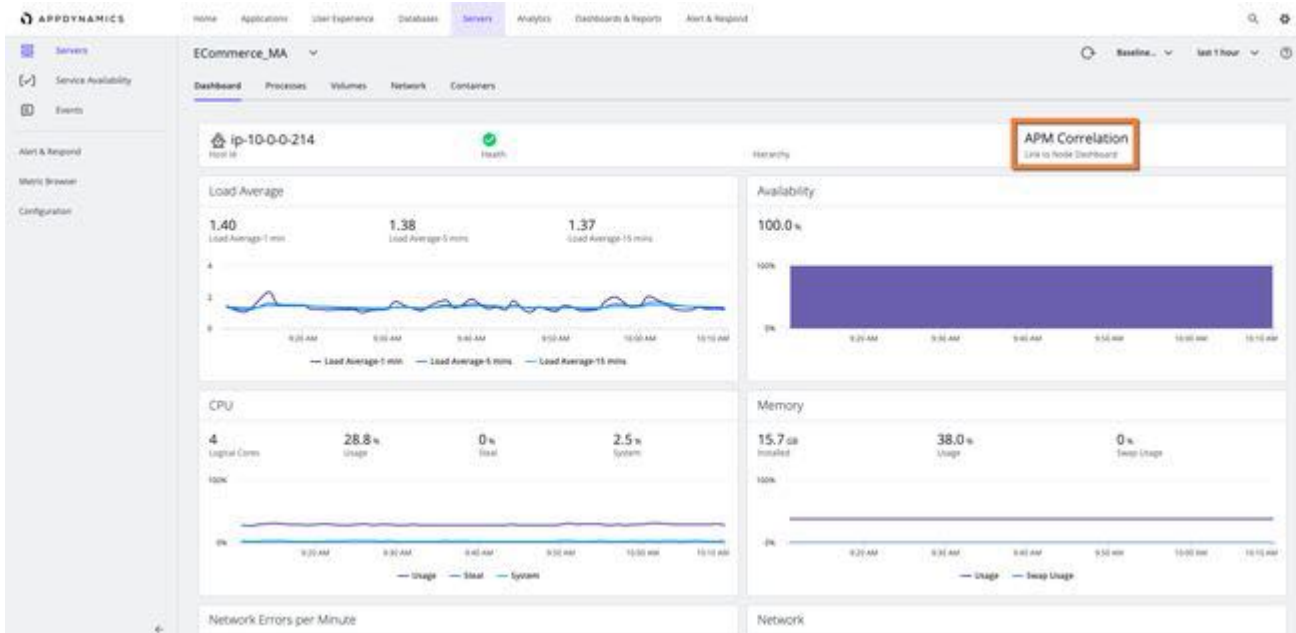

From the list of transaction snapshots, you can drill down to server metrics to determine if there is anything suspicious contributing to slow transactions. Double-click a snapshot of interest, drill down into the call to view the Server tab and its associated metrics.

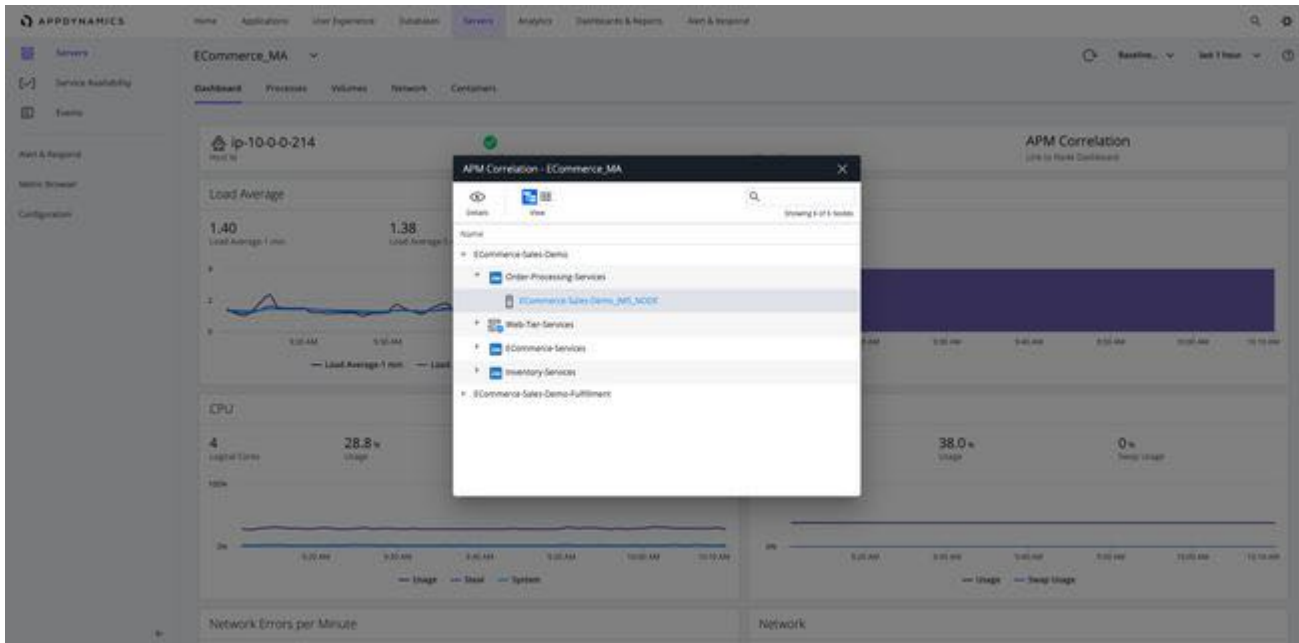

From the snapshot Server tab, you can review **CPU**, **Memory**, and **Network** utilization, and determine which processes are consuming server resources.

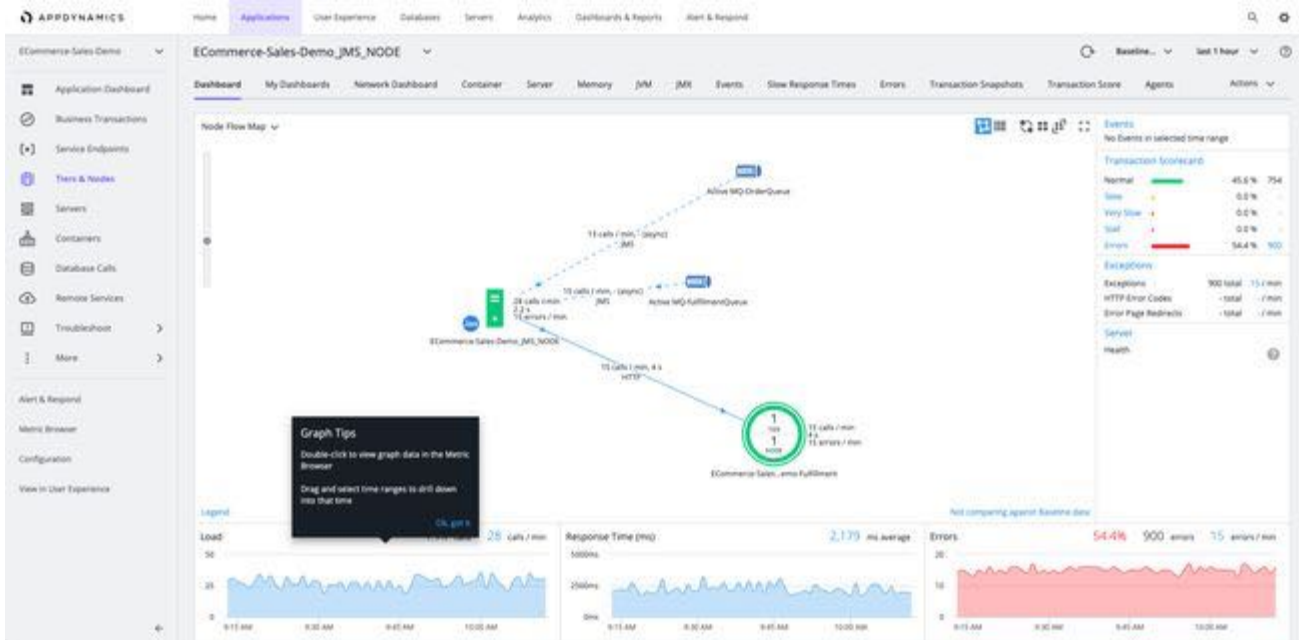

From the Servers Dashboard tab, select **APM Correlation**.

Select the **APM Correlation** link to review the APM node associated with the server. If there is more than one APM node running on the server, a dialog displays enabling you to select the APM node you want.

By selecting the APM node, its associated **Dashboard** displays.

Dynamic Monitoring Mode and Server Visibility

You can selectively control the number of metrics reported by individual Machine Agents (including Server Visibility Agents). Rather than have all Agents report all the metrics all the time, you can configure individual Agents to collect metrics.

- Key Performance Indicator metrics only (*KPI mode*)
- KPI and Diagnostic metrics (*Diagnostic mode*)
- All available metrics (*Advanced Diagnostic mode*)

This provides the flexibility to report KPI metrics on most machines, and then increase the metric level on specific servers for deeper visibility to diagnose problems. You can increase scalability on the Controller and conserve metric bandwidth on the network with no sacrifice in visibility.

Every Basic and Server Visibility metric has a default Dynamic Monitoring Mode (DMM) class: KPI, Diagnostic, and Advanced Diagnostic. See [Hardware Resources Metrics](#)(see page 2558).

Important Notes

- You can disable DMM on individual Agents. When DMM is disabled on an Agent, that Agent will report all metrics regardless of whether DMM is enabled or disabled on the Controller. Disabling DMM on an Agent is recommended only for mission-critical servers and other machines for which you are sure you want to collect all metrics. See [Machine Agent Configuration Properties](#)(see page 2613).
- If you switch the monitoring mode in the Controller from a more-inclusive to a less-inclusive mode, the Metric Browser will show values for the newly-excluded metrics for one hour after the switch. For example, if you switch from Diagnostic to KPI mode, for any Diagnostic metric, the Metric Browser will report a steady line (at 0 or the last-reported value) for one hour after the switch; then the line will disappear. This is standard behavior in the Metric Browser for an Agent when it stops reporting a specific metric.
- Each Machine Agent has a set of configurable settings that specify the volumes, networks, and processes to report and to ignore. For example, you can define a process allowlist (report on matching processes) and blocklist (ignore matching processes). An Agent will not report metrics for items excluded by its local settings, regardless of the monitoring mode. See [Machine Agent Settings for Server Visibility](#)(see page 2692).
- If you have any custom health rules based on Diagnostic or Advanced Diagnostic metrics, DMM might cause these rules to generate "false-positive" alerts. (Standard, non-custom health rules are not affected.) If you have any health rules similar to this, edit the rule to use a KPI metric instead of the Diagnostic or Advanced Diagnostic metric.

Initial Setup

DMM is enabled by default. To configure DMM:

1. Log in to the Controller administration console using the root user password. See [Access the Administration Console](#)¹⁶¹¹.

```
http://<controller host>:<port>/controller/admin.jsp
```

2. Set these options:
 - a. `sim.machines.dmm.defaultMode`(see page 2704) = KPI (Sets the default mode to KPI on all Machine Agents)
 - b. `sim.machines.dmm.dmmAllowed`(see page 0) = true (Enables Dynamic Monitoring Mode on the Controller)
3. For servers that require additional visibility, increase the monitoring mode to **Diagnostic** or **Advanced Diagnostic**. To change the monitoring mode of one or more agents:
 - a. Log in to the Controller UI.
 - b. Click **Servers**.
 - c. In the **Servers** table, check the box next to one or more servers whose monitoring mode you want to change.
 - d. Right-click the server and select **Set DMM Mode**. A dialog box appears.
 - e. Select the desired monitoring mode.
 - f. Click **Save**.

¹⁶¹¹ <https://docs.appdynamics.com/display/PRMY21/.Access+the+Administration+Console+v21.5>

Workflow Example

After you complete the initial setup, you can set the Dynamic Monitoring Mode on individual Machine Agents as required. The following is a workflow example:

- The DevOps team for a large enterprise monitors its IT infrastructure using Machine Agents (1,000-plus Agents monitoring servers in hundreds of locations). All Agents are initially set to KPI mode.
- One Agent reports a lot of disk read/write operations (KPI metric) on critical-server-A.
- Set the Agent DMM on critical-server-A to **Diagnostic**.
- Monitor the amount of data read and written for the entire disk, and for each partition (Diagnostic metrics), on critical-server-A.
- If the Diagnostic metrics do not indicate the source of the problem, and further investigation is needed, set the agent DMM to **Advanced Diagnostic**.
- Monitor average queue times and read/write times for each partition (Advanced Diagnostic metrics) on critical-server-A.
- When advanced diagnostics are no longer required on critical-server-A, set the agent DMM back to **KPI**.

Tier Metric Correlator

The Tier Metric Correlator enables you to identify load and performance anomalies across all nodes in a tier. Suppose you have a tier composed of a cluster of nodes running on containers or servers. You expect all the nodes to behave exactly the same under the same load conditions. How can you monitor this cluster for anomalies and outliers? You can use the Tier Metric Correlator to answer the following questions:

- Are all the nodes behaving within the expected band of performance, or do some nodes have outliers (slow calls, stalls, and errors)?
- In what time windows, and on which nodes, are these outliers occurring?
- Are outliers associated with a specific node cluster—for example, a cluster running a canary release?
- Are any resource issues (such as high CPU I/O or paging) correlated with these outliers?
- Are calls getting distributed evenly across all nodes in the tier?

This page describes two [example use cases](#)(see page 2678):

- Use Tier Metric Correlation to quickly identify balances and imbalances in the distribution of calls across all nodes in a tier.
- Use Tier Metric Correlation to monitor and troubleshoot a canary deployment scenario. This example shows how you can easily compare performance across node clusters, identify nodes with transaction outliers, and determine if any resource issues are causing these outliers.

Key Concepts

Transaction Outliers

The first step in metric correlation is to determine the *transaction outliers* for a tier: the number of Slow Calls, Very Slow Calls, and Stalled Calls whose response times are significantly outside the norm for that tier. The Transaction Outliers Heatmap visualizes the rate of these outliers and their distribution across all nodes in the tier.

A heatmap is a time-series chart with an extra dimension: the color intensity of each bar shows the distribution of outliers across all nodes. The darker the hue, the more nodes have outliers. The chart colors the bars in shades of gray (fewer outliers) and orange (more outliers).

Heatmaps enable you to easily identify the normal bands of performance and any outliers for all nodes in a tier. In this example, all nodes fall within two bands:

This heatmap highlights two time windows where the performance metric is noticeably higher for 50% of the nodes:

Correlated Metrics

The Correlated Metrics heatmaps enable you to correlate transaction outliers with specific resource metrics. The Correlate Metrics panel enables you to easily identify performance metrics that correlate (and do not correlate) with transaction outliers of interest. This example shows three heatmaps:

1. Transaction outliers
2. Correlated metric

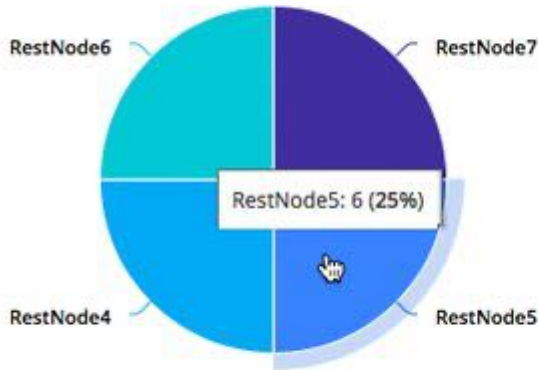

3. Uncorrelated metric (no outliers)

Troubleshooting Nodes and Servers

When you select a set of transaction outliers, the Selected Nodes and Impacted Servers charts show the distribution of these outliers across all nodes in the tier. This makes it easy to determine if these outliers are associated with specific node clusters. Double-click a pie chart to troubleshoot the node or server.

Selected Nodes

Impacted Servers

Example Use Cases

Comparing Load Distributions

In this example, a DevOps engineer wants to ensure that transaction calls are getting distributed evenly to all the nodes in a tier. The engineer accesses the **Tiers & Nodes** view, right-clicks a tier, and selects **Correlate Metrics**. Looking at the Calls Per Minute heatmap, the engineer can immediately see that the band of performance is 20-22 calls per minute, but for some nodes, the rate is higher during certain intervals. The engineer decides to investigate the relevant load balancer and finds that a simple misconfiguration is causing the device to distribute calls unevenly at certain times. Using heatmaps, they can identify and fix a minor issue before it has a significant impact on their team's mission-critical applications.

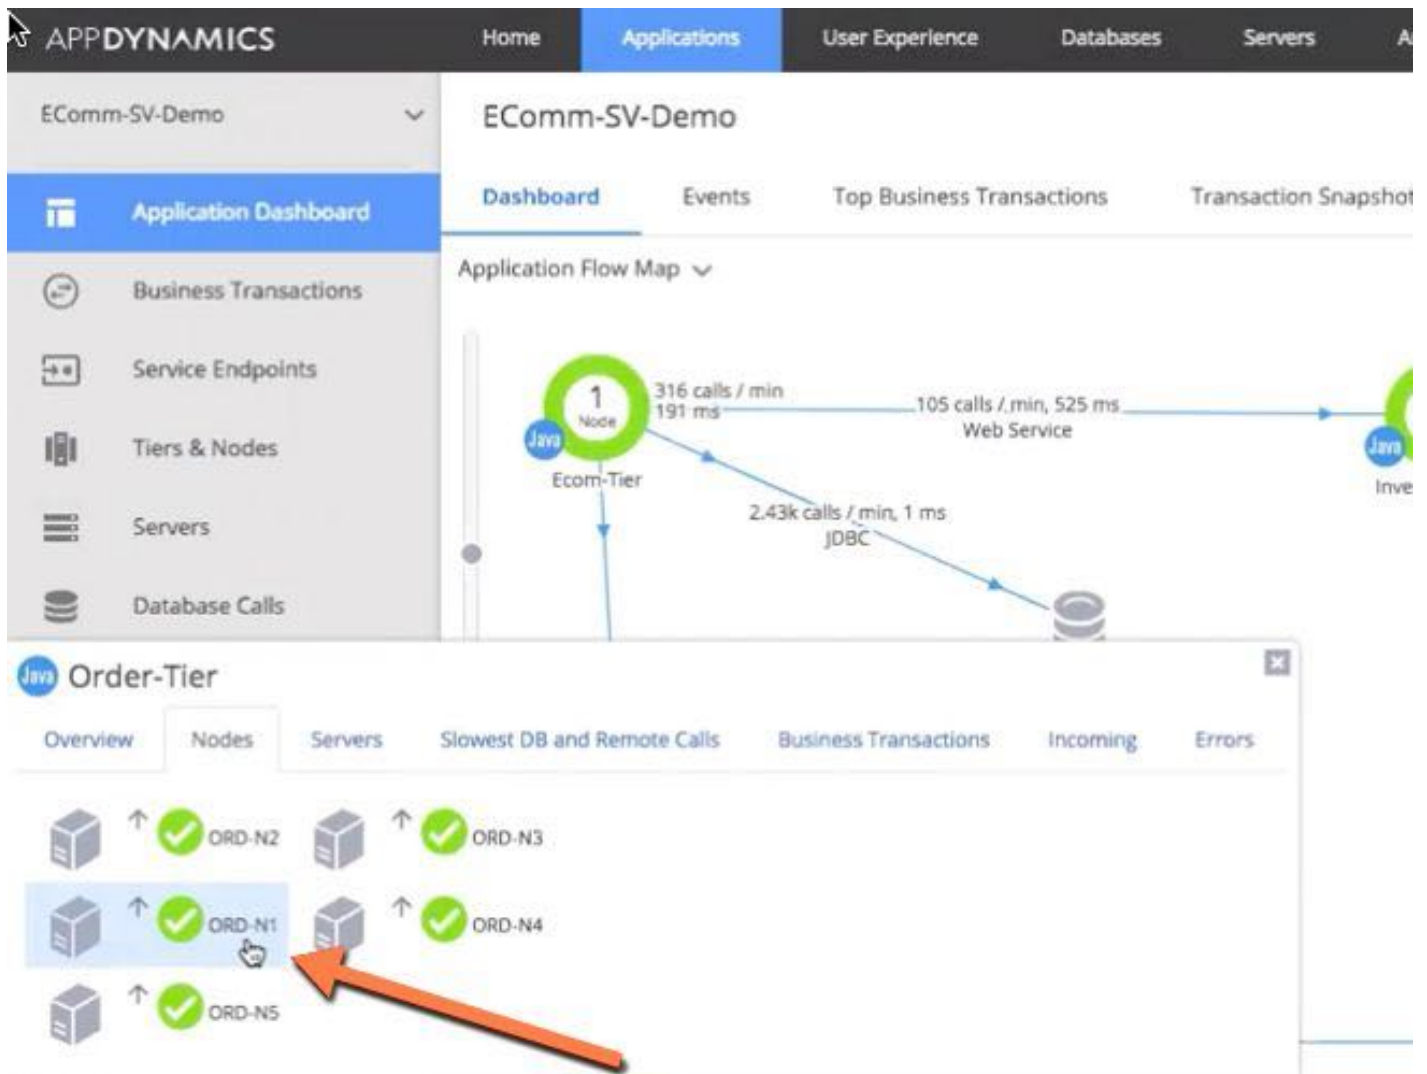

Calls Per Minute

Canary Deployment Testing

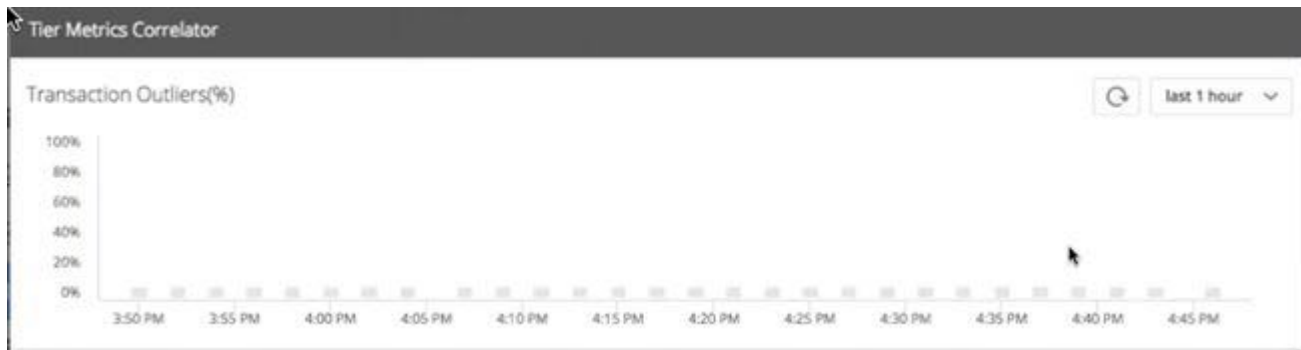

A DevOps engineer is responsible for a four-tier e-commerce application. The Order-Tier has five nodes running version 1.0 of the service. The engineer deploys a "canary" (version 1.1 of the service) on one node.

Before the engineer deploys 1.1 on all nodes, they want to determine if there is any performance degradation on this node.

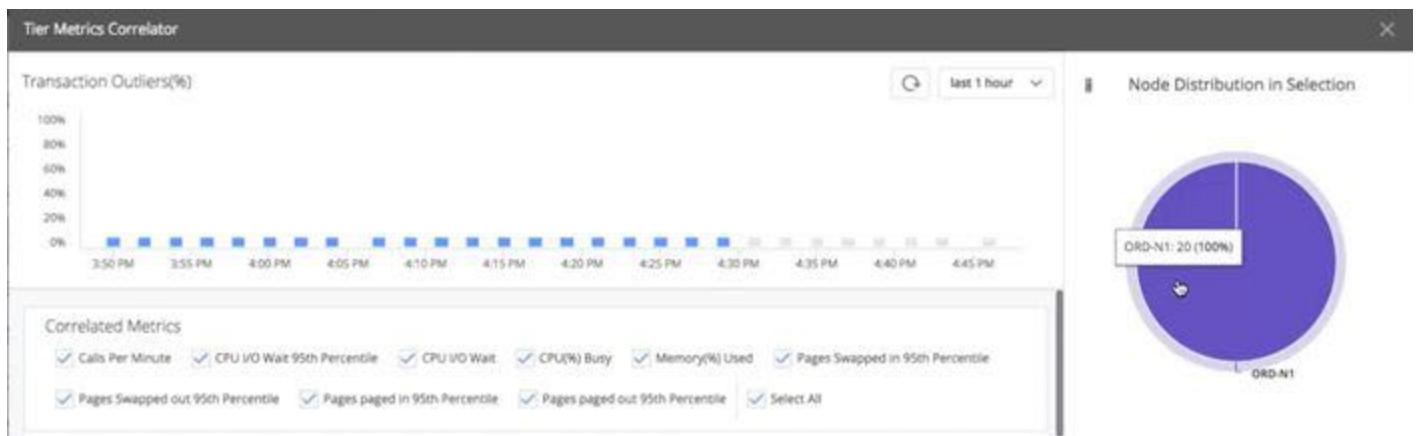

The engineer opens the Controller, accesses the **Tiers & Nodes** view for the application of interest, right-clicks the Order-Tier, and selects **Correlate Metrics**. The Tier Metric Correlator displays.

The [Transaction Outliers heatmap](#)(see page 2675) shows that some calls are outliers: Errors, Slow Calls, Very Slow Calls, or Stalled Calls whose response times are significantly higher than the band of performance for that tier.

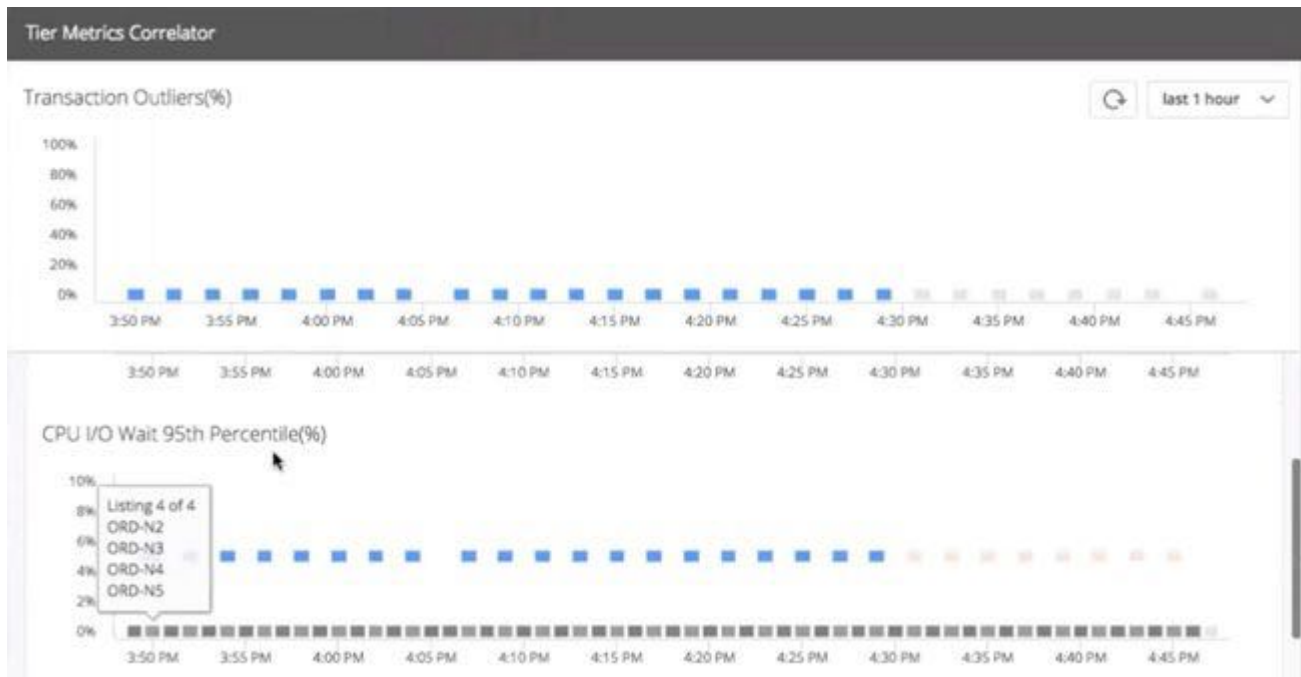

The first question is: *Are these outliers associated with our "canary node" (ORD-N1)?* The engineer drag-selects a set of these outliers. The **Node Distribution in Selection** pie chart (right) shows that all outliers are associated with the canary node. Clearly, the new code is not performing as well as the old code.

The next question is: *Are any resource issues causing these outliers?* The engineer examines the [Correlated Metrics](#) (see page 2676) heatmaps to look for metrics that correlate with the outliers on the canary node. Most heatmaps show no correlation. For example, **CPU Busy%** shows that all nodes stay within the band of performance of 0-20%.

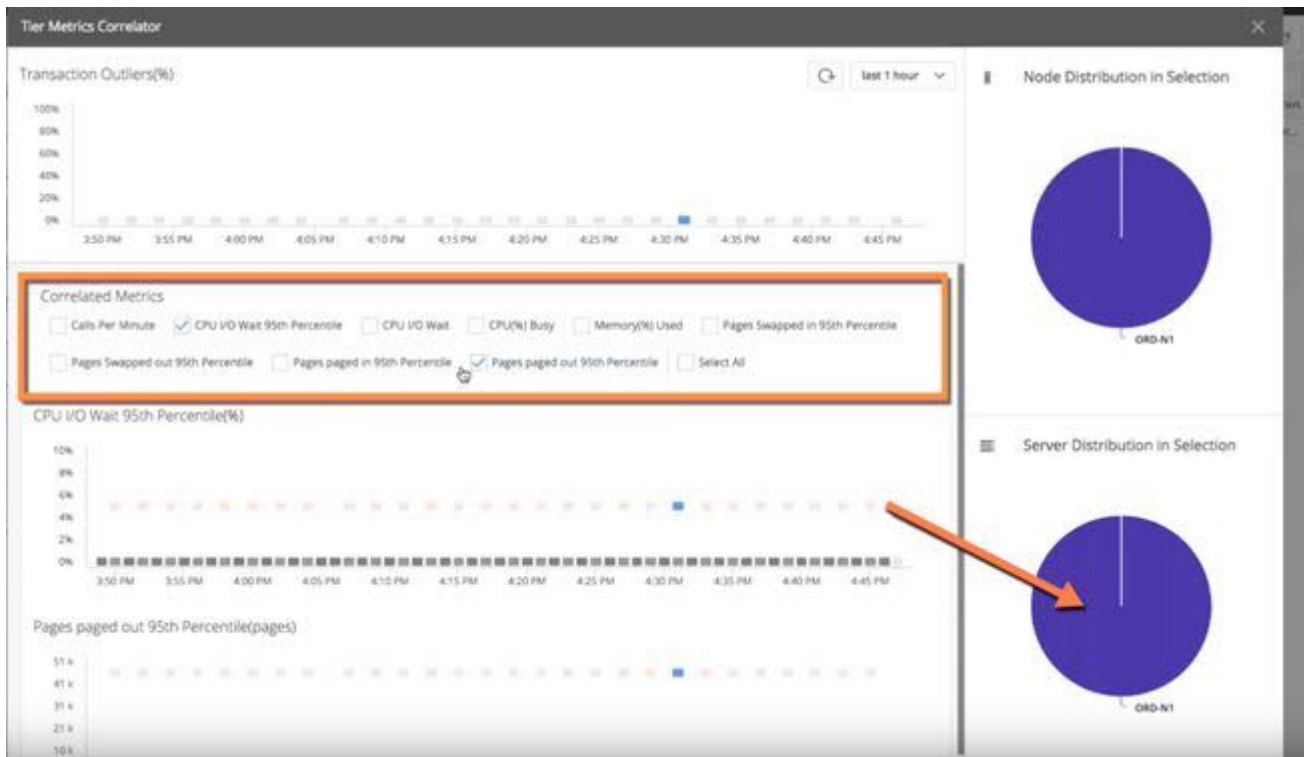

However, the CPU I/O Wait 95th Percentile(%) heatmap shows a strong correlation: All the metric outliers occur on the canary node, while all other nodes remain within the band of performance.

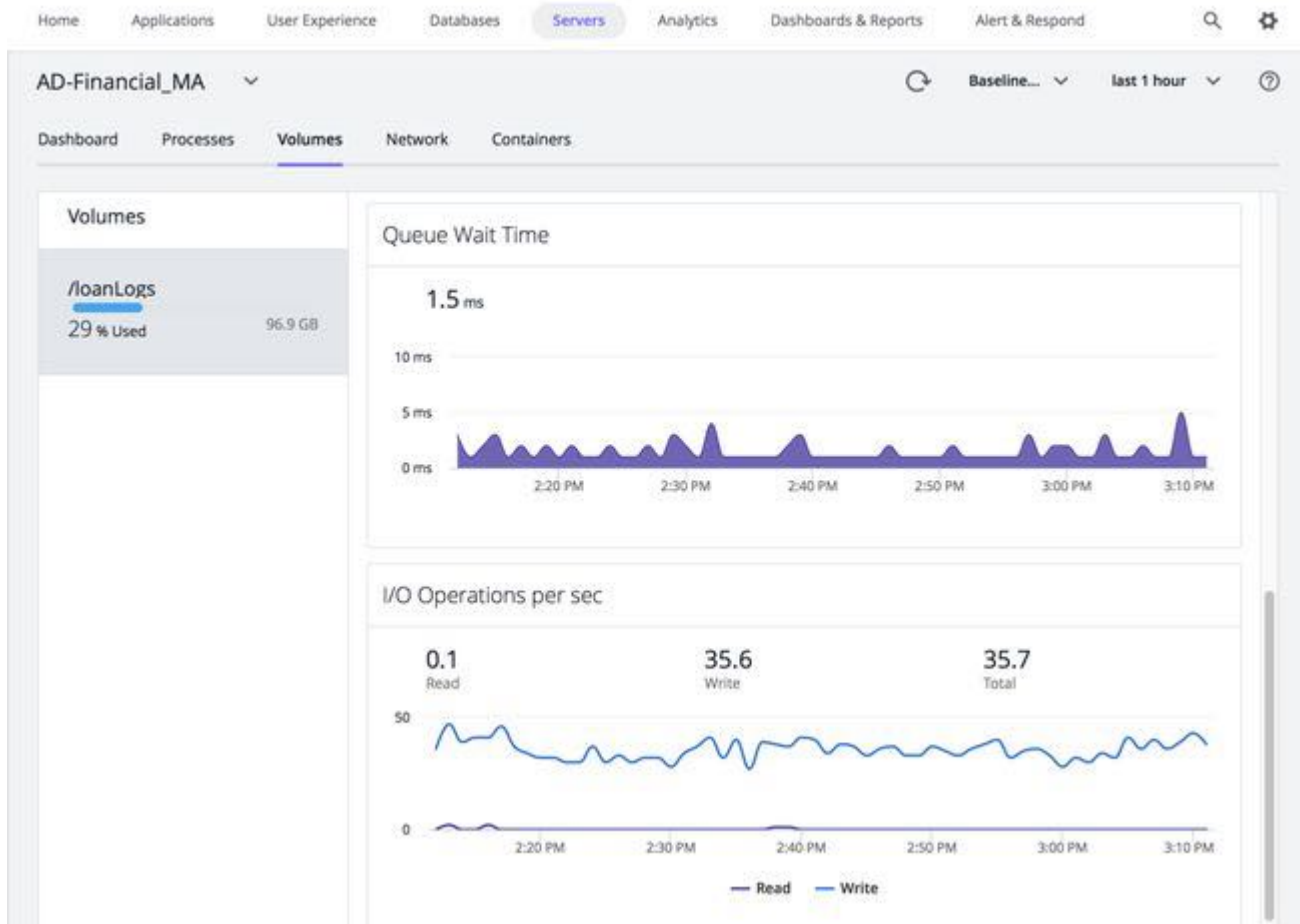

The **Pages paged out 95th Percentile (pages)** heatmap also shows a strong correlation with the transaction outliers on the canary node. With just a few clicks, they can immediately see that the canary node is performing worse; that the node has a CPU I/O problem; and that the CPU I/O problem is related to paging, which indicates a disk problem.

To reduce the visual noise and highlight the correlations, the engineer unchecks all the uncorrelated metrics. The next step is to investigate and troubleshoot the underlying server. To drill down into the canary node, they double-click on the **Server Distribution in Selection** pie chart (bottom right).

The Server Dashboard for the canary node displays. The engineer selects the Volumes tab and sees many spikes in I/O operations and queue wait times. They decide that the canary code is not ready to deploy to the entire tier, and need to re-examine the canary code, fix the regression, and re-test.

Enabling Tier Metric Correlation

You enable Tier Metric Correlation per account on the Controller. If you are using a SaaS Controller, contact [AppDynamics Support](#)¹⁶¹². If you are using an on-premises Controller:

1. Log in to the Controller administration console using the root user password:
`http://<controller host>:<port>/controller/admin.jsp`
2. Access the Accounts page, and select the account for which you want to enable this feature.
3. Select **Add Property** in the accounting settings and add:
`ENABLE_SIM_HEATMAPS = true`

To correlate percentile metrics, you must enable percentile metric reporting on both the Controller and the Machine Agent. By default, reporting is *disabled* on the Controller and *enabled* on the Agent.

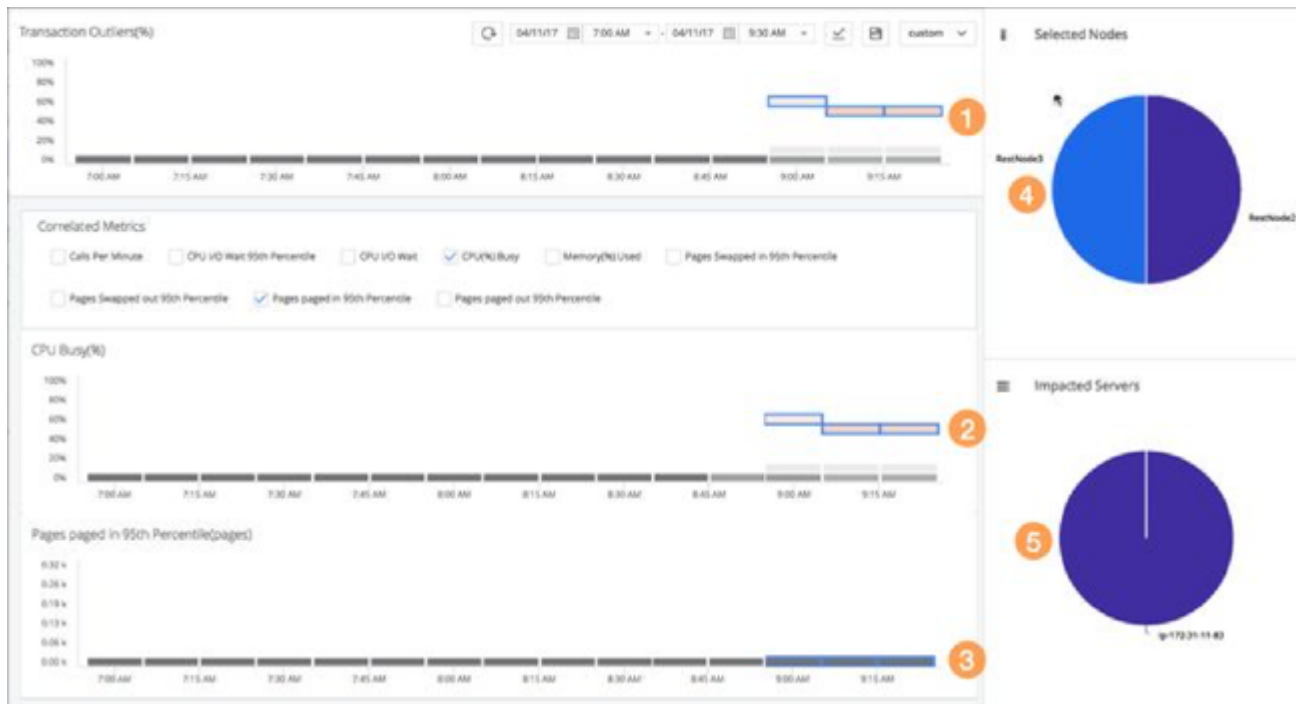

- To enable/disable reporting on the Controller, log in to the Controller administration console and set the `sim.machines.percentile.percentileMonitoringAllowed` property. See [Controller Settings for Machine Agents](#)(see page 2623)
- To enable/disable reporting on the Agent, open the `<machine_agent_home>/extensions/ServerMonitoring/conf/ServerMonitoring.yml` file and set the `percentileEnabled` property. See [Machine Agent Settings for Server Visibility](#)(see page 2692)

¹⁶¹² <https://www.appdynamics.com/support/>

Workflow Description

These steps outline the workflow description:

- Access the **Tiers & Nodes** view for the application of interest.
- Right-click the tier and select **Correlate Metrics**. The Tier Metric Correlator displays.
- Identify **transaction outliers**(see page 2675) **1** for the tier – calls flagged as Slow, Very Slow, Stalls, or Errors (see [Monitor the Performance of Business Transactions](#)(see page 1250)).
- Drag the cursor to select the outliers of interest. The pie charts on the right show the distribution of these outliers by node and server.
- Identify any **correlated metrics**(see page 2676) **2** for the outliers. Unselect checkboxes for non-correlated metrics **3**.
- Identify and troubleshoot the nodes **4** and servers **5** where the outliers are occurring. Double-click a pie slice to open the dashboard view. You can use the correlated metrics to guide your troubleshooting.

Service Availability Monitoring

Effective immediately, AppDynamics is ending support for Service Availability Monitoring. Customers who have never purchased SAM will no longer be able to do so. Renewals and additional licenses by existing customers of SAM that are purchased before June 2021, for a one-year term only, are permitted. All existing users of SAM can continue to use it. See [Support Advisory: Service Availability Monitoring End of Life \(EOL\) Notice](#)¹⁶¹³.

To access Service Availability Monitoring, select **AppDynamics Home > Servers > Service Availability** (left navigation menu).

¹⁶¹³<https://docs.appdynamics.com/display/PAA/Support+Advisory%3A+Service+Availability+Monitoring+End+of+Life+%28EOL%29+Notice>

The Service Availability Monitoring feature of Server Visibility enables you to monitor internal or external HTTP and HTTPS services. You configure service monitoring from the Controller UI. After you configure monitoring for a service, Service Availability Monitoring evaluates the service:

- The Agent evaluates each response, based on your specified violation rules, and flags each response as failed (rule violation) or successful (no violation).
- The service monitor maintains a rolling buffer of evaluated responses. This buffer has a configurable window size (number of evaluated responses), success threshold (number of successful responses), and failure ratio (number of failed responses).
- The monitor collects evaluated responses until the response buffer is full. Then, it evaluates the service as:
 - NORMAL - Successful responses are greater than or equal to the success threshold.
 - CRITICAL - Failed responses are greater than or equal to the failure threshold.
- When the buffer is full, the monitor re-evaluates the service every time it evaluates a new response.

For example, with the following values:

- Success threshold = 3
- Failure threshold = 1
- Results window size = 5

The Agent waits until five check results are received, and from these five results, if there is one failure, then the target state is CRITICAL. If there are at least three successful results, then the target state is NORMAL.

Licensing and System Requirements

Service Availability Monitoring requires a separate license and a Server Visibility license. Server Visibility is currently available for Linux, Windows, and Solaris. See [Observe License Usage](#)(see page 203) and [Server Visibility Requirements and Supported Environments](#)(see page 2657)

Viewing the Monitored Services

You can view the monitored services in the Monitored Services list. The state is determined by evaluating the Response Validators during the results window. Response Validators are rules you configure that are used to evaluate against the responses received from the service.

The possible states are:

- NORMAL - The number of successful responses in the result window is greater than or equal to the configured success threshold.
- CRITICAL - The number of failed responses in the result window is greater than or equal to the configured failed threshold.
- UNKNOWN - If the Machine Agent does not provide any data.

Monitored Services List

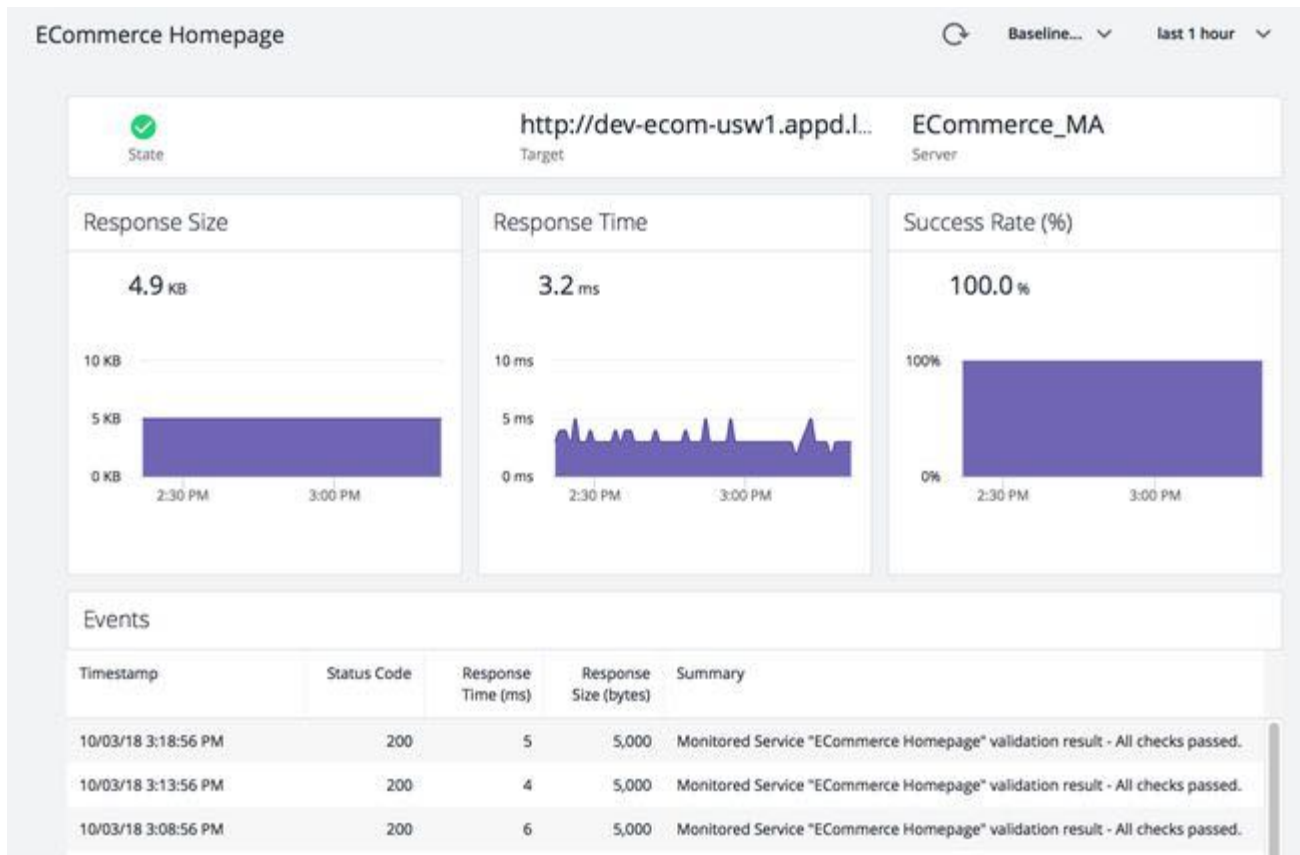

From the top navigation bar, select **Servers > Service Availability** to view a list of monitored services. Use the action toolbar to manage your monitored services by adding new ones, viewing details, and so on.

The screenshot shows the 'Service Availability' interface. At the top, there's a title 'Service Availability' and a refresh button. Below the title is a toolbar with icons for 'Details', 'Add', 'Edit', 'Delete', 'Copy', and 'View Options'. A search bar is also present. The main content is a table with columns: 'Monitored Service ↑', 'Server', 'State', 'Success Rate (%)', 'Response Time (ms)', and 'Response Size (bytes)'. The table shows two entries: 'ECommerce Homepage' with a success rate of 100.0% and 'ECommerce Marketing Landing Page' with a success rate of 0.0%.

Monitored Service ↑	Server	State	Success Rate (%)	Response Time (ms)	Response Size (bytes)
ECommerce Homepage	ECommerce_MA	✓	100.0	3	5.0k
ECommerce Marketing Landing Page	ECommerce_MA	✗	0.0	2	1.5k

Monitored Service Details

Select a monitored service, and double-click to view the associated details.

Configure Service Availability

By default, configuration changes take effect within at least two minutes of the change, so you do not need to restart the Machine Agent after changing the configuration. If the protocol, target, or method of a service are changed once a service is created, the state of the service is set to UNKNOWN and is re-evaluated with the new configuration.

To configure this feature, users need the *Configure Server Visibility* permission. See [Server Visibility Permissions](#)(see page 172)

To access the configuration panel:

1. From the Controller top navigation bar, select **Servers > Service Availability**.
A list of monitored services display, if any are configured.

- To add a service, select **Add**.

The Add Service Monitoring Configuration panel displays with three tabs.

- From the Main tab, specify the required fields and save the configuration. Each field has an associated tooltip that provides help. See [Main Configuration Panel](#)(see page 2687).
- From the Request Configuration tab, specify your request headers. See [Request Configuration](#)(see page 2688)
- From the Response Validators tab, configure your validation rules. See [Response Validators](#)(see page 2689)

Main Configuration Panel

Field	Description	Default	Required
Name	Your name for this target configuration. This name displays in the Service Availability list.	N/A	Yes
Target	The resource to be monitored, for example, http://myThirdPartyService.com/data ¹⁶¹⁴ . Specify which HTTP method to use to send the request (GET, POST, HEAD)	N/A	Yes

¹⁶¹⁴ <http://mythirdpartyservice.com/data>

Field	Description	Default	Required
Server	Name of the Machine Agent performing the monitoring. Only servers that are enabled for Server Visibility display in the dropdown.	N/A	Yes
Socket Timeout	How long to wait, in milliseconds, after a successful connection for a complete HTTP response.	30000	Yes
Success threshold	Number of required successes within the results panel for a NORMAL state.	3	Yes
Check Interval	Interval time in between checks in seconds. <div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;"> <p>i Setting this interval to more than 60 seconds will result in visible gaps in the metric graphs for monitored services.</p> </div>	10	Yes
Results Window Size	Number of most recent results to use in determining the state of the service.	5	Yes
Connect Timeout	How long to wait (in ms) for the service to respond to a connection request.	30000	Yes
Failure threshold	Number of required failures within the result window for a CRITICAL state.	1	Yes
Max response size	Maximum response size to collect in bytes.	5000	Yes
Follow redirects	Deprecated. Follow redirect to determine the state of service.	No	No

Restricted Addresses

By default, these addresses are restricted:

- Loop back address: localhost, 127.0.0.1, ::1(IPv6)
- Site local address: 192.168.0.0/16, 10.0.0.0/8, 172.16.0.0/12, fec0::/8(IPv6)
- Link local address: 169.254.0.1 - 169.254.255.254, fe80::/10(IPv6)
- Any local address: 0.0.0.0, ::(IPV6)
- Multicast address: 224.0.0.0/4(224.0.0.0 to 239.255.255.255), ff00::/8(IPV6)

Request Configuration

You can define a list of customized headers to send with requests. For example, the list can mimic desktop or mobile browsers. You can also define a request body for POST requests. You can specify an "Authorization" header", if credentials are required.

Protocol	Field	Value Type	Default	Description
HTTP	header name and value pair	String	empty	Customized header to send with requests.
	body	String	empty	Any data to send with the request. Usually used for POST.

Response Validators

You can provide a list of rules for the Machine Agent to use to validate the health of a monitored service. If any rule is violated, the response is considered failed.

For each rule you can specify:

- HTTP property
- operator
- value

The list of operators varies depending on the property selected in the first dropdown.

Monitoring the Service Health

An event is sent to the Controller for every state change and periodically (by default every 5 minutes). You can change the update interval by setting the System property: `appdynamics.machine.agent.sam.event.updateIntervalMillis`. See [Configuration Property Reference](#)(see page 2613)

The events are visible from the Monitored Service details panel and from the Server Visibility Events list.

Double-click the event to review details.

The event properties are as follows:

- Category: CUSTOM
- Event Type: Service Availability
- Property: severity Values can be ERROR (failure) or INFO (passing).

Configuring Alerts

To create alerts for your monitored services:

1. From the Servers panel, select **Alert & Respond**.
2. Select **Policies**.
3. Select **Create Policy Manually**.
If policies already exist, you may not see this option. Click + to add a policy manually.

- Under Custom Events, click + to Add Custom Event.

- In the Actions section of the Policy panel, add the action you want to execute if the policy violates and save the policy.

Server Visibility Events

To access Server Visibility Events, from the top navigation bar > **Servers** > **Events**.

You can view Machine Agent events on the Server Events list, and on the Application Events list for applications associated with the Machine Agent. See [Monitor Events](#)(see page 231).

Machine Agent events include:

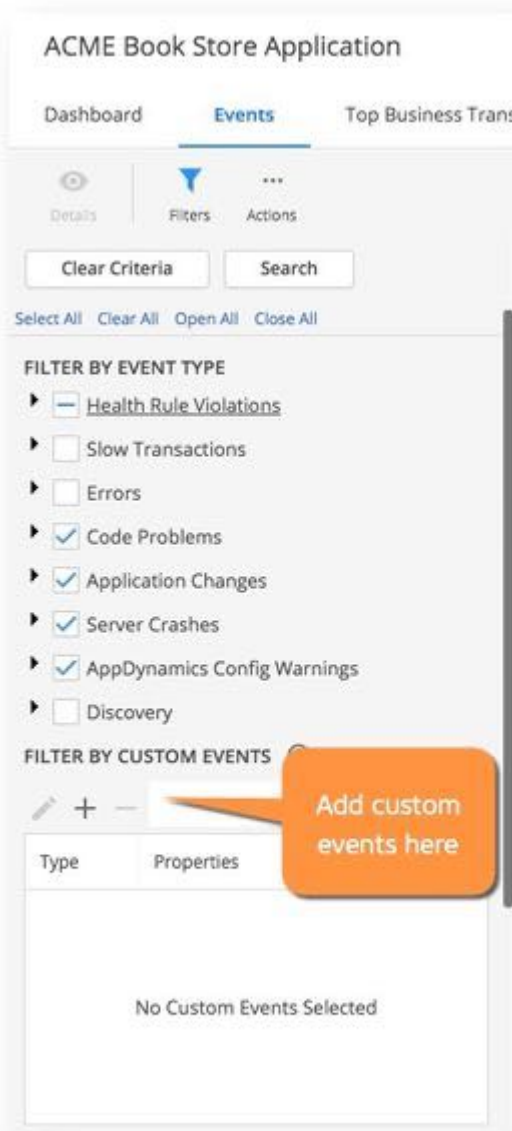

- [Custom Events](#)(see page 2691)
- [Agent Internal Diagnostic Events](#)(see page 2692)

Custom Events

Custom events include events generated by the extensions, and Service Availability Monitoring events. Service Availability Monitoring events are custom events that are sent to the Controller periodically, and for every state change in the service's health.

Events triggered by extensions are custom events and also display on the **Servers** > **Events** list.

To view custom events in the application Events list, you can add them to the event list filters.

Agent Internal Diagnostic Events

AGENT_DIAGNOSTICS

- Description – Diagnostic information concerning Agent activity, such as resetting a Machine Agent. The reset functionality is available for pre-4.2 version Machine Agents only.
- Category – AppDynamics Internal Diagnostics
- Name – `EventMessage.MACHINE_AGENT_RESET_SUCCEEDED`

Machine Agent Settings for Server Visibility

You can modify the default configuration for Server Visibility. This page describes the configurable settings and their default values.

Edit this configuration file: `<machine-agent-home>/extensions/ServerMonitoring/conf/ServerMonitoring.yml`

Edit YML Files

When editing YML files:

- If you make any changes to `ServerMonitoring.yml`, or to any other YML file, make sure that the modified file meets standard YML syntax rules.
Follow these important YML good practices:
 - Do not include any tab characters. Use whitespace characters only to indent fields.
 - Use the exact same number of whitespace characters to indent entries that are on the same level.
 - Use a plain-text editor, not a WYSIWIG editor, to edit the file. Use a monowidth/monospaced font to view the contents.
 - Always save using UTF-8 encoding.
 - Test and verify the edited file using an online YML syntax tester.
- The safest way to edit a setting in a YML file is to:
 - Copy the line you want to edit, and paste the copy into a new line. Make sure that you select, copy, and paste the entire line.
 - Comment out the original line and edit the copy, as desired.
- To add or edit a regular expression in this file, you should test and verify the regular expression using an online regex tester.
- Before you make any changes to this file, review the option descriptions on this page, and the comments in the file, carefully before you change a setting.
- The Agent updates dynamically in response to Agent configuration property changes, so you do not need to restart the Agent after you update this file.

Configurable Server Visibility Settings

Setting	Description
<code>basicEnabled</code>	Indicates whether the Machine Agent should report the basic metrics through the SIM extension. Set this to <code>false</code> to use Sigar to report basic metrics. This setting only affects monitoring on Linux. Default = <code>true</code>
<code>volumeMonitorConfig:</code> <code> maxNumberVolumes</code>	Do not report more than <i>N</i> volumes, where <i>N</i> = <code>maxNumberVolumes</code> . Default = 5 <div style="border: 1px solid red; background-color: #ffe6e6; padding: 5px;">! Changing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can process the increased resource requirements.</div>
<code>volumeMonitorConfig:</code> <code> whitelistSelectorRegex</code>	Volumes with names that match this regular expression are always reported, up to the maximum specified by <code>maxNumberVolumes</code> . Default = ""

Setting	Description
volumeMonitorConfig: blacklistSelectorRegex	<p>Volumes with names that match this regular expression are excluded. This setting is useful for filtering out irrelevant metrics.</p> <p>If a volume name matches both the blacklist and whitelist regexes, metrics for that network are reported (the whitelist takes priority) up to the maximum specified by <code>maxNumberVolumes</code>.</p> <p>The default <code>ServerMonitoring.yml</code> file does not include a <code>blacklistSelectorRegex</code> field for volumes. If you want to add one, use the same indentation and formatting as the <code>volumeMonitorConfig:whitelistSelectorRegex</code> field.</p>
volumeMonitorConfig: samplingInterval	<p>Specifies a custom sampling interval for collecting volume metrics on Linux.</p> <p>Default = 3000</p>
networkMonitorConfig: maxNumberNetworks	<p>Do not report more than N networks, where $N = \text{maxNumberNetworks}$.</p> <p>Default = 5</p> <div style="border: 1px solid red; background-color: #ffe6e6; padding: 5px; margin-top: 10px;"> <p> Changing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can handle the increased resource requirements.</p> </div>
networkMonitorConfig: whitelistSelectorRegex	<p>Networks with names that match this regular expression are always reported, up to the maximum specified by <code>maxNumberNetworks</code>.</p> <p>To report metrics for one or more virtual networks, specify a regex that matches the virtual network names.</p> <p>When collecting Process metrics on Solaris, the Machine Agent observes and captures only the first 80 characters of each process name and argument list. This means that the Agent considers only the first 80 characters of each process string when it applies whitelists.</p> <p>Default = ""</p>

Setting	Description
<p>networkMonitorConfig: blacklistSelectorRegex</p>	<p>Networks with names that match this regular expression are excluded. This setting is useful for filtering out irrelevant metrics.</p> <p>If a network name matches both the blacklist and whitelist regexes, metrics for that network are reported (the whitelist takes priority) up to the maximum specified by <code>maxNumberNetworks</code>.</p> <p>The default regex excludes virtual networks. To monitor a set of one or more virtual networks, edit <code>whitelistSelectorRegex</code> to include the networks of interest. To monitor all virtual networks, change the <code>blacklistSelectorRegex</code> to an empty string.</p> <p>When collecting Process metrics on Solaris, the Machine Agent observes and captures only the first 80 characters of each process name and argument list. This means that the Agent considers only the first 80 characters of each process string when it applies blacklists.</p> <p>Default = "<code>^veth.* ^vnet.*</code>"</p>
<p>defaultProcessClassSelector</p>	<p>The default "class selector" based on a <code>class_selector_regex</code>. If this regex is defined, and a match is found in the process command line, the class name is the first group occurrence of that regex in the command line.</p> <p>Default = ""</p>

Setting	Description
<p>processClassSelectorRegexList</p>	<p>A list of <i>class_name:regex</i> mappings. If the command line for a process matches regex, the metrics for that process are assigned to <i>class_name</i>. This setting is useful when you want to ensure that high-priority processes get reported, even if the number of defined classes is higher than the <code>maxNumberMonitoredClasses</code> setting.</p> <p>For example:</p> <pre>processMonitorConfig: processClassSelectorRegexList : machineAgentTasks: '.*java.*machineagent.*' controllerTasks: '.*java.*controller.*' nextOne: '.*svchost.*'</pre> <p>The Machine Agent assigns a process to a class as follows:</p> <ol style="list-style-type: none"> 1. Assign to the first match in <code>processClassSelectorRegexList</code>. 2. If there is no match for the <code>processClassSelectorRegexList</code> (step1), apply the default <code>ProcessClassSelector</code> regex to the command line. 3. If there is no match for the default <code>ProcessClassSelector</code> regex (step 2), use the process name (truncated if the name exceeds the <code>maxClassIdLength</code>). <p>These steps outline the recommended workflow for updating this list:</p> <ol style="list-style-type: none"> 1. The default <code>ServerMonitoring.yml</code> file includes an example that is commented out. If you are updating the default list for the first time, you should: <ol style="list-style-type: none"> a. Create a copy of the example. b. Uncomment the copy (remove the <code><!--</code> and <code>--></code> comment tags), and edit it as needed. 2. Choose the process(es) that you want to monitor on the host machine. 3. Create a regex to match the process name(s) of interest. You should test the regex using an online regex validator. 4. Add the regex to the list. You should order the mappings by priority, highest to lowest. If a command line matches multiple regexes, the first match is used. 5. Save the <code>ServerMonitoringConfiguration.yml</code> file. 6. Wait 15 minutes or longer for the updated list to take effect, and then verify that the matching process(es) display in the Controller UI.

Setting	Description
samplingInterval	Indicates how often to gather metric data. Units in milliseconds. Default = 30000 (30 seconds)
maxClassIdLength	Specifies the maximum process class name length. Any process class name that is longer than the specified maximum is truncated. The global maximum of the process class name is 100. If this variable is set to be greater than 100, then the process name is truncated at 100. Default = 50
processSelectorRegex	Contains a regular expression that specifies which processes should be monitored by the Machine Agent. The regular expression is compared against the full command line that was used to start the process. The default regular expression will filter out any processes where the command line ends with a close bracket (']'). For Linux, the process arguments could not be found, which usually indicates a kernel process. For Windows, no processes should end with a bracket character, so the regex should include all processes on Windows. Default = ""^.[^]]\$"
minLiveTimeMillisBeforeMonitoring	Specifies the minimum amount of time a process must be alive before it is monitored by the Machine Agent. Use this to prevent the Machine Agent from being overloaded by monitoring short-lived processes. Units in milliseconds. Default = 60000 (60 seconds)

Setting	Description
maxNumberMonitoredClasses	<p>Specifies the maximum number of process classes that the Machine Agent monitors.</p> <p>The processes that are reported are using the highest CPU and memory that match the regex specified by processSelectorRegex.</p> <p>Default = 20</p> <div style="border: 1px solid red; background-color: #ffe6e6; padding: 5px; margin-top: 10px;"> <p>! Changing this setting can affect the resource consumption of your deployment. Before you change this setting verify your application environment and Controller can process the increased resource requirements.</p> </div>
defaultDiskSectorSize	<p>Specifies the default sector size (in bytes) for each disk if the Machine Agent cannot determine the sector size. This value is used to calculate the number of bytes read/written for the disk.</p> <p>Default = 512</p>
memoryMonitorConfig	<p>Specifies a custom sampling interval for collecting memory metrics on Linux.</p> <p>Default = 3000</p>
cpusMonitorConfig	<p>Specifies a custom sampling interval for collecting CPU metrics on Linux.</p> <p>Default = 3000</p>
tag	<p>A list of user-defined tags for the individual server. Use these tags to query, filter, aggregate, and compare related servers. See Server Tagging(see page 2712)</p> <p>Each tag is specified by a key-value pair. You can define tag names up to 127 unicode characters, and tag values up to 255 unicode characters. Define each key on a separate line. All key-value strings should be within single quotes. If a key has multiple values, delineate the list with commas:</p> <pre><key>: [<value>] tags: 'Location': ['NYC', 'Data Center', 'Server Room 7'] 'Environment': ['preProduction']</pre>

Docker Visibility Settings

See [Configure Docker Visibility](#)(see page 2833).

Process Limits

These additional configurable settings are available in the Controller Admin UI:

- Total number of processes displayed in the UI for a single query is 5000 processes per call.
- Total number of processes tracked per account. The default value is 10000 processes per account.

See [Controller Settings for Server Visibility](#)(see page 2701).

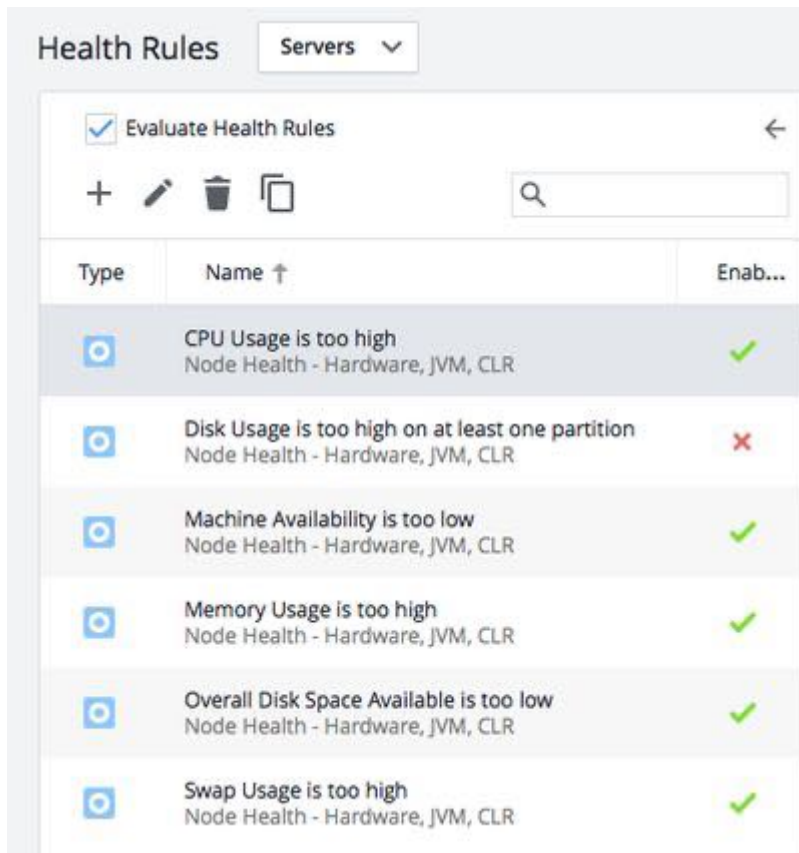

Configure Health Rules to Monitor Servers

You can configure Server Visibility to alert you when certain conditions are met or exceeded based on monitored server hardware metrics. If you are new to AppDynamics, the Getting Started Wizard can help you through the process. Alternatively, you can create alerting policies manually if you are already familiar with the process.

You configure [Health Rules](#)(see page 2699), [Actions](#)(see page 334), [Policies](#)(see page 262), and Email Digests for monitoring servers similar to how you would configure these for monitored applications, with some minor changes.

Health Rules

Default health rules based on several usage metrics are enabled for Server Visibility. You can modify these and set up your own health rules. Select **Alert & Respond** > **Health Rules** to view a list of the rules on the Controller.

From the Affects tab of the **Health Rule** wizard, you can choose to apply the Server Health Rule to:

- Subgroups (All or selected [subgroups](#)(see page 2700))
- Machines
 - All machines in the active account
 - Machines within selected subgroups
 - Selected machines
 - Machines whose names match certain criteria

The health rule is violated when specified critical or warning conditions are met.

Hierarchies, Groups, and Subgroups

You can apply health rules to subgroups or machines within selected subgroups. Subgroups available on the Affects tab of the Health Rules wizard are machines that are grouped into hierarchies based on the [Machine Hierarchy Property](#)(see page 2613) configuration for the Machine Agent. See [Machine Agent Hierarchy](#)(see page 2710).

The subgroups are the leaf group a machine is in. For example, there are three machines:

- A is in group Data Center 1|Rack 1
- B is in group Data Center 1|Rack 2
- C is in group Data Center 1|Rack 1

A and C are in the same subgroup, B is in a different one.

Policies

Server [Policy](#)(see page 262) Actions are triggered when any or select Health Rule Violation Events occur. Unlike Application Policies, Server Policies cannot be based on custom events.

Actions

Actions(see [page 334](#)) are performed when a health rule is violated and a policy is triggered. Actions can be email or SMS message notifications, HTTP requests, or custom actions that have been uploaded to the Controller. You can also use [email](#)(see [page 339](#)) and [HTTP request](#)(see [page 347](#)) templates for alert and respond actions.

Email Digests

Email Digests enables you to send notification of chosen health rule violation events to specific email addresses at a specified frequency, such as every 2 hours.

Controller Settings for Server Visibility

This page describes Controller Admin settings that are specific to Server Visibility. You can apply these Controller settings and permissions from either the **Account** or **Controller** tabs. Changes to the settings take effect the next time the Agent is restarted and connects to the Controller.

 You need the [root user](#)¹⁶¹⁵ password to change these settings.

You cannot set all configuration properties at the account-level. Check the Description column for each property to determine whether you can enable a specific Server Visibility Property. See [Roles and Permissions](#)¹⁶¹⁶ and [Manage Users and Groups](#)¹⁶¹⁷

To change the Controller Admin settings for Machine Agents, see [Controller Settings for Machine Agents](#)¹⁶¹⁸

Server Visibility Property	Description	Default
sim.docker.enabled	Enable Docker Visibility (see page 0). See Monitor Containers with Docker Visibility (see page 2826).	true
sim.docker.machine.container.limit	The global limit for the number of containers to monitor per machine. You can specify this in the Access the Administration Console ¹⁶¹⁹ as a Controller setting (all accounts) or as an account setting for individual accounts. The maximum limit you can specify is 120 containers.	15

1615 <https://docs.appdynamics.com/display/PRMY21/.Update+the+Root+User+and+Glassfish+Admin+Passwords+v21.5>

1616 <https://docs.appdynamics.com/display/PRO45/Roles+and+Permissions>

1617 <https://docs.appdynamics.com/display/PRO45/Manage+Users+and+Groups>

1618 <https://docs.appdynamics.com/display/PRO45/Controller+Settings+for+Standalone+Machine+Agents>

1619 <https://docs.appdynamics.com/display/PRMY21/.Access+the+Administration+Console+v21.5>

Server Visibility Property	Description	Default
<code>sim.docker.monitorAPMContainersOnly</code> (previously known as <code>sim.docker.infraMode.enabled</code>)	When set to <code>true</code> , allows you to monitor APM containers only. If the value is set to <code>false</code> , monitors all the containers on the machine except the Machine Agent container. You can apply this property at an account level and enable the monitoring of containers with and without APM. This property was formerly named <code>sim.docker.infraMode.enabled</code> .	<code>true</code>
<code>sim.exceptions.stacktrace.enabled</code>	When this setting is enabled, Controller stack traces are sent in the error response when a client request encounters an error. <div style="border: 1px solid red; padding: 5px; margin-top: 10px;">  Setting this to <code>true</code> is a security risk, and should only be set to <code>true</code> if you understand the consequences, and if directed by a Support Engineer. </div>	<code>false</code>
<code>sim.machines.agent.process.maxClasses</code>	The global maximum for the number of process classes collected per machine. <ul style="list-style-type: none"> If <code>maxClasses</code> (global setting in Controller) is lower than <code>maxNumberMonitoredClasses</code> (local setting in <code>serverMonitoringConfig.yml</code>), the local setting is overridden and the global <code>MaxClasses</code> is the effective maximum for that machine. If <code>maxClasses</code> (global) is higher than <code>maxNumberMonitoredClasses</code> (local), the local setting is the effective maximum for that machine. See Machine Agent Settings for Server Visibility (see page 2692) <div style="border: 1px solid red; padding: 5px; margin-top: 10px;">  Increasing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can process the increased resource requirements. </div>	20

Server Visibility Property	Description	Default
<code>sim.machines.container.hostid.conflict.check.enabled</code>	<p>When using Docker Visibility, if the unique host ID setting is not configured to use container ID in host network mode, the Machine Agent automatically registers the container using the container ID as the host ID.</p> <p>This setting was introduced in version 20.8 of the Controller, with the default value = <code>false</code>. As of Controller ≥ 20.11 the default value is <code>true</code>. If set to <code>true</code> any container with setting <code>--network=host</code> and Machine Agent version is ≤ 20.6 the container does not register.</p>	<code>true</code>
<code>sim.machines.count.maxPerAccount</code>	<p>A maximum number of machines allowed per account. Any additional machines will not appear. If you have more than 2000 machines reporting to one Controller and need to increase this number, be aware that you might need to increase the <code>sim.machines.registrations.maxPerSecondPerAccount</code> setting as well.</p> <div style="border: 1px solid red; padding: 5px; margin-top: 10px;"> <p>! Changing this setting can affect the resource consumption of your deployment. Before you change this setting, verify your application environment and Controller can process the increased resource requirements.</p> </div>	<code>2000/account</code>
<code>sim.machines.deleteStaleMachines.maxLimit</code>	<p>Set the number of machines to be deleted every 10 minutes, which is one cycle of the purger. For better performance, you can purge up to 700 machines per cycle.</p>	<code>100</code>

Server Visibility Property	Description	Default
sim.machines.dmm.defaultMode	<p>Sets the Dynamic Monitoring Mode and Server Visibility(see page 2673) default on the Controller. The allowable settings are:</p> <ul style="list-style-type: none"> • KPI – Collect Key Performance Indicator metrics only • DIAGNOSTIC – Collect KPI and Diagnostic metrics • ADVANCED_DIAGNOSTIC – Collect All available metrics <p><i>You must enter one of these exact strings. If you enter a different value (such as "advanced-diagnostic"), the Controller will not update the setting and some servers might not appear in the Servers list.</i></p>	KPI
sim.machines.dmm.dmmAllowed	<p>With this option enabled, the Controller collects metrics from each Machine Agent based on the Dynamic Monitoring Mode and Server Visibility(see page 2673) setting on that Agent. If this option is disabled, the Controller collects all available metrics from each Agent.</p>	false
sim.machines.dotNet.HostIdConflictCheckAllowed	<p>With this option enabled, the Controller throws an exception if a Machine Agent tries to register with the Controller while both of the following conditions are true:</p> <ol style="list-style-type: none"> 1. A .NET Agent on the same machine is already registered with the same <host-id> specified for the Machine Agent, and 2. .NET Compatibility Mode(see page 2628) is disabled on either the Controller or the Machine Agent. <p>The generated exception acts as a reminder that that .NET Compatibility Mode mode must be enabled on both the Controller and the Machine Agent.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p> Do not disable this option unless instructed by AppDynamics Support.</p> </div>	true
sim.machines.hostidMappingAllowed	<p>You must enable this mode if you want to collect and view Machine or Server metrics on a server with Machine and .NET Agents installed. See .NET Compatibility Mode(see page 2628).</p>	false

Server Visibility Property	Description	Default
<code>sim.machines.offline.toStaleTimeoutMillis</code>	<p>How much time, in milliseconds, to wait before considering an offline machine to be stale and marked for deletion. If this value is too high, it prevents fresh data from coming in. If the value is too low, it means less history.</p> <p>As of Controller \geq 21.2.0 two properties are used in conjunction to purge stale machines. These properties are used in tandem to determine how to display the Servers list in the user interface:</p> <ul style="list-style-type: none"> • use <code>sim.machines.offline.toStaleTimeoutMillis</code> (172800000 ms) to determine which machines are considered stale. • the <code>sim.machines.registrations.update.frequency</code> setting (86400000 ms) determines the frequency at which a server's <code>lastSeenTimeStamp</code> is updated, if there are no changes in the properties of the monitored host. This setting can not be modified. <p>You may wish to change the <code>sim.machines.offline.toStaleTimeoutMillis</code> setting according to your needs. You can specify this setting in the Access the Administration Console¹⁶²⁰ as a Controller setting (all accounts) or as an account setting for individual accounts. If this setting is modified in the Controller then a restart is required. If this setting is modified at the account level, you do not need to restart.</p> <p>Under rare circumstances old logic leads to a machine being deemed eligible for purge earlier than customer configuration.</p>	172800000 ms (2 days)
<code>sim.machines.registrations.hashCache.enabled</code>	Prevent subsequent registration requests from fetch data and compare if nothing has changed in the request payload.	true

¹⁶²⁰ <https://docs.appdynamics.com/display/PRMY21/.Access+the+Administration+Console+v21.5>

Server Visibility Property	Description	Default
<code>sim.machines.registrations.maxPerSecondPerAccount</code>	<p>Set the maximum number of registrations allowed per second per account. This setting controls the rate at which concurrent registrations are processed and prevents one account on a multi-tenant Controller from monopolizing resources needed to register the Agents.</p> <p>The default value assumes that the Machine Agents are started evenly across a minute. If you are running 2000 or more machines, you may need to increase this setting to 600/sec. A suggested formula is: ((number of Machine Agents, version 4.2 or higher / 60)).</p> <p>If you use a deployment script that starts all your Agents within a few seconds of each other, you may need to further adjust the max registrations per second.</p> <div style="border: 1px solid red; background-color: #ffe6e6; padding: 5px; margin-top: 10px;"> <p>! Changing this setting can affect the resource consumption of your deployment. Before you change this setting, verify your application environment and Controller can process the increased resource requirements.</p> </div>	<p>60</p>
<code>sim.machines.registrations.update.frequency</code>	<p>Updates the timestamp of the machine on a specific frequency, regardless of stale timeout value. Determines the frequency at which a server's <code>lastSeenTimeStamp</code> is updated, if there are no changes in the properties of the monitored host. This setting can not be modified. As of Controller <code>>= 21.2.0</code> two properties are used in conjunction to purge stale machines. These properties are used in tandem to determine how to display the Servers list in the user interface. See <code>sim.machines.offline.toStaleTimeoutMilliseconds</code> property.</p> <p>Under rare circumstances old logic leads to a machine being deemed eligible for purge earlier than customer configuration.</p>	<p>86400000 ms (1 day)</p>

Server Visibility Property	Description	Default
<code>sim.machines.reuse.enabled</code>	<p>Reuse SIM Machine entities to handle the ephemeral environment. Support is currently limited to Docker container machines.</p> <p>If set to <code>false</code>, every new container will be considered a new machine.</p>	<code>true</code>
<code>sim.machines.simAllowed</code>	This setting allows you to enable or disable Server Visibility from the Controller.	<code>true</code>
<code>sim.machines.stale.purgeIntervalMillis</code>	An interval in milliseconds that determines when stale machines are deleted from the Controller database. If the duration of this value is too short, it might overload the server. If the value is too high, then stale machines are deleted more slowly.	21600000 ms (6 hours)
<code>sim.machines.tags.maxPerAccount</code>	The maximum number of unique tags per account.	1000
<code>sim.machines.tags.maxPerMachine</code>	The maximum number of tags per machine.	50
<code>sim.metrics.metricBrowser.machineMetricMappings.enabled</code>	Enables or disables the Metric Browser to display the metrics reported per machine. When this feature is enabled, tier level aggregated metrics, available under Tier node in the Server metric browser, are not visible. With Streamlined Browsing enabled, the Hardware Resources and Custom Metrics folders do not display.	<code>true</code>
<code>sim.metrics.store.customMetrics.simNodeEnabled</code>	<p>Enables or disables the persistence of custom metric values to machines monitored by Server Visibility.</p> <p>If the setting is:</p> <ul style="list-style-type: none"> <code>true</code>: The collector stores and displays custom metric values for applications and machines. Custom metrics are displayed in Metric Browsers for both Applications and Server Visibility. <code>false</code>: The collector stores and displays custom metric values for applications only. Custom metrics are displayed in the Metric Browser for Applications only (not for Server Visibility). <p>Disable this setting if you are collecting a lot of custom metrics. This will prevent potential spikes in the number and rate of metric values stored for individual machines.</p>	<code>true</code>

Server Visibility Property	Description	Default
sim.metrics.trackRegisteredEnabled	Enable Streamlined Browsing (see page 2577) for node metrics. Use this option when you are browsing metrics for tiers that contain multiple nodes.	false
sim.perAccountProperty.enabled	Enables a user to configure properties at an account level.	true
sim.perAccountProperty.syncFrequencyInMillis	The interval in milliseconds for the per Account Property data to sync with a database.	300000
sim.perAccountProperty.syncInBackground	Enables syncing the per Account Property data with a database in the background. For better performance, set this value to true.	true
sim.processes.bulkDelete.enabled	Delete processes in bulk instead of fetching one by one. For better performance, set this value to true.	true
sim.processes.delete.maxCount	Set the maximum number of processes to be deleted every 10 minutes, which is one cycle of the purger. For better performance, set the delete maxCount processes value to 55000 per cycle.	10000
sim.processes.count.maxPerAccount	The maximum number of processes stored per account.	300000
sim.processes.count.maxPerMachine	The maximum number of processes that each Machine Agent can monitor. <div style="border: 1px solid red; background-color: #ffe6e6; padding: 5px; margin-top: 10px;"> <p>! Increasing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can process the increased resource requirements.</p> </div>	1000

Server Visibility Property	Description	Default
<code>sim.processes.creation.maxConcurrent</code>	<p>The maximum number of processes that can be registered simultaneously by the Controller. The default is 5000 processes. The Machine Agent will retry to register the processes if the first attempt fails. Until the process request is accepted and processed by the Controller, processes within that request will be missing from the Process Details page. The limit works as follows:</p> <p>Case 1: Machine Agent sends a request with 6000 processes to register, and the limit is set to 5000, then this request is rejected until the limit is increased.</p> <p>Case 2: Two Machine Agents (MA1 and MA2) each try to register 3000 processes and the limit is set to 5000. Both MA1 and MA2 requests are received by the Controller and only one of the requests will be processed ($3000 + 3000 > 5000$). So, the Controller can only process one request and rejects the other one.</p> <p>Case 3: Two Machine Agents (MA1 and M2) each try to register 500 processes and the limit is set to 5000. Both requests arrived at the Controller and since $500 + 500 < 5000$, then both requests are processed, and the processes are registered.</p>	5000
<code>sim.processes.query.maxResultLimit</code>	<p>The maximum number of processes that the UI can show (for example, in the Server Dashboard > Processes tab). Suppose the time range is 2 weeks and the Agent reported over 10000 processes during that interval. If <code>maxResultLimit = 5000</code>, the UI will show 5000 processes.</p>	5000
<code>sim.processes.registration.s.maxPerSecondPerAccount</code>	<p>Set the maximum number of process requests handled per second per account. For better performance, set to 600/sec. On a multi-tenant Controller, the total number of Agents per second should not exceed 600/sec.</p>	60/sec
<code>sim.processes.stale.purgeIntervalMillis</code>	<p>The number of milliseconds between consecutive deletes of stale processes for an account.</p>	3600000 ms (1 hour)

Server Visibility Property	Description	Default
sim.processes.terminated.toStaleTimeoutMillis	The number of milliseconds before a terminated process is considered stale and can be deleted to make space for new data. You can specify these in the Access the Administration Console ¹⁶²¹ as a Controller setting (all accounts) or as an account setting for individual accounts.	172800000 ms (2 days)

Machine Agent Hierarchy

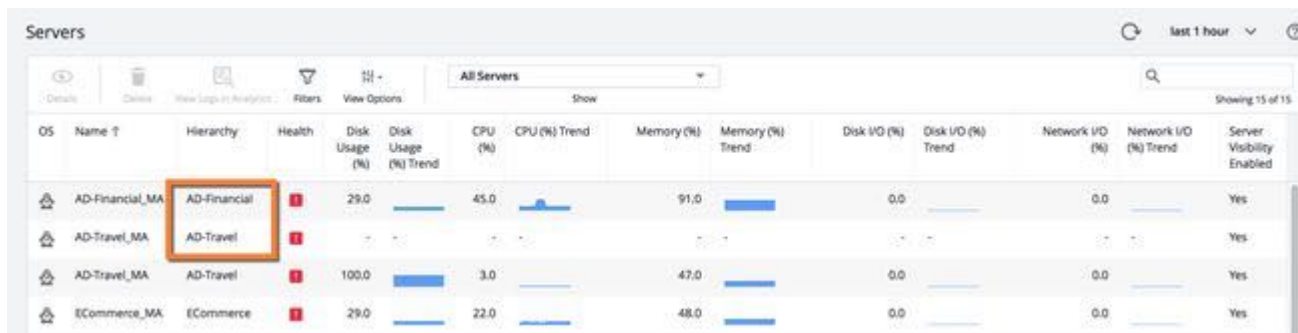

To group servers together so that you can apply health rules to the specific server groups, use the [Machine Hierarchy](#) (see page 2619) property. This property enables you to group servers into arbitrary hierarchies by specifying a hierarchical path to the server. You can group servers based on departments, geographical locations, such as data centers, or other organizational units. You can then create health rules that apply to these departments.

The server hierarchy displays in the Metric Browser, on the Servers list, and on Server Visibility dashboard.

You need a Server Visibility license to use this feature.

You can specify the [Machine Hierarchy](#) (see page 2619) property using `controller-info.xml`, a system property, or an environment variable.

For example, to group servers into geographical locations, perhaps representing different data centers, you could group the following:

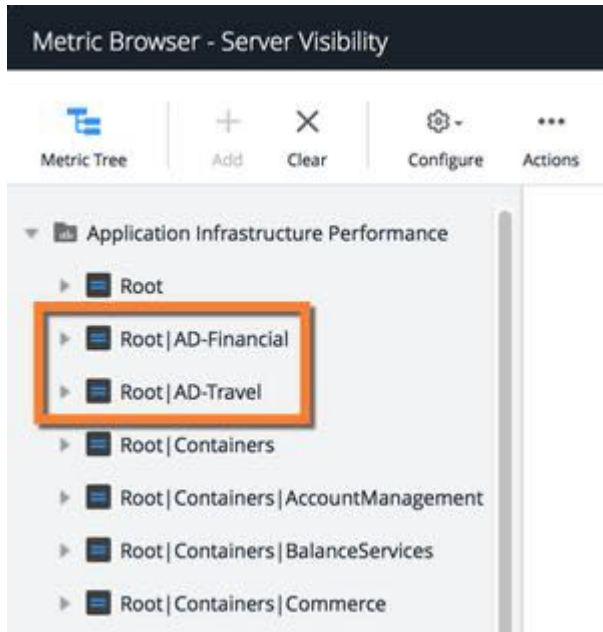

Use the `machine-path` element in the `controller-info.xml` configuration file to specify the tier and node:

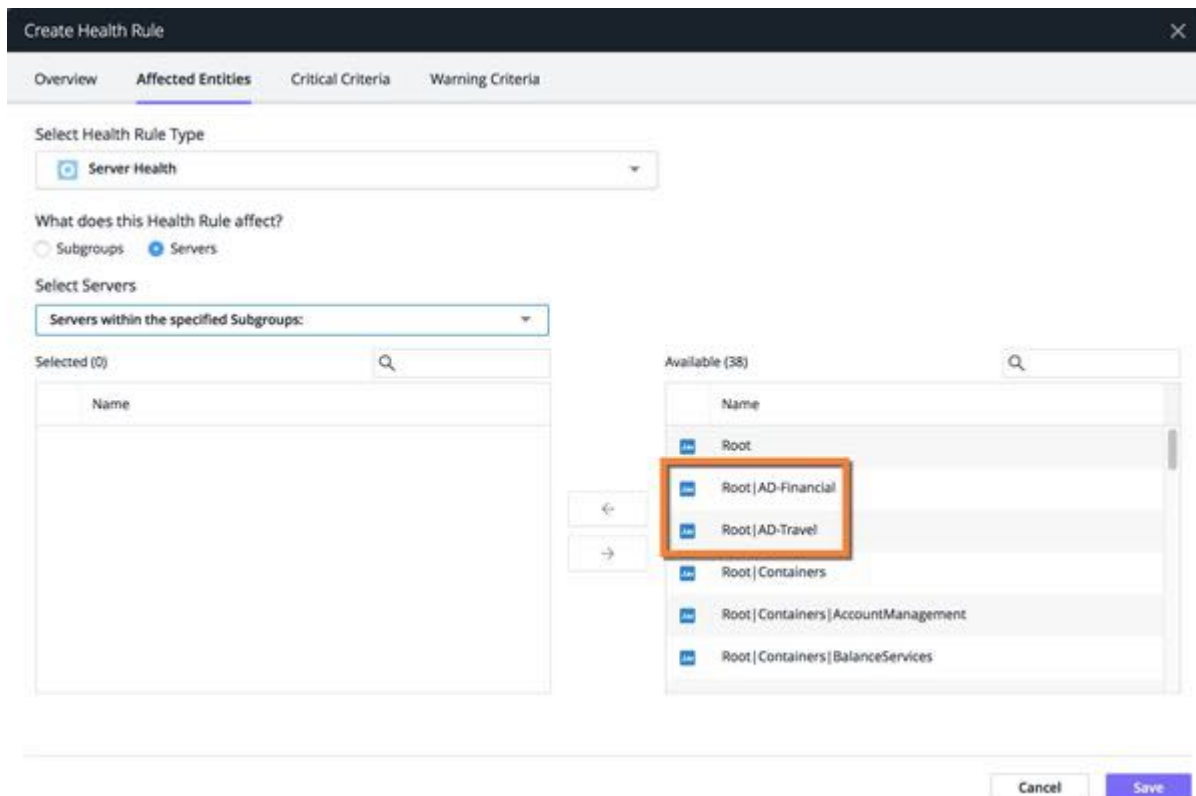

```
<machine-path>AD-Financial|Node1</machine-path>
```

The Metric Browser view for this example:

1621 <https://docs.appdynamics.com/display/PRMY21/.Access+the+Administration+Console+v21.5>

When creating health rules, you can select one or more subgroups from the Affected Entities tab:

Server Tagging

Use Server Tagging to query, filter, and compare related servers using custom metadata. You can tag related servers based on OS, location, tier, owner, or any other relevant criteria. Server tags provide additional context to server metrics.

For example, you may want to specify deployment-version tags to the servers in a specific cluster, and then use those tags to identify anomalies in server metrics during a new deployment.

Server Tagging requires a Server Visibility license. Server Tagging is currently available for Linux, Windows, and Solaris.

Server Visibility can import the tags (described in the table) automatically.

Source	Tags	Controller and Agent Requirements
Custom	Server Visibility can import: <ul style="list-style-type: none"> • Custom tags defined in <code>ServerMonitoringConfig.yml</code>. See Defining and Viewing Tags for a Server (see page 2713). • Custom tags defined in Amazon EC2 (See Tagging EC2 Resources¹⁶²² in the Amazon AWS documentation). 	<ul style="list-style-type: none"> • Controller ≥ 20.3 • Machine Agent ≥ 20.1
Machine Agent	These tags display in the Server Dashboard under Tags: <ul style="list-style-type: none"> • OS Architecture • OS Kernel • AppDynamics Agent Version 	<ul style="list-style-type: none"> • Controller ≥ 20.3 • Machine Agent ≥ 20.1
Amazon Web Services	These tags display in the Server Dashboard under Tags as <code>AWS <tag></code> . See Importing Tags from Amazon Web Services (see page 2715). <ul style="list-style-type: none"> • <code>resource-id</code> • <code>availability-zone</code> • <code>region</code> • <code>ami-id</code> • <code>instance-type</code> • <code>security-group</code> 	<ul style="list-style-type: none"> • Controller ≥ 20.3 • Machine Agent ≥ 20.1

¹⁶²² https://aws.amazon.com/search/?searchQuery=tagging+ec2+resources#facet_type=documentation&page=1

Source	Tags	Controller and Agent Requirements
Docker	<p>Server Visibility can import user-defined tags and system container-level tags. These display under Container Details > Tags as Docker <tag>.</p> <p>The exact set of tags imported can vary depending on the system on which the container is running.</p>	<ul style="list-style-type: none"> • Controller >= 20.3 • Machine Agent >= 20.1
Kubernetes OpenShift	<p>Server Visibility can import ReplicaSet and pod tags. These appear under Container Details > Tags as K8s <tag>.</p>	<ul style="list-style-type: none"> • Controller >= 20.3 • Machine Agent >= 20.1

View Servers by Tag in the Controller UI

To view filter servers by tag in the Servers list, select **Filters** and add the criteria you want for the tag filter. If you specify multiple criteria, the filter performs an AND search (for criteria with different keys) and an OR search (for criteria with the same key). This example shows the tag criteria filters for all servers with:

1. A **Tier** tag that equals **ECommWeb** OR **ECommInventory**, AND
2. An **OS Architecture** tag that equals **x86_64**.

The screenshot shows the 'Servers' page in the AppDynamics Controller UI. The navigation bar includes Home, Applications, User Experience, Databases, Servers (selected), Analytics, Dashboards & Reports, and Alert & Respond. The 'Servers' section has a toolbar with icons for Details, Delete, View Logs in Analytics, Filters, and View Options. A dropdown menu shows 'All Servers' with a 'Show' button. Below the toolbar, there is an 'Add Criteria' button and a filter tag 'OS Architecture: x86_64'. The main table displays server details:

OS	Name ↑	Hierarchy	He...	Disk Usage (%)	Disk Usage (%) Trend	CPU (%)	CPU (%) Trend	Memory (%)	Memory (%) Trend
	AD-Travel_MA	AD-Travel	!	100.0	[Progress Bar]	4.0	[Progress Bar]	47.0	[Progress Bar]
	ECommerce_MA	ECommerce	!	29.0	[Progress Bar]	23.0	[Progress Bar]	48.0	[Progress Bar]

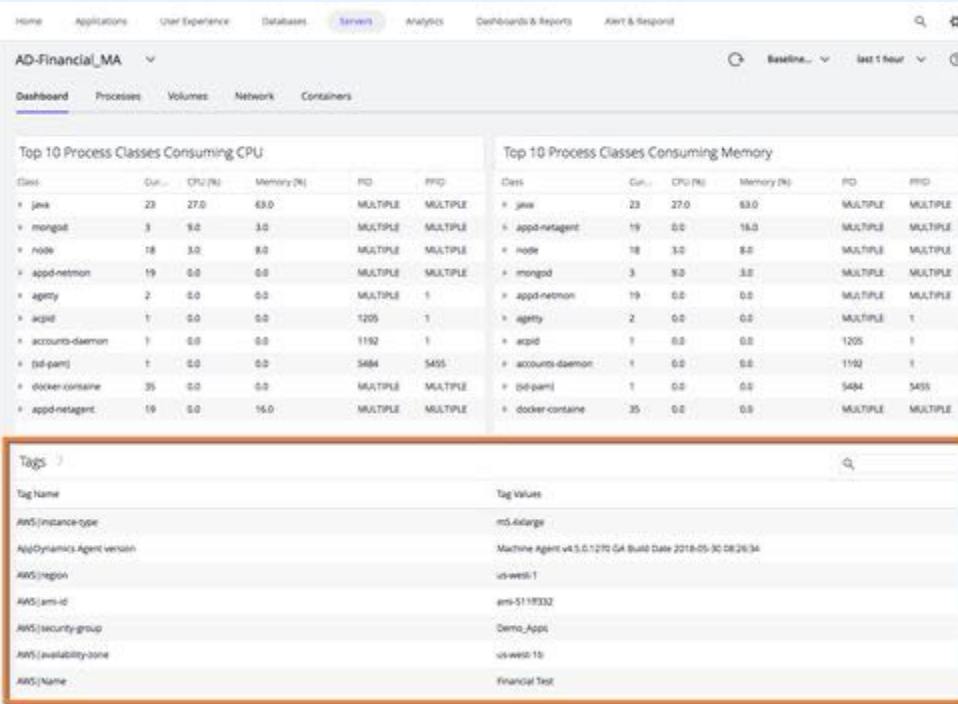

Define and View Tags for a Server

You can specify custom tags as a set of key-value strings in the Agent config directory. Each Agent can support up to 50 tags by default.

i Follow these suggested best practices to define server tags:

If an Agent is deployed in Amazon Web Services, the Agent can auto-detect and import tags defined in AWS. The Controller also auto-assigns a set of default tags to each server.

The primary use case for custom tags is to specify information that is not already specified in AWS and auto-assigned tags. Before you specify custom tags in the Agent config directory, you should review the current set of tags. Access the Server Dashboard and view the Tags pane at the bottom of the page:

Be careful not to define duplicate tags in the YAML file.

Configure the following option in `<machine_agent_home>/extensions/ServerMonitoring/ServerMonitoringConfig.yml`:

Setting	Description
tag	<p>A list of user-defined tags for the individual server. You can use these tags to query, filter, aggregate, and compare related servers.</p> <p>Each tag is specified by a key-value pair. You can define tag names up to 127 Unicode characters and tag values up to 255 Unicode characters. Define each key on a separate line. All key-value strings should be within single quotes. If a key has multiple values, delineate the list with commas:</p> <pre><key>: [<value>]</pre> <p>tags:</p> <pre>'Location': ['NYC', 'Data Center', 'Server Room 7'] 'Environment': ['preProduction']</pre>

Import Tags from Amazon Web Services

i Detailed information about Amazon Web Services is outside the scope of AppDynamics documentation.

Before Server Visibility can import tags from AWS, you must set up IAM roles:

1. Log in to the AWS console: <https://console.aws.amazon.com/iam/>¹⁶²³
2. Create a role with read access to EC2 tags.
Specifically, the role must have an AWS Managed Policy with the required permissions (such as, AmazonEC2ReadOnlyAccess) attached.
3. Add this role to your EC2 instance.
For information about these steps, search for "To create an IAM role using the IAM console" and "Attaching an IAM Role to an Instance" in this [page](#)¹⁶²⁴.
4. Run the Machine Agent with Amazon Web Services enabled.

Configuration Options for Server Tagging

To edit these settings, log in to the Controller administration console using the root user password. See [Access the Administration Console](#)¹⁶²⁵.

Server Visibility Property	Description	Default
sim.machines.tags.enabled	Enable or disable server tags for all servers	True
sim.machines.tags.aws.enabled	Enable or disable the collection of AWS tags for all servers	True
sim.machines.tags.aws.pollingInterval	Length of time in milliseconds between each polling of AWS tags	21600000 (6 hours)
sim.machines.tags.maxPerMachine	Maximum number of unique tags per account	50
sim.machines.tags.maxPerAccount	Maximum number of unique tags per account	500

Configuration Options for Docker Tags

You can configure the Machine Agent to collect different types of tags. By default, all tags are collected. To turn off tag collection, set `dockerTagsEnabled` to "false".

¹⁶²³ https://urldefense.proofpoint.com/v2/url?u=https-3A_console.aws.amazon.com_iam_&d=DwMFAg&c=3_5eq9zYXWRS8ywqccmjfTRKM8mRLoQp6HBg1Tdb_Pc&r=Rx4A70a83mdwXdLLT9wue2DbGUPbCcPazNQX0CsKvh4&m=Oa-A9qeboCbQ9MrJHnv7ABPieDKI7O-8epUd_36-2Hk&s=zaQ34bOIRR6E5eSvjcykEp3mtqvWgeCRHqdOUyGwT4I&e=

¹⁶²⁴ <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

¹⁶²⁵ <https://docs.appdynamics.com/display/PRMY21/.Access+the+Administration+Console+v21.5>

1. Edit the `<machine_agent_home>/extensions/DockerMonitoring/DockerMonitoringConfig.yml` file.
2. Under the `containerMonitoringConfig` section, set `dockerTagsEnabled: "false"`

```
# WARNING: Before making any changes to this file read the following section carefully
#
# After editing the file, make sure the file follows the yml syntax. Common issues
include
# - Using tabs instead of spaces
# - File encoding should be UTF-8
#
# The safest way to edit this file is to copy paste the examples provided and make the
# necessary changes using a plain text editor instead of a WYSIWYG editor.
#

# samplingInterval indicates how often to gather metric data. Units in milliseconds.
samplingInterval: 30000

containerMonitoringConfig:
  # containerProcessSelectorRegex defines regular expression to evaluate the processes
in
  # each running container to be monitored by the machine agent. The regular expression
is
  # compared against each process full command line within running
  # If the pattern matches, then the machine agent start monitoring it.
  containerProcessSelectorRegex: ".*[ ]-Dappdynamics.*"
  dockerTagsEnabled: "false"
```

Configuration Options for AWS Tags

You can configure the Machine Agent to collect different types of tags. By default, all tags are collected. To turn off tag collection, set `awsTagsEnabled` to `"false"`.

1. Edit the `<machine_agent_home>/extensions/ServerMonitoring/conf/ServerMonitoring.yml` file.
2. Set `awsTagsEnabled: "false"`

```
//ServerMonitoring.yml
# WARNING: Before making any changes to this file read the following section carefully
#
# After editing the file, make sure the file follows the yml syntax. Common issues
include
# - Using tabs instead of spaces
# - File encoding should be UTF-8
#
# The safest way to edit this file is to copy paste the examples provided and make the
# necessary changes using a plain text editor instead of a WYSIWYG editor.
#
awsTagsEnabled: "false"
# samplingInterval indicates how often to gather metric data. Units in milliseconds.
```

```
samplingInterval: 30000
...
```

Configuration Options for Kubernetes and OpenShift Tags

You can configure the Machine Agent to collect different types of tags. By default, all tags are collected. To turn off tag collection, set `k8sTagsEnabled` to "false".

1. Edit the `<machine_agent_home>/extensions/ServerMonitoring/conf/ServerMonitoring.yml` file.
2. Set `k8sTagsEnabled: "false"`

```
//ServerMonitoring.yml
# WARNING: Before making any changes to this file read the following section carefully
#
# After editing the file, make sure the file follows the yml syntax. Common issues
include
# - Using tabs instead of spaces
# - File encoding should be UTF-8
#
# The safest way to edit this file is to copy paste the examples provided and make the
# necessary changes using a plain text editor instead of a WYSIWYG editor.
#
k8sTagsEnabled: "false"
# samplingInterval indicates how often to gather metric data. Units in milliseconds.
samplingInterval: 30000
...
```

Tagged Metrics

Beta Disclaimer

This documentation mentions features that are currently beta. AppDynamics reserves the right to change the features at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

Tagged Metrics

The **Tagged Metrics** panel enables you to aggregate all nodes in a tier based on a server tag (user-defined, or imported from AWS or Kubernetes) and then compare performance metrics between the node groups in one set of charts. For example, you can quickly compare the performance on all "blue nodes" and "green nodes" during a canary deployment.

1. In the Controller left-side panel, select **More > Tagged Metrics**.
2. In the **Tagged Metrics** panel, select the server tag and the tier of interest.
3. Compare the response times, call rates and transaction outliers (errors, slow calls, very slow calls) between the tag-based node groups.

The following chart shows how you can easily compare performance between different sets of nodes. For example, you want to analyze node performance for a tier with 26 nodes running v1 of the software, and one node running v2. You select the "version" tag, which represents a Kubernetes label. The charts show very clearly that the rate of slow and very slow calls has increased dramatically on the v2 node.

This feature is disabled by default.

To enable Tagged Metrics:

1. Log in to the administration console: [http:<controller-hostname>:8080/controller/admin.jsp](http://<controller-hostname>:8080/controller/admin.jsp) or [https:<controller-hostname>:443/controller/admin.jsp](https://<controller-hostname>:443/controller/admin.jsp)
2. In Controller Settings, search for "tagged.metrics.enabled" and set this field to true.
3. In Account Settings:
 - a. Select the account to enable.
 - b. Under **Account > Additional Properties**, select **Add Property**, add the "tagged.metrics.enabled" property, and set it to true.

Network Visibility

Deployment Support

With Network Visibility, you can:

- Answer the key question quickly and easily: *Is the network to blame for any performance issues in my application?*

- Identify the root cause of performance issues in the application, the network, or in application/network interactions (for example, how an application or server utilizes the network).
- Pinpoint the traffic flows, individual nodes, and transport connections where network or application/network issues are occurring.
- Collect detailed metrics that show how the network is performing, and how well your application uses network connections and resources.
- Collect and report targeted troubleshooting information to network, IT, DevOps, and other teams.

Installation And Administration On Linux

- [Set Up Network Visibility on Linux](#)(see page 2724)
- [Set Up the Network and App Agents on Linux](#)(see page 2730)
- [Administer Network Agents on Linux](#)(see page 2740)

Installation And Administration On Windows

- [Set Up Network Visibility on Windows](#)(see page 2751)
- [Install the App Agent on Windows](#)(see page 2754)
- [Administer Network Agents on Windows](#)(see page 2758)

Using Network Visibility

- [User Interface](#)¹⁶³¹
- [Network Visibility Events](#)¹⁶³²

Network Visibility Overview

Application Intelligence and Network Visibility

Network Visibility extends the application intelligence of AppDynamics APM down the stack from the application to the network. With "app-only" visibility, it can be easy to mistakenly blame (or not blame) the network when an application issue arises. Network Visibility can help reduce or eliminate the guesswork involved in identifying root causes. Network Agents and App Agents, working together, automate the work of mapping TCP connections to the application flows that use them. Network Agents can identify intermediate load balancers (which often split TCP connections) and correlate the connections on either side of these devices.

1626 <https://docs.appdynamics.com/display/PRO45/Managing+Network+Agents+in+the+Controller>

1627 <https://docs.appdynamics.com/display/PRO45/Network+Visibility+Metrics>

1628 <https://docs.appdynamics.com/display/PRO45/Advanced+Operations>

1629 <https://docs.appdynamics.com/display/PRO45/Network+Visibility+Concepts>

1630 <https://docs.appdynamics.com/display/PRO45/Workflows+and+Example+Use+Cases>

1631 <https://docs.appdynamics.com/display/PRO45/User+Interface>

1632 <https://docs.appdynamics.com/display/PRO45/Network+Visibility+Events>

The Agent-based approach of Network Visibility provides these advantages over standard approaches to network monitoring:

- More cost-efficient than using network monitoring appliances, which often view traffic from a few central locations
- Especially useful for distributed environments and multi-tier applications that span multiple network segments
- Works in cloud and hybrid networks, unlike most network-monitoring solutions

Drill Down to the Root Cause

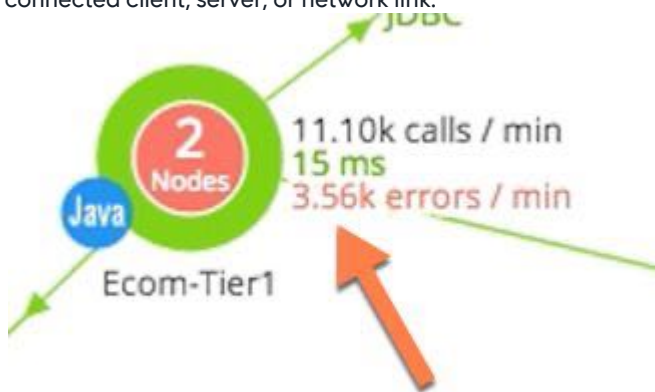

If network issues are affecting your application, Network Visibility can help you determine the cause.

- You see a spike in transaction outliers in the Application Dashboard. Are network issues to blame?
- Switch over to the [Network Dashboard](#)(see page 2814). Each tier, node, and link shows network KPIs (Key Performance Indicators) that measure the network health of that element. Use baselining to highlight network elements with KPIs outside the baseline.
- To diagnose a tier, node, or network link, right-click and select **View Metrics**. In the right-click dashboard, look for network metrics with spikes that correlate with the spikes in your transaction outliers. This is often provides direction to the network root cause.
- If a network element requires more in-depth troubleshooting, [configure the relevant Network Agents](#)(see page 2782) to collect metrics on the individual Connections used by that element. You can then
 - Click a node or link and view KPIs for the Connections used by the relevant nodes.
 - Right-click a Connection and view detailed metrics in a right-click dashboard or in the Metric Browser.

Network Visibility Metrics

Network Visibility collects and displays these metric types:

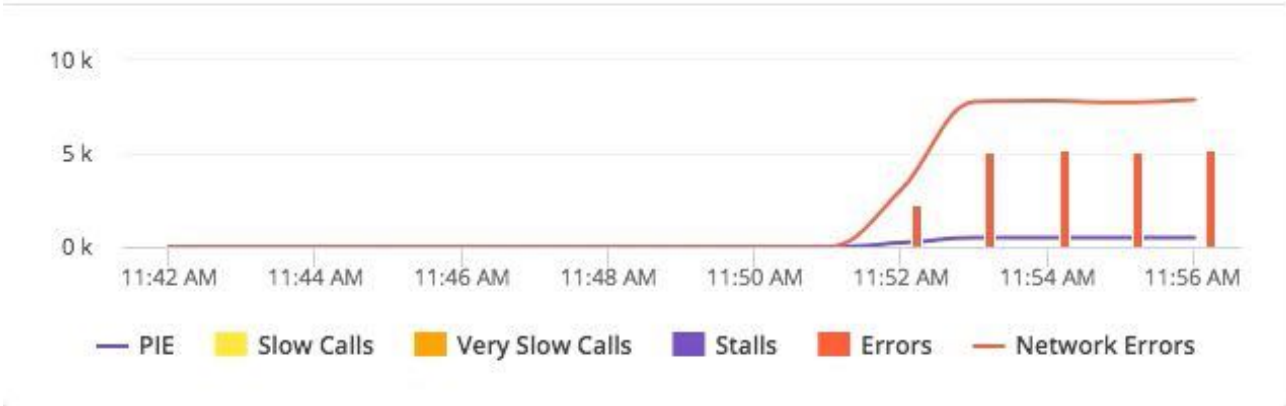

- [Network KPIs \(Key Performance Indicators\)](#)(see page 2760) provide high-level, at-a-glance measures of whether the network is affecting the performance of the monitored application. The Network Flow Map shows KPIs for each tier, node, and link.
- The [PIE \(Performance Impacting Events\)](#)(see page 2762) metric enables you to see immediately if there are any such events on a connected client, server, or network link.

- If the KPI metrics indicate an issue with a specific element, you can view [additional metrics](#)(see page 2762) for that element to identify root causes. Right-click an element and select **View Metrics**. The metrics and charts in the right-click dashboard are all

designed to answer the question: *Are there any bottlenecks on this element that are affecting my applications?*

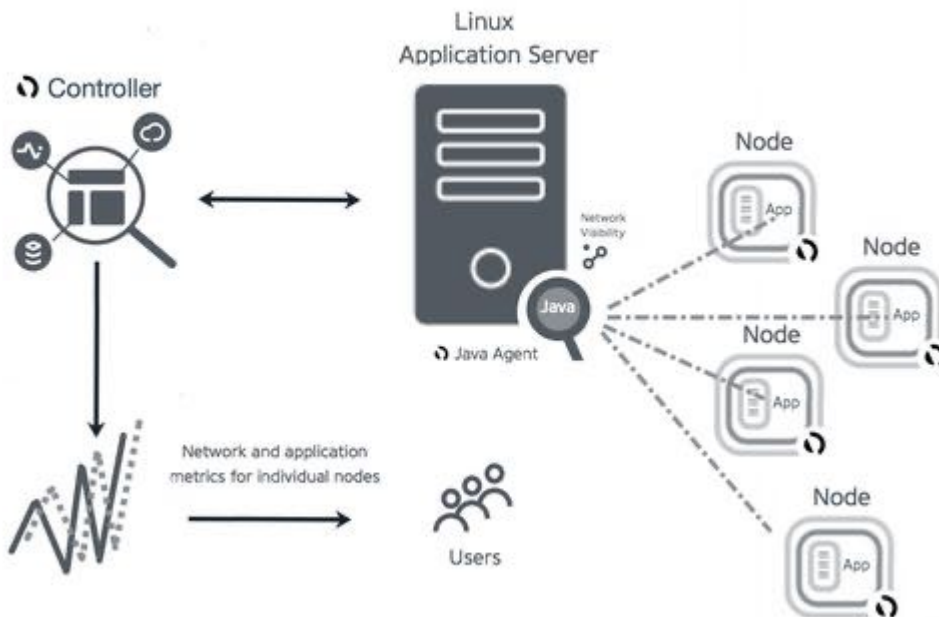

Network Impact on Transactions

- To perform in-depth analysis, you can view detailed [TCP Flow metrics](#)(see page 2768) in the Metric Browser.
- You can view [node metrics](#)(see page 2766) to evaluate the health of TCP sockets and network interfaces.

Network Visibility for Multiple App Nodes on the Same Server

Network Agents can monitor multiple nodes that are associated with the same IP address because they run on the same physical or virtual server. The Agent monitors each node individually and calculates network metrics for each node. These metrics are based on the ingress/egress traffic for each individual node, not aggregate traffic for the IP address of the host on which the node is running.

Network Visibility Supported Environments

Related pages:

- [Observe License Usage](#)(see page 203)
- [Java Supported Environments](#)(see page 493)
- [App Server Agent Supported Environments](#)(see page 1537)

This page describes application environments, operating systems, and version support for the Network Agent.

General Requirements

With a Network Visibility license, you can use Network Visibility features on Linux and Windows. You must have a supported version of the Network Agent to be installed on the monitored server. See [License Entitlements and Restrictions](#)(see page 190).

By default, Network Visibility is disabled in the Controller. To enable Network Visibility, set the agent node property `socket-enabled=true`. See [App Agent Node Properties \(S\)](#)(see page 1195).

Network Visibility is not supported on JDK 1.6. To run the Network Agent, upgrade to JDK ≥ 1.8 .

Network Visibility is compatible with Kubernetes and Docker, but not Docker Swarm.

Network Visibility on Linux

Operating System Requirements

Network Visibility is supported on Linux(see page 2724) hosts with Java app server agents only.

Each host on Linux must have:

- Network Visibility Agent ≥ 4.4
- Java Agent ≥ 4.4 with an App Agent license
- Controller ≥ 4.4 with a Network Visibility license

You must have `sudo` or `root` access permissions on the Agent host to install the Network Agent. You do not need `sudo` or `root` access to run the agent.

Distributions

The following Linux distributions support the Network Agent based on `glibc` ≥ 2.12 :

- CentOS ≥ 6 (32-bit and 64-bit)
- Ubuntu ≥ 14 (32-bit and 64-bit)
- Red Hat Enterprise Linux ≥ 6 (32-bit and 64-bit)
- Fedora ≥ 24 (32-bit and 64-bit)

You must install these required libraries before installing the Network Agent host:

- [libdl.so](#)^{1633,2}
- [libpthread.so](#)^{1634,0}
- [librt.so](#)^{1635,1}
- [libm.so](#)^{1636,6}
- [libc.so](#)^{1637,6}
- [libncurses.so](#)^{1638,5}
- [libtinfo.so](#)^{1639,5}
- [libstdc++.so.6](#)
- [libgcc_s.so](#)^{1640,1}

Network Visibility on Windows

Operating System Requirements

Each Windows host must have:

- Network Visibility Agent >= 4.5.7.
- An account with administrative privileges on the Windows machine where you want to install the Network Agent.

Additionally, each Windows host must also have:

- .NET Agent >= 4.5.15 with an App Agent License. See [Install the .NET Agent](#)(see page 652) and [Observe License Usage](#)(see page 203).
- Controller >= 4.5.14 compatible with the .NET Agent.

OR

- Java Agent >= 4.5.4.24386 with an App Agent license. See [Install the Java Agent](#)(see page 527) and [Observe License Usage](#)(see page 203).
- Controller >= 4.5.4.24386 compatible with the Java Agent. See [Agent and Controller Compatibility](#)(see page 3918).

To install AppDynamics for testing, you need to verify system requirements, prepare the host, and perform the Controller installation. See [Upgrade the Controller Using the Enterprise Console](#)¹⁶⁴¹ and [Install the Controller Using the CLI](#)¹⁶⁴².

Distributions

The following Windows distributions support the Network Agent on Java applications:

- Windows Server 2019 (64-bit)
- Windows Server 2016 (64-bit)
- Windows Server 2012 (64-bit)
- Windows Server 2012 R2 (64-bit)

The following Windows runtime environments support the Network Agent on .NET applications (starting with .NET Framework version 3.5):

- Microsoft IIS versions 6.0, 7.0, 7.5, 8.0, 8.5, 10
- Managed Windows Services

¹⁶³³ <http://libdl.so>

¹⁶³⁴ <http://libpthread.so>

¹⁶³⁵ <http://librt.so>

¹⁶³⁶ <http://libm.so>

¹⁶³⁷ <http://libc.so>

¹⁶³⁸ <http://libncurses.so>

¹⁶³⁹ <http://libtinfo.so>

¹⁶⁴⁰ http://libgcc_s.so

¹⁶⁴¹ <https://docs.appdynamics.com/display/PRMY21/.Upgrade+the+Controller+Using+the+Enterprise+Console+v21.5>

¹⁶⁴² <https://docs.appdynamics.com/display/PRMY21/.Install+the+Controller+Using+the+CLI+v21.5>

- Managed Standalone Applications

You can use the Network Visibility features with the .NET Agent if you have installed:

- Network Agent >= 4.5.7
- .NET Agent >= 4.5.15
- AppDynamics Controller >= 4.5.14

 Network Visibility is not supported for .NET core based applications. Ensure to set socket-enabled node property to false to such nodes.

You can monitor .NET applications that are implemented using synchronous calls. However, Directory Search and ADO.NET are not supported.

 AppDynamics does not currently support monitoring network traffic for asynchronous .NET calls.

Limitations

The following **Network Flow Map** features are not supported:

- Federated Flow Maps
- Visualization of flows between web servers and APM entry tiers

The Network Flow Map does not filter out connections on the selected time range.

Cross-application correlation of a .NET application with Network Visibility is not supported for .NET environments.

The Network Agent cannot monitor multiple app server agents on the same host if these agents report to different Controllers. All app server agents must report to the same Controller.

The **Network Dashboard** does not show data for Health Rules or Health Rule violations. To view any Health Rule violations, including those based on Network Visibility data, access the **Application Dashboard**.

Potential Issues

Network Visibility cannot monitor cross-application flows that use Jersey web servlets. As a workaround, disable Jersey servlet instrumentation and business transactions on the flows will be recognized as servlets instead of web services:

1. Select the application of interest in the Controller UI.
2. Select **Configuration > Instrumentation > Transaction Detection**.
3. Disable instrumentation for Jersey Servlet and Jersey 2.x Servlet.

If you open the **Network Flow Map** for an individual node, the KPI metrics for node-to-load-balancer and node-to-TCP-endpoint links show network KPIs for all nodes in the parent tier (instead of KPIs for the individual node only). To view KPIs for the individual node, open the link popup and review the Connection KPIs.

Set Up Network Visibility on Linux

To set up Network Visibility on Linux, see:

1. [Network Visibility Supported Environments](#)(see page 2721)

2. [Install the Network Agent on Linux](#)(see page 2725)
3. [Set Up the Network and App Agents on Linux](#)(see page 2730)
4. [Administer the Network Agent on Linux](#)(see page 2740)

Install the Network Agent on Linux

Install the Network Agent Independent of Machine Agent

You can install and run the Network Agent independently of the Machine Agent using the ZIP, RPM, or DEB installers.

ZIP Network Agent Install

Important Notes

- If you are using Network Visibility to monitor applications running in Docker containers, you must install the Network Agent in a container as well. See [Docker and Network Visibility](#)(see page 2727).
- To run the install script, log in as root.
- For all other operations, log in as the designated agent administrator (<appd-agent-administrator>) for that host.

1. Check System Requirements. See [Network Visibility Supported Environments](#)(see page 2721).
2. Download and unzip the Agent installer:

Login User = Agent Administrator

- a. Log in to the Agent host as <appd-agent-administrator>.
- b. Access the [AppDynamics Downloads Portal](#)¹⁶⁴³, download the Network Agent installer, and unzip it.
- c. In a terminal window, cd to the folder where you downloaded the Network Agent ZIP package.
- d. Enter the following command, where <network_agent_home> is the folder where you want to install the agent software:

```
unzip <installer.zip> -d <network_agent_home>
```

The parent path should not include any directory names with spaces:

```
/opt/appdynamics/
networkVisibility (correct)
/opt/appdynamics/network
visibility (incorrect)
```

3. Install the Agent:

Login User = root

- a. Log out, and then log in as root.

¹⁶⁴³ <https://download.appdynamics.com/download/>

- b. Go to `<network_agent_home>` and run the install script:
`cd <network-agent-home>`
`./install.sh`

4. Start and verify the Agent:

i Login User = Agent Administrator

- a. Log out, and then log in as `appd-agent-administrator`.
- b. Open a CLI window and enter these commands:
 - i. `<network-agent-home>/bin/start.sh` (starts the Agent)
 - ii. `<network-agent-home>/bin/appd-netviz.sh status` (verifies that the Agent is running and shows PID of the Agent process)

5. If you experience any problems or issues, see [FAQs for Network Visibility](#)(see page 2775).
6. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#)(see page 2724) workflow, proceed to [Set Up the Network and App Agents on Linux](#)(see page 2730).

RPM Network Agent Install

i Important Note

If you are using Network Visibility to monitor applications running in Docker containers, you must install the Network Agent in a container as well. See [Docker and Network Visibility](#)(see page 2727).

1. Check System Requirements. See [Network Visibility Supported Environments](#)(see page 2721).
2. If you are logged in to the Agent host as a non-root user, log out and then log back in as root.
3. Access the [AppDynamics Downloads Portal](#)¹⁶⁴⁴ and download the Network Agent installer.
4. Open a terminal window and enter these commands:
 - a. `sudo rpm -ivh <installer.rpm>` (installs the Agent under `opt/appdynamics/netviz`)
 - b. `sudo service appd-netviz start` (starts the Agent)
 - c. `sudo service appd-netviz status` (verifies that the Agent is running)
5. If you experience any problems or issues, see [FAQs for Network Visibility](#)(see page 2775).
6. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#)(see page 2724) workflow, proceed to [Set Up the Network and App Agents on Linux](#)(see page 2730).

DEB Network Agent Install

i Important Note

If you are using Network Visibility to monitor applications running in Docker containers, you must install the Network Agent in a container as well. See [+ Docker and Network Visibility](#)(see page 2727).

1. Check System Requirements. See [Network Visibility Supported Environments](#)(see page 2721).

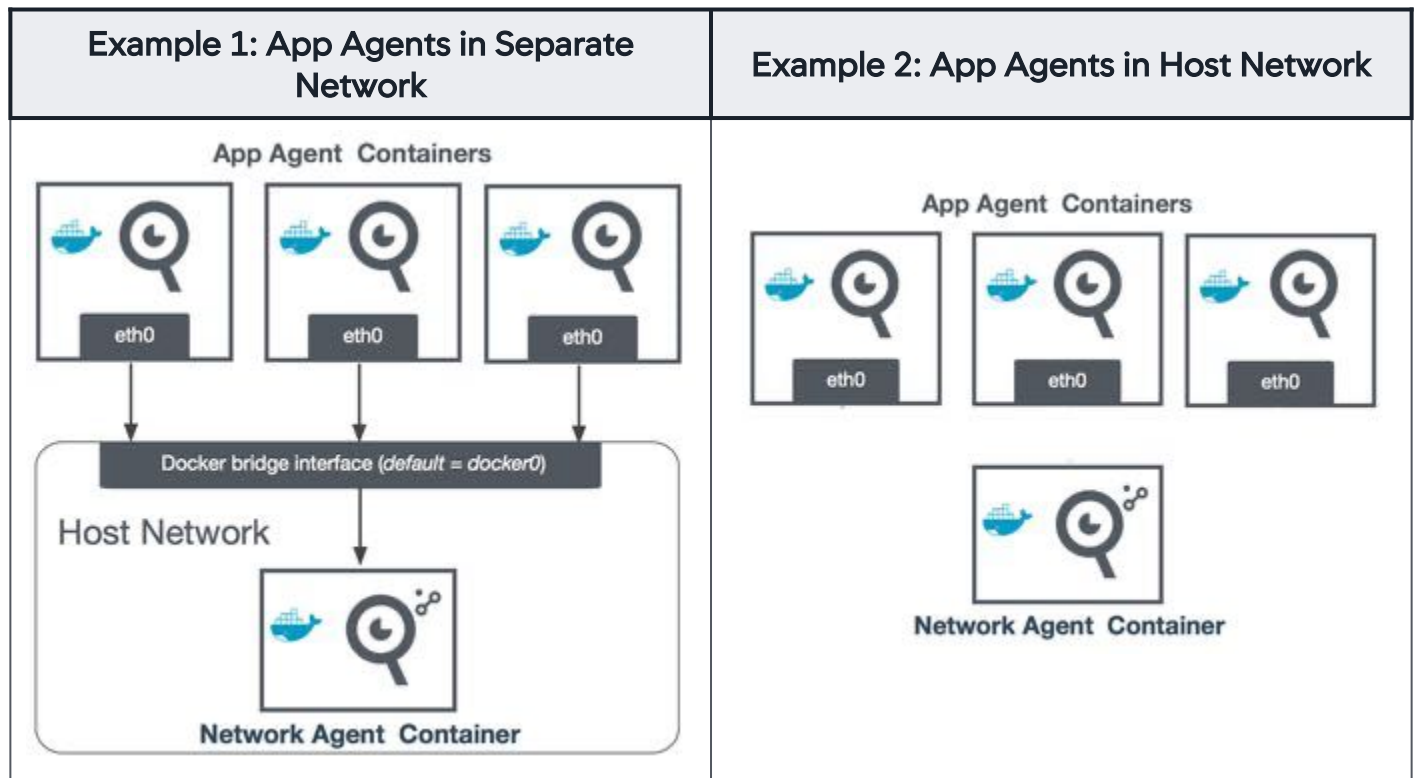

¹⁶⁴⁴ <https://download.appdynamics.com/download/>

2. If you are logged in to the Agent host as a non-root user, log out and then log back in as root.
3. Access the [AppDynamics Downloads Portal](#)¹⁶⁴⁵ and download the Network Agent installer.
4. Open a terminal window and enter the following commands:
 - a. `sudo dpkg -i <installer.deb>` (installs the Agent under `opt/appdynamics/netviz`)
(starts the agent, outputs " `appd-netviz start/running. process <pid #>`")
 - b. `sudo service appd-netviz status` (verifies the Agent status)
5. If the Agent does not start, enter: `sudo service appd-netviz start`.
6. If you experience any problems or issues, see [FAQs for Network Visibility](#)(see page 2775).
7. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#)(see page 2724) workflow, proceed to [Set Up the Network and App Agents on Linux](#)(see page 2730).

Install the Network Agent in a Docker Container

The Network Agent can monitor applications running in Docker containers on the same host. You can deploy one Network Agent per host and collect individual metrics for every local application monitored by a Java App Agent in a container.

AppDynamics recommends that you install the Network Agent in a separate container in [Docker Host](#)¹⁶⁴⁶ network mode on the same host as the application containers. This recommendation applies when the App Agent containers are running in [Docker Bridge](#)¹⁶⁴⁷ or Docker Host mode.

¹⁶⁴⁵ <https://download.appdynamics.com/download/>

¹⁶⁴⁶ <https://docs.docker.com/network/host/>

¹⁶⁴⁷ <https://docs.docker.com/network/bridge/>

Install the Network Agent and App Agents

1. Paste the sample Dockerfile into a text file and save the file. This sample Dockerfile contains commands for installing the Network Agent.

```
FROM centos:centos7

RUN yum update -y && yum install -y \
  net-tools \
  iproute \
  tcpdump \
  curl \
  unzip \
  sysvinit-tools \
  openssh-clients

WORKDIR /netviz-agent

ARG NETVIZ_ZIP_PKG

# copy NetViz agent contents
ADD ${NETVIZ_ZIP_PKG} .

# run the agent install script
RUN unzip *.zip && ./install.sh \
  && sed -i -e "s|enable_netlib = 1|enable_netlib = 0|g" ./conf/agent_config.lua \
  && sed -i -e "s|WEBSERVICE_IP=.*/WEBSERVICE_IP=\"0.0.0.0\"|g" ./conf/agent_config.lua

# default command to run for the agent
CMD ./bin/appd-netagent -c ./conf -l ./logs -r ./run
```

2. Navigate to the directory where you saved the Dockerfile. Build the Docker image by entering:

```
docker build --build-arg NETVIZ_ZIP_PKG=/path/to/netviz-agent-pkg.zip -t appd-netviz .
```

3. Push the Docker image to your Docker Trusted Registry.
4. Deploy your Docker image using this sample Docker Compose file:

```
version: '2'
services:
  appd-netviz-agent:
    image: path/to/your/docker/image # docker registry image
    network_mode: "host"
    restart: unless-stopped
    ports:
      - '3892:3892'
    cap_add:
      - NET_ADMIN
      - NET_RAW
```

Alternatively, enter:

```
docker run -d --network=host --cap-add=NET_ADMIN --cap-add=NET_RAW path/to/your/netviz/  
docker/image
```

5. Set up the Network Agent. Follow the single-tenant setup instructions on [Set Up the Network and App Agents on Linux](#)(see page 2730).

i For single-tenant setup, you do not need to enable netlib.

Specify the Docker Host Gateway IP on the App Agent

If you are running the App Agent in a Docker container outside of the [Docker Host](#)¹⁶⁴⁸ network (as shown in [Example 1](#)(see page 2727) in the diagram), complete these steps.

1. In the host for your App Agent, enter these environment variables:

```
export APPDYNAMICS_NETVIZ_AGENT_HOST=$(ip -4 addr show docker0 | grep -Po 'inet \K[\d.]  
+')  
export APPDYNAMICS_NETVIZ_AGENT_PORT=3892
```

2. Set the values for the port and host address. Run the application Docker image by passing the AppDynamics environment variables which were exported in Step 1. For example:

```
docker run --env "APPDYNAMICS_NETVIZ_AGENT_HOST=$APPDYNAMICS_NETVIZ_AGENT_HOST"  
--env "APPDYNAMICS_NETVIZ_AGENT_PORT=$APPDYNAMICS_NETVIZ_AGENT_PORT"  
<application_docker_image>
```

Install the Network Agent as an Extension of the Machine Agent (Bundled)

You can install and run the Network Agent as an extension of the Machine Agent (ZIP only) if you want to install both Agents at the same time.

i Important Notes

- If you are using Network Visibility to monitor applications running in Docker containers, you must install the Network Agent in a container as well. See [+ Docker and Network Visibility](#)(see page 2727).
- To run the install script, log in as root.
- For all other operations, log in as the designated agent administrator <appd-agent-administrator> for that host.

1. Check System Requirements. See [Network Visibility Supported Environments](#)(see page 2721).
2. Download and unzip the Machine Agent:

¹⁶⁴⁸ <https://docs.docker.com/network/host/>

i Login User = Agent Administrator

- a. Log in to the Agent host as `<appd-agent-administrator>`.
- b. Access the [AppDynamics Downloads Portal](#)¹⁶⁴⁹, download the Machine Agent installer, and unzip it.
- c. Install the Machine Agent using the Linux ZIP installer as described in the [Linux Install Using ZIP with Bundled JRE](#)(see page 2598) page.

3. Install the Machine Agent and Network Visibility extension:

i Login User = root

- a. Log out and then log in as root.
- b. Open a CLI window and enter:
 - i. `cd <machine-agent-home>/extensions/NetVizExtension`
 - ii. `./install-extension.sh`

4. Enable the Network Visibility extension and start the Agent:

i Login User = Agent Administrator

- a. Log out and then log in as `<appd-agent-administrator>`.
- b. Enter the CLI command:
 - i. `<machine-agent-home>/bin/machine-agent -d -p <machine-agent-home>/pidfile` (starts the Machine Agent)

5. If you experience any problems or issues, see [FAQs for Network Visibility](#)(see page 2775).
6. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#)(see page 2724) workflow, proceed to [Set Up the Network and App Agents on Linux](#)(see page 2730).

Set Up the Network and App Agents on Linux

i Network Agent 4.5.7 and Java Agent 4.5.11 eliminate the need to separately configure the Network Agent in a multi-tenant setup when running multiple nodes on the same machine. If you use the Network Agent 4.5.7 with Java Agent <= 4.5.10, you need to configure the Network Agent in a multi-tenant setup. See [Network Agent and Java Agent Installation Instructions](#)(see page 2730).

Network Agent and Java Agent Installation Instructions

If you are using	then
Network Agent >= 4.5.7 and Java Agent >= 4.5.11	Install the Network Agent (see page 2731).

¹⁶⁴⁹ <https://download.appdynamics.com/download/>

If you are using	then
Network Agent >= 4.5.7 and Java Agent <= 4.5.10	Install the Network Agent in a multi-tenant setup (see page 2733) or a single tenant setup (see page 2738). You do not need to manually enable the <code>netlib</code> parameter during the multi-tenant setup, it is enabled by default.
Network Agent <= 4.5.6	Install the Network Agent in a multi-tenant (see page 2733)setup or a single tenant (see page 2738)setup. You need to manually enable the netlib (see page 2733) parameter during the multi-tenant setup.
Java App Agent <= 4.4	Update the Java Agent ¹⁶⁵⁰ .

Install the Network Agent

i If you are using Java Agent >= 4.5.13, you do not need to manually enable the socket collection. It is enabled automatically. You can skip Step 1 and proceed to Step 2.

- [Enable Socket Collection on the App Agent](#)(see page 2731)
- [Specify the Docker Host Gateway IP on the App Agent](#)(see page 2733)
- [Restart the App \(IBM JVM Only\)](#)(see page 2733)

Enable Socket Collection on the App Agent

1. Configure the Java App Agent startup command to perform these tasks, as shown in the example:
 - Enable `appdynamics.socket.collection.bci.enable` for the Network Agent to map network metrics to application flows.
For example:

```
java -javaagent:<app_server_agent_home>/javaagent.jar \
-Dappdynamics.socket.collection.bci.enable=true
```
2. The following examples illustrate how editing the Agent startup command can differ, depending on the framework of the monitored application. See [Agent Installation by Java Framework](#)(see page 541) and its relevant framework documentation.

Framework	Example (App Agent ZIP)
IBM WebSphere and InfoSphere (see page 546)	In the WebSphere/InfoSphere UI, navigate to the Java Virtual Machine properties page for the monitored server. Then, add <code>javaagent</code> and <code>appdynamics.socket.collection.bci.enable=true</code> as a Generic JVM argument. For example: <pre>javaagent:/usr/appd/agents/apm/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true</pre>

¹⁶⁵⁰ <https://docs.appdynamics.com/display/PRO45/Install+the+Java+Agent>

Framework	Example (App Agent ZIP)
Apache Tomcat (see page 542)	<p>Add the full command as a Catalina environment variable in file CATALINA_BASE/bin/setenv.sh (Tomcat 6 and later). For example:</p> <pre>export CATALINA_OPTS="\$CATALINA_OPTS -javaagent:/usr/appd/agents/apm/ javaagent.jar -Dappdynamics.socket.collection.bci.enable=true"</pre>
Glassfish (see page 545)	<p>Add the full command as a -javaagent JVM option in the GlassFish domain. You can add the Agent using the asadmin tool. For example:</p> <pre>export LD_PRELOAD=/usr/appd/agents/netviz/ lib/appd-netlib.so glassfish4\bin\asadmin create-jvm-options "- javaagent\:/usr/appd/agents/apm/ javaagent.jar:- Dappdynamics.socket.collection.bci.enable=true"</pre>
JBoss Standalone (see page 553)	<p>Add the full command to the standalone.sh file. For example:</p> <pre>export JAVA_OPTS="\$JAVA_OPTS -javaagent:/usr/appd/agents/apm/ javaagent.jar(see page 2730) -Dappdynamics.socket.collection.bci.enable=true"</pre>
Jetty (see page 560)	<p>Add the full command to the start.ini config file in the Jetty base directory. For example:</p> <pre>--exec -javaagent:/usr/appd/agents/apm/ javaagent.jar -Dappdynamics.socket.collection.bci.enable=true</pre>

- To verify that the App Agent is running correctly, enter:
strings /proc/<app_pid>/environ

Specify the Docker Host Gateway IP on the App Agent

i These steps are required only if the App Agent is running in a Docker container outside of the [Docker Host¹⁶⁵¹](#) network.

1. Open the following file: `<app-agent-install-dir>/<version-number>/external-services/netviz/netviz-service.properties`
(You might need to unzip `external-services/netviz.zip` to access this file.)
2. For the `netviz.agent.host.address`, specify the Gateway IP of the [Docker Host¹⁶⁵²](#) network interface.
To determine this IP, enter this command on the Docker host:
`docker inspect <app_container_name> | grep Gateway`
3. Restart the App Agent.
4. To determine if the [Docker Host¹⁶⁵³](#) network is connected, enter this command from within the container:
`curl -k -v <host-network-IP>:3892`
If you receive a response, even if it is 404 Not Found, then the network is connected.

Restart the App (IBM JVM Only)

If the monitored app is running in an IBM JVM, you must restart the app for the Network Agent to detect and monitor any persistent connections.

Multi-Tenant Setup (Multiple Apps on the Agent Host)

If you want the Network Agent to [monitor multiple app nodes on the same host¹⁶⁵⁴](#), you perform the following steps *for each App Agent*.

- [Install or Update the App Agent \(if needed\)\(see page 2734\)](#)
- [Extract the NetViz External Services Folder on the App Agent\(see page 2734\)](#)
- [Preload NetLib and Enable Socket Collection on the App Agent\(see page 2734\)](#)
- [Specify the Docker Host Gateway IP on the App Agent\(see page 2737\)](#)
- [Restart the App \(IBM JVM Only\)\(see page 2738\)](#)

⚠ If you are using Network Agent <= 4.5.6, enable the `netLib` parameter manually as described in [Step 1\(see page 2733\)](#).

Enable Netlib on the Network Agent

1. Open the following file in a text editor: `<network_agent_home>/conf/agent_config.lua`
2. Edit the `enable_netlib` parameter:

```
npm_config = {
    log_destination = "file",
```

¹⁶⁵¹ <https://docs.docker.com/network/host/>

¹⁶⁵² <https://docs.docker.com/network/host/>

¹⁶⁵³ <https://docs.docker.com/network/host/>

¹⁶⁵⁴ <https://docs.appdynamics.com/display/PRO45/Network+Visibility#NetworkVisibility-NetworkVisibilityforMultipleAppNodesonthesameServer>

```

log_file = "agent.log",
debug_log_file = "agent-debug.log",
disable_filter = 1,
mode = "Advanced",
enable_netlib = 1,
lua_scripts_path = ROOT_DIR .. "/scripts/netagent/lua/",
}

```

Install or Update the App Agent (if needed)

The Network Agent requires Java App Server Agent >= 4.4. Update each App Agent that is running an earlier version. See [Install the Java Agent](#)(see page 527)

Extract the NetViz External Services Folder on the App Agent

1. Navigate to the folder: `<app-agent-install-dir>/<version-number>/external-services`
2. If not already extracted, extract the `netviz.zip` archive so that the ZIP contents are under this folder:
`<app-agent-install-dir>/<version-number>/external-services`

Preload NetLib and Enable Socket Collection on the App Agent

1. You must configure the Java App Agent startup command to perform two additional tasks, as shown in the following:
 - Preload the `appd-netlib` library so the Network Agent can collect network metrics for each individual node (rather than for the entire host)
 - Enable `appdynamics.socket.collection.bci.enable` for the Network Agent to map network metrics to application flows

For example:

```

LD_PRELOAD=/<network-agent-home>/lib/appd-netlib.so1655 \
  java -javaagent:<app_server_agent_home>/javaagent.jar \
  -Dappdynamics.socket.collection.bci.enable=true

```

The following examples illustrate how editing the Agent startup command can differ, depending on the framework of the monitored application. See [Agent Installation by Java Framework](#)(see page 541) and its relevant framework documentation.

¹⁶⁵⁵ <http://appd-netlib.so>

Framework	Example (App Agent ZIP)
<p>IBM WebSphere and InfoSphere(see page 546)</p>	<p>In the WebSphere/InfoSphere UI, navigate to the Java Virtual Machine properties page for the monitored server. Then add <code>javaagent</code> and <code>appdynamics.socket.collection.bci.enable=true</code> as a Generic JVM argument. For example:</p> <pre>javaagent:/usr/appd/agents/apm/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true</pre> <p>You can add <code>LD_PRELOAD</code> as a JVM environment variable. This example describes how to add an environment variable on a Cognos server using IBM Connections 6.0.0:</p> <ol style="list-style-type: none"> Log in to the WebSphere Application Server administrative console of the Cognos server. Click Servers > Server Types > WebSphere application servers. Click the <code>cognos_server</code> link. Click JAVA > Process Management > Process definition > Environment Entries > New to add this entry: <code>LD_PRELOAD=/usr/appd/agents/netviz/lib/appd-netlib.so</code> <ol style="list-style-type: none"> In the WebSphere/InfoSphere UI, navigate to the Java Virtual Machine properties page for the monitored server. Add <code>javaagent</code> and <code>appdynamics.socket.collection.bci.enable=true</code> as a Generic JVM argument. For example: <pre>javaagent:/usr/appd/agents/apm/javaagent.jar¹⁶⁵⁶ - Dappdynamics.socket.collection.bci.enable=true</pre> <p>You can add <code>LD_PRELOAD</code> as a system environment variable. This example describes how to add an environment variable on a Cognos server using IBM Connections 6.0.0:</p> <ol style="list-style-type: none"> Log in to the WebSphere Application Server administrative console of the Cognos server. Go to Servers > Server Types > WebSphere Application Servers. Click <code>cognos_server</code>.

¹⁶⁵⁶ <http://javaagent/usr/appd/agents/apm/javaagent.jar>

Framework	Example (App Agent ZIP)
	<p>4. Go to Java > Process Management > Process Definition > Environment Entries > New to add this entry: LD_PRELOAD=/usr/appd/agents/netviz/lib/appd-netlib.so¹⁶⁵⁷</p>
<p>Apache Tomcat(see page 542)</p>	<p>Add the full command as a Catalina environment variable in file CATALINA_BASE/bin/setenv.sh (Tomcat 6 and later). For example:</p> <pre>export LD_PRELOAD=/<network-agent-home-directory>/lib/appd-netlib.so export CATALINA_OPTS="\$CATALINA_OPTS -javaagent:/<java-agent-home-directory>/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true"</pre>
<p>Glassfish(see page 545)</p>	<p>Add the full command as a -javaagent JVM option in the GlassFish domain. You can add the Agent using the asadmin tool. For example:</p> <pre>export LD_PRELOAD=/<network-agent-home-directory>/lib/appd-netlib.so¹⁶⁵⁸ glassfish4\bin\asadmin create-jvm-options "-javaagent\:/<java-agent-home-directory>/javaagent.jar:- Dappdynamics.socket.collection.bci.enable=true"</pre>
<p>JBoss Standalone(see page 553)</p>	<p>Add the full command to the standalone.sh file. For example:</p> <pre>export LD_PRELOAD=/<network-agent-home-directory>/lib/appd-netlib.so JAVA_OPTS="\$JAVA_OPTS - javaagent:/<java-agent-home-directory>/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true"</pre>

1657 <http://appd-netlib.so/>
 1658 http://appd-netlib.so

Framework	Example (App Agent ZIP)
<p>Jetty(see page 560)</p>	<p>For a standalone Jetty using <code>start.jar</code>:</p> <ol style="list-style-type: none"> Add the full command to the <code>start.ini</code> config file in the Jetty base directory. For example: <pre>exec javaagent:/usr/appd/agents/apm/ javaagent.jar¹⁶⁵⁹</pre> <p><code>-Dappdynamics.socket.collection.bci.enable=true</code></p> Create a script to start Jetty. For example, <code>startJetty.sh</code>: <pre>export LD_PRELOAD=/usr/appdynamics/agents/ netviz/lib/appd-netlib.so¹⁶⁶⁰ java -jar start.jar</pre> <p>For service with embedded Jetty:</p> <ol style="list-style-type: none"> Create a script to start Jetty. For example, <code>startJetty.sh</code>: <pre>export LD_PRELOAD=/<network-agent-home- directory>/lib/appd-netlib.so¹⁶⁶¹ java -javaagent:/<java-agent-home-directory>/ javaagent.jar -Dappdynamics.socket.collection.bci.enable=true -jar <embedded_jetty_jar></pre>

To verify that the App Agent is running correctly, enter:

```
strings /proc/<app_pid>/environ
```

Specify the Docker Host Gateway IP on the App Agent

i These steps are required only if the App Agent is running in a Docker container outside of the [Docker Host](#)¹⁶⁶² network.

- Open the file: `<app-agent-install-dir>/<version-number>/external-services/netviz/netviz-service.properties`
 (You might need to unzip `external-services/netviz.zip` to access this file.)
- For the `netviz.agent.host.address`, specify the Gateway IP of the [Docker Host](#)¹⁶⁶³ network interface.

¹⁶⁵⁹ <http://javaagent/usr/appd/agents/apm/javaagent.jar>

¹⁶⁶⁰ <http://appd-netlib.so>

¹⁶⁶¹ <http://appd-netlib.so>

¹⁶⁶² <https://docs.docker.com/network/host/>

¹⁶⁶³ <https://docs.docker.com/network/host/>

To determine this IP, run this command on the Docker host:

```
docker inspect <app_container_name> | grep Gateway
```

3. Restart the App Agent.

4. To determine if the [Docker Host](#)¹⁶⁶⁴ network is connected, run this command from within the container:

```
curl -k -v <host-network-IP>:3892
```

If you receive a response, even if it is 404 Not Found, then the network is connected.

Restart the App (IBM JVM Only)

If the monitored app is running in an IBM JVM, you must restart the app for the Network Agent to detect and monitor any persistent connections.

Single-Tenant Setup (One App Only on the Agent Host)

If you want the Network Agent to monitor one app node only on the same host, perform these steps:

- [Install or Update the App Agent \(if needed\)](#)(see page 2738)
- [Extract the NetViz External Services Folder on the App Agent](#)(see page 2738)
- [Enable Socket Instrumentation](#)(see page 2738)
- [Specify the Docker Host Gateway IP on the App Agent](#)(see page 2739)
- [Restart the App \(IBM JVM Only\)](#)(see page 2740)

Install or Update the App Agent (if needed)

Network Visibility requires a Java App Agent >= 4.4 installed on the same host as the Network Agent. See [Install the Java Agent](#)(see page 527).

Extract the NetViz External Services Folder on the App Agent

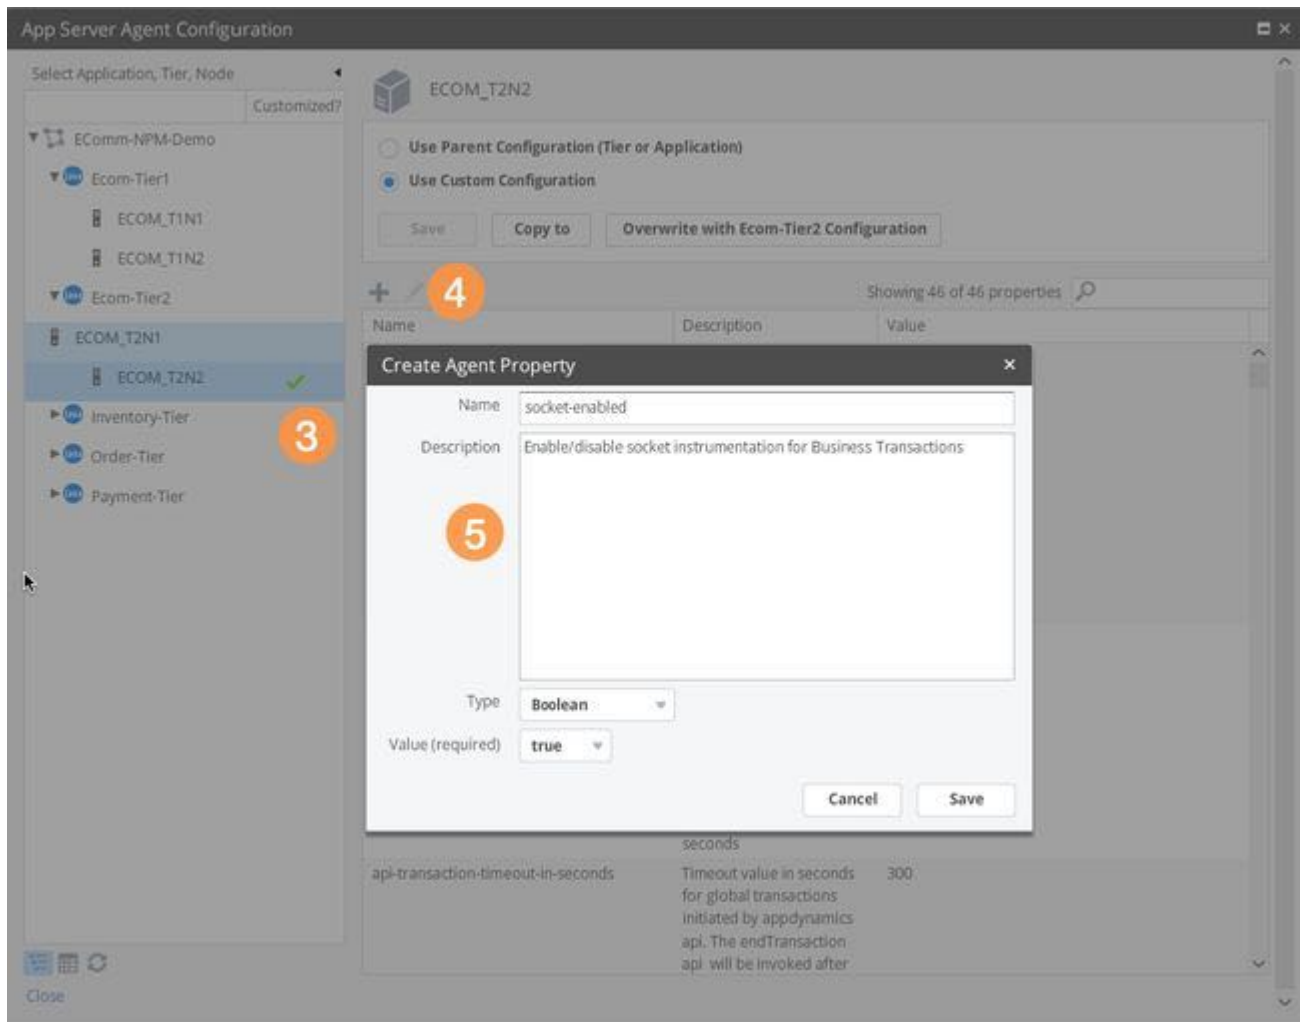

1. Navigate to folder: <app-agent-install-dir>/<version-number>/external-services
2. If not already extracted, extract the netviz.zip archive so that the ZIP contents are under this folder:
<app-agent-install-dir>/<version-number>/external-services

Enable Socket Instrumentation

This is required for the Agent to map network metrics to application flows.

1. In the Controller, click the gear icon () and select **AppDynamics Agents > App Server Agents**.
2. Select the Agent in the table and click **Configure**. The App Server Agent Configuration page appears.
3. Select the application, tier, and node in the treeview (left).
4. Select **Use Custom Configuration** and then click **+ Create Agent Property**.
5. In the Edit Agent Property dialog, specify:
 - a. Name = **socket-enabled**
 - b. Type = **Boolean**
 - c. Value = **true**

¹⁶⁶⁴ <https://docs.docker.com/network/host/>

Specify the Docker Host Gateway IP on the App Agent

i These steps are required only if the App Agent is running in a Docker container outside of the [Docker Host](#)¹⁶⁶⁵ network.

1. Open the file: `<app-agent-install-dir>/<version-number>/external-services/netviz/netviz-service.properties`
(You might need to unzip `external-services/netviz.zip` to access this file.)
2. For the `netviz.agent.host.address`, specify the Gateway IP of the [Docker Host](#)¹⁶⁶⁶ network interface.
To determine this IP, run this command on the Docker host:
`docker inspect <app_container_name> | grep Gateway`
3. Restart the App Agent.

¹⁶⁶⁵ <https://docs.docker.com/network/host/>

¹⁶⁶⁶ <https://docs.docker.com/network/host/>

4. To determine if the [Docker Host](#)¹⁶⁶⁷ network is connected, run this command from within the container:
`curl -k -v <host-network-IP>:3892`
 If you receive a response, even if it is 404 Not Found, then the network is connected.

Restart the App (IBM JVM Only)

If the monitored app is running in an IBM JVM, you must restart the app for the Network Agent to detect and monitor any persistent connections.

Administer the Network Agent on Linux

See the following pages for details:

ZIP Network Agent Operations

You install the Network Agent as part of an overall workflow for setting up Network Visibility. The supported workflows are:

- [Multi-Tenant Setup](#)(see page 2733)
- [Single-Tenant Setup](#)(see page 2738)

See [Set Up Network Visibility on Linux](#)(see page 2724).

The NetViz Agent needs to be started separately from the Machine Agent when using a bundled approach.

Install the ZIP Network Agent

You can install the Agent using the Machine Agent or the Network Agent ZIP.

- [Install Using the Machine Agent ZIP](#)(see page 2740)
- [Install Using the Network Agent ZIP](#)(see page 2741)

Install Using the Machine Agent ZIP

You can install the Network Agent as an extension using the Machine Agent installer. This option is available on Linux 32-bit and 64-bit ZIP installers, >= 4.4.2, only.

1. Check System Requirements. See [Network Visibility Supported Environments](#)(see page 2721).
2. If you are installing the Network Agent as part of the [Multi-Tenant Install](#)(see page 2733) workflow, stop each application of interest if it is monitored by an installed App Agent. You will restart each application after you install and set up the Network Agent.
3. Install the Machine Agent using the Linux ZIP installer as described in the [Linux Install Using ZIP with Bundled JRE](#)¹⁶⁶⁸ page.
4. Run the install script using sudo:

```
cd <machine-agent-home>/NetVizExtension/agent/
sudo ./install.sh
```
5. Enable the NetVizMonitoring extension:
 - a. Open this file in a plain-text editor such as vi or Notepad++:
`<machine-agent-home>/NetVizExtension/conf/netVizExtensionConf.yml`
 - b. Set the start setting to true and save the file.

¹⁶⁶⁷ <https://docs.docker.com/network/host/>

¹⁶⁶⁸ <https://docs.appdynamics.com/display/PRO44/Linux+Install+Using+ZIP+with+Bundled+JRE>

6. Start the Machine Agent. The NetVizMonitoring extension should start automatically. To start the Agent on Linux, enter:

```
<machine_agent_home>/bin/machine-agent -d -p <machine_agent_home>/pidfile
```

7. Verify that the Network Agent is running:

```
<machine-agent-home>/NetVizExtension/agent/bin/appd-netviz.sh status
```

The output provides the process ID (PID) of the Network Agent process.

See [FAQs for Network Visibility](#)(see page 2775).

8. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#)(see page 2724) workflow, proceed to the next step in the workflow:
 - [Multi-Tenant Setup](#)(see page 2733)
 - [Single-Tenant Setup](#)(see page 2738)

Install Using the Network Agent ZIP

1. Check System Requirements. See [Network Visibility Supported Environments](#)(see page 2721).
2. If you are installing the Network Agent as part of the [Multi-Tenant Install](#)(see page 2733) workflow, stop each application of interest if it is monitored by an installed App Agent. You will restart each application after you install and set up the Network Agent.
3. Verify that you have sudo or root access permissions on the host where you want to install the Network Agent. (You do not need sudo or root access to run the Agent.)
4. Open a command prompt on the host, enter the mount command, and check the mounted file system for the directory where you plan to install the agent. The file system should not have the noexec and nosuid flags set.
5. Download the network-agent package to the machine.
6. In a terminal window, cd to the folder where you downloaded the Network Agent ZIP package.
7. Enter the following command, where <network_agent_home> is the folder where you want to install the Agent software:

```
unzip <installer.zip> -d <network_agent_home>
```

i The parent path should not include any directory names with spaces:

```
/opt/appdynamics/networkVisibility (correct)
```

```
/opt/appdynamics/network visibility (incorrect)
```

8. Run these commands as the administrator or root user on the host machine:
 - a. This command is required *only* if you are logged in as a different user from the one that will configure and run the Agent:

```
chown -R <network-agent-user-group>:<network-agent-user> <network-agent-home>
```
 - b. Go to <network_agent_home> and run the install script:

```
cd<network-agent-home>
./install.sh
```
9. Start the Agent by running the following command as the <network_agent_user>:

```
<network-agent-home>/bin/start.sh
```
10. Verify that the Network Agent is running:
 - a. Identify the agent process: <network-agent-home>/bin/appd-netviz.sh status
The output provides the process ID (PID) of the Network Agent process.
 - b. See [FAQs for Network Visibility](#)(see page 2775)
11. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#)(see page 2724) workflow, proceed to the next step in the workflow:
 - [Multi-Tenant Setup](#)(see page 2733)

- [Single-Tenant Setup](#)(see page 2738)

Administer the ZIP Network Agent

Run commands as <network_agent_user>

You should run the following commands as a <network_agent_user> with permissions to configure and run the Agent on the host machine.

Operation	Command	Notes
Start Agent	<network-agent-home>/bin/start.sh	If the Agent starts successfully, the following displays: Starting AppDynamics Network Monitoring appd-netviz... OK appd-netviz running.. <pid_of_process>
Stop Agent	<network-agent-home>/bin/stop.sh	If the Agent stops successfully, the following displays: Stopping AppDynamics Network Monitoring appd-netviz... OK
Check Agent status	<network-agent-home>/bin/appd-netviz.sh status	This command shows whether the Agent is running or not. The following displays: appd-netviz start/running, process <pid #>
Restart Agent	<network-agent-home>/bin/appd-netviz.sh restart	If the Agent restarts successfully, the following displays: Stopping AppDynamics Network Monitoring appd-netviz... OK Starting AppDynamics Network Monitoring appd-netviz... OK appd-netviz running.. <pid_of_process>

Uninstall the ZIP Network Agent

1. Open a terminal and cd to the <network-agent-home> directory.
2. Stop the Agent by entering: ./bin/stop.sh

3. cd to the `<network-agent-home>` parent directory: `cd . .`
4. Remove the Agent directory by entering: `rm -rf <network-agent-home>`

RPM Network Agent Operations

You install the Network Agent as part of an overall workflow for setting up Network Visibility. The three supported workflows are:

- [Multi-Tenant Install](#)¹⁶⁶⁹
- [Single-Tenant Install with App Restart](#)¹⁶⁷⁰
- [Single-Tenant Install with no App Restart](#)¹⁶⁷¹

See [Set Up Network Visibility on Linux](#)(see page 2724).

Install the RPM Agent

1. Check System Requirements. See [Network Visibility Supported Environments](#)(see page 2721).
2. Stop each application of interest if it is monitored by an installed App Agent. You will restart each application after you install and set up the Network Agent.
3. Verify that you have sudo or root access permissions on the machine where you want to install the Network Agent. (You do not need sudo or root access to run the Agent.)
4. Open a command prompt on the host, enter the mount command, and check the mounted file system for the directory where you plan to install the Agent. The file system should not have the noexec and nosuid flags set.
5. Download the `network-agent` package to the machine.
6. Verify that you have sudo or root access permissions on the machine where you want to install the Agent.
7. Download the Agent package to the machine.
8. Open a terminal window and enter: `sudo rpm -ivh <installer.rpm>`
The Network Agent software is installed under `/opt/appdynamics/netviz`.
9. To start the Agent, enter: `sudo service appd-netviz start`
10. Verify that the Network Agent is running: `sudo service appd-netviz status`
11. If you experience any problems or issues, see [FAQs and Troubleshooting for Network Visibility](#)¹⁶⁷².
12. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#)(see page 2724) workflow, proceed to the next step in the workflow:
 - [Multi-Tenant Install](#)¹⁶⁷³
 - [Single-Tenant Install with App Restart](#)¹⁶⁷⁴
 - [Single-Tenant Install with no App Restart](#)¹⁶⁷⁵

Administer the RPM Agent

You should run the following commands as a `<network_agent_user>` with permissions to configure and run the Agent on the host machine.

¹⁶⁶⁹ <https://docs.appdynamics.com/display/PRO44/Multi-Tenant+Install>

¹⁶⁷⁰ <https://docs.appdynamics.com/display/PRO44/Single-Tenant+Install+with+App+Restart>

¹⁶⁷¹ <https://docs.appdynamics.com/display/PRO44/Single-Tenant+Install+with+No+App+Restart>

¹⁶⁷² <https://docs.appdynamics.com/pages/viewpage.action?pageId=42585558>

¹⁶⁷³ <https://docs.appdynamics.com/display/PRO44/Multi-Tenant+Install>

¹⁶⁷⁴ <https://docs.appdynamics.com/display/PRO44/Single-Tenant+Install+with+App+Restart>

¹⁶⁷⁵ <https://docs.appdynamics.com/display/PRO44/Single-Tenant+Install+with+No+App+Restart>

Operation	Command	Notes
Start Agent	<code>sudo service appd-netviz start</code>	<p>If the Agent starts successfully, the following displays:</p> <pre>Starting appd-netviz (via systemctl): [OK]</pre>
Stop Agent	<code>sudo service appd-netviz stop</code>	<p>If the Agent stops successfully, the following displays:</p> <pre>Stopping appd-netviz (via systemctl): [OK]</pre>
Restart Agent	<code>sudo service appd-netviz restart</code>	<p>If the Agent restarts successfully, the following displays:</p> <pre>Stopping appd-netviz (via systemctl): [OK]</pre>

Operation	Command	Notes
Check Agent status	sudo service appd-netviz status	<p>The following example illustrates status output:</p> <pre> appd-netviz.service - Appdynamics Network Monitoring Loaded: loaded (/usr/lib/systemd/system/appd-netviz.service; disabled; vendor Active: active (running) since Thu 2016-09-29 14:52:42 PDT; 14s ago Process: 3981 ExecStart=/opt/appdynamics/netviz/bin/appd-netmon (code=exited, Process: 3973 ExecStartPre=/bin/chown -R appd-netviz:appd-netviz /opt/appdynam Process: 3968 ExecStartPre=/bin/mkdir -p /opt/appdynamics/netviz/run/ (code=ex Main PID: 3983 (appd-netmon) Tasks: 12 (limit: 512) CGroup: /system.slice/appd-netviz.service └─3983 /opt/appdynamics/netviz/bin/appd-netmon └─3984 appd-netagent -l /opt/appdynamics/netviz/scripts/netagent/lua/ └─3985 appd-netcor -l /opt/appdynamics/netviz/scripts/netcor/lua/ Sep 29 14:52:42 localhost.localdomain systemd[1]: Starting Appdynamics Network M Sep 29 14:52:42 localhost.localdomain systemd[1]: Started Appdynamics Network Mo lines 1-15/15 (END) </pre>

Uninstall the RPM Agent

To uninstall the Network Agent, enter:

```
sudo rpm -e appd-netviz
```

This command generates no output. To confirm that the Agent is removed, enter the status command again: `sudo service appd-netviz status`

DEB Network Agent Operations

You install the Network Agent as part of an overall workflow for setting up Network Visibility. The three supported workflows are:

- [Multi-Tenant Install](#)¹⁶⁷⁶
- [Single-Tenant Install with App Restart](#)¹⁶⁷⁷
- [Single-Tenant Install with no App Restart](#)¹⁶⁷⁸

To determine the best workflow for your environment, see [Set Up Network Visibility on Linux](#)(see page 2724).

Install the DEB Network Agent

1. Check System Requirements. See [Network Visibility Supported Environments](#)(see page 2721).
2. If you are installing the Network Agent as part of the [Multi-Tenant Install](#)¹⁶⁷⁹ workflow, stop each application of interest if it is monitored by an installed App Agent. You will restart each application after you install and set up the Network Agent.
3. Verify that you have `sudo` or `root` access permissions on the machine where you want to install the Agent. (You do not need `sudo` or `root` access to run the Agent.)
4. Open a command prompt on the host, enter the `mount` command, and check the mounted file system for the directory where you plan to install the Agent. The file system should not have the `noexec` and `nosuid` flags set.
5. Download the Agent package to the machine.
6. Enter:

```
sudo dpkg -i <installer.deb>
```

The Network Agent software is installed under `/opt/appdynamics/netviz`.
The Agent should start automatically with the following message: `appd-netviz start/running. process <pid #>`
To verify the Network Agent status, enter: `sudo service appd-netviz status`
7. If the Agent does not start, enter: `sudo service appd-netviz start`
8. If you experience any problems or issues, see [FAQs and Troubleshooting for Network Visibility](#)¹⁶⁸⁰.
9. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#)(see page 2724) workflow, proceed to the next step in the workflow:
 - [Multi-Tenant Install](#)¹⁶⁸¹

¹⁶⁷⁶ <https://docs.appdynamics.com/display/PRO44/Multi-Tenant+Install>

¹⁶⁷⁷ <https://docs.appdynamics.com/display/PRO44/Single-Tenant+Install+with+App+Restart>

¹⁶⁷⁸ <https://docs.appdynamics.com/display/PRO44/Single-Tenant+Install+with+No+App+Restart>

¹⁶⁷⁹ <https://docs.appdynamics.com/display/PRO44/Multi-Tenant+Install>

¹⁶⁸⁰ <https://docs.appdynamics.com/pages/viewpage.action?pageId=42585558>

¹⁶⁸¹ <https://docs.appdynamics.com/display/PRO44/Multi-Tenant+Install>

- [Single-Tenant Install with App Restart](#)¹⁶⁸²
- [Single-Tenant Install with no App Restart](#)¹⁶⁸³

Administer the DEB Network Agent

Operation	Command	Notes
Start Agent	<code>sudo service appd-netviz start</code>	If the Agent starts successfully, the following displays: <code>appd-netviz start/running. process <pid #></code>
Stop Agent	<code>sudo service appd-netviz stop</code>	If the Agent stops successfully, the following displays: <code>appd-netviz stop appd-netviz stop/waiting</code>
Restart Agent	<code>sudo service appd-netviz restart</code>	
Check Agent Status	<code>sudo service appd-netviz status</code>	This command shows whether the Agent is running or not. The following displays: <code>appd-netviz start/running, process <pid #></code>

Uninstall the DEB Network Agent

The Network Agent software is installed under `/opt/appdynamics/netviz`. To uninstall the Agent, enter:

```
sudo dpkg -P appd-netviz
```

Managing Network Agents in the Controller

Controller Operations for Network Agents

Using an AppDynamics Administrator account, select **Settings > AppDynamics Agents > Network Visibility Agents** to see details and manage your installed Machine Agents. You can perform most operations on multiple Agents: Shift or Ctrl+Click the Agents of interest, right-click, and select the operation. These Agent settings are defined in the Controller and retain their state when an Agent is stopped and restarted.

Right-click one or more Agents to:

- [View Packet Capture Configuration](#)(see page 2748)
- [Start Packet Capture](#)(see page 2748)
- [Disable Agent\(s\) or Enable Agent\(s\)](#)(see page 2748)
- [Change Dynamic Monitoring Mode](#)(see page 2748)

¹⁶⁸² <https://docs.appdynamics.com/display/PRO44/Single-Tenant+Install+with+App+Restart>

¹⁶⁸³ <https://docs.appdynamics.com/display/PRO44/Single-Tenant+Install+with+No+App+Restart>

- [Delete Agent from System](#)(see page 2748)

View Packet Capture Configuration

View and edit configuration settings for a single network Agent. See [Packet Captures](#)(see page 2820).

Start Packet Capture

Start a packet capture on one or more Agents.

Disable Agent(s) or Enable Agent(s)

When disabled, the Agent temporarily suspends its collection of network metrics. You can quickly re-enable the Agent when you want.

While disabled, the Agent continues to consume a Network Visibility license. The Agent maintains a "heartbeat" connection to the Controller so you can enable it again quickly. The Agent persists its enabled/disabled state after it restarts and resumes all normal activities after it is re-enabled.

Change Dynamic Monitoring Mode

Defines the set of metrics that the Agent collects. In general, you should run the Agent in KPI unless you need to diagnose network performance on the node or Connections monitored by that Agent. See [Dynamic Monitoring Mode and Network Visibility](#)(see page 2782).

Delete Agent from System

Deletes the underlying Network Visibility metadata for an orphaned Network Agent. A Network Agent is considered "orphaned" when the Agent host no longer has any App Server Agents installed or running. To delete a Network Agent, you must first delete all APM nodes on that host. Account Administrator privileges are required to delete Network Agents.

Check Network Agent Status

To check the status of your Network Agents, access **Tiers & Nodes** and then select **Network** in the Show Data pulldown.

Network Visibility with Kubernetes

This page describes how to configure Network Visibility to monitor applications running on Kubernetes.

Network Visibility monitors an application's network interactions and reports key performance metrics. These metrics isolate an application's network issues from its application issues.

The Network Agent uses a REST API to open a TCP port in each node for the application containers to communicate with the Network DaemonSet container. This communication enables monitoring between pods and nodes. You can deploy the agent as a DaemonSet in each node that has the host mode enabled.

Before You Begin

Before you create a Docker image for the DaemonSet and configure the agent, verify the following requirements:

- You have at least one pod with a Java Agent ≥ 4.4 deployed to the same cluster as the Network Agent.
- The TCP port 3892 is not already used by the node. The application pods use port 3892 to communicate with the DaemonSet.

Create a Network Visibility DaemonSet Docker Image

To configure Network Visibility with Kubernetes, you must first create a Docker image for the Network Visibility DaemonSet and push the image to your Docker Trusted Registry.

1. Paste this sample Dockerfile into a text file and save the file.

```
FROM ubuntu:14.04

ARG NETVIZ_ZIP_PKG
RUN groupadd -r appd-netviz && useradd -r -g appd-netviz appd-netviz

RUN apt-get update && apt-get install -y \
  net-tools \
  tcpdump \
  curl \
  unzip \
  ssh-client \
  binutils \
  build-essential

WORKDIR /netviz-agent

# copy NetViz agent contents
COPY $NETVIZ_ZIP_PKG .

# run the agent install script and disable netlib
RUN unzip $NETVIZ_ZIP_PKG && ./install.sh \
  && sed -i -e "s|enable_netlib = 1|enable_netlib = 0|g" ./conf/agent_config.lua \
  && sed -i -e "s|WEBSERVICE_IP=.*|WEBSERVICE_IP=\"0.0.0.0\"|g" ./conf/agent_config.lua

RUN chown -R appd-netviz:appd-netviz /netviz-agent
RUN setcap cap_net_raw=eip /netviz-agent/bin/appd-netagent
USER appd-netviz

# default command to run for the agent
CMD ./bin/appd-netagent -c ./conf -l ./logs -r ./run
```

2. Navigate to the directory where you saved the Dockerfile and build the Docker image by entering the following command:

```
$ docker build --build-arg NETVIZ_ZIP_PKG=/path/to/netviz-agent-pkg.zip -t appd-netviz .
```

3. Push the Docker image to your Docker Trusted Registry.

Configure Network Visibility with Kubernetes

1. Create a yaml file with the following configuration:

```
apiVersion: apps/v1 # for versions before 1.9.0 use apps/v1beta2
```

```

kind: DaemonSet
metadata:
  name: appd-netviz-agent
spec:
  selector:
    matchLabels:
      name: appd-netviz-agent
  template:
    metadata:
      name: appd-netviz-agent
      labels:
        name: appd-netviz-agent
    spec:
      hostIPC: true
      hostNetwork: true
      containers:
      - name: appd-netviz-agent
        image: path/to/your/Docker/image # docker registry image
        resources:
          requests:
            memory: "250Mi"
            cpu: "0.5"
          limits:
            memory: "2Gi"
            cpu: "1"
        securityContext:
          capabilities:
            add: ["NET_RAW"]
        ports:
        - containerPort: 3892
          hostPort: 3892
      imagePullSecrets:
      - name: your-registry-key # add the registry key, kubectl create secret ...
  
```

2. In the configuration file, update the following fields:
 - image (under containers): the file path to the DaemonSet image in your Docker Trusted Registry.
 - name (under imagePullSecrets): the key for your Docker Trusted Registry.
3. Deploy the Network Agent in Kubernetes by entering the following command:

```
$ kubectl apply -f MyConfigFile.yaml
```

Configure Network Visibility to Monitor Application Pods

After deploying Network Visibility in Kubernetes, you must deploy at least one pod with a Java Agent ≥ 4.4 to the same cluster as the Network Agent. This allows you to map network metrics to application flows.

1. Open the application's deployment configuration `yaml` file with Kubernetes in a text editor and set the `APPDYNAMICS_NETVIZ_AGENT_HOST` and `APPDYNAMICS_NETVIZ_AGENT_PORT` values:

```
- name: APPDYNAMICS_NETVIZ_AGENT_HOST
```

```
valueFrom:
  fieldRef:
    fieldPath: status.hostIP
- name: APPDYNAMICS_NETVIZ_AGENT_PORT
  value: 3892
```

i If you are using a version of the Java Agent that is <= 4.5.2, you must open the <app-agent-install-dir>/<version-number>/external-services/netviz/netviz-service.properties file to set these values.

2. In the Controller UI, enable socket instrumentation to map network metrics to application flows. See [Set Up the Network and App Agents](#)(see page 2730).

Set Up Network Visibility on Windows

To set up Network Visibility on Windows, see:

1. [Network Visibility Supported Environments](#)(see page 2721)
2. [Install the Network Agent on Windows](#)¹⁶⁸⁴
3. [Install the App Agents on Windows](#)
(see page 2754)

i Network Visibility on Windows supports both Java and .NET applications.

4. [Administer the Network Agent on Windows](#)(see page 2758)
5. [Verify the Network Visibility Installation on Windows](#)(see page 2752)

Install the Network Agent on Windows

The Network Visibility on Windows requires a supported version of the Network Agent to be installed on the server.

To monitor Java applications in your Controller, install the AppDynamics Java Agent on each server that hosts applications that you want to monitor.

You need a Network Visibility license to enable the Network Agent and its features.

No additional configuration is required on your AppDynamics Controller; Network Visibility is enabled by default.

Agent Install Directory

Network Agent is packaged as a zip bundle. The Network Agent install directory <network_agent_home> is the directory where you install the Agent. You can unzip the bundle at any location which is your <network_agent_home> directory.

It contains these administrative files:

- install.bat to install and start the Network Visibility Agent

¹⁶⁸⁴ <https://docs.appdynamics.com/display/PRO45/Install+the+Network+Agent+on+Windows>

- `start.bat` to start the Network Visibility Agent
- `status.bat` to check the status of the Network Visibility Agent
- `stop.bat` to stop the Network Visibility Agent
- `uninstall.bat` to uninstall the Network Visibility Agent

As part of the installation, `install.bat` installs the required VC redistributable on the system along with NPcap (if it does not already exist). If NPcap does exist on the system, then the installation of NPcap is skipped. To listen to the traffic on localhost, NPcap should be running in LoopBack mode. If NPcap is already installed on the system and not running in loopback mode, you must re-install it using loopback mode.

Network Agent and Java Agent Installation Instructions

Depending on the Network Agent version and Java Agent version, you can install the Network Agent in a multi-tenant or single-tenant setup:

If you are using	Multi-tenant Setup	Single-tenant Setup
Network Agent >= 4.5.7, and Java Agent >= 4.5.11	Install(see page 2752)	Install(see page 2752)
Network Agent >= 4.5.7, and Java Agent <= 4.5.10	Not supported	Install(see page 2752)

Install Network Agent on Windows using the ZIP Installer

These steps describe how to install and run the Network Agent for Windows using the ZIP installer.

1. Review the [Network Visibility Requirements and Supported Environments](#)¹⁶⁸⁵.
2. Download the Network Agent Windows ZIP package from the [AppDynamics Downloads Portal](#)¹⁶⁸⁶ and unzip the package.
 - a. Verify your administrator permissions on the host where you want to install the Network Agent.
 - b. Extract the contents to the Agent installation directory `<network_agent_home>`.
3. Double-click the `install.bat` file to install the Network Agent and start the AppDynamics Network Visibility Service.

i If you run the `install.bat` script without administrator privileges, a dialog displays this message: "Do you want to allow this app to make changes to your device?"
Click **Yes** to continue with the installation.

4. To verify if the Network Agent is running, navigate to the folder that contains the `status.bat` file.
 - a. Double-click the `status.bat` file.
 - b. Locate the AppDynamics Network Visibility Service and verify its status in the **Status** column. Alternately, check if AppDynamics NetViz Service is listed in `services.msc`.

See [Administer the Network Agent on Windows\(see page 2758\)](#).

¹⁶⁸⁵ <https://docs.appdynamics.com/display/PRO45/Network+Visibility+Requirements+and+Supported+Environments>

¹⁶⁸⁶ https://download.appdynamics.com/download/#version=&apm=&os=&platform_admin_os=&events=&eum=&page=1

Uninstall Network Agent Using the ZIP

To uninstall the Network Agent:

1. Open a Windows command prompt and **cd** to the `<network-agent-home>` directory.
2. Uninstall the Network Agent by entering: `\<network-agent-home>\uninstall.bat`.

Install Network Agent on Windows using the MSI Package

To install the Network Agent using the MSI package:

1. Review the [Network Visibility Requirements and Supported Environments](#)¹⁶⁸⁷.
2. Download the MSI installer package from the [AppDynamics Download Center](#)¹⁶⁸⁸.
3. Run the MSI installer package.
4. Read the End User License Agreement and accept the terms. Click **Next**.
5. If required, change the Network Agent installation directory on the **Destination Folder** panel.

 You can also change the destination of the logs directory later using the [AppDynamics Agent Configuration utility](#)¹⁶⁸⁹.

6. Click **Next**. The **Ready to install** page displays.
7. Click **Install**. The **User Account Control** panel displays and prompts you for permission to install.
8. From the **User Account Control** panel, click **Yes** to allow the installer to make changes to the device. Wait for the installation to complete.

 If you do not have administrator privileges, the installer prompts you to provide the password for an administrator account.

9. Click **Finish**.
10. Verify the installation by reviewing the Control Panel for AppDynamics NetViz Agent and `service.msc` for NetVizService.

¹⁶⁸⁷ <https://docs.appdynamics.com/display/PRO45/Network+Visibility+Requirements+and+Supported+Environments>

¹⁶⁸⁸ <https://download.appdynamics.com/download>

¹⁶⁸⁹ <https://docs.appdynamics.com/display/PRO43/Configure+the+.NET+Agent>

Uninstall Network Agent Using the MSI Package

To uninstall the Network Agent:

1. Open the Windows Control Panel and select **AppDynamics NetViz Agent**.
2. Click **Uninstall**.
3. From the **User Account Control** panel, click **Yes** to uninstall the Network Agent.

Install the App Agent on Windows

Instrumenting an application adds the AppDynamics Application Agent, known as an App Agent, into the runtime process of the application. An App Server is a server application that is constantly running. You can deploy applications on the App Server.

Install the Java App Agent on Windows

To monitor Java applications in the Controller, you need to install the AppDynamics Java Agent $\geq 4.5.4$, on each server that hosts applications that you want to monitor.

- To install using the Agent Download Wizard in the Controller, see [Java Agent](#)(see page 492).
- To install and configure the AppDynamics Java Agent into the application JVM, see [Install the Java Agent](#)(see page 527).

Set Up the Java App Agent on Windows

If you want the Network Agent to monitor an App Node on the same host:

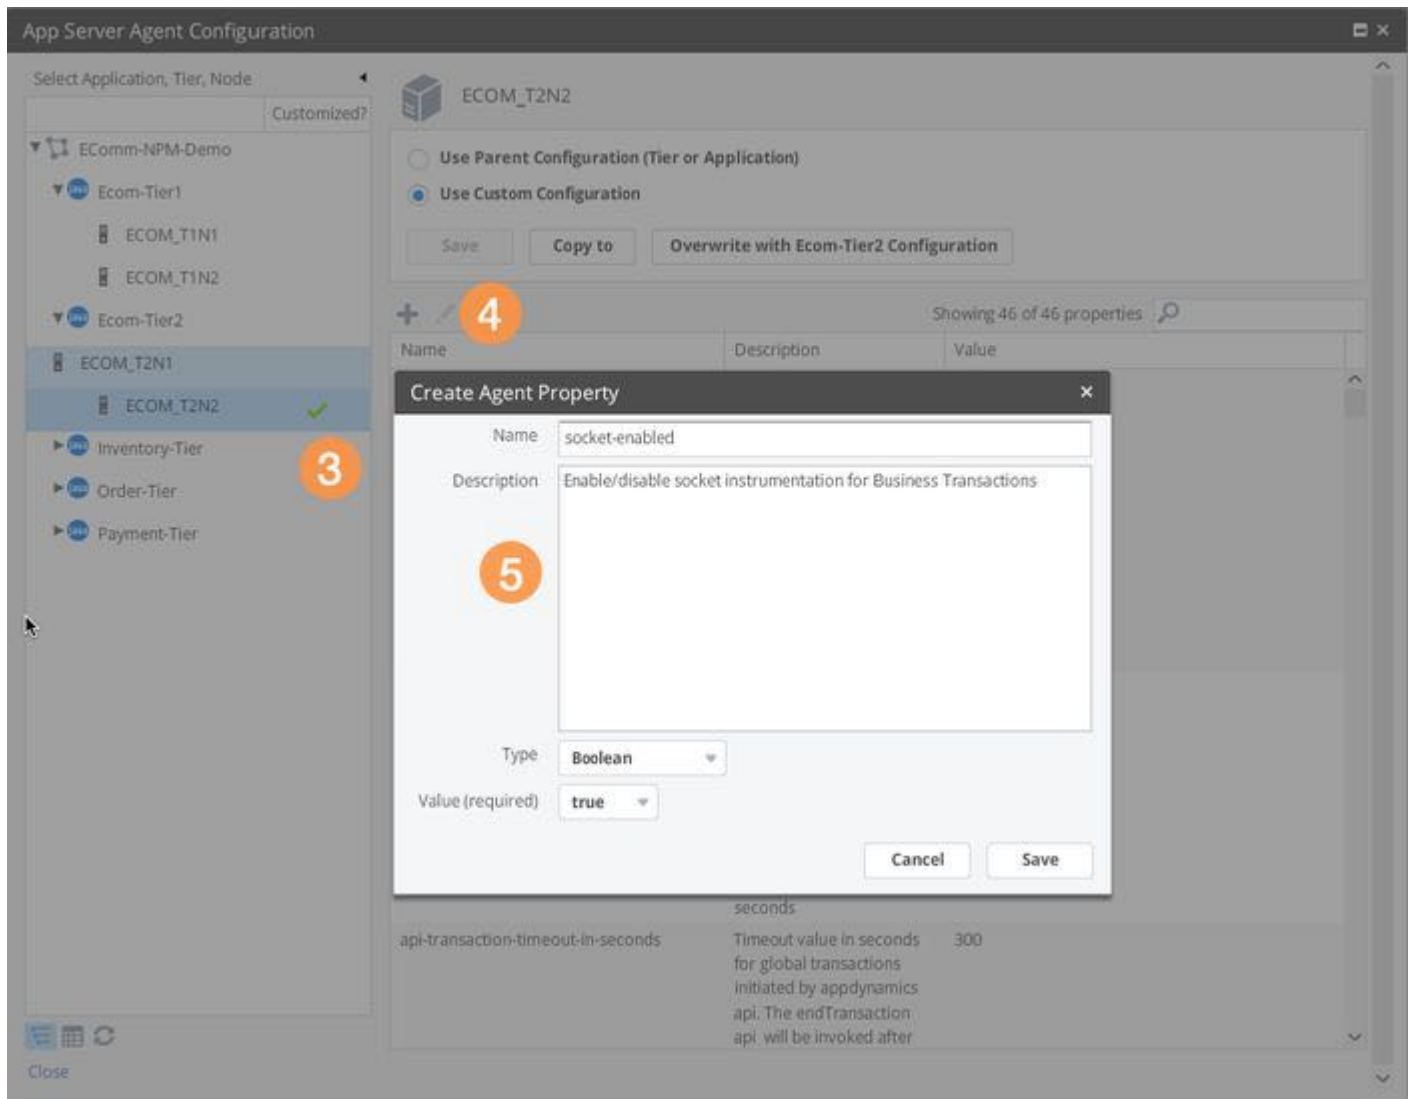

1. Enable Socket Instrumentation.
2. Restart the App (*IBM JVM only*).

Enable Socket Instrumentation

 If you are using Java Agent $\geq 4.5.13$, you need not manually enable the socket collection. It is enabled automatically. You can skip Step 1 and proceed with Step 2.

For the Agent to map network metrics to application flows, perform these steps:

1. In the Controller, click the gear icon () and select **AppDynamics Agents > App Server Agents**.
2. Select the Agent in the table and click **Configure**. The App Server Agent Configuration page appears.
3. Select the application, tier, and node in the tree-view (left).
4. Select Use Custom Configuration and then click **+**. The **Create Agent Property** dialog appears.
5. From the **Create Agent Property** dialog, specify:
 - a. Name = **socket-enabled**
 - b. Type = **Boolean**
 - c. Value = **true**

Restart the App (*IBM JVM only*).

If the monitored App is running in an IBM JVM, you must restart the App for the Network Agent to detect and monitor any persistent connections.

Install and Set Up .NET App Agent on Windows

To monitor .NET applications with AppDynamics, you need to install the .NET Agent on the servers where the applications run.

You only need to install the Agent once per server (even if you want to monitor more than one application on the server).

- To install the .NET agent for IIS applications using the Getting Started wizard in the Controller, see [.NET Agent](https://docs.appdynamics.com/display/PRO45/.NET+Agent)¹⁶⁹⁰.
- To install and configure the AppDynamics .NET Agent using the MSI package, see [Install .NET Agent](https://docs.appdynamics.com/display/PRO45/Install+the+.NET+Agent+for+Windows)¹⁶⁹¹.

¹⁶⁹⁰ <https://docs.appdynamics.com/display/PRO45/.NET+Agent>

¹⁶⁹¹ <https://docs.appdynamics.com/display/PRO45/Install+the+.NET+Agent+for+Windows>

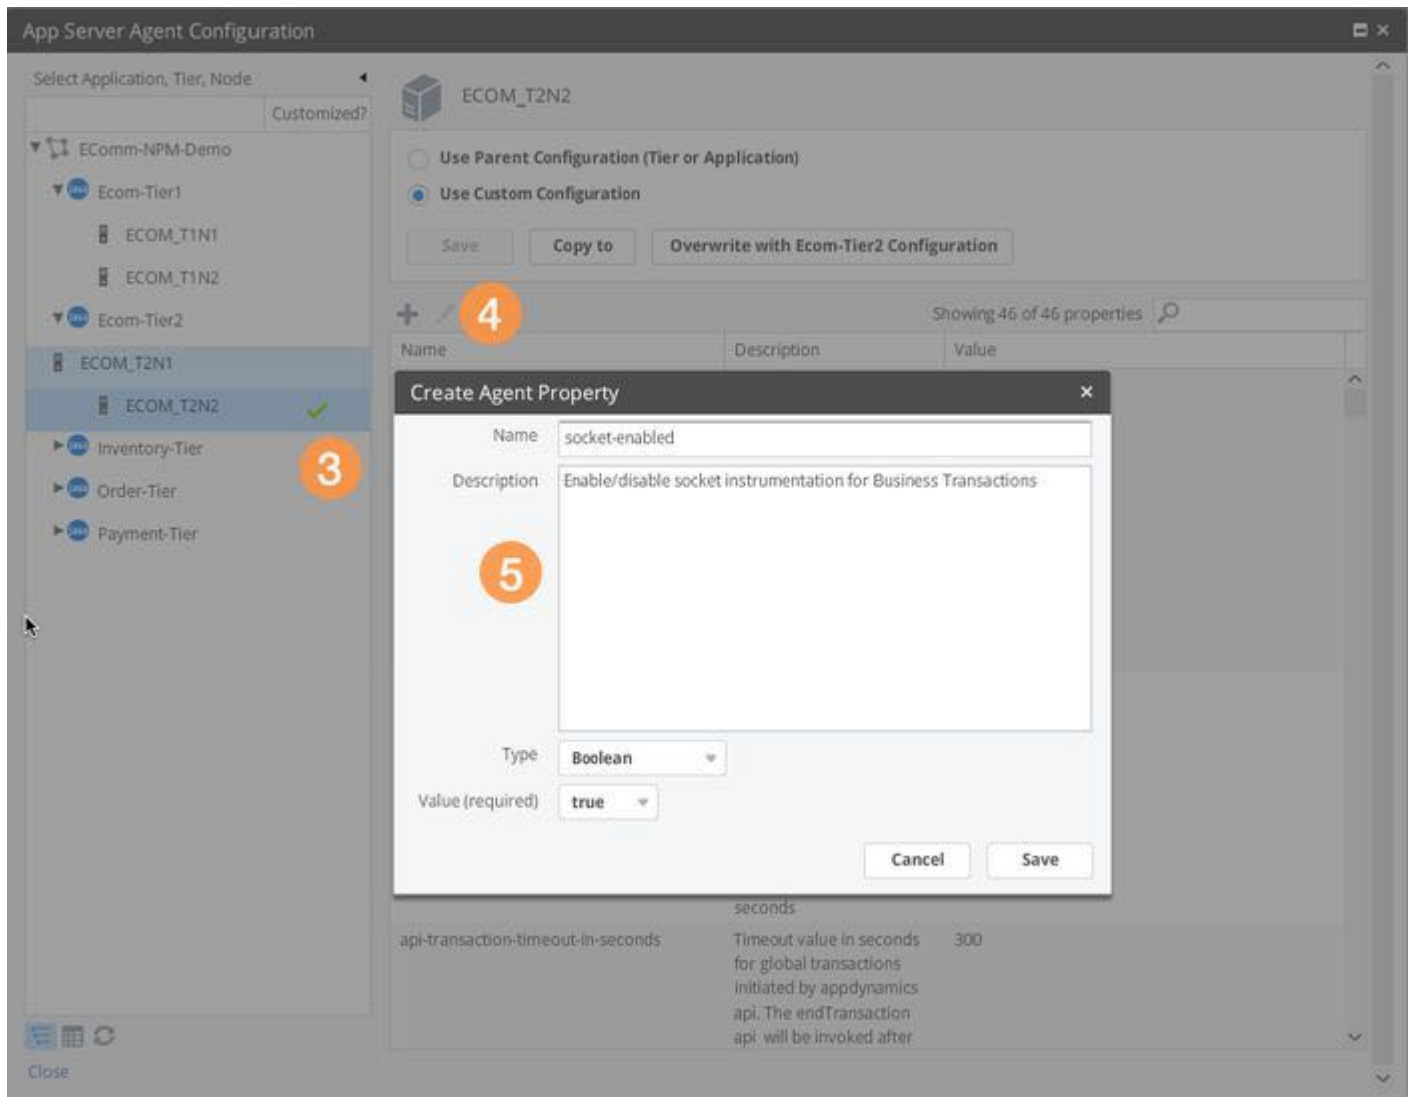

Set Up the .NET App Agent on Windows

If you want the Network Agent to monitor an app node on the same host, [Enable Socket Instrumentation](#)(see page 2757).

Enable Socket Instrumentation

For the Agent to map network metrics to application flows, perform these steps:

1. In the Controller, click the gear icon (⚙️) and select **AppDynamics Agents > App Server Agents**.
2. Select the Agent in the table and click **Configure**. The App Server Agent Configuration page appears.
3. Select the application, tier, and node in the tree-view (left).
4. Select Use Custom Configuration and then click +. The **Create Agent Property** dialog appears.
5. In the **Create Agent Property** dialog, specify:
 - a. Name = **socket-enabled**
 - b. Type = **Boolean**
 - c. Value = **true**

Administer the Network Agent on Windows

Related pages:

- [Observe License Usage](#)(see page 203)
- [Java Supported Environments](#)(see page 493)

Depending on how you installed and deployed the Network Agent, there may be more than one method to administer the Network Agent. AppDynamics provides both GUI and command-line tool for common operations, such as starting and stopping Network Agents and their services. See [Managing Network Agents in the Controller](#)(see page 2747).

This page describes how to administer the Network Agent using command-line tools for the Network Agent ZIP. You can manage the Network Agent using these commands:

- install
- start
- status
- stop
- uninstall

Ensure that you run all the scripts using administrator privilege. If you run the scripts without administrator privilege, the scripts prompt for the privilege request after a three second timeout. You can start these scripts from Windows Explorer or from the command line. If you run the scripts from the command line, the install, start and stop scripts have a `-quiet` option. The `-quiet` option runs the scripts without prompts, messages, or dialogs.

Operation	Command	Notes
Install Agent	<code>\<network-agent-home>\install.bat</code>	The <code>install.bat</code> installs the Network Visibility Agent and starts the AppDynamics Network Visibility Service.
Start Agent	<code>\<network-agent-home>\start.bat</code>	<p>If the Agent starts successfully, this message displays:</p> <pre>Starting the network agent service SERVICE_NAME: NetVizService TYPE : 10 WIN32_OWN_PROCESS STATE : 4 RUNNING (STOPPABLE, NOT_PAUSABLE, ACCEPTS_PRESHUTDOWN) WIN32_EXIT_CODE : 0 (0x0) SERVICE_EXIT_CODE : 0 (0x0) CHECKPOINT : 0x0 WAIT_HINT : 0x0 PID : 7556 FLAGS :</pre>

Operation	Command	Notes
Check Agent status	<code>\<network-agent-home>\status.bat</code>	This command shows if the Agent is running or not. <pre> SERVICE_NAME: NetVizService TYPE : 10 WIN32_OWN_PROCESS STATE : 4 RUNNING (STOPPABLE, NOT_PAUSABLE, ACCEPTS_PRESHUTDOWN) WIN32_EXIT_CODE : 0 (0x0) SERVICE_EXIT_CODE : 0 (0x0) CHECKPOINT : 0x0 WAIT_HINT : 0x0 </pre>
Stop Agent	<code>\<network-agent-home>\stop.bat</code>	If the Agent stops successfully, this message displays: <pre> SERVICE_NAME: NetVizService TYPE : 10 WIN32_OWN_PROCESS STATE : 1 STOPPED WIN32_EXIT_CODE : 0 (0x0) SERVICE_EXIT_CODE : 0 (0x0) CHECKPOINT : 0x0 WAIT_HINT : 0x0 </pre>
Uninstall Agent	<code>\<network-agent-home>\uninstall.bat</code>	If the Agent uninstalls successfully, this message displays: <pre> Stopping service NetVizService. NetVizService is stopped. Service AppDynamics NetViz Service uninstalled. </pre>

Manage Network Agent on Windows

You can start or stop the Network Agent using `start.bat` or `stop.bat`. You require admin privileges to start or stop the Network Agent.

You can view the services that are currently running on the system using AppDynamics NetViz Service.

Network Visibility Metrics

Network Visibility can collect these types of metrics:

- [KPI Metrics in Network Dashboard and Application Flow Map](#)(see page 2760)
 - Key Performance Indicator (KPI) metrics are essential measures of whether a network element is performing successfully. The Network Browser shows KPIs for tiers, nodes, network links, and the entire application
 - [KPI Metrics in Right-Click Dashboards](#)(see page 2762)
- You can right-click on a network element and perform network troubleshooting in the right-click dashboard. These dashboards make it easy to drill down to network elements and metrics that correlate with application-performance issues.

- [TCP Connection Metrics in Metric Browser](#)(see page 2768)
When you narrow down a network problem to a specific network location, you can configure Network Agents to collect advanced metrics for the relevant connections.
- [Node Metrics in Network Dashboard and Metric Browser](#)(see page 2766)
The Network Agent also collects node-level metrics for monitoring the TCP stack health, collisions, and errors on physical interfaces.

KPI Metrics in Network Dashboard and Application Flow Map

Some network metrics are considered Key Performance Indicators (KPIs) because they are essential measures of whether the network or a specific part of the network, is performing successfully. Network Agents collect network KPIs for all monitored tiers, nodes, network links, and application flows. You can view KPI metrics for these elements:

View Network KPIs

For the Entire Application

The **Network Dashboard** includes Throughput, TCP Loss, and PIE charts that measure network health for the entire application.

For a Network Link

- **Network Dashboard** – The flow map shows KPIs for each link. Click a link to view KPI time charts and KPIs per Connection.
- Right-click dashboard – Right-click a link in the Network Dashboard and select **View Metrics**. See [KPI Metrics in Right-Click Dashboards](#)(see page 2762).

For a Tier

- **Network Flow Map** – Click a tier to view KPI time charts.
- Right-click dashboard – Right-click a tier in the Network Dashboard and select **View Metrics**. See [KPI Metrics in Right-Click Dashboards](#)(see page 2762).

For a Node

- **Tiers & Nodes** page – Set the Show Data menu to **Network**. The table shows network KPIs and the Network Agent status for each node.
- **Node Dashboard** – Right-click the node and select **View Metrics**. See [KPI Metrics in Right-Click Dashboards](#)(see page 2762).

For a Connection

- **Network Agents** do not collect metrics for Connections by default. To collect metrics for the Connections used by a specific node, change the Monitoring Mode on the Agent. See [Dynamic Monitoring Mode and Network Visibility](#)(see page 2782).

Connections Explorer – Access the Network Dashboard and select **Connections**. The Explorer shows network KPIs for all network links. Drill down into a network link to view the Connections used on that link. If a Network Agent has collected metrics for a Connection, you can:

- View network KPIs in the Explorer table.
- Right-click and select **View Metrics**. See [KPI Metrics in Right-Click Dashboards](#)(see page 2762).
- Right-click and select **View Metric Browser**. See [TCP Connection Metrics in Metric Browser](#)(see page 2768).

KPI Metric Descriptions

Metric	Description	Default Monitoring Mode
Throughput	<p>The average rate of Application X traffic sent and received over one Connection, or a set of Connections.</p> <p>Correlated spikes along with Response Time indicate bottlenecks.</p>	KPI
Latency	<p>The average TCP Latency (round-trip time) for a packet to go from one application tier the other, and back again. When TCP effects are not significant, Latency primarily measures <i>network</i> round trip times. Network latency is primarily a factor of the physical distance between two nodes and remains consistent over time.</p> <p>Correlated spikes along with Response Time indicate that TCP effects between two tiers (such as packet queueing and delayed acknowledgments) are affecting application performance.</p>	KPI
TCP Loss (mille)	<p>The average number of packets (per 1000) that were sent but never received. Packet loss can degrade application performance significantly. TCP detects and re-transmits lost packets; this ensures reliable transmission but introduces delays.</p> <ul style="list-style-type: none"> • Correlated spikes with Response Time indicates that network congestion between the sender and receiver is affecting application performance. • Correlated spikes with Throughput indicates that a tier is sending more data than the receiving tier or the network can handle. 	KPI
Errors	<p>The number of TCP messages sent indicating an error in setting up the connection (SYN errors(see page 0)) or tearing down the connection (FIN errors(see page 2770)) for a specific TCP session.</p>	KPI

Metric	Description	Default Monitoring Mode
PIE (Performance Impacting Events)	<p>The rate of PIE (Performance Impacting Events), which indicate performance issues on one node, both nodes, or the network between two nodes:</p> <ul style="list-style-type: none"> • Client Limited(see page 2769) and Client Zero Window(see page 2769) events indicate that the Client node is receiving data at a higher rate than it can process. • TCP Retransmission Timeouts (RTO)(see page 2773) events indicate that the network is losing packets between the client and the server node. RTOs can cause severe performance degradations. • Server Limited(see page 2773) and Server Zero (see page 2773)Window events indicate that the Server node is receiving data at a higher rate than it can process. 	KPI

KPI Metrics in Right-Click Dashboards

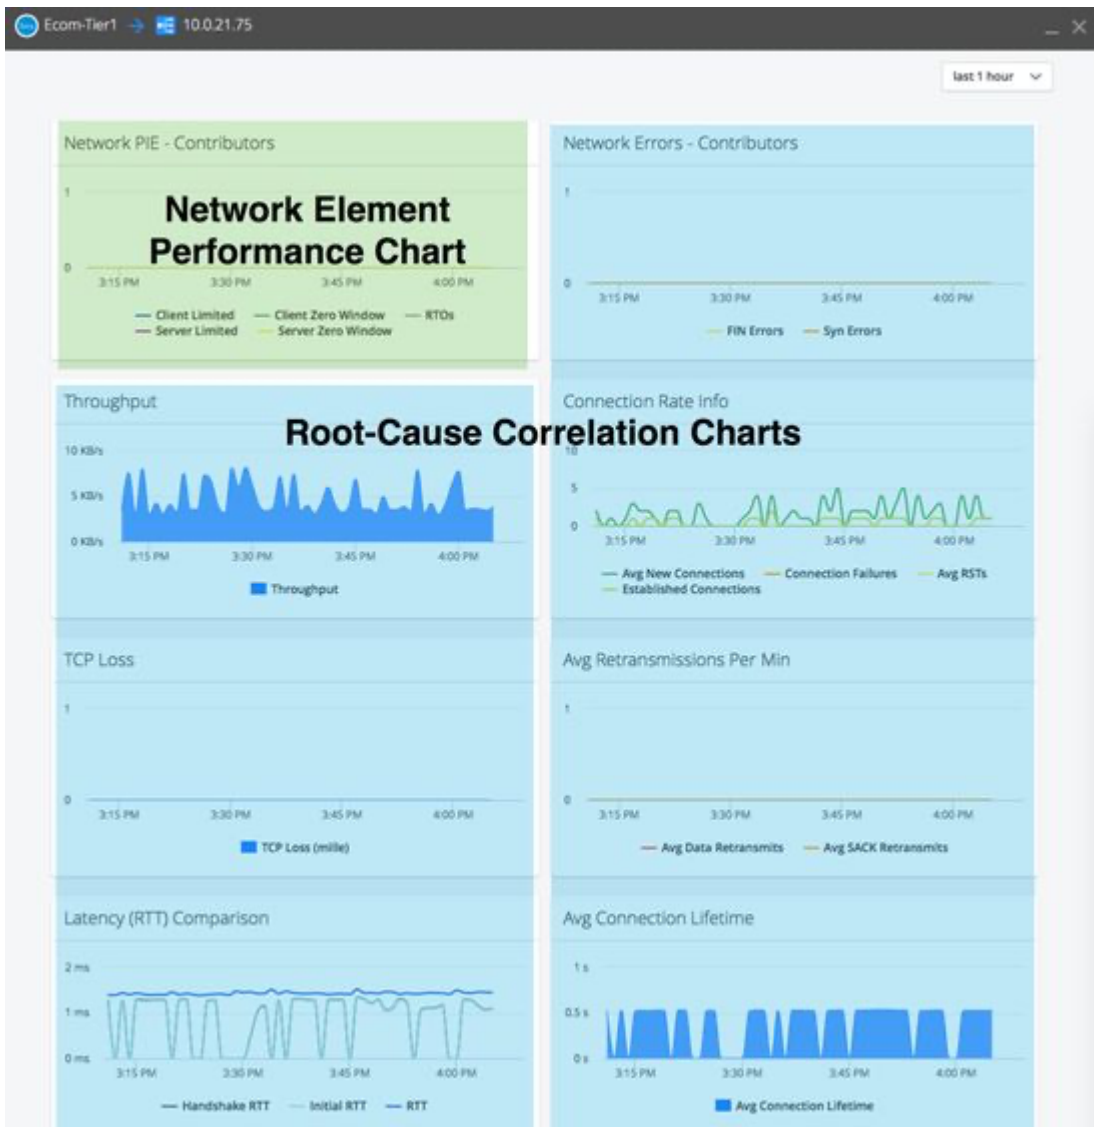

To diagnose a network element, right-click and select **View Metrics**. You can troubleshoot these network elements:

- Tier – The performance chart (top left) shows the rate or application performance outliers on the relevant nodes (Errors and Slow/Very Slow/Stalled Calls) and the Key Performance Indicators for all connections used by those nodes (Errors and PIE).
- Network Link – The performance chart (top left) shows the rate of Performance Impacting Events for all member connections of that link.
- Network Connection – You can troubleshoot a connection from the Connection Explorer or from the Connections tab in a link popup.
- You can troubleshoot a transaction from a Transaction Snapshot.
 - You can right-click an application flow and select **View Network Metrics**.
 - You can also drill down to a node where a transaction delay/stall/error occurred and access the Network tab.

To troubleshoot a tier, link, or connection in the Network Dashboard, right-click the network element and select **View Metrics**. The top-left chart in the dashboard shows the overall network or network/application performance of the element. To troubleshoot the element, search for correlations between the performance chart (top left) and the other charts on the page.

i Tip

To best highlight metric spikes and variations, you can switch between the linear and logarithmic scale in each chart. Click the **settings** button (top-right corner of the chart) to switch between scales.

Right-Click Chart Descriptions

Chart	Description	Default Monitoring Mode
Network Impact on Transactions (Tiers)	<p>This chart highlights the possible impact of Performance Impacting Events(see page 2772) on the app-transaction outliers (Transaction Errors and Slow, Very Slow, and Stalled Calls shown in the Transaction Scorecard(see page 1250)).</p> <p>If you see spikes in transaction outliers and correlated spikes in PIE or errors, this indicates that the network is affecting application performance. Search for correlated spikes in the other charts to identify specific issues and root causes: connection errors, packet loss, re-transmissions, high-latency connections, and so on.</p>	KPI
Host Stack KPIs	<p>Interface errors indicate issues on the node's physical interfaces. See Node Metrics in Network Dashboard and Metric Browser(see page 2766).</p> <p>TCP Wait sockets(see page 2766) can result in significant delays or errors for the application, or service, that relies on that socket. Many simultaneous WAIT sockets can prevent applications and services from creating new connections.</p>	KPI
Network PIE - Contributors	<p>Use Performance Impacting Elements (PIE) to identify the location of actual or potential bottlenecks:</p> <ul style="list-style-type: none"> • Client Limited(see page 2769) and Client Zero Window(see page 2769) events indicate a possible problem on the client node • RTOS(see page 2773) indicate a possible problem on the network path between two nodes • Server Limited(see page 2773) and Server Zero Window(see page 2773) events indicate a possible problem on the server node 	KPI

Chart	Description	Default Monitoring Mode
Network Errors - Contributors	<p>Use this chart to identify network errors that can affect application performance:</p> <ul style="list-style-type: none"> • FIN Errors – Errors when tearing down a TCP connection • Syn Blackholes - Connection attempts that went unanswered and resulted in a failure • Syn Resets – Connection attempts that were explicitly refused by the other host • RST on Established - TCP connection resets 	KPI
Throughput	<p>Traffic throughput for the application of interest on the network element. This chart measures application payload data only; TCP, IP, and other packet headers are excluded.</p>	KPI
Connection Rate Info	<p>Spikes in this chart, that coincide with spikes in slows calls or applications errors, indicate a possible issue with how the application is using TCP.</p> <ul style="list-style-type: none"> • New Connections – Number of new connection attempts • Connection Errors – The rate of TCP connection setup (SYN) errors and connection teardown (FIN) errors • RSTs (resets) – A TCP reset is an immediate closing of a connection. Not all connection resets indicate a problem, but you should investigate any spike in resets that coincides with a spike in application errors or slow transactions/calls. Connection resets can occur for various reasons, such as: <ul style="list-style-type: none"> ◦ Inability to create connections by the server ◦ Intermediate network elements, such as load balancers, firewalls, and so on, due to misconfiguration or other errors • Current Established Connections 	KPI
TCP Loss (mille)	<p>The number of packets lost (sent but not received) per 1000 packets sent. "Per mille" is a percentage with one additional digit of precision. TCP detects lost packets and retransmits each lost packet until it receives an ACK (acknowledgment) from the peer. Spikes in TCP Loss indicate that the network is over utilized.</p>	KPI

Chart	Description	Default Monitoring Mode
Retransmissions per Minute	<ul style="list-style-type: none"> • Data Retransmits – The percentage of packets that were retransmitted. This metric includes SYN and FIN retransmissions • SACK Retransmits – The percentage of data packets that were retransmitted due to selective acknowledgments (SACK, a TCP Feature) 	KPI
Latency (RTT) Comparison	<p>This chart compares the average TCP round-trip times (RTTs) for different types of packet request and responses.</p> <ul style="list-style-type: none"> • Handshake RTT – Average RTT for the initial 3-way handshake (SYN, SYN/ACK, ACK) to set up a connection. If Handshake RTTs are significantly higher than Initial RTTs, this indicates that the client node is taking a long time to set up the connection. • Initial RTT – Average RTT for the initial SYN packets (between SYN and SYN-ACK or SYN-ACK and ACK). If Initial RTTs are high, the delay may be due to an intervening firewall, asymmetric routing, or other network issues that causes the network to treat SYN packets differently from data packets. • RTT – Average TCP RTT for data request/responses— Time for TCP Data segments to be transmitted and acknowledged from the peer. This is different from Application Response Time metrics that measure the time an application takes to process a request. 	KPI
Connection Lifetime	<p>TCP is most efficient when using long, stable connections. Connection setups and teardowns are very time-consuming and resource-intensive. The more short-term connections are generated, the worse TCP performance will be because most of the time is spent creating connections and because "Slow-Start" in TCP optimal TCP bandwidth is not achieved.</p>	KPI

Node Metrics in Network Dashboard and Metric Browser

The Network Agent collects various TCP socket metrics at the host level for the local node on which it is installed. Use these metrics to monitor the TCP stack health, collisions, and errors on all the physical interfaces, and CPU consumption of the Network Agent.

TCP Socket Metrics in the Network Dashboard

These metrics measure the overall TCP socket health of an individual node. To view these metrics, select a node: access the Network Dashboard, click a tier, select the Nodes tab, and select the node of interest. The TCP Socket metrics for the selected node appear on the right side of the dashboard.

Metric	Description	Default Monitoring Mode
Established	The number of sockets that are in the established state	KPI
Embryonic	The number of sockets that are in the process of being set up	KPI
Wait	<p>The number of sockets that are unavailable for new connections because they are in the process of being closed. When a socket sends a Connection Close (FIN) message, the socket goes through three states:</p> <ol style="list-style-type: none"> 1. FIN_WAIT1 – Socket has sent the FIN and is waiting for an ACK from the remote socket 2. FIN_WAIT2 – Socket receives ACK, and waits for FIN (final connection close) from the remote socket 3. TIME_WAIT – The socket remains open to handle any packets for the TCP connection that might still be in the network. The TIME_WAIT state can last from one to four minutes, depending on the implementation. <p>A WAIT socket can result in significant delays or errors for the application, or service, that relies on that socket. Many simultaneous WAIT sockets can prevent applications and services from creating new connections.</p>	KPI
Time Wait	<p>The FIN_WAIT states are relatively short (in milliseconds), while the TIME_WAIT state is relatively long (one to four minutes). As a result, the Wait and Time Wait metrics should be fairly similar. Significant differences indicate a significant network or other delays between the selected node and another host.</p>	KPI

Interface Metrics in the Metric Browser

These metrics measure the number of collisions and errors on the physical interfaces of the node. To view these metrics, drill down in the Metric Browser by selecting:

Application Infrastructure Performance > <tier-name> > **Individual Nodes** > <node-name> > **Host** > **Interface**

Metric Name	Description / Notes	Monitoring Mode
# Collisions	Number of collision errors seen on all the interfaces, when an interface was blocked from sending a frame due to an Ethernet collision detection	KPI
# Receive Drops	Number of packets dropped while receiving by all interfaces on the host	KPI
# Receive Errors	Number of collision errors seen on all the interfaces, when an interface could not receive a frame due to a physical problem on the interface or the connected cable	KPI
# Transmit Drops	Number of packets dropped while transmitting by all interfaces on the host	KPI
# Transmit Errors	Number of collision errors seen on all the interfaces, when an interface could not send a frame due to a physical problem on the interface or the connected cable	KPI
# Total Errors	The total number of Ethernet or physical errors detected on the interface	KPI

TCP Connection Metrics in Metric Browser

Network Visibility Agents can calculate an extensive set of metrics based on the TCP flows observed by the Network Agents. In addition to KPI, PIE, and Troubleshooting metrics, you can view advanced metrics for network elements of interest (tiers, nodes, links, and connections) in the Metric Browser. Using time-based charts, you can detect and analyze these behavior traits:

- TCP flow setup/teardown times and errors
- Distribution of TCP flows for an element by throughput, setup time, lifetime, and round-trip time
- Flows closed by TCP resets
- Distribution of flows based on TCP configuration options (Selective Acknowledgement, Timestamp)

- For these metrics, the Metric Browser uses the terms *Connection* and *Flow* interchangeably. See [Flows, Links, and Connections](#)(see page 2780).
- Network Agents do not collect metrics for individual Connections by default. The recommended workflow is to enable TCP Flow metric collection only when you need to diagnose a performance issue on an associated node or Connection. See [Dynamic Monitoring Mode and Network Visibility](#)(see page 2782).

Viewing TCP Flow Metrics

To view advanced network metrics, open the Metric Browser and navigate to Application Infrastructure Performance. The Metric Browser shows connection/flow metrics for the following aggregations (highlighted in red):

- **Application Infrastructure Performance >**

- **Advanced Network >**
 - **Flows >**
 - **All Connections/Flows for Application**
- *tier-name*
 - **Advanced Network >**
 - **Flows >**
 - **Call from <tier> to <service>**
 - **Call from <node> to <node-or-service>**
 - **Individual Connection/Flow (<node> to <service>)**
 - **All Connections/Flows for Network Link (<tier> to <service>)**
 - **All Connections/Flows for tier**

TCP Flow Metric Descriptions

Metric Name	Description and Notes	Default Monitoring Mode
# Client Limited	The number of TCP window updates sent by a client node indicating that it is receiving data at a faster rate than the application can process	KPI
# Client Zero Window	<p>If a client's TCP buffer is full, it sends Zero as the TCP receive window size to indicate that it cannot receive more data. The data transfer then stops until the client can process the data in its buffer.</p> <p>A high rate of Client TCP Zero Window messages indicates a problem with either:</p> <ul style="list-style-type: none"> • The TCP configuration on the node, or • The client-side application using that flow 	KPI
# Connection Errors	The sum of Syn Resets(see page 2773) + Syn Blackholes(see page 2773) + TCP Resets - Established(see page 2773)	KPI
# Connection Requests	The total number of connection requests (successful and unsuccessful) sent during the selected time window	KPI
# Current Established Connections	The number of established (setup) flows/connections	KPI
# Data Retransmits	Number of TCP data packets that were retransmitted for all TCP Connections	KPI
# Delayed Acks (Data Piggy Back)	The average number of times a receiving node sent an ACK (acknowledgment) by "piggybacking" the ACK onto another message	Advanced

Metric Name	Description and Notes	Default Monitoring Mode
# Delayed Acks (Timeouts)	<p>The average number of times a receiving node sent an ACK (acknowledgment) because the Delayed ACK timer expired</p> <p>This is a "worst-case" delay for the Delayed ACK algorithm and occurs most often when Nagle's algorithm and Delayed ACK are enabled on the sending and receiving node, respectively. A high rate of delayed ACKs may contribute significantly to the average Latency(see page 2761) on a Connection.</p>	Advanced
# Errors	The number of TCP messages sent indicating an error in setting up the connection (SYN errors), or tearing down the connection (FIN errors)	KPI
# Fin Errors	The number of errors generated while tearing down the connections (TCP FIN errors). Many connections in FIN wait states can cause delays in creating new connections.	KPI
# Flows (<1KB) # Flows (1k - 10k) # Flows (10k - 100k) # Flows (100k-1MB) # Flows (1MB - 10MB) # Flows (>10MB)	Use these metrics to analyze the distribution of flows by throughput	Advanced
# Flows - Handshake (1SD) # Flows - Handshake (2SD) # Flows - Handshake (3SD)	<p>The number of TCP flows with connection-setup times that are 1, 2, or 3 Standard Deviations outside (higher or lower than) the average for that connection group</p> <p>Under ideal conditions, all flows should be within 1SD of the average</p>	Advanced

Metric Name	Description and Notes	Default Monitoring Mode
# Flows - Lifetime (1SD) # Flows - Lifetime (2SD) # Flows - Lifetime (3SD)	<p>The number of TCP flows with lifetimes that are 1, 2, or 3 Standard Deviations outside (higher or lower than) the average.</p> <p>Under ideal conditions, all flows should be within 1SD of the average. 2SD or 3SD flows indicate inconsistent flow treatment along the network path. These inconsistencies can occur when a network service decreases the available bandwidth intentionally (<i>bandwidth throttling</i>) or prioritizes some types of traffic over others (<i>traffic shaping</i>).</p> <p>Short-lived connections, even if they are intermittent, may indicate an issue worth investigating. The more short-lived connections get generated, the more resources are spent setting up and tearing down these connections.</p>	Advanced
# Flows - RTT (1SD) # Flows - RTT (2SD) # Flows - RTT (3SD)	<p>Number of flows whose Round Trip Times are 1, 2, or 3 Standard Deviations higher than the average for all flows in the parent group. Under ideal conditions, all flows should be within 1SD of the average.</p> <p>High-RTT connections, even if they are intermittent, may indicate an issue worth investigating. If the average response time for an eCommerce web app is two seconds (acceptable), but 5% of transactions are 20 seconds or higher (not acceptable), this can result in a significant number of unhappy customers and lost revenue.</p>	Advanced
# Flows - TCP Data Rxmt	<p>Number of flows within which any packet was retransmitted. Retransmissions are an indication of packet loss.</p>	Advanced
# Flows - TCP Resets	<p>The average number of flows that were closed by a TCP Reset</p>	KPI

Metric Name	Description and Notes	Default Monitoring Mode
# Flows - w/o TCP SACK	Number of flows with the TCP Selective Acknowledgment (SACK) option disabled. With SACK enabled, a receiver can send SACK packets to acknowledge receipt of multiple data packets in the case of lost segments. This improves network performance by reducing the number of retransmissions. With SACK disabled, the receiver must resend all the packets after the last lost segment, even if they were received by the peer.	Advanced
# Flows - w/o TCP Timestamp	Number of flows with the TCP Timestamp option disabled. Use this option to calculate more accurate Round Trip Times.	Advanced
# IP Fragment Count	The total number of IP fragments attributes to this TCP connection group. A high level of fragmentation indicates network issues which can severely affect application performance.	KPI
# Loss Pkts	The total number of packets that were lost (sent but never received)	Advanced
# Nagle Delays	The number of times a message-send event was delayed because the sending node had to wait for previously-sent data to be acknowledged (ACK'd). This occurs most often when Nagle's algorithm and Delayed ACK are enabled on the sending and receiving node, respectively.	Advanced
# PIE Events	Use Performance Impacting Elements (PIE) to identify the location of actual or potential bottlenecks: <ul style="list-style-type: none"> • Client Limited(see page 2769) and Client Zero Window(see page 2769) events indicate a possible problem on the client node • RTOs(see page 2773) indicate a possible problem on the network path between two nodes • Server Limited(see page 2773) and Server Zero Window(see page 2773) events indicate a possible problem on the server node 	KPI

Metric Name	Description and Notes	Default Monitoring Mode
# RetransmissionTimeouts	<p>Retransmission Timeouts (RTOs) indicate network packet loss which results in retransmission of data when the TCP retransmission timer expires (Timer to make sure data is ACK'ed)</p> <ul style="list-style-type: none"> • This timer varies from 200ms-3 sec by default (different for each operating systems and their versions) • It causes severe performance degradations because a considerable amount of time is wasted resending lost data • TCP falls back to the "Slow Start" phase impacting the performance even more 	KPI
# SACK Retransmits	Average number of packets that were retransmitted due to a SACK message that indicated an unreceived packet	KPI
# Server Limited	The number of TCP window updates sent by a server node indicating that it is receiving data at a faster rate than the application can process	KPI
# Server Zero Window	<p>If a server's TCP buffer is full, it sends Zero as the TCP receive window size to indicate that it cannot receive more data. The data transfer then stops until the server can process the data in its buffer.</p> <p>A high rate of Server TCP Zero Window messages indicates a problem with either:</p> <ul style="list-style-type: none"> • The TCP configuration on the node, or • The client-side application using that flow 	KPI
# Syn Blackholes	The number of connection attempts that went unanswered and resulted in a failure. Syn blackholes can severely impact application performance.	KPI
# Syn Resets	The number of connection attempts that were explicitly refused by the other host. Syn resets can severely impact application performance.	KPI
# TCP Resets - Established	The average number of times an established TCP flow was reset	KPI

Metric Name	Description and Notes	Default Monitoring Mode
# TCP Resets - Fin	The average number of times a TCP flow was reset while it was in the process of getting closed	KPI
# TTL Changes (1 - 2 hops) # TTL Changes (3 - 4 hops) # TTL Changes (>=5 hops)	The number of routing-hop changes experienced by this connection. Frequent variations in routing-hop changes indicate routing problems in the network and can severely affect app performance. Under ideal conditions, the number of hops should be consistent.	Advanced
Avg # TTL Hops	The average number of routing-hop changes experienced by this connection	Advanced
Delayed Acks Lag (usec)	The average amount of lag that Delayed ACKs are adding to the overall Latency of the Connection	Advanced
Initial RTT (usec)	Round trip time for the initial two SYN packets (between SYN and SYN-ACK, or SYN-ACK and ACK depending upon whether the Agent is running on client or server)	KPI
Latency - RTT (usec)	Average round-trip latency (from packet transmission to acknowledgment) for all packets	KPI
Lifetime (usec)	Average lifetime (from initial setup to final teardown) for TCP sessions in the Connection group	KPI
Loss (per mille)	The number of packets lost per 1000 packets sent. "Per mille" is a percentage with one additional digit of precision.	KPI
Nagle Delays Lag (usec)	The average amount of lag that Nagle delays are adding to the overall Latency (see page 2761) of the Connection	Advanced
Pkts per Sec	Average rate of packets sent and received	KPI
Rx Pkts per Sec	Average rate of packets received	Advanced
Rx Throughput (BPS)	Average rate of bytes received	Advanced

Metric Name	Description and Notes	Default Monitoring Mode
TCP Handshake (usec)	Round trip time for the initial three-way connection setup for all flows in the parent group: 1. SYN (client --> server) 2. SYN-ACK (client <-- server) 3. ACK (client --> server)	KPI
Throughput (BPS)	Throughput (bytes per second) for the application of interest on all TCP sessions	KPI
Tx Pkts per Sec	Rate of packets sent	Advanced
Tx Throughput (BPS)	Rate of traffic received	Advanced

FAQs for Network Visibility

General

- Why are there no connection metrics for a tier, node, or network link?

