- **Database Objects**: search for specific objects, and browse through database schemas, tables, columns, and indices.

Database Custom Metrics Window

The **Custom Metrics** window displays metrics for the custom queries that you specified for Database Visibility to monitor. See Configure Custom Metrics.

Access the Database Custom Metrics Window

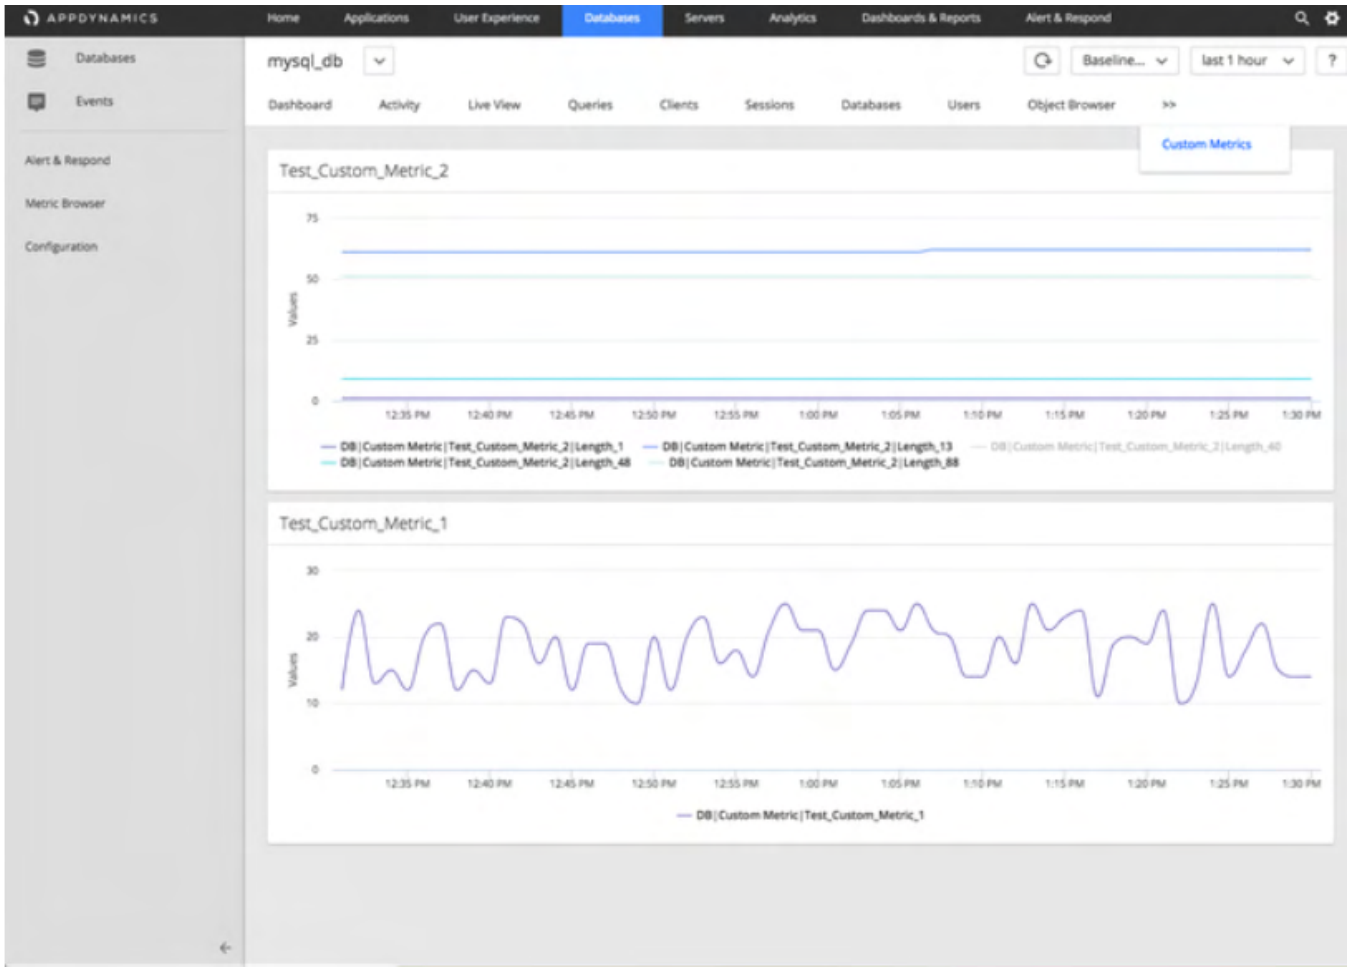
To access the Database **Custom Metrics** window:

1. To view a database's objects, click the name of the database.
2. Click the Custom Metrics tab.

Database Custom Metrics Window Features

From the Database Custom Metrics window, you can:

- View the values for each row of the custom query output. For example, if the query returns four rows, then the graph displays four lines.
- Double-click the graph to view the custom metric in the **Metric Browser**.



Monitor Database Server Hardware

Access the Database Server Hardware Metrics Window

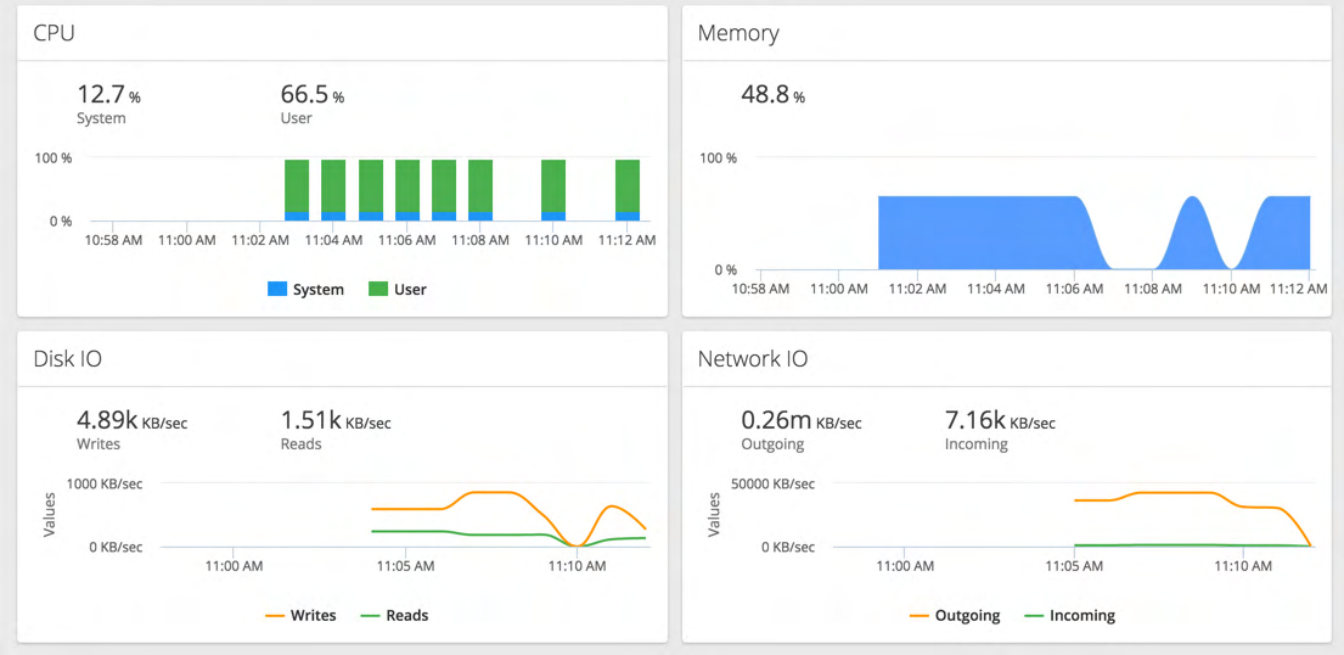
Hardware metrics are reported on:

- Database Dashboard window
- Database Live window
- Metric Browser

Hardware Metrics Graphs Features

On the hardware metrics graphs, you can:

- Click anywhere on the graphs to get details about activity at that point in time.
- Double-click KPI points in the graph to display the Metric Browser showing the selected metric. Metrics are collected by the agent and reported once a minute.



Compare Server and Database Metrics

You can view and compare hardware and database metrics in the Metric Browser. This can help you visualize the effect of server performance on database performance.

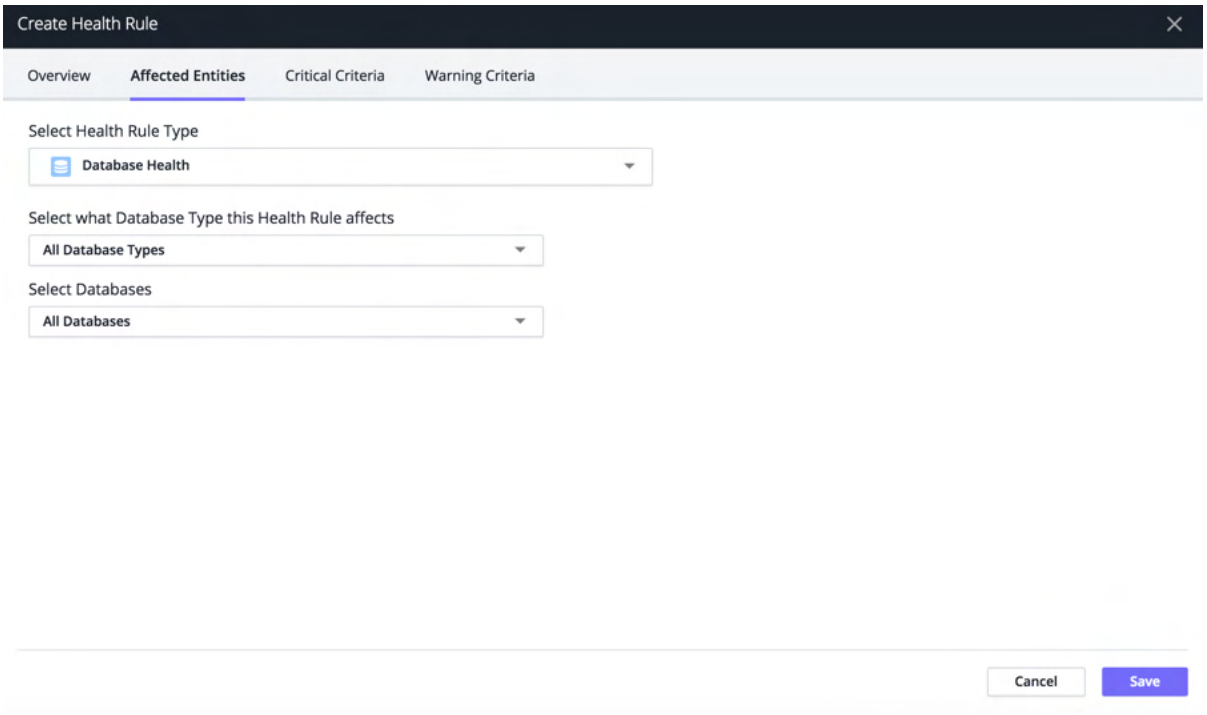
Database Health Rules and Alerts

You can configure AppDynamics Database Visibility to alert you when certain conditions are met or exceeded for monitored databases, operating systems, and server hardware. Use the **Getting Started Wizard** to guide you through the process if you are a new AppDynamics Pro user.

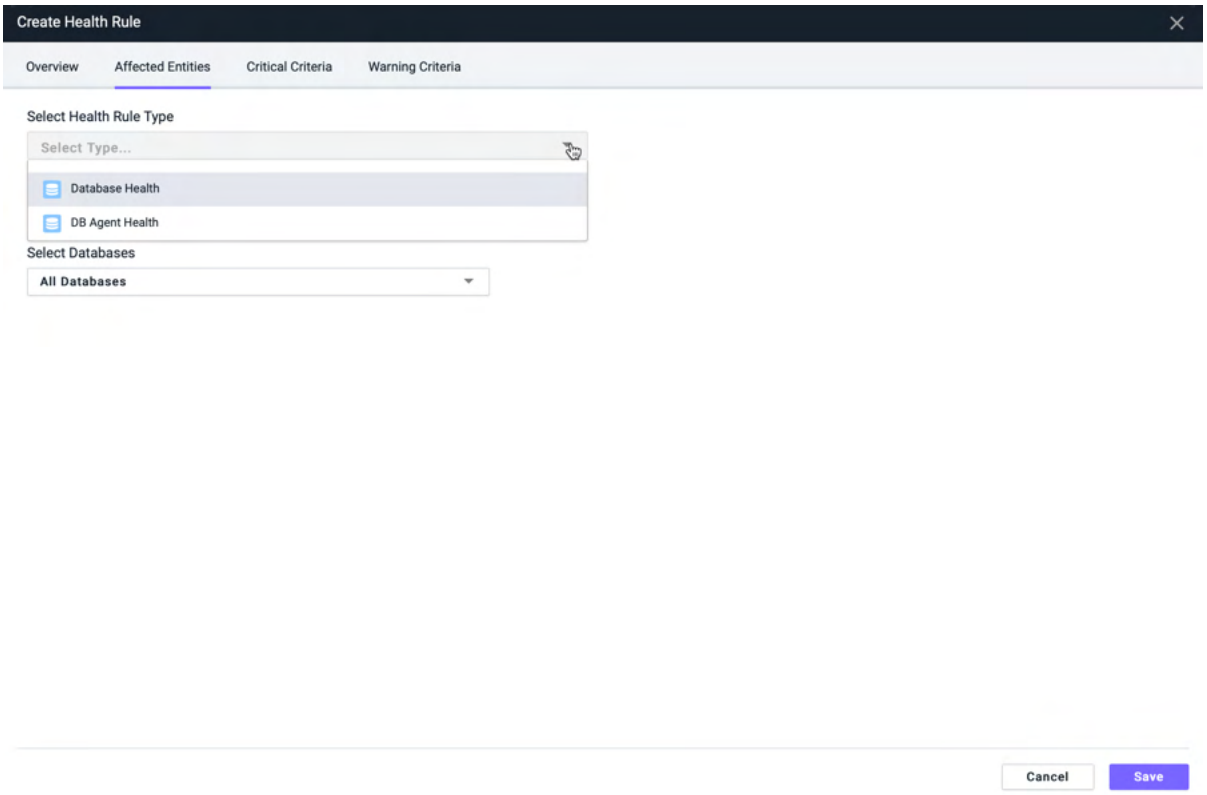
You configure Health Rules, Actions, Policies, and Email Digests for monitoring databases almost exactly as you would configure these for monitored applications.

To view the health rules for your databases, click **Alert & Respond > Health Rules** and select **Databases** from the dropdown at the top. Use the Affected Entities tab of the **Create Health Rule** dialog to specify the **Database Health** rules. See Alert and Respond.

In the Affected Entities tab, you can apply a database health rule to all databases, all databases of a specific database type, or to select instances of a specific database type being monitored. You can select the metrics on which to base the health rule. The health rule is violated when specified critical or warning conditions are met.



Similarly, you can create the health rule for Database Agent (**DB Agent Health)** and the Affected Entities tab of the **Create Health Rule** dialog allows specifying the **DB Agent Health** rule. You can apply a Database Agent (**DB Agent Health**) rule to all the Database Agents or specific Database Agents. You can select the required metrics on which to base the health rule. The health rule is violated when specified critical or warning conditions are met.



Each Health Rule is only evaluated for the subset of databases or database that you currently have permissions for. If your permissions have changed since you created the Health Rule, then your current permissions are applied to the Health Rule evaluation.

Database Policy Actions are limited to email or SMS message notifications, and custom actions that have been uploaded to the Controller.

Once you have defined Health Rules and Actions, you can create a Policy based on a Health Rule to send you an email or an SMS message when a Health Rule is violated.

Database Monitoring Metrics

Related page:

Metric Browser
This document describes metrics collected by the Database Agent. It shows the path to the metric from the main AppDynamics menu down to the relevant branch of the Metric Browser tree. Some of these metrics are displayed in the Database Visibility user interface and so are also documented with the name of the window, column, section, and metric name.

The Metric Browser window name uses the following format:

- Metric Browser - *application_name*: When you access the Metric Browser from Applications.
- Metric Browser - Database Monitoring: When you access the Metric Browser from Infrastructure.

For most types of metrics in the browser, you can click any of the points in the graph to view more information about the metric observed at that point in time. The information shown includes the metric identifier, date and time of the observation, along with any of the following values relevant to the metric:

- **Obs** (observed value): the average of all data points seen for that interval. For a cluster or a time rollup, this represents the weighted average across nodes or over time.
- **Min**: the minimum data point value seen for that interval
- **Max**: the maximum data point value seen for that interval
- **Sum**: the sum of all data point values seen for that interval.
- **Count**: number of observations aggregated in that one point. For example, a count of 5 indicates that there were 5 1-minute data points aggregated into one point.

Key Performance Indicators (KPI)

These metrics are available for all database platforms supported.

Calls per Minute: The number of SQL calls to the database per minute.

DB Availability: The times when the database is available (has an active connection). If the database is not available, nothing is reported.

Number of Connections: The number of connections established with the database at any point during the selected time period. A connection is a session established between a database client and a server. Since the value displayed is the average number of connections over a time range, it is common to see a very low number or 0 for this metric.

Time Spent in Execution (s): The current amount of time the database spent executing SQL statements.

Total Database Size (PostgreSQL only): The amount of disk space (in MB) that the database is using.

Total Lock Time: Total time the database was in lock state in seconds.

Cassandra Metrics

Metrics	Description
Average Read|Write latency (microseconds)	Total Read|Write divided Number of Reads|Writes
Commands Completed(Only For DSE Cassandra)	Total read repair commands completed since startup.
Commands Pending(Only For DSE Cassandra)	A current number of the read repair commands pending.
Compaction Tasks Completed	The number of completed compactions since server start or restart.
Compaction Tasks Pending	The estimated number of compactions remaining to perform.
Disk Load (bytes)	The size (in bytes) of the on-disk data size the node manages.
Dropped Mutations	A dropped Write attempt on a node
Exceptions	The number of internal exceptions caught. Under normal exceptions, this should be zero.
GC Collection Count	The total number of collections that have occurred.
GC Collection Time (ms)	The time (in milliseconds) that Cassandra JVM takes to perform the garbage collection.
Heap Memory Used (bytes)	The heap Memory Used by JVM in bytes.
Key Cache Hit Percentage	The percentage of Key cache(Cache for partition to sstable offsets) hit rate.
Max Partition Size	The size of the largest compacted partition (in bytes).

Memtable Live Data Size (bytes)	The disk space used by SSTables that belongs to this table (in bytes).
Messaging Latency	The latency for inter-node communication.
Non Heap Memory Used (bytes)	The memory used by JVM other than heap memory (in bytes).
Number of Reads|Writes	The number of the `Reads|Write` requests.
Prepared Statements Executed	A number of Prepared Statements executed.
Process CPU Load Percentage	The Percentage of the `recent cpu usage` for the Java Virtual Machine process.
Read Failures	The number of failed `Read` operations
Read Repair Attempted(Only For DSE Cassandra)	The read repairs attempted since startup.
Read Repaired Background(Only For DSE Cassandra)	A number of the read repairs performed asynchronously since startup.
Read Repaired Blocking(Only For DSE Cassandra)	A number of the read repairs performed synchronously since startup.
Read Timeout Exceptions	The number of timeouts encountered for the read request.
Read Unavailability Exceptions	The number of unavailable exceptions encountered for the read request.
Read|Write Throughput	Derived from Number of Reads|Writes metrics over 1 minute.
Regular Statements Executed	A number of nonprepared statements executed.
Repair Age Percentage	The percentage of the table data that is repaired on disk.
Responses Completed(Only For DSE Cassandra)	The current read repairs completed count.
Responses Pending(Only For DSE Cassandra)	The current read repair responses pending count.
System CPU Load Percentage	The Percentage of the `recent cpu usage` for the whole system.
ThreadPools|Request|Active Tasks|Authz Stage	The number of tasks being actively worked on by AuthzStage thread pool.
ThreadPools|Request|Active Tasks|Read Repair Stage	The number of tasks being actively worked on by Read Repair Stage thread pool.
ThreadPools|Request|Active Tasks|Request Response Stage	The number of tasks being actively worked on by Request Response Stage thread pool.
ThreadPools|Internal|Active Tasks|Anti Entropy Stage	The number of tasks being actively worked on by Anti Entropy Stage thread pool.
ThreadPools|Internal|Active Tasks|Background IO Stage	The number of tasks being actively worked on by Background IO Stage thread pool.
ThreadPools|Internal|Active Tasks|Gossip Stage	The number of tasks being actively worked on by Gossip Stage thread pool.
ThreadPools|Internal|Active Tasks|Internal Response Stage	The number of tasks being actively worked on by Internal Response Stage thread pool.
ThreadPools|Internal|Active Tasks|Migration Stage	The number of tasks being actively worked on by Migration Stage thread pool.
ThreadPools|Internal|Active Tasks|Misc Stage	The number of tasks being actively worked on by Misc Stage thread pool.
ThreadPools|Request|Pending Tasks|Authz Stage	The number of queued tasks queued up by AuthzStage thread pool.
ThreadPools|Request|Pending Tasks|Read Repair Stage	The number of queued tasks queued up by the Read Repair Stage thread pool.
ThreadPools|Request|Pending Tasks|Request Response Stage	The number of queued tasks queued up by Request Response Stage thread pool.
ThreadPools|Internal|Pending Tasks|Anti Entropy Stage	The number of queued tasks queued up by Anti Entropy Stage thread pool.
ThreadPools|Internal|Pending Tasks|Background IO Stage	The number of queued tasks queued up by Background IO Stage thread pool.
ThreadPools|Internal|Pending Tasks|Gossip Stage	The number of queued tasks queued up by Gossip Stage thread pool.
ThreadPools|Internal|Pending Tasks|Internal Response Stage	The number of queued tasks queued up by Internal Response Stage thread pool.
ThreadPools|Internal|Pending Tasks|Migration Stage	The number of queued tasks queued up by Migration Stage thread pool.
ThreadPools|Internal|Pending Tasks|Misc Stage	The number of queued tasks queued up by Misc Stage thread pool.
ThreadPools|Request|Currently Blocked Tasks|Authz Stage	The number of tasks that were blocked due to queue saturation on AuthzStage thread pool.

ThreadPools|Request|Currently Blocked Tasks|Read Repair Stage	The number of tasks that were blocked due to queue saturation on Read Repair Stage thread pool.
ThreadPools|Request|Currently Blocked Tasks|Request Response Stage	The number of tasks that were blocked due to queue saturation on Request Response Stage thread pool.
ThreadPools|Internal|Currently Blocked Tasks|Anti Entropy Stage	The number of tasks that were blocked due to queue saturation on Anti Entropy Stage thread pool.
ThreadPools|Internal|Currently Blocked Tasks|Background IO Stage	The number of tasks that were blocked due to queue saturation on Background IO Stage thread pool.
ThreadPools|Internal|Currently Blocked Tasks|Gossip Stage	The number of tasks that were blocked due to queue saturation on Gossip Stage thread pool.
ThreadPools|Internal|Currently Blocked Tasks|Internal Response Stage	The number of tasks that were blocked due to queue saturation on Internal Response Stage thread pool.
ThreadPools|Internal|Currently Blocked Tasks|Migration Stage";	The number of tasks that were blocked due to queue saturation on Migration Stage thread pool.
ThreadPools|Internal|Currently Blocked Tasks|Misc Stage";	The number of tasks that were blocked due to queue saturation on Misc Stage thread pool.
Total Read|Write latency (microseconds)	Total Read|Write Latency
Write Failures	The number of failed `Write` operations
Write Timeout Exceptions	Number of timeouts encountered for write request.
Write Unavailability Exceptions	Number of unavailable exceptions encounteredfor write request.

Couchbase Metrics

Gc_num: Number of objects garbage collected
Gc_pause_time: Garbage collection pause time
Gc_pause_percent: Garbage collection pause percentage

Memory_usage: Memory (in GB) currently used by Couchbase
Memory_total: Memory (in GB) used by Couchbase over the total period of time
Memory_system: Memory (in GB) used by the system.

Cpu_user_percent: Percentage of CPU used by the user
Cpu_sys_percent: Percentage of CPU used by the system

Request_completed_count: Number of requests completed
Request_active_count: Number of active requests
Request_per_sec_1min: Requests per second in the last minute
Request_per_sec_5min: Requests per second in the last 5 minutes
Request_per_sec_15min: Requests per second in the last 15 minutes
Request_time_mean: Average request time
Request_time_median: Median request time
Request_time_80: 80th percentile request time
Request_time_95: 95th percentile request time
Request_time_99: 99th percentile request time
Request_prepared: Number of requests prepared

cpu_utilization_rate: Rate of CPU utilization
swap_total: Total amount of swap available
swap_used: Amount of swap used
mem_total: Total available memory
mem_free: Total amount of free memory

cmd_get: Compare and Swap gets
couch_docs_actual_disk_size: The physical memory used in the node
couch_docs_data_size: Data size of couch documents associated with a node
couch_spatial_data_size: Size of object data for spatial views
couch_spatial_disk_size: Amount of disk space occupied by spatial views
couch_views_actual_disk_size: Amount of disk space occupied by Couch views
couch_views_data_size: Size of object data for Couch views
curr_items: Number of active items in memory
curr_items_tot: Total number of items
ep_bg_fetched: Disk reads per second
get_hits: Number of get hits
mem_used: Engine's total memory usage
ops: Spatial operations
vb_replica_curr_items: Number of in memory items
operations per second: The total amount of operations per second (including XDCR) to this bucket (measured from `cmd_lookup` + `cmd_set` + `incr_misses + incr_hits` + `decr_misses` + `decr_hits` + `delete_misses` + `delete_hits` + `ep_num_ops_del_meta` + `ep_num_ops_get_meta` + `ep_num_ops_set_meta`).
active docs resident %: The percentage of active items cached in RAM in this bucket (measured from `vb_active_resident_items_ratio`).
gets per sec: The number of reads (get operations) per second from this bucket (measured from `cmd_get`).
sets per sec: The number of writes (set operations) per second to this bucket (measured from `cmd_set`).
deletes per sec: The number of delete operations per second for this bucket (measured from `delete_hits`).
disk creates per sec: The number of new items created on disk per second for this bucket (measured from `vb_active_ops_create` + `vb_replica_ops_create` + `vb_pending_ops_create`).
disk updates per sec: The number of items updated on disk per second for this bucket (measured from `vb_active_ops_update` + `vb_replica_ops_update` + `vb_pending_ops_update`).
disk reads per sec: The number of reads per second from disk for this bucket (measured from `ep_bg_fetched`).
disk read failures: The number of disk read failures (measured from `ep_data_read_failed`).
disk write failures: The number of disk write failures (measured from `ep_data_write_failed`).
temp OOM per sec: The number of back-offs sent per second to client SDKs due to the out-of-memory situations from this bucket (measured from `ep_tmp_oom_errors`).
cache miss ratio: The percentage of reads per second to this bucket from disk as opposed to RAM (measured from `ep_bg_fetches` / `cmd_lookup` * 100).
disk queue fill rate: The total number of items per second being put on the disk queue in this bucket (measured from `ep_diskqueue_fill`).
disk queue drain rate: The total number of items per second being written to disk in this bucket (measured from `ep_diskqueue_drain`).
disk write queue: The number of items waiting to be written to disk in this bucket (measured from ep_queue_size+ep_flusher_todo).

DB2 Server Metrics

ACTIVE_SORTS: The number of sorts in the database that currently have a sort heap allocated.

AGENTS_TOP: At the database level, it is the maximum number of agents for all applications.

APPLS_CUR_CONS: The number of applications that are currently connected to the database.

APPLS_IN_DB2: The number of applications that are currently connected to the database, and for which the database manager is currently processing a request.

BINDS_PRECOMPILES: The number of binds and pre-compiles attempted. You can use this element to gain insight into the current level of activity within the database manager. This value does not include the count of int_auto_rebinds, but it does include binds that occur as a result of the REBIND PACKAGE command.

CONNECTIONS_TOP: The highest number of simultaneous connections to the database since the database was activated.

COORD_AGENTS_TOP: The highest number of coordinating agents. If the peak number of coordinating agents represents too high a workload for this node, you can reduce this upper boundary by changing the max_coordagents configuration parameter.

DDL_SQL_STMTS: The number of SQL Data Definition Language (DDL) statements that were executed.

DEADLOCKS: The number of deadlocks that have occurred.

DIRECT_READ_REQS: Use the following formula to calculate the average number of sectors that are read by a direct read: direct_reads / direct_read_reqs.

DIRECT_READ_TIME: Time spent doing direct read operations.

DIRECT_READS: Direct reads are performed in units, the smallest being a 512-byte sector. They are used when: Reading LONG VARCHAR columns, Reading LOB (large object) columns, Performing a backup.

DIRECT_WRITE_REQS: Use the following formula to calculate the average number of sectors that are written by a direct write: direct_writes / direct_write_reqs.

DIRECT_WRITE_TIME: Time spent doing direct write operations.

DIRECT_WRITES: Direct writes are performed in units, the smallest being a 512-byte sector. They are used when: Writing LONG VARCHAR columns, Writing LOB (large object) columns, Performing a restore, Performing a load, Allocating new extents for SMS table space if MPFA is enabled (which is the default).

DYNAMIC_SQL_STMTS: The number of dynamic SQL statements that were attempted.

ELAPSED_EXEC_TIME_MS: The total time (in milliseconds) required to execute all the statements for a particular application during the specified time period.

ELAPSED_EXEC_TIME_S: The total time (in seconds) required to execute all the statements for a particular application during the specified time period.

FAILED_SQL_STMTS: The number of SQL statements that were attempted, but failed.

INT_AUTO_REBINDS: The number of commits initiated internally by the database manager.

INT_COMMITS: The number of commits initiated internally by the database manager.

INT_DEADLOCK_ROLLBACKS: The number of forced rollbacks initiated by the database manager due to a deadlock. A rollback is performed on the current unit of work in an application selected by the database manager to resolve the deadlock.

INT_ROLLBACKS: The number of rollbacks initiated internally by the database manager.

INT_ROWS_DELETED: The number of rows deleted from the database as a result of internal activity.

INT_ROWS_INSERTED: The number of rows inserted into the database as a result of internal activity caused by triggers.

INT_ROWS_UPDATED: The number of rows updated from the database as a result of internal activity.

LOCK_ESCALS: The number of times that locks have been escalated from several row locks to a table lock.

LOCK_LIST_IN_USE: The total number of bytes of lock list memory in use.

LOCK_TIMEOUTS: The number of times that a request to lock an object timed-out instead of being granted.

LOCK_WAIT_TIME: The total elapsed time (in milliseconds) spent waiting for locks.

LOCK_WAITS: The number of times that applications or connections waited for locks.

LOCKS_HELD: The number of locks currently held.

LOCKS_WAITING: The number of agents waiting on a lock.

LOG_HELD_BY_DIRTY_PAGES: The amount of log (in bytes) corresponding to the difference between the oldest dirty page in the database and the top of the active log.

LOG_READ_TIME_NS: The total elapsed time spent by the logger reading log data from the disk. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type.

LOG_READ_TIME_S: At the database level, this is the number of subagents for all applications.

LOG_READS: The number of log pages read from disk by the logger.

LOG_TO_REDO_FOR_RECOVERY: The size of the log (in bytes) that will have to be redone for crash recovery.

LOG_WRITE_TIME_NS: The total elapsed time spent by the logger writing log data to the disk. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type.

LOG_WRITE_TIME_S: At the database level, this is the number of subagents for all applications.

LOG_WRITES: The number of log pages written to disk by the logger.

NUM_ASSOC_AGENTS: At the database level, this is the number of subagents for all applications.

NUM_INDOUBT_TRANS: The number of outstanding indoubt transactions in the database. Indoubt transactions hold log space for uncommitted transactions, which can cause the logs to become full. When the logs are full, further transactions cannot be completed. The resolution of this problem involves a manual process of heuristically resolving the indoubt transactions. This monitor element provides a count of the number of currently outstanding indoubt transactions that must be heuristically resolved.

NUM_LOG_BUFFER_FULL: The number of times agents had to wait for log data to write to disk while copying log records into the log buffer.

NUM_LOG_DATA_FOUND_IN_BUFFER: The number of times log data was read from buffer instead of from disk, which is slower.

NUM_LOG_PART_PAGE_IO: Number of I/O requests issued by the logger for writing partial log data to disk. To determine if the current disk is adequate for logging, use this metric in conjunction with log_writes, log_write_time, and num_log_write_io.

NUM_LOG_READ_IO: Number of I/O requests issued by the logger to read log data from disk. To determine if the current disk is adequate for logging, use this metric in conjunction with log_reads and log_read_time.

NUM_LOG_WRITE_IO: Number of I/O requests issued by the logger to write log data to disk. To determine if the current disk is adequate for logging, use this metric in conjunction with log_writes and log_write_time.

POOL_ASYNC_DATA_READ_REQS: Number of asynchronous read requests by the prefetcher to the operating system. These requests are usually large block I/Os of multiple pages.

POOL_ASYNC_DATA_READS: Number of data pages read in from the table space physical containers by asynchronous engine dispatchable units for all types of table spaces. To determine the number of physical read that were performed synchronously, use this metric along with the pool_data_p_reads metrics.

POOL_ASYNC_DATA_WRITES: Number of times a buffer pool data page was physically written to disk by either an asynchronous page cleaner or prefetcher. To determine how well the buffer page cleaners are performing, use this metric in conjunction with pool_data_writes and pool_async_data_writes.

POOL_ASYNC_INDEX_READS: Number of index pages read in from the physical table space containers by asynchronous engine dispatchable units for all types of table spaces. To determine how well the prefetchers are working, compare the ratio of asynchronous reads to total physical reads. Use this information to tune the num_ioservers configuration parameter.

POOL_ASYNC_INDEX_WRITES: Number of times a buffer pool index page was physically written to disk by either an asynchronous page cleaner or prefetcher.

POOL_ASYNC_READ_TIME: Total number of milliseconds spent reading in data and index pages from physical table space containers by asynchronous engine dispatchable units for all types of table spaces. Use this metric to analyze the I/O work being performed.

POOL_ASYNC_WRITE_TIME: Total number of milliseconds spent writing data or index pages from the buffer pool to disk by database manager page cleaners. Use this metric to analyze the I/O work being performed.

POOL_DATA_FROM_ESTORE: Number of buffer pool data pages read from the extended storage monitor.

POOL_DATA_L_READS: Number of data pages which have been requested from the buffer pool (logical) for regular and large table spaces. The functionality to record buffer pool information at the statement level is supported for API and CLP snapshot requests.

POOL_DATA_P_READS: Number of data pages read in from the table space containers (physical) for regular and large table spaces. The functionality to record buffer pool information at the statement 7 level is supported for API and CLP snapshot requests.

POOL_DATA_WRITES: Number of times a buffer pool data page was physically written to disk.

POOL_DRTY_PG_STEAL_CLNS: Number of times a page cleaner was invoked because a synchronous write was needed during the victim buffer replacement for the database.

POOL_DRTY_PG_THRSH_CLNS: Number of times a page cleaner was invoked because a buffer pool had reached the dirty page threshold criterion for the database.

POOL_INDEX_L_READS: Number of index pages which have been requested from the buffer pool (logical) for 9 regular and large table spaces. The functionality to record buffer pool information at the statement level is supported for API and CLP snapshot requests.

POOL_INDEX_P_READS: Number of index pages read in from the table space containers (physical) for regular and large table spaces. The functionality to record buffer pool information at the statement level is supported for API and CLP snapshot requests.

POOL_INDEX_WRITES: Number of times a buffer pool index page was physically written to disk.

POOL_LSN_GAP_CLNS: Number of times a page cleaner was invoked because the logging space used had reached a predefined criterion for the database.

POOL_NO_VICTIM_BUFFER: Number of times an agent did not have a preselected victim buffer available.

POOL_READ_TIME: Number of milliseconds spent reading in data and index pages from the physical table space for all types of table spaces.

POOL_TEMP_DATA_L_READS: Number of data pages which have been requested from the logical buffer pool for temporary table spaces.

POOL_TEMP_DATA_P_READS: Number of data pages read in from the physical table space containers for temporary table spaces.

POOL_TEMP_INDEX_L_READS: Number of index pages which were requested from the logical buffer pool for temporary table spaces.

POOL_TEMP_INDEX_P_READS: Number of index pages read in from the physical table space containers for temporary table spaces.

POOL_WRITE_TIME: Number of milliseconds spent physically writing data or index pages from the buffer pool to disk.

PREFETCH_WAIT_TIME: Number of milliseconds spent waiting for an I/O prefetcher server to finish loading pages into the buffer pool.

ROWS_DELETED: Number of row deletions attempted.

ROWS_INSERTED: Number of row insertions attempted.

ROWS_READ: Number of rows read from tables.

ROWS_SELECTED: Number of rows that have been selected and returned to the application.

ROWS_UPDATED: Number of row updates attempted.

SEC_LOG_USED_TOP: The maximum number of bytes of secondary log space used.

SEC_LOGS_ALLOCATED: Number of secondary log files currently being used for the database.

SELECT_SQL_STMTS: The number of SQL SELECT statements that were executed.

SORT_HEAP_ALLOCATED: The number of allocated pages of sort heap space for all sorts at the level chosen and at the current time.

SORT_OVERFLOWS: The number of sorts that ran out of sort heap and may have required disk space for temporary storage.

SORT_SHRHEAP_ALLOCATED: The total amount of shared sort memory allocated in the database.

SORT_SHRHEAP_TOP: Database-wide shared sort memory high-water mark in 4k pages.

STATIC_SQL_STMTS: The number of static SQL statements that were attempted.

TOT_LOG_USED_TOP: The maximum number of bytes used for log space.

TOTAL_APP_COMMITS: Total number of commit statements issued by the client application.

TOTAL_APP_ROLLBACKS: Total number of rollback statements issued by the client application.

TOTAL_CONS: Number of newly opened connections to the database.

TOTAL_LOG_AVAILABLE: Number of bytes of active log space in the database that is not being used by uncommitted transactions.

TOTAL_LOG_USED: Number of bytes of active log space currently used in the database.

TOTAL_SEC_CONS: The number of connections made by a subagent to the database at the node.

TOTAL_SORT_TIME: The total elapsed time (in milliseconds) for all sorts that have been executed.

TOTAL_LOCK_TIME: The total time for which database is in locked state.

TOTAL_SORTS: The number of sorts that have been executed.

TOT_LOG_USED_TOP: The maximum amount of total log space used (in bytes).

UID_SQL_STMTS: Number of SQL UPDATE, INSERT, and DELETE statements that were executed.

UNREAD_PREFETCH_PAGES: Number of pages that the prefetcher read in that were never used.

MongoDB Server Metrics

asserts_msg: The number of message asserts. These are internal server errors that have a well defined text string. Stack traces are logged for these.

asserts_regular: The number of regular asserts raised since this process started.

asserts_user: The number of user asserts. These are errors that can be generated by a user such as out of disk space or duplicate key.

asserts_warning: The number of warnings raised since this process started.

BackgroundFlushing_flushes: The number of times the database has flushed all writes to disk.

BackgroundFlushing_total_ms: The number of milliseconds (ms) that the mongod processes have spent writing (i.e. flushing) data to disk.

Connections_available: The number of unused available connections that the database can provide. Consider this value in combination with the value of current to understand the connection load on the database, and the UNIX ulimit Settings document for more information about system thresholds on available connections.

Connections_current: The number of connections to the database server from clients. This number includes the current shell session. Consider the value of available to add more context to this datum. This figure will include the current shell connection as well as any inter-node connections to support a replica set or sharded cluster.

Cursor_timedOut: The number of cursors that have timed out since the server process started. If this number is large or growing at a regular rate, this may indicate an application error.

Cursor_totalOpen: The number of cursors that MongoDB is maintaining for clients. Because MongoDB exhausts unused cursors, typically this value small or zero. However, if there is a queue, stale tailable cursors, or a large number of operations this value may rise.

globalLock_ActiveClients: The number of connected clients.

globalLock_CurrentQueue: The number of operations queued waiting for the lock. A consistently small queue, particularly of shorter operations should cause no concern. Also, consider this value in light of the size of queue waiting for the read lock (e.g. readers) and write lock (e.g. writers) individually.

Mem_mapped: The number of megabytes of memory mapped by the database. Because MongoDB uses memory-mapped files, this value will be roughly equivalent to the total size of your databases.

Mem_resident: The amount of RAM, in megabytes (MB), currently used by the database process. In normal use this value tends to grow. In dedicated database servers this number tends to approach the total amount of system memory.

Mem_virtual: The quantity, in megabytes (MB), of virtual memory used by the mongod process. With journaling enabled, the value of virtual is at least twice the value of mapped. If virtual value is significantly larger than mapped (e.g. 3 or more times), this may indicate a memory leak.

Network_bytesIn: The amount of network traffic, in bytes, received by this database. Use this value to ensure that network traffic sent to the mongod process is consistent with expectations and overall inter-application traffic.

Network_bytesOut: The amount of network traffic, in bytes, sent from this database. Use this value to ensure that network traffic sent by the mongod process is consistent with expectations and overall inter-application traffic.

Network_numRequests: The number of distinct requests that the server has received. Use this value to provide context for the bytesIn and bytesOut values to ensure that MongoDB network utilization is consistent with expectations and application use.

OpCounters_command: The number of commands sent to MongoDB.

OpCounters_delete: The number of Delete operations.

OpCounters_getmore: The number of GetMore operations.

OpCounters_insert: The number of Insert operations.

OpCounters_query: The number of Query operations.

OpCounters_update: The number of Update operations.

Oplog_Max_Size *(new in 4.5.4)*: The maximum size of the operation log

Oplog_Size *(new in 4.5.4)*: The size of the operation log

OplogTimeDiff_in_sec *(new in 4.5.4)*: The difference (in seconds) between the first entry in the log and the last entry in the log

Repl_command: The number of Replicated Commands issued to the database.

Repl_delete: The number of Replicated Delete operations.

Repl_getmore: The number of GetMore operations. This counter can be high even if the query count is low. Secondary nodes send getMore operations as part of the replication process.

Repl_insert: The number of replicated insert operations.

Repl_query: The number of Replicated Queries.

Repl_update: The number of Replicated Update Operations.

Replication_MyState *(new in 4.5.4)*: An integer between 0 and 10 that represents the replica state of the current member.

Index_missRatio: Ratio of index hits to misses. If there are a lot of index misses then you should look at your queries to see if they are optimally using your indexes. You may need to add new indexes to make the queries run faster. You can explain the query to see which index queries are hitting and the total execution time so you can compare query performance before and after adding the new indexes.

Microsoft SQL Server Metrics

Active cursors: The number of active cursors.

Active Temp Tables: The number of temporary tables/table variables in use.

Active Transactions: The number of active transactions for the database.

AU cleanup batches/sec: The number of batches per second that were completed successfully by the background task that cleans up deferred dropped allocation units.

AU cleanups/sec: The number of allocation units per second that were successfully dropped the background task that cleans up deferred dropped allocation units. Each allocation unit drop requires multiple batches.

Auto-Param Attempts/sec: The number of auto-parameterization attempts per second. Total should be the sum of the failed, safe, and unsafe auto-parameterizations. Auto-parameterization occurs when an instance of SQL Server tries to parameterize a Transact-SQL request by replacing some literals with parameters so that reuse of the resulting cached execution plan across multiple similar-looking requests is possible. Note that auto-parameterizations are also known as simple parameterizations in newer versions of SQL Server. This counter does not include forced parameterizations.

Average Latch Wait Time (ms): Average latch wait time (in milliseconds) for latch requests that had to wait.

Average Wait Time (ms): Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.

Backup/Restore Throughput/sec: Read/write throughput for backup and restore operations of a database per second. For example, you can measure how the performance of the database backup operation changes when more backup devices are used in parallel or when faster devices are used. Throughput of a database backup or restore operation allows you to determine the progress and performance of your backup and restore operations.

Batch Requests/sec: The number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.

Buffer cache hit ratio: Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups over the last few thousand page accesses. The ratio is displayed as a percentage. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.

Bulk Copy Rows/sec: The number of rows bulk copied per second.

Bulk Copy Throughput/sec: Amount of data bulk copied (in kilobytes) per second.

By-reference Lob Create Count: Count of large object (lob) values that were passed by reference. By-reference lobs are used in certain bulk operations to avoid the cost of passing them by value.

By-reference Lob Use Count: Count of by-reference lob values that were used. By-reference lobs are used in certain bulk operations to avoid the cost of passing them by-value.

Cache Hit Ratio: Ratio between cache hits and lookups. The ratio is displayed as a percentage.

Cache Object Counts: The number of cache objects in the cache.

Cache Objects in use: The number of cache objects in use.

Cache Pages: The number of 8-kilobyte (KB) pages used by cache objects.

Cached Cursor Counts: The number of cursors of a given type in the cache.

Checkpoint pages/sec: The number of pages flushed to disk per second by a checkpoint or other operation that require all dirty pages to be flushed.

CLR Execution: Total execution time in CLR (microseconds)

Connection Memory (KB): Total amount of dynamic memory the server is using for maintaining connections.

Count Lob Readahead: Count of lob pages on which readahead was issued.

Count Pull In Row: Count of column values that were pulled in-row from off-row.

Count Push Off Row: Count of column values that were pushed from in-row to off-row.

Cursor memory usage: Amount of memory consumed by cursors in kilobytes (KB).

Count/sec: Times each type of cached cursor has been used. Cursor memory usage Amount of memory consumed by cursors in kilobytes (KB).

Cursor Requests/sec: The number of SQL cursor requests received by the server. Cursor worktable usage Number of worktables used by cursors. Data File(s) Size (KB) Cumulative size (in kilobytes) of all the data files in the database including any automatic growth. Monitoring this counter is useful, for example, for determining the correct size of Database pages Number of pages in the buffer pool with database content.

Cursor worktable usage: Number of worktables in use by cursors.

Data File(s) Size(KB): Cumulative size (Kb) of all data files in the database including any automatic growth. Monitoring this counter to determine the correct size of tempdb.

Database pages: Number of database pages in use.

DBCC Logical Scan Bytes/sec: The number of logical read scan bytes per second for database console commands (DBCC).

Deferred Dropped rowsets: The number of rowsets created as a result of aborted online index build operations that are waiting to be dropped by the background task that cleans up deferred dropped rowsets.

Dropped rowset cleanups/sec: The number of rowsets per second created as a result of aborted online index build operations that were successfully dropped by the background task that cleans up deferred dropped rowsets.

Dropped rowsets skipped/sec: The number of rowsets per second created as a result of aborted online index build operations that were skipped by the background task that cleans up deferred dropped rowsets created.

Errors/sec: The number of errors/sec.

Event Notifications Delayed Drop: The number of event notifications waiting to be dropped by a system thread.

Extent Deallocations/sec: The number of extents deallocated per second in all databases in this instance of SQL Server.

Extents Allocated/sec: The number of extents allocated per second in all databases in this instance of SQL Server.

Failed AU cleanup batches/sec: The number of batches per second that failed and required retry, by the background task that cleans up deferred dropped allocation units. Failure could be due to lack of memory or disk space, hardware failure, and other reasons.

Failed Auto-Params/sec: The number of failed auto-parameterization attempts per second. This should be small. Note that auto-parameterizations are also known as simple parameterizations in later versions of SQL Server.

Failed leaf page cookie: The number of times that a leaf page cookie could not be used during an index search since changes happened on the leaf page. The cookie is used to speed up the index search.

Failed tree page cookie: The number of times that a tree page cookie could not be used during an index search since changes happened on the parent pages of those tree pages. The cookie is used to speed up the index search.

Forced Parameterizations/sec: The number of successful forced parameterizations per second.

Forwarded Records/sec: The number of records per second fetched through forwarded record pointers.

Free list stalls/sec: The number of requests per second that had to wait for a free page.

Free Space in tempdb (KB): The amount of space (in kilobytes) available in FreeSpace Page.

FreeSpace Page Fetches/sec: Number of pages fetched/second by free space scans. These scans search for free space within pages already allocated to an allocation unit, to address requests to insert or modify record fragments.

FreeSpace Scans/sec: The number of scans per second that were initiated to search for free space within pages already allocated to an allocation unit to insert or modify record fragment. Each scan may find multiple pages.

Full Scans/sec: The number of unrestricted full scans per second. These can be either base-table or full-index scans.

Granted Workspace Memory (KB): Total amount of memory currently granted to executing processes such as hash, sort, bulk copy, and index creation operations.

Guided Plan Executions/sec: The number of plan executions per second in which the query plan has been generated by using a plan guide.

HTTP Authenticated Requests: The number of authenticated HTTP requests started per second. Index Searches/sec Number of index searches per second. These are used to start a range scan, reposition a range scan, revalidate a scan point, fetch a single index record, and search down the index to locate where to insert a new row.

Index Searches/sec: Number of index searches per second. These are used to start a range scan, reposition a range scan, revalidate a scan point, fetch a single index record, and search down the index to locate where to insert a new row.

Latch Waits/sec: The number of latch requests that could not be granted immediately.

Lazy writes/sec: The number of buffers written per second by the buffer manager's lazy writer. The lazy writer is a system process that flushes out batches of dirty, aged buffers (buffers that contain changes that must be written back to disk before the buffer can be reused for a different page) and makes them available to user processes. The lazy writer eliminates the need to perform frequent checkpoints in order to create available buffers.

LobHandle Create Count: Count of temporary lobs created.

LobHandle Destroy Count: Count of temporary lobs destroyed.

LobSS Provider Create Count: Count of LOB Storage Service Providers (LobSSP) created. One worktable created per LobSSP.

LobSS Provider Destroy Count: Count of LobSSP destroyed.

LobSS Provider Truncation Count: Count of LobSSP truncated.

Lock Blocks: Current number of lock blocks in use on the server (refreshed periodically). A lock block represents an individual locked resource, such as a table, page, or row.

Lock Blocks Allocated: Current number of allocated lock blocks. At server startup, the number of allocated lock blocks plus the number of allocated lock owner blocks depends on the SQL Server

Lock Memory (KB): Total amount of dynamic memory the server is using for locks.

Lock Owner Blocks: The number of lock owner blocks currently in use on the server (refreshed periodically). A lock owner block represents the ownership of a lock on an object by an individual thread. Therefore, if three threads each have a shared (S) lock on a page, there will be three lock owner blocks.

Lock Owner Blocks Allocated: Current number of allocated lock owner blocks. At server startup, the number of allocated lock owner blocks and the number of allocated lock blocks depend on the SQL

Lock Requests/sec: The number of new locks and lock conversions per second requested from the lock manager.

Lock Timeouts (timeout > 0)/sec: The number of lock requests per second that timed out, but excluding requests for NOWAIT locks.

Lock Timeouts/sec: The number of lock requests per second that timed out, including requests for NOWAIT locks.

Lock Wait Time (ms): Total wait time (in milliseconds) for locks in the last second.

Lock Waits/sec: The number of lock requests per second that required the caller to wait.

Log Bytes Flushed/sec: Total number of log bytes flushed.

Log Cache Hit Ratio: Percentage of log cache reads satisfied from the log cache.

Log Cache Reads/sec: Reads performed per second through the log manager cache.

Log File(s) Size (KB): Cumulative size (in kilobytes) of all the transaction log files in the database.

Log File(s) Used Size (KB): The cumulative used size of all the log files in the database.

Log Flush Wait Time Total wait time (in milliseconds) to flush the log.

Log Flush Waits/sec: The number of commits per second waiting for the log flush.

Log Flushes/sec: The number of log flushes per second.

Log Growths: Total number of times the transaction log for the database has been expanded.

Log Shrinks: Total number of times the transaction log for the database has been shrunk.

Log Truncations: Total number of times the transaction log for the database has been truncated.

Logical Connections: The number of logical connections to the system.

Logins/sec: Total number of logins started per second. This does not include pooled connections.

Logouts/sec: Total number of logout operations started per second.

Longest Transaction Running Time: The length of time (in seconds) since the start of the transaction that has been active longer than any other current transaction.

Mars Deadlocks: The number of Mars Deadlocks detected.

Maximum Workspace Memory (KB): Maximum amount of memory available for executing processes such as hash, sort, bulk copy, and index creation operations.

Memory Grants Outstanding: Total number of processes that have successfully acquired a workspace memory grant.

Memory Grants Pending: Total number of processes waiting for a workspace memory grant.

Mixed page allocations/sec: The number of pages allocated per second from mixed extents. These could be used for storing the IAM pages and the first eight pages that are allocated to an allocation unit.

Non-atomic yield rate: The number of non-atomic yields per second.

NonSnapshot Version Transactions: The number of currently active transactions that are not using snapshot isolation level and have made data modifications that have generated row versions in the Number of active cursor plans.

Number of active cursor plans: Number of cursor plans.

Number of Deadlocks/sec: The number of lock requests per second that resulted in a deadlock.

Number of SuperLatches: The number of latches that are currently SuperLatches.

Optimizer Memory (KB): Total amount of dynamic memory the server is using for query optimization.

Page compression attempts/sec: The number of pages evaluated for page-level compression. Includes pages that were not compressed because significant savings could be achieved. Includes all objects in the instance of SQL Server. For information about specific objects, see sys. dm_db_index_operational_stats (Transact-SQL).

Page Deallocations/sec: The number of pages deallocated per second in all databases in this instance of SQL Server. These include pages from mixed extents and uniform extents.

Page life expectancy: The number of seconds a page will stay in the buffer pool without references.

Page lookups/sec: The number of requests per second to find a page in the buffer pool.

Page reads/sec: The number of physical database page reads that are issued per second. This statistic displays the total number of physical page reads across all databases. Because physical I/O is expensive, you may be able to minimize the cost, either by using a larger data cache, intelligent indexes, and more efficient queries or by changing the database design.

Page Splits/sec: The number of page splits per second that occur as the result of overflowing index pages.

Page writes/sec: The number of physical database page writes issued per second.

Pages Allocated/sec: The number of pages allocated per second in all databases in this instance of SQL Server. These include pages allocations from both mixed extents and uniform extents.

Pages compressed/sec: The number of data pages that are compressed by using PAGE compression. Includes all objects in the instance of SQL Server. For information about specific objects, see sys.dm_db_index_operational_stats (Transact-SQL).

Percent Log Used: Percentage of space in the log that is in use.

Probe Scans/sec: The number of probe scans per second that are used to find at most one single qualified row in an index or base table directly.

Processes blocked: The number of currently blocked processes.

Range Scans/sec: The number of qualified range scans through indexes per second.

Readahead pages/sec: The number of pages read per second in anticipation of use.

Repl. Trans. Rate: The number of transactions per second read out of the transaction log of the publication database and delivered to the distribution database.

Safe Auto-Params/sec: The number of safe auto-parameterization attempts per second. Safe refers to a determination that a cached execution plan can be shared between different similar-looking Transact-SQL statements. SQL Server makes many auto-parameterization attempts some of which turn out to be safe and others fail. Note that auto-parameterizations are also known as simple parameterizations in later versions of SQL Server. This does not include forced parameterizations.

Scan Point Revalidations/sec: The number of times per second that the scan point had to be revalidated to continue the scan.

Skipped Ghosted Records/sec: The number of ghosted records per second skipped during scans.

Snapshot Transactions: The number of currently active transactions using the snapshot isolation level. N.B. The SOAP Empty Requests Number of empty SOAP requests started per second.

SOAP Empty Requests: The number of SOAP method invocations passed to the stored procedure (or template) with an empty string as its value (not a NULL value) in order to provide an included input parameter with no value assigned to it.

SOAP Method Invocations: The number of SOAP method invocations started per second.

SOAP Session Initiate Requests: The number of SOAP Session initiate requests started per second.

SOAP Session Terminate Requests: The number of SOAP Session terminate requests started per second.

SOAP SQL Requests: The number of SOAP SQL requests started per second.

SOAP WSDL Requests: The number of SOAP Web Service Description Language requests started per second.

SQL Attention rate: The number of attentions per second. An attention is a request by the client to end the currently running request.

SQL Cache Memory (KB): Total amount of dynamic memory the server is using for the dynamic SQL cache.

SQL Compilations/sec: The number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles caused by statement-level recompilations in SQL Server. After SQL Server user activity is stable, this value reaches a steady state.

SQL Re-Compilations/sec: The number of statement recompiles per second. Counts the number of times statement recompiles are triggered. Generally, you want the recompiles to be low. In later versions of SQL Server, recompilations are statement-scoped instead of batch-scoped recompilations in Microsoft SQL Server 2000. Therefore, direct comparison of values of this counter between SQL Server and earlier versions is not possible.

Stored Procedures Invoked/sec: This counter reports the total number of activation stored procedures invoked by all queue monitors in the instance per second.

SuperLatch Demotions/sec: The number of SuperLatches that have been demoted to regular latches in the last second.

SuperLatch Promotions/sec: The number of latches that have been promoted to SuperLatches in the last second.

Table Lock Escalations/sec: The number of times locks on a table were escalated to the TABLE or HoBT granularity. Target pages Ideal number of pages in the buffer pool.

Target pages: Ideal number of pages in the buffer pool.

Target Server Memory (KB): Total amount of dynamic memory the server can consume.

Task Limit Reached: The number of times that a queue monitor would have started a new task, but did not because the maximum number of tasks for the queue is already running.

Task Limit Reached/sec: The number of times per second that a queue monitor would have started a new task, but did not because the maximum number of tasks for the queue is already running.

Tasks Aborted/sec: The number of activation stored procedure tasks that end with an error or are aborted by a queue monitor for failing to receive messages.

Tasks Running: The number of activation stored procedures that are currently running.

Tasks Started/sec: The number of activation stored procedures started per second by all queue monitors in the instance.

Temp Tables Creation Rate: The number of temporary tables/table variables created per second.

Temp Tables For Destruction: The number of temporary tables/table variables waiting to be destroyed by the cleanup system thread.

Total Latch Wait Time (ms): Total latch wait time (in milliseconds) for latch requests in the last second.

TOTAL_LOCK_TIME: The total time for which database is in locked state.

Total Server Memory (KB): The committed memory from the buffer pool (in kilobytes).

Transactions/sec: The number of transactions started for the database per second.

Unsafe Auto-Params/sec: The number of unsafe auto-parameterization attempts per second. For example, the query has some characteristics that prevent the cached plan from being shared. These are designated as unsafe. This does not count the number of forced parameterizations.

Update conflict ratio: The percentage of those transactions using the snapshot isolation level that have encountered update conflicts within the last second. An update conflict occurs when a snapshot isolation level transaction attempts to modify a row that last was modified by another transaction that was not committed when the snapshot isolation level transaction started.

Update Snapshot Transactions: The number of currently active transactions using the snapshot isolation level and have modified data.

Used leaf page cookie: The number of times a leaf page cookie is used successfully during an index search since no change happened on the leaf page. The cookie is used to speed up the index search.

Used tree page cookie: The number of times a tree page cookie is used successfully during an index search since no change happened on the parent page of the tree page. The cookie is used to speed up the index search.

User Connections: The number of users currently connected to SQL Server.

Version Cleanup rate (KB/s): The rate (in kilobytes per second) at which row versions are removed from the snapshot isolation version store.

Version Generation rate (KB/s): The rate (in kilobytes per second) at which new row versions are added to the snapshot isolation version store.

Version Store Size (KB): The amount of space (in kilobytes) in Version Store unit count The number of active allocation units in the snapshot isolation version store.

Version Store unit creation: The number of allocation units that have been created in the snapshot isolation store since the instance of the Database Engine was started.

Version Store unit truncation: The number of allocation units that have been removed from the snapshot isolation store since the instance of the Database Engine was started.

Workfiles Created/sec: The number of work files created per second. For example, work files could be used to store temporary results for hash joins and hash aggregates.

Worktables Created/sec: The number of work tables created per second. For example, work tables could be used to store temporary results for query spool, lob variables, XML variables, and cursors.

Worktables From Cache Ratio: Percentage of work tables created where the initial two pages of the work table were not allocated but were immediately available from the work table cache. (When a work table is dropped, two pages may remain allocated and they are returned to the work table cache. This increases performance.)

Write Transactions/sec: The number of transactions that wrote to the database and committed, in the last second.

Microsoft SQL Azure Metrics

avg_cpu_percent: Average compute utilization in the percentage of the limit of the service tier.

avg_data_io_percent: Average data I/O utilization in percentage based on the limit of the service tier.

avg_log_write_percent: Average write resource utilization in the percentage of the limit of the service tier.

avg_memory_percent: Average memory utilization in the percentage of the limit of the service tier.

MySQL Server Metrics

Aborted_clients: The number of clients that were aborted (because they did not properly close the connection to the MySQL server). For some applications, this can be OK, but for some other applications you might want to track the value, as aborted connects may indicate some sort of application failure.

Aborted_connects: The number of failed attempts to connect to the MySQL server.

Bytes_received: The number of bytes received from all clients.

Bytes_sent: The number of bytes sent to all clients.

Com_alter_table: The number of times each ALTERTABLE statement has been executed.

Com_create_index: The number of times each CREATE INDEX statement has been executed.

Com_create_table: The number of times each CREATE TABLE statement has been executed.

Com_delete: The number of times each DELETE statement has been executed.

Com_insert: The number of times each INSERT statement has been executed.

Com_optimize: The number of times each OPTIMIZE statement has been executed.

Com_select: The number of times each SELECT statement has been executed.

Com_update: The number of times each UPDATE statement has been executed.

Connections: The number of connection attempts (successful or not) to the MySQL server.

Created_tmp_disk_tables: The number of temporary tables on disk created automatically by the server while executing statements.

Created_tmp_files: How many temporary files mysqld has created.

Created_tmp_tables: The number of in-memory temporary tables created automatically by the server while executing statements. If Created_tmp_disk_tables is large, you may want to increase the tmp_table_size value to cause temporary tables to be memory-based instead of disk-based.

Handler_delete: The number of times that rows have been deleted from tables.

Innodb_buffer_pool_pages_data: The number of pages containing data (dirty or clean).

Innodb_buffer_pool_pages_dirty: The number of pages currently dirty.

Innodb_buffer_pool_pages_flushed: The number of buffer pool page-flush requests.

Innodb_buffer_pool_pages_free: The number of free pages.

Innodb_buffer_pool_pages_misc: The number of pages that are busy because they have been allocated for administrative overhead such as row locks or the adaptive hash index. This value can also be calculated as Innodb_buffer_pool_pages_total.

Innodb_buffer_pool_pages_total: The total size of the buffer pool, in pages.

Innodb_buffer_pool_read_ahead_rnd: The number of random read-aheads initiated by InnoDB. This happens when a query scans a large portion of a table but in random order.

Innodb_buffer_pool_read_requests: The number of logical read requests InnoDB has done.

Innodb_buffer_pool_reads: The number of logical reads that InnoDB could not satisfy from the buffer pool and had to do a single-page read.

Innodb_buffer_pool_wait_free: Normally, writes to the InnoDB buffer pool happen in the background. However, if it is necessary to read or create a page and no clean pages are available, it is also necessary to wait for pages to be flushed first. This counter counts instances of these waits. If the buffer pool size has been set properly, this value should be small.

Innodb_buffer_pool_write_requests: The number writes done to the InnoDB buffer pool.

Innodb_data_fsyncs: The number of fsync() operations so far.

Innodb_data_pending_fsyncs: The current number of pending fsync() operations.

Innodb_data_pending_reads: The current number of pending reads.

Innodb_data_pending_writes: The current number of pending writes.

Innodb_data_read: The amount of data read so far, in bytes.

Innodb_data_reads: The total number of data reads.

Innodb_data_writes: The total number of data writes.

Innodb_data_written: The amount of data written so far, in bytes.

Innodb_dblwr_pages_written: The number of doublewrite operations that have been performed.

Innodb_dblwr_writes: The number of pages that have been written for doublewrite operations.

Innodb_log_waits: The number of times that the log buffer was too small and a wait was required for it to be flushed before continuing.

Innodb_log_write_requests: The number of log write requests.

Innodb_log_writes: The number of physical writes to the log file.

Innodb_pages_created: The number of pages created.

Innodb_pages_read: The number of pages read.

Innodb_pages_written: The number of pages written.

Innodb_row_lock_current_waits: The number of row locks currently being waited for.

Innodb_row_lock_time: The total time spent in acquiring row locks, in milliseconds.

Innodb_row_lock_time_avg: The average time to acquire a row lock, in milliseconds.

Innodb_row_lock_time_max: The maximum time to acquire a row lock, in milliseconds.

Innodb_row_lock_waits: The number of times a row lock had to be waited for.

Innodb_rows_deleted: The number of rows deleted from InnoDB tables.

Innodb_rows_inserted: The number of rows inserted into InnoDB tables.

Innodb_rows_read: The number of rows read from InnoDB tables.

Innodb_rows_updated: The number of rows updated in InnoDB tables.

Key_blocks_used: The number of used blocks in the key cache. This value is a high-water mark that indicates the maximum number of blocks that have ever been in use at one time.

Key_read_requests: The number of requests to read a key block from the cache. Key_writes The number of physical writes of a key block to disk.

Key_reads: The number of physical reads of a key block from disk. If Key_reads is large, then your key_buffer_size value is probably too small. The cache miss rate can be calculated as Key_reads/Key_read_requests.

Key_write_requests: The number of requests to write a key block to the cache.

Key_writes: The number of physical writes of a key block from the `MyISAM` key cache to the physical disk.

Open_files: The number of files that are open. Open_streams The number of streams that are open (used mainly for logging).

Open_tables: The number of table cache misses. If the value is large, you probably need to increase table_cache. Typically you would want this to be less than 1 or 2 opened tables per second.

Opened_tables: The number of tables that have been opened. The number of tables that have been opened. If Opened_tables is big, your table_cache value is probably too small.

Qcache_free_blocks: The number of free memory blocks in the query cache.

Qcache_free_memory: The amount of free memory for the query cache.

Qcache_hits: The number of query cache hits.

Qcache_inserts: The number of queries added to the query cache.

Qcache_lowmem_prunes: The number of queries that were deleted from the query cache because of low memory.

Qcache_not_cached: The number of non-cached queries (not cacheable, or not cached due to the query_cache_type setting).

Qcache_queries_in_cache: The number of queries registered in the query cache.

Qcache_total_blocks: The total number of blocks in the query cache.

Questions: The number of statements that clients have sent to the server.

Seconds_Behind_Master: The number of seconds that the replica SQL thread is behind processing the primary binary log. This field directly drives MTTR. A high or increased number of Seconds_Behind_Master indicates a slow disk or poorly tuned machine running the database. If this value reaches 45 minutes or more, the ability to recover from a crash, or after a manual failover, is delayed. If this value is tracked by the Machine Agent through the MySQL extension and shows a generally positive slope, it indicates a death spiral.

Select_full_join: Joins performed without keys. This should be zero. This is a good way to catch development errors, as just a few such queries can decrease the system's performance.

Select_full_range_join: The number of joins that used a range search on a reference table.

Select_range: The number of joins that used ranges on the first table. This is normally not a critical issue even if the value is quite large.

Select_range_check: The number of joins without keys that check for key usage after each row. If this is not 0, you should carefully check the indexes of your tables.

Select_scan: Number of queries that performed a full table scan. In some cases these are OK but their ratio to all queries should be constant. if you have the value growing it can be a problem with the optimizer, lack of indexes or some other problem.

Slave_IO_Running: Whether the I/O thread for reading the primary's binary log is running.

Slave_open_temp_tables: The number of temporary tables that the replica SQL thread currently has open.

Slave_SQL_Running: Whether the SQL thread for executing events in the relay log is running.

Slow_launch_threads: The number of threads that have taken more than slow_launch_time seconds to create.

Slow_queries: The number of queries longer than --long-query-time or that are not using indexes. These should be a small fraction of all queries. If it grows, the system will have performance problems.

Sort_merge_passes: The number of merge passes that the sort algorithm has had to do. If this value is large, you should consider increasing the value of the sort_buffer_size system variable.

Sort_range: The number of sorts that were done using ranges.

SQL_Delay: The number of seconds that the replica lags behind the primary

Threads_cached: The number of threads in the thread cache.

Threads_connected: The number of currently open connections.

Threads_created: This should be low. Higher values may mean that you need to increase the value of thread_cache or you have the number of connections increasing, which also indicates a potential problem.

Threads_running: The number of threads that are not sleeping.

Oracle Server Metrics

bytes received via SQL*Net from client: Total number of bytes received from the client over Oracle Net Services

bytes received via SQL*Net from dblink: Total number of bytes received from a database link over Oracle Net Services

bytes sent via SQL*Net to client: Total number of bytes sent to the client from the foreground processes

bytes sent via SQL*Net to dblink: Total number of bytes sent over a database link

CPU used by this session: Amount of CPU time (in 10s of milliseconds) used by a session from the time a user call starts until it ends. If a user call completes within 10 milliseconds, the start and end user-call time are the same for purposes of this statistics, and 0 milliseconds are added.

db block changes: Closely related to consistent changes, this statistic counts the total number of changes that were part of an update or delete operation that were made to all blocks in the SGA. Such changes generate redo log entries and hence become permanent changes to the database if the transaction is committed.This approximates total database work. It statistic indicates the rate at which buffers are being dirtied (on a per-transaction or per-second basis, for example).

db block gets: The number of times a CURRENT block was requested. See Also: consistent gets

db block gets from cache: The number of times a CURRENT block was requested from the buffer cache. This is a subset of db block gets statistics value.

DBWR checkpoint buffers written: The number of buffers that were written for checkpoints

DBWR checkpoints: The number of times the DBWR was asked to scan the cache and write all blocks marked for a checkpoint or the end of recovery. This statistic is always larger than background checkpoints completed.

DML statements parallelized: The number of DML statements that were executed in parallel.

enqueue conversions: Total number of conversions of the state of table or row lock.

enqueue deadlocks: Total number of deadlocks between table or row locks in different sessions.

enqueue releases: Total number of table or row locks released.

enqueue requests: Total number of table or row locks acquired.

enqueue timeouts: Total number of table and row locks (acquired and converted) that timed out before they could complete.

enqueue waits: Total number of waits that occurred during an enqueue convert or get because the enqueue get was deferred

exchange deadlocks: The number of times that a process detected a potential deadlock when exchanging two buffers and raised an internal, restartable error. Index scans are the only operations that perform exchanges.

execute count: Total number of calls (user and recursive) that executed SQL statements.

gc current block receive time: The total time required for consistent read requests to complete. It records the round-trip time for all requests for consistent read blocks.

index fast full scans (direct read): The number of fast full scans initiated using direct read.

index fast full scans (full): The number of fast full scans initiated for full segments.

index fast full scans (rowid ranges): The number of fast full scans initiated with rowid endpoints specified.

lob reads: The number of LOB API read operations performed in the session/system. A single LOB API read may correspond to multiple physical/logical disk block reads.

lob writes: The number of LOB API write operations performed in the session/system. A single LOB API write may correspond to multiple physical/logical disk block writes.

logons current: Total number of current logons. Useful only in V$SYSSTAT.

Number of Small Reads: The total number of **physical reads** less the number of **physical read total multi block requests**.

Number of Small Writes: The total number of **physical writes** less the number of **physical write total multi block requests**.

opened cursors current: Total number of current open cursors.

Parallel operations not downgraded: The number of times parallel execution was executed at the requested degree of parallelism.

parse count (hard): Total number of parse calls (real parses). A hard parse is a very expensive operation in terms of memory use, because it requires Oracle to allocate a workheap and other memory structures and then build a parse tree.

parse count (total): Total number of parse calls (hard and soft). A soft parse is a check on an object already in the shared pool, to verify that the permissions on the underlying object have not changed.

parse time cpu: Total CPU time used for parsing (hard and soft) in 10s of milliseconds.

parse time elapsed: Total elapsed time for parsing, in 10s of milliseconds. Subtract parse time cpu from this statistic to determine the total waiting time for parse resources.

physical read bytes: Total size in bytes of all disk reads by application activity (and not other instance activity) only.

physical read IO requests: The number of read requests for application activity (mainly buffer cache and direct load operation) which read one or more database blocks per request. This is a subset of physical read total IO requests statistic.

physical read total bytes: Total size in bytes of disk reads by all database instance activity including application reads, backup and recovery, and other utilities. The difference between this value and physical read bytes gives the total read size in bytes by non-application workload.

physical read total IO requests: The number of read requests which read one or more database blocks for all instance activity including application, backup and recovery, and other utilities. The difference between this value and physical read total multi block requests gives the total number of single block read requests.

physical reads: Total number of data blocks read from disk. This value can be greater than the value of physical reads direct plus physical reads cache as reads into process private buffers also included in this statistic.

physical write bytes: Total size in bytes of all disk writes from the database application activity (and not other kinds of instance activity).

physical write IO requests: The number of write requests for application activity (mainly buffer cache and direct load operation) which wrote one or more database blocks per request.

physical write total bytes: Total size in bytes of all disk writes for the database instance including application activity, backup and recovery, and other utilities. The difference between this value and physical write bytes gives the total write size in bytes by non-application workload.

physical write total IO requests: The number of write requests which wrote one or more database blocks from all instance activity including application activity, backup and recovery, and other utilities. The difference between this stat and physical write total multi block requests gives the number of single block write requests.

physical writes: Total number of data blocks written to disk. This statistics value equals the sum of physical writes direct and physical writes from cache values.

physical writes direct: The number of writes directly to disk, bypassing the buffer cache (as in a direct load operation).

physical writes from cache: Total number of data blocks written to disk from the buffer cache. This is a subset of physical writes statistic.

process last non-idle time: The last time this process executed.

queries parallelized: The number of SELECT statements executed in parallel.

Read Percent:

recovery blocks read: The number of blocks read during recovery.

recursive calls: The number of recursive calls generated at both the user and system level. Oracle maintains tables used for internal processing. When Oracle needs to make a change to these tables, it internally generates an internal SQL statement, which in turn generates a recursive call.

recursive cpu usage: Total CPU time used by non-user calls (recursive calls). Subtract this value from CPU used by this session to determine how much CPU time was used by the user calls.

redo blocks written: This is the total number of redo blocks written. This statistic divided by "redo writes" equals the number of blocks per write.

redo buffer allocation retries: Total number of retries necessary to allocate space in the redo buffer. Retries are needed either because the redo writer has fallen behind or because an event such as a log switch is occurring.

redo log space requests: The number of times the active log file is full and Oracle must wait for disk space to be allocated for the redo log entries. Such space is created by performing a log switch.

redo log space wait time: Total elapsed waiting time for redo log space requests in 10s of milliseconds.

redo size: Total amount of redo generated in bytes.

redo synch time: Elapsed time of all redo synch writes calls in 10s of milliseconds

redo write time: Total elapsed time of the write from the redo log buffer to the current redo log file in microseconds.

redo writes: Total number of writes by LGWR to the redo log files. redo blocks written divided by this statistic equals the number of blocks per write.

session cursor cache count: Total number of cursors cached. This statistic is incremented only if SESSION_CACHED_CURSORS > 0. This statistic is the most useful in V$SESSTAT. If the value for this statistic in V$SESSTAT is close to the setting of the SESSION_CACHED_CURSORS parameter, the value of the parameter should be increased.

session cursor cache hits: The number of hits in the session cursor cache. A hit means that the SQL statement did not have to be reparsed. Subtract this statistic from parse count (total) to determine the real number of parses that occurred.

session logical reads: The sum of db block gets plus consistent gets. This includes logical reads of database blocks from either the buffer cache or process private memory.

session stored procedure space: Amount of memory this session is using for stored procedures.

Small IO Percent:

sorts (disk): The number of sort operations that required at least one disk write.

sorts (memory): The number of sort operations that were performed completely in memory and did not require any disk writes.

sorts (rows): Total number of rows sorted.

table scan rows gotten: The number of rows that are processed during scanning operations.

table scans (direct read): The number of table scans performed with direct read (bypassing the buffer cache).

table scans (long tables): Long (or conversely short) tables can be defined as tables that do not meet the short table criteria as described in table scans (short tables).

table scans (rowid ranges): During a parallel query, the number of table scans conducted with specified ROWID ranges.

transaction lock background get time: Useful only for internal debugging purposes.

transaction lock foreground wait time: Useful only for internal debugging purposes.

transaction rollbacks: The number of transactions being successfully rolled back.

TOTAL_LOCK_TIME: The total time for which database is in locked state.

user calls: The number of user calls such as login, parse, fetch, or execute

user commits: The number of user commits. When a user commits a transaction, the redo generated that reflects the changes made to database blocks must be written to disk. Commits often represent the closest thing to a user transaction rate.

user rollbacks: The number of times users manually issue the ROLLBACK statement or an error occurs during a user's transactions.

Some of the obsolete metrics were removed and the following metrics are included with 20.11 and later versions of Controller.

DB|Server Statistic|DB time: The sum of CPU consumption of all the Oracle process and the sum of non-idle wait time

DB|Server Statistic|OS System time used: The total CPU time used for system calls

DB|Server Statistic|OS User time used: The total CPU time used for user calls

DB|Server Statistic|SMON posted for instance recovery: The total count or number of times SMON posted for instance recovery

DB|Server Statistic|SMON posted for txn recovery for other instances: The total count or number of times SMON posted for other transactions recovery in an Oracle RAC or a cluster

DB|Server Statistic|java call heap live size: The Java call heap live size

DB|Server Statistic|java call heap total size: The total Java call heap size

DB|Server Statistic|java call heap used size: The Java call heap used size

DB|Server Statistic|non-idle wait count: The total count of non-idle wait events

DB|Server Statistic|non-idle wait time: The total elapsed time for non-idle events

PostgreSQL Server Metrics

blks_hit: Number of times disk blocks were found already in the buffer cache, so that a physical disk read was not necessary. This only includes hits in the PostgreSQL buffer cache, does not include the operating system's file system .cache).

blks_read: Number of disk blocks read from the database.

confl_bufferpin: Number of queries in the database that were canceled because of pinned buffers.

confl_deadlock: Number of queries in the database that were canceled because of deadlocks

confl_lock: Number of queries in the database that were canceled due because of timeouts.

confl_snapshot: Number of queries in the database that were canceled because of old snapshots.

confl_tablespace: Number of queries in the database that were canceled because of dropped tablespaces.

numbackends: Number of backends currently connected to the database.

size_mb:

tup_deleted: Number of rows deleted by queries in the database.

tup_fetched: Number of rows fetched by queries in the database.

tup_inserted: Number of rows inserted by queries in the database.

tup_returned: Number of rows returned by queries in the database.

tup_updated: Number of rows updated by queries in the database.

xact_commit: Number of transactions in the database that have been committed.

xact_rollback: Number of transactions in the database that have been rolled back.

Sybase ASE and IQ Server Metrics

active_connections: The number of users currently connected to the database

ActiveReq: Returns the number of server threads that are currently handling a request.

ActiveVersionsCount: Count of Active Transaction Versions.

ActiveVersionsCreateMB: Size in Mb of versions for active transaction.

ActiveVersionsDeleteMB: Size in Mb of versions for active transactions.

AIOs_delayed_due_to_engine_limit:

AIOs_delayed_due_to_os_limit:

AIOs_delayed_due_to_server_limit:

BytesReceived: Returns the number of bytes received during client/server communications. This value is updated for HTTP and HTTPS connections.

BytesReceivedUncomp: Returns the number of bytes that would have been received during client/server communications if compression was disabled. (This value is the same as the value for BytesReceived if compression is disabled.)

BytesSent: Returns the number of bytes sent during client/server communications. This value is updated for HTTP and HTTPS connections.

BytesSentUncomp: Returns the number of bytes that would have been sent during client/server communications if compression was disabled. (This value is the same as the value for BytesSent if compression is disabled.)

CacheFileDirty: Returns the number of cache pages that are dirty (needing a write).

CacheFree: Returns the number of cache pages not being used.

CacheHits: Returns the number of database page lookups.

CachePanics: Returns the number of times the cache manager has failed to find a page to allocate.

CachePinned: Returns the number of pinned cache pages.

CacheRead: Returns the number of cache reads.

CacheReplacements: Returns the number of pages in the cache that have been replaced.

CacheScavenges: Returns the number of times the cache manager has scavenged for a page to allocate.

DiskRead: Returns the number of disk reads.

mempages_alloced: The number of memory pages that have been allocated.

mempages_freed: The number of memory pages that have been de-allocated.

OtherVersionsCount: Shows count of other db versions. These versions will eventually be dropped when they are no longer referenced or referencable by active transactions.

OtherVersionsMB: Shows space usage in MB of other db versions. These versions will eventually be dropped when they are no longer referenced or referencable by active transactions.

ProcessCPU: Returns CPU usage for the database server process. Values are in seconds. This property is supported on Windows and Unix. This property is not supported on Windows Mobile.

ProcessCPUSystem: Returns system CPU usage for the database server process CPU. This is the amount of CPU time that the database server spent inside the operating system kernel. Values are in seconds. This property is supported on Windows and Unix. This property is not supported on Windows Mobile.

ProcessCPUUser: Returns user CPU usage for the database server process. Values are in seconds. This excludes the amount of CPU time that the database server spent inside the operating system kernel. This property is supported on Windows and Unix. This property is not supported on Windows Mobile.

RequestsReceived: Requests received by the server.

TempBufferCapacityCount: Capacity count of Temporary Buffers.

TempBufferCapacityMB: Capacity in Mb of Temporary Buffers.

TempBufferLockedCount: The number of Temporary Buffers that are locked.

TempBufferUsedCount: The number of Temporary Buffers in use.

total_bytes_received: The number of bytes received during client/server communications. This value is updated for HTTP and HTTPS connections.

total_bytes_sent: Returns the number of bytes sent during client/server communications. This value is updated for HTTP and HTTPS connections.

TOTAL_LOCK_TIME: The total time for which database is in locked state.

xacts: The number of transactions.

yields: Returns the number of times the Adaptive Server engine(s) yielded to the operating system.

Database Agent Events Reference

You can view Database Agent events on the **Database Monitoring > Events** window and in the `<agent_home>/logs/db-agent#.log` files. Database Agent events are of type Agent Diagnostic Event, with case-specific messages attached. See Monitor Events.

Agent Diagnostic Events

Initialize/re-initialize the DB Collector

Summary: Initialize/re-initialize the DB collector

Description: Sent when database collector has successfully started. This happens when you configure a new collector, start/restart the agent process (in which case you'll see this event once for each collector), or when the collector recovers from a failure to communicate with the monitored database (for example, when the database goes down for a while, then comes back).

Severity: Info

Initialize/re-initialize the Hardware Metric Collector

Summary: Initialize/re-initialize the hardware metric collector

Description: Same as the above, but refers to a hardware collector, not a database collector.

This is sent when hardware collector has successfully started. This happens when you configure a new collector, start/restart the agent process (in which case you'll see this event once for each collector), or when the collector recovers from a failure to communicate with the monitored hardware (for example, when the system goes down for a while, then comes back).

Severity: Info

Server Parameter [?] has been Changed from [?] to [?]

Summary: Server parameter [?] has been changed from [?] to [?]

Description: The Database Agent constantly monitors database configuration parameters. When a parameter changes, which generally means a database administrator made a deliberate change, the agent sends this event. AppDynamics Database Visibility users can use these events to track configuration changes in their databases.

Severity: Info

JDBC Driver-related Agent Diagnostic Events

Summary: The text of the message is the error from the vendor's JDBC driver.

Description: When the agent fails to collect data from a monitored database, it sends this event, and goes into sleep mode for one minute. It will then retry contacting the database every minute until it succeeds. Once it succeeds, it will send an Agent Event "initialize/re-initialize" message, as described above. This happens when the database goes down, or when you add a collector with a wrong password, or wrong hostname, etc.

When the Collector is in sleep mode because of an error, you'll see an indicator next to the database on the **Infrastructure** and **Infrastructure > Databases**, on **Configure > Collectors** panel. You will also see the full text of the error in the **Infrastructure > Events** panel.

Severity: Error

Wait State Filtering

Database wait states are pauses or delays in database activity. While Database Visibility collects data on all wait states, you may be more interested in some wait states than others. You can specify which wait states that you want to exclude from being reported by the agent so that you can focus on the critical wait states.

To specify wait states to exclude, navigate to **Configuration** > **Wait State Filtering**. Check the boxes of the wait states that you want to exclude. The wait states you exclude are no longer displayed in the Top 10 Query Wait States metric. In addition, any future queries that experience the wait states you exclude are not reported by the agent.

Configure Custom Metrics

Database Visibility extends monitoring by specifying SQL queries to run on the monitored database and the queries run during normal database activity. You can schedule these custom queries to run on regular intervals and collect the results in a custom metric. See Database Custom Metrics Window.

To specify custom queries to run:

1. Navigate to **Configuration > Custom Metrics > New**.
2. Complete the following fields:
    a. **Name**: The name you want to name your custom metric. Once you create a custom metric/event, you cannot change its name.
    b. **Custom Query Metric Type**: The type of result that you want from the query.
        i. Select the **Metric** type to generate metrics for which health rules can be defined. Metrics of this type are displayed in the **Metric Browser** or in the Custom Metrics tab of each collector.
        ii. Select the **Event Data** type to generate custom events whenever the custom query output is non-empty. If you want to be notified when a custom event occurs, you can create a policy that is triggered by that custom event. Custom events are displayed in the Events tab. If the custom query outputs multiple rows, the first 40 rows will be included in the event details. Each row displays a maximum of 5000 characters, including the column separators (|).
    c. **Database Type**: The database platform that you want to run the metric on.
    d. **Databases**: The database instances that you want to run the metric on. You can run the metric on all database instances of the specified database type, or on specific database instances that you specify.
    e. **Schedule**: The time interval at which you want to run the query. For metric type custom queries, the metric value reported in between the specified intervals is the value observed in the previous query execution.
    The timeout for configured custom metric depends on the frequency of running the query. This table provides the timeout details based on the time interval:

Interval (minutes)	Timeout (seconds)
1	10
5	15
10	30
30	60
60	120
360	180
720	300
1440	300

    f. **Query Text**: The query that you want to execute. If you are creating a custom metric of Metric type, its query must have one of the following return types:
        i. Positive integer. For example, the query below returns a positive integer.

```
SELECT COUNT(*) FROM employees
```

        ii. String and positive integer. For example, the query below returns a string and a positive integer.

```
SELECT name, salary FROM employees
```

Custom queries appear for all collectors, but the data only reflects the collector that you created it for. You can test the semantics of the query and also validate the results by clicking the **Test Query** button.

Custom query results are validated if the Database Agent >= 4.5.5.

The following points provide information about using limits when configuring custom metrics:

- The total number of custom metrics or events that you can create per account is the product of `total number of Collectors` and `dbmon.config.max.custommetric`.
  By default, the value of `dbmon.config.max.custommetric` is 40. You can adjust the limit up to 150 using the `dbmon.config.max.custommetric` property in the Controller Settings.
- Up to 150 custom metrics can be reported per collector per minute.
- You can increase the custom metrics limit from the agent configuration properties by using the key, `dbagent.custom.metric.reportable.per.server` and the `Max` value 150. See Database Agent Configuration Properties for information about the key value.
- The maximum limit configured in the agent takes precedence and overrides the maximum limit configured at the account level and Controller level. Therefore, the priority order is as following:

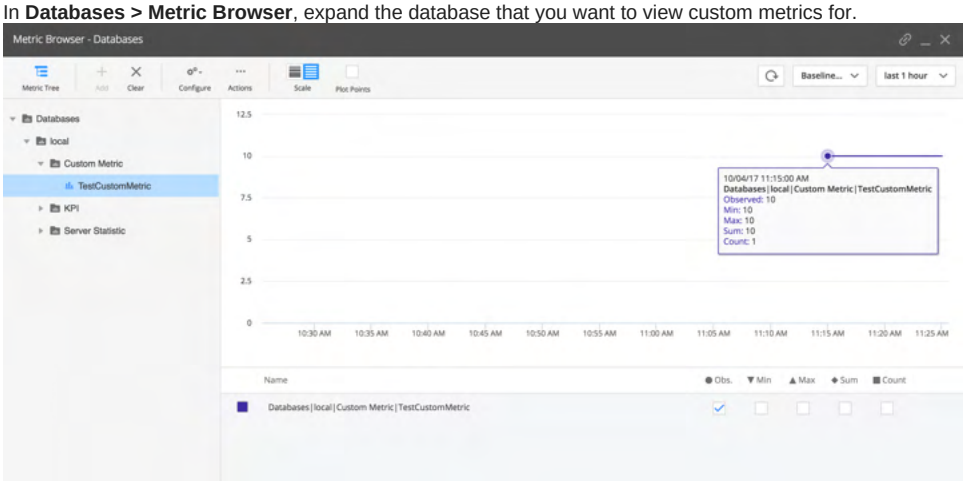
- Agent-level configuration
- Account-level configuration
- Controller-level configuration

Custom metrics are supported for all relational databases: MySQL, Microsoft SQL Server, Oracle, PostgreSQL, DB2, and Sybase.

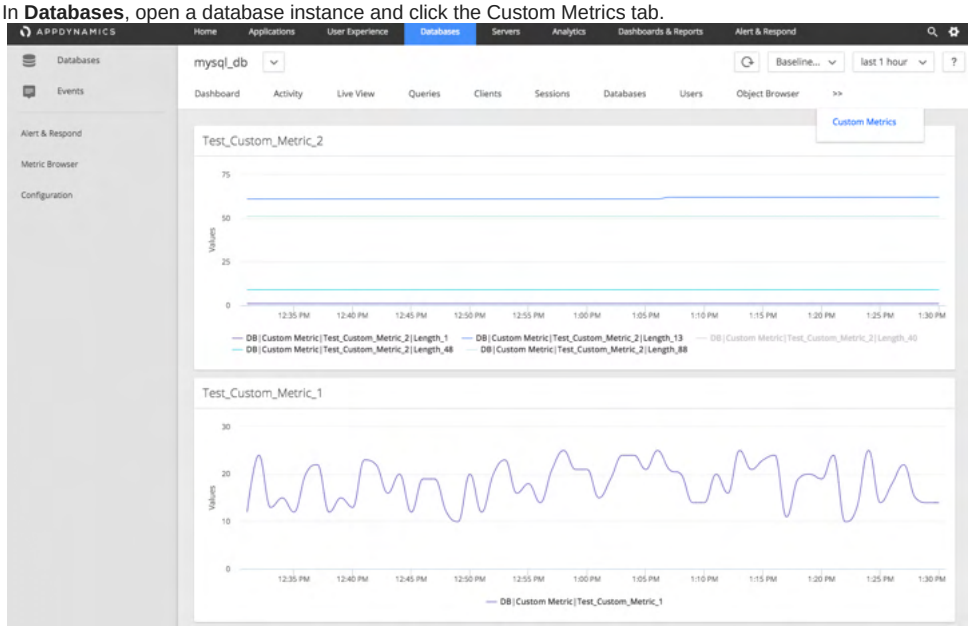
View Custom Metrics

You can view your custom metrics in the following locations:

- In **Databases > Metric Browser**, expand the database that you want to view custom metrics for.



- In **Databases**, open a database instance and click the Custom Metrics tab.



Configure Query Literals Security

In SQL, literals are the string or integer values representing data retrieved from the database. By default, literals are removed from SQL queries, as they can contain sensitive user data such as social security numbers, CC numbers, and so on.

To show literals in the queries, you can disable the **Remove literals from the queries** option.

1. Click **Databases**.
2. Click **Configuration**.
3. In the Security section, uncheck **Remove literals from the queries**.

Once you uncheck the option, literals will always be displayed in the queries. You can revert to hiding the literals by checking the option.

To record the audit logs when this option is enabled or disabled, ensure to configure the Controller audit report with the object name as **Remove Literals** and object type as **DBMON_ACCOUNT_CONFIGURATION**. See Controller Audit Log.

Integrate Database Visibility with Server Visibility

You can integrate Database Visibility with Server Visibility to capture accurate hardware metric details from the Machine Agent (with Server Visibility) to the Database Visibility dashboard. These metrics display without the need for an SSH connection to the host machine. Additionally, this integration helps the Server Visibility machine to automatically connect to the Database Visibility server when both the Database Agent and the Server Visibility Agent capture the same IP address.

When you integrate Server Visibility with Database Visibility, you can view these metrics on the Database Dashboard:

- **CPU Busy%** instead of CPU System% and CPU User%
- **Memory Used%**
- **Disk IO** (in Ops/sec for Reads and Writes) instead of Disk IO in KB/sec
- **Network IO** (in KB/sec for Outgoing and Incoming)

Requirements

To view the hardware metrics from Server Visibility to the Database Visibility dashboard, you must ensure to meet the following requirements:

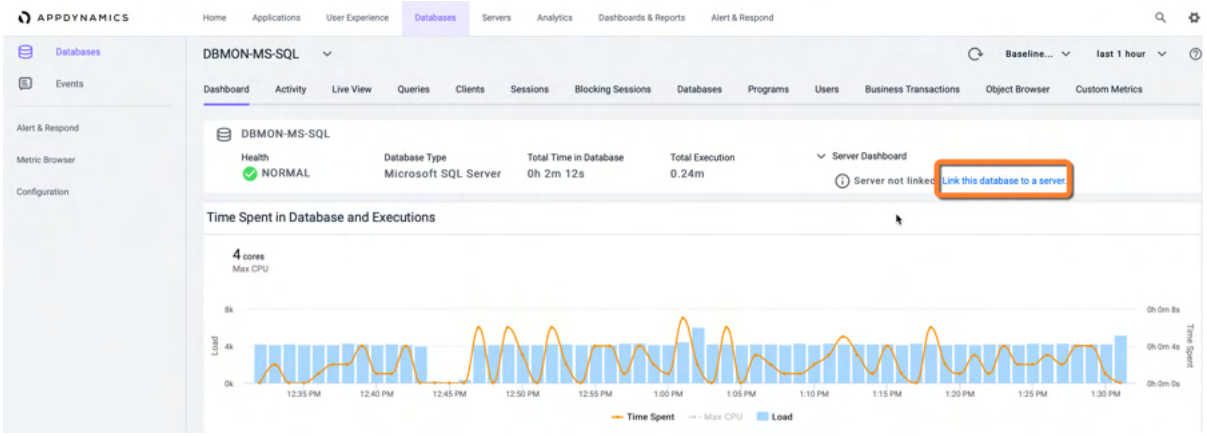
- Install and register Machine Agent.
- Enable Server Visibility on the Machine Agent. See Server Visibility.
- Disable the Hardware Monitoring section for the database collector. If you Configure the Database Agent to Monitor Server Hardware, then the Database Agent displays the hardware metrics based on the collector configuration using the SSH connection.

View Hardware Metrics

You can view the Server Dashboard section on the Databases dashboard when the Machine Agent and the Database Agents are registered and connected.

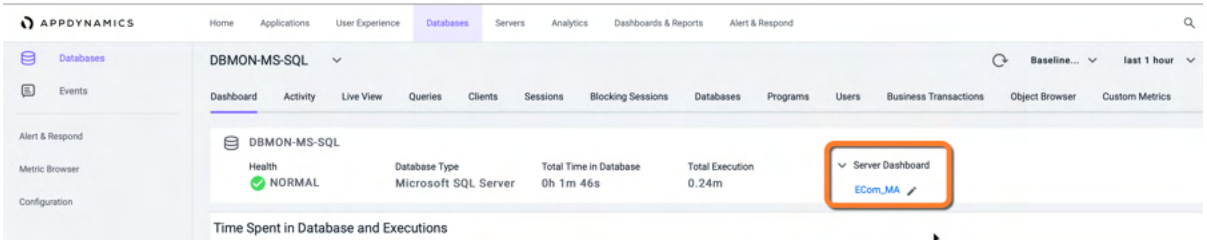
You can manually connect or disconnect the Database Visibility Server with the Server Visibility Server by using the URL, **Link this database to a server**, described in the Server Dashboard section. You may require to manually connect the database node to the Server Visibility server in these scenarios:

- The IP addresses do not match and the servers are not connected automatically.
- You want to connect the database server to another Server Visibility machine.
- You do not require connecting a particular database server to a Server Visibility machine.

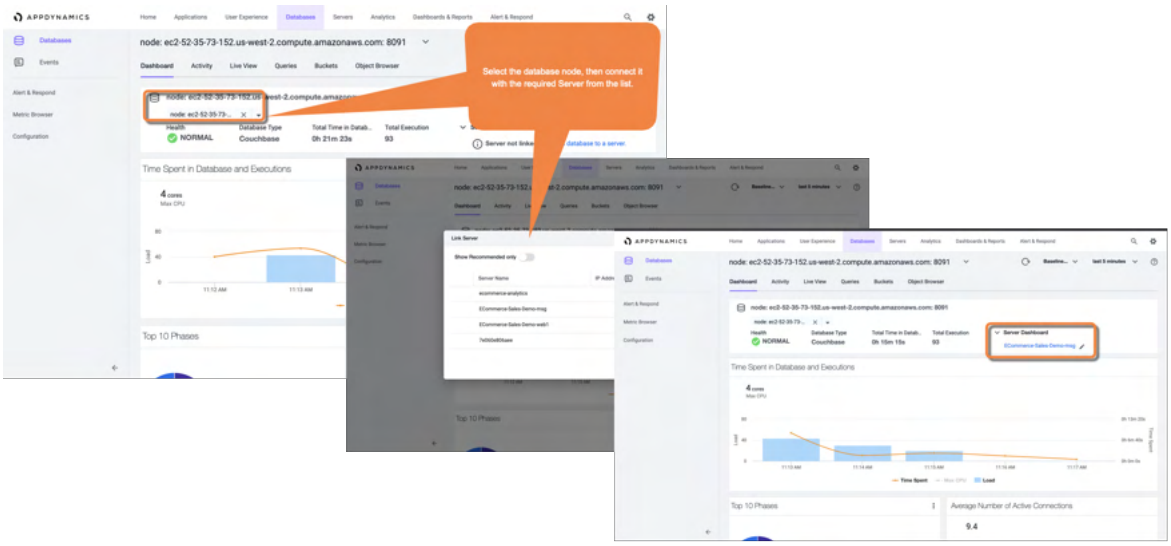


You can map multiple database nodes to a single Server Visibility machine.

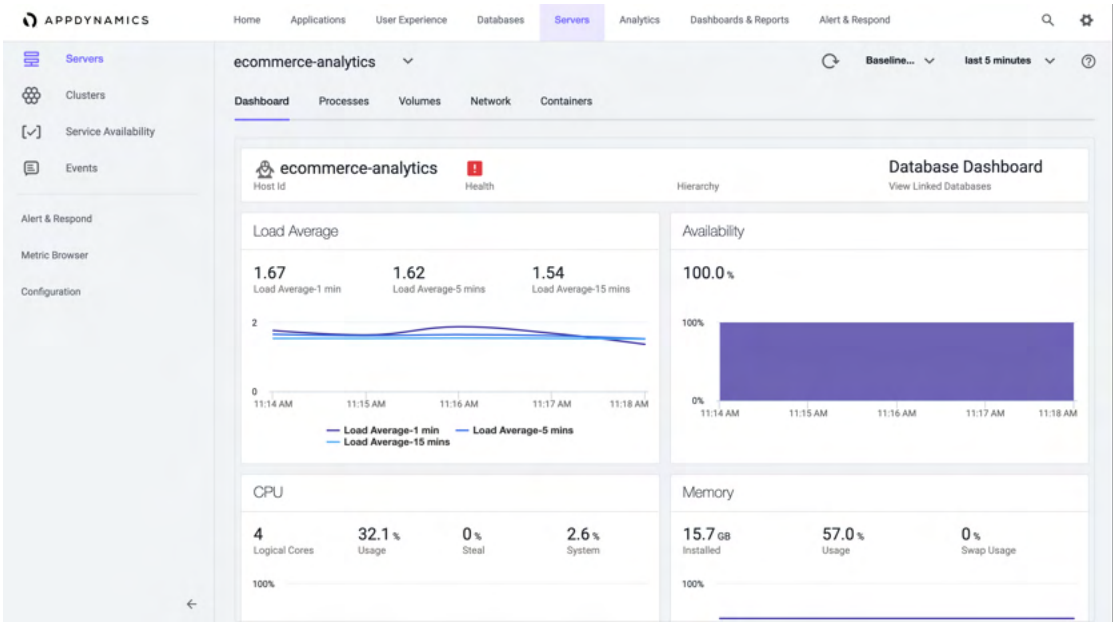
If the servers are connected, then you can find the link to the connected Server Dashboard under the **Server Dashboard** section.



For a database cluster, you can find the link to each Server Dashboard corresponding to each database node.



When you click the connected server under the **Server Dashboard** section, the page redirects to the Server Visibility dashboard with all the hardware metrics.



On the Server Dashboard, you can click the **Database Dashboard**, which displays a dialog that includes the list of database nodes that are connected to the Server Visibility machine. You can select any database node to navigate to the Database Dashboard.

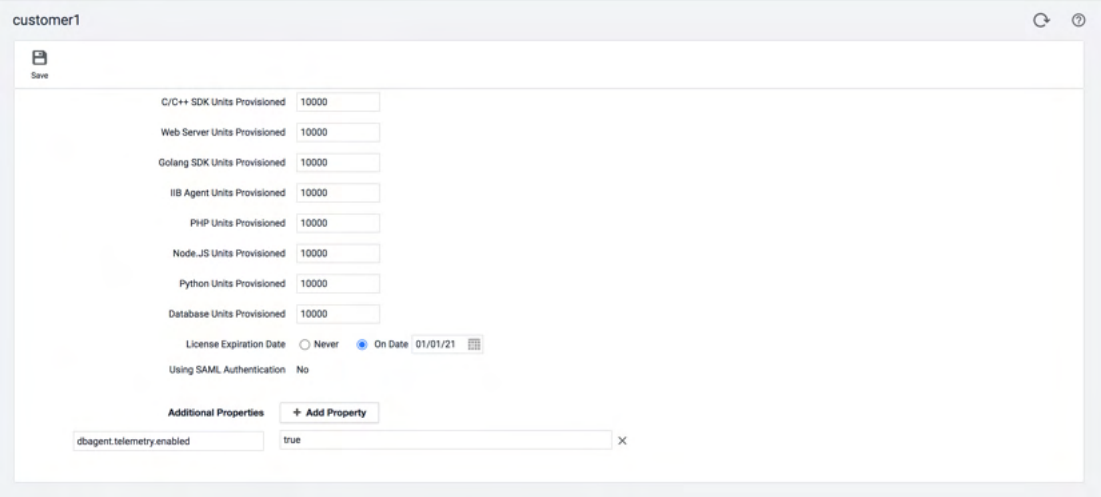
Database Agent Telemetry

You can monitor the Database Agent metrics and configure health rules for the agent. To add a health rule or view the metrics along with the status of the agent, you must enable the agent telemetry property.

Enable Database Agent Telemetry

You can enable the agent telemetry property at the account level on the Controller or at the agent level. If you configure the property on the Controller, all metrics display for each Database Agent. Whereas, if you configure the property in the agent configuration, the metrics display only for the configured agent.

For account level on Controller, use the Administration Console to add the `dbagent.telemetry.enabled` feature flag and set the value to `true`.



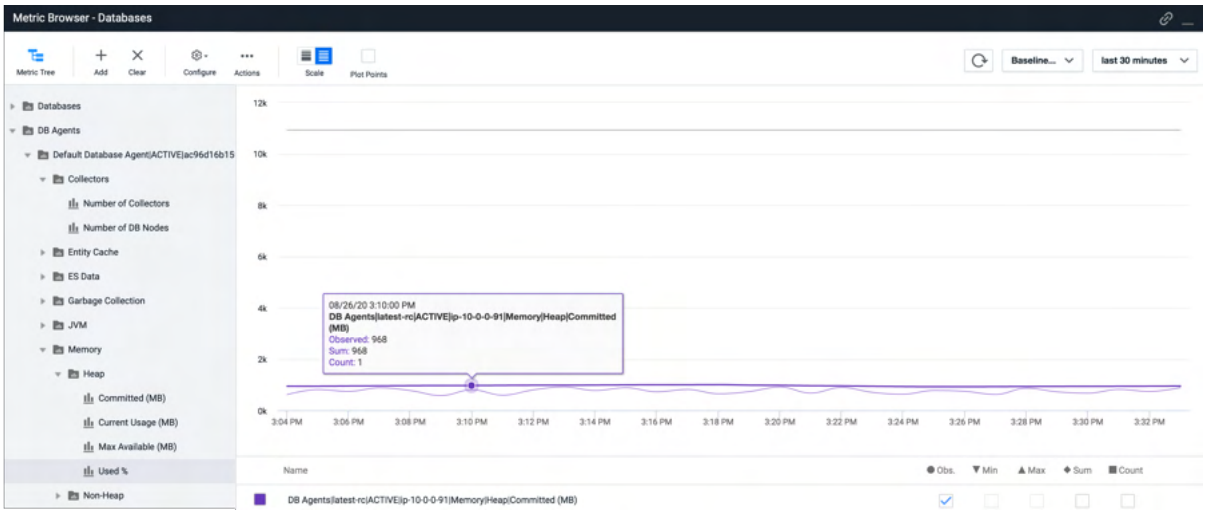
Similarly, for only specific Database Agents, start the Database Agent with the `-Ddbagent.telemetry.enabled=true` system properties.

> Each agent is associated with a unique host identifier and name. If two or more agents have the same name and unique identifier, the agents report metrics in the same node. Therefore, start a Database Agent with a different name and unique host identifier.
>
> The unique host identifier is by default the host-name of the Database Agent host machine. You can override the unique host identifier by using the system property `-Dappdynamics.agent.uniqueHostId=<Some_unique_identifier_name>`. See Unique Host ID at Database Agent Configuration Properties.

To configure a health rule for Database Agent, see Database Health Rules and Alerts.

Monitor Database Agent Metrics

You can view the Database Agent metrics in the **Metric Browser**. After enabling the Database Agent telemetry, the metric tree displays the list of Database Agent names along with its status under **DB Agents**. Each Database Agent name includes the list of Database Agent metrics.



JVM and Memory Metrics

This table lists the JVM and Memory metrics of Database Agent:

Metric Name	Description
DB AGENT|Memory|Heap|Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the heap
DB AGENT|Memory|Heap|Current Usage (MB)	Returns the amount of used memory in MB
DB AGENT|Memory|Heap|Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management
DB AGENT|Memory|Heap|Used %	(Current Usage/Max Available) * 100
DB AGENT|Memory|Non-Heap|Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the non-heap
DB AGENT|Memory|Non-Heap|Current Usage (MB)	Returns the amount of used memory in MB (for non-heap)
DB AGENT|JVM|Process CPU Burnt (ms /min)	CPU Time in milliseconds (ms) by this process
DB AGENT|JVM|Process CPU Usage %	CPU Used % in that minute. (CPU Time in that min/(Up Time in that min * number of processors))* 100 This metric is cumulative
DB AGENT|JVM|Threads|Current No. of Threads	Number of current live threads (including daemon and non-daemon)

Garbage Collections and Memory Pool Metrics

This table lists the Garbage Collections (GC) and the memory pool metrics:

Metric Name	Description
DB AGENT|Garbage Collection|Major Collection Time Spent Per Min (ms)	Time taken by Major GC at time of the metric collection
DB AGENT|Garbage Collection|Number of Major Collections Per Min	Major GC Count at time of the metric collection
DB AGENT|Garbage Collection|Minor Collection Time Spent Per Min (ms)	Time taken by minor GC at time of the metric collection
DB AGENT|Garbage Collection|Number of Minor Collections Per Min	Minor GC Count at time of the metric collection
DB AGENT|Garbage Collection|GC Time Spent Per Min (ms)	Major GC Time(if present) + Minor GC Time(if present)
DB AGENT|Garbage Collection|Memory Pools|Code Cache|Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the non-heap memory pools
DB AGENT|Garbage Collection|Memory Pools|Code Cache|Current Usage (MB)	Returns the amount of used memory in MB for non-heap memory pools
DB AGENT|Garbage Collection|Memory Pools|Code Cache|Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for non-heap memory pools
DB AGENT|Garbage Collection|Memory Pools|Compressed Class Space|Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the non-heap memory pools
DB AGENT|Garbage Collection|Memory Pools|Compressed Class Space|Current Usage (MB)	Returns the amount of used memory in MB for non-heap memory pools
DB AGENT|Garbage Collection|Memory Pools|Compressed Class Space|Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for non-heap memory pools
DB AGENT|Garbage Collection|Memory Pools|Metaspace|Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the non-heap memory pools
DB AGENT|Garbage Collection|Memory Pools|Metaspace|Current Usage (MB)	Returns the amount of used memory in MB for non-heap memory pools

DB AGENT|Garbage Collection|Memory Pools|PS Eden Space|Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the heap memory pools
DB AGENT|Garbage Collection|Memory Pools|PS Eden Space|Current Usage (MB)	Returns the amount of used memory in MB for heap memory pools
DB AGENT|Garbage Collection|Memory Pools|PS Eden Space|Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for heap memory pools
DB AGENT|Garbage Collection|Memory Pools|PS Old Gen|Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the heap memory pools
DB AGENT|Garbage Collection|Memory Pools|PS Old Gen|Current Usage (MB)	Returns the amount of used memory in MB for heap memory pools
DB AGENT|Garbage Collection|Memory Pools|PS Old Gen|Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for heap memory pools
DB AGENT|Garbage Collection|Memory Pools|PS Survivor Space|Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the heap memory pools
DB AGENT|Garbage Collection|Memory Pools|PS Survivor Space|Current Usage (MB)	Returns the amount of used memory in MB for heap memory pools
DB AGENT|Garbage Collection|Memory Pools|PS Survivor Space|Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for heap memory pools

The listed metrics are for Java HotSpot(TM) 64-Bit Server JVM and 1.8.0_212 Java version. These metrics might change depending on the JVM.

Cache Usage Metrics

The following table lists the cache usage metrics that are accumulated metrics for all collectors that are monitored by the Database Agent.

The following details help in understanding the metrics mentioned in the table:

- `entities` stores all the entities with its hash and id
- `unregQueryCache` stores all unregistered query entities till its registration
- `unregCaches` stores all unregistered entities (except Server, Query, Query Plan) till its registration
- `unregQueryPlanCache` stores all unregistered query plan entities till its registration
- `counters` store all the unregistered wait states till they get converted to DTO's and get Uploaded to Controller/ES
- `catalog` stores all the unregistered query statistics till they get converted to DTO's and get Uploaded to Controller/ES

MetricName	Description
DB AGENT|Entity Cache|Total Entities	The total number of all types of entities stored in EntityCache All entity types are taken into account except `Server`
DB AGENT|Entity Cache|Registered Entities	Number of entities registered in that minute All entity types are taken into account except Server
DB AGENT|Entity Cache|Pending Entities	Number of pending entities waiting in `unRegCache`, `unRegQueryCache`, or `unRegQueryPlanCache` to get registered All entity types are taken into account except `Server`
DB AGENT|Entity Cache|Duplicate Entities	Number of entities that are for re-registration All entity types are taken into account except `Server`
DB AGENT|Entity Cache|Unregistered Query Cache Size (KB)	Total query size in KB of queries that are present in the cache(`unregQueryCache`), waiting for registration Only the Query entity type is taken into account.
DB AGENT|ES Data|Cache Usage|Number Of Wait Counters	Number of Wait Counters present in the cache, waiting to get uploaded
DB AGENT|ES Data|Cache Usage|Number of Query Stats	Number of Query Stats present in the cache, waiting to get uploaded
DB AGENT|ES Data|Successful ES Uploads|Number of Wait Counters	Number of Wait Counters uploaded to ES in that min

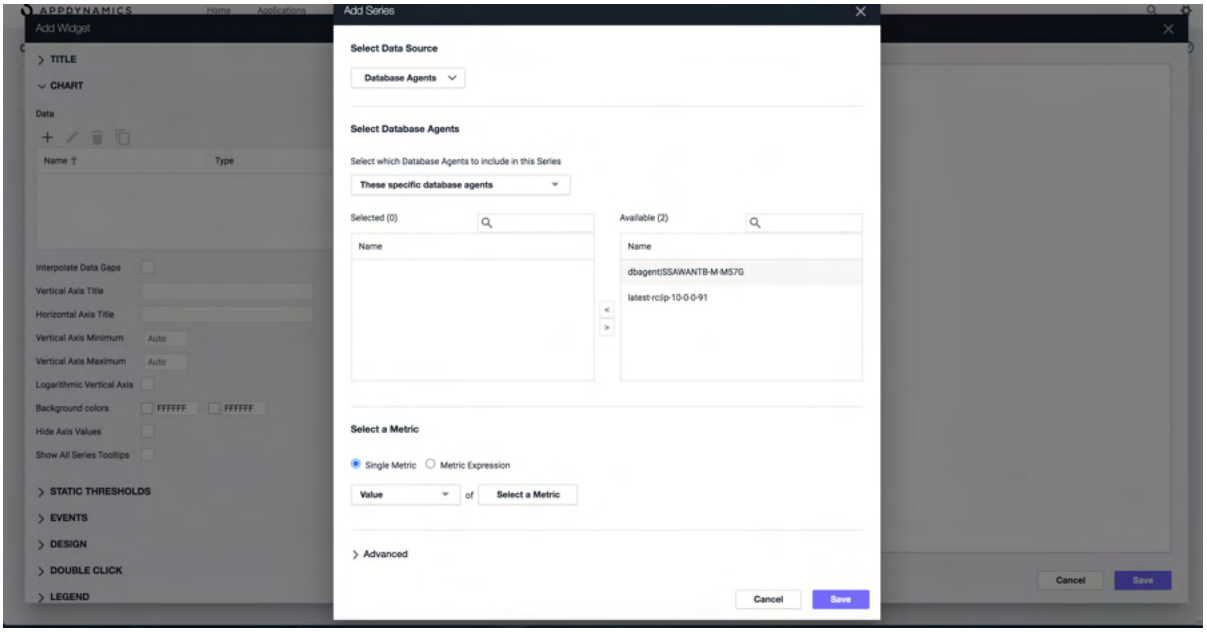
DB AGENT|ES Data|Successful ES Uploads|Number of Query Stats	Number of Query Stats uploaded to ES in that min

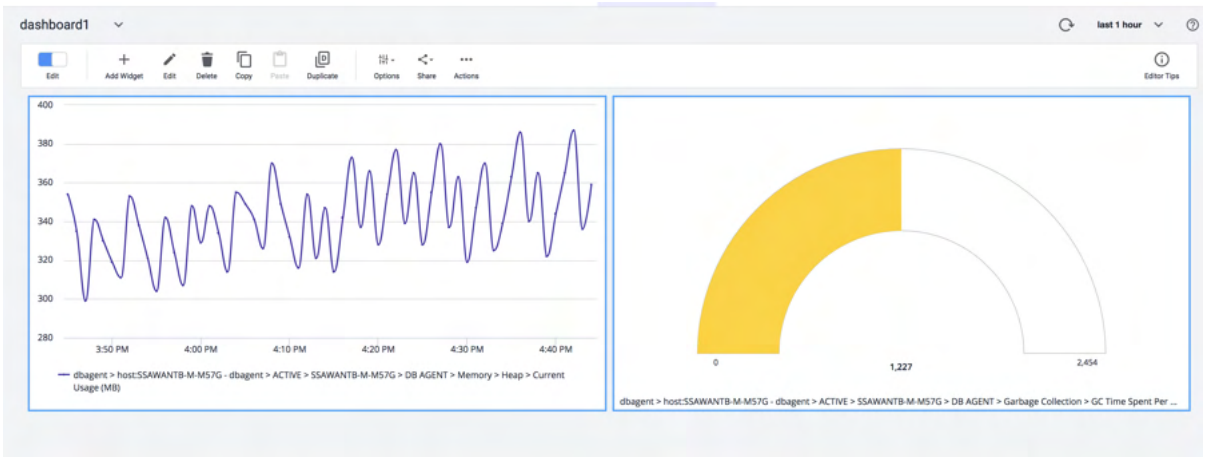
Monitor Database Agent Metrics on Database Custom Dashboard

You can monitor the Database Agent metrics on **Custom Dashboard**.

To create a custom dashboard:

1. Click **Dashboards & Reports > Create Dashboard**.
2. Add a widget.
3. Add the data by selecting the data source as **Database Agents**. See Custom Dashboards.





Infrastructure Visibility

AppDynamics Infrastructure Visibility provides end-to-end visibility on the performance of the hardware running your applications. You can use Infrastructure Visibility to identify and troubleshoot problems that can affect application performance such as server failures, JVM crashes, and network packet loss.

Infrastructure Visibility provides these metrics:

- CPU busy/idle times, disk and partition reads/writes, and network interface utilization (Machine Agents)
- Packet loss, round trip times, connection setup/tear down errors, TCP window size issues, and re-transmission timeouts (Network Visibility, additional license required)
- Disk/CPU/memory utilization, process, and machine availability (Server Visibility, additional license required)

Machine Agent

- Requirements and Supported Environments
- Install the Agent
- Configure the Agent
- Enable SSL for the Agent
- Administer the Agent
- Extensions and Custom Metrics
- Hardware Resources Metrics
- Machine Agent Metric Collection

Server Visibility

- Requirements and Supported Environments
- Monitoring Servers
- Configuring Docker Visibility
- Configuring Health Rules to Monitor Servers
- Tier Metric Correlator
- Server Tagging
- Service Availability Monitoring

Network Visibility

- Requirements and Supported Environments
- Set Up Network Visibility on Linux
- Administer the Network Agent on Linux
- Set up Network Visibility on Windows
- Administer the Network Agent on Windows
- Network Visibility Metrics
- FAQs for Network Visibility
- Workflows and Use Cases
- Advanced Operations

Monitoring Kubernetes and Containers

- Monitoring Kubernetes with the Cluster Agent
- Monitoring Containers with Docker Visibility
- Container Metrics

Overview of Infrastructure Visibility

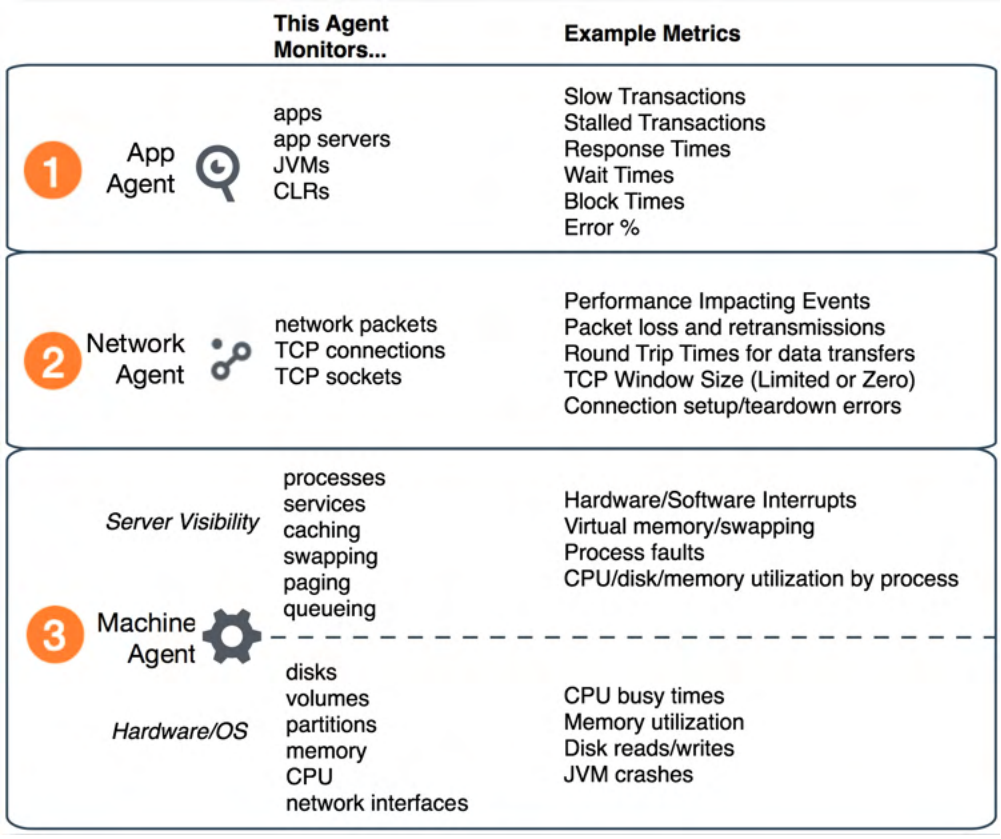
You can determine the root cause of application issues by looking at application, network, server, and machine metrics that measure infrastructure utilization.
For example, the following infrastructure issues may slow down your application:

- Too much time spent in garbage collection of temporary objects (application metric)
- Packet loss between two nodes that results in re-transmissions and slow calls (network metric)
- Inefficient processes that result in high CPU utilization (server metric)
- Excessively high rates of reads/writes on a specific disk or partition (hardware metric)

Infrastructure Visibility enables you to isolate, identify, and troubleshoot these types of issues. Infrastructure Visibility is based on a Machine Agent that runs with an App Server Agent on the same machine. These two agents provide multi-layer monitoring:

1. The App Server Agent collects metrics about applications and identifies applications, tiers, and nodes with slow transactions, stalled transactions, and other application-performance issues.
2. The Network Agent monitors the network packets sent and received on each node and identifies lost/re-transmitted packets, TCP bottlenecks, high round trip times, and other network issues.
3. The Machine Agent collects metrics at two levels:
    - Server Visibility metrics for local processes, services, and resource utilization.
    - Basic machine metrics for disks, memory, CPU, and network interfaces.

This multi-layer monitoring enables you to determine possible correlations between application issues and service, process, hardware, network, or other issues on the machine.



Network Visibility

Network Visibility monitors traffic flows, network packets, TCP connections, and TCP ports. Network Agents leverage the APM intelligence of App Server Agents to identify the TCP connections used by each application. Network Visibility includes:

- Detailed metrics about dropped/re-transmitted packets, TCP window sizes (Limited/Zero), connection setup/tear down issues, high round trip times, and other performance-impacting issues
- Network Dashboard that highlights network KPIs (Key Performance Indicators) for tiers, nodes, and network links
- Right-click dashboards for tiers, nodes, and network links that enable quick drill-downs from transaction outliers to network root causes
- Automatic mapping of TCP connections with application flows
- Automatic detection of intermediate load balancers that split TCP connections
- Diagnostic mode for collecting advanced diagnostic information for individual connections

Server Visibility

Server Visibility monitors local processes, services, and resource utilization. You can use these metrics to identify time windows when problematic application performance correlates with problematic server performance on one or more nodes.