By default, Network Agents do not collect connection metrics. The recommended workflow is to identify the link with the network issue and configure the relevant agents to collect metrics for the relevant connections. See [Dynamic Monitoring Mode and Network Visibility](#)(see page 2782).

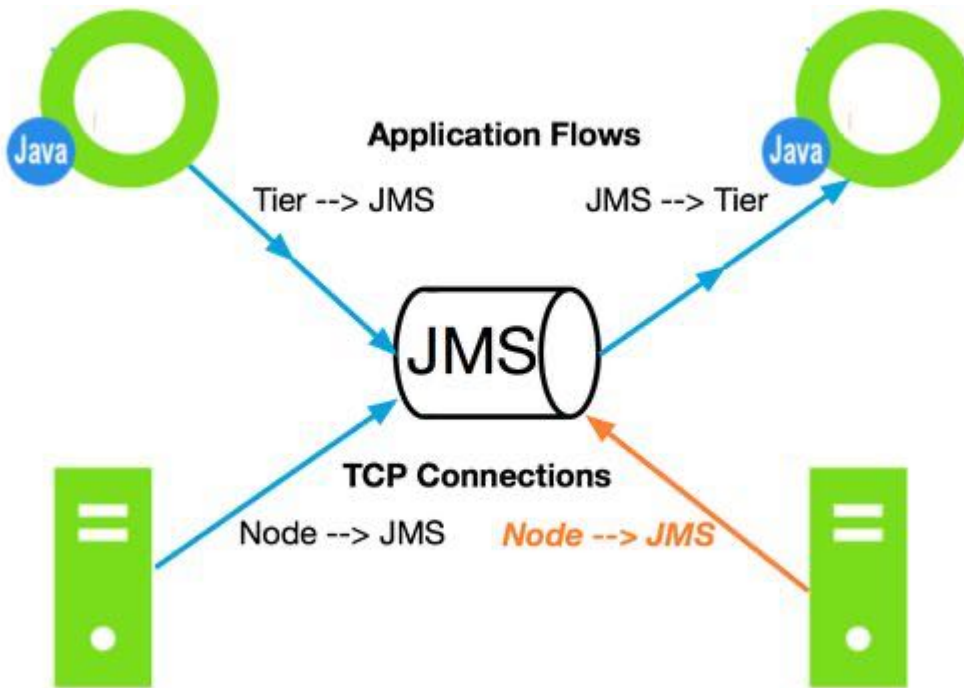

- The Network Agent cannot register with the Controller. What should I do?

If a Network Agent cannot register with the Controller:

- Check that the user account has a Network Visibility product license.
- If the user account has license rules defined, verify that the correct number of license units have been allocated.
- To change the number of allocated units in a rule:
 - Go to **Controller Settings > License > Rules**.
 - Edit the **License Rule** of interest. (There may be only one License Rule, named **Default**.)
 - In **General**, set the **Allocated Units** field for the Network Visibility license and apply the change.
- In some cases, I see that an application flow for a JMS queue goes in one direction but a TCP connection used by that queue goes in the opposite direction. Why is that?

Typically, the network links and TCP connections used by an application flow have the same direction (source → destination) as the flow itself. You may notice different directions, however, if two tiers transfer data through a JMS queue. In some JMS implementations, the individual nodes in each tier initiate the TCP connection to the queue, so the direction is always: node (source) → queue (destination).

Some of these connections may be used by an application flow in the opposite direction: queue (source) → tier (destination).

- How do I change the Network Agent communications port?

When you start the Network Agent, the `appd_netmon` process spawns the `appd-agent` process. By default, these two processes communicate over TCP port 3892. If this port is already in use, you should see a log message in one or both files. To configure the Network Agent to use a different port:

1. Use the `netstat` command to verify that the new port is not in use.
2. Update the Network Agent:
 - a. Use a text editor to open this file: `<network_agent_home>/conf/agent_config.lua`.
 - b. Set the `port` option to the new TCP port number (under `webserver_config`).

```
webserver_config = {
    port = <new-port-number>,
    request_timeout = 10000,
    threads = 2,
}
```
 - c. Save the file and restart the Network Agent.
3. Update the App Agent:
 - a. Use a text editor to open this file: `<app_agent_home>/<version-number>/external-services/netviz/netviz-service.properties`.
 - b. Set the `netviz.agent.api.service.port` option to the new TCP port number.
 - c. Save the file and restart the App Agent.

- The application I want to monitor uses TCP port 32768 or higher. How do I configure the Network Agent to monitor this port?

1. Use a text editor to open this file: `<network_agent_home>/conf/agent_config.lua`
2. If you plan to monitor any application or service that uses any TCP ports higher than 32767, uncomment the `application_service_ports` block and specify these ports as a comma-separated list in the `ports` option:
Original:

```
--[[
application_service_ports = {
ports = "",
}
--]]
```

Edited:

```
application_service_ports = {
ports = "40000, 41000",
}
```

- How can I replace the AppDynamicsNetMQ.dll with another version of NetMQ?
1. Download the NetMQ.dll version and its dependencies.
 2. ILMerge them into one dll file named AppDynamicsNetMQ.dll.
 3. Include the AppDynamicsNETMQ.dll file in the .NET Agent home directory, such as c:\Program Files\AppDynamics\AppDynamics .NET Agent.
 4. Restart the monitored application.
- Why does running the Dynamic Service increase the DNS resolution time of the application?

If you specify FQDN/hostname as a value to define the Network Visibility property `netviz.agent.host.address` in the `netviz-service.properties` file, the Dynamic Service resolves the FQDN/hostname to its respective IP address frequently, resulting in increased resolution time.

To resolve this problem, use IP Address as a value to define the Network Visibility property `netviz.agent.host.address`. Alternately, you can also increase the value of `networkaddress.cache.ttl` depending on your application requirements.

- Are there any additional fully qualified domain name (FQDN) configurations for the `agent_config.lua` file?

```
ip_config = {
expire_interval = 20,
retry_count = 5,
}
```

Refresh Timeout: `expire_interval` defines when an IP in the .NET Agent IP cache needs to be re-resolved for FQDN or flushed if not associated to any flowgroup. The expire interval ranges from 1 to 30 mins (maximum).

Retry Count: `retry_count` defines how many times an IP tried to resolve for FQDN. Every resolution happens after `expire_interval` time. you can update the default value in situations where the DNS record for the IP is created and there is a lot of churn in the IP to FQDN mappings.

Logs

- How do I resolve the error, "ERROR MsgZmq::Bind: zmq_bind failed: File name too long"?

This error occurs when the file name is too long. The complete path to the file is included in the file name.

To resolve this error, move the Network Agent to a smaller absolute path.

1. Create a soft (symbolic) link for the longer directory name: `$ ln -s /long/dir/name /short/dir/name.`
2. Go to the short directory: `$ cd /short/dir/name.`

3. Run the install.sh script: `$ sudo ./install.sh`.
4. Change the LD_PRELOAD parameter in application to use the library from the short directory name: `$ LD_PRELOAD=/short/dir/name/lib/appd-netlib.so1692 <command to start app>`.
 - Why do I see the error, "ERROR cw_flowgroup_uri_cb: Failed to write data on connection"?

This error occurs when the Network Agent supports a large number of AppServer Agents. If this error occurs frequently, restart the Agent using an increased number of thread counts in `webserver_config` in a `gent_config.lua` config file.

- Why do I see the error, "ERROR ip_flowgrp_lookup: flowgrp alloc failed"?

Connections (Source IP : Source Port : Destination IP : Destination Port) in Network Agent are represented as flows. Aggregating these connections on a source port provides flow group, represented as (Source IP : Destination IP : Destination Port). The Network Agent can monitor only a certain number of flow groups. This error occurs when the maximum number of flow groups is reached and the Network Agent cannot monitor any new incoming flow groups.

- Why do I see the error, "DEBUG adns_resolve: ip resolve error: Name or service not known"?

AppDynamics resolves IP addresses to provide fully qualified domain name (FQDN) information to the Controller for the IP addresses visible in the system. This error occurs when some IP addresses cannot be resolved.

Network Visibility Concepts

The these concepts are central to Network Visibility:

- Network Visibility can identify two types of [performance bottlenecks](#)(see page 2778):
 - Network-performance bottlenecks
 - App/Network-interaction bottlenecks (for example, how an application tier or node uses network resources)
- The [Network Dashboard](#) (see page 2814) shows the network-level view of a monitored application. You can quickly identify network elements with performance issues (red/yellow links or tiers), view Key Performance Indicators for each network element, and troubleshoot individual elements (right-click an element and select **View Metrics**).
- Network Agents can detect [load balancers and TCP endpoints](#)(see page 2779), which appear in network flow maps (but not application flow maps), and sometimes function as traffic sources and destinations.
- Network Visibility can collect metrics for individual [application flows, TCP connections, and network links](#).(see page 2780)
- To support in-depth troubleshooting, you can [configure Network Agents to collect detailed diagnostic metrics](#)(see page 2782) for nodes and connections with performance issues.

Identifying Performance Bottlenecks

Performance Bottleneck Categories

Network Visibility can pinpoint performance bottlenecks down to a specific tier, node, or network path. Either of these bottlenecks can slow down an application significantly:

- Application/Network bottlenecks

Many bottlenecks identified as "network issues" actually have their root cause defined by how an application or a server uses network resources. Network Visibility can detect [many different types of app/network bottlenecks](#)(see page 2782), as well as bottlenecks due to [TCP socket issues on a specific node](#)(see page 2766).
- Network bottlenecks

A network bottleneck indicates that a specific section of the network cannot process the application loads between the source and destination nodes. Symptoms of a network bottleneck include a [high rate of packet loss](#)(see page 0) or [high round-trip times \(RTTs\)](#)(see page 2774) between two nodes.

¹⁶⁹² <http://appd-netlib.so/>

Load Balancers and TCP Endpoints

You may notice objects in a Network Flow Map that do not show up in an Application Flow Map. This is because these Network Flow Map objects represent devices that are detected by the Network Agents, and are relevant to the monitored application, but the detected devices do not have Network Agents installed.

Load Balancers

Network Visibility detects load balancers (LB) automatically, and displays them in Network Flow Maps. Load balancers seek to optimize the distribution of network traffic and often hide internal IP addresses from external nodes. Application Flow Maps do not show load balancers because these devices do not function as application nodes.

An intermediate load balancer splits an application message into two separate connections: node A connection to a load balancer, and the load balancer connection to node B (node A -> LB, and LB -> node B). This additional layer of detail in the Network Browser makes it easier to identify network segments that have specific performance issues.

TCP Endpoints

The Controller uses TCP endpoints to represent flows where the monitoring vantage point is from one end. The Network Agent monitors the connection between a monitored node and a TCP endpoint. However, the Network Agent cannot determine if this endpoint is on another node, or on an intermediate device (such as a load balancer) that splits the connection in two.

These diagrams show two different views of the same application:

The **Application Dashboard** shows two tiers connecting to two MySQL instances. The Application Flow Map shows application messages between monitored nodes that are directly visible to App Agents.

The **Network Dashboard** shows TCP endpoints on links between tiers and nodes. The Network Flow Map shows Network Agents installed (left) and nodes that the Network Agents cannot see directly (right).

This example shows how a Network Agent monitors a connection between an Inventory-Tier node (left), and an Inventory Database service. A TCP endpoint divides the link into:

- 1 A colored line representing the connection visible to the Network agent, and
- 2 A gray line representing a connection that is not instrumented by Network Visibility. A gray line connection link without Network Visibility indicates one of two things:
 - The TCP endpoint and an Inventory Database service are *on the same device* with an intermediate device that splits the connection in two.
 - The TCP endpoint and an Inventory Database service are *on two devices* using a separate connection that does not allow for network visibility.

For these reasons, gray line connection links do not have associated metrics.

Flows, Links, and Connections

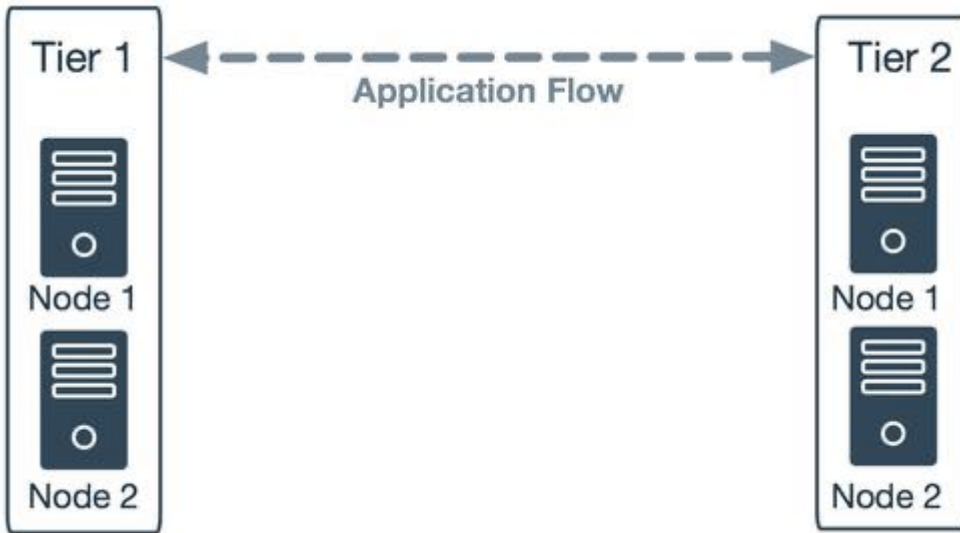

Network Visibility can collect metrics for these object types:

- Network links between tiers, or between tiers and load balancers/TCP endpoints
- Connections between nodes, or between nodes and load balancers/TCP endpoints

Troubleshooting a performance issue in Network Visibility often involves drilling down from an application issue (flow) to a network issue (link) to the root cause (connection). See [Workflows and Example Use Cases](#)(see page 2783).

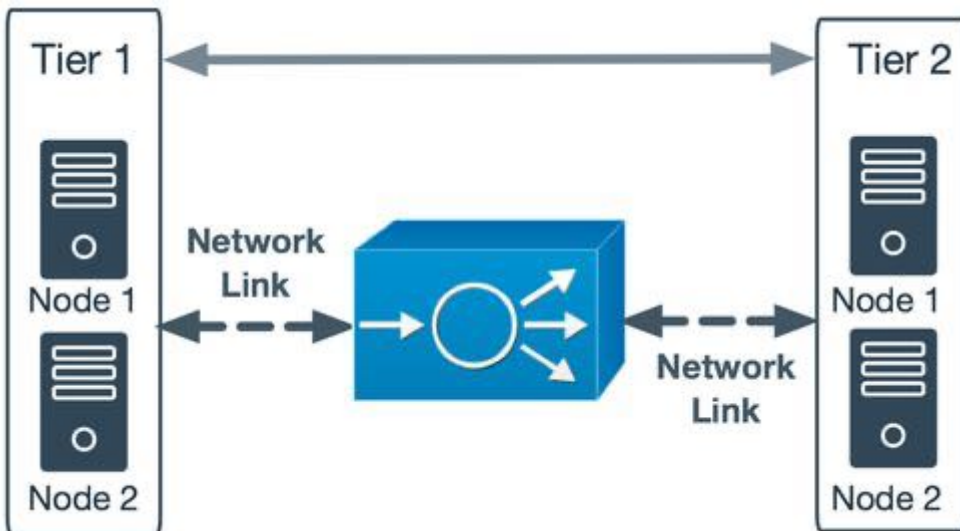

Application Flows

App Agents collect metrics for *application flows* between tiers, as shown in the Application Flow Map. This diagram shows the calls, transactions, and messages for application x between tier 1 and tier 2.

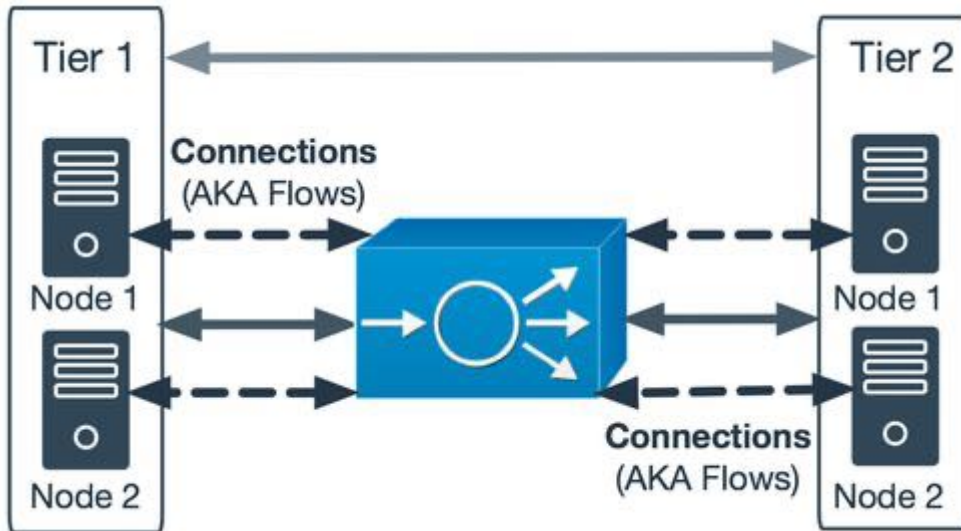

Network Links

Network Agents collect metrics for *network links*, which you can view in the **Network Dashboard**. A network link is the set of all traffic between two tiers, or between a tier and an intermediate load balancer, or TCP endpoint. If an application flow transports traffic through a load balancer, Network Visibility creates a link on each side and calculates metrics for each link. This diagram shows the network traffic for application *x* sent and received by the two tiers through a load balancer.

TCP Connections

Individual nodes send and receive traffic over connections. In Network Visibility, a *connection* is a set of all traffic with the same source IP address, destination IP address, destination port, and protocol. This diagram shows the individual connections used by the four nodes to send and receive traffic for application *x* through the load balancer.

Dynamic Monitoring Mode and Network Visibility

Like Server Visibility Agents, Network Agents support Dynamic Monitoring Mode (DMM). Rather than have all Network Agents report all metrics all the time, you can run each Agent in one of three modes:

- KPI Mode – Network KPI metrics for all monitored objects (application flows, tiers, nodes, and network links) except individual connections
- Diagnostic Mode – Network KPI metrics for all monitored objects, including connections
- Advanced Diagnostic Mode – All network metrics for all monitored objects, including connections

Every Network Visibility metric has a default DMM class (KPI, Diagnostic, and Advanced Diagnostic).

See [Network Visibility Metrics](#)(see page 2759)

By default, all Network Agents run in KPI mode. The recommended workflow is to:

1. Run all Network Agents in KPI mode.
2. When you notice a performance issue on a specific node or network link, increase the metric level on the associated Network Agents to Diagnostic, and collect KPI metrics for the connections.
3. Based on the connection KPIs, identify the connections with performance issues.
4. To troubleshoot an individual connection, increase the metric level on the associated Network Agents to Advanced Diagnostic, and collect advanced metrics for the connection.
5. When the issue is resolved, reset the Agents back to KPI mode.

Change the DMM on a Network Agent

1. Click the gear icon () in the top-right corner of the Controller page, select **AppDynamics Agents**, and go to the Network Visibility Agents table.
2. Select the Agents of interest, right-click, and select **Change Dynamic Monitoring Mode**.

The Network Agent retains its DMM setting even if the Agent is stopped and restarted. See [Managing Network Agents in the Controller](#)(see page 2747).

Connection Diagnostics and Network Bottlenecks

Network Agents can collect an extensive set of individual connection metrics within a network link. Network Visibility can detect these TCP performance issues:

- The data-receive window is too small (or zero) on the [client](#)(see page 2769) or the [server](#)(see page 2773), which slows down the transfer of data.
- One or more servers are experiencing errors [setting up](#)(see page 0) or [tearing down](#)(see page 2770) the connection for an individual TCP session.
- The client and server take a [long time](#)(see page 0) to set up an individual session.
- The application is using many [short-lived connections](#)(see page 2766). TCP is most efficient when long, stable connections are used.
- Some TCP sessions have [unusually high round-trip times \(RTTs\)](#)(see page 0). When TCP is performing well, RTTs are stable and determined by the network path between two nodes.

The Network Agent does not collect any connection metrics in KPI mode (the default setting). To diagnose a node or network path that is monitored by an Agent, you can change the Dynamic Monitoring Mode on a Network Agent.

Example Workflow

After you complete the initial setup, you can set the Dynamic Monitoring Mode on individual Network Agents, as needed. This is an example workflow:

- The DevOps team for a large enterprise monitors its IT infrastructure using Network Agents on critical servers. All Agents are initially set to KPI mode.
- The Network Dashboard shows a spike in latency on a network link between tier-A and tier-B.
- A DevOps team member:
 - Sets the Network Agent DMM on the tier-A and tier-B servers to Diagnostic.
 - Collects KPI metrics for the connections between the tier-A and tier-B nodes.
 - Identifies one high-latency connection between nodes TA-N1 and TB-N3, based on the Connection KPIs. The KPIs for all other connections are within acceptable bounds.
 - Sets the Network Agent DMM on TA-N1 and TB-N3 to Advanced Diagnostic, and the DMM on all other Agents to KPI.
 - Notes a set of spikes in Nagle delays on this connection. These spikes correspond to the latency spikes noticed on the network link.
 - Reconfigures TCP on the two nodes, and monitors the connection. The Nagle and latency spikes no longer occur.
 - Resets DMM on the TA-N1 and TB-N3 Agents back to KPI.

Workflows and Example Use Cases

Network Visibility makes it easy to answer the question: *Is the network impacting my application's performance?* This page describes the high-level troubleshooting workflows and includes several examples of how to use these workflows to solve real-world network problems.

Application Troubleshooting

From the Application Dashboard and I see slow, very slow, error, or stalled transactions. Are network conditions to blame?

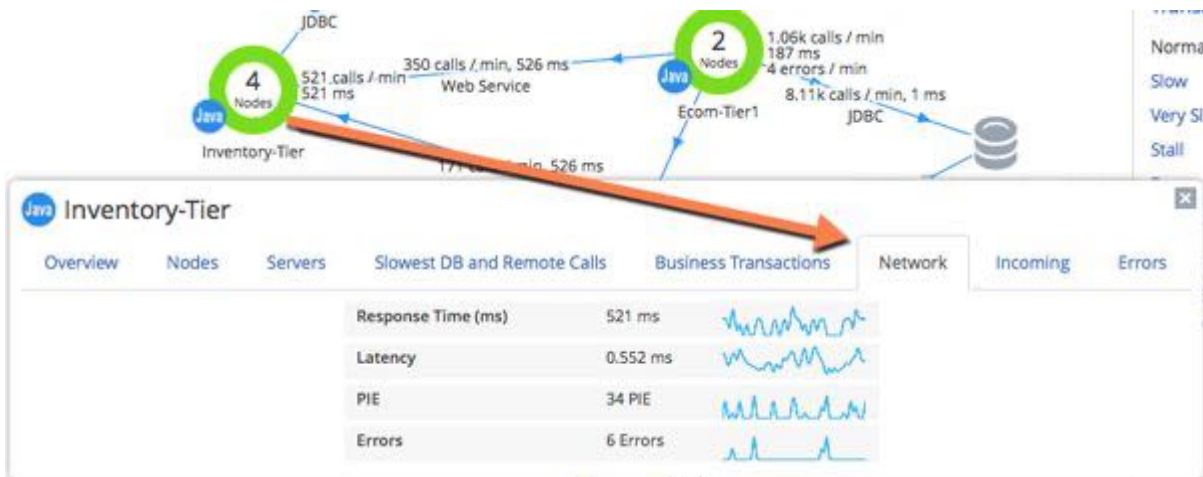

- - [Application Dashboard: Are network conditions to blame for the issue?](#)(see page 2783)
 - [Network Dashboard: Which network tiers and links are associated with these network conditions?](#)(see page 2784)
 - [Tier Dashboard: Which network metrics on this tier correlate with my outlier transactions?](#)(see page 2784)
 - [Network Dashboard \(Advanced Diagnosis\): On which TCP connections are these network issues occurring?](#)(see page 2786)

Application Dashboard: Are network conditions to blame for the issue?

Network Agents collect network-performance metrics for each application tier. If you notice performance issues in the Application Flow Map, open a popup and click Network tab. Do you see correlations between the Response Time and the other charts? If so, it indicates that the Response Time is affected by:

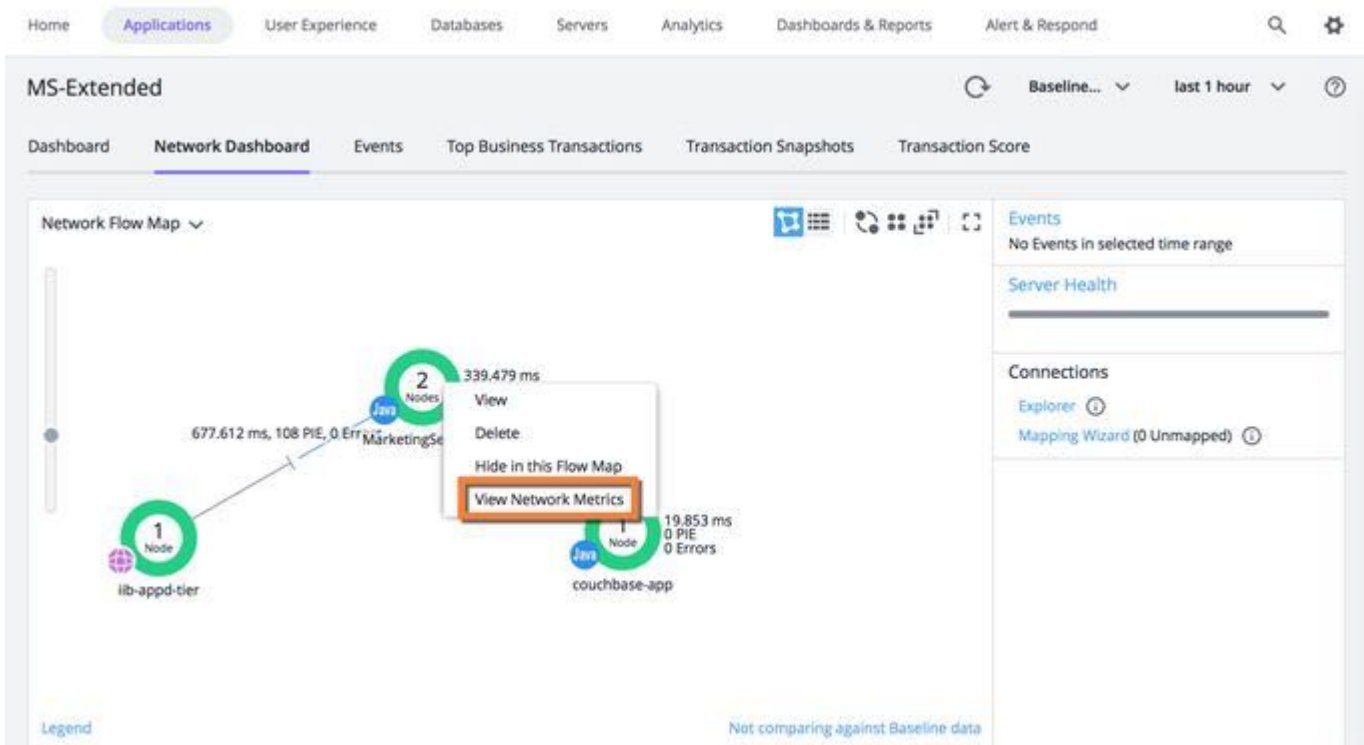

- TCP effects between the two tiers (Latency)
- Performance Impacting Events at the client tier, server tier, or the network path between the tiers (PIE)

- Errors setting up or tearing down TCP connections (Errors)

Network Dashboard: Which network tiers and links are associated with these network conditions?

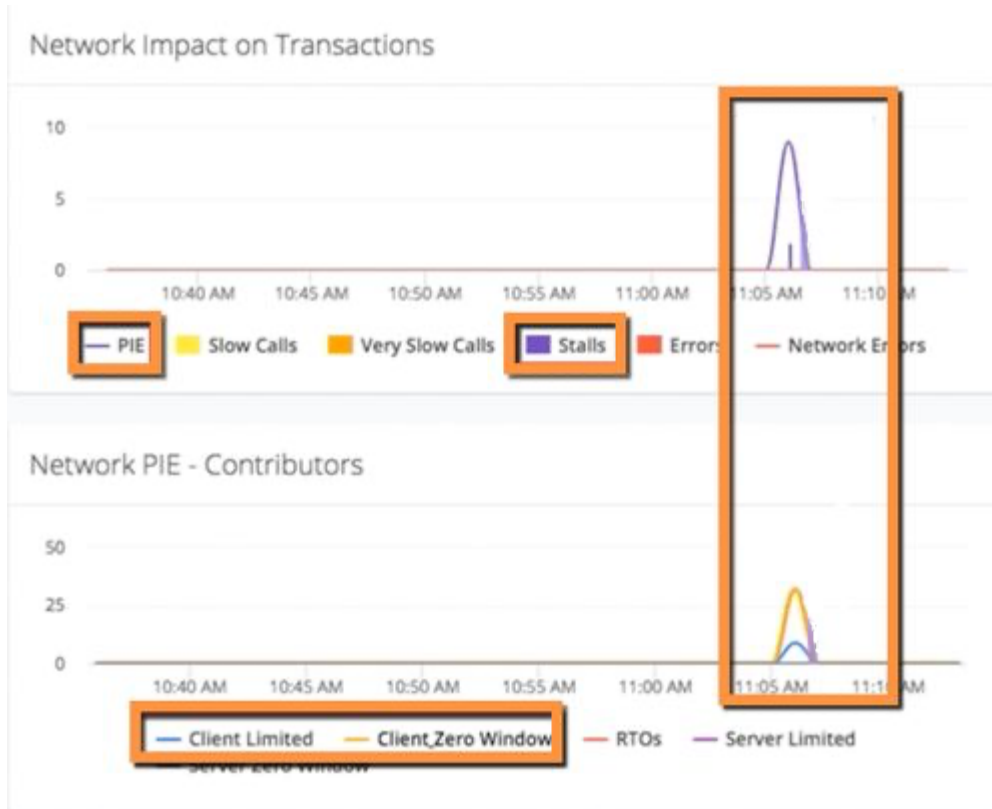

Go to the Network Dashboard, which shows the TCP and network context for the application. Each tier and link has a View Metrics right-click option that opens a context-sensitive dashboard. The dashboard charts make it easy to determine network root causes. Start from the top-left chart in each dashboard, then search for metric correlations in the other charts.

Tier Dashboard: Which network metrics on this tier correlate with my outlier transactions?

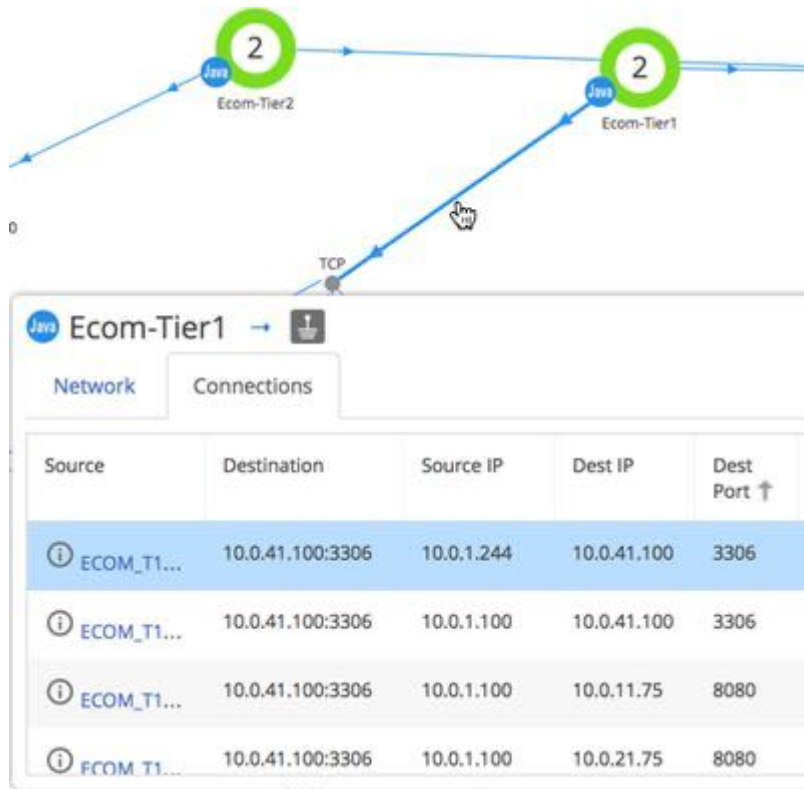

The link and tier dashboards both have a Network Pie - Contributors chart, which answers the question: *Where are these network conditions occurring – on the client tier, server tier, or the network link?*

In this example, the top chart shows that a spike in Stalled transactions is correlated with a spike in [PIE \(Performance Impacting Events\)](#)(see [page 2760](#)); the bottom chart shows that these events occurred on the client tier. With this information, you can then locate other correlated metrics and identify the issues on the client tier.

Basic Diagnosis

You now have a set of correlated network metrics and associated tiers/links. In many cases, this information is enough to identify and resolve the issue. You can contact your network team and say: *I see the following network issues on tier X, link Y, and so on, and these issues correlate with performance issues in my application. You can send them a URL to the Network Dashboard and say: Click on link Y and look at the connections. The issues are happening on one or more of these connections.* This often provides enough information for the networking team to identify and resolve the issue.

Network Dashboard (Advanced Diagnosis): On which TCP connections are these network issues occurring?

If you need to collect more information, you can drill down to the TCP connection(s) where the network conditions are occurring. Click the relevant network link and select **Connections** in the popup. Sort the table based on the KPI metrics for the monitored connections (Throughput, TCP Loss, PIE, Errors). You can then right-click a connection and view metrics in the Metric Browser, or in a context-sensitive dashboard.

i By default, Network Agents do not monitor individual connections. The recommended workflow is to enable connection monitoring only after you narrow an issue down to a specific set of links. See [Dynamic Monitoring Mode and Network Visibility](#)(see page 2782)

Order-Tier → Payment-Tier

Network | Connections

Source Tier / Node	Destination Tier / Node	Source IP	Destination IP	Destinat... Port ↑	L... (...)	Through... (KB/s)	TCP Loss (mille)	PIE	Errors
ORD-N1_1	PAY-N1_0	10.0.11.100	10.0.31.100	8080	0....	98.0	1	40	40
ORD-N1_0	PAY-N1_0	10.0.11.100	10.0.31.100	8080	0....	98.0	1	40	40
ORD-N5_1	PAY-N1_0	10.0.11.101	10.0.31.100	8080	0....	48.6	1	18	18
ORD-N5_0	PAY-N1_0	10.0.11.101	10.0.31.100	8080	0....	48.6	1	18	18

Transaction Diagnosis

I'm troubleshooting a specific outlier (Slow, Very Slow, Error, or Stalled) transaction. Are network conditions to blame?

- [Transaction Snapshots list: Is the network to blame for a specific slow, stalled, or error transaction?\(see page 2787\)](#)
- [Network Dashboard for Transaction Snapshot: Are there any correlations between problematic transactions and network-performance issues around the time of this transaction?\(see page 2788\)](#)

Transaction Snapshots list: Is the network to blame for a specific slow, stalled, or error transaction?

You can diagnose the network performance for an individual transaction in the transaction viewer. Double-click a snapshot in a Transaction Snapshots list.

Transaction Snapshot viewer: Where (at which tier) are the delays, stalls, or errors occurring?

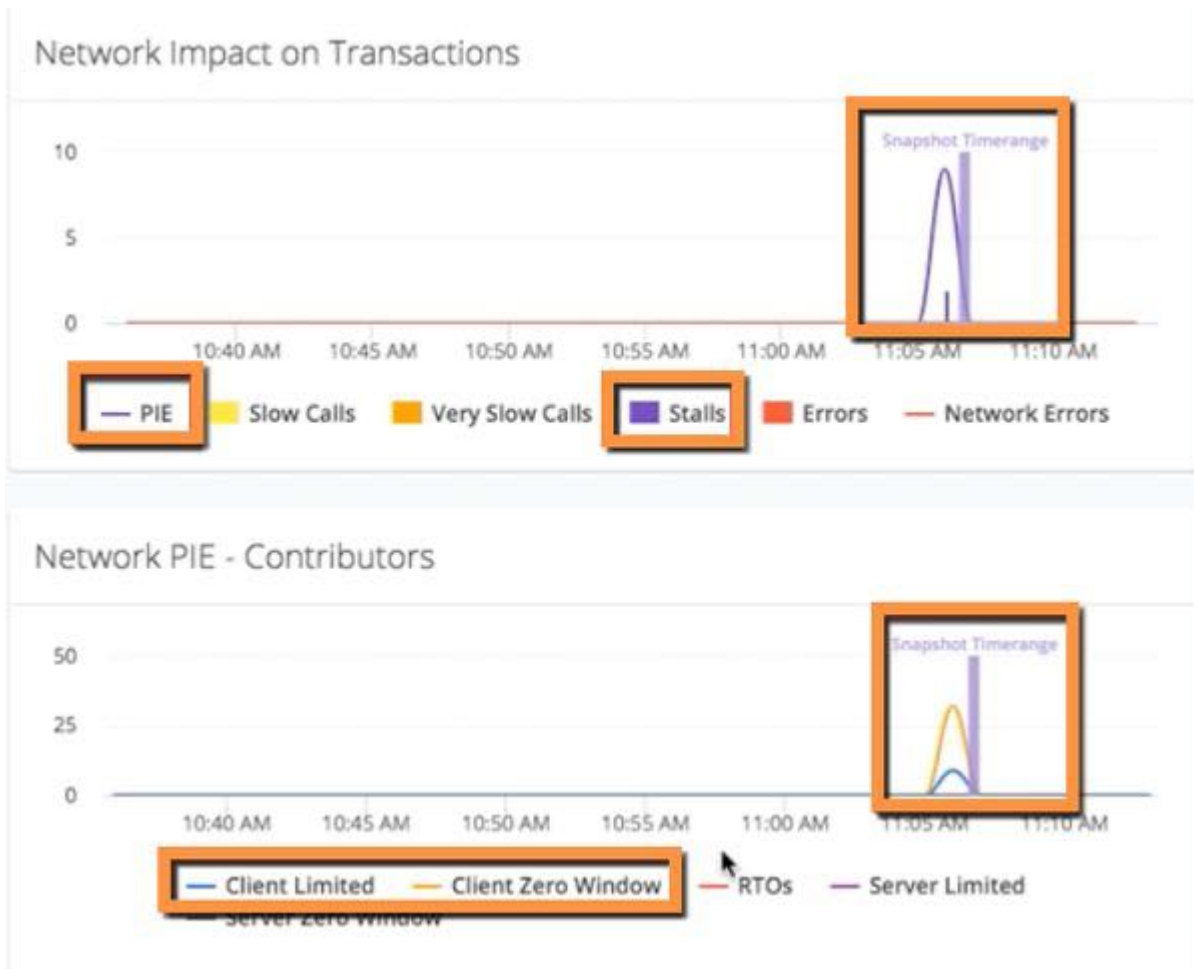

When the Transaction viewer appears, click **Drill Down** on the tier where the delays, stalls, or errors are occurring.

In the Tier Overview tab, click **Network**.

Network Dashboard for Transaction Snapshot: Are there any correlations between problematic transactions and network-performance issues around the time of this transaction?

The transaction dashboard shows the rate of transaction outliers, Performance Impacting Events, and Network Errors when the transaction occurred. Each chart has the Snapshot Time range highlighted. The Network Impact on Transactions chart (top left) highlights any correlations between transaction outliers, Network Errors, and Performance Impacting Events. You can then look for correlations in other charts and drill down to the root cause.

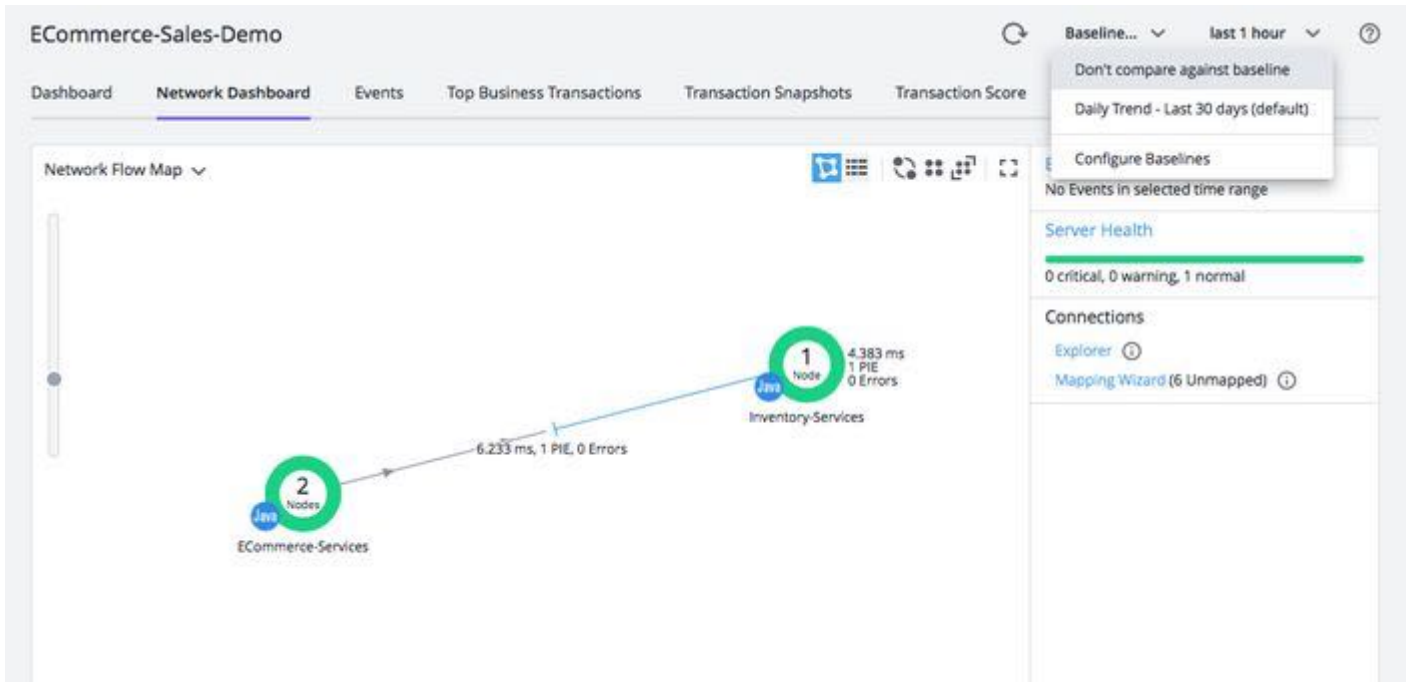

Network Health Check

Currently, I do not see any application issues, however, I would like to monitor my network and identify any potential issues before they start to affect my applications.

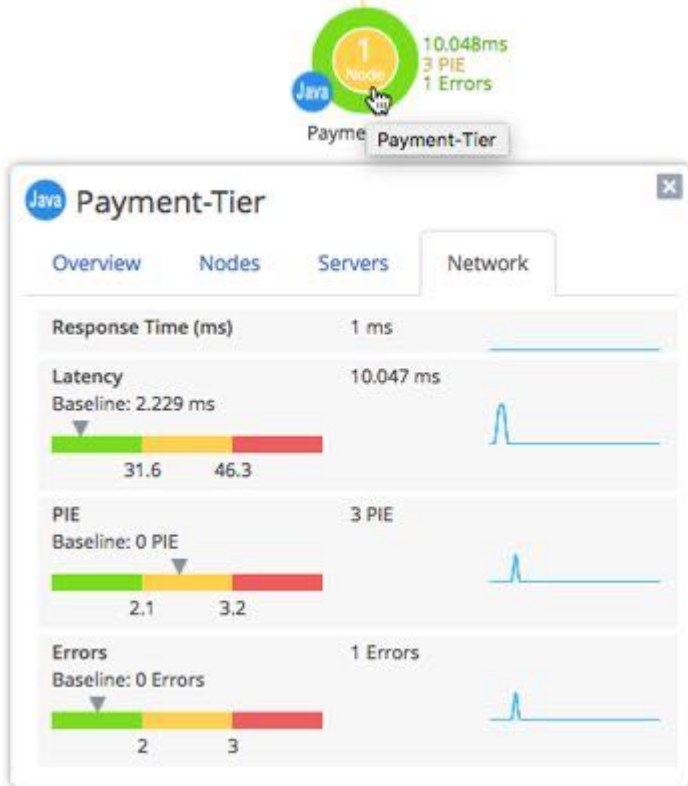

- - [Network Dashboard: Is any tier or link performing outside its baseline?\(see page 2788\)](#)
 - [Network Dashboard: Do any network links or connections have significant performance issues?\(see page 2790\)](#)

Network Dashboard: Is any tier or link performing outside its baseline?

To perform a quick network health check, go to the Network Dashboard and enable baselining. Elements with network KPIs that exceed the baseline for that element are colored yellow or red.

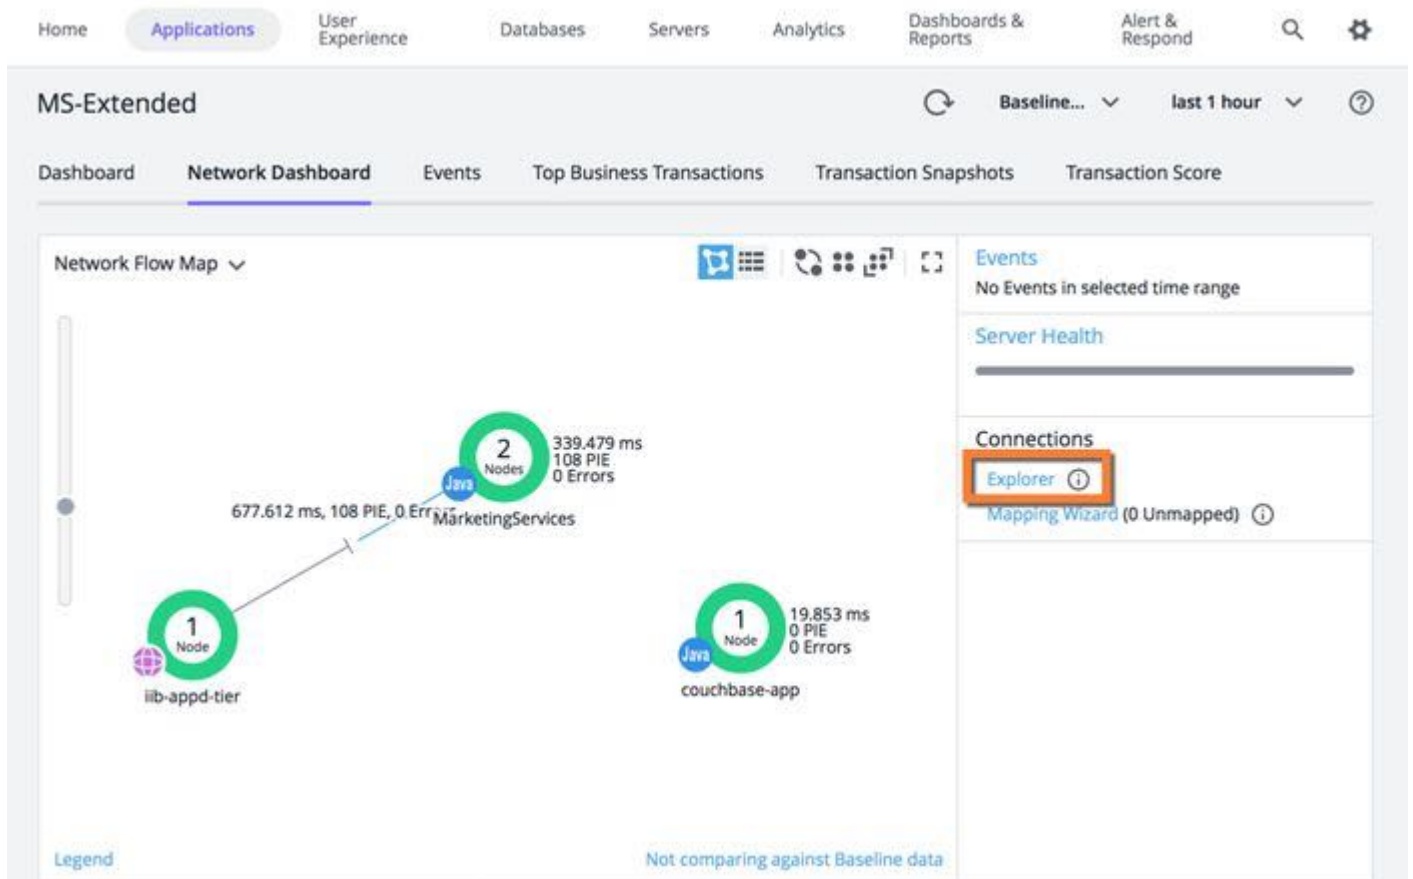

If the network KPIs for a tier or link are outside the performance baseline for that element, you can view baselines and outliers for that element in the Network tab of the popup. If an element has KPI outliers, you can also diagnose that element in a context-sensitive dashboard (right-click and select **View Metrics**).

Network Dashboard: Do any network links or connections have significant performance issues?

To see immediately if any links or connections have performance issues, open the Connections Explorer (click the **Explorer** link to the immediate right of the Network Flow Map). The KPIs of all network links and connections display in one table. You can sort the table based on KPIs or Errors, and expand each network-link to view KPIs for all connections within that link.

Example Use Cases

- [Network Congestion - Example Use Case](#)(see page 2790)
- [Packet Loss - Example Use Case](#)(see page 2796)
- [TCP Port Exhaustion - Example Use Case](#)(see page 2801)
- [TCP Window Bottlenecks - Example Use Case](#)(see page 2805)
- [Traffic Throttling - Example Use Case](#)(see page 2810)

Network Congestion - Example Use Case

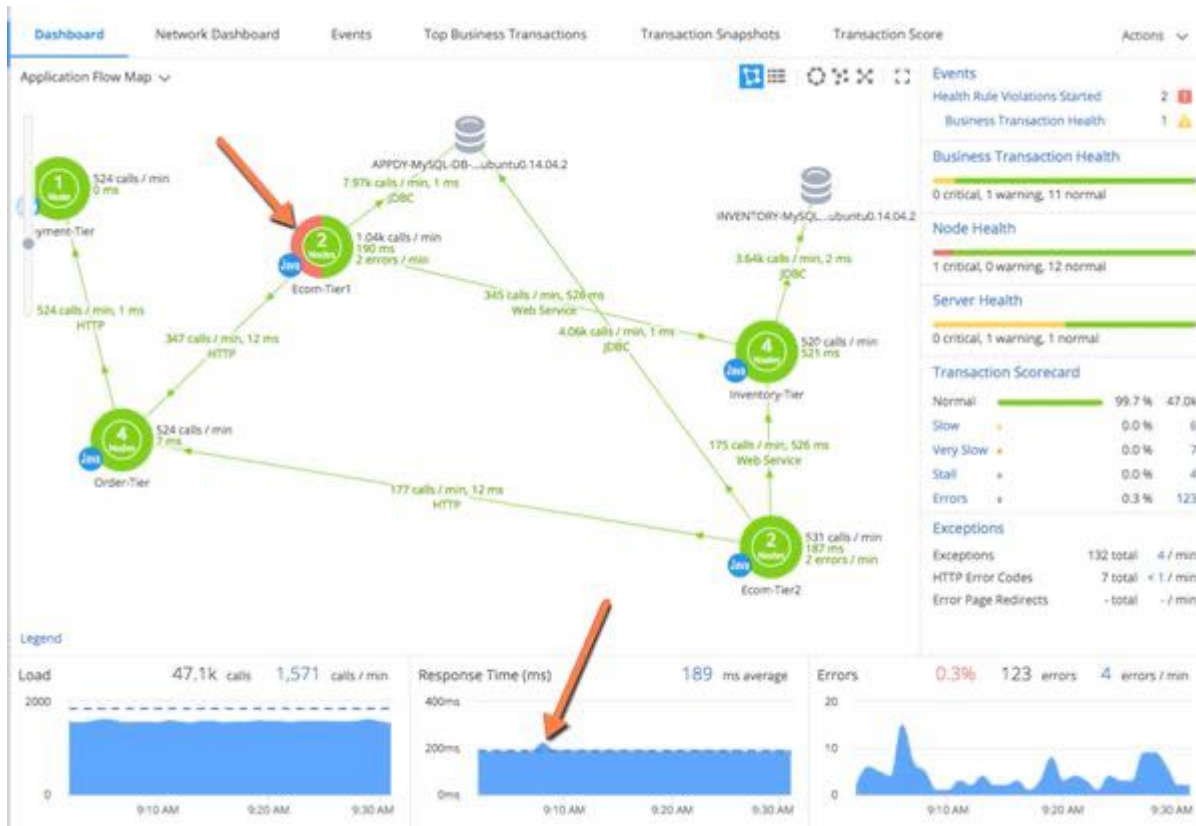

Network congestion may be caused by:

- A user may launch a "bandwidth-hogging" backup job during a period of peak network utilization.
- A server may drop packets at seemingly random intervals due to a TCP misconfiguration.

Traditional monitoring tools such as SNMP are good at detecting persistent network bottlenecks, but often miss intermittent bottlenecks. With Network Visibility, you can easily identify and diagnose intermittent network bottlenecks that affect application performance.

Application Symptoms

A DevOps engineer is responsible for monitoring a mission-critical app. One day, she opens the Application Dashboard and notices that Ecom-Tier1 has suddenly gone partially red, which indicates performance degradation on one of the nodes in this tier. She also sees a small spike in response times for the overall application. She decides to investigate.

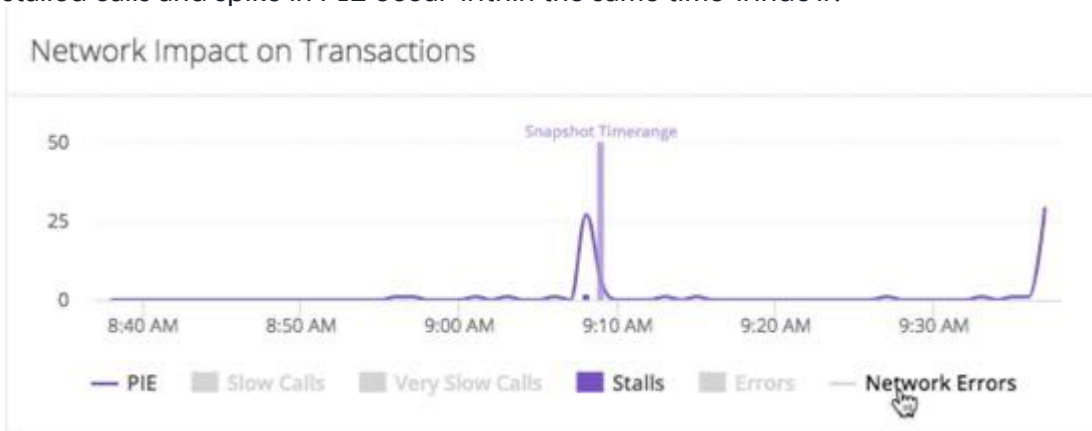

Network Diagnosis

1. To determine if there is a network problem, she:
 - a. Goes to the Transaction Snapshots page and filters the list to show only stalled calls.
 - b. Double-clicks a specific call to view the transaction flow map. Because it was a stalled call, the entire flow map does not display.

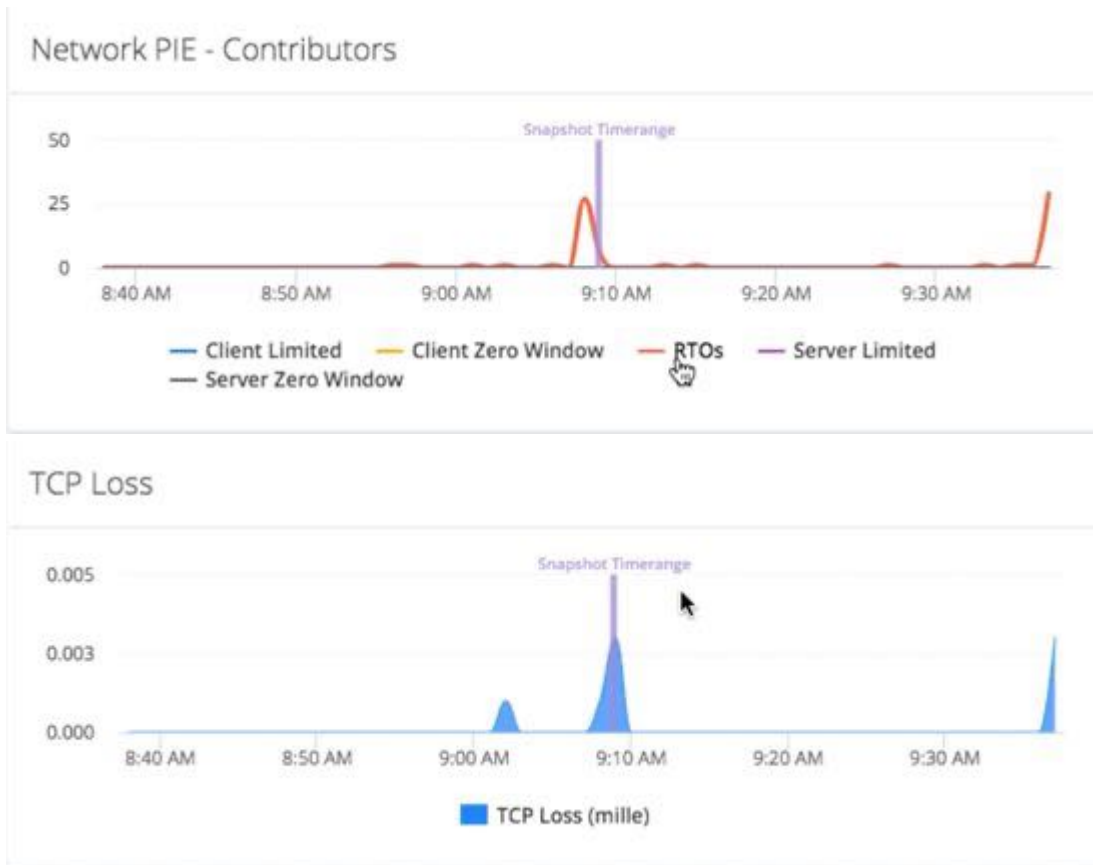

- c. Clicks **Drill Down** to open the Transaction Dashboard, and then switches to the Network tab to analyze the network performance during this call.

2. The Network Impact on Transactions chart (top left) shows a spike in Performance Impacting Events (PIE) around the time of the transaction snapshot. By showing only PIE and Stalls, she can see that the stalled calls and spike in PIE occur within the same time window.

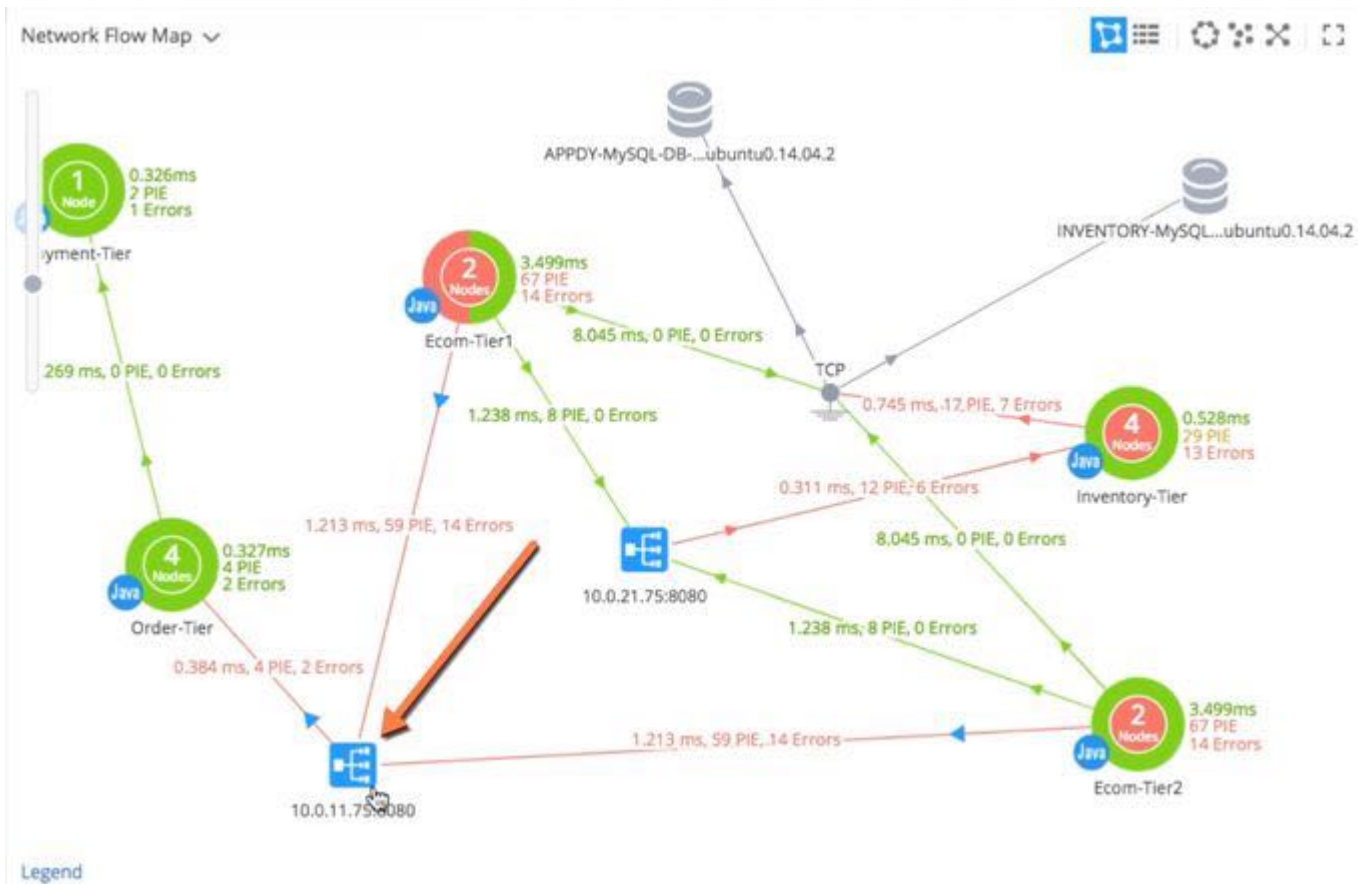

3. In the Network Pie - Contributors chart, she can see that all the Performance Impacting Events are retransmission timeouts (RTOs). This indicates packet loss on the network paths between the two tiers, which is confirmed by the spike in TCP Loss that occurs within the same time window.

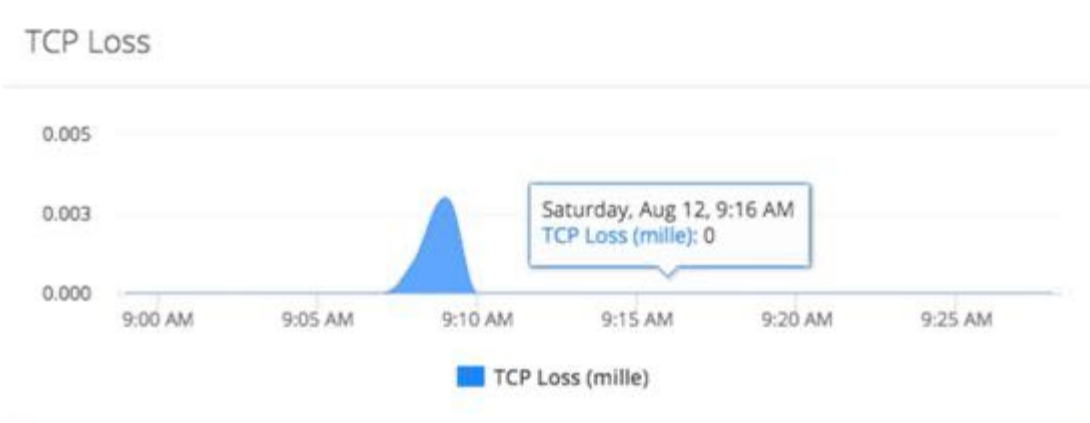

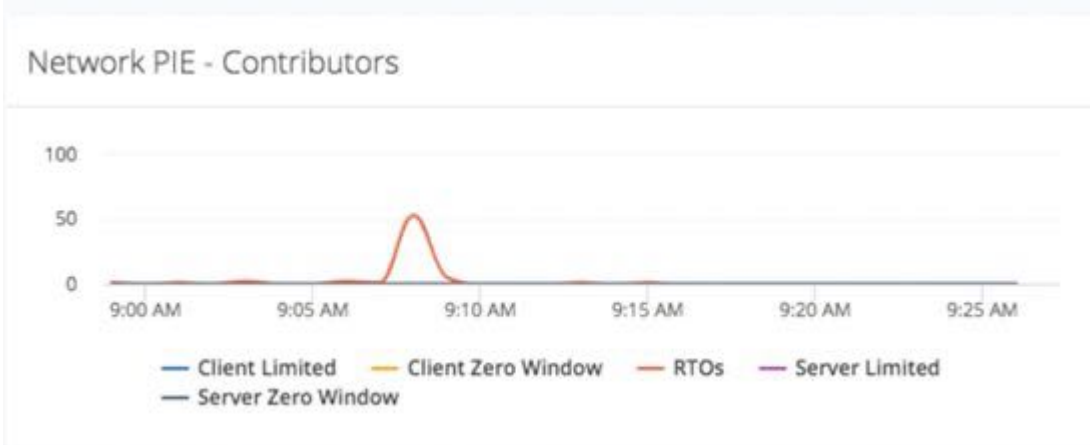

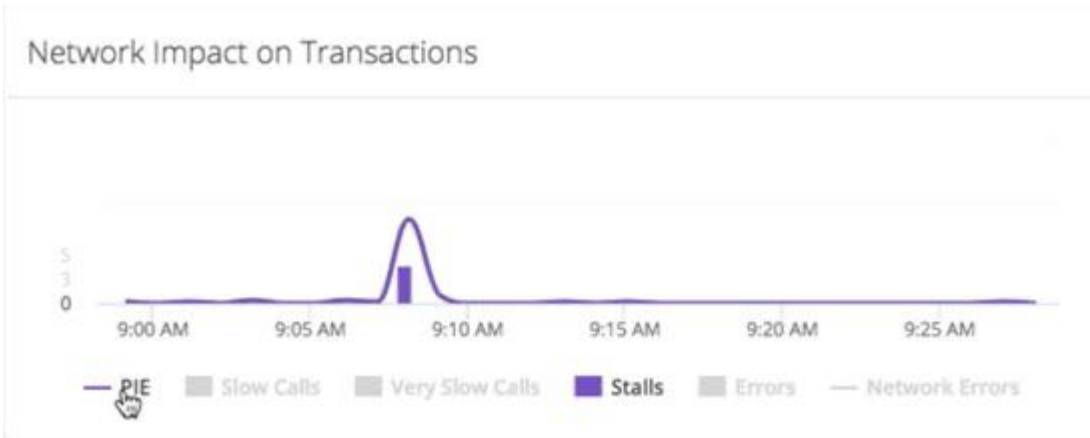

4. She knows there is a correlation between stalled calls and retransmissions, and wants to learn more about these events. The Retransmissions Per Min chart indicates that all these are all data retransmits, which indicate a problem on the network path between two nodes. (SACK retransmits indicate a problem setting up TCP connections on one or two nodes.)

5. In a few seconds, she has identified a chain of correlation: stalled calls > PIE > Retransmissions > Data retransmissions on a network path. The next step is to identify where in the network these retransmissions are occurring. She switches over to the Network Dashboard, and looks for network links with high PIE scores. She sees the PIE scores on two links are 59 (much higher than any other links). Both of these links are used by ECom-Tier1 and Ecom-Tier2 to connect with Order-Tier through a load balancer.

- Given this information, she decides to investigate one of these tiers. She right-clicks Ecom-Tier1 and selects **View Metrics**. The Dynamic Dashboard for this tier appears. The dashboard shows the same metric correlations for the entire tier that she saw for the individual transaction.

7. Now that she has confirmed that data retransmissions are spiking for the entire tier, she wants to identify the TCP connections on which these events are occurring. She clicks the network link between Ecom-Tier and the load balancer. She can see that that PIE is occurring on both connections:
 ECOM_T1N1:8080 < - > Load_Balancer_10.0.11.77:8080
 ECOM_T1N2:8080 < - > Load_Balancer_10.0.11.77:8080
8. Given this information, she contacts the network-management team in her organization and says: "I can see that there was intermittent loss from 9:07-9:10 AM on the following TCP connections, and that these correlate with a spike in stalled calls." The network team can now investigate the network paths used by these connections and determine if the problem exists on the load balancer or elsewhere.

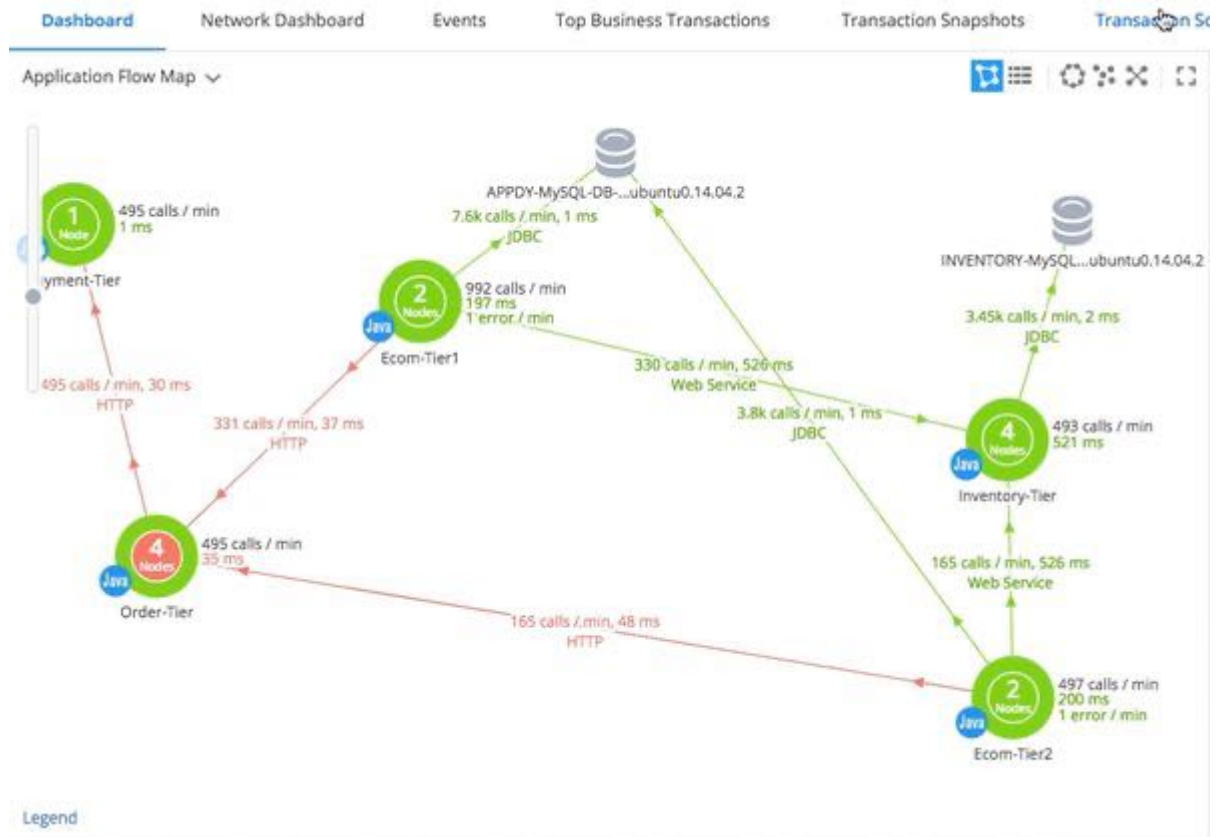

Packet Loss - Example Use Case

In some cases, packet loss can occur on a server or intermediate device. The problem may be hardware-related; perhaps the device simply cannot handle peak traffic loads, or there may be faulty cabling on one or more network interfaces.

The problem may be software-related; a bug or misconfiguration that results in intermittent packet loss at seemingly random intervals. When packet loss affects application performance, you can use Network Visibility to pinpoint the nodes, devices, and TCP connections where the packets are getting dropped.

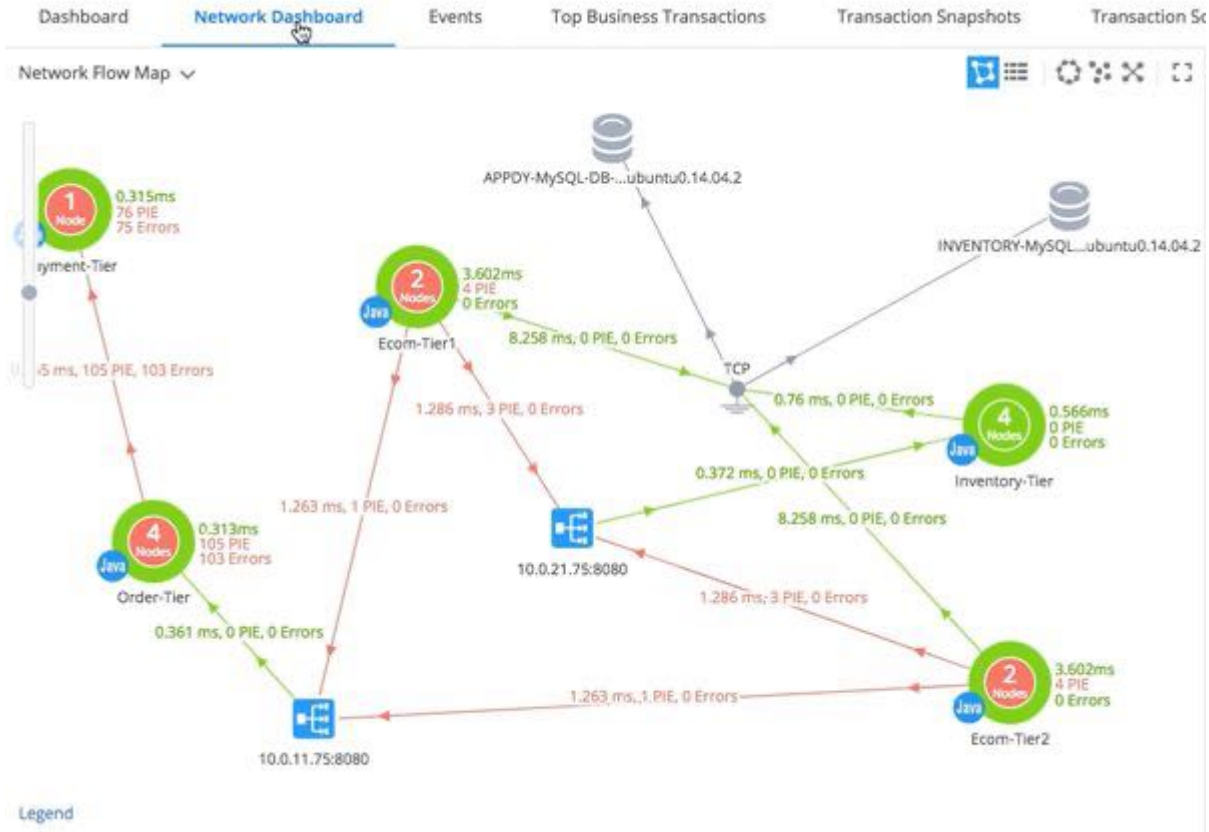

Application Symptoms

A DevOps engineer is responsible for monitoring the performance of a mission-critical app. She opens the **Application** Dashboard notices that the Order-Tier, and the application flows to and from this tier, have suddenly turned red. She decides to investigate.

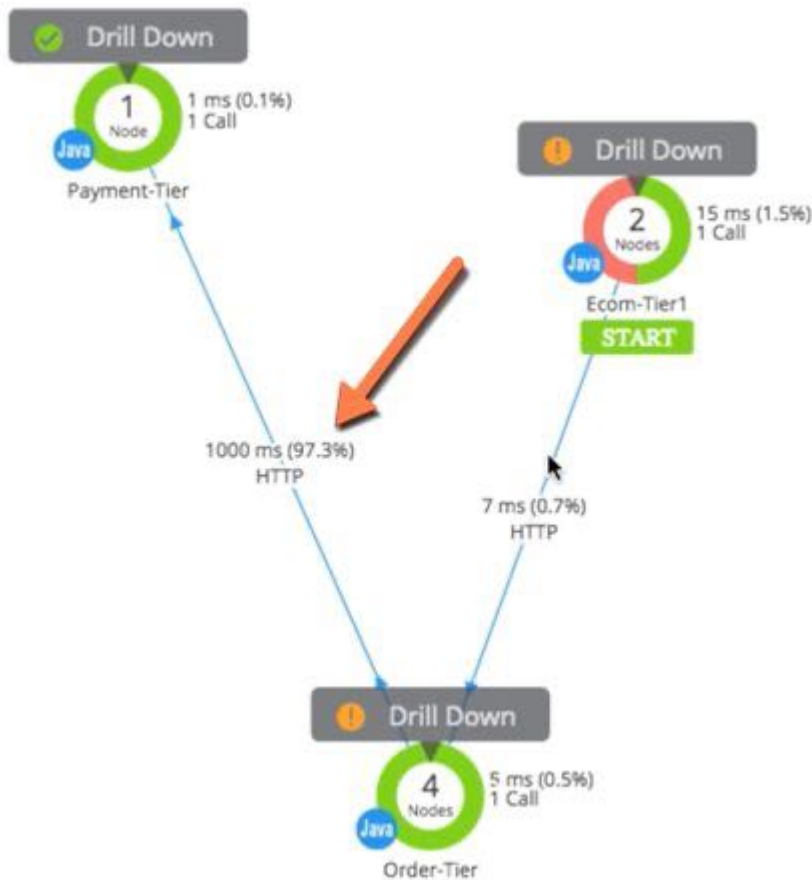

Network Diagnosis

1. She switches over to the **Network** Dashboard and sees that the Order-Tier and Payment-Tier, and the network link between them, show a spike in PIE and network errors.

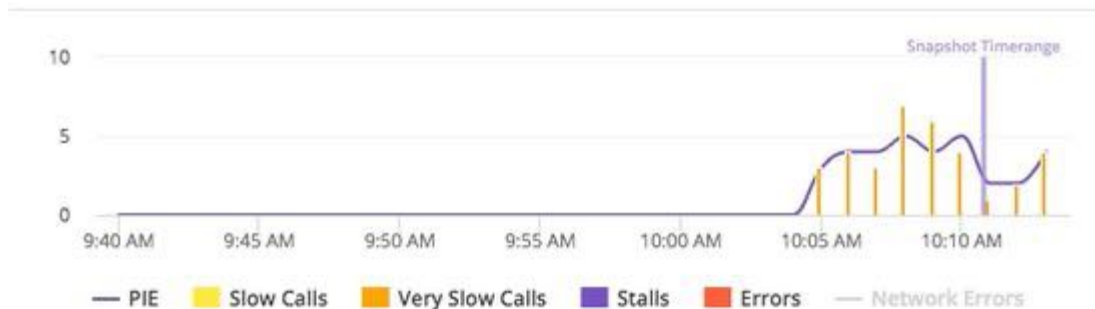

2. She decides to analyze an individual transaction. She goes to the **Transaction Snapshots** page and double-clicks a Very Slow transaction. The **Transaction Overview** shows that 97% of the delay is on the link between Order-Tier and Payment-Tier. She drills down into the Order-Tier and goes to the Network

tab.

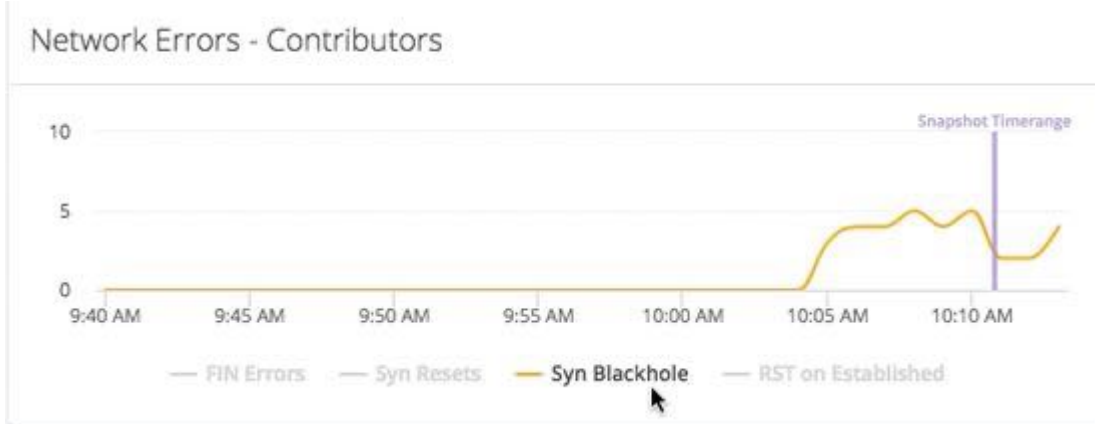

3. Scanning the dashboard for this transaction, she sees immediately that:
 - a. The Network Impact on **Transactions** graph (top left) shows a spike in PIE and Very Slow Calls around the snapshot time range.

Network Impact on Transactions

- b. She sees the correlation between Errors and Very Slow Calls, so she reviews the Network Errors - Contributors chart. She sees immediately that all these errors are Syn Blackholes. The Order-Tier node is trying to establish connections to the Payment-tier node, but something in the middle is silently

dropping the connection. When this happens, it usually indicates that a firewall or other intermediate device is dropping packets. The requesting tier tries and retries to re-establish the connection, which introduces significant delays.

- c. The Retransmissions Per Min chart confirms that the retransmissions during the time window of interest are all Data Retransmits, which means that the drops are occurring on an intermediate device rather than at an application node.

- 4. She now wants to pinpoint the specific TCP connections where the packet drops are occurring. She enables **Advanced Diagnostic** monitoring on the relevant Network Agents to collect TCP diagnostic metrics. She then goes to the **Network** Dashboard and clicks the links between Order-Tier and Payment-Tier. This provides all of the connections with elevated PIE and errors.

Source Tier / Node	Destination Tier / Node	Source IP	Destination IP	Destinat... Port ↑	L... (...)	Through... (KB/s)	TCP Loss (mille)	PIE	Errors
ORD-N1_1	PAY-N1_0	10.0.11.100	10.0.31.100	8080	0....	98.0	1	40	40
ORD-N1_0	PAY-N1_0	10.0.11.100	10.0.31.100	8080	0....	98.0	1	40	40
ORD-N5_1	PAY-N1_0	10.0.11.101	10.0.31.100	8080	0....	48.6	1	18	18
ORD-N5_0	PAY-N1_0	10.0.11.101	10.0.31.100	8080	0....	48.6	1	18	18

As a result, she contacts the network-management team in her organization and says: "We're seeing intermittent SYN blackholes and retransmissions on these connections, can you please investigate and fix."

TCP Port Exhaustion - Example Use Case

A TCP socket is a specific TCP port on a specific node. Port exhaustion occurs when a node runs out of available ports. When an application stops using a specific port, the port enters a "time-wait state" before it becomes available for use by another application. If a node runs out of available ports to create new connections, the symptom appears as a spike in application errors.

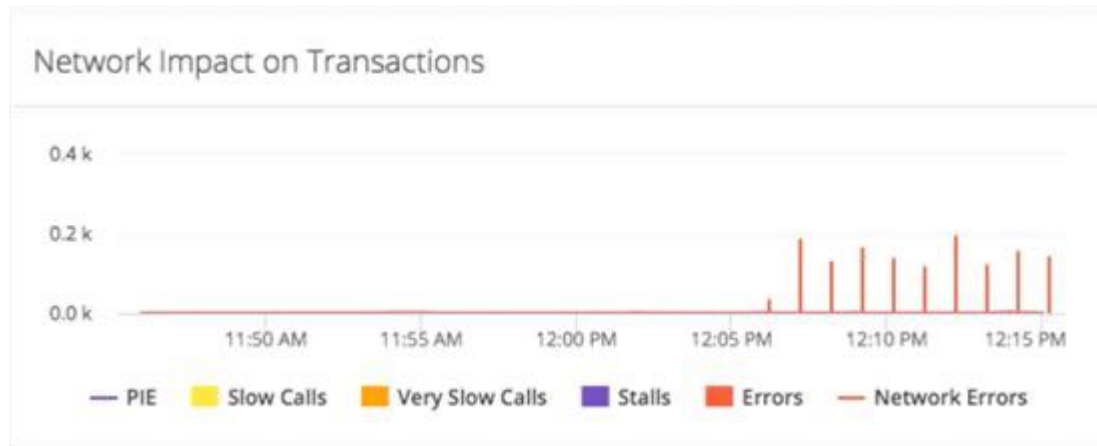

Application Symptoms

A DevOps engineer is responsible for monitoring the performance of a mission-critical app. She opens the **Application** Dashboard and notices a sudden spike in transaction errors on the Ecom-Tiers and for the entire application. She also sees that response times for the entire App are going down and load is increasing. She decides to investigate.

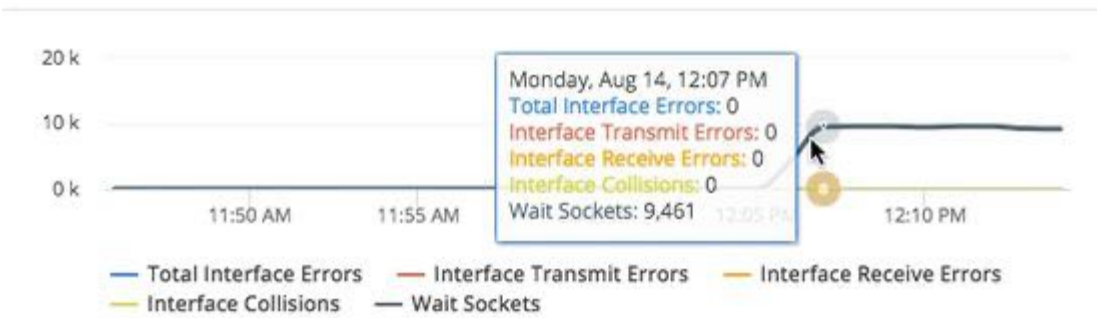

Network Diagnosis

1. She switches over to the **Network** Dashboard, right-clicks Ecom-Tier2, and selects **View Metrics**. The Host Stack KPIs show an increase in wait sockets at the same time as the increase in Error transactions.

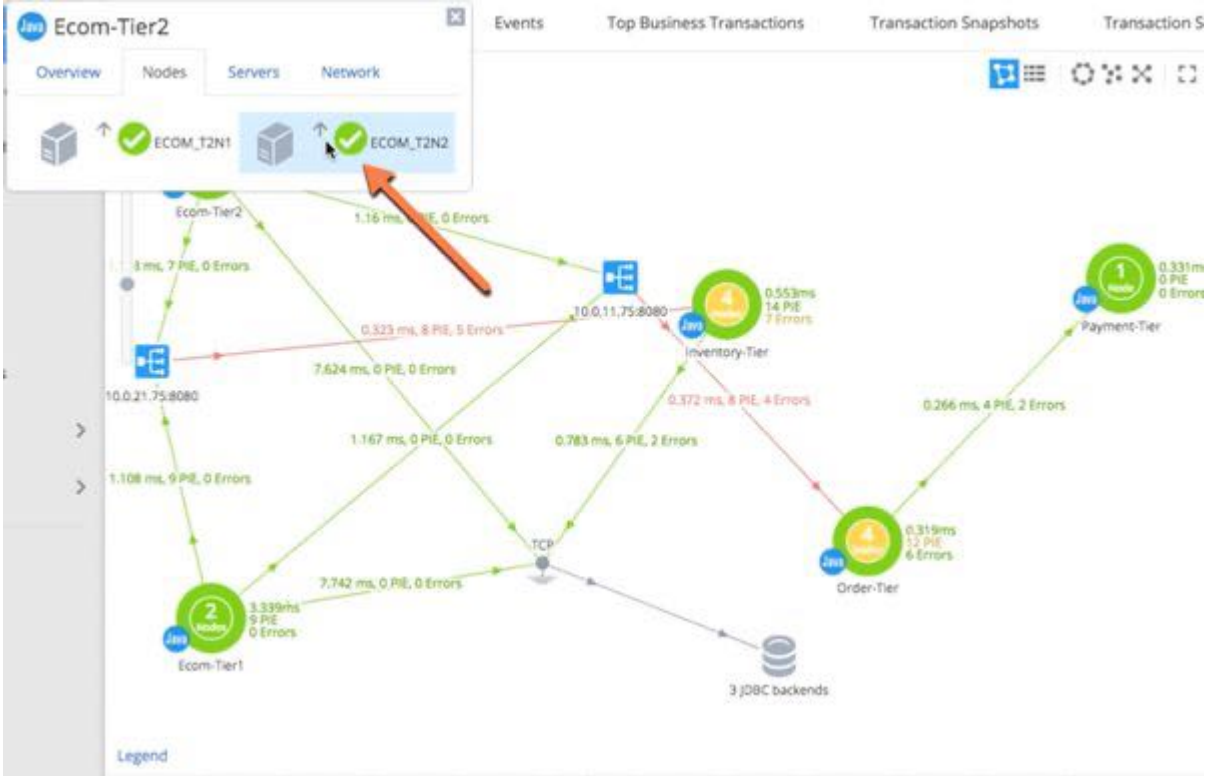

Host Stack KPIs

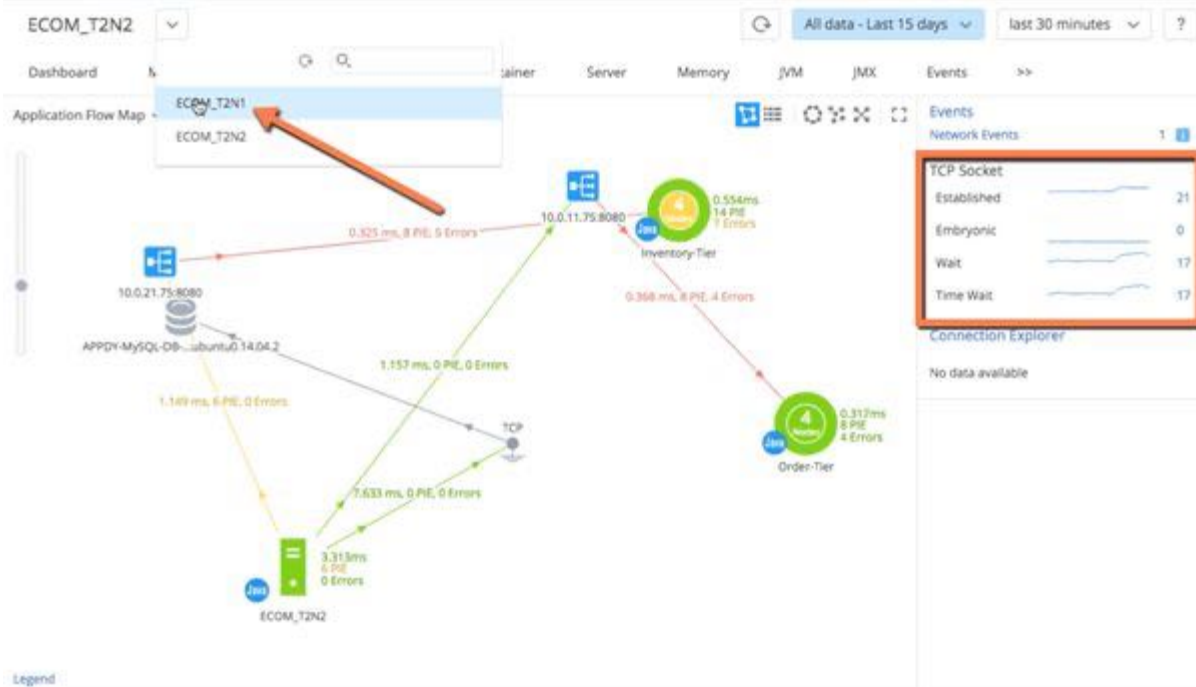

2. She knows there are many wait sockets for the entire tier. She wants to pinpoint the specific node (or nodes) where these wait sockets are occurring. She returns to the **Network** Dashboard, clicks Ecom-

Tier2, and clicks ECOM_T2N1 in the Nodes tab.

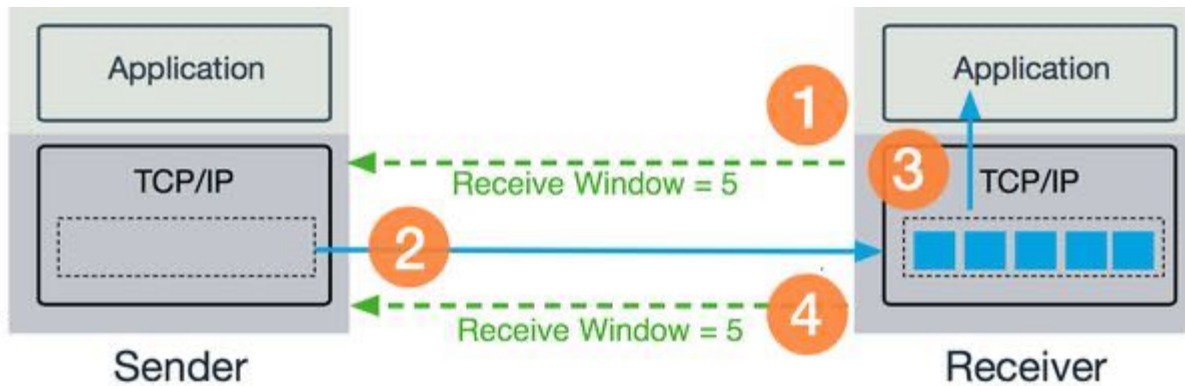

- The TCP Socket chart (right) for node ECOM_T2N2 shows that the level of wait sockets is in an acceptable range. She switches over to view ECOM_T2N1.

- The TCP Socket chart for this node shows a significantly high number of wait sockets. She knows now that the spike in application errors is occurring because this node is running out of available sockets.

TCP Window Bottlenecks - Example Use Case

Back pressure is common in microservices and service-oriented applications, especially in distributed environments. Back pressure occurs when two services communicate and one service gets overwhelmed. This diagram shows the sequence of events:

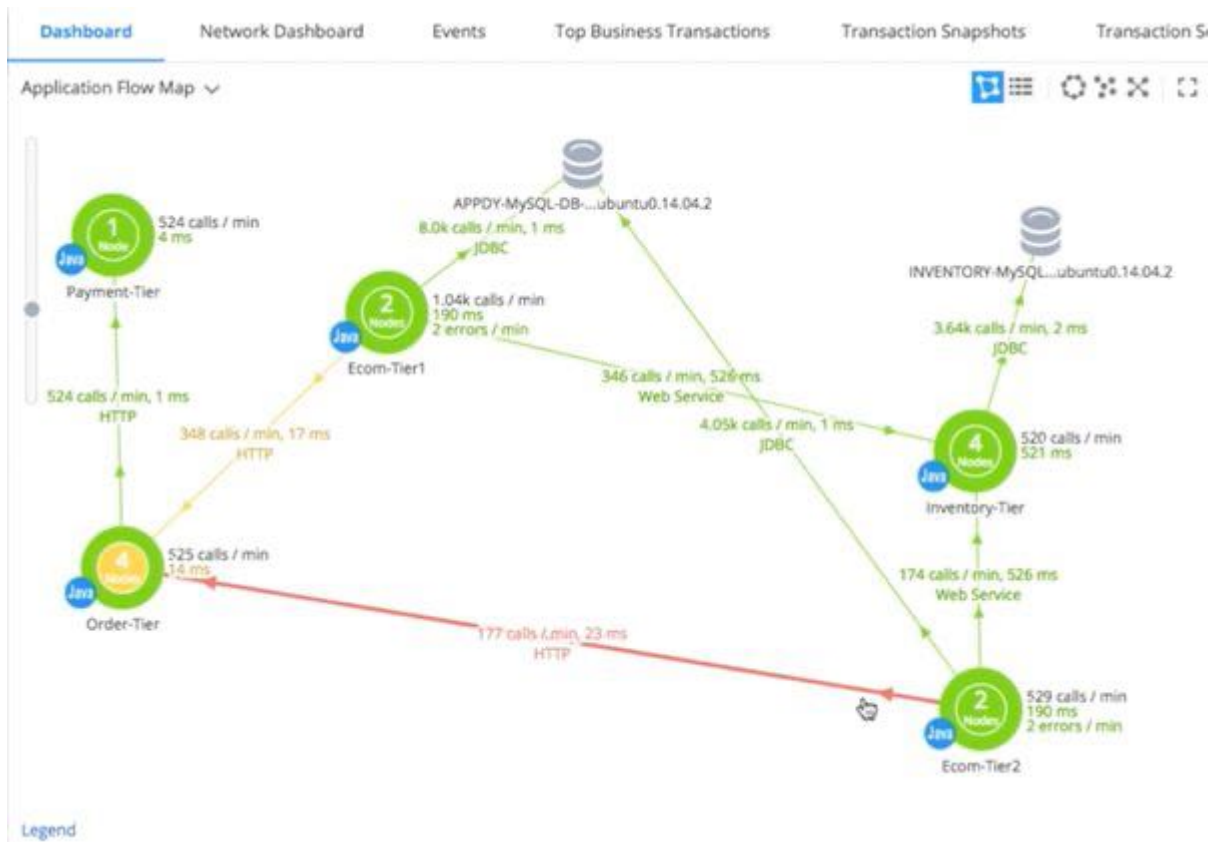

1. Receiver has a TCP Receive buffer for incoming packets. It advertises the available buffer space to the sender.
2. Sender sends a chunk of data based on the advertised window size.
3. Application on the receiver processes the packets in the buffer and frees up space in the buffer.
4. Receiver advertises the new window size.

This process works smoothly until the receiving node cannot process incoming packets quickly enough. In this case, the receiver sends TCP Limited or TCP Zero messages to the sender and the transfer slows down.

Application Symptoms

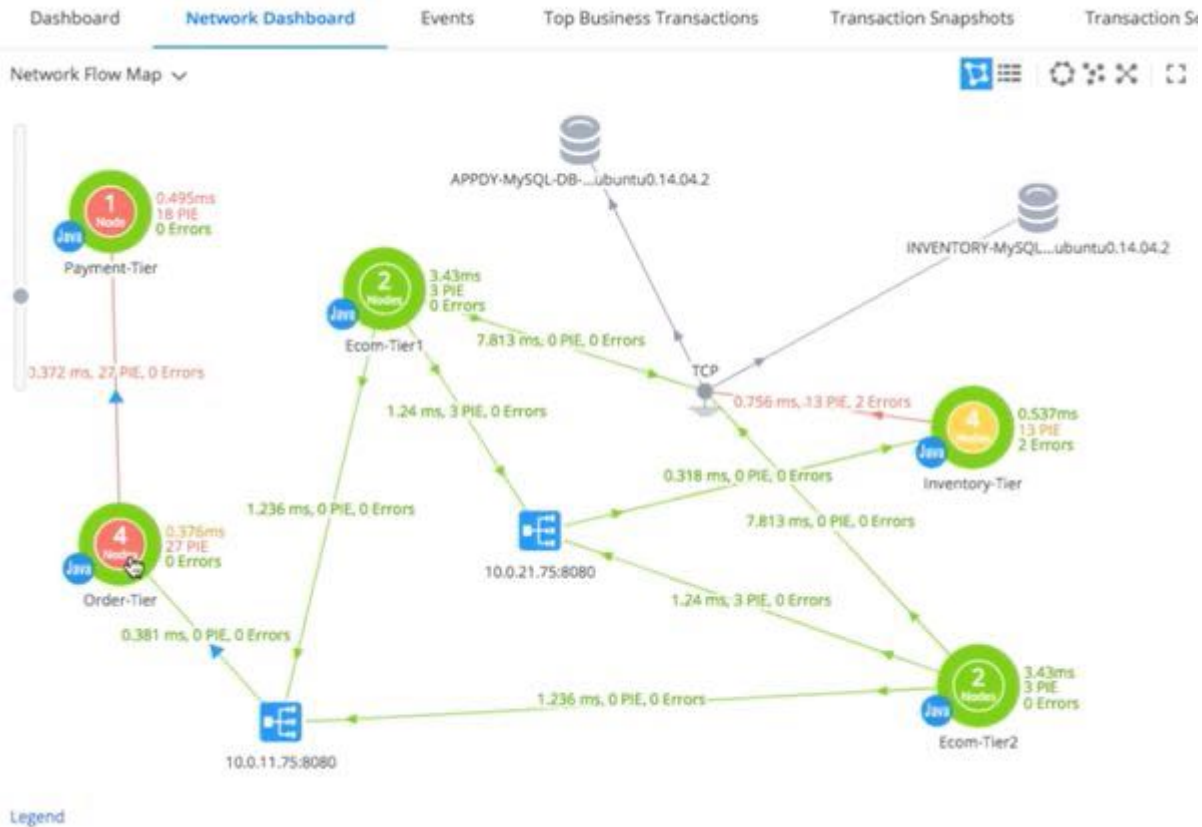

A DevOps engineer is responsible for monitoring a mission-critical app. She scans the **Application** Dashboard and notices that a link and tier have turned yellow and another link has turned red. She decides to investigate.

Network Diagnosis

1. She switches over to the **Network** Dashboard and sees a significant increase in Performance Impacting Events (PIE) between the Order-Tier and the Payment-Tier. While the **Application** Dashboard shows performance issues on the upstream Order-Tiers, the **Network** Dashboard implies that the problem is

further downstream—between the Order-Tier and Payment-Tier.

- To troubleshoot further, she goes to the **Transaction Snapshots** list, filters on stalled transactions, and double-clicks on a transaction to drill down.

AD-DevOps last 2 weeks

Dashboard Network Dashboard Events Top Business Transactions **Transaction Snapshots** Transaction Score

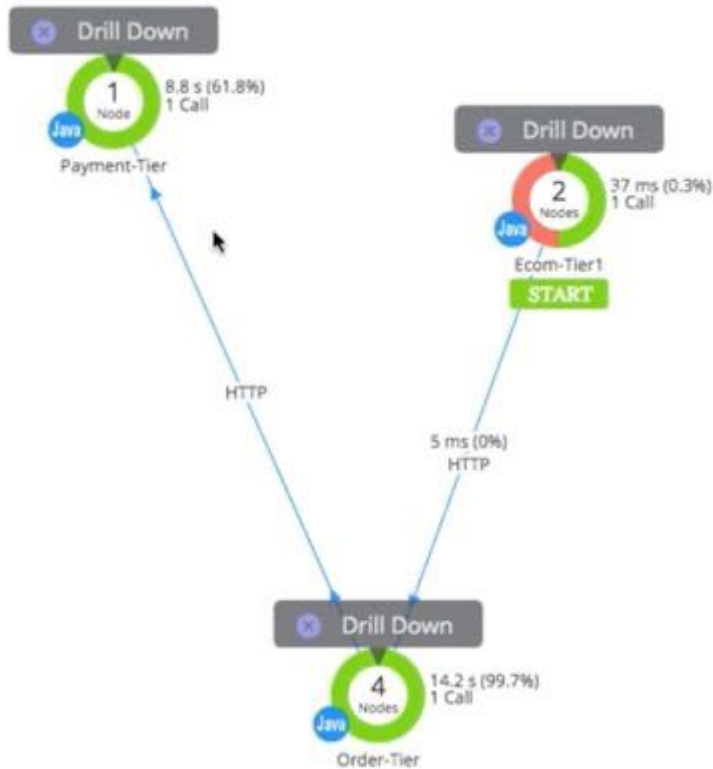

All Snapshots Slow and Error Transactions Diagnostic Sessions Periodic Collection

Filters: **User Experience: Stall**

Showing 800 of 800 [transaction snapshots](#)

3. She drills down into the Order-Tier, since nearly all of the transaction time (99.7%) occurred at this tier.

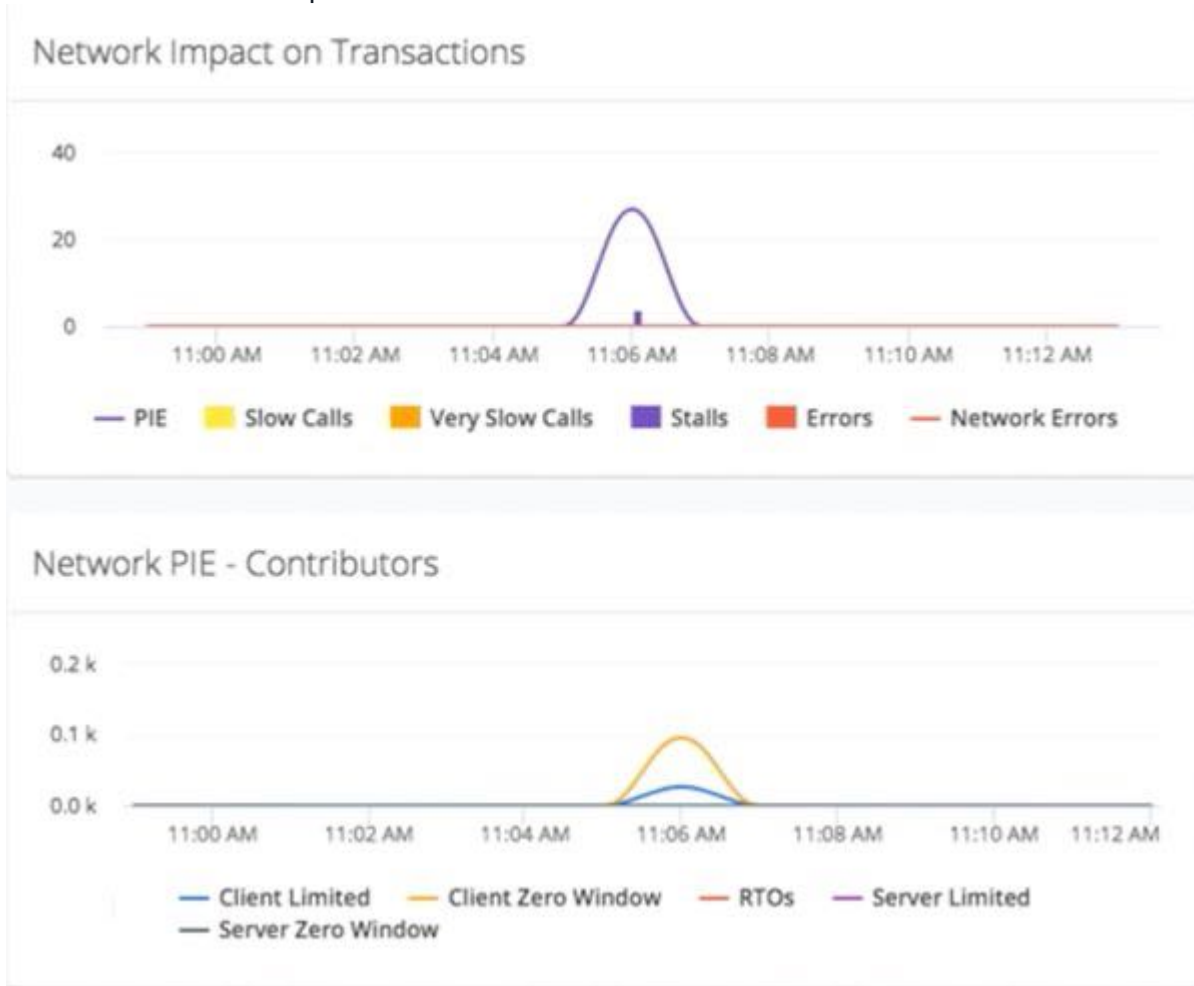

4. In the **Transaction Drilldown** page, she switches over to the **Network** view. Scanning the dashboard, she can see immediately that:
 - a. The transaction correlates with a spike in stalled calls and Performance Impacting Events.

- b. All of these events (Client Limited and Client Zero Window) took place on the client (Order-Tier) node.

5. She returns to the **Network** Dashboard, right-clicks on the Order-Tier, and chooses **View Metrics**. She immediately sees that the Client Limited and Client Zero Window events are spiking for the entire tier

and correlate with the spike in stalled calls.

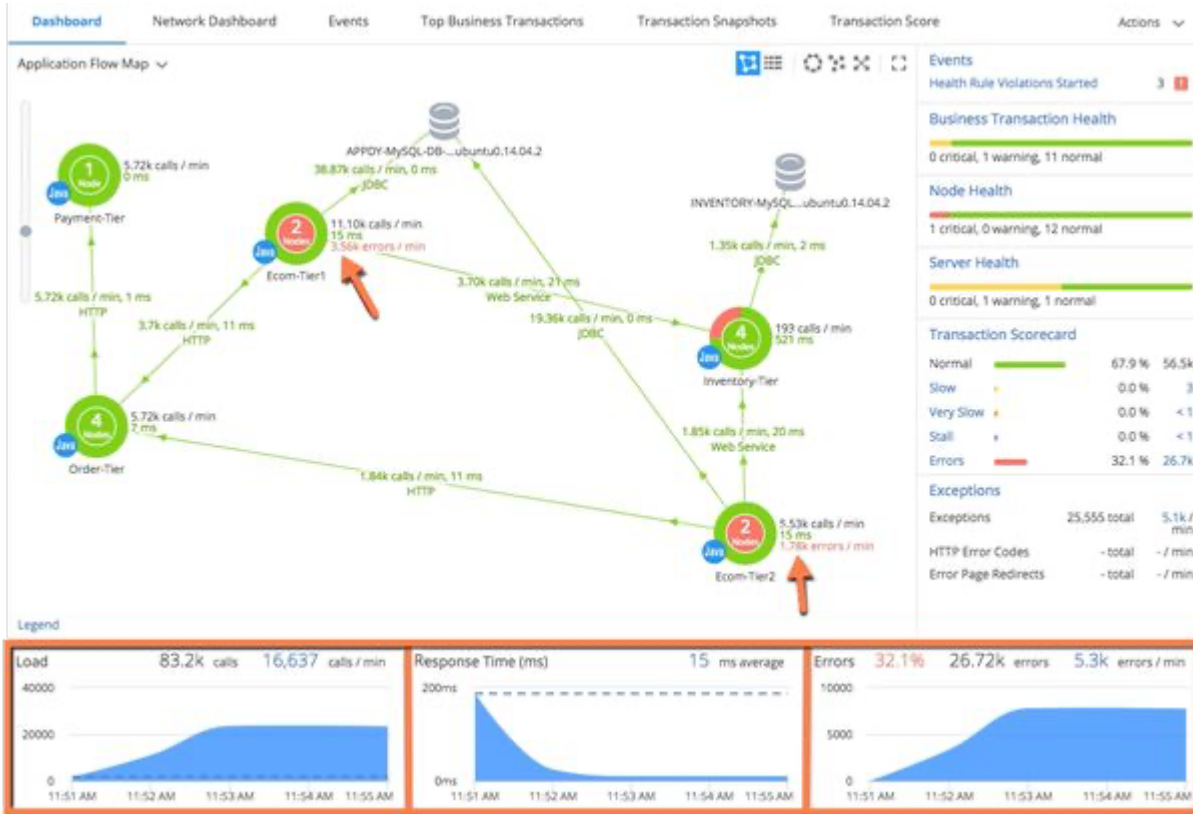

Traffic Throttling - Example Use Case

Firewall throttling occurs when a firewall or other intermediate device prioritizes some connections over others, or denies some connections. This may be due to traffic policies explicitly defined on the device, or to one or more misconfigurations.

Application Symptoms

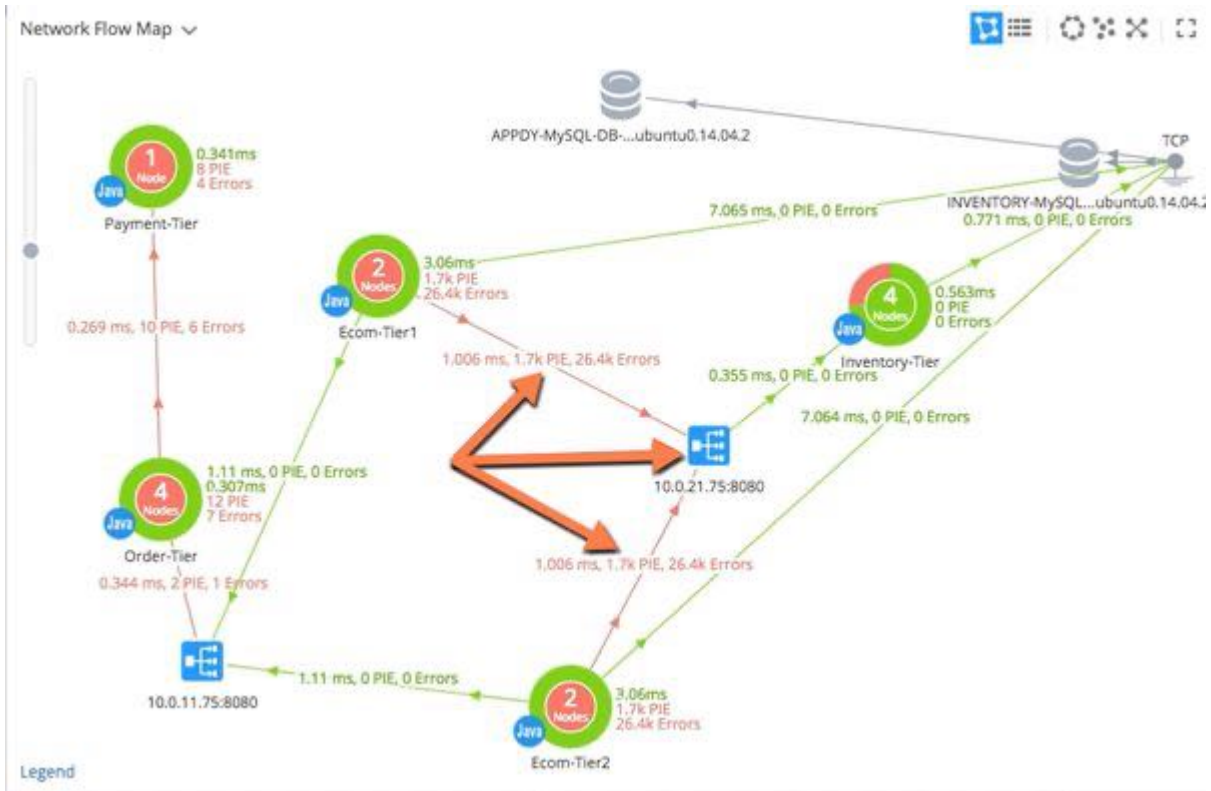

A DevOps engineer is responsible for monitoring the performance of a mission-critical app. She scans the **Application Dashboard** and notices that:

- Ecom-Tier1 and Ecom-Tier2 are showing many errors
- Traffic Loads and Errors are increasing, while response times are decreasing (bottom charts)

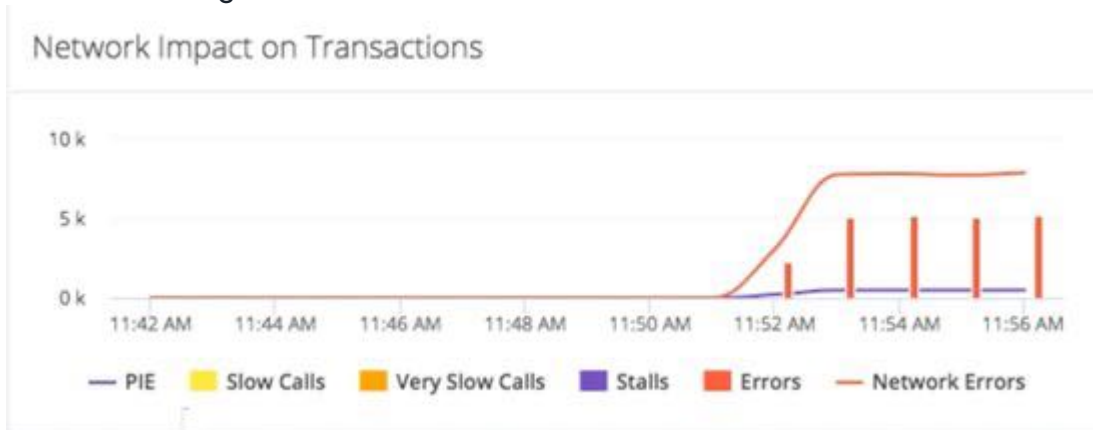

Network Diagnosis

1. She switches over to the **Network** Dashboard and sees immediately that many network errors are occurring on the links between the Ecom-Tiers and the load balancer in the center.

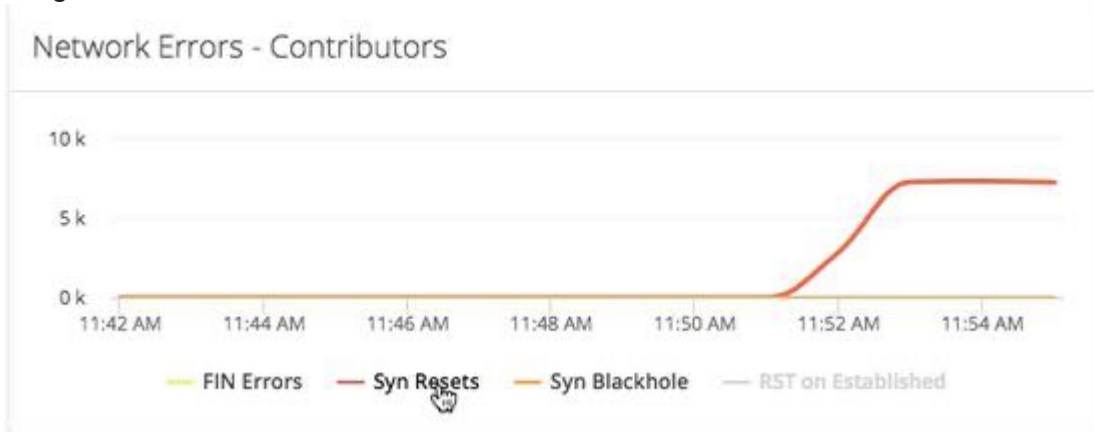

2. She right-clicks Ecom-Tier1 and selects **View Metrics**. She notices:
 - a. The **Network Impact on Transactions** chart shows that transaction Errors and Network Errors have started increasing at the same time.

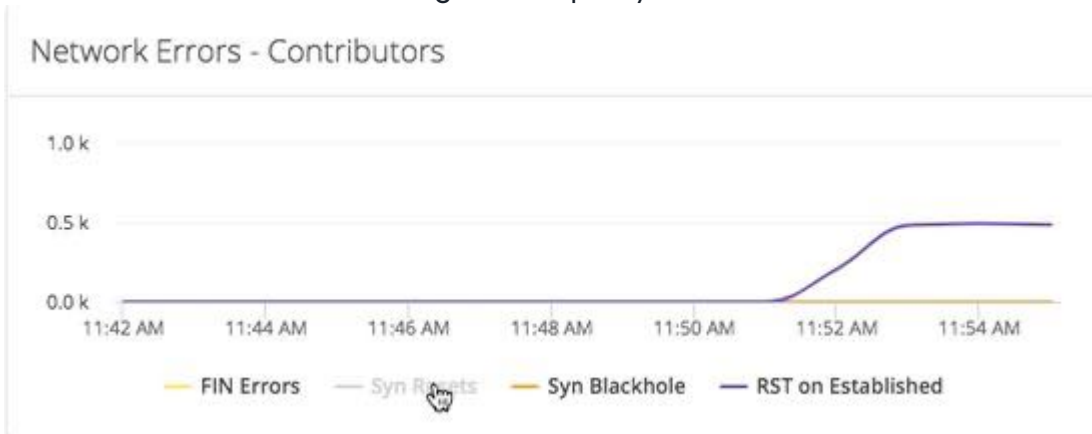

- b. The **Network Errors - Contributors** chart shows that two types of Network Errors are increasing:

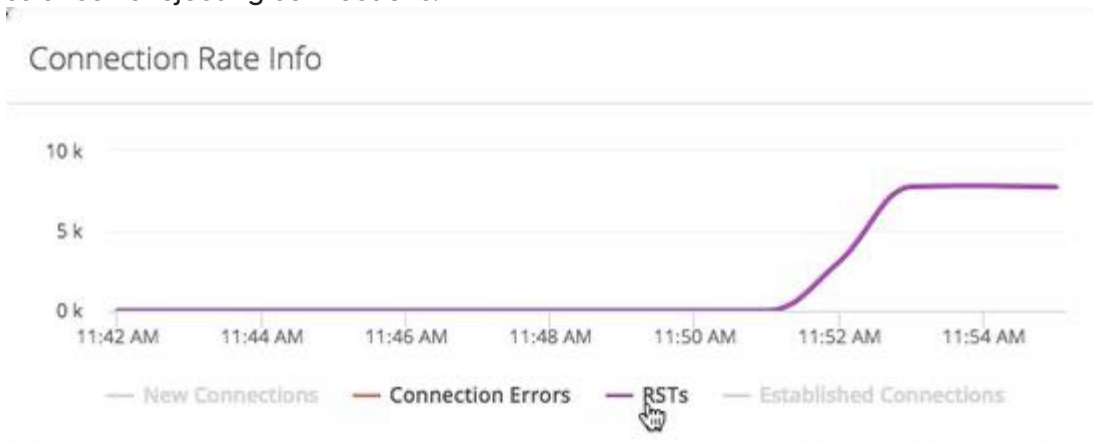

- i. Syn Resets — This reset occurs when the firewall explicitly rejects a connection request before it can get established.

- ii. RST on Established — This reset occurs when the firewall shuts down an established connection due to traffic-throttling or other policy on the device.

- c. The **Connection Rate Info** chart shows that the rate of Connection Errors and Resets are exactly the same where every connection error is a connection reset. This shows that the firewall in the load balancer is rejecting connections.

User Interface

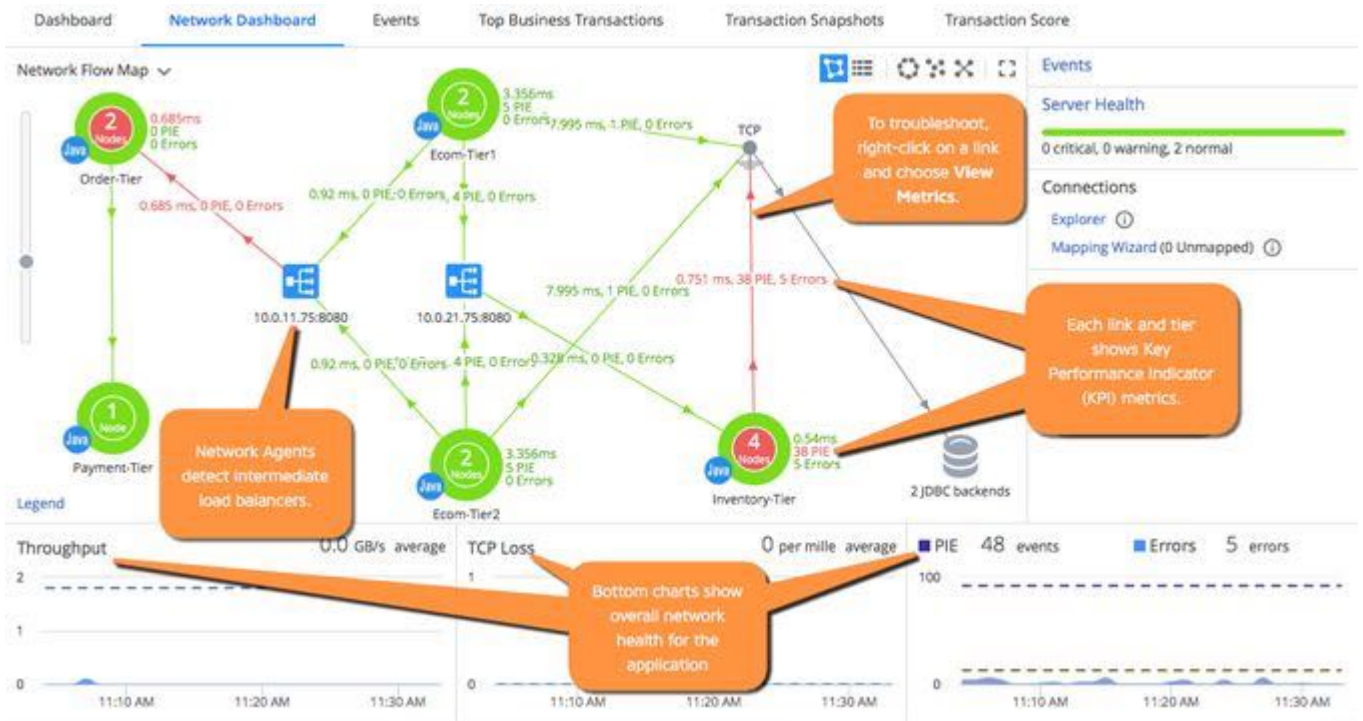

This page describes:

- [Network Dashboard](#)(see page 2814)
- [Connection Explorer](#)(see page 2816)
- [Custom Dashboards for Network Visibility](#)(see page 2818)

Network Dashboard

The **Network** Dashboard provides a network-layer view of your application where you can quickly determine if any part of the network is impacting application performance. The bottom charts show the overall network health. Each tier and link shows network KPI (Key Performance Indicator) metrics. Network Agents detect intermediate load balancers and TCP endpoints. You can:

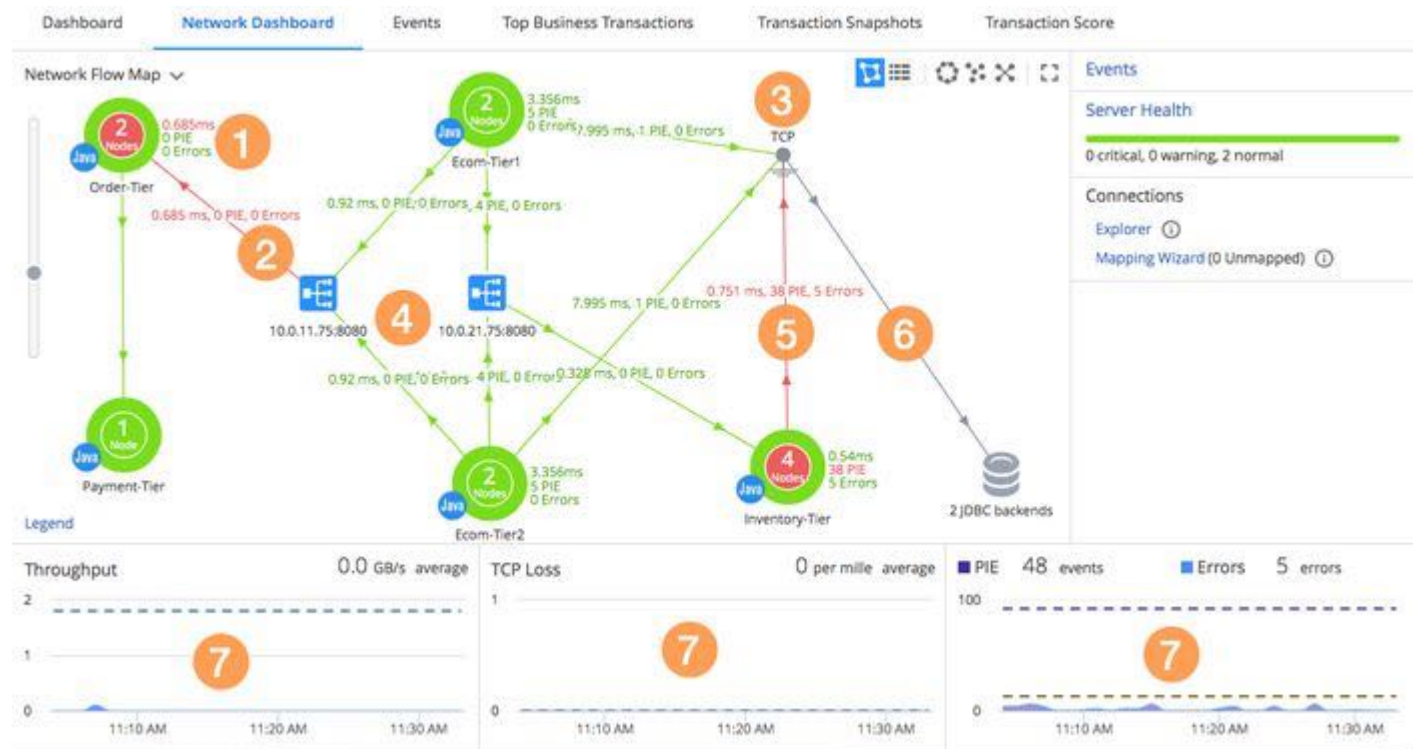

- Enable baselining to visualize network elements with performance issues (red/yellow links and tiers)
- View network metric charts in tier/link popups
- Find root causes in a specific network link. Right-click and select **View Metrics** to open a context-sensitive dashboard for the element.
 - The tier dashboard shows correlations between outlier (Slow/Very Slow/Stalled/Error) transactions and network-performance metrics
 - The link dashboard shows network-performance issues on the client tier, server tier, and network path
- Find root causes in a specific connection. When you narrow the issue down to a specific network link, you can:
 - Configure the Network Agents to collect detailed metrics for the individual Connections used on that link.
 - Drill down to find the root cause in an individual Connection.
- Copy IP addresses and ports for individual connections from the **Network** Dashboard enabling you to forward this information to operations and other personnel when troubleshooting an issue. To copy IP addresses and ports:
 - a. Click a link to open the link popup, and go to the Connections tab.
 - b. Select the connections of interest (use Ctrl-click to select multiple connections).
 - c. Right-click the selection and select **Copy IP addresses to clipboard**.

Important Notes

- In many cases, the **Application** Dashboard and **Network** Dashboard might show different topologies for the same application. This is the expected behavior. Unlike App Server Agents, Network Agents detect intermediate network devices between nodes, and consider these devices when collecting metrics. The two dashboards show the same application but from different perspectives: an application perspective and a multi-layer, network/application perspective.
- This release does not support these Network Flow Map features:
 - Federated Flow Maps
 - Visualization of flows between web servers and APM entry tiers
 - The Network Flow Map does not filter out connections based on the selected time range
- In some cases, the KPIs for a tier or link might be different in the Network tab versus the Flow Map. The popup shows the latest data; the Flow Map updates data every two minutes. Any discrepancy between KPI values is due to this difference in reporting times.
- If you open the Network Flow Map for an individual node, the KPI metrics for node-to-load-balancer and node-to-tcp-endpoint links show KPIs for all nodes in the parent tier (instead of KPIs for the individual node only). To view KPIs for the individual node, open the link popup and review the Connection KPIs.

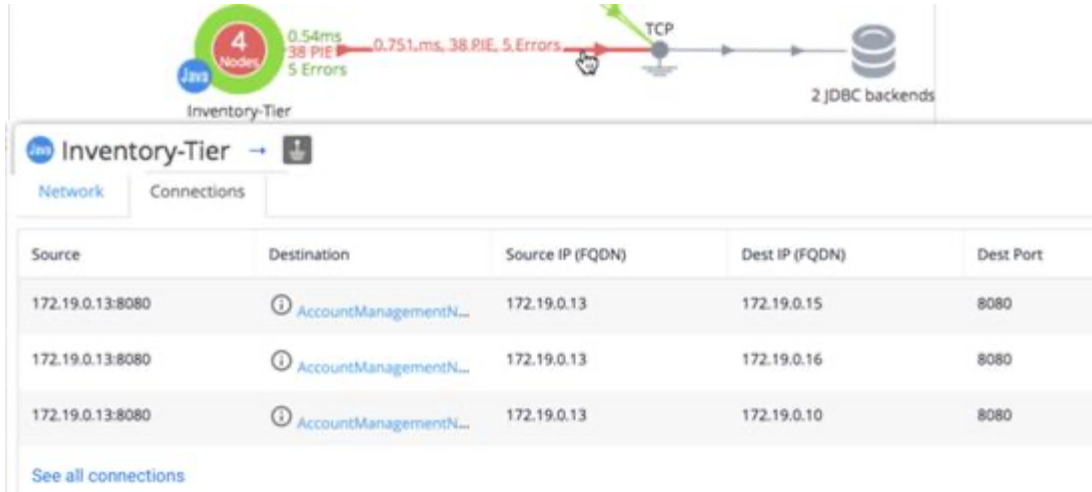

Network Dashboard Reference

The Network Dashboard shows:

- Network-based [key performance Indicators \(KPIs\)](#) (see page 2760) ¹ for the monitored nodes in each tier:
 - Average [Latency \(#ms\)](#) (see page 2761) for individual packets
 - Number of [Performance Impacting Events \(PIE\)](#) (see page 2762)
 - Number of [Errors](#) (see page 2761)

- KPIs for all [network links](#)¹⁶⁹³ 2. Click a load balancer or a network element to review the set of five associated [Connections](#)¹⁶⁹⁴. (A gray link indicates a connection that a Network Agent detected but did not directly monitor.) If a link or load balancer is associated with more connections, click **See all connections**. The **Connections** page lists the details of all the connections.

- The **Network** Dashboard shows a [TCP endpoint](#)(see page 2779) 3 icon when a Network Agent observes traffic between a monitored node and an endpoint (IP address, TCP port, and protocol), but cannot determine if the endpoint represents:
 - An application node that sends or receives traffic for the application, or
 - An intermediate device (proxy or load balancer) that transfers traffic to and from another node over a separate connection
- Network Agents automatically detect [load balancers](#)(see page 2779) 4, which often mask internal IP addresses and have the effect of splitting an in-flight application message into two separate TCP connections. The auto-detection of TCP endpoints and load balancers between application nodes enable you to easily identify the exact locations where network issues are occurring.
- Links are colored in the **Network** Dashboard as:
 - Green/yellow/red, to visualize the network performance compared to the overall performance baseline for that link 5
 - Blue, if baselining is disabled
 - Gray, for connections between application nodes and TCP endpoints. 6 In this example, the gray link indicates "The connected node and endpoint are either the same device, or two devices exchanging traffic over a separate, unmonitored connection."
- The **Network** Dashboard also shows KPIs 7 for the entire application. You can review:
 - Overall [throughput](#)(see page 2761) that the application places on the network
 - Rate of [network packet loss](#)(see page 2761) (packets sent but never received)
 - Number of [Performance Impacting Events \(PIE\)](#)(see page 2762), which indicate potential problems on one or more nodes or connections
 - Number of [errors](#)(see page 2761) for the entire application

Connection Explorer

Related pages:

- [KPI Metrics in Right-Click Dashboards](#)(see page 2762)

¹⁶⁹³ https://docs.appdynamics.com/display/PRO45/Flows,+Links,+and+Connections#Flows,Links,andConnections-nw_linkNetworkLinks

¹⁶⁹⁴ <https://docs.appdynamics.com/display/PRO45/Flows%2C+Links%2C+and+Connections#Flows,Links,andConnections-TCPConnections>

- [Network Visibility Metrics](#)(see page 2759)

The Connection Explorer (**Explorer** link, right side of **Network** Dashboard) shows all application flows and TCP Connections for an application in one table. Use the Connection Explorer for large, complex applications. You can sort the table based on network KPIs to locate flows with performance issues; then you can drill down and analyze the supporting connections in right-click Connection Dashboards. See [Flows, Links, and Connections](#)(see page 2780).

The Connection Explorer shows information for:

- [Network Links](#)(see page 2817)
- [Connections](#)(see page 2818)

Network Links

The Explorer shows this information for each network link. Select **View Options** to show or hide information as appropriate.

- Source
- Destination
- Network Element

Tip

If two flows connect through a Load Balancer (LB), the table shows the LB IP:port and the connection source:

Flow direction: LB --> Tier 10.0.11.150:8080

Flow direction: Tier --> LB 10.0.21.150:8080

To see the relationships between application tiers and intermediate Load Balancers (LBs) more clearly, you can drag the Network Element heading so that the columns are ordered **Source | Network Element | Destination**.

Network Links last 1 hour

View Options Search...

Source	Network Element	Destination	Connections
Ecom-Tier1		APPDY-MySQL-DB-5.5.46-0ubuntu	2
Ecom-Tier1	10.0.11.75:8080	Order-Tier	2
Ecom-Tier1	10.0.21.75:8080	Inventory-Tier	2
Ecom-Tier1	10.0.11.75:8080	Order-Tier	4
Ecom-Tier2	10.0.11.75:8080		
Ecom-Tier1	10.0.21.75:8080	Inventory-Tier	3

- [Connections](#)(see page 2818)
- [Latency](#)(see page 2761)
- [Errors](#)(see page 2761)

- [PIE¹⁶⁹⁵](#)
- [TCP Loss \(Mille\)](#)(see page 2761)

Connections

To view the load balancer details for a connection, click the connection. Select **View Options** to show or hide information as appropriate.

- Source IP, or Fully Qualified Domain Name (when available) for Load Balancers and TCP Endpoints
- Destination IP, or Fully Qualified Domain Name (when available) for Load Balancers and TCP Endpoints

Custom Dashboards for Network Visibility

You can create [Custom Dashboards](#)(see page 372) based on Network Visibility metrics using the standard workflows. To add a Network Visibility metric to a custom dashboard:

1. In the Add Widget pane, click + (under **Data**).
2. Under **Data Source**, select the application of interest.
3. Under **Select a Metric Category**, select **Custom (use any metrics)**.
4. Under Select a Metric, navigate to the metric of interest under one of these:
 - **Application Infrastructure Performance > Advanced Network**
 - **Application Infrastructure Performance > <tier-name> > Advanced Network**

See [Network Visibility Metrics](#)(see page 2759).

Network Visibility Events

This page lists the Network Visibility events and severity.

Packet Capture Events

Sub-type: PCAP (set by Network Agent)

Description	Severity
Packet capture successful, Packet capture ID: <id>, Captured file: <file.pcap>	Info
Packet capture already active, Packet capture ID: <id>	Info
Packet capture couldn't be started, Storage location </loc/path> does not exist, Packet capture ID: <id>	Err
Not enough space to start packet capture, Packet capture ID: <id>	Err
Packet capture failed. Capture directory </loc/path> does not exist, Packet capture ID: <id>	Err

569[https://docs.appdynamics.com/display/PRO45/KPI+Metrics+in+Network+Dashboard+and+Application+Flow+Map#KPIMetricsinNetworkDashboardandApplicationFlowMap-kpi_piePIE\(PerformanceImpactingEvents\)](https://docs.appdynamics.com/display/PRO45/KPI+Metrics+in+Network+Dashboard+and+Application+Flow+Map#KPIMetricsinNetworkDashboardandApplicationFlowMap-kpi_piePIE(PerformanceImpactingEvents))

Description	Severity
Packet capture successful and exported, Packet capture ID: <id>, Captured file: <file.pcap>	Info
Packet capture successful but export failed, Packet capture ID: <id>, Captured file: <file.pcap>	Err
Packet capture not started. Agent Disabled, Packet capture ID: <id>	Err

Dynamic Monitoring Mode Events

Sub-type: Config (set by Network Agent)

Description	Severity
Network Visibility Agent mode change successful, Last DMM: <Kpi/Diagnostic/Advanced>, Current DMM: <Kpi/Diagnostic/Advanced>	Info
Network Visibility Agent mode change failed, Current DMM: <Kpi/Diagnostic/Advanced>	Err

State-Change Events

Sub-type: Config (set by Network Agent)

Description	Severity
Network Visibility Agent state change successful, Current state: <Enabled/Disabled>	Info
No change in Network Visibility Agent state, Current state: <Enabled/Disabled>	Info
Network Visibility Agent state change failed as Packet capture active, Current state: <Enabled/Disabled>	Err
Network Visibility Agent state change failed, Current state: <Enabled/Disabled>	Err
Network Visibility Agent started successfully, Current state: <Enabled/Disabled>	Info

Start Events

Description	Severity
Network Visibility Agent registered successfully	Info

Description	Severity
Network Visibility Agent registration failed due to an invalid ID	Err
Network Visibility Agent started successfully, PID: <pid>	Info

Advanced Operations

Network Visibility includes these advanced operations:

- [Resolve Unmapped Connections](#)(see page 2822) – In some cases, there is not enough context to map a TCP Connection to an application flow automatically. This page describes how to resolve these connections manually.
- [Packet Captures](#)(see page 2820) – A packet capture is a snapshot of live network traffic. Packet captures are very useful for advanced, in-depth network diagnostics and troubleshooting.

Packet Captures

A packet capture is a snapshot of live network traffic. Use packet captures for in-depth network diagnostics and troubleshooting. When you discover a network issue that affects your applications, you can capture traffic using Network Visibility Agents and send the resulting data to your network or Ops team for further analysis.

Network Agents save packet captures as [pcap](#)¹⁶⁹⁶ files. A wide variety of network analysis tools support pcap: [Wireshark](#)¹⁶⁹⁷, [tcpdump](#)¹⁶⁹⁸, [Windump](#)¹⁶⁹⁹, and so on. Packet captures are supported on Linux platforms only.

Restrict packet capture privileges to authorized users only

Packet capture files include "raw" application data that might contain sensitive information. Any user with [Account Owner](#)¹⁷⁰⁰ or [Administrator](#)¹⁷⁰¹ privileges can perform packet captures. For this reason, these roles should be assigned to authorized users only. See [Roles and Permissions](#)¹⁷⁰².

Before You Begin

 You must perform this setup *on each host* before you can capture packets on that host.

1. In the Controller, click the gear icon in the top right () and select **AppDynamics Agents > Network Visibility Agents**.
2. Right-click the Agent to set up and select **View Packet Capture Configuration**.
3. Set the capture settings:
 - **Duration (sec)** – Make it long enough to capture at least one Business Transaction over the link that you want to troubleshoot

¹⁶⁹⁶ <https://en.wikipedia.org/wiki/Pcap>

¹⁶⁹⁷ <http://www.tcpdump.org/>

¹⁶⁹⁸ <http://www.tcpdump.org/>

¹⁶⁹⁹ <http://www.tcpdump.org/>

¹⁷⁰⁰ <https://docs.appdynamics.com/display/PRMY21/.Roles+and+Permissions+v21.2>

¹⁷⁰¹ <https://docs.appdynamics.com/display/PRMY21/.Roles+and+Permissions+v21.2>

¹⁷⁰² <https://docs.appdynamics.com/display/PRMY21/.Roles+and+Permissions+v21.2>

- **Size** – The maximum size for any single capture file
- **Packet Capture Filename Prefix** – You must specify a prefix. It is good practice to include the hostname or another string that clearly identifies the node. The resulting pcap filename includes the prefix, the IP address, the interfaces captured, and the timestamp.
 For example, if you specify a prefix of DataCenterNYC--, the resulting pcap will have filename: DataCenterNYC--ip-10-0-21-101_any_1_2017_09_28_17_58_03.pcap

4. Set the storage settings:

- **Path** – If remote storage is disabled, the Agent stores capture files in this folder on the Agent host
 - The specified folder must exist on the Agent host. The default path is /opt/appdynamics/netviz/pcap.
 - The <network-agent-user> account (the one used to install and run the Network Agent) should have read and write permissions to this folder
- **Maximum Allotted Space** – Maximum storage allotted for all capture files. This setting applies to both the Agent host and the remote server. As new capture files are created, the Agent deletes older files to free up space.

5. Set the storage settings (SCP server):

- **Remote Storage (upload to SCP Server)** – With this option enabled, the Agent uploads the capture file to the specified server when the packet-capture operation ends
- **Host/Port/Username/Password/Path**
 - The local path must be defined on the remote server
 - The specified user account must have write permissions on the specified path

Best Practices for Packet Captures

Packet Capture files can get very large, very quickly. When a capture job is in progress, the Network Agent captures all bytes in all packets on all network interfaces that it monitors. The size of the capture file depends on the capture duration, and the rate of packets sent and received on the network interfaces of the node. The duration should be long enough to capture a few Business Transaction calls between the two nodes, but no longer.

If you want to retain any capture file for archiving or extended analysis, copy the file from the storage folder as soon as the capture completes. This ensures that it does not get overwritten by newer files.

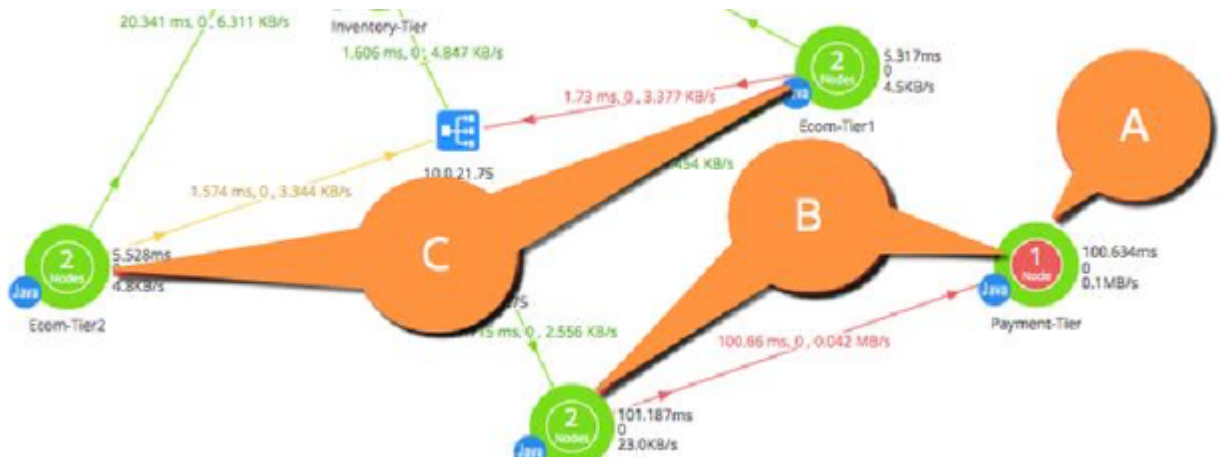

Packet capture operations generate a number of [Network Visibility Events](#)(see [page 2818](#)) that you can use for monitoring and troubleshooting.

Create a Packet Capture

- ◦ [Determine the Nodes to Capture](#)(see [page 2821](#))
- [Start the Packet Capture](#)(see [page 2822](#))

Determine the Nodes to Capture

- Go to the Network Dashboard, set the reporting duration to the last five minutes, and verify that the network issue you need to troubleshoot is currently active.
- Note the node(s) where you need to capture packets.
 - To troubleshoot a node, capture on the node **(A)**.
 - To troubleshoot a link, capture on the two connecting nodes on each side of the link **(B)**.
 - If the link is bisected by a load balancer, capture on both sides of the load balancer **(C)**.

Start the Packet Capture

When you start a capture, the Agent captures all packets sent and received by all network interfaces on the Agent host. When the Agent stops capturing (as specified by the **Duration (sec)** capture setting), it saves the pcap file in the folder specified by **Storage** settings).

There are two capture methods:

- [From the Agents Page](#)(see page 2822)
- [From the Node Dashboard](#)(see page 2822)

From the Agents Page

Use this method to capture on one or more nodes:

1. In the Controller, click the gear icon in the top right (⚙️) and select **AppDynamics Agents > Network Visibility Agents**.
2. Select the Agents on the nodes where you want to capture. Use Ctrl-click or Shift-click to select multiple Agents.
3. Right-click a selected Agent and select **Start Packet Capture**.

From the Node Dashboard

Use this method to capture on a single node:

1. Drill down to the node in the Network Browser:
 - a. Go to **Tiers & Nodes**, right-click the node, and select **View**.
 - b. When the Node view appears, go to the Network Browser.
2. Right-click the node and select **Start Packet Capture**.

Resolve Unmapped Connections

After you set up the App Server Agent and the Network Agent together, the Network Agent automatically:

- Monitors TCP connections
- Identifies the application flow that uses each connection
- Maps the connection to the flow

However in some cases, there is not enough context to associate a connection with a specific application flow resulting in an *unmapped* connection. In this case, you need to map the connection manually. If a

connection remains unmapped, the Network Agent collects metrics for that connection but cannot associate these metrics with any monitored application flow.

To resolve an unmapped connection:

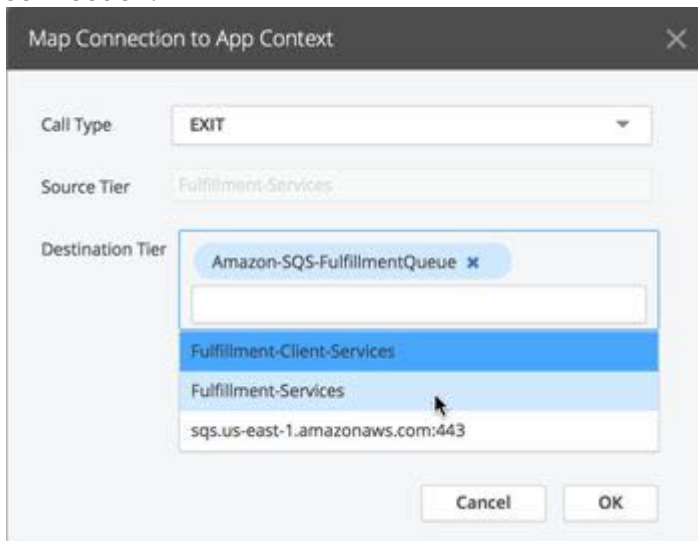

1. Go to the **Network Dashboard** and select **Mapping Wizard** (under **Connections** on the right). You can also open this wizard directly from a **Tier Dashboard**, if that tier has any unmapped connections.
2. The **Connection Mapping Wizard** appears. The left pane shows all tiers with unmapped connections. When you select a tier, the **Connections** list (right pane) shows all the unmapped connections for that tier. The workflow is to iterate through each tier, and specify the mapping for each connection for that tier.

For each unmapped connection:

- a. Determine the application flow that uses the unmapped connection.

i You need to know the source tier, destination tier, and the call type (ENTRY/EXIT) for the application flow. If you do not know this information, contact someone else who knows the application well.

- b. Select a tier in the left pane.
- c. In the right pane, group the IP addresses by Destination VIP or Prefix (bit mask).
- d. Right-click a connection and select **Map Connection(s)**.
- e. Specify the **Call Type**, **Source Tier**, and **Destination Tier** for the application flow that uses that connection.

Troubleshooting Network Visibility Problems

How do I troubleshoot the Network Agent?

- [Network Agent Logs](#)(see page 2823)
- [Network Agent Health Rule](#)(see page 2824)

Network Agent Logs

If you notice any performance issues related to the Agent:

1. Stop the Network Agent:

- a. For ZIP packages: Identify the Agent process and enter: `ps ef | grep \appd-netagent`
The output provides the process ID (PID) of the Network Agent process: `kill <network_agent_PID>`
- b. For RPM and DEB packages, enter: `sudo service appd-netviz stop`
2. Review these log files under `<network-agent-install>/logs`:
 - a. `appd-netmon.log`
 - b. `appd-netagent.log.log`

Network Agent Health Rule

Use this default Health Rule to troubleshoot Network Agents: Network-Host: Packet drops too high
This rule triggers an alert when packets get dropped between a Network Agent and the host interface. A high rate of packet drops on the host can result in inaccurate metrics.

i If the issue persists, run the `collect.sh` script available in the `bin/` folder in the agent directory, and share the logs with your support contact to expedite troubleshooting. This script is available for Network Agent \geq 4.5.9.

Monitor Cloud Applications

In cloud environments, services and components are added and removed continuously. AppDynamics provides robust support to monitor applications in these dynamic environments.

Monitor Containers with Docker Visibility

Use the Machine Agent to monitor application nodes running inside Docker containers and to identify container issues that impact application performance. By viewing and comparing APM metrics with the underlying container and server/machine metrics, you can easily answer the question: Is my application problem purely an application problem, or is the root cause in the container or the server?

 Container monitoring requires a Server Visibility license >=4.3.3, for both the Controller and the Machine Agent.

You should deploy the Machine Agent inside a Docker container. The Machine Agent collects metrics for Docker containers on the same host, and server and machine metrics for the host itself. The Controller shows all monitored containers, for each host, and the container and host IDs, for each container.

In a BRIDGE networking mode, the containers take on the container ID as the host name. If networking is in host mode, then the containers take on the node name of the host ID. This means every container on that node has the same host ID. In this case you need to use the unique host ID settings. See [Register the Container ID as the Host ID](#)(see page 2839). When using Docker Visibility, if the unique host ID setting is not configured to use container ID in host network mode, the Machine Agent automatically registers the container using the container ID as the host ID. If you have an older version of the Controller or Machine Agent, AppDynamics recommends that you upgrade to Machine Agent version 20.7 or later. See [Using Docker Visibility with Kubernetes](#)(see page 0).

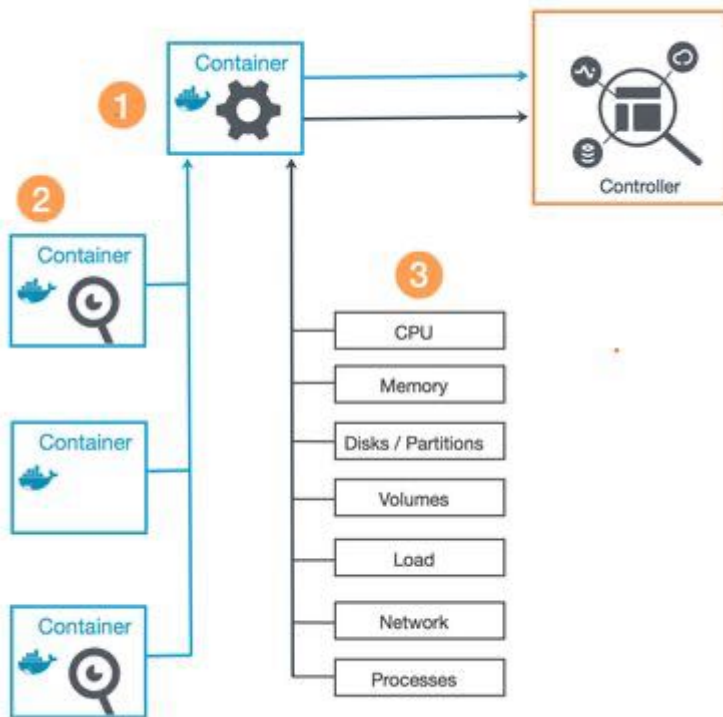

With Controller $\geq 20.11.0$:

- If the Machine Agent $\geq 20.7.0$, the Machine Agent automatically registers the container using the container ID as the host ID. No further action is needed.
- If the Machine Agent $\leq 20.6.0$ is configured incorrectly, the Controller rejects the misconfigured containers registration.

By default, the Machine Agent only monitors containers that have a running APM Agent. You can change this by setting the `sim.docker.monitorAPMContainersOnly` property on the Controller. See [Controller Settings for Server Visibility](#)(see page 2701).

i To deploy a Machine Agent on a host outside a Docker container, create a symbolic link: `ln -s / /hostroot` on the host. This symbolic link enables the Machine Agent to collect host metrics with Docker container metrics. When you deploy a Machine Agent inside a Docker container for monitoring, the symbolic link is automatically created when the volume mounts. To grant more restrictive permissions, enter this command to create symbolic links: `ln -s /proc /hostroot/proc; ln -s /sys /hostroot/sys; ln -s /etc /hostroot/etc`. You can make these links read-only because the AppDynamics Agent does not need write privileges to these directories.

This diagram illustrates how to deploy container monitoring:

- Install the Machine Agent (1) in a standalone container. The Machine Agent collects hardware metrics for each monitored container, as well as Machine and Server metrics for the host (3), and forwards the metrics to the Controller.
- The Machine Agent can monitor all containers that are running on that host, subject to established limits, and will report runtime metrics and metadata for every container. Additionally, if any of the containers have an APM Agent installed (2), then the Machine Agent also correlates the container metadata and runtime metrics with the associated APM Node.

Before You Start

1. AppDynamics recommends that you use Docker CE/EE 17.03 or Docker Engine 1.13 with this product. Some data might be missing if you use previous versions of Docker.
2. Container Monitoring is not supported on Docker for Windows, or Docker for Mac.
3. AppDynamics strongly recommends that you follow these guidelines, [Instrument JVMs in a Dynamic Environment](#)(see page 575) when monitoring container-based applications.
4. The Machine Agent can monitor up to 120 running containers per host. The default maximum number of containers per host is 100. With the [cgroup enabled](#)(see page 2833) flag set to true, the Machine Agent can monitor up to 600 containers per host. See [Configure Docker Visibility](#)(see page 2833).
5. The Machine Agent collects metrics from containers with one or more running processes whose command line matches a configurable regex. By default, this regex matches all processes (*). To override this behavior, edit this regex in <machine_agent_home>/extensions/DockerMonitoring/conf/DockerMonitoring.yml:

```
containerMonitoringConfig:containerProcessSelectorRegex: ".*"
```
6. The maximum number of containers you can monitor in one Controller depends on the Controller size, the total number of App Agents, and the current load. If you are using a SaaS Controller, please work with your Account Manager.
7. Please review:

- a. Best Practices for setting up [App Agents and Machine Agents](#)(see page 455).
- b. Docker Visibility issues in the latest [Release Notes](#)(see page 3911).

Enable Container Monitoring

To enable Container Monitoring:

1. On the Controller, log in to the [Administration Console](#)¹⁷³⁷ and verify that `sim.docker.enabled` is set to `true`.
2. On the Agent, [enable Server Visibility](#)(see page 2621) and [Docker Visibility](#)(see page 2617).

Container Monitoring Setup

The quickest and easiest way to run the Machine Agent with Container Monitoring enabled is to use one of the official images from the Docker Store: <https://store.docker.com/images/appdynamics>. These images are produced by AppDynamics, based on certified base images from the Docker Community, and can either be run directly or used as base images for your own application containers. For full details of how to download and run containers based on these official images, see the documentation posted on the Docker Store. To build your own base images, the full source code for building these images is posted to GitHub. You can use this as a pattern for your own builds: <https://github.com/Appdynamics/appdynamics-docker-images>.

For the Machine Agent to monitor containers running on the server, configure these settings (See [Configure Installation Options](#)(see page 458)):

- [Server Visibility Enabled](#)(see page 2621) – [Enable Server Visibility](#)(see page 2658)
- [Docker Enabled](#)(see page 2617) – [Enable Docker Visibility](#)
- **Volume Mounts** – Specify:
 - Volume mounts to allow read-only access to the underlying file system (`/proc`, `/etc` and `/sys`). This allows the Server Agent to collect host-level metrics for containers running on the server.
 - The UNIX domain socket on which the Docker daemon is configured to listen for API calls.

View Container Details

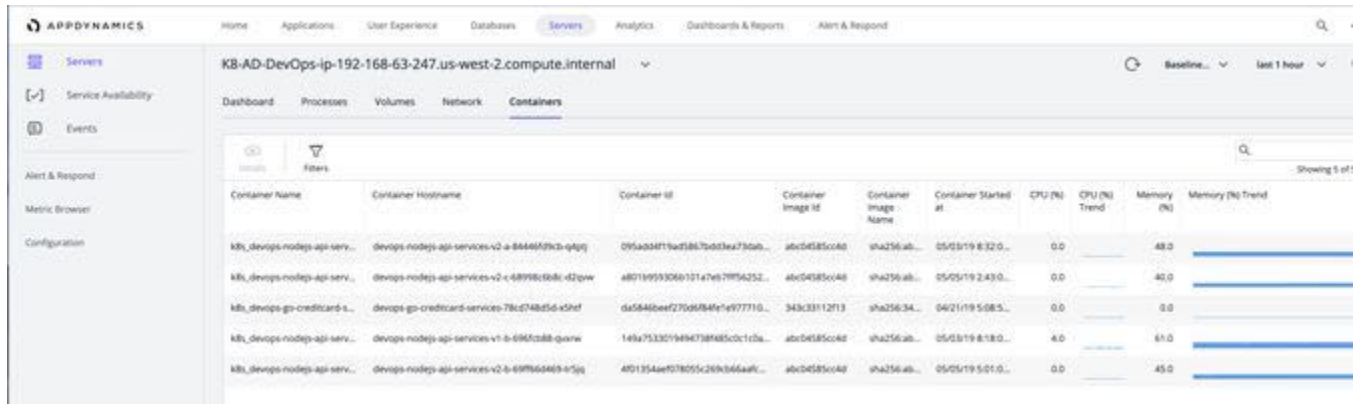

To view container metadata and metrics in the Controller:

- In the **Applications** Dashboard, go to **Containers** to see all monitored containers used by the application.

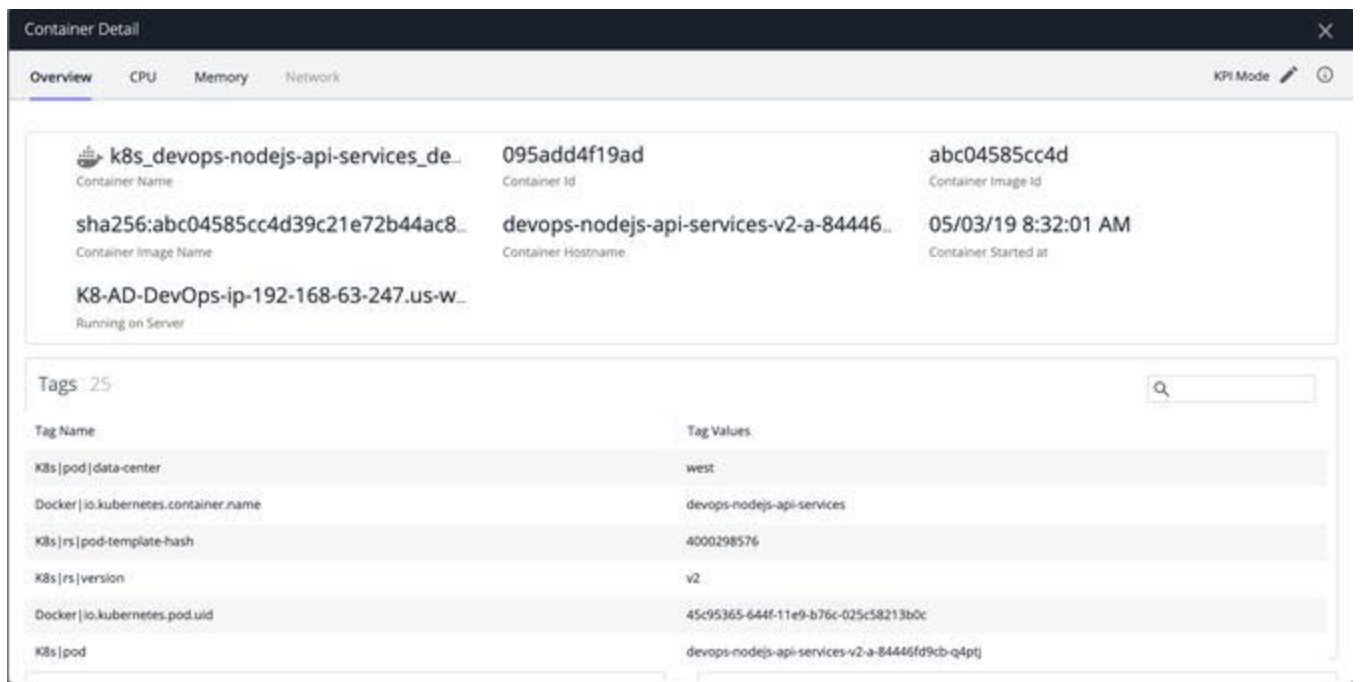

Container Name	Container Hostname	Container Id	Container Image Id	Container Image Name	Container Started at	CPU (%)	CPU (%) Trend	Memory (%)	Memory (%) Trend

- In the **Servers** Dashboard, go to **Containers** to see all monitored containers on that host.

1737 <https://docs.appdynamics.com/display/PRMY21/.Access+the+Administration+Console+v21.5>

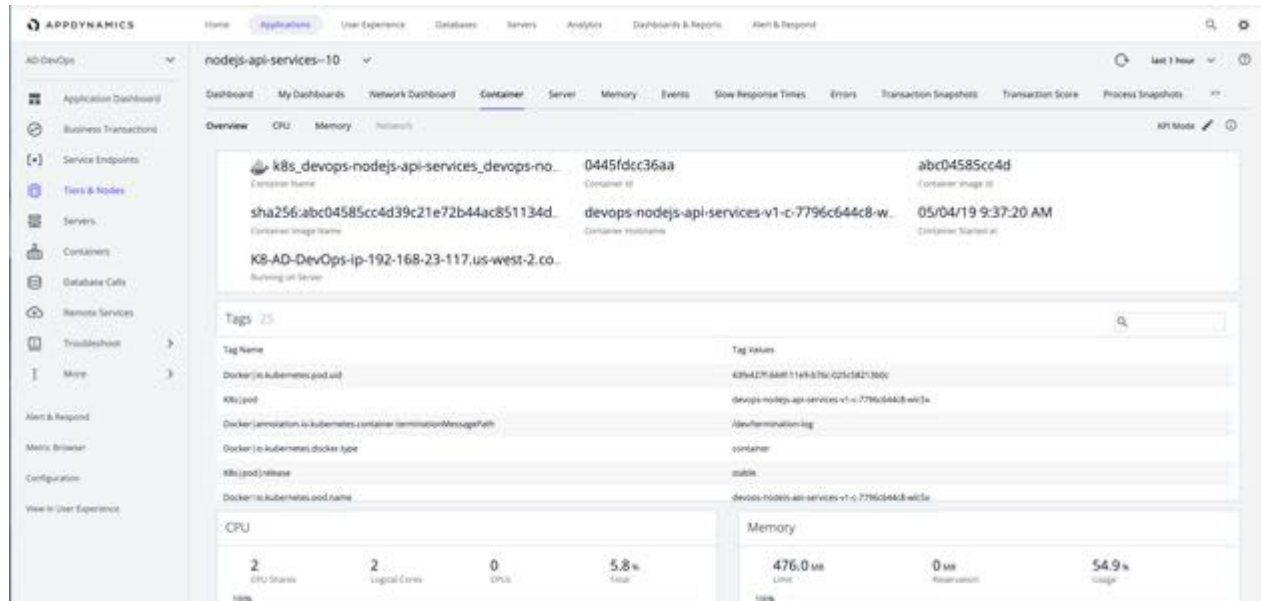

- To open the Container Dashboard, right-click on the container name, and choose **View Details**.

The Container Details view contains these tabs, which provide an overview of the health and resource usage for the container:

- Overview** - Container metadata, Tags (name-value pairs derived from Docker/Kubernetes) plus AWS tags where applicable, and single chart views for CPU, memory, network and disk usage
 - CPU** - CPU Usage and Throttled Time metrics
 - Memory** - Memory Usage and Memory Fault metrics
 - Network** - Network Usage metrics (only available when running in Diagnostic mode), see "Enable Dynamic Monitoring Mode (DMM)" under [Machine Agent Configuration Properties](#)(see page 2613).
- The Node Dashboard also includes a Containers tab for the container in which that node is running.

View Container Metrics Using the Metric Browser

To view time-series metric data for containers, double-click one of container metric graphs (CPU, Memory, Network, Disk) to open the Metric Browser with the displayed metric selected. The Metric Browser tree displays the full set of metrics available for that container, and you can add these to the Metric Browser display by double-clicking the metric you wish to select. See [Container Metrics](#)(see page 2852).

Troubleshooting Containers Using Dynamic Monitoring Mode

Using Dynamic Monitoring Mode (DMM), you can selectively control the number of Container metrics reported for individual containers. Rather than have all Agents report all metrics for all containers all the time, you can configure individual Agents to collect:

- Key Performance Indicator metrics only (*KPI mode*)
- KPI and Diagnostic metrics (*Diagnostic mode*)
- All available metrics (*Advanced Diagnostic mode*)

This provides the flexibility to report KPI metrics only on most containers, and then increase the metric level on specific containers when you need deeper visibility to diagnose problems. You can increase scalability on the Controller and conserve metric bandwidth on the network with no sacrifice in visibility. Every Docker Visibility metric has a default DMM class (KPI, Diagnostic, and Advanced Diagnostic). For details, consult the Container Metrics table: the Default Monitoring Mode column indicates the default category of each metric when Dynamic Monitoring Mode is enabled.

When you notice a container that requires additional analysis or troubleshooting, change the DMM on that container to collect more metrics:

1. Open the **Container Detail** panel for the container of interest: Open the Containers table (**Containers**, left menu) and double-click the container.
2. Click the **Edit** (pen) button in the top-right corner, change the mode to **Diagnostic** or **Advanced Diagnostic**, and click the checkmark to apply the changes.
3. Collect additional metrics for your analysis or troubleshooting.
4. When you no longer need to collect additional metrics for that container, set the DMM on that container back to KPI.

Note:

- Depending on the type of metrics collected by the Agent, the Controller has three different DMM defaults. These defaults are all set to KPI (the lowest setting):
 - `sim.machines.dmm.containerAware.defaultMode` (see page 2704)
Default for [Hardware Resources Metrics](#) (see page 2558) on servers with Docker Visibility enabled
 - `sim.machines.dmm.container.defaultMode` (see page 2704)
Default for [Docker Container Metrics](#) (see page 2852) on containers
- The default for both settings is KPI (the lowest setting).
- AppDynamics recommends that you leave these global settings at their defaults. If you need to collect advanced metrics for a specific server or container, increase the DMM on an "as-needed" basis.
- When a container monitored by a Java App Agent shuts down and restarts, any overridden DMM specified for the shut-down container is lost. The DMM for the restarted container automatically resets to the global default specified by `sim.machines.dmm.container.defaultMode`.
- If you switch the monitoring mode in the Controller from a more-inclusive to a less-inclusive mode, the Metric Browser will show values for the newly-excluded metrics for one hour after the switch. For example, if you switch from Diagnostic to KPI mode. For any Diagnostic metric, the Metric Browser will report a steady line (at 0, or the last-reported value) for one hour after

the switch; then the line will disappear. This is standard behavior in the Metric Browser for an Agent when it stops reporting a specific metric.

Configure Docker Visibility

- [Machine Agent Settings for Docker Visibility](#)(see page 2833)
- [Controller Settings for Docker Visibility](#)(see page 2836)

Machine Agent Settings for Docker Visibility

You can configure the Docker Visibility settings in the file: `<machine-agent-home>/extensions/DockerMonitoring/conf/DockerMonitoring.yml`

i Before you edit this file, please review "Editing YML Files: Important Notes" in [Machine Agent Settings for Server Visibility](#)(see page 2692).

Property	Description	Default
cgroupEnabled	<p>The Machine Agent can collect Memory and CPU metrics for Docker containers using <code>cgroupdata</code>. This method is much faster than using the Docker API (the default metric-collection method). You can enable <code>cgroupmetriccollection</code> on all platforms except Amazon Linux OS. With the <code>cgroupEnabled</code> flag set to <code>true</code>, the Machine Agent can monitor up to 600 containers per host. When <code>cgroup</code> is enabled, you do not have to update the Docker Metric Collector Pool Size. The max container limit is independent of this.</p> <p>This mode is disabled by default. To enable <code>cgroupmetriccollection</code>, run the agent with the following command-line option set to true:</p> <pre>java -Dappdynamics.docker.container.collection.cgroup.enabled=true -jar machineagent.jar</pre>	true

Property	Description	Default
containerProcessSelectorRegex	<p>The Machine Agent can monitor up to 150 running containers (depending on the pool size configuration, described below). The agent collects metrics from containers with one or more running processes whose command line matches a configurable regex. By default, the value of this regex is ".*" and matches all containers irrespective of the processes running in them. If you cannot restart the APM agents, or if you want to filter APM agents based on another command-line argument, you can override this behavior by editing this regex.</p> <p>Default = "."</p>	".*"
docker.metric.collector.pool.size	<p>Specify the local limit for the number of containers the agent can monitor. The effective limit for each agent is the minimum amount for:</p> <ul style="list-style-type: none"> The <code>sim.docker.machine.container.limit</code> on the Controller (default limit = 15 containers), or The Docker Metric Collector Pool Size on the agent (default pool size = 3, or 90 containers). <p>You can change this setting to monitor up to 120 containers (pool size = 4) or 150 containers (pool size = 5). The trade-off is that increasing the pool size might lead to higher resource consumption on the agent host.</p> <p>To change the pool size, set these properties:</p> <p>System Property</p> <pre>-Dappdynamics.docker.metric.collector.pool.size</pre> <p>Environment Variable</p> <pre>APPDYNAMICS_DOCKER_METRIC_COLLECTOR_POOL_SIZE</pre>	<p>default limit = 15 containers</p> <p>default pool size = 3, or 90 containers</p>
dockerTagsEnabled	<p>Enable (default) or disable the collection of Docker tags from containers monitored by the Machine Agent.</p>	

Property	Description	Default
<p><code>docker.use.container.name.selector</code></p>	<p>Use the Machine Agent to identify containers by container names only.</p> <p>By default for Docker monitoring, the Machine Agent obtains a list of containers. For each container, the Machine Agent retrieves all running processes inside the container. Then, the Machine Agent matches the container to be monitored by the process full command line. Because there are many containers, the selection process lasts longer than a minute, causing gaps in reporting container metrics.</p> <p>The Docker Use Container Name Selector configuration option provides an alternative way to select containers to be monitored by using the container's name. This option allows the Machine Agent to run significantly faster since the Machine Agent does not have to gather all the processes for each container.</p> <p>To enable matching with the container name, you can either use an environment variable or a JVM property. If both are defined, the environment variable is used.</p> <p>System Property</p> <div data-bbox="516 1157 1232 1276" style="border: 1px solid black; padding: 5px;"> <pre>-Dappdynamics.docker.use.container.name.selector=false</pre> </div> <p>Environment Variable</p> <div data-bbox="516 1346 1232 1465" style="border: 1px solid black; padding: 5px;"> <pre>APPDYNAMICS_DOCKER_USE_CONTAINER_NAME_SELECTOR=false</pre> </div> <p>You can select which containers to be monitored by providing the regular expression, <code>containerNameSelectorRegex</code>, to match the container names. By default, the Machine Agent matches all container names. Regular expressions are part of the <code>extensions/DockerMonitoring/conf/DockerMonitoring.yml</code> file.</p> <p>To exclude containers from monitoring, use an environment variable or the JVM property. If both are defined, the environment variable is used.</p>	<pre># default value ".*(machine-agent machineagent) .*"</pre>

Property	Description	Default
	<pre># default value ".*(machine-agent machineagent).*" # environment variable export APPDYNAMICS_DOCKER_CONTAINER_NAME_SELECTOR_BL ACKLIST_REGEX=".*(machine-agent machineagent).*" # JVM property -Dappdynamics.docker.container.name.selector. blacklist.regex=".*(machine-agent machineagent).*"</pre>	

Controller Settings for Docker Visibility

For information about how to configure these settings, see [Controller Settings for Machine Agents](#)(see page 2623).

Property	Description	Default
sim.docker.apmNode.markHistorical.enabled	Enables configuration to mark the APM node historical when a container running the app agent is stopped.	true
sim.docker.enabled	Enable the Docker Monitoring feature.	true
sim.docker.machine.container.limit	<p>Global limit for the number of containers that each Machine Agent can monitor. The effective limit for each agent is a minimum of</p> <ul style="list-style-type: none"> The sim.docker.machine.container.limit on the Controller (default limit = 15 containers), or The Docker Metric Collector Pool Size(see page 2834) on the agent (default pool size = 3, or 90 containers). <p>You can specify this in the Administration Console¹⁷³⁸ as a Controller setting (all accounts) or as an Account setting for individual accounts. 150 is the maximum limit you can specify.</p>	15

1738 <https://docs.appdynamics.com/display/PRMY21/.Access+the+Administration+Console+v21.5>

Property	Description	Default
<code>sim.machines.reuse.enabled</code>	Reuse SIM Machine entities to handle an ephemeral environment. Support is currently limited to Docker container machines. If set to <code>false</code> , each new container is considered a new machine.	<code>true</code>
<code>sim.machines.tags.enabled</code>	Enable or disable the import of Docker tags to the Controller.	<code>true</code>

Use Docker Visibility with Kubernetes

This page describes how to set up the Machine Agent with Docker Visibility enabled to run as a DaemonSet on a Kubernetes cluster.

Container visibility enables you to monitor containerized applications running inside Kubernetes pods and identify container issues that impact application performance. You deploy the Machine Agent as a Kubernetes DaemonSet in every node of a Kubernetes cluster. Deploying the Machine Agent as a DaemonSet ensures that every Kubernetes worker node runs the Machine Agent to collect critical resource metrics from the node host and associated Docker containers.

Using Docker Visibility to monitor Kubernetes containers is no longer the preferred option and will be deprecated. Use the Cluster Agent instead as described in [Monitor Kubernetes with the Cluster Agent](#) (see page 2856). The Cluster Agent supports Kubernetes container visibility, as well as visibility into cluster health and capacity.

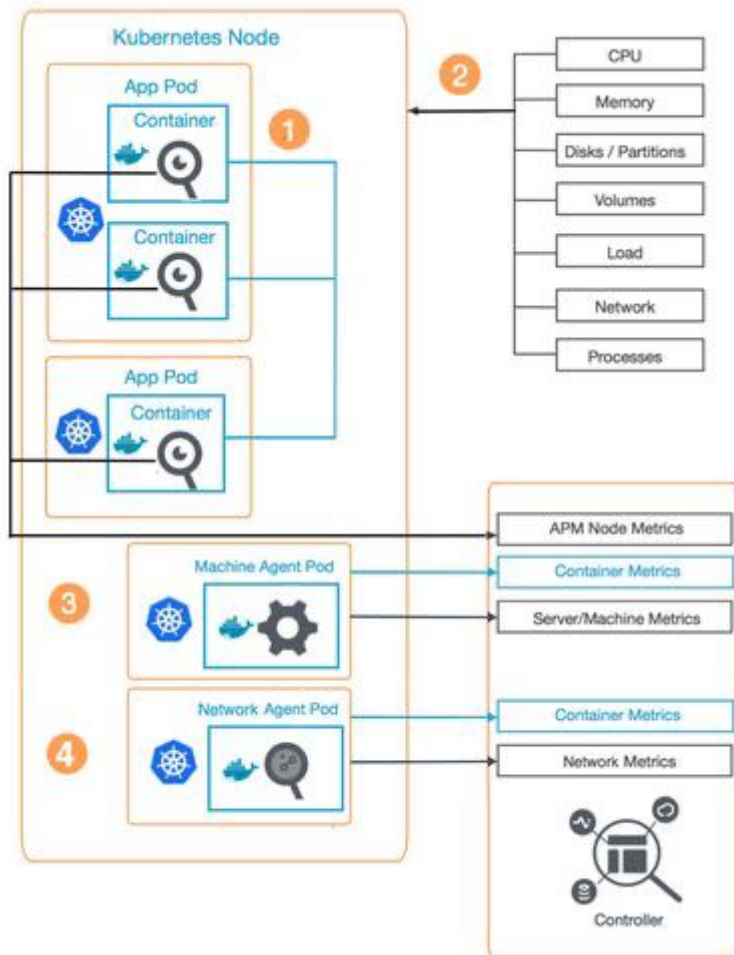

Container Visibility with Kubernetes

Deploy the Machine Agent in Docker-enabled mode (see page 2617). To configure and run the Machine Agent using Docker, see [Configure Docker Visibility](#) (see page 2833).

The Machine Agent:

- Identifies the containers managed by Kubernetes.
- Determines if these containers contain app server agents.
- Correlates containers with app server agents with the APM nodes for that application.

This diagram depicts the deployment scenario for container visibility in Kubernetes:

- Install the Machine Agent container (1) as a DaemonSet on each Kubernetes node.
- To collect APM metrics from any container in a pod, install the correct App Server Agent (2) in the container before deploying the pod.
- The Machine Agent collects resource usage metrics for each monitored container (3), as well as Machine and Server metrics for the host, and forwards the metrics to the Controller.
- (Optional) Install the Network Agent (4) as a DaemonSet on the node you want to monitor. The Network Agent collects metrics for all network connections between monitored application components and sends these metrics to the Controller.

Before You Begin

Review the requirements for Container Visibility with Kubernetes:

- A Machine Agent must run as a DaemonSet on every Kubernetes node you want to monitor.
- Every node to be monitored must have a Server Visibility license.
- Docker Visibility must be enabled on each Machine Agent.
- Both App Server Agents and Machine Agents are registered by the same account and are using the same Controller.
- If you have multiple App Server Agents running in the same pod, register the container ID as the host ID on each App Server Agent and Machine Agent.

Limitations

- Only the Docker Container Runtime is supported.
- Only Pod and ReplicaSet labels are supported.

Procedure

1. [Enable Container Visibility](#)(see page 2839)
2. [Register the Container ID as the Host ID](#)(see page 2839)
3. [Configure the Cluster Role](#)(see page 2840)
4. [Deploy the Machine Agent on Kubernetes](#)(see page 2842)

After the Machine Agent has been deployed on Kubernetes, you can add the App Server Agent into your image:

- [Instrument Applications with Kubernetes](#)(see page 2843)
 - [Resource Limits](#)(see page 2843)

Enable Container Visibility

Update the Controller to $\geq 4.4.3$.

To enable Kubernetes Visibility in your environment, edit these parameters:

- Controller
 - `sim.machines.tags.k8s.enabled`: The value defaults to true. The global tags enabled flag has priority over this.
 - `sim.machines.tags.k8s.pollingInterval`: The value defaults to one minute. The minimum value you can set for the polling interval is 30 seconds.
- Machine Agent
 - `k8sTagsEnabled`: The value defaults to true and is specified in the `ServerMonitoring.yml` file.

Continue with [Use Docker Visibility with Red Hat OpenShift](#)(see page 2844). You can use the example DaemonSet, the sample Docker image for Machine Agent, and the sample Docker start script to set up the Machine Agent.

Register the Container ID as the Host ID

Install an app server agent in every container in a Kubernetes pod to collect application metrics. If multiple app server agents are running in the same pod, for example, in the RedHat OpenShift platform, you must register the container ID as the unique host ID, on both the app server agent and the Machine Agent, to collect container-specific metrics from the pod. Kubernetes pods can contain multiple containers and they share the same host ID. The Machine Agent cannot identify different containers running in a pod unless each container ID is registered as the host ID.

To register the container ID as the host ID:

1. Get the container ID from the `cgroup`.

```
cat /proc/self/cgroup | awk -F '/' '{print $NF}' | head -n 1
```

2. Register the app server agents.

```
-Dappdynamics.agent.uniqueHostId=$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup)
```

3. Register the Machine Agent.

```
-Dappdynamics.docker.container.containerIdAsHostId.enabled=true
```

Configure the Cluster Role

This sample cluster role definition provides read access to various Kubernetes resources. These permissions enable Kubernetes extensions to the Machine Agent and pod metadata collection. The role is called `appd-cluster-reader`, but you can rename it. The cluster role definition outlines various API groups that will be available for members of this role. For every API group, we define a list of resources that will be accessed and the access method. Because we need to retrieve information from these API endpoints, we need the read-only access, expressed by "get", "list," and "watch" verbs.

```
kind: ClusterRole
apiVersion: rbac.authorization.k8s.io/v1
metadata:
  name: appd-cluster-reader
rules:
- nonResourceURLs:
  - '*'

  - watch

```

Once the role is defined, you must create cluster role bindings to associate the role with a service account. This example of a ClusterRoleBinding spec makes `appd-cluster-reader` service account a member of the `appd-cluster-reader-role` in the project "myproject". The naming is purely coincidental. The names of the service account and the cluster role do not have to match.

```

kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1
metadata:
  name: cluster-reader-role-binding
subjects:
- kind: ServiceAccount
  name: appd-cluster-reader
  namespace: myproject
roleRef:
  kind: ClusterRole
  name: appd-cluster-reader
  apiGroup: rbac.authorization.k8s.io

```

Deploy the Machine Agent on Kubernetes

You can deploy the AppDynamics Machine Agent in a single container image without an init container. By default, the Machine Agent is deployed to the cluster as a DaemonSet and distributes every Agent instance evenly across all cluster nodes. When required, you can configure the DaemonSet with node affinity rules or

node anti-affinity rules to ensure that it is deployed to a desired set of nodes and not across the entire cluster. See [Assigning Pods to Nodes](#)¹⁷³⁹ to learn about node affinity.

To harvest pod metadata, the service account used to deploy the Machine Agent must have the `cluster-reader` role in OpenShift. The `cluster-reader` role is also required for the Kubernetes extensions to the Machine Agent.

```
# assigning cluster-reader role in OpenShift
oc adm policy add-cluster-role-to-user cluster-reader -z appd-account
```

If you are working with a vanilla Kubernetes distribution, it may not have a pre-built cluster role similar to `cluster-reader` in OpenShift. See [ClusterRole Configuration](#)(see page 2840).

Instrument Applications with Kubernetes

There are several approaches to instrumenting applications deployed with Kubernetes; the method you choose depends on your particular requirements and DevOps processes. To monitor an application container with AppDynamics, you must include an App Server Agent in that container by:

- Using an appropriate base image which has the App Server Agent pre-installed.
- Loading the App Server Agent dynamically as part of the container startup using an init container.
- Loading the App Server Agent and dynamically attaching it to a running process (where the language runtime supports it).

The third option is usually applicable only to Java-based applications since the JVM supports Dynamic Attach, a standard feature of the AppDynamics Java APM Agent. See [Dynamic Java Instrumentation](#)¹⁷⁴⁰.

For the other options, it is common practice to make use of standard Kubernetes features such as Init Containers, ConfigMaps, and Secrets (as described in [Deploying AppDynamics Agents to OpenShift Using Init Containers](#)¹⁷⁴¹).

Resource Limits

The main application being monitored should have resource limits defined. Provide 2% padding for CPU and add up to 100 MB of memory.

To support up to 500 containers, you can configure the Machine Agent with the following resource requests and limits: Mem = 400M, CPU = "0.1" and Mem = 600M, CPU = "0.2"

i AppDynamics provides a [Kubernetes Snapshot Extension](#)¹⁷⁴² to monitor the health of the Kubernetes Cluster. When deploying this extension, only a single version of the extension should be deployed to the cluster. Do not include it in the DaemonSet to avoid duplicates and potential cluster overload. Instead, consider deploying the Machine Agent instance with this extension, in addition to the DaemonSet, as a separate deployment with a single replica for Server Visibility. In this case, you can drop the memory request to 250 M and disable the Machine Agent SIM and Docker.

Use Docker Visibility with Red Hat OpenShift

This page describes how to set up the Machine Agent with Docker Visibility enabled to run as a DaemonSet on an OpenShift cluster.

Docker Visibility supports OpenShift Version 3. With the Machine Agent, you can collect performance data from OpenShift clusters. By installing the agent as a DaemonSet on each host in the OpenShift cluster, the DaemonSet monitors each host on the OpenShift cluster and the corresponding containers that have an AppDynamics App Agent running. This process is similar to that of monitoring the Kubernetes cluster.

! Using Docker Visibility to monitor OpenShift containers is no longer the preferred option and will eventually be deprecated. Use the Cluster Agent instead as described in [Monitor Kubernetes with the Cluster Agent](#)(see page 2856). The Cluster Agent supports OpenShift container visibility, as well as visibility into cluster health and capacity.

Before You Begin

 This functionality requires a Server Visibility license.

- You must have an OpenShift user account with a `cluster-admin` role, such as `system:admin`.
- Install the OpenShift command line tool (`oc`)
- AppDynamics recommends that you use Docker CE/EE v17.03 or Docker Engine \geq v1.13 with this product. Some data may be unavailable if you are using previous versions of Docker.

Set the Java Options

By default, the `MaxMetaspaceSize` is set to 100 MB in OpenShift. If your application operates within a small margin of its existing memory resource allocation, increase the allocation for the application. AppDynamics recommends allocating additional Metaspace Size space to accommodate the machine agent. Directly configure the environment variable `GC_MAX_METASPACE_SIZE` to set the `MaxMetaspaceSize` parameter in the deployment through a config map.

Register the Container ID as the Host ID

Install an App Server Agent in each container in a Kubernetes pod to collect application metrics. If multiple App Server agents are running in the same pod (for example, in the RedHat OpenShift platform), you must register the container ID as the unique host ID on both the App Server Agent and the Machine Agent to collect container-specific metrics from the pod. Kubernetes pods can contain multiple containers and they share the same host ID. The Machine Agent cannot identify different containers running in a pod unless each container ID is registered as the host ID.

To register the container ID as the host ID:

1. Get the container ID from the `cgroup`.

```
cat /proc/self/cgroup | awk -F '/' '{print $NF}' | head -n 1
```

2. Register the App Server Agents.

```
-Dappdynamics.agent.uniqueHostId=$(sed -rn '1s#.*/#; 1s/docker-(.{12}).*/\1/p' /proc/self/cgroup)
```

3. Register the Machine Agent.

```
-Dappdynamics.docker.container.containerIdAsHostId.enabled=true
```

Create Project and Service Account

In OpenShift terminology, a *project* is a mechanism to isolate a group of users and their resources. An administrator can provide individual users or groups with permission to create projects and/or manage specific projects.

To isolate the Machine Agent from other projects, create a machine agent project:

```
oc new-project machine-agent
```

To create a service account, *ma*, with necessary privileges for the Machine Agent to obtain metrics:

1. Verify that the current project is *machine-agent*.

```
oc status
```

2. Create a service account.

```
oc create serviceaccount ma
```

Service accounts provide a secure way to control OpenShift API access without sharing a regular user's credentials.

3. Assign the privileged security context constraints (SCC) to the service account. SCC determines the permissions and abilities of pods.

```
oc adm policy add-scc-to-user privileged -z ma
```

See [Security Permissions for the Service Account](#)(see page 2846) for the detailed list of permissions for the service account.

4. Add the *cluster-reader* role to the service account.

```
oc adm policy add-cluster-role-to-user cluster-reader -z ma
```

Secure the Machine Agent

You can deploy the Machine Agent with tighter security. Determine the level of security for the project and leverage security permissions to secure the Machine Agent.

Run the Machine Agent Without cluster-reader Role

Without the `cluster-reader` role, the Machine Agent cannot read information such as Pod and ReplicaSet from the OpenShift cluster. The agent can, however, collect other metrics except for the tags in the app server agent container.

Run the Machine Agent Without Privileged Container Mode

To disable this privilege, remove the section below from the DaemonSet YAML file.

```
securityContext:
  privileged: true
```

Without the Privileged Container mode, the Machine Agent cannot read files like `/hostroot/etc/passwd` and `/hostroot/proc/<pid>/etc`. Therefore, it cannot collect metrics such as processes and network.

Disabling this privilege has no effect on collecting the App Server Agent container metrics.

Security Permissions for the Service Account

The Service Account requires the following security permissions to provide maximum isolation to the project under which the Machine Agent is running:

Permission	Description
The cluster-reader role	<p>This cluster-reader role allows the Machine Agent to read tags from the OpenShift cluster.</p> <p>For example:</p> <pre>oc adm policy add-cluster-role-to-user cluster-reader -z ma</pre>
The privileged SCC	<p>The privileged SCC allows the Machine Agent to be run as the root user.</p> <p>For example:</p> <pre>oc adm policy add-scc-to-user privileged -z ma</pre>

Permission	Description
Run as privileged container	<p>Running as the privileged container allows the Machine Agent to perform operations such as reading files from <code>/etc</code> and reading process information from <code>/proc</code>.</p> <p>This privilege is configured in the DaemonSet YAML file as follows.</p> <pre>securityContext: privileged: true</pre>

Create a Docker Image of the Machine Agent

Copy the following files to a directory on a machine that can build the Docker image.

- Machine Agent Bundle - 64-bit Linux (zip)
Download this [bundle](#)¹⁷⁴³ and rename it to `machine-agent.zip`.
- Dockerfile
See the [sample Docker file](#)(see page 2850) below.
- `start-appdynamics` script
See the [sample script](#)(see page 2850) below.

Build the image with your desired method and make it available in your image registry.

Deploy the Machine Agent as DaemonSet

1. Modify the sample DaemonSet to point to your Controller:
 - a. Select the worker node.

```
nodeSelector:
  node-role.kubernetes.io/compute: "true"
```

- b. Change the following Controller information in the sample DaemonSet.

```
containers:
  - env:
    - name: APPDYNAMICS_CONTROLLER_HOST_NAME
      value: "<controller-host-name>"
    - name: APPDYNAMICS_CONTROLLER_PORT
      value: "<controller-port>"
    - name: APPDYNAMICS_CONTROLLER_SSL_ENABLED
      value: "true"
    - name: APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY
      value: "<account-access-key>"
    - name: APPDYNAMICS_AGENT_ACCOUNT_NAME
      value: "<your-account>"
    - name: APPDYNAMICS_SIM_ENABLED
```

¹⁷⁴³ <https://download.appdynamics.com/download/>

```
value: "true"
- name: APPDYNAMICS_DOCKER_ENABLED
value: "true"
```

- c. Specify the Docker image.

```
image: "<your image>"
```

- d. Enable the Machine Agent to run as the privileged user.

```
securityContext:
  privileged: true
```

- e. If you have a different service account name, replace it with the existing one.

```
serviceAccount: ma
serviceAccountName: ma
```

2. Create DaemonSet below:

- a. Verify that the current project is machine-agent.

```
oc status
```

- b. Create the machine-agent DaemonSet.

```
oc create -f machine-agent-daemonset.yaml
```

The Machine Agent appears in the UI.

Verify Machine Agent Status

If the Machine Agent does not appear in the UI, check the status as follows:

1. Check the machine-agent DaemonSet.

```
oc get ds
```

2. Check the machine-agent pod.

```
oc get pod
```

The pod name is machine-agent-daemonset-**<XXXX>**.

3. Check logs whether the last line is "Started AppDynamics Machine Agent Successfully."

```
oc get logs -f <machine-agent-daemonset-<XXXX>>
```

Sample Machine Agent Deployment Files

Below are sample DaemonSet, Dockerfile and Start Script that you can use as a reference for deploying the Machine Agent.

Sample DaemonSet

Modify the sample DaemonSet to suit your deployment scenario.

```

apiVersion: extensions/v1beta1
kind: DaemonSet
metadata:
  name: machine-agent-daemonset
  namespace: machine-agent
spec:
  selector:
    matchLabels:
      name: appdynamics-machine-agent
  template:
    metadata:
      labels:
        name: appdynamics-machine-agent
    spec:
      nodeSelector:
        node-role.kubernetes.io/compute: "true"
      containers:
        - env:
            - name: APPDYNAMICS_CONTROLLER_HOST_NAME
              value: "<your-hostname>"
            - name: APPDYNAMICS_CONTROLLER_PORT
              value: "<your-port>"
            - name: APPDYNAMICS_CONTROLLER_SSL_ENABLED
              value: "true"
            - name: APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY
              value: "<your-access-key>"
            - name: APPDYNAMICS_AGENT_ACCOUNT_NAME
              value: "<your-account>"
            - name: APPDYNAMICS_SIM_ENABLED
              value: "true"
            - name: APPDYNAMICS_DOCKER_ENABLED
              value: "true"
          image: <your-image>
          name: machine-agent
          securityContext:
            privileged: true
          volumeMounts:
            - mountPath: /hostroot
              name: hostroot
              readOnly: true
            - mountPath: /var/run/docker.sock
              name: docker-sock

```

```

restartPolicy: Always
imagePullPolicy: Always
serviceAccount: ma
serviceAccountName: ma
volumes:
- name: hostroot
  hostPath:
    path: /
- name: docker-sock
  hostPath:
    path: /var/run/docker.sock
  
```

Sample Dockerfile

You can use this Dockerfile sample or the one in [OpenShift Visibility Manifests¹⁷⁴⁴](#).

```

# Sample Dockerfile for the AppDynamics Machine Agent
# This is provided for illustration purposes only

FROM ubuntu:16.04
# Install required packages
RUN apt-get update && \
    apt-get install -y unzip && \
    apt-get clean
# Install AppDynamics Machine Agent
ENV MACHINE_AGENT_HOME /opt/appdynamics/machine-agent/
ADD machine-agent.zip /tmp/machine-agent.zip
RUN mkdir -p ${MACHINE_AGENT_HOME}
# Include start script to configure and start MA at runtime
ADD start-appdynamics ${MACHINE_AGENT_HOME}
RUN chmod 774 ${MACHINE_AGENT_HOME}/start-appdynamics
# change files and directories to be owned by root so MA container user in root
group can access
RUN chgrp -R 0 /opt && \
    chmod -R g=u /opt
RUN chgrp -R 0 /tmp/machine-agent.zip && \
    chmod g=u /tmp/machine-agent.zip
# Changing directory to MACHINE AGENT HOME
WORKDIR ${MACHINE_AGENT_HOME}
# Configure and Run AppDynamics Machine Agent
CMD "./start-appdynamics"
  
```

Sample start-appdynamics Script

```

#!/bin/bash
unzip -oq /tmp/machine-agent.zip -d ${MACHINE_AGENT_HOME} && \
    rm /tmp/machine-agent.zip
  
```

¹⁷⁴⁴ <https://github.com/Appdynamics/openshift-agents-daemonset>

```
# Start Machine Agent
./bin/machine-agent -j jre/
```

Monitor VMware Tanzu

VMware Tanzu Application Service (PCF)

VMware Tanzu Application Service (TAS), formerly known as Pivotal Cloud Foundry (PCF), is an open-source cloud computing Platform as a Service (PaaS). Developers can develop, deploy, operate, and scale cloud-native applications for public and private clouds.

AppDynamics provides three tiles to support VMware TAS 2.x ($\geq v2.0.7$) and is available on the [VMware Tanzu Network](#)¹⁷⁴⁵ to download and install in a TAS foundation.

VMware Tanzu Kubernetes Grid Integrated (PKS)

VMware Tanzu Kubernetes Grid Integrated (TKGI), formerly known as Pivotal Container Service (PKS), is VMware's product used to deploy and manage open-source Kubernetes. The Kubernetes monitoring that AppDynamics provides has been tested to with TKGI. See [Monitor Kubernetes with the Cluster Agent](#)(see [page 2856](#)) to set up container and cluster visibility within TKGI.

AppDynamics Application Performance Monitoring for VMware Tanzu

To simplify APM setup, the [AppDynamics Application Performance Monitoring for VMware Tanzu](#)¹⁷⁴⁶ tile delivers a service broker to support an AppDynamics marketplace service. You can configure the Controller parameters in the tile and automatically publish to the marketplace after you install the tile.

To bind a TAS app to the marketplace service to consume the Controller credentials, enter:

```
$ cf bind my-tas-app my-appd-marketplace-service
```

To use the integrated AppDynamics buildpack support to start the APM Agent based on the parameters from the marketplace service, and start sending performance metrics to the Controller, perform a push:

```
$ cf push
```

The tile also installs the AppDynamics extension buildpack in the TAS environment. See the [tile documentation](#)¹⁷⁴⁷ for buildpack support and language-specific workflows to enable APM

AppDynamics Platform Monitoring for VMware Tanzu

The [AppDynamics Platform Monitoring for VMware Tanzu](#)¹⁷⁴⁸ tile provides visibility into the TAS platform where you deployed your AppDynamics-monitored applications. The tile deploys a Firehose Nozzle that collects KPI metrics and publishes them to a Controller. The tile also deploys a Dashboard App that

¹⁷⁴⁵ <http://network.pivotal.io/>

¹⁷⁴⁶ <https://network.pivotal.io/products/p-appdynamics/>

¹⁷⁴⁷ <https://docs.pivotal.io/partners/appdynamics/using.html>

¹⁷⁴⁸ <https://network.pivotal.io/products/appdynamics-platform/>

automatically creates KPI health rules and custom dashboards associated with the health rules. The Dashboard App enables you to monitor the health and capacity of one, or more, TAS foundations. See the [tile documentation](#)¹⁷⁴⁹.

Container Metrics

To access the **Containers** Dashboard, select: AppDynamics Home > **Servers** > **Containers**.

The **Containers** Dashboard shows resource utilization metrics of your containerized applications and the underlying host machine. You can access the **Containers** Dashboard from the Servers tab in the Controller UI. The **Containers** page lists all monitored containers used by an application that is registered to the Controller.

Container Metrics

- - [CPU](#)(see page 2852)
 - [Disks](#)(see page 2853)
 - [Memory](#)(see page 2854)
 - [Network](#)(see page 2855)

CPU

Name	Description	Default Monitoring Mode
%Busy	Percentage of time the CPU was busy processing system or user requests from this container; this metric includes CPU Stolen time.	KPI
%Busy Scaled	<p>If the <code>-cpus=<value></code>¹⁷⁵⁰ option is set in the container, this metric measures the scaled value of the CPUs property. If this value is not set, this metric measures the scaled value of the Logical CPUs property.</p> <p>To enable CPU Scaling:</p> <ul style="list-style-type: none"> ◦ Log in to the Administration Console: <code>http://<controller host>:<port>/controller/admin.jsp</code> ◦ Select the user account you want. ◦ Select Add Property and add: <code>key = sim.docker.container.cpuScaling</code> <code>value = true</code> 	KPI
Logical Cores	Number of logical cores on the host machine that are available to the container.	KPI

¹⁷⁴⁹ <https://docs.pivotal.io/partners/appdynamics-platform/index.html>

¹⁷⁵⁰ https://docs.docker.com/config/containers/resource_constraints/#configure-the-default-cfs-scheduler

Name	Description	Default Monitoring Mode
Shares	The <code>-c</code> or <code>cpu-shares</code> ¹⁷⁵¹ setting used to start the container.	KPI
Throttle Count	Number of times the container CPU is throttled. Use Advanced mode to view this metric as Throttled Time. If Throttled Time is less and the container is limited on computation, then this metric is available for you to review.	KPI
Throttled Time (ms)	Total amount of time the container CPU was throttled but did not receive enough host CPU. High throttle times indicate that the <code>-c</code> or <code>cpu-shares</code> ¹⁷⁵² setting (used to start the container) was too low.	KPI
Total %	Average utilization, of all available CPUs, by the container.	KPI

Disks

Name	Description	Default Monitoring Mode
Average IO Utilization %	Average disk utilization for read/write operations. This metric may be unavailable on some platforms.	KPI
<code><disk></code> Reads/sec	Number of read operations by the container on <code><disk></code> .	Diagnostic
<code><disk></code> Writes/sec	Number of write operations by the container on <code><disk></code> .	Diagnostic
KB Read/sec	The rate of data read by the container from all disks and partitions.	KPI
KB Written/sec	The rate of data written by the container to all disks and partitions.	KPI
MB Reads/sec (MB)	Number of read operations by the container on all disks and partitions.	KPI

¹⁷⁵¹ <https://docs.docker.com/engine/reference/run/#cpu-share-constraint>

¹⁷⁵² <https://docs.docker.com/engine/reference/run/#cpu-share-constraint>

Name	Description	Default Monitoring Mode
MB Writes/sec	Number of write operations by the container on all disks and partitions.	KPI
Queue Size	Average number of container requests queued during the time bucket. Consistently high queue sizes indicate that the container is not receiving enough IO resources. This metric may be unavailable on some platforms.	KPI

Memory

Name	Description	Default Monitoring Mode
Cache Size (MB)	Total amount of data cached in memory.	Diagnostic
Failed Count	Number of times a memory allocation failure occurred because it exceeded the pre-set memory limit for that container; or, number of times the hard limit for the container was reached.	KPI
Page Major Fault Count	Number of major page faults caused by the container. Docker metric is <code>pgmajfault</code> ¹⁷⁵³ . A high rate of page faults could indicate that the specified memory constraints for the container are too low.	KPI
Reservation	Soft limit based on the <code>--memory-reservation</code> ¹⁷⁵⁴ used to start the container.	KPI
Resident Set Size (MB)	Total amount of memory that belongs to stacks, heaps, and anonymous memory maps.	KPI
Usage	Memory usage by the container, in bytes.	KPI
Used %	Memory utilization by the container as a percentage of the memory hard limit, based on the <code>--memory</code> ¹⁷⁵⁵ option used to start the container.	KPI
Used MB	Memory utilization by the container, in MB.	KPI

¹⁷⁵³ <https://docs.docker.com/config/containers/runmetrics/#metrics-from-cgroups-memory-cpu-block-io>

¹⁷⁵⁴ <https://docs.docker.com/engine/reference/run/#runtime-constraints-on-resources>

¹⁷⁵⁵ <https://docs.docker.com/engine/reference/run/#runtime-constraints-on-resources>

Network

Name	Description	Default Monitoring Mode ¹ (see page 0)
Count (KB)	Network Volume, count (KB), incoming from an external network and outgoing to an external network.	KPI
Rate (KB/s)	Network Rate, rate (KB/s), incoming from an external network and outgoing to an external network.	Diagnostic
Incoming (KB)	Network traffic received by the container.	KPI
Outgoing (KB)	Network traffic sent by the container.	KPI
Incoming (KB/sec)	Rate of network traffic received by the container.	Diagnostic
Outgoing (KB/sec)	Rate of network traffic sent by the container.	Diagnostic
Incoming Packets	Number of packets received by the container.	Diagnostic
Outgoing Packets	Number of packets sent by the container.	Diagnostic
Incoming Packets Dropped	Number of incoming packets dropped before reaching the container. A high count of dropped packets may indicate high congestion or an issue on the network path.	KPI
Outgoing Packets Dropped	Number of outgoing packets dropped after leaving the container. A high count of dropped packets may indicate high congestion or an issue on the network path.	KPI
Incoming Errors	Number of packets received with errors.	KPI
Outgoing Errors	Number of packets sent with errors.	KPI
<eth0> Incoming Errors	Number of collision errors when <eth0> could not receive a frame due to a problem on the interface.	Diagnostic
<eth0> Outgoing Errors	Number of collision errors when <eth0> could not send a frame due to a problem on the interface.	Diagnostic
<eth0> Incoming KB	Average KB of traffic received on <eth0>.	Diagnostic
<eth0> Outgoing KB	Average KB of traffic sent on <eth0>.	Diagnostic

Name	Description	Default Monitoring Mode ¹ (see page 0)
<eth0> Incoming KB/sec	Average rate of traffic received on <eth0>.	Diagnostic
<eth0> Outgoing KB/sec	Average rate of traffic sent on <eth0>.	Diagnostic
<eth0>Incoming Errors	Number of packets received on <eth0> with errors.	Diagnostic
<eth0> Outgoing Errors	Number of packets sent on <eth0> with errors.	Diagnostic
<eth0> Incoming Packets Dropped	Number of incoming packets dropped before reaching <eth0>. A high count of dropped packets may indicate high congestion or an issue on the network path.	Diagnostic
<eth0> Outgoing Packets Dropped	Number of outgoing packets dropped after leaving <eth0>. A high count of dropped packets may indicate high congestion or an issue on the network path.	Diagnostic

Monitor Kubernetes with the Cluster Agent

Deployment Support

The Cluster Agent monitors the health of Kubernetes and OpenShift clusters and is supported on all major Kubernetes distributions. The Cluster Agent collects metrics and metadata for the entire cluster, including every node and namespace down to the container level. When you instrument applications with AppDynamics APM Agents, you can use the Cluster Agent to view both Kubernetes and APM metrics for those pods (if both the Cluster Agent and the APM Agents are reporting data to the same account on a Controller).

You can use the Cluster Agent to:

- Gain visibility into key Kubernetes metrics and events, and detect uptime and availability issues
- Track resource usage of pods relative to the defined requests and limits
- Diagnose issues that may prevent uptime or scalability issues, such as:
 - Pod failures and restarts
 - Node starvation
 - Pod eviction threats and pod quota violations
 - Image and storage failures
 - Pending or stuck pods
 - Bad endpoints (detects broken links between pods and application components)
 - Service endpoints in a failed state
 - Missing dependencies (Services, ConfigMaps, and Secrets)

Deploy On Kubernetes

- [Install the Cluster Agent](#)(see page 2861)
- [Configure the Cluster Agent](#)(see page 2884)
- [Install Infrastructure Visibility with the Cluster Agent Operator](#)(see page 2908)

Cluster Agent

- [Use the Cluster Agent](#)(see page 2968)
- [Cluster Metrics](#)(see page 2975)
- [Administer the Cluster Agent](#)(see page 2997)
- [Monitor Cluster Health](#)(see page 2985)
- [Monitor Kubernetes Events](#)(see page 2992)

Reference And Troubleshooting

- [Install the Cluster Agent](#)(see page 2861)
- [Validate the Cluster Agent Installation](#)(see page 2874)
- [Troubleshoot the Cluster Agent](#)(see page 2876)
- [Overview of Cluster Monitoring](#)(see page 2857)
- [Cluster Agent Requirements and Supported Environments](#)(see page 2858)
- [Cluster Metrics](#)(see page 2975)

Overview of Cluster Monitoring

The AppDynamics Cluster Agent is a lightweight Agent written in Golang used to monitor Kubernetes and OpenShift clusters. You can use the Cluster Agent to monitor and understand how Kubernetes infrastructure affects your applications and business performance. With the Cluster Agent, you can collect metadata, metrics, and events for a Kubernetes cluster. The Cluster Agent is supported on Red Hat OpenShift and cloud-based Kubernetes platforms, such as Amazon EKS, Azure AKS, and Rancher.

Cluster Monitoring in the Controller

The Cluster Agent monitors events and metrics of Kubernetes or OpenShift clusters. It also tracks the state of most Kubernetes resources: pods, replica sets, deployments, services, persistent volumes, nodes, and so on. The data is received through the Kubernetes API server and is sent to the AppDynamics Controller. See [Cluster Metrics](#)(see page 2975).

Cluster Agent and Server Visibility with Docker Monitoring

AppDynamics Server Visibility monitors the worker nodes at a more detailed level. Server Visibility includes the ability to monitor running containers through Docker Monitoring. However, the Cluster Agent also monitors the same containers through the Kubernetes API server. You cannot run Server Visibility with Docker Monitoring enabled, and the Cluster Agent concurrently. Doing so may result in your data being overwritten, and may lead to unpredictable behaviors. See [Install Infrastructure Visibility with the Cluster Agent Operator](#)(see page 2908).

When you deploy both Agents to the cluster, ensure that you deploy the Machine Agent with Docker Visibility disabled. See [Monitor Containers with Docker Visibility](#)(see page 2826).

Cluster Dashboard Metrics

The Cluster Dashboard provides an overview of potential issues with cluster health, grouped by category and severity. It shows error events, evictions, node resource starvation, distribution of pod phases, and issues associated with:

- Applications
- Cluster configuration
- Image or storage access
- Security access errors
- Quota violations

The dashboard contains cluster resource capacity stats and resource usage data relative to the deployment requests and limits for CPU, Memory, and Storage. The dashboard also provides real-time statistics on the state of monitored objects on the cluster, best-practice violations, and missing dependencies. See [Monitor Cluster Health](#)(see page 2985).

Cluster Agent Health Rules

You can create Cluster Agent Health Rules based on cluster metrics. Because Health Rules for clusters are created using server health rules, the health rule violations for clusters show as a server health rule violation. When creating the Health Rule, in the **Affected Entities** section, select **Custom**, and then select your Cluster Agent from the list of machines. When setting the Critical/Warning conditions, the entire metric tree displays. Select the Cluster Agent metrics for which to create the Health Rule. To create Health Rules for Cluster Agent metrics, follow the [Create a Health Rule](#)(see page 305) procedures.

You can create Health Rules for these metrics:

- Number of error events
- Number of evictions
- Number of threats
- Nodes with disk pressure
- Nodes with memory pressure
- CPU/Memory utilization

Cluster Agent Requirements and Supported Environments

This page describes the resource requirements, compatibility with different Kubernetes-based software, Cluster Agent distribution, licensing, and performance specifications.

Hardware Requirements

The default requirement for the hardware is as following:

- CPU: 1250m
- Memory: 300Mi

 These values are applicable when you use Cluster Agent without auto-instrumentation. The values can change when you perform auto-instrumentation. With auto-instrumentation, you need to increase the memory limits by 50Mi for every 100 pods. For Example, If 500 pods are instrumented through the

agent, add 550Mi (300Mi + 250Mi) to the memory limits value. You need to increase the CPU limits by 100m (1350m) when auto-instrumentation is enabled.

Software Requirements

The Cluster Agent is designed to run on Linux and deployed using the [AppDynamics Operator](#)¹⁷⁵⁶.

The Cluster Agent requires:

- AppDynamics Controller >= 20.3.0.
- Kubernetes versions, 1.11, 1.13, or >=1.14, with the Kubernetes [metrics-server](#)¹⁷⁵⁷ deployed and enabled on the cluster.
- A cluster that you can access and monitor.
- Sufficient Server Visibility licenses. The Cluster Agent consumes one [Server Visibility license](#)¹⁷⁵⁸. See [License Management](#)¹⁷⁵⁹
- Access to Docker Hub or Red Hat Container Registry to pull the Cluster Agent Operator and Cluster Agent images, or access to an internal repository where these images are maintained. See [Install the Cluster Agent](#)(see page 2861).

i If you deploy the Cluster Agent to monitor your Kubernetes Cluster, it does not monitor worker nodes. To monitor worker nodes, you must install the Machine Agent which consumes additional Server Visibility licenses (one Machine Agent per node). See [Install Infrastructure Visibility with the Cluster Agent Operator](#)(see page 2908)

The Cluster Agent is compatible with these cloud platforms:

Cloud Platform	Version
Rancher Kubernetes Engine (RKE)	<ul style="list-style-type: none"> • 1.0.4 with Kubernetes 1.17 • 1.2.1 with Kubernetes 1.19.3 • 1.3.1 with kubernetes 1.21.5
Kubernetes	1.11, 1.13, 1.14, 1.17, 1.19, 1.20, 1.21, and 1.22 with the Kubernetes metrics-server ¹⁷⁶⁰ deployed
Amazon EKS	1.11, 1.13, 1.14, 1.15, 1.16, 1.17, 1.18, 1.19, 1.20, and 1.21 with the Kubernetes metrics-server ¹⁷⁶¹ deployed
Azure AKS	1.11, 1.13, 1.14, 1.15, 1.16, 1.17, 1.18, 1.19, 1.20, and 1.21 with the Kubernetes metrics-server ¹⁷⁶² deployed
Google GKE	1.14, 1.15, 1.16, 1.17, 1.18, 1.19, 1.20, and 1.21

¹⁷⁶² <https://github.com/kubernetes-incubator/metrics-server>

Cloud Platform	Version
Red Hat OpenShift	3.11, 4.1, 4.2, 4.3, 4.4, 4.5, 4.6 and 4.7 <div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;"> <p>i The metrics-server is not shipped with OpenShift, you must deploy it separately. The CRI-O container runtime is supported on >=4.2.7.</p> </div>
kubect ¹⁷⁶³	>=1.11.3

i Installing AppDynamics to test or evaluate involves verifying system requirements, preparing the host, and then installing the Controller. See [Install the Controller Using the Enterprise Console¹⁷⁶⁴](#) and [Install the Controller Using the CLI¹⁷⁶⁵](#).

Cluster Agent Distribution

You can download the Cluster Agent from the [AppDynamics Download site¹⁷⁶⁶](#) as a zip archive. The archive also contains distribution-specific configuration files for the deployment.

Licensing

The Cluster Agent requires a [Server Visibility license¹⁷⁶⁷](#). To get started, see [Enable Server Visibility](#)(see page 2658). If you already have a Server Visibility license, see [Install the Cluster Agent](#)(see page 2861) for installing Cluster Agent on a Kubernetes cluster.

Cluster Agent Performance Certification

Cluster Agent Version	Performance Certification
<=20.10	You can monitor the certified stable limit of 750 pods and 1500 containers

¹⁷⁶³ <https://kubernetes.io/docs/tasks/tools/install-kubectl/>

¹⁷⁶⁴ <https://docs.appdynamics.com/display/PRMY21/Upgrade+the+Controller+Using+the+Enterprise+Console+v21.5>

¹⁷⁶⁵ <https://docs.appdynamics.com/display/PRMY21/Install+the+Controller+Using+the+CLI+v21.5>

¹⁷⁶⁶ <https://download.appdynamics.com/download/>

¹⁷⁶⁷ https://docs.appdynamics.com/display/PRO45/License+Entitlements+and+Restrictions#LicenseEntitlementsandRestrictions-server_visibility

Cluster Agent Version	Performance Certification
>=20.11	<ul style="list-style-type: none"> Cluster Agent Vertical Scaling: This is the certified stable limit: If you run one container per pod then you can monitor 2250 pods and 2250 containers. If you run two containers per pod, then you can monitor 1500 pods and 3000 containers. Cluster Agent Horizontal Scaling: If the number of pods per cluster exceeds the limit, then you can deploy multiple Cluster Agents to monitor the cluster using Helm charts. See Install the Cluster Agent with Helm Charts(see page 2864). For the limit of Cluster Agents per Controller, see Cluster Agent and Pod Limits(see page 2861).

Cluster Agent and Pod Limits

On-Premises

You can configure the number of Cluster Agents based on the overall controller capacity. To configure the limit, see the `sim.cluster.agent.limit` description under [Controller Settings for the Cluster Agent](#)¹⁷⁶⁸.

If your Cluster has more pods than can be monitored, the Cluster Agent ensures that the group of pods being monitored remains the same over time. If any of the reported pods are terminated in the future, then the Cluster Agent replaces the terminated pods with previously unreported pods and starts monitoring the newly included pods.

The total pods metric displayed on the **Pods List** page reflects only the number of pods up to the configured limit. See the `sim.cluster.pod.limit` description under [Controller Settings for the Cluster Agent](#)¹⁷⁶⁹.

SaaS

To configure the limits, create an [AppDynamics Support](#)¹⁷⁷⁰ ticket.

Install the Cluster Agent

This page describes how to install the Cluster Agent. For optional post-installation steps, including instrumenting applications with App Server Agents, see [Post-Install Workflow](#)(see page 2862).

Installation Overview

You can install the Cluster Agent using either the Kubernetes CLI (`kubectl`) or Helm. In both cases, the Cluster Agent Operator is installed first, followed by the Cluster Agent. The exact configuration applied during the installation differs slightly based on whether the cluster is an OpenShift or Kubernetes cluster.

¹⁷⁶⁸ <https://docs.appdynamics.com/display/PRO45/Administer+the+Cluster+Agent>

¹⁷⁶⁹ <https://docs.appdynamics.com/display/PRO45/Administer+the+Cluster+Agent>

¹⁷⁷⁰ <https://docs.appdynamics.com/display/PRO45/AppDynamics+Support>

Installation Workflow

You must make these decisions during the installation workflow:

- The first decision is whether to use the pre-built Cluster Agent images published on Docker Hub or the OpenShift Container Registry. This is the simplest option when using the Kubernetes CLI or Helm. If you need to build a custom image to satisfy internal image policies, or if you require that the pre-built Cluster Agent image is stored in an internal container registry, see [Build the Cluster Agent Container Image](#)(see page 2917).
- The second decision is whether to install the Cluster Agent using the Kubernetes CLI or the Cluster Agent Helm Chart. See [Install the Cluster Agent with the Kubernetes CLI](#)(see page 2862) and [Install the Cluster Agent with Helm Charts](#)(see page 2864).

The Cluster Agent requires that you install the [Metrics Server](#)¹⁷⁷¹ in the cluster. If the metrics server is not already installed under the `kube-system` namespace, then you can install it using the Kubernetes CLI, as described in [Install the Cluster Agent with the Kubernetes CLI](#)(see page 2862). If you are using the Cluster Agent Helm chart, you can set the `install.metrics-server` Helm value to `true` to install the Metrics Server subchart. See [Install the Cluster Agent with Helm Charts](#)(see page 2864).

After the installation completes, see [Validate the Cluster Agent Installation](#)(see page 2874) for validation and troubleshooting procedures.

Post-Install Workflow

After you install and [Validate the Cluster Agent](#)(see page 2874), you can instrument the Kubernetes applications in the cluster with AppDynamics Server Agents. See [Container Installation Options](#)(see page 458) for an overview of the options.

To install the AppDynamics Server Visibility Agent or Network Agent on cluster nodes, see [Install Infrastructure Visibility with the Cluster Agent Operator](#)(see page 2908).

To enable log collection for failing pods on on-premises Controllers, see [Enable Log Collection for Failing Pods](#)(see page 3000).

Next Steps

[Install the Cluster Agent with the Kubernetes CLI](#)(see page 2862)

[Install the Cluster Agent with Helm Charts](#)(see page 2864)

This page describes how to install the Cluster Agent. For optional post-installation steps, including instrumenting applications with App Server Agents, see [Post-Install Workflow](#)(see page 2862).

Install the Cluster Agent with the Kubernetes CLI

This page describes how to install the Cluster Agent using the Kubernetes CLI which is an alternative to [Install the Cluster Agent with Helm Charts](#)(see page 2864).

Requirements

Before you begin, verify that you have:

¹⁷⁷¹ <https://github.com/kubernetes-sigs/metrics-server>

- Installed `kubect`¹⁷⁷² \geq 1.11.3
- Met the requirements described here: [Cluster Agent Requirements and Supported Environments](#)¹⁷⁷³

Installation Procedure

1. If you have not already installed the `metrics-server`, then install it. See <https://github.com/kubernetes-sigs/metrics-server> for the most recent installation instructions.

```
kubectl apply -f https://github.com/kubernetes-sigs/metrics-server/releases/latest/download/components.yaml
```

2. Download the Kubernetes or OpenShift Cluster Agent bundle from the [Download portal](#)¹⁷⁷⁴, unzip the contents of the bundle to the current directory:

```
unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
```

3. Create a namespace for `appdynamics` in your cluster:

```
kubectl create namespace appdynamics
```

4. Install the Cluster Agent Operator using the correct Kubernetes and OpenShift version (where applicable):

[Kubernetes \$\geq\$ 1.16](#) [OpenShift with Kubernetes \$\geq\$ 1.16](#) [Kubernetes \$\leq\$ 1.15](#) [OpenShift with Kubernetes \$\leq\$ 1.15](#)

```
kubectl create -f cluster-agent-operator.yaml
```

[Kubernetes \$\geq\$ 1.16](#) [OpenShift with Kubernetes \$\geq\$ 1.16](#) [Kubernetes \$\leq\$ 1.15](#) [OpenShift with Kubernetes \$\leq\$ 1.15](#)

```
kubectl create -f cluster-agent-operator-openshift.yaml
```

[Kubernetes \$\geq\$ 1.16](#) [OpenShift with Kubernetes \$\geq\$ 1.16](#) [Kubernetes \$\leq\$ 1.15](#) [OpenShift with Kubernetes \$\leq\$ 1.15](#)

```
kubectl create -f cluster-agent-operator-1.15-or-less.yaml
```

[Kubernetes \$\geq\$ 1.16](#) [OpenShift with Kubernetes \$\geq\$ 1.16](#) [Kubernetes \$\leq\$ 1.15](#) [OpenShift with Kubernetes \$\leq\$ 1.15](#)

¹⁷⁷² <https://kubernetes.io/docs/tasks/tools/install-kubect/>

¹⁷⁷³ <https://docs.appdynamics.com/display/PRO45/Cluster+Agent+Requirements+and+Supported+Environments>

¹⁷⁷⁴ <https://accounts.appdynamics.com/downloads>

```
kubectl create -f cluster-agent-operator-openshift-1.15-or-less.yaml
```

5. Based on the Account Access Key for the Controller, create the Controller Access Key Secret that the Cluster Agent reports to:

```
kubectl -n appdynamics create secret generic cluster-agent-secret --from-literal=controller-key=<access-key>
```

6. Edit `cluster-agent.yaml` to set the AppDynamics Controller details for the Cluster Agent to report to.
 - a. Set the `nsToMonitor` or `nsToMonitorRegex` options to include the namespaces you want to monitor.
 - b. Set the image tag to the version you are installing, `cluster-agent:21.2.0`, for example.
 For additional configuration tasks, such as configuring SSL for on-premises Controllers, proxy support, or pull secrets, see [Configure the Cluster Agent](#) (see page 2884).

This example assumes the use of the pre-built Cluster Agent image on Docker Hub. See [Build the Cluster Agent Container Image](#) (see page 2917) to build your own image.

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "dev-cluster"
  controllerUrl: "http://mycontroller.com:8080"
  account: "my-account"
  # docker image info
  image: "docker.io/appdynamics/cluster-agent:21.2.0"
  serviceAccountName: appdynamics-cluster-agent
  nsToMonitor: [appdynamics,namespace1,namespace2]
  stdoutLogging: "true"
```

7. Install the Cluster Agent:

```
kubectl create -f cluster-agent.yaml
```

See [Validate the Cluster Agent Installation](#) (see page 2874) to validate and troubleshoot the installation. Once the install is validated, see [Container Installation Options](#) (see page 458) for options to install App Server Agents in applications in the cluster.

Install the Cluster Agent with Helm Charts

This page describes how to use Helm Charts to deploy the Cluster Agent.

Helm is a package manager for Kubernetes. Helm charts are a collection of files that describe a set of Kubernetes resources. The Cluster Agent Helm chart is a convenient method to deploy the Cluster Agent Operator and Cluster Agent. You can also use the Cluster Agent Helm chart to deploy multiple Cluster Agents in a single cluster. This may be necessary for larger clusters that exceed the pod monitoring limit for a single Cluster Agent. See [Cluster Agent Requirements and Supported Environments](#)(see page 2858).

Requirements

- Cluster Agent version ≥ 20.6
- Controller version ≥ 20.6
- Cluster Agent Helm charts are compatible with Helm 3.0

Install a Single Cluster Agent in a Cluster

1. Add the chart repository to Helm:

```
helm repo add appdynamics-charts https://ciscovnet.github.io/appdynamics-charts
```

2. Create a namespace for appdynamics in your cluster:

```
kubectl create namespace appdynamics
```

3. Create a Helm values file, in the example called `values-ca1.yaml`. Update the `controllerInfo` properties with the credentials from your Controller. Update the `clusterAgent` properties to set the namespace and pods to monitor. See [Configure the Cluster Agent](#)(see page 2884) for information about the available properties `nsToMonitor`, `nsToMonitorRegex`, `nsToExcludeRegex` and `podFilter`.

values-ca1.yaml

```
# To install Cluster Agent
installClusterAgent: true

# AppDynamics controller info
controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

# Cluster agent config
clusterAgent:
  nsToMonitorRegex: dev-.*
```

See [Configuration Options for values.yaml](#)(see page 2867) for more information regarding the available options. Also, you can download a copy of `values.yaml` from the Helm Chart repository using this command:

```
helm show values appdynamics-charts/cluster-agent
```

- If you have not installed the Kubernetes `metrics-server` in the cluster (usually located in the `kube-system` namespace), then set `install.metrics-server` to `true` in the values file to invoke the subchart to install it.

```
install:
  metrics-server: true
```

i Setting `install.metrics-server` installs `metrics-server` in the namespace with the `--namespace` flag which is located in the same namespace as the Cluster Agent.

- Deploy the Cluster Agent to the `appdynamics` namespace:

```
helm install -f ./values-ca1.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --namespace=appdynamics
```

Enable Auto-Instrumentation

Once you have validated that the Cluster Agent was successfully installed, you can add additional configuration to the `instrumentationConfig` section of the values YAML file to enable auto-instrumentation. In this example, `instrumentationConfig.enabled` has been set to `true`, and multiple `instrumentationRules` have been defined. See [Auto-Instrument Applications with the Cluster Agent](#) (see page 2928).

values-ca1.yaml with Auto-Instrumentation Enabled

```
# To install Cluster Agent
installClusterAgent: true

# AppDynamics controller info
controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

# Cluster agent config
clusterAgent:
  nsToMonitorRegex: ecom|books|groceries
```

```
instrumentationConfig:
  enabled: true
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom|books|groceries
  defaultAppName: Ecommerce
  appNameStrategy: namespace
  imageInfo:
    java:
      image: "docker.io/appdynamics/java-agent:latest"
      agentMountPath: /opt/appdynamics
      imagePullPolicy: Always
  instrumentationRules:
    - namespaceRegex: groceries
      language: dotnetcore
      imageInfo:
        image: "docker.io/appdynamics/dotnet-core-agent:latest"
        agentMountPath: /opt/appdynamics
        imagePullPolicy: Always
    - namespaceRegex: books
      matchString: openmct
      language: nodejs
      imageInfo:
        image: "docker.io/appdynamics/nodejs-agent:20.5.0-alpinev10"
        agentMountPath: /opt/appdynamics
        imagePullPolicy: Always
  analyticsHost: <hostname of the Analytics Agent>
  analyticsPort: 443
  analyticsSslEnabled: true
```

After saving the `values-ca1.yaml` file with the added auto-instrumentation configuration, you must upgrade the Helm Chart:

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --namespace appdynamics
```

Configuration Options

Config option	Description	Required
deploymentMode	Used for multiple cluster agent deployment in a single cluster	Optional
installClusterAgent	Used for installing Cluster Agent. This must be set to true.	Optional (Defaults to true)

Image config options (Config options under `imageInfo` key in `values.yaml` (see page 0))

imageInfo.agentImage	Cluster agent image address in format <registryUrl>/<registryAccount>/<project>	Optional (Defaults to the Docker Hub ¹⁷⁷⁵ image)
imageInfo.agentTag	Cluster agent image tag/version	Optional (Defaults to latest)
imageInfo.operatorImage	Operator image address in format <registryUrl>/<registryAccount>/<project>	Optional (Defaults to the Docker Hub ¹⁷⁷⁶ image)
imageInfo.operatorTag	Operator image tag/version	Optional (Defaults to latest)
imageInfo.imagePullPolicy	Image pull policy for the operator pod	Optional
Controller config options (Config options under controllerInfo key in values.yaml (see page 0))		
controllerInfo.accessKey	AppDynamics Controller accessKey	Required
controllerInfo.account	AppDynamics Controller account	Required
controllerInfo.authenticateProxy	true/false if the proxy requires authentication	Optional
controllerInfo.customSSLCert	Base64 encoding of PEM formatted SSL certificate	Optional
controllerInfo.password	AppDynamics Controller password	Required only when auto-instrumentation is enabled.
controllerInfo.proxyPassword	Password for proxy authentication	Optional
controllerInfo.proxyUrl	Proxy URL if the Controller is behind some proxy	Optional
controllerInfo.proxyUser	Username for proxy authentication	Optional
controllerInfo.url	AppDynamics Controller URL	Required
controllerInfo.username	AppDynamics Controller username	Required only when auto-instrumentation is enabled.
RBAC config		
agentServiceAccount	Service account to be used by the Cluster Agent	Optional

1775 <https://hub.docker.com/>
 1776 <https://hub.docker.com/>

createServiceAccount	Set to true if ServiceAccounts mentioned are to be created by Helm	Optional
operatorServiceAccount	Service account to be used by the AppDynamics Operator	Optional
Agent pod config		
agentPod.nodeSelector	Kubernetes node selector field in the Cluster Agent pod spec	Optional
agentPod.tolerations	Kubernetes tolerations field in the Cluster Agent pod spec	Optional
agentPod.resources	Kubernetes CPU and memory resources in the Cluster Agent pod spec	Optional
agentPod.labels	Adds any required pod labels to the Cluster Agent pod.	Optional
Operator pod config		
operatorPod.nodeSelector	Kubernetes node selector field in the AppDynamics Operator pod spec	Optional
operatorPod.tolerations	Kubernetes tolerations field in the AppDynamics Operator pod spec	Optional
operatorPod.resources	Kubernetes CPU and memory resources in the AppDynamics Operator pod spec	Optional
Install switches		
install.metrics-server	True if metrics are to be installed. Metrics-server is installed in the same namespace as the agent.	Optional

Install Additional Cluster Agents in a Cluster

The Cluster Agent Helm Chart supports multiple Cluster Agents installation in a cluster. This may be necessary for larger clusters that exceed the pod monitoring limit for a single Cluster Agent. See [Cluster Agent Requirements and Supported Environments](#)(see page 2858).

Each additional Cluster Agents that is deployed must have different configuration from any previously deployed Cluster Agents. This is achieved by limiting the monitoring to a distinct set of namespaces and pods using the `nsToMonitor`, `nsToMonitorRegex`, `nsToMonitorExcludeRegex` and `podFilter` properties. See [Configure the Cluster Agent](#)(see page 2884).

The first Cluster Agent must be installed using the steps above where the default value of the `deploymentMode` property is not overridden and set to `PRIMARY`. Additional Cluster Agents must set `deploymentMode` to `NAMESPACED`.

To install additional Cluster Agents:

1. Create a new values file, called `values-ca2.yaml` as the example, that uses the same `controllerInfo` properties as the first Cluster Agent.
 Set `deploymentMode` to `NAMESPACED`.
 Add additional properties, such as `nsToMonitorRegex` and `podFilter`, to set the monitoring scope for this Cluster Agent.

values-ca2.yaml

```

deploymentMode: NAMESPACE
# To install Cluster Agent
installClusterAgent: true
# AppDynamics controller info
controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

# Cluster agent config
clusterAgent:
  nsToMonitorRegex: stage.*

podFilter:
  allowlistedLabels:
    - label1: value1
    - label2: value2
  blocklistedLabels: []
  allowlistedNames: []
  blocklistedNames: []
  
```

2. Create a namespace distinct from the previous namespace used for the first installation:

```
kubectl create ns appdynamics-ca2
```

3. Install the additional Cluster Agent:

```
helm install -f ./values-ca2.yaml "<my-2nd-cluster-agent-helm-release>" appdynamics-
charts/cluster-agent --namespace=appdynamics-ca2
```

i You can enable auto-instrumentation only in the first Cluster Agent using PRIMARY mode. The Helm Chart generates an error if auto-instrumentation was enabled by additional Cluster Agents using that Namespaced mode.

Cluster Agent Helm Chart Configuration Examples

These examples display various configurations for the Cluster Agent Helm chart:

Use the Cluster Agent Helm Chart to Enable Custom SSL

user-values.yaml

```
controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

#====
customSSLCert: "<base64 of PEM formatted cert>"
#====

agentServiceAccount: appdynamics-cluster-agent-ssl      # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl      # Can be any valid name
```

Use the Cluster Agent Helm Chart to Enable the Proxy Controller

Without authentication:

user-values.yaml

```
# To install Cluster Agent
installClusterAgent: true

controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

#====
proxyUrl: http://<proxy-url>.appd-controller.com
#====
```

```

agentServiceAccount: appdynamics-cluster-agent-ssl      # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl      # Can be any valid name
  
```

With authentication:

user-values.yaml

```

# To install Cluster Agent
installClusterAgent: true

controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

#=====
authenticateProxy: true
proxyUrl: http://<proxy-url>.appd-controller.com
proxyUser: hello
proxyPassword: world
#=====

agentServiceAccount: appdynamics-cluster-agent-ssl      # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl      # Can be any valid name
  
```

Use the Cluster Agent Helm Chart to add `nodeSelector` and `tolerations`

user-values.yaml

```

agentPod:
  nodeSelector:
    nodeLabelKey: nodeLabelValue
  tolerations:
    - effect: NoExecute
      operator: Equal
      key: key1
      value: val1
      tolerationSeconds: 11

operatorPod:
  nodeSelector:
    nodeLabelKey: nodeLabelValue
  
```

```

  anotherNodeLabel: anotherNodeLabel
  tolerations:
    - operator: Exists
      key: key1
  
```

Best Practices for Sensitive Data

We recommend using multiple `values.yaml` files to separate sensitive data in separate `values.yaml` files. Examples of these values are:

- `controllerInfo.password`
- `controllerInfo.accessKey`
- `controllerInfo.customSSLCert`
- `controllerInfo.proxyPassword`

Each `values` file follows the structure of the default `values.yaml`¹⁷⁷⁷ enabling you to easily share files with non-sensitive configuration properties yet keep sensitive values safe.

Default `user-values.yaml` File Example

`user-values.yaml`

```

deploymentMode: PRIMARY

# To install Cluster Agent
installClusterAgent: true

imageInfo:
  agentImage: dtr.corp.appdynamics.com/sim/cluster-agent
  agentTag: latest
  operatorImage: docker.io/appdynamics/cluster-agent-operator
  operatorTag: latest
  imagePullPolicy: Always

controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

agentServiceAccount: appdynamics-cluster-agent-ssl      # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl      # Can be any valid name
  
```

¹⁷⁷⁷ <http://docs.appdynamics.com/#default-values-yaml>

user-values-sensitive.yaml

```
controllerInfo:
  password: welcome
  accessKey: abc-def-ghi-1516
```

When installing the Helm Chart, use multiple `-f` parameters to reference the files:

```
helm install -f ./user-values.yaml -f ./user-values-sensitive.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --namespace ca-appdynamics
```

Validate the Cluster Agent Installation

This page describes how to validate a Cluster Agent installation using the Kubernetes CLI or Helm chart.

Cluster Agent Validation

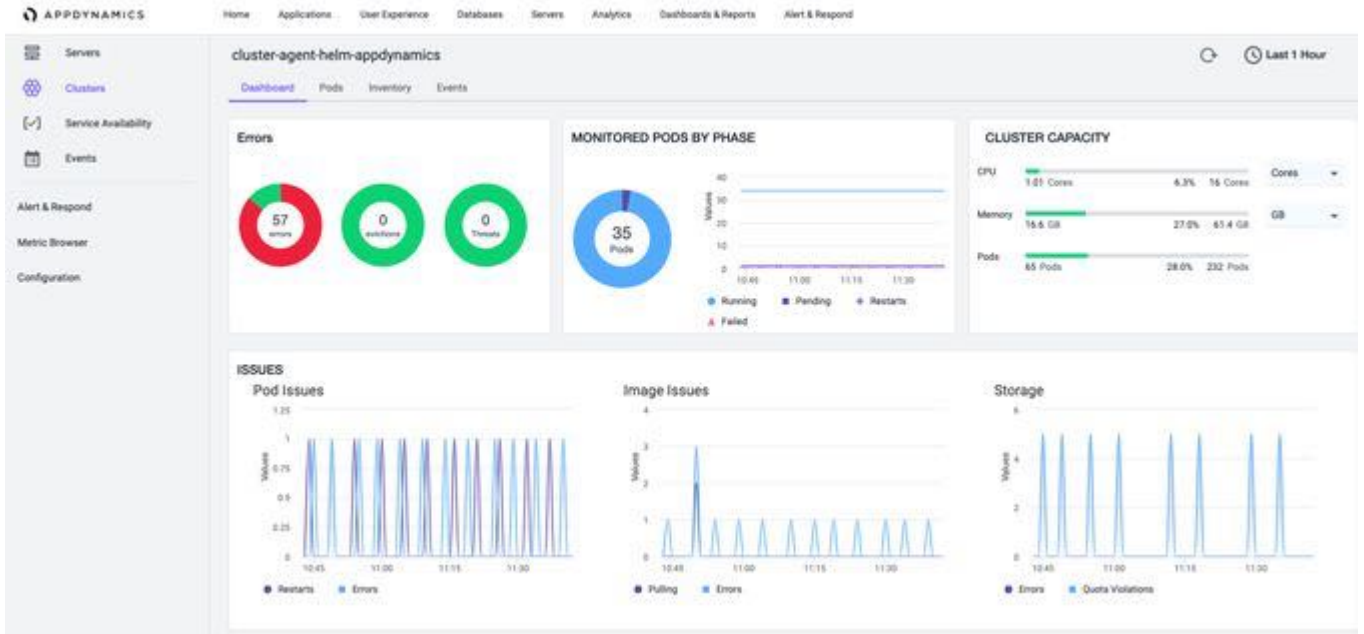

1. Verify that the Cluster Agent and Cluster Agent Operator pods are running by reviewing the status:

```
kubectl -n appdynamics get pods
```

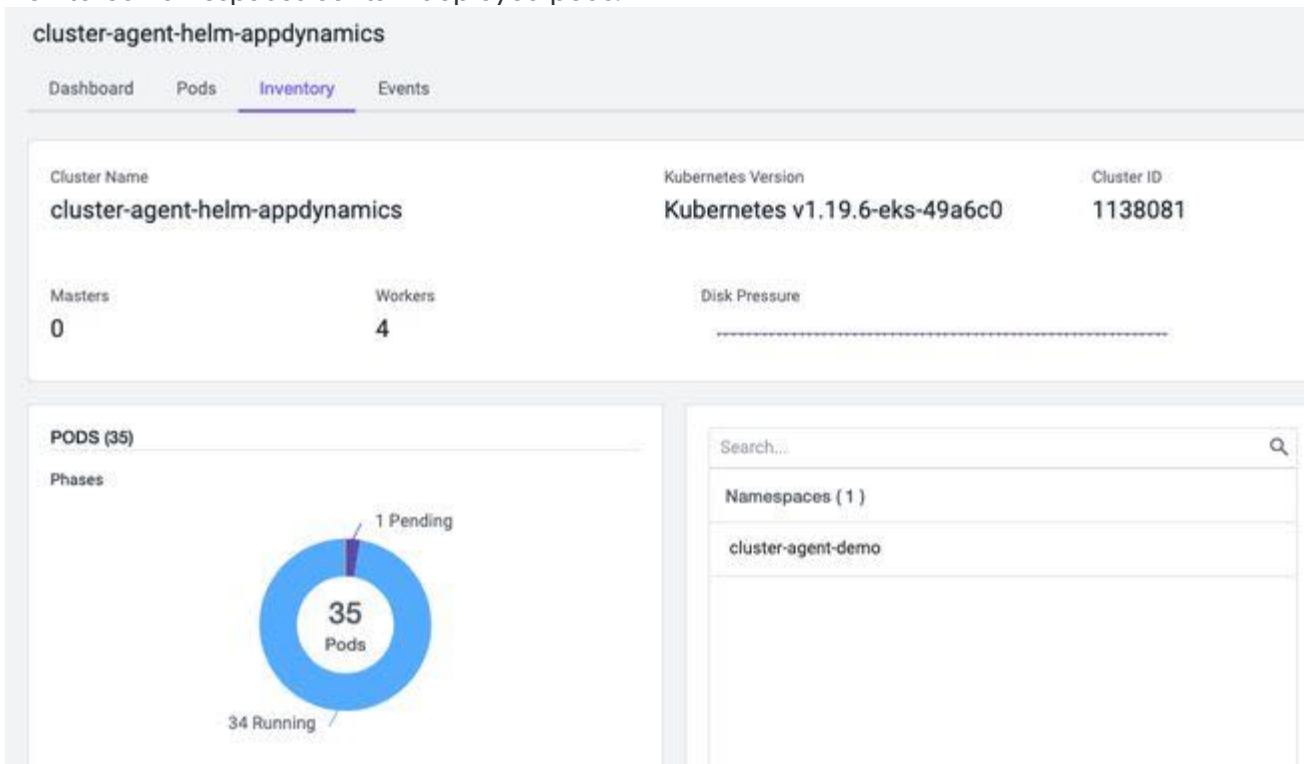

NAME	READY	STATUS	RESTARTS
AGE			
appdynamics-operator-7958f676d9-gvdcw 4d21h	1/1	Running	0
k8s-cluster-agent-5967c9b7b9-rkwzt 4d21h	1/1	Running	0

2. Verify that the Cluster Agent is reporting to the Controller. If the Cluster Agent successfully registers with the Controller based on the credentials you entered in the `cluster-agent.yaml` file, and the `cluster-agent-secret` you created in the `appdynamics` namespace (which contains the Controller Account Access Key), then the Cluster Agent displays in the Controller UI under **Servers/Cluster** using the `appName` from `cluster-agent.yaml`.

 It may take 5-10 minutes for the data to populate.

- Verify the monitored namespaces. Under the **Inventory** dashboard, check that the monitored namespaces match the namespace configuration in the `cluster-agent.yaml` file and that the monitored namespaces contain deployed pods.

If necessary, update the namespace configuration (`nsToMonitor`, `nsToMonitorRegex`) in `cluster-agent.yaml` and re-create the Cluster Agent.

```
kubectl -n appdynamics delete -f cluster-agent.yaml
kubectl -n appdynamics create -f cluster-agent.yaml
```

If you are still experiencing problems with the installation, see [Troubleshoot the Cluster Agent](#)(see page 2876).

Troubleshoot the Cluster Agent

This page describes steps to troubleshoot the Cluster Agent install. See [Install the Cluster Agent](#)(see page 2861) and [Validate the Cluster Agent Installation](#)(see page 2874).

Troubleshoot a Cluster Agent Not Reporting to the Controller

If after installing the Cluster Agent the Cluster Dashboard does not appear in the Controller, it could be the result of a connectivity issue with the Controller.

1. Verify that a Server Visibility license is available. The Cluster Agent requires an available Server Visibility license to register successfully. See [Cluster Agent Requirements and Supported Environments](#)(see page 2858). From the Controller UI, check that a license is available under **Administration/License/Account Usage**.
2. Review the Cluster Agent events. If the Cluster Agent or Cluster Agent Operator fails to start, then review the events in the appdynamics namespace:

```
kubectl -n appdynamics get events

# to sort by most recent events:
kubectl -n appdynamics get events --sort-by='.lastTimestamp'
```

You can review the Cluster Agent pod specification for additional events:

```
kubectl -n appdynamics get pod <cluster-agent-pod> -o yaml
```

3. Review the Cluster Agent logs for errors regarding Controller communication. Open a command-line prompt and enter:

```
kubectl -n appdynamics logs <cluster-agent-pod-name>
```

4. Verify the Cluster Agent configuration. The Cluster Agent checks for configuration changes once a minute. To verify that your configurations have been applied and that the Cluster Agent is using the new values, open a command-line prompt and enter:

```
kubectl -n appdynamics describe cm cluster-agent-mon cluster-agent-log cluster-agent-config
```

5. Verify that the latest Cluster Agent is installed. If you are upgrading the Cluster Agent from a previous version, then the previous Operator YAML or image may not be compatible. You must reinstall the Cluster Agent Operator and Cluster Agent using the procedure described in [Upgrade the Cluster Agent](#)(see page 3004).

Troubleshoot a Cluster Agent Not Reporting Metrics

If the Cluster Agent does not report metrics for certain containers, pods, or nodes, it may be due to a problem with the Kubernetes [Metrics Server](#)¹⁷⁷⁸. If metrics are not reported by the Metrics Server, then the Cluster Agent is unable to report them.

To verify that the Metrics Server is sending metrics, enter this command from your cluster's primary node:

```
$ kubectl get --raw /apis/metrics.k8s.io/v1beta1/pods
```

If the output of the command does not show metrics for the container, there may be a problem with the Metrics Server. This example shows output from the Metrics Server:

```
{
  "kind": "PodMetricsList",
  "apiVersion": "metrics.k8s.io/v1beta1",
  "metadata": {
    "selfLink": "/apis/metrics.k8s.io/v1beta1/pods"
  },
  "items": [
    {
      "metadata": {
        "name": "replicaset-test-cjnsc",
        "namespace": "test-qe",
        "selfLink": "/apis/metrics.k8s.io/v1beta1/namespaces/test-qe/pods/replicaset-test-cjnsc",
        "creationTimestamp": "2019-09-23T10:24:46Z"
      },
      "timestamp": "2019-09-23T10:23:38Z",
      "window": "30s",
      "containers": [
        {
          "name": "appagent",
          "usage": {
            "cpu": "1667384n",
            "memory": "258672Ki"
          }
        }
      ]
    }
  ]
}
```

As the Metric Server collects metrics from nodes, pods, and containers, it logs all issues. To retrieve and view logs for the Metric Server, enter:

¹⁷⁷⁸ <https://github.com/kubernetes-sigs/metrics-server>

```
$ kubectl logs <metric-server pod name> -n <namespace for metric-server(default value is: "kube-system")> --tail <number of required lines of logs>
```

For example:

```
$ kubectl logs metrics-server-6764b987d-mtn7g -n kube-system --tail 20
```

The Metric Server logs may reveal why it could not collect metrics. For example:

```
E0920 11:44:54.204075      1 reststorage.go:147] unable to fetch pod metrics for pod test-
qe/replicaset-test-9k7rl: no metrics known for pod
E0920 11:44:54.204080      1 reststorage.go:147] unable to fetch pod metrics for pod test/
replicaset1-458-g9n2d: no metrics known for pod
E0920 11:44:54.204089      1 reststorage.go:147] unable to fetch pod metrics for pod kube-
system/kube-proxy-t54rc: no metrics known for pod
E0920 11:45:19.188033      1 manager.go:111] unable to fully collect metrics: unable to
fully scrape metrics from source kubelet_summary:ip-111.111.111.111: unable to fetch metrics
from Kubelet ip-111.111.111.111 (111.111.111.111): Get https://111.111.111.111:2222/stats/
summary/: dial tcp 111.111.111.111:2222: i/o timeout
```

Cluster Agent Restarts

If the Cluster Agent restarts, you can verify that a restart occurred from the pod details. To retrieve the pod details, enter:

```
kubectl get pods -n appdynamics
```

Sample output:

NAME	READY	STATUS	RESTARTS	AGE
appdynamics-operator-6fff76b466-qtx57	1/1	Running	0	4h18m
k8s-cluster-agent-perf-jg-6fc498d557-q7zst	1/1	Running	1	83m

If the Cluster Agent unexpectedly restarts, the `RESTARTS` count value will be greater than zero. You will have to explicitly reset both namespaces and the logs.

i AppDynamics strongly recommends that you do not overwrite the default `stdoutLogging: true` property value in the `cluster-agent.yaml` file. If you set this property to `false`, the `kubectl logs` command does not return logs.

Cluster Agent logs persist even if the Cluster Agent is restarted by Kubernetes. To view the Cluster Agent logs for the Cluster Agent pod (that restarted), enter:

```
kubectl -n appdynamics logs --previous ${CLUSTER_AGENT_POD_NAME}
```

If the Cluster Agent pod has restarted, the monitored namespaces (that you configured through the UI) are not preserved. If you configured namespaces through the UI, you should add the same namespaces to your `cluster-agent.yaml` file under `nsToMonitor`, and then apply the configuration. As a result, the Cluster Agent pod will retain the monitored namespaces when it restarts.

If you did not add namespaces to the `cluster-agent.yaml` file, you can reconfigure your monitored namespaces:

1. Go to **Appdynamics Agents > Cluster Agents > {CLUSTER_AGENT} > Configure**.
2. Add the namespaces to monitor.

See [Add or Remove Namespaces](#)(see page 2973).

APM Correlation on OpenShift 4.x

Container Runtime Interface using OCI (Open Container Initiative) compatible runtimes (CRI-O), is the default container runtime on Red Hat OpenShift 4.x. If you use APM Agents with OpenShift 4.x, you must update the `UNIQUE_HOST_ID` to support the syntax required for CRI-O containers. This setting applies to both new and existing application containers. If you are running App Agents, then you must modify the App Agent YAML file.

To run App Agents with APM correlation on OpenShift 4.x:

1. Open your App Agent YAML file.
2. Locate the `spec: > args:` section within the file.
3. Update the `UNIQUE_HOST_ID` argument in the `containers spec` using this example as a guide:

```
spec:
  containers:
    - name: client-api
      command: ["/bin/sh"]
      args: ["-c", "UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/(.{12}).*/\\1/p' /proc/self/cgroup) && java -Dappdynamics.agent.uniqueHostId=${UNIQUE_HOST_ID} $JAVA_OPTS -jar /java-services.jar"]
      envFrom:
        - configMapRef:
            name: agent-config
```

If APM Correlation is working correctly, when you click the **Pod Details** link, the link opens the APM Node Dashboard for that node.

Cluster Agents or Pods are not Visible in the Controller

If Agents or pods are not visible in the Controller, or if Agents or pods are not registered and reporting, review the `sim.cluster.agent.limit` and `sim.cluster.pod.limit` descriptions in [Controller Settings for the Cluster Agent](#)¹⁷⁷⁹.

¹⁷⁷⁹ <https://docs.appdynamics.com/display/PRO45/Administer+the+Cluster+Agent>

Cluster Agent Pods are not Created When Security Policy is Enabled

If you have Pod Security Policies applied in the cluster, add the following to the `cluster-agent-operator.yaml` file:

```
securityContext:
  runAsUser: 1000
```

This YAML file example displays the security context:

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: appdynamics-operator
  namespace: appdynamics
  .
  .
spec:
  .
  .
  .
  template:
    .
    .
    securityContext:
      runAsUser: 1000
```

i For Agent 20.4 and 20.5, add the `runAsUser: 1000` field in the `cluster-agent.yaml` file.

Cluster Agent Configuration Files

This page provides a reference for these internal configuration files used by the Cluster Agent:

- `agent-monitoring.yaml`
- `bootstrap-config.yaml`
- `logger-config.yaml`

! AppDynamics recommends that you do not change the default values unless asked to do so by AppDynamics Support. Values supplied by the AppDynamics Operator always take precedence over the internal configuration files.

Agent Monitoring Configuration Reference

The `agent-monitoring.yaml` file contains configuration information that can be modified by the Cluster Agent. The table lists the fields expected by the `agent-monitoring.yaml` file. Use these fields to configure pods and containers monitored by the Cluster Agent:

Field name	Description	Default
blocklisted-label	(Optional) Field used to specify a Kubernetes label (a key-value pair). If this label exists, then the container, or pod, is not monitored. In the example, any pods with the label <code>appdynamics.exclude</code> set to <code>true</code> are blocklisted.	<code>appdynamics.exclude: true</code>
blocklisted-names	(Optional) Field used to specify which pods and containers are not monitored. In the example, the pod <code>ignored-pod</code> with associated containers <code>container3</code> and <code>container4</code> are not monitored.	Empty
cluster-metric-collection-interval-seconds	How often the Agent collects metrics in seconds Do not set this value to less than 30 seconds	60
container-filter	(Optional) Blocklist or allowlist pods and containers, based on the container names	Empty
container-registration-batch-size	Maximum number of containers per batch in one registration cycle	25
container-registration-max-parallel-requests	Maximum number of batches in one registration cycle	3
metadata-collection-interval-seconds	How often metadata is collected for containers and pods	60
metric-collection-interval-seconds	<p>Sampling interval at which metrics should be collected periodically</p> <p>Do not set this value to less than 15 seconds</p> <div style="border: 1px solid #007bff; background-color: #e6f2ff; padding: 10px; margin-top: 10px;"> <p> The Kubernetes Metrics Server¹⁷⁸⁰'s sampling interval must be the same as this configuration value. Any change to this configuration</p> </div>	<ul style="list-style-type: none"> • Default metric collection sampling interval is 30 seconds • Default collection interval in <code>kubelet</code> is 15 seconds

¹⁷⁸⁰ <https://github.com/kubernetes-incubator/metrics-server>

Field name	Description	Default
	requires a re-deployment of the Kubernetes metrics-server¹⁷⁸¹ add-on.	
metric-upload-retry-count	Number of times metric upload action to be attempted, if unsuccessful for the first time	3
metric-upload-retry-interval-milliseconds	Interval between consecutive metric upload retries, in milliseconds	5
pod-registration-batch-size	Maximum number of pods per batch in one registration cycle	30
allowlisted-names	(Optional) Field used to specify pods and containers to monitor. In the example, the pod monitored-pod with its containers container1 and container2 are monitored.	Empty

agent-monitoring.yml example:

```

metric-collection-interval-seconds: 30
container-filter:
  blocklisted-label:
    appdynamics.exclude:
      true
# allowlisted-names:
#   pod-name1:
#     container-name1
#     container-name2
#   pod-name2:
#     container-name1
#     container-name2
#   pod-name3:
#     container-name1
#     container-name2
# blocklisted-names:
#   pod-name:
#     container-name1
#     container-name2
#   pod-name2:
#     container-name1
#     container-name2

```

¹⁷⁸¹ <https://kubernetes.io/docs/tasks/debug-application-cluster/resource-metrics-pipeline/>

Bootstrap Configuration Reference

The `bootstrap-config.yml` file contains configuration information read by the Cluster Agent during start up. The table lists the fields expected by the `bootstrap-config.yml` file:

Field name	Description	Default
<code>account</code>	Name of the account on the Controller	Empty
<code>account-access-key</code>	Account access key	Empty
<code>cluster-name</code>	Unique name assigned to the monitoring cluster	Empty
<code>container-registration-interval-seconds</code>	How often the Cluster Agent sends container information to the Controller. The interval at which the Cluster Agent checks for running containers. Modify the default value only if you want to discover running containers more frequently; use the default value for most environments.	120
<code>controller-host</code>	Controller host name	Empty
<code>controller-port</code>	Controller port	Empty
<code>controller-ssl-enabled</code>	Denotes if the Controller is SSL-enabled	false
<code>event-upload-interval-seconds</code>	How often events are uploaded to the Controller, in seconds	10
<code>http-client-timeout-seconds</code>	Number of seconds after which the server call is terminated if no response is received from the Controller	30
<code>log-output-directory</code>	Directory to which the logs should be written	logs
<code>monitored-namespaces</code>	Namespaces to be monitored in the cluster; comma-separated strings	default

`bootstrap-config.yml` example:

```

account: <account-name>
account-access-key:<account-access-key>
controller-host: localhost
controller-port: 8090
cluster-name: <cluster-name>
monitored-namespaces: default
event-upload-interval-seconds: 10
  
```

```

container-registration-interval-seconds: 120
http-client-timeout-seconds: 30
log-output-directory: logs
# SSL configuration
controller-ssl-enabled: false
  
```

Logging Configuration Reference

By default, the AppDynamics Cluster Agent writes log files to the `<cluster_agent_home>/logs/<node_name>` directory.

You can control the logging level for the Cluster Agent by changing the value of the `log-level` parameter. For maximum debugging information, set the `logger-config.yml` logging level to `DEBUG`.

You can modify the `logger-config.yml` file and set values for these attributes:

Attribute	Description	Default	Type
<code>log-level</code>	Number of log details: INFO, WARNING, DEBUG or TRACE	INFO	String
<code>max-filesize-mb</code>	Maximum file size of the log in MB	5	Integer
<code>max-backups</code>	Maximum number of backups the log saves. When the maximum number of backups is reached, the oldest log file after the initial log file is deleted.	3	Integer
<code>write-to-stdout</code>	Write logging information to stdout. Options: true, false.	true	String

`logger-config.yml` example:

```

log-level: INFO
max-filesize-mb: 5
max-backups: 3
write-to-stdout: true
  
```

Configure the Cluster Agent

This page describes the contents of the Cluster Agent bundle downloaded from the [Download portal](#)¹⁷⁸², and how to perform common configuration tasks:

- [Configure Proxy Support](#)¹⁷⁸³
- [Configure the Cluster Agent to use SSL for on-premises Controllers](#)¹⁷⁸⁴

¹⁷⁸² <https://accounts.appdynamics.com/downloads>

¹⁷⁸³ <https://docs.appdynamics.com/display/PRO45/Configure+the+Cluster+Agent#ConfiguretheClusterAgent-ConfigureProxySupport>

¹⁷⁸⁴ <https://docs.appdynamics.com/display/PRO45/Configure+the+Cluster+Agent#ConfiguretheClusterAgent-ConfiguretheClusterAgenttoUseSSLforOn-PremisesControllers>

- [Configure a Pull Secret](#)(see page 2888)

See [Cluster Agent YAML File Configuration Reference](#)(see page 0) for configuration option details.

i This page contains links to Kubernetes documentation. AppDynamics makes no representation as to the accuracy of Kubernetes documentation because Kubernetes controls its own documentation.

Directory Structure of the Cluster Agent Bundle

An unzipped Cluster Agent bundle contains this directory structure:

[Alpine Linux](#) [Rhel Linux 7](#)

```

cluster-agent
├─ cluster-agent-operator.yaml
├─ cluster-agent-operator-1.15-or-less.yaml
├─ cluster-agent-operator-openshift-1.15-or-less.yaml
├─ cluster-agent-operator-openshift.yaml
├─ cluster-agent.yaml

Cluster Agent Bundle Files

This table describes the Cluster Agent directory files:

File Name	Description
cluster-agent.yaml	File used to configure and deploy the Cluster Agent. <ul style="list-style-type: none"> The cluster-agent.yaml file provides Controller details and starts the Cluster Agent. Where values are specified in the AppDynamics Operator configuration, these values always take precedence over any internal configuration file.
cluster-agent-operator.yaml cluster-agent-operator-1.15-or-less.yaml	Files used to deploy the Cluster Agent Operator. These files set the default values for Kubernetes, Amazon EKS, and AKS, including a minimal set of RBAC permissions.
cluster-agent-operator-openshift.yaml cluster-agent-operator-openshift-1.15-or-less.yaml	Files used to deploy the Cluster Agent on Red Hat OpenShift. These files set the default values for Red Hat OpenShift, including a minimal set of RBAC permissions.
docker	Docker directory contains all files required to create the Cluster Agent image.
Dockerfile	dockerfile used to create the Alpine-based Cluster Agent image.
Dockerfile-rhel	dockerfile used to create the RHEL-based Cluster Agent image.
LICENSE	Latest EULA file attached with the Cluster Agent image.
cluster-agent.zip	Zip archive containing the Cluster Agent binaries and configuration files.
helm-charts	Folder used to build the charts for deploying the Cluster Agent using Helm in Kubernetes.

File Name	Description
README-rhel.md README-alpine.md	Contains instructions on how to start the Cluster Agent using your preferred operating system.
start-appdynamics	Script used to run the Cluster Agent within Docker.

Configure Proxy Support

1. Locate and edit the `cluster-agent.yaml` file.
2. Add a `proxyUrl` parameter to the `cluster-agent.yaml` file:

```
proxyUrl: <protocol>://<host>:<port>
```

3. (Optional) If the proxy server requires authentication:
 - a. Add a `proxyUser`:

```
proxyUser: <user>
```

- b. Create a secret with a proxy-password:

```
kubectl -n appdynamics create secret generic cluster-agent-proxy-secret --from-literal=proxy-password='<password>'
```

4. (Optional) If you are using SSL only for your proxy:
 - a. Create a secret from a `.pem` certificate file (the certificate file must be named `proxy-ssl.pem`):

```
kubectl -n appdynamics create secret generic ssl-cert --from-file=proxy-ssl.pem
```

- b. Set a secret filename in the `cluster-agent.yaml` file:

```
customSSLSecret: "ssl-cert"
```

To use SSL with your proxy and your Controller, see [Proxy and On-Premises Certificates Combined](#)(see page 0).

Configure the Cluster Agent to Use SSL for On-Premises Controllers

 Cluster Agent SSL is automatically handled for SaaS Controllers.

Controllers with Public and Self-Signed Certificates

To configure SSL with a public or self-signed certificate, use `kubectl` to generate a secret. Enter this `kubectl` command, and include the path to your public or self-signed certificate:

```
kubectl -n appdynamics create secret generic ssl-cert --from-file=<path-to-your-self-signed-certs>/custom-ssl.pem
```

The certificate file must be named: `custom-ssl.pem`.

After your secret is created, you must add the `customSSLSecret` property with the secret name specified in the previous step to the `cluster-agent.yaml` file:

```
customSSLSecret: "ssl-cert"
```

Proxy and On-Premises Certificates Combined

If you have two different SSL certificates (one for the proxy server, and a different one for the on-premises Controller), then you can encapsulate both of them into a single secret:

```
kubectl -n appdynamics create secret generic ssl-cert --from-file=proxy-ssl.pem --from-file=<path-to-your-self-signed-certs>/custom-ssl.pem
```

The Cluster Agent pulls each certificate from the secret identified in the `customSSLSecret` attribute and uses it appropriately.

This example shows a `cluster-agent.yaml` file with the `customSSLSecret` attribute defined:

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent-manual
  namespace: appdynamics
spec:
  # init agent configuration
  appName: "test-k8s-cluster-agent"
  controllerUrl: "https://<controller-url>:443" # always schema and port
  account: "<account-name>" # account
  # agent related properties
  # custom SSL secret name
  customSSLSecret: "ssl-cert"
  # logging properties
  logLevel: INFO
  logFileSizeMb: 7
  logFileBackups: 6
  # docker image info
  image: "<image-url>"
```

If the Cluster Agent requires a secret to pull images from a container registry, use the Kubernetes API to create the secret and reference it in `cluster-agent.yaml`.

[Kubernetes](#) [OpenShift](#)

```
$ kubectl -n appdynamics create secret docker-registry myregcred --docker-server=https://
index.docker.io/v1 --docker-username=<docker-username> --docker-password=<docker-password>
--docker-email=unused
```

[Kubernetes](#) [OpenShift](#)

```
$ oc -n appdynamics create secret docker-registry myregcred --docker-server=https://
index.docker.io/v1 --docker-username=<docker-username> --docker-password=<docker-password>
--docker-email=unused
$ oc -n appdynamics secrets link appdynamics-operator regcred --for=pull
```

Set the `imagePullSecret` property in `cluster-agent.yaml` to the name of the secret created above (myregcred):

```
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "mycluster"
  controllerUrl: "http://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  image: "<your-docker-registry>/appdynamics/cluster-agent:tag"
  serviceAccountName: appdynamics-cluster-agent
  imagePullSecret: "myregcred"
```

Cluster Agent YAML File Configuration Reference

To configure the Cluster Agent, use the `cluster-agent.yaml` file included with the download package as a template. You can modify these parameters:

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
account	AppDynamics account name.	admin	N/A	No	String	Required
appName	Name of the cluster; displays in the Controller UI as your cluster name.	k8s-cluster	N/A	No	String	Required

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
controller url	Full AppDynamics Controller URL, including protocol and port.	HTTP: http:// appd- controller .com: 8090/ HTTPS: https:// appd- controller .com: 443	N/A	No	String	Required

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
clusterSSLsecret	Provides the self-signed or public certificates to the Cluster Agent.	"ssl-cert"	N/A	No	String	Optional
eventuploadinterval	How often Kubernetes warning and state-change events are uploaded to the Controller in seconds. See Monitor Kubernetes Events (see page 2992).	10	10	No	Integer	Optional

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
httpClientTimeout	If no response is received from the Controller, number of seconds after which the server call is terminated.	30	30	No	Integer	Optional
image	Cluster Agent image.	your-docker-registry/appdynamics/cluster-agent:latest	N/A	No	String	Required

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
imagePullSecret	Credential file used to authenticate when pulling images from your private Docker registry or repository. Based on your Docker registry configuration, you may need to create a secret file for the AppDynamics Operator to use when pulling the image for the Cluster Agent. See Create a Secret by providing credentials on the command line ¹⁷⁸⁵ .	regcred	N/A	No	String	Optional
labels	Adds any required pod labels to the Cluster Agent pod.	labels: key1: value1 key2: value2	The following labels are created by default and cannot be modified: name:clusterAgent clusterAgent_cr:<name of agent> pod-template-hash:<assigned by Kubernetes> <div style="border: 1px solid #007bff; padding: 5px; margin-top: 10px;"> <p>i The key value pairs that you specify for this parameter gets added to the Cluster Agent pod along with the default value.</p> </div>	No	map[string]string	Optional

¹⁷⁸⁵ <https://kubernetes.io/docs/tasks/configure-pod-container/pull-image-private-registry/#create-a-secret-by-providing-credentials-on-the-command-line>

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
logFileSizeMB	Maximum file size of the log in MB.	5	5	Yes	Integer	Optional
logFileBackups	Maximum number of backups saved in the log. When the maximum number of backups is reached, the oldest log file after the initial log file is deleted.	3	3	Yes	Integer	Optional
logLevel	Number of log details. INFO, WARNING, DEBUG, or TRACE.	"INFO"	INFO	Yes	String	Optional

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
maxPodLogsTailLineCount	<p>Number of lines to be tailed while collecting logs.</p> <p>To use this parameter, enable the log capturing feature. See Enable Log Collection for Failing Pods(see page 3000).</p>	500	500	Yes	Integer	Optional
nodeSelector	<p>The Cluster Agent pod runs on the node that includes the specified key-value pair within its labels property. See nodeSelector¹⁷⁸⁶.</p>	<p>nodeSelector: kubernetes.io/e2e-az-name: az1</p>	N/A	No	map[string]string	Optional

¹⁷⁸⁶ <https://kubernetes.io/docs/concepts/scheduling-eviction/assign-pod-node/#nodeselector>

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
nsToMonitor	Namespaces to be monitored in the cluster.	<pre>nsToMonitor: - "default" - "appdynamics"</pre>	default	No	String List (Sequence)	Optional

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
nsToMonitorRegex	<p>The regular expression for selecting the required namespaces to be monitored in the cluster.</p> <p>This parameter supersedes nsToMonitor. If you do not specify a value for this parameter, then the Cluster Agent uses the default value of nsToMonitor.</p> <div style="border: 1px solid #00a0e3; padding: 5px; margin-top: 10px;"> <p>i This parameter is supported in Cluster Agent >= 20.9, and Controller >= 20.10.</p> </div> <p>See Edit Namespaces¹⁷⁸⁷.</p>	<p>nsToMonitorRegex: .*</p>	N/A	Yes	Regular expression	Optional

¹⁷⁸⁷ <https://docs.appdynamics.com/display/PRO45/Use+the+Cluster+Agent#editnamespace>

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
nsToExcludeRegex	<p>The regular expression for the namespaces that must be excluded from the selected namespaces that match the regular expression mentioned for nsToMonitorRegex.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin: 10px 0;"> <p> This parameter is supported in Cluster Agent >= 20.9, and Controller >= 20.10.</p> </div> <p>This parameter can be used only if you have specified a value for the nsToMonitorRegex parameter.</p>	nsToExcludeRegex: ns.*	N/A	Yes	Regular expression	Optional

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
podFilter	<p>Blocklist or allowlist pods based on:</p> <ul style="list-style-type: none"> Regular expressions for pod names Pod labels <p>Blocklisting or allowlisting by name takes preference over blocklisting or allowlisting by labels. For example, if you have the podFilter as :</p> <pre>podFilter: blocklistedLabels: - release: v1 allowlistedNames: - ^podname</pre> <p>This blocks all the pods which have the label 'release=v1' except for the ones which have the names starting with 'podname'.</p> <ul style="list-style-type: none"> When a pod is listed as allowed by name and blocked by name, it will be allowlisted. When a pod is listed as allowed by a label and blocked by a label, it will be allowlisted. 	<pre>podFilter: blocklistedLabels: - label1: value1 allowlistedLabels: - label1: value1 - label2: value2 allow</pre>	N/A	Yes	String	Optional

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
proxyUrl	Publicly accessible host name of the proxy.	https://myproxy.example.com:8080	N/A	No	String	Optional
proxyUser	Username associated with the basic authentication credentials.	"user1"	N/A	No	String	Optional

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
resources	Requests and limits of CPU and memory resources for the Cluster Agent.	<pre>resources: limits: cpu: 300m memory: "200Mi" requests: cpu: 200m memory: "100Mi"</pre>	<ul style="list-style-type: none"> • CPU <ul style="list-style-type: none"> ◦ request: 750m ◦ limit: 1250m • Memory <ul style="list-style-type: none"> ◦ request: 150Mi ◦ limit: 300Mi 	Yes	Array	Optional

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
stdoutLogging	By default, the Cluster Agent writes to a log file in the logs directory. Additionally, the stdoutLogging parameter is provided to send logs to the container stdout.	"true", "false"	true	Yes	String	Optional

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
tolerations	An array of tolerations required for the pod. See Taint and Tolerations ¹⁷⁸⁸ .	<pre> tolerations: - effect: NoSchedule key: type value: test </pre>	N/A	No	Array	Optional

¹⁷⁸⁸ <https://kubernetes.io/docs/concepts/scheduling-eviction/taint-and-toleration/>

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
		<pre>- effect: NoExecute key: node.kubernetes.io/n</pre>				

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
		o t- r e a d y o p e r a t o r: E x i s t o l e r a t i o n S e c o n d				

i For specific auto-instrumentation configurations, see [Auto-Instrument Applications with the Cluster Agent](#)(see page 2928). Also the `.yaml` file includes the permissions for auto-instrumentation, which is enabled by default. If you do not want to use auto-instrumentation, you can remove the following text from the `.yaml` file:

```
kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1
metadata:
  name: appdynamics-cluster-agent-instrumentation
subjects:
  - kind: ServiceAccount
    name: appdynamics-cluster-agent
    namespace: appdynamics
roleRef:
  kind: ClusterRole
  name: appdynamics-cluster-agent-instrumentation
  apiGroup: rbac.authorization.k8s.io
```

Cluster Agent File Example

This example shows a `cluster-agent.yaml` configuration file:

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<app-name>"
  controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  # docker image info
  image: "<your-docker-registry>/appdynamics/cluster-agent:tag"
  nsToMonitor:
    - "default"
  eventUploadInterval: 10
  containerRegistrationInterval: 120
  httpClientTimeout: 30
  customSSLSecret: "<secret-name>"
  proxyUrl: "<protocol>://<domain>:<port>"
  proxyUser: "<proxy-user>"
  metricsSyncInterval: 30
  clusterMetricsSyncInterval: 60
  metadataSyncInterval: 60
  containerBatchSize: 25
  containerParallelRequestLimit: 3
```

```

podBatchSize: 30
metricUploadRetryCount: 3
metricUploadRetryIntervalMilliseconds: 5
podFilter:
  # blocklistedLabels:
  #   - label1: value1
  # allowlistedLabels:
  #   - label1: value1
  #   - label2: value2
  # allowlistedNames:
  #   - name1
  # blocklistedNames:
  #   - name2
logLevel: "INFO"
logFileSizeMb: 5
logFileBackups: 3
stdoutLogging: "true"
resources:
  limits:
    cpu: 300m
    memory: "200Mi"
  requests:
    cpu: 200m
    memory: "100Mi"
labels:
  key1: value1
  key2: value2

```

Install Infrastructure Visibility with the Cluster Agent Operator

This page describes how to install the Machine Agent and Network Agents in a Kubernetes cluster where the Cluster Agent Operator is installed.

The Cluster Agent Operator provides a custom resource definition called `InfraViz`. You can use `InfraViz` to simplify deploying the Machine and Network Agents as a daemonset in a Kubernetes cluster. Additionally, you can deploy these agents by creating a daemonset YAML which does not require the Cluster Agent Operator. For more information, see [these examples](#)¹⁷⁸⁹.

To deploy the Analytics Agent as a daemonset in a Kubernetes cluster, see [Install Agent-Side Components in Kubernetes](#)(see page 3096).

Requirements

Before you begin, verify that you have:

- Installed `kubectl`¹⁷⁹⁰ \geq 1.11.3
- Cluster Agent \geq 21.3.1

¹⁷⁸⁹ <https://github.com/Appdynamics/ContainerLabs/tree/master/Labs/Lab-2.5-MachineAgent>

¹⁷⁹⁰ <https://kubernetes.io/docs/tasks/tools/install-kubectl/>

- Met these requirements: [Cluster Agent Requirements and Supported Environments](#)(see page 2858).
- If Server Visibility is required, sufficient Server Visibility licenses based on the number of worker nodes in your cluster.
- Permissions to view servers in the AppDynamics Controller.

Installation Procedure

1. **Install the Cluster Agent**¹⁷⁹¹. From this Alpine Linux example:
 - a. Download the Cluster Agent bundle.
 - b. Unzip the Cluster Agent bundle.
 - c. Deploy the Cluster Agent Operator using the CLI specifying the correct Kubernetes and OpenShift version (if applicable):

```
unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
kubectl create namespace appdynamics
```

[Kubernetes >= 1.16](#) [OpenShift with Kubernetes >= 1.16](#) [Kubernetes <= 1.15](#)
[OpenShift with Kubernetes <= 1.15](#)

```
kubectl create -f cluster-agent-operator.yaml
```

[Kubernetes >= 1.16](#) [OpenShift with Kubernetes >= 1.16](#) [Kubernetes <= 1.15](#)
[OpenShift with Kubernetes <= 1.15](#)

```
kubectl create -f cluster-agent-operator-openshift.yaml
```

[Kubernetes >= 1.16](#) [OpenShift with Kubernetes >= 1.16](#) [Kubernetes <= 1.15](#)
[OpenShift with Kubernetes <= 1.15](#)

```
kubectl create -f cluster-agent-operator-1.15-or-less.yaml
```

[Kubernetes >= 1.16](#) [OpenShift with Kubernetes >= 1.16](#) [Kubernetes <= 1.15](#)
[OpenShift with Kubernetes <= 1.15](#)

```
kubectl create -f cluster-agent-operator-openshift-1.15-or-less.yaml
```

¹⁷⁹¹ <https://docs.appdynamics.com/display/PRO216/Install+the+Cluster+Agent>

2. Create a Cluster Agent secret using the Machine Agent access key to connect to the Controller. If a `cluster-agent-secret` does not exist, you must create one, see [Install the Cluster Agent with the Kubernetes CLI](#)¹⁷⁹².

```
kubectl -n appdynamics create secret generic cluster-agent-secret --from-literal=controller-key=<access-key>
```

3. Update the `infraviz.yaml` file to set the `controllerUrl`, `account`, and `globalAccount` values based on the information from the Controller's **License** page.
To enable Server Visibility, set `enableServerViz` to `true` (shown in the `infraviz.yaml` configuration example).
To deploy a Machine Agent without Server Visibility enabled, set `enableServerViz` to `false`.

infraviz.yaml Configuration File with Server Visibility Enabled

```
apiVersion: v1
kind: ServiceAccount
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
---
apiVersion: appdynamics.com/v1alpha1
kind: InfraViz
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
spec:
  controllerUrl: "https://mycontroller.saas.appdynamics.com"
  image: "docker.io/appdynamics/machine-agent-analytics:latest"
  account: "<your-account-name>"
  globalAccount: "<your-global-account-name>"
  enableContainerHostId: true
  enableServerViz: true
  resources:
    limits:
      cpu: 500m
      memory: "1G"
    requests:
      cpu: 200m
      memory: "800M"
```

The `infraviz.yaml` configuration file example deploys a daemonset that runs a single pod per node in the cluster. Each pod runs a single container from where the Machine Agent, or Server Visibility Agent runs.

4. To enable the Network Visibility Agent to run in a second container in the same pod, add the `netVizImage` and `netVizPort` keys and values as shown in this configuration file example:

¹⁷⁹² <https://docs.appdynamics.com/display/PRO216/Install+the+Cluster+Agent+with+the+Kubernetes+CLI>

infraviz.yaml Configuration File with Second Container in a Single Pod

```

apiVersion: v1
kind: ServiceAccount
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
---
apiVersion: appdynamics.com/v1alpha1
kind: InfraViz
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
spec:
  controllerUrl: "https://mycontroller.saas.appdynamics.com"
  image: "docker.io/appdynamics/machine-agent-analytics:latest"
  account: "<your-account-name>"
  globalAccount: "<your-global-account-name>"
  enableContainerHostId: true
  enableServerViz: true
  netVizImage: appdynamics/machine-agent-netviz:latest
  netVizPort: 3892
  resources:
    limits:
      cpu: 500m
      memory: "1G"
    requests:
      cpu: 200m
      memory: "800M"

```

5. Use kubectl to deploy infraviz.yaml

 For environments where Kubernetes PodSecurityPolicies block certain pod security context configuration, such as privileged pods, you must deploy the `infraviz-pod-security-policy.yaml` before editing the `infraviz.yaml` file.

For environments where OpenShift SecurityContextConstraints block certain pod security context configuration, such as privileged pods, you must deploy the `infraviz-security-context-constraint-openshift.yaml` before editing the `infraviz.yaml` file.

[Kubernetes](#) [Kubernetes with Pod Security Policy](#) [OpenShift](#)

```
kubectl create -f infraviz.yaml
```

Kubernetes [Kubernetes with Pod Security Policy](#) OpenShift

```
kubectl create -f infraviz-pod-security-policy.yaml
kubectl create -f infraviz.yaml
```

Kubernetes Kubernetes with Pod Security Policy [OpenShift](#)

```
kubectl create -f infraviz-security-context-constraint-openshift.yaml
kubectl create -f infraviz.yaml
```

6. Confirm that the `appdynamics-infraviz` pod is running, and the Machine Agent, Server Visibility Agent, and Network Agent containers are ready:

```
kubectl -n appdynamics get pods
NAME                                READY   STATUS    RESTARTS   AGE
appdynamics-infraviz-shkhj         2/2     Running   0          18s
```

7. To verify that the agents are registering with the Controller, review the logs and confirm that the agents display in the **Agents Dashboard** of the Controller Administration UI. In the Controller, if Server Visibility is enabled, the nodes are visible under **Controller > Servers**.

```
kubectl -n appdynamics logs appdynamics-infraviz-shkhj -c appd-infra-agent
...
Started AppDynamics Machine Agent Successfully
```

Mixed Operating System Clusters

The Cluster Agent Operator can deploy Machine Agent daemonsets to both Linux and Windows nodes. The value of the `nodeOS` property determines the deployment strategy in mixed operating system (OS) clusters. You can set this property to one of these options:

- `all`
- `linux`
- `windows`

Set `nodeOS`: `all` when both Linux and Windows daemonsets share the same properties that you can configure in a single `infraviz.yaml` file. When `nodeOS` is set to `all` or `windows`, you must set the `imageWin` property to a Windows Machine Agent image.

In this example, a single `infraviz.yaml` file is used to configure the Machine Agents that run on Windows and Linux nodes.

```
apiVersion: v1
kind: ServiceAccount
```

```

metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
---
apiVersion: appdynamics.com/v1alpha1
kind: InfraViz
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
spec:
  controllerUrl: "https://mycontroller.saas.appdynamics.com"
  image: "docker.io/appdynamics/machine-agent-analytics:latest"
  account: "<your-account-name>"
  globalAccount: "<your-global-account-name>"
  enableContainerHostId: true
  enableServerViz: true
  netVizImage: appdynamics/machine-agent-netviz:latest
  netVizPort: 3892
  resources:
    limits:
      cpu: 500m
      memory: "1G"
    requests:
      cpu: 200m
      memory: "800M"
  imageWin: docker.io/appdynamics/machine-agent-analytics:20.6.0-win-ltsc2019
  nodeOS: all
  
```

Set `nodeOS: windows` or `nodeOS: linux` when the Windows and Linux daemonsets properties differ and must be defined in separate `infraviz.yaml` files. Depending on the value of `nodeOS`, the Cluster Agent Operator assigns a `nodeSelector` value to the Machine Agent that determines its placement.

For `nodeOS: windows`, it sets `"kubernetes.io/os1793"` to `windows`.

For `nodeOS: linux`, it sets `kubernetes.io/os1794` to `linux`.

To override this default behavior, specify a `nodeSelector` in `infraviz.yaml`. For example:

```

apiVersion: v1
kind: ServiceAccount
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
---
apiVersion: appdynamics.com/v1alpha1
kind: InfraViz
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
spec:
  
```

¹⁷⁹³ <http://kubernetes.io/os>

¹⁷⁹⁴ <http://kubernetes.io/os>

```
# ... content removed for brevity
nodeOS: windows
imageWin: docker.io/appdynamics/machine-agent-analytics:20.6.0-win-ltsc2019
nodeSelector:
  kubernetes.io/os: my-windows-node-selector
```

InfraViz Configuration Settings

To configure Infrastructure Visibility, you can modify these parameters in the `infraviz.yaml` file included with the download package. After changing the file, delete and re-create the InfraViz deployment to ensure the changes are applied.

Parameter	Description	Required/Optional	Default
account	AppDynamics account name	Required	N/A
args	List of command arguments	Optional	N/A
controllerUrl	URL of the AppDynamics Controller	Required	N/A
enableContainerHostId	Flag that determines how container names are derived; specify either pod name or container id.	Required	false
enableMasters	By default, only Worker nodes are monitored. When set to true, Server Visibility is provided for Master nodes. For managed Kubernetes providers, the flag has no effect because the Master plane is not accessible.	Optional	false
enableServerViz	Enable Server Visibility	Required	false
enableDockerViz	Enable Docker Visibility	Required	false
env	List environment variables	Optional	N/A
eventServiceUrl	Event Service Endpoint	Optional	N/A
globalAccount	Global account name	Required	N/A
image	Retrieves the most recent version of the Machine Agent image.	Optional	appdynamics/machine-agent-analytics:latest

Parameter	Description	Required/ Optional	Default
imagePullSecret	Name of the pull secret image	Optional	N/A
imageWin	Machine Agent image for Windows nodes	Required when nodeOS is set to all or windows	N/A
logLevel	Level of logging verbosity. Valid options are: info or debug.	Optional	info
metricsLimit	Maximum number of metrics that the Machine Agent sends to the Controller.	Optional	N/A
netVizImage	Retrieves the most recent version of Network Agent image.	Optional	appdynamics/ machine-agent- netviz:latest
netVizPort	When > 0, the Network Agent is deployed in a sidecar with the Machine Agent. By default, the Network Visibility Agent works with port 3892.	Optional	3892
nodeSelector	OS specific label that identifies nodes for scheduling of the daemonset pods.	Optional	all
overrideVolumeMounts	The list of volumeMounts.	Optional	overrideVolumeMounts: - proc - sys - etc
priorityClassName	Name of the priority class that determines priority when a pod needs to be evicted.	Optional	N/A
propertyBag	String with any other Machine Agent parameters	Optional	N/A
proxyUrl	URL of the proxy server (protocol://domain:port¹⁷⁹⁵)	Optional	N/A
proxyUser	Proxy user credentials (user@password)	Optional	N/A
resources	Definitions of resources and limits for the Machine Agent	Optional	N/A

¹⁷⁹⁵ protocol://domainport

Parameter	Description	Required/Optional	Default
resourcesNetViz	Set resources for the Network Visibility (NetViz) container	Optional	Request <ul style="list-style-type: none"> CPU: 100m Memory: 150Mi Limit <ul style="list-style-type: none"> CPU: 200m Memory: 300Mi
stdoutLogging	Determines if logs are saved to a file or redirected to the Console.	Optional	false
tolerations	List of tolerations based on the taints that are associated with nodes.	Optional	N/A
uniqueHostId	Unique host ID in AppDynamics. Valid options are: spec.nodeName, status.hostIP.	Optional	spec.nodeName

Build the Cluster Agent Container Image

This page describes how to build a Cluster Agent container image or push a pre-built image to an internal registry.

This procedure is required when you:

- Need to build your own image to satisfy internal image policies, or
- Require that the pre-built Cluster Agent Image from Docker Hub, or the Red Hat Container Registry, is stored in an internal container registry.

See [Install the Cluster Agent](#)(see page 2861).

Otherwise, you can reference the pre-built Cluster Agent Images on Docker Hub and the Red Hat Container Registry in the `cluster-agent.yaml` or `values.yaml` Helm file. This example uses the pre-built Cluster Agent Image 21.5.0 published to Docker Hub:

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  controllerUrl: "http://<account>.saas.appdynamics.com"
  account: "<account-name>"
  appName: "Cluster1"
  image: docker.io/appdynamics/cluster-agent:21.5.0
  
```

Build the Custom Cluster Agent Image

The download packages from the AppDynamics [Download Portal](#)¹⁷⁹⁶ include files you need to build and deploy the container image for the Cluster Agent.

Depending on the base Image that was used to build the Cluster Agent Image, there are two package types available on the portal:

- Alpine Linux-based base Image
- RHEL Linux 7-based base Image

The directory structure of the download packages for the Alpine and RHEL Linux is:

[Alpine Linux](#) [RHEL Linux 7](#)

```

```

Build the Custom Cluster Agent Image

i You can build the RHEL Linux 7-based Cluster Agent image on Red Hat Linux only. Red Hat Linux is a subscription-based system. You must subscribe to the Red Hat Linux system to use the packages manager such as `microdnf`, which is used in `Dockerfile-rhel`. Perform these tasks before running the `docker build` command for RHEL:

1. Use Red Hat Linux 7 (RHEL VM Box, RHEL EC2 instance, and so on)
2. To subscribe to the Red Hat Linux system, from a command-prompt enter:

```
$ subscription-manager register --username=<your-username>
--password=<your-password>
```

3. To get the pool-ids, enter:

```
$ subscription-manager list --available
```

4. To attach the pool-id from step 3, enter:

```
$ subscription-manager attach --pool=<pool-id>
```

5. To enable repos, enter:

```
$ subscription-manager repos --enable=rhel-7-server-rpms
$ subscription-manager repos --enable=rhel-7-server-extras-
rpms
```

```
$ subscription-manager repos --enable=rhel-7-server-optional-rpms
```

- To install Docker on the RHEL machine, enter:

```
$ yum install docker device-mapper-libs device-mapper-event-lib
```

- To start docker services, enter:

```
$ systemctl start docker.service
$ systemctl enable docker.service
```

- To build the RHEL based Cluster Agent image using Docker, enter:

```
$ docker build -t docker.io/<organization>/cluster-agent:<Agent-Version> -f Dockerfile-rhel
```

See the Red Hat website under [Using the docker command and service](#)¹⁷⁹⁷ for more details.

These steps are also available at the official website of Red Hat under [Using the docker command and service](#)¹⁷⁹⁸.

If you are unable to perform the preceding steps, you can use a pre-built RHEL-based Cluster Agent image mentioned in [Use Pre-Built Cluster Agent Image](#) (see page 0). This pre-built option requires that you have Docker installed and Red Hat credentials. The pre-built image can run on any operating system. To get Red Hat credentials, create an account on the [Red Hat portal](#)¹⁷⁹⁹.

- Change directories into the docker directory:

```
$ cd docker
```

- Build and tag a docker image using this syntax:

[Alpine Linux](#) [RHEL Linux 7](#)

¹⁷⁹⁷ https://access.redhat.com/documentation/en-us/red_hat_enterprise_linux_atomic_host/7/html-single/getting_started_with_containers/index#using_the_docker_command_and_service

¹⁷⁹⁸ https://access.redhat.com/documentation/en-us/red_hat_enterprise_linux_atomic_host/7/html-single/getting_started_with_containers/index#using_the_docker_command_and_service

¹⁷⁹⁹ <https://www.redhat.com/en>

```
$ docker build -t <registryname>/<accountname>/cluster-agent:<Agent-version> --build-arg version=<alpine-version> .
```

Alpine Linux [Rhel Linux 7](#)

```
$ docker build -t <registryname>/<accountname>/cluster-agent:<Agent-version> -f Dockerfile-rhel .
```

i To use a specific Alpine Image version, set the version using `--build-arg version=<alpine-version>`. If you do not specify an image version, then the build command takes the *latest* Alpine image version automatically.

For example, to build and tag the image version 21.5.0 using alpine version 3.14.0 on Docker Hub registry for the account name johndoe:

[Alpine Linux](#) Rhel Linux 7

```
$ docker build -t docker.io/johndoe/cluster-agent:21.5.0 --build-arg version=3.14.0 .
```

Alpine Linux [Rhel Linux 7](#)

```
$ docker build -t docker.io/johndoe/cluster-agent:21.5.0 -f Dockerfile-rhel .
```

- When the build is successful, verify that the image appears in your local Docker repository.
Example output:

[Alpine Linux](#) Rhel Linux 7

```

Successfully built 819441b5a912
```

4. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example, pushing the image version 21.5.0 to Docker Hub registry for the account name Johndoe:

```
$ docker push docker.io/johndoe/cluster-agent:21.5.0
```

Use Pre-Built Cluster Agent Image

You can also use a pre-built Alpine-based Cluster Agent or Rhel-based Cluster Agent to an internal registry.

Alpine Cluster Agent Image

You can use the pre-built Alpine-based Cluster Agent image from the [AppDynamics Docker Hub¹⁸⁰⁰](#) account.

1. Log in to your Docker Hub account:

```
$ docker login docker.io -u <your-username> -p <your-password>
```

2. Pull the image:

```
$ docker pull docker.io/appdynamics/cluster-agent:<Agent-version>
```

For example, to pull the Alpine based cluster agent image version 21.5.0:

```
$ docker pull docker.io/appdynamics/cluster-agent:21.5.0
```

To push this image to another registry or accounts:

1. Rename the image:

```
$ docker tag docker.io/appdynamics/cluster-agent:<Agent-version> <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example:

```
$ docker tag docker.io/appdynamics/cluster-agent:21.5.0 docker.io/johndoe/cluster-agent:21.5.0
```

¹⁸⁰⁰ https://hub.docker.com/_/appdynamics

2. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example, to push the image version 21.5.0 to Docker Hub registry for the account name Johndoe:

```
$ docker push docker.io/johndoe/cluster-agent:21.5.0
```

Rhel Cluster Agent Image

Alternatively, you can use the pre-built Rhel based Cluster Agent Image from the [Appdynamics Redhat Container Registry](#)¹⁸⁰¹ account.

1. Log in to Red Hat Registry using your Customer Portal credentials:

```
$ docker login registry.connect.redhat.com -u <your-username> -p <your-password>
```

2. Pull the image:

```
$ docker pull registry.connect.redhat.com/appdynamics/cluster-agent:<Agent-version>
```

For example, to pull the Rhel based Cluster Agent version 21.5.0:

```
$ docker pull registry.connect.redhat.com/appdynamics/cluster-agent:21.5.0
```

You can now use the Cluster Agent image.

To push this image to another registry, or to other accounts:

1. Rename the image:

```
$ docker tag registry.connect.redhat.com/appdynamics/cluster-agent:<Agent-version>  
<registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example:

```
$ docker tag registry.connect.redhat.com/appdynamics/cluster-agent:21.5.0  
scan.connect.redhat.com/johndoe/cluster-agent:21.5.0
```

2. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example, to push the image version 21.5.0 to Redhat Registry for account name johndoe:

¹⁸⁰¹ <https://catalog.redhat.com/software/containers/search?q=AppDynamics>

```
$ docker push scan.connect.redhat.com/johndoe/cluster-agent:21.5.0
```

Set the Image in Cluster Agent YAML Specification

Make sure to reference the image in the `cluster-agent.yaml` spec:

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  controllerUrl: "http://<account>.saas.appdynamics.com"
  account: "<account-name>"
  appName: "Cluster1"
  image: <registryname>/<username>/cluster-agent:<Agent-version>
```

For assistance, contact [AppDynamics Support](#)¹⁸⁰².

Cluster Agent and the Operator Compatibility Matrix

The compatibility matrix describes which Operator (Kubernetes or OpenShift) version is required for each Cluster Agent version.

- To view the list of features for the latest agent, see [Release Notes](#)(see page 3911).
- To view the list of features for older agents, see [Past Agent Releases](#)(see page 4020).

AppDynamics recommends that you upgrade the Operator with the Cluster Agent upgrade. See [Upgrade the Cluster Agent](#). Ensure that use the latest YAML configuration files for the Operator and Cluster Agent from the upgraded version because the Cluster Agent may support new or modified configuration. If you do not update the Operator or YAML configuration file, and the Cluster Agent is upgraded, then the Cluster Agent may not work properly.

This table lists the Operator version with its supported Cluster Agent version:

Operator (Kubernetes/ OpenShift)	Cluster Agent
0.6.11	21.10.0
0.6.10	21.7.0
0.6.9	21.5.0
0.6.8	21.3.1, 21.3.0
0.6.7	21.2.0

¹⁸⁰² <https://www.appdynamics.com/support/>

Operator (Kubernetes/ OpenShift)	Cluster Agent
0.6.6	20.12.0, 20.12.1
0.6.5	20.11.0
0.6.4	20.11.0
0.6.3	20.10.0
0.6.2	20.9.1, 20.9.0
0.6.1	20.9.1, 20.9.0
0.5.4	20.8.0
0.5.3	20.7.0
0.5.2	20.6.0

Auto-Instrument Applications with the Cluster Agent

This page describes how to auto-instrument Kubernetes workloads running in a cluster where the Cluster Agent is deployed. See [Install the Cluster Agent](#)(see page 2861).

For instrumentation options, see [Container Installation Options](#)(see page 458).

AppDynamics recommends using auto-instrumentation to simplify operations.

With auto-instrumentation, you can dynamically add an App Server Agent to workloads for these application types:

- Java
- .NET Core on Linux
- Node.js

We support these Kubernetes workloads: Deployments, DeploymentConfigs and StatefulSets.

Auto-Instrumentation Overview

To enable auto-instrumentation, you:

- Add additional configuration to the `cluster-agent.yaml` file, or
- Add configuration to the Cluster Agent Helm Chart `values.yaml` file. See [Install the Cluster Agent with Helm Charts](#)(see page 2864).

Then, you can apply the changes using `kubectl` or upgrade the Cluster Agent Helm Chart.

When the Cluster Agent detects a supported workload, and the workload matches the configured auto-instrumentation rules, the Cluster Agent modifies the workload's spec using the Kubernetes API. The Cluster Agent attaches an init container with the AppDynamics .NET Core, Node.js, or Java Agent image to the workload. When the application restarts, the required agent is copied into the application container. As a result, the application container references the AppDynamics agent (Node.js Agent, .NET Core on Linux Agent, or Java Agent) in an auto-instrumented application.

Requirements

AppDynamics Requirements

- Cluster Agent \geq 20.5. See [Cluster Agent Requirements and Supported Environments](#)(see page 2858).
- Installed the latest Cluster Agent and Operator versions in the cluster. The `cluster-agent-operator.yaml` sets up the permissions required by the Cluster Agent to perform auto-instrumentation. See [Install the Cluster Agent](#)(see page 2861).
- At least one application is deployed to the cluster that was not previously instrumented with the required AppDynamics agent.
- A Controller with sufficient agent licenses based on the number of applications that will be auto-instrumented.
- Ensure that you have sufficient cluster capacity to process pod restarts. See [Minimize the Impact of Pod Restarts](#)(see page 2935).

Language-Specific Requirements

- Node.js \geq 8.6
- Java
 - Java applications must support including the `-javaagent` argument in the Java command using an environment variable. By default, the Cluster Agent uses `JAVA_TOOL_OPTIONS`; however, you can change this using the `defaultEnv` property.
 - Based on Java Agent resource requirements, it may be necessary to adjust the configured memory requests or limits for the application pods (see [Install the Java Agent](#)¹⁸⁰³).
- .NET Core on Linux and Node.js
 - Ensure that the application base image Operating System (OS) matches the App Server Agent base image OS (Linux versus Alpine). For example, if your .NET Core on Linux application uses an Ubuntu base image, then you must set the `imageInfo.image` tag to the Linux version. In this example, the image tag is `20.11.0-linux`. If the application used an Alpine Linux base image OS, then the tag would be `20.11.0-alpine`. See the [AppDynamics Docker Hub page](#)¹⁸⁰⁴.

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  # content removed for brevity
  instrumentationRules:
    - namespaceRegex: dev
      language: dotnetcore
      appName: MyDotNetAppOnUbuntu
      imageInfo:
        image: "docker.io/appdynamics/dotnet-core-agent:20.11.0-linux"
        agentMountPath: /opt/appdynamics
  
```

If the base image Operating Systems do not match, then the App Server Agent may not start. See [Validate Auto-Instrumentation](#)(see page 2960). The Node.js Agent also has specific Node.js runtime requirements that may prevent the agent from starting. See [Node.js Supported Environments](#)¹⁸⁰⁵.

- For .NET Core and Node.js applications that communicate with an on-premises Controller, see [Use Auto-Instrumentation with an On-Premises Controller](#)(see page 2928).
- If transaction analytics data is required, then you must configure the Cluster Agent `analyticsHost` and `analyticsPort` properties.

¹⁸⁰³ <https://docs.appdynamics.com/display/PRO45/Install+the+Java+Agent#javaagentresourceoverhead>

¹⁸⁰⁴ <https://hub.docker.com/u/appdynamics>

¹⁸⁰⁵ <https://docs.appdynamics.com/display/PRO21/Node.js+Supported+Environments>

Enable Auto-Instrumentation for the Cluster Agent

To set up the Cluster Agent feature:

1. First, remove any deleted pods from the Controller **Tiers & Nodes** Dashboard. Then, re-create the `cluster-agent-secret` that was created in [Install the Cluster Agent](#)(see page 2861) to include `api-user`. Set the `api-user` value to a local user from the Controller with the Administrator role:

```
kubectl -n appdynamics delete secret cluster-agent-secret
kubectl -n appdynamics create secret generic cluster-agent-secret --from-literal=controller-key=<access-key> --from-literal=api-user="<username>@<customer>:<password>"
```

The Cluster Agent uses the `api-user` to mark the associated node in the Controller as historical upon pod deletion.

2. Add auto-instrumentation configuration to the `cluster-agent.yaml` or the Helm `values.yaml` file. The configuration determines which Deployments, DeploymentConfigs and StatefulSets workloads to target for auto-instrumentation and which agent types and versions to use. See [Auto-Instrumentation Configuration](#)(see page 2936).
3. After you save the configuration, apply or upgrade the Cluster Agent deployment. The related pods and containers restart based on the deployment rollout strategy associated with the applications.

[Kubernetes CLI](#) [Helm Chart](#)

```
kubectl apply -f cluster-agent.yaml
```

[Kubernetes CLI](#) [Helm Chart](#)

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --namespace appdynamics
```

To validate and troubleshoot auto-instrumentation, see [Validate the Cluster Agent Installation](#)(see page 2874).

- If a workload does not match the properties defined in `instrumentationRules`, then auto-instrumentation is not enabled.
- If an auto-instrumentation property is not defined as a default, or in `instrumentationRules`, then the Cluster Agent uses the corresponding default value specified in [Auto-Instrumentation Configuration](#)(see page 2936). If there are no corresponding default values, then auto-instrumentation is not enabled.

Configuration Examples

Example 1 targets Java applications in the namespaces that match the `ecom.*` pattern. Each matching application will be instrumented with a `20.20.1` Java Agent and will report to the `Ecommerce` application in the AppDynamics Controller. By default, the tier name is the name of the Kubernetes workload, but you can override it by setting the `tierName` property.

Example 1: cluster-agent-auto-1.yaml

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<app-name>"
  controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  image: "docker.io/appdynamics/cluster-agent:20.12.1"
  serviceAccountName: appdynamics-cluster-agent
  nsToMonitorRegex: ecom.*
  #
  # auto-instrumentation config
  #
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom.*
  defaultAppName: Ecommerce
  instrumentationRules:
    - language: java
      imageInfo:
        image: docker.io/appdynamics/java-agent:20.20.1
        agentMountPath: /opt/appdynamics
  
```

Example 2 targets namespaces that contain Java and .NET Core on Linux applications, and incorporates these advanced configurations:

- Uses multiple `instrumentationRules` to target Java applications versus .NET Core on Linux applications.
- Uses the `labelMatch` strategy to determine the agent type and associated agent image based on the value of the framework label in the workload spec `auto-instrumented-dotnet-app.yaml` and `auto-instrumented-java-app.yaml` below.
- Rather than assigning a Controller application name in the YAML file, the configuration uses `appNameStrategy: label` to assign an application name based on a label from the workload spec.
- For the Java applications, it uses `instrumentContainer: select` and `containerMatchString: .*service` to instruct the Cluster Agent to auto-instrument only the application service container only, and ignore any other defined containers defined.

Example 2: cluster-agent-auto-2.yaml

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<app-name>"
  controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  image: "docker.io/appdynamics/cluster-agent:20.12.1"
  serviceAccountName: appdynamics-cluster-agent
  nsToMonitorRegex: ecom.*
  #
  # auto-instrumentation config
  #
  instrumentationMethod: Env
  nsToInstrumentRegex: stage
  appNameStrategy: label
  instrumentationRules:
    - namespaceRegex: stage
      language: dotnetcore
      labelMatch:
        - framework: dotnetcore
      appNameLabel: appName
      imageInfo:
        image: "docker.io/appdynamics/dotnet-core-agent:20.11.0-linux"
        agentMountPath: /opt/appdynamics
    - namespaceRegex: stage
      language: java
      labelMatch:
        - framework: java
      appNameLabel: appName
      instrumentContainer: select
      containerMatchString: .*service
      imageInfo:
        image: "docker.io/appdynamics/java-agent:21.3.0"
        agentMountPath: /opt/appdynamics
  
```

Examples 3 and 4 show Deployment specs for .NET and Java services that define the `appName` and `framework` labels, based on the auto-instrumentation configuration from the `cluster-agent-auto-2.yaml`:

[Example 3: auto-instrumented-dotnet-app.yaml](#)

[Example 4: auto-instrumented-java-app.yaml](#)

.NET

```

apiVersion: apps/v1
kind: Deployment
metadata:
  name: dotnet-profile-service
  labels:
    appName: backend-services
    framework: dotnetcore
spec:
  containers:
    - image: myrepo/profile-service:v2
      name: profile-service
# ...

```

Example 3: [auto-instrumented-dotnet-app.yaml](#) [Example 4: auto-instrumented-java-app.yaml](#)

Java

```

apiVersion: apps/v1
kind: Deployment
metadata:
  name: java-account-service
  labels:
    appName: backend-services
    framework: java
spec:
  containers:
    - image: myrepo/account-service:v2
      name: account-service
    - image: myrepo/proxy-util:v1
      name: proxy-util
# ...

```

The value of `containerMatchString` in `cluster-agent-auto-2.yaml` indicates that only the `account-service` container will be auto-instrumented in `auto-instrumented-java-app.yaml`.

For additional configuration examples, see [Auto-Instrumentation Configuration Examples](#) (see page 2953).

AppDynamics Application Name Strategies

The Controller's **Application Dashboard** provides three application name strategies. Select a strategy by assigning the `appNameStrategy` property to one of these values:

- [manual](#)(see page 0): Use the `defaultAppName` or `appName` parameters in the `cluster-agent.yaml` file to set the application name.
- [label](#)(see page 2934): Use a label from the workload's spec as the application name.
- [namespace](#)(see page 2935): Use the Kubernetes namespace as the application name.

Manual Strategy

By default, the `appNameStrategy` is `manual`, which uses the `defaultAppName` or `appName` parameter to set the application name.

- If `defaultAppName` is provided, then use it (unless overwritten in an instrumentation rule).
- If `appName` is provided in an instrumentation rule, then use it.

For example in this spec, `ECommerce` is the default application name applied to the `ecom` and `groceries` namespaces, and `BookStore` is the application name applied to the `books` namespace.

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<cluster-name>"
  # ...
  # auto-instrumentation config
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom|books|groceries
  appNameStrategy: manual
  defaultAppName: ECommerce
  instrumentationRules:
    - namespaceRegex: books
      appName: BookStore
  
```

Label Strategy

This option uses the `label` parameter as the application name strategy. To use the label option, specify a value in the `appNameLabel` parameter. The `appNameLabel` value refers to a label specified in the workload spec.

- If `spec.appNameLabel` is provided, then use it (unless overwritten in an instrumentation rule).
- If `appNameLabel` is provided in an instrumentation rule, then use it.

For example in this spec, the workload spec label `appname` is used to set the application name in the `ecom` and `groceries` namespaces, and the label `app` is used in the `books` namespace.

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<cluster-name>"
  
```

```
# ...
# auto-instrumentation config
instrumentationMethod: Env
nsToInstrumentRegex: ecom|books|groceries
appNameStrategy: label
appNameLabel: appname
instrumentationRules:
  - namespaceRegex: books
    appNameLabel: app
```

For an application deployed to the `ecom` or `groceries` namespaces that sets the label `appname` (shown in this Deployment spec snippet), it reports to the eCommerce application in the Controller's **Application Dashboard**.

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: ecom-app
  labels:
    appname: eCommerce
spec:
  ...
```

Namespace Strategy

This option uses the Kubernetes `namespace` parameter as the application name strategy and allows you to use the namespace name where an application is deployed as the application name in the Controller's **Application Dashboard**.

In this spec, each application in `ecom`, `books`, and `groceries` namespace uses the application name based on the namespace that it is deployed to.

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<cluster-name>"
  # ...
  # auto-instrumentation config
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom|books|groceries
  appNameStrategy: namespace
```

Minimize the Impact of Pod Restarts

When auto-instrumentation is enabled, the related pods restart based on the deployment rollout strategy associated with the workload. Pod restarts often create CPU and memory usage spikes that may adversely impact performance or exhaust available capacity. To accommodate pods restarts, you may need to

increase memory and CPU quotas associated with the impacted namespaces. To reduce the impact of restarting a large number of pods, the Cluster Agent (by default) allows only two concurrent auto-instrumentation tasks. The subsequent workloads (`resourcesToInstrument`) are auto-instrumented after the rollout of an instrumented workload. However, you can configure the parameter, `numberOfTaskWorkers`, to specify the number of concurrent auto-instrumentation tasks based on your cluster's requirements.

Auto-Instrumentation Configuration

This page describes the properties available in the `cluster-agent.yaml` and the Helm `values.yaml` file that you can use to configure auto-instrumentation.

Configuration Structure for Auto-Instrumentation

The structure of the auto-instrumentation configuration is based on a set of default properties, which you can override by using properties defined in one or more `instrumentationRules`.

[cluster-agent.yaml](#) `values.yaml`

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  # cluster agent properties
  # ...
  # required to enable auto-instrumentation
  instrumentationMethod: Env
  # default auto-instrumentation properties
  # may be overridden in an instrumentationRule
  nsToInstrumentRegex: dev|stage|prod
  image: "docker.io/appdynamics/java-agent:21.7.0"
  # ...
  # one or more instrumentationRules
  instrumentationRules:
    - nsToInstrumentRegex: dev
      imageInfo:
        image: "docker.io/appdynamics/java-agent:21.3.1"
        agentMountPath: /opt/appdynamics
        imagePullPolicy: Always
      # ...
    - nsToInstrumentRegex: stage
      imageInfo:
        image: "docker.io/appdynamics/java-agent:21.5.0"
        agentMountPath: /opt/appdynamics
        imagePullPolicy: Always
      # ...

```

cluster-agent.yaml [values.yaml](#)

```

deploymentMode: MASTER

# cluster agent properties
# ...
clusterAgent:
  nsToMonitorRegex: .*
# ...
# Instrumentation config

      agentMountPath: /opt/appdynamics
      imagePullPolicy: Always
    # ...
  - nsToInstrumentRegex: stage
    imageInfo:
      image: "docker.io/appdynamics/java-agent:21.5.0"
      agentMountPath: /opt/appdynamics
      imagePullPolicy: Always
    # ...

```

Overriding Default Properties with InstrumentationRules

The Cluster Agent uses a combination of `namespaceRegex`, `matchString`, and `labelMatch` properties in an `InstrumentationRule` to target `Deployments`, `DeploymentConfigs` and `StatefulSets` in a namespace for auto-instrumentation. The first matching `InstrumentationRule` is used. If no matching rule is found, then the default properties are used to determine if auto-instrumentation should be applied:

- `nsToInstrumentRegex`
- `defaultInstrumentationLabelMatch`
- `defaultInstrumentMatchString`

For example, the following `InstrumentationRule` with `-matchString "<string>"` is added to the Cluster Agent configuration file:

```
instrumentationRules:
  - matchString: "<string>"
```

i You must have a deployment for auto-instrumentation to work.

If the deployment name matches this string, then the remaining properties under the matching `instrumentationRule` are applied and will override any default properties that are set. If the string does not match, then the Cluster Agent defaults to the properties `nsToInstrumentRegex`, `defaultInstrumentationLabelMatch`, and `defaultInstrumentMatchString` to determine the instrumentation rules.

Common Auto-Instrumentation Tasks

These properties are available to support common auto-instrumentation configuration tasks:

- To set the namespaces that are in scope for auto-instrumentation:
 - `nsToInstrument`
 - `nsToInstrumentRegex`
- (Optional) To filter and target the set of applications within a namespace that are in scope for auto-instrumentation:
 - `instrumentationMatchString`
 - `labelMatch`
- To assign an application and tier name to an instrumented application:
 - `appNameStrategy`
 - `tierName` (optional, will use deployment name by default)

See [Options for Naming the AppDynamics Application](#) (see page 0).

- To instrument which containers are in a multi-container application:
 - `instrumentContainer`
 - `containerMatchString`

The `instrumentContainer` default is to instrument the first container based on the ordering returned by the Kubernetes API.

- If transaction analytics is required for Node.js applications, then specify the analytics host and port:
 - `analyticsHost`
 - `analyticsPort`

See [Deploy Analytics Without the Analytics Agent](#)¹⁸⁰⁶. Configuration of transaction analytics is not required for .NET and Java applications. You can deploy the Analytics Agent using the sidecar model where you add an Analytics Agent container to each application pod, and then start/stop with the application container. If you use the sidecar approach, the App Server Agent uses the default host `localhost` and port `9090` and connects automatically. No additional configuration is required. See [Install Agent Side Components in Kubernetes](#)¹⁸⁰⁷.

Default Auto-Instrumentation Properties

This table describes the default properties available to configure auto-instrumentation, defined in the `cluster-agent.yaml` spec:

¹⁸⁰⁶ <https://docs.appdynamics.com/21.8/en/analytics/deploy-analytics-without-the-analytics-agent>

¹⁸⁰⁷ <https://docs.appdynamics.com/21.8/en/analytics/deploy-analytics-with-the-analytics-agent/install-agent-side-components-in-kubernetes>

Parameter Name	Default Value	Description
appNameLabel	N/A	The value of this label will be the AppDynamics application name.
appNameStrategy	manual	<p>The option to specify a name for the AppDynamics application. You can specify any of these values for this parameter:</p> <ul style="list-style-type: none"> • manual • namespace • label <p>See Options for Naming the AppDynamics Application¹⁸⁰⁸.</p>
defaultAnalyticsHost	N/A	<p>The hostname of the Analytics Agent.</p> <p>This parameter is required if you require the Node.js Agent or the .NET Core Agent to send the default transaction data to the Analytics Agent.</p> <p>The default value is applied to all the instrumented resources unless it is overwritten by the <code>instrumentationRules</code> configuration.</p>
defaultAnalyticsPort	N/A	<p>The listening port for Analytics Agent.</p> <p>For example, if the Analytics Agent is listening on port 9090, then the value of this parameter is 9090.</p> <p>The default value is applied to all the instrumented resources unless it is overwritten by the <code>instrumentationRules</code> configuration.</p> <p>This parameter is required along with <code>defaultAnalyticsHost</code> if you require the Node.js or the .NET Core Agent to send the default transaction data to the Analytics Agent.</p>

¹⁸⁰⁸ <http://docs.appdynamics.com/#naming-appd-application>

Parameter Name	Default Value	Description
defaultAnalyticsSslEnabled	N/A	<p>This value is based on whether the Analytics Agent port is SSL enabled. If the port is SSL enabled, specify the value as <code>true</code>; else, specify as <code>false</code>.</p> <p>This parameter is required with <code>defaultAnalyticsPort</code> and <code>defaultAnalyticsHost</code>, if you require the Node.js or the .NET Core Agent, to send the default transaction data to the Analytics Agent.</p> <p>The default value is applied to all the instrumented resources unless it is overwritten by the <code>instrumentationRules</code> configuration.</p>
defaultAppName	""	(Required) Application name used by the agent to report to the Controller.
defaultCustomConfig	N/A	<p>This parameter is specific to Java applications.</p> <p>You can add any custom system property if your application framework requires any specific configuration for instrumentation.</p> <p>This value is appended to the <code>env</code> or <code>defaultEnv</code> variable as configured with other Java Agent properties.</p>
defaultContainerMatchString	N/A	<p>This is a regex value to choose the containers to instrument. This parameter requires you to use the <code>select</code> option within the <code>instrumentContainer</code> (specified in the instrumentation rules).</p> <p>When the <code>select</code> option is used with this parameter, Cluster Agent instruments the containers that match the regex value.</p>

Parameter Name	Default Value	Description
defaultEnv	JAVA_TOOL_OPTIONS	<p>This parameter is specific to Java applications.</p> <p>Environment variable to which the -javaagent argument and App Agent system properties are added.</p> <p>You can override this variable to use any other environment variable best suited for the deployment.</p>
defaultInstrumentationLabelMatch	[]	<p>Specific deployment labels marked for instrumentation.</p> <p>This parameter accepts a list of key-value pairs to instrument.</p> <p>You must match a minimum of one label for instrumentation.</p> <p>For example:</p> <pre>defaultInstrumentationLabelMatch: - label1: value1 - label1: value2 - label2: value2</pre> <p>For example, if only label1: value2 matches, then the instrumentation works as expected.</p>

Parameter Name	Default Value	Description
defaultInstrumentMatchString	.*	<p>Names of deployments targeted for instrumentation.</p> <p>This parameter is used as the default value for the <code>matchstring</code> parameter that is specified within instrumentationRules (see page 0). If <code>matchstring</code> is not specified, then Cluster Agent uses this parameter value.</p> <p>This parameter accepts deployment names as a regular expression or regex.</p> <p>If there are multiple deployments to instrument, you can separate names with a <code> </code> without spaces.</p> <p>By default, this parameter instruments all deployments configured by <code>nsToInstrumentRegex</code>. Therefore, if there is no value specified for <code>matchString</code> in the instrumentation rules and if you do not specify any value for this parameter, then Cluster Agent instruments every deployment.</p>

Parameter Name	Default Value	Description
imageInfo	<pre> java: image: "docker.io/ appdynamics/java- agent:latest" agentMountPath: "/opt/ appdynamics" imagePullPolicy: "IfNotPresent" dotnetcore: image: "docker.io/ appdynamics/dotnet-core- agent:latest" agentMountPath: / opt/appdynamics imagePullPolicy: "IfNotPresent" nodejs: image: "docker.io/ appdynamics/nodejs- agent:20.8.0-stretch- slimv14" agentMountPath: /opt/ appdynamics imagePullPolicy: "IfNotPresent" </pre>	<p>The Docker repository from where the Node.js Agent, .NET Core for Linux, and Java Agent is pulled.</p> <p>Supported values are:</p> <ul style="list-style-type: none"> image: Location of the agent image, along with its tag/version. agentMountPath: Location of image artifacts in the image file system. The default is /opt/appdynamics. You must change this configuration if the path is different. imagePullPolicy: The pull policy required for the agent's docker image. You can choose one of these pull policies based on your requirement: <ul style="list-style-type: none"> Always IfNotPresent Never <p>This parameter is used in the init containers that are added during auto-instrumentation.</p>
instrumentationMethod	None	<p>The instrumentation method used for instrumenting Apps.</p> <p>Supported values are:</p> <ul style="list-style-type: none"> None: Instrumentation is disabled. Env: Attach the instrumentation properties to the container environment variables. If a value is not set, the instrumentation will not start.

Parameter Name	Default Value	Description
instrumentationRules	[]	<p>Required. This parameter is used to enable auto-instrumentation.</p> <p>This includes the list of specific instrumentation rules. You can apply the rules to one or more namespaces, and can filter on deployment names and labels. Instrumentation rules are granular to support targeting specific deployments.</p> <p>See Cluster Agent Configuration for Instrumentation Rules(see page 0).</p>
nsToInstrumentRegex	""	<p>Required. If you do not specify a value, auto-instrumentation will not work.</p> <p>Specify the namespaces to be instrumented as a regex.</p> <p>If there are multiple namespaces to instrument, separate namespaces using " " without spaces.</p> <p>By default, namespaces are not instrumented.</p>
numberOfTaskWorkers	2	<p>To configure the rate limit for the number of deployments that are auto-instrumented at the same time.</p> <div style="border: 1px solid #0070C0; background-color: #E6F2FF; padding: 10px; margin-top: 10px;"> <p>i Increasing this value may lead to a larger number of concurrent pod restarts in the cluster.</p> </div>

Parameter Name	Default Value	Description
netvizInfo	bciEnabled: true port: 3892	<p>To configure the Network Visibility App Agent, <code>netviz</code>, you must deploy a Network Agent separately and set this parameter. See Install Infrastructure Visibility with the Cluster Agent Operator(see page 2908) on how to install the Network Agent.</p> <p>By default, <code>netviz</code> is enabled. In the absence of a Network Agent, this property does not have any impact. You can enable or disable the <code>netviz</code> Agent.</p> <p>Supported values are:</p> <ol style="list-style-type: none"> 1. <code>bciEnabled</code>: Boolean flag denoting whether <code>netviz</code> is enabled. 2. <code>port</code>: The port the Network Agent is listening on (default is 3892). Override this value only when running the Network Agent on a port other than the default port.
runAsGroup	0	<p>If you configured the application container as a non-root user, provide the group ID (GID) of the corresponding group.</p> <p><code>runAsGroup</code> is used to set the appropriate file permission on the agent artifacts.</p> <p>The default <code>runAsGroup</code> value is applied to all the instrumented resources, unless it is overwritten by the <code>instrumentationRules</code> configuration.</p>
runAsUser	0	<p>If you configured the application container as a non-root user, provide the user ID (UID) of the corresponding user.</p> <p><code>runAsUser</code> is used to set the appropriate file permission on the agent artifacts.</p> <p>The default <code>runAsUser</code> value is applied to all the instrumented resources unless it is overwritten by <code>instrumentationRules</code> configuration.</p>

Parameter Name	Default Value	Description
resourcesToInstrument	Deployment	<p>Cluster Agent instruments the resources that are listed in this parameter. The supported values are:</p> <ul style="list-style-type: none"> • Deployment • StatefulSet • DeploymentConfig <p>For example, to instrument Deployments and StatefulSets, configure:</p> <pre>resourcesToInstrument:</pre> <ul style="list-style-type: none"> - Deployment - StatefulSet

InstrumentationRule Properties

This table describes the properties available to configure auto-instrumentation in an InstrumentationRule.

Parameter Name	Default Value	Description
analyticsHost	N/A	<p>The hostname of the Analytics Agent.</p> <p>This parameter is required if you require the Node.js Agent or the .NET Core Agent to send the default transaction data to the Analytics Agent.</p>
analyticsPort	N/A	<p>The listening port for Analytics Agent.</p> <p>For example, if the Analytics Agent is listening on port 9090, then the value of this parameter is 9090.</p> <p>This parameter is required with defaultAnalyticsHost if you require the Node.js or the .NET Core Agent to send the default transaction data to the Analytics Agent.</p>

Parameter Name	Default Value	Description
<code>analyticsSslEnabled</code>	N/A	<p>This value is based on whether the Analytics Agent port is SSL enabled. If the port is not SSL enabled, specify the value as <code>false</code>.</p> <p>This parameter is required with <code>defaultAnalyticsPort</code> and <code>defaultAnalyticsHost</code> if you require the Node.js or the .NET Core Agent to send the default transaction data to the Analytics Agent.</p>
<code>containerMatchString</code>	N/A	<p>This is a regex value to choose the containers with the name that satisfies the value. This parameter requires you to use the <code>select</code> option within <code>defaultInstrumentContainer</code> or <code>instrumentContainer</code>.</p> <p>When the <code>select</code> option is used with this parameter, Cluster Agent instruments the containers that match the regex value.</p> <p>This parameter overrides the default value specified for <code>defaultContainerMatchString</code>.</p>

Parameter Name	Default Value	Description
<p>customAgentConfigSource</p>	<p>N/A</p>	<p>This parameter provides an option to use the custom configuration of the instrumenting agents through ConfigMaps. This parameter requires that you create the required ConfigMaps in the Cluster Agent namespace. This parameter is dynamically configurable from the Cluster Agent YAML file. The changes that you make in the YAML file are updated to all the instrumented agents without restarting the application. Similarly, the changes that you make to the configuration in the ConfigMap is updated to all the instrumented agents without restarting the application.</p> <ul style="list-style-type: none"> • <code>configMapName</code>: Specify the name of the ConfigMap. This allows the agent to use the same custom ConfigMap to update all the instrumented agent namespace. • <code>subDir</code>: (Required for Java Agent) Specify the relative path where the ConfigMaps are mounted. For example: <code>/ver20.8.0.3686/conf</code>, where <code>20.8.0.3686</code> is the version of the Java Agent. This directory may differ based on the Java Agent version. See Example 6 (see page 0). The absolute mount path for the ConfigMap is <code><agent home path>/subDir</code> This ConfigMap replaces any ConfigMap of the same name in the target application's namespace. <div style="border: 1px solid #00aaff; padding: 10px; margin-top: 10px;"> <p>i If you need to remove a ConfigMap file (used in the rules) from your deployment, then you must first remove this parameter from the Cluster Agent YAML file, and then remove the ConfigMap from the Cluster Agent's namespace.</p> </div>

Parameter Name	Default Value	Description
instrumentContainer	first	<p>This parameter provides an option to choose the container that must be instrumented. You can specify any of these values:</p> <ul style="list-style-type: none"> • <code>first</code>: This is the default value. When you specify this value, Cluster Agent instruments the first container in the pod. • <code>all</code>: When you specify this value, Cluster Agent instruments all the containers in the pod. • <code>select</code>: When you specify this value, Cluster Agent instruments only those containers with the name that matches a regex specified in the <code>defaultContainerMatchString</code> parameter or the <code>containerMatchString</code> parameter.
language	N/A	<p>The language of the application to be instrumented.</p> <p>These languages are supported:</p> <ul style="list-style-type: none"> • <code>dotnetcore</code> • <code>java</code> • <code>nodejs</code>
matchString	N/A	<p>Regular expression to match on deployment name on which the rule applies.</p> <p>If you do not specify a value for this parameter, then the Cluster Agent uses the value specified in the <code>defaultInstrumentMatchString</code>, and instruments all the deployments that satisfy the value.</p>
labelMatch	{}	<p>A list of key-value pairs of labels to include in this rule. It is sufficient to match any one of the labels.</p> <p>For example:</p> <pre>labelMatch: -label1: value1 -label1: value2 -label2: value2</pre> <p>If only <code>label1: value2</code> matches, then instrumentation works as expected.</p>

Parameter Name	Default Value	Description
appName	<defaultAppName>	<p>Application name used by the Java Agent to report to the Controller. This overrides defaultAppName.</p> <p>If no value is provided, then the configured defaultAppName is used.</p>
appNameLabel	N/A	The value of this label is the AppDynamics application name.
customAgentConfig	N/A	<p>This parameter is specific to Java applications.</p> <p>You can add any custom system property if your application framework requires any specific configuration for instrumentation. This value takes precedence over the default value specified in the defaultCustomConfig parameter.</p> <p>This value is appended to the env or defaultEnv variable as configured with other Java Agent properties.</p>
tierName	""	<p>Tier name used by the Java Agent to report to the Controller.</p> <p>If no tier name is provided, then the deployment name is used as the default.</p>
env	""	<p>This parameter is specific to Java applications.</p> <p>Environment variable to which the App Agent system properties will be added. When specified, this overrides defaultEnv for the deployments matching this instrumentation rule.</p> <p>If none are provided, it defaults to the defaultEnv (if configured), or to the default env JAVA_TOOL_OPTIONS (if not configured at the default cluster level).</p>

Parameter Name	Default Value	Description
imageInfo	<pre> image: "docker.io/ appdynamics/java- agent:latest" agentMountPath: "/opt/ appdynamics" imagePullPolicy: "IfNotPresent" dotnetcore: image: "docker.io/ appdynamics/dotnet-core- agent:latest" agentMountPath: /opt/ appdynamics imagePullPolicy: "IfNotPresent" nodejs: image: "docker.io/ appdynamics/nodejs- agent:20.8.0-stretch- slimv14" agentMountPath: /opt/ appdynamics imagePullPolicy: "IfNotPresent" </pre>	<p>Location of the agent image. You can select one of these properties:</p> <ul style="list-style-type: none"> • <code>image</code>: Location of the agent image, and its tag/ version. • <code>agentMountPath</code>: Location of image artifacts in the image file system. The default is <code>/opt/appdynamics</code>. This configuration is required only if the path differs from the default path. • <code>imagePullPolicy</code>: The pull policy required for the agent's Docker image. The default is <code>IfNotPresent</code>. You can choose one of these pull policies based on your requirement: <ul style="list-style-type: none"> ◦ <code>Always</code> ◦ <code>IfNotPresent</code> ◦ <code>Never</code> <p>This parameter is used in the init containers that are added during auto-instrumentation.</p> <p>The default value is <code>IfNotPresent</code>.</p> <p>For the specific language mentioned in this rule, this overrides <code>image-info</code> for the deployments matching this instrumentation rule.</p> <p>You must configure this if you want to override the default cluster-level configuration and use a custom agent version for this specific rule selection.</p>

Parameter Name	Default Value	Description
netvizInfo	<pre>bciEnabled: true port: 3892</pre>	<p>To configure the Network Visibility App Agent, <code>netviz</code>, you must deploy a Network Agent separately and set this parameter. See Install Infrastructure Visibility with the Cluster Agent Operator(see page 2908) to install the Network Agent.</p> <p>By default, <code>netviz</code> is enabled. This property has no impact without a Network Agent.</p> <p>You can enable or disable the <code>netviz</code> Agent.</p> <p>Supported values are:</p> <ol style="list-style-type: none"> 1. <code>bciEnabled</code>: Boolean flag denoting whether <code>netviz</code> is enabled or not. 2. <code>port</code>: The port the Network Agent is listening on (default is 3892). Override this value only when running the Network Agent on a port other than the default port.
runAsGroup	0	<p>If you configured the application container as a non-root user, provide the <code>groupId</code> of the corresponding group.</p> <p>This sets the appropriate file permission on the agent artifacts.</p> <p>This value is applied to all the instrumented resources.</p> <p>Add this parameter, if you require to override the default value of <code>runAsGroup</code> that is configured for default instrumentation, or if you require a specific value for the resources that satisfy this rule.</p>

Parameter Name	Default Value	Description
runAsUser	0	<p>If you configured the application container as a non-root user, it provides the <code>userId</code> of the corresponding user.</p> <p>This sets the appropriate file permission on the agent artifacts.</p> <p>This value is applied to all the instrumented resources.</p> <p>Add this parameter, if you require to override the default value of <code>runAsUser</code> that is configured for default instrumentation, or if you require a specific value for the resources that satisfy this rule.</p>

Auto-Instrumentation Configuration Examples

This page describes examples for common auto-instrumentation configuration scenarios.

- **Example 1:** Instrument all the deployments in the `ecom` namespace. The Java Agents running in each pod will register to the Controller with the `Ecommerce` application, and the tier names will default to the Kubernetes deployment names.
- **Example 2:** Instrument only those deployments with names starting with `Payment` and with the label `module=payment` in any namespace.
- **Example 3:** Instrument all deployments in namespaces `ecom` and `books`. For applications in the `books` namespace, use the `BookStore` application name in the Controller and a specific version of the Java Agent.
- **Example 4:** Override the configuration in Example 3 for the `groceries` namespace to use a different Controller application name, and the `JAVA_OPTS` environment variable to inject the `-javaagent` Java argument.
- **Example 5:** Instrument a Node.js application in namespace `books` and a .NET Core Linux application in namespace `groceries`. Also, the Node.js application must send the transaction data to the Analytics Agent.
- **Example 6:** Instrument the containers with the names that start with `str` for the Java application in namespace `ecom`. Also, use the custom agent configurations in `controller-info.xml` and `app-agent-config.xml` configuration files that are in the `controllerConf` ConfigMap along with the `log4j2.xml` file for logging settings of the agent in the `logConf` ConfigMap. These ConfigMaps are in the Cluster Agent's namespace.
- **Example 7:** Instrument all the deployments in the `groceries` namespace and instrument only those deployments with names starting with `Payment` in the `books` and `ecom` namespace.

  instrumentationRules:
    - namespaceRegex: groceries
      matchString: .*
    - namespaceRegex: ecom|books
      #no matchstring so it will take default matchstring which is ^payment
  
```

Use Auto-Instrumentation with an On-Premises Controller

The .NET Core and Node.js applications support certificates signed by a certificate authority (CA) only. The applications do not support self-signed certificates. If your Controller is using a self-signed certificate, then only auto-instrumentation for Java applications is supported.

To support auto-instrumentation with an on-premises Controller, configure the Cluster Agent `customSSLSecret` property to set the SSL certificates that the Cluster Agent uses to communicate with the on-premises Controller. See [Configure the Cluster Agent to Use SSL for On-Premises Controllers](#) (see page 2887). The Cluster Agent copies the certificates to the auto-instrumented pods where they are used by App Server Agents to establish connections with the on-premises Controller.

Configuration for Node.js and an On-Premises Controller

In addition to configuring the Cluster Agent `customSSLSecret` property, you must perform these steps for auto-instrumented Node.js applications that use an on-premises Controller.

1. Create a file named `shim.js` that sets the `certificateFile` property used by the Node.js Agent. See [Node.js Settings Reference](#)¹⁸⁰⁹.

```
require("appdynamics").profile({
  certificateFile: "/opt/appdynamics-nodejs/custom-ssl.pem"
});
```

2. Create a `ConfigMap` in the `appdynamics` namespace from the `shim.js` file:

```
kubectl create cm nodejs-cert-configmap --from-file ./shim.js -n appdynamics
```

3. Edit the `cluster-agent.yaml` file to set the `customAgentConfigSource/configMapName` property to the name of the `ConfigMap` (`nodejs-cert-configmap`):

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  # content removed for brevity
  # ...
  instrumentationRules:
    - namespaceRegex: dev
      appName: MyNodeJSApp
      language: nodejs
      customAgentConfigSource:
        - configMapName: nodejs-cert-configmap
      imageInfo:
        image: "docker.io/appdynamics/nodejs-agent:20.12.0-10.0.0-alpine"
```

¹⁸⁰⁹ <https://docs.appdynamics.com/display/PRO211/Node.js+Settings+Reference>

```
agentMountPath: /opt/appdynamics
```

4. Apply the updated Cluster Agent configuration:

```
kubectl apply -f cluster-agent.yaml
```

The Cluster Agent updates the Node.js workload spec which recreates the pods and copies the certificate file to the pods. The certificate file is referenced by the Node.js Agent through the `NODE_OPTIONS` environment variable and `shim.js` file.

Validate Auto-Instrumentation

This page describes how to validate and troubleshoot Cluster Agent auto-instrumentation.

Prerequisites

- Cluster Agent is reporting to the Controller. See [Validate the Cluster Agent Installation](#)(see page 2874).
- If you upgraded the Cluster Agent, you followed the [Upgrade the Cluster Agent](#)(see page 3004) procedure and used a compatible set of images and YAML files.

Validate Auto-Instrumentation

- After applying auto-instrumentation, confirm that the application is reporting to the Controller using the application name assigned based on the name strategy you chose. See [Auto-Instrument Applications with the Cluster Agent](#)(see page 2928).
- Verify that the application pods targeted for auto-instrumentation have been recreated. As auto-instrumentation is being applied, use `kubectl get pods` with the `-w` flag to print out updates to pod status in real-time. A successfully auto-instrumented application shows that the app pod was recreated, and the correct init container was applied and copied the App Server Agent to the application container.

```
kubectl -n <app ns> get pods -w
NAME                                READY   STATUS             RESTARTS   AGE
dotnet-app-85c7d66557-s8hzm         1/1    Running            0           3m11s
dotnet-app-6c45b6d4f-fpp75         0/1    Pending            0           0s
dotnet-app-6c45b6d4f-fpp75         0/1    Init:0/1           0           0s
dotnet-app-6c45b6d4f-fpp75         0/1    PodInitializing    0           5s
dotnet-app-6c45b6d4f-fpp75         1/1    Running            0           6s
dotnet-app-85c7d66557-s8hzm         1/1    Terminating      0           20m\
```

You can also use `kubectl get pods -o yaml` to check whether the application spec was updated to include the init container and the state of the init container:

```
kubectl -n <app-ns> get pod <app-pod> -o yaml
...
initContainers:
- command:
  - cp
  - -r
```

```

- /opt/appdynamics/.
- /opt/appdynamics-java
image: docker.io/appdynamics/java-agent:latest
...
initContainerStatuses:
- containerID: docker://
8bb892f322e5a043866d038631392a2272b143e54c8c431b3590312729043eb9
  image: appdynamics/java-agent:20.9.0
  imageID: docker-pullable://appdynamics/java-
agent@sha256:077ac1c4f761914c1742f22b2f591a37a127713e3e96968e9e570747f7ba6134
  ...
  state:
    terminated:
      containerID: docker://
8bb892f322e5a043866d038631392a2272b143e54c8c431b3590312729043eb9
      exitCode: 0
      finishedAt: "2021-02-03T22:39:25Z"
      reason: Completed

```

 The pod annotation may display APPD_POD_INSTRUMENTATION_STATE as failed for Node.js and .NET Core (Linux) applications even when the instrumentation is successful.

Troubleshoot Auto-Instrumentation When Not Applied

If the application pod was not recreated, and an init container was not applied, there may be an issue with the namespace and application matching rules used by the Cluster Agent.

1. First, confirm that the Cluster Agent is using the latest auto-instrumentation configuration.

```
kubectl -n appdynamics get cm instrumentation-config -o yaml
```

If the YAML output does not reflect the latest auto-instrumentation configuration, then validate the Cluster Agent YAML configuration, and apply or upgrade the Cluster Agent:

[Kubernetes CLI](#) [Helm Chart](#)

```
kubectl apply -f cluster-agent.yaml
```

[Kubernetes CLI](#) [Helm Chart](#)

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/
cluster-agent --namespace appdynamics
```

2. If the pods are still not recreated, then enable DEBUG logging in the Cluster Agent configuration:

[Cluster Agent YAML](#) [Helm Values YAML](#)

cluster-agent.yaml

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  # content removed for brevity
  logLevel: DEBUG
```

[Cluster Agent YAML](#) [Helm Values YAML](#)

ca1-values.yaml

```
clusterAgent:
  # content removed for brevity
  logProperties:
    logLevel: DEBUG
```

3. Apply or upgrade the Cluster Agent to update the DEBUG logging configuration:

[Kubernetes CLI](#) [Helm Chart](#)

```
kubectl apply -f cluster-agent.yaml
```

[Kubernetes CLI](#) [Helm Chart](#)

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --namespace appdynamics
```

4. After you update the Cluster Agent logging configuration, tail the logs to search for messages indicating that the Cluster Agent has detected the application, and considers the application in scope for auto-instrumentation:

```
# apply grep filter to see instrumentation related messages:
kubectl -n appdynamics logs <cluster-agent-pod> -f | grep -E 'instrumentationconfig.go|
deploymenthandler.go'
```

However, if output displays (similar to this example) for the application you want to auto-instrument, then the Cluster Agent does not consider the application in scope for auto-instrumentation:

```
[DEBUG]: 2021-03-30 21:22:09 - instrumentationconfig.go:660 - No matching rule found for
Deployment dotnet-app in namespace stage with labels map[appName:jah-stage
framework:dotnetcore]
[DEBUG]: 2021-03-30 21:22:09 - instrumentationconfig.go:249 - Instrumentation state for
Deployment dotnet-app in namespace stage with labels map[appName:jah-stage
framework:dotnetcore] is false
```

Review your auto-instrumentation configuration to determine any necessary updates and save the changes. Then, delete and re-create the Cluster Agent as described previously. For example, if you overwrote the namespace configuration in an instrumentationRule using namespaceRegex, be sure that you use a value that is included in nsToInstrumentRegex (dev in the example):

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  # content removed for brevity
  nsToInstrumentRegex: stage|dev
  instrumentationRules:
    - namespaceRegex: dev
```

After you update the configuration and the Cluster Agent has been recreated, your output should be similar to this example indicating that the Cluster Agent recognizes the application as in scope for auto-instrumentation:

```
[DEBUG]: 2021-03-30 21:22:10 - instrumentationconfig.go:645 - rule stage matches
Deployment spring-boot-multicontainer in namespace stage with labels map[appName:jah-
stage acme.com/framework:java]
[DEBUG]: 2021-03-30 21:22:10 - instrumentationconfig.go:656 - Found a matching rule
{stage map[acme.com/framework:[java]] java select .* JAVA_TOOL_OPTIONS
map[agent-mount-path:/opt/appdynamics image:docker.io/appdynamics/java-agent:21.3.0
image-pull-policy:IfNotPresent] map[bci-enabled:true port:3892] 0 0 appName 0 false []}
for Deployment spring-boot-multicontainer in namespace stage with labels map[appName:jah-
stage acme.com/framework:java]
[DEBUG]: 2021-03-30 21:22:10 - instrumentationconfig.go:249 - Instrumentation state for
Deployment spring-boot-multicontainer in namespace stage with labels map[appName:jah-
stage acme.com/framework:java] is true
[DEBUG]: 2021-03-30 21:22:10 - deploymenthandler.go:312 - Added instrument task to queue
stage/spring-boot-multicontainer
```

Troubleshoot Auto-Instrumentation When it Fails to Complete

If the application pod was re-created but the instrumented application is not reporting to the Controller, then auto-instrumentation did not complete successfully, or the App Server Agent failed to register with the Controller.

1. If the application pods are being restarted, but the init container is not completing successfully, then check for events in the application namespace using the **Cluster Agent Events** dashboard or `kubectl get events`. Some common issues that may prevent the init container from completing are: image pull or resource quotas issues.

```
kubectl -n <app ns> get events
```

2. Verify that the application deployment spec was updated with an init container, and if the status information includes any errors:

```
kubectl -n <app-ns> get pod <app-pod> -o yaml
```

3. Start a shell inside the application container to confirm the auto-instrumentation results. Check if the App Server Agent environment variables are set correctly and if the logs are free of errors.

```
kubectl -n <app-ns> exec -it <app-pod> /bin/sh
# Issue these commands in the container
env | grep APPD

# For Java app
env | grep JAVA_TOOL_OPTIONS # or value of defaultEnv
ls /opt/appdynamics-java
cat /opt/appdynamics-java/ver<version>/logs/<node-name>/agent.<date>.log

# For .NET Core app
ls /opt/appdynamics-dotnetcore
cat /tmp/appd/dotnet/1_agent_0.log

# For Node.js app
ls /opt/appdynamics-nodejs
cat /tmp/appd/<id>/appd_node_agent_<date>.log
```

4. If you are instrumenting a Node.js or .NET Core application, and the auto-instrumentation files have been copied to the app container, but the App Server Agent logs do not exist, or errors regarding binary incompatibilities display, then you may have a mismatch between the app image and the App Server Agent Image (referenced in the `image` property of the auto-instrumentation configuration). For .NET Core, the image OS versions must match (Linux for example). For Node.js, the image OS versions must match, as well as the Node.js version. To confirm, check the image tags, Dockerfiles, or exec-ing into the app container:

```
$ kubectl -n <app-ns> exec -it <app-pod> /bin/sh
cat /etc/os-release # (or /etc/issue)
```

```
NAME="Alpine Linux"...
# for Node.js app
node -v
```

Uninstall Auto-Instrumentation from an Instrumented Application

This page describes how to uninstall instrumentation changes from an application that has been auto-instrumented using the Cluster Agent.

Uninstall Auto-Instrumentation

1. To remove the application from auto-instrumentation scope, update `cluster-agent.yaml` by using the `nsToInstrument`, `nsToInstrumentRegex`, `instrumentationMatchString` and `labelMatch` properties (depending on which properties you initially used). To completely disable auto-instrumentation, set the `instrumentationMethod` to `None`. See [Auto-Instrument Applications with the Cluster Agent](#)(see page 2928).
2. To update the auto-instrumentation configuration, apply or upgrade the Cluster Agent.

[Kubernetes CLI](#) [Helm Chart](#)

```
kubectl apply -f cluster-agent.yaml
```

[Kubernetes CLI](#) [Helm Chart](#)

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --namespace appdynamics
```

3. Delete and re-create the application deployment.

Manually Configure App Agents to Correlate with the Cluster Agent

This page describes how to configure APM container correlation with the Cluster Agent when manually instrumenting Kubernetes applications. See [Instrument Kubernetes Applications Manually](#)(see page 459).

When you establish APM correlation, the application containers monitored by the Cluster Agent display in the Controller under the **Application/Container** view. The **Cluster Agent Pod** Dashboard also provides a link to the **APM Node** Dashboard in the **Pod Details** page.

i This configuration is required only when you use init containers or Dockerfiles to manually instrument applications in a cluster where the Cluster Agent is running. When you use Cluster Agent auto-instrumentation, APM container correlation is processed automatically. See [Auto-Instrument Applications with the Cluster Agent](#)(see page 2928).

APM container correlation uses the `UNIQUE_HOST_ID` (or `APPDYNAMICS_AGENT_UNIQUE_HOST_ID`) property of specific language agents. For examples of how to set this property, see the language-specific container installation page:

- Install the Java Agent in Containers¹⁸¹⁰
- Install the .NET Core Agent for Linux in Containers¹⁸¹¹
- Install the Node.js Agent in Containers¹⁸¹²

The table lists the commands required to assign the `UNIQUE_HOST_ID` value based on runtime, platform, and App Agent type:

Platform	Container Runtime	Command for Container ID
Kubernetes	Docker	<code>UNIQUE_HOST_ID=\$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup)</code>
OpenShift 3.10 and 3.11	Docker	<code>UNIQUE_HOST_ID=\$(sed -rn '1s#.*/#; 1s/docker-(.{12}).*/\1/p' /proc/self/cgroup)</code>
OpenShift 4.x	CRI-O	<code>UNIQUE_HOST_ID=\$(cat /proc/self/cgroup head -1 awk -F '/' '{print \$NF}' awk -F '-' '{print \$2}' cut -c 1-12) ; if [-z \$UNIQUE_HOST_ID]; then UNIQUE_HOST_ID=\$(cat /proc/self/cgroup head -1 awk -F '/' '{print \$NF}' cut -c 1-12) ; fi ;</code>

Kubernetes with Docker

Java APM correlation works out-of-the-box because the Agent retrieves the `UNIQUE_HOST_ID` value automatically. For other Agents with the `UNIQUE_HOST_ID` property, you must set the property using this command: `UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup)`

For all language Agents with a `uniqueHostId` property, set the property using this method when building the App image:

¹⁸¹⁰ <https://docs.appdynamics.com/display/PRO21/Install+the+Java+Agent+in+Containers>

¹⁸¹¹ <https://docs.appdynamics.com/display/PRO21/Install+the+.NET+Agent+for+Linux+in+Containers>

¹⁸¹² <https://docs.appdynamics.com/display/PRO21/Install+the+Node.js+Agent+in+Containers>

```
UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup)
JAVA_OPTS="$JAVA_OPTS -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID"
```

If you cannot change the application image, you can assign the `UNIQUE_HOST_ID` in the Kubernetes deployment specification by modifying the `command` attribute:

```
command: ["/bin/sh"]
args: ["-c", "UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup) &&
java -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
```

This approach implies that the entry point of the application is known. In the example, the original entry point is:

```
java $JAVA_OPTS -jar /java-services.jar
```

OpenShift 3.10 and 3.11 with Docker Runtime

For all language Agents with the `UNIQUE_HOST_ID` property in OpenShift v3.10 and v3.11 with Docker runtime, set the property using this method when building the App image:

```
UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/docker-(.{12}).*/\1/p' /proc/self/cgroup)
```

If you cannot change the application image, you can assign the `UNIQUE_HOST_ID` in the OpenShift v3.10 or v3.11 deployment specification by modifying the `command` attribute:

```
command: ["/bin/sh"]
args: ["-c", "UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/docker-(.{12}).*/\1/p' /proc/self/cgroup) &&
java -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
```

This approach implies that the entry point of the application is known. In the example, the original entry point is:

```
java $JAVA_OPTS -jar /java-services.jar
```

OpenShift 4.x with CRI-O Runtime

For all language Agents with the `UNIQUE_HOST_ID` property in OpenShift v4.x with CRI-O runtime, set the property using this method when building the App image:

```
UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' '
{print $NF}' | awk -F '-' '{print $2}' | cut -c 1-12) ; if [ -z $UNIQUE_HOST_ID ]; then
UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' '{print $NF}' | cut -c 1-12) ;
fi ;
```

If you cannot change the application image, you can assign the `UNIQUE_HOST_ID` in the OpenShift v4.x deployment specification by modifying the `command` attribute:

```
command: ["/bin/sh"]
args: ["-c", "UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' '{print $NF}' |
awk -F '-' '{print $2}' | cut -c 1-12) ; if [ -z $UNIQUE_HOST_ID ]; then UNIQUE_HOST_ID=$(
cat /proc/self/cgroup | head -1 | awk -F '/' '{print $NF}' | cut -c 1-12) ; fi ; java
-Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
```

This approach implies that the entry point of the application is known. In the example, the original entry point is:

```
java $JAVA_OPTS -jar /java-services.jar
```

Use the Cluster Agent

You administer the Cluster Agent from the AppDynamics Controller where you can enable, disable, configure, and delete the Cluster Agent. You can also change which namespaces to monitor.

Any configuration change you make in the Controller also applies to the Cluster Agent. These changes take a couple of minutes, and the status displays with a progress indicator.

View the Cluster Agent Summary

From the **Controller UI** panel:

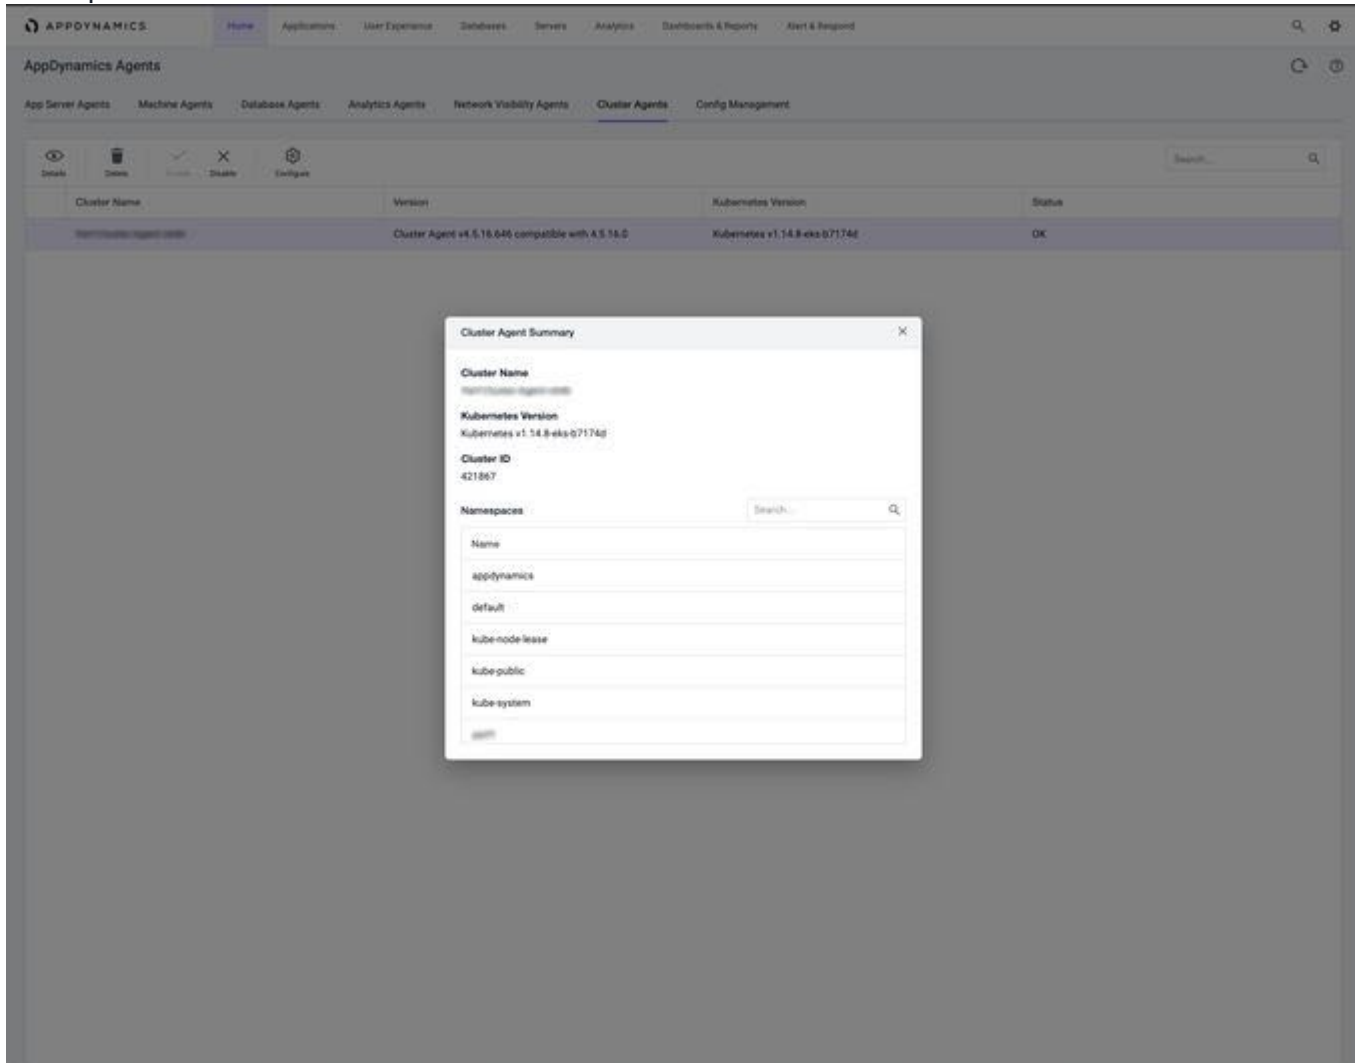

1. In the upper-right corner, click **Settings**  > **AppDynamics Agents**.
2. Select the **Cluster Agents** tab to display a list of clusters. By default, all Agents are enabled.

Cluster Name	Version	Kubernetes Version	Status
testClusterAgentForPerf	Cluster Agent v4.5.16.592 compatible with 4.5.16.0	Kubernetes v1.18.6-eko-5047ed	OK
testPerf_CA2	Cluster Agent v4.5.16.0 compatible with 4.5.16.0	Kubernetes v1.18.6-eko-5047ed	OK
test k8s-cluster-agent EKS	Cluster Agent v4.5.16.592 compatible with 4.5.16.0	Kubernetes v1.18.7-eks-v99160	OK
test k8s-cluster-agent OpenShift	Cluster Agent v4.5.16.592 compatible with 4.5.16.0	Kubernetes v1.9.1+ad0c1b0c57	OK

3. Double-click a Cluster Agent. A dialog appears showing a **Cluster Agent Summary** of your current settings. The summary card shows the **Cluster Name**, **Kubernetes Version**, **Cluster ID**, and currently monitored **Namespaces**. To the right of the **Namespaces** table is a Search bar, where you can search by

namespace.

4. Click X to close the Cluster Agent Summary card.

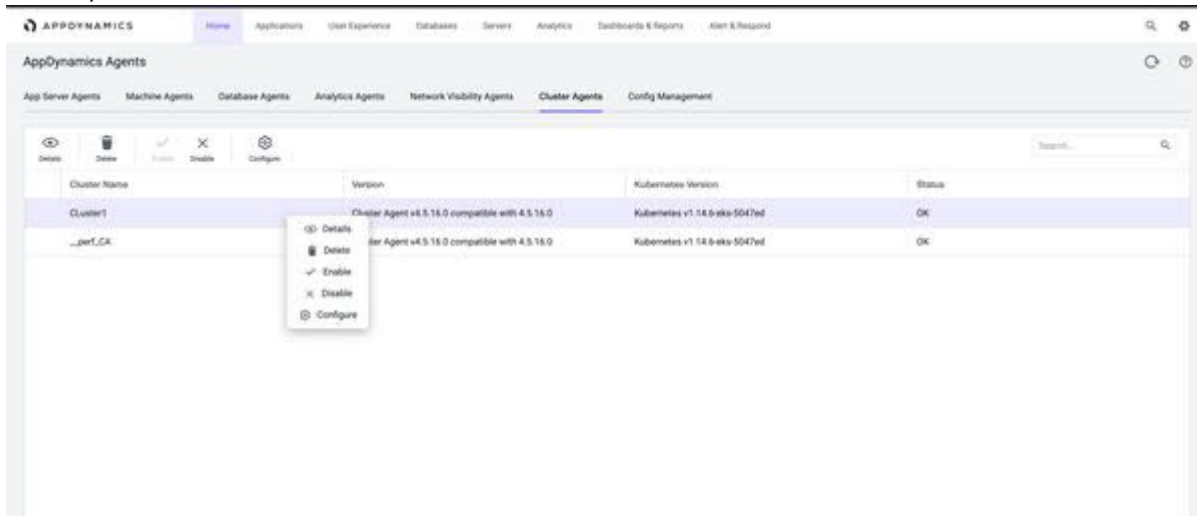

Disable the Cluster Agent

1. Select a Cluster Agent from the list.
2. Click Disable **X**. You can also select the Cluster name, right-click, and select **Disable**. A dialog appears confirming that you disabled the agent successfully. These changes take a couple of minutes, and the status displays with a progress indicator. When you disable the Cluster Agent, it does not report metrics or events, nor monitor pods or containers. You can re-enable a disabled Cluster Agent.

Enable the Cluster Agent

1. Select a Cluster Agent from the list.
2. Click Enable ✓. You can also select the Cluster name, right-click, and select **Enable**. A dialog appears confirming that you enabled the agent successfully. These changes take a couple of minutes, and the status displays with a progress indicator. When you enable the Cluster Agent, it reports metrics and events, and monitors containers.

Edit Namespaces

You can modify the namespaces by using either `nsToMonitor` or `nsToMonitorRegex` fields.

These are common namespace behavior scenarios with the `nsToMonitor` field:

- After the Cluster Agent's initial registration, the namespaces are retrieved from the Cluster Agent YAML file.
- After initial registration, if the Cluster Agent restarts and the Controller is running, the Controller UI's user namespace settings take precedence.
- After initial registration, if the Controller restarts and the Cluster Agent is running, any previous changes made to the namespaces in the Controller UI are preserved.
- If both the Cluster Agent and the Controller restart, the namespaces are retrieved from the YAML file.

The following are common namespace behavior scenarios with `nsToMonitorRegex` field:

i To use the `nsToMonitorRegex` field, ensure that you are using Controller \geq 20.10 and Agent \geq 20.9.

- After initial registration, at every subsequent minute the agent checks for the `nsToMonitorRegex` field to match the namespaces. If there is `nsToExcludeRegex` mentioned, those namespaces are excluded from the monitored namespaces.
- If a namespace configuration is to be monitored or ignored from the Controller, it takes precedence over the agent configuration (Cluster Agent YAML file). Therefore, if a namespace satisfies the regular expression that is configured for `nsToExcludeRegex`, but the Controller configuration includes that namespace under monitored namespaces, then the namespace is monitored.
To exclude this namespace from being monitored, you must delete the namespace in the Controller configuration. In this scenario, where there is a conflict between the agent configuration and the Controller configuration, the addition or removal of the relevant namespace from the Cluster Agent configuration does not have any effect.
- If the Cluster Agent is restarted, the `nsToMonitorRegex` and `nsToExcludeRegex` fields are read from the agent configuration file along with the namespaces configured in the Controller.

- If the Controller is restarted, the monitored and ignored namespaces included in the Controller configuration are retained and reapplied along with the agent configuration.
- If both the Cluster Agent and the Controller are restarted at the same time, the `nsToMonitorRegex` and `nsToExcludeRegex` fields are read from the agent configuration file. The namespaces to be monitored are determined based on the agent configuration.
- If a new namespace matching the configured regex is added, the namespace is monitored without any additional configuration. Similarly, when a namespace does not match the configured regex, it is not monitored.

You can modify namespaces in a Cluster by:

- [Updating Namespaces in the Cluster Agent Configuration File](#)(see page 2971) - Modify the `nsToMonitor` or the `nsToMonitorRegex` field in the `cluster-agent.yaml` file before deploying the Cluster Agent. Namespaces mentioned in the `nsToMonitor` field are considered only during initial registration. You can update the `nsToMonitorRegex` field in the `cluster-agent.yaml` file even after the registration.
You can specify regular expressions (regex) for the namespaces that you want to monitor by using the `nsToMonitorRegex` field. If you do not require the Cluster Agent to monitor some of the namespaces that match the regex specified in the `nsToMonitorRegex` field, then you can specify `nsToExcludeRegex` along with `nsToMonitorRegex`. For example, if Cluster Agent must monitor all the namespaces except the namespace that has the name starting with `exclude`, specify `nsToMonitorRegex` as `.*` and `nsToExcludeRegex` as `^exclude`.
- [Editing Namespaces in the User Interface](#)(see page 2972) - Edit namespaces after you deploy the Cluster Agent. Once deployed, the cluster is listed under AppDynamics Agents/Cluster Agents. Open the AppDynamics browser-based configuration user interface and edit namespaces.

Update Namespaces in the Cluster Agent Configuration File

To update namespaces in a cluster, use the `nsToMonitor` or the `nsToMonitorRegex` field in the `cluster-agent.yaml` before deploying the Cluster Agent.

Updating namespaces using the `nsToMonitor` field in the `cluster-agent.yaml` file does not change your currently monitored namespaces. However, updating namespaces using the `nsToMonitorRegex` changes the currently monitored namespaces. The scenarios are mentioned at [Edit Namespaces](#)(see page 2970).

If the Cluster Agent pod unexpectedly restarts, the namespaces stored in the Controller take precedence and are preserved. See [Troubleshoot the Cluster Agent](#)¹⁸¹³.

To update namespaces:

1. Open the `cluster-agent.yaml` file in a text editor.
2. Locate the `nsToMonitor` field:

```
nsToMonitor:
  - "default"
  - "appdynamics"
```

Or

To specify namespaces based on regular expressions, include the `nsToMonitorRegex` field:

```
nsToMonitorRegex: <regular expression>
nsToExcludeRegex: <regular expression> #This is an optional field
```

3. Verify the list of namespaces. If it is not correct, add or remove namespaces in the `cluster-agent.yaml` file.
4. Open a command prompt. To apply the namespaces changes, enter:

¹⁸¹³ <https://docs.appdynamics.com/display/PRO45/Troubleshoot+the+Cluster+Agent>

```
kubectl apply -f cluster-agent.yaml
```

5. To verify that the AppDynamics Operator registered the monitored namespace value, enter:
When using the `nsToMonitor` field:

```
kubectl -n appdynamics describe cm cluster-agent-config | grep  
APPDYNAMICS_CLUSTER_MONITORED_NAMESPACES -A 2
```

When using the `nsToMonitorRegex` field:

```
kubectl-app describe cm cluster-agent-mon
```

This is the expected output from the `nsToMonitor` example:

```
APPDYNAMICS_CLUSTER_MONITORED_NAMESPACES:  
----  
default
```

If you use the `nsToMonitorRegex` field, the default value of `nsToMonitor` is ignored.

Edit Namespaces in the User Interface

Once you have deployed the Cluster Agent, the **Selected** namespaces column displays the currently monitored namespaces.

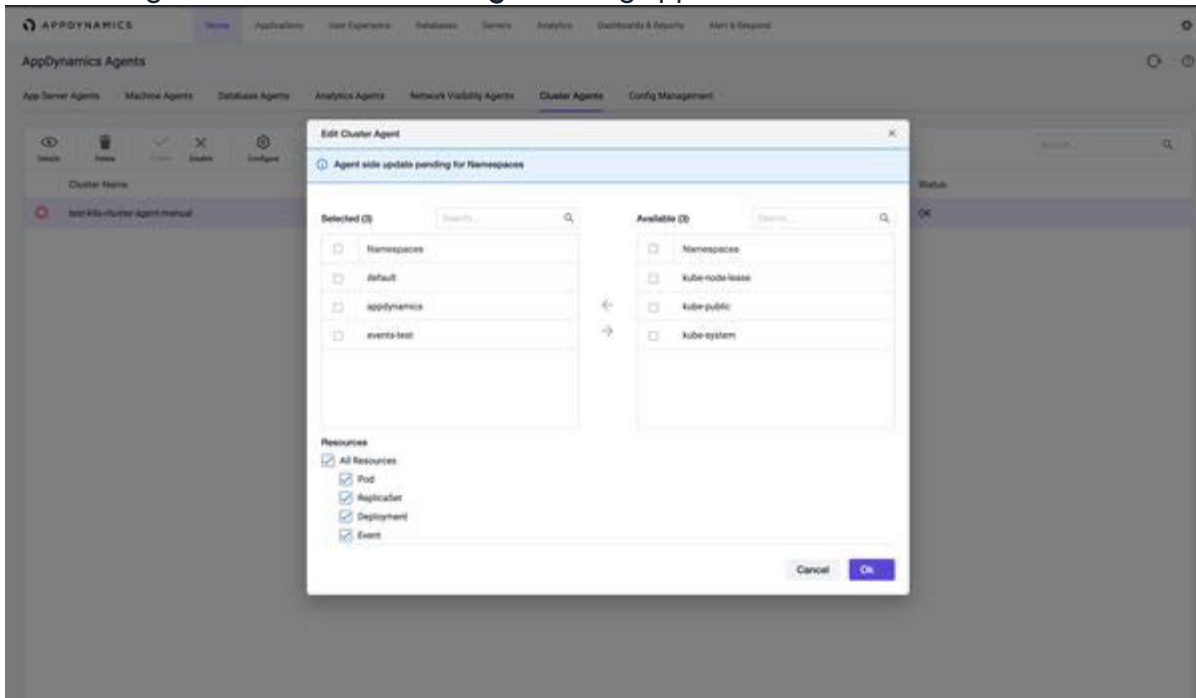

To edit a namespace from the cluster, you must have administrator permissions:

To edit a namespace:

1. Double-click a cluster from the list.

2. Click **Configure** . An **Edit Cluster Agent** dialog appears.

3. To modify namespaces, select a namespace by checking the corresponding box.
4. Once the desired namespace box is checked, click the arrow to move it to either the **Selected** namespace table or the **Available** namespace table.
5. Click **OK** to close the dialog box. These changes take a couple of minutes and the status displays in a banner notification.

 Updating namespaces in the `cluster-agent.yaml` file does not change your currently monitored namespaces. It assures that if the Cluster Agent pod unexpectedly restarts, that your namespaces are preserved. See [Troubleshoot the Cluster Agent](https://docs.appdynamics.com/display/PRO45/Troubleshoot+the+Cluster+Agent)¹⁸¹⁴.

Add or Remove Namespaces

 To add or remove a namespace from the cluster, you must have administrator permissions:

To add or remove a namespace from the cluster:

1. Double-click a cluster from the list.

¹⁸¹⁴ <https://docs.appdynamics.com/display/PRO45/Troubleshoot+the+Cluster+Agent>

2. Click Configure .

3. To modify namespaces, select a namespace by checking the corresponding box. Once the desired namespace box is checked, click the arrow to move it to either the **Selected** namespace table, or the **Available** namespace table.
4. Click **OK** to close the dialog box. These changes take a couple of minutes and the status displays with a progress indicator..

Delete a Monitored Namespace

To delete a Cluster Agent monitored namespace:

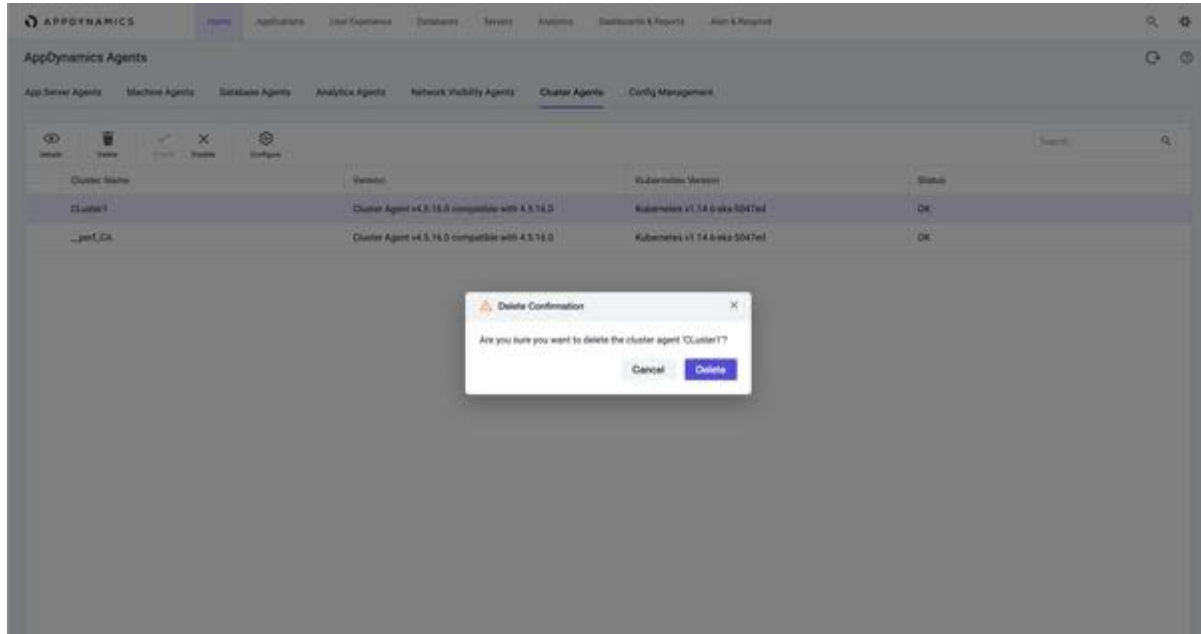

1. Double-click a cluster from the list.
2. Click Configure . The **Edit Cluster Agent** dialog appears.
3. Select a namespace by checking the corresponding box.
4. Click the arrow to move to either the **Available** namespace, or to the **Selected** namespace table.
5. Delete the namespace from your Kubernetes cluster.

Delete the Cluster Agent

To delete a Cluster Agent:

1. Select the Cluster Agent name that you want to delete.

2. Click Delete . A dialog asks you to confirm that you want to delete the Cluster Agent.
3. Click **Delete**. If you delete a Cluster Agent, you will lose all historical data.

Cluster Metrics

The **Cluster Agent Dashboard** metrics derive from the Kubernetes API, and they report information for the clusters and pods. For any defined set of namespaces, the Cluster Agent reports events on these Kubernetes and hardware resources.

AppDynamics monitors cluster health and Kubernetes objects for:

- [Cluster Summary Metrics](#)(see page 2976)
- [CPU](#)(see page 2978)
- [DaemonSets](#)(see page 2979)
- [Deployments](#)(see page 2980)
- [Endpoints](#)(see page 2980)
- [Jobs](#)(see page 2980)
- [Memory](#)(see page 2981)
- [Nodes](#)(see page 2982)
- [Pods](#)(see page 2982)
- [PVC](#)(see page 2983)
- [ReplicaSets](#)(see page 2984)
- [StatefulSets](#)(see page 2984)
- [Services](#)(see page 2984)
- [Storage Quota](#)(see page 2985)

Cluster Summary Metrics

Metric Name	Description	UI Location	Metric Path
Error events count	Number of error events	Dashboard > Errors	Hardware Resources Cluster Error events count
Evicted pods count	Number of evicted pods	Pods > Evicted	Hardware Resources Cluster Evicted pods count
Eviction threats count	Number of events that represent pod evictions	Dashboard > Errors	Hardware Resources Cluster Eviction threats count
Image pull errors	Number of image pull errors	Dashboard > Issues > Image Issues	Hardware Resources Cluster Image pull errors
Image pulls	Number of image pulls	Dashboard > Issues > Image Issues	Hardware Resources Cluster Image pulls
Info events count	Number of informational events	Dashboard > Errors	Hardware Resources Cluster Info events count
Pod errors	Number of errors related to pods	Dashboard > Issues > Pod Issues	Hardware Resources Cluster Pod errors
Pod Kills	Number of pods that were killed	Inventory > Pods > Pod Kills	Hardware Resources Cluster Pod Kills
Pod restarts	Number of times the pods restarted	Dashboard > Issues > Pod Issues	Hardware Resources Cluster Pod restarts
Pods Scaledowns	Count of scaledowns; you can scale down your deployments and replica sets.	Inventory > Pods > Scaledowns	Hardware Resources Cluster Pods Scaledowns
Pods count	Total count of pods	Inventory > Pods > Phases > Normal	Hardware Resources Cluster Pods count
Pods failed	Number of failed pods	Pods > Failed	Hardware Resources Cluster Pods failed
Pods pending	Number of pods in a pending state. Pending status normally	Pods > Pending	Hardware Resources Cluster Pods pending

Metric Name	Description	UI Location	Metric Path
	indicates an issue. See the Kubernetes documentation ¹⁸¹⁵ .		
Pods running	Number of pods in a running state	Pods > Running	Hardware Resources Cluster Pods running
Pods succeeded	Number of pods in Succeeded phase	Dashboard > Pods By Phase	Hardware Resources Cluster Pods succeeded
Pods unknown	Number of pods in Unknown state	Dashboard > Pods By Phase	Hardware Resources Cluster Pods unknown
Pods with Missing Dependencies - Config Maps and Secrets	If a pod is dependent on any Config Maps & Secrets, then those dependencies are missing.	Inventory > Pods > Missing Dependencies - Config Maps and Secrets	Hardware Resources Cluster Pods With Missing Dependencies - Config Maps And Secrets (Pod Metrics for Inventory tab)
Pods with Missing Dependencies - Services	If a pod is dependent on any Services, then those dependencies are missing.	Inventory > Pods > Missing Dependencies - Services	Hardware Resources Cluster Pods With Missing Dependencies (Pod Metrics for Inventory Tab)
Pods with No Limits	Number of pods with no limits (on CPU/memory) set. If you specified limits on any pod that you are starting, this metric indicates how many pods do not have a limit defined (Displays in the Inventory tab, under Pod Metrics).	Inventory > Pods > No Limits	Hardware Resources Cluster Pods With No Limits
Pods With No Liveness Probe	Number of pods with no liveness probe. If you configured a probe in Kubernetes to monitor liveness, the values display in the Inventory tab, under Pod Metrics.	Inventory > Pods > No Probes -Liveness	Hardware Resources Cluster Pods With No Liveness Probe

¹⁸¹⁵ <https://kubernetes.io/docs/tasks/debug-application-cluster/debug-application/>

Metric Name	Description	UI Location	Metric Path
Pods With No Readiness Probe	Number of pods with no readiness probe. If you configured a probe in Kubernetes to monitor readiness, the values display in the Inventory tab, under Pod Metrics.	Inventory > Pods > No Probes -Readiness	Hardware Resources Cluster Pods With No Readiness Probe
Privileged Pods	Number of privileged pods that run with root access (Displays in the Inventory tab, under Pod Metrics).	Inventory > Pods > Privileged	Hardware Resources Cluster Privileged Pods
Storage errors	Overall number of errors related to storage for the cluster.	Inventory > Pod Metrics	Hardware Resources Cluster Storage errors
Storage quota violations	Number of storage quota violations; if someone exceeds that quota.	Inventory > Pod Metrics	Hardware Resources Cluster Storage quota violations

CPU

CPU Capacity

Metric Name	Description	UI Location	Metric Path
Total (MilliCores)	Total CPU capacity for the cluster in MilliCores	Cluster Capacity > CPU	Hardware Resources Cluster CPU Capacity Total (MilliCores)
Used (MilliCores)	CPU capacity already used by the cluster in MilliCores	Cluster Capacity > CPU	Hardware Resources Cluster CPU Capacity Used (MilliCores)

CPU Quota

Metric Name	Description	UI Location	Metric Path
Limit Used (%)	Percentage of CPU limit quota used	Dashboard > Quotas > CPU Limit	Hardware Resources Cluster CPU Quota Limit Used (%)
Limit Used (MilliCores)	MilliCores value for CPU limit quota used	Dashboard > Quotas > CPU Limit	Hardware Resources Cluster CPU Quota Limit Used (MilliCores)

Metric Name	Description	UI Location	Metric Path
Request Used (%)	Percentage of CPU request quota used	Dashboard > Quotas > CPU Request	Hardware Resources Cluster CPU Quota Request Used (%)
Request Used (MilliCores)	MilliCores value for CPU request quota used	Dashboard > Quotas > CPU Request	Hardware Resources Cluster CPU Quota Request Used (Millicores)

CPU Utilization

Metric Name	Description	UI Location	Metric Path
Limit (MilliCores)	Limit of CPU which can be used by the pods. Only the pods belonging to monitored namespaces are used to calculate this metric.	Dashboard > Utilization > CPU	Hardware Resources Cluster CPU Utilization Limit (MilliCores)
Request (MilliCores)	MilliCore value of CPU for which all the pods in monitored namespaces have requested.	Dashboard > Utilization > CPU	Hardware Resources Cluster CPU Utilization Request (MilliCores)
Used (MilliCores)	Actual CPU which the pods from monitored namespaces are currently using.	Dashboard > Utilization > CPU	Hardware Resources Cluster CPU Utilization Used (MilliCores)

DaemonSets

Metric Name	Description	UI Location	Metric Path
Count	Number of daemon sets that exist	Inventory > Objects > DaemonSets > (Count)	HardwareResources Cluster DaemonSets Count
Nodes Available	Number of nodes that are running and available on the cluster	Inventory > Objects > DaemonSets > Available	HardwareResources Cluster DaemonSets Nodes Available
Nodes MissScheduled	Number of nodes that are running, but should not be running	Inventory > Objects > DaemonSets > MissScheduled	HardwareResources Cluster DaemonSets Nodes MissScheduled
Nodes Unavailable	Number of nodes that should be running, but are not running	Inventory > Objects > DaemonSets > Unavailable	HardwareResources Cluster DaemonSets Nodes Unavailable

Deployments

Metric Name	Description	UI Location	Metric Path
Count	Number of deployments that exist in the cluster	Inventory > Objects > Deployments > (Count)	HardwareResources Cluster Deployments Count
Replicas	Number of pod replicas in the cluster that are not in a terminated state	Inventory > Objects > Deployments > Available	HardwareResources Cluster Deployments Replicas
Replicas Unavailable	Total number of unavailable pod replicas across all deployments in the cluster	Inventory > Objects > Deployments > Unavailable	HardwareResources Cluster Deployments ReplicasUnavailable

Endpoints

Metric Name	Description	UI Location	Metric Path
Count	Number of endpoints in the cluster	Inventory > Services > Endpoints > Count	HardwareResources Cluster Endpoints Count
Not Ready Address	Total number of not ready addresses for all the endpoints in the cluster	Inventory > Services > Endpoints without ready IP	HardwareResources Cluster Endpoints Not Ready Address
Orphans	Total number of endpoints in the cluster which do not have any ready, nor any not ready addresses	Inventory > Services > Orphan Endpoints with no IP	HardwareResources Cluster Endpoints Orphans
Ready Address	Total number of ready addresses for all the endpoints in the cluster	Inventory > Services > Endpoints	HardwareResources Cluster Endpoints Ready Address

Jobs

Metric Name	Description	UI Location	Metric Path
Count	Total number of jobs in the cluster	Inventory > Objects > Jobs > (Count)	Hardware Resources Cluster Jobs Count
Pods Active	Total number of active pods for all the jobs in the cluster	Inventory > Objects > Jobs > Active	Hardware Resources Cluster Jobs Pods Active
Pods Failed	Total number of pods which reached phase Failed for all the jobs in the cluster	Inventory > Objects > Jobs > Failed	Hardware Resources Cluster Jobs Pods Failed

Metric Name	Description	UI Location	Metric Path
Pods Succeeded	Total number of pods which reached phase Succeeded for all the jobs in the cluster	Inventory > Objects > Jobs > Succeeded	Hardware Resources Cluster Jobs Pods Succeeded

Memory

Memory Capacity

Metric Name	Description	UI Location	Metric Path
Total (MB)	Total Memory capacity for the cluster in MBs	Dashboard > Cluster Capacity > Memory	Hardware Resources Cluster Memory Capacity Total (MB)
Used (MB)	Memory capacity already used by the cluster in MBs	Dashboard > Cluster Capacity > Memory	Hardware Resources Cluster Memory Capacity Used (MB)

Memory Quota

Metric Name	Description	UI Location	Metric Path
Limit Used (%)	Percentage of Memory limit quota used	Dashboard > Quotas > Memory Limit	Hardware Resources Cluster Memory Quota Limit Used (%)
Limit Used (MB)	MB value for Memory limit quota used	Dashboard > Quotas > Memory Limit	Hardware Resources Cluster Memory Quota Limit Used (MB)
Request Used (%)	Percentage of Memory request quota used	Dashboard > Quotas > Memory Request	Hardware Resources Cluster Memory Quota Request Used (%)
Request Used (MB)	MB value for Memory request quota used	Dashboard > Quotas > Memory Request	Hardware Resources Cluster Memory Quota Request Used (MB)

Memory Utilization

Metric Name	Description	UI Location	Metric Path
Limit (MB)	Limit of Memory which can be used by the pods. Only the pods belonging to monitored namespaces are used to calculate this metric.	Dashboard > Utilization > Memory	Hardware Resources Cluster Memory Utilization Limit (MB)
Request (MB)	MB value of Memory for which all the pods in monitored namespaces have requested.	Dashboard > Utilization > Memory	Hardware Resources Cluster Memory Utilization Request (MB)
Used (MB)	Actual Memory which the pods from monitored namespaces are currently using.	Dashboard > Utilization > Memory	Hardware Resources Cluster Memory Utilization Used (MB)

Nodes

Metric Name	Description	UI Location	Metric Path
Master Count	Number of master nodes in the cluster	Inventory > Masters	Hardware Resources Cluster Nodes Master Count
Worker Count	Number of worker nodes in the cluster	Inventory > Workers	Hardware Resources Cluster Nodes Worker Count
Memory Pressure Count	Number of nodes that are under memory pressure in the cluster	Inventory > Memory Pressure	Hardware Resources Cluster Nodes Memory Pressure Count
Disk Pressure Count	Number of nodes that are under disk pressure in the cluster	Inventory > Disk Pressure	Hardware Resources Cluster Nodes Disk Pressure Count

Pods

Pods Capacity

Metric Name	Description	UI Location	Metric Path
Total Count	Total number of pods that a cluster can support	Pods > Total Count	Hardware Resources Cluster Pods Capacity Total Count
Used Count	Number of pods already created in the cluster	Pods > Count	Hardware Resources Cluster Pods Capacity Used Count

Pods CPU Usage

Metric Name	Description	UI Location	Metric Path
%Busy Scaled	This percentage is calculated based on the used CPU relative to its pod limit.	Server > Metric Browser	Root Individual Nodes <namespace>/<pod-name> Hardware Resources CPU %Busy Scaled
%Busy	The percentage of the CPU cores used by a pod.	Server > Metric Browser	Root Individual Nodes <namespace>/<pod-name> Hardware Resources CPU %Busy

Pods Memory Usage

Metric Name	Description	UI Location	Metric Path
Used (MB)	The amount of memory used by a pod.	Server > Metric Browser	Root Individual Nodes <namespace>/<pod-name> Hardware Resources Memory Used (MB)

PVC

PVC Quota

Metric Name	Description	UI Location	Metric Path
Used	PVC quota already being used in the cluster (count)	Dashboard > Quotas > PVC	Hardware Resources Cluster PVC Quota Used
Used %	Percentage of PVC quota already being used in the cluster	Dashboard > Quotas > PVC	Hardware Resources Cluster PVC Quota Used (%)

PVC Utilization

Metric Name	Description	UI Location	Metric Path
Capacity (MB)	Total PVC available for the pods in the monitored namespaces	Dashboard > Utilization > PVCs	Hardware Resources Cluster PVC Utilization Capacity (MB)
Request (MB)	Value for PVC requested by pods in monitored namespaces	Dashboard > Utilization > PVCs	Hardware Resources Cluster PVC Utilization Request (MB)

ReplicaSets

Metric Name	Description	UI Location	Metric Path
Count	Number of replica set resources in the cluster	Inventory > Objects > ReplicaSets > Count	Hardware Resources Cluster Count
Replicas	Total number of replicas for all the replica sets in the cluster	Inventory > Objects > ReplicaSets > Count	Hardware Resources Cluster ReplicaSets Replicas
Replicas Available	Total number of available replicas for all the replica sets in the cluster	Inventory > Objects > ReplicaSets > Available	Hardware Resources Cluster ReplicaSets Replicas Available
Replicas Unavailable	Total number of unavailable replicas for all the replica sets in the cluster	Inventory > Objects > ReplicaSets > Unavailable	Hardware Resources Cluster ReplicaSets Replicas Unavailable

Services

Metric Name	Description	UI Location	Metric Path
Count	Total number of Kubernetes Services running in the cluster	Inventory > Services > Services	Hardware Resources Cluster Services Count

StatefulSets

Metric Name	Description	UI Location	Metric Path
Count	Number of statefulsets in monitored namespaces	Inventory > Objects > StatefulSets > (Count)	Hardware Resources Cluster StatefulSets Count
Replicas Ready	Number of replicas in a ready state across all statefulsets in monitored namespaces	Inventory > Objects > StatefulSets > Replicas Ready	Hardware Resources Cluster StatefulSets Replicas Ready
Replicas Desired	Number of replicas across all statefulsets in monitored namespaces which are specified as desired in statefulset spec	N/A	Hardware Resources Cluster StatefulSets Replicas Desired
Replicas Not Ready	Number of replicas across all statefulsets in monitored namespaces which are not ready and are yet to be created or started	Inventory > Objects > StatefulSets > Replicas Not Ready	Hardware Resources Cluster StatefulSets Replicas Not Ready

Metric Name	Description	UI Location	Metric Path
Collisions	Number of hash collisions for statefulsets across all namespaces monitored	N/A	Hardware Resources Cluster StatefulSets Collisions

Storage Quota

Metric Name	Description	UI Location	Metric Path
Used (MB)	Storage quota used by the cluster in MB	Dashboard > Quotas > Storage	Hardware Resources Cluster Storage Quota Used (MB)
Used (%)	Percentage of storage quota used by the cluster	Dashboard > Quotas > Storage	Hardware Resources Cluster Storage Quota Used (%)

Monitor Cluster Health

The **Cluster Dashboard** provides visibility into your cluster's health to quickly determine any impact on performance. Each dashboard indicator provides a different aspect of the cluster performance.

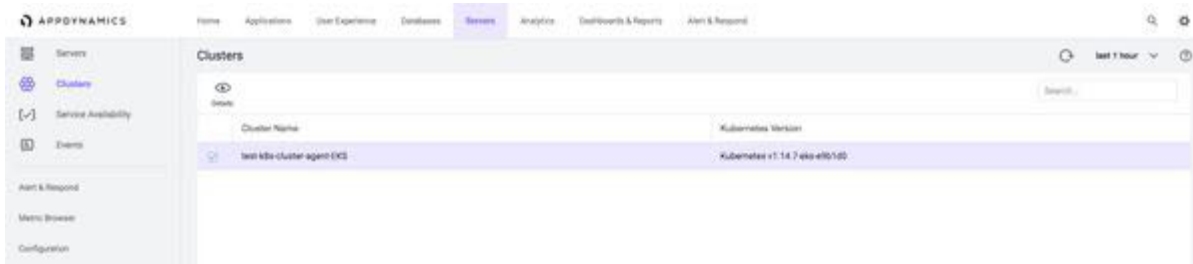

Important Notes

- The **Cluster Inventory Dashboard** may display 0 (zero) for Master Nodes; this is expected behavior. Unlike on-premises clusters, cloud providers develop and release at a different pace compared to the Kubernetes project and evolve independently. This master node, or a number of master nodes, in Amazon EKS, AKS, and other cloud-based environments or clusters, hide the master node of the cluster. The reported cluster results are similar to the results generated by the `kubectl get nodes` command. To verify your reported results, enter the `kubectl get nodes` command to review node information, and if master nodes are shown as zero.
- Cluster-level resource utilization metrics are the sum of resources consumed by each of the pods. These metric values may reach hundreds of thousand because the Cluster Agent reports sums for individual pods.
- Pod utilization metrics are the sum of each of the containers running within a pod.
- Pod count and pod state (running, pending, evicted, and failed pods) metrics show real-time values (not historical values averaged over a designated period of time). Whatever pods are running "now", are reported.

Clusters Dashboard

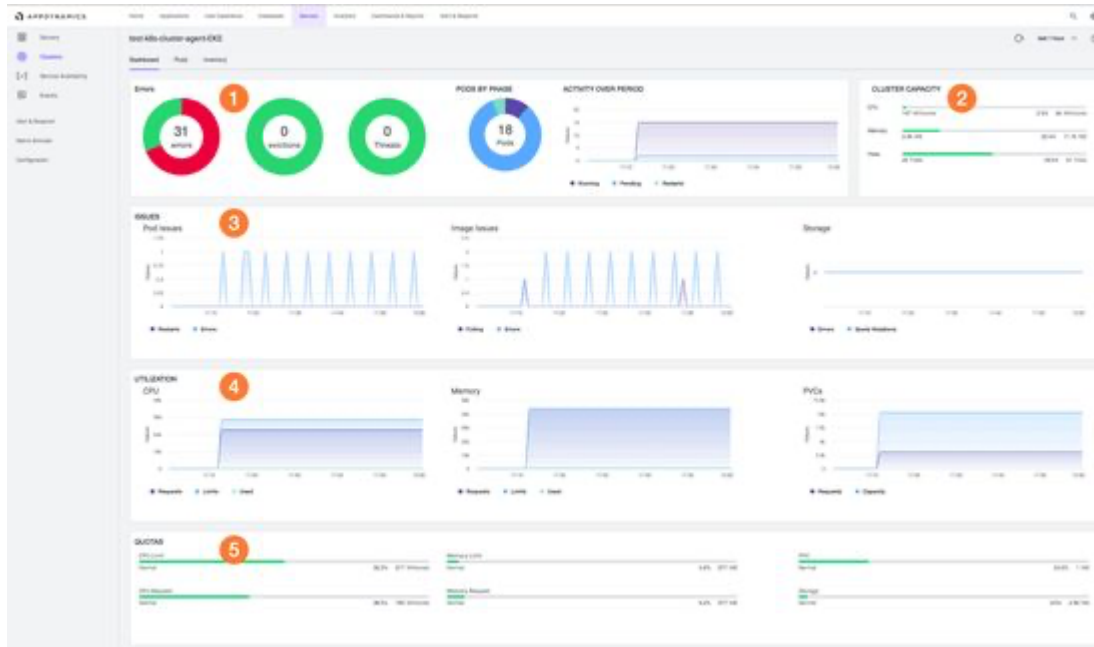

To access your cluster from the Controller:

1. Select **Servers > Clusters > Cluster Name**.

2. Select a Cluster Agent and double-click. The cluster interface displays the Dashboard, Pods, Inventory, and Events tabs.

Dashboard Tab

- **Errors card:** 1 Displays pie chart graphs for the monitored namespaces in each cluster:
 - **Errors:** Number of **Errors** (Error events count), **Evictions** (Evicted pods count), and **Threats** (Eviction threats count) for individual pods.
 - **Pods by phase:** Number of pods that are in various states: **Failed**, **Pending**, **Running**, **Succeeded**, and **Unknown**.
 - **Activity over period:** Time-series chart that shows the number of pods in **Running**, and **Pending** states for a given time period.
- **Cluster Capacity:** 2 Score bar displays **CPU**, **Memory**, and **Pods**. A green line indicates the capacity usage. The Dashboard indicates the percent usage of **CPU**, **Memory** and **Pod** capacity of the cluster which you can use to plan the resource capacity for this cluster.
- **Issues card:** 3 Displays:
 - **Pod issues:** When a Cluster Agent observes pod restarts and errors.
 - **Image issues:** Image pulling and errors.
 - **Storage:** Storage capacity issues such as errors and quota violations.
- **Utilization card:** 4 Displays:
 - **CPU:** Requests, limits and used.
 - **Memory:** Requests, limits and used.
 - **PVCs:** Requests and capacity.
- **Quotas card:** 5 Displays % utilization of resources relative to the respective quotas. The Agent tracks these resources:
 - Percentage of CPU Limit Quota Used.
 - Memory Limit of Quota Used.
 - Percentage of PVC Quota Used.
 - Percentage of CPU Request Quota Used.
 - Percentage of Memory Request Quota Used.
 - Percentage of Storage Quota Used.

Numbers are cumulative for the entire cluster. Use these indicators to track the availability of specific resources based on the imposed quotas and use in cluster capacity planning.

Pods Tab

The Pods tab displays pods in various states and shares a high-level summary of their status. This example shows pods running in Amazon EKS. All pods are displayed based on their registered **Namespace** and **Pod Name**.

i Terminated pods continue to display in the Pods list until they have been purged from the AppDynamics Controller, however, their metrics are not updated. Purging occurs automatically at regular intervals. See [Administer the Cluster Agent](#)(see page 2997).

The top card displays a summary of the monitored pods and their status in each cluster:

- **Total Pods:** Total number of pods in the monitored cluster.
- **Running:** Percentage and number of pods in a running state.
- **Pending:** Percentage and number of pods in a pending state. Pending status normally indicates an issue. See [Kubernetes documentation](#)¹⁸¹⁶.
- **Evicted:** Percentage and number of evicted pods.
- **Failed:** Percentage and number of failed pods.

The screenshot shows the AppDynamics interface for a cluster named 'test-eks-cluster-agent-EKS'. The top summary card displays the following metrics:

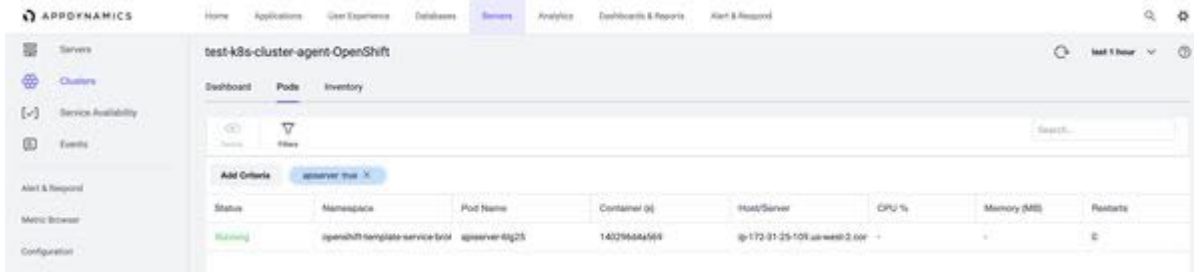

- Total Pods:** 18
- Running:** 89% (16 Pods)
- Pending:** 11% (2 Pods)
- Evicted:** 0% (0 Pods)
- Failed:** 0% (0 Pods)

Below the summary is a table with columns: Status, Namespace, Pod Name, Container ID, Host/Server, CPU %, Memory (MB), and Restarts. The table lists various pods, including 'appdynamics-operator', 'kube-apiserver', 'kube-controller-manager', 'kube-proxy', 'etcd', and 'nginx'.

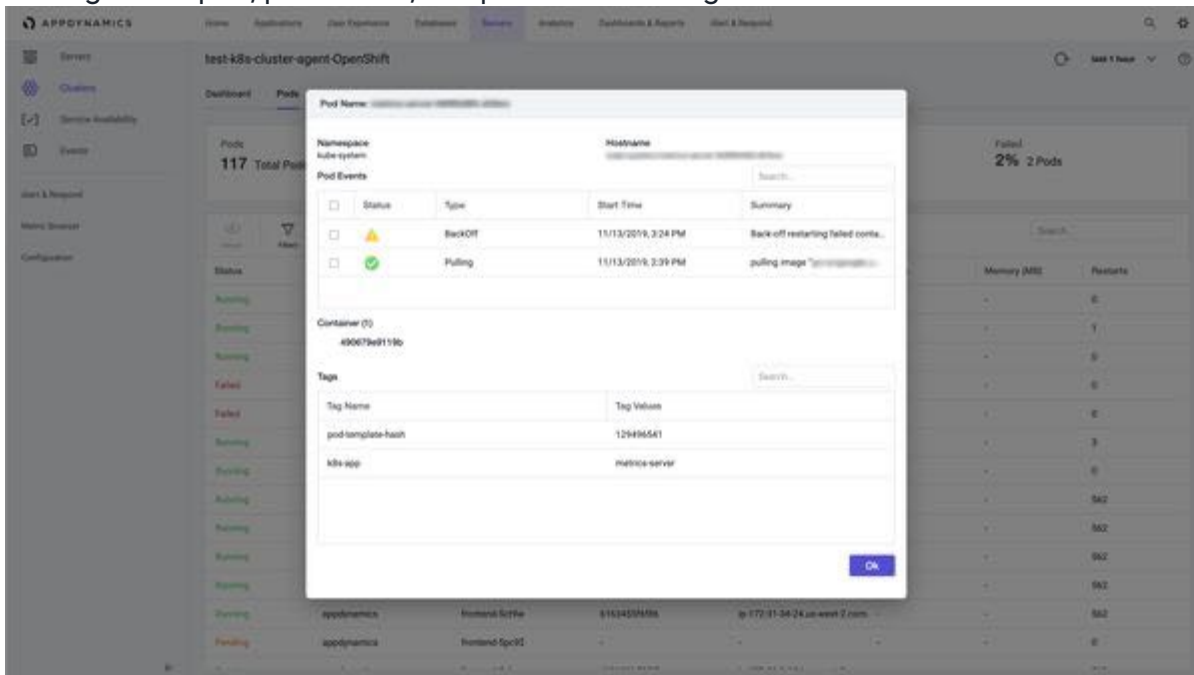

You can search based on **Namespace** or **Pod Name**.

1816 <https://kubernetes.io/docs/tasks/debug-application-cluster/debug-application/>

You can further filter based on pod tags and labels:

Double-click any pod to display its **Pod Details** panel. From the **Pod Details** panel, you can review containers running in that pod, pod events, and pod labels and tags.

The Cluster Agent automatically detects a pod's:

- Status
- Namespace
- Pod name
- Container IDs
- Host or server
- CPU % (sum of running containers within the pod)
- Memory MB (sum of running containers within the pod)
- Restarts

Pods are deleted for these reasons:

- When the namespace is un-monitored.
- When pods are deleted from the cluster, except for the failed pods.
- When the pod count exceeds the pod limit.
- If the pod is blocklisted.

Pod Details Panel

The **Pod Details** panel displays:

- **Namespace:** In which namespace the pod is running.
- **Hostname:** Namespace or pod name.
- **Pod Events:** List of the most-recent events generated from the `kubectl describe pods` command.
- **Container (count):** List of running containers displayed by Container ID in this pod. Click each container to display individual container metrics.
- **Tags:** Kubernetes labels provided to this pod.

Inventory Tab

The Inventory tab displays a high-level snapshot or inventory view of your cluster. It displays the contents of the cluster which enables you to troubleshoot applications running in the cluster.

The Cluster card displays:

- **Cluster Name:** Name of the cluster.
- **Kubernetes Version:** Kubernetes version running on the cluster.
- **Cluster ID:** ID of the Cluster Agent.
- **Pods:** Number of monitored pods.
- **Namespaces:** Number of monitored namespaces.
- **Masters:** Number of master nodes.
- **Workers:** Number of worker nodes.
- **Disk Pressure:** Snippet of disk pressure trend in the cluster.
- **Memory Pressure:** Snippet of memory pressure trend in the cluster.

The Pods card displays:

- **Pods by Phases:** Whether a pod is running, evicted, pending or failed. This number is the same count as the pods in a "running" state in the Pods tab.
- **Privileged Pods:** The pods run as root.
- **No Limits:** You can specify limits to any pod that you are starting. The No Limits metric indicates how many pods do not have a limit defined.
- **No Readiness Probe:** If you configured a probe in Kubernetes to monitor readiness, the values display here.
- **No Liveness Probe:** If you configured a probe in Kubernetes to monitor liveness, the values display here.
- **Missing Dependencies - Config Maps & Secrets:** If a pod is dependent on any Config Maps & Secrets, then those dependencies are missing.
- **Missing Dependencies - Services:** If a pod is dependent on any Services, then those dependencies are missing.
- **Scaledowns:** Count of scaledowns of your deployments and replicaset.
- **Pod Kills:** Number of pods that were killed.

Namespaces: List of namespaces that you can search from the Search bar

The Objects card displays:

- **Jobs:** Total number of jobs in the monitored namespaces, and the number of failed, active, and succeeded job counts.
- **Deployments:** Number of deployments in monitored namespaces, and the total available and unavailable replica counts.
- **ReplicaSets:** Number of replicaset in monitored namespaces, and the total available and unavailable replica counts.

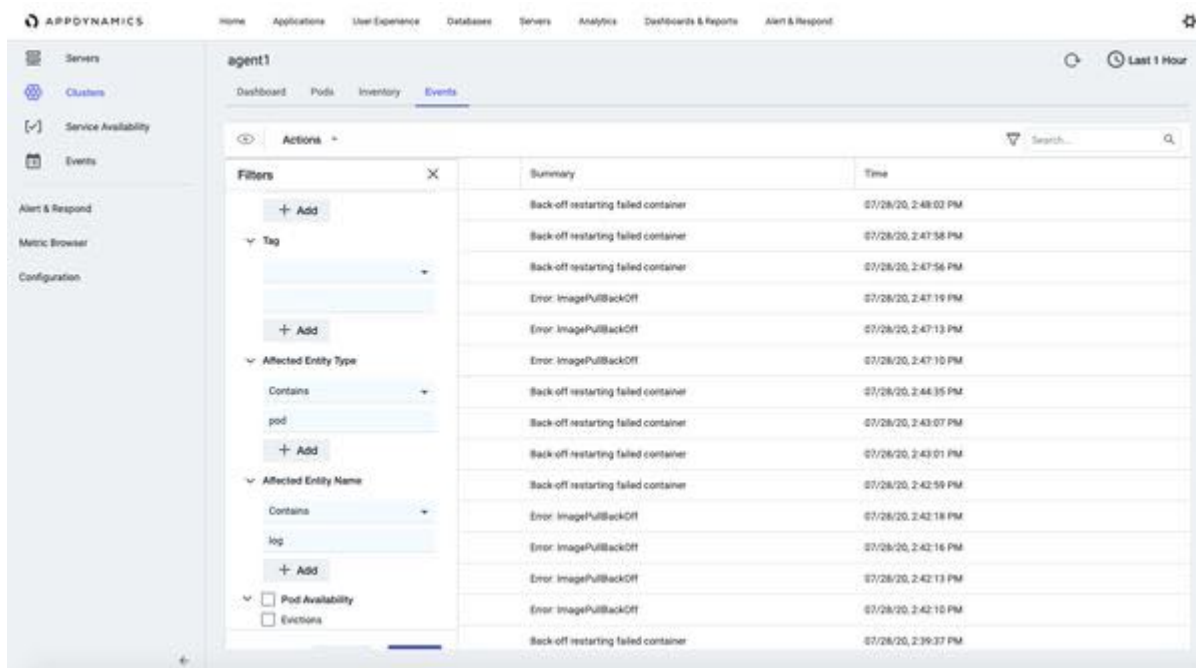

- **DaemonSets:** Number of daemonsets in monitored namespaces, and the total available, unavailable, and mis-scheduled pod counts.
- **StatefulSets:** Number of statefulsets in monitored namespaces, and the total ready and not ready replica counts.

The Services card displays the health of the entire cluster:

- **Services:** Total number of services being monitored.
- **Endpoints:** Total number of endpoints being monitored.
- **Readiness:** Number of endpoints without a ready IP address.
- **Orphans:** Number of orphaned endpoints with no IP address.

Events Tab

The Events tab displays the cluster events that are specific to the selected cluster. You can use **Filters** to view any specific event.

Monitor Kubernetes Events

There are two event types in Kubernetes:

- Normal events
- Warning events

See [Application Introspection and Debugging](#)¹⁸¹⁷ for more information on Kubernetes events. AppDynamics reports a subset of these as Cluster Events. They are comprised of Kubernetes warning events and important informational notices concerning state changes in the cluster. An example of a state change is a pod transitioning from a pending to a running state.

1817 <https://kubernetes.io/docs/tasks/debug-application-cluster/debug-application-introspection/>

i This document contains links to Kubernetes documentation. AppDynamics makes no representation as to the accuracy of Kubernetes documentation because Kubernetes controls its own documentation.

A **Cluster Event** of type warning displays a  yellow warning icon. When a Pod, Replicaset, or Deployment gets added, updated, or deleted, otherwise known as a state change, the Cluster Agent reports it as an Info type event and displays a  blue info icon.

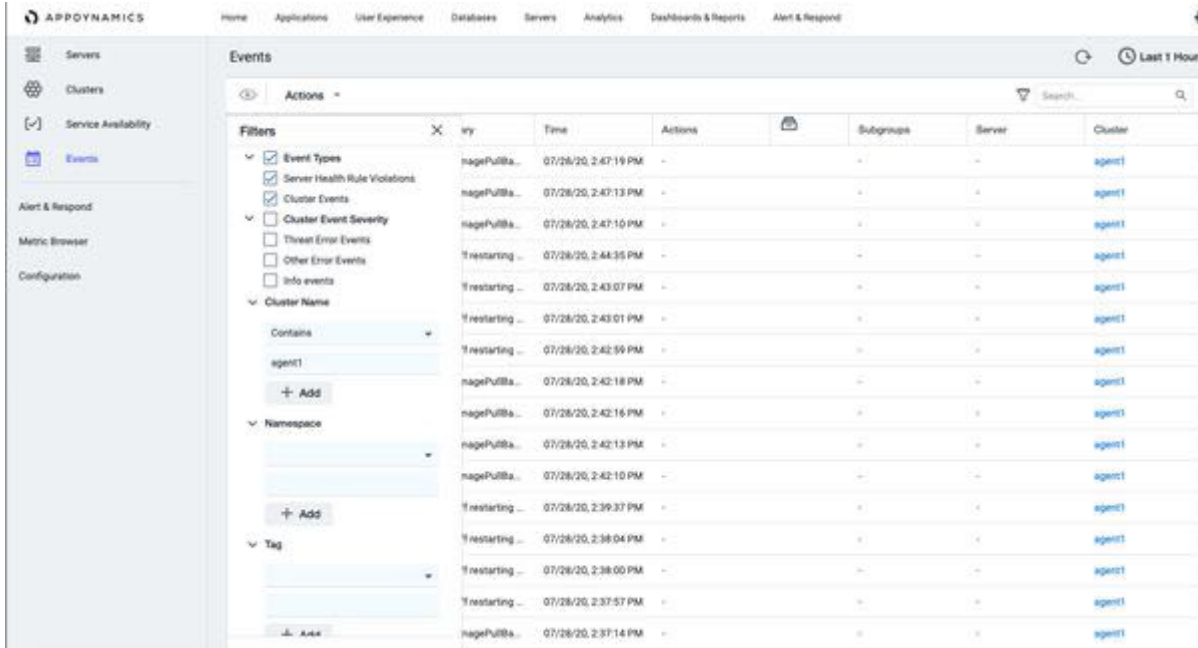

To access Cluster Event data:

1. Click the **Servers** tab.
2. On the navigation bar, select **Events**. A panel displays a list of events that have been reported from both servers and clusters. To check for specific events, you can use the **Filters** option.

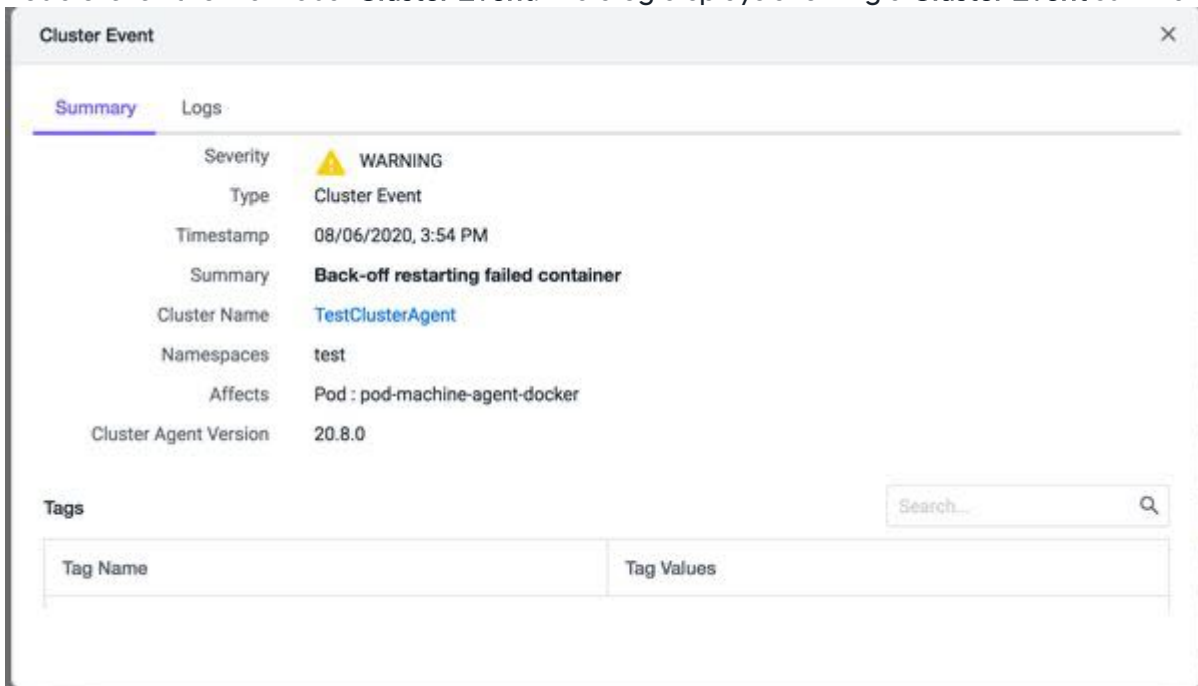

Filters	Summary	Time
	Back-off restarting failed container	07/28/20, 2:48:02 PM
	Back-off restarting failed container	07/28/20, 2:47:58 PM
	Back-off restarting failed container	07/28/20, 2:47:56 PM
	Error: imagePullBackOff	07/28/20, 2:47:19 PM
	Error: imagePullBackOff	07/28/20, 2:47:13 PM
	Error: imagePullBackOff	07/28/20, 2:47:10 PM
	Back-off restarting failed container	07/28/20, 2:44:35 PM
	Back-off restarting failed container	07/28/20, 2:43:07 PM
	Back-off restarting failed container	07/28/20, 2:43:01 PM
	Back-off restarting failed container	07/28/20, 2:42:59 PM
	Error: imagePullBackOff	07/28/20, 2:42:16 PM
	Error: imagePullBackOff	07/28/20, 2:42:16 PM
	Error: imagePullBackOff	07/28/20, 2:42:13 PM
	Error: imagePullBackOff	07/28/20, 2:42:10 PM
	Back-off restarting failed container	07/28/20, 2:39:37 PM

3. Click **Add** to add a filter and select the desired filters from the available list.

4. Click **Apply**. The list of events is filtered to show only the selected events.

5. Double-click the individual **Cluster Event**. A dialog displays showing a **Cluster Event** summary.

The **Logs** tab displays the log details. See [Enable Log Collection for Failing Pods](#)(see page 3000).

6. Click **X** to close the dialog.

View Container Information

Related pages:

-
- [Container Metrics](#)(see page 2852)
 - [Administer the Cluster Agent](#)(see page 2997)
 - [Hardware Resources Metrics](#)(see page 2558)

The AppDynamics Cluster Agent runs within your Kubernetes cluster. Metrics reported for containers are taken from the Kubernetes [Metrics Server](#)¹⁸¹⁸. Users need to install the metrics-server on their cluster to see container metrics. Once deployed, it discovers nodes in your cluster and starts collecting metrics from the Kubelet API. The Containers Dashboard shows the resource utilization metrics of your containerized applications.

The Containers page lists all containers to be monitored that are used by an application that is registered to the Controller.

View Container Metrics

To view Container metrics:

1. Navigate to **Servers > Clusters**.
2. Double-click a cluster to view the cluster agent **Dashboard**.
3. Navigate to the **Pods** tab.
4. Double-click a pod to view the pod details and the containers that are running in the pod.
A list of Container names is displayed.
5. Click a **Container Name** to expand and view the metrics for that specific container.

CPU Usage

2.02%

Usage

Memory Usage

45.48%

Usage

Measure Resource Usage

Two metrics are reported per container:

- **CPU Usage:** Hardware Resources|CPU|%Busy
- **Memory Usage:** Hardware Resources|Memory|Used %

CPU

Name	Description
%Busy	Percentage of time the CPU was busy processing system or user requests from this container; this metric includes CPU Stolen time. This %Busy value can exceed 100%. For example, if a system has 16 cores the %Busy can go to 1600%.

Memory

Name	Description
Used %	Memory utilization by the container as a percentage of the memory hard limit.

Administer the Cluster Agent

You can use several settings in the Controller to administer the Cluster Agent.

Plan the Cluster Agent Deployment

If you have more than one Cluster Agent on your Controller, you must start your Cluster Agents in a staggered fashion. This procedure ensures that the Controller responds optimally. Use the table to determine the stagger start time for each cluster. Based on the cluster size, it may take a few minutes for the Cluster Agent to fully register with the Controller.

Plan capacity for Clusters

Capacity planning is important when preparing to deploy the Cluster Agent. The Cluster Agent and the Machine Agent share the capacity of the same Controller. The total number of pods and containers in your cluster is equal to the number of Machine Agents slots that are used. For example, if you have 250 pods and 250 containers, that is equivalent to using 500 Machine Agents in the Controller. See [Controller Sizing](#)¹⁸¹⁹.

Controller Settings for the Cluster Agent

These properties are recommended for a Controller supporting the Cluster Agent. Certain Server Visibility properties will apply to all instances of Server Visibility and the Cluster Agent.

Property	Description	Recommend
<code>sim.cluster.agent.limit</code>	Maximum number of Cluster Agents per account. Configurable at the account level. For example, if you set the <code>sim.cluster.agent.limit</code> to a value of five, and you have ten Cluster Agents reporting, then the Controller randomly selects a subset of Cluster Agents. These random Cluster Agents will not be registered and reported. If the configured limit is reached, any new Cluster Agent will not be registered.	10

¹⁸¹⁹ <https://docs.appdynamics.com/display/PRO45/Controller+System+Requirements#ControllerSystemRequirements-controllersizingControllerSizing>

Property	Description	Recommend
<code>sim.cluster.pod.limit</code>	Maximum number of pods per Cluster Agent per account. Configurable at the account level. If the number of pods exceeds the configured limit, the Cluster Agent randomly selects a set of pods that will not register or report.	1500
<code>sim.machines.registrations.maxPerSecondPerAccount</code>	Maximum number of machine registrations allowed per account, per second. This property applies to all instances of Server Visibility and the Cluster Agent.	10000
<code>sim.cluster.container.limit</code>	Controller level limit for the number of containers per cluster. This is used if there is no account-level configuration. To overwrite at account-level, add an additional property to the corresponding account. This property only affects the Cluster Agent.	3000
<code>sim.machines.offline.toStaleTimeoutMillis</code>	Length of time in milliseconds before an offline machine is considered stale, and eligible for purging. This property applies to all instances of Server Visibility and the Cluster Agent.	172,800,000 ms
<code>sim.machines.registrations.update.frequency</code>	Machine's timestamp update frequency in milliseconds. This property applies to all instances of Server Visibility and the Cluster Agent.	86,400,000 ms
<code>sim.cluster.events.maxPerMinute</code>	Controller level limit for the number of cluster events that are allowed per minute. This property only affects the Cluster Agent.	4000
<code>sim.machines.simAllowed</code>	Availability of Server Visibility features. This property must be set to true to send the data (metrics) from Cluster Agent to Controller.	true
<code>sim.cluster.monitoring.enabled</code>	This property enables the Cluster Agent on the Controller. If set to false, all Cluster Agents stop reporting metrics and components, but still register every minute. This property only affects the Cluster Agent.	true

See [Controller Settings for Server Visibility](#)(see page 2701).

i To avoid the risk of purging live entities, ensure that the `sim.machines.offline.toStaleTimeoutMillis` value is always greater than the `sim.machines.registrations.update.frequency` value.

On-Premises Customers

For on-premises customers, to modify the Cluster Agent properties for your account:

1. Log in to the [Administration Console](#)¹⁸²⁰ with the administrator root password.
2. Select **Controller Settings**.
3. In the **Controller Settings** list, search for the setting.
4. In the **Value** field, enter the recommended value.
5. Click **Save**.
6. Log out of the Administrator Console.

SaaS Customers

For SaaS customers, create an [AppDynamics Support](#)¹⁸²¹ ticket to have the Cluster Agent properties updated for your account.

Control Cluster Agent Reporting

You can stop and resume the Cluster Agent from reporting metrics and registering containers and pods. You can do this on a per-account basis, or on a Controller-wide basis.

Stop a Cluster Agent by Account

To stop the Cluster Agent on the Controller:

1. Log in to the [Administration Console](#)¹⁸²² with the administrator root password.
2. Select **Account Settings**.
3. In the accounts list, double-click the account for which you want to configure the Cluster Agent.
4. In the **Additional Properties** pane, click **+Add Property**.
5. In the left field, enter "sim.cluster.monitoring.enabled".
6. In the right field, enter "false".
7. Click **OK** to save the property.
8. Log out of the Administrator Console.

License Expiration Date Never On Date 12/31/20

Using SAML Authentication No

Additional Properties

sim.cluster.monitoring.enabled	false	<input type="button" value="X"/>
--------------------------------	-------	----------------------------------

Start a Cluster Agent by Account

To start the Cluster Agent on the Controller:

¹⁸²⁰ <https://docs.appdynamics.com/display/LATEST/Access+the+Administration+Console>

¹⁸²¹ <https://docs.appdynamics.com/display/PRO45/AppDynamics+Support>

¹⁸²² <https://docs.appdynamics.com/display/LATEST/Access+the+Administration+Console>

1. Log in to the [Administration Console](#)¹⁸²³ with the administrator root password.
2. Select **Account Settings**.
3. In the accounts list, double-click the account for which you want to configure the Cluster Agent.
4. Locate the `sim.cluster.monitoring.enable` property, and in the right field, enter "true".
5. Click **OK** to save the property.
6. Log out of the Administrator Console.
7. If the Cluster Agent has been stopped using the "sim.cluster.monitoring.enabled" setting, it does not resume reporting metrics and registering pods and containers until you enable the Cluster Agent using the User Interface. See [Use the Cluster Agent](#)(see page 2968).

Stop all Agents on the Controller

To stop all Cluster Agents on the Controller:

1. Log in to the [Administration Console](#)¹⁸²⁴ with the administrator root password.
2. Select **Controller Settings**.
3. In the **Controller Settings** list, search for the "sim.cluster.monitoring.enabled" setting.
4. In the right field, set the value to "false".
5. Click **Save**.
6. Log out of the Administrator Console.

Start all Agents on the Controller

To start all Cluster Agents on the Controller:

1. Log in to the [Administration Console](#)¹⁸²⁵ with the administrator root password.
2. Select **Controller Settings**.
3. In the **Controller Settings** list, search for the "sim.cluster.monitoring.enabled" setting.
4. In the right field, set the value to "true".
5. Click **Save**.
6. Log out of the Administrator Console.
7. If Cluster Agents have been stopped using the "sim.cluster.monitoring.enabled" setting, they do not resume reporting metrics and registering pods and containers until they are enabled through the User Interface. See [Use the Cluster Agent](#)(see page 2968).

Enable Log Collection for Failing Pods

This page describes how to enable and use the Cluster Agent feature to collect logs for failing pods. This feature is automatically enabled on SaaS Controllers. You must enable on-premises Controllers described on this page.

When enabled, the Cluster Agent automatically collects logs for restarted or failed pods. The pod failure logs capture the status of the `CrashLoopBackoff` events that display the `Back-off restarting failed container` message. This message usually indicates that Kubernetes started a container but then the

1823 <https://docs.appdynamics.com/display/LATEST/Access+the+Administration+Console>

1824 <https://docs.appdynamics.com/display/LATEST/Access+the+Administration+Console>

1825 <https://docs.appdynamics.com/display/LATEST/Access+the+Administration+Console>

container quickly exits. If this occurs, Kubernetes attempts to restart the container. You can use these log messages to determine why the pod is exiting, whether due to a liveness probe, or some other issue.

Minimum Requirements

The Cluster Agent log collection feature requires:

- Cluster Agent >= 20.7
- Controller >= 20.10.0

Requirements to Enable On-Premises Controllers

- Enable logging by using the Cluster Agent configuration setting, `sim.cluster.logs.capture.enabled`.
- Update the full file path to store the logs using the Controller setting, `sim.cluster.logs.root.file.path`. The logs are stored in the specified file location.
- Ensure you have 50 GB of hard disk space on the file system.
- When updating the file path, ensure that you move previously collected logs from the old path to the new path to view them on the Controller UI.

Controller Settings

The following table lists the log settings required for an on-premises environment:

i For SaaS, the Technical Support team updates the configuration properties. Therefore, to configure the logs for SaaS, contact the support team by creating an [AppDynamics Support](#)¹⁸²⁶ ticket.

Setting	Definition	Location	Default
<code>sim.cluster.logs.bucket.name</code>	The folder name to store the pod logs.	Controller Administration Console with root user permission (Controller Settings)	kubernetes-log-snippets
<code>sim.cluster.logs.capture.enabled</code>	An option to enable or disable log capturing. This option is disabled by default.	Controller Administration Console with root user permission You can configure this setting at both account level (Account Settings) and Controller level (Controller Settings)	true
<code>sim.cluster.logs.expiration.in.days</code>	The number of days after which the logs get cleared from the storage.	Controller Administration Console with root user permission (Controller Settings)	10

¹⁸²⁶ <https://docs.appdynamics.com/display/PRO45/AppDynamics+Support>

Setting	Definition	Location	Default
sim.cluster.logs.root.file.path	The complete root file path to store the logs. Modifying the path results in storing the logs in the new path but the older logs will remain in the previous location.	Controller Administration Console with root user permission (Controller Settings)	/opt/appdynamics
sim.cluster.failed.pod.limit	The number of historical pods beyond this value is purged.	Controller Administration Console with root user permission (Controller Settings)	1000

Use Cluster Agent Log Collection

You can view the logs on the **Pod Details** page and the **Cluster Event** page.

Pod Details Page

1. Select **Servers > Clusters > Cluster Name**.
2. Select a Cluster Agent and double-click. The cluster interface displays the **Dashboard**, the **Pods**, the **Inventory**, and the **Events** tabs.
3. Click **Pods**.
4. Double-click any pod to display its **Pod Details** panel.
5. Review the **Error Log**.

POD DETAIL: replicaset-machine-agent-docker-z4fm9 [Close]

Ok

Cluster Events Page

- Click the **Servers** tab.
- On the left navigation bar, select **Events** to see a list of events that have been reported from both servers and clusters.
or
Select **Clusters** > <Clustername> > **Details** > **Events**

3. Double-click a cluster event to view the logs under the **Logs** tab.

Upgrade the Cluster Agent

This page describes how to upgrade the Cluster Agent using:

- Kubernetes CLI, or
- Cluster Agent Helm Chart

See [Install the Cluster Agent](#) (see page 2861).

Upgrade the Cluster Agent Using Kubernetes CLI

1. Download the target version of the Cluster Agent bundle from the [AppDynamics Downloads](#)¹⁸²⁷ portal.
2. Unzip the bundle and cd to the unzipped folder:

```

unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
cd appdynamics-cluster-agent-alpine-linux-<version>

```

3. Update the `cluster-agent.yaml` to include any previously applied configuration.
4. Update the image tag to add the version of the downloaded Cluster Agent bundle (for example, 20.12.1):

```

apiVersion: appdynamics.com/v1alpha1

```

¹⁸²⁷ <https://accounts.appdynamics.com/downloads>

```

kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<app-name>"
  controllerUrl: "http://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  # docker image info
  image: "docker.io/appdynamics/cluster-agent:20.12.1"
  serviceAccountName: appdynamics-cluster-agent
  
```

5. Delete and re-create the Operator and Cluster Agent.

```

kubectl delete -f cluster-agent.yaml
kubectl delete -f cluster-agent-operator.yaml
kubectl create -f cluster-agent-operator.yaml
kubectl create -f cluster-agent.yaml
  
```

Upgrade the Cluster Agent Using the Helm Chart

The latest Cluster Agent Helm Chart is available at `appdynamics-charts/cluster-agent`. Before you can upgrade to the latest Cluster Agent, you must first uninstall the existing Helm Chart and then re-install it.

1. Use `helm get` and `helm show` to determine if an upgrade is required to install the most recent Cluster Agent images from `appdynamics-charts/cluster-agent`:

```

# which images are currently installed by my release?
helm get all "<my-cluster-agent-helm-release>" -n appdynamics | grep -E 'agentTag|operatorTag'
  agentTag: 20.10.0
  operatorTag: 0.6.3

# which images are available to install?
helm show values appdynamics-charts/cluster-agent | grep -E 'agentTag|operatorTag'
  agentTag: 20.11.0
  operatorTag: 0.6.5
  
```

2. To perform the upgrade, uninstall and re-install the Cluster Agent Helm Chart using the same namespace from the previous installation:

```

helm uninstall "<my-cluster-agent-helm-release>" --namespace appdynamics
helm install -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --namespace=appdynamics
  
```

Uninstall the Cluster Agent

This page describes how to uninstall the Cluster Agent using:

- Kubernetes CLI, or
- Cluster Agent Helm Chart

See [Install the Cluster Agent](#)(see page 2861).

Uninstall the Cluster Agent Using Kubernetes CLI

Delete the Cluster Agent Operator and Cluster Agent using the YAML files:

```
kubectl delete -f cluster-agent.yaml
kubectl delete -f cluster-agent-operator.yaml
```

Uninstall the Cluster Agent Using the Helm Chart

Uninstall the Cluster Agent Helm Chart using the namespace that you used for the installation:

```
helm uninstall "<my-cluster-agent-helm-release>" --namespace appdynamics
```

Analytics

You can use Analytics with the APM, Browser RUM, Mobile RUM, and Browser Synthetic Monitoring product modules for:

- Transaction Analytics
- Log Analytics
- Browser Analytics
- Mobile Analytics
- Browser Synthetic Analytics
- Connected Devices Analytics

Analytics extracts the data, generates baselines and dashboards, and provides perspective beyond traditional APM by enabling real-time analysis of business performance correlated with your application performance.

Installation And Administration

- [Deploy Analytics Without the Analytics Agent](#)(see page 3127)
- [Deploy Analytics With the Analytics Agent](#)(see page 3076)
- [Analytics and Data Security](#)(see page 3108)
- [Upgrade Analytics Agent](#)(see page 3107)
- [Troubleshoot Analytics Issues](#)(see page 3272)

Analytics Data Collection

- [Collect Log Analytics Data](#)(see page 3158)
- [Collect Transaction Analytics Data](#)(see page 3132)
- [Business Transaction and Log Correlation](#)(see page 3193)
- [Collect Business Data From SQL Calls](#)(see page 3154)

Using Analytics

- [Business Journeys](#)(see page 3242)
- [Experience Level Management](#)(see page 3261)
- [Search Analytics Data](#)(see page 3214)
- [Visualize Analytics Data](#)(see page 3224)

Extensibility And Reference

- [Create Analytics Metrics From Scheduled Queries](#)(see page 3239)
- [Analytics Events API](#)(see page 3743)
- [ADQL Reference](#)(see page 3011)

Overview of Analytics

This page describes Analytics. Analytics is built on the AppDynamics Application Performance Management (APM) platform, which includes the Events Service, the unstructured document store for the platform.

Analytics can answer business-oriented questions such as:

- How many users experienced failed checkout transactions in the last 24 hours?
- How much revenue was lost because of these failures?
- How is the lost revenue distributed across different product categories?
- What is your revenue for the day for a geographical region?
- What was the revenue impact, by product category, associated with the two marketing campaigns we ran last week?

The exact components you need to install depend upon your environment and your requirements.

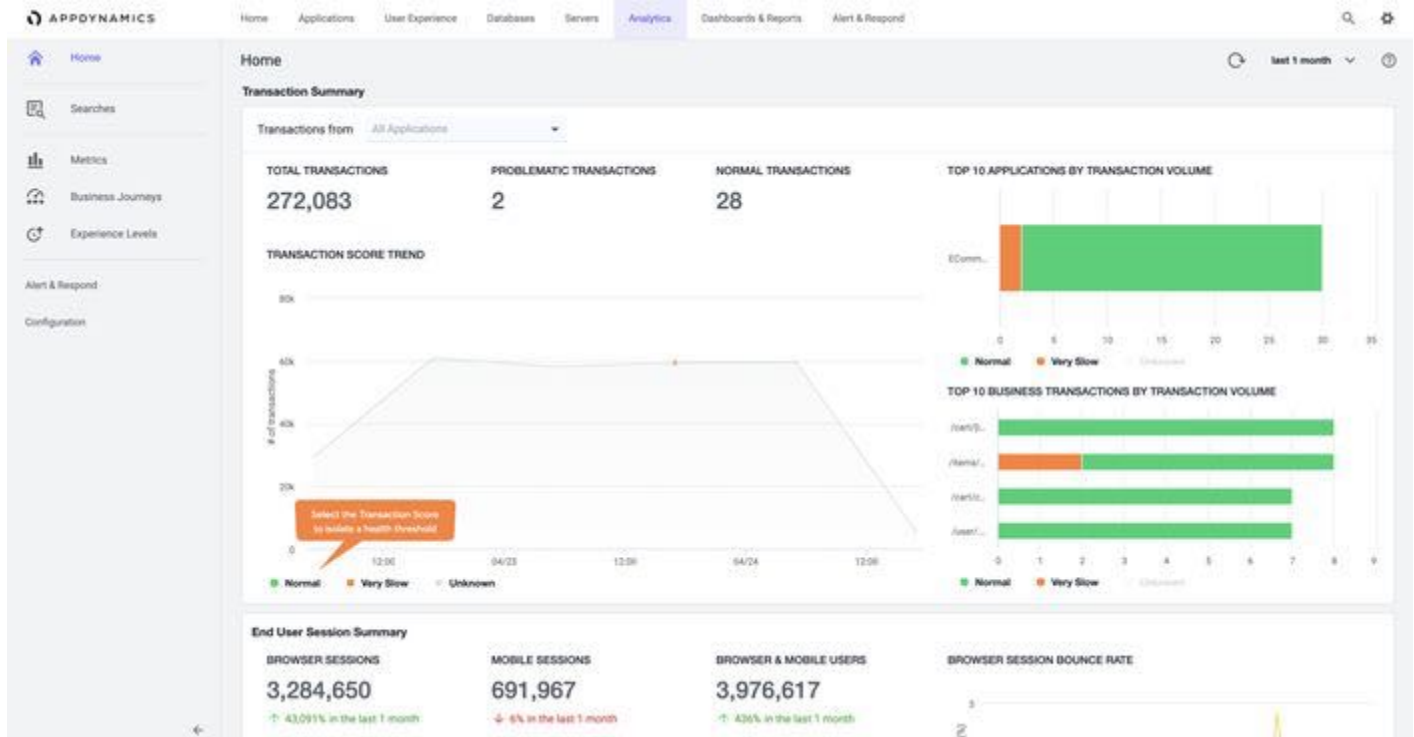

- To plan your deployment, see [Deploy Analytics With the Analytics Agent](#)(see page 3076).
- If you are upgrading from a previous version, see [Upgrade Analytics Agent](#)(see page 3107).
- If you have been using job files for Log Analytics and want to switch to using source rules (part of Configuration Log Management), see [Migrate Log Analytics Job Files to Source Rules](#)(see page 3191).
- To view Analytics Agents connected to your Controller, see [View Analytics Agent Health](#)(see page 3116).

Analytics Home Page

The **Analytics Home** page consolidates data from the transaction, browser, and mobile events. The **Home** page automatically generates **Transaction** and **End User Monitoring Summary** panels through queries that aggregate data into widgets.

To view the different widgets on the home page, you need the appropriate licenses and access. See [Restrictions and Security](#)(see page 3011).

You can access the AppDynamics home page by clicking the **Home** icon on the left navigation pane in **Analytics**. You can either use the left navigation pane, or click **Home** on the right pane to navigate to the Analytics modules (**Searches**, **Metrics**, **Business Journeys**, **Experience Levels**, **Alert & Respond**, and **Configuration**).

Home Page Data

AppDynamics Query Language (ADQL) queries are used to generate the data for each home page widget. You cannot access or edit the ADQL queries.

When you select a time range, each query automatically includes the time filter for the widgets. These widgets refresh every two minutes.

Transaction Summary

The **Transaction Summary** panel aggregates the Analytics data from applications and business transactions. **Transaction Summary** widgets are categorized by [Transaction Threshold](#)(see page 1253) from normal to error. The **Transaction Summary** panel contains six widgets:

- **Total Transactions** - Count of all transactions.
- **Problematic Transactions** - Count of transactions that are not within normal threshold boundaries.
- **Normal Transactions** - Count of transactions that are within the normal threshold boundaries.
- **Top 10 Applications by Transaction Volume** - Graphical view of applications.
- **Top 10 Business Transactions by Transaction Volume** - Graphical view of transactions.
- **Transaction Score Trend** - Total number of transactions for all applications.

End User Session Summary

The **End User Session Summary** panel displays browser and mobile session data in widgets. The **End User Session Summary** panel contains six widgets:

- **Browser Sessions** - Count of unique browser sessions.
- **Mobile Sessions** - Count of unique mobile sessions.
- **Browser & Mobile Users** - Count of browser and mobile users.
- **Browser Session Bounce Rate** - Rate of bounces per total sessions.

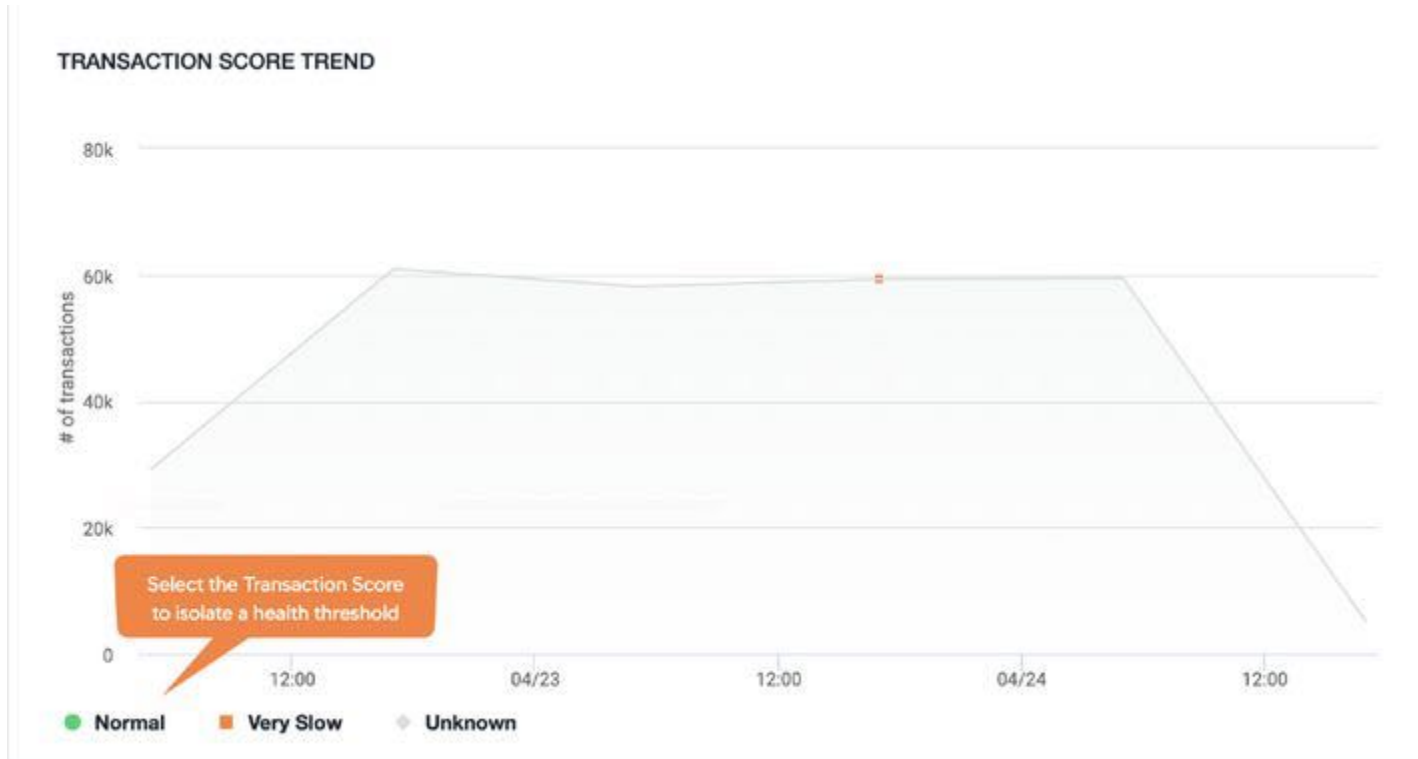

A bounce is a browser session where the page count is one. Bounces occur when a user opens a webpage and leaves the site without visiting additional pages.

- **Top Page Referrers by Session Volume** - Website visited by users before accessing your website. The referrer is an optional component of the Events Service. If you have not configured referrers, this widget does not contain data.
- **Session Trend** - Total number of sessions separated by browser and mobile sessions.

Options for Home Page Data

Transaction Score Options

You can select the transaction score in each chart to isolate metrics. For example, selecting **Normal** in **Transaction Score Trend** removes other transaction scores:

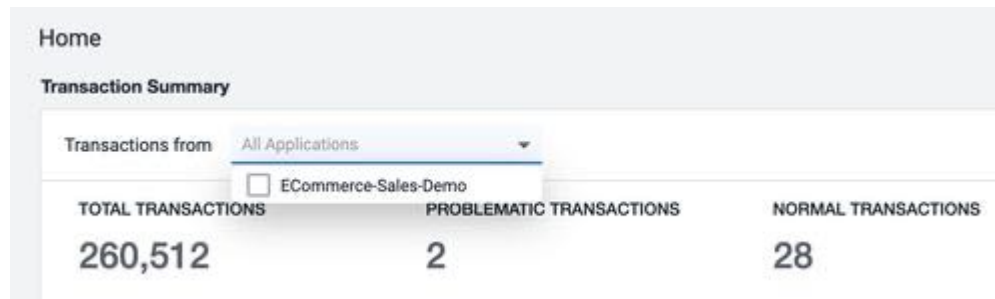

Next to the **Transaction Score Trend** are two horizontal bar graphs that display the top ten applications and business transactions by transaction volume. Hover over the graphs to see a breakdown of additional transaction information.

Transaction Filter Options

You can filter the view of each panel to display specific applications or application keys. Click the dropdown arrow at the top of each panel and select the desired fields.

End User Monitoring Filter Options

You can filter browser sessions and mobile sessions to display application keys. For mobile sessions, selecting specific application names further filters the application keys.

Drill Down Options

You can drill down into each metric to open the ADQL search that generates the metric. For example, selecting **Normal Transactions** automatically displays the ADQL Query for normal transactions.

Restrictions and Security

If your **Analytics Home** page does not display data on widgets, there is either an error in retrieving data, or no data is available in the Events Service.

If panels or widgets are missing from your home page, confirm that you have sufficient licenses and have access to Analytics data.

Licenses

To view data on the **Transaction Summary** panel, you need:

- At least one application enabled for Analytics
- Active Transaction Analytics licenses

If your Transaction Analytics license expires, Analytics stops ingesting data for the **Analytics Home** page. The **Transaction Summary** panel still displays your existing data, but does not ingest any new data.

To view data in the **End User Session Summary** panel, you need:

- Browser Analytics and/or Mobile Analytics enabled. See [Analytics Data Sources](#)(see page 3075).
- Active EUM licenses to Mobile and/or Browser Real User Monitoring.

Some widgets may not be available depending on your End User Monitoring (EUM) licenses. For example, if you have a license to Mobile RUM only, your Analytics Home page will not contain browser-specific widgets (browser sessions, bounce rate, and referrers). Aggregated widgets such as Browser & Mobile Users and Session Trend only show the data to which you have an EUM license.

RBAC

Analytics enforces role-based access control (RBAC). As a result of RBAC, your **Analytics Home** page displays only the data to which you have access. See [Analytics and Data Security](#)(see page 3108).

 In the **End User Session Summary** panel, numeric widgets and the **Session Trend** chart requires access to both Browser and Mobile Real User Monitoring. To see data in these widgets, you must have access to **Browser Requests** and **Mobile Requests and Sessions** events.

ADQL Reference

The AppDynamics Query Language (ADQL) is a query language for searching available data in Analytics.

ADQL is similar to the SELECT statement in the prevalent Structure Query Language (SQL) but is designed solely for AppDynamics Analytics data. Just like the SELECT command in SQL, ADQL allows you to specify the data source (such as transaction events, EUM events, and logs), a list of fields to retrieve, and conditions for selecting events from the analytics data store.

With ADQL, you can construct queries in these environments:

- Analytics Search panel in the Controller with **Advanced Mode**.
- Analytics Query Events APIs in the body of the query request.

To simplify entering your queries in Analytics Search with **Advanced Mode**, the ADQL auto-complete feature displays keywords, a list of available fields, and functions based on the stage of your typed search. See [Creating Advanced Searches for Analytics](#)(see page 3218).

ADQL Typographical Conventions and Symbols

ADQL reference topics use custom typographical conventions and symbols to describe the syntax for ADQL queries.

Convention	Name	Usage
BOLD	Bold typeface	Bold typeface indicates ADQL keywords and operators, such as SELECT , FROM , AND and so on.
field_name and numeric_field_name	N/A	The terms field_name and numeric_field_name represent field names that appear in your analytics data. Field names depend on the event type. See ADQL Data (see page 3052).
Monospace typeface	Monospace typeface	Function names, such as count are indicated by monospace typeface.
event_type	N/A	The term event_type represents the available event types collected from your applications. Valid values are: <ul style="list-style-type: none"> • transactions • logs • browser requests • mobile requests • mobile crash reports • analytics custom events • synthetic sessions
<i>Italic typeface</i>	<i>Italics</i>	<i>Italics</i> represent variables or placeholders. You supply the actual value.

Convention	Name	Usage
[]	Square brackets	Terms in square brackets are optional. Nested square brackets indicate that the term inside is optional and can only be included if the optional term in the outer square brackets is included.
	Pipe	The pipe character separates alternate items to indicate one of the items may be included. You can read it as "or" in a syntax statement.
{ }	Curly braces	Curly braces are used to group items to disambiguate the definition of items.
()	Parentheses	Parentheses are used to indicate the order of operation in an expression.
...	Ellipsis	An ellipsis indicates the preceding term may be repeated.