Server Visibility is an add-on module to the Machine Agent. With Server Visibility enabled, the Machine Agent provides the following functionality:

- Extended hardware metrics such as machine availability, disk/CPU/virtual-memory utilization, and process page faults
- Monitor application nodes that run inside Docker containers and identify container issues that impact application performance
- The Tier Metric Correlator which enables you to identify load and performance anomalies across all nodes in a tier
- Import and define server tags used to query, filter, and compare related servers using custom metadata
- Monitor internal or external HTTP and HTTPS services
- Support for grouping servers so you can apply health rules to specific server groups
- Support for defining alerts that trigger when certain conditions are met or exceeded based on monitored server hardware metrics

Basic Machine Metrics

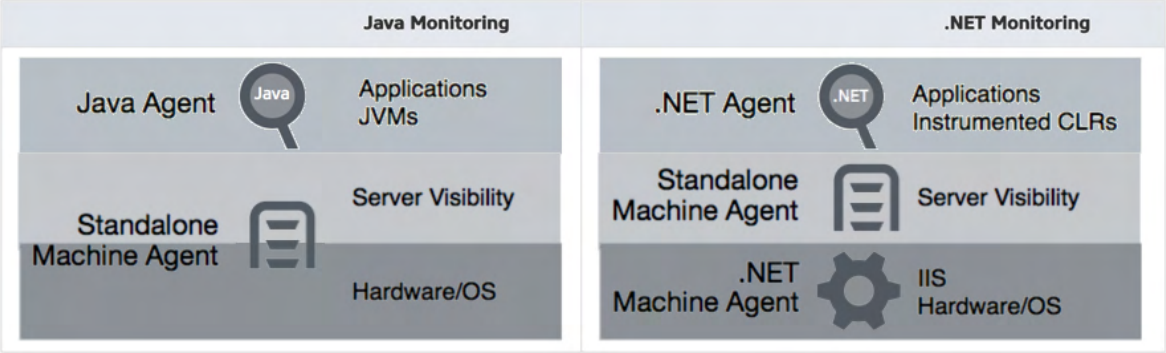
The Machine Agent collects basic hardware metrics from the server's OS and provides the following functionality:

- Basic hardware metrics from the server's OS such as CPU and memory utilization, throughput on network interfaces, and disk and network I/O
- Support for creating extensions to generate custom metrics
- Support for running remediation scripts to automate your runbook procedures. You can optionally configure the remediation action to require human approval before starting the script.
- JVM Crash Guard for monitoring JVM crashes and optionally running remediation scripts

Java and .NET Infrastructure Monitoring

Infrastructure Visibility uses different agents to monitor Java and .NET environments:

- The Java Agent collects metrics for business applications and JVMs. The Machine Agent collects Server Visibility and hardware/OS metrics.
- The .NET Agent collects metrics for business applications and instrumented CLRs. The .NET Agent includes a .NET Machine Agent that collects IIS and hardware/OS metrics (see Monitor Windows Hardware Resources). The Machine Agent collects Server Visibility metrics.



Infrastructure Visibility Strategies

You can use these strategies to locate infrastructure issues that affect application performance:

- Transaction snapshots for slow or stalled transactions – Use snapshots to correlate infrastructure metrics for the specific node so that you can identify the root cause of slow or stalled transactions.
- Metric correlation –
  - One example workflow is to open the Node Dashboard for a mission-critical server with a machine agent installed and then cross-compare data in the following tabs:
    - JVM (application performance)
    - JMX (server performance)
    - Server (hardware resource consumption)
  - The Network Dashboard includes right-click dashboards for tiers, nodes, and network links. Use these dashboards to find correlations between application issues and network root causes.
  - The Tier Metric Correlator enables you to identify load and performance anomalies in a tier composed of a cluster of nodes running on containers or servers.
- Health rules – Configure health rules on metrics such as garbage collection time, connection pool contention, or CPU usage to catch issues early in the cycle before any impact on your business transactions.
- Infrastructure rules, policies, and alerts –
  - Create health rules on metrics such as garbage collection time, connection pool contention, or CPU usage to catch issues early in the cycle before any impact on your business transactions.
  - Define policies that trigger actions (such send an email, start diagnostics, or perform a thread dump) when Infrastructure metrics report a critical level.
  - You can configure alerts for JVM and CLR crashes respectively using JVM Crash Guard and the .NET Machine Agent.
  - Configure the agent to run scripts in response to critical events (for example, restart an application or JVM in response to a crash).

With the right monitoring strategy in place, you can be alerted to problems and fix them before user transactions are affected.

Hardware Resources Metrics

This page describes the basic hardware metrics collected by the Machine Agent and the additional metrics collected by the Machine Agent for Server Visibility. Not all of the metrics that appear in the Hardware Resources branch of the Metric Browser tree are provided by the Machine Agent; some are collected by the Database Agent and are used in the Database Monitoring UI, while others might be custom metrics added by another extension run by your Machine Agent.

For most metrics in the Metric Browser, you can select any point in the graph to view more information about the metric observed at that point in time. The information includes the metric identifier, date and time of the observation, along with any of the following values relevant to the metric:

- **Obs** (observed value): Average of all data points seen for that interval. For a cluster or a time rollup, this represents the weighted average across nodes or over time.
- **Min**: Minimum data point value seen for that interval
- **Max**: Maximum data point value seen for that interval
- **Sum**: Sum of all data point values seen for that interval. For the Percentile Metric for the App Agent for Java, this is the result of the percentile value multiplied by the Count.
- **Count**: Number of data points generated for the metric in that interval. The collection interval for infrastructure metrics varies by environment. For example:
    - For AIX, HP-UX, Mac OS X and Z/OS: CPU and memory metrics are gathered every two seconds and averaged over a period of one minute. Machine agent network and disk metrics are gathered at one-minute intervals.
    - For Windows, Linux, and Solaris: All metrics are collected at one-minute intervals and aggregated over one-minute intervals.

CPU Metrics

Metric Name	Description	Basic or Server Visibility	Windows	Linux [1]	Solaris	AIX	Default Monitoring Mode [3]
%Idle	Percentage of time the CPU was idle; the CPU had completed its tasks and has nothing to do.	Basic	✓	✓	✓	✓	KPI
%Busy	Percentage of time the CPU was busy processing system or user requests; this metric includes CPU Stolen time.	Basic	✓	✓	✓	✓	KPI
%Stolen [4]	Usually, stolen time is the percentage of time a virtual CPU waits for a real CPU while the hypervisor is servicing another virtual processor.	Basic	✓	✓	✓	✓	KPI
%Nice	Percentage of CPU time spent on low priority processes.	Server Visibility	✗	✓	✗	✗	Advanced
System	Percentage of time the CPU was busy processing kernel code.	Server Visibility	✓	✓	✓	✓	KPI
User	Percentage of time the CPU was busy processing non-kernel code.	Server Visibility	✓	✓	✓	✓	KPI
IOWait	Percentage of CPU time spent waiting for an I/O request.	Server Visibility	✗	✓	✓	✗	KPI
%Irq	Percentage of CPU time spent servicing hardware interrupts.	Server Visibility	✗	✓	✗	✗	Diagnostic
%SoftIrq	Percentage of CPU time spent servicing software interrupts.	Server Visibility	✗	✓	✗	✗	Advanced
%Busy 95th Percentile [2]	The CPU %Busy percentage was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI
IOWait 95th Percentile [2]	The CPU %Busy percentage was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI

1 See Linux Kernel Processes.

2 See Percentile Metric Reporting must be Enabled.

3 See Default Monitoring Mode.

4 See Stolen Times are Reported Differently.

Memory Metrics

Metric Name	Description	Basic or Server Visibility	Windows	Linux [1]	Solaris	AIX	Default Monitoring Mode [3]
Total (MB)	The total amount of memory.	Basic	✓	✓	✓	✓	KPI

Used %	The percentage of memory used.	Basic	✓	✓ [4]	✓	✓	KPI
Used (MB)	The amount of memory used.	Basic	✓	✓ [4]	✓	✓	Advanced
Free %	Percentage of free or unused memory available for processes.	Basic	✓	✓ [4]	✓	✓	Advanced
Free (MB)	The total amount of free or unused memory available for processes.	Basic	✓	✓ [4]	✓	✓	Advanced
Swap Free (MB)	The total amount of free swap space. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	Advanced
Swap Total (MB)	The total amount of allocated swap space. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	KPI
Swap Used (MB)	The amount of swap space used. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	Advanced
Swap Used %	The percentage of available swap space used. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	KPI
Swap Free %	Percentage of free swap space. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	Advanced
Pages Paged In 95th Percentile [2]	The paging-in rate to memory was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI
Pages Paged Out 95th Percentile [2]	The paging-out rate from memory was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI
Pages Swapped In 95th Percentile [2]	The swapping rate of pages from disks was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI
Pages Swapped Out 95th Percentile [2]	The swapping rate of pages to disks was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI

1 See Linux Kernel Processes.

2 See Percentile Metric Reporting must be Enabled.

3 See Default Monitoring Mode.

4 See Configure Free/Used Memory Metric Calculation on Linux.

Disk and Partition Metrics

The agent reports metrics for each disk partition and for disks in aggregate. Only mounted partitions and local partitions are reported.

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode[1]
KB read /sec	The number of KB per second read from all disks and partitions.	Basic	✓	✓	✓	✓	Advanced
KB written /sec	The average amount of data per second written to all disks and partitions.	Basic	✓	✓	✓	✓	Advanced
Reads/sec	Number of read operations per second performed on all disks and partitions.	Basic	✓	✓	✓	✓	KPI
Writes/sec	Number of write operations per second performed on all disk and partitions.	Basic	✓	✓	✓	✓ [5]	KPI
Avg IO Utilization (%)	The average time spent processing read/write requests on all disks and partitions as a percentage of the total reported time window. Databases often report high disk I/O utilization due to frequent read/write requests. For example, if the agent detects read/write processing in 55 out of 60 seconds, the Avg IO Utilization for that minute is 92%. This metric does not measure the amount of available disk space or read/write request sizes.	Server Visibility	✓	✓	✓	✓	KPI
<partition> %CPU Time	The percentage of CPU processing consumed by a partition during read and write operations.	Basic	✗	✓	✗	✓	Diagnostic
<partition> Avg Service Time (ms)	Time in milliseconds spent performing read and write operations across one partition.	Basic	✗	✓	✓	✓	Diagnostic
<partition> Avg Queue Time (ms)	Time in milliseconds that a read or write request is in the queue before it gets processed across one partition.	Basic	✗	✓	✗	✓	KPI
<partition> KB read /sec	The average amount of data per second read from one specific partition.	Basic	✓	✓	✓	✓	Diagnostic
<partition> KB written /sec	The average amount of data per second written to one specific partition.	Basic	✓	✓	✓	✓	Diagnostic
<partition> Reads/sec	Number of read operations per second performed on one specific partition.	Basic	✓	✓	✓	✓	KPI

<partition> Writes /sec	Number of write operations per second performed on one specific partition.	Basic	✓	✓	✓	✓[5]	KPI
<partition> Space Available	The amount of unused or free disk space on a specific partition in KB.	Basic	✓	✓[4]	✓	✓	KPI
<partition> Space Used	The amount of used or unavailable disk space on a specific partition in KB.	Basic	✓	✓[4]	✓	✓	Advanced
<partition> Avg IO Utilization (%)	The average time spent processing read/write requests as a percentage of the total reported time window. Databases often report high disk I/O utilization due to frequent read/write requests. For example, if the agent detects read/write processing in 55 out of 60 seconds, the Avg IO Utilization for that minute is 92%. This metric does not measure the amount of available disk space or read/write request sizes.	Server Visibility	✓	✓	✓	✓	KPI
<partition> Avg read time (ms)	The average time in milliseconds required to service a read request by all disks or by one specific disk or across one partition.	Server Visibility	✓[2]	✓	✓	✗	KPI
<partition> Avg write time (ms)	The average time in milliseconds required to service a write request across one partition.	Server Visibility	✓[2]	✓	✓	✗	KPI
<partition> Queue Time 95th Percentile [3]	The queue time for read/write requests was this long or shorter 95% of the time for the reported time window.	Server Visibility	✗	✓	✗	✓	KPI

1 See Default Monitoring Mode.

2 For some versions of Windows Server 2008 and Windows Vista, the Hardware Resources|Disks|<partition>|Avg Read Time (ms) and Hardware Resources|Disks|<partition>|Avg Write Time (ms) metrics will be reported as 0. This is due to a known bug with Windows. To resolve this issue, download the hotfix: https://support.microsoft.com/en-us/kb/961435.

3 See Percentile Metric Reporting must be Enabled.

4 See Configure Disk Usage Metric Collection on Linux.

5 See HardwareMonitor and JavaHardwareMonitor Calculate "Writes/Sec" Differently on AIX Machines

Volume Metrics

AppDynamics Server Visibility retrieves the volume space metrics on POSIX systems using the `df` command. The volume metrics are reported across all listed volumes and for each volume at a specified mount point, such as `"/boot"`. Only local volumes are reported.

Metric Name	Description	Basic or Server Visibility	Windows	Linux [1]	Solaris [2]	AIX	Default Monitoring Mode[3]
Total (MB)	The amount of storage space available (used and free) across all listed volumes or at the specified mount point. On Linux, the space reserved for root is not counted in the available space.	Server Visibility	✓	✓	✓	✓	KPI
Free (MB)	The amount of unused or free space across all listed volumes or on the selected volume at the specified mount point. On Linux, the space reserved for root is not counted in the available space.	Server Visibility	✓	✓	✓	✓	Advanced (*volume*)
Used (MB)	The amount of storage space in use across all listed volumes or on the selected volume at the specified mount point.	Server Visibility	✓	✓	✓	✓	Advanced (*volume*)
Used (%)	The percentage of storage space in use across all listed volumes or on the selected volume at the specified mount point.	Server Visibility	✓	✓	✓	✓	KPI
Count	The number of partitions for which storage space metrics are collected.	Server Visibility				✓	KPI
<partition> Free (MB)	The amount of unused or free space for <partition>.	Server Visibility				✓	KPI
<partition> Total (MB)	The amount of storage space available (used and free) for <partition>.	Server Visibility				✓	KPI
<partition> Used (%)	The percentage of storage space in use for <partition>.	Server Visibility				✓	KPI
<partition> Used (MB)	The amount of storage space in use for <partition>.	Server Visibility				✓	Advanced

1 Only **/dev** volumes are monitored on Linux.

2 Only **/dev/dsk** and **/rpool** volumes are monitored on Solaris.

3 See Default Monitoring Mode.

Load Metrics

The load metrics are reported for each machine. The CPU % (reported as part of the basic Machine Agent metrics) is the percentage of the CPU consumed by processes that are currently running. Load takes into account processes that are waiting to run. These metrics are shown as percentages in the Server Dashboard and are scaled by 100 in the Metric Browser.

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode[1]
Last 1 minute	CPU Load, presented as an average over the last 1 minute.	Server Visibility	✓	✓	✓	✓	KPI
Last 5 minutes	CPU Load, presented as an average over the last 5 minutes.	Server Visibility	✓	✓	✓	✓	KPI
Last 15 minutes	CPU Load, presented as an average over the last 15 minutes.	Server Visibility	✓	✓	✓	✓	KPI

1 See Default Monitoring Mode.

Machine Metrics

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode[1]
Availability	The percentage of time the Machine Agent was reporting to the Controller. In the Server Visibility UI, this provides a percentage with 6 digits of precision (for example, 100.0000) to measure availability. The Machine Agent sends a heartbeat to the AppDynamics Controller once per minute to indicate the agent is reporting. Reported for each machine.	Server Visibility	✓	✓	✓	✓	KPI

1 See Default Monitoring Mode.

Network Metrics

The Machine Agent is configured to ignore virtual networks by default. See Machine Agent Settings for Server Visibility.

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode[1]
Incoming KB[2]	The volume of data received by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Incoming KB /sec	The amount of data per second received by all monitored network devices.	Basic	✓	✓	✓	✓	KPI
Incoming packets[2]	The number of packets received by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Incoming packets/sec	The number of data packets per second received by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Outgoing KB[2]	The volume of data sent by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Outgoing KB /sec	The volume of data sent per second by all monitored network devices.	Basic	✓	✓	✓	✓	KPI
Outgoing packets[2]	The number of packets sent by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Outgoing packets/sec	The number of data packets sent per second by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Incoming Errors/min	The number of incoming packet errors the network incurs every minute.	Server Visibility	✓	✓	✓	✓	KPI
Outgoing Errors/min	The number of outgoing packet errors the network incurs every minute.	Server Visibility	✓	✓	✓	✓	KPI
Avg Utilization (%)	The average network utilization as a percentage of the maximum possible throughput. This metric is not reported if the agent cannot determine the throughput (not supported for some devices and Linux versions). The percentage is rounded to the nearest integer. Therefore, very low utilization may be reported as 0%. Reported for: • Servers • <group> • <network interface>	Server Visibility	✓	✓	✓	✓	KPI
<network interface> Incoming KB	The volume of data received by the selected network interface.	Basic	✓	✓	✓	✓	Advanced

<network interface> Incoming KB /sec	The volume of data received per second by the selected network interface.	Basic	✓	✓	✓	✓	KPI
<network interface> Incoming packets	The number of data packets received by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Incoming packets/sec	The number of data packets received per second by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Outgoing KB	The volume of data sent by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Outgoing KB /sec	The volume of data sent per second by all monitored network interface.	Basic	✓	✓	✓	✓	KPI
<network interface> Outgoing packets	The number of data packets sent per second by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Outgoing packets/sec	The number of data packets sent per second by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Incoming Errors/min	The number of incoming packet errors the network incurs every minute.	Server Visibility	✓	✓	✓	✓	KPI
<network interface> Outgoing Errors/min	The number of outgoing packet errors the network incurs every minute.	Server Visibility	✓	✓	✓	✓	KPI

1 See Default Monitoring Mode.

2 The ServerMonitoring and JavaHardwareMonitor extensions calculate unidirectional throughput (packet/KB) metrics differently. ServerMonitoring reports the total number of packets /bytes in the last minute. JavaHardwareMonitor reports the total number of packets/bytes from the time the Machine Agent started.

Process Metrics

The following metrics are aggregated and reported for each process or process class (except Total Process Count, which measures all processes observed by the agent). See Machine Agent Settings for Server Visibility to modify the default process monitoring.

Metric Name	Description	Basic or Server Visibility	Windows	Linux [1]	Solaris [2]	AIX	Default Monitoring Mode[3]
Count	The number of processes in this class consuming CPU or memory resources or the total number of processes in this class.	Server Visibility	✓	✓	✓	✓	Diagnostic
CPU Used (%)	Percentage of the CPU bandwidth used by all processes in a process class. A process using 100% CPU is executing on all processors on the system. If there are four cores on the machine and the process is executing four threads, each executing on one core, then the process can use up to 400% CPU. If there are four cores on the machine and the process is executing one thread on one core, then the process can use up to 25% CPU.	Server Visibility	✓	✓	✓	✓	KPI
Major Faults/sec	Number of major page faults caused by all processes in this class.	Server Visibility	✗	✓	✗	✓	Diagnostic
Minor Faults/sec	Number of minor page faults caused by all processes in this class.	Server Visibility	✗	✓	✗	✓	Diagnostic
Memory Used (%)	Percentage of memory consumed by the top 10 consuming processes or the percentage of memory used by all processes in this class.	Server Visibility	✓	✓	✓	✓	KPI
Memory Used (KB)	Amount of memory used by all processes in this class.	Server Visibility	✓	✓	✓	✓	Advanced
Memory Virtual (KB)	Current size of the virtual address space that the process is using. Use of virtual address space does not necessarily imply a corresponding use of either disk or main memory pages. Virtual space is finite and, by using too much, the process can limit its ability to load libraries.	Server Visibility	✓	✓	✓	✓	Advanced
Thread Count	The number of kernel threads used by all processes in this class.	Server Visibility	✓	✓	✓	✓	Diagnostic

Total Process Count	All individual processes observed by the Machine Agent, *before* it filters out unreported processes and groups the remaining processes into classes. You can use this metric to identify anomalies in the number of processes running on a specific machine. For example, if the average Total Process Count on a machine is usually 200 to 300, and then suddenly rises to 2000 or more, this could indicate a problem on that machine. To collect this metric, the Machine Agent captures the number of processes every 30 seconds and calculates the average number of processes per minute. • Observed is the average number of processes per minute. • Min and Max are the 30-second buckets with the least and most processes. • Count and Sum are the number of process captures each minute and the sum of the processes in each capture for that minute (capture1 + capture2).	Server Visibility	✓	✓	✓	✓	Diagnostic

1 See Linux Kernel Processes.

2 When collecting Process metrics on Solaris, the Machine Agent observes and captures only the first 80 characters of each process name and argument list. The agent considers only the first 80 characters of each process string when it applies allowlists ("always monitor this process") and blocklists ("never monitor this process") defined in ServerMonitoring.yml.

3 See Default Monitoring Mode.

Service Availability Metrics

Reported for each service that is configured.

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode[1]
Response Time (ms)	The elapsed time between sending a request and receiving a response from the monitored service.	Server Visibility	✓	✓	✓	✓	KPI
Response Size (bytes)	The size of the response received from the monitored service.	Server Visibility	✓	✓	✓	✓	KPI
Success Rate (%)	The percentage of successful requests over all requests made to the service.	Server Visibility	✓	✓	✓	✓	KPI

1 See Default Monitoring Mode.

Enable Percentile Metric Reporting

You must enable percentile metric reporting on both the Controller and the Machine Agent. By default, reporting is *disabled* on the Controller and *enabled* o n the Machine Agent.

- To enable/disable reporting on the Controller, log in to the Controller Administration Console and set the `sim.machines.percentile.percentileMonitoringAllowed` property. See Controller Settings for Machine Agents.
- To enable/disable reporting on the agent, open the `<machine_agent_home>/extensions/ServerMonitoring/conf/ServerMonitoring.yml` file and set the `percentileEnabled` property. See Machine Agent Settings for Server Visibility.

Configure Disk Usage Metric Collection on Linux

You can configure the Linux Machine Agent to calculate the following metrics similar to using the Linux `df` command:

- Servers > Volumes > /opt > Disk Usage
- Metric Browser > Disks and Partitions > <partition> > Space Available
- Metric Browser > Disks and Partitions > <partition> > Space Used

Linux includes a mechanism for reserving some disk space to ensure that the system remains functioning even if non-privileged users consume all other disk space. By default, these metrics do not include this reserved space. The total disk space reported by the agent might differ from the total disk space reported by the Linux `df` command or other sources.
To override this default, and to ensure that these metrics include this reserved space, run the agent with the following command-line argument:

```
-Dappdynamics.machine.agent.extensions.calcVolumeFreeAndUsedWithDfCommand=true
```

This feature is supported for Linux versions of the Machine Agent only.

Configure Free/Used Memory Metric Collection on Linux

You can configure how the Machine Agent calculates the amount of free and used memory on Linux machines. By default, the agent calculates any slab-reclaimable memory as used (not free) memory.
To configure the agent to calculate slab-reclaimable memory as free (not used) memory, run Machine Agent with the following command-line argument:

```
-Dappdynamics.machine.agent.extensions.countSlabReclaimableAsFreeMem=true
```

This setting affects the following metrics:

- Memory Usage (in Server Dashboard)
- Memory Used %, Memory Used MB, Memory Free %, and Memory Free MB (in Metric Browser)

Viewing Server Visibility Metrics

You can only view Server Visibility metrics in the Server Visibility version of the Metric Browser. You see this when you access the Metric Browser from the Servers tab in the top navigation bar of the Controller UI.

Machine Agent Versus .NET Machine Agent

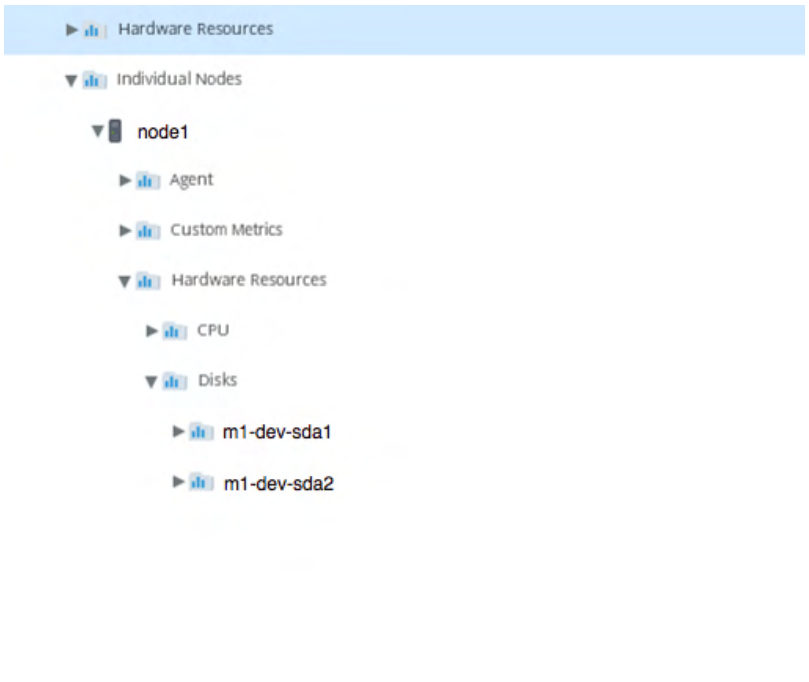
If a server has both Machine and .NET Agents installed, there may be differences in metric values reported by the Machine Agent and the .NET Agent due to different averaging rates and measurement methods. See .NET Compatibility Mode.

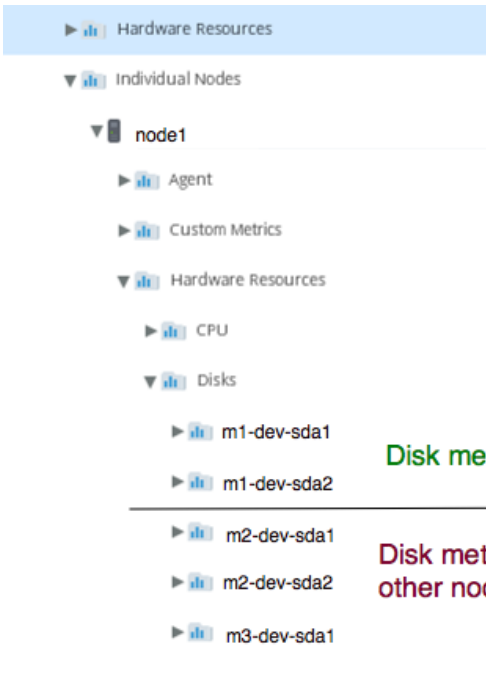
Streamlined Browsing Mode

The Server Metric Browser includes a Streamlined Browsing option for node metrics. Use this option to browse metrics for tiers that contain multiple nodes.

- With Streamlined Browsing enabled, each node in the browser tree view shows only metrics reported by the Machine Agent on the corresponding node.
- With Streamlined Browsing enabled, the **Hardware Resources** and **Custom Metrics** folders do not display.
- With Streamlined Browsing disabled, each node in the browser tree view also shows metrics for other nodes in the same tier (with no indication of the node that corresponds to which tier group).

This streamlining option is not enabled by default. AppDynamics recommends that you enable this option. To enable this option, go to: `http://<controller host>:<port>/controller/admin.jsp` and set `sim.metrics.metricBrowser.machineMetricMappings.enabled` to true.

Streamlined Browsing Enabled	Streamlined Browsing Disabled
	




Linux Kernel Processes

The Machine Agent has a processSelectorRegex setting that specifies the set of processes monitored by the agent. The default `regex` filters out most kernel processes on Linux machines. The agent considers monitored processes only when it calculates CPU, Memory, and Process metrics. These metrics may differ from metrics reported by other sources such as Linux commands.

Default Monitoring Mode

The **Default Monitoring Mode** column indicates the default category of each metric when Dynamic Monitoring Mode (DMM) is enabled. When this mode is enabled, a Machine Agent reports metrics based on the DMM setting on that server:

- KPI – Report Key Performance Indicator metrics only
- Diagnostic – Report KPI and Diagnostic metrics
- Advanced – Report all unfiltered metrics on the Machine Agent.

Load Average Percentages are Scaled by 100 in the Metric Browser

Load Average metrics are shown as float values (such as 0.70 or 1.05) in the Server Dashboard. In the Metric Browser, these metrics are multiplied by 100 to provide two decimal points of precision. If a server has an average load of 7.67, for example, the Server Dashboard shows the Load Average as 7.67 and the Metric Browser shows the Load as 767. To use one of the metrics in a health rule or custom dashboard, divide the metric by 100.

Stolen Times are Reported Differently

On Windows Machine Agents, if CPU %Stolen is not matching values reported by AppDynamics, it may be because Windows Performance Monitor's (Perfmon) counters operate at a granularity of 100ns for CPU metrics. For CPU %Stolen, the counters are provided by the Hypervisor, which operates on a granularity of 1ms. Windows Perfmon divides the CPU %Stolen counter (operating on 1ms) directly by time (in units of 100ns), which results in the CPU % Stolen values being reported at a very low percentage (~0.01%).

AppDynamics makes the correction between different units of time, which is why values reported by AppDynamics are greater than Perfmon's values by a factor of 10,000 (time in 1ms * 10,000 = time in 100ns). CPU %Stolen values reported by AppDynamics sometimes exceed 100% under high load. These CPU %Stolen values are a result of multiple cores being used by the guest machine, where %Stolen time is added across multiple cores.

To compute the %Stolen time:

1. On a PowerShell terminal in the monitored guest machine, run `Get-WmiObject Win32_PerfRawData_vmGuestLib_VCPU.`
2. Note the CpuStolenMs counter (in ms).
3. Note the Timestamp_PerfTime counter (in ms, take a look at Frequency_Perftime, this value should be 1000 (in hz)).
4. After a minute, run `Get-WmiObject Win32_PerfRawData_vmGuestLib_VCPU` again and take note of both the counters once more.
5. CPU %Stolen = 100% * (CpuStolenMS (at T2) - CpuStolenMs (at T1) / (Timestamp_PerfTime (T2) - Timestamp_PerfTime (T1)).

HardwareMonitor and JavaHardwareMonitor Calculate "Writes/Sec" Differently on AIX Machines

The Machine Agent calculates the Disk metric writes/sec on AIX machines differently, depending on whether the HardwareMonitor or the JavaHardwareMonitor extension is used. These extensions assume different block sizes when calculating these metrics. For HardwareMonitor, the block size is 4096 bytes. For JavaHardwareMonitor (based on SIGAR), the block size is 512 bytes. Because the number of writes/sec is calculated as <kb_written>/<block_size>, the HardwareMonitor results are lower than those calculated by JavaHardwareMonitor.

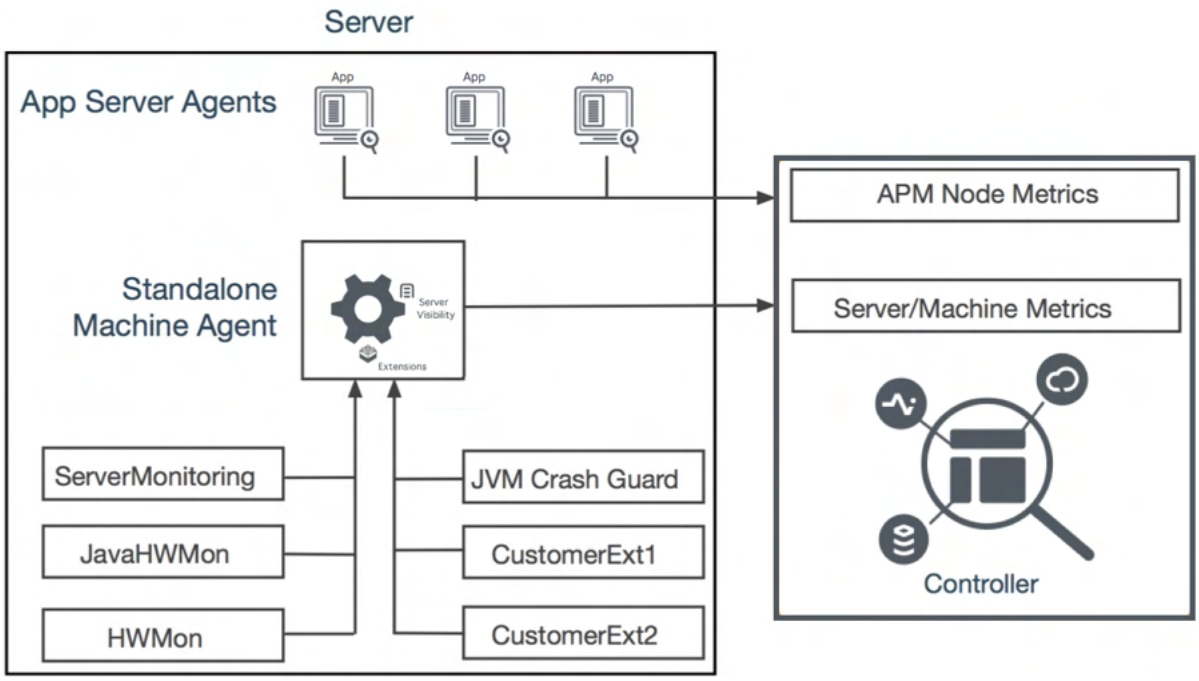
Standalone Machine Agent

You use the Machine Agent to collect basic hardware metrics. The Machine Agent is a Java program that has an extensible architecture enabling you to supplement the basic metrics reported in the AppDynamics Controller UI with your own custom metrics. The Machine Agent is also the delivery vehicle for AppDynamics Server Visibility, which provides an expanded set of hardware metrics and additional monitoring capability. See License Entitlements and Restrictions for a complete list of licenses for Server Visibility and the Machine Agent.

Functionality provided by the Machine Agent includes:

- Reporting basic hardware metrics from the server's OS, for example, %CPU and memory utilization, disk and network I/O
- Reporting metrics passed to the Controller by extensions
- Running remediation scripts for policy actions
- Running JVM Crash Guard

The Machine Agent collects infrastructure metrics from multiple extensions and forwards them to the Controller. You can also use these metrics to find correlations between infrastructure issues on one or more servers and application-performance issues reported by the App Agents.



Standalone Machine Agent Requirements and Supported Environments

This page lists the application environments and versions supported by the Machine Agent. Any environments or versions that are not listed are not supported.

Machine Agent Supported Platforms

Supported platforms and environments for the Machine Agent depend on the metric data collection extension and the machine's OS. See Machine Agent Metric Collection. Machine Agent >= 21.4.0 collects `diskstats` from Linux kernels versions >= 4.18.

The Azul JRE is included as a component in the AppDynamics products and modules. In response to how often Oracle produces and distributes JRE/JDK 8, AppDynamics replaced Oracle JRE with Azul JRE in the 20.5.0 Machine Agent.

JRE Requirements

The Machine Agent requires a Java Virtual Machine (JVM). Downloads for many of the supported operating systems include Azul JRE 1.8.0_262. The Machine Agent should work with most of the JVMs supported by the Java Agent JRE 1.8. However, it is extensively tested only for the Azul JRE.

- For tested platforms listed in the table, AppDynamics recommends using the latest available Machine Agent release from the AppDynamics Downloads page.
- For Linux Flavors, the Machine Agent is bundled with Azul JRE 11. For Windows and Solaris, the Machine Agent is bundled with Azul JRE 1.8

If you upgrade the Linux Machine Agent to 21.1.0, then you must also upgrade all extensions to their latest versions to support Machine Agent 21.1.0.

- To run the Machine Agent on other platforms (such as AIX or HP-UX), use the unbundled Machine Agent ZIP without the JRE. For these platforms, you must install JRE 1.8 on the Machine Agent host.
- If you are using a 64-bit Operating System, use only a 64-bit JRE.

A 64-bit long has a maximum and minimum value of 9223372036854775807 and -9223372036854775808, respectively. To handle large values for metrics, run the Machine Agent using a 64-bit JDK.

Bash Requirements

Linux and Solaris agents require Bash >=3.1.

Required Libraries

Linux systems must include the `procps` library.

This table provides instructions on how to install the library on some common flavors of Linux operating systems.

Linux Flavor	Command
Red Hat and CentOS	Use `yum` to install the library, such as: `yuminstallprocps`
Fedora	Install the library `RPM` from the Fedora website: `yuminstallprocps`
Ubuntu	Use `apt-get`, such as: `sudoapt-getinstallprocps`
Debian	Use a package manager such as `APT` to install the library (as described in the previous Ubuntu instructions).
SUSE 12	Use `zypper` to install the library, such as: `zypperinstallprocps`

Supported Environments

Tested Platforms

OS	Architecture x64 (64-bit)	Architecture SPARC (64-bit)	Versions
AIX	Yes	No	7.1, 7.2
Linux / CentOS	Yes	No	6
	Yes	No	7
Linux / Debian	Yes	No	8
	Yes	No	9

Linux / Fedora	Yes	No	28
	Yes	No	29
Linux / openSUSE Leap	Yes	No	42.3
	Yes	No	15.0
Linux / Red Hat Enterprise Linux	Yes	No	6
	Yes	No	7
	Yes	No	8
Linux / SUSE Linux Enterprise	Yes	No	12
	Yes	No	15
Linux / Ubuntu	Yes	No	14.04
	Yes	No	16.04
	Yes	No	18.04
Solaris	Yes	Yes	10
	Yes	Yes	11
Windows	Yes	No	Windows Server 2012 R2
	Yes	No	Windows Server 2016
	Yes	No	Windows 2019

Other Platforms

These other platforms (supported by JRE 1.8), should also be compatible with the Machine Agent. However, AppDynamics has not fully tested them.

- Oracle JRE 1.8
- IBM SDK, Java Technology Edition, Version 8
- HP JDK/JRE 8

You should be able to run the Bundled version of the Machine Agent on machines based on Power Architecture processors, including PowerPC processors, but Server Visibility is not supported on these platforms. For OS platforms like AIX or HP-UX, AppDynamics recommends using the unbundled Machine Agent ZIP without the JRE on machines with Power Architecture processors, including PowerPC processors.

Hardware and Sizing Requirements

Agent: One additional GB of RAM.

Controller: Although we recommend that you install the AppDynamics Controller on a dedicated server, in some cases the Machine Agent can co-exist with the Controller on the same system. The exact number of Machine Agents that can be supported depends on whether other agents are reporting to the same Controller and whether the Machine Agents have Server Visibility enabled (more metrics are generated under Server Visibility). See Controller System Requirements.

JVM Memory Requirements

The lightweight Machine Agent consumes minimal resources of your computer.

AppDynamics recommends the following additional Heap and PermGen space to accommodate the agent:

- `Maximum heap size (-Xmx): 256 MB`
- `Maximum PermGen heap size (-XX:MaxPermSize): 20 MB`

By default, the JVM maximum heap size is set to 256 MB. To override this setting, you can set this flag through the `JAVA_OPTS` environment variable on your system. For example, if you enter: `export JAVA_OPTS="-Xms20m -Xmx128m"` on Linux, this sets the initial heap size to 20 MB and the max heap size to 128 MB.

Extension Considerations

The exact CPU or memory overhead added by the agent can vary based on the extensions used and whether the extensions are Java. Java extensions require more heap space; the amount required depends on how you code the extension. If you start adding extensions, you should increase the maximum heap space to 256 MB or 512 MB. Additionally, you may need to increase the size of the initial memory allocation. Monitor the memory consumption of the agent to ensure that there are sufficient resources allocated to it. You can also enable Garbage Collection logging on the JVM to help tune the heap size for the extensions.

Example settings for increasing the initial heap size:

Linux and Unix systems: `<machine_agent_home>/bin/machine-agent -Xms64m`

Windows: `cscript <machine_agent_home>\machine-agent.vbs -Xms64m`

Machine Agent Metric Collection

The Standalone Machine Agent collects hardware metrics using default extensions appropriate to specific operating systems. The following table lists the metric collection extension and its supported OS information. In some limited cases, you may want to change the default collection extension. The table also lists the most common reasons for changing the default extension.

Supported environments, observation rates, configurability, some metric names, and definitions depend on the extension.

OS	Default Metric Collection Extension	Metrics Collected	Reason to Change the Default Extension	Supported Environments
Microsoft Windows	JavaHardwareMonitor (if Server Visibility is disabled) ServerMonitoring (if Server Visibility is enabled)	Basic Metrics Server Visibility Metrics	To Customize Metrics for Virtual Disks and External Network Traffic The HardwareMonitoring extension is not recommended on Windows. See Monitoring Windows Guidelines	Standalone Machine Agent Supported Environments
Linux	ServerMonitoring	Basic Metrics Server Visibility Metrics	To Customize Metrics for Virtual Disks and External Network Traffic	Standalone Machine Agent Supported Environments
Solaris / SunOS	HardwareMonitor (if Server Visibility is disabled) ServerMonitoring (if Server Visibility is enabled)	Basic Metrics Server Visibility Metrics	To Customize Metrics for Virtual Disks and External Network Traffic	Standalone Machine Agent Supported Environments
AIX	JavaHardwareMonitor	Basic Metrics	SIGAR (System Information Gatherer And Reporter) is not supported for your OS or Linux Distribution	SIGAR
HP-UX	JavaHardwareMonitor	Basic Metrics	SIGAR is not supported for your OS or Linux Distribution	SIGAR
Mac OS X	JavaHardwareMonitor	Basic Metrics	SIGAR is not supported for your OS or Linux Distribution	SIGAR
Solaris	HardwareMonitor (if Server Visibility is disabled) ServerMonitoring (if Server Visibility is enabled)	Basic Metrics Server Visibility Metrics	To Customize Metrics for Virtual Disks and External Network Traffic	Standalone Machine Agent Supported Environments

In case of a time discrepancy issue on a server (not related to daylight savings time), where time is reset manually, the Machine Agent stops reporting. During this interruption, application and server data are not reported. To continue monitoring, you must restart the Machine Agent.

Java Hardware Monitor

The JavaHardwareMonitor is based on SIGAR (System Information Gatherer And Reporter). SIGAR is a legacy method of collecting basic hardware metrics and is used in pre-4.1 versions and for machines running operating systems that are not supported by the ServerMonitoring extension. The following sections list scenarios where you might want to change the extension used to collect the machine metrics.

Customize Metrics for Virtual Disks and External Network Traffic

By default, the Standalone Machine Agent reports metrics for network-mounted and local disks only. Additionally, only the external network traffic is aggregated (to ensure backward compatibility with previous versions of AppDynamics). For operating systems using the ServerMonitoring extension, you can change to the JavaHardwareMonitor to configure specific disks and network interfaces to be monitored. See Configure Metrics for Virtual Disks and External Network Traffic - JavaHardwareMonitor Extension Only to customize the behavior of the JavaHardwareMonitor metrics

Metric Observation Rate

The JavaHardwareMonitor takes observations of metrics in two distinct ways:

- For disk and network metrics: One observation per minute. When you view the count for these metrics in the Metric Browser, you see the count of 1 per minute. If you select a 15-minute interval, the count would be 15 times 1 = 15 and so on.
- For CPU and memory metrics: One observation every two seconds. When you view the count for these metrics, you see the count of 30 per minute. If you select a 15-minute interval, the count would be 15 times 30 = 450 and so on.

Collect Basic Metrics Using JavaHardwareMonitor

Linux and Windows machines use the ServerMonitoring extension by default to report basic metrics. However if you have Server Visibility enabled, falling back to the JavaHardwareMonitor only affects the collection of the basic hardware metrics. The extended Server Visibility metrics are still collected correctly by the ServerMonitoring extension.

How to Change from ServerMonitoring to JavaHardwareMonitor

1. Stop the Machine Agent.
2. Disable basic ServerMonitoring:
    a. Edit the `ServerMonitoring.yml` file from `<machine_agent_home>/extensions/ServerMonitoring/conf/`.
    b. Change the value of `basicEnabled` to "`false`".
    The `basicEnabled` setting controls whether the Machine Agent reports basic hardware metrics through the ServerMonitoring extension. Setting this to `false` enables the JavaHardwareMonitor to report the basic hardware metrics using the legacy SIGAR-based reporting.
    c. Save the file.
3. Enable JavaHardwareMonitor:
    a. Edit `monitor.xml` from `<machine_agent_home>/monitors/JavaHardwareMonitor/`.
        - For Linux, remove this line: `<enable-override os-type="linux">false</enable-override>`.
        - For Windows, remove this line: `<enable-override os-type="windows">false</enable-override>`.
    b. Save the file.
4. Restart the Machine Agent.

Hardware Monitor

The HardwareMonitor extension is a collection of OS-specific scripts. SunOS and Solaris machines use this extension by default. For the operating systems that use the JavaHardwareMonitor by default, you may want to switch to an OS-specific monitor. You can switch to the OS-specific monitors when the JavaHardwareMonitor fails to report statistics and you see error logs similar to the following:

```
[Agent-Scheduler-1] 28 Nov 2013 13:13:55,435 ERROR SigarMinuteTask - Error fetching network statistics for
interface [eth0:17]. Blacklisting it.
[Agent-Scheduler-1] 28 Nov 2013 13:13:55,435 ERROR SigarMinuteTask - Error fetching disk i/0 statistics for
interface [eth0:17]. Blacklisting it.
```

Collect Basic Hardware Metrics using HardwareMonitor

How to Change from JavaHardwareMonitor to an OS-Specific Monitor

1. Stop the Machine Agent.
2. Disable the JavaHardwareMonitor:
    a. Locate and edit `monitor.xml` from `<machine_agent_home>/monitors/JavaHardwareMonitor/`.
    b. Change the value `<enabled>true</enabled>` to `<enabled>false</enabled>`.
    c. Save the file.
3. Enable the HardwareMonitor for the OS you want to monitor:
    a. Edit `monitor.xml` from `<machine_agent_home>/monitors/HardwareMonitor/.`
    b. Change `<enabled>false</enabled>` to `<enabled>true</enabled>`.
    c. Save the file.
4. Restart the machine agent.

Modify Free Memory Metric Configuration

If your Machine Agent installation is using an OS-specific HardwareMonitor for metric collection, then by default the agent reports free memory as the memory that is not used by any process nor in an I/O buffer or cache. It is more useful for the free memory metric to include memory that is in an I/O buffer or cache but can be available for new processes.

To include the memory in I/O buffers or cache that can be made available to new processes, modify the HardwareMonitor configuration:

1. Open `<machine_agent_home>/monitors/HardwareMonitor/config.sh`.
2. Set `REPORT_MEMORY_FREE_AS_MEMORY_AVAILABLE` to 1.
3. Restart the agent.

Monitoring Windows Guidelines

When using the Machine Agent on Windows:

- Check the server frequently to ensure that it has the latest Windows updates installed.
- If you have a Server Visibility license, use the ServerMonitoring extension.
- If you do not have a Server Visibility license, or if you want to collect Basic metrics only, use the JavaHardwareMonitor extension.
    - There is a known Windows issue when using the HardwareMonitor extension to collect metrics on Windows 8: The "Win32_Service" WMI class leaks memory in Windows Server 2008 R2 and in Windows 7. As a result, AppDynamics does not recommend using the HardwareMonitor extension on Windows. You should use JavaHardwareMonitor instead.
    - However, if you must use the HardwareMonitor extension on Windows, apply this Microsoft hotfix to the server: https://support.microsoft.com/en-us/kb/981314

Server Visibility on Windows

See Server Visibility Requirements and Supported Environments.

Running the Machine Agent and .NET Agent on the Same Machine

To collect Machine or Server metrics on a machine with Machine and .NET Agents installed, you must enable .NET Compatibility Mode on both the Controller and the Machine Agent. See .NET Compatibility Mode.

Configure Metrics for Virtual Disks and External Network Traffic - JavaHardwareMonitor Extension Only

By default, the Machine Agent reports metrics for network-mounted and local disks only. Additionally to ensure backward compatibility with previous versions of AppDynamics, only the external network traffic is aggregated.

You can customize the default behavior by modifying the auto-generated configuration file, `task-template.xml`. The `task-template.xml` file provides information about the current configuration of the Machine Agent and is created when you first start up the agent. It discovers the disks and network hardware on the machine where it is installed that the agent can monitor.

This configuration applies to the JavaHardwareMonitor extension only. The ServerMonitoring extension is recommended if you have a Server Visibility license and the monitored system meets the system requirements. See Server Visibility Requirements and Supported Environments

Customize the Default Machine Agent Metric Collection

1. Locate the `task-template.xml` file.
   This file is located in the `<machine_agent_home>/monitors/JavaHardwareMonitor/` directory when the Machine Agent starts the first time.
2. Edit the `task-template.xml` file:

   - To enable aggregation operation for localhost (lo) network metrics, change the value of the aggregate attribute (for the network element "lo") to "true".
   - To enable monitoring for a virtual disk, set the value of the enabled attribute to "true" for that disk.

   The following is a sample `task-template.xml` file:

```
<config>
    <disk aggregate="false" enabled="false">sunrpc</disk>
    <disk aggregate="true" enabled="true">/dev/sdb1</disk>
    <disk aggregate="false" enabled="false">proc</disk>
    <disk aggregate="false" enabled="false">none</disk>
    <disk aggregate="false" enabled="false">devpts</disk>
    <disk aggregate="true" enabled="true">/dev/sda1</disk>
    <disk aggregate="false" enabled="false">nfsd</disk>
    <disk aggregate="true" enabled="true">/dev/mapper/saas4-binlog</disk>
    <disk aggregate="false" enabled="false">sysfs</disk>
    <disk aggregate="false" enabled="false">tmpfs</disk>

    <network aggregate="true" enabled="true">lo</network>
    <network aggregate="true" enabled="false">sit0</network>
    <network aggregate="true" enabled="true">eth0:1</network>
    <network aggregate="true" enabled="true">eth0</network>
    <network aggregate="true" enabled="false">eth1</network>
</config>
```

3. To prevent the Machine Agent from overwriting the file, rename the `task-template.xml` file to `task.xml` .
4. To monitor a special device that is not enabled, add a file named `task.xml` in the `<machine_agent_home>/monitors/JavaHardwareMonitor/` directory.
   The format of the `task.xml` file must be exactly the same format as the `task-template.xml` file.
   Not all disks and networks must be included in the `task.xml` file. If the Machine Agent finds a disk or a network that is not in the `task.xml` file, then it applies the default properties.
5. Restart the Machine Agent.

View Hardware Metrics

Without having to enable Server Visibility, you can view basic machine metrics in these locations:

- **Metric Browser** – Go to **Application Infrastructure Performance** > **Hardware Resources**.
- **Node** page > Server tab – Go to **Tiers & Nodes**, select the node of interest, and go to the Server tab.
- **Custom Dashboards** – To add CPU metrics to your Custom Dashboard, add the metrics for any node on your target machine. Metrics collected for a node associated with the machine agent are for the server hosting that node. Any machine metrics collected will be the same for nodes that are on the same machine.

Server Visibility provides additional metrics and pages to view basic and server metrics. See Monitor Your Servers Using Server Visibility.

Hardware Resources Metrics describes metrics collected by the Machine Agent.

Customize Default Metrics

You can enable collection of metrics for virtual disks and external network traffic.

Add Custom Metrics

You can add script-based and Java-based custom monitoring extensions to collect additional metrics. For example, the ehCache monitoring extension available from AppDynamics Exchange can collect metrics to monitor Ehcache performance. The metrics appear in **Application Infrastructure Performance | Custom Metrics** section of the Metric Browser and which you can use on custom dashboards.

You can also send metrics to the Machine Agent using the HTTP listener. See Extensions and Custom Metrics.

Install the Standalone Machine Agent

This page provides requirements, permissions, and a procedure to install the Machine Agent. You can also use the AppDynamics Agent Installer to streamline the deployment of the Machine Agent. The Agent Installer simplifies the agent installation process.

To install Machine Agents in Kubernetes, see Install Infrastructure Visibility with the Cluster Agent Operator.

Make sure to thoroughly test your deployment in a staging or test environment before deploying it to production.

JRE Requirements

- JRE 1.8 is required.
- In 4.2, JRE 1.8 is bundled with the OS-specific Machine Agent installation downloads.
- The Machine Agent starts within its own JVM.
- You can use an existing JRE previously installed in your environment.

Permissions

- To avoid permission issues, install the agent as the same user who owns the Machine Agent files or as an administrator on the host machine.
- All files in the `<machine-agent-home>` installation directory should be readable by the Machine Agent.
- The user that runs the Machine Agent must have write privileges to the logging output directory and to the `/conf` directory in the agent installation directory.
- If you plan to enable the JVM Crash Guard, review the required permissions for JVM Crash Guard.
- To create a non-root user to run the Machine Agent, see Permissions Required to Run the Machine Agent.
- Windows permissions for files and subfolders are inherited by default from the parent folder (`<machine_agent_home>`). Appdynamics recommends that you restrict permissions to users authorized to start, stop, and configure the Machine Agent:
    - Read and Write permissions to all files and subfolders under `<machine-agent-home>`.
    - If running as a:
        - Terminal application, then restrict Read, Write, and Execute permissions for the file `<machine-agent-home>\bin\machine-agent.vbs`.
        - Service, then restrict Start, Stop, and Restart permissions for the Machine Agent service. You only need admin privileges to install the service. The Machine Agent runs under the local system account which has extensive privileges on the local system. However, if WMI access is revoked, then you must run the Machine Agent as Administrator. Typically, users do have WMI access. See User Account Control and WMI.
- Enable Windows Script Host for the Windows Machine Agent.

Installation Directory and Path Name Requirements

The following table lists characters that are not supported for the `<machine-agent-home>` directory name or in any directory in the path:

Not Supported on any OS	Not Supported on Linux	Not Supported on Windows
Whitespace characters	% #	% # \ / : * ? " < > |
An exclamation point at the end of the directory name		Control characters such as ASCII EOL, CR, etc.

Configuration

The `controller-info.xml` file contains the properties used to specify agent to Controller communications. To specify the Controller host, port, and account access key properties, see Plan the Machine Agent Configuration. Based on your installation requirements, you may need to configure additional properties.

Installation for New Standalone Machine Agent

The following steps are for *new* installations. To upgrade Machine Agent <= 4.3, see Upgrade the Machine Agent.

1. Plan the Machine Agent Configuration.
2. From AppDynamics Downloads, download the Machine Agent installation package for your OS environment onto the machine you want to monitor.

If there is no download bundle for your OS, use the Machine Agent zip file without the JRE, and use a separately downloaded JRE to run it. You need to download a separate JRE if the one already installed on the machine is a version earlier than JRE 1.8.

- Install Using the Non-JRE Zip File - Use this for OS environments other than Linux, Solaris, Windows, and Mac OS X.

    - Linux Install Using the RPM Package
    - Linux Install Using ZIP with Bundled JRE
    - Solaris Install Using ZIP with Bundled JRE
    - Windows Install Using ZIP with Bundled JRE
3. Verify the Machine Agent Installation.
4. Start the Machine Agent by executing `<machine_agent_home>/bin/machine-agent`. If you have `java` or `system` properties, you can add them to the end of the command. To review machine usage, enter `machine-agent -h`.

Standalone Machine Agent Installation Scenarios

Related pages:

- Plan the Machine Agent Configuration
- Where to Specify Machine Agent Configuration
- Machine Agent Configuration Properties

This page describes scenarios for new Machine Agent installations.

APM Machine Agent Installation Scenario

This scenario contains a host server running one or more instrumented applications and one Machine Agent. When you install the Machine Agent on the same server with any app agent, do not specify the application name and tier name. The one Machine Agent reports the hardware metrics to each node where the app agent and the Machine Agent have matching host IDs.

If you plan to enable Server Visibility on a Windows server where a .NET APM agent is installed, you must enable .NET Compatibility Mode on both the Controller and the Machine Agent. See .NET Compatibility Mode.

> **Licensing Note**
>
> >= 4.3 includes one Machine Agent license with each APM app agent. You can install this Machine Agent only on the same server with the app agent.

Independent Machine Agent Installation

This scenario contains a host server running only the Machine Agent without app agents. You do not need to specify an application or tier. You can view the Machine Agent metrics from the Servers list or the metric browser. This scenario requires a Server Visibility license.

> **Licensing Note**
>
> >= 4.3 requires a Server Visibility license for a Machine Agent installation.

If you are doing an Independent Machine Agent installation and you want the hardware metrics reported to nodes in an application, then you must configure the application name and tier name where you want the metrics to appear. The node name defaults to Node1 for the machine.

Using the values for the application name and tier where you want to see the metrics reported, configure these properties:

- Application name
- Tier name
- `uniqueHostId` for both the machine agent and app agent: use the same value

Unique Host ID Property

The `uniqueHostId` property is not required. However, if you do not define `uniqueHostId`, then the Machine Agent uses the Java API to retrieve the host ID. The results from the API can be inconsistent. The same JVM may return a different value for the same machine each time you restart the Machine Agent. As a workaround, AppDynamics recommends that you set the value of `uniqueHostId` to the host ID that you want to see in the UI. Use the same value for `uniqueHostId` for the App Agent.

Plan the Machine Agent Configuration

AppDynamics provides multiple ways to configure the Machine Agent. As part of planning your installation, determine which options work best in your environment:

- Controller-info.xml
- System properties
- Environment variables

See Configure the Machine Agent.

Collect Configuration Information

Determine your configuration requirements and collect the necessary information. See Machine Agent Configuration Properties.

Planning Item	Description
Determine your installation scenario	For new installations, see Machine Agent Installation Scenarios. For upgrades, see Upgrade the Machine Agent.
Location of the startup script	You add startup arguments and system properties in the startup script. If you are using a Java service wrapper, you need to know the location of the wrapper configuration. See Where to Specify Machine Agent Configuration.
Memory and CPU	See Machine Agent Requirements and Supported Environments.
Connecting the agent to the Controller	You need to know the Controller host, Controller port, and account access key where you want your metrics to be reported. The account access key is generated at the Controller installation time and is located on the AppDynamics Administration Console.
(Optional) SSL Communications	If you plan to use SSL to communicate with the Controller, see Enable SSL for Machine Agent. SSL-related properties include: • Controller SSL Enabled Property • Controller Keystore Password • Controller Keystore Filename • Force Default SSL Certificate Validation
Proxy Settings	If you plan to connect to the Controller using a proxy server, you need to know the Proxy host, Proxy port, and the path to the Proxy Password file.
Multi-tenant mode or SaaS Installations	In addition to the Account Access property, use the Account Name property to configure multi-tenant mode or SaaS account Information. This information is provided in the Welcome email from the AppDynamics Support Team. You can also locate this information in the `<controller_home>/initial_account_access_info.txt file.`
Deploying from a common directory	See Deploy Multiple Machine Agents From a Common Directory.
Extension considerations	If you plan to use a number of extensions in your environment, see the "Extension Considerations" section in Machine Agent Requirements and Supported Environments.
Enabling Server Availability and Service Availability Monitoring	Server Availability requires a separate license. See Enable Server Visibility.

Install Using the Non-JRE Zip File

This page describes how to install the Machine Agent using the zip file that does not include the JRE. You can use this zip file if your environment already has Java >= 1.8, or when installing on an OS environment that does not have an OS-specific installation package on the AppDynamics download site. The agent uses the JRE specified in the `$JAVA_HOME` environment variable or the default JRE for the server (enter `which java` in a terminal window).

Install the Machine Agent

1. Before installing, review Install the Machine Agent.
2. Download and unzip the ZIP file. Extract the contents to the agent installation directory, *<machine_agent_home>*.
3. Gather your configuration details and configure the agent by editing the `<machine_agent_home>/conf/controller-info.xml` file or by adding system properties to the JVM startup script file. See Plan the Machine Agent Configuration.
    a. (*Required*) Configure the Controller host name, port number, and account access key.
    b. (*Required for Multi-Tenant Mode or SaaS installations*) Configure the Agent Account Information. See Multi-Tenant Controller Accounts.
    c. (*Optional*) Review memory requirements. See Machine Agent Requirements and Supported Environments.
    d. (*Optional*) Configure the agent to use SSL. See Enable SSL for Machine Agent.
    e. (*Optional*) Configure the agent to use proxy settings. See Machine Agent Configuration Properties.
    f. (*Optional*) For application and tier name, see Machine Agent Installation Scenarios to determine if you need to specify an application name and tier name. If you are installing the Machine Agent on the same server with any APM app agent, do not specify the application name and tier name.
4. Start the Agent:
    - Windows in a terminal window: <machine_agent_home>`\bin\machine-agent.vbs`
    - Windows as a service: <machine_agent_home>`\InstallService.vbs`
    - Linux or Unix-like: <machine_agent_home>`/bin/machine-agent`

Linux Install Using the RPM Package

Related pages:

- Where to Specify Machine Agent Configuration
- Start and Stop the Machine Agent

This page describes how to install the Standalone Machine Agent on Linux systems that support the RPM Package Manager:

- CentOS
- RHEL
- Fedora
- openSUSE
- SUSE Linux Enterprise Server

For Linux systems that do not support RPM, use the JRE Bundled Zip Archive.

The RPM installer makes these changes to the host machine:

- Creates an appdynamics-machine-agent group and an appdynamics-machine-agent user
- Assigns ownership of certain files in the machine-agent directory to the appdynamics-machine-agent user

These changes are necessary to enable non-root users to configure and run an RPM-installed agent. To use a different user or group for the machine agent service, set the MACHINE_AGENT_USER and MACHINE_AGENT_GROUP environment variables in a shell for RPM installation.

```
sudo MACHINE_AGENT_USER=myuser MACHINE_AGENT_GROUP=mygroup rpm -ivh appdynamics-machine-agent.rpm
```

If the specified user or group does not exist, an error message appears and the RPM installation stops. To continue, you must define users and groups. If this is an issue in your environment, then you install the agent using the ZIP archive (see Linux Install Using ZIP with Bundled JRE).

Install the Machine Agent

1. Before installing, review Install the Machine Agent.
2. Download and install the RPM Package. With administrative privileges, enter the following CLI code where <pkg-name.rpm> is the name of the package for your environment, such as `appdynamics-machine-agent-<version>.x86_64.rpm`.

   ```
   sudo rpm -ivh <pkg-name.rpm>
   ```

   The agent files are installed in `opt/appdynamics/machine-agent` and the agent is added as a service.
3. Gather your configuration details and configure the agent by editing<machine_agent_home>/conf/controller-info.xml file or by adding system properties to the JVM startup script file.
   See Plan the Standalone Machine Agent Configuration.

   a. (*Required*) Configure the Controller host name, port number, and account access key.
   b. (*Optional*) Review memory requirements. See Machine Agent Requirements and Supported Environments.
   c. (*Optional*) Configure the agent to use SSL. See Enable SSL for Machine Agent.
   d. (*Optional*) Configure the agent to use proxy settings. See Machine Agent Configuration Properties.
   e. (*Required for Multi-Tenant Mode or SaaS installations*) Configure the Agent Account Information. See Multi-Tenant Controller Accounts.
   f. (*Optional*) Determine if you need to specify an application name and tier name. See Machine Agent Installation Scenarios.
   If you are installing the Standalone Machine Agent on the same server with any APM app agent, do not specify application name and tier name.
4. Start the Agent. You can start the agent as a service (requires sudo or root user) or from the command line. If `systemd` was detected during installation, you can use the `systemctl` command to start the agent service.
   - Using SysV – `service appdynamics-machine-agent start`
   - Using systemd – `systemctl start appdynamics-machine-agent`
   - From the Command Line – <machine_agent_home>`/bin/machine-agent`
   - From the Launcher – <machine_agent_home>`/etc/init.d/appdynamics-machine-agent start`

RPM Package Function

The RPM package manager installs the agent files to `opt/appdynamics/machine-agent`, creates symbolic links, sets environment variables, and adds the agent as a service.

Symbolic Links

The RPM package manager creates the symbolic links to agent scripts and configuration files in the `/etc` directory. You can edit these links to accommodate a different installation directory, JRE, or system user account running the agent.

Link for SysV Service Script

`/etc/init.d/appdynamics-machine-agent >> /opt/appdynamics/machine-agent/etc/init.d/appdynamics-machine-agent`

This script provides these service commands:

- `Start` – Starts the service, runs a script that starts the agent
- `Stop` – Stops the service
- `Restart` – Restarts the service
- `Status` – Returns the status of the service.

For example: `service appdynamics-machine-agent start`

Link for Environment Variables

SysV –

```
/etc/sysconfig/appdynamics-machine-agent >> /opt/appdynamics/machine-agent/etc/sysconfig/appdynamics-machine-agent
```

This script sets up the environment variables:

- `MACHINE_AGENT_HOME=/opt/appdynamics/machine-agent` – Specifies where the agent files are located.
- `JAVA_HOME=/opt/appdynamics/machine-agent/jre` – Specifies the JRE the agent uses. AppDynamics recommends that you use the RPM package installer that contains its own JRE. However, you can use a different JRE as long as it meets the JRE requirements.
- `MACHINE_AGENT_USER=root` – Specifies the system user for starting the agent (default is root). AppDynamics recommends that you create a non-root user to run the machine agent. The new user needs to have read-access to controller-info.xml and write access to the log file. See Permissions Required to Run the Machine Agent

systemd – The environment variables are in the service file:

```
/etc/systemd/system/appdynamics-machine-agent.service >> /opt/appdynamics/machine-agent/etc/systemd/system/appdynamics-machine-agent.service
```

"MACHINE_AGENT_USER" variable doesn't exist in the `systemd` service file. The variable is just `User`.

Link for Agent to Controller Communication

Sets up a link to the controller-info.xml file containing the properties for agent-to-controller communication.

```
/etc/appdynamics/machine-agent/controller-info.xml >> /opt/appdynamics/machine-agent/conf/controller-info.xml
```

Logging Configuration

The log4j.xml file controls the detail of information logged by the agent. By default, the logging level is set to `info`.

```
/etc/appdynamics/machine-agent/logging/log4j.xml >> /opt/appdynamics/machine-agent/conf/logging/log4j.xml
```

Adds the Agent as a Service

After the package is installed, the appdynamics-machine-agent runs `opt/appdynamics/machine-agent/bin/postInstall.sh` to add the agent to the services. The installer either copies the SysV script to add the service or, if `systemd` is detected, the installer copies the agent unit file `/etc/systemd/system/appdynamics-machine-agent.service` and adds the agent to the services using this unit file.

Installs a systemd Unit File for the Agent Service

If `systemcd` is detected on the system when you install the RPM package or run the `postinstall.sh` script, the `systemd` unit file for the agent service is copied to the following location: `/etc/systemd/system/appdynamics-machine-agent.service`

ExecStart: This option in the `systemd` service file points to a script that starts the agent as a daemon. If you did not install the Machine Agent in `/opt/appdynamics/machine-agent`, then change the path to `<machine-agent-home>/scripts/machine-agent-daemon`. If you did not edit the path, then it points to the correct place by default.

You can start and stop the agent service using the relevant `systemctl` commands. For information on all `systemctl` commands, see the systemctl man pages.

Command	Format

`start`
`stop`
`status`
`restart`
	`systemctl <command> appdynamics-machine-agent.service`

`disable`
`enable`
(Use the full path)
	`systemctl <command> /etc/systemd/system/appdynamics-machine-agent.service`

Linux Install Using ZIP with Bundled JRE

This page describes how to install the Standalone Machine Agent using the Linux ZIP archive that includes JRE 1.8.

It is easier to download and use the RPM package if your Linux distribution supports the RPM Package Manager.

Install the Agent

1. Before installing, see Install the Machine Agent.

   > Read/write privileges to the <machine-agent-home> installation directory are required.

2. Download and unzip the Agent zip bundle. From the command line, enter:

   ```
   unzip <zip-bundle.zip> -d <machine_agent_home>
   ```

   where <zip-bundle.zip> is the name of the zip archive for your environment and <agent_home> is the name of the directory where you want to install the agent.
3. Gather your configuration details and configure the agent by editing<machine_agent_home>/conf/controller-info.xml file or by adding system properties to the JVM startup script file. See Plan the Standalone Machine Agent Configuration.

   a. (*Required*) Configure the Controller host name, port number, and account access key.
   b. (*Optional*) Review memory requirements. See Machine Agent Requirements and Supported Environments.
   c. (*Optional*) Configure the agent to use SSL. See Enable SSL for Machine Agent.
   d. (*Optional*) Configure the agent to use proxy settings. See Machine Agent Configuration Properties.
   e. (*Required for Multi-Tenant Mode or SaaS installations*) Configure the Agent Account Information. See Multi-Tenant Controller Accounts.
   f. (*Optional*) Determine if you need to specify an application name and tier name. See Standalone Machine Agents and Applications.
   If you are installing the Standalone Machine Agent on the same server with any APM app agent, do not specify application name and tier name.
4. To add the Machine Agent as a service, see Add the Agent as a Service.
5. Start the Machine Agent by entering: `<machine_agent_home>/bin/machine-agent`. For example, from the <machine_agent_home> directory:

   ```
   ./bin/machine-agent
   ```

   To review Machine Agent usage, enter: `machine-agent -h`

   ```
   Usage: machine-agent [-dh] [-j JAVA_HOME] [-p pidfile] [-D prop] [-X prop]
   Start the machine agent.
       -d            daemonize (run in background)
       -p pidfile    write PID to <pidfile>
       -h
       --help        print command line options
       -D prop       set JAVA system property
       -X prop       set non-standard JAVA system property
   ```

6. (Optional) Verify the installation. See Verify the Machine Agent Installation.

Add the Agent as a Service Using SysV

1. Install the Standalone Machine Agent.
2. Create a link to `/etc/sysconfig`:

   ```
   ln -s <machine-agent-home>/etc/sysconfig/appdynamics-machine-agent /etc/sysconfig/appdynamics-machine-agent
   ```

3. Copy the machine agent to `/etc/init.d`. For example:

   ```
   cp <machine-agent-home>/etc/init.d/appdynamics-machine-agent /etc/init.d/appdynamics-machine-agent
   ```

4. Edit the environment variables in `/etc/sysconfig/appdynamics-machine-agent` configuration file:

   - MACHINE_AGENT_HOME – Specifies where the Machine Agent files are located.

- JAVA_HOME – Specifies the JRE the agent uses. AppDynamics recommends that you use the Machine Agent bundled with the JRE. However, you can use an existing JRE. (1.8 or later).
- MACHINE_AGENT_USER – Specifies the system user used to start the Standalone Machine Agent. By default this is root. AppDynamics recommends that you create a non-root user to run the Machine Agent. The new user needs to have read-access to controller-info.xml and write access to the log file. See Permissions Required to Run the Machine Agent.

5. Add the agent as a service. For example, enter:

```
chkconfig --add appdynamics-machine-agent
```

   For Ubuntu, you can use `update-rc.d` or `sysv-rc-conf`. See the Ubuntu documentation for details.
6. Start the agent service: `service appdynamics-machine-agent start.`
7. Verify that the Agent is reporting to the Controller. See Verify the Machine Agent Installation.

Add the Agent as a Service Using systemd

1. Install the Standalone Machine Agent.
2. Edit the environment variables and options in the service file as needed: <*machine-agent-home*>`/etc/systemd/system/appdynamics-machine-agent.service`
   a. MACHINE_AGENT_HOME – Specifies where the Machine Agent files are located.
   b. JAVA_HOME – Specifies the JRE the agent uses. Appdynamics recommends that you use the Machine Agent bundled with the JRE. However, you can use an existing JRE.
      – JRE >= 1.7 for = 4.3
      – JRE >= 1.8 for >= 4.4
   c. User – This option in the service file specifies the system user to use to start the Standalone Machine Agent. By default this is root. AppDynamics recommends that you create a non-root user to run the Machine Agent. The new user needs to have read access to controller-info.xml and write access to the log files. See Permissions for Non-Root User to Run the Machine Agent .
      The `systemd` service file does not include the "MACHINE_AGENT_USER" variable.
3. Copy the file:

```
cp <machine-agent-home>/etc/systemd/system/appdynamics-machine-agent.service \
/etc/systemd/system/appdynamics-machine-agent.service
```

4. Enable the Machine Agent to start at system startup:

```
systemctl enable appdynamics-machine-agent
```

5. Start the agent service:

```
systemctl start appdynamics-machine-agent
```

6. Check the service status:

```
systemctl status appdynamics-machine-agent
```

7. Verify that the Agent is reporting to the Controller. See Verify the Machine Agent Installation.

Solaris Install Using ZIP with Bundled JRE

This page describes how to install the Machine Agent on 64-bit Solaris using the ZIP archive that includes JRE 1.8.

> Adding the Machine Agent as a service is not supported on Solaris.

Install the Agent

1. Before installing, see Install the Machine Agent.
2. The Machine Agent on Solaris is supported only when you install it in Global zones.
3. The Solaris agent requires that the `nawk` (new awk) utility is installed. Verify that the Solaris host has the `nawk` utility installed.
4. Download one of the two installation Machine Agent Bundles for Solaris from the AppDynamics Download Site:
   - For Sparc machines: Machine - Agent Bundle - 64-bit `solaris-sparcv9.zip`
   - For x86 machine: Machine Agent Bundle - 64-bit `Solaris.zip`
5. Unzip the agent Zip bundle:

   ```
   unzip <zip-bundle.zip> -d <machine_agent_home>
   ```

   where <machine_agent_home> is the install directory.
6. Gather your configuration details and configure the agent by editing <machine_agent_home>/conf/controller-info.xml file or by adding system properties to the JVM startup script file. See Plan the Machine Agent Configuration.

   a. (*Required*) Configure the Controller host name, port number, and account access key.
   b. (*Required for Multi-Tenant Mode or SaaS installations*) Configure the Agent Account Information. See Multi-Tenant Controller Accounts.
   c. (*Optional*) Review memory requirements. See Machine Agent Requirements and Supported Environments.
   d. (*Optional*) Configure the agent to use SSL. See Enable SSL for Machine Agent.
   e. (*Optional*) Configure the agent to use proxy settings. See Machine Agent Configuration Properties.
   f. (*Optional*) Determine if you need to specify an application name and tier name. See Standalone Machine Agent Installation Scenarios. However, if you are installing the Standalone Machine Agent on the same server with any APM app agent, do not specify the application name and tier name.
7. Start the agent from the command line:

   ```
   % <machine_agent_home>/bin/machine-agent
   ```

8. Verify that the Agent is reporting to the Controller.

Windows Install Using ZIP with Bundled JRE

This page describes how to install Windows using ZIP with bundled JRE.

For some versions of Windows Server 2008 and Windows Vista, the Avg Read and Write Time disk metrics are reported as 0. This is due to a known Microsoft Windows bug. See Microsoft Knowledge Base. If this affects you, download the available hotfix. This refers to the following metrics:

- `Hardware Resources|Disks|<mount_point>|Avg Read Time (ms)`
- `Hardware Resources|Disks|<mount_point>|Avg Write Time (ms)`

Install the Agent

1. Before installing, see Install the Machine Agent.
2. Install all available Windows updates.
3. If you have not restarted your machine recently, you must restart it. Failure to do so may cause your machine to experience a CPU spike when you start the Machine Agent.
4. Download and unzip the Windows ZIP bundle. Extract the contents to the agent installation directory `<machine_agent_home>`.
5. Gather your configuration details and configure the agent by editing the <machine_agent_home>/conf/controller-info.xml file or by adding system properties to the JVM startup script file. See Plan the Machine Agent Configuration.
    a. (*Required*) Configure the Controller host name, port number, and account access key.
    b. (*Required for Multi-Tenant Mode or SaaS installations*) Configure the Agent Account Information. See Multi-Tenant Controller Accounts.
    c. (*Optional*) Review memory requirements. See Machine Agent Requirements and Supported Environments.
    d. (*Optional*) Configure the agent to use SSL. See Enable SSL for Machine Agent.
    e. (*Optional*) Configure the agent to use proxy settings. See Machine Agent Configuration Properties.
    f. (*Optional*) Determine if you need to specify an application name and tier name. See Standalone Machine Agent Installation Scenarios. However, if you are installing the Standalone Machine Agent on the same server with any APM app agent, do not specify the application name and tier name.
6. Start the agent. If no `-D` options are required on the command line, you can run the following `.vbs` scripts by selecting them from Windows Explorer.
    a. As a Windows Service - Administrative privileges are required. You can specify AppDynamics-specific `-D` options from the command line or edit the controller-info.xml. You can also add other JVM properties as needed.
    Open a terminal window and enter:

    ```
    cscript <machine_agent_home>\InstallService.vbs <jvm_options>
    ```

    You can now start or stop the AppDynamics Machine Agent service from Windows Services.
    b. From an application in the terminal window, enter:

    ```
    cscript <machine_agent_home>\bin\machine-agent.vbs.
    ```

    The usage parameters for `machine-agent.vbs` are:

    Using machine-agent.vbs

    ```
    > machine-agent.vbs -h
    Usage: machine-agent.vbs[-h] [-j JAVA_HOME][-Dprop1 ...] [-Xprop2 ...]
    Start the machine agent.
        -h              print command line options
        -j JAVA_HOME    set java home for the agent
        -Dprop1         set standard system properties for the agent
        -Xprop2         set non-standard system properties for the agent
    ```

    The following is an example of machine-agent.vbs:

    ```
    > cscript machine-agent.vbs -Dappdynamics.controller.hostName=192.168.1.20 -Dappdynamics.
    controller.port=8090
    ```

Deploy Multiple Machine Agents From a Common Directory

You can deploy the Standalone Machine Agent on multiple hosts from one central directory. This setup provides an easier method to update the agent because each agent instance starts from one set of executables in one central location.

Workflow Description

1. Set up the central agent directory:
    a. Install the Machine Agent executables and config files in a central directory, such as an NFS-mounted shared directory.
    b. Specify properties common to all remote agents in this central directory.
2. Configure each remote host to start an instance of the agent from this central directory:
    a. Specify properties that are unique to the agent on that host, either in a startup script or on the command line.
    b. Configure a startup script to start an instance of the Machine Agent from the central agent directory.

Set Up the Central Agent Directory

1. Download the latest Machine Agent ZIP file. See Download AppDynamics Software.
2. Unzip the downloaded file to the desired root directory (`<central-agent-root-directory>`) on the central host.
3. Specify the properties common to all Standalone Machine Agent instances running on all remote hosts. Examples of common properties include the account name, and the Controller host and port. You specify these properties in `<central-agent-root-directory>/conf/controller-info.xml`.

Configure Each Remote Host to Start an Agent Instance

On each Machine Agent host, specify the properties unique to that agent such as: runtime directory, application name, tier name, and node name. To specify these properties, configure `-D` parameters in the startup script or on the command line. For example, the startup script on a remote host might include the following command:

```
<central_agent_root_directory>/bin/machine-agent -Dappdynamics.agent.runtime.dir=<agent_runtime_dir>  -
Dappdynamics.agent.applicationName=<application_name>
```

You should specify a unique runtime directory for each remote host to ensure that log files for each agent instance are saved to a separate directory. The agent log directory is located under the agent runtime directory, which you specify in the `-Dappdynamics.agent.runtime.dir` system property. The log directory is directly under the runtime directory (`<agent-runtime-dir>/logs`).

- Specify the runtime directory as an absolute path in the startup script on the remote host:

    ```
    -Dappdynamics.agent.runtime.dir=<absolute_path_to_local_agent_runtime_directory>
    ```

- To change the log directory and file name from the default value, edit the file `<*machine-agent-home*>/confs/logging/log4.xml`. Change the value of the `"FileAppender" > "fileName"` and `"FileAppender" > "filePattern"` parameters to the desired directory and file name.
- The file-system permissions must allow creation of the log directory and file.

Verify the Standalone Machine Agent Installation

Related pages:

- FAQs and Troubleshooting for the Machine Agent
- Machine Agent Configuration Properties

Check Agent Logs

After a successful install, the agent log at `<machine_agent_home>/logs`, should contain the following message:

```
Started AppDynamics Machine Agent Successfully
```

If the agent log file is not present, the Machine Agent may not be accessing the command properties. To troubleshoot, check the application server log file where STDOUT is logged. It has the fallback log messages, which are useful for troubleshooting the agent.

Verify that the Agent is Reporting to the Controller

1. From the Controller Top Navigation Bar, select **Settings > AppDynamics Agents**.
2. Click the Machine Agents tab.
   The listing for the Machine Agent displays. If you do not see the Machine Agent listed, check your property settings in `<machine_agent_home>/conf/controller-info.xml`. See Resolve Machine Agent Installation Problems.

Machine Agent Not Reporting

If it seems that the Machine Agent is not reporting to the Controller, see Machine Agent Not Reporting article in the Community Knowledge Base.

Resolve Standalone Machine Agent Installation Problems

Related pages:

- FAQs and Troubleshooting for the Machine Agent
- Machine Agent Configuration Properties

Verify That the Agent Process is Running

Use the following command to verify that the agent process is running:

Linux:

```
ps -ef | grep machine
```

Windows:

1. Open a command line console.
2. Start the Task Manager and click the Processes tab.
3. The agent process should be running. If it is not running, stop and then restart the agent.

Resolve Agent Connectivity Problems

Make sure you have configured the Controller IP address, Controller port number, and Account Access Key in the agent startup command, script or plist, or in the controller-info.xml file.

After configuring, restart the agent and check the behavior. Machine Agent log files may also provide troubleshooting information.

If you start the Machine Agent, and it cannot register with the Controller or associate with the same node in the Controller, then the stack trace may indicate the reason.

For example, the following message in the stack trace may indicate that the application, tier, and node information was not provided during the Machine Agent startup command or in the controller-info.xml file.

```
<execution-output>System agent 239590 not associated with application, metric registration request refused.<
/execution-output>
```

Start and Stop the Standalone Machine Agent

This page contains a summary of the `start` and `stop` commands for the Machine Agent. See Permissions Required to Run the Machine Agent.

> **Running the Machine Agent with a Non-Bundled JRE**
>
> To run the Machine Agent with the default JRE on the machine (rather than the JRE bundled with the agent), you should first install a non-JRE version of the Machine Agent, and then run the non-JRE agent instead. See Install Using the Non-JRE Zip File.

Start the Machine Agent

If you do not use the Machine Agent bundled JRE, you need to specify the Java version and customize the `<path/to/java_location>` using the `-j` parameter and version JRE >= 1.8, see Machine Agent Requirements and Supported Environments and Install Using the Non-JRE Zip File. Make certain the path is valid and accessible for all users who start the Machine Agent.

```
<machine_agent_home>/bin/machine-agent -j <path/to/java_location>
```

RPM-based Linux Systems

If you installed using the Linux RPM, start the Machine Agent:

- SysV systems: `service appdynamics-machine-agent start`
- systemd systems: Use the Machine Agent service launcher and enter: `systemctl start appdynamics-machine-agent`

Linux and Solaris Systems

If you installed using the JRE bundled zip archive for Linux and Solaris, run the launcher:

- Linux: `<machine_agent_home>/bin/machine-agent -d -p <machine_agent_home>/pidfile`
- Solaris: `<machine_agent_home>/bin/machine-agent -d -p <machine_agent_home>/pidfile`

Windows Systems

See Windows Install Using ZIP with Bundled JRE.

Stop the Machine Agent

Non-JRE Bundled Zip Archive

If the Machine Agent process is running in the background, you can stop it by entering the `kill` command with the process ID as the argument. If it is running in the foreground in a console, press Ctrl+C to shut down the agent.

RPM-based Linux Systems

SysV: Use the service launcher:

```
% service /etc/init.d/appdynamics-machine-agent stop
```

systemd: Use the systemd unit file:

```
% systemctl stop appdynamics-machine-agent
```

Linux and Solaris Systems

Running in the Foreground: Press Ctrl+C to stop the agent process.

Running in the Background: Identify the process ID (PID) and use the `kill` command.

1. Identify the agent process: `ps -ef | grep machineagent.`
   The output provides the process ID (PID) of the Machine Agent process.
2. Stop the agent process: `kill <machine_agent_PID>`.

Windows

In the foreground in a console window: Use Ctrl+C to shut down the agent.

As a Windows Service: Stop the service using either of these methods:

- In the Windows Services application, select **AppDynamics Machine Agent** and click **Stop**.
- Use the `MachineAgentService` command:

```
C:\> <machine_agent_home>\bin\MachineAgentService.exe /stop
```

Mac OS X

As a background process: Enter the `kill` command with the process ID as the argument.

As a service: From the bash command line:

```
> sudo launchctl unload -w <machine_agent_home>/com.appdynamics.machineagent.plist
```

Permissions Required to Run the Machine Agent

This page describes the permissions needed to run the Machine Agent. During installation, the default user for running the Machine Agent is set to root. This is because the only user that is standard on a UNIX or Linux system is root and we do not want to create users on your system. We recommend that you create a non-root user, for example *<machine_agent_user>*, and assign the appropriate permissions to that user. See Install the Machine Agent.

For all environments, create a specific user with the necessary read/write/execute permissions.

- All files in the *<machine-agent-home>* installation directory should be readable by the Machine Agent.
- The user that runs the Machine Agent must have write privileges to the logging output directory and to the `/conf` directory in the agent installation directory.
- Additionally, the user that runs the Machine Agent needs execute access.

Important Notes

- You do not need to run the Machine Agent from a root or administrator account. However, if you enable the JVM Crash Guard on a monitored application running from a root or administrator account, then the Machine Agent requires root or administrator privileges to access the monitored application's JVM process and directory listings for crash files.
- You need to run with administrator or root privileges if you want to monitor networks or disks that are only available to the administrator or root user.
- The user that runs the Machine Agent must have write privileges to the `conf` and `logs` directories in the *<machine_agent_home>* directory.
- The Machine Agent implements a shutdown hook, so issuing the `kill` command (or Ctrl+C) from the operating system will cause the agent to perform a graceful shutdown.

Linux

- ip
- df
- awk
- basename
- cat
- date
- dmesg
- md5sum
- readlink
- sed
- uname
- ps

Windows

Windows permissions for files and subfolders are inherited by default from the parent folder (*<machine_agent_home>*). You should restrict permissions to users authorized to start, stop, and configure the Machine Agent:

- Read and Write permissions to all files and subfolders under `<machine-agent-home>`
- (If running as a terminal application) Read, Write, and Execute permissions for the file `<machine-agent-home>\bin\machine-agent.vbs`
- (If running as a service) Start, Stop, and Restart permissions for the Machine Agent service. You only need admin privileges to install the service. The Machine Agent runs under the local system account which has extensive privileges on the local system, so you do not need to run the Machine Agent as Administrator, unless WMI access is revoked. Normal users typically have WMI access. See https://technet.microsoft.com/en-us/library/cc771551.aspx.

Mac OS X, AIX, HP-UX, and Z/OS

There are no particular execute privileges required.

Solaris System Utilities

- awk
- netstat
- zpool
- egrep
- iostat
- prtconf
- pagesize
- kstat
- prstat
- grep
- vmstat

JVM Crash Guard

If you plan to enable JVM Crash Guard, see JVM Crash Guard for additional required permissions.

Configure the Standalone Machine Agent

Related pages:

- Plan the Machine Agent Configuration
- .NET Compatibility Mode

AppDynamics provides flexibility for configuring the Machine Agent so that you can choose the best fit for your deployment environment.

Not all options are available for all properties. See Machine Agent Configuration Properties.

Configure the Machine Agent Properties

You can configure the Machine Agent by:

- Editing the `controller-info.xml` file located in the *<machine_agent_home>*`/conf` directory.
- Adding Agent system properties (`-D`*<system_property>*) to the Machine Agent start-up script or on the command line.
- Using environment variables. To configure the Agent with environment variables, set the value of the environment variable in the environment where the monitored application runs and restart the Agent. Environment variables exist for most of the Agent settings in the `controller-info.xml file`, but not all settings are configurable through environment variables. For those settings, you need to use system properties or `controller-info.xml`. See Machine Agent Configuration Properties.

Empty spaces and special characters are not allowed in either the full path to the Machine Agent home directory, or in the directory name itself. If the Machine Agent does not start up, review the path to determine if it contains empty spaces or special characters. For example, the path `/opt/appdynamics/machine agent` is problematic, however, the path`/opt/appdynamics/machine-agent` works correctly.

The JVM system properties and environment variables override the settings in the `controller-info.xml` file. The Agent applies the first non-empty value for a configuration property. The Machine Agent applies configurations using the following sources (in order).

1. Environment variables
2. System properties passed in the `start` command for the JVM
3. Global configuration file: *<machine-agent-home>*`/conf/controller-info.xml`

See Where to Specify Machine Agent Configuration for OS environment and install package details

Example Configuration

Machine Agent controller-info.xml File

```
<?xml version="1.0" encoding="UTF-8"?>
<controller-info>    <controller-host>your-controller-host</controller-host>
    <controller-port>your-controller-port</controller-port>
    <account-access-key>your-access-key<account-access-key>
    <controller-ssl-enabled>true</controller-ssl-enabled>
    <enable-orchestration>false</enable-orchestration>
    <sim-enabled>false</sim-enabled>
    <unique-host-id>your-host-id</unique-host-id>
    <account-name>your-account-name</account-name>
</controller-info>
```

bash command-line Example

```
<machine_agent_home>/bin/machine-agent -Dappdynamics.controller.hostName=your-controller-host
-Dappdynamics.controller.port=your-controller-port -Dappdynamics.agent.accountAccessKey=your-access-key -
Dappdynamics.agent.uniqueHostId=your-host-id -Dappdynamics.agent.accountName=your-account-name
```

Where to Specify Machine Agent Configuration

Related pages:

- Install the Machine Agent
- Plan the Machine Agent Configuration
- Machine Agent Configuration Properties

You configure Agent system properties in different ways based on your operating system and whether you are starting the Agent from the command line or as a service.

Linux As a Service

- SysV service launcher:
  Specify the Agent system properties in the `<machine_agent_home>/etc/sysconfig/appdynamics-machine-agent` configuration file, and edit the `JAVA_OPTS` environment variable.
- systemd:
  Specify the Agent system properties in the `<machine_agent_home>/etc/systemd/system/appdynamics-machine-agent.service` file, and edit the `JAVA_OPTS` environment variable.

Any UNIX-like System

When starting the Agent application on the command line for an UNIX-like system ((Linux, Solaris, Mac, AIX, and so on) using the `machine-agent` command, specify the agent system properties on the command line:

- Run agent in the background:
  ```
  % nohup <machine_agent_home>/bin/machine-agent -D<system_property1>=<value1> -D<system_property2>=<value2> ... &
  ```
- Run agent in the foreground:
  ```
  % <machine_agent_home>/bin/machine-agent -D<system_property1>=<value1> -D<system_property2>=<value2> ...
  ```

Windows

When installing and starting a Windows service (you need admin privileges), specify AppDynamics-specific -D options on the command line or in `controller-info.xml`.
Add other JVM properties on the command line:

```
<machine_agent_home>\cscript InstallService.vbs InstallService.cmd <jvm_options>
```

Mac OS X

Start the Agent service using the `<machine_agent_home>/osx-install.sh` script and specify the Agent system properties on the command line:

```
> sh <machine_agent_home>/osx-install.sh -D<system_property1>=<value1> -D<system_property2>=<value2> ...
```

When you run the `<machine_agent_home>/osx-install.sh` script, the `<machine_agent_home>/com.appdynamics.machineagent.plist.template` is updated with the installation directory and the java properties set for the Machine Agent.

Machine Agent Configuration Properties

This page describes the Agent configuration properties, including `controller-info.xml` elements, system property options (on the command line or in the startup script), and environment variables (where applicable). You configure Agent system properties based on your operating system and installation package.

The Agent updates dynamically in response to Agent configuration property changes, so you do not need to restart the Agent.

System Property Syntax

- System properties are case-sensitive
- Values that contain spaces must be enclosed with double-quotes

Reference

.NET Compatibility Mode

You must enable this mode if you want to collect and view Machine or Server metrics on a server with Machine and .NET Agents installed. See .NET Compatibility Mode.

Element in controller-info.xml: `<dotnet-compatibility-mode>`

System Property:

```
-Dappdynamics.machine.agent.dotnetCompatibilityMode
```

Environment Variable: N/A

Type: boolean

Default: false

Required: This mode is required if you want to collect and view Machine or Server metrics on a server with Machine and .NET Agents installed.

Account Access Key

The account access key used to authenticate with the Controller. This key is generated during installation, and you can locate the key by reviewing the license information in the Controller Settings. See License Management.

Element in controller-info.xml: `<account-access-key>`

System Property: `-Dappdynamics.agent.accountAccessKey`

Environment Variable: `APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY`

Type: String

Default: None

Required: Prior to version 4.1, this property was required only for SaaS and multi-tenant Controllers. For versions 4.1 and later, the account access key property is required to authenticate all agent to Controller communications.

Example: `-Dappdynamics.agent.accountAccessKey=165e65645-95c1-40e3-9576-6a1424de9625`

Account Name

The account name used to authenticate with the Controller. If you are using the AppDynamics SaaS Controller, the Account Name is provided in the Welcome email sent by AppDynamics.

Element in controller-info.xml: `<account-name>`

System Property: `-Dappdynamics.agent.accountName`

Environment Variable: `APPDYNAMICS_AGENT_ACCOUNT_NAME`

Type: String

Default: None

Required: For AppDynamics SaaS Controller and multi-tenant users, but not for single-tenant mode (the default). When the Agent is registered with an AppDynamics SaaS Controller, features used to run Remediation Scripts are disabled. If you reconfigure the Agent `controller-info.xml` to register with a non-SaaS or on-premises Controller, the Agent can run local scripts as usual.

Agent Logging Directory

Deprecated. `appdynamics.agent.logs.dir` should be used instead. Behavior identical to Agent Logs Directory: `<appdynamics.agent.logs.dir>/logs/`.

System Property: `-Dappdynamics.agent.logging.dir`

Environment Variable: N/A

Type: String

Default: None

Required: No

Agent Logs Directory

Sets the logs directory for log files for nodes that use this agent installation. If this property is specified, all agent logs are written to `<appdynamics.agent.logs.dir>/logs`. See Deploy Multiple Machine Agents From a Common Directory when deploying multiple Machine Agents from a common directory. This property overrides the directory specified through the `appdynamics.agent.runtime.dir`. If `appdynamics.agent.logs.dir` property is not provided, the logs directory will be created on the same level as the Machine Agent installation folder. No changes are expected in `log4j.xml` file.

System Property: `-Dappdynamics.agent.logs.dir`

Environment Variable: N/A

Type: String

Default: None

Required: No

Agent Runtime Directory

Sets the runtime directory for all runtime files (such as logs) for nodes that use this Agent installation. If you specify this property, then all Agent logs are written to `<agent-runtime-dir>/logs/node-name`. Use when deploying multiple Machine Agents from a common directory. See Deploy Multiple Machine Agents From a Common Directory.

System Property: `-Dappdynamics.agent.runtime.dir`

Environment Variable: N/A

Type: String

Default: None

Required: No

Container Process Selector Blacklist Regex

Any container with a process matching this regex is ignored and is not registered in the Controller.

System Property: `-Dappdynamics.docker.container.process.selector.blacklist.regex`

Environment Variable: `APPDYNAMICS_DOCKER_CONTAINER_PROCESS_SELECTOR_BLACKLIST_REGEX`

Type: String

Default: None

Required: No

Controller Host

This is the host name or IP address of the AppDynamics Controller, for example: 192.168.1.22 or *myhost* or *myhost.abc.com*. This is the same host used to access the AppDynamics browser-based user interface.

Element in controller-info.xml: `<controller-host>`

System Property: `-Dappdynamics.controller.hostName`

Environment Variable: `APPDYNAMICS_CONTROLLER_HOST_NAME`

Type: String

Default: None

Required: If the Enable Orchestration property is false.
If Enable Orchestration is true, and if the Agent is deployed in a compute cloud instance created by an AppDynamics workflow, do not set the Controller host unless you want to override the auto-detected value. See Enable Orchestration Property.

Controller Keystore Filename

By default, the Agent looks for a Java truststore file named `cacerts.jks` in the `conf` directory in the Agent home. Use this property to enable full validation of Controller SSL certificates with a different Java truststore file. See Enable SSL for the Standalone Machine Agent.

Element in controller-info.xml: `<controller-keystore-filename>`

System Property: N/A

Environment Variable: N/A

Type: String

Default: None

Required: No

Controller Keystore Password

The plain text or encrypted value of the Controller certificate password. To encrypt or obfuscate passwords, see Encrypt Agent Credentials.

Element in controller-info.xml: `<controller-keystore-password>`

System Property: N/A

Environment Variable: N/A

Type: String

Default: None

Required: No

Controller Port

The HTTP(S) port of the AppDynamics Controller. This is the same port that you use to access the AppDynamics browser-based user interface. If the Controller SSL Enabled property is set to true, specify the HTTPS port of the Controller; otherwise, specify the HTTP port. See Controller SSL Enabled Property.

Element in controller-info.xml: `<controller-port>`

System Property: `-Dappdynamics.controller.port`

Environment Variable: `APPDYNAMICS_CONTROLLER_PORT`

Type: Positive Integer

On-premises Default: port 8090 for HTTP and port 8181 for HTTPS

SaaS Default: For the SaaS Controller Service, use port 443 for HTTPS connections.

Required: If the Enable Orchestration property is false.

If Enable Orchestration is true, and if the Agent is deployed in a compute cloud instance created by an AppDynamics workflow, do not set the Controller port unless you want to override the auto-detected value. See Enable Orchestration Property.

Controller SSL Enabled

Specifies whether the Agent should use SSL (HTTPS) to connect to the Controller. If SSL Enabled is true, set the Controller Port property to the HTTPS port of the Controller. See Controller Port Property.

Element in controller-info.xml: <controller-ssl-enabled>

System Property: `-Dappdynamics.controller.ssl.enabled`

Environment Variable: `APPDYNAMICS_CONTROLLER_SSL_ENABLED`

Type: Boolean

Default: false

Required: No

Create Node if Absent

Force the Machine Agent to create an APM node when the Agent registers with the Controller.

Element in controller-info.xml: `<create-node-if-absent>`

System Property: `-Dappdynamics.machine.agent.registration.createNodeIfAbsent`

Environment Variable: N/A

Type: Boolean

Default: true

Required: No. If you set the app/tier/node in your `controller-info.xml` file (existing upgrades or by accident), you can prevent the Machine Agent from creating APM nodes by setting this flag to false. See Machine Agent Installation Scenarios.

Enable Docker Visibility

To enable Docker Visibility on the Agent, manually add the docker-enabled element in `controller-info.xml` setting, and set the flag to `true`.

Element in controller-info.xml: <docker-enabled>true</docker-enabled>

System Property: -Dappdynamics.docker.enabled

Environment Variable: APPDYNAMICS_DOCKER_ENABLED

Type: Boolean

Default: false

Required: Yes

Enable HTTP Listener

When set to `true`, this property enables the Machine Agent HTTP listener. You can send metrics to the Machine Agent using its HTTP listener. You can report metrics through the Machine Agent by making HTTP calls to the Agent instead of piping to the Agent through `sysout`.

Element in controller-info.xml: N/A

System Property: `-Dmetric.http.listener`

Environment Variable: N/A

Type: Boolean

Default: false

Required: No

Enable Orchestration

Enables the Machine Agent workflow task execution when set to `true`. It also enables auto-detection of the Controller host and port when the app server is a compute cloud instance created by an AppDynamics orchestration workflow. In a cloud computing environment, auto-detection is necessary for the Create Machine tasks in the workflow to run correctly. The Machine Agent polls for task executions only when orchestration is enabled. If the host machine on which this Agent resides is not created through AppDynamics workflow orchestration, this property should be set to `false`. See Controller Host Property and Controller Port Property.

Element in controller-info.xml: `<enable-orchestration>`

System Property: N/A

Environment Variable: N/A

Type: Boolean

Default: false

Required: No

Force Default SSL Certificate Validation

Used to override the default behavior for SSL validation.

This property has three states:

> *true:* Forces the Agent to perform full validation of the certificate sent by the Controller, enabling the Agent to enforce the SSL trust chain. Use this setting when a public certificate authority(CA) signs your Controller SSL certificate.
>
> *false:* Forces the Agent to perform minimal validation of the certificate. This property disables full validation of the Controller's SSL certificate. Use this setting when full validation of a SaaS certificate fails.
>
> *unspecified:* The validation performed by the Agent depends on the context:
>
> - If the Agent is connecting to a SaaS Controller, full validation is performed.
> - If the Agent is connecting to an on-premises Controller and the `cacerts.jks` file is present, then full validation is performed using the cacerts.jks file.
> - If the Agent is connecting to an on-premises Controller, and there is no `cacerts.jks` file, then minimal validation is performed

Element in controller-info.xml: N/A

System Property: `-Dappdynamics.force.default.ssl.certificate.validation`

Environment Variable: N/A

Type: Boolean

Default: None

Required: No

Enable Dynamic Monitoring Mode (DMM)

When this option is enabled, the Agent reports metrics based on the Dynamic Monitoring Mode specified for that Agent in the Controller. When this option is disabled, the Agent reports all metrics based on its local configuration; DMM settings on the Controller have no effect. Disabling DMM on an Agent is recommended only for mission-critical servers and other machines for which you are sure you want to collect all available metrics at all times. See Dynamic Monitoring Mode and Server Visibility.

Element in controller-info.xml: <dynamic-monitoring-enabled>

System Property: appdynamics.machine.agent.dynamicMonitoring.enabled

Environment Variable: APPDYNAMICS_DYNAMIC_MONITORING_ENABLED

Type: Boolean

On-premises Default: True

SaaS Default: True

Required: No

HTTP Listener Port

To enable the Machine Agent HTTP listener, you must also specify the HTTP listener port.

Element in controller-info.xml: N/A

System Property: `-Dmetric.http.listener.port`

Environment Variable: N/A

Type: Numeric

Default: 8293

Required: Only if the HTTP listener is enabled.

Log4j

Logging functionality is done via Apache Log4j2. Use this property to provide a custom location for log4j configuration. In this case, you need to ensure that all file destinations are valid and contain absolute paths.

Element in controller-info.xml: N/A

System Property: `-Dlog4j.configurationFile`

Environment Variable: N/A

Type: Numeric

Default: None

Required: No

Machine Hierarchy

You need a Server Visibility license to use this feature.

This setting enables you to group servers together into arbitrary hierarchies by specifying a hierarchical path to the server. The server hierarchy displays in the Metric Browser and on the Server Dashboard. The server hierarchy is also used to select subgroups of machines for health rules. The last element of the path indicates the server name (a name of your choice). This name appears as the Name on the Servers list. If the path contains spaces, then you must it enclose it in double-quotes. See Machine Agent Hierarchy.

Element in controller-info.xml: `<machine-path>`

System Property: `-Dappdynamics.machine.agent.hierarchyPath`

Environment Variable: `APPDYNAMICS_MACHINE_HIERARCHY_PATH`

Type: ASCII string with path elements that are separated by a "|" (bar).

Default: The value specified by Unique Host ID. If the last part of the machine hierarchy is empty, the Unique Host ID is the machine name. For example, if machine hierarchy is "Data Center 1|Rack 2|" and Unique host ID is "Host ID 3", then the machine hierarchy will become "Data Center 1|Rack 2|Host ID 3".

Required: No

Limitation: The length of the characters composing the machine-path up to, but not including, the last pipe cannot exceed 95 characters.

Examples:

- *System Properties:* `-Dappdynamics.machine.agent.hierarchyPath= "Data Center 1|Rack 2|Machine3"`
- *controller-info.xml:*

```
<machine-path>
     "Data Center 1|Rack 2|Machine3"
</machine-path>
```

- *Environment Variable:* `APPDYNAMICS_MACHINE_HIERARCHY_PATH="Data Center 1|Rack 2|Machine3`

Proxy Password File

The absolute path to the file containing the password of the user that is authenticated by the proxy host. The password must be the first line of the file and must be in clear (unencrypted) text. See Encrypt Agent Credentials.

Element in controller-info.xml: N/A

System Property: `-Dappdynamics.http.proxyPasswordFile`

Environment Variable: N/A

Type: String

Default: None

Required: No

Example: `-Dappdynamics.http.proxyPasswordFile=/path/to/file-with-password`

Proxy User Name

The name of the user that is authenticated by the proxy host.

Element in controller-info.xml: N/A

System Property: `-Dappdynamics.http.proxyUser`

Environment Variable: N/A

Type: String

Default: None

Required: No

Server Visibility Enabled

Enable Server Visibility on the Agent. This requires a Server Visibility license.

Element in controller-info.xml: `<sim-enabled>`

System Property: `-Dappdynamics.sim.enabled`

Environment Variable: `APPDYNAMICS_SIM_ENABLED`

Type: Boolean

Default: false

Required: Required to enable Server Visibility. See Enable Server Visibility.

Service Availability Update Interval

This setting controls the time, in milliseconds, to wait between sending Service Availability periodic events to the Controller. See Service Availability.

Element in controller-info.xml: `<sam-event-update-interval-millis>`

System Property: `-Dappdynamics.machine.agent.sam.event.updateIntervalMillis`

Environment Variable: N/A

Type: Positive integer

Default: 300000 ms (5 minutes)

Required: No

Unique Host ID

This property logically partitions a single physical host or virtual machine. In the context of installing the Machine Agent, the unique Host ID property is not required. However, if you do not define a unique Host ID, then the Machine Agent uses the Java API to retrieve the host ID. The results from the API can be inconsistent, and may cause the same JVM to return a different value for the same machine, each time the Machine Agent is restarted. To avoid these issues, AppDynamics recommends that you set the value of unique Host ID to the host ID that you want to see in the UI.

Element in controller-info.xml: `<unique-host-id>`

System Property: `-Dappdynamics.agent.uniqueHostId`

Environment Variable: `APPDYNAMICS_AGENT_UNIQUE_HOST_ID`

Type: ASCII string without spaces and must be unique across the entire managed infrastructure.

Default: None

Required: Optional, but recommended.

Use Simple Hostname

By default (unless overridden with the `uniqueHostId` system property), the Agent determines the host name of the OS it is running in using reverse DNS lookup. In some circumstances, this host name may be set as the fully qualified domain name of the host name. If this property is set to `true`, the Agent removes any domain name and uses the simple hostname to identify the host. In cases where the host name is an IP address (which happens if the DNS lookup fails) then the full IP address in string form is used. The host name is used in mapping metrics gathered by the Machine Agent to application nodes. See Unique Host ID Property.

Element in controller-info.xml: `<use-simple-hostname>`

Type: Boolean

Default: False

Required: No

For example: If this property is set to true '`server.mydomain.com`' becomes 'server'.

Independent Standalone Machine Agent Install Scenario

Typically, you only use the following properties if you are installing the Machine Agent on a server that does not have any AppDynamics App Agents installed.

Application Name

The name of the logical business application that this JVM node belongs to. This is not the deployment name (ear/war/jar) on the application server. If a business application of the configured name does not exist, it is created automatically.

Element in controller-info.xml: `<application-name>`

System Property: `-Dappdynamics.agent.applicationName`

Environment Variable: `APPDYNAMICS_AGENT_APPLICATION_NAME`

Type: String

Defaults: None

Required: No. See Machine Agent Installation Scenarios.

Node Name

The name of the JVM node. When not specified, this defaults to `Node1` for the Machine Agent.

Element in controller-info.xml: `<node-name>`

System Property: `-Dappdynamics.agent.nodeName`

Environment Variable: `APPDYNAMICS_AGENT_NODE_NAME`

Type: String

Defaults: None

Required: No. See Machine Agent Installation Scenarios.

Tier Name

The name of the logical tier that this JVM node belongs to. This is not the deployment name (ear/war/jar) on the application server. If a tier of the configured name does not exist, it is created automatically.

Element in controller-info.xml: `<tier-name>`

System Property: `-Dappdynamics.agent.tierName`

Environment Variable: `APPDYNAMICS_AGENT_TIER_NAME`

Type: String

Defaults: None

Required: No. See Machine Agent Installation Scenarios.

Controller Settings for Standalone Machine Agents

Related pages:

- Database Size and Data Retention
- Controller Settings for Server Visibility

This page describes Controller Admin settings that are specific to the Machine Agent. You need the root user password to change these settings.

You can change the amount of Machine Agent data you retain in the Controller database by changing the retention period for Machine Agent snapshots. Lo wering the retention settings purges data that is aged out by the new retention setting and reduces the amount of data stored by the Controller on an ongoing basis. Consider the amount of Machine Agent data to retain when tuning the size of the Controller database.

Change the Controller Settings for Machine Agents

1. Log in to the Controller administration console using the root user password. See Access the Administration Console.

   ```
   http://<controller host>:<port>/controller/admin.jsp
   ```

   Use the root user password to access the Admin console when the Controller is installed in single- or multi-tenant mode. See Update the Root User and Glassfish Admin Passwords.
2. Select **Controller Settings**.
3. Change the settings as needed, and then select **Save**. Changes to the settings occur the next time you restart the Agent and it connects to the Controller.

Controller Settings Reference for Machine Agent

Property Name	Property Description	Default	Allowed Values
`machine.agent.in-progress.actions.timeout`	This property determines the length of time the Controller waits for the Agent to perform an IN-PROGRESS action before it stops the action.	86400000 ms (1 day)	1 to 840 hours (5 weeks)
`machine.agent.max.new.actions.per.min`	Maximum number of new actions dispatched per minute for each Machine Agent. This is the maximum number of "runbook" actions sent to the Machine Agent. For example, you may request the Machine Agent to run a script because of a health rule violation, if the number of requests in a one minute period is greater than the preset value, then the action is executed the next minute.	15 per minute	1 to 28999999
`machine.agent.pending.actions.timeout`	Determines how long the Controller waits for the Agent to perform a PENDING action before it stops the action.	1800000 ms (12 hrs)	
`machine.agent.snapshots.buffer.size`	Size in Megabytes of the in-memory buffer storing machine snapshots uploaded from Agents prior to database flush.	50 MB	
`machine.snapshots.retention.period`	Time in hours to retain server snapshot data.	336 hours (2 weeks)	1 to 840 hours (5 weeks)

Enable SSL for Standalone Machine Agent

Related pages:

- Secure the Platform
- Controller SSL and Certificates
- Install the Machine Agent

This page describes how to configure the AppDynamics Machine Agent to connect to the Controller using SSL. It assumes that you use a SaaS Controller or have configured the on-premises Controller to use SSL.

The Machine Agent supports extending and enforcing the SSL trust chain when in SSL mode.

Plan SSL Configuration

Gather this information:

- The Controller SSL port:
  - For SaaS Controllers: SSL port is 443
  - For on-premises Controllers: Default SSL port is 8181, but you may configure the Controller to listen for SSL on another port
- The signature method for the Controller's SSL certificate:
  - A publicly known certificate authority (CA) signed the certificate. This applies for DigiCert, Verisign, Thawte, and other commercial CAs.
  - A CA internal to your organization signed the certificate. Some companies maintain internal certificate authorities to manage trust and encryption within their domain.
  - The Controller uses a self-signed certificate.

Establish Trust for the Controller's SSL Certificate

To establish trust between the Machine Agent and the AppDynamics Controller, you must create an agent truststore that contains the root certificate for the authority that signed the Controller's certificate.

1. Obtain one of the following root certificates:
   - DigiCert Global Root CA for the AppDynamics SaaS Controller
   - The root certificate for the publicly known certificate authority (CA) that signed the certificate for your on-premises Controller
   - The root certificate for the internal CA that signed the Controller certificate for your on-premises Controller
2. Run the Java `keytool` command to create the Agent truststore:

   ```
   keytool -import -alias rootCA -file <root_certificate_file_name> -keystore cacerts.jks -storepass
   <truststore_password>
   ```

   For example:

   ```
   keytool -import -alias rootCA -file /usr/home/appdynamics/DigicertGlobalRootCA.pem -keystore cacerts.jks
   -storepass MySecurePassnword
   ```

   Note the truststore password; you will need this later to configure the Machine Agent.

3. Install the Agent truststore to the Agent configuration directory:

   ```
   <machine_agent_home>/conf/
   ```

Secure the Machine Agent Truststore

AppDynamics recommends you take the following security measures to prevent tampering with the Machine Agent truststore:

- Secure the truststore file through filesystem permissions:
  - Make the Agent truststore readable by any user
  - Make the truststore owned by a privileged user
  - Make the truststore writable only by the specified privileged user
- Secure the `controller-info` configuration file so that it is only readable by the Agent runtime user and only writable by a privileged user:

  <machine_agent_home>`/conf/controller-info.xml`

Enable SSL for the Machine Agent

1. Configure the following system properties in the `controller-info.xml`: `<machine_agent_home>/conf/controller-info.xml`. See Machine Agent Configuration Properties for full details on each property.
    - *Controller Host:* Should be the same as either the Common Name or the Subject Alternative Name (SAN) in the certificate configured for the Controller.

      ```
      <controller-host>common_name_in_certificate.com</controller-host>
      ```
    - *Controller Port:* The SSL port for the Controller. It is 443 for AppDynamics SaaS.

      ```
      <controller-port>443</controller-port>
      ```
    - *Controller SSL Enabled:* true

      ```
      <controller-ssl-enabled>true</controller-ssl-enabled>
      ```
    - *Controller SSL Password:* The plain text password for the Agent truststore.

      ```
      <controller-keystore-password>MySecurePassword</controller-keystore-password>
      ```

      If you have enabled the Secure Credential Store, encrypt the password you enter here. See Encrypt Agent Credentials.
    - *Controller Keystore Filename:* The path of the Agent truststore relative to `<machine_agent_home>/conf`. This is required if you use a truststore other than the default `<machine_agent_home>/conf/cacerts.jks`.

      ```
      <controller-keystore-filename>../conf/cacerts.jks</controller-keystore-filename>
      ```

      > You can specify the Controller port and enable SSL for the Controller in the Machine Agent startup script, but you must specify the truststore password and filename in the `controller-info.xml` file.

2. Restart the Machine Agent.

Sample controller-info.xml with SSL and Secure Credential Store Encryption Enabled

```
<?xml version="1.0" encoding="UTF-8"?>
<controller-info>
        <controller-host>mycompany.saas.appdynamics.com</controller-host>
        <controller-port>443</controller-port>
        <controller-ssl-enabled>true</controller-ssl-enabled>
    <!-- Encrypted Controller keystore / agent trust store password -->
        <controller-keystore-password>Tw49bd0hdCMBoQ5pfMMuYA/cA5B4pouVPkv48ovRm6c=</controller-keystore-
password>
        <controller-keystore-filename>../../conf/cacerts.jks</controller-keystore-filename>
        ...
    <!-- Secure Credential Store configuration -->
    <!-- Enable the Secure Credential Store -->
    <use-encrypted-credentials>true</use-encrypted-credentials>
    <!-- Path to they secure credential keystore -->
    <credential-store-filename>/opt/appdynamics/secretKeyStore</credential-store-filename>
    <!-- Obfuscated secure credential keystore password -->
    <credential-store-password>n/8GvAZsKk4gM3Z6g+XQ1w==</credential-store-password>
</controller-info>
```

Keystore Certificate Extractor Utility

The Keystore Certificate Extractor Utility exports certificates from the Controller's Java keystore and writes them to an Agent truststore. You can run this utility with the Agent distribution on the Controller:

```
<controller_home>/appserver/glassfish/domains/domain1/appagent
```

1. Execute `kr.jar` and include the following parameters:
    - The full path to the Controller's keystore:

      ```
      <controller_home>/appserver/glassfish/domains/domain1/config/keystore.jks
      ```

    - The truststore output file name. By default, the Machine Agent looks for `cacerts.jks`.
    - The password for the Controller's certificate, which defaults to "changeit". If you do not include a password, the extractor applies the password "changeit" to the output truststore.

```
java -jar kr.jar <controller_home>/appserver/glassfish/domains/domain1/config/keystore.jks cacerts.
jks <controller_certificate_password>
```

2. Install the Agent trust store to the Agent configuration directory:

```
<machine_agent_home>/conf/
```

.NET Compatibility Mode

This page explains how to set compatibility mode for the .NET Agent. Compatibility mode allows you to collect and view machine or server metrics on a server with Machine and .NET Agents installed.

Before You Begin

Review the list of requirements and general information about compatibility mode:

- .NET Compatibility Mode is required for metrics from a Machine Agent and a .NET Agent on the same server to be visibly associated with the same node in the Controller UI.
- Differences may exist between metric values reported by the Machine Agent and the .NET Agent due to different averaging rates and measurement methods.
- You must enable .NET Compatibility Mode on the Machine Agent.
- When .NET Compatibility Mode is enabled:
  - Events from Service Availability and Custom Extensions appear in the Servers tab, but are not associated with .NET applications in the Controller UI.
  - The Controller UI may show the server name with "`-java-MA`" appended to the host ID. Thus, a Machine Agent with a `<unique-host-id>` set to "ABC" might appear as "`ABC-java-MA`" in the Controller UI. This is expected behavior; the "`-java-MA`" suffix indicates that the host has a Machine Agent running in .NET Compatibility Mode.
- Do not specify the `<application-name>`, `<tier-name>`, or `<node-name>` properties on the Machine Agent. These properties are used with a Machine Agent on a host that has no other AppDynamics Agents installed.

Enable Compatibility Mode

To enable .NET Compatibility Mode:

1. Enable .NET Compatibility Mode on the Agent using one of two methods:
   - Set these options in `<machine_agent_home>/conf/controller-info.xml`:
     a. `<dotnet-compatibility-mode>`**true**`</dotnet-compatibility-mode>`
        You may need to add this line to the `controller-info.xml` file.
     b. `<unique-host-id>`*`<unique-host-id-of-dot-net-agent>`*`</unique-host-id>`
        For both Agents to report metrics to the same node, the Machine Agent must use the same case-sensitive Unique Host ID used by the .NET Agent. See FAQs and Troubleshooting.
   - Set the `./bin/machine-agent` system property to: `./bin/machine-agent -Dappdynamics.machine.agent.dotnetCompatibilityMode=true`
2. Save the `controller-info.xml` file.
3. Start or restart the Machine Agent to apply the changes.

Extensions and Custom Metrics

Using the Machine Agent, you can supplement the existing metrics in the AppDynamics Controller UI with your own custom metrics. There are many extensions currently available on the AppSphere Community site. Some are created by AppDynamics and some have been created by users.

Similar to built-in metrics, your custom metrics are subject to the following AppDynamics features:

- Automatic baselines and anomaly detection
- Availability to display on custom dashboards
- Availability to use in policies
- Visibility of all metrics in the Metric Browser and on the Infrastructure tab (where you can display external metrics and AppDynamics metrics on the same graph)

Add New Custom Metrics

To create custom metrics, you create a monitoring extension. In your extension, you define the name and path of your metric (where it appears in the metric browser tree), what type of metric it is (sum, average, and so on), and how the data for the metric should be rolled up as it ages. One Agent can run many extensions, although you may need to increase the amount of memory for the JVM Agent. You can have multiple copies of the same extension if they are in different directories.

A custom metric can be common across nodes or associated with a specific tier. When you create a metric, you specify the path in which it will appear in the metric tree. To create a common custom metric, use the root tree path Custom Metrics in your metric declaration. To create a tier-specific metric, specify the metric path associated with that component.

If your application uses a large number of AppDynamics extensions with the Machine Agent, you may need to increase the size of the memory allocation:

For Linux and Unix-like Systems

```
% <machine_agent_home>/bin/machine-agent -Xms64m
```

For Windows

```
> <machine_agent_home>\bin\machine-agent.cmd -Xms64m
```

The wildcard feature is not supported for custom metrics.

Monitoring Extension Types

You can implement custom metrics using these mechanisms:

- Using a script:
  You can write a shell script (Linux and Unix-like systems) or batch file (Windows) to report custom metrics every minute to the Machine Agent. The Machine Agent passes these metrics on to the Controller. See Build a Monitoring Extension Using Scripts.
- Using Java:
  Your custom metrics may be too complicated to collect using a script. For example, you may need to perform complex calculations or call a third-party API to retrieve the metrics. In this case, you can extend the `JavaServersMonitor` class to collect the metrics and report them to the Machine Agent. Your Java program extends the `JavaServersMonitor` class to provide your custom functionality. See Build a Monitoring Extension Using Java.
- Using HTTP:
  If you enable the Agent HTTP listener, you can post HTTP requests to the Machine Agent to send it custom metrics every minute. To do this, start the Machine Agent with a Jetty HTTP listener. See Machine Agent HTTP Listener.

Build a Monitoring Extension Using Scripts

Related pages:

- Extensions and Custom Metrics
- Build a Monitoring Extension Using Java
- Machine Agent HTTP Listener

You can write a monitoring extension script (also known as a custom monitor or hardware monitor) to add custom metrics to the metric set that AppDynamics already collects and reports to the Controller. Your script reports the custom metrics every minute to the Machine Agent. The Machine Agent passes these metrics to the Controller.

This page describes the steps for adding custom metrics using a shell script and includes an example.

Review Existing Extensions

Before creating your own extension, review the extensions that have been created and shared among members of the AppDynamics community. New extensions are added continuously. It is possible that someone has already created what you need or something close enough that you can download and use it after making a few modifications.

See the AppDynamics Exchange for free downloads.

Agent Configuration Requirements

Confirm that you have correctly configured the Machine Agent in the `controller-info.xml` file and on the Agent `start` command on the command line. See Machine Agent Configuration Properties.

Create a Monitoring Extension

To create a monitoring extension using a script:

1. Create your script. See Create the Script File.
2. Create a `monitor.xml` configuration file. See Create the monitor.xml File.
3. Create a subdirectory, `<your_extension_dir>`, in `<machine_agent_home>/monitors`. See Create a directory under the Machine Agent monitors directory.
4. Copy your script file and the `monitor.xml` file into the new subdirectory.
5. Restart the Machine Agent.

Define Your Metrics

Metric names must be unique within the same metric path but need not be unique for the entire metric hierarchy. AppDynamics recommends using short metric names so that the whole name is visible when displayed in the Metric Browser. Prepend the metric path to the metric name when you upload the metrics to the Controller.