ADQL Queries

This page describes ADQL query syntax. ADQL uses the **SELECT** statement and filtering statements, otherwise referred to as queries, to return sets of data that you can add to **Custom Dashboards**.

ADQL search queries have a 5,000 character limit and reserve keywords in certain field names or milestones.

Reserved ADQL Keywords
SELECT

TRIM

CONCAT

NOW

The query syntax is:

```

SELECT * | {[DISTINCT] expression [AS alias] [, expression [AS alias]]...}
FROM event_type
[WHERE condition_expression]
[SINCE timevalue [UNTIL timevalue]]
[HAVING condition_expression]
[ORDER BY {field_name | alias} [ASC | DESC] [, {field_name | alias} [ASC | DESC]]...]
[LIMIT integer [, integer]...]
  
```

While the **SELECT** and **FROM** clauses are required, all other clauses are optional. Enter spaces around each keyword.

For **GROUP BY** functionality, see [GROUP BY](#)(see page 3017).

SELECT Clause

The ADQL event query begins with a **SELECT** clause, which can take one or more arguments.

SELECT * | {[**DISTINCT**] field_expression [**AS** alias] [, field_expression [**AS** alias]]...}

- A single asterisk * in the **SELECT** clause returns the list of fields for each event.
- To return specific fields for each event, specify a comma-separated list of fields. Optionally, each field_expression can be aliased to a label using the **AS** construct.
- Use the **DISTINCT** qualifier to return unique combinations of the specified field values. If no limit specified, the top ten results by count are returned. See [LIMIT Clause](#)(see page 3026).

DISTINCT can not be applied to a wild card **SELECT** query, such as

```
SELECT DISTINCT *
```

- String values must be surrounded by either single quotes or double quotes, such as 'hello' and "hello".

The field_expression can take several forms. See [ADQL Expressions](#)(see page 3013).

Query Examples with SELECT Clause

Query	Result
SELECT count(transactionName) FROM transactions WHERE application='yourAppName'	Returns a count of business transactions for the specified application.
SELECT * FROM logs WHERE sourceType='yourLogFile' AND message LIKE 'GET'	Returns log events containing a specified keyword.
SELECT * FROM transactions WHERE application='yourAppName' AND transactionName='yourBTName'	Returns all fields for business transactions in the specified application matching the specified transaction name.
SELECT DISTINCT transactionName FROM transactions WHERE application='yourAppName'	Returns a list of unique transaction names from the specified application.
SELECT customerName AS "First And Last Name", age AS "Years Old", ...	Returns the specified fields relabeled as specified in the query statement. In this query, customerName and age are user-defined fields.

AS Clause

Use the **AS** clause to rename a field to a label of your choice. The label is also referred to as an alias.

field_expression **AS** alias

Returns the field with the specified alias. The alias may be any valid identifier (a letter followed by any number of letter or digit characters) or a value in quotes. If the value of the alias contains spaces or special characters, it must be in quotes. See [ADQL Expressions](#)(see page 3028).

AS Clause Example

SELECT eventTimestamp **AS** 'Time Stamp' **FROM** transactions **WHERE** application='yourAppName'

FROM Clause

Use the **FROM** clause to specify the event type. For example:

FROM event_type

Event Types

Event types describe the source of the analytics data, such as business transactions (transactions) or browser requests. Each event type has a UI field name and an Events Service internal name. The Events Service internal name is used in ADQL queries.

This table lists the event types with their UI names and Events Service internal names.

Event Type UI Label	Events Service Internal Name
Transactions	transactions
Logs	logs
Browser Requests	browser_records
Browser Sessions	session_records
Mobile Requests	mobile_snapshots
Mobile Sessions	mobile_session_records
Mobile Crash Reports	mobile_crash_reports
Synthetic Sessions	synth_session_records

FROM Clause Examples

For this result	Query
Return all fields for browser requests	SELECT * FROM browser_records WHERE appkey='E2E-AAB-AUM'
Return all fields for the business transactions in your application	SELECT * FROM transactions WHERE application='yourAppName'
Return all fields for the logs specified by "yourLogFile"	SELECT * FROM logs WHERE sourceType='yourLogFile'

WHERE Clause

Overview

Use the **WHERE** clause to specify one or more condition expressions separated by logical operators such as **AND**, **OR**.

The **WHERE** clause uses the following syntax:

```
[WHERE condition_expression]
```

See [ADQL Expressions](#)(see page 3028) for a description of the condition expression syntax. Condition expressions use [Comparison Operators](#)(see page 3047).

AppDynamics recommends that you do not use periods (.) in the field name, otherwise, the syntax will break.

Examples

To filter logs based on error or warning log level, use a query similar to the following:

```
SELECT * FROM logs WHERE sourceType='yourLogFile' AND (logLevel='ERROR' OR logLevel='WARN')
```

GROUP BY

ADQL does not have an explicit **GROUP BY** clause. However, queries containing field names in the **SELECT** clause behave as **GROUP BY** statements if the query contains [metric functions](#)(see page 3030) or [bucketing functions](#)(see page 3030).

Group by queries are limited to containing up to five terms. Terms can be either fields (which use an implicit **GROUP BY**) or bucketing functions, such as *series*.

Aggregation Examples

In this example, the query groups the `avg(responseTime)` aggregation based on the non-aggregation field, `application`. So the result contains the average response time calculated for each application.

```
SELECT application, avg(responseTime) FROM transactions
```

Sample results:

The screenshot shows the AppDynamics search interface. At the top, there's a 'New Search' section with 'Basic' and 'Advanced' radio buttons, and a 'last 1 week' filter. Below this is a text area containing the SQL query: `1 SELECT application, avg(responseTime) FROM transactions`. A 'Search' button is located below the query. The interface has tabs for 'Data' and 'Visualization', with 'Visualization' selected. Below the tabs is a 'Current Search Results' table with two columns: 'Application' and 'avg(responseTime)'. The table contains two rows: 'ECommerce-E2E' with a value of 588.307, and 'TelecomDemoApp-DP' with a value of 624.241. To the right of the table is a 'Chart Types' panel with 'Simple' and 'Time Series' categories, each containing several chart icons. At the bottom of the table, there are navigation controls including arrows, a page number '1 / 1', and '50 items per page'.

The implicit grouping can be extended by using multiple non-aggregation fields preceding an aggregation field. For example:

SELECT application, segments.tier, avg(responseTime) **FROM** transactions

By adding tier as a second non-aggregation field, the query groups the avg(responseTime) aggregation based on the non-aggregation fields, application, and tierName. Because there are multiple grouping fields, the second non-aggregation field, tier name, is sub-grouped under the application grouping. So each combination of application and tier name together forms a group over which the average response time is calculated.

Sample results:

New Search Basic Advanced last 1 week ?

```
1 SELECT application, segments.tier, avg(responseTime) FROM transactions
```

?

Data **Visualization**

Current Search Results

Application	segments.tier	avg(responseTime)
ECommerce-E2E	Inventory-Services	3,957.022
ECommerce-E2E	ECommerce-Services	587.871

Chart Types

Simple

Time Series

Univariate

For SQL users, these two statements produce similar results in their respective environments:

- ADQL query: **SELECT** application, segments.tier, avg(responseTime) **FROM** transactions
- SQL query: **SELECT** application, segments.tier, avg(responseTime) **FROM** transactions **GROUP BY** applicationName, segments.tier

Bucketing Function Example

Bucketing functions such as `series` and `range` define groups over which other aggregations can be calculated. The buckets are specified by the parameters of the respective functions and form groups over which subsequent aggregations are calculated.

For example, the following query calculates the average response time over two-minute intervals (or buckets):

```
SELECT series(eventTimestamp, '2m'), avg(responseTime)
```

Sample results:

```
1 SELECT series(eventTimestamp, '2m'), avg(responseTime) FROM transactions WHERE application = 'ECommerce-E2E'
```

Search

Data Visualization Save Actions

series(eventTimest...	avg(responseTime)
08/22/16 3:40:00 PM	46.172
08/22/16 3:42:00 PM	56.328
08/22/16 3:44:00 PM	44.537
08/22/16 3:46:00 PM	50.068
08/22/16 3:48:00 PM	50.157
08/22/16 3:50:00 PM	43.767
08/22/16 3:52:00 PM	51.759
08/22/16 3:54:00 PM	37.514

You can also combine an aggregation with a bucketing function and implicit **GROUP BY**. The following query returns the average response time grouped by tier over the series of six-hour intervals.

SELECT series(eventTimestamp, '6h'), segments.tier, avg(responseTime) **FROM** transactions

Sample Results:

```
1 SELECT series(eventTimestamp, '6h'), segments.tier, avg(responseTime) FROM transactions
```

08/23/16 11:00:00 AM	ECommerce-Services	10.580

ORDER BY Clause

The **ORDER BY** clause enables you to sort the query results by one or more fields. The syntax is:

```
[ORDER BY {field_name | alias} [ASC | DESC] [, {field_name | `alias`} [ASC | DESC]]...
```

Rules governing ordering include:

- Sort order, ascending (**ASC**) or descending (**DESC**) is applied per field. If not specified, the ascending (**ASC**) order is the default.
- ORDER BY** is supported on fields or aliases specified in the **SELECT** clause.
- Aliases used in the **ORDER BY** clause should be surrounded with back quotes if they contain spaces or other special characters.
- ORDER BY** works on single-value metric functions and single-value math expressions. **ORDER BY** can not be used with percentile or stats.
- ORDER BY** on nested fields or metric aggregations that operate on nested fields is not supported. A nested field is any field that has a "." in the name, such as `segments.errorList.errorType` or `btdata.estimatedtime`.

Ordering functionality for [metric and bucketing functions](#)(see page 3030) includes:

- ORDER BY** can be used to order the buckets on a bucketed field in a bucketing function. For example, see the "Series aggregations - Ordering based on the keys of the series buckets." in the table below.

- **ORDER BY** can be used on metric functions that follow bucketing functions, including filtered metric functions. Ordering by the metric value orders the resulting buckets. The metric function must be aliased and referenced by its alias such as:

```
SELECT transactionName, avg(responseTime) AS averageResponseTime FROM
transactions ORDER BY averageResponseTime
```

- Compound orderings can be specified for functions that provide implicit **GROUP BY** ([see page 3017](#)) functionality.
- A single ordering can be defined for the series function, no ordering is allowed for the range function.
- **ORDER BY** can accept math expressions on fields, but not math expressions on metric functions. If the value of a math expression is null it is ordered at the end of the results in ascending order. The following is an invalid query:
SELECT transactionName, max(discountValue) / max(cartTotal) **AS** ratio **FROM** transactions **ORDER BY** ratio

ORDER BY Clause Examples

For This Result	Query
An ordering of queries with no aggregations	SELECT field_name FROM event_type ORDER BY field_name ASC
Group By (see page 3017) - Ordering by the lexicographic ordering of the terms. The fields included in the ORDER BY clause must be in the same order as in the query itself.	SELECT field_name, count(*) FROM event_type ORDER BY field_name DESC
Returns a sorted set of timestamp ranges	SELECT series(eventTimestamp, 10m), count(*) FROM transactions ORDER BY eventTimestamp DESC
Series aggregations - Ordering based on the keys of the series buckets.	SELECT series(salary, 20000), count(salary) FROM event_type ORDER BY salary DESC
Date series aggregations - Ordering based on the date value of the keys of the series buckets	SELECT series(eventTimestamp, '1h'), count(eventTimestamp) FROM transactions ORDER BY eventTimestamp
Order by an alias.	SELECT responseTime AS RT FROM transactions ORDER BY RT
Order by an aliased math expression.	SELECT discountValue / cartTotal AS ratio FROM transactions ORDER BY ratio

HAVING Clause

Use the **HAVING** clause on the output produced by another aggregation. The **HAVING** clause operates on an expression to determine the intervals to be shown in the response. The metric specified in the expression must be numeric and the expression must return a boolean value for the **HAVING** clause to work.

Additionally, the **HAVING** clause must be referenced by an alias in the query as follows:

```
SELECT customerName, count(*) as Requests, avg(responseTime) as  
ResponseTime FROM transactions HAVING Requests > 10000
```

where Requests is the alias referenced in the query.

Syntax

```
SELECT selectItems  
FROM relation  
WHERE where=booleanExpression  
SINCE statement  
HAVING havingClause  
ORDER BY sortItems  
LIMIT limits  
;
```

where havingClause is a boolean expression. The **WHERE**, **ORDER BY**, and **LIMIT** clauses and **SINCE** statement are optional.

HAVING Clause Examples

HAVING clause examples with different filters:

Simple Comparison Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type  
HAVING AVRT > 0
```

Simple Range Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type  
HAVING AVRT BETWEEN [10, 90)
```

Simple List Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type  
HAVING AVRT IN (20, 30, 40, 60)
```

Compound Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT > 20 AND AVRT < 90
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT < 20 OR AVRT > 90
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT > 20 AND AVRT < 90 AND AVRT IN (70, 80)
```

Not Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING NOT AVRT > 50
```

Not Compound Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING NOT (AVRT > 20 AND AVRT < 90)
```

Multi-Metric Filter

```
SELECT transactionName, avg(responseTime) as AVRT,
max(responseTime) as MAXRT FROM type HAVING NOT (AVRT > 20 AND
AVRT < 90) AND MAXRT > 130
```

Limitations

The **HAVING** clause is not supported for:

- Nested fields in Elasticsearch
- Multi-metric functions, such as percentiles and stdev
- Filtered metric functions (filter function)
- Invalid queries:

Unsupported Conditions/Filters	Queries
Like	SELECT transactionName, avg(responseTime) as AVRT FROM transactions HAVING AVRT LIKE '10'
Exists	SELECT transactionName, avg(responseTime) as AVRT FROM transactions HAVING AVRT IS NOT NULL

Unsupported Conditions/Filters	Queries
Not Aliased	SELECT avg(responseTime) as avtr FROM type HAVING avg(responseTime) > 10 SELECT txName, count(*), node, count(*) FROM transactions HAVING count(*) > 10
Nested	SELECT transactionId, AVG(segments.numCalls) as av_numCalls, MIN(segments.numCalls), MAX(segments.numCalls), SUM(segments.numCalls) FROM transactions HAVING av_numCalls > 2
Filter Function	SELECT appraisalrating, filter(min(salary), where salary > 60000) as val FROM transactions HAVING val > 60000
Multi-Valued Metric Functions	Percentile: SELECT appraisalrating, percentile(salary, 94) as per_sal FROM transactions HAVING per_sal > 2 ORDER By appraisalrating Standard Deviation: SELECT appraisalrating, stdev(salary) as stdev_sal FROM transactions HAVING stdev_sal > 2 ORDER By appraisalrating
Missing Parent Aggregation	SELECT avg(responseTime) as AVRT FROM transactions HAVING AVRT > 2

SINCE...UNTIL Clause

Use the **SINCE... UNTIL** clause on a time range in a query. If the **UNTIL** portion is omitted, the query matches all the events that occurred after the time specified in the **SINCE** portion. A query can contain both a **SINCE... UNTIL** clause and a [WHERE](#) (see page 3017) clause. In such cases, [WHERE](#)¹⁸²⁸ argument comes before **SINCE... UNTIL** and is applied in that order. The time range specified in the clause overrides any other time limits applied to the query, including the time range selection in the UI.

Syntax

```
SINCE timevalue [UNTIL timevalue]
```

where `timevalue` is a combination of an integer and (optionally) a time unit. If `timevalue` is omitted the value is interpreted as a Unix epoch timestamp in milliseconds.

¹⁸²⁸ <https://docs.appdynamics.com/display/PRO45/WHERE+Clause>

Unit Symbols	Description
[m minute minutes]	minute
[h hour hours]	hour
[d day days]	day
[w week weeks]	week (7 days)

Examples

Query	Result
SELECT * FROM transactions SINCE 1 h UNTIL 15 m	All transactions that occurred between 1 hour and 15 minutes ago
SELECT * FROM transactions SINCE 1 h	All transactions that occurred after one hour ago
SELECT * FROM transactions SINCE 1502147143000 UNTIL 1502148043000	All transactions that occurred between the Unix timestamps 1502147143000 and 1502148043000

LIMIT Clause

The **LIMIT** clause enforces a limit on the returned search results. **LIMIT** works differently for non-aggregation and aggregation queries.

The syntax is:

[**LIMIT** integer [, integer]...]

An integer is a sequence of digits. If **ORDER BY** is not specified in the query, the results sort in descending timestamp order. The Analytics Search UI caps the number of search results at 10000 records.

Non-Aggregation Queries

Specify **LIMIT N** for non-aggregation queries to return the first N documents.

```
SELECT * FROM transactions LIMIT 10
```

For non-aggregation queries, using the Analytics Query API, can return a maximum of 10,000 results. If a limit value higher than 10,000 is specified, the value is overridden with the maximum value.

Aggregation Queries

For aggregation queries a list of values is allowed in the **LIMIT** clause. Each value applies to one "group by" term or bucketing function in the query. A "group by" term is a field name in an aggregation query. In the following example, *field1* and *field3* are group by terms, and *series(field2, '1m')* is a bucketing function:

```
SELECT field1, series(field2, '1m'), field3, count(*) ...
```

Bucketing functions consume a value from the **LIMIT** clause list of values, but that value is ignored because it doesn't apply to such functions. Because the default limit is 10, if there are more bucketing functions than user-specified limits, the **LIMIT** clause will use 10 buckets. For example, if there two limit values specified, but three functions or terms that could consume the limit values, the last one defaults to a limit of 10.

The maximum number of buckets is 1000 for the first group by term or bucketing function. Subsequent terms are limited to 100 buckets. A larger value is overridden and replaced with the maximums. Aggregation queries can return a maximum of 10000 results.

i REST API usage for limits is slightly different. See [Analytics Events API](#)(see page 3743).

Aggregation Examples

Query	Result
SELECT transactionName, avg(responseTime) FROM transactions	No limit specified, shows a maximum of top 10 results by count.
SELECT DISTINCT requestGUID FROM transactions	No limit specified, shows the top 10 results by count.
SELECT transactionName, avg(responseTime) FROM transactions LIMIT 50	Returns the top 50 results by count.
SELECT application, transactionName, avg(responseTime) FROM transactions LIMIT 500, 50	Returns the top 500 applications by count. Within each of those buckets, the top 50 transactionNames by count.
SELECT application, transactionName, avg(responseTime) FROM transactions LIMIT 2000, 500	Because of the enforced limits, this query returns the top 1000 applications by count. Within each of those buckets, the top 100 transactionNames by count.
SELECT application, transactionName, avg(responseTime) FROM transactions LIMIT 20	Returns the top 20 applications by count. within each of those buckets the top 10 (using the default) transactionNames by count.
SELECT application, series(eventTimestamp, '1m'), transactionName, avg(responseTime) FROM transactions LIMIT 20, 25, 30	Returns the top 20 applications by count. Within those a date-time series with all the data. Within each date-time series bucket, shows the top 30 transactionNames by count. The value 25 is applied to the series function, but because series is a bucketing function, it does not actually use the limit.

Query	Result
<pre>SELECT application, series (eventTimestamp, '1m'), transactionName, avg(responseTime) FROM transactions LIMIT 20, 25</pre>	<p>Returns the top 20 applications by count. Within those, shows a date-time series with all the data. Within each date-time series bucket the top 10 (using the default) transactionNames by count. The value 25 is applied to the series function, but because series is a bucketing function, it does not actually use the limit.</p>
<pre>SELECT series(eventTimestamp, '1m'), avg(responseTime) FROM transactions LIMIT 20</pre>	<p>LIMIT doesn't apply to the functions, only to the group by terms, therefore in this query, the limit value has no effect and the query returns all the data in the series function.</p>

ADQL Expressions

ADQL uses two primary categories of expressions in ADQL queries:

- Field expressions used in the **SELECT** clause
- Condition expressions used in the **WHERE** clause

To build an expression, use field names, functions, numbers, and operators indicated in the described syntax.

Syntax of field_expression (SELECT clause)

- {field_name | function | numeric_literal}
- (expression): surround the expression with parentheses to denote the order of operation in the query
- [Math expressions](#)(see page 3045) such as:
 - unary_operator expression
 - expression binary_operator expression
- A condition_expression such as **[NOT]** expression [COMPARISON_OPERATOR](#)(see page 3047) value can also be an alias used in a field_expression in the **SELECT** clause.
For example:

```
SELECT field_name AS myField... WHERE myField > 2
```

Syntax of condition_expression (WHERE clause)

- **[NOT]** expression [COMPARISON_OPERATOR](#)(see page 3047) value
- (condition_expression)
- condition_expression [LOGICAL_OPERATOR](#)(see page 3050) condition_expression

The field expression syntax in the **SELECT** clause can also contain functions. The syntax of a function_expression is: function(field_name, arguments, ...)

Syntax Element	Description
field_name or numeric_field_name	<p>The name of a field in the specified event type. Field names require back quotes when the name contains spaces or special characters. For example, the field name, `full name`, is surrounded by back quotes because it contains a space. See Special Characters(see page 3030) for the full list.</p> <p>Use the Events Service internal names in your ADQL queries. The list of default fields and their internal names are described under ADQL Data(see page 3052).</p>
function	See Analytics Functions (see page 3030).
numeric_literal	A sequence of digits, optionally including a decimal point "." or sign {+ -}. Example: 2, -4, 3.14
unary_operator	The - unary operator negates the value of the operand.
binary_operator	Arithmetic operators: {*, /, %, +, -}. See Math Expressions (see page 3045).
COMPARISON_OPERATOR	A set of operators that compare values. See Comparison Operators (see page 3047) for the full list.
LOGICAL_OPERATOR	See Logical Operators (see page 3050).
value	<p>The syntax for a value = {numeric_literal string boolean}. Values are text, numbers, dates or boolean values used to compare with the value in the specified field_name. The data type of the value must match the type of the specified field.</p> <p>Text strings require quotes. Numbers, dates, boolean values (true or false) and null do not need quotes. Quotes can be either single or double quotes.</p>

i Instead of specifying that the expression applies to a particular array element, the expression can apply to any array element.

Fields with Spaces or Special Characters

If the Events Service internal name contains a special character, then the name must be surrounded by back quotes when it is used in a field expression in the **WHERE** clause. For a field name such as `segments.httpData.headers.User-Agent`, the ADQL query must use `segments.httpData.headers.`User-Agent``.

For example:

```
SELECT segments.httpData.headers.`User-Agent`, count(segments.httpData.headers.`User-Agent`)
FROM transactions WHERE segments.httpData.url = 'http://localhost:29990/packages'
```

The most likely situation in which spaces and other special characters may be used in naming are when field names are added with data collectors.

Special Characters

Special characters in ADQL are:

- equals : '='
- not equals : '<>' or '!='
- less than : '<'
- less than or equals : '<='
- greater than : '>'
- greater than or equals : '>='
- plus: '+'
- minus: '-'
- asterisk: '*'
- slash: '/'
- percent: '%'
- concatenation: '||'
- question mark: '?'
- open parens: '('
- open square bracket/brace: '['
- close parens: ')'
- close square bracket/brace: ']'

Analytics Functions

Functions serve as arguments in the **SELECT** clause. Function types in ADQL include:

- Metric functions
- Bucketing functions
- String functions
- Funnel functions
- Data type conversion functions
- Functions that modify other functions

For many functions, only numeric fields are valid. "All" data types means *integer*, *floating point*, *datetime*, and *string*.

Functions ignore null values, such as those resulting from integer division by zero or empty data fields.

To add a **WHERE** clause to a query, use the query box in the data tab of the Controller Analytics search UI. When you perform the search, the visualization tab under the table widget shows the results of any metric functions.

Each section below describes one type of function.

Metric Functions

Metric functions:

- Perform a calculation on a set of values for a field.
- Return a result such as a count or sum, or a set of results such as percentile.
- Can only be in the **SELECT** clause.

- Should always follow a field name if one exists—otherwise, not all visualizations may work.

i The `distinctcount()` function is accurate for up to 3000 unique return values. For over 3000 unique return values, `distinctcount()` is approximate due to performance optimizations.

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>avg</code> (<code>numeric_field_name</code>)	Average value for a numeric field.	<i>integer, floating point, datetime</i>	SELECT avg(btdata.estimatedtime) FROM browser_records WHERE appkey = 'your_appkey'
<code>count</code> (<code>field_name</code>)	A count of events.	<i>all</i> The form <code>count(*)</code> is also valid.	SELECT count(orderID) AS 'Sales' FROM logs WHERE method='GET' The following query returns the top 10 IP addresses sending HTTP requests to an application. SELECT ip, count(*) FROM web_session_records WHERE appkey = "yourApp" LIMIT 10
<code>distinctcount</code> (<code>field_name</code>)	A count of the number of unique values recorded for a field.	<i>all</i>	SELECT distinctcount(field_name) FROM logs
<code>max</code> (<code>numeric_field_name</code>)	The maximum recorded value of a numeric field.	<i>integer, floating point, datetime</i> Specify one field only.	SELECT max(numeric_field_name) FROM transactions SELECT nodeName, max(eventtimestamp) FROM logs
<code>min</code> (<code>numeric_field_name</code>)	The minimum recorded value of a numeric field.	<i>integer, floating point, datetime</i> Specify one field only.	SELECT min(numeric_field_name) FROM transactions
<code>stdev</code> (<code>numeric_field_name</code>)	The population standard deviation of a numeric field.	<i>integer, floating point</i>	SELECT stdev(numeric_field_name) FROM transactions

Function	Returns	Valid Field Type(s)	ADQL Query Examples
sum (numeric_field_name)	The sum of the values of a numeric field.	<i>integer, floating point, datetime</i> Specify one field only.	SELECT sum(numeric_field_name) FROM transactions
percentile (numeric_field_name, percent)	The specified percentile values between 0 and 100.	<i>integer, floating point, datetime</i> Specify one or more percentiles.	SELECT percentile(responseTime, 50, 75, 90, 95) FROM transactions
stats(numeric_field_name)	Statistics for a field: count, min, max, average, and sum.	<i>integer, floating point, datetime</i>	SELECT stats(numeric_fieldName) FROM transactions WHERE application='yourApp'
totalResultCount ()	The total count of events.	Does not accept a field.	This query first selects all error transactions for the "ECommerce" application. It then calculates, for each unique transaction name, the ratio of instances of that transaction name to the total number of error transactions. (The assumption is that any given transaction name can appear in multiple error transactions.) SELECT transactionName, count (*) / totalResultCount() FROM transactions WHERE application = 'ECommerce' AND userExperience = 'ERROR'

Bucketing Functions

Bucketing functions operate on a field, and group data into buckets. Often, the data in the buckets are further aggregated by another function. For example, this query creates buckets that group an app's transactions by the hour, and then count how many transactions are in each bucket (hour):

```
SELECT series(eventTimestamp, '1h'), count(*) FROM transactions WHERE application='yourAppName'
```

To include a larger data set in your results, use the time range selector in the upper right corner of the Controller Analytics search UI.

Dates are different from datetime values. Units from weeks down to milliseconds are supported:

- '1w' for one week
- '10d' for ten days
- '2h' for two hours
- '5m' for five minutes
- '36s' for thirty-six seconds
- '800ms' for eight hundred milliseconds

When you use dates to define buckets, think about how many buckets your definition produces. The number of buckets for series() cannot exceed 2000, and much smaller numbers of buckets are the norm.

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>range(field_name, n (n1, n2), n3 (n4, n5), ...)</code>	One or more buckets.	<i>integer, floating point, dates</i> Use a single value x or pairs of values (x,y). See below for explanation of how to define buckets.	This range query: SELECT range(segment.transactionTime, 0, 10, 20) FROM transactions Results in the following buckets: [-Inf, 0], [0, 10], [10, 20], [20, +Inf]

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<p>series(field_name, interval_size)</p> <p>series(field_name, interval_size, lower_extended_bound, upper_extended_bound, [offset], [rangeStyleBucketKeys], [strictEndpoints])</p> <p>If you specify bounds, then all buckets are returned, empty or not.</p> <p>If you do not specify bounds, then:</p> <ul style="list-style-type: none"> • If you are using the UI, the UI inserts default bounds. • If you are using the API, then only non-empty buckets are returned. 	<p>A series of buckets based on the provided interval.</p>	<p><i>integer, floating point, dates</i></p> <p>For numeric fields, specify the interval as an integer.</p> <p>See below for explanation of optional keyword arguments: offset, rangeStyleBucketKeys, and strictEndpoints.</p>	<p>SELECT series(metri cs.`Application Server Time (ms)`,10), count(*) FROM browser_records WHERE appkey='yourAppKey'</p> <p>SELECT series(event Timestamp, '1h'), count(*) FROM transactions WHERE application='yourAppName'</p>

Defining Buckets for range()

Every bucket is defined as bounded by two single values, where the bucket includes the first value and excludes the second.

Pairs of values (x, y) define an explicit bucket from x, inclusive, to y, exclusive.

A single value x implicitly defines a bucket according to rules that depend on where the value is placed among the arguments to range().

- Rules for using a single value to define a bucket:
 - Immediately after the field (that is, as the second argument): The bucket starts at negative infinity.
 - After another single value: The bucket starts at the previous argument, inclusive, and extends to x, exclusive.
 - After a pair of values, and before another single value: The bucket starts at x, inclusive, and extends to the following argument, exclusive.
 - At the end of the parameter list: The bucket ends at positive infinity. This is the one exception to the assumption that x is the second of two values.
 - Between two pairs of values: No bucket can be defined, and the value is ignored.

Range Query Example

Here is a range query that exercises most of the rules above:

SELECT range(segments.transactionTime, 0, (10, 20), 30, (40, 50), 60, 70) **FROM** transactions

The query produces the following buckets:

- [-Inf, 0] because rule a applies to 0

- [10, 20] because (10, 20) defines that bucket explicitly
- no bucket for 30 because rule *e* applies so 30 is ignored
- [40, 50] because (40, 50) defines that bucket explicitly
- [60, 70] because rule *c* applies to 60
- [70, +Inf] because rule *d* applies to 70

Optional keyword arguments for `series()`: `offset`, **`rangeStyleBucketKeys`**, and **`strictEndpoints`**

Series supports the following optional keyword arguments.

`offset`

Changes the start value of each series from 0 by the specified positive (+) or negative offset (-) duration, such as 1h for an hour, or 1d for a day. The values `alignStart` and `alignEnd` align buckets to the start and end of the extended bounds arguments respectively. The function must have extended bounds specified to use these special values. Defaults to 0. Accepts both integer and string values.

Examples:

```
SELECT series(responseTime, 1, 1, 10, offset="alignStart"), count(*) FROM transactions
```

```
SELECT series(responseTime, 100, 1, 1000, offset=1), count(*) FROM transactions
```

`rangeStyleBucketKeys`

Converts the start and end values in a numeric series to "bucketStart - bucketEnd" format as a string type. For example, "0-10", "10-20", and so on. This output this argument returns is similar to what returned by the range function. The series function must be acting on a numeric type to use this keyword argument. Defaults to false. Accepts a boolean only.

Example:

```
SELECT series(responseTime, 100, 1, 1000, rangeStyleBucketKeys=true), count(*) FROM transactions
```

`strictEndpoints`

Adds a filter on the query starting at the minimum extended bound and extending to the maximum extended bound. This ensures that no buckets outside of the extended bounds are present in the results. Defaults to false. Accepts a boolean only. Extended bound forces the histogram aggregation to start building intervals on a specific minimum value and expands the interval up to a given maximum value.

Example:

```
SELECT series(responseTime, 2, 1, 5, strictEndpoints=true, rangeStyleBucketKeys=true), count(*) FROM transactions
```

Selecting the Top *n* Results for Time Series Queries

Deployment Support

Top n results is available for SaaS deployments only.

SELECT `series(eventTimestamp, '1m'), transactionName, count(*)` **FROM** `transaction` **LIMIT** 1, 12
The `series` function can compute the global top n over an entire period. To set a top n limit, add a **LIMIT** clause to the end of your query:

This example limits the query to the top 12 results of `transactionName`. The value 1 is applied to the `series` function, but because `series` is a bucketing function, it does not actually use the limit. You must include a value for the `series` function.

The global top n limit does not apply when queries:

- Contain a selection before the `series` function
SELECT `application, series(eventTimestamp, '1m'), transactionName, . . .`
- Have additional bucketing functions
SELECT `series(eventTimestamp, '1m'), range(responseTime, 0, 60, 120), transactionName, . . .`
- Include a **HAVING** clause
SELECT `series(eventTimestamp, '1m'), transactionName, avg(responseTime), ...` **HAVING** `a > 15`

String Functions

ADQL string manipulation functions:

- Resemble their SQL counterparts.
- Are case-sensitive.
- Return null if any argument is null.
- Use 1-based, not 0-based, indexing.
 - For example, the `indexOf()` function gives the index of the first character of a string as 1, not 0.
 - As a result, 0 is not a valid value for any integer argument

String functions can transform any event data that resides in the Analytics Events Service. One important use case is doing ad hoc data transformation when the structure, serialization, or format in which data has been collected needs to be changed.

i For AppDynamics < 4.5.2, fixing incorrectly-collected data requires adjusting collection settings.

You can use string functions to:

- Home in on a `substring()` by working with `string length()` and/or the `indexOf()` characters in a string
 - For example, you can extract the domain name from a URL
- Combine multiple strings using the `concat()` operator
 - For example, you can combine values from multiple fields into a single value
- `trim()` whitespace from the beginnings and ends of fields
- Pair the output of the `substring()` function, item by item, with the output of another function
 - This implicit aggregation is the ADQL equivalent of `GROUP BY` in SQL
 - See the Implicit Aggregation Example:

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>concat(inputString1, string inputString2, ... inputStringN)</code>	A single string which combines the input strings.	<i>string</i> Specify two or more strings.	Function: <code>concat('foo', 'bar')</code> Result: 'foobar'
<code>indexOf(inputString, substring, [occurrence])</code>	1-based start index of substring in string. If substring is not found, returns 0. If occurrence is supplied as <i>n</i> , returns index of nth occurrence of substring. If occurrence is supplied as <i>-n</i> , returns index of nth occurrence of substring counting backwards from the end of inputString.	<i>string</i> for inputString, substring positive or negative <i>int</i> for occurrence	Function: <code>indexOf('www.wikipedia.org', '.', 1)</code> Result: 4 Function: <code>indexOf('www.wikipedia.org', '.', -1)</code> Result: 14 Function (example of chaining and combining functions): SELECT <code>substring('www.wikipedia.org', indexOf('www.wikipedia.org', '.', 1)+1, indexOf('www.wikipedia.org', '.', -1) - indexOf('www.wikipedia.org', '.', 1) -1) FROM transactions</code> Result: 'wikipedia'

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>length(inputString)</code>	The number of characters including whitespace of the input string.	<i>string</i>	Function: <code>length(' foo bar ')</code> Result: 9
<code>substring(inputString, startIndex, numChars)</code>	The substring of <code>inputString</code> starting at (1-based) <code>startIndex</code> . If <code>startIndex</code> is negative, starts that number of characters from the end of the string. If <code>numChars</code> is supplied, returns substring of that length; if <code>numChars</code> runs past end of string, returns only up to end of string. If <code>startIndex</code> or <code>numChars</code> is invalid, returns an empty string.	<i>string</i> for <code>inputString</code> positive or negative <i>int</i> for <code>startIndex</code> positive <i>int</i> for <code>numChars</code>	This example extract the domain name from a URL. Function: <code>substring('https://example.com/home.htm', 9, indexOf('https://example.com/home.htm', '/') - 9)</code> Result: 'example.com'
<code>trim(inputString)</code>	A copy of the input string with leading and trailing whitespace removed.	<i>string</i>	Function: <code>trim(' foo bar ')</code> Result: 'foo bar'

Implicit Aggregation Example

Consider this data:

Application ID	responseTime (ms)
SJC-001	500
SJC-002	600
SJC-003	700
LAX-001	200

Application ID	responseTime (ms)
LAX-002	300
LAX-003	400

The following ADQL query pairs each item from the output of `substring()` with a corresponding item from the output of `avg()`:

```
SELECT substring(application, 1, 3), avg(responseTime) FROM transactions
```

The results are:

SJC, 600

LAX, 300

Notice how ADQL uses `substring()` to govern the groupings to which the second function, `avg()`, is applied.

Funnel Functions

You can create [funnel widgets](#) (see page 3224) from an ADQL query using the funnel function. This query example creates a funnel widget of normal transactions:

```
SELECT funnel(transactionName, responseTime < 90, showHealth=true, health="NORMAL") FROM transactions
```

To see the funnel widget, enter your query and select **Search**. After you see the search results, select **Basic** at the top right of the query:

```
1 SELECT funnel(transactionName, responseTime < 90, showHealth=true, health="NORMAL") FROM transactions
```

Basic

Search

See [AppDynamics Community](#)¹⁸²⁹.

Data Type Conversion Functions

i Data type conversion functions are only available for SaaS deployments.

Data type conversion functions can be used in the **SELECT** or **WHERE** clauses. Below are the available data type conversion functions. For `formatString` requirements, see `Joda's DateTimeFormat` documentation in the `Classes` section.

¹⁸²⁹ <https://community.appdynamics.com/t5/Knowledge-Base/Analytics-search-ADQL-SELECT-funnel-Query/ta-p/28899>

Function	Returns	ADQL Query Example
toDate(string value, [string formatString])	A string value formatted as a datetime.	SELECT toDate(field_name, "MM/dd/yyyy") FROM transactions <i>Returns</i> 2019-01-15T00:00:00.000Z for a field_name with string value "01/15/2019"
toDate(int value)	An integer value formatted as a datetime.	SELECT toDate(12341234) FROM transactions <i>Returns</i> Dec 31 1969 19:25:41 GMT-0800
toString(datetime value, [string formatString])	A datetime value formatted as a string.	SELECT toString(field_name, "MMM dd, yyyy") FROM transactions <i>Returns</i> "Jan 15, 2019" for a field_name with datetime value 2019-01-15T00:00:00.000Z
toString(float/int/bool value)	A value formatted as a string.	SELECT toString(123.123) FROM transactions <i>Returns</i> "123.123"
toInt(datetime/float/string/bool value)	An integer value, formatted as follows: <ul style="list-style-type: none"> • datetime- converts to milliseconds, • float- truncates • string- parses to floats and truncates to an integer • bool- converts to 0/1 	SELECT toInt(123.4) FROM transactions <i>Returns</i> 123

Function	Returns	ADQL Query Example
toFloat(int/string value)	An integer or string value formatted as a float.	SELECT toFloat(123123) FROM transactions <i>Returns</i> 123123.0
round(float value, int decimalPlaces)	A value rounded off to decimalPlaces. decimalPlaces must be a non-negative integer.	SELECT round(123.123123, 3) FROM transactions <i>Returns</i> 123.123
ifNull(object value, object replacementValue)	A value if the value is non-null. If the value is null, returns replacementValue.	SELECT ifNull(field_name, 10) FROM transactions <i>Returns</i> 10 if the value of field_name is null <i>Returns</i> Value of field_name if the value is not null

For data type conversion functions (except ifNull), if the value of field_name returns null, the converted data type will also return null.

Use mathematical and now() functions on datetimes

You can perform addition and subtraction mathematical functions on datetime and long values, for example:

```
SELECT toDate(field_name, "MMM, dd, yyyy") - toDate(field_name, "MMM, dd, yyyy") FROM transactions
```

The function will return a datetime value. Multiplication, division, and modulus mathematical functions are not supported. Addition and subtraction functions cannot be combined with floats.

You can use the now() function to add or subtract the server's current time from a value, for example:

```
SELECT toInt(now() - field_name) FROM transactions
```

The above function determines how long ago field_name was created and converts the value to an integer.

Functions That Modify Other Functions

Function	Returns	Valid Field Type(s)	ADQL Query Examples
filter(metric_function (field_expression) , ...) [WHERE] condition_expression)	Aggregations for specific subsets of data, computed by applying a filter to the input of a single metric function.	<p>The metric function must be one of the following that returns a single value.</p> <pre>{count avg max min sum distinctcount}</pre> <p>The second argument has the same syntax as a WHERE clause and optionally begins with the WHERE keyword, for example:</p> <pre>SELECT filter(avg(responseTime), WHERE responseTime > 1) FROM transactions WHERE application = "Travel"</pre>	<pre>filter(sum(numeric_field_name), numeric_field_name > 100) SELECT 100.0 * filter(count(*), field_name = "value") / count(*) as "%" FROM transactions WHERE application = "yourApp" AND transactionName = "yourValue"</pre>

Combining Different Types of Functions

Here are some special cases to consider when combining functions of different types:

- The maximum accuracy of `distinctcount()` is reduced if it follows a bucketing function. Nested `distinctcount()` queries trade accuracy for memory savings, because the previous function establishes buckets, and `distinctcount()` creates sets of buckets within each of the previous function's buckets, and Elasticsearch automatically makes that tradeoff when that happens
 - For example, the first of the two example queries below returns less accurate results than the second:
 - SELECT** transactionName, distinctcount(userId) **FROM** transactions
 - SELECT** distinctcount(userId) **FROM** transactions
- The return value of `stdev(numeric_field_name)` cannot be used to sort or filter results.

Analyzed Fields

Selected fields in the analytics data are "analyzed". Analysis consists of tokenizing a block of text into individual terms suitable for use in an inverted index and normalizing these terms into a standard form to improve their searchability. The ADQL [Comparison Operators](#)(see [page 3047](#)) behave differently for analyzed and non-analyzed fields. To construct queries on analyzed fields, you need to understand some concepts about how the tokens are built.

Uppercase letters in analyzed fields are all converted to lowercase to build tokens.

Delimiters and other factors (such as CamelCase terms) affect how strings are tokenized. For a string such as "myname@company.com", "@" is a delimiter, therefore myname and company.com are two separate tokens. Additionally, company.com is two separate tokens. Note that all non-alphanumeric characters are delimiters. A term that uses CamelCase, such as VicePresident, is tokenized into separate tokens based on

recognition of the CamelCase nature of the term resulting in the tokens: Vice and President as well as VicePresident.

For an example string such as: <VicePresident:SalesAndMarketing> - EMEAAustraliaUSA94107, the tokens generated include the following:

- vicepresident
- vice
- president
- salesandmarketing
- sales
- and
- marketing
- emeaaustraliausa94107
- emeaaustraliausa
- emea
- australia
- usa
- 94107

Analytics Analyzed Fields

The analyzed fields in analytics events are:

- **Logs:** Message
- **Transactions:** Errors and Error Detail
- **Mobile:** stacktrace

Queries on Analyzed Fields

Full-text search is supported on analyzed fields, including the message field for logs, using the **LIKE** operator. See [Comparison Operators](#)(see page 3047).

On analyzed fields, the **REGEXP** operator matches exactly only the analyzed and processed tokens, so you cannot query across the complete message.

Consider this log message:

```
[2016-06-09 06:07:50,118] [INFO ]
[org.springframework.jms.listener.DefaultMessageListenerContain
r#0-1] [com.appdynamics.provision.OrderMessageListener]
[AD_REQUEST_GUID[2b8ce807-986c-45f9-a5b4-2fe5a6fd90f3]] Received
a message to process the order Order_3138 for the user
myname@company.com
```

In this log message, myname and company.com are two separate tokens because "@" is a delimiter. To search a log message like this for results based on the email address requires searching across tokens.

A query such as the following using **REGEXP**, will **fail** because myname and company.com are two separate tokens.

```
SELECT FROM logs WHERE appName = 'yourAppName' AND sourceType =
'yourLogFile' AND message REGEXP 'myname@company.*'
```

The **LIKE** operator is not affected by delimiters, so an alternative query using **LIKE** operator is a better choice.

```
SELECT FROM logs WHERE appName = 'yourAppName' AND sourceType =
'yourLogFile' AND message LIKE 'myname@company'
```

You can also use wildcards in the query because they work across tokens.

```
SELECT FROM logs WHERE appName = 'yourAppName' AND sourceType =
'yourLogFile' AND message LIKE 'myname@company*'
```

Example Queries for Analyzed Fields

Searching the following analytics log events:

```
Jun 7 11:27:45 appd sshd[1032]: Illegal user test from
110.49.183.11
Jun 7 11:27:46 appd sshd[1032]: Failed password for illegal user
test from 110.49.183.11 port 9218 ssh2
Jun 7 11:27:46 appd sshd[1032]: error: Could not get shadow
information for NOUSER
```

Note the results from the following queries:

Query	Results
SELECT * FROM logs WHERE sourceType='yourLogFile' AND message REGEXP 'illegal.+user'	Does not match any log events in the sample because the query string spans across multiple tokens. Use LIKE for an instance like this.
SELECT * FROM logs WHERE sourceType='yourLogFile' AND message REGEXP 'illegal.*'	Matches the first two log events
SELECT * FROM logs WHERE sourceType='yourLogFile' AND message REGEXP 'Failed*'	Does not match any log events in the sample because the token has only lowercase 'failed'

To search for string : javaIOException

Query

```
SELECT * FROM transactions WHERE application =
'yourApp' AND segments.errorList.errorCode REGEXP 'java[a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z]'
```

Math Expressions

Math expressions are field expressions that use arithmetic operators. These expressions can be used in ADQL queries in both the **SELECT** and **WHERE** clauses.

field_expression **BINARY_OPERATORS** field_expression

Arithmetic Operators

Math operators are valid on integer and float data fields, constants (for example, 3.14), and on functions that return a single integer or float value, with the exception of % (modulo). The operators *, / and % have higher precedence than + and -. Parentheses can be used to control the order of operations, a unary minus (-) is also supported.

Operator	Name	Description
*	asterisk	Multiplication
/	slash	Division of two integer types performed as integer division. Integer division by zero returns null.
%	modulo	Calculates the remainder after the division of two integers. Valid only for integers.
+	plus	Addition. Requires a space before a numeric literal.
-	minus	Subtraction. Requires a space before a numeric literal. Can also be used as unary_operator.

Math Expression Usage

Math expressions can be used in several ways.

Query	Result
SELECT regionId % 4, count(*) FROM transactions WHERE application = "yourApp"	Math expression is used as a GROUP BY term in an implicit group by query
SELECT field_name1, (field_name2 + field_name3) * 3.14 FROM transactions WHERE application = "yourApp"	Math expression is used as a composite field.

Query	Result
<pre>SELECT sum(field_name1) / count (field_name2) FROM transactions WHERE application = "yourApp" SELECT filter(sum(field_name1), WHERE field 2 IS NOT NULL) / count(field_name3) FROM . ..</pre>	Math expression used on an aggregation function.
<pre>SELECT avg(field1 + field2) FROM event_type WHERE ... SELECT series(field1 + field2, 1) FROM event_type WHERE ...</pre>	Math expression used within an aggregation function.
<pre>SELECT * FROM transactions WHERE (responseTime * cartValue) > 100 SELECT * FROM transactions WHERE (regionId % 3) IN (1, 2) SELECT * FROM transactions WHERE (responseTime * cartValue) BETWEEN (100, 200)</pre>	Math expression used in a WHERE clause with comparison operators.
<pre>SELECT segments.userData.itemTitle, (segments.userData.itemPrice / 100) AS Price FROM transactions WHERE application = 'ECommerce 2.0' AND transactionName = '/' product_details.xhtml' AND Price > 20</pre>	Convert a value in cents to dollars. This query converts segments.userData.itemPrice from cents to dollars and shows results where the price is greater than \$20.
<pre>SELECT transactionName, (responseTime / 1000) AS responseSeconds, userExperience, requestGUID FROM transactions WHERE application = "ECommerce 2.0" AND responseSeconds > 5</pre>	Convert a value such as average response time to seconds instead of milliseconds and view each transaction that is greater than X seconds.

Usage Notes

If any field or intermediate expression result for an expression is null, the entire expression will be null.

Math expressions in the **WHERE** clause are evaluated per record, not in aggregate.

Fields and metric functions can not be combined in the same expression, for example, a query for the following type is *not* valid:

```
SELECT responseTime + sum(cartValue) FROM ...
```

Mathematical operations that operate on every event (as opposed to on aggregation functions) will reduce query performance. Avoid statements such as:

WHERE (responseTime - 200) > 800 and use a construct such as **WHERE** responseTime > 1000 instead.

Comparison Operators

Comparison operators, such as =, !=, <, >, **LIKE**, and **IN**, can be used in condition_expressions of the **WHERE** clause in the ADQL query statement.

This page describes the comparison operators that you can use in the condition_expression syntax.

Operators

Comparisons on strings are case-insensitive.

Operator	Description	Supported Usage
=	Equals: True if the value of the specified field_name equals the specified value in the expression. String comparisons using the equals operator are case-sensitive.	non-analyzed fields
!=	Not equals: True if the value in the specified field_name does not equal the specified value.	non-analyzed fields
>	Greater than: True if the value in the specified field_name is greater than the specified value.	non-analyzed fields of type int, float and date
>=	Greater than or equal: True if the value in the specified field_name is greater than or equal to the specified value.	non-analyzed fields of type int, float and date
<	Less than: True if the value in the specified field_name is less than the specified value.	non-analyzed fields of type int, float and date
<=	Less than or equals: True if the value in the specified field_name is less than or equal to the specified value.	non-analyzed fields of type int, float and date

Operator	Description	Supported Usage
IN	<p>Finds records where the value of a field equals any one of the specified values in a list of string or numeric values. The values for IN must be in parentheses. String values must be surrounded by single quotes. Wild card usage within the list of values provided to the IN operator is supported.</p> <p>For example:</p> <pre> SELECT transactionName, percentile(segments.transactionTime, 90) FROM transactions WHERE application = 'prd-analytics' AND transactionName IN ('api_v2./v2/ events/*/search','api_v1./v1/events/*/ search')</pre>	non-analyzed fields only. Invalid for analyzed fields.
LIKE	<p>The LIKE operator performs a full-text search that analyzes the string value and field value. If the string value contains multiple terms, separated by spaces, it is processed as an AND condition of the terms. Use LIKE to search values in analyzed fields.</p> <p>The LIKE operator supports the use of wild cards.</p> <p>LIKE is not supported for queries on mixed case strings. For example, querying against a log message that contains "pEer" will not match the search string 'peer', because "pEer" is tokenized by the search analyzer into two separate tokens - "p" and "eer").</p>	for full-text search of analyzed fields
BETWEEN	<p>Finds values of a field based on an inclusive or exclusive value range. For an inclusive range search, use square brackets []. For an exclusive value range, use parentheses ().</p>	Supported for data types int, float, and datetime (<i>New in 4.4.1</i>).
IS NULL	<p>Finds records where a field does not contain a value.</p>	non-analyzed fields and analyzed fields
IS NOT NULL	<p>Finds records where a field contains a value.</p>	analyzed and non-analyzed fields

Operator	Description	Supported Usage
NOT BETWEEN	Finds records where a field does not contain a value in an inclusive or exclusive value range. The reverse of BETWEEN .	non-analyzed fields
NOT LIKE	The reverse of LIKE .	analyzed fields
NOT IN	Finds records where the value of a field does <u>not</u> match any value in a list of string or numeric values. The values for NOT IN must be in parentheses, and string values must be surrounded by single quotes. There is also a logical operator NOT , which is unrelated to this comparison operator.	non-analyzed fields
REGEXP	The REGEXP operator applies a regular expression pattern match of a string to the pattern passed as an argument. See REGEXP Operator (see page 3051) for details of usage. This is an advanced feature and requires knowledge of regular expression patterns.	non-analyzed fields For analyzed fields: <ul style="list-style-type: none"> • Use lowercase input strings. • Do not use to search across tokens
* ?	The wild card operators. Use of wild cards is supported on queries of string fields. The asterisk, '*', character matches zero or more characters and the question mark, '?', character matches a single character. The wild card operator works similarly when used with the equals "=" or LIKE operator. The wild card operator is case sensitive for non-analyzed fields.	analyzed fields and non-analyzed fields

Examples

Query	Result
SELECT * FROM mobile_snapshots WHERE appkey='your_appkey' AND numeric_field_name IN (1419, 613, 748)	Returns all fields for mobile snapshots for the specified appkey where the value of the specified numeric field matches one of the values in parentheses.

Query	Result
SELECT count(*) FROM browser_records WHERE appkey='your_appkey' AND field_name IN ('string1','string2', 'string3')	Returns a count of browser records for the specified appkey where the value of the specified field matches one of the specified strings.
SELECT ip FROM browser_records WHERE ip LIKE "10.134.*"	By filtering on IP address range using wild card operator, finds records in the specified IP address range.
SELECT * FROM logs WHERE message LIKE 'DEBUG Adding operation'	Matches the sample log line "DEBUG com.appdynamics.operations.PublishTestService - Adding to bulk publish operation."
SELECT * FROM logs WHERE message LIKE 'error'	Finds all the log events containing the word 'Error' in any field
SELECT * FROM transactions WHERE application='yourAppName' AND cartTotal BETWEEN [10, 50]	Inclusive range: Returns all transactions with a cart total between 10 and 50, including 10 and 50.
SELECT * FROM transactions WHERE application='yourAppName' AND cartTotal BETWEEN (10, 50)	Exclusive range: Returns all transactions with cart total between 10 and 50, excluding 10 and 50.

Logical Operators

Logical operators can be used in the **WHERE** clause in an ADQL query to make compound condition expressions. These operators are **AND**, **OR**, and **NOT**.

Condition Expression Syntax

(condition_expression **LOGICAL_OPERATOR** condition_expression)

Examples

Expression	Result
(field_expression_1 AND field_expression_2)	Evaluates as true if both field_expressions are true.
(field_expression_1 OR field_expression_2)	Evaluates as true if either field_expression is true.
(field_expression_1 AND NOT field_expression_2)	Evaluates are true if field_expression_1 is true and field_expression_2 is false.

REGEXP Operator

i This is an advanced feature and requires knowledge of regular expression patterns.

The regular expression operator, **REGEXP**, can be used in the **WHERE** clause to handle complex matching queries. This operator applies a regular expression pattern match of a string to the pattern passed as an argument. ADQL uses the Lucene regular expression engine to analyze the **REGEXP** expression. The search results for queries that use the **REGEXP** operator are dependent not only on regular expression syntax and rules but also on whether you are searching analyzed or non-analyzed fields. To use **REGEXP** on analyzed fields, see [Analyzed Fields](#)(see page 3042).

The **REGEXP** operator can only match with the lowercased tokens in the analyzed fields. To search for an uppercase string in an analyzed field using a wild card or **REGEXP**, you need to input a lowercase string. For example info, not INFO.

Allowed Characters

Any Unicode character may be used in the regular expression pattern, but certain characters are reserved and must be escaped. Any reserved character can be escaped with a backslash "*" including a literal backslash character:"\\".

The standard reserved characters are:

. ? + * | { } [] () " \

For query performance reasons, before using any reserved character in a **REGEXP** pattern, you need to specify the first three characters of the string explicitly, such as specifying 123 before the brackets [0-9] in the following example:

```
SELECT * FROM logs WHERE sourceType='yourLogFile' AND id REGEXP '123 [ 0-9 ]'
```

i A query such as the following is invalid.
SELECT * FROM logs WHERE sourceType='yourLogFile' AND id REGEXP '[0-9]'

Example Operations, Strings, and Associated Patterns

Supported Operation	Description	String	Pattern
Match any character	A period "." can be used to represent any character.	abcde	abc..
One or more	A plus sign "+" can be used to repeat the preceding shortest pattern one or more times.	aaabb	aaab+

Supported Operation	Description	String	Pattern
Zero or more	An asterisk "*" can be used to match the preceding shortest pattern zero or more times.	aaaabbbcc	aaaab*c*
Zero or one	A question mark "?" makes the preceding shortest pattern optional. It matches zero or one times.	aaabbbc	aaa?b+c?
Min-to-max	Curly brackets "{}" can be used to specify a minimum and (optionally) a maximum number of times the preceding shortest pattern can repeat. Allowed forms: {5} # repeat exactly 5 times {2,5} # repeat at least twice and at most 5 times	aaaabbbcc	aaaab{3}c{2} aaaab{2,4}c{2,4}
Grouping	Parentheses "()" can be used to form sub-patterns.	abababab	abab(ab)*
Alternation	The pipe symbol " " acts as an OR operator. The match will succeed if the pattern on either the left-hand side OR the right-hand side matches.	aaabbb	aaa(ccc bbb)

ADQL Data

This page describes data that ADQL captures in Analytics.

Analytics Type	Description
Transaction Analytics	Transaction Analytics is defined as event data collected by the Java and .NET Agents for every instance of a business transaction. Every instance of a business transaction that passes through a tier is defined as an event. You can view the raw data for any transaction instance that occurs within the data retention time. Transaction Analytics enables you to analyze the business impact of every event and observe how customers use your application.
Browser, Mobile, and IoT Analytics	Browser, Mobile, and IoT Analytics provide event data collected by the End User Monitoring (EUM) JavaScript Agent, Mobile, and IoT Monitoring SDKs.

Analytics Type	Description
Log Analytics	Log Analytics provides event data collected from log files.
Synthetic Sessions Analytics	Synthetic Sessions Analytics provides events data on sessions collected by Browser Synthetic Monitoring.

See [AppDynamics Analytics Events API](#)(see page 3743).

Analytics Transaction Data

Each instance of a business transaction passing through a single tier is an event, so the data associated with a single execution of a distributed business transaction (for example, Checkout) is stored as a series of events in Analytics. The data consists of the default transaction data and additional data from data collectors configured for that transaction. This data is organized and stored per business transaction.

Default Transaction Data

Event Type: transactions

Key (event type identifier): application

The following table lists the data collected by default for each instance of the business transactions that are enabled for Analytics. The table also lists the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

UI Field Name	Description	Events Service Internal Name
Application	Application name	application
Business Transaction	Business transaction name	transactionName
Error	Error details (deprecated) This field is replaced by the more granular fields: Error Code, Error Detail, and Error Type.	deprecated
Error Code	The value of this field depends on the Error Type. For example, if Error Type is an HTTP_Error_code, then the value is a string representing the corresponding HTTP error code such as 404, 503 and so on.	segments.errorList.errorCode
Error Detail	This is what the "Error" field represented in 4.1. Primarily the error message	segments.errorList.errorDetail
Error Type	Classification of errors into buckets done internally by the Agent. For example, the error type could be HTTP_ERROR_CODE, LOGGER_MESSAGE, THROWABLE and so on.	segments.errorList.errorType
Node	Node name	segments.node

UI Field Name	Description	Events Service Internal Name
Tier	Tier name	segments.tier
requestGUID	GUID for this specific user request as assigned by AppDynamics	requestGUID
Response Time (ms)	Business transaction response time for this request in milliseconds	responseTime
Timestamp	Time the event occurred in the application	eventTimestamp
User Experience	Indicates if the transaction was marked as Normal, Slow, Very Slow, Stall, or Error	userExperience
Exit calls	Details of database and remote service calls. View Details flow map. Note that for partial snapshots, exit call information captured in call graphs can differ between the Analytics and APM UI. Each UI presents an appropriate level of contextual visibility while preserving low overhead. An APM snapshot, for example, may capture only the exit calls that are most pertinent to transaction performance.	Not Applicable

Custom HTTP Request Data

When HTTP data collectors are configured, the following information can be collected:

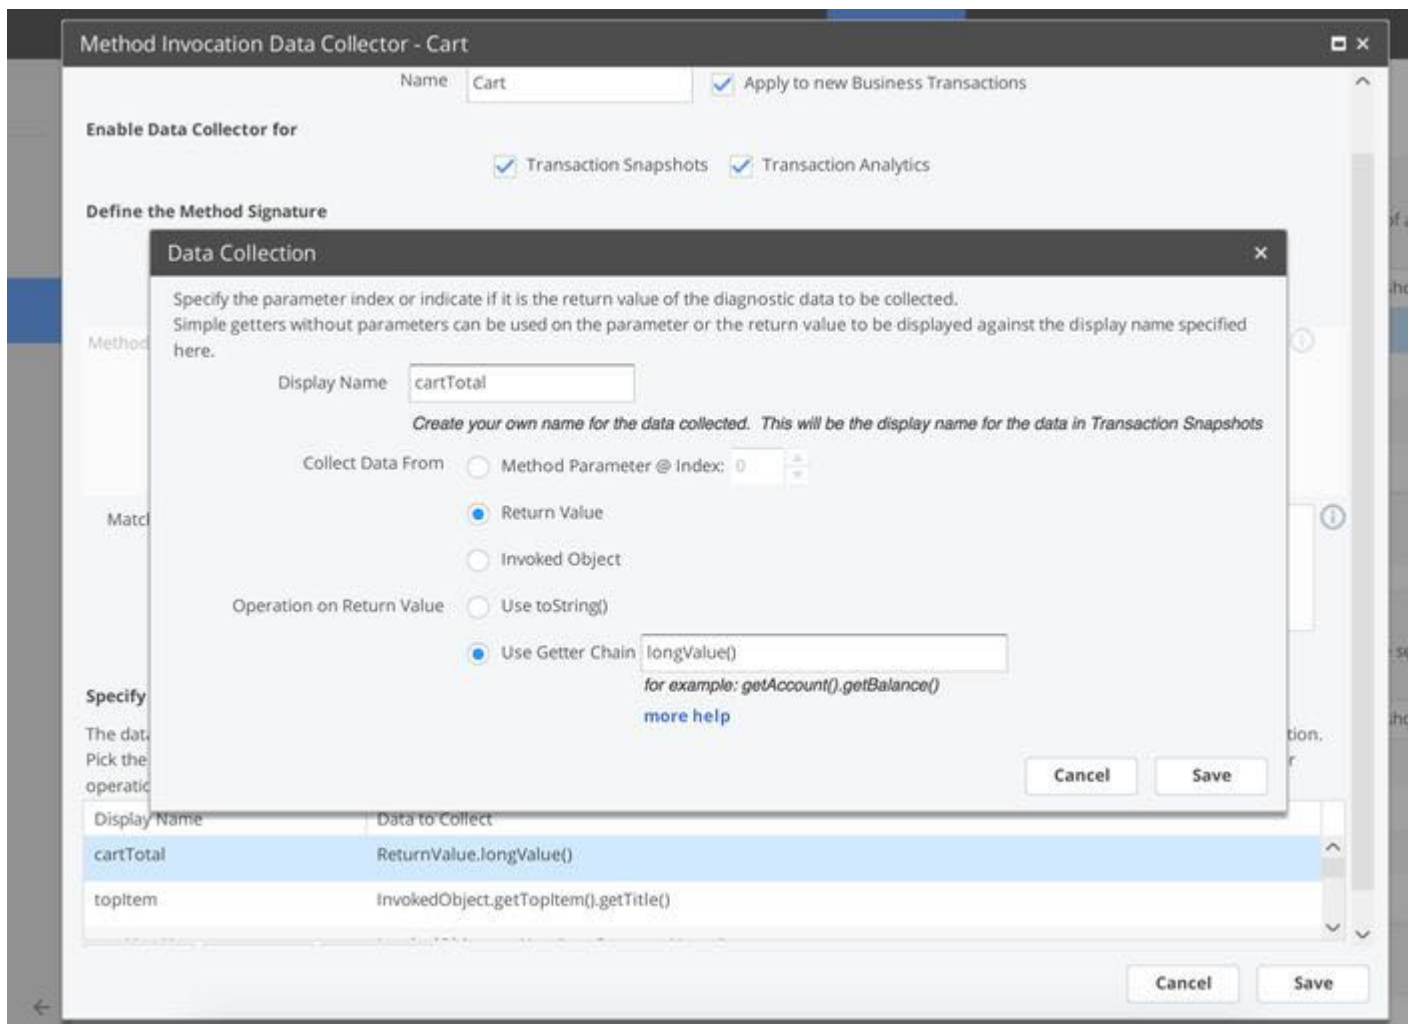

Field	Events Service Database Name
cookies	segments.httpData.cookies
headers	segments.httpData.headers
parameters	segments.httpData.parameters
principal	segments.httpData.principal
session ID	segments.httpData.sessionId
session Objects	segments.httpData.sessionObjects
URL	segments.httpData.url
URI path segments: segment0- <i>n</i>	segments.httpData.uriPathSegments

Analytics uses the configured display name as the field name for the HTTP parameters. In Controller versions prior to 4.3, Analytics displayed the data using the actual parameter name.

Custom Method Data

Custom data collected as specified in the method invocation data collector configuration. See [Data Collectors](#)(see page 1502).

To specify a custom data field when using the Analytics query APIs, prefix the field name with `segments.userData`. For example, if your field is `cartTotal`, such as shown in the following screenshot, the database name is `segments.userData.cartTotal`.

Deprecated Fields

AppDynamics deprecated the Request Experience and Transaction Time for Analytics Agents $\geq 4.2.x$. Both fields are replaced with new fields:

Deprecated Field	Description	New Field
Request Experience	Indicates if the transaction was marked as Normal, Slow, Very Slow, Stall, or Error	User Experience

Deprecated Field	Description	New Field
Transaction Time	Business transaction response time for this request in milliseconds	Response Time

Analytics Log Data

Log Analytics collects from log files depends on the source of the log file and the pattern that you specify to structure the data in the log with. Every log entry is an event in the Log Analytics event stream.

Log Analytics Data

Log Analytics only supports the UTF-8 encoding format.

Event Type: logs

Key (event type identifier): sourceType

These fields are captured by default; you can configure and capture optional data, but these fields are always present:

UI Field Name	Description	Events Service Internal Name
pickupTimestamp	The timestamp when the Java Agent picked up the event and sent it to the Analytics Agent.	pickupTimestamp
Message	The message body of the log event.	message
host	IP address or host name where the event was generated.	host
source	Location of the logs, usually a path or directory such as /tomcat/logs.	source
sourceType	The kind of log file, such as apache-httpserver-access-log.	sourceType
Timestamp	Timestamp of the log event.	eventTimestamp
Extracted Fields	Fields that were extracted using the Controller UI in previous versions appear in the Extracted Fields list. See Collect Log Analytics Data (see page 3158).	Varies

You can optionally configure these fields:

Optional Fields	Description
nodeName	Name of the node where the log event occurred.

Optional Fields	Description
tierName	Name of the tier where the log event occurred.
appName	Application name where the log event occurred.

Analytics Custom Events Data

Data collected for your Analytics custom events depends on the schema you create and manage.

The only default field is `eventTimestamp`. If custom events are used to configure Business Journeys, this field is mandatory. All other fields are defined by your schema.

If you are exporting data as a CSV file, a single quotation mark (') prepends cells that begin with =, +, -, @, or ".

See [Analytics Events API](#)(see page 3743).

Analytics Browser Requests Data

Browser Analytics provides details about each browser user request. The data collected includes information about pages, performance metrics, location of your users, browser and device data, errors, and any custom data that you configured in your Browser RUM configuration.

This page lists the field names available for browser request Analytics data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query. See [Browser RUM Metrics](#)¹⁸³⁰.

Event Type: `browser_records`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
Page Info Fields	
Agent ID	<code>agentid</code>
<code>appkey</code>	<code>appkey</code>
Client GUID	<code>cguid</code> The Client GUID is a unique identifier for each browser request. It is unique on each page reported in the session.
IP address	<code>ip</code>
Page Experience	<code>pageexperience</code>
Page Name	<code>pagename</code>

------------------------	--

Analytics Mobile Crash Reports Data

This page describes the field names available for Analytics Mobile Crash Reports data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: `mobile_crash_reports`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
App Crash Time	<code>appcrashtimestamp</code>
App Key	<code>appkey</code>
Carrier	<code>carrier</code>
Connection Type	<code>connectiontype</code> For example: "wifi", "4g", "cell"
Country	<code>geocountry</code>
Crash Group ID	<code>groupid</code>
Crash Id	<code>crashid</code>
Crashed Function	<code>crashfunction</code> For example: "-[MTFirstViewController segFault413]", "com.appd.examples.android.instrumentation.MainActivity.d42" This value depends on your application.
Device / Manufacturer	<code>devicemanufacturer</code> For example: "Samsung", "Apple"

UI Field Name	Events Service Internal Name
Mobile App Name	mobileappname
Mobile App Version	mobileappversion
Model	devicemodel For example: "iPhone 5" "iPad 2 WIFI"
OS Version	osversion For example: "iOS 6.0", "Android 4.2"
Platform	platform For example: "Android", "iOS"
Region	georegion
User Data	
<i>your_field_name</i>	userdata.your_field_name userdataBoolean.your_field_name userdataDate.your_field_name userdataLong.your_field_name userdataDouble.your_field_name <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p>i If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code></p> </div>

Analytics Mobile Requests Data

Mobile Analytics provides details about the performance of your mobile apps as experienced by your end users. The data collected includes information about the mobile app names and versions, network requests, performance times, locations, carrier and device data, errors, and any custom data that you configured in your Mobile RUM configuration.

This page describes the field names available for mobile requests Analytics data, along with the Events Service internal name. See [Mobile RUM Metrics](#)(see page 2298). When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: mobile_snapshots

Key (event type identifier): appkey

UI Field Name	Events Service Internal Name
Mobile App Info Fields	
agentid	agentid
agentversion	agentversion
appkey	appkey
cguid	cguid
Mobile App Name	mobileappname For example: "com.appdynamics.eum.test.apps.E2E-PictureSharingApp"
Mobile App Version	mobileappversion
Platform	platform
Network Request Fields	
Background	happenedinbackground
Experience	networkrequestexperience
HTTP Status Code	httpstatuscode
Network Request Name	networkrequestname
Network Request Type	networkrequesttype
Request Content Length	requestContentLength
Response Content Length	responseContentLength
Performance Time Fields	
Estimated BT Time	btdata.estimatedtime
Network Request Time	networkrequesttime
Location Fields	
Country	geocountry
Region	georegion
Carrier and Device Data Fields	
Carrier	carrier

UI Field Name	Events Service Internal Name
Connection Type	connectiontype For example: "wifi", "4g", "cell"
Device / Manufacturer	devicename For example: "Samsung", "Apple"
Model	devicemodel For example: "iPhone 5" "iPad 2 WIFI"
OS Version	osversion For example: "iOS 6.0", "Android 4.2"
Error Fields	
Network Type Error	networkerror
Custom User Data Fields	
<i>your_field_name</i>	userdata.your_field_name userdataBoolean.your_field_name userdataDate.your_field_name userdataLong.your_field_name userdataDouble.your_field_name <div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;"> <p>i If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code></p> </div>

Analytics Mobile Sessions Data

This page describes the field names available for Analytics Mobile Sessions data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: mobile_session_records

Key (event type identifier): appkey

UI Field Name	Events Service Internal Name
Mobile Session Fields	
Mobile App Name	mobileappname example: "com.appdynamics.eum.test.apps.E2E-PictureSharingApp"
Carrier	carrier For example: "AT&T", "Verizon"
Closed	closed
Connection Type	connectiontype For example: "cell", "3g"
Country	geocountry
Device / Manufacturer	devicename
Duration	metrics.durationMS
IP Address	ip
Mobile App Version	mobileappversion
Model	devicemodel For example: "iPad 2 WIFI", "Kindle Fire"
OS Version	osversion For example: "iOS 5.1", "Android 4.2"
Region	georegion
Session Start Time	startTimeMS
Session Status	closed Note "closed" is a Boolean field. True means the session is closed. False means the session is still going on.
Event Count Fields	
Breadcrumb Count	metrics.breadcrumbcount

UI Field Name	Events Service Internal Name
Crash Count	metrics.crashcount
Custom Metric Count	metrics.custommetriccount
Event Time Stamp	eventTimestamp
Info Point Count	metrics.infopointcount
Network Request Count	metrics.networkrequestcount
Timer Count	metrics.timerCount
UI Event Count	metrics.uiCount
User Data Count	metrics.userdatacount
Crash Fields	
App Crash Time	crash.appcrashtimestamp
Crash Exception	crash.crashexception For example: "java.lang.NullPointerException"
Crash File	crash.crashfile For example, "MainActivity.java"
Crash Group ID	crash.groupid
Crash Line Number	crash.crashlinenumber
Error Description	error.description
Symbolicated or Deobfuscate	crash.symbolicateddeobfuscated For example: false
User Data	

UI Field Name	Events Service Internal Name
<i>your_field_name</i>	userdata.your_field_name userdataBoolean.your_field_name userdataDate.your_field_name userdataLong.your_field_name userdataDouble.your_field_name <div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;"> <p>i If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code></p> </div>
Breadcrumb Fields	
Breadcrumb Text	breadcrumb.bctext
Network Request Fields	
Connection Type	networkrequest.connectiontype
End Time	networkrequest.endTimeMS
Experience	networkrequest.networkrequestexperience
HTTP Status Code	networkrequest.httpstatuscode
IP Address	networkrequest.ip
Network Error	networkrequest.networkerror
Network Request Name	networkrequest.networkrequestname
Network Request Time	networkrequest.networkrequesttime
Infopoint Fields	
Duration (ms)	infopoint.duration
infopname	infopoint.infopname
Is Dynamic	infopoint.isdynamic
UI Event Fields	
Activity	ui.activity

UI Field Name	Events Service Internal Name
Class	ui.uiclass For example: "UITableView"
Label	ui.uilabel For example: "IOS TableCell"
Root View	ui.rootview For example: "SettingsScreen"
UI Event	ui.uievent For example: "Button Pressed", "Root View Change", "Table Cell Selected"

Analytics Mobile Non-Fatal Issues Data

This page describes the field names available for Analytics Mobile Non-Fatal Issues data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: mobile_non_fatal_issue_records

UI Field Name	Events Service Internal Name
Agent Info Fields	
Agent ID	agentid
Agent Version	agentversion
App Info Fields	
App Key	appkey
Mobile App Name	mobileappname For example: "com.appdynamics.eum.test.apps.E2E-PictureSharingApp"
Mobile App Version	mobileappversion
Device Info Fields	
Carrier	carrier For example: "AT&T", "Verizon"

UI Field Name	Events Service Internal Name
Connection Type	connectiontype For example: "cell", "3g"
Device Manufacturer	devicemanufacturer For example: "Samsung"
Device Model	devicemodel For example: "Galaxy S5"
Device Name	devicename
IP Address	ip
jailbroken	jailbroken
OS Version	osversion For example: "5.1", "4.2"
Platform	platform For example: "iOS", "Android"
Code Issues	
description	description For example: "App Not Responding in Utils.formatData"
filename	filename
groupid	groupid
Line Number	linenumber
severity	severity For example: "Info", "warning"
symbolicateddeobfuscated	symbolicateddeobfuscated For example: false
symbolname	symbolname For example: "MainActivity.onResume"

UI Field Name	Events Service Internal Name
pickupTimestamp	pickupTimestamp
Timestamp	timestamp For example: "03/15/18 5:32:33 PM"
Custom User Data Fields	
<i>your_field_name</i>	userdata.your_field_name userdataBoolean.your_field_name userdataDate.your_field_name userdataLong.your_field_name userdataDouble.your_field_name <div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;"> <p>i If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code></p> </div>
Event Fields	
eventid	eventid
eventindex	eventindex
timestamp	eventTimestamp
eventtype	eventtype For example: "ANR", "Error"
Location Fields	
City	geocity
Country	geocountry
Region	georegion For example: "California", "Sichuan"

Analytics Synthetic Sessions Data

This page lists the field names available for Analytics Browser Synthetic Sessions data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query. For details on the meaning of each metric, see [Browser Synthetic Metrics](#) (see page 1999).

Event Type: synth_session_records

Key (event type identifier): Job Name (scheduleName)

UI Field Name	Events Service Internal Name
Session Fields	
Browser	browser For example: "Internet Explorer", "Chrome"
Browser Version	browserversion For example: "52.0.2743.116", "11.0.9600.18124"
City	geocity
Closed	closed
Country	geocountry
Devices	device The computer form factor of the device. For example: "Computer" or "Mobile & Tables"
Device Model	devicemodel The model of the device. For example: "Galaxy S8" or "iPhone 7"
Device OS	deviceos The operating system of the device. For example: "Windows" or "Android"
Duration (sec)	metrics.`Session Duration (ms)`
End Time	endTimeMS
Error Type	failureType For example: "Timed out", "Test script crashed"

Job Name	scheduleName The name of the synthetic job.
Region	georegion
Result	success
Schedule ID	measurementSpec.scheduleId
Session Type	sessionType For example: "WEB_DRIVER", "URL"
Session Visual Time (sec)	metrics:`Session Visual Time (ms)`
Start Time	startTimeMS
Status	status
Timestamp	eventTimestamp
Page View Fields	
Page Error Type	browserRecords.pageerror
RUM Page Name	browserRecords.pagename
URL	pageurl

Analytics Connected Device Data

Connected Device Data provides details about each IoT connected device. The data collected includes information about devices, network requests and error events, and any custom properties and events that you instrument in your IoT application.

This page describes the required field names for Analytics Connected Device data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query. Because [IoT Monitoring](#)¹⁸³⁵ largely depends on custom data, your connected device Analytics data will most likely include many more field names than given below.

Event Type: `iot_records`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
Fields	
App Key	appkey

¹⁸³⁵ <https://docs.appdynamics.com/display/PRO216/IoT+Monitoring>

UI Field Name	Events Service Internal Name
deviceguid	deviceguid
devicetype	devicetype
Timestamp	eventTimestamp
eventtype	eventtype
customevent Fields	
eventssummary	customevent.eventssummary
networkrequestevent Fields	
duration	networkrequestevent.duration
networkerror	networkrequestevent.networkerror
statuscode	networkrequestevent.statuscode
URL	networkrequestevent.url
errorevent Field	
Resource Name	errorevent.name ¹⁸³⁶

ADQL Changes in Events Service 20.9.0

This page describes the ADQL-related changes caused by an update to the Events Service in version 20.9.0.

The following ADQL changes are currently only available for customers with accounts provisioned in the following regions: Bombay, Cape Town, São Paulo, and Hong Kong. Contact your system administrator to confirm where your account is provisioned.

ADQL Percentile Query Results

In the Events Service 20.9.0, the ADQL percentile query now returns the larger number instead of the median number in a range of candidates. The ADQL percentile query syntax for the Events Service 20.9.0 has not changed.

¹⁸³⁶ <http://errorevent.name>

Sample ADQL Percentile Query Syntax

```
New Search
```

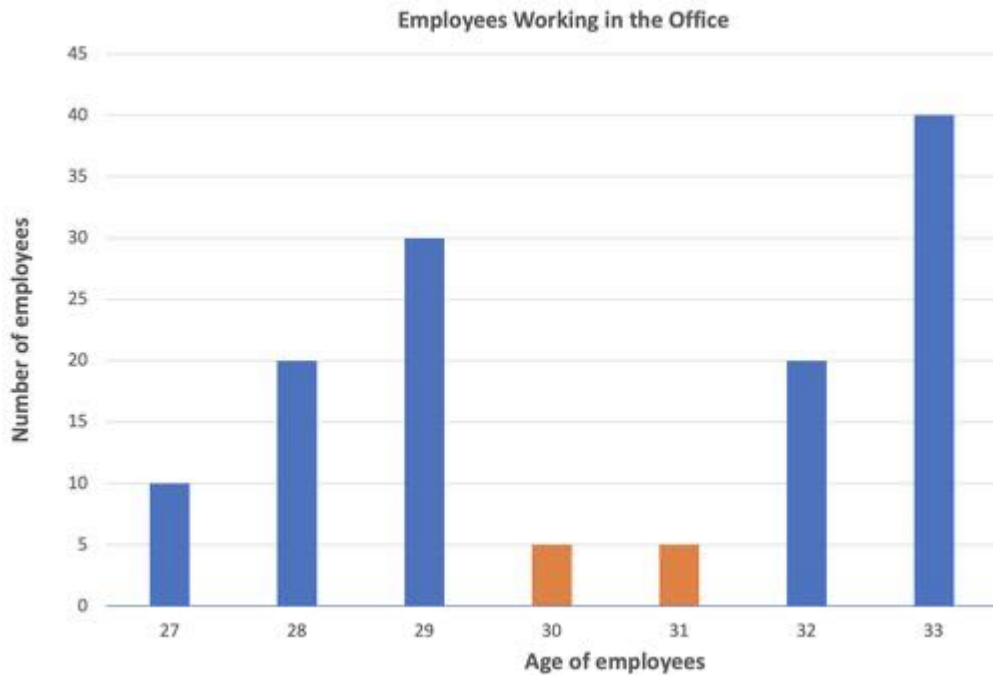

```
1 SELECT percentile(age, 50) FROM transactions
```

ADQL Terms

Term	Description
SELECT	<ul style="list-style-type: none"> A SELECT keyword is the first keyword in an ADQL query. It is followed by a list of columns or expressions to query data in a table.
Percentile	<ul style="list-style-type: none"> The percentile keyword represents the similarly named ADQL function. It contains a field and the percentile value. In the sample ADQL percentile query syntax(see page 3074), the percentile value is the 50th percentile.
Field	<ul style="list-style-type: none"> A field is the column that is queried in a table. In the sample ADQL percentile query syntax(see page 3074), the field is the age.
FROM	<ul style="list-style-type: none"> A FROM keyword comes after the SELECT keyword and a list of fields or expressions.
Table	<ul style="list-style-type: none"> A table is the collection of fields and their values. In the sample ADQL percentile query syntax(see page 3074), transactions is the table that contains the age queried field.

ADQL Example

This example displays the 50th percentile age of employees working in the office. Based on the distribution, the 50th percentile age is 30 and 31. This is because out of a total of 130 employees in the table, 65 employees are 30 or younger and 65 employees are 31 or older.

Results

- For Events Service < 20.9.0, the 50th percentile age value is 30.5, which is the median of 30 and 31.
- For Events Service >= 20.9.0, the 50th percentile age value is 31, which is the larger candidate.

In a production environment, there can be millions of values in each field. As a result, the percentile query returning the larger number in a percentile bucket is a more accurate data distribution.

Analytics Data Sources

Related pages:

- [ADQL Data](#)(see page 3052)

This page describes how Analytics can collect data from many sources in your AppDynamics APM Platform.

Transaction Analytics Data Sources

Transaction Analytics data is collected by the AppDynamics Java, .NET, PHP and Node.js App Agents. Collecting Transaction Analytics data requires no change to your application code. You enable analytics on the app server agents and Controller you already use.

Once you have enabled analytics on your application, you can collect and analyze several kinds of data:

- Default performance data collected by the app agents about your application's business transactions.
- HTTP-based data collected by HTTP data collectors.
- Custom data collected by method invocation data collectors.
- Business data collected from parameterized SQL calls.

See [Collect Transaction Analytics Data](#)(see page 3132).

Log Data Sources

You can collect Log Analytics data from many types of log files, including instrumented and non-instrumented applications as well as infrastructure. Log Analytics can be used as a standalone component. You can search and analyze log data just as you do transaction data. Log Analytics works by default with the syslog (log4j) format and can be configured for other log formats, including GZIP files (log files ending in .gz). You can capture other log formats by setting up regular-expression-based mapping. See [Collect Log Analytics Data](#)(see page 3158).

You can view correlated Log and Transaction Analytics Data. By configuring business transaction GUID injection, you can see logs that are related to specific business transaction requests. See [Business Transaction and Log Correlation](#)(see page 3193).

End User Monitoring Data Sources

Analytics can also use data collected by [Browser Real User Monitoring](#)(see page 1689), [Mobile Real User Monitoring](#)(see page 2066) and [IoT Monitoring](#)(see page 2331). Analytics makes the data available in a more flexible search format. If you have enabled Browser RUM, Mobile RUM or IoT Monitoring *and* enabled Analytics, you see these event types on the Analytics search page.

For details on how analytics extends the capability of EUM, see the section "[Browser Analyze versus Browser Request Analytics](#)" in [Browser RUM Analyze](#)(see page 1714).

Browser Synthetic Data Sources

Sessions data captured through Browser Synthetic Analytics is available in Analytics.

Custom Event Sources

You can add custom events for Analytics using the [AppDynamics Analytics Events API](#)¹⁸³⁷.

Deploy Analytics With the Analytics Agent

Related pages:

- [Monitor JVMs](#)(see page 1281)
- [Monitor .NET Nodes](#)(see page 1297)

This page describes the deployment options for Analytics, which includes the Events Service.

Transaction Analytics Only

The Analytics Agent is only required for the Node.js, PHP Agents, and Python Agents, and not the Java and .NET Agents if the minimum versions are met. You need an Analytics Agent to capture Transaction Analytics for:

- Any version of Node.js Agent
- Any version of PHP Agent
- Python Agent ≥ 21.10 (Python Agent < 21.10 does not support Transaction Analytics)
- Java Agent $\leq 4.5.15$
- .NET Agent ≤ 20.10

1837 <https://docs.appdynamics.com/display/PRO45/Analytics+Events+API>

To configure Transaction Analytics:

- Download and install either the [Machine Agent](#)(see page 2590) or the Analytics Agent (standalone binary) on each machine. You can also use a shared Analytics Agent instance.
- Enable Analytics for applications in the [Controller](#)(see page 3131).

Log Analytics Only

To configure Log Analytics:

- Install either the [Machine Agent](#)(see page 2590) or the Analytics Agent (standalone binary) on the machine.
- Enable Analytics for log sources in the [Controller](#)(see page 3131).

Transaction and Log Analytics

To configure Transaction and Log Analytics:

- Install either the [Machine Agent](#)(see page 2590) or the Analytics Agent (standalone binary) on the machine.
- Enable Analytics for applications and log sources in the [Controller](#)(see page 3131).

SaaS/On-premises Analytics Configuration

When you deploy Analytics with the Analytics Agent, the configuration requirements differ based on your deployment.

- SaaS: The Events Service is provided as part of the SaaS service. AppDynamics stores the data and hosts the server components of the system for you. You need to install only the Analytics Agent components of the system described in [Agent Side Components](#)(see page 3078).
- On-premises: You host the components yourself, storing all data on-premises. You need to install the [Agent Side Components](#)(see page 3078), [Controller Deployment Components](#)¹⁸³⁸, and [Events Service Deployment Components](#)¹⁸³⁹. While the on-premises deployment involves additional setup and administration, you are able to retain the Analytics data in your own data center.

Encrypt Data on the Analytics Agent

You can encrypt any data on the Analytics Agent using `secure://<your-encrypted-credentials>`. You can encrypt data in the Analytics Agent properties file or in System Properties.

The following example demonstrates how to encrypt `http.event.accessKey` in the Analytics Agent properties file.

```
http.event.accessKey=secure://-001-24-Dr9FQGC179o4vPnuLjnx8A==ZGVw/
P400NvpUIdIhJ2u78FpRVVW8fbgr8J1HBHXwnE=
ad.secure.credential.store.filename=/opt/appdynamics/secretKeyStore
ad.secure.credential.store.password=s_gsnwR6+LDch8JBf1RamiBoWfMvjkipkrtJMZXAYEkw8=
```

See [Encrypt Agent Credentials](#)(see page 1123).

¹⁸³⁸ <https://docs.appdynamics.com/display/PRMY21/.Controller+Deployment+v21.5>

¹⁸³⁹ <https://docs.appdynamics.com/display/PRMY21/.Events+Service+Deployment+v21.6>

Separate Host for the Analytics Agent

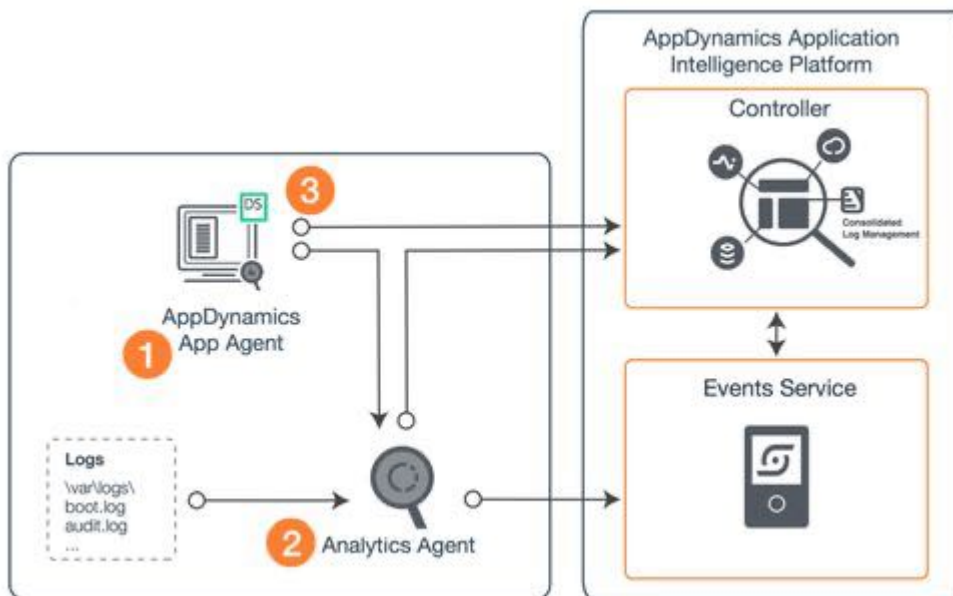

If your Analytics Agent is on a host separate from the monitored application, see [Remote Analytics Agent Sizing](#)(see page 3121).

Analytics Agent Components

This page describes Analytics Agent architecture.

Analytics Agent-Side Components

For both SaaS and on-premises Analytics, you need to deploy (or enable) agent-side Analytics components in your application environment.

Legend: Agent Components

- 1 AppDynamics App Agent: Analytics relies upon the same app server agents that AppDynamics APM uses. If you use AppDynamics APM, you likely already have these deployed to your monitored applications.
- 2 Analytics Agent: The Analytics Agent collects data from one or more app server agents and sends it to the Events Service. It also reads and transmits log data from log files from the local machine. The Analytics Agent is available as a standalone binary or as part of the Machine Agent download.
 - As part of the [Machine Agent](#)(see page 2590) download, the Analytics Agent runs as an extension (also called a monitor).
 - A standalone binary distribution of the Analytics Agent is available for Windows environments or other environments that do not have the Machine Agent installed.
- 3 Analytics Dynamic Service: The Analytics Dynamic Service extends your app server agent functionality to collect and forward data to the Analytics Agent. It is built into the Java and .NET Agents but is not enabled by default. No additional download is needed.

Browser and Mobile Analytics

To see Analytics data from Browser and Mobile Real User Monitoring, you need to enable those components and enable Analytics. See [EUM Server Deployment](#)¹⁸⁴⁰.

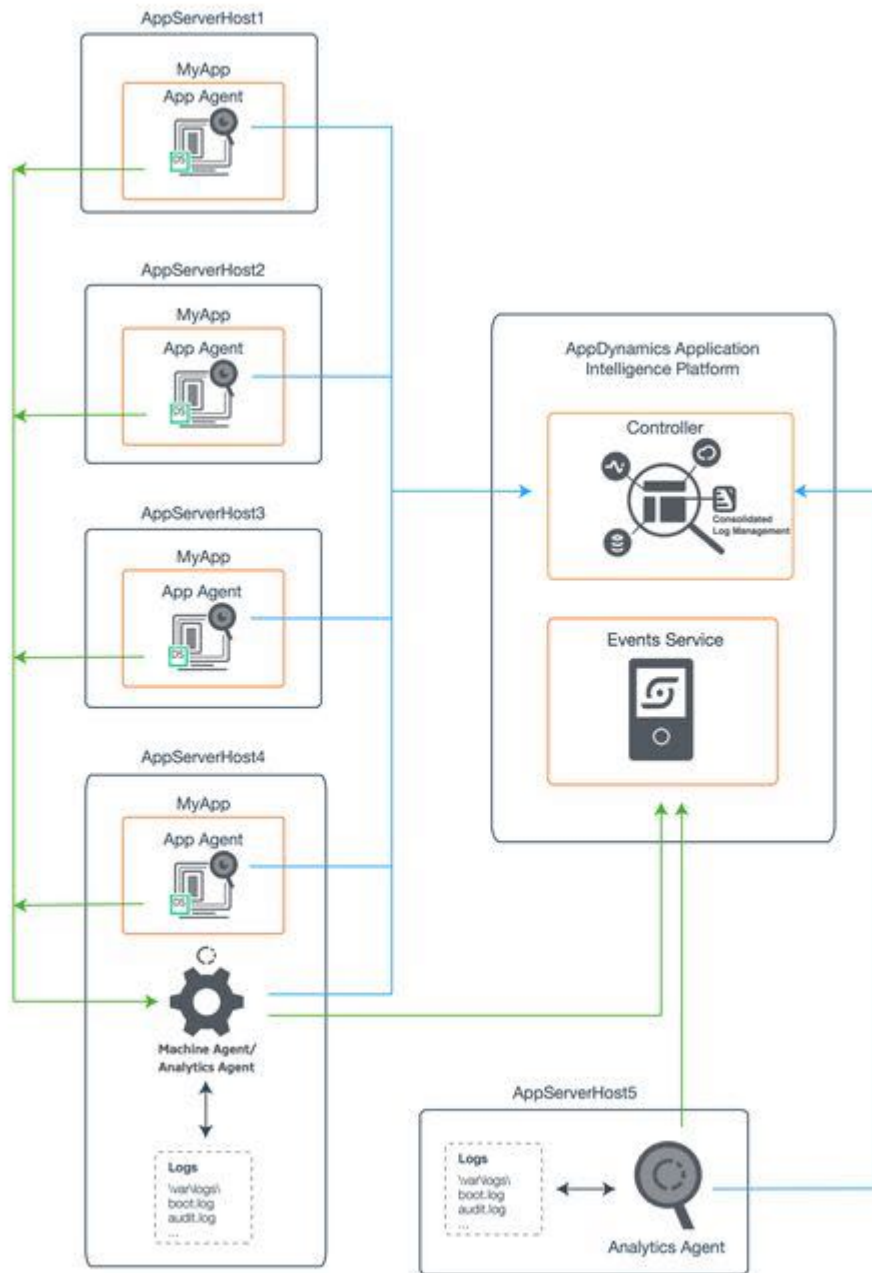

Deploying Analytics Agents to Multiple Nodes

A real-world scenario is unlikely to consist of a single monitored node, as shown in the diagram above. It usually consists of many applications deployed over many hosts.

While the APM app server agents continue to send data to the Controller in the normal way, the Analytics Dynamic Service sends its data to the Analytics Agent. This agent runs in a separate JVM process in the local environment or network, either as part of the Machine Agent or on its own.

There must be at least one Analytics Agent in the monitored environment, although multiple app server agents collecting only transaction data can share a single Analytics Agent, as shown in the diagram below. However, each machine where you want to gather log data must have its own Analytics Agent instance.

¹⁸⁴⁰ <https://docs.appdynamics.com/display/PRMY21/.EUM+Server+Deployment+v21.5>

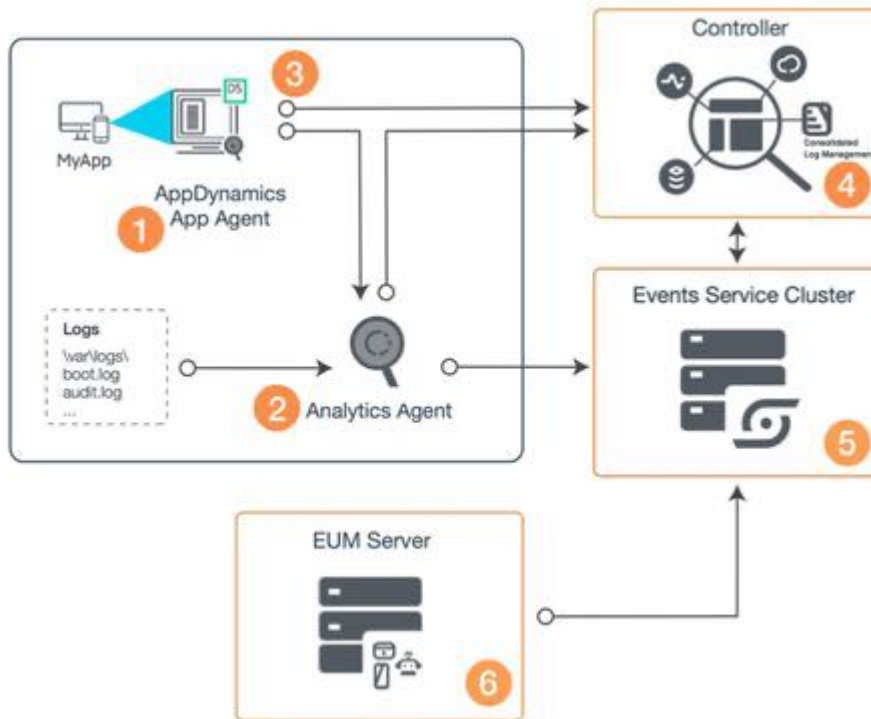

In this example, AppServerHost1-3 are collecting only Transaction data, so only app server agents are required. Each one connects to the Analytics Agent on AppServerHost4, where log information is also being collected. The Analytics Agents could also reside on the same machines as each app server agents. On AppServerHost5, only log data is being collected, so an Analytics Agent is also necessary there.

Server Side Components for On-premises

To set up AppDynamics Analytics on-premises, you also need to install the server parts of the system, the AppDynamics Controller, and the Events Service.

The following figure depicts the basic components of an on-premises deployment:

Legend: Server Components

i If you are using SaaS EUM, you must use the SaaS Events Service. If you are using the on-premises EUM Server, you must use an on-premises instance of the Events Service.

4 AppDynamics Controller: The heart of an AppDynamics deployment, the Controller processes and presents the information gathered by the agents.

5 Events Service: The unstructured document store, it gathers and stores data from the Analytics, Database, and Network Visibility Agents and, if you have End User Monitoring, from **6**, the EUM Server. It allows the Controller UI to run queries on that data.

Install Agent-Side Components

On this page:

- [Prepare to Enable the Agents](#)(see page 3082)
- [Install the Standalone Analytics Agent on Windows](#)(see page 3083)

- [Install the Standalone Analytics Agent on Linux](#)(see page 3086)
- [Enable the Standalone Analytics Agent](#)(see page 3090)
- [Enable the Analytics Agent as an Extension to the Machine Agent](#)(see page 3092)
- [Tune Analytics Agent](#)(see page 3094)
- [Additional Configurations](#)(see page 3095)
- [Troubleshooting Tips](#)(see page 3095)

Related pages:

- [Analytics Agent Components](#)(see page 3078)

This page provides an overview of how to configure Application Analytics components to collect business transaction data.

In most Application Analytics deployment scenarios, you must enable the Analytics Agent-side components. The agents are distributed as system-based operations or standalone bundles in the [AppDynamics Downloads Portal](#)¹⁸⁴¹.

If your app server agent supports Agentless Analytics, such as the [Java Agent](#)(see page 492) (21.2 and later) and [.NET Agent](#)(see page 645) (20.10 and later), you do not need to install the standalone Analytics Agent or Machine Agent extension for Transaction Analytics data collection. See [Deploy Analytics Without the Analytics Agent](#)(see page 3127) for more information.

Prepare to Enable the Agents

Review the deployment options, agent-side component architecture, and components you will need to install in [Deploy Analytics With the Analytics Agent](#)(see page 3076).

Analytics Agent

The Analytics Agent collects and sends data from the AppDynamics App Agent and log files to the Events Service. The Analytics Agent is not enabled by default. You need to download and enable the desired bundle using a method of your choice.

In the Analytics Agent version ≥ 21.7 the `debug/grok` endpoint is disabled by default. To enable the endpoint, start the Analytics Agent with the property `ad.debug.grok.endpoint.enabled=true` in `agent.properties` file.

To use Application Analytics:

1. Obtain a separate [Application Analytics license](#)(see page 196).
2. Enable the Analytics Agent.
3. Point to the Event Service. See [Revise the Analytics Agent Properties File](#)(see page 3083) for agent-specific configuration and [Event Service Deployment](#)¹⁸⁴² for the Event Service.
4. Enable Analytics on the Controller.

AppDynamics App Agent

To access Analytics and collect transaction data from an application, you must deploy a supported app server agent version in all environments, such as the [Node.js Agent](#)(see page 809) or the [PHP Agent](#)(see page 854). If you already use AppDynamics APM, agents may already be installed in your environment.

¹⁸⁴¹ <https://download.appdynamics.com/>

¹⁸⁴² <https://docs.appdynamics.com/display/PRMY21/.Events+Service+Deployment+v21.6>

Install the Standalone Analytics Agent on Windows

As described in [Analytics Deployment Options](#)¹⁸⁴³, the Analytics Agent can run on the same host or on a different host from the app server agent, depending on your use case.

The [AppDynamics Downloads Portal](#)¹⁸⁴⁴ provides the following distribution archives:

- Standalone Analytics Agent (no JRE)
- Analytics Agent with JRE 1.8 for both 32-bit and 64-bit Windows machines

Revise the Analytics Agent Properties File

The Analytics Agent properties file determine how your Analytics Agent communicate with other components, what type of data it gathers from the monitored application, and how the components of the Application Analytics deployment and the Controller authenticate to each other.

Modify the default configuration and set the desired values for the agent properties in the properties file. The location of this file depends on your exact deployment scenario.

1. Open the <analytics-agent-home>/conf/analytics-agent.properties file with a text editor. The Analytics Agent on Windows requires double backslash for paths.

For example:

```
conf.dir=C:\\AppD\\analytics-agent\\conf
ad.dw.log.path=C:\\AppD\\analytics-agent\\logs
```

2. To run the Analytics Agent as a Windows service, modify the following properties:

- ad.dw.log.path=<analytics-agent-home>\\logs
- conf.dir=<analytics-agent-home>\\conf
- adjvm.options.name=analytics-agent.vmoptions
- ad.jvm.heap.min=512m
- ad.jvm.heap.max=1g

3. Follow the instructions to [enable the standalone Analytics Agent](#)(see page 3090).

4. To install the Analytics Agent on Windows, run the install command:

```
bin\\analytics-agent.exe service-install
```

Start and Stop the Analytics Agent

To start/stop the Analytics Agent on Windows, run the following commands in the Windows Services menu.

To start the agent, run:

```
bin\\analytics-agent.exe service-start
```

To stop the agent, run:

```
bin\\analytics-agent.exe service-stop
```

¹⁸⁴³ <https://docs.appdynamics.com/display/PRO45/.Deploy+Analytics+With+the+Analytics+Agent+v20.3>

¹⁸⁴⁴ <https://download.appdynamics.com/>

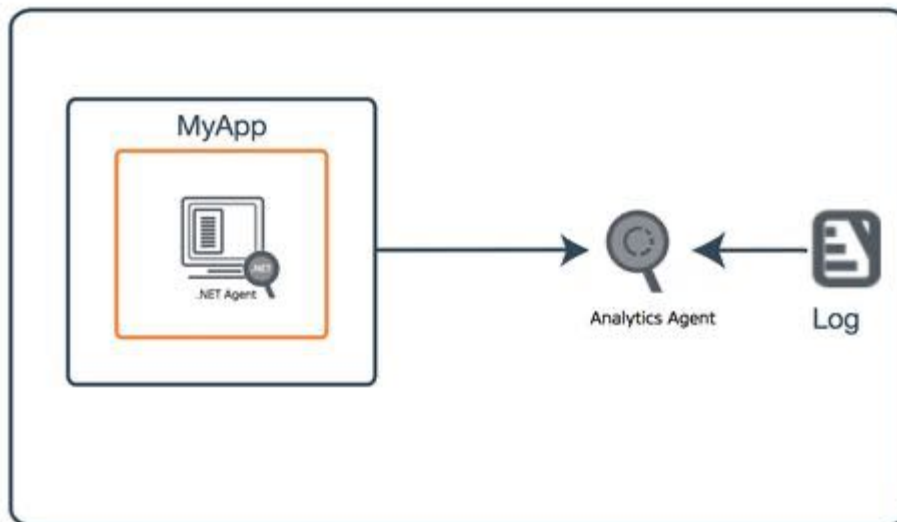

Uninstall the Analytics Agent

To uninstall the Analytics Agent, run the `.exe` file with the `uninstall` command:

```
bin\analytics-agent.exe service-uninstall
```

Enable Analytics Agent for a Local App Server Agent

This section assumes that you are installing the Analytics Agent on the same host as your app server agent. In this deployment, the Analytics Agent reads and transmits log data in log files from the local machine. The app server agent transmits data from the monitored application to the Analytics Agent.

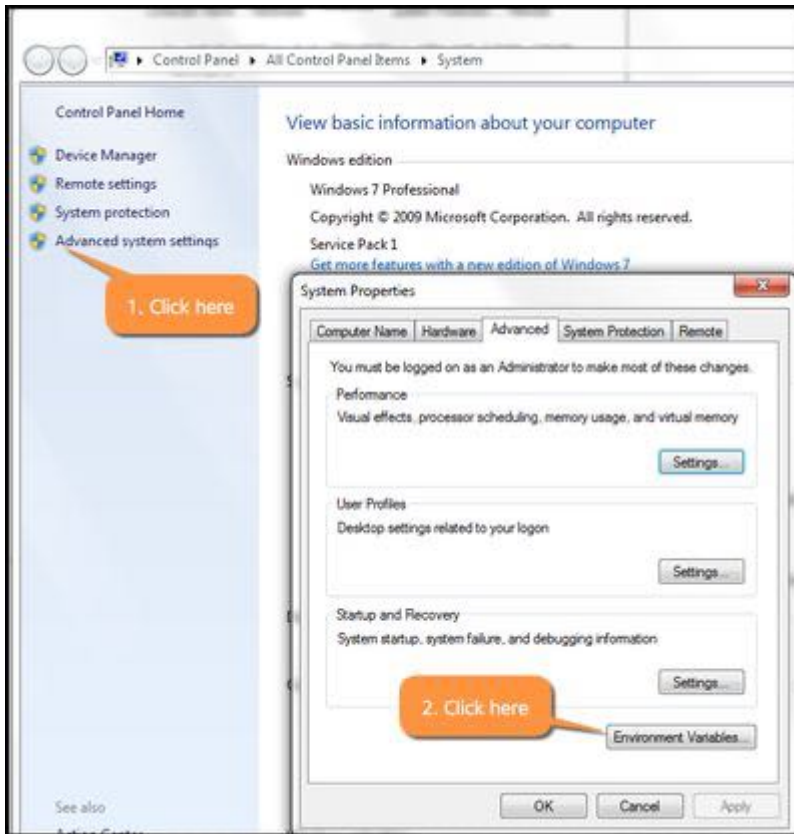

Install the Analytics Agent with the `.exe` and `analytics-agent.exe` files found in the `<analytics-agent-home>/bin` directory. Because the Analytics Agent is written in Java, you will run the agent in a Java Virtual Machine (JVM). The Analytics Agent runs as a Windows service.

Enable the App Server Agent for a Remote Analytics Agent

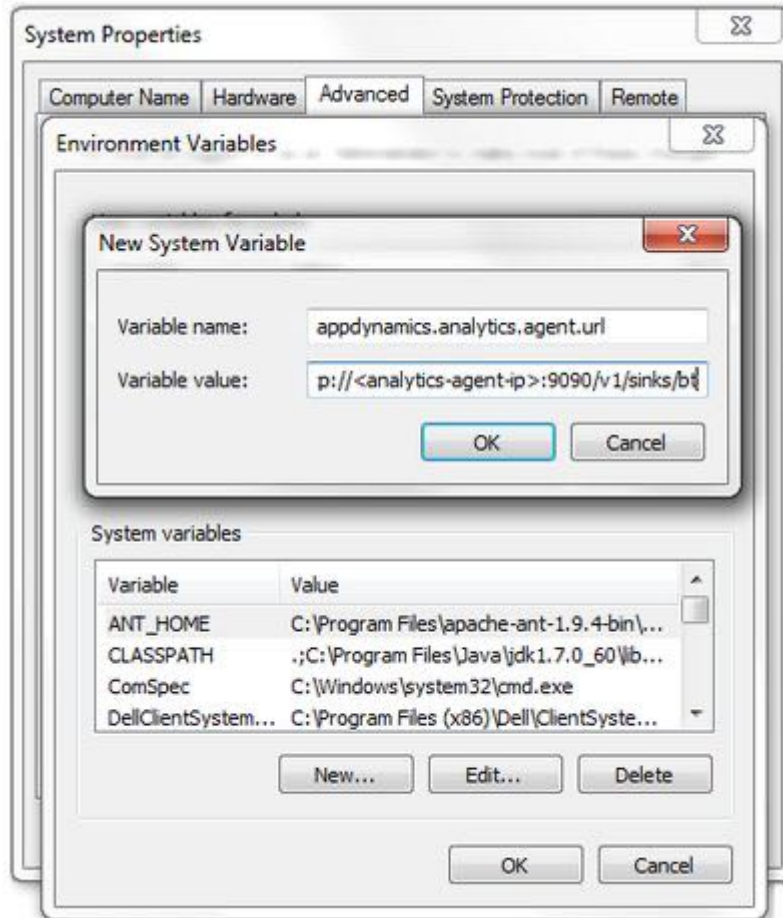

To specify the location of the remote Analytics Agent with an environment variable named `appdynamics.analytics.agent.url` on Windows:

1. On your Windows machine, go to **System Properties > Advanced system settings > Environment Variables**.

2. Under **System Variables**, click **New**. AppDynamics recommends a system environment variable approach as opposed to a user environment variable approach; in the environment variable approach, a user must have the same permissions as the user with all the instrumented applications running.
3. Set the value for the `appdynamics.analytics.agent.url` system variable to `http://<analytics-agent-ip>:9090/v2/sinks/bt`.

Replace `<analytics-agent-ip>` with the hostname of the Analytics Agent for your environment.

- Restart the applicable application or process where you want the new environment variables to take effect. While it is not required that you restart your machine, the parent process that invokes the monitored process must be restarted. For `w3wp` on Windows, restart IIS by running `iisreset` after the changes are made to the environment variables.

Install the Standalone Analytics Agent on Linux

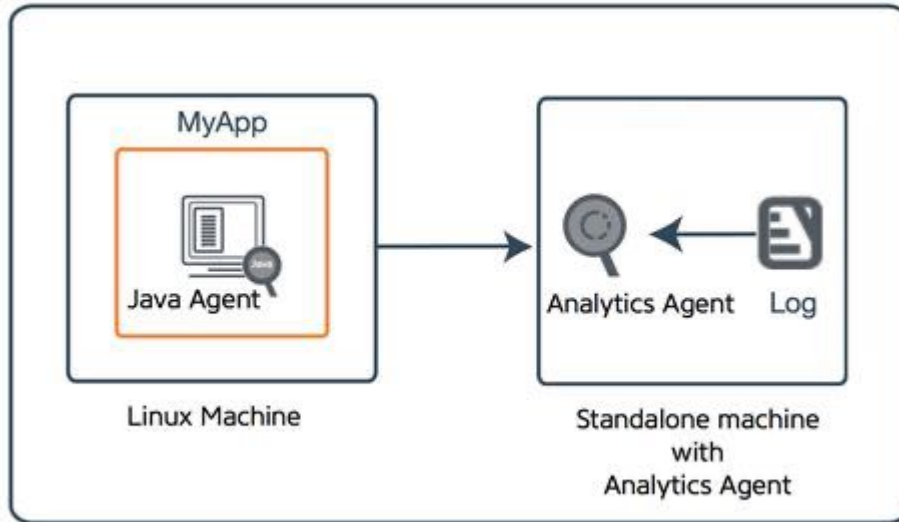

As described in [Analytics Deployment Options](#)(see page 3076), the Analytics Agent can run on the same host or on a different host from the app server agent, depending on your use case.

The [AppDynamics Downloads Portal](#)¹⁸⁴⁵ provides the following distribution archives:

- Standalone Analytics Agent (no JRE)

The default settings of the app server agent typically assume that the Analytics Agent is on the same host and uses the default port. If your Analytics Agent is on a host separate from the app server agent, as shown in the diagram below, or you have changed the default port, you need to specify the new host and port values for the app server agent.

¹⁸⁴⁵ <https://download.appdynamics.com/>

Revise the Analytics Agent Properties File

The Analytics Agent properties file determine how your Analytics Agent communicate with other components, what type of data it gathers from the monitored application, and how the components of the Application Analytics deployment and the Controller authenticate to each other.

Modify the default configuration and set the desired values for the agent properties in the properties file. The location of this file depends on your exact deployment scenario.

1. Open the `<analytics-agent-home>/conf/analytics-agent.properties` file with a text editor.
2. Follow the instructions to [enable the standalone Analytics Agent](#)(see page 3090).

Start and Stop the Analytics Agent

You can start and stop the Analytics Agent directly in the command line.

To start the agent, run:

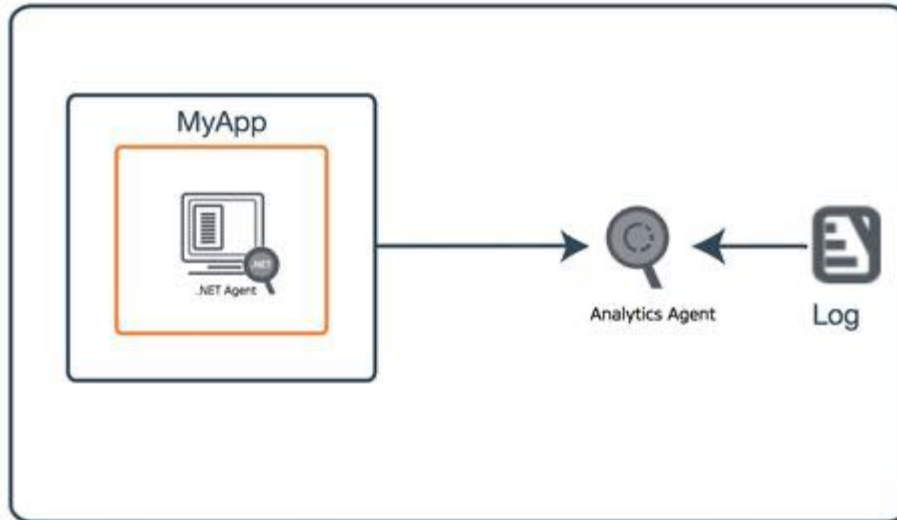

```
<analytics agent executable> start
```

To stop the agent, run:

```
<analytics agent executable> stop
```

Run the Analytics Agent From a Read-Only Filesystem

In this deployment, the Analytics Agent is installed and run from a read-only filesystem. To do so, you need to direct the Analytics Agent to write its log files to a writable partition.

By creating a directory for the Analytics Agent in a writable file system and symlinks for the content of the Analytics Agent in the read-only file system, you will have a writable top-level directory for the Analytics Agent and a writable logs directory under the top-level directory.

To run the Analytics Agent from a separate writable directory using artifacts from a read-only directory:

1. Provide necessary permissions to the read-only Analytics Agent directory.

```
# analytics-agent-readonly refers to the read-only analytics agent.
chmod -R 555 /tmp/analytics-agent-readonly/
```

2. Create a directory for the Analytics Agent in a writable file system.

```
mkdir /tmp/analytics-agent-writable
chmod 755 analytics-agent-writable/
cd /tmp/analytics-agent-writable
```

3. Create symlinks to the contents of the Analytics Agent in the read-only file system.

```
ln -s /tmp/analytics-agent-readonly/bin/ bin
ln -s /tmp/analytics-agent-readonly/lib/ lib
ln -s /tmp/analytics-agent-readonly/monitor.xml monitor.xml
```

4. Create a writable conf directory under that top-level directory.

```
cd /tmp/analytics-agent-writable
mkdir conf
chmod 755 conf/
```

```
cd conf
```

5. Create symlinks to the contents of the conf directory.

```
ln -s /tmp/analytics-agent-readonly/conf/analytics-agent.* .
ln -s /tmp/analytics-agent-readonly/conf/job/ job
ln -s /tmp/analytics-agent-readonly/conf/grok/ grok

cd /tmp/analytics-agent-writable
```

6. Create logs directory under the analytics-agent-writable directory.
7. Run the Analytics Agent from the writable directory.

```
cd /tmp/analytics-agent-writable
nohup bin/analytics-agent.sh start &
```

8. The resulting directories look similar to:

```
/tmp/
dr-xr-xr-x  6 ec2-user ec2-user 4096 Jul 17 20:45 analytics-agent-readonly
drwxr-xr-x  4 ec2-user ec2-user 4096 Jul 26 20:17 analytics-agent-writable

/tmp/analytics-agent-writable/
total 24

```

Enable the App Server Agent for a Remote Analytics Agent

For most configurations, install the Analytics Agent on the same machine as the app server agent. In certain setups, such as installing an Analytics Agent extension, you will need a separate machine.

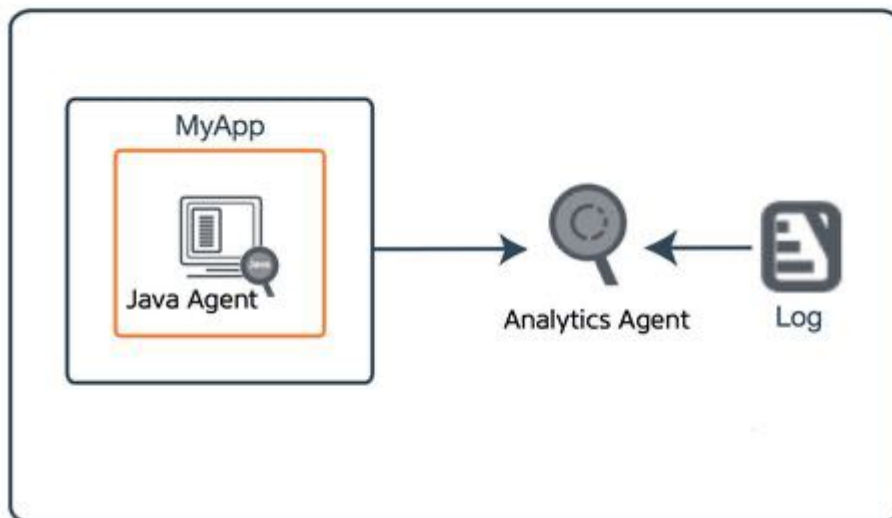

1. Specify the location of the remote Analytics Agent with a `-D` parameter. The argument is passed to the monitored application as follows:

```
-Dappdynamics.analytics.agent.url=http://<analytics-agent-ip>:9090/v2/sinks/bt
```

2. Replace `<analytics-agent-ip>` with the hostname of the Analytics Agent for your environment.

Enable the Standalone Analytics Agent

In this deployment, the Analytics Agent and app server agent runs on the same machine. The Analytics Agent reads and transmits log data from log files on the host machine. The app server agent transmits data from the monitored application to the Analytics Agent.

For environments that do not have a Machine Agent installed, install the Analytics Agent as a separate binary, `analytics-agent.sh`.

1. Unzip the Analytics Agent distribution archive to the installation directory on each target host.

When you unzip this archive, you get three directories:

- `bin`: contains the binary file for Linux, Solaris, and OSX
- `lib`: contains all the jar files that need to be in the classpath
- `conf`: contains all the configuration files, such as the properties and `vmoptions` files

2. Open the following file to configure connectivity from the Analytics Agent to the Events Service.

```
<analytics-agent-home>/conf/analytics-agent.properties
```

3. In the `analytics-agent.properties` file, do the following:

- Change the default URL and, if necessary, the port number to connect the Events Service by modifying the `http.event.endpoint` value.
For example:

```
http.event.endpoint=http://<events_service_host:events_service_port>
```

For SaaS-based installations, the host and port are:

- `https://analytics.api.appdynamics.com:443` (North America)
- `https://fra-ana-api.saas.appdynamics.com:443` (Europe)
- `https://syd-ana-api.saas.appdynamics.com:443` (APAC)

If your firewall rules use IP addresses, review firewall considerations in [Troubleshoot Analytics Agent Issues](#) (see page 3272). For on-premises installations, use any host and port that you have configured. In clustered environments, this is often a load balancer.

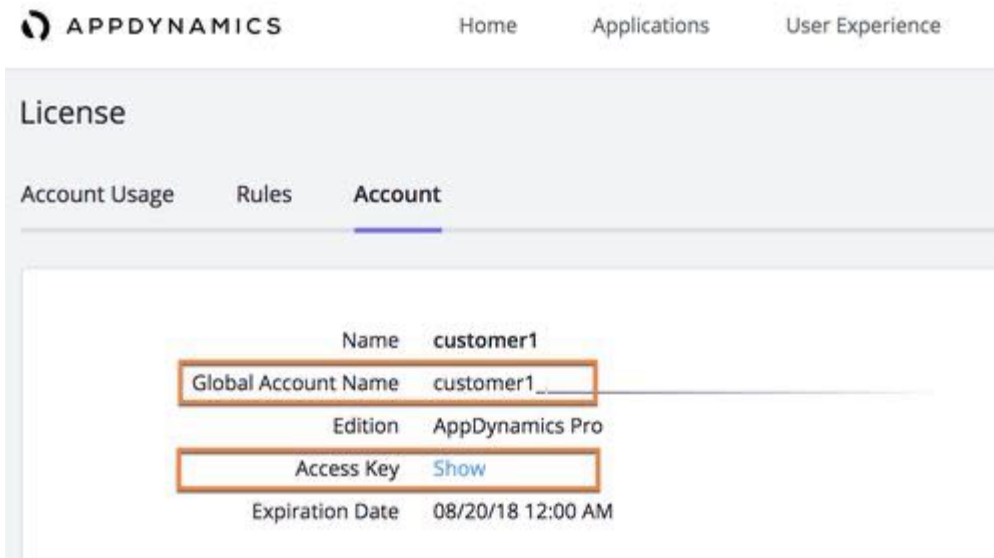

- Change the default URL and the port number to point to the Controller by modifying the `ad.controller.url` property.

For example:

```
ad.controller.url=http://<application_server_host_name>:<http-listener-port>
```

This is the URL and the port number you use to access the Controller UI.

4. The **Global Account Name** and **Access Key** values are found under **View License** in the Controller.

5. Configure the account and account key for which the agent should publish the business transaction data. Use the **Global Account Name** and **Access Key** values you have collected earlier. For example:

```
# The global_account_name in the Controller for this analytics data, similar to the
following:
http.event.accountName=<customer1_74678b04-8a71-40ef-acaf-xxxxxxxxxxxx>
# Replace this value with the access key of the account name configured above.
http.event.accessKey=<3d58aba2-xxx-xxx>
```

The `http.event.accountName` property specifies the **Global Account Name** of the account. The `http.event.accessKey` property specifies the **Access Key**, which provides an authentication mechanism between the Controller and the components of the Application Analytics deployment. The

Controller installation process generates the **Access Key** value.

For SaaS-based installations, set the `http.event.name` property to **Name** of the account. The default value is `customer1`. If the property is not configured correctly, the Analytics Agent will not be able to authenticate. The resulting errors are stored in the `analytics-agent.log` file.

6. If you are collecting log information on this host, you need to:
 - Configure your log sources. See [Collect Log Analytics Data](#)(see page 3158) for details.
 - Update additional properties. See [Configure Properties for Consolidated Log Management](#)(see page 3094).
7. Save and close the file.
8. Start the Analytics Agent by running the following command.

```
bin\analytics-agent.sh start
```

Enable the Analytics Agent as an Extension to the Machine Agent

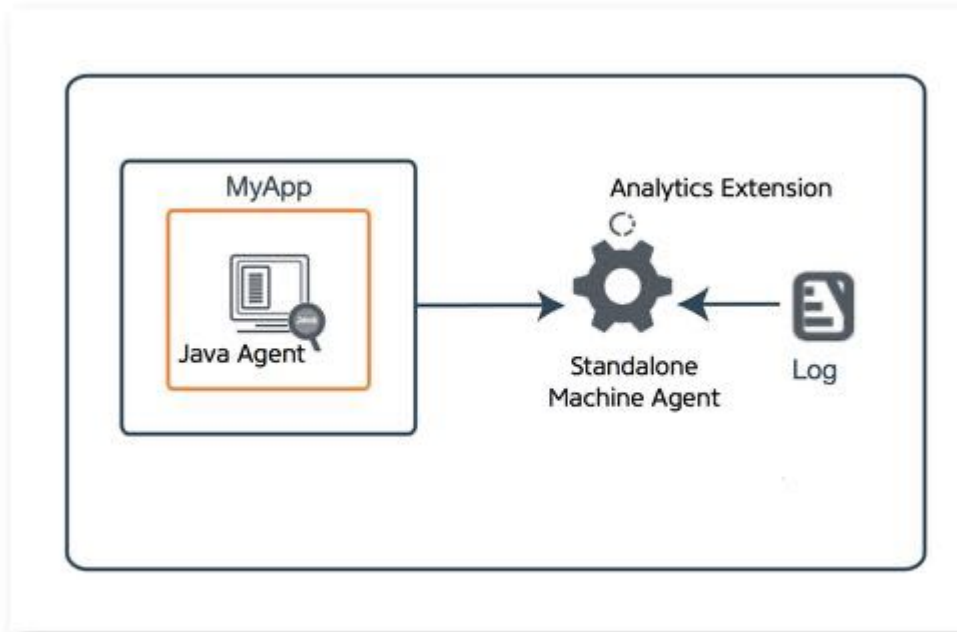

This section describes how to configure the Analytics Agent as an extension to the Machine Agent and run as a Machine Agent monitor.

The [AppDynamics Downloads Portal](#)¹⁸⁴⁶ provides the following distribution archives:

- Machine Agent Bundle - 64-bit osx (zip)
- Machine Agent Bundle - for both 32-bit and 64-bit Linux machines (rpm)
- Machine Agent Bundle - for both 32-bit and 64-bit Linux machines (zip)
- Machine Agent Bundle - for 64-bit solaris (zip)
- Machine Agent Bundle - for 64-bit solaris-sparcv9 (zip)
- Machine Agent Bundle - for 64-bit solaris-x64 (zip)
- Machine Agent Bundle - for both 32-bit and 64-bit Windows machines (zip)

If the Machine Agent and app server agent are running on the same machine, installing a standalone Analytics Agent is not necessary. In environments with the Machine Agent already running, you can enable and run the Analytics Agent as an extension.

¹⁸⁴⁶ <https://download.appdynamics.com/>

Confirm that JRE 8 or later is installed on the host running the Machine Agent. If the required version of JRE is not available on the host, then the Analytics Agent cannot be enabled.

1. On the host running the Machine Agent, open `<machine-agent-home>/monitors/analytics-agent/monitor.xml` with a text editor.
2. Set the `enabled` tag to `true` and save the file when you are finished.

```
<monitor>
  <name>AppDynamics Analytics Agent</name>
  <type>managed</type>
  <!-- Enabling this requires JRE 8 or higher -->
  <enabled>true</enabled>
  ...
```

3. Open the following file to configure connectivity from the Analytics Agent to the Events Service:

```
<machine-agent-home>/monitors/analytics-agent/conf/analytics-agent.properties
```

4. Follow the instructions to [enable the standalone Analytics Agent](#)(see page 3090).
5. If the Machine Agent is already running at this point, restart it to pick up the changes in the configuration.

i To connect to the Events Service through a proxy server, see [Connect the Agent to the Events Service through a Proxy](#)(see page 3094).

Tune Analytics Agent

This section describes the post-installation configuration of the Analytics Agent: configuring Analytics Agent to connect to an Event Service with a proxy server, collecting log files using Consolidated Log Management (CLM), setting resource usage limit, and changing JVM options.

Connect to the Events Service through a Proxy

If the Analytics Agent needs to connect to the Events Service through a proxy server:

1. Open `<analytics-agent-home>\conf\analytics-agent.properties` with a text editor.
2. Add this information:

```
# optional proxy properties
http.event.proxyHost=<your proxy host>
http.event.proxyPort=<your proxy port>
http.event.proxyUsername=<your proxy username, if authentication is required>
http.event.proxyPassword=<your proxy password, if authentication is required>
```

3. Save and close the file.

Configure Analytics Agent for Consolidated Log Management

If you want your Analytics Agent to work with CLM you need to configure a few properties in the Analytics Agent properties file.

Provide the Controller URL, customer name, and name of your Analytics Agent in the `analytics-agent.properties` file. The customer name is found under **View License** in the Controller.

If you are using CLM to configure your log files with source rules, you will need to provide these properties with the correct values.

The default values are the following:

```
# Format should be http://<host>:<port>
ad.controller.url=http://localhost:8090

# The customer name field from the AppDynamics license page.
http.event.name=customer1
```

```
# This is the friendly agent name that will show up in the controller when the agent
registers and syncs configuration.
ad.agent.name=analytics-agent1
```

Change Java Virtual Machine Options

If you need to change any JVM startup options, modify `<analytics-agent-home>/conf/analytics-agent.vmoptions` with a text editor.

The `vmoptions` file name is read from the `ad.jvm.options.name=analytics-agent.vmoptions` properties file. If you change the `vmoptions` file name, you will need to change the `ad.jvm.options.name` property as well.

If the Analytics Agent Windows service is installed and you need to change the properties file or the `vmoptions` file, you need to uninstall the service and reinstall it for the changes to take effect.

Configure Resource Usage Limit

To limit resource usage, you can enable the default limit on the number of job for a single Analytics Agent.

This limit can be overridden but is not recommended without a thorough understanding of the potential impact on resource usages, such as CPU usage, disk, and network I/O.

The property is `ad.max.enabled.jobs` and is found in the `<analytics-agent-home>/conf/analytics-agent.properties` file. By default, `ad.max.enabled.jobs` is set to `20`.

Verify Analytics Agent Status

To verify that the Analytics Agent has started, look for the following entry in the App Agent log file: `Started [Analytics] collector.`

To connect to the Events Service through a proxy server, see [Connect the Agent to the Events Service through a Proxy](#) (see page 3094).

Additional Configurations

For Analytics Agent version ≥ 21.7 , you can add authentication to pipeline resources. To do so:

1. Use the following property in `analytics-agent.properties` to add authentication to pipeline endpoints:

```
ad.pipeline.resource.authenticate=true
```

2. Once enabled, access the endpoints by passing the `Global-Account-Name` and `Access-Key` of the account as HTTP headers `X-AppDynamics-Global-Account-Name` and `X-Analytics-Agent-Access-Key` accordingly:

```
--header 'X-Analytics-Agent-Access-Key: access_key' \
--header 'X-AppDynamics-Global-Account-Name: global_account_name' \
```

Troubleshooting Tips

- Ensure that the properties in `analytics-agent.properties` are properly set. See [Enabled Job Files Limit](#) (see page 3095).

- JRE version is ≥ 1.7 and the JAVA_HOME variable is set in the environment.
- All properties in analytics-agent/conf/analytics-agent.vmoptions are compatible with the JRE.

Install Agent-Side Components in Kubernetes

This page describes the deployment options for Transaction Analytics and Log Analytics instrumented with AppDynamics app server agents in Kubernetes applications. See [Install Agent-Side Components](#)(see page 3081).

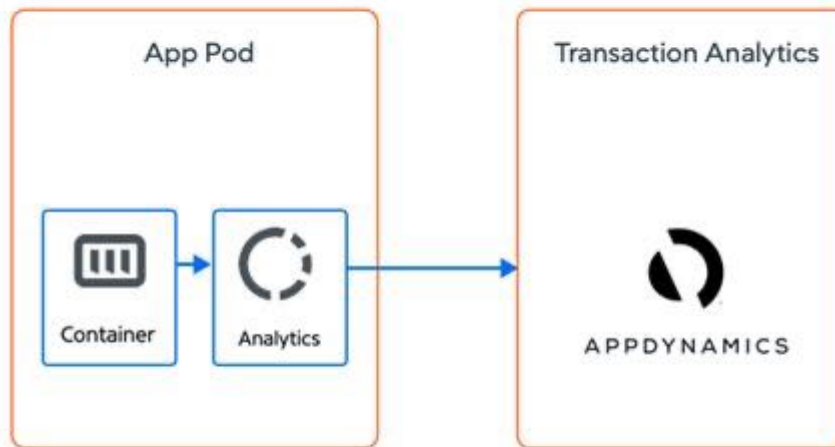

i Transaction Analytics and Log Analytics require that an Analytics Agent is deployed with an app server agent. The Java Agent $\geq 4.5.15$ or the .NET Agent ≥ 20.10 does not require deploying an Analytics Agent for Transaction Analytics. See [Deploy Analytics Without the Analytics Agent](#)(see page 3127).

Transaction Analytics

The Analytics Agent acts as a proxy between the app server agent and the Events Service. See [Deploy Analytics With the Analytics Agent](#)(see page 3076).

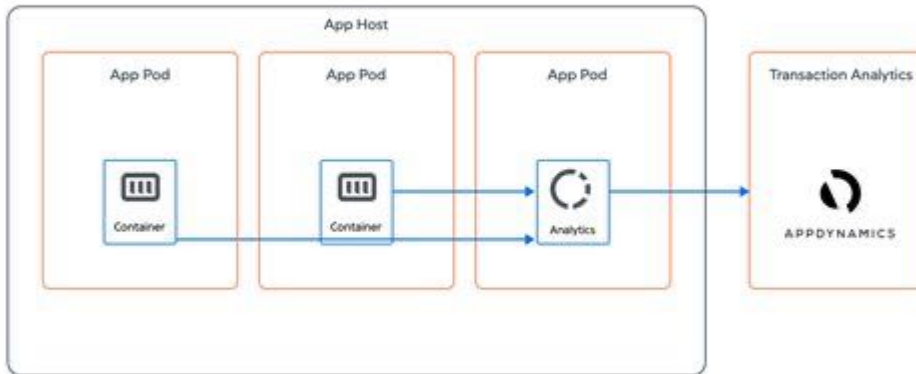

There are two deployment options for the Analytics Agent to support Transaction Analytics on a Kubernetes application.

1. A sidecar to the application container.

In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container.

2. A shared agent where a single Analytics Agent is deployed on each Kubernetes worker node. Each pod on the node will use that Analytics Agent to communicate with the Events Service.

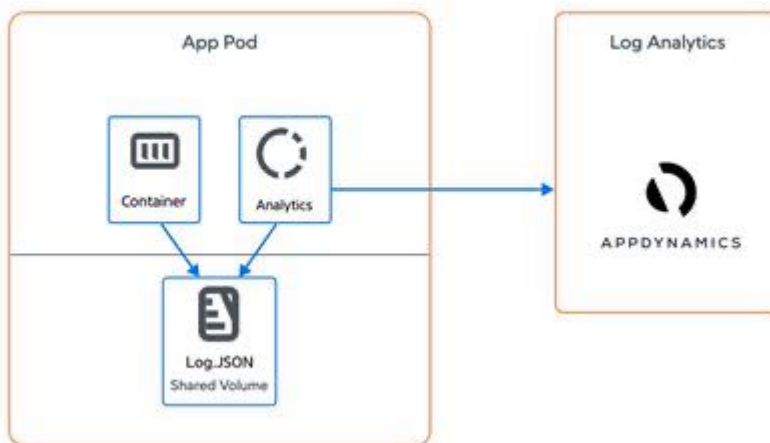

In this model, the Analytics Agent is deployed as a Daemonset.

Log Analytics

Once deployed, the Analytics Agent has access to the application's logs and can send log data to the Events Service.

There are three deployment options for the Analytics Agent to support Log Analytics on a Kubernetes application.

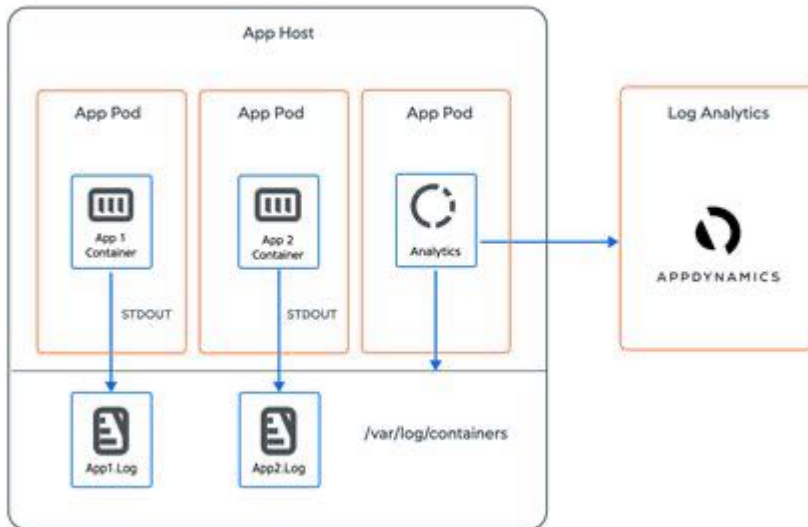

1. A sidecar to the application container.

In this model, an Analytics Agent container is added to each application pod and will start/stop with the

application container. The Analytics Agent and application container are configured to share a volume where the application logs are written.

2. If the application bypasses the container filesystem and emits log data to STDOUT and STDERR, the Analytics Agent can be deployed on each Kubernetes worker node. The Analytics Agent can access the log output for every application container on the worker node's file system, stored by Kubernetes under `/var/log/containers` as a unique file per container.

In this model, the Analytics Agent is deployed as a Daemonset.

i For some Kubernetes distributions such as OpenShift, the Analytics Agent will require elevated permissions to access the files under `/var/log/containers`.

3. If a syslog provider is available in the Kubernetes cluster, the Analytics Agent can be deployed to receive syslog messages with TCP transport. A single Analytics Agent instance is required per syslog provider. See [Collect Log Analytics Data from Syslog Messages](#)(see page 3175).

For Transaction and Log Analytics, the sidecar approach is simpler to deploy, but consumes more cluster resources because it requires one additional container per application pod. The shared agent approach adds another deployment object to manage, but can significantly reduce the overall resource consumption for a cluster.

Example Configurations to Deploy the Analytics Agent

The following deployment specs are specific examples of how to implement the deployment options explained above. In addition, see [Install the .NET Agent for Linux in Containers](#)(see page 767) and [Install the Node.js Agent in Containers](#)(see page 821) for best practices on how to set the Analytics Agent host, port, and SSL environment variables.

Transaction Analytics: Deployment Spec Using A Sidecar

The following deployment spec defines two containers, the application container `flight-services`, which uses an image instrumented with an app server agent, and the Analytics Agent container `appd-analytics-agent`, which uses the Analytics Agent from Docker Hub, `docker.io/appdynamics/analytics-agent:latest`.

The `appd-analytics-agent` container leverages a ConfigMap and Secret to configure the Events Service credentials required by the Analytics Agent, including the account access key and global account name. See [Install Agent-Side Components](#)(see page 3081).

As a sidecar, the Analytics Agent is available at `localhost` and uses the default port `9090`. The app server agent will connect automatically and no additional configuration is required.

The full spec can be found in the [Flight Services YAML File](#)¹⁸⁴⁷. The controller-info ConfigMap can be found in the [Controller Info YAML File](#)¹⁸⁴⁸. The command to create appd-secret can be found in [Secret](#)¹⁸⁴⁹.

Transaction Analytics: Deployment Specs Using A Shared Analytics Agent

The following deployment spec is for the same `flight-services` application, but instead of using a sidecar, it references a shared Analytics Agent deployed separately as a Daemonset. The `flight-services` container sets the agent environment variables `APPDYNAMICS_ANALYTICS_HOST` and `APPDYNAMICS_ANALYTICS_PORT` to the `analytics-proxy` service for the shared Analytics Agent defined in the example below.

```

apiVersion: apps/v1
kind: Deployment
metadata:
  name: flight-services
spec:

```

¹⁸⁴⁷ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.3-Analytics/app/deploy/flight-services.yaml>

¹⁸⁴⁸ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.3-Analytics/app/dependencies/controller-info.yaml>

¹⁸⁴⁹ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.3-Analytics/app/dependencies/secret>

```

            cpu: 100m
            memory: 600M
        volumeMounts:
          - name: ma-log-volume
            mountPath: /opt/appdynamics/conf/logging/log4j.xml
            subPath: log4j.xml
          - mountPath: /hostroot
            name: hostroot
            readOnly: true
        restartPolicy: Always
    volumes:
      - name: ma-log-volume
        configMap:
          name: ma-log-config
  
```

```

    - name: hostroot
      hostPath:
        path: /
        type: Directory
  ---
  apiVersion: v1
  kind: Service
  metadata:
    name: appd-infra-agent-service
  spec:
    selector:
      name: appd-infra-agent
    ports:
      - name: "9090"
        port: 9090
        targetPort: 9090
  status:
    loadBalancer: {}

```

The full deployment spec can be found in the [Machine Agent YAML File](#)¹⁸⁵¹. The appdynamics-infraviz service account is defined in the [RBAC YAML File](#)¹⁸⁵². The ma-log-config ConfigMap is defined in the [Machine Agent Log Config File](#)¹⁸⁵³.

A best practice is to deploy the shared Analytics Agent in a dedicated namespace (typically appdynamics) separate from the namespaces used by applications.

```
$ kubectl -n appdynamics apply -f analytics-agent.yaml
```

To provide access to the shared Analytics Agent from an application namespace:

1. An ExternalName service is required to map a service name (analytics-proxy in the example) to the DNS name of appd-infra-agent-service created previously:

```

kind: Service
apiVersion: v1
metadata:
  name: analytics-proxy
spec:
  type: ExternalName
  externalName: appd-infra-agent-service.appdynamics.svc.cluster.local
  ports:
    - port: 9090
      targetPort: 9090

```

2. Create this service in each application namespace where an App Server Agent is deployed:

1851 <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.5-MachineAgent/machine-agent.yaml>

1852 <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.5-MachineAgent/rbac.yaml>

1853 <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.5-MachineAgent/ma-log-config.yaml>

```
$ kubectl -n <app namespace> apply -f analytics-proxy.yaml
```

- Note that `analytics-proxy` is the value of `APPDYNAMICS_ANALYTICS_HOST` used in the `flight-services` deployment spec.

```
- name: APPDYNAMICS_ANALYTICS_HOST
  value: analytics-proxy
```

Log Analytics: Deployment Spec Using A Side Car

The following deployment spec snippet is for a Java application that defines an application container, `client-api`, and an Analytics Agent container, `appd-analytics-agent`, that acts as a sidecar to the application container. An init container, `appd-agent-attach`, is also defined, but the related definitions are removed to simplify the example.

A shared volume, `appd-volume`, is mounted to the application container and Analytics Agent container using the mount path `/opt/appdlogs`. The Java application is configured to write its logs to this path and the Analytics Agent is configured to read the logs from this path and send them to the Events Service.

```

```

The full spec can be found in the [Java App YAML File](https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.3-Analytics/java-app.yaml)¹⁸⁵⁴.

¹⁸⁵⁴ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.3-Analytics/java-app.yaml>

Log Analytics: Deployment Spec For Shared Analytics Agent (STDOUT/STDERR Support)

The following deployment spec supports the use case where application containers are emitting logs to STDOUT and STDERR, not the application container filesystem.

Since Kubernetes writes the container logs to the host under `/var/log/containers`, the Analytics Agent can read them there. The Analytics Agent is deployed as a Daemonset. A volume `varlog` is defined with access to the host path `/var/log/containers` and mounted to the Analytics Agent container, `appd-analytics-agent`. The Analytics Agent is configured to read the container-specific logs written to `/var/log/containers`. See [Configure Log Analytics Using Source Rules](#) (see page 3159).

```

```

The full spec can be found in the [Log Analytics YAML File](#)¹⁸⁵⁵. An OpenShift example can be found in the [Log Analytics OpenShift YAML File](#)¹⁸⁵⁶.

Upgrade Analytics Agent

This page describes how to update the Analytics Agent standalone binary and includes some steps that are relevant only if you are collecting Log Analytics data.

If you are running the Analytics Agent through the Machine Agent, see [Upgrade the Machine Agent](#)(see page 2651) for instructions.

i You should maintain a copy of the controller.xml file in addition to the analytics-agent.properties, job folder, and watermark folder. Preserving the watermark file and the job files is only necessary when you are collecting log data for analytics. The watermark file preserves information about the number of bytes read from the log sources by the Analytics Agent and is relevant only when Log Analytics is enabled.

File Locations

After unzipping the Analytics Agent standalone binary, the file locations are:

- property file: <analytics-agent-home>/conf/analytics-agent.properties

¹⁸⁵⁵ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.3-Analytics/logging/log-analytics.yaml>

¹⁸⁵⁶ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.3-Analytics/logging/log-analytics-openshift.yaml>

- job files: `<analytics-agent-home>/conf/job`
- watermark file: `<analytics-agent-home>/conf/watermark`

Running Analytics Agent via the Machine Agent, the file locations are:

- properties file: `<machine-agent-home>/monitors/analytics-agent/conf/analytics-agent.properties`
- job file: `<machine-agent-home>/monitors/analytics-agent/conf/job`
- watermark file: `<machine-agent-home>/monitors/analytics-agent/conf/watermark`

Upgrade Procedure for Analytics Agent (Standalone Binary)

Use these steps to upgrade your Analytics Agent (standalone binary) to 20.x.

1. Stop the Analytics Agent.
2. Download the 20.x Analytics Agent binary from the download site.
3. Extract the new zip. Be sure to extract into a new empty directory or confirm that the old directories are empty before extracting the new version. Otherwise, you may encounter errors starting the Analytics Agent.
4. (Windows only) If the Analytics Agent is installed as a Windows Service, you need to manually uninstall the old service before installing the 20.x version.
5. Save a copy of your old `analytics-agent.properties` so you can copy values to the new `analytics-agent.properties` file.
6. Modify the new `analytics-agent.properties` file with in accordance with the steps here: [Install Agent-Side Components](#)¹⁸⁵⁷, referring to your previous properties as needed.
7. If you have been collecting log analytics data:
 - a. Copy the old watermark file to the corresponding location in the new `<analytics-agent-home>` directory structure.
 - b. Copy your pre-existing job files to the corresponding location in the new `<analytics-agent-home>` directory structure.
8. Start the new Analytics Agent.

You can observe that the agent starts the enabled job file, and starts tailing the logs from the last read position in the watermark file. Usually, a log message is displayed stating the start of the tailing from last read location. It matches with the watermark file. If at time printing log message gets out of sync, it can be manually validated through the UI that all logs have been tailed, and no duplicate logs have been tailed.

To move from job files to the new Consolidated Log Management source rules, see [Migrate Log Analytics Job Files to Source Rules](#)¹⁸⁵⁸.

Analytics and Data Security

Related pages:

- [Manage Field Visibility](#)(see page 3112)
- [Manage API Keys](#)(see page 3110)
- [Create and Manage Custom Roles](#)(see page 156)

Application Analytics provides role-based access control (RBAC) to enable you to control and protect your data. The Analytics permissions enable you to provide granular, controlled access to features and analytics data in your environment. This topic outlines the available permissions.

1857 <https://docs.appdynamics.com/display/PRO211/Install+Agent-Side+Components>

1858 <https://docs.appdynamics.com/display/PRO211/Migrate+Log+Analytics+Job+Files+to+Source+Rules>

Roles and Permissions

A predefined role called Analytics Administrator is provided with preset permissions for all Analytics-specific permissions.

You can clone predefined roles as a starting point for creating your own customized roles, but you should not assume the cloned roles have all of the permissions of the predefined role. In some cases, there may be hidden permissions, so you should add or remove permissions as needed for your customized role to ensure that you get the RBAC result you need.

To create roles and assign users to roles for Analytics, users need both the **Analytics Administrator** and the **Account Owner** role.

See [Transaction Analytics Permissions](#)(see page 166).

Default Application

To ensure that your users have access to the full Analytics functionality they need, be sure to give them the view permission on the Default Application. This permission is given to all predefined admin roles and to the read-only role, **Applications & Dashboards Viewer**. If you create new roles for analytics, you need to grant this permission in addition to specific analytics permissions.

When you create a new role, this permission is not automatically given to that role. You can add the read-only role to new users. Alternatively, navigate to **Administration > Applications** and select the **View** permission in the Default Application.

Analytics Administration UI Tabs

Access the Analytics tab in the Controller Administration UI when creating new roles to see the available permissions.

General Permissions

This section describes permissions that control access to analytics features:

- [Manage Fields](#)(see page 3112)
- [Manage APIs](#)(see page 3110)
- [Manage Metrics](#)(see page 3239)
- [Configure Log Analytics with Source Rules](#)(see page 3159)
- [Manage Business Journeys](#) (see page 3113)
- [Manage Experience Levels](#)(see page 3113)

Search Permissions

All the saved searches created in Analytics appear in this section. The admin role can assign View, Edit, and Delete permissions on a search by search level. The admin can create and save specific searches needed by various roles in your organization. In addition to enabling the permissions, View, Edit, and Delete, for a specific saved search, the admin must also enable access to the related application or log source type for the search. Otherwise, the data access level won't be granted to the role.

To create a new saved search, the user must have the **Can Create a Search** permission.

View permission: Assigning only the View permission for a saved search means users can not edit or delete the search.

Edit permission: Assigning Edit permission for a saved search means users can modify the filter criteria and save back to the same search.

Delete permission: Assigning Delete permission for a saved search means users can delete the search.

Event Type Permissions

Transactions Permissions: Enables the admin user to assign permissions for viewing application transaction data. Permissions can be granted to view all transaction data for the account or on an application-by-application basis. When creating new roles, remember that granting permissions to view transaction analytics data does not automatically grant permissions to see all application data associated with a specific transaction analytics record.

You need to grant at least read-only permissions to the application to enable the user to see associated transaction snapshot data such as flow maps.

Log Permissions: Enables the admin user to assign permissions for viewing log data. Permissions can be granted to view log data for all source types configured for the account or on a source by source basis.

Browser Requests Permissions: Enables the admin user to assign permissions for viewing browser request data. Permissions can be granted to view data for all applications for the account or for specific applications.

Mobile Requests Permissions: Enables the admin user to assign permissions for viewing mobile requests and crash report data. Permissions can be granted to view data for all applications for the account or for specific applications.

Custom Analytics Events: Enables the admin user to assign permissions for querying custom analytics events data. Permissions can be granted to view data for all custom analytics events or for specific applications.

Synthetic Permissions: Enables the admin user to assign permissions for querying Synthetic events data. Permissions can be granted to view data for all applications for the account or for specific applications.

Manage API Keys

Related pages:

- [Create and Manage Custom Roles](#)(see page 156)

This page describes how to manage REST API Keys.

The Analytics Events REST API provides three independent endpoints for these responsibilities:

- Schema Management
- Publish Events
- Query Events

API Keys provide a secure authentication mechanism for a caller to prove identity when using these public REST APIs.

Because call sites can vary across your infrastructure, departments, and geographic regions, these credentials could be widely distributed and hard to control. Publishing or querying events from different call sites, therefore, require fine-grained control over the keys and the operations allowed for a particular key. You may also need to revoke these keys on demand if they are found to be compromised.

For these reasons, managing access for the Analytics Events API uses API keys. Your organization can create multiple API keys, manage and distribute them based on your own internal policies. For instance, each department or geographic region may be assigned its own API key for distribution and control management. If an API key is compromised, it can be deleted and a new key created without other undesirable side effects.

API keys are only valid for calling the public Analytics Events REST API and can't be used to access the AppDynamics Controller or data in any other way. See [Analytics Events API](#) (see page 3743).

Permissions

API keys are used only for Analytics Events REST APIs. When you create an API key, you can specify read and write permissions for each API key.

Users with the **Manage API** permission can do the following actions:

- Add—Creates an API key
- Disable—Deactivates the calls using that key temporarily, but does not remove the key
- Enable—Re-enables a deactivated key
- Delete—Removes the key permanently

 It may take up to 15 minutes for a key that has been deleted or deactivated to be detected and all operations using that key to be rejected.

When you create an API key, you see permissions for the various event types (logs, transactions, browser, and mobile) in our platform. By using these permissions you can limit or grant access to specific event types for each specific API key.

Examples:

Select **Publish all Custom Events** when you create their API key to generate an API key for your partners allowing them to only publish custom events.

Under **Log Permissions**, select **apache** as the **source type** to generate an API key to allow various users to only query Apache log data.

 Once an API Key is created, you cannot change the permissions.

You can grant permissions for API Keys as follows:

Custom Analytics Events

- Manage Schema— Enables creation of schemas using the Analytics Events Schema Management APIs.
- Query Custom Events—Enables you to query all Analytics event types (with the appropriate permissions).
- Publish Custom Events—Enables you to publish Analytics custom events using the Analytics Events Publish APIs.

Transactions—Query all transactions or specific applications.

Logs—Query all logs or specific source types.

Browser Requests—Query all browser requests or specific applications.

Mobile Requests—Query all mobile requests or specific applications.

Synthetic Requests Permissions—Query all synthetic requests data or specific applications.

Connected Devices Permissions—Query all connected device requests data or specific applications.

i If you have deployed EUM such that you are using an on-premises Events Service for transaction and log analytics data, and the SaaS Events Service for your EUM data, you can not query the browser or mobile request data using the Analytics API.

Create API Keys

1. Navigate to **Analytics > Configuration > API Keys**. You can view existing keys and access actions to manage the keys.
2. Click **+Add** to view the configuration panel.
3. Add a **Name** and **Description**.

⚠ Do not click **Create** until you finish selecting all the necessary permissions for your use case, including any necessary analytics data permissions. You cannot change the permissions once create the key. You can only edit the description and whether the key is active or inactive.

4. Expand each permission section to select the permissions for this key.
5. Click **Create**.
6. Copy and save the key.
7. Select the checkbox indicating you have copied the key and click **Done**.

⚠ You cannot retrieve the key once you dismiss this dialog.

Manage Field Visibility

Related pages:

- [Create and Manage Custom Roles](#)(see page 156)
- [Analytics and Data Security](#)(see page 3108)

This page describes how to manage the visibility of fields in your analytics data. This capability enables you to prevent fields from being viewed by others in your organization.

You can set the visibility of the fields in most of the analytics event types with the exception of custom events. Hiding fields in custom events is not supported.

Permissions

The Manage Fields permission is required to manage field visibility. If a role has the Manage Fields permission, it means all the users with that role can manage all the fields they have access to. They can unhide the fields or see which fields have been hidden. For instance, if you have Manage Fields permission and View permission for the business transactions in the Ecommerce App, then you can only see and manage fields for that application.

Manage Fields

1. From the Analytics Search panel, click  next to each component grouping to open the Manage Fields panel.
2. Use the Manage Fields panel to show or hide fields. The list of fields varies based on the event type selected for the search.

Delete Extracted Fields

For ≥ 4.3 , you may have two types of extracted fields, fields created in 4.2 where the Controller version has been upgraded to a higher version and fields extracted from logs with log source rules.

For fields created in 4.2, you can delete the fields:

1. Hover over the field and click on the view icon that appears.
2. Click on **Delete** in the popup.

For fields being extracted from logs using log source rules, you can delete the fields by editing the source rules. See [Field Extraction for Source Rules](#)(see page 3170).

Manage Business Journeys and Experience Levels

This page describes how to manage the visibility of business journeys and experience level management (XLM) with role-based access control (RBAC). Business journey and XLMRBAC is required to restrict access to sensitive information among your organization. If a user attempts to access restricted features, a message appears warning the user that access is denied.

Only the analytics admin can grant permissions to business journeys and XLM, as well as with their respective searches, event types, and sources. The admin authorizes access on an individual basis by assigning each user to the applicable role.

Creating Business Journey and XLM Roles

In the Controller UI, navigate to **Settings > Administration > Roles**.

The analytics admin can view and edit existing roles in the Analytics tab, which contains three sections: General, Searches, and Events. Select **+Create** to make a new role.

General Permissions

In the General tab, the analytics admin authorizes access to business journeys and/or XLM. This is required for the user to perform any actions on either business journeys or XLM. Check **Manage Business Journeys** and/or **Manage Experience Levels**:

General Account Applications Databases **Analytics**

General Searches Events

Select All Unselect All

Manage Centralized Log Config

Manage Fields

Manage APIs

Manage Metrics

Manage Business Journeys

Manage Experience Levels

With general permission, the user has feature level access to business journeys and/or XLM. However, the user cannot view the definition of existing events or saved searches, or create new events, with only general permission. See the below sections to enable these permissions.

i A user can access business journey data through searches without general permission to business journeys, as long as the user's role permits access to the underlying event type(s) used in business journey definition. In this way, you can restrict access to define business journeys while also allowing a user to query the data. Ensure the user has all necessary access to event type(s) in the Events tab and leave **Manage Business Journeys** unchecked.

Search Permissions

There are two search types in Analytics, drag and drop and query language. The analytics admin grants access to both types in the Searches tab.

Choose **Can Create a Search** to access both search types. Choose **+Add** to access specific saved searches.

Create search permission is required in order for a user to perform these operations:

- Save a search
- Create a metric
- Create a visual widget

Search access is dependent on event type access. A user has access to create and save searches only for the event type(s) and source(s) assigned in the user's role.

Event Type and Source Permissions

The section describes how to assign event type and source access. Granting permission to business journeys and/or XLM does not provide a user blanket access to all reports. Users have access only to the exact event type(s) and source(s) granted by the analytics admin. For example, transactions are an event type, and their source is applications. Therefore, if a user requires access to particular applications, the analytics admin must select transactions as well as each necessary application for the user.

This table lists the available event types and their corresponding sources:

Event Type	Source
Transaction	Application
Log	Source Type
Browser Records	App Key
Mobile Records and Sessions	App Key
Synthetic Session	App Key
Connected Devices	App Key
Custom Analytics Events	Particular user-defined event type

You can specify exact access in the Events tab. Select the event type, then specify access for the relevant source. Check "**Can View Data from all [source]**" to grant blanket access to each source. To select individual sources, click **+Add**.

Create Role ? Save

General Account Applications Databases **Analytics** Dashboards User and Groups with this Role

General Searches **Events**

Type

Can view data from all Applications Grant access to all sources for the event type

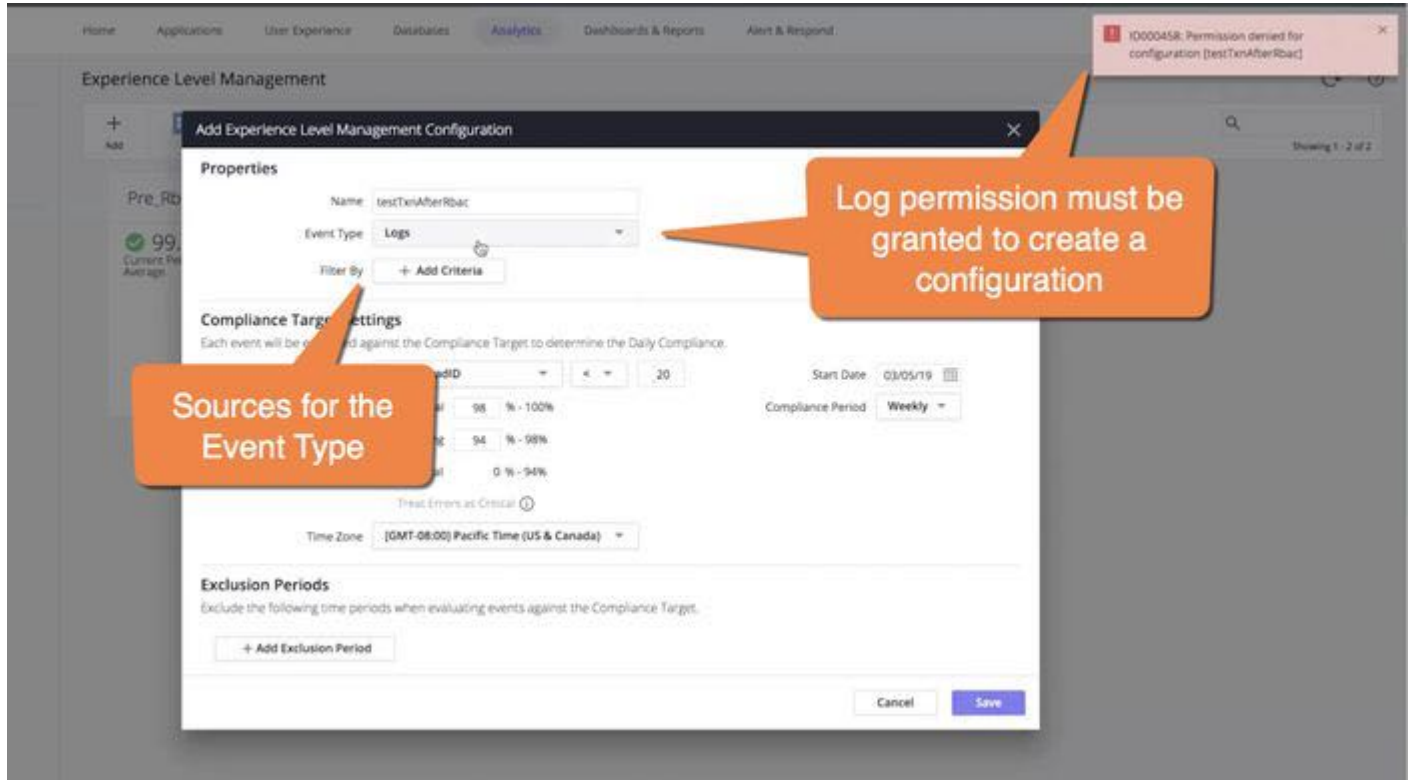

Can view data from the following Applications:

+ Add Remove

Application Grant access individual sources

Showing 0 of 0 Applications

With the appropriate event type and source permissions, the user can access existing reports as well as create new reports. For example, a user with permissions to Transactions and all applications can now create a new configuration for any application. However, if this user attempts to create a configuration for Log events, the configuration does not save and an error message appears in the UI:

For XLM configurations, the **Filter By** field indicates the source(s) of the given **Event Type**. Users with limited permission to sources need to add their permitted source(s) as filter criteria. If you do not specify filter criteria, you must have permission to all sources for the event type to create the configuration.

Dashboard Access

Grant permission to dashboards in the Dashboard tab. In this tab, the admin specifies if a user can create dashboards and time permissions, as well as custom permissions.

If an Analytics dashboard contains data from business journeys and/or XLM, access to the dashboard depends on the above permissions. For example, a role that allows its users to create a dashboard, but contains no permission to business journeys, does not permit the user to access a business journey-related dashboard. Ensure that roles have the necessary permission to access Analytics data and general dashboard access.

View Analytics Agent Health

This page describes how to access the health list of Analytics Agents.

You can view Analytics Agents connected to your Controller in **Settings > AppDynamics Agent > Analytics Agents**. You can also view agent status and health information for the Log Analytics and Transaction Analytics pipelines.

When a new Analytics Agent starts and connects to the Controller, it registers with the Controller. Once the agent is registered, the agent requests configuration information every five minutes. As part of this request, the Analytics Agent reports health status information to the Controller. A healthy pipeline means analytics data is flowing from the Analytics Agent to the Events Service successfully.

Condition	Transaction Pipeline Health	Log Pipeline Health
Analytics Agent does not contact the Controller for more than five minutes.	Not connected 	Not connected 
No business transaction analytics data is flowing and there are no errors in the connection.	Connection is healthy, no data flowing 	Not Applicable
Business transaction analytics data is flowing and the Agent is publishing to the Events Service successfully with no errors.	Healthy 	Not Applicable
Business transaction analytics data is flowing, but the Agent is experiencing errors while publishing transactions to the Events Service.	Unhealthy 	Not Applicable
No log analytics data is flowing and there are no errors in the connection.	Not Applicable	Connection is healthy, no data flowing 
Log analytics data is flowing and the Agent is publishing to the Events Service successfully with no errors.	Not Applicable	Healthy 
Log analytics data is flowing, but the Agent is experiencing errors while publishing transactions to the Events Service.	Not Applicable	Unhealthy 

Permissions

To view the Analytics Agents list, you must belong to a role with the Account level **Administer users, groups, role authentication, etc. View License. View AppDynamics Agents. Use Agent Download Wizard** permission. The default Account Owner and Analytics Administrator roles have this permission.

Access Analytics Agent Health List

To access Analytics Agents health view, navigate to **Settings > AppDynamics Agents > Analytics Agents**.

1. View information for connected Analytics Agents.

Name	Unique Host ID	Version	Last Connected	Log Pipeline Health	Transaction Pipeline Health
analytics-agent1	a5453663	4.4.0	08/28/17 11:18:09 AM	✓	✓

3. View Analytics Agents by event type (log data and business transaction data).

4. Perform a search on the list of registered Analytics Agents.

Analytics Licenses

Related Pages:

- [Observe License Usage](#)(see page 203)
- [License Entitlements and Restrictions](#)(see page 190)

This page describes how to interpret the details of your Analytics license. The information is split between [Infrastructure-based Licensing and Agent-based Licensing](#)¹⁸⁵⁹. To see a complete list of licenses and packages, see [License Entitlements and Restrictions](#)(see page 190).

1859 <https://docs.appdynamics.com/display/PRO21/AppDynamics+Licensing>

Licensing for Analytics

Analytics licenses differ depending on what licenses you purchase. Under the Infrastructure-based Licensing model, Analytics licenses are part of monitoring packages, except for Log Analytics, which is a separate license. Under the Agent-based model, each Analytics agent is licensed separately. Learn more about [Licensing](#)¹⁸⁶⁰.

[Infrastructure-based Licensing](#) [Agent-based Licensing](#)

Types of Licenses

There are three types of licenses associated with Analytics:

1. Browser and Mobile Analytics (part of Real User Monitoring Peak)
2. Transaction Analytics (part of the Enterprise package)
3. Log Analytics (part of Log Analytics Pro)

See [License Entitlements and Restrictions](#)¹⁸⁶¹ for more information on each license.

With a Browser Synthetic Pro license, you do not need an Analytics license to view Synthetic session data.

How Licenses Are Consumed

- The Java Agent collects Transaction Analytics data. The Transaction Analytics license (as part of the Enterprise license package) is consumed through the Java Agent (as part of the Analytics Agent). If the APM Agent does not have an Enterprise license allocated, the agent will not be able to report Transaction Analytics data.
- The Analytics Agent does not consume any licenses. The Controller account information configured in the Analytics Agent is used for the periodic health check and log configuration sync; whether or not the account has IBL licenses provisioned does not matter.

Accounts and Licenses

- The Global Account Name (GAN) configured in the Analytics Agent is used for request authentication and rate-limiting in the Events Service, and is not related to license allocation.
- The account configured in the Java Agent must have enough licenses, and the agent should acquire the license in the configuration sync.

Overages

Analytics does not support overages. AppDynamics stops capturing analytics data once your limit has been reached.

[Infrastructure-based Licensing](#) [Agent-based Licensing](#)

Types of Licenses

There are four types of licenses associated with Analytics:

¹⁸⁶⁰ <https://docs.appdynamics.com/display/PRO21/AppDynamics+Licensing>

¹⁸⁶¹ <https://docs.appdynamics.com/display/PRO21/License+Entitlements+and+Restrictions>

1. Transaction Analytics
2. Log Analytics
3. Browser Analytics
4. Mobile Analytics

See [License Entitlements and Restrictions](#)¹⁸⁶² for more information on each license.

With a Browser Synthetic Pro license, you do not need an Analytics license to view Synthetic session data.

Overages

Analytics does not support overages. AppDynamics stops capturing analytics data once your limit has been reached.

Remote Analytics Agent Sizing

Related pages:

- [Deployment Options and Scenarios](#)(see page 3127)
- [Install Agent-Side Components](#)(see page 3081)
- [Event Service Sizing and Capacity](#)¹⁸⁶³

This page describes how to estimate the hardware requirements for a remote Analytics Agent deployment where a single Analytics Agent is aggregating transaction events from multiple APM Application Agents. This page describes transaction analytics only.

You should consider these two questions when sending analytics data to a remote Analytics Agent:

- How many APM agents can report to one remote Analytics Agent?
- What are the machine requirements for hosting the remote Analytics Agent?

Do not extract the numbers on this page to size for Log Analytics because you must install the Analytics Agent on the local machine to capture Log Analytics.

Analytics Agent Sizing Based on Event Volume

Based on our testing, the volume of events being sent to the Analytics Agent is the limiting factor in determining how many APM agents can report to one remote Analytics Agent.

The tests were conducted on virtual hardware and programmatically generated workload. Real-world workloads may vary. To best estimate your hardware sizing requirements, carefully consider the traffic patterns in your application and test in a test environment that closely resembles your production application and user activity.

¹⁸⁶² <https://docs.appdynamics.com/display/PRO21/License+Entitlements+and+Restrictions>

¹⁸⁶³ <https://docs.appdynamics.com/display/PRMY21/.Events+Service+Requirements+v21.5>

Calculate Analytics Event Volume

One business transaction can traverse many tiers. In each tier, one business transaction traverses one node. One node produces one request per business transaction when the transaction is synchronous. For async transactions, multiple events may be generated by a node for a single request. One request equals one analytics event. To calculate how many events a business transaction generates, you need to count the number of tiers/nodes that are sending data into the Analytics Agent.

You can estimate the number of events using the following formula:

One business transaction generates events at a rate = **calls per minute** times the **number of tiers** reporting analytics data for the business transaction.

In simple terms: #events for one business transaction = calls per minute times # of tiers.

Characteristics of the Amazon EC2 Instance Types

For complete information on Amazon EC2 instance types, see <https://aws.amazon.com/ec2/instance-types/>.

The testing was performed using c3.large, c3.xlarge, and c4.4xlarge.

Model	vCPU	Mem (GiB)	SSD Storage (GB)
c3.large	2	3.75	2 x 16
c3.xlarge	4	7.5	2 x 40
c4.4xlarge	16	30	EBS-Only

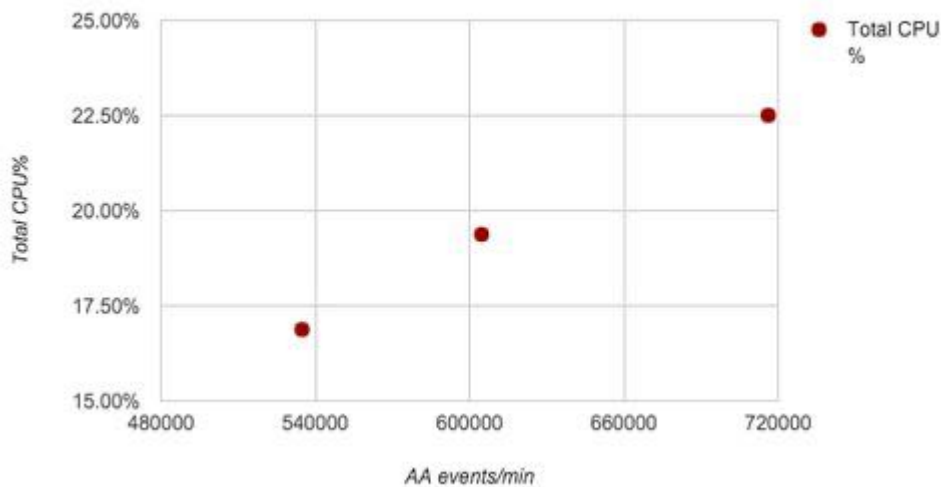

Test Results

c3.xlarge CPU% vs. AA events/min

Total CPU% vs. AA events/min

Raw Data

Analytics Agent Host Machine	Analytics Agent events/min	Total CPU%	JVM Heap (Mb)
c3.large	52313	17%	468
c3.large	54831	17%	470
c3.large	70746	24%	475

Analytics Agent Host Machine	Analytics Agent events/min	Total CPU%	JVM Heap (Mb)

c4.4xlarge	716141	23%	1024

Enable SSL for the Analytics Agent

Related pages:

- [Controller SSL and Certificates](#)¹⁸⁶⁴

This page describes how to configure the AppDynamics Analytics Agent to connect to your app server agents using SSL.

1. Run the `keytool` command to create a new key pair for the Analytics Agent in the keystore. Refer to the [Oracle documentation](#)¹⁸⁶⁵ for more details on using `keytool`. The following command creates a keystore if it doesn't exist and generates the public/private key pair:

```
keytool -genkeypair -alias analytics-agent -keystore aa-keystore.jks -validity 1825
```

Follow the on-screen instructions to configure the certificate. This generates a self-signed certificate in the keystore. The next step generates a signing request for the certificate. Note the following:

- a. For the first and last name, enter the domain name where the Analytics Agent is running. The domain name used in the `appdynamics.analytics.agent.url` property must match the Common Name (CN) of the certificate used by the Analytics Agent. For example, if the URL was `https://localhost:9090/v2/sinks/bt` then the CN of the certificate should be `localhost`. If the names don't match then the client marks the certificate as invalid and the HTTPS connection is not established".
 - b. Enter a secure password for the key. This command creates a key pair with a validity of 1825 days (5 years). Replace 1825 with the validity period appropriate for your environment.
2. Generate a certificate signing request for the certificate you created as follows:

```
keytool -certreq -alias analytics-agent -keystore aa-keystore.jks -file AppDynamics.csr
```

3. Submit the certificate signing request file generated by the command (`AppDynamics.csr` in the example command) to your Certificate Authority (CA) of choice.
4. When it's ready, the CA returns the signed certificate and any root and intermediary certificates required for the trust chain. The response from the CA should include any special instructions for importing the certificate if needed. If the CA supplies the certificate in text format, copy and paste the text into a text file.
5. Import the signed certificate:

```
keytool -import -trustcacerts -alias analytics-agent -file mycert.cer -keystore aa-keystore.jks
```

This command assumes the certificate is located in a file named `mycert.cer`.

6. If you see the error "Failed to establish chain from reply", install the issuing CA's root and any intermediate certificates into the keystore. The root CA chain establishes the validity of the CA signature on your certificate. Although most common root CA chains are included in the bundled JVM's trust store, you may need to import additional root certificates, such as certificates belonging to a private CA. To do so:

¹⁸⁶⁴ <https://docs.appdynamics.com/display/PRMY21/Controller+SSL+and+Certificates+v21.5>

¹⁸⁶⁵ <http://docs.oracle.com/javase/7/docs/technotes/tools/windows/keytool.html>

```
keytool -import -alias [Any_alias] -file <path_to_root_or_intermediate_cert> -keystore <controller_home>/appserver/glassfish/domains/domain1/config/aa-keystore.jks
```

7. When done importing the certificate chain, try importing the signed certificate again.
8. Update the following properties in the analytics-agent.properties file:
 - a. `ad.dw.https.enabled=true` to enable the HTTPS connector on the Analytics Agent. The HTTPS connection is exposed on the port defined by the `ad.dw.http.port` property.
 - b. `ad.dw.https.keyStorePath=` absolute path to the Java keystore that contains the Analytics Agent public and private key.
 - c. `ad.dw.https.keyStorePassword=` Java keystore password.
 - d. `ad.dw.https.trustStorePath=` absolute path to the truststore that establishes the chain of trust for the Analytics Agent public key certificate.
 - e. `ad.dw.https.trustStorePassword=` the truststore password.
 - f. `ad.dw.https.certAlias=` alias of the public key certificate stored in the Java Key Store.
9. Start the Analytics Agent.
The HTTPS connection should now be exposed.
10. Confirm that the app server agent is configured to trust the Analytics Agent certificate.
For details on enabling SSL communication, see:

Agent	Location
Java Agent	"Enable SSL between the Java Agent and the Analytics Agent" at Enable SSL for the Java Agent (see page 586)
Python Agent	Enable SSL Between Python Agent and Analytics Agent ¹⁸⁶⁶

Analytics Agent Logging

Related pages:

- [Troubleshoot Analytics Issues](#)(see page 3272)

By default, the AppDynamics Analytics Agent writes log files to the `<analytics_agent_home>/logs` directory. See [Agent Log Files](#)(see page 1128) for how the logs are organized into sets that roll over.

Log File Sizes

Each log can grow to 64 MB in size before being compressed and renamed. A maximum of ten compressed files can be generated.

The default pattern for agent log naming is `<filename>-<date_compressed>.log.gz` as shown in this table:

Log File Name	Definition
<code>analytics-agent.log</code>	Current log

¹⁸⁶⁶ <https://docs.appdynamics.com/display/STAGE/Draft+-+Enable+SSL+for+the+Analytics+Agent#Draft-EnableSSLfortheAnalyticsAgent-Enable-SSL-PythonAgent-AnalyticsAgent>

Log File Name	Definition
analytics-agent-2018-12-11.log.gz	Previous log
analytics-agent-2018-12-10.log.gz.log	Second previous log

Logging Level for the Analytics Agent

The default logging level for most log files is INFO. Higher logging levels consume more disk space.

You can control the logging level for the Analytics Agent by changing the value of the `ad.dw.log.level` parameter in the `analytics-agent.properties` file.

For example, to set the log level to DEBUG:

```
ad.dw.log.level=DEBUG
```

Deploy Analytics Without the Analytics Agent

Deployment Support

The Analytics Agent is not required to capture Transaction Analytics data. This page describes the requirements to use the "agentless" configuration of Analytics.

In this context, "agentless" refers to the configuration of Transaction Analytics without an Analytics Agent. An [app server agent](#) (see page 455), such as Java or .NET, is still required to use this feature.

Agentless Analytics

To capture Transaction Analytics for Java or .NET Windows applications, you can configure Transaction Analytics without a dedicated Analytics Agent.

In this deployment model, Analytics retrieves data directly from your app agent. The data is reported to the Events Service and then the Controller. No separate Analytics Agent is required.

If you upgrade the Java Agent to $\geq 4.5.15$, and use Transaction Analytics, Agentless Analytics is automatically enabled. If you upgrade the .NET Agent to ≥ 20.10 , and use Transaction Analytics, Agentless Analytics is automatically disabled; you can enable this feature in the Controller or with a node property. See [Enable Agentless Analytics](#) (see page 3130).

You may notice unusual behavior (such as gaps in Analytics data) related to two known issues:

- High CPU usage (in the Java Agent version 4.5.19 and below)
- Blocked firewall requests

See [Troubleshoot Analytics Issues](#) (see page 3272).

Requirements

Make sure you meet the following minimum requirements:

- Sufficient [Transaction Analytics Licenses](#)(see page 3119)
- Java Agent >= 4.5.15
- .NET Agent >= 20.10
- Controller >= 4.5.16 (SaaS or on-premises)

To use Agentless Analytics, see this compatibility matrix for your agent deployment requirements.

[Java](#) [.NET](#)

Minimum Controller Version	Minimum Java Agent Version	Agentless Analytics Support
4.5.16	4.5.15	Generally available.
4.5.16	4.5.17	Supports proxy configuration and authentication with encrypted credentials.
4.5.17	4.5.18	Supports license rules configured in the Java Agent.

[Java](#) [.NET](#)

Minimum Controller Version	Minimum .NET Agent Version	Agentless Analytics Support
4.5.16	20.10.0	Generally available and supports proxy configuration.
4.5.17	20.10.0	Supports license rules configured in the .NET Agent.

Connect App Agents to the Events Service

[Java](#) [.NET](#)

For most deployments, communication between the Java Agent and the Events Service automatically occurs as long as you have the correct agent version.

[Java](#) [.NET](#)

Communication between the .NET Agent and the Events Service is disabled by default; to re-enable, see [Enable Agentless Analytics](#)(see page 3127).

See the following sections to ensure that your deployment can connect to the Events Service:

- [Identify Internal Events Service Endpoints](#)(see page 3129)
- [Connection Ports](#)(see page 3129)
- [Enable SSL](#)(see page 3129)

- [Proxy Configuration](#)(see page 3130)

Identify Internal Events Service Endpoints

The Controller uses the connection URL configured in `Admin.jsp` to the Events Service. Agentless Analytics also uses this URL. See [Connect to the Events Service](#)¹⁸⁶⁷.

[SaaS](#) On-prem

In a SaaS environment, the internal URLs to connect to the Controller/app agents to the Events Service have already been deployed.

SaaS [On-prem](#)

In an on-premises environment, the Controller may use an internal Events Service URL that the app agent cannot access.

If this URL is not accessible from agents, configure an additional URL which agents can access:

1. Log in to the Administration Console:
`http:<controller-hostname>:8080/controller/admin.jsp` or `https:<controller-hostname>:45/controller/admin.jsp`.
2. In **Controller Settings**, set `analytics.agentless.event.service.url` to the Events Service endpoint that is accessible from agents.
3. Press **Save**.

Connection Ports

[SaaS](#) On-prem

The connection between the Java Agent, the .NET Agent, and the Events Service occurs over ports 80 (HTTP) and 443 (HTTPS). If your firewall rules are not configured properly, gaps will appear in your Analytics data.

SaaS [On-prem](#)

The port on which the Events Service receives data from the Java Agent and the .NET Agent is configured during installation.

If you have network policies that may prevent this connection, such as firewalls, you need to configure the policies to connect with the Events Service. See [Troubleshoot Analytics Issues](#)(see page 3272).

Enable SSL

If you use a custom trust store, see [Enable SSL for the Java Agent](#)(see page 586) or [Enable SSL for the .NET Agent](#)(see page 658).

1867 <https://docs.appdynamics.com/display/PRMY21/.Connect+to+the+Events+Service+v21.5>

Proxy Configuration

[Java](#) [.NET](#)

To encrypt credentials for proxy authentication, you need Java Agent \geq 4.5.17 and Controller \geq 4.5.17. See [Java Agent Configuration Properties](#)(see page 596).

Java [.NET](#)

The .NET Agent does not support proxy authentication. Use these environment variables for proxy configuration.

To configure the .NET Agent to communicate with the Events Service with the proxy:

1. Add/update the following environment variables.
2. Restart your Windows application.

Agent → Events Service Sending Data For Proxy
appdynamics.http.proxyHost
appdynamics.http.proxyPort

Enable Agentless Analytics

You can enable Agentless Transaction Analytics at the Controller, node/tier, and agent level.

[Java](#) [.NET](#)

By default, Agentless Analytics is automatically enabled for the Java Agent.

Java [.NET](#)

By default, Agentless Analytics is disabled for the .NET Agent. Enabling Agentless Analytics changes your deployment to Agentless Analytics mode.

To enable Agentless Analytics at the tier or node level, add the `agentless-analytics-disabled` [property](#)(see page 1143) and set to `false`. When set to `false`, this node property changes the tier/node to Agentless Analytics mode. To add a node property, see [App Agent Node Properties](#)(see page 1137).

Disable Agentless Analytics

You can disable Agentless Transaction Analytics at the Controller, node/tier, and agent level.

[Java](#) [.NET](#)

Disabling Agentless Analytics changes your deployment to Analytics Agent mode.

To disable Agentless Analytics at the tier or node level, add the `agentless-analytics-disabled` [property](#)(see [page 1143](#)) and set to `true`. When set to `true`, this node property reverts the tier/node to Analytics Agent mode. To add a node property, see [App Agent Node Properties](#)(see [page 1137](#)).

Java [.NET](#)

By default, Agentless Analytics is disabled for the .NET Agent. Enabling Agentless Analytics changes your deployment to Agentless Analytics mode.

To disable Agentless Analytics, set the value of `agentless-analytics-disabled` to `true`.

Existing Analytics Agents

Once you upgrade to the minimum Controller and agent versions, existing Analytics Agents stops reporting data. Agentless Analytics does not duplicate data from the Analytics Agent. AppDynamics recommends when you see **Transaction Analytics** in the Controller, you can uninstall the Analytics Agent unless you are using Log Analytics.

Configure Analytics

To generate information for Analytics, such as data collectors and log analytics, you need to configure the system to collect the applicable data.

Access Analytics in the Controller UI

In the Controller UI, navigate to **Analytics > Configuration**.

The Analytics configuration options include:

- **Transaction Analytics - Configuration:** Enable Analytics for specific applications and business transactions.
- **Transaction Analytics - Manual Data Collection:** Configure data collectors. Analytics supports three types of data collectors: method invocation data collector (MIDC), HTTP, and SQL.
- **Log Analytics:** Configure source rules to collect data for log analytics.
- **API Keys:** Create API authentication keys for users of the Analytics Events API.

End User Monitoring Data

Analytics monitors End User Monitoring (EUM) products. For SaaS deployments, Browser Request Analytics and Mobile Request Analytics, alternate views of EUM data, do not require configuration. If you are using an on-premises Events Service and an on-premises EUM Server, you need to configure the EUM Server to send data to the Events Service. See [EUM Server Deployment](#)¹⁸⁶⁸.

Collect Transaction Analytics Data

Works with:

This page describes how to configure Transaction Analytics for Java and .NET applications. See [Configure Transaction Analytics for Node.js, PHP, and Python Applications](#)(see page 3148).

Before You Begin

If you have Java Agent \geq 4.5.15, .NET Agent \geq 20.10, and Controller \geq 4.5.16, you do not need a local Analytics Agent to configure Transaction Analytics. See [Deploy Analytics Without the Analytics Agent](#)(see page 3127).

All other app agents and Controller versions require an Analytics Agent. See the appropriate documentation to ensure you have installed and configured the required components.

- SaaS deployments: [Install Agent-Side Components](#)(see page 3081)
- On-premises deployments: [Custom Install](#)¹⁸⁶⁹ and [Events Service Deployment](#)¹⁸⁷⁰

Configure Transaction Analytics

You need to configure Transaction Analytics for each desired application. Configuring Transaction Analytics consists of selecting the application and the specific business transactions that you want to analyze.

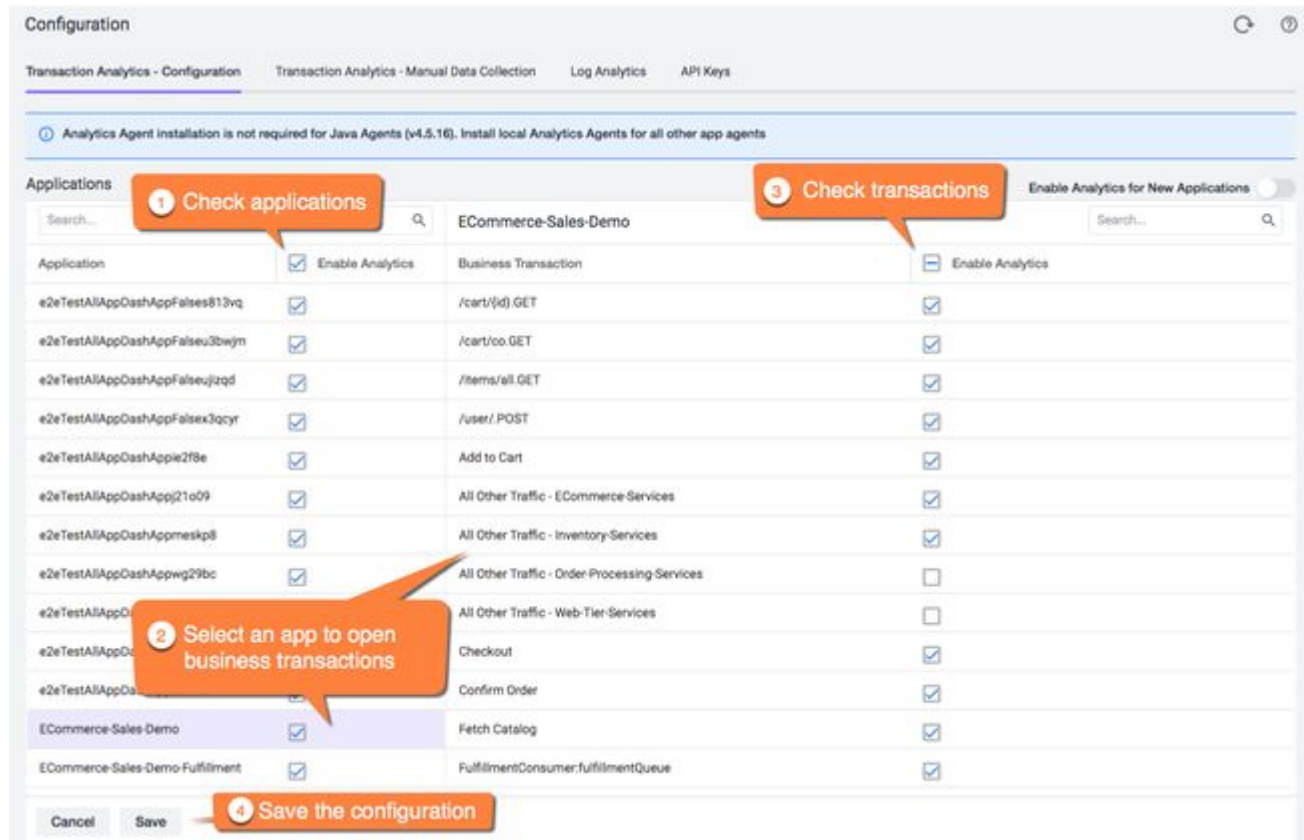

To configure Transaction Analytics:

1. In the Controller UI, from the top navigation bar, select **Analytics**.
2. Select **Configuration** from the left panel.
3. Go to the Transaction Analytics - Configuration tab.
4. Check the application(s) from the left panel. You can select or deselect all applications by checking **Enable Analytics**. Find specific applications using the search box above **Applications**.
5. Select an application to open the business transactions in the right panel. By default, all business transactions, except [All Other Traffic](#)(see page 0), are selected. You can deselect any business transactions you do not want to monitor. Find specific business transactions using the search box in the top right of the panel.
6. Click **Save**.

¹⁸⁶⁸ <https://docs.appdynamics.com/display/PRMY21/.EUM+Server+Deployment+v21.5>

¹⁸⁶⁹ <https://docs.appdynamics.com/display/PRMY21/.Custom+Install+v21.5>

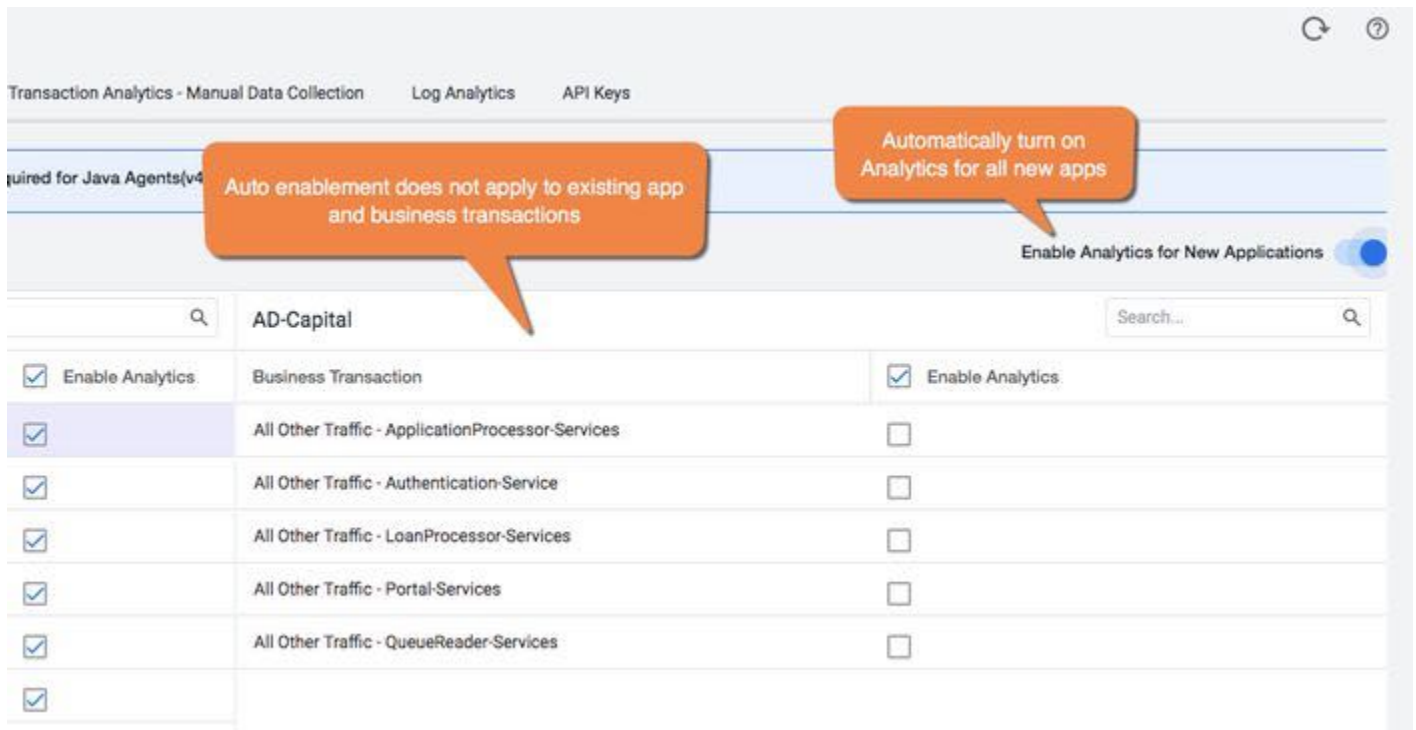

¹⁸⁷⁰ <https://docs.appdynamics.com/display/PRMY21/.Events+Service+Deployment+v21.6>

Automatically Enable Transaction Analytics

You can enable Transaction Analytics automatically for all applications $\geq 4.3.x$. Click the toggle next to **Enable Analytics for New Applications**. This option configures Transaction Analytics for all new applications and all of each application's business transactions, except business transactions categorized as [All Other Traffic](#)(see page 0).

Enable Analytics for New Applications applies to applications created after you select the feature. You need to [manually configure Analytics](#)(see page 3132) for any applications and business transactions created before selecting **Enabled Analytics for New Applications**.

i You can configure Transaction Analytics for older agents manually. Go to **Transaction Analytics - Configuration** and locate the desired application. Uncheck and recheck the app, then select your business transaction(s).

Click the toggle again to turn off **Enable Analytics for New Applications**. The toggle becomes grey when the feature is turned off.

Edit Transaction Analytics Configuration

You can add or remove applications and business transactions from Transaction Analytics at any time.

To make changes to your Transaction Analytics configuration, select or deselect the desired applications and business transactions in **Transaction Analytics - Configuration**.

When you revert changes to Transaction Analytics, AppDynamics saves the previous configuration state. For example, you enable Transaction Analytics for an application and one specific business transaction. You later disable Transaction Analytics for the application, then re-enable it at a later date. When you re-enable the application, AppDynamics automatically selects the business transaction you originally selected.

Security Restrictions

The Analytics Administrator has complete access to all applications in Transaction Analytics. All other users can only view applications to which they have access based on [RBAC permissions](#)(see page 3108).

i The Analytics Dynamic Service loads Transaction Analytics for enabled applications after your JVM instance runs for at least two minutes.

Configure Recommended Data Collectors

Related pages:

- [Configure Manual Data Collectors](#)(see page 3144)

Deployment Support

This page describes Recommended Data Collectors in AppDynamics.

Recommended Data Collectors are potential Method Invocation Data Collectors (MIDC) suggested by Analytics. Recommended Data Collectors reduce the number of steps required to configure data collectors.

When you configure data collectors manually, provide the class and method parameters for each transaction that you want to monitor. Recommended Data Collectors automatically collect the event data from the Java Agent and publishes it to the Event Service. You can browse this data (transactions, classes, methods) and search for specific terms in the Controller.

Recommended Data Collectors do not support HTTP and SQL data collectors.

Before You Begin

To use Recommended Data Collectors, ensure that your setup meets these requirements.

You need the **Configure Diagnostic Data Collectors** permission to access Recommended Data Collectors. The Analytics Administrator does not have this permission by default.

To view application data for Recommended Data Collectors, you need view access to the application and its transactions.

- For application permissions, configure user settings in **Administration > Roles > Applications**.
- For transaction permissions, configure user settings in **Administration > Roles > Analytics > Events**.

See [Analytics and Data Security](#)(see page 3108).

AppDynamics Components

- SaaS Controller >= 20.6.0
- Java Agent >= 21.1

Agentless Analytics

Recommended Data Collectors require Agentless Transaction Analytics. When you use the minimum supported versions of the Controller and Java Agent, Agentless Analytics is automatically enabled. See [Deploy Analytics Without an Analytics Agent](#)(see page 3127) to ensure that your deployment works properly.

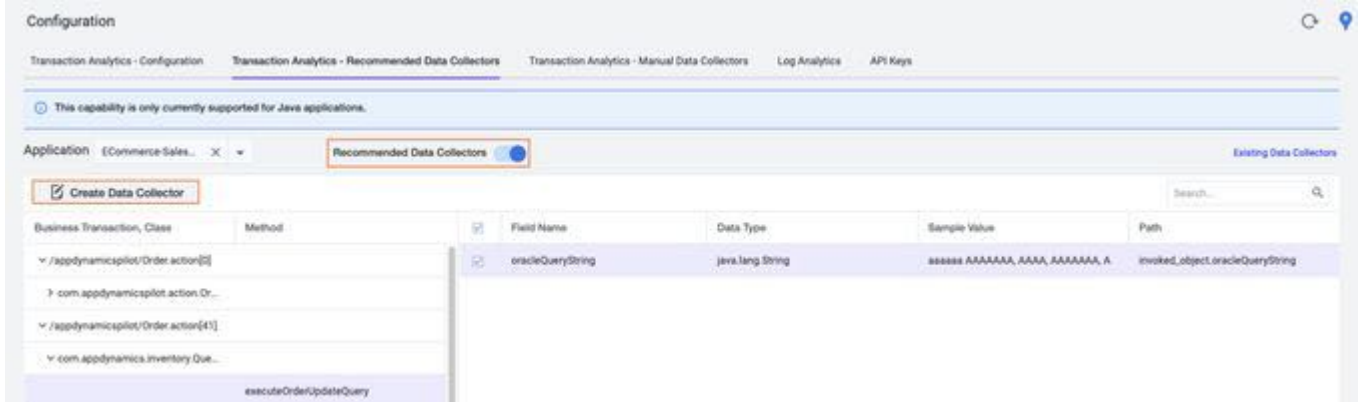

You must enable Agentless Analytics to use this feature. If you turn off Agentless Analytics, you cannot use Recommended Data Collectors.

Create Recommended Data Collectors

To use Recommended Data Collectors:

1. In the Controller, select **Analytics > Configuration > Transaction Analytics - Recommended Data Collectors**.
2. Select an application from the **Application** dropdown menu. A list of business transactions appears in the left pane.

- If not already enabled, turn on the **Recommended Data Collectors** toggle to the right of **Application**.

- Select the dropdown arrow next to the desired business transaction name. A list of available classes appears in the left pane.
- Select the desired class. A list of available methods appears.
- Select the desired method.
- Additional data appears in the right pane. Select the desired field name.
- Above the business transaction list in the left pane, click **Create Data Collector**.
- Enter a data collector name and confirm that the method signature information is correct. If you select multiple fields, enter a unique name for each data collector in the dialog.

Create Method Invocation Data Collector
✕

A method invocation data collector needs the java method signature with the fully qualified class/interface/super-class/annotation name and the method name. If the method is overloaded, it is recommended that you specify the fully qualified parameter types also.

Select **Existing Data Collectors** to view the created MIDCs. The **Transaction Analytics - Manual Data Collectors** tab appears.

Recommended Data Collectors UI Overview

UI Term	Description
Business Transaction	<p>The name of the business transaction(s) for the selected application. Business transaction names appear as:</p> <p>The relative path and business transaction ID in brackets []. For example, /portal/Submit Application[65].</p> <p>If the Java Agent does not identify a relative path, the name is the business transaction ID only. For example, Business Transaction 1.</p>
Class	The fully qualified class name of the selected business transaction.
Method	<p>The method name of the selected class.</p> <p>Overloaded methods contain identifying data to distinguish each method. For example, if a class calls <code>method1</code> multiple times with different return values, the return value is displayed next to the method name:</p> <ul style="list-style-type: none"> • <code>int method1()</code> • <code>void method1()</code> <p>Variations in the method parameters are displayed in the parentheses:</p> <ul style="list-style-type: none"> • <code>method1(str, ...)</code> • <code>method1(int, ...)</code>
Field Name	The name of the field of the selected method. The field name can be a parameter, return value, or invoked object.
Data Type	Type of the field name.

UI Term	Description
<p>Sample Value</p>	<p>Shows an example field value. Special characters (- , . @) are not obfuscated.</p> <p>The following names are obfuscated for security:</p> <ul style="list-style-type: none"> • Boolean: aaaaaa • Enums: the string value is pulled and obfuscated the same as upper and lower case letters • Lower case letters: a • Numbers: 0 • Upper case letters: A • All other characters: # <p>In the case of arrays, collections, and maps, the values display a special format.</p> <ul style="list-style-type: none"> • Array/Collection: [Aaaa, ...] • Map: [{aaa=Aaaa}, ...] <p>The Instance of <class_name> value is displayed when the depth limit is obtained after introspecting the object. If you want to introspect further on this instance type, you can increase the introspection depth with the <code>analytics-runtime-introspection-depth</code> property. For example, in method <code>int getPrice(a)</code>, <code>a → b → c → d → e</code> where <code>a</code> has field <code>b</code>, <code>b</code> has field <code>c</code>, and so on. If the depth is 2, the value will be Instance of <code>c</code>.</p> <p>This case applies to arrays, collections, and maps.</p> <ul style="list-style-type: none"> • Array/Collection: [Instance of <class_name>, ...] • Map: [{Instance of <key_class_name>={Instance of <value_class_name>}}, ...]
<p>Path</p>	<p>Describes where the Java Agent has located the Recommended Data Collector in your code.</p>

Disable Recommended Data Collectors for an Application

1. Go to **Transaction Analytics > Recommended Data Collectors**.
2. Select the application from the dropdown.
3. Turn off the **Recommended Data Collectors** toggle.

Troubleshoot Recommended Data Collectors Issues

Recommended Data Collectors in the Controller UI

There are a few reasons why Recommended Data Collectors may not appear in the Controller UI:

- **Auto-Refresh:** In the Controller UI, data under the **Transaction Analytics - Recommended Data Collectors** tab does not refresh automatically. If you recently created an application and do not see it in the UI, refresh your browser.
- **Deactivated Agentless Analytics:** Recommended Data Collectors require Agentless Analytics. If a particular application is unavailable, confirm that Agentless Analytics is enabled for the tier or node.
- **Permission:** Recommended Data Collectors enforces RBAC. Without the **Configure Diagnostic Data Collectors** permission, you cannot create data collectors, but you can view suggested Recommended Data Collectors for the applications that you have access to.

Field Names Display Unavailable

Field names are not available for data captured on parameters, return values, and invoked objects, such as `int getNumber(intValue)`.

For example:

```
public class Calculator {
    public int getArea(int width, int height) {
        return width * height;
    }
}
```

Field Name	Explanation
Invoked Object	Refers to the object on which the method is invoked. In this example, the <code>Calculator</code> object is being invoked. The name of the <code>Calculator</code> object instance is not obtained, so Invoked Object displays Unavailable .
Parameters	Refers to the inputs to the method. In this example, the parameters are the <code>width</code> and the <code>height</code> . The parameter names are not obtained, so Parameters display Unavailable .
Return Value	Refers to the return value of the method. Return values do not have assigned names and Return Value displays Unavailable .

Customize Recommended Data Collectors

This page provides a list of system and node properties that customize Recommended Data Collectors.

Enable or Disable Recommended Data Collectors

You can enable or disable Recommended Data Collectors after restarting the Java Agent and setting the system properties as a JVM parameter. Recommended Data Collectors is enabled by default; the property `appdynamics.analytics.collection.feature.enabled` is optional.

System Property	Description	Default Value
appdynamics.analytics.collection.feature.enabled	Enable or disable Recommended Data Collectors on the Java Agent.	true

Customize Recommended Data Collectors

To customize Recommended Data Collectors, you can adjust the node properties in the Java Agent. See [App Agent Node Properties](#)¹⁸⁷¹.

Node Property	Description	Default Value
analytics-collection-stack-traces-collected	Number of stack traces collected per interval (time between stack trace collection limit resets).	20
analytics-collection-stack-trace-collection-reset-interval	Interval (in seconds) to reset stack trace collection limit.	10
analytics-collection-special-characters	List of characters which will not be sanitized from sample values. For example, a^z will not sanitize a, ^, and z.	N/A
analytics-collection-elements-scan-per-stack-trace	Number of elements to scan per stack trace before stopping.	20

¹⁸⁷¹ <https://docs.appdynamics.com/display/PRO45/App+Agent+Node+Properties>

Node Property	Description	Default Value
analytics-collection-elements-retain-per-stack-trace	Number of elements to collect per stack trace. For example, in this stack: <pre>com.a -> com.b -> com.c -> com.d -> com.e -> com.f -> AppD exit point method</pre> Elements com.b to com.f (bottom five) are analyzed by default.	5
analytics-collection-package-prefix	Comma separated list of package names that will be treated preferably for suggestions.	N/A
analytics-element-analysis-interval	Interval (in seconds) for triggering element analysis.	600
analytics-collection-reap-interval	Interval (in seconds) to remove one suppressed collection instrumentation point. Removes the oldest suppressed point first.	10
analytics-method-instrumentation	Number of methods (unique class name/method name combinations) to instrument with Recommended Data Collectors. Overloaded variants are considered the same for this limit.	10
analytics-maximum-num-rules-multiplier	Average number of overloaded methods per instrumented method. The maximum number of instrumentation points is calculated with this formula: analytics-method-instrumentation * analytics-maximum-num-rules-multiplier.	10

Node Property	Description	Default Value
analytics-instrumentation-suppression	Number of times Recommended Data Collectors is invoked and processed. For example, if analytics-instrumentation-suppression is set to 3 and a method is called four times, the fourth call does not collect data.	3
analytics-runtime-attribute-value-length	Maximum length of sample value string displayed.	32
analytics-runtime-introspection-depth	Level of depth in the object tree that Recommended Data Collectors extracts information.	2

Configure Manual Data Collectors

This page describes how to configure data collectors for Transaction Analytics.

There are three types of data collectors: HTTP, method invocation, and SQL. Data collectors enable you to add business context to a transaction. For example, a Method Invocation Data Collector (MIDC) can tell you if an order is slow based on method parameters.

Before You Begin

You must configure Transaction Analytics before you can configure data collectors. See [Collect Transaction Analytics Data](#) (see page 3132).

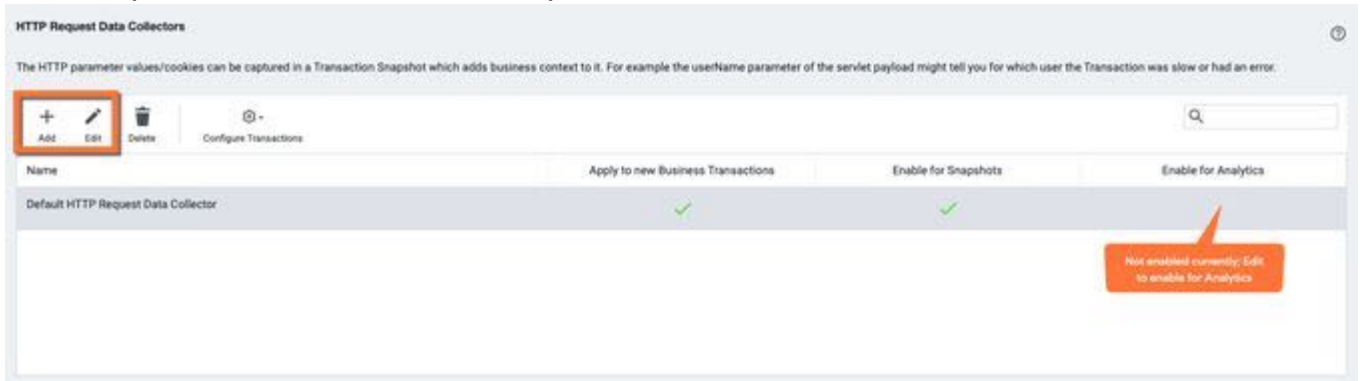

Configure HTTP Data Collectors

To collect HTTP request data, you can use the default HTTP Request Data Collector. You need to explicitly enable the collector for Analytics.

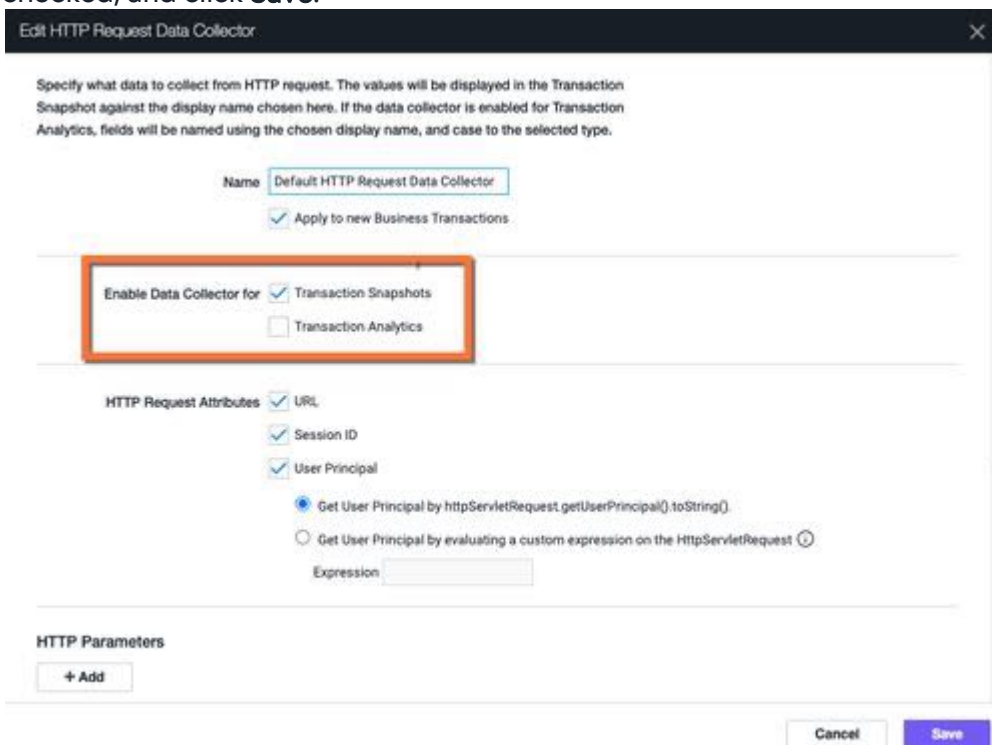

To configure HTTP Data Collectors for Analytics:

1. In the Controller UI, select **Analytics > Configuration** from the top navigation bar.
2. Go to the Transaction Analytics - Manual Data Collection tab.
3. Select the application of interest from the **Configure Analytics for Application** dropdown.

- Navigate to **HTTP Request Data Collectors**. Select the HTTP Data Collector to enable and click **Edit** (or **Add** to create new collectors).

- On the **HTTP Request Data Collector** page, confirm the data to collect, confirm **Transaction Analytics** is checked, and click **Save**.

- Select **Configure Transactions** and confirm that the data collector is enabled on the appropriate business transactions. See [Data Collectors](#)(see page 1502).

Configure Method Invocation Data Collectors

You can also use the **Analytics > Configuration** page to enable existing or new Method Invocation Data Collectors. Open the **Method Invocation Data Collectors** panel. The process is essentially the same as described in [Data Collectors](#)(see page 1502).

- Check the **Transaction Analytics** check box to use this collector for Analytics.
- Check the **Configure Transactions** popup to confirm you have enabled the right Business Transactions.
- Check that the name of the MIDC does not exceed the 50 character limit.

Field Name Recommendations

While there are no requirements for MIDC field names, AppDynamics recommends using only alphanumeric characters, hyphens, and underscores.

MIDC field names that start with special characters may cause application events to disappear from Analytics in the Controller. As a best practice, avoid the following characters in your MIDC field names:

- Dots
- Spaces
- Slashes
- Special characters (such as \$, %, &)
- Regular expression characters

You can learn more about field name conventions and recommendations in [Data Field Naming for Events Service >= 4.5.3¹⁸⁷²](#).

i Changing the name of method invocation data collector will create a completely new field in Transaction Analytics. If you want to change the type of a data collector field, we recommend creating a new field instead to avoid conflicts with the old data.

Field Length Limit

The maximum number of characters allowed in a custom data field is 8,191.

Configure SQL Data Collectors

Transaction snapshots capture SQL queries. SQL data collectors provide a way to extract business data from parameters used in the SQL statements for use in analytics. See [Collect Business Data From SQL Calls](#)(see page 3154).

Enable Transaction Analytics Data Type Conversion for Data Collectors

i Transaction Analytics data type conversion requires Controller versions 21.6.3, 21.8.0, and >=21.9.0. For Java deployments, Transaction Analytics data type conversion is available for Java Agents >= 21.3.0.32281. For .NET deployments, Transaction Analytics data type conversion is available for .NET Agents = 21.5.1.

Data collectors determine field type (string, boolean, or number) at runtime. At times the data you collect may not be the type in which you want to use it. For example, you are not able to add metrics if any data collectors are field type string.

While field type cannot be changed, you can specify field type before runtime with Transaction Analytics data type conversion.

To enable Transaction Analytics data type conversion:

1. Log in to the administration console:
http:<controller-hostname>:8080/controller/admin.jsp or https:<controller-hostname>:45/controller/admin.jsp.

¹⁸⁷² <https://docs.appdynamics.com/display/PRMY21/.Data+Field+Naming+for+Events+Service+4.5.3+and+Above+v21.5>

2. On the **Controller Settings** page, change the value of `analytics.type.conversion.enabled` from `false` to `true`.
3. Click **Save**.

Data type conversion only appears when enabled in the **HTTP** and **Method Invocation Data Collector** configuration pages on your Controller. If this page was opened while you enabled data type conversion, you will need to refresh your page to see changes.

Data type conversion operates by the following rules:

- Available for new data collectors only.
- Select type manually for each data collector.
- Type cannot be changed once saved.

Transaction Analytics Data Type Conversion in HTTP Data Collectors

To use Transaction Analytics data type conversion, create a new HTTP parameter. You can add to an existing HTTP Request Data Collector or create a new one.

The process is essentially the same as creating an HTTP parameter. However, now that you've enabled Transaction Analytics data type conversion, you will see **Type** field with a dropdown.

Select the desired field type for your HTTP parameter. If you do not want to specify a type, leave this field blank. The default type for HTTP data collectors is `string`.

Transaction Analytics Data Type Conversion in Method Invocation Data Collectors

To use Transaction Analytics data type conversion, create a new Method Invocation Data Collector (MIDC). You can add to an existing MIDC or create a new one.

The process is essentially the same as creating an MIDC. However, now that you've enabled Transaction Analytics data type conversion, you will see **Change Type to** field with a dropdown.

Display Name

Create your own name for the data collected. This will be the display name for the data in Transaction Snapshots.

Collect Data From
 @ Index

Operation on Method Parameter

Transaction Analytics Type
 Use APM Type Change Type to

String

Boolean

Number

Select the desired field type for your MIDC.

Transaction Analytics Type defaults to **Use APM Type**, which determines type at runtime. If you do not want to specify a type, select **Use APM Type**.

Name Requirements For Transaction Analytics Data Type Conversion

Refer to these naming requirements when using Transaction Analytics data type conversion:

- Display Names must be unique within each data collector. Names are case sensitive.
- You can repeat Display Names across different data collector configurations, as long the field type is also the same.
- If you delete a field from a data collector and add it again with a different field type, you must rename the data collector.

Change Field Types

Field types cannot be changed once they have been saved to the data collector. To change the field type, we recommend to delete and recreate with a new name.

Configure Transaction Analytics for Node.js, PHP, and Python Applications

This page describes how to configure Transaction Analytics and Data Collectors for Node.js, PHP, and Python applications.

Before You Begin

Make sure you have installed and configured the components described in [Installing Agent-Side Components](#)(see page 3081) and, for on-premises, [Custom Install](#)¹⁸⁷³ and [Events Service Deployment](#)¹⁸⁷⁴ before attempting to configure Transaction Analytics.

¹⁸⁷³ <https://docs.appdynamics.com/display/PRMY21/.Custom+Install+v21.5>

¹⁸⁷⁴ <https://docs.appdynamics.com/display/PRMY21/.Events+Service+Deployment+v21.6>

Configure Analytics for Node.js

Collect Default Node.js Transaction Data

To configure the Node.js Agent to send the default transaction data to the Analytics Agent, modify the require statement in your application.

Add these variables with the proper values to point to your Analytics Agent:

```
analytics: {
  host: <analyticsHostName>,
  port: <analyticsPort>,
  ssl: <true || false>
}
```

The Analytics Agent can be on the same host as the Node.js Agent or on a different host. See [Install the Node.js Agent](#)(see page 818).

Configure Data Limits

You can also configure the Node.js Agent to set limits on data sent to the Analytics Agent with these properties correlated to environment variables.

Property Name	Description	Environment Variable
analyticsMaxSegmentSize InBytes	The maximum size of a business transaction segment collected in an Analytics request. By default, the value is 0.1MB.	APPDYNAMICS_ANALYTICS_MAX_SEGMENT_SIZE
analyticsMaxSegmentsPer Request	The maximum number of segments per Analytics request. By default, the value is 16.	APPDYNAMICS_ANALYTICS_MAX_SEGMENTS_PER_REQUEST
analyticsMaxMessageSize InBytes	The size of a single request body sent to the Analytics Agent. By default, the value is 1MB.	APPDYNAMICS_ANALYTICS_MAX_MESSAGE_SIZE

Your require statement should look similar to the following example where your Analytics Agent is on localhost and listening on Port 9090:

```
require ("appdynamics").profile({
  controllerHostName: '<Controller host name>',
  controllerPort: <Controller port number>,
  controllerSslEnabled: false, // Set to true if controllerPort is SSL
  accountName: '<AppDynamics account name>',
  accountAccessKey: '<AppDynamics account key>', // Required
  applicationName: '<Your application name>',
  debug: false,
  tierName: '<Choose a tier name>',
```

```

nodeName: '<Choose a node name>', // The Controller appends the node name with a unique
number
analyticsMaxSegmentSizeInBytes: 20,
analyticsMaxSegmentsPerRequest: 20,
analyticsMaxMessageSizeInBytes: 100,
analytics: {
  host: 'localhost',
  port: 9090 },
logging: {
  'logfiles': [
    {'root_directory': '/tmp/appd', 'filename': 'echo_%N.log', 'level': 'TRACE',
'max_size': 5242880, 'max_files': 10 },
    {'root_directory': '/tmp/appd', 'filename': 'protobuf_%N.log', 'level': 'TRACE',
'max_size': 5242880, 'max_files': 10, 'channel': 'protobuf' }]
  }
});

```

Collect Node.js Data Collectors

You can also collect additional data from your Node.js business transactions by using the Node.js API. To configure Transaction Analytics data collectors for Node.js, see `txn.addAnalyticsData()` in the [Node.js Agent API Reference](#) (see page 834).

Configure Analytics for PHP Applications

The screenshot shows the 'Configuration' page for Transaction Analytics. It features a table with columns for 'Application', 'Enable Analyti...', 'Business Transaction', and 'Enable Analytics'. The 'AAA-WebSrv6' application is selected, and its business transactions, '/load.php' and '/test.php', have their 'Enable Analytics' checkboxes checked. A search bar is visible at the top right of the table.

1. In **Transaction Analytics - Configuration**, click the **Enable Analytics** checkbox to enable/disable Analytics on a PHP application.
2. To the right of **Business Transactions**, click the **Enable Analytics** checkbox to enable/disable Analytics on any Business Transaction(s) in the application.

Analytics data cannot be collected from PHP CLI programs.

To collect Transaction Analytics from the PHP Agent:

1. Configure the PHP Agent to send the default transaction data to the Analytics Agent. Modify the `.ini` file depending on the operating system under which your PHP Agent is installed. By default, your `.ini` file contains the following configuration where your Analytics Agent is on `localhost` and listens to Port `9090`:

```
agent.analyticsHostName = localhost
agent.analyticsPort = 9090
```

Add the following variables with the proper values to point to your Analytics Agent:

```
agent.analyticsHostName = <analyticsHostName>
agent.analyticsPort = <analyticsPort>
```

The Analytics Agent can either be on the same host as the PHP Agent, or on a different host. For information about installing the PHP Agent, see [Install the PHP Agent](#)(see page 861).

You must set the node level setting `analytics-dynamic-service-enabled=true` for reporting analytics.

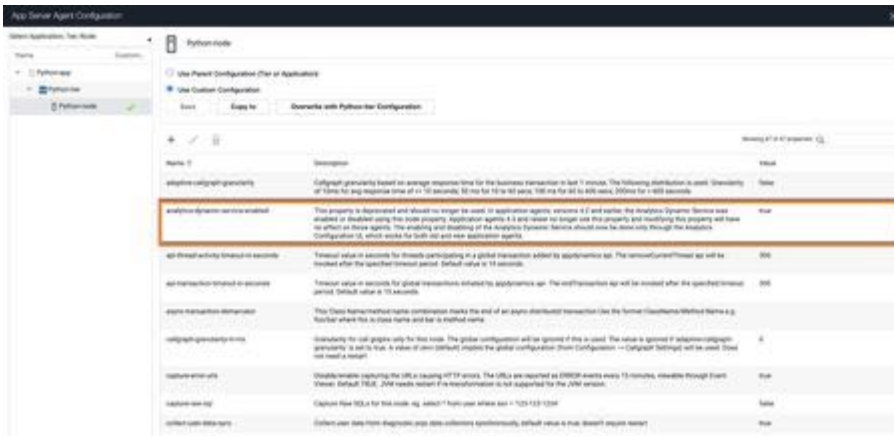

2. HTTP/Method Invocation Data collectors for Analytics must be enabled for both transaction snapshots and Transaction Analytics to report data from the PHP Agent. In order to collect the method return value with an MIDC, the value must be assigned to a variable.

```
$ret = function()
```

If the return value is not stored in any variable, it displays as `null` in both snapshot and Analytics data.

Configure Analytics for Python Applications

1. In **Transaction Analytics - Configuration**, click **Enable Analytics** to enable Analytics on a Python application.
2. To the right of **Business Transactions**, click **Enable Analytics** to enable Analytics on any Business Transaction(s) in the application.
3. For Controller versions `<= 21.10`, set the `analytics-dynamic-service-enabled=true` node property to report analytics.

For details on how to add node properties, see [Add a Registered Node Property](#)¹⁸⁷⁵.

i The parent configuration is not supported for the `analytics-dynamic-service-enabled` property. You must set this property to each node to report transaction analytics.