Metric Processing Qualifiers

The Controller has various qualifiers for how it processes a metric regarding aggregation, time rollup, and tier rollup. There are three types of metric qualifiers:

1. Aggregator qualifier
2. Time roll-up qualifier
3. Cluster roll-up qualifier

In the script, specify the metric qualifiers after the name-value pair for the metric. A typical metric entry in the script file has the following structure:

```
name=<metric name>,value=<long value>,aggregator=<aggregator type>, time-rollup=<time-rollup strategy>, cluster-rollup=<cluster-rollup strategy>
```

Aggregator Qualifier

The *aggregator* qualifier specifies how the Machine Agent aggregates the values reported during a one-minute period. Specify the aggregator qualifier as a `ggregator="aggregator type"`. This value is an enumerated type. If no value is reported during that minute, no data is reported to the Controller, and an UNCHANGED notice appears in the Machine Agent log for that metric. Valid values are:

Aggregator Type	Description
AVERAGE	(Default) Average of all reported values in that minute
SUM	Sum of all reported values in the minute, causes the metric to behave like a counter

OBSERVATION	Last reported value in the minute

Time Roll-Up Qualifier

The *time-rollup* qualifier specifies how the Controller rolls up the values when it converts from one-minute granularity tables to 10-minute granularity tables, and 60-minute granularity tables over time. The value is an enumerated type. Valid values are:

Roll Up Strategy	Description
AVERAGE	Average of all one-minute values when adding it to the 10-minute granularity table; the average of all 10-minute values when adding it to the 60-minute granularity table
SUM	Sum of all one-minute values when adding it to the 10-minute granularity table; the sum of all 10-minute values when adding it to the 60-minute granularity table
CURRENT	Last reported one-minute value in that 10-minute interval; the last reported 10-minute value in that 60-minute interval

Cluster Roll-Up Qualifier

The *cluster-rollup* qualifier specifies how the Controller aggregates metric values in a tier (a cluster of nodes). The value is an enumerated type. Valid values are:

Roll up Strategy	Description
INDIVIDUAL	Aggregates the metric value by averaging the metric values across each node in the tier
COLLECTIVE	Aggregates the metric value by adding up the metric values for all the nodes in the tier

For example, if a tier has two nodes, Node A and Node B, and Node A has three errors per minute and Node B has seven errors per minute, then the INDIVIDUAL qualifier reports a value of five errors per minute, and COLLECTIVE qualifier reports ten errors per minute. INDIVIDUAL is appropriate for metrics such as % CPU Busy, where you want the value for each node. COLLECTIVE is appropriate for metrics, such as Number of Calls, where you want a value for the entire tier.

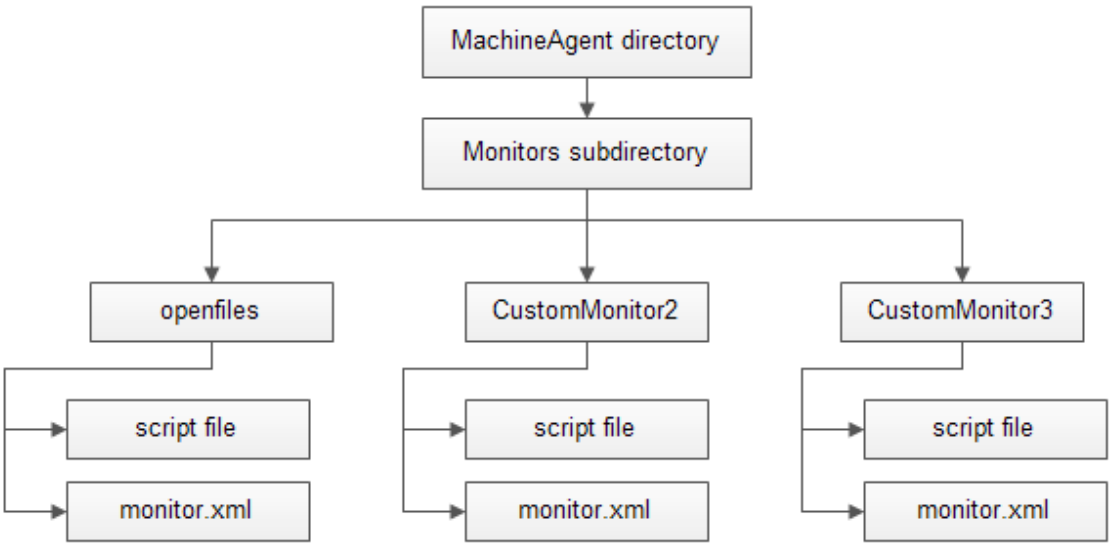
Add a Monitoring Extension Script

To add a monitoring extension script:

Create a Subdirectory Under the Machine Agent Monitors Directory

The `<machine_agent_home>/monitors` directory is the repository for the Machine Agent extensions. For each new extension, create a subdirectory under the `/monitors` directory. The user running the Agent requires read, write, and execute permissions to this subdirectory.

For example to create an extension that monitors open files in the JVM, create a subdirectory named "`openfiles`" under `<machine_agent_home>/monitors`. The structure looks like:



Create the Script File

A script writes data to STDOUT. The Machine Agent parses STDOUT and sends information to the Controller every minute. Use these instructions to create the script file:

> **For Windows custom metrics, PowerShell and VBScript are recommended over .bat files**
>
> To generate custom metrics on Windows, AppDynamics recommends that you use PowerShell and VBasic scripts instead of `.bat` files. When a standard Windows batch (`.bat`) script echoes metric names, it surrounds the names with quotes. The quotes will cause the Machine Agent to ignore these metrics. PowerShell and VBasic scripts do not have this issue.

1. Specify a `name-value` pair for the metrics.
   Each metric has a `name-value` pair that is converted to a java `'long'` value. A typical metric entry in the script file has this structure:

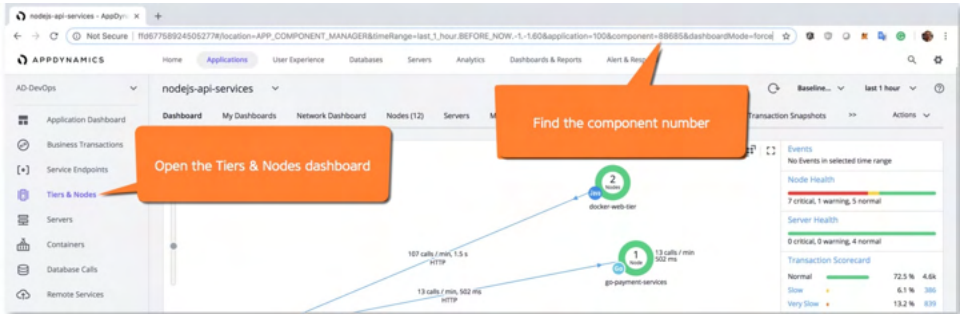
   ```
   name=<metric name>,value=<long value>,aggregator=<aggregator type>, time-rollup=<time-rollup strategy>,
   cluster-rollup=<cluster-rollup strategy>
   ```

   Use the following format:

Form	Format
Standard Form	`Hardware Resources| Instrument Name=Instrument Value`
Fully Qualified Form	`Hardware Resources| <metric name>,value=<long value>`

2. Define the category of the metric, for example:
   a. Infrastructure (for the default hardware metrics, see Machine Agent)
   b. JVM
   c. Custom Metrics, where Custom Metrics must have the path prefixes:
      - Custom Metrics
      - Server|Component:<*tier-name-or-tier-id*>
3. Metrics with the Custom Metrics prefix are common across all tiers in your application. Metrics with the Server|Component:<*tier-name-or-tier-id*> prefix appear only under the specified tier.

   To find the component ID of a tier, open the dashboard for the tier and review the URL. The ID appears as the component value in the URL:



The Machine Agent has to be associated with the target or destination for the metrics. If you attempt to publish metrics to a tier that is not associated with the Machine Agent, the metrics are not reported.

The "|" character separates the branches in the metric hierarchy notifying the Controller where the metric should appear in the metric tree:

```
Custom Metrics|Hardware Resources|Disks|Total Disk Usage %
Custom Metrics|Hardware Resources|Disks|Disk 1|Current Disk Usage %
```

You can insert a custom metric next to an existing type of metric. For example, the following declaration causes the custom metric named `pool usage` to appear next to the `JMX` metrics:
Server|Component:18|JMX|Pool|First|pool usage

4. You can then use the metric in health rules as would other types of JMX metrics.
   To monitor multiple metrics with the same script file, edit the script to write a different line for each one to STDOUT. For example:

```
name=Custom Metrics|Hardware Resources|Disks|Total Disk Usage %, value=23
name=Custom Metrics|Hardware Resources|Disks|Disk 1|Current Disk Usage %, value=56
```

Copy the Script File to the Subdirectory Created in Step 1

Ensure that the Agent process has execute permissions for the script file and for the contents of the file.

Create the monitor.xml File

For each custom monitoring extension script, create a `monitor.xml` file. The `monitor.xml` file executes the script file created in Step 2. You can edit the following sample file to create your own file:

```
<monitor>
    <name>HardwareMonitor</name>
       <type>managed</type>
        <description>Monitors system resources - CPU, Memory, Network I/O, and Disk I/O.</description>
        <monitor-configuration>     </monitor-configuration>
        <monitor-run-task>
           <!--  Edit execution-style as needed. -->
           <execution-style>continuous</execution-style>
           <name>Run</name>
           <type>executable</type>
           <task-arguments></task-arguments>
            <executable-task>
                <type>file</type>
                <!--  Use only one file element per os-type. -->
                 <file os-type="linux">linux-stat.sh</file>
                 <file os-type="mac">macos-stat.sh</file>
                 <file os-type="windows">windows-stat.bat</file>
                 <file os-type="solaris">solaris-stat.sh</file>
                 <file os-type="sunos">solaris-stat.sh</file>
                 <file os-type="aix">aix-stat.sh</file>
           </executable-task>
         </monitor-run-task>
</monitor>
```

The `os-type` attribute is optional for the `executable-task` file element when only one `os-type` is specified. One `monitor.xml` file executes one script per `os-type`.

1. Select the execution style: `continuous` or `periodic`.

Execution Style	Description	Example

continuous	Select `continuous` if you want data collection averaged over time. For example, average CPU usage over a minute.
	For the monitor to be declared as '`continuous`', the script should also run in an infinite loop. This ensures that the script keeps running until the Machine Agent process is terminated.
		`while [ 1 ]; do`
		... the actual script goes here ...
		`sleep 60`
		`done`

periodic	Select `periodic` to report data from system performance counters periodically. The periodic task runs every minute by default, and the data is aggregated.
	
	To specify a different frequency, use the `execution-frequency-in-seconds` element. The execution frequency must be less than 60. For periodic execution style, you can also specify the timeout setting (shown in the example).
		`<monitor-run-task>`
		
		`...`
		
		`<execution-style>periodic</execution-style>`
		`<execution-frequency-in-seconds>30<`
		`/execution-frequency-in-seconds> <execution-timeout-in-secs>30</execution-timeout-in-secs>`
		
		`...`
		
		`</monitor-run-task>`

2. Add the name of your script file to the `<file>` element in the `monitor.xml` file. Be sure to use the correct `os-type` attribute. The `os-type` value should match the value returned from calling `System.getProperty("os.name")`.

```
<file os-type="your-os-type">{script file name}</file>
```

   You can use either the relative or absolute path of the script.

Copy the monitor.xml file to the Subdirectory Created in Step 1

Restart the Machine Agent

> **Required Agent Properties**
>
> Ensure that you have correctly configured the Agent in the `controller-info.xml` file and on the Agent `start` command on the command line. See Database Agent Configuration Properties.

After restarting the Machine Agent, you should see following message in your log file:

```
Executing script [<script_name>] on the console to make sure your changes work with the machine agent.
```

Verify Execution of the Monitoring Extension Script

To verify the execution of extension, wait at least one minute and check the metric data in the Metric Browser.

You can now create alerts based on any of these metrics.

Example: Create a Monitoring Extension for Open Files

To create a custom monitor for monitoring all the open files for JVMs:

1. Create a new directory in the custom monitor repository.
2. Create the script file. You can review these two examples:

   Modify this UNIX script for the specific process name (for example: Author, Publish, and so on).

```
lookfor="<process name 1>"
pid=`ps aux | grep "$lookfor" | grep -v grep | tr -s " " | cut -f2 -d' '`
count1=`lsof -p $pid | wc -l | xargs`

lookfor="<process name 2>"
pid=`ps aux | grep "$lookfor" | grep -v grep | tr -s " " | cut -f2 -d' '`
count2=`lsof -p $pid | wc -l | xargs`

echo "name=JVM|Files|<process name 1>,value="$count1
echo "name=JVM|Files|<process name 2>,value="$count2
```

The following Windows `.bat` example reports a metric to the Controller if it a Java process is running on the machine.

To generate custom metrics on Windows, AppDynamics recommends that you use PowerShell and VBasic scripts instead of `.bat` files.
When a standard Windows batch (`.bat`) script echoes metric names, it surrounds the names with quotes. The quotes will cause the Machine Agent to ignore these metrics. PowerShell and VBasic scripts do not have this issue.

```
SETLOCAL enabledelayedexpansion

REM  Check to see if there is a java process running
TASKLIST /FI "IMAGENAME eq java.exe" 2>NUL | find /I /N "java.exe">NUL
if "%ERRORLEVEL%"=="0" (
    SET metric="Custom Metrics|Process|java|Running,value=1"
    REM This strips the quotes that are added by the bat script
    REM so that the machine agent can understand the metric
    @echo !metric:"=!
)
```

3. Create the following `monitor.xml` file and point it to the UNIX script shown in Step 2.

```
<monitor>
    <name>MyMonitors</name>
    <type>managed</type>
    <description>Monitor open file count </description>
    <monitor-configuration>
    </monitor-configuration>
    <monitor-run-task>
        <execution-style>continuous</execution-style>
        <name>Run</name>
        <type>executable</type>
        <task-arguments>
        </task-arguments>
        <executable-task>
            <type>file</type>
            <file>openfilecount.sh</file>
        </executable-task>
    </monitor-run-task>
</monitor>
```

Build a Monitoring Extension Using Java

Related pages:

- Machine Agent Configuration Properties
- Build a Monitoring Extension Using Scripts

You can create Java monitoring extensions that enable the Machine Agent and Server Visibility to collect custom metrics, which you define and provide, and report them to the Controller. This is an alternative to adding monitoring extensions using scripts.

When you capture custom metrics with a monitoring extension, they are supported by the same AppDynamics services that you receive for the standard metrics captured with the AppDynamics application and Machine Agents. These services include automatic baselining, anomaly detection, display in the Metric Browser, availability for display on custom dashboards, and availability for use in policies to trigger alerts and other actions.

This page describes how to create a monitoring extension in Java.

To the Agent, a monitoring extension is a task that runs on a fixed schedule and collects metrics.

Before You Begin

Before creating your own extension from scratch, review the extensions on the AppDynamics community. See GitHub for a free download of the extensions

New extensions are constantly being added. It is possible that someone has already created what you need, or something close enough, that you can download it and use it after making a few modifications.

Create a Monitoring Extension in Java

To create a monitoring extension in Java:

1. Create your extension class. See Create the Monitoring Extension.
2. Create a `monitor.xml` configuration file. See Create the monitor.xml File.
3. Create a subdirectory (<*`your_extension_dir`*>) under <*`agent_home`*>`/monitors`.
4. Place the extension class file and the `monitor.xml` file (plus any dependent `jar` files) in <*`your_extension_dir`*>.
5. Enter the Controller access information and credentials. See Configure the Machine Agent.

   > Make sure that your `controller-info` and command line parameters are correctly configured. Required properties include: Controller name, port number, and account access key.

6. Restart the Machine Agent.

Create the Monitoring Extension Class

Create a monitoring extension class by extending the `AManagedMonitor` class in the `com.singularity.ee.agent.systemagent.api` package. This package is included in the `MachineAgent.jar` file.

The monitoring extension class performs these tasks:

- Populates a hash map with the values of the metrics that you want to add to AppDynamics. You obtain these metrics based on your environment and the source from which you derive your custom metrics.
- Defines the type of metrics to collect using the `MetricWriter` class. See Metric Processing Qualifier.
- Uploads the metrics to the Controller using the `execute()` method of the `AManagedMonitor` class.

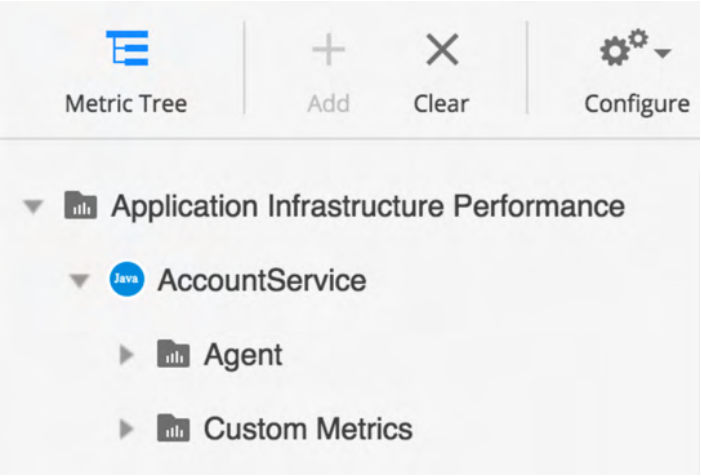
See Extension_Class_Source.txt for example source code.

Metric Path

All custom metrics processed by the Machine Agent and Server Visibility appear in the **Metric Browser > Application Infrastructure Performance**. Use the "|" character to specify the path from Application Infrastructure Performance to the custom metric. If the metrics apply to a specific tier, use the metric path for the tier, with "Component" followed by a colon ":" and the tier name or tier ID.

For example to associate a metric with tier AccountService, you would specify the metric path as: `Server|Component:AccountService|Custom Metrics|Path|`

The metric would then appear under the tree in the Metric Browser:



You can report a custom metric only to the tier that is associated with the Machine Agent. If you attempt to publish metrics to a different tier, the metrics are not reported.

You can insert a custom metric next to an existing type of metric. For example, the following declaration causes the custom metric named pool usage to appear next to the JMX metrics: name="Server|Component:<*tier-name*>|JMX|Pool|First|pool usage",value=10

You can then use the metric in health rules similar to other types of JMX metrics.

To test the appearance of your custom metric in the Controller API. post the metric data to the Machine Agent's REST API. Pass the path, name type and values of the metric as URL arguments. See Machine Agent HTTP Listener.

Metric Names

Metric names must be unique within the same metric path but need not be unique for the entire metric hierarchy.

AppDynamics recommends that you use short metric names so that they are visible when they are displayed in the Metric Browser.

Prepend the metric path to the metric name when you upload the metrics to the Controller.

Metric Processing Qualifier

The Controller has various qualifiers for how it processes a metric regarding aggregation, time roll-up, and tier roll-up.

There are three types of metric qualifiers:

- Aggregator qualifier
- Time roll-up qualifier
- Cluster roll-up qualifier

You specify these options with the enumerated types provided by the MetricWriter class.

Aggregation Qualifier

The *aggregator* qualifier specifies how the Machine Agent aggregates the values reported during a one-minute period.

Specify the aggregation qualifier as `aggregator="aggregator type"`

This value is an enumerated type. Valid values are:

Aggregator Type	Description
`METRIC_AGGREGATION_TYPE_AVERAGE`	Default. Average of all reported values in that minute.
`METRIC_AGGREGATION_TYPE_SUM`	Sum of all reported values in that minute, causes the metric to behave like a counter.
`METRIC_AGGREGATION_TYPE_OBSERVATION`	Last reported value in the minute. If no value is reported in that minute, the last reported value is used.

Time Roll-Up

The *time-rollup* qualifier specifies how the Controller rolls up the values when it converts from one-minute granularity tables to 10-minute granularity tables, and 60-minute granularity tables over time.

Roll up Strategy	Description
`METRIC_TIME_ROLLUP_TYPE_AVERAGE`	Average of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
`METRIC_TIME_ROLLUP_TYPE_SUM`	Sum of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
`METRIC_TIME_ROLLUP_TYPE_CURRENT`	Last reported one-minute data point in that 10-minute or 60-minute interval.

Cluster Roll-Up

The *cluster-rollup* qualifier specifies how the Controller aggregates metric values in a tier.

Roll up Strategy	Description
`METRIC_CLUSTER_ROLLUP_TYPE_INDIVIDUAL`	Aggregates the metric value by averaging the metric values across each node in the tier.
`METRIC_CLUSTER_ROLLUP_TYPE_COLLECTIVE`	Aggregates the metric value by adding up the metric values for all the nodes in the tier.

For example, if a tier has two nodes, Node A and Node B, and Node A has three errors per minute and Node B has seven errors per minute, the INDIVIDUAL qualifier reports a value of five errors per minute and COLLECTIVE qualifier reports ten errors per minute. INDIVIDUAL is appropriate for metrics such as % CPU Busy where you want the value for each node. COLLECTIVE is appropriate for metrics such as Number of Calls where you want a value for the entire tier.

Sample Monitoring Extension Class

The `NGinXMonitor` class retrieves the following metrics from the Nginx Web Server, and adds them to the metrics reported by AppDynamics:

- `Active Connections:` number of active connections
- `Accepts:` number of accepted requests
- `Handled:` number of handled requests
- `Requests:` total number of requests
- `Reading:` number of reads
- `Writing:` number of writes
- `Waiting:` number of keep-alive connections

The source for the extension class is included as an attachment.

Create monitor.xml

Create a `monitor.xml` file with a `<monitor>` element to configure how the Machine Agent executes the extension.

1. Set the `<name>` to the name of your Java monitoring extension class.
2. Set the `<type>` to `managed`.
3. The `<execution-style>` can be `continuous` or `periodic.`
    - Continuous means to collect the metrics averaged over time; for example, average CPU usage per minute. In continuous execution, the Machine Agent invokes the extension once and the program runs continuously, returning data every 60 seconds.
    - Periodic means to invoke the monitor at a specified frequency. In periodic execution, the Machine Agent invokes the extension, runs it briefly, and returns the data on the schedule set by the `<execution-frequency-in-seconds>` element.

    > Do not set the `<execution-frequency-in-seconds>` greater than 300 seconds (five minutes). The extension must collect metrics at least once every five minutes.

4. If you select `periodic` for the execution style, set the frequency of collection in `<execution-timeout-in-secs>` element. The default frequency is 60 seconds.
   If you select `continuous`, this setting is ignored.
5. Set the `<type>` in the `<monitor-run-task>` child element to `java`.
6. Set the `<execution-timeout-in-secs>` to the number of seconds before the extension times out.
7. Specify any required task arguments in the `<task-arguments>` element. The default arguments that are specified here are the only arguments that the extension uses. They are not set anywhere else.
8. Set the `<classpath>` to the `jar` file that contains your extension's classes. Include any dependent `jar` files, separated by semicolons.
9. Set the `<impl-class>` to the full path of the class that the Machine Agent invokes.

Sample monitor.xml Files

This attached monitor.xml file configures the NGinXMonitor monitoring extension. This extension executes every 60 seconds.

This attached monitor.xml file configures the MysqlMonitor. This monitor executes every 60 seconds, has four required task arguments and one optional task argument and one dependent `jar` file.

Standalone Machine Agent HTTP Listener

You can send metrics to the Machine Agent using its HTTP listener. You can report metrics through the Machine Agent by making HTTP calls to the Agent instead of piping to the Agent through `sysout`.

Activate the HTTP Listener

The HTTP listener is not enabled by default. To activate the HTTP listener, restart the Machine Agent and set the `metric.http.listener` system property to `true`. Optionally, you can specify the port for the listener with system property. The HTTP listener can only accept calls from localhost.

The `-D system properties` are:

- `metric.http.listener:` Required. Set to `true`.
- `metric.http.listener.port:` Optional. Set to the port to be used, defaults to 8293.

```
<machine_agent_home>/bin/machine-agent -Dmetric.http.listener=true -Dmetric.http.listener.port=<port_number> -
Dmetric.http.listener.host=0.0.0.0
```

If starting the Agent by invoking the Machine Agent JAR, ensure that you place the options before the `JAR` name in your start-up command. For example:

```
java -Dmetric.http.listener=true  -jar MACHINE_AGENT_HOME/machineagent.jar
```

Create Metrics

Use to post custom metrics to the Machine Agent for uploading to the Controller. Define one or more metrics in the body of the request as `JSON` data.

URI

POST /api/v1/metrics

Metric Definition Fields

Parameter	Description
`metricName`	Name for the metric as it will appear in the Controller UI.
`aggregatorType`	How the metrics should be aggregated. Options are: • `AVERAGE`: The average of all one-minute data points when adding it to the 10-minute or 60-minute granularity table. • `SUM:` The sum of all one-minute data points when adding it to the 10-minute or 60-minute granularity table. • `OBSERVATION:` Last reported one-minute data point in that 10-minute or 60-minute interval.
`Value`	A 64-bit integer value for the metric.

Format

```
POST /api/v1/metrics

 [

  {

    "metricName": "Custom Metrics|Test|MetricFromRESTClient1",

    "aggregatorType": "AVERAGE",

    "value": 10

  }

]
```

Create Events

Use to post custom events to the Machine Agent for uploading to the Controller. Define one or more events in the body of the request as `JSON` data.

URI

POST /api/v1/events

Event Definition Fields

Parameter Name	Description
`eventSeverity`	Severity of the event, from INFO, WARN, ERROR.
`type`	A string describing the event subtype. The event will be of type CUSTOM, subtype will be the value of this parameter.
`summaryMessage`	A summary of the event.
`properties`	Event properties. These properties are retrieved along with events by the Controller in a given query and provide a means for filtering the events. The maximum size of a key is 500 characters and the maximum size of a value is 5000 characters. The values can be a numeric or string value.
`details`	Arbitrary key-value details for the event; similar in constraints to properties but are retrieved in a separate call. Use this to store details that should only be retrieved when requested by the user, which avoids the expense of retrieving this data in the usual event calls.

Format

```
POST /api/v1/events
[
  {
    "eventSeverity": <event_severity>,
    "type": "<event_type>",
    "summaryMessage": "<event_summary>",
    "properties": {
      "<key>": {
        <user-specified_object>
      },...
    },
    "details": {
      "<key>": "<value>"
    }
  },
  {
    "eventSeverity": <event_severity>,
    "type": "<event_type>",
    "summaryMessage": "event_summary>",
    "properties": {
      "<key>": {
        <user-specified_object>
      },...
    },
    "details": {
      "<key>": "<value>"
    }
  },...
]
```

Legacy Machine Agent HTTP APIs

The following API endpoints are supported for backward compatibility, but are not extended or enhanced in future versions.

Upload Metrics

You can use `GET` or `POST` to upload metrics to the Metric Browser under **Application Performance > *Tier***, where the tier is the one defined for the Machine Agent.

The format for `GET` is:

```
GET /machineagent/metrics
```

For example:

```
http://host:port/machineagent/metrics?name=Custom Metrics|Test|My Metric&value=42&type=average
```

The format for `POST` is:

```
POST /machineagent/metrics
```

with header:

```
Content-Type: application/xml
```

with body content:

```
<?xml version="1.0"?>
<request>
<metric name="[name of metric 1]", type="[aggregation type]", value="[value of metric 1]" />
<metric name="[name of metric 2]", type="[aggregation type]", value="[value of metric 2]" />
...
<metric name="[name of metric n]", type="[aggregation type]", value="[value of metric n]" />
</request>
```

Example:

```
http://host:port/machineagent/metrics
```

Example of body content:

```
<request>
<metric name="Custom Metrics|Test|My Metric 1", type="AVERAGE", value="22" />
<metric name="Custom Metrics|Test|My Metric 2", type="SUM", value="98737" />
<metric name="Custom Metrics|Test|My Metric 3", type="CURRENT", value="93" />
</request>
```

Valid values for type are:

- `AVERAGE:` Average of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
- `SUM:` Sum of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
- `CURRENT`: Last reported one-minute data point in that 10-minute or 60-minute interval.

Upload Events

Send events using HTTP `GET` requests to upload events to the Machine Agent. The format is:

```
GET /machineagent/event
```

For example:

```
http://localhost:8293/machineagent/event?type=<event_type>&summary=<summary_text>
```

`Event_type` is one of the following:

- error
- info
- warning

Administer the Standalone Machine Agent

These pages describe procedures and provide reference material relevant to the AppDynamics Pro Administrator.

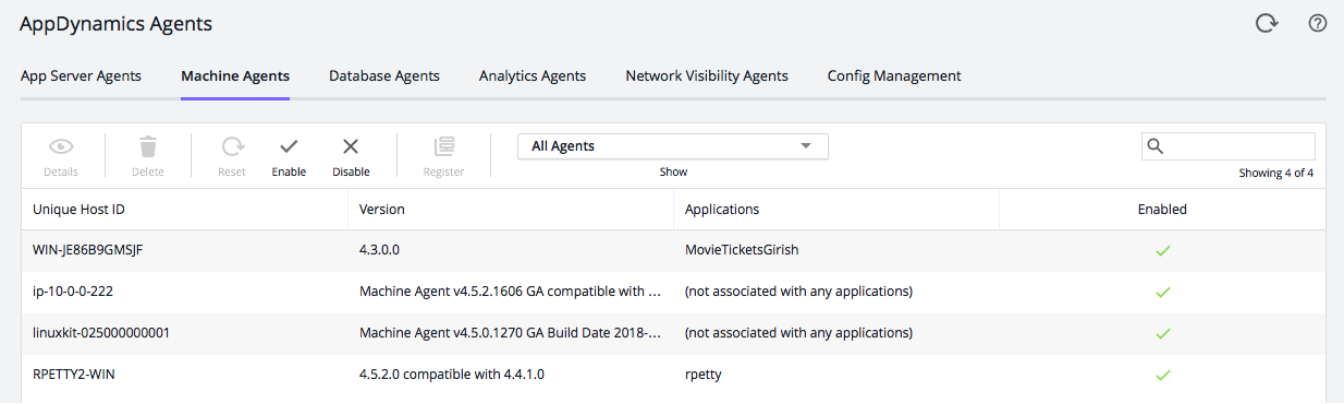
Manage Machine Agents

This page describes how to manage Machine Agents.

View Details

Using an AppDynamics Administrator account, click **Settings > AppDynamics Agents > Machine Agents** to see details and manage your installed Machine Agents.

- **Hostname**: Name of the machine on which the Agent is installed.
- **Version**: Version of the installed Machine Agent software.
- **Applications**: Name of the application with which the Agent is associated.
- **Enabled:** Whether the Agent is enabled.



Available Actions

Reset Selected Machine Agent

Restarts the selected Machine Agent and runs it with any updated configuration files on the Agent host, and any changes made on the Controller that affect the Agent. The reset functionality is only available for Machine Agents <= 4.2.

View Machine

Shows summary details about the Machine Agent:

- **Name:** Name of the machine on which the Agent is installed
- **IP Address:** IP address of the machine on which the Agent is installed
- **OS:** Operating system running the Agent
- **Status:** Field displays status information: Initialized
- **Install Time:** Date and time Agent was installed
- **Last Start Time:** Date and time Agent was last restarted

Disable and Enable Agents

Disabling the Agent temporarily suspends its collection of metrics. You can quickly re-enable the Agent when desired.

> **Permission:**
>
> You must have the application-level permission, *configure agent properties*, to enable and disable Agents.

When the Machine Agent is disabled, the Agent stops reporting hardware metrics and metrics from any extensions installed on the Agent until you re-enable it. The disabled Machine Agent no longer reports events and any installed extensions are also stopped. While disabled, the Agent continues to consume a license. The Agent maintains a 'heartbeat' connection to the Controller so that it can be 'enabled' again quickly. The Agent persists its enabled /disabled state even after the Machine Agent is restarted. Once re-enabled, all normal Machine Agent activities resume.

Delete Selected Machine Agent

The delete functionality on the admin page is to delete the underlying machine metadata for an orphaned machine. A machine is considered "orphaned" when it is no longer associated with any APM nodes or with Server Availability. You cannot delete a machine that is not an orphan. To delete a machine that is not an orphan, you must first delete all nodes on that machine, and then delete the machine from the Servers list. You can select multiple machines to delete.

You can also delete a Machine Agent from the Servers List.

- Server Visibility Administrator permission is required to delete machines.
- You can delete machines from the Servers list regardless of whether they have Server Visibility enabled. You can select multiple machines to delete.
- Deleting a machine from the Servers list deletes the underlying machine metadata that displays on the AppDynamics Agents Admin page, but only if no APM nodes are currently associated with the same machine.
- Deleting a machine that still has APM nodes currently associated with it removes the entry from the Servers list, but retains the underlying machine metadata. That information continues to display on the AppDynamics Agents admin page.

Upgrade the Standalone Machine Agent

This page describes how to upgrade an existing installation of the Machine Agent. The instructions have been tested and certified to work for Machine Agent >= 4.3.

For a new installation, see Install the Machine Agent.

> **Machine Agent >= 4.3 Recommended**
>
> AppDynamics recommends using Machine Agent >= 4.3 for this release. Machine Agent <= 4.1 is no longer supported. Although Machine Agents may be compatible with future releases of the Controller, AppDynamics only provides support for Machine Agent versions with the Controller for two years after the release of the Agent.

Perform the Upgrade

1. Do the following (as needed) before you update the Agent:
    a. Review the Release Notes for changes that affect your environment.
    b. Back up the *<machine_agent_home>* directory to a *<machine_agent_home_BACKUP>* so you can revert to the previous installation, if required.
    c. *If you are upgrading the Controller as well as the Agents:* Upgrade the Controller Using the Enterprise Console, and then return to this procedure.
    d. *If you have been collecting Log Analytics data by running the Analytics Agent via the Machine Agent:* Do the following.
        i. Preserve the old watermark file so that you can copy it to the new *<analytics-agent-home>*.
            Machine Agent location: *<machine-agent-home>*`/monitors/analytics-agent/conf/watermark`
            Analytics Agent location: *<analytics-agent-home>*`/conf/watermark`
        ii. Preserve your pre-existing job files so that you can copy them to the new *<analytics-agent-home>*.
            Machine Agent location: *<machine-agent-home>*`/monitors/analytics-agent/conf/job`
            Analytics Agent location: *<analytics-agent-home>*/conf/job
2. Download the installer suitable for your OS environment from the AppDynamics Download Center.
3. Stop all instances of the Machine Agent that are currently running from the *<machine_agent_home>* that you want to upgrade. See Start and Stop the Machine Agent
4. Update your Machine Agent installation:
    - RPM-based Linux installation:
      Update the existing package. For example: `sudo rpm -U <package>`
    - RPM-based installation on a systemd Linux system (such as CentOS 7, Ubuntu, newer Fedora Core systems, newer OpenSUSE systems, and newer SUSE Enterprise Linux systems).
      If you don't know if your Linux installation is using systemd, do a clean install to avoid issues. Remove the old package and then install the new one.
    - For all other scenarios:
      First, delete the *<machine_agent_home>* for the old Agent. Make sure you retain the *<machine_agent_home_BACKUP>* you created in Step 1.
      Then, install the Machine Agent as described Linux Install Using the RPM Package for your specific installation in Install the Machine Agent.

      > If you are running the Analytics Agent as an extension to the Machine Agent, failure to clear out the old directory or use a new location may cause your embedded Analytics Agent to fail to start.

5. Configure the Agent settings in *<machine_agent_home>*`/conf/controller-info.xml`. See Machine Agent Configuration Properties

    > The RPM-based Linux installer retains the configuration settings for the previous Agent by default.
    >
    > If you used another installer and want to maintain your previous Agent configuration, copy the *<machine_agent_home_BACKUP>*`/conf/controller-info.xml` file to the new installation directory.

6. Before you start the updated Agent, perform the following steps (as required):
    a. *If you are updating on Windows:* When you install the new Machine Agent in the existing directory, you may see two "`InstallService`" and "`UninstallService`" files. Use the `.vbs` files (VbScript) and delete the `.cmd` files (Windows Command Script), which are leftover from your previous version.
    b. *If the agent install package includes a new JRE:* Update any related custom scripts that use the Machine Agent JRE.
    c. Update all users who have the Account Administrator role for the account and add the appropriate SIM roles (SIM admin and SIM user) to other users in the account, as needed.
7. Start the Agent, verify the Agent installation, and verify that the Agent is reporting to the Controller as described for your specific installation in Install the Machine Agent.

Uninstall the Standalone Machine Agent

To uninstall the Machine Agent:

1. Stop the Machine Agent (or service). For the commands for your environment, see Start and Stop the Machine Agent.
2. If you installed the Machine Agent as a service, delete the service using the commands described on this page.
   For Windows and Mac OS X, the commands to remove the service also stop the service cleanly.
3. Delete the `<machine-agent-install>` installation directory.

Remove the Agent Service

Linux RPM

Execute the following command:

```
sudo rpm -ev appdynamics-machine-agent
```

Windows

Execute the following command:

```
> UninstallService.vbs
```

Mac OS X

Execute the following command:

```
sudo launchctl unload -w <machine_agent_home>/com.appdynamics.machineagent.plist
```

Delete Using AppDynamics Manage Agents

If you delete a Machine Agent from the Controller UI (as described in Manage Machine Agents), but do not shut down the JVM that the Machine Agent runs on, the Machine Agent reappears in the UI the next time it connects to the Controller. To prevent a Machine Agent from connecting to the Controller, you must remove the Machine Agent settings from the JVM configuration. This frees the license associated with the Agent in the Controller and makes it available for use by another Machine Agent.

FAQs and Troubleshooting for the Machine Agent

Machine Agent and App Agent on the Same Machine, but Report to Different Nodes

Issue

A machine has a Machine Agent and an App Server Agent running together, however, the Agents report to different nodes. When you review the Metric Browser, for example, the application metrics appear under node *abc* but machine metrics appear under node *abc.mydomain.com*.

Resolution

Check if the hostnames match. If they do not match, then:

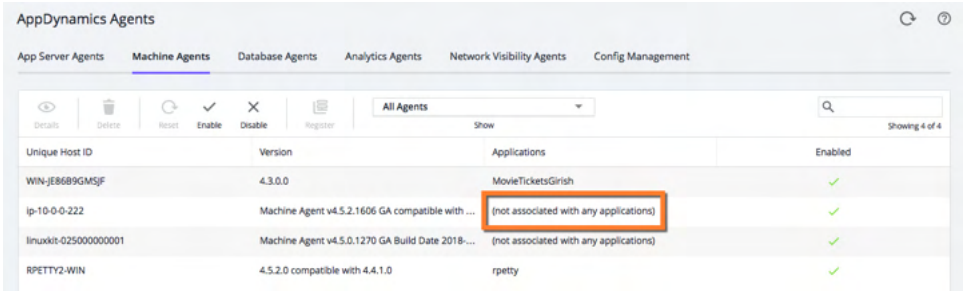
1. Set the `<unique-host-id>` for the Machine Agent to the same `<unique-host-id>` as the App Server Agent.
2. Restart the Machine Agent to apply the previous changes.

The `<unique-host-id>` on the Machine Agent and the `<unique-host-id>` for the App Server Agent must match exactly. These settings are case-sensitive and ensure that both Agents report metrics to the same node.

To verify that the hostnames match:

1. Click the gear icon ( ) in the Controller menu and select **AppDynamics Agents**.
2. Select the Machine Agents tab.
3. Review the **Applications** field for the Agent name.

   In addition, for consistency in naming in the Servers tab, use the `<machine path>` attribute to set the hostname. By using the machine path, you do not need to use the fully qualified domain name (FQDN) for some Agents, and the hostname for others. The reported hostname is still available to view by checking the option in the Agents Admin view.



4. Review the ID for the App Server Agent:
   a. Go to the App Server Agents tab.
   b. Search for the App Server Agent to which you want to associate the Machine Agent.
   c. Review the **Unique Host ID** field for the App Server Agent installed on that machine.
5. Set the `<unique-host-id>` for the Machine Agent to the same `<unique-host-id>` as the App Server Agent.
6. Restart the Machine Agent to apply the previous changes. Your Agents will appear as associated after a few minutes

Identify the Machine Agent Process

Linux and Unix-like Systems
To identify which process is running the Machine Agent, enter:

```
ps -ef | grep machine
```

Windows Systems

In the Windows Services Application, search for the AppDynamics Machine Agent service.

Metric Values for Disk and Network are Zero

When a 32-bit JRE is used with a 64-bit operating system, you may see values of zero for disk and network metrics. To solve this problem, use a 64-bit JRE with the 64-bit operating system.

Flow Maps and the Machine Agent

The Machine Agent monitors a particular machine (also called "host server") and not a particular application server; therefore, the Machine Agent can report to multiple nodes running on the same machine. However, a flow map displays the communication between different nodes during application execution, or the business transaction flow from tier to tier. A Machine Agent cannot be a part of the flow and is not shown in the flow map.

Server Health Indicator

Health rule violations based on metrics monitored by the Machine Agent are included in the health indicator on the various application, tier, and node dashboards. The health indicator is driven by health rule violations in the given time period configured on hardware metrics collected by the Machine Agent. Some health rules are configured by default. To configure additional health rules, see Configure Health Rules and Configure Health Rules to Monitor Servers.

Server Visibility

Related pages:

- Enable Server Visibility
- Monitor Your Servers Using Server Visibility
- Hardware Resources Metrics

The AppDynamics Server Visibility module uses the Machine Agent to provide extended hardware metrics. Server Visibility includes additional windows in the Controller UI that enable you to quickly see underlying infrastructure issues impacting your application performance and rapidly troubleshoot hardware performance problems.

Requirements

- Linux, Windows, Solaris, and AIX
- Server Visibility license for monitored machines
- Server Visibility enabled on the Machine Agent

> Before you enable Server Visibility:
>
> 1. Review the Server Visibility Requirements and Supported Environments.
> 2. Install and configure the Machine Agent on a machine with a supported OS as described in Install the Machine Agent.
>
> Without having to enable Server Visibility, you can view basic hardware metrics.

Feature Comparison

Feature	Server Visibility	Machine Agent
Supported Platforms	Linux, Windows, Solaris, AIX	Linux and Unix-like systems, MacOS, Windows, AIX
Extensions and Custom Metrics	Yes	Yes
Monitor Docker container metrics from the Docker host	Yes	No
Tier Metric Correlator	Yes	No
Dynamic Monitoring Mode	Yes	No
JVM Crash Guard	Yes	Yes
Remediation Scripts	Yes	Yes
Graphical User Interface	Yes	Functionality is limited to viewing Machine Agent metrics in the Servers List
Extended Hardware Metrics	Yes	No
Server metrics in transaction snapshots	Yes	No
Server KPIs in application flow map	Yes	No
Health rules for extended hardware metrics	Yes	No
Licensing	Server Visibility	Machine Agent

Permissions

Server Visibility provides two predefined roles, and two related permissions:

- Server Visibility Administrator
- Server Visibility User
- View Server Visibility permission
- Configure Server Visibility permission - enables configuring Service Availability

See Server Visibility Permissions.

Server Visibility User Interface

The Servers list provides key performance metrics for all your servers on a single panel.

The Servers > Dashboard shows key performance metrics for the selected machine, including the top ten consumers of CPU and memory.

The Servers > Volumes panel displays performance metrics for disks, partitions, and volumes for the selected machine.

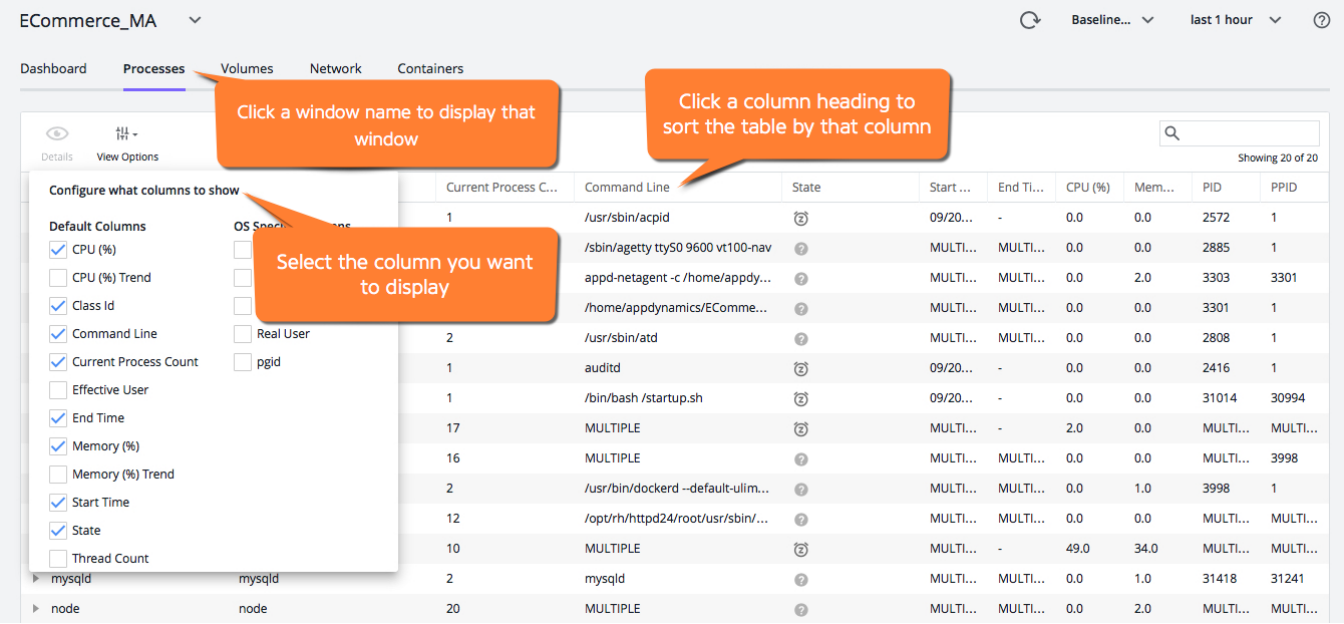
The Servers > Network panel shows network performance metrics for network interfaces on the selected machine.

The Servers > Processes panel shows a configurable set of performance metrics for processes.

The Servers > Containers panel lists the monitored containers used by an application.

Using the Server Visibility UI

The Server Visibility user interface uses many of the same mechanisms that are common to the various panels of the Controller UI. The sample image illustrates these mechanisms.



Search Results and Sorting

Pagination is the default behavior on the **Servers** and **Containers** list pages. The information is retrieved on demand, and additional records are retrieved and displayed as you scroll. Search is only available for the **Name** and **Host ID** columns. Sorting is only available on the **Hostname**, **Container**, **Metric %**, and **Health** fields.

Server Visibility Requirements and Supported Environments

To enable Server Visibility, review these system requirements guidelines.

System Requirements

Server Visibility requires a supported version of the Machine Agent to be installed on the monitored server. See Machine Agent Requirements and Supported Environments.

Server Visibility features are available for AIX, Linux, Windows, and Solaris. You need a Server Visibility license to enable and use Server Visibility features. Server Visibility is enabled by default on AppDynamics Controllers. You must explicitly enable Server Visibility on your Standalone Machine Agent to start sending the expanded set of Server Visibility metrics.

You can install and run Machine Agents on other supported platforms, however, Server Visibility features are not available. For OS platforms like AIX or HP-UX, AppDynamics recommends using the unbundled Machine Agent ZIP without the JRE.

Limitations

- Total number of Machine Agents and containers reporting to a single Controller is 30,000.
- Total number of App Agents reporting to a single Controller is 100,000.
- Monitored servers are considered stale 30 days after they go offline. They are purged from the Controller database when that time limit is reached.
- Docker Visibility is supported on Linux only.

Server Visibility on Windows

Review these notes:

- It is good practice to check the server frequently to ensure that it has the latest Windows updates installed. WMI (Windows Management Instrumentation) updates are especially important because the Agent uses WMI to collect Server Visibility metrics.
- The monitored server should have at least four cores or multiple CPUs. WMI processes can be highly resource-intensive, especially on Windows Server 2012.
- If you do not have a Server Visibility license, or to collect Basic metrics only, configure the Agent to use the `JavaHardwareMonitor` extension. Server Visibility should not be enabled on the Agent.
- The Windows Machine Agent uses these extensions by default:
  - `JavaHardwareMonitor` (for Basic metrics)
  - `ServerMonitoring` (for Server Visibility metrics)
- The `HardwareMonitor` extension is not recommended on Windows.
- To enable Server Visibility on a Windows server with a .NET APM Agent installed, you must enable .NET Compatibility Mode on both the Controller and the Standalone Machine Agent.

Enable Server Visibility

Before you enable Server Visibility:

1. Review the Server Visibility Requirements and Supported Environments.
2. Install and configure the Machine Agent on a machine with a supported OS as described in Install the Machine Agent.

> **Server Visibility License Required**
>
> Infrastructure Visibility is an add-on module to the Machine Agent and requires a Server Visibility license on the Agent.

Enable Server Visibility

1. Set the "`sim enabled`" property to "`true`". See Where to Specify Machine Agent Configuration, and configure the value based on your configuration choice:
   - Element in `controller-info.xml`: `<sim-enabled>`
   - System Property: `-Dappdynamics.sim.enabled`
   - Environment Variable: `APPDYNAMICS_SIM_ENABLED`
2. Restart the Machine Agent. See Start and Stop the Machine Agent.

Monitor Your Servers Using Server Visibility

This page describes the Server Visibility panels in the Controller UI:

Discover Normal Server Activity

Related pages:

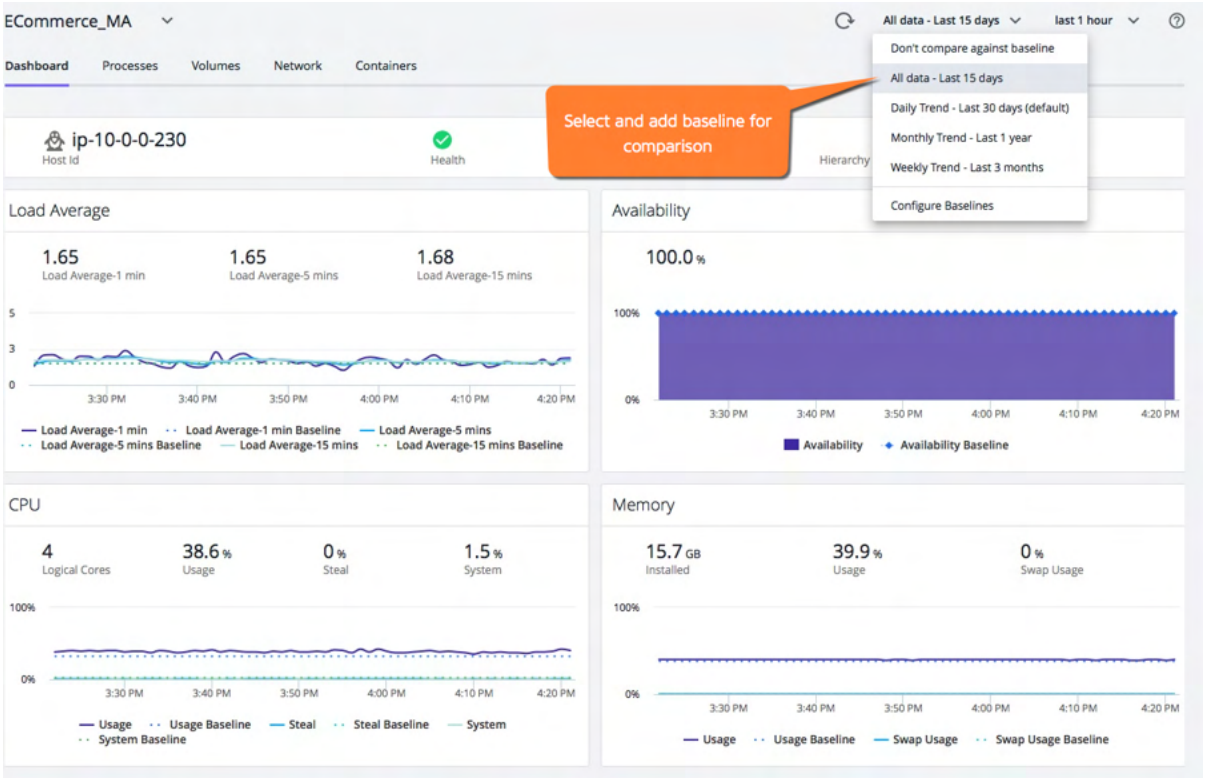
- Dynamic Baselines
- Hardware Resources Metrics

The Server Visibility module automatically learns to detect performance anomalies using baselines that are specific to your server environments.

AppDynamics creates baselines by collecting metrics from your monitored servers over defined periods of time. This establishes what is normal for your environment so you can create health rules to alert you when metric deviations occur from the normal range. You can also create your own baselines.

View Performance Metrics Compared to Baselines

You can compare performance metrics to their dynamic baselines on the Server Dashboard.



You can visualize performance metrics and review deviations from expected behaviors established by the baseline from the **Metric Browser - Server Visibility** panel.

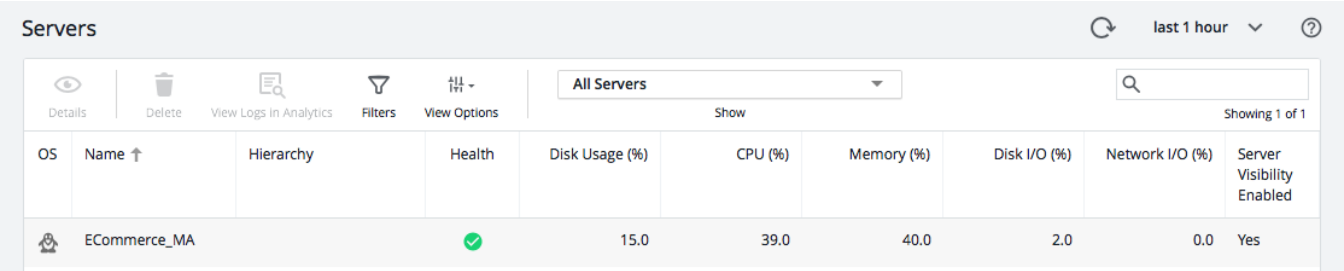
Servers List

To access: AppDynamics Home > **Servers**

The **Servers** list shows all machines registered by a Machine Agent. This list shows metric data for Server-Visibility-enabled machines only. Machines registered with App or .NET Agents, with no Machine Agent running, do not appear in this list.

On the Servers list you can:

- See the complete list of Machine Agents reporting to this Controller. The **Name** is taken from the value in `<machine-path>` in `controller-info.xml`. The last string after the last | (pipe) is used. For example, if the value is `<machine-path>Group | myName<machine-path>`, then the name is `myName`. For `<machine-path>JustName<machine-path>`, then the name is `JustName`.
- Filter the list using the dropdown to show all servers (the default) or just servers with Server Visibility enabled or disabled.
- Use **View Options** to select the columns shown for each server in the table. You can show or hide metrics such as **CPU Steal**, **Load Average**, **Memory Swap Used**, and **Network I/O**. You can also show or hide properties such as Host ID and JVM version.
- See key performance metrics for your monitored servers at a glance.
- Change the time period of the metrics displayed.
- See an overview of the health of the servers, as determined by whether any health rules have been violated. See View Health Rule Status in the UI.
- Click the violations icon ( ) to view health rule violations for a server.
- Click on any point on a spark chart to see the percentage usage at that time.
- Sort the chart by any of the columns.
- Right-click on a set of selected servers to
  - Delete the servers from the Servers list. See "Delete Selected Machine Agent" in Manage Machine Agents.
  - View and analyze log data for the servers (if you have an Application Analytics license). See Analytics.
  - Set the **Dynamic Monitoring Mode** on the servers. See Dynamic Monitoring Mode and Server Visibility.
- See additional details of servers that are enabled for Server Visibility. Double-click a selected server to see server-specific dashboard, and details of the server's volumes, network, and processes.
- Filter data according to the "liveness" of servers. A Machine Agent that reports metrics from a server is considered live. Eventually, servers can transition to a terminated or unrecoverable state. By specifying a time range in the Server Dashboard, you can filter servers which were live and reporting metrics during that time range. To enable this option for an individual account:
  1. Log in to the Controller admin page: `<controller-hostname>/controller/admin.jsp`
  2. From **Accounts**, open the account page of interest.
  3. Click **Controller Settings** > **Controller Configurations** and enter:
     a. Name = `entity.liveness.filter.enabled`
     b. value = `true`
     c. Name =`entity.liveness.tracker.enabled`
     d. value = `true`
- Disable automatic sorting of the Servers List table when it first loads. This option is useful if the Controller is monitoring hundreds or thousands of Machine Agents and the table is taking a long time to load. This option disables the ability to sort the table by any metric or metric trend column. To enable this option for an individual account, do the following:
  1. Log in to the Controller admin page: `<controller-hostname>/controller/admin.jsp`
  2. From **Accounts**, open the account page of interest.
  3. Click **+ Add Property** and enter:
     a. Property = `SIM_DISABLE_MACHINE_SORTING`
     b. value = `true`



Available Metrics in the Servers List

Metric Name	Description
Hierarchy	Specifies the root of the hierarchical path to the server. See the machine hierarchy property in this topic: Machine Agent Configuration Properties.
Health	Indicates if server health rules have been violated on this machine.
Disk Usage % trend	The percentage usage trend over time of storage space in use across all listed volumes, partitions, and disks.

CPU (%)	The percentage of time the CPU was busy processing system or user requests.
CPU Trend	The trend over time of CPU usage.
Memory (%)	The percentage of memory used.
Memory Trend	The trend over time of memory usage.
Disk I/O (%)	The percentage of time spent performing read and write operations across one or more disks, volumes, or partitions.
Disk IO Trend	The trend over time of disk usage.
Network I/O (%)	The average network utilization of network bandwidth for all monitored network devices. The network utilization percentage is the total incoming and outgoing bytes per second, divided by the maximum speed of the network interface. In some cases, if the Network I/O percentage value is too small compared to the network speed (10,000 Mb/s), the value is rounded to zero on the Servers List. In this case, the Network I/O % shows as zero, while the drilled-down details of the machine might show network traffic.
Network Trend	The trend over time of network usage.
Server Visibility Enabled	Indicates if Server Visibility is enabled for this machine. Values=Yes, No, and Not Supported. Not Supported indicates that Server Visibility is not available for that machine OS.
Icon	Representation of the machine's Operating System

Server Dashboard

To access Server Dashboard, select **AppDynamics Home > Servers > Dashboard**.

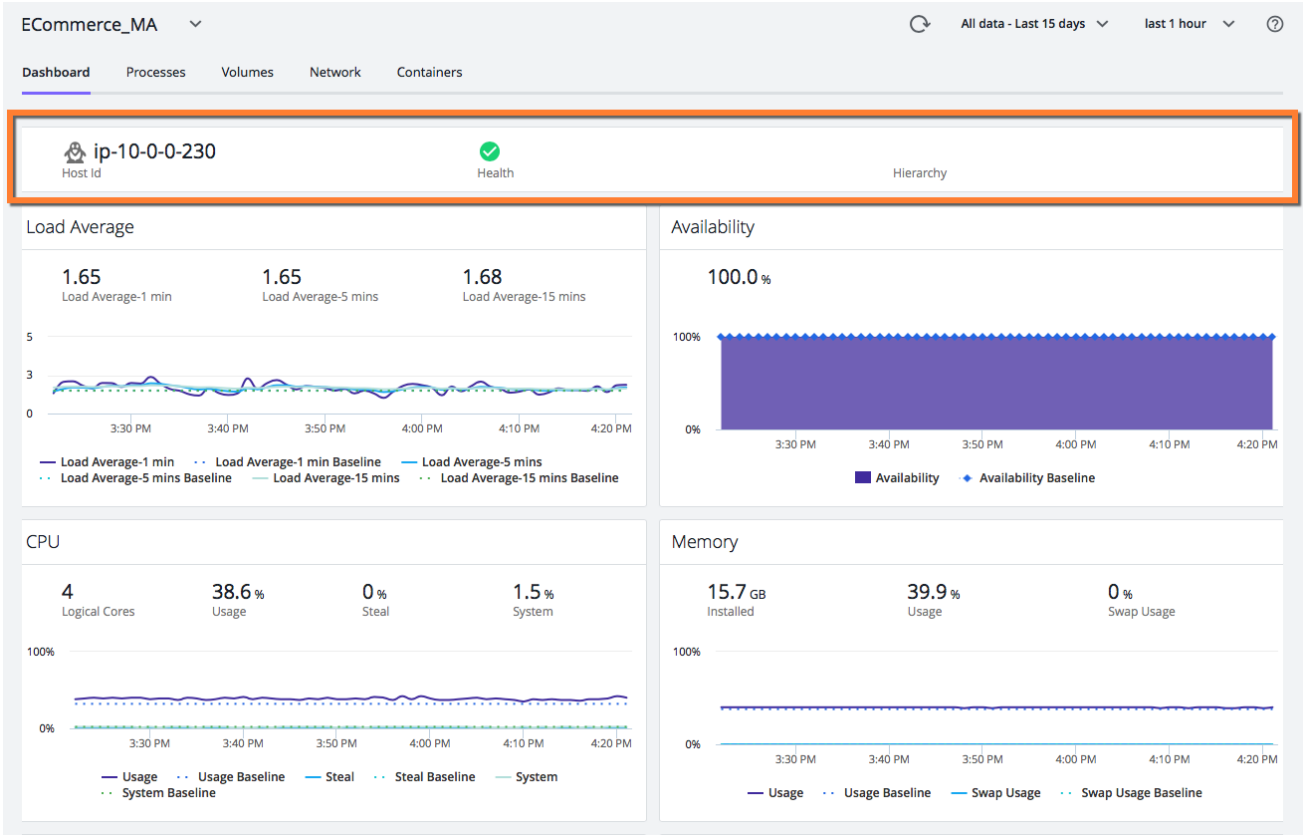
Select a server from the list and double-click a server name to display its Dashboard. In this Dashboard, you can:

- View charts of key performance metrics for the selected monitored servers:
  - Server availability
  - CPU, memory, and network usage percentages
  - Server properties
  - Disk, partition, and volume metrics
  - Top ten processes consuming CPU resources and memory
- Change the time period of the metrics displayed.
- View an assessment of the overall health of the server based on any health rule violations. See View Health Rule Status in the UI.
- View the hierarchy or grouping of the server as specified in the `controller-info.xml` using the machine-path configuration property.
- Click on any point on a chart to see the metric value for that time.
- Sort the chart using any of the columns as a sorting key.
- Find and switch to other Server Dashboards from the dropdown next to server tier.
- View an aggregate of the top ten processes by CPU usage, and top ten processes by memory.

Server Dashboard Metrics

Host ID, Health, Hierarchy (*Top Pane*)

- **Host Id**: This is an ID for the server that is unique to the AppDynamics Controller.
- **Health**: Shows the overall health of the server. Hover over the health icon for details; for example, the following appears when hovering over the exclamation mark (!) in a red box, "There are Critical Health Rule Violations on this machine during the time range."
- **Hierarchy**: This is an arbitrary hierarchy to group your servers together, specified by Machine Hierarchy Property.



Load Average

The CPU load presented as an average over the past 1 minute, 5 minutes, and 15 minutes. The CPU load is the percentage of the CPU consumed by processes that are currently running or that are waiting to run. These metrics are shown as percentages in the Server Dashboard and are scaled by 100 in the Metric Browser.

Availability

- **Availability**: Percentage of time the Machine Agent is able to communicate with the Controller. The Machine Agent sends availability information in the form of a heartbeat to the AppDynamics Controller once a minute to indicate the Agent is alive. The heartbeat may show as available when other functions of the Machine Agent and Server fail. The availability only indicates that the Machine Agent is communicating with the Controller, and does not indicate the overall health of the functions within the Machine Agent.
- **time series chart**: Shows the Machine Agent availability trend over time. There are situations where the Machine Agent is able to communicate with the Controller while other functions of the Machine Agent, or processes on the server, are non-functional. Do not use the time series metric to indicate the overall availability of the server.

CPU

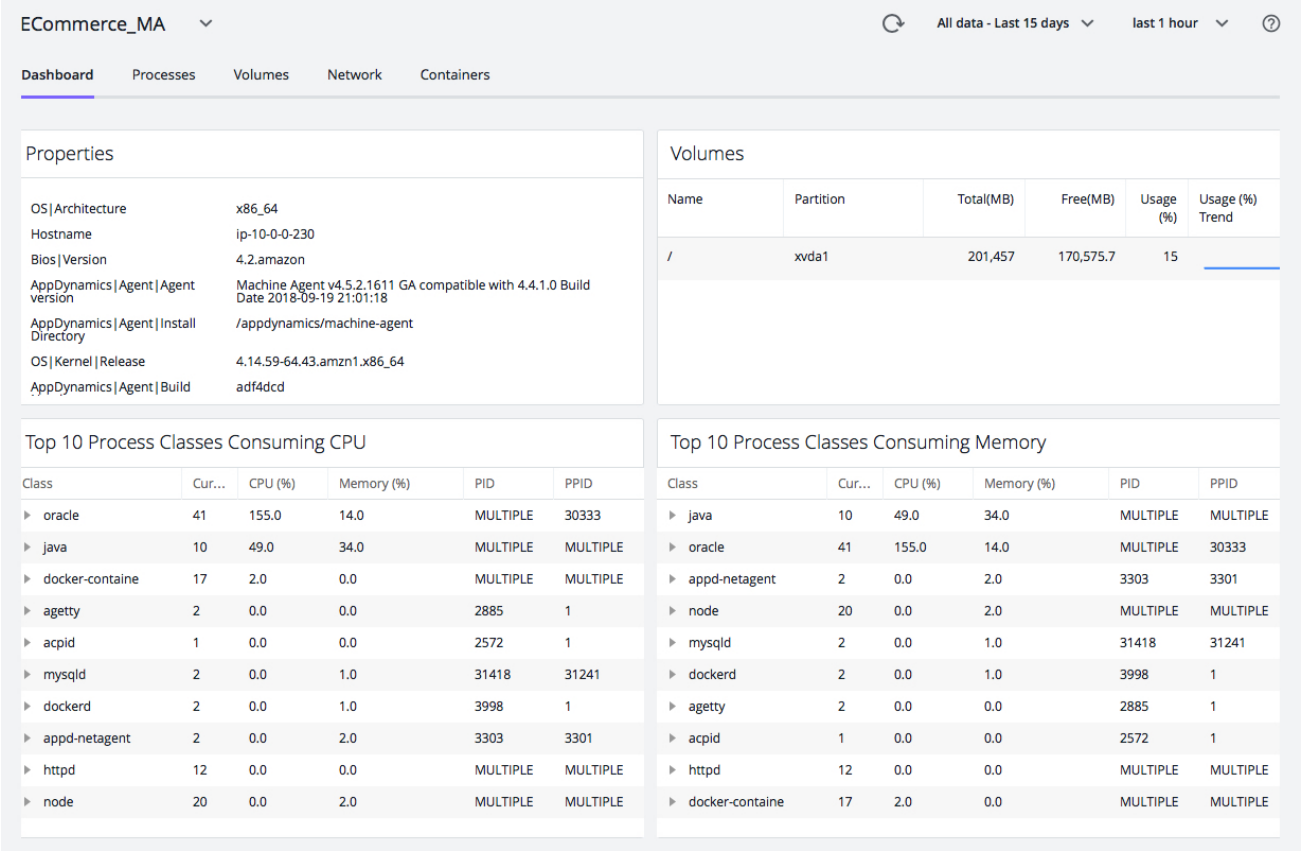
- **CPU Usage**: Average usage of CPU over the chosen time-range.
- **# of Cores**: Number of cores for the CPU.
- **time series chart**: Shows CPU busy percentage trend over time.

Memory

- **Installed**: Total amount of memory, free and used, on the server.
- **Memory Usage**: Percentage of memory used.
- **Swap Usage**: Swap usage tracks the swap file utilization. A swap file enables an operating system to use hard disk space to simulate extra memory. When the system runs low on memory, it swaps a section of RAM being used by an idle program onto the hard disk to free up memory for other executing programs. When the idle, swapped out program begins executing again, it is moved back to RAM, potentially displacing some other idle program. This causes a large amount of hard disk reading and writing that can slow down the system considerably.
- **time series chart**: Shows the memory usage trend over time.

Network

- **Interfaces**: Number of network interfaces on the server.
- **Outgoing**: Kilobytes of data sent per second for all monitored network devices.
- **Incoming**: Kilobytes of data received per second for all monitored network devices.
- **time series chart**: Shows the network incoming and outgoing volume trend over time.



Volumes

- **Total**: Storage space, free and used, on the disk, partition or volume. For Linux systems, this does not include disk space reserved by the kernel.
- **Free**: Total storage space available. For Linux systems, this does not include disk space reserved by the kernel.
- **Usage(%)**: Percentage of storage space in use across each disk, partition, and volume.
- **time series chart**: Shows the storage usage trend over time.

Top 10 Processes Consuming CPU

- **Count**: Number of processes in this class.
- **CPU (%)**: Percentage of CPU resources consumed by all processes in this class.
- **Memory (%)**: Percentage of memory consumed by all processes in the class.
- **PID**: Process ID.
- **PPID**: Parent Process ID.

Top 10 Processes Consuming Memory

- **Count**: The number of processes in this class consuming memory resources.
- **CPU (%)**: Percentage of CPU consumed by all processes in this class.
- **Memory (%)**: Percentage of memory consumed by all processes in this class.
- **PID**: Process ID.
- **PPID**: Parent Process ID.

Server Process Metrics

Related pages:

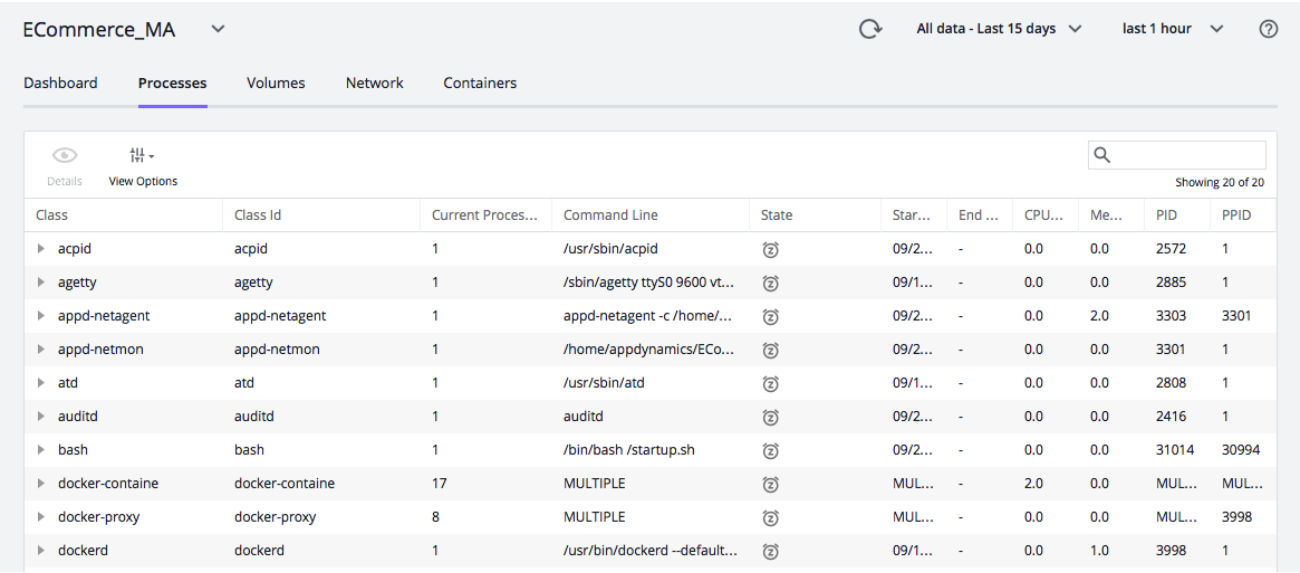
- Hardware Resources Metrics
- Enable Server Visibility
- Machine Agent Settings for Server Visibility

To access Server Process Metrics, select **AppDynamics Home** > **Servers** > (double-click a server) > **Processes**.

You can configure which processes AppDynamics monitors, how they are grouped, the number of processes to monitor, and how long they must be alive before monitoring them. See Machine Agent Settings for Server Visibility

From the Server Processes tab, you can:

- View all the processes active during the selected time period. The processes are grouped by class as specified in the `ServerMonitoring.yml` file.
- View the full command line that began this process by hovering over the process entry in the **Command Line** column.
- Expand a process class to see the processes associated with that class.
- Select **View Options** to configure which columns to display in the chart.
- Change the time period of the metrics displayed.
- Sort the chart using the columns as a sorting key. You cannot sort by CPU Trend or Memory Trend on sparkline charts.
- Review CPU and Memory usage trends.



Class	Class Id	Current Proces...	Command Line	State	Star...	End ...	CPU...	Me...	PID	PPID

Metrics for Server Processes

The following information displays for each monitored class and process:

Default Columns

- **Class**: The process class.
- **Count**: The number of processes in this class.
- **Command Line**: The command that began the process.
- **State**: An icon represents the process state: sleeping, running, terminated, zombie or multiple. Hover over the icon to discover its state. The State column displays a question mark when there is more than one process associated with the class. Expand the class to review the state of the related processes.
- **Effective User**: The name of the user account that started the process.
- **Start Time**: The time, as set on the Controller machine, when the process started.
- **End Time**: The time, as set on the Controller machine, when the process ended.
- **CPU (%)**: The percentage of CPU resources by all processes in this class.
- **CPU Trend**: A chart that shows CPU usage over the selected time period.
- **Memory (%)**: The percentage of memory resources by all processes in this class.
- **Memory Trend**: A chart that shows memory usage over the selected time period.
- **PID**: Process ID.
- **PPID**: ID of the parent process.

OS-Specific Columns

The column information is specific to processes monitored on a Linux server.

- **pgid**: Process group ID.
- **Real Group**: The process real group ID.
- **Real User**: The process real user ID.
- **Effective Group**: The user ID the kernel uses to determine the process permissions when using shared resources such as: message queues, shared memory, and semaphores.
- **Nice Level**: The priority used to indicate the amount of CPU to afford the process or the process priority, where -20 is the highest priority, and 19 or 20, is the lowest priority.

Windows Process Collection Configuration

When too many processes slow down the performance of the Machine Agent on Windows, you must adjust the system environment variables to accommodate. Specifically, in relation to Windows-based operating systems supported by the AppDynamics platform. See System Requirements.

Microsoft Windows process collection is enabled by default in the Controller and is missing the Effective User value due to performance issues. To retrieve the Effective User value, set the `APPDYNAMICS_ENABLE_PROCESS_OWNER_INFORMATION` environment variable. Although you can retrieve this information, this will most likely slow your process collection and may lead to additional issues, such as high CPU usage and the failure to report metrics. To disable process collection, set the `APPDYNAMICS_MACHINE_AGENT_STOP_PROCESS_COLLECTION` to speed up your performance at the expense of losing process metrics and metadata.

Windows System Environment Variables

This information is specific to processes monitored on a Windows server.

1. **Default:** Retrieve all Windows processes and metadata. Starting with Machine Agent 4.5.4, Effective User information is excluded by default to improve performance.
2. `APPDYNAMICS_ENABLE_PROCESS_OWNER_INFORMATION`: Retrieve all Windows processes and metadata, including the Effective User, but the Machine Agent may experience performance issues. This is available starting with Machine Agent 4.5.4.
3. `APPDYNAMICS_MACHINE_AGENT_STOP_PROCESS_COLLECTION`: Stops all Windows process metrics and metadata collection, but improves Machine Agent performance. If you set this variable, then the `APPDYNAMICS_ENABLE_PROCESS_OWNER_INFORMATION` variable is ignored. This is available starting with Machine Agent 4.4.0.

These environment variables only need to be set; you do not need to assign a value to the variable.

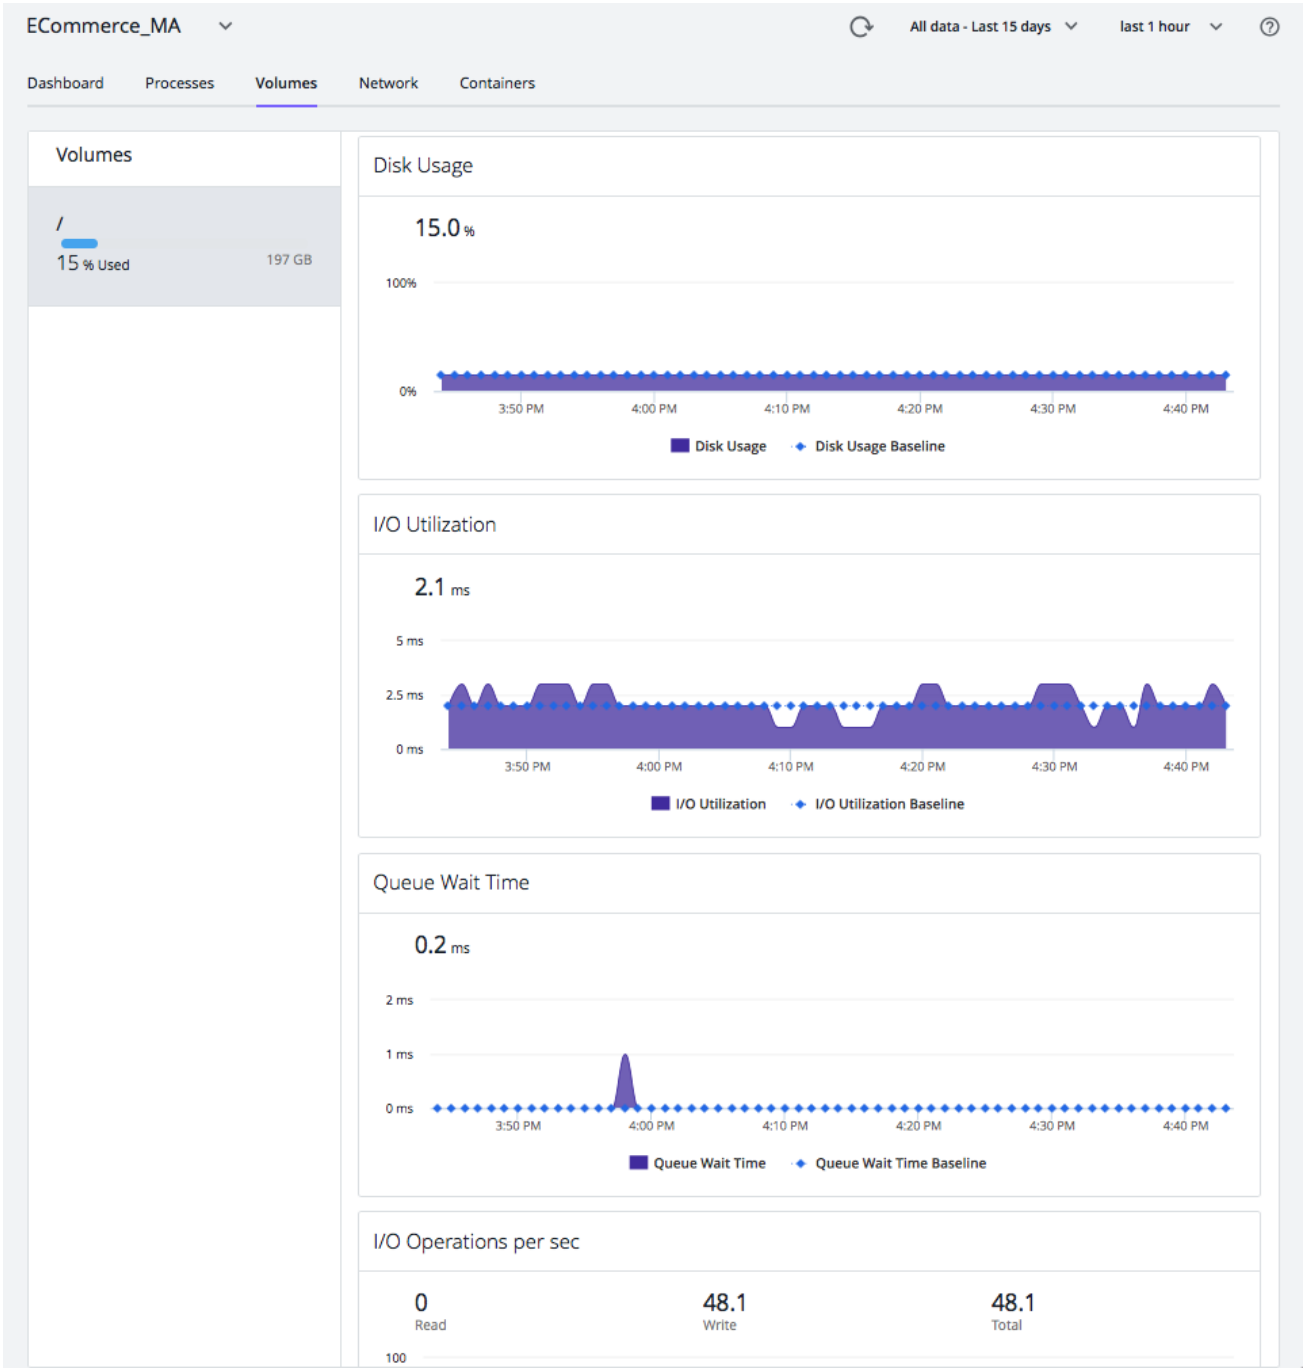
You must restart the Machine Agent for these changes to take effect.

Server Volumes Metrics

To access Server Volumes Metrics, select **AppDynamics Home > Servers >** double-click server > **Volumes**.

From the Server Volumes tab, you can:

- View the list of volumes, the percentage used, and total storage space available on the disk, partition, or volume
- View disk usage and I/O utilization, rate, operations per second, and wait time
- Change the time period of the metrics collected and displayed
- Click on any point on a chart to review the metric value for that time



Metrics in the Server Volumes Tab

For each selected disk, partition or volume, these columns are available for the **Server Volumes** panel.

- **Disk Usage %**: The percentage of storage space in use (To configure how this metric is calculated on Linux, see Configure Disk Usage Metric Collection on Linux).
- **I/O Utilization %**: The percentage of time spent performing read and write operations
- **I/O Rate read**: The number of kilobytes per second of data reads
- **I/O Rate write**: The number of kilobytes per second of data writes
- **I/O Operations per sec read**: The number of read operations per second
- **I/O Operations per sec write**: The number of write operations per second
- **I/O Wait Time read**: The percentage of time the CPU was waiting for read operations to complete
- **I/O Wait Time write**: The percentage of time the CPU was waiting for write operations to complete

- Volume space metrics on POSIX systems are obtained using the "`df`" command.
- On Linux, the space reserved for `root` is not counted in the available space.

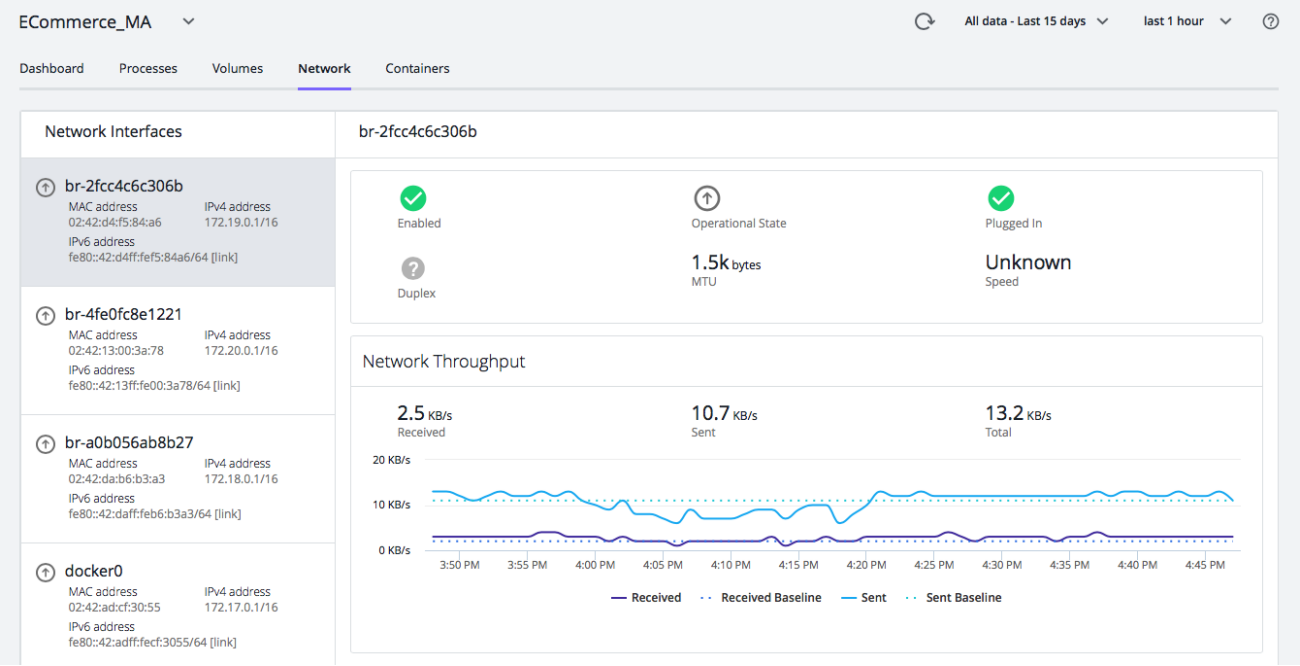
Server Network Metrics

To access Server Network Metrics, select **AppDynamics Home > Servers >** double-click server > **Network**.

From the Server Network tab, you can:

- View the MAC, IPv4, and IPv6 IP address for each network interface.
- View the state of the network interface:
    - Enabled
    - Functional (its operational state)
    - Equipped with an Ethernet cable that is plugged in
    - Operating in full or half-full duplex mode
- View the maximum transmission unit (MTU) or size (in bytes) of the largest protocol data unit that the network interface can pass
- View the speed of the Ethernet connection in Mbit/sec
- View network throughput in kilobytes/sec and packet traffic
- Change the time period of the metrics displayed
- Hover over any point on a chart to review the metric value for that time

If no metrics display, the network device speed cannot be found for some devices and some Linux versions.



Server Network Metrics

These columns are available for the Server Network panel.

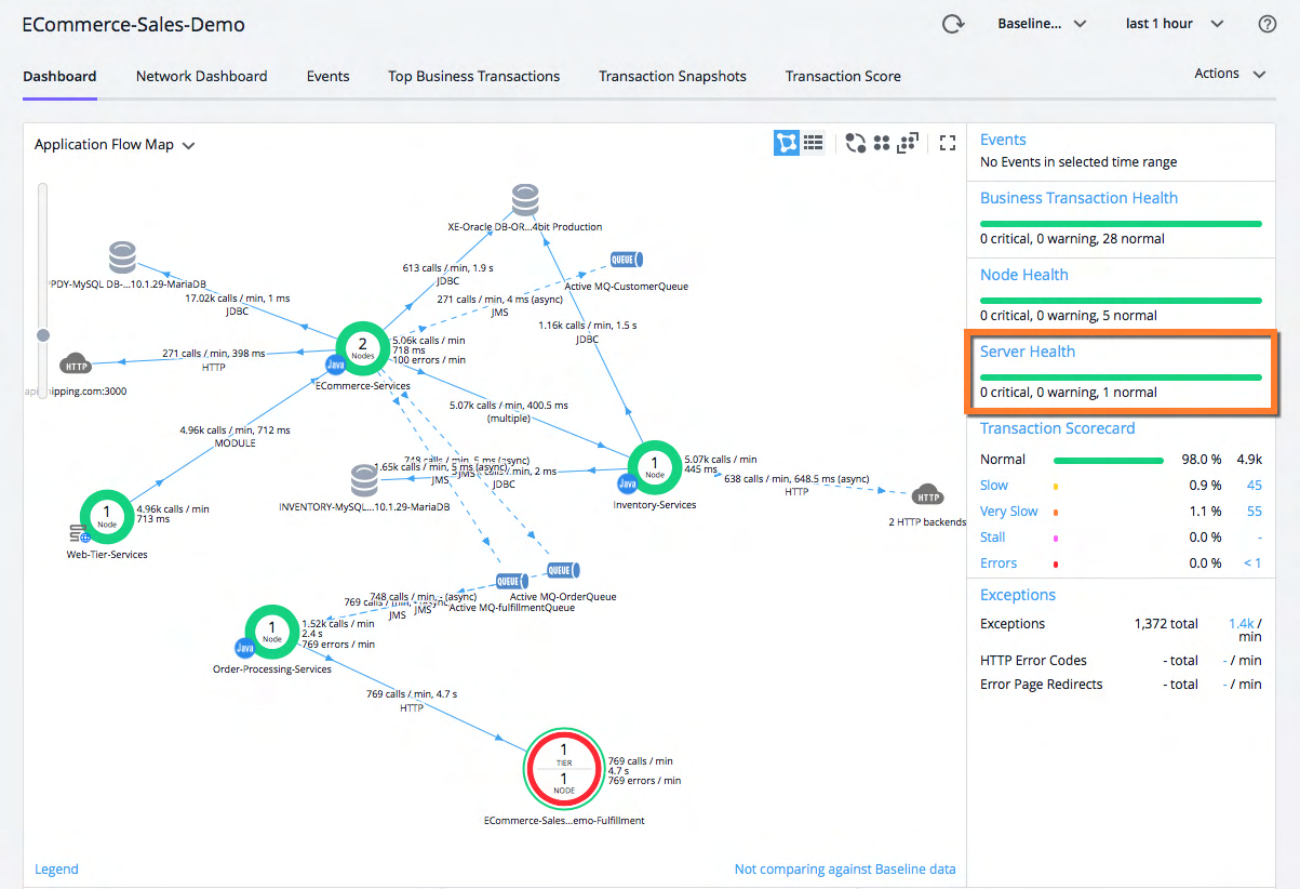
For the selected network interface:

- **Network Throughput received**: The volume of data received per second
- **Network Throughput sent**: The volume of data sent per second
- **Packets per sec incoming**: The number of data packets received per second
- **Packets per sec outgoing**: The number of data packets sent per second

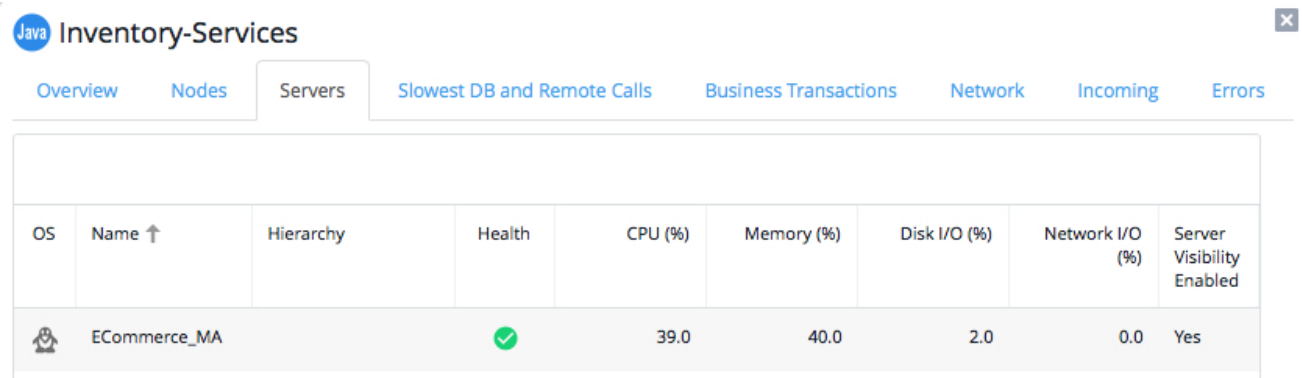
Navigating Between Server and Application Contexts

With Server Visibility enabled, you can access server performance metrics in the context of your applications. See Monitor Your Servers Using Server Visibility.

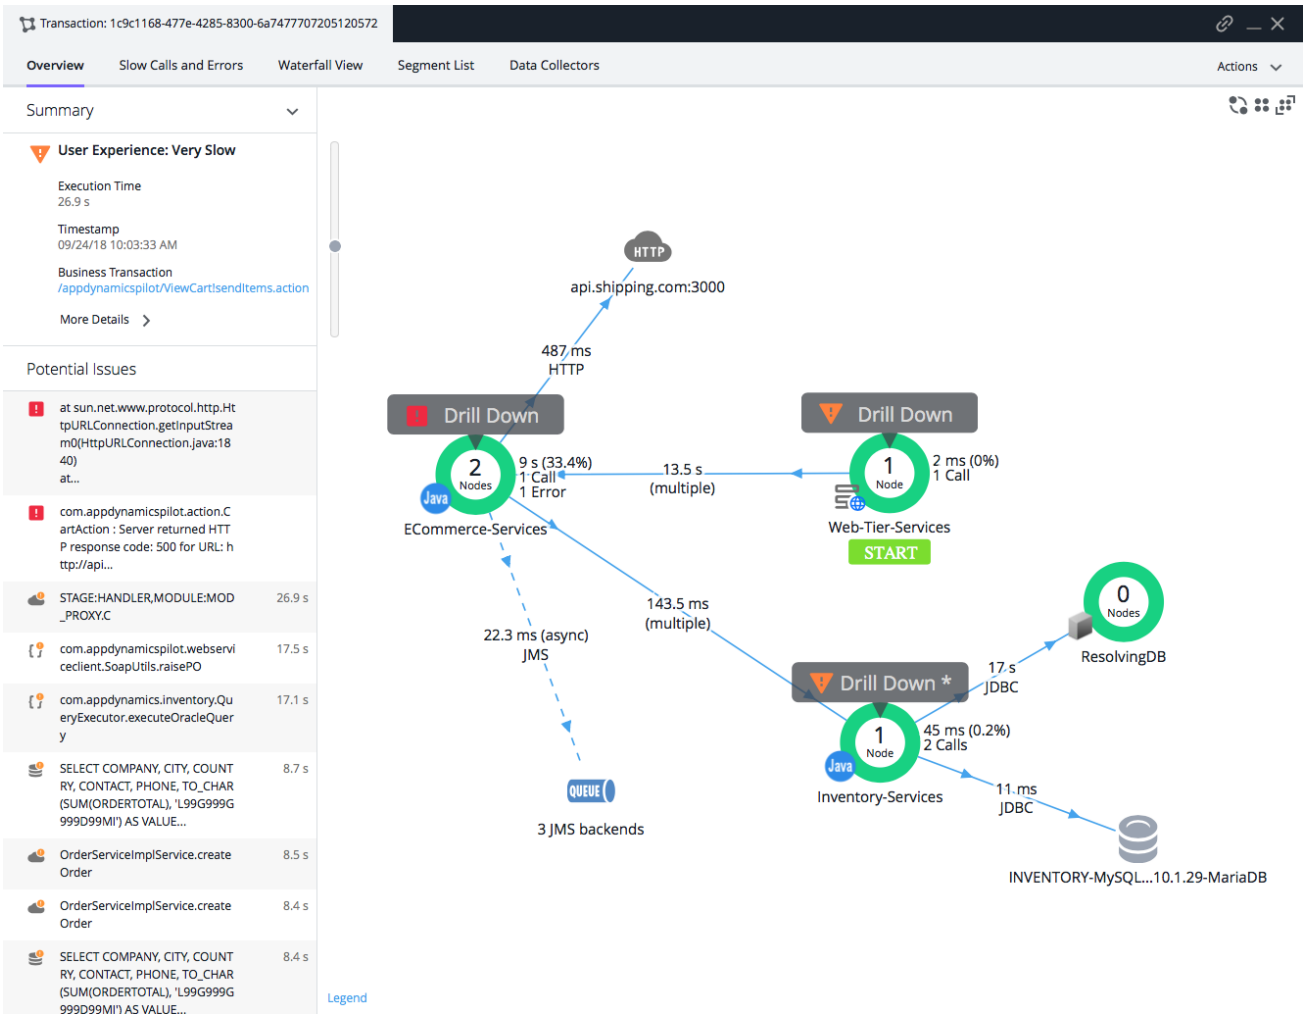
After logging in to the AppDynamics Controller, and locating your application flow maps, you can drill down to Server metrics for a selected tier or node. The Server health summary shows the number of critical/warning/normal conditions for the application's servers.



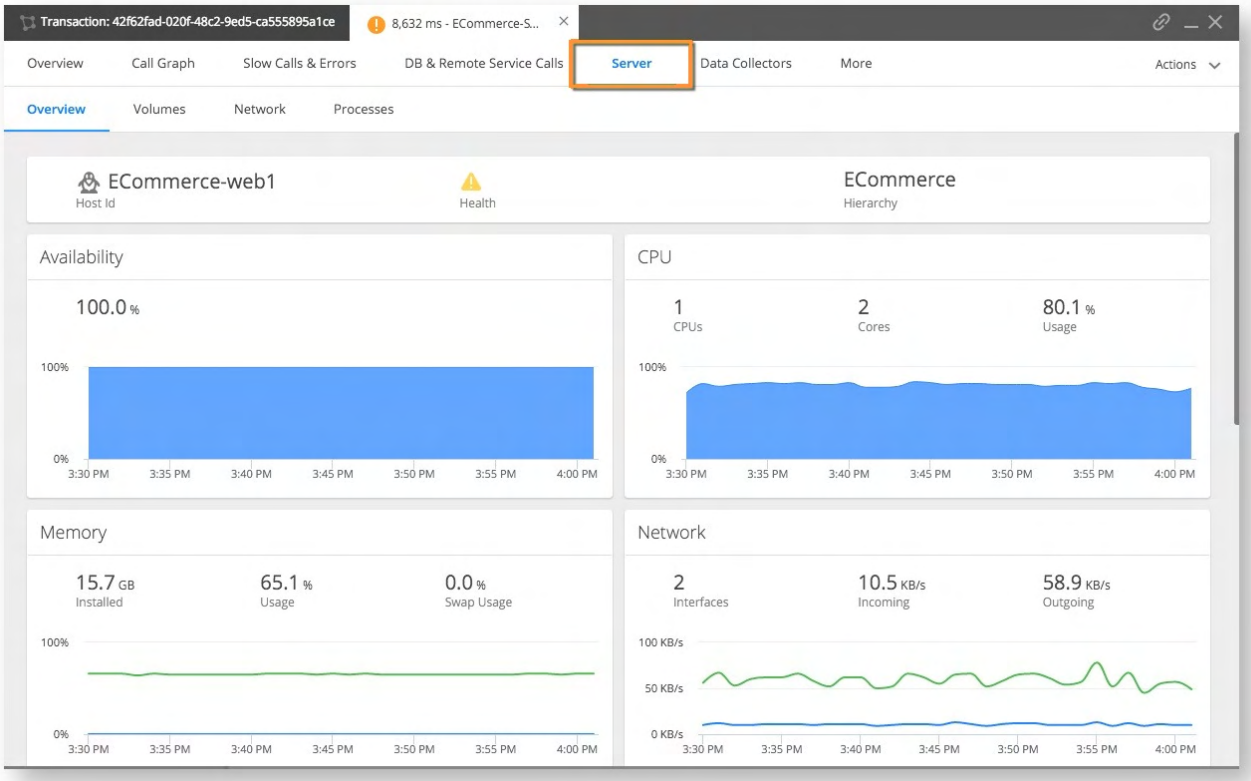
Select a tier, such as in this example, *Inventory-Services*, to review the server details.



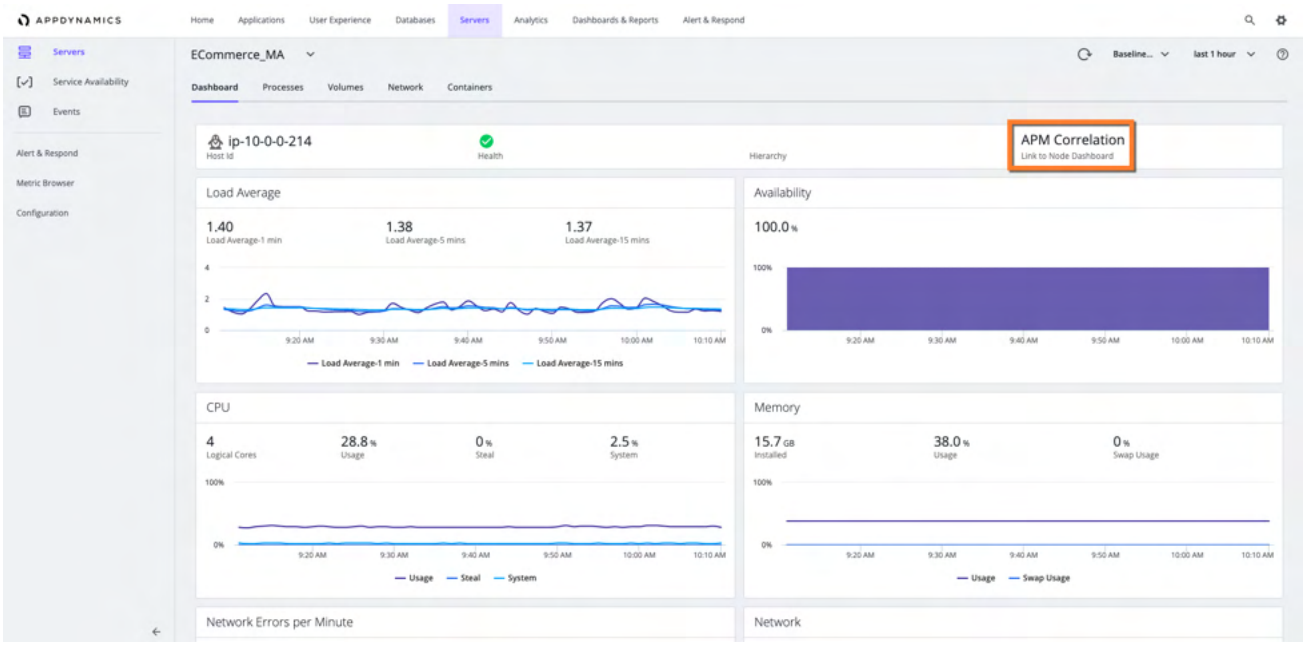
From the list of transaction snapshots, you can drill down to server metrics to determine if there is anything suspicious contributing to slow transactions. Double-click a snapshot of interest, drill down into the call to view the Server tab and its associated metrics.



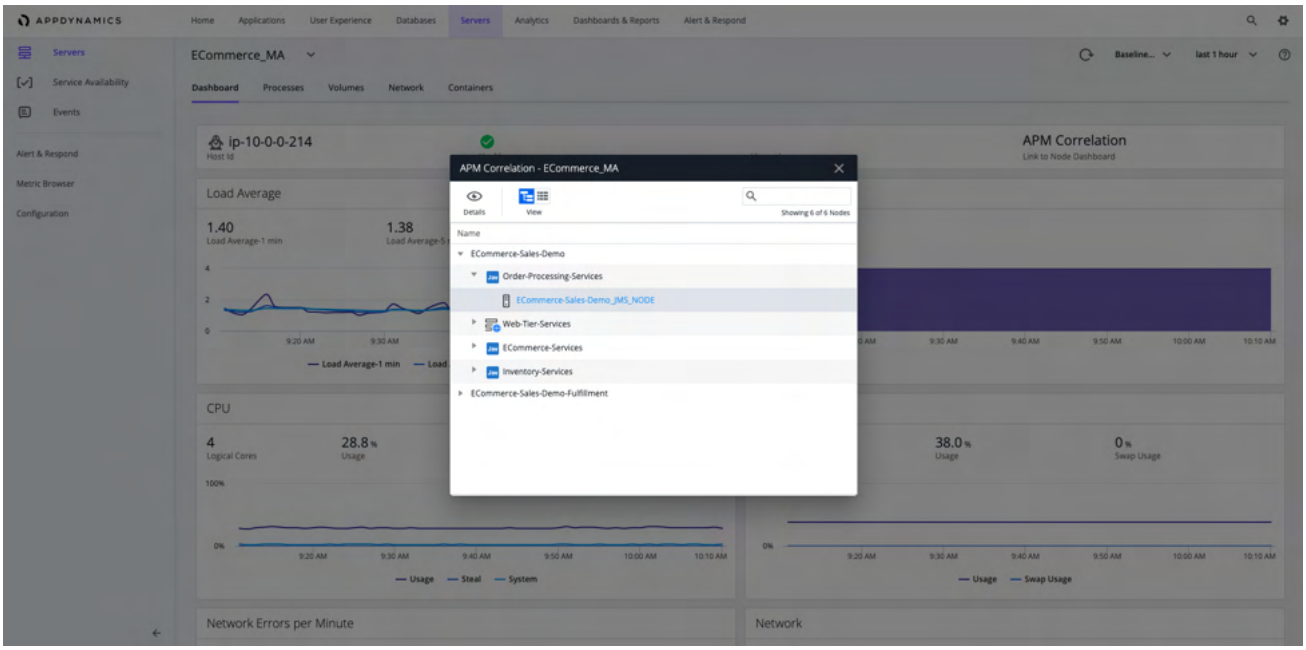
From the snapshot Server tab, you can review **CPU**, **Memory**, and **Network** utilization, and determine which processes are consuming server resources.



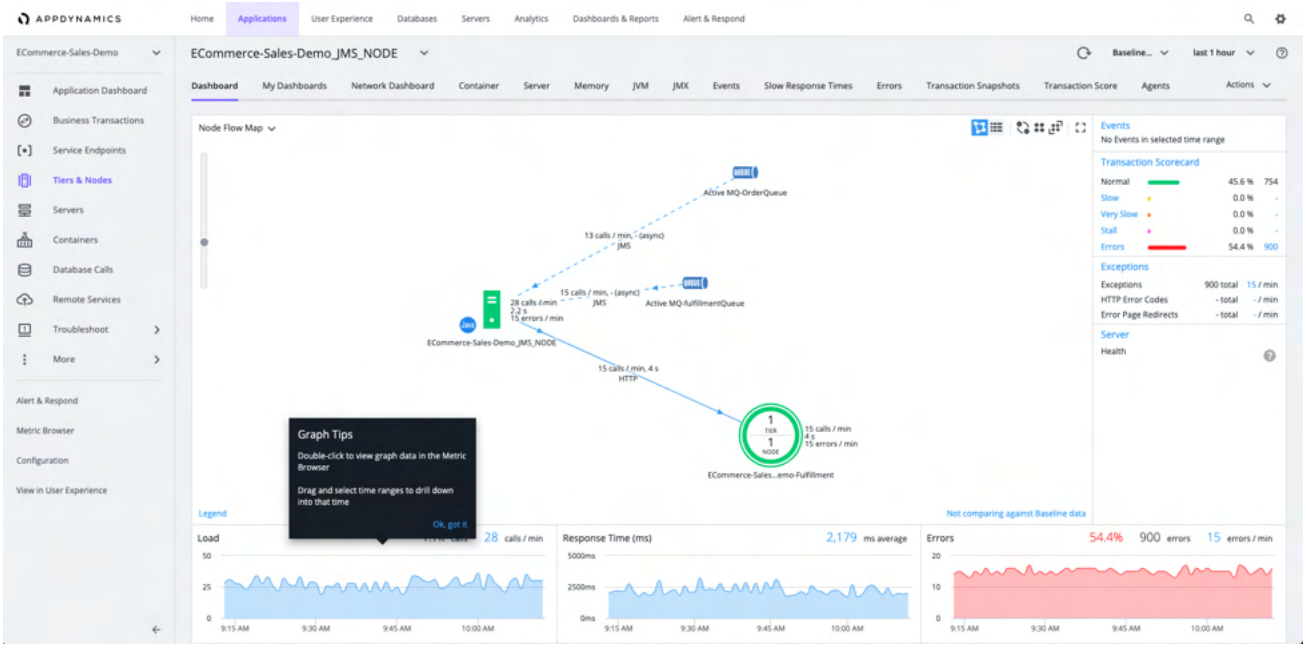
From the Servers Dashboard tab, select **APM Correlation**.



Select the **APM Correlation** link to review the APM node associated with the server. If there is more than one APM node running on the server, a dialog displays enabling you to select the APM node you want.



By selecting the APM node, its associated **Dashboard** displays.



Dynamic Monitoring Mode and Server Visibility

You can selectively control the number of metrics reported by individual Machine Agents (including Server Visibility Agents). Rather than have all Agents report all the metrics all the time, you can configure individual Agents to collect metrics.

- Key Performance Indicator metrics only (*KPI mode*)
- KPI and Diagnostic metrics (*Diagnostic mode*)
- All available metrics (*Advanced Diagnostic mode*)

This provides the flexibility to report KPI metrics on most machines, and then increase the metric level on specific servers for deeper visibility to diagnose problems. You can increase scalability on the Controller and conserve metric bandwidth on the network with no sacrifice in visibility.

Every Basic and Server Visibility metric has a default Dynamic Monitoring Mode (DMM) class: KPI, Diagnostic, and Advanced Diagnostic. See Hardware Resources Metrics.

Important Notes

- You can disable DMM on individual Agents. When DMM is disabled on an Agent, that Agent will report all metrics regardless of whether DMM is enabled or disabled on the Controller. Disabling DMM on an Agent is recommended only for mission-critical servers and other machines for which you are sure you want to collect all metrics. See Machine Agent Configuration Properties.
- If you switch the monitoring mode in the Controller from a more-inclusive to a less-inclusive mode, the Metric Browser will show values for the newly-excluded metrics for one hour after the switch. For example, if you switch from Diagnostic to KPI mode, for any Diagnostic metric, the Metric Browser will report a steady line (at 0 or the last-reported value) for one hour after the switch; then the line will disappear. This is standard behavior in the Metric Browser for an Agent when it stops reporting a specific metric.
- Each Machine Agent has a set of configurable settings that specify the volumes, networks, and processes to report and to ignore. For example, you can define a process allowlist (report on matching processes) and blocklist (ignore matching processes). An Agent will not report metrics for items excluded by its local settings, regardless of the monitoring mode. See Machine Agent Settings for Server Visibility.
- If you have any custom health rules based on Diagnostic or Advanced Diagnostic metrics, DMM might cause these rules to generate "false-positive" alerts. (Standard, non-custom health rules are not affected.) If you have any health rules similar to this, edit the rule to use a KPI metric instead of the Diagnostic or Advanced Diagnostic metric.

Initial Setup

DMM is enabled by default. To configure DMM:

1. Log in to the Controller administration console using the `root` user password. See Access the Administration Console.

   ```
   http://<controller host>:<port>/controller/admin.jsp
   ```

2. Set these options:
   a. `sim.machines.dmm.defaultMode` = `KPI` (Sets the default mode to KPI on all Machine Agents)
   b. `sim.machines.dmm.dmmAllowed` = `true` (Enables Dynamic Monitoring Mode on the Controller)
3. For servers that require additional visibility, increase the monitoring mode to **Diagnostic** or **Advanced** Diagnostic. To change the monitoring mode of one or more agents:
   a. Log in to the Controller UI.
   b. Click **Servers**.
   c. In the **Servers** table, check the box next to one or more servers whose monitoring mode you want to change.
   d. Right-click the server and select **Set DMM Mode**. A dialog box appears.
   e. Select the desired monitoring mode.
   f. Click **Save**.

Workflow Example

After you complete the initial setup, you can set the Dynamic Monitoring Mode on individual Machine Agents as required. The following is a workflow example:

- The DevOps team for a large enterprise monitors its IT infrastructure using Machine Agents (1,000-plus Agents monitoring servers in hundreds of locations). All Agents are initially set to KPI mode.
- One Agent reports a lot of disk read/write operations (KPI metric) on critical-server-A.
- Set the Agent DMM on critical-server-A to **Diagnostic**.
- Monitor the amount of data read and written for the entire disk, and for each partition (Diagnostic metrics), on critical-server-A.
- If the Diagnostic metrics do not indicate the source of the problem, and further investigation is needed, set the agent DMM to **Advanced Diagnostic**.
- Monitor average queue times and read/write times for each partition (Advanced Diagnostic metrics) on critical-server-A.
- When advanced diagnostics are no longer required on critical-server-A, set the agent DMM back to **KPI**.

Tier Metric Correlator

The Tier Metric Correlator enables you to identify load and performance anomalies across all nodes in a tier. Suppose you have a tier composed of a cluster of nodes running on containers or servers. You expect all the nodes to behave exactly the same under the same load conditions. How can you monitor this cluster for anomalies and outliers? You can use the Tier Metric Correlator to answer the following questions:

- Are all the nodes behaving within the expected band of performance, or do some nodes have outliers (slow calls, stalls, and errors)?
- In what time windows, and on which nodes, are these outliers occurring?
- Are outliers associated with a specific node cluster—for example, a cluster running a canary release?
- Are any resource issues (such as high CPU I/O or paging) correlated with these outliers?
- Are calls getting distributed evenly across all nodes in the tier?

This page describes two example use cases:

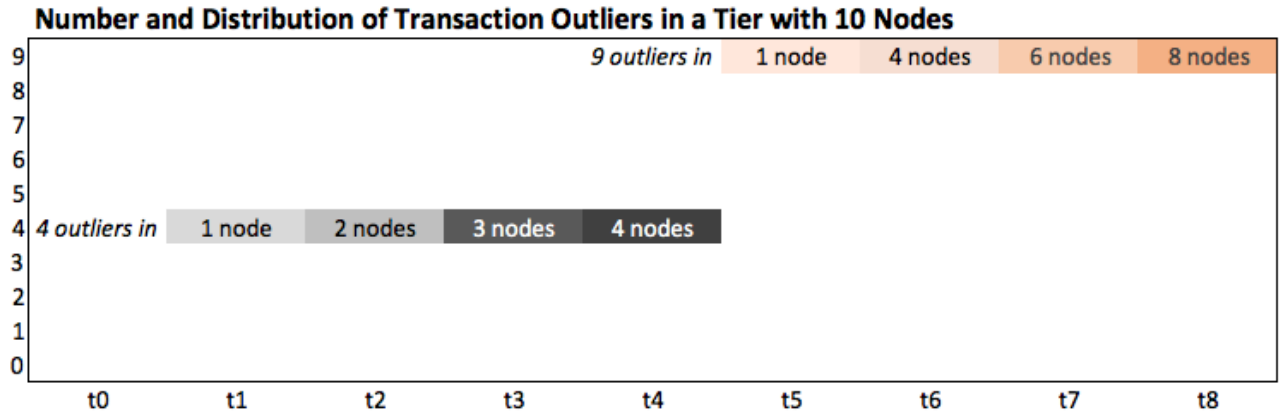
- Use Tier Metric Correlation to quickly identify balances and imbalances in the distribution of calls across all nodes in a tier.
- Use Tier Metric Correlation to monitor and troubleshoot a canary deployment scenario. This example shows how you can easily compare performance across node clusters, identify nodes with transaction outliers, and determine if any resource issues are causing these outliers.

Key Concepts

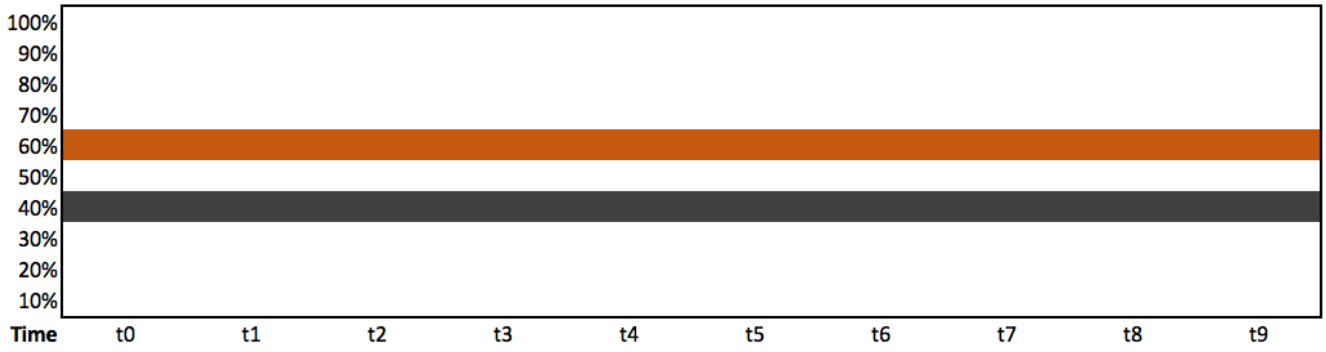
Transaction Outliers

The first step in metric correlation is to determine the *transaction outliers* for a tier: the number of Slow Calls, Very Slow Calls, and Stalled Calls whose response times are significantly outside the norm for that tier. The Transaction Outliers Heatmap visualizes the rate of these outliers and their distribution across all nodes in the tier.

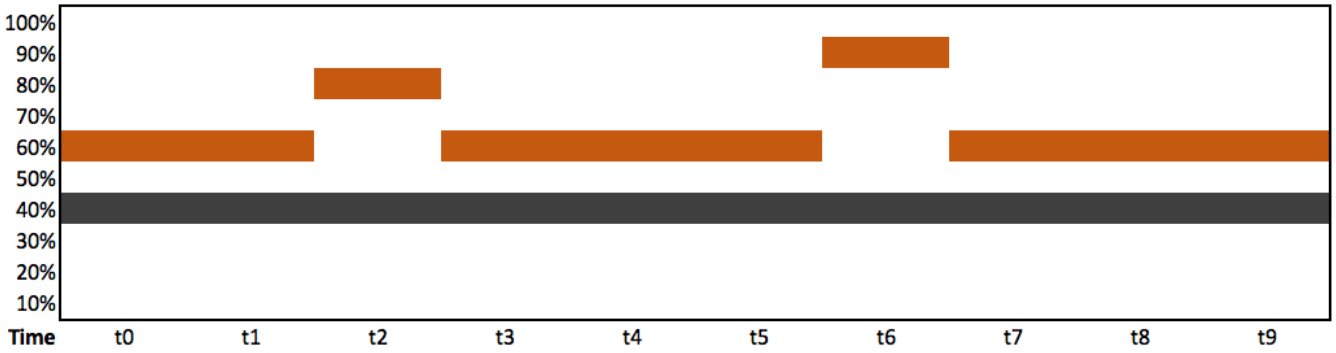
A heatmap is a time-series chart with an extra dimension: the color intensity of each bar shows the distribution of outliers across all nodes. The darker the hue, the more nodes have outliers. The chart colors the bars in shades of gray (fewer outliers) and orange (more outliers).