Collect Transaction Analytics

To collect Transaction Analytics from the Python Agent, configure the Python Agent to send the default transaction data to the Analytics Agent:

- Modify the Python Agent configuration file.

```
[services:analytics]
host= <analyticsHostName>
port= <analyticsPort>
```

i The default value of the host is `localhost` and port is `9090`.

Or,

- Set these environment variables:
- `APPDYNAMICS_ANALYTICS_HOSTNAME`
- `APPDYNAMICS_ANALYTICS_PORT`

i For details about how to set the environment variables, see [Python Agent Settings](#)(see page 913).

Enable SSL Between Python Agent and Analytics Agent

To enable SSL between Python Agent and Analytics Agent:

1. Obtain the root certificate of the CA authority that signed the Analytics Agent certificate.
2. Enable SSL and specify the path of the certificate file in the Python Agent configuration file.

¹⁸⁷⁵https://docs.appdynamics.com/21.10/en/application-monitoring/administer-app-server-agents/app-agent-node-properties#AppAgentNodeProperties-add_node_propertyAddaRegisteredNodeProperty

```
[services:analytics]
ssl= on
ca-file=<path of the CA certificate file>
```

i Python Agent accepts the certificate file in .pem format. If there are intermediate certificate authorities, specify the path of the chain of trust in place of the root certificate authority.

Or,

Set these environment variables:

- APPDYNAMICS_ANALYTICS_SSL_ENABLED
- APPDYNAMICS_ANALYTICS_CAFILE

Add Custom Fields to Transactions Using Java SDK

You can add custom data using the Java Agent SDK as an alternative to adding [data collectors](#)(see page 1502) from the Controller UI.

The fields show up on Transaction Analytics under a section called "Custom Method Data".

Add the code similar the following to your application:

```
//include the app agent SDK packages

import com.appdynamics.apm.appagent.api.AgentDelegate;
import com.appdynamics.apm.appagent.api.DataScope;
import com.appdynamics.apm.appagent.api.IMetricAndEventReporter;

public void someMethod(String stringParam, int intParam, ComplexObject complexObjParam) {

    //Get the data reporter.
    IMetricAndEventReporter reporter = AgentDelegate.getMetricAndEventPublisher();

    //Define the scope for data collection.
    Set<DataScope> allScopes = new HashSet<DataScope>();
    allScopes.add(DataScope.ANALYTICS);
    allScopes.add(DataScope.SNAPSHOTS);

    Set<DataScope> analyticsScope = new HashSet<DataScope>();
    analyticsScope.add(DataScope.ANALYTICS);

    //Add data to different scopes based on the need.
    //Here both key1 and key2 are collected for both snapshots and analytics
    reporter.addSnapshotData("key1", stringParam, allScopes);
    reporter.addSnapshotData("key2", intParam, allScopes);

    //Here key3 is only collected for analytics.
    //Since the passed object is a complex java object and not a primitive type, toString()
    method is invoked on it and the string value will
```

```
//be collected.
reporter.addSnapshotData("key3", complexObjParam, analyticsScope);

.....
Business logic.
```

The third parameter to the method is a set of enums, `DataScope`, that define the scope for collecting the custom data:

- To collect custom data only for snapshots, use `DataScope.SNAPSHOTS` as the third parameter.
- To collect the custom data for analytics, use `DataScope.ANALYTICS` as the third parameter.
- If custom data should be added to both snapshots and analytics then both the enums should be passed in a set as the third parameter.

Method details for `addSnapshotData()`

```
boolean addSnapshotData(java.lang.String key,
                        java.lang.Object value,
                        java.util.Set<DataScopes> dataScopes)
```

Method Parameters

- `key` - key
- `value` - Primitive types can be passed as values and the types (int, boolean, etc) will be respected. Strings can be passed as values, however, note that if you pass composite objects then agent performs a `.toString()` operation on it.
- `dataScopes` - scope for the custom data collection:
 - `Datascope.SNAPSHOTS`
 - `Datascope.ANALYTICS`

Returns

true if the agent successfully collects the key-value pair for the given scope.

Collect Business Data From SQL Calls

Transaction snapshots capture SQL database calls. The SQL calls can contain useful business data. Analytics SQL data collectors are a way to collect the business data from SQL parameters for use in transaction analytics.

To configure an Analytics SQL data collector you need to know:

- Analytics-enabled application where the SQL call is executed.
- Database target of the SQL call.
- Specific SQL parameterized statement that contains the data of interest as a query parameter.
- Analytics-enabled business transactions making the database call.
- Parameters to be collected.

This feature is supported as:

- The SQL data collector list shows the slowest database calls over the last 30 days. You can also create a SQL data collector directly from the **DB & Remote Service Calls** tab of a snapshot.
- Requires 4.3 Java Agent or 4.3 .NET Agent.
- Only prepared statements containing data of interest as binding variables can be used. Literal strings that are passed in can not be collected.
- There is a 500-character limit on the length of the SQL statement. Do not use any truncated queries that might appear in the SQL Statements list or a snapshot.

- The overall number of executions of SQL queries configured to collect Analytics data is limited to 10K. This is configurable using the `analytics-sql-cpm-limit` node property. See [App Agent Node Properties](#)(see page 1137).

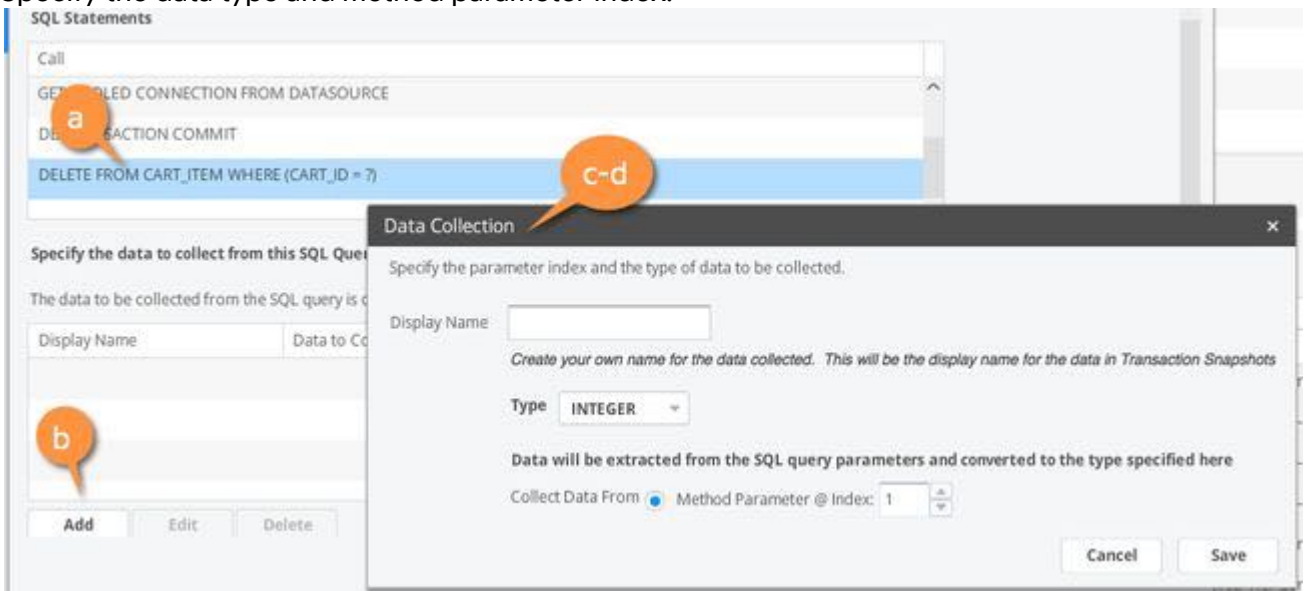

Configure SQL Data Collectors From Analytics

1. In the Controller UI, from the top navigation bar, select **Analytics > Configuration**.
2. From the Transaction Analytics tab, select the application from the **Configure Analytics for Application** dropdown and confirm that analytics data collection is enabled.
3. Scroll down to expand the **SQL Data Collectors** section, and click **Add**.

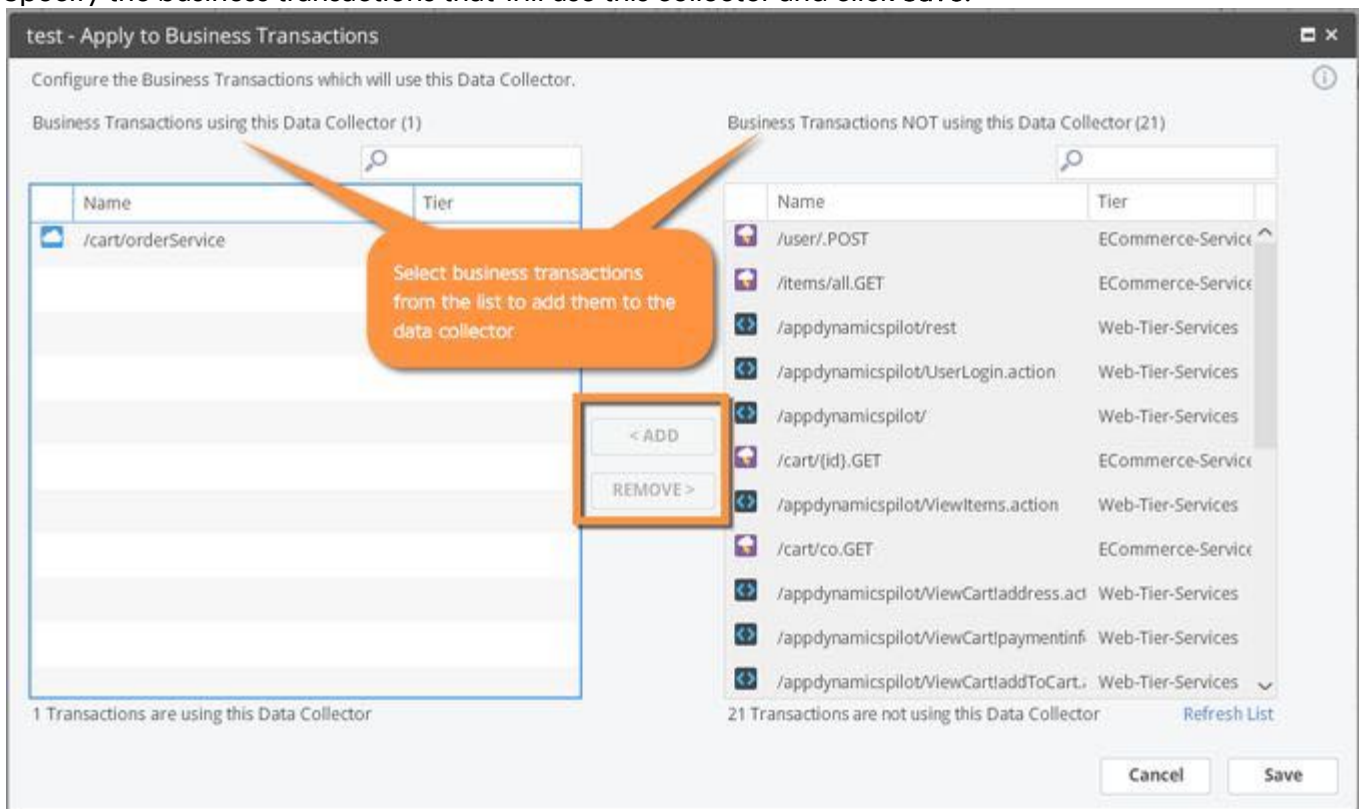

4. Name your data collector and indicate if the collector should apply to new business transactions.
5. Select the appropriate database. A list of available SQL statements displays showing the slowest database calls over the last 30 days. This timeframe is not configurable.

6. Define the data to collect.
 - a. Select the SQL prepared statement containing the parameter that you want to capture for analytics.
 - b. Click **Add** to specify the data to be collected.

- c. Type a display name for the data you are collecting.
This name appears in the Analytics UI Fields list when the data is collected and passed to Analytics.
- d. Specify the data type and method parameter index.

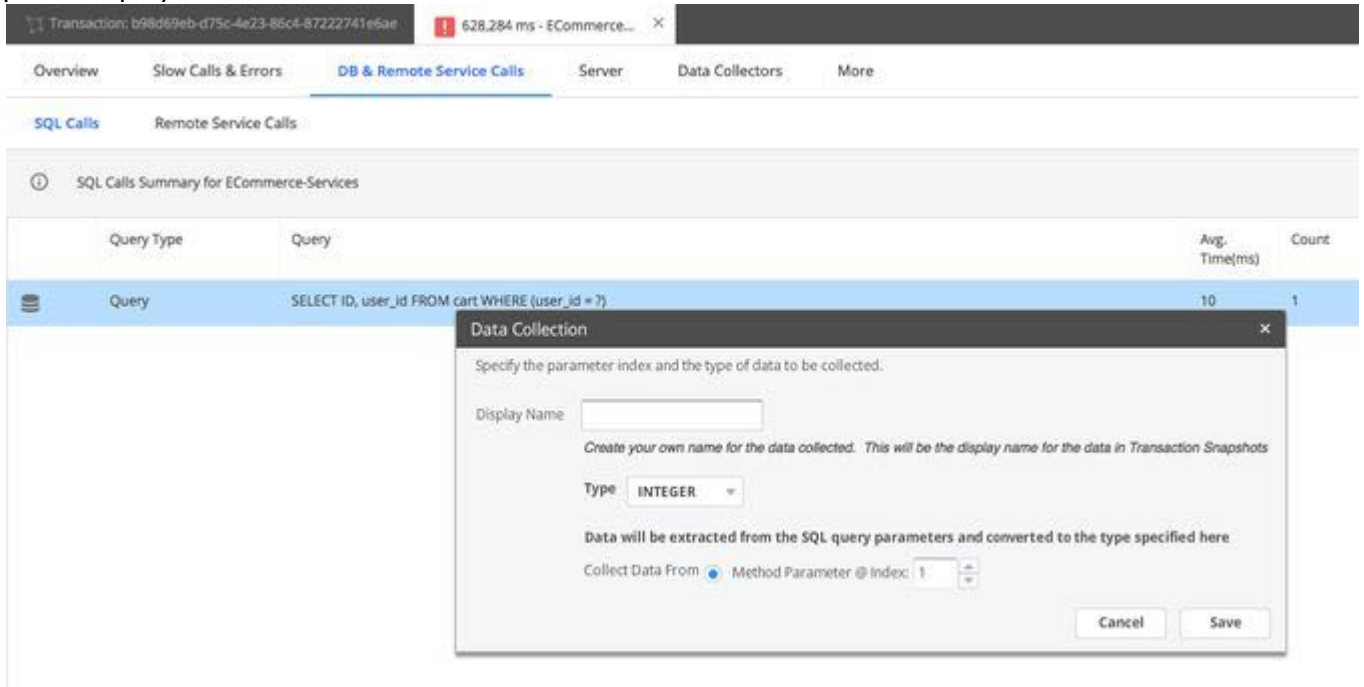

- e. Click **Save**.
 - f. Click **Create SQL Data Collector**.
7. Specify the business transactions that will use this collector and click **Save**.

Configure SQL Data Collectors From Snapshots

This procedure provides a shortcut way to set up the configuration for an Analytics SQL data collector for a database call captured in an application transaction snapshot. You need to find the transaction snapshot of interest and drill down to the node that contains the database call of interest.

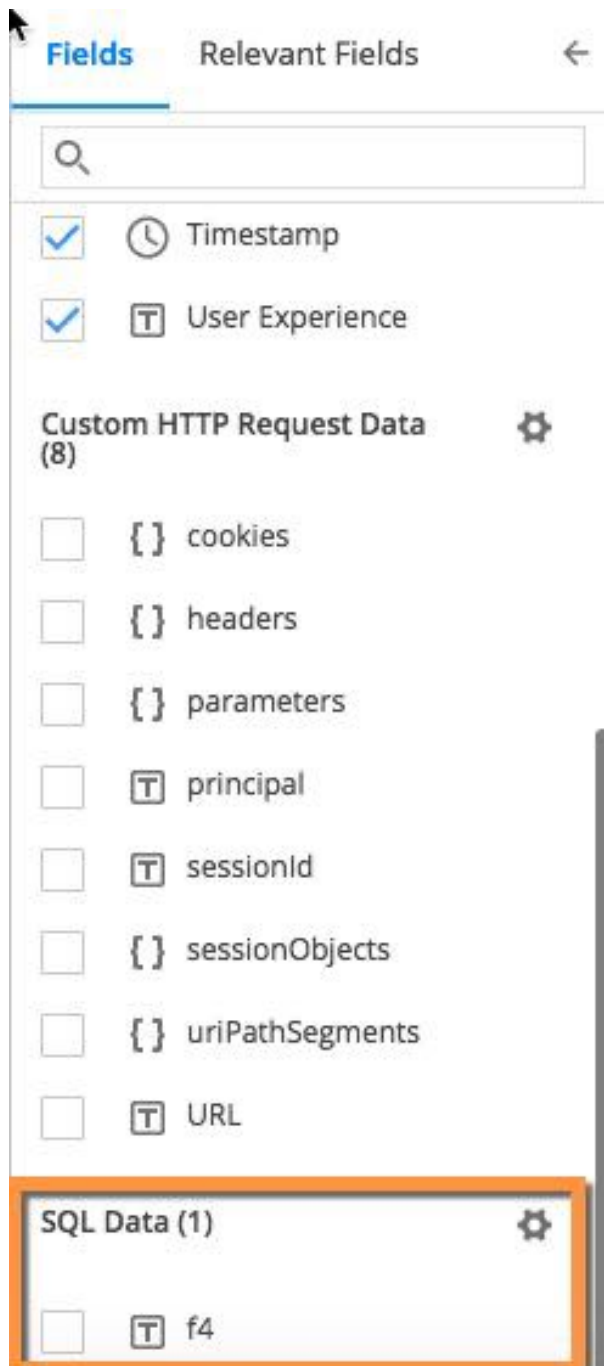

1. From the **DB & Remote Service Calls** tab of a snapshot containing the SQL call of interest, select the prepared statement that contains the data you want to collect for analytics.
2. Right-click the query and select **Configure Data Collector** from the context menu. The **Data Collection** panel displays.

3. Enter a display name for the data you are collecting.
4. Specify the type and the parameter to collect and click **Save**.
5. Select the business transactions from which to collect the data and click **Save**.

View SQL Data in Analytics

After the data is successfully collected for analytics, you see the fields in the **Fields** list in a section labeled SQL Data. This can take a few minutes depending on your application and the frequency of transactions executing the relevant SQL query.

Collect Log Analytics Data

Related pages:

- [Configure Log Analytics Using Job Files](#)(see page 3179)
- [Analytics Log Data](#)(see page 3056)

To capture and present log records as analytics data, you must configure one or more *log sources* for the Analytics Agent. The Analytics Agent uses the log source configuration to:

- Capture records from the log file
- Structure the log data according to your configuration
- Send the data to the Analytics Processor.

The Controller presents the Log Analytics data in the Analytics UI.

Before attempting to configure Log Analytics, confirm you have installed and configured the components described in [Install Agent-Side Components](#)(see page 3081) and, for on-premises, [Custom Install](#)¹⁸⁷⁶ and [Events Service Deployment](#)¹⁸⁷⁷.

Versions < 4.3 use *job files* to configure the log sources. You may continue to use job files that were created in previous versions. If you want to collect new log events into our platform, we recommend that you use the Centralized Log Management UI to define *source rules*. You may also find it useful to replace existing job file configurations with the new source rules so you can take advantage of new features introduced in 4.3. See [Migrate Log Analytics Job Files to Source Rules](#)(see page 3191).

To configure data collection for your log sources, see [Configure Log Analytics Using Source Rules](#)(see page 3159).

Manage Extracted Fields

In Controller < 4.3, you could extract fields from logs in the Controller UI. This is described on the [Create Extracted Fields from Logs](#)¹⁸⁷⁸ page. This option is not available >= 4.3. It is replaced entirely by Field Extraction in the Centralized Log Management UI. See [Configure Log Analytics Using Source Rules](#)(see page 3159) for details.

Fields that were extracted by this mechanism in previous versions appear in the Extracted Fields list. Hovering over the field reveals a **View** icon. Click the **View** icon to delete the field or to see the configuration details:

- Regular expression used to extract the field
- Field name
- Field type
- Source type

Configure Log Analytics Using Source Rules

Related pages:

- [Agent Scopes for Configuration Log Management](#)(see page 3173)
- [Analytics Log Data](#)(see page 3056)
- [Collect Log Analytics Data from Syslog Messages](#)(see page 3175)

The Centralized Log Management UI enables you to configure your log data sources using source rules.

Once you define source rules, you specify which Analytics Agents should use the rules by associating specific source rules with Agent Scopes. Agent Scopes are groups of Analytics Agents that you define. Using Agent Scopes simplifies the deployment of the log source configuration to multiple agents.

Log Analytics Source Rules

Analytics Agents collect logging information based on the log source rules you define in the Controller.

¹⁸⁷⁶ <https://docs.appdynamics.com/21.4/en/application-performance-monitoring-platform/enterprise-console/custom-install>

¹⁸⁷⁷ <https://docs.appdynamics.com/21.4/en/application-performance-monitoring-platform/events-service-deployment>

¹⁸⁷⁸ <https://docs.appdynamics.com/display/PRO42/Create+Extracted+Fields+from+Logs>

The primary function of a source rule is to specify the location and type of a log file, the pattern for capturing records from the log file, and the structure of the data of captured records. They can also specify field masking or sensitive data removal and manage time zones of captured records.

When the log source rules are enabled and associated with Agent Scopes, Analytics Agents automatically start collecting the configured logs as follows:

- Analytics Agents register with the Controller on startup
- Analytics Agents download log source rules to configure log collection (after registration)
- Log source rules are stored in the Controller data store and are configurable through the Centralized Log Management UI
- Analytics Agents start acting on log source rule changes within five minutes (this could be longer if there are any network communication issues)

Permissions

To configure log analytics source rules, you need the following permissions:

- Manage Centralized Log Config permission
- View access to the specific source types that you want to configure

See [Analytics and Data Security](#)(see page 3108).

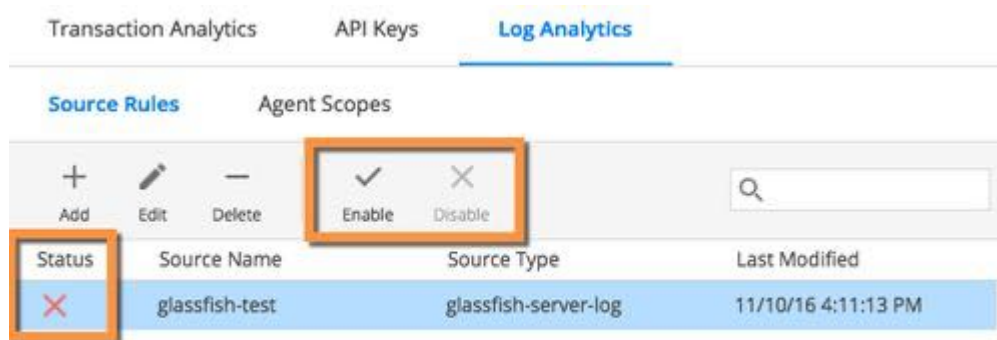

Analytics Agent Properties

If you are using Centralized Log Management (CLM), you need to configure additional properties in the `analytics-agent.properties` file. See information on configuring properties for consolidated log management in [Install Agent-Side Components](#)(see page 3081) for details.

Managing Source Rules

When you create a source rule and save it, the rule is initially disabled. This is shown in the **Status** column on the source rule list page.

You can enable or disable a source rule by selecting it and choosing the corresponding option from the **Source Rules** menu, shown in the following screenshot:

You can also see which source rules use a specific agent scope. The Analytics Agent does not collect the log data until the source rule is enabled and assigned to an Agent Scope with active Analytics Agents.

Starting Point for Creating a Source Rule

You can create a source rule from any one of these starting points:

- AppDynamics template. Several templates for common log file formats are available.
- Existing source rule. You can use existing source rules as the starting point for new rules.

- New source rule. Start from scratch when your log file does not match one of the available templates.

Preview Extracted Log Data Using Sample Log Files

To improve validation of data collection and parsing of log messages, you can use a local log file with the Log Analytics Configuration UI to preview the field extraction that you want. Three types of field extraction are available.

- Grok patterns and key-value pair extraction
- Auto extraction using regular expressions
- Manual extraction using regular expressions

Best Practices for Source Rule Design

A few recommendations apply to making source rules.

Use the simplest possible regular expressions and grok matching patterns possible. Do not make excessive use of wildcards or quantifiers as it can slow the responsiveness of the Controller UI. You can view examples of such greedy quantifiers on <https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html>.

If a regex pattern (including grok) is taking more than five seconds to match against a logline, extraction and further processing for those fields stop. If this occurs, some fields may be missing for that log line when viewed on the Controller. Other log lines are not impacted; however, this occurrence is often the result of an ineffective or faulty matching pattern in the first place, and processing is likely to take a long time for all log lines. This behavior is applicable to the dynamic Preview screens in the **Centralized Log Analytics Configuration** page as well.

The Controller limits the size of the records it retrieves to 32 KB by source rule in log analytics. This limit guards against excessive system resource burden, including potential resource burden that might be caused by excessive data collection due to faulty source rule patterns.

Create a Source Rule

1. From the Controller top navigation bar, click **Analytics**.
2. From the left navigation panel, click **Configuration > Log Analytics**.
You see two tabs, one for Source Rules and one for Agent Scopes.
3. From the Source Rules tab, click **+ Add**.
You see the **Add Source Rule** panel.
4. In the **Add Source Rule** panel, select your starting point for the source rule. Note that you can also use a job file as the starting point for your source rule. See [Migrate Log Analytics Job Files to Source Rules](#)(see

page 3191).

5. Use **Collection Type** to indicate if the source log file resides on the local filesystem or will be collected from a network connection.

i Collecting from a network connection is only used for a TCP source rule, which extracts log analytics fields from `syslog` messages over TCP. See [Collect Log Analytics Data from Syslog Messages](#)(see page 3175).

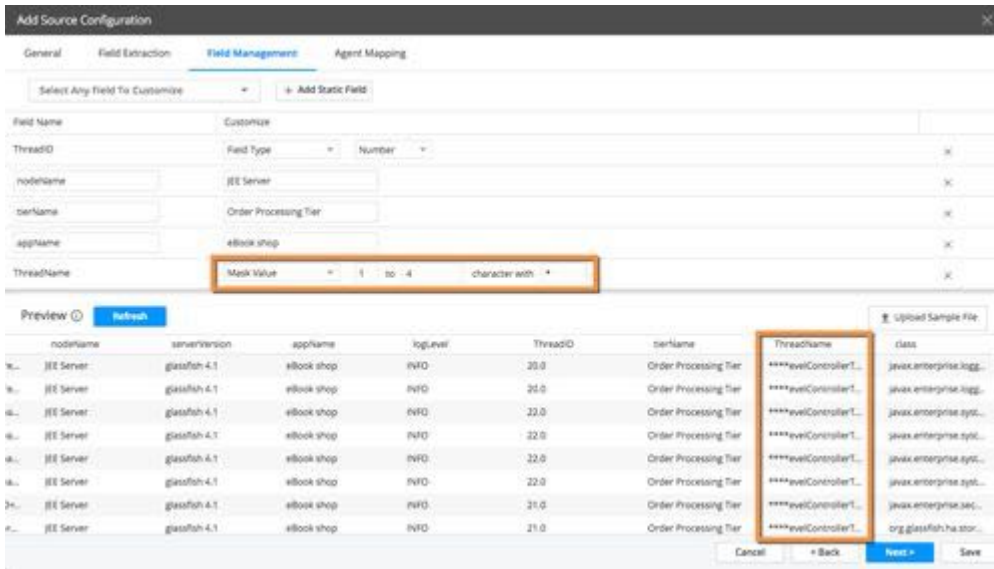

6. Use the **Browser** button to locate and specify a sample log file to preview the results of your configuration. You can also specify a sample file later in the configuration process during the field extraction step.

7. Click **Next** to see the **Add Source Configuration** page. Some fields may be prepopulated with data if you selected either an AppDynamics template or an existing source rule as your starting point. The four tabs are:
 - General
 - Field Extraction
 - Field Customization
 - Agent Mapping
8. On the General tab, name your rule, specify its location, timestamp handling, and other general characteristics. See [General Configuration](#)(see page 3164).
9. On the Field Extraction tab, configure the fields that you want to capture from your log file. For more details on the fields on this subtab, see [Field Extraction](#)(see page 3167). For a detailed procedure on using Auto Field Extraction, see [Field Extraction for Source Rules](#)(see page 3170).

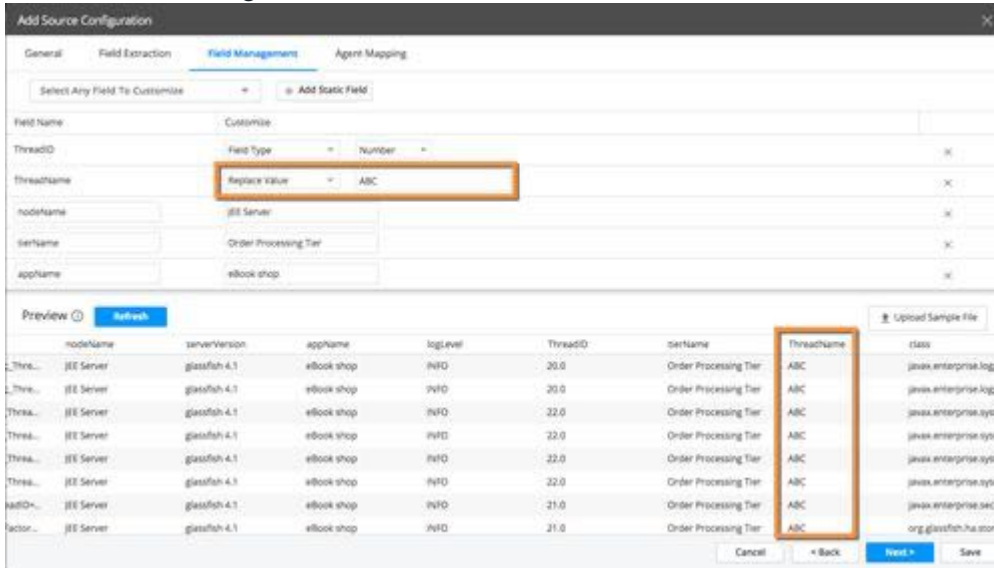

i Use the simplest possible regular expressions and grok matching patterns. Do not make excessive use of wildcards or quantifiers as it can slow the responsiveness of the Controller UI. Examples of expensive and greedy quantifiers can be found here <https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html>

10. On the Field Management tab, you can customize the handling of fields in a number of way including masking sensitive data, renaming fields, changing the data type and more. See [Field Management](#)(see page 3169).

Mask Value: Use this option to mask values of sensitive data such as credit card numbers or social security numbers. Select **Mask Value** and enter the starting index and ending index (1 and 4 respectively for the example shown) and a character to use for masking in the display, such as an * asterisk.

Replace Value: Use this option to replace the entire data field with a static string. Select **Replace Value** and enter the string to use:

11. On the Agent Mapping tab, assign the source rule to specific Agent Scopes.
12. Click **Save** when you are finished. The source rule is saved in a disabled state.

Centralized Log Management UI Details

General Configuration Tab

Field	Description	Required
Source Name	Name of this source rule. This name must be unique. Appears in the list of defined source rules.	Yes

Source Type	<p>Specifies the event type of log source file. This field is prepopulated when you start from an AppDynamics template or an existing source rule. If you are creating a new source rule from scratch, you can specify any value. This value is used to identify this specific type of log event and can be used in searching and filtering the collected log data. The value shows up in the field list for the log data.</p>	Yes
Source File	<p>The location and name of the log file to serve as a log source. The location must be on the same machine as the analytics-agent.</p> <p>You can use wild cards and you can specify whether to match files one level deep or all log files in the path directory structure.</p> <ul style="list-style-type: none"> • Example for multi-level matching: path: <code>/var/log/**/*</code>.log This matches both <code>/var/log/apache2/logs/error.log</code> and <code>/var/log/cassandra/system.log</code> • Example for one level matching: path: <code>/var/log/*</code>.log This searches for .log files one level deep in the <code>/var/log</code> directory (matches on <code>/var/log/cassandra/system.log</code> but not on <code>/var/log/apache2/logs/error.log</code>). 	Required when collection type is from the local filesystem.
Exclude Files	<p>Exclude, or blacklist, files from the defined source rule(s). Input the relative path of the file(s) to exclude, using wildcards to exclude multiple files.</p> <ul style="list-style-type: none"> • Example for a single file: Source File: <code>/var/log/**/*</code>.log Exclude Files: <code>cassandra/system.log</code> • Example for multiple files: Source File: <code>/var/log/**/*</code>.log Exclude Files: <code>*/system.log</code> 	No

<p>TCP Port</p>	<p>Specifies the port for the analytics-agent to collect log files from a network connection. This field is not present if the collection type is From local file system. If no port number is provided, port 514 is used. Both the syslog utility and analytics-agent should have root access to send logs to port 514 (binding to ports less than 1024 requires root access).</p>	<p>Required when collection type is from a network connection.</p>
<p>Enable path extraction</p>	<p>This checkbox enables extraction of fields from the path name. Add a grok pattern in the text box.</p> <p>The syntax for a grok pattern is <code>{%{SYNTAX:SEMANTIC}}</code>. For example, to extract AdminSever from <code>/opt/apps/oracle/middleware/user_projects/domains/ouaf_domain1/servers/AdminServer/logs/AdminServer.log</code>, enter the following GROK pattern: <code>servers/{%{DATA:servername}}/{%{GREEDYDATA}}</code>, where <code>{%{DATA:server}}</code> filters the server name and <code>{%{GREEDYDATA}}</code> filters rest of the message from the log path.</p>	<p>No</p>
<p>Start collecting from</p>	<p>Indicate where to begin tailing (collecting the log records). Options are:</p> <ul style="list-style-type: none"> • From the beginning of the log file • From the end of the log file • A specific time range (in hours) - For example, if you set this to four hours, then when you enable the rule and analytics starts tailing the log data, only the last four hours of data is ingested. When tailing starts, the watermark state is maintained for that file. If the agent is now stopped and restarted, it will start tailing from where it left off for any old file. For new files, it will only tail the last four hours of data. 	<p>The default is to collect log records from the beginning of the file.</p>
<p>Override time zone</p>	<p>Use this to override the time zone for eventTimestamp in log events. If your log events don't have a time zone assigned and you are not overriding it, the host machine time zone is assigned to the log events. You cannot override the timezone</p>	<p>No</p>

	in the pickupTimestamp field. If you override the time zone, you must provide a timestamp format. Time zone formats should conform to Joda-Time Available Time Zones ¹⁸⁷⁹ , and the timestamp format should be created with the Joda-Time formatting system ¹⁸⁸⁰ .	
Override timestamp format	You can override the format if needed. Time zone formats should conform to Joda-Time Available Time Zones ¹⁸⁸¹ , and the timestamp format should be created with the Joda-Time formatting system ¹⁸⁸² .	Yes. The override timestamp format is needed to extract out time correctly from the log file. If you do not provide this field, the eventTimestamp will be equal to pickupTimestamp despite log line having a timestamp.
Auto-Correct duplicate Timestamps	Enable this option to preserve the order of original log messages if the messages contain duplicate timestamps. This adds a counter to preserve the order.	No
Collect Gzip files	Enable this to also find gzip files in the specified path.	No

Field Extraction Tab

The following table describes the fields and actions on this tab. For a detailed procedure on using Auto or Manual Field Extraction, see [Field Extraction for Source Rules](#)(see page 3170).

Section/Field or Action	Description
Add Grok Pattern	
Message Pattern	This is the grok pattern used to extract fields from the log message. A pattern may be prepopulated when you use an AppDynamics template or an existing source rule as your starting point. You can add or remove grok patterns as needed.

1879 <http://joda-time.sourceforge.net/timezones.html>

1880 https://www.joda.org/joda-time/key_format.html

1881 <http://joda-time.sourceforge.net/timezones.html>

1882 https://www.joda.org/joda-time/key_format.html

<p>Multiline Format</p>	<p>For log files that include log records that span multiple lines (spanning multiple line breaks), use this field to indicate how the individual records in the log file should be identified. You have two options:</p> <ul style="list-style-type: none"> • startsWith: A simple prefix that matches the start of the multiline log record. • regex: A regular expression that matches the multiline log record. <p>The multiline format is not supported when you are collecting log data from a network connection.</p>
<p>Extract Key-Value Pairs</p>	
<p>Field</p>	<p>Shows the field selected for key-value pair configuration.</p>
<p>Split</p>	<p>The delimiter used to separate the key from its value. In this example, "key=value": the split delimiter is the equal sign "=". Multiple comma-separated values can be added.</p>
<p>Separator</p>	<p>The delimiter used to separate out two key-value pairs. In this example, "key1=value1;key2=value2": the separator is the semi-colon ";". Multiple comma-separated values can be added.</p>
<p>Trim</p>	<p>A list of characters to remove from the starting and/or the end of the key/value before storing them. In this example, "_ThreadID_": you can specify the underscore "_" as the trim character to result in "ThreadID". Multiple comma-separated values can be added.</p>
<p>Include</p>	<p>A list of key names to capture from the "source". You must provide keys in the include field. If the include field is left blank no key-value pairs are collected.</p>
<p>Actions</p>	
<p>Upload Sample file</p>	<p>Browse to a local file to upload a sample log file.</p>
<p>Preview</p>	<p>Use to refresh the Preview grid to see the results of the specified field extraction pattern.</p>
<p>Auto Field Extraction</p>	
<p>Definer Sample</p>	<p>Select a message from the preview grid that is representative of the fields that you want to extract from the log records. You can select only one definer sample per source rule.</p>
<p>Refiner Samples</p>	<p>Refines the regular expression to include values that were not included in the original definer sample.</p>

Counter Sample	This specifies something to ignore. Refines the regular expression to exclude values that were included by the original definer or refiner sample.
Manual Field Extraction	
Regular Expression	Add a regular expression to define the field you want to extract.
Field Type	Specify the type for the field.
Field Name	Automatically generated within the regular expression pattern. This name appears in the Fields list in the Analytics Search UI.
Actions	
Add Field	Use to add additional regular expressions for extracting more fields. You cannot add more than 20 fields.
Preview <ul style="list-style-type: none"> • All • Matching • Non-Matching 	Use these buttons to filter the viewable results in the preview grid.
Upload Sample File	Upload a sample file from your local file system to use in the preview grid.

Field Management Tab

Field/Action	Description
Select Any Field to Customize	Select the field to add customizations. You can add multiple customizations to a single field.
Field Name	This column lists the fields that have customizations.
Customize	This column shows the specific customizations. For static fields, the display name is shown. Static fields cannot be further customized.
Mask Value	This customization option masks values in the collected data. Specify the starting and ending position in the data and the character to use as the masking value.
Replace Value	This customization option replaces the entire value of the field with a static string.
Rename	This customization option enables you to rename a field to a more recognizable display name.

Field Type	<p>Use to change the data type of the field. For example, from string to number. Available types are String, Boolean, and Number.</p> <p>Note that after a source rule has been saved with a field of a specified data type, you cannot later change the data type of that field. Once the fields are indexed in the analytics database trying to specify a new type will cause a validation error.</p>
Remove	<p>This customization turns off data collection for the field. It can be reversed at a later time.</p>
Add Static Field	<p>This action allows you to add a static field to all the log events collected from this source. This field can then be used to search and filter the log data. For example, use this to add Tier, Node, and Application Name to the log data.</p>

Field Extraction for Source Rules

This page describes how to use Auto and Manual Field Extraction to configure Log Analytics source rules. Field Extraction uses regular expressions to identify and format the fields for your Log Analytics data.

Auto Field Extraction enables you to upload a sample log file and select fields for extraction. The necessary regular expressions are automatically generated and highlighted in your sample messages. You can fine-tune the generated regular expressions using Refiner Sample and Counter Sample log messages.

Manual Field Extraction enables you to upload a sample log file and enter your own regular expressions to define fields and associate the fields with a data type.

Definitions

- **Source Rule:** a set of configuration settings for extracting analytics data from log files. You create source rules using the Centralized Log Management UI in the Controller. Source rules are stored in the Controller data store and periodically synced with the Analytics Agent. See [Configure Log Analytics Using Source Rules](#)(see page 3159).
- **Sample File:** a representative log file uploaded to the Controller that provides a way to test and fine-tune your log file source rules.
- **Definer Sample:** a specific log message selected from the sample log file used to define the fields that you want to extract from the log messages.
- **Refiner Sample:** an additional log message used to revise the auto-generated regular expression created in the Definer Sample step. The Refiner sample helps capture fields that were missed in the initial step.
- **Counter Sample:** an additional log message used to eliminate false positives while extracting the fields as defined in the Definer or Refiner steps.

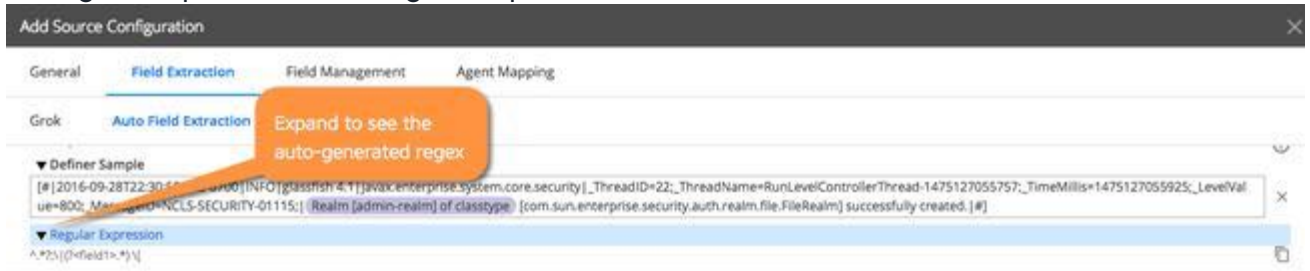

Auto Field Extraction

This section describes how to use Auto Field Extraction to extract fields from your log files.

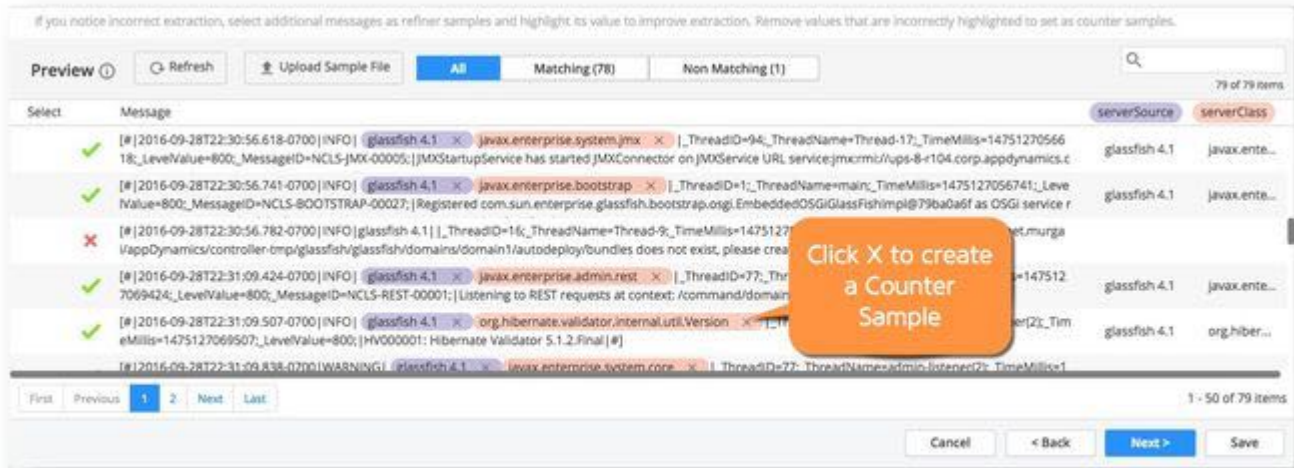

To specify field extraction using a Definer Sample log message:

1. Using the Centralized Log Management UI, add a new source rule (or edit an existing source rule), and navigate to the Auto Field Extraction subtab within the Field Extraction tab. See the section "*Create a Source Rule*" in [Configure Log Analytics Using Source Rules](#)(see page 3159) for detailed steps on accessing this UI.

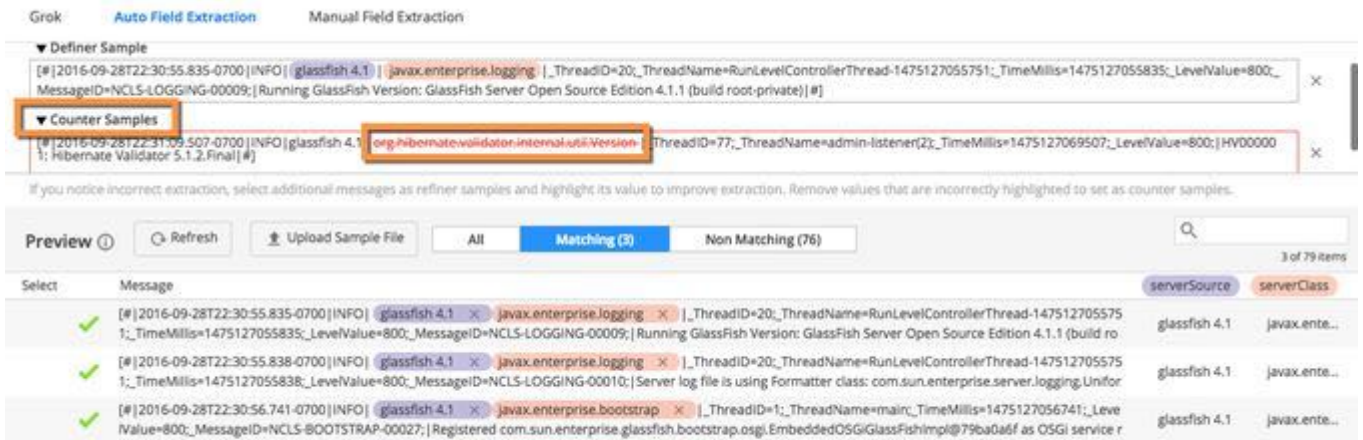

2. If you do not see log messages in the grid, upload a sample file by clicking **Upload Sample File**.
If you uploaded a sample file in a previous step in the configuration process or you started your new source rule using an existing source rule, you will see log messages in the grid.
3. Hover over any row on the grid and click **+Select as Definer Sample**.
Choose a sample log message that contains the fields you want to extract from the log file. When you need to capture fields from dissimilar log messages, you can create more than one definer.
4. After you select the Definer Sample message, use the following steps to extract fields from the message. After selecting the Definer Sample and specifying the fields to extract, the preview grid displays rows with matching and non-matching results.
 - a. Select text in the message. If you are defining key-value pairs, it is only necessary to highlight the key field.
A popup appears where you can specify properties of the extracted field.
 - b. Enter the field name, select the data type, and click **Extract**.
The preview grid is updated to show matching rows with the selected text highlighted with a color.
 - c. (Optional) To update the properties or delete the field, click the field you just created in the definer and the properties popup appears.
 - d. Repeat steps a, b and c to create more fields.
As you add additional fields, the regular expression changes. You can view or copy (but not edit) the regular expression in the regular expression section.

5. (Optional) Specify Refiner Samples: As you review the non-matching rows, if you notice a value that was not extracted and should have been extracted, then you can add that row as a Refiner Sample. A refiner sample is used to match the unmatched rows from the Definer step.
 - a. On the grid, click **+Select as Refiner Sample**. You do not see this option unless you already selected the Definer Sample.
 - b. Select the text.
 - c. A popup appears. You can associate this portion of text with a field already created in the Definer step. When you extract, the regular expression changes and matching rows get updated in the Preview grid and will be shown as Matching. If necessary, you can add more than one Refiner Sample message.
6. (Optional) Specify Counter Samples: Counter samples eliminate false positives while extracting the fields. In the Preview grid, the highlighted values are shown along with an X button. Click the X next to a field to mark a value as a false positive (a Counter Sample).

The Counter Sample is shown below the Definer and Refiner Samples and the regular expression is updated to show the new set of matching and non-matching rows.

7. Click **Save** to save the fields to the source rule.
8. Continue to the other tabs of the Add Source Rule dialog to complete your source rule configuration.

Manual Field Extraction

You can specify your own regular expressions if needed using Manual Field Extraction.

1. Using the Centralized Log Management UI, add a new source rule (or edit an existing source rule), and navigate to the Manual Field Extraction subtab within the Field Extraction tab. See "[Create a Source Rule](#)" in [Configure Log Analytics Using Source Rules](#)(see page 3159) for detailed steps on accessing this UI.
2. If you do not see log messages in the grid, upload a sample file by clicking **Upload Sample File**.
3. Click **Add Field**.
4. Click **Show Example** to review how to write regular expressions.
5. Type in your regular expression and associate it with a field type using the drop-down menu.

6. In the Preview grid, click Refresh.
The preview grid is highlighted with the results of applying the regular expression to the sample log messages. You cannot add more than 20 fields.
7. (Optional) You can change the regular expression or the type and use **Refresh** to see the updated results.
8. Click **Save** to update your source rule.

Agent Scopes for Configuration Log Management

Related pages:

- [Configure Log Analytics Using Source Rules](#)(see page 3159)

Agent Scopes are used to determine which agents use the CLM source rules. You can group your deployed Analytics Agents into scopes, then assign source rules to the scopes. While creating an agent scope, you are given an option to either choose agents from a static list or to add agents dynamically by specifying matching rules.

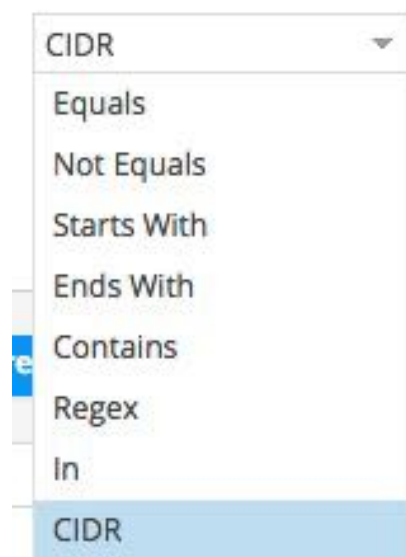

Static Agent Scopes

The Available Agents list is populated with the Analytics Agents reporting to your controller. You can use this list to add currently available agents to a scope.

Dynamic Agent Scopes

You can specify match conditions where registered Analytics Agents that match the rule are automatically added to, or excluded from, the scope. Analytics Agents that register with your Controller in the future, with characteristics that match the scope criteria, will also be added to the scope. You can match on agent name, unique host ID, or IP address.

The available operators for the matching conditions include regular expressions (regex) and Classless Inter-Domain Routing (CIDR) notation. CIDR is a compact notation for an IP address and its associated routing prefix.

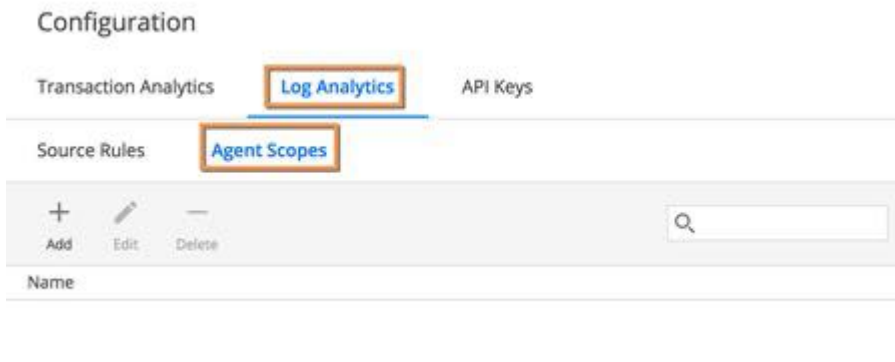

The match conditions are additive, so exclusions will take precedence over inclusions. An agent must satisfy all conditions to be included. For example, an agent named *ABC* would not be included in the scope if you specify something similar to the following conditions:

- include name equals 'ABC'
- include name that ends with 'D'

Define Agent Scopes

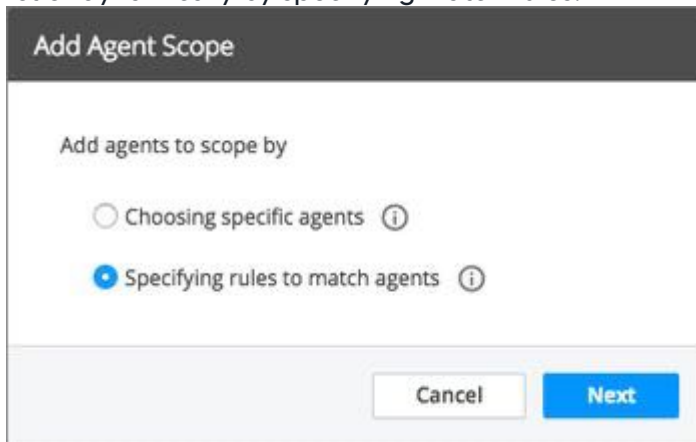

To add an Agent Scope:

1. From the Controller top navigation bar, click **Analytics**.
2. From the left navigation panel, click **Configuration > Log Analytics > Agent Scopes**.

3. Click **+Add**.

You see the Add Agent Scope pane where you can specify how you want to add agents: from a static list or dynamically by specifying match rules.

4. To add specific agents, select **Choosing specific agents** and move agents from the list of Available Agents to the list of Selected Agents to define the scope.

- To add agents dynamically, select **Specifying rules to match agents** and specify your matching rules.

- Name the **Agent Scope** and click **Save**.

Collect Log Analytics Data from Syslog Messages

Related pages:

- [Configure Log Analytics Using Job Files](#)(see page 3179)
- [Analytics Log Data](#)(see page 3056)

You can configure the Analytics Agent to receive syslog messages using TCP transport and standard syslog format adhering to RFC 5424. The Analytics Agent can listen on a TCP port for syslog messages coming from a remote source or from the same host on which the Analytics Agent is present.

To set this up:

- Configure your web server, such as Apache, to send logs to the Analytics Agent. There are two ways to direct the syslog data to the Analytics Agent:
 - Write the log messages to the usual log files and then read and forward to the agent from the log file. See [Read syslog Messages From the Log File and Send to Analytics Agent](#)(see page 3177).
 - Send the log data directly to the Analytics Agent without writing to a file first. See [Send syslog Data Directly to the Analytics Agent](#)(see page 3176).
- Configure the Analytics Agent to receive and parse the logs. There are two ways to configure syslog message collection for Log Analytics:
 - Job files (for <= 4.2), see [Configure Log Analytics TCP Job File](#)(see page 3178).

- Source rules (for 4.3) Recommended for your new log file sources. See [Configure Log Analytics TCP Source Rule](#)(see page 3177).

Supported Environment Details

- Linux only
- Network protocol is TCP only
- A template for Apache Web Server syslog format is shipped with the Analytics Agent. You can bring any log data in through syslog over TCP as long as you provide the correct configuration to parse the log message.
- One job file per Analytics Agent can be enabled to receive syslog messages over TCP.

i Both the syslog utility and analytics-agent should have root access if the port where the analytics-agent is listening for syslog messages is lower than 1024.

Send syslog Data Directly to the Analytics Agent

You can use the Linux Logger utility to direct your Apache access and error log messages to the syslog daemon directly. Using this method, the logs are not written to the usual access log and error log apache files or to the `/var/log/message` file. Instead, the log lines are sent directly to a syslog daemon which then forwards the data to the analytics-agent.

Configure:

1. Configure Apache to delegate logs to `/usr/bin/logger`.
 - a. Locate and open `httpd.conf`, the Apache configuration file. This is typically located at `/etc/httpd/conf/`.
 - b. Add a new `CustomLog` directive to send access logs and error logs to the syslog and comment out the line that sends to the `access_logs`.

```
#comment the following line to avoid logging to access_logs
#CustomLog logs/access_log combined

#Add a new CustomLog directive to send access logs and error logs to the syslog
CustomLog "|/usr/bin/logger -t httpd -p local6.info" combined
```

This directive uses the logger utility to send messages with facility `local6`, tag 'httpd' and log format combined.

The facility code specifies the type of program that is logging the message. Messages with different facilities may be handled differently.

The tag 'httpd' in the `httpd.conf` directly relates to the program name in the `rsyslog.conf` (see next step) for filtering out which messages need to be sent. For example, there can be other programs writing to that particular port, but we only want to send the logs from the httpd program to analytics-agent.

2. Configure the rsyslog client.
 - a. Edit `rsyslog.conf`, typically located at `/etc/`.
 - b. Add the following lines above "RULES" or "var/log/messages" filter so Apache doesn't log to the `/var/log/message` file.

```
# log to analytics-agent
if $syslogfacility-text == 'local6' and $programname == 'httpd' then
@@<analytics_agent_home>:514
# Prevent logging httpd to /var/log/messages
if $syslogfacility-text == 'local6' and $programname == 'httpd' then ~
```

Make sure you replace 514 with the port where the analytics-agent is listening for syslog messages. This must match the port specified in the job file.

3. Restart apache and rsyslog, and look at /var/log/messages for any rsyslog errors.

Read syslog Messages From the Log File and Send to Analytics Agent

In this case, the Apache server writes logs to the usual access log and error log files, and the rsyslog daemon is configured to read from these log files and forward the log data to analytics agent. This method preserves the original log files. In this case, the access and the error log messages are logged in the /var/log/message file.

In this example, the rsyslog client is configured to read from a specific file and forward the message with facility local6 and severity level info over the specified port (default port is 514).

1. Locate and edit rsyslog.conf, typically located at /etc/.
2. In the begin forwarding section of the rsyslog.conf file, add the following lines:

```
# add these lines in the begin forwarding section
$ModLoad imfile
$InputFileName /etc/httpd/logs/access_log << your file
$InputFileTag apache-access
$InputFileStateFile stat-apache-access
$InputFileSeverity info
$InputFileFacility local6
$InputRunFileMonitor
local6.info @@localhost:514
```

\$InputFileName: path to the log file you want to tail.

local6.info: Use the Analytics Agent IP address if your analytics agent is not local to the controller. If needed, replace 514 with the port where the analytics-agent is listening for syslog messages. This must match the port specified in the job file or the source rule.

3. Restart rsyslog and review /var/log/messages for any rsyslog errors.

Configure Log Analytics TCP Source Rule

Using the Centralized Log Management UI, you can configure a source rule to extract log analytics fields from syslog messages over TCP.

1. Access the Centralized Log Management UI from your Controller by clicking **Analytics > Configuration > Log Analytics**.
2. On the Source Rules tab, click **+ Add**.
3. In the Add Source Rule panel, select the **Create from** source template and select **From Network Connection** as the collection type. For example, select the default Apache syslog template `apache-httpserver-access-syslog`:

The screenshot shows the 'Add Source Rule' dialog box. It has a dark header with the title 'Add Source Rule'. Below the header, there are three radio buttons under 'Create from': 'AppDynamics template' (selected), 'Existing source rule', and 'New source rule'. To the right of these is a dropdown menu with 'apache-httpserver-access-syslog' selected. Below that are three radio buttons under 'Collection type': 'From Local file system', 'From Network connection' (selected), and 'From Network connection'. At the bottom, there is a text input field for 'Sample log file for preview' and a 'Browse...' button. At the very bottom right are 'Cancel' and 'Next' buttons.

Several log format templates are shipped with the Analytics Agent. You can create a new source rule for any log format over syslog TCP as long as you configure it correctly.

4. Click **Next** to see the Add Source Configuration wizard.
5. Specify the collection details, such as the name of the source rule, source type and enter the TCP Port where the Analytics Agent is listening.
6. When you specify **From Network Connection** as the collection type, the grok pattern for the syslog header (which is appended to the log messages) is automatically added at the beginning of the grok Message Pattern:

```
%{SYSLOG5424PRI}%{SYSLOGBASE2}
```

7. Confirm that the value for Multiline Format is **None**.
8. Configure field extraction and field management as for any other source rule. See [Configure Log Analytics Using Source Rules](#)(see page 3159).

Configure Log Analytics TCP Job File

When selecting and configuring the port where the analytics agent will listen for the syslog data, make sure it does not conflict with anything else active in the network. If no port number is provided, port 514 is used. Both the syslog utility and analytics-agent should have root access to send logs to port 514 (binding to ports less than 1024 requires root access).

To allow the analytics-agent to listen at a port, specify the log file **source** property and associated parameters for **type=syslog**. For example, add the following to the appropriate job file:

```
source:
  type: syslog
  port: 514
  protocol: tcp
```

```
numThreads: 1
```

A job file for apache commons is included in the analytics distribution at `/<analytics-agent-home>/conf/job/sample-apache-httpserver-access-syslog.job`.

Your job file should look similar to the following:

```
version: 2
enabled: true

source:
  type: syslog
  port: 514
  protocol: tcp
  numThreads: 5

fields:
  sourceType: apache-httpserver-access-syslog
  nodeName: Node1
  tierName: Tier1
  appName: App1

grok:
  patterns:
    - "%{SYSLOG5424PRI}%{SYSLOGBASE2} %{COMBINEDAPACHELOG}"

eventTimestamp:
  pattern: "dd/MMM/yyyy:HH:mm:ss Z"
```

Configure Log Analytics Using Job Files

Related pages:

- [Analytics Log Data](#)(see page 3056)
- [Configure Log Analytics Using Source Rules](#)(see page 3159)

This page describes how to configure log sources using job files. If you are configuring new log sources, we recommend you use the Centralized Log Management UI to define source rules.

To configure log analytics using job files:

1. [Describe the Log Source in a Job File](#)(see page 3179)
2. [Map the Log File Data to Analytics Fields](#)(see page 3183)
3. [Verify Analytics Agent Properties](#)(see page 3187)

Describe the Log Source in a Job File

Each log source is represented by a job file. A job file is a configuration file that specifies the following:

- Location of the source log file
- Pattern for capturing records from the log file
- Pattern for structuring the data from the captured log records
- Other options for capturing records from the log source

To define a source, you create a job file (or modify one of the samples) in the Analytics Agent configuration directory. The Analytics Agent includes sample job files for Glassfish, OSX log, and others. The Analytics Agent can also collect and parse GZIP files - (log files ending in .gz).

The job files are located in the following directory:

- <Analytics_Agent_Home>/conf/job/

The agent reads the job files in the directory dynamically, so you can add job files in the directory without restarting the agent.

To configure a job file, use these configurable settings in the file:

- **enabled:** Determines whether this log source is active. To capture analytics data from this log source, set the value to true.
- **source:** Specifies the source of the logs.
 - **type:** Specifies the type of log source. There are two types, file, and syslog. Additional parameters depend on the value of **type**.
 - **file:** The location and name of the log file to serve as a log source. The location must be on the same machine as the analytics-agent. File has the following parameters:
 - **path:** Path to the directory where the log files reside. On Windows, the path should be provided as if on Unix environments such as:
 - Example: demo/logs
 - Example: C:/app/logs
 - **nameGlob:** A string to use to match on the log file name. You can use wild cards and you can specify whether to match files one level deep or all log files in the path directory structure. If the wild card starts the value of nameGlob, you must enclose the value in quotes. The matching patterns that are supported can be found here: <http://java.boot.by/ocpjp7-upgrade/ch06s05.html> under "glob".
 - Example for multi-level matching:

```
path: /var/log
nameGlob: '**/*.log'
```

 This matches both /var/log/apache2/logs/error.log and /var/log/cassandra/system.log
 - Example of one level matching:

```
path: /var/log
nameglob: '*/*.log'
```

 This searches for .log files one level deep in the /var/log directory (matches on /var/log/cassandra/system.log but not on /var/log/apache2/logs/error.log).
 - **startAtEnd:** If set to true allows tailing the file from the end.
 - **syslog:** See [Collect Log Analytics Data from Syslog Messages](#)(see page 3175).
- **multiline:** For log files that include log records that span multiple lines (spanning multiple line breaks) configure the multiline property and indicate how the individual records in the log file should be identified. A typical example of a multiline log record is one that includes a Java exception. You can use one of two options with the multiline property to identify the lines for a multiline log record:
 - **startsWith:** A simple prefix that matches the start of the multiline log record.
Example 1: To capture the following multiline log as one record:

```
[#|2015-09-24T06:33:31.574-0700|INFO|glassfish3.1.2|
com.appdynamics.METRICS.WRITE|_ThreadID=206;_ThreadName=Thread-2;|
NODE PURGER Completed in 14 ms|#]
```

You could use this:

```
multiline:
  startsWith: "[#|"
```

Example 2: To capture the following multiline log as one record:

```

May 5, 2016 6:07:02 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit requested amount:245.43000
May 5, 2016 6:07:02 AM

INFO: Source deposit reason code:200
May 5, 2016 6:07:03 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit orderId:7654
May 5, 2016 6:07:03 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit piId:1234B
May 5, 2016 6:07:03 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit referenceNumber:4620346703956702001
May 5, 2016 6:07:03 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit extData requestToken:alf/7wSR9PBh3zSMQ++
+IYTRlk3Ys2D0x0mM5jWLRtyFJaSggCTyFJaSgjSB1/2v0wyTWRV0ekb0X
    
```

You could use this:

```

multiline:
  startsWith: "INFO: Source deposit requested amount"
    
```

- **regex:** A regular expression that matches the multiline log record.

Example: To capture this multiline log as one record:

```

2016-06-01 16:28:21.035 WebContainer : 8 TRANSTART>
=====
2016-06-01 16:28:21.036 WebContainer : 8 MERCHCFG > merchantID=appD,
sendToProduction=true, targetAPIVersion=1.00, keyFilename=(null),
serverURL=(null), namespaceURI=(null), enableLog=true,
    
```

```
logDirectory=logs, logFilename=(null), logMaximumSize=10,
useHttpClient=false, timeout=130
2016-06-01 16:28:21.037 WebContainer : 8 REQUEST >
merchantID=appD
davService_run=true
clientLibraryVersion=2.0.1
clientEnvironment=OS/400/V7R1M0/LINUX
application_id=ff22
exportService_addressWeight=medium
merchantReferenceCode=appD
clientLibrary=Java Basic
billTo_customer=xxxxxxxxxx
billTo_finance=true
billTo_postalCode=94105
billTo_country=US
```

You can use the following regex configuration to identify the start of each "record":

```
multiline:
  regex: "^\\d{4}-\\d{2}-\\d{2} \\d{2}:\\d{2}:\\d{2}\\.\\d{3} WebContainer :
\\d+ TRANSTART\\u003E ===== $"
```

The regex describes that the line should match 4 digits(2016) followed by followed by 2 digits (01), followed by a space, followed by 2 digit(16) ':' 2 digit (28) ':' 2 digits(21) ':' 3 digits(035) space followed by term 'WebContainer' space digit followed by term 'TRANSTART' folowed by '>'.

Whenever the Log tailer sees the matching pattern at the start of the line, it starts a new match and passes the previously collected data as one log record. Each matching pattern identifies when to start accumulating the log lines in a buffer until the matching pattern is found again at the beginning of another record.

If the particular format of a multiline log file does not permit reliable continuation line matching by regular expression, you may choose to use a single line format. For most types of logs, this would result in the capture of the majority of log records.

- **fields:** The fields are used to specify the context of the log data in the Controller UI, by application name, tier name, and so on. Specify the fields as free form, key-value pairs.
- **grok:** The grok parameter specifies the patterns by which the data in the unstructured log record is mapped to structured analytics fields. It associates a named grok expression (as defined in a .grok file that is bundled inside lib/analytics-shared-pipeline-core.jar) to a field in the data as structured by the agent. For example:

```
grok:
  patterns:
    - "\\[%{LOGLEVEL:logLevel}%{SPACE}\\] \\[%{DATA:threadName}\\] \\
[%{JAVAClass:class}\\] %{GREEDYDATA}"
    - "pattern 2"
    ...
```

In this case, the grok-pattern name LOGLEVEL is matched to an analytics data field named logLevel. The regular expression that is specified by the name LOGLEVEL is defined in the file grok-patterns.grok in the grok directory. See [Specifying Grok Expressions](#)(see page 3183).

Previous versions of Log Analytics used a single "pattern" rather than a pattern list. This mode is still supported for backward compatibility.

The log analytics grok processor does not allow underscores in the field names. For example, a field name "log_fields" will not work, Instead, use something like "logfields".

- **keyValue:** The keyValue parameter specifies how to parse the logs to identify key-value pairs with a user-defined delimiter. This enables you to configure the parsing for a message of the type "Key1 = Value1 Key2 = Value 2". See [Specifying Key Value Pairs](#)(see page 3186).
- **transform:** This parameter specifies how to change the type or alias name of any field extracted from the logs by grok or keyValue parameters.
- **eventTimestamp:** This setting defines the pattern for the timestamp associated with captured data.

Map the Log File Data to Analytics Fields

To specify how data in the unstructured log records should be mapped to structured analytics fields for log analytics, you provide the configuration in the job file. You can map unstructured log data in the following ways:

- grok patterns
- key value pairs
- transforms

Specify Grok Expressions

Grok is a way to define and use complex, nested regular expressions in an easy to read and use format. Regular expressions defining discrete elements in a log file are mapped to grok-pattern names, which can also be used to create more complex patterns.

Grok-pattern names for many of the common types of data found in logs are provided for you with the analytics agent. A list of basic grok-pattern names and their underlying structures are bundled inside `lib/analytics-shared-pipeline-core.jar`. You can list the grok files with a command such as the following:

```
unzip -l ./lib/analytics-shared-pipeline-core.jar|grep "\.grok"
```

To can view the definition of a grok file with a command such as the following:

```
unzip -p ./lib/analytics-shared-pipeline-core.jar grok/grok-patterns.grok
```

The grok directory also contains samples of more complex definitions customized for various common log types - `java.grok`, `mongodb.grok`, and so on. Additional grok patterns can be found here: <https://grokdebug.herokuapp.com/patterns#>.

Once the grok-pattern names are created, they are then associated in the jobs file with field identifiers that become the analytics keys.

The basic building block is `%{grok-pattern name:identifier}`, where `grok-pattern name` is the grok pattern that knows about the type of data in the log you want to fetch (based on a regex definition) and `identifier` is your identifier for the kind of data, which becomes the analytics key. So `{IP:client}` would select an IP address in the log record and map it to the key `client`.

Custom Grok Patterns

Complex grok patterns can be created using nested basic patterns. For example, from the `mongodb.grok` file:

```
MONGO_LOG %{SYSLOGTIMESTAMP:timestamp} \[%{WORD:component}\] %
{GREEDYDATA}
```

It is also possible to create entirely new patterns using regular expressions. For example, the following line from `java.grok` defines a grok pattern named `JAVACLASS`.

```
JAVACLASS (?:[a-zA-Z$_][a-zA-Z$_0-9]*\.)*[a-zA-Z$_][a-zA-Z$_0-9]*
```

Because `JAVACLASS` is defined in a `.grok` file in the `grok` directory can be used as if it were a basic grok pattern. In a jobs file, you can use the `JAVACLASS` pattern match as follows:

```
grok:
  pattern: "... \[%{JAVACLASS:class}\]
```

In this case, the field name as it appears in the Analytics UI would be "class". For a full example, see the following files:

- Job file: `<Analytics_Agent_Home>/conf/job/sample-analytics-log.job`
- Grok file: `java.grok` bundled inside `lib/analytics-shared-pipeline-core.jar`

Special Considerations for Backslashes

The job file is in YAML format, which treats the backslash as an escape character. Therefore, to include a literal backslash in the String pattern you need to escape the backslash with a second backslash. You can avoid the need to escape backslashes in the `.job` file grok pattern, by enclosing the grok pattern in single quotes instead of double quotes such as the following:

```
grok:
  patterns:
    - '\[%{DATESTAMP:TIME}%{SPACE}CET\]%{SPACE}%{NOTSPACE:appId}%{SPACE}%{NOTSPACE:appName}%{SPACE}%{NOTSPACE:Severity}%{SPACE}%{NOTSPACE:messageId}:%{SPACE}%{GREEDYDATA}'
```

Numeric Fields

In Release 4.1.3, the grok definition syntax was enhanced to support three basic data types. When defining a pattern in the `.grok` file you can specify the data type as number, boolean, or string. If a Grok alias uses that grok definition in a `.job` file then the extracted field is stored as a number or boolean. Strings are the default. If the number or boolean conversion fails, then a log message appears in the agent's log file. No validations are performed as it is not possible to reverse engineer a regex reliably. These are pure runtime extractions and conversions.

Upgrade pre-4.1.3 Job Files

Click to expand...

For 4.1.2 (or older) `.job` files in use that have fields that are unspecified or specified as `NUMBER` and now switch to the "type aware" files, the data inside Events Service will break. This is due to the type mapping. To avoid this, you need to modify the grok alias in your job files.

Examples:

```
Was:
grok:
  patterns:
    - "%{DATE:happenedAt},%{NUMBER:quantity}"

Update job to:
grok:
  patterns:
    - "%{DATE:happenedAt},%{NUMBER:quantity_new}"
```

```
Was:
grok:
  patterns:
    - "%{DATE:happenedAt},%{DATA:howMany}"

Update job to:
grok:
  patterns:
    - "%{DATE:happenedAt},%{POSINT:howManyInt}"
```

To Upgrade (Migrate) < 4.1.3 Job Files:

1. Stop analytics-agent.
2. Change .job files that use the enhanced grok patterns:

```
BOOL:boolean
INT:number
BASE10NUM:number
NUMBER:number
POSINT:number
NONNEGINT:number
```

Change the grok alias so as not to conflict with the older aliases:

```
grok:
  patterns:
(Old) - "%{DATE:quoteDate},%{NUMBER:open},%{NUMBER:high},%
{NUMBER:low},%{NUMBER:close},%{NUMBER:volume},%
{NUMBER:adjClose}"
```

```
(New aliases) - "%{DATE:quoteDate},%{NUMBER:openNum},%
{NUMBER:highNum},%{NUMBER:lowNum},%{NUMBER:closeNum},%
{NUMBER:volumeNum},%{NUMBER:adjCloseNum}"
```

3. Start analytics-agent.

Specifying Key-Value Pairs

This section of the mapping configuration captures key-value pairs from fields specified by the `source` parameter. The values listed under `source` should refer to fields that were defined and captured by a grok pattern. For example, if you have a grok parameter that defines the following pattern "%{DATA:keyValuePairs}" then you can list the field "keyValuePairs" under the `source` parameter to capture any key-value pairs listed in the "keyValuePairs" string. If the `source` parameter is not specified then the agent attempts to extract key-value pairs from the entire log message. The result can be different than expected if the message contains more information than just key-value pairs.

The Key Value mapping contains these fields:

- **source:** A list of strings on which the keyValue filter should be applied. It is an optional field. If it is not provided the key-value pairs are parsed from the original log "message" string.
- **split:** The delimiter defined by the user to separate out the key from the value. In this example, key=value, the split delimiter between the key and the value is the equal sign =
- **separator:** The delimiter defined by the user to separate out two key-value pairs. In this example, key1=value1;key2=value2, the separator is the semi-colon ;
- **include:** A list of key names that the user wants to capture from the "source". If nothing is provided in "include" we capture all the key-value pairs.
- **trim:** A list of characters the user wants to remove from the starting and/or the end of the key/value before storing them.

The sample-glassfish-log.job file includes key-value pairs configuration. This file is found here: `<analytics_agent_home>/conf/job/`.

Key-Value Pairs Example

For a log file with the following entries:

```
[#I2015-09-24T06:33:31:574-0700|INFO|glassfish3.1.2|com.appdynamics,METRICS.WRITE|
_ThreadID=200;_ThreadName=Thread-2;|NODE PURGER Complete in 14 ms|#]

[#I2015-09-24T06:33:46:541-0700|INFO|glassfish3.1.2|
com.singularity.ee.controller.beans.license.LicenseUsageManagerBeanWRITE|
_ThreadID=202;_ThreadName=Thread-2;|about to start persisting license usage data|#]
```

And the following grok pattern:

```
grok:
  patterns:
    - "\\[#\\#\\|%{DATA}\\|%{LOGLEVEL:logLevel}\\|%
{DATA:serverVersion}\\|%{JAVACLASS:class}\\|%
{DATA:keyValuePairs}\\|%{GREEDYDATA}"
```

The key-value parameter to extract the ThreadID and the ThreadName should look similar to the following:

```
keyValue:
  source:
    - "keyValuePairs"
  split: "="
  separator: ";"
  include:
    - "ThreadID"
    - "ThreadName"
  trim:
    - "_"
```

Specify Transform Parameters

This section of the mapping configuration enables you to change the type or alias name of any field previously extracted from the logs by your grok or key value configuration. The transform is applied after all fields have been captured from the log message. You can specify a list of field names, where you want to cast the value to a specific type or rename the field with an "alias".

The Transform mapping contains these fields:

- **field:** Specifies the name of the field to transform and can not be empty or null. If `field` is defined, either type or alias must be specified. If neither is specified, an error is written to the `analytics-agent.log` file.
- **alias:** The new name for the field.
- **type:** The value type for the field. Valid values are:
 - NUMBER
 - BOOLEAN
 - STRING - default is STRING

Verify Analytics Agent Properties

In addition to configuring the log source in the job file, you should verify the values in the `analytics-agent.properties` file found in the `conf` directory. Confirm these property values:

- `http.event.endpoint` should be the location of the Events Service.
 - For SaaS controllers the URL is one of the following:
 - `https://analytics.api.appdynamics.com:443` (North America)
 - `https://fra-ana-api.saas.appdynamics.com:443` (Europe)
 - `https://syd-ana-api.saas.appdynamics.com:443` (APAC)
 - For on-premises installations use whatever host and port you have configured. In clustered environments, this is often a load balancer.
- The `http.event.accountName` and `http.event.accessKey` settings should be set to the name and the key of the account in the Controller UI with which the logs should be associated. By default, they are set to the built-in account for a single tenancy Controller.
- The `pipeline.poll.dir` setting specifies where the log configuration files are located. This would not normally be changed unless you want to keep your files in a different location.
- `ad.controller.url` should match your AppDynamics controller URL and port.

Troubleshoot Logs

If log capture is working correctly, logs should start appearing in the Log tab in the Analytics UI. It can take some time for logs to start accumulating. Note the following troubleshooting points:

- If nothing appears in the log view, try searching over the past 24 hours.
- Timezone discrepancies between the logs and the local machine can cause log entries to be incorrectly excluded based on the selected timeframe in the Controller UI. To remediate, try setting the log files and system time to UTC or logging the timezone with the log message to verify.
- An inherent delay in indexing may result in the "last minute" view in the UI consistently yielding no logs. Increase the time range if you encounter this issue.

Troubleshoot Patterns

To help you troubleshoot the data extraction patterns in your job file, you can use the two debug REST endpoints in the Analytics Agent:

- `http://<Analytics_Agent_host>:<Analytics_Agent_http_port>/debug/grok`: [For testing grok patterns\(see page 3188\)](#)
- `http://<Analytics_Agent_host>:<Analytics_Agent_http_port>/debug/timestamp`: [For testing timestamp patterns\(see page 3190\)](#)

In the following examples, the Analytics Agent host is assumed to be `localhost` and the Analytics Agent port is assumed to be `9090`. To configure the port on your Agent, use the property `ad.dw.http.port` in `<Analytics_Agent_Home>/conf/analytics-agent.properties`.

In the Analytics Agent version ≥ 21.7 the `debug/grok` endpoint is disabled by default. To enable the endpoint, start the Analytics Agent with the property `ad.debug.grok.endpoint.enabled=true` in `agent.properties` file.

The Grok Endpoint

Click to expand...

The Grok tool works in two modes: extraction from a single line log and extraction from a multi-line log. To get a description of usage options:

```
curl -X GET http://localhost:9090/debug/grok
```

Single Line

In this mode, you pass in (as a POST request) a sample line from your log and the grok pattern you are testing, and you receive back the data you passed in organized as key/value pairs, where the keys are your identifiers.

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode "logLine=LOG_LINE" --data-urlencode "pattern=PATTERN"
```

For example, the input:

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode "logLine=[2014-09-04T15:22:41,594Z] [INFO ] [main] [o.e.j.server.handler.ContextHandler] Started i.d.j.MutableServletContextHandler@2b3b527{/ ,null,AVAILABLE}" --
```

```
data-urlencode "pattern=\\[%{LOGLEVEL:logLevel}%{SPACE}\\] \\[%{DATA:threadName}\\] \\[%{JAVACLASS:class}\\] \\[%{GREEDYDATA}]"
```

would produce this output:

```
{
  threadName => main
  logLevel => INFO
  class => o.e.j.server.handler.ContextHandler
}
```

The input:

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode "logLine=2010-05-05,500.98,515.72,500.47,509.76,4566900,509.76" --data-urlencode "pattern=%{DATE:quoteDate},%{DATA:open},%{DATA:high},%{DATA:low},%{DATA:close},%{DATA:volume},%{GREEDYDATA:adjClose}"
```

would produce this output:

```
{
  open => 500.98
  adjClose => 509.76
  volume => 4566900
  quoteDate => 10-05-05
  high => 515.72
  low => 500.47
  close => 509.76
}
```

Multi-line

The multi-line version uses a file stored on the local filesystem as the source input.

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode "logLine=`cat FILE_NAME`" --data-urlencode "pattern=PATTERN"
```

where FILE_NAME is the full path filename of the file that contains the multi-line log.

The Timestamp Endpoint

Click to expand...

The timestamp tool extracts the timestamp from a log line in Unix epoch time.

To get a description of usage options:

```
curl -X GET http://localhost:9090/debug/timestamp
```

In this mode, you pass in (as a POST request) a sample line from your log and the timestamp pattern you are testing, and you receive back the timestamp contained within the log line.

```
curl -X POST http://localhost:9090/debug/timestamp --data-  
urlencode "logLine=LOG_LINE" --data-urlencode "pattern=PATTERN"
```

For example, the input:

```
curl -X POST http://localhost:9090/debug/timestamp --data-  
urlencode "logLine=[2014-09-04T15:22:41,237Z] [INFO ] [main]  
[io.dropwizard.server.ServerFactory] Starting DemoMain" --data-  
urlencode "pattern=yyyy-MM-dd'T'HH:mm:ss,SSSZ"
```

would produce this output Unix epoch time:

```
{  
  eventTimestamp => 1409844161237  
}
```

The input:

```
curl -X POST http://localhost:9090/debug/timestamp --data-  
urlencode "logLine=Nov 17, 2014 8:21:51 AM  
com.foo.blitz.processor.core.hbase.coprocessor.endpoint.TimeRoll  
upProcessEndpoint$HBaseDataFetcher callFoo1" --data-urlencode  
"pattern=MMM d, yyyy h:mm:ss aa"
```

would produce this output Unix epoch time:

```
{
  eventTimestamp => 1416212511000
}
```

Sample Log Analytics Job Files

A number of sample job files are shipped with the Analytics Agent. These files can be found at `<analytics-agent-home>/conf/job`.

The sample job files include:

- Analytics logs: sample-analytics-log.job
- Analytics logs with requestGUID config example: sample-analytics-log-with-request-guid.job
- Apache access logs: sample-apache-httpserver-access-log.job
- Apache access logs with syslog config example: sample-apache-httpserver-access-sysloglog.job
- Apache error logs: sample-apache-httpserver-error-log.job
- Cassandra logs: sample-cassandra-log.job
- CouchDB logs: sample-couchdb-log.job
- Glassfish logs: sample-glassfish-log.job
- IIS logs: sample-iis-log.job
- Java Agent logs: sample-java-agent-log.job
- Jetty error logs: sample-jetty-error-log.job
- Jetty request logs: sample-jetty-request-log.job
- Log4J: sample-log4j.job
- MongoDB logs: sample-mongodb-log.job
- MySQL error logs: sample-mysql-error-log.job
- Nginx access logs: sample-nginx-access-log.job
- Nginx error logs: sample-nginx-error-log.job
- OS X system logs: sample-osx-system-log.job
- Postgres logs: sample-postgres-log.job
- Redis logs: sample-redis-log.job
- Stock quotes: sample-stock-quotes-csv.job
- WebLogic logs: sample-weblogic-log.job

Migrate Log Analytics Job Files to Source Rules

Related pages:

- [Upgrade Analytics Agent](#)(see page 3107)

The Centralized Log Management UI enables you to configure your log data sources using source rules. Manually created job files are no longer needed.

We recommend that you convert your log source configuration from job files (job files were used for configuration < 4.3) to source rules.

1. Confirm that you have upgraded your Controller, Events Service, and Analytics Agent to 4.4. See these corresponding upgrade pages:
 - [Upgrade the Controller Using the Enterprise Console](#)¹⁸⁸³
 - [Upgrade the Events Service Using the Enterprise Console](#)¹⁸⁸⁴
 - [Upgrade Analytics Agent](#)(see page 3107)
2. Use the Centralized Log Management UI to create source rules for your existing job files by importing the configuration from your old job file to a new source rule.

¹⁸⁸³ <https://docs.appdynamics.com/display/PRMY21/Upgrade+the+Controller+Using+the+Enterprise+Console+v21.5>

¹⁸⁸⁴ <https://docs.appdynamics.com/display/PRMY21/Upgrade+the+Events+Service+Using+the+Enterprise+Console+v21.5>

Be sure to use either '**Parsing time range**' or '**End of log file**'. If you do not use this, you will double collect all the log files that have already been tailed by the job file. Read [Timing Notes](#)(see page 3192) for more information to help you decide on your collection timing settings.

When you save the source rules, they are in the disabled state by default.

3. Map the source rules to an Agent Scope.
4. Enable the new source rules through the UI.
5. Disable the job files that are actively collecting log analytics data. You do this by manually editing the job file and changing the enabled property to false. See [Configure Log Analytics Using Job Files](#)(see page 3179).
6. After you have migrated all your job file configurations to source rules, you can completely disable the use of job files by clicking "**Disable Field Extraction With Job Files**". This action can not be reversed and you will not be able to use job files after performing this action. Only trigger this action once you have completely moved to source rules created through the Centralized Log Management UI.

Timing Notes

By default, the controller communicates new configuration information to the Analytics Agent every five minutes. So it could be up to five minutes before the agent starts tailing your log file using the new source rule configuration. On the other hand, if you have both a job file *and* a source rule enabled for the same log data, the data is collected twice. To avoid this situation, you can use configuration settings to specify when to start collecting the log data:

- At the end of the file (UI field = **Start collecting from End of log file**)

- During a specific time range (UI field = **Parsing time range**)

The screenshot shows the 'Add Source Configuration' interface with the following fields and settings:

- Source Name:** glassfish server log
- Source Type:** glassfish-server-log
- Source File:** test
- Enable path extraction:** (disabled)
- Start collecting from:**
 - Beginning of log file
 - End of log file
- Parsing time range:** Last Hours

See the section describing the configuration settings on the "*General Configuration Tab*" in [Configure Log Analytics Using Source Rules](#)(see page 3159).

Be sure to disable the job file once you have enabled the source rule to collect the Log Analytics data. You can verify that the new source rule is collecting data correctly by waiting until the new log records appear in the Analytics Search UI data grid. One way to distinguish between the log data collected by a job file or a source rule is to use a different source type in the source rule.

Business Transaction and Log Correlation

Works with:

(see page 1281)

This page provides instructions on the correlation between Business Transaction requests and logs. When investigating the cause of slowdowns/outages in your business applications, the problem does not always originate in the application code. Any additional information from application or machine logs can be helpful in your DevOps teams' investigation. One way to see supporting data that impacts the business transaction is to analyze logs for that transaction.

By configuring business transactions for GUID Injection, you can correlate logs to specific business transaction requests. This can be helpful when you see slow transactions and the call graph does not give you enough information to get to the root cause. You can use this feature to get the full context related to a failed or slow transaction.

Correlating specific instances of your business transactions to the related logs works by injecting the same requestGUID of the business transaction into the associated logs through our Java Agent. This helps you to quickly find the relevant logs from multiple tiers and nodes for a specific business transaction.

Visibility for this correlation requires both Transaction Analytics and Log Analytics licenses. See [License Entitlements and Restrictions](#)¹⁸⁸⁵.

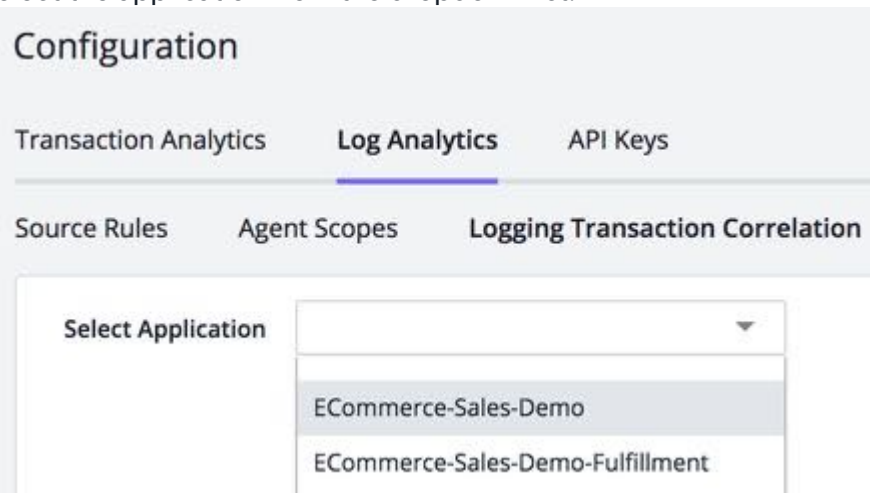

Configuring GUID Injection

This feature supports the following Java logging frameworks:

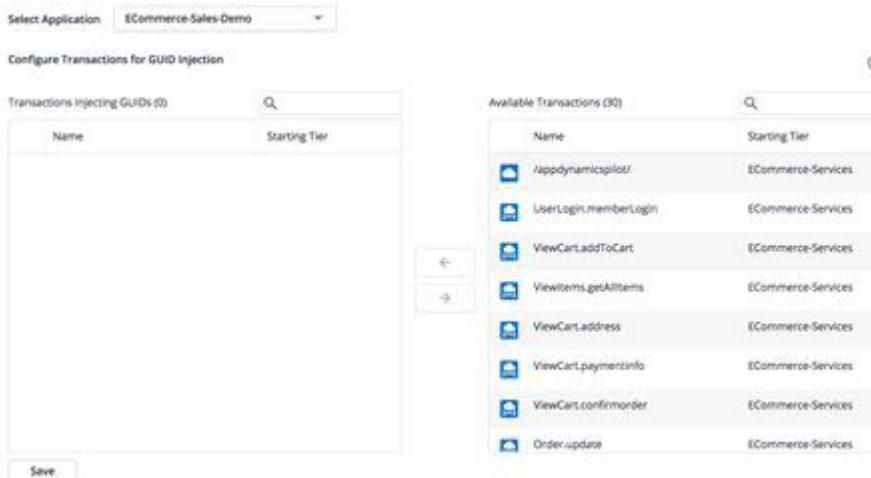

- Apache log4j versions 1.2.12 to 1.2.17 and 2.6.2 to 2.13.2.
- logback versions 1.0.0 to 1.2.3. Any version before 1.0.0 is not supported.

To enable transaction to log correlation, use the following steps. You must select the business transactions and specify the logging format.

1. Select business transactions for log correlation. This is how you specify to the Java Agent which business transactions you are interested in.
 - a. In the Controller UI, click **Analytics > Configuration**. Then select **Log Analytics > Logging Transaction Correlation**.
 - b. Select the application from the dropdown list:

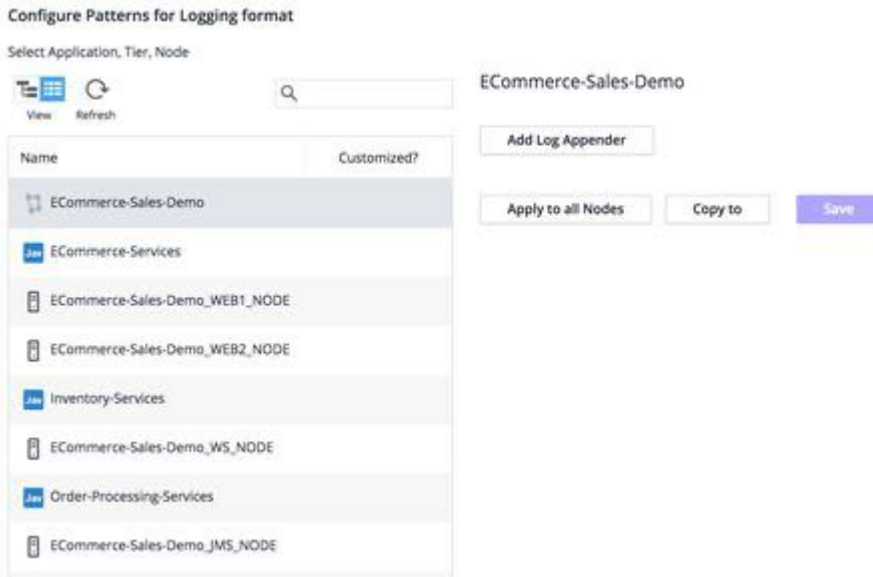

- c. Scroll down to the section **Configure Transactions for GUID Injection**:

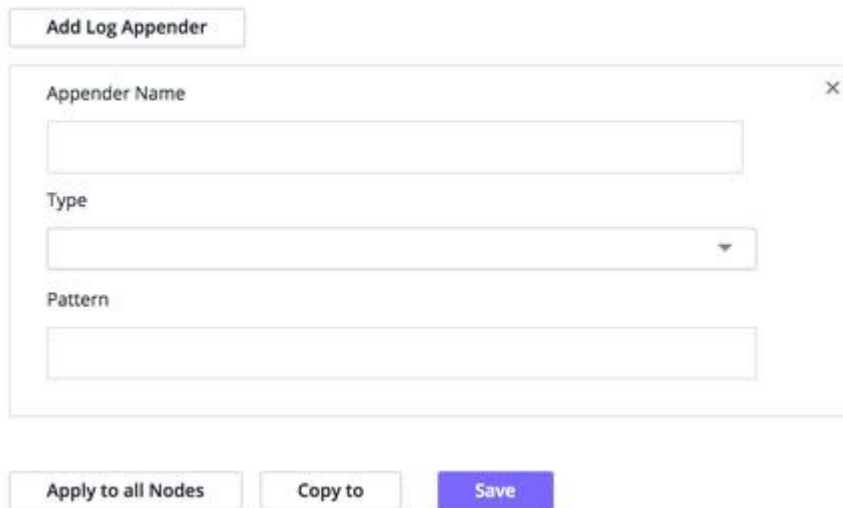

1885 <https://docs.appdynamics.com/display/PRO21/License+Entitlements+and+Restrictions>

- d. Add transactions from the right-hand list to the left-hand list and **Save**.
 - e. Proceed to the next step. You must also configure the logging patterns before you can see correlated logs.
2. Define how the injected information appears in the logs. You need to know the appender name and pattern for your application logging framework so you can properly configure this feature. In simple terms, a pattern is responsible for formatting a logging request and an appender takes care of output destination. You can configure this through the Controller UI as described here. You can also add the appender directly to your code. See [Add Appender in Your Source Code](#)(see page 3196).
- a. On the Analytics Configuration window, scroll to the section **Configure Patterns for Logging format**.
 - b. Select application, tier, or node where you want to collect correlated logs.

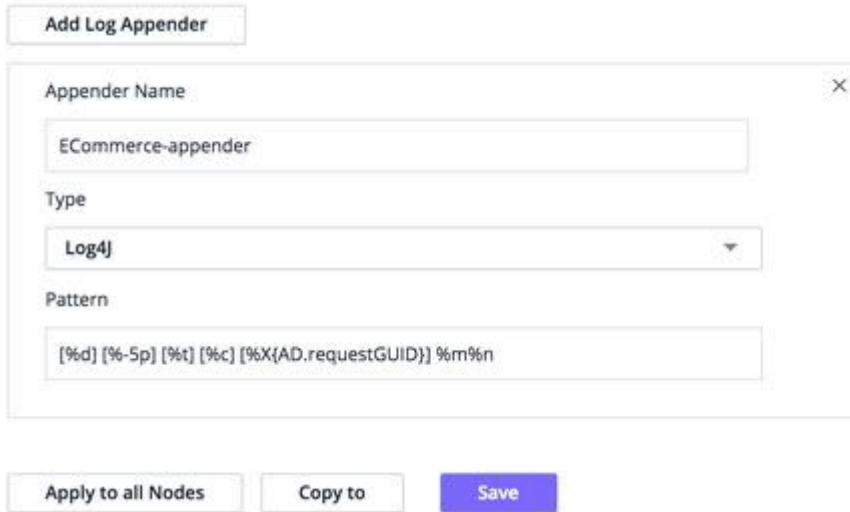

- c. Enter the Appender name and choose the log framework.
ECommerce-Sales-Demo

- d. Enter the pattern and the request GUID string. You can add the request GUID anywhere in the pattern. The request GUID must match the following exactly:

```
[%X{AD.requestGUID}]
```

For example, the following screenshot shows the standard log4j pattern plus the request GUID:

Detail of Log4j example with the request GUID string:

```
[%d] [%-5p] [%t] [%c] [%X{AD.requestGUID}] %m%n
```

- Restart the affected application to enable the logger to pick up the new logging configuration.

Add Appender in Your Source Code

If you have access to the source code for your application, you can also add the appender to the `log4j.properties` file directly. Here is an example of what that might look like with the request GUID in **BOLD**:

```
log4j.appender.order-file-appender=org.apache.log4j.FileAppender
log4j.appender.order-file-appender.File=logs/telecom-order.log
log4j.appender.order-file-appender.layout=org.apache.log4j.PatternLayout
log4j.appender.order-file-appender.layout.ConversionPattern=[%d] [%-5p] [%t] [%c]
[%X{AD.requestGUID}] %m%n
log4j.logger.com.appdynamics.order=DEBUG, order-file-appender
log4j.additivity.com.appdynamics.order=false
```

Extracting Request GUID From the Source Rule Configuration

To enable searching logs by request GUID and to view correlated logs and transaction data, use the following steps:

- In the Controller UI, click **Analytics > Configuration > Log Analytics > Source Rule**.

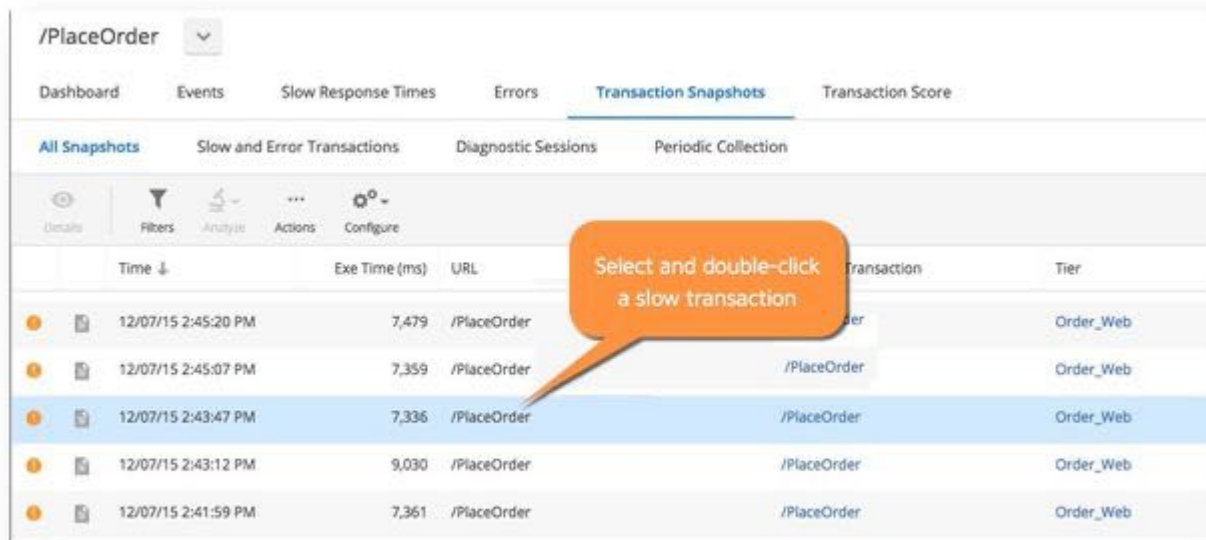

2. Extract the request GUID field in the log source rule configuration. See [Field Extraction for Source Rules](#)¹⁸⁸⁶.
 - a. If Manual Field Extraction is selected, the following regular expression can be used to configure request GUID: `AD_REQUEST_GUID\[(?<requestGUID>.*)\]\]`.

Viewing Correlated Logs and Transaction Data

Once you have configured GUID injection, you can search the log files from a number of points in the Controller. Correlation only works when there are logs with the associated GUID in the given time range for an application where this feature is configured. The **Search Logs By Request GUID** button appears when there are logs for the snapshot request GUID in the snapshot time range.

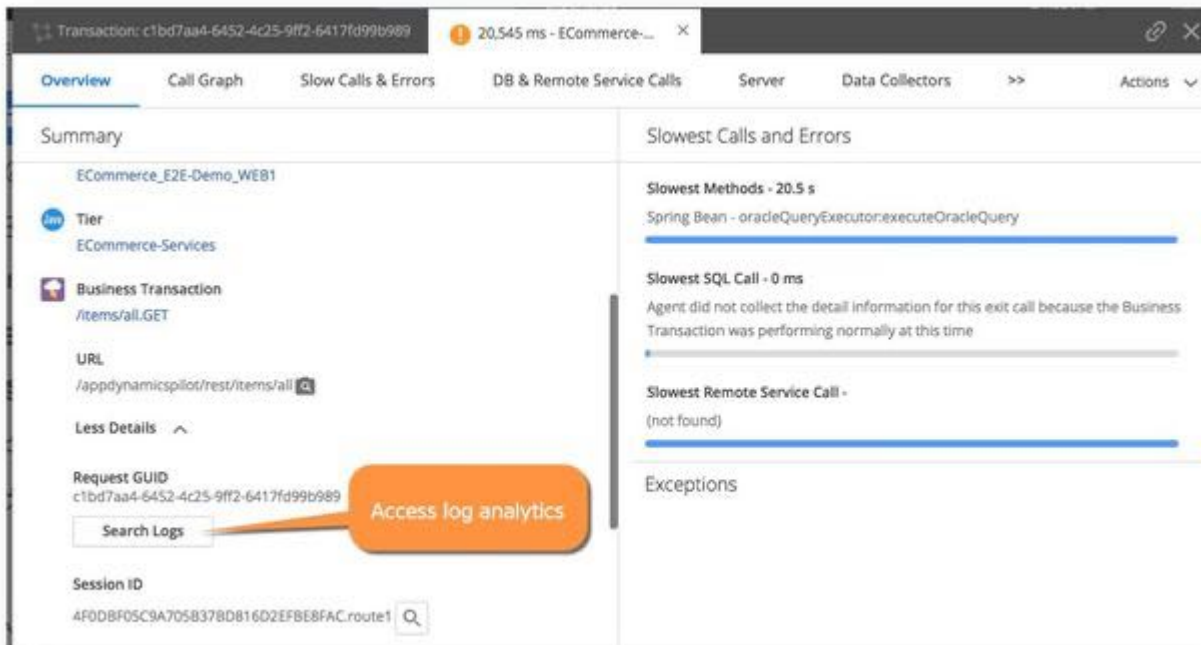

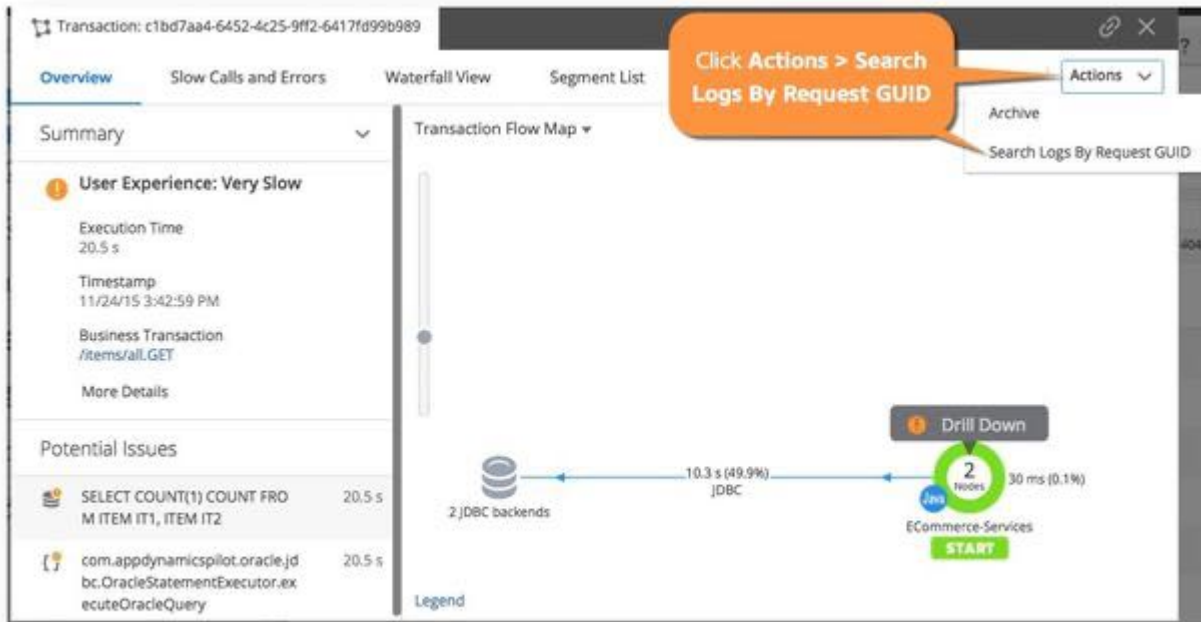

APM to Analytics: From a business transaction snapshot

1. Locate a slow transaction or other transaction that you want to troubleshoot.

2. Click **More Details** > **Search Logs** or use **Actions** > **Search Logs By Request GUID**.

¹⁸⁸⁶ <https://docs.appdynamics.com/21.8/en/analytics/configure-analytics/collect-log-analytics-data/configure-log-analytics-using-source-rules/field-extraction-for-source-rules>

From the log details in this example, you can see that the reason this transaction was slow is that the order processing queue was full and it took many retries before the order could complete.

12/07/15 2:43:56 PM	[2015-12-07 22:43:54,593] [INFO] [org.springframework.jms.listener.DefaultMessageListenerContainer#0-1] [com.appdynamics.provision.OrderMessageListener] [AD_REQUEST_GUID[8f34fb97-b5fa-4f80-93a9-b56e0c75d222]] Received a message to process the order Order_506932 for the user timmy@lamelectrics.com	8f34fb97-b5fa-4f80-93a9-b56e0c75d222

Transaction Analytics to Log Analytics

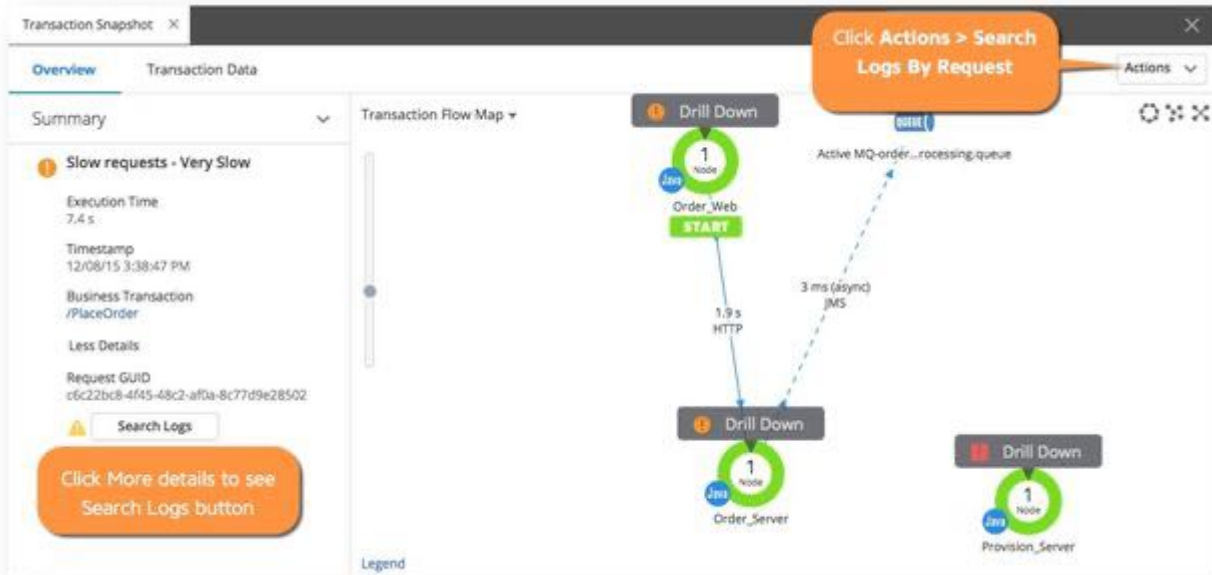

You can select relevant transactions from any transaction analytics search and see details.

1. Select the transaction, then double-click or click **Details** in the **Action** toolbar.

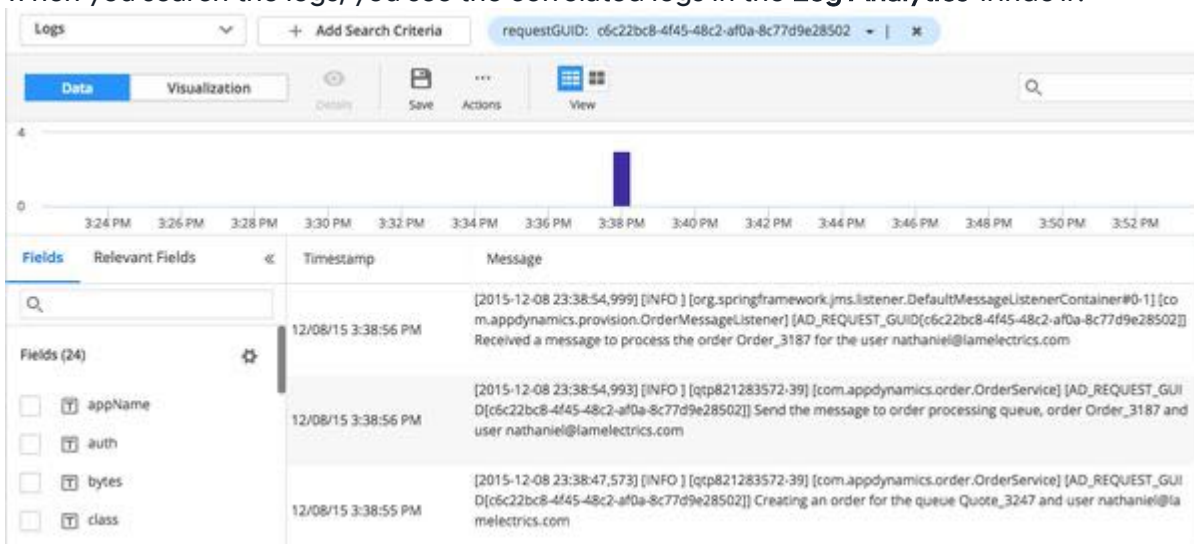

The screenshot shows the Transaction Analytics interface. At the top, there are tabs for 'Data' and 'Visualization'. Below the tabs is a bar chart showing transaction counts over time. A table below the chart displays transaction details. An orange callout bubble points to a transaction in the table with the text 'Select the transaction, double-click or click Details'.

Fields	Relevant Fields	User Experience	Response Time (Ms)	Business Transaction	Tier
		✓		21 /PlaceOrder	Order_Web
		✓		19 /PlaceOrder	Order_Web
		✓		17 /PlaceOrder	Order_Web
		⚠	7,433	/PlaceOrder	Order_Web
		✓		23 /PlaceOrder	Order_Web

2. On the **Overview** tab, you have two ways to search the logs by request GUID.

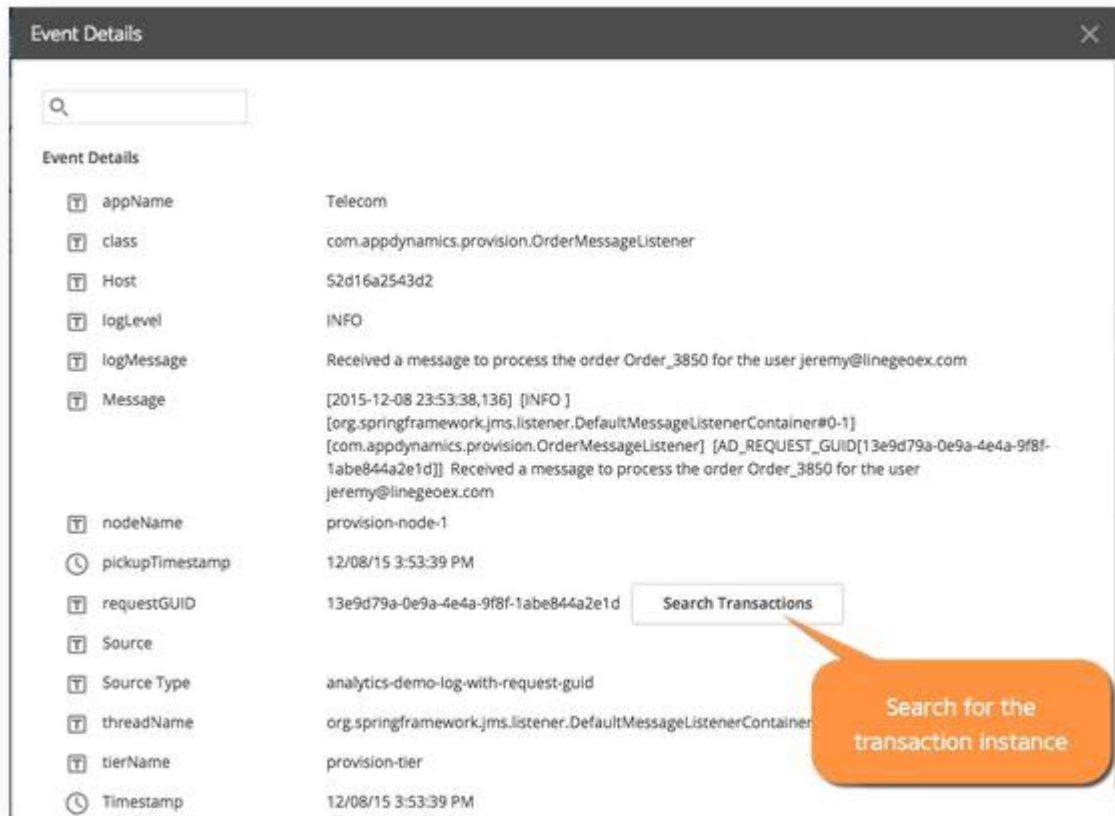

3. When you search the logs, you see the correlated logs in the **Log Analytics** window.

From Log Analytics to Transaction Analytics

You can select a log from any log analytics search and see the Event Details.

1. Select the log, then double-click or click **Details** in the **Action** toolbar. You can see the **Event Details** window.

2. Use the **Search Transactions** button to find the relevant business transaction in transaction analytics data.

Deploy Analytics in Kubernetes

This page describes deployment options for Transaction Analytics and Log Analytics instrumented with AppDynamics app server agents in Kubernetes applications.

Transaction Analytics (except for Java and .NET Agent) and Log Analytics require that an Analytics Agent is deployed with an app server agent.

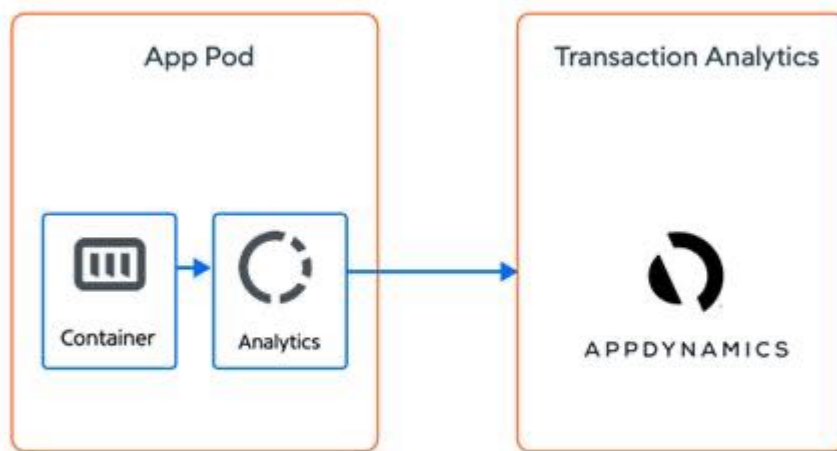

i For Transaction Analytics, the Java Agent $\geq 4.5.15$ or the .NET Agent ≥ 20.10 supports "agentless" analytics, which does not require that an Analytics Agent is deployed. See [Deploy Analytics Without the Analytics Agent](#)(see page 3127).

Transaction Analytics

The Analytics Agent acts as a proxy between the app server agent and the Events Service. See [Deploy Analytics With the Analytics Agent](#)(see page 3076).

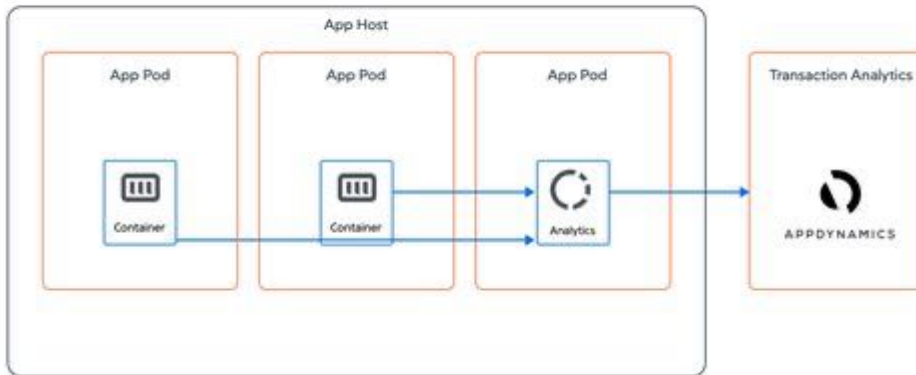

There are two deployment options for the Analytics Agent to support Transaction Analytics on a Kubernetes application.

1. A sidecar to the application container.

In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container.

2. A shared agent where a single Analytics Agent is deployed on each Kubernetes worker node. Each pod on the node will use that Analytics Agent to communicate with the Events Service.

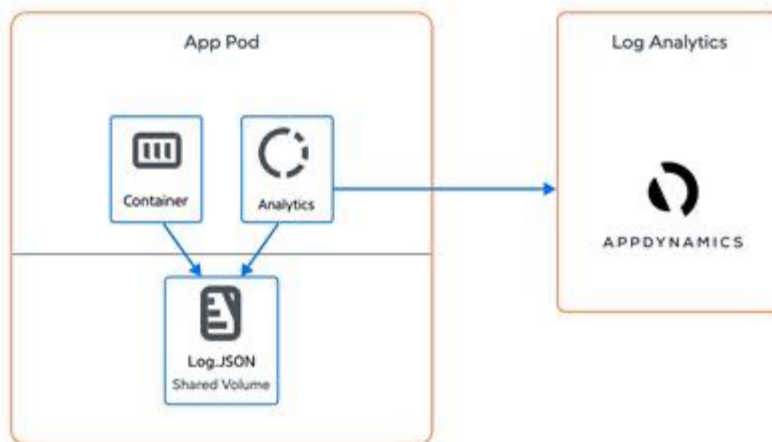

In this model, the Analytics Agent is deployed as a Daemonset.

Log Analytics

Once deployed, the Analytics Agent has access to the application's logs and can send log data to the Events Service.

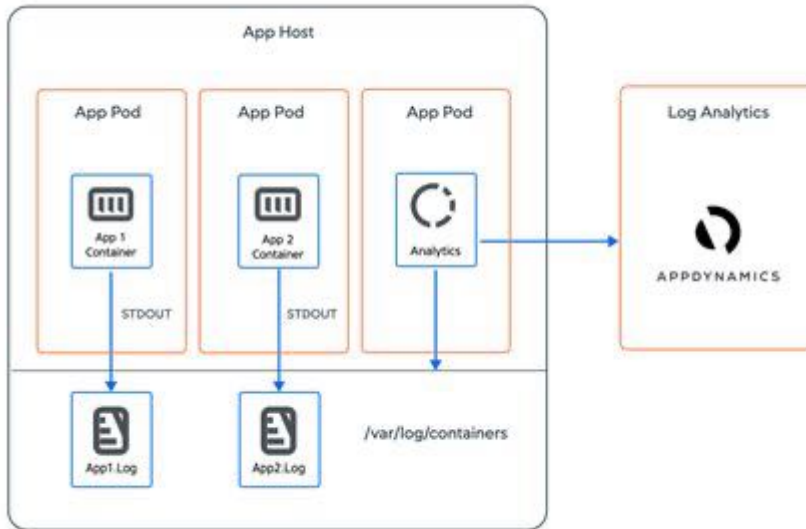

There are three deployment options for the Analytics Agent to support Log Analytics on a Kubernetes application.

1. A sidecar to the application container.

In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container. The Analytics Agent and application container are configured to share a volume where the application logs are written.

- If the application bypasses the container filesystem and emits log data to STDOUT and STDERR, the Analytics Agent can be deployed on each Kubernetes worker node. The Analytics Agent can access the log output for every application container on the worker node's file system, stored by Kubernetes under `/var/log/containers` as a unique file per container.

In this model, the Analytics Agent is deployed as a Daemonset.

i For some Kubernetes distributions such as OpenShift, the Analytics Agent will require elevated permissions to access the files under `/var/log/containers`.

- If a syslog provider is available in the Kubernetes cluster, the Analytics Agent can be deployed to receive syslog messages with TCP transport. A single Analytics Agent instance is required per syslog provider. See [Collect Log Analytics Data from Syslog Messages](#)(see page 3175).

For Transaction and Log Analytics, the sidecar approach is simpler to deploy, but consumes more cluster resources because it requires one additional container per application pod. The shared agent approach adds another deployment object to manage, but can significantly reduce the overall resource consumption for a cluster.

Example Configurations to Deploy the Analytics Agent

The following deployment specs are specific examples of how to implement the deployment options explained above. In addition, see [Install the .NET Agent for Linux in Containers](#)(see page 767) and [Install the Node.js Agent in Containers](#)(see page 821) for best practices on how to set the Analytics Agent host, port, and SSL environment variables.

Transaction Analytics: Deployment Spec Using A Sidecar

The following deployment spec defines two containers, the application container `flight-services`, which uses an image instrumented with an app server agent, and the Analytics Agent container `appd-analytics-agent`, which uses the Analytics Agent from Docker Hub, docker.io/appdynamics/analytics-agent:latest¹⁸⁸⁷.

The `appd-analytics-agent` container leverages a ConfigMap and Secret to configure the Events Service credentials required by the Analytics Agent, including the account access key and global account name. See [Install Agent-Side Components](#)(see page 3081).

As a sidecar, the Analytics Agent is available at `localhost` and uses the default port `9090`. The app server agent will connect automatically and no additional configuration is required.

Transaction Analytics: Deployment Specs Using A Shared Analytics Agent

The following deployment spec is for the same `flight-services` application, but instead of using a sidecar, it references a shared Analytics Agent deployed separately as a Daemonset. The `flight-services` container sets the agent environment variables `APPDYNAMICS_ANALYTICS_HOST` and `APPDYNAMICS_ANALYTICS_PORT` to the `analytics-proxy` service for the shared Analytics Agent defined in the example below.

```

apiVersion: apps/v1
kind: Deployment
metadata:

```

¹⁸⁸⁸ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.3-Analytics/app/deploy/flight-services.yaml>

¹⁸⁸⁹ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.3-Analytics/app/dependencies/controller-info.yaml>

¹⁸⁹⁰ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.3-Analytics/app/dependencies/secret>

```

    port: 9090
    targetPort: 9090
status:
  loadBalancer: {}

```

The full deployment spec can be found in the [Machine Agent YAML File](#)¹⁸⁹². The appdynamics-infraviz service account is defined in the [RBAC YAML File](#)¹⁸⁹³. The ma-log-config ConfigMap is defined in the [Machine Agent Log Config File](#)¹⁸⁹⁴.

A best practice is to deploy the shared Analytics Agent in a dedicated namespace (typically appdynamics) separate from the namespaces used by applications.

```
$ kubectl -n appdynamics apply -f analytics-agent.yaml
```

To provide access to the shared Analytics Agent from an application namespace:

1. An ExternalName service is required to map a service name (analytics-proxy in the example) to the DNS name of appd-infra-agent-service created previously:

```

kind: Service
apiVersion: v1
metadata:
  name: analytics-proxy
spec:
  type: ExternalName
  externalName: appd-infra-agent-service.appdynamics.svc.cluster.local
  ports:
  - port: 9090
    targetPort: 9090

```

2. Create this service in each application namespace where an App Server Agent is deployed:

¹⁸⁹² <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.5-MachineAgent/machine-agent.yaml>

¹⁸⁹³ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.5-MachineAgent/rbac.yaml>

¹⁸⁹⁴ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.5-MachineAgent/ma-log-config.yaml>

```
$ kubectl -n <app namespace> apply -f analytics-proxy.yaml
```

- Note that `analytics-proxy` is the value of `APPDYNAMICS_ANALYTICS_HOST` used in the `flight-services` deployment spec.

```
- name: APPDYNAMICS_ANALYTICS_HOST
  value: analytics-proxy
```

Log Analytics: Deployment Spec Using A Side Car

The following deployment spec snippet is for a Java application that defines an application container, `client-api`, and an Analytics Agent container, `appd-analytics-agent`, that acts as a sidecar to the application container. An init container, `appd-agent-attach`, is also defined, but the related definitions are removed to simplify the example.

A shared volume, `appd-volume`, is mounted to the application container and Analytics Agent container using the mount path `/opt/appdlogs`. The Java application is configured to write its logs to this path and the Analytics Agent is configured to read the logs from this path and send them to the Events Service.

Log Analytics: Deployment Spec For Shared Analytics Agent (STDOUT/STDERR Support)

The following deployment spec supports the use case where application containers are emitting logs to STDOUT and STDERR, not the application container filesystem.

Since Kubernetes writes the container logs to the host under `/var/log/containers`, the Analytics Agent can read them there. The Analytics Agent is deployed as a Daemonset. A volume `varlog` is defined with access to the host path `/var/log/containers` and mounted to the Analytics Agent container, `appd-analytics-agent`. The Analytics Agent is configured to read the container-specific logs written to `/var/log/containers`. See [Configure Log Analytics Using Source Rules](#) (see page 3159).

The full spec can be found in the [Log Analytics YAML File](#)¹⁸⁹⁶. An OpenShift example can be found in the [Log Analytics OpenShift YAML File](#)¹⁸⁹⁷.

Using Analytics Data

Related Pages:

- [Configure Analytics](#)(see page 3131)
- [Create Analytics Metrics From Scheduled Queries](#)(see page 3239)
- [Analytics and Data Security](#)(see page 3108)

This describes how to use the Analytics data. You have several strategies available for locating and using analytics data of interest. Once you have identified data that is useful for your business, you can use visualization or other features to represent and monitor that data.

Analytics enables you to:

- Configure data sources to collect data for analytics.
- Create and visualize searches and add them to custom dashboards.
- Create API Keys for users of the Analytics Events API.
- Create and view metrics created from analytics searches.
- Define and monitor [Business Journeys](#)(see page 3242).
- Define [Experience Level reports](#)(see page 3265).
- Export data to CSV files.

¹⁸⁹⁶ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.3-Analytics/logging/log-analytics.yaml>

¹⁸⁹⁷ <https://github.com/Appdynamics/ContainerLabs/blob/master/Labs/Lab-2.3-Analytics/logging/log-analytics-openshift.yaml>

Strategies for Locating Data of Interest

- Use a saved search by selecting one from the list. Use the actions in the action bar to manage named searches by saving, duplicating, and so on.
- Create searches for specific use cases. See [Search Analytics Data](#)(see page 3214).
- Focus on a specific time range by dragging your mouse across the event stream or by using the time range dropdown.
- Select various fields from the data, targeting the kind of data of interest to you, then scan the event list. Double-click any specific event to display more information.
- Examine Top 10 Values. Click on a field to see the top 10 values of that field in your filtered dataset. The results are presented as a count and percentage of all data within the specified time range for that field. These values provide immediate insights from your data without having any predefined rules or previous knowledge of the data. You can add a value to the search criteria bar by hovering over the value and clicking the + icon.
- Relevant Fields. This feature helps you find fields with a high relevance score. A high relevance score indicates these fields are significantly more common in your filtered results than in the entire data set and may be useful to investigate. See [Investigate Using Relevant Fields](#)(see page 3222) for a suggested workflow.

Visualize Analytics Data

Once you have defined your data, use the Visualization tab to explore specific aspects of the data that interests you and drill down into the relationships you need to understand.

Each visualization type is a widget and widgets can be added/removed. See [Visualize Analytics Data](#)(see page 3224).

Search Analytics Data

You can search Analytics data in two modes:

- Basic mode, where you can add search criteria to filter your data and return a subset of available events. In Basic mode, you see the list of events that match your search criteria, along with a count of those events. This mode is referred to in the UI as **Drag and Drop Search**.
- Advanced Mode, where you can use the AppDynamics Query Language (ADQL). ADQL is a SQL-like query language that provides additional operators and functions to enable more complicated searches. This mode is referred to in the UI as **Query Language Search**.

For each mode, you see the analytics data sources that are licensed and enabled for your application. The applications, data sources, and other fields that you see depend on how the administrator has set the permissions for your role. When creating new roles, remember that granting permissions to view transaction analytics data does not automatically grant permissions to see all application data associated with a specific transaction analytics record. You need to grant at least read-only permissions to the application to enable the user to see associated transaction snapshot data such as flow maps.

Search Results Limits

Search results in the UI can return up to 1000 records. By default, each page displays 50 results at a time. In Advanced mode, you can explicitly set a LIMIT to see more than 50 results on a page. Setting a limit disables pagination and shows up to 1000 records on a single page. The total number of records for the query shows at the bottom right. The UI caps the number of search results at 1000 regardless of mode or the value of an explicit LIMIT. To return more than 1000 records, you must use the [Analytics Events Query API](#)(see page 3743).

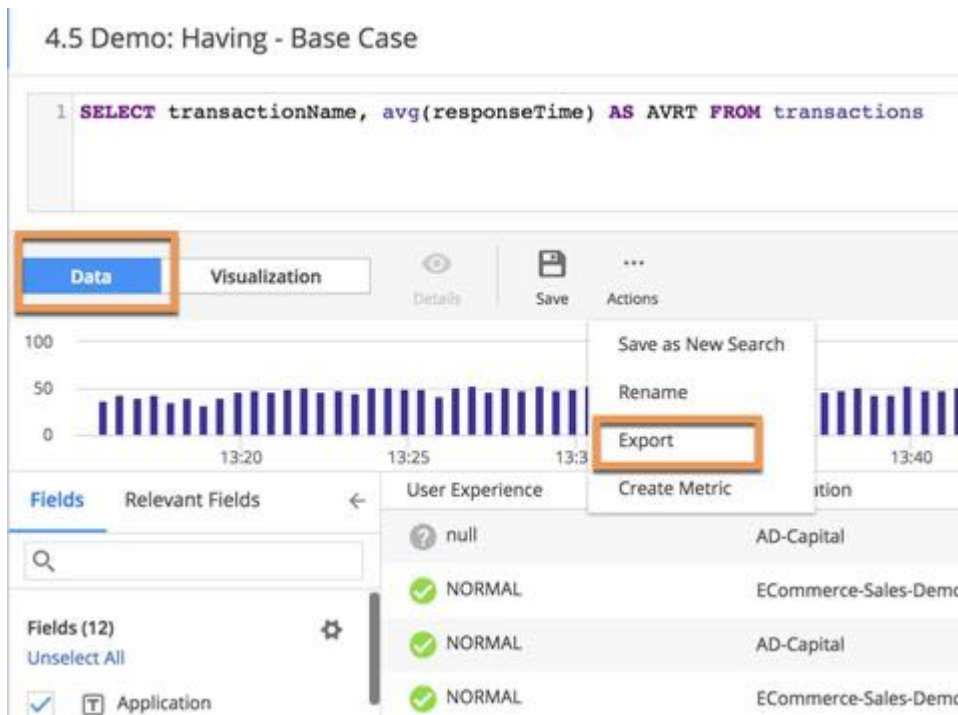

See [LIMIT Clause](#)(see page 3026).

Exporting Analytics Data

Analytics allows you to export data to a file in CSV format for external use.

Before you export a set of data, consider these guidelines:

- The maximum number of records exported for a non-aggregation query is 65000. Use the LIMIT clause to restrict the records to a number below the upper bound. The LIMIT clause does not return any additional records that satisfy the export selection criteria.
- The number of records exported for an aggregation query by default is 10. If you want more than 10 records, use the LIMIT clause. You can export up to 1000 records by using the LIMIT clause.
- The CSV file format is RFC4180.
- Response from all valid ADQL queries can be exported. The method of writing ADQL queries remains the same.
- Only the fields that you specify in the SELECT clause are exported to the CSV file. ADQL query supersedes the UI selection. The fields selected to be displayed in the Data tab has no impact on the exported data even if the query includes SELECT *.
- Fields having nested representation are flattened and appear as separate fields in the CSV file. Additionally, the corresponding unflattened nested fields also appear in the exported records. Flattening fields refers to separating nested fields into individual fields.
- The supported datetime format is ISO, yyyy-MM-dd'T'HH:mm:ssZZ, without the millisecond value. The timezone is local to the browser from which export is requested. A timestamp field in a nested field is converted to the local timezone only in the flatten fields, not in the unflattened nested field. The format in the UI, that is MM/DD/YYYY HH:MM:SS AM/PM, is different from the format that you see in the exported data.
- The time required to export data varies with the size of the record you are trying to export. Exporting tends to slow down for larger set of records because executing the query on and retrieving a large data set takes longer to complete.

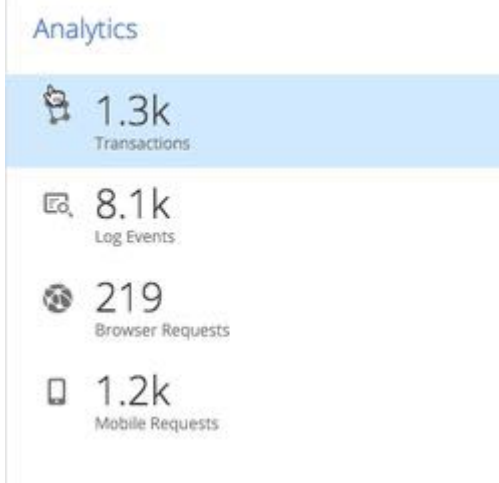

You can export metrics the Metric Browser and search results from the Searches screen. Use the **Export** option under **Actions** on the toolbar to do so. While you are on the Searches panel, use the **Data** mode to export your search result.

Access the Analytics Search UI

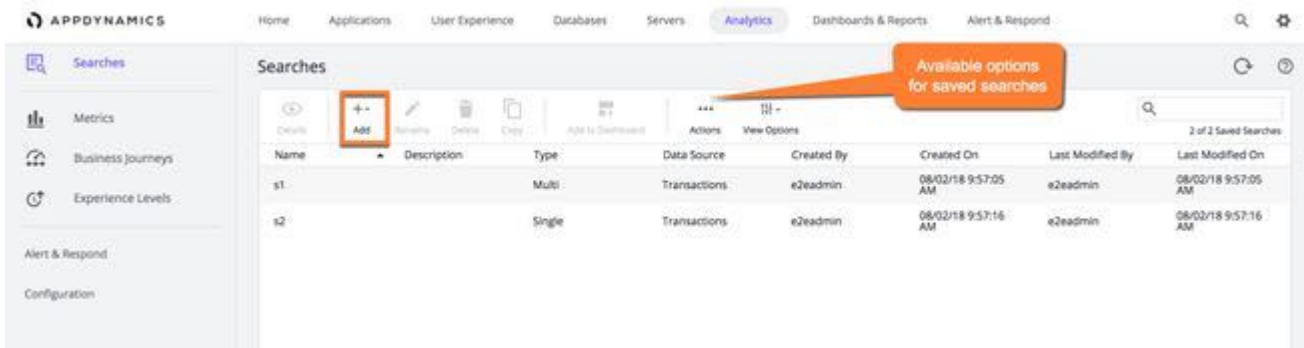

1. Navigate to the Analytics interface in the Controller UI by clicking **Analytics** in the top navigation bar.

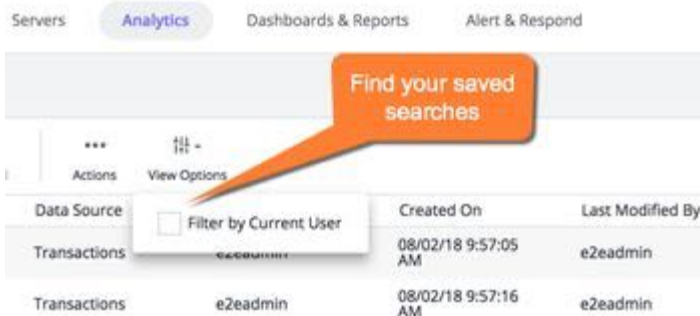

An alternate way to access Analytics is from the Home page: select a data source to see a default search for that event type.

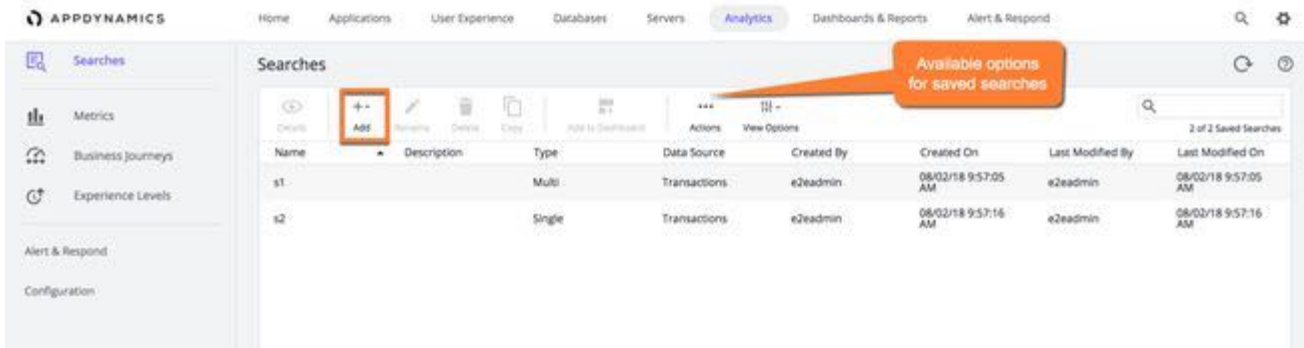

2. Click **Searches** to create new searches and see a list of previously saved searches. The saved searches list displays any pre-existing, saved searches for which you have view permissions. The default sort order for the list is alphabetical by saved search name.

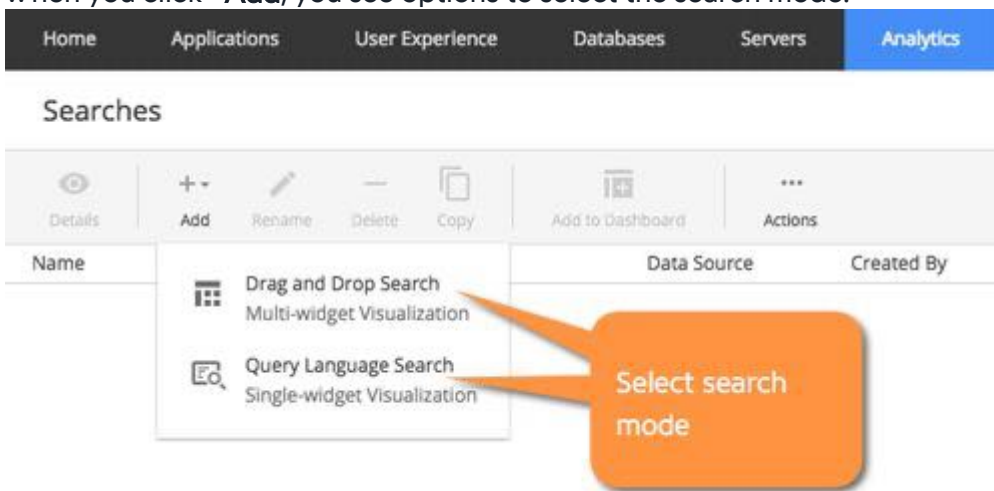

3. To view your saved searches, click **View Options** and select **Filter by Current User**.

4. Click **+Add** to create a new search or select an existing search to activate the actions on the action toolbar.

5. When you click **+Add**, you see options to select the search mode.

For details on the two search modes, see:

- Drag and Drop Search, see [Create Basic Analytics Searches](#)(see page 3219)
- Query Language Search: see [Create Advanced Analytics Searches](#)(see page 3218)

On the Search details page, you see two tabs for displaying the results for the Search.

- All event types share the same basic layout on the Data tab of the Search details page.
- Use the Data tab to search and filter the data that you want to review and analyze.
- Use the Visualization tab to create graphic representations based on that data.
- Search actions are available for each search. The actions vary according to the type of search and the tab you use. These actions are available:
 - Rename
 - Export (to CVS - only from the Data tab)
 - Create Metric
 - Add to Dashboard (only from the Visualization tab)

Basic and Advanced Search Comparison

This table provides a comparison of the functionality available in each search mode.

Functionality	Basic	Advanced
Drag and drop fields to the criteria search bar	yes	no

Functionality	Basic	Advanced
Type-ahead (auto-complete)	N/A	yes
Visualization canvas widget support	multiple widgets	one widget per search query
Grouping of events with the GROUP BY keyword	yes	yes
Wild cards with comma-separated text (Basic mode) or IN operator (Advanced mode)	no	no
Percentile Histogram widget	yes	no

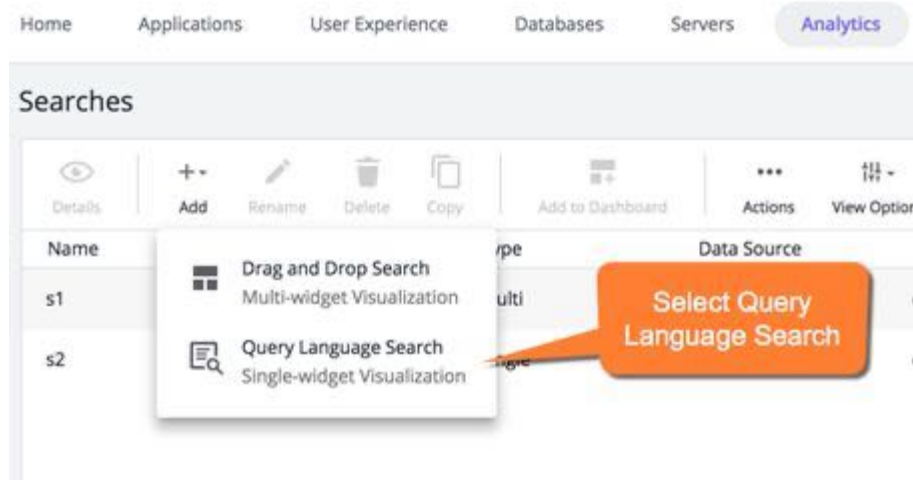

Create Advanced Analytics Searches

Related pages:

- [Using Analytics Data](#)(see page 3213)
- [ADQL Reference](#)(see page 3011)

This page describes how to use the AppDynamics Query Language (ADQL) to search analytics data using **Advanced** mode in the Analytics Search panel. If you have never used AppDynamics Analytics, you might want to start with [basic mode](#)(see page 3219) before using Advanced mode for your searches.

Access Advanced mode by clicking **Add+** on the Analytics Search page. Select **Query Language Search**:

Construct ADQL Queries

Each ADQL event query begins with a **SELECT** statement that uses a **FROM** clause. Use the **FROM** clause to specify the data source you want to query. You can query one data source in each query.

Use the **SELECT** statement to further qualify the query using `field_expressions` and `math_expressions`. The **WHERE** clause adds conditions. For more details on specific ADQL syntax, keywords, functions, and operators, see the [ADQL Reference](#)(see page 3011).

When you click **Search** for queries other than select all fields (**SELECT ***), the results display on the visualization tab where the table widget accurately renders your query.

Use ADQL Auto-Complete

As you construct your query and type a space after a keyword, auto-complete offers suggestions for the next keyword or operator in the query. The display of auto-complete suggestions is based on the stage of your query and the event type you selected. Auto-complete offers suggestions for data values, such as event types and fields, when you type an equals sign "=" or other [comparison operator](#)(see [page 3047](#)) after the event type name.

Note: The query box in the data tab is used only for adding **WHERE** clause differentiation. Aggregation functions are only available in the visualization tab under the table widget.

In advanced mode, when you type **SELECT**, the fields from the last specified event type display in the auto-complete list. Fields specific to a new event type display after you complete the **FROM** clause.

 Remember to type a space in front of the next keyword or you may see a validation error when executing the search or the search will be inexecutable.

Field Name Mapping

The field names in the auto-complete dropdown list correspond to UI labels and are obvious in most cases with minor differences in capitalization. When the field names have prepended database-related information, such as `segments.errorList.errorType` for Error Type or `segments.httpData` for HTTP data fields, they refer to data for individual segments of the transaction as it progresses from tier to tier. The segments fields do not represent data that refers to the overall business transaction instance. See [ADQL Data](#)(see [page 3052](#)) for a list of fields, UI labels, and internal database names for each data source.

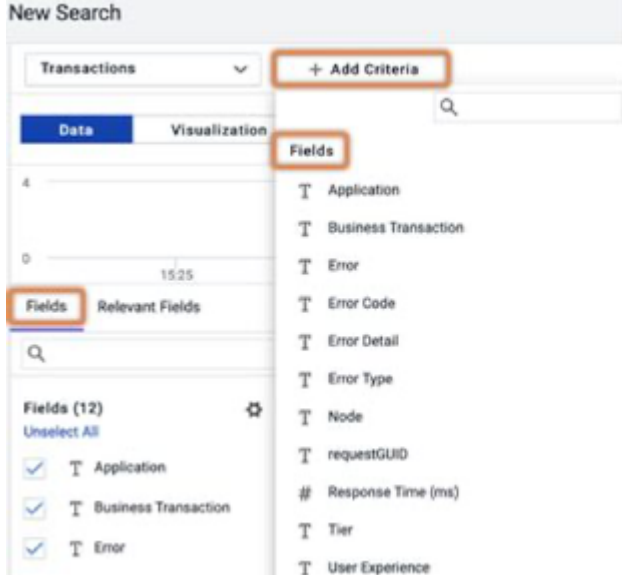

Create Basic Analytics Searches

This page describes UI elements available in the Analytics search panels and focuses on how to create searches in Basic mode. This mode is also called **Drag and Drop Search** in the UI and enables you to do multi-widget visualization of your search results. In this mode, you add search criteria based on the fields collected for the event type. Field search enables you to search for all values or a specific value of the field.

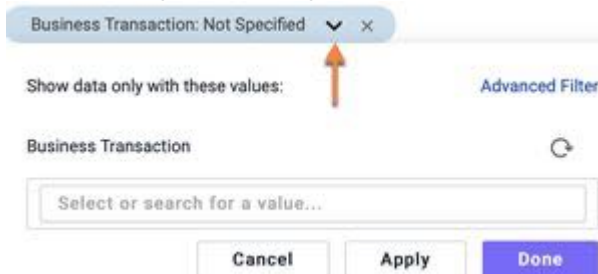

UI Elements

These UI elements are available to help construct your searches:

- New Search: The scope of the search depends on the **Fields** type. You can filter your search with the **+ Add Criteria** button.

- Field value dropdown: After you have selected a field, use the dropdown to add a list of values.

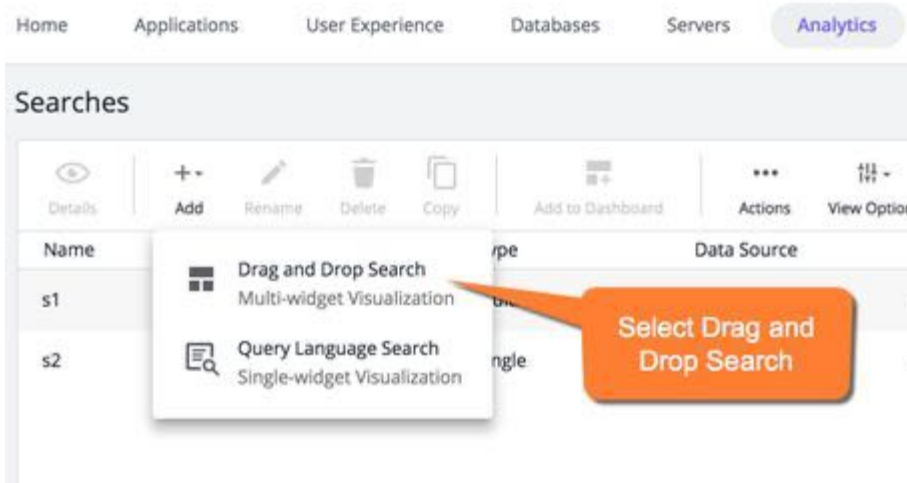

- Combination field selector and search: This field value selector combines a list of values with the ability to search for terms in the values list. It also has an **Advanced Filter** option.
- Text filter: Enables you to do an exact match on the term entered. Supports wild cards. See [Search Options](#)(see page 3221).

Basic Search

To create a search using a field:

1. From the Analytics Search list, click **+ Add**.

- To use basic mode and multi-widget visualizations, select **Drag and Drop Search**.

To use advanced mode (ADQL) and single-widget visualizations, see [Create Advanced Analytics Searches](#)¹⁸⁹⁸.

- On the Transactions tab, select the data source type that you want to search.
- To add filters to your search, click **+ Add Criteria**.
The field selector dropdown appears, so you can select the field you want to use.
- Select a field. The field name appears in the search criteria line.
- Click the dropdown next to the field name to open the field value selector. Select a value for the field.
Fields such as application, business transaction, and node display a list of the values available. Some fields show a search box where you can enter criteria to filter the values of this field.

Search Options

This table describes free text search and text filter behavior:

Type of entry	Analyzed	Non-analyzed
<i>term</i>	Find entries with this term. This search is case insensitive. For example, using the term "great" finds "great" and "AppDynamics is great".	Looks for an exact match and <u>is</u> case sensitive. For example, using the term "order" finds "order" but not "/PlaceOrder".
<i>term1 term2</i>	Returns results containing both <i>term1</i> and <i>term2</i> irrespective of the order the terms appear.	Terms are implicitly AND'd. Looks for an exact match and find results containing " <i>term1 term2</i> ".
<i>term1, term2</i>	This works the same as the space-separated list of terms.	Terms are implicitly OR'd. Looks for an exact match for either <i>term1</i> or <i>term2</i> .

¹⁸⁹⁸ <https://docs.appdynamics.com/display/PRO21/Create+Advanced+Analytics+Searches>

Type of entry	Analyzed	Non-analyzed
<i>term*</i> <i>term?</i>	Finds all fields where the value is this string plus one additional character <?> or multiple <*>. Because all non-alphanumeric fields are delimiters, the escape character has no effect.	Finds all fields where the value is this string plus one additional character <?> or multiple <*>. To search for a field containing a wild card character, escape with a "\".
NOT <i>term</i>	Use the NOT comparison operator to find everything except the term. NOT can be used with any of the entries in this table.	Use the NOT comparison operator to find everything except the term. NOT can be used with any of the entries in this table.

Free Text Search in Log Analytics

For log analytics, a free text search is available for searching the message field. This enables you to search for any keyword or string anywhere in the message field.

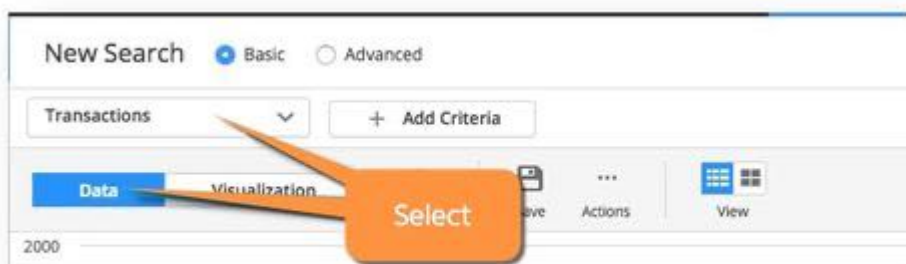

Investigate Using Relevant Fields

You can use Relevant Fields to find data fields that show a high Relevance Score. A high relevance score indicates these fields are significantly more common in your filtered dataset than in the entire dataset and may be particularly useful to analyze. Relevant field investigation may provide valuable insights and enable you to conduct better root cause analysis.

Relevant Fields investigation can be used with all event types.

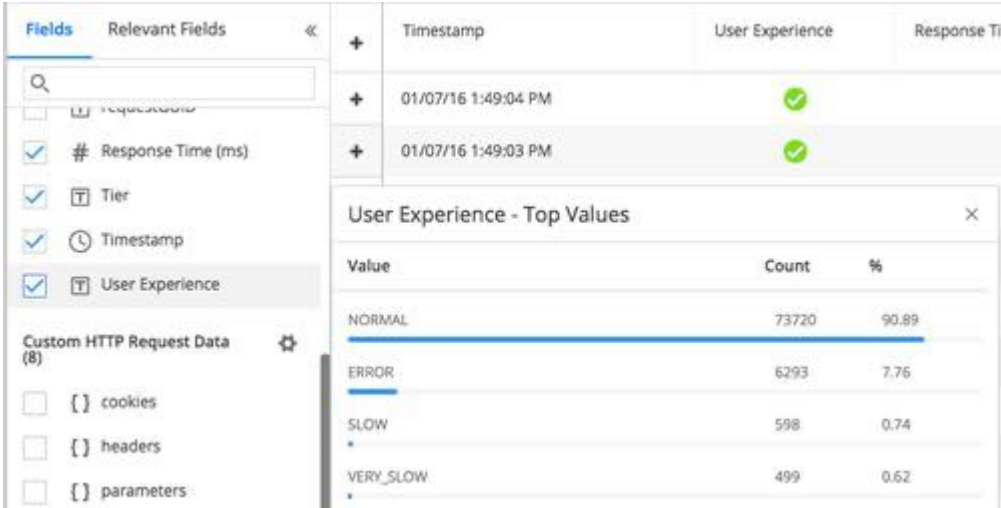

As an example, you can use the following suggested workflow to investigate poor user experience.

1. From the Analytics Search page, select the **Transactions** event type and the Data tab.

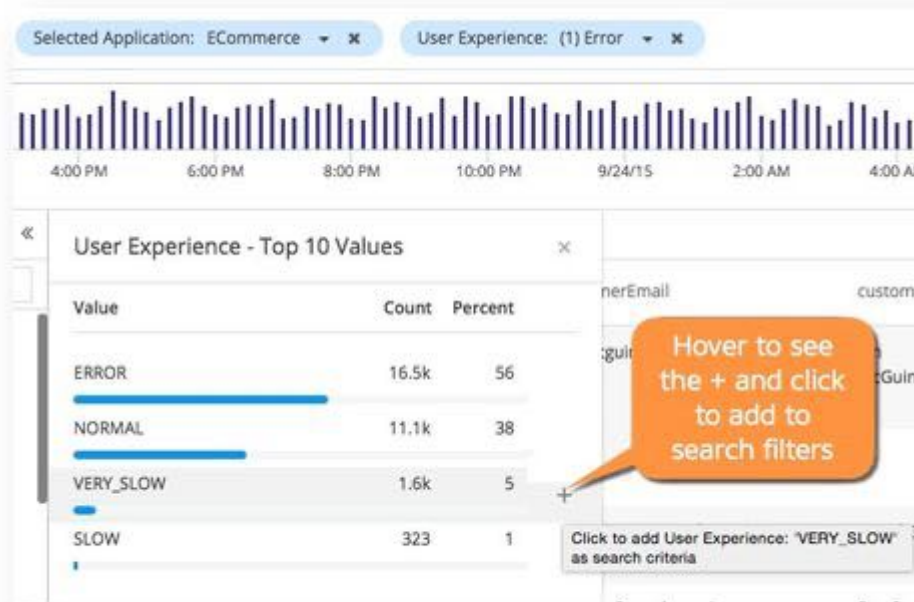

2. Click **Add Criteria** and select an application to investigate.
3. Click **User Experience** or another field in the **Fields** list to see the **Top Values**. If you see lots of error and very slow transactions, you realize it is not easy to investigate hundreds of error and very slow

transactions.

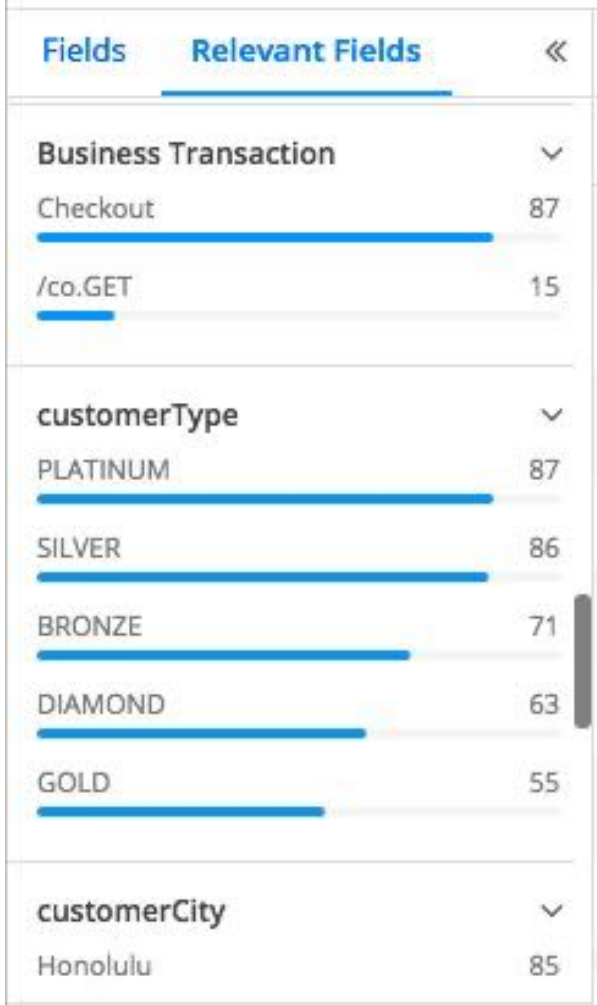

4. Add **Error** and **Very Slow** values to your search criteria to narrow the total number of transactions to a smaller dataset. You can add the values quickly by hovering over the field in the **Top Values** list until the + sign appears at the right. Click the + to add to the search criteria. Now the focus is only on error/very slow transactions.

5. Click the **Relevant Fields** label and now you can see where to focus your investigation. In this example, you might start with the **Checkout** business transaction as the relevance score is 87. You can also see that **Platinum** and **Silver** customers have the two highest scores. The relevance score is an indication of

where the highest proportion of error and very slow transactions are occurring.

6. Click a field in the **Relevant Field** list to see more details. You can continue to add relevant fields to your search criteria to keep narrowing the dataset. This process should enable you to find issues of significance for investigation.

Visualize Analytics Data

Related Pages:

- [Create Basic Analytics Searches](#)(see page 3219)

After you have created a search for the Analytics data that you want to visualize, you can configure a widget to display the results of the search graphically.

Access the Analytics Widget Builders

You can access the Analytics visualization widgets from the Analytics Search UI or directly from **Dashboards & Reports**.

To access the Analytics widget builder from Analytics:

1. Select **Analytics > Searches** to view the saved searches list.

2. Double-click the search that you want to visualize or add a new search.

To access the Analytics widget builder from a Custom Dashboard:

1. From the top navigation bar, click **Dashboards & Reports** to see the custom dashboard list.
2. Either double-click the dashboard where you want to add the Analytics widget or click **Create Dashboard** to create a new dashboard.
3. In the custom dashboard, click **Edit**, then **Add Widget**.
4. Click **Analytics, Saved Searches, or Experience Levels**.
5. Add Analytics widgets as needed to your dashboard.

Build a Widget

To use the Analytics widget builder:

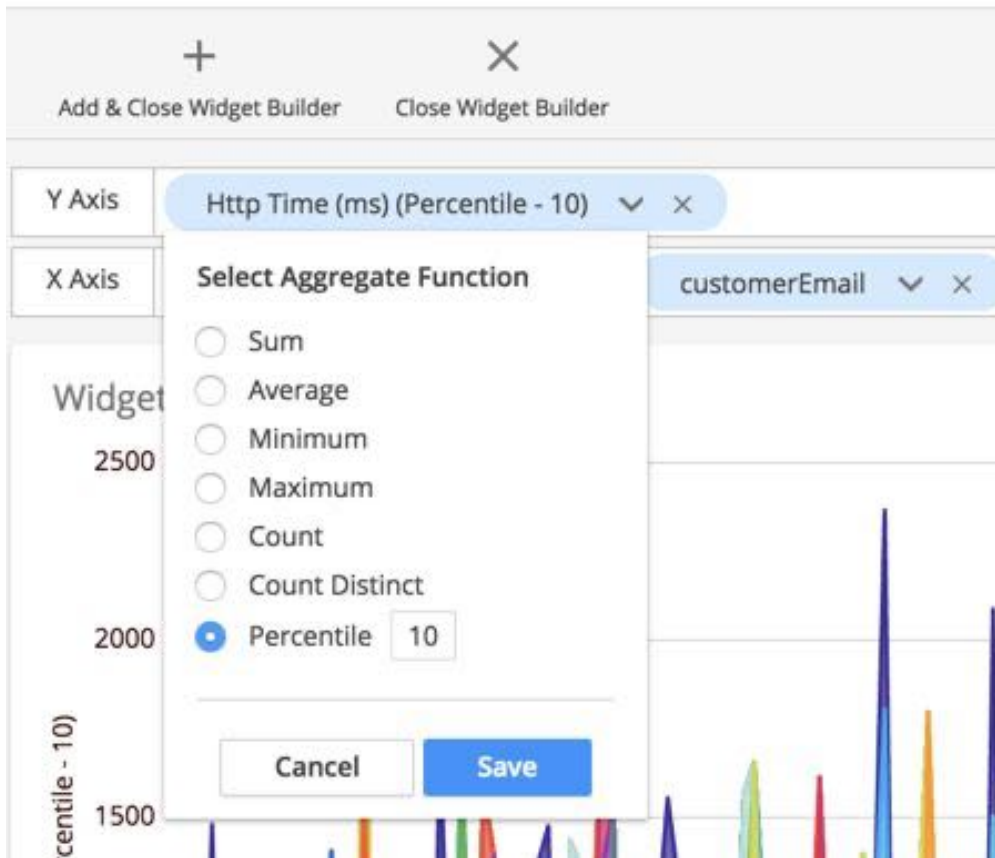

1. Click the Visualization tab.
2. In the **Visualization** canvas, you can create widgets with one of the following modes:
 - In **Drag and Drop Search** (Basic) mode you can create multiple widgets on the canvas.
 - In **Query Language Search** (Advanced) mode you can generate one widget from your ADQL query at a time. In addition, when you use the Visualization tab in this mode, the order of functions and fields in the query matters. For all widgets (except table), the aggregate functions, such as count(*), avg(), sum(), percentile and so on, should always be preceded by a field. If the fields and functions in the query are not in this order, some visualizations do not work.

See [Conversion Analysis](#)(see page 3226) for an example of creating a conversion analysis using the funnel widget.

3. Click **Add Widget**, then select **Custom Widget Builder** or **Funnel Widget Builder** depending on the type of widget that you want to create.

In Basic mode, you can build custom widgets and drag fields to the canvas, which uses X and Y axes for configuration. After dragging a field to the axes, select a function from the drop-down next to the field name.

In this example, the percentile function is applied to **HTTP Time (ms)**.

The funnel widget is configured differently from the other custom widgets, which use the Y and X axes as the basis of the configuration. A funnel widget is used to display data of progressively-staged proportions in a color-coded funnel.

You can add a title to the widget by over-writing **Widget Title** on the canvas.

4. After adding a widget and fields, you can right-click menu widget values to see other options. Select **Apply a global filter for <field_value>** to add a value to the existing search criteria. The supported boolean operators are **true**, **false**, **null**, and **is not null**. Use **is not null** to check both boolean and non-boolean fields, such as `loan amount` or `IsReached`.
5. Click **Save & Close** to save the widget configuration.

Conversion Analysis Using Funnel Widget

Funnel analysis include a series of events that lead towards a defined goal. For example, tracking user activity in a mobile app, a sale on an eCommerce website, online advertisements, and eventual purchase.

The funnel widget visualizes use cases such as:

- Retail application checkout drop-off rates from the point of adding items to the shopping cart to the actual purchase
- Business Journey drop-off rates from the point of applying for a loan to approving the loan
- Home mortgage loan approval drop-off rates from submitted application to approved applications
- Impact from performance issues by total sales, customer segment, location, and purchased products are gauged in a funnel with other health rule widgets

In this custom dashboard, the impact from performance issues by total sales, customer segment, location, and purchased products are gauged in a funnel with other health rule widgets.

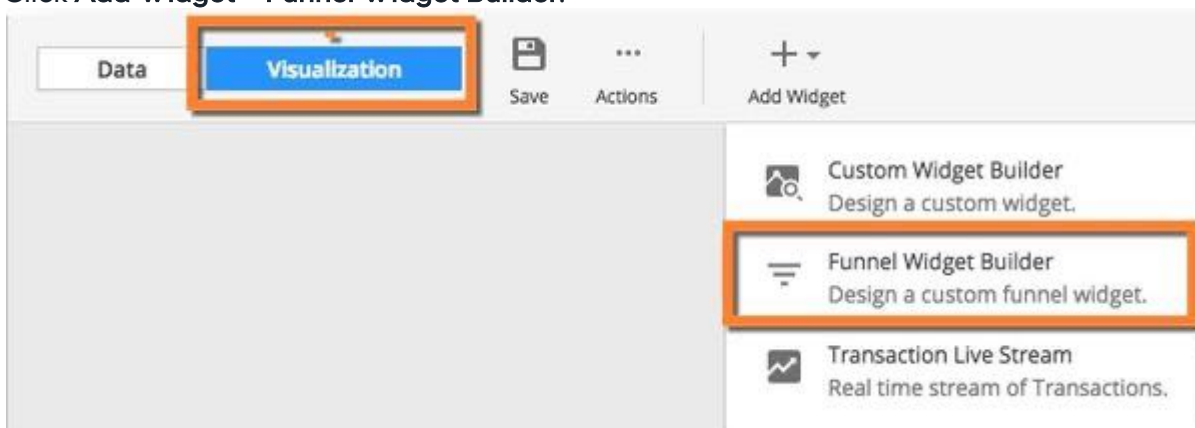

Funnels return the number of unique actors that successfully (or unsuccessfully) make it through a series of steps. Actors could mean users, devices, or any other identifiers that are meaningful to you. A funnel analysis reveals where a given flow loses the most actors. This helps identify areas for improvement, as well as the overall health of your business.

The first step in the funnel is the anchor step, and always represents 100% of the results. The filter criteria for the first step creates a set of unique values, and every subsequent step results in a subset of the values from the previous step and renders the corresponding drop-offs. The second and later steps describe the number of events that match the criteria for each step towards the goal. This number is typically less than 100%, but could be 100% if every event matches the subsequent steps.

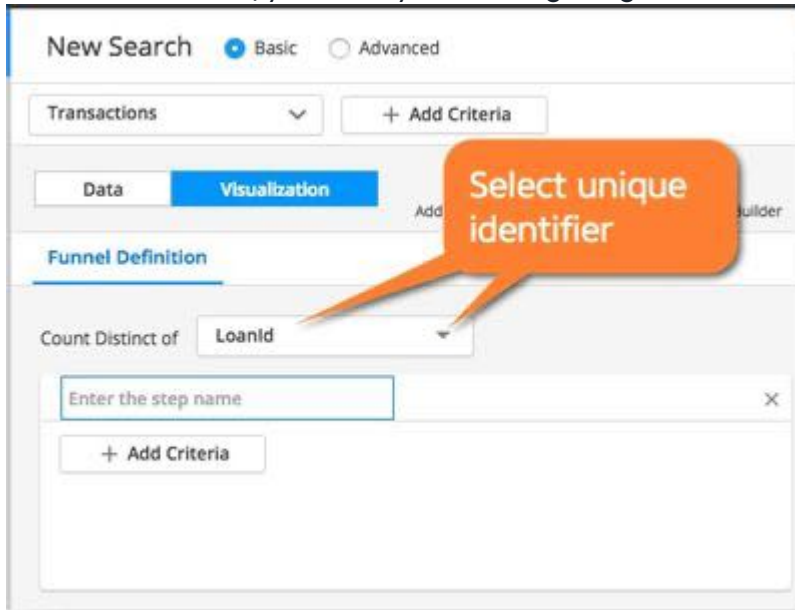

Build a Funnel Widget

1. From the **Analytics Search** page using **Drag and Drop** (Basic) Mode, select the Visualization tab.
2. Click **Add Widget > Funnel Widget Builder**.

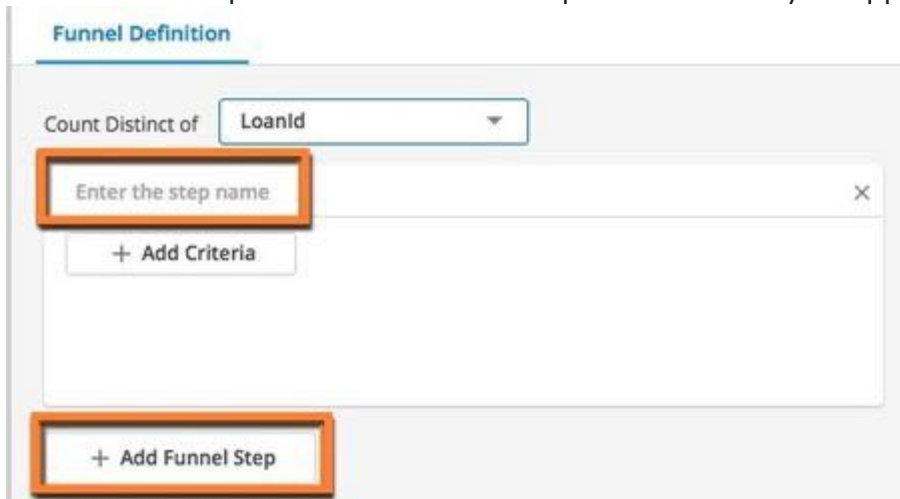

3. In the **Funnel Definition** pane, click the down arrow to select the unique field representing the items that you are counting. In this example, following the steps of a loan approval process, LoanId is used.

The fields depend on your application. There is a limit of 50,000 unique values for the first step. If you encounter this limit, you can try decreasing the global time range and look at fewer values at a time.

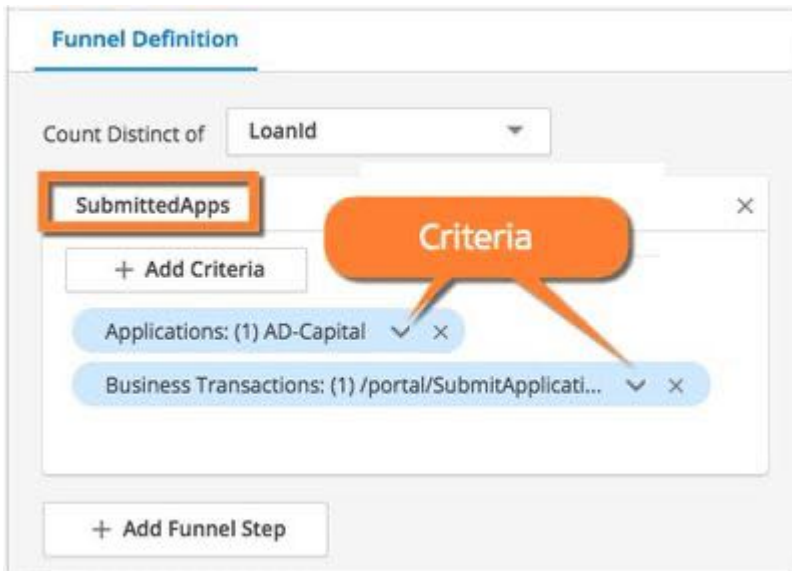

i Filtering on fields with null and empty values may cause more records in subsequent levels.

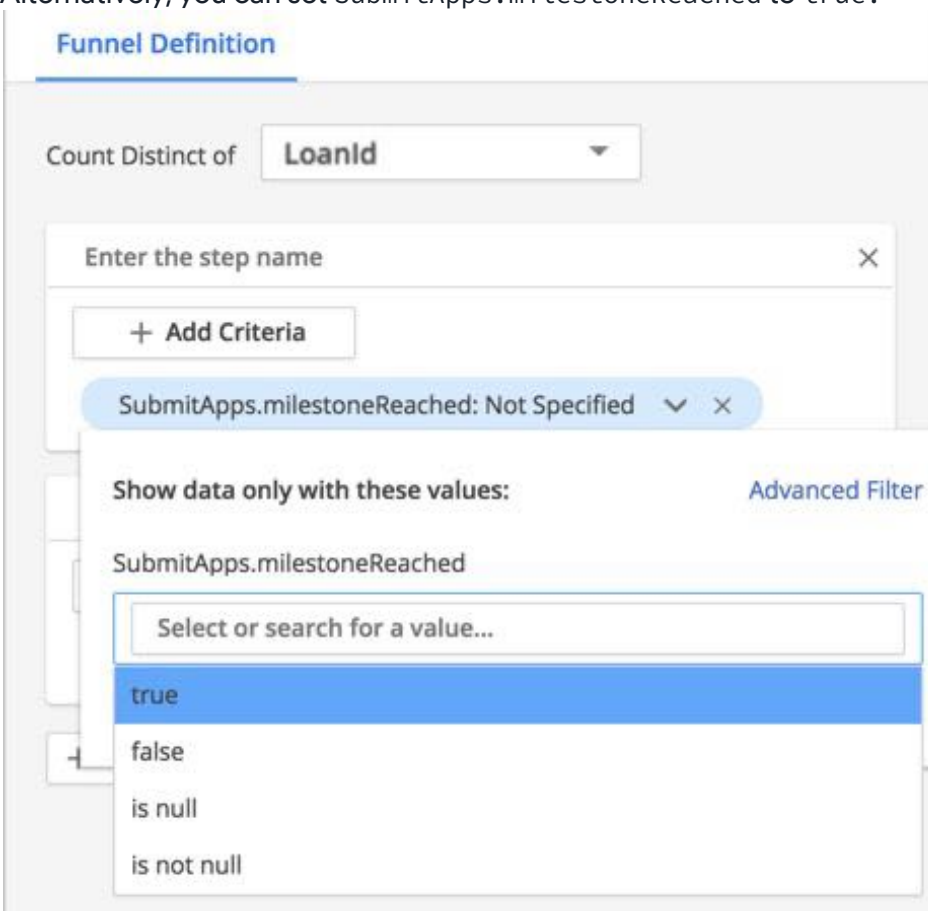

- Label the first step and continue to add steps as needed for your application process.

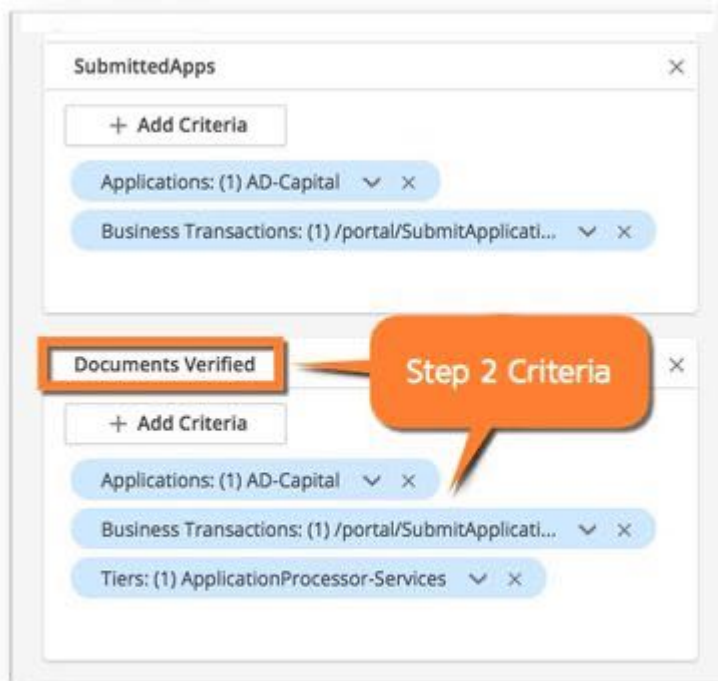

For this example, the first step represents the number of submitted loan applications. The search criteria include the AD-Capital application and the /portal/SubmitApplication business transaction.

Alternatively, you can set `SubmitApps.milestoneReached` to true.

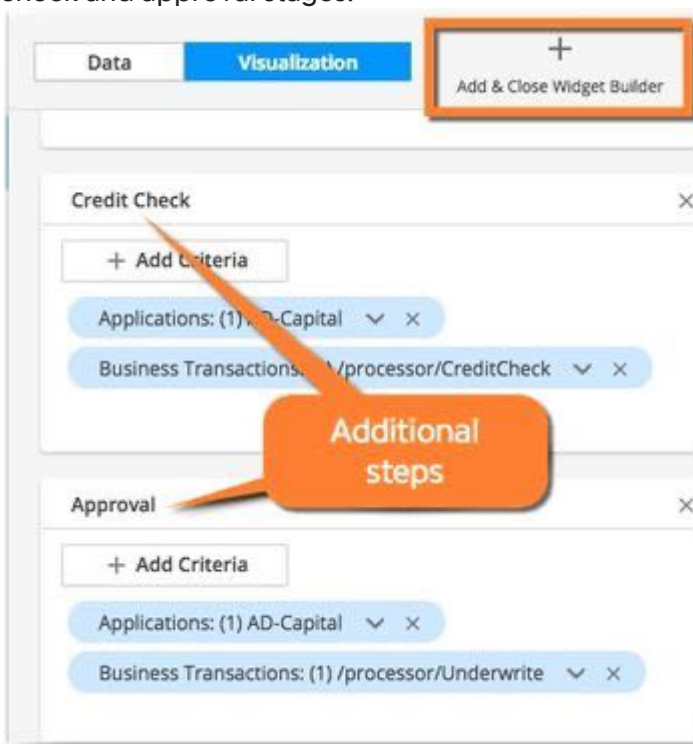

- Continue to add and label your steps. This step represents the number of loan applications that reached the stage "Documents Verified."

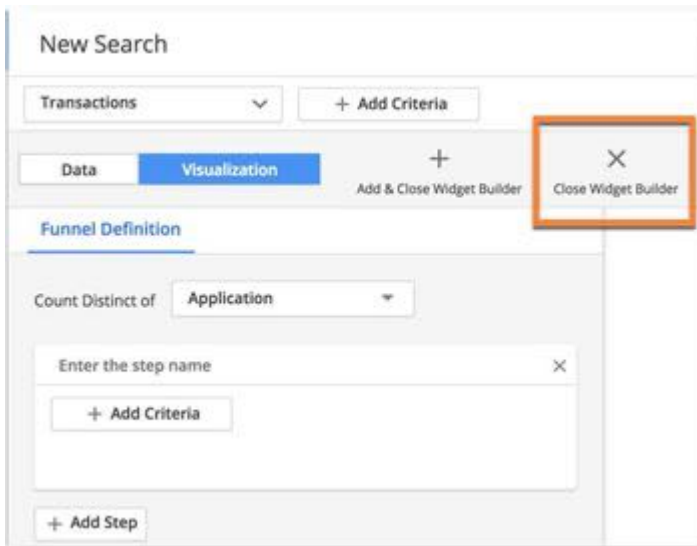

Alternatively, use the `milestoneReached` field and set it to true.

6. After you have added all the necessary steps, click **Add & Close Widget Builder** to save the completed funnel widget. This example contains two additional steps representing loans that reached the credit check and approval stages.

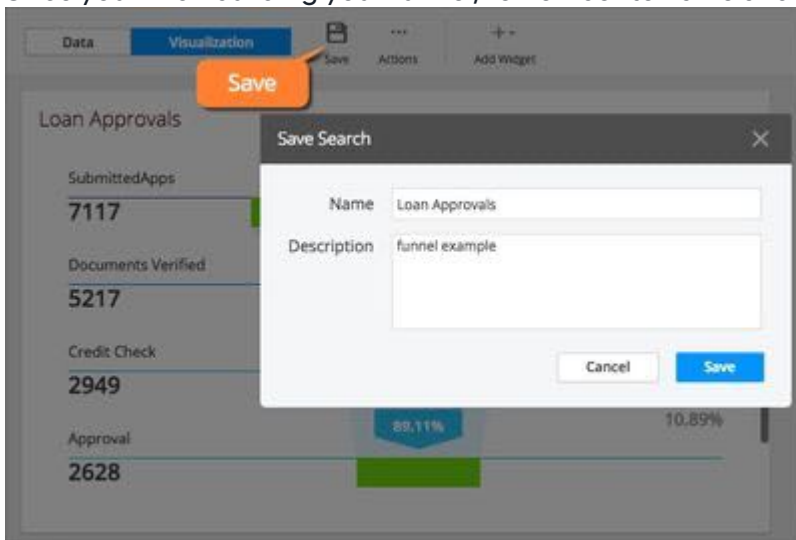

If you want to cancel editing and revert to the previous version, click **Close Widget Builder**.

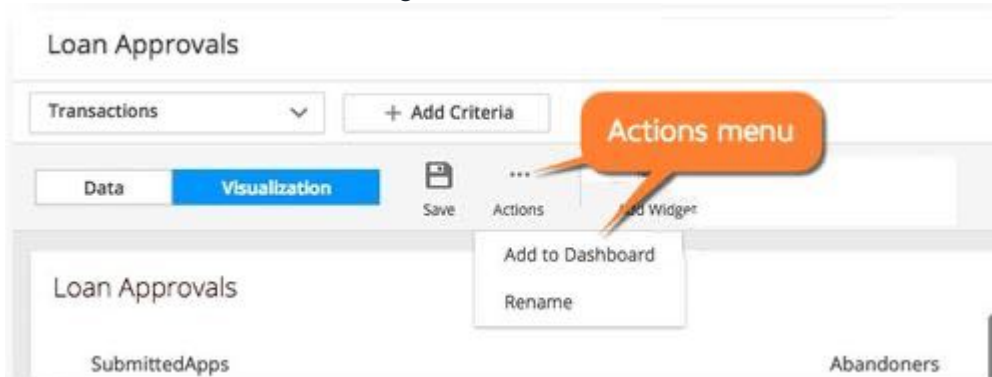

If the funnel steps need a rearrangement you can simply reorder them by simply dragging and dropping each step into appropriate positions.

7. Once you finish building your funnel, remember to name and save your search result.

8. To add the finished funnel widget to a custom dashboard, click **Actions > Add to Dashboard**.

Use the Funnel to Troubleshoot

The finished funnel widget for the above example shows the drop-offs (Abandoners) in unique loan IDs from submission to approval. When creating the funnel, you can also select **Show Health** in the properties pane to display a health overlay that correlates application health data with the business conversion data. This helps to visualize performance for each step of the funnel widget.

The health overlay is supported for these event types with a user experience value:

- Transaction Events – userExperience
- Browser Records – pageexperience
- Mobile Snapshots (Network Requests) – networkrequestexperience
- Web Session Records (Browser Sessions) – experience
- Mobile Session – networkrequest.networkrequestexperience

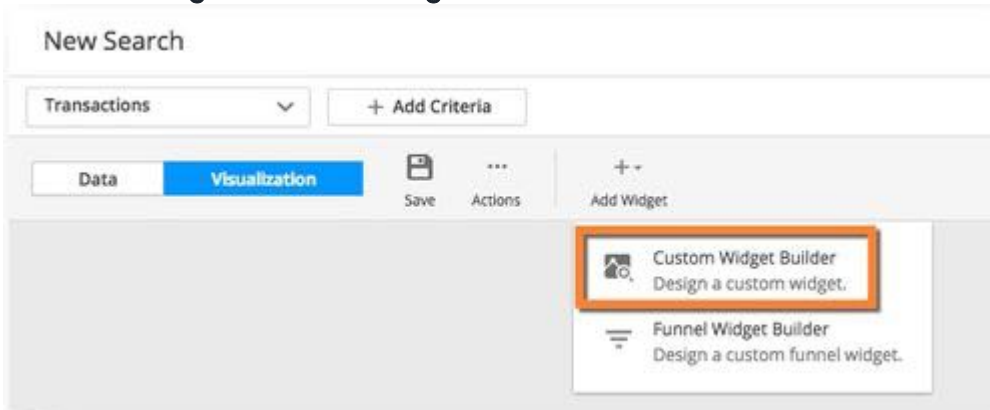

For enhanced troubleshooting, you can drill down to event data from any of the funnel steps by double-clicking the numbers on conversions and abandoners or by using Health Overlay and clicking on each health segment.

Configure Custom Widgets

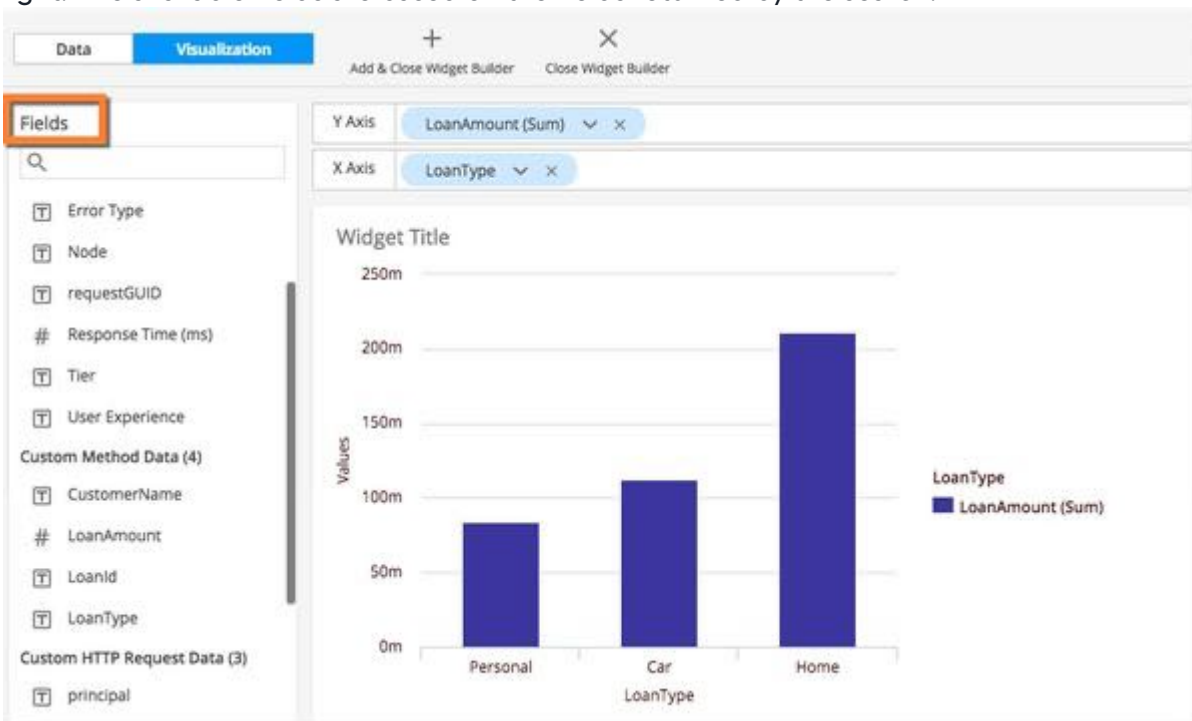

To configure custom widgets for your analytics searches:

1. From the Analytics Search page using **Drag and Drop Search** (Basic) Mode, select the Visualization tab.

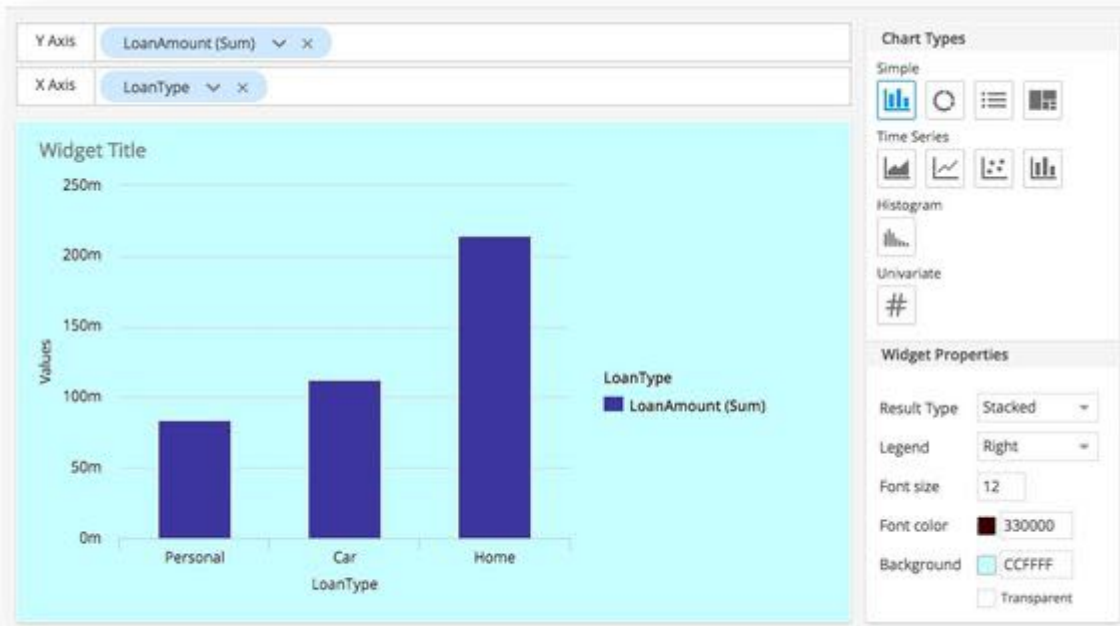

2. Click **Add Widget > Custom Widget Builder**.

3. To add a field to a widget, drag the field from the **Fields** panel on the left to the Y-axis or X-axis on the right. The available fields are based on the fields returned by the search.

4. From the **Chart Types** panel on the right, click the widget type to use for the display. The widget is previewed in the main panel. You can experiment previewing which widget type is best for visualizing a particular data set.

- Usage for the X and Y axes depends on the chart type. The UI prevents you from adding more fields than the widget supports. Different widgets have different limits for the maximum number of fields permitted on each axis.
- For the time series widgets (area, line, scatter, and histogram), you can use the **Resolution** field that appears on the X-axis to customize the frequency displayed if you do not want the widget to automatically select a default resolution based on the current time range. This time resolution field is not counted toward the field limit. The granularity of resolutions that can be chosen depends on the Global time range.

Custom Widget Builder Data Type and Field Restrictions

Widget Type	Data Type	Number of Fields on Y-axis	Number of Fields on X-axis
Column (simple)	any	zero	up to two
		one	up to two
		two or three	zero or one
Pie	any	one	up to two
Table	any	one	up to ten
Tree Map	any	one	up to two
Time Series (Area, Line, Points, Column)	any	zero	one
		one	one

Widget Type	Data Type	Number of Fields on Y-axis	Number of Fields on X-axis
		two or three	zero
Percentile Histogram (Not available in Advanced Mode)	numeric	zero	one
Numeric (Univariate)	any	one	zero

Upgraded Funnel

Contact your administrator for access to the upgraded funnel experience.

Upgraded Analytics Funnel

The upgraded Analytics funnel is a widget in the Funnel Watch page that allows business personas to implement and perform conversion analysis. The upgraded Analytics funnel improves the funnel discovery with the Funnel Watch creation process in the Funnel Wizard, and provides visualization for total abandonment percentages.

Contact your administrator for access to the upgraded funnel experience.

Example of Abandonment and Conversion

Legend

Red Bar	Grey Bar	Grey Arrows	Grey Numbers	Red Numbers
Displays the total percentage (%) of abandonment from the previous step.	Displays the total percentage (%) number of successful conversions from the previous step.	Displays conversions from the previous step.	Displays the total conversion number from the first step.	Displays the total of abandonment number from the first step.

Configure the Funnel Watch

The **Funnel Watch** page is a dashboard where you can view all created funnels. To configure the Funnel Watch:

1. From the **Analytics** tab, click **Funnel Watch**.
 2. Click the '+' icon.
 3. Choose the Application Performance Monitoring (APM) application for which to create the funnel. You can use the **Search** bar to find applications.
 4. Enter the values for the fields:
 1. **Funnel Name:** Enter your preferred Funnel name.
 2. **Field:** Choose a field for the funnel.
- Under **Add a funnel step**, select a business transaction in the dropdown. You can enter a step name in the provided text box, or remove an unwanted step.
 - Click **Next**.
 - Click **Finish**.

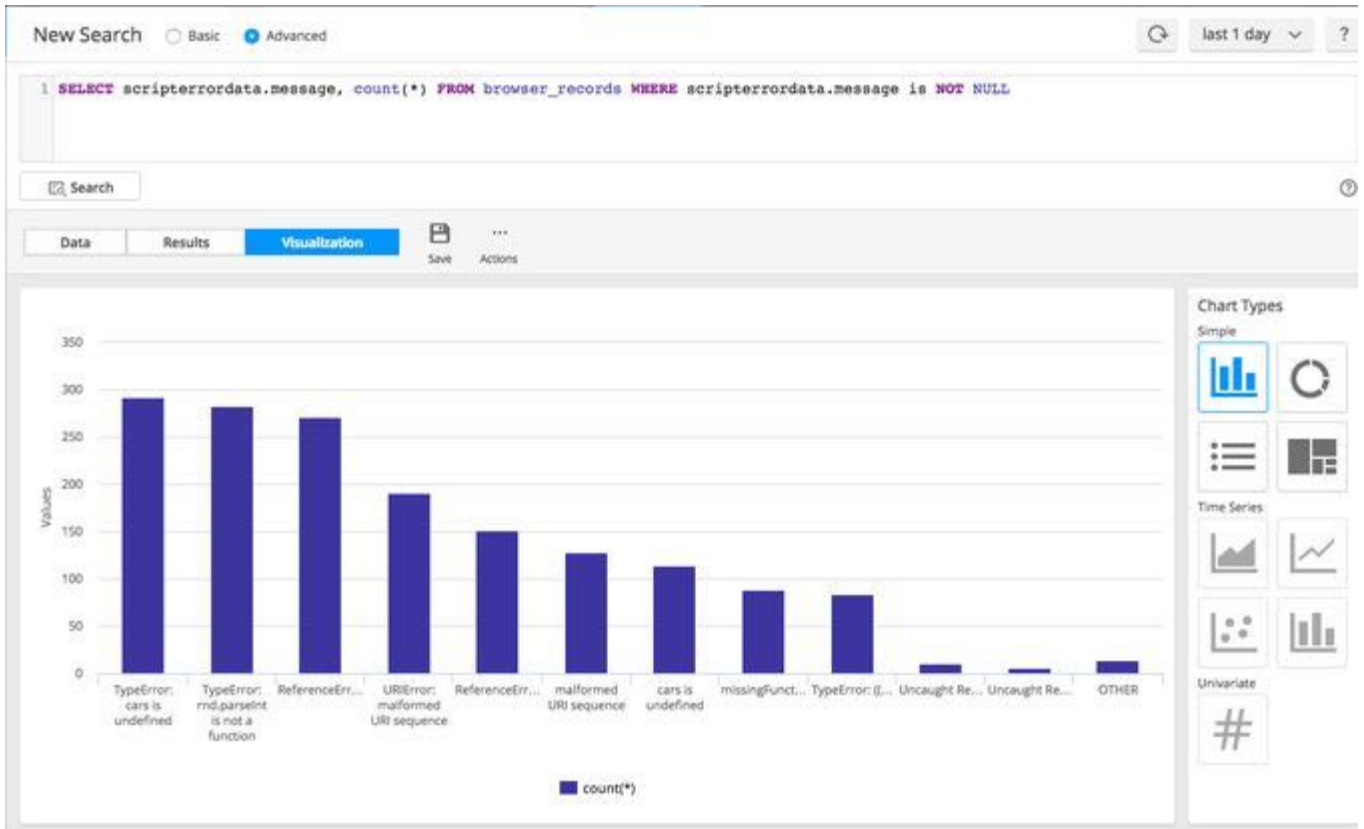

Visualize JavaScript Errors

You can use Analytics to query your Browser Request event data and create a JavaScript exception and error summary dashboard.

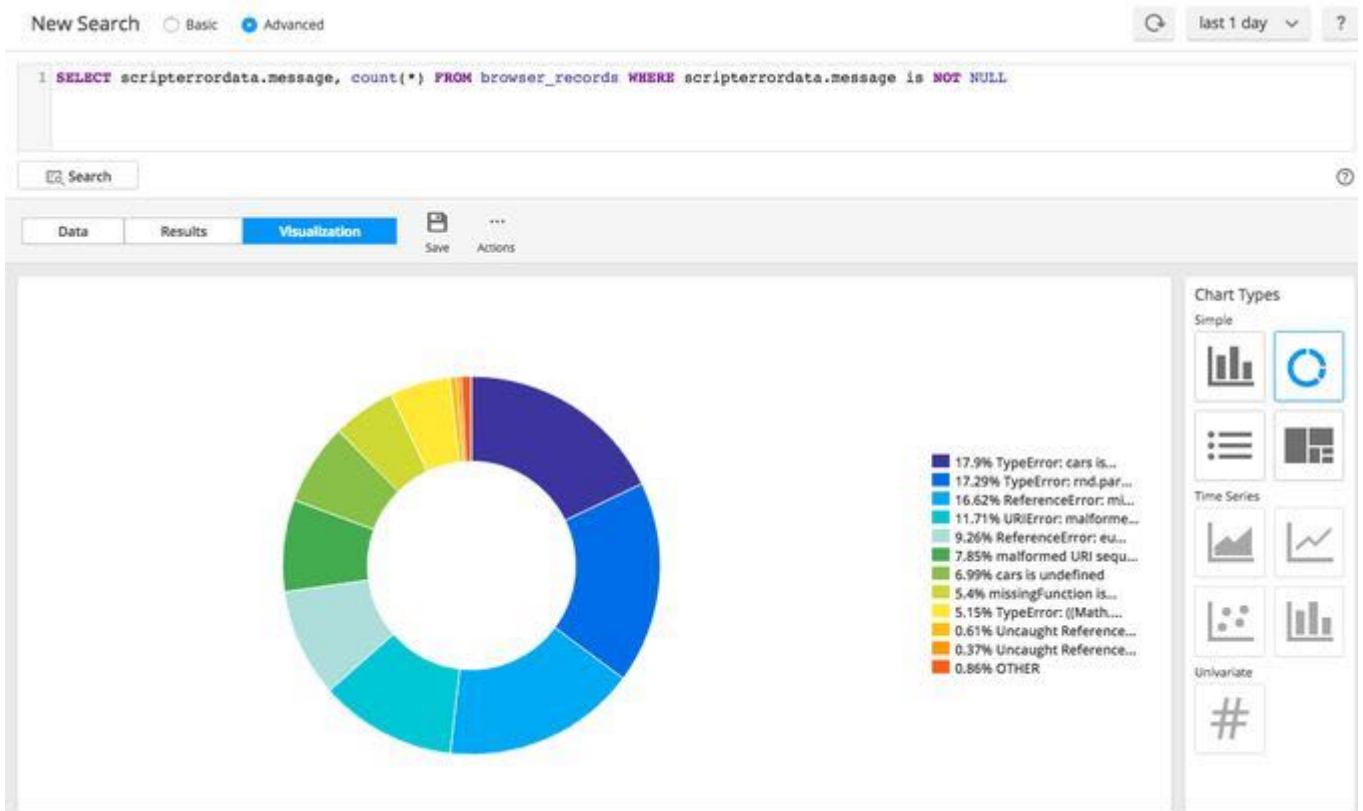

This procedure assumes that you have configured and enabled the reporting of the JavaScript errors for Browser RUM and that JavaScript errors exist in the Events Service.

Using ADQL, you can search for the errors and then export a chart visualizing the results to a custom dashboard.

1. From the Analytics tab in the Controller UI, click **Add** to access the Analytics Search page.
2. Select Advanced mode and enter the following query:
SELECT scripterrordata.message, count(*) **FROM** browser_records **WHERE** scripterrordata.message **IS NOT NULL**. The results are shown on the Visualization tab similar to the following:

3. Select the chart type you prefer to visualize the results.

4. From the **Actions** menu, click **Add to Dashboard** and either create a new dashboard or add it to your existing dashboard.

Now you can customize the dashboard as needed with labels or other widgets and data.

You can also leverage additional fields such as `scripterrordata.origin` or `pagename` to group the errors together. The additional fields are:

- `scripterrordata.linenumber`
- `scripterrordata.origin`
- `scripterrordata.timestamp`

New Search Basic Advanced last 1 day ?

```
1 SELECT scripterrordata.linenumber, scripterrordata.message, scripterrordata.origin, count(*) FROM browser_records WHERE scripterrordata.message is NOT NULL
```

Search

Create Analytics Metrics From Scheduled Queries

Related pages:

- [Using Analytics Data](#)(see page 3213)
- [ADQL Reference](#)(see page 3011)
- [Create and Manage Custom Roles](#)(see page 156)

This page describes how to create analytics metrics from scheduled queries.

If you want to execute an analytics search repeatedly to monitor its value, you can create a metric from the search. The search will execute once per minute and report the results as a metric. You can create alerts on the metric in the usual way using [Health Rules](#)(see page 304) to trigger [Policies](#)(see page 260) and [Actions](#)(see page 334). The analytics metric list is searchable.

You can create metrics for all Analytics event types - Browser, Mobile, Transaction, Log, and Custom.

i Although the metrics calculated by scheduled queries may have decimal point precision, we only save and report whole numbers.

You can create a metric from an analytics search for the functions shown in this table. See [Metric Data Resolution over Time](#)(see page 226).

Function	Metric Rollup Type	Example
count(* field_name)	sum	SELECT count(activeMacUsers) FROM dummyTransactions
distinctcount(field_name)	average	SELECT distinctcount(activeMacUsers) FROM dummyTransactions
sum(numeric_field_name)	sum	SELECT sum(responseTime)where userExperience = "NORMAL" FROM transactions
avg(numeric_field_name)	average	SELECT avg(responseTime) FROM transactions
min(numeric_field_name)	average	SELECT min(responseTime) FROM transactions
max(numeric_field_name)	average	SELECT max(responseTime) FROM transactions
(exp1)/(exp2)	average	SELECT (count(activeMacUsers)) / (avg(activeWindowsUsers)) FROM dummyTransactions SELECT (avg(responseTime)*2)/ ((avg(segments.transactionTime)+3)/2) FROM transactions SELECT (sum(responseTime)*2)/ (filter(sum(responseTime), where userExperience = "NORMAL") + 0.5) FROM transactions

 Each side of the expression must be enclosed in parenthesis.

You must have **Manage Metrics** permission and View access to Analytics to create metrics from analytics searches. See [Analytics and Data Security](#)(see page 3108) and [Transaction Analytics Permissions](#)(see page 166).

Create an Analytics Metric

1. Working in the **Analytics > Search** editor, set the search criteria to select the appropriate data.
2. Click **Actions > Create Metric** in the search action toolbar.
3. In the pop-up window, give your metric a name and a description.
The name determines how the metric appears in the Metrics panel and the Metric Browser. Keep in mind:

- Metrics are truncated to whole values. So values less than one are truncated to zero. To work around this, you can multiply a `numeric_field_name` by a factor of 10, 100, 1000, and so on, depending on the level of decimal accuracy you need. We recommend that you add this factor into the metric display name so other users can understand what the metric represents, for example, Display Name = Metric (Factor 1000). In cases where the value is a percentage, and you convert by multiplying by 100, you probably don't need to put the factor in the metric name because it would be implicit (Metric %).
- Math operations are only supported inside the aggregation function. For example, `count(numeric_field_name * 10)` from `transactions`.

Metric Timestamps

Timestamp metrics always aggregate events from the current minute because metrics are created for events published in the last minute.

If you have specified a value for the `eventTimestamp` field, the timestamp value in the new metric uses an aggregation of events from the `pickupTimestamp` field.

For example, you set an `eventTimestamp` for an event on a previous day. You then create a metric for the event today. The metric does not use your explicit `eventTimestamp` because it is no longer from the current minute. The metric aggregates events using `pickupTimestamp`. This ensures that the metric timestamp is based on the current minute because `pickupTimestamp` cannot be explicitly changed.

See [Analytics Events API](#)(see page 3743).

Correlate Metrics from Multiple Events

When you create a query, AppDynamics produces a holistic metric. Because the queried data comes from different events, the Events Service has to retrieve this segmented data and stitch it together to produce a single metric. The Events Service waits for correlated events to arrive, where the maximum wait time depends on the event type:

- Mobile and Browser Session Events - two minutes.
- Transaction Events - ten seconds.

The wait time resets when the Events Service finds a correlated event.

If an event arrives after the maximum wait time, the event is not stitched together correctly in your query. For example in the following query `fieldA` and `fieldB` are separate but correlated events:

```
select count(*) from transactions where fieldA = "foo" and fieldB = "bar"
```

The Events Service finds `fieldA` and waits 10 seconds for a correlated event. If `fieldB` arrives 15 seconds after `fieldA`, the Events Services does not correlate both events. The count metric is now inaccurate because the events are not connected.

Monitor Analytics Metrics

For performance reasons, the scheduled queries used in analytics metrics can be disabled as follows:

- Queries are disabled if calling the Events Service results in any errors for ten consecutive times.
- Queries are not disabled if the Events Service is not reachable from the controller, such as during maintenance and upgrade windows.
- When the Controller is restarted, the queries which were previously disabled by the system due to consecutive failures are re-enabled.
- User-disabled queries remain disabled even after the system is restarted.

To monitor the metric:

1. Click **Metrics** in the left navigation bar.
2. Search, edit, enable, disable, or delete metrics from the **Metrics list**.

 You can edit only the description of the selected metric.

3. To activate or deactivate metrics in a batch, select the corresponding rows in the grid and click the **Enable** or **Disable** button in the toolbar. Use Shift+ click or Command + click rows to select multiple rows.

 If you see a status that says "Disabled due to repetitive failures", you can re-enable it by clicking **Enable**.

4. To see the metric in the Metric Browser, click the **Metric Browser**. For more details, see the section "*Metric Data Point Details*" in [Metric Browser](#)¹⁸⁹⁹.

Business Journeys

Deployment Support

Related pages:

- [Configure Business Journeys](#)(see page 3248)
- [View Business Journeys](#)(see page 3252)
- [Create Example Business Journeys](#)(see page 3257)

This page provides an overview of business journeys in AppDynamics.

Many industries have complex workflows and user journeys that span multiple transactions and event types, such as logs and End User Monitoring (EUM) data. These workflows typically manifest over long periods and cannot be measured using transactions alone. Business Journeys are a way to monitor and correlate the linear data flow across multiple event sources and track the total time for defined business workflows.

Typical multi-step workflows from different industries include:

- Payment transfers, credit card approval, and loan approval in financial services industries
- Cellphone activation and data recharge (pre-paid) in the Telco sector
- Insurance application through policy approval and insurance claims approval for insurance companies

About Business Journeys

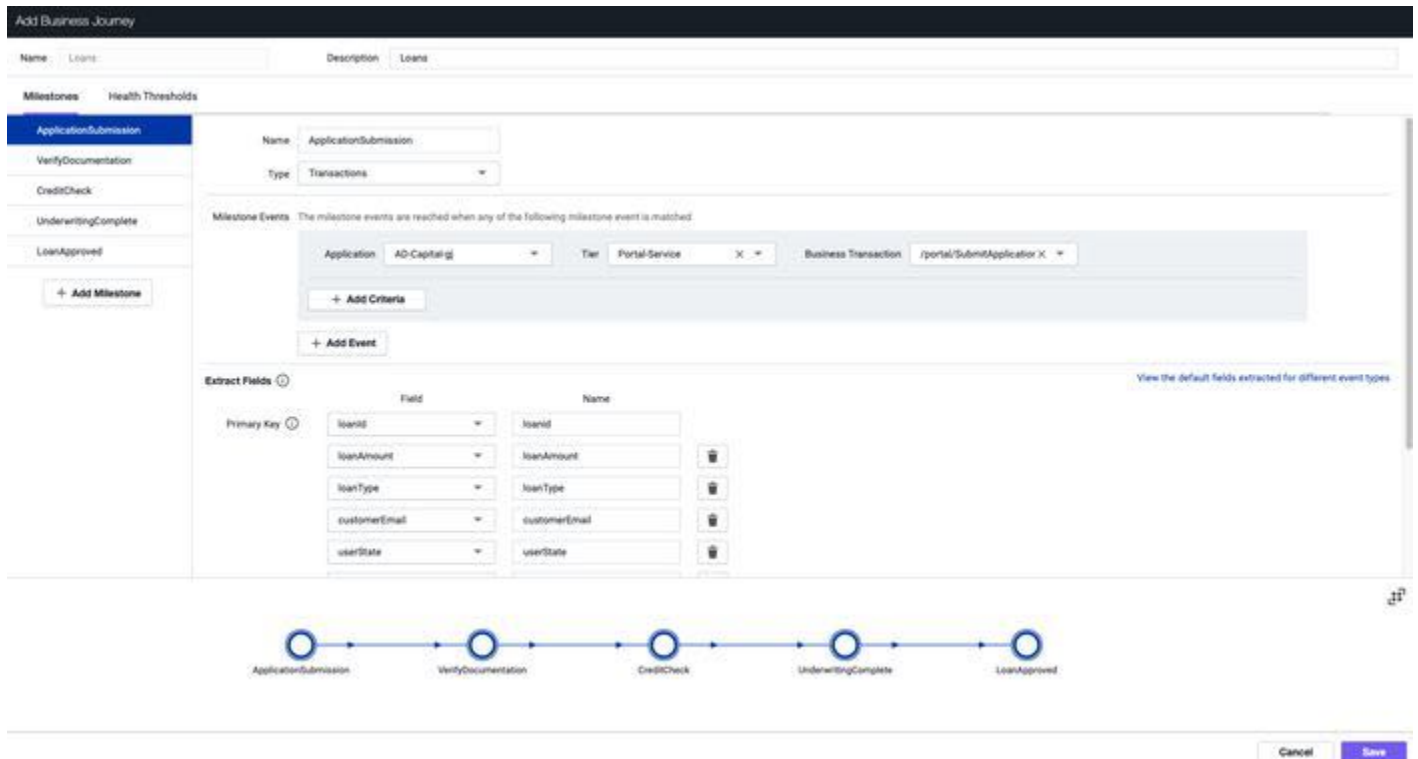

An AppDynamics Business Journey is a composite event type based on defined workflows. A Business Journey can include events from multiple analytics event types, such as logs, business transactions, custom events, and EUM data.

¹⁸⁹⁹ <https://docs.appdynamics.com/display/PRO21/Metric+Browser>

You will need at least one unit of the [Transaction Analytics license](#)¹⁹⁰⁰ for Business Journeys, even if none of the milestones use any of the Transaction Analytics fields.

Business Journeys track linear processes. Branching, repetition, and loops are not allowed. The following image depicts an example Business Journey definition.

You create a Business Journey, as shown above, by defining the following:

- [Milestones](#)(see page 3244) and the events comprising the milestones. Milestones are the steps in your business workflow.
- [Fields](#)(see page 3245) to be captured from each milestone event. A field indicates a category of information pertaining to the event.
- The primary key field that uniquely ties the events together. A primary key correlates the milestones for your Business Journey. The primary key value must be present in each milestone event.
- Additional fields that allow you to segment on different dimensions of the business workflow, such as loan types or payment amounts.
- [Health thresholds](#)(see page 3244) for monitoring the Business Journey performance.

Application Analytics starts collecting the Business Journey events after you have defined and enabled a Business Journey. Analytics does not go back in time to collect Business Journey composite events. To define specific Business Journeys, you may need to configure the collection of additional fields from your source analytics events. See [Data Prerequisites for Defining Business Journeys](#)(see page 3248) for more information.

Once the Business Journey events are being collected, you can view them from the Analytics Search UI in the same manner as other Analytics events. Because Business Journey events are, by their nature, potentially long-running processes, useful data might take some time to appear in the Analytics events list.

¹⁹⁰⁰ <https://docs.appdynamics.com/display/PRO21/License+Entitlements+and+Restrictions>

Business Journey events are reported even when only one milestone is completed and the event is updated over time as subsequent events complete.

If you are already familiar with the fundamental concepts in Business Journeys clearly, proceed to either [Configure Business Journeys](#)(see page 3248) or [View Business Journeys](#)(see page 3252) as desired.

Business Journeys Milestones

A milestone is an event marking a significant stage in a business workflow. For example, in a loan application, the first milestone might be a user submitting a loan application. The second milestone might be document verification, followed by credit approval, insurance underwriting, and finally, loan approval. All milestones are mandatory; do not duplicate milestones.

The events in milestones are sequential. You need to create each milestone in the order that the event occurs. For example, in a loan Business Journey, a credit approval milestone cannot precede the loan application milestone.

In each Business Journey milestone, you can add filters to specify the events that constitute a milestone and add fields to capture additional information about the workflow. You can use these events and fields to run ADQL queries and narrow down your searches.

As you create milestones, a flow map detailing the business workflow is automatically displayed in the Business Journey page. For more information, see [Enable Flow Map](#)(see page 3248).

Business Journeys Health Thresholds

A threshold is a boundary of acceptable or normal performance. Business Journey authoring provides default health thresholds against which it compares the performance of the business workflow. The health thresholds are based on the total time to complete all the milestones in your Business Journey. The threshold values are calculated by determining the standard deviation from the simple moving average over an interval of time. The default time interval is two hours. This means that if the average end-to-end time for the last two hours is N milliseconds, and if the Business Journey takes time equal to the standard deviation over N milliseconds (ms), it violates the threshold.

Milestones
Health Thresholds

Health thresholds based on the total time to complete all the milestones

	Slow	3	Standard Deviations for the last	2	Hours ▾
	Very Slow	4	Standard Deviations for the last	2	Hours ▾
	Stall	300	Standard Deviations for the last 2 hours		

Consider a simple moving average that is 1500 ms with a standard deviation of 100 ms. If you set the threshold to three, it means that the threshold is three times the standard deviation. In other words, a transaction that takes more than $1500 + (3 \times 100)$ or 1800 ms violates the health threshold.

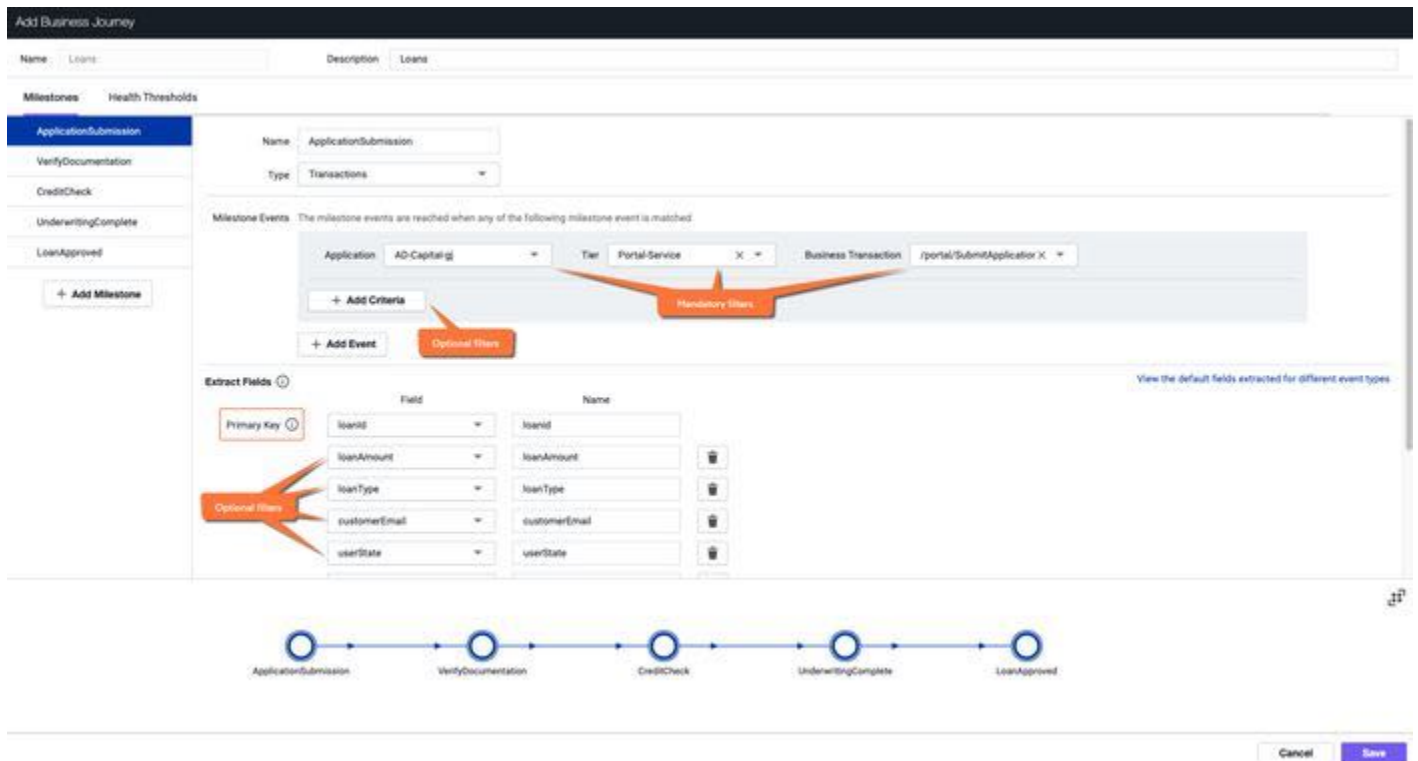

Before configuring the health threshold for a Business Journey definition, consider the following:

- A user experience (normal, slow, very slow, stall) is assigned for the Business Journey event when a value for `totalTime` is present and is greater than zero. Total time for the event could end up less than zero if the milestones are defined in an incorrect order. This can also happen even after the order is correctly defined, but the milestones are not in time order such that an early milestone has a future date compared to a later milestone.
- The total time for the Business Journey is calculated when both the first and the last milestones events have been reached. Therefore, the user experience cannot be determined and displayed until total time for the Business Journey is available.
- When a milestone encounters an error, for example, a transaction event where the `requestExperience` is Error, the user experience for the entire Business Journey event is marked as an Error. In this case, the total time is not available.
- Typically when a milestone has an error, the entire Business Journey workflow does not complete. However, if for some reason, all the milestones complete even when milestone errors exist, the total time for the Business Journey is available. However, in this case, we will retain overall user experience as an error and not change to Normal, Slow, and so on.
- After a Business Journey is initially enabled, Business Journey events are generated. The standard deviation is calculated every five minutes, so the first few Business Journey events will not have a user experience assigned to them.
- The minimum duration over which standard deviation is calculated is 30 minutes.

Filters and Fields

Filters allow you to extract event data for a select milestone based on selected criteria. For example, loan applications submitted in California. Filters define the scope of a milestone by limiting associated events. Fields extract additional relevant information from each milestone.

The mandatory filters are populated with the last 15 days of data. If no analytics data has been collected during the last 15 days, the drop-down menus for the mandatory fields will be empty. Besides the mandatory filters for each event type, Analytics allows you to optionally select additional filters by using the **Filter By** option. All the fields that are part of the filters and the additional filters that you optionally choose are automatically collected. You can use them to run ADQL queries later on.

A field indicates a category of information pertaining to the event. The **Extract Fields** section collects additional relevant information from each milestone. You can use data to query desired events and visualize matrices. The fields are categorized into mandatory and optional fields. The only mandatory field you must enter is the primary key. It is the unique identifier that ties milestones together.

In addition to the primary key, you can optionally add additional fields. These fields provide a context for your Business Journey definition. For example, loan amount, loan type, and customer name, customer id, and so on provide further details about a loan application. You can use these field values to slice and dice business transaction data later on. You must provide unique fields for each milestone. Validation fails if you create more than one milestone with the same set of fields or with the same set of mandatory and optional filters.

For each milestone, a field called `milestoneReached` is added to the associated event. The value is true if the milestone has been reached, otherwise it is null. You can use this field to query all events for which a milestone has been reached. You can also use `milestoneReached` to build a funnel widget that shows drop-offs for each milestone. The milestone name is appended to the field name as follows:

- `milestone1_name.milestoneReached`
- `milestone2_name.milestoneReached`

Likewise, the default fields and filters are also appended with and namespaced by milestone name.

At the Business Journey level, a field named `completed` tracks the status of the workflow using the boolean values. True represents a completed Business Journey, whereas False indicates that the journey is in progress or is incomplete. Use the Analytics Search UI or an ADQL query for the desired Business Journey with the query string `completed` to view the status of the associated events.