Heatmaps enable you to easily identify the normal bands of performance and any outliers for all nodes in a tier. In this example, all nodes fall within two bands:



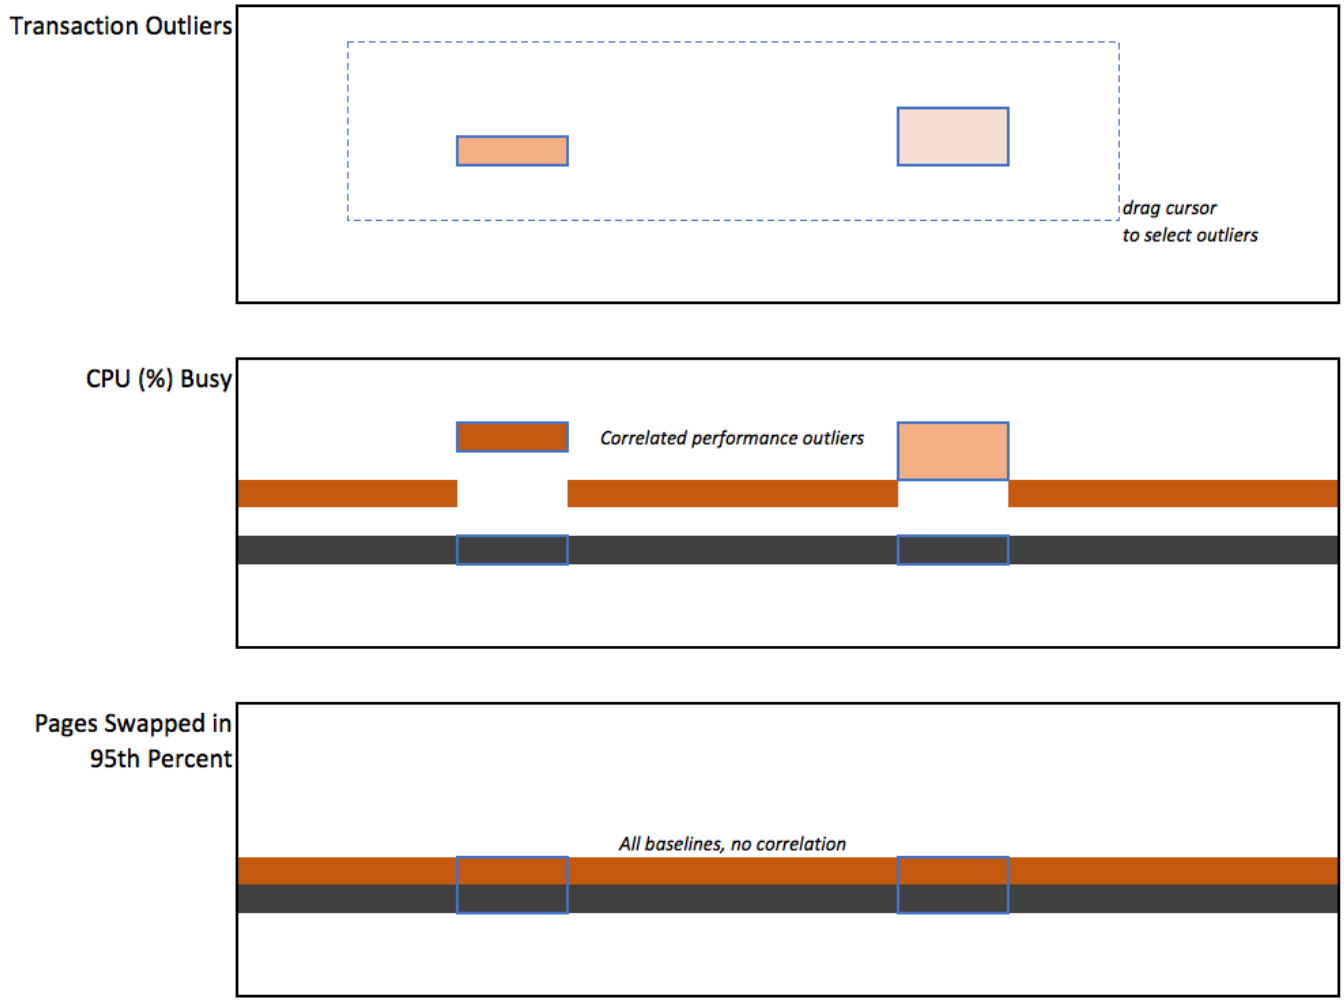
This heatmap highlights two time windows where the performance metric is noticeably higher for 50% of the nodes:



Correlated Metrics

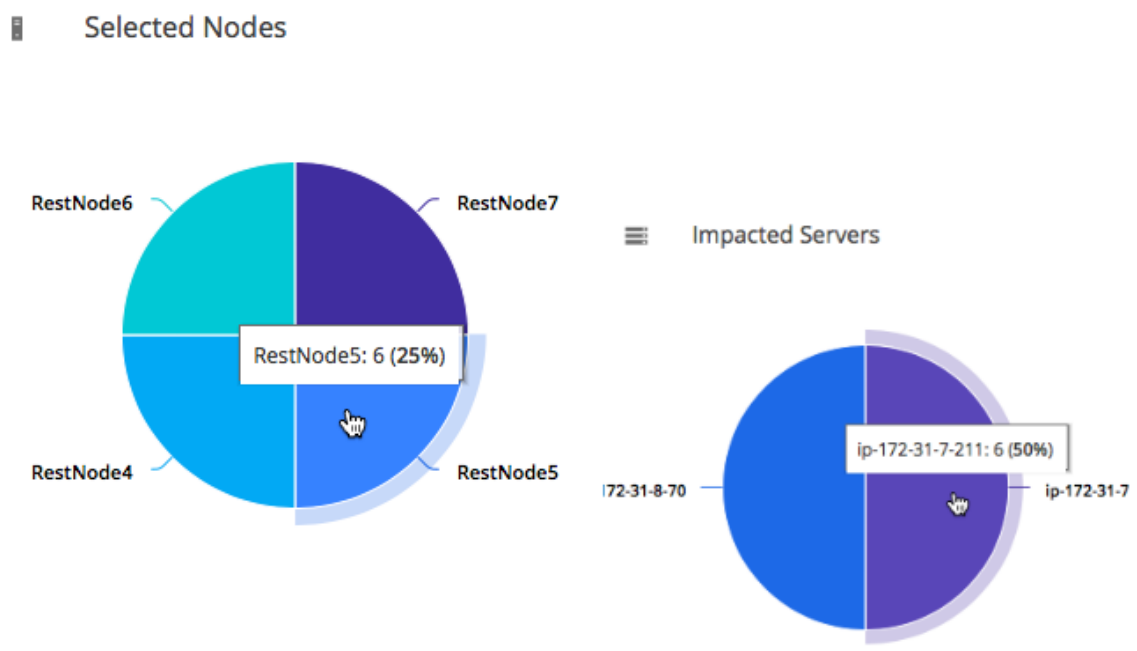
The Correlated Metrics heatmaps enable you to correlate transaction outliers with specific resource metrics. The Correlate Metrics panel enables you to easily identify performance metrics that correlate (and do not correlate) with transaction outliers of interest. This example shows three heatmaps:

1. Transaction outliers
2. Correlated metric
3. Uncorrelated metric (no outliers)



Troubleshooting Nodes and Servers

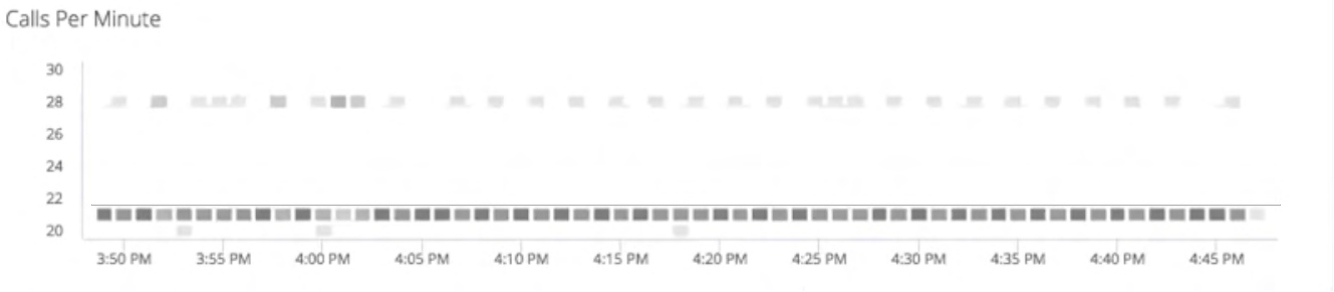
When you select a set of transaction outliers, the Selected Nodes and Impacted Servers charts show the distribution of these outliers across all nodes in the tier. This makes it easy to determine if these outliers are associated with specific node clusters. Double-click a pie chart to troubleshoot the node or server.



Example Use Cases

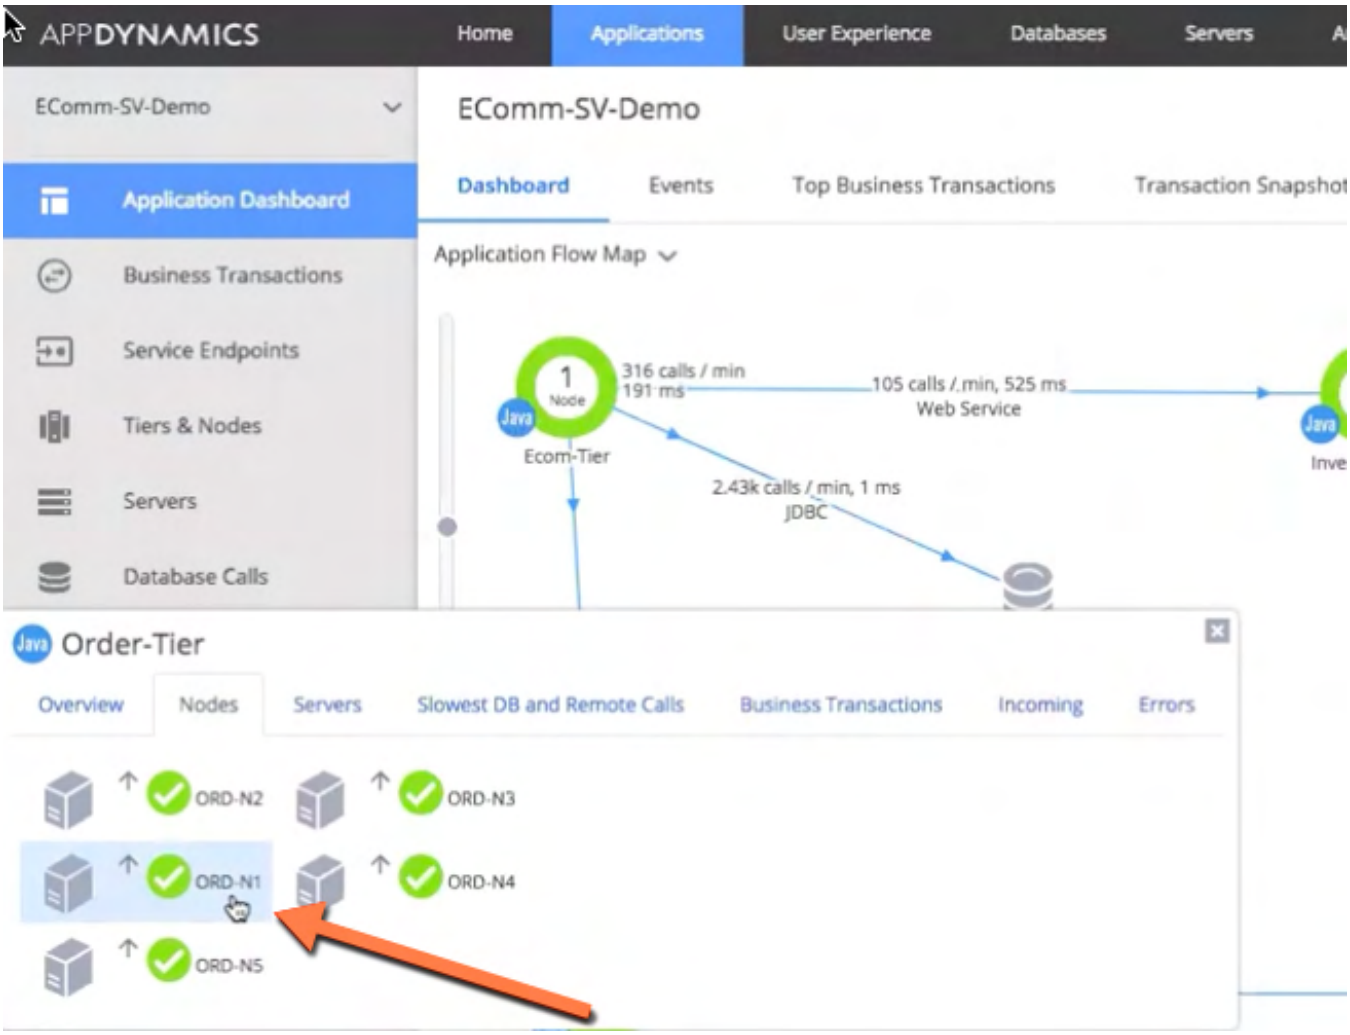
Comparing Load Distributions

In this example, a DevOps engineer wants to ensure that transaction calls are getting distributed evenly to all the nodes in a tier. The engineer accesses the **Tiers & Nodes** view, right-clicks a tier, and selects **Correlate Metrics**. Looking at the Calls Per Minute heatmap, the engineer can immediately see that the band of performance is 20-22 calls per minute, but for some nodes, the rate is higher during certain intervals. The engineer decides to investigate the relevant load balancer and finds that a simple misconfiguration is causing the device to distribute calls unevenly at certain times. Using heatmaps, they can identify and fix a minor issue before it has a significant impact on their team's mission-critical applications.



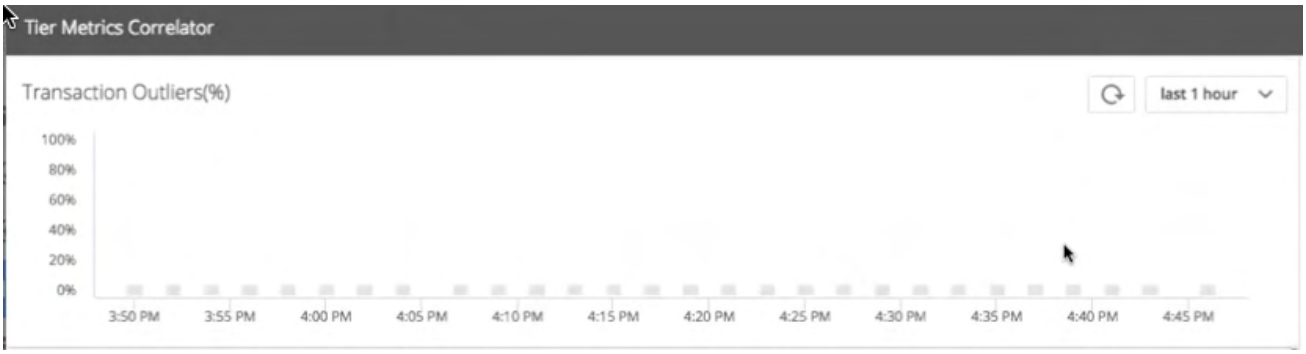
Canary Deployment Testing

A DevOps engineer is responsible for a four-tier e-commerce application. The Order-Tier has five nodes running version 1.0 of the service. The engineer deploys a "canary" (version 1.1 of the service) on one node. Before the engineer deploys 1.1 on all nodes, they want to determine if there is any performance degradation on this node.

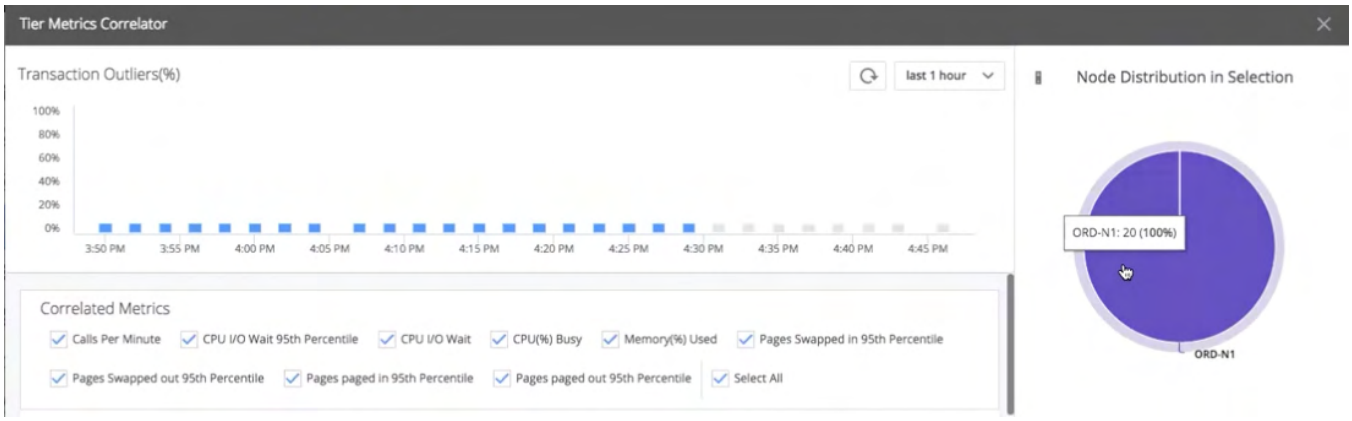


The engineer opens the Controller, accesses the **Tiers & Nodes** view for the application of interest, right-clicks the Order-Tier, and selects **Correlate Metrics**. The Tier Metric Correlator displays.

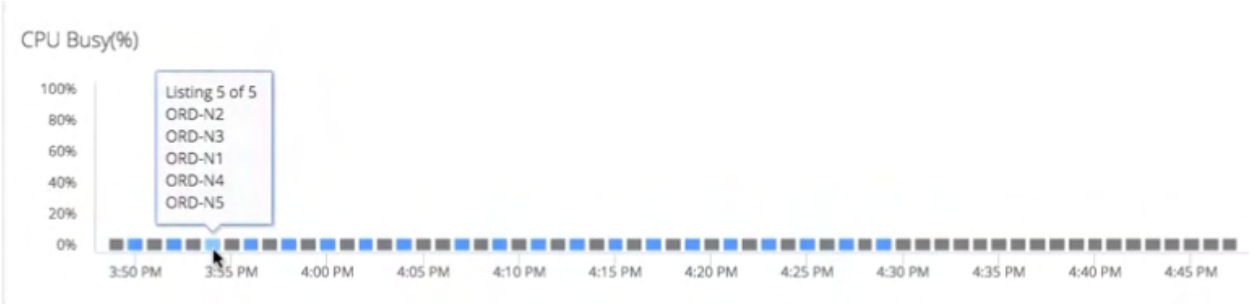
The Transaction Outliers heatmap shows that some calls are outliers: Errors, Slow Calls, Very Slow Calls, or Stalled Calls whose response times are significantly higher than the band of performance for that tier.



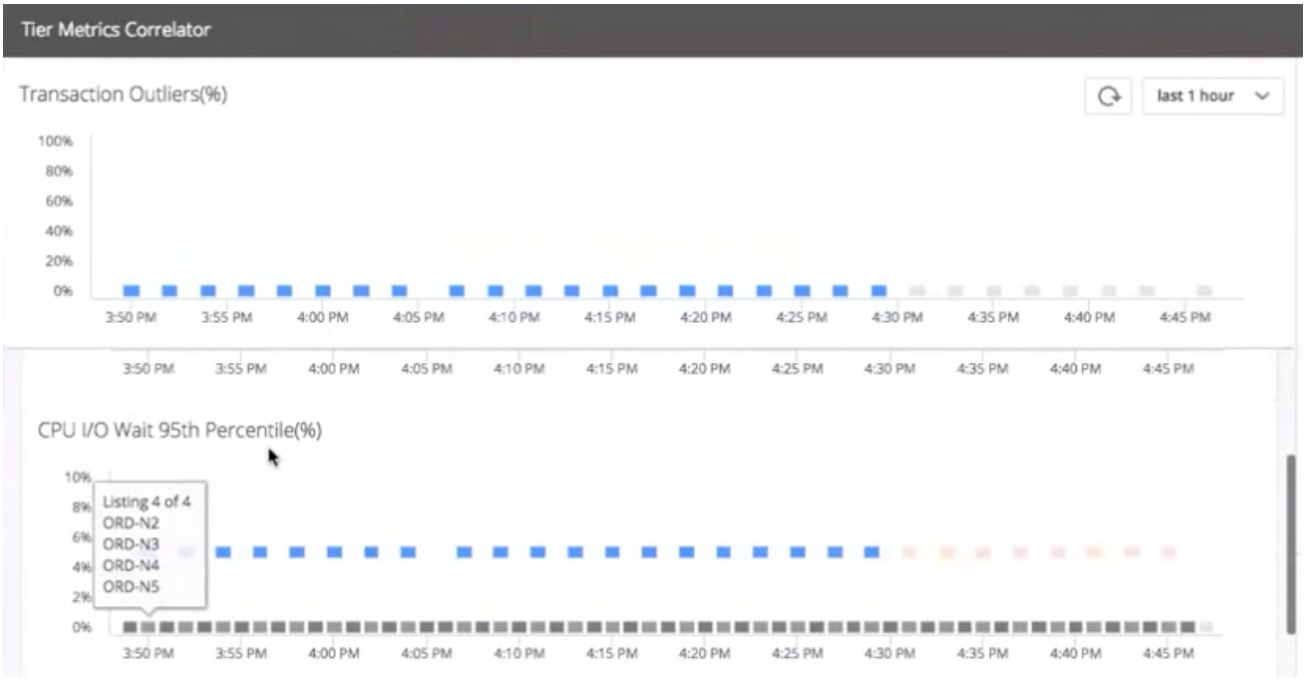
The first question is: *Are these outliers associated with our "canary node" (ORD-N1)?* The engineer drag-selects a set of these outliers. The **Node Distribution in Selection** pie chart (right) shows that all outliers are associated with the canary node. Clearly, the new code is not performing as well as the old code.



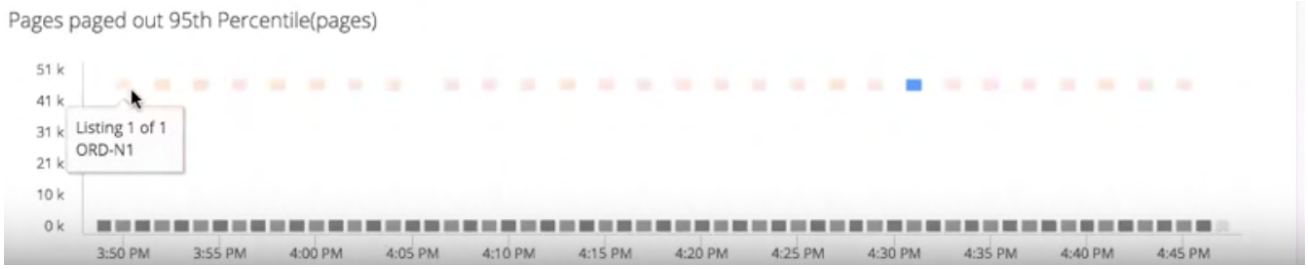
The next question is: *Are any resource issues causing these outliers?* The engineer examines the **Correlated Metrics** heatmaps to look for metrics that correlate with the outliers on the canary node. Most heatmaps show no correlation. For example, **CPU Busy%** shows that all nodes stay within the band of performance of 0-20%.



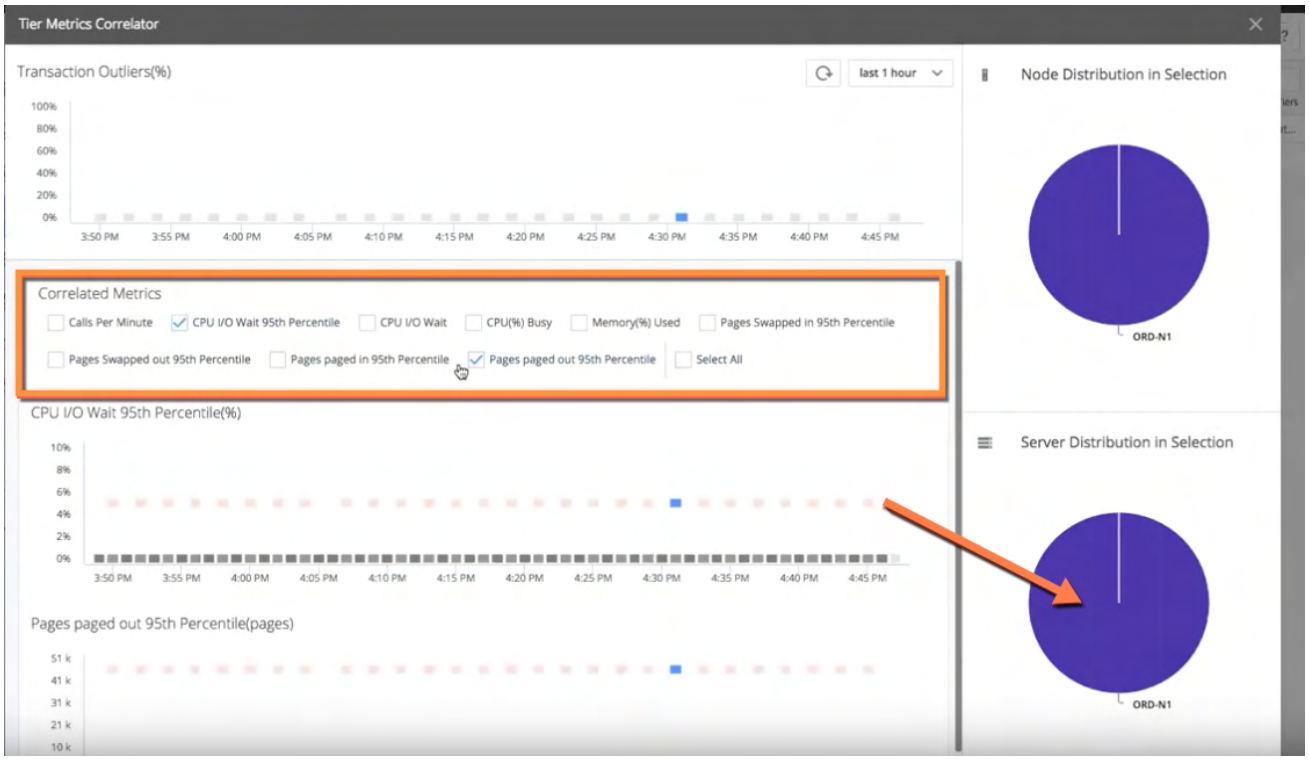
However, the CPU I/O Wait 95th Percentile(%) heatmap shows a strong correlation: All the metric outliers occur on the canary node, while all other nodes remain within the band of performance.



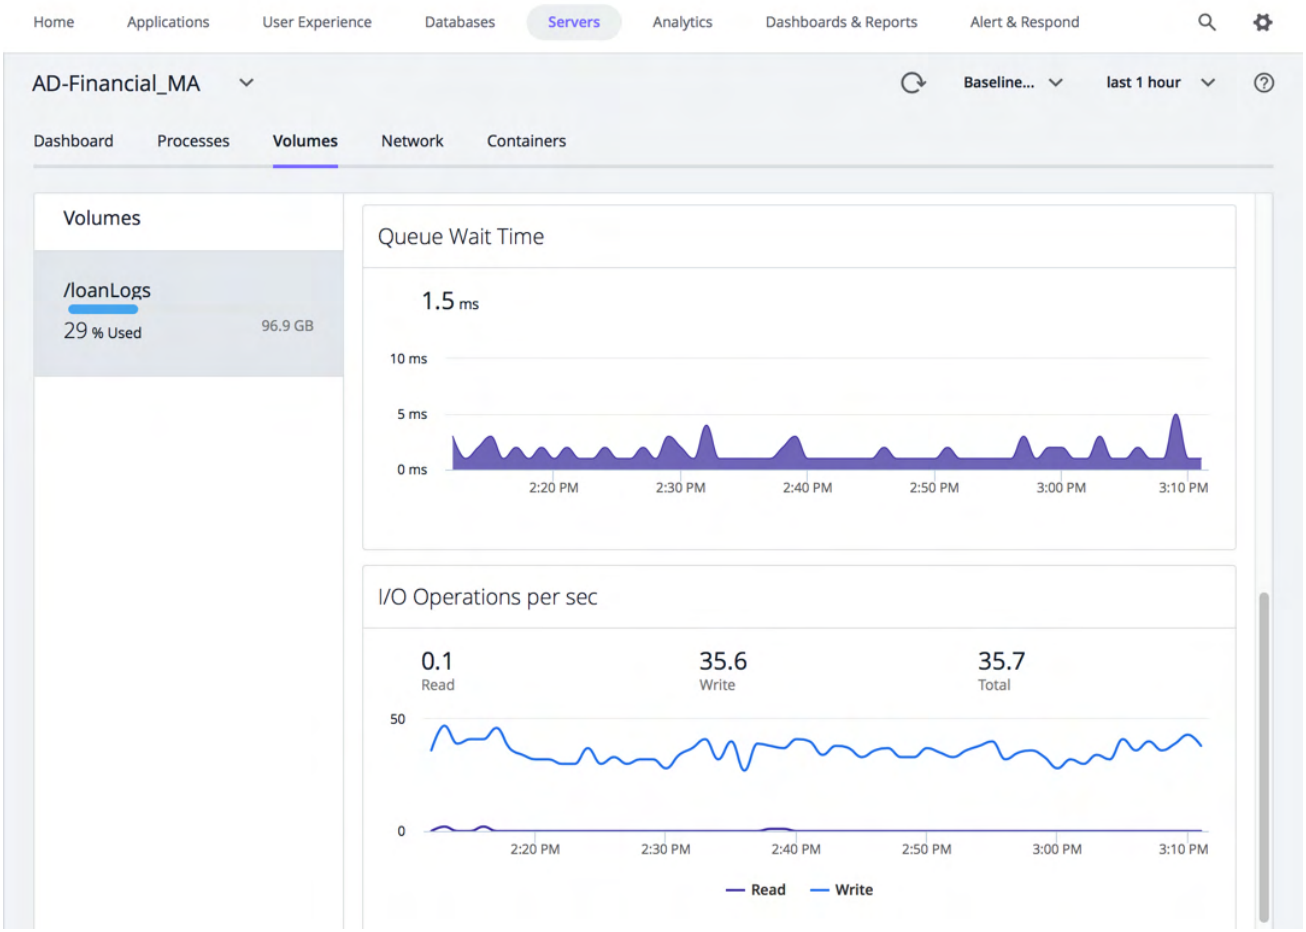
The **Pages paged out 95th Percentile (pages)** heatmap also shows a strong correlation with the transaction outliers on the canary node. With just a few clicks, they can immediately see that the canary node is performing worse; that the node has a CPU I/O problem; and that the CPU I/O problem is related to paging, which indicates a disk problem.



To reduce the visual noise and highlight the correlations, the engineer unchecks all the uncorrelated metrics. The next step is to investigate and troubleshoot the underlying server. To drill down into the canary node, they double-click on the **Server Distribution in Selection** pie chart (bottom right).



The Server Dashboard for the canary node displays. The engineer selects the Volumes tab and sees many spikes in I/O operations and queue wait times. They decide that the canary code is not ready to deploy to the entire tier, and need to re-examine the canary code, fix the regression, and re-test.



Enabling Tier Metric Correlation

You enable Tier Metric Correlation per account on the Controller.
If you are using a SaaS Controller, contact AppDynamics Support.
If you are using an on-premises Controller:

1. Log in to the Controller administration console using the `root` user password:
   `http://<controller host>:<port>/controller/admin.jsp`
2. Access the Accounts page, and select the account for which you want to enable this feature.
3. Select **Add Property** in the accounting settings and add:
   `ENABLE_SIM_HEATMAPS` = true

To correlate percentile metrics, you must enable percentile metric reporting on both the Controller and the Machine Agent. By default, reporting is *disabled* on the Controller and *enabled* on the Agent.

- To enable/disable reporting on the Controller, log in to the Controller administration console and set the `sim.machines.percentile.percentileMonitoringAllowed` property. See Controller Settings for Machine Agents
- To enable/disable reporting on the Agent, open the `<machine_agent_home>/extensions/ServerMonitoring/conf/ServerMonitoring.yml` file and set the `percentileEnabled` property. See Machine Agent Settings for Server Visibility

Workflow Description

These steps outline the workflow description:

- Access the **Tiers & Nodes** view for the application of interest.
- Right-click the tier and select **Correlate Metrics**. The Tier Metric Correlator displays.
- Identify *transaction outliers* (1) for the tier – calls flagged as Slow, Very Slow, Stalls, or Errors (see Business Transaction Performance).
- Drag the cursor to select the outliers of interest. The pie charts on the right show the distribution of these outliers by node and server.
- Identify any *correlated metrics* (2) for the outliers. Unselect checkboxes for non-correlated metrics (3).
- Identify and troubleshoot the nodes (4) and servers (5) where the outliers are occurring. Double-click a pie slice to open the dashboard view. You can use the correlated metrics to guide your troubleshooting.

Service Availability Monitoring

Effective immediately, AppDynamics is ending support for Service Availability Monitoring. Customers who have never purchased SAM will no longer be able to do so. Renewals and additional licenses by existing customers of SAM that are purchased before June 2021, for a one-year term only, are permitted. All existing users of SAM can continue to use it. See Support Advisory: Service Availability Monitoring End of Life (EOL) Notice.

To access Service Availability Monitoring, select **AppDynamics Home > Servers** > **Service Availability** (left navigation menu).

The Service Availability Monitoring feature of Server Visibility enables you to monitor internal or external HTTP and HTTPS services. You configure service monitoring from the Controller UI. After you configure monitoring for a service, Service Availability Monitoring evaluates the service:

- The Agent evaluates each response, based on your specified violation rules, and flags each response as failed (rule violation) or successful (no violation).
- The service monitor maintains a rolling buffer of evaluated responses. This buffer has a configurable window size (number of evaluated responses), success threshold (number of successful responses), and failure ratio (number of failed responses).
- The monitor collects evaluated responses until the response buffer is full. Then, it evaluates the service as:
    - NORMAL - Successful responses are greater than or equal to the success threshold.
    - CRITICAL - Failed responses are greater than or equal to the failure threshold.
- When the buffer is full, the monitor re-evaluates the service every time it evaluates a new response.

For example, with the following values:

- Success threshold = 3
- Failure threshold = 1
- Results window size = 5

The Agent waits until five check results are received, and from these five results, if there is one failure, then the target state is CRITICAL. If there are at least three successful results, then the target state is NORMAL.

Licensing and System Requirements

Service Availability Monitoring requires a separate license and a Server Visibility license. Server Visibility is currently available for Linux, Windows, and Solaris. See License Management and Server Visibility Requirements and Supported Environments

Viewing the Monitored Services

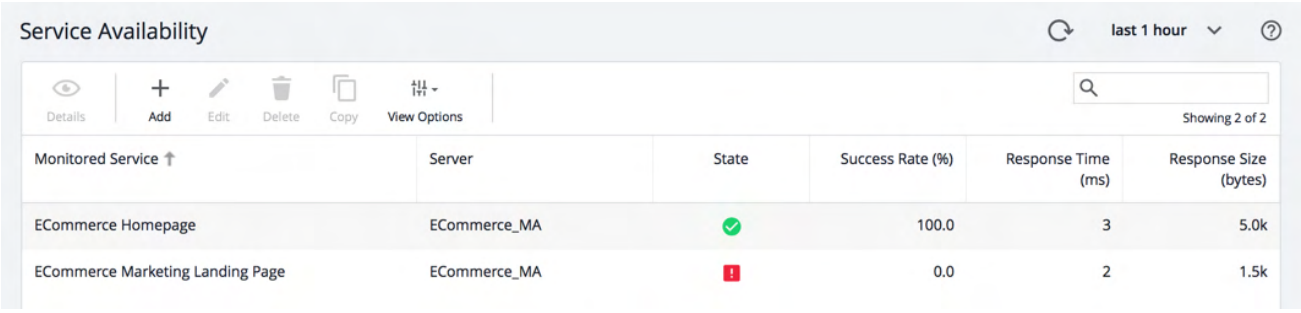
You can view the monitored services in the Monitored Services list. The state is determined by evaluating the Response Validators during the results window. Response Validators are rules you configure that are used to evaluate against the responses received from the service.

The possible states are:

- NORMAL - The number of successful responses in the result window is greater than or equal to the configured success threshold.
- CRITICAL - The number of failed responses in the result window is greater than or equal to the configured failed threshold.
- UNKNOWN - If the Machine Agent does not provide any data.

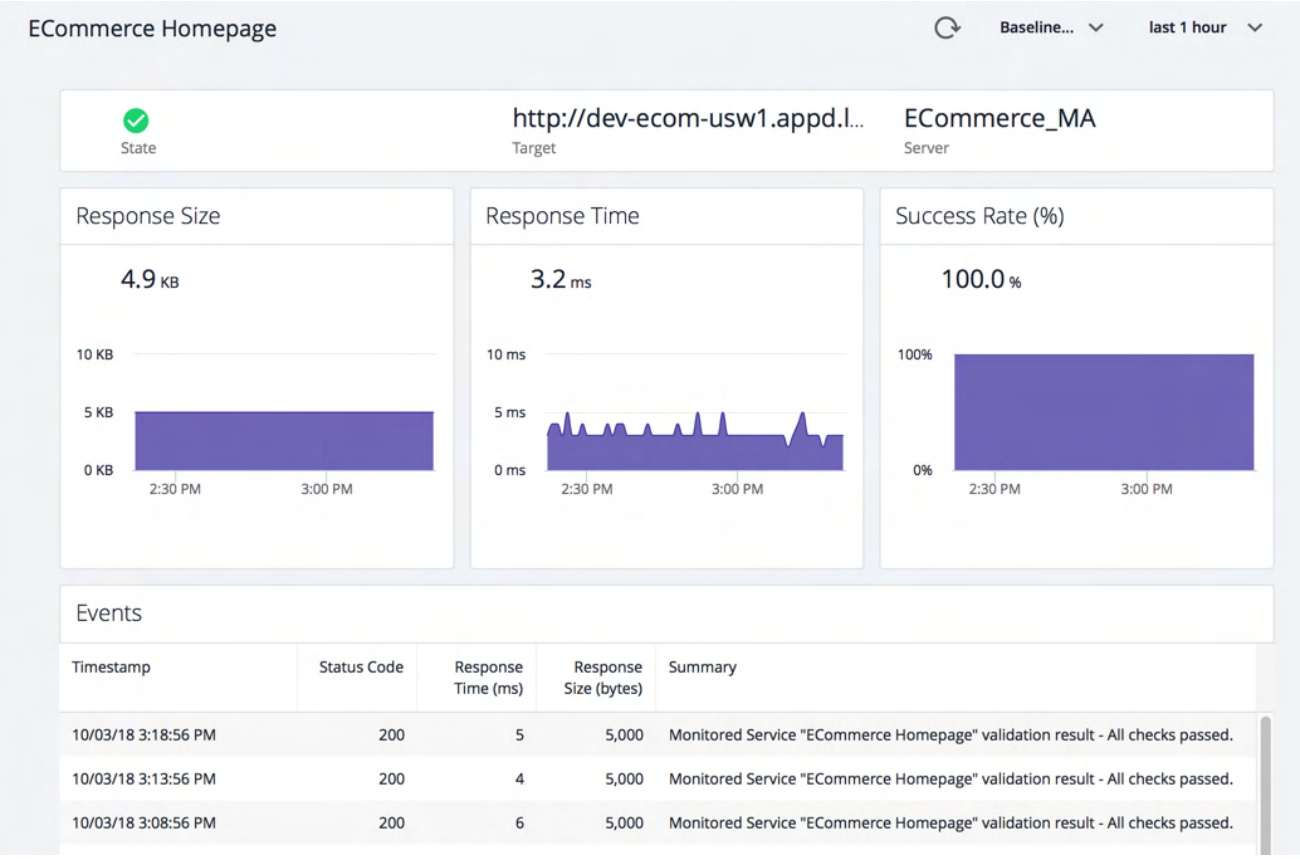
Monitored Services List

From the top navigation bar, select **Servers > Service Availability** to view a list of monitored services. Use the action toolbar to manage your monitored services by adding new ones, viewing details, and so on.



Monitored Service Details

Select a monitored service, and double-click to view the associated details.



Configure Service Availability

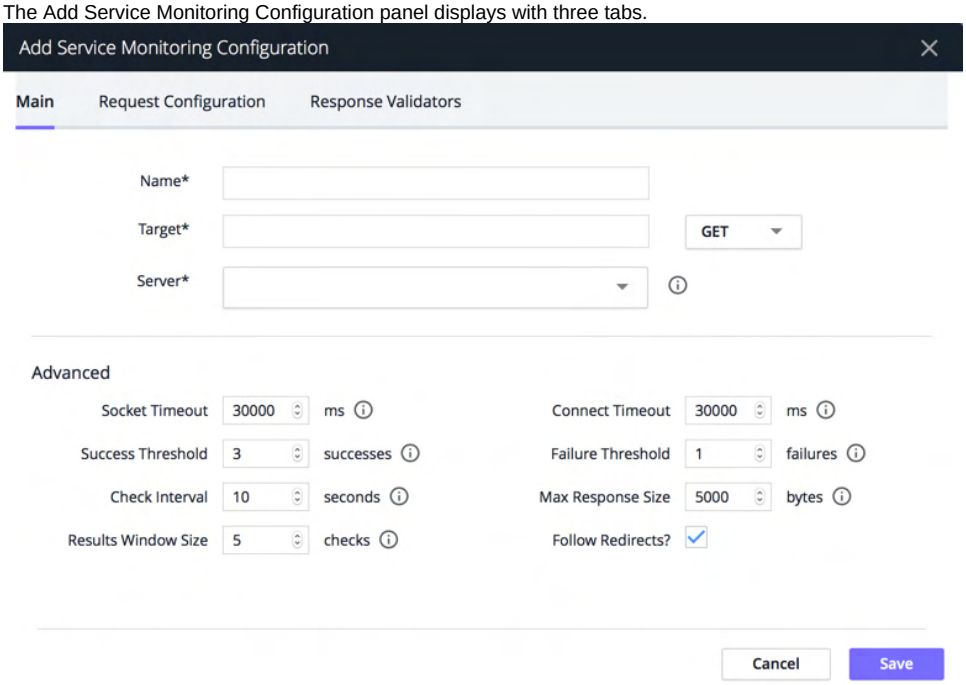
By default, configuration changes take effect within at least two minutes of the change, so you do not need to restart the Machine Agent after changing the configuration. If the protocol, target, or method of a service are changed once a service is created, the state of the service is set to UNKNOWN and is re-evaluated with the new configuration.

To configure this feature, users need the *Configure Server Visibility* permission. See Server Visibility Permissions

To access the configuration panel:

1. From the Controller top navigation bar, select **Servers > Service Availability**.
   A list of monitored services display, if any are configured.

2. To add a service, select **Add**.
   The Add Service Monitoring Configuration panel displays with three tabs.



3. From the Main tab, specify the required fields and save the configuration. Each field has an associated tooltip that provides help. See Main Configuration Panel.
4. From the Request Configuration tab, specify your request headers. See Request Configuration
5. From the Response Validators tab, configure your validation rules. See Response Validators

Main Configuration Panel

Field	Description	Default	Required
Name	Your name for this target configuration. This name displays in the Service Availability list.	N/A	Yes
Target	The resource to be monitored, for example, *http://myThirdPartyService.com/data*. Specify which HTTP method to use to send the request (`GET`, `POST`, `HEAD`)	N/A	Yes
Server	Name of the Machine Agent performing the monitoring. Only servers that are enabled for Server Visibility display in the dropdown.	N/A	Yes
Socket Timeout	How long to wait, in milliseconds, after a successful connection for a complete HTTP response.	30000	Yes
Success threshold	Number of required successes within the results panel for a NORMAL state.	3	Yes
Check Interval	Interval time in between checks in seconds. ⓘ Setting this interval to more than 60 seconds will result in visible gaps in the metric graphs for monitored services.	10	Yes
Results Window Size	Number of most recent results to use in determining the state of the service.	5	Yes
Connect Timeout	How long to wait (in ms) for the service to respond to a connection request.	30000	Yes
Failure threshold	Number of required failures within the result window for a CRITICAL state.	1	Yes
Max response size	Maximum response size to collect in bytes.	5000	Yes
Follow redirects	Deprecated. Follow redirect to determine the state of service.	No	No

Restricted Addresses

By default, these addresses are restricted:

- Loop back address: `localhost, 127.0.0.1, ::1(IPv6)`

- Site local address: `192.168.0.0/16, 10.0.0.0/8, 172.16.0.0/12, fec0::/8(IPv6)`
- Link local address: `169.254.0.1 - 169.254.255.254, fe80::/10(IPv6)`
- Any local address: `0.0.0.0, ::(IPV6)`
- Multicast address: `224.0.0.0/4(224.0.0.0 to 239.255.255.255), ff00::/8(IPV6)`

Request Configuration

You can define a list of customized headers to send with requests. For example, the list can mimic desktop or mobile browsers. You can also define a request body for `POST` requests. You can specify an "Authorization" header", if credentials are required.

Protocol	Field	Value Type	Default	Description
HTTP	header name and value pair	String	empty	Customized header to send with requests.
	body	String	empty	Any data to send with the request. Usually used for POST.

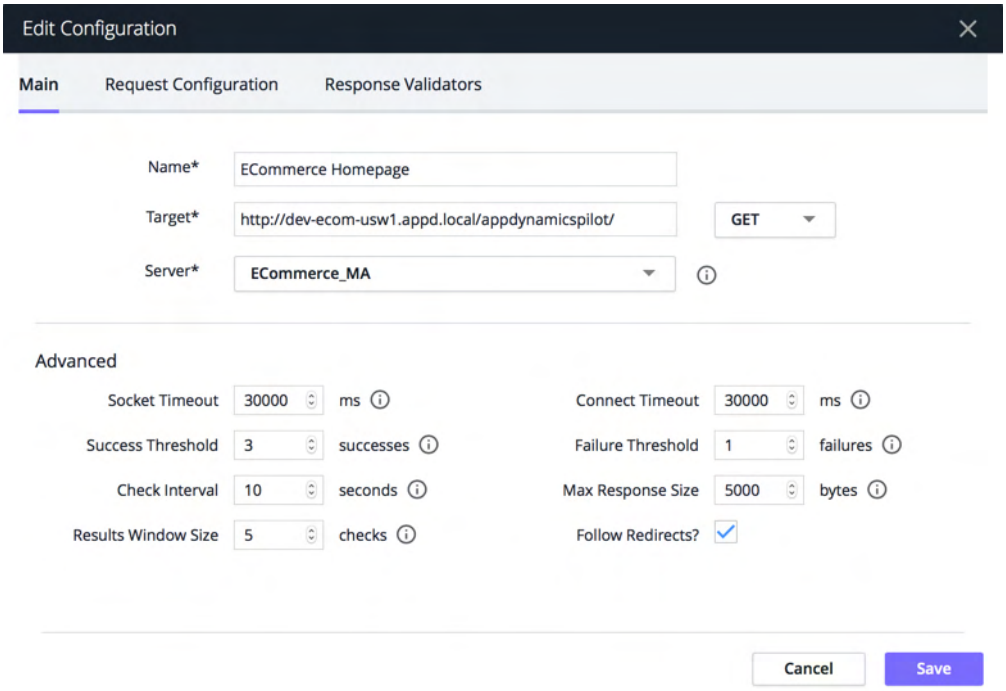
Response Validators

You can provide a list of rules for the Machine Agent to use to validate the health of a monitored service. If any rule is violated, the response is considered failed.

For each rule you can specify:

- HTTP property
- operator
- value

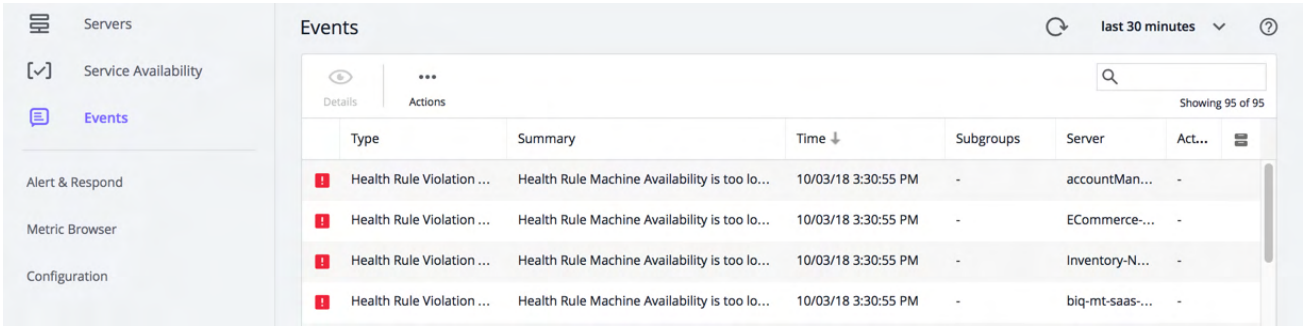
The list of operators varies depending on the property selected in the first dropdown.



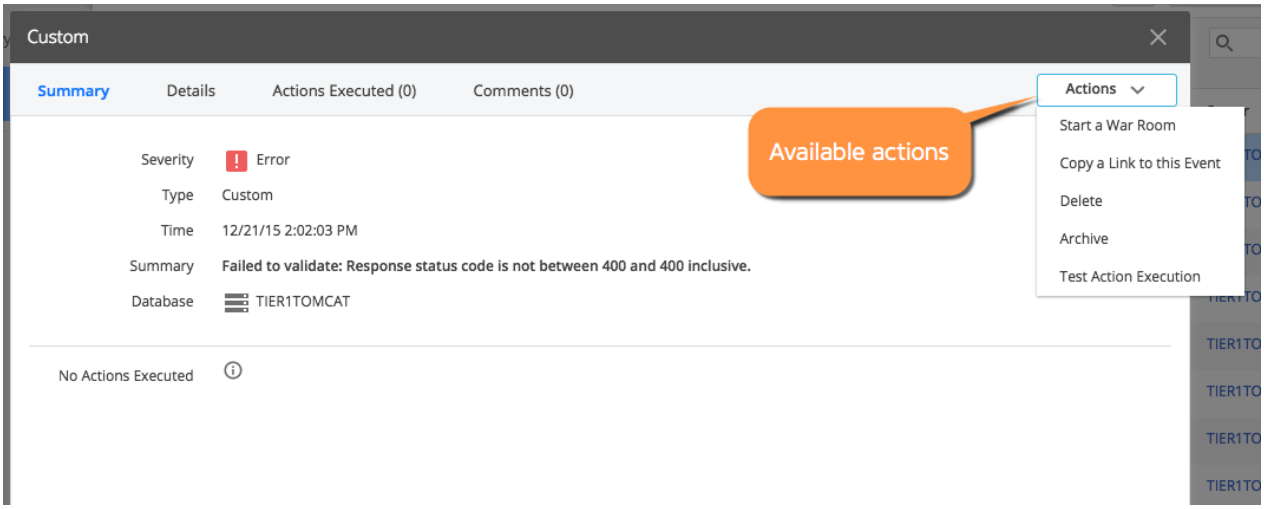
Monitoring the Service Health

An event is sent to the Controller for every state change and periodically (by default every 5 minutes). You can change the update interval by setting the `System property: appdynamics.machine.agent.sam.event.updateIntervalMillis`. See Configuration Property Reference

The events are visible from the Monitored Service details panel and from the Server Visibility Events list.



Double-click the event to review details.



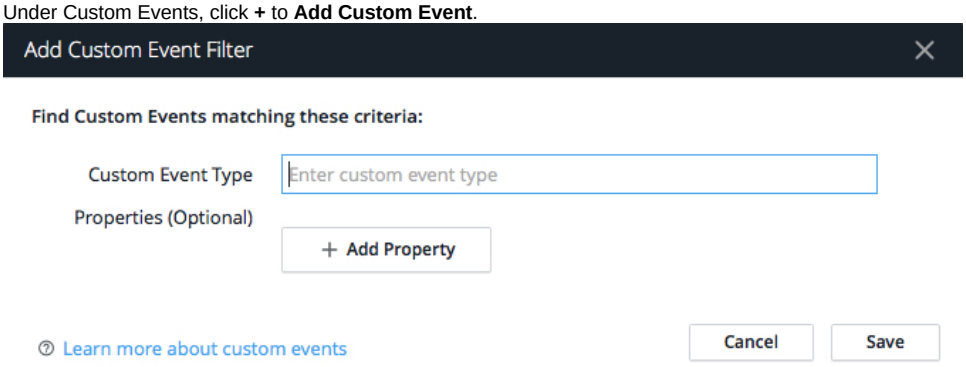
The event properties are as follows:

- `Category: CUSTOM`
- `Event Type: Service Availability`
- `Property: severity` Values can be ERROR (failure) or INFO (passing).

Configuring Alerts

To create alerts for your monitored services:

1. From the Servers panel, select **Alert & Respond**.
2. Select **Policies**.
3. Select **Create Policy Manually**.
   If policies already exist, you may not see this option. Click **+** to add a policy manually.
4. Under Custom Events, click **+** to **Add Custom Event**.



5. In the Actions section of the Policy panel, add the action you want to execute if the policy violates and save the policy.

Server Visibility Events

To access Server Visibility Events, from the top navigation bar > **Servers** > **Events**.

You can view Machine Agent events on the Server Events list, and on the Application Events list for applications associated with the Machine Agent. See Monitor Events.

Machine Agent events include:

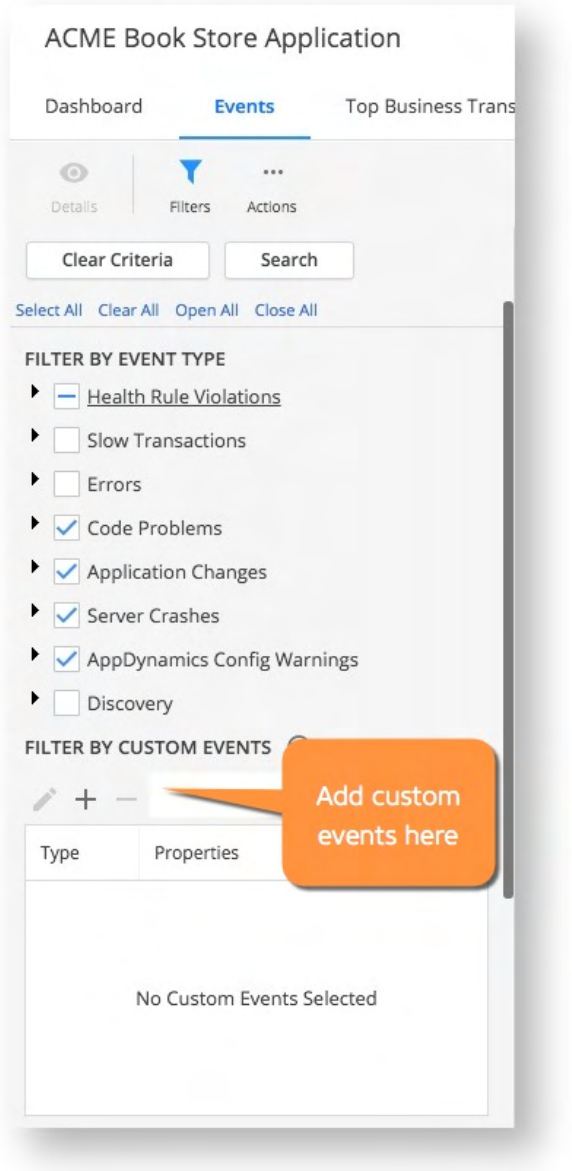
- Custom Events
- Agent Internal Diagnostic Events

Custom Events

Custom events include events generated by the extensions, and Service Availability Monitoring events. Service Availability Monitoring events are custom events that are sent to the Controller periodically, and for every state change in the service's health.

Events triggered by extensions are custom events and also display on the **Servers > Events** list.

To view custom events in the application Events list, you can add them to the event list filters.



Agent Internal Diagnostic Events

AGENT_DIAGNOSTICS

- Description – Diagnostic information concerning Agent activity, such as resetting a Machine Agent. The reset functionality is available for pre-4.2 version Machine Agents only.
- Category – AppDynamics Internal Diagnostics
- Name – `EventMessage.MACHINE_AGENT_RESET_SUCCEEDED`

Machine Agent Settings for Server Visibility

You can modify the default configuration for Server Visibility. This page describes the configurable settings and their default values.

Edit this configuration file: *<machine-agent-home>*/extensions/ServerMonitoring/conf/ServerMonitoring.yml

Edit YML Files

When editing YML files:

- If you make any changes to ServerMonitoring.yml, or to any other YML file, make sure that the modified file meets standard YML syntax rules.
  Follow these important YML good practices:
  - Do not include any tab characters. Use whitespace characters only to indent fields.
  - Use the exact same number of whitespace characters to indent entries that are on the same level.
  - Use a plain-text editor, not a WYSIWIG editor, to edit the file. Use a monowidth/monospaced font to view the contents.
  - Always save using UTF-8 encoding.
  - Test and verify the edited file using an online YML syntax tester.
- The safest way to edit a setting in a YML file is to:
  - Copy the line you want to edit, and paste the copy into a new line. Make sure that you select, copy, and paste the entire line.
  - Comment out the original line and edit the copy, as desired.
- To add or edit a regular expression in this file, you should test and verify the regular expression using an online regex tester.
- Before you make any changes to this file, review the option descriptions on this page, and the comments in the file, carefully before you change a setting.
- The Agent updates dynamically in response to Agent configuration property changes, so you do not need to restart the Agent after you update this file.

Configurable Server Visibility Settings

Setting	Description
basicEnabled	Indicates whether the Machine Agent should report the basic metrics through the SIM extension. Set this to false to use Sigar to report basic metrics. This setting only affects monitoring on Linux. Default = true
volumeMonitorConfig: maxNumberVolumes	Do not report more than *N* volumes, where *N* = maxNumberVolumes. Default = 5 Changing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can process the increased resource requirements.
volumeMonitorConfig: whitelistSelectorRegex	Volumes with names that match this regular expression are always reported, up to the maximum specified by maxNumberVolumes. Default = ""
volumeMonitorConfig: blacklistSelectorRegex	Volumes with names that match this regular expression are excluded. This setting is useful for filtering out irrelevant metrics. If a volume name matches both the blacklist and whitelist regexes, metrics for that network are reported (the whitelist takes priority) up to the maximum specified by maxNumberVolumes. The default ServerMonitoring.yml file does not include a blacklistSelectorRegex field for volumes. If you want to add one, use the same indentation and formatting as the volumeMonitorConfig:whitelistSelectorRegex field.
volumeMonitorConfig: samplingInterval	Specifies a custom sampling interval for collecting volume metrics on Linux. Default = 3000

`networkMonitorConfig:` `maxNumberNetworks`	Do not report more than *N* networks, where *N* = `maxNumberNetworks`. Default = 5 Changing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can handle the increased resource requirements.
`networkMonitorConfig:` `whitelistSelectorRegex`	Networks with names that match this regular expression are always reported, up to the maximum specified by `maxNumberNetworks`. To report metrics for one or more virtual networks, specify a regex that matches the virtual network names. When collecting Process metrics on Solaris, the Standalone Machine Agent observes and captures only the first 80 characters of each process name and argument list. This means that the Agent considers only the first 80 characters of each process string when it applies whitelists. Default = ""
`networkMonitorConfig:` `blacklistSelectorRegex`	Networks with names that match this regular expression are excluded. This setting is useful for filtering out irrelevant metrics. If a network name matches both the blacklist and whitelist regexes, metrics for that network are reported (the whitelist takes priority) up to the maximum specified by `maxNumberNetworks`. The default regex excludes virtual networks. To monitor a set of one or more virtual networks, edit `whitelistSelectorRegex` to include the networks of interest. To monitor all virtual networks, change the `blacklistSelectorRegex` to an empty string. When collecting Process metrics on Solaris, the Standalone Machine Agent observes and captures only the first 80 characters of each process name and argument list. This means that the Agent considers only the first 80 characters of each process string when it applies blacklists. Default = "^veth.*|^vnet.*"
`defaultProcessClassSelector`	The default "class selector" based on a *`class_selector_regex`*. If this regex is defined, and a match is found in the process command line, the class name is the first group occurrence of that regex in the command line. Default = ""

`processClassSelectorRegexList`	A list of *`class_name`*:*`regex`* mappings. If the command line for a process matches regex, the metrics for that process are assigned to *`class_name`*. This setting is useful when you want to ensure that high-priority processes get reported, even if the number of defined classes is higher than the `maxNumberMonitoredClasses` setting.
	
	For example:
	
	`processMonitorConfig:`
	
	`processClassSelectorRegexList :`
	
	`machineAgentTasks: '.*java.*machineagent.*'`
	
	`controllerTasks: '.*java.*controller.*'`
	
	`nextOne: '.*svchost.*'`
	
	The Machine Agent assigns a process to a class as follows:
	
	1. Assign to the first match in `processClassSelectorRegexList`.
	2. If there is no match for the `processClassSelectorRegexList` (step1), apply the `defaultProcessClassSelector` regex to the command line.
	3. If there is no match for the `defaultProcessClassSelector` regex (step 2), use the process name (truncated if the name exceeds the `maxClassIdLength`).
	
	These steps outline the recommended workflow for updating this list:
	
	1. The default `ServerMonitoring.yml` file includes an example that is commented out. If you are updating the default list for the first time, you should:
	a. Create a copy of the example.
	b. Uncomment the copy (remove the <!-- and --> comment tags), and edit it as needed.
	2. Choose the process(es) that you want to monitor on the host machine.
	3. Create a regex to match the process name(s) of interest. You should test the regex using an online regex validator.
	4. Add the regex to the list. You should order the mappings by priority, highest to lowest. If a command line matches multiple regexes, the first match is used.
	5. Save the `ServerMonitoringConfiguration.yml` file.
	6. Wait 15 minutes or longer for the updated list to take effect, and then verify that the matching process(es) display in the Controller UI.

`samplingInterval`	Indicates how often to gather metric data. Units in milliseconds. Default = 30000 (30 seconds)
`maxClassIdLength`	Specifies the maximum process class name length. Any process class name that is longer than the specified maximum is truncated. The global maximum of the process class name is 100. If this variable is set to be greater than 100, then the process name is truncated at 100. Default = 50
`processSelectorRegex`	Contains a regular expression that specifies which processes should be monitored by the Machine Agent. The regular expression is compared against the full command line that was used to start the process. The default regular expression will filter out any processes where the command line ends with a close bracket (']'). For Linux, the process arguments could not be found, which usually indicates a kernel process. For Windows, no processes should end with a bracket character, so the regex should include all processes on Windows. Default = ""^.+[^]]$""
`minLiveTimeMillisBeforeMonitoring`	Specifies the minimum amount of time a process must be alive before it is monitored by the Machine Agent. Use this to prevent the Machine Agent from being overloaded by monitoring short-lived processes. Units in milliseconds. Default = 60000 (60 seconds)
`maxNumberMonitoredClasses`	Specifies the maximum number of process classes that the Machine Agent monitors. The processes that are reported are using the highest CPU and memory that match the regex specified by `processSelectorRegex`. Default = 20 Changing this setting can affect the resource consumption of your deployment. Before you change this setting verify your application environment and Controller can process the increased resource requirements.
`defaultDiskSectorSize`	Specifies the default sector size (in bytes) for each disk if the Machine Agent cannot determine the sector size. This value is used to calculate the number of bytes read/written for the disk. Default = 512
`memoryMonitorConfig`	Specifies a custom sampling interval for collecting memory metrics on Linux. Default = 3000
`cpusMonitorConfig`	Specifies a custom sampling interval for collecting CPU metrics on Linux. Default = 3000

`tag`	A list of user-defined tags for the individual server. Use these tags to query, filter, aggregate, and compare related servers. See Server Tagging
	Each tag is specified by a `key-value` pair. You can define tag names up to 127 unicode characters, and tag values up to 255 unicode characters. Define each key on a separate line. All key-value strings should be within single quotes. If a key has multiple values, delineate the list with commas:
	`<key>: [ <value> ]`
	`tags:`
	`  'Location': ['NYC', 'Data Center', 'Server Room 7']`
	`  'Environment': ['preProduction']`

Docker Visibility Settings

See Configuring Docker Visibility.

Process Limits

These additional configurable settings are available in the Controller Admin UI:

- Total number of processes displayed in the UI for a single query is 5000 processes per call.
- Total number of processes tracked per account. The default value is 10000 processes per account.

See Controller Settings for Server Visibility.

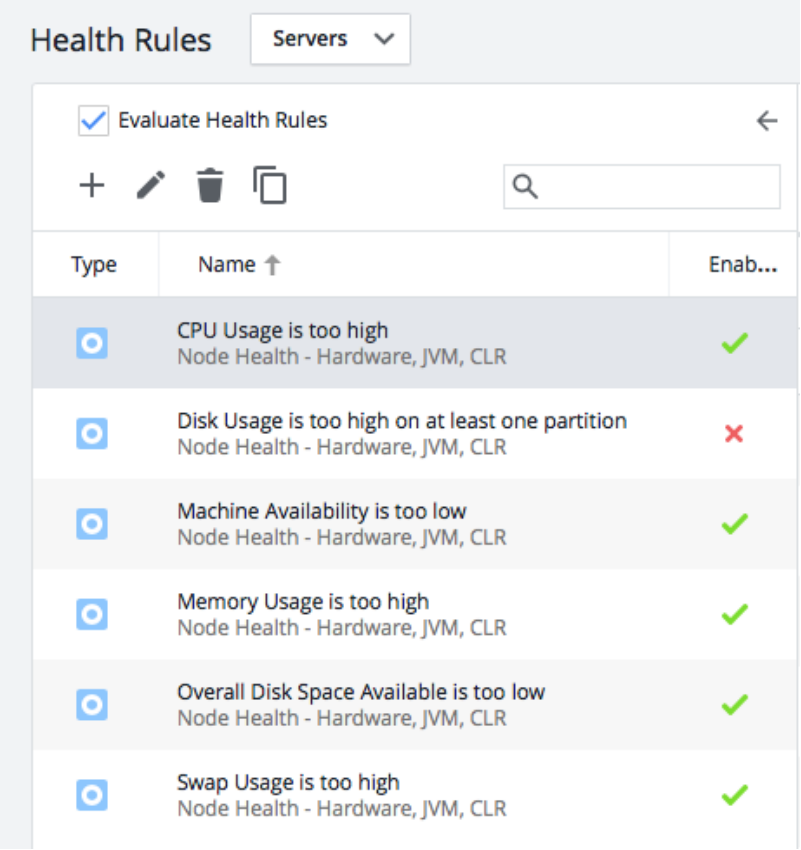
Configure Health Rules to Monitor Servers

You can configure Server Visibility to alert you when certain conditions are met or exceeded based on monitored server hardware metrics. If you are new to AppDynamics, the Getting Started Wizard can help you through the process. Alternatively, you can create alerting policies manually if you are already familiar with the process.

You configure Health Rules, Actions, Policies, and Email Digests for monitoring servers similar to how you would configure these for monitored applications, with some minor changes.

Health Rules

Default health rules based on several usage metrics are enabled for Server Visibility. You can modify these and set up your own health rules. Select **Alert & Respond** > **Health Rules** to view a list of the rules on the Controller.



From the Affects tab of the **Health Rule** wizard, you can choose to apply the Server Health Rule to:

- Subgroups (All or selected subgroups)
- Machines
    - All machines in the active account
    - Machines within selected subgroups
    - Selected machines
    - Machines whose names match certain criteria

The health rule is violated when specified critical or warning conditions are met.

Hierarchies, Groups, and Subgroups

You can apply health rules to subgroups or machines within selected subgroups. Subgroups available on the Affects tab of the Health Rules wizard are machines that are grouped into hierarchies based on the Machine Hierarchy Property configuration for the Standalone Machine Agent. See Machine Agent Hierarchy.
The subgroups are the leaf group a machine is in. For example, there are three machines:

- A is in group Data Center 1|Rack 1
- B is in group Data Center 1|Rack 2
- C is in group Data Center 1|Rack 1

A and C are in the same subgroup, B is in a different one.

Policies

Server Policy Actions are triggered when any or select Health Rule Violation Events occur. Unlike Application Policies, Server Policies cannot be based on custom events.

Actions

Actions are performed when a health rule is violated and a policy is triggered. Actions can be email or SMS message notifications, HTTP requests, or custom actions that have been uploaded to the Controller. You can also use email and HTTP request templates for alert and respond actions.

Email Digests

Email Digests enables you to send notification of chosen health rule violation events to specific email addresses at a specified frequency, such as every 2 hours.

Controller Settings for Server Visibility

This page describes Controller Admin settings that are specific to Server Visibility. You can apply these Controller settings and permissions from either the **Account** or **Controller** tabs. Changes to the settings take effect the next time the Agent is restarted and connects to the Controller.

You need the root user password to change these settings.

You cannot set all configuration properties at the account-level. Check the Description column for each property to determine whether you can enable a specific Server Visibility Property. See Roles and Permissions and Manage Users and Groups

To change the Controller Admin settings for Machine Agents, see Controller Settings for Machine Agents

Server Visibility Property	Description	Default
`sim.docker.enabled`	Enable Docker Visibility.	`true`
`sim.docker.machine.container.limit`	The global limit for the number of containers to monitor per machine. You can specify this in the Access the Administration Console as a Controller setting (all accounts) or as an account setting for individual accounts. The maximum limit you can specify is 120 containers.	`15`
`sim.docker.monitorAPMContainersOnly (previously known as sim.docker.infraMode.enabled)`	When set to `true`, allows you to monitor APM containers only. If the value is set to `false`, monitors all the containers on the machine except the Machine Agent container. You can apply this property at an account level and enable the monitoring of containers with and without APM. This property was formerly named `sim.docker.infraMode.enabled`.	`true`
`sim.exceptions.stacktrace.enabled`	When this setting is enabled, Controller stack traces are sent in the error response when a client request encounters an error. Setting this to `true` is a security risk, and should only be set to `true` if you understand the consequences, and if directed by a Support Engineer.	`false`
`sim.machines.agent.process.maxClasses`	The global maximum for the number of process classes collected per machine. • If `maxClasses` (global setting in Controller) is lower than `maxNumberMonitoredClasses` (local setting in `serverMonitoringConfig.yml`), the local setting is overridden and the global `MaxClasses` is the effective maximum for that machine. • If `maxClasses` (global) is higher than `maxNumberMonitoredClasses` (local), the local setting is the effective maximum for that machine. See Machine Agent Settings for Server Visibility Increasing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can process the increased resource requirements.	`20`
`sim.machines.container.hostid.conflict.check.enabled`	When using Docker Visibility, if the `unique host ID` setting is not configured to use `container ID` in host network mode, the Machine Agent automatically registers the container using the `container ID` as the `host ID`. This setting was introduced in version 20.8 of the Controller, with the default value = `false`. As of Controller >= 20.11 the default value is `true`. If set to true any container with `setting --network=host` and Machine Agent version is <= 20.6 the container does not register.	`true`
`sim.machines.count.maxPerAccount`	A maximum number of machines allowed per account. Any additional machines will not appear. If you have more than 2000 machines reporting to one Controller and need to increase this number, be aware that you might need to increase the `sim.machines.registrations.maxPerSecondPerAccount` setting as well. Changing this setting can affect the resource consumption of your deployment. Before you change this setting, verify your application environment and Controller can process the increased resource requirements.	`2000 /account`

`sim.machines.deleteStaleMachines.maxLimit`	Set the number of machines to be deleted every 10 minutes, which is one cycle of the purger. For better performance, you can purge up to 700 machines per cycle.	`100`
`sim.machines.dmm.defaultMode`	Sets the Dynamic Monitoring Mode and Server Visibility default on the Controller. The allowable settings are: • `KPI` – Collect Key Performance Indicator metrics only • `DIAGNOSTIC` – Collect KPI and Diagnostic metrics • `ADVANCED_DIAGNOSTIC` – Collect All available metrics *You must enter one of these exact strings*. If you enter a different value (such as "advanced-diagnostic"), the Controller will not update the setting and some servers might not appear in the Servers list.	KPI
`sim.machines.dmm.dmmAllowed`	With this option enabled, the Controller collects metrics from each Standalone Machine Agent based on the Dynamic Monitoring Mode and Server Visibility setting on that Agent. If this option is disabled, the Controller collects all available metrics from each Agent.	`false`
`sim.machines.dotNet.HostIdConflictCheckAllowed`	With this option enabled, the Controller throws an exception if a Standalone Machine Agent tries to register with the Controller while both of the following conditions are true: 1. A .NET Agent on the same machine is already registered with the same `<host-id>` specified for the Standalone Machine Agent, and 2. .NET Compatibility Mode is disabled on either the Controller or the Standalone Machine Agent. The generated exception acts as a reminder that that .NET Compatibility Mode mode must be enabled on both the Controller and the Standalone Machine Agent. Do not disable this option unless instructed by AppDynamics Support.	`true`
`sim.machines.hostidMappingAllowed`	You must enable this mode if you want to collect and view Machine or Server metrics on a server with Machine and .NET Agents installed. See .NET Compatibility Mode.	`false`
`sim.machines.offline.toStaleTimeoutMillis`	How much time, in milliseconds, to wait before considering an offline machine to be stale and marked for deletion. If this value is too high, it prevents fresh data from coming in. If the value is too short, it means less history. As of Controller >= 21.2.0 two properties are used in conjunction to purge stale machines: • use `sim.machines.offline.toStaleTimeoutMillis` (172800000 ms) to determine which machines are considered stale. • the `sim.machines.registrations.update.frequency` setting (86400000 ms) to determine the interval to purge stale machines. You may wish to change either or both settings according to your needs. You can specify these in the Access the Administration Console as a Controller setting (all accounts) or as an account setting for individual accounts. If this setting is modified in the Controller then a restart is required. If this setting is modified at the account level, you do not need to restart. Under rare circumstances old logic leads to a machine being deemed eligible for purge earlier than customer configuration.	`172800000 ms` (2 days)
`sim.machines.registrations.hashCache.enabled`	Prevent subsequent registration requests from fetch data and compare if nothing has changed in the request payload.	`true`
`sim.machines.registrations.maxPerSecondPerAccount`	Set the maximum number of registrations allowed per second per account. This setting controls the rate at which concurrent registrations are processed and prevents one account on a multi-tenant Controller from monopolizing resources needed to register the Agents. The default value assumes that the Machine Agents are started evenly across a minute. If you are running 2000 or more machines, you may need to increase this setting to 600/sec. A suggested formula is: ((number of Machine Agents, version 4.2 or higher / 60)). If you use a deployment script that starts all your Agents within a few seconds of each other, you may need to further adjust the max registrations per second. Changing this setting can affect the resource consumption of your deployment. Before you change this setting, verify your application environment and Controller can process the increased resource requirements.	60

`sim.machines.registrations.update.frequency`	Updates the timestamp of the machine on a specific frequency, regardless of stale timeout value. This allows the purger to use only metadata for purging machines.	`86400000 ms` (1 day)
`sim.machines.reuse.enabled`	Reuse SIM Machine entities to handle the ephemeral environment. Support is currently limited to Docker container machines. If set to `false`, every new container will be considered a new machine.	`true`
`sim.machines.simAllowed`	This setting allows you to enable or disable Server Visibility from the Controller.	`true`
`sim.machines.stale.purgeIntervalMillis`	An interval in milliseconds that determines when stale machines are deleted from the Controller database. If the duration of this value is too short, it might overload the server. If the value is too high, then stale machines are deleted more slowly.	`21600000 ms` (6 hours)
`sim.machines.tags.maxPerAccount`	The maximum number of unique tags per account.	`1000`
`sim.machines.tags.maxPerMachine`	The maximum number of tags per machine.	`50`
`sim.metrics.metricBrowser.machineMetricMappings.enabled`	Enables or disables the Metric Browser to display the metrics reported per machine. When this feature is enabled, tier level aggregated metrics, available under Tier node in the Server metric browser, are not visible. With Streamlined Browsing enabled, the **Hardware Resources** and **Custom Metrics** folders do not display.	`true`
`sim.metrics.store.customMetrics.simNodeEnabled`	Enables or disables the persistence of custom metric values to machines monitored by Server Visibility. If the setting is: • `true`: The collector stores and displays custom metric values for applications and machines. Custom metrics are displayed in Metric Browsers for both Applications and Server Visibility. • `false`: The collector stores and displays custom metric values for applications only. Custom metrics are displayed in the Metric Browser for Applications only (not for Server Visibility). Disable this setting if you are collecting a lot of custom metrics. This will prevent potential spikes in the number and rate of metric values stored for individual machines.	`true`
`sim.metrics.trackRegisteredEnabled`	Enable Streamlined Browsing for node metrics. Use this option when you are browsing metrics for tiers that contain multiple nodes.	`false`
`sim.perAccountProperty.enabled`	Enables a user to configure properties at an account level.	`true`
`sim.perAccountProperty.syncFrequencyInMillis`	The interval in milliseconds for the per Account Property data to sync with a database.	300000
`sim.perAccountProperty.syncInBackground`	Enables syncing the per Account Property data with a database in the background. For better performance, set this value to `true`.	`true`
`sim.processes.bulkDelete.enabled`	Delete processes in bulk instead of fetching one by one. For better performance, set this value to true.	`true`
`sim.processes.delete.maxCount`	Set the maximum number of processes to be deleted every 10 minutes, which is one cycle of the purger. For better performance, set the delete `maxCount` processes value to 55000 per cycle.	`10000`
`sim.processes.count.maxPerAccount`	The maximum number of processes stored per account.	`300000`
`sim.processes.count.maxPerMachine`	The maximum number of processes that each Machine Agent can monitor. Increasing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can process the increased resource requirements.	`1000`

`sim.processes.creation.maxConcurrent`	The maximum number of processes that can be registered simultaneously by the Controller. The default is 5000 processes. The Machine Agent will retry to register the processes if the first attempt fails. Until the process request is accepted and processed by the Controller, processes within that request will be missing from the Process Details page. The limit works as follows: Case 1: Machine Agent sends a request with 6000 processes to register, and the limit is set to 5000, then this request is rejected until the limit is increased. Case 2: Two Machine Agents (MA1 and MA2) each try to register 3000 processes and the limit is set to 5000. Both MA1 and MA2 requests are received by the Controller and only one of the requests will be processed (3000 + 3000 > 5000). So, the Controller can only process one request and rejects the other one. Case 3: Two Machine Agents (MA1 and M2) each try to register 500 processes and the limit is set to 5000. Both requests arrived at the Controller and since 500 + 500 < 5000, then both requests are processed, and the processes are registered.	`5000`
`sim.processes.query.maxResultLimit`	The maximum number of processes that the UI can show (for example, in the **Server Dashboard >** Processes tab). Suppose the time range is 2 weeks and the Agent reported over 10000 processes during that interval. If `maxResultLimit = 5000`, the UI will show 5000 processes.	`5000`
`sim.processes.registrations.maxPerSecondPerAccount`	Set the maximum number of process requests handled per second per account. For better performance, set to 600 /sec. On a multi-tenant Controller, the total number of Agents per second should not exceed 600/sec.	`60/sec`
`sim.processes.stale.purgeIntervalMillis`	The number of milliseconds between consecutive deletes of stale processes for an account.	`3600000 ms` (1 hour)
`sim.processes.terminated.toStaleTimeoutMillis`	The number of milliseconds before a terminated process is considered stale and can be deleted to make space for new data. You can specify these in the Access the Administration Console as a Controller setting (all accounts) or as an account setting for individual accounts.	`172800000 ms` (2 days)

Machine Agent Hierarchy

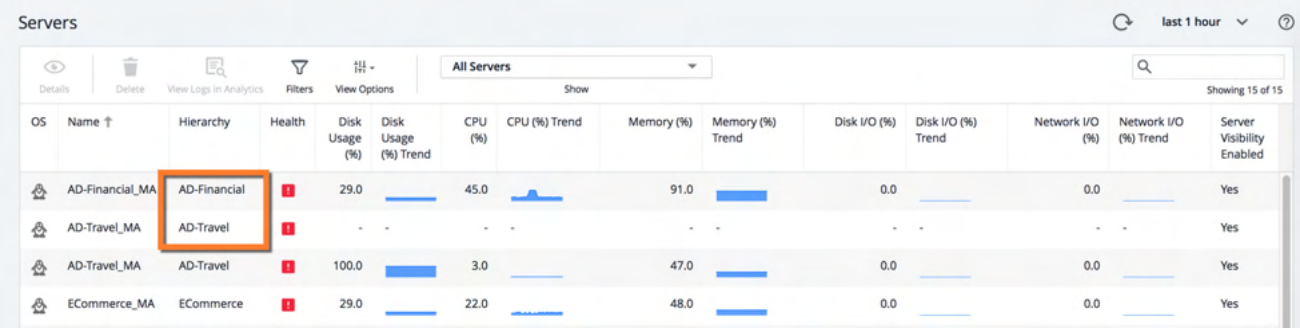
To group servers together so that you can apply health rules to the specific server groups, use the Machine Hierarchy property. This property enables you to group servers into arbitrary hierarchies by specifying a hierarchical path to the server. You can group servers based on departments, geographical locations, such as data centers, or other organizational units. You can then create health rules that apply to these departments.

The server hierarchy displays in the Metric Browser, on the Servers list, and on Server Visibility dashboard.

You need a Server Visibility license to use this feature.

You can specify the Machine Hierarchy property using `controller-info.xml`, a system property, or an environment variable.

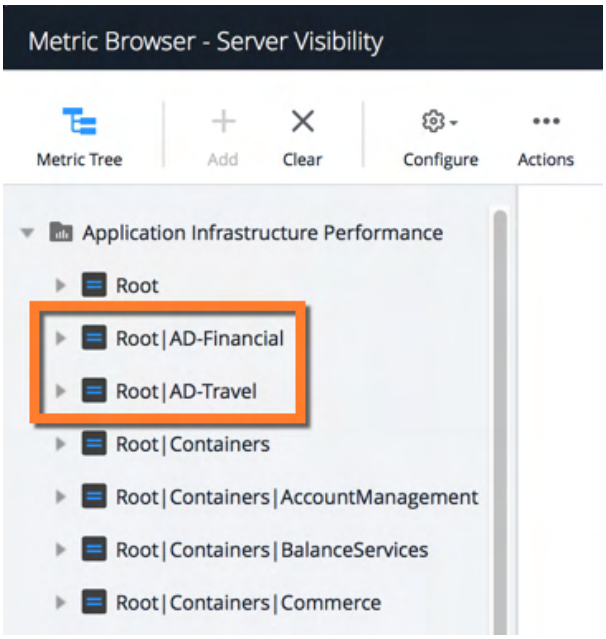
For example, to group servers into geographical locations, perhaps representing different data centers, you could group the following:



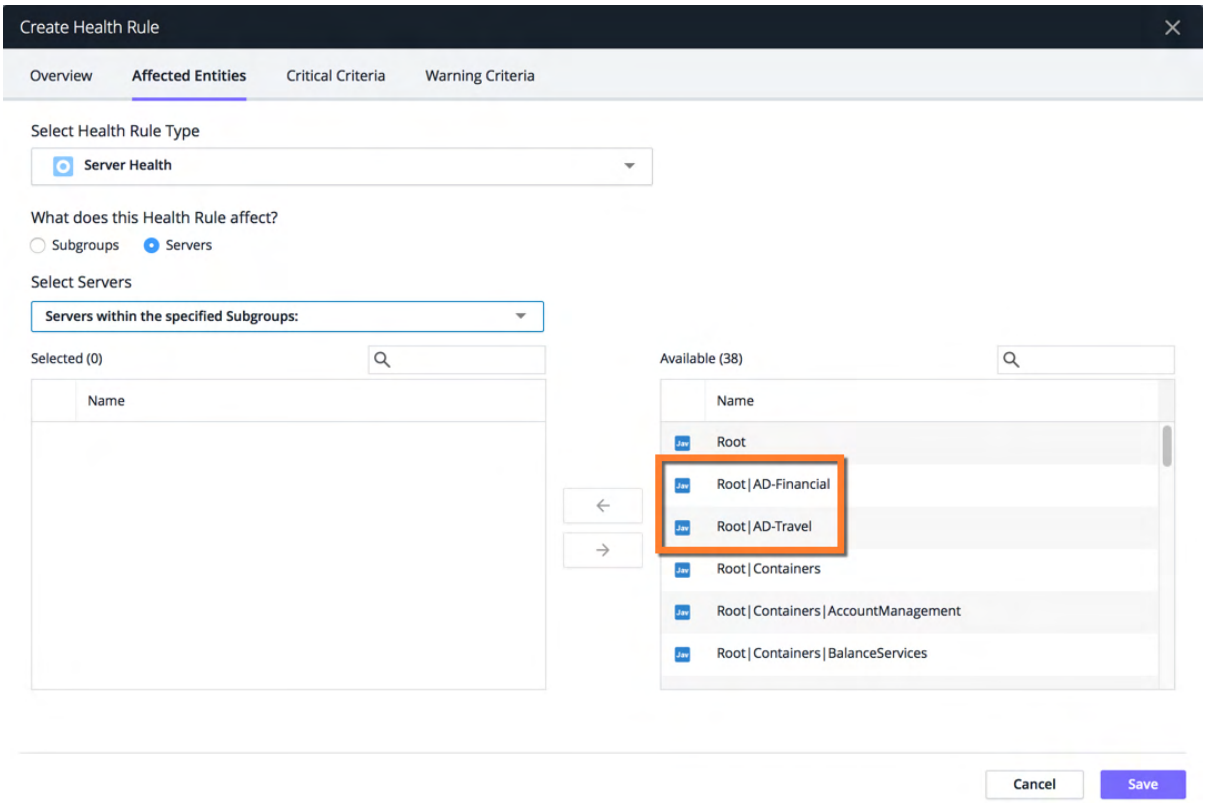
Use the `machine-path` element in the `controller-info.xml` configuration file to specify the tier and node:

```
<machine-path>AD-Financial|Node1</machine-path>
```

The Metric Browser view for this example:



When creating health rules, you can select one or more subgroups from the Affected Entities tab:



Create Health Rule
Overview
Affected Entities
Critical Criteria
Warning Criteria
Select Health Rule Type
Server Health
What does this Health Rule affect?
Subgroups
Servers
Select Servers
Servers within the specified Subgroups:
Selected (0)
Name
Available (38)
Name
Root
Root|AD-Financial
Root|AD-Travel
Root|Containers
Root|Containers|AccountManagement
Root|Containers|BalanceServices
Cancel
Save

Server Tagging

Use Server Tagging to query, filter, and compare related servers using custom metadata. You can tag related servers based on OS, location, tier, owner, or any other relevant criteria. Server tags provide additional context to server metrics.

For example, you may want to specify deployment-version tags to the servers in a specific cluster, and then use those tags to identify anomalies in server metrics during a new deployment.

Server Tagging requires a Server Visibility license. Server Tagging is currently available for Linux, Windows, and Solaris.

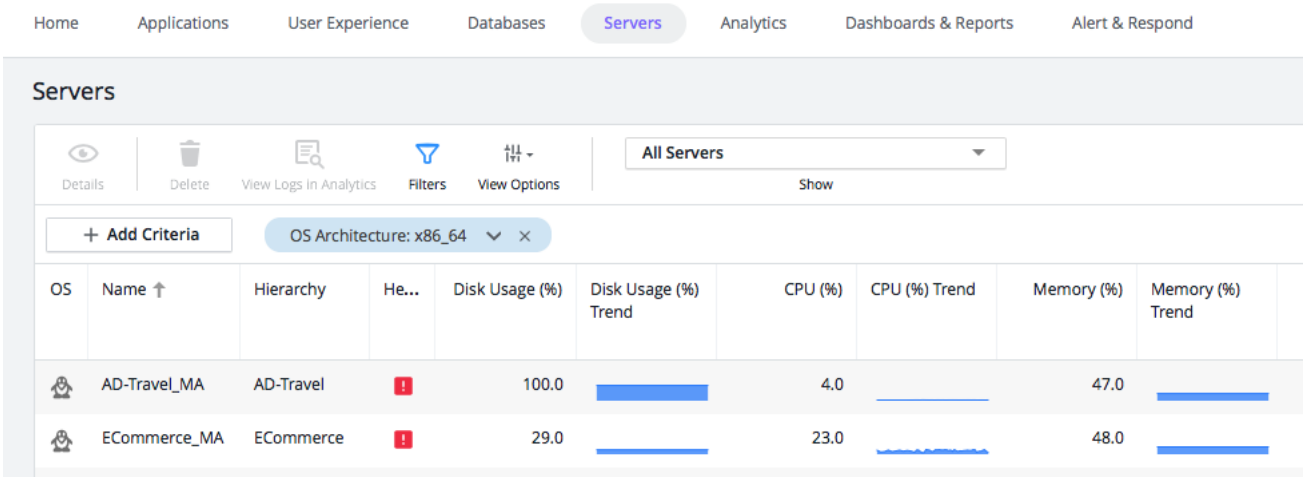
Server Visibility can import the tags (described in the table) automatically.

Source	Tags	Controller and Agent Requirements
Custom	Server Visibility can import: • Custom tags defined in `ServerMonitoringConfig.yml`. See Defining and Viewing Tags for a Server. • Custom tags defined in Amazon EC2 (See Tagging EC2 Resources in the Amazon AWS documentation).	• Controller >= 4.4 • Standalone Machine Agent >= 4.4
Machine Agent	These tags display in the Server Dashboard under Tags: • OS Architecture • OS Kernel • AppDynamics Agent Version	• Controller >= 4.4 • Standalone Machine Agent >= 4.2
Amazon Web Services	These tags display in the Server Dashboard under Tags as `AWS|<tag>`. See Importing Tags from Amazon Web Services. • `resource-id` • `availability-zone` • `region` • `ami-id` • `instance-type` • `security-group`	• Controller >= 4.4 • Standalone Machine Agent >= 4.4
Docker	Server Visibility can import user-defined tags and system container-level tags. These display under **Container Details > Tags** as `Docker|<tag>`. The exact set of tags imported can vary depending on the system on which the container is running.	• Controller >= 4.4.3 • Standalone Machine Agent >= 4.4.3
Kubernetes OpenShift	Server Visibility can import ReplicaSet and pod tags. These appear under **Container Details > Tags** as `K8s|<tag>`.	• Controller >= 4.4.3 • Standalone Machine Agent >= 4.4.3

View Servers by Tag in the Controller UI

To view filter servers by tag in the Servers list, select **Filters** and add the criteria you want for the tag filter. If you specify multiple criteria, the filter performs an AND search (for criteria with different keys) and an OR search (for criteria with the same key). This example shows the tag criteria filters for all servers with:

1. A **Tier** tag that equals **ECommWeb** OR **ECommInventory**, AND
2. An **OS Architecture** tag that equals **x86_64**.



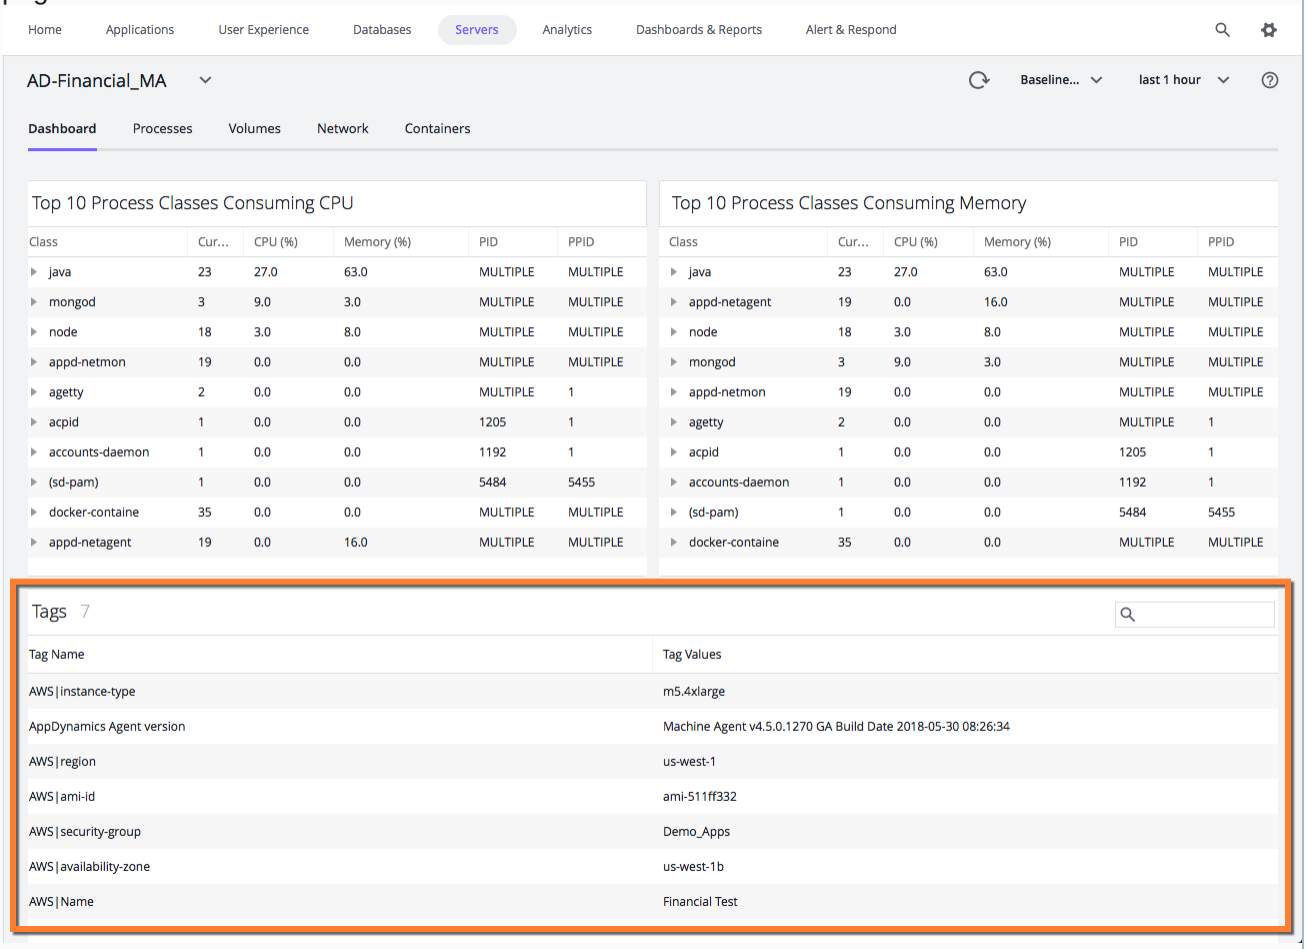
Define and View Tags for a Server

You can specify custom tags as a set of key-value strings in the Agent config directory. Each Agent can support up to 50 tags by default.

Follow these suggested best practices to define server tags:

If an Agent is deployed in Amazon Web Services, the Agent can auto-detect and import tags defined in AWS. The Controller also auto-assigns a set of default tags to each server.

The primary use case for custom tags is to specify information that is not already specified in AWS and auto-assigned tags. Before you specify custom tags in the Agent config directory, you should review the current set of tags. Access the Server Dashboard and view the Tags pane at the bottom of the page:



Be careful not to define duplicate tags in the `YML` file.

Configure the following option in `<machine_agent_home>/extensions/ServerMonitoring/ServerMonitoringConfig.yml`:

Setting	Description

`tag`	A list of user-defined tags for the individual server. You can use these tags to query, filter, aggregate, and compare related servers. Each tag is specified by a key-value pair. You can define tag names up to 127 Unicode characters and tag values up to 255 Unicode characters. Define each key on a separate line. All key-value strings should be within single quotes. If a key has multiple values, delineate the list with commas:
	`<key>: [ <value> ]`
	`tags:`
	`  'Location': ['NYC', 'Data Center', 'Server Room 7']`
	`  'Environment': ['preProduction']`

Import Tags from Amazon Web Services

Detailed information about Amazon Web Services is outside the scope of AppDynamics documentation.

Before Server Visibility can import tags from AWS, you must set up IAM roles:

1. Log in to the AWS console: https://console.aws.amazon.com/iam/
2. Create a role with read access to EC2 tags.
   Specifically, the role must have an AWS Managed Policy with the required permissions (such as, AmazonEC2ReadOnlyAccess) attached.
3. Add this role to your EC2 instance.
   For information about these steps, search for "To create an IAM role using the IAM console" and "Attaching an IAM Role to an Instance" in this page.
4. Run the Machine Agent with Amazon Web Services enabled.

Configuration Options for Server Tagging

To edit these settings, log in to the Controller administration console using the `root` user password. See Access the Administration Console.

Server Visibility Property	Description	Default
`sim.machines.tags.enabled`	Enable or disable server tags for all servers	`True`
`sim.machines.tags.aws.enabled`	Enable or disable the collection of AWS tags for all servers	`True`
`sim.machines.tags.aws.pollingInterval`	Length of time in milliseconds between each polling of AWS tags	21600000 (6 hours)
`sim.machines.tags.maxPerMachine`	Maximum number of unique tags per account	50
`sim.machines.tags.maxPerAccount`	Maximum number of unique tags per account	500

Configuration Options for Docker Tags

You can configure the Machine Agent to collect different types of tags. By default, all tags are collected. To turn off tag collection, set `dockerTagsEnablec` to "`false`".

1. Edit the *<machine_agent_home>*`/extensions/DockerMonitoring/DockerMonitoringConfig.yml` file.
2. Under the `containerMonitoringConfig` section, set `dockerTagsEnabled: "false"`

```
# WARNING: Before making any changes to this file read the following section carefully
#
# After editing the file, make sure the file follows the yml syntax. Common issues include
# - Using tabs instead of spaces
# - File encoding should be UTF-8
#
# The safest way to edit this file is to copy paste the examples provided and make the
# necessary changes using a plain text editor instead of a WYSIWYG editor.
#

# samplingInterval indicates how often to gather metric data. Units in milliseconds.
samplingInterval: 30000

containerMonitoringConfig:
    # containerProcessSelectorRegex defines regular expression to evaluate the processes in
    # each running container to be monitored by the machine agent. The regular expression is
    # compared against each process full command line within running
    # If the pattern matches, then the machine agent start monitoring it.
    containerProcessSelectorRegex: ".*[ ]-Dappdynamics.*"
    dockerTagsEnabled: "false"
```

Configuration Options for AWS Tags

You can configure the Machine Agent to collect different types of tags. By default, all tags are collected. To turn off tag collection, set `awsTagsEnabled` to "`false`".

1. Edit the *<machine_agent_home>*`/extensions/ServerMonitoring/conf/ServerMonitoring.yml` file.
2. Set `awsTagsEnabled: "false"`

```
//ServerMonitoring.yml
# WARNING: Before making any changes to this file read the following section carefully
#
# After editing the file, make sure the file follows the yml syntax. Common issues include
# - Using tabs instead of spaces
# - File encoding should be UTF-8
#
# The safest way to edit this file is to copy paste the examples provided and make the
# necessary changes using a plain text editor instead of a WYSIWYG editor.
#
awsTagsEnabled: "false"
# samplingInterval indicates how often to gather metric data. Units in milliseconds.
samplingInterval: 30000
...
```

Configuration Options for Kubernetes and OpenShift Tags

You can configure the Machine Agent to collect different types of tags. By default, all tags are collected. To turn off tag collection, set `k8sTagsEnabled` to "`false`".

1. Edit the <*machine_agent_home*>`/extensions/ServerMonitoring/conf/ServerMonitoring.yml` file.
2. Set `k8sTagsEnabled: "false"`

```
//ServerMonitoring.yml
# WARNING: Before making any changes to this file read the following section carefully
#
# After editing the file, make sure the file follows the yml syntax. Common issues include
# - Using tabs instead of spaces
# - File encoding should be UTF-8
#
# The safest way to edit this file is to copy paste the examples provided and make the
# necessary changes using a plain text editor instead of a WYSIWYG editor.
#
k8sTagsEnabled: "false"
# samplingInterval indicates how often to gather metric data. Units in milliseconds.
samplingInterval: 30000
...
```

Tagged Metrics

Beta Disclaimer

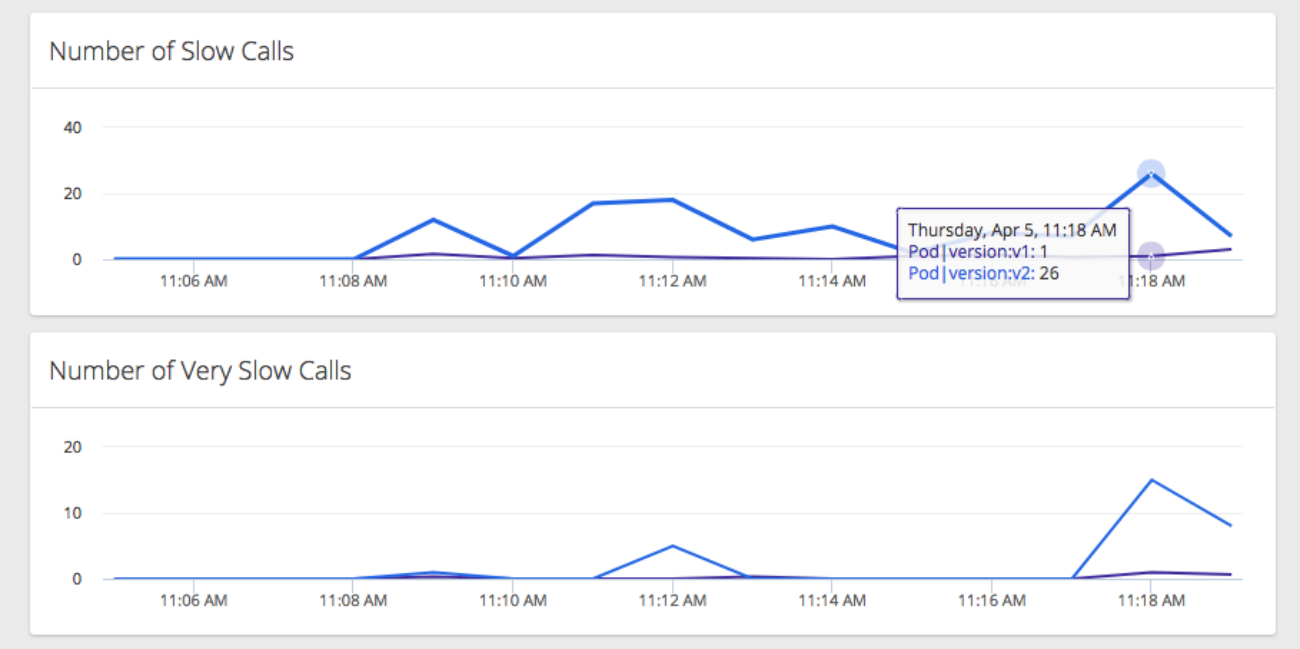
This documentation mentions features that are currently beta. AppDynamics reserves the right to change the features at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

Tagged Metrics

The **Tagged Metrics** panel enables you to aggregate all nodes in a tier based on a server tag (user-defined, or imported from AWS or Kubernetes) and then compare performance metrics between the node groups in one set of charts. For example, you can quickly compare the performance on all "blue nodes" and "green nodes" during a canary deployment.

1. In the Controller left-side panel, select **More > Tagged Metrics**.
2. In the **Tagged Metrics** panel, select the server tag and the tier of interest.
3. Compare the response times, call rates and transaction outliers (errors, slow calls, very slow calls) between the tag-based node groups.

The following chart shows how you can easily compare performance between different sets of nodes. For example, you want to analyze node performance for a tier with 26 nodes running v1 of the software, and one node running v2. You select the "version" tag, which represents a Kubernetes label. The charts show very clearly that the rate of slow and very slow calls has increased dramatically on the v2 node.



This feature is disabled by default.

To enable Tagged Metrics:

1. Log in to the administration console: `http:<controller-hostname>:8080/controller/admin.jsp` or `https:<controller-hostname>:443/controller/admin.jsp`
2. In Controller Settings, search for "`tagged.metrics.enabled`" and set this field to `true`.
3. In Account Settings:
    a. Select the account to enable.
    b. Under **Account > Additional Properties**, select **Add Property**, add the "`tagged.metrics.enabled`" property, and set it to `true`.

Network Visibility

Deployment Support

With Network Visibility, you can:

- Answer the key question quickly and easily: *Is the network to blame for any performance issues in my application?*
- Identify the root cause of performance issues in the application, the network, or in application/network interactions (for example, how an application or server utilizes the network).
- Pinpoint the traffic flows, individual nodes, and transport connections where network or application/network issues are occurring.
- Collect detailed metrics that show how the network is performing, and how well your application uses network connections and resources.
- Collect and report targeted troubleshooting information to network, IT, DevOps, and other teams.

Installation and Administration on Linux

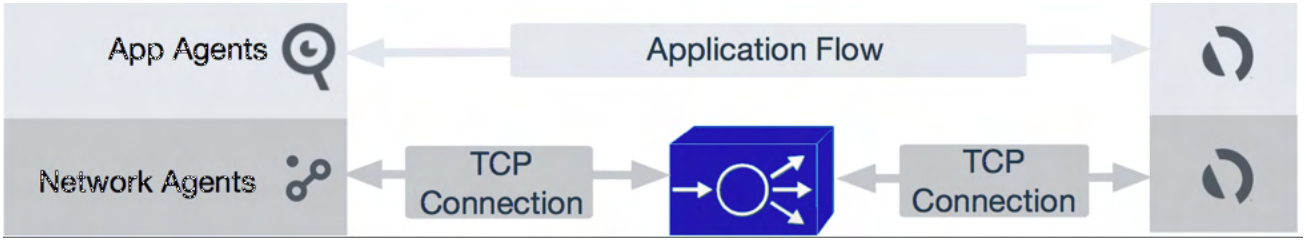
Network Visibility Overview

Application Intelligence and Network Visibility

Network Visibility extends the application intelligence of AppDynamics APM down the stack from the application to the network. With "app-only" visibility, it can be easy to mistakenly blame (or not blame) the network when an application issue arises. Network Visibility can help reduce or eliminate the guesswork involved in identifying root causes. Network Agents and App Agents, working together, automate the work of mapping TCP connections to the application flows that use them. Network Agents can identify intermediate load balancers (which often split TCP connections) and correlate the connections on either side of these devices.



The Agent-based approach of Network Visibility provides these advantages over standard approaches to network monitoring:

- More cost-efficient than using network monitoring appliances, which often view traffic from a few central locations
- Especially useful for distributed environments and multi-tier applications that span multiple network segments
- Works in cloud and hybrid networks, unlike most network-monitoring solutions

Drill Down to the Root Cause

If network issues are affecting your application, Network Visibility can help you determine the cause.

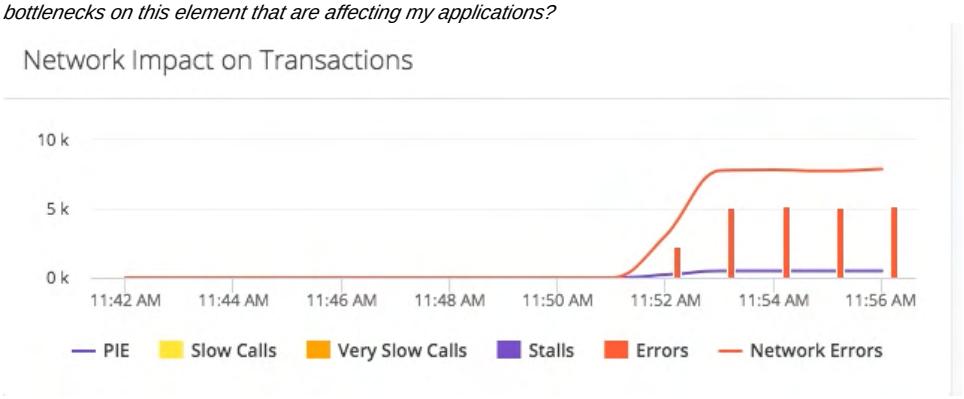
- You see a spike in transaction outliers in the Application Dashboard. Are network issues to blame?
- Switch over to the Network Dashboard. Each tier, node, and link shows network KPIs (Key Performance Indicators) that measure the network health of that element. Use baselining to highlight network elements with KPIs outside the baseline.
- To diagnose a tier, node, or network link, right-click and select **View Metrics**. In the right-click dashboard, look for network metrics with spikes that correlate with the spikes in your transaction outliers. This is often provides direction to the network root cause.
- If a network element requires more in-depth troubleshooting, configure the relevant Network Agents to collect metrics on the individual Connections used by that element. You can then
    - Click a node or link and view KPIs for the Connections used by the relevant nodes.
    - Right-click a Connection and view detailed metrics in a right-click dashboard or in the Metric Browser.

Network Visibility Metrics

Network Visibility collects and displays these metric types:

- Network KPIs (Key Performance Indicators) provide high-level, at-a-glance measures of whether the network is affecting the performance of the monitored application. The Network Flow Map shows KPIs for each tier, node, and link.
- The PIE (Performance Impacting Events) metric enables you to see immediately if there are any such events on a connected client, server, or network link.

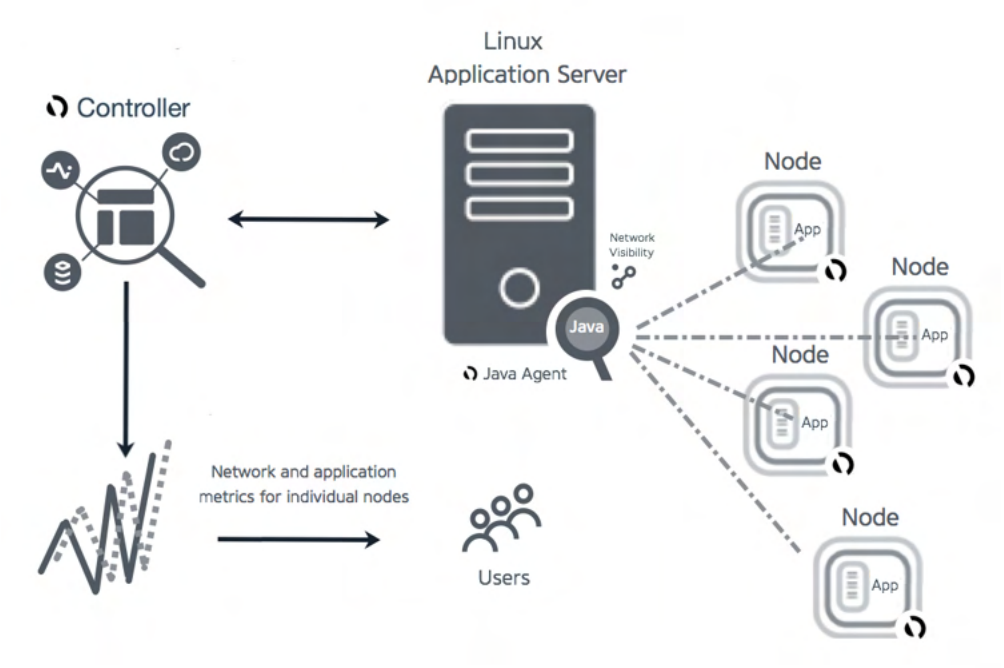
- If the KPI metrics indicate an issue with a specific element, you can view additional metrics for that element to identify root causes. Right-click an element and select **View Metrics**. The metrics and charts in the right-click dashboard are all designed to answer the question: *Are there any bottlenecks on this element that are affecting my applications?*



- To perform in-depth analysis, you can view detailed TCP Flow metrics in the Metric Browser.
- You can view node metrics to evaluate the health of TCP sockets and network interfaces.

Network Visibility for Multiple App Nodes on the Same Server

Network Agents can monitor multiple nodes that are associated with the same IP address because they run on the same physical or virtual server. The Agent monitors each node individually and calculates network metrics for each node. These metrics are based on the ingress/egress traffic for each individual node, not aggregate traffic for the IP address of the host on which the node is running.



Network Visibility Supported Environments

Related pages:

- License Management
- Java Supported Environments
- App Server Agent Supported Environments

This page describes application environments, operating systems, and version support for the Network Agent.

General Requirements

With a Network Visibility license, you can use Network Visibility features on Linux and Windows. You must have a supported version of the Network Agent to be installed on the monitored server. See License Entitlements and Restrictions.

By default, Network Visibility is disabled in the Controller. To enable Network Visibility, set the agent node property `socket-enabled=true`. See App Agent Node Properties (S).

Network Visibility is not supported on JDK 1.6. To run the Network Agent, upgrade to JDK >= 1.8.

Network Visibility is compatible with Kubernetes and Docker, but not Docker Swarm.

Network Visibility on Linux

Operating System Requirements

Network Visibility is supported on Linux hosts with Java app server agents only.

Each host on Linux must have:

- Network Visibility Agent >= 4.4
- Java Agent >= 4.4 with an App Agent license
- Controller >= 4.4 with a Network Visibility license

You must have `sudo` or `root` access permissions on the Agent host to install the Network Agent. You do not need `sudo` or `root` access to run the agent.

Distributions

The following Linux distributions support the Network Agent based on glibc >= 2.12:

- CentOS >= 6 (32-bit and 64-bit)
- Ubuntu >= 14 (32-bit and 64-bit)
- Red Hat Enterprise Linux >= 6 (32-bit and 64-bit)
- Fedora >= 24 (32-bit and 64-bit)

You must pre-install the following libraries for the Network Agent host:

- libdl.so.2
- libpthread.so.0
- librt.so.1
- libm.so.6
- libc.so.6
- libncurses.so.5
- libtinfo.so.5
- libstdc++.so.6
- libgcc_s.so.1

Network Visibility on Windows

Operating System Requirements

Each Windows host must have:

- Network Visibility Agent >= 4.5.7.
- An account with administrative privileges on the Windows machine where you want to install the Network Agent.

Additionally, each Windows host must also have:

- .NET Agent >= 4.5.15 with an App Agent License. See Install the .NET Agent and License Management.
- Controller >= 4.5.14 compatible with the .NET Agent.

OR

- Java Agent >= 4.5.4.24386 with an App Agent license. See Install the Java Agent and License Management.
- Controller >= 4.5.4.24386 compatible with the Java Agent. See Agent and Controller Compatibility.

> To install AppDynamics for testing, you need to verify system requirements, prepare the host, and perform the Controller installation. See Upgrade the Controller Using the Enterprise Console and Install the Controller Using the CLI.

Distributions

The following Windows distributions support the Network Agent on Java applications:

- Windows Server 2019 (64-bit)
- Windows Server 2016 (64-bit)
- Windows Server 2012 (64-bit)
- Windows Server 2012 R2 (64-bit)

The following Windows runtime environments support the Network Agent on .NET applications (starting with .NET Framework version 3.5):

- Microsoft IIS versions 6.0, 7.0, 7.5, 8.0, 8.5, 10
- Managed Windows Services
- Managed Standalone Applications

You can use the Network Visibility features with the .NET Agent if you have installed:

- Network Agent >= 4.5.7
- .NET Agent >= 4.5.15
- AppDynamics Controller>= 4.5.14

You can monitor .NET applications that are implemented using synchronous calls. However, Directory Search and ADO.NET are not supported.

> Support for monitoring network traffic for asynchronous .NET calls is limited. If your asynchronous .NET calls are not reporting network traffic correctly, contact AppDynamics Support to report your use case and include the libraries, API, and framework involved in the transaction. This information may be shared with the Product team for future enhancements.

Limitations

The following **Network Flow Map** features are not supported:

- Federated Flow Maps
- Visualization of flows between web servers and APM entry tiers

The Network Flow Map does not filter out connections on the selected time range.

Cross-application correlation of a .NET application with Network Visibility is not supported for .NET environments.

The Network Agent cannot monitor multiple app server agents on the same host if these agents report to different Controllers. All app server agents must report to the same Controller.

The **Network Dashboard** does not show data for Health Rules or Health Rule violations. To view any Health Rule violations, including those based on Network Visibility data, access the **Application Dashboard**.

Potential Issues

Network Visibility cannot monitor cross application flows that use Jersey web servlets. As a workaround, disable Jersey servlet instrumentation and business transactions on the flows will be recognized as servlets instead of web services:

1. Select the application of interest in the Controller UI.
2. Select **Configuration > Instrumentation > Transaction Detection**.
3. Disable instrumentation for Jersey Servlet and Jersey 2.x Servlet.

If you open the **Network Flow Map** for an individual node, the KPI metrics for `node-to-load-balancer` and `node-to-TCP-endpoint` links show network KPIs for all nodes in the parent tier (instead of KPIs for the individual node only). To view KPIs for the individual node, open the link popup and review the Connection KPIs.

Set Up Network Visibility on Linux

To set up Network Visibility on Linux, see:

1. Network Visibility Supported Environments
2. Install the Network Agent on Linux
3. Set Up the Network and App Agents on Linux
4. Administer the Network Agent on Linux

Install the Network Agent on Linux

Install the Network Agent Independent of Standalone Machine Agent

You can install and run the Network Agent independently of the Standalone Machine Agent using the ZIP, RPM, or DEB installers.

ZIP Network Agent Install

Important Notes

- If you are using Network Visibility to monitor applications running in Docker containers, you must install the Network Agent in a container as well. See Docker and Network Visibility.
- To run the install script, log in as `root`.
- For all other operations, log in as the designated agent administrator (<*appd-agent-administrator*>) for that host.

1. Check System Requirements. See Network Visibility Supported Environments.
2. Download and unzip the Agent installer:

   Login User = Agent Administrator

   a. Log in to the Agent host as `<appd-agent-administrator>`.
   b. Access the AppDynamics Downloads Portal, download the Network Agent installer, and unzip it.
   c. In a terminal window, `cd` to the folder where you downloaded the Network Agent ZIP package.
   d. Enter the following command, where <*network_agent_home*> is the folder where you want to install the agent software:
   `unzip <installer.zip> -d <network_agent_home>`

   The parent path should not include any directory names with spaces:

   `/opt/appdynamics/networkVisibility` (correct)

   `/opt/appdynamics/network visibility` (incorrect)

3. Install the Agent:

   Login User = root

   a. Log out, and then log in as `root`.
   b. Go to <*network_agent_home*> and run the install script:
   `cd <network-agent-home>`
   `./install.sh`

4. Start and verify the Agent:

   Login User = Agent Administrator

   a. Log out, and then log in as *appd-agent-administrator*.
   b. Open a CLI window and enter these commands:
      i. <*network-agent-home*>`/bin/start.sh` (starts the Agent)
      ii. <*network-agent-home*>`/bin/appd-netviz.sh status` (verifies that the Agent is running and shows PID of the Agent process)

5. If you experience any problems or issues, see FAQs for Network Visibility.
6. If you are installing the Network Agent as part of a Set Up Network Visibility on Linux workflow, proceed to Set Up the Network and App Agents on Linux.

RPM Network Agent Install

Important Note

If you are using Network Visibility to monitor applications running in Docker containers, you must install the Network Agent in a container as well. See Docker and Network Visibility.

1. Check System Requirements. See Network Visibility Supported Environments.
2. If you are logged in to the Agent host as a non-root user, log out and then log back in as `root`.
3. Access the AppDynamics Downloads Portal and download the Network Agent installer.

4. Open a terminal window and enter these commands:
    a. `sudo rpm -ivh <installer.rpm>` (installs the Agent under *opt/appdynamics/netviz*)
    b. `sudo service appd-netviz start` (starts the Agent)
    c. `sudo service appd-netviz status` (verifies that the Agent is running)
5. If you experience any problems or issues, see FAQs for Network Visibility.
6. If you are installing the Network Agent as part of a Set Up Network Visibility on Linux workflow, proceed to Set Up the Network and App Agents on Linux.

DEB Network Agent Install

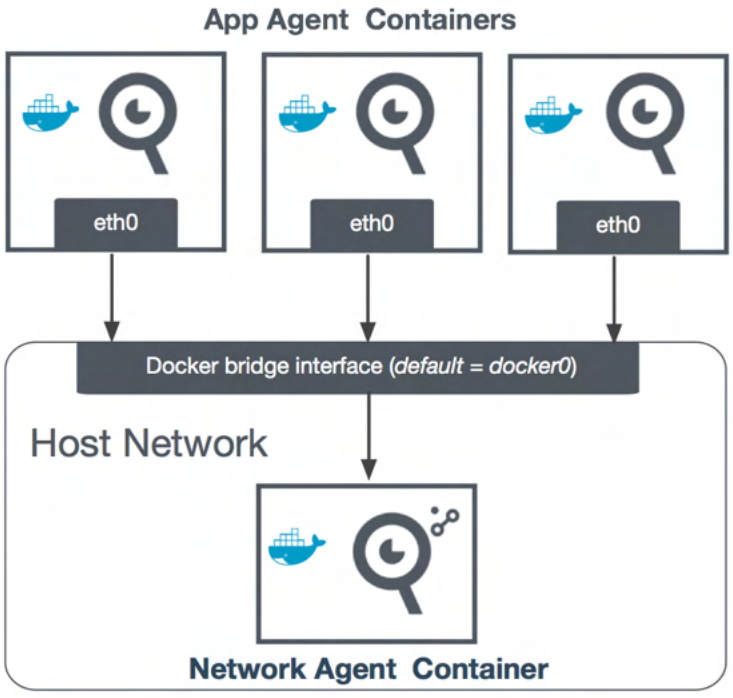
> **Important Note**
>
> If you are using Network Visibility to monitor applications running in Docker containers, you must install the Network Agent in a container as well. See + Docker and Network Visibility.

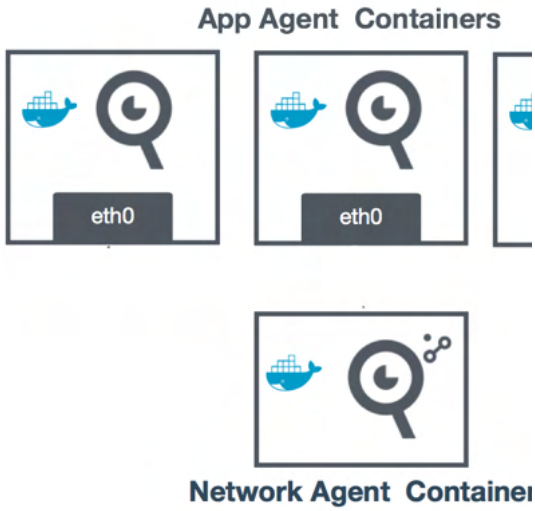
1. Check System Requirements. See Network Visibility Supported Environments.
2. If you are logged in to the Agent host as a non-root user, log out and then log back in as `root`.
3. Access the AppDynamics Downloads Portal and download the Network Agent installer.
4. Open a terminal window and enter the following commands:
    a. `sudo dpkg -i <installer.deb>` (installs the Agent under *opt/appdynamics/netviz*)
    (starts the agent, outputs *" appd-netviz start/running. process <pid #>"*)
    b. `sudo service appd-netviz status` (verifies the Agent status)
5. If the Agent does not start, enter: `sudo service appd-netviz start`.
6. If you experience any problems or issues, see FAQs for Network Visibility.
7. If you are installing the Network Agent as part of a Set Up Network Visibility on Linux workflow, proceed to Set Up the Network and App Agents on Linux.

Install the Network Agent in a Docker Container

The Network Agent can monitor applications running in Docker containers on the same host. You can deploy one Network Agent per host and collect individual metrics for every local application monitored by a Java App Agent in a container.

AppDynamics recommends that you install the Network Agent in a separate container in Docker Host network mode on the same host as the application containers. This recommendation applies when the App Agent containers are running in Docker Bridge or Docker Host mode.

Example 1: App Agents in Separate Network	Example 2: App Agents in Host Networ
	




Install the Network Agent and App Agents

1. Paste the sample Dockerfile into a text file and save the file. This sample Dockerfile contains commands for installing the Network Agent.

```
FROM centos:centos7

RUN yum update -y && yum install -y \
  net-tools \
  iproute \
  tcpdump \
  curl  \
  unzip   \
  sysvinit-tools \
  openssh-clients

WORKDIR /netviz-agent

ARG NETVIZ_ZIP_PKG

# copy NetViz agent contents
ADD ${NETVIZ_ZIP_PKG} .

# run the agent install script
RUN unzip *.zip && ./install.sh \
    && sed -i -e "s|enable_netlib = 1|enable_netlib = 0|g" ./conf/agent_config.lua \
    && sed -i -e "s|WEBSERVICE_IP=.*|WEBSERVICE_IP=\"0.0.0.0\"|g" ./conf/agent_config.lua

# default command to run for the agent
CMD  ./bin/appd-netagent -c ./conf -l ./logs -r ./run
```

2. Navigate to the directory where you saved the Dockerfile. Build the Docker image by entering:

```
docker build --build-arg NETVIZ_ZIP_PKG=/path/to/netviz-agent-pkg.zip -t appd-netviz .
```

3. Push the Docker image to your Docker Trusted Registry.
4. Deploy your Docker image using this sample Docker Compose file:

```
version: '2'
services:
  appd-netviz-agent:
    image: path/to/your/docker/image # docker registry image
    network_mode: "host"
    restart: unless-stopped
    ports:
      - '3892:3892'
    cap_add:
      - NET_ADMIN
      - NET_RAW
```

Alternatively, enter:

```
docker run -d --network=host --cap-add=NET_ADMIN --cap-add=NET_RAW path/to/your/netviz/docker/image
```

5. Set up the Network Agent. Follow the single-tenant setup instructions on Set Up the Network and App Agents on Linux.

> For single-tenant setup, you do not need to enable netlib.

Specify the Docker Host Gateway IP on the App Agent

If you are running the App Agent in a Docker container outside of the Docker Host network (as shown in Example 1 in the diagram), complete these steps.