Milestone Timestamps

The `totalTime` and `timeTaken` fields represent the time it takes to reach a milestone. Timestamp fields are empty when the Business Journey is partially complete. As each milestone completes and the event data is captured in the Business Journey event, the total time is updated. The total time is calculated by subtracting the timestamp for the first event from the timestamp for the final event.

Timestamps are not exact fields. AppDynamics cannot calculate the exact time of events in a milestone because the event may occur at any point in method. For example, in the loan Business Journey above, the Credit Approval milestone may come from a log event. Your system may trigger a log at any point in the credit approval process. However, the start time of the Business Journey milestone can only be detected when the log event reaches AppDynamics. You may notice a slight difference in actual time due to this behavior.

Business Journey and Milestone Metrics

The table below lists the metrics that are calculated out of the box for Business Journeys and milestones, which are the only metrics supported by Business Journeys. You cannot use metric queries created from an ADQL search for Business Journeys.

	Metric	Description
Milestones	Average time taken	Average of time taken to reach the current milestone from the previous milestone. Not applicable for the first milestone.
	Calls per minute	Total number of Business Journeys that reached the milestone in the last one minute and started in the last 24 hours.
Business Journeys	Average total time	Average of time to reach to completion for all Business Journeys that started in last one day and completed in the last one minute. Calculated taking the average value of <code>totalTime</code> field stored in all Business Journey events.
	Calls per minute	Total number of Business Journeys that started in the last one minute. A Business Journey starts when AppDynamics detects the first milestone.

Mandatory Fields

Mandatory filters, mandatory fields, and fields extracted by default depend on the event type as shown in the following table.

Event Type	Mandatory Filters	Mandatory Fields	Fields extracted by Default
Transactions	Application Name Business Transaction Name Tier Name	Primary Key	eventTimestamp requestGuid requestExperience
Logs	Source Type	Primary Key	eventTimestamp logLevel logType
Browser RUM	AppKey Page Name Page Type	Primary Key	eventTimestamp cguid pageexperience
Mobile RUM	AppKey Network Request Name	Primary Key	eventTimestamp cguid networkrequestexperience
Custom Events	Source Type	Primary Key	eventTimestamp

For custom events, you must include a date in the eventTimestamp field for the Business Journey to register the event. See [Analytics Events API](#)(see page 3743) for more information.

Configure Business Journeys

Related pages:

- [View Business Journeys](#)¹⁹⁰¹
- [Create an Example Business Journey](#)¹⁹⁰²

This page describes how to configure Business Journeys.

Before You Begin

Before creating Business Journeys, ensure that the feature is enabled in your environment. You also should review data prerequisites, validation rules, and limitations for names and Business Journey definitions.

Enable Business Journeys

By default, Business Journeys is enabled on SaaS environments. However, the feature is disabled for on-premises installations. To enable Business Journeys, an Administrator needs to configure certain properties in **Settings**.

Before starting the Event Service:

¹⁹⁰¹ <https://docs.appdynamics.com/display/PRO45/View+Business+Journeys>

¹⁹⁰² <https://docs.appdynamics.com/display/PRO45/Create+an+Example+Business+Journey>

1. Open the `events-service-api-store.properties` file.
2. Change `ad.bizoutcome.enabled=false` to `true`.

The page displays a flow map detailing the business workflow across milestones. You can hide the flow map by changing the value of the `analytics.business.outcomes.flowmap.enabled` property to `false` in **Settings**.

Enable Flow Maps

As you create milestones, a flow map detailing the business workflow displays on the page. Selecting a Business Journey prompts a new window with the enabled flow map. This behavior is controlled by the `analytics.business.outcomes.flowmap.enabled` property in **Settings**. Setting its value to `true` indicates that flow maps are enabled for Business Journeys.

Data Prerequisites for Defining Business Journeys

Analytics creates Business Journey composite events by collecting events and fields that you have already captured as analytics data. In addition to built-in analytics data sources, custom event data can also be used to create Business Journeys. As you define the milestones in the Business Journey, you specify which events to use and which fields to extract from the events. You can extract fields collected by default or custom fields that you have configured for collection. You can also add milestones with custom events created from Analytics API Keys.

You need to know the starting event, ending event, and clearly-defined steps in between. To collect additional fields in the events being captured by Analytics, see:

- [Analytics Custom Events Data](#)¹⁹⁰³
- [Data Collectors](#)¹⁹⁰⁴
- [Collect Business Data From SQL Calls](#)¹⁹⁰⁵
- [Configure Log Analytics Using Source Rules](#)¹⁹⁰⁶

Restrictions and Caveats

- Business Journey names are case-insensitive and are stored as all lowercase. This means that two definitions named `application` and `Application` are considered a duplicate.
- The **Event Type** drop-down displays the lowercase definition name.
- Use the lowercase name for advanced queries.
- The primary key must be unique and not null. If the primary key holds null values, the underlying milestone events will not be stitched together to form a Business Journey event.
- Choose the primary key carefully; in particular, the cardinality of the values. The primary key is expected to uniquely identify and join milestone events together to form a meaningful business workflow. If the milestone events are misidentified by the primary key, inaccurate milestone events will join and produce faulty results.
- The primary key name cannot be changed unless the Business Journey definition is in the draft state.
- The Business Journey definition name cannot be changed after the definition is deployed. You can rename it while the definition is in the draft state.
- If a field related to a custom event is renamed, update the Business Journey definition created from the custom event for the renamed field to be correctly extracted.

Validation Rules

This section describes certain rules to validate Business Journey definition and naming convention for Business Journeys, milestones and extracted fields. You can save your work as a draft without invoking validation. When you are ready, you can use **Validate and Save** to check that your definition is acceptable. Saving the Business Journey definition does not enable the Business Journey. Data is not captured until you actually enable the Business Journey. See [Business Journeys Life Cycle](#)(see page 3251).

Validation Rules for Names

This section describes the validation rules for naming Business Journeys, milestones, and extracted fields. Validation rules are not applied when you save your Business Journey definition as a draft. Validation is only invoked when you use **Validate and Save**. The validation rules include the following:

- Names of Business Journeys, milestones, and extracted fields must have an alphanumeric string containing a-z, A-Z and 0-9. The only special character allowed is the underscore _.
- Special characters such as spaces, hyphens, dashes are not allowed in the names.
- Primary Key fields must have the same name (label) in all milestones in a Business Journey definition. The field name itself may vary in different event types.
- The primary key name cannot be changed unless the Business Journey definition is in the draft state. See [Business Journeys Life Cycle](#)(see page 3251) for more information.
- The following reserved field names cannot be used to name milestones or fields in your Business Journey definition.
 - pickupTimestamp
 - eventTimestamp
 - totalTime
 - userExperience
- You cannot name milestones or field names with ADQL keywords. See [ADQL Queries](#)¹⁹⁰⁷.

Validation Rules for Business Journey Definition

A Business Journey definition must contain:

- A minimum of two milestones.
- A unique set of filters. More than one milestone with the exact same set of required and optional filters is not allowed in the same definition.
- Unique milestone names.
- Extracted field names must be unique (except the Primary Key field).
- There must be one Primary Key field per milestone.
- Slow threshold duration must be greater than 30 minutes.

Create a Business Journeys Definition

1. In the Controller UI, navigate to **Analytics > Business Journeys**. A list of existing Business Journeys (if any) displays.
2. To define milestones, click **+ Add Milestone**.
3. Type a name.
4. From the **Type** dropdown, select the [source of the analytics data](#)¹⁹⁰⁸, such as Transactions, Logs, Browser Requests, and Mobile Requests.
5. The **Milestone Events** section displays mandatory filters based on your selected data source. The fields vary based on your data source type.

¹⁹⁰⁷ <https://docs.appdynamics.com/display/PRO45/ADQL+Queries>

¹⁹⁰⁸ <https://docs.appdynamics.com/display/PRO45/Analytics+Data+Sources>

For Transactions, specify the [Application](#)¹⁹⁰⁹, [Tier](#)¹⁹¹⁰, and [Business Transaction](#)¹⁹¹¹ for each milestone you intend to create. For Analytics, the tier represents a Java Virtual Machine (JVM) service, such as an authentication service, in your application environment. Business Transaction is the cross-tier processing path representing the request for a service provided by the application.

6. You can optionally click **+ Add Criteria** to add additional filters based on your data source type.
7. You can define multiple milestone events of the same event type. Click **+ Add Event** to create another milestone event.
8. In the **Extract Fields** section, define your primary key field and name to specify which fields will be captured from the milestone event. You can click **Auto Fit** to auto-organize the milestone events or organize the events freely.

Once you name the primary key, you can not change the name unless the definition is in the draft state. See [Business Journey Life Cycle](#)(see page 3251).

The primary key field is not populated for subsequent milestones because the primary key might have different field names in the event type for different milestones.

 Fields that are extracted by default in Business Journeys are not shown.

9. You can save the Business Journey with either:
 - **Save As Draft:** saves the definition in draft form. No validation is performed and you can return to the definition to complete it at a later time.
 - **Validate and Save:** Performs necessary validation. Use this option when you have completed all milestones. The definition is saved, but is not enabled.
10. In the **Health Thresholds** tab, you can specify the values that determine acceptable performance. See [Business Journeys Health Thresholds](#)(see page 0) to learn how the user experience value is calculated. When you finish creating the Business Journey definition, you are ready to enable it.
11. Select the Business Journey from the list and click **Enable**. The option is greyed out until you select a valid draft Business Journey from the list. To enable a Business Journey, the state must be "Valid Draft".

<div style="display: flex; justify-content: space-around; align-items: center;"> + Add Edit – Delete <div style="border: 2px solid orange; padding: 2px;"> Enable </div> Disable </div>		
Name	Description	State
insurance		User Disabled
LoanApplication		Enabled
insurance_processing		Draft
sim_card_activation		Valid Draft

Business Journeys Life Cycle

This section provides information about the Business Journeys life cycle.

¹⁹⁰⁹ <https://docs.appdynamics.com/display/PRO45/Business+Applications>

¹⁹¹⁰ <https://docs.appdynamics.com/display/PRO45/Tiers%2C+Nodes%2C+and+Naming>

¹⁹¹¹ <https://docs.appdynamics.com/display/PRO45/Business+Transactions>

Draft

You might not have all the required details at the beginning and therefore, creating the definition may involve multiple temporary versions. Use **Save As Draft** to capture your initial, incomplete definition and place your Business Journey into a Draft state.

- No analytics data is processed and no Business Journey events are created in draft state, so there is nothing to query.
- The primary key can be changed when the Business Journey is in draft state.
- The draft state is less restrictive with respect to validations and supports most update operations.

Valid Draft

Once the definition has the required details, use **Validate and Save**, which transitions the definition into the Valid Draft state. You can still modify the definition in this state. Business Journey events are not captured until you enable the definition.

Enabled

When you are ready to process data, use the **Enable** action. This transitions the definition to the Enabled state. Most definitions will spend their lifetime in the Enabled state.

- Configuration changes are synced to the Analytics Servers every two minutes. Therefore, once you enable a Business Journey definition, there could be a delay of up to two minutes for events to be generated.
- Incoming events are processed, composite Business Journey events are created and stored. You can query for the Business Journey events.
- You can modify the definition in the following ways:
 - Add, rename, or delete fields for extraction (non-default fields)
 - Add, rename, or delete milestones

User Disabled

At some point, you may want to disable the Business Journey. The **Disable** action transitions the Business Journey definition to the User Disabled state. In this state, no incoming events are processed. Existing events can still be queried.

You can update the definition in the following ways:

- Add, rename or delete fields for extraction (non-default fields)
- Add, rename or delete milestones

Deleted

When you no longer need the Business Journey definition, use the **Delete** action. This is the final phase of the definition's lifecycle. In this state, no incoming events are processed for it. Existing Business Journey events are not available to query.

View Business Journeys

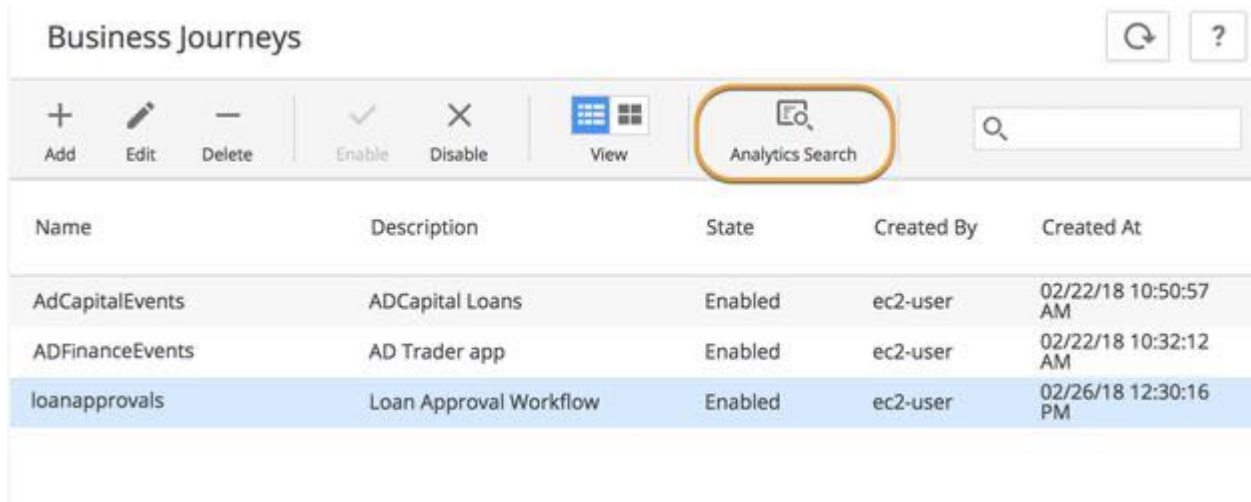

Related pages:

- [Search Analytics Data](#)(see page 3214)
- [ADQL Reference](#)(see page 3011)

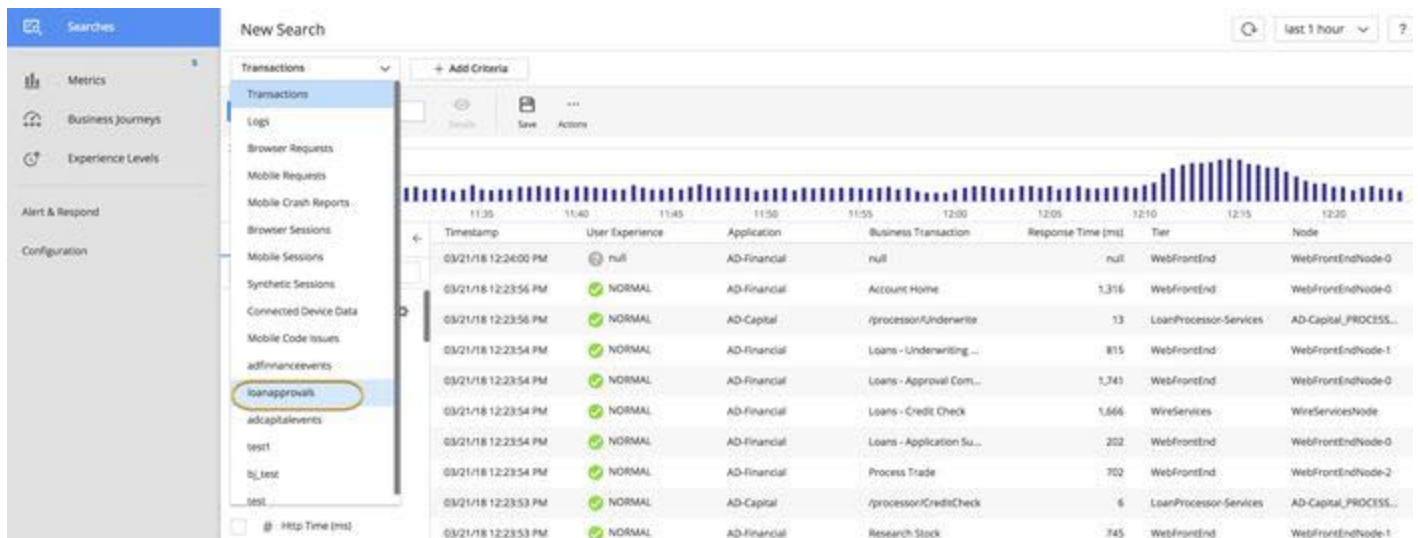

View Business Journey events from the Analytics Search UI in the same way as any other event type. Alternatively, use the **Analytics Search** button on the Business Journey UI.

Search for Business Journeys

Use the **Analytics Search** button in the Business Journeys UI for one-click access to the underlying events. Selecting an enabled Business Journey and clicking **Analytics Search** takes you directly to the Searches page in Basic mode. **Analytics Search** button is unavailable for definitions in Draft and Valid Draft states.

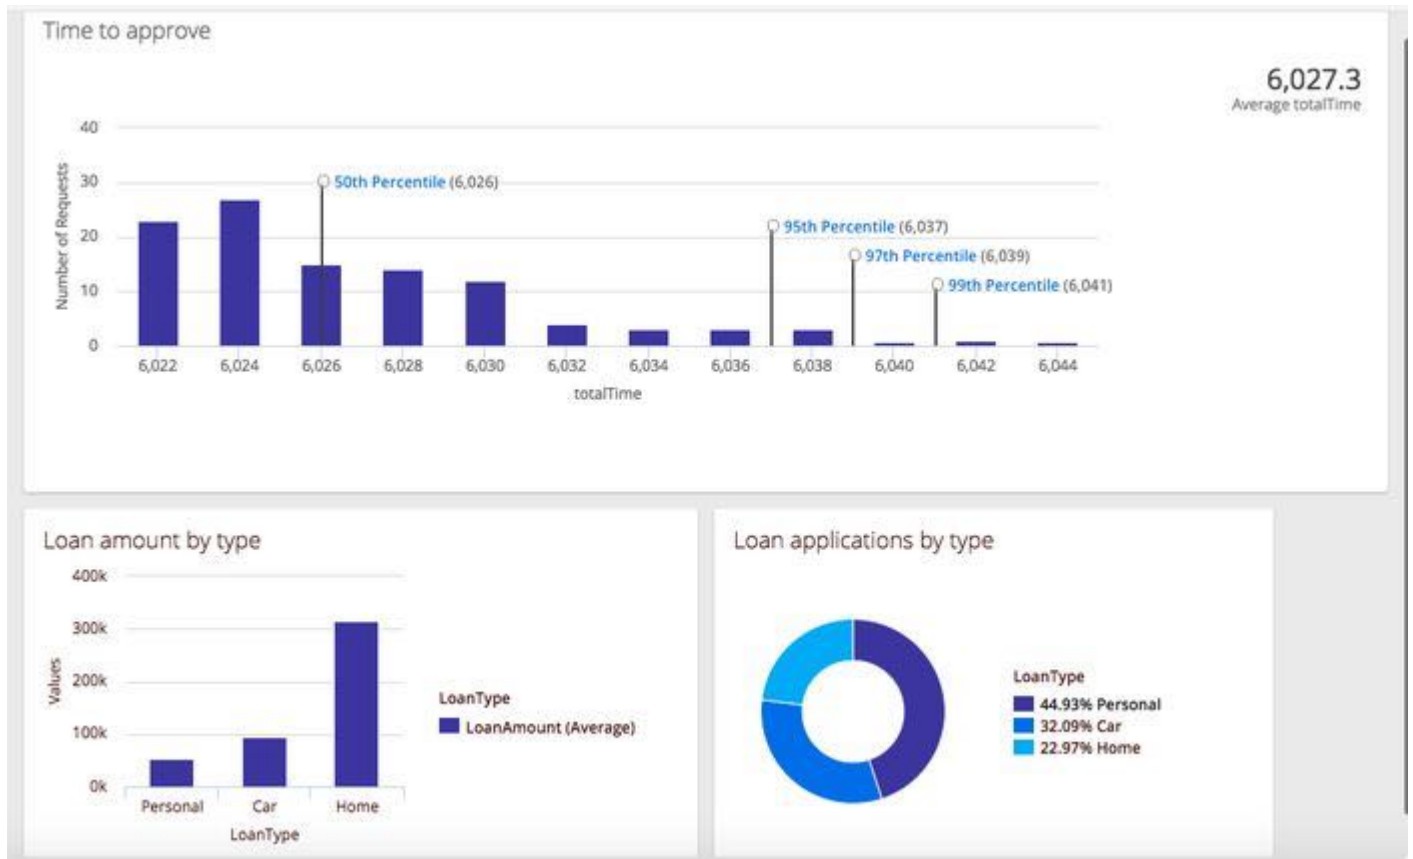

Alternatively, access the Analytics Search UI and use the event type dropdown to find your Business Journey event. The Business Journey name identifies the event type in the Search UI similar to custom events. In this example, it is "loanapprovals".

You can search the Business Journey data and create visualizations in the same fashion as for any other analytics event type.

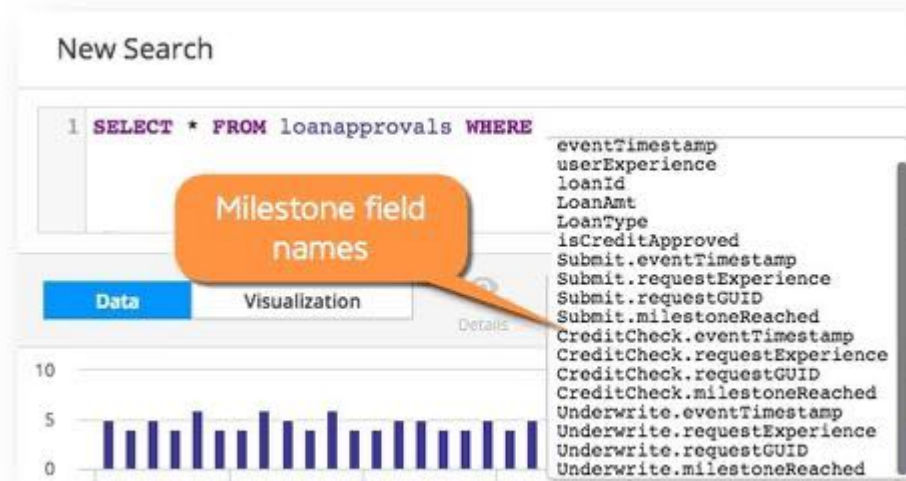

Business Journeys also gives you the ability to perform analytics, slice and dice data, and create widgets. For example, using the loan approval Business Journey, visualize percentile values of approval time, loan amount by type, and loan applications by type as follows:

The 50th Percentile line indicates that 50% of the loan approvals occurred below this line. Similarly, each percentile line represents the corresponding percentage of loans approved below that line.

Business Journeys ADQL Queries

To use ADQL to query Business Journey events, you need to use the full namespaced field name for each milestone. The field names are constructed by appending the milestone name to the field. When constructing queries with ADQL in the Search UI, you must use the full name of the field. The following image shows constructing a sample ADQL query.

A sample ADQL query for the loanapproval Business Journey is:

The screenshot shows the 'New Search' interface with a specific query: `1 SELECT * FROM loanapprovals WHERE CreditCheck.milestoneReached = true AND LoanType = "Personal"`. The interface includes a search bar, a refresh button, and a dropdown for 'last 15 minutes'. Below the query, there are tabs for 'Data' and 'Visualization'. The 'Data' tab is selected, and a bar chart is visible. Below the chart, there is a table with columns: 'User Experience', 'Total Time (ms)', 'loanId', 'LoanAmt', 'LoanType', 'CreditCheck.milestoneReached', and 'isCreditApproved'. The table contains 10 rows of data. On the left side, there is a 'Fields' panel with a search bar and a list of fields with checkboxes for selection. The 'Submit' section has 4 fields: 'Timestamp', 'milestoneReached', 'Request Experience', and 'requestGUID'. The 'CreditCheck' section has 4 fields: 'Timestamp', 'milestoneReached', and 'Request Experience'.

User Experience	Total Time (ms)	loanId	LoanAmt	LoanType	CreditCheck.milestoneReached	isCreditApproved
AM	6,013	b7f99ba8-3539-43...	62,000	Personal	true	true
AM	6,013	bc7faa5b-e94a-40b...	96,000	Personal	true	true

Business Journeys Metrics

Analytics generates out-of-the-box metrics at the Business Journey definition and milestone levels. You can view these metrics in the [Metric Browser](#)¹⁹¹². The metric values are reported per minute. For example, an observed value of 5 indicates that it's the count of the records received in the one-minute interval. If the

¹⁹¹² <https://docs.appdynamics.com/display/PRO45/Create+Analytics+Metrics+From+Scheduled+Queries>

number of records reported in the last five minute is 25, the Metric Browser reflects an approximate observed value, that is 5. To calculate metrics, Analytics adds two fields named `timeTaken` and `totalTime`.

The `timeTaken` field is added to the associated event for each milestone. This field represents the time taken for an event to reach a milestone from the previous milestone, and therefore, the first milestone will not have this value.

The `totalTime` field is added to the associated event for each Business Journey definition. `totalTime` represents the time for an event to cover all the milestones comprising the Business Journey. It is the time an event takes to reach the last milestone from the first one. If the first or the last milestone is missing, `totalTime` is not calculated for that event. For example, if the loan application is rejected in the CreditCheck stage, the workflow never reaches the approval stage. In this case, `totalTime` is not determined.

By using the above-mentioned fields, the following out-of-the-box metrics are generated.

Milestone Level

Average timeTaken: Average of the values measured for the `timeTaken` field. Evaluates the events that started in the last one day and reached the milestone in the last one minute.

Calls per minute: Number of events that started within the last one day and reached the selected milestone in the last one minute.

Definition level

Average totalTime: Average of the values measured for the `totalTime` field. Evaluates the events that started in the last one day and reached the first milestone in the last one minute.

Calls per minute: Number of Business Journey events measured per minute. This number is equal to the calls per minute value of the first milestone. The value is calculated by evaluating the events that started in the last one day and reached the first milestone in the last one minute.

 The lookback period to generate out-of-the-box metrics is one day. The values for the metrics might not be accurate if events take more than a day to complete or to even reach the next milestone. This is due to the lack of sufficient event records for Analytics to generate correct values, leading to displaying incorrect values. For example, the average `totalTime` metrics will only be accurate if events finish within the lookback period, that is one day.

Note that the existing definitions will not have the out-of-the-box metrics created. You need to create new definitions to generate corresponding out-of-the-box metrics.

Business Journeys Dashboard

Analytics provides two Views for Business Journeys: Card View and Grid View. Business Journeys page defaults to the Grid View, but after switching to the Card View the UI makes it as the preference. The next time you log in, Business Journeys page defaults to the Card View. Use the **View** button on the toolbar to switch between the Views.

Business Journeys

Name	Description	State	Created By	Created At	Last Modified By	Last Modified At
AdCapitalEvents	ADCapital Loans	Enabled	ec2-user	02/22/18 10:50:57 AM	ec2-user	02/22/18 10:51:01 AM
ADFinanceEvents	AD Trader app	Enabled	ec2-user	02/22/18 10:32:12 AM	ec2-user	02/22/18 10:48:16 AM
Loan Approval	Loan Approval Workflow	Draft	ec2-user	02/26/18 12:30:16 PM	ec2-user	02/26/18 12:30:16 PM

The Card View displays an out-of-the-box dashboard for each Business Journey definition along with key metrics. The dashboard highlights the milestones associated with each Business Journey definitions and these metrics:

i Dashboards for Business Journeys created prior to the release of Analytics 4.5 do not display the *Average time to reach the next milestone* metric. To workaround, edit the **Extract Field** section of one of the milestones and add the new field or remove an existing field. After the definition is saved Analytics starts generating the missing values. Within a few minutes, you should see values for *Average time to reach the next milestone* for the Business Journey you edited.

Time range menu determines what events are considered for calculating metrics. The events that are considered for calculating metrics are only those started in the selected time range.

- End-to-End: The average end-to-end time an event takes to complete the corresponding Business Journey. It is the average time taken by an event to reach the last milestone from the first one.
- Conversion: The conversion rate represents the percentage of events that reached the last milestone from the first one. It is calculated as $(\text{events reached the last milestone}) * 100 / (\text{events reached the first milestone})$.
- Average time to reach the next milestone: It is the average time an event takes to reach the next milestone from the current one. This value is represented by the number shown in between each milestone.
- Event count per milestone: It is the number of events that reached a particular milestone. This value is indicated by the number shown inside the circles representing each milestone.

Create Example Business Journeys

Related pages:

- [Configure Business Journeys](#)¹⁹¹³
- [View Business Journeys](#)¹⁹¹⁴

This page describes a loan application process, [AD-Capital](#)¹⁹¹⁵, to demonstrate the milestone workflow. Similar to a typical loan application process, the workflow in this Business Journey starts with application submission, followed by document verification, credit check, underwriting, and loan approval.

Milestones Data

The data for each milestone comes from different applications and event types, such as business transactions, logs, and end-user events.

In this workflow, the data associated with application submission comes from business transaction events while the document verification status comes from logs. Third-party service providers perform the credit check and underwriting. Then, the status is updated in logs and the loan approval status is updated in the transaction events.

Extract Fields: Primary Key and Additional Fields

Choose a distinct primary key that uniquely identifies and ties together these independent milestones to represent loan application. In this example, `loanId` is used as the primary key. Enter `loanId` in the **Primary Key** field in each milestone. You must use the same data type as the primary key for all milestones in any given business journey.

In addition to the default information collected by the Business Journey, such as event timestamp, you can extract additional business information, such as customer details, loan amount, loan type, bank name, and so on with the optional fields. These additional fields provide further context for your Business Journey definition. You can also use these fields to run ADQL queries.

Define Milestones

In the following example, you can define an application submission milestone by selecting an event type, primary key, and filters. The mandatory filters to limit the events for this milestones are **Type**, **Application**, **Tier**, and **Business Transaction**. The primary key is defined as `loanId`. Fields such as `loanAmount`, `loanType`, and `customerEmail`, are extracted in this milestone.

¹⁹¹³ <https://docs.appdynamics.com/display/PRO45/Configure+Business+Journeys>

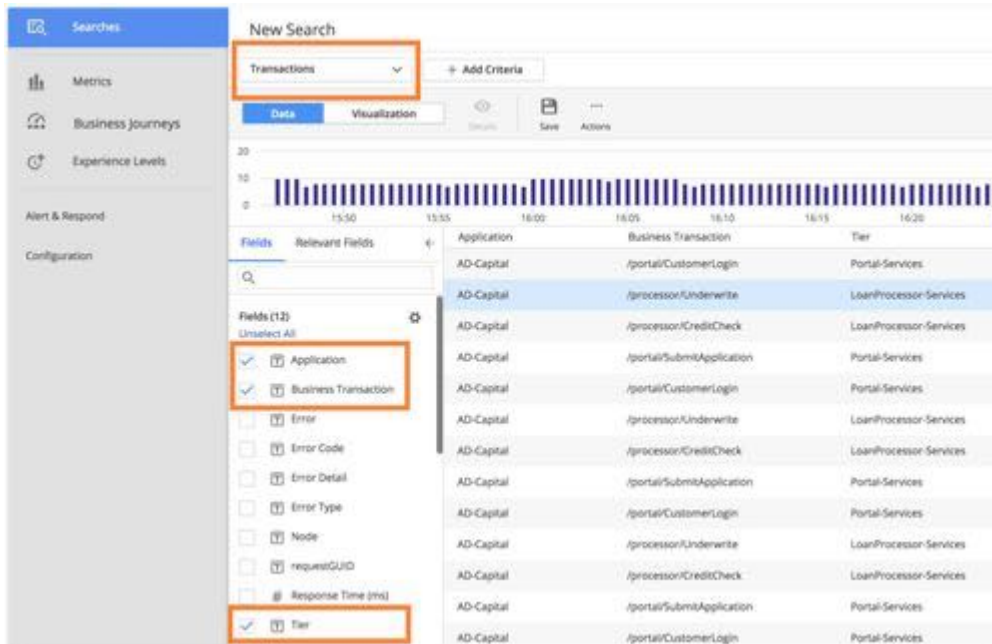

¹⁹¹⁴ <https://docs.appdynamics.com/display/PRO45/View+Business+Journeys>

¹⁹¹⁵ <https://github.com/Appdynamics/AD-Capital>

Define your remaining milestones, validate, and save the Business Journey. It takes a few minutes to display the generated records from the associated events.

Troubleshoot the Business Journey

If you think that the combination of selected fields and filters for each milestone is incorrect, you can validate with an ADQL query search or use the Analytics **Searches** widget:

You can see the valid Tiers and associated Business Transactions for AD-Capital in **Searches**, which displays all the valid values for your selection.

Alternatively, you can access **Tiers & Nodes** in the Controller for the AD-Capital application.

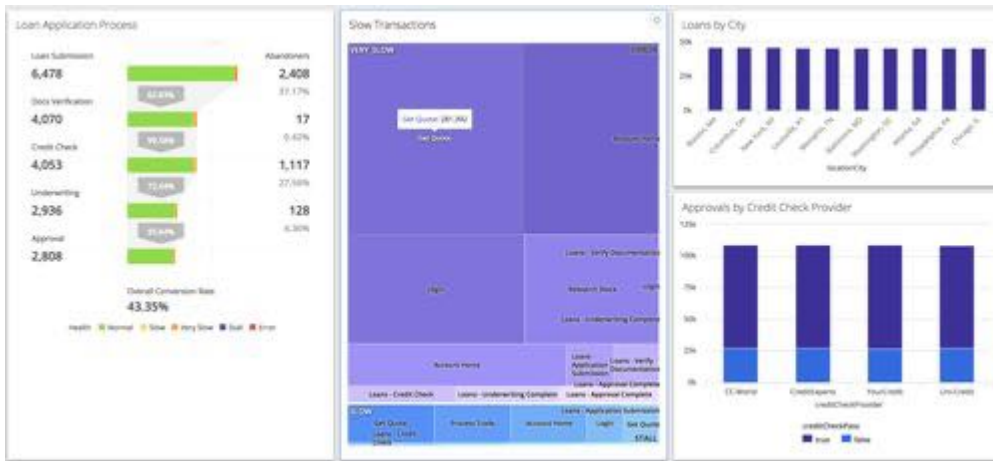

Run Analytics on the Business Journey

Use one of the [search methods](#)¹⁹¹⁶ from **Searches** to view data, run Analytics, or visualize the performance of the Business Journey you just created.

View the Business Journey

You can view dashboards and widgets of the loan approval Business Journey in **Dashboards & Reports**. The visualization makes it easy to understand the performance of loan application workflow.

¹⁹¹⁶ <https://docs.appdynamics.com/display/PRO45/Search+Analytics+Data>

The funnel widget is located on the left side of the image. This widget represents the overall conversion rate, the health of participating events, and the number of abandoners at each critical step in the loan application process.

At the center of the dashboard, a widget illustrates slow business transactions at each step in the Business Journey.

The widget on the lower right side of the image compares credit check providers on the basis of credit approvals.

The widget on the upper right side displays the number of loans approved in different cities.

Experience Level Management

Related pages:

- [View and Export XLM Compliance Data](#)(see page 3267)
- [Configure Experience Level Management](#)(see page 3265)
- [Migrate XLM Configurations Between Environments](#)(see page 3272)

The performance of business transactions and other types of events can affect user experience. Different levels of performance may correspond to service level agreements (SLAs), compliance targets, or compliance policies that your application must satisfy.

For example, an e-retailer might want to ensure that when customers add items to their carts, the transactions always complete within 100 milliseconds.

Experience Level Management (XLM) enables you to define experience levels. XLM shows you how your application is performing relative to those levels, in custom dashboards and in reports that you can view and export.

Working with XLM

Whether you speak of an experience level or a service level depends on whether your focus is user experience or SLAs, but you configure both through the same XLM UI. What this section says about experience levels applies equally to service levels.

You can define experience levels for any kind of data that meets the following criteria:

1. The data must be numerical.
2. The data must be individual (per event) values, not aggregates.

Since data collectors provide individual values, they are a good basis for experience levels as long as the values are numeric. By contrast, metrics and information points cannot be used as the basis for experience levels, because they provide aggregate values.

The following are all good bases for defining experience levels:

- Sales in dollars per week during the time an ad campaign is running
- Application response times calculated from business transaction events
- End-user response times calculated from RUM and synthetic events
- Custom analytics such as login times for platinum customers or item checkout response times for London customers

Compliance against the configured thresholds is calculated in daily intervals from the specified start date. The local time zone starting time for each day is converted to midnight of the equivalent Greenwich Mean Time (GMT) date. For example, *07/30* means *12:00 am GMT on 07/30*. The reporting job that calculates the XLM data runs every day at midnight and noon GMT. The results are updated the next time the reporting job runs.

XLM aggregates the results of reporting jobs into weekly or monthly periods, according to your choice of **Compliance Period** settings, including **Time Zone**.

When viewing XLM data for a week or month, you can drill down into daily granularity. XLM also allows you to

- Create XLM reports in the time zone of your choice
- Export reports of however many reporting periods you choose, in CSV format
- Add your XLM report to a custom dashboard for periodic generation and delivery

You can export XLM configurations, and migrate them from one environment to another. You can also view and export the XLM Audit Trail, which automatically records XLM configurations and changes to them.

If you revise the configuration, the new configuration takes effect the next time the XLM reporting job runs. Past data is immutable and configuration changes do not affect the values.

To see which configuration was in effect at a particular moment in a reporting period, view the [XLM Audit Trail](#)(see page 3264).

Configuration Overview

In the XLM UI, you configure **Properties**, **Compliance Target Settings**, and optional **Exclusion Periods**.

- **Properties** specify what type of event to measure and what filters to apply.
- **Compliance Target Settings** specify the performance criteria you want XLM to report, through
 - the **Compliance Target**, which defines the desired level of performance for the properties
 - **Daily Target Thresholds** which define *Normal*, *Warning*, and *Critical* performance as percentages of the compliance target
 - **Treat Errors as Critical**, an option helpful for applications [where apparently normal performance thresholds tend to conceal errors](#)¹⁹¹⁷
- **Compliance Target Settings** also specify how you want your XLM reports structured in terms of time, through
 - the **Start Date**—the date you want the compliance calculation to begin
 - the **Compliance Period**, which
 - you can think of as the *reporting period*
 - can be weekly or monthly; choose one or the other according to your SLA requirements
 - the **Time Zone** of your choice

¹⁹¹⁷ <https://docs.appdynamics.com/display/PRO45/Configure+Experience+Level+Management>

- **Exclusion Periods help you account for performance deviations caused by upgrades, maintenance, or usage patterns associated with weekends or holidays.**

Here is how our e-retailer example might look:

- The properties have *Transactions* as the event type, filtered to exclude all but an *Add to Cart* business transaction, for the relevant application
- The compliance target is *Response Time (ms)*, set to *100*
- Values for daily target thresholds are *95% to 100%* for *Normal*, *90% to 95%* for *Warning*, and *0% to 90%* for *Critical*
- The compliance period is *Weekly*
- The time zone is *GMT+02:00* for Amsterdam, where our hypothetical e-retailer has customers

Configured this way, XLM reports that performance is *Normal* for each week-long reporting period when the Add to Cart business transaction completes within 100 milliseconds greater than 95% of the time.

For periods when Add to Cart performance meets the target 95% of the time or less, but above 90% of the time, performance is at *Warning* level.

For periods when performance meets the target 90% of the time or less, performance is *Critical*.

This example configuration is illustrated below.

XLM Exclusion Periods

Exclusion periods are time periods which you want to exclude from an XLM report.

For example, scheduled upgrades and maintenance can disrupt performance, so you may not want those periods reflected in XLM reports. Likewise, you may want XLM reports to exclude weekends, holidays, or other times with atypical usage patterns.

XLM queries executed against your Analytics event data observe only the exclusion periods you explicitly configure in the XLM UI. You configure exclusion periods using the time zone of your choice. Under the hood, AppDynamics keeps track of the exclusion period in the corresponding GMT dates.

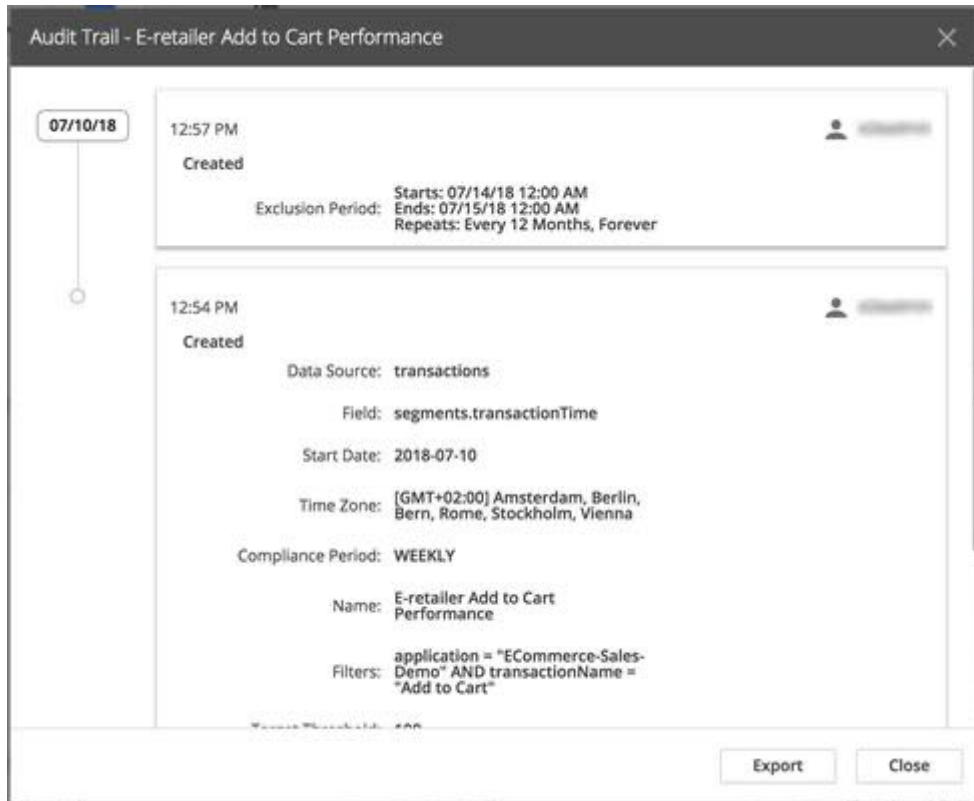

i XLM does not recognize exclusion and maintenance periods that you configure at the Controller level.

XLM Auditing

All changes to XLM configurations produce an immutable audit record called an XLM Audit Trail, which contains complete XLM configuration information. Since XLM audit reporting is separate from all other reporting in the AppDynamics Controller UI, the XLM Audit Trail is distinct from other available reports, such as the Controller Audit Report. You can export the XLM Audit Trail to a CSV file.

Each XLM configuration is limited to 1000 updates. If that limit is reached, the oldest audit records are dropped as new ones are added.

The XLM audit records contain information about what operations are performed and what fields are changed. The UI presents XLM audit records as a sequential timeline.

Configure Experience Level Management

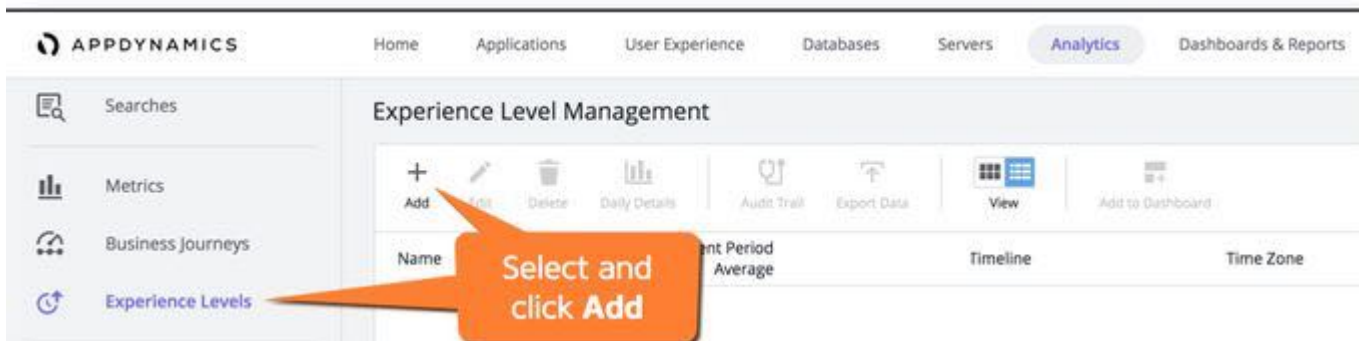

Related pages:

- [View and Export XLM Compliance Data](#)(see page 3267)
- [Migrate XLM Configurations Between Environments](#)(see page 3272)

To configure Experience Level Management (XLM), you specify **Properties**, **Compliance Target Settings**, and optional **Exclusion Periods** as described [earlier](#)¹⁹¹⁸.

Configure an XLM report

1. From the Controller UI, choose **Analytics > Experience Levels** and click **Add**.

¹⁹¹⁸ <https://docs.appdynamics.com/display/PRO45/Experience+Level+Management>

2. In the **Properties** section, name your XLM report uniquely. Select the event type and any filters necessary for isolating the data that you want to evaluate.

Add Experience Level Management Configuration

Properties

Name

Event Type

Filter By
Application: ECommerce-Sales-Demo
Business Transaction: Add to Cart

3. Select the desired field, target value, and daily target thresholds. Choose a time zone, report start date, and reporting period. Past dates are not allowed.

Compliance Target Settings

Each event will be evaluated against the Compliance Target to determine the Daily Compliance.

Compliance Target

Start Date

Daily Target Thresholds

<input checked="" type="checkbox"/>	Normal	<input type="text" value="95"/>	% - 100%
<input type="checkbox"/>	Warning	<input type="text" value="90"/>	% - 95%
<input type="checkbox"/>	Critical	<input type="text" value="0"/>	% - 90%

Treat Errors as Critical ⓘ

Compliance Period

Time Zone

4. (Optional) Select [Treat Errors as Critical Failures](#)(see page 3267).

- (Optional) Specify **Exclusion Periods** using the time period of your choice to denote periods during which data should be not collected.

- Save the configuration. Data is collected and compliance is calculated in an automatic job that runs twice per day.

Treat Errors as Critical Failures

You can choose to treat events with errors as critical failures.

This enables you to identify instances where an event meets the compliance target but has a user experience status of Error.

For example, if you have defined Response Time of under 2000 milliseconds as the compliance target, an event with a response time of 100 milliseconds meets the compliance target, even if that event finished prematurely because of an error. In that case, XLM reporting that performance as Normal could be considered a false positive.

When you enable **Treat Errors as Critical Failures**, XLM will catch instances like this. Whether this option is optimal for your application is a subjective judgment for you to make.

Treat Errors as Critical Failures is only supported for event types that contain a user experience or similar field, as shown in the table below.

Event Type	Experience Field
Transaction Event	userExperience
Browser Record	pageexperience
Mobile Snapshot (Network Request)	networkrequestexperience
Browser Session	pageexperience
Mobile Session	networkrequest.networkrequestexperience

View and Export XLM Compliance Data

List View

As in the card view, you can:

- Click any reporting period for a daily breakdown
- Right-click any day to view associated events

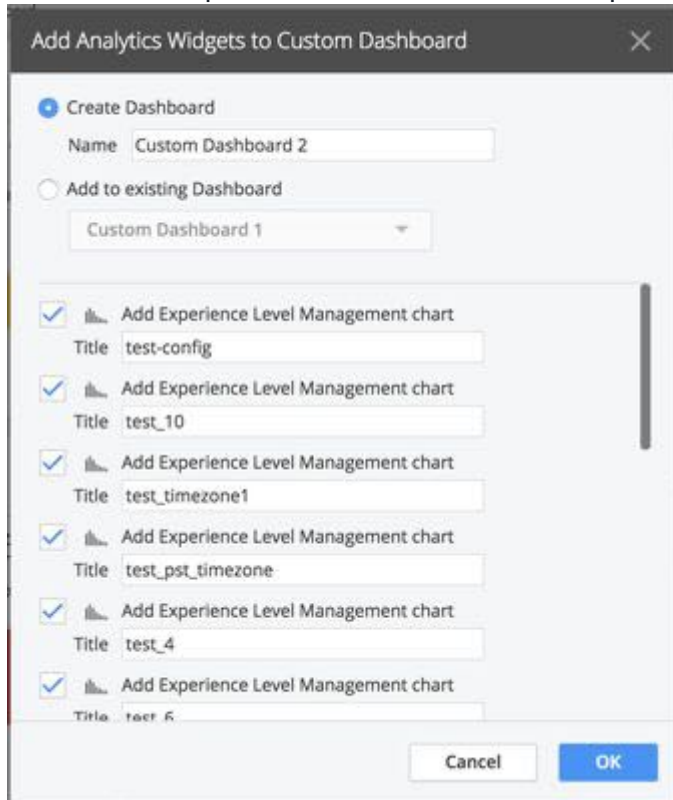

Add XLM Reports to Custom Dashboards

You can add XLM reports as read-only widgets to your custom dashboards:

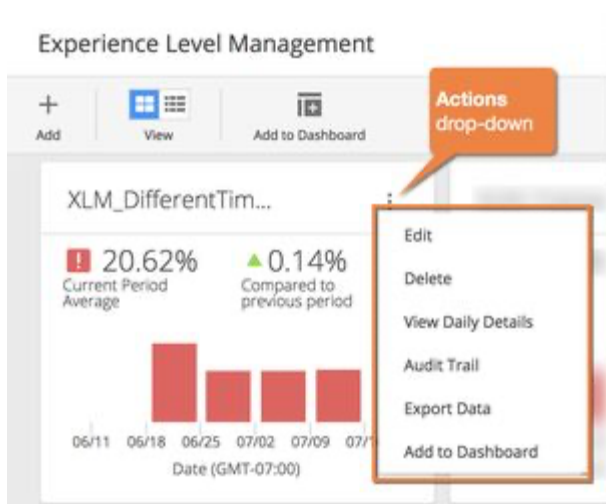

- One at a time, from the Actions drop-down, or
- One or more at once, from **Add to Dashboard** in the Experience Level Management panel

From the Experience Level Management panel, click **Add to Dashboard**. Alternatively, click the **Actions** dropdown on an individual XLM report.

Export XLM Data

You can export XLM data using the **Actions** dropdown, which also offers additional views and actions.

You can export as many reporting periods as you wish. The export format is CSV.

i The XLM export file shows the latest configuration along with compliance data.

Migrate XLM Configurations Between Environments

Related pages:

- [Configure Experience Level Management](#)¹⁹²¹
- [View and Export XLM Compliance Data](#)(see page 3267)

You can migrate XLM configurations from one environment to another. For example, you might first deploy a configuration to a staging or test environment and later migrate it to production.

To migrate an XLM configuration, make two API calls:

1. Export XLM configuration(s) from one environment.
GET /controller/analytics/xlm/configuration
Optionally, supply a configuration ID, or a comma-delimited list of configuration IDs, as a query parameter.
If this parameter is omitted, the API returns a bulk export of all XLM configurations.
2. Import a single XLM configuration into another environment.
POST /controller/analytics/xlm/configuration

Troubleshoot Analytics Issues

Related pages:

- [Agent Log Files](#)(see page 1128)
- [Analytics Agent Logging](#)¹⁹²²
- [.NET Agent on Windows Logging](#)¹⁹²³

This page provides general troubleshooting techniques for deployment issues and workarounds for certain scenarios in Application Analytics.

General Troubleshooting Issues

If you encounter problems with your Analytics deployment, check the logs for errors and warnings.

These logs are useful to:

- Determine if the Analytics Dynamic Service is enabled or disabled.
- Determine if the Analytics Dynamic Service encounters errors sending messages to the Analytics Agent. For example, when the Analytics Dynamic Service is not able to communicate with the Analytics Agent due to invalid connection configuration.
- Determine if messages are being dropped by the Analytics Dynamic Service because its internal buffers are full.
- View the configurations used on startup.

The following components write log information.

- Analytics Agent: The Analytics Agent writes log messages to files in the `<analytics_agent_home>/logs` directory.

¹⁹²¹ <https://docs.appdynamics.com/display/PRO45/Configure+Experience+Level+Management>

¹⁹²² <https://docs.appdynamics.com/display/PRO45/Analytics+Agent+Logging>

¹⁹²³ <https://docs.appdynamics.com/display/PRO45/.NET+Agent+on+Windows+Logging>

- **Events Service:** The Events Service writes log messages to files in the `<events_service_home>/logs` directory. The `analytics-api-store.log` file can help with troubleshooting.
- **Java Agent:** The Analytics Dynamic Service is built into the Java Agent and writes logs to the same file as the app agent. The logs are in the `<application_home>/<app_agent_home>/logs` directory.
 - The primary log file to use for troubleshooting is the file named `agent.<timestamp>.log`. Search the file for messages written by the Analytics Dynamic Service.
- **.NET Agent:** The .NET Agent writes log messages to files in the `%ProgramData%\AppDynamics\DotNetAgent\Logs` directory. By default, the .NET Agent writes Analytics logs from the `com.appdynamics.ee.service.analytics.Analytics` logger to determine if the Analytics Dynamic Service is enabled/disabled and to view the configuration on startup. Errors are logged in the `warnfile`.
 - The `com.appdynamics.CONFIG.AnalyticsDynamicServiceConfigListener` logger gathers Analytics Dynamic Service configuration details from the Controller. Ensure that the `eventServiceURL` comes from the Controller.
 - The `com.appdynamics.analytics.EventsServiceSink` logger provides information about the communication between the .NET Agent and the Events Service.

For additional logger information, see [.NET Agent on Windows Logging](#)¹⁹²⁴.

Configuration Issues

Verify that your configuration settings are properly configured with the required account name and key. Slashes in account names and key values must be escaped.

Windows Commands

On Windows, you cannot delete a log file with the `del` command when the Analytics Agent is collecting log data from the file.

Do not use robocopy commands to move files on Windows. AppDynamics recommends that you use the `move` command instead.

Starting the Analytics Agent Issues

If you are running the Analytics Agent as an extension to the Machine Agent with JRE 1.8.0_171 or later, starting the Analytics Agent with encrypted credentials will fail. Workarounds include:

- Disable encryption in the Machine Agent
- Use a standalone Analytics Agent with encryption
- Use JRE 1.8.0_162 to run the Machine Agent with encryption

PID File

If an instance of the Analytics Agent terminates and leaves behind a process ID file (PID file), the next agent startup will fail with the following error:

```
java.lang.RuntimeException: Unable to create file [D:\AppDynamics\analytics-agent\analytics-agent.id] to store the process id because it already exists. Please stop any currently running process and delete the process id file
```

You can use the `-f` flag option while starting the agent. This option causes a pre-existing process id file to be deleted. The flag is not required when you are starting the agent as a Windows service.

Use the `-f` flag as follows:

- UNIX type OS: `start -f`

¹⁹²⁴ <https://docs.appdynamics.com/display/PRO45/.NET+Agent+on+Windows+Logging>

- Windows CLI: `start -f`

i The `-f` flag option only works for the standalone Analytics Agent. This option does not work for the Analytics Agent embedded in the Machine Agent. In versions 20.6 and later of the Machine Agent, the bundled Analytics Agent no longer drops a PID file. For the Analytics Agent running inside the Machine Agent (embedded mode), upgrade the Machine Agent to 20.6. You no longer need to delete PID files from previous runs where the agent crashed.

High CPU Usage in Transaction Analytics without Analytics Agent (Agentless Analytics)

Reaching the Transaction Analytics license limit may cause high CPU usage in older Java Agents. AppDynamics recommends that you upgrade to the Java Agent version 20.3 and later. Look out for high CPU and memory usage in the .NET Agent.

Analytics Data Issues

Clock Management

AppDynamics recommends maintaining clock-time consistency throughout your monitored environment. If Analytics metrics are consistently reporting zero, confirm that clocks are synchronized across the application, Controller, and Events Service nodes.

Timestamps

There are potentially four time zones involved with Log Analytics:

1. The timestamp and time zone from the log file.
2. The event timestamp and pickup timestamp time zones can be different from those in the log for a number of reasons:
 - a. When the time zone is overridden.
 - b. The time zone is not provided correctly in the log.
 - c. The timestamp and time zone parsing goes awry.
 - d. When no time zone is specified in the log timestamp, then local time is assumed.
3. The Events Service time zone and the Events Service stores all timestamps in UTC time.
4. The browser used to view the Analytics data in the Controller UI (such as the **Event Timestamp** column in the UI search results or the **Time Picker** widget) converts all timestamps to the browser's local time.

Environment Variables

If you are not seeing or only seeing partial Analytics data in the Controller, configure the following environment variables.

Environment Variable	Description
<code>appdynamics.analytics.agent.send.attempt.max</code>	The maximum number of times that the Dynamic Service running in the APM Agent will try sending the Analytics data after a communication failure.

Environment Variable	Description
appdynamics.analytics.agent.send.attempt.pauseMillis	The wait time between attempts to send Analytics data to the Analytics Agent after a communication failure.
appdynamics.analytics.numOfSinkWriterTasks	The number of sinks used by the Dynamic Service running in APM Agent to send data to Analytics Agent. The default number is 2 and can be increased as needed.

Log Analytics Missing Field Extractions Issues

If you are missing fields in your Log Analytics data that you expect to see based on your source rule configuration or using regex (including grok patterns) in your field extraction, you may encounter a performance safeguard.

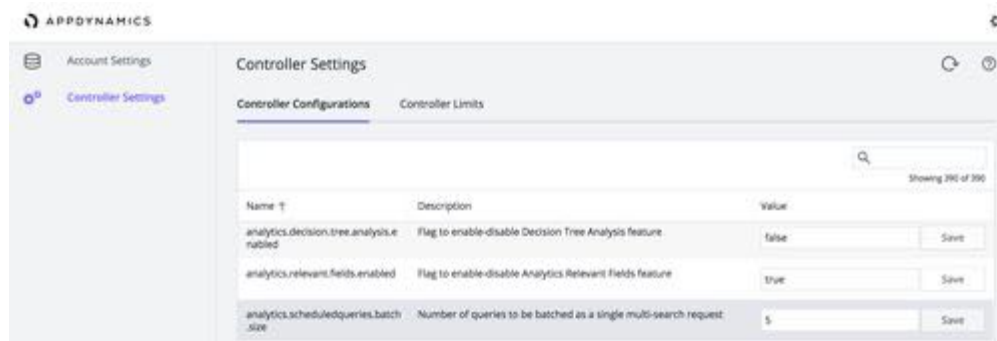

If a regex pattern takes more than five seconds to match against a log line, the attempt to extract the fields is terminated. No further processing that requires the extracted fields will occur. As a result, some fields may be missing when viewed on the Controller for that log line. In this case, the following error message appears in the Analytics Agent log:

```
[ERROR ] java.util.concurrent.TimeoutException: The current regex has spent 5 seconds attempting to match the log line, further processing has been stopped for this log line.
```

Another reason for missing fields is if the log line doesn't contain the field to be extracted as defined in the pattern.

Custom Analytics Metrics Issues

If you are having issues with metrics created from saved searches or with the alerts performance for those metrics, try increasing the query batch size. You can increase the size using the `analytics.scheduledqueries.batch.size` Controller setting in **Controller Settings > Controller Configurations**. The default value for this setting is 5.

See [Access the Administration Console](#)¹⁹²⁵ for information about accessing the setting.

¹⁹²⁵ <https://docs.appdynamics.com/display/PRMY21/.Access+the+Administration+Console+v21.5>

Business Transaction Events Limits

The Analytics Dynamic Service sends messages to the Events Service where the request body is an array of event segments. A business transaction event consists of one or more segments that are related to each other by the business transaction `requestGUID`. There are ingestion limits related to messages.

- **Event (segment) size:** The maximum size of an individual business transaction segment collected by the Analytics Dynamic Service is .1 MB. This limit is defined by the `appdynamics.analytics.message.maxSizeBytes` Java system property. To change this value, pass it on the command line as a system property when the Java Agent starts. For example:

```
'-Dappdynamics.analytics.message.maxSizeBytes=1024000'
```

- **Events per request:** The maximum number of segments per request is defined by the `appdynamics.analytics.agent.send.batch.items.max` Java system property. The default value of this property is 16. To change this value, pass it on the command line as a system property when the Java Agent is started.
- **Message Size:** This limit refers to the size of a single request body sent to the Events Service, which is usually an array of event segments. Publish requests for all event types are limited to 1 MB. If the limit is exceeded, you will see exceptions in agent log file and messages in Events Service logs.

Agent-Side Metrics

Analytics components in the Java Agent reports performance metrics. These metrics can be used to monitor the health of Transaction Analytics reporting in the agent/node. These metrics are under the `Agent|Analytics|<Metric Name>` path in the Metric Browser.

Metric Name	Metric Time Rollup Type	Metric Cluster Rollup Type	Metric Description
Collector Objects Count	Current	Individual	The current count of Analytics data collectors in use.
Messages Sent	Sum	Collective	The number of messages sent.
Messages Dropped Since Input Queue Full	Sum	Collective	The number of dropped messages due to the input queue being full.
Messages Dropped Since Size Exceeded	Sum	Collective	The number of dropped messages due to message size exceeding limit.
Message Send Errors	Sum	Collective	The number of transient and permanent errors in event registration or publish.
Message Latency (ms)	Average	Individual	Latency calculated in milliseconds.

Metric Name	Metric Time Rollup Type	Metric Cluster Rollup Type	Metric Description
Pending Messages In Queue	Current	Individual	Messages pending in the buffer.
Sink Writers Count	Current	Individual	Number of active sink writer threads.

Firewall Considerations

Transaction Analytics without an Analytics Agent requires a connection between the Java/.NET Agent and the Events Service. If you have a firewall that blocks requests from the Java/.NET Agent to the SaaS or on-premises Events Service, you need to open the firewall to avoid gaps in Analytics data. See [Port Settings](#)¹⁹²⁶ and [Agent-to-Controller Connections](#)(see page 463).

For SaaS-based installations, configure the Analytics endpoint by modifying the `http.event.endpoint` setting in the `\conf\analytics-agent.properties` file (as described in [Install Agent-Side Components](#)(see page 3081)). For example, `http.event.endpoint=http://analytics.api.appdynamics.com:443`.

If your firewall rules require you to use specific IP addresses, rather than hostnames, note the following information. If you are unable to see Transaction Analytics data collected as expected (even after configuring your firewall rules) and you see repetitive Connection Reset messages in the logs similar to the following, your firewall rules may not include the correct IP addresses.

```
[2015-12-18T16:08:39,907-06:00] [INFO ] [AD Thread Pool-Global0]
[o.a.http.impl.execchain.RetryExec] I/O exception (java.net.SocketException) caught when
processing request to {s}->https://analytics.api.appdynamics.com:443: Connection reset
```

Your firewall rules may not include the correct IP addresses.

In SaaS environments, `analytics.api.appdynamics.com`, `fra-ana-api.saas.appdynamics.com`, and `syd-ana-api.saas.appdynamics.com` are round-robin DNS aliases and may resolve to multiple DNS (54. vs 52.) in the following examples.

<pre>Name: analytics.api.appdynamics. com Address: 54.213.173.141 Name: analytics.api.appdynamics. com Address: 52.88.111.157</pre>	<pre>Name: fra-p-con-2.saas.app dynamics.com Address: 52.28.42.67 Name: fra-p-con-2.saas.app dynamics.com Address: 52.57.96.225</pre>	<pre>Name: syd-p-con-1.saas.app dynamics.com Address: 54.153.248.179 Name: syd-p-con-1.saas.app dynamics.com Address: 54.153.246.219</pre>
---	---	--

Amazon Web Services (AWS) controls the IPs used, so they may change from time to time. AWS publishes its current IP address ranges in JSON format, so if you are unable to open firewalls to hostnames, you can

¹⁹²⁶ <https://docs.appdynamics.com/display/PRMY21/.Port+Settings+v21.5>

download the AWS IP address ranges. If you want to be notified whenever there is a change to the AWS IP address ranges, you can subscribe to receive notifications using Amazon SNS.

See [Analytics IP Ranges](#)¹⁹²⁷ for the AWS regions for the SaaS Analytics environments. You can view the [AWS IP Ranges](#)¹⁹²⁸ for each listed region.

Monitoring Analytics Agent Health

This describes monitoring the health of the Analytics Agent.

Check-Health Command Usage

Argument	Description
-hp (--host-and-port) STRING[]	Optional. Application host name or IP:HTTP admin port (Multiple values separated by space).
-p (--properties) TYPE_PATH	Optional. Path to the properties file (Multiple values separated by space).
-v (--verbose) TYPE_BOOLEAN	Optional. Verbose output.

The check-health command returns the status of the Analytics Agent. You can specify the agent to check using a properties file or IP address and port.

For example, using a properties file.

```
./bin/analytics-agent.sh check-health --properties conf/analytics-agent.properties
```

You can also use the -hp argument and pass the host IP address and the port number for the Analytics Agent.

For example, the default Analytics Agent port for the health check is 9091.

```
bin/analytics-agent.sh check-health -hp <ip-address>:9091
```

Extend AppDynamics

This page describes how to extend and customize the AppDynamics Application Performance Management (APM) Platform.

The [AppDynamics Community Exchange](#)¹⁹²⁹ includes many pre-built extensions you can use to customize AppDynamics and integrate with other systems.

You can also use AppDynamics REST APIs to create custom integrations and automation tasks.

¹⁹²⁷ <https://docs.appdynamics.com/display/PAA/SaaS+Domains+and+IP+Ranges>

¹⁹²⁸ <http://docs.aws.amazon.com/general/latest/gr/aws-ip-ranges.html>

¹⁹²⁹ <https://www.appdynamics.com/community/exchange/>

AppDynamics REST APIs

- [Using the Controller APIs](#)(see page 3285)

AppDynamics Extensions

- [Integration Modules](#)(see page 3864)
- [Integrate AppDynamics with Splunk](#)(see page 3890)
- [Integrate AppDynamics with Scalyr](#)(see page 3876)

AppDynamics APIs

Related pages:

- [Extensions and Custom Metrics](#)(see page 2629)
- [AppDynamics Exchange](#)¹⁹³⁰

This page provides an overview of AppDynamics APIs, which let you extend and customize various aspects of the AppDynamics Application Performance Monitoring (APM) Platform.

Overview of AppDynamics APIs

The AppDynamics APM Platform exposes various APIs for customizing and extending its features on the platform-side, which are served by the Controller and Events Service, and on the agent-side.

The AppDynamics platform server components and agents offer the following APIs:

- **Controller APIs:** Administer the Controller, configure, monitor, query metrics, and more. See the [Platform API Index](#)(see page 3280)
- **Accounts APIs:** Manage and monitor accounts, users, and other aspects of AppDynamics licensing. Accounts APIs are made up of these modules:
 - actions suppressions
 - business transactions
 - health rules
 - license modules
 - mdsconfig
 - nodes
 - policiesSee [Observe License Usage](#)(see page 203).
- **Analytics Events API:** Send custom analytics events from your data sources to the Events Service. See the Analytics Events API section in the [Platform API Index](#)(see page 3280).
- **Machine Agent APIs:** HTTP APIs available at the machine agent for uploading custom metrics. See [Machine Agent HTTP Listener](#)(see page 2645).
- **Database Agent APIs:** Get, create, update, and delete Database Monitoring database Collectors. See [Database Visibility API](#)(see page 3733).
- **Application Agent Instrumentation APIs:** Control and customize transaction detection and correlation, along with exit point detection. Agent APIs include:
 - [PHP Agent API](#)(see page 891)
 - [Python Agent API](#)(see page 936)
 - [Node.js Agent API Reference](#)(see page 834)
 - [C/C++ SDK](#)(see page 1016)
- **Java Agent API:** Customize agent instrumentation. See the SDK folder in the agent home directory.
- **Mobile RUM:** Instrument mobile applications for real user performance monitoring. See [Instrument iOS Applications](#)(see page 2134).

¹⁹³⁰ <http://www.appdynamics.com/community/exchange/>

Platform API Index

These methods are Below is a list of all the methods in the AppDynamics Controller and Events Service APIs:

- **Accounts API**
 - [Retrieve Controller Audit History](#)(see page 3341)
 - [Configure Metric Retention by Account](#)(see page 3342)
 - [Configure Metric Retention by Application](#)(see page 3343)
- **Application Model API**
 - [Retrieve All Business Applications](#)(see page 3292)
 - [Retrieve All Business Transactions in a Business Application](#)(see page 3294)
 - [Retrieve All Tiers in a Business Application](#)(see page 3296)
 - [Retrieve All Registered Backends in a Business Application with Their Properties](#)(see page 3298)
 - [Retrieve Node Information for All Nodes in a Business Application](#)(see page 3301)
 - [Retrieve Node Information by Node Name](#)(see page 3303)
 - [Retrieve Node Information for All Nodes in a Tier](#)(see page 3304)
 - [Retrieve Tier Information by Tier Name](#)(see page 3306)
- **Metric and Snapshot API**
- **Alert and Respond APIs**
 - **Health Rule API**
 - [Create a Health Rule](#)(see page 3344)
 - [Retrieve a List of Health Rules for an Application](#)(see page 3348)
 - [Retrieve Details of a Specified Health Rule](#)(see page 3349)
 - [Update a Health Rule](#)(see page 3351)
 - [Delete a Health Rule](#)(see page 3354)
 - **Schedule API**
 - [Create a New Schedule](#)(see page 3441)
 - [Retrieve a List of Schedules for a Given Application](#)(see page 3442)
 - [Retrieve the Details of a Specified Schedule](#)(see page 3443)
 - [Update a Schedule](#)(see page 3444)
 - [Delete a Schedule](#)(see page 3445)
 - **Policy API**
 - [Create a Policy](#)(see page 3476)
 - [Retrieve a list of Policies associated with an Application](#)(see page 3479)
 - [Retrieve Details of a Specified Policy](#)(see page 3480)
 - [Update a Policy](#)(see page 3482)
 - [Delete a Policy](#)(see page 3485)
 - **Actions API**
 - [Create a New Action](#)(see page 3544)
 - [Retrieve a List of Actions for a Given Application](#)(see page 3545)
 - [Retrieve Details of a Specified Action](#)(see page 3545)
 - [Update an Action](#)(see page 3546)
 - [Delete an Action](#)(see page 3547)

- [Remove Role from Group](#)(see page 3775)
- [Get Role by ID](#)(see page 3775)
- [Get Role by Name](#)(see page 3777)
- [Get All Roles](#)(see page 0)
- [Update Role](#)(see page 3780)
- [Delete Role](#)(see page 3781)
- **License Rules API**
 - [Creates a New License Rule](#)(see page 3849)
 - [Returns a Summary of All License Rules for the Current Account](#)(see page 3850)
 - [Updates a License Rule](#)(see page 3851)
 - [Deletes a License Rule](#)(see page 3854)
 - [Retrieve a License Rule via its Id](#)(see page 0)
 - [Retrieves a License Rule by Access Key](#)(see page 3855)
 - [Retrieve a License Rule by Name](#)(see page 3856)

API Clients

This page describes how to create and use the API Clients identity type to provide secure access to the Controller through AppDynamics Controller REST API calls. These calls use Open Authorization (OAuth) token-based authentication.

Open Authorization (OAuth) Mechanisms

OAuth is an open protocol to allow secure authorization in a simple and standard method from web, mobile, and desktop applications. See <https://oauth.net/>

It acts as the intermediary on your behalf by providing third-party applications with an access token that authorizes sharing specific account information. Using the OAuth protocol with AppDynamics Controller REST APIs is the best way to securely grant access to your Controller information.

The OAuth authentication process authenticates a request token and uses it to obtain an encrypted access token from your Controller. Once the access token is available, you can use it to make requests to your Controller until the token expires or is revoked.

The tokens are based on JSON Web Tokens (JWT) authentication format, which is the industry standard RFC 7519 method for representing claims securely between two parties.

Accessing Authentication Provider Settings

 Users with the **Account Owner** role or the **Administer users, groups, roles ...** permission can view API Clients settings in the **Settings > Administration** page.

Creating API Clients

You can create new API Client identity types that can be used to generate OAuth tokens.

1. Log in to the Controller UI as an **Account Owner** or other roles with the **Administer users, groups, roles ...** permission.
2. Click  > **Administration**.
3. Click the API Clients tab to view the list of existing clients.
4. Click **+ Create**.
5. Enter the Client Name and Description.
6. Click **Generate Secret** to populate the Client Secret.
This will generate a UUID as the secret of the API Client.

 This API Client secret acts as a password. It does not generate the authentication token.

7. Set the Default API-generated Token Expiration. This expiration only applies to authentication tokens generated through the `/controller/api/oauth/access_token` REST API, not to Temporary Access Tokens generated from the UI. See [Using the Access Token](#)(see page 3282).

 Every API-generated access token has an expiration. Although the default is five minutes, you can set it to any second, minute, or hour limit. The Default API-generated Token has a shorter expiration than the authentication token generated through the Administration UI.

8. Add the **Roles** you would like to associate with this API Client. You can add or remove roles at any time. See [Create and Manage Custom Roles](#)(see page 156).

 The REST APIs will use the identity which the access token represents to pull up RBAC permissions and check those permissions at the underlying API level.

9. Click **Save** at the top right.

Using the Access Token

You can generate and use the access token for each API access call into your Controller by generating the token through one of the following means:

- Administration UI: These tokens usually have a longer expiration. The account administrator can generate and distribute to parties/teams who need Controller access, but do not want to refresh such tokens frequently.
- API: These tokens usually have a relatively short expiration. The program generates and refreshes regularly before expiration. These tokens are visible from the UI and are not individually tracked and managed.

Generate the Token Through the UI

When you are ready to use the access token, you will generate it through the Administration UI:

1. Click **Generate Temporary Access Token** when you are ready to use the access token.

i Remember that temporary token expirations are usually longer than the Default API-generated Token Expiration.

2. Copy and paste the access token from the **Temporary Access Token** field into the TOKEN portion of your curl command. For example:

```
curl -H "Authorization:Bearer <AUTH_TOKEN>" "http://master-onprem-controller.e2e.appd-test.com:8090/controller/rest/applications"
```

3. Check that your call is successful. It should look like this:

```
$ curl -H "Authorization:Bearer eyJraWQ1OjIiIiwiaWxnIjoisFMvNTYifQ.eyJpc3MiOiJ3bChBEeW5hbnW1jcyIsInF1ZC16IikFwcERfQV83cyIsInV4cC16MTUyNjg1MzcyNiwiianRpIjoibEZOZDhRtbfQzbfBTTFk3WEFyaHhPQ51sImhhdCI6MTUyNDc2NzMyNiwiibm9iIjoixNTI0NzY3MjA2LjZrdwI0iJUZkXN8QX8pQ2xpZw50IiwidHlwZSI6IkhFQ5V9DTE1F1Q1LCJ9J39QAQn1soQ_Vi73zG11GCzBtGVs-giRkpc" "http://master-onprem-controller.e2e.appd-test.com:8090/controller/rest/applications"
<applications><application>
  <id>8</id>
  <name>ECommerce-Sales-Demo-Fulfillment</name>
</application>
<application>
  <id>11</id>
  <name>AshishTest</name>
</application>
<application>
  <id>20</id>
  <name>Ibe@pmApp</name>
</application>
<application>
  <id>5</id>
  <name>ECommerce-Sales-Demo</name>
  <description></description>
</application>
```

Generate the Token Through an API

You can use REST APIs to generate a short-lived access token. This default, on-demand token is not tracked on the UI.

Use POST /controller/api/oauth/access_token. You will need the API Client name and Client Secret to generate the token. For example:

```
curl -X POST -H "Content-Type: application/vnd.appd.cntrl+protobuf;v=1" "https://<controller address>/controller/api/oauth/access_token" -d 'grant_type=client_credentials&client_id=<apiClientName>@<accountName>&client_secret=10d5-573e-4a75-8396-afa006fd8f19'
```

i Be aware that:

- For Controllers < 4.5.9, an authentication header is required in the request as shown below:

 There is no way to retrieve previous or currently valid tokens. Therefore, only the current token can be revoked.
Also, API-generated tokens that have Default API-generated Token Expiration, cannot be viewed nor revoked through the UI or REST API.

Using the Controller APIs

This page describes API usage information. The Controller APIs are served by the Controller instance, rather than by the Events Service or an agent component. They include:

- Accounts API
- Application Model API
- Metric and Snapshot API
- Alert and Respond API
- Configuration API
- Configuration Import and Export APIs
- Analytics Events API

Controller API Base URI

Except as indicated in the format listing for a particular method, URIs in the Controller API use the following base URI:

```
http://<controller_host>:<controller_port>/controller/rest/  
<REST_URI>
```

 The port that serves the API is the same primary port for the Controller used by Controller UI and agents.

Retrieving Data in JSON Format

The AppDynamics Controller APIs return data in eXtensible Markup Language (XML) or JavaScript Object Notation (JSON). The default output format is XML.

Any Controller API with a URI in the `/controller/rest/` format shown in [Controller API Base URI](#) (see page 3285) can return data in JSON format.

To retrieve data in JSON, call the API with the output query parameter set to JSON, as follows:

```
curl --user user1@customer1:secret http://demo.appdynamics.com/  
controller/rest/applications?output=JSON  
[  
  {  
    "description": "",  
    "id": 5,  
    "name": "ECommerce_E2E"  
  },  
]
```

```
[
  {
    "description": "",
    "id": 8,
    "name": "ECommerce_E2E-Fulfillment"
  },
]
```

You can specify JSON output format for any of the Controller APIs.

When a client uses HTTP 1.1 and accepts gzip content-encoding, the Controller returns JSON responses using gzip compression.

Authentication

You can use OAuth identity types for authentication. See [API Clients](#)(see page 3281).

To invoke the REST APIs using basic HTTP authentication, you must provide the authentication credentials as well as your account information. These are:

- Account: the AppDynamics tenant account name
- Username: a user in that account
- Password: the password for that account

Pass the credentials in the following form:

```
<your_username>@<your_accountname>:<your_password>
```

Most on-premises Controllers are single-tenant Controllers that use `customer1` as the primary default account name. The account name should be left as default. For example:

```
<your_username>@customer1:<your_password>
```

Most SaaS Controllers are multi-tenant Controllers and allow you to replace `customer1` with your own, instance-specific account name. See [Observe License Usage](#)(see page 203).

Invalid Characters for Usernames and Passwords

REST API calls will not authenticate usernames and passwords that contain these characters:

```
\ / " [ ] : | < > + = ; , ? * , ' % tab space @
```

If you have already created user credentials that contain any of the disallowed characters, such as "user:customer66", create new credentials without the disallowed character for the purpose of accessing the REST APIs.

For usernames or passwords containing the "@" symbol, URL encode the "@" character as %40.

Copying a Metric URL in the Metric Browser

1. Right-click a metric in the **Metric Browser**.
2. Copy the full REST URL of the metric.
3. Paste the REST URL into your code or onto the command line.

 For security reasons, AppDynamics only supports making API calls programmatically or at the command line. Do not attempt to paste the REST URL into a browser.

Agent Installer Platform Service API

 The Agent Installer requires microservices configuration performed by AppDynamics.

The AppDynamics Agent Installer simplifies deployment to instrument your applications faster. You can manage applications instrumented by the Agent Installer with minimal code changes in [Monitoring Settings](#)(see page 474).

The Agent Installer:

- Deploys Java and Machine Agents, and is compatible with Linux
- Automatically instruments applications
- Assigns unique names to tiers and nodes
- Upgrades and rollbacks the agents

You can deploy other agents using the Getting Started Wizard.

Agent Installer Overview

The Agent Installer works with these items:

- *Agent Installer* - Executable installer inside the `appdynamics-zero-agent-<version>.zip` file (representing the Agent Installer Platform). The Agent Installer installs the Agent Installer Platform with Java, and Machine Agents on a system. You access the installer from the Controller UI.
- *Decorator* - Library responsible for automatically instrumenting new processes with AppDynamics APM agents. The library auto-instruments the application and auto-names tiers and nodes for the Controller.
- *Agent Installer Platform* - Software bundle that manages the Decorator, Java Agent, and Machine Agent. Enables automatic instrumentation and reports the status of various processes to the Controller UI. Collective term for the decorator, agent daemon, agent binaries.
- *Downloader* - Script (`zero-agent.sh`) that downloads individual zip files containing the Java and Machine (if applicable) Agents, and Agent Installer Platform.
- *Watchdog* - Agents installed with the Agent Installer can be managed with the `Watchdog` process.
- *Updater* - Responsible for the rollback and upgrade of the monitoring agents.

Agent Installer Requirements

The Agent Installer requires the following components, permissions, and supported environments.

AppDynamics Components

- The Agent Installer requires SaaS Controller => 20.6.0.
- You also need sufficient APM licenses to use the Java and Machine Agents. No additional license is required for the Agent Installer Platform.

Configure and Unblock Your Firewall

You may need to configure your firewall rules to allow outgoing traffic to certain URLs including:

- Access to your AppDynamics Controller: `<customername>.saas.appdynamics.com/*`¹⁹³¹ to allow APM traffic.
- Access to the AppDynamics download files site: `download-files.appdynamics.com`¹⁹³² to download the agent binaries.

Agent Installer Permission

i To configure access and roles, you must either be the AppDynamics Account owner, or have Administrator permissions. Additionally, Cloud Native Visualization requires configuration changes in the AppDynamics SaaS platform. The configurations began rolling out to SaaS Controllers on October 28, 2020.

To use the Agent Installer, you need **Install Agent** account-level permission and at least one of the following:

- Any default role (except for the Analytics Administrator role)
- Any application-level permission
- **Execute Workflow** account-level permission

Install Agent permission is not added to any default role. See [Roles and Permissions](#)¹⁹³³.

Supported Environments

This table lists the Agent Installer supported environments. JVM and Application Server requirements only apply if you install the Java Agent. The Agent Installer does not support Windows installations.

Agent Installer Supported Environments	
Operating System	<p>Linux (64 bit). Fully tested flavors:</p> <ul style="list-style-type: none"> • CentOS 7, 8 • RHEL 7, 8 • Ubuntu 18.04 • Fedora 31 • Debian 10 <p>Other Linux operating systems and versions should work but are not certified by AppDynamics.</p>
JVM	<ul style="list-style-type: none"> • Open => JDK 1.6 • Oracle => JDK 1.7 • IBM JDK => 1.6
Application Server	<ul style="list-style-type: none"> • Apache Tomcat • Jboss Wildfly • GlassFish • Websphere • Weblogic

¹⁹³¹ <http://saas.appdynamics.com/>*

¹⁹³² <http://download-files.appdynamics.com>

¹⁹³³ <https://docs.appdynamics.com/display/PRMY21/.Roles+and+Permissions+v21.2>

See [Java Supported Environments](#)(see page 493) and [Machine Agent Requirements and Supported Environments](#)(see page 2580) for version compatibility.

Agent and Process Limitations

This table lists the active agent registrations, process, and process group limitations for the Agent Installer:

Agent	Maximum Per-Account Limit
Active agent registrations	1000
Process	Maximum Per-Account Limit
Managed processes	10,000
Unmanaged processes	10,000
Managed processes in a single installation	100
Unmanaged processes in a single installation	100
Process Group	Maximum Per-Account Limit
Managed process groups	1000
Unmanaged process groups	1000
Managed process groups in a single installation	100
Unmanaged process groups in a single installation	100

Available Agents with the Agent Installer

The Agent Installer deploys the Agent Installer Platform, which downloads monitoring agents to your machine. You can install:

- Java Agent >= 4.5.19
- Machine Agent >= 20.3.0

Use the Agent Installer to Deploy an Agent

To use the Agent Installer to deploy an agent:

1. From the Controller UI, select **Home > Agent Installer**.
2. From the **Specify Application to Deploy to** dropdown, select an existing application, or select **New application** and enter its name.

 Application names cannot contain a single quotation mark (').

3. Download and run the Agent Installer using either an [express installation](#)(see page 3290) or a [custom installation](#)(see page 3290) method.

Express Installation Method

1. The **Express installation** method is selected as the default. With minimal effort, you can download and install the latest version of all available agents.
2. Copy and run the first command to download the latest available agents.
3. Select  (top right corner of the second command) to copy and run the second command to install the agents. Additionally, you can select **Show command** to reveal the full command with your access key.
4. Restart the application processes you want to monitor.
5. Click **Next** to continue with the instrumentation.

After you finish installing the agents, you are redirected to the [Monitoring Settings](#)(see page 474) tab to view instrumented tiers and nodes.

Custom Installation Method

1. Select **Custom installation**.
2. Select the **Java** or **Machine Agent(s)** you want to install.

 You must select at least one agent to proceed with the installation.

3. The default version displays next to the selected agent(s). You can edit the version from the corresponding dropdown. A command based on the agent(s) you selected is generated.
4. Copy and run the command into your terminal or automated tools.
5. Determine how to run the Agent Installer by setting user permissions:
 - Select **Instrument processes for all system users** (requires sudo access) to run the Agent Installer with sudo permission and enable the Agent Installer Platform for *all* users on the host.
 - Select **Instrument processes for an individual user** to run the Agent Installer without sudo permission and enable the Agent Installer Platform for the *current* user only.
See [Sudo vs. Non-Sudo Access](#)(see page 0) for more information.
6. After confirming the user installation permissions, select  (top right corner of the command) to copy and run the command. To reveal the full command with your access key, select **Show command**.

 When you run the command on a designated host, the agent files download onto that host *only*. To install agents on multiple hosts, select [Run the Agent Installer on Multiple Hosts](#)(see page 3291).

7. Restart the application processes you want to monitor.
8. Click **Next** to continue with the instrumentation.

After you finish installing the agents, you are redirected to the [Monitoring Settings](#)(see page 474) tab to view instrumented tiers and nodes.

Sudo Versus Non-Sudo Access

You can run the Agent Installer with or without sudo permission.

 AppDynamics recommends using the sudo command to install the agents for all users in your system.

This table describes the differences between sudo and non-sudo installations:

	sudo Installation	Non-sudo Installation
Description	Installs the agents on all supported processes for all users in your system.	Installs the agents for the current user only.
Automatic Instrumentation Process	By default, integrates with <code>systemd</code> to ensure the agents always run. See Customize the Agent Installer (see page 476) to override this behavior.	Auto-instruments processes that are started by the installing user, running under a Linux shell such as <code>bash</code> .

Instrument `systemd`-Managed Processes in a Non-sudo Environment

To enable the instrumentation of a `systemd`-managed application process in non-sudo Agent Installer Platform installations, the profile of the `systemd` service responsible used to load the application process must define the `LD_PRELOAD` environment variable using the path to the decorator library.

The actual path varies based on the operating system and product installation directory. This example shows an updated Apache Tomcat `systemd` service profile on CentOS 7:

```
$ grep LD_PRELOAD /etc/systemd/system/apache-tomcat-7.service Environment=LD_PRELOAD=/home/centos/appdynamics/zeroagent/lib64/libpreload.so
```

After the profile has been updated, you must reload the `systemctl` daemon and restart the application for the changes to take effect:

```
$ sudo systemctl daemon-reload
$ sudo systemctl restart apache-tomcat-7.service
```

Run the Agent Installer on Multiple Hosts

You can download the Agent Installer once and run on multiple hosts. To install the agent bundle across multiple hosts, distribute the binaries to all applicable machines.

For example, these steps show how to move files across hosts using the `tar` command.

1. Download the agent bundle (see [Use the Agent Installer to Deploy an Agent](#)(see page 3289)).
2. Distribute the Agent Installer to multiple hosts.
 - a. Make sure you are in the same directory in which you downloaded the agent bundle.
 - b. Use the `tar` command to place the script in a single file:

```
tar cvf zero-agent.tar *
```

- c. Copy the file to multiple hosts:

```
scp zero-agent.tar <target host>:<directory>
```

- d. Extract the archived script in the same directory:

```
tar xvf zero-agent.tar
```

3. Complete the Agent Installer deployment using the [custom installation method](#)(see page 3290).

Customize the Agent Installer

See [Customize the Agent Installer](#)(see page 476) to modify the agent configuration.

Upgrade and Rollback the Agent Installer

See, [Upgrade and Rollback the Agents](#)(see page 481).

Uninstall the Agent Installer

To uninstall the Agent Installer, in the terminal, navigate to the directory where the Agent Installer Platform is installed and run this command:

```
languagebash<install-directory>/bin/zeroctl uninstall
```

Application Model API

This page describes how application APIs let you retrieve information about the monitored environment as modeled in AppDynamics. This information includes, for example, the names and IDs of the business applications, business transactions, tiers, and nodes in the modeled environment.

Retrieve All Business Applications

The application API method returns the business application names and internal numeric identifier. Many of the operations in the Controller APIs occur in the context of a business application. Use this method to discover the application names or IDs to use before invoking other methods.

Format

GET /controller/rest/applications

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

Parameter Name	Parameter Type	Value	Mandatory
time-range-type	Time	<p>A time parameter to filter data based on time range options (time-range-type, startTime, endTime). If a time-range-type option is specified, the query returns alive applications on that GMT day, otherwise, the query returns all applications.</p> <ul style="list-style-type: none"> Case 1 : If time-range-type is last T mins and the time-range-type just falls into one GMT day then the API returns all the applications which are alive on that GMT day. Case 2 : If time-range-type is last T mins and the time-range-type falls into 2 GMT days (for example if the current time is 4:05 PST and time-range-type specified is last 10 mins then the API returns applications which are alive on this and the previous GMT day). <p>This feature is available for SaaS only and the API returns all applications for on-premises.</p> <p>For more information see Metric and Snapshot API¹⁹³⁴.</p>	No

i An *alive application* is an application with at least one node that submits at least one metric to the Controller in the provided time range.

Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/rest/applications

<applications>
  <application>
    <id>5</id>
    <name>ECommerce_E2E</name>
  </application>
  <application>
    <id>8</id>
    <name>ECommerce_E2E-Fulfillment</name>
  </application>
</applications>
```

¹⁹³⁴ <https://docs.appdynamics.com/display/PRO45/Metric+and+Snapshot+API#MetricandSnapshotAPI-usingtimeranges>

```

<application>
  <id>11</id>
  <name>jimix12110919</name>
  <description></description>
  <accountGuid>429c7884-3f36-4b5a-9412-fdf827e6c86e</
accountGuid>
</application>
</applications>

```

Retrieve All Business Transactions in a Business Application

Format

GET /controller/rest/applications/*application_name*/business-transactions

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	The application name or application ID.	Yes
exclude	Query	<ul style="list-style-type: none"> • false: the query retrieves only the business transactions that are included for monitoring. • true: the query retrieves only the excluded business transactions. Excluded business transactions have been configured to be excluded from monitoring either from the UI or through the REST interface. • The default is false. 	No
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

Parameter Name	Parameter Type	Value	Mandatory
time-range-type	Time	<p>Time parameter to filter data based on time range options (time-range-type, startTime, endTime). If a time-range-type option is specified, the query returns alive business transactions on that GMT day, otherwise, the query returns all business transactions.</p> <ul style="list-style-type: none"> • Case 1 : If time-range-type is last T mins and the time-range-type just falls into one GMT day then the API returns all the business transactions which are alive on that GMT day. • Case 2 : If time-range-type is last T mins and the time-range-type falls into 2 GMT days (for example if the current time is 4:05 PST and time-range-type specified is last 10 mins then the API returns business transactions which are alive on this and the previous GMT day). <p>This feature is available for SaaS only and the API returns all business transactions for on-premises.</p> <p>See Metric and Snapshot API¹⁹³⁵.</p>	No

i An *alive business transaction* is a transaction that submits at least one metric to the Controller in the provided time range.

Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/rest/applications/5/business-transactions

<business-transactions>
  <business-transaction>
    <id>92</id>
    <name>/user/.POST</name>
    <entryPointType>WEB_SERVICE</entryPointType>
    <internalName>/user/.POST</internalName>
    <tierId>9</tierId>
    <tierName>ECommerce-Services</tierName>
    <background>>false</background>
  </business-transaction>
```

¹⁹³⁵ <https://docs.appdynamics.com/display/PRO45/Metric+and+Snapshot+API#MetricandSnapshotAPI-usingtimeranges>

```

...
<business-transaction>
  <id>184</id>
  <name>OrderServiceImplService.createOrder</name>
  <entryPointType>WEB_SERVICE</entryPointType>
  <internalName>OrderServiceImplService.createOrder</
internalName>
  <tierId>12</tierId>
  <tierName>Inventory-Services</tierName>
  <background>false</background>
</business-transaction>
</business-transactions>

```

Retrieve All Tiers in a Business Application

Format

GET /controller/rest/applications/application_name/tiers

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	The application name or application ID.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

Parameter Name	Parameter Type	Value	Mandatory
time-range-type	Time	<p>Time parameter to filter data based on time range options (time-range-type, startTime, endTime). If a time-range-type option is specified, the query returns alive tiers on that GMT day, otherwise, the query returns all tiers.</p> <ul style="list-style-type: none"> Case 1 : If time-range-type is last T mins and the time-range-type just falls into one GMT day then the API returns all the tiers which are alive on that GMT day. Case 2 : If time-range-type is last T mins and the time-range-type falls into 2 GMT days (for example if the current time is 4:05 PST and time-range-type specified is last 10 mins then the API returns tiers which are alive on this and the previous GMT day). <p>This feature is available for SaaS only and the API returns all tiers for on-premises.</p> <p>See Metric and Snapshot API¹⁹³⁶.</p>	No

i An *alive tier* is a tier with at least one node in this tier that submits at least one metric to the Controller in the provided time range.

Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/rest/applications/5/tiers

<tiers>
<tier>
  <id>8</id>
  <name>Address-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
  <id>16</id>
  <name>Customer-Survey-Services</name>
```

¹⁹³⁶ <https://docs.appdynamics.com/display/PRO45/Metric+and+Snapshot+API#MetricandSnapshotAPI-usingtimeranges>

```
<type>Application Server</type>
<agentType>APP_AGENT</agentType>
<numberOfNodes>1</numberOfNodes>
</tier>
<tier>
  <id>9</id>
  <name>ECommerce-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>2</numberOfNodes>
</tier>
<tier>
  <id>12</id>
  <name>Inventory-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
  <id>17</id>
  <name>Order-Processing-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
  <id>18</id>
  <name>Web-Tier-Services</name>
  <type>Web Server</type>
  <agentType>NATIVE_WEB_SERVER</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
</tiers>
```

Retrieve All Registered Backends in a Business Application With Their Properties

Format

GET /controller/rest/applications/application_name/backends

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	Provide either the application name or application id.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/rest/applications/5/backends
```

```
<backends><backend>
  <id>10</id>
  <name>INVENTORY-MySQL DB-DB</name>
  <exitPointType>JDBC</exitPointType>

Retrieve Node Information for All Nodes in a Business Application

Format

GET /controller/rest/applications/application_name/nodes

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	Provide either the application name or application id.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No
time-range-type	Time	<p>Time parameter to filter data based on time range options (time-range-type, startTime, endTime). If a time-range-type option is specified, the query returns alive nodes on that GMT day, otherwise, the query returns all nodes.</p> <ul style="list-style-type: none"> Case 1 : If time-range-type is last T mins and the time-range-type just falls into one GMT day then the API returns all the nodes which are alive on that GMT day. Case 2 : If time-range-type is last T mins and the time-range-type falls into 2 GMT days (for example if the current time is 4:05 PST and time-range-type specified is last 10 mins then the API returns nodes which are alive on this and the previous GMT day). <p>This feature is available for SaaS only and the API returns all nodes for on-premises.</p> <p>See Metric and Snapshot API¹⁹³⁷.</p>	No

i An *alive node* is a node that submits at least one metric to the Controller in the provided time range.

¹⁹³⁷ <https://docs.appdynamics.com/display/PRO215/Metric+and+Snapshot+API#MetricandSnapshotAPI-usingtimeranges>

Example

```
curl --user user1@customer1:welcome http://
demo.appdynamics.com:8090/controller/rest/applications/5/nodes
```

```

```

Retrieve Node Information by Node Name

Format

GET /controller/rest/applications/application_name/nodes/node_name

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	The application name or application ID.	Yes
node_name	URI	The node name or ID	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

Example

```
curl --user user1@customer1:welcome http://
demo.appdynamics.com:8090/controller/rest/applications/5/nodes/
10

<nodes><node>
  <id>10</id>
  <name>Node_8002</name>
  <type>Tomcat 5.x</type>
  <tierId>14</tierId>
  <tierName>Inventory Server</tierName>
  <machineId>6</machineId>
  <machineName>TIER3TOMCAT</machineName>
  <machineOSType>Linux</machineOSType>
  <machineAgentPresent>true</machineAgentPresent>
  <machineAgentVersion>Machine Agent v4.2.0.0 GA Build Date
2015-12-18 18:47:15</machineAgentVersion>

  </ipAddresses>
  <agentType>APP_AGENT</agentType>
</node>
</nodes>
```

Retrieve Node Information for All Nodes in a Tier

Format

GET /controller/rest/applications/application_name/tiers/tier_name/nodes

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	The application name or application ID.	Yes
tier_name	URI	The tier name or ID.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

Parameter Name	Parameter Type	Value	Mandatory
time-range-type	Time	<p>Time parameter to filter data based on time range options (time-range-type, startTime, endTime). If a time-range-type option is specified, the query returns alive nodes on that GMT day, otherwise, the query returns all nodes.</p> <ul style="list-style-type: none"> • Case 1 : If time-range-type is last T mins and the time-range-type just falls into one GMT day then the API returns all the nodes which are alive on that GMT day. • Case 2 : If time-range-type is last T mins and the time-range-type falls into 2 GMT days (for example if the current time is 4:05 PST and time-range-type specified is last 10 mins then the API returns nodes which are alive on this and the previous GMT day). <p>This feature is available for SaaS only and the API returns all nodes for on-premises.</p> <p>See Metric and Snapshot API¹⁹³⁸.</p>	No

Example

```
curl --user user1@customer1:welcome http://
demo.appdynamics.com:8090/controller/rest/applications/25/tiers/
70/nodes

<nodes><node>
  <id>81</id>
  <name>PHP_Node</name>
  <type>Other</type>
  <tierId>70</tierId>
  <tierName>PHP_Tier</tierName>
  <machineId>65</machineId>
  <machineName>232fe50b8f9c</machineName>
  <machineOSType>Linux</machineOSType>
  <machineAgentPresent>>false</machineAgentPresent>
  <appAgentPresent>>true</appAgentPresent>
  <appAgentVersion>Proxy v4.2.0.0 GA
  SHA-1:.c86ec090f4ff77195df065fe56dade4dfc3913aa #9909 8869-
  master-build</appAgentVersion>
```

¹⁹³⁸ <https://docs.appdynamics.com/display/PRO215/Metric+and+Snapshot+API#MetricandSnapshotAPI-usingtimeranges>

```
<ipAddresses>
  <ipAddress>fe80:0:0:0:42:acff:fe11:2%eth0</ipAddress>
  <ipAddress>172.17.0.2</ipAddress>
</ipAddresses>
<agentType>PHP_APP_AGENT</agentType>
</node>
</nodes>
```

Retrieve Tier Information by Tier Name

Format

GET /controller/rest/applications/application_name/tiers/tier_name

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	The application name or application ID.	Yes
tier_name	URI	Tier name or ID.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

Example

```
curl --user user1@customer1:welcome http://
demo.appdynamics.com:8090/controller/rest/applications/5/tiers/
14

<tiers><tier>
  <id>14</id>
  <name>Inventory Server</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
</tiers>
```

Metric and Snapshot API

This page describes the Controller Metrics and Events API methods that allow you to retrieve information on metric data and various types of activities in your monitored environment. You can also configure how long you retain the metrics.

i The [AppDynamics Dexter Data Extraction Enhanced Reporting](#)¹⁹³⁹ (DEXTER) extension provides an alternative to using a REST client to get metric data by makes AppDynamics data queryable in the manner of a data warehouse.

Retrieve Metric Hierarchy

This API returns information about the metric tree structure. Because it retrieves the first generation of child elements, you can only expand the children of the folder type.

- If a child element is a container item in the response, its type value is `folder`.
- Otherwise, the type value for the child element is `leaf`.

You can recurse the metric tree structure further by using the `metric-path` parameter as described in the [Metric Data API](#)(see page 3309).

Format

GET `/controller/rest/applications/application_name/metrics`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>application_name</code>	URI	The name or ID of the business or EUM (browser/mobile/IoT) application. Use the call to get the application ID in the Application Model API (see page 3292).	Yes
<code>output</code>	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

¹⁹³⁹ <https://www.appdynamics.com/community/exchange/extension/appdynamics-dexter-data-extraction-enhanced-reporting/>

Parameter Name	Parameter Type	Value	Mandatory
metric-path	Query	<p>The path to the metric in the metric hierarchy.</p> <div style="border: 1px solid #00aaff; padding: 5px; margin-top: 10px;"> <p> When including the pipe () or backslash (\) special characters in the metric-path, you must include an additional backslash to indicate escape.</p> </div>	No

Example

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications/ECommerce_E2E/metrics"
```

```
<metric-items><metric-item>
  <type>folder</type>
  <name>Backends</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Service Endpoints</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>End User Experience</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Errors</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Business Transaction Performance</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Information Points</name>
</metric-item>
<metric-item>
```

```

    <type>folder</type>
    <name>Overall Application Performance</name>
</metric-item>
<metric-item>
    <type>folder</type>
    <name>Application Infrastructure Performance</name>
</metric-item>
<metric-item>
    <type>folder</type>
    <name>Mobile</name>
</metric-item></metric-items>

```

Retrieve Metric Data

The metric data method lets you get values generated for metrics. To use this method, specify the following parameters to the API:

- The path of the metric to retrieve.
- The time frame for the data.

Using the Controller UI is the simplest way to learn how to construct the metric path and time range-related parameters.

1. Right-click on the metric in the Metric Browser.
2. Select **Copy REST URL**. The copied URL includes the path to this metric and time range selected in the UI.
3. Certain clients can accept and properly encode the full path value as the metric path parameter.
4. Hover over the metric in the tree or copy it using the **Copy Full Path** option in the right-click menu.

Certain examples below are shown with the **full path value** rather than the fully encoded URL value. If you test calls with the full path, avoid using a pipe character at the start or end of the path.

These sections provide additional details and examples for the metric data method:

- [Metric Response Values](#)(see page 3311)
- [Using Wildcards](#)(see page 3312)
- [Using Time Ranges](#)(see page 3329)
- [Retrieving All Other Traffic Business Transaction Metrics](#)(see page 3330)

Format

GET /controller/rest/applications/*application_name*/metric-data

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
metric-path	Query	<p>The path to the metric in the metric hierarchy.</p> <div style="border: 1px solid #00aaff; padding: 5px; margin-top: 10px;"> <p>i When including the pipe () or backslash (\) special characters in the metric-path, you must include an additional backslash to indicate escape.</p> </div>	Yes
rollup	Query	<p>By default, the values of the returned metrics are rolled up into a single data point (rollup=true). To get separate results for all values within the time range, set the Rollup parameter to false in the query.</p>	No

Additional mandatory parameters for specifying time ranges are described in [Using Time Ranges](#)(see page 3329).

Example

Retrieve metric values for a metric at an absolute path:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications/ECommerce_E2E/metric-data?metric-path=Overall%20Application%20Performance%7CAverage%20Response%20Time%20%28ms%29&time-range-type=BEFORE_NOW&duration-in-mins=15"
```

```
<metric-datas><metric-data>
  <metricId>2339</metricId>
  <metricPath>Overall Application Performance|Average Response Time (ms)</metricPath>
  <metricName>BTM|Application Summary|Average Response Time (ms)</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
      <startTimeInMillis>1450562160000</startTimeInMillis>
      <value>302</value>
      <min>0</min>
```

```

    <max>15212</max>
    <current>15212</current>
    <sum>97800</sum>
    <count>324</count>
    <standardDeviation>0.0</standardDeviation>
    <occurrences>0</occurrences>
    <useRange>true</useRange>
  </metric-value>
</metricValues>
</metric-data>
</metric-datas>

```

Metric Response Values

Metrics results include the following fields:

Name	Definition
current	The value for the current minute. This is used only when the time rollup type used by the Controller is current.
count	The number of times the agent collected the metric over the selected time period.
min, max	The minimum and maximum values reported across the selected time period. These are not used for all metric types.
occurrences	The number of data samples taken by the Controller to calculate the standard deviation.
standardDeviation	The intermediate values calculated by the Controller during time rollup used to calculate standard deviation. See Dynamic Baselines (see page 1255).
startTimeInMillis	The <code>startTimeInMillis</code> is the start time of the time range to which the result metric data applies in UNIX epoch time.
sum	The total accumulated value for the metric over the selected time period.
useRange	Used internally by the Controller to process the metric.
value	The <code>value</code> value is one of the following for all metric values reported across the configured evaluation time length: <ul style="list-style-type: none"> • Arithmetic average: if the metric time rollup type is average. • Sum: if the metric time rollup type is sum. • Latest: if the metric time rollup type is current.

i min and max values are not available for any count-based or sum-based metric except when the metric is rolled up to hourly or daily data points. These metrics include errors per minute, calls per minute, and so on.

Using Wildcards

When you copy the REST URL in the Metric Browser, you get the path to a specific metric within a specific application and tier. Alternatively, you can use wildcard characters in one or more steps in the URL path to get metric data for entities, including multiple business transactions, tiers, or nodes.

The following format examples show where to put wildcard characters in various metric paths to achieve particular results. For reading clarity, these format examples use the **Full Path** for the metric rather than the REST URL. For a full working example, click the expanding link under each format listing:

- Retrieve the **app agent availability time** for all tiers in the application using a wildcard for the tier name:

```
/controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-path=Application Infrastructure Performance|*|Agent|App|Availability&time-range-type=BEFORE_NOW&duration-in-mins=15
```

Full Example:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-path=Application%20Infrastructure%20Performance%7C*%7CAgent%7CApp%7CAvailability&time-range-type=BEFORE_NOW&duration-in-mins=15"
```

```
<metric-datas><metric-data>
  <metricId>2329</metricId>
  <metricPath>Application Infrastructure Performance|Fulfillment-Services|
Agent|App|Availability</metricPath>
  <metricName>Agent|App|Availability</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
      <startTimeInMillis>1450562460000</startTimeInMillis>
      <value>1</value>
      <min>0</min>
      <max>0</max>
      <current>1</current>
      <sum>15</sum>
      <count>15</count>
      <standardDeviation>0.0</standardDeviation>
      <occurrences>0</occurrences>
      <useRange>>false</useRange>
    </metric-value>
  </metricValues>
</metric-data>
<metric-data>
  <metricId>2329</metricId>
  <metricPath>Application Infrastructure Performance|Fulfillment-Client-
```

```

Services|Agent|App|Availability</metricPath>
<metricName>Agent|App|Availability</metricName>
<frequency>ONE_MIN</frequency>
<metricValues>
  <metric-value>
    <startTimeInMillis>1450562460000</startTimeInMillis>
    <value>1</value>
    <min>0</min>
    <max>0</max>
    <current>1</current>
    <sum>15</sum>
    <count>15</count>
    <standardDeviation>0.0</standardDeviation>
    <occurrences>0</occurrences>
    <useRange>false</useRange>
  </metric-value>
</metricValues>
</metric-data>
</metric-datas>

```

- Retrieve the **CPU % Busy** metric for all the nodes in all tiers using a wildcard for the tier and node names:

```

/controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-
path=Application Infrastructure Performance|*|Individual Nodes|*|Hardware
Resources|CPU|%Busy&time-range-type=BEFORE_NOW&duration-in-mins=15

```

Full Example:

```

curl --user user1@customer1:your_password "http://demo.appdynamics.com/
controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-
path=Application%20Infrastructure%20Performance%7C*%7CIndividual%20Nodes%7C
*%7CHardware%20Resources%7CCPU%7C%25Busy&time-range-
type=BEFORE_NOW&duration-in-mins=15"

<metric-datas><metric-data>
  <metricId>2231</metricId>
  <metricPath>Application Infrastructure Performance|Fulfillment-Client-
Services|Individual Nodes|FulfillmentClient|Hardware Resources|CPU|%Busy</
metricPath>
  <metricName>Hardware Resources|CPU|%Busy</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
      <startTimeInMillis>1450563000000</startTimeInMillis>
      <value>10</value>
      <min>2</min>
      <max>82</max>
      <current>6</current>
      <sum>4474</sum>
      <count>450</count>
      <standardDeviation>0.0</standardDeviation>
    </metric-value>
  </metricValues>
</metric-data>
</metric-datas>

```

```

        <occurrences>0</occurrences>
        <useRange>>true</useRange>
    </metric-value>
</metricValues>
</metric-data>
<metric-data>
    <metricId>2231</metricId>
    <metricPath>Application Infrastructure Performance|Fulfillment-Services|
Individual Nodes|Fulfillment|Hardware Resources|CPU|%Busy</metricPath>
    <metricName>Hardware Resources|CPU|%Busy</metricName>
    <frequency>ONE_MIN</frequency>
    <metricValues>
        <metric-value>
            <startTimeInMillis>1450563000000</startTimeInMillis>
            <value>10</value>
            <min>2</min>
            <max>82</max>
            <current>6</current>
            <sum>4478</sum>
            <count>450</count>
            <standardDeviation>0.0</standardDeviation>
            <occurrences>0</occurrences>
            <useRange>>true</useRange>
        </metric-value>
    </metricValues>
</metric-data>
</metric-datas>

```

- Retrieve the **Calls per Minute** metric for all the business transactions on the ECommerce tier using a wildcard for the business transaction name:

```

/controller/rest/applications/ACME Book Store Application/metric-data?
metric-path=Business Transaction Performance|Business Transactions|
ECommerce Server|*|Calls per Minute&time-range-type=BEFORE_NOW&duration-in-
mins=15

```

Full Example:

```

curl --user user1@customer1:your_password "http://demo.appdynamics.com/
controller/rest/applications/ECommerce_E2E/metric-data?metric-
path=Business%20Transaction%20Performance%7CBusiness%20Transactions%7CEComm
erice-Services%7C*%7CCalls%20per%20Minute&time-range-
type=BEFORE_NOW&duration-in-mins=15"
<metric-datas><metric-data>
    <metricId>4042</metricId>
    <metricPath>Business Transaction Performance|Business Transactions|

Disabling Data Rollup

By default, metric data is rolled up for the time frame you request. You can set the rollup parameter to false to get all data points within the time frame. For example:

```

curl --user user1@customer1:your_password "http://
demo.appdynamics.com/controller/rest/applications/ECommerce_E2E/
metric-data?rollup=false&metric-
path=Overall%20Application%20Performance%7CAverage%20Response%20
Time%20%28ms%29&time-range-type=BEFORE_NOW&duration-in-mins=15"

```

```

<metric-datas><metric-data>
  <metricId>2339</metricId>
  <metricPath>Overall Application Performance|Average Response
Time (ms)</metricPath>
  <metricName>BTM|Application Summary|Average Response Time
(ms)</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
      <startTimeInMillis>1450503540000</startTimeInMillis>
      <value>334</value>
      <min>0</min>
      <max>3340</max>
      <current>2</current>

Using Time Ranges

You can fetch metric data for any time range, including for a range between specific points, such as from 2:00 to 2:15 pm Monday, or for a relative time range.

Time-based input parameters for the metric data API method let you specify a time range in several ways, as described in the following table.

Time Range Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
time-range-type	Query	Possible values are: <ul style="list-style-type: none"> • BEFORE_NOW—must specify the duration-in-mins parameter. • BEFORE_TIME—must specify the duration-in-mins and end-time parameters. • AFTER_TIME—must specify the duration-in-mins and start-time parameters. • BETWEEN_TIMES—must specify the start-time and end-time parameters. The BETWEEN_TIMES range includes the start-time and excludes the end-time. 	Yes
duration-in-mins	Query	Duration (in minutes) to return the metric data.	If time-range-type is BEFORE_NOW, BEFORE_TIME, or AFTER_TIME
start-time	Query	Start time (in milliseconds) from which the metric data is returned in UNIX epoch time.	If time-range-type is AFTER_TIME or BETWEEN_TIMES
end-time	Query	End time (in milliseconds) until which the metric data is returned in UNIX epoch time.	If time-range-type is BEFORE_TIME or BETWEEN_TIMES

Examples

Most examples on this page use the previous 15 minutes as the request time range. The following format examples show other ways you can define the time range for the request.

- Time range of the 15 minutes after December 19, 2015 5:40:00 AM GMT:

```
?time-range-type=AFTER_TIME&start-time=1450532400000&duration-in-mins=15
```

- Time range of the 15 minutes before December 19, 2015 6:00:00 AM GMT.

```
?time-range-type=BEFORE_TIME&end-time=1450533600000&duration-in-mins=15
```

- Time range between December 19, 2015 6:00:00 AM GMT and December 19, 2015 6:30:00 AM GMT:

```
?time-range-type=BETWEEN_TIMES&start-time=1450533600000&end-time=1450535400000
```

Retrieving All Other Traffic Business Transaction Metrics

The **All Other Traffic** business transaction is a type of business transaction that aggregates traffic for new transactions once the business transaction registration limits are reached and uses the special identifier, `_APPDYNAMICS_DEFAULT_TX_`, in API URI paths. See [Business Transactions](#)(see page 1238).

The following shows an example of retrieving the average CPU used by the **All Other Traffic** business transaction:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com:8090/controller/rest/applications/ACME%20Book%20Store%20Application/metric-data?metric-path=Business%20Transaction%20Performance%7CBusiness%20Transactions%7CECommerce%20Server%7C_APPDYNAMICS_DEFAULT_TX_%7CAverage%20CPU%20Used%20%28ms%29&time-range-type=BEFORE_NOW&duration-in-mins=15"
```

```
<metric-datas><metric-data>
  <metricId>4000</metricId>
  <metricPath>Business Transaction Performance|Business Transactions|ECommerce Server|_APPDYNAMICS_DEFAULT_TX_|Average CPU Used (ms)</metricPath>
  <metricName>BTM|BTs|BT:78|Component:12|Average CPU Used (ms)</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
      <startTimeInMillis>1450570800000</startTimeInMillis>
```

```

    <value>22</value>
    <min>0</min>
    <max>50</max>
    <current>20</current>
    <sum>3140</sum>
    <count>146</count>
    <standardDeviation>0.0</standardDeviation>
    <occurrences>0</occurrences>
    <useRange>true</useRange>
  </metric-value>
</metricValues>
</metric-data>
</metric-datas>

```

Retrieve Transaction Snapshots

Snapshots contain details on transactions, by request segment. The time range parameters are the same for snapshots as for retrieving metrics. You can similarly specify a relative time range or a specific range.

See [Using Time Ranges](#)(see page 3329).

Format

GET /controller/rest/applications/*application_name*/request-snapshots

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	Provide either the application name or application id.	Yes
time-range-type	Query	Possible values are: <ul style="list-style-type: none"> • BEFORE_NOW—must specify the duration-in-mins parameter. • BEFORE_TIME—must specify the duration-in-mins and end-time parameters. • AFTER_TIME—must specify the duration-in-mins and start-time parameters. • BETWEEN_TIMES—must specify the start-time and end-time parameters. The BETWEEN_TIMES range includes the start- time and excludes the end-time. 	Yes

Parameter Name	Parameter Type	Value	Mandatory
duration-in-mins	Query	Duration (in minutes) to return the data.	If time-range type is BEFORE_NOW, BEFORE_TIME, or AFTER_TIME
start-time	Query	Start time (in milliseconds) from which the data is returned.	If time-range type is AFTER_TIME or BETWEEN_TIMES

Parameter Name	Parameter Type	Value	Mandatory
end-time	Query	End time (in milliseconds) until which the data is returned.	If time-range type is BEFORE_TIME or BETWEEN_TIMES
guids	Query	Array of comma-separated GUIDs for the transaction snapshots. If not specified, retrieves all snapshots in the specified time range.	No
archived	Query	True to retrieve archived snapshots. Default is false.	No
deep-dive-policy	Query	Array of comma-separated snapshot policy filters to apply. Valid values are: <ul style="list-style-type: none"> • SLA_FAILURE • TIME_SAMPLING • ERROR_SAMPLING • OCCURRENCE_SAMPLING • ON_DEMAND • APPLICATION_STARTUP • SLOW_DIAGNOSTIC_SESSION • ERROR_DIAGNOSTIC_SESSION • POLICY_FAILURE_DIAGNOSTIC_SESSION • DIAGNOSTIC_SESSION • INFLIGHT_SLOW_SESSION 	No

Parameter Name	Parameter Type	Value	Mandatory
application-component-ids	Query	Array of comma-separated tier IDs to filter. The default is all the tiers in the application.	No
application-component-node-ids	Query	Array of comma-separated node ID filters. Default is all the nodes in the application	No
business-transaction-ids	Query	Array of comma-separated business transaction ID filters. Default is all the business transactions in the application.	No
user-experience	Query	Array of comma-separated user experiences filters. Valid values are: <ul style="list-style-type: none"> • NORMAL • SLOW • VERY_SLOW • STALL • ERROR 	No
first-in-chain	Query	If true, retrieve only the first request from the chain. Default is false.	No
need-props	Query	If true, the values of the following snapshot properties are included in the output. These values correspond to the values of the data-collector-type parameter. If false, the default, these values are empty in the output. <ul style="list-style-type: none"> • errorDetails • errorIDs • httpParameters • businessData • cookies • httpHeaders • sessionKeys • responseHeaders • logMessages • transactionProperties • transactionEvents • dotnetProperty 	No

Parameter Name	Parameter Type	Value	Mandatory
need-exit-calls	Query	If <code>true</code> , exit calls are included in the result. Default is <code>false</code> .	No
execution-time-in-milis	Query	If set, retrieves only data for requests with execution times greater than this value.	No
session-id	Query	If set, retrieves data only for this session id.	No
user-principal-id	Query	If set, retrieves data only for this user login.	No
error-ids	Query	Array of comma-separated error codes to filter by. The default is to retrieve all error codes.	No
starting-request-id, ending-request-id	Query	If set, retrieves data only for this range of request IDs.	No
error-occurred	Query	If <code>true</code> , retrieves only error requests. Default is <code>false</code> .	No
diagnostic-snapshot	Query	If <code>true</code> , retrieves only diagnostic snapshots. Default is <code>false</code> .	No
bad-request	Query	If <code>true</code> , retrieves only slow and error requests. Default is <code>false</code> .	No
diagnostic-session-guid	Query	Array of comma-separated diagnostic session GUIDs to filter.	No
data-collector-name	Query	Used with <code>data-collector-value</code> to filter snapshot collection based on the value of a data collector.	No

Parameter Name	Parameter Type	Value	Mandatory
data-collector-value	Query	Used with data-collector-name to filter snapshot collection based on the value of a data collector.	If data-collector-name is set.
data-collector-type	Query	Used with data-collector-name and data-collector-value to filter snapshot collection based on the value of a data collector. Some of the values contain spaces. All are case-sensitive and where indicated the spaces are required. Valid values are: <ul style="list-style-type: none"> • Error IDs • Stack Traces • Error Detail • Http Parameter • Business Data (This type is a method invocation data collector.) • Cookie • Http Header • Session Key • Response Header • Log Message • Transaction Property • Transaction Event • Dotnet Property • isProtoBuf • EUM Request GUID 	
output	Query	HTTP Request parameter included as part of the URL to change the output format Valid values are XML (default) or JSON.	No
maximum-results	Query	If specified, the number of maximum results will be returned. If not specified, a default of 600 results can be returned at most.	No

Examples

- Retrieve list of transaction snapshots for the ACME Book Store:

```
/controller/rest/applications/ECommerce_E2E-Fulfillment/request-snapshots?
time-range-type=BEFORE_NOW&duration-in-mins=5
```

Full Example:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/
controller/rest/applications/ECommerce_E2E-Fulfillment/request-snapshots?
time-range-type=BEFORE_NOW&duration-in-mins=5"
```

Retrieve Controller Audit History

The Controller audit history is a record of the configuration and user activities in the Controller configuration. The `ControllerAuditHistory` API method returns the audit log for the time range specified. The output format can be JSON or CSV. This information is the same as that found in the `audit.log` file. See [Platform Log Files](#)¹⁹⁴⁰ and [Log File Information by Platform](#)¹⁹⁴¹

Format

GET `/controller/ ControllerAuditHistory?startTime=<start-time>&endTime=<end-time>&include=<field>:<value>&exclude=<field>:<value>`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>start-time</code>	Query	Start time in the format: <code>yyyy-MM-dd'T'HH:mm:ss.SSSZ</code>	Yes
<code>end-time</code>	Query	End time in the format: <code>yyyy-MM-dd'T'HH:mm:ss.SSSZ</code>	Yes
<code>time-zone-id</code>	Query	Time zone	No
<code>include</code>	Query	Restricted information in the Controller audit history	No
<code>exclude</code>	Query	Restricted information in the Controller audit history	No

- To control the size of the output, the range between the `start-time` and `end-time` cannot exceed 24 hours. For periods longer than 24 hours, use multiple queries with consecutive time parameters.
- Multiple filters of the same type are allowed.
 - The backend API treats included filters with the same `<field>` with relationship OR
 - Filters with different `<field>` with relationship AND. There is no direct interaction between `include` and `exclude` filters.
- Each filter needs to be a parameter, e.g. `include=filterName1:filterValue1&include=filterName2:filterValue2`. See the below examples:

```
http://localhost:8080/controller/ControllerAuditHistory?
startTime=yyyy-MM-dd&HH:mm:ss.SSSZ&endTime=yyyy-MM-
dd&HH:mm:ss.SSSZ?
include=filterName1:filterValue1&include=filterName1:filterValue
1&exclude=filterName1:filterValue1&exclude=filterName1:filterVal
ue1
```

Configure Metric Retention by Account

You can configure the Controller to purge stale metrics once a day based on the account.

- Stale metrics are metrics that have not had new data reported based on the number of days configured.
- This only deletes EUM and SIM metrics that are more than two days old.

 To configure this option, you must be the account owner.

Format

POST /controller/api/accounts/<account_id>/metricstaleduration/<number_of_days>

Input Parameters

Parameter Name	Parameter Type	Value
account_id	URI	The account ID.
number_of_days	Integer	The number of days you want to retain stale metrics.

Example

```
curl -X POST -u user1@customer1:your_password "http://demo.appdynamics.com:8090/controller/api/accounts/2/metricstaleduration/3"
```

Configure Metric Retention by Application

You can configure the Controller to purge stale metrics once a day based on application.

- Stale metrics are metrics that have not had new data reported based on the number of days configured.
- This only deletes EUM and SIM metrics that are more than two days old.

To configure this option, you must have administrator permissions or higher.

Format

POST /controller/api/accounts/<account_id>/applications/<application_name>/metricstaleduration/<number_of_days>

Input Parameters

Parameter Name	Parameter Type	Value
account_id	URI	The account ID.
application_id	URI	The application ID.
number_of_days	Integer	The number of days you want to retain stale metrics.

Example

```
curl -X POST -u user1@customer1:your_password "http://demo.appdynamics.com:8090/controller/api/accounts/2/applications/12/metricstaleduration/3"
```

Alert and Respond API

This page provides links to the Alert and Respond APIs that allow you to create, configure and manage:

- [Health Rules](#)(see page 3344)
- [Schedules](#)(see page 3441)
- [Policies](#)(see page 3476)
- [Actions](#)(see page 3543)
- [Email Digests](#)(see page 3564)
- [Action Suppression](#)(see page 3643)
- [Events and Action Suppression](#)(see page 3682)

You can create and use the identity type, `API Clients`, to provide secure access to the AppDynamics controller using REST API calls. These calls use Open Authorization (OAuth) token-based authentication. You can create new API Client identity types that can be used to generate OAuth tokens. See [API Clients](#)(see page 3281).

Health Rule API

Related pages:

- [Health Rules](#)(see page 283)

This page describes the Health Rule API methods you can use to create, configure, update, and delete health rules for multiple applications simultaneously. This API allows you to programmatically update and maintain single or multiple health rules and migrate them across applications or Controllers.

- Minimal syntax validation of the JSON payload is done when creating the health rule.
- Path validation for a specified metric is not done. Ensure that you provide valid paths for all the metrics you define.
- If metrics are not resolved during the health rule evaluation, the health rule attains an unknown (?) state. Ensure that you provide valid metrics for all the affected entities you define.

Create a Health Rule

Creates a new health rule from the specified JSON payload. See [Property Details](#)¹⁹⁴²

Resource URL

POST <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules

¹⁹⁴² <https://docs.appdynamics.com/display/PRO45/Health+Rule+API#HealthRuleAPI-PropertyDetails>

Request/Response Format

JSON

Example

This example creates a health rule with an affected entity type `business transaction performance` and defines the evaluation criteria for the health rule. See [Download Examples](#)(see page 3441)

Retrieve a List of Health Rules for an Application

This API returns a list of all the health rule IDs and names for the specified application ID. To retrieve complete details of the health rule, use GET `//health-rule/{health-rule-id}`. See [Property Details](#)¹⁹⁴³

Resource URL

GET `<controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules`

Response Format

JSON

Example Response

```

[
  {
    "id": 1,
    "name": "Machine Availability is too low",
    "enabled": true
  },
  {
    "id": 2,
    "name": "Overall Disk Space Available is too low",
    "enabled": true
  },
  {
    "id": 3,
    "name": "CPU Usage is too high",
    "enabled": true
  },
  {

```

¹⁹⁴³ <https://docs.appdynamics.com/display/PRO45/Health+Rule+API#HealthRuleAPI-PropertyDetails>

```

    "id": 4,
    "name": "Memory Usage is too high",
    "enabled": true
  },
  {
    "id": 5,
    "name": "Swap Usage is too high",
    "enabled": true
  },
  {
    "id": 6,
    "name": "Disk Usage is too high on at least one partition",
    "enabled": false
  }
]

```

Retrieve Details of a Specified Health Rule

This API Returns the health rule details for the specified health rule ID.

 JMX Health Rules are not supported.

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules/{health-rule-id}

Response Format

Delete a Health Rule

Deletes an existing health rule with the specified ID.

Resource URL

DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules/{health-rule-id}

Update a Health Rule Configuration

This API updates one or more configuration setting(s) of a health rule. See [Property Details](#)(see page 3357)

You can enter one or both of the following field(s) in the request:

- Enable/disable the health rule.
- Update the schedule of the health rule.

Resource URL

PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules/{health-rule-id}/configuration

Property Details

HealthRule

Property Name	Type and Valid Values	Description
id	integer	Auto-generated by the system and returned in the response. It is a readOnly value.
name	string Minimum length: 1	Name of the health rule.

Property Name	Type and Valid Values	Description
enabled	boolean Default value: true	Sets the health rule to enabled/disabled state. A health rule is evaluated only if it is in enabled state.
useDataFromLastNMinutes	integer Minimum value: 1 Maximum value: 360	The time interval (in minutes) during which the data collected is considered for health rule evaluation. Enter a value between 1 to 9 or a multiple of 10 that is less than 360.
waitTimeAfterViolation	integer Minimum time: 1 minute	The wait time after a violation in minutes.

Property Name	Type and Valid Values	Description
scheduleName	string Default option: Always	Name of schedule to be associated with the health rule for evaluation.

Property Name	Type and Valid Values	Description						
affects*		<p>Describes entities affected by the health rule. 		value	The number or percentage of nodes that must violate the condition to constitute a health rule violation. If you select NUMBER_OF_NODES, enter an integer. If you select PERCENTAGE_NODES, enter a number.	number minimum: 0				

HealthRuleSummaryArray

Property	Type
id*	integer
name	string minLength: 1
enabled*	boolean

HealthRuleConfiguration

The configuration details of a health rule that you can update individually without the need to send the complete health rule JSON payload. You can mention one or more properties and all those properties are set to the new specified values.

Property	Type
enabled	boolean
scheduleName	string

MetricEvalDetail

Property	Type	Enums
metricEvalDetailType*	string	BASELINE_TYPE SPECIFIC_TYPE

BaselineMetricEvalDetail

The deviation of a metric from the baseline used to evaluate the health rule.

Property	Type	Enums
metricEvalDetailType*	string	BASELINE_TYPE SPECIFIC_TYPE
baselineCondition*	string	WITHIN_BASELINE NOT_WITHIN_BASELINE GREATER_THAN_BASELINE LESS_THAN_BASELINE

Property	Type	Enums
baselineName*	string minLength: 1	
compareValue*	number minimum: 0	
baselineUnit*	string	STANDARD_DEVIATIONS PERCENTAGE

SpecificValueMetricEvalDetail

The deviation of a metric from a specific value used to evaluate the health rule.

Property	Type	Enums
metricEvalDetailType*	string	BASELINE_TYPE SPECIFIC_TYPE
compareCondition*	string	GREATER_THAN_SPECIFIC_VALUE LESS_THAN_SPECIFIC_VALUE
compareValue*	number minimum: 0	

MetricAggregateFunction

Metrics aggregated to determine the deviation and evaluate the health rule.

Property	Type	Enums
MetricAggregateFunction*	string	MINIMUM MAXIMUM VALUE SUM COUNT CURRENT GROUP_COUNT

SingleMetricEvalDetail

The deviation of a single metric from the aggregated value used to evaluate the health rule.

Property	Type	Enums
evalDetailType*	string	SINGLE_METRIC METRIC_EXPRESSION
metricAggregateFunction*	string	MINIMUM MAXIMUM VALUE SUM COUNT CURRENT GROUP_COUNT
metricPath*	string minLength: 1	
metricEvalDetail*	string	BASELINE_TYPE SPECIFIC_TYPE

MetricExpressionEvalDetail

The metric expression used to evaluate the health rule.

Property	Type	Enums

Property	Type	Enums
matchType	string	AVERAGE ANY_NODE PERCENTAGE_NODES NUMBER_OF_NODES
value Enter the matching criteria only when you select PERCENTAGE_NODES or NUMBER_OF_NODES as matchType. If you select NUMBER_OF_NODES, enter an integer; else if you select PERCENTAGE_NODES, enter a number.	number minimum: 0	

Condition

A single condition that can be independently evaluated to true or false. List of conditions (maximum 8) along with other properties form a criteria.

Property	Description	Type/Enums
name*	Name of the condition.	string

Property	Description	Type/Enums						
shortname*	A short name used in <code>conditionExpression</code> to evaluate <code>CUSTOM</code> <code>conditionType</code> .	string pattern: <code>^[A-Z]{1,3}\$</code> Enums A B C D E F G H						
evaluateToTrueOnNoData	Controls the evaluation of the condition in cases where any metric on which the condition is based, returns no data. The condition evaluates to <code>unknown</code> by default when no data is returned. If the health rule is based on all the conditions evaluating to <code>true</code> , having no data returned may affect whether the health rule triggers an action.	boolean default: <code>false</code>						
evalDetail*	Details of metric(s) considered for evaluation of the condition. Use <code>SINGLE_METRIC</code> (see page 3366) to evaluate a single metric. Use <code>METRIC_EXPRESSION</code> (see page 3367) to evaluate a metric expression.	ConditionEvalDetail <table border="1"> <thead> <tr> <th>Property</th> <th>Type</th> <th>Enums</th> </tr> </thead> <tbody> <tr> <td><code>evalDetailType</code></td> <td>string</td> <td><code>SINGLE_METRIC</code> <code>METRIC_EXPRESSION</code></td> </tr> </tbody> </table>	Property	Type	Enums	<code>evalDetailType</code>	string	<code>SINGLE_METRIC</code> <code>METRIC_EXPRESSION</code>
Property	Type	Enums						
<code>evalDetailType</code>	string	<code>SINGLE_METRIC</code> <code>METRIC_EXPRESSION</code>						
triggerEnabled	If set to <code>true</code> , the value in field <code>minimumTriggers</code> is considered for evaluation.	boolean default: <code>false</code>						

Property	Description	Type/Enums
minimumTriggers	If you set a non-zero value, persistence thresholds ¹⁹⁴⁷ are considered when evaluating the conditions. Ensure that you define a value less than <code>useDataFromLastNMinutes</code> (see page 3358).	integer default: 0 minimum: 0 maximum: 30

ConditionEvalDetail

Property	Type	Enums
evalDetailType	string	SINGLE_METRIC METRIC_EXPRESSION

Criteria

Property	Description	Type/Enums
conditionAggregationType	Condition evaluation criteria that constitute a health rule violation.	string default: ALL Enums ALL ANY CUSTOM
conditionExpression	Use only when you set the <code>conditionAggregationType</code> variable to <code>CUSTOM</code> (see page 3361). Use the <code>ShortName</code> of the condition to define the boolean expression.	String minLength: 1

¹⁹⁴⁷ <https://docs.appdynamics.com/display/PRO45/Health+Rule+Conditions#HealthRuleConditions-PersistenceThresholds>

Download Examples

Download a set of examples that help you configure a health rule, [health_rule_request_examples.zip](#).

Download Swagger YAML spec

Download the Swagger YAML spec [health_rule_openapi.yml](#).

Schedule API

This page describes the Schedule API methods you can use to create, configure, and manage the evaluation time frame for the health rules of an application. The metrics associated with a health rule are evaluated according to a schedule that you control. See [Health Rule Schedules](#)(see page 286).

- Syntax validation of the JSON payload is done when creating the schedule.
- Ensure that you pick a time zone the [Time Zone List](#)¹⁹⁵⁰.

Create a New Schedule

Creates a new schedule with the specified JSON payload. See [Property Details](#)¹⁹⁵¹.

Resource URL

POST <controller_url>/controller/alerting/rest/v1
/applications/<application_id>/schedules

Request/Response Format

JSON

Example

This example creates a health rule schedule that evaluates the health rule once. See [Download Examples](#)¹⁹⁵².

Retrieve a List of Schedules for a Given Application

Returns a list of [schedule\(s\) details](#)(see page 3452) for a health rule associated with the specified application ID. This API returns the schedule ID, name, and description of the schedule. See [Property Details](#)¹⁹⁵³.

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/schedules

Response Format

JSON

Example Response

This example returns a list of schedules applicable to a given application ID.

```
[
  {
    "id": 62,
    "name": "Daily Schedule",
    "description": "Daily Schedule",
    "timezone": "America/Los_Angeles"
  },
  {
    "id": 12,
    "name": "End of Business Hour: 5pm-6pm, Mon-Fri",
    "description": "This schedule is active Monday through Friday, during end of business hour",
    "timezone": "Asia/Kolkata"
  }
]
```

¹⁹⁵³ <https://docs.appdynamics.com/display/PRO45/Schedule+API#ScheduleAPI-PropertyDetails>

```

    "id": 61,
    "name": "Schedule1",
    "description": "Custom Schedule",
    "timezone": "America/Los_Angeles"
  },
  {
    "id": 11,
    "name": "Weekday lunch: 12pm-1pm, Mon-Fri",
    "description": "This schedule is active Monday through Friday, during lunch hour",
    "timezone": "Asia/Kolkata"
  },
  {
    "id": 10,
    "name": "Weekday mornings: 8am-12pm, Mon-Fri",
    "description": "This schedule is active Monday through Friday, during morning hours",
    "timezone": "Asia/Kolkata"
  },
  {
    "id": 7,
    "name": "Weekdays: 8am-5pm, Mon-Fri",
    "description": "This schedule is active Monday through Friday, during business
hours",
    "timezone": "Asia/Kolkata"
  },
  {

    "description": "This schedule is active Monday through Friday, during night time
batch runs",
    "timezone": "Asia/Kolkata"
  }
]

```

Retrieve the Details of a Specified Schedule

Retrieves a schedule with a specified ID. See [Property Details](#)¹⁹⁵⁴.

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/schedules/{schedule-id}

¹⁹⁵⁴ <https://docs.appdynamics.com/display/PRO45/Schedule+API#ScheduleAPI-PropertyDetails>

Response Format

JSON

Example Response

This example retrieves the details of a schedule. See [Download Examples](#)¹⁹⁵⁵.

```
{
  "id": 12,
  "name": "End of Business Hour: 5pm-6pm, Mon-Fri",
  "description": "This schedule is active Monday through Friday, during end of business
hour",
  "timezone": "Asia/Kolkata",
  "scheduleConfiguration": {
    "scheduleFrequency": "WEEKLY",
    "days": [
      "MONDAY",
      "TUESDAY",
      "WEDNESDAY",
      "THURSDAY",
      "FRIDAY"
    ],
    "startTime": "17:00",
    "endTime": "18:00"
  }
}
```

Update a Schedule

Updates an existing schedule with a specified JSON payload. See [Property Details](#)¹⁹⁵⁶.

Resource URL

PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/schedules/{schedule-id}

Request/Response Format

JSON

Example

This example updates a schedule that evaluates the health rule once. See [Download Examples](#)¹⁹⁵⁷.

[Request](#) Response

Property Details

Schedule

Payload details for the health rule schedule.

Property Name	Type	Description and Valid Values
id	integer	Auto-generated by the system and returned in the response. It is a ReadOnly value.
name*	string	Name of schedule to be associated with the health rule for evaluation. Minimum length: 1
description	string	Description of the schedule with evaluation details. Example: Health rules are evaluated daily at 12 noon. Default value: true
timezone*	string	Timezone Id - Unique identifier of the time zone. See Time Zones ¹⁹⁵⁹ . Example: America/Los_Angeles

¹⁹⁵⁹ <https://docs.appdynamics.com/display/PRO45/List+of+Time+Zone+IDs>

Property Name	Type	Description and Valid Values		
scheduleConfiguration*		Property Name	Type	Description
		scheduleFrequency	string	The health rule(s) evaluation frequency specified in the schedule. Enums: ONE_TIME (see page 3447) DAILY (see page 3448) WEEKLY (see page 3448) MONTHLY_SPECIFIC_DATE (see page 3449) MONTHLY_SPECIFIC_DAY (see page 3450) CUSTOM (see page 3452)

OneTimeSchedule

This schedule evaluates the health rule once.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums (see page 3447).
startDate*	string	The scheduled start date in DD/MM/YYYY format. Pattern: ^(?: (?: 31(\- \/ \.) (?: 0?[13578] 1[02])) \1 (?: (?: 29 30) (\- \/ \.) (?: 0?[13-9] 1[0-2])) \2) (?: (?: 1[6-9] [2-9]\d)? \d{2}) \$ ^ (?: 29(\- \/ \.) 0? 2\3 (?: (?: 1[6-9] [2-9]\d)? (?: 0[48] [2468] [048] [13579] [26]) (?: (?: 16 [2468] [048] [3579] [26]) 00))) \$ ^ (?: 0?[1-9] 1\d 2[0-8]) (\- \/ \.) (?: (?: 0?[1-9]) (?: 1[0-2])) \4 (?: (?: 1[6-9] [2-9]\d)? \d{2}) \$

Property Name	Type	Description
startTime*	string	The scheduled start time in a 24-hour format. Pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>
endDate*	string	The scheduled end date in DD/MM/YYYY format. Pattern: <code>^(?:((?:31(\- \/ \.)?(?:0?[13578] 1[02]))\1 (?:(?:29 30)(\- \/ \.)?(?:0?[13-9] 1[0-2]))\2)(?:1[6-9] [2-9]\d)?\d{2})\$ ^((?:29(\- \/ \.)?2\3(?:1[6-9] [2-9]\d)?(?:0[48] [2468][048] [13579][26]) (?:(?:16 [2468][048] [3579][26])00)))\$ ^((?:0?[1-9] 1\d 2[0-8])(\- \/ \.)?(?:0?[1-9]) (?:1[0-2]))\4(?:1[6-9] [2-9]\d)?\d{2})\$</code>
endTime*	string	The scheduled end time in a 24-hour format. Pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>

DailySchedule

A recurring schedule to evaluate the health rule every day.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums (see page 3447).
startTime*	string	The scheduled start time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>
endTime*	string	The scheduled end time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>

WeeklySchedule

A recurring schedule to evaluate the health rule every week.

Property Name	Type	Description						
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums (see page 3447).						
days*	string	The day of the week to evaluate the health rule. minItems: 1 maxItems: 7 <table border="1" data-bbox="873 562 1495 1102"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DayOfWeek</td> <td>string</td> <td> Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY </td> </tr> </tbody> </table>	Property Name	Type	Description	DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY
Property Name	Type	Description						
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY						
startTime*	string	The scheduled start time in a 24-hour format. pattern: $^([01]\d 2[0-3]):([0-5]\d)$$						
endTime*	string	The schedule end time in 24-hour format. pattern: $^([01]\d 2[0-3]):([0-5]\d)$$						

MonthlySpecificDateSchedule

A recurring schedule to evaluate the health rule every month on a specific date.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums (see page 3447).

Property Name	Type	Description
startDate*	string	The schedule start date in DD/MM/YYYY format. pattern: $^((?:31(\backslash/ -\backslash\.)0?[13578] 1[02]))\1 ((?:29 30)(\backslash/ -\backslash\.)0?[13-9] 1[0-2])\2)((?:1[6-9] 2-9\d)?\d{2})\$(?:29(\backslash/ -\backslash\.)0?2\3(?:1[6-9] 2-9\d)?(0[48] 2468[048] 13579[26]) (?:16[2468][048] 3579[26])00))\$(?:0?[1-9] 1\d 2[0-8])(\backslash/ -\backslash\.)((?:0?[1-9]) (?:1[0-2]))\4(?:1[6-9] 2-9\d)?\d{2})\$$$
startTime*	string	The scheduled start time in a 24-hour format. pattern: $^([01]\d 2[0-3]):([0-5]\d)\$$
endDate*	string	The scheduled end date in DD/MM/YYYY format. pattern: $^((?:31(\backslash/ -\backslash\.)0?[13578] 1[02]))\1 ((?:29 30)(\backslash/ -\backslash\.)0?[13-9] 1[0-2])\2)((?:1[6-9] 2-9\d)?\d{2})\$(?:29(\backslash/ -\backslash\.)0?2\3(?:1[6-9] 2-9\d)?(0[48] 2468[048] 13579[26]) (?:16[2468][048] 3579[26])00))\$(?:0?[1-9] 1\d 2[0-8])(\backslash/ -\backslash\.)((?:0?[1-9]) (?:1[0-2]))\4(?:1[6-9] 2-9\d)?\d{2})\$$$
endTime*	string	The scheduled end time in a 24-hour format. pattern: $^([01]\d 2[0-3]):([0-5]\d)\$$

MonthlySpecificDaySchedule

A recurring schedule to evaluate the health rule every month on a specific date.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums (see page 3447).

Property Name	Type	Description						
startTime*	string	The scheduled start time in a 24-hour format. pattern: ^([01]\d 2[0-3]):([0-5]\d)\$						
endTime*	string	The schedules end time in a 24-hour format. pattern: ^([01]\d 2[0-3]):([0-5]\d)\$						
day*	string	The day of the week to evaluate the health rule. minItems: 1 maxItems: 7 <table border="1" data-bbox="873 821 1495 1381"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DayOfWeek</td> <td>string</td> <td>Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY</td> </tr> </tbody> </table>	Property Name	Type	Description	DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY
Property Name	Type	Description						
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY						
occurrence*	string	The occurrence of the day within a month. Enums: FIRST SECOND THIRD FOURTH LAST						

CustomSchedule

A custom schedule to evaluate the health rule based on specific requirements and timezone. Use UNIX cron expressions to define properties.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums(see page 3447) .
startCron*	string	The beginning of the UNIX cron expression.
endCron*	string	The end of the UNIX cron expression.

ScheduleSummaryElement

The details of the schedule you have defined that are returned when you retrieve the schedules API.

Property Name	Type	Description
id	integer	Auto-generated by the system and returned in the response.
name*	string	Name of the schedule associated with the health rule for evaluation.
description	string	Description of the schedule and evaluation details.
timezone*	string	Timezone ID - Unique identifier of the time zone.

*This property is required (mandatory).

Policy API

This page describes the Policy API methods you can use to create, configure, and manage [policies](#)(see [page 260](#)) for an application.

A policy consists of a *trigger* based on one or more events and an *action* in response to that trigger. You use policies to automate monitoring, alerting, and problem remediation.

- Syntax validation of the JSON payload is done when creating the policy.
- Objects/Entities corresponding to EUM applications are not supported.

Create a Policy

Creates a new policy using the given JSON payload.

Resource URL

POST <controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies

Request/Response Format

JSON

Example

[Request](#) Response

```
{
  "name": "Policy json create example",
  "enabled": true,

```

Example Response

```
[
  {
    "id": 1,
    "name": "Policy json update example",
    "enabled": true
  },
  {
    "id": 2,
    "name": "Policy json create example",
    "enabled": true
  }
]
```

Retrieve Details of a Specified Policy

Returns a JSON representation of a policy for the given policy ID.

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies/{policy-id}

Response Format

JSON

Example Response

This example retrieves the configuration details of a policy.

```
{
  "id": 1,
  "name": "Policy REST get json example",
  "enabled": true,
  "executeActionsInBatch": true,
  "actions": [
    {
      "actionName": "your@email.com",
      "actionType": "EMAIL",
      "notes": "example notes"
    },
    {
      "actionName": "1234567890",
      "actionType": "SMS"
    },
    {
      "actionName": "Thread dump action",
      "actionType": "THREAD_DUMP",

```

```

        "specifiedEntityActionDetails": {
            "specifiedEntityActionScope": "SPECIFIC_NODES",
            "nodes": [
                "node1"
            ]
        }
    ],

        ]
    }
}
]
}
}

```

Update a Policy

Updates the configuration settings of an existing policy with the values of a specified policy ID.

This request requires a complete JSON payload as input. AppDynamics recommends

1. Retrieving the JSON payload using GET `/policies/{policy-id}` and update the required fields.
2. Send the modified payload as part of the PUT request.

Resource URL

PUT `<controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies/{policy-id}`

Request/Response Format

Delete a Policy

Deletes an existing policy with the specified ID.

 Ensure that you provide a valid existing policy ID.

Resource URL

DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies/{policy-id}

Update a Policy Configuration

Updates one or more specific configuration setting(s) of a policy. You can update the **Name** and **Enabled** fields using this API.

Resource URL

PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies/{policy-id}/configuration

Request/Response Format

JSON

Property Details

Policy

Payload details of a policy.

Property Name	Type	Description and Valid Values									
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.									
name*	string	Name of the policy. Minimum length: 1									
enabled	boolean	Sets the policy to enabled/disabled state. Default value: true									
executeActionsInBatch*	boolean	Executes the actions configured for a policy, once for all the triggering events that occurred during the last minute. Default value: true									
actions*	minItems: 1	<p>Action Describes the predefined, reusable, and automated response to an event to be taken when the policy is triggered.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>actionName*</td> <td>string</td> <td>Name of the action defined for a policy.</td> </tr> <tr> <td>actionType*</td> <td>string</td> <td> ActionType Enum Creates the following types of actions: SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA </td> </tr> </tbody> </table>	Property Name	Type	Description	actionName*	string	Name of the action defined for a policy.	actionType*	string	ActionType Enum Creates the following types of actions: SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
Property Name	Type	Description									
actionName*	string	Name of the action defined for a policy.									
actionType*	string	ActionType Enum Creates the following types of actions: SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA									

Property Name	Type	Description and Valid Values
events*		Events Describes the events that trigger the policy.

AnomalyEvents

Events generated due to anomaly detection that trigger the policy.

Property Name	Type	Description
anomalyEvents	string minItems: 1	AnomalyEventType Enums ANOMALY_OPEN_WARNING ANOMALY_OPEN_CRITICAL ANOMALY_UPGRADED ANOMALY_DOWNGRADED ANOMALY_CLOSE_WARNING ANOMALY_CLOSE_CRITICAL ANOMALY_CANCELED_WARNING ANOMALY_CANCELED_CRITICAL

Action

A list of actions that are taken when a policy is triggered.

Property Name	Type	Description
actionName*	string	

Property Name	Type	Description
actionType*	string	ActionType Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

SimpleActionType

A simple action that is taken when the policy is triggered.

Property Name	Type	Description
actionName*	string	
actionType*	string	ActionType Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

EmailActionType

An email is sent when the policy is triggered.

Property Name	Type	Description
actionName*	string	
actionType*	string	ActionType Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
notes	string	

ActionOnSpecifiedEntities

A simple action that is taken for specific entities when the policy is triggered.

Property Name	Type	Description
actionName*	string	
actionType*	string	ActionType Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

Download the Swagger YAML spec [policies_openapi.yml](#).

Actions API

This page describes the Action API methods you can use to create, configure, and manage various [actions](#)(see [page 334](#)) that are to be triggered as a response to events. Use this API to create these types of actions:

- [Notification](#)¹⁹⁶⁰
- [Diagnostic](#)¹⁹⁶¹
- [Remediation](#)¹⁹⁶²
- [JIRA](#)¹⁹⁶³
- [HTTP Request](#)¹⁹⁶⁴
- [Custom](#)¹⁹⁶⁵

Syntax validation of the JSON payload is done when creating the action.

¹⁹⁶⁰ <https://docs.appdynamics.com/display/PRO45/Notification+Actions>

¹⁹⁶¹ <https://docs.appdynamics.com/display/PRO45/Diagnostic+Actions>

¹⁹⁶² <https://docs.appdynamics.com/display/PRO45/Remediation+Actions>

¹⁹⁶³ <https://docs.appdynamics.com/display/PRO45/JIRA+Actions>

¹⁹⁶⁴ <https://docs.appdynamics.com/display/PRO45/HTTP+Request+Actions+and+Templates>

¹⁹⁶⁵ <https://docs.appdynamics.com/display/PRO45/Custom+Actions>

Create a New Action

Creates a new action with the specified JSON payload. See [Property Details](#)¹⁹⁶⁶.

Resource URL

POST <controller_url>/controller/alerting/rest/v1
/applications/<application_id>/actions

Request/Response Format

JSON

Example

[Request](#) [Response](#)

This example creates an action of the type **Thread Dump**. See [Download Examples](#)(see page 3563).

```
{
  "actionType": "THREAD_DUMP",
  "name": "Thread Dump Action",
  "numberOfThreadDumps": 2,
  "intervalInMs": 500,
  "approvalBeforeExecution": {
    "requireApproval": true,
    "approverEmail": "email@website.com"
  }
}
```

[Request](#) [Response](#)

This example returns the created action object.

```
{
  "id": "3",
  "actionType": "THREAD_DUMP",
  "name": "Thread Dump Action",
  "numberOfThreadDumps": 2,
  "intervalInMs": 500,
  "approvalBeforeExecution": {
    "requireApproval": true,
    "approverEmail": "email@website.com"
  }
}
```

¹⁹⁶⁶ <https://docs.appdynamics.com/display/PRO45/Actions+API#ActionsAPI-PropertyDetails>

Retrieve a List of Actions for a Given Application

Returns the action ID, name, and description of the action pertaining to a specified application ID. See [Property Details](#)¹⁹⁶⁷.

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/actions

Response Format

JSON

Example Response

This example returns a list of actions pertaining to a given application ID.

```
[{"id":1,"name":"Thread Dump Action","actionType":"THREAD_DUMP"}]
```

Retrieve Details of a Specified Action

Retrieves the details of action with a specified ID. See [Property Details](#)¹⁹⁶⁸.

 Ensure that you provide a valid action ID.

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/actions/{action-id}

Response Format

JSON

Example Response

This example retrieves the details of an action. See [Download Examples](#)(see page 3543).

```
{
  "id": 1,
  "actionType": "THREAD_DUMP",
  "name": "Thread Dump Action",
  "numberOfThreadDumps": 2,
  "intervalInMs": 500,
  "approvalBeforeExecution": {
    "requireApproval": true,
    "approverEmail": "email@website.com"
  }
}
```

¹⁹⁶⁷ <https://docs.appdynamics.com/display/PRO45/Actions+API#ActionsAPI-PropertyDetails>

¹⁹⁶⁸ <https://docs.appdynamics.com/display/PRO45/Actions+API#ActionsAPI-PropertyDetails>

```
}
}
```

Update an Action

Updates an existing action with a specified JSON payload. See [Property Details](#)¹⁹⁶⁹.

 This request requires a complete JSON payload as input. Hence, it is recommended that you retrieve the JSON payload using, GET /action/{action-id} and update the required fields. Then, send the modified payload as part of a PUT request.

Resource URL

PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action/{action-id}

Request/Response Format

JSON

Example

[Request](#) Response

```
{
  "actionType": "THREAD_DUMP",
  "name": "Thread Dump Action",
  "numberOfThreadDumps": 2,
  "intervalInMs": 500,
  "approvalBeforeExecution": {
    "requireApproval": true,
    "approverEmail": "email@website.com"
  }
}
```

Request [Response](#)

This example returns the updated action.

```
{
  "id": "3",
  "actionType": "THREAD_DUMP",
```

¹⁹⁶⁹ <https://docs.appdynamics.com/display/PRO45/Actions+API#ActionsAPI-PropertyDetails>

```

    "name": "Thread Dump Action",
    "numberOfThreadDumps": 2,
    "intervalInMs": 500,
    "approvalBeforeExecution": {
      "requireApproval": true,
      "approverEmail": "email@website.com"
    }
  }
}

```

Delete an Action

Deletes an action with the specified ID. See [Property Details](#)¹⁹⁷⁰.

 Ensure that you provide a valid action ID.

Resource URL

DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action/{action-id}

Response Codes

Code	Description
200	Fetches successfully
201	Created successfully
204	Deleted successfully
400	Bad request
401	Unauthorized
403	Forbidden
404	Resource not found
409	Already exists

Property Details

Action

Payload details for an action triggered as a response to an event.

¹⁹⁷⁰ <https://docs.appdynamics.com/display/PRO45/Actions+API#ActionsAPI-PropertyDetails>

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnlly value.
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

SmsAction

An SMS notification is triggered as a response to an event.

 **Note**

Ensure that you have configured the email and SMS settings for AppDynamics. See [Configure the SMTP Server](#)¹⁹⁷¹.

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnlly value.

¹⁹⁷¹ <https://docs.appdynamics.com/display/PRO45/Enable+an+Email+Server>

Property Name	Type	Description and Valid Values
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
phoneNumber*	string pattern: $\backslash d\{10,\}\$$	

EmailAction

An email notification is triggered as a response to an event.

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnLy value.

Property Name	Type	Description and Valid Values
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
emails*	string pattern ^[a-zA-Z0-9_+]+@[a-zA-Z0-9]+\.[a-zA-Z0-9-]+\$	

CustomEmailAction

An email notification based on a predefined template is triggered as a response to an event.

 The template must already exist before you can use it in an action. See [Email Templates](#)¹⁹⁷².

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.

¹⁹⁷² <https://docs.appdynamics.com/display/PRO45/Email+Templates>

Property Name	Type	Description and Valid Values
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
name*	string minLength: 1	ActionName The name you assign to the action.
emailTemplateName*	string minLength: 1	The name of the template to be used for email notification.
to*	string pattern: ^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$	EmailArray A list of email IDs.
cc*	string pattern: ^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$	EmailArray A list of email IDs.
bcc*	string pattern: ^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$	EmailArray A list of email IDs.

Property Name	Type	Description and Valid Values						
customTemplateVariables*	string	KeyValuePair <table border="1" data-bbox="1003 390 1495 579"> <thead> <tr> <th>Property Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td>key*</td> <td>string</td> </tr> <tr> <td>value*</td> <td>string</td> </tr> </tbody> </table>	Property Name	Type	key*	string	value*	string
Property Name	Type							
key*	string							
value*	string							

ThreadDumpAction

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
name*	string minLength: 1	ActionName The name you assign to the action.
numberOfThreadDumps*	integer minimum: 1 maximum: 5 0	The number of thread dump samples you want the 'action' to collect.
intervalInMs*	integer minimum: 5 00	The time interval in milliseconds between the thread dump samples collected.

Property Name	Type	Description and Valid Values						
approvalBeforeExecution*		<p>ApprovalBeforeExecution Mandate an approval before the thread dump action is started.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td>requireApproval</td> <td>boolean</td> </tr> <tr> <td>approverEmail</td> <td> string pattern: $^{\wedge}[a-zA-Z0-9_+@][a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\\$ </td> </tr> </tbody> </table>	Property Name	Type	requireApproval	boolean	approverEmail	string pattern: $^{\wedge}[a-zA-Z0-9_+@][a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$$
Property Name	Type							
requireApproval	boolean							
approverEmail	string pattern: $^{\wedge}[a-zA-Z0-9_+@][a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$$							

HttpRequestAction

Property Name	Type	Description and Valid Values
id	integer	<p>This is auto-generated by the system and returned in the response.</p> <p>It is a readOnly value.</p>
actionType*	string	<p>The type of action triggered as a response to an event.</p> <p>Enums</p> <p>SMS</p> <p>EMAIL</p> <p>CUSTOM_EMAIL</p> <p>THREAD_DUMP</p> <p>HTTP_REQUEST</p> <p>CUSTOM</p> <p>RUN_SCRIPT_ON_NODES</p> <p>DIAGNOSE_BUSINESS_TRANSACTIONS</p> <p>CREATE_UPDATE_JIRA</p>
name*	string minLength: 1	<p>ActionName</p> <p>The name you assign to the action.</p>

Property Name	Type	Description and Valid Values						
httpRequestTemplateName	string minLength: 1	An existing HTTP request template to be used in an HTTP request action.						
customTemplateVariables		KeyValuePair <table border="1" data-bbox="922 514 1495 703"> <thead> <tr> <th>Property Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td>key*</td> <td>string</td> </tr> <tr> <td>value*</td> <td>string</td> </tr> </tbody> </table>	Property Name	Type	key*	string	value*	string
Property Name	Type							
key*	string							
value*	string							

CustomAction

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
name*	string minLength: 1	ActionName The name you assign to the action.
customActionName*	string minLength: 1	

ScriptAction

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnLy value.
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
name*	string minLength: 1	ActionName The name you assign to the action.
scriptPath*	string minLength: 1	The relative path of the script. <div style="border: 1px solid #007bff; background-color: #e6f2ff; padding: 5px; margin-top: 10px;">i Enter the part after \$ <code>{machine.agent.directory}/local-scripts/</code></div>
logFilePath		The absolute path of the log file(s).
scriptTimeout*	string integer minimum: 1 maximum: 1440	

Property Name	Type	Description and Valid Values						
approvalBeforeExecution*		<p>Mandate approval before the script action is started.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td>requireApproval</td> <td>boolean</td> </tr> <tr> <td>approverEmail</td> <td>string pattern: ^[a-zA-Z0-9_+]+@[a-zA-Z0-9]+\.[a-zA-Z0-9-]+\$</td> </tr> </tbody> </table>	Property Name	Type	requireApproval	boolean	approverEmail	string pattern: ^[a-zA-Z0-9_+]+@[a-zA-Z0-9]+\.[a-zA-Z0-9-]+\$
Property Name	Type							
requireApproval	boolean							
approverEmail	string pattern: ^[a-zA-Z0-9_+]+@[a-zA-Z0-9]+\.[a-zA-Z0-9-]+\$							

DiagnosticAction

Property Name	Type	Description and Valid Values
id	integer	<p>This is auto-generated by the system and returned in the response.</p> <p>It is a readOnly value.</p>
actionType*	string	<p>The type of action triggered as a response to an event.</p> <p>Enums</p> <p>SMS</p> <p>EMAIL</p> <p>CUSTOM_EMAIL</p> <p>THREAD_DUMP</p> <p>HTTP_REQUEST</p> <p>CUSTOM</p> <p>RUN_SCRIPT_ON_NODES</p> <p>DIAGNOSE_BUSINESS_TRANSACTIONS</p> <p>CREATE_UPDATE_JIRA</p>
name*	string minLength: 1	<p>ActionName</p> <p>The name you assign to the action.</p>

Property Name	Type	Description and Valid Values
duration*	integer minimum: 1 maximum: 10	The duration in minutes to run the diagnostic session.
snapshotRate*	integer minimum: 1 maximum: 10	The rate at which diagnostic snapshots are captured.
businessTransactions*	string	Runs the diagnostic session on the specified Business Transactions. Enums ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

JiraAction

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
name*	string minLength: 1	ActionName The name you assign to the action.

Property Name	Type	Description and Valid Values
jiraActionDetails*	string	jiraActionType The JIRA action type triggered as a response to an event. Enums CREATE_JIRA UPDATE_JIRA

JiraActionDetails

The JIRA action type triggered as a response to an event.

Property Name	Type	Description and Valid Values
jiraActionType	string	Enums CREATE_JIRA UPDATE_JIRA

JiraCreateAction

The Jira action type create JIRA is triggered as a response to an event.

Property Name	Type	Description and Valid Values
jiraActionType*	string	Enums CREATE_JIRA UPDATE_JIRA
assignee*	string minLength: 1	
project*	string minLength: 1	
priority*	string minLength: 1	
issueType*	string minLength: 1	

JiraUpdateAction

The Jira action type update JIRA is triggered as a response to an event.

Property Name	Type	Description and Valid Values
jiraActionType*	string	Enums CREATE_JIRA UPDATE_JIRA
changePriorityTo*	string minLength: 1	

ActionName

The name you assign to the action.

Property Name	Type	Description and Valid Values
ActionName	string minLength: 1	

ApprovalBeforeExecution

Mandate email approval before the action execution is initiated.

Property Name	Type
requireApproval	boolean
approverEmail	string pattern: ^[a-zA-Z0-9_ .+-]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9- .]+\$

BusinessTransactions

Run the diagnostic session on the specified Business Transactions.

Property Name	Type	Description and Valid Values
businessTransactionScope	string	Enums ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

AllAffectedBusinessTransactions

Run the diagnostic session on all Business Transactions.

Property Name	Type	Description and Valid Values
businessTransactionScope	string	Enums ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

SpecificBusinessTransactions

Run the diagnostic session on the Business Transactions that match the specified criteria.

Property Name	Type	Description and Valid Values
businessTransactionScope	string	Enums ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS
businessTransactionNames*	string minItems: 1	

EmailArray

Property Name	Type
EmailArray	string pattern: ^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\.\$

KeyValuePair

Property Name	Type
key*	string
value*	string

Email

Property Name	Type
Email	string pattern: <code>^[a-zA-Z0-9_+-.]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\.\$</code>

ActionSummaryArray

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnlY value.
name*	string minLength: 1	ActionName The name you assign to the action.
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

ActionSummary

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnlY value.

Property Name	Type	Description and Valid Values
name*	string minLength: 1	ActionName The name you assign to the action.
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

StringIntegerPair

Property Name	Type
id	integer
name*	string minLength: 1

JiraActionTypeEnum

Property Name	Type	Description and Valid Values
jiraActionTypeEnum	string	CREATE_JIRA UPDATE_JIRA

BusinessTransactionScopeEnum

Property Name	Type	Description and Valid Values
BusinessTransactionScopeEnum	string	ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

ActionTypeEnum

Property Name	Type	Description and Valid Values
ActionTypeEnum	string	Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

ErrorResponse

Property Name	Type
statusCode	integer
message	string

Download Examples

Download [actions_api.zip](#) for a set of examples that help you configure an action.

Download SWAGGER YAML file

Download the Swagger [actions_openapi.yml](#).

Email Digest API

This page provides Email Digest API methods you can use to report a summary of a specific event(s) to a recipient list configured on a health rule schedule. [Email digests](#)(see page 364) are triggered as a response to a health rule violation event.

Syntax validation of the JSON payload is done when creating the email digest.

Create a New Email Digest

Creates a new email digest with the specified JSON payload. See [Property Details](#)(see page 3573).

Resource URL

POST <controller_url>/controller/alerting/rest/v1
/applications/<application_id>/email-digests

Request/Response Format

JSON

Example

[Request](#) Response

This example creates a new email digest. See [Download Examples](#)(see page 3643).

```
{
  "name": "My new email digest",
  "enabled": true,
  "executeActionsInBatch": true,
  "frequency": 2,
  "actions": [
    {
      "actionName": "My action 1",
      "actionType": "SMS"
    }
  ],
  "events": {
    "healthRuleEvents": {
      "healthRuleEventTypes": [
        "HEALTH_RULE_CONTINUES_CRITICAL",
        "HEALTH_RULE_UPGRADED"
      ],
      "healthRuleScope": {
        "healthRuleScopeType": "ALL_HEALTH_RULES"
      }
    },
    "otherEvents": [
      "CLR_CRASH",
      "DEADLOCK"
    ]
  }
}
```

```

  ],

```

Retrieve a List of Email Digests for an Application

This API returns the email digest names, IDs, and enable flag details pertaining to the specified application. See [Property Details](#)(see page 3573).

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests

Response Format

JSON

Example Response

This example returns a list of email digests pertaining to the specified application ID.

```

[
  {
    "id": 12,
    "name": "some email digest name",
    "enabled": true
  }
]

```

```
}
]
```

Retrieve Details of an Email Digest

Retrieves the details of an email digest with a specified ID. See [Property Details](#)(see page 3573).

 Ensure that you provide a valid email digest ID.

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}

Response Format

JSON

Example Response

```
{
  "id": 0,
  "name": "My new email digest",
  "enabled": true,
  "executeActionsInBatch": true,
  "frequency": 2,
  "actions": [
    {
      "actionName": "My action 1",
      "actionType": "SMS"
    }
  ],
  "events": {
    "healthRuleEvents": {
      "healthRuleEventTypes": [
        "HEALTH_RULE_CONTINUES_CRITICAL",
        "HEALTH_RULE_UPGRADED"
      ],
      "healthRuleScope": {
        "healthRuleScopeType": "ALL_HEALTH_RULES"
      }
    },
    "otherEvents": [
      "CLR_CRASH",
      "DEADLOCK"
    ],
    "anomalyEvents": [
      "ANOMALY_OPEN_WARNING",
      "ANOMALY_CLOSE_CRITICAL"
    ]
  }
}
```

```

    ],
    "customEvents": [
      {
        "eventName": "string",
        "propertyMatchCriteria": "ANY",
        "keyValuePairArray": [
          {
            "key": "key1",
            "value": "value1"
          }
        ]
      }
    ]
  },
  "selectedEntities": {
    "selectedEntityType": "ANY_ENTITY"
  }
}

```

Update an Email Digest

Updates an existing email digest with a specified JSON payload. See [Property Details](#)(see page 3573).

This request requires a complete JSON payload as input. It is recommended that you retrieve the JSON payload using, GET `email-digests/{email-digest-id}` and update the required fields. Then, send the modified payload as part of PUT request.

Resource URL

PUT `<controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}`

Request/Response Format

JSON

Example

[Request](#) Response

This example updates an action. See [Download Examples](#)(see page 3643).

```

{
  "name": "My new email digest",
  "enabled": true,
  "executeActionsInBatch": true,
  "frequency": 2,

```

```

"actions": [
  {
    "actionName": "My action 1",
    "actionType": "SMS"
  }
],
"events": {
  "healthRuleEvents": {
    "healthRuleEventTypes": [
      "HEALTH_RULE_CONTINUES_CRITICAL",
      "HEALTH_RULE_UPGRADED"
    ],
    "healthRuleScope": {
      "healthRuleScopeType": "ALL_HEALTH_RULES"
    }
  },
  "otherEvents": [
    "CLR_CRASH",
    "DEADLOCK"
  ],
  "anomalyEvents": [
    "ANOMALY_OPEN_WARNING",
    "ANOMALY_CLOSE_CRITICAL"
  ],
  "customEvents": [
    {
      "eventName": "string",
      "propertyMatchCriteria": "ANY",
      "keyValuePairArray": [
        {
          "key": "key1",
          "value": "value1"
        }
      ]
    }
  ]
},
"selectedEntities": {
  "selectedEntityType": "ANY_ENTITY"
}
}

```

Request [Response](#)

This example returns the updated action.

```

{
  "id": 0,

```

```

"name": "My new email digest",
"enabled": true,
"executeActionsInBatch": true,
"frequency": 2,
"actions": [
  {
    "actionName": "My action 1",
    "actionType": "SMS"
  }
],
"events": {
  "healthRuleEvents": {
    "healthRuleEventTypes": [
      "HEALTH_RULE_CONTINUES_CRITICAL",
      "HEALTH_RULE_UPGRADED"
    ],
    "healthRuleScope": {
      "healthRuleScopeType": "ALL_HEALTH_RULES"
    }
  },
  "otherEvents": [
    "CLR_CRASH",
    "DEADLOCK"
  ],
  "anomalyEvents": [
    "ANOMALY_OPEN_WARNING",
    "ANOMALY_CLOSE_CRITICAL"
  ],
  "customEvents": [
    {
      "eventName": "string",
      "propertyMatchCriteria": "ANY",
      "keyValuePairArray": [
        {
          "key": "key1",
          "value": "value1"
        }
      ]
    }
  ]
},
"selectedEntities": {
  "selectedEntityType": "ANY_ENTITY"
}
}

```

Delete an Email Digest

Deletes an email digest with the specified ID. See [Property Details](#)(see page 3573).

i Ensure that you provide a valid email digest ID.

Resource URL

DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}

Update one or more properties of an Email Digest

Updates the properties of an existing email digest with a specified JSON payload. See [Property Details](#)(see page 3573)

Resource URL

PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}/configuration

Request/Response Format

JSON

Example

[Request](#) [Response](#)

This example updates the properties of a specified email digest.

```
{
  "enabled": true,
  "emailDigestName": "test email digest",
  "frequency": 2
}
```

[Request](#) [Response](#)

This example returns the properties updated for a specified email digest.

```
{
  "id": 0,
  "name": "My new email digest",
  "enabled": true,
  "executeActionsInBatch": true,
  "frequency": 2,
  "actions": [
    {
      "actionName": "My action 1",
      "actionType": "SMS"
    }
  ]
}
```

```

],
"events": {
  "healthRuleEvents": {
    "healthRuleEventTypes": [
      "HEALTH_RULE_CONTINUES_CRITICAL",
      "HEALTH_RULE_UPGRADED"
    ],
    "healthRuleScope": {
      "healthRuleScopeType": "ALL_HEALTH_RULES"
    }
  },
  "otherEvents": [
    "CLR_CRASH",
    "DEADLOCK"
  ],
  "anomalyEvents": [
    "ANOMALY_OPEN_WARNING",
    "ANOMALY_CLOSE_CRITICAL"
  ],
  "customEvents": [
    {
      "eventName": "string",
      "propertyMatchCriteria": "ANY",
      "keyValuePairArray": [
        {
          "key": "key1",
          "value": "value1"
        }
      ]
    }
  ]
},
"selectedEntities": {
  "selectedEntityType": "ANY_ENTITY"
}
}

```

Property Details

Email Digest

Payload details of an email digest.

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.
name*	string Minimum length: 1	Name of the email digest.
enabled	boolean Default value: true	Sets the email digest to enabled/disabled state.
frequency	integer minimum: 1 maximum: 168	The frequency in hours at which emails are sent as a response to an event.

Property Name	Type	Description and Valid Values									
actions*	minItems: 1	<p>Action Describes the predefined, reusable, and automated response to an event to be taken when the event is triggered.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>actionName*</td> <td>string</td> <td>Name of the action defined for an email digest.</td> </tr> <tr> <td>actionType*</td> <td>string</td> <td> ActionTypeEnum Creates the following types of actions: SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA </td> </tr> </tbody> </table>	Property Name	Type	Description	actionName*	string	Name of the action defined for an email digest.	actionType*	string	ActionTypeEnum Creates the following types of actions: SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
Property Name	Type	Description									
actionName*	string	Name of the action defined for an email digest.									
actionType*	string	ActionTypeEnum Creates the following types of actions: SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA									

Property Name	Type	Description and Valid Values
events*		Events Describes the events that trigger the email digest.

Property Name	Type	Description and Valid Values

Download SWAGGER YAML file

Download the Swagger [email_digests_openapi.yml](#) file.

Action Suppression API

This page describes the Action Suppression API methods you can use to temporarily suspend the automatic trigger of actions and alerts by a policy in response to an event. This API is useful when performing maintenance activities or troubleshooting a component.

Note

Syntax validation of the JSON payload is done when creating action suppression.

Create a New Action Suppression

Creates a new action suppression with the specified JSON payload. See [Property Details](#)(see page 3648).

Resource URL

POST <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions

Request/Response Format

JSON

Example

[Request](#) [Response](#)

This example creates an action suppression that affects specific health rules within an application. See [Download Examples](#)(see page 3681).

```
{
  "id": 9,
  "name": "TestAS",
  "disableAgentReporting": false,
  "suppressionScheduleType": "ONE_TIME",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-08-19T11:43:00",
  "endTime": "2020-08-19T12:43:00",
  "recurringSchedule": null,
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

[Request](#) [Response](#)

```
{
  "id": 9,
  "name": "TestAS",
  "disableAgentReporting": false,
  "suppressionScheduleType": "ONE_TIME",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-08-19T11:43:00",
  "endTime": "2020-08-19T12:43:00",
  "recurringSchedule": null,
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

Retrieve a List of Action Suppressions Configured for a Given Application

Returns all the action suppressions that are configured for a given application. The required fields are action suppression IDs and names. Details such as `timezone`, `startTime`, `endTime` and `recurringSchedule` of configured action suppressions are returned. See [Property Details](#)(see page 3648).

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions

Response Format

JSON

Example Response

```
[
  {
    "id": 11,
    "name": "TestAS1",
    "timezone": "Asia/Kolkata",
    "startTime": "2020-08-19T12:06:00",
    "endTime": "2020-08-19T13:06:00"
  }
  {
    "id": 12,
    "name": "TestAS2",
    "timezone": "Asia/Kolkata",
    "startTime": "2020-08-19T12:27:00",
    "endTime": "2020-08-19T13:27:00"
  }
  {
    "id": 13,
    "name": "TestAS3",
    "timezone": "Asia/Kolkata",
    "startTime": "2020-08-19T12:08:00",
    "endTime": "2020-08-19T13:08:00"
  }
]
```

Retrieve the Details of an Action Suppression

Returns JSON representation of action suppression for the given action suppression ID. See [Property Details](#)(see page 3648).

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions/{action-suppression-id}

Response Format

JSON

Example Response

```
{
  "id": 9,
  "name": "TestAS",
  "disableAgentReporting": false,
  "suppressionScheduleType": "ONE_TIME",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-08-19T11:43:00",
  "endTime": "2020-08-19T12:43:00",
  "recurringSchedule": null,
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

Update an Action Suppression

Updates an existing action suppression with a specified JSON payload. See [Property Details](#)(see page 3648).

Resource URL

PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions/{action-suppression-id}

Request/Response Format

JSON

Example

[Request](#) Response

```
{
  "id": 9,
  "name": "TestAS1",
  "disableAgentReporting": false,

}
```

Delete an Action Suppression

Deletes an action suppression with the specified ID. See [Property Details](#)(see page 3648).

Resource URL

DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions/{action-suppression-id}

Retrieve the Details of an Action Suppression by Name

Returns JSON representation of action suppression for the given action suppression name. See [Property Details](#)(see page 3648).

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions/action-suppression-by-name/?name=<ActionSuppressionName>

i Replace <ActionSuppressionName> with a name you specified for the action suppression. For example, ACTION_SUP_15.

Response Format

JSON

Example Response

```

{
  "id": 9,
  "name": "TestAS1",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-08-19T12:05:00",
  "endTime": "2020-08-19T13:05:00",
  "recurringSchedule": null
}

```

Response Codes

Code	Description
200	Fetches successfully
201	Created successfully
204	Deleted successfully
400	Bad request
401	Unauthorized
403	Forbidden
404	Resource not found
409	Already exists

Property Details

Action Suppression

Payload details for action suppression.

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.
name*	string minLength: 1 maxLength: 100	The name of action suppression.

Property Name	Type	Description and Valid Values
disableAgentReporting	boolean default: false	If enabled, the agents defined in the scope do not report any metric data during the specified time frame.
<div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;"> <p>i You cannot define a recurring action suppression if you set <code>disableAgentReporting</code> to true.</p> </div>		
suppressionScheduleType	string default: ONE_TIME	The available scheduling options for action suppression. Enums ONE_TIME RECURRING
timezone	string	The timezone ID. The default time zone is the controller timezone.
startTime	string format: yyyy-MM-ddTHH:mm:ss	The time at which the action suppression is initiated. Specify <code>startTime</code> only if <code>suppressionScheduleType</code> is set to <code>ONE_TIME</code> . If you do not specify the <code>startTime</code> , action suppression starts from the current time. The expected format is yyyy-MM-ddTHH:mm:ss conforming to rfc3339 ¹⁹⁷³ .
endTime	string format: yyyy-MM-ddTHH:mm:ss	The time at which the ongoing action suppression ends. Specify <code>startTime</code> only if <code>suppressionScheduleType</code> is set to <code>ONE_TIME</code> . If not specified, action suppression ends at 60 minutes from the current time. The expected format is yyyy-MM-ddTHH:mm:ss conforming to rfc3339 ¹⁹⁷⁴ .

¹⁹⁷³ <https://tools.ietf.org/html/rfc3339>

¹⁹⁷⁴ <https://tools.ietf.org/html/rfc3339>

Property Name	Type	Description and Valid Values						
recurringSchedule	string	<p>The recurring schedule details to initiate an action suppression.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>scheduleFrequency*</td> <td>string</td> <td> <p>The frequency of invoking action suppression.</p> <p>Enums</p> <p>DAILY</p> <p>WEEKLY</p> <p>MONTHLY_SPECIFIC_DATE</p> <p>MONTHLY_SPECIFIC_DAY</p> </td> </tr> </tbody> </table>	Property Name	Type	Description	scheduleFrequency*	string	<p>The frequency of invoking action suppression.</p> <p>Enums</p> <p>DAILY</p> <p>WEEKLY</p> <p>MONTHLY_SPECIFIC_DATE</p> <p>MONTHLY_SPECIFIC_DAY</p>

Property Name	Type	Description						
healthRuleScopeType*	string	<p>The health rule types affected by action suppression.</p> <p>Enums</p> <p>SPECIFIC_HEALTH_RULES</p>						

Action Suppression Schedule Type

Use this property to schedule a one-time or recurring action suppression.

Property Name	Type	Description
ActionSuppressionScheduleType	string	Enums ONE_TIME RECURRING

Example for one-time action suppression

```
{
  "name": "Action Suppression With One Time Schedule",
  "disableAgentReporting": false,
  "suppressionScheduleType": "ONE_TIME",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-06-18T13:33:37",
  "endTime": "2021-06-30T16:48:37",
  "recurringSchedule": null,
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

Recurring Schedule Frequency Details

Use this property to define the frequency of invoking action suppression on a recurring basis.

Property Name	Type	Description
scheduleFrequency*	string	Describes how often action suppression is invoked. Enums DAILY WEEKLY MONTHLY_SPECIFIC_DATE MONTHLY_SPECIFIC_DAY

Property Name	Type	Description
Example for recurring action suppression scheduled on a daily basis		
<pre> { "name": "Action Suppression With Daily Schedule", "disableAgentReporting": false, "suppressionScheduleType": "RECURRING", "timezone": "Asia/Kolkata", "startTime": null, "endTime": null, "recurringSchedule": { "scheduleFrequency": "DAILY", "startTime": "01:00", "endTime": "01:22" }, "affects": { "affectedInfoType": "APPLICATION" }, "healthRuleScope": null } </pre>		

Daily Schedule - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a daily basis.

Property Name	Type	Description
scheduleFrequency*	string	Action suppression is invoked daily. Enum DAILY
startTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which the action suppression is initiated. The time in 24 hour format.
endTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which the ongoing action suppression ends. The time in 24 hour format.

Property Name	Type	Description
Example		
<pre> { "name": "Action Suppression With Daily Schedule", "disableAgentReporting": false, "suppressionScheduleType": "RECURRING", "timezone": "Asia/Kolkata", "startTime": null, "endTime": null, "recurringSchedule": { "scheduleFrequency": "DAILY", "startTime": "01:00", "endTime": "01:22" }, "affects": { "affectedInfoType": "APPLICATION" }, "healthRuleScope": null } </pre>		

Weekly Schedule - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a weekly basis.

Property Name	Type	Description
scheduleFrequency*	string	Action suppression is invoked on a specific day of the week. Enum WEEKLY

Property Name	Type	Description						
days*	string minItems: 1 maxItems: 7	The day(s) of the week to suppress actions. <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DayOfWeek</td> <td>string</td> <td>Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY</td> </tr> </tbody> </table>	Property Name	Type	Description	DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY
Property Name	Type	Description						
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY						
startTime*	Time string pattern: ^([01]\d 2[0-3]): ([0-5]\d)\$	The time at which the action suppression is initiated. The time in 24 hour format.						
endTime*	Time string pattern: ^([01]\d 2[0-3]): ([0-5]\d)\$	The time at which the ongoing action suppression ends. The time in 24 hour format.						

Property Name	Type	Description
Example		
<pre>{ "name": "Action Suppression With Weekly Schedule", "disableAgentReporting": false, "suppressionScheduleType": "RECURRING", "timezone": "Asia/Kolkata", "startTime": null, "endTime": null, "recurringSchedule": { "scheduleFrequency": "WEEKLY", "startTime": "06:00", "endTime": "18:00", "days": ["SUNDAY", "MONDAY"] }, "affects": { "affectedInfoType": "APPLICATION" }, "healthRuleScope": null }</pre>		

Monthly Schedule, Specific Date - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a monthly basis, on a specific date.

Property Name	Type	Description
scheduleFrequency*	string	Action suppression is invoked on a specific date every month. Enum MONTHLY_SPECIFIC_DATE
startDate*	string pattern: <code>^(0[1-9] [12][0-9] 3[01])\$ ^Last Day\$</code>	The start date of the month to suppress actions.
startTime*	Time string pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>	The time at which action suppression is initiated. The time in 24 hour format.

Property Name	Type	Description
endDate*	string pattern: ^(0[1-9] [12][0-9] 3[01])\$ ^Last Day\$	The end date of the month to suppress actions.
endTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which the ongoing action suppression ends. The time in 24 hour format.

Example

```
{
  "name": "Action Suppression With Monthly Specific Date Schedule",
  "disableAgentReporting": false,
  "suppressionScheduleType": "RECURRING",
  "timezone": "Asia/Kolkata",
  "startTime": null,
  "endTime": null,
  "recurringSchedule": {
    "scheduleFrequency": "MONTHLY_SPECIFIC_DATE",
    "startDate": "01",
    "startTime": "06:00",
    "endDate": "Last Day",
    "endTime": "18:00"
  },
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

Monthly Schedule, Specific Day - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a monthly basis, on a specific date.

Property Name	Type	Description
scheduleFrequency*	string	Action suppression is invoked on a specific day of the month. Enum MONTHLY_SPECIFIC_DAY

Property Name	Type	Description						
startTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which action suppression is initiated. The time in 24 hour format.						
endTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which the ongoing action suppression ends. The time in 24 hour format.						
days*	string	The day of the month to suppress actions. <table border="1" data-bbox="911 688 1495 1213"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DayOfWeek</td> <td>string</td> <td>Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY</td> </tr> </tbody> </table>	Property Name	Type	Description	DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY
Property Name	Type	Description						
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY						
occurrence*	string	Enums FIRST SECOND THIRD FOURTH LAST						

Property Name	Type	Description
---------------	------	-------------

Example

```

{
  "name": "Action Suppression With Monthly Specific Day Schedule",
  "disableAgentReporting": false,
  "suppressionScheduleType": "RECURRING",
  "timezone": "Asia/Kolkata",
  "startTime": null,
  "endTime": null,
  "recurringSchedule": {
    "scheduleFrequency": "MONTHLY_SPECIFIC_DAY",
    "startTime": "06:00",
    "endTime": "18:00",
    "day": "SUNDAY",
    "occurrence": "FIRST"
  },
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}

```

Schedule Frequency Details

Use this property to define the frequency of invoking an action suppression.

Property Name	Type	Description
scheduleFrequency*	string	Enums DAILY WEEKLY MONTHLY_SPECIFIC_DATE MONTHLY_SPECIFIC_DAY

Property Name	Type	Description
Example		
<pre>{ "recurringSchedule":{ "scheduleFrequency":"WEEKLY", "startTime":"06:00", "endTime":"18:00", "days":["SUNDAY", "MONDAY"] } }</pre>		

Occurrence Details

The occurrence of the day of the month to suppress actions.

Property Name	Type	Description
occurrence	string	Enums FIRST SECOND THIRD FOURTH LAST
Example		
<pre>{ "recurringSchedule":{ "scheduleFrequency":"MONTHLY_SPECIFIC_DAY", "startTime":"06:00", "endTime":"18:00", "day":"SUNDAY", "occurrence":"FIRST" } }</pre>		

Monthly Action Suppression - Day

The day of the month to suppress actions.

Property Name	Type	Description
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY

Example

```
{
  "recurringSchedule":{
    "scheduleFrequency":"MONTHLY_SPECIFIC_DAY",
    "startTime":"06:00",
    "endTime":"18:00",
    "day":"SUNDAY",
    "occurrence":"FIRST"
  }
}
```

Action Suppression Time Details

Use this property to define the time details to suppress an action.

Property Name	Type	Description
Time	string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time in 24 hour format.

Example

```
{
  "recurringSchedule": {
    "scheduleFrequency": "MONTHLY_SPECIFIC_DATE",
    "startDate": "01",
    "startTime": "06:00",
    "endDate": "Last Day",
    "endTime": "18:00"
  }
}
```

Timezone

Property Name	Type	Description
Timezone	string	Timezone Id. The default time zone is the controller timezone.

Example

```
{
  "name": "Action Suppression With One Time Schedule",
  "disableAgentReporting": false,
  "suppressionScheduleType": "ONE_TIME",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-06-18T13:33:37",
  "endTime": "2021-06-30T16:48:37",
  "recurringSchedule": null,
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

Entities Affected by Action Suppression

Information pertaining to entities affected by action suppression.

Property Name	Type	Description and Valid Values
affectedInfoType*	string	Enums APPLICATION BUSINESS_TRANSACTIONS TIERS_NODES SERVERS DATABASES

Property Name	Type	Description and Valid Values
---------------	------	------------------------------

Example

```

{
    "affectedInfoType": "TIERS_NODES",
    "affectedEntities": {
        "tierNodeType": "NODE",
        "nodeType": "ALL_NODES",
        "affectedNodes": {
            "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
            "specificTiers": ["Tier1"]
        }
    }
}

```

Application-level Entities Affected by Action Suppression

Use to suppress actions for entities at the application-level.

Property Name	Type	Description and Valid Values
affectedInfoType*	string	Enum APPLICATION

Example

```

{
    "affectedInfoType": "APPLICATION"
}

```

Business Transactions Affected by Action Suppression

Use this to suppress actions for entities at the business transaction (BT) level.

Property Name	Type	Description and Valid Values
affectedInfoType*	string	Enum BUSINESS_TRANSACTIONS

Property Name	Type	Description and Valid Values						
affectedBusinessTransactions*		<p>The scope of the business transactions affected by action suppression.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>businessTransactionScope*</td> <td>string</td> <td> <p>Enums</p> <p>ALL_BUSINESS_TRANSACTIONS</p> <p>SPECIFIC_BUSINESS_TRANSACTIONS</p> <p>BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS</p> <p>BUSINESS_TRANSACTIONS_MATCHING_PATTERN</p> </td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	businessTransactionScope*	string	<p>Enums</p> <p>ALL_BUSINESS_TRANSACTIONS</p> <p>SPECIFIC_BUSINESS_TRANSACTIONS</p> <p>BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS</p> <p>BUSINESS_TRANSACTIONS_MATCHING_PATTERN</p>
Property Name	Type	Description and Valid Values						
businessTransactionScope*	string	<p>Enums</p> <p>ALL_BUSINESS_TRANSACTIONS</p> <p>SPECIFIC_BUSINESS_TRANSACTIONS</p> <p>BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS</p> <p>BUSINESS_TRANSACTIONS_MATCHING_PATTERN</p>						

Example

```

{
  "affectedInfoType":"BUSINESS_TRANSACTIONS",
  "affectedBusinessTransactions":{
    "businessTransactionScope":"BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS",
    "specificTiers":["DefaultTier1"]
  }
}

```

Scope of Business Transactions Affected

Use this to suppress actions for entities at the BT level for the selected BT types.

Property Name	Type	Description and Valid Values
businessTransactionScope*	string	<p>Enums</p> <p>ALL_BUSINESS_TRANSACTIONS</p> <p>SPECIFIC_BUSINESS_TRANSACTIONS</p> <p>BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS</p> <p>BUSINESS_TRANSACTIONS_MATCHING_PATTERN</p>

All Types of Business Transactions

Use this to suppress actions for entities at the BT level for all BTs.

Property Name	Type	Description and Valid Values
businessTransactionScope*	string	Enum ALL_BUSINESS_TRANSACTIONS
<p>Example</p> <pre> { "affectedInfoType": "BUSINESS_TRANSACTIONS", "affectedBusinessTransactions": { "businessTransactionScope": "ALL_BUSINESS_TRANSACTIONS" } } </pre>		

Specific Business Transactions

Use this to suppress actions for entities at the BT level for the specific BTs only.

Property Name	Type	Description and Valid Values
businessTransactionScope*	string	Enum SPECIFIC_BUSINESS_TRANSACTIONS
businessTransactions*	array of strings minItems: 1	Specific business transactions affected by action suppression. For example: [CheckoutBt, LoginBt]
<p>Example</p> <pre> { "affectedInfoType": "BUSINESS_TRANSACTIONS", "affectedBusinessTransactions": { "businessTransactionScope": "SPECIFIC_BUSINESS_TRANSACTIONS", "businessTransactions": ["/BT/", "/BT/rest"] } } </pre>		

Business Transactions Associated with Specific Tiers

Use this to suppress actions for entities at the BT level for BTs within specific tiers only.

Property Name	Type	Description and Valid Values
businessTransactionScope*	string	Enum BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS
specificTiers*	array of strings minItems: 1	Business transactions associated with specific tiers affected by action suppression. For example: [CheckoutTier, LoginTier]

Example

```

{
  "affectedInfoType":"BUSINESS_TRANSACTIONS",
  "affectedBusinessTransactions":{
    "businessTransactionScope":"BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS",
    "specificTiers":["DefaultTier1"]
  }
}

```

Business Transactions Matching a Pattern

Use this to suppress actions for entities at the BT level for BTs with properties that match a given pattern.

Property Name	Type	Description and Valid Values
businessTransactionScope*	string	Enums BUSINESS_TRANSACTIONS_MATCHING_PATTERN

Property Name	Type	Description and Valid Values												
patternMatcher*		EntityMatchingPattern <table border="1" data-bbox="896 367 1495 1155"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>matchTo*</td> <td>string</td> <td>Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX</td> </tr> <tr> <td>matchValue*</td> <td>string minLength: 1</td> <td>The pattern match value.</td> </tr> <tr> <td>shouldNot</td> <td>boolean default: false</td> <td>Select this to reverse the pattern match condition.</td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	matchTo*	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX	matchValue*	string minLength: 1	The pattern match value.	shouldNot	boolean default: false	Select this to reverse the pattern match condition.
Property Name	Type	Description and Valid Values												
matchTo*	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX												
matchValue*	string minLength: 1	The pattern match value.												
shouldNot	boolean default: false	Select this to reverse the pattern match condition.												

Example

```

{
  "affectedInfoType": "BUSINESS_TRANSACTIONS",
  "affectedBusinessTransactions": {
    "businessTransactionScope": "BUSINESS_TRANSACTIONS_MATCHING_PATTERN",
    "patternMatcher": {
      "matchTo": "STARTS_WITH",
      "matchValue": "E",
      "shouldNot": false
    }
  }
}

```

Tiers/Nodes Entities Affected

Use this to suppress actions for entities at the Tier/Node level.

Property Name	Type	Description and Valid Values						
affectedInfoType*	string	Enum TIERS_NODES						
affectedEntities*		TierNodeEntities <table border="1" data-bbox="623 541 1495 810"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>tierNodeType*</td> <td>string</td> <td>Enums TIER NODE</td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	tierNodeType*	string	Enums TIER NODE
Property Name	Type	Description and Valid Values						
tierNodeType*	string	Enums TIER NODE						

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "NODE",
    "nodeType": "ALL_NODES",
    "affectedNodes": {
      "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
      "specificTiers": ["Tier1"]
    }
  }
}

```

Tier or Node Entities Affected

Use this to suppress actions for entities at the tier level or node level.

Property Name	Type	Description and Valid Values
tierNodeType*	string	Enums TIER NODE

Tier-level Entities Affected

Property Name	Type	Description and Valid Values						
tierNodeType*	string	Enum TIER						
affectedTiers*		AffectedTiers <table border="1" data-bbox="909 535 1494 840"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>affectedTierScope*</td> <td>string</td> <td>Enums ALL_TIERS SPECIFIC_TIERS</td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	affectedTierScope*	string	Enums ALL_TIERS SPECIFIC_TIERS
Property Name	Type	Description and Valid Values						
affectedTierScope*	string	Enums ALL_TIERS SPECIFIC_TIERS						

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "TIER",
    "affectedTiers": {
      "affectedTierScope": "SPECIFIC_TIERS",
      "tiers": ["ECommerce-Services", "Inventory-Services"]
    }
  }
}

```

Node-level Entities Affected

Property Name	Type	Description and Valid Values
tierNodeType*	string	Enum NODE
nodeType*	string	Enums ALL_NODES JAVA_NODES DOT_NET_NODES PHP_NODES

Property Name	Type	Description and Valid Values						
affectedNodes*		AffectedNodes <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>affectedNodeScope*</td> <td>string</td> <td> Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER </td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	affectedNodeScope*	string	Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER
Property Name	Type	Description and Valid Values						
affectedNodeScope*	string	Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER						

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "NODE",
    "nodeType": "ALL_NODES",
    "affectedNodes": {
      "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
      "specificTiers": ["Tier1"]
    }
  }
}

```

Affected Tier Scope

Property Name	Type	Description and Valid Values
affectedTierScope*	string	Enums ALL_TIERS SPECIFIC_TIERS

All Tiers

Use this to suppress actions for entities at the tier level for all tiers.

Property Name	Type	Description and Valid Values
affectedTierScope*	string	Enum ALL_TIERS

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "TIER",
    "affectedTiers": {
      "affectedTierScope": "ALL_TIERS"
    }
  }
}

```

Specific Tiers

Use this to suppress actions for entities at the tier level for specific tiers only.

Property Name	Type	Description and Valid Values
affectedTierScope*	string	Enum SPECIFIC_TIERS
tiers*	array of strings minItems: 1	

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "TIER",
    "affectedTiers": {
      "affectedTierScope": "SPECIFIC_TIERS",
      "tiers": ["ECommerce-Services", "Inventory-Services"]
    }
  }
}

```

Affected Nodes

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER

Example

```
{
  "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
  "specificTiers": ["Tier1"]
}
```

All Nodes

Use this to suppress actions for entities at the node level for all nodes.

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enum ALL_NODES

Example

```
{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "NODE",
    "nodeType": "ALL_NODES",
    "affectedNodes": {
      "affectedNodeScope": "ALL_NODES"
    }
  }
}
```

Specific Nodes

Use this to suppress actions for entities at the node level for specific nodes only.

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enum SPECIFIC_NODES
nodes*	array of strings minItems: 1	A list of nodes considered as affected entities for action suppression. For example: [Node1, Node2]

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "NODE",
    "nodeType": "ALL_NODES",
    "affectedNodes": {
      "affectedNodeScope": "SPECIFIC_NODES",
      "nodes": ["Node1", "Node2"]
    }
  }
}

```

Nodes within Specific Tiers

Use this to suppress actions for entities at the node level for nodes within specific tiers only.

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enum NODES_OF_SPECIFIC_TIERS
specificTiers*	array of strings minItems: 1	

Property Name	Type	Description and Valid Values
Example		
<pre> { "affectedInfoType": "TIERS_NODES", "affectedEntities": { "tierNodeType": "NODE", "nodeType": "ALL_NODES", "affectedNodes": { "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS", "specificTiers": ["ECommerce-Services", "Inventory-Services"] } } } </pre>		

Nodes that Match a Pattern

Use this to suppress actions for entities at the node level for nodes with properties that match a pattern.

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enum NODES_MATCHING_PATTERN

Property Name	Type	Description and Valid Values												
patternMatcher*		EntityMatchingPattern <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>matchTo*</td> <td>string</td> <td>Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX</td> </tr> <tr> <td>matchValue*</td> <td>string minLength: 1</td> <td>The pattern match value.</td> </tr> <tr> <td>shouldNot</td> <td>boolean default: false</td> <td>Select this if you want to reverse the pattern match condition.</td> </tr> </tbody> </table>	Property Name	Type	Description	matchTo*	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX	matchValue*	string minLength: 1	The pattern match value.	shouldNot	boolean default: false	Select this if you want to reverse the pattern match condition.
Property Name	Type	Description												
matchTo*	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX												
matchValue*	string minLength: 1	The pattern match value.												
shouldNot	boolean default: false	Select this if you want to reverse the pattern match condition.												

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "NODE",
    "nodeType": "ALL_NODES",
    "affectedNodes": {
      "affectedNodeScope": "NODES_MATCHING_PATTERN",
      "patternMatcher": {
        "matchTo": "STARTS_WITH",
        "matchValue": "A",
        "shouldNot": false
      }
    }
  }
}

```

Node Property Variable Matcher

Use this to suppress actions for entities at the node level for nodes that match specified environment variables.

Property Name	Type	Description and Valid Values												
affectedNodeScope*	string	Enum NODE_PROPERTY_VARIABLE_MATCHER												
propVarPairs*		<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>propertyType*</td> <td>string</td> <td>Enums META ENV JVM</td> </tr> <tr> <td>name*</td> <td>string minLength: 1</td> <td></td> </tr> <tr> <td>value*</td> <td>string minLength: 1</td> <td></td> </tr> </tbody> </table>	Property Name	Type	Description	propertyType*	string	Enums META ENV JVM	name*	string minLength: 1		value*	string minLength: 1	
Property Name	Type	Description												
propertyType*	string	Enums META ENV JVM												
name*	string minLength: 1													
value*	string minLength: 1													

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "NODE",
    "nodeType": "ALL_NODES",
    "affectedNodes": {
      "affectedNodeScope": "NODE_PROPERTY_VARIABLE_MATCHER",
      "propVarPairs": [{
        "propertyType": "ENV",
        "name": "CLASSPATH",
        "value": "C:\\Users\\Java\\Classes"
      }]
    }
  }
}

```

Servers Affected

Use this to suppress actions for entities at the server level.

Property Name	Type	Description and Valid Values						
affectedInfoType*	string	Enum SERVERS						
affectedServers*		ApplicationAffectedServers <table border="1" data-bbox="623 541 1495 751"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>serversScope*</td> <td>string</td> <td>Enum SPECIFIC_SERVERS_IN_APPLICATION</td> </tr> </tbody> </table>	Property Name	Type	Description	serversScope*	string	Enum SPECIFIC_SERVERS_IN_APPLICATION
Property Name	Type	Description						
serversScope*	string	Enum SPECIFIC_SERVERS_IN_APPLICATION						
Example <pre data-bbox="126 890 1495 1171"> { "affectedInfoType": "SERVERS", "affectedServers": { "serversScope": "SPECIFIC_SERVERS_IN_APPLICATION", "specificServers": ["DropWizardTestApplicationDropWizardDefaultNode1"] } }</pre>								

Specific Servers within an Application

Use this property to suppress actions for entities at the server level for specific servers within an application.

Property Name	Type	Description
serversScope*	string	Enum SPECIFIC_SERVERS_IN_APPLICATION
specificServers*	array of strings minItems: 1 MinLength: 1	A list of servers considered as affected entities for action suppression. For example: [server1, server2]

Property Name	Type	Description
Example		
<pre>{ "affectedInfoType":"SERVERS", "affectedServers":{ "serversScope":"SPECIFIC_SERVERS_IN_APPLICATION", "specificServers":["DropWizardTestApplicationDropWizardDefaultNode1"] } }</pre>		

Databases Affected

Use this property to suppress actions for entities at the database level.

Property Name	Type	Description and Valid Values												
affectedInfoType*	string	Enum DATABASES												
affectedDatabases*		AffectedDatabases <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>databaseScope*</td> <td>string</td> <td> <table border="1" style="margin-top: 5px;"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums ALL_DATABASES SPECIFIC_DATABASES</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Property Name	Type	Description	databaseScope*	string	<table border="1" style="margin-top: 5px;"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums ALL_DATABASES SPECIFIC_DATABASES</td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES
Property Name	Type	Description												
databaseScope*	string	<table border="1" style="margin-top: 5px;"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums ALL_DATABASES SPECIFIC_DATABASES</td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES						
Property Name	Type	Description												
AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES												

Property Name	Type	Description and Valid Values
Example		
<pre>{ "affects":{ "affectedInfoType":"DATABASES", "affectedDatabases":{ "databaseScope":"ALL_DATABASES" } } }</pre>		

Scope of Affected Databases

Use this property to define the scope of action suppression at the database level.

Property Name	Type	Description						
databaseScope*	string	<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums ALL_DATABASES SPECIFIC_DATABASES</td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES
Property Name	Type	Description						
AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES						

Scope of Affected Databases—All Databases

Use this property to suppress actions for entities of all the databases.

Property Name	Type	Description						
databaseScope*	string	<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums ALL_DATABASES</td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	Enums ALL_DATABASES
Property Name	Type	Description						
AffectedDatabaseType	string	Enums ALL_DATABASES						

Scope of Affected Databases—Specific Databases

Use this property to suppress actions for entities of specific databases.

Property Name	Type	Description		
databaseScope*	string	Property Name	Type	Descripti on
		AffectedDa tatabaseType	string	Enums SPECIFIC_D ATABASES
databases*	array of strings minItems: 1	DbServer		
		Property Name	Type	
		serverName*	string	minLength: 1
		collectorConfig Name*	string	minLength: 1

Example

```

{
  "affects":{
    "affectedInfoType":"DATABASES",
    "affectedDatabases":{
      "databaseScope":"SPECIFIC_DATABASES",
      "databases":[
        {
          "serverName":"MongoNewKC",
          "collectorConfigName":"MongoNewKC"
        },
        {
          "serverName":"Collector41",
          "collectorConfigName":"Collector41"
        }
      ]
    }
  }
}

```

Database Server Details

Use this property to define database server details.

Property Name	Type
serverName*	string minLength: 1
collectorConfigName*	string minLength: 1

Affected Database Types

Use this property to define the scope of affected databases.

Property Name	Type	Description
AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES

Health Rule Scope

Use this to suppress actions triggered as a response to health rule violation events.

Property Name	Type	Description
healthRuleScopeType*	string	HealthRuleScopeType Enum SPECIFIC_HEALTH_RULES

Example

```
{
  "healthRuleScopeType": "SPECIFIC_HEALTH_RULES",
  "healthRules": ["CPU utilization is too high", "JVM Garbage Collection Time is too high"]
}
```

Health Rule Scope Type

Property Name	Type	Description
healthRuleScope*	string	Enum SPECIFIC_HEALTH_RULES

Specific Health Rules

Property Name	Type	Description
healthRuleScopeType*	string	HealthRuleScopeType Enum SPECIFIC_HEALTH_RULES
healthRules*	array of strings minItems: 1	

Example

```

{
  "healthRuleScopeType": "SPECIFIC_HEALTH_RULES",
  "healthRules": ["CPU utilization is too high", "JVM Garbage Collection Time is too high"]
}

```

Action Suppression Summary

Property Name	Type
id*	integer
name*	string minLength: 1

Error Response

Property Name	Type
statusCode	integer
message	string

*This property is required.

Events and Action Suppression API

This page describes the Events and Suppression API methods you can use to create, manage, and monitor events and action suppression.

Retrieve All Health Rule Violations in a Business Application

Returns all [health rule](#)(see page 283) violations that have occurred in an application within a specified time frame.

URI

/controller/rest/applications/application_id/problems/healthrule-violations

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	Provide either the application name or application id.	Yes
time-range-type	Query	Possible values are: BEFORE_NOW To use the "BEFORE_NOW" option, you must also specify the "duration-in-mins" parameter. BEFORE_TIME To use the "BEFORE_TIME" option, you must also specify the "duration-in-mins" and "end-time" parameters. AFTER_TIME To use the "AFTER_TIME" option, you must also specify the "duration-in-mins" and "start-time" parameters. BETWEEN_TIMES To use this option, you must also specify the "start-time" and "end-time" parameters. The "BETWEEN_TIMES" range includes the start-time and excludes the end-time.	Yes
duration-in-mins	Query	Duration (in minutes) to return the metric data.	If time-range-type is BEFORE_NOW, BEFORE_TIME, or AFTER_TIME
start-time	Query	Start time (in milliseconds) from which the metric data is returned.	If time-range-type is AFTER_TIME or BETWEEN_TIMES

Parameter Name	Parameter Type	Value	Mandatory
end-time	Query	End time (in milliseconds) until which the metric data is returned.	If time-range-type is BEFORE_TIME or BETWEEN_TIMES
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

</policy-violations>

```

Retrieve Event Data

You can capture data for the event types listed in the eventtypes parameter.

URI

/controller/rest/applications/application_id/events

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	Provides either the application name or application id.	Yes

Parameter Name	Parameter Type	Value	Mandatory
summary	Query	Provides the summary for the event.	Yes
comment	Query	Provides the comments (if any) for the event.	No
eventtype	Query	APPLICATION_DEVELOPMENT	Yes
time-range-type	Query	<p>Possible values are:</p> <p>BEFORE_NOW To use the "BEFORE_NOW" option, you must also specify the "duration-in-mins" parameter.</p> <p>BEFORE_TIME To use the "BEFORE_TIME" option, you must also specify the "duration-in-mins" and "end-time" parameters.</p> <p>AFTER_TIME To use the "AFTER_TIME" option, you must also specify the "duration-in-mins" and "start-time" parameters.</p> <p>BETWEEN_TIMES To use this option, you must also specify the "start-time" and "end-time" parameters. The "BETWEEN_TIMES" range includes the start-time and excludes the end-time.</p>	Yes
duration-in-mins	Query	Specify the duration (in minutes) to return the metric data.	If time-range-type is BEFORE_NOW, BEFORE_TIME, or AFTER_TIME
start-time	Query	Specify the start time (in milliseconds) from which the metric data is returned.	If time-range-type is AFTER_TIME or BETWEEN_TIMES
end-time	Query	Specify the end time (in milliseconds) until which the metric data is returned.	If time-range-type is BEFORE_TIME or BETWEEN_TIMES

Parameter Name	Parameter Type	Value	Mandatory
event-types	Query	Specify the comma-separated list of event types for which you want to retrieve event information. See Events Reference (see page 236).	Yes
severity	Query	Provides the severity level. Specify the comma-separated list of severities for which you want to retrieve event information. Allowed values are: <ul style="list-style-type: none"> • INFO • WARN • ERROR In the UI these values become Info, Warning, and Critical.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No
tier	Query	Name of the tier in the application	No

 This API can retrieve 600 events at a time.

Example

Retrieve the list of events of type APPLICATION_ERROR or DIAGNOSTIC_SESSION of any severity that occurred in the specified time range:

```
curl --user user1@customer1:your_password http://demo.appdynamics.com//controller/rest/applications/6/events?time-range-type=BEFORE_NOW\&duration-in-mins=30\&event-types=%20APPLICATION_ERROR,DIAGNOSTIC_SESSION\&severities=INFO,WARN,ERROR

<events><event>
  <id>44658</id>
  <type>DIAGNOSTIC_SESSION</type>
  <subType>ERROR_DIAGNOSTIC_SESSION</subType>
  <eventTime>1451343453085</eventTime>
```

```

<severity>WARN</severity>
<summary>Starting Diagnostic Session after series of errors
for a Business Transaction 18% (2/11) of requests had errors in
the last minute starting 12/28/15 10:57 PM local time</summary>
<affectedEntities>

```

```
</event>
</events>
```

Create Events

Application deployment events notify AppDynamics when you upgrade your application, push new code, etc. This lets you correlate these application deployment activities with other data inside AppDynamics. This is useful for regression analysis, root cause analysis, and performance studies. It is beneficial to inject your application deployment event into AppDynamics as part of the build process for deploying a new version of your application.

The AppDynamics REST API lets you integrate events of type APPLICATION_DEPLOYMENT with other systems.

For example, to create an event automatically in your AppDynamics monitored system for every new release you would integrate these systems and use the following REST API to create an event of type "APPLICATION_DEPLOYMENT" in your managed environment.

You should receive the event ID after the successful invocation of the request.

Roles and Permissions

Creating events requires the **Create Events** permission. See [Application Permissions](#)(see page 161).

URI

POST /controller/rest/applications/application_id/events

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	Provide either application name or application id.	Yes
summary	Query	Provide a summary describing the event.	Yes
comment	Query	Provide the comments (if any) for the event.	No
eventtype	Query	APPLICATION_DEPLOYMENT	Yes

Parameter Name	Parameter Type	Value	Mandatory
severity	Query	Provide a severity level. Allowed values include: <ul style="list-style-type: none"> "INFO" "WARN" "ERROR" In the UI, these become "Info", "Warning", and "Critical"	Yes

Create a Custom Event

You can create custom events to be reported in the AppDynamics event viewer and in the event panels on the AppDynamics dashboards. See [Monitor Events](#)(see page 231) to learn how to filter on your custom events. Then you can create alerts triggered by these events as you do for AppDynamics standard events.

You should receive the event ID after the successful invocation of the request.

Roles and Permissions

 Creating a custom event requires the **Create Events** permission. See [Application Permissions](#)(see page 161).

URI

POST /controller/rest/applications/application_id/events

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	Provide either application name or application id.	Yes
summary	Query	Provide a summary describing the event.	Yes
comment	Query	Provide a comment for the event.	No

Parameter Name	Parameter Type	Value	Mandatory
severity	Query	Provide a severity level. Allowed values include: <ul style="list-style-type: none"> "INFO" "WARN" "ERROR" In the UI, these become "Info", "Warning", and "Critical"	Yes
eventtype	Query	CUSTOM	Yes
customeventtype	Query	Provide a name for the "type". For example, the source could be "nagios".	No
node	Query	Provide the affected node name.	No
tier	Query	Provide the affected tier name.	Yes, if node and bt are specified
bt	Query	Provide the affected business transaction name.	No
propertynames	Query	Provide a property name as a pair, i.e., the "key".	No, but if one element of the pair is defined, the other must be defined also
propertyvalues	Query	Provide the property value as a pair, i.e., the "value".	No, but if one element of the pair is defined, the other must be defined also

Example

```
curl -X POST --user user1@customer1:your_password 'http://demo.appdynamics.com/controller/rest/applications/5/events?severity=INFO&summary=test1&eventtype=CUSTOM&customeventtype=mycustomevent&propertynames=key1&propertynames=key2&propertyvalues=value1&propertyvalues=value'
```

 Notice the pattern for custom properties: `propertynames` and `propertyvalues` get matched up by order position, so to set N property values, you need N occurrences of `propertynames` and N occurrences of `propertyvalues`.

Create Custom URLs for Notifications

Single tenants in a multi-tenant Controller instance should use this API method to specify a custom or vanity URL for notification purposes. Instead of a URL such as `paid8.appdynamics.com` being displayed as the host, the custom URL can be displayed as `yourcompany.appdynamics.com` in the notification.

URI

POST `/controller/rest/accounts/customer_name/update-controller-url`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>customer_name</code>	URI	The customer account name	Yes

Body Parameter

As Application/JSON content:

```
{
  "controllerURL": "http://<my-custom-hostname:port>"
}
```

 If the URL in the alerts is invalid, you can set it using the following curl command:

```
curl -k --basic --user root@system --header
"Content-Type: application/json" --data
'{"controllerURL": "http://
<controller>:<port>" }' http://
<controller>:<port>/controller/rest/
accounts/<ACCOUNT-NAME>/update-controller-
url
```

```
curl -k --basic --user root@system --header
"Content-Type: application/json" --data
'{"controllerURL": "http://
<controller>:<port>" }' http://
<controller>:<port>/controller/rest/
```

```
accounts/<ACCOUNT-NAME>/update-controller-
url
```

For example:

```
curl -k --basic --user root@system --header
"Content-Type: application/json" --data
'{"controllerURL": "https://myVIP:443" }'
https://myhost:8181/controller/rest/
accounts/customer1/update-controller-url
```

There is no need to reset the Controller as upgrading it will reset the deep link URL settings.

Create and Delete Action Suppressions

By default any response is in JSON, although XML can be requested by using the following header:

Name : Accept
Value : application/vnd.appd.cntrl+xml;v=1

Retrieve All Existing Action Suppressions

Use this to retrieve a list of all existing action suppressions.

URI

GET /controller/api/accounts/account_id/applications/application_id/actionsuppressions

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
account_id	URI	The account ID	Yes
application_id	URI	The application ID	Yes

Example request to get all action suppressions:

```
/controller/api/accounts/2/applications/9/actionsuppressions
```

Example response:

```
Status : 200 ok
Output Data :
{"actionSuppressions": [{"id": "15", "name": "App-
ASw", "timeRange": {"startTimeMillis":
```

```
"2014-10-25T04:16:30+0000", "endTimeMillis":
"2014-10-25T06:16:30+0000"}, "affects": {"type": "APP"}}, {"id":
"16", "name": "Node-ASW", "timeRange": {"startTimeMillis":
"2014-10-25T04:16:57+0000", "endTimeMillis":
"2014-10-25T05:16:57+0000"}, "healthRuleIds": [60, 61], "affects":
{"type": "NODE", "nodeAffectedEntities": {"type":
"SPECIFIC", "nodeType": "ALL", "nodes": [17, 18]}}}], "actions":
[{"href": "http://demo.appdynamics.com:8090/controller/api/
accounts/2/applications/9/actions suppressions/
%7Bactions suppressions.id%7D/%7Bactions.name%7D", "method":
["POST", "DELETE"], "name": "enabled"}], "links": [{"href":
"http://ec2-54-80-163-175.compute-1.amazonaws.com:8090/
controller/api/accounts/2/applications/9/actions suppressions/
%7Bactions suppressions.id%7D", "name": "actions suppressions"}]}
```

Retrieve a Specific Action Suppression by ID

Use this to get an action suppression by the specified ID.

URI

/controller/api/accounts/account_id/applications/application_id/actions suppressions/
actions suppression_id

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
account_id	URI	The account id.	Yes
application_id	URI	The application id.	Yes
actions suppressions_id	URI	The action suppression id.	Yes

Example request:

```
/controller/api/accounts/2/applications/9/actions suppressions/15
```

Example response:

```
Status : 200 ok
Output Data :
{"id": "15", "name": "App-ASW", "timeRange": {"startTimeMillis":
```

```
"2014-10-25T04:16:30+0000", "endTimeMillis":
"2014-10-25T06:16:30+0000"}, "affects": {"type": "APP"}}
```

Create a New Action Suppression

This is a POST request that should return a 201 - created response.

URI

POST /controller/api/accounts/account_id/applications/application_id/actionsSuppressions

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
account_id	URI	The account ID.	Yes
application_id	URI	The application ID.	Yes
name	body key	The name of the action suppression window.	Yes
timeRange	body key	The start and end time of the window. Includes: startTimeMillis, eg 2014-10-25T04:16:57+0000 endTimeMillis, eg 2014-10-25T05:16:57+0000	Yes
healthRuleIds	body key	The ids of the affected health rules. If not provided, all rules affected	No

Parameter Name	Parameter Type	Value	Mandatory																				
affects	body key	<p>Type of entity and corresponding IDs:</p> <table border="1"> <thead> <tr> <th>Scope</th> <th>Type</th> <th>Value</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>Application</td> <td>APP</td> <td>Covers the entire application</td> <td>"affects": {"type": "APP"}</td> </tr> <tr> <td>Business Transaction</td> <td>BT</td> <td>Covers one or more Business Transactions</td> <td></td> </tr> <tr> <td></td> <td></td> <td>All Business Transactions</td> <td>"affects": {"type": "BT", "btAffectedEntities": {"type": "ALL"}}}</td> </tr> <tr> <td></td> <td></td> <td>Business Transactions from specific tiers</td> <td>"affects": {"type": "BT", "btAffectedEntities": {"type": "WITHIN_TIERS", "tiers": [11,12]}} where 11,12 are Tier Ids</td> </tr> </tbody> </table>	Scope	Type	Value	Example	Application	APP	Covers the entire application	"affects": {"type": "APP"}	Business Transaction	BT	Covers one or more Business Transactions				All Business Transactions	"affects": {"type": "BT", "btAffectedEntities": {"type": "ALL"}}}			Business Transactions from specific tiers	"affects": {"type": "BT", "btAffectedEntities": {"type": "WITHIN_TIERS", "tiers": [11,12]}} where 11,12 are Tier Ids	Yes
Scope	Type	Value	Example																				
Application	APP	Covers the entire application	"affects": {"type": "APP"}																				
Business Transaction	BT	Covers one or more Business Transactions																					
		All Business Transactions	"affects": {"type": "BT", "btAffectedEntities": {"type": "ALL"}}}																				
		Business Transactions from specific tiers	"affects": {"type": "BT", "btAffectedEntities": {"type": "WITHIN_TIERS", "tiers": [11,12]}} where 11,12 are Tier Ids																				

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
				Specific Business Transactions by id	<pre>"affects": {"type": "BT","btAffectedEntities": {"type": "SPECIFIC", "bts": [1,2]}} where 1,2 are BT Ids</pre>	
				Business Transactions that match criteria	<pre>"affects": {"type": "BT","btAffectedEntities": {"type": "CRITERIA", "matchesOperator": "CONTAINS", "matchesValue": "pojo"}} where " matchesOperator" can be: • CONTAINS • EQUALS • STARTS • ENDS • REGEX_VALUE</pre>	
		Tier	TIER	Covers one or more tiers		

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
				All tiers	"affects": { "type": "TIER", "tierAffectedEntities": { "type": "ALL"} }	
				Specific tiers	"affects": { "type": "TIER", "tierAffectedEntities": { "type": "SPECIFIC", "tiers": [11,12]} } where 11,12 are Tier Ids	
		Node	NO DE	Covers one or more nodes		
				All nodes	"affects": { "type": "NODE", "nodeAffectedEntities": { "type": "ALL", "nodeType": "ALL"} }	

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
				Nodes belonging to specific tiers	<pre>"affects": {"type": "NODE","nodeAffectedEntities": {"type": "WITHIN_TIERS","nodeType": "ALL","tiers": [11,12]}} where 11,12 are Tier Ids</pre>	
		Specific nodes	<pre>"affects": {"type": "NODE","nodeAffectedEntities": {"type": "SPECIFIC","nodeType": "ALL","nodes": [9,10]}} where 9,10 are Node Ids</pre>			

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
				Nodes that match criteria	<pre>"affects": {"type": "NODE","nodeAffectedEntities": {"type": "NAME_CRITERIA","nodeType": "ALL","nameMatchesOperator": "EQUALS","nameMatchesValue": "Node"}}} - String match "affects": {"type": "NODE","nodeAffectedEntities": {"type": "PROPERTY_CRITERIA","nodeType": "ALL","metaInfoProperties": [{"name": "ProcessID", "value": 12343}]}} - Meta Info Properties match where "matchesOperator" can be:</pre>	

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
					<ul style="list-style-type: none"> CONTAINS EQUALS STARTS ENDS REGEX_VALUE 	
		Machine	MACHINE	Covers one or more machines	"affects": {"type": "MACHINE", "machineAffectedEntities": {"type": "SPECITIC", "machines": [4,5]}} where 4,5 are Machine Ids You must spell the value as "SPECITIC" due to a typo in the underlying code.	

Example request

```
/controller/api/accounts/2/applications/9/actions suppressions
```

Header

- Name: Content-Type
- Value: application/vnd.appd.cntrl+json;v=1

Body

```

{"name": "App-ASW_2", "timeRange": {"startTimeMillis":
"2014-10-25T04:16:30+0000", "endTimeMillis":
"2014-10-25T06:16:30+0000"}, "affects": {"type": "APP"}}

```

or

```

{"name": "Node-ASW_1", "timeRange": {"startTimeMillis":
"2014-10-25T04:16:57+0000", "endTimeMillis":
"2014-10-25T05:16:57+0000"}, "healthRuleIds": [60,61], "affects":
{"type": "NODE", "nodeAffectedEntities": {"type":
"SPECIFIC", "nodeType": "ALL", "nodes": [17,18]}}}

```

Delete a Specific Action Suppression by ID

This is a DELETE request that should return a 204 - No Content message.

URI

DELETE /controller/api/accounts/account_id/applications/application_id/
actionsuppressions/actionsuppression_id

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
account_id	URI	The account ID	Yes
application_id	URI	The application ID	Yes
actionsuppression_id	URI	The ID of the action suppression to be deleted	Yes—The Alert and Respond APIs let you manage and monitor events, health rules, and other aspects of the AppDynamics alert and respond features.

Configuration API

This page describes the Configuration API methods you can use to read and modify selected Controller configuration settings programmatically. You can use it to script or automate tasks that must be performed frequently or in large batches, such as adding users.

i The Configuration Export and Import API provides the ability to perform select configuration changes as well as you can edit and import Controller configuration definition files.

Create and Modify AppDynamics Users

Use this API to create or modify user accounts in the Controller.

You pass the user configuration settings as query parameters to the API call. The format of the create and modify user calls are identical except for the `user-id` parameter, which is not passed for the create operation. The `user-id` is generated by the create operation.

Format

POST /controller/rest/users

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
user-name	Query	user name	Yes
user-id	Query	user id	No for a create; yes for an update
user-display-name	Query	display name	Yes
user-roles	Query	comma-separated list of roles	No
user-password	Query	user password	Yes for a create; optional for an update
user-email	Query	user email	Yes

Example

```
curl -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller/rest/users?user-name=user2\&user-display-name=User%20Two\&user-password=welcome\&user-email=user2\@example.com
```

Include or Exclude a Business Transaction from Monitoring

You can exclude or include business transactions for monitoring by passing the exclude parameter to the business-transactions retrieval API described in the [Application Model API](#)(see page 3292).

To exclude a business transaction, pass the XML-represented ID of the business transaction to be excluded with the `exclude` parameter set to `true`. To turn on monitoring for a currently excluded business transaction, set the `exclude` parameter to `false`.

Send the list of business transactions to be excluded or re-included as the XML-formatted POST payload. A sample business-transaction list is:

```
<business-transactions>
  <business-transaction>
    <id>15</id>
  </business-transaction>
  <business-transaction>
    <id>16</id>
  </business-transaction>
</business-transactions>
```

Ensure that the Content-Type header is set to `application/xml`.

Format

POST `/controller/rest/applications/application_id/business-transactions`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>application_id</code>	URI	Provide either the application name or application id.	Yes
<code>exclude</code>	Post	<code>true false</code>	Yes

Example

```
curl -X POST -H "Content-Type:text/xml" --user
user1@customer1:your_password http://demo.appdynamics.com/
controller/rest/applications/6/business-transactions\?
exclude=true -d @businesstransaction.xml
```

Retrieve All Controller Settings

The Controller global configuration values are made up of the Controller settings that are presented in the [Administration Console](#)¹⁹⁷⁵.

Format

GET /controller/rest/configuration

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

Example

```
curl --user admin@customer1:your_password http://
demo.appdynamics.com/controller/rest/configuration

<configuration-items><configuration-item>
  <name>eventsvc.request.segment.data.max.retrieval.size</name>
  <value>5000</value>
  <description>Max number of request segment data that can be
retrieved from event service in a query</description>
  <updateable>true</updateable>
  <scope>cluster</scope>
</configuration-item>
<configuration-item>
  <name>machine.agent.max.new.actions.per.min</name>
  <value>15</value>
  <description>Maximum number of new actions dispatched per
minute for each machine agent</description>

</configuration-items>

```

Retrieve a Controller Setting by Name

Use this API to get the value of a given Controller configuration setting.

Format

GET /configuration?name=controller_setting_name

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Query	Name of the Controller setting to retrieve	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

Example

```
curl --user admin@customer1:your_password http://
demo.appdynamics.com/controller/rest/configuration?
name=metrics\.min\.retention\.period

<configuration-items><configuration-item>
  <name>metrics.min.retention.period</name>
  <value>4</value>
  <description>Time (in hours) to retain minute metric data
values before they are purged from the system.</description>
  <updateable>true</updateable>
  <scope>cluster</scope>
</configuration-item>
</configuration-items>
```

Configure Global Controller Settings

Use this API to set a Controller setting to a specified value.

 You cannot use this REST API to modify Controller settings on SaaS.

Format

POST /controller/rest/configuration

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Query	Name of the Controller setting to get.	Yes
value	Query	Value to set.	Yes

Mark Nodes as Historical

Use this API to [mark nodes as historical](#)(see page 1133), which suspends certain types of processing activities for the node (i.e. rule evaluation). By default, AppDynamics marks as historical (soft deletes) a node that has lost contact with the Controller for the number of hours configured in the `node.retention.period` Controller setting. The default is 500 hours.

Pass one or more identifiers of the node to be marked as historical, up to a maximum of 25 nodes. Multiple IDs should be comma-separated.

Format

POST /controller/rest/mark-nodes-historical?application-component-node-ids=value

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application-component-node-ids	Query	Comma-separated list of node IDs	Yes

Example

```
curl -X POST --user admin@customer1:your_password http://
demo.appdynamics.com/controller/rest/mark-nodes-historical?
application-component-node-ids=44,45

<application-component-node-id>
<44/>
<45/>
</application-component-node-id>
```

Configuration Import and Export API

This page describes the AppDynamics API methods you can use to import and export various types of configuration settings in the Controller.

About the Configuration Import/Export APIs

The Configuration Import/Export APIs enable you to migrate configuration settings across Controller accounts, business applications, or Controller instances. You can also use it to add configuration artifacts like transaction detection rules, health rules, or custom dashboards to an existing configuration programmatically.

An exported configuration is an XML or JSON representation of the configuration artifact. After exporting the file, you can upload it to another account or application, optionally modifying the configuration.

Export Actions from an Application

Use this to export all actions in the specified application to a JSON file.

The user account you use to make the API call must have permission to view an action or action template in the application you are exporting from.

Format

GET /controller/actions/application_id

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actions/7

[
  {
    actionType: "EmailAction",
    name: "6DA8942B-DF4A-417A-E1NF-59F14231D670",
    priority: 1,
    description: null,
    toAddress: "user1@example.com",
    subject: "",
    timeZone: null
  },
  {
    actionType: "DiagnosticSessionAction",
    name: "MyDiagnostic",
```

```

    priority: 0,
    description: null,
    businessTransactionTemplates: [ ],
    numberOfSnapshotsPerMinute: 5,
    durationInMinutes: 10,
    adjudicate: false,
    adjudicatorEmail: null
  }
]

```

Import Actions into an Application

After you have exported actions, you can import them to a different application passing the JSON file created by the export operation as the payload to a POST request.