1. In the host for your App Agent, enter these environment variables:

```
export APPDYNAMICS_NETVIZ_AGENT_HOST=$(ip -4 addr show docker0 | grep -Po 'inet \K[\d.]+')
export APPDYNAMICS_NETVIZ_AGENT_PORT=3892
```

2. Set the values for the port and host address.
    a. If you are using an App Agent version 4.5.1 or earlier:
    Open the `<app-agent-install-dir>/<version-number>/external-services/netviz/netviz-service.properties` file and set these properties:
        - `netviz.agent.host.address`
        - `netviz.agent.api.service.port`
    b. If you are using an App Agent version 4.5.2 or later:
    Run the application Docker image by passing the AppDynamics environment variables which were exported in Step 1. For example:

```
docker run --env "APPDYNAMICS_NETVIZ_AGENT_HOST=$APPDYNAMICS_NETVIZ_AGENT_HOST"
--env "APPDYNAMICS_NETVIZ_AGENT_PORT=$APPDYNAMICS_NETVIZ_AGENT_PORT" <application_docker_image>
```

Install the Network Agent as an Extension of the Machine Agent (Bundled)

You can install and run the Network Agent as an extension of the Standalone Machine Agent (ZIP only) if you want to install both Agents at the same time. This option is available on Linux 32-bit and 64-bit ZIP installers >= 4.4.2, only.

Important Notes

- If you are using Network Visibility to monitor applications running in Docker containers, you must install the Network Agent in a container as well. See + Docker and Network Visibility.
- To run the install script, log in as `root`.
- For all other operations, log in as the designated agent administrator `<appd-agent-administrator>` for that host.

1. Check System Requirements. See Network Visibility Supported Environments.
2. Download and unzip the Standalone Machine Agent:

Login User = Agent Administrator

    a. Log in to the Agent host as *<appd-agent-administrator>*.
    b. Access the AppDynamics Downloads Portal, download the Standalone Machine Agent installer, and unzip it.
    c. Install the Standalone Machine Agent using the Linux ZIP installer as described in the Linux Install Using ZIP with Bundled JRE page.

3. Install the Standalone Machine Agent and Network Visibility extension:

Login User = root

    a. Log out and then log in as `root`.
    b. Open a CLI window and enter:
        i. `cd <standalone-machine-agent-home>/extensions/NetVizExtension`
        ii. `./install-extension.sh`

4. Enable the Network Visibility extension and start the Agent:

Login User = Agent Administrator

    a. Log out and then log in as *<appd-agent-administrator>*.
    b. Enter the CLI command:
        i. `<machine-agent-home>/bin/machine-agent -d -p <machine-agent-home>/pidfile` (starts the Machine Agent)

5. If you experience any problems or issues, see FAQs for Network Visibility.
6. If you are installing the Network Agent as part of a Set Up Network Visibility on Linux workflow, proceed to Set Up the Network and App Agents on Linux.

Set Up the Network and App Agents on Linux

Network Agent 4.5.7 and Java Agent 4.5.11 eliminate the need to separately configure the Network Agent in a multi-tenant setup when running multiple nodes on the same machine. If you use the Network Agent 4.5.7 with Java Agent <= 4.5.10, you need to configure the Network Agent in a multi-tenant setup. See Network Agent and Java Agent Installation Instructions.

Network Agent and Java Agent Installation Instructions

If you are using	then
Network Agent >= 4.5.7 and Java Agent >= 4.5.11	Install the Network Agent.
Network Agent >= 4.5.7 and Java Agent <= 4.5.10	Install the Network Agent in a multi-tenant setup or a single tenant setup. You do not need to manually enable the `netlib` parameter during the multi-tenant setup, it is enabled by default.
Network Agent <= 4.5.6	Install the Network Agent in a multi-tenant setup or a single tenant setup. You need to manually enable the `netlib` parameter during the multi-tenant setup.
Java App Agent <= 4.4	Update the Java Agent.

Install the Network Agent

If you are using Java Agent >= 4.5.13, you do not need to manually enable the socket collection. It is enabled automatically. You can skip Step 1 and proceed to Step 2.

Enable Socket Collection on the App Agent

1. Configure the Java App Agent startup command to perform these tasks, as shown in the example:
   - Enable `appdynamics.socket.collection.bci.enable` for the Network Agent to map network metrics to application flows. For example:
     ```
     java -javaagent:<app_server_agent_home>/javaagent.jar \
     -Dappdynamics.socket.collection.bci.enable=true
     ```
2. The following examples illustrate how editing the Agent startup command can differ, depending on the framework of the monitored application. See Agent Installation by Java Framework and its relevant framework documentation.

Framework	Example (App Agent ZIP)
IBM WebSphere and InfoSphere	In the WebSphere/InfoSphere UI, navigate to the Java Virtual Machine properties page for the monitored server. Then, add `javaagent` and `appdynamics.socket.collection.bci.enable=true` as a Generic JVM argument. For example: `javaagent:/usr/appd/agents/apm/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true`
Apache Tomcat	Add the full command as a Catalina environment variable in file `CATALINA_BASE/bin/setenv.sh` (Tomcat 6 and later). For example: `export CATALINA_OPTS="$CATALINA_OPTS -javaagent:/usr/appd/agents/apm/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true"`

Glassfish	Add the full command as a `-javaagent` JVM option in the GlassFish domain. You can add the Agent using the asadmin tool. For example:
	
	`export LD_PRELOAD=/usr/appd/agents/netviz/lib/appd-netlib.so`
	
	`glassfish4\bin\asadmin create-jvm-options "-`
	
	`javaagent\:/usr/appd/agents/apm/javaagent.jar:-Dappdynamics.socket.collection.bci.enable=true"`

JBoss Standalone	Add the full command to the `standalone.sh` file. For example: `export JAVA_OPTS="$JAVA_OPTS -javaagent:/usr/appd/agents/apm/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true"`
Jetty	Add the full command to the `start.ini` config file in the Jetty base directory. For example: `--exec -javaagent:/usr/appd/agents/apm/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true`

3. To verify that the App Agent is running correctly, enter:
   `strings /proc/<app_pid>/environ`

Specify the Docker Host Gateway IP on the App Agent

These steps are required only if the App Agent is running in a Docker container outside of the Docker Host network.

1. Open the following file: `<app-agent-install-dir>/<version-number>/external-services/netviz/netviz-service.properties`
   (You might need to unzip `external-services/netviz.zip` to access this file.)
2. For the `netviz.agent.host.address`, specify the Gateway IP of the Docker Host network interface.
   To determine this IP, enter this command on the Docker host:
   `docker inspect <app_container_name> | grep Gateway`
3. Restart the App Agent.
4. To determine if the Docker Host network is connected, enter this command from within the container:
   `curl -k -v <host-network-IP>:3892`
   If you receive a response, even if it is `404 Not Found`, then the network is connected.

Restart the App (*IBM JVM Only*)

If the monitored app is running in an IBM JVM, you must restart the app for the Network Agent to detect and monitor any persistent connections.

Multi-Tenant Setup (*Multiple Apps on the Agent Host*)

If you want the Network Agent to monitor multiple app nodes on the same host, you perform the following steps *for each App Agent*.

If you are using Network Agent <= 4.5.6, enable the `netlib` parameter manually as described in Step 1.

Enable Netlib on the Network Agent

1. Open the following file in a text editor: `<network_agent_home>/conf/agent_config.lua`
2. Edit the `enable_netlib` parameter:

```
npm_config = {
      log_destination = "file",
      log_file = "agent.log",
      debug_log_file = "agent-debug.log",
      disable_filter = 1,
      mode = "Advanced",
      enable_netlib = 1,
      lua_scripts_path = ROOT_DIR .. "/scripts/netagent/lua/",
}
```

Install or Update the App Agent (if needed)

The Network Agent requires Java App Server Agent >= 4.4. Update each App Agent that is running an earlier version. See Install the Java Agent

Extract the NetViz External Services Folder on the App Agent

1. Navigate to the folder: `<app-agent-install-dir>/<version-number>/external-services`

2. If not already extracted, extract the `netviz.zip` archive so that the ZIP contents are under this folder:
   `<app-agent-install-dir>/<version-number>/external-services`

Preload NetLib and Enable Socket Collection on the App Agent

1. You must configure the Java App Agent startup command to perform two additional tasks, as shown in the following:
   - Preload the `appd-netlib` library so the Network Agent can collect network metrics for each individual node (rather than for the entire host)
   - Enable `appdynamics.socket.collection.bci.enable` for the Network Agent to map network metrics to application flows
     For example:
     ```
     LD_PRELOAD=/<network-agent-home>/lib/appd-netlib.so \
     java -javaagent:<app_server_agent_home>/javaagent.jar \
     -Dappdynamics.socket.collection.bci.enable=true
     ```

The following examples illustrate how editing the Agent startup command can differ, depending on the framework of the monitored application. See Agent Installation by Java Framework and its relevant framework documentation.

Framework	Example (App Agent ZIP)
IBM WebSphere and InfoSphere	In the WebSphere/InfoSphere UI, navigate to the Java Virtual Machine properties page for the monitored server. Then add `javaagent` and `appdynamics.socket.collection.bci.enable=true` as a Generic JVM argument. For example: `javaagent:/usr/appd/agents/apm/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true` You can add `LD_PRELOAD` as a JVM environment variable. This example describes how to add an environment variable on a Cognos server using IBM Connections 6.0.0: a. Log in to the WebSphere Application Server administrative console of the Cognos server. b. Click **Servers** > **Server Types** > **WebSphere application servers**. c. Click the `cognos_server` link. d. Click **JAVA** > **Process Management** > **Process definition** > **Environment Entries** > **New** to add this entry: `LD_PRELOAD=/usr/appd/agents/netviz/lib/appd-netlib.so` 1. In the WebSphere/InfoSphere UI, navigate to the Java Virtual Machine properties page for the monitored server. 2. Add `javaagent` and `appdynamics.socket.collection.bci.enable=true` as a Generic JVM argument. For example: `javaagent:/usr/appd/agents/apm/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true` You can add `LD_PRELOAD` as a system environment variable. This example describes how to add an environment variable on a Cognos server using IBM Connections 6.0.0: 1. Log in to the WebSphere Application Server administrative console of the Cognos server. 2. Go to **Servers** > **Server Types** > **WebSphere Application Servers**. 3. Click `cognos_server`. 4. Go to **Java** > **Process Management** > **Process Definition** > **Environment Entries** > **New** to add this entry: `LD_PRELOAD=/usr/appd/agents/netviz/lib/appd-netlib.so`

Apache Tomcat	Add the full command as a Catalina environment variable in file `CATALINA_BASE/bin/setenv.sh` (Tomcat 6 and later). For example:
	`export LD_PRELOAD=/<network-agent-home-directory>/lib/appd-netlib.so`
	`export CATALINA_OPTS="$CATALINA_OPTS -javaagent:/<java-agent-home-directory>/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true"`

Glassfish	Add the full command as a `-javaagent` JVM option in the GlassFish domain. You can add the Agent using the asadmin tool. For example:
	`export LD_PRELOAD=/<network-agent-home-directory>/lib/appd-netlib.so`
	`glassfish4\bin\asadmin create-jvm-options`
	`"-javaagent\:/<java-agent-home-directory>/javaagent.jar:-Dappdynamics.socket.collection.bci.enable=true"`

JBoss Standalone	Add the full command to the `standalone.sh` file. For example:
	`export LD_PRELOAD=/<network-agent-home-directory>/lib/appd-netlib.so`
	`JAVA_OPTS="$JAVA_OPTS -`
	`javaagent:/<java-agent-home-directory>/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true"`

Jetty	For a standalone Jetty using `start.jar`:
	
	a. Add the full command to the `start.ini` config file in the Jetty base directory. For example:
	`exec javaagent:/usr/appd/agents/apm/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true`
	b. Create a script to start Jetty. For example, `startJetty.sh`:
	
	`export LD_PRELOAD=/usr/appdynamics/agents/netviz/lib/appd-netlib.so java -jar start.jar`
	
	For service with embedded Jetty:
	
	a. Create a script to start Jetty. For example, `startJetty.sh`:
	`export LD_PRELOAD=/<network-agent-home-directory>/lib/appd-netlib.so java -javaagent:/<java-agent-home-directory>/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true -jar <embedded_jetty_jar>`

To verify that the App Agent is running correctly, enter:
`strings /proc/<app_pid>/environ`

Specify the Docker Host Gateway IP on the App Agent

These steps are required only if the App Agent is running in a Docker container outside of the Docker Host network.

1. Open the file: `<app-agent-install-dir>/<version-number>/external-services/netviz/netviz-service.properties`
   (You might need to unzip `external-services/netviz.zip` to access this file.)
2. For the `netviz.agent.host.address`, specify the Gateway IP of the Docker Host network interface.
   To determine this IP, run this command on the Docker host:
   `docker inspect <app_container_name> | grep Gateway`
3. Restart the App Agent.
4. To determine if the Docker Host network is connected, run this command from within the container:
   `curl -k -v <host-network-IP>:3892`
   If you receive a response, even if it is `404 Not Found`, then the network is connected.

Restart the App (*IBM JVM Only*)

If the monitored app is running in an IBM JVM, you must restart the app for the Network Agent to detect and monitor any persistent connections.

Single-Tenant Setup (*One App Only on the Agent Host*)

If you want the Network Agent to monitor one app node only on the same host, perform these steps:

- 1 Install or Update the App Agent (if needed)
- 2 Extract the NetViz External Services Folder on the App Agent
- 3 Enable Socket Instrumentation
- 4 Specify the Docker Host Gateway IP on the App Agent
- 5 Restart the App (IBM JVM Only)

Install or Update the App Agent (if needed)

Network Visibility requires a Java App Agent >= 4.4 installed on the same host as the Network Agent. See Install the Java Agent.

Extract the NetViz External Services Folder on the App Agent

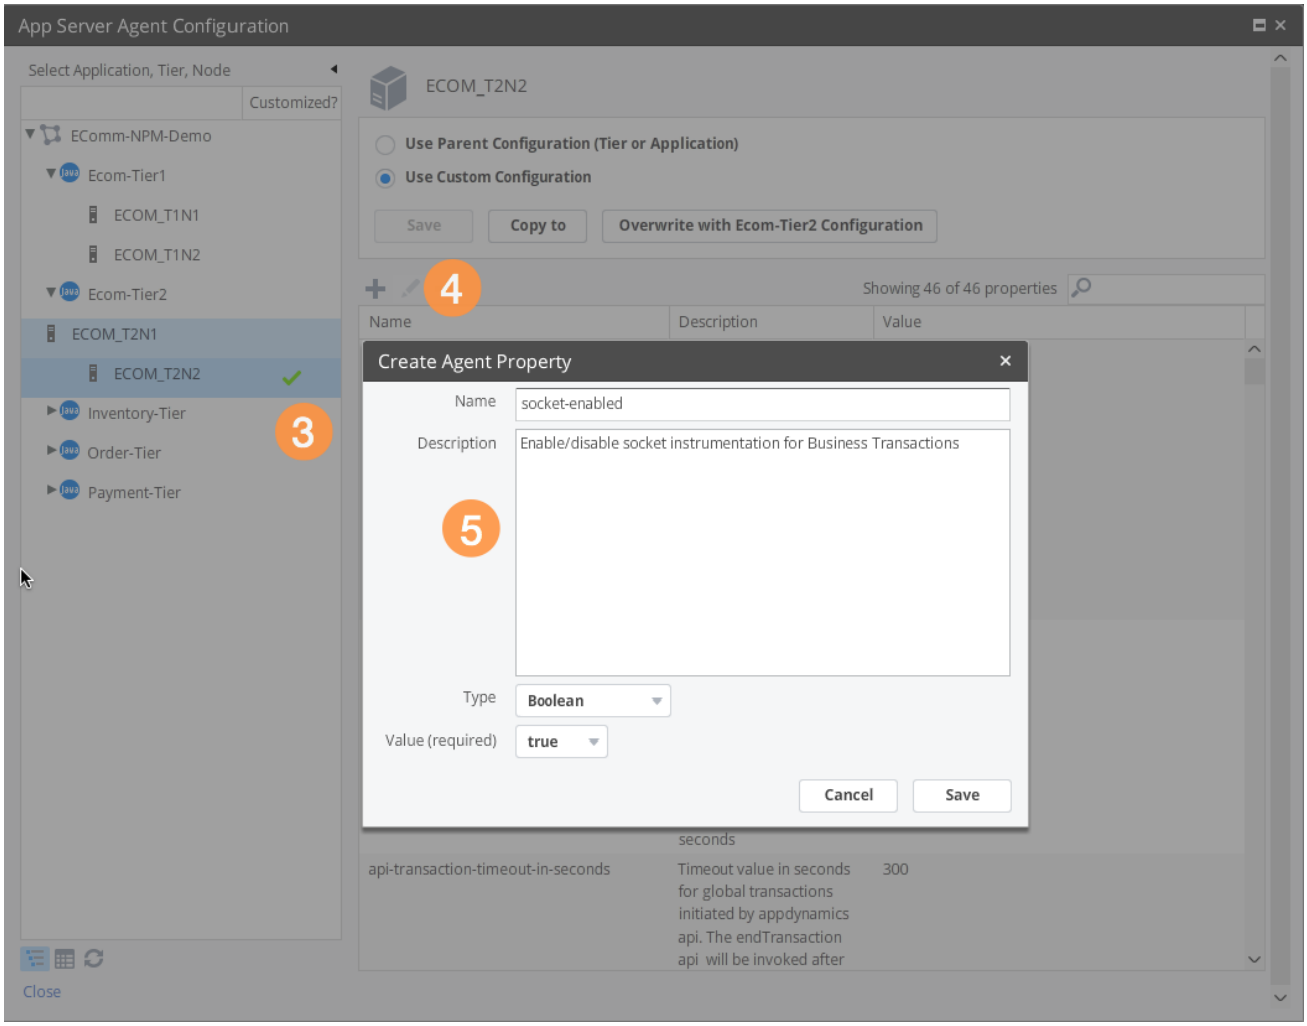
1. Navigate to folder: `<app-agent-install-dir>/<version-number>/external-services`
2. If not already extracted, extract the `netviz.zip` archive so that the ZIP contents are under this folder:
   `<app-agent-install-dir>/<version-number>/external-services`

Enable Socket Instrumentation

This is required for the Agent to map network metrics to application flows.

1. In the Controller, click the gear icon () and select **AppDynamics Agents** > **App Server Agents**.
2. Select the Agent in the table and click **Configure**. The App Server Agent Configuration page appears.
3. Select the application, tier, and node in the treeview (left).
4. Select **Use Custom Configuration** and then click **+ Create Agent Property**.
5. In the Edit Agent Property dialog, specify:

a. Name = **socket-enabled**
b. Type = **Boolean**
c. Value = **true**



Specify the Docker Host Gateway IP on the App Agent

These steps are required only if the App Agent is running in a Docker container outside of the Docker Host network.

1. Open the file: `<app-agent-install-dir>/<version-number>/external-services/netviz/netviz-service.properties`
   (You might need to unzip `external-services/netviz.zip` to access this file.)
2. For the `netviz.agent.host.address`, specify the Gateway IP of the Docker Host network interface.
   To determine this IP, run this command on the Docker host:
   `docker inspect <app_container_name> | grep Gateway`
3. Restart the App Agent.
4. To determine if the Docker Host network is connected, run this command from within the container:
   `curl -k -v <host-network-IP>:3892`
   If you receive a response, even if it is `404 Not Found`, then the network is connected.

Restart the App (*IBM JVM Only*)

If the monitored app is running in an IBM JVM, you must restart the app for the Network Agent to detect and monitor any persistent connections.

Administer the Network Agent on Linux

See the following pages for details:

ZIP Network Agent Operations

You install the Network Agent as part of an overall workflow for setting up Network Visibility. The supported workflows are:

- Multi-Tenant Setup
- Single-Tenant Setup

See Set Up Network Visibility on Linux.

> The NetViz Agent needs to be started separately from the Machine Agent when using a bundled approach.

Install the ZIP Network Agent

You can install the Agent using the Standalone Machine Agent or the Network Agent ZIP.

- Install Using the Standalone Machine Agent ZIP
- Install Using the Network Agent ZIP

Install Using the Standalone Machine Agent ZIP

You can install the Network Agent as an extension using the Standalone Machine Agent installer. This option is available on Linux 32-bit and 64-bit ZIP installers, >= 4.4.2, only.

1. Check System Requirements. See Network Visibility Supported Environments.
2. If you are installing the Network Agent as part of the Multi-Tenant Install workflow, stop each application of interest if it is monitored by an installed App Agent. You will restart each application after you install and set up the Network Agent.
3. Install the Standalone Machine Agent using the Linux ZIP installer as described in the Linux Install Using ZIP with Bundled JRE page.
4. Run the install script using `sudo`:
   ```
   cd <standalone-machine-agent-home>/NetVizExtension/agent/
   sudo ./install.sh
   ```
5. Enable the `NetVizMonitoring` extension:
   a. Open this file in a plain-text editor such as vi or Notepad++:
      `<standalone-machine-agent-home>/NetVizExtension/conf/netVizExtensionConf.yml`
   b. Set the `start` setting to `true` and save the file.
6. Start the Standalone Machine Agent. The `NetVizMonitoring` extension should start automatically. To start the Agent on Linux, enter:
   `<machine_agent_home>/bin/machine-agent -d -p <machine_agent_home>/pidfile`
7. Verify that the Network Agent is running:
   `<standalone-machine-agent-home>/NetVizExtension/agent/bin/appd-netviz.sh status`
   The output provides the process ID (PID) of the Network Agent process.
   See FAQs for Network Visibility.
8. If you are installing the Network Agent as part of a Set Up Network Visibility on Linux workflow, proceed to the next step in the workflow:
   - Multi-Tenant Setup
   - Single-Tenant Setup

Install Using the Network Agent ZIP

1. Check System Requirements. See Network Visibility Supported Environments.
2. If you are installing the Network Agent as part of the Multi-Tenant Install workflow, stop each application of interest if it is monitored by an installed App Agent. You will restart each application after you install and set up the Network Agent.
3. Verify that you have `sudo` or `root` access permissions on the host where you want to install the Network Agent. (You do not need `sudo` or `root` access to run the Agent.)
4. Open a command prompt on the host, enter the `mount` command, and check the mounted file system for the directory where you plan to install the agent. The file system should not have the `noexec` and `nsuid` flags set.
5. Download the `network-agent` package to the machine.
6. In a terminal window, `cd` to the folder where you downloaded the Network Agent ZIP package.
7. Enter the following command, where `<network_agent_home>` is the folder where you want to install the Agent software:
   `unzip <installer.zip> -d <network_agent_home>`

   > The parent path should not include any directory names with spaces:
   >
   > `/opt/appdynamics/networkVisibility` (correct)
   >
   > `/opt/appdynamics/network visibility` (incorrect)

8. Run these commands as the administrator or root user on the host machine:
   a. This command is required *only* if you are logged in as a different user from the one that will configure and run the Agent:
      `chown -R <network-agent-user-group>:<network-agent-user> <network-agent-home>`
   b. Go to `<network_agent_home>` and run the install script:
      `cd<network-agent-home>`
      `./install.sh`

9. Start the Agent by running the following command as the <*network_agent_user*>:
   <*network-agent-home*>/bin/start.sh
10. Verify that the Network Agent is running:
    a. Identify the agent process: <*network-agent-home*>/bin/appd-netviz.sh status
       The output provides the process ID (PID) of the Network Agent process.
    b. See FAQs for Network Visibility
11. If you are installing the Network Agent as part of a Set Up Network Visibility on Linux workflow, proceed to the next step in the workflow:
    - Multi-Tenant Setup
    - Single-Tenant Setup

Administer the ZIP Network Agent

> **Run commands as <network_agent_user>**
>
> You should run the following commands as a <*network_agent_user*> with permissions to configure and run the Agent on the host machine.

Operation	Command	Notes

Start Agent	<*network-agent-home*>/bin/start.sh	If the Agent starts successfully, the following displays:
		`Starting AppDynamics Network Monitoring appd-netviz...`
		`OK`
		`appd-netviz running.. <pid_of_process>`

Stop Agent	<*network-agent-home*>/bin/stop.sh	If the Agent stops successfully, the following displays:
		`Stopping AppDynamics Network Monitoring appd-netviz...`
		`OK`

Check Agent status	<*network-agent-home*>/bin/appd-netviz.sh status	This command shows whether the Agent is running or not. The following displays: `appd-netviz start/running, process <pid #>`

Restart Agent	<*network-agent-home*>/bin/appd-netviz.sh restart	If the Agent restarts successfully, the following displays:
		`Stopping AppDynamics Network Monitoring appd-netviz...`
		`OK`
		`Starting AppDynamics Network Monitoring appd-netviz...`
		`OK`
		`appd-netviz running.. <pid_of_process>`

Uninstall the ZIP Network Agent

1. Open a terminal and cd to the <*network-agent-home*> directory.
2. Stop the Agent by entering: ./bin/stop.sh
3. cd to the <*network-agent-home*> parent directory: cd ..
4. Remove the Agent directory by entering: rm -rf <*network-agent-home*>

RPM Network Agent Operations

You install the Network Agent as part of an overall workflow for setting up Network Visibility. The three supported workflows are:

- Multi-Tenant Install
- Single-Tenant Install with App Restart
- Single-Tenant Install with no App Restart

See Set Up Network Visibility on Linux.

Install the RPM Agent

1. Check System Requirements. See Network Visibility Supported Environments.
2. Stop each application of interest if it is monitored by an installed App Agent. You will restart each application after you install and set up the Network Agent.
3. Verify that you have `sudo` or `root` access permissions on the machine where you want to install the Network Agent. (You do not need `sudo` or `root` access to run the Agent.)
4. Open a command prompt on the host, enter the `mount` command, and check the mounted file system for the directory where you plan to install the Agent. The file system should not have the `noexec` and `nsuid` flags set.
5. Download the `network-agent` package to the machine.
6. Verify that you have `sudo` or `root` access permissions on the machine where you want to install the Agent.
7. Download the Agent package to the machine.
8. Open a terminal window and enter: `sudo rpm -ivh <installer.rpm>`
   The Network Agent software is installed under `/opt/appdynamics/netviz`.
9. To start the Agent, enter: `sudo service appd-netviz start`
10. Verify that the Network Agent is running: `sudo service appd-netviz status`
11. If you experience any problems or issues, see FAQs and Troubleshooting for Network Visibility.
12. If you are installing the Network Agent as part of a Set Up Network Visibility on Linux workflow, proceed to the next step in the workflow:
    - Multi-Tenant Install
    - Single-Tenant Install with App Restart
    - Single-Tenant Install with no App Restart

Administer the RPM Agent

> You should run the following commands as a `<network_agent_user>` with permissions to configure and run the Agent on the host machine.

Operation	Command	Notes
Start Agent	`sudo service appd-netviz start`	If the Agent starts successfully, the following displays: `Starting appd-netviz (via systemctl): [  OK  ]`
Stop Agent	`sudo service appd-netviz stop`	If the Agent stops successfully, the following displays: `Stopping appd-netviz (via systemctl):  [  OK  ]`
Restart Agent	`sudo service appd-netviz restart`	If the Agent restarts successfully, the following displays: `Stopping appd-netviz (via systemctl):  [  OK  ]`

Check Agent status	`sudo service appd-netviz status`	The following example illustrates status output:
		
		`appd-netviz.service - Appdynamics Network Monitoring`
		`  Loaded: loaded (/usr/lib/systemd/system/appd-netviz.service; disabled; vendor`
		`  Active: active (running) since Thu 2016-09-29 14:52:42 PDT; 14s ago`
		`  Process: 3981 ExecStart=/opt/appdynamics/netviz/bin/appd-netmon (code=exited,`
		`  Process: 3973 ExecStartPre=/bin/chown -R appd-netviz:appd-netviz /opt/appdynam`
		`  Process: 3968 ExecStartPre=/bin/mkdir -p /opt/appdynamics/netviz/run/ (code=ex`
		`Main PID: 3983 (appd-netmon)`
		`  Tasks: 12 (limit: 512)`
		`  CGroup: /system.slice/appd-netviz.service`
		`  3983 /opt/appdynamics/netviz/bin/appd-netmon`
		`  3984 appd-netagent -l /opt/appdynamics/netviz/scripts/netagent/lua/`
		`  3985 appd-netcor -l /opt/appdynamics/netviz/scripts/netcor/lua/`
		
		`Sep 29 14:52:42 localhost.localdomain systemd[1]: Starting Appdynamics Network M`
		`Sep 29 14:52:42 localhost.localdomain systemd[1]: Started Appdynamics Network Mo`
		`lines 1-15/15 (END)`

Uninstall the RPM Agent

To uninstall the Network Agent, enter:

```
sudo rpm -e appd-netviz
```

This command generates no output. To confirm that the Agent is removed, enter the status command again: `sudo service appd-netviz status`

DEB Network Agent Operations

You install the Network Agent as part of an overall workflow for setting up Network Visibility. The three supported workflows are:

- Multi-Tenant Install
- Single-Tenant Install with App Restart
- Single-Tenant Install with no App Restart

To determine the best workflow for your environment, see Set Up Network Visibility on Linux.

Install the DEB Network Agent

1. Check System Requirements. See Network Visibility Supported Environments.
2. If you are installing the Network Agent as part of the Multi-Tenant Install workflow, stop each application of interest if it is monitored by an installed App Agent. You will restart each application after you install and set up the Network Agent.
3. Verify that you have `sudo` or `root` access permissions on the machine where you want to install the Agent. (You do not need `sudo` or `root` acce ss to run the Agent.)
4. Open a command prompt on the host, enter the `mount` command, and check the mounted file system for the directory where you plan to install the Agent. The file system should not have the `noexec` and `nsuid` flags set.
5. Download the Agent package to the machine.
6. Enter:
   `sudo dpkg -i <installer.deb>`
   The Network Agent software is installed under `/opt/appdynamics/netviz`.
   The Agent should start automatically with the following message: `appd-netviz start/running. process <pid #>`
   To verify the Network Agent status, enter: `sudo service appd-netviz status`
7. If the Agent does not start, enter: `sudo service appd-netviz start`
8. If you experience any problems or issues, see FAQs and Troubleshooting for Network Visibility.
9. If you are installing the Network Agent as part of a Set Up Network Visibility on Linux workflow, proceed to the next step in the workflow:
   - Multi-Tenant Install
   - Single-Tenant Install with App Restart
   - Single-Tenant Install with no App Restart

Administer the DEB Network Agent

Operation	Command	Notes
Start Agent	`sudo service appd-netviz start`	If the Agent starts successfully, the following displays: `appd-netviz start/running. process <pid #>`

Stop Agent	`sudo service appd-netviz stop`	If the Agent stops successfully, the following displays:
		`appd-netviz stop`
		`appd-netviz stop/waiting`

Restart Agent	`sudo service appd-netviz restart`	
Check Agent Status	`sudo service appd-netviz status`	This command shows whether the Agent is running or not. The following displays: `appd-netviz start/running, process <pid #>`

Uninstall the DEB Network Agent

The Network Agent software is installed under `/opt/appdynamics/netviz`. To uninstall the Agent, enter:

```
sudo dpkg -P appd-netviz
```

Managing Network Agents in the Controller

Controller Operations for Network Agents

Using an AppDynamics Administrator account, select **Settings > AppDynamics Agents > Network Visibility Agents** to see details and manage your installed Machine Agents. You can perform most operations on multiple Agents: Shift or Ctrl+Click the Agents of interest, right-click, and select the operation. These Agent settings are defined in the Controller and retain their state when an Agent is stopped and restarted.

Right-click one or more Agents to:

- View Packet Capture Configuration
- Start Packet Capture
- Disable Agent(s) or Enable Agent(s)
- Change Dynamic Monitoring Mode
- Delete Agent from System

View Packet Capture Configuration

View and edit configuration settings for a single network Agent. See Packet Captures.

Start Packet Capture

Start a packet capture on one or more Agents.

Disable Agent(s) or Enable Agent(s)

When disabled, the Agent temporarily suspends its collection of network metrics. You can quickly re-enable the Agent when you want.

While disabled, the Agent continues to consume a Network Visibility license. The Agent maintains a "heartbeat" connection to the Controller so you can enable it again quickly. The Agent persists its enabled/disabled state after it restarts and resumes all normal activities after it is re-enabled.

Change Dynamic Monitoring Mode

Defines the set of metrics that the Agent collects. In general, you should run the Agent in KPI unless you need to diagnose network performance on the node or Connections monitored by that Agent. See Dynamic Monitoring Mode and Network Visibility.

Delete Agent from System

Deletes the underlying Network Visibility metadata for an orphaned Network Agent. A Network Agent is considered "orphaned" when the Agent host no longer has any App Server Agents installed or running. To delete a Network Agent, you must first delete all APM nodes on that host. Account Administrator privileges are required to delete Network Agents.

Check Network Agent Status

To check the status of your Network Agents, access **Tiers & Nodes** and then select **Network** in the Show Data pulldown.

Network Visibility with Kubernetes

This page describes how to configure Network Visibility to monitor applications running on Kubernetes.

Network Visibility monitors an application's network interactions and reports key performance metrics. These metrics isolate an application's network issues from its application issues.

The Network Agent uses a REST API to open a TCP port in each node for the application containers to communicate with the Network DaemonSet container. This communication enables monitoring between pods and nodes. You can deploy the agent as a DaemonSet in each node that has the host mode enabled.

Before You Begin

Before you create a Docker image for the DaemonSet and configure the agent, verify the following requirements:

- You have at least one pod with a Java Agent >= 4.4 deployed to the same cluster as the Network Agent.
- The TCP port 3892 is not already used by the node. The application pods use port 3892 to communicate with the DaemonSet.

Create a Network Visibility DaemonSet Docker Image

To configure Network Visibility with Kubernetes, you must first create a Docker image for the Network Visibility DaemonSet and push the image to your Docker Trusted Registry.

1. Paste this sample Dockerfile into a text file and save the file.

```
FROM ubuntu:14.04

ARG NETVIZ_ZIP_PKG
RUN groupadd -r appd-netviz && useradd -r -g appd-netviz appd-netviz

RUN apt-get update && apt-get install -y \
  net-tools \
  tcpdump \
  curl  \
  unzip   \
  ssh-client \
  binutils \
  build-essential \

WORKDIR /netviz-agent

# copy NetViz agent contents
COPY $NETVIZ_ZIP_PKG .

# run the agent install script and disable netlib
RUN unzip $NETVIZ_ZIP_PKG && ./install.sh \
    && sed -i -e "s|enable_netlib = 1|enable_netlib = 0|g" ./conf/agent_config.lua \
    && sed -i -e "s|WEBSERVICE_IP=.*|WEBSERVICE_IP=\"0.0.0.0\"|g" ./conf/agent_config.lua

RUN chown -R appd-netviz:appd-netviz /netviz-agent
RUN setcap cap_net_raw=eip /netviz-agent/bin/appd-netagent
USER appd-netviz

# default command to run for the agent
CMD  ./bin/appd-netagent -c ./conf -l ./logs -r ./run
```

2. Navigate to the directory where you saved the Dockerfile and build the Docker image by entering the following command:

```
$ docker build --build-arg NETVIZ_ZIP_PKG=/path/to/netviz-agent-pkg.zip -t appd-netviz .
```

3. Push the Docker image to your Docker Trusted Registry.

Configure Network Visibility with Kubernetes

1. Create a `yaml` file with the following configuration:

```
apiVersion: apps/v1 # for versions before 1.9.0 use apps/v1beta2
kind: DaemonSet
metadata:
  name: appd-netviz-agent
spec:
  selector:
    matchLabels:
      name: appd-netviz-agent
  template:
    metadata:
      name: appd-netviz-agent
      labels:
        name: appd-netviz-agent
    spec:
      hostIPC: true
      hostNetwork: true
      containers:
      - name: appd-netviz-agent
        image: path/to/your/Docker/image # docker registry image
        resources:
          requests:
            memory: "250Mi"
            cpu: "0.5"
          limits:
            memory: "2Gi"
            cpu: "1"
        securityContext:
          capabilities:
            add: ["NET_RAW"]
        ports:
        - containerPort: 3892
          hostPort: 3892
      imagePullSecrets:
        - name: your-registry-key # add the registry key, kubectl create secret ...
```

2. In the configuration file, update the following fields:
   - `image` (under `containers`): the file path to the DaemonSet image in your Docker Trusted Registry.
   - `name` (under `imagePullSecrets`): the key for your Docker Trusted Registry.
3. Deploy the Network Agent in Kubernetes by entering the following command:

```
$ kubectl apply -f MyConfigFile.yaml
```

Configure Network Visibility to Monitor Application Pods

After deploying Network Visibility in Kubernetes, you must deploy at least one pod with a Java Agent >= 4.4 to the same cluster as the Network Agent. This allows you to map network metrics to application flows.

1. Open the application's deployment configuration `yaml` file with Kubernetes in a text editor and set the `APPDYNAMICS_NETVIZ_AGENT_HOST` and `APPDYNAMICS_NETVIZ_AGENT_PORT` values:

```
- name: APPDYNAMICS_NETVIZ_AGENT_HOST
  valueFrom:
    fieldRef:
      fieldPath: status.hostIP
- name: APPDYNAMICS_NETVIZ_AGENT_PORT
  value: 3892
```

If you are using a version of the Java Agent that is <= 4.5.2, you must open the `<app-agent-install-dir>/<version-number>/external-services/netviz/netviz-service.properties` file to set these values.

2. In the Controller UI, enable socket instrumentation to map network metrics to application flows. See Set Up the Network and App Agents.

Set Up Network Visibility on Windows

To set up Network Visibility on Windows, see:

1. Network Visibility Supported Environments
2. Install the Network Agent on Windows
3. Install the App Agents on Windows

> Network Visibility on Windows supports both Java and .NET applications.

4. Administer the Network Agent on Windows
5. Verify the Network Visibility Installation on Windows

Install the Network Agent on Windows

The Network Visibility on Windows requires a supported version of the Network Agent to be installed on the server.

To monitor Java applications in your Controller, install the AppDynamics Java Agent on each server that hosts applications that you want to monitor.

You need a Network Visibility license to enable the Network Agent and its features.

No additional configuration is required on your AppDynamics Controller; Network Visibility is enabled by default.

Agent Install Directory

Network Agent is packaged as a zip bundle. The Network Agent install directory <*network_agent_home*> is the directory where you install the Agent. You can unzip the bundle at any location which is your <*network_agent_home*> directory.

It contains these administrative files:

- `install.bat` to install and start the Network Visibility Agent
- `start.bat` to start the Network Visibility Agent
- `status.bat` to check the status of the Network Visibility Agent
- `stop.bat` to stop the Network Visibility Agent
- `uninstall.bat` to uninstall the Network Visibility Agent

As part of the installation, `install.bat` installs the required VC redistributable on the system along with NPcap (if it does not already exist). If Npcap does exist on the system, then the installation of NPcap is skipped. To listen to the traffic on localhost, NPcap should be running in LoopBack mode. If NPcap is already installed on the system and not running in loopback mode, you must re-install it using loopback mode.

Network Agent and Java Agent Installation Instructions

Depending on the Network Agent version and Java Agent version, you can install the Network Agent in a multi-tenant or single-tenant setup:

If you are using	Multi-tenant Setup	Single-tenant Setup
Network Agent >= 4.5.7, and Java Agent >= 4.5.11	Install	Install
Network Agent >= 4.5.7, and Java Agent <= 4.5.10	Not supported	Install

Install Network Agent on Windows using the ZIP Installer

These steps describe how to install and run the Network Agent for Windows using the ZIP installer.

1. Review the Network Visibility Requirements and Supported Environments.
2. Download the Network Agent Windows ZIP package from the AppDynamics Downloads Portal and unzip the package.
    a. Verify your `administrator` permissions on the host where you want to install the Network Agent.
    b. Extract the contents to the Agent installation directory <*network_agent_home*>.
3. Double-click the `install.bat` file to install the Network Agent and start the AppDynamics Network Visibility Service.

    > If you run the `install.bat` script without `administrator` privileges, a dialog displays this message: "Do you want to allow this app to make changes to your device?"
    >
    > Click **Yes** to continue with the installation.

4. To verify if the Network Agent is running, navigate to the folder that contains the `status.bat` file.
    a. Double-click the `status.bat` file.
    b. Locate the AppDynamics Network Visibility Service and verify its status in the **Status** column.
    Alternately, check if AppDynamics NetViz Service is listed in services.msc.

See Administer the Network Agent on Windows.

Uninstall Network Agent Using the ZIP

To uninstall the Network Agent:

1. Open a Windows command prompt and **cd** to the <*network-agent-home*> directory.
2. Uninstall the Network Agent by entering: `\<network-agent-home>\uninstall.bat.`

Install Network Agent on Windows using the MSI Package

To install the Network Agent using the MSI package:

1. Review the Network Visibility Requirements and Supported Environments.
2. Download the MSI installer package from the AppDynamics Download Center.

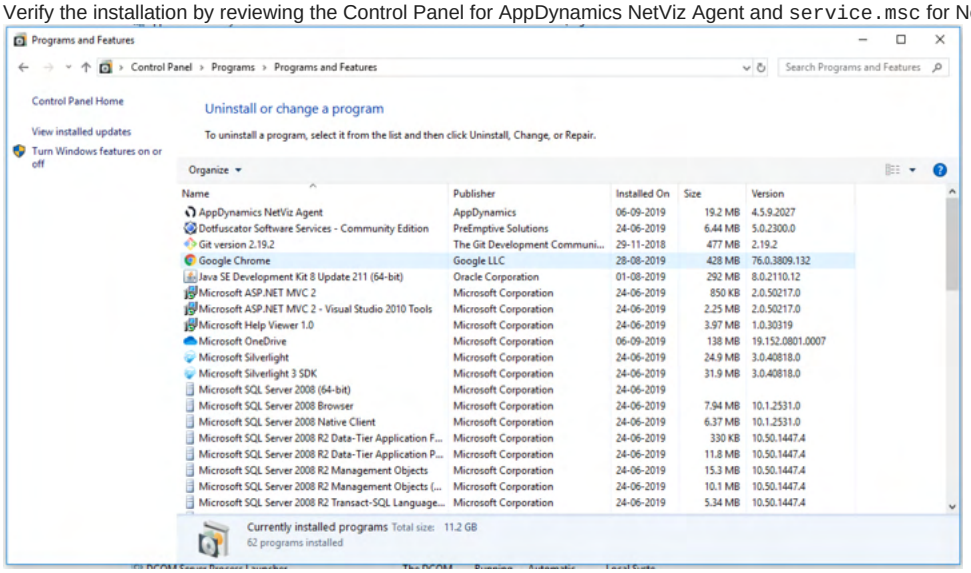
3. Run the MSI installer package.
4. Read the End User License Agreement and accept the terms. Click **Next**.
5. If required, change the Network Agent installation directory on the **Destination Folder** panel.

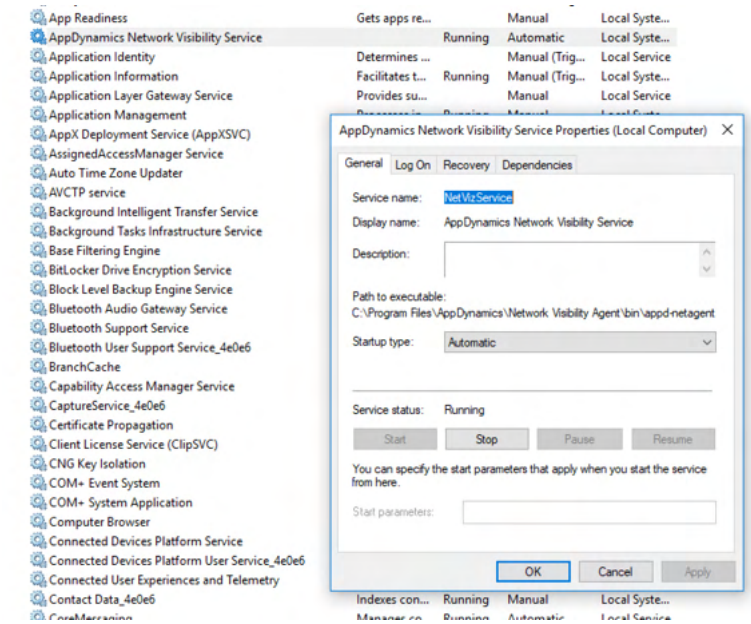
> You can also change the destination of the logs directory later using the AppDynamics Agent Configuration utility.

6. Click **Next**. The **Ready to install** page displays.
7. Click **Install**. The **User Account Control** panel displays and prompts you for permission to install.
8. From the **User Account Control** panel, click **Yes** to allow the installer to make changes to the device. Wait for the installation to complete.

> If you do not have administrator privileges, the installer prompts you to provide the password for an administrator account.

9. Click **Finish**.
10. Verify the installation by reviewing the Control Panel for AppDynamics NetViz Agent and `service.msc` for NetVizService.





Uninstall Network Agent Using the MSI Package

To uninstall the Network Agent:

1. Open the Windows Control Panel and select **AppDynamics NetViz Agent**.
2. Click **Uninstall**.

3. From the **User Account Control** panel, click **Yes** to uninstall the Network Agent.

Install the App Agent on Windows

Instrumenting an application adds the AppDynamics Application Agent, known as an App Agent, into the runtime process of the application. An App Server is a server application that is constantly running. You can deploy applications on the App Server.

Install the Java App Agent on Windows

To monitor Java applications in the Controller, you need to install the AppDynamics Java Agent >= 4.5.4, on each server that hosts applications that you want to monitor.

- To install using the Agent Download Wizard in the Controller, see Java Agent.
- To install and configure the AppDynamics Java Agent into the application JVM, see Install the Java Agent.

Set Up the Java App Agent on Windows

If you want the Network Agent to monitor an App Node on the same host:

1. Enable Socket Instrumentation.
2. Restart the App (*IBM JVM only*).

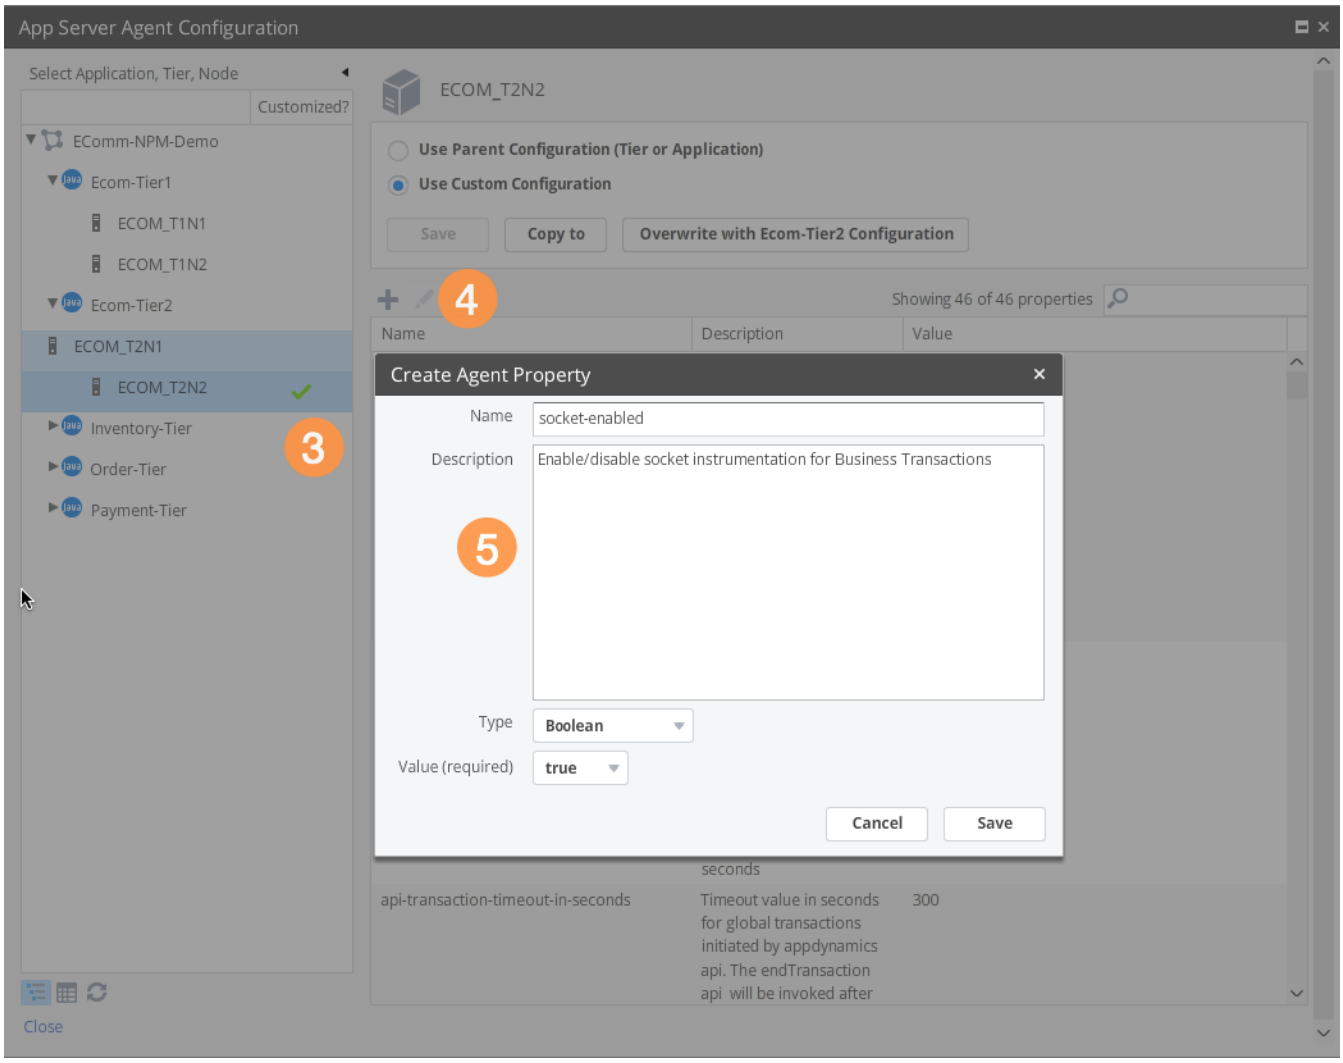
Enable Socket Instrumentation

> If you are using Java Agent >= 4.5.13, you need not manually enable the socket collection. It is enabled automatically. You can skip Step 1 and proceed with Step 2.

For the Agent to map network metrics to application flows, perform these steps:

1. In the Controller, click the gear icon ( ) and select **AppDynamics Agents** > **App Server Agents**.
2. Select the Agent in the table and click **Configure**. The App Server Agent Configuration page appears.
3. Select the application, tier, and node in the tree-view (left).
4. Select Use Custom Configuration and then click **+**. The **Create Agent Property** dialog appears.
5. From the **Create Agent Property** dialog, specify:

    a. Name = **socket-enabled**
    b. Type = **Boolean**
    c. Value = **true**



Restart the App (*IBM JVM only*).

If the monitored App is running in an IBM JVM, you must restart the App for the Network Agent to detect and monitor any persistent connections.

Install and Set Up .NET App Agent on Windows

To monitor .NET applications with AppDynamics, you need to install the .NET Agent on the servers where the applications run.

You only need to install the Agent once per server (even if you want to monitor more than one application on the server).

- To install the .NET agent for IIS applications using the Getting Started wizard in the Controller, see .NET Agent.
- To install and configure the AppDynamics .NET Agent using the MSI package, see Install .NET Agent.

Set Up the .NET App Agent on Windows

If you want the Network Agent to monitor an app node on the same host, Enable Socket Instrumentation.

Enable Socket Instrumentation

For the Agent to map network metrics to application flows, perform these steps:

1. In the Controller, click the gear icon ( ) and select **AppDynamics Agents** > **App Server Agents**.
2. Select the Agent in the table and click **Configure**. The App Server Agent Configuration page appears.
3. Select the application, tier, and node in the tree-view (left).
4. Select Use Custom Configuration and then click **+**. The **Create Agent Property** dialog appears.
5. In the **Create Agent Property** dialog, specify:

    a. Name = **socket-enabled**
    b. Type = **Boolean**

c. Value = **true**

Administer the Network Agent on Windows

Related pages:

- License Management
- Java Supported Environments

Depending on how you installed and deployed the Network Agent, there may be more than one method to administer the Network Agent. AppDynamics provides both GUI and command-line tool for common operations, such as starting and stopping Network Agents and their services. See Managing Network Agents in the Controller.

This page describes how to administer the Network Agent using command-line tools for the Network Agent ZIP. You can manage the Network Agent using these commands:

- `install`
- `start`
- `status`
- `stop`
- `uninstall`

Ensure that you run all the scripts using administrator privilege. If you run the scripts without administrator privilege, the scripts prompt for the privilege request after a three second timeout. You can start these scripts from Windows Explorer or from the command line. If you run the scripts from the command line, the `install`, `start` and `stop` scripts have a `-quiet` option. The `-quiet` option runs the scripts without prompts, messages, or dialogs.

Operation	Command	Notes
Install Agent	`\<`*`network-agent-home`*`>\install.bat`	The `install.bat` installs the Network Visibility Agent and starts the AppDynamics Network Visibility Service.

Start Agent	`\<`*`network-agent-home`*`>\start.bat`	If the Agent starts successfully, this message displays:
		`Starting the network agent service`
		`SERVICE_NAME: NetVizService`
		`TYPE : 10 WIN32_OWN_PROCESS`
		`STATE : 4 RUNNING`
		`(STOPPABLE, NOT_PAUSABLE, ACCEPTS_PRESHUTDOWN)`
		`WIN32_EXIT_CODE : 0 (0x0)`
		`SERVICE_EXIT_CODE : 0 (0x0)`
		`CHECKPOINT : 0x0`
		`WAIT_HINT : 0x0`
		`PID : 7556`
		`FLAGS :`

Check Agent status	`\<`*`network-agent-home`*`>\status.bat`	This command shows if the Agent is running or not.
		`SERVICE_NAME: NetVizService`
		`TYPE : 10 WIN32_OWN_PROCESS`
		`STATE : 4 RUNNING`
		`(STOPPABLE, NOT_PAUSABLE, ACCEPTS_PRESHUTDOWN)`
		`WIN32_EXIT_CODE : 0 (0x0)`
		`SERVICE_EXIT_CODE : 0 (0x0)`
		`CHECKPOINT : 0x0`
		`WAIT_HINT : 0x0`

Stop Agent	`\<`*`network-agent-home`*`>\stop.bat`	If the Agent stops successfully, this message displays:
		`SERVICE_NAME: NetVizService`
		`TYPE : 10 WIN32_OWN_PROCESS`
		`STATE : 1 STOPPED`
		`WIN32_EXIT_CODE : 0 (0x0)`
		`SERVICE_EXIT_CODE : 0 (0x0)`
		`CHECKPOINT : 0x0`
		`WAIT_HINT : 0x0`

Uninstall Agent	`\<`*`network-agent-home`*`>\uninstall.bat`	If the Agent uninstalls successfully, this message displays:
		`Stopping service NetVizService.`
		`NetVizService is stopped.`
		`Service AppDynamics NetViz Service uninstalled.`

Manage Network Agent on Windows

You can start or stop the Network Agent using `start.bat` or `stop.bat`. You require admin privileges to start or stop the Network Agent.

You can view the services that are currently running on the system using AppDynamics NetViz Service.

Network Visibility Metrics

Network Visibility can collect these types of metrics:

- KPI Metrics in Network Dashboard and Application Flow Map
- Key Performance Indicator (KPI) metrics are essential measures of whether a network element is performing successfully. The Network Browser shows KPIs for tiers, nodes, network links, and the entire application
- KPI Metrics in Right-Click Dashboards
  You can right-click on a network element and perform network troubleshooting in the right-click dashboard. These dashboards make it easy to drill down to network elements and metrics that correlate with application-performance issues.
- TCP Connection Metrics in Metric Browser
  When you narrow down a network problem to a specific network location, you can configure Network Agents to collect advanced metrics for the relevant connections.
- Node Metrics in Network Dashboard and Metric Browser
  The Network Agent also collects node-level metrics for monitoring the TCP stack health, collisions, and errors on physical interfaces.

KPI Metrics in Network Dashboard and Application Flow Map

Some network metrics are considered Key Performance Indicators (KPIs) because they are essential measures of whether the network or a specific part of the network, is performing successfully. Network Agents collect network KPIs for all monitored tiers, nodes, network links, and application flows. You can view KPI metrics for these elements:

View Network KPIs

For the Entire Application

The **Network Dashboard** includes Throughput, TCP Loss, and PIE charts that measure network health for the entire application.

For a Network Link

- **Network Dashboard** – The flow map shows KPIs for each link. Click a link to view KPI time charts and KPIs per Connection.
- Right-click dashboard – Right-click a link in the Network Dashboard and select **View Metrics**. See KPI Metrics in Right-Click Dashboards.

For a Tier

- **Network Flow Map** – Click a tier to view KPI time charts.
- Right-click dashboard – Right-click a tier in the Network Dashboard and select **View Metrics**. See KPI Metrics in Right-Click Dashboards.

For a Node

- **Tiers & Nodes** page – Set the Show Data menu to **Network**. The table shows network KPIs and the Network Agent status for each node.
- **Node Dashboard** – Right-click the node and select **View Metrics**. See KPI Metrics in Right-Click Dashboards.

For a Connection

Network Agents do not collect metrics for Connections by default. To collect metrics for the Connections used by a specific node, change the Monitoring Mode on the Agent. See Dynamic Monitoring Mode and Network Visibility.

Connections Explorer – Access the Network Dashboard and select **Connections**. The Explorer shows network KPIs for all network links. Drill down into a network link to view the Connections used on that link. If a Network Agent has collected metrics for a Connection, you can:

- View network KPIs in the Explorer table.
- Right-click and select **View Metrics**. See KPI Metrics in Right-Click Dashboards.
- Right-click and select **View Metric Browser**. See TCP Connection Metrics in Metric Browser.

KPI Metric Descriptions

Metric	Description	Default Monitoring Mode
Throughput	The average rate of Application *X* traffic sent and received over one Connection, or a set of Connections. Correlated spikes along with Response Time indicate bottlenecks.	KPI
Latency	The average TCP Latency (round-trip time) for a packet to go from one application tier the other, and back again. When TCP effects are not significant, Latency primarily measures *network* round trip times. Network latency is primarily a factor of the physical distance between two nodes and remains consistent over time. Correlated spikes along with Response Time indicate that TCP effects between two tiers (such as packet queueing and delayed acknowledgments) are affecting application performance.	KPI
TCP Loss (mille)	The average number of packets (per 1000) that were sent but never received. Packet loss can degrade application performance significantly. TCP detects and re-transmits lost packets; this ensures reliable transmission but introduces delays. • Correlated spikes with Response Time indicates that network congestion between the sender and receiver is affecting application performance. • Correlated spikes with Throughput indicates that a tier is sending more data than the receiving tier or the network can handle.	KPI

Errors	The number of TCP messages sent indicating an error in setting up the connection (SYN errors) or tearing down the connection (FIN errors) for a specific TCP session.	KPI
PIE (Performance Impacting Events)	The rate of PIE (Performance Impacting Events), which indicate performance issues on one node, both nodes, or the network between two nodes: • Client Limited and Client Zero Window events indicate that the Client node is receiving data at a higher rate than it can process. • TCP Retransmission Timeouts (RTO) events indicate that the network is losing packets between the client and the server node. RTOs can cause severe performance degradations. • Server Limited and Server Zero Window events indicate that the Server node is receiving data at a higher rate than it can process.	KPI

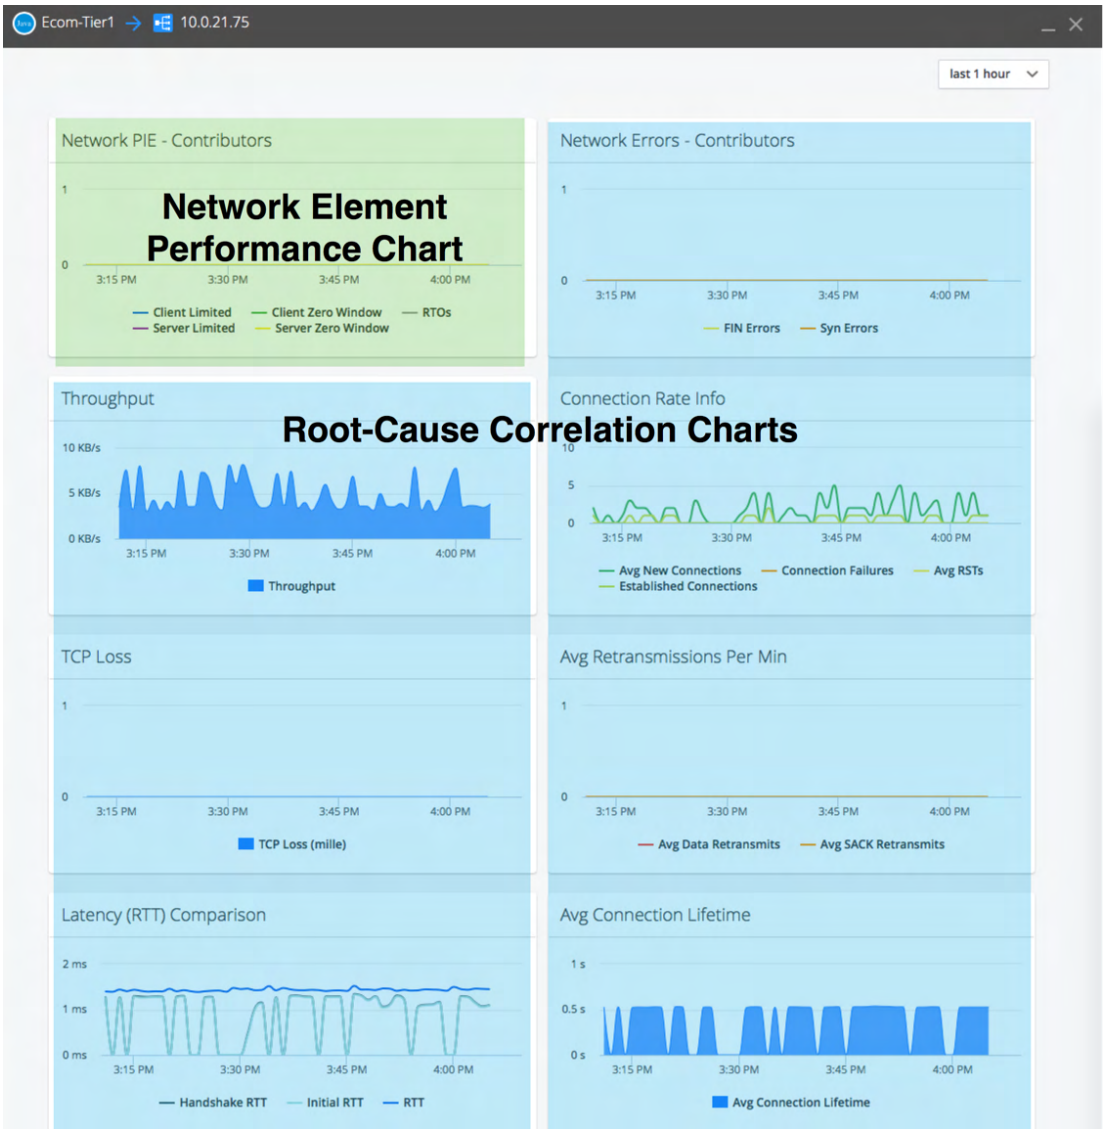
KPI Metrics in Right-Click Dashboards

To diagnose a network element, right-click and select **View Metrics**. You can troubleshoot these network elements:

- Tier – The performance chart (top left) shows the rate or application performance outliers on the relevant nodes (Errors and Slow/Very Slow /Stalled Calls) and the Key Performance Indicators for all connections used by those nodes (Errors and PIE).
- Network Link – The performance chart (top left) shows the rate of Performance Impacting Events for all member connections of that link.
- Network Connection – You can troubleshoot a connection from the Connection Explorer or from the Connections tab in a link popup.
- You can troubleshoot a transaction from a Transaction Snapshot.
    - You can right-click an application flow and select **View Network Metrics**.
    - You can also drill down to a node where a transaction delay/stall/error occurred and access the Network tab.

To troubleshoot a tier, link, or connection in the Network Dashboard, right-click the network element and select **View Metrics**. The top-left chart in the dashboard shows the overall network or network/application performance of the element. To troubleshoot the element, search for correlations between the performance chart (top left) and the other charts on the page.

> **Tip**
>
> To best highlight metric spikes and variations, you can switch between the linear and logarithmic scale in each chart. Click the **settings** button (top-right corner of the chart) to switch between scales.



Right-Click Chart Descriptions

Chart	Description	Default Monitoring Mode
Network Impact on Transactions (Tiers)	This chart highlights the possible impact of Performance Impacting Events on the app-transaction outliers (Transaction Errors and Slow, Very Slow, and Stalled Calls shown in the Transaction Scorecard). If you see spikes in transaction outliers and correlated spikes in PIE or errors, this indicates that the network is affecting application performance. Search for correlated spikes in the other charts to identify specific issues and root causes: connection errors, packet loss, re-transmissions, high-latency connections, and so on.	KPI
Host Stack KPIs	Interface errors indicate issues on the node's physical interfaces. See Interface Metrics. TCP Wait sockets can result in significant delays or errors for the application, or service, that relies on that socket. Many simultaneous WAIT sockets can prevent applications and services from creating new connections.	KPI
Network PIE - Contributors	Use Performance Impacting Elements (PIE) to identify the location of actual or potential bottlenecks: • Client Limited and Client Zero Window events indicate a possible problem on the client node • RTOs indicate a possible problem on the network path between two nodes • Server Limited and Server Zero Window events indicate a possible problem on the server node	KPI
Network Errors - Contributors	Use this chart to identify network errors that can affect application performance: • FIN Errors – Errors when tearing down a TCP connection • Syn Blackholes - Connection attempts that went unanswered and resulted in a failure • Syn Resets – Connection attempts that were explicitly refused by the other host • RST on Established - TCP connection resets	KPI
Throughput	Traffic throughput for the application of interest on the network element. This chart measures application payload data only; TCP, IP, and other packet headers are excluded.	KPI

Connection Rate Info	Spikes in this chart, that coincide with spikes in slows calls or applications errors, indicate a possible issue with how the application is using TCP.
	
	• New Connections – Number of new connection attempts
	• Connection Errors – The rate of TCP connection setup (SYN) errors and connection teardown (FIN) errors
	• RSTs (resets) – A TCP reset is an immediate closing of a connection. Not all connection resets indicate a problem, but you should investigate any spike in resets that coincides with a spike in application errors or slow transactions /calls. Connection resets can occur for various reasons, such as:
	  • Inability to create connections by the server
	  • Intermediate network elements, such as load balancers, firewalls, and so on, due to misconfiguration or other errors
	• Current Established Connections
		KPI

TCP Loss (mille)	The number of packets lost (sent but not received) per 1000 packets sent. "Per mille" is a percentage with one additional digit of precision. TCP detects lost packets and retransmits each lost packet until it receives an ACK (acknowledgment) from the peer. Spikes in TCP Loss indicate that the network is over utilized.	KPI
Retransmissions per Minute	• Data Retransmits – The percentage of packets that were retransmitted. This metric includes SYN and FIN retransmissions • SACK Retransmits – The percentage of data packets that were retransmitted due to selective acknowledgments (SACK, a TCP Feature)	KPI
Latency (RTT) Comparison	This chart compares the average TCP round-trip times (RTTs) for different types of packet request and responses. • Handshake RTT – Average RTT for the initial 3-way handshake (SYN, SYN/ACK, ACK) to set up a connection. If Handshake RTTs are significantly higher than Initial RTTs, this indicates that the client node is taking a long time to set up the connection. • Initial RTT – Average RTT for the initial SYN packets (between SYN and SYN-ACK or SYN-ACK and ACK). If Initial RTTs are high, the delay may be due to an intervening firewall, asymmetric routing, or other network issues that causes the network to treat SYN packets differently from data packets. • RTT – Average TCP RTT for data request/responses—Time for TCP Data segments to be transmitted and acknowledged from the peer. This is different from Application Response Time metrics that measure the time an application takes to process a request.	KPI
Connection Lifetime	TCP is most efficient when using long, stable connections. Connection setups and teardowns are very time-consuming and resource-intensive. The more short-term connections are generated, the worse TCP performance will be because most of the time is spent creating connections and because "Slow-Start" in TCP optimal TCP bandwidth is not achieved.	KPI

Node Metrics in Network Dashboard and Metric Browser

The Network Agent collects various TCP socket metrics at the host level for the local node on which it is installed. Use these metrics to monitor the TCP stack health, collisions, and errors on all the physical interfaces, and CPU consumption of the Network Agent.

TCP Socket Metrics in the Network Dashboard

These metrics measure the overall TCP socket health of an individual node. To view these metrics, select a node: access the Network Dashboard, click a tier, select the Nodes tab, and select the node of interest. The TCP Socket metrics for the selected node appear on the right side of the dashboard.

Metric	Description	Default Monitoring Mode
Established	The number of sockets that are in the established state	KPI
Embryonic	The number of sockets that are in the process of being set up	KPI
Wait	The number of sockets that are unavailable for new connections because they are in the process of being closed. When a socket sends a Connection Close (FIN) message, the socket goes through three states: 1. FIN_WAIT1 – Socket has sent the FIN and is waiting for an ACK from the remote socket 2. FIN_WAIT2 – Socket receives ACK, and waits for FIN (final connection close) from the remote socket 3. TIME_WAIT – The socket remains open to handle any packets for the TCP connection that might still be in the network. The TIME_WAIT state can last from one to four minutes, depending on the implementation. A WAIT socket can result in significant delays or errors for the application, or service, that relies on that socket. Many simultaneous WAIT sockets can prevent applications and services from creating new connections.	KPI
Time Wait	The FIN_WAIT states are relatively short (in milliseconds), while the TIME_WAIT state is relatively long (one to four minutes). As a result, the Wait and Time Wait metrics should be fairly similar. Significant differences indicate a significant network or other delays between the selected node and another host.	KPI

Interface Metrics in the Metric Browser

These metrics measure the number of collisions and errors on the physical interfaces of the node. To view these metrics, drill down in the Metric Browser by selecting:

Application Infrastructure Performance > <*tier-name*> **> Individual Nodes >** <*node-name*> **> Host > Interface**

Metric Name	Description / Notes	Monitoring Mode
# **Collisions**	Number of collision errors seen on all the interfaces, when an interface was blocked from sending a frame due to an Ethernet collision detection	KPI
# **Receive Drops**	Number of packets dropped while receiving by all interfaces on the host	KPI
# **Receive Errors**	Number of collision errors seen on all the interfaces, when an interface could not receive a frame due to a physical problem on the interface or the connected cable	KPI
# **Transmit Drops**	Number of packets dropped while transmitting by all interfaces on the host	KPI
# **Transmit Errors**	Number of collision errors seen on all the interfaces, when an interface could not send a frame due to a physical problem on the interface or the connected cable	KPI
# **Total Errors**	The total number of Ethernet or physical errors detected on the interface	KPI

TCP Connection Metrics in Metric Browser

Network Visibility Agents can calculate an extensive set of metrics based on the TCP flows observed by the Network Agents. In addition to KPI, PIE, and Troubleshooting metrics, you can view advanced metrics for network elements of interest (tiers, nodes, links, and connections) in the Metric Browser. Using time-based charts, you can detect and analyze these behavior traits:

- TCP flow setup/teardown times and errors
- Distribution of TCP flows for an element by throughput, setup time, lifetime, and round-trip time
- Flows closed by TCP resets
- Distribution of flows based on TCP configuration options (Selective Acknowledgement, Timestamp)

- For these metrics, the Metric Browser uses the terms *Connection* and *Flow* interchangeably. See Flows, Links, and Connections.
- Network Agents do not collect metrics for individual Connections by default. The recommended workflow is to enable TCP Flow metric collection only when you need to diagnose a performance issue on an associated node or Connection. See Dynamic Monitoring Mode and Network Visibility.

Viewing TCP Flow Metrics

To view advanced network metrics, open the Metric Browser and navigate to Application Infrastructure Performance. The Metric Browser shows connection /flow metrics for the following aggregations (highlighted in red):

- **Application Infrastructure Performance >**
  - **Advanced Network >**
    - **Flows >**
      - **All Connections/Flows for Application**
  - *tier-name*
    - **Advanced Network >**
      - **Flows >**
        - **Call from** <*tier*> **to** <*service*>
          - **Call from** <*node*> **to** <*node-or-service*>
            - **Individual Connection/Flow** (<*node*> to <*service*>)
          - **All Connections/Flows for Network Link** (<*tier*> to <*service*>)
        - **All Connections/Flows for tier**

TCP Flow Metric Descriptions

Metric Name	Description and Notes	Default Monitoring Mode
# Client Limited	The number of TCP window updates sent by a client node indicating that it is receiving data at a faster rate than the application can process	KPI
# Client Zero Window	If a client's TCP buffer is full, it sends Zero as the TCP receive window size to indicate that it cannot receive more data. The data transfer then stops until the client can process the data in its buffer. A high rate of Client TCP Zero Window messages indicates a problem with either: • The TCP configuration on the node, or • The client-side application using that flow	KPI
# Connection Errors	The sum of Syn Resets + Syn Blackholes + TCP Resets - Established	KPI
# Connection Requests	The total number of connection requests (successful and unsuccessful) sent during the selected time window	KPI
# Current Established Connections	The number of established (setup) flows/connections	KPI
# Data Retransmits	Number of TCP data packets that were retransmitted for all TCP Connections	KPI

# Delayed Acks (Data Piggy Back)	The average number of times a receiving node sent an ACK (acknowledgment) by "piggybacking" the ACK onto another message	Advanced
# Delayed Acks (Timeouts)	The average number of times a receiving node sent an ACK (acknowledgment) because the Delayed ACK timer expired This is a "worst-case" delay for the Delayed ACK algorithm and occurs most often when Nagle's algorithm and Delayed ACK are enabled on the sending and receiving node, respectively. A high rate of delayed ACKs may contribute significantly to the average Latency on a Connection.	Advanced
# Errors	The number of TCP messages sent indicating an error in setting up the connection (SYN errors), or tearing down the connection (FIN errors)	KPI
# Fin Errors	The number of errors generated while tearing down the connections (TCP FIN errors). Many connections in FIN wait states can cause delays in creating new connections.	KPI
# Flows (<1KB) # Flows (1k - 10k) # Flows (10k - 100k) # Flows (100k-1MB) # Flows (1MB - 10MB) # Flows (>10MB)	Use these metrics to analyze the distribution of flows by throughput	Advanced
# Flows - Handshake (1SD) # Flows - Handshake (2SD) # Flows - Handshake (3SD)	The number of TCP flows with connection-setup times that are 1, 2, or 3 Standard Deviations outside (higher or lower than) the average for that connection group Under ideal conditions, all flows should be within 1SD of the average	Advanced
# Flows - Lifetime (1SD) # Flows - Lifetime (2SD) # Flows - Lifetime (3SD)	The number of TCP flows with lifetimes that are 1, 2, or 3 Standard Deviations outside (higher or lower than) the average. Under ideal conditions, all flows should be within 1SD of the average. 2SD or 3SD flows indicate inconsistent flow treatment along the network path. These inconsistencies can occur when a network service decreases the available bandwidth intentionally (*bandwidth throttling*) or prioritizes some types of traffic over others (*traffic shaping*). Short-lived connections, even if they are intermittent, may indicate an issue worth investigating. The more short-lived connections get generated, the more resources are spent setting up and tearing down these connections.	Advanced

# Flows - RTT (1SD) # Flows - RTT (2SD) # Flows - RTT (3SD)	Number of flows whose Round Trip Times are 1, 2, or 3 Standard Deviations higher than the average for all flows in the parent group. Under ideal conditions, all flows should be within 1SD of the average. High-RTT connections, even if they are intermittent, may indicate an issue worth investigating. If the average response time for an eCommerce web app is two seconds (acceptable), but 5% of transactions are 20 seconds or higher (not acceptable), this can result in a significant number of unhappy customers and lost revenue.	Advanced
# Flows - TCP Data Rxmt	Number of flows within which any packet was retransmitted. Retransmissions are an indication of packet loss.	Advanced
# Flows - TCP Resets	The average number of flows that were closed by a TCP Reset	KPI
# Flows - w/o TCP SACK	Number of flows with the TCP Selective Acknowledgment (SACK) option disabled. With SACK enabled, a receiver can send SACK packets to acknowledge receipt of multiple data packets in the case of lost segments. This improves network performance by reducing the number of retransmissions. With SACK disabled, the receiver must resend all the packets after the last lost segment, even if they were received by the peer.	Advanced
# Flows - w/o TCP Timestamp	Number of flows with the TCP Timestamp option disabled. Use this option to calculate more accurate Round Trip Times.	Advanced
# IP Fragment Count	The total number of IP fragments attributes to this TCP connection group. A high level of fragmentation indicates network issues which can severely affect application performance.	KPI
# Loss Pkts	The total number of packets that were lost (sent but never received)	Advanced
# Nagle Delays	The number of times a message-send event was delayed because the sending node had to wait for previously-sent data to be acknowledged (ACK'd). This occurs most often when Nagle's algorithm and Delayed ACK are enabled on the sending and receiving node, respectively.	Advanced
# PIE Events	Use Performance Impacting Elements (PIE) to identify the location of actual or potential bottlenecks: • Client Limited and Client Zero Window events indicate a possible problem on the client node • RTOs indicate a possible problem on the network path between two nodes • Server Limited and Server Zero Window events indicate a possible problem on the server node	KPI
# Retransmission Timeouts	Retransmission Timeouts (RTOs) indicate network packet loss which results in retransmission of data when the TCP retransmission timer expires (Timer to make sure data is ACK'ed) • This timer varies from 200ms-3 sec by default (different for each operating systems and their versions) • It causes severe performance degradations because a considerable amount of time is wasted resending lost data • TCP falls back to the "Slow Start" phase impacting the performance even more	KPI
# SACK Retransmits	Average number of packets that were retransmitted due to a SACK message that indicated an unreceived packet	KPI
# Server Limited	The number of TCP window updates sent by a server node indicating that it is receiving data at a faster rate than the application can process	KPI
# Server Zero Window	If a server's TCP buffer is full, it sends Zero as the TCP receive window size to indicate that it cannot receive more data. The data transfer then stops until the server can process the data in its buffer. A high rate of Server TCP Zero Window messages indicates a problem with either: • The TCP configuration on the node, or • The client-side application using that flow	KPI
# Syn Blackholes	The number of connection attempts that went unanswered and resulted in a failure. Syn blackholes can severely impact application performance.	KPI
# Syn Resets	The number of connection attempts that were explicitly refused by the other host. Syn resets can severely impact application performance.	KPI

# TCP Resets - Established	The average number of times an established TCP flow was reset	KPI
# TCP Resets - Fin	The average number of times a TCP flow was reset while it was in the process of getting closed	KPI
# TTL Changes (1 - 2 hops) # TTL Changes (3 - 4 hops) # TTL Changes (>=5 hops)	The number of routing-hop changes experienced by this connection. Frequent variations in routing-hop changes indicate routing problems in the network and can severely affect app performance. Under ideal conditions, the number of hops should be consistent.	Advanced
Avg # TTL Hops	The average number of routing-hop changes experienced by this connection	Advanced
Delayed Acks Lag (usec)	The average amount of lag that Delayed ACKs are adding to the overall Latency of the Connection	Advanced
Initial RTT (usec)	Round trip time for the initial two SYN packets (between SYN and SYN-ACK, or SYN-ACK and ACK depending upon whether the Agent is running on client or server)	KPI
Latency - RTT (usec)	Average round-trip latency (from packet transmission to acknowledgment) for all packets	KPI
Lifetime (usec)	Average lifetime (from initial setup to final teardown) for TCP sessions in the Connection group	KPI
Loss (per mille)	The number of packets lost per 1000 packets sent. "Per mille" is a percentage with one additional digit of precision.	KPI
Nagle Delays Lag (usec)	The average amount of lag that Nagle delays are adding to the overall Latency of the Connection	Advanced
Pkts per Sec	Average rate of packets sent and received	KPI
Rx Pkts per Sec	Average rate of packets received	Advanced
Rx Throughput (BPS)	Average rate of bytes received	Advanced
TCP Handshake (usec)	Round trip time for the initial three-way connection setup for all flows in the parent group: 1. SYN (client --> server) 2. SYN-ACK (client <-- server) 3. ACK (client --> server)	KPI
Throughput (BPS)	Throughput (bytes per second) for the application of interest on all TCP sessions	KPI
Tx Pkts per Sec	Rate of packets sent	Advanced

Tx Through put (BPS)	Rate of traffic received	Advanced

FAQs for Network Visibility

General

- Why are there no connection metrics for a tier, node, or network link?

By default, Network Agents do not collect connection metrics. The recommended workflow is to identify the link with the network issue and configure the relevant agents to collect metrics for the relevant connections. See Dynamic Monitoring Mode and Network Visibility.

- The Network Agent cannot register with the Controller. What should I do?

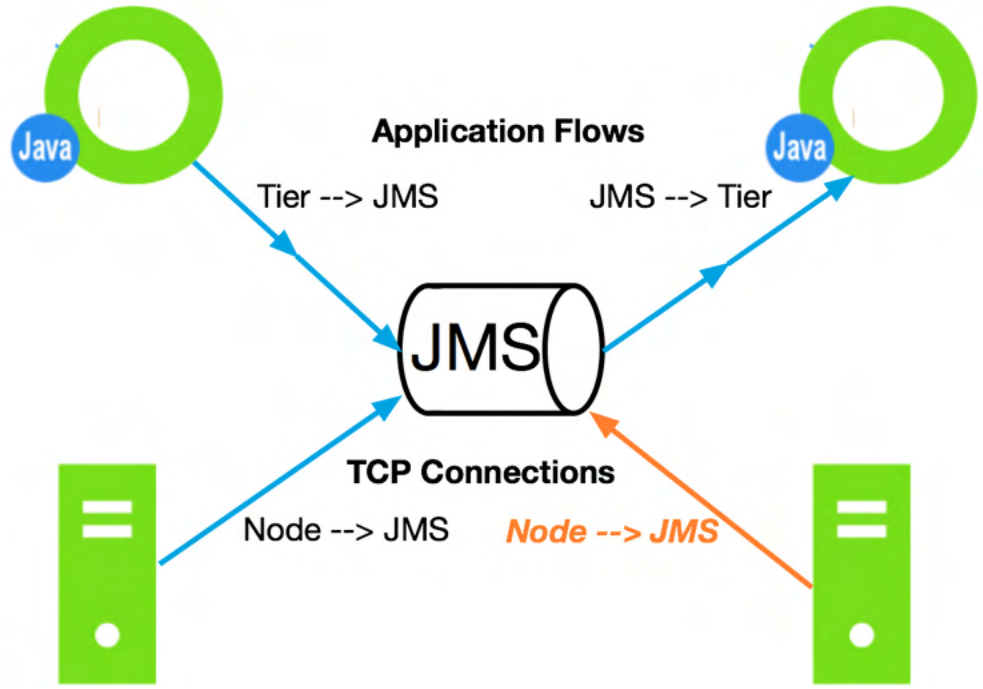
If a Network Agent cannot register with the Controller:

  - Check that the user account has a Network Visibility product license.
  - If the user account has license rules defined, verify that the correct number of license units have been allocated.
  - To change the number of allocated units in a rule:
    - Go to **Controller Settings > License > Rules**.
    - Edit the **License Rule** of interest. (There may be only one License Rule, named **Default**.)
    - In **General**, set the **Allocated Units** field for the Network Visibility license and apply the change.

- In some cases, I see that an application flow for a JMS queue goes in one direction but a TCP connection used by that queue goes in the opposite direction. Why is that?

Typically, the network links and TCP connections used by an application flow have the same direction (source destination) as the flow itself. You may notice different directions, however, if two tiers transfer data through a JMS queue. In some JMS implementations, the individual nodes in each tier initiate the TCP connection to the queue, so the direction is always: node (source) queue (destination).

Some of these connections may be used by an application flow in the opposite direction: queue (source) tier (destination).



- How do I change the Network Agent communications port?

When you start the Network Agent, the `appd_netmon` process spawns the `appd-agent` process. By default, these two processes communicate over TCP port 3892. If this port is already in use, you should see a log message in one or both files. To configure the Network Agent to use a different port:

1. Use the `netstat` command to verify that the new port is not in use.
2. Update the Network Agent:
   a. Use a text editor to open this file: `<network_agent_home>/conf/agent_config.lua`.
   b. Set the `port` option to the new TCP port number (under `webserver_config`).

```
webserver_config = {
   port = <new-port-number>,
   request_timeout = 10000,
   threads = 2,
  }
```

   c. Save the file and restart the Network Agent.

3. Update the App Agent:
    a. Use a text editor to open this file: <*app_agent_home*>/<*version-number*>/external-services/netviz/netviz-service.properties.
    b. Set the `netviz.agent.api.service.port` option to the new TCP port number.
    c. Save the file and restart the App Agent.

- The application I want to monitor uses TCP port 32768 or higher. How do I configure the Network Agent to monitor this port?

1. Use a text editor to open this file: <*network_agent_home*>/conf/agent_config.lua
2. If you plan to monitor any application or service that uses any TCP ports higher than 32767, uncomment the `application_service_ports` block and specify these ports as a comma-separated list in the `ports` option:

    Original:

    ```
    --[[
    application_service_ports = {
    ports = "",
    }
    --]]
    ```

    Edited:

    ```
    application_service_ports = {
    ports = "40000, 41000",
    }
    ```

- How can I replace the `AppDynamicsNetMQ.dll` with another version of NetMQ?

1. Download the `NetMQ.dll` version and its dependencies.
2. ILMerge them into one `dll` file named `AppDynamicsNetMQ.dll`.
3. Include the `AppDynamicsNETMQ.dll` file in the .NET Agent home directory, such as `c:\Program Files\AppDynamics\AppDynamics .NET Agent`.
4. Restart the monitored application.

- Why does running the Dynamic Service increase the DNS resolution time of the application?

If you specify `FQDN/hostname` as a value to define the Network Visibility property `netviz.agent.host.address` in the `netviz-service.properties` file, the Dynamic Service resolves the FQDN/hostname to its respective IP address frequently, resulting in increased resolution time.

To resolve this problem, use IP Address as a value to define the Network Visibility property `netviz.agent.host.address`. Alternately, you can also increase the value of `networkaddress.cache.ttl` depending on your application requirements.

- Are there any additional fully qualified domain name (FQDN) configurations for the `agent_config.lua` file?

```
ip_config = {
expire_interval = 20,
retry_count = 5,
}
```

Refresh Timeout: `expire_interval` defines when an IP in the .NET Agent IP cache needs to be re-resolved for FQDN or flushed if not associated to any flowgroup. The expire interval ranges from 1 to 30 mins (maximum).

Retry Count: `retry_count` defines how many times an IP tried to resolve for FQDN. Every resolution happens after `expire_interval` time. you can update the default value in situations where the DNS record for the IP is created and there is a lot of churn in the IP to FQDN mappings.

Logs

- How do I resolve the error, "`ERROR MsgZmq::Bind: zmq_bind failed: File name too long`"?

This error occurs when the file name is too long. The complete path to the file is included in the file name.

To resolve this error, move the Network Agent to a smaller absolute path.

1. Create a soft (symbolic) link for the longer directory name: `$ ln -s /long/dir/name /short/dir/name`.
2. Go to the short directory: `$ cd /short/dir/name`.
3. Run the install.sh script: `$ sudo ./install.sh`.
4. Change the LD_PRELOAD parameter in application to use the library from the short directory name: `$ LD_PRELOAD=/short/dir/name /lib/appd-netlib.so <command to start app>`.

- Why do I see the error, "`ERROR cw_flowgroup_uri_cb: Failed to write data on connection`"?

This error occurs when the Network Agent supports a large number of AppServer Agents. If this error occurs frequently, restart the Agent using an increased number of thread counts in `webserver_config` in `agent_config.lua` config file.

- Why do I see the error, "`ERROR ip_flowgrp_lookup: flowgrp alloc failed`"?

Connections (`Source IP : Source Port : Destination IP : Destination Port`) in Network Agent are represented as flows. Aggregating these connections on a source port provides flow group, represented as (`Source IP : Destination IP : Destination Port`). The Network Agent can monitor only a certain number of flow groups. This error occurs when the maximum number of flow groups is reached and the Network Agent cannot monitor any new incoming flow groups.

- Why do I see the error, "`DEBUG adns_resolve: ip resolve error: Name or service not known`"?

AppDynamics resolves IP addresses to provide fully qualified domain name (FQDN) information to the Controller for the IP addresses visible in the system. This error occurs when some IP addresses cannot be resolved.

Network Visibility Concepts

The these concepts are central to Network Visibility:

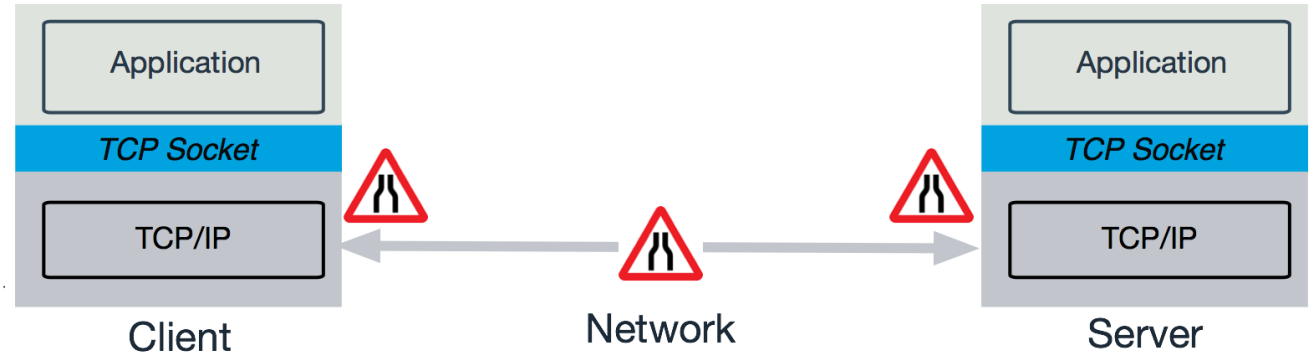
- Network Visibility can identify two types of performance bottlenecks:
  - Network-performance bottlenecks
  - App/Network-interaction bottlenecks (for example, how an application tier or node uses network resources)
- The Network Dashboard shows the network-level view of a monitored application. You can quickly identify network elements with performance issues (red/yellow links or tiers), view Key Performance Indicators for each network element, and troubleshoot individual elements (right-click an element and select **View Metrics**).
- Network Agents can detect load balancers and TCP endpoints, which appear in network flow maps (but not application flow maps), and sometimes function as traffic sources and destinations.
- Network Visibility can collect metrics for individual application flows, TCP connections, and network links.
- To support in-depth troubleshooting, you can configure Network Agents to collect detailed diagnostic metrics for nodes and connections with performance issues.

Identifying Performance Bottlenecks

Performance Bottleneck Categories

Network Visibility can pinpoint performance bottlenecks down to a specific tier, node, or network path. Either of these bottlenecks can slow down an application significantly:

- Application/Network bottlenecks
  Many bottlenecks identified as "network issues" actually have their root cause defined by how an application or a server uses network resources. Network Visibility can detect many different types of app/network bottlenecks, as well as bottlenecks due to TCP socket issues on a specific node.
- Network bottlenecks
  A network bottleneck indicates that a specific section of the network cannot process the application loads between the source and destination nodes. Symptoms of a network bottleneck include a high rate of packet loss or high round-trip times (RTTs) between two nodes.



Load Balancers and TCP Endpoints

You may notice objects in a Network Flow Map that do not show up in an Application Flow Map. This is because these Network Flow Map objects represent devices that are detected by the Network Agents, and are relevant to the monitored application, but the detected devices do not have Network Agents installed.

Load Balancers

Network Visibility detects load balancers (LB) automatically, and displays them in Network Flow Maps. Load balancers seek to optimize the distribution of network traffic and often hide internal IP addresses from external nodes. Application Flow Maps do not show load balancers because these devices do not function as application nodes.

An intermediate load balancer splits an application message into two separate connections: node A connection to a load balancer, and the load balancer connection to node B (node A -> LB, and LB -> node B). This additional layer of detail in the Network Browser makes it easier to identify network segments that have specific performance issues.

TCP Endpoints

The Controller uses TCP endpoints to represent flows where the monitoring vantage point is from one end. The Network Agent monitors the connection between a monitored node and a TCP endpoint. However, the Network Agent cannot determine if this endpoint is on another node, or on an intermediate device (such as a load balancer) that splits the connection in two.

These diagrams show two different views of the same application:

The **Application Dashboard** shows two tiers connecting to two MySQL instances. The Application Flow Map shows application messages between monitored nodes that are directly visible to App Agents.	The **Network Dashboard** shows TCP endpoints on links between tiers and nodes. The Network Flow Map shows Network Agents installed (left) and nodes that the Network Agents cannot see directly (right).	
This example shows how a Network Agent monitors a connection between an Inventory-Tier node (left), and an Inventory Database service. A TCP endpoint divides the link into:

1 A colored line representing the connection visible to the Network agent, and

2 A gray line representing a connection that is not instrumented by Network Visibility. A gray line connection link without Network Visibility indicates one of two things:

- The TCP endpoint and an Inventory Database service are *on the same device* with an intermediate device that splits the connection in two.
- The TCP endpoint and an Inventory Database service are *on two devices* using a separate connection that does not allow for network visibility.

For these reasons, gray line connection links do not have associated metrics.

Flows, Links, and Connections

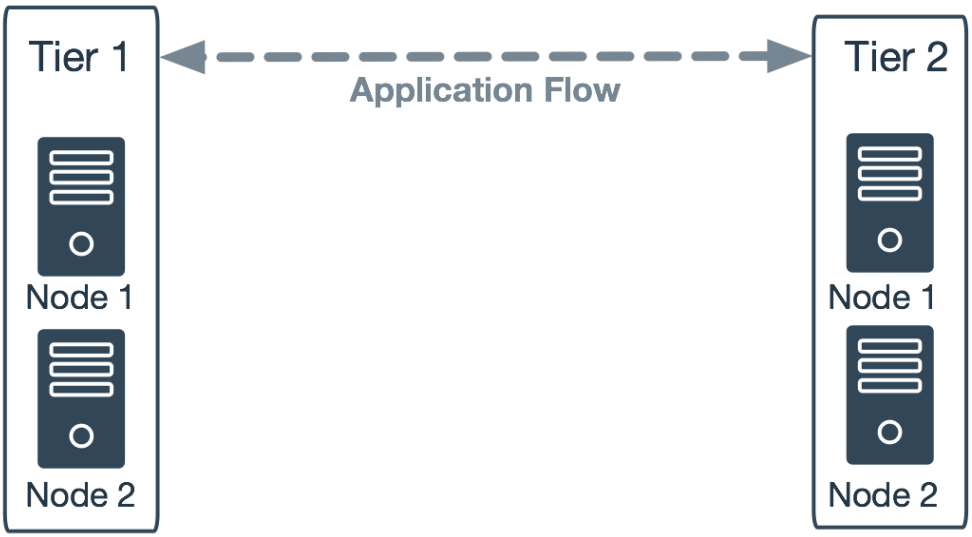
Network Visibility can collect metrics for these object types:

- Network links between tiers, or between tiers and load balancers/TCP endpoints
- Connections between nodes, or between nodes and load balancers/TCP endpoints

Troubleshooting a performance issue in Network Visibility often involves drilling down from an application issue (flow) to a network issue (link) to the root cause (connection). See Workflows and Example Use Cases.

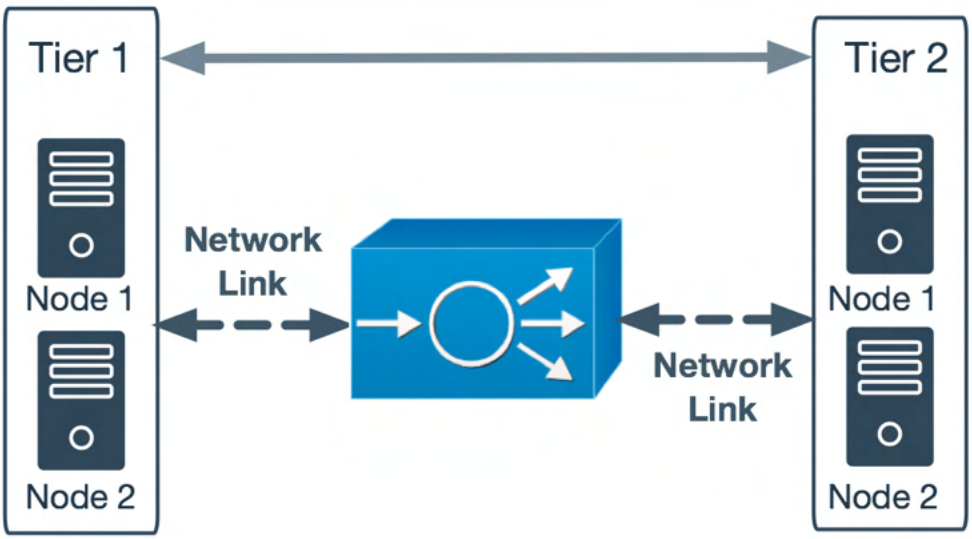
Application Flows

App Agents collect metrics for *application flows* between tiers, as shown in the Application Flow Map. This diagram shows the calls, transactions, and messages for application *x* between tier 1 and tier 2.



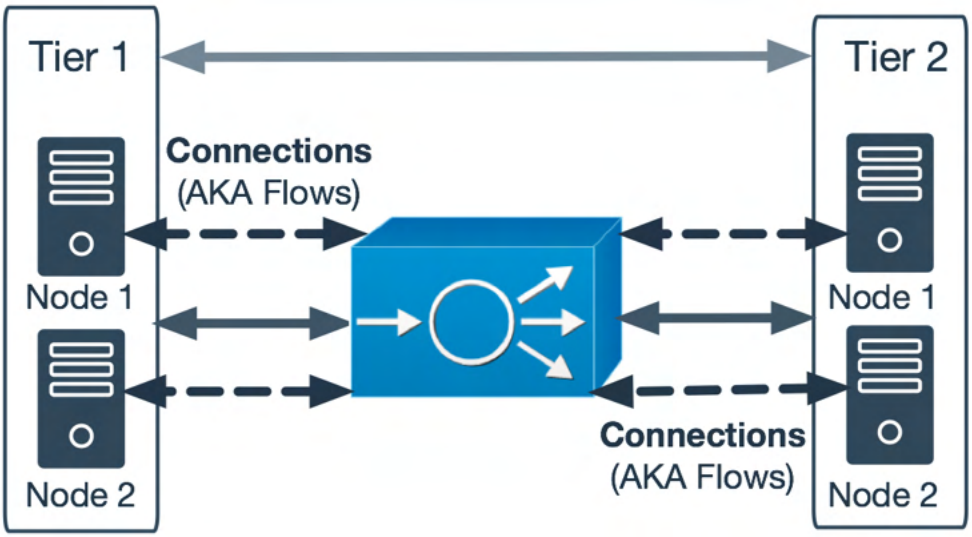
Network Links

Network Agents collect metrics for *network links*, which you can view in the **Network Dashboard**. A network link is the set of all traffic between two tiers, or between a tier and an intermediate load balancer, or TCP endpoint. If an application flow transports traffic through a load balancer, Network Visibility creates a link on each side and calculates metrics for each link. This diagram shows the network traffic for application *x* sent and received by the two tiers through a load balancer.



TCP Connections

Individual nodes send and receive traffic over connections. In Network Visibility, a c*onnection* is a set of all traffic with the same source IP address, destination IP address, destination port, and protocol. This diagram shows the individual connections used by the four nodes to send and receive traffic for application *x* through the load balancer.



Dynamic Monitoring Mode and Network Visibility

Like Server Visibility Agents, Network Agents support Dynamic Monitoring Mode (DMM). Rather than have all Network Agents report all metrics all the time, you can run each Agent in one of three modes:

- KPI Mode – Network KPI metrics for all monitored objects (application flows, tiers, nodes, and network links) except individual connections
- Diagnostic Mode – Network KPI metrics for all monitored objects, including connections
- Advanced Diagnostic Mode – All network metrics for all monitored objects, including connections

Every Network Visibility metric has a default DMM class (KPI, Diagnostic, and Advanced Diagnostic). See Network Visibility Metrics

By default, all Network Agents run in KPI mode. The recommended workflow is to:

1. Run all Network Agents in KPI mode.
2. When you notice a performance issue on a specific node or network link, increase the metric level on the associated Network Agents to Diagnostic, and collect KPI metrics for the connections.
3. Based on the connection KPIs, identify the connections with performance issues.
4. To troubleshoot an individual connection, increase the metric level on the associated Network Agents to Advanced Diagnostic, and collect advanced metrics for the connection.
5. When the issue is resolved, reset the Agents back to KPI mode.

Change the DMM on a Network Agent

1. Click the gear icon () in the top-right corner of the Controller page, select **AppDynamics Agents**, and go to the Network Visibility Agents table.
2. Select the Agents of interest, right-click, and select **Change Dynamic Monitoring Mode**.

The Network Agent retains its DMM setting even if the Agent is stopped and restarted. See Managing Network Agents in the Controller.

Connection Diagnostics and Network Bottlenecks

Network Agents can collect an extensive set of individual connection metrics within a network link. Network Visibility can detect these TCP performance issues:

- The data-receive window is too small (or zero) on the client or the server, which slows down the transfer of data.
- One or more servers are experiencing errors setting up or tearing down the connection for an individual TCP session.
- The client and server take a long time to set up an individual session.
- The application is using many short-lived connections. TCP is most efficient when long, stable connections are used.
- Some TCP sessions have unusually high round-trip times (RTTs). When TCP is performing well, RTTs are stable and determined by the network path between two nodes.

The Network Agent does not collect any connection metrics in KPI mode (the default setting). To diagnose a node or network path that is monitored by an Agent, you can change the Dynamic Monitoring Mode on a Network Agent.

Example Workflow

After you complete the initial setup, you can set the Dynamic Monitoring Mode on individual Network Agents, as needed. This is an example workflow:

- The DevOps team for a large enterprise monitors its IT infrastructure using Network Agents on critical servers. All Agents are initially set to KPI mode.
- The Network Dashboard shows a spike in latency on a network link between tier-A and tier-B.
- A DevOps team member:
    - Sets the Network Agent DMM on the tier-A and tier-B servers to Diagnostic.
    - Collects KPI metrics for the connections between the tier-A and tier-B nodes.
    - Identifies one high-latency connection between nodes TA-N1 and TB-N3, based on the Connection KPIs. The KPIs for all other connections are within acceptable bounds.
    - Sets the Network Agent DMM on TA-N1 and TB-N3 to Advanced Diagnostic, and the DMM on all other Agents to KPI.
    - Notes a set of spikes in Nagle delays on this connection. These spikes correspond to the latency spikes noticed on the network link.
    - Reconfigures TCP on the two nodes, and monitors the connection. The Nagle and latency spikes no longer occur.
    - Resets DMM on the TA-N1 and TB-N3 Agents back to KPI.

Workflows and Example Use Cases

Network Visibility makes it easy to answer the question: *Is the network impacting my application's performance?* This page describes the high-level troubleshooting workflows and includes several examples of how to use these workflows to solve real-world network problems.

Application Troubleshooting

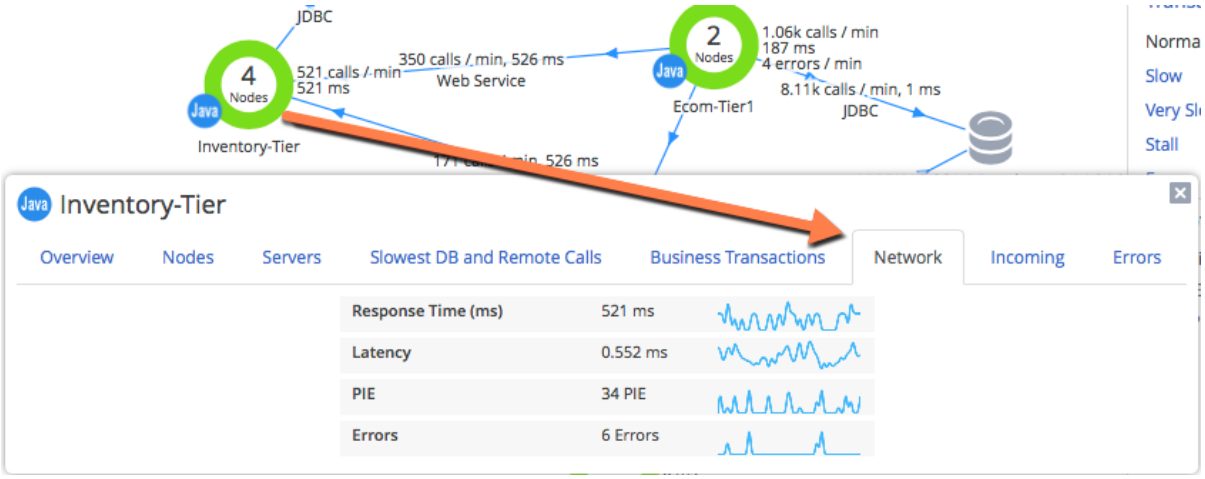
From the Application Dashboard and I see slow, very slow, error, or stalled transactions. Are network conditions to blame?

- Application Dashboard: Are network conditions to blame for the issue?
- Network Dashboard: Which network tiers and links are associated with these network conditions?
- Tier Dashboard: Which network metrics on this tier correlate with my outlier transactions?
- Network Dashboard (Advanced Diagnosis): On which TCP connections are these network issues occurring?

Application Dashboard: Are network conditions to blame for the issue?

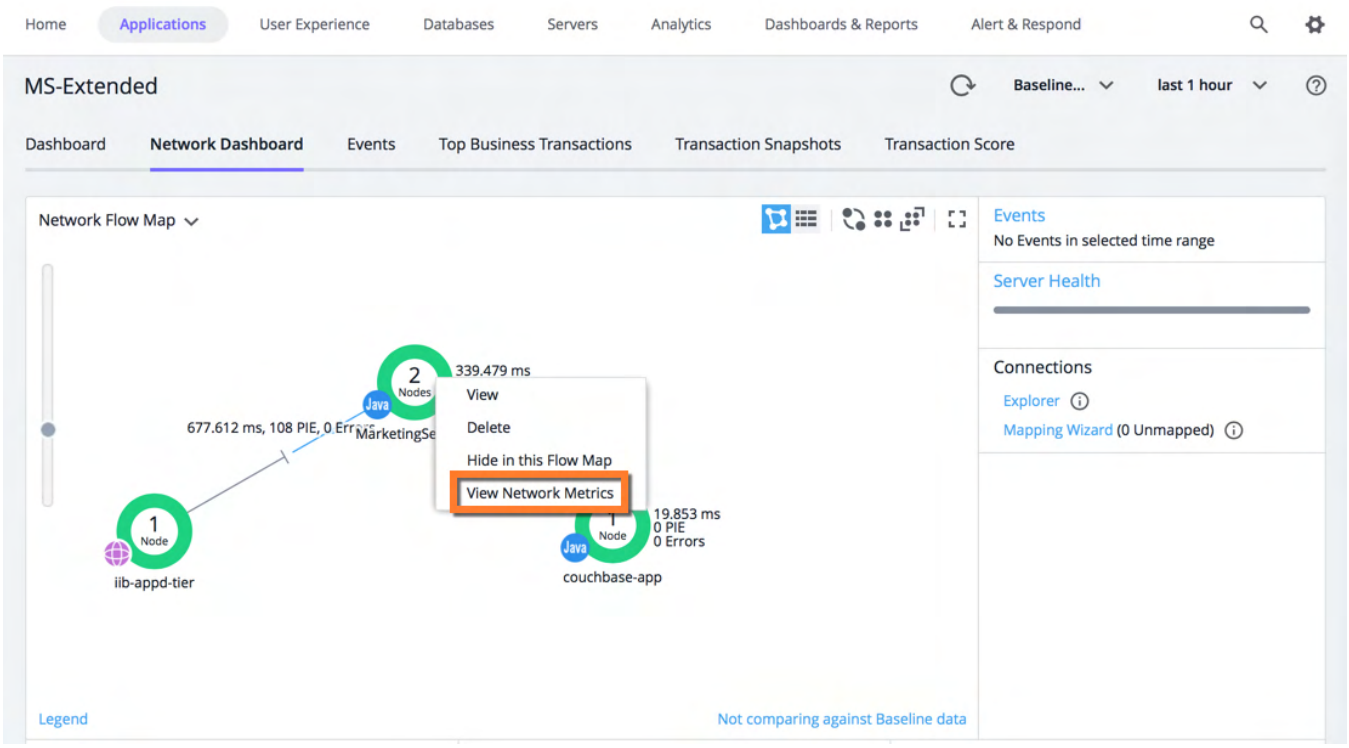
Network Agents collect network-performance metrics for each application tier. If you notice performance issues in the Application Flow Map, open a popup and click Network tab. Do you see correlations between the Response Time and the other charts? If so, it indicates that the Response Time is affected by:

- TCP effects between the two tiers (Latency)
- Performance Impacting Events at the client tier, server tier, or the network path between the tiers (PIE)
- Errors setting up or tearing down TCP connections (Errors)



Network Dashboard: Which network tiers and links are associated with these network conditions?

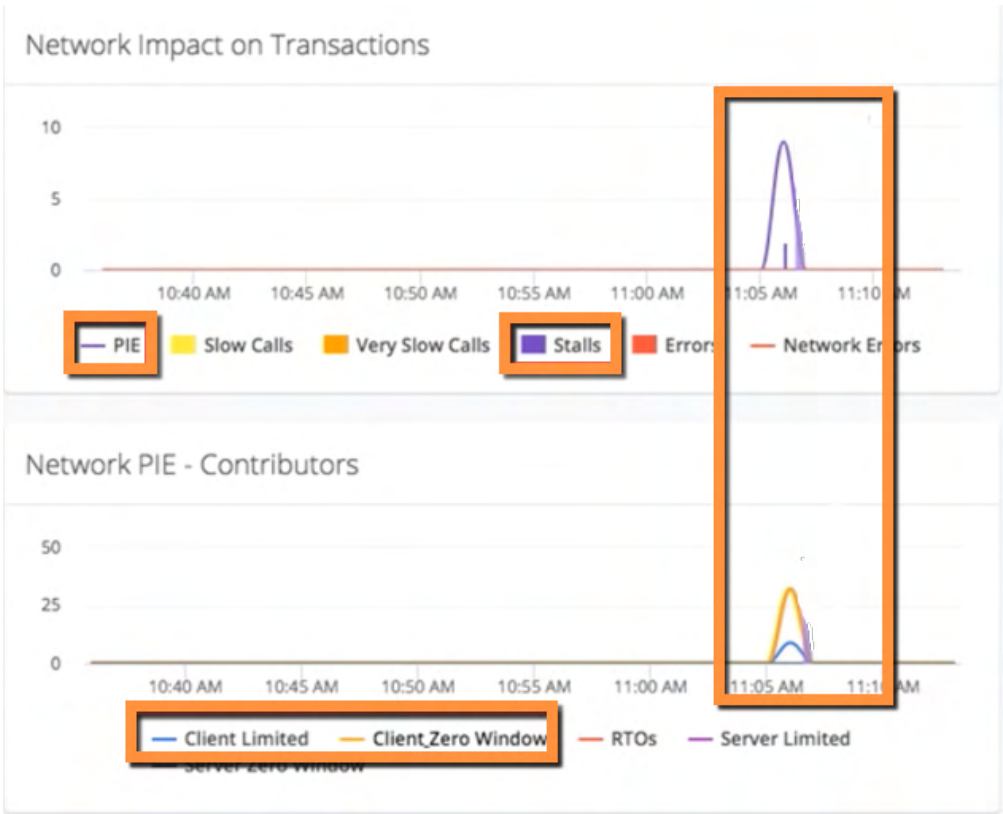
Go to the Network Dashboard, which shows the TCP and network context for the application. Each tier and link has a View Metrics right-click option that opens a context-sensitive dashboard. The dashboard charts make it easy to determine network root causes. Start from the top-left chart in each dashboard, then search for metric correlations in the other charts.



Tier Dashboard: *Which network metrics on this tier correlate with my outlier transactions?*

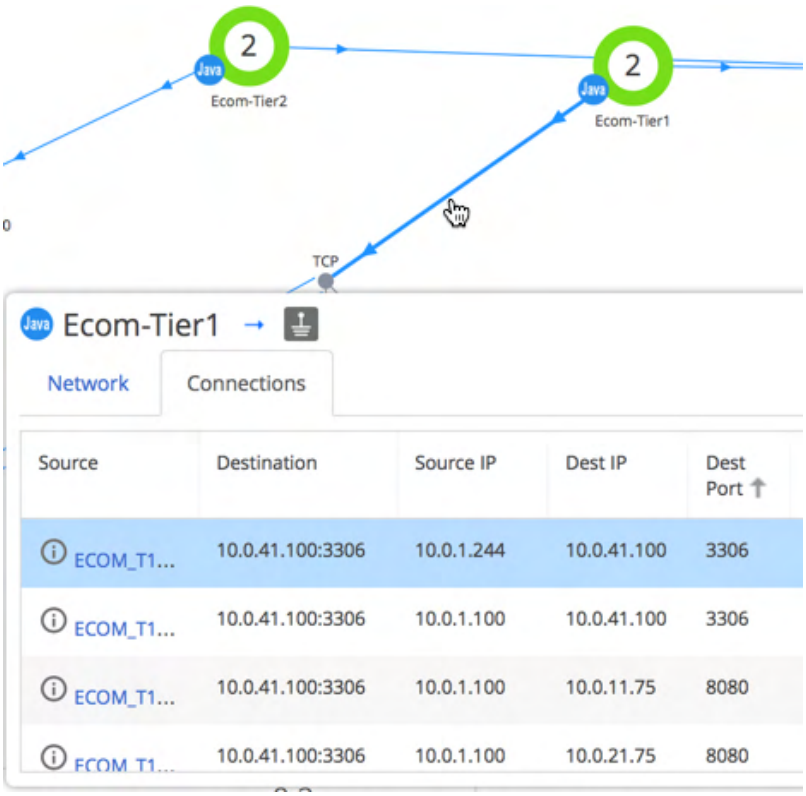
The link and tier dashboards both have a Network Pie - Contributors chart, which answers the question: *Where are these network conditions occurring – on the client tier, server tier, or the network link*?

In this example, the top chart shows that a spike in Stalled transactions is correlated with a spike in PIE (Performance Impacting Events); the bottom chart shows that these events occurred on the client tier. With this information, you can then locate other correlated metrics and identify the issues on the client tier.



Basic Diagnosis

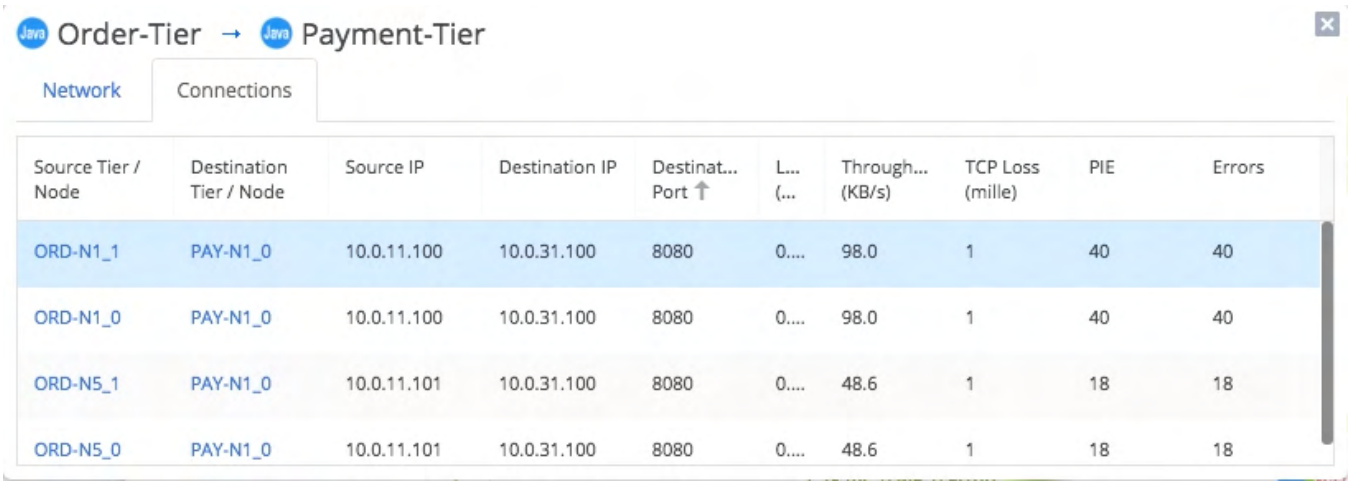
You now have a set of correlated network metrics and associated tiers/links. In many cases, this information is enough to identify and resolve the issue. You can contact your network team and say: *I see the following network issues on tier X, link Y, and so on, and these issues correlate with performance issues in my application.* You can send them a URL to the Network Dashboard and say: *Click on link Y and look at the connections. The issues are happening on one or more of these connections.* This often provides enough information for the networking team to identify and resolve the issue.



Network Dashboard (Advanced Diagnosis): On which TCP connections are these network issues occurring?

If you need to collect more information, you can drill down to the TCP connection(s) where the network conditions are occurring. Click the relevant network link and select **Connections** in the popup. Sort the table based on the KPI metrics for the monitored connections (Throughput, TCP Loss, PIE, Errors). You can then right-click a connection and view metrics in the Metric Browser, or in a context-sensitive dashboard.

> By default, Network Agents do not monitor individual connections. The recommended workflow is to enable connection monitoring only after you narrow an issue down to a specific set of links. See Dynamic Monitoring Mode and Network Visibility



Transaction Diagnosis

I'm troubleshooting a specific outlier (Slow, Very Slow, Error, or Stalled) transaction. Are network conditions to blame?

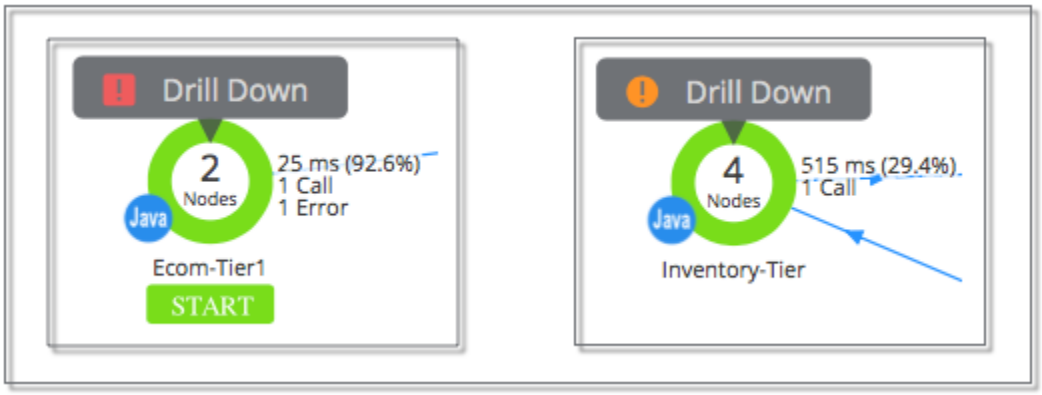
- Transaction Snapshots list: Is the network to blame for a specific slow, stalled, or error transaction?
- Network Dashboard for Transaction Snapshot: Are there any correlations between problematic transactions and network-performance issues around the time of this transaction?

Transaction Snapshots list: Is the network to blame for a specific slow, stalled, or error transaction?

You can diagnose the network performance for an individual transaction in the transaction viewer. Double-click a snapshot in a Transaction Snapshots list.

Transaction Snapshot viewer: Where (at which tier) are the delays, stalls, or errors occurring?

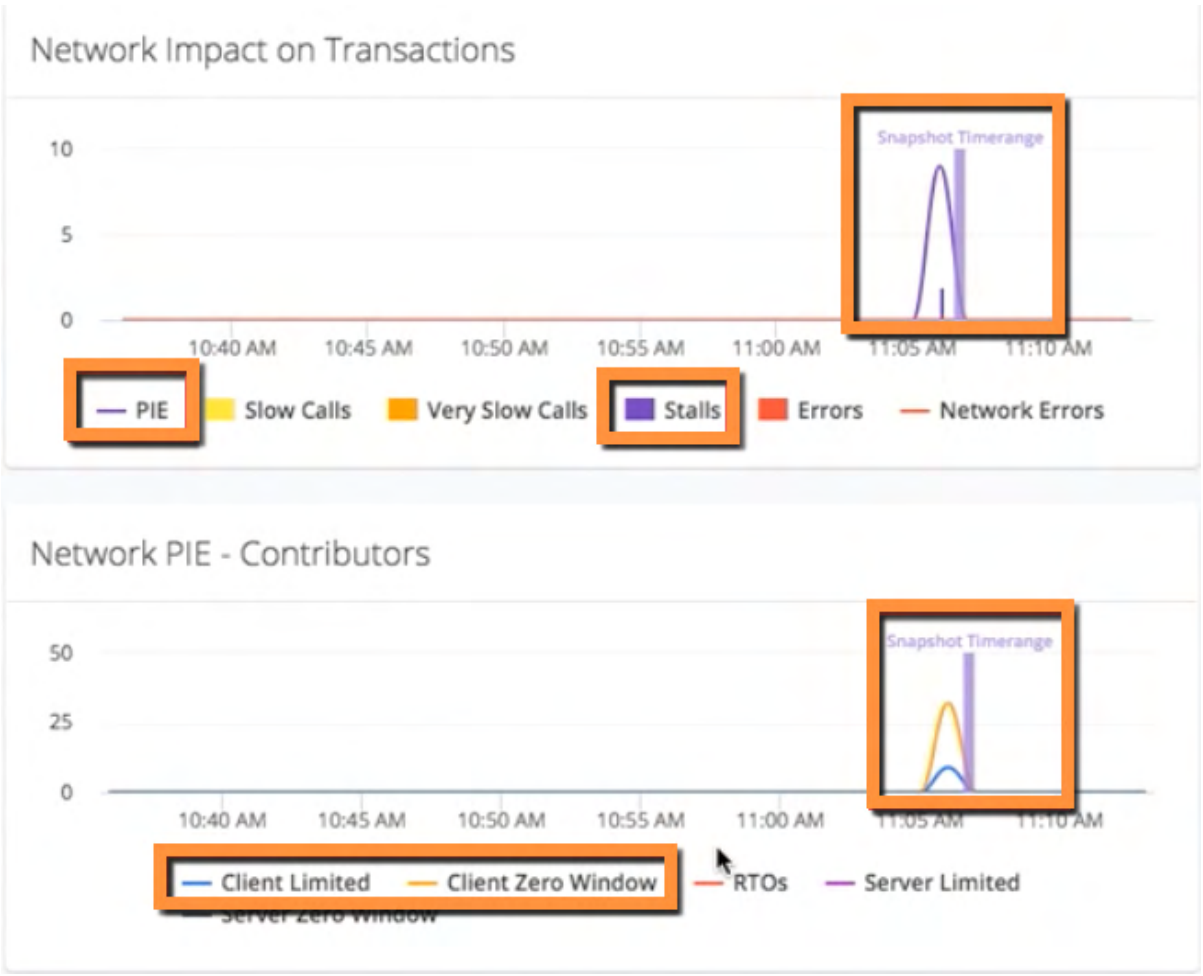
When the Transaction viewer appears, click **Drill Down** on the tier where the delays, stalls, or errors are occurring.



In the Tier Overview tab, click **Network**.

Network Dashboard for Transaction Snapshot: Are there any correlations between problematic transactions and network-performance issues around the time of this transaction?

The transaction dashboard shows the rate of transaction outliers, Performance Impacting Events, and Network Errors when the transaction occurred. Each chart has the Snapshot Time range highlighted. The Network Impact on Transactions chart (top left) highlights any correlations between transaction outliers, Network Errors, and Performance Impacting Events. You can then look for correlations in other charts and drill down to the root cause.



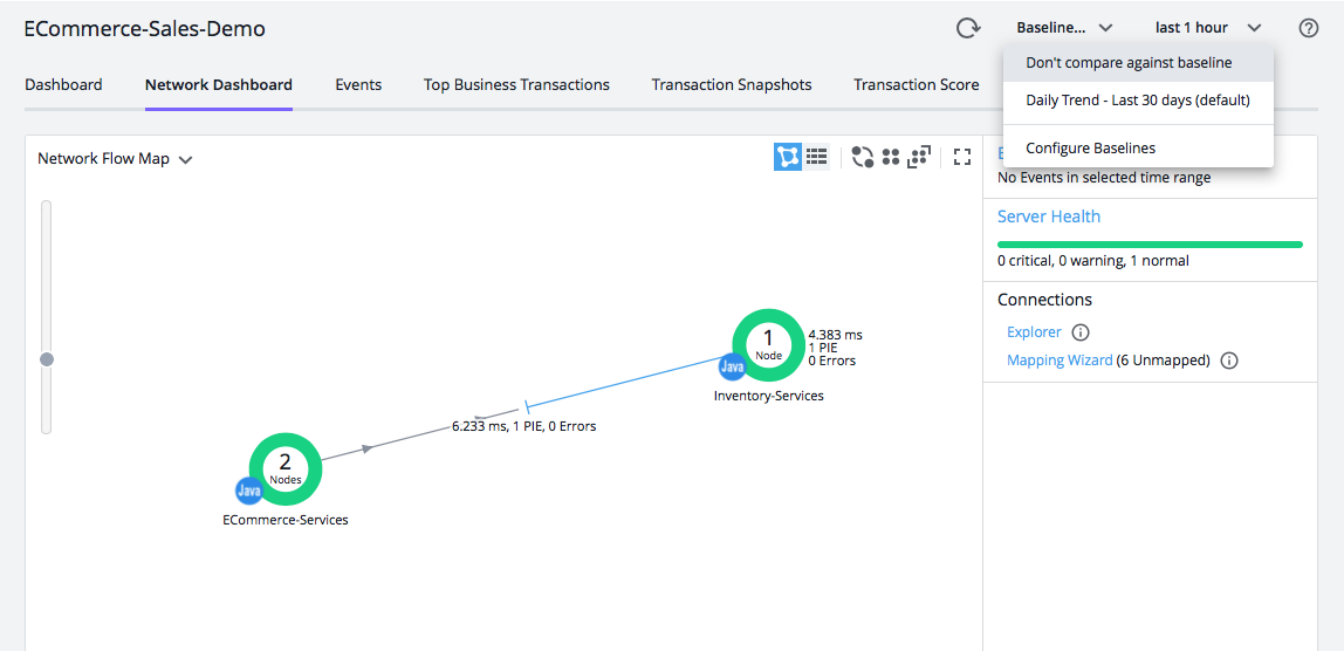
Network Health Check

Currently, I do not see any application issues, however, I would like to monitor my network and identify any potential issues before they start to affect my applications.

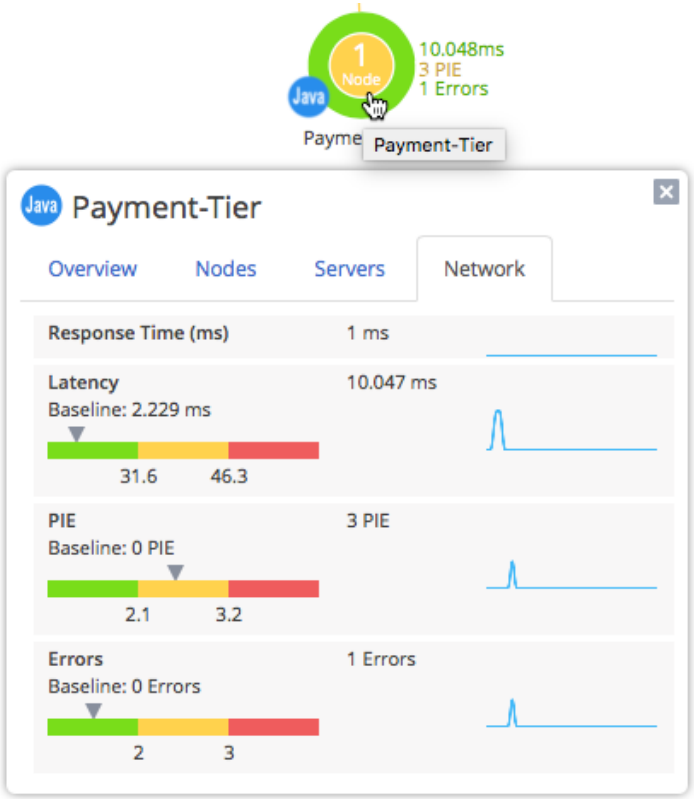
- Network Dashboard: Is any tier or link performing outside its baseline?
- Network Dashboard: Do any network links or connections have significant performance issues?

Network Dashboard: Is any tier or link performing outside its baseline?

To perform a quick network health check, go to the Network Dashboard and enable baselining. Elements with network KPIs that exceed the baseline for that element are colored yellow or red.

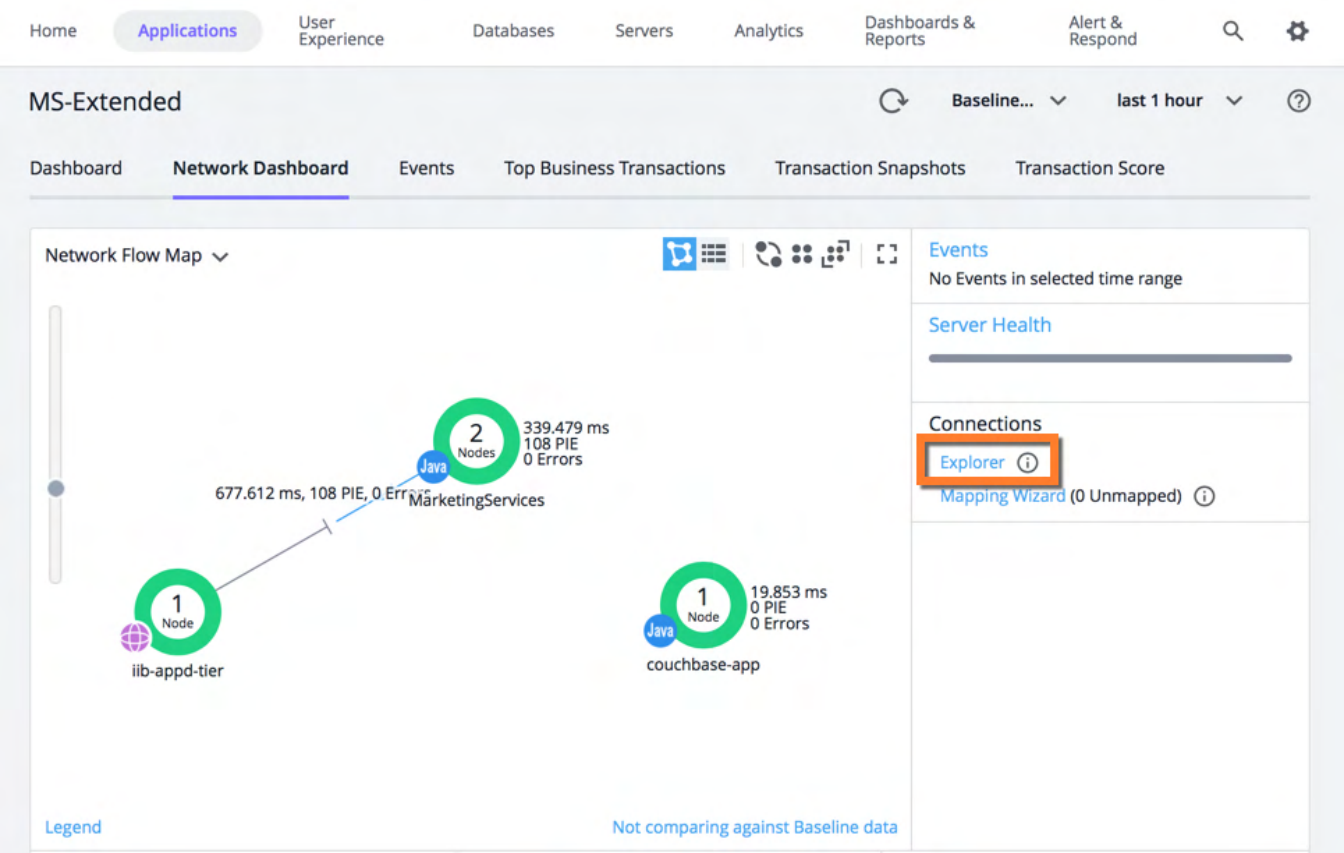


If the network KPIs for a tier or link are outside the performance baseline for that element, you can view baselines and outliers for that element in the Network tab of the popup. If an element has KPI outliers, you can also diagnose that element in a context-sensitive dashboard (right-click and select **View Metrics**).



Network Dashboard: Do any network links or connections have significant performance issues?

To see immediately if any links or connections have performance issues, open the Connections Explorer (click the **Explorer** link to the immediate right of the Network Flow Map). The KPIs of all network links and connections display in one table. You can sort the table based on KPIs or Errors, and expand each network-link to view KPIs for all connections within that link.



Example Use Cases

- Network Congestion - Example Use Case
- Packet Loss - Example Use Case
- TCP Port Exhaustion - Example Use Case
- TCP Window Bottlenecks - Example Use Case
- Traffic Throttling - Example Use Case

Network Congestion - Example Use Case

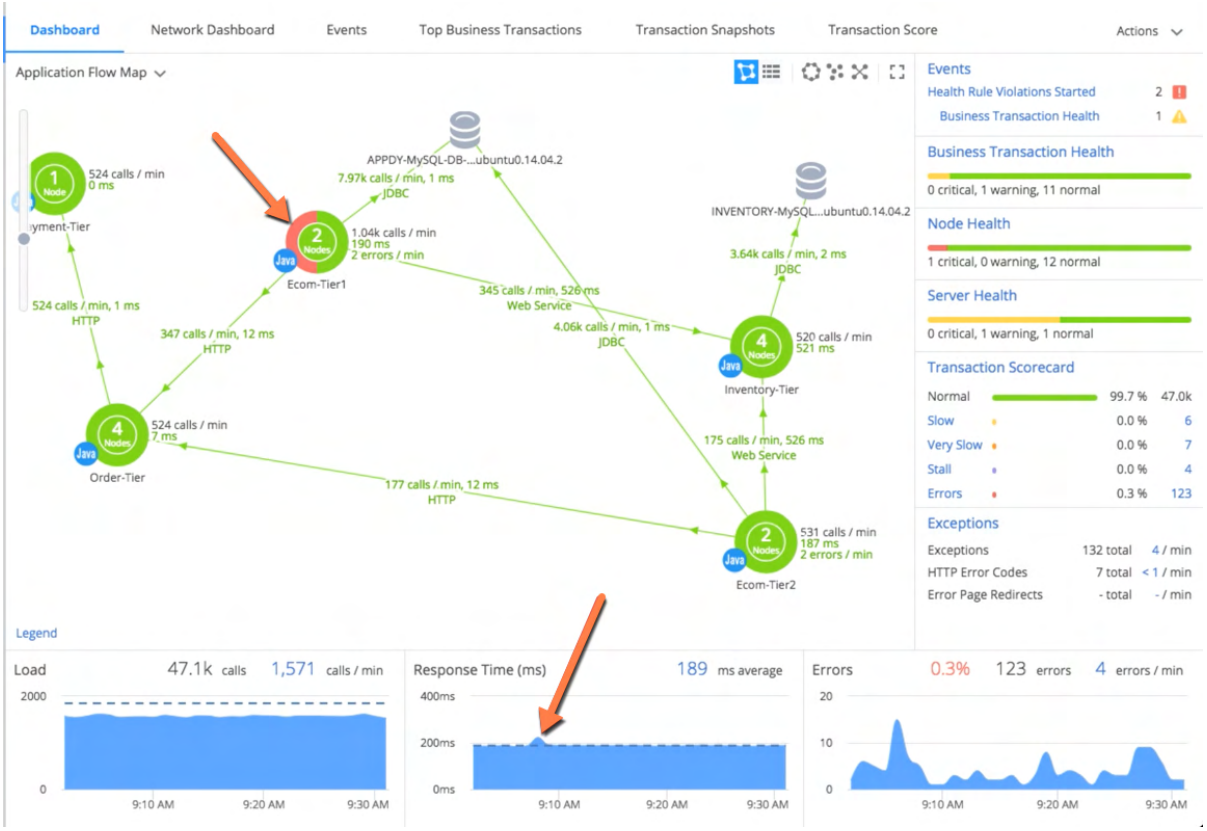
Network congestion may be caused by:

- A user may launch a "bandwidth-hogging" backup job during a period of peak network utilization.
- A server may drop packets at seemingly random intervals due to a TCP misconfiguration.

Traditional monitoring tools such as SNMP are good at detecting persistent network bottlenecks, but often miss intermittent bottlenecks. With Network Visibility, you can easily identify and diagnose intermittent network bottlenecks that affect application performance.

Application Symptoms

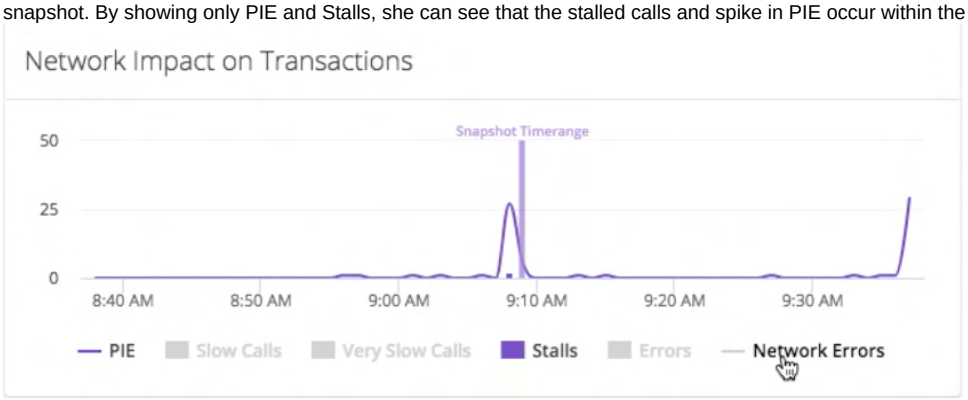
A DevOps engineer is responsible for monitoring a mission-critical app. One day, she opens the Application Dashboard and notices that Ecom-Tier1 has suddenly gone partially red, which indicates performance degradation on one of the nodes in this tier. She also sees a small spike in response times for the overall application. She decides to investigate.



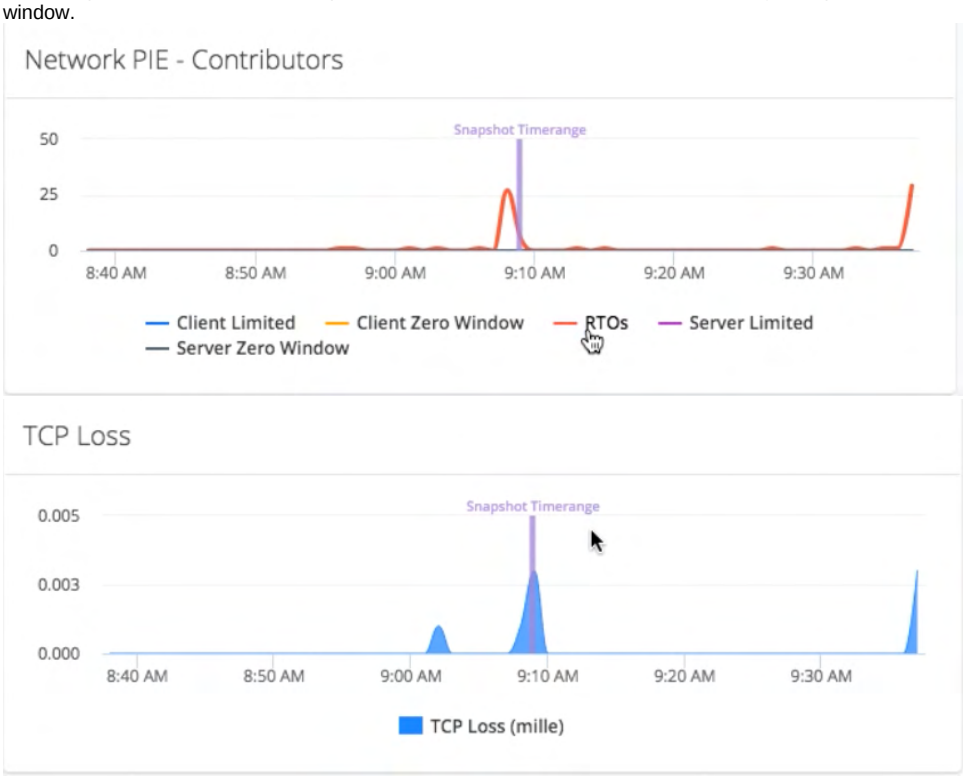
Network Diagnosis

1. To determine if there is a network problem, she:
    a. Goes to the Transaction Snapshots page and filters the list to show only stalled calls.
    b. Double-clicks a specific call to view the transaction flow map. Because it was a stalled call, the entire flow map does not display.
    c. Clicks **Drill Down** to open the Transaction Dashboard, and then switches to the Network tab to analyze the network performance during this call.

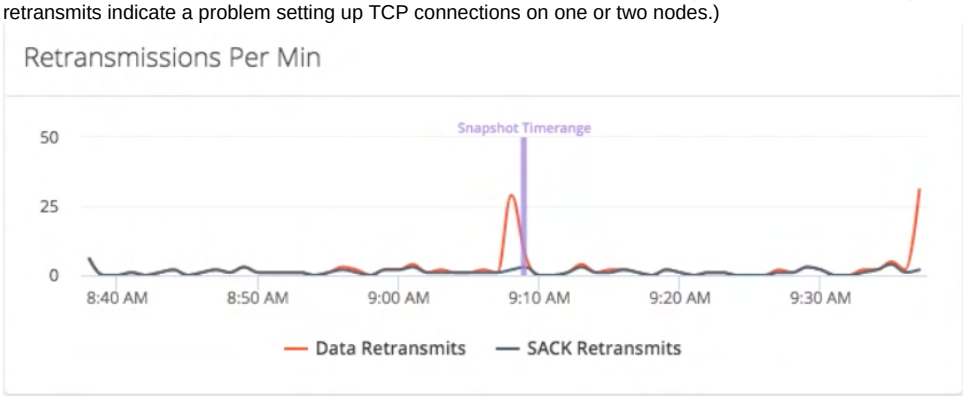
2. The Network Impact on Transactions chart (top left) shows a spike in Performance Impacting Events (PIE) around the time of the transaction snapshot. By showing only PIE and Stalls, she can see that the stalled calls and spike in PIE occur within the same time window.



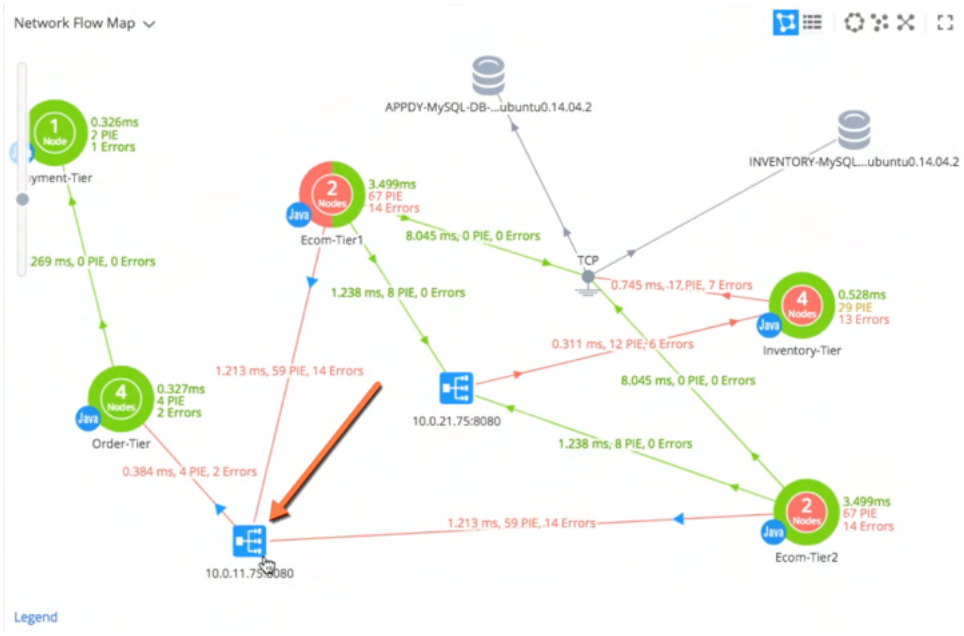
3. In the Network Pie - Contributors chart, she can see that all the Performance Impacting Events are retransmission timeouts (RTOs). This indicates packet loss on the network paths between the two tiers, which is confirmed by the spike in TCP Loss that occurs within the same time window.



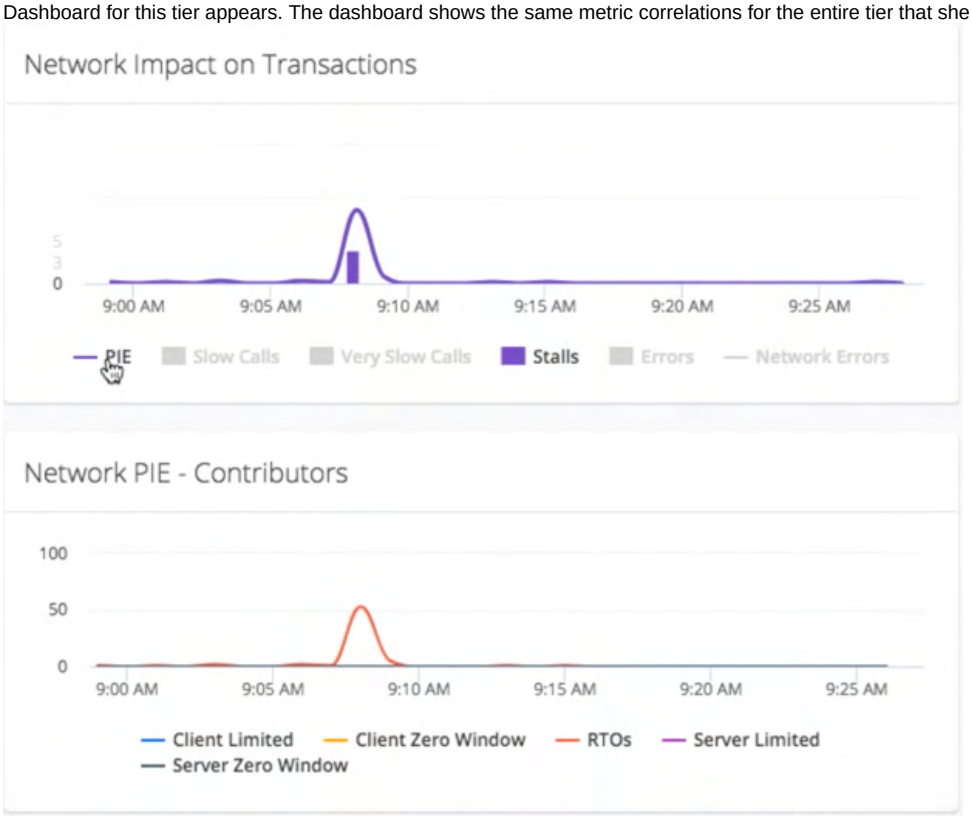
4. She knows there is a correlation between stalled calls and retransmissions, and wants to learn more about these events. The Retransmissions Per Min chart indicates that all these are all data retransmits, which indicate a problem on the network path between two nodes. (SACK retransmits indicate a problem setting up TCP connections on one or two nodes.)



5. In a few seconds, she has identified a chain of correlation: stalled calls > PIE > Retransmissions > Data retransmissions on a network path. The next step is to identify where in the network these retransmissions are occurring. She switches over to the Network Dashboard, and looks for network links with high PIE scores. She sees the PIE scores on two links are 59 (much higher than any other links). Both of these links are used by ECom-Tier1 and Ecom-Tier2 to connect with Order-Tier through a load balancer.



6. Given this information, she decides to investigate one of these tiers. She right-clicks Ecom-Tier1 and selects **View Metrics**. The Dynamic Dashboard for this tier appears. The dashboard shows the same metric correlations for the entire tier that she saw for the individual transaction.



7. Now that she has confirmed that data retransmissions are spiking for the entire tier, she wants to identify the TCP connections on which these events are occurring. She clicks the network link between Ecom-Tier and the load balancer. She can see that that PIE is occurring on both connections:
   ECOM_T1N1:8080 < – > Load_Balancer_10.0.11.77:8080
   ECOM_T1N2:8080 < – > Load_Balancer_10.0.11.77:8080
8. Given this information, she contacts the network-management team in her organization and says: "I can see that there was intermittent loss from 9:07-9:10 AM on the following TCP connections, and that these correlate with a spike in stalled calls." The network team can now investigate the network paths used by these connections and determine if the problem exists on the load balancer or elsewhere.

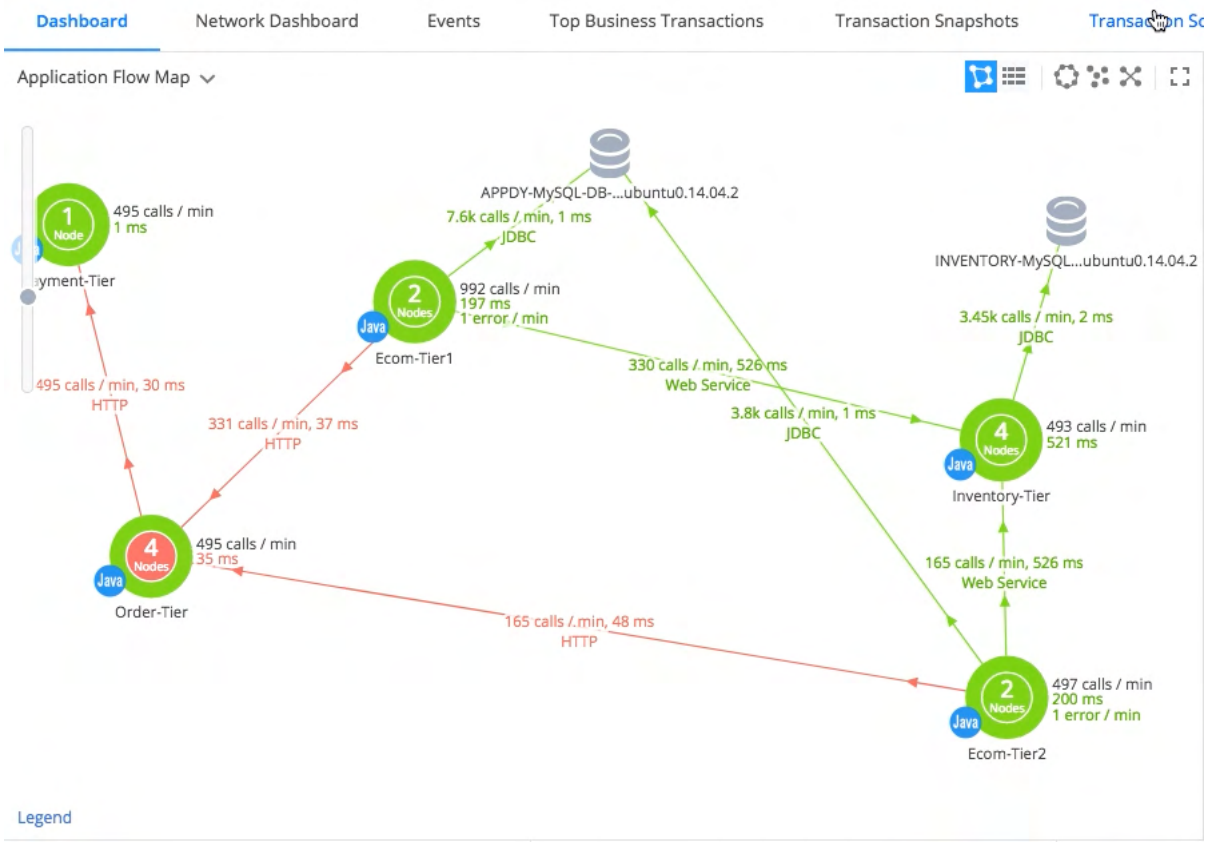
Packet Loss - Example Use Case

In some cases, packet loss can occur on a server or intermediate device. The problem may be hardware-related; perhaps the device simply cannot handle peak traffic loads, or there may be faulty cabling on one or more network interfaces.

The problem may be software-related; a bug or misconfiguration that results in intermittent packet loss at seemingly random intervals. When packet loss affects application performance, you can use Network Visibility to pinpoint the nodes, devices, and TCP connections where the packets are getting dropped.

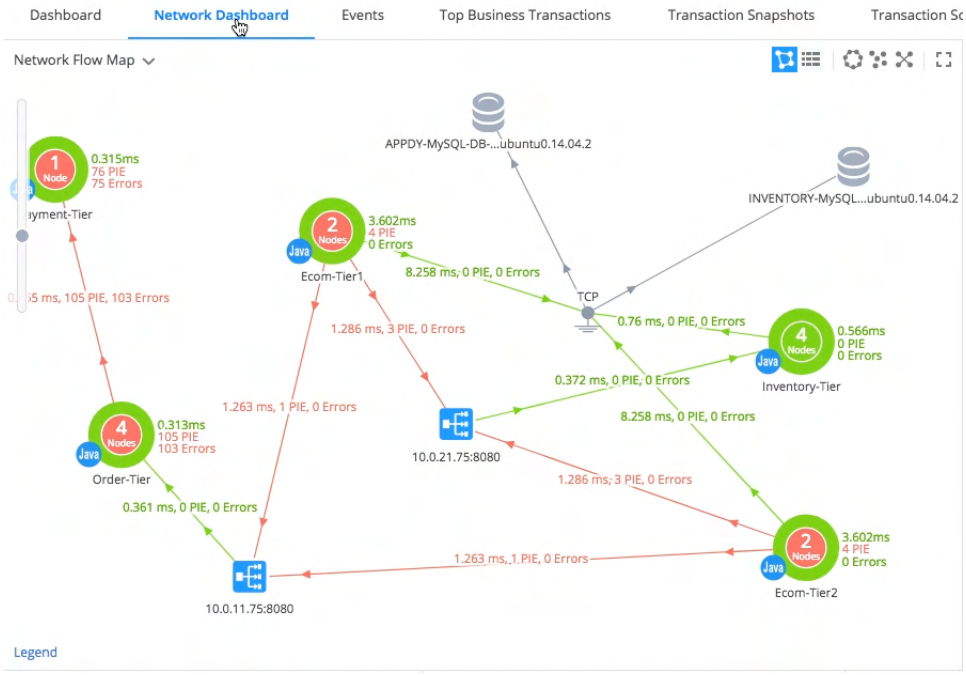
Application Symptoms

A DevOps engineer is responsible for monitoring the performance of a mission-critical app. She opens the **Application** Dashboard notices that the Order-Tier, and the application flows to and from this tier, have suddenly turned red. She decides to investigate.

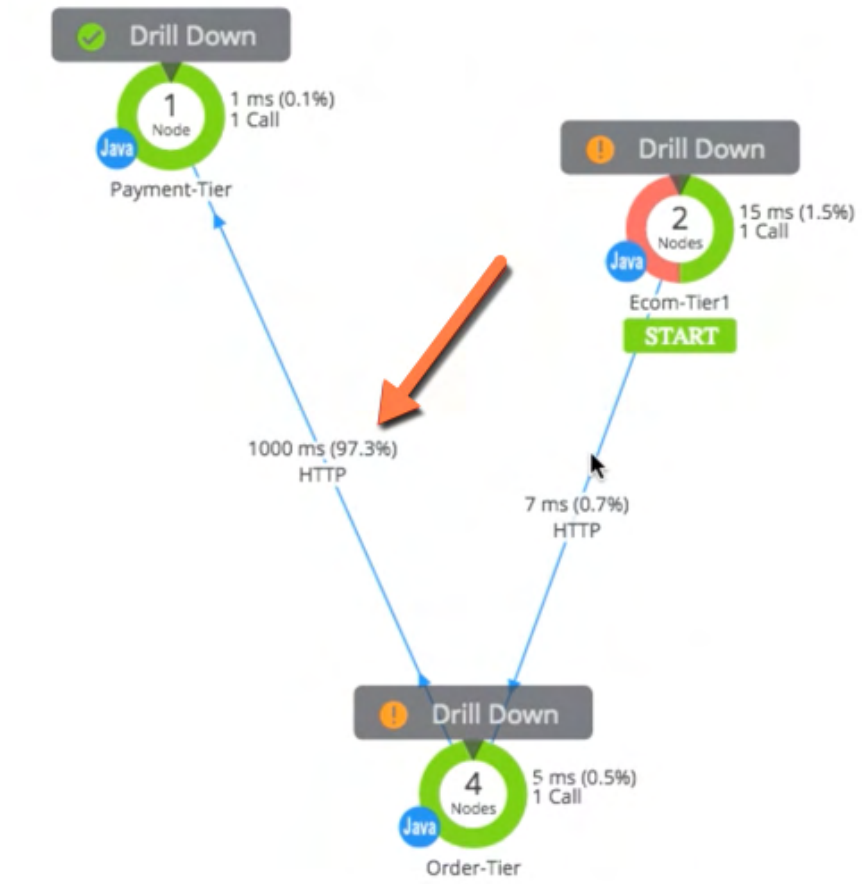


Network Diagnosis

1. She switches over to the **Network** Dashboard and sees that the Order-Tier and Payment-Tier, and the network link between them, show a spike in PIE and network errors.

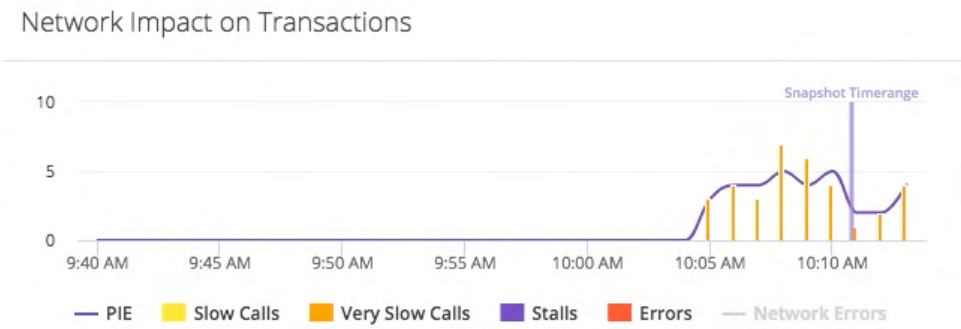


2. She decides to analyze an individual transaction. She goes to the **Transaction Snapshots** page and double-clicks a Very Slow transaction. The **T ransaction Overview** shows that 97% of the delay is on the link between Order-Tier and Payment-Tier. She drills down into the Order-Tier and goes to the Network tab.

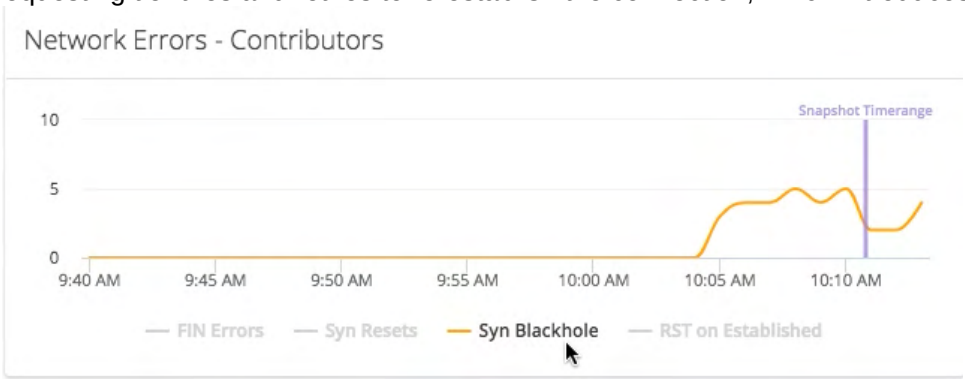


3. Scanning the dashboard for this transaction, she sees immediately that:

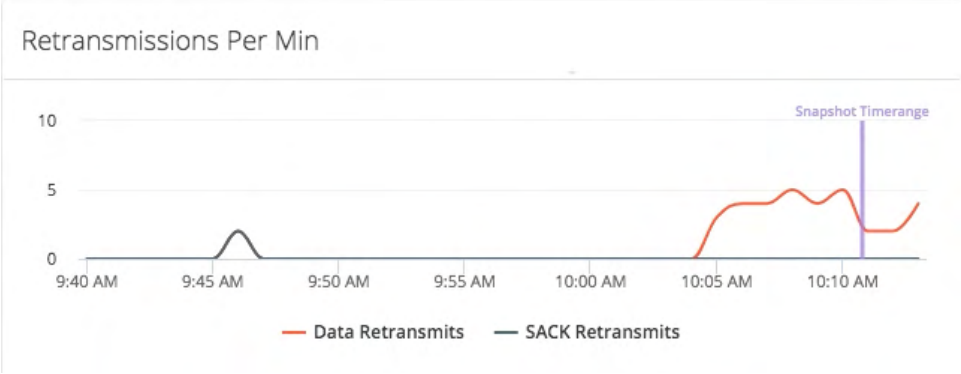
a. The Network Impact on **Transactions** graph (top left) shows a spike in PIE and Very Slow Calls around the snapshot time range.



b. She sees the correlation between Errors and Very Slow Calls, so she reviews the Network Errors - Contributors chart. She sees immediately that all these errors are Syn Blackholes. The Order-Tier node is trying to establish connections to the Payment-tier node, but something in the middle is silently dropping the connection. When this happens, it usually indicates that a firewall or other intermediate device is dropping packets. The requesting tier tries and retries to re-establish the connection, which introduces significant delays.

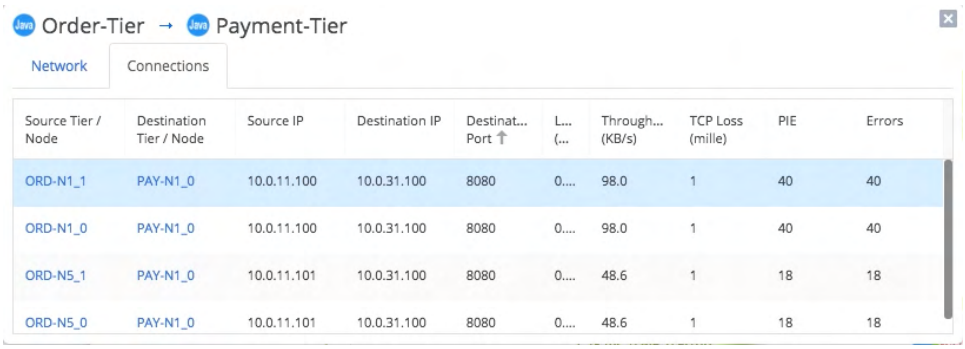


c. The Retransmissions Per Min chart confirms that the retransmissions during the time window of interest are all Data Retransmits, which means that the drops are occurring on an intermediate device rather than at an application node.



4. She now wants to pinpoint the specific TCP connections where the packet drops are occurring. She enables **Advanced Diagnostic** monitoring on the relevant Network Agents to collect TCP diagnostic metrics. She then goes to the **Network** Dashboard and clicks the links between Order-Tier and

Payment-Tier. This provides all of the connections with elevated PIE and errors.



Source Tier / Node	Destination Tier / Node	Source IP	Destination IP	Destinat... Port	L... (...	Through... (KB/s)	TCP Loss (mille)	PIE	Errors
ORD-N1_1	PAY-N1_0	10.0.11.100	10.0.31.100	8080	0....	98.0	1	40	40
ORD-N1_0	PAY-N1_0	10.0.11.100	10.0.31.100	8080	0....	98.0	1	40	40
ORD-N5_1	PAY-N1_0	10.0.11.101	10.0.31.100	8080	0....	48.6	1	18	18
ORD-N5_0	PAY-N1_0	10.0.11.101	10.0.31.100	8080	0....	48.6	1	18	18

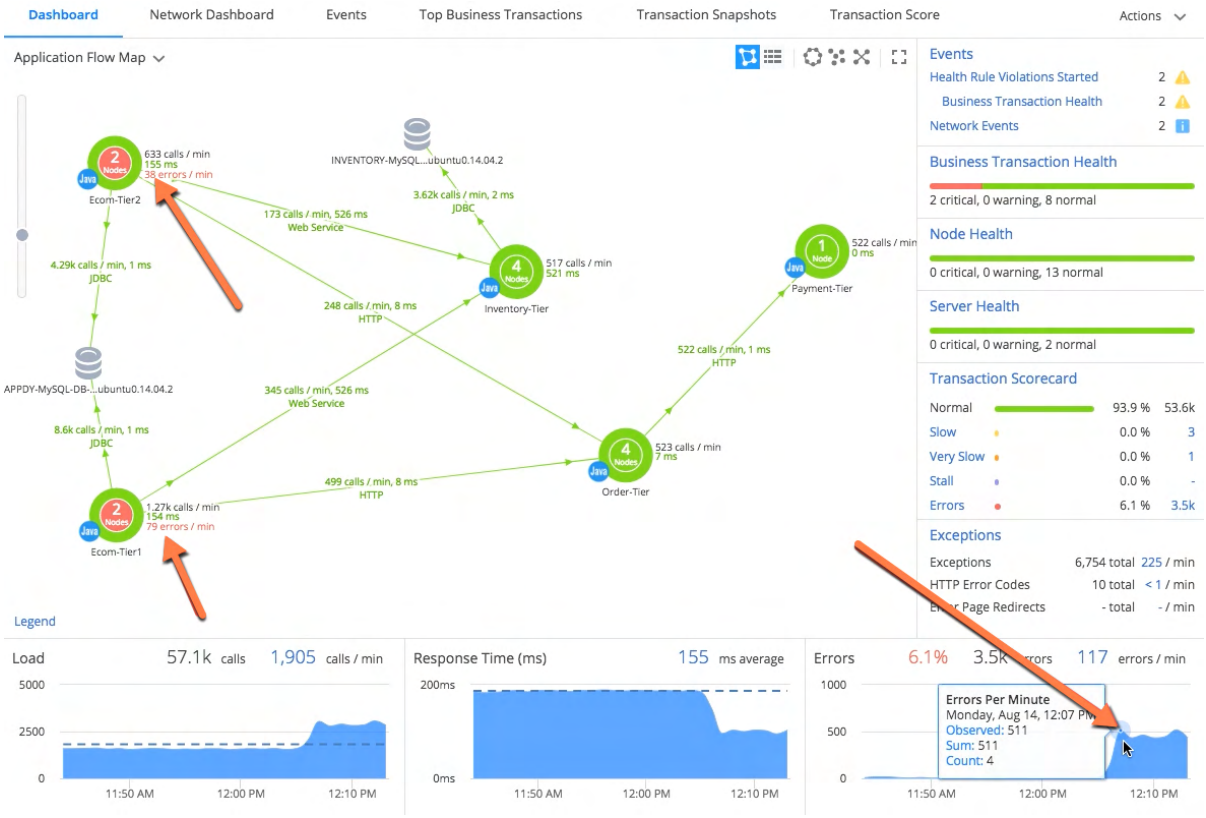
As a result, she contacts the network-management team in her organization and says: "We're seeing intermittent SYN blackholes and retransmissions on these connections, can you please investigate and fix."

TCP Port Exhaustion - Example Use Case

A TCP socket is a specific TCP port on a specific node. Port exhaustion occurs when a node runs out of available ports. When an application stops using a specific port, the port enters a "time-wait state" before it becomes available for use by another application. If a node runs out of available ports to create new connections, the symptom appears as a spike in application errors.

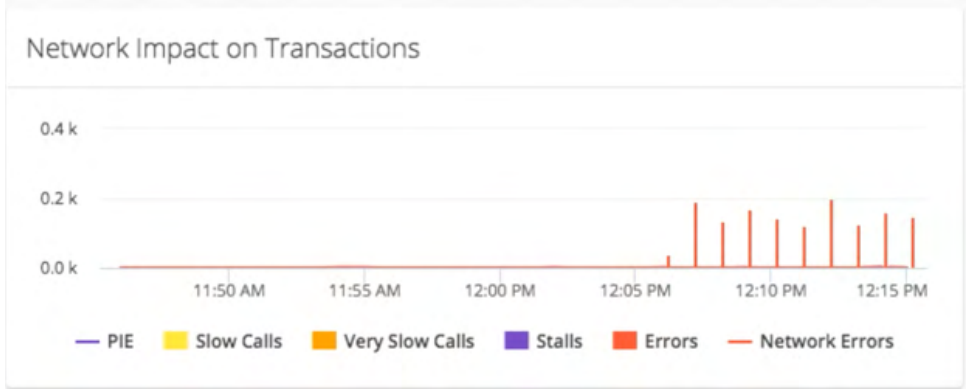
Application Symptoms

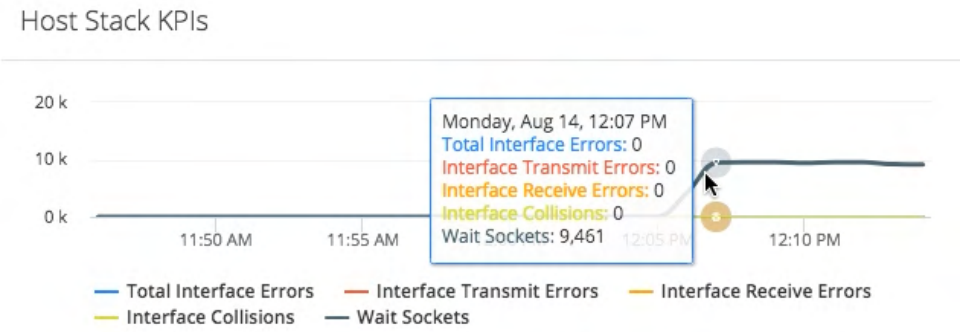
A DevOps engineer is responsible for monitoring the performance of a mission-critical app. She opens the **Application** Dashboard and notices a sudden spike in transaction errors on the Ecom-Tiers and for the entire application. She also sees that response times for the entire App are going down and load is increasing. She decides to investigate.



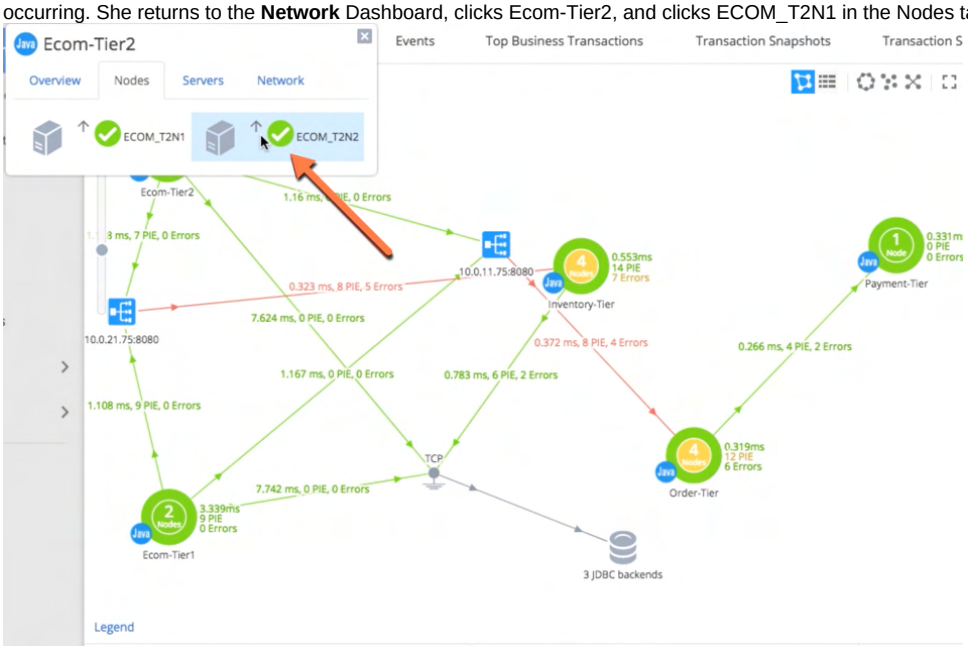
Network Diagnosis

1. She switches over to the **Network** Dashboard, right-clicks Ecom-Tier2, and selects **View Metrics**. The Host Stack KPIs show an increase in wait sockets at the same time as the increase in Error transactions.

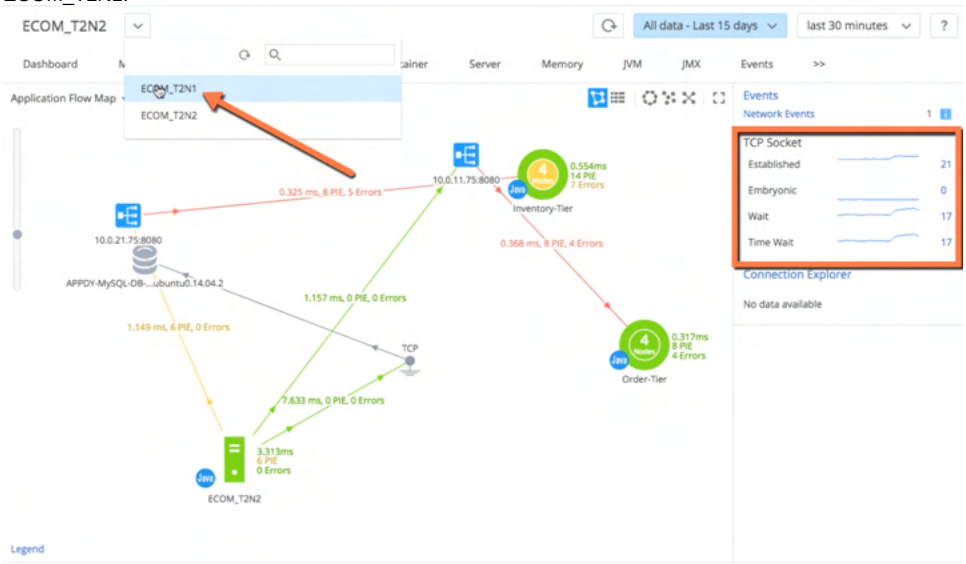




2. She knows there are many wait sockets for the entire tier. She wants to pinpoint the specific node (or nodes) where these wait sockets are occurring. She returns to the **Network** Dashboard, clicks Ecom-Tier2, and clicks ECOM_T2N1 in the Nodes tab.



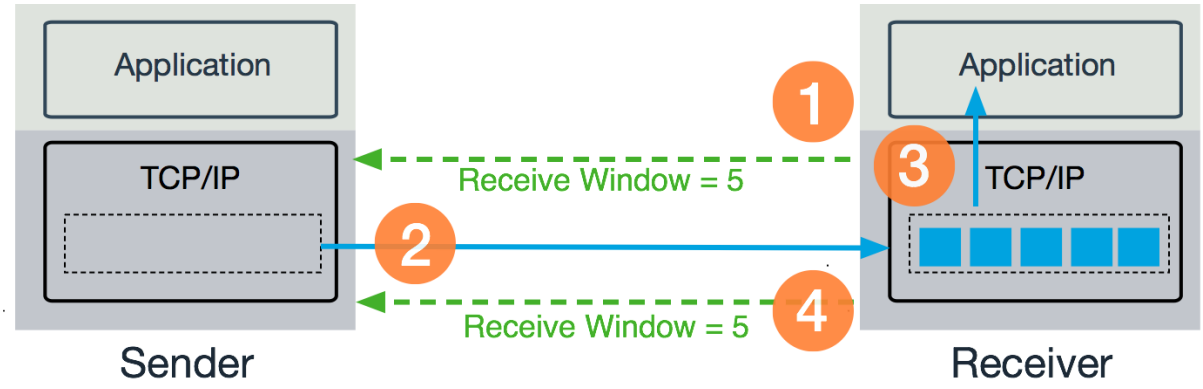
3. The TCP Socket chart (right) for node ECOM_T2N2 shows that the level of wait sockets is in an acceptable range. She switches over to view ECOM_T2N1.



4. The TCP Socket chart for this node shows a significantly high number of wait sockets. She knows now that the spike in application errors is occurring because this node is running out of available sockets.

TCP Window Bottlenecks - Example Use Case

Back pressure is common in microservices and service-oriented applications, especially in distributed environments. Back pressure occurs when two services communicate and one service gets overwhelmed. This diagram shows the sequence of events:

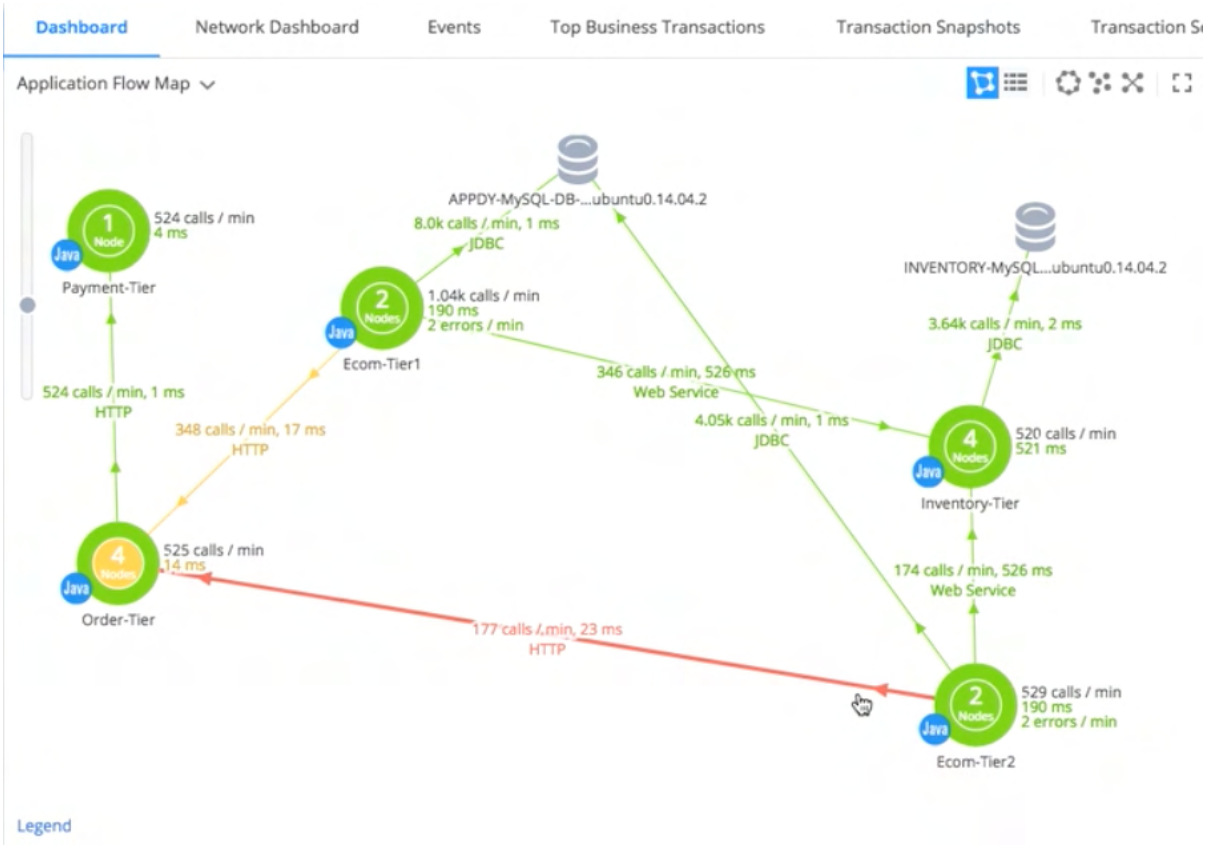


1. Receiver has a TCP Receive buffer for incoming packets. It advertises the available buffer space to the sender.
2. Sender sends a chunk of data based on the advertised window size.
3. Application on the receiver processes the packets in the buffer and frees up space in the buffer.
4. Receiver advertises the new window size.

This process works smoothly until the receiving node cannot process incoming packets quickly enough. In this case, the receiver sends TCP Limited or TCP Zero messages to the sender and the transfer slows down.

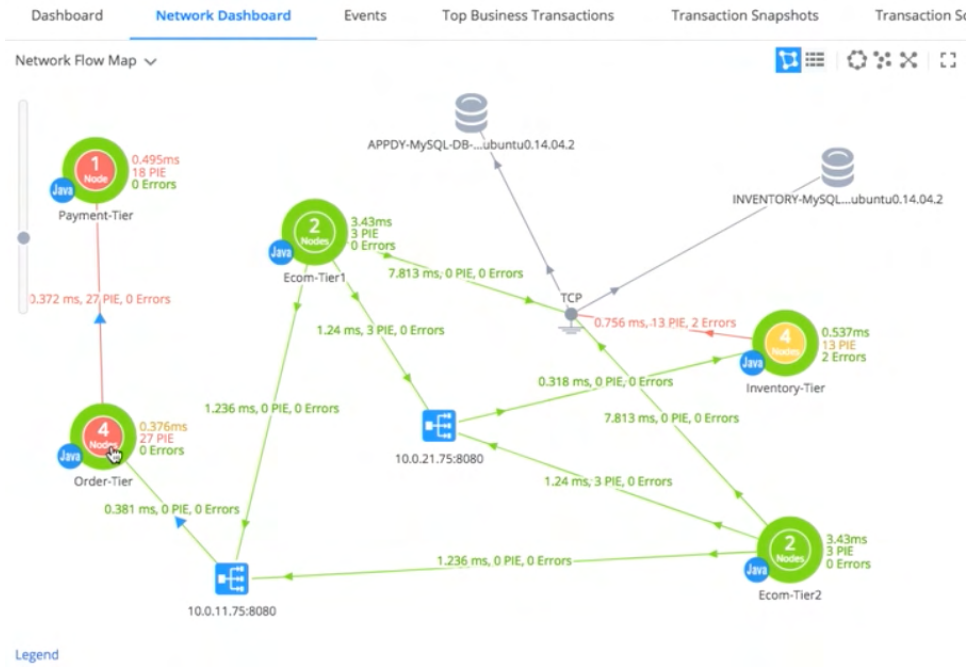
Application Symptoms

A DevOps engineer is responsible for monitoring a mission-critical app. She scans the **Application** Dashboard and notices that a link and tier have turned yellow and another link has turned red. She decides to investigate.

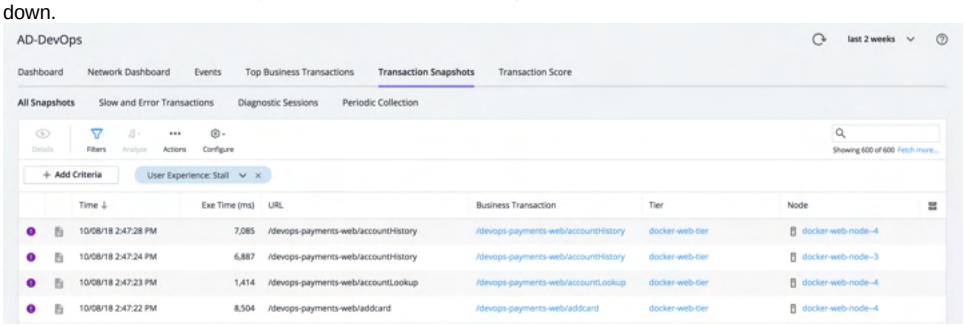


Network Diagnosis

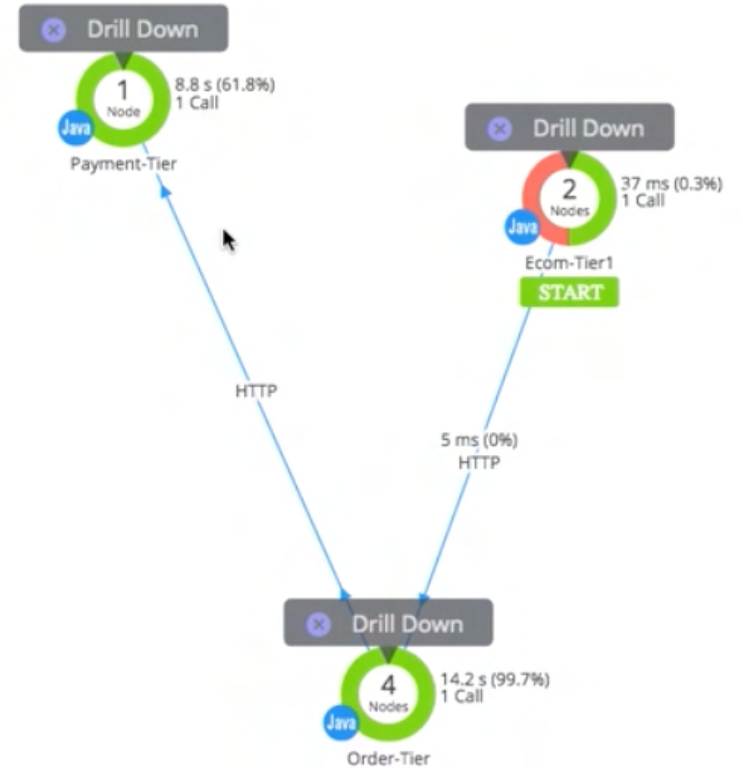
1. She switches over to the **Network** Dashboard and sees a significant increase in Performance Impacting Events (PIE) between the Order-Tier and the Payment-Tier. While the **Application** Dashboard shows performance issues on the upstream Order-Tiers, the **Network** Dashboard implies that the problem is further downstream—between the Order-Tier and Payment-Tier.



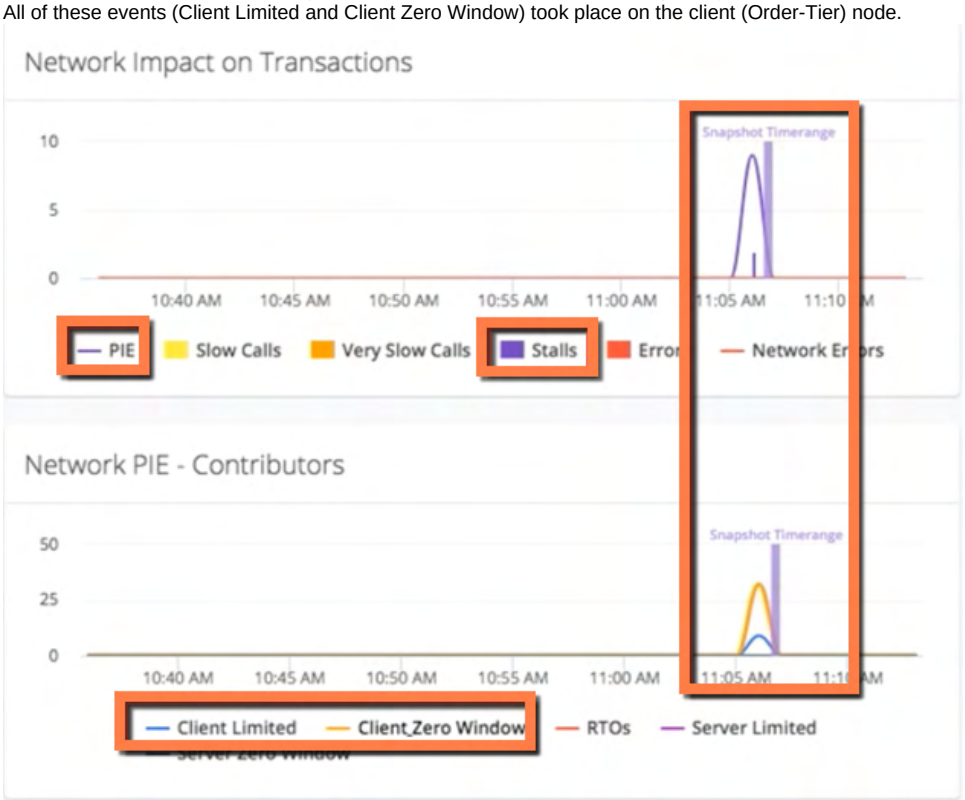
2. To troubleshoot further, she goes to the **Transaction Snapshots** list, filters on stalled transactions, and double-clicks on a transaction to drill down.



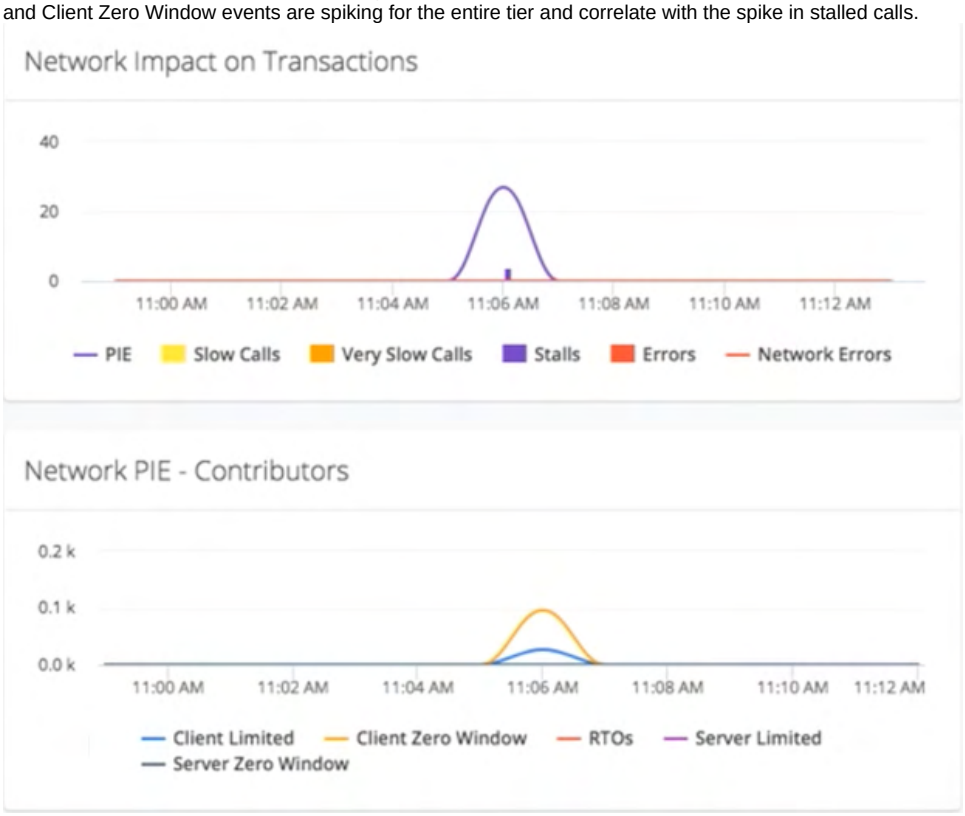
3. She drills down into the Order-Tier, since nearly all of the transaction time (99.7%) occurred at this tier.



4. In the **Transaction Drilldown** page, she switches over to the **Network** view. Scanning the dashboard, she can see immediately that:
   a. The transaction correlates with a spike in stalled calls and Performance Impacting Events.
   b. All of these events (Client Limited and Client Zero Window) took place on the client (Order-Tier) node.



5. She returns to the **Network** Dashboard, right-clicks on the Order-Tier, and chooses **View Metrics**. She immediately sees that the Client Limited and Client Zero Window events are spiking for the entire tier and correlate with the spike in stalled calls.



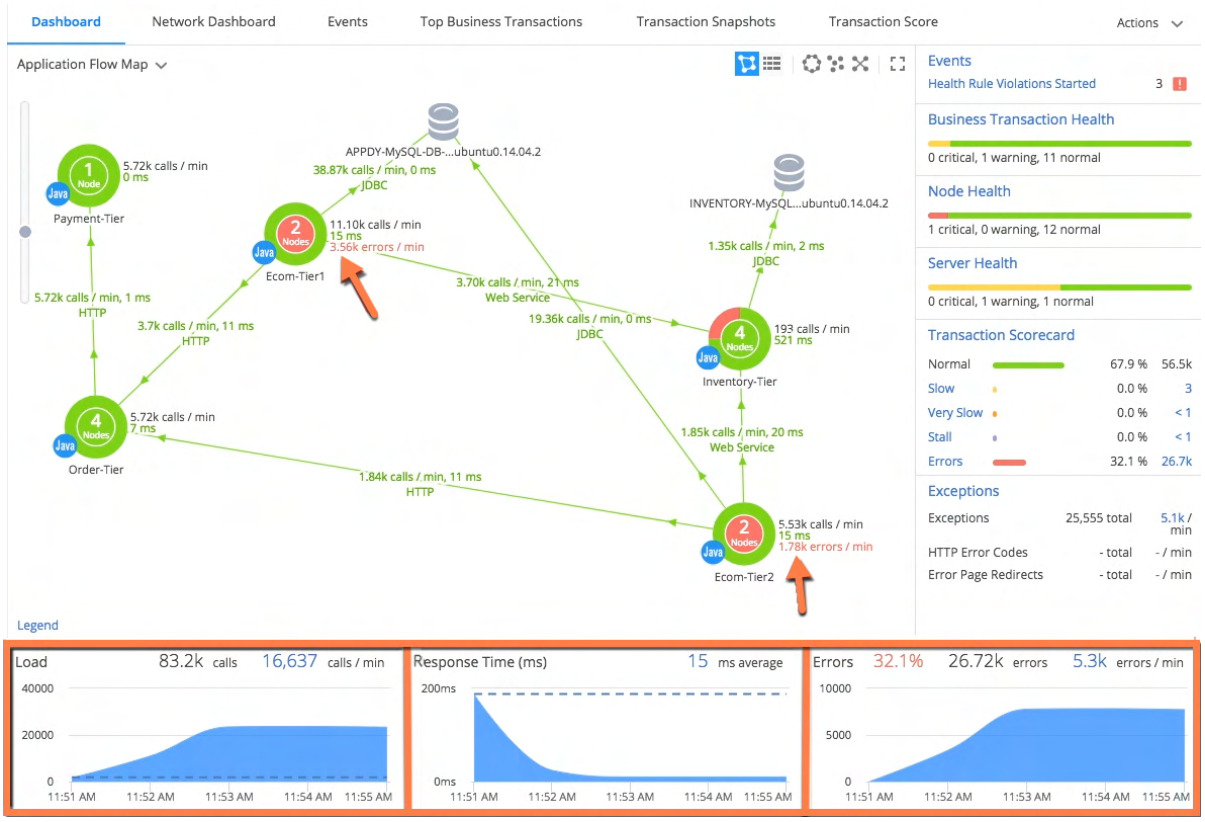
Traffic Throttling - Example Use Case

Firewall throttling occurs when a firewall or other intermediate device prioritizes some connections over others, or denies some connections. This may be due to traffic policies explicitly defined on the device, or to one or more misconfigurations.

Application Symptoms

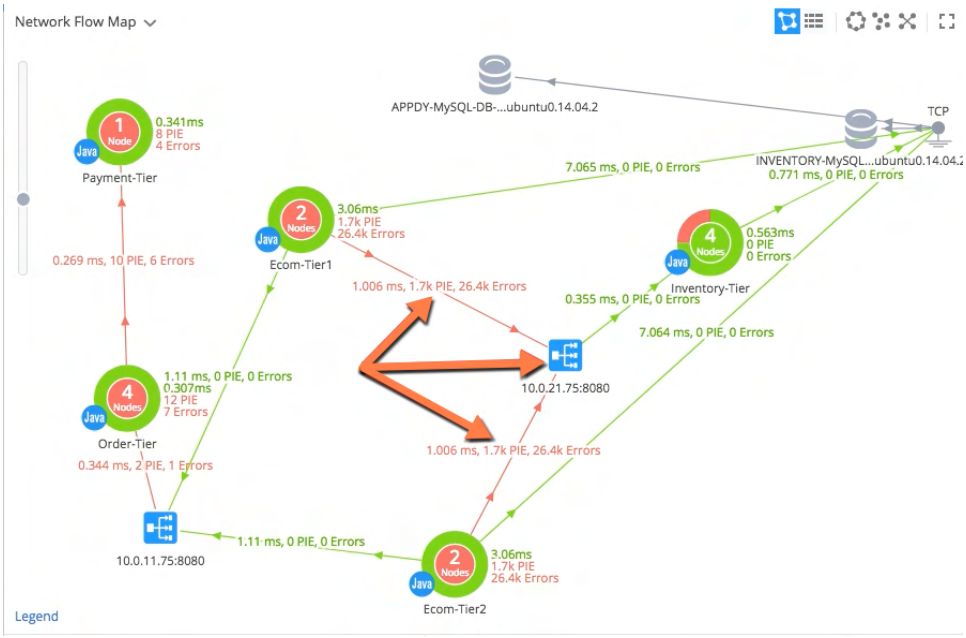
A DevOps engineer is responsible for monitoring the performance of a mission-critical app. She scans the **Application** Dashboard and notices that:

- Ecom-Tier1 and Ecom-Tier2 are showing many errors
- Traffic Loads and Errors are increasing, while response times are decreasing (bottom charts)



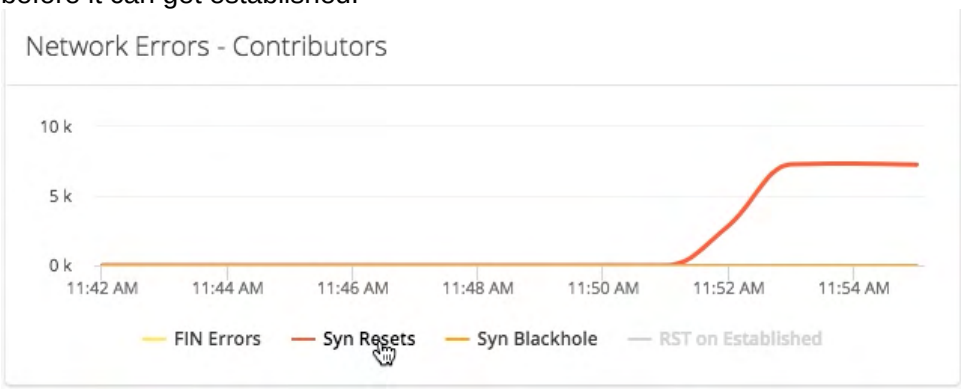
Network Diagnosis

1. She switches over to the **Network** Dashboard and sees immediately that many network errors are occurring on the links between the Ecom-Tiers and the load balancer in the center.

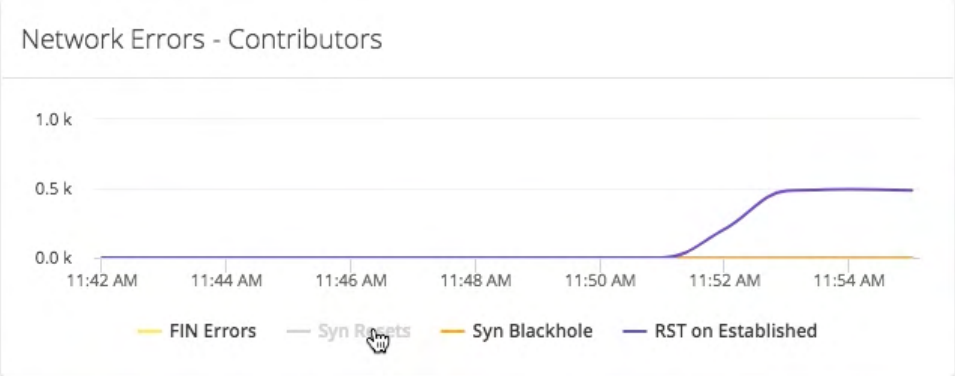


2. She right-clicks Ecom-Tier1 and selects **View Metrics**. She notices:
   a. The **Network Impact on Transactions** chart shows that transaction Errors and Network Errors have started increasing at the same time.

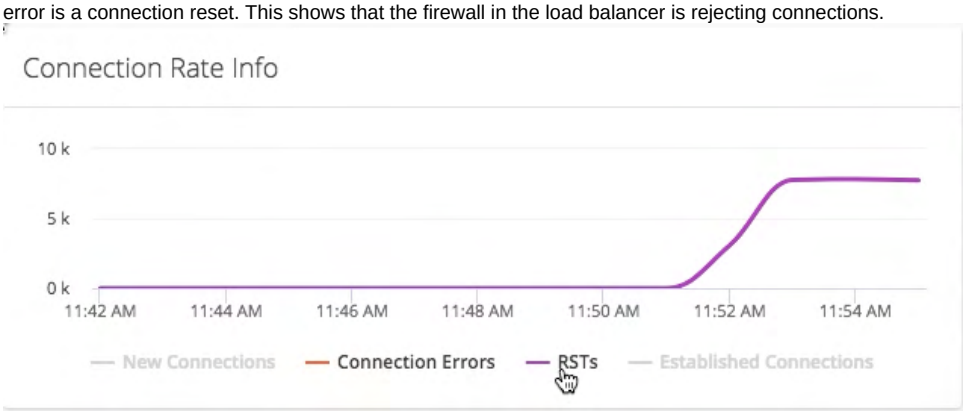
   b. The **Network Errors - Contributors** chart shows that two types of Network Errors are increasing:
      i. Syn Resets — This reset occurs when the firewall explicitly rejects a connection request before it can get established.



ii. RST on Established — This reset occurs when the firewall shuts down an established connection due to traffic-throttling or other policy on the device.



c. The **Connection Rate Info** chart shows that the rate of Connection Errors and Resets are exactly the same where every connection error is a connection reset. This shows that the firewall in the load balancer is rejecting connections.



User Interface

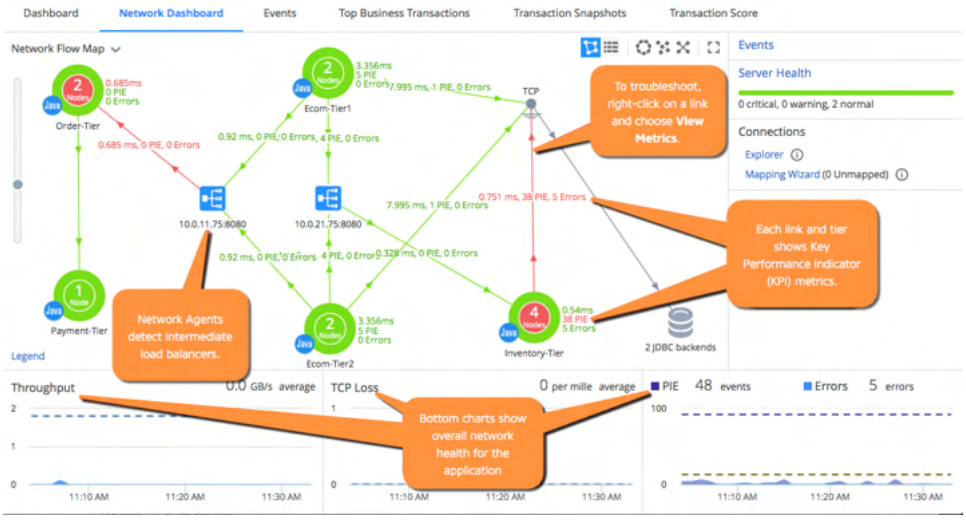
This page describes:

Network Dashboard

The **Network** Dashboard provides a network-layer view of your application where you can quickly determine if any part of the network is impacting application performance. The bottom charts show the overall network health. Each tier and link shows network KPI (Key Performance Indicator) metrics. Network Agents detect intermediate load balancers and TCP endpoints. You can:

- Enable baselining to visualize network elements with performance issues (red/yellow links and tiers)
- View network metric charts in tier/link popups
- Find root causes in a specific network link. Right-click and select **View Metrics** to open a context-sensitive dashboard for the element.
    - The tier dashboard shows correlations between outlier (Slow/Very Slow/Stalled/Error) transactions and network-performance metrics
    - The link dashboard shows network-performance issues on the client tier, server tier, and network path
- Find root causes in a specific connection. When you narrow the issue down to a specific network link, you can:
    - Configure the Network Agents to collect detailed metrics for the individual Connections used on that link.
    - Drill down to find the root cause in an individual Connection.
- Copy IP addresses and ports for individual connections from the **Network** Dashboard enabling you to forward this information to operations and other personnel when troubleshooting an issue. To copy IP addresses and ports:

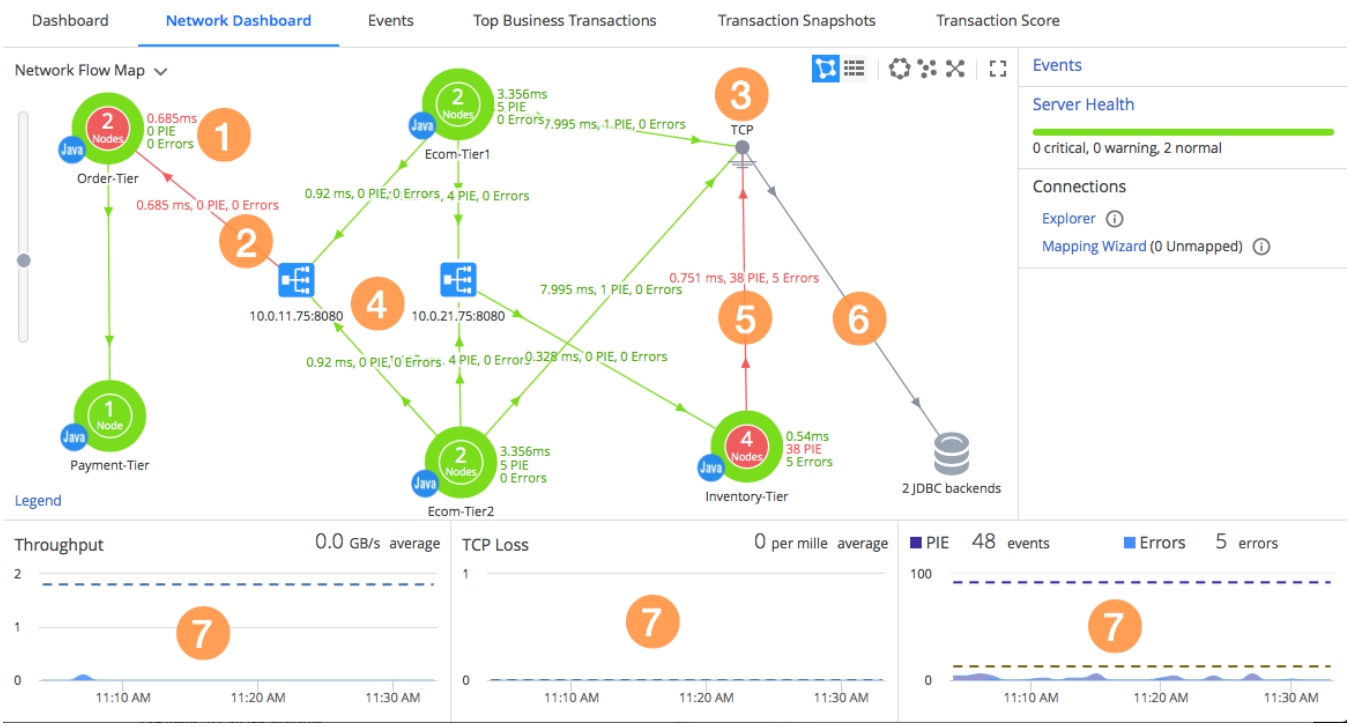
    1. Click a link to open the link popup, and go to the Connections tab.
    2. Select the connections of interest (use Ctrl-click to select multiple connections).
    3. Right-click the selection and select **Copy IP addresses to clipboard**.



Important Notes

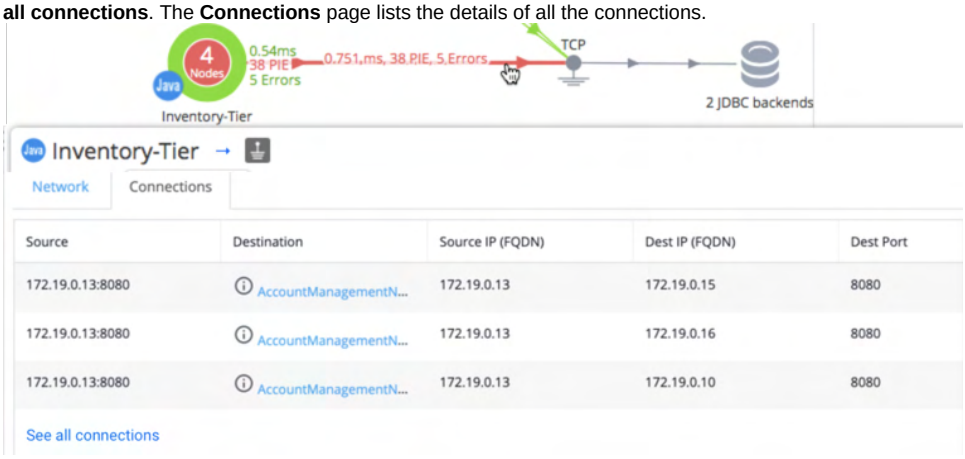
- In many cases, the **Application** Dashboard and **Network** Dashboard might show different topologies for the same application. This is the expected behavior. Unlike App Server Agents, Network Agents detect intermediate network devices between nodes, and consider these devices when collecting metrics. The two dashboards show the same application but from different perspectives: an application perspective and a multi-layer, network/application perspective.
- This release does not support these Network Flow Map features:
    - Federated Flow Maps
    - Visualization of flows between web servers and APM entry tiers
    - The Network Flow Map does not filter out connections based on the selected time range
- In some cases, the KPIs for a tier or link might be different in the Network tab versus the Flow Map. The popup shows the latest data; the Flow Map updates data every two minutes. Any discrepancy between KPI values is due to this difference in reporting times.
- If you open the Network Flow Map for an individual node, the KPI metrics for node-to-load-balancer and node-to-tcp-endpoint links show KPIs for all nodes in the parent tier (instead of KPIs for the individual node only). To view KPIs for the individual node, open the link popup and review the Connection KPIs.

Network Dashboard Reference



The Network Dashboard shows:

- Network-based key performance Indicators (KPIs) (1) for the monitored nodes in each tier:
  - Average Latency (#ms) for individual packets
  - Number of Performance Impacting Events (PIE)
  - Number of Errors
- KPIs for all network links (2). Click a load balancer or a network element to review the set of five associated Connections. (A gray link indicates a connection that a Network Agent detected but did not directly monitor.) If a link or load balancer is associated with more connections, click **See all connections**. The **Connections** page lists the details of all the connections.



- The **Network** Dashboard shows a TCP endpoint (3) icon when a Network Agent observes traffic between a monitored node and an endpoint (IP address, TCP port, and protocol), but cannot determine if the endpoint represents:
  - An application node that sends or receives traffic for the application, or
  - An intermediate device (proxy or load balancer) that transfers traffic to and from another node over a separate connection
- Network Agents automatically detect load balancers (4), which often mask internal IP addresses and have the effect of splitting an in-flight application message into two separate TCP connections. The auto-detection of TCP endpoints and load balancers between application nodes enable you to easily identify the exact locations where network issues are occurring.
- Links are colored in the **Network** Dashboard as:
  - Green/yellow/red, to visualize the network performance compared to the overall performance baseline for that link (5)
  - Blue, if baselining is disabled
  - Gray, for connections between application nodes and TCP endpoints. (6) In this example, the gray link indicates "The connected node and endpoint are either the same device, or two devices exchanging traffic over a separate, unmonitored connection."

- The **Network** Dashboard also shows KPIs 7 for the entire application. You can review:
  - Overall throughput that the application places on the network
  - Rate of network packet loss (packets sent but never received)
  - Number of Performance Impacting Events (PIE), which indicate potential problems on one or more nodes or connections
  - Number of errors for the entire application

Connection Explorer

Related pages:

- KPI Metrics in Right-Click Dashboards
- Network Visibility Metrics

The Connection Explorer (**Explorer** link, right side of **Network** Dashboard) shows all application flows and TCP Connections for an application in one table. Use the Connection Explorer for large, complex applications. You can sort the table based on network KPIs to locate flows with performance issues; then you can drill down and analyze the supporting connections in right-click Connection Dashboards. See Flows, Links, and Connections.

The Connection Explorer shows information for:

- Network Links
- Connections

Network Links

The Explorer shows this information for each network link. Select **View Options** to show or hide information as appropriate.

- Source
- Destination
- Network Element

> **Tip**
>
> If two flows connect through a Load Balancer (LB), the table shows the LB IP:port and the connection source:
>
> Flow direction: LB --> Tier 
>
>
> Flow direction: Tier --> LB

- TCP Loss (Mille)

Connections

To view the load balancer details for a connection, click the connection. Select **View Options** to show or hide information as appropriate.

- Source IP, or Fully Qualified Domain Name (when available) for Load Balancers and TCP Endpoints
- Destination IP, or Fully Qualified Domain Name (when available) for Load Balancers and TCP Endpoints

Custom Dashboards for Network Visibility

You can create Custom Dashboards based on Network Visibility metrics using the standard workflows. To add a Network Visibility metric to a custom dashboard:

1. In the Add Widget pane, click **+** (under **Data**).
2. Under **Data Source**, select the application of interest.
3. Under **Select a Metric Category**, select **Custom (use any metrics)**.
4. Under Select a Metric, navigate to the metric of interest under one of these:
    - **Application Infrastructure Performance > Advanced Network**
    - **Application Infrastructure Performance >** <*tier-name*> **> Advanced Network**

See Network Visibility Metrics.

Network Visibility Events

This page lists the Network Visibility events and severity.

Packet Capture Events

Sub-type: PCAP (set by Network Agent)

Description	Severity
Packet capture successful, Packet capture ID: <*id*>, Captured file: <*file*.pcap>	Info
Packet capture already active, Packet capture ID: <*id*>	Info
Packet capture couldn't be started, Storage location </loc/path> does not exist, Packet capture ID: <*id*>	Err
Not enough space to start packet capture, Packet capture ID: <*id*>	Err
Packet capture failed. Capture directory </*loc*/*path*> does not exist, Packet capture ID: <*id*>	Err
Packet capture successful and exported, Packet capture ID: <*id*>, Captured file: <*file*.pcap>	Info
Packet capture successful but export failed, Packet capture ID: <*id*>, Captured file: <*file*.pcap>	Err
Packet capture not started. Agent Disabled, Packet capture ID: <*id*>	Err

Dynamic Monitoring Mode Events

Sub-type: Config (set by Network Agent)

Description	Severity
Network Visibility Agent mode change successful, Last DMM: <Kpi/Diagnostic/Advanced>, Current DMM: <Kpi/Diagnostic/Advanced>	Info
Network Visibility Agent mode change failed, Current DMM: <Kpi/Diagnostic/Advanced>	Err

State-Change Events

Sub-type: Config (set by Network Agent)

Description	Severity
Network Visibility Agent state change successful, Current state: <Enabled/Disabled>	Info
No change in Network Visibility Agent state, Current state: <Enabled/Disabled>	Info
Network Visibility Agent state change failed as Packet capture active, Current state: <Enabled/Disabled>	Err
Network Visibility Agent state change failed, Current state: <Enabled/Disabled>	Err
Network Visibility Agent started successfully, Current state: <Enabled/Disabled>	Info

Start Events

Description	Severity
Network Visibility Agent registered successfully	Info
Network Visibility Agent registration failed due to an invalid ID	Err
Network Visibility Agent started successfully, PID: <pid>	Info

Advanced Operations

Network Visibility includes these advanced operations:

- Resolve Unmapped Connections – In some cases, there is not enough context to map a TCP Connection to an application flow automatically. This page describes how to resolve these connections manually.
- Packet Captures – A packet capture is a snapshot of live network traffic. Packet captures are very useful for advanced, in-depth network diagnostics and troubleshooting.

Packet Captures

A packet capture is a snapshot of live network traffic. Use packet captures for in-depth network diagnostics and troubleshooting. When you discover a network issue that affects your applications, you can capture traffic using Network Visibility Agents and send the resulting data to your network or Ops team for further analysis.

Network Agents save packet captures as pcap files. A wide variety of network analysis tools support pcap: Wireshark, tcpdump, Windump, and so on. Packet captures are supported on Linux platforms only.

> **Restrict packet capture privileges to authorized users only**
>
> Packet capture files include "raw" application data that might contain sensitive information. Any user with Account Owner or Administrator privileges can perform packet captures. For this reason, these roles should be assigned to authorized users only. See Roles and Permissions.

Before You Begin

> You must perform this setup *on each host* before you can capture packets on that host.

1. In the Controller, click the gear icon in the top right () and select **AppDynamics Agents** > **Network Visibility Agents**.
2. Right-click the Agent to set up and select **View Packet Capture Configuration**.
3. Set the capture settings:
   - **Duration (sec)** – Make it long enough to capture at least one Business Transaction over the link that you want to troubleshoot
   - **Size** – The maximum size for any single capture file
     Packet Capture Filename Prefix – You must specify a prefix. It is good practice to include the hostname or another string that clearly identifies the node. The resulting pcap filename includes the prefix, the IP address, the interfaces captured, and the timestamp.
     For example, if you specify a prefix of `DataCenterNYC--`, the resulting pcap will have filename: `DataCenterNYC--ip-10-0-21-101_any_1_2017_09_28_17_58_03.pcap`
4. Set the storage settings:
   - **Path** – If remote storage is disabled, the Agent stores capture files in this folder on the Agent host
     - The specified folder must exist on the Agent host. The default path is `/opt/appdynamics/netviz/pcap`.
     - The *<network-agent-user>* account (the one used to install and run the Network Agent) should have read and write permissions to this folder
   - **Maximum Allotted Space** – Maximum storage allotted for all capture files. This setting applies to both the Agent host and the remote server. As new capture files are created, the Agent deletes older files to free up space.
5. Set the storage settings (SCP server):
   - **Remote Storage (upload to SCP Server)** – With this option enabled, the Agent uploads the capture file to the specified server when the packet-capture operation ends
   - **Host/Port/Username/Password/Path**
     - The local path must be defined on the remote server
     - The specified user account must have write permissions on the specified path

Best Practices for Packet Captures

Packet Capture files can get very large, very quickly. When a capture job is in progress, the Network Agent captures all bytes in all packets on all network interfaces that it monitors. The size of the capture file depends on the capture duration, and the rate of packets sent and received on the network interfaces of the node. The duration should be long enough to capture a few Business Transaction calls between the two nodes, but no longer.

If you want to retain any capture file for archiving or extended analysis, copy the file from the storage folder as soon as the capture completes. This ensures that it does not get overwritten by newer files.

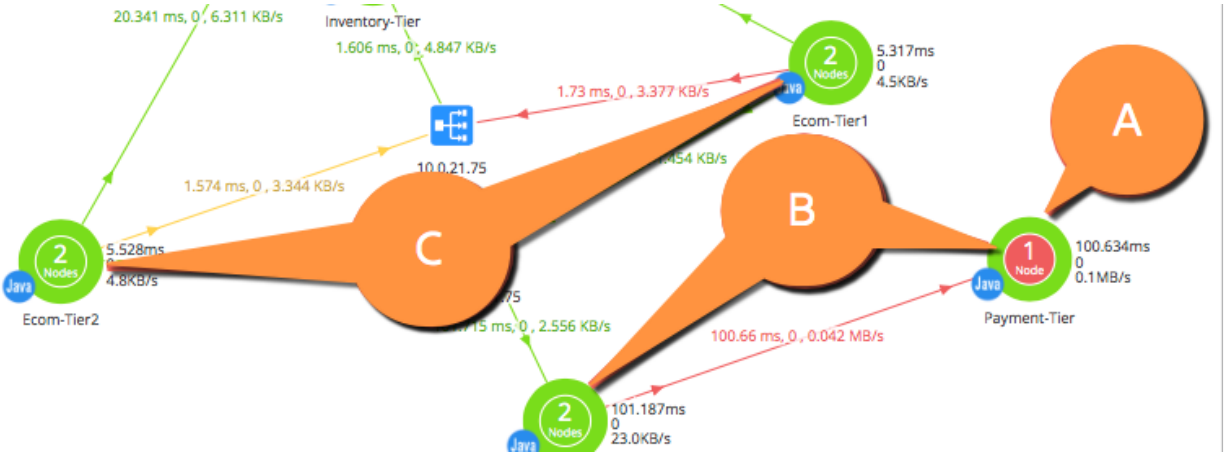
Packet capture operations generate a number of Network Visibility Events that you can use for monitoring and troubleshooting.

Create a Packet Capture

- Determine the Nodes to Capture
- Start the Packet Capture

Determine the Nodes to Capture

- Go to the Network Dashboard, set the reporting duration to the last five minutes, and verify that the network issue you need to troubleshoot is currently active.
- Note the node(s) where you need to capture packets.
  - To troubleshoot a node, capture on the node (**A**).
  - To troubleshoot a link, capture on the two connecting nodes on each side of the link (**B**).
  - If the link is bisected by a load balancer, capture on both sides of the load balancer (**C**).



Start the Packet Capture

When you start a capture, the Agent captures all packets sent and received by all network interfaces on the Agent host. When the Agent stops capturing (as specified by the **Duration (sec)** capture setting), it saves the pcap file in the folder specified by **Storage** settings).

There are two capture methods:

- From the Agents Page
- From the Node Dashboard

From the Agents Page

Use this method to capture on one or more nodes:

1. In the Controller, click the gear icon in the top right ( ) and select **AppDynamics Agents** > **Network Visibility Agents**.
2. Select the Agents on the nodes where you want to capture. Use Ctrl-click or Shift-click to select multiple Agents.
3. Right-click a selected Agent and select **Start Packet Capture**.

From the Node Dashboard

Use this method to capture on a single node:

1. Drill down to the node in the Network Browser:
    a. Go to **Tiers & Nodes**, right-click the node, and select **View**.
    b. When the Node view appears, go to the Network Browser.
2. Right-click the node and select **Start Packet Capture**.

Resolve Unmapped Connections

After you set up the App Server Agent and the Network Agent together, the Network Agent automatically:

- Monitors TCP connections
- Identifies the application flow that uses each connection
- Maps the connection to the flow

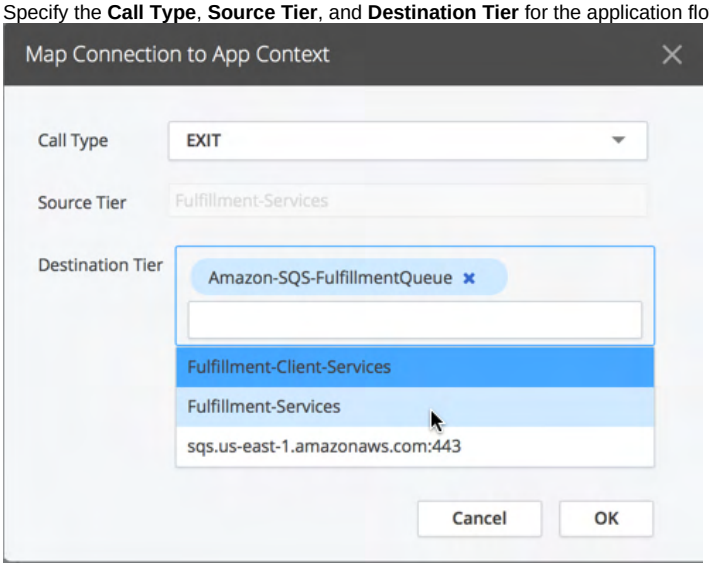
However in some cases, there is not enough context to associate a connection with a specific application flow resulting in an *unmapped* connection. In this case, you need to map the connection manually. If a connection remains unmapped, the Network Agent collects metrics for that connection but cannot associate these metrics with any monitored application flow.

To resolve an unmapped connection:

1. Go to the **Network** Dashboard and select **Mapping Wizard** (under **Connections** on the right). You can also open this wizard directly from a **Tier** Dashboard, if that tier has any unmapped connections.
2. The **Connection Mapping Wizard** appears. The left pane shows all tiers with unmapped connections. When you select a tier, the **Connections** list (right pane) shows all the unmapped connections for that tier. The workflow is to iterate through each tier, and specify the mapping for each connection for that tier.
   For each unmapped connection:
   a. Determine the application flow that uses the unmapped connection.

      > You need to know the source tier, destination tier, and the call type (`ENTRY/EXIT`) for the application flow. If you do not know this information, contact someone else who knows the application well.

   b. Select a tier in the left pane.
   c. In the right pane, group the IP addresses by Destination VIP or Prefix (bit mask).
   d. Right-click a connection and select **Map Connection(s)**.
   e. Specify the **Call Type**, **Source Tier**, and **Destination Tier** for the application flow that uses that connection.



Troubleshooting Network Visibility Problems

How do I troubleshoot the Network Agent?

Network Agent Logs

If you notice any performance issues related to the Agent:

1. Stop the Network Agent:
    a. For ZIP packages: Identify the Agent process and enter: `ps ef | grep \appd-netagent`
    The output provides the process ID (`PID`) of the Network Agent process: `kill <network_agent_PID>`
    b. For RPM and DEB packages, enter: `sudo service appd-netviz stop`
2. Review these log files under `<network-agent-install>/logs`:
    a. `appd-netmon.log`
    b. `appd-netagent.log.log`

Network Agent Health Rule

Use this default Health Rule to troubleshoot Network Agents: `Network-Host: Packet drops too high`
This rule triggers an alert when packets get dropped between a Network Agent and the host interface. A high rate of packet drops on the host can result in inaccurate metrics.

> If the issue persists, run the `collect.sh` script available in the `bin/` folder in the `agent` directory, and share the logs with your support contact to expedite troubleshooting. This script is available for Network Agent >= 4.5.9.

Monitor Cloud Applications

In cloud environments, services and components are added and removed continuously. AppDynamics provides robust support to monitor applications in these dynamic environments.

Monitor Containers with Docker Visibility

Use the Machine Agent to monitor application nodes running inside Docker containers and to identify container issues that impact application performance. By viewing and comparing APM metrics with the underlying container and server/machine metrics, you can easily answer the question: Is my application problem purely an application problem, or is the root cause in the container or the server?

> Container monitoring requires a Server Visibility license >=4.3.3, for both the Controller and the Machine Agent.

You should deploy the Machine Agent inside a Docker container. The Machine Agent collects metrics for Docker containers on the same host, and server and machine metrics for the host itself. The Controller shows all monitored containers, for each host, and the container and host IDs, for each container.

In a BRIDGE networking mode, the containers take on the container ID as the host name. If networking is in host mode, then the containers take on the node name of the host ID. This means every container on that node has the same host ID. In this case you need to use the unique host ID settings. See Register the Container ID as the Host ID. When using Docker Visibility, if the unique host ID setting is not configured to use container ID in host network mode, the Machine Agent automatically registers the container using the container ID as the host ID. If you have an older version of the Controller or Machine Agent, AppDynamics recommends that you upgrade to Machine Agent version 20.7 or later. See Using Docker Visibility with Kubernetes.

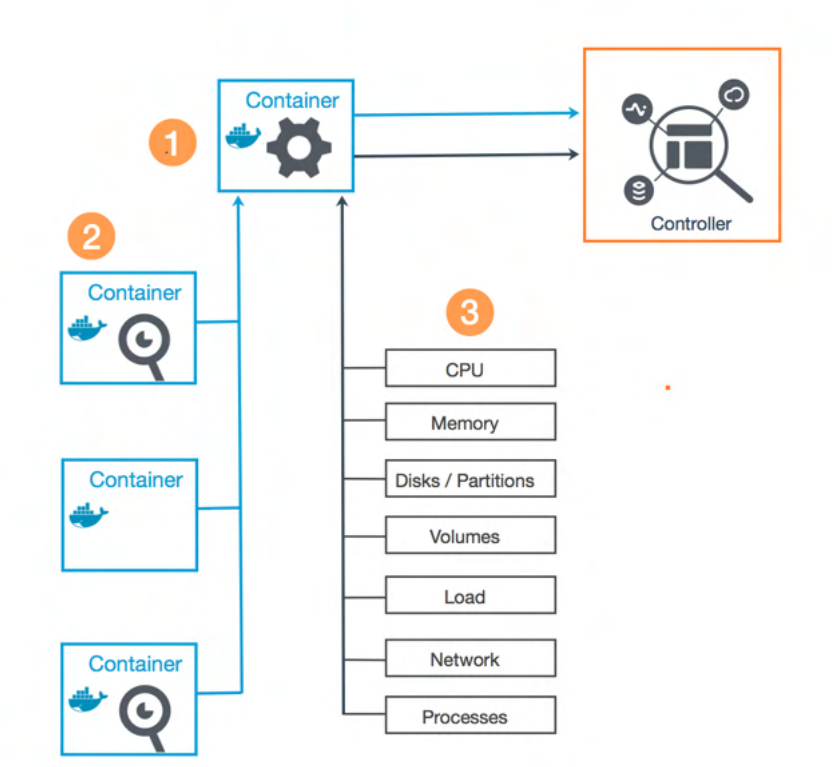
With Controller >=20.11.0:

- If the Machine Agent >=20.7.0, the Machine Agent automatically registers the container using the container ID as the host ID. No further action is needed.
- If the Machine Agent <=20.6.0 is configured incorrectly, the Controller rejects the misconfigured containers registration.

By default, the Machine Agent only monitors containers that have a running APM Agent. You can change this by setting the `sim.docker.monitorAPMContainersOnly` property on the Controller. See Controller Settings for Server Visibility.

> To deploy a Machine Agent on a host outside a Docker container, create a symbolic link: `ln -s / /hostroot` on the host. This symbolic link enables the Machine Agent to collect host metrics with Docker container metrics. When you deploy a Machine Agent inside a Docker container for monitoring, the symbolic link is automatically created when the volume mounts. To grant more restrictive permissions, enter this command to create symbolic links: `ln -s /proc /hostroot/proc`; `ln -s /sys /hostroot/sys`; `ln -s /etc /hostroot/etc`. You can make these links read-only because the AppDynamics Agent does not need write privileges to these directories.

This diagram illustrates how to deploy container monitoring:



- Install the Machine Agent (1) in a standalone container. The Machine Agent collects hardware metrics for each monitored container, as well as Machine and Server metrics for the host (3), and forwards the metrics to the Controller.

- The Machine Agent can monitor all containers that are running on that host, subject to established limits, and will report runtime metrics and metadata for every container. Additionally, if any of the containers have an APM Agent installed (2), then the Machine Agent also correlates the container metadata and runtime metrics with the associated APM Node.

Before You Start

1. AppDynamics recommends that you use Docker CE/EE 17.03 or Docker Engine 1.13 with this product. Some data might be missing if you use previous versions of Docker.
2. Container Monitoring is not supported on Docker for Windows, or Docker for Mac.
3. AppDynamics strongly recommends that you follow these guidelines, Instrument JVMs in a Dynamic Environment when monitoring container-based applications.
4. The Machine Agent can monitor up to 120 running containers per host. The default maximum number of containers per host is 100. With the cgroup enabled flag set to true, the Machine Agent can monitor up to 600 containers per host. See Configure Docker Visibility.
5. The Machine Agent collects metrics from containers with one or more running processes whose command line matches a configurable regex. By default, this regex matches all processes (*). To override this behavior, edit this regex in `<machine_agent_home>/extensions/DockerMonitoring/conf/DockerMonitoring.yml`:
   `containerMonitoringConfig:containerProcessSelectorRegex: ".*"`
6. The maximum number of containers you can monitor in one Controller depends on the Controller size, the total number of App Agents, and the current load. If you are using a SaaS Controller, please work with your Account Manager.
7. Please review:
   a. Best Practices for setting up App Agents and Standalone Machine Agents.
   b. Docker Visibility issues in the latest Release Notes.

Enable Container Monitoring

To enable Container Monitoring:

1. On the Controller, log in to the Administration Console and verify that **sim.docker.enabled** is set to **true**.
2. On the Agent, enable Server Visibility and Docker Visibility.

Container Monitoring Setup

The quickest and easiest way to run the Machine Agent with Container Monitoring enabled is to use one of the official images from the Docker Store: https://store.docker.com/images/appdynamics. These images are produced by AppDynamics, based on certified base images from the Docker Community, and can either be run directly or used as base images for your own application containers. For full details of how to download and run containers based on these official images, see the documentation posted on the Docker Store. To build your own base images, the full source code for building these images is posted to GitHub. You can use this as a pattern for your own builds: https://github.com/Appdynamics/appdynamics-docker-images.

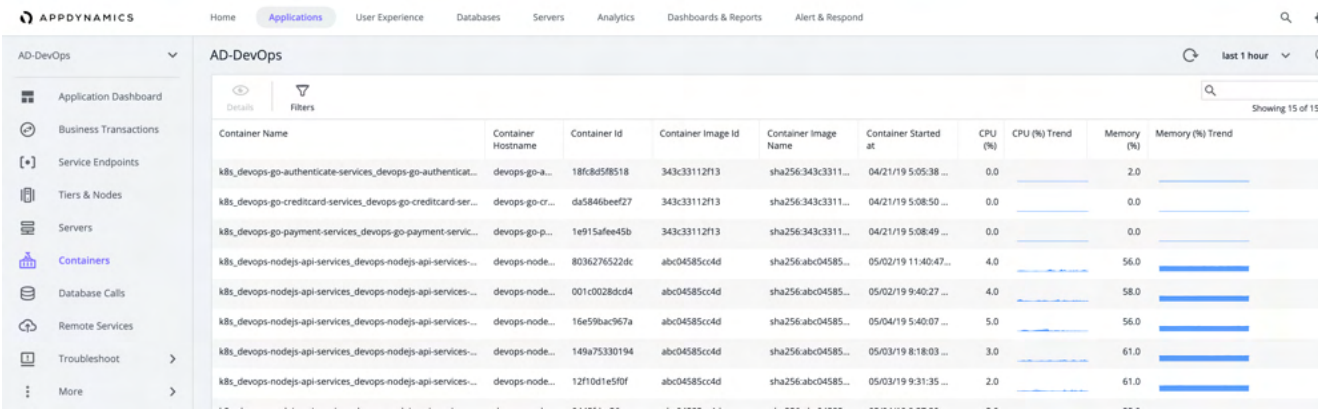
For the Machine Agent to monitor containers running on the server, configure these settings (See Configure Installation Options):

- **Server Visibility Enabled** – Enable Server Visibility
- **Docker Enabled** – Enable Docker Visibility
- **Volume Mounts** – Specify:
  - Volume mounts to allow read-only access to the underlying file system (`/proc`, `/etc` and `/sys`). This allows the Server Agent to collect host-level metrics for containers running on the server.
  - The UNIX domain socket on which the Docker daemon is configured to listen for API calls.

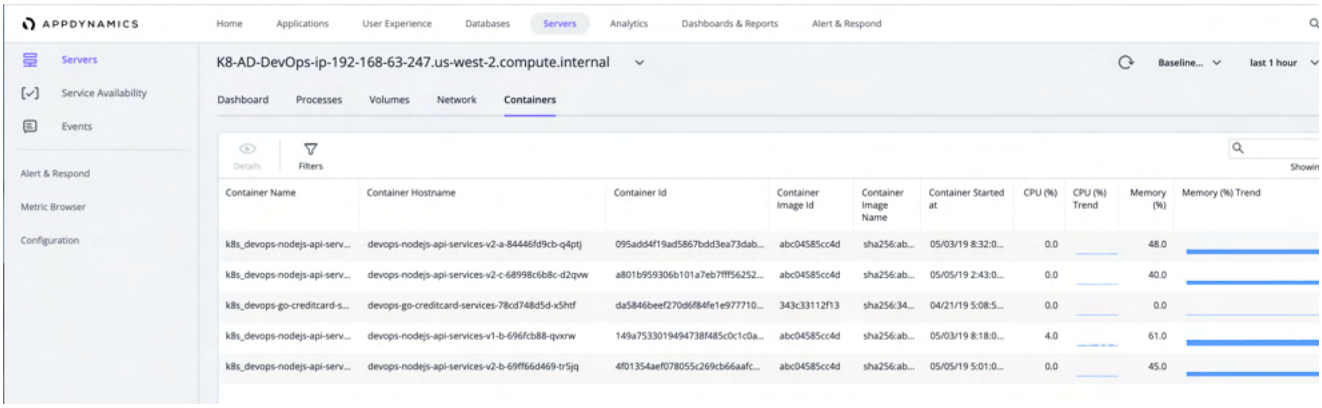
View Container Details

To view container metadata and metrics in the Controller:

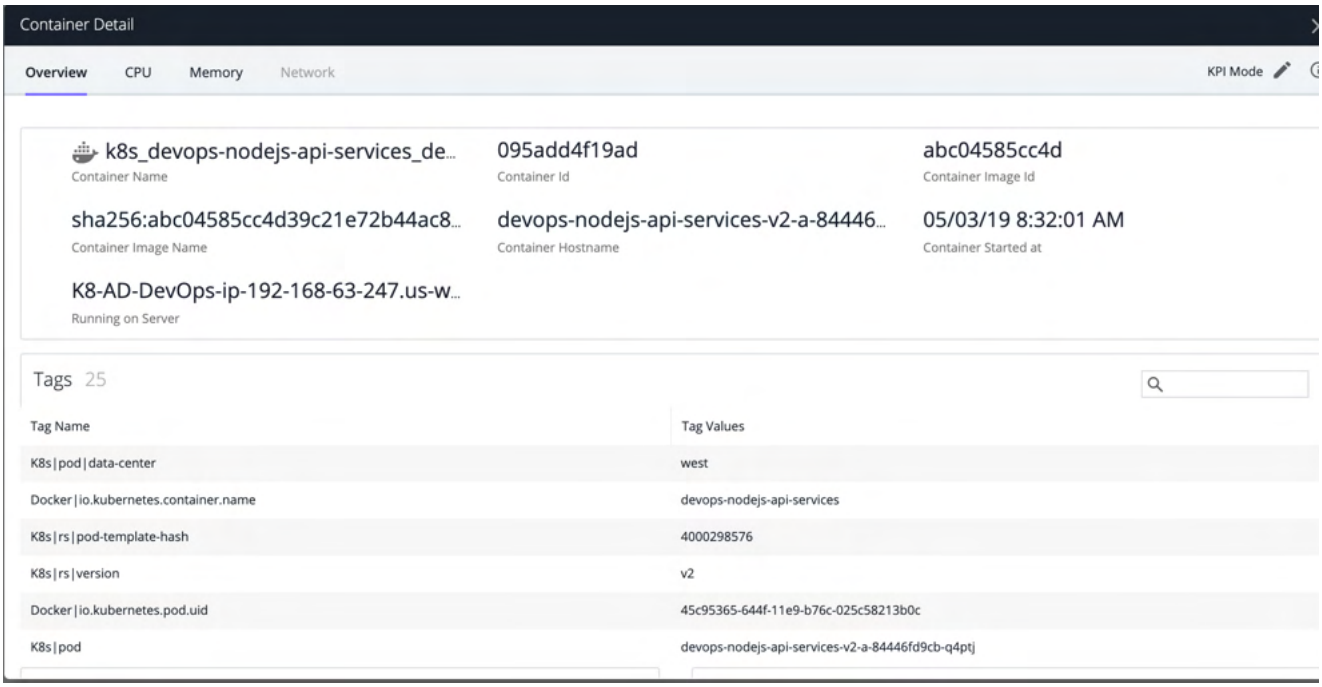
- In the **Applications** Dashboard, go to **Containers** to see all monitored containers used by the application.



- In the **Servers** Dashboard, go to **Containers** to see all monitored containers on that host.



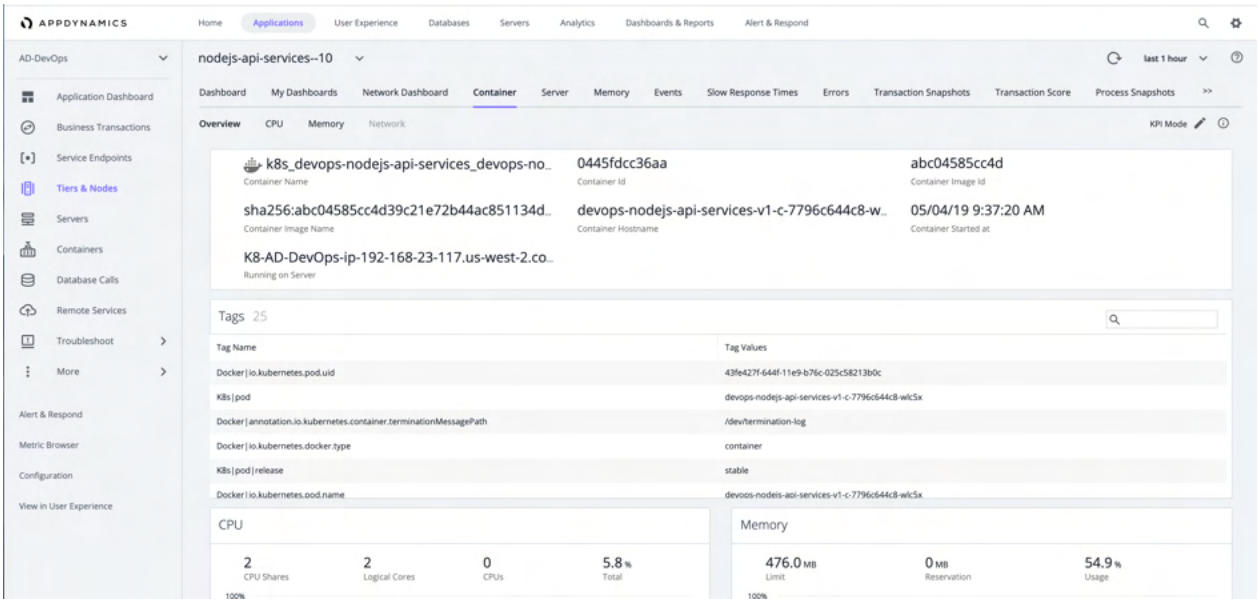
- To open the Container Dashboard, right-click on the container name, and choose **View Details**.



The Container Details view contains these tabs, which provide an overview of the health and resource usage for the container:

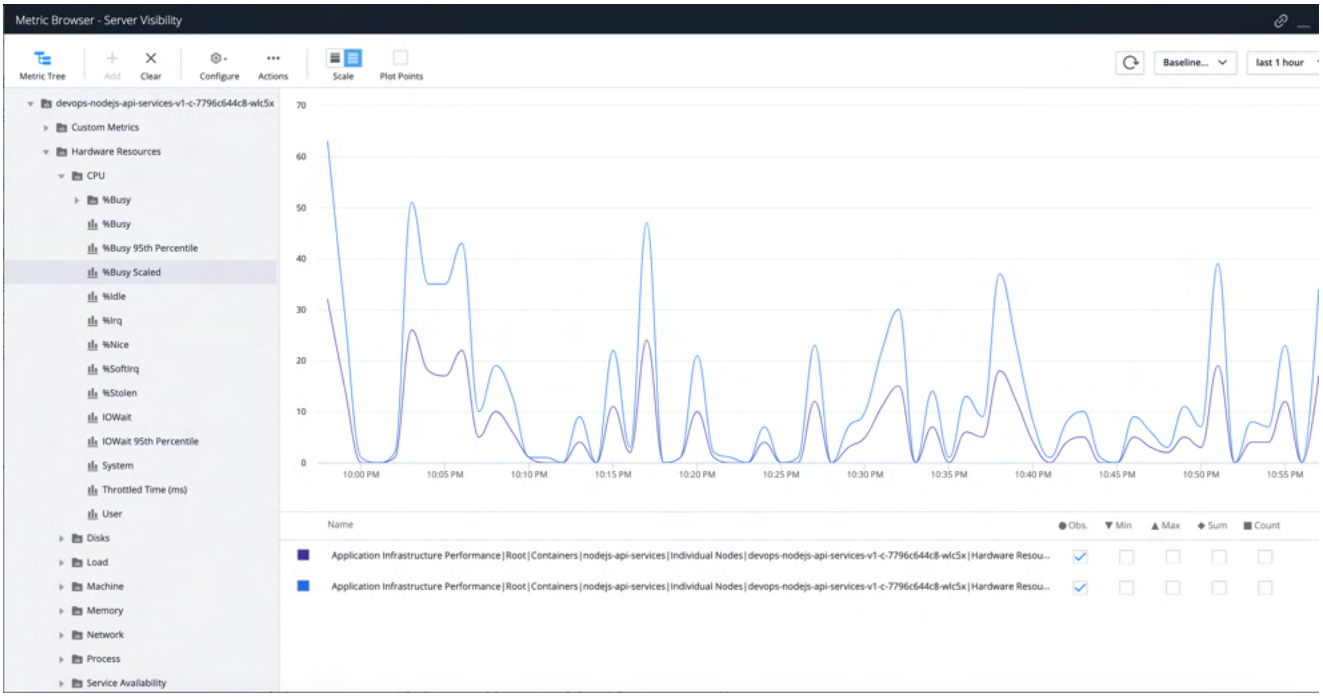
- **Overview** - Container metadata, Tags (name-value pairs derived from Docker/Kubernetes) plus AWS tags where applicable, and single chart views for CPU, memory, network and disk usage
- **CPU** - CPU Usage and Throttled Time metrics
- **Memory** - Memory Usage and Memory Fault metrics
- **Network** - Network Usage metrics (only available when running in Diagnostic mode), see "Enable Dynamic Monitoring Mode (DMM)" under Machine Agent Configuration Properties.