The user account you use to make the API call must have permission to create an action or action template in the account.

Actions in the import file that have conflicting names with actions in the existing configuration are not imported. The import for those actions fails, while new actions are imported successfully. This call takes data as multipart/form-data content. Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Format

POST /controller/actions/application_id

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes

Example

```

curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actions/38 -F
file=@ExportActions.json

{"success":true,"errors":[],"warnings":[]}

```

If there are actions in the file with the same name as ones in the configuration, those actions are not imported, and the response indicates the success of the request as false. For example:

```

{"success":false,"errors":["Not importing Action with name:
DuplicateExportedDiagnosticAction, since it already
exists."],"warnings":["Imported 1 out of 2 actions"]}

```

Export Email Action Templates from an Account

This API exports all the email action templates in the current account in JSON format.

Format

GET /controller/actiontemplate/email

Example

```

curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actiontemplate/email

[ {
  "actionPlanType" : "email",
  "name" : "MyCustomEmailTemplate",
  "oneEmailPerEvent" : true,
  "eventClampLimit" : 100,
  "defaultCustomProperties" : [ {
    "id" : 0,
    "version" : 0,
    "name" : "env",
    "value" : "%OS"
  } ],
  "allowCustomRecipients" : true,
  "toRecipients" : [ ],
  "ccRecipients" : [ ],
  "bccRecipients" : [ ],
  "headers" : [ ],
  "subject" : "We've got a situation...",
  "includeTextBody" : true,
  "textBody" : "<h1>Summary of events occurring during the $
{policy.digestDurationInMins}+ minute(s) prior to $
{action.triggerTime}:</h1> <table> #foreach(${eventList} in $
{fullEventsByTypeMap.values()}) #foreach(${event} in $
{eventList}) <tr> <td> <!-- Event icon --> 
</td> <td> <!-- Event name with event link --> <a href="$

```

```
{event.deepLink}">${event.displayName}</a> </td> <td> <!-- Event
message --> ${event.eventMessage} </td> </tr> #end #end </
table>""
  "includeHtmlBody" : true,
  "htmlBody" : "<p>Please look into it.</p>",
  "testLogLevel" : "DEBUG",
  "testPropertiesPairs" : [ ],
  "testToRecipients" : [ ],
  "testCcRecipients" : [ ],
  "testBccRecipients" : [ ],
  "eventTypeCountPairs" : [ ]
} ]
```

Import Email Action Templates

Use this to import email action templates to an account as a JSON file.

i The import will fail if you attempt to import a template with the same name as an existing template of the same type in the destination account.

Data for this call should be in the form of multipart/form-data. Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Format

POST /controller/actiontemplate/email

Example

```
curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actiontemplate/email -F
file=@emailactiontemplate.json

{"success":true,"errors":[],"warnings":[]}
```

Export HTTP Request Action Templates from an Account

This API exports all the HTTP request action templates in the current account to a JSON file.

Format

GET /controller/actiontemplate/httprequest/

Example:

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actiontemplate/httprequest
```

```
[ {
  "actionPlanType" : "httprequest",
  "name" : "MyCustomHTTPTemplate",
  "oneRequestPerEvent" : false,
  "eventClampLimit" : -1,
  "defaultCustomProperties" : [ ],
  "method" : "GET",
  "scheme" : "HTTP",
  "host" : "http",
  "port" : 0,
  "path" : "//demo.appdynamics.com//controller/rest/
applications/${latestEvent.application.name}/nodes/${
latestEvent.node.name}",
  "query" : "",
  "urlCharset" : "UTF_8",
  "authType" : "BASIC",
  "authUsername" : "user1",
  "authPassword" : "your_password",
  "headers" : [ ],
  "payloadTemplate" : {
    "httpRequestActionMediaType" : "text/plain",
    "charset" : "UTF_8",
    "formDataPairs" : [ ],
    "payload" : ""
  },
  "connectTimeoutInMillis" : 5000,
  "socketTimeoutInMillis" : 15000,
  "maxFollowRedirects" : 0,
  "responseMatchCriteriaAnyTemplate" : [ ],
  "responseMatchCriteriaNoneTemplate" : [ ],
  "testLogLevel" : "DEBUG",
  "testPropertiesPairs" : [ ],
  "eventTypeCountPairs" : [ ]
} ]
```

Import HTTP Action Templates into an Account

After you have exported HTTP request action templates, you can import them to a different account by logging into the destination account and passing the JSON file created by the export operation as the payload to the POST request.

You can modify the exported file before you import it. You might want to do this to remove one or more template configurations or to change their names.

i The import will fail if you attempt to import a template with the same name as an existing template of the same type in the destination account.

Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Format

GET /controller/actiontemplate/httprequest

Example

```
curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actiontemplate/httprequest -F
file=@httpactiontemplate.json

{"success":true,"errors":[],"warnings":[]}
```

Export Custom Dashboards and Templates

You can export and import custom dashboards and custom dashboard templates interactively from the Controller UI or by using this API call. See [Import and Export Custom Dashboards and Templates Using the UI](#)(see page 385).

 To export the dashboard, the user making the API call must have permission to view the custom dashboard.

In the export call, you must identify the dashboard to export by its ID. When you open the dashboard in the UI, the ID appears as the dashboard parameter at the end of the URL.

For example, in this URL snippet, the custom dashboard ID is

3: location=CDASHBOARD_DETAIL&mode=MODE_DASHBOARD&dashboard=3

Format

GET /controller/CustomDashboardImportExportServlet?dashboardId=dashboard_id

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
dashboardId	Query	The numeric ID of the custom dashboard.	Yes

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/
CustomDashboardImportExportServlet?dashboardId=8
```

```
{
  "schemaVersion" : null,
  "dashboardFormatVersion" : "3.0",
  "name" : "Analytics-BrowserData",
  ...
  "warRoom" : false,
  "template" : false
}
```

View a complete response example:

```
{
  "schemaVersion" : null,
  "dashboardFormatVersion" : "3.0",
  "name" : "Analytics-BrowserData",
  "description" : null,
  "properties" : null,
  "templateEntityType" : "APPLICATION_COMPONENT_NODE",
  "associatedEntityTemplates" : null,
  "minutesBeforeAnchorTime" : 15,

    "pollingInterval" : null,
    "unit" : null
  } ],
  "warRoom" : false,
  "template" : false
}0

```

Import Custom Dashboards and Templates

You can import custom dashboards and templates based on a previously exported JSON definition, which has optionally been modified. Import the definition as an `application/json` content type.

The user making the API call must have permission to create dashboards in the Controller.

Data for this call should be in the form of `multipart/form-data`. Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Prior to version 4.1, exported custom dashboards were in XML format. You can import custom dashboards previously exported as XML data into the current Controller; however, custom dashboards can only be exported as JSON data.

Format

POST `/controller/CustomDashboardImportExportServlet`

Example

```
curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/
CustomDashboardImportExportServlet -F
file=@customdashboards.json

{"success":true,"errors":[],"warnings":
[], "createdDashboardName":"Uploaded-Analytics-BrowserData"}
```

Export Health Rules from an Application

Returns all health rules in XML format.

The user account you use to make the API call must have permission to view the health rule.

Format

GET /controller/healthrules/application_id?name=health_rule_name

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes
name	Query	The name of the health rule to export. If not specified, exports all health rules.	No

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/healthrules/38?
name=MyCustomHealthRule

<health-rules controller-version="004-002-000-000">
  <health-rule>
    <name>MyCustomHealthRule</name>
    <type>BUSINESS_TRANSACTION</type>
```

```

      </metric-definition>
    </metric-expression>
  </policy-condition>
</warning-execution-criteria>
</health-rule>
</health-rules>

```

Import Health Rules into an Application

You can import health rules defined in an XML file into a business application.

Data for this call should be in the form of multipart/form-data. In the POST request, use UTF-8 URL encoding for the URI; for example, do not replace a space (" ") with "%20" in the URI.

By default, a health rule in the posted data with an identical name to one in the existing configuration does not overwrite the existing health rule. If you want to overwrite an existing health rule of the same name, use the overwrite parameter.

The syntax is the same for importing one health rule configuration or several. All the health rule configurations in the posted XML file are imported.

Format

POST /controller/healthrules/application_id?overwrite=true_or_false

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes
overwrite	Query	Set to true to have health rules in the posted data overwrite existing health rules with the same name. The default is false.	No

Example

```
curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/healthrules/38 -F
file=@uploadhealthrule.xml
```

```
Imported 1 health rules successfully.
```

If the health rule exists and you have not enabled the overwrite parameters, you will get the following response:

```
Not importing the health rule: healthrulename since it already
exists.
```

Export Transaction Detection Rules

Use this to get all transaction detection rules in XML format. This call returns different types of detection rule configurations when MDS is enabled.

You can get transaction detection rules from a number of different configurations, including the configuration for a specific scope by name.

The URI used by clients for this call should be UTF-8 encoded.

Format

```
GET /controller/transactiondetection/application_id/[scope_name]/rule_type/
[entry_point_type]/[rule_name] >> xml_name.xml
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID. It can be found in the URL in the address bar if you click the specified application. It is an Integer value. It will return an error if you do not specify.	Yes
scope_name	URI	The name of the scope from which you are exporting the entry point configuration. The scope name cannot be <code>custom</code> and <code>auto</code> . If the scope name contains a space, type <code>%20</code> instead of space. For example: <code>curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/10(see page 3707)/default%20scope/custom >> result.xml</code> It will export all the rules under all the scopes if you do not specify.	No
rule_type	URI	The type of rule to export, from these options: <ul style="list-style-type: none"> • auto: Automatic detection rules • custom: Custom detection rules in the configuration It will return an error if you do not specify.	Yes

Parameter Name	Parameter Type	Value	Mandatory
entry_point_type	URI	<p>The POJO, Servlet, EJB, Spring Bean, etc. It exports the rules which belong to all the entry point types if you do not specify.</p> <p>Complete List below (Case insensitive):</p> <ul style="list-style-type: none"> binaryRemoting servlet strutsAction springBean ejb pojo jms webService aspDotNet dotNetRemoting dotNetWebService wcf dotNetJms poco phpWeb phpMvc phpDrupal phpWordpress phpCli phpWebService nodeJsWeb native nativeSDKWeb nativeDynamicWeb nativeWebServerWeb golangSDKWeb wmbAgentWeb 	No
rule_name	URI	<p>The name of the rule which you are exporting. It will export all the rules under a scope or all the scopes if you do not specify.</p>	No

- The order of the parameters cannot be changed. The order of the parameters should be: application_id/[scope_name]/rule_type/[entry_point_type]/[rule_name].
- It will return an XML file with error content if you use the wrong name(s) in all the parameters.
- Tier information is provided in the scope list.
- If you do not specify the scope when exporting, then you should also not specify it when importing.
- Please check the server . Log file if you do not get the expected result after exporting.

Scenarios:

- Export the rules from all the scopes.

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/applicationID/{rule_type} >> {xml_name}.xml
```

Example:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/10/custom >> result.xml
```

If you do not include scope_name, the output is divided into three parts under <mds-config-data>: scope-list, rule-list, and scope-rule-mapping-list.

```
<mds-data>
  <mds-config-data>
    <scope-list>
      <scope scope-description="" scope-name="scope0"
        scope-type="ALL_TIERS_IN_APP" scope-version="0"/>
      <scope scope-description="" scope-name="scope1"
        scope-type="SELECTED_TIERS" scope-version="0"/>
    </scope-list>
    <rule-list>
      <rule agent-type="APPLICATION_SERVER" enabled="true"
        priority="1"
        rule-description="ruleInScope1_SERVLET"

[]}}], "actions":[{"type":"HTTP_SPLIT","httpsplit":{}}],"properties":
[]},"agenttype":"APPLICATION_SERVER"}</tx-match-rule>
            </rule>
        </rule-list>
        <scope-rule-mapping-list>
            <scope-rule-mapping scope-name="scope1">
                <rule rule-description="ruleInScope1_SERVLET" rule-
name="ruleInScope1_SERVLET"/>
            </scope-rule-mapping>
            <scope-rule-mapping scope-name="scope0">
                <rule rule-description="ASP.NET MVC5 Resource Handler"
rule-name="ASP.NET MVC5 Resource Handler"/>
                <rule rule-description="whatever_SERVLET" rule-
name="whatever_SERVLET"/>
                <rule rule-description="testPOJO" rule-name="testPOJO"/>
            </scope-rule-mapping>
        </scope-rule-mapping-list>

```

```
</mds-config-data>
</mds-data>
```

- Export the rules under the specified scope:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/applicationID/scope_name/{rule_type} >>
{xml_name}.xml
```

Example:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/10/scope0/custom >> result.xml
```

 If you include scope_name then only rule-list is included in the output.

```
<mds-data>
  <mds-config-data>
    <rule-list>
      <rule agent-type="DOT_NET_APPLICATION_SERVER"
        enabled="true" priority="0"

        </rule>
      </rule-list>
    </mds-config-data>
  </mds-data>

```

Import Transaction Detection Rules

Use this to import automatic detection rules in XML format. This call returns different types of detection rule configurations when MDS is enabled.

Importing action will overwrite a rule or add the new rule to the all/specified scopes.

Data for this call should be in the form of multipart/form-data. The URI for this call should be UTF-8 encoded.

Format

```
POST /controller/transactiondetection/application_id/[scope_name]/rule_type/[entry_point_type]/[rule_name] -F file=@exported_file_name.xml
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID. It can be found in the URL in address bar if you click the specified application. It is an Integer value. It will return an error if you do not specify.	Yes
scope_name	URI	The name of the scope from which you are importing the entry point configuration. It will import the rules to all the scopes if you do not specify.	No
rule_type	URI	The type of rule to import, from these options: <ul style="list-style-type: none"> • auto: Automatic detection rules • custom: Custom detection rules in the configuration • exclude: Custom exclude rules for transaction detection It will return an error if you do not specify.	Yes
entry_point_type	URI	The POJO, Servlet, EJB, Spring Bean, etc	No
rule_name	URI	The name of the rule which you are importing. It will import all the rules under a scope or all the scopes if you do not specify.	No

- When you import, if the XML file does not have <scope-list>, then you should type the scope name, otherwise, it will fail, and vice versa.
- It will return an error if you use the wrong name(s) in all the parameters.
- If you do not specify the scope when importing, then you should not specify it when exporting.
- Check the server . log file if you do not get the expected result after exporting.

Examples

- Import the rule(s) to the application without scopes specified:

```
curl -X POST --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/{application_id}/{rule_type}
-F file=@{exported_file_name}.xml
```

- Import the rule(s) to the application with scopes specified:

```
curl -X POST --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/{application_id}/{scope_name}/{rule_type}
-F file=@{exported_file_name}.xml
```

- For more scenarios to import, see [Export Transaction Detection Rules](#)(see page 3719).

Export Policies

You can export policies to a JSON file. Before you export policies, export any actions or health rules with their respective APIs.

Format

GET /controller/policies/application_id

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/policies/application_id
```

```
[ {
  "applicationName" : "ECommerce-Books",
  "name" : "My Policy",
  "reactorType" : "IMMEDIATE",
  "enabled" : true,
  "batchActionsPerMinute" : true,
  "durationInMin" : 1,
  "eventFilterTemplate" : {
    "applicationName" : "ECommerce-E2E",
    "healthRuleNames" : null,
    "eventTypes" : [ "POLICY_OPEN_WARNING",
  "POLICY_OPEN_CRITICAL", "POLICY_CONTINUES_WARNING",
  "POLICY_CONTINUES_CRITICAL" ],
    "rsdTypes" : null,
  }
```

```

    "customEventFilters" : null,
    "specificEntityNamesByType" : null
  },
  "entityFilterTemplates" : [ ],
  "actionWrapperTemplates" : [ {
    "actionTag" : "ops_viewer@acme.com",
    "type" : null,
    "value" : 0,
    "notes" : "Policy: My Policy",
    "entityIdentifierTemplates" : [ ]
  } ]
} ]

```

Import Policies

You can import policies that you exported with the Export Policies API. Before you import policies, import any actions or health rules with their respective APIs.

You can import a policy after modifying the defined parameter(s) and overwrite the existing policy with the updated one.

Format

POST /controller/policies/application_id ?overwrite=true_or_false

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes
overwrite	Query	Set to true to have updates to a policy overwrite the existing policy with the same name. The default is false.	No

Example

```

curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/policies/38 -F
file=@ImportPolicies.json

{"success":true,"errors":[],"warnings":[]}

```

Example to Overwrite a Policy

```
curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/policies/38\?overwrite\=true -F
file=@ImportPolicies.json

{"success":true,"errors":[],"warnings":[]}
```

Export Application Analytics Dynamic Service Configuration

The Analytics Dynamic Service is an AppDynamics app agent plugin that performs Analytics client functions for the agent. Enabling the Dynamic Service enables AppDynamics Analytics for an app agent type. You can export the Dynamic Service configuration to back up the configuration or for later import into another Controller.

Format

GET /controller/analyticsdynamicservice/application_id

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes
filename	Query	The name of a file to which the configuration will be exported.	No

Example

```
curl -i --user user1@customer1:your_password http://
demo.appdynamics.com/controller/analyticsdynamicservice/10

<analytics-dynamic-service-configurations controller-
version="004-003-000-000">
  <analytics-dynamic-service-configuration>
    <override>true</override>
    <agent-type>APP_AGENT</agent-type>
    <enabled>true</enabled>
  </analytics-dynamic-service-configuration>
  <analytics-dynamic-service-configuration>
    <override>true</override>
    <agent-type>DOT_NET_APP_AGENT</agent-type>
    <enabled>true</enabled>
  </analytics-dynamic-service-configuration>
```

```
<analytics-dynamic-service-configuration>
  <override>true</override>
  <agent-type>NODEJS_APP_AGENT</agent-type>
  <enabled>true</enabled>
</analytics-dynamic-service-configuration>
</analytics-dynamic-service-configurations>
```

Import Application Analytics Dynamic Service Configuration

The Analytics Dynamics Service configuration determines whether AppDynamics Analytics is enabled for an app agent type. You use this API to import a previously exported configuration to another Controller.

Data for this call should be in the form of multipart/form-data.

Format

POST /controller/analyticsdynamicsservice/application_id

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The name or ID identifier of the application to which the Analytics Dynamic Service configuration should be applied.	Yes

Example

```
curl -i -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/analyticsdynamicsservice/10 -F
file=@dynamicsservice.xml
```

The following example shows sample contents of the `dynamicsservice.xml` file. Notice that the `agent-type` element indicates the type of app server agent to which the enabled state of the dynamics service applies. The `APP_AGENT` type represents the Java Agent, the `DOT_NET_APP_AGENT` the .NET Agent, and so on.

```
<analytics-dynamic-service-configurations controller-
version="004-003-000-000">
  <analytics-dynamic-service-configuration>
    <override>true</override>
    <agent-type>APP_AGENT</agent-type>
    <enabled>false</enabled>
  </analytics-dynamic-service-configuration>
  <analytics-dynamic-service-configuration>
```

```

        <override>true</override>
        <agent-type>DOT_NET_APP_AGENT</agent-type>
        <enabled>>false</enabled>
    </analytics-dynamic-service-configuration>
    <analytics-dynamic-service-configuration>
        <override>true</override>
        <agent-type>NODEJS_APP_AGENT</agent-type>
        <enabled>true</enabled>
    </analytics-dynamic-service-configuration>
</analytics-dynamic-service-configurations>

```

Database Visibility API

This page describes the Database Visibility API methods you can use to get, create, update, and delete Database Visibility Collectors.

Include the following headers for all Database Visibility API requests:

```
Accept: application/json; Content-type: application/json
```

JSON is currently the only supported format.

i Database Visibility uses infrastructure-based licensing, where there is no direct correlation between the database collector and license usage. Therefore for Controller version ≥ 21.2 , the `licensesUsed` parameter always returns `-1`.

Get All Collectors

```
GET /controller/rest/databases/collectors
```

Get a Specific Collector

```
GET /controller/rest/databases/collectors/{configurationId}
```

Create a Collector

```
POST /controller/rest/databases/collectors/create
```

The JSON you send must contain the relevant Collector information. The required fields describing the Collector vary based on the type of database. See [UI Collector versus JSON Collector Configuration Field Names](#)(see page 3741)

Example JSON Request

```

{
  "type": "MYSQL",
  "name": "localdocker_dbagent-MySQLCollector",
  "hostname": "mysql",
  "port": "3306",
  "username": "root",

  }
]

```

```

    }
  ]
}

```

extraProperties: To configure the frequency for sampling queries from the database (except Cassandra), you can use the `extraProperties` parameter in the JSON request payload. The following JSON sample can be used in the request payload to configure the sampling interval:

```

{
  "type": "POSTGRESQL",
  "agentName": "UpgradeTest204",
  "name": "SamplingInterval",
  "hostname": "ec2-54-202-140-213.us-west-2.compute.amazonaws.com",
  "port": "5432",
  "username": "postgres",
  "password": "Appd123",
  "removeLiterals": "true",
  "enableOSMonitor": "true",
  "hostOS": "LINUX",
  "sshPort": "22",
  "hostUsername": "ec2-user",
  "hostPassword": "",
  "certificateAuth": true,
  "enabled": "true",
  "enterpriseDB": "false",
  "extraProperties": [
    {
      "key": "dbagent.sampling.interval",
      "value": "10",
      "sensitive": false
    }
  ]
}

```

The following JSON key-value pair is used in `extraProperties` for configuring the interval:

key: `dbagent.sampling.interval`

value: positive integer

The value can be 1, 2, 5, 10, 20, or 30.

You can configure this property through the agent. See [Configure the Agent Settings for Monitoring Database](#) (see page 2413).

Update a Collector

1. Make a GET request for the collector that you want to update.
2. Copy the JSON response body that is returned by the GET request to a text editor, and modify the fields that you want to update.
3. Make a POST request for the collector that you want to update, and include the updated JSON.

POST /controller/rest/databases/collectors/update

Example JSON Request

```
{
  "id":1,
  "type":"MYSQL",
  "name":"localdocker_dbagent-MySQLCollector",
  "hostname":"mysql",
  "port":"3306",
  "username":"root",
  "password":"appdynamics_redacted_password",
  "enabled":true,
  "excludedSchemas":null,
  "databaseName":null,
  "failoverPartner":null,
  "connectAsSysdba":false,
  "useServiceName":false,
  "sid":null,
  "customConnectionString":null,
  "enterpriseDB":false,
  "useSSL":false,
  "enableOSMonitor":false,
  "hostOS":null,
  "useLocalWMI":false,
  "hostDomain":null,
  "hostUsername":null,
  "hostPassword": "",
  "dbInstanceIdentifier":null,
  "region":null,
  "certificateAuth":false,
  "removeLiterals":true,
  "sshPort":0,
  "agentName":"localdocker_dbagent",

    "dbCyberArkFolder":null,
    "dbCyberArkObject":null,
    "hwCyberArkEnabled":false,
    "hwCyberArkApplication":null,
    "hwCyberArkSafe":null,
    "hwCyberArkFolder":null,
    "hwCyberArkObject":null,
    "orapkiSslEnabled":false,
    "orasslClientAuthEnabled":false,
    "orasslTruststoreLoc":null,
    "orasslTruststoreType":null,
    "orasslTruststorePassword":"","
  }
]

```

```

        "orasslKeystoreLoc":null,
        "orasslKeystoreType":null,
        "orasslKeystorePassword":"","
        "ldapEnabled":false,
        "customMetrics":null
    }
]
}

```

The JSON you send must contain all the details of the existing collector with only the fields that you want to modify changed. To ensure you have all the fields, use the [Get a Specific Collector](#)(see page 3733) call.

To add a new sub-collector to an existing collector, provide the sub-collector details without the id field.

i To configure the interval for sampling queries, refer to the `extraProperties` parameter in the JSON request payload as mentioned in [extraProperties](#)(see page 3736) under [Create a Collector](#)¹⁹⁷⁶.

Delete a Specific Collector

```
DELETE /controller/rest/databases/collectors/{configurationId}
```

Example Delete Request

```
DELETE /controller/rest/databases/collectors/{1}
```

Batch Delete Multiple Collectors

```
POST /controller/rest/databases/collectors/batchDelete
```

Send an array of the configuration Ids of the Collectors.

Below is an example of a batch delete command.

```
curl --user {username}@{account_name}:{password} -H "Accept: application/json" -H "Content-type: application/json" -X POST -d '[1,2,3]' {Controller_URL}/controller/rest/databases/collectors/batchDelete
```

Get All Monitored Database Servers

```
GET /controller/rest/databases/servers
```

¹⁹⁷⁶ <https://docs.appdynamics.com/display/PRO45/Database+Visibility+API>

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/databases/servers
```

The output is a list of database servers and their details.

Get Database Server Details

```
GET /controller/rest/databases/servers/{dbserver_id}
```

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/databases/servers/{dbserver_id}
```

The output contains a list of the database's details, including name, node ID, and database type.

Get all Database Agent Events

```
GET /controller/rest/applications/_dbmon/events
```

For a list of query string parameters, see [Retrieve Event Data](#)(see page 3684).

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/applications/_dbmon/events?time-range-type=BEFORE_NOW&duration-in-mins=30&event-types=%20AGENT_EVENT,DB_SERVER_PARAMTER_CHANGE&severities=INFO,WARN,ERROR
```

The output gives you a list of events. For each event element, you can determine the node that the event is mapped to by looking for the entity-definition element.

Get all Database Monitoring Application Nodes

```
GET /controller/rest/applications/_dbmon/nodes
```

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/applications/_dbmon/nodes
```

UI Collector versus JSON Collector Configuration Field Names

Use the table below to ensure you use the correct field names for your API calls. The Collector configuration field names are described in [Configure the Database Agent to Monitor Server Hardware](#)(see page 2461) and [Add Database Collectors](#)(see page 2415).

Section	UI Collector Configuration Field Name	JSON Collector Configuration Field Name
		id (AppDynamics assigns this ID to the Collector when you configure the Collector. You need this ID when doing a batch delete.)
	Database Type	type
	Database Agent	agentName
	Database	name
Connection Details	Hostname/IP Address	hostname
	EnterpriseDB	enterpriseDB
	Failover Partner	failoverPartner
	Listener Port	port
	Custom JDBC Connection String	customConnectionString
	Use Service Name	useServiceName
	SID or SERVICE_NAME	sid
	Connect as a sysdba	connectAsSysdba
	Username	username
	Password	password
	Logging Enabled	
Hardware Monitoring	Monitor Operating System	enableOSMonitor
	Operating System	hostOS
	Use Local WMI	useLocalWMI
	Domain	hostDomain
	SSH Port	sshPort
	Use certificate	certificateAuth

Section	UI Collector Configuration Field Name	JSON Collector Configuration Field Name
	Username	hostUsername
	Password	hostPassword

i SSL field

In addition to JSON Configuration Fields, there is the SSL field. SSL is a configurable property for the Database Agent. If the Database Agent has been configured to use SSL, then you must also provide the SSL field and its value in your Database Visibility API calls.

Get Health Rule Violations for a Collector

```
GET /controller/rest/databases/servers/healthrule-violations/<server-id>
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
server_id	URI	Provide the database server name or ID.	Yes
time-range-type	Query	<p>Possible values are:</p> <p>BEFORE_NOW To use the "BEFORE_NOW" option, you must also specify the "duration-in-mins" parameter.</p> <p>BEFORE_TIME To use the "BEFORE_TIME" option, you must also specify the "duration-in-mins" and "end-time" parameters.</p> <p>AFTER_TIME To use the "AFTER_TIME" option, you must also specify the "duration-in-mins" and "start-time" parameters.</p> <p>BETWEEN_TIMES To use this option, you must also specify the "start-time" and "end-time" parameters. The "BETWEEN_TIMES" range includes the start-time and excludes the end-time.</p>	Yes

Parameter Name	Parameter Type	Value	Mandatory
duration-in-mins	Query	Duration (in minutes) to return the metric data.	If time-range-type is BEFORE_NOW, BEFORE_TIME, or AFTER_TIME
start-time	Query	Start time (in milliseconds) from which the metric data is returned.	If time-range-type is AFTER_TIME or BETWEEN_TIMES
end-time	Query	End time (in milliseconds) until which the metric data is returned.	If time-range-type is BEFORE_TIME or BETWEEN_TIMES
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/databases/servers/healthrule-violations/<server-id>?time-range-type=BEFORE_NOW&duration-in-mins=<required_duration>
```

Analytics Events API

AppDynamics Analytics provides built-in support for collecting analytics data from various types of sources, such as agent-instrumented Java applications, .NET applications, browser applications, and more. The Analytics Events API supplements built-in analytics data sources with your custom data sources and event types.

In addition to the transaction events published by the app agents, custom events collected by the Analytics Events API are metered.

Publishing custom events requires Transaction Analytics licensing. Transaction Analytics license units determine the limit on the volume of custom events that you can publish.

About the Analytics Events API

In Analytics, an event encapsulates a unit of analytics data. In APM, for example, each event corresponds to a method or service invocation, whether it be an entry point service or downstream service.

With the Analytics API, you define the structure of your own custom event in the data store, capture the event records as they occur in your custom source, and send them to the Events Service, the data store for Analytics. Once your data is in the Events Store, users can query your data through the Controller UI or the Analytics Events API.

Analytics Events API uses a shared key to authenticate clients to the Events Service. As a Controller or Analytics Administrator, you can generate API keys from the Controller UI. See [Manage API Keys](#) (see page 3110).

i A Transaction Analytics license is required to use the Events Service API. The same licensing model that applies to business transactions for custom events (based on the number of events per unit/day) applies to the API.

Addressing the Events Service Data Store

Unlike most AppDynamics REST APIs, which are presented at the Controller, you access the Analytics Events API by addressing the Events Service instance in the AppDynamics platform.

You address the Events Service at one of the following URLs:

[SaaS](#) [On-premises](#)

Region	URL
North America	https://analytics.api.appdynamics.com
Europe	https://fra-ana-api.saas.appdynamics.com
APAC	https://syd-ana-api.saas.appdynamics.com

[SaaS](#) [On-premises](#)

"[https://<events_service_endpoint>:9080/events/](#)"

For an on-premises Events Service, address the Events Service instance host (or more likely, the virtual IP presented by a load balancer for the Events Service cluster). Use the primary default listening port for the Events Service, 9080.

Calls to the Analytics Events API need to specify the `<global_accountp_name>` for the Controller account being address, and the `<api_key>` generated by the administrator for this client. The API expects the values as headers, property-value pairs that are separated by a colon. As cURL arguments, for example, the values would be passed with curl through the `-H` or --header` option` as follows:`

```
-H"X-Events-API-AccountName:<global_account_name>" -H"X-Events-API-Key:<api_key>"
```

You can get the global account name to use from the [License page](#)(see page 203) in the Controller UI. The API keys are described in [Manage API Keys](#)(see page 3110).

The content type, also as a cURL argument, is:

```
-H"Content-type: application/vnd.appd.events+json;v=2"
```

AppDynamics strongly recommends the use of SSL/HTTPS to access the API. Otherwise, the API key is sent in plain text.

i For security reasons, the Analytics Events API, by default, does not accept cross-origin HTTP requests. For example, from links embedded directly in web pages.

Data Format

The Analytics Events API takes events as JSON-formatted name-value pair data.

Before sending data that conforms to a custom events schema, you need to define the data structure for the custom schema. The Events Service matches incoming events data to the appropriate schema.

Supported Data Types

- Boolean
- Date – Supported time formats include:
 - ISO 8601 format: yyyy-MM-dd 'T' HH:mm:ss .SSSZ.
 - UNIX epoch date format: A 13-digit number representing the number of seconds/milliseconds since UNIX epoch time (Jan 1, 1970). For example, (GMT): Mon, 17 Apr 2017 23:46:22 GMT would be 1492472782000.
- Float
- Integer
- Object
- String

Naming Restrictions

Custom event names and field names must conform to the following:

- Contain only a-z, A-Z, _ (underscore), 0-9.
- Names can not start with a number.

Timestamp Fields

Two implicit timestamp fields are automatically added to custom schemas:

- eventTimestamp
- pickupTimestamp

The eventTimestamp field represents the time an event occurred. An API client can specify a value for the timestamp field when it creates an event. If it does not, the Analytics Events API uses the same value for eventTimestamp as it uses for another implicit field, pickupTimestamp. The pickupTimestamp field, which is always populated by the Events Service, represents the time the event was received by the Events Service.

When configuring a milestone in Business Journeys, you need to supply a date in the `eventTimestamp` field in order for the event to register. In order to use Custom Events to define Business Journey, the custom events should send the `eventTimestamp` field. If not, the Business Journeys will not work.

AppDynamics uses another timestamp, `eventCompletionTimestamp`, which is not automatically added to custom schemas. The `eventCompletionTimestamp` field represents the time an event ends. Generally, AppDynamics uses this field internally to accurately report long-running events.

You can express all timestamp fields using ISO 8601 or UNIX epoch time (64-bit milliseconds) format.

Example API Call Flow

The following steps take you through an on-premises API call workflow for using the Analytics Events API. The steps show cURL examples for creating a schema, publishing an event to that schema, and then querying the event.

i For SaaS deployments, replace the value for the URL and port in the examples (`<events_service_endpoint>:9080`) to your SaaS URL.

1. Define the schema by associating field names with data types. For example, the following defines a Purchase event type:

```
curl -X POST "<events_service_endpoint>:9080/events/schema/myProducts" -H"X-Events-API-AccountName:customer1_1234-567a-bccc-123" -H"X-Events-API-Key:a123b456-c789-1d23-e456-  
nnn" -H"Content-type: application/vnd.appd.events+json;v=2" -d '{"schema" : { "id":  
"string", "productBrand": "string", "userRating": "integer", "price": "float",  
"productName": "string", "description": "string" } }'
```

2. Publish an event based on the schema you created:

```
curl -X POST "<events_service_endpoint>:9080/events/publish/myProducts" -H"X-Events-API-AccountName:customer1_1234-567a-bccc-123" -H"X-Events-API-Key:a123b456-c789-1d23-e456-  
nnn" -H"Content-type: application/vnd.appd.events+json;v=2" -d '[{"id":  
"5653b879ab33a", "productBrand": "ACME", "userRating": 3, "price": 2006.41, "productName":  
"Watch", "description": "new watch"}, {"id": "5653b879700", "productBrand":  
"Widget", "userRating": 1, "price": 3800.13, "productName": "Watch", "description": "2015  
watch"}]'
```

3. Query the event data:

```
curl -X POST "http://<events_service_endpoint>:9080/events/query" -H"X-Events-API-AccountName:customer1_7xxx-467a-bccc-xxx" -H"X-Events-API-Key:a123b456-c789-1d23-e456-  
nnn" -H"Content-type: application/vnd.appd.events+text;v=2" -d 'SELECT * FROM myProducts'
```

If including fields with ADQL keywords, enclose the keywords in single quotes. These keywords include, for example, `between`, `in`, `select`, and others.

For a single query request, use this content type:

```
-H"Content-type: application/vnd.appd.events+text;v=2"
```

In a multi-query request, the queries are passed as JSON body text. In this case, use the following content type header:

```
-H"Content-type: application/vnd.appd.events+json;v=2"
```

Custom Event Ingestion Limits

Controller ingestion of custom events has the following limits:

- Fields: 255 maximum per event type
- String attributes: 4 kb maximum length
- Batch total count: 10,000 events per call
- Batch total size: 5 Mb maximum per call
- Max custom events for an account: 20

Custom Events Limit Increase

i Custom events limit increases are available for SaaS Events Service version 4.5.13 and later. On-premises Events Services cannot exceed a maximum of 1500 custom field events.

By default, the Events Service allows you to create up to 1500 custom fields. If you reach 80% capacity of custom fields (1200 fields), the maximum field limit increases by 500 fields at the next index rollover.

For example, if you reach 1400 custom fields, your maximum field limit will increase from 1500 to 2000 fields. If you later reach 1800 custom fields, and maximum increases to 2500 fields.

You can create an absolute maximum of 3000 custom fields. Reaching or exceeding the maximum fields could result in lag or outages.

Publish Events

The Publish Events API call takes an array of events and stores them in the Events Service storage. The data must comply with an existing schema. A single request cannot publish to multiple event types.

If the event data doesn't match an event schema, the Events Service makes a best-effort attempt to match the data to the schema and returns a 400 bad request if unsuccessful.

Format

SaaS On-premises

```
POST https://analytics.api.example.com/events/publish/{schemaName}
```

SaaS On-premises

```
POST http://<events_service_endpoint>:9080/events/publish/{schemaName}
```

Query Params

N/A

Path Parameters

Name	Description
accountId	Account ID
schemaName	Event schema name

Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI License page.
X-Events-API-Key	The Analytics API key. See Manage API Keys (see page 3110)
Content-Type	The Content-Type of the request body. The default is application/vnd.appd.events+json;v=2 which also versions the resource representation (v=2).

Example SaaS Publish

[Request](#) Response

```
POST https://analytics.api.example.com/events/publish/{schemaName}
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-Type: application/vnd.appd.events+json;v=2
Accept: application/vnd.appd.events+json;v=2
{
  "schema" : {
    "account": "integer",
    "amount": "float",
    "product": "string"
  }
}
```

Request [Response](#)

```
HTTP/1.1 202 ACCEPTED
```

Error Codes

Error Code	Description
400	The given request was invalid.
401	The given authentication information provided in the authorization header was invalid.
404	No event type could be found for this account.
406	The Accept header was not application/vnd.appd.events+json;v=2.
413	The request body is larger than the max allowed size.
415	The Content-Type header was not application/vnd.appd.events+json;v=2.
429	Too many requests. Returned when account or event reaches limits.

Create Event Schema

Use this API to create your own event schema. The schema defines the overall structure of an event type by field and type.

You only need to use this API if the event you are uploading does not match an existing schema for first-class event types (such as logs or transactions). Events that conform to an existing schema automatically match that schema. Review the supported [data types](#)(see page 3745) and [naming restrictions](#)(see page 3745) described prior to this topic.

Format

[SaaS](#) [On-premises](#)

```
POST https://analytics.api.example.com/events/schema/{schemaName}
```

[SaaS](#) [On-premises](#)

```
POST http://<events_service_endpoint>:9080/events/schema/{schemaName}
```

Path Params

Name	Description
accountId	Account ID
schemaName	Event schema name

Query Params

N/A

Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI License page.
X-Events-API-Key	The Analytics API key. See Manage API Keys (see page 3110)
Accept	The Content-Type of the response body. The supported value is application/vnd.appd.events+json;v=2.
Content-type	The Content-Type of the request body. The default is application/vnd.appd.events+json;v=2 which also versions the resource representation (v=2).

Example SaaS Create

[Request](#) Response

```
POST http://analytics.api.example.com/events/schema/{schemaName} HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-Type: application/vnd.appd.events+json;v=2
Accept: application/vnd.appd.events+json;v=2
```

```
{
  "schema" : {
    "account": "integer",
    "amount": "float",
    "product": "string"
  }
}
```

Request [Response](#)

```
HTTP/1.1 201 CREATED
```

Retrieve Event Schema

Use this API to retrieve an existing event schema.

Format

[SaaS](#) [On-premises](#)

```
GET http://analytics.api.example.com/events/schema/{schemaName}
```

SaaS [On-premises](#)

```
GET http://<events_service_endpoint>:9080/events/schema/{schemaName}
```

Path Params

Name	Description
accountId	Account ID
schemaName	Event schema name

Query Params

N/A

Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI License page.
X-Events-API-Key	The Analytics API key. See Manage API Keys (see page 3110)
Accept	The Content-Type of the response body. The supported value is <code>application/vnd.appd.events+json;v=2</code> .

Example SaaS Retrieve

[Request](#) [Response](#)

```
GET http://analytics.api.example.com/events/schema/{schemaName} HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Accept: application/vnd.appd.events+json;v=2
```

[Request](#) [Response](#)

```
HTTP/1.1 200 OK
{
  "schema" : {
    "account": "integer",
    "amount": "float",
    "product": "string"
  }
}
```

Update Event Schema

Use this API to update an existing event schema by field. The request body defines the updates to be applied to the event schema.

As shown in the following example, you specify each field update action as a named section in the request body. The actions are represented by these fields:

- Add field
- Rename field

For the Add field definition, you need to specify the data format for the new field, as you would when [creating the event schema](#)(see page 3749).

The response to this call should be the complete event schema as modified.

Format

[SaaS](#) [On-premises](#)

```
PATCH http://analytics.api.example.com/events/schema/{schemaName}
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
```

[SaaS](#) [On-premises](#)

```
PATCH http://<events_service_endpoint>:9080/events/schema/{schemaName}
```

Path Parameters

Name	Description
accountId	Account id
schemaName	Event schema name

Query Params

N/A

Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI License page.
X-Events-API-Key	The Analytics API key. See Manage API Keys (see page 3110).
Accept	The Content-Type of the response body. The supported value is application/vnd.appd.events+json;v=2.
Content-type	The Content-Type of the request body. The default is application/vnd.appd.events+json;v=2 which also versions the resource representation (v=2).

Example SaaS Update

[Request](#) [Response](#)

```

PATCH http://analytics.api.example.com/events/schema/{schemaName} HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-type: application/vnd.appd.events+json;v=2
Accept: application/vnd.appd.events+json;v=2

[
  {
    "add": {
      "newfield": "integer"
    },
    "rename": {
      "oldname": "newname",
      "oldname2": "newname2"
    }
  }
]

```

[Request](#) [Response](#)

```

HTTP/1.1 200 OK

```

Delete Event Schema

Use this API to delete an existing event schema.

Format

[SaaS](#) [On-premises](#)

```

DELETE http://<events_service_endpoint>:9080/events/schema/{schemaName}
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>

```

[SaaS](#) [On-premises](#)

```
DELETE http://<events_service_endpoint>:9080/events/schema/{schemaName}
```

Path Params

Name	Description
accountId	Account id
eventType	Event schema name

Query Params

N/A

Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI License page .
X-Events-API-Key	The Analytics API key. See Manage API Keys (see page 3110)
Accept	The Content-Type of the response body. The following is the supported value: application/vnd.appd.events+json;v=2

Example SaaS Delete Request

```
DELETE http://analytics.api.example.com/events/schema/{schemaName} HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Accept: application/vnd.appd.events+json;v=2
```

Querying Events

When querying analytics events data, the following applies:

- Every Events Service API has a limit of 200 searches per minute by each account on each event type.
- The Multi-Query Events API is limited to twenty queries per HTTP request.
- The Analytics Query API can return a maximum of 10,000 results. If you would like to retrieve and paginate over the data, you can use the scroll mode. Scroll mode is limited to 1,000 results per batch.

Scroll mode cannot be used in Query Events (Multiple Queries).

- Limits work differently for aggregation and non-aggregation queries. Because we use the limits specified in the ADQL query as the bucket count limit, it is not possible to also use it as the overall result count limit. Therefore, the URL parametric limit is used

for the overall limit. In the case of non-aggregation queries, there is no bucket limit, so the limit specified in the ADQL query is taken as the row count limit and the URL parametric limit becomes the second place to look for it if the ADQL query does not specify a limit.

- Aggregation queries: the total returned row count is limited by the limit in the URL query parameter, and is not directly related to the limits specified in the ADQL query statement itself. The limits in the ADQL query apply only to bucket counts in aggregations.
- Non-aggregation queries: If LIMIT is not specified in the SELECT statement, the value specified in the URL query parameter is used. If the limit query parameter is also absent, the default is 100.

Query Events (Single Query)

This API can be used either as a simple text-formatted query or as a JSON-formatted query. The JSON-formatted query can accommodate multiple queries per call and is described in [Query Events \(Multiple Queries\)](#)(see page 3759).

An event type might search against multiple event types. Therefore, the event type is not provided in the URL path or as a query parameter, but as part of the ADQL query provided in the request body itself. Your ADQL queries must adhere to the syntax described in the [ADQL Reference](#)(see page 3011).

This section describes the single query form for querying events.

Format

SaaS On-premises

```
POST http://analytics.api.example.com/events/query?limit=20
```

SaaS On-premises

```
POST http://<events_service_endpoint>:9080/events/query
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-type: application/vnd.appd.events+text;v=2
```

Query Params

Name	Description
start	Filter results based on the minimum event timestamp, specified in ISO 8601 time (https://en.wikipedia.org/wiki/ISO_8601) or Unix time (http://en.wikipedia.org/wiki/Unix_time). If not specified, then the default is no minimum timestamp filtering. Note that data returned will always be limited by the data retention. Specify the time in combined UTC date and time format or epoch milliseconds. Start time is inclusive of limiting timestamps.

Name	Description
end	<p>Filter results based on the maximum event timestamp, specified in ISO 8601 time (https://en.wikipedia.org/wiki/ISO_8601) or Unix time (http://en.wikipedia.org/wiki/Unix_time). If not specified, then the default is no maximum timestamp filtering.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin: 10px 0;"> <p> Data returned will always be limited by the data retention.</p> </div> <p>Specify the time in combined UTC date and time format or epoch milliseconds. End time is inclusive of limiting timestamps.</p>
limit	<p>Limits the number of results returned. The default value is 100. The upper limit on the results that can be fetched is 1,000.</p>
mode	<p>The default mode is none. You can use the scroll mode to fetch bulk data and paginate over 10,000 ADQL results. Unless a limit is specified in the query, the API enables the Events Service to fetch beyond the maximum limit. The default mode supports aggregation but the scroll mode does not support aggregation or math operations. Order by queries is supported in scroll mode.</p> <p>Scroll queries returns results in batches. Every request response contains results along with a <code>scrollid</code>, which needs to be passed in the next request to fetch the next batch of results.</p>

Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI License page.
X-Events-API-Key	The Analytics API key. See Manage API Keys (see page 3110).
Accept	The Content-Type of the response body. The supported value is <code>application/vnd.appd.events+json;v=2</code> .
Content-type	The Content-Type of the request body. The default is <code>application/vnd.appd.events+json;v=2</code> which also versions the resource representation (v=2).

Example SaaS Query

[Request](#) Response

```
POST http://analytics.api.example.com/events/query?
start=1422823420000&end=1423687476000&limit=20000 HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-Type: application/vnd.appd.events+text;v=2
Accept: application/vnd.appd.events+json;v=2

SELECT * FROM county WHERE size>=30 AND population>20000
```

Request [Response](#)

```
HTTP/1.1 200 OK
{
  "total": 10000,
  "fields": [
    { "label": "eventTimestamp", "field": "eventTimestamp", "type": "date",
"aggregation": null },
    { "label": "size", "field": "size", "type": "integer",
"aggregation": null },
    { "label": "population", "field": "population", "type": "integer",
"aggregation": null },
    { "label": "pickupTimestamp", "field": "pickupTimestamp", "type": "date",
"aggregation": null }
  ],
  "results": [
    [ "2015-01-03T23:55:39.801-08:00", 35, 47500, "2015-02-11T19:52:28.805Z" ],
    ...
  ]
}
```

[First Request](#) First Response Subsequent Requests

```
curl -s -X POST "<events_service_endpoint>:<events_service_port>/events/query?
start=1422823420000&end=1423687476000" \
-H"X-Events-API-Key:<api_key>" \
-H"X-Events-API-AccountName:<global_account_name>" \

PQ==\\"
}"
```

Query Events (Multiple Queries)

Use this API to execute multiple queries against a particular account and event type in parallel. A query event that specifies multiple queries does so by including multiple ADQL queries in the body of the request. Your ADQL queries must adhere to the syntax described in the [ADQL Reference](#)(see page 3011).

Using queries in this form takes advantage of certain backend optimizations in query performance. Query filter criteria, such as time range and limit, can be overridden by each inner query.

i The Multi-Query Events API is limited to twenty queries per HTTP request.

Format

SaaS On-premises

```
POST http://analytics.api.example.com/events/query?limit=20
```

SaaS On-premises

```
POST http://<events_service_endpoint>:9080/events/query
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
```

Path Params

None

Query Params

Name	Description
start	<p>Filter results based on the minimum event timestamp, specified in ISO 8601¹⁹⁷⁷ time or Unix¹⁹⁷⁸ time. If not specified, then the default is no minimum timestamp filtering.</p> <p>Specify the time in combined UTC date and time format or epoch milliseconds.</p> <p>Start time is inclusive of limiting timestamps.</p>

¹⁹⁷⁷ https://en.wikipedia.org/wiki/ISO_8601

¹⁹⁷⁸ http://en.wikipedia.org/wiki/Unix_time

Name	Description
end	<p>Filter results based on the maximum event timestamp, specified in ISO 8601¹⁹⁷⁹ time or Unix¹⁹⁸⁰ time. If not specified, then the default is no maximum timestamp filtering.</p> <p>Specify the time in combined UTC date and time format or epoch milliseconds.</p> <p>End time is inclusive of limiting timestamps.</p>
limit	Limits the number of results returned. The default value is 100. The upper limit on the results that can be fetched is 10,000.

Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI License page.
X-Events-API-Key	The Analytics API key. See Manage API Keys (see page 3110).
Accept	The Content-Type of the response body. The supported value is <code>application/vnd.appd.events+json;v=2</code> .
Content-type	The Content-Type of the request body. The default is <code>application/vnd.appd.events+json;v=2</code> which also versions the resource representation (v=2).

Payload

Field	Description
label	(Optional) Friendly name to identify the query.
query	ADQL query to execute.
start	(Optional) Overrides the start parameter value provided as a query parameter.
end	(Optional) Overrides the end parameter value provided as a query parameter.
limit	(Optional) Overrides the limit provided as a query parameter.

  }
]

```

RBAC API

This page describes the Role-Based Access Control (RBAC) API methods you can use to manage users, groups, and roles for AppDynamics features. These operations provide more flexibility and automation with RBAC management. Relationship settings such as `addUserToGroup` and `removeUserToGroup` are supported.

Support

- You must be the account owner or have **administer user** permissions to use the RBAC API.
- SAML and LDAP user creations are not supported. You can only create permissions through the UI. See [Create and Manage Tenant Users](#)(see page 155).

Create User

Use this to create users in the current account. The request payload should specify name, `security_provider_type`, `displayName`, and `password`. The user ID is generated by the server.

Format

POST /controller/api/rbac/v1/users

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
security_provider_type	Request payload	"INTERNAL"	Yes
displayName	Request payload		Yes
password	Request payload		Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"name": "user10", "security_provider_type":
"INTERNAL", "displayName": "user10", "password": "welcome"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
users
```

Response status code 200 :

```
{
  "id": 10,
  "name": "user10",
  "displayName": "user10",
  "security_provider_type": "INTERNAL"
}
```

Get User by ID

Use this to get full user information, including a summary of affiliated groups and roles, using the `userId` in the current account.

Format

GET `/controller/api/rbac/v1/users/userId`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/users/4
```

Response status code 200 :

```
{
  "id": 4,
  "name": "user1",
  "email": "user1@customer1.com",
  "displayName": "user1",
  "security_provider_type": "INTERNAL",
  "roles":
  [
    {"id": 17, "name": "Workflow Executor"},
    {"id": 18, "name": "DB Monitoring Administrator"},
    {"id": 19, "name": "DB Monitoring User"},
    {"id": 20, "name": "Analytics Administrator"},
    {"id": 21, "name": "Server Monitoring Administrator"},
    {"id": 22, "name": "Server Monitoring User"},
  ]
}
```

```

    {"id": 23,"name": "Universal Agent Administrator"},
    {"id": 24,"name": "Universal Agent User"},
    {"id": 13,"name": "Account Administrator"},
    {"id": 14,"name": "Administrator"},
    {"id": 15,"name": "User"},
    {"id": 16,"name": "Dashboard Viewer"}
  ],
  "groups":
  [
    {"id": 1,"name": "group_01"}
  ]
}
```

Get User by Name

Use this to get full user information, including a summary of affiliated groups and roles, using the `userName` in the current account.

Format

GET `/controller/api/rbac/v1/users/name/name`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/name/user1
```

Response status code 200 :

```

{
  "id": 4,
  "name": "user1",
  "email": "user1@customer1.com",
  "displayName": "user1",
  "security_provider_type": "INTERNAL",
  "roles":
  [
    {"id": 17,"name": "Workflow Executor"},
    {"id": 18,"name": "DB Monitoring Administrator"},
    {"id": 19,"name": "DB Monitoring User"},
    {"id": 20,"name": "Analytics Administrator"},
    {"id": 21,"name": "Server Monitoring Administrator"},
    {"id": 22,"name": "Server Monitoring User"},
    {"id": 23,"name": "Universal Agent Administrator"},
  ]
}
```

```

        {"id": 24, "name": "Universal Agent User"},
        {"id": 13, "name": "Account Administrator"},
        {"id": 14, "name": "Administrator"},
        {"id": 15, "name": "User"},
        {"id": 16, "name": "Dashboard Viewer"}
    ],
    "groups":
    [
        {"id": 1, "name": "group_01"}
    ]

```

- This API only supports retrieving internal users and not SAML or LDAP.
- You have to include an optional parameter (`securityProviderType`) to find SAML/LDAP users.

Get All Users

Use this to get a list of all users in the current account. The list includes user summaries, which includes `userId` and `userName`.

Format

GET `/controller/api/rbac/v1/users`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users
```

Response status code 200 :

```

{
  "users":
  [
    {"id": 4, "name": "user1"},
    {"id": 10, "name": "user10"}
  ]
}

```

Update User

Use this to update a user by `userId` in the current account. Only the user object itself is updated, with the relationship to roles and groups remaining unaffected.

Format

PUT /controller/api/rbac/v1/users/userId

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	Request payload		Yes
name	Request payload		Yes
displayName	Request payload		Yes
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 11,"name": "updated_user9","displayName":
"user9","security_provider_type": "INTERNAL"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
users/11
```

Response status code 200 :

```
{
  "id": 11,
  "name": "updated_user9",
  "displayName": "user9",
  "security_provider_type": "INTERNAL"
}
```

Delete User

Use this to delete a user by userId in the current account.

Format

DELETE /controller/api/rbac/v1/users/userId

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/users/11
```

Response status code 200 :

Create Group

Use this to create a group in the current account. The groupId is generated by the server.

Format

POST /controller/api/rbac/v1/groups

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
description	Request payload		No
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"name": "group100","description": "new description",
"security_provider_type": "INTERNAL"}' -u user1@customer1
http://localhost:8080/controller/api/rbac/v1/groups
```

Response status code 200 :

```
{
  "id": 2,
  "name": "group100",
  "security_provider_type": "INTERNAL",
  "description": "new description"
}
```

Get Group by ID

Use this to get full group information by groupId in the current account.

Format

GET /controller/api/rbac/v1/groups/groupId

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups/1
```

Response status code 200 :

```
{
```

```

    "id": 1,
    "name": "group_03",
    "security_provider_type": "INTERNAL"
    "description": "",
    "roles":
      [
        {"id": 19,"name": "DB Monitoring User"},
        {"id": 20,"name": "Analytics Administrator"},
        {"id": 21,"name": "Server Monitoring Administrator"},
        {"id": 22,"name": "Server Monitoring User"},
        {"id": 23,"name": "Universal Agent Administrator"},
        {"id": 13,"name": "Account Administrator"},
        {"id": 16,"name": "Dashboard Viewer"}
      ]
  }

```

Get Group by Name

Use this to get full group information by groupName in the current account.

Format

GET /controller/api/rbac/v1/groups/name/name

Example

```

curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups/name/group_03

Response status code 200 :
{
  "id": 1,
  "name": "group_03",
  "security_provider_type": "INTERNAL"
  "description": "",
  "roles":
    [
      {"id": 19,"name": "DB Monitoring User"},
      {"id": 20,"name": "Analytics Administrator"},
      {"id": 21,"name": "Server Monitoring Administrator"},
      {"id": 22,"name": "Server Monitoring User"},
      {"id": 23,"name": "Universal Agent Administrator"},
      {"id": 13,"name": "Account Administrator"},
      {"id": 16,"name": "Dashboard Viewer"}
    ]
}

```

```

    ]
}

```

Get All Groups

Use this to get all groups in the current account. This only returns group summaries, which includes groupId and groupName.

Format

GET /controller/api/rbac/v1/groups

Example

```

curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups

Response status code 200 :
{
  "groups":
  [
    {"id": 1, "name": "group_03"},
    {"id": 2, "name": "group100"}
  ]
}

```

Update Group

Use this to update a group by groupId in the current account. Only the group itself is updated, while the relationships with users and roles remain unaffected.

Format

PUT /controller/api/rbac/v1/groups/groupId

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	Request payload		Yes
name	Request payload		Yes
description	Request payload		No
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 1, "name": "group2", "description": "new
description", "security_provider_type": "INTERNAL"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
groups/1
```

Response status code 200 :

```
{
  "id": 1,
  "name": "group2",
  "security_provider_type": "INTERNAL",
  "description": "new description",
  "roles":
    [
      {"id": 19, "name": "DB Monitoring User"},
      {"id": 20, "name": "Analytics Administrator"},
      {"id": 21, "name": "Server Monitoring Administrator"},
      {"id": 22, "name": "Server Monitoring User"},
      {"id": 23, "name": "Universal Agent Administrator"},
      {"id": 13, "name": "Account Administrator"},
      {"id": 16, "name": "Dashboard Viewer"}
    ]
}
```

Delete Group

Use this to delete a group by groupId in the current account.

Format

```
DELETE /controller/api/rbac/v1/groups/groupId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/groups/1
```

Response status code 200 :

Add User to Group

Use this to add a user to a group by userId and groupId.

Format

PUT /controller/api/rbac/v1/groups/groupId/users/userId

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups/2/users/10
```

Response status code 200 :

Remove User from Group

Use this to remove a user from a group by userId and groupId.

Format

DELETE /controller/api/rbac/v1/groups/groupId/users/userId

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/groups/2/users/10
```

Response status code 200 :

Create Role

Use this to create a role in the current account. The ID is generated by the server.

Format

POST /controller/api/rbac/v1/roles

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
description	Request payload		No
permissions	Request payload		No

Example

```

curl -X POST /controller/api/rbac/v1/roles \
-H 'Content-Type: application/vnd.appd.cntrl+json;v=1' \
-d '{
  "name": "SampleRole2",
  "permissions": [
    {
      "entityType": "APPLICATION",
      "entityId": 24,
      "action": "CONFIG_ACTIONS"
    },
    {
      "entityType": "APPLICATION",
      "entityId": 24,
      "action": "CONFIG_BASELINES"
    },
    {
      "entityType": "APPLICATION",
      "entityId": 24,
      "action": "CONFIG_BUSINESS_TRANSACTIONS"
    },
    {
      "entityType": "APPLICATION",
      "entityId": 24,
      "action": "CONFIG_ERROR_DETECTION"
    },
    {
      "entityType": "APPLICATION",
      "entityId": 24,
      "action": "CONFIG_EUM"
    },
    {
      "entityType": "APPLICATION",
      "entityId": 24,
      "action": "CONFIG_EVENT_REACTOR"
    },
    {
      "entityType": "APPLICATION",
      "entityId": 24,
      "action": "CONFIG_POLICIES"
    },
    {
      "entityType": "APPLICATION",

```

```

    "entityId": 24,
    "action": "CONFIG_TRANSACTION_DETECTION"
  },
  {
    "entityType": "APPLICATION",
    "entityId": 24,
    "action": "VIEW"
  }
]
}'

```

```

200 OK
{
  "id": 87,
  "name": "SampleRole2"
}

```

Add Role to User

Use this to add a role to a user by `roleId` and `userId`.

Format

PUT /controller/api/rbac/v1/roles/roleId/users/userId

Example

```

curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/50/users/10

```

Response status code 200 :

Remove Role from User

Use this to remove a role from a user by `roleId` and `userId`.

Format

DELETE /controller/api/rbac/v1/roles/roleId/users/userId

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/50/users/10

Response status code 200 :
```

Add Role to Group

Use this to add a role to a group by `roleId` and `groupId`.

Format

```
PUT /controller/api/rbac/v1/roles/roleId/groups/groupId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/50/groups/2

Response status code 200 :
```

Remove Role from Group

Use this to remove a role from a group by `roleId` and `groupId`.

Format

```
DELETE /controller/api/rbac/v1/roles/roleId/groups/groupId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/50/groups/2

Response status code 200 :
```

Get Role by ID

Use this to get full role information by `roleId` in the current account. This only returns the `role` object.

Format

```
GET /controller/api/rbac/v1/roles/[roleId]?include-permissions=true
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	Request payload		Yes
include-permissions (>= v4.5.14)	Request payload	"true"	No

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/15?include-permissions=true
```

Response status code 200 :

```
{
  "id": 15,
  "name": "SampleRole",
  "permissions": [
    {
      "id": 2619,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_ACTIONS"
    },
    {
      "id": 2621,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_BASELINES"
    },
    {
      "id": 2620,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_BUSINESS_TRANSACTIONS"
    },
    {
      "id": 2610,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_ERROR_DETECTION"
    }
  ]
}
```

```

    },
    {
      "id": 2615,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_EUM"
    },
    {
      "id": 2618,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_EVENT_REACTOR"
    },
    {
      "id": 2617,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_POLICIES"
    },
    {
      "id": 2608,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_TRANSACTION_DETECTION"
    },
    {
      "id": 2606,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "VIEW"
    }
  ]
}

```

Get Role by Name

Use this to get full role information by `roleName` in the current account.

Format

GET `/controller/api/rbac/v1/roles/name/[RoleName]?include-permissions=true`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
include-permissions (>= v4.5.14)	Request payload	"true"	No

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/name/SampleRole?include-permissions=true
```

Response status code 200 :

```
{
  "id": 15,
  "name": "SampleRole",
  "permissions": [
    {
      "id": 2619,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_ACTIONS"
    },
    {
      "id": 2621,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_BASELINES"
    },
    {
      "id": 2620,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_BUSINESS_TRANSACTIONS"
    },
    {
      "id": 2610,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_ERROR_DETECTION"
    }
  ]
}
```

```

    },
    {
      "id": 2615,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_EUM"
    },
    {
      "id": 2618,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_EVENT_REACTOR"
    },
    {
      "id": 2617,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_POLICIES"
    },
    {
      "id": 2608,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_TRANSACTION_DETECTION"
    },
    {
      "id": 2606,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "VIEW"
    }
  ]
}

```

Get All Roles

Use this to get all roles in the current account. This only returns role summaries, which includes `roleId` and `roleName`.

Format

GET `/controller/api/rbac/v1/roles`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles

Response status code 200 :
{
  "roles":
  [
    {"id": 13,"name": "Account Administrator"},
    {"id": 14,"name": "Administrator"},
    {"id": 20,"name": "Analytics Administrator"},
    {"id": 16,"name": "Dashboard Viewer"},
    {"id": 18,"name": "DB Monitoring Administrator"},
    {"id": 19,"name": "DB Monitoring User"},
    {"id": 21,"name": "Server Monitoring Administrator"},
    {"id": 22,"name": "Server Monitoring User"},
    {"id": 23,"name": "Universal Agent Administrator"},
    {"id": 24,"name": "Universal Agent User"},
    {"id": 15,"name": "User"},
    {"id": 17,"name": "Workflow Executor"}
  ]
}
```

Update Role

Use this to update a role by `roleId` in the current account. This only updates the `role` object itself, while leaving the relationship with users and groups unaffected.

You cannot update permissions within a role through this API. You can only update the name and description parameters.

Format

PUT `/controller/api/rbac/v1/roles/roleId`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	Request payload		Yes
name	Request payload		Yes
description	Request payload		No

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 49, "name": "role1", "description": "new
description" }' -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/49
```

Response status code 200 :

```
{
  "id": 49,
  "name": "role1",
  "description": "new description"
}
```

Delete Role

Use this to delete a role in the current account.

Format

DELETE /controller/api/rbac/v1/roles/roleId

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/49
```

Response status code 200 :

Create Central Identity User API

This page describes the Create Central Identity User API methods you can use to create central identity(ci) users in the current account. This API is only available when the current account is configured with the CI_USER_CREATION property.

You must be the account owner or have the **administer user** permissions to use the Create Central Identity User

SAML and LDAP user creations are not supported. You can only create permissions through the UI. See [Create and Manage Custom Roles](#)(see page 156).

Create User

The request payload should specify `email`, `security_provider_type`, and `displayName`. The server generates the user ID.

Format

POST `/controller/api/rbac/v1/ci-user`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
email	Request payload		Yes
security_provider_type	Request payload	"INTERNAL"	Yes
displayName	Request payload		Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"email": "user10@domain.com",
"security_provider_type": "INTERNAL", "displayName": "user10"}'
-u user1@customer1 http://localhost:8080/controller/api/rbac/v1/
ci-user
```

Response status code 200 :

```
{
  "id": 10,
  "name": "user10@domain.com",
  "email": "user10@domain.com",
  "displayName": "user10",
  "security_provider_type": "INTERNAL"
}
```

Get User by ID

Use this to get full user information, including a summary of affiliated groups and roles, using the `userId` in the current account.

Format

GET `/controller/api/rbac/v1/users/userId`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/4
```

Response status code 200 :

```
{
  "id": 4,
  "name": "user1",
  "email": "user1@customer1.com",
  "displayName": "user1",
  "security_provider_type": "INTERNAL",
  "roles":
  [
    {"id": 17, "name": "Workflow Executor"},
    {"id": 18, "name": "DB Monitoring Administrator"},
    {"id": 19, "name": "DB Monitoring User"},
    {"id": 20, "name": "Analytics Administrator"},
    {"id": 21, "name": "Server Monitoring Administrator"},
    {"id": 22, "name": "Server Monitoring User"},
    {"id": 13, "name": "Account Administrator"},
    {"id": 14, "name": "Administrator"},
    {"id": 15, "name": "User"},
    {"id": 16, "name": "Dashboard Viewer"}
  ],
  "groups":
  [
    {"id": 1, "name": "group_01"}
  ]
}
```

Get User by Name

Use this to get full user information, including a summary of affiliated groups and roles, using the userName in the current account.

Format

```
GET /controller/api/rbac/v1/users/name/name
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/name/user1
```

Response status code 200 :

```
{
  "id": 4,
  "name": "user1",
  "email": "user1@customer1.com",
  "displayName": "user1",
  "security_provider_type": "INTERNAL",
  "roles":
    [
      {"id": 17,"name": "Workflow Executor"},
      {"id": 18,"name": "DB Monitoring Administrator"},
      {"id": 19,"name": "DB Monitoring User"},
      {"id": 20,"name": "Analytics Administrator"},
      {"id": 21,"name": "Server Monitoring Administrator"},
      {"id": 22,"name": "Server Monitoring User"},
      {"id": 13,"name": "Account Administrator"},
      {"id": 14,"name": "Administrator"},
      {"id": 15,"name": "User"},
      {"id": 16,"name": "Dashboard Viewer"}
    ],
  "groups":
    [
      {"id": 1,"name": "group_01"}
    ]
}
```

Get All Users

Use this to get a list of all users in the current account. The list includes user summaries, which includes userId and userName.

Format

GET /controller/api/rbac/v1/users

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/users
```

Response status code 200 :

```
{
  "users":
    [
      {"id": 4,"name": "user1"},
    ]
}
```

```

    {"id": 10,"name": "user10"}
  ]
}

```

Update User

Use this to update a user by `userId` in the current account. Only the user object itself is updated, with the relationship to roles and groups remaining unaffected.

Format

PUT `/controller/api/rbac/v1/users/userId`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	Request payload		Yes
name	Request payload		Yes
displayName	Request payload		Yes
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```

curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 11,"name": "updated_user9","displayName":
"user9","security_provider_type": "INTERNAL"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
users/11

```

Response status code 200 :

```

{
  "id": 11,
  "name": "updated_user9",
  "displayName": "user9",
  "security_provider_type": "INTERNAL"
}

```

Delete User

Use this to delete a user by `userId` in the current account.

Format

DELETE /controller/api/rbac/v1/users/userId

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/users/11
```

Response status code 200 :

Create Group

Use this to create a group in the current account. The groupId is generated by the server.

Format

POST /controller/api/rbac/v1/groups

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
description	Request payload		No
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"name": "group100","description": "new description",
"security_provider_type": "INTERNAL"}' -u user1@customer1
http://localhost:8080/controller/api/rbac/v1/groups
```

Response status code 200 :

```
{
  "id": 2,
  "name": "group100",
  "security_provider_type": "INTERNAL",
  "description": "new description"
}
```

Get Group by ID

Use this to get full group information by groupId in the current account.

Format

GET /controller/api/rbac/v1/groups/groupId

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups/1

Response status code 200 :
{
  "id": 1,
  "name": "group_03",
  "security_provider_type": "INTERNAL"
  "description": "",
  "roles":
    [
      {"id": 19,"name": "DB Monitoring User"},
      {"id": 20,"name": "Analytics Administrator"},
      {"id": 21,"name": "Server Monitoring Administrator"},
      {"id": 22,"name": "Server Monitoring User"},
      {"id": 13,"name": "Account Administrator"},
      {"id": 16,"name": "Dashboard Viewer"}
    ]
}
```

Get Group by Name

Use this to get full group information by groupName in the current account.

Format

GET /controller/api/rbac/v1/groups/name/name

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups/name/group_03

Response status code 200 :
{
  "id": 1,
  "name": "group_03",
  "security_provider_type": "INTERNAL"
  "description": "",
  "roles":
```

```
[
  {"id": 19,"name": "DB Monitoring User"},
  {"id": 20,"name": "Analytics Administrator"},
  {"id": 21,"name": "Server Monitoring Administrator"},
  {"id": 22,"name": "Server Monitoring User"},
  {"id": 13,"name": "Account Administrator"},
  {"id": 16,"name": "Dashboard Viewer"}
]
```

Get All Groups

Use this to get all groups in the current account. This only returns group summaries, which includes `groupId` and `groupName`.

Format

```
GET /controller/api/rbac/v1/groups
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups
```

Response status code 200 :

```
{
  "groups":
  [
    {"id": 1,"name": "group_03"},
    {"id": 2,"name": "group100"}
  ]
}
```

Update Group

Use this to update a group by `groupId` in the current account. Only the group itself is updated, while the relationships with users and roles remain unaffected.

Format

```
PUT /controller/api/rbac/v1/groups/groupId
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	Request payload		Yes
name	Request payload		Yes
description	Request payload		No
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 1, "name": "group2", "description": "new
description", "security_provider_type": "INTERNAL"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
groups/1
```

Response status code 200 :

```
{
  "id": 1,
  "name": "group2",
  "security_provider_type": "INTERNAL",
  "description": "new description",
  "roles":
  [
    {"id": 19, "name": "DB Monitoring User"},
    {"id": 20, "name": "Analytics Administrator"},
    {"id": 21, "name": "Server Monitoring Administrator"},
    {"id": 22, "name": "Server Monitoring User"},
    {"id": 13, "name": "Account Administrator"},
    {"id": 16, "name": "Dashboard Viewer"}
  ]
}
```

Delete Group

Use this to delete a group by groupId in the current account.

Format

```
DELETE /controller/api/rbac/v1/groups/groupId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/  
controller/api/rbac/v1/groups/1
```

```
Response status code 200 :
```

Add User to Group

Use this to add a user to a group by `userId` and `groupId`.

Format

```
PUT /controller/api/rbac/v1/groups/groupId/users/userId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X  
PUT -u user1@customer1 http://localhost:8080/controller/api/  
rbac/v1/groups/2/users/10
```

```
Response status code 200 :
```

Remove User from Group

Use this to remove a user from a group by `userId` and `groupId`.

Format

```
DELETE /controller/api/rbac/v1/groups/groupId/users/userId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/  
controller/api/rbac/v1/groups/2/users/10
```

```
Response status code 200 :
```

Create Role

Use this to create a role in the current account. The ID is generated by the server.

Format

POST /controller/api/rbac/v1/roles

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
description	Request payload		No

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"name": "role2","description": "new description"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
roles
```

Response status code 200 :

```
{
  "id": 49,
  "name": "role2",
  "description": "new description"
}
```

Add Role to User

Use this to add a role to a user by `roleId` and `userId`.

Format

PUT /controller/api/rbac/v1/roles/roleId/users/userId

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/50/users/10
```

Response status code 200 :

Remove Role from User

Use this to remove a role from a user by `roleId` and `userId`.

Format

```
DELETE /controller/api/rbac/v1/roles/roleId/users/userId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/50/users/10
```

```
Response status code 200 :
```

Add Role to Group

Use this to add a role to a group by `roleId` and `groupId`.

Format

```
PUT /controller/api/rbac/v1/roles/roleId/groups/groupId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/50/groups/2
```

```
Response status code 200 :
```

Remove Role from Group

Use this to remove a role from a group by `roleId` and `groupId`.

Format

```
DELETE /controller/api/rbac/v1/roles/roleId/groups/groupId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/50/groups/2
```

```
Response status code 200 :
```

Get Role by ID

Use this to get full role information by `roleId` in the current account. This only returns the role object.

Format

GET /controller/api/rbac/v1/roles/roleId

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/15

Response status code 200 :
{
  "id": 15,
  "name": "User",
  "description": "Can view applications and dashboards but not modify their configuration"
}
```

Get Role by Name

Use this to get full role information by roleName in the current account.

Format

GET /controller/api/rbac/v1/roles/name/name

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/name/User

Response status code 200 :
{
  "id": 15, "name": "User",
  "description": "Can view applications and dashboards but not modify their configuration"
}
```

Get All Roles

Use this to get all roles in the current account. This only returns role summaries, which includes roleId and roleName.

Format

GET /controller/api/rbac/v1/roles

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles

Response status code 200 :
{
  "roles":
  [
    {"id": 13,"name": "Account Administrator"},
    {"id": 14,"name": "Administrator"},
    {"id": 20,"name": "Analytics Administrator"},
    {"id": 16,"name": "Dashboard Viewer"},
    {"id": 18,"name": "DB Monitoring Administrator"},
    {"id": 19,"name": "DB Monitoring User"},
    {"id": 21,"name": "Server Monitoring Administrator"},
    {"id": 22,"name": "Server Monitoring User"},
    {"id": 15,"name": "User"},
    {"id": 17,"name": "Workflow Executor"}
  ]
}
```

Update Role

Use this to update a role by `roleId` in the current account. This only updates the role object itself, while leaving the relationship with users and groups unaffected.

Format

PUT /controller/api/rbac/v1/roles/roleId

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	Request payload		Yes
name	Request payload		Yes
description	Request payload		No

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 49, "name": "role1","description": "new
description" }' -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/49
```

```
Response status code 200 :
{
  "id": 49,
  "name": "role1",
  "description": "new description"
}
```

Delete Role

Use this to delete a role in the current account.

Format

DELETE /controller/api/rbac/v1/roles/roleId

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/49
```

```
Response status code 200 :
```

License API

Related pages:

- [Observe License Usage](#)(see page 203)

APIs for [Infrastructure-based Licensing](#)(see page 3795):

License Usage API

A RESTful API to programmatically retrieve overall license usage by application ID or name, or by host ID.

Retrieve Usage by Application ID

You can retrieve license usage details (such as vCPU count) for an application by application ID.

URL

http://<host>:<port>/controller/licensing/v1/account/{accountId}/grouped-usage/application/by-id

Format

GET /controller/licensing/v1/account/{accountId}/grouped-usage/application/by-id

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes

Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
appId	Array	A set of application IDs.	Yes
includeAgents	Boolean	Flag indicates whether the list of agents is required in response.	No

Response Format

response appObject

Parameter Name	Parameter Type	Value
vCpuTotal	Integer	Total number of vCPUs on hosts where all applications are running.

Parameter Name	Parameter Type	Value
fallbackLicenseUnits	Object	Total number of (fallback) license units used by the applications per package name.
items	Object	Detail of usages by application.

appItemObject

Parameter Name	Parameter Type	Value
appId	Integer	Application ID.
appName	String	Application name.
vCpu	Integer	Number of vCPU on the host.
nodes	Object (nodeObject)	Nodes where the application is running.
containers	Object (containerObject)	Containers where the application is running.
agents	Object (agentObject)	(Optional) License keys associated with all agents.
hosts	Object (hostObject)	Hosts where the application is running. Will be null when this object is self-referenced.

nodeObject

Parameter Name	Parameter Type	Value
nodeName	String	Node name.

containerObject

Parameter Name	Parameter Type	Value
containerId	String	Container ID.

agentObject

Parameter Name	Parameter Type	Value
type	String	Agent type.
version	String	Agent version.
licenseKey	String	License key used to obtain lease.

hostObject

Parameter Name	Parameter Type	Value
vCpuTotal	Integer	Total number of vCPUs on hosts.
items	Object	Detail of usages by host.

hostItemObject

Parameter Name	Parameter Type	Value
host	String	Host name.
fallbackLicenseUnits	Object	License unit used by the application/host per package name.
vCpu	Integer	Number of vCPU on the host.
nodes	Object (nodeObject)	Number of nodes on the host.
containers	Object (containerObject)	Number of containers on the host.
agents	Object (agentObject)	(Optional) License keys associated with all agents.
application	Object (appItemObject)	Applications running on the host. Will be null when this object is self-referenced.

Example

[Request](#) Response

Request [Response](#)

Retrieve by Application Name

You can retrieve license usage details (such as vCPU count) for an application by application name.

URL

`http://<host>:<port>/controller/licensing/v1/account/{accountId}/grouped-usage/application/by-name`

Format

GET /controller/licensing/v1/account/{accountId}/grouped-usage/application/by-name

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes

Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
appName	Array	A set of (URL escaped) application names.	Yes
includeAgents	Boolean	Flag indicates whether the list of agents is required in response.	No

Response Format

response appObject

Parameter Name	Parameter Type	Value
vCpuTotal	Integer	Total number of vCPUs on hosts where all applications are running.
fallbackLicenseUnits	Object	Total number of (fallback) license units used by the applications per package name.
items	Object	Detail of usages by application.

appItemObject

Parameter Name	Parameter Type	Value
appId	Integer	Application ID.
appName	String	Application name.
vCpu	Integer	Number of vCPUs on the host.
nodes	Object (nodeObject)	Nodes where the application is running.
containers	Object (containerObject)	Containers where the application is running.
agents	Object (agentObject)	(Optional) License keys associated with all agents.
hosts	Object (hostObject)	Hosts where the application is running. Will be null when this object is self-referenced.

nodeObject

Parameter Name	Parameter Type	Value
nodeName	String	Node name.

containerObject

Parameter Name	Parameter Type	Value
containerId	String	Container ID.

agentObject

Parameter Name	Parameter Type	Value
type	String	Agent type.
version	String	Agent version.
licenseKey	String	License key used to obtain lease.

hostObject

Parameter Name	Parameter Type	Value
vCpuTotal	Integer	Total number of vCPUs on hosts.
items	Object	Detail of usages by host.

hostItemObject

Parameter Name	Parameter Type	Value
host	String	Host name.
fallbackLicenseUnits	Object	License unit used by the application/host per package name.
vCpu	Integer	Number of vCPU nodes on the host.
nodes	Object (nodeObject)	Nodes where the application is running.
containers	Object (containerObject)	Containers where the application is running.
agents	Object (agentObject)	(Optional) License keys associated with all agents.
application	Object (appItemObject)	Applications running on the host. Will be null when this object is self-referenced.

[Request](#) [Response](#)

Retrieve Usage by Host ID

You can retrieve license usage information (such as vCPU count) for an application by host ID.

URL

http://<host>:<port>/controller/licensing/v1/account/{accountId}/grouped-usage/host

Format

GET /controller/licensing/v1/account/{accountId}/grouped-usage/host

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes

Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
hostId	Array	A set of (URL escaped) host IDs.	Yes
includeAgents	Boolean	A flag indicates whether the list of agents is required in response.	No

Response Format

response hostObject

Parameter Name	Parameter Type	Value
vCpuTotal	Integer	Total number of vCPUs on hosts.
items	Object	Detail of usages by host.

hostItemObject

Parameter Name	Parameter Type	Value
host	String	Host name.
fallbackLicenseUnits	Object	License unit used by the application/host per package name.
vCpu	Integer	Number of vCPU on the host.
nodes	Object (nodeObject)	Number of nodes on the host.

Parameter Name	Parameter Type	Value
containers	Object (containerObject)	Number of containers on the host.
agents	Object (agentObject)	(Optional) License keys associated with all agents.
application	Object (appItemObject)	Applications running on the host. Will be null when this object is self-referenced.

nodeObject

Parameter Name	Parameter Type	Value
nodeName	String	Node name.

containerObject

Parameter Name	Parameter Type	Value
containerId	String	Container ID.

agentObject

Parameter Name	Parameter Type	Value
type	String	Agent type.
version	String	Agent version.
licenseKey	String	License key used to obtain lease.

appObject

Parameter Name	Parameter Type	Value
vCpuTotal	Integer	Total number of vCPUs on hosts where all applications are running.
fallbackLicenseUnits	Object	Total number of (fallback) license units used by the applications per package name.

Parameter Name	Parameter Type	Value
items	Object	Detail of usages by application.

appItemObject

Parameter Name	Parameter Type	Value
appId	Integer	Application ID.
appName	String	Application name.
vCpu	Integer	Number of vCPU on the host.
nodes	Object (nodeObject)	Nodes where the application is running.
containers	Object (containerObject)	Containers where the application is running.

Account Usage API

A RESTful API to programmatically retrieve account usage by license and account ID.

Retrieve Account Usage by License ID

Retrieve account usage referenced by given license ID.

URL

http://<host>:<port>/controller/licensing/v1/usage/license/{licenseId}

Format

GET /controller/licensing/v1/usage/license/{licenseId}

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
licenseId	String	License Id for which an usage is requested to be retrieved.	Yes

Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
dateFrom	String	Start date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
dateTo	String	End date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
granularityMinutes	Integer	Requested granularity of the license usage data.	Yes
includeEntityTypes	Boolean	Determines whether to include licensed entity type usage or not. The default is false.	No
includeConsumptionBased	Boolean	Whether to include consumption-based usages. The default is false.	No

Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID.

Parameter Name	Parameter Type	Value
licenseRule	Object	Entity representing license usage either for an account or for an allocation.
packages	Array of package Objects	

licenseRule Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID.
name	String	Allocation name.
licenseKey	String	License key for this particular allocation.

packageObject

Parameter Name	Parameter Type	Value
packageName	String	An enumeration representing the name of the package (edition) instance: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" • "ENTERPRISE"
type	String	An enumeration representing the type of the package instance: <ul style="list-style-type: none"> • "PAID" • "TRIAL" • "LITE"
kind	String	Package kind derived from the licensing model where the package originated from. Useful for quickly distinguishing packages based on the legacy Agent based license modules (APM, DOTNET, etc.) from the new Infrastructure based packages. Enum: "AGENT_BASED" "INFRASTRUCTURE_BASED"

Parameter Name	Parameter Type	Value
family	String	Package family.
createdDate	String	Creation date of the package instance in the license. ISO 8601 date-time string.
startDate	String	Start date of the package instance. For example, the date from which the package instance becomes active: ISO 8601 date-time string.
expirationDate	String	Expiration date of the package instance, i.e. date from which the package instance is no longer active. ISO 8601 date-time string.
licenseUnits	String	Number of licenses available for the package instance.
properties	Object	Collection of package specific custom properties in the form of key-value pairs. In case of merging with global properties, conflicting package specific properties take precedence.

Example

License Allocation API

The methods below allow you retrieve, create, filter, and delete license allocations (license rules) for an account.

Retrieve All License Allocations

Retrieve all license allocations, and narrow the list of allocations by using optional [query parameters](#)(see [page 3810](#)).

URL

http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation

Format

GET /controller/licensing/v1/account/{accountId}/allocation

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes

Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	String	Name of the allocation. Cannot be used in combination with license-key and tag.	No

Parameter Name	Parameter Type	Value	Mandatory
license-key	String	License key of the allocation. Cannot be used in combination with name and tag.	No
tag	String	Tag associated with allocations. Cannot be used in combination with name and license-key.	No

Response Format

response Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID. Unique per account.
accountId	Integer	Account ID the allocation belongs to.
name	String	Name of the allocation. Unique per account.
licenseKey	String	License key used by the allocation. Unique per account.
filters	Array of Objects	Array of filter objects
limits	Array of Objects	Array of limit objects
tags	Array of Strings	Tags associated with the allocation.
createdDate	String	Creation date of the allocation: ISO 8601 date-time string.
lastUpdatedDate	String	Last update date of the allocation: ISO 8601 date-time string.

filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"
operator	String	Operator of the following enumerations used to check the <code>type</code> against the <code>value</code> : <ul style="list-style-type: none"> • ID_EQUALS – Exact match of entity Id • EQUALS – Exact match of entity value • STARTS_WITH – Match of entity starting with a value • ENDS_WITH – Match of entity ending with a value • CONTAINS – Match of entity containing a value • REGEX – Match of entity against a regexp
value	String	Value to be used to filter against.

limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" • "ENTERPRISE"
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

Example

[Request](#) Response

Request [Response](#)

Retrieve Allocation Usage by Account ID

Retrieve allocation rule usage referenced by a given license key ID.

URL

http://<host>:<port>/controller/licensing/v1/usage/account/{accountId}/allocation/{licenseKey}

Format

GET /controller/licensing/v1/usage/account/{accountId}/allocation/{licenseKey}

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account ID for which a usage is requested to be retrieved.	Yes
licenseKey	String	License key based on the allocation rule is selected. Returned usage will be related to that particular allocation rule.	Yes

Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
dateFrom	String	Start date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
dateTo	String	End date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
granularityMinutes	Integer	Requested granularity of the license usage data.	Yes
includeEntityTypes	Boolean	Determines whether to include licensed entity type usage or not. The default is false.	No

Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID.
licenseRule	Object	Entity representing license usage either for an account or for an allocation.
packages	Array	Package objects.

licenseRule Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID.
name	String	Allocation name.
licenseKey	String	License key for this particular allocation.

packageObject

Parameter Name	Parameter Type	Value
packageName	String	An enumeration representing the name of the package (edition) instance: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" • "ENTERPRISE"
type	String	An enumeration representing the type of the package instance: <ul style="list-style-type: none"> • "PAID" • "TRIAL" • "LITE"

Parameter Name	Parameter Type	Value
kind	String	Package kind derived from the licensing model where the package originated from. Useful for quickly distinguishing packages based on the legacy Agent based license modules (APM, DOTNET, etc.) from the new Infrastructure based packages. Enum: "AGENT_BASED" "INFRASTRUCTURE_BASED"
family	String	Package family.
createdDate	String	Creation date of the package instance in the license. ISO 8601 date-time string.
startDate	String	Start date of the package instance. For example, the date from which the package instance becomes active: ISO 8601 date-time string.
expirationDate	String	Expiration date of the package instance, i.e. date from which the package instance is no longer active. ISO 8601 date-time string.
licenseUnits	String	Number of licenses available for the package instance.
properties	Object	Collection of package specific custom properties in the form of key-value pairs. In case of merging with global properties, conflicting package specific properties take precedence.

Example

[Request](#) [Response](#)

[Request](#) [Response](#)

Retrieve Allocation Usage by License Key

Retrieve allocation usage referenced by a given license key.

URL

http://<host>:<port>/controller/licensing/v1/usage/license/{licenseId}/allocation/{licenseKey}

Format

GET /controller/licensing/v1/usage/license/{licenseId}/allocation/{licenseKey}

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
licenseId	String	License ID for which a usage is requested to be retrieved.	Yes
licenseKey	String	License key based on the allocation rule is selected. Returned usage will be related to that particular allocation rule.	Yes

Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
dateFrom	String	Start date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
dateTo	String	End date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
granularityMinutes	Integer	Requested granularity of the license usage data.	Yes
includeEntityTypes	Boolean	Determines whether to include licensed entity type usage or not. The default is false.	No

Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID.
licenseRule	Object	Entity representing license usage either for an account or for an allocation.
packages	Array of package objects	Package objects.

licenseRule Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID.
name	String	Allocation name.
licenseKey	String	License key for this particular allocation.

packageObject

Parameter Name	Parameter Type	Value
Parameter Name	Parameter Type	Value
packageName	String	An enumeration representing the name of the package (edition) instance: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" • "ENTERPRISE"
type	String	An enumeration representing the type of the package instance: <ul style="list-style-type: none"> • "PAID" • "TRIAL" • "LITE"

Parameter Name	Parameter Type	Value
kind	String	Package kind derived from the licensing model where the package originated from. Useful for quickly distinguishing packages based on the legacy Agent based license modules (APM, DOTNET, etc.) from the new Infrastructure based packages. Enum: "AGENT_BASED" "INFRASTRUCTURE_BASED"
family	String	Package family.
createdDate	String	Creation date of the package instance in the license. ISO 8601 date-time string.
startDate	String	Start date of the package instance. For example, the date from which the package instance becomes active: ISO 8601 date-time string.
expirationDate	String	Expiration date of the package instance, i.e. date from which the package instance is no longer active. ISO 8601 date-time string.
licenseUnits	String	Number of licenses available for the package instance.
properties	Object	Collection of package specific custom properties in the form of key-value pairs. In case of merging with global properties, conflicting package specific properties take precedence.

Example

Request [Response](#)

Create a License Allocation

Create a license allocation. For this method, make sure:

- IDs of sub-entities (filters, limits) are not filled
- Other unique parameters (e.g., name, licenseKey) don't conflict with existing allocations

URL

http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation

Format

POST /controller/licensing/v1/account/{accountId}/allocation

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes

Request Format

request Object

Parameter Name	Parameter Type	Value
name	String	Name of the allocation. Unique per account.
filters	Array of Objects	Array of filter objects
limits	Array of Objects	Array of limit objects

Filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"
operator	String	Operator of the following enumerations used to check the type against the value: <ul style="list-style-type: none"> • ID_EQUALS – Exact match of entity Id • EQUALS – Exact match of entity value • STARTS_WITH – Match of entity starting with a value • ENDS_WITH – Match of entity ending with a value • CONTAINS – Match of entity containing a value • REGEX – Match of entity against a regexp

Parameter Name	Parameter Type	Value
value	String	Value to be used to filter against.

limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" • "ENTERPRISE"
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

Response Format

response Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID. Unique per account.
accountId	Integer	Account ID the allocation belongs to.
name	String	Name of the allocation. Unique per account.
licenseKey	String	License key used by the allocation. Unique per account.
filters	Array of Objects	Array of filter objects

Parameter Name	Parameter Type	Value
limits	Array of Objects	Array of limit objects
tags	Array of Strings	Tags associated with the allocation.
createdDate	String	Creation date of the allocation: ISO 8601 date-time string.
lastUpdatedDate	String	Last update date of the allocation: ISO 8601 date-time string.

filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"
operator	String	Operator of the following enumerations used to check the type against the value: <ul style="list-style-type: none"> • ID_EQUALS – Exact match of entity Id • EQUALS – Exact match of entity value • STARTS_WITH – Match of entity starting with a value • ENDS_WITH – Match of entity ending with a value • CONTAINS – Match of entity containing a value • REGEX – Match of entity against a regexp
value	String	Value to be used to filter against.

limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.

Parameter Name	Parameter Type	Value
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" • "ENTERPRISE"
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

Example

Request [Response](#)

Retrieve a License Allocation

Retrieve a license allocation by allocation ID.

URL

http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation/{allocationId}

Format

GET /controller/licensing/v1/account/{accountId}/allocation/{allocationId}

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes
allocationId	String	Allocation ID referencing allocation to be retrieved.	Yes

Response Format

response Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID. Unique per account.
accountId	Integer	Account ID the allocation belongs to.
name	String	Name of the allocation. Unique per account.
licenseKey	String	License key used by the allocation. Unique per account.
filters	Array of Objects	Array of filter objects
limits	Array of Objects	Array of limit objects
tags	Array of Strings	Tags associated with the allocation.
createdDate	String	Creation date of the allocation: ISO 8601 date-time string.
lastUpdatedDate	String	Last update date of the allocation: ISO 8601 date-time string.

filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"

Parameter Name	Parameter Type	Value
operator	String	Operator of the following enumerations used to check the type against the value: <ul style="list-style-type: none"> • ID_EQUALS – Exact match of entity Id • EQUALS – Exact match of entity value • STARTS_WITH – Match of entity starting with a value • ENDS_WITH – Match of entity ending with a value • CONTAINS – Match of entity containing a value • REGEX – Match of entity against a regexp
value	String	Value to be used to filter against.

limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" • "ENTERPRISE"
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

[Request](#) [Response](#)

Update a License Allocation

Update a license allocation by allocation ID.

URL

http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation/{allocationId}

Format

PUT /controller/licensing/v1/account/{accountId}/allocation/{allocationId}

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes
allocationId	String	Allocation ID referencing allocation to be retrieved.	Yes

Request Format

request Object

Parameter Name	Parameter Type	Value	Mandatory
name	String	Name of the allocation. Unique per account.	Yes
filters	String	Allocation ID referencing allocation to be retrieved.	No
limits	Object		No
tags	Array of Strings		No

filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.

Parameter Name	Parameter Type	Value
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"
operator	String	Operator of the following enumerations used to check the type against the value: <ul style="list-style-type: none"> • ID_EQUALS – Exact match of entity Id • EQUALS – Exact match of entity value • STARTS_WITH – Match of entity starting with a value • ENDS_WITH – Match of entity ending with a value • CONTAINS – Match of entity containing a value • REGEX – Match of entity against a regexp
value	String	Value to be used to filter against.

limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" • "ENTERPRISE"
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

Example

[Request](#) Response

Request [Response](#)

Delete a License Rule Allocation

Delete a license allocation by allocation ID.

URL

http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation/{allocationId}

Format

DELETE /controller/licensing/v1/account/{accountId}/allocation/{allocationId}

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes
allocationId	String	Allocation ID referencing allocation to be retrieved.	Yes

Example

```
curl --user <user>@<AccountName>:<password> -X DELETE \
http://<host>:<port>/controller/licensing/v1/account/
{accountId}/allocation/{allocationId}
```

License Information API

A RESTful API to programmatically retrieve license information for an account, such as license type, package, and expiration date.

Retrieve Account License Information

Retrieve license information for an account.

URL

http://<host>:<port>/controller/licensing/v1/account/{accountId}/info

Format

GET /controller/licensing/v1/account/{accountId}/info

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes

Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID the license info belongs to.
licenseId	String	SFDC license ID.
customerId	String	Customer ID.
customerName	String	Customer name.
environment	String	Enumerations representing the environment the license is intended to be used on: <ul style="list-style-type: none"> • "DEV/TEST" • "PROD"
hardwareFingerprint	String	Hardware fingerprint of a machine the license is intended to be used on. Currently only the MAC address is supported. Might be ANY for no restrictions.
type	String	Enumeration representing the intended consumer of the license: <ul style="list-style-type: none"> • "SAAS-CONTROLLER" • "SAAS-ACCOUNT" • "ONPREM-CONTROLLER" • "ONPREM-ACCOUNT"
expirationDate	String	Expiration date of the whole license: ISO 8601 date-time string.

Parameter Name	Parameter Type	Value
status	String	Enumeration representing the license status: <ul style="list-style-type: none"> • "ACTIVE" - Unexpired and paID license. All units are paid. • "LIMITED" - Unexpired and either lite or trial. at least one unit is LITE or TRIAL. • "EXPIRED" - Expired license.
packages	Array of Objects	
properties	Object	Collection of global custom properties tied to the license in the form of key → value. These properties might be shared among all packages.
fallbackUnits	Object	Account level fallback unit definition, it is mapping agent types (string) to their fallback units (integer).

package Object

Parameter Name	Parameter Type	Value
packageName	String	An enumeration representing the name of the package (edition) instance: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" "ENTERPRISE"
type	String	An enumeration representing the type of the package instance: <ul style="list-style-type: none"> • "PAID" • "TRIAL" • "LITE"
kind	String	Package kind derived from the licensing model where the package originated from. Useful for quickly distinguishing packages based on the legacy Agent based license modules (APM, DOTNET, etc.) from the new Infrastructure based packages. Enum: "INFRASTRUCTURE_BASED"
family	String	Package family.

Parameter Name	Parameter Type	Value
createdDate	String	Creation date of the package instance in the license. ISO 8601 date-time string.
startDate	String	Start date of the package instance. For example, the date from which the package instance becomes active: ISO 8601 date-time string.
expirationDate	String	Expiration date of the package instance, i.e. date from which the package instance is no longer active. ISO 8601 date-time string.
licenseUnits	String	Number of licenses available for the package instance.
properties	Object	Collection of package specific custom properties in the form of key-value pairs. In case of merging with global properties, conflicting package specific properties take precedence.

APIs for [Agent-based Licensing](#)(see page 3795):

License Rules API

This section describes the License Rules API methods you can use to retrieve information about the license rules as modeled in AppDynamics such as creating, updating and deleting license rules, and also retrieving license rules by its ID, access key, and name.

The following are true for all License Rule APIs:

- `id`—is GUID (or UUID) which is an acronym for Globally Unique Identifier.
- `access_key`—must be unique across all `licenseRules`.
- `name`—must be unique across all `licenseRules`.
- `account_id`—Use GET API to know your current `account_ID`.

Creates a New License Rule

URL

http://<host>:<port>/controller/mds/v1/license/rules

Format

POST /controller/mds/v1/license/rules

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
license_module_type	String	String representing the type of the license module. Module types are: <ul style="list-style-type: none"> • NETVIZ • MACHINE_AGENT • SIM_MACHINE_AGENT • APM • APP_AGENT • DOT_NET_AGENT 	Yes
id	String	String representing the ID or name.	Yes
version	Integer	Indicates the version number.	Yes
number_of_licenses	Integer	Integer indicating the required number of licenses.	Yes
account_id	String	Provides the account name or account ID.	Yes
access_key	Path	Provides the account access key.	Yes

LicenseRule is comprised of license_module_type, id, access_key, account_id, version, and number_of_licenses.

Example

[Request](#) Response

Request [Response](#)

The version must be 0 when creating.

Returns a Summary of All the License Rules for the Current Account

Use this to retrieve a summary of the license rules. The data transfer objects (DTOs) returned will not contain any constraints, match conditions, or entitlements.

URL

http://<host>:<port>/controller/mds/v1/license/rules

Format

GET /controller/mds/v1/license/rules

Example

```
[
  {
    "id":"f36e08e2-5f57-4b8c-9ad2-f18873adcd87",
    "version":2,
    "name":"Default",
    "description":null,
    "enabled":true,
    "constraints":[
    ],
    "entitlements":[
    ],
    "account_id":"0429fc7b-a2b9-42e3-a7fb-f704d436a054",
    "access_key":"account-accesskey-123",
    "total_licenses":120,
    "peak_usage":null
  }
]
```

Updates a License Rule

URL

http://<host>:<port>/controller/mds/v1/license/rules

Format

PUT /controller/mds/v1/license/rules

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
id	String	String representing the ID or name.	Yes

Parameter Name	Parameter Type	Value	Mandatory
license_module_type	String	String representing the type of the license module. Module types are: <ul style="list-style-type: none"> • NetViz • Machine Agent • SIM Machine Agent • APM 	Yes
version	Integer	Indicates the version number.	Yes
number_of_licenses	Integer	Integer indicating the required number of licenses.	Yes
account_id	String	Provides the account name or account ID.	Yes
access_key	Path	Provides the account access key.	Yes

Example Request

```

curl -v -X PUT http://<host>:<port>/controller/mds/v1/license/
rules \
  --user <user>@<AccountName>:<password> \
  -H 'Content-Type: application/json' \
  -d '{
    "id": "321116a4-124c-4b73-9343-f315836f103b",
    "version": 0,
    "name": "Default_API",
    "description": null,
    "enabled": true,
    "constraints": [],
    "entitlements": [
      {
        "license_module_type": "JAVA",
        "number_of_licenses": 1000
      },
      {
        "license_module_type": "NATIVE_WEB_SERVER",
        "number_of_licenses": 100
      },
      {

```

```

        "license_module_type": "NATIVE_SDK",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "DOT_NET",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "NETVIZ",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "MACHINE_AGENT",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "NODEJS",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "SIM_MACHINE_AGENT",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "PHP",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "PYTHON",
        "number_of_licenses": 100
    }
],
"account_id": "8b1e92f2-387c-45b6-9bb5-ebd7f67587d4",
"access_key": "api845ad-1f3e-4c9b-909b-a3cfa510bfb0",
"total_licenses": null,
"peak_usage": null
}

```

To update the license rules:

1. Get the payload using any of the available GET methods.

2. Update accessKeys, entitlements, etc.
3. Send the PUT request without changing other key-value pairs.
4. "version" should be kept as it was during GET. This would be incremental.

Deletes a License Rule

URL

http://<host>:<port>/controller/mds/v1/license/rules/f36e08e2-5f57-4b8c-9ad2-f18873adcd87

Format

DELETE /controller/mds/v1/license/rules/{id}

Input parameter

Parameter Name	Parameter Type	Value	Mandatory
LicenseRuleId	Path	Deletes license rule by its ID.	Yes

Retrieve a License Rule by ID

Use this to retrieve a license rule by the license rule ID.

URL

http://<host>:<port>/mds/v1/license/rules/f36e08e2-5f57-4b8c-9ad2-f18873adcd87

Format

GET /mds/v1/license/rules/{licenseRuleId}

Path Parameter

Parameter Name	Parameter Type	Value	Mandatory
licenseRuleId	Path	Retrieves the UUID of the license rule.	Yes

Output Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	String	String representing the ID or name.	Yes
version	Integer	Indicates the version number.	Yes

Parameter Name	Parameter Type	Value	Mandatory
total_licenses	Integer	Integer indicating the total number of licenses.	Yes
account_id	String	Provides the account name or account ID.	Yes
access_key	path	Provides the account access key.	Yes

Example

[Request](#) [Response](#)

[Request](#) [Response](#)

 The "version" gets updated after every update from UI or API.

Retrieves a License Rule by Access Key

URL

http://<host>:<port>/controller/mds/v1/license/rules/accessKey/account-accesskey-123

Format

GET /controller/mds/v1/license/rules/accessKey/{accessKey}

Path Parameter

Parameter Name	Parameter Type	Value	Mandatory
access_key	Path	Retrieves the access key assigned to the license rule.	Yes

Output Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	String	String representing the ID or name.	Yes
version	Integer	Indicates the version number.	Yes

Parameter Name	Parameter Type	Value	Mandatory
total_licenses	Integer	Integer indicating the total number of licenses.	Yes
account_id	String	Provides the account name or account ID.	Yes

Example

[Request](#) [Response](#)

[Request](#) [Response](#)

Retrieve a License Rule by Name

URL

http://<host>:<port>/controller/mds/v1/license/rules/name/Default

Format

GET /controller/mds/v1/license/rules/name/{name}

Path Parameter

Parameter Name	Parameter Type	Value	Mandatory
name	Path	Retrieves the name of the license rule.	Yes

Output Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	String	String representing the ID or name.	Yes
version	Integer	Indicates the version number.	Yes
total_licenses	Integer	Integer indicating the total number of licenses.	Yes
account_id	String	Provides the account name or account ID.	Yes

Integration Modules

Related pages:

- [AppDynamics Exchange](#)¹⁹⁸⁴

The [AppDynamics Community Exchange](#)¹⁹⁸⁵ includes many extensions that supplement the capabilities of the AppDynamics Application Performance Monitoring (APM) Platform. Documentation on setting up and using the integration module appears with the module.

Some integrations listed here do not display on the Controller UI Integrations page. This is because not all integrations require configuration at the Controller (e.g., Rookout, Apica) level or they can only be configured at the underlying [Glassfish Admin Console](#)¹⁹⁸⁶ level (e.g., DB CAM).

The following integration modules are built into the AppDynamics platform and described on the pages linked here.

Integrate AppDynamics with Cisco® Application Centric Infrastructure

 AppDynamics is ending support for Application Centric Infrastructure (ACI). The feature will not work once customers upgrade their Controllers beyond > 21.1. See Support Advisory: Application Centric Infrastructure (ACI) End of Life (EOL) Notice.

This page describes the advantages of the integration of AppDynamics with Cisco® Application Centric Infrastructure (Cisco ACI™). This solution provides a unified view from the application code to underlying network layers for business-critical applications running in a data center. This enables the network operations Admin and the application operations Admin to quickly troubleshoot issues at the application and the network levels.

 You can integrate the Cisco ACI™ solution with select AppDynamics Controllers only. If you are interested in using the integrated solution, contact help@appdynamics.com¹⁹⁹⁰. See [Troubleshoot Using the Integrated Solution](#)¹⁹⁹¹.

Getting Started with AppDynamics- Cisco ACI™ Integration

⚠ AppDynamics is ending support for Application Centric Infrastructure (ACI). The feature will not work once customers upgrade their Controllers beyond > 21.1. See [Support Advisory: Application Centric Infrastructure \(ACI\) End of Life \(EOL\) Notice](#).

This page provides instructions for integrating AppDynamics with Cisco ACI™ solution and verifying interoperability between the applications. This integration provides end-to-end visibility into the application and network layers within a data center.

Before You Begin

Ensure that your environment meets these minimum system requirements:

- Controller \geq 4.5.2 with a Network Visibility license per OS instance. See [Controller System Requirements](#)¹⁹⁹².
- Hosts with Network Visibility Agents \geq 4.5.2. See [Network Visibility Requirements and Supported Environments](#)¹⁹⁹³.
- Hosts with Java Agents \geq 4.5.2 or .NET Agent for Windows \geq 4.5.15 with an App Agent license. See [Install Java Agent](#)(see page 527) or [.NET Agent](#)(see page 652).
- sudo or root access permissions on the agent host to install the Network Agent.
- Network Visibility is supported on Linux and Windows operating systems. See [Network Visibility Supported Environments](#)(see page 2721).

i If your applications are running in a Kubernetes environment, enable the Kubernetes-ACI integration before you proceed with the AppDynamics and Cisco ACI™ integration. See [Cisco ACI and Kubernetes Integration](#)¹⁹⁹⁴.

Enable SSL for Cisco ACI Integration

The Cisco Application Policy Infrastructure Controller (APIC) supports the import and storage of an SSL certificate and private key into the Controller to create a secure and trusted environment with AppDynamics.

1. Access the AppDynamics Controller using the SSH.
2. At a command prompt, change directories to the following location:

```
<controller_home>/appserver/glassfish/domains/domain1/config
```

3. Import the self-signed certificate from the appropriate directory as follows:

```
keytool -import -keystore cacerts.jks -file /path/to/RootCA.crt
```

Enable Cisco ACI Integration (Controller \leq 4.5.10)

i The Cisco ACI Integration is enabled by default for \geq 4.5.11.

¹⁹⁹² <https://docs.appdynamics.com/display/PRMY21/.Controller+System+Requirements+v21.5>

¹⁹⁹³ <https://docs.appdynamics.com/display/PRO45/Network+Visibility+Requirements+and+Supported+Environments>

¹⁹⁹⁴ https://www.cisco.com/c/en/us/td/docs/switches/datacenter/aci/apic/sw/kb/b_Kubernetes_Integration_with_ACI.html

1. Log in to the Administration Console:

```
http:<controller-hostname>:<controller-port>/controller/admin.jsp
```

For example:

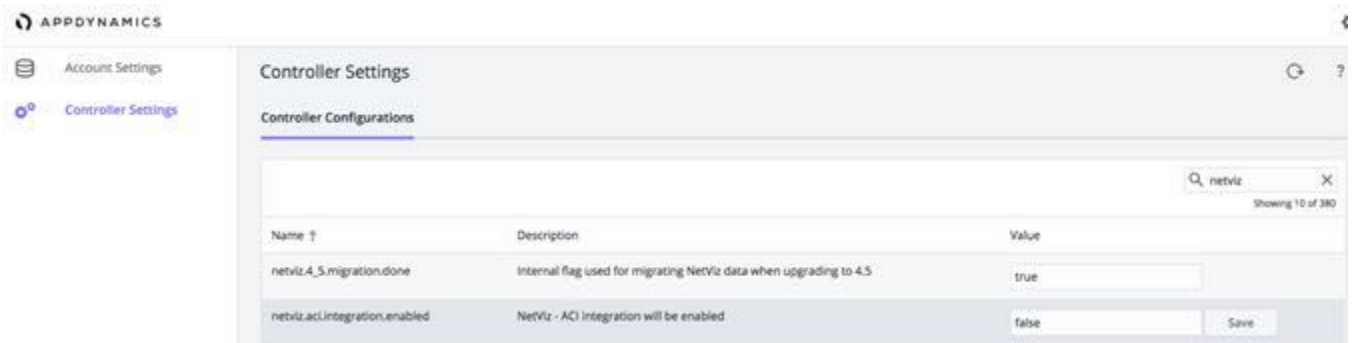

```
https:<controller-hostname>:8800/controller/admin.jsp
```

```
https:<controller-hostname>:443/controller/admin.jsp
```

You must use the password that was set for the root user of the Controller when the Controller was in [Management](#)¹⁹⁹⁵

2. In **Controller Settings**, search for **netviz.aci.integration.enabled** and set this field to **true**.
3. Click **Save**.

Configure Cisco ACI Credentials

If you are using an AppDynamics Controller \geq 4.5.11, the Cisco ACI Integration feature is enabled by default. If you are using an AppDynamics Controller \leq 4.5.10, you must [enable Cisco ACI Integration manually](#)¹⁹⁹⁶ before you configure your credentials.

1. Log in to the AppDynamics Controller as an administrator:

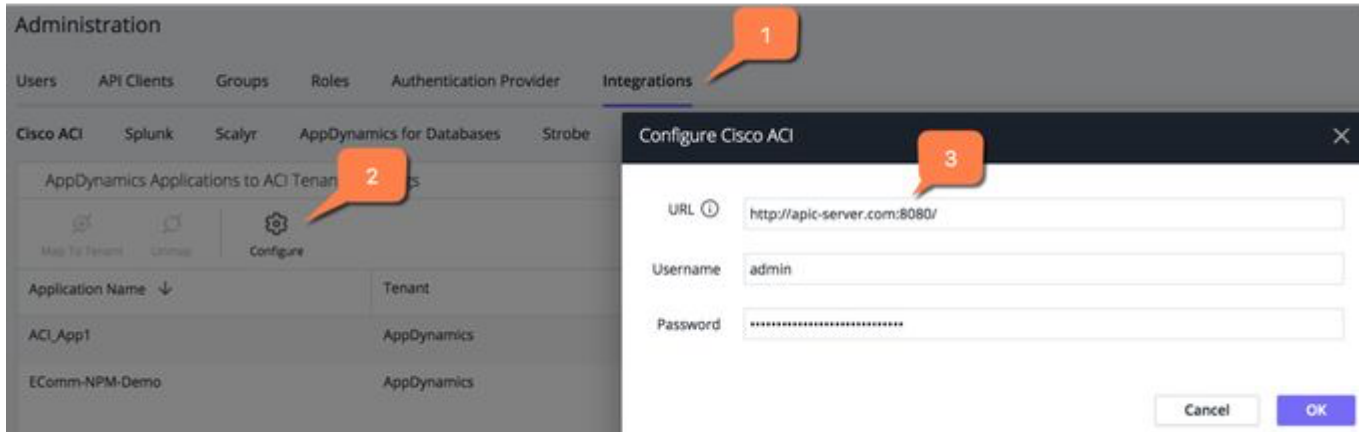

```
http:<controller-hostname>:<controller-port>/controller
```

2. Click **Settings > Administration**.

¹⁹⁹⁵ <https://docs.appdynamics.com/display/PRO45/User+Management>

¹⁹⁹⁹ <https://docs.appdynamics.com/pages/viewpage.action?pageId=45510337#GettingStartedwithAppDynamics-CiscoACI™Integration-EnableCiscoACIIntegration>

3. Select the Integration tab. **Cisco ACI** is selected by default in the **Integrations** list.

4. Click **Configure** and enter these details:
 - a. Full URL along with the port details to the Cisco APIC Server. For example, `http://apic-server.com:8080/`
 - b. User credentials to the Cisco APIC.
5. Click **OK**.

AppDynamics initiates the background processes required to integrate with the Cisco ACI solution.

Correlate AppDynamics and Cisco ACI Components

The AppDynamics integration with Cisco ACI brings together the logical constructs of both solutions. This enables the network operations admin and the application operations admin to obtain a comprehensive end-to-end view from the application to the network. Correlating or mapping the components of both solutions helps the admins triage and troubleshoot issues quickly.

AppDynamics Components

The AppDynamics application model serves as the framework around which AppDynamics organizes and presents application performance information. A typical application environment consists of different components that interact in multiple ways.

- **Application**—The top-level container in the AppDynamics model. A business application contains a set of related services and business transactions.
- **Tier**—A grouping of one or more nodes in the AppDynamics application model. There is no interaction among nodes within a single tier.
- **Node**—The smallest unit of the modeled environment. A node corresponds to a monitored server or JVM in the application environment. A node may correspond to an individual application server, JVM, CLR, PHP application, and Apache Web server.

AppDynamics components are logically arranged as **Application**¹⁹⁹⁷ > **Tiers**¹⁹⁹⁸ > **Nodes**¹⁹⁹⁹.

Cisco ACI Components

Cisco ACI is a Software-Defined Networking (SDN) solution that simplifies, optimizes, and accelerates infrastructure deployment and governance, and expedites the application deployment lifecycle.

¹⁹⁹⁷ <https://docs.appdynamics.com/display/PRO44/Business+Applications>

¹⁹⁹⁸ <https://docs.appdynamics.com/display/PRO44/Tiers+and+Nodes>

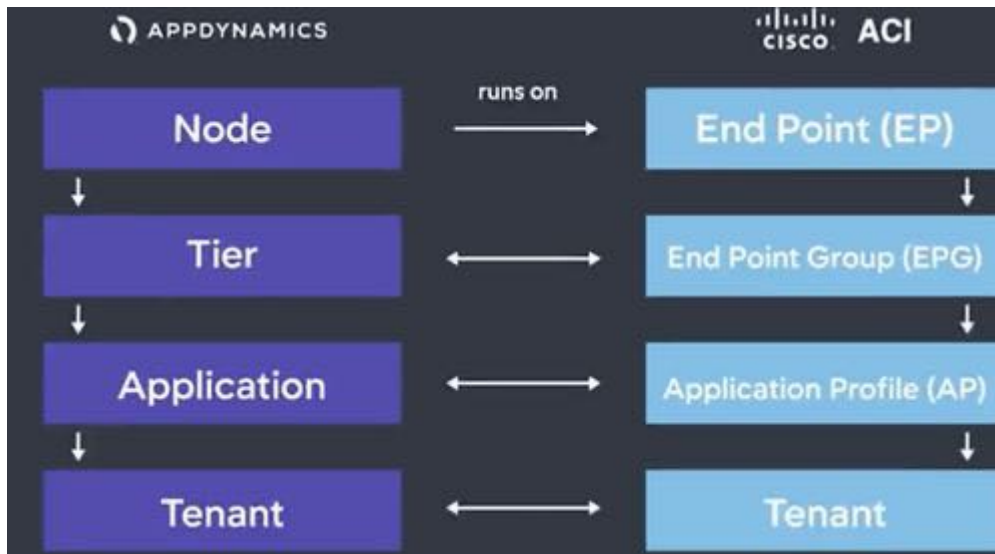

¹⁹⁹⁹ <https://docs.appdynamics.com/display/PRO44/Tiers+and+Nodes>

Cisco ACI implements Cisco’s intent-based networking framework. It captures higher-level business and user intent in the form of a policy and converts this intent into the network constructs necessary to dynamically provision the network, security, and infrastructure services.

- Cisco APIC—The infrastructure Controller is the main architectural component of the Cisco ACI solution. It is the unified point of automation and management for the Cisco ACI fabric, policy enforcement, and health monitoring.
 - The APIC appliance is a centralized, clustered controller that optimizes performance and unifies the operation of physical and virtual environments. The controller manages and operates a scalable multi-tenant Cisco ACI fabric.
- Tenant—A logical container for policies that enable an administrator to exercise domain-based access control.
- Application Profile—Defines the policies, services, and relationships between endpoint groups (EPGs).
- EPG—A managed object that is a named logical entity. It is a collection of endpoints (EPs).
- Endpoints—Devices that are connected to the network directly or indirectly. They have an address (identity), a location, and attributes (such as version).

Cisco APIC components are logically arranged as [Application profile](#)²⁰⁰⁰ > [EPGs](#)²⁰⁰¹ > [EPs](#)²⁰⁰².

This figure shows the correlation of AppDynamics and Cisco ACI components.

AppDynamics Applications to ACI Tenant Mapping

After you configure Cisco ACI credentials, all AppDynamics applications display in the **AppDynamics Applications to ACI Tenant Mappings** page.

²⁰⁰⁰ http://10.23.248.85/help/content/index.html#c_application-profiles.html

²⁰⁰¹ http://10.23.248.85/help/content/index.html#c_endpoint-groups.html

²⁰⁰² http://10.23.248.85/help/content/index.html#c_endpoint-groups.html

Administration

Users API Clients Groups Roles Authentication Provider **Integrations**

Cisco ACI Splunk Scalyr AppDynamics for Databases Strobe Atlassian JIRA OpenAuth

AppDynamics Applications to ACI Tenant Mappings

Map To Tenant Unmap Configure

Application Name ↓	Tenant	Mapping
ACI_App1	-	-
ACI_App1_NoConflict	-	-
EComm-NPM-Demo	AppDynamics	Automatic

These mappings are based on the mappings between AppDynamics nodes and Cisco ACI endpoints.

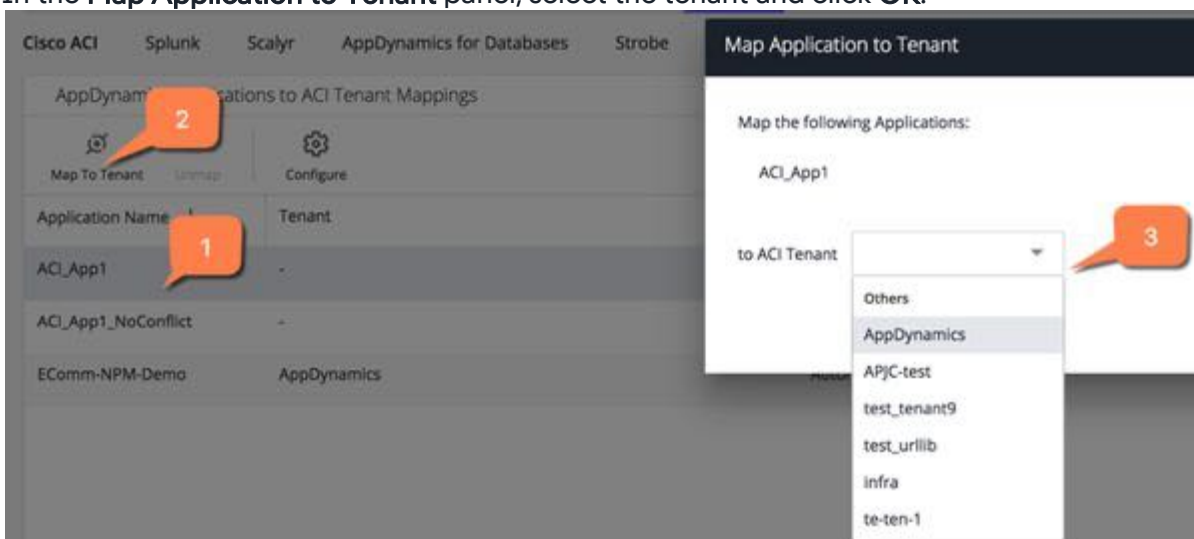

When the endpoints in different tenants have the same IP address, a node-to-endpoint mapping conflict occurs. AppDynamics resolves these conflicts based on heuristic data. However, if the conflicts persist, you must resolve these conflicts manually.

Map AppDynamics Application to Cisco ACI Tenant Manually

The application to Cisco ACI tenant map is left blank in **AppDynamics Applications to ACI Tenant Mappings** page when there is a conflict in auto-mapping. You can map applications to Cisco ACI tenants manually.

1. Select the AppDynamics application you want to map manually. Multiple applications can be mapped to a tenant at a given time.
2. Click **Map to Tenant**.
3. In the **Map Application to Tenant** panel, select the tenant and click **OK**.

Override Auto-Mapping

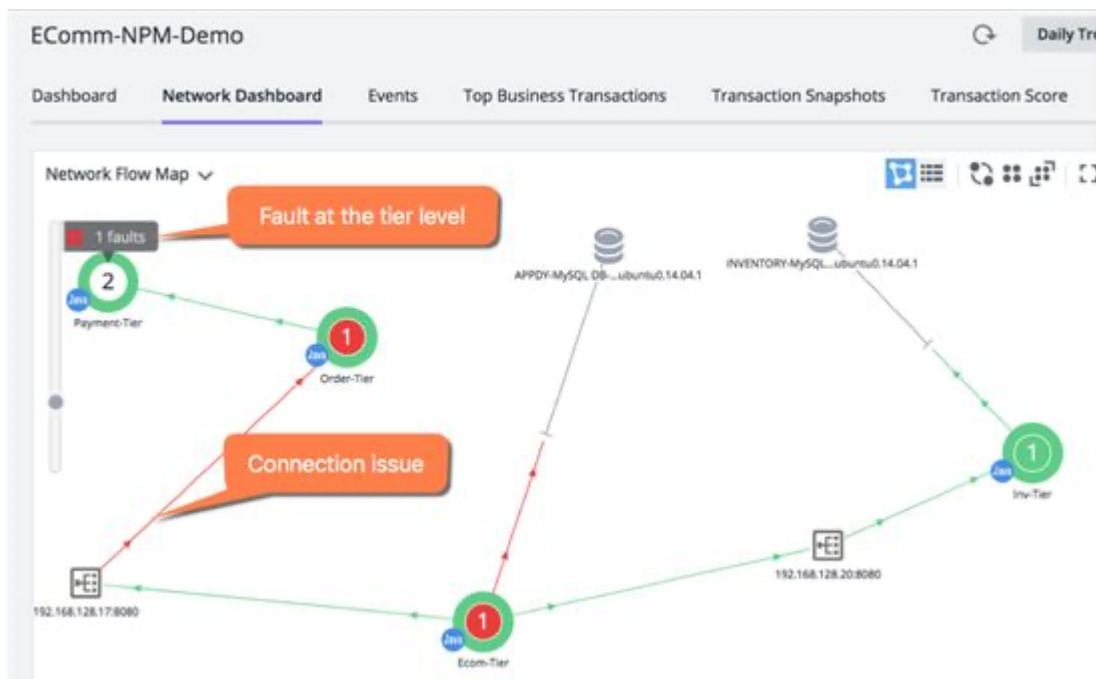

You can override the auto-map and map the application to another Cisco ACI tenant using the **Map Application to Tenant** panel. To override the auto-map, **Unmap** the application to tenant map and map it to another Cisco ACI tenant.

To revert to auto-map, **Unmap** the application to tenant map and refresh the page. AppDynamics auto-maps the application to the corresponding Cisco ACI tenant.

Troubleshoot Using the Integrated Solution

⚠ AppDynamics is ending support for Application Centric Infrastructure (ACI). The feature will not work once customers upgrade their Controllers > 21.1. See Support Advisory: Application Centric Infrastructure (ACI) End of Life (EOL) Notice.

This page describes how to troubleshoot applications using the Cisco APIC integration. The AppDynamics Network Dashboard displays a network-layer view of the monitored application. Based on the runtime state of the application, AppDynamics automatically fetches the faults and connection issues and displays them in the network dashboard:

Faults display at the tier level. The number of faults displayed indicates an aggregate of faults occurring at all EPGs within the tier. You can view the number of faults at a given point of time in the Network Dashboard.

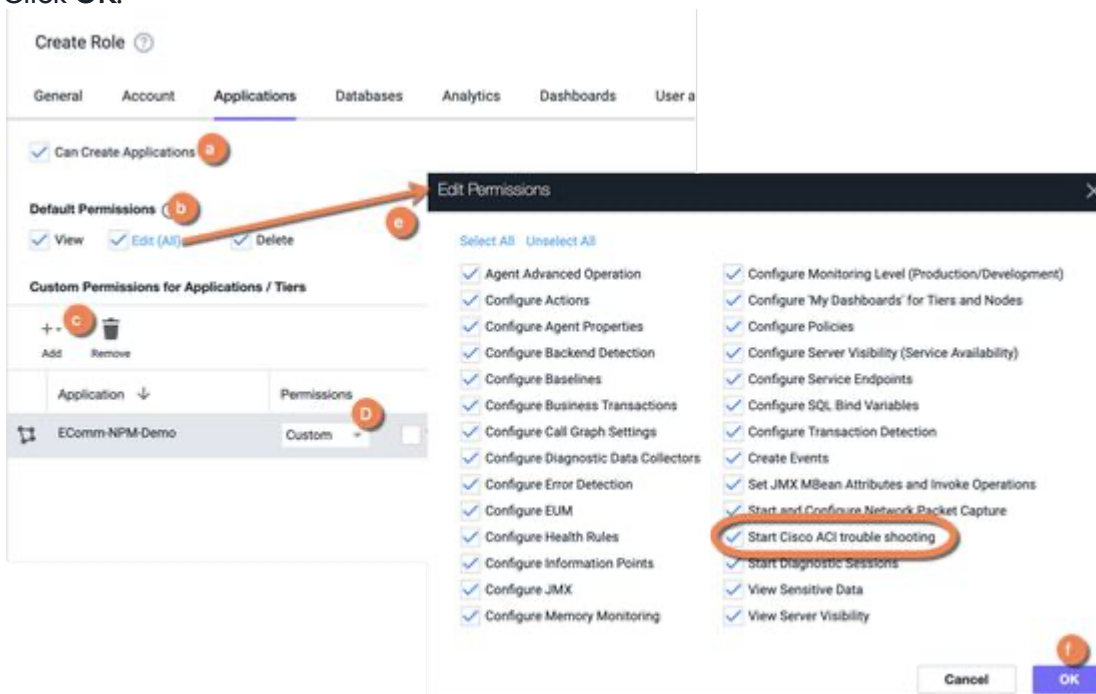

A connection is the set of all traffic for an application that has the same Source IP, Destination IP, Destination Port, and Protocol. AppDynamics detects if there is an issue in the traffic flow and indicates the connection issue on the network dashboard.

You can initiate a diagnosis to determine the exact location of the connection issue within the network by cross-launching the connection in Cisco APIC Controller.

Set Custom Permission to Cross-Launch Cisco APIC Controller

To include permission to cross-launch Cisco APIC Controller:

1. Log in to the Controller UI as an Administrator or Account Owner.
2. Click the gear icon (⚙️) > **Administration**.
3. Click the Roles tab.
4. Click **+ Create**.
5. Specify a **Name** and a **Description** for the newly created role.
6. Customize the business application level permission according to these guidelines:
 - a. On the **Applications** tab, click **Can Create Applications**.
 - b. Under **Default Permissions**, select **View**, **Edit**, and **Delete**.
 - c. Click **+ Add** to add a new custom permission and click **Done**.
The custom permission is added.
 - d. Select **Custom** from the **Permissions** menu for the application (replacing the value of Inherited).
 - e. Click **Edit(All)** and ensure that **Start Cisco ACI trouble shooting** is selected.
 - f. Click **OK**.

Customize Permissions to Cross-Launch a Connection Issue in Cisco APIC Controller

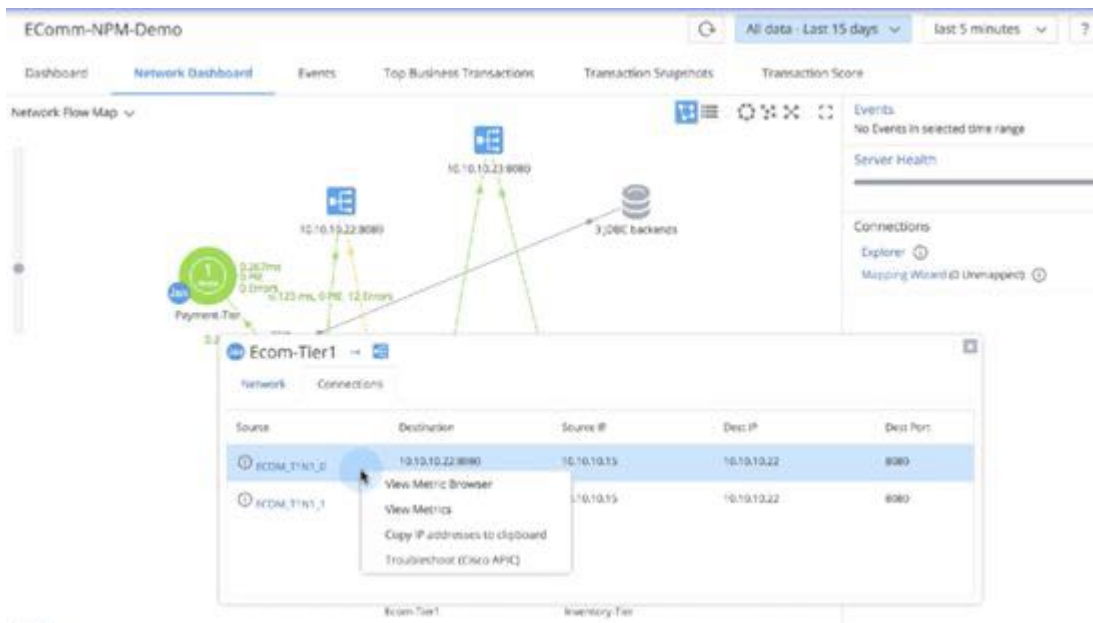

As an AppDynamics administrator, you can now customize the permissions for various roles to include permission to cross-launch a connection issue in the Cisco APIC Controller. See [Set Custom Permission to Cross-Launch Cisco APIC Controller](#)(see page 3872).

Launch Affected Connection in Cisco APIC

After collecting the connection issue information, you can cross-launch the connection in the Cisco APIC Controller.

1. Click on the affected connection on the **Network flow Map**.
2. Click the Connections tab.

3. Select the connection you want to troubleshoot.
4. Right-click on the selection and select **Troubleshoot (Cisco APIC)**.

5. Enter your Cisco APIC login credentials. After the initial entry, your credentials will be cached. The connection opens in the Cisco APIC Controller with the correct contracts (Visibility & Troubleshooting wizard) and the right set of endpoints.

! If you are using the Cisco ACI Release 4.0, you need not enter the login credentials. The authentication happens automatically. You must enter the login credentials only if you are using a lower version of the Cisco ACI.

6. Troubleshoot the issue in Cisco APIC.

Integrate AppDynamics with Compuware Strobe

This page describes how to integrate AppDynamics with Compuware Strobe. This integration allows you to drill down from a SQL Call of a transaction snapshot to view and analyze the calls in Strobe.

Configure Compuware Strobe Integration

1. Log in to the Controller UI as an administrator.
2. Select **Settings > Administration**.
3. Select **Integration > Strobe**.
4. Click the **Enabled** checkbox.
5. For the **URL**, enter the Strobe URL and port number.
6. For the **Strobe LPAR**, enter the name of the logical partition where Strobe is running.
7. Click **Save**.

Launch Strobe from AppDynamics

You can access the **View in Strobe** option from a transaction snapshot.

1. Navigate to the Business Transactions dashboard.
2. From the **Transaction Snapshot** tab, select a transaction snapshot containing DB2 z/OS database access.
3. Select the **SQL Calls** tab.
4. Right-click a SQL query and select **View in Strobe**.

Integrate AppDynamics with DB CAM

Related pages:

- [Access the Administration Console](#)²⁰⁰³
- [Monitor Databases](#)(see page 1314)

This page describes how to integrate AppDynamics with DB CAM. You can link to DB CAM for any DB CAM-monitored database that is discoverable by AppDynamics. This integration provides access to the database performance metrics provided by DB CAM.

Before You Begin

To use this integration you must have a DB CAM license. DB CAM must be configured to monitor the databases that you want to link to from AppDynamics.

Configure AppDynamics to Interface with DB CAM

You configure DB CAM integration at the account level and app agent level.

Configure DB CAM at the Account Level

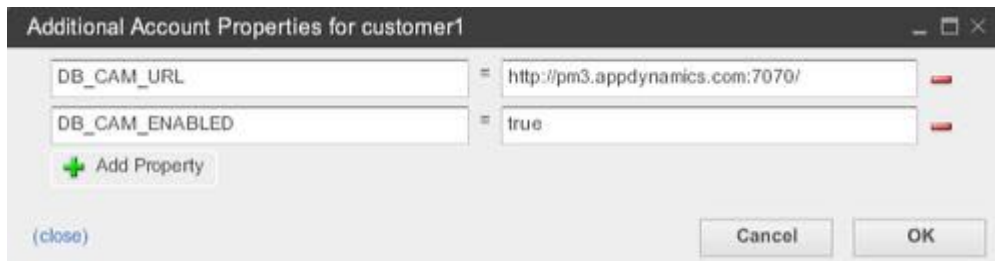

Configure the integration at the account level using the Administration Console at `<host>:<port>/controller/admin.jsp`.

Create two new properties as name-value pairs in each account for which you want to enable DB CAM integration.

Configure One AppDynamics Account for DB CAM Integration

1. Log in to the Administrator Console with the administrator root password.
2. Select **Accounts**.
3. Double-click the account for which you want to configure DB CAM integration.
4. Click **Additional Account Properties** in the upper right.
5. Click **Add Property**.
6. In the left dialog, enter "DB_CAM_URL".
7. In the right dialog, enter the URL of the AppDynamics Controller that you are configuring using the syntax: `http[s]://<host>:<port>`
8. Click **Add Property** again.
9. In the left dialog, enter "DB_CAM_ENABLED".
10. In the right dialog, enter "true".
11. Click **OK**.
12. Log out of the Administrator Console.

²⁰⁰³ <https://docs.appdynamics.com/display/PRMY21/.Access+the+Administration+Console+v21.5>

Configure DB CAM at the Agent Level

Perform this procedure for each app agent for which you want to enable access to deep diagnostics from DB CAM:

1. Open the `AppServerAgent/conf/app-agent-config.xml` file for the app agent.
2. Locate the `TransactionMonitoringService` element, `<agent-service name="TransactionMonitoringService" enabled="true">`.
3. Add the `jdbc-dbcam-integration-enabled` property for the service:

```
<agent-service name="TransactionMonitoringService"
enabled="true">
  <service-dependencies>BCIEngine, SnapshotService</service-
dependencies>
  <configuration-properties>
    <property name="jdbc-dbcam-integration-enabled"
value="true"/>
  </configuration-properties>
</agent-service>
```

4. Save the file.

Link to DB CAM from AppDynamics

You can link to DB CAM from any AppDynamics flow map that displays a discovered DB CAM-monitored database. The flow map could be in a dashboard or a transaction snapshot.

If you link to DB CAM from a dashboard, you gain access to the DB CAM instance dashboard. If you link to be DB CAM from a transaction snapshot, you gain access to the DB CAM Session Drill Down pane.

To Link to DB CAM from a Dashboard

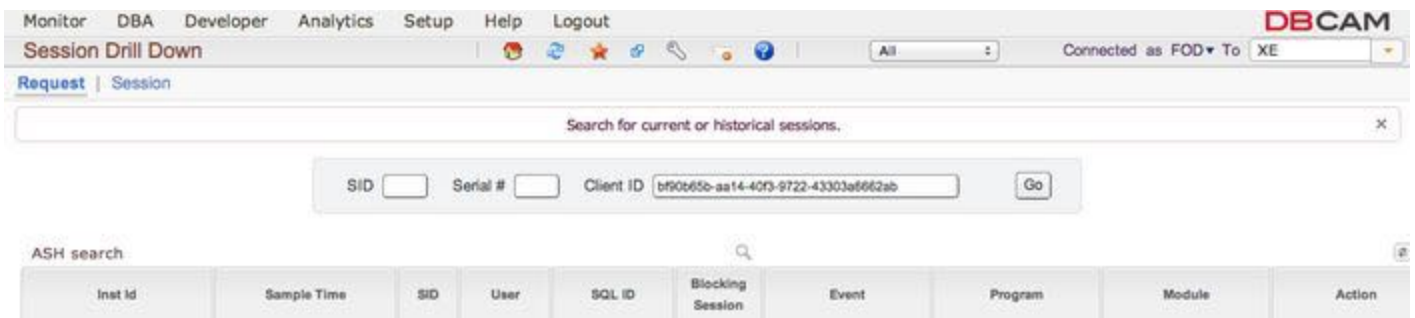

1. In the flow map of a dashboard, right-click on the link below a database icon.
2. Select **Search in DBCam**. DB CAM launches and displays the instance dashboard for the selected database.

To Link to DB CAM from a Transaction Snapshot

1. In the flow map of a transaction snapshot, right-click on the link below the database icon.

2. Select **Search in DBCam**. DB CAM launches and displays the session drill down for the selected database.

Integrate AppDynamics with Scalyr

This page describes how to integrate AppDynamics with the Scalyr module. This integration gives you a single entry point for viewing and analyzing data gathered by AppDynamics and [Scalyr²⁰⁰⁴](https://www.scalyr.com/). With the Scalyr integration module enabled, you can launch Scalyr searches directly from the AppDynamics Console.

The Scalyr search includes context from the AppDynamics UI session, including the time range and IP or hostname of the node being investigated in the AppDynamics UI.

Enable the Scalyr Integration Module

To enable and configure the Scalyr integration:

1. Log in to the Controller UI as an administrator.
2. Select **Settings > Administration**.
3. Select **Integration > Scalyr**.
4. Click the **Enabled** checkbox.
5. For the **URL**, enter <https://www.scalyr.com/>.
6. Click **Save**.

Search Scalyr Data from AppDynamics

To launch a Scalyr search, Controller UI users must have:

- An active browser session in the Scalyr UI.
- Scalyr credentials.
- Popups permitted in the browser.

Controller users can search Scalyr logs from the node dashboard, business transaction dashboard, or from segments of a transaction snapshot. The time frame passed to Scalyr varies for each context.

Node Dashboard Access

1. Navigate to a node dashboard.
2. Select **Actions > Search Scalyr**.

This passes a search for that node with the timeframe currently selected in the Controller UI.

²⁰⁰⁴ <https://www.scalyr.com/>

Business Transaction Dashboard

1. Select the Transaction Snapshot tab.
2. Select **Actions** or right-click a transaction snapshot.
3. Select **Search Scalyr**.

This generates a search on the nodes where the transaction occurred within the general time frame of the transaction execution. The time frame spans from 30 minutes before the transaction start time to 30 minutes after.

Call Drilldown Access

1. Select a **Call** in the drilldown view.
2. Select **Actions > Search Scalyr**.

This generates a search on the machine on which the snapshot was generated for the time frame of that segment.

Integrate AppDynamics with ServiceNow CMDB and Event Management

This page describes how to integrate the AppDynamics for ServiceNow[®] application with ServiceNow[®].

Download

To download, visit the [AppDynamics Downloads](https://accounts.appdynamics.com/downloads)²⁰⁰⁵.

Version 20.7

AppDynamics has released a new version of the sync utility to integrate with the Orlando Release of ServiceNow[®]. To review version-specific configuration details, see [New Version 20.7](#)(see page 3889).

Please review this version compatibility matrix to guide your installation and upgrade decision:

Integration Version	AppDynamics	ServiceNow [®]
20.7	>= 4.5.0.1	Orlando, Paris, and Quebec
3.1	>= 4.5.0.1	New York and earlier

Use Case

AppDynamics Application Performance Monitoring traces every transaction and builds real-time application topology. The ServiceNow[®] integration provides these capabilities:

- AppDynamics application topology feeds data into the *AppDynamics for ServiceNow[®]* application as custom tables in the CMDB.

In this version, monitored servers can be reconciled with the ServiceNow[®] appropriate CMDB Server CIs.

- AppDynamics can send alerts to the *ServiceNow[®] Event Management* application and use the AppDynamics created entities. The AppDynamics for ServiceNow[®] application imports the AppDynamics alerts as entities. These entities can be used only when they are added to the ServiceNow[®] table. The AppDynamics for ServiceNow[®] application then creates a ServiceNow[®] table that maps with the entities.

²⁰⁰⁵ <https://accounts.appdynamics.com/downloads>

This table lists these entities along with the ServiceNow® table that is created to represent them:

AppDynamics Entity Installed	ServiceNow® Table Created
Application	x_apd_appdynamics_application
Business Transaction	x_apd_appdynamics_business_transaction
Controller	x_apd_appdynamics_controller
Database	x_apd_appdynamics_database
Node	x_apd_appdynamics_node
Remote Service	x_apd_appdynamics_remote_service
Tier	x_apd_appdynamics_tier

Before You Begin the Integration

This integration requires that you download, install, and complete the following tasks, in this order, before starting the integration.

1. Download and install the [AppDynamics for ServiceNow® application](#)²⁰⁰⁶ from the ServiceNow® Store. This application creates the custom AppDynamics tables in the Configuration Management Database (CMDB).
2. Download, install, and configure the [Data Sync Utility](#)²⁰⁰⁷. This utility makes API calls to AppDynamics and ServiceNow® to push our topology into the CMDB tables.
3. Once the data sync utility has been configured, go back to the utility and choose to download and install the Alerting template. The template contains the proper settings for AppDynamics to send alerts to the event service in ServiceNow®.
4. Install Java >= 1.8 on the machine that runs this program.
5. Start Java with 512 MB of initial memory (-Xms512m).

Add AppDynamics Discovery Source to ServiceNow®

You must create an AppDynamics Discovery Source before installing the integration from the ServiceNow® Store:

1. Log in to the ServiceNow® store.
2. In the left menu, select **System Definition > Choice Lists**.
3. Click **New**.
4. Specify the following details only. Do not change the values of other fields.

²⁰⁰⁶ https://store.servicenow.com/sn_appstore_store.do#!/store/application/3671b358db0d2200b141d6fdbf9619de/3.0.9?referer=%2Fstore%2Fsearch%3Fq%3Dappdynamics&sl=sh

²⁰⁰⁷ <https://www.appdynamics.com/community/exchange/appdynamics-servicenow-cmdb-integration/>

Table	Configuration Item [cmdb_ci]
Element	discovery_source
Label	AppDynamics
Value	AppDynamics

Download AppDynamics for ServiceNow® Application

Download the [AppDynamics for ServiceNow® application](#)²⁰⁰⁸ from the ServiceNow® store and install it on your ServiceNow® instance.

 Ensure that you follow the instructions under the *System Requirements* and *Other Requirements* sections of the ServiceNow® download page.

To use Node-to-Server CI Reconciliation in ServiceNow® >= 3.1, you must have:

- [AppDynamics Machine Agents with Server Visibility enabled](#)²⁰⁰⁹ installed and running on each host supporting AppDynamics Nodes to be imported.
- AppDynamics Controller and Machine Agent >= 4.5.0.1 with Server Visibility enabled.
- If you have issues, see [Troubleshooting](#)(see page 3886).

Download AppDynamics-ServiceNow® Data Sync Utility

Download the [Data Sync Utility](#)²⁰¹⁰ zip file from the AppDynamics Downloads portal.

You can download this utility either as a standalone Java application or as a JAR file. The standalone Java application can run on a Windows or Linux host and the JAR file can run as a Java program on any host machine.

 This host must have connectivity to both the target ServiceNow® instance and the target AppDynamics Controller.

The downloaded file includes a lightweight web server that has a basic web application to configure the integration. You can also run the integration in CLI mode only.

Server Options

Download and unzip the `appdynamics-cmdb-service-$version.zip` [Data Sync Utility](#)²⁰¹¹ file.

1. Unzip the `appdynamics-cmdb-service-$version.zip` file.
2. Start the Server.
 - a. **init.d service (System V)**

⁸⁰⁰ https://store.servicenow.com/sn_appstore_store.do#!/store/application/3671b358db0d2200b141d6fdbf9619de/3.0.9?referer=%2Fstore%2Fsearch%3Fq%3Dappdynamics&sl=sh

²⁰⁰⁹ <https://docs.appdynamics.com/display/PRO45/Server+Visibility>

²⁰¹⁰ <https://accounts.appdynamics.com/downloads>

²⁰¹¹ <https://accounts.appdynamics.com/downloads>

```
sudo ln -s /path/to/appdynamics-cmdb-service/appdynamics-cmdb-service.jar /etc/init.d/
appdynamics-cmdb-service
sudo /etc/init.d/appdynamics-cmdb-service start
```

The java options can be configured in the `$HOME/appdynamics-cmdb-service.conf` file.
The application logs are created in the `$HOME/logs` directory.
The system out logs are created in the `/var/log/appdynamics-cmdb-service.log` file.

b. Windows (winsw):

Open a terminal and navigate to the `appdynamics-cmdb-service` folder where you extracted the zip file:

```
cd C:\Path-to\appdynamics-cmdb-service
```

Run the following command:

```
javaw -jar appdynamics-cmdb-service.jar
```

The Java options can be configured in the `;%HOME%/bin/appdynamics-cmdb-service-win.xml` file.
The logs are created in the `$HOME/logs` directory.

c. Other platforms:

```
java -Xms512m -jar /path/to/appdynamics-cmdb-service.jar
```

The application logs are created in the `$HOME/logs` directory.

Upgrades

1. Backup the data directory `data/` where the java sync utility is installed.
2. Overwrite the existing installation with the new file.

Setup

1. `init.d` service: The configuration file is located at `$HOME/appdynamics-cmdb-service.conf`. Add the params to the `JAVA_OPTS` property.
2. Windows service: The configuration file is located at `$HOME/bin/appdynamics-cmdb-service-win.xml`. Add the params to the `<arguments>` property.
3. `jar`: Add the params directly to the command preceding `-jar ...`

Options

- Use a different port:

```
-Dserver.port=8080
```

- Enable authentication:

```
-Dplatform.security.enabled=true # This will create a local login with the following
credentials.
-Dplatform.username=user
-Dplatform.password="deFAultPwd4Platfrm"
-Dplatform.security.encryption-key=mykey
-Dplatform.security.encryption-salt=mysalt
```

 The encryption-key and encryption-salt are optional.

Configure the Data Sync Utility

User Roles and Permissions

The Sync Utility needs to communicate with both an AppDynamics Controller and a ServiceNow® instance. We recommend using a service account for this access:

- **AppDynamics Controller:**

The service account user requires these roles with rights to all applications to be synchronized.

- Applications and Dashboards Viewer
- Server Monitoring User—Optional if you want to enable node-to-server CI reconciliation

- **ServiceNow®:** These roles should be assigned to the ServiceNow® user account that will be posting data to ServiceNow®:

 This user can be set to **web service access only** on the user form.

- If Event Management is activated in your ServiceNow® instance, add these roles:
 - x_apd_appdynamics.appdynamics_role
 - evt_mgmt_user
 - evt_mgmt_integration
 - mid_server—Optional if you want to do server CI reconciliation.
 - app_service_admin—Required for sync utility v20.7.
- If Event Management is *not* activated, add these roles:
 - x_apd_appdynamics.appdynamics_role
 - itil
 - mid_server—Optional if you want to do server CI reconciliation.
 - app_service_admin—Required for sync utility v20.7.

Domain Separated ServiceNow® Instances

If your ServiceNow® instance is domain-separated, a unique user account is required for each domain you want to update in the CMDB. For each domain:

1. Create a user account as described in [User Roles and Permissions](#)(see page 3881) with the required roles.
2. Assign this user to the appropriate domain for the applications that it needs to access.
3. Create a new ServiceNow® instance with the appropriate user for each domain.
4. Set up synchronization for the applications appropriate for each domain user.

Synchronize with the CMDB

The integration supports the synchronization of one or more ServiceNow® instances with one or more AppDynamics Controllers.

1. Log in to the Sync Utility.
 - a. Open `http://<host>:8080` on a browser.
 - b. The default username is `user` and the default password is `deFAuLtPwD4P1atfRm`.

This can be overridden by the java startup property `-Dplatform.password=welcome`. See [Server Options](#)(see page 3879).

2. Select the **Service Model Integration** left menu bar.
3. Click **AppDynamics Controllers** and add your Controller(s).

If your Controller is on-premises or dedicated SaaS (single-tenant), the **Account Name** will be `customer1`.

4. Click **ServiceNow® Instances** and add your ServiceNow® instance(s).
5. Click **Synchronize** from the top menu.
6. Choose applications from the **Applications** list to export to ServiceNow®.
7. Select which **AppDynamics Relationships to Synchronize** to include:
 - **Tier to Tier**
 - **Tier to Remote** (Remote Services)
 - **Tier to Application**
 - **Node-to-Server CI**
 - Reconciles the node host with an existing Server CI and builds a **Runs** relationship with the `x_apd_appdynamics_node` running on it. See [Node-to-Server CI Reconciliation](#)(see page 3883).
 - **Create Business Service**
 - Creates a Business Service CI (`cmdb_ci_service`) and builds a **Runs** relationship to the `x_apd_appdynamics_application` CI. See [Create Business Service CI](#)(see page 3885).
8. Click **Run Diagnostics** to begin verification without creating any data.
 - If successful, click **Synchronize** to run a one-time synchronization.
 - If not successful, address the issues in the diagnostic messages provided.

Most integration users may like the synchronization to run at regular intervals to keep the service models. The integrated scheduler function allows for the creation and running of synchronization automatically.

UI Tab	Description
Schedules	Allows schedule creation using a cron expression. The Synchronize options on this page are the same as the other configuration panes.
History	Provides a graphical view of prior runs. You can expand each run to get details of the run, including error messages.
Settings	Provides additional settings for connection timeouts, SSL, proxy configuration, and additional static values that can be added to fields in various CMDB tables.

After the synchronization is complete, log in to ServiceNow® instance and select the AppDynamics menu item to view the tables and data associated with the integration.

Node-to-Server CI Reconciliation

i In >= 3.1, the **Node-to-Server CI** checkbox in the sync utility builds a relationship between an AppDynamics Node (`x_apd_appdynamics_node`) and the underlying host Server CI (`cmdb_ci_linux_server`, `cmdb_ci_windows_server`) in the ServiceNow® CMDB.

To use this feature, a Machine Agent with Server Visibility enabled must be installed and running on each host that supports an imported AppDynamics Node. See [Machine Agent with Server Visibility](#)²⁰¹².

The integration uses the default ServiceNow® hardware identification rules for reconciliation:

- **Name:** AppDynamics uses the operating system-reported hostname as the value for this field, which is subject to the following **Discovery Property** settings in ServiceNow®, whether Discovery is installed or not:

The `mid_server` role must be assigned to the ServiceNow® user for the integration to read these properties.

- `glide.discovery.hostname.case`
- `glide.discovery.hostname.include_domain`
- `glide.discovery.fqdn.regex`

Refer to the ServiceNow® product documentation for more information about these properties.

- **IP Address + MAC address** (Network Adapter Table): AppDynamics uses any adapter with a valid IPv4 or IPv6 address and a MAC address.

These attributes are provided by Machine Agents with Server Visibility enabled for Controller and Machine Agent >= 4.5.0.1.

1. To avoid duplicate Server CIs being created by this integration, any discovery sources employed must adhere to the same hardware identification rules:
 - a. **Name** in the Server CI should match the system reported hostname subject to the Discovery properties described above.
 - b. For each **Server Network Adapter**, the `ip_address` and `mac_address` must be populated in the Network Adapter table and related to the Server CI.

ServiceNow® CMDB Identification and Reconciliation will not consider IP Address and MAC Address values populated on the Server CI form directly.

2. This integration identifies Linux and Windows servers and reconciles them to their respective CI classes on update or create (`cmdb_ci_linux_server` & `cmdb_ci_windows_server`).

If a server is not Windows or Linux, no CMDB relationships will be created.

²⁰¹² <https://docs.appdynamics.com/display/PRO45/Server+Visibility>

Fields Populated in ServiceNow® by Node-to-Server CI Reconciliation

For the appropriate Server Class (cmdb_ci_*_server) and related to the parent AppDynamics Node:

ServiceNow® Server CI Field	AppDynamics Server Visibility Attribute Used
Name (name)	The reported Hostname—the Sync Utility reads and uses the discovery properties listed above to determine the hostname.
Hostname (host_name)	The reported Hostname.

Each Network Adapter reported populates the Network Adapter CI (cmdb_ci_network_adapter) and related parent Server CI:

ServiceNow® Network Adapter CI Field	AppDynamics Server Visibility Attribute Used
IP Address (ip_address)	IP Address with /x removed. Using either IPv4 or IPv6 Address as reported. If neither is populated, the adapter is not synced.
MAC Address (mac_address)	The reported MAC address.

Add Static Values to Required Fields

If there are required fields in your CMDB that AppDynamics does not populate, you can use the **CMDB Additional Fields** to add multiple static values per table.

1. Navigate to the AppDynamics-ServiceNow® Sync Utility.
2. Select **Settings**.
3. Select **CMDB Additional Fields**.
4. For the desired CI table, click **Add Field**.
5. Enter the ServiceNow® **Field Name** (not the label).
6. Enter the static value to populate all records of this type. For example, if you are required to populate the hardware_status field on all cmdb_ci_server and child class records, enter "hardware_status" and then "Installed".
7. Click **Save**.

Considerations for Dynamic Application Environments

If the application environments you are monitoring with AppDynamics change frequently, you may end up with artifacts in the ServiceNow® CMDB that no longer reflect the current state of your application topology.

In order to address this, ServiceNow® provides documentation on how to configure “data refresh rules” in the CMDB so that irrelevant AppDynamics CIs can be removed. For the New York release, see [Create data refresh rules](#)²⁰¹³.

Create Business Service CI

AppDynamics Application to ServiceNow® Application Service Relationships

Health rule violation alerts related to a ServiceNow® Application Service are shown in the Event Management Dashboard. There are two ways to build this relationship based on the current state of the ServiceNow® CMDB:

If Business Services do not exist:

1. If there are no Business Service CIs in the CMDB, ensure that the **Create Business Service** checkbox is checked when initially synchronizing an application. Follow the instructions in the Sync Utility documentation that explain how to convert that CI to an Application Service (cmdb_ci_service_discovered) CI that can be shown on the ServiceNow® Event Management Dashboard.
You must select six (6) levels of CIs to include in the model.

This step requires the app_service_admin role. See the ServiceNow® [Convert a business service to an application service](#)²⁰¹⁴.

If Business Services exist:

If the Business Service entities are Application Service class CIs, a relationship can be manually created between the AppDynamics Application and the ServiceNow® Application Service. To create the relationship:

1. Open the AppDynamics Application CI (x_apd_appdynamics_application).
2. Click **Add CI relationship**.
3. In the filter, set the “Class” - “is” - “Application Service”.
4. Click **Run Filter**.
5. Select the **Application Service CI**.
6. Select the **Runs On::Runs** relationship.
7. Click **Create new relationships with selected configuration item(s)**.

AppDynamics Tier to ServiceNow® Application Service Relationships

In some cases, an AppDynamics Tier may be the correct entity to relate to a ServiceNow® Application Service. To build this relationship in the ServiceNow® CMDB:

1. Open the **AppDynamics Tier CI** (x_apd_appdynamics_tier).
2. Click **Add CI relationship**.
3. In the filter, set the “Class” - “is” - “Application Service”.

³⁰¹ <https://docs.servicenow.com/bundle/newyork-servicenow-platform/page/product/configuration-management/task/create-datasource-staleness-rule.html>

²⁰¹ <https://docs.servicenow.com/bundle/newyork-servicenow-platform/page/product/service-mapping/task/convert-business-service-to-IT-service.html>

4. Click **Run Filter**.
5. Select the **Application Service CI**.
6. Select the **Runs On::Runs** relationship.
7. Click **Create new relationships with selected configuration item(s)**.

Additional Application Relationships

The AppDynamics Application description and Tier description fields are populated in the AppDynamics Application CI (x_apd_appdynamics_application) and AppDynamics Tier CI (x_apd_appdynamics_tier) respectively:

Table	Application CI Field	AppDynamics Field Used
x_apd_appdynamics_application	Description (short_description)	Application description

Table	Tier CI Field	AppDynamics Field Used
x_apd_appdynamics_tier	Description (short_description)	Tier description

Troubleshooting

Logs

The logs are generated in the `logs/` directory where the application is installed.

Debug Logs:

To enable debug logging, edit the file `conf/log4j2.xml` and change the level of the logger `com.appdynamics` to `DEBUG`.

Read Timeouts

If you encounter any Read Timeout errors while doing the sync:

1. Increase the **Socket Timeout** value in the Settings tab up to 60,000 initially and higher if needed.
2. Reduce the **Sync Batch Size** of entities to ServiceNow® Instance.
3. Navigate to the `Installation` directory.
4. Find the `conf/application.properties` file and adjust the size value.
5. Restart the AppDynamics ServiceNow® Sync Utility service or daemon (Required).

Events Integration

This section assumes that you are familiar with the configuration of HealthRules, Policies, and Actions in AppDynamics. See [Alert and Respond](#)²⁰¹⁵.

The Events integration uses the HTTP templates feature in the Controller to push events to the ServiceNow® Events API. The details of the ServiceNow® Events API can be found [here](#)²⁰¹⁶. See [HTTP Request Actions and Templates](#)²⁰¹⁷.

²⁰¹⁵ <https://docs.appdynamics.com/display/PRO45/Alert+and+Respond>

²⁰¹⁶ https://docs.servicenow.com/bundle/geneva-it-operations-management/page/product/event_management/task/t_EMSEndEventStream.html

²⁰¹⁷ <https://docs.appdynamics.com/display/PRO45/HTTP+Request+Actions+and+Templates>

Prerequisites

- Download and install the [AppDynamics for ServiceNow® application](#)²⁰¹⁸ on your ServiceNow® instance.
- Run the AppDynamics-ServiceNow® Data Sync Utility and verify that the entities are imported into your ServiceNow® instance. See [Data Sync Utility](#)²⁰¹⁹.
- Activate the ServiceNow® Event Management plugin.

Events Installation and Configuration

In this section, you will create an Action, configure Health Rule Violations, and create binding Policies.

Create an Action on the AppDynamics Controller

1. Log in to the web UI for the AppDynamics-ServiceNow® Data Sync Utility.
2. Select **Service Model Integration > Event Integration**.
3. Select the Controller you would like to configure. If one is not configured, see [Data Sync Utility Configuration](#)(see page 3877).
4. Click **Download Template**.

Use the downloaded file to configure the HTTP Request template in AppDynamics. You will then create an Action and apply that action to a policy that specifies a health rule and action. To create the new Action:

1. Navigate to the **Alert & Respond** top menu in your AppDynamics Controller.
2. Click **Alert & Respond > HTTP Request Templates** in the left navigation.
3. Select the resource on which the action is to be created.
4. Click **New** and fill out the following fields:
 - a. **Name:** Any name to uniquely identify the template
 - b. **Request URL**
 - i. **Method:** POST
 - ii. **Raw URL:** `https://<your-instance>.service-now.com/em_event.do?JSONv2&sysparm_action=insertMultiple`²⁰²⁰. Replace <your-instance> with the id of the actual instance.
 - c. **Authentication**
 - i. **Type:** BASIC
 - ii. Enter the user name and password of your ServiceNow® instance.

 Ensure you have already configured the ServiceNow® User and Roles as described in [User Roles and Permissions](#)²⁰²¹.

- d. **Payload**
 - i. **MIME Type:** `application/json`
 - ii. Copy the contents from the downloaded file, `event-request-template.txt`, and then paste it in the **Payload** text area
 - iii. Update the `controllerName` in the first line of the file. It must be the same value that you set while adding the AppDynamics Controller Name in the Sync Utility.
5. Save the HTTP Template.

⁸⁰¹ https://store.servicenow.com/sn_appstore_store.do#!/store/application/3671b358db0d2200b141d6fdbf9619de/3.0.9?referer=%2Fstore%2Fsearch%3Fq%3Dappdynamics&sl=sh

²⁰¹⁹ <https://www.appdynamics.com/community/exchange/appdynamics-servicenow-cmdb-integration/>

²⁰²⁰ http://service-now.com/em_event.do?JSONv2&sysparm_action=insertMultiple

²⁰²¹ <https://docs.appdynamics.com/display/PRO45/Roles+and+Permissions>

Configure Health Rules on the AppDynamics Controller

1. Select the **Alert & Respond** tab.
2. Select **Health Rules**.
3. Use the **Select** dropdown to choose an application on which you want to alert.
4. Review the list of **Health Rules** configured out-of-the-box for that application. Add more **Health Rules** if needed.

Create a Policy on the AppDynamics Controller to Bind Health Rules to Actions

1. Select **Alert & Respond > Policies**.
2. Select **Create a Policy Manually** if there are no policies configured already.
3. Select the type of scenarios on which you want to receive alerts.

 Checking all the boxes might lead to an alert storm on your ServiceNow® instance.

4. Click **Save**.
5. Select the **Health Rule Scope** defining which tiers and nodes the Health Rule should cover and click **Save**.
6. Select the **Object Scope** and choose the **Tiers and Nodes** to be covered in this policy and click **Save**.
7. Select **Actions**.
8. Click **Add +** sign to create a new **Action**.
9. Select the ServiceNow® **Action** you created [Create an Action on the AppDynamics Controller](#)(see page 3887) and click **Save**.

Create a Manual Entry Point for the AppDynamics Monitored Application on the Application Service CI

 If you are connecting to a ServiceNow® instance running Orlando or later, skip this section and refer to the [New Version 20.7](#)(see page 3889) instructions.

For AppDynamics alerts to impact the health of an application service in ServiceNow® Event Management, you must create a manual entry point.

1. If you chose to have the Sync Utility create a Business Service:
 - a. Make sure you convert the service to an application service by following the prompts in the sync utility after synchronizing the application.
 - b. This conversion will add the manual entry point automatically.
2. If you already have Application Service CIs that you want to associate with an AppDynamics monitored application (or application tier):
 - a. Open the **Application Service CI** record.
 - b. Click **Add Entry Point**.
 - c. Select the AppDynamics monitored **Application or Tier CI Type**.
 - d. Select the name of the AppDynamics monitored application or tier to associate.
 - e. Click **Save**.
 - f. Click the **Additional Info** link.
 - g. Click the **Update with changes from CMDB UI Action** link.
 - h. Select the number of levels of related CIs to include in the new application service.
 - i. Click **OK**.

New Version 20.7

Requirements

Versions

- AppDynamics \geq 4.5.0.1 is required.
- ServiceNow® instances to be synchronized must be running Orlando or greater.

New Roles

- No additional roles are needed for the service account in AppDynamics.
- The service account in ServiceNow® will also need the `app_service_admin` role.

Upgrade to Version 20.7

To upgrade an existing sync utility, follow the [upgrade](#)(see page 3880) section. Below are some answers to questions about upgrading an existing sync utility:

What happens to existing applications that have already been synchronized?

Existing AppDynamics monitored applications and related entities that have been synchronized to a ServiceNow® CMDB from previous versions of the sync utility will remain in the CMDB. When the same application is re-synchronized using 20.7, a calculated service CI is created for those applications (or tiers) as configured. See [Creating Calculated Application Service CIs](#)(see page 3889).

What happens to existing manual entry points?

If you created manual entry points for Application Service CIs using AppDynamics monitored application CIs `x_apd_appdynamics_application` will remain as-is. After synchronizing using 20.7 of the sync utility, a new calculated application service CI will be added to the relationships.

AppDynamics recommends that you remove any previously created entry points and create a manual entry point to the new Calculated Application Service `cmdb_ci_service_calculated` CI. To do this:

1. To remove the existing manual entry point:
 - a. Open the **Application Service CI** you are monitoring with Event Management
 - b. Click - next to the **Manually Added CI** link and click **Remove**.
2. Add a manual entry point for the calculated application service:
 - a. Open the application service CI you are monitoring in ServiceNow.
 - b. Click **Add Entry Point**.
 - c. Select **Manually Created**.
 - d. For **CI Type**, select **Calculated Application Service**.
 - e. For **CI Name**, select the name for the application you synched.

Create Calculated Application Service CIs

Orlando introduces a new CI class called Calculated Application Service `cmdb_ci_service_calculated`. This new class is dynamic and provides additional capability to automatically update a service map when relationships in the CMDB change for CIs that are part of the application service.

Some AppDynamics customers monitor applications as Tiers. With the new version 20.7, you can map AppDynamics Applications or AppDynamics Tiers to `cmdb_ci_service_calculated` CIs in ServiceNow®.

Select Tiers to Monitor as Application Services in ServiceNow®

By default, all applications monitored by an AppDynamics controller relate to a new calculated application service when synchronized for the first time with 20.7 with a **Used By::Depends On** relationship.

To sync monitored tiers to a calculated Application Service CI in ServiceNow®:

1. Navigate to **Application Mappings**.
2. Add a Controller if none exists, or select the Controller from the dropdown. A list of all the AppDynamics monitored applications in the selected Controller display in the left panel.
3. To map each tier of a monitored application to a Calculated Application Service CI, move that application to the right bucket as an **Application Group**.

Synchronize the Application Services in ServiceNow®

ServiceNow® requires that each Calculated Application Service CI (cmdb_ci_service_calculated) has a unique name. When synchronized for the first time using 20.7, a new Calculated Application Service CI is created with this naming convention:

- By default, each monitored application will have a Calculated Application Service CI named:
 - AppD - AppNameGoesHere (controllerName)
- If an application is designated as an Application Group, each monitored tier will have a Calculated Application Service CI named:
 - AppD - AppnameGoesHere:TierNameGoesHere (controllerName)

AppDynamics Application & ServiceNow Calculated Application CI Dashboard

Use the **View Mapped Applications** dashboard to view the mappings between AppDynamics Applications (and Tiers) and ServiceNow® Calculated Application CI.

To delete a mapping from ServiceNow®, click the red 'X' to delete the mapping from this panel. This will delete both the Calculated Application CI and the relationship displayed. The AppDynamics entities in the CMDB will remain.

Event Integration Enhancements

The Event Integration Template has several enhancements in the 20.7 release. Alerts are more easily bound to Business Transaction and Node CIs.

Support

For questions or feature requests, please contact [AppDynamics Help](#)²⁰²².

Integrate AppDynamics with Splunk

Related pages:

- [Splunkbase Apps](#)²⁰²³
- [Splunk documentation](#)²⁰²⁴

²⁰²² <https://mail.google.com/mail/u/0/?view=cm&fs=1&tf=1&source=mailto&to=help@appdynamics.com>

²⁰²³ <https://splunkbase.splunk.com/apps/>

²⁰²⁴ <http://docs.splunk.com/Documentation/Splunk>

This page describes how to integrate AppDynamics and [Splunk²⁰²⁵](#). This integration provides a single, cohesive view of data and allows you to:

- Launch Splunk searches using auto-populated queries from the AppDynamics Console based on criteria such as time ranges and the node IP address.
- Push notifications on policy violations and events from AppDynamics to Splunk.
- Mine performance data from AppDynamics using the Controller REST API and push it into Splunk.

Configure Splunk Integration

1. Log in to the Controller UI as an administrator.
2. Select **Settings > Administration**.
3. Select **Integration > Splunk**.
4. Click the **Enabled** checkbox.
5. For the **URL**, enter the Splunk URL and port number.
6. Optionally, enter **Extra Query Parameters**. These parameters are appended to each Splunk search initiated from AppDynamics.
7. Click **Save**.

Launch a Splunk Search from AppDynamics

You can launch a search of Splunk logs for a specific time frame associated with a transaction snapshot from several places in AppDynamics.

To launch a Splunk search:

- You need Splunk credentials. You will only enter your credentials the first time that you launch a Splunk search. Your credentials are cached by the browser after the first login.
- Ensure the Splunk Server is running.
- Configure your browser to allow popups.

Enable Pop-ups

If you do not see a login prompt at first login, either your browser is blocking the Splunk login popup or the Splunk Server is not running.

You can access the **Search Splunk** option from the node dashboard or the business transaction dashboard.

Node Dashboard Access

1. Navigate to a node dashboard.
2. Select **Actions > Search Splunk**.

Business Transaction Dashboard

1. Select the **Transaction Snapshot** tab.
2. Right-click a transaction snapshot.
3. Select **More Actions**.
4. Select **Search Splunk**.

Product and Release Announcements

This table lists the agent, Controller, and on-premises releases. Note that some releases will not have resolved issues or enhancements. For other types of announcements, see [Product Announcements and Alerts Home](#)²⁰²⁶.

Date	Announcement
November 17, 2021	1.0 (AppDynamics iOS Sample App) released. See AppDynamics iOS Sample App Enhancements ²⁰²⁷ .
November 17, 2021	21.4.9-24662 (Enterprise Console) released. See 21.4 On-premises Platform Enhancements ²⁰²⁸ and 21.4 Controller (SaaS/On-Premises) Resolved Issues ²⁰²⁹ .
November 16, 2021	21.11.1 (General) released. See 21.11 Controller Enhancements ²⁰³⁰ and 21.11 Controller Resolved Issues ²⁰³¹ .
November 16, 2021	21.11.0 (PHP Agent) released. See 21.11 Agent Resolved Issues ²⁰³² .
November 15, 2021	21.9.4 (General) released. See 21.9 Controller Enhancements ²⁰³³ and 21.9 Controller Resolved Issues ²⁰³⁴ .
November 12, 2021	21.11.1 (Android Agent) released. See 21.11 Agent Enhancements ²⁰³⁵ .
November 4, 2021	21.11.0 (General) released. See 21.11 Controller Enhancements ²⁰³⁶ and 21.11 Controller Resolved Issues ²⁰³⁷ .
November 2, 2021	21.11.0 (React Native Agent) released. See 21.11 Agent Enhancements ²⁰³⁸ .
November 2, 2021	21.10.0 (Machine Agent) released. See 21.10 Agent Enhancements ²⁰³⁹ .

Release Notes

Related pages:

- [Product Announcements and Alerts Home](#)²³⁷⁶
- [Past Releases](#)(see page 3920)

AppDynamics provides release information for Commercial SaaS and agent releases, resolved issues, system requirements, and all current product updates.

Resolved and Known Issues

These are the resolved issues for the agents and the Controller SaaS in the 21.11 release.

When artifacts are updated, they are listed with their new version numbers in the tables below. Version numbers are also shown in the [AppDynamics Downloads Portal](#)(see page 3911).

You can sort the table of resolved issues by key, version, and product, or use the search field to find resolved issues. The most recent releases appear at the top of the page.

Agent Resolved Issues

Filter table:

Key	Product	Summary	Ver
DOTNET-5802	.NET Agent	Common Language Runtime (CLR) Metric drops	21.1
DOTNET-5824	.NET Agent	The instrumented application crashes due to access violation exception	21.1
DOTNET-5831	.NET Agent	Fix string transformation with en-US culture variant on .NET 6.0	21.1
DOTNET-5857	.NET Agent	Query values are not retrieved in ASP.NET Core	21.1
PHP-1447	PHP Agent	The application response time increases when you enable PHP Agent	21.1
PHP-1487	PHP Agent	The CPU utilization increases when you enable PHP Agent	21.1
PHP-1495	PHP Agent	The PHP application crashes when it calls the APIEndTransaction API function	21.1
PHP-1515	PHP Agent	Agent does not start after installation	21.1

Controller (SaaS) Resolved Issues

 Filter table:

Key	Product	Summary
ALERT-9115	Alert & Respond	Update the health rule configuration to handle permission errors
ALERT-9967	Alert & Respond	Health Rule Affected Entities list is rendered blank when inverse is selected in the regex
ALERT-9978	Alert & Respond	Alert Sensitivity Tuning charts are not displayed on the health rule dialog
ANALYTICS-13601	Analytics	XLM widget not showing data in shared dashboards
ANALYTICS-13875	Analytics	Searching for values based on set criteria yields no results because of null option values
BRUM-6671	Browser RUM	Session Summary shows incorrect user data in browser session
BRUM-6720	Browser RUM	Resource timing markers are missing
BRUM-6778	Browser RUM	JavaScript Agent auto-injection snippet includes incorrect copy of the JavaScript Agent for self-hosting deployments
CDM-7594	IoT Monitoring	Enable data export from IoT widgets
DBMON-8091	Database Visibility	Display error message when databases permissions at the application level are missing
DBMON-8159	Database Visibility	Drill Down button missing under Transaction Snapshot
DBMON-8216	Database Visibility	Database Collector created with REST API not working as expected when using the useSSL parameter
DBMON-8319	Database Visibility	Unable to add databases to the role configuration

Key	Product	Summary
LIC-1335	Licensing	License usage for transaction analytics is incorrectly computed for data during the period that starts before the requested time range
LIC-1681	Licensing	IBL license consumption is not reported for on premise controllers
SYNTH-7432	Synthetic Browser Monitoring	Users can edit synthetic jobs without EUM permissions

Known Issues

There are no known issues for the 21.11 release yet.

Agent Enhancements

Filter table:

Agent	Summary	Version/Date
Analytics Agent	There is no release for 21.11.0 yet.	
Android Agent	This release includes minor fixes and optimizations.	21.11.1 - November 12, 2021
Apache Web Server Agent	There is no release for 21.11.0 yet.	
AppDynamics AWS Lambda Extension for Serverless APM	There is no release for 21.11.0 yet.	
C/C++ SDK	There is no release for 21.11.0 yet.	
Cluster Agent	There is no release for 21.11.0 yet.	
Cordova Plugin	There is no release for 21.11.0 yet.	
Database Agent	There is no release for 21.11.0 yet.	
Go SDK	There is no release for 21.11.0 yet.	

Agent	Summary	Version/Date
IBM Integration Bus Agent	There is no release for 21.11.0 yet.	
iOS Agent	There is no release for 21.11.0 yet.	
Java Agent	This release includes support to monitor the Microsoft Azure Spring Cloud workloads with AppDynamics. See Monitor Azure Spring Cloud with Java Agent (see page 621).	Version 21.11.0 - November 2021
JavaScript Agent	There is no release for 21.11.0 yet.	
Java Serverless Tracer	There is no release for 21.11.0 yet.	
Machine Agent	There is no release for 21.11.0 yet.	
.NET Agent	This release includes: <ul style="list-style-type: none"> • Support for .NET 6.0. • Support for basic .NET Core metrics for .NET Agent on Linux, MSI-based .NET Agent for Windows, and .NET Microservices Agent for Windows, including applications on Azure. • Usage of WeakReference for ASP.NET Core customer objects. • Add logging to stack trace sampling code. 	Version 21.11.0 - November 2021
Network Agent	There is no release for 21.11.0 yet.	
Node.js Agent	There is no release for 21.11.0 yet.	
Node.js Serverless Tracer	There is no release for 21.11.0 yet.	
PHP Agent	This release includes bug fixes.	Version 21.11.0 - November 2021
Python Agent	There is no release for 21.11.0 yet.	
Python Serverless Tracer	There is no release for 21.11.0 yet.	
React Native Agent	This release includes minor enhancements and fixes.	Version 21.11.0 - November 2021
SAP	There is no release for 21.11.0 yet.	
Synthetic Hosted Agent	There is no release for 21.11.0 yet.	

Agent	Summary	Version/Date
Synthetic Private Agent (Linux-based)	There is no release for 21.11.0 yet.	
Xamarin Agent	There is no release for 21.11.0 yet.	

Controller Enhancements

21.11.1

This release includes bug fixes and optimizations. See [Controller \(SaaS\) Resolved Issues](#)²³⁷⁷ for details.

21.11.0

End User Monitoring

- A new base-page cookie consent setting for requiring cookie consent for business transaction correlation with End User Monitoring. See [Cookie Consent Management](#)(see page 1813).

Database Monitoring

- You can now view the following roles/ states of the replicaset and sharded cluster:
 - primary
 - secondary
 - startup
 - recovering
 - startup2
 - unknown
 - arbiter
 - down
 - rollback

To view these roles on the **Topology** tab, you need the Database Agent >= 21.9.0.

- The Couchbase collector is enhanced to display the **Filter by Phases** in the **Queries** page and elapsed time is displayed for the phases report in the **Activity** page. See [Database Queries Window](#) (see page 2482) and [Database Activity Window](#)(see page 2476).

Licensing

- A new setting to prioritize Machine and Cluster Agent consumption of an infrastructure-based license. See [Machine/Cluster Agent Prioritization](#)(see page 216).

AppDynamics Mobile Application Enhancements

The AppDynamics 21.11.0 mobile application documentation is enhanced:

- User documentation includes the flag to enable push notifications
- General improvements

AppDynamics iOS Sample App Enhancements

The [AppDynamics 1.0 iOS Sample App](#)²³⁷⁸ released November 17, 2021. See [.Release Notes v21.11](#)(see page 3911).

²³⁷⁷ <https://docs.appdynamics.com/display/PRO2111/Release+Notes#ReleaseNotes-controller-resolved-issues>

²³⁷⁸ <https://github.com/CiscoDevNet/AppDynamicsSampleAppiOS>

System Requirements and Supported Environments

See the relevant page for the component you want to install or upgrade.

Agent Requirements

- App Agents:
 - [Java Supported Environments](#)(see page 493)
 - [.NET Supported Environments](#)(see page 646)
 - [.NET Core Microservices Agent Support](#)(see page 757)
 - [.NET Core for Linux SDK Supported Environments](#)²³⁷⁹
 - [Node.js Supported Environments](#)(see page 810)
 - [PHP Supported Environments](#)(see page 857)
 - [Python Supported Environments](#)(see page 901)
 - [Supported Apache Web Servers](#)(see page 997)
 - [C/C++ Agent Supported Platforms](#)²³⁸⁰
 - [Go SDK](#)(see page 1066)
- [Analytics Agent Environments](#)(see page 3127)
- [Browser RUM Supported Environments](#)(see page 1860)
- [Mobile RUM Supported Environments](#)(see page 2299)
- [Database Visibility Supported Environments](#)(see page 2383)
- [Machine Agent Requirements and Supported Environments](#)(see page 2580)
- [Network Visibility Supported Environments](#)(see page 2721)
- [Server Visibility Requirements and Supported Environments](#)²³⁸¹
- [Serverless APM Environment](#)²³⁸²

Calendar Versioning

This page describes the versioning format used for product releases.

We use a calendar-based version format with a syntax of *YY.M.X* to reflect the date of release. For example, a release in October 2020 was 20.10.0, November was 20.11.0, and so on. If another version releases in the same month, the last number of the version increments by one, for example 20.11.1.

Controller and Agent Releases

The versioning of AppDynamics language agents is done independently of each other and the Controller. See [Agent and Controller Compatibility](#)(see page 3918).

Maintenance Support for Software Versions

AppDynamics maintains and supports every software version for one calendar year after the next major software release is generally available. For example, support and maintenance of the 20.3 release will continue for 12 months after the 20.4 release.

See [Product Announcements and Alerts](#)²³⁸³.

²³⁸² <https://docs.appdynamics.com/display/PRMY21/.Set+Up+the+Serverless+APM+Environment+v21.5>

²³⁸³ <https://docs.appdynamics.com/display/PRO21/Product+and+Release+Announcements>

i For specific maintenance and support terms, refer to your license agreement(s).

Controller GA End of Maintenance and Support

This table lists generally available AppDynamics versions, release dates, and end of maintenance and support dates:

Controller Version	Release Date	End of Maintenance and Support
21.11	November 4, 2021	To be determined
21.9	September 27, 2021	November 4, 2022
21.8	August 9, 2021	September 27, 2022
21.6	June 28, 2021	August 9, 2022
21.5	May 17, 2021	June 28, 2022
21.4	April 5, 2021	May 17, 2022 *
21.2	February 22, 2021	April 5, 2022
20.11	November 16, 2020	February 22, 2022
20.10	October 5, 2020	November 16, 2021
20.8	August 24, 2020	October 5, 2021
20.7	July 16, 2020	August 24, 2021
20.6	June 2, 2020	July 16, 2021
20.4	April 21, 2020	June 2, 2021
20.3	March 9, 2020	April 21, 2021

* For on-premises customers, AppDynamics will extend support for this release beyond May 2022.

AppDynamics Artifacts End of Maintenance and Support

Artifacts are generally available AppDynamics agent and platform components on the [AppDynamics Downloads Portal](https://download.appdynamics.com/download/)²³⁸⁴ or [AppDynamics Accounts Downloads](https://accounts.appdynamics.com/downloads)²³⁸⁵.

Artifact end of maintenance and support dates are one calendar year after the next generally available artifact release. For example, the .NET Agent 20.11 has an end of maintenance and support date of December 18, 2021 because 20.12 released on December 18, 2020.

²³⁸⁴ <https://download.appdynamics.com/download/>

²³⁸⁵ <https://accounts.appdynamics.com/downloads>

Hotfixes are not considered major releases, and therefore do not affect the end of maintenance and support dates. Certain AppDynamics platform components have diverged from calendar versioning, such as the Events Service.

Agent and Controller Compatibility

This page describes the compatibility mapping between Agent and Controller versions.

Agent and Controller Compatibility Mapping

Please refer to the [Language Agent Backward Compatibility](#)(see page 3918) table for AppDynamics Agents and AppDynamics Controller compatibility.

As long as all agents are compatible with the Controller version, a monitored environment may have different agent versions deployed in it at a given time. However, the oldest agents should be on originating tiers of any business transactions. This ensures that agents on downstream nodes can process the correlation header created by the originating tier.

When rolling out agent upgrades, be sure to start upgrading the agents on the nodes of downstream tiers first, and then upgrade the agents on the originating tier nodes last.

Language Agent Backward Compatibility

This table outlines the Controller and language agent releases that are compatible.

Starting in release 20.2, the AppDynamics language agents are backward-compatible with any Controller, including Controllers using [Calendar Versioning](#)(see page 0) ≥ 20.3 .

i The Database Agent ≥ 20.7 is compatible only with the Controller ≥ 20.2 .

Controller Release	Language Agent Release	Notes
≥ 20.3	≥ 20.2	Controllers ≥ 20.3 can accept connections from Agents ≥ 20.2 that use Calendar Versioning.

i The above table is only a reference for general software compatibility. For specific maintenance and support terms, refer to your specific EULA.

Backward compatibility is supported on these agents:

- C/C++ SDK
- Cluster
- Go SDK
- Java
- IBM Integration Bus (IIB)
- Machine
- .NET
- Node.js
- PHP

- Python

i While using the Enterprise Console to upgrade the Controller, several folders (including the appagent folder) are removed and reinstalled. If you deployed a Java Agent with a newer version than the Controller in the controller/appserver/glassfish/domains/domain1/appagent folder, the upgrade will fail and internal monitoring will be lost. To prevent this, you must [update the domain.xml file²³⁸⁶](#) to point to the new Java Agent or avoid using customized installation for Java Agents.

For notes on SSL protocol compatibility between versions of the agent and Controller, see [SSL Compatibility Matrix for App Agent for Java - Controller](#)(see page 3919).

Agent Versions Compatible with Controller 21.x

Agent Version/ Agent Type	Languages Agents								Cluster Agent	Database Agent	AppDynamics for Databases	Machine Agent	Network Agent	Analytics Agent
	Java Agent	.NET Agent	Node.js Agent	PHP Agent	Python Agent	Web Server Agent	Go SDK	C/C++ SDK						
>= 21.x	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓		✓	✓	✓
>= 20.x	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓		✓	✓	✓

SSL Compatibility between Java Agent and Controller

The default protocol used by the Controller is TLSv1.2. See [Secure the Platform²³⁸⁷](#) for information on changing the default security protocol used by the Controller or agent.

For the Java Agent, the default protocols are:

- For Java 8 SE applications: TLSv1.2.
- For Java >= 7 applications: TLSv1.2.

i SSLv3 has been disabled for SaaS Controllers because of the [CVE-2014-3566 vulnerability²³⁸⁸](#). SSLv3 connections are no longer supported.

²³⁸⁶ [https://docs.appdynamics.com/display/](https://docs.appdynamics.com/display/PRMY21/Update+Platform+Configurations+v21.5#id-.UpdatePlatformConfigurationsv21.5-controller-settings)

²³⁸⁸ <https://cve.mitre.org/cgi-bin/cvename.cgi?name=cve-2014-3566>

Introduction of New Agent Features

Even when new and old agents are supported by the same up-to-date Controller, new functionality introduced by later agents is not available on the older agents.

Past Releases

See the following for the release notes of past versions:

- [Past Resolved and Known Issues by Release](#)(see page 3920)
- [Past Agent Releases](#)(see page 4020)
- [Past Controller Releases](#)(see page 4073)
- [Past On-premises Platform Releases](#)(see page 4087)
- [Past Mobile App Releases](#)(see page 4106)

Past Resolved and Known Issues by Release

This page lists the resolved issues for the agents, the Controller (on-premises or SaaS), and the on-premises platform since the 20.2 release.

When artifacts are updated, they are listed with their new version numbers in the tables below. Version numbers are also shown in the [AppDynamics Downloads Portal](#)²³⁸⁹.

You can sort the table of resolved issues by key, version, and product, or use the search field to find resolved issues. The most recent releases appear at the top of the page.

21.10 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Ver
ANALYTICS-13689	Analytics Agent	Fixed ad.process.name startup error	21.1
ANALYTICS-13758	Analytics Agent	Updated jakarta.el library to 3.0.4	21.1
ANALYTICS-13801	Analytics Agent	Upgraded netty library to 4.1.69.Final	21.1
DOTNET-5570	.NET Agent	The typo in "Query Type" snapshot property key for CosmosDb instrumentation is fixed	21.1

²³⁸⁹ <http://download.appdynamics.com/>

Key	Product	Summary	Version
DOTNET-5786	.NET Agent	The Common Language Runtime (CLR) crashes when a log directory with no write permission is used	21.1
JAVA-10074	Java Agent	RMI backends appear with improper names when you use the custom naming option to configure the backend names in the Remote Services screen, in the Controller	21.1
JAVA-10222	Java Agent	The Controller does not detect Business Transactions; this intermittent issue occurs when a ProducerInterceptor is invoked before registering the business transaction on the Controller.	21.1
JAVA-10231	Java Agent	Correlation of Akka Http exit calls fail when the application invokes <code>HttpRequest.withHeaders()</code>	21.1
JAVA-10265	Java Agent	When a JVM crash occurs on an application, the event logs are lost after some time from the Controller	21.1
JAVA-10035	Java Agent	When debug logs including <code>SegmentManager</code> are collected from the Controller, the following issues are observed: <ul style="list-style-type: none"> • A significant drop in application load • Increase in Average Response Time • Decrease in the number of errors reported 	21.1
SRVLESS-1862	Node.js Serverless Tracer	Updated Axios version to 0.21.3	21.16
PYTHON-931	Python Agent	The Python agent does not instrument the exit calls when used with the threading module	21.1

Controller (SaaS) Resolved Issues

 Filter table:

Key	Product	Summary	Version
STUDIO-3752	Dash Studio	The Health widget search option does not work	21.10.0

Known Issues

There were no known issues for the 21.10 release.

21.9 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	V o
ANALYTIC S-13686	Analytics Agent	Fixed Java 11 support	2
ANALYTIC S-13687	Analytics Agent	Upgraded the slf4j-api library	2
ANALYTIC S-13700	Analytics Agent	Upgraded the JNA library version to 5.8.0	2
ANALYTIC S-13708	Analytics Agent	Upgraded the Docker image	2
ANALYTIC S-13739	Analytics Agent	Upgraded JNA and nuprocess libraries	2
ANALYTIC S-13740	Analytics Agent	Upgraded Jetty library to version 9.4.43.v20210629	2
ANALYTIC S-13745	Analytics Agent	Fixed Analytics Agent startup issue in Windows 64 caused by JNA and nuprocess libraries	2
DBMON-81 56	Database Agent	An issue occurs during MSSQL topology resolution and the Database Agent logs are flooded with the connection timeout errors	2
DBMON-81 67	Database Agent	An issue occurs during MSSQL cluster discovery because of the mismatch between the replica server name and cluster member names	2
DBMON-82 18	Database Agent	An infrastructure-based licensing issue occurs for an MSSQL database when there is a mismatch between Database Agent and Machine Agent hostname	2
DOTNET-5 669	.NET Agent	Agent fails to get session value from the Asp.Net core applications	2

Key	Product	Summary	V
DOTNET-5772	.NET Agent	Fix the System.FormatException in Analytics	2
DOTNET-5777	.NET Agent	Fix hooking issues in the Windows Profiler	2
DOTNET-5808	.NET Agent	Fix the canary thread running as a foreground thread	2
JAVA-10034	Java Agent	Java Agent does not ignore btname if it is present along with btid in the incoming header. This results in the discontinuation of a business transaction	2
JAVA-10127	Java Agent	Mongo DB connectivity fails after upgrading the agent to version 21.3	2
JAVA-10133	Java Agent	Akka 2.6 transactions are reported as stalled	2
JAVA-10169	Java Agent	The property disable-exit-call-correlation-for gets overridden by the values on the Controller when a configuration refresh is done	2
NODEJS-554	Node.js Agent	The Node.js Agent overwrites the default port from 443 to 80	2
SERVER-8624	Machine Agent	Memory Used % and Total (MB) metrics are incorrect for Solaris Sparc	2
SERVER-8622	Machine Agent	hostname resolution error in Infraviz in privateDNS setups of AKS	2
PYTHON-902	Python Agent	The Java proxy considers the container ID instead of uniquehostid value in the Kubernetes and OpenShift environment	2
SYNTH-7119	Synthetic Agent	Script with a custom exception throws the "Invalid Measurement status" error message	2
SYNTH-7286	Synthetic Agent	Removed the sum-chrome-agent dependency on docker runtime	2
SYNTH-7441	Synthetic Agent	Synthetic Sessions have broken measurements and display the message "Failed to parse measurement (RTE) on IE11" (Synthetic Hosted and Windows Private Synthetic Agent)	2
SYNTH-7452	Synthetic Agent	Test agents fail to post results with the "Invalid value: "": must be no more than 63 characters" error message	2

Controller (SaaS) Resolved Issues

 Filter table:

Key	Product	Summary	Version
ALERT-8962	Alert & Respond	Creation of Alerting template failed	21.9.0
ALERT-9783	Alert & Respond	User is not able to create a Custom Action due to the unavailability of the Save and Cancel buttons	21.9.1
ALERT-9824	Alert & Respond	Loading issue with the Alert Sensitivity Tuning charts	21.9.2
ANALYTICS-13614	Analytics	Unable to remove criteria from the Basic Query Search to the Visualization tab	21.9.0
ANALYTICS-13617	Analytics	Analytics Agent cache contains nulls	21.9.0
ANALYTICS-13752	Analytics	Experience Level Management widget not showing data in the shared dashboards	21.9.0
ANALYTICS-13849	Analytics	Searching for values based on set criteria yields no results because of null option values	21.9.4
CDM-6406	IoT Monitoring	"Getting Started" page for IoT displays the wrong collector URL	21.9.0
CDM-7657	Mobile RUM	Business Transactions and Snapshots are not correlated with the mobile sessions	21.9.0
DBMON-8094	Database Visibility	A license is consumed for all the servers in a configuration of all inactive servers	21.9.0
DBMON-8171	Database Visibility	The values of Logical Reads and Logical Writes are displayed as the same on the MSSQL query details page	21.9.0
DBMON-8316	Database Visibility	Execution Plan for Oracle queries are not working	21.9.2

Key	Product	Summary	Version
DBMON-8320	Database Visibility	Unable to add databases to the role configuration	21.9.0, 21.9.2
IAM-1944	Identity, Authentication, Authorization, and Audit	Support tenant names that start with numbers	21.9.0
LIC-1537	Licensing	Current license consumption is not displayed for license rules for each module type	21.9.1
PLATSE-240	Platform Sustaining Engineering	Applying filter to reject unsecure URLs	21.9.1
PLATSE-265	Platform Sustaining Engineering	Health Status widget does not show configured entities when editing	21.9.2
PLATSE-280	Platform Sustaining Engineering	Self-closing HTML element <input> does not render	21.9.3
SYNTH-7453	Synthetic Browser Monitoring	Synthetic Jobs stopped running after outage 2021/06/16	21.9.0
USERIMPACT-1108	Experience Journey Map	Experience Journey Map view remains in draft mode when map is expanded and the label is changed for a node	21.9.0

Known Issues

There were no known issues for the 21.9 release.

21.8 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
CDM-7704	iOS Agent	NSURLSession handling for beacons is failing	21.8.1
CDM-7684	iOS Agent	ADEumTimeStamp initWithNSDate produces invalid UPTIME value	21.8.0
DOTNET-5589	.NET Agent	Re-enable the call graph consolidation by default	21.8.1

Key	Product	Summary	Version
DOTNET-5691	.NET Agent	The Agentless Analytics on .NET Core Applications exits due to an error	21.8.0
DOTNET-5699	.NET Agent	Update Docker Hub appdynamics/dotnet-core-agent: latest to the latest version.	21.8.0
DOTNET-5721	.NET Agent	Fix the increase of IIS Request queue	21.8.0
DOTNET-5736	.NET Agent	Remove the use of IsBadReadPtr	21.8.0
DOTNET-5738	.NET Agent	The Application Restarted Events are not sending	21.8.0
DOTNET-5740	.NET Agent	Ensure that the stall transaction timeout is configurable	21.8.0
DOTNET-5764	.NET Agent	Fixed NullRefException while collecting SQL query for Analytics	21.8.0
DOTNET-5769	.NET Agent	Fix the SSL configuration validation	21.8.1
NODEJS-537	Node.js Agent	Remove the request module	21.8.0
NODEJS-544	Node.js Agent	Fix packaging of the standalone Node.js builds	21.8.0
PYTHON-874	Python Agent	Fixed important security issues	21.8.0

Controller (SaaS) Resolved Issues

 Filter table:

Key	Product	Summary	Version
ALERT-8681	Alert and Respond	The alert email notification exposes the internal IP address of the instance	21.8.1
ALERT-9137	Alert and Respond	User getting logged out when trying to create action suppression with default view permissions	21.8.0
ANALYTICS-11112	Analytics	The query in the URL doesn't get updated when a filter is added in the search	21.8.0
ANALYTICS-13461	Analytics	Fixed the LoadingCache to fetch configurations	21.8.0

Key	Product	Summary	Version
BRUM-6847	Browser RUM	Auto-injected code snippet for the Java Agent is not correct for customers self-hosting the agent	21.8.3
DBMON-7371	Database Visibility	The details of the database collector on the Databases window display mismatch between the card and the grid view	21.8.0
DBMON-7829	Database Visibility	Incorrect sorting for "Rows_examined" on the Session list page	21.8.0
DBMON-7986	Database Visibility	All custom metrics are not reported when you change the value of the <code>dbmon.config.max.custommetric</code> setting	21.8.0
DBMON-8059	Database Visibility	The Cassandra database metrics are not displayed when you select longer duration on the Databases Dashboard	21.8.0
DBMON-8134	Database Visibility	The database collectors stop reporting to Controller, and the Database Agent logs display exception errors	21.8.0
DBMON-8315	Database Visibility	The Oracle query Explain another query shows empty result; Database Execution Plan is not displayed	21.8.4
IAM-1787	Identity, Authentication, Authorization, and Audit	The property <code>system.use.notification.message</code> is not working on Controller version 21.2.3 and higher	21.8.0
MQS-1259	Metric Query Service	Metric expressions do not work when the Metric Hierarchy is enabled	21.8.0
MQS-1264	Metric Query Service	Metric expressions do not work for database metrics	21.8.0
PLATSE-224	Platform Sustaining Engineering	Applying filter to reject unsecure URLs	21.8.2
PLATSE-237	Platform Sustaining Engineering	App Server Agent log files not available for download from Controller	21.8.3
PLATSE-239	Platform Sustaining Engineering	Applying filter to reject unsecure URLs	21.8.3
PLATSE-279	Platform Sustaining Engineering	Self-closing HTML element <code><input></code> does not render	21.8.4

Key	Product	Summary	Version
PLATSE-264	Platform Sustaining Engineering	Health Status widget does not display any configured entities when you edit the health rule	21.8.4
STUDIO-3412	Dash Studio	If you use a variable during the Datagrid widget configuration, an HTTP 500 internal error is displayed on the dashboard	21.8.0
STUDIO-3761	Dash Studio	Cannot change the number of applications on the Health Rule widget	21.8.0
STUDIO-3909	Dash Studio	Unable to view reports in the Reports & Dashboards > Reports tab	21.8.3
STUDIO-4012	Dash Studio	The following libraries in the Controller have been upgraded to the specified versions: <ul style="list-style-type: none"> • jQuery 3.5.1 • AngularJS 1.8.2 	21.8.1
UIK-3644	Dash Studio	The Dash Studio widgets do not render the quotation marks (" ") of metrics	21.8.0

Known Issues

There were no known issues for the 21.8 release.

21.7 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
ANALYTICS-13649	Analytics Agent	Disabled the /debug/grok endpoint	21.7.0
CLUSTERMON-2988	Cluster Agent	The Helm repository is migrated to CiscoDevNet ²³⁹⁰	21.7.0

²³⁹⁰ <https://github.com/CiscoDevNet/appdynamics-charts>

Key	Product	Summary	Version
DBMON-815 2	Database Agent	The used memory calculation is fixed. It does not include the buffered memory and the swap cache memory	21.7.0
DBMON-815 5	Database Agent	The error log file includes exception error messages when you start Database Agent on Windows	21.7.0
DOTNET-562 6	.NET Agent	Slow IIS restart with large numbers of App domains	21.7.1
DOTNET-563 8	.NET Agent	Profiler lock prober causes a stack overflow exception	21.7.1
DOTNET-563 9	.NET Agent	MIDC with a getter chain accessing a struct array element is not working	21.7.1
DOTNET-566 4	.NET Agent	Deadlock due to loader lock while snapshotting (while unloading a DLL)	21.7.1
DOTNET-569 3	.NET Agent	Updated third-party dependencies	21.7.0
DOTNET-569 6	.NET Agent	Fixed privilege escalation	21.7.0
DOTNET-571 3	.NET Agent	Failure to parse a certificate pem file on Linux	21.7.1
DOTNET-571 4	.NET Agent	Boost Log Console was changed to stdout instead of stderr	21.7.1
JAVA-8010	Java Agent	ReflectionUtility errors are detected for fileId[socket] when the Netiviz agent is used on the MultiplexedSocketChannel and DemultiplexedSocketChannel classes	21.7.0
JAVA-9658	Java Agent	The Ignore Exception rules do not work as expected when configured to ignore the BT snapshot error	21.7.0
JAVA-9724	Java Agent	Custom naming of the RMI backend does not work	21.7.0
JAVA-9961	Java Agent	Asynchronous servlets that are not completed appropriately are detected as stalled in WebLogic	21.7.0
PHP-1448	PHP Agent	When the Controller is down, the backend agents spam the log files with the error, Interceptors found on op_array when no interceptors have been registered	21.7.0
WEBSRV-460	Apache Agent	A missing 'ts' flag in the correlation header sent by the Apache Agent	21.7.0

Key	Product	Summary	Version
WEBSRV-475	Apache Agent	An issue with the Garbage URL is reported for the agent	21.7.0
WEBSRV-477	Apache Agent	The Java proxy for Apache Agent is upgraded	21.7.0
WEBSRV-479	Apache Agent	A missing URL in the transaction snapshot for Apache Agent is displayed because the agent is unable to handle a sub-request or an internal redirect appropriately	21.7.0
WEBSRV-499	Apache Agent	Apache Agent does not handle the incoming correlation from an upstream application	21.7.0

Controller (SaaS) Resolved Issues

Key	Product	Summary	Version
USERIMPACT-904	Experience Journey Map	Custom Data Filter Fields added in filter panel are not persistent	21.7.0

Known Issues

There were no known issues for the 21.7 release.

21.6 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
ANALYTICS-13610	Analytics Agent	The Analytics Agent file path is experiencing high CPU.	21.6.0
CDM-7039	Android Agent	Build time for debug builds is taking longer than expected.	21.6.0
DBMON-8011	Database Agent	The metrics on the Metric Browser drop to zero because of the thread synchronization issue.	21.6.0
JAVA-9859	Java Agent	WSO2 business transaction naming also considers the URL parameter as part of the segment.	21.6.1
LIBAGENT-411	C/C++SDK	The C/C++SDK Transaction Type field in the Call Graph is displayed as Undefined	21.6.0
NODEJS-314	Node.js Agent	The Node.js Agent is experiencing an error when using reuseNode and reuseNodePrefix.	21.6.0

Key	Product	Summary	Version
NODEJS-383	Node.js Agent	The Node process crashes when Snapshots is enabled.	21.6.0
NODEJS-497	Node.js Agent	The Node.js Agent crashes when Object Instance tracking is enabled.	21.6.0
NODEJS-514	Node.js Agent	The Node.js Agent is unable to capture exit calls for couchbase versions 3.x.x.	21.6.0
PHP-1412	PHP Agent	PHP application crashes when ending Java proxy process	21.6.0
PYTHON-772	Python Agent	Python Agent does not report some transactions because of missing backend metrics.	21.6.0

Controller (SaaS) Resolved Issues

 Filter table:

Key	Product	Summary	V o
ALERT-8297	Alert & Respond	Missing line break in the alert message	2
ALERT-8442	Alert & Respond	Event API is returning NULL for some applications	2
ANALYTICS-13426	Analytics	Corrected the limit issue for the application selector query from the Analytics landing page	2
ANALYTICS-13663	Analytics	Correct the LoadingCache issue in AnalyticsBTypeConfigManager for the .NET Agent	2
CDM-7192	Mobile RUM	Network Name dropdown under NetworkRequest > Snapshot tab should not accept random string	2
DBMON-7969	Database Visibility	Database Monitoring does not display Couchbase buckets and details for memcached type	2
DBMON-7970	Database Visibility	Sorting does not work correctly when selecting last 1 week or longer period	2
DBMON-8003	Database Visibility	Registering large numbers of database servers causes threadpool saturation	2
DBMON-8012	Database Visibility	HTTP 500 error displayed when trying to access a Database Agent health rule	2

Key	Product	Summary	V o
DBMON-8028	Database Visibility	Database Metric Browser does not load intermittently	2
DBMON-8029	Database Visibility	Database Metric Browser does not load	2
DBMON-8135	Database Visibility	Concurrent Modification Exception while polling configuration	2
DBMON-8314	Database Visibility	Execution Plan for Oracle queries are not working	2
DIAGPLAT-1256	APM	Service endpoint Snapshots fail to load with error <code>getRequestSegmentDataListItemWithFilterHandle</code>	2
IAM-1924	Identity, Authentication, Authorization, and Audit	Login entries and user role/permissions are not displayed in the Audit Report & Audit Table	2
LIC-779	Licensing	Error "Current user does not have access to this method" appearing on the Getting Started Wizard - Servers page	2
LIC-801	Licensing	License Rules page displays the message "Invalid License Key"	2
LIC-1257	Licensing	License usage for Synthetic Hosted Pro package is displayed incorrectly	2
MQS-1267	Metric Query Service	Metric Expressions are not working for database metrics	2
MQS-1273	Metric Query Service	Create a cache for existing Metric Hierarchy nodes	2
PLATSE-223, PLATSE-242	Platform Sustaining Engineering	Applying filter to reject unsecure URLs	2
PRE-873	Server Visibility	Servers no longer disappear and reappear rapidly. If the <code>sim.machines.offline.toStaleTimeoutMillis</code> property is set to lower than 1 day, the Servers list fetched for <code>LivenessStatus=ALL</code> displays correct results.	2
STUDIO-4012	Dash Studio	The following libraries in the Controller have been upgraded to the specified versions: <ul style="list-style-type: none"> • jQuery 3.5.1 • AngularJS 1.8.2 	2

Key	Product	Summary	Version
UISVCS-1491	UI Services	Reports not working correctly for User Experience (EUM)	21.5.0
USERIMPACT-1028	Experience Journey Map	The calculation of the outgoing traffic percentage is incorrect	21.5.0

Known Issues

Agent	Summary	Version/Date
Machine Agent	<pre>-Dappdynamics.http.proxyHost</pre> <pre>-Dappdynamics.http.proxyPort</pre> The http configuration properties work for both http and https. Use either http / https depending on the proxy configuration.	21.6.0 - June 24, 2021
Python Agent	Backend resolution does not create the correct flow map in the case of cross-application architecture. See Cross Application Flow ²³⁹¹ for details about cross-application architecture.	21.6.0 - June 17, 2021

21.5 Resolved and Known Issues

Agent Resolved Issues

 Filter table:

Key	Product	Summary	Version
CDM-7188	Android Agent	Apply code changes UI function is not working in Android studio when the appdynamicsGeneratedBuildId_ field is added or removed	21.5.0
CLUSTERMON-2663	Cluster Agent	Even though the auto-instrumentation fails for an application, the environment is updated with some changes	21.5.0
DOTNET-4246	.NET Agent	"Console" as a logging configuration directs logs to STDERR instead of to STDOUT	21.5.0

²³⁹¹ <https://docs.appdynamics.com/display/PRO21/Cross+Application+Flow>

Key	Product	Summary	Version
DOTNET-4793	.NET Agent	HTTP request body removed for certain cases when ASP.NET Legacy instrumentation is enabled in .NET Agent for Alpine Linux	21.5.0
DOTNET-5344	.NET Agent	By default, the Unique Host ID should be set to the Container ID	21.5.0
DOTNET-5377	.NET Agent	There is a <code>System.TypeLoadException</code> exception on POCOs with nullable arguments	21.5.0
DOTNET-5490	.NET Agent	The Linux Agent does not correctly instrument generic value types	21.5.0
DOTNET-5551	.NET Agent	When the <code>site-regex</code> attribute is set to <code>true</code> for an IIS site configuration in the <code>config.xml</code> file, the full Windows agent now applies the configuration to all site names matching the provided regular expression, instead of to just one site name.	21.5.0
DOTNET-5564	.NET Agent	CoreCLR interceptors are not working with the MSI installation	21.5.0
DOTNET-5603	.NET Agent	Improved logging performance for .NET Agent on Linux	21.5.1
DOTNET-5611	.NET Agent	Supports the <code>APPDYNAMICS_CONTROLLER_SSL_CERTFILE</code> and <code>APPDYNAMICS_CONTROLLER_SSL_CERTDIR</code> environment variables for Analytics SSL in .NET Agent on Linux	21.5.1
DOTNET-5612	.NET Agent	Supports multiple certificates in a single file Base-64 format for .NET Agent on Linux	21.5.1
DOTNET-5628	.NET Agent	Docker image is compatible with cluster agent auto-instrumentation	21.5.1
JAVA-9254	Java Agent	Instrumentation point gets disabled for Netty exits	21.5.0
JAVA-8827	Java Agent	Agent does not sync with Controller appropriately for the purged application diagnostic ids	21.5.0
NODEJS-501	Node.js Agent	Agent does not show the correct number of nodes when starting the process manager.	21.5.0
PHP-1396	PHP Agent	One of the third-party libraries for the PHP Agent is upgraded	21.5.0
PHP-1357	PHP Agent	The <code>ADRUM_BT</code> cookie is sent across only for secure connections (HTTPS)	21.5.0

Key	Product	Summary	Version
SYNTH-7071	Synthetic Agent	"Test agent failed to post result" error is displayed while executing jobs	21.5.0

Controller (SaaS) Resolved Issues

 Filter table:

Key	Product	Summary	Version
ANALYTIC S-13291	Analytics	Selecting multiple source to create Business Journey Maps prevents the retrieving of data for selectors	21.5.0
ANLYTCS_ES-4881	Events Service	Resolve the discrepancy between Metric Processor parsing of control characters and Elasticsearch	21.5.0
ANLYTCS_ES-5121	Events Service	Elasticsearch analyzer does not match the current Metric Processor Lucene analyzer	21.5.0
ANLYTCS_ES-5235	Events Service	Merge changes in 20.9 to release/21.4.next	21.4.1
DBMON-7665	Database Visibility	The health rule violation details are not displayed when you click the health status in "Databases">"Dashboard" tab	21.5.0
DBMON-7879	Database Visibility	For some database, the "Object Browser">"Error log" screen does not render the log data	21.5.0
DBMON-7925	Database Visibility	JMX connection not working for Cassandra cluster with SSL enabled	21.5.0
DBMON-7931	Database Visibility	Database Agent naming convention prevents collectors from reporting data	21.5.0
DBMON-8032	Database Visibility	Add Controller flag to control metric filtering for configurations such as Cassandra's keyspace metrics and Couchbase's bucket metrics	21.5.0
DBMON-8037	Database Visibility	DBMonEventBus POST event caused thread pool saturation	21.5.0
DIAGPLAT-1130	APM	Snapshots filter for data collectors when collector type is "Any" is not working	21.5.0
DIAGPLAT-1151	APM	Missing end-to-end latency time in the "Business Transaction" view	21.5.0

Key	Product	Summary	Version
DIAGPLAT-1281	APM	Service endpoint snapshots fail to load with the error <code>getRequestSegmentDataListItemWithFilterHandle</code>	21.5.0
EUMPLAT-2086	End User Monitoring	Improve the performance of a query affecting the browser Page Views in Session timeline	21.5.4
IAM-1925	Identity, Authentication, Authorization, and Audit	Login entries and user role/permissions are not displayed in the Audit Report & Audit Table	21.5.5
L4A-17293	Accounts	The Controller Launch API used by Accounts is producing a SAML login error	21.5.0
LIC-759	Licensing	Some Controllers are sending 0 hourly total count for licenses consumed	21.5.0
LIC-1124	Licensing	Retrieving data causes high load on the database, which brings the Controller down	21.5.0
METADATA-9578	Dashboard	Business transaction metric expression is miscalculated on the Dashboard	21.5.0
METADATA-9610	APM	Corrected caching issue to ensure the setting of the Strict-Transport-Security header	21.5.0
MQS-1261	Metric Query Service	Metric Expressions do not work when the Metric Hierarchy is enabled	21.5.1
MQS-1268	Metric Query Service	Metric expressions do not work for database metrics	21.5.3
PLATSE-222, PLATSE-243	Platform Sustaining Engineering	Applying filter to reject unsecure URLs	21.5.6
PLATSE-262	Platform Sustaining Engineering	Apply filter across all segments of data to retrieve snapshots	21.5.6
STUDIO-4014	Dash Studio	The following libraries in the Controller have been upgraded to the specified versions: <ul style="list-style-type: none"> • jQuery 3.5.1 • AngularJS 1.8.2 	21.5.6
TMNT	APM	Notifications slow the UI when there are many notifications	21.5.0

Known Issues

There are no known issues in the 21.5 release.

21.4 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
BRUM-6565	JavaScript Agent	Error in Visually Complete Time calculation when element is detached from DOM in IE11	21.4.0
BRUM-6613	JavaScript Agent	Calling the ADRUM command addUserData adds an entry even when the key/value pair is null or undefined	21.4.0
DBMON-7950	Database Agent	The pg_database_size metric for Postgres system statistics was computed every minute causing high CPU utilization. With this release, the pg_database_size value is computed at an interval of 1hr approximately	21.4.0
DBMON-8026	Database Agent	The Pluggable Database monitoring (PDB) does not work with the Database Agent 21.2	21.4.0
DOTNET-5406	.NET Agent	.NET Agent correctly reports all HTTP errors	21.4.0
DOTNET-5555	.NET Agent	When restarting the application using the MicroServices Agent, the node reuse environment variables now use the correct values	21.4.0
JAVA-9448	Java Agent	After upgrading Java Agent from 4.5.9 to 20.x or 21.x, the servlet business transactions are not displayed. The node property osb-enable-webservice-entry value has to be set to false (true by default)	21.4.0
JAVA-9433	Java Agent	An upgrade required for the agent such that the legacy agent uses commons-io-2.5 and non-legacy agent uses commons-io-2.8 library for singularity-commons dependency	21.4.0

Key	Product	Summary	Version
JAVA-9361	Java Agent	When you use action suppression for disabling agent reporting, the suppression is not performed for the complete configured duration	21.4.0
JAVA-9261	Java Agent	Update the agent to allow splitting of business transaction on Spring Web Service entry by creating a custom configuration	21.4.0
JAVA-9235	Java Agent	The name of a node is generated multiple times for ephemeral nodes	21.4.0
JAVA-9110	Java Agent	Snapshot reporting stops after a few minutes post the agent-reset	21.4.0
JAVA-9859	Java Agent	WSO2 business transaction naming also considers the URL parameter as part of the segment. The fix is available in 21.4.1 and versions >= 21.6.	21.4.1
LIBAGENT-442	Node.js Agent	Node.js Agent does not report HTTP data collector to Analytics	21.4.0
NODEJS-245	Node.js Agent	Node.js Agent fails HTTP tunneling for secure connections	21.4.0
WEBSRV-398	Apache Agent	HttpClient library for the Apache Agent is upgraded	21.4.0

Controller (SaaS/On-Premises) Resolved Issues

 Filter table:

Key	Product	Summary	Version
ALERT-8667	Alert & Respond	Affects column not available in the Health Rule widget	21.4.3
ALERT-8667 8	Alert & Respond	Behavior of the Controller's Email Template Editor is confusing	21.4.3
ANALYTICS-13273	Analytics	Add back ticks to ADQL query if field matches ADQL keyword	21.4.0
ANALYTICS-13434	Analytics	Optimize the Analytics Agent status call by using AnalyticsAgentConfigurationCache	21.4.3

Key	Product	Summary	Version
BRUM-6548	Browser RUM	Null Point Error preventing the Controller UI from loading the dashboard data	21.4.0
CLUSTERMON-2958	Cluster Monitoring	After adding namespaces, unable to add additional namespaces to monitor	21.4.4
DBMON-7397	Database Visibility	Remove incorrect max heap size information from the Getting Started Wizard - Databases	21.4.0
DBMON-7533	Database Visibility	HTTP thread pool saturation preventing access to the Controller UI	21.4.0
DBMON-7843	Database Visibility	No auditing for database collectors (update/delete/create)	21.4.0
DBMON-8033	Database Visibility	Add Controller flag to control metric filtering for configurations such as Cassandra's keyspace metrics and Couchbase's bucket metrics	21.4.2
DBMON-8038	Database Visibility	DBMonEventBus POST event caused thread pool saturation	21.4.2
DIAGPLAT-1280	APM	Service Endpoints returns an HTTP 500 status and emits the error message Error handling snapshot data	21.4.3
IAM-1546	Identity, Authentication, Authorization, and Audit	Remove invalid notification configs in SaaS Account DTO.	21.4.6
IAM-1924	Identity, Authentication, Authorization, and Audit	Login entries and user role/permissions are not displayed in the Audit Report & Audit Table	21.4.4
IAM-2067	Identity, Authentication, Authorization, and Audit	LDAP user unable to import applications	21.4.6
L4A-17233	License Management	Usage views not displaying proper data granularity	21.4.0
L4A-17818	License Management	Multiple entries with the same key caused an <code>IllegalArgumentException</code> in Glassfish	21.4.0
LIC-1172	Licensing	Server exception for missing database partition encountered when fetching license usage	21.4.4

Key	Product	Summary	Version
LIC-1663	Licensing	Licensing error with the .NET Agent: vCPU information is not passed to renew lease calls	21.4.9
LIC-1669	Licensing	IBL license consumption reporting is not working for on-prem Controllers	21.4.9
LIC-1691	Licensing	Integrate the data migration fix to on-prem Controllers	21.4.9
METADATA-9564	Dashboard	Export Custom Dashboard should check for null widgets and not include them in the export	21.4.0
METADATA-9614	Dashboard	Corrected caching issue to ensure the setting of the Strict-Transport-Security header	21.4.2
MOBILE-1778	Mobile App	Remove registered device details from cache when users delete the account from mobile applications	21.4.7
MOBILE-1813	Mobile App	Notifications are not being pushed to mobile devices	21.4.7
PLATSE-132	Platform Engineering	Display the correct node information in the flow map	21.4.3
PLATSE-221, PLATSE-244	Platform Sustaining Engineering	Applying filter to reject unsecure URLs	21.4.7
PLATSE-250	Platform Sustaining Engineering	HTTP Data Collector parameters conversion type is not getting applied to the .NET Agent	21.4.7
PLATSE-272	Platform Sustaining Engineering	From the Waterfall view, drilling down to an application in a snapshot causes an error	21.4.8
STUDIO-3979	Dash Studio	Upgraded the following JavaScript libraries to the specified versions: <ul style="list-style-type: none"> • JQuery version 3.5.1 • AngularJS version 1.8.2 	21.4.7
SVCMON-1253	APM	Null Pointer Error is preventing the deletion of business transactions and applications	21.4.0
SVCMON-1273	APM	Service Endpoints page displays No Data Available message or blank screen after scrolling	21.4.0
SVCMON-1277	APM	Improved the loading of Custom Dashboards by optimizing business transaction queries	21.4.0

Key	Product	Summary	Version
SVCMON-1278	APM	New Service Endpoints table does not fit on the screen size	21.4.0
SYNTH-7058	Synthetic Browser Monitoring	Synthetic Agent is not displaying in the Job Editor	21.4.3
SYSTEAM-306	Systems Engineering	Upgrade the Reports Service version that uses Node.js version 14.17.5	21.4.7
TMNT-1767	APM	Large number of license notifications freezes Controller UI	21.4.0
UISVCS-1622	UI Services	Upgrade Controller to use latest Reports Service with new nodemailer package	21.4.6

On-Premises Platform Resolved Issues

 Filter table:

Key	Product	Summary	Version
ECONSOLE-6426	Enterprise Console	The upgrade process after the glassfish password change is fixed	21.4.0
ECONSOLE-6436	Enterprise Console	The HA Module final replication process is fixed	21.4.0
ECONSOLE-6438	Enterprise Console	The Database data directory downtime is fixed	21.4.0
ECONSOLE-6440	Enterprise Console	The HA Module now shows rsync errors for the Database replication	21.4.0
ECONSOLE-6468 ECONSOLE-6535	Enterprise Console	Change the Glassfish admin password using the asadmin utility of the Enterprise Console	21.4.4
ECONSOLE-6497	Enterprise Console	Fixed "illegal option -- V" finalize replication error	21.4.7
ECONSOLE-6530	Enterprise Console	Updated the regex for cleaning up InnoDB log files from the Secondary during replication	21.4.4
ECONSOLE-6537	Enterprise Console	Udate Azul JRE to 8.54.0.22 jdk8.0.292	21.4.4

Key	Product	Summary	Version
ECONSOLE-6539	Enterprise Console	Updated the regex for sanitizing InnoDB log files from the Secondary during replication	21.4.4
ECONSOLE-6569	Enterprise Console	When upgrading the Controller, the diagnosis script runs twice causing increased CPU usage	21.4.4
ECONSOLE-6570	Enterprise Console	Hardening the file permissions of the pa_orcha directory	21.4.4
ECONSOLE-6587	Enterprise Console	Upgrade Node.js to the latest Long-Term Support (LTS) Version 14.17.4	21.4.5
EUMPLAT-2101	EUM Server	Infrastructure-based Licensing (IBL) license file signature validation failure	21.4.2
SYNTH-7154	Synthetic Server	Synthetic jobs get deleted when there are connection issues between the Synthetic Server and EUM database	21.4.0

Known Issues

There are no known issues in the 21.4 release.