- The Node Dashboard also includes a Containers tab for the container in which that node is running.



View Container Metrics Using the Metric Browser

To view time-series metric data for containers, double-click one of container metric graphs (CPU, Memory, Network, Disk) to open the Metric Browser with the displayed metric selected. The Metric Browser tree displays the full set of metrics available for that container, and you can add these to the Metric Browser display by double-clicking the metric you wish to select. See Container Metrics.



Troubleshooting Containers Using Dynamic Monitoring Mode

Using Dynamic Monitoring Mode (DMM), you can selectively control the number of Container metrics reported for individual containers. Rather than have all Agents report all metrics for all containers all the time, you can configure individual Agents to collect:

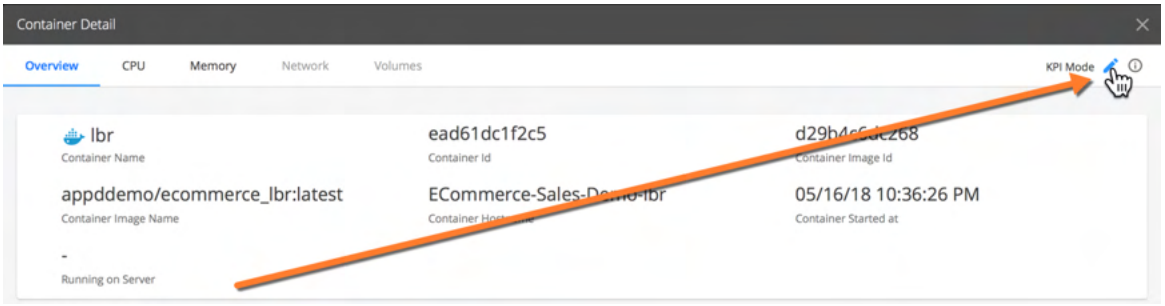
- Key Performance Indicator metrics only (*KPI mode*)
- KPI and Diagnostic metrics (*Diagnostic mode*)
- All available metrics (*Advanced Diagnostic mode*)

This provides the flexibility to report KPI metrics only on most containers, and then increase the metric level on specific containers when you need deeper visibility to diagnose problems. You can increase scalability on the Controller and conserve metric bandwidth on the network with no sacrifice in visibility.

Every Docker Visibility metric has a default DMM class (KPI, Diagnostic, and Advanced Diagnostic). For details, consult the Container Metrics table: the Default Monitoring Mode column indicates the default category of each metric when Dynamic Monitoring Mode is enabled.

When you notice a container that requires additional analysis or troubleshooting, change the DMM on that container to collect more metrics:

1. Open the **Container Detail** panel for the container of interest: Open the Containers table (**Containers**, left menu) and double-click the container.
2. Click the **Edit** (pen) button in the top-right corner, change the mode to **Diagnostic** or **Advanced Diagnostic**, and click the checkmark to apply the changes.
3. Collect additional metrics for your analysis or troubleshooting.
4. When you no longer need to collect additional metrics for that container, set the DMM on that container back to KPI.



Note:

- Depending on the type of metrics collected by the Agent, the Controller has three different DMM defaults. These defaults are all set to KPI (the lowest setting):
  - `sim.machines.dmm.containerAware.defaultMode`
    Default for Hardware Resources Metrics on servers with Docker Visibility enabled
  - `sim.machines.dmm.container.defaultMode`
    Default for Docker Container Metrics on containers
- The default for both settings is KPI (the lowest setting).
- AppDynamics recommends that you leave these global settings at their defaults. If you need to collect advanced metrics for a specific server or container, increase the DMM on an "as-needed" basis.
- When a container monitored by a Java App Agent shuts down and restarts, any overridden DMM specified for the shut-down container is lost. The DMM for the restarted container automatically resets to the global default specified by `sim.machines.dmm.container.defaultMode`.
- If you switch the monitoring mode in the Controller from a more-inclusive to a less-inclusive mode, the Metric Browser will show values for the newly-excluded metrics for one hour after the switch. For example, if you switch from Diagnostic to KPI mode. For any Diagnostic metric, the Metric Browser will report a steady line (at 0, or the last-reported value) for one hour after the switch; then the line will disappear. This is standard behavior in the Metric Browser for an Agent when it stops reporting a specific metric.

Configure Docker Visibility

Machine Agent Settings for Docker Visibility

You can configure the Docker Visibility settings in the file: *<machine-agent-home>*/extensions/DockerMonitoring/conf/DockerMonitoring.yml

Before you edit this file, please review "Editing YML Files: Important Notes" in Machine Agent Settings for Server Visibility.

Property	Description	Default
cgroupEnabled	The Machine Agent can collect Memory and CPU metrics for Docker containers using cgroupdata. This method is much faster than using the Docker API (the default metric-collection method). You can enable cgroupmetriccollection on all platforms except Amazon Linux OS. With the cgroupEnabled flag set to true, the Machine Agent can monitor up to 600 containers per host. When cgroup is enabled, you do not have to update the Docker Metric Collector Pool Size. The max container limit is independent of this. This mode is disabled by default. To enable cgroupmetriccollection, run the agent with the following command-line option set to **true**: `java -Dappdynamics.docker.container.collection.cgroup.enabled=true -jar machineagent.jar`	true
containerProcessSelectorRegex	The Machine Agent can monitor up to 150 running containers (depending on the pool size configuration, described below). The agent collects metrics from containers with one or more running processes whose command line matches a configurable regex. By default, the value of this regex is ".*" and matches all containers irrespective of the processes running in them. If you cannot restart the APM agents, or if you to want to filter APM agents based on another command-line argument, you can override this behavior by editing this regex. Default = ".*"	".*"
docker.metric.collector.pool.size	Specify the local limit for the number of containers the agent can monitor. The effective limit for each agent is the minimum amount for: • The sim.docker.machine.container.limit on the Controller (default limit = 15 containers), or • The Docker Metric Collector Pool Size on the agent (default pool size = 3, or 90 containers). You can change this setting to monitor up to 120 containers (pool size = 4) or 150 containers (pool size = 5). The trade-off is that increasing the pool size might lead to higher resource consumption on the agent host. To change the pool size, set these properties: • System Property: -Dappdynamics.docker.metric.collector.pool.size • Environment Variable: APPDYNAMICS_DOCKER_METRIC_COLLECTOR_POOL_SIZE	default limit = 15 containers default pool size = 3, or 90 containers
dockerTagsEnabled	Enable (default) or disable the collection of Docker tags from containers monitored by the Machine Agent.	

`docker.use.container.name.selector`	Use the Machine Agent to identify containers by container names only.
	
	By default for Docker monitoring, the Machine Agent obtains a list of containers. For each container, the Machine Agent retrieves all running processes inside the container. Then, the Machine Agent matches the container to be monitored by the process full command line. Because there are many containers, the selection process lasts longer than a minute, causing gaps in reporting container metrics.
	
	The Docker Use Container Name Selector configuration option provides an alternative way to select containers to be monitored by using the container's name. This option allows the Machine Agent to run significantly faster since the Machine Agent does not have to gather all the processes for each container.
	
	To enable matching with the container name, you can either use an environment variable or a JVM property. If both are defined, the environment variable is used.
	
	• System Property: `-Dappdynamics.docker.use.container.name.selector=false`
	• Environment Variable: `APPDYNAMICS_DOCKER_USE_CONTAINER_NAME_SELECTOR=false`
	
	You can select which containers to be monitored by providing the regular expression, `containerNameSelectorRegex`, to match the container names. By default, the Machine Agent matches all container names. Regular expressions are part of the `extensions/DockerMonitoring/conf/DockerMonitoring.yml` file.
	
	To exclude containers from monitoring, use an environment variable or the JVM property. If both are defined, the environment variable is used.
	
	`# default value`
	`".*(machine-agent|machineagent).*"`
	
	`# environment variable`
	`export APPDYNAMICS_DOCKER_CONTAINER_NAME_SELECTOR_BLACKLIST_REGEX=".*(machine-agent|machineagent).*"`
	
	`# JVM property`
	`-Dappdynamics.docker.container.name.selector.blacklist.regex=".*(machine-agent|machineagent).*"`
		`# default value ".*(machine-agent|machineagent).*"`

Controller Settings for Docker Visibility

For information about how to configure these settings, see Controller Settings for Standalone Machine Agents.

Property	Description	Default
`sim.docker.apmNode.markHistorical.enabled`	Enables configuration to mark the APM node historical when a container running the app agent is stopped.	`true`
`sim.docker.enabled`	Enable the Docker Monitoring feature.	`true`
`sim.docker.machine.container.limit`	Global limit for the number of containers that each Machine Agent can monitor. The effective limit for each agent is the minimum of • The `sim.docker.machine.container.limit` on the Controller (default limit = 15 containers), or • The Docker Metric Collector Pool Size on the agent (default pool size = 3, or 90 containers). You can specify this in the Administration Console as a Controller setting (all accounts) or as an Account setting for individual accounts. 150 is the maximum limit you can specify.	15
`sim.machines.reuse.enabled`	Reuse SIM Machine entities to handle an ephemeral environment. Support is currently limited to Docker container machines. If set to `false`, each new container is considered a new machine.	`true`
`sim.machines.tags.enabled`	Enable or disable the import of Docker tags to the Controller.	`true`

Use Docker Visibility with Kubernetes

This page describes how to set up the Machine Agent with Docker Visibility enabled to run as a `DaemonSet` on a Kubernetes cluster.

Container visibility enables you to monitor containerized applications running inside Kubernetes pods and identify container issues that impact application performance. You deploy the Machine Agent as a Kubernetes `DaemonSet` in every node of a Kubernetes cluster. Deploying the Machine Agent as a `DaemonSet` ensures that every Kubernetes worker node runs the Machine Agent to collect critical resource metrics from the node host and associated Docker containers.

> Using Docker Visibility to monitor Kubernetes containers is no longer the preferred option and will be deprecated. Use the Cluster Agent instead as described in Monitor Kubernetes with the Cluster Agent. The Cluster Agent supports Kubernetes container visibility, as well as visibility into cluster health and capacity.

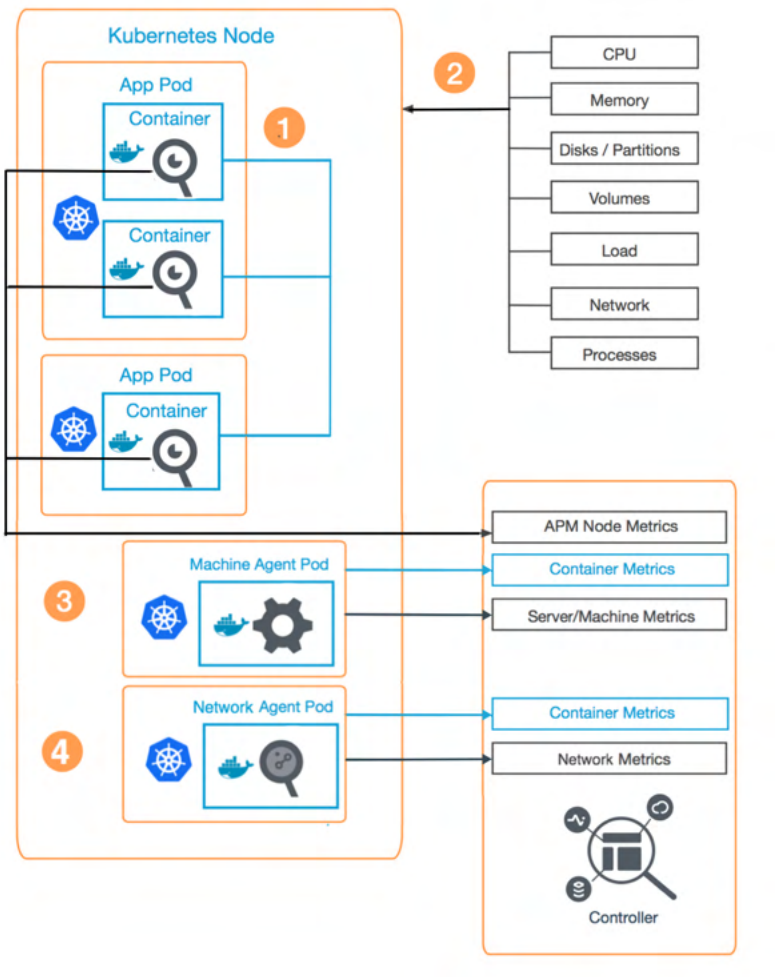
Container Visibility with Kubernetes

Deploy the Machine Agent in Docker-enabled mode. To configure and run the Machine Agent using Docker, see Configure Docker Visibility.

The Machine Agent:

- Identifies the containers managed by Kubernetes.
- Determines if these containers contain app server agents.
- Correlates containers with app server agents with the APM nodes for that application.

This diagram depicts the deployment scenario for container visibility in Kubernetes:



- Install the Machine Agent container (1) as a `DaemonSet` on each Kubernetes node.
- To collect APM metrics from any container in a pod, install the correct App Server Agent (2) in the container before deploying the pod.

- The Machine Agent collects resource usage metrics for each monitored container (3), as well as Machine and Server metrics for the host, and forwards the metrics to the Controller.
- (Optional) Install the Network Agent (4) as a `DaemonSet` on the node you want to monitor. The Network Agent collects metrics for all network c onnections between monitored application components and sends these metrics to the Controller.

Before You Begin

Review the requirements for Container Visibility with Kubernetes:

- A Machine Agent must run as a `DaemonSet` on every Kubernetes node you want to monitor.
- Every node to be monitored must have a Server Visibility license.
- Docker Visibility must be enabled on each Machine Agent.
- Both App Server Agents and Machine Agents are registered by the same account and are using the same Controller.
- If you have multiple App Server Agents running in the same pod, register the container ID as the host ID on each App Server Agent and Machine Agent.

Limitations

- Only the Docker Container Runtime is supported.
- Only Pod and ReplicaSet labels are supported.

Procedure

1. Enable Container Visibility
2. Register the Container ID as the Host ID
3. Configure the Cluster Role
4. Deploy the Machine Agent on Kubernetes

After the Machine Agent has been deployed on Kubernetes, you can add the App Server Agent into your image:

- Instrument Applications with Kubernetes
    - Resource Limits

Enable Container Visibility

Update the Controller to >= 4.4.3.

To enable Kubernetes Visibility in your environment, edit these parameters:

- Controller
    - `sim.machines.tags.k8s.enabled`: The value defaults to `true`. The global tags enabled flag has priority over this.
    - `sim.machines.tags.k8s.pollingInterval`: The value defaults to one minute. The minimum value you can set for the polling interval is 30 seconds.
- Machine Agent
    - `k8sTagsEnabled`: The value defaults to `true` and is specified in the `ServerMonitoring.yml` file.

Continue with Use Docker Visibility with Red Hat OpenShift. You can use the example `DaemonSet`, the sample Docker image for Machine Agent, and the sample Docker start script to set up the Machine Agent.

Register the Container ID as the Host ID

Install an app server agent in every container in a Kubernetes pod to collect application metrics. If multiple app server agents are running in the same pod, for example, in the RedHat OpenShift platform, you must register the container ID as the unique host ID, on both the app server agent and the Machine Agent, to collect container-specific metrics from the pod. Kubernetes pods can contain multiple containers and they share the same host ID. The Machine Agent cannot identify different containers running in a pod unless each container ID is registered as the host ID.

To register the container ID as the host ID:

1. Get the container ID from the `cgroup`.

    ```
    cat /proc/self/cgroup | awk -F '/' '{print $NF}'  | head -n 1
    ```

2. Register the app server agents.

    ```
    -Dappdynamics.agent.uniqueHostId=$(sed -rn '1s#.*/##; 1s/(.{12}).*/\1/p' /proc/self/cgroup)
    ```

3. Register the Machine Agent.

    ```
    -Dappdynamics.docker.container.containerIdAsHostId.enabled=true
    ```

Configure the Cluster Role

This sample cluster role definition provides read access to various Kubernetes resources. These permissions enable Kubernetes extensions to the Machine Agent and pod metadata collection. The role is called `appd-cluster-reader`, but you can rename it. The cluster role definition outlines various API groups that will be available for members of this role. For every API group, we define a list of resources that will be accessed and the access method. Because we need to retrieve information from these API endpoints, we need the read-only access, expressed by "`get`", "`list`," and "`watch`" verbs.

```
kind: ClusterRole
apiVersion: rbac.authorization.k8s.io/v1
metadata:
  name: appd-cluster-reader
rules:
- nonResourceURLs:
      - '*'
  verbs:
      - get
- apiGroups: ["batch"]
  resources:
    - "jobs"
  verbs: ["get", "list", "watch"]
- apiGroups: ["extensions"]
  resources:
    - daemonsets

    - list
    - watch
- apiGroups:
  - apiregistration.k8s.io
  resources:
    - apiservices
    - apiservices/status
  verbs:
    - get
    - list
    - watch
- apiGroups:
  - events.k8s.io
  resources:
    - events
  verbs:
    - get
    - list
    - watch
```

Once the role is defined, you must create cluster role bindings to associate the role with a service account. This example of a ClusterRoleBinding spec makes `appd-cluster-reader` service account a member of the `appd-cluster-reader-role` in the project "`myproject`". The naming is purely coincidental. The names of the service account and the cluster role do not have to match.

```
kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1
metadata:
  name: cluster-reader-role-binding
subjects:
- kind: ServiceAccount
  name: appd-cluster-reader
  namespace: myproject
roleRef:
  kind: ClusterRole
  name: appd-cluster-reader
  apiGroup: rbac.authorization.k8s.io
```

Deploy the Machine Agent on Kubernetes

You can deploy the AppDynamics Machine Agent in a single container image without an init container. By default, the Machine Agent is deployed to the cluster as a `DaemonSet` and distributes every Agent instance evenly across all cluster nodes. When required, you can configure the `DaemonSet` with node affinity rules or node anti-affinity rules to ensure that it is deployed to a desired set of nodes and not across the entire cluster. See Assigning Pods to Nodes to learn about node affinity.

To harvest pod metadata, the service account used to deploy the Machine Agent must have the `cluster-reader` role in OpenShift. The `cluster-reader` role is also required for the Kubernetes extensions to the Machine Agent.

```
# assigning cluster-reader role in OpenShift
oc adm policy add-cluster-role-to-user cluster-reader -z appd-account
```

If you are working with a vanilla Kubernetes distribution, it may not have a pre-built cluster role similar to `cluster-reader` in OpenShift. See ClusterRole Configuration.

Instrument Applications with Kubernetes

There are several approaches to instrumenting applications deployed with Kubernetes; the method you choose depends on your particular requirements and DevOps processes. To monitor an application container with AppDynamics, you must include an App Server Agent in that container by:

- Using an appropriate base image which has the App Server Agent pre-installed.
- Loading the App Server Agent dynamically as part of the container startup using an init container.
- Loading the App Server Agent and dynamically attaching it to a running process (where the language runtime supports it).

The third option is usually applicable only to Java-based applications since the JVM supports Dynamic Attach, a standard feature of the AppDynamics Java APM Agent. See Dynamic Java Instrumentation.

For the other options, it is common practice to make use of standard Kubernetes features such as Init Containers, ConfigMaps, and Secrets (as described in Deploying AppDynamics Agents to OpenShift Using Init Containers).

Resource Limits

The main application being monitored should have resource limits defined. Provide 2% padding for CPU and add up to 100 MB of memory.

To support up to 500 containers, you can configure the Machine Agent with the following resource requests and limits: `Mem = 400M, CPU = "0.1"` and `Mem = 600M, CPU = "0.2"`

AppDynamics provides a Kubernetes Snapshot Extension to monitor the health of the Kubernetes Cluster. When deploying this extension, only a single version of the extension should be deployed to the cluster. Do not include it in the `DaemonSet` to avoid duplicates and potential cluster overload. Instead, consider deploying the Machine Agent instance with this extension, in addition to the `DaemonSet`, as a separate deployment with a single replica for Server Visibility. In this case, you can drop the memory request to 250 M and disable the Machine Agent SIM and Docker.

Use Docker Visibility with Red Hat OpenShift

This page describes how to set up the Machine Agent with Docker Visibility enabled to run as a `DaemonSet` on an OpenShift cluster.

Docker Visibility supports OpenShift Version 3. With the Machine Agent, you can collect performance data from OpenShift clusters. By installing the agent as a `DaemonSet` on each host in the OpenShift cluster, the `DaemonSet` monitors each host on the OpenShift cluster and the corresponding containers that have an AppDynamics App Agent running. This process is similar to that of monitoring the Kubernetes cluster.

Using Docker Visibility to monitor OpenShift containers is no longer the preferred option and will eventually be deprecated. Use the Cluster Agent instead as described in Monitor Kubernetes with the Cluster Agent. The Cluster Agent supports OpenShift container visibility, as well as visibility into cluster health and capacity.

Before You Begin

This functionality requires a Server Visibility license.

- You must have an OpenShift user account with a `cluster-admin` role, such as `system:admin`.
- Install the OpenShift command line tool (`oc`)
- AppDynamics recommends that you use Docker CE/EE v17.03 or Docker Engine >= v1.13 with this product. Some data may be unavailable if you are using previous versions of Docker.

Machine Agent Installation and Configuration

The process includes:

- Set the Java Options
- Register the Container ID as the Host ID
- Create Project and Service Account
- Secure the Machine Agent
    - Run the Machine Agent Without cluster-reader Role
    - Run the Machine Agent Without Privileged Container Mode
    - Security Permissions for the Service Account
- Create a Docker Image of the Machine Agent
- Deploy the Machine Agent as DaemonSet
    - Verify Machine Agent Status

Set the Java Options

By default, the `MaxMetaspaceSize` is set to 100 MB in OpenShift. If your application operates within a small margin of its existing memory resource allocation, increase the allocation for the application. AppDynamics recommends allocating additional Metaspace Size space to accommodate the machine agent. Directly configure the environment variable `GC_MAX_METASPACE_SIZE` to set the `MaxMetaspaceSize` parameter in the deployment through a config map.

Register the Container ID as the Host ID

Install an App Server Agent in each container in a Kubernetes pod to collect application metrics. If multiple App Server agents are running in the same pod (for example, in the RedHat OpenShift platform), you must register the container ID as the unique host ID on both the App Server Agent and the Machine Agent to collect container-specific metrics from the pod. Kubernetes pods can contain multiple containers and they share the same host ID. The Machine Agent cannot identify different containers running in a pod unless each container ID is registered as the host ID.

To register the container ID as the host ID:

1. Get the container ID from the `cgroup`.

    ```
    cat /proc/self/cgroup | awk -F '/' '{print $NF}'  | head -n 1
    ```

2. Register the App Server Agents.

    ```
    -Dappdynamics.agent.uniqueHostId=$(sed -rn '1s#.*/##; 1s/docker-(.{12}).*/\1/p' /proc/self/cgroup)
    ```

3. Register the Machine Agent.

```
-Dappdynamics.docker.container.containerIdAsHostId.enabled=true
```

Create Project and Service Account

In OpenShift terminology, a *project* is a mechanism to isolate a group of users and their resources. An administrator can provide individual users or groups with permission to create projects and/or manage specific projects.

To isolate the Machine Agent from other projects, create a machine agent project:

```
oc new-project machine-agent
```

To create a service account, `ma`, with necessary privileges for the Machine Agent to obtain metrics:

1. Verify that the current project is `machine-agent`.

   ```
   oc status
   ```

2. Create a service account.

   ```
   oc create serviceaccount ma
   ```

   Service accounts provide a secure way to control OpenShift API access without sharing a regular user's credentials.
3. Assign the privileged security context constraints (SCC) to the service account. SCC determines the permissions and abilities of pods.

   ```
   oc adm policy add-scc-to-user privileged -z ma
   ```

   See Security Permissions for the Service Account for the detailed list of permissions for the service account.
4. Add the `cluster-reader` role to the service account.

   ```
   oc adm policy add-cluster-role-to-user cluster-reader -z ma
   ```

Secure the Machine Agent

You can deploy the Machine Agent with tighter security. Determine the level of security for the project and leverage security permissions to secure the Machine Agent.

Run the Machine Agent Without cluster-reader Role

Without the `cluster-reader` role, the Machine Agent cannot read information such as Pod and ReplicaSet from the OpenShift cluster. The agent can, however, collect other metrics except for the tags in the app server agent container.

Run the Machine Agent Without Privileged Container Mode

To disable this privilege, remove the section below from the `DaemonSet` YAML file.

```
securityContext:
          privileged: true
```

Without the Privileged Container mode, the Machine Agent cannot read files like `/hostroot/etc/passwd` and `/hostroot/proc/<pid>/etc`. Therefore, it cannot collect metrics such as processes and network.

Disabling this privilege has no effect on collecting the App Server Agent container metrics.

Security Permissions for the Service Account

The Service Account requires the following security permissions to provide maximum isolation to the project under which the Machine Agent is running:

Permission	Description
The cluster-reader role	This cluster-reader role allows the Machine Agent to read tags from the OpenShift cluster. For example: `oc adm policy add-cluster-role-to-user cluster-reader -z ma`
The privileged SCC	The privileged SCC allows the Machine Agent to be run as the root user. For example: `oc adm policy add-scc-to-user privileged -z ma`

Run as privileged container	Running as the privileged container allows the Machine Agent to perform operations such as reading files from `/etc` and reading process information from `/proc`.
	
	This privilege is configured in the DaemonSet YAML file as follows.
	
	`securityContext:`
	`  privileged: true`

Create a Docker Image of the Machine Agent

Copy the following files to a directory on a machine that can build the Docker image.

- Machine Agent Bundle - 64-bit Linux (zip)
  Download this bundle and rename it to `machine-agent.zip`.
- Dockerfile
  See the sample Docker file below.
- `start-appdynamics` script
  See the sample script below.

Build the image with your desired method and make it available in your image registry.

Deploy the Machine Agent as `DaemonSet`

1. Modify the sample `DaemonSet` to point to your Controller:
   a. Select the worker node.

```
nodeSelector:
        node-role.kubernetes.io/compute: "true"
```

   b. Change the following Controller information in the sample `DaemonSet`.

```
containers:
     - env:
        - name: APPDYNAMICS_CONTROLLER_HOST_NAME
          value: "<controller-host-name>"
        - name: APPDYNAMICS_CONTROLLER_PORT
          value: "<controller-port>"
        - name: APPDYNAMICS_CONTROLLER_SSL_ENABLED
          value: "true"
        - name: APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY
          value: "<account-access-key>"
        - name: APPDYNAMICS_AGENT_ACCOUNT_NAME
          value: "<your-account>"
        - name: APPDYNAMICS_SIM_ENABLED
          value: "true"
        - name: APPDYNAMICS_DOCKER_ENABLED
          value: "true"
```

c. Specify the Docker image.

```
image: "<your image>"
```

d. Enable the Machine Agent to run as the privileged user.

```
securityContext:
          privileged: true
```

e. If you have a different service account name, replace it with the existing one.

```
serviceAccount: ma
      serviceAccountName: ma
```

2. Create `DaemonSet` below:
   a. Verify that the current project is machine-agent.

```
oc status
```

   b. Create the machine-agent `DaemonSet`.

```
oc create -f machine-agent-daemonset.yaml
```

   The Machine Agent appears in the UI.

Verify Machine Agent Status

If the Machine Agent does not appear in the UI, check the status as follows:

1. Check the machine-agent `DaemonSet`.

```
oc get ds
```

2. Check the machine-agent pod.

```
oc get pod
```

   The pod name is `machine-agent-daemonset-<XXXX>`.
3. Check logs whether the last line is "Started AppDynamics Machine Agent Successfully."

```
oc get logs -f <machine-agent-daemonset-<XXXX>>
```

Sample Machine Agent Deployment Files

Below are sample `DaemonSet`, Dockerfile and Start Script that you can use as a reference for deploying the Machine Agent.

Sample `DaemonSet`

Modify the sample `DaemonSet` to suit your deployment scenario.

```
apiVersion: extensions/v1beta1
kind: DaemonSet
metadata:
  name: machine-agent-daemonset
  namespace: machine-agent
spec:
  selector:
    matchLabels:
      name: appdynamics-machine-agent
  template:
    metadata:
      labels:
        name: appdynamics-machine-agent
    spec:
      nodeSelector:
        node-role.kubernetes.io/compute: "true"
      containers:
      - env:
        - name: APPDYNAMICS_CONTROLLER_HOST_NAME
          value: "<your-hostname>"
        - name: APPDYNAMICS_CONTROLLER_PORT
          value: "<your-port>"
        - name: APPDYNAMICS_CONTROLLER_SSL_ENABLED
          value: "true"
        - name: APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY
          value: "<your-access-key>"
        - name: APPDYNAMICS_AGENT_ACCOUNT_NAME
          value: "<your-account>"
        - name: APPDYNAMICS_SIM_ENABLED
          value: "true"
        - name: APPDYNAMICS_DOCKER_ENABLED
          value: "true"
        image: <your-image>
        name: machine-agent
        securityContext:
          privileged: true
        volumeMounts:
        - mountPath: /hostroot
          name: hostroot
          readOnly: true
        - mountPath: /var/run/docker.sock
          name: docker-sock
      restartPolicy: Always
      imagePullPolicy: Always
      serviceAccount: ma
      serviceAccountName: ma
      volumes:
      - name: hostroot
        hostPath:
          path: /
      - name: docker-sock
        hostPath:
          path: /var/run/docker.sock
```

Sample Dockerfile

You can use this Dockerfile sample or the one in OpenShift Visibility Manifests.

```
# Sample Dockerfile for the AppDynamics Machine Agent
# This is provided for illustration purposes only

FROM ubuntu:16.04
# Install required packages
RUN apt-get update && \
    apt-get install -y unzip && \
    apt-get clean
# Install AppDynamics Machine Agent
ENV MACHINE_AGENT_HOME /opt/appdynamics/machine-agent/
ADD machine-agent.zip /tmp/machine-agent.zip
RUN mkdir -p ${MACHINE_AGENT_HOME}
# Include start script to configure and start MA at runtime
ADD start-appdynamics ${MACHINE_AGENT_HOME}
RUN chmod 774 ${MACHINE_AGENT_HOME}/start-appdynamics
# change files and directories to be owned by root so MA container user in root
group can access
RUN chgrp -R 0 /opt && \
    chmod -R g=u /opt
RUN chgrp -R 0 /tmp/machine-agent.zip && \
    chmod g=u /tmp/machine-agent.zip
# Changing directory to MACHINE AGENT HOME
WORKDIR ${MACHINE_AGENT_HOME}
# Configure and Run AppDynamics Machine Agent
CMD "./start-appdynamics"
```

Sample start-appdynamics Script

```
#!/bin/bash
unzip -oq /tmp/machine-agent.zip -d ${MACHINE_AGENT_HOME} && \
    rm /tmp/machine-agent.zip
# Start Machine Agent
./bin/machine-agent -j jre/
```

Monitor Pivotal Cloud Foundry

VMware Tanzu Application Service (PCF)

VMware Tanzu Application Service (TAS), formerly known as Pivotal Cloud Foundry (PCF), is an open-source cloud computing Platform as a Service (PaaS). Developers can develop, deploy, operate, and scale cloud-native applications for public and private clouds.

AppDynamics provides three tiles to support VMware TAS 2.x (>= v2.0.7) and is available on the VMware Tanzu Network to download and install in a TAS foundation.

VMware Tanzu Kubernetes Grid Integrated (PKS)

VMware Tanzu Kubernetes Grid Integrated (TKGI), formerly known as Pivotal Container Service (PKS), is VMware's product used to deploy and manage open-source Kubernetes. The Kubernetes monitoring that AppDynamics provides has been tested to with TKGI. See Monitor Kubernetes with the Cluster Agent to set up container and cluster visibility within TKGI.

AppDynamics Application Performance Monitoring for VMware Tanzu

To simplify APM setup, the AppDynamics Application Performance Monitoring for VMware Tanzu tile delivers a service broker to support an AppDynamics marketplace service. You can configure the Controller parameters in the tile and automatically publish to the marketplace after you install the tile.

To bind a TAS app to the marketplace service to consume the Controller credentials, enter:

```
$ cf bind my-tas-app my-appd-marketplace-service
```

To use the integrated AppDynamics buildpack support to start the APM Agent based on the parameters from the marketplace service, and start sending performance metrics to the Controller, perform a push:

```
$ cf push
```

The tile also installs the AppDynamics extension buildpack in the TAS environment. See the tile documentation for buildpack support and language-specific workflows to enable APM

AppDynamics Platform Monitoring for VMware Tanzu

The AppDynamics Platform Monitoring for VMware Tanzu tile provides visibility into the TAS platform where you deployed your AppDynamics-monitored applications. The tile deploys a Firehose Nozzle that collects KPI metrics and publishes them to a Controller. The tile also deploys a Dashboard App that automatically creates KPI health rules and custom dashboards associated with the health rules. The Dashboard App enables you to monitor the health and capacity of one, or more, TAS foundations. See the tile documentation.

AppDynamics Application Analytics for VMware Tanzu

The AppDynamics Application Analytics for VMware Tanzu tile supports collecting Transaction Analytics (in real-time) from TAS apps to connect application performance, user experience, and business outcomes. The tile deploys an Analytics Agent in the TAS environment that forwards transaction analytics events from TAS apps to an AppDynamics Events Service. See the tile documentation.

Container Metrics

To access the **Containers** Dashboard, select: AppDynamics Home > **Servers** > **Containers**.

The **Containers** Dashboard shows resource utilization metrics of your containerized applications and the underlying host machine. You can access the **Containers** Dashboard from the Servers tab in the Controller UI. The **Containers** page lists all monitored containers used by an application that is registered to the Controller.

Container Metrics

CPU

Name	Description	Default Monitoring Mode
%Busy	Percentage of time the CPU was busy processing system or user requests from this container; this metric includes CPU Stolen time.	KPI

%Busy Scaled	If the -cpus=<value> option is set in the container, this metric measures the scaled value of the CPUs property. If this value is not set, this metric measures the scaled value of the Logical CPUs property.
	
	To enable CPU Scaling:
	• Log in to the Administration Console: `http://<controller host>:<port>/controller/admin.jsp`
	• Select the user account you want.
	• Select **Add Property** and add:
	`key` = `sim.docker.container.cpuScaling`
	`value` = `true`
		KPI

Logical Cores	Number of logical cores on the host machine that are available to the container.	KPI
Shares	The -c or cpu-shares setting used to start the container.	KPI
Throttle Count	Number of times the container CPU is throttled. Use **Advanced** mode to view this metric as Throttled Time. If Throttled Time is less and the container is limited on computation, then this metric is available for you to review.	KPI
Throttled Time (ms)	Total amount of time the container CPU was throttled but did not receive enough host CPU. High throttle times indicate that the -c or cpu-shares setting (used to start the container) was too low.	KPI
Total %	Average utilization, of all available CPUs, by the container.	KPI

Disks

Name	Description	Default Monitoring Mode
Average IO Utilization %	Average disk utilization for read/write operations. This metric may be unavailable on some platforms.	KPI
<*disk*> Reads/sec	Number of read operations by the container on <*disk*>.	Diagnostic
<*disk*> Writes/sec	Number of write operations by the container on <*disk*>.	Diagnostic
KB Read /sec	The rate of data read by the container from all disks and partitions.	KPI
KB Written /sec	The rate of data written by the container to all disks and partitions.	KPI
MB Reads /sec (MB)	Number of read operations by the container on all disks and partitions.	KPI

MB Writes /sec	Number of write operations by the container on all disks and partitions.	KPI
Queue Size	Average number of container requests queued during the time bucket. Consistently high queue sizes indicate that the container is not receiving enough IO resources. This metric may be unavailable on some platforms.	KPI

Memory

Name	Description	Default Monitoring Mode
Cache Size (MB)	Total amount of data cached in memory.	Diagnostic
Failed Count	Number of times a memory allocation failure occurred because it exceeded the pre-set memory limit for that container; or, number of times the hard limit for the container was reached.	KPI
Page Major Fault Count	Number of major page faults caused by the container. Docker metric is pgmajfault. A high rate of page faults could indicate that the specified memory constraints for the container are too low.	KPI
Reservation	Soft limit based on the `--memory-reservation` used to start the container.	KPI
Resident Set Size (MB)	Total amount of memory that belongs to stacks, heaps, and anonymous memory maps.	KPI
Usage	Memory usage by the container, in bytes.	KPI
Used %	Memory utilization by the container as a percentage of the memory hard limit, based on the `--memory` option used to start the container.	KPI
Used MB	Memory utilization by the container, in MB.	KPI

Network

Name	Description	Default Monitoring Mode[1]
Count (KB)	Network Volume, count (KB), incoming from an external network and outgoing to an external network.	KPI
Rate (KB/s)	Network Rate, rate (KB/s), incoming from an external network and outgoing to an external network.	Diagnostic
Incoming (KB)	Network traffic received by the container.	KPI
Outgoing (KB)	Network traffic sent by the container.	KPI
Incoming (KB/sec)	Rate of network traffic received by the container.	Diagnostic
Outgoing (KB/sec)	Rate of network traffic sent by the container.	Diagnostic
Incoming Packets	Number of packets received by the container.	Diagnostic
Outgoing Packets	Number of packets sent by the container.	Diagnostic
Incoming Packets Dropped	Number of incoming packets dropped before reaching the container. A high count of dropped packets may indicate high congestion or an issue on the network path.	KPI
Outgoing Packets Dropped	Number of outgoing packets dropped after leaving the container. A high count of dropped packets may indicate high congestion or an issue on the network path.	KPI
Incoming Errors	Number of packets received with errors.	KPI
Outgoing Errors	Number of packets sent with errors.	KPI
<eth0> Incoming Errors	Number of collision errors when <eth0> could not receive a frame due to a problem on the interface.	Diagnostic
<eth0> Outgoing Errors	Number of collision errors when <eth0> could not send a frame due to a problem on the interface.	Diagnostic
<eth0> Incoming KB	Average KB of traffic received on <eth0>.	Diagnostic
<eth0> Outgoing KB	Average KB of traffic sent on <eth0>.	Diagnostic

<eth0> Incoming KB /sec	Average rate of traffic received on <eth0>.	Diagnostic
<eth0> Outgoing KB /sec	Average rate of traffic sent on <eth0>.	Diagnostic
<eth0>Incoming Errors	Number of packets received on <eth0> with errors.	Diagnostic
<eth0> Outgoing Errors	Number of packets sent on <eth0> with errors.	Diagnostic
<eth0> Incoming Packets Dropped	Number of incoming packets dropped before reaching <eth0>. A high count of dropped packets may indicate high congestion or an issue on the network path.	Diagnostic
<eth0> Outgoing Packets Dropped	Number of outgoing packets dropped after leaving <eth0>. A high count of dropped packets may indicate high congestion or an issue on the network path.	Diagnostic

Monitor Kubernetes with the Cluster Agent

Deployment Support

The Cluster Agent monitors the health of Kubernetes and OpenShift clusters and is supported on all major Kubernetes distributions. The Cluster Agent collects metrics and metadata for the entire cluster, including every node and namespace down to the container level. When you instrument applications with AppDynamics APM Agents, you can use the Cluster Agent to view both Kubernetes and APM metrics for those pods (if both the Cluster Agent and the APM Agents are reporting data to the same account on a Controller).

You can use the Cluster Agent to:

- Gain visibility into key Kubernetes metrics and events, and detect uptime and availability issues
- Track resource usage of pods relative to the defined requests and limits
- Diagnose issues that may prevent uptime or scalability issues, such as:
  - Pod failures and restarts
  - Node starvation
  - Pod eviction threats and pod quota violations
  - Image and storage failures
  - Pending or stuck pods
  - Bad endpoints (detects broken links between pods and application components)
  - Service endpoints in a failed state
  - Missing dependencies (Services, ConfigMaps, and Secrets)

Deploy on Kubernetes

- Install the Cluster Agent
- Configure the Cluster Agent
- Install Infrastructure Visibility with the Cluster Agent Operator

Cluster Agent

- Use the Cluster Agent
- Cluster Metrics
- Administer the Cluster Agent
- Monitor Cluster Health
- Monitor Kubernetes Events

Reference and Troubleshooting

- Install the Cluster Agent
- Validate the Cluster Agent Installation
- Troubleshoot the Cluster Agent
- Overview of Cluster Monitoring
- Cluster Agent Requirements and Supported Environments
- Cluster Metrics

Overview of Cluster Monitoring

The AppDynamics Cluster Agent is a lightweight Agent written in Golang used to monitor Kubernetes and OpenShift clusters. You can use the Cluster Agent to monitor and understand how Kubernetes infrastructure affects your applications and business performance. With the Cluster Agent, you can collect metadata, metrics, and events for a Kubernetes cluster. The Cluster Agent is supported on Red Hat OpenShift and cloud-based Kubernetes platforms, such as Amazon EKS, Azure AKS, and Rancher.

Cluster Monitoring in the Controller

The Cluster Agent monitors events and metrics of Kubernetes or OpenShift clusters. It also tracks the state of most Kubernetes resources: pods, replica sets, deployments, services, persistent volumes, nodes, and so on. The data is received through the Kubernetes API server and is sent to the AppDynamics Controller. See Cluster Metrics.

Cluster Agent and Server Visibility with Docker Monitoring

AppDynamics Server Visibility monitors the worker nodes at a more detailed level. Server Visibility includes the ability to monitor running containers through Docker Monitoring. However, the Cluster Agent also monitors the same containers through the Kubernetes API server. You cannot run Server Visibility with Docker Monitoring enabled, and the Cluster Agent concurrently. Doing so may result in your data being overwritten, and may lead to unpredictable behaviors. See Install Infrastructure Visibility with the Cluster Agent Operator.

> When you deploy both Agents to the cluster, ensure that you deploy the Machine Agent with Docker Visibility disabled. See Monitor Containers with Docker Visibility.

Cluster Dashboard Metrics

The Cluster Dashboard provides an overview of potential issues with cluster health, grouped by category and severity. It shows error events, evictions, node resource starvation, distribution of pod phases, and issues associated with:

- Applications
- Cluster configuration
- Image or storage access
- Security access errors
- Quota violations

The dashboard contains cluster resource capacity stats and resource usage data relative to the deployment requests and limits for CPU, Memory, and Storage. The dashboard also provides real-time statistics on the state of monitored objects on the cluster, best-practice violations, and missing dependencies. See Monitor Cluster Health.

Cluster Agent Health Rules

You can create Cluster Agent Health Rules based on cluster metrics. Because Health Rules for clusters are created using server health rules, the health rule violations for clusters show as a server health rule violation. When creating the Health Rule, in the **Affected Entities** section, select **Custom** , and then select your Cluster Agent from the list of machines. When setting the Critical/Warning conditions, the entire metric tree displays. Select the Cluster Agent metrics for which to create the Health Rule. To create Health Rules for Cluster Agent metrics, follow the Create a Health Rule procedure s.

You can create Health Rules for these metrics:

- Number of error events
- Number of evictions
- Number of threats
- Nodes with disk pressure
- Nodes with memory pressure
- CPU/Memory utilization

Cluster Agent Requirements and Supported Environments

This page describes the software requirements, compatibility with different Kubernetes-based software, Cluster Agent distribution, licensing, and performance specifications.

Software Requirements

The Cluster Agent is designed to run on Linux and deployed using the AppDynamics Operator.

The Cluster Agent requires:

- AppDynamics Controller >= 20.3.0.
- Kubernetes versions, 1.11, 1.13, or >=1.14, with the Kubernetes metrics-server deployed and enabled on the cluster.
- A cluster that you can access and monitor.
- Sufficient Server Visibility licenses. The Cluster Agent consumes one Server Visibility license. See License Management
- Access to Docker Hub or Red Hat Container Registry to pull the Cluster Agent Operator and Cluster Agent images, or access to an internal repository where these images are maintained. See Install the Cluster Agent.

> If you deploy the Cluster Agent to monitor your Kubernetes Cluster, it does not monitor worker nodes. To monitor worker nodes, you must install the Machine Agent which consumes additional Server Visibility licenses (one Standalone Machine Agent per node). See Install Infrastructure Visibility with the Cluster Agent Operator

The Cluster Agent is compatible with these cloud platforms:

Cloud Platform	Version
Rancher Kubernetes Engine (RKE)	• 1.0.4 with Kubernetes 1.17 • 1.2.1 with Kubernetes 1.19.3
Kubernetes	1.11, 1.13, 1.14, 1.17, 1.19.3 with the Kubernetes metrics-server deployed
Amazon EKS	1.11, 1.13, 1.14, 1.15, 1.16, 1.17, 1.18, and 1.19 with the Kubernetes metrics-server deployed
Azure AKS	1.11, 1.13, 1.14, 1.18, 1.19, 1.20 with the Kubernetes metrics-server deployed
Google GKE	1.14, 1.15, 1.16, 1.17, 1.18, 1.19, and 1.20
Red Hat OpenShift	3.11, 4.1, 4.2, 4.3, 4.4, 4.5, 4.6 and 4.7 The metrics-server is not shipped with OpenShift, you must deploy it separately. The CRI-O container runtime is supported on >=4.2.7.
kubectl	>=1.11.3

> Installing AppDynamics to test or evaluate involves verifying system requirements, preparing the host, and then installing the Controller. See Install the Controller Using the Enterprise Console and Install the Controller Using the CLI.

Cluster Agent Distribution

You can download the Cluster Agent from the AppDynamics Download site as a zip archive. The archive also contains distribution-specific configuration files for the deployment.

Licensing

The Cluster Agent requires a Server Visibility license. To get started, see Enable Server Visibility. If you already have a Server Visibility license, see Install the Cluster Agent for installing Cluster Agent on a Kubernetes cluster.

Cluster Agent Performance Certification

Cluster Agent Version	Performance Certification
<=20.10	You can monitor the certified stable limit of 750 pods and 1500 containers
>=20.11	• Cluster Agent Vertical Scaling: This is the certified stable limit: If you run one container per pod then you can monitor 2250 pods and 2250 containers. If you run two containers per pod, then you can monitor 1500 pods and 3000 containers. • Cluster Agent Horizontal Scaling: If the number of pods per cluster exceeds the limit, then you can deploy multiple Cluster Agents to monitor the cluster using Helm charts. See Install the Cluster Agent with Helm Charts. For the limit of Cluster Agents per Controller, see Cluster Agent and Pod Limits.

Cluster Agent and Pod Limits

On-Premises

You can configure the number of Cluster Agents based on the overall controller capacity. To configure the limit, see the `sim.cluster.agent.limit` description under Controller Settings for the Cluster Agent.

If your Cluster has more pods than can be monitored, the Cluster Agent ensures that the group of pods being monitored remains the same over time. If any of the reported pods are terminated in the future, then the Cluster Agent replaces the terminated pods with previously unreported pods and starts monitoring the newly included pods.
The total pods metric displayed on the **Pods List** page reflects only the number of pods up to the configured limit. See the `sim.cluster.pod.limit` description under Controller Settings for the Cluster Agent.

SaaS

To configure the limits, create an AppDynamics Support ticket.

Install the Cluster Agent

This page describes how to install the Cluster Agent. For optional post-installation steps, including instrumenting applications with App Server Agents, see Post-Install Workflow.

Installation Overview

You can install the Cluster Agent using either the Kubernetes CLI (`kubectl`) or Helm. In both cases, the Cluster Agent Operator is installed first, followed by the Cluster Agent. The exact configuration applied during the installation differs slightly based on whether the cluster is an OpenShift or Kubernetes cluster.

Installation Workflow

You must make these decisions during the installation workflow:

- The first decision is whether to use the pre-built Cluster Agent images published on Docker Hub or the OpenShift Container Registry. This is the simplest option when using the Kubernetes CLI or Helm. If you need to build a custom image to satisfy internal image policies, or if you require that the pre-built Cluster Agent image is stored in an internal container registry, see Build the Cluster Agent Container Image.
- The second decision is whether to install the Cluster Agent using the Kubernetes CLI or the Cluster Agent Helm Chart. See Install the Cluster Agent with the Kubernetes CLI and Install the Cluster Agent with Helm Charts.

The Cluster Agent requires that you install the Metrics Server in the cluster. If the metrics server is not already installed under the `kube-system` name space, then you can install it using the Kubernetes CLI, as described in Install the Cluster Agent with the Kubernetes CLI. If you are using the Cluster Agent Helm chart, you can set the `install.metrics-server` Helm value to `true` to install the Metrics Server subchart. See Install the Cluster Agent with Helm Charts.

After the installation completes, see Validate the Cluster Agent Installation for validation and troubleshooting procedures.

Post-Install Workflow

After you install and Validate the Cluster Agent, you can instrument the Kubernetes applications in the cluster with AppDynamics Server Agents. See Contanier Installation Options for an overview of the options.

To install the AppDynamics Server Visibility Agent or Network Agent on cluster nodes, see Install Infrastructure Visibility with the Cluster Agent Operator.

To enable log collection for failing pods on on-premises Controllers, see Enable Log Collection for Failing Pods.

Next Steps

Install the Cluster Agent with the Kubernetes CLI

Install the Cluster Agent with Helm Charts

This page describes how to install the Cluster Agent. For optional post-installation steps, including instrumenting applications with App Server Agents, see Post-Install Workflow.

Install the Cluster Agent with the Kubernetes CLI

This page describes how to install the Cluster Agent using the Kubernetes CLI which is an alternative to Install the Cluster Agent with Helm Charts.

Requirements

Before you begin, verify that you have:

- Installed kubectl >= 1.11.3
- Met the requirements described here: Cluster Agent Requirements and Supported Environments

Installation Procedure

1. If you have not already installed the `metrics-server`, then install it. See https://github.com/kubernetes-sigs/metrics-server for the most recent installation instructions.

   ```
   kubectl create -f https://github.com/kubernetes-sigs/metrics-server/releases/download/v0.3.7/components.yaml
   ```

2. Download the Kubernetes or OpenShift Cluster Agent bundle from the Download portal, unzip the contents of the bundle to the current directory:

   ```
   unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
   ```

3. Create a `namespace` for `appdynamics` in your cluster:

   ```
   kubectl create namespace appdynamics
   ```

4. Install the Cluster Agent Operator using the correct Kubernetes and OpenShift version (where applicable):

5. Based on the Account Access Key for the Controller, create the Controller Access Key Secret that the Cluster Agent reports to:

   ```
   kubectl -n appdynamics create secret generic cluster-agent-secret --from-literal=controller-key=<access-key>
   ```

6. Edit `cluster-agent.yaml` to set the AppDynamics Controller details for the Cluster Agent to report to.
   a. Set the `nsToMonitor` or `nsToMonitorRegex` options to include the namespaces you want to monitor.
   b. Set the image tag to the version you are installing, `cluster-agent:21.2.0`, for example.
   For additional configuration tasks, such as configuring SSL for on-premises Controllers, proxy support, or pull secrets, see Configure the Cluster Agent.

   This example assumes the use of the pre-built Cluster Agent image on Docker Hub. See Build the Cluster Agent Container Image to build your own image.

   ```
   apiVersion: appdynamics.com/v1alpha1
   kind: Clusteragent
   metadata:
     name: k8s-cluster-agent
     namespace: appdynamics
   spec:
     appName: "dev-cluster"
     controllerUrl: "http://mycontroller.com:8080"
     account: "my-account"
     # docker image info
     image: "docker.io/appdynamics/cluster-agent:21.2.0"
     serviceAccountName: appdynamics-cluster-agent
     nsToMonitor: [appdynamics,namespace1,namespace2]
     stdoutLogging: "true"
   ```

7. Install the Cluster Agent:

```
kubectl create -f cluster-agent.yaml
```

See Validate the Cluster Agent Installation to validate and troubleshoot the installation. Once the install is validated, see Container Installation Options for options to install App Server Agents in applications in the cluster.

Install the Cluster Agent with Helm Charts

This page describes how to use Helm Charts to deploy the Cluster Agent.

Helm is a package manager for Kubernetes. Helm charts are a collection of files that describe a set of Kubernetes resources. The Cluster Agent Helm chart is a convenient method to deploy the Cluster Agent Operator and Cluster Agent. You can also use the Cluster Agent Helm chart to deploy multiple Cluster Agents in a single cluster. This may be necessary for larger clusters that exceed the pod monitoring limit for a single Cluster Agent. See Cluster Agent Requirements and Supported Environments.

Requirements

- Cluster Agent version >= 20.6
- Controller version >= 20.6
- Cluster Agent Helm charts are compatible with Helm 3.0

Install a Single Cluster Agent in a Cluster

1. Add the chart repository to Helm:

   ```
   helm repo add appdynamics-charts https://appdynamics.github.io/appdynamics-charts
   ```

2. Create a namespace for `appdynamics` in your cluster:

   ```
   kubectl create namespace appdynamics
   ```

3. Create a Helm values file, in the example called `values-ca1.yaml`.
   Update the `controllerInfo` properties with the credentials from your Controller.
   Update the `clusterAgent` properties to set the namespace and pods to monitor. See Configure the Cluster Agent for information about the available properties `nsToMonitor`, `nsToMonitorRegex`, `nsToExcludeRegex` and `podFilter`.

   values-ca1.yaml

   ```
   # AppDynamics controller info
   controllerInfo:
     url: https://<controller-url>:443
     account: <appdynamics-controller-account>
     username: <appdynamics-controller-username>
     password: <appdynamics-controller-password>
     accessKey: <appdynamics-controller-access-key>

   # Cluster agent config
   clusterAgent:
     nsToMonitorRegex: dev-.*
   ```

   See Configuration Options for values.yaml for more information regarding the available options. Also, you can download a copy of `values.yaml` from the Helm Chart repository using this command:

   ```
   helm show values appdynamics-charts/cluster-agent
   ```

4. If you have not installed the Kubernetes `metrics-server` in the cluster (usually located in the `kube-system` namespace), then set `install.metrics-server` to `true` in the values file to invoke the subchart to install it.

   ```
   install:
     metrics-server: true
   ```

   > Setting `install.metrics-server` installs `metrics-server` in the namespace with the `--namespace` flag which is located in the same namespace as the Cluster Agent.

5. Deploy the Cluster Agent to the `appdynamics` namespace:

```
helm install -f ./values-ca1.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent
--namespace=appdynamics
```

Enable Auto-Instrumentation

Once you have validated that the Cluster Agent was successfully installed, you can add additional configuration to the `instrumentationConfig` section of the values YAML file to enable auto-instrumentation. In this example, `instrumentationConfig.enabled` has been set to `true`, and multiple `instrumentationRules` have been defined. See Auto-Instrument Applications with the Cluster Agent.

values-ca1.yaml with Auto-Instrumentation Enabled

```
# AppDynamics controller info
controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

# Cluster agent config
clusterAgent:
  nsToMonitorRegex: ecom|books|groceries

instrumentationConfig:
  enabled: true
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom|books|groceries
  defaultAppName: Ecommerce
  appNameStrategy: namespace
  imageInfo:
    java:
      image: "docker.io/appdynamics/java-agent:latest"
      agentMountPath: /opt/appdynamics
      imagePullPolicy: Always
  instrumentationRules:
    - namespaceRegex: groceries
      language: dotnetcore
      imageInfo:
        image: "docker.io/appdynamics/dotnet-core-agent:latest"
        agentMountPath: /opt/appdynamics
        imagePullPolicy: Always
    - namespaceRegex: books
      matchString: openmct
      language: nodejs
      imageInfo:
        image: "docker.io/appdynamics/nodejs:20.6.0"
        agentMountPath: /opt/appdynamics
        imagePullPolicy: Always
      analyticsHost: <hostname of the Analytics Agent>
      analyticsPort: 443
      analyticsSslEnabled: true
```

After saving the `values-ca1.yaml` file with the added auto-instrumentation configuration, you must upgrade the Helm Chart:

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --
namespace appdynamics
```

Configuration Options

Config option	Description	Required

`deploymentMode`	Used for multiple cluster agent deployment in a single cluster	Optional
Image config options (Config options under `imageInfo` key in `values.yaml`)		
`imageInfo.agentImage`	Cluster agent image address in format `<registryUrl>/<registryAccount>/<project>`	Optional (Defaults to the Docker Hub image)
`imageInfo.agentTag`	Cluster agent image tag/version	Optional (Defaults to latest)
`imageInfo.operatorImage`	Operator image address in format `<registryUrl>/<registryAccount>/<project>`	Optional (Defaults to the Docker Hub image)
`imageInfo.operatorTag`	Operator image tag/version	Optional (Defaults to latest)
`imageInfo.imagePullPolicy`	Image pull policy for the operator pod	Optional
Controller config options (Config options under `controllerInfo` key in `values.yaml`)		
`controllerInfo.accessKey`	AppDynamics Controller accessKey	Required
`controllerInfo.account`	AppDynamics Controller account	Required
`controllerInfo.authenticateProxy`	true/false if the proxy requires authentication	Optional
`controllerInfo.customSSLCert`	Base64 encoding of PEM formatted SSL certificate	Optional
`controllerInfo.password`	AppDynamics Controller password	Required only when auto-instrumentation is enabled.
`controllerInfo.proxyPassword`	Password for proxy authentication	Optional
`controllerInfo.proxyUrl`	Proxy URL if the Controller is behind some proxy	Optional
`controllerInfo.proxyUser`	Username for proxy authentication	Optional
`controllerInfo.url`	AppDynamics Controller URL	Required
`controllerInfo.username`	AppDynamics Controller username	Required only when auto-instrumentation is enabled.
RBAC config		
`agentServiceAccount`	Service account to be used by the Cluster Agent	Optional
`createServiceAccount`	Set to true if `ServiceAccounts` mentioned are to be created by Helm	Optional
`operatorServiceAccount`	Service account to be used by the AppDynamics Operator	Optional
Agent pod config		
`agentPod.nodeSelector`	Kubernetes node selector field in the Cluster Agent pod spec	Optional
`agentPod.tolerations`	Kubernetes tolerations field in the Cluster Agent pod spec	Optional
`agentPod.resources`	Kubernetes CPU and memory resources in the Cluster Agent pod spec	Optional
Operator pod config		
`operatorPod.nodeSelector`	Kubernetes node selector field in the AppDynamics Operator pod spec	Optional
`operatorPod.tolerations`	Kubernetes tolerations field in the AppDynamics Operator pod spec	Optional
`operatorPod.resources`	Kubernetes CPU and memory resources in the AppDynamics Operator pod spec	Optional
Install switches		
`install.metrics-server`	True if metrics are to be installed. Metrics-server is installed in the same namespace as the agent.	Optional

Install Additional Cluster Agents in a Cluster

The Cluster Agent Helm Chart supports multiple Cluster Agents installation in a cluster. This may be necessary for larger clusters that exceed the pod monitoring limit for a single Cluster Agent. See Cluster Agent Requirements and Supported Environments.

Each additional Cluster Agents that is deployed must have different configuration from any previously deployed Cluster Agents. This is achieved by limiting the monitoring to a distinct set of namespaces and pods using the `nsToMonitor`, `nsToMonitorRegex, nsToMonitorExcludeRegex` and `podFilter` properties. See Configure the Cluster Agent.

The first Cluster Agent must be installed using the steps above where the default value of the `deploymentMode` property is not overridden and set to `PRIMARY`. Additional Cluster Agents must set `deploymentMode` to `NAMESPACED`.

To install additional Cluster Agents:

1. Create a new values file, called `values-ca2.yaml` as the example, that uses the same `controllerInfo` properties as the first Cluster Agent.
   Set `deploymentMode` to `NAMESPACED`.
   Add additional properties, such as `nsToMonitorRegex` and `podFilter`, to set the monitoring scope for this Cluster Agent.

   values-ca2.yaml

   ```
   deploymentMode: NAMESPACED

   # AppDynamics controller info
   controllerInfo:
     url: https://<controller-url>:443
     account: <appdynamics-controller-account>
     username: <appdynamics-controller-username>
     password: <appdynamics-controller-password>
     accessKey: <appdynamics-controller-access-key>

   # Cluster agent config
   clusterAgent:
     nsToMonitorRegex: stage.*

   podFilter:
     allowlistedLabels:
       - label1: value1
       - label2: value2
     blocklistedLabels: []
     allowlistedNames: []
     blocklistedNames: []
   ```

2. Create a namespace distinct from the previous namespace used for the first installation:

   ```
   kubectl create ns appdynamics-ca2
   ```

3. Install the additional Cluster Agent:

   ```
   helm install -f ./values-ca2.yaml "<my-2nd-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --namespace=appdynamics-ca2
   ```

You can enable auto-instrumentation only in the first Cluster Agent using `PRIMARY` mode. The Helm Chart generates an error if auto-instrumentation was enabled by additional Cluster Agents using that `Namespaced` mode.

Cluster Agent Helm Chart Configuration Examples

These examples display various configurations for the Cluster Agent Helm chart:

Use the Cluster Agent Helm Chart to Enable Custom SSL

user-values.yaml

```
controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

  #=====
  customSSLCert: "<base64 of PEM formatted cert>"
  #=====

agentServiceAccount: appdynamics-cluster-agent-ssl     # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl       # Can be any valid name
```

Use the Cluster Agent Helm Chart to Enable the Proxy Controller

Without authentication:

user-values.yaml

```
controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

  #=====
  proxyUrl: http://proxy-url.appd-controller.com
  #=====

agentServiceAccount: appdynamics-cluster-agent-ssl     # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl       # Can be any valid name
```

With authentication:

user-values.yaml

```
controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

  #=====
  authenticateProxy: true
  proxyUrl: http://proxy-url.appd-controller.com
  proxyUser: hello
  proxyPassword: world
  #=====

agentServiceAccount: appdynamics-cluster-agent-ssl     # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl       # Can be any valid name
```

Use the Cluster Agent Helm Chart to add node`Selector` and `tolerations`

user-values.yaml

```
agentPod:
  nodeSelector:
    nodeLabelKey: nodeLabelValue
  tolerations:
    - effect: NoExecute
      operator: Equal
      key: key1
      value: val1
      tolerationSeconds: 11

operatorPod:
  nodeSelector:
    nodeLabelKey: nodeLabelValue
    anotherNodeLabel: anotherNodeLabel
  tolerations:
    - operator: Exists
      key: key1
```

Best Practices for Sensitive Data

We recommend using multiple `values.yaml` files to separate sensitive data in separate `values.yaml` files. Examples of these values are:

- `controllerInfo.password`
- `controllerInfo.accessKey`
- `controllerInfo.customSSLCert`
- `controllerInfo.proxyPassword`

Each `values` file follows the structure of the default `values.yaml` enabling you to easily share files with non-sensitive configuration properties yet keep sensitive values safe.

Default `user-values.yaml` File Example

user-values.yaml

```
deploymentMode: PRIMARY

imageInfo:
  agentImage: dtr.corp.appdynamics.com/sim/cluster-agent
  agentTag: latest
  operatorImage: docker.io/appdynamics/cluster-agent-operator
  operatorTag: latest
  imagePullPolicy: Always

controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

agentServiceAccount: appdynamics-cluster-agent-ssl     # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl       # Can be any valid name
```

user-values-sensitive.yaml

```
controllerInfo:
  password: welcome
  accessKey: abc-def-ghi-1516
```

When installing the Helm Chart, use multiple `-f` parameters to reference the files:

```
helm install -f ./user-values.yaml -f ./user-values-sensitive.yaml "<my-cluster-agent-helm-release>"
appdynamics-charts/cluster-agent --namespace ca-appdynamics
```

Validate the Cluster Agent Installation

This page describes how to validate a Cluster Agent installation using the Kubernetes CLI or Helm chart.

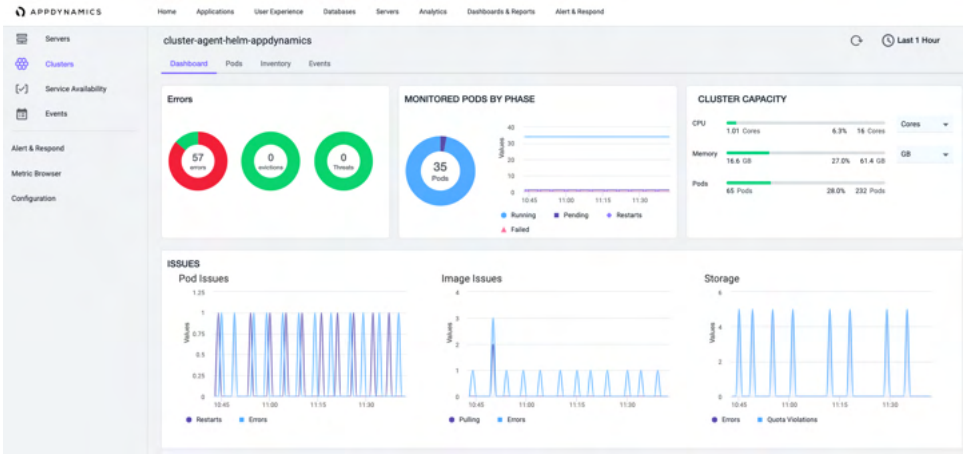
Cluster Agent Validation

1. Verify that the Cluster Agent and Cluster Agent Operator pods are running by reviewing the status:

```
kubectl -n appdynamics get pods
NAME                                                READY   STATUS    RESTARTS   AGE
appdynamics-operator-7958f676d9-gvdcw               1/1     Running   0          4d21h
k8s-cluster-agent-5967c9b7b9-rkwzt                  1/1     Running   0          4d21h
```

2. Verify that the Cluster Agent is reporting to the Controller. If the Cluster Agent successfully registers with the Controller based on the credentials you entered in the `cluster-agent.yaml` file, and the `cluster-agent-secret` you created in the `appdynamics` namespace (which contains the Controller Account Access Key), then the Cluster Agent displays in the Controller UI under **Servers/Cluster** using the `appName` from `cluster-agent.yaml`.

   > It may take 5-10 minutes for the data to populate.



3. Verify the monitored namespaces. Under the **Inventory** dashboard, check that the monitored namespaces match the namespace configuration in the `cluster-agent.yaml` file and that the monitored namespaces contain deployed pods.

   If necessary, update the namespace configuration (`nsToMonitor`, `nsToMonitorRegex`) in `cluster-agent.yaml` and re-create the Cluster Agent.

```
kubectl -n appdynamics delete -f cluster-agent.yaml
kubectl -n appdynamics create -f cluster-agent.yaml
```

If you are still experiencing problems with the installation, see Troubleshoot the Cluster Agent.

Troubleshoot the Cluster Agent

This page describes steps to troubleshoot the Cluster Agent install. See Install the Cluster Agent and Validate the Cluster Agent Installation.

Troubleshoot a Cluster Agent Not Reporting to the Controller

If after installing the Cluster Agent the Cluster Dashboard does not appear in the Controller, it could be the result of a connectivity issue with the Controller.

1. Verify that a Server Visibility license is available. The Cluster Agent requires an available Server Visibility license to register successfully. See Cluster Agent Requirements and Supported Environments. From the Controller UI, check that a license is available under **Administration /License/Account Usage**.
2. Review the Cluster Agent events. If the Cluster Agent or Cluster Agent Operator fails to start, then review the events in the `appdynamics` na mespace:

   ```
   kubectl -n appdynamics get events

   # to sort by most recent events:
   kubectl -n appdynamics get events --sort-by='.lastTimestamp'
   ```

   You can review the Cluster Agent pod specification for additional events:

   ```
   kubectl -n appdynamics get pod <cluster-agent-pod> -o yaml
   ```

3. Review the Cluster Agent logs for errors regarding Controller communication. Open a command-line prompt and enter:

   ```
   kubectl -n appdynamics logs <cluster-agent-pod-name>
   ```

4. Verify the Cluster Agent configuration. The Cluster Agent checks for configuration changes once a minute. To verify that your configurations have been applied and that the Cluster Agent is using the new values, open a command-line prompt and enter:

   ```
   kubectl -n appdynamics describe cm cluster-agent-mon cluster-agent-log cluster-agent-config
   ```

5. Verify that the latest Cluster Agent is installed. If you are upgrading the Cluster Agent from a previous version, then the previous Operator YAML or image may not be compatible. You must reinstall the Cluster Agent Operator and Cluster Agent using the procedure described in Up grade the Cluster Agent.

Troubleshoot a Cluster Agent Not Reporting Metrics

If the Cluster Agent does not report metrics for certain containers, pods, or nodes, it may be due to a problem with the Kubernetes Metrics Server. If metrics are not reported by the Metrics Server, then the Cluster Agent is unable to report them.

To verify that the Metrics Server is sending metrics, enter this command from your cluster's primary node:

```
$ kubectl get --raw /apis/metrics.k8s.io/v1beta1/pods
```

If the output of the command does not show metrics for the container, there may be a problem with the Metrics Server. This example shows output from the Metrics Server:

```
{
   "kind":"PodMetricsList",
   "apiVersion":"metrics.k8s.io/v1beta1",
   "metadata":{
      "selfLink":"/apis/metrics.k8s.io/v1beta1/pods"
   },
   "items":[
      {
         "metadata":{
            "name":"replicaset-test-cjnsc",
            "namespace":"test-qe",
            "selfLink":"/apis/metrics.k8s.io/v1beta1/namespaces/test-qe/pods/replicaset-test-cjnsc",
            "creationTimestamp":"2019-09-23T10:24:46Z"
         },
         "timestamp":"2019-09-23T10:23:38Z",
         "window":"30s",
         "containers":[
            {
               "name":"appagent",
               "usage":{
                  "cpu":"1667384n",
                  "memory":"258672Ki"
               }
            }
         ]
      }
   ]
}
```

As the Metric Server collects metrics from nodes, pods, and containers, it logs all issues. To retrieve and view logs for the Metric Server, enter:

```
$ kubectl logs <metric-server pod name>  -n <namespace for metric-server(default value is: "kube-system")> --
tail <number of required lines of logs>
```

For example:

```
$ kubectl logs metrics-server-6764b987d-mtn7g -n kube-system --tail 20
```

The Metric Server logs may reveal why it could not collect metrics. For example:

```
E0920 11:44:54.204075       1 reststorage.go:147] unable to fetch pod metrics for pod test-qe/replicaset-
test-9k7rl: no metrics known for pod
E0920 11:44:54.204080       1 reststorage.go:147] unable to fetch pod metrics for pod test/replicaset1-458-
g9n2d: no metrics known for pod
E0920 11:44:54.204089       1 reststorage.go:147] unable to fetch pod metrics for pod kube-system/kube-proxy-
t54rc: no metrics known for pod
E0920 11:45:19.188033       1 manager.go:111] unable to fully collect metrics: unable to fully scrape
metrics from source kubelet_summary:ip-111.111.111.111: unable to fetch metrics from Kubelet ip-
111.111.111.111 (111.111.111.111): Get https://111.111.111.111:2222/stats/summary/: dial tcp 111.111.111.111:
2222: i/o timeout
```

Cluster Agent Restarts

If the Cluster Agent restarts, you can verify that a restart occurred from the pod details. To retrieve the pod details, enter:

```
kubectl get pods -n appdynamics
```

Sample output:

```
NAME                                          READY   STATUS    RESTARTS   AGE
appdynamics-operator-6fff76b466-qtx57         1/1     Running   0          4h18m
k8s-cluster-agent-perf-jg-6fc498d557-q7zst    1/1     Running   1          83m
```

If the Cluster Agent unexpectedly restarts, the `RESTARTS` count value will be greater than zero. You will have to explicitly reset both namespaces and the logs.

> AppDynamics strongly recommends that you do not overwrite the default `stdoutLogging: true` property value in the `cluster-agent.yaml` file. If you set this property to `false`, the `kubectl logs` command does not return logs.

Cluster Agent logs persist even if the Cluster Agent is restarted by Kubernetes. To view the Cluster Agent logs for the Cluster Agent pod (that restarted), enter:

```
kubectl -n appdynamics logs --previous ${CLUSTER_AGENT_POD_NAME}
```

If the Cluster Agent pod has restarted, the monitored namespaces (that you configured through the UI) are not preserved. If you configured namespaces through the UI, you should add the same namespaces to your `cluster-agent.yaml` file under `nsToMonitor`, and then apply the configuration. As a result, the Cluster Agent pod will retain the monitored namespaces when it restarts.

If you did not add namespaces to the `cluster-agent.yaml` file, you can reconfigure your monitored namespaces:

1. Go to **Appdynamics Agents > Cluster Agents >** {CLUSTER_AGENT} **> Configure**.
2. Add the namespaces to monitor.

See Add or Remove Namespaces.

APM Correlation on OpenShift 4.x

Container Runtime Interface using OCI (Open Container Initiative) compatible runtimes (CRI-O), is the default container runtime on Red Hat Openshift 4.x. If you use APM Agents with OpenShift 4.x, you must update the `UNIQUE_HOST_ID` to support the syntax required for CRI-O containers. This setting applies to both new and existing application containers. If you are running App Agents, then you must modify the App Agent `YAML` file.

To run App Agents with APM correlation on Openshift 4.x:

1. Open your App Agent `YAML` file.
2. Locate the `spec: > args:` section within the file.
3. Update the `UNIQUE_HOST_ID` argument in the `containers spec` using this example as a guide:

```
spec:
      containers:
      - name: client-api
        command: ["/bin/sh"]
        args: ["-c", "UNIQUE_HOST_ID=$(sed -rn '1s#.*/##; 1s/(.{12}).*/\\1/p' /proc/self/cgroup) &&
java -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
        envFrom:
        - configMapRef:
            name: agent-config
```

If APM Correlation is working correctly, when you click the **Pod Details** link, the link opens the APM Node Dashboard for that node.

Cluster Agents or Pods are not Visible in the Controller

If Agents or pods are not visible in the Controller, or if Agents or pods are not registered and reporting, review the `sim.cluster.agent.limit` and `sim.cluster.pod.limit` descriptions in Controller Settings for the Cluster Agent.

Cluster Agent Pods are not Created When Security Policy is Enabled

If you have Pod Security Policies applied in the cluster, add the following to the `cluster-agent-operator.yaml` file:

```
securityContext:
  runAsUser: 1000
```

This YAML file example displays the security context:

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: appdynamics-operator
  namespace: appdynamics
  .
  .
spec:
  .
  .
  .
  template:
    .
    .
    securityContext:
      runAsUser: 1000
```

For Agent 20.4 and 20.5, add the `runAsUser: 1000` field in the `cluster-agent.yaml` file.

Cluster Agent Configuration Files

This page provides a reference for these internal configuration files used by the Cluster Agent:

- `agent-monitoring.yml`
- `bootstrap-config.yml`
- `logger-config.yml`

> AppDynamics recommends that you do not change the default values unless asked to do so by AppDynamics Support. Values supplied by the AppDynamics Operator always take precedence over the internal configuration files.

Agent Monitoring Configuration Reference

The `agent-monitoring.yml` file contains configuration information that can be modified by the Cluster Agent. The table lists the fields expected by the `agent-monitoring.yml` file. Use these fields to configure pods and containers monitored by the Cluster Agent:

Field name	Description	Default
`blocklisted-label`	(Optional) Field used to specify a Kubernetes label (a `key-value` pair). If this label exists, then the container, or pod, is not monitored. In the example, any pods with the label `appdynamics.exclude` set to `true` are blocklisted.	`appdynamics.exclude: true`
`blocklisted-names`	(Optional) Field used to specify which pods and containers are not monitored. In the example, the pod `ignored-pod` with associated containers `container3` and `container4` are not monitored.	Empty
`cluster-metric-collection-interval-seconds`	How often the Agent collects metrics in seconds Do not set this value to less than 30 seconds	`60`
`container-filter`	(Optional) Blocklist or allowlist pods and containers, based on the container names	Empty
`container-registration-batch-size`	Maximum number of containers per batch in one registration cycle	`25`
`container-registration-max-parallel-requests`	Maximum number of batches in one registration cycle	`3`
`metadata-collection-interval-seconds`	How often metadata is collected for containers and pods	`60`
`metric-collection-interval-seconds`	Sampling interval at which metrics should be collected periodically Do not set this value to less than 15 seconds > The Kubernetes Metrics Server's sampling interval must be the same as this configuration value. Any change to this configuration requires a re-deployment of the Kubernetes metrics-server add-on.	- Default metric collection sampling interval is `30` seconds - Default collection interval in `kubelet` is `15` seconds
`metric-upload-retry-count`	Number of times metric upload action to be attempted, if unsuccessful for the first time	`3`
`metric-upload-retry-interval-milliseconds`	Interval between consecutive metric upload retries, in milliseconds	`5`
`pod-registration-batch-size`	Maximum number of pods per batch in one registration cycle	`30`
`allowlisted-names`	(Optional) Field used to specify pods and containers to monitor. In the example, the pod `monitored-pod` with its containers `container1` and `container2` are monitored.	Empty

`agent-monitoring.yml` example:

```
metric-collection-interval-seconds: 30
container-filter:
  blocklisted-label:
    appdynamics.exclude:
      true
#  allowlisted-names:
#    pod-name1:
#      container-name1
#      container-name2
#    pod-name2:
#      container-name1
#      container-name2
#    pod-name3:
#      container-name1
#      container-name2
#  blocklisted-names:
#    pod-name:
#      container-name1
#      container-name2
#    pod-name2:
#      container-name1
#      container-name2
```

Bootstrap Configuration Reference

The `bootstrap-config.yml` file contains configuration information read by the Cluster Agent during start up. The table lists the fields expected by the `bootstrap-config.yml` file:

Field name	Description	Default
`account`	Name of the account on the Controller	Empty
`account-access-key`	Account access key	Empty
`cluster-name`	Unique name assigned to the monitoring cluster	Empty
`container-registration-interval-seconds`	How often the Cluster Agent sends container information to the Controller. The interval at which the Cluster Agent checks for running containers. Modify the default value only if you want to discover running containers more frequently; use the default value for most environments.	`120`
`controller-host`	Controller host name	Empty
`controller-port`	Controller port	Empty
`controller-ssl-enabled`	Denotes if the Controller is SSL-enabled	`false`
`event-upload-interval-seconds`	How often events are uploaded to the Controller, in seconds	`10`
`http-client-timeout-seconds`	Number of seconds after which the server call is terminated if no response is received from the Controller	`30`
`log-output-directory`	Directory to which the logs should be written	`logs`
`monitored-namespaces`	Namespaces to be monitored in the cluster; comma-separated strings	`default`

`bootstrap-config.yml` example:

```
account: <account-name>
account-access-key:<account-access-key>
controller-host: localhost
controller-port: 8090
cluster-name: <cluster-name>
monitored-namespaces: default
event-upload-interval-seconds: 10
container-registration-interval-seconds: 120
http-client-timeout-seconds: 30
log-output-directory: logs
# SSL configuration
controller-ssl-enabled: false
```

Logging Configuration Reference

By default, the AppDynamics Cluster Agent writes log files to the *<cluster_agent_home>*/logs/*<node_name>* directory.

You can control the logging level for the Cluster Agent by changing the value of the `log-level` parameter. For maximum debugging information, set the `logger-config.yml` logging level to `DEBUG`.

You can modify the `logger-config.yml` file and set values for these attributes:

Attribute	Description	Default	Type
`log-level`	Number of log details: `INFO`, `WARNING`, `DEBUG` or `TRACE`	`INFO`	String
`max-filesize-mb`	Maximum file size of the log in MB	`5`	Integer
`max-backups`	Maximum number of backups the log saves. When the maximum number of backups is reached, the oldest log file after the initial log file is deleted.	`3`	Integer
`write-to-stdout`	Write logging information to `stdout`. Options: `true`, `false`.	`true`	String

`logger-config.yml` example:

```
log-level: INFO
max-filesize-mb: 5
max-backups: 3
write-to-stdout: true
```

Configure the Cluster Agent

This page describes the contents of the Cluster Agent bundle downloaded from the Download portal, and how to perform common configuration tasks:

- Configure Proxy Support
- Configure the Cluster Agent to use SSL for on-premises Controllers
- Configure a Pull Secret

See Cluster Agent YAML File Configuration Reference for configuration option details.

> This page contains links to Kubernetes documentation. AppDynamics makes no representation as to the accuracy of Kubernetes documentation because Kubernetes controls its own documentation.

Directory Structure of the Cluster Agent Bundle

An unzipped Cluster Agent bundle contains this directory structure:

Cluster Agent Bundle Files

This table describes the Cluster Agent directory files:

File Name	Description
`cluster-agent.yaml`	File used to configure and deploy the Cluster Agent. • The `cluster-agent.yaml` file provides Controller details and starts the Cluster Agent. • Where values are specified in the AppDynamics Operator configuration, these values always take precedence over any internal configuration file.

`cluster-agent-operator.yaml`
 	
`cluster-agent-operator-1.14-or-less.yaml`
	Files used to deploy the Cluster Agent Operator. These files set the default values for Kubernetes, Amazon EKS, and AKS, including a minimal set of RBAC permissions.

`cluster-agent-operator-openshift.yaml`
 	
`cluster-agent-operator-openshift-1.14-or-less.yaml`
	Files used to deploy the Cluster Agent on Red Hat OpenShift. These files set the default values for Red Hat OpenShift, including a minimal set of RBAC permissions.

`docker`	Docker directory contains all files required to create the Cluster Agent image.
`Dockerfile`	`dockerfile` used to create the Alpine-based Cluster Agent image.
`Dockerfile-rhel`	`dockerfile` used to create the Rhel-based Cluster Agent image.
`LICENSE`	Latest EULA file attached with the Cluster Agent image.
`cluster-agent.zip`	Zip archive containing the Cluster Agent binaries and configuration files.
`helm-charts`	Folder used to build the charts for deploying the Cluster Agent using Helm in Kubernetes.

`README-rhel.md`
 	
`README-alpine.md`
	Contains instructions on how to start the Cluster Agent using your preferred operating system.

`start-appdynamics`	Script used to run the Cluster Agent within Docker.

Configure Proxy Support

1. Locate and edit the `cluster-agent.yaml` file.
2. Add a `proxyUrl` parameter to the `cluster-agent.yaml` file:

```
proxyUrl: <protocol>://<host>:<port>
```

3. (Optional) If the proxy server requires authentication:
    a. Add a `proxyUser`:

```
proxyUser: <user>
```

b. Create a `secret` with a `proxy-password`:

```
kubectl -n appdynamics create secret generic cluster-agent-proxy-secret --from-literal=proxy-password='<password>'
```

4. (Optional) If you are using SSL only for your proxy:
   a. Create a `secret` from a `.pem` certificate file (the certificate file must be named `proxy-ssl.pem`):

```
kubectl -n appdynamics create secret generic ssl-cert --from-file=proxy-ssl.pem
```

   b. Set a secret filename in the `cluster-agent.yaml` file:

```
customSSLSecret: “ssl-cert”
```

To use SSL with your proxy and your Controller, see Proxy and On-Premises Certificates Combined.

Configure the Cluster Agent to Use SSL for On-Premises Controllers

Cluster Agent SSL is automatically handled for SaaS Controllers.

Controllers with Public and Self-Signed Certificates

To configure SSL with a public or self-signed certificate, use `kubectl` to generate a secret. Enter this `kubectl` command, and include the path to your public or self-signed certificate:

```
kubectl -n appdynamics create secret generic ssl-cert --from-file=<path-to-your-self-signed-certs>/custom-ssl.pem
```

The certificate file must be named: `custom-ssl.pem`.

After your secret is created, you must add the `customSSLSecret` property with the secret name specified in the previous step to the `cluster-agent.yaml` file:

```
customSSLSecret: “ssl-cert”
```

Proxy and On-Premises Certificates Combined

If you have two different SSL certificates (one for the proxy server, and a different one for the on-premises Controller), then you can encapsulate both of them into a single secret:

```
kubectl -n appdynamics create secret generic ssl-cert --from-file=proxy-ssl.pem --from-file=<path-to-your-self-signed-certs>/custom-ssl.pem
```

The Cluster Agent pulls each certificate from the secret identified in the `customSSLSecret` attribute and uses it appropriately.

This example shows a `cluster-agent.yaml` file with the `customSSLSecret` attribute defined:

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent-manual
  namespace: appdynamics
spec:
  # init agent configuration
  appName: "test-k8s-cluster-agent"
  controllerUrl: "https://<controller-url>:443" # always schema and port
  account: "<account-name>" # account
  # agent related properties
  # custom SSL secret name
  customSSLSecret: "ssl-cert"
  # logging properties
  logLevel: INFO
  logFileSizeMb: 7
  logFileBackups: 6
  # docker image info
  image: "<image-url>"
```

Configure a Pull Secret

If the Cluster Agent requires a secret to pull images from a container registry, use the Kubernetes API to create the secret and reference it in `cluster-agent.yaml`.

Set the `imagePullSecret` property in `cluster-agent.yaml` to the name of the secret created above (`myregcred`):

```
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "mycluster"
  controllerUrl: "http://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  image: "<your-docker-registry>/appdynamics/cluster-agent:tag"
  serviceAccountName: appdynamics-cluster-agent
  imagePullSecret: "myregcred"
```

Cluster Agent YAML File Configuration Reference

To configure the Cluster Agent, use the `cluster-agent.yaml` file included with the download package as a template. You can modify these parameters:

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
`account`	AppDynamics account name.	`admin`	N/A	No	String	Required
`appName`	Name of the cluster; displays in the Controller UI as your cluster name.	`k8s-cluster`	N/A	No	String	Required

`controllerUrl`	Full AppDynamics Controller URL, including protocol and port.	`HTTP: http://appd-controller.com:8090/`
		
		`HTTPS: https://appd-controller.com:443`
			N/A	No	String	Required

`customSSLSecret`	Provides the self-signed or public certificates to the Cluster Agent.	`"ssl-cert"`	N/A	No	String	Optional
`eventUploadInterval`	How often Kubernetes warning and state-change events are uploaded to the Controller in seconds. See Monitor Kubernetes Events.	`10`	10	No	Integer	Optional

`httpClientTimeout`	If no response is received from the Controller, number of seconds after which the server call is terminated.	`30`	30	No	Integer	Optional
`image`	Cluster Agent image.	`your-docker-registry/appdynamics/cluster-agent:latest`	N/A	No	String	Required
`imagePullSecret`	Credential file used to authenticate when pulling images from your private Docker registry or repository. Based on your Docker registry configuration, you may need to create a secret file for the AppDynamics Operator to use when pulling the image for the Cluster Agent. See Create a Secret by providing credentials on the command line.	`regcred`	N/A	No	String	Optional
`logFileSizeMb`	Maximum file size of the log in MB.	`5`	5	Yes	Integer	Optional
`logFileBackups`	Maximum number of backups saved in the log. When the maximum number of backups is reached, the oldest log file after the initial log file is deleted.	`3`	3	Yes	Integer	Optional
`logLevel`	Number of log details. `INFO`, `WARNING`, `DEBUG`, or `TRACE`.	`"INFO"`	`INFO`	Yes	String	Optional
`maxPodLogsTailLinesCount`	Number of lines to be tailed while collecting logs. To use this parameter, enable the log capturing feature. See Enable Log Collection for Failing Pods.	`500`	`500`	Yes	Integer	Optional

`nodeSelector`	The Cluster Agent pod runs on the node that includes the specified `key-value` pair within its labels property. See nodeSelector.	`nodeSelector:`
		
		`kubernetes.io/e2e-az-name: az1`
			N/A	No	map [string] [string]	Optional

`nsToMonitor`	Namespaces to be monitored in the cluster.	`nsToMonitor:`
		
		`- "default"`
		`- "appdynamics"`
			`default`	No	String List (Sequence)	Optional

`nsToMonitorRegex`	The regular expression for selecting the required namespaces to be monitored in the cluster. This parameter supersedes `nsToMonitor`. If you do not specify a value for this parameter, then the Cluster Agent uses the default value of `nsToMonitor`. ⓘ This parameter is supported in Cluster Agent >= 20.9, and Controller >= 20.10. See Edit Namespaces.	nsToMonitoRegex: .*	N/A	Yes	Regular expression	Optional
`nsToExcludeRegex`	The regular expression for the namespaces that must be excluded from the selected namespaces that matche the regular expression mentioned for `nsToMonitorRegex`. ⓘ This parameter is supported in Cluster Agent >= 20.9, and Controller >= 20.10. This parameter can be used only if you have specified a value for the `nsToMonitorRegex` parameter.	nsToExcludeRegex: ns.*	N/A	Yes	Regular expression	Optional

`podFilter`	Blocklist or allowlist pods based on:
	
	• Regular expressions for pod names
	• Pod labels
	
	Blocklisting or allowlisting by name takes preference over blocklisting or allowlisting by labels. For example, if you have the `podFilter` as :
	
	`podFilter:`
	
	`blocklistedLabels:`
	`- release: v1`
	
	`allowlistedNames:`
	`- ^podname`
	
	This blocks all the pods which have the label '`release=v1`' except for the ones which have the names starting with '`podname`'.
	
	• When a pod is listed as allowed by name and blocked by name, it will be allowlisted.
	• When a pod is listed as allowed by a label and blocked by a label, it will be allowlisted.
		`podFilter:`
		
		`blocklistedLabels:`
		`- label1: value1`
		
		`allowlistedLabels:`
		`- label1: value1`
		`- label2: value2`
		
		`allowlistedNames:`
		`- name1`
		
		`blocklistedNames:`
		`- name2`
			N/A	Yes	String	Optional

`proxyUrl`	Publicly accessible host name of the proxy.	`https://myproxy.example.com:8080`	N/A	No	String	Optional
`proxyUser`	Username associated with the basic authentication credentials.	`"user1"`	N/A	No	String	Optional

`resources`	Requests and limits of CPU and memory resources for the Cluster Agent.	`resources:`
		`  limits:`
		`  cpu: 300m`
		`  memory: "200Mi"`
		`  requests:`
		`  cpu: 200m`
		`  memory: "100Mi"`
			• CPU
			  • `request: 750m`
			  • `limit: 1250m`
			• Memory
			  • `request: 150Mi`
			
			`limit: 300Mi`
				Yes	Array	Optional

`stdoutLogging`	By default, the Cluster Agent writes to a log file in the `logs` directory. Additionally, the `stdoutLogging` parameter is provided to send logs to the container `stdout`.	`"true", "false"`	`true`	Yes	String	Optional

`tolerations`	An array of tolerations required for the pod. See Taint and Tolerations.	`tolerations:`
		
		`- effect: NoSchedule`
		
		`key: type value: test`
		
		`- effect: NoExecute`
		
		`key: node.kubernetes.io/not-ready operator: Exists tolerationSeconds: 600`
			N/A	No	Array	Optional

For specific auto-instrumentation configurations, see Auto-Instrument Applications with the Cluster Agent. Also the `.yaml` file includes the permissions for auto-instrumentation, which is enabled by default. If you do not want to use auto-instrumentation, you can remove the following text from the `.yaml` file:

```
kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1
metadata:
 name: appdynamics-cluster-agent-instrumentation
subjects:
 - kind: ServiceAccount
 name: appdynamics-cluster-agent
 namespace: appdynamics
roleRef:
 kind: ClusterRole
 name: appdynamics-cluster-agent-instrumentation
 apiGroup: rbac.authorization.k8s.io
```

Cluster Agent File Example

This example shows a `cluster-agent.yaml` configuration file:

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<app-name>"
  controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  # docker image info
  image: "<your-docker-registry>/appdynamics/cluster-agent:tag"
  nsToMonitor:
    - "default"
  eventUploadInterval: 10
  containerRegistrationInterval: 120
  httpClientTimeout: 30
  customSSLSecret: "<secret-name>"
  proxyUrl: "<protocol>://<domain>:<port>"
  proxyUser: "<proxy-user>"
  metricsSyncInterval: 30
  clusterMetricsSyncInterval: 60
  metadataSyncInterval: 60
  containerBatchSize: 25
  containerParallelRequestLimit: 3
  podBatchSize: 30
  metricUploadRetryCount: 3
  metricUploadRetryIntervalMilliSeconds: 5
  podFilter:
    # blocklistedLabels:
    #   - label1: value1
    # allowlistedLabels:
    #   - label1: value1
    #   - label2: value2
    # allowlistedNames:
    #   - name1
    # blocklistedNames:
    #   - name2
  logLevel: "INFO"
  logFileSizeMb: 5
  logFileBackups: 3
  stdoutLogging: "true"
  resources:
        limits:
                cpu: 300m
                memory: "200Mi"
        requests:
                cpu: 200m
                memory: "100Mi"
```

Install Infrastructure Visibility with the Cluster Agent Operator

This page describes how to install the Machine Agent and Network Agents in a Kubernetes cluster where the Cluster Agent Operator is installed.

The Cluster Agent Operator provides a custom resource definition called `InfraViz`. You can use `InfraViz` to simplify deploying the Machine and Network Agents as a `daemonset` in a Kubernetes cluster. Additionally, you can deploy these agents by creating a `daemonset YAML` which does not require the Cluster Agent Operator. For more information, see these examples.

To deploy the Analytics Agent as a `daemonset` in a Kubernetes cluster, see Install Agent-Side Components in Kubernetes.

Requirements

Before you begin, verify that you have:

- Installed kubectl >= 1.11.3
- Cluster Agent >= 21.3.1
- Met these requirements: Cluster Agent Requirements and Supported Environments.
- If Server Visibility is required, sufficient Server Visibility licenses based on the number of worker nodes in your cluster.
- Permissions to view servers in the AppDynamics Controller.

Installation Procedure

1. Install the Cluster Agent Operator. From this Alpine Linux example:

    a. Download the Cluster Agent bundle.
    b. Unzip the Cluster Agent bundle.
    c. Deploy the Cluster Agent Operator using the CLI specifying the correct Kubernetes and OpenShift version (if applicable):

    ```
    unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
    kubectl create namespace appdynamics
    ```

2. Create a Cluster Agent secret using the Machine Agent access key to connect to the Controller. If a `cluster-agent-secret` does not exist, you must create one, see Install the Cluster Agent with the Kubernetes CLI (DOC-6096).

    ```
    kubectl -n appdynamics create secret generic cluster-agent-secret --from-literal=controller-key=<access-key>
    ```

3. Update the `infraviz.yaml` file to set the `controllerUrl`, `account`, and `globalAccount` values based on the information from the Controller's **License** page.
    To enable Server Visibility, set `enableServerViz` to `"true"` (shown in the `infraviz.yaml` configuration example).
    To deploy a Machine Agent without Server Visibility enabled, set `enableServerViz` to `"false"`.

infraviz.yaml Configuration File with Server Visibility Enabled

```
apiVersion: v1
kind: ServiceAccount
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
---
apiVersion: appdynamics.com/v1alpha1
kind: InfraViz
metadata:
  name: appd-infraviz
  namespace: appdynamics
spec:
  controllerUrl: "https://mycontroller.saas.appdynamics.com"
  image: "docker.io/appdynamics/machine-agent-analytics:latest"
  account: "<your-account-name>"
  globalAccount: "<your-global-account-name>"
  enableServerViz: "true"
  resources:
    limits:
      cpu: 500m
      memory: "1G"
    requests:
      cpu: 200m
      memory: "800M"
```

The `infraviz.yaml` configuration file example deploys a `daemonset` that runs a single pod per node in the cluster. Each pod runs a single container from where the Machine Agent, or Server Visibility Agent runs.

4. To enable the Network Visibility Agent to run in a second container in the same pod, add the `netVizImage` and `netVizPort` keys and values as shown in this configuration file example:

infraviz.yaml Configuration File with Second Container in a Single Pod

```
apiVersion: v1
kind: ServiceAccount
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
---
apiVersion: appdynamics.com/v1alpha1
kind: InfraViz
metadata:
  name: appd-infraviz
  namespace: appdynamics
spec:
  controllerUrl: "https://mycontroller.saas.appdynamics.com"
  image: "docker.io/appdynamics/machine-agent-analytics:latest"
  account: "<your-account-name>"
  globalAccount: "<your-global-account-name>"
  enableServerViz: "true"
  netVizImage: appdynamics/machine-agent-netviz:latest
  netVizPort: 3892
  resources:
    limits:
      cpu: 500m
      memory: "1G"
    requests:
      cpu: 200m
      memory: "800M"
```

5. Use `kubectl` to deploy `infraviz.yaml`

For environments where Kubernetes `PodSecurityPolicies` block certain pod security context configuration, such as privileged pods, you must deploy the `infraviz-pod-security-policy.yaml` before editing the `infraviz.yaml` file.

For environments where OpenShift `SecurityContextConstraints` block certain pod security context configuration, such as privileged pods, you must deploy the `infraviz-security-context-constraint-openshift.yaml` before editing the `infraviz.yaml` file.

6. Confirm that the `appd-infraviz` pod is running, and the Machine Agent, Server Visibility Agent, and Network Agent containers are ready:

```
kubectl -n appdynamics get pods
NAME                                READY   STATUS    RESTARTS   AGE
appd-infraviz-shkhj                 2/2     Running   0          18s
```

7. To verify that the agents are registering with the Controller, review the logs and confirm that the agents display in the **Agents Dashboard** of the Controller Administration UI. In the Controller, if Server Visibility is enabled, the nodes are visible under **Controller > Servers**.

```
kubectl -n appdynamics logs appd-infraviz-shkhj -c appd-infra-agent
...
Started AppDynamics Machine Agent Successfully
```

Mixed Operating System Clusters

The Cluster Agent Operator can deploy Machine Agent `daemonsets` to both Linux and Windows nodes. The value of the `nodeOS` property determines the deployment strategy in mixed operating system (OS) clusters. You can set this property to one of these options:

- `all`
- `linux`
- `windows`

Set `nodeOS: all` when both Linux and Windows `daemonsets` share the same properties that you can configure in a single `infraviz.yaml` file. When `nodeOS` is set to `all` or `windows`, you must set the `imageWin` property to a Windows Machine Agent image.

In this example, a single `infraviz.yaml` file is used to configure the Machine Agents that run on Windows and Linux nodes.

```
apiVersion: v1
kind: ServiceAccount
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
---
apiVersion: appdynamics.com/v1alpha1
kind: InfraViz
metadata:
  name: appd-infraviz
  namespace: appdynamics
spec:
  controllerUrl: "https://mycontroller.saas.appdynamics.com"
  image: "docker.io/appdynamics/machine-agent-analytics:latest"
  account: "<your-account-name>"
  globalAccount: "<your-global-account-name>"
  enableServerViz: "true"
  netVizImage: appdynamics/machine-agent-netviz:latest
  netVizPort: 3892
  resources:
    limits:
      cpu: 500m
      memory: "1G"
    requests:
      cpu: 200m
      memory: "800M"
  imageWin: docker.io/appdynamics/machine-agent-analytics:20.6.0-win-ltsc2019
  nodeOS: all
```

Set `nodeOS: windows` or `nodeOS: linux` when the Windows and Linux `daemonsets` properties differ and must be defined in separate `infraviz.yaml` files. Depending on the value of `nodeOS`, the Cluster Agent Operator assigns a `nodeSelector` value to the Machine Agent that determines its placement.
For `nodeOS: windows`, it sets "`kubernetes.io/os`" to `windows`.
For `nodeOS: linux`, it sets `kubernetes.io/os` to `linux`.

To override this default behavior, specify a `nodeSelector` in `infraviz.yaml`. For example:

```
apiVersion: v1
kind: ServiceAccount
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
---
apiVersion: appdynamics.com/v1alpha1
kind: InfraViz
metadata:
  name: appd-infraviz
  namespace: appdynamics
spec:
  # ... content removed for brevity
  nodeOS: windows
  imageWin: docker.io/appdynamics/machine-agent-analytics:20.6.0-win-ltsc2019
  nodeSelector:
    kubernetes.io/os: my-windows-node-selector
```

`InfraViz` Configuration Settings

To configure Infrastructure Visibility, you can modify these parameters in the `infraviz.yaml` file included with the download package. After changing the file, delete and re-create the `InfraViz` deployment to ensure the changes are applied.

Parameter	Description	Required/Optional	Default
`account`	AppDynamics account name	Required	N/A
`args`	List of command arguments	Optional	N/A
`controllerUrl`	URL of the AppDynamics Controller	Required	N/A
`enableContainerHostId`	Flag that determines how container names are derived; specify either `pod name` or `container id`.	Optional	`true`
`enableMasters`	By default, only Worker nodes are monitored. When set to `true`, Server Visibility is provided for Master nodes. For managed Kubernetes providers, the flag has no effect because the Master plane is not accessible.	Optional	`false`
`enableServerViz`	Enable Server Visibility	Optional	`true`
`env`	List environment variables	Optional	N/A
`eventServiceUrl`	Event Service Endpoint	Optional	N/A
`globalAccount`	Global account name	Required	N/A
`image`	Retrieves the most recent version of the Machine Agent image.	Optional	`appdynamics/machine-agent-analytics:latest`
`imagePullSecret`	Name of the pull secret image	Optional	N/A
`imageWin`	Machine Agent image for Windows nodes	Required when `nodeOS` is set to `all` or `windows`	N/A
`logLevel`	Level of logging verbosity. Valid options are: `info` or `debug`.	Optional	`info`
`metricsLimit`	Maximum number of metrics that the Machine Agent sends to the Controller.	Optional	N/A
`netVizImage`	Retrieves the most recent version of Network Agent image.	Optional	`appdynamics/machine-agent-netviz:latest`

`netVizPort`	When > 0, the Network Agent is deployed in a sidecar with the Machine Agent. By default, the Network Visibility Agent works with port `3892`.	Optional	`3892`
`nodeSelector`	OS specific label that identifies nodes for scheduling of the `daemonset` pods.	Optional	`all`
`priorityClassName`	Name of the priority class that determines priority when a pod needs to be evicted.	Optional	N/A
`propertyBag`	String with any other Machine Agent parameters	Optional	N/A
`proxyUrl`	URL of the proxy server (`protocol://domain:port`)	Optional	N/A
`proxyUser`	Proxy user credentials (`user@password`)	Optional	N/A
`resources`	Definitions of resources and limits for the Machine Agent	Optional	N/A
`resourcesNetViz`	Set resources for the Network Visibility (NetViz) container	Optional	**Request** • CPU: 100m • Memory: 150Mi **Limit** • CPU: 200m • Memory: 300Mi
`stdoutLogging`	Determines if logs are saved to a file or redirected to the Console.	Optional	`false`
`tolerations`	List of tolerations based on the taints that are associated with nodes.	Optional	N/A
`uniqueHostId`	Unique host ID in AppDynamics. Valid options are: `spec.nodeName`, `status.hostIP`.	Optional	`spec.nodeName`

Build the Cluster Agent Container Image

This page describes how to build a Cluster Agent container image or push a pre-built image to an internal registry.

This procedure is required when you:

- Need to build your own image to satisfy internal image policies, or
- Require that the pre-built Cluster Agent Image from Docker Hub, or the Red Hat Container Registry, is stored in an internal container registry. See Install the Cluster Agent.

Otherwise, you can reference the pre-built Cluster Agent Images on Docker Hub and the Red Hat Container Registry in the `cluster-agent.yaml` or `values.yaml` Helm file. This example uses the pre-built Cluster Agent Image 20.12.1 published to Docker Hub:

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 controllerUrl: "http://<account>.saas.appdynamics.com"
 account: "<account-name>"
 appName: "Cluster1"
 image: docker.io/appdynamics/cluster-agent:20.12.1
```

Build the Custom Cluster Agent Image

The download packages from the AppDynamics Download Portal include files you need to build and deploy the container image for the Cluster Agent.

Depending on the base Image that was used to build the Cluster Agent Image, there are two package types available on the portal:

- Alpine Linux-based base Image
- Rhel Linux 7-based base Image

The directory structure of the download packages for the Alpine and Rhel Linux is:

Build the Custom Cluster Agent Image

You can build the Rhel Linux 7-based Cluster Agent image on Red Hat Linux only. Red Hat Linux is a subscription-based system. You must subscribe to the Red Hat Linux system to use the packages manager such as `microdnf`, which is used in `Dockerfile-rhel`. Perform these tasks before running the docker build command for Rhel:

1. Use Red Hat Linux 7 (Rhel VM Box, Rhel EC2 instance, and so on)
2. To subscribe to the Red Hat Linux system, from a command-prompt enter:

```
$ subscription-manager register --username=<your-username> --password=<your-password>
```

3. To get the pool-ids, enter:

```
$ subscription-manager list --available
```

4. To attach the pool-id from step 3, enter:

```
$ subscription-manager attach --pool=<pool-id>
```

5. To enable repos, enter:

```
$ subscription-manager repos --enable=rhel-7-server-rpms
$ subscription-manager repos --enable=rhel-7-server-extras-rpms
$ subscription-manager repos --enable=rhel-7-server-optional-rpms
```

6. To install Docker on the Rhel machine, enter:

```
$ yum install docker device-mapper-libs device-mapper-event-lib
```

7. To start docker services, enter:

```
$ systemctl start docker.service
$ systemctl enable docker.service
```

8. To build the Rhel based Cluster Agent image using Docker, enter:

```
$ docker build -t docker.io/<organization>/cluster-agent:<Agent-Version> -f Dockerfile-rhel
```

See the Red Hat website under Using the docker command and service for more details.

These steps are also available at the official website of Red Hat under Using the docker command and service.

If you are unable to perform the preceding steps, you can use a pre-built Rhel-based Cluster Agent image mentioned in Use Pre-Built Cluster Agent Image. This pre-built option requires that you have Docker installed and Red Hat credentials. The pre-built image can run on any operating system. To get Red Hat credentials, create an account on the Red Hat portal.

1. Change directories into the `docker` directory:

```
$ cd docker
```

2. Build and tag a `docker` image using this syntax:

To use a specific Alpine Image version, set the version using `--build-arg version=<alpine-version>`.

If you do not specify an image version, then the build command takes the *latest* Alpine image version automatically.

For example, to build and tag the image version 20.8.0 using alpine version 3.11.6 on Docker Hub registry for the account name `johndoe`:

3. When the build is successful, verify that the image appears in your local Docker repository.
   Example output:
4. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example, pushing the image version 20.8.0 to Docker Hub registry for the account name Johndoe:

```
$ docker push docker.io/johndoe/cluster-agent:20.8.0
```

Use Pre-Built Cluster Agent Image

You can also use a pre-built Alpine-based Cluster Agent or Rhel-based Cluster Agent to an internal registry.

Alpine Cluster Agent Image

You can use the pre-built Alpine-based Cluster Agent image from the AppDynamics Docker Hub account.

1. Log in to your Docker Hub account:

```
$ docker login docker.io -u <your-username> -p <your-password>
```

2. Pull the image:

```
$ docker pull docker.io/appdynamics/cluster-agent:<Agent-version>
```

For example, to pull the Alpine based cluster agent image version 20.8.0:

```
$ docker pull docker.io/appdynamics/cluster-agent:20.8.0
```

To push this image to another registry or accounts:

1. Rename the image:

```
$ docker tag docker.io/appdynamics/cluster-agent:<Agent-version> <registryname>/<accountname>/cluster-
agent:<Agent-version>
```

For example:

```
$ docker tag docker.io/appdynamics/cluster-agent:20.8.0 docker.io/johndoe/cluster-agent:20.8.0
```

2. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example, to push the image version 20.8.0 to Docker Hub registry for the account name Johndoe:

```
$ docker push docker.io/johndoe/cluster-agent:20.8.0
```

Rhel Cluster Agent Image

Alternatively, you can use the pre-built Rhel based Cluster Agent Image from the Appdynamics Redhat Container Registry account.

1. Log in to Red Hat Registry using your Customer Portal credentials:

```
$ docker login registry.connect.redhat.com -u <your-username> -p <your-password>
```

2. Pull the image:

```
$ docker pull registry.connect.redhat.com/appdynamics/cluster-agent:<Agent-version>
```

For example, to pull the Rhel based Cluster Agent version 20.8.0:

```
$ docker pull registry.connect.redhat.com/appdynamics/cluster-agent:20.8.0
```

You can now use the Cluster Agent image.

To push this image to another registry, or to other accounts:

1. Rename the image:

```
$ docker tag registry.connect.redhat.com/appdynamics/cluster-agent:<Agent-version> <registryname>
/<accountname>/cluster-agent:<Agent-version>
```

For example:

```
$ docker tag registry.connect.redhat.com/appdynamics/cluster-agent:20.8.0 scan.connect.redhat.com
/johndoe/cluster-agent:20.8.0
```

2. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example, to push the image version 20.8.0 to Redhat Registry for account name `johndoe`:

```
$ docker push scan.connect.redhat.com/johndoe/cluster-agent:20.8.0
```

Set the Image in Cluster Agent YAML Specification

Make sure to reference the image in the `cluster-agent.yaml` `spec:`

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  controllerUrl: "http://<account>.saas.appdynamics.com"
  account: "<account-name>"
  appName: "Cluster1"
  image: <registryname>/<username>/cluster-agent:<Agent-version>
```

For assistance, contact AppDynamics Support.

Cluster Agent and the Operator Compatibility Matrix

The compatibility matrix describes which Operator (Kubernetes or OpenShift) version is required for each Cluster Agent version.

- To view the list of features for the latest agent, see Release Notes.
- To view the list of features for older agents, see Past Agent Releases.

AppDynamics recommends that you upgrade the Operator with the Cluster Agent upgrade. See Upgrade the Cluster Agent. Ensure that use the latest YAML configuration files for the Operator and Cluster Agent from the upgraded version because the Cluster Agent may support new or modified configuration. If you do not update the Operator or YAML configuration file, and the Cluster Agent is upgraded, then the Cluster Agent may not work properly.

This table lists the Operator version with its supported Cluster Agent version:

Operator (Kubernetes/ OpenShift)	Cluster Agent
0.6.9	21.5.0
0.6.8	21.3.1, 21.3.0
0.6.7	21.2.0
0.6.6	20.12.1
0.6.6	20.12.0
0.6.5	20.11.0
0.6.4	20.11.0
0.6.3	20.10.0
0.6.2	20.9.1, 20.9.0
0.6.1	20.9.1, 20.9.0
0.5.4	20.8.0
0.5.3	20.7.0
0.5.2	20.6.0

Auto-Instrument Applications with the Cluster Agent

This page describes how to auto-instrument Kubernetes applications running in a cluster where the Cluster Agent is deployed. See Install the Cluster Agent.

For available instrumentation options, see Container Installation Options. AppDynamics recommends using auto-instrumentation for the simplest operational experience.

Auto-instrumentation supports dynamically adding the required App Server Agents to these application types:

- Java
- .NET Core on Linux
- Node.js

Enable Auto-Instrumentation

To enable auto-instrumentation, you:

- Add additional configuration to the `cluster-agent.yaml` file (described on this page), or
- Add configuration to the Cluster Agent Helm Chart `values.yaml` file (see Install the Cluster Agent with Helm Charts), and upgrade the Cluster Agent.

When the Cluster Agent detects a supported application deployment and the deployment matches the configured auto-instrumentation rules, the Cluster Agent modifies the application's deployment spec using the Kubernetes API. The Cluster Agent attaches an init container with the AppDynamics .NET Core, Node.js, or Java Agent image to the deployment. When the application restarts, the required agent is copied into the application container. As a result, the application container references the AppDynamics agent (Node.js Agent, .NET Core on Linux Agent, or Java Agent) in an auto-instrumented application.

Requirements

- Cluster Agent >= 20.5. See Cluster Agent Requirements and Supported Environments.
- Installed the latest Cluster Agent and Operator versions in the cluster. The `cluster-agent-operator.yaml` will set up the permissions required by the Cluster Agent to perform auto-instrumentation. See Install the Cluster Agent.
- At least one application is deployed to the cluster that was not previously instrumented with the required AppDynamics agent.
- A Controller with sufficient agent licenses based on the number of applications that will be auto-instrumented.
- Ensure that you have sufficient cluster capacity to handle pod restarts. See Minimize the Impact of Pod Restarts.

Application-Specific Requirements

- Node.js >= 8.6
- Java
  - Java applications must support including the `-javaagent` argument in the Java command using an environment variable. By default, the Cluster Agent uses `JAVA_TOOL_OPTIONS`; however, you can change this using the `defaultEnv` property.
  - Based on Java Agent resource requirements, it may be necessary to adjust the configured memory requests or limits for the application pods (see Install the Java Agent).
- .NET Core on Linux and Node.js
  - Ensure that the application base image OS matches the App Server Agent base image OS (Linux versus Alpine). For example, if your .NET Core on Linux application uses an Ubuntu base image, then you must set the `imageInfo.image` tag to the Linux version. In this example, the image tag is `20.11.0-linux`.
    If the application used an Alpine Linux base image OS, then the tag would be `20.11.0-alpine`. See the AppDynamics Docker Hub page.

    ```
    apiVersion: appdynamics.com/v1alpha1
    kind: Clusteragent
    metadata:
      name: k8s-cluster-agent
      namespace: appdynamics
    spec:
      # content removed for brevity
      instrumentationRules:
        - namespaceRegex: dev
          language: dotnetcore
          appName: MyDotNetAppOnUbuntu
          imageInfo:
            image: "docker.io/appdynamics/dotnet-core-agent:20.11.0-linux"
            agentMountPath: /opt/appdynamics
    ```

    If the base images do not match, then the App Server Agent may not start successfully. See Validate Auto-Instrumentation. The Node.js Agent also has specific Node.js runtime requirements that could prevent the agent from starting. See Node.js Supported Environments.

- For .NET Core and Node.js applications which communicate with an on-premises Controller, see Using Auto-Instrumentation with an On-premises Controller.
- If transaction analytics data is required, then you must configure the `analyticsHost` and `analyticsPort` properties.

Auto-Instrumentation Configuration

1. Set up the Cluster Agent feature to remove deleted pods from the Controller **Tiers & Nodes** Dashboard. Re-create the `cluster-agent-secret` that was created in Install the Cluster Agent to include `api-user`, and set the value to a local user from the Controller with the `Administrator` role:

   ```
   kubectl -n appdynamics delete secret cluster-agent-secret
   kubectl -n appdynamics create secret generic cluster-agent-secret --from-literal=controller-key=<access-key> --from-literal=api-user="<username>@<customer>:<password>"
   ```

   The Cluster Agent uses the `api-user` to mark the associated node in the Controller as historical upon pod deletion.

2. Add auto-instrumentation configuration to the `cluster-agent.yaml` file or the Helm values `YAML`. The structure of the auto-instrumentation configuration is based on a set of default properties. The addition of one, or more `instrumentationRules`, can target specific application deployments and may override the default properties.

   ```
   apiVersion: appdynamics.com/v1alpha1
   kind: Clusteragent
   metadata:
     name: k8s-cluster-agent
     namespace: appdynamics
   spec:
     # cluster agent properties
     #...
     # required to enable auto-instrumentation
     instrumentationMethod: Env
     # default auto-instrumentation properties
     # may be overridden in an instrumentationRule
     defaultProperty1: value
     defaultProperty2: value
     # ...
     # one or more instrumentationRules
     instrumentationRules:
       - property1: value
         property2: value
       - property1: value
         property3: value
       # ...
   ```

   To perform these common tasks, configure the specified properties:

   - To set the namespaces that are in scope for auto-instrumentation, configure these properties:
     - `nsToInstrument`
     - `nsToInstrumentRegex`
   - (Optional) To filter and target the set of applications within a namespace that are in scope for auto-instrumentation, configure these properties:
     - `instrumentationMatchString`
     - `labelMatch`
   - To assign an application and tier name to an instrumented application, configure these properties: (See Options for Naming the AppDynamics Application)
     - `appNameStrategy`
     - `tierName` (optional, will use deployment name by default)
   - To instrument which containers are in a multi-container application (default is to instrument the first container), configure these properties:
     - `instrumentContainer`
     - `containerMatchString`
   - If transaction analytics is required for .NET and Node.js applications, configure these properties for the analytics host and port (not required for Java):
     - `analyticsHost`
     - `analyticsPort`

   For available configuration options, see Cluster Agent Configuration for Auto-Instrumentation and Cluster Agent Configuration for Instrumentation Rules.

3. After you save the configuration, apply or upgrade the Cluster Agent deployment. The related pods and containers restart based on the deployment rollout strategy associated with the applications.

To validate and troubleshoot auto-instrumentation, see Validate the Cluster Agent Installation.

- If an application deployment does not match the properties defined in `instrumentationRules`, then auto-instrumentation is not enabled.
- If an auto-instrumentation property is not defined as a default, or in an `instrumentationRules`, then the Cluster Agent uses the corresponding default value specified in Cluster Agent Configuration for Auto-Instrumentation. If there are no corresponding default values, then auto-instrumentation is not enabled.

Configuration Examples

This first example targets Java applications in the namespaces that match the `ecom.*` pattern. Each matching application will be instrumented with a `20.20.1` Java Agent and will report to the `Ecommerce` application in the AppDynamics Controller. By default, the tier name will be the name of the Kubernetes deployment.

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<app-name>"
  controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  image: "docker.io/appdynamics/cluster-agent:20.12.1"
  serviceAccountName: appdynamics-cluster-agent
  nsToMonitorRegex: ecom.*
  #
  # auto-instrumentation config
  #
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom.*
  defaultAppName: Ecommerce
  instrumentationRules:
    - language: java
      imageInfo:
        image: docker.io/appdynamics/java-agent:20.20.1
        agentMountPath: /opt/appdynamics
```

The second example targets namespaces that contain Java and .NET Core on Linux applications.
The example incorporates these advanced configurations:

- Uses multiple `instrumentationRules` to target Java versus .NET Core on Linux applications.
- Uses the `labelMatch` strategy to determine the agent type and associated agent image based on the value of the `framework` label in each application spec.
- Rather than assigning a Controller application name in the `YAML` file, the configuration uses `appNameStrategy: label` to assign an application name based on a label from the application deployment spec.
- For the Java applications, it uses `instrumentContainer: select` and `containerMatchString: .*` to instruct the Cluster Agent to auto-instrument each container in a multi-container deployment, rather than just the first container (default).

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<app-name>"
  controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  image: "docker.io/appdynamics/cluster-agent:20.12.1"
  serviceAccountName: appdynamics-cluster-agent
  nsToMonitorRegex: ecom.*
  #
  # auto-instrumentation config
  #
  instrumentationMethod: Env
  nsToInstrumentRegex: stage
  appNameStrategy: label
  instrumentationRules:
    - namespaceRegex: stage
      language: dotnetcore
      labelMatch:
        - framework: dotnetcore
      appNameLabel: appName
      imageInfo:
        image: "docker.io/appdynamics/dotnet-core-agent:20.11.0-linux"
        agentMountPath: /opt/appdynamics
    - namespaceRegex: stage
      language: java
      labelMatch:
        - framework: java
      appNameLabel: appName
      instrumentContainer: select
      containerMatchString: .*
      imageInfo:
        image: "docker.io/appdynamics/java-agent:21.3.0"
        agentMountPath: /opt/appdynamics
```

The third example is a deployment spec that defines the `appName` and `framework` label for a matching .NET Core on Linux application, based on the auto-instrumentation configuration from the second example:

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: dotnet-app
  labels:
    appName: my-app
    framework: dotnetcore
spec:
   # ...
```

AppDynamics Application Name Strategies

The Controller's **Application Dashboard** provides three application name strategies. Select a strategy by assigning the `appNameStrategy` property to one of these values:

- manual: Use the `defaultAppName` or `appName` parameters in the `cluster-agent.yaml` file to set the application name.
- label: Use a label from the application's deployment spec as the application name.
- namespace: Use the Kubernetes namespace as the application name.

Manual

By default, the `appNameStrategy` is `manual`, which uses the `defaultAppName` or `appName` parameter to set the application name.

- If `defaultAppName` is provided, then use it (unless overwritten in an instrumentation rule).
- If `appName` is provided in an instrumentation rule, then use it.

For example in this spec, `ECommerce` is the default application name applied to the `ecom` and `groceries` namespace, and `BookStore` is the application name applied to the `books` namespace.

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<cluster-name>"
  # ...
  # auto-instrumentation config
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom|books|groceries
  appNameStrategy: manual
  defaultAppName: ECommerce
  instrumentationRules:
    - namespaceRegex: books
      appName: BookStore
```

Label

This option uses the `label` parameter as the application name strategy. To use the label option, specify a value in the `appNameLabel` parameter. Th e `appNameLabel` value refers to a label specified in the application deployment spec.

- If `spec.appNameLabel` is provided, then use it (unless overwritten in an instrumentation rule).
- If `appNameLabel` is provided in an instrumentation rule, then use it.

For example in this spec, the deployment spec label `appname` is used to set the application name in the `ecom` and `groceries` namespaces, and the label `app` is used in the `books` namespace.

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<cluster-name>"
  # ...
  # auto-instrumentation config
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom|books|groceries
  appNameStrategy: label
  appNameLabel: appname
  instrumentationRules:
    - namespaceRegex: books
      appNameLabel: app
```

For an application deployed to the `ecom` or `groceries` namespaces that sets the label `appname` (shown in this deployment spec snippet), it reports to the `eCommerce` application in the Controller's **Application Dashboard**.

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: ecom-app
  labels:
    appname: eCommerce
spec:
...
```

Namespace

This option uses the `namespace` parameter as the application name strategy and allows you to use the namespace name where an application is deployed as the application name in the Controller's **Application Dashboard**.