21.3 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
DOTNET-4992	.NET Agent	Fixed process hang when capturing the thread snapshots under some conditions	21.3.1
DOTNET-5382	.NET Agent	(For Full Windows .NET Agent) You can now use the APPDYNAMICS_CONTROLLER_HOST_NAME , APPDYNAMICS_CONTROLLER_PORT, and APPDYNAMICS_CONTROLLER_SSL_ENABLED configuration environment variables to override properties in the config.json file for "controller host", "controller port", and "enable controller ssl connection", respectively.	21.3.1
DOTNET-5417	.NET Agent	Sensitive URL filter has been fixed for stalled transactions in .NET Core MicroServices Agent	21.3.0

Controller (SaaS/On-Premises) Resolved Issues

There was no Controller release for 21.3.

Key	Product	Summary	Version
DOTNET-5453	.NET Agent	.NET Agent for full Windows now reports correct Average CPU Time	21.3.0
DOTNET-5455	.NET Agent	Able to switch to different DMM modes from KPI for .NET application through Netviz Agent on Windows	21.3.0
DOTNET-5456	.NET Agent	Can start pcap for .NET application through Netviz Agent on Windows	21.3.0
DOTNET-5492	.NET Agent	Memory leak due to NetViz has been fixed	21.3.0
JAVA-9297	Java Agent	Issue with the commons-io library that is packaged with the Java Agent	21.3.0
DOTNET-5527	.NET Agent	TypeCache implementation is now safe for threading	21.3.1
DOTNET-5534	.NET Agent	Fix for proper handling of empty application configuration in .NET Agent configuration	21.3.1
DOTNET-5536	.NET Agent	Optimization for CPU usage when NetViz is not enabled	21.3.1
JAVA-8997	Java Agent	Servlet Split rule based on the selected parameter in the request does not work for the Reactor Netty framework	21.3.0
JAVA-8748	Java Agent	Duplicate backends are created with Java Agent API	21.3.0
LIBAGENT-442	Node.js Agent	Node.js Agent does not report HTTP data collector to Analytics	21.3.0
LIBAGENT-487	C/C++ SDK	Fix unsynchronized access to the Business Transactions data	21.3.0
LIBAGENT-494	C/C++ SDK	Frame calls are abruptly failing	21.3.0
NETWORK-626 4	Network Agent	The Network Agent Npcap version is upgraded to 1.20	21.3.0
NETWORK-626 9	Network Agent	The Network Agent installation of Visual C++ is fixed	21.3.0
SRVLESS-1537	Node.js Serverless Tracer	Updated appdynamics-lambda-trace package dependencies	21.3.0

On-Premises Platform Resolved Issues

There was no on-premises platform release for 21.3.

21.2 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
ANALYTICS-13226	Java Agent	Enabling recommended data collection intermittently affects Transaction Analytics reporting	21.2.0
BRUM-6539	JavaScript Agent	ReferenceError: hideCookieBanner is not defined when page is injected with adrum-latest.js	21.2.0
BRUM-6552	JavaScript Agent	Extra value at the end of the app URL set by the ADRUM cookie	21.2.0
BRUM-6553	JavaScript Agent	JavaScript statements inside setTimeout and setInterval run in local scope when adrum is enabled	21.2.0
CDM-7032	React Native Agent	Networking request responses are corrupted	21.2.0
CDM-7033	iOS Agent	iOS Agent disables SwiftUI previews	21.2.0
CDM-7175	Android Agent	Events are stored on EventBus even when agent is not initialized	21.2.0
DBMON-7552	Database Agent	The Database Agent sends the health rule data of a MongoDB replica node even after the node is stopped	21.2.0
DBMON-7568	Database Agent	The Database Agent log file includes the error, invalid USERENV parameter, for an Oracle collector	21.2.0
DBMON-7739	Database Agent	The custom metrics value drops to zero intermittently	21.2.0
DBMON-7654	Database Agent	The Oracle collector log displays an error when Sysmetrics query is used	21.2.0

Key	Product	Summary	Version
DBMON-7745	Database Agent	The Explain another query: field under Execution Plan displays an error without any details for MariaDB	21.2.0
DOTNET-4538	.NET Agent	Optimizations for Async tracking in .NET Core and .NET Framework applications	21.2.0
DOTNET-4834	.NET Agent	Fix for high thread contention in certain Async-heavy applications	21.2.0
DOTNET-5175	.NET Agent	Fix for analytics data loss in certain cases when the Analytics Agent is recycled and loses communication with the .NET Agent	21.2.0
JAVA-9093	Java Agent	The User Experience value based on the set threshold limit is incorrect only for those records that do not have a matching transaction snapshot on the APM	21.2.0
JAVA-9037	Java Agent	Upgrading the Java Agent to 20.11 displays an exception <code>Error instantiating DispatcherServletInterceptor</code> in the logs	21.2.0
LIBAGENT-490	Node.js Agent	Unregistered backend metrics appear in the Metric Browser	21.2.0
METADATA-9624	APM	Ensure that the HTTP header <code>Strict-Transport-Security</code> is set	21.2.5
NETWORK-6227	Network Agent	Network Agent does not support host metrics on Windows	21.2.0
NODEJS-324	Node.js Agent	HTTP Request Data Collectors collect HTTP Parameters Name instead of Display Name	21.2.0
PYTHON-498	Python Agent	Java proxy caches stale agent data	21.2.0
PHP-1170	PHP Agent	PHP Agent does not support using an environment variable for defining a unique host ID	21.2.0

Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary	Version
ALERT-7111	Alert & Respond	Garbled characters appear in email template instead of cyrillic string	21.2.0
ALERT-7786	Alert & Respond	Health rules not available in cache after Controller upgrade	21.2.0
AMCSEV-1260	App Monitoring Cloud Services	Tiers Page does not show node details for the nodes after the 10th registered node	21.2.0
ANALYTICS-13205	Analytics	From the Dashboard , double-clicking "business journey" transactions directs user to Overview page instead of Details dialog	21.2.0
ANALYTICS-13219	Analytics	When changing the date format in My Preferences to "DD/MM/YY" and then opening a transaction snapshot in Analytics the error TRS has illegal timeRange is displayed	21.2.0
ANLYTCS_ES-3474	Events Service	Some logically incorrect ADQL is validated	21.2.0
BRUM-6410	Browser RUM	Review of health rules violations from User Experience applications redirects to health rules for Application Performance	21.2.0
CLUSTERMON-2060	Cluster Monitoring	Agent registration is prevented while storing Cluster Agent properties in the database	21.2.0
DBMON-7131	Database Visibility	An Incorrect Database Agent version is displayed in the Database Agents setting after upgrading the agent and starting the new agent with the same name	21.2.0
DBMON-7222	Database Visibility	When configuring Monitoring Operating System for an AWS RDS collector, the required region is not displayed in the list. Now, the required regions are included and some unnecessary regions are removed from the list.	21.2.0
DBMON-7302	Database Visibility	Disk Usage within the database Queries displays an incorrect error message for the PostgreSQL database	21.2.0
DBMON-7308	Database Visibility	The Live view session list displays all the active sessions when the View filter is set to All Sessions , but active sessions are not displayed when the filter is set to All Active	21.2.0
DBMON-7354	Database Visibility	The Invalid DB error is displayed when saving an action suppression on one of the nodes of the database cluster	21.2.0

Key	Product	Summary	Version
DBMON-7373	Database Visibility	A blank window is displayed when you click Drill Down for a database on the Transactions snapshot	21.2.0
DBMON-7517	Database Visibility	Inconsistent Custom Metric permissions	21.2.0
DBMON-7535	Database Visibility	The Exclude Schemas option gets checked after upgrading from old Controller to new Controller	21.2.0
DBMON-7549	Database Visibility	Duplicate IO Metric entries are displayed for Microsoft SQL Server on the Health Rule configuration page	21.2.0
DBMON-7604	Database Visibility	Custom Metric not displayed in Custom Metrics tab even though data is displayed in Metric Browser	21.2.0
DBMON-8034	Database Visibility	Added the <code>dbmon.config.metrics.filtering.enabled</code> Controller flag to control the Database metric filtering for Cassandra's Keyspace and Couchbase's bucket-level metrics	21.2.6
DBMON-8039	Database Visibility	DBMonEventBus post-event call results in thread pool saturation	21.2.6
DIAGPLAT-1080	APM	Searching for snapshots yields inaccurate results for Standard Time Range from Transaction Snapshot	21.2.0
DIAGPLAT-1212	APM	"Internal Server Error" when opening Error Snapshots	21.2.0
DIAGPLAT-1229	APM	Correct the data population for the "Snapshots Summary View"	21.2.6
DIAGPLAT-1279	APM	ServiceEndpoint Snapshots fail to load with the error <code>getRequestSegmentDataListItemsWithFilterHandle</code>	21.2.8
LIC-647	Licensing	Database Monitoring license usage reporting does not work with Agent-based license rules	21.2.3
L4A-17203	License Management	The Get License Usage API was reporting zero active licenses despite active agents with valid leases	21.2.0
L4A-17796	Accounts	Increase the container-app version in the Controller	21.2.1
L4A-17818	License Management	Multiple entries with the same key caused an <code>IllegalArgumentException</code> in Glassfish	21.2.0
L4A-17838	Accounts	Multiple entries with the same key	21.2.1
L4A-17959	Accounts	SAML and LDAP users without email addresses are not able to edit or add roles	21.2.2

Key	Product	Summary	Version
PLATSE-120	Platform Maintenance	Reset counter when restarting Developer mode	21.2.6
SVCMON-1303	APM	NPE in BtServiceImpl#registerDeleteMdsBtEntityTransactionListener does not allow purge of applications and Business Transactions	21.2.0
UISVCS-1063	Accessibility	The color of blue links in data grids, such as the Business Transactions list, has been updated to #0040B6 for improved contrast	21.2.0
USERIMPACT-714	Experience Journey Map	Bad Link when clicking View All Applications in Experience Journey Map	21.2.0

On-Premises Platform Resolved Issues

Filter table:

Key	Product	Summary	Version
ANLYTCS_ES-5166	Enterprise Console	Update the Enterprise Controller to use Events Service 20.9	21.2.4
ECONSOLE-6395	Enterprise Console	The Controller monitoring setting in the AppServer configuration is fixed	21.2.0
ECONSOLE-6518	Enterprise Console	Correct the Enterprise Console's discovery for the latest version of the Events Service	21.2.7
ECONSOLE-6598	Enterprise Console	Upgrade Node.js to the latest Long-Term Support (LTS) Version 14.17.4	21.2.8

Known Issues

Synthetic Services (Version 21.2.0)

Change in Synthetic job failure events behaviour (in the 20.7.0. version) affects the alerting configurations. This change triggers alerts for wrong events.

In this release:

- The events behaviour is reverted to the [standard behaviour](#)²³⁹² in Chrome, IE, and Firefox browsers. The issue still persists in Mobile Browser Emulation.
- Non-alphanumeric characters are not displayed in script logs of the Synthetic sessions.

²³⁹² <https://docs.appdynamics.com/display/PRO21/Synthetic+Jobs#SyntheticJobs-job-retest>

21.1 Resolved and Known Issues

Agent Resolved Issues

 Filter table:

Key	Product	Summary	Version	Controller (SaaS/On-Premises) Resolved Issues
DOTNET-5316	.NET Agent	Sensitive Message Filter has been fixed when including parameters message-pattern FOUND but redaction-regex NOT MATCHED	21.1.0	
DOTNET-5372	.NET Agent	Improvements to Azure Service Bus async error tracking	21.1.0	
JAVA-7603	Java Agent	An error is reported when the maximum analytics collector limit exceeds	21.1.0	
JAVA-8137	Java Agent	A Null Pointer Exception occurs if no regex pattern is provided in the custom backend naming config	21.1.0	
JAVA-8255	Java Agent	Agent reset through the controller does not reset Dynamics Service (ADS) runtime state	21.1.0	
JAVA-8380	Java Agent	EUM does not work appropriately with request match rules in non-servlet environments	21.1.0	
JAVA-8407	Java Agent	Snapshots are not generated due to SQL parsing, even though the snapshots are reported to the controller	21.1.0	
JAVA-8595	Java Agent	The transformation limit is reached due to the Analytics data collection interceptor	21.1.0	
JAVA-8878	Java Agent	Business transaction data is not displayed if the business transaction lockdown is enabled in a service-proxy enabled environment	21.1.0	
NODEJS-378	Node.js Agent	Unhandled <code>TypeError</code> exception terminates the Node.js Agent	21.1.0	

Key	Product	Summary	Version	On-Premises Platform Resolved Issues
PHP-1210	PHP Agent	PHP Agent does not report metrics after the Business Transaction lockdown in the Controller	21.1.0	
PYTHON-640	Python Agent	Applied changes from JAVA-8878 to the Python Java proxy	21.1.0	
SERVER-8458	Machine Agent	Server Agent no longer purges machines inadvertently before the expected purge time	21.1.0	

 Filter table:

Key	Product	Summary	Version
ALERT-7111	Alert & Respond	Garbled characters are appearing in email template instead of a Cyrillic string	21.1.0
ALERT-7682	Alert & Respond	Action suppression time selector value is reset once you navigate away from the tab	20.8.0, 20.10.0, 20.11.0, 21.1.0
AMCSEV-575	App Monitoring Cloud Services	Not able to create custom Service Endpoint for JMS type with property type Integer	21.1.0
AMCSEV-927	App Monitoring Cloud Services	Long thread names are difficult to read	21.1.0
AMCSEV-1075	App Monitoring Cloud Services	Popup on flow map does not show the calls per minute/response as per grouped JDBC	21.1.0
AMCSEV-1099	App Monitoring Cloud Services	Filter UI For Tiers & Nodes in application need to close on Cancel or Apply	21.1.0
AMCSEV-1187	App Monitoring Cloud Services	Machine Agents screen displays the error unnecessary keys are empty error	21.1.0
ANALYTICS-12060	Analytics	Automatic field extraction does not permit adding a definer sample for more than one field	21.1.0

Key	Product	Summary	Version
ANALYTICS-12912	Analytics	Missing start tier causes TypeError in Business Transaction flow map with EUM and BT node	21.1.0
ANALYTICS-12846	Analytics	Better handling of fields to display from originating tier in Analytics data table	21.1.0
ANALYTICS-12938	Analytics	Funnel Dashboard UI: Access to the specified resource forbidden	21.1.0
ANALYTICS-12953	Analytics	When editing the Analytics Search widget on the Dashboard , the toggle Use Dashboard Time Range is not responding	21.1.0
ANALYTICS-13003	Analytics	From Analytics Search , the array of Booleans and numbers display incorrect values	21.1.0
ANALYTICS-13031	Analytics	From Analytics Search , the Tier filter is incorrectly initialized by the Node filter	21.1.0
ANALYTICS-13070	Analytics	From Transaction Snapshots , the Analytics timestamp is incorrect if the customer changed Display Time Zone in Preferences	21.1.0
ANALYTICS-13090	Analytics	NodeJS does not receive Analytics HTTP config	21.1.0
BRUM-6390	Browser RUM	From Timing Breakdown , the SSL/TLS bar is not rendering correctly	21.1.0
CDM-7016	Mobile RUM	Accessing warning snapshots from Code Issues causes a java.lang.exception	21.1.0
DIAGPLAT-1001	APM	Snapshots are sometimes not displaying the potential issue information	21.1.0
DIAGPLAT-1043	APM	Query executed in <code>getSummariesAndAppendBlobsIfNeeded</code> times out	21.1.0
DIAGPLAT-1081	APM	Searching for snapshots yields inaccurate results for Standard Time Range from Transaction Snapshot	21.1.0
L4A-15351	Accounts	Email address field not accepting special characters.	21.1.0
L4A-15898	Accounts	Company Admin is unable to add new user	21.1.0
L4A-16541	Controller-License	The UI is storing the <code>machineId</code> instead of the <code>hostId</code> value reported by the agent, therefore it doesn't match the value stored for the filter.	20.8.0, 20.10.0, 20.11.0, 21.1.0

Key	Product	Summary	Version
L4A-16565	Accounts	After migrating to Infrastructured-based Licensing, the Premium package had the wrong license consumption	21.1.0
METADATA-9467	APM	The security header response (HSTS) is fixed	21.1.0
METADATA-9483	APM	Health rule status precedence is fixed	21.1.0
REPORTS-799	Reports	Scheduled reports are sent on clicking Save	21.1.0
REPORTS-811	Reports	Reports (scheduled or one time) with a custom time range are delivered with the Login page	21.1.0
TMNT-952	APM	Customer time range does not display time as per the timezone configured in the preferences	21.1.0
TMNT-1799	APM	Notifications slow the UI down when there are many notifications	21.1.0
UISVCS-1011	UI Services	Creation of error detection configuration field for the HTTP return codes for the PHP Agent	21.1.0

 Filter table:

Key	Product	Summary	Version
ECONSO LE-6162	Enterprise Console	The Enterprise Console now selectively calls the create-xxx commands and sets the alias equal to s1as (the default for the Controller)	21.1.0
ECONSO LE-6245	Enterprise Console	check-ec-dir-owner.orchs now runs a task on all inventory hosts	21.1.0
ECONSO LE-6303	Enterprise Console	The lsof package check on controller.sh has been updated with a non-pipe () implementation	21.1.0
ECONSO LE-6304	Enterprise Console	Function to check privileged ports in install-init.sh has been fixed	21.1.0
ECONSO LE-6344	Enterprise Console	EC Installer copies mysql 5.5 binaries to null in 4.5.17+ versions	4.5.17, 20.3.0, 20.4.0, 20.7.0, 20.8.0, 20.10.0, 20.11.0, 20.6.10, 21.1.0
ECONSO LE-6368	Enterprise Console	The Controller diagnosis job has been fixed and no longer fails in a Windows implementation	21.1.0

Key	Product	Summary	Version
ECONSOLE-6370	Enterprise Console	Installation of Enterprise Console fails on some time zone settings	21.1.0
EUMPLA-T-1280	EUM Server	HMAC key is not available for Synthetic Hosted Agent license	21.1.1
EUMPLA-T-1320	EUM Server	Unified license terms not properly provisioned on Controller with license file	21.1.0
EUMPLA-T-2101	Licensing	Infrastructure-based license file signature fails to validate	21.4.1
L4A-15433	Authorization	A non-system account user is able to login to admin.jsp with no elevated permissions.	21.1.0
L4A-16638	Enterprise Console	Unable to download AppDynamics platform components for on-premises platform upgrade	21.1.0

Known Issues

There are no known issues in the 21.1 release.

20.12 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
ANALYTICS-13154	Java Agent	toString() method displays “[Ljava.lang.String;@23377943”] error for Java arrays in Data Collectors	20.12.0
BRUM-6403	JavaScript Agent	Page renders slowly for AngularJS apps if there is no onreadystatechange handler for AJAX calls	20.12.0
BRUM-6438	JavaScript Agent	ADRUM cookie triggers sameSite attribute warning in Firefox	20.12.0

20.11 Resolved and Known Issues

Agent Resolved Issues

Key	Product	Summary	Version
CLUSTERMON-2259	Cluster Agent	The <code>cluster-agent-operator-openshift.yaml</code> file fails to deploy the pod on OpenShift and the log displays the <code>no matches for kind "Clustercollector" in version error</code>	20.12.1
CLUSTERMON-2088	Cluster Agent	The auto-instrumentation does not work when there is a space in the <code>appname</code> configuration within the <code>cluster-agent.yaml</code> file	20.12.0
DBMON-7391	Database Agent	The Network IO metrics value displays an unreasonable number for the AIX servers	20.12.0
DBMON-7561	Database Agent	When configuring Monitoring Operating System for an AWS RDS collector, the eu-north-1 region is not displayed	20.12.0
DBMON-7495	Database Agent	When the IP address of the host machine keeps changing, the database metrics drop to zero and the Events page displays that the collectors are reinitialized	20.12.0
DBMON-7444	Database Agent	When a database uses the Database Partitioning Feature (DPF), the Calls per Minute metric on the Metric Browser displays incorrect data	20.12.0
DBMON-7428	Database Agent	The hardware monitoring stops working and the log displays the <code>com.jcraft.jsch.JSchException: session is down error</code>	20.12.0
DOTNET-5047	.NET Agent	Ability to download latest .NET Agent from the Controller	20.12.0
DOTNET-5108	.NET Agent	Fixed issue of incorrect CPU% reporting in certain cases	20.12.0
DOTNET-5111	.NET Agent	Download link for .NET has been updated on the Getting Started Wizard page	20.12.0
DOTNET-5270	.NET Agent	Ability to add headers to ASP.NET Core HTTP responses is now available	20.12.0
DOTNET-5300	.NET Agent	Agent MSI MA registration request with vCPU information was extended to support IBL licensing	20.12.0

Key	Product	Summary	Version	Controller (SaaS/On-Premises) Resolved Issues
DOTNET-5340	.NET Agent	Unhandled exception in timer thread may cause application crash in some situations	20.12.0	
NODEJS-199	Node.js Agent	Standalone 64-bit Node.js Agent versions 10 and 12 fail in Linux with a Segmentation Fault error	20.12.0	
NODEJS-284	Node.js Agent	Node.js Agent errors in Alpine-based Docker images	20.12.0	
PHP-999	PHP Agent	PHP Agent does not detect ports when a client uses CURLOPT_PORT instead of placing it in the URL	20.12.0	
PHP-1187	PHP Agent	Analytics snapshot data is missing for continuing and terminating the PHP Tiers snapshots	20.12.0	
PYTHON-518	Python Agent	Upstream application is not visible on Controller when the downstream application is Python	20.12.0	
SERVER-8351	Machine Agent	Machine Agent works with user-defined JAVA_HOME with -j flag	20.12.0	

Controller (SaaS/On-Premises) Resolved Issues

There are no Controller releases for 20.12 yet.

On-Premises Platform Resolved Issues

There are no on-premises platform releases for 20.12.

Known Issues

There are no known issues in the 20.12 release as of yet.

Filter table:

Key	Product	Summary	Version
BRUM-6350	JavaScript Agent	Visually Complete Time sometimes reports as a Page Complete Time	20.11.0
CDM-6991	Android Agent	Issue parsing the mobile agent token that registers the agent with the Controller, causing extra licenses to be consumed	20.11.0

Key	Product	Summary	Version
CLUSTER MON-208 9	Cluster Agent	Agent registration is prevented while storing Cluster Agent properties in the database	20.11.0
CLUSTER MON-205 7	Cluster Agent	The terminologies blacklist and whitelist are replaced with blocklist and allowlist to follow neutral usage of words	20.11.0
DOTNET- 4986	.NET Agent	Fix for race condition in tracking CLR instances for IIS in-processes hosted by .NET Core 3.1 applications	20.11.0
DOTNET- 5159	.NET Agent	To prevent correlation headers from becoming too long, the Linux Agent now limits the number of in-process call chain segments for thread correlation to ten segments per node. To disable this limit, set the node property track-all-async = true.	20.11.0
DOTNET- 5244	.NET Agent	Fix for application crash if more than one URL filter is configured	20.11.0
JAVA-859 9	Java Agent	Upgrading the Java Agent to use Agentless Analytics results in custom data not getting reported to analytics	20.11.0
JAVA-853 6	Java Agent	A significant number of threads are blocked in the Java Agent UUID generation	20.11.0
JAVA-845 6	Java Agent	Issue with the snapshot generation post-JVM restarts	20.11.0
JAVA-844 1	Java Agent	When JVM is restarted before the end of Action suppression rule created with disable agent reporting, the agent is not re-enabled automatically and the metrics are not reported	20.11.0
JAVA-828 3	Java Agent	A Null Pointer Exception error is reported when retrieving JMX attribute	20.11.0
JAVA-794 4	Java Agent	Issue with the Average Response Time and reporting of Thread Task metrics	20.11.0
JAVA-760 3	Java Agent	An error is reported when the maximum analytics collector limit is exceeded	20.11.0

Key	Product	Summary	Version	On-Premises Platform Resolved Issues
PYTHON-517	Python Agent	Python agent does not group all methods (GET, POST, PUT, and DELETE) when custom transaction detection rules are applied without HTTP method criteria	20.11.0	
PYTHON-581	Python Agent	Individual Business Transactions are formed even in the presence of Custom Transaction Rule	20.11.0	
SERVER-8419	Machine Agent	Machine Agent installed with RPM does not honor settings for user and user group	20.11.0	
SERVER-8465	Machine Agent	JVM options provided via service installation is set in vmoptions file	20.11.0	
SERVER-8471	Machine Agent	CPU usage reporting fix for Solaris 11	20.11.0	
SERVER-8530	Machine Agent	Correct CPU used percentage reported for each processor group	20.11.0	
SRVLESS-1305	Serverless Tracer	The Java, Node.js, and Python Serverless Tracers now default HTTP calls made by the tracer to timeout after 2000ms	20.11.0	

Filter table:

Key	Product	Summary	Version
ALERT-6830	Alert & Respond	Incorrect link destination during remediation script action creation	20.11.0

Key	Product	Summary	Version
ALERT-6990	Alert & Respond	Only application object scope is supported for application error displays when you suppress an action (one-time) for an EUM enabled APM application	20.11.0
ALERT-7088	Alert & Respond	Health Rule for the User Experience Application does not automatically include new pages	20.11.0
ALERT-7828	Alert & Respond	Health rules not available in cache after Controller upgrade	20.11.4
AMCSEV-727	App Monitoring Cloud Services	Automatic Leak detection session duration shows 60 minutes when the agent default is 30 minutes	20.11.0

Key	Product	Summary	Version
AMCSEV-1023	App Monitoring Cloud Services	Unable to export the call graph	20.11.0
AMCSEV-1328	App Monitoring Cloud Services	Tiers page does not display node details after the 10th node is registered	20.11.7
ANALYTICS-12780	Application Analytics	ADQL basic search filter does not escape double quotation	20.11.0
ANALYTICS-13089	Application Analytics	Incorrect Browser Sessions/ Mobile Sessions details in the Analytics Home page	20.11.1
ANALYTICS-13095	Application Analytics	Node.js Agent does not receive the Analytics HTTP configuration	20.11.0
ANALYTICS-13067	Application Analytics	From Analytics Search , the Tier filter is initialized incorrectly by the Node filter	20.11.3

Key	Product	Summary	Version
CLUSTERMON-2089	Cluster Monitoring	Agent registration is prevented while storing Cluster Agent properties in the database	20.11.0
DBMON-7170	Database Visibility	The database health rule is not evaluated for the custom metric name that has more than two (pipe) symbols	20.11.0
DBMON-7256	Database Visibility	Some Sybase custom metrics do not display when the SQL query returns multiple result sets	20.11.0

Key	Product	Summary	Version
DBMON-7268	Database Visibility	You cannot update the Advanced Options for a collector because the collector is automatically updated when you select the Advanced Options on the Collector configuration page	20.11.0
DBMON-7269	Database Visibility	The values cannot be added in Advanced Options on the Edit Collector page	20.11.0
DBMON-6620	Database Visibility	The Oracle collector cannot be created with a custom connection string and sub-collectors	20.11.0

Key	Product	Summary	Version
DBMON-7615	Database Visibility	Custom Metric appears in the Metric Tree for all the configurations regardless of the configuration it belongs to in the Metric Browser	20.11.1
DBMON-7618	Database Visibility	Unable to create action suppression on single node for database with multiple nodes (topology)	20.11.1
DIAGPLAT-879	APM	Retrieve Event Data API is not filtered by the tier ID	20.11.0
DIAGPLAT-891	APM	Event creation locked because of a thread pool saturation	20.11.0

Key	Product	Summary	Version
DIAGPLAT-907	APM	Filtering is incorrect for the Service Endpoints in getRequestSegmentsByFilterHandle API	20.11.0
DIAGPLAT-947	APM	Some TSS bound its detail string with the wrong ID	20.11.0
DIAGPLAT-950	APM	Providing JavaScript to purge bad TSS detail IDs from the cache	20.11.0
DIAGPLAT-1061	APM	Query executed in getSummariesAndAppendBlobsIfNeeded timed out	20.11.3
DIAGPLAT-1082	APM	Search for snapshots gives inaccurate results for Standard Time Range under Transaction Snapshot	20.11.4, 20.11.5

Key	Product	Summary	Version
JAVA-8865	APM	ServiceProxy feature for Controllers upgraded to 20.11.0 are disabled	20.11.2
L4A-14347	Accounts	Improper Authorization allows access to admin.jsp	20.11.0
METADATA-9402	APM	REST API has added load historical liveness data for a tier, its node, and its parent app based on an anchor metric ID provided by users	20.11.0
METADATA-9485	APM	Ensure that the HTTP header Strict-Transport-Security is set	20.11.0
METADATA-9488	APM	Health rule status precedence is incorrect	20.11.0

Key	Product	Summary	Version
MQS-1247	Metric Query Service	Metric Browser does not display data for some random window sizes	20.11.9
REPORTS-813	Reports	Reports with custom time ranges getting delivered with login page	20.11.0
SVCMON-1301	APM	Improve queries for business transactions to optimize performance	20.11.8
SYNTH-5864	Synthetic Browser Monitoring	Synth Credential vault shows EUM App name in the dropdown instead of the app name	20.11.0

Key	Product	Summary	Version
TMNT-707	APM	When exporting metric data, the browser does not show data points after the Daylight Savings Time (DST) change	20.11.0

 Filter table:

Key	Product	Summary	Version
ECONSOLE-5932	Enterprise Console	The .properties files are no longer included in the Enterprise Console Installer	20.11.0
ECONSOLE-6190	Enterprise Console	Enterprise Console successfully changes the http-listener-2.port after the update_config job completes	20.11.0
ECONSOLE-6196	Enterprise Console	The Controller DB user password has been updated with Aurora DB	20.11.0
ECONSOLE-6201	Enterprise Console	Customizations to the domain.xml file are no longer lost during upgrade to 20.4	20.11.0
ECONSOLE-6216	Enterprise Console	The Enterprise Console recognizes timeouts in Windows Stop Service from playbooks	20.11.0
ECONSOLE-6344	Enterprise Console	MySQL 5.5 and 5.6 binaries are fixed in the Enterprise Console packaging for Windows	20.11.0
ECONSOLE-6587	Enterprise Console	Upgrade Node.js to the latest Long-Term Support (LTS) Version 14.17.4	21.11.1

Known Issues

There were no known issues in the 20.11 release.

20.10 Resolved and Known Issues

Agent Resolved Issues

 Filter table:

Key	Product	Summary	Version
BRUM-6375	JavaScript Agent	Invalid pointer error for JavaScript Agent in Internet Explorer/Edge is caused by HTMLImageElement URI length	20.10.0
BRUM-6230	JavaScript Agent	updateFetchEventResponseHeaders throws the error message "forEach is not a function.." intermittently	20.10.0
BRUM-6351	JavaScript Agent	A virtual page event is triggered when there is a call to push or replace states, even when there is no URL change	20.10.0
CDM-5817	iOS Agent	MAT is retained across calls when config.collectorChannel is set	20.10.0
DBMON-7057	Database Agent	The database events summary displays an error, Maximum custom metric limit 40 is reached, even when the number of custom metrics is lower than 40	20.10.0
DBMON-7280	Database Agent	Metric Browser does not display the performance metrics for Oracle Pluggable Database (PDB)	20.10.0
DBMON-7423	Database Agent	The Topology tab displays incorrect port numbers for the non-default ports of Microsoft SQL and Oracle clusters	20.10.0
DBMON-7255	Database Agent	Oracle Database failover issue with the SCAN IP in a custom JDBC string	20.10.0
DBMON-6900	Database Agent	Even when an SQL query is updated to include a label for a column within a custom metric, the Details tab of the event displays the column name instead of the label	20.10.0
DOTNET-4860	.NET Agent	.NET Agent logging has been fixed and no longer shows extraneous Socket error messages	20.10.0
DOTNET-4990	.NET Agent	When you split a URI using a custom exit call naming rule with method parameters, the string length has been expanded to 100 characters	20.10.0
DOTNET-5082	.NET Agent	Fix for 20.4 .NET Agent for Windows causing high CPU in some scenarios	20.10.0

Key	Product	Summary	Version
DOTNET-5141	.NET Agent	Added a new configuration option (set <code>APPDYNAMICS_AGENT_MASK_ENV_VARS</code> environment variable = true) to mask environment variables in the Linux agent before sending information to the Controller	20.10.0
DOTNET-5171	.NET Agent	Fix for .NET Agent for Windows where diagnostic messages from the agent were failing on malformed Regex rules	20.10.0
DOTNET-5205	.NET Agent	Fix for BT level error metrics not including HTTP errors in some situations	20.10.0
JAVA-8537	Java Agent	After upgrading the Java Agent version 4.5.9 to 20.8, the OSB Rules are not applied correctly	20.10.0
JAVA-8436	Java Agent	When Java Agent 20.9 is instrumented with JDK 15, the agent does not start and throws a Null Pointer Exception error	20.10.0
JAVA-8399	Java Agent	Snapshots are not generated, even though they are reported to the controller	20.10.0
JAVA-8009	Java Agent	The agent is unable to find the matching <code>AgentBackendDiscoveryConfig</code> as it is unable to extract the database names for the Oracle RAC connection	20.10.0
JAVA-7898	Java Agent	The Java Agent cannot be dynamically attached to the Java 11 process	20.10.0
JAVA-7775	Java Agent	The JVM tab displays empty contents for the Java Agent installed on Docker and instrumented with JDK11	20.10.0
JAVA-7713	Java Agent	<code>java.lang.IllegalStateException</code> is reported due to incomplete instrumentation and a race condition seen under heavy load	20.10.0
NODEJS-10	Node.js Agent	Mark Nodes as Historical API causes C++ Rest SDK errors on shutdown	20.10.0
NODEJS-245	Node.js Agent	Remove <code>request</code> package from the Node.js Agent	20.10.0
NODEJS-261	Node.js Agent	Upgrade Java proxy to version 20.7.0.30393	20.10.0
NODEJS-285	Node.js Agent	Remove <code>console.log(process.env)</code> ; from Node.js Installer script	20.10.0

Key	Product	Summary	Version
PHP-1044	PHP Agent	PHP Agent does not capture Postgres queries when an explicit connection handle is passed to the query functions	20.10.0
PHP-1040	PHP Agent	The PHP Agent crashes due to a null reference, when accessing a call graph node on the request shutdown	20.10.0
PHP-1001	PHP Agent	The PHP Agent crashes applications during the call graph collection	20.10.0
PHP-987	PHP Agent	There is no way to filter expected error codes resulting from an outgoing service call using <code>drupal_http_request</code>	20.10.0
PYTHON-324	Python Agent	Python Agent collects all the errors in one bucket when custom error codes are configured	20.10.0
SERVER-8435	Machine Agent	Resolved high CPU usage caused while executing <code>WmiPrvSE.exe</code> process commands	20.10.0
SERVER-8466	Machine Agent	Reports correct CPU usage date for AIX systems	20.10.0
SERVER-8469	Machine Agent	English Locale set for AIX collector to parse output correctly	20.10.0
WEBSRV-298	Apache Agent	Issue with the backend naming for a large number of virtual hosts.	20.10.0

Controller (SaaS/On-Premises) Resolved Issues

 Filter table:

Key	Product	Summary	Version
ALERT-6669	Alert and Respond	Drill down for health rule violation and affected entities display blank results	20.10.0
ALERT-6767	Alert and Respond	Application with <code>id:-1</code> does not exist error is displayed when you access the health rules using the dashboard and click on Critical or Warning tab	20.10.0
ALERT-6781	Alert and Respond	Support Overall Application Performance type health rules through Alerting Templates for EUM-enabled APM applications	20.10.1

Key	Product	Summary	Version
ALERT-7379	Alert and Respond	Unable to save action suppression for EUM-enabled applications	20.10.1
AMCSEV-743	App Monitoring Cloud Services	Node count on the Dashboard does not match the node count on the Node panel	20.10.0
AMCSEV-768	App Monitoring Cloud Services	Custom transaction match rules cannot be created from Snapshot screen	20.10.0
AMCSEV-808	App Monitoring Cloud Services	Java Agent version not displayed correctly on Tier & Nodes	20.10.0
AMCSEV-862	App Monitoring Cloud Services	Backend discovery rules losing data upon enabling or disabling	20.10.0
AMCSEV-885	App Monitoring Cloud Services	Java Agent version not displayed correctly on Tier & Nodes . Backport to 20.8	20.8.0, 20.10.0
AMCSEV-1170	App Monitoring Cloud Services	Enable Automated Transaction Diagnostics in the Controller by default	20.10.1
ANALYTICS-11516	Application Analytics	UI not setting start and end timestamps correctly in ADQL aggregation query	20.10.0
ANALYTICS-12809	Application Analytics	Selected options do not attach the correct options in Add Business Journeys	20.10.0
ANALYTICS-12926	Application Analytics	Limit error messages and stack traces in Business Transactions to 8191 characters	20.10.0
ANALYTICS-13094	Application Analytics	Node.js Agent does not receive the Analytics HTTP configuration	20.10.5
BRUM-6243	Browser RUM	Creating EUM Application using Getting Started Wizard fails with error	20.10.0
BRUM-6223	Browser RUM	EURT column on Pages and AJAX request UI is too slim and column sizing does not persist	20.10.0
CDM-6544	Mobile RUM	Correct Fragment Start Event type typo in the Collector	20.10.0
CDM-6571	Mobile RUM	Create unit test cases for IP Header and Geo resolution handling for mobile beacons	20.10.0
CLUSTERMON-1948	Cluster Monitoring	The Pods tab does not display data	20.10.0
CLUSTERMON-2090	Cluster Monitoring	Cluster Agent runs out of database space when persisting the agent registration request	20.10.2

Key	Product	Summary	Version
DBMON-6275	Database Visibility	When you edit the query text of a custom metric, the changes get saved without clicking Save	20.10.0
DBMON-6816	Database Visibility	The Metric Browser displays a 504 Error when you launch it for the first time	20.10.0
DBMON-6937	Database Visibility	The Custom Metrics tab displays a 500 internal error	20.10.0
DBMON-6947	Database Visibility	The database health rules are not evaluated for the collectors with the view permissions	20.10.0
DBMON-7055	Database Visibility	The memory metrics are not displayed for the Oracle 11g database	20.10.0
DBMON-7060	Database Visibility	The Transaction Snapshot is not displayed for the Oracle Cluster	20.10.0
DBMON-7600	Database Visibility	Only add custom metrics to the configuration which it belongs to in the Metric Browser	20.10.8
DBMON-7617	Database Visibility	Unable to create action suppression on single node for database with multiple nodes (topology)	20.10.8
DIAGPLAT-767	APM	No RSD found for filter error in /snapshot/getRequestSegmentDataV2	20.10.0
DIAGPLAT-925	APM	Filtering incorrect for the Service Endpoints in the getRequestSegmentsByFilterHandle API	20.10.0
DIAGPLAT-961	APM	Some top summary stats (TSS) are bound to the wrong ID	20.10.0
DIAGPLAT-994	APM	Added a filter to the REST endpoint /restui/events/query to curtail unexpected results	20.10.3
DIAGPLAT-1018	APM	Incorrect join for archive queries when getting potential problems for snapshots	20.10.5
DIAGPLAT-1060	APM	Query executed in getSummariesAndAppendBlobsIfNeeded timed out	20.10.9
DIAGPLAT-1083	APM	Search for snapshots gives inaccurate results for Standard Time Range under Transaction Snapshot	20.10.9, 20.10.10
IAM-1541	Identity, Authentication, Authorization, and Audit	The Controller is running slow due to multiple calls for config import/export to ApiClientResourceImpl.	20.10.0

Key	Product	Summary	Version
L4A-8473	Accounts	When passing multiple groups, the SAML Access Attribute does not work	20.10.0
L4A-13281	Accounts	Account key is appearing in the Controller audit report	20.10.0
METADATA-9355	APM	MDS connection pools no longer ignore JDBC parameters in domain.xml	20.10.0
METADATA-9372	APM	MDS connection pools no longer ignore JDBC parameters in domain.xml	20.10.0
METADATA-9486	APM	Ensure that the HTTP header Strict-Transport-Security is set	20.10.4
METADATA-9489	APM	Health rule status precedence is incorrect	20.10.4
MOBILE-1619	Mobile App	Fetch push server URL from the Configuration Manager in each notification request	20.10.2
METADATA-5428	Dashboards	Dashboard health status widget appears green even when the health rule shows grey	20.10.0
REPORTS-799, REPORTS-814	Reports	Scheduled reports are sent on clicking Save	20.10.0, 20.10.6
REPORTS-812	Reports	Reports with a custom time range are delivered with the login page	20.10.6
SVCMON-963	APM	Exit calls to resolved backends now display on Flow Maps	20.10.0
SVCMON-1252	APM	Query updating a flow map preference causes high CPU usage	20.10.7

On-Premises Platform Resolved Issues

 Filter table:

Key	Product	Summary	Version
ECONSOLE-6221	Enterprise Console	Enterprise Console now honors timeouts in Windows Stop Service during upgrade	20.10.0

Key	Product	Summary	Version
ECONSOLE-6343	Enterprise Console	Upgrading the Enterprise Console from 20.8 to 20.10 no longer hinders the JRE upgrade on Controller nodes during an orcha upgrade	20.10.0
ECONSOLE-6596	Enterprise Console	Upgrade Node.js to the latest Long-Term Support (LTS) Version 14.17.4	20.10.11
EUMPLAT-1104	EUM Server	Upgrade MySQL to 5.7.31	20.10.0
EUMPLAT-1231	EUM Server	Threads blocked in JSON parsing in the gson library	20.10.1

Known Issues

There are no known issues in the 20.10 release.

20.9 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
BRUM-6321	JavaScript Agent	promise.then() throws an error when receiving non-function parameters	20.9.0
CLUSTERMON-1910	Cluster Agent	Cluster Agent is unable to monitor the namespaces that include the config string	20.9.0
CLUSTERMON-1869	Cluster Agent	The auto-instrumentation of Java applications fail when using the 20.6 version of the Redhat Java Agent image	20.9.0
DBMON-7160	Database Agent	The Disk IO hardware metric is not displayed for a Linux machine	20.9.0
DBMON-7231	Database Agent	The monitoring of Oracle database is affected when the v\$osstat permission is missing	20.9.0
DBMON-7232	Database Agent	Issues with Oracle topology resolution when using a specific LDAP connection string or a specific local_listener value	20.9.0

Key	Product	Summary	Version
DBMON-7127	Database Agent	The CPU metric value is displayed incorrectly when the instance caging is enabled in Oracle	20.9.0
DOTNET-4397	.NET Agent	Business Transaction name now registers as the <code>ControllerName.ActionName</code>	20.9.0
DOTNET-4942	.NET Agent	Business Transaction correlation for EUM has been fixed so that the .NET Agent appends the Business Transaction ID cookie	20.9.0
DOTNET-4954	.NET Agent	Windows service does not stall after a few days of instrumentation	20.9.0
DOTNET-4973	.NET Agent	<p>The .NET Linux Agent no longer crashes with a <code>seqfault</code> error.</p> <p>To avoid potential crashes, you can disable snapshots by entering the following code:</p> <pre style="border: 1px solid black; padding: 5px;"> "profiler": { "eventMask": 2149842980 }</pre>	20.9.0
IIB-316	IBM Integration Bus Agent (IIB)	Business Transactions are missing for some of the message flows on the AppDynamics Business Transaction view	20.9.0
JAVA-8110	Java Agent	Java Agent is unable to register an application and send metrics because an <code>InstantiationException</code> with <code>NettyMarkerInterceptor</code> is observed on the console or agent logs when the Servlet monitoring is disabled	20.9.0
JAVA-8052	Java Agent	A Snapshot call graph contains CPU times - This is a Hotspot call graph message is displayed on some of the transaction snapshots	20.9.0
JAVA-8047	Java Agent	A large number of AppDynamics threads are found on the applications using Vert.x	20.9.0

Key	Product	Summary	Version
JAVA-7947	Java Agent	A <code>ClassCastException</code> is observed when the Live Preview session is started with the Custom Servlet rule	20.9.0
JAVA-7601	Java Agent	Ignored errors or exceptions are still counted towards Service Endpoint errors per minute	20.9.0
LIBAGENT-46	C/C++ SDK	Thread Name shows -1 for C/C++ SDK segments in the Waterfall View tab	20.9.0
LIBAGENT-53	C/C++ SDK	Cross-application correlation displays incorrectly in the primary Application Flow Map dashboard	20.9.0
LIBAGENT-54	C/C++ SDK	C/C++ SDK Agent on Windows fails to connect and logs an <code>Open failed</code> error	20.9.0
PHP-988	PHP Agent	PHP Drupal application crashes when handling an outgoing HTTP request	20.9.0
PHP-985	PHP Agent	PHP packages fail the Aqua security scan	20.9.0
PHP-974	PHP Agent	PHP Agent crashes PHP applications on Drupal7 HTTP interception	20.9.0
PYTHON-493	Python Agent	Jackson jars dependency removed from Python Agent	20.9.0
PYTHON-473	Python Agent	Python Agent reports misleading error format	20.9.0
SERVER-8437	Machine Agent	Machine Agent now extracts numerical addresses for network interfaces without symbolic host, port or user names	20.9.0
SERVER-8443	Machine Agent	Machine Agent for AIX no longer gets stuck on remote volumes command and reports only local volumes metrics	20.9.0
SERVER-8446	Machine Agent	Removed <code>perfstat_partition_config()</code> call due to AIX bug crashing the Machine Agent	20.9.0

Key	Product	Summary	Version
WEBSRV-256	Apache Agent	Agent crashes the worker process when the Backend ID is NULL	20.9.0

Controller (SaaS/On-Premises) Resolved Issues

 Filter table:

Key	Product	Summary	Version
ALERT-6835	Alert and Respond	Alerting template popup status does not change as per the template progress status	20.9.0
SYNTH-6536	Synthetic Browser Monitoring	Cookies not visible in request headers of Chrome v83	20.9.0

20.8 Resolved and Known Issues

Agent Resolved Issues

 Filter table:

Key	Product	Summary
BRUM-6191	JavaScript Agent	adrum.js beacon response fails due to multiple Access-Control-Allow-Origin headers being set
BRUM-6216	JavaScript Agent	Console error cannot read property url of undefined on a fetch call
BRUM-6207	JavaScript Agent	adrum.js beacon contains more events than the graphql events call
CDM-6144	iOS Agent	Inconsistent crash report time stamp in Controller
DOTNET-4089	.NET Agent	Applications no longer generate invalid token exceptions
DOTNET-4579	NET Agent	Access violation in Redis backend resolution attempt to retrieve host name

Key	Product	Summary
DOTNET-4599	NET Agent	Two lines of the console output that appeared when the Windows agent started up no longer appear. To restore them, create and set an <code>appdynamics.outputMode</code> environment variable.
DOTNET-4659	.NET Agent	Reporting service from the Microsoft Power BI Tools no longer fails
DOTNET-4707	.NET Agent	Analytics transaction metrics are not starting unless Micro Services APM Agent is restarted
DOTNET-4811	.NET Agent	OWIN cookies no longer lost after agent upgrade
DOTNET-4898	.NET Agent	IPC timeout configurability between coordinator and .NET Agent
JAVA-7625	Java Agent	A null message passed causes a Null Pointer Exception in the <code>ALoggerMessageInterceptor</code>
JAVA-7569	Java Agent	Sensitive message filter does not work appropriately when the message-pattern is FOUND but redaction-regex is NOT MATCHED
JAVA-7939	Java Agent	Vertx exit interceptor fails to create exit call due to a bad URI
JAVA-7950	Java Agent	In certain scenarios, <code>ServerTransactions</code> , which are started before all required classes get instrumented, remain in the agent memory permanently even after they get aborted
JAVA-8007	Java Agent	After a tier is deleted, JMX rules are not re-registered and therefore the JMX metrics are not displayed on the Metric Browser
JAVA-8013	Java Agent	The auto-discovered spring web service names display multiple duplicate names with different ns numbers when auto-detection is enabled (java web services)
NETWORK-6171	Network Agent	Network Agent now reports data in low throughput environments
PHP-984	PHP Agent	A large number of errors are displayed in the agent logs due to <code>No URL filter config found in filterUrl</code>
PYTHON-244	Python Agent	MongoDB Transaction snapshots expose sensitive data
SERVER-8361	Machine Agent	AIX CPU metrics calculation now uses proper timestamp

Key	Product	Summary
SERVER-8367	Machine Agent	The Controller has been enhanced to not allow registration of misconfigured container type Server Visibility or Docker Visibility Agents (released in disabled mode)
SERVER-8420	Machine Agent	Add default heap JVM options in InstallService.vbs for Windows MA installer
SERVER-8450	Machine Agent	Default heap JVM options now default to -Xms256m and -Xmx256m in the InstallService.vbs script for the Windows Machine Agent installer

Controller (SaaS/On-Premises) Resolved Issues

 Filter table:

Key	Product	Summary	Ver
ALERT-6676	Alert and Respond	The third-party Bzip2 library used by the Controller has been updated to version 1.0.8	20.8
ALERT-6761	Alert and Respond	Upon clicking the View Dashboard During Health Rule Violation for a BT, you are redirected to a non-existing entity with the id -1	20.8
ALERT-6860	Alert and Respond	When you access a health rule using the health status widget on the dashboard, Application with id:-1 does not exist error is displayed	20.8
ALERT-6916	Alert and Respond	Upgrade to Kafka Streams 2.3.1	20.8
ALERT-6996	Alert and Respond	Actions are not getting triggered after Recurring Action Suppression time has expired	20.8
AMCSEV-62	App Monitoring Cloud Services	Unable to save an exception match condition	20.8
AMCSEV-90	App Monitoring Cloud Services	Create Method Invocation Data Collector dialog from call graph does not autofill	20.8
AMCSEV-519	App Monitoring Cloud Services	Unable to save Java Error Detection Configuration because of an <code>OptimisticLockException</code>	20.8
AMCSEV-543	App Monitoring Cloud Services	Unable to delete archived machine snapshots	20.8

Key	Product	Summary	Version
AMCSEV-607	App Monitoring Cloud Services	Error counts for the URLs in the Error Occurrence Details table are not getting refreshed for different time ranges	20.8.
AMCSEV-755	App Monitoring Cloud Services	Failed to create a backend detection Custom Exit Point via the right-right-click	20.8.
AMCSEV-885	App Monitoring Cloud Services	Java Agent version is not displayed correctly with the Controller version on Tier & Nodes	20.8.
ANALYTICS-12711	Application Analytics	Overloaded method checkbox becomes unchecked in Create Data Collector dialog box	20.8.
ANALYTICS-12730	Application Analytics	Analytics widget size is setting wrong when add to absolute layout dashboard	20.8.
ANALYTICS-12900	Application Analytics	Analytics Home page displays inconsistent EUM charts	20.8.
ANALYTICS-12912	Application Analytics	Missing start tier causes <code>TypeError</code> in Business Transaction flow map with EUM and BT node	20.8.
ANALYTICS-12935	Application Analytics	When you add a Business Journey and select a Business Transaction, the BT name is replaced with the BT ID upon saving the Business Journey	20.8.
ANALYTICS-13024	Application Analytics	The Business Transactions are not filtered based on the tier selected in the Business Journey page	20.8.
ANALYTICS-13093	Application Analytics	Node.js Agent does not receive the Analytics HTTP configuration	20.8.
ANLYTCS_ES-3766	Events Service	The third-party netty library used by the Controller has been updated to 4.1.48	20.8.
ANLYTCS_ES-3804	Events Service	User is unable to see data in the Metric Browser because of the error message <code>last run failed</code>	20.8.
ANLYTCS_ES-3861	Events Service	The third-party <code>search-guard-ssl</code> library used by the Event Service is updated to version 24.0 and kibana plugin is updated to version 5.6.8.7	20.8.

Key	Product	Summary	Version
APMPLAT-11061	APM	App and Machine Agent Status now correctly display percentages for Nodes and Tiers in the user interface	20.8
BRUM-6161	Browser RUM	Analyze records can fail to load	20.8
CLUSTERMON-1870	Cluster Monitoring	Collect Cluster Agent adoption and usage data	20.8
COGENG-901	Cognition Engine	The third-party netty library used by the Controller has been updated to 4.1.48	20.8
DBMON-6596	Database Monitoring	The Oracle Collector does not work when the Oracle Wallet option is enabled during the Oracle Collector configuration	20.8
DBMON-6764	Database Monitoring	The Hardware Monitoring option includes an outdated region for Amazon RDS	20.8
DBMON-7005	Database Monitoring	The third-party netty library used by the Controller has been updated to 4.1.48	20.8
DBMON-7111	Database Monitoring	The Controller does not display any data when you open the Metric Browser for the first time	20.8
DBMON-7140	Database Monitoring	Upgrade the JAR singularity-xml to include Apache Xerces 2.12.0	20.8
DIAGPLAT-798	APM	Snapshots do not get loaded, 500 Internal Server Error is displayed	20.8
DIAGPLAT-828	APM	Call to /snapshot/getRequestSegmentDatav2 returns the error No RSD found for filter	20.8
DIAGPLAT-893	APM	Correct the exit call mapper RSD v2	20.8
DIAGPLAT-916	APM	When reviewing a Business Transaction Snapshot, the display of Potential Issues takes time of 30 to 60 seconds	20.8
DIAGPLAT-926	APM	Service Endpoints do not filter corresponding transaction snapshots when you use the getRequestSegmentsByFilterHandle API	20.8
DIAGPLAT-942	APM	Correct the Service Endpoints filter for snapshots at the front-end layer	20.8

Key	Product	Summary	Version
DIAGPLAT-960	APM	Modify query for loading the TSS detail string to cache	20.8.0
DIAGPLAT-963	APM	Some TSS bound its detail string with the wrong ID	20.8.0
JAVA-8021	Java Agent - Controller	Upgrade the Java Agent to 20.6.0-30555 in the Controller	20.8.0
L4A-12908	Accounts	Reset password via email does not work for single tenant	20.8.0
L4A-14101	Accounts	Upgrade platform-rbac to 20.4.0-170	20.8.0
L4A-14454	Accounts	Upgrade the dropwizard library to 20.4.0-170	20.8.0
L4A-14543	Authentication	LDAP group sync fails due to deleted groups being included in results	20.8.0
METADATA-9008	APM	Socket timeout and number of connections in Jedis pool are configurable	20.8.0
METADATA-9384	APM	MDS connection pools no longer ignore JDBC parameters in domain.xml	20.8.0
METADATA-9397	APM	Upgrade the JAR singularity.xml to include Apache Xerces 2.12.0	20.8.0
METADATA-9397	APM	The context is not reset post an exception in some dashboard flows	20.8.0
METADATA-9453	APM	REST API loads historical liveness data for a tier, its node, and its parent app based on an anchor metric ID provided by users	20.8.0
METADATA-9487	APM	Ensure that the HTTP header Strict-Transport-Security is set	20.8.0
METRICSV-5021	Metric Service	App and Machine Agent Status now correctly display percentages for Nodes and Tiers in the user interface	20.8.0
METRICSV-5758	Metric Service	Upgrade the PostgreSQL JDBC Driver library to 42.2.14	20.8.0
MQS-1139	Metric Query Service	App and Machine Agent Status now correctly display percentages for Nodes and Tiers in the user interface	20.8.0

Key	Product	Summary	Version
NETWORK-5403	Network Visibility	User with Administration, Agents, Getting Started Wizard permission is not allowed to view the Network Visibility Agents tab	20.8.0
REPORTS-791	Reports	Controller changes made all reports fail if any had scheduling fails on startup	20.8.0
REPORTS-795	Reports	NodeJs used by controller has been updated to v14.8	20.8.0
REPORTS-777	Reports	Upgrade the version of Node.js in the Controller to 8.17.0	20.8.0
SERVER-8174	Machine Agent	App and Machine Agent Status now correctly display percentages for Nodes and Tiers in the user interface	20.8.0
SVCMON-827	APM	In Controller UI, Web Service Exit Call showing as <code>ui:ms_TransactionExitPointType_null</code>	20.8.0
SVCMON-864	APM	Controller logs full of the Redis error Cache unavailable issue	20.8.0
SYNTH-5965	Synthetic Browser Monitoring	Problem Ended event should be generated only after Error/Warning is confirmed	20.8.0
TMNT-720	APM	Time changes randomly in the Custom Time range component	20.8.0

On-Premises Platform Resolved Issues

 Filter table:

Key	Product	Summary	Version
ECONSOLE-862	Enterprise Console	User who installed Enterprise Console is the only user permitted to upgrade the Enterprise Console	20.8.0

Known Issues

There were no known issues in the 20.8 release.

20.7 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
CDM-6426	Android Agent	Screenshot tiles are not properly sent to the collector and as a result, screenshots may not be rendered correctly in the collector	20.7.0
CLUS TERM ON-1 758	Cluster Agent	The Cluster Agent Pod does not start and remains in the Pending state when taint is defined in the nodepool This release adds support to set tolerations. See <i>tolerations</i> in the Configure the Cluster Agent YAML File section ²³⁹³ .	20.7.0
DBM ON-7 036	Database Agent	The literals are unmasked for a CREATE statement even after selecting Remove literals from the queries in the Security configuration	20.7.0
DOT NET- 4728	.NET Agent	Unable to see complete stacktrace after upgrading to MSI-based 20.5 agent from .NET Microservice agent	20.7.0
IIB-2 53	IBM Integration Bus (IIB) Agent	IIB Agent log files grow continuously for un-instrumented execution groups	20.7.0
IIB-2 80	IBM Integration Bus (IIB) Agent	Nodes are not getting discovered by the IIB Agent on ACE (IIB 11)	20.7.0
IIB-2 94	IBM Integration Bus (IIB) Agent	Shutdown of the broker that runs multiple execution groups might result in a crash on some execution groups	20.7.1
IIB-2 87	IBM Integration Bus (IIB) Agent	The Broker on AIX crashes during startup when instrumented with IIB Agent version 20.7.0	20.7.1
JAVA -7825	Java Agent	Java Agent stops reporting analytics data on the agent version 20.4	20.7.0
JAVA -7820	Java Agent	Running Corretto with Java Agent results in an Unrecognized Vendor message	20.7.0

²³⁹³ <https://docs.appdynamics.com/display/PRO45/Configure+the+Cluster+Agent#yaml>

Key	Product	Summary	Version
JAVA-7800	Java Agent	End User Monitoring (EUM) correlation with ADRUM headers does not work for Akka HTTP	20.7.0
JAVA-7569	Java Agent	The slowest database and remote calls are not displayed for any time slice (current or historical) for one hour or less	20.7.0
JAVA-7504	Java Agent	The ApacheLog4 library in appserver agent shipped with controller installer is upgraded	20.7.0
JAVA-7234	Java Agent	The Servlet filter API is displayed as a POJO type in the call graph in place of Servlet entry point	20.7.0
NODEJS-EJS-39	Node.js Agent	Agent detects proxy server as HTTP Backend and displays it in the Flow Map	20.7.0
PHP-947	PHP Agent	PHP Agent reports incorrect HTTP response code when exceptions are thrown	20.7.0
PYTHON-ON-323	Python Agent	Python Agent affects the request header of Application API when using pyagent	20.7.0
PYTHON-ON-20	Python Agent	def get_proxysupport_dir() error is displayed when instrumenting ODOO application using the Python Agent	20.7.0
PYTHON-ON-228	Python Agent	CVE-2019-17571 vulnerability found in the Python AppDynamics proxy	20.7.0
SERVICES-ER-8322	Machine Agent	Windows: OSHI process CPU utilization metric displays correctly when compared to WMI-based metrics	20.7.0
SERVICES-ER-8348	Machine Agent	CPU User metric now shown in KPI mode	20.7.0
SYNTHETIC-H-5620	Synthetic Agent	Resource errors are not excluded when authentication protocol determines synthetic job session status	20.7.0
SYNTHETIC-H-5313	Synthetic Agent	In certain cases of network failure in Chrome, the Synthetic Agent records retried network requests as two distinct pages in the session	20.7.0

Key	Product	Summary	Version
SYNTH-6495	Synthetic Agent	Synthetic job results in the error Invalid SSL/TLS certificate: INET_E_INVALID_CERTIFICATE' in IE11 Browser for Azure Agents	20.7.0
WEB-SRV-241	Apache Agent	The install.sh script unnecessarily creates an entry in the /etc/ld.so ²³⁹⁴ conf.d directory	20.7.0

Controller (SaaS/On-Premises) Resolved Issues

 Filter table:

Key	Product	Summary	Version
ALERT-3800	Alert and Response	The audit.log and REST API response include a typo, helathRuleIds	20.7.0
ALERT-4781	Alert and Response	When you update an existing action, OBJECT_UPDATED events in the audit log file show old values as 0 instead of the previously configured value	20.7.0
ALERT-5940	Alert and Response	When you update a global health rule checkbox for an application, the application name is missing in the audit log	20.7.0
ALERT-6106	Alert and Response	Action suppression does not work for health rules with status Ended - Critical; this happens for events of the type Database	20.7.0
ALERT-6139	Alert and Response	Alerting template does not get applied to applications, it gets stuck with a status In Queue	20.7.0

Key	Product	Summary	Version
DBMON-6601	Database Visibility	The Events tab for the MySQL collector displays the error, Error processing InnoDB metrics for config	20.7.0
DBMON-7141	Database Visibility	The third-party Apache xerces library used by the Database Agent is updated to 2.12.0	20.7.3
DIAGPLAT-807	APM	Snapshots do not get loaded, 500 Internal Server Error is displayed	20.7.1
DIAGPLAT-809	APM	ArrayIndexOutOfBoundsException is displayed for RSD V2 enabled Controllers	20.7.1
DIAGPLAT-815	APM	Allow a list of GUIDs in SnapshotListFilter to view multiple GUIDs in the snapshot list view	20.7.3
DIAGPLAT-857	APM	No RSD found for filter error is displayed for the REST API call /snapshot/getRequestSegmentDataV2?	20.7.3
DIAGPLAT-892	APM	Correct the exit call mapper RSD v2	20.7.5
DIAGPLAT-915	APM	Correction of a query for the RSD v2	20.7.5
DIAGPLAT-927	APM	Service Endpoints do not filter corresponding transaction snapshots when you use the getRequestSegmentsByFilterHandle API	20.7.6
DIAGPLAT-943	APM	Correct the Service Endpoints filter for snapshots at the front-end layer	20.7.6
EUMPLAT-593	EUM	Archived Browser Snapshot does not open when the linked Transaction Snapshot does not exist	20.7.0
EUMPLAT-831	EUM	Account credential is not updated when hitting renew-license-key endpoint	20.7.0
JAVA-8020	APM	The third-party Apache xerces library used by the Java Agent is updated to 2.12.0	20.7.3
L4A-12097	Accounts	No audit log entry created for license changes	20.7.0
L4A-12444	Accounts	NullPointerException when using REST API to generate an access token for API Client	20.7.0

Key	Product	Summary	Version
L4A-12447	Accounts	Encountered LDAP sync failure while updating user outside Hibernate session	20.7.0
L4A-13981	Accounts	The third-party Jackson databind library used by platform-rbac is updated to 2.9.10.5	20.7.3
L4A-14453	Accounts	Upgrade the dropwizard to 20.7	20.7.5
L4A-14542	Accounts	LDAP group sync fails due to deleted groups being included in results	20.7.5
METADAT A-7833	APM	Anchor metrics for business transactions are getting lost causing issues in entity liveness	20.7.0
METADAT A-8834	Metric Browser	ADDs display correctly in the Metric Browser without a name conflict	20.7.0
METADAT A-9035	APM	Able to use native query to find Business Transaction IDs and their tier IDs from the database correctly	20.7.0
METADAT A-9171	APM	No snapshots are created because the ADD stacktrace purger takes more than 20 hours to complete and holds the read-only lock for the metadata table	20.7.0
METADAT A-9381	APM	MDS connection pools ignore the JDBC parameters in domain.xml including useSSL, which impacts the the AppDynamics GovAPM deployment	20.7.4
METADAT A-9393	APM	Upgrade the JAR singularity.xml to include Apache Xerces 2.12.0	20.7.5
METADAT A-9430	APM	Context is not reset in some dashboard flows post an exception	20.7.6
METRICSV C-5472	Metric Service	Reader client version was updated to version 2.12.0.5959 for Controller primary	20.7.0
METRICSV C-5776	Metric Service	The third-party PostgreSQL JDBC Driver library used by the Controller has been updated to version 4.2.13	20.7.1
METRICSV C-5972	Metric Service	Client connection pool saturated	20.7.4
MQS-1100	Metric Query Service	Missing business transaction specific graphs in the Expression Dashboard	20.7.0
REPORTS-792	Reports	Scheduled reports not working after Controller upgrade if any invalid report definitions exist when appserver is restarted	20.7.3

Key	Product	Summary	Version
REPORTS-796	Reports	NodeJS used by controller has been updated to v14.7.0	20.7.0
SERVER-8232	Server Visibility	Service availability check interval in the Controller UI now displays minutes instead of seconds	20.7.0
SERVER-8271	Server Visibility	Server metrics no longer disappear in the UI when scrolling	uic-20.7.0
SVCMON-883	APM	WebService type exit call is displayed as ui:ms_TransactionExitPointType_null	20.7.0
SVCMON-900	Controller UI	ResourceManager renders package:key strings when a key is not found instead of the locale strings, with a log message package or string not found	20.7.0
TMNT-580	Machine Agent	Unable to download the Machine Agent from Getting Started Wizard - Servers	20.7.0

Key	Product	Summary	Version
ECONSOLE-5645	Enterprise Console	Controller Upgrade button has been fixed and is now responsive after Enterprise Console upgrade	20.7.0
ECONSOLE-6070	Enterprise Console	Add secondary job now verifies JRE version and updates the JRE configuration on both primary and secondary Controllers	20.7.0
SYNTH-4759	Synthetic Server	On-premises Controller with hosted license is unable to create jobs due to SaaS API call failures	20.7.0
SYNTH-5678	Synthetic Server	Private synthetic agent jobs do not consume synthetic license units if webpages are not loaded	20.7.0
SYNTH-5685	Synthetic Agent	TEMP directory C:\users\agent_user\AppData\Local\Temp does not get deleted automatically	20.7.0
SYNTH-5636	Synthetic Server	Synthetic jobs are auto-disabled even when sufficient license units are left	20.7.0
SYNTH-5554	Synthetic Server	Synthetic job editor becomes unresponsive when it receives errors from AJAX calls	20.7.0
SYNTH-5458	Synthetic Server	Capacity-related error messages displayed for private agents are now different from the error messages displayed for SaaS agents	20.7.0

Key	Product	Summary	Version
SYNTH-5445	Synthetic Server	Waterfall graph displays duplicate tick labels in the timeline on the Session Summary page	20.7.0
ALERT-4182	Alert and Respond	NullPointerException is displayed when configuring the Email SMS for an on-premises Controller	20.7.0

Controller (SaaS/On-Premises) Resolved Issues

Key	Product	Summary	V	C
CLUSTERMON-168	Cluster Agent	After Cluster Agent pod restarts, it does not preserve the configuration for monitored namespaces	2	
CLUSTERMON-1164	Cluster Agent	ClusterAgent v4.5.16.780 on a K8s Cluster v1.11 crashes with panic: runtime error: integer divide by zero	2	
CLUSTERMON-6628	Cluster Agent	Cluster Error Graph: Shows an incorrect number of Error Events	2	
DBMON-6219	Database Monitoring	Database Agent cannot connect to Sybase Adaptive Server Enterprise 16.0 SP03	2	
DBMON-6553	Database Monitoring	Database Agent does not capture details from Sybase 15.5 database.	2	
DBMON-6303	Database Monitoring	The metric browser does not capture the buffer and the cache memory metrics for a Linux collector	2	
DBMON-6460	Database Monitoring	Database Agent cannot resolve the different nodes of Oracle RAC by using LDAP authentication	2	
DOTNET-4521	.NET Agent	Agent does not report Http Status codes in Asp.Net core in-process hosted app	2	
DOTNET-4448	.NET Agent	Coordinator taking longer to start when set as Earlystartservices	2	
DOTNET-4508	.NET Agent	.NET Core 3.1 based application is failing to instrument with .NET Agent version 20.3	2	
BRUM-5979	JavaScript Agent	node.type not supported in IE11 and throws an error	2	
JAVA-6355	Java Agent	Server Transaction times out and is abandoned in projectreactor.io ²³⁹⁶ based application with executor mode thread tracing enabled	2	
JAVA-6560	Java Agent	Java Agent does not start when trying to instrument an application running with JDK1.6 due to log4j	2	
JAVA-6965	Java Agent	In the dynamic agent attach scenario, the agent throws a NullPointerException and is unable to start due to a cached system property	2	

²³⁹⁶ <http://projectreactor.io/>

Key	Product	Summary	V
JAVA-6617 and JAVA-7263	Java Agent	JMX attributes are marked as ignored if they are de-registered from the Mbean server. The attributes are not registered by the agent even if registered again with the Mbean server	2
JAVA-7139	Java Agent	Object Instance Tracking (OIT) does not work for all the Adopt JDK versions with both Hotspot and OpenJ9 distributions, the OIT works with AdoptJDK9-Hotspot	2
JAVA-7225	Java Agent	Fixed the VerifyError that is displayed on the application startup	2
JAVA-7279	Java Agent	Thread dump files captured are reported with a length of zero bytes	2
JAVA-7312	Java Agent	Upgrade the commons-io:commons-io library to 2.6 version	2
JAVA-7322	Java Agent	An exception is reported when Java Agent runs with an application that has JDK9+ and the application makes SQL calls	2
JAVA-7342	Java Agent	An error is reported in the agent when instrumenting apps deployed on jetty 6.x because the class org.mortbay.jetty.Response#getHeaders returns an enumeration object	2
SERVER-6167	Machine Agent	Machine Agent shows wrong IPV4 address for the network interface card	2

ANALYTICS-12322	Application Analytics	No access to Mobile Code Issues event type on Analytics search screen	20
ANALYTICS-12397	Application Analytics	Option to create SQL Data collector from APM snapshot is missing from 4.5.10 Controller version	20
APMPLAT-11662	APM	Excessive logging of error messages has been fixed	20
APMPLAT-13124	APM	Filters for Transaction Snapshots has been fixed and is working correctly	20
CDM-6119	iOS	AppD sessions do not end post 10 mins inactivity as per the defined timeout, leading to long-running events	20
CDM-6198	Mobile RUM	Crash Snapshot Details dialog fails to open	20
CLUSTERMON-868	Controller	Some Cluster Agent metrics are listed even when there are not enough Server Visibility licenses	20
CLUSTERMON-1177	Controller	High load on Controller when monitoring the deleted and the succeeded pods in a cluster	20
COGENG-110	Cognition Engine	Selecting the business transaction in filters does not change the list of violations	20
COGENG-438	Cognition Engine	Variables are not being replaced with values intermittently, within an email template for anomaly events	20
COGENG-703	Cognition Engine	UI does not invoke the API to plot the abstract syntax tree (AST) graph intermittently	20
DBMON-3906	Database Visibility	The hardware metrics are not captured on the MS SQL Database dashboard or on the Metric Browser when using a custom cluster	20
DBMON-6115	Database Visibility	The controller displays access key mismatch event when the database agents start with license rule access key	20

Key	Product	Summary	V
DBMON-6119	Database Visibility	The details pane on the Queries Statistics Report page is too small to view the data	20
DBMON-6307	Database Visibility	Remote DB Service with meta-info jdbc db adodotnet cannot be mapped to a database collector	20
DBMON-6529	Database Visibility	The Connect backends to Database Visibility to track health status message is displayed every time, even when it is not required	20
DBMON-6628, DBMON-6641	Controller	Missing the database nodes in the Network Dashboard flow map	20 20
DIAGPLAT-58	Controller	Optimizing EventManagerBean.getEventDetailsInBatch to prevent Internal Service and Event details errors	20
DIAGPLAT-425	Controller	Receiving 500 internal errors when attempting to view snapshots in an application	20
L4A-10645	Authentication	SAML encryption key is updated when a role is deleted	20
L4A-11010	Authentication	LDAP TLS client contexts should default to the newest TLS version supported by the Controller's bundled JRE	20
L4A-11361	Authentication	Nested group functionality not working	20
L4A-11846	Authentication	Reset password button is disabled	20
L4A-12066	Authentication	Optimizing LDAP sync	20
L4A-13322	Authentication	Unable to set an expiry date for account license	20
L4A-14540	Authentication	LDAP group sync fails due to deleted groups being included in results	20
METADATA-8112	Dashboards and Reports	Show error in Controller UI when a user doesn't have permission to create dashboards	20
METADATA-8228	Controller - Platform	The CustomDashboardImportExportServlet no longer writes a reply to the client before committing the transaction	20
METADATA-9221	APM	No snapshots are created because the ADD stacktrace purger takes more than 20 hours to complete and holds the read-only lock for the metadata table	20
METRICSVCS-5902	Metric Service	The client connection pool gets saturated as the connections to the Controller are not cleared after a task is performed	20
MQS-1028	Metadata	Expression widget with business transactions with MetricHierarchy shows no data	20

Key	Product	Summary	V
MQS-1203	Metric Query Service	Availability metric appears to be different in MySQL when querying for 10 minutes after the 10 minute boundary	2020
MQS-1201	Metric Query Service	MQDC may not return the right metric data for a given time range	2020
MQS-1207	Metric Query Service	Fix availability is below 100% for high retention enabled case	2020
MQS-1209	Metric Query Service	Availability metric appears less than 100% even when it is 100%	2020
REPORTS-591	Reports Service	Application Health Reports show APPDYNAMICS_INTERNAL_DIAGNOSTICS events	2020
SERVER-6833	Controller UI	Server page displays total number of servers in the bottom right footer	2020
SERVER-7505	Controller - Machine Agent	AppDynamics Agents UI displays <code>java.lang.NullPointerException</code> error for Machine Agents	2020
SERVER-7725	Controller - Machine Agent	Machine Agent reports data continuously, but health rules on those metrics remain in a Cancelled status	2020
SERVER-7855	Controller - Machine Agent	Metric hierarchy REST API returns empty response for <code>Root *</code> in hierarchy path	2020
SERVER-8249	Controller UI	OS icons are not displaying properly on on-premises Controller UI	2020
SVCMON-639	Controller	Creating a business transaction group causes a <code>NullPointerException</code>	2020
SYNTH-5024	Synthetic Browser Monitoring	Synthetic Private Agent license usage for SaaS customers is incorrect	2020
SYNTH-5027	Synthetic Browser Monitoring	500 Internal Server Error caused by null pointer exception	2020
UIPLATF-9947	Custom Dashboards	Custom Time Range seems to be broken	2020
UIPLATF-6208	Custom Dashboards	Absolute Layout: Widgets aren't saved correctly after creation	2020
USERIMPACT-258	Controller	Read-only users cannot access the Experience Journey Maps UI	2020

BRUM-5926	Browser RUM	Page Limit Ajax Request Warning documentation link does not work	2 0
CDM-5729	Mobile RUM	Health rule violation summaries are not rendered when the health rule name contains HTML/XML elements	2 0
CDM-5818	Mobile RUM	Health rule violation descriptions display incorrect health rule name containing HTML/XML elements	2 0
CLUSTERMON-74	Cluster Monitoring	Metrics are now available when the time range filter is set to 8 days	2 0

Key	Product	Summary	V i
CLUSTERMON-866, CLUSTERMON-34, CLUSTERMON-342	Cluster Monitoring	Cluster Agent should respect pod limit set by the Controller	2 0
CLUSTERMON-1137	Cluster Monitoring	Incoming Cluster Agent requests are directed to the wrong threadpool	2 1
CLUSTERMON-1173	Cluster Monitoring	AppDynamics Metric Browser stops responding when cluster monitoring is enabled and a large number of nodes are registered	2 2
CLUSTERMON-1183	Cluster Monitoring	Default SIM health rules are being evaluated for clusters and pods leading to incorrect evaluation and health rule violations as depicted in the UI	2 2
CLUSTERMON-1199	Cluster Monitoring	Normal pods count is negative	2 3
CUSTOMDASH-9325	Custom Dashboards	Custom widget title is no longer displaying after upgrading to 4.5.16	2 0
DBMON-6193	Database Monitoring	None of the DB collectors are reporting after Controller upgrade to 4.5.17	2 0
DBMON-6672	Database Monitoring	Removed the DBMon Service from the Controller	2 7
DBMON-6694	Database Monitoring	Upgrade the <code>mysql-connector-java:8.0.13</code> library for the DBMon Service to <code>8.0.20</code>	2 7
DIAGPLAT-516	Health Rules	Event Summary page shows exception when accessed via link from email	2 0
DIAGPLAT-554	Events	Several ID blockers are skipped during the activation of the Controller	2 3
DIAGPLAT-556	Events	Invalid Account: Principal error is displayed when you load the events, post controller upgrade	2 2
DIAGPLAT-664	Events	Upgrade the H2 database engine library in the Controller	2 7

Key	Product	Summary	V i
DIAGPLAT-667	Events	Upgrade the Apache Commons library <code>commons-collections:1.8.3</code> in the Controller to 1.9.4	2 7
DIAGPLAT-681	Events	Upgrade the <code>mysql-connector-java</code> library in the Controller to 8.0.20	2 7
EUMPLAT-811, EUMPLAT-823	Controller - EUM	Upgrade the library <code>jackson-databind</code> to 2.11.0, and the libraries <code>dropwizard-core</code> and <code>dropwizard-validation</code> to 1.3.23 in the EUM client for the Controller	2 7
JAVA-7529	Controller	Update the Java Agent in the Controller to 20.4	2 7
L4A-7824	Accounts	New permissions added in a later release are not saved when added to existing roles	2 0
L4A-9790	RBAC	Cannot assign roles to the LDAP users when user attribute is updated on LDAP	2 0
L4A-9822	Accounts	Read-only user can access admin pages and see some admin entities	2 0
L4A-10035	Accounts	Error saving LDAP configuration if nested group attribute is an empty string in DB	2 0
L4A-10463	Accounts	User update operation leads to extra references in <code>AuthEntityHelper.CacheRepository</code>	2 0
L4A-12140	Admin Console	Optimize account listing for the Controller Admin Console	2 5
L4A-12311	Accounts	Email alerts are not generated as the notification configuration for AppDynamics account moves to invalid state	2 6
L4A-12292	Authentication	Including SAML config in Account DTO causes performance problems on controllers with many accounts	2 6
L4A-12065	Authentication	LDAP sync takes a lot of time in case there are more than 1,000 users with multiple groups assigned	2 6
L4A-12508	Authentication	LDAP sync fails while updating user outside of session	2 7

Key	Product	Summary	V i
L4A-12712	Authentication	Update the OneLogin SAML version to 2.5.0 in the Controller	2 7
L4A-13321	Authentication	Unable to set an expiry date for the account license	2 1
L4A-13321	Authentication	LDAP group sync fails due to deleted groups being included in results	2 1
METADATA-7800	APM	Flowmap view and Detail screen no longer show mismatched data	2 0
METADATA-7922	Accounts	The accounts to application cache is now consistent with applications cache and database	2 0
METADATA-7956	APM	Server Health Status now shows correctly when the same dashboard is exported and imported	2 0
METADATA-7980	APM	BT liveness data now loads correctly from Blitz	2 0
METADATA-8305	Accounts	Admins can now enable the HSTS header as a setting	2 0
METADATA-8433	Dashboards	Metric Expression corrected in Custom dashboard	2 0
METADATA-8903	Metrics	Downgrade metric ID log level to debug to 20.3.0	2 3
METADATA-8999	Metrics	Upgraded the libraries netty to version 4.1.48.Final and lettuce-core to 5.1.8.RELEASE	2 5
METADATA-9120	Metrics	Upgrade the libraries apache-tomcat to 9.0.31, dropwizard-validation to 1.3.2, and mysql-connector-java to 8.0.20 for the Controller	2 7
METADATA-9149	Metrics	Upgrade the mysql-connector Java library to 8.0.20 in modules of the Controller	2 7
METADATA-9168	Metrics	Upgrade the dom4j library to 2.1.3 in the GlassFish application server of the Controller	2 7
MQS-1032	Metric Query Service	No data available when the custom time range is less than 30 minutes	2 0

Key	Product	Summary	V
MQS-1161	Metric Query Service	Split an insert statement for the Metric Hierarchy Store into smaller partitions	29
NETWORK-5276	Network Visibility	Error message needs to improve when user does not have permission to view Network agents tab	20
PLATCPS-14052	Controller	jsessionId no longer appears in URL and server log	20
REPORTS-715	Reports	Audit Report shows inconsistency when data is displayed in PDF and CSV formats	20
REPORTS-738	Reports	Unable to save the custom time range using the schedule report calendar fields	22
REPORTS-754	Reports	Remove older unused version of the AppDynamics Node.js Agent from the Reports Service bundle	27
SERVER-7017	Server Visibility	Server Visibility health rules work correctly with .NET compatible-mode enabled	20
SERVER-8254	Server Visibility	Upgrade the Apache commons-httpclient library used by the Controller to version 5.0	27
SVCMON-552	APM	Divide by Zero exception creates 500 error in Controller flowmap	20
SVCMON-597	APM	Slow application dashboard flowmap	20
SERVER-7017	Server Visibility	SIM API not working for .NET agent in compatibility mode	20
SERVER-7345	Server Visibility	ID column in SIM table changed from int type to BigInt type	20
SYNTH-4791	Browser Synthetic Monitoring	Business Transactions Missing Scroll Bar	20

On-Premises Platform Resolved Issues

Key	Product	Summary	V	i
SYNTH-5403	Browser Synthetic Monitoring	Synthetic Private Agent license usage for SaaS customers is incorrect	2	7
TMNT-27	APM	Functionality to set default landing screen is not working	2	0

21.x Agent Releases

Analytics Agent

Version 21.10.0 - October 28, 2021

This release includes bug fixes.

Version 21.9.0 - September 23, 2021

This release includes bug fixes.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0 - July 26, 2021

This release includes:

- Authentication to pipeline resources
- libjpeg upgrades
- Java Runtime Environment (JRE) upgrade to version 1.8.0_292

Version 21.6.0 - June 24, 2021

This release includes the Netty third-party library upgrade to version 4.1.65.Final.

Version 21.5.0 - May 27, 2021

This release includes the third-party library upgrades:

- Jetty upgrade to version 2.34.
- Netty upgrade to version 4.1.63.Final.

Version 21.4.0 - April 22, 2021

This release includes the Jetty third-party library upgrade to version 9.4.39.v20210325.

Version 21.3.0 – March 25, 2021

This release includes the following enhancements:

- The Analytics Agent bundled in Machine Agent 20.8 has enhanced improvements
- The Analytics Agent Jetty libraries are upgraded
- The Analytics Agent Jersey is upgraded
- The Dropwizard and Hibernate Validator libraries are upgraded
- The unused HTTP methods in Analytics Agent have been disabled

Version 21.2.1 – February 25, 2021

The following third-party libraries have been upgraded.

- com.fasterxml.jackson.core:jackson-databind:2.12.0
- com.google.guava:guava:30.0-jre
- commons-io:commons-io:2.8.0
- guava: 30.0-jre
- httpclient: 4.5.13
- jackson-core: 2.12.0
- jackson-databind: 2.12.0
- jetty-server to 9.4.30.v20200611.jar
- jetty-webapp to 9.4.33.v20201020.jar
- junit:junit:4.13.1
- netty-all: 4.1.55
- org.apache.ant:ant:1.10.9
- org.apache.httpcomponents:httpclient:4.5.13
- org.bouncycastle:bcprov-jdk15on:1.67
- org.eclipse.jetty:jetty-server:9.4.35.v20201120
- org.eclipse.jetty:jetty-webapp:9.4.35.v20201120
- org.exist-db.thirdparty.xerces:xercesImpl:2.12.1
- org.hibernate:hibernate-validator:6.1.6.Final

Version 21.1.0

There was no release for 21.1.

Android Agent

Version 21.10.0

There was no release for 21.10.0.

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.0.2068 - June 22, 2021

Android Agent 21.6.0.2068 includes a customization to [attach a custom user data property to a network request](#)(see [page 2210](#)).

Version 21.5.0 - May 17, 2021

Android Agent 21.5.0 released with minor enhancements and fixes.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.0.

Version 21.2.0 - February 18, 2021

Android Agent 21.2.0 released with [minor bug fixes](#)(see page 3920) and API enhancements:

- [Disable the agent to stop sending user data to the collector](#)(see page 2204)
- [Disable crash reporting](#)(see page 2204)

Manual and automatic screenshots are limited to one screenshot per 10-second interval.

Version 21.1.0

There was no release for 21.1.

Apache Web Server Agent**Version 21.10.0**

There was no release for 21.10.0.

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0 - July 14, 2021

This release allows you to configure the cleanup timer `AppDynamicsRequestCacheCleanupInterval`. You can use this configuration for Java proxy to clean up the request cache. See, [Past Agent Releases](#)(see page 4020).

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

AppDynamics AWS Lambda Extension for Serverless APM

Version 21.10.0

There was no release for 21.10.0.

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0 - May 10, 2021

To use AppDynamics AWS Lambda Extension for Serverless APM, choose ARN 10 which corresponds to these versions

- Node (npm) [21.5.286](https://www.npmjs.com/package/appdynamics-lambda-tracer/v/21.5.286)²³⁹⁷
- Python (PyPI) [20.11.411](https://pypi.org/project/appdynamics-lambda-tracer/)²³⁹⁸

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

C/C++ SDK

Version 21.10.0

There was no release for 21.10.0.

Version 21.9.0

There was no release for 21.9.0.

²³⁹⁷ <https://www.npmjs.com/package/appdynamics-lambda-tracer/v/21.5.286>

²³⁹⁸ <https://pypi.org/project/appdynamics-lambda-tracer/>

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.4 - July 28, 2021

This release includes upgrades to Data Filters and input strings.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

Cluster Agent**Version 21.10.0 - October 28, 2021**

This release includes the following enhancements:

- The Cluster Agent go language version is upgraded.
- You can now use the `overrideVolumeMounts` property in the `infraviz.yaml` file to list the volumes that you require to mount. See [Install Infrastructure Visibility with the Cluster Agent Operator](#)(see page 2908).
- The `installClusterAgent` property is introduced to install Cluster Agent with Helm chart. See [Install the Cluster Agent with Helm Charts](#)(see page 2864).

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0 - July 28, 2021

This release includes these enhancements:

- The Infrastructure Visibility properties for `enableServerViz`, `enableContainerHostId` and `enableDockerViz` variables have changed to boolean to make these variable datatypes consistent. See, [InfraViz Configuration Settings on Past Agent Releases](#)(see page 4020).
 - You can now add labels to the Cluster Agent pod by using `labels` in the Cluster Agent Configuration file. See, [Labels on Past Agent Releases](#)(see page 4020).
-

-
- The Cluster Agent uses the CustomResourceDefinitions API version that is not supported in newer versions of Kubernetes. Therefore, the CustomResourceDefinitions API for the Cluster Agent operator is updated for Kubernetes 1.16 and later to support monitoring Kubernetes v1.22 and later.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0 - May 25, 2021

You can now use `resourcesNetViz` parameter within the `infraviz.yaml` file to set the resources for the Network Visibility container.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.1 – March 26, 2021

This release includes the support for Infrastructure Visibility with Cluster Agent. You can now use the `infraviz.yaml` file with Cluster Agent Operator. For more information, see [Install Infrastructure Visibility with the Cluster Agent Operator](#)(see page 2908).

Version 21.3.0 – March 25, 2021

This release of Cluster Agent does not include any enhancement but fixes some minor issues.

Version 21.2.0 – February 24, 2021

This release of Cluster Agent includes the following updates:

- Cluster Agent is available with the 0.6.7 version of the operator. You can find the list of supported operators for each Cluster Agent at [Cluster Agent and the Operator Compatibility Matrix](#)(see page 2927).
- The deployment modes for the Cluster Agent Helm chart are now PRIMARY and NAMESPACE instead of MASTER and NAMESPACE. See [Install the Cluster Agent with Helm Charts](#)(see page 2864).

Version 21.1.0

There was no release for 21.1.

Cordova Plugin

Version 21.10.0

There was no release for 21.10.0.

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0 - May 18, 2021

Cordova Plugin 21.5.0 release includes iOS and Android Agents 21.5.0

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.1 – February 19, 2021

Cordova Plugin 21.2.1 released with minor fixes and enhancements, and includes the latest version of the iOS and Android Agents.

Version 21.1.0

There was no release for 21.1.

Database Agent

Version 21.10.0

There was no release for 21.10.0.

Version 21.9.0 - September 24, 2021

This release provides support for the following roles of the MongoDB replica sets and the shard clusters:

- primary
- secondary
- startup
- recovering
- startup2
- unknown
- arbiter
- down
- rollback

To view these roles on the **Topology** tab, you require the Database Agent version \geq 21.9 and Controller version \geq 21.11.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0 - July 22, 2021

This release includes bug fixes.

Version 21.6.0.2406 - June 23, 2021

This release included resolved issues. For the list of resolved issues, see [Past Agent Resolved Issues](#)(see page 3920).

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0 - April 21, 2021

This release includes the following enhancements:

You can now view:

- Costly operations in execution plan along with the warnings in the execution plan. See [Database Query Execution Plan Window](#)(see page 2487)
- Additional Cassandra metrics such as Dropped Mutations, Max Partition Size, Messaging Latency, Read Failures, Repair Age Percentage, and Write Failures. See [Database Monitoring Metrics](#)(see page 2507).

Version 21.3.0

There was no release for 21.3.

Version 21.2.0 – February 17, 2021

This release of Database Agent collects additional Couchbase metrics. For the list of resolved issues, see [Past Agent Resolved Issues](#)(see page 3920).

Version 21.1.0

There was no release for 21.1.

Go SDK

Version 21.10.0

There was no release for 21.10.0.

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

IBM Integration Bus Agent**Version 21.10.0**

There was no release for 21.10.0.

Version 21.9.0 - September 29, 2021

This release includes the bug fixes for cross-application Business Transaction correlation and percentile metrics registration.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0 - May 27, 2021

The IIB Agent 21.5.0 is released with bug fixes for cross-app BT correlation.

Version 21.4.1 - April 27, 2021

The IIB Agent 21.4.1 release introduces the Flow Visibility feature. The timings are collected only for flow start and end and any external calls made from within a flow. Therefore, the expected CPU cost of instrumenting the flows with the agent is reduced, especially for complex flows. See [IIB Agent Flow Level Visibility](#)(see page 1093).

Version 21.4.0 - April 5, 2021

The IIB Agent 21.4.0 release introduces the cross-application Business Transaction correlation feature that helps you to correlate the business transactions passing through an IIB application.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

iOS Agent

Version 21.10.0

There was no release for 21.10.0.

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.1 - August 13, 2021

This hotfix release includes changing the beacon handler NSURLSession back to NSURLConnection.

Version 21.8.0 - August 9, 2021

This release includes replacing NSURLConnection with NSURLSession to send beacon data to the collector.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.1 - July 23, 2021

iOS Agent 21.6.1 release fixed a bug that caused a crash during collector traffic when the device network is unavailable.

Version 21.6.0.2497 - June 22, 2021

iOS Agent 21.6.0.2497 release includes a customization to [attach a custom user data property to a network request](#)(see [page 2167](#)).

Version 21.5.0 - May 12, 2021

iOS Agent 21.5.0 released with minor enhancements and fixes.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0 – February 16, 2021

Manual and automatic screenshots are limited to one screenshot per 10-second interval. See [Past Resolved and Known Issues by Release](#)(see [page 3920](#)), and [iOS SDK Documentation](#)²³⁹⁹.

Version 21.1.0

There was no release for 21.1.

Java Agent

Version 21.10.0 - October 21, 2021

This release adds support for:

²³⁹⁹ <https://docs.appdynamics.com/display/PRO21/Customize+the+iOS+Instrumentation>

- GraalVM version 21.3.0
- JBoss Wildfly version 25.x
- OkHttp version 4.9.2
- gRPC version 1.40.x
- Kafka version 2.8.1
- logback version 1.2.3

See [Java Supported Environments](#)(see page 493).

Version 21.9.0 - September 28, 2021

This release adds support for JBoss EAP 7.3. See [Java Supported Environments](#)²⁴⁰⁰.

Version 21.8.0 - August 24, 2021

This release includes the upgraded versions of `grpc-netty-shaded` and `snakeyaml` for Java Agent.

Version 21.7.0 - August 11, 2021

This release adds support for the following:

- BellSoft JVM. See [Java Supported Environments](#)²⁴⁰¹.
- Mule 4.3. See [Java Supported Environments](#)²⁴⁰².
- WebMethods entry support. See [Java Supported Environments](#)²⁴⁰³.

Version 21.6.1 - July 12, 2021

This release adds entry support for Mule 4.2.x.

Version 21.5.0 - May 26, 2021

Java Agent 21.5.0 released with minor enhancements and [fixes](#)(see page 0).

Version 21.4.0 - April 20, 2021

- Java Agent 21.4.0 adds entry and exit support for Vert.x 4.0. See [Java Supported Environments](#)(see page 493).
- This release adds exit support for WSO2 API Microgateway. See [Java Supported Environments](#)(see page 493).
- An option to rediscover MBean servers periodically using a node property is introduced. See [App Agent Node Properties](#)(see page 1172).
- Support has been added for JDK16. See [Java Supported Environments](#)(see page 493).

Version 21.3.0 – March 23, 2021

- Java Agent 21.3.0 adds entry and exit support for Micronaut 2.0. See [Java Supported Environments](#)(see page 493).
- This release adds entry support for WSO2 API Microgateway. See [Java Supported Environments](#)(see page 493).

Version 21.2.0 – February 15, 2021

The Java Agent 21.2.0 adds a new property to truncate the length of SQL statements. For more information, see [App Agent Node Properties](#)(see page 1179).

Version 21.1.1 - January 28, 2021

- Java Agent 21.1.1 adds support for Tomcat 10. For more information, see [Java Supported Environments](#)²⁴⁰⁴.

²⁴⁰⁰ <https://docs.appdynamics.com/display/PRMY21/.Java+Supported+Environments+v21.9>

²⁴⁰¹ <https://docs.appdynamics.com/display/PRMY21/.Java+Supported+Environments+v21.7>

²⁴⁰² <https://docs.appdynamics.com/display/PRMY21/.Java+Supported+Environments+v21.7>

²⁴⁰³ <https://docs.appdynamics.com/display/PRMY21/.Java+Supported+Environments+v21.7>

²⁴⁰⁴ <https://docs.appdynamics.com/display/PRO21/Java+Supported+Environments>

- This release adds support for Ktor and Netty frameworks. For more information, see [Java Supported Environments](#)²⁴⁰⁵.
- This release adds exit support for Couchbase database. For more information, see [Java Backend Detection](#)²⁴⁰⁶.

Version 21.1.0 - January 18, 2021

Java Agent 21.1.0 adds support for OOTB Detection for Maria DB. For more information, see [Java Supported Environments](#)²⁴⁰⁷.

JavaScript Agent

Version 21.10.0

There was no release for 21.10.0.

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0 - July 21, 2021

The JavaScript Agent 21.7.0 includes:

- [Support for the Nonce attribute](#)(see page 1809)
- Support for Angular 10-11 SPAs

Controller 21.9.0 will support auto-injection for JavaScript 21.7.0.

Version 21.6.0 - June 29, 2021

The JavaScript Agent 21.6.0 release includes:

- [A new API to disable the JavaScript Agent at runtime](#)(see page 1809)
- [A workaround for ensuring SAP Fiori launchpad pages load correctly](#)²⁴⁰⁸

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0 – February 17, 2021

See [Past Resolved and Known Issues by Release](#)(see page 3920).

Version 21.1.0

There was no release for 21.1.

²⁴⁰⁵ <https://docs.appdynamics.com/display/PRO21/Java+Supported+Environments>

²⁴⁰⁶ <https://docs.appdynamics.com/display/PRO21/Java+Backend+Detection>

²⁴⁰⁷ <https://docs.appdynamics.com/display/PRO21/Java+Supported+Environments>

²⁴⁰⁸ <https://docs.appdynamics.com/display/SAP/Browser+End-User+Monitoring>

Java Serverless Tracer

Version 21.10.0

There was no release for 21.10.0.

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

Machine Agent

Version 21.10.0 - November 2, 2021

This release includes Analytics Agent fixes that are bundled in the Machine Agent.

Version 21.9.0 - September 23, 2021

The following third-party libraries have been upgraded:

- Ant: 1.10.11-rc1

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0 - July 27, 2021

This release includes improvements to the Activate HTTP Listener. See [Machine Agent HTTP Listener](#)(see [page 2645](#)).

Version 21.6.0 - June 24, 2021

The Machine Agent 21.6.0 release includes:

- Changed the Process Metrics Count and Total Process Count Dynamic Monitoring Mode metric defaults from "Diagnostic" to "KPI". See [Default Monitoring Mode](#)(see page 2558).
- Has updated JRE 8 from Java 8 Azul Zulu build version 8.52 to 8.54.
- Has updated JRE 11 from Java 11 Azul Zulu build version 11.45 to 11.48.

The following third-party libraries have been upgraded:

- Bouncy Castle 1.69
- Commons-IO 2.10.0
- Dropwizard 2.0.22
- Jetty 9.4.41.v20210516
- Oshi 5.7.4

Version 21.5.0-3130 - May 19, 2021

Machine Agent 21.5.0 release:

- Deprecates the `metric.http.listener.host` property.

Upgrades these third-party libraries:

- Ant 1.10.10
- Dropwizard 2.0.21
- Fabric8-Kubernetes 4.13.3
- Jackson 2.12.3
- Jetty 9.4.40.20210413
- OSHI 5.7.2

Version 21.4.0-3075 - April 22, 2021

This release of Machine Agent :

- has updated Java 8 Azul to build version 8.52 and Java 11 Azul to build version 11.45.
- supports `diskstats` output for Linux kernel versions ≥ 4.18

The following third-party libraries have been upgraded.

- dropwizard: 2.0.20
- guava: 30.0-jre
- Fabric8 Kubernetes: 4.13.2
- jackson-core: 2.12.0
- jackson-databind: 2.12.0
- jetty-server to 9.4.39.20210325
- Log4j2: 2.14.1

Version 21.3.0-3059 – March 25, 2021

The Machine Agent release is bundled with the latest releases of the Analytics Agent and Network Agent.

Version 21.2.0 – February 25, 2021

The Machine Agent has been updated, tested, and certified to work with the following:

- `org.eclipse.jetty:jetty-server 9.4.36.v20210114`
- `org.eclipse.jetty:jetty-servlet 9.4.36.v20210114`
- `org.eclipse.jetty:jetty-servlets 9.4.36.v20210114`
- `org.bouncycastle:bcprov-jdk15on 1.68`
- `commons-net:commons-net 3.7.2`

- commons-codec:commons-codec 1.15
- commons-validator:commons-validator 1.7
- io.dropwizard:dropwizard-jetty 2.0.18
- io.dropwizard:dropwizard-util 2.0.18
- com.google.guava:guava 30.1-jre
- com.fasterxml.jackson.* 2.12.1
- io.fabric8:kubernetes-client 4.13.1

Version 21.1.1 – June 11, 2021

- The Machine Agent resolved an issue with the `NoClassDefFoundError: java/sql/SQLException`. The extension class loader now uses a parent loader for any Java classes.

Version 21.1.0 – January 22, 2021

- The Machine Agent and Server Visibility on Linux bundles have been updated to Java 11 Azul JRE. If you upgrade the Linux Machine Agent to 21.1.0, then you must also upgrade all [extensions](#)²⁴⁰⁹ to their latest versions to support Machine Agent 21.1.0. See [Machine Agent Requirements and Supported Environments](#)²⁴¹⁰ for details.
- The Machine Agent has updated the bundled Analytics Agent to version 20.10.0-7428.

.NET Agent

Version 21.10.0 - October 15, 2021

This release includes:

- Usage of `WeakReference` in the dynamic reflector library.
- Linux Agent log errors / warnings to the console `STDERR` channel.
- Linux instrumentation for `AzureServiceBus` is in parity with Windows.
- Cleanup of unused code in `Poco AsyncInterceptor` and improves resource usages for Task related interceptors.
- Updated list of supported versions for the .Net Agent, aligning with vendor support. See, [.NET Supported Environments](#)²⁴¹¹.

Version 21.9.1 - September 30, 2021

This release includes bug fixes.

Version 21.9.0 - September 22, 2021

This release includes:

- Updates to native dependencies.
- Allows to manage Linux Agent console output via environment variable (Windows Agent Parity).

Version 21.8.1 - September 7, 2021

This release includes writing the `CORECLR` environment values to the logs.

Version 21.8.0 - August 27, 2021

This release includes:

- Support for SQL Data Collector on Linux (known issues: SQL parameters may be shown twice, non-string parameters are shown as empty in Analytics UI)
- Docker image for latest tag was updated. See [Upgrade the .NET Agent for Linux](#)²⁴¹² instructions.

²⁴⁰⁹ <https://www.appdynamics.com/community/exchange/>

²⁴¹⁰ <https://docs.appdynamics.com/display/PRO21/Standalone+Machine+Agent+Requirements+and+Supported+Environments>

²⁴¹¹ <https://docs.appdynamics.com/display/PRO2110/.NET+Supported+Environments>

²⁴¹² <https://docs.appdynamics.com/21.8/en/application-monitoring/install-app-server-agents/net-agent/net-agent-for-linux/upgrade-the-net-agent-for-linux>

Version 21.7.0 - July 29, 2021

.NET Agent for Linux now supports the following:

- Agentless Analytics
- Attributes (annotations) used to define POCO
- Custom correlation
- Custom error detection
- HTTP Data Collectors
- All HTTP backend custom detection/naming configuration options
- Method Invocation Data Collectors (MIDC)
- Service Endpoint configuration

.NET Agent for Linux and .NET Agent for Windows Microservices Agent now supports basic .NET Core metrics.

.NET Machine Agent enhanced for periodic reporting of vCPU information.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.1 - June 17, 2021

.NET Agent has been updated with resolved issues. See [Past Resolved and Known Issues by Release](#)(see [page 3920](#)).

Version 21.5.0 - May 28, 2021

.NET Agent for Linux 21.5 incorporates significant architectural changes to accelerate the development of missing features in the Linux Agent relative to .NET Agent for Windows. These architectural changes do not affect .NET Agent for Windows (MSI and Microservices).

Because .NET Agent for Linux 21.5 is a significant architectural update, some issues may arise despite extensive testing performed. If you experience any blocking issues, please open a high priority support ticket where AppDynamics will provide workarounds or alternate options.

Generally, .NET Agent for Linux 21.5 maintains parity with existing features in .NET Agent for Linux < 21.5. However due to architectural updates, there are differences between .NET Agent for Linux >= 21.5 and .NET Agent for Linux < 21.5. Before you upgrade to .NET Agent for Linux 21.5, see [Upgrade the .NET Agent for Linux](#)²⁴¹³.

Enhancements:

- Sensitive data filters for Linux. See [Filter Sensitive Data with the .NET Agent](#)²⁴¹⁴.
- Custom exit points for Linux. See [Exit Point Detection Rules](#)²⁴¹⁵.
- Instrumentation configuration enhancements for: `classIgnore`, `typeMatch` 'Signature', 'IsSubClass' list and `regex` for Linux.
- ASP.NET instrumentation enhancements for Linux. See [ASP.NET Core Instrumentation Options](#)²⁴¹⁶.
- Redis backend detection for IP address endpoint for all platforms.
- EUM for .NET Core for Linux. See [Browser RUM Supported Environments](#)²⁴¹⁷.
- .NET extends support for BasicPublish and BasicConsume in the RabbitMQ client >= 6.0.0 for all platforms.
- .NET Agent supports SSL mutual authentication for Azure PaaS app services for Windows only.

²⁴¹³ <https://docs.appdynamics.com/display/PRO215/Upgrade+the+.NET+Agent+for+Linux>

²⁴¹⁴ <https://docs.appdynamics.com/display/PRO215/Filter+Sensitive+Data+with+the+.NET+Agent>

²⁴¹⁵ <https://docs.appdynamics.com/display/PRO214/Exit+Point+Detection+Rules>

²⁴¹⁶ <https://docs.appdynamics.com/display/PRO215/ASP.NET+Core+Instrumentation+Options>

²⁴¹⁷ <https://docs.appdynamics.com/display/PRO215/Browser+RUM+Supported+Environments>

- The download package options for .NET Agent on Linux have been updated. The ".NET Agent - 64-bit alpine-linux" package has been discontinued and is replaced with the ".NET Agent - 64-bit linux" package.
- .NET Agent supports custom trusted certificate validation for all .NET Core Linux and Windows.

Version 21.4.0 - April 28, 2021

.NET Agent supports [mutual authentication \(mTLS\)](#)(see [page 667](#)) for Windows Agent for both .NET Full Framework and .NET Core applications; excluding Azure PaaS environments such as Azure App Services. See [Resolved and Known Issues](#)(see [page 4020](#)).

Version 21.3.0 – March 29, 2021

- .NET Agent for Windows running on .NET Core >= 3.1 supports async exit calls over HTTP to WCF services. The remote address, full URL, host, and port identifying properties and correlation are supported.
- .NET Agent supports the Controller service proxy feature.
- New instrumentation options for [ASP.NET Core](#)(see [page 1415](#)).

See [Past Resolved and Known Issues by Release](#)(see [page 3920](#)) for details

Version 21.2.0 – February 24, 2021

The .NET 21.2.0 release includes:

- .NET Agent for Windows on .NET Core now automatically captures errors for loggers implementing the Microsoft.Extensions.Logging.ILogger API. The standard Error Detection configuration options apply.
- **CosmosDB for .NET Core on Windows is supported.**
- Added optimizations for Async Task tracking and Netviz socket tracking.

See [Past Resolved and Known Issues by Release](#)(see [page 3920](#)).

Version 21.1.0 – January 29, 2021

- Windows Agents now support End User Monitoring (EUM) for ASP.NET Core Web applications running on .NET Core 3.1 and .NET 5, including automatic Business Transaction correlation and automatic JavaScript Agent injection. Both MVC and Razor Pages are supported.
- Redis instrumentation is now supported on both .NET Full Framework and Core Framework on Windows.
- The Windows Agents can now automatically set the `HttpOnly` flag to `false` for EUM cookies on ASP.NET. To enable, set the `eum-auto-httponly-false` boolean node property to `true`.

Network Agent

Version 21.10.0

There was no release for 21.10.0.

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0 – March 25, 2021

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)(see [page 3920](#)).

Version 21.2.0 – February 25, 2021

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)(see [page 3920](#)) for details.

Version 21.1.0

There was no release for 21.1.

Node.js Agent**Version 21.10.0**

There was no release for 21.10.0.

Version 21.9.0 - September 30, 2021

This release removes support for Java proxy, and improves the Synchronous Call.

Version 21.8.0 - August 4, 2021

This release removes support for Node.js versions 8 and 10.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.0 - June 25, 2021

The Node.js Agent 21.6.0 release includes resolves issues. For resolved issues, see [Past Agent Resolved Issues](#)(see [page 3920](#)).

Version 21.5.0 - May 28, 2021

This release includes:

- Support for gRPC. See [gRPC Support for the Node.js Agent](#)(see [page 846](#)).
- Availability for cross-application Business Transactions.

Version 21.4.0 - April 16, 2021

This release includes no new features, but bug fixes. See [Resolved and Known Issues](#)(see [page 4020](#)).

Version 21.3.0

There was no release for 21.3.

Version 21.2.0 – February 25, 2021

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)(see [page 3920](#)) for details.

Version 21.1.0 – January 29, 2021

- You can now use Node.js 15.
- You can also tune Analytics data limits with the agent settings.

Node.js Serverless Tracer

Version 21.10.316 - October 18, 2021

This hotfix includes an update to Axios version 0.21.3.

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.286 - May 10, 2021

The Node.js Serverless Tracer has been updated to [21.5.286](#)²⁴¹⁸

Version 21.4.0

There was no release for 21.4.

Version 21.3.278 – March 26, 2021

The Node.js Serverless Tracer has removed request 2.88.0 library and added axios 0.21.1 library. See [Past Resolved and Known Issues by Release](#)(see [page 3920](#)) for details.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

PHP Agent

Version 21.10.0

There was no release for 21.10.0.

²⁴¹⁸ <https://www.npmjs.com/package/appdynamics-lambda-tracer/v/21.5.286>

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0 - July 29, 2021

This release adds PHP Agent support for PHP 8. See, [Past Agent Releases](#)(see page 4020).

Version 21.6.0 - June 22, 2021

PHP Agent now adds support for PHP ZTS. See, [Install PHP Agent with PHP ZTS](#)(see page 870).

Version 21.5.0 - May 26, 2021

PHP Agent 21.5.0 released with [bug fixes](#)(see page 0).

Version 21.4.0

There was no release for 21.4.

Version 21.3.0

There was no 21.3 release.

Version 21.2.0 – February 24, 2021

This release introduces an environment variable to set a unique host ID for the PHP Agent. See [PHP Agent Configuration Settings](#)(see page 883).

Version 21.1.0 – January 27, 2021

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues](#)²⁴¹⁹ for details.

Python Agent

Version 21.10.0 - October 27, 2021

This release includes support for Transaction Analytics for the Python Agent. See [Configure Analytics for Python Applications](#)(see page 3148).

End of Support Notice

This release ends support for:

- Python version 3.4 and 3.5
- Linux x86 32-bit architecture

See [AppDynamics End of Support Notices](#)²⁴²⁰.

Version 21.9.0 - September 30, 2021

This release includes:

²⁴¹⁹ <https://docs.appdynamics.com/display/PRO21/Past+Resolved+and+Known+Issues+by+Release>

⁰⁴² [https://docs.appdynamics.com/display/PAA/](https://docs.appdynamics.com/display/PAA/Product+Announcements+and+Alerts+Home#ProductAnnouncementsandAlertsHome-AppDynamicsEndofSupportNotices)

[Product+Announcements+and+Alerts+Home#ProductAnnouncementsandAlertsHome-AppDynamicsEndofSupportNotices](https://docs.appdynamics.com/display/PAA/Product+Announcements+and+Alerts+Home#ProductAnnouncementsandAlertsHome-AppDynamicsEndofSupportNotices)

-
- Updated the `end_bt()` API to allow user-provided exceptions.
 - Added checks to handle the invalid configuration values.
 - Updated the Python agent APIs to add maximum range-bound on the size of the input string.

Version 21.8.0 - August 31, 2021

This release includes support for Alpine Linux. See [Python Supported Environments](#)²⁴²¹.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.0 - June 17, 2021

The Python Agent 21.6.0 release includes:

- [Ability to configure Java Proxy in a containerized environment](#)²⁴²²
- [Backend resolution improvement to identify service proxy as the backend](#)²⁴²³

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.

Version 21.3.0

There was no 21.3 release.

Version 21.2.0 – February 2, 2021

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues](#)²⁴²⁴ for details.

Version 21.1.0

There was no 21.1 release.

Python Serverless Tracer

Version 21.10.0

There was no release for 21.10.0.

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0

There was no release for 21.7.0.

²⁴²¹ <https://docs.appdynamics.com/21.8/en/application-monitoring/install-app-server-agents/python-agent/python-supported-environments>

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.

Version 21.3.0

There was no 21.3 release.

Version 21.2.0

There was no 21.2 release.

Version 21.1.0

There was no 21.1 release.

React Native Agent**Version 21.10.0**

There was no release for 21.10.0.

Version 21.9.0 - September 17, 2021

This release includes minor fixes and optimizations.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0 - April 5, 2021

This release includes an API to manually track custom HTTP requests. See [Customize the React Native Instrumentation](#)²⁴²⁵.

Version 21.3.0

There was no 21.3 release.

²⁴²⁵ <https://docs.appdynamics.com/display/PRO21/Customize+the+React+Native+Instrumentation>

Version 21.2.1 – February 19, 2021

React Native Agent 21.2.1 supports `CrashReportCallback` to receive a report for native crashes. See [Customize the React Native Instrumentation](#)(see page 2291).

Version 21.1.0

There was no 21.1 release.

SAP

Version 21.10.0

There was no release for 21.10.0.

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0 - August 20, 2021

SAP 21.8.0 released. See [Release Notes Version 21.8.0](#)²⁴²⁶.

Version 21.7.0

There was no release for 21.7.0.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.

Version 21.3.0

There was no 21.3 release.

Version 21.2.0 – February 26, 2021

See [Release Notes Version 21.2.0](#)²⁴²⁷.

Version 21.1.0

There was no 21.1 release.

Synthetic Hosted Agent

Version 21.10.0

There was no release for 21.10.0.

²⁴²⁶ <https://docs.appdynamics.com/display/SAP/Release+Notes+Version+21.8.0>

²⁴²⁷ <https://docs.appdynamics.com/display/SAP/Release+Notes+Version+21.2.0>

Version 21.9.0

There was no release for 21.9.0.

Version 21.8.0

There was no release for 21.8.0.

Version 21.7.0 - July 13, 2021

The Synthetic Hosted Agent 21.7.0 includes support for [Chrome version 86](#)(see [page 1944](#)) in Azure locations.

Version 21.6.0

There was no release for 21.6.0.

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.

Version 21.3.0

There was no 21.3 release.

Version 21.2.0 – February 16, 2021

Chrome browser version 86 is now available. See [Chrome Version 86](#)²⁴²⁸ for details.

Xamarin Agent**Version 21.10.0**

There was no release for 21.10.0.

Version 21.9.0 - September 9, 2021

This release includes a new API for tracking UI elements with Xamarin.Forms. See [Track UI Elements](#)(see [page 2248](#)).

Version 21.8.0 - August 12, 2021

This release includes:

- When instrumenting a Xamarin application, you must add the NuGet package Xamarin.Forms. See [Instrument Xamarin Applications](#)²⁴²⁹.
- Use Xamarin.Forms to add page tracking. See [Customize the Xamarin Instrumentation](#)²⁴³⁰.

Version 21.7.0

There was no release for 21.7.0.

²⁴²⁸ <https://docs.appdynamics.com/display/PRO21/Chrome+Version+86>

²⁴²⁹ <https://docs.appdynamics.com/display/PRO218/Instrument+Xamarin+Applications#InstrumentXamarinApplications-get-xamarin-agent>

²⁴³⁰ <https://docs.appdynamics.com/display/PRO218/>

[Customize+the+Xamarin+Instrumentation#CustomizetheXamarinInstrumentation-xamarin-forms-page-tracking](#)

Version 21.6.0 - June 25, 2021

Xamarin Agent 21.6.0 release includes:

- support for [touch point screenshots](#) (see page 2080)
- support for Application Not Responding (ANR) detection (now automatically enabled)
- customization to add a [crash report runtime callback](#)(see page 2239)

Version 21.5.1 - May 18, 2021

The Xamarin 21.5.1 Agent includes newly exposed APIs to:

- Configure a semi-automatic HTTP tracker using the `HttpMessageHandler`
- Transform URLs for network requests
- Configure, disable, block, and unblock screenshots

See [Customize the Xamarin Instrumentation](#)²⁴³¹.

Other enhancements:

- When setting up the Xamarin Agent, you must add the `AppDynamics.Agent` package and call an extra line of code in `MainActivity.cs` under `OnCreate`. See [Instrument Xamarin Applications](#)²⁴³².

Version 21.4.0

There was no release for 21.4.

Version 21.3.0

There was no 21.3 release.

Version 21.2.0 – February 19, 2021

Xamarin Agent 21.2.0 release includes fixes from the 21.2.0 JavaScript Agent, iOS, and Android Agent.

Version 21.1.0

There was no 21.1 release.

20.x Agent Releases

Analytics Agent

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no release for 20.11.

Version 20.10.0

There was no release for 20.10.

²⁴³¹ <https://docs.appdynamics.com/display/PRO21/Customize+the+Xamarin+Instrumentation>

²⁴³² <https://docs.appdynamics.com/display/PRO21/Instrument+Xamarin+Applications>

Version 20.9.0

There was no release for 20.9.

Version 20.8.0

There was no release for 20.8.

Version 20.7.0

There was no release for 20.7.

Version 20.6.0 – June 25, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release²⁴³³](#) for details.

Version 20.5.0 – May 26, 2020

- Oracle JRE has been replaced with Azul's Zulu JRE in the Window Analytics Agent Bundle.
- Third-party libraries have been upgraded.

Version 20.4.0

There was no 20.4 release for the Analytics Agent.

Version 20.3.0 – March 4, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release²⁴³⁴](#) for details.

Version 20.2.0

There was no release for the Analytics Agent.

Android Agent

Version 20.12.0

There was no release for 20.12.

Version 20.11.1 - November 17, 2020

Android Agent 20.11.0 released with minor enhancements and fixes.

Version 20.10.0 – October 9, 2020

Android Agent 20.10.0 captures mobile device metrics with which you can filter performance data, such as network requests, crashes and code issues, based on device specifications, such as CPU type, memory, disk space, and battery. See [Mobile RUM Metrics²⁴³⁵](#) for details.

Version 20.9.0

There was no 20.9 release for Android Agent.

²⁴³³ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁴³⁴ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁴³⁵ <https://docs.appdynamics.com/display/PRO20X/Mobile+RUM+Metrics>

Version 20.8.0

There was no 20.8 release for Android Agent.

Version 20.7.1 – July 2, 2020

Android Agent 2020.7.0.1710 is released. See [Past Resolved and Known Issues by Release](#)²⁴³⁶.

Recommendations

- If your project uses Android Gradle Plugin version < 4.5.1, use Android Agent 20.4.0.
- If your project uses Android Gradle Plugin version >= 4.5.1, use Android Agent >=20.7.1.

Version 20.6.0

There was no 20.6.0 release for the Android Agent.

Version 20.5.0 – May 13, 2020

The Android Agent has updated the Android Gradle plugin dependency to version 3.4.1 or higher. If you are unable to update to Android Gradle Plugin 3.4.1 or higher, you are recommended to use Android Agent 20.4.0 or earlier.

Version 20.4.0

There was no 20.4.0 release for the Android Agent.

Version 20.3.1 - March 31, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁴³⁷.

Version 20.3.0 – March 4, 2020

This release includes optimizations and small code changes.

Version 20.2.0

There was no 20.2.0 release for the Android Agent.

Apache Web Server Agent

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no release for 20.11.

Version 20.10.0

The release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁴³⁸.

Version 20.9.0 – September 21, 2020

The release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁴³⁹.

²⁴³⁶ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁴³⁷ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁴³⁹ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Version 20.8.0

There was no 20.8 release for the Apache Web Server Agent.

Version 20.7.0 – July 27, 2020

Apache Agent 20.7.0 is released with small code changes and optimizations. See [Past Resolved and Known Issues by Release](#)²⁴⁴⁰.

Version 20.6.0 – June 24, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁴⁴¹.

Version 20.5.0 – May 14, 2020

This release includes optimizations and small code changes.

Version 20.4.0

There was no 20.4.0 release for the Apache Web Server Agent.

Version 20.3.0

There was no 20.3.0 release for the Apache Web Server Agent.

Version 20.2.0

There was no 20.2.0 release for the Apache Web Server Agent.

AppDynamics AWS Lambda Extension for Serverless APM

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no 20.10 release for the AppDynamics AWS Lambda Extension for Serverless APM.

Version 20.10.0 – October 8, 2020

AppDynamics AWS Lambda Extension for Serverless APM released. See [Use the AppDynamics AWS Lambda Extension to Instrument Serverless APM at Runtime](#)²⁴⁴².

C/C++ SDK

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no 20.11 release for the C/C++ SDK.

²⁴⁴⁰ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁴⁴¹ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁴⁴² <https://docs.appdynamics.com/display/PRO20X/>

[Use+the+AppDynamics+AWS+Lambda+Extension+to+Instrument+Serverless+APM+at+Runtime](#)

Version 20.10.0

There was no 20.10 release for the C/C++ SDK.

Version 20.9.0 – September 30, 2020

This release includes new features and bug fixes.

- The C/C++ SDK is now compatible with calendar versioning.
- `appd_sdk_add_app_context` now logs Controller and application information. See [C/C++ SDK Reference](#)²⁴⁴³.
- The C/C++ SDK now supports Custom Events. You can create a custom event, add data to the event, and report the event to the Controller. See [C/C++ Agent SDK Resource Management](#)²⁴⁴⁴.
- You can enable/disable Analytics reporting. When disabled, the Analytics-related logging messages are suppressed. See [C/C++ SDK Reference](#)²⁴⁴⁵.

Version 20.8.0

There was no 20.8 release for the C/C++ SDK.

Version 20.7.0

There was no 20.7.0 release for C/C++ SDK.

Version 20.6.0

There was no 20.6.0 release for the C/C++ SDK.

Version 20.5.0

There was no 20.5.0 release for the C/C++ SDK.

Version 20.4.0

There was no 20.4.0 release for the C/C++ SDK.

Version 20.3.0

There was no 20.3.0 release for the C/C++ SDK.

Version 20.2.0

There was no 20.2.0 release for the C/C++ SDK.

Cluster Agent

Version 20.12.1-1948 – December 18, 2020

There are no enhancements in this release. For the resolved issue, see [Past Resolved and Known Issues by Release](#)²⁴⁴⁶.

Version 20.12.0-1937 – December 17, 2020

There are no enhancements in this release. For the resolved issue, see [Past Resolved and Known Issues by Release](#)²⁴⁴⁷.

²⁴⁴³ <https://docs.appdynamics.com/display/PRO20X/CCPP+SDK+Reference>

²⁴⁴⁴ <https://docs.appdynamics.com/display/PRO20X/CCPP+SDK+Resource+Management>

²⁴⁴⁵ <https://docs.appdynamics.com/display/PRO20X/CCPP+SDK+Reference>

²⁴⁴⁶ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁴⁴⁷ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Version 20.11.0-1877 – November 25, 2020

This release provides the following enhanced capabilities:

- The Cluster Agent can now monitor 1500 pods and 3000 containers (for 2 containers per pod) or 2250 pods and 2250 containers (for 1 container per pod). See [Cluster Agent Performance Certification](#)²⁴⁴⁸.
- You can configure the requests and limits of CPU and memory resources for the Cluster Agent. See the resources parameter at [Configure the Cluster Agent](#)²⁴⁴⁹.
- The instrumentationRules parameter is now mandatory to enable auto-instrumentation of supported applications. This ensures auto-instrumentation is enabled for the required application deployment. See [Enable Auto-Instrumentation for the Supported Applications](#)²⁴⁵⁰.
 If you do not specify any value for the matchString parameter within the instrumentationRules, the Cluster Agent takes into account the value specified in the defaultInstrumentMatchString and instruments all the deployments that satisfy the default value. See [Cluster Agent Configuration for Instrumentation Rules](#)²⁴⁵¹.

Version 20.10.0 – October 23, 2020

- This release of Cluster Agent provides enhanced configuration for auto-instrumentation.
 - You can use the custom configuration for instrumenting the supported applications by using the customAgentConfigSource parameter within instrumentation rules. See [Cluster Agent Configuration for Instrumentation Rules](#)²⁴⁵².
 - The imagePullPolicy option of the imageInfo parameter can now be used within the instrumentation rules. See [Cluster Agent Configuration for Instrumentation Rules](#)²⁴⁵³.
- This release supports custom SSL for instrumenting the supported applications. For Node.js you must use the custom configuration to use the custom SSL certificate. See, [Supported Applications for Auto-Instrumentation](#)²⁴⁵⁴.

Version 20.9.1-1675 – September 30, 2020

The AppDynamics Operator that is to be used by the Cluster Agent has been updated to version 0.6.2.

Version 20.9.0-1662 – September 25, 2020

This release of Cluster Agent provides the following enhancements:

- You can now auto-instrument the Node.js and the .Net Core on Linux applications along with the Java applications. See [Enable Auto-Instrumentation of Supported Applications](#)²⁴⁵⁵.
- You can now limit the number of auto-instrumentation tasks that Cluster Agent can run simultaneously. See the numberOfTaskWorkers property at [Cluster Agent Configuration for Auto-Instrumentation](#)²⁴⁵⁶. By default, Cluster Agent can perform two auto-instrumentation deployments simultaneously.

Version 20.8.0 – August 26, 2020

Cluster Agent released with minor enhancements and fixes.

Version 20.7.0 – July 23, 2020

With this release of Cluster Agent, you can:

²⁴⁴⁸ <https://docs.appdynamics.com/display/PRO20X/Cluster+Agent+Requirements+and+Supported+Environments>

²⁴⁴⁹ <https://docs.appdynamics.com/display/PRO45/Configure+the+Cluster+Agent#yaml>

²⁴⁵⁰ <https://docs.appdynamics.com/display/PRO45/Enable+Auto-Instrumentation+of+Java+Applications#enable>

²⁴⁵¹ <https://docs.appdynamics.com/display/PRO45/Enable+Auto-Instrumentation+of+Java+Applications#instrumentation-rules>

²⁴⁵² <https://docs.appdynamics.com/display/PRO45/Enable+Auto-Instrumentation+of+Supported+Applications#instrumentation-rules>

²⁴⁵³ <https://docs.appdynamics.com/display/PRO45/Enable+Auto-Instrumentation+of+Supported+Applications#instrumentation-rules>

²⁴⁵⁴ <https://docs.appdynamics.com/display/PRO20X/Enable+Auto-Instrumentation+of+Supported+Applications>

²⁴⁵⁵ <https://docs.appdynamics.com/display/PRO20X/Enable+Auto-Instrumentation+of+Supported+Applications>

²⁴⁵⁶ <https://docs.appdynamics.com/display/PRO20X/Enable+Auto-Instrumentation+of+Supported+Applications>

- Use auto-instrumentation for the Java applications that are deployed using the DeploymentConfig resource. See [Supported Resources for Instrumentation](#)²⁴⁵⁷.
- Set tolerations on Cluster Agent pod. See tolerations in [Configure the Cluster Agent YAML File](#)²⁴⁵⁸.
- Deploy the Cluster Agent with Helm Charts. See [Deploy the Cluster Agent with Helm Charts](#)²⁴⁵⁹.
- Monitor the cluster-specific events from the **Clusters** dashboard. See the **Events** tab in [Monitor Cluster Health](#)²⁴⁶⁰.

Version 20.6.0 – June 26, 2020

- Cluster Agent now supports instrumenting the Java applications that are deployed as StatefulSet. This release introduces the parameter resourcesToInstrument to configure auto-instrumentation based on the resource that is used for deploying the Java application. See [Cluster Agent Configuration for Auto-Instrumentation](#)²⁴⁶¹.
- You can now configure runAsUser and runAsGroup as instrumentation rules. This configuration takes precedence over the default configuration. See [Cluster Agent Configuration for Instrumentation Rules](#)²⁴⁶².
- You can use the appNameStrategy parameter to choose the option for naming the AppDynamics Application. See [Options for Naming the Appdynamics Application](#)²⁴⁶³.

Version 20.5.0 – May 29, 2020

Cluster Agent can now enable auto-instrumentation for Java applications. See [Enable Auto-Instrumentation of Java Applications](#)²⁴⁶⁴.

Version 20.4 – April 28, 2020

This release includes the following enhancements:

- Support for Cluster Agent on Rancher Kubernetes Engine (RKE) 1.0.4 with Kubernetes 1.17. See [Cluster Agent Requirements and Supported Environments](#)²⁴⁶⁵.
- Support for Cluster Agent on Google GKE 1.14
- Support for monitoring Kubernetes stateful sets
- Changes have been made to preserve the configuration for monitored namespaces. See the nstoMonitor property in [Configure the Cluster Agent](#)²⁴⁶⁶ and [Use the Cluster Agent](#)²⁴⁶⁷.

Version 20.3.0 – March 6, 2020

- The Cluster Agent can blacklist and allowlist pods based on regular expression and domains.
- You can configure the maximum number of Cluster Agents that can report to an account.
- You can configure the maximum number of pods that can be associated with any Cluster Agent.

Version 20.2.0

There was no release for the Cluster Agent.

Cordova Plugin

Version 20.12.0

There was no release for 20.12.

²⁴⁵⁷ <https://docs.appdynamics.com/display/PRO20X/Enable+Auto-Instrumentation+of+Supported+Applications>

²⁴⁵⁸ <https://docs.appdynamics.com/display/PRO20X/Configure+the+Cluster+Agent>

²⁴⁶⁴ <https://docs.appdynamics.com/display/PRO20X/Enable+Auto-Instrumentation+of+Supported+Applications>

²⁴⁶⁵ <https://docs.appdynamics.com/display/PRO20X/Cluster+Agent+Requirements+and+Supported+Environments>

²⁴⁶⁶ <https://docs.appdynamics.com/display/PRO20X/Configure+the+Cluster+Agent>

²⁴⁶⁷ <https://docs.appdynamics.com/display/PRO20X/Use+the+Cluster+Agent>

Version 20.11.0 – November 19, 2020

Cordova Plugin 20.11.0 released with minor fixes and optimizations. Cordova Plugin 20.11.0 is integrated with Android Agent 20.11.1.

Version 20.10.0 – October 16, 2020

This release includes optimizations and small code changes.

Version 20.9.0

There was no 20.9 release for the Cordova Plugin.

Version 20.8.0

There was no 20.8 release for the Cordova Plugin.

Version 20.7.0 – July 13, 2020

Cordova Agent 20.7.0 captures `hybridAgentType` and `hybridAgentVersion`.

Version 20.6.0

There was no 20.6.0 release for the Cordova Plugin.

Version 20.5.0

There was no 20.5.0 release for the Cordova Plugin.

Version 20.4.0

There was no 20.4.0 release for the Cordova Plugin.

Version 20.3.0 – March 18, 2020

The Cordova Plugin has now been tested and certified to work with the following:

- Cordova 9.0.0
- Cordova iOS 4.5.5/5.0.0
- Cordova 8.0.0
- Ionic CLI 6.1.0
- Node 12.16.1
- npm 6.13.4

Version 20.2.0

There was no 20.2.0 release for the Cordova Plugin.

Database Agent

Version 20.12.0-2183 – December 16, 2020

- Database Agent now supports mutual (client and server) authentication. See [Mutual Authentication](https://docs.appdynamics.com/display/PRO20X/Mutual+Authentication)²⁴⁶⁸.
- You can now use the service record (SRV record) within the connection string while configuring the MongoDB collector. See [SRV Record](https://docs.appdynamics.com/display/PRO20X/Configure+MongoDB+Collectors) at [Configure MongoDB Collectors](https://docs.appdynamics.com/display/PRO20X/Configure+MongoDB+Collectors)²⁴⁶⁹.

²⁴⁶⁸ <https://docs.appdynamics.com/display/PRO20X/Mutual+Authentication>

²⁴⁶⁹ <https://docs.appdynamics.com/display/PRO20X/Configure+MongoDB+Collectors>

Version 20.11.0

There was no 20.11 release for the Database Agent.

Version 20.10.0 – October 27, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁴⁷⁰ for details.

Version 20.9.0 – September 16, 2020

The release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁴⁷¹.

Version 20.8.0

There was no 20.8 release for the Database Agent.

Version 20.7.0 – July 28, 2020

The Database Agent 20.7 and later are not compatible with Controller versions 4.5.0 and 4.5.1. Therefore, some of the features may not work when the Controller version is 4.5.0 or 4.5.1.

For the resolved issue, see [Past Resolved and Known Issues by Release](#)²⁴⁷².

Version 20.6.0

There was no 20.6.0 release for Database Agent.

Version 20.5.0 – May 26, 2020

- You can now create multiple Database Agents as different Windows services with different names. For more information, see [Start the Database Agent Automatically on Windows](#)²⁴⁷³.
- Database Agent adds support for Windows 64-bit. See [Database Visibility Supported Environments](#)²⁴⁷⁴. From 20.5 release onwards, Database Visibility is not supported on Windows 32-bit.

Version 20.4 – April 28, 2020

This release includes the following new features:

- Support for Microsoft SQL Server 2019
- Support for Cassandra database
- Customize the sampling interval
- Capture details to integrate Database Visibility with the Application Flow Map

For the issues that are fixed in this release, see [Past Resolved and Known Issues by Release](#)²⁴⁷⁵.

Version 20.3.0 – March 20, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁴⁷⁶ for details.

²⁴⁷⁰ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁴⁷⁶ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Version 20.2.0

There was no 20.2.0 release for Database Agent.

Go SDK**Version 20.12.0**

There was no release for 20.12.

Version 20.11.0

There was no release for 20.11.

Version 20.10.0

There was no 20.10.0 release for the Go SDK.

Version 20.9.0

There was no 20.9.0 release for the Go SDK.

Version 20.8.0

There was no 20.8.0 release for the Go SDK.

Version 20.7.0

There was no 20.7.0 release for the Go SDK.

Version 20.6.0

There was no 20.5.0 release for the Go SDK.

Version 20.5.0

There was no 20.5.0 release for the Go SDK.

Version 20.4.0

There was no 20.4.0 release for the Go SDK.

Version 20.3.0

There was no 20.3.0 release for the Go SDK.

Version 20.2.0

There was no 20.2.0 release for the Go Agent.

IBM Integration Bus Agent**Version 21.1.0**

There was no release for 21.1.

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no release for 20.11.

Version 20.10.0

There was no 20.10 release for the IBM Integration Bus Agent.

Version 20.9.0 – September 24, 2020

The release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁴⁷⁷.

Version 20.8.0

There was no 20.8 release for the IBM Integration Bus Agent.

Version 20.7.0 – July 2, 2020

AppDynamics IIB Agent introduces a configurable setting for the log file size. See [Install the IIB Agent](#)²⁴⁷⁸.

Version 20.6.0

There was no 20.6.0 release for the IBM Integration Bus Agent.

Version 20.5.0 – May 14, 2020

- The Appdynamics IIB Agent now adds support for ACE 11 on the AIX platform. See [IIB Supported Environments](#)²⁴⁷⁹.
- This release also includes optimizations and small code changes.

Version 20.4.0

There was no 20.4.0 release for the IBM Integration Bus Agent.

Version 20.3.0 – March 31, 2020

The tracer's version is now compatible with calendar versioning. This release includes no new enhancements.

Version 20.2.0

There was no 20.2.0 release for the IBM Integration Bus Agent.

iOS Agent**Version 20.12.0 – December 15, 2020**

You can now disable the iOS Agent to stop sending user data to the collector. See [Customize the iOS Instrumentation](#)²⁴⁸⁰.

Version 20.11.0

There was no release for the iOS Agent.

²⁴⁷⁷ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁴⁷⁸ <https://docs.appdynamics.com/display/PRO20X/Install+the+IIB+Agent>

²⁴⁷⁹ <https://docs.appdynamics.com/display/PRO20X/IIB+Supported+Environments>

²⁴⁸⁰ <https://docs.appdynamics.com/display/PRO20X/Customize+the+iOS+Instrumentation>

Version 20.10.0.2298 – October 7, 2020

iOS Agent 20.10.0 captures mobile device metrics with which you can filter performance data, such as network requests, crashes and code issues, based on device specifications, such as CPU type, memory, disk space, and battery. See [Mobile RUM Metrics](#)²⁴⁸¹ for details.

For information on the iOS 14 privacy guidelines, see [iOS Data Collection Disclosure](#)²⁴⁸². For bug fixes, see [Past Resolved and Known Issues by Release](#)²⁴⁸³.

Version 20.9.0

There was no release for the iOS Agent.

Version 20.8.0 – August 20, 2020

The iOS Agent released with minor enhancements and fixes. See [Past Resolved and Known Issues by Release](#)²⁴⁸⁴.

Version 20.7.0.2209 – July 8, 2020

Filtered URLs are logged when the logging level is set to verbose.

Version 20.6.0

There was no release for the iOS Agent.

Version 20.5.0

There was no release for the iOS Agent.

Version 20.4.0

There was no release for the iOS Agent.

Version 2020.3.0-2006 – March 2, 2020

This release includes optimizations and small code changes.

Version 20.2.0

There was no release for the iOS Agent.

Java Agent**Version 20.12.0**

There was no release for 20.12.

2481 <https://docs.appdynamics.com/display/PRO20X/Mobile+RUM+Metrics>

2482 <https://docs.appdynamics.com/display/PRO20X/iOS+Data+Collection+Disclosure>

2483 <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

2484 <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Version 20.11.0 - November 27, 2020

- Java Agent 20.11.0 adds exit support for Vertx 3.9. For more information, see [Java Supported Environments](#)²⁴⁸⁵.
- This release makes the *Executor* mode the default mode for handling asynchronous transactions. See [Configure the Thread Correlation in Java Agent](#)²⁴⁸⁶.
- This release adds a property for optimized heap mode enabling. See [Optimize Heap Mode](#)²⁴⁸⁷.

Version 20.10.0 – October 20, 2020

- This release adds an asynchronous entry and exit support for gRPC. For more information, see [Java Supported Environments](#)²⁴⁸⁸.
- This release certifies support for Java 15. For more information, see [Java Supported Environments](#)²⁴⁸⁹.
- This release adds exit support for the HTTP4 blaze client.

Version 20.9.0 – September 22, 2020

- This release adds the synchronous entry and exit support for gRPC. For more information, see [Java Supported Environments](#)²⁴⁹⁰.
- This release adds support for the following thread handoff across Reactive Extension for Java (RxJava 2): **Observable** in addition to the thread handoff **Single**.

Version 20.8.0 – August 21, 2020

This release verifies support for GraalVM using the Graal compiler as a HotSpot JIT.

Version 20.7.0 – July 31, 2020

- This release adds support for MySQL 6.0 and 8.0. See [Java Supported Environments](#)²⁴⁹¹.
- This release adds support for MongoDB drivers (synchronous, asynchronous, and reactivestreams) up to v4.x. See [Java Supported Environments](#)²⁴⁹².
- This release verifies support for Spring 5.2. See [Java Supported Environments](#)²⁴⁹³.
- This release adds support for Spring Cloud Gateway.
- This release adds support for the following thread handoffs across Reactive Extension for Java (RxJava 2): **Maybe**, **Completable**, and **Flowable** in addition to the thread handoff **Single**.
- An additional artifact for Java Agent to include the security compliant versions of the third-party dependencies is included. An agent compatible with Java version 7 will no longer be available for Java applications running on PCF.

Version 20.6.0 – June 23, 2020

- Java Agent 20.6.0 adds support for Oracle 10, 11, 12, 18, and 19 drivers. See [Java Supported Environments](#)²⁴⁹⁴.
- Support for Spring WebFlux and WebClient 5.2 is added. See [Java Supported Environments](#)²⁴⁹⁵.
- A node property is added to prevent duplicate ADRUM headers from being injected in the HTTP response. See [App Agent Node Properties \(D-E\)](#)²⁴⁹⁶.
- Java Agent 20.6.0 adds support to the service proxy feature. See [Service Proxy Overview](#)²⁴⁹⁷.

²⁴⁹⁷ <https://docs.appdynamics.com/display/PRO20X/Service+Proxy+Overview>

Version 20.5.0 – May 21, 2020

- Java Agent 20.5.0 adds support for Vertx 3.8. See [Java Supported Environments](#)²⁴⁹⁸.
- You can now capture the raw SQL queries for databases such as MongoDB, DynamoDB, and CassandraDB. See [Call Graph Settings](#)²⁴⁹⁹.

Version 20.4.0 – April 22, 2020

- Java Agent 20.4.0 adds support for netty version 4.x async exit. See [Java Supported Environments](#)²⁵⁰⁰.
- This release adds Java 14 certification for AdoptOpenJDK, Azul Zulu OpenJDK, Oracle, and Open Source OpenJDK. See [Java Supported Environments](#)²⁵⁰¹.

Version 20.3.0 – March 20, 2020

- Java Agent version 20.3.0 adds support for netty version 4.x async entry.
- Support added for Rx Java 2 Single.
- Support added for Akka HTTP Non-Route DSL.
- Support to enable business transaction correlation using SOAP:Header with JBoss. To enable the correlation only for JBoss, you must create a Servlet exclude rule.

Agentless Transaction Analytics

- You can now disable agentless Transaction Analytics at the [tier and node level](#)²⁵⁰².

Version 20.2.0

There was no release for the Java Agent.

JavaScript Agent

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no 20.11.0 release for the JavaScript Agent.

Version 20.10.0 – October 21, 2020

JavaScript Agent 20.10.0 released with minor optimizations, including to how Visually Complete Time (VCT) is calculated. For bug fixes, see [Past Resolved and Known Issues by Release](#)²⁵⁰³.

Version 20.9.0 – September 15, 2020

JavaScript Agent 20.9.0 was released. See [Past Resolved and Known Issues by Release](#)²⁵⁰⁴ for more information.

Version 20.8.0 – August 5, 2020

JavaScript Agent released with bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵⁰⁵ for more information.

²⁴⁹⁸ <https://docs.appdynamics.com/display/PRO20X/Java+Supported+Environments>

²⁴⁹⁹ <https://docs.appdynamics.com/display/PRMY21/Call+Graph+Settings>

²⁵⁰⁵ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Version 20.7.0

There was no 20.7.0 release for the JavaScript Agent.

Version 20.6.0.3177 – June 17, 2020

Angular 9 is now supported.

Version 20.5.0.3144 – May 15, 2020

Images without extensions or dots (.) are now classified as "images" instead of "other."

Version 20.4.0.3090 – April 14, 2020

This release includes bug fixes but no new features. See [Past Resolved and Known Issues by Release²⁵⁰⁶](#) for details.

Version 20.3.0-3009 – March 18, 2020

The JavaScript Agent, by default, limits the number of Ajax requests reported per page. Starting with this version, you can configure the JavaScript Agent to [report an unlimited number of Ajax requests](#)(see [page 4020](#)) per page.

Version 20.2.0-2928 – February 13, 2020

This release includes bug fixes but no new features. See [Past Resolved and Known Issues by Release²⁵⁰⁷](#) for details.

Java Serverless Tracer**Version 20.12.0**

There was no release for 20.12.

Version 20.11.1400

The Java Serverless Tracer has added an environment variable, APPDYNAMICS_HTTP_TIMEOUT_MS, which allows you to set the timeout in milliseconds for all the HTTP calls made by the tracer. See [Past Resolved and Known Issues by Release²⁵⁰⁸](#) for details.

Version 20.10.0

There was no 20.10 release for the Java Serverless Tracer.

Version 20.9.0

There was no 20.9 release for the Java Serverless Tracer.

Version 20.8.0

There was no 20.8 release for the Java Serverless Tracer.

Version 20.7.0

There was no release for 20.7.

²⁵⁰⁶ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁵⁰⁷ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁵⁰⁸ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Version 20.6.0

There was no release for the Java Serverless Tracer Agent.

Version 20.5.0

There was no release for the Java Serverless Tracer Agent.

Version 20.4.0

There was no release for the Java Serverless Tracer Agent.

Version 20.3.1391 – March 17, 2020

The tracer's version is now compatible with calendar versioning. This release includes no new enhancements or resolved issues.

Version 20.2.0

There was no release for the Java Serverless Tracer Agent.

Machine Agent

Version 20.12.0-3016 - December 16, 2020

This release provides the following enhancements:

- The Machine Agent now prepends the hostname in the log files.
- The Machine Agent has been updated, tested, and certified to work with the following:
 - `com.fasterxml.jackson.core:jackson-databind:2.12.0`
 - `com.google.guava:guava:30.0-jre`
 - `commons-io:commons-io:2.8.0`
 - `junit:junit:4.13.1`
 - `org.apache.ant:ant:1.10.9`
 - `org.apache.httpcomponents:httpclient:4.5.13`
 - `org.bouncycastle:bcprov-jdk15on:1.67`
 - `org.eclipse.jetty:jetty-server:9.4.35.v20201120`
 - `org.eclipse.jetty:jetty-webapp:9.4.35.v20201120`
 - `org.exist-db.thirdparty.xerces:xercesImpl:2.12.1`
 - `org.hibernate:hibernate-validator:6.1.6.Final`

Version 20.11.1-3044 - January 26, 2021

This release provides the following enhancements:

- The Machine Agent has been updated, tested, and certified to work with the following:
 - `com.fasterxml.jackson.core:jackson-databind:2.12.0`
 - `com.google.guava:guava:30.0-jre`
 - `commons-io:commons-io:2.8.0`
 - `junit:junit:4.13.1`
 - `org.apache.ant:ant:1.10.9`
 - `org.apache.httpcomponents:httpclient:4.5.13`
 - `org.bouncycastle:bcprov-jdk15on:1.67`
 - `org.eclipse.jetty:jetty-server:9.4.35.v20201120`
 - `org.eclipse.jetty:jetty-webapp:9.4.35.v20201120`
 - `org.exist-db.thirdparty.xerces:xercesImpl:2.12.1`
 - `org.hibernate:hibernate-validator:6.1.6.Final`
-

Version 20.11.0.2915 - November 19, 2020

The Machine Agent Azul Zulu JRE version has been updated to 8.50 (maps to OpenJDK version 8u272). Machine Agent OSHI library upgraded to version 5.3.5.

Version 20.10.0-2813 - October 22, 2020

This release includes optimizations and small code changes. For bug fixes, see [Past Resolved and Known Issues by Release](#)²⁵⁰⁹.

Version 20.9.0 – September 21, 2020

Machine Agent 20.9.0-2763 was released. Machine Agent OSHI library upgraded to version 5.2.5. See [Past Resolved and Known Issues by Release](#)²⁵¹⁰.

Version 20.8.0.2713 – August 20, 2020

Machine Agent released with bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵¹¹ for more information.

Version 20.7.0-2694 – July 23, 2020

When using Docker Visibility, if the unique host ID setting is not configured to use container ID in host network mode, the Machine Agent now automatically registers the container using the container ID as the host ID. See [Using Docker Visibility with Kubernetes](#)²⁵¹².

Version 20.6.0-2676 – June 25, 2020

The Machine Agent now has the ability to identify container processes by container names only. See [Configuring Docker Visibility](#)²⁵¹³.

Version 20.5.1-2635 – May 29, 2020

The Machine Agent has been updated, tested, and certified to work with the following:

- ant v1.10.8
- commons-fileupload v1.4.0
- hibernate-validator v6.1.5
- snakeyaml v1.26

Version 20.5.0-2617 – May 20, 2020

Azul JRE 8.0.252 is replacing Oracle JRE as a component included in the Machine Agent. See [Machine Agent Requirements and Supported Environments](#)²⁵¹⁴.

Version 20.4.0-2571 – April 27, 2020

The Machine Agent has been updated, tested, and certified to work with the following:

- ch.qos.logback:logback-core:1.2.3
- commons-codec:commons-codec:1.14
- commons-io:commons-io:2.6

²⁵⁰⁹ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁵¹³ <https://docs.appdynamics.com/display/PRO20X/Configuring+Docker+Visibility>

²⁵¹⁴ <https://docs.appdynamics.com/display/PRO20X/Standalone+Machine+Agent+Requirements+and+Supported+Environments>

- commons-net:commons-net:3.6
- dropwizard-jetty 2.0.7
- log4j-api:2.13.1
- log4j-core:2.13.1
- org.antlr:antlr4-runtime:4.8-1
- org.apache.httpcomponents:httpclient:4.5.12
- org.bouncycastle:bcprov-jdk15on:1.62
- org.hibernate:hibernate-validator:6.1.2.Final
- org.javassist:javassist:3.21.0-GA
- org.jboss.logging:jboss-logging:3.4.1.Final

Version 20.3.2 – March 27, 2020

The Machine Agent has been updated, tested and certified to work with the following:

- okhttp 3.12.6
- log4j-api 2.13.1
- log4j-core 2.13.1
- log4j-slf4j-impl 2.13.1

log4j_log4j 1.2.17 has been removed.

Version 20.3.1-2476 – March 16, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵¹⁵ for details.

Version 20.3.0-2468 – March 9, 2020

This release includes optimizations and small code changes.

Version 20.2.0

There was no 20.2.0 release for the Machine Agent.

.NET Agent

Version 20.12.0 – December 18, 2020

There are no enhancements in this release. For the resolved issue, see [Past Resolved and Known Issues by Release](#)²⁵¹⁶.

Version 20.11.0 - November 20, 2020

.NET Agent now supports the [.NET 5.0 environment](#)²⁵¹⁷.

Version 20.10.0 - October 28, 2020

.NET Agent includes these enhancements:

- .NET Agent supports Agentless Analytics on Windows. See [Agentless Analytics Overview](#)²⁵¹⁸.
- .NET Agent is now supported on [Windows Server 2019](#)²⁵¹⁹.

2515 <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

2516 <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

2517 <https://docs.appdynamics.com/display/PRO20X/.NET+Supported+Environments>

2518 <https://docs.appdynamics.com/display/PRO20X/Deploy+Analytics+Without+the+Analytics+Agent>

2519 <https://docs.appdynamics.com/display/PRO20X/.NET+Supported+Environments>

- The [ASP.NET business transactions configuration feature](#)²⁵²⁰ has been removed as a preview feature in the Linux Agent. You now have the ability to perform custom backend naming for HTTP backends in the Linux Agent in your production environment.

For bug fixes, see [Past Resolved and Known Issues by Release](#)²⁵²¹.

Version 20.9.0 – September 24, 2020

Azure Cosmos DB

The .NET Linux Agent now supports the Azure Cosmos DB through the SQL API. Both of these Azure versions are supported:

- Microsoft.Azure.DocumentDB.Core (2.x)
- Microsoft.Azure.Cosmos (3.x)

Note the following:

- The backend naming of the Azure Cosmos DB is detected as {host} . {port}.
- The backend properties of the exit type shows Database Account with host and port.
- The Snapshot properties of "Query through LINQ" call does not contain the SQL Query Statement.
- The ConnectionString of the Azure Cosmos DB is not shown in any of the Snapshot properties, nor in the backend properties.
- The following is *not supported*:
 - Instrumentation of BulkExecution
 - Sensitive data filters on Query

See [Past Resolved and Known Issues by Release](#)²⁵²² for details.

Version 20.8.0 – August 24, 2020

The .NET Agent now supports the transport layer security (TLS) 1.2 and proxy-related environment variables for the Micro Services Agent on Windows. See [Configure the Agent Using Environment Variables](#)²⁵²³ for details.

Version 20.7.0 - July 23, 2020

The .NET Agent for Linux now:

- Partially supports the detection of WCF exit calls on .NET Core 3.1 and later. See [.NET Backend Detection](#)²⁵²⁴ for more details.
- Supports setting APPDYNAMICS_AGENT_UNIQUE_HOST_ID as an environment variable.

This release also includes bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵²⁵ for details.

Version 20.6.1 - July 17, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵²⁶ for details.

Version 20.6.0 - July 1, 2020

- The .NET Agent for Windows now correlates business transactions with End User Monitoring by default.

²⁵²⁰ <https://docs.appdynamics.com/display/PRO20X/.NET+Agent+for+Linux+Business+Transaction+Configuration>

²⁵²¹ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁵²² <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁵²³ <https://docs.appdynamics.com/display/PRO20X/.NET+Agent+Environment+Variables>

²⁵²⁴ <https://docs.appdynamics.com/display/PRO20X/.NET+Backend+Detection>

²⁵²⁵ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁵²⁶ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

- Improvements have been added to instrumentation in full-no-dependency mode. You can now instrument non-NGen assemblies when MSCorlib is loaded as NGen.
- Internal library upgrades and code improvements added to the .NET Agent for Linux.
- Improvements added to the .NET Agent to detect RabbitMQ Async entry points.

This release also includes bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵²⁷ for details.

Version 20.5.0 – May 20, 2020

- Sensitive information for MongoDB query expressions is now filtered out by default. You can enable raw query collections for MongoDB in [Call Graph Settings](#)²⁵²⁸.
- RabbitMQ backend detection is now compatible with RabbitMQ Client version 6. See [RabbitMQ Backends for .NET](#)²⁵²⁹ for more details.

Version 20.4.1 (.NET Agent for Windows) - April 29, 2020

Due to a signing issue, the 20.4.0 version of the .NET Agent for Windows has been replaced with 20.4.1. It has no feature difference with 20.4.0.

Version 20.4.0 - April 28, 2020

This release includes log improvements in the Linux profiler and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵³⁰ for details.

Version 20.3.1 - April 7, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵³¹ for details.

Version 20.3.0 - March 26, 2020

This release contains the .NET Agent for Linux only. The .NET Agent for Linux now supports .NET Core 3.1.

Version 20.3.0 – March 25, 2020

This release contains the .NET Agent for Windows only.

The .NET Agent MSI installer for Windows now includes support for .NET Core applications, enabling unified management of .NET Core and full framework applications on Windows. The agent monitors .NET Core applications for IIS out of the box, if automatic IIS mode is configured.

- The MSI Installer bundles .NET Core agent with the existing .NET framework agent and creates appropriate environment variables.
- [Supported environments](#)²⁵³² are identical to the previous .NET Agent.
- .NET Core versions 2.0 and later are supported.
- IIS-hosted .NET Core applications are monitored similar to the .NET frameworks configured in [automatic mode](#)²⁵³³.
- You can [configure .NET Core applications](#)²⁵³⁴ in the `config.xml` file, just as you would configure .NET framework applications.

²⁵²⁷ <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

²⁵²⁹ <https://docs.appdynamics.com/display/PRO20X/RabbitMQ+Backends+for+.NET>

²⁵³⁰ <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

²⁵³¹ <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

²⁵³² <https://docs.appdynamics.com/display/PRO20X/.NET+Agent+Environment+Variables>

²⁵³³ <https://docs.appdynamics.com/display/PRO20X/Administer+the+.NET+Agent>

²⁵³⁴ <https://docs.appdynamics.com/display/PRO20X/>

[Configure+the+.NET+Agent+for+Windows+Services+and+Standalone+Applications](#)

You have to manually configure .NET Core applications in the `config.xml` file in either of the following scenarios:

- You monitor ASP .NET core applications that are not hosted in process, but are hosted in `dotnet.exe`
- You currently monitor standalone applications

The .NET Agent for Windows supports Azure Functions 3.x and the following:

- Supports Netviz entry calls for non-IIS applications.
- Filters sensitive data in environment variables.
- Reports CoreCLR runtime to the Controller.
- Includes WCF entry points with the agent's network visibility support, if the WCF service is operating in ASP.NET compatibility mode. If the WCF service is not using ASP.NET compatibility mode, or if the service receives requests that do not use this mode, the agent logs a warning that network visibility is currently not supported for this setup.

Version 20.2.0

There was no 20.2.0 release for the .NET Agent.

Network Agent

Version 20.12.0

There was no 20.12.0 release for the Network Agent.

Version 20.11.0

There was no 20.11.0 release for the Network Agent.

Version 20.10.0

There was no 20.10.0 release for the Network Agent.

Version 20.9.0

There was no 20.9.0 release for the Network Agent.

Version 20.8.0.2169 – August 26, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release²⁵³⁵](#) for details.

Version 20.7.0

There was no 20.7.0 release for the Network Agent.

Version 20.6.0 – June 25, 2020

This release includes optimizations and small code changes.

Version 20.5.0 – May 21, 2020

This release includes optimizations and small code changes.

Version 20.4.0

There was no 20.4.0 release for the Network Agent.

²⁵³⁵ <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

Version 20.3.0-2139 – March 9, 2020

This release includes optimizations and small code changes.

Version 20.2.0

There was no 20.2.0 release for the Network Agent.

Node.js Agent

Version 20.12.0 – December 8, 2020

- You can attach existing Analytics data generated for any given transaction to an exit call. For more information, see [Node.js Agent API Reference](#)²⁵³⁶.
- Docker init container images are now available on [Dockerhub](#)²⁵³⁷ for Linux and Alpine environments. For all other environments, see [Build the Node.js Agent Init Container Image](#)²⁵³⁸.

Version 20.11.0

There was no 20.11.0 release for the Node.js Agent.

Version 20.10.1 – October 16, 2020

This release includes optimizations and small code changes.

Version 20.10.0 – October 15, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵³⁹ for details.

Version 20.9.0

There was no 20.9.0 release for the Node.js Agent.

Version 20.8.0-2169 – August 27, 2020

You can now separate Business Transactions into multiple queries with GraphQL. For more information, see [Custom Match Rules](#)²⁵⁴⁰.

Version 20.7.0 – July 29, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵⁴¹ for details.

Version 20.6.0 – June 12, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵⁴² for details.

²⁵⁴² <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

Version 20.5.0 – May 29, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release²⁵⁴³](#) for details.

Version 20.4.0 – April 29, 2020

This release includes optimizations and small code changes.

Version 20.3.1 – March 27, 2020

This release includes optimizations and small code changes.

Version 20.3.0 – March 26, 2020

This release includes optimizations and small code changes.

Version 20.2.0

There was no release for the Node.js Agent.

Node.js Serverless Tracer

Version 20.12.0

There was no 20.12.0 release for the Node.js Serverless Tracer.

Version 20.11.242

The Node.js Serverless Tracer has added an environment variable, `APPDYNAMICS_HTTP_TIMEOUT_MS`, which allows you to set the timeout in milliseconds for all the HTTP calls made by the tracer. See [Past Resolved and Known Issues by Release²⁵⁴⁴](#) for details.

Version 20.10.0

There was no 20.10.0 release for the Node.js Serverless Tracer.

Version 20.9.221 – September, 2020

This release includes minor enhancements and bug fixes.

Version 20.8.0

There was no 20.8.0 release for the Node.js Serverless Tracer.

Version 20.7.0

There was no 20.7.0 release for the Node.js Serverless Tracer.

Version 20.6.0

There was no 20.6.0 release for the Node.js Serverless Tracer.

Version 20.5.0

There was no 20.5.0 release for the Node.js Serverless Tracer.

²⁵⁴³ <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

²⁵⁴⁴ <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

Version 20.4.0

There was no 20.4.0 release for the Node.js Serverless Tracer.

Version 20.3.178 – March 16, 2020

The tracer's version is now compatible with calendar versioning. This release includes no new enhancements or resolved issues.

Version 20.2.0

There was no 20.2.0 release for the Node.js Serverless Tracer.

PHP Agent

Version 20.12.0 – December 16, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵⁴⁵ for details.

Version 20.11.0 - November 24, 2020

This release supports the Node Reuse feature. For more information, see [Node Reuse for PHP Agent](#)²⁵⁴⁶.

Version 20.10.0 – October 22, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵⁴⁷ for details.

Version 20.9.0 – September 15, 2020

The release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵⁴⁸.

Version 20.8.0.4083 – August 26, 2020

PHP Agent released with bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵⁴⁹.

Version 20.7.0 – July 16, 2020

The PHP Agent 20.7.0 release enhances the General Data Protection Regulation (GDPR) compliance for data filtering.

This helps you to redact any sensitive data (URLs, Exit calls, or cookies), which is shown in the Controller. For more information, see [Redaction of URL Segments and Query Parameters](#)²⁵⁵⁰.

Version 20.6.0 – June 23, 2020

The PHP Agent 20.6.0 release implements the General Data Protection Regulation (GDPR) compliance for data filtering.

²⁵⁴⁵ <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

²⁵⁴⁶ <https://docs.appdynamics.com/display/PRO20X/Node+Reuse+for+PHP+Agent>

²⁵⁴⁷ <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

²⁵⁴⁹ <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

²⁵⁵⁰ <https://docs.appdynamics.com/display/PRO20X/Filter+Data>

This helps you to redact any sensitive data (URLs, Exit calls, or cookies), which is shown in the Controller. For more information, see [Redaction of URL Segments and Query Parameters](#)²⁵⁵¹.

Version 20.5.0 – May 29, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵⁵² for details.

Version 20.4.0.3759 – April 29, 2020

This release adds support to CakePHP 4.0 and Magento 2.3 for the PHP Agent. See [PHP Supported Environments](#)²⁵⁵³.

Version 20.3.1 – March 26, 2020

This release supports PHP Agent for CentOS version 8 and adds support to the following frameworks:

- FuelPHP 1.8.1
- Zend 3
- Laravel 6
- CodeIgnitor4

Version 20.3.0 – March 3, 2020

- PHP 7.4 support is added to the AppDynamics PHP Agent. See [PHP Supported Environments](#)²⁵⁵⁴.
- The PHP Agent now supports Symfony versions 3 and 4. See [PHP Supported Environments](#)²⁵⁵⁵.

Version 20.2.0

There was no 20.2.0 release for the PHP Agent.

Python Agent

Version 20.12.0 – December 18, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵⁵⁶ for details.

Version 20.11.411

The Python Serverless Tracer has added an environment variable, APPDYNAMICS_HTTP_TIMEOUT_MS, which allows you to set the timeout in milliseconds for all the HTTP calls made by the tracer. See [Past Resolved and Known Issues by Release](#)²⁵⁵⁷ for details.

Version 20.11.0 - November 25, 2020

The Python Agent has released with minor fixes and optimizations. See [Past Resolved and Known Issues by Release](#)²⁵⁵⁸.

²⁵⁵¹ <https://docs.appdynamics.com/display/PRO20X/Filter+Data>

²⁵⁵² <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

²⁵⁵⁸ <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

Version 20.10.0 - October 21, 2020

- This release supports Node Reuse feature.
- This release supports Tornado 6 for Python Agent 3.7 and later versions.

For bug fixes, see [Past Resolved and Known Issues by Release](#)²⁵⁵⁹.

Version 20.9.0

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁵⁶⁰ for details.

Version 20.8.0

There was no 20.8 release for the Python Agent.

Version 20.8.0

There was no 20.8 release for the Python Agent.

Version 20.7.0.2292 – July 7, 2020

Python Agent artifacts can now be downloaded from the AppDynamics Downloads Portal. For more information, see [Install the Python Agent](#)²⁵⁶¹.

Deprecation Notice

Support for Mac OS X has been removed for Python Agent.

Version 20.6.0

There was no 20.6.0 release for the Python Agent.

Version 20.5.0

There was no 20.5.0 release for the Python Agent.

Version 20.4.0

There was no 20.4.0 release for the Python Agent.

Version 20.3.0

There was no 20.3.0 release for the Python Agent.

Version 20.2.0

There was no 20.2.0 release for the Python Agent.

Python Serverless Tracer

Version 20.12.0

There was no 20.12.0 release.

²⁵⁵⁹ <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

²⁵⁶⁰ <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

²⁵⁶¹ <https://docs.appdynamics.com/display/PRO20X/Install+the+Python+Agent>

Version 20.11.411

The Python Serverless Tracer has added an environment variable, `APPDYNAMICS_HTTP_TIMEOUT_MS`, which allows you to set the timeout in milliseconds for all the HTTP calls made by the tracer. See [Past Resolved and Known Issues by Release](#)²⁵⁶² for details.

Version 20.10.0

There was no 20.10.0 release for the Python Serverless Tracer.

Version 20.9.0

There was no 20.9.0 release for the Python Serverless Tracer.

Version 20.8.0

There was no 20.8.0 release for the Python Serverless Tracer.

Version 20.7.383 - July 29, 2020

The Python Serverless Tracer is now generally available to monitor AWS Lambda functions written in Python. The tracer is available on the [PyPi](#)²⁵⁶³ repository. See [Python Serverless Tracer](#)²⁵⁶⁴ to get started.

React Native Agent

Version 20.12.0

There was no 20.12.0 release.

Version 20.11.0 - November 20, 2020

The React Native Agent has released with minor fixes and optimizations.

Version 20.10.0 – October 16, 2020

This release includes minor enhancements and bug fixes. React Native 0.60 is now supported.

Version 20.9.0

There was no 20.9.0 release for the React Native Agent.

Version 20.8.0

There was no 20.8.0 release for the React Native Agent.

Version 20.7.0 – July 8, 2020

React Native Agent 20.7.0 captures `hybridAgentType` and `hybridAgentVersion`.

Version 20.6.0

There was no 20.6.0 release for the React Native Agent.

Version 20.5.0

There was no 20.5.0 release for the React Native Agent.

²⁵⁶² <https://docs.appdynamics.com/display/PRMY21/Past+Resolved+and+Known+Issues+by+Release>

²⁵⁶³ <https://pypi.org/project/appdynamics-lambda-tracer/>

²⁵⁶⁴ <https://docs.appdynamics.com/display/PRO20X/Python+Serverless+Tracer>

Version 20.4.0

There was no 20.4.0 release for the React Native Agent.

Version 20.3.0

There was no 20.3.0 release for the React Native Agent.

Version 20.2.0

There was no 20.2.0 release for the React Native Agent.

SAP**Version 20.12.0**

There was no 20.12.0 release.

Version 20.11.0 - November 23, 2020

SAP Agent has released. See [Release Notes Version 20.11.0](#)²⁵⁶⁵.

Version 20.10.0

There was no 20.10.0 release for SAP.

Version 20.9.0

There was no 20.9.0 release for SAP.

Version 20.8.0

SAP 20.8.0 is released. See [Release Notes Version 20.8.0](#)²⁵⁶⁶.

Version 20.7.0

SAP 20.7.0 is released. See [Release Notes Version 20.7.0](#)²⁵⁶⁷.

Version 20.6.0

There was no 20.6.0 release for SAP.

Version 20.5.0

SAP 20.5.0 is released. See [Release Notes Version 20.5.0](#)²⁵⁶⁸.

Version 20.4.0

There was no 20.4.0 release for SAP

Version 20.3.0

There was no 20.3.0 release for SAP.

²⁵⁶⁵ <https://docs.appdynamics.com/display/SAP/Release+Notes+Version+20.11.0>

²⁵⁶⁶ <https://docs.appdynamics.com/display/SAP/Release+Notes+Version+20.8.0>

²⁵⁶⁷ <https://docs.appdynamics.com/display/SAP/Release+Notes+Version+20.7.0>

²⁵⁶⁸ <https://docs.appdynamics.com/display/SAP/Release+Notes+Version+20.5.0>

Version 20.2.0

There was no 20.2.0 release SAP.

Synthetic Agent (Hosted Agents)

Version 20.6.0 - June 25, 2020

Synthetic monitoring: 'os', 'socket', and 'subprocess' modules will not be allowed for any new job. See [Import Python Packages in Synthetic Scripts](#)²⁵⁶⁹ for details.

Xamarin Agent

Version 20.12.0

There was no 20.12.0 release.

Version 20.11.0 - November 10, 2020

The Xamarin Agent has released with minor fixes and optimizations.

Version 20.10.0

There was no 20.10.0 release for the Xamarin Agent.

Version 20.9.0

There was no 20.9.0 release for the Xamarin Agent.

Version 20.8.0

There was no 20.8.0 release for the Xamarin Agent.

Version 20.7.0

There was no 20.7.0 release for the Xamarin Agent.

Version 20.6.0

There was no release for the Xamarin Agent.

Version 20.5.0

There was no release for the Xamarin Agent.

Version 2020.4.0 – April 6, 2020

You can set the boolean property `EnableAggregateExceptionHandler` to `true` to configure the Xamarin Agent to report aggregate exceptions as crashes. When the property is set to `false`, only unhandled exceptions are reported. The default value is `false`.

Version 2020.3.3 – March 16, 2020

This release includes optimizations and small code changes.

²⁵⁶⁹ <https://docs.appdynamics.com/display/PRO20X/Import+Python+Packages+in+Synthetic+Scripts>

Version 2020.3.2 – March 13, 2020

By default, the Xamarin Agent reports exceptions as crashes. You can now set a configuration to [disable the reporting of crashes as exceptions](#)²⁵⁷⁰.

Version 2020.3.1 – March 10, 2020

This release includes optimizations and small code changes.

Version 2020.2.0

There was no 20.2.0 release for the Xamarin Agent.

Past Controller Releases

The Controller releases occur every six weeks. This page lists the past SaaS and on-premises Controller enhancements since 20.2.

21.10 Release

20.10.0

Agent Installer

This release includes APIs to support upgrades for the Machine Agent and Java Agent on the Linux environment. See [Agent Installer Platform Service API](#)(see page 3287).

Dash Studio

This release includes these enhancements to the Metric Number widget:

- A new **Horizontal Alignment** property. See [Widget Properties](#)²⁵⁷¹.
- The **Reverse Trend Color** and **Compared Value Only** options under the **Compare Time Range** property. See [Time Range Comparison](#)²⁵⁷².

21.9 Release

21.9.4

This release includes bug fixes and optimizations. See [21.9 Controller \(SaaS\) Resolved Issues](#)(see page 3924) for details.

21.9.3

This release includes bug fixes and optimizations. See [21.9 Controller \(SaaS\) Resolved Issues](#)(see page 3924) for details.

21.9.2

This release includes bug fixes and optimizations. See [21.9 Controller \(SaaS\) Resolved Issues](#)(see page 3924) for details.

²⁵⁷⁰<https://docs.appdynamics.com/display/PRMY21/Customize+the+Xamarin+Instrumentation#CustomizetheXamarinInstrumentation-CustomizetheXamarinInstrumentation-disable-reporting-exceptions-as-crashes>

²⁵⁷¹ <https://docs.appdynamics.com/21.10/en/appdynamics-essentials/dashboards-and-reports/dash-studio/dash-studio-widgets#DashStudioWidgets-WidgetProperties.2>

²⁵⁷² <https://docs.appdynamics.com/display/PRO2110/Time+Range+Comparisons>

21.9.1

This release includes an improved URL filter for APIs and fixes some bugs. See the [21.9 Controller \(SaaS\) Resolved Issues](#)(see page 3924) for details.

21.9.0

This release includes bug fixes and optimizations. See [21.9 Controller \(SaaS\) Resolved Issues](#)(see page 3924) for details.

21.8 Release

20.8.4

This release includes bug fixes and optimizations. See the 21.8.4 resolved issues given in in [Past Controller Resolved Issues](#)(see page 3926) for details.

21.8.3

This Controller release includes an improved URL filter for APIs and fixes some bugs. See the 21.8.3 resolved issues given in [Past Controller Resolved Issues](#)(see page 3926) for details.

21.8.2

This Controller release includes improved URL filter for APIs. See PLATSE-224 in the [Past Controller Resolved Issues](#)(see page 3926) for details.

21.8.1

The Controller has upgraded jQuery to 3.5.1 and AngularJS to 1.8.2. See [Past Controller Resolved Issues](#)(see page 3926).

21.8.0

License Management

License error messages have been updated for infrastructure-based licenses. See [License Errors and Troubleshooting](#)(see page 209).

License Entitlements

The Mobile Real User Monitoring Pro (SaaS) retention entitlement has changed for Event Data. See [License Entitlements and Restrictions](#)(see page 190).

Dash Studio

- You can click on the Metric Number widget to access the ThousandEyes dashboard. See [Configure the ThousandEyes Dashboard](#)²⁵⁷³.
- A new **Previous Time Range** option is available with the time range comparison feature. See [Time Range Comparisons](#)²⁵⁷⁴.

Experience Journey Map

You can now filter Experience Journey Map by region and city. See [How to Use Experience Journey Map](#)²⁵⁷⁵.

²⁵⁷³ <https://docs.appdynamics.com/display/PRO218/Configure+the+ThousandEyes+Dashboard>

²⁵⁷⁴ <https://docs.appdynamics.com/display/PRMY21/.Time+Range+Comparisons+v21.8>

²⁵⁷⁵ <https://docs.appdynamics.com/display/PRMY21/.How+to+Use+Experience+Journey+Map+v21.8>

21.7 Release

Controller 21.7.0 Release

Dash Studio

With this release, you can:

- Access tests from every account group instead of just the default account group. See [Configure the ThousandEyes Dashboard](#)(see page 446).
- Click on the Metric Number widget to access the ThousandEyes dashboard. See [Configure the ThousandEyes Dashboard](#)(see page 446).

21.6 Release

Controller 21.6.5 Release

The 21.6.5 released with upgrades to JavaScript libraries and several bug fixes. See [21.6 Controller \(SaaS\) Resolved Issues](#)(see page 3931).

Controller 21.6.4 Release

The 21.6.4 released with a bug fix. See MQS-1273 in [21.6 Controller \(SaaS\) Resolved Issues](#)(see page 3931).

Controller 21.6.3 Release

The 21.6.3 released with bug fixes. See ANALYTICS-13663 and LIC-1257 in [21.6 Controller \(SaaS\) Resolved Issues](#)(see page 3931).

Controller 21.6.2 Release

The 21.6.2 released with a bug fix. See IAM-1926 in [21.6 Controller \(SaaS\) Resolved Issues](#)(see page 3931).

Controller 21.6.1 Release

The 21.6.1 released with bug fixes. See DBMON-8138 and MQS-1267 in [21.6 Controller \(SaaS\) Resolved Issues](#)(see page 3931).

Controller 21.6.0 Release

Licensing

With an infrastructure-based license and Controller \geq 21.6.0, you can use a new API to retrieve license usage information by application and by host. See [License API](#)(see page 3795).

Database Visibility

The user interface of the **Queries Execution Plan** window for Oracle and MSSQL database is updated as part of the explain plan enhancements. See [Database Query Execution Plan Window](#)(see page 2487).

21.5 Release

Controller 21.5.6 Release

The 21.5.6 released with upgraded JavaScript libraries and bug fixes. See the [21.5 Controller \(SaaS\) Resolved Issues](#)(see page 3935) for details.

Controller 21.5.5 Release

The 21.5.5 released with a bug fix. See IAM-1925 in [21.5 Controller \(SaaS\) Resolved Issues](#)(see page 3935).

Controller 21.5.4 Release

The 21.5.4 released with a bug fix. See EUMPLAT-2086 in [21.5 Controller \(SaaS\) Resolved Issues](#)(see page 3935).

Controller 21.5.3

The 21.5.3 released with a bug fix. See MQS-1268 in [21.5 Controller \(SaaS\) Resolved Issues](#)(see page 3935).

Controller 21.5.2

The 21.5.1 released with bug fixes. See DBMON-8137 and DBMON-8139 in [21.5 Controller \(SaaS\) Resolved Issues](#)(see page 3935).

Controller 21.5.1

The 21.5.1 released with a bug fix. See MQS-1261 in [21.5 Controller \(SaaS\) Resolved Issues](#)(see page 3935).

Controller 21.5.0

License Management

For infrastructure-based licenses in Controller 21.5.0:

- The license summary drill-down dashboard allows you to filter usage data by time and view a list of agents connected to a license rule.
- When looking at license usage and license rules, you can view and sort applications with analytics enabled.

Database Visibility

The Controller audit report can fetch the audit log for the Remove literal flag. See [Controller Audit Log](#)²⁵⁷⁶ and [Configure Query Literals Security](#)²⁵⁷⁷.

The user interface is updated. You can:

- Return to **Queries** page from the **Query Details** page. See [Database Query Details Window](#)²⁵⁷⁸.
- Check the number of database nodes for each collector on the **Databases** page. The number of nodes is included in both card and list view. See [View Overall Database and Server Performance](#)²⁵⁷⁹.
- Navigate between different nodes of the cluster on the database **Dashboard**. See [Database Dashboard](#)²⁵⁸⁰.

21.4 Release

Account Management Enhancements

AppDynamics has enhanced user management and security for customers choosing to use AppDynamics to authenticate their users.

²⁵⁷⁶ <https://docs.appdynamics.com/display/PRMY21/.Controller+Audit+Log+v21.5>

²⁵⁷⁷ <https://docs.appdynamics.com/display/PRO21/Configure+Query+Literals+Security>

²⁵⁷⁸ <https://docs.appdynamics.com/display/PRO21/Database+Query+Details+Window>

²⁵⁷⁹ <https://docs.appdynamics.com/display/PRO21/View+Overall+Database+and+Server+Performance>

²⁵⁸⁰ <https://docs.appdynamics.com/display/PRO21/Database+Dashboard>

Enhanced Security

- You can now have a single user identity for all your SaaS Tenants and across your entire SaaS environment.
- You can have a single identity extended to the [Account Management Portal](#)²⁵⁸¹.
- All first user accounts authorize using a validated email.
- Administrators can no longer create or update user passwords. Users now create and update their own passwords using an updated password security policy.

Enhanced User Management

Administrators can now:

- Use a single interface to centrally manage all their users regardless if they have rights on the Tenants themselves.
- Delete users that have an inactive status.
- View Tenants and licenses associated with users.

Experience Journey Map

- (SaaS only) You can create custom views to filter the Experience Journey Map by specified user journeys. See [Create a Custom View](#)²⁵⁸².
- You can filter the Experience Journey Map by custom user data. See [Using the Custom User Data Filter](#)²⁵⁸³.

Database Visibility Enhancement

- You can now monitor the MS SQL cluster instances. See [Configure Microsoft SQL Server Collectors](#)(see page 2428).
- You can now use the Kerberos authentication for the DB2 and Oracle Collector. See [Configure IBM DB2 Collectors](#)(see page 2423) and [Configure Oracle Collectors](#)(see page 2445).

License Management

- When viewing license usage, you can customize the time range on the **License Summary** dashboard.

ThousandEyes Integration with AppDynamics

AppDynamics and ThousandEyes integration delivers a full-stack solution, which enables you to identify network-related performance issues to reduce the impact on critical applications. See [ThousandEyes Integration with AppDynamics](#)²⁵⁸⁴.

21.3 Release

Dash Studio (21.3.1)

Simple Navigations

You can now navigate from one dashboard to the other using **Single Click Action** option. See [Dash Studio Widgets](#)²⁵⁸⁵.

Dash Studio (21.3.0)

You can now set performance baselines in a Time Series widget by adding a **Threshold** value. See [Dash Studio Widgets](#)²⁵⁸⁶.

2581 <https://accounts.appdynamics.com/overview>

258 [https://docs.appdynamics.com/display/](https://docs.appdynamics.com/display/PRMY21/.How+to+Use+Experience+Journey+Map+v21.8#id-.HowtoUseExperienceJourneyMapv21.8-custom-view)

2584 <https://docs.appdynamics.com/display/PRO21/ThousandEyes+Integration+with+AppDynamics>

2585 <https://docs.appdynamics.com/display/PRO21/Dash+Studio+Widgets>

2586 <https://docs.appdynamics.com/display/PRO21/Dash+Studio+Widgets>

Cisco Secure Application

AppDynamics introduces Cisco Secure Application to monitor the security of APM-managed applications. The data from the managed application is scanned for any security issues and displayed in a real-time dashboard. Secure Application is bundled within the Java Agent and is available from the 21.3.0 release onwards with the purchase of an additional SKU.

21.2 Release

Agent Installer

- Machine Agent is supported in non-sudo installations.
- Agent Installer supports the Infrastructure Agent.
- A new watchdog process is included with the Agent Installer Platform installation to monitor and ensure that agents are running properly.
- When installing the Agent Installer Platform with systemd, a profile is created for the watchdog process instead of for individual agents.
- bash profiles for non-sudo installations are no longer created.

Analytics

- You can add alternative milestone events of the same event type.
- You can configure agent-side metrics in the Metric Browser. For more information, see [Troubleshoot Analytics Issues](#)²⁵⁸⁷.

Cloud Native Visualization

- Cloud Native Visualization introduces options to monitor the health and performance of entities. You can create and configure health rules to monitor the health of the entities. You can use anomaly detection to automatically detect anomalies with entities. This helps initiate remediation actions quickly. See [2021-09-03_03-42-28_Configure Entity Health](#)(see page 4073)
- You can now monitor the metrics of AWS instances with both basic (5 minute granularity) and detailed (1 minute granularity) monitoring. See [2021-09-03_03-41-33_Cloud Native Visualization Metrics Overview](#)(see page 4073)

Database Monitoring

- The top query statistics report for Oracle database now displays only the following statistic type data:
 - Buffer Gets
 - Cpu Time
 - Disk Reads
 - Elapsed Time
 - Executions
 - Parse Calls
 - Rows ProcessedSee [Database Activity Window](#)(see page 2476)
- You can use the **SRV Record** option for MongoDB. See [Configure MongoDB Collectors](#)(see page 2440)
- Additional Couchbase metrics are added for the database monitoring. See [Couchbase Metrics](#) at [Database Monitoring Metrics](#)(see page 2507)

End User Monitoring

Experience Journey Map

- You can customize how you [analyze user journeys](#)²⁵⁸⁸
- You can [customize naming of mobile views/activities](#)²⁵⁸⁹ with the SessionFrame API.
- You can [filter by Internet Service Provider \(ISP\)](#)²⁵⁹⁰ for browser apps.

2587 <https://docs.appdynamics.com/display/PRO21/Troubleshoot+Analytics+Issues>

2588 <https://docs.appdynamics.com/display/PRO21/Analyze+Traffic+Segments+in+Experience+Journey+Map>

2589 <https://docs.appdynamics.com/display/PRO21/Configure+Experience+Journey+Map>

2590 <https://docs.appdynamics.com/display/PRO21/Filter+User+Journeys>

License Management

Controller 21.2.0 includes a new UI for managing infrastructure-based licenses.

Dash Studio (21.2.0)

Gauge Widget

You can now present metric data on a relative scale using the Gauge widget. See [Dash Studio Widgets](#)²⁵⁹¹.

Time Range Comparison

This feature is now available for Metric Number widget. See [Time Range Comparisons](#)²⁵⁹².

21.1 Release

Dash Studio (21.1.0)

Grouped Widgets

You can now group two or more widgets on a single card or on their respective cards. See [Dash Studio Widgets](#)²⁵⁹³.

Label Widget

You can now apply these properties to modify the appearance of the Label widget:

- Font Color
- Font Size
- Horizontal Alignment
- Vertical Alignment

See [Dash Studio Widgets](#)²⁵⁹⁴.

20.12 Release

Dash Studio (uic-20.12.1)

Auto Refresh Interval

You can now enable the **Auto Refresh Interval** option to automatically refresh the dashboard at regular intervals. For more information, see [Visual Dashboard Editor](#)²⁵⁹⁵.

Group Time Range

You can now set the time range for a set of grouped widgets. For more information, see [Dash Studio Widgets](#)²⁵⁹⁶.

Cloud Native Visualization (uic-20.12.0)

You can now monitor the health status of entities in Cloud Native Visualization. Entities in the Relationships map, Interactions map, and the List view are grouped into healthy and unhealthy categories based on their health status. To initiate remediation actions quickly, you can click the unhealthy

²⁵⁹¹ <https://docs.appdynamics.com/display/PRO21/Dash+Studio+Widgets>

²⁵⁹² <https://docs.appdynamics.com/display/PRO21/Time+Range+Comparisons>

²⁵⁹³ <https://docs.appdynamics.com/display/PRO21/Dash+Studio+Widgets>

²⁵⁹⁴ <https://docs.appdynamics.com/display/PRO21/Dash+Studio+Widgets>

²⁵⁹⁵ <https://docs.appdynamics.com/display/PRO20X/Visual+Dashboard+Editor>

²⁵⁹⁶ <https://docs.appdynamics.com/display/PRO20X/Dash+Studio+Widgets>

entity to drill down and determine the affected business transactions, services, and service instances to resolve any critical issues. For more information, see [Monitor the Health of Entities](#)(see page 4073).

20.11 Release

Agent Installer

Monitoring Settings

- The content of the [Monitoring Settings](#)²⁵⁹⁷ page has been reorganized into three tabs: **Managed Processes**, **Unmanaged Processes**, and **Uninstrumented Processes**.
- The ability to paginate has been added to the [Monitoring Settings](#)²⁵⁹⁸ page eliminating the previous 1000 record limitation.

End User Monitoring

Mobile Real User Monitoring

You can filter performance data, such as network requests, crashes and code issues, based on device specifications, such as CPU type, memory, disk space, and battery. See [Mobile RUM Metrics](#)²⁵⁹⁹ for details.

Dash Studio

Mobile Applications Metrics

Mobile Applications metrics in the **Data** panel of the Dash Studio allows you to filter and create customized metrics to view the performance of mobile applications. See [Data Binding](#)²⁶⁰⁰.

Browser Applications Metrics

Browser Applications metrics in the **Data** panel of the Dash Studio allows you to filter and create customized metrics to view the performance of the web applications. See [Data Binding](#)²⁶⁰¹.

Simple Navigations

Simple navigation actions in Dash Studio allow you to drill down into complex and detailed information about a selected entity. See [Dash Studio Widgets](#)²⁶⁰².

Database Visibility

You can now integrate Database Visibility with Server Visibility. See [Integrate Database Visibility with Server Visibility](#)²⁶⁰³.

There are new Oracle Server metrics available with this Controller release. See [Database Monitoring Metrics](#)²⁶⁰⁴.

Service Endpoints

The [Service Endpoints](#)²⁶⁰⁵ page includes these enhancements:

2597 <https://docs.appdynamics.com/display/PRO20X/Monitoring+Settings>

2598 <https://docs.appdynamics.com/display/PRO20X/Monitoring+Settings>

2599 <https://docs.appdynamics.com/display/PRO20X/Mobile+RUM+Metrics>

2600 <https://docs.appdynamics.com/display/PRO20X/Data+Binding>

2601 <https://docs.appdynamics.com/display/PRO20X/Data+Binding>

2602 <https://docs.appdynamics.com/display/PRO20X/Dash+Studio+Widgets>

2603 <https://docs.appdynamics.com/display/PRO20X/Integrate+Database+Visibility+with+Server+Visibility>

2604 <https://docs.appdynamics.com/display/PRO20X/Database+Monitoring+Metrics>

2605 <https://docs.appdynamics.com/display/PRO20X/Service+Endpoints>

- A new grid display is available that includes a total count of entries at the bottom right of the grid. This information was previously located below the Search text box.
- The top toolbar on the page includes buttons for: **Details**,  (Delete), **Exclude**, **View Excluded**, **Configure**, and **Filter** (replacing the previous Actions sub-menu that included these buttons).
- When you select the Filter icon, the **Filter** menu panel is overlaid on top of the grid on the left side of the page and includes additional filter options.

20.10 Release

Agent Installer

Improvements to the **Agent Installer** page have been implemented to improve the customer experience:

- Overall installation process has been streamlined to reduce manual input
- Two installation options are available:
 - **Express** - for new installations
 - **Custom** - provides options you can customize

APM Platform

The Automated Transaction Diagnostics (ATD) capability is now available for SaaS. This feature exposes periods of anomalous behavior in your business transactions and pinpoints the causal factor to facilitate a more efficient root cause analysis process.

Using the already collected transaction snapshots, the diagnostic process:

- Analyzes business transaction response time data to determine if there was an issue and the time period impacted.
- Analyzes metrics data across the business transaction path to identify the suspected cause and type of issue.
- Provides a guided root cause analysis that diagnoses the business transaction anomaly allowing you to manage the issue before it becomes visible to customers.

Cloud Native Visualization

AppDynamics new Cloud Native Visualization services are generally available today. Cloud Native Visualization provides new streamlined views of your application landscape enabling you to make informed decisions. By correlating application metrics and interactions to cloud infrastructure, Cloud Native Visualization enables you to explore deployments, and examine the cloud infrastructure impact on application performance.

 As part of the launch program, early adopters have access to the Cloud Native Visualization functionality for six months free of charge. After six months, a purchase of new licenses is required to continue using the functionality. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the end of the six month period.

Cloud Native Visualization is available for versions:

- SaaS Controller $\geq 20.10.0$
- Java Agent $\geq 20.9.0$
- .NET Agent $\geq 20.10.0$
- Node.js Agent $\geq 20.10.0$

Note: Java Agent, .NET Agent, and Node.js Agent are required for Amazon EC2 to APM node correlation.

Cloud Native Visualization requires:

- Applications to be deployed in Amazon Web Services (AWS).

- Configuration changes in the AppDynamics SaaS platform to be performed by AppDynamics.

i Controller configuration is being rolled out gradually to SaaS customers beginning on October 28, 2020.

Cloud Native Visualization Benefits:

- Correlates APM data fully with cloud platform data to help you make informed decisions.
- Ingests cloud platform metrics and metadata automatically using the AIOps platform, thereby introducing new holistic views of your cloud application landscape.
- Displays application services (formerly known as tiers), and related infrastructure entities such as load balancers, databases, and business transactions, in a single unified view.

Cloud Native Visualization provides full-stack correlation with these AWS services:

- Amazon Elastic Compute Cloud (EC2)
- Amazon Elastic Block Store (EBS)
- Amazon Relational Database Service (RDS)
- Amazon Aurora
- Amazon Elastic Load Balancers (ELB) including NLBs, ALBs and CLB
- Virtual Private Cloud (VPC) metadata

End User Monitoring

- Experience Journey Map can be filtered in the Controller UI by fields such as device, OS, and location.
- Automatic business transaction correlation for .Net Agent 20.6.0 and higher is enabled by default. You can also manually enable and disable business transaction correlation with older APM agents or applications with frameworks other than .Net and Java. See [Correlate Business Transactions for EUM Monitoring](#)²⁶⁰⁶ for more information.

Browser Real User Monitoring

- When configuring the JavaScript Agent in the Controller, you can set a custom page title to an arbitrary string. See [Configure the JavaScript Agent](#)²⁶⁰⁷.

Mobile Real User Monitoring

- You can filter performance data, such as network requests, crashes and code issues, based on device specifications, such as CPU type, memory, disk space, and battery. See [Mobile RUM Metrics](#)²⁶⁰⁸ for details.

20.9 Release

There was no 20.9.0 Controller release.

20.8 Release

Alert and Respond

Action Suppression

You can now suppress a policy's automatic invocation of actions and alerts on a recurring basis. For example, if you have scheduled maintenance every month and would not like to be notified of any event violations or trigger any actions for these events during the maintenance period, you can schedule to

²⁶⁰⁶ <https://docs.appdynamics.com/display/PRO20X/Correlate+Business+Transactions+for+EUM+Monitoring>

²⁶⁰⁷ <https://docs.appdynamics.com/display/PRO20X/Configure+the+JavaScript+Agent>

²⁶⁰⁸ <https://docs.appdynamics.com/display/PRO20X/Mobile+RUM+Metrics>

suppress the alerts and actions. For more information, see [Configure and Manage Action Suppressions](#)²⁶⁰⁹. For corresponding API updates, see [Action Suppression API](#)²⁶¹⁰.

HTTP/HTTPS Proxy for On-premise Controller

You can now configure an HTTP/HTTPS proxy for an on-premise Controller. When you configure a proxy, the HTTP request actions or JIRA actions are routed through the HTTP proxy if the endpoint is an HTTP endpoint or HTTPS proxy if the endpoint is an HTTPS endpoint. You can configure the HTTP/HTTPS proxy settings in the `domain.xml` global configuration file. For more information, see [Configure HTTP/HTTPS Proxy](#)²⁶¹¹.

i You can configure an HTTP/HTTPS proxy for an on-premise Controller only.

Database Monitoring

- You can now view the Database Agent telemetry on the **Metric Browser** window. See [Database Agent Telemetry](#)²⁶¹² for details.
- For Oracle database, you can view the procedure for queries and view the container where the query is running. Also, you can view the CPU and Memory metrics without enabling hardware monitoring. For more information about containers and procedures, see [Database Containers Window](#)²⁶¹³ and [Database Procedures Window](#)²⁶¹⁴ respectively. To view these you must be using Database Agent 20.6 or later.
- You can view the Database Agent related logs for debugging and resolving issues. For more information about the agent logs, see [View Database Agent Properties and Logs](#)²⁶¹⁵.

Cluster Monitoring

You can now use filters to view the required event details from the list of cluster events. See [Monitor Kubernetes Events](#)²⁶¹⁶.

End User Monitoring

- You can customize Experience Journey Map by toggling performance markers on or off, and by setting values for performance thresholds and drop-off rates. See [Configure Experience Journey Map](#)²⁶¹⁷ for details.
- You can filter mobile crashes based on the following agent version fields: agent version, hybrid agent version, and hybrid agent type.
- All Synthetic Agent IBM SoftLayer locations have been migrated to Azure and AWS. Agents in Dallas, Texas, Houston, TX, and Querétaro, Mexico are no longer available and have been replaced with San Antonio, TX with Azure. See [Synthetic Agent Locations](#)²⁶¹⁸ for details.
- Browser Synthetic Monitoring has transitioned all hosted Synthetic Agent IBM locations to Azure and AWS. See [Synthetic Agent Locations](#)²⁶¹⁹ for an up-to-date list of agent locations and providers.

Transaction Detection for Node.js Applications

GraphQL Business Transactions, a feature that enables transaction detection on the Node.js Agent, is now available. You can define a custom match rule that separates a business transaction into several GraphQL queries with GraphQL Business Transactions. See [Node.js Business Transaction Detection](#)²⁶²⁰.

20.7 Release

Alert and Respond

Alerting Template

You can now export a configured alerting template and save it for later use. You can import a saved template and apply it to applications. For more information, see [Configure and Manage Alerting Templates](#)²⁶²¹.

Alert Sensitivity Tuning

You can now define a metric expression to evaluate a health rule condition and use Alert Sensitivity Tuning to fine-tune the configuration. For more information, see [Create a Health Rule and Fine-tune Metric Evaluation](#)²⁶²².

Application Analytics

The End User Monitoring (EUM) filter has been added to the Analytics Home page with options to display browser and mobile sessions. See [Overview of Application Analytics](#)²⁶²³.

End User Monitoring

- [Experience Journey Map](#)²⁶²⁴ is supported for on-prem Controller 20.7.0 and later and requires a EUM PEAK license.
- You can now custom configure the JavaScript Agent in the Controller UI. This UI-based configuration is only available for SaaS Controller 20.7.0 and later. See [Configure the JavaScript Agent](#)²⁶²⁵.

20.6 Release

Agent Installer

The Agent Installer requires microservices configuration performed by AppDynamics. The configurations will be rolled out gradually to SaaS Controllers beginning on June 8, 2020.

The Agent Installer is now available. The Agent Installer simplifies the installation process for the Java and Machine Agents. The installer provides two lines of script that:

- deploy the Java and (optionally) Machine Agents,
- automatically instrument applications, and
- assign unique names to tiers and nodes

The Agent Installer is available for SaaS deployments and Linux operating systems. See [Agent Installer](#)²⁶²⁶ documentation for more information.

²⁶²⁶ <https://docs.appdynamics.com/display/PRO20X/Agent+Installer>

Analytics Events Service (SaaS only)

The `eventCompletionTimestamp` field has been introduced for ADQL queries. `eventCompletionTimestamp` indicates the time that the event was received by the Events Services. See [Analytics Events API](#)²⁶²⁷ for details.

The metric processor will be rolled out gradually to SaaS Controllers. Contact [AppDynamics Support](#)²⁶²⁸ for more information.

Application Analytics

[Recommended Data Collectors](#)²⁶²⁹, a feature that simplifies data collector configuration, is now available for SaaS deployments. Instead of manually configuring data collectors, you can browse and search for event data displayed in the Controller that Recommended Data Collectors automatically collects from the Java Agent.

Cluster Monitoring

The **Cluster Event** summary dialog is enhanced with the following additional details:

- The **Affects** and the **Cluster Agent Version** fields are added to provide information about the affected entity and the version of the Cluster Agent respectively.
- The **Cluster Name** field displays the name of the cluster along with an option to drill down. Therefore, you can launch the Cluster Agent dashboard by clicking the name.

End User Monitoring

[Experience Journey Map](#)²⁶³⁰ visualizes real-time user journeys, providing performance metrics and traffic data for browser and mobile applications. This feature is only available for customers with a SaaS Controller and EUM PEAK license.

Service Proxy

A new [service proxy feature](#)²⁶³¹ (represented by this icon ) has been added to enable the system to discover the backend (remote service) as a service proxy, and display the correct component structure in a flow map. The service proxy feature is enabled in the Controller. Once the Controller has identified the backend as a service proxy, it sends the configuration information to an Agent (Java Agent version 20.5.0 and later, is the only Agent supported with this release).

20.5 Release

The Controller release occurs every six weeks. There was no Controller release for 20.5. For bug fixes, see [Past Resolved and Unknown Issues by Release](#)²⁶³².

20.4 Release

Alert and Respond

Alerting Template

AppDynamics 20.4 introduces 'Alerting Template' that allows you to efficiently maintain and manage alerting configuration at scale. An Alerting Template is a configuration of features like Health Rules, Policies, Actions, Action Suppression, Schedules, and Email digests. Templates eliminate the need to configure or update individual applications. You can easily update a template and ensure that updates are consistently applied across multiple applications. For more information, see:

- [Alert and Respond](#)²⁶³³
- [Alerting Templates](#)²⁶³⁴
- [Configure Alerting Templates](#)²⁶³⁵
- [Alerting Template Questions and Answers](#)²⁶³⁶

Action Suppression and Email Digest APIs

AppDynamics introduces REST APIs to perform CRUD operations for action suppression and policy email digest. For more details, see:

- [Action Suppression API](#)²⁶³⁷
- [Email Digest API](#)²⁶³⁸

Alert Sensitivity Tuning

AppDynamics introduces 'Alert Sensitivity Tuning (AST)' that helps you visualize the impact of the alerting configuration you define. AST provides historical data for the metric or the baseline being configured. Instant insights are provided in a graphical format when you configure the alerts. Based on this data, you can set up alerts with the appropriate sensitivity and avoid false alerts. For more information, see:

- [Alert Sensitivity Tuning](#)²⁶³⁹
- [Create a Health Rule and Fine-tune Metric Evaluation](#)²⁶⁴⁰
- [AST Questions and Answers](#)²⁶⁴¹

Database Monitoring

- The controller provides the following visual context for the backend database on the flow map:
 - The database icon with green mark shows that the status of the database is healthy. If there are any health rule violations, the icon changes accordingly.
 - If there are any disconnected backend database servers, a message is displayed to connect to the appropriate server or cluster in Database Visibility.
- The Metric browser now displays the buffer and the cache memory metrics for a Linux collector.
- The controller now supports monitoring Apache Cassandra.

2640 <https://docs.appdynamics.com/display/PRO20X/Create+a+Health+Rule+and+Fine-tune+Metric+Evaluation>

2641 <https://docs.appdynamics.com/display/PRO20X/Alert+Sensitivity+Tuning+Questions+and+Answers>

End User Monitoring

- Business transaction correlation is enabled by default for business applications instrumented with the Java Agent 4.5.0 or higher.
- Admin-level users can configure read-only user permissions for the Synthetic Credential Vault.
- Python 3 is supported in Synthetic Scripts to create Synthetic Jobs.
- AppDynamics offers a unified Real User Monitoring license that can be allocated to both Browser and Mobile Real User Monitoring usage.

Known Issues

- License service makes individual accounts' usage and term calls to the Events Service.

SAML Authentication

The AppDynamics Controller now supports HTTP GET as well as POST for the authentication request to the identity provider for the sign-out message to the identity provider.

20.3 Release

Alert and Respond

AppDynamics introduces REST APIs to perform CRUD operations for various actions that are triggered as a response to events. For more details, see [Actions API](#)²⁶⁴².

Anomaly Detection

AppDynamics root cause analysis (RCA) algorithms have been refined considerably to determine and isolate faulty components while reducing false positives. This new algorithm greatly improves the time taken to fetch metrics and hence RCA response for any anomaly event. For more information, see [Troubleshooting Anomalies](#)²⁶⁴³.

My Preferences

Time Zone

The time zone controller setting helps adjust the time zone enabling you to collaborate and troubleshoot issues with more accuracy. This setting also eliminates issues such as translating timestamp of your location to another user's time zone. See [Time Zone Controller](#)²⁶⁴⁴, for more details. In the 20.3.0 release, enable the `ui.platform.timezone.enabled` flag for the time zone capability to work. The flag will be enabled by default for the upcoming releases.

20.2 Release

The Controller release occurs every six weeks. There is no Controller release for 20.2. For bug fixes, see [Past Resolved and Unknown Issues by Release](#)²⁶⁴⁵.

Past On-premises Platform Releases

This page lists all the past on-premises releases since the 20.2 release.

21.5 Release

Synthetic Private Agent (K8S Container Based Agent)

Version 21.5.0 - May 25, 2021

New Private Synthetic Agent (K8S Container Based Agent) is available now. See [Private Synthetic Agent](#).²⁶⁴⁶

21.4 Release

Enterprise Console

Version 21.4.9 – November 17, 2021

This release includes bug fixes related to licensing. See [Controller 21.4 Resolved and Known Issues](#)(see page 3938) for details.

Version 21.4.8 – October 21, 2021

This release includes a bug fix. See PLATSE-272 in the [Controller 21.4 Resolved and Known Issues](#)(see page 3938) for details.

Version 21.4.7 – October 14, 2021

This release includes fixes for mobile application notifications and upgrades to Node.js for the Reports Service and the libraries AngularJS and JQuery. See [Controller 21.4 Resolved and Known Issues](#)(see page 3938) for details.

Version 21.4.6 – September 3, 2021

This release includes an upgrade to the Reports Service and a bug fix regarding LDAP users. See [Controller 21.4 Resolved and Known Issues](#)(see page 3938) for details.

Version 21.4.5 – August 26, 2021

The version of Node.js has been upgraded to the latest Long-Term Support (LTS) version 14.17.4. See ECONSOLE-6587 in the [21.4 On-Premises Platform Resolved Issues](#)(see page 3941).

Version 21.4.4 – July 16, 2021

The following enhancements have been added to the Enterprise Console:

- MySQL version 5.7.34 is now supported.
- Java Runtime Environment (JRE) version 8.54.0.22 is now supported.
- Java Development Kit (JDK) version 8.0.292 is now supported.
- Users can change the Glassfish Admin Password in the Update Controller Configuration job.
- The regex for sanitizing InnoDB log files from the Secondary during replication is updated.

For the bug fixes included in the release, see [Resolved and Known Issues](#)(see page 0) for details.

Version 21.4.3 – April 29, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)(see page 3920) for details.

²⁶⁴⁶ <https://docs.appdynamics.com/21.5/en/end-user-monitoring/browser-monitoring/browser-synthetic-monitoring/private-synthetic-agent-linux-based-agent-in-kubernetes-container>

Version 21.4.2 – April 22, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)(see page 3920) for details.

Version 21.4.0 – April 5, 2021

The following enhancements have been added to the Enterprise Console:

- MySQL version 5.7.33 is now supported.
- Java Runtime Environment (JRE) version 8.0.28 is now supported.

EUM Server

Version 21.4.2 – October 15, 2021

This release fixes an issue with the Infrastructure-based Licensing (IBL) license file. See [Past Resolved and Known Issues by Release](#)(see page 3920) for details.

Version 21.4.0 – April 5, 2021

In this release, the MySQL version was upgraded to 5.7.33.

Events Service

There was no 21.4.0 release of the Events Service.

Geo Server

Version 21.4.2 – October 15, 2021

There were no updates made for this release.

Version 21.4.0 – April 8, 2021

There were no updates made for this release.

Synthetic Private Agent

There was no 21.4.0 release of the Synthetic Private Agent.

Synthetic Server

Version 21.4.2 – September 27, 2021

Support to execute IE 11 and Firefox jobs in Linux-based PSA.

 The IE 11 and Firefox jobs will be executed in the Chrome (headless) browser with IE 11 and Firefox user agents.

Version 21.4.1 – July 27, 2021

This release supports Linux-based Private Synthetic Agent with on-premises Controller. See [Private Synthetic Agent](#)²⁶⁴⁷.

²⁶⁴⁷ <https://docs.appdynamics.com/21.7/en/end-user-monitoring/browser-monitoring/browser-synthetic-monitoring/private-synthetic-agent-linux-based-agent-in-kubernetes-container>

Version 21.4.0

There was no 21.4.0 release of the Synthetic Server.

21.3 Release

There was no on-premises platform release for 20.3.

21.2 Release

Enterprise Console

Version 21.2.8 – August 31, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)(see page 3920) for details.

Version 21.2.7 – May 3, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)(see page 3920) for details.

Version 21.2.6 – April 23, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)(see page 3920) for details.

Version 21.2.3 – March 15, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)(see page 3920) for details.

Version 21.2.2 – March 8, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)(see page 3920) for details.

Version 21.2.1 – February 24, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)(see page 3920) for details.

Version 21.2.0 – February 22, 2021

The following enhancements have been added to the Enterprise Console:

- MySQL version 5.6.50 and 5.7.32 is now supported.
- Libncurses and ncurses version 5 and 6 is now supported.
- Java Runtime Environment (JRE) version 8u172 is now supported.

EUM Server

There was no 21.2.0 release of the EUM Server.

Events Service

There was no 21.2.0 release of the Events Service.

Geo Server

There was no 21.2.0 release of the Geo Server.

Synthetic Private Agent

There was no 21.2.0 release of the Synthetic Private Agent.

Synthetic Server

Version 21.2.0 – February 26, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)(see page 3920) for details.

21.1 Release

Enterprise Console

There was no 21.1.0 release of the Enterprise Console.

EUM Server

There was no 21.1.0 release of the EUM Server.

Events Service

There was no 21.1.0 release of the Events Service.

Geo Server

There was no 21.1.0 release of the Geo Server.

Synthetic Private Agent

There was no 21.1.0 release of the Synthetic Private Agent.

Synthetic Server

There was no 21.1.0 release of the Synthetic Server.

20.12 Release

Enterprise Console

There was no release of the Enterprise Console for 20.12.0.

EUM Server

There was no release of the EUM Server for 20.12.0.

Events Service

There was no release of the Events Service for 20.12.0.

The current version, 4.5.2.20640, is available as a standalone artifact or as a bundle with the Enterprise Console. This version contains hotfixes. See [4.5.x Hotfixes](#)²⁶⁴⁸ for details.

²⁶⁴⁸ <https://docs.appdynamics.com/display/PRO20X/4.5.x+Hotfixes>

Geo Server

There was no release of the Geo Server for 20.12.0.

Synthetic Private Agent

There was no release of the Synthetic Private Agent for 20.12.0.

Synthetic Server

There was no release of the Synthetic Server for 20.12.0.

20.11 Release

Enterprise Console

Version 20.11.10 – August 30, 2021

The version of Node.js has been upgraded to the latest Long-Term Support (LTS) version 14.17.4. See ECONSOLE-6587 in the [Past On-Premises Platform Resolved Issues](#)²⁶⁴⁹.

Version 20.11.9 – February 18, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁶⁵⁰ for details.

Version 20.11.8 – February 4, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁶⁵¹ for details.

Version 20.11.7 – January 29, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁶⁵² for details.

Version 20.11.6 – January 25, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁶⁵³ for details.

Version 20.11.5 – December 18, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁶⁵⁴ for details.

Version 20.11.4 – December 17, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁶⁵⁵ for details.

Geo Server

Version 20.11.0 – November 16, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁶³](#) for details.

Synthetic Private Agent

There is no release of the Synthetic Private Agent for 20.11.0.

Synthetic Server

There is no release of the Synthetic Server for 20.11.0.

20.10 Release

AppDynamics Cluster Manager

There is no release of the AppDynamics Cluster Manager for 20.10.

Enterprise Console

Version 20.10.11 – September 1, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁶⁴](#) for details.

Version 20.10.10 – January 8, 2021

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁶⁵](#) for details.

Version 20.10.9 – December 18, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁶⁶](#) for details.

Version 20.10.8 – December 3, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁶⁷](#) for details.

Version 20.10.7 – November 13, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁶⁸](#) for details.

Version 20.10.6 – November 10, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁶⁹](#) for details.

Version 20.10.5 – November 2, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁷⁰](#) for details.

Version 20.10.4 – October 22, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁷¹](#) for details.

Version 20.10.3 – October 19, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁷²](#) for details.

Version 20.10.2 – October 16, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁷³](#) for details.

Version 20.10.1 – October 13, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁷⁴](#) for details.

Version 20.10.0 – October 6, 2020

The Azul JRE version has been updated to 1.8.0_262 used by the Enterprise Console Installer.

EUM Server

Version 20.10.1-32458 – October 12, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁷⁵](#) for details.

Version 20.10.0 – October 6, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁷⁶](#) for details.

Events Service

There is no release of the Events Service for 20.10.0.

²⁶⁷⁶ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

The current version, 4.5.2.20634, is available as a standalone artifact or as a bundle with the Enterprise Console. This version contains hotfixes. See [4.5.x Hotfixes](#)²⁶⁷⁷ for details.

Geo Server

Version 20.10.0 – October 6, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁶⁷⁸ for details.

Synthetic Private Agent

There is no release of the Synthetic Private Agent for 20.10.0.

Synthetic Server

There is no release of the Synthetic Server for 20.10.

20.9 Release

AppDynamics Cluster Manager

There is no release of the AppDynamics Cluster Manager for 20.9.

EUM Server

There is no release of the EUM Server for 20.9.

Events Service

There is no release of the Events Service for 20.9.

Synthetic Private Agent

Version 20.9.0 – September 30, 2020

You can use the `privateMode:true` flag to remediate the disk filling up issue on private agents. Private Synthetic Agents do not run the `webdriver-server` component if `privateMode:true` is set in the file `C:\appdynamics\synthetic-agent\synthetic-driver\conf\synthetic-driver.yml`. Note that the Internet Explorer (IE) needs the `webdriver-server` component to run, therefore setting the `privateMode` flag to true causes all IE measurements to fail.

Synthetic Server

There was no release for the Synthetic Server for 20.9.0.

20.8 Release

AppDynamics Cluster Manager

There was no release of the AppDynamics Cluster Manager for 20.8.

²⁶⁷⁷ <https://docs.appdynamics.com/display/PRO20X/4.5.x+Hotfixes>

²⁶⁷⁸ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Enterprise Console

Version 20.8.9-23271 – October 28, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁷⁹](#) for details.

Version 20.8.8-23269 – October 21, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁸⁰](#) for details.

Version 20.8.7-23267 – October 7, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁸¹](#) for details.

Version 20.8.6-23263 – October 1, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁸²](#) for details.

Version 20.8.5-23257 – September 23, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁸³](#) for details.

Version 20.8.4-23255 – September 15, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁸⁴](#) for details.

Version 20.8.3-23251 – September 14, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁸⁵](#) for details.

Version 20.8.2-3834 – September 10, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁸⁶](#) for details.

Version 20.8.1-23241 – September 1, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁸⁷](#) for details.

²⁶⁷⁹ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Version 20.8.0-23236 – August 27, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁶⁸⁸ for details.

EUM Server

Version 20.8.0.31802 – August 27, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁶⁸⁹ for details.

Events Service

There is no release of the Events Service for 20.8.

The current version, 4.5.2.20634, is available as a standalone artifact or as a bundle with the Enterprise Console. This version contains hotfixes. See [4.5.x Hotfixes](#)²⁶⁹⁰ for details.

Geo Server

Version 20.8.0-31802 – August 27, 2020

This release includes optimizations and bug fixes.

Synthetic Private Agent

There was no release of the Synthetic Private Agent for 20.8.

Synthetic Server

There was no release of the Synthetic Server for 20.8.

20.7 Release

AppDynamics Cluster Manager

There was no release of the AppDynamics Cluster Manager.

Enterprise Console

Version 20.7.6-22956 – September 29, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁶⁹¹ for details.

Version 20.7.5-22944 – September 14, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁶⁹² for details.

2688 <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

2689 <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

2692 <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Version 20.7.4-22931 – August 13, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁹³](#) for details.

Version 20.7.3-22924 – August 7, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁹⁴](#) for details.

Version 20.7.2-22914 – July 24, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁹⁵](#) for details.

Version 20.7.1-22912 – July 21, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁹⁶](#) for details.

Version 20.7.0-22903 – July 16, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁹⁷](#) for details.

EUM Server

Version 20.7.0-31650 – July 16, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁶⁹⁸](#) for details.

Events Service

There was no release of the Events Service for July 2020.

The current version, 4.5.2.20634, is available as a standalone artifact or as a bundle with the Enterprise Console and contains hotfixes. See [4.5.x Hotfixes²⁶⁹⁹](#) for details.

Geo Server

Version 20.7.0-31650 – July 16, 2020

This release includes small code changes and optimizations.

Synthetic Private Agent

There is no release of the Synthetic Private Agent.

Synthetic Server

Version 20.7.0-31 – June 24, 2020

This release includes small code changes and optimizations. See [Past Resolved and Known Issues by Release²⁷⁰⁰](#) for details.

20.6 Release

AppDynamics Cluster Manager

There was no release of the AppDynamics Cluster Manager for June 2020.

Enterprise Console

Version 20.6.10-22689 – September 16, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁷⁰¹](#) for details.

Version 20.6.9-22674 – August 13, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁷⁰²](#) for details.

Version 20.6.8-22664 – July 24, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁷⁰³](#) for details.

Version 20.6.7-22661 – July 21, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁷⁰⁴](#) for details.

Version 20.6.6-226586 – July 15, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁷⁰⁵](#) for details.

Version 20.6.50-22646 – July 9, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁷⁰⁶](#) for details.

Version 20.6.3-22635 – June 25, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release²⁷⁰⁷](#) for details.

20.5 Release

AppDynamics Cluster Manager

Version 20.5.0 – May 29, 2020

AppDynamics Cluster Manager is an optional service that AppDynamics administrators and end users can install in an on-premises environment. It is an orchestrated set of software components which run on multiple server nodes. AppDynamics Cluster Manager provides on-premises customers improved platform, metrics, and database scalability.

AppDynamics Cluster Manager is compatible with Controller version 20.4.3 and later.

20.4 Release

Enterprise Console

Version 20.4.10-22377 – October 8, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷¹³ for details.

Version 20.4.9-22374 – September 16, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷¹⁴ for details.

Version 20.4.8-22353 – June 12, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷¹⁵ for details.

Version 20.4.7-22350 – June 8, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷¹⁶ for details.

Version 20.4.6-22344 – May 29, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷¹⁷ for details.

Version 20.4.5.22338 – May 26, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷¹⁸ for details.

²⁷¹³ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁷¹⁸ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Version 20.4.4-22335 – May 21, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷¹⁹ for details.

Version 20.4.3-22332 – May 19, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷²⁰ for details.

Version 20.4.2-22301 – May 4, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷²¹ for details.

Version 20.4.1-22292 – April 28, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷²² for details.

Version 20.4.0-22285 – April 21, 2020

Azul JRE 1.8.0_242 is replacing Oracle JRE as a component included in the AppDynamics products for:

- Enterprise Console upgrade
- Controller upgrade
- Events Service upgrade

EUM Server**Version 20.4.2-31620 – June 30, 2020**

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷²³ for details.

Version 20.4.1-31303 – May 13, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷²⁴ for details.

Version 20.4.0-31010 – April 21, 2020

The Oracle Java Runtime Environment (JRE) for the EUM Server has been replaced with Azul's Zulu OpenJDK 8 JRE.

Events Service

There was no release of the Events Service.

²⁷¹⁹ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁷²⁰ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁷²¹ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁷²³ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁷²⁴ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Synthetic Private Agent

Version 20.4.0 – April 21, 2020

- The Oracle Java Runtime Environment (JRE) bundled with the Synthetic Private Agent has been replaced with the OpenJDK 8 JRE.
- Support is now available for Python 3.

Synthetic Server

Version 20.4.0-30998 – April 21, 2020

This release includes optimizations and small code changes.

20.3 Release

Enterprise Console

Version 20.3.13-22001 – September 16, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷²⁵ for details.

Version 20.3.12-21986 – June 29, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷²⁶ for details.

Version 20.3.11-21983 – June 24, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷²⁷ for details.

Version 20.3.10-21980 – June 22, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷²⁸ for details.

Version 20.3.9-21977 – June 10, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷²⁹ for details.

Version 20.3.8-21967 – May 21, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷³⁰ for details.

²⁷²⁵ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁷³⁰ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Version 20.3.7-21963 – May 20, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷³¹ for details.

Version 20.3.6-21932 – April 20, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷³² for details.

Version 20.3.5-21927 – April 13, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷³³ for details.

Version 20.3.4-21917 – April 7, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷³⁴ for details.

Version 20.3.3-21908 – April 2, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷³⁵ for details.

Version 20.3.2-21899 – March 27, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷³⁶ for details.

Version 20.3.1-21882 – March 18, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷³⁷ for details.

Version 20.3.0 – March 9, 2020

The HA Controller Upgrade Wizard is now automatically enabled when you choose to upgrade your Controllers.

EUM Server**Version 20.3.1-31617 – June 30, 2020**

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷³⁸ for details.

²⁷³⁸ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

Version 20.3.0-30600 – March 9, 2020

This release includes optimizations and small code changes.

Events Service

There was no release of the Events Service.

Synthetic Private Agent

Version 20.3.0 – March 17, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷³⁹ for details.

Synthetic Server

Version 20.3.0-30600 – March 9, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#)²⁷⁴⁰ for details.

20.2 Release

Enterprise Console

There was no release of the Enterprise Console.

EUM Server

There was no release of the EUM Server.

Events Service

There was no release of the Events Service.

Synthetic Private Agent

Version 20.2.1560 – February 11, 2020

- Synthetic Private Agent now supports Windows Server 2016.
- Synthetic Private Agent Installer has been upgraded to support regional clouds.

Synthetic Server

There was no release of the Synthetic Server.

Past Mobile App Releases

This page lists the AppDynamics mobile app enhancements for all releases.

21.9 Release

We up-levelled the AppDynamics App 2.0 to make our mobile app a more awesome experience for you. In this release, we fixed some minor bugs and added the following capability:

²⁷³⁹ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

²⁷⁴⁰ <https://docs.appdynamics.com/display/PRO20X/Past+Resolved+and+Known+Issues+by+Release>

- Deep links are getting smarter. You can now click on the web URL of any APM entity detail page and event screen on the mobile device, and it will open the content on the AppDynamics App.

21.8 Release

The AppDynamics 21.8.0 mobile application is released for General Availability. With our reimagined AppDynamics mobile app you can:

- **Customize home screen** to monitor your most important entities and metrics at a glance
- View all events across entities and identify correlations through **centralized event feed**
- See key monitoring data in detail with entity centric page and navigate between related entities with ease
- Quickly identify potential root causes with **Automated Transaction Diagnostics (ATD) support**
- Get alerted immediately for critical events through **push notifications and seamless integration** with messaging tools such as PagerDuty, Slack, SMS

Glossary

Familiarize yourself with a list of common terms you may come across as an AppDynamics user.

Action

An automatic response to an event based on a policy.

Examples include sending alerts, taking diagnostic snapshots, remediation through scripts, or making a REST API call to integrate with other tools. Actions are customizable.

Agent

Code that collects and reports data.

Agents can refer to languages (Java, Node.js, Python, etc), machines (hardware and network data), and databases, etc.

Alert

Email, SMS, or customized external notification interface that notifies you of a problem or event.

Application

A named collection of tiers representing a monitored environment. Also referred to as Business Application.

See also: Tier, Node

Backend

Databases, remote services, and any detected out of process components that are involved in business transaction processing.

Business transaction

An action of your application. Business transactions represent your critical business functions.

Examples include login, browse, and checkout.

Controller

With on-premises deployments, it collects, stores, analyzes, and baselines performance data collected by agents.

Data collector

Enables you to collect supplemental application data for business transaction snapshots and/or analytics.

There are three types of data collectors: Method Invocation (MIDC), HTTP, and SQL.

Entity

Any object that AppDynamics monitors. Entities typically have associated metrics, events, and a health status.

Examples of entities are applications, tiers, nodes, and business transactions.

Event

Unstructured data that represents an action or occurrence detected by the agent.

Examples include JVM restart, deadlock, and error.

Flow map

Graphical view of information flow within a business application.

Health rule

Allows you to select specific metrics as key to the overall health of an application and to define ranges for acceptable performance of those metrics.

You can customize default health rules or create new ones.

Information point

Instruments a method in application code outside the context of any business transaction.

Used for monitoring the performance of the method itself, or for capturing numerical data from the method's input parameters or return value.

Metric

Numerical measurement over a time interval. A data point is a numerical value that an agent measures and reports.

Examples include "calls per minute" and "average response time."

Node

The smallest unit of the AppDynamics modeling environment.

See also: Application, Tier

Policy

Provides a mechanism to automate monitoring, alerting, and problem remediation.

Consists of:

1. A trigger based on events
2. An action in response to the trigger

Service endpoint

Provides basic metrics for one application service, or group of services, provided by a tier.

Tenant

With a SaaS deployment, it collects, stores, analyzes, and baselines performance data collected by agents. Each customer account is a tenant of the AppDynamics platform. An AppDynamics Tenant can host one or more accounts. Each account represents one tenant,

Tier

A named collection of nodes, typically representing a service.

See also: Application, Node

Transaction snapshot

A collection of detailed diagnostic information captured during a single invocation of a business transaction.

Examples include call graphs and timing during a single user login, where login is the business transaction.