In this spec, each application in `ecom`, `books` and `groceries` namespace uses the application name based on the namespace that it is deployed to.

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<cluster-name>"
  # ...
  # auto-instrumentation config
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom|books|groceries
  appNameStrategy: namespace
```

Cluster Agent Configuration for Auto-Instrumentation

These configuration parameters are supported in the `cluster-agent.yaml` file for auto-instrumentation. For additional configuration parameters supported by the Cluster Agent, see Configure the Cluster Agent.

Parameter Name	Default Value	Description
`appNameLabel`	N/A	The value of this label will be the AppDynamics application name.
`appNameStrategy`	manual	The option to specify a name for the AppDynamics application. You can specify any of these values for this parameter: • manual • namespace • label See Options for Naming the AppDynamics Application.
`defaultAnalyticsHost`	N/A	The hostname of the Analytics Agent. This parameter is required if you require the Node.js Agent or the .NET Core Agent to send the default transaction data to the Analytics Agent. The default value is applied to all the instrumented resources unless it is overwritten by the `instrumentationRules` configuration.
`defaultAnalyticsPort`	N/A	The listening port for Analytics Agent. For example, if the Analytics Agent is listening on port 9090, then the value of this parameter is `9090`. The default value is applied to all the instrumented resources unless it is overwritten by the `instrumentationRules` configuration. This parameter is required along with `defaultAnalyticsHost` if you require the Node.js or the .NET Core Agent to send the default transaction data to the Analytics Agent.
`defaultAnalyticsSslEnabled`	N/A	This value is based on whether the Analytics Agent port is SSL enabled. If the port is SSL enabled, specify the value as `true`; else, specify as `false`. This parameter is required with `defaultAnalyticsPort` and `defaultAnalyticsHost`, if you require the Node.js or the .NET Core Agent, to send the default transaction data to the Analytics Agent. The default value is applied to all the instrumented resources unless it is overwritten by the `instrumentationRules` configuration.
`defaultAppName`	""	(Required) Application name used by the agent to report to the Controller.
`defaultCustomConfig`	N/A	This parameter is specific to Java applications. You can add any custom system property if your application framework requires any specific configuration for instrumentation. This value gets appended to the `env or defaultEnv` variable as configured with other Java Agent properties.

`defaultContainerMatchString`	N/A	This is a regex value to choose the containers to instrument. This parameter requires you to use the `select` option within the `instrumentContainer` (specified in the instrumentation rules). When the `select` option is used with this parameter, Cluster Agent instruments the containers that match the regex value.
`defaultEnv`	`JAVA_TOOL_OPTIONS`	This parameter is specific to Java applications. Environment variable to which the `-javaagent` argument and App Agent system properties are added. You can override this to use any other environment best suited for the deployment

`defaultInstrumentationLabelMatch`	`[]`	Specific deployment labels marked for instrumentation.
		
		This parameter accepts a list of `key-value` pairs to instrument.
		
		You must match a minimum of one label for instrumentation.
		
		For example:
		
		`defaultInstrumentationLabelMatch:`
		`- label1: value1`
		
		`- label1: value2`
		
		`- label2: value2`
		
		For example, if only `label1: value2` matches, the instrumentation works as expected.

`defaultInstrumentMatchString`	`.*`	Names of deployments targeted for instrumentation. This parameter is used as the default value for the `matchstring` parameter that is specified within instrumentationRules. If `matchstring` is not specified, then Cluster Agent uses this parameter value. This parameter accepts deployment names as a regular expression or regex. If there are multiple deployments to instrument, you can separate names with a '`|`' without spaces. By default, this parameter instruments all deployments configured by `nsToInstrumentRegex`. Therefore, if there is no value specified for `matchString` in the instrumentation rules and if you do not specify any value for this parameter, then Cluster Agent instruments every deployment.

`imageInfo`	`java:`
	`  image: "docker.io/appdynamics/java-  agent:latest"`
	`  agentMountPath: "/opt/appdynamics"`
	`  imagePullPolicy: "IfNotPresent"`
	
	`dotnetcore:`
	`  image: "docker.io/appdynamics/dotnet-core-agent:latest"`
	`  agentMountPath: /opt/appdynamics`
	
	`imagePullPolicy: "IfNotPresent"`
	
	`nodejs:`
	`  image: "docker.io/appdynamics/nodejs-agent:20.8.0-stretch-slimv14"`
	`  agentMountPath: /opt/appdynamics`
	`  imagePullPolicy: "IfNotPresent"`
		The Docker repository from where the Node.js Agent, .NET Core for Linux, and Java Agent is pulled.
		
		Supported values are:
		
		• `image`: Location of the agent image, along with its `tag/version`
		• `agentMountPath`: Location of image artifacts in the image file system. The default is `/opt/appdynamics`.
		You must change this configuration if the path is different.
		• `imagePullPolicy`: The pull policy required for the agent's docker image. You can choose one of the following pull policy based on your requirement:
		  ◦ `Always`
		  ◦ `IfNotPresent`
		  ◦ `Never`
		
		This parameter is used in the init containers that are added during auto-instrumentation.

`instrumentationMethod`	`None`	The instrumentation method used for instrumenting Apps. Supported values are: • `None`: Instrumentation is disabled. • `Env`: Attach the instrumentation properties to the container environment variables. If a value is not set, the instrumentation will not start.
`instrumentationRules`	`[ ]`	This is a mandatory parameter to enable auto-instrumentation. This includes the list of specific instrumentation rules. You can apply the rules to one or more namespaces, and can filter on deployment names and labels. Instrumentation rules are granular to support targeting specific deployments. See Cluster Agent Configuration for Instrumentation Rules.
`nsToInstrumentRegex`	`""`	Required. If you do not specify a value, auto-instrumentation will not work. Specify the namespaces to be instrumented as a regex. If there are multiple namespaces to instrument, separate namespaces using "|" without spaces. By default, namespaces are not instrumented.
numberOfTaskWorkers	2	To configure the rate limit for the number of deployments that are auto-instrumented at the same time. Increasing this value may lead to a larger number of concurrent pod restarts in the cluster.

`netvizInfo`	`bciEnabled: true`
	
	`port: 3892`
		To configure the Network Visibility App Agent, `netviz`, you must deploy a Network Agent separately (in addition to setting this parameter).
		See Install Infrastructure Visibility with the Cluster Agent Operator on how to install the Network Agent.
		
		By default, `netviz` is enabled. In the absence of a Network Agent, this property does not have any impact.
		You can enable or disable the `netviz` Agent per your requirements.
		
		Supported values are:
		
		1. `bciEnabled`: Boolean flag denoting whether `netviz` is enabled or not.
		2. `port`: The port the Network Agent is listening on (default is `3892`). Override this value only when running the Network Agent on a port other than the default port.

`runAsGroup`	`0`	If you configured the application container as a non-root user, provide the group ID (GID) of the corresponding group. `runAsGroup` is used to set the appropriate file permission on the agent artifacts. `The default runAsGroup` value is applied to all the instrumented resources, unless it is overwritten by the `instrumentationRules` configuration.
`runAsUser`	`0`	If you configured the application container as a non-root user, provide the user ID (UID) of the corresponding user. `runAsUser` is used to set the appropriate file permission on the agent artifacts. The default `runAsUser` value is applied to all the instrumented resources, unless it is overwritten by `instrumentationRules` configuration.

`resourcesToInstrument`	`Deployment`	Cluster Agent instruments the resources that are listed in this parameter. The default value is Deployment. If you need to instrument StatefulSets, add `StatefulSet` to the list.
		
		For example, to instrument Deployments and StatefulSets, configure:
		
		`resourcesToInstrument:`
		
		`- Deployment`
		`- StatefulSet`

Cluster Agent Configuration for Instrumentation Rules

The Cluster Agent uses a combination of `namespaceRegex`, `matchString,` and `labelMatch` for selecting an instrumentation rule on a first match basis. If the rules do not match, then the configuration uses the default values that were specified by these parameters:

- `nsToInstrumentRegex`
- `defaultInstrumentationLabelMatch`
- `defaultInstrumentMatchString`

For example, instrumentation rule `-matchString "<string>"` is added to the Cluster Agent configuration file:

```
instrumentationRules:
    - matchString: "<string>"
```

If the name of the deployment matches this string, then the remaining parameters under `instrumentationRules` are applied. If the string does not match, auto-instrumentation stops. If the parameters are not defined within the rules, then the Cluster Agent defaults to the parameters `nsToInstrumentRegex, defaultInstrumentationLabelMatch`, and `defaultInstrumentMatchString` to determine the instrumentation rules.

Parameter Name	Default Value	Description
`analyticsHost`	N/A	The hostname of the Analytics Agent. This parameter is required if you require the Node.js Agent or the .NET Core Agent to send the default transaction data to the Analytics Agent.
`analyticsPort`	N/A	The listening port for Analytics Agent. For example, if the Analytics Agent is listening on port 9090, then the value of this parameter is `9090`. This parameter is required along with `defaultAnalyticsHost` if you require the Node.js or the .NET Core Agent to send the default transaction data to the Analytics Agent.

`analyticsSslEnabled`	N/A	This value is based on whether the Analytics Agent port is SSL enabled or not. If the port is not SSL enabled, specify the value as `false`. This parameter is required along with `defaultAnalyticsPort` and `defaultAnalyticsHost` if you require the Node.js or the .NET Core Agent to send the default transaction data to the Analytics Agent.
`containerMatchString`	N/A	This is a regex value to choose the containers with the name that satisfies the value. This parameter requires you to use the `select` option within `defaultInstrumentContainer` or `instrumentContainer`. When the `select` option is used along with this parameter, Cluster Agent instruments the containers that match the regex value This parameter overrides the default value specified for `defaultContainerMatchString`.
`customAgentConfigSource`	N/A	This parameter provides an option to use the custom configuration of the instrumenting agents through ConfigMaps. This parameter requires that you create the required ConfigMaps in the Cluster Agent namespace. This parameter is dynamically configurable from the Cluster Agent YAML file. The changes that you make in the YAML file are updated to all the instrumented agents without restarting the application. Similarly, the changes that you make to the configuration in the ConfigMap is updated to all the instrumented agents without restarting the application. • `configMapName`: Specify the name of the ConfigMap. This allows the agent to use the same custom ConfigMap to update all the instrumented agent namespace. • `subDir`: (Required for Java Agent) Specify the relative path where the ConfigMaps are mounted. For example: `/ver20.8.0.3686/conf` , where `20.8.0.3686` is the version of the Java Agent. This directory may differ based on the Java Agent version. See Example 6. The absolute mount path for the ConfigMap is `<agent home path>/subDir` This `ConfigMap` replaces any ConfigMap of the same name in the target application's namespace. If you need to remove a ConfigMap file (used in the rules) from your deployment, then you must first remove this parameter from the Cluster Agent YAML file, and then remove the ConfigMap from the Cluster Agent's namespace.
`instrumentContainer`	`first`	This parameter provides an option to choose the container that must be instrumented. You can specify any of the following values: • `first`: This is the default value. When you specify this value, Cluster Agent instruments the first container in the pod. • `all`: When you specify this value, Cluster Agent instruments all the containers in the pod. • `select`: When you specify this value, Cluster Agent instruments only those containers with the name that matches a regex specified in the `defaultContainerMatchString` parameter or the `containerMatchString` parameter.
`language`	N/A	The language of the application to be instrumented. These languages are supported: • `dotnetcore` • `java` • `nodejs`
`matchString`	N/A	Regular expression to match on deployment name on which the rule applies. If you do not specify a value for this parameter, then the Cluster Agent uses the value specified in the `defaultInstrumentMatchString`, and instruments all the deployments that satisfy the value.

`labelMatch`	{}	A list of `key-value` pairs of labels to include in this rule. It is sufficient to match any one of the labels.
		
		For example:
		`labelMatch:`
		`-label1: value1`
		`-label1: value2`
		`-label2: value2`
		If only `label1: value2` matches, then instrumentation works as expected.

`appName`	`<defaultAppName>`	Application name used by the Java Agent to report to the Controller. This overrides `defaultAppName`. If no value is provided, then the configured `defaultAppName` is used.
`appNameLabel`	N/A	The value of this label is the AppDynamics application name.

`customAgentConfig`	N/A	This parameter is specific to Java applications. You can add any custom system property if your application framework requires any specific configuration for instrumentation. This value takes precedence over the default value specified in the `defaultCustomConfig` parameter. This value is appended to the `env` or `defaultEnv` variable as configured with other Java Agent properties.
`tierName`	""	Tier name used by the Java Agent to report to the Controller. If no tier name is provided, then the deployment name is used as the default.
`env`	""	This parameter is specific to Java applications. Environment variable to which the App Agent system properties will be added. When specified, this overrides `defaultEnv` for the deployments matching this instrumentation rule. If none are provided, it defaults to the `defaultEnv` (if configured), or to the default `env JAVA_TOOL_OPTIONS` (if not configured at default cluster level).

`imageInfo`	`image: "docker.io/appdynamics/java-agent:latest" agentMountPath: "/opt/appdynamics" imagePullPolicy: "IfNotPresent"`
	
	`dotnetcore: image: "docker.io/appdynamics/dotnet-core-agent:latest" agentMountPath: /opt/appdynamics imagePullPolicy: "IfNotPresent"`
	
	`nodejs: image: "docker.io/appdynamics/nodejs-agent:20.8.0-stretch-slimv14" agentMountPath: /opt/appdynamics imagePullPolicy: "IfNotPresent"`
		Location of the agent image. You can select one of these parameters:
		• `image`: Location of the agent image, and its tag/version.
		• `agentMountPath`: Location of image artifacts in the image file system. The default is `/opt/appdynamics`. This configuration is required only if the path differs from the default path.
		• `imagePullPolicy`: The pull policy required for the agent's Docker image. The default is `IfNotPresent`. You can choose one of these pull policies based on your requirement:
		  ◦ `Always`
		  ◦ `IfNotPresent`
		  ◦ `Never`
		This parameter is used in the init containers that are added during auto-instrumentation.
		
		The default value is `IfNotPresent`.
		
		For the specific language mentioned in this rule, this overrides `image-info` for the deployments matching this instrumentation rule.
		
		You must configure this if you want to override the default cluster-level configuration, and use a custom agent version for this specific rule selection.

`netvizInfo`	`bciEnabled: true`
	
	`port: 3892`
		To configure the Network Visibility App Agent, `netviz`, you must deploy a Network Agent separately (in addition to setting this parameter).
		See Install Infrastructure Visibility with the Cluster Agent Operator to install the Network Agent.
		
		By default, `netviz` is enabled. This property has no impact without a Network Agent.
		You can enable or disable the `netviz` Agent based on your requirements.
		
		Supported values are:
		
		1. `bciEnabled`: Boolean flag denoting whether `netviz` is enabled or not.
		2. `port`: The port the Network Agent is listening on (default is `3892`). Override this value only when running the Network Agent on a port other than the default port.

`runAsGroup`	`0`	If you configured the application container as a non-root user, provide the `groupId` of the corresponding group. This sets the appropriate file permission on the agent artifacts. This value is applied to all the instrumented resources. Add this parameter, if you require to override the default value of `runAsGroup` that is configured for default instrumentation, or if you require a specific value for the resources that satisfy this rule.
`runAsUser`	`0`	If you configured the application container as a non-root user, it provides the `userId` of the corresponding user. This sets the appropriate file permission on the agent artifacts. This value is applied to all the instrumented resources. Add this parameter, if you require to override the default value of `runAsUser` that is configured for default instrumentation, or if you require a specific value for the resources that satisfy this rule.

Configuration Examples

Example 1: Instrument all the deployments in the `ecom` namespace. The Java Agents running in each pod will register to the Controller with the `Ecommerce` application, and the tier names will default to the Kubernetes deployment names.

Example 2: Instrument only those deployments with names starting with `Payment` and with the label `module=payment` in any namespace.

Example 3: Instrument all deployments in namespaces `ecom` and `books`. For applications in the `books` namespace, use the `BookStore` application name in the Controller and a specific version of the Java Agent.

Example 4: Override the configuration in Example 3 for the `groceries` namespace to use a different Controller application name, and the `JAVA_OPTS` environment variable to inject the `-javaagent` Java argument.

Example 5: Instrument a Node.js application in namespace `books` and a .NET Core Linux application in namespace `groceries`. Also, the Node.js application must send the transaction data to the Analytics Agent.

Example 6: Instrument the containers with the names that start with `str` for the Java application in namespace `ecom`. Also, use the custom agent configurations in `controller-info.xml` and `app-agent-config.xml` configuration files that are present in the `controllerConf` ConfigMap along with the `log4j2.xml` file for logging settings of the agent present in `logConf` ConfigMap. These ConfigMaps are present in the Cluster Agent's namespace.

Example 7: Instrument all the deployments in the `groceries` namespace and instrument only those deployments with names starting with `Payment` in the `books` and `ecom` namespace.

Use Auto-Instrumentation with an On-Premises Controller

- The .NET Core and Node.js applications support only certificates signed by CA, not the self-signed certificates. If your Controller is using a self-signed certificate, only auto-instrumentation for Java applications is supported.
- To use the custom SSL certificate, ensure to configure the Cluster Agent uses SSL for on-premises Controllers. This certificate is used by the instrumentation agents. See Configure the Cluster Agent.
- For Node.js applications, you must update the certificate path in the `shim.js` file, and use this ConfigMap within the `customAgentConfigSource` parameter:
  `certificateFile: "/opt/appdynamics-nodejs/custom-ssl.pem"`
  For more information about this parameter, see Cluster Agent Configuration for Instrumentation Rule.

Minimize the Impact of Pod Restarts

When auto-instrumentation is enabled, the related pods restart based on the deployment rollout strategy associated with the deployments. To accommodate pods restarts, you may need to increase memory and CPU quotas associated with the impacted namespaces. To reduce the impact of restarting a large number of pods, the Cluster Agent (by default) allows only two concurrent auto-instrumentation tasks. The subsequent deployments (`resourcesToInstrument`) are auto-instrumented after the rollout of an instrumented deployment. However, you can configure the parameter, `numberOfTaskWorkers`, to specify the number of concurrent auto-instrumentation tasks based on your cluster's requirements.

Validate Auto-Instrumentation

This page describes how to validate and troubleshoot Cluster Agent auto-instrumentation.

Prerequisites

- Cluster Agent is reporting to the Controller. See Validate the Cluster Agent Installation.
- If you upgraded the Cluster Agent, you followed the Upgrade the Cluster Agent procedure and used a compatible set of images and YAML files.

Validate Auto-Instrumentation

1. After applying auto-instrumentation, confirm that the application is reporting to the Controller using the application name assigned based on the name strategy you chose. See Auto-Instrument Applications with the Cluster Agent.

2. Verify that the application pods targeted for auto-instrumentation have been recreated. As auto-instrumentation is being applied, use `kubectl get pods` with the `-w` flag to print out updates to pod status in real-time. A successfully auto-instrumented application shows that the app pod was recreated, and the correct init container was applied and copied the App Server Agent to the application container.

```
kubectl -n <app ns> get pods -w
NAME                          READY   STATUS            RESTARTS   AGE
dotnet-app-85c7d66557-s8hzm   1/1     Running           0          3m11s
dotnet-app-6c45b6d4f-fpp75    0/1     Pending           0          0s
dotnet-app-6c45b6d4f-fpp75    0/1     Init:0/1          0          0s
dotnet-app-6c45b6d4f-fpp75    0/1     PodInitializing   0          5s
dotnet-app-6c45b6d4f-fpp75    1/1     Running           0          6s
dotnet-app-85c7d66557-s8hzm   1/1     Terminating       0          20m\
```

   You can also use `kubectl get pods -o yaml` to check whether the application spec was updated to include the init container and the state of the init container:

```
kubectl -n <app-ns> get pod <app-pod> -o yaml
 ...
 initContainers:
  - command:
    - cp
    - -r
    - /opt/appdynamics/.
    - /opt/appdynamics-java
    image: docker.io/appdynamics/java-agent:latest
  ...
  initContainerStatuses:
  - containerID: docker://8bb892f322e5a043866d038631392a2272b143e54c8c431b3590312729043eb9
    image: appdynamics/java-agent:20.9.0
    imageID: docker-pullable://appdynamics/java-agent@sha256:
077ac1c4f761914c1742f22b2f591a37a127713e3e96968e9e570747f7ba6134
    ...
    state:
      terminated:
        containerID: docker://8bb892f322e5a043866d038631392a2272b143e54c8c431b3590312729043eb9
        exitCode: 0
        finishedAt: "2021-02-03T22:39:25Z"
        reason: Completed
```

   > The pod annotation may display `APPD_POD_INSTRUMENTATION_STATE` as `failed` for Node.js and .NET Core (Linux) applications even when the instrumentation is successful.

Troubleshoot Auto-Instrumentation When Not Applied

If the application pod was not recreated, and an init container was not applied, there may be an issue with the namespace and application matching rules used by the Cluster Agent.

1. First, confirm that the Cluster Agent is using the latest auto-instrumentation configuration.

```
kubectl -n appdynamics get cm instrumentation-config -o yaml
```

If the YAML output does not reflect the latest auto-instrumentation configuration, then validate the Cluster Agent YAML configuration, and apply or upgrade the Cluster Agent:

2. If the pods are still not recreated, then enable `DEBUG` logging in the Cluster Agent configuration:
3. Apply or upgrade the Cluster Agent to update the `DEBUG` logging configuration:
4. After you update the Cluster Agent logging configuration, tail the logs to search for messages indicating that the Cluster Agent has detected the application, and considers the application in scope for auto-instrumentation:

```
# apply grep filter to see instrumentation related messages:
kubectl -n appdynamics logs <cluster-agent-pod> -f | grep -E 'instrumentationconfig.go|deploymenthandler.
go'
```

However, if output displays (similar to this example) for the application you want to auto-instrument, then the Cluster Agent does not consider the application in scope for auto-instrumentation:

```
[DEBUG]: 2021-03-30 21:22:09 - instrumentationconfig.go:660 - No matching rule found for Deployment
dotnet-app in namespace stage with labels map[appName:jah-stage framework:dotnetcore]
[DEBUG]: 2021-03-30 21:22:09 - instrumentationconfig.go:249 - Instrumentation state for Deployment
dotnet-app in namespace stage with labels map[appName:jah-stage framework:dotnetcore] is false
```

Review your auto-instrumentation configuration to determine any necessary updates and save the changes. Then, delete and re-create the Cluster Agent as described previously. For example, if you overwrote the namespace configuration in an `instrumentationRule` using `namespaceRegex`, be sure that you use a value that is included in `nsToInstrumentRegex` (`dev` in the example):

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  # content removed for brevity
  nsToInstrumentRegex: stage|dev
  instrumentationRules:
    - namespaceRegex: dev
```

After you update the configuration and the Cluster Agent has been recreated, your output should be similar to this example indicating that the Cluster Agent recognizes the application as in scope for auto-instrumentation:

```
[DEBUG]: 2021-03-30 21:22:10 - instrumentationconfig.go:645 - rule stage matches Deployment spring-boot-
multicontainer in namespace stage with labels map[appName:jah-stage acme.com/framework:java]
[DEBUG]: 2021-03-30 21:22:10 - instrumentationconfig.go:656 - Found a matching rule {stage  map[acme.com
/framework:[java]]   java select .*  JAVA_TOOL_OPTIONS map[agent-mount-path:/opt/appdynamics image:
docker.io/appdynamics/java-agent:21.3.0 image-pull-policy:IfNotPresent] map[bci-enabled:true port:3892]
0 0 appName  0 false []} for Deployment spring-boot-multicontainer in namespace stage with labels map
[appName:jah-stage acme.com/framework:java]
[DEBUG]: 2021-03-30 21:22:10 - instrumentationconfig.go:249 - Instrumentation state for Deployment
spring-boot-multicontainer in namespace stage with labels map[appName:jah-stage acme.com/framework:java]
is true
[DEBUG]: 2021-03-30 21:22:10 - deploymenthandler.go:312 - Added instrument task to queue stage/spring-
boot-multicontainer
```

Troubleshoot Auto-Instrumentation When it Fails to Complete

If the application pod was re-created but the instrumented application is not reporting to the Controller, then auto-instrumentation did not complete successfully, or the App Server Agent failed to register with the Controller.

1. If the application pods are being restarted, but the init container is not completing successfully, then check for events in the application namespace using the **Cluster Agent Events** dashboard or `kubectl get events`. Some common issues that may prevent the init container from completing are: image pull or resource quotas issues.

```
kubectl -n <app ns> get events
```

2. Verify that the application deployment spec was updated with an init container, and if the status information includes any errors:

```
kubectl -n <app-ns> get pod <app-pod> -o yaml
```

3. Start a shell inside the application container to confirm the auto-instrumentation results. Check if the App Server Agent environment variables are set correctly and if the logs are free of errors.

```
kubectl -n <app-ns> exec -it <app-pod> /bin/sh
# Issue these commands in the container
env | grep APPD

# For Java app
env | grep JAVA_TOOL_OPTIONS # or value of defaultEnv
ls /opt/appdynamics-java
cat /opt/appdynamics-java/ver<version>/logs/<node-name>/agent.<date>.log

# For .NET Core app
ls /opt/appdynamics-dotnetcore
cat /tmp/appd/dotnet/1_agent_0.log

# For Node.js app
ls /opt/appdynamics-nodejs
cat /tmp/appd/<id>/appd_node_agent_<date>.log
```

4. If you are instrumenting a Node.js or .NET Core application, and the auto-instrumentation files have been copied to the app container, but the App Server Agent logs do not exist, or errors regarding binary incompatibilities display, then you may have a mismatch between the app image and the App Server Agent Image (referenced in the `image` property of the auto-instrumentation configuration).
For .NET Core, the image OS versions must match (Linux for example).
For Node.js, the image OS versions must match, as well as the Node.js version. To confirm, check the image tags, Dockerfiles, or exec-ing into the app container:

```
$ kubectl -n <app-ns> exec -it <app-pod> /bin/sh
cat /etc/os-release   # (or /etc/issue)
NAME="Alpine Linux"...
# for Node.js app
node -v
```

Uninstall Auto-Instrumentation from an Instrumented Application

This page describes how to uninstall instrumentation changes from an application that has been auto-instrumented using the Cluster Agent.

Uninstall Auto-Instrumentation

1. To remove the application from auto-instrumentation scope, update `cluster-agent.yaml` by using the `nsToInstrument`, `nsToInstrumentRegex`, `instrumentationMatchString` and `labelMatch` properties (depending on which properties you initially used).
   To completely disable auto-instrumentation, set the `instrumentationMethod` to `None`. See Auto-Instrument Applications with the Cluster Agent .
2. To update the auto-instrumentation configuration, apply or upgrade the Cluster Agent.
3. Delete and re-create the application deployment.

Configure App Agents to Correlate with Cluster Agent

This page describes how to configure APM container correlation with the Cluster Agent when manually instrumenting Kubernetes applications. See Instrument Kubernetes Applications Manually.

When you establish APM correlation, the application containers monitored by the Cluster Agent display in the Controller under the **Application /Container** view. The **Cluster Agent Pod** Dashboard also provides a link to the **APM Node** Dashboard in the **Pod Details** page.

> This configuration is required only when you use init containers or Dockerfiles to manually instrument applications in a cluster where the Cluster Agent is running. When you use Cluster Agent auto-instrumentation, APM container correlation is processed automatically. See Auto-Instrument Applications with the Cluster Agent.

APM container correlation uses the `UNIQUE_HOST_ID` (or `APPDYNAMICS_AGENT_UNIQUE_HOST_ID`) property of specific language agents. For examples of how to set this property, see the language-specific container installation page:

- Install the Java Agent in Containers
- Install the .NET Core Agent for Linux in Containers
- Install the Node.js Agent in Containers

The table lists the commands required to assign the `UNIQUE_HOST_ID` value based on runtime, platform, and App Agent type:

Platform	Container Runtime	Command for Container ID
Kubernetes	Docker	`UNIQUE_HOST_ID=$(sed -rn '1s#.*/##; 1s/(.{12}).*/\\1/p' /proc/self/cgroup)`
OpenShift 3.10 and 3.11	Docker	`UNIQUE_HOST_ID=$(sed -rn '1s#.*/##; 1s/docker-(.{12}).*/\\1/p' /proc/self/cgroup)`
OpenShift 4.x	CRI-O	`UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' ' {print $NF}' | awk -F '-' '{print $2}' | cut -c 1-12) ; if [ -z $UNIQUE_HOST_ID]; then UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' '{print $NF} ' | cut -c 1-12) ; fi ;`

Kubernetes with Docker

Java APM correlation works out-of-the-box because the Agent retrieves the `UNIQUE_HOST_ID` value automatically. For other Agents with the `UNIQUE_HOST_ID` property, you must set the property using this command: `UNIQUE_HOST_ID=$(sed -rn '1s#.*/##; 1s/-(.{12}).*/\\1/p' /proc/self/cgroup)`

For all language Agents with a `uniqueHostId` property, set the property using this method when building the App image:

```
UNIQUE_HOST_ID=$(sed -rn '1s#.*/##; 1s/(.{12}).*/\\1/p' /proc/self/cgroup)
JAVA_OPTS="$JAVA_OPTS -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID"
```

If you cannot change the application image, you can assign the `UNIQUE_HOST_ID` in the Kubernetes deployment specification by modifying the `command` attribute:

```
command: ["/bin/sh"]
args: ["-c", "UNIQUE_HOST_ID=$(sed -rn '1s#.*/##; 1s/(.{12}).*/\\1/p' /proc/self/cgroup) && java -
Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
```

This approach implies that the entry point of the application is known. In the example, the original entry point is:

```
java $JAVA_OPTS -jar /java-services.jar
```

OpenShift 3.10 and 3.11 with Docker Runtime

For all language Agents with the `UNIQUE_HOST_ID` property in OpenShift v3.10 and v3.11 with Docker runtime, set the property using this method when building the App image:

```
UNIQUE_HOST_ID=$(sed -rn '1s#.*/##; 1s/docker-(.{12}).*/\\1/p' /proc/self/cgroup)
```

If you cannot change the application image, you can assign the `UNIQUE_HOST_ID` in the OpenShift v3.10 or v3.11 deployment specification by modifying the `command` attribute:

```
command: ["/bin/sh"]
args: ["-c", "UNIQUE_HOST_ID=$(sed -rn '1s#.*/##; 1s/docker-(.{12}).*/\\1/p' /proc/self/cgroup) && java -
Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
```

This approach implies that the entry point of the application is known. In the example, the original entry point is:

```
java $JAVA_OPTS -jar /java-services.jar
```

OpenShift 4.x with CRI-O Runtime

For all language Agents with the `UNIQUE_HOST_ID` property in OpenShift v4.x with CRI-O runtime, set the property using this method when building the App image:

```
UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' '
{print $NF}' | awk -F '-' '{print $2}' | cut -c 1-12) ; if [ -z $UNIQUE_HOST_ID ]; then UNIQUE_HOST_ID=$(cat
/proc/self/cgroup | head -1 | awk -F '/' '{print $NF}' | cut -c 1-12) ; fi ;
```

If you cannot change the application image, you can assign the `UNIQUE_HOST_ID` in the OpenShift v4.x deployment specification by modifying the `command` attribute:

```
command: ["/bin/sh"]
args: ["-c", "UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' '{print $NF}' | awk -F '-'
'{print $2}' | cut -c 1-12) ; if [ -z $UNIQUE_HOST_ID ]; then UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head
-1 | awk -F '/' '{print $NF}' | cut -c 1-12) ; fi ;  java -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID
$JAVA_OPTS -jar /java-services.jar"]
```

This approach implies that the entry point of the application is known. In the example, the original entry point is:

```
java $JAVA_OPTS -jar /java-services.jar
```

Use the Cluster Agent

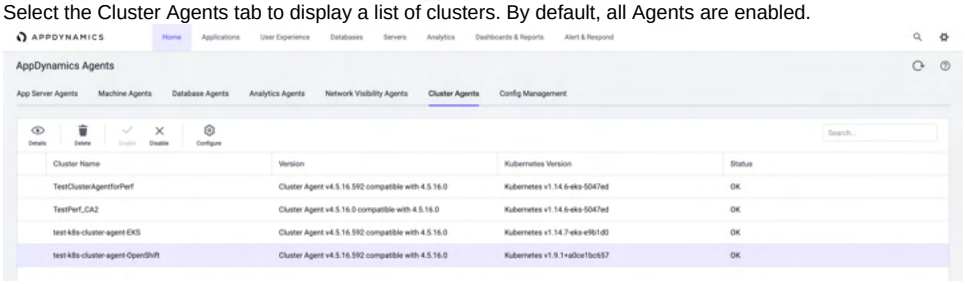
You administer the Cluster Agent from the AppDynamics Controller where you can enable, disable, configure, and delete the Cluster Agent. You can also change which namespaces to monitor.

Any configuration change you make in the Controller also applies to the Cluster Agent. These changes take a couple of minutes, and the status displays with a progress indicator.

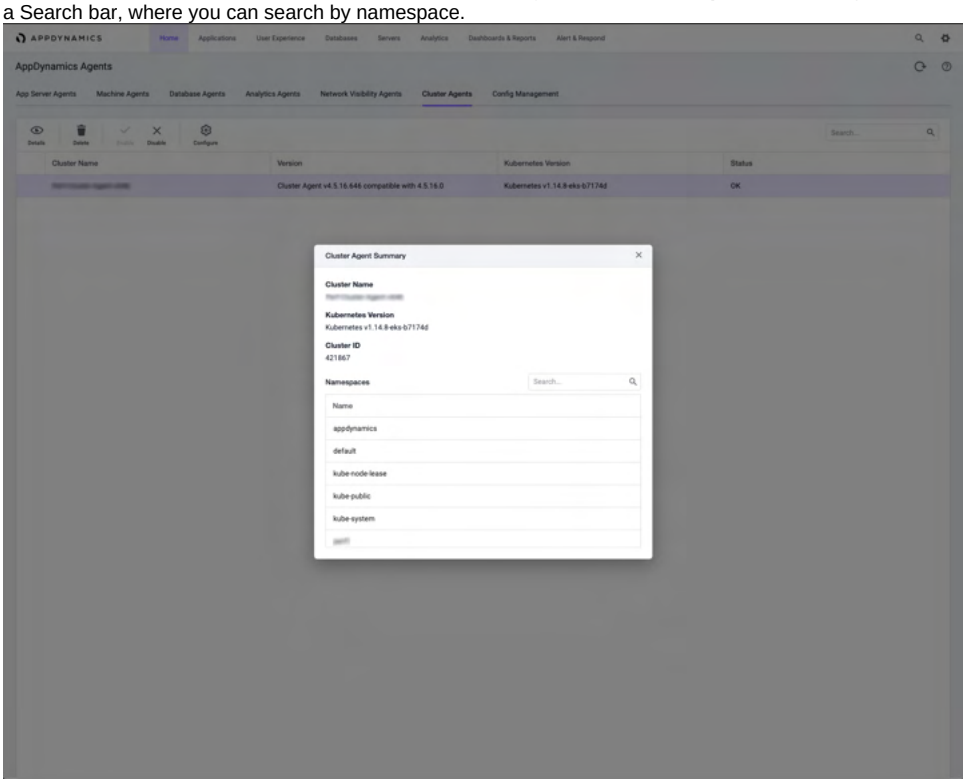
View the Cluster Agent Summary

From the **Controller UI** panel:

1. In the upper-right corner, click Settings **> AppDynamics Agents**.
2. Select the Cluster Agents tab to display a list of clusters. By default, all Agents are enabled.



3. Double-click a Cluster Agent. A dialog appears showing a **Cluster Agent Summary** of your current settings. The summary card shows the **Cluster Name**, **Kubernetes Version**, **Cluster ID**, and currently monitored **Namespaces**. To the right of the **Namespaces** table is a Search bar, where you can search by namespace.

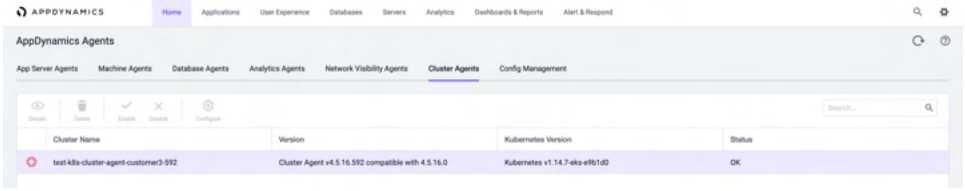


4. Click **X** to close the Cluster Agent Summary card.

Disable the Cluster Agent

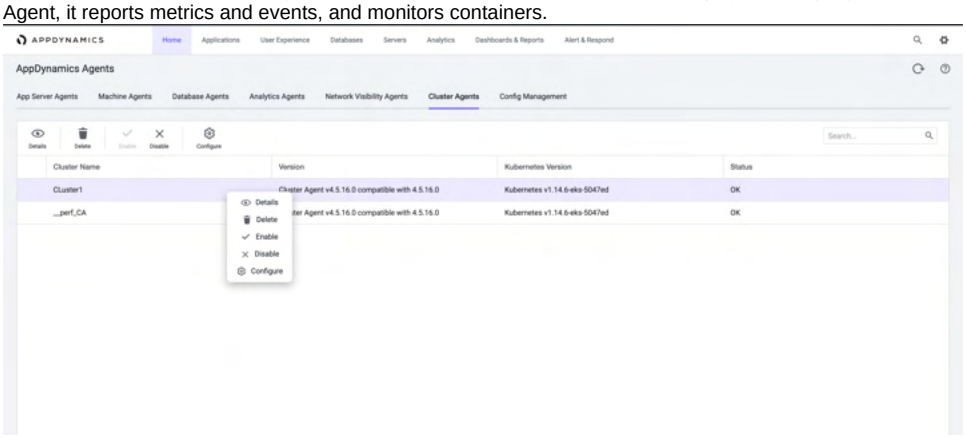
1. Select a Cluster Agent from the list.

2. Click Disable ✕. You can also select the Cluster name, right-click, and select **Disable**. A dialog appears confirming that you disabled the agent successfully. These changes take a couple of minutes, and the status displays with a progress indicator. When you disable the Cluster Agent, it does not report metrics or events, nor monitor pods or containers. You can re-enable a disabled Cluster Agent.



Enable the Cluster Agent

1. Select a Cluster Agent from the list.
2. Click Enable ✓. You can also select the Cluster name, right-click, and select **Enable**. A dialog appears confirming that you enabled the agent successfully. These changes take a couple of minutes, and the status displays with a progress indicator. When you enable the Cluster Agent, it reports metrics and events, and monitors containers.



Edit Namespaces

You can modify the namespaces by using either `nsToMonitor` or `nsToMonitorRegex` fields.

These are common namespace behavior scenarios with the `nsToMonitor` field:

- After the Cluster Agent's initial registration, the namespaces are retrieved from the Cluster Agent `YAML` file.
- After initial registration, if the Cluster Agent restarts and the Controller is running, the Controller UI's user namespace settings take precedence.
- After initial registration, if the Controller restarts and the Cluster Agent is running, any previous changes made to the namespaces in the Controller UI are preserved.
- If both the Cluster Agent and the Controller restart, the namespaces are retrieved from the `YAML` file.

The following are common namespace behavior scenarios with `nsToMonitorRegex` field:

> To use the `nsToMonitorRegex` field, ensure that you are using Controller >= 20.10 and Agent >= 20.9.

- After initial registration, at every subsequent minute the agent checks for the `nsToMonitorRegex` field to match the namespaces. If there is `nsToExcludeRegex` mentioned, those namespaces are excluded from the monitored namespaces.
- If a namespace configuration is to be monitored or ignored from the Controller, it takes precedence over the agent configuration (Cluster Agent YAML file). Therefore, if a namespace satisfies the regular expression that is configured for `nsToExcludeRegex`, but the Controller configuration includes that namespace under monitored namespaces, then the namespace is monitored.
  To exclude this namespace from being monitored, you must delete the namespace in the Controller configuration. In this scenario, where there is a conflict between the agent configuration and the Controller configuration, the addition or removal of the relevant namespace from the Cluster Agent configuration does not have any effect.
- If the Cluster Agent is restarted, the `nsToMonitorRegex` and `nsToExcludeRegex` fields are read from the agent configuration file along with the namespaces configured in the Controller.
- If the Controller is restarted, the monitored and ignored namespaces included in the Controller configuration are retained and reapplied along with the agent configuration.
- If both the Cluster Agent and the Controller are restarted at the same time, the `nsToMonitorRegex` and `nsToExcludeRegex` fields are read from the agent configuration file. The namespaces to be monitored are determined based on the agent configuration.
- If a new namespace matching the configured regex is added, the namespace is monitored without any additional configuration. Similarly, when a namespace does not match the configured regex, it is not monitored.

You can modify namespaces in a Cluster by:

- Updating Namespaces in the Cluster Agent Configuration File - Modify the `nsToMonitor` or the `nsToMonitorRegex` field in the `cluster-agent.yaml` file before deploying the Cluster Agent. Namespaces mentioned in the `nsToMonitor` field are considered only during initial registration. You can update the `nsToMonitorRegex` field in the `cluster-agent.yaml` file even after the registration.
  You can specify regular expressions (regex) for the namespaces that you want to monitor by using the `nsToMonitorRegex` field. If you do not require the Cluster Agent to monitor some of the namespaces that match the regex specified in the `nsToMonitorRegex` field, then you can specify `nsToExcludeRegex` along with `nsToMonitorRegex`. For example, if Cluster Agent must monitor all the namespaces except the namespace that has the name starting with exclude, specify `nsToMonitorRegex` as `.*` and `nsToExcludeRegex` as `^exclude`.
- Editing Namespaces in the User Interface - Edit namespaces after you deploy the Cluster Agent. Once deployed, the cluster is listed under AppDynamics Agents/Cluster Agents. Open the AppDynamics browser-based configuration user interface and edit namespaces.

Update Namespaces in the Cluster Agent Configuration File

To update namespaces in a cluster, use the `nsToMonitor` or the `nsToMonitorRegex` field in the `cluster-agent.yaml` before deploying the Cluster Agent.

Updating namespaces using the `nsToMonitor` field in the `cluster-agent.yaml` file does not change your currently monitored namespaces. However, updating namespaces using the nsToMonitorRegex changes the currently monitored namespaces. The scenarios are mentioned at Edit Namespaces.

If the Cluster Agent pod unexpectedly restarts, the namespaces stored in the Controller take precedence and are preserved. See Troubleshoot the Cluster Agent.

To update namespaces:

1. Open the `cluster-agent.yaml` file in a text editor.
2. Locate the `nsToMonitor` field:

   ```
   nsToMonitor:
       - "default"
       - "appdynamics"
   ```

   Or
   To specify namespaces based on regular expressions, include the `nsToMonitorRegex` field:

   ```
   nsToMonitorRegex: <regular expression>
   nsToExcludeRegex: <regular expression> #This is an optional field
   ```
3. Verify the list of namespaces. If it is not correct, add or remove namespaces in the `cluster-agent.yaml` file.
4. Open a command prompt. To apply the namespaces changes, enter:

   ```
   kubectl apply -f cluster-agent.yaml
   ```
5. To verify that the AppDynamics Operator registered the monitored namespace value, enter:
   When using the `nsToMonitor` field:

   ```
   kubectl -n appdynamics describe cm cluster-agent-config | grep
   APPDYNAMICS_CLUSTER_MONITORED_NAMESPACES -A 2
   ```

   When using the `nsToMonitorRegex` field:

   ```
   kubectl-app describe cm cluster-agent-mon
   ```

This is the expected output from the `nsToMonitor` example:

```
APPDYNAMICS_CLUSTER_MONITORED_NAMESPACES:
----
default
```

If you use the `nsToMonitorRegex` field, the default value of `nsToMonitor` is ignored.

Edit Namespaces in the User Interface

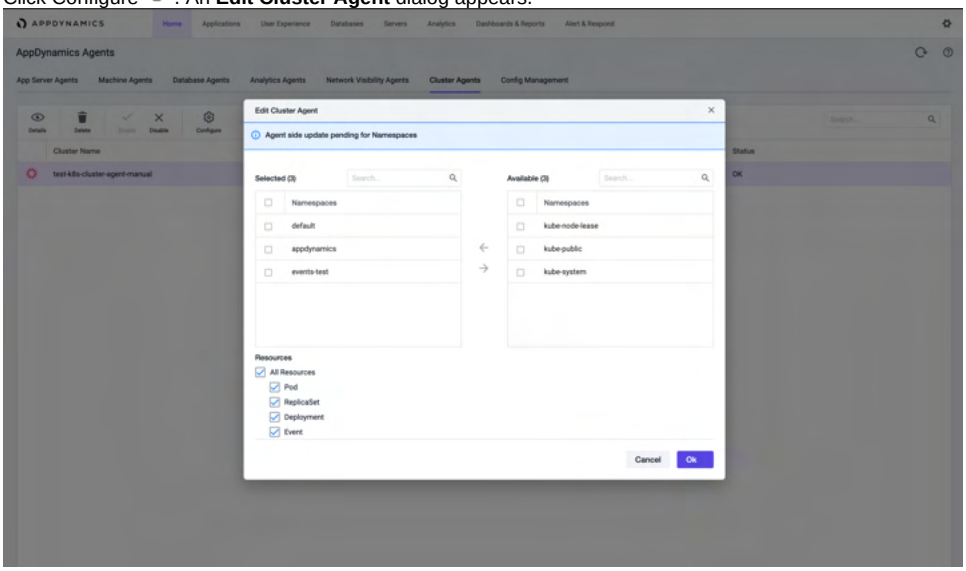
Once you have deployed the Cluster Agent, the **Selected** namespaces column displays the currently monitored namespaces.

To edit a namespace from the cluster, you must have administrator permissions:

To edit a namespace:

1. Double-click a cluster from the list.

2. Click Configure. An **Edit Cluster Agent** dialog appears.



3. To modify namespaces, select a namespace by checking the corresponding box.
4. Once the desired namespace box is checked, click the arrow to move it to either the **Selected** namespace table or the **Available** namespace table.
5. Click **OK** to close the dialog box. These changes take a couple of minutes and the status displays in a banner notification.

Updating namespaces in the `cluster-agent.yaml` file does not change your currently monitored namespaces. It assures that if the Cluster Agent pod unexpectedly restarts, that your namespaces are preserved. See Troubleshoot the Cluster Agent.

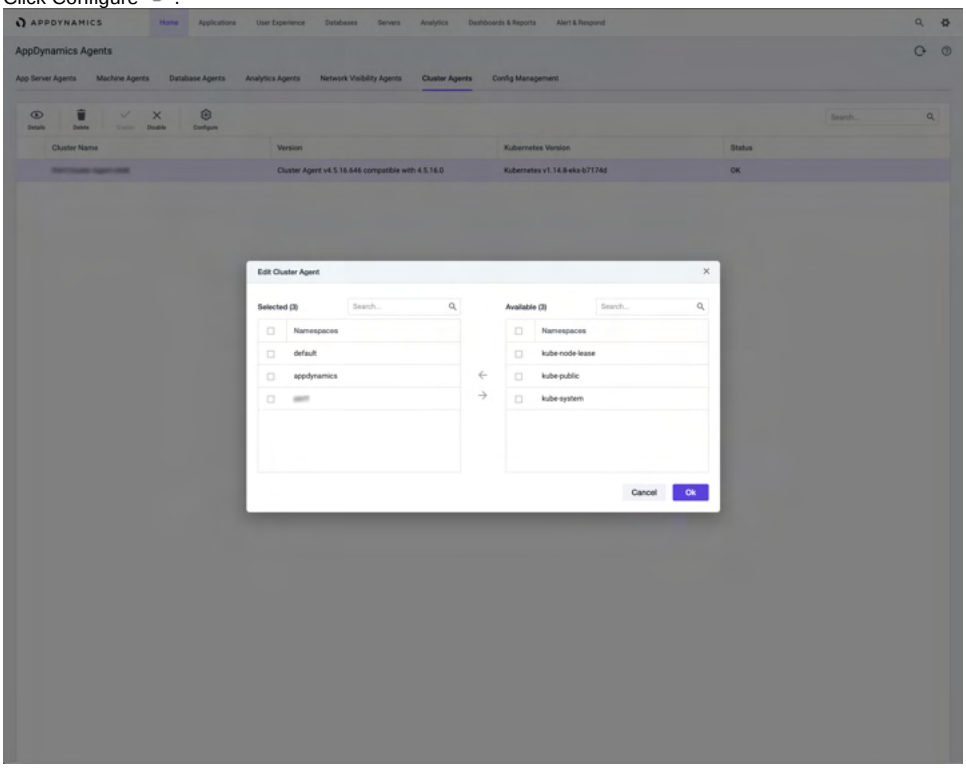
Add or Remove Namespaces

To add or remove a namespace from the cluster, you must have administrator permissions:

To add or remove a namespace from the cluster:

1. Double-click a cluster from the list.

2. Click Configure .



3. To modify namespaces, select a namespace by checking the corresponding box. Once the desired namespace box is checked, click the arrow to move it to either the **Selected** namespace table, or the **Available** namespace table.
4. Click **OK** to close the dialog box. These changes take a couple of minutes and the status displays with a progress indicator..

Delete a Monitored Namespace

To delete a Cluster Agent monitored namespace:

1. Double-click a cluster from the list.
2. Click Configure . The **Edit Cluster Agent** dialog appears.
3. Select a namespace by checking the corresponding box.
4. Click the arrow to move to either the **Available** namespace, or to the **Selected** namespace table.
5. Delete the namespace from your Kubernetes cluster.

Delete the Cluster Agent

To delete a Cluster Agent:

1. Select the Cluster Agent name that you want to delete.
2. Click Delete . A dialog asks you to confirm that you want to delete the Cluster Agent.
3. Click **Delete**. If you delete a Cluster Agent, you will lose all historical data.

Cluster Metrics

The **Cluster Agent Dashboard** metrics derive from the Kubernetes API, and they report information for the clusters and pods. For any defined set of namespaces, the Cluster Agent reports events on these Kubernetes and hardware resources.

AppDynamics monitors cluster health and Kubernetes objects for:

- Cluster Summary Metrics
- CPU
- DaemonSets
- Deployments
- Endpoints
- Jobs
- Memory
- Nodes
- Pods
- PVC
- ReplicaSets
- StatefulSets
- Services
- Storage Quota

Cluster Summary Metrics

Metric Name	Description	UI Location	Metric Path
Error events count	Number of error events	**Dashboard > Errors**	Hardware Resources|Cluster|Error events count
Evicted pods count	Number of evicted pods	**Pods > Evicted**	Hardware Resources|Cluster|Evicted pods count
Eviction threats count	Number of events that represent pod evictions	**Dashboard > Errors**	Hardware Resources|Cluster|Eviction threats count
Image pull errors	Number of image pull errors	**Dashboard > Issues > Image Issues**	Hardware Resources|Cluster|Image pull errors
Image pulls	Number of image pulls	**Dashboard > Issues > Image Issues**	Hardware Resources|Cluster|Image pulls
Info events count	Number of informational events	**Dashboard > Errors**	Hardware Resources|Cluster|Info events count
Pod errors	Number of errors related to pods	**Dashboard > Issues > Pod Issues**	Hardware Resources|Cluster|Pod errors
Pod Kills	Number of pods that were killed	**Inventory > Pods > Pod Kills**	Hardware Resources|Cluster|Pod Kills
Pod restarts	Number of times the pods restarted	**Dashboard > Issues > Pod Issues**	Hardware Resources|Cluster|Pod restarts
Pods Scaledowns	Count of scaledowns; you can scale down your deployments and replica sets.	**Inventory > Pods > Scaledowns**	Hardware Resources|Cluster|Pods Scaledowns
Pods count	Total count of pods	**Inventory > Pods > Phases > Normal**	Hardware Resources|Cluster|Pods count
Pods failed	Number of failed pods	**Pods > Failed**	Hardware Resources|Cluster|Pods failed
Pods pending	Number of pods in a pending state. Pending status normally indicates an issue. See the Kubernetes documentation.	**Pods > Pending**	Hardware Resources|Cluster|Pods pending
Pods running	Number of pods in a running state	**Pods > Running**	Hardware Resources|Cluster|Pods running
Pods succeeded	Number of pods in Succeeded phase	**Dashboard > Pods By Phase**	Hardware Resources|Cluster|Pods succeeded
Pods unknown	Number of pods in Unknown state	**Dashboard > Pods By Phase**	Hardware Resources|Cluster|Pods unknown
Pods with Missing Dependencies - Config Maps and Secrets	If a pod is dependent on any Config Maps & Secrets, then those dependencies are missing.	**Inventory > Pods > Missing Dependencies - Config Maps and Secrets**	Hardware Resources|Cluster|Pods With Missing Dependencies - Config Maps And Secrets (Pod Metrics for Inventory tab)

Pods with Missing Dependencies - Services	If a pod is dependent on any Services, then those dependencies are missing.	**Inventory > Pods > Missing Dependencies - Services**	Hardware Resources|Cluster|Pods With Missing Dependencies (Pod Metrics for Inventory Tab)
Pods with No Limits	Number of pods with no limits (on CPU/memory) set. If you specified limits on any pod that you are starting, this metric indicates how many pods do not have a limit defined (Displays in the Inventory tab, under Pod Metrics).	**Inventory > Pods > No Limits**	Hardware Resources|Cluster|Pods With No Limits
Pods With No Liveness Probe	Number of pods with no liveness probe. If you configured a probe in Kubernetes to monitor liveness, the values display in the Inventory tab, under Pod Metrics.	**Inventory > Pods > No Probes -Liveness**	Hardware Resources|Cluster|Pods With No Liveness Probe
Pods With No Readiness Probe	Number of pods with no readiness probe. If you configured a probe in Kubernetes to monitor readiness, the values display in the Inventory tab, under Pod Metrics.	**Inventory > Pods > No Probes -Readiness**	Hardware Resources|Cluster|Pods With No Readiness Probe
Privileged Pods	Number of privileged pods that run with root access (Displays in the Inventory tab, under Pod Metrics).	**Inventory > Pods > Privileged**	Hardware Resources|Cluster|Privileged Pods
Storage errors	Overall number of errors related to storage for the cluster.	**Inventory > Pod Metrics**	Hardware Resources|Cluster|Storage errors
Storage quota violations	Number of storage quota violations; if someone exceeds that quota.	**Inventory > Pod Metrics**	Hardware Resources|Cluster|Storage quota violations

CPU

CPU Capacity

Metric Name	Description	UI Location	Metric Path
Total (MilliCores)	Total CPU capacity for the cluster in MilliCores	**Cluster Capacity > CPU**	Hardware Resources|Cluster|CPU|Capacity|Total (MilliCores)
Used (MilliCores)	CPU capacity already used by the cluster in MilliCores	**Cluster Capacity > CPU**	Hardware Resources|Cluster|CPU|Capacity|Used (MilliCores)

CPU Quota

Metric Name	Description	UI Location	Metric Path
Limit Used (%)	Percentage of CPU limit quota used	**Dashboard > Quotas > CPU Limit**	Hardware Resources|Cluster|CPU|Quota|Limit Used (%)
Limit Used (MilliCores)	MilliCores value for CPU limit quota used	**Dashboard > Quotas > CPU Limit**	Hardware Resources|Cluster|CPU|Quota|Limit Used (MilliCores)
Request Used (%)	Percentage of CPU request quota used	**Dashboard > Quotas > CPU Request**	Hardware Resources|Cluster|CPU|Quota|Request Used (%)
Request Used (MilliCores)	MilliCores value for CPU request quota used	**Dashboard > Quotas > CPU Request**	Hardware Resources|Cluster|CPU|Quota|Request Used (Millicores)

CPU Utilization

Metric Name	Description	UI Location	Metric Path
Limit (MilliCores)	Limit of CPU which can be used by the pods. Only the pods belonging to monitored namespaces are used to calculate this metric.	**Dashboard > Utilization > CPU**	Hardware Resources|Cluster|CPU|Utilization|Limit (MilliCores)
Request (MilliCores)	MilliCore value of CPU for which all the pods in monitored namespaces have requested.	**Dashboard > Utilization > CPU**	Hardware Resources|Cluster|CPU|Utilization|Request (MilliCores)
Used (MilliCores)	Actual CPU which the pods from monitored namespaces are currently using.	**Dashboard > Utilization > CPU**	Hardware Resources|Cluster|CPU|Utilization|Used (MilliCores)

DaemonSets

Metric Name	Description	UI Location	Metric Path

Count	Number of daemon sets that exist	**Inventory > Objects > DaemonSets > (Count)**	HardwareResources|Cluster|DaemonSets|Count
Nodes Available	Number of nodes that are running and available on the cluster	**Inventory > Objects > DaemonSets > Available**	HardwareResources|Cluster|DaemonSets|Nodes Available
Nodes MissScheduled	Number of nodes that are running, but should not be running	**Inventory > Objects > DaemonSets > MissScheduled**	HardwareResources|Cluster|DaemonSets|Nodes MissScheduled
Nodes Unavailable	Number of nodes that should be running, but are not running	**Inventory > Objects > DaemonSets > Unavailable**	HardwareResources|Cluster|DaemonSets|Nodes Unavailable

Deployments

Metric Name	Description	UI Location	Metric Path
Count	Number of deployments that exist in the cluster	**Inventory > Objects > Deployments > (Count)**	HardwareResources|Cluster|Deployments|Count
Replicas	Number of pod replicas in the cluster that are not in a terminated state	**Inventory > Objects > Deployments > Available**	HardwareResources|Cluster|Deployments|Replicas
Replicas Unavailable	Total number of unavailable pod replicas across all deployments in the cluster	**Inventory > Objects > Deployments > Unavailable**	HardwareResources|Cluster|Deployments|ReplicasUnavailable

Endpoints

Metric Name	Description	UI Location	Metric Path
Count	Number of endpoints in the cluster	**Inventory > Services > Endpoints > Count**	HardwareResources|Cluster|Endpoints|Count
Not Ready Address	Total number of not ready addresses for all the endpoints in the cluster	**Inventory > Services > Endpoints without ready IP**	HardwareResources|Cluster|Endpoints|Not Ready Address
Orphans	Total number of endpoints in the cluster which do not have any ready, nor any not ready addresses	**Inventory > Services > Orphan Endpoints with no IP**	HardwareResources|Cluster|Endpoints|Orphans
Ready Address	Total number of ready addresses for all the endpoints in the cluster	**Inventory > Services > Endpoints**	HardwareResources|Cluster|Endpoints|Ready Address

Jobs

Metric Name	Description	UI Location	Metric Path
Count	Total number of jobs in the cluster	**Inventory > Objects > Jobs > (Count)**	Hardware Resources|Cluster|Jobs|Count
Pods Active	Total number of active pods for all the jobs in the cluster	**Inventory > Objects > Jobs > Active**	Hardware Resources|Cluster|Jobs|Pods Active
Pods Failed	Total number of pods which reached phase Failed for all the jobs in the cluster	**Inventory > Objects > Jobs > Failed**	Hardware Resources|Cluster|Jobs|Pods Failed
Pods Succeeded	Total number of pods which reached phase Succeeded for all the jobs in the cluster	**Inventory > Objects > Jobs > Succeeded**	Hardware Resources|Cluster|Jobs|Pods Succeeded

Memory

Memory Capacity

Metric Name	Description	UI Location	Metric Path
Total (MB)	Total Memory capacity for the cluster in MBs	**Dashboard > Cluster Capacity > Memory**	Hardware Resources|Cluster|Memory|Capacity|Total (MB)
Used (MB)	Memory capacity already used by the cluster in MBs	**Dashboard > Cluster Capacity > Memory**	Hardware Resources|Cluster|Memory|Capacity|Used (MB)

Memory Quota

Metric Name	Description	UI Location	Metric Path
Limit Used (%)	Percentage of Memory limit quota used	**Dashboard > Quotas > Memory Limit**	Hardware Resources|Cluster|Memory|Quota|Limit Used (%)
Limit Used (MB)	MB value for Memory limit quota used	**Dashboard > Quotas > Memory Limit**	Hardware Resources|Cluster|Memory|Quota|Limit Used (MB)
Request Used (%)	Percentage of Memory request quota used	**Dashboard > Quotas > Memory Request**	Hardware Resources|Cluster|Memory|Quota|Request Used (%)
Request Used (MB)	MB value for Memory request quota used	**Dashboard > Quotas > Memory Request**	Hardware Resources|Cluster|Memory|Quota|Request Used (MB)

Memory Utilization

Metric Name	Description	UI Location	Metric Path
Limit (MB)	Limit of Memory which can be used by the pods. Only the pods belonging to monitored namespaces are used to calculate this metric.	**Dashboard > Utilization > Memory**	Hardware Resources|Cluster|Memory|Utilization|Limit (MB)
Request (MB)	MB value of Memory for which all the pods in monitored namespaces have requested.	**Dashboard > Utilization > Memory**	Hardware Resources|Cluster|Memory|Utilization|Request (MB)
Used (MB)	Actual Memory which the pods from monitored namespaces are currently using.	**Dashboard > Utilization > Memory**	Hardware Resources|Cluster|Memory|Utilization|Used (MB)

Nodes

Metric Name	Description	UI Location	Metric Path
Master Count	Number of master nodes in the cluster	**Inventory > Masters**	Hardware Resources|Cluster|Nodes|Master Count
Worker Count	Number of worker nodes in the cluster	**Inventory > Workers**	Hardware Resources|Cluster|Nodes|Worker Count
Memory Pressure Count	Number of nodes that are under memory pressure in the cluster	**Inventory > Memory Pressure**	Hardware Resources|Cluster|Nodes|Memory Pressure Count
Disk Pressure Count	Number of nodes that are under disk pressure in the cluster	**Inventory > Disk Pressure**	Hardware Resources|Cluster|Nodes|Disk Pressure Count

Pods

Pods Capacity

Metric Name	Description	UI Location	Metric Path
Total Count	Total number of pods that a cluster can support	**Pods > Total Count**	Hardware Resources|Cluster|Pods|Capacity|Total Count
Used Count	Number of pods already created in the cluster	**Pods > Count**	Hardware Resources|Cluster|Pods|Capacity|Used Count

PVC

PVC Quota

Metric Name	Description	UI Location	Metric Path
Used	PVC quota already being used in the cluster (count)	**Dashboard > Quotas > PVC**	Hardware Resources|Cluster|PVC|Quota|Used
Used %	Percentage of PVC quota already being used in the cluster	**Dashboard > Quotas > PVC**	Hardware Resources|Cluster|PVC|Quota|Used (%)

PVC Utilization

Metric Name	Description	UI Location	Metric Path
Capacity (MB)	Total PVC available for the pods in the monitored namespaces	**Dashboard > Utilization > PVCs**	Hardware Resources|Cluster|PVC|Utilization|Capacity (MB)

Request (MB)	Value for PVC requested by pods in monitored namespaces	**Dashboard > Utilization > PVCs**	Hardware Resources|Cluster|PVC|Utilization|Request (MB)

ReplicaSets

Metric Name	Description	UI Location	Metric Path
Count	Number of replica set resources in the cluster	**Inventory > Objects > ReplicaSets > Count**	Hardware Resources|Cluster|Count
Replicas	Total number of replicas for all the replica sets in the cluster	**Inventory > Objects > ReplicaSets > Count**	Hardware Resources|Cluster|ReplicaSets|Replicas
Replicas Available	Total number of available replicas for all the replica sets in the cluster	**Inventory > Objects > ReplicaSets > Available**	Hardware Resources|Cluster|ReplicaSets|Replicas Available
Replicas Unavailable	Total number of unavailable replicas for all the replica sets in the cluster	**Inventory > Objects > ReplicaSets > Unavailable**	Hardware Resources|Cluster|ReplicaSets|Replicas Unavailable

Services

Metric Name	Description	UI Location	Metric Path
Count	Total number of Kubernetes Services running in the cluster	**Inventory > Services > Services**	Hardware Resources|Cluster|Services|Count

StatefulSets

Metric Name	Description	UI Location	Metric Path
Count	Number of statefulsets in monitored namespaces	**Inventory > Objects > StatefulSets > (Count)**	Hardware Resources|Cluster|StatefulSets|Count
Replicas Ready	Number of replicas in a ready state across all statefulsets in monitored namespaces	**Inventory > Objects > StatefulSets > Replicas Ready**	Hardware Resources|Cluster|StatefulSets|Replicas Ready
Replicas Desired	Number of replicas across all statefulsets in monitored namespaces which are specified as desired in statefulset spec	N/A	Hardware Resources|Cluster|StatefulSets|Replicas Desired
Replicas Not Ready	Number of replicas across all statefulsets in monitored namespaces which are not ready and are yet to be created or started	**Inventory > Objects > StatefulSets > Replicas Not Ready**	Hardware Resources|Cluster|StatefulSets|Replicas Not Ready
Collisions	Number of hash collisions for statefulsets across all namespaces monitored	N/A	Hardware Resources|Cluster|StatefulSets|Collisions

Storage Quota

Metric Name	Description	UI Location	Metric Path
Used (MB)	Storage quota used by the cluster in MB	**Dashboard > Quotas > Storage**	Hardware Resources|Cluster|Storage|Quota|Used (MB)
Used (%)	Percentage of storage quota used by the cluster	**Dashboard > Quotas > Storage**	Hardware Resources|Cluster|Storage|Quota|Used (%)

Monitor Cluster Health

The **Cluster Dashboard** provides visibility into your cluster's health to quickly determine any impact on performance. Each dashboard indicator provides a different aspect of the cluster performance.

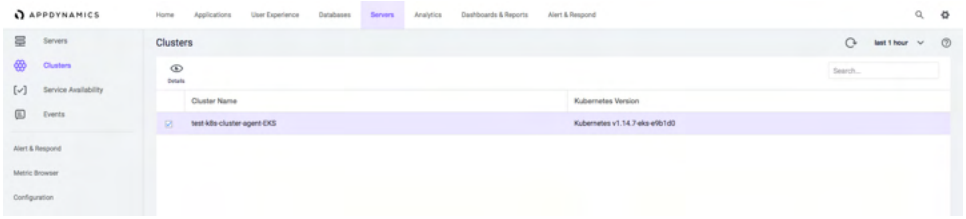
Important Notes

- The **Cluster Inventory Dashboard** may display 0 (zero) for Master Nodes; this is expected behavior. Unlike on-premises clusters, cloud providers develop and release at a different pace compared to the Kubernetes project and evolve independently. This master node, or a number of master nodes, in Amazon EKS, AKS, and other cloud-based environments or clusters, hide the master node of the cluster. The reported cluster results are similar to the results generated by the `kubectl get nodes` command. To verify your reported results, enter the `kubectl get nodes` command to review node information, and if master nodes are shown as zero.
- Cluster-level resource utilization metrics are the sum of resources consumed by each of the pods. These metric values may reach hundreds of thousand because the Cluster Agent reports sums for individual pods.
- Pod utilization metrics are the sum of each of the containers running within a pod.
- Pod count and pod state (running, pending, evicted, and failed pods) metrics show real-time values (not historical values averaged over a designated period of time). Whatever pods are running "now", are reported.

Clusters Dashboard

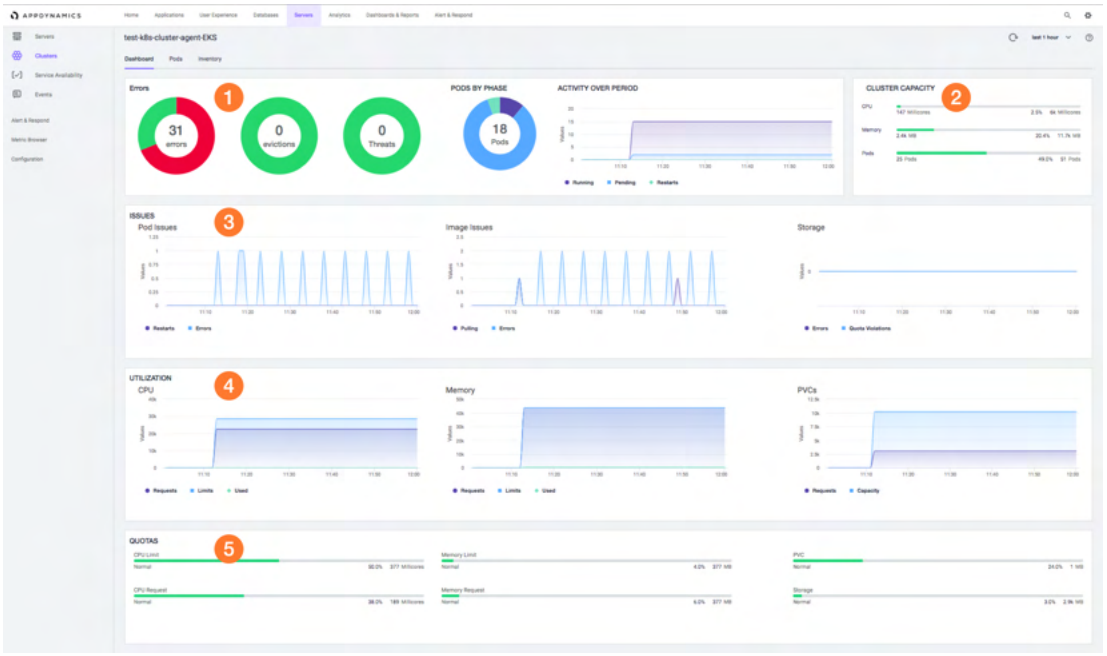
To access your cluster from the Controller:

1. Select **Servers > Clusters > Cluster Name**.



2. Select a Cluster Agent and double-click. The cluster interface displays the Dashboard, Pods, Inventory, and Events tabs.

Dashboard Tab



- **Errors card**: 1 Displays pie chart graphs for the monitored namespaces in each cluster:
  - **Errors**: Number of **Errors** (Error events count), **Evictions** (Evicted pods count), and **Threats** (Eviction threats count) for individual p ods.
  - **Pods by phase**: Number of pods that are in various states: **Failed**, **Pending**, **Running**, **Succeeded**, and **Unknown**.
  - **Activity over period**: Time-series chart that shows the number of pods in **Running**, and **Pending** states for a given time period.
- **Cluster Capacity**: 2 Score bar displays **CPU**, **Memory**, and **Pods**. A green line indicates the capacity usage. The Dashboard indicates the percent usage of **CPU**, **Memory** and **Pod** capacity of the cluster which you can use to plan the resource capacity for this cluster.

- **Issues card:** 3 Displays:
  - **Pod issues**: When a Cluster Agent observes pod restarts and errors.
  - **Image issues**: Image pulling and errors.
  - **Storage**: Storage capacity issues such as errors and quota violations.
- **Utilization card:** 4 Displays:
  - **CPU**: Requests, limits and used.
  - **Memory**: Requests, limits and used.
  - **PVCs**: Requests and capacity.
- **Quotas card**: 5 Displays % utilization of resources relative to the respective quotas. The Agent tracks these resources:
  - Percentage of CPU Limit Quota Used.
  - Memory Limit of Quota Used.
  - Percentage of PVC Quota Used.
  - Percentage of CPU Request Quota Used.
  - Percentage of Memory Request Quota Used.
  - Percentage of Storage Quota Used.

Numbers are cumulative for the entire cluster. Use these indicators to track the availability of specific resources based on the imposed quotas and use in cluster capacity planning.

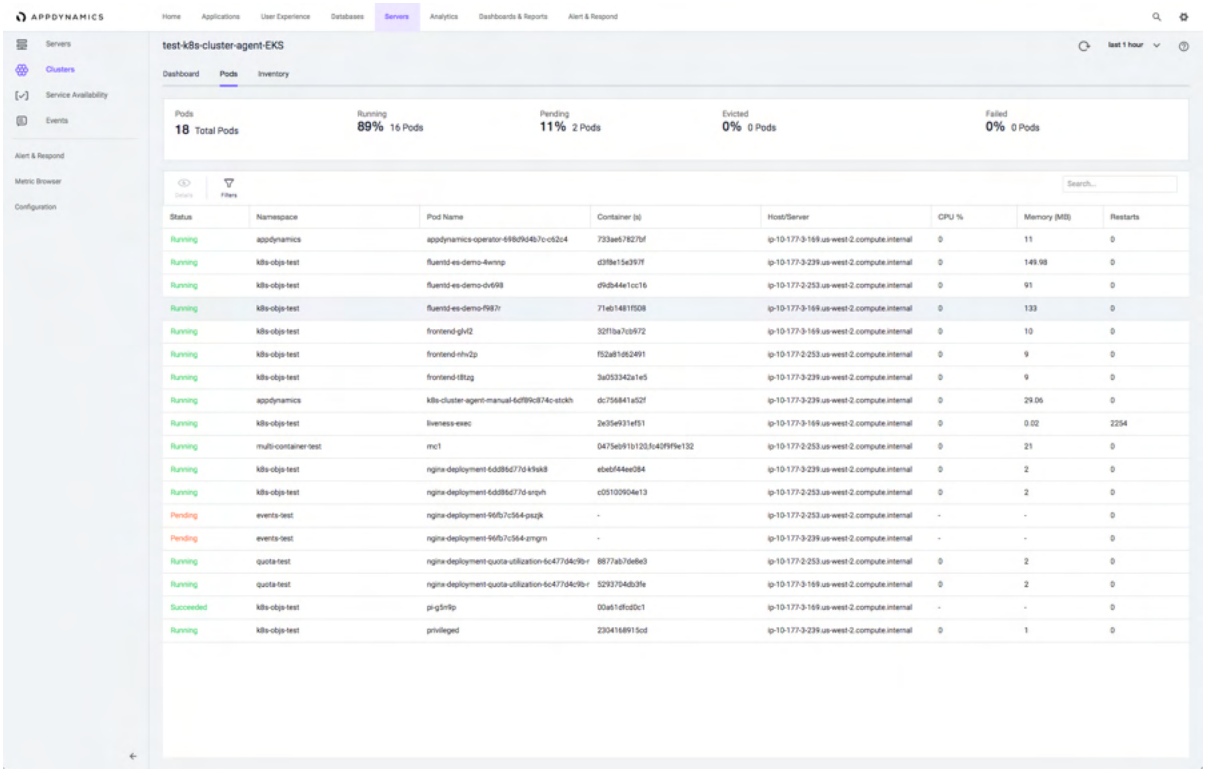
Pods Tab

The Pods tab displays pods in various states and shares a high-level summary of their status. This example shows pods running in Amazon EKS. All pods are displayed based on their registered **Namespace** and **Pod Name**.

> Terminated pods continue to display in the Pods list until they have been purged from the AppDynamics Controller, however their metrics are not updated. Purging occurs automatically at regular intervals. See Controller Settings for the Cluster Agent.

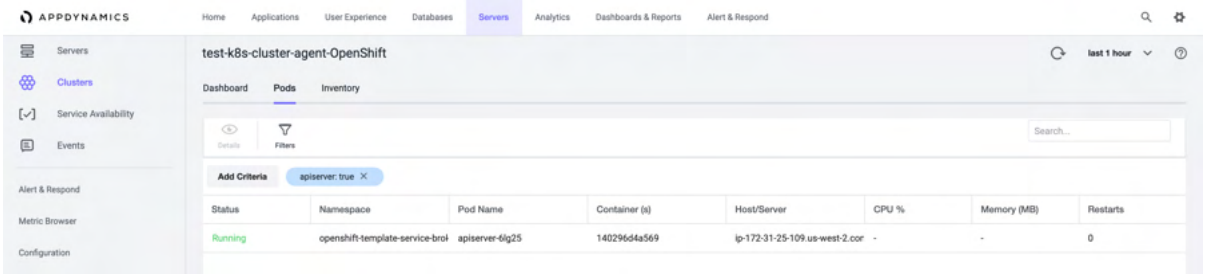
The top card displays a summary of the monitored pods and their status in each cluster:

- **Total Pods**: Total number of pods in the monitored cluster.
- **Running**: Percentage and number of pods in a running state.
- **Pending**: Percentage and number of pods in a pending state. Pending status normally indicates an issue. See Kubernetes documentation.
- **Evicted**: Percentage and number of evicted pods.
- **Failed**: Percentage and number of failed pods.

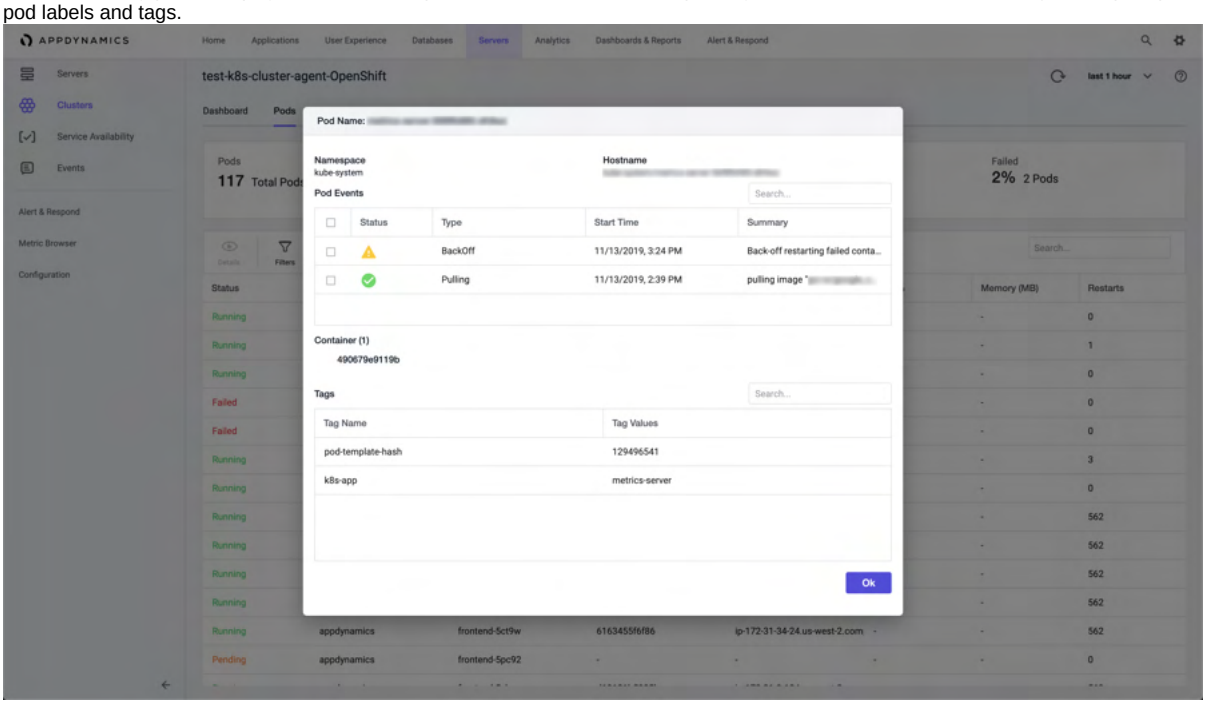


You can search based on **Namespace** or **Pod Name**.

You can further filter based on pod tags and labels:



Double-click any pod to display its **Pod Details** panel. From the **Pod Details** panel, you can review containers running in that pod, pod events, and pod labels and tags.



The Cluster Agent automatically detects a pod's:

- Status
- Namespace
- Pod name
- Container IDs
- Host or server
- CPU % (sum of running containers within the pod)
- Memory MB (sum of running containers within the pod)
- Restarts

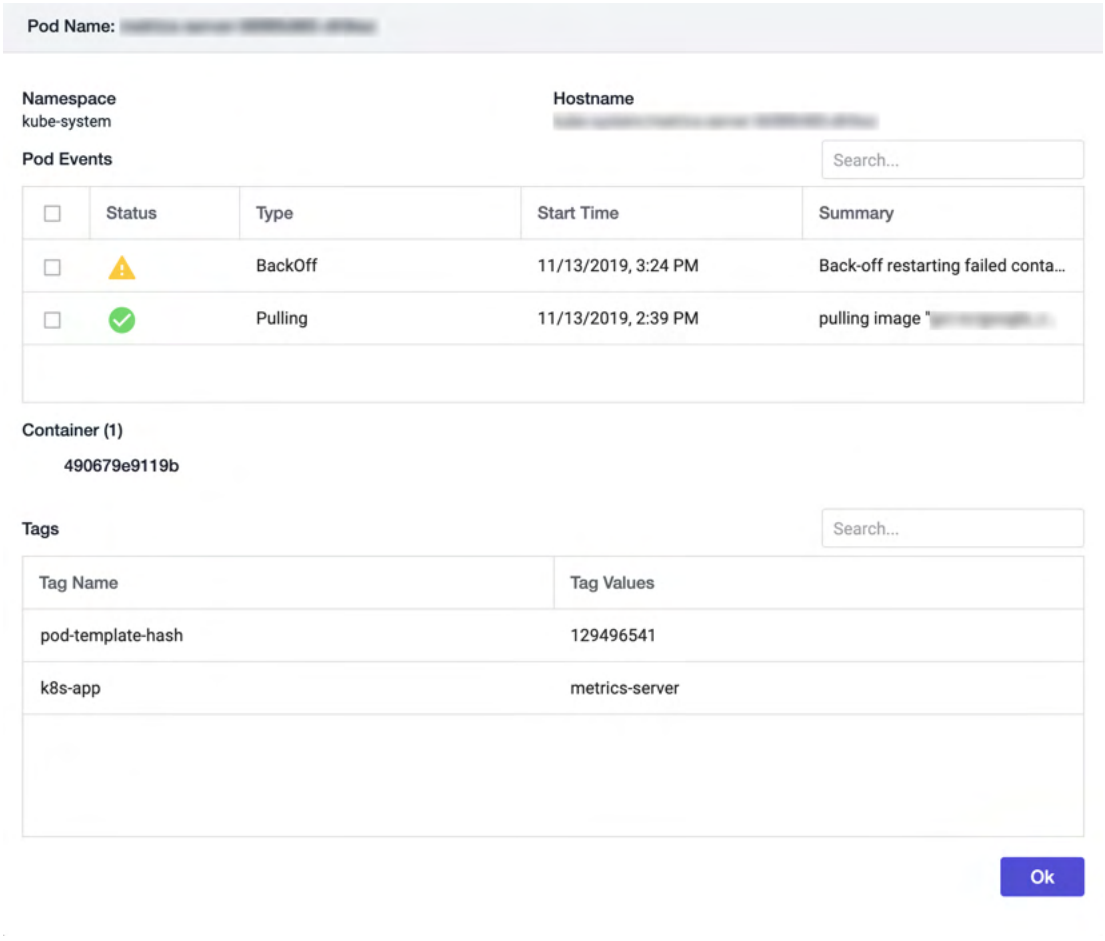
Pods are deleted for these reasons:

- When the namespace is un-monitored.
- When pods are deleted from the cluster, except for the failed pods.
- When the pod count exceeds the pod limit.
- If the pod is blocklisted.

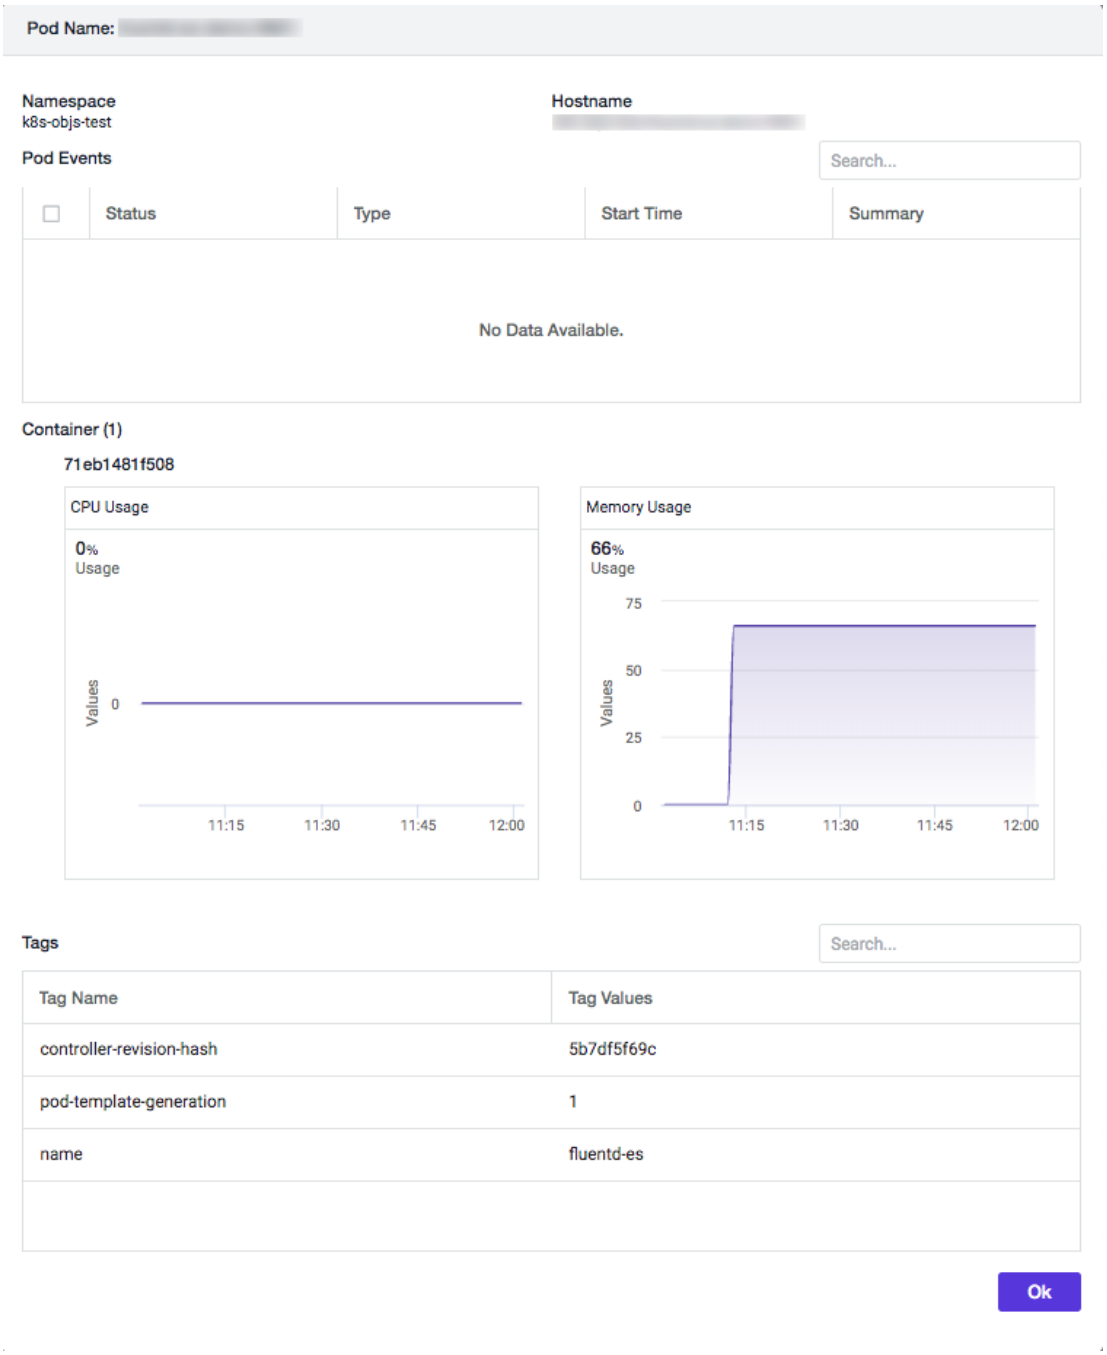
Pod Details Panel

The **Pod Details** panel displays:

- **Namespace**: In which namespace the pod is running.
- **Hostname**: Namespace or pod name.
- **Pod Events**: List of the most-recent events generated from the `kubectl describe pods` command.
- **Container** (count): List of running containers displayed by Container ID in this pod. Click each container to display individual container metrics.
- **Tags:** Kubernetes labels provided to this pod.

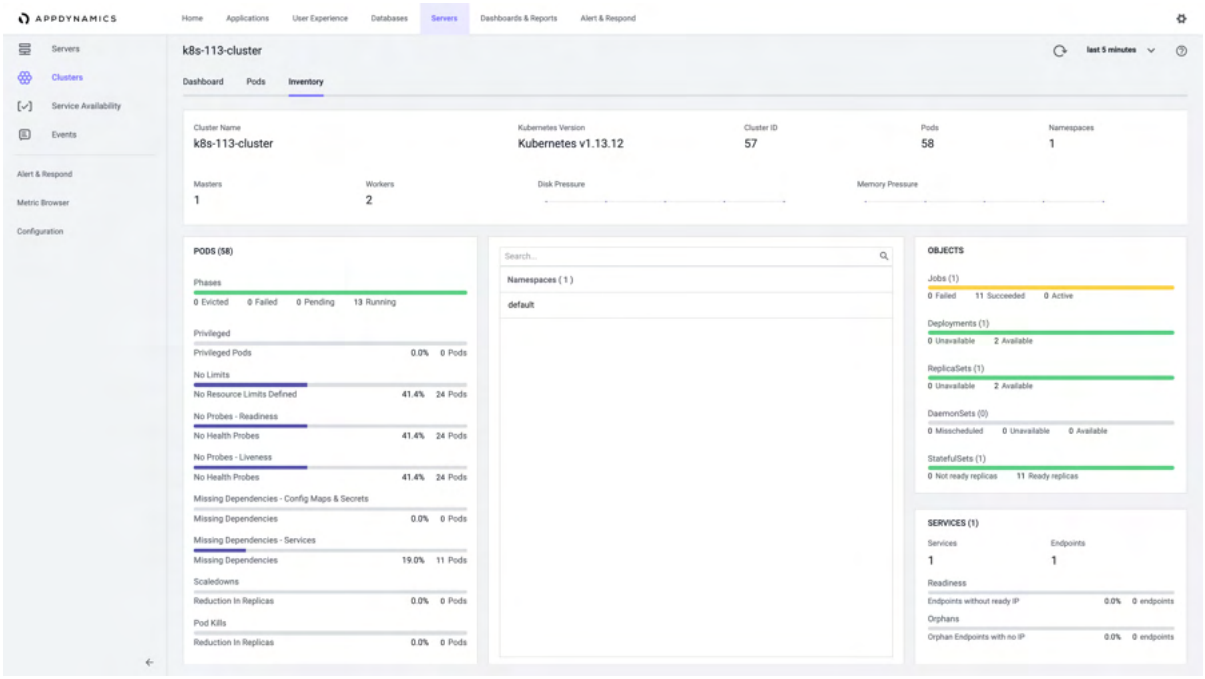


If you click the **Container ID**, it expands to display two container metrics: CPU and Memory Usage.



Inventory Tab

The Inventory tab displays a high-level snapshot or inventory view of your cluster. It displays the contents of the cluster which enables you to troubleshoot applications running in the cluster.



The Cluster card displays:

- **Cluster Name**: Name of the cluster.
- **Kubernetes Version**: Kubernetes version running on the cluster.
- **Cluster ID**: ID of the Cluster Agent.
- **Pods**: Number of monitored pods.
- **Namespaces**: Number of monitored namespaces.
- **Masters**: Number of master nodes.
- **Workers**: Number of worker nodes.
- **Disk Pressure**: Snippet of disk pressure trend in the cluster.
- **Memory Pressure**: Snippet of memory pressure trend in the cluster.

The Pods card displays:

- **Pods by Phases**: Whether a pod is running, evicted, pending or failed. This number is the same count as the pods in a "running" state in the Pods tab.
- **Privileged Pods**: The pods run as root.
- **No Limits**: You can specify limits to any pod that you are starting. The No Limits metric indicates how many pods do not have a limit defined.
- **No Readiness Probe**: If you configured a probe in Kubernetes to monitor readiness, the values display here.
- **No Liveness Probe**: If you configured a probe in Kubernetes to monitor liveness, the values display here.
- **Missing Dependencies - Config Maps & Secrets**: If a pod is dependent on any Config Maps & Secrets, then those dependencies are missing.
- **Missing Dependencies - Services**: If a pod is dependent on any Services, then those dependencies are missing.
- **Scaledowns**: Count of scaledowns of your deployments and replicasets.
- **Pod Kills**: Number of pods that were killed.

Namespaces: List of namespaces that you can search from the Search bar

The Objects card displays:

- **Jobs**: Total number of jobs in the monitored namespaces, and the number of failed, active, and succeeded job counts.
- **Deployments**: Number of deployments in monitored namespaces, and the total available and unavailable replica counts.
- **ReplicaSets**: Number of replicasets in monitored namespaces, and the total available and unavailable replica counts.
- **DaemonSets**: Number of daemonsets in monitored namespaces, and the total available, unavailable, and mis-scheduled pod counts.
- **StatefulSets**: Number of statefulsets in monitored namespaces, and the total ready and not ready replica counts.

The Services card displays the health of the entire cluster:

- **Services**: Total number of services being monitored.
- **Endpoints**: Total number of endpoints being monitored.
- **Readiness**: Number of endpoints without a ready IP address.
- **Orphans**: Number of orphaned endpoints with no IP address.

Events Tab

The Events tab displays the cluster events that are specific to the selected cluster. You can use **Filters** to view any specific event.

Monitor Cluster Events

There are two event types in Kubernetes:

- Normal events
- Warning events

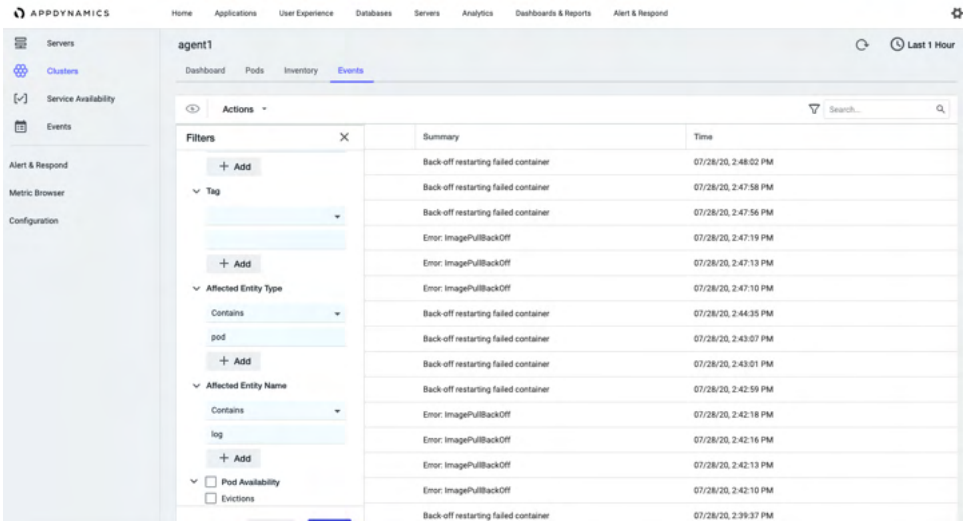
See Application Introspection and Debugging for more information on Kubernetes events. AppDynamics reports a subset of these as Cluster Events. They are comprised of Kubernetes warning events and important informational notices concerning state changes in the cluster. An example of a state change is a pod transitioning from a pending to a running state.

> This document contains links to Kubernetes documentation. AppDynamics makes no representation as to the accuracy of Kubernetes documentation because Kubernetes controls its own documentation.

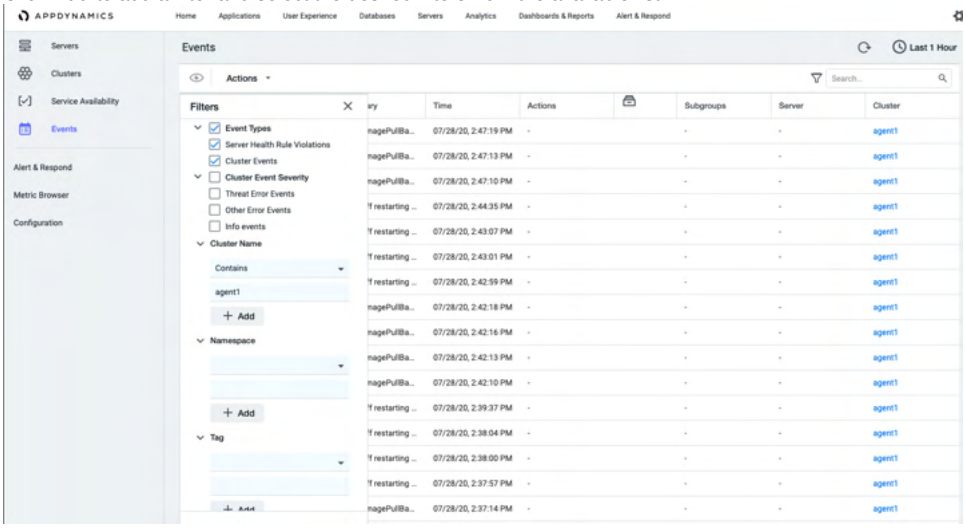
A **Cluster Event** of type warning displays a yellow warning icon. When a Pod, Replicaset, or Deployment gets added, updated, or deleted, otherwise known as a state change, the Cluster Agent reports it as an Info type event and displays a blue info icon.

To access Cluster Event data:

1. Click the **Servers** tab.
2. On the navigation bar, select **Events**. A panel displays a list of events that have been reported from both servers and clusters. To check for specific events, you can use the **Filters** option.



3. Click **Add** to add a filter and select the desired filters from the available list.



4. Click **Apply**. The list of events is filtered to show only the selected events.

5. Double-click the individual **Cluster Event**. A dialog displays showing a **Cluster Event** summary.

   The **Logs** tab displays the log details. See Enable Log Collection for Failing Pods.
6. Click **X** to close the dialog.

View Container Information

Related pages:

- Container Metrics
- Administer the Cluster Agent
- Hardware Resources Metrics

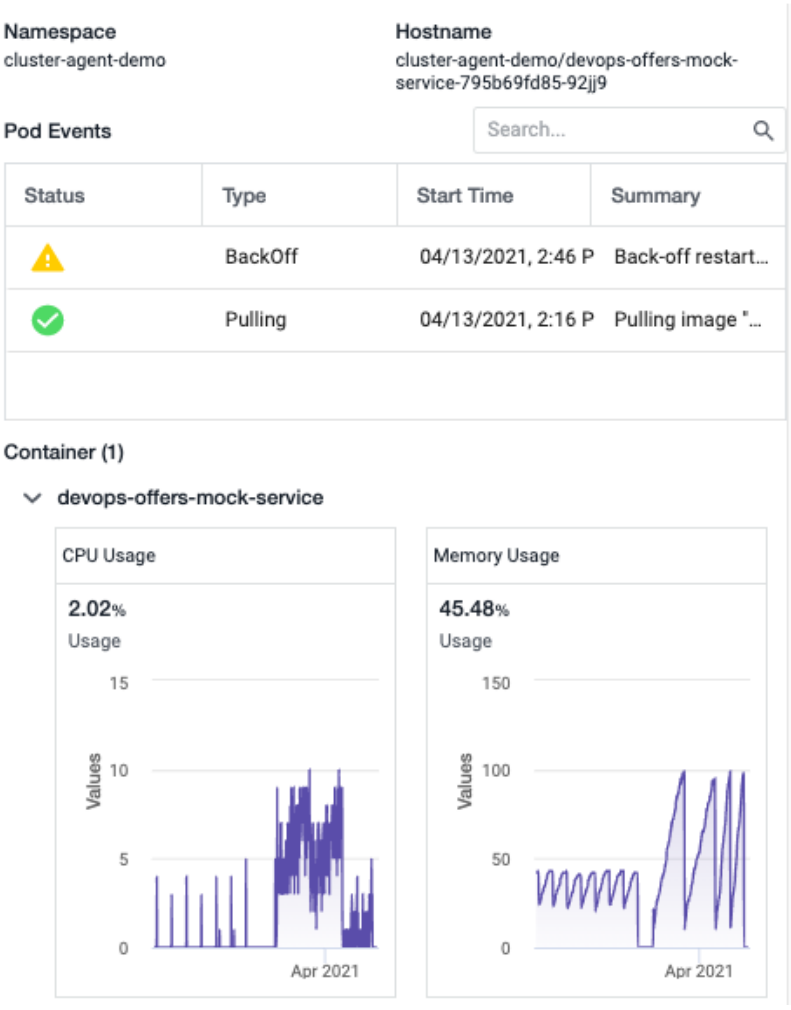
The AppDyamics Cluster Agent runs within your Kubernetes cluster. Metrics reported for containers are taken from the Kubernetes Metrics Server. Users need to install the metrics-server on their cluster to see container metrics. Once deployed, it discovers nodes in your cluster and starts collecting metrics from the Kubelet API. The Containers Dashboard shows the resource utilization metrics of your containerized applications.

The Containers page lists all containers to be monitored that are used by an application that is registered to the Controller.

View Container Metrics

To view Container metrics:

1. Navigate to **Servers** > **Clusters**.
2. Double-click a cluster to view the cluster agent **Dashboard**.
3. Navigate to the **Pods** tab.
4. Double-click a pod to view the pod details and the containers that are running in the pod.
   A list of Container names is displayed.
5. Click a **Container Name** to expand and view the metrics for that specific container.



Measure Resource Usage

Two metrics are reported per container:

- **CPU Usage**: Hardware Resources|CPU|%Busy
- **Memory Usage**: Hardware Resources|Memory|Used %

CPU

Name	Description
%Busy	Percentage of time the CPU was busy processing system or user requests from this container; this metric includes CPU Stolen time. This %Busy value can exceed 100%. For example, if a system has 16 cores the %Busy can go to 1600%.

Memory

Name	Description
Used %	Memory utilization by the container as a percentage of the memory hard limit.

Administer the Cluster Agent

You can use several settings in the Controller to administer the Cluster Agent.

Plan the Cluster Agent Deployment

If you have more than one Cluster Agent on your Controller, you must start your Cluster Agents in a staggered fashion. This procedure ensures that the Controller responds optimally. Use the table to determine the stagger start time for each cluster. Based on the cluster size, it may take a few minutes for the Cluster Agent to fully register with the Controller.

Plan capacity for Clusters

Capacity planning is important when preparing to deploy the Cluster Agent. The Cluster Agent and the Machine Agent share the capacity of the same Controller. The total number of pods and containers in your cluster is equal to the number of Machine Agents slots that are used. For example, if you have 250 pods and 250 containers, that is equivalent to using 500 Machine Agents in the Controller. See Controller Sizing.

Controller Settings for the Cluster Agent

These properties are recommended for a Controller supporting the Cluster Agent. Certain Server Visibility properties will apply to all instances of Server Visibility and the Cluster Agent.

Property	Description
`sim.cluster.agent.limit`	Maximum number of Cluster Agents per account. Configurable at the account level. For example, if you set the `sim.cluster.agent.limit` to a value of five, and you have ten Cluster Agents reporting, then the Controller randomly selects a subset of Clu Agents. These random Cluster Agents will not be registered and reported. If the configured limit is reached, any new Cluster Age will not be registered.
`sim.cluster.pod.limit`	Maximum number of pods per Cluster Agent per account. Configurable at the account level. If the number of pods exceeds the configured limit, the Cluster Agent randomly selects a set of pods that will not register or report.
`sim.machines.registrations.maxPerSecondPerAccount`	Maximum number of machine registrations allowed per account, per second. This property applies to all instances of Server Visib and the Cluster Agent.
`sim.cluster.container.limit`	Controller level limit for the number of containers per cluster. This is used if there is no account-level configuration. To overwrite a account-level, add an additional property to the corresponding account. This property only affects the Cluster Agent.
`sim.machines.offline.toStaleTimeoutMillis`	Length of time in milliseconds before an offline machine is considered stale, and eligible for purging. This property applies to all instances of Server Visibility and the Cluster Agent.
`sim.machines.registrations.update.frequency`	Machine's timestamp update frequency in milliseconds. This property applies to all instances of Server Visibility and the Cluster Agent.
`sim.cluster.events.maxPerMinute`	Controller level limit for the number of cluster events that are allowed per minute. This property only affects the Cluster Agent.
`sim.cluster.monitoring.enabled`	This property enables the Cluster Agent on the Controller. If set to false, all Cluster Agents stop reporting metrics and component but still register every minute. This property only affects the Cluster Agent.

See Controller Settings for Server Visibility.

To avoid the risk of purging live entities, ensure that the `sim.machines.offline.toStaleTimeoutMillis` value is always greater than the `sim.machines.registrations.update.frequency` value.

On-Premises Customers

For on-premises customers, to modify the Cluster Agent properties for your account:

1. Log in to the Administration Console with the administrator root password.
2. Select **Controller Settings**.
3. In the **Controller Settings** list, search for the setting.

4. In the **Value** field, enter the recommended value.
5. Click **Save**.
6. Log out of the Administrator Console.

SaaS Customers

For SaaS customers, create an AppDynamics Support ticket to have the Cluster Agent properties updated for your account.

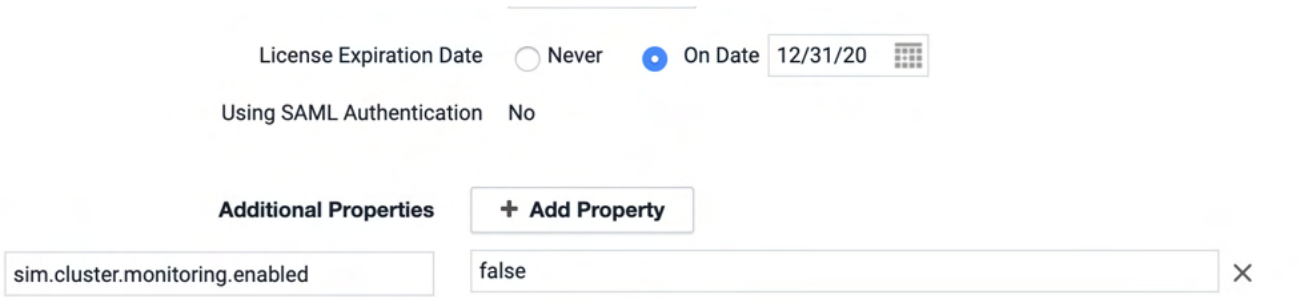
Control Cluster Agent Reporting

You can stop and resume the Cluster Agent from reporting metrics and registering containers and pods. You can do this on a per-account basis, or on a Controller-wide basis.

Stop a Cluster Agent by Account

To stop the Cluster Agent on the Controller:

1. Log in to the Administration Console with the administrator root password.
2. Select **Account Settings**.
3. In the accounts list, double-click the account for which you want to configure the Cluster Agent.
4. In the **Additional Properties** pane, click **+Add Property**.
5. In the left field, enter "sim.cluster.monitoring.enabled".
6. In the right field, enter "false".
7. Click **OK** to save the property.
8. Log out of the Administrator Console.



Start a Cluster Agent by Account

To start the Cluster Agent on the Controller:

1. Log in to the Administration Console with the administrator root password.
2. Select **Account Settings**.
3. In the accounts list, double-click the account for which you want to configure the Cluster Agent.
4. Locate the sim.cluster.monitoring.enable property, and in the right field, enter "true".
5. Click **OK** to save the property.
6. Log out of the Administrator Console.
7. If the Cluster Agent has been stopped using the "sim.cluster.monitoring.enabled" setting, it does not resume reporting metrics and registering pods and containers until you enable the Cluster Agent using the User Interface. See Use the Cluster Agent.

Stop all Agents on the Controller

To stop all Cluster Agents on the Controller:

1. Log in to the Administration Console with the administrator root password.
2. Select **Controller Settings**.
3. In the **Controller Settings** list, search for the "sim.cluster.monitoring.enabled" setting.
4. In the right field, set the value to "false".
5. Click **Save**.
6. Log out of the Administrator Console.

Start all Agents on the Controller

To start all Cluster Agents on the Controller:

1. Log in to the Administration Console with the administrator root password.
2. Select **Controller Settings**.
3. In the **Controller Settings** list, search for the "sim.cluster.monitoring.enabled" setting.

4. In the right field, set the value to "true".
5. Click **Save**.
6. Log out of the Administrator Console.
7. If Cluster Agents have been stopped using the "sim.cluster.monitoring.enabled" setting, they do not resume reporting metrics and registering pods and containers until they are enabled through the User Interface. See Use the Cluster Agent.

Enable Log Collection for Failing Pods

This page describes how to enable and use the Cluster Agent feature to collect logs for failing pods. This feature is automatically enabled on SaaS Controllers. You must enable on-premises Controllers described on this page.

When enabled, the Cluster Agent automatically collects logs for restarted or failed pods. The pod failure logs capture the status of the `CrashLoopBackoff` events that display the `Back-off restarting failed container` message. This message usually indicates that Kubernetes started a container but then the container quickly exits. If this occurs, Kubernetes attempts to restart the container. You can use these log messages to determine why the pod is exiting, whether due to a liveness probe, or some other issue.

Minimum Requirements

The Cluster Agent log collection feature requires:

- Cluster Agent Agent >= 20.7
- Controller >= 20.10.0

Requirements to Enable On-Premises Controllers

- Enable logging by using the Cluster Agent configuration setting, `sim.cluster.logs.capture.enabled`.
- Update the full file path to store the logs using the Controller setting, `sim.cluster.logs.root.file.path`. The logs are stored in the specified file location.
- Ensure you have 50 GB hard disk space on the file system.
- When updating the file path, ensure that you move previously collected logs from the old path to the new path to view them on the Controller UI.

Controller Settings

The following table lists the log settings required for an on-premises environment:

> For SaaS, the Technical Support team updates the configuration properties. Therefore, to configure the logs for SaaS, contact the support team by creating an AppDynamics Support ticket.

Setting	Definition	Location	Default
`sim.cluster.logs.bucket.name`	The folder name to store the pod logs.	Controller Administration Console with root user permission (**Controller Settings**)	`kubernetes-log-snippets`
`sim.cluster.logs.capture.enabled`	An option to enable or disable log capturing. This option is disabled by default.	Controller Administration Console with root user permission You can configure this setting at both account level (**Account Settings**) and Controller level (**Controller Settings**)	true
`sim.cluster.logs.expiration.in.days`	The number of days after which the logs get cleared from the storage.	Controller Administration Console with root user permission (**Controller Settings**)	`10`
`sim.cluster.logs.root.file.path`	The complete root file path to store the logs. Modifying the path results in storing the logs in the new path but the older logs will remain in the older location.	Controller Administration Console with root user permission (**Controller Settings**)	`/opt/appdynamics`
`sim.cluster.failed.pod.limit`	The number of historical pods beyond this value is purged.	Controller Administration Console with root user permission (**Controller Settings**)	`1000`

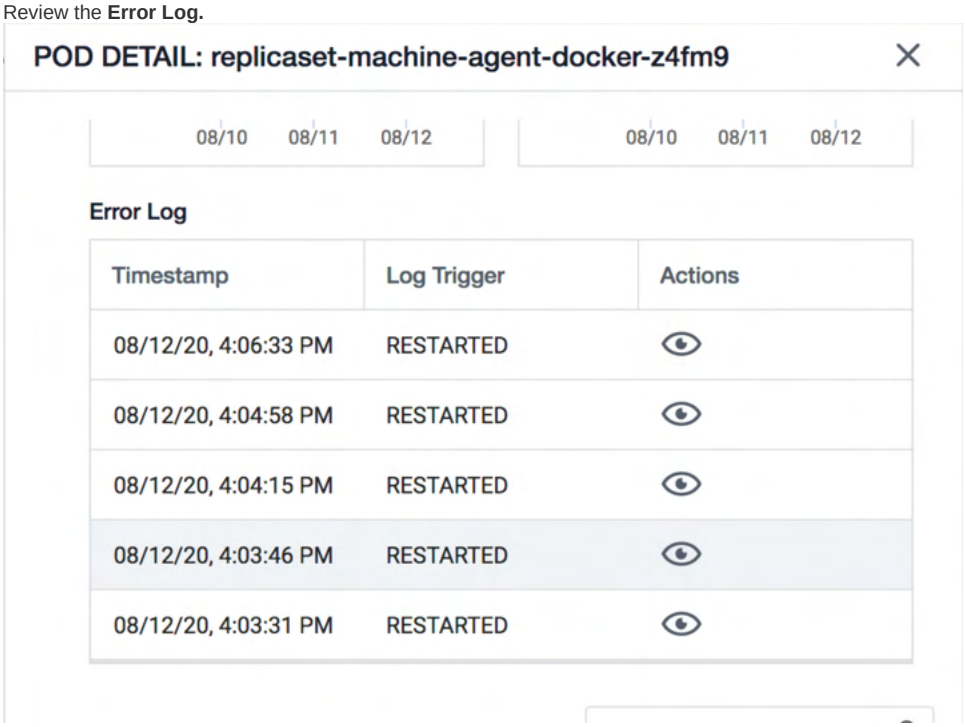
Use Cluster Agent Log Collection

You can view the logs on the **Pod Details** page and the **Cluster Event** page.

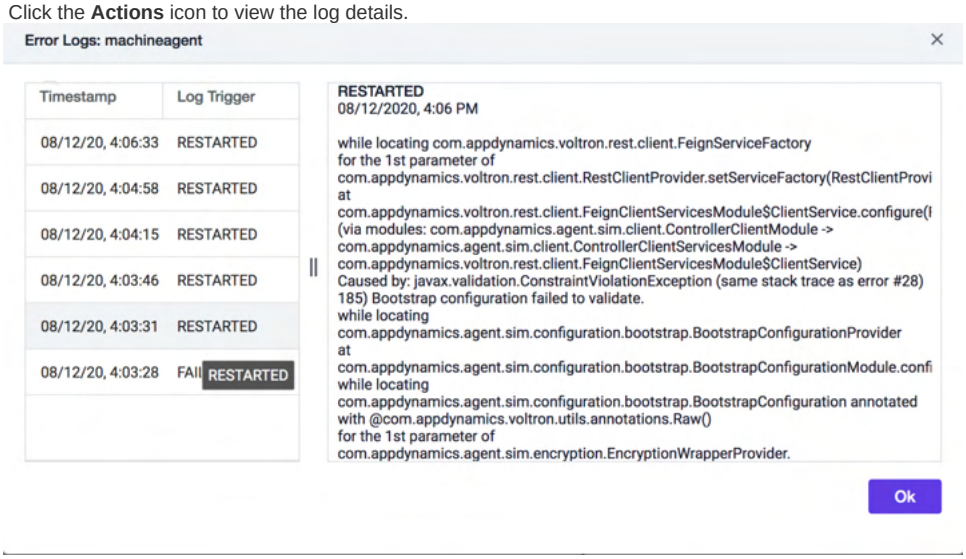
Pod Details Page

1. Select **Servers > Clusters > Cluster Name**.
2. Select a Cluster Agent and double-click. The cluster interface displays the **Dashboard**, the **Pods**, the **Inventory**, and the **Events** tabs.
3. Click **Pods**.
4. Double-click any pod to display its **Pod Details** panel.

5. Review the **Error Log.**



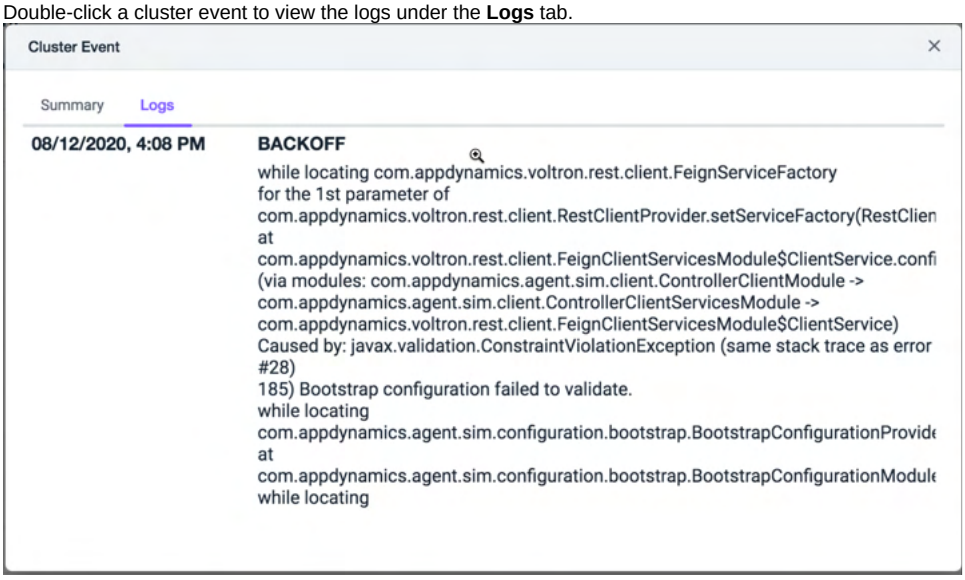
6. Click the **Actions** icon to view the log details.



Cluster Events Page

1. Click the **Servers** tab.
2. On the left navigation bar, select **Events** to see a list of events that have been reported from both servers and clusters.
   or
   Select **Clusters >** `<Clustername>` **> Details > Events**

3. Double-click a cluster event to view the logs under the **Logs** tab.



Upgrade the Cluster Agent

This page describes how to upgrade the Cluster Agent using:

- Kubernetes CLI, or
- Cluster Agent Helm Chart

See Install the Cluster Agent.

Upgrade the Cluster Agent Using Kubernetes CLI

1. Download the target version of the Cluster Agent bundle from the AppDynamics Downloads portal.
2. Unzip the bundle and `cd` to the unzipped folder:

```
unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
cd appdynamics-cluster-agent-alpine-linux-<version>
```

3. Update the `cluster-agent.yaml` to include any previously applied configuration.
4. Update the image tag to add the version of the downloaded Cluster Agent bundle (for example, 20.12.1):

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<app-name>"
  controllerUrl: "http://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  # docker image info
  image: "docker.io/appdynamics/cluster-agent:20.12.1"
  serviceAccountName: appdynamics-cluster-agent
```

5. Delete and re-create the Operator and Cluster Agent.

```
kubectl delete -f cluster-agent.yaml
kubectl delete -f cluster-agent-operator.yaml
kubectl create -f cluster-agent-operator.yaml
kubectl create -f cluster-agent.yaml
```

Upgrade the Cluster Agent Using the Helm Chart

The latest Cluster Agent Helm Chart is available at `appdynamics-charts/cluster-agent`. Before you can upgrade to the latest Cluster Agent, you must first uninstall the existing Helm Chart and then re-install it.

1. Use `helm get` and `helm show` to determine if an upgrade is required to install the most recent Cluster Agent images from `appdynamics-charts/cluster-agent`:

```
# which images are currently installed by my release?
helm get all "<my-cluster-agent-helm-release>" -n appdynamics | grep -E 'agentTag|operatorTag'
  agentTag: 20.10.0
  operatorTag: 0.6.3

# which images are available to install?
helm show values appdynamics-charts/cluster-agent | grep -E 'agentTag|operatorTag'
  agentTag: 20.11.0
  operatorTag: 0.6.5
```

2. To perform the upgrade, uninstall and re-install the Cluster Agent Helm Chart using the same namespace from the previous installation:

```
helm uninstall "<my-cluster-agent-helm-release>" --namespace appdynamics
helm install -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --
namespace=appdynamics
```

Uninstall the Cluster Agent

This page describes how to uninstall the Cluster Agent using:

- Kubernetes CLI, or
- Cluster Agent Helm Chart

See Install the Cluster Agent.

Uninstall the Cluster Agent Using Kubernetes CLI

Delete the Cluster Agent Operator and Cluster Agent using the YAML files:

```
kubectl delete -f cluster-agent.yaml
kubectl delete -f cluster-agent-operator.yaml
```

Uninstall the Cluster Agent Using the Helm Chart

Uninstall the Cluster Agent Helm Chart using the namespace that you used for the installation:

```
helm uninstall "<my-cluster-agent-helm-release>" --namespace appdynamics
```

Cloud Native Visualization

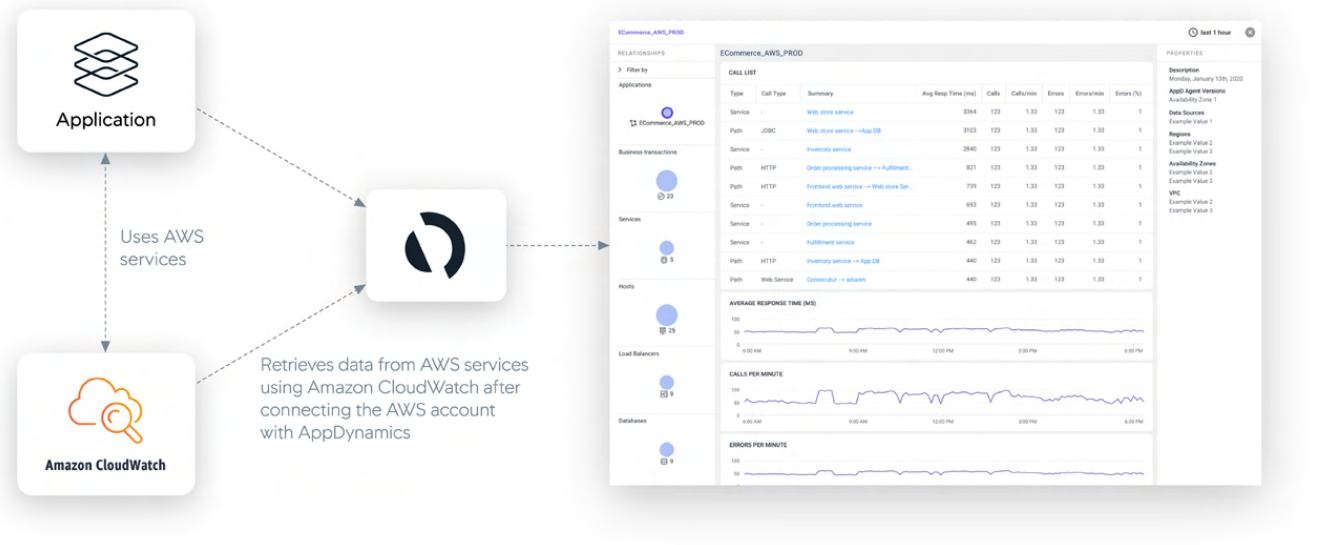
Deployment Support

SaaS

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

Cloud Native Visualization introduces the AIOps platform to visualize the interactions and relationships between objects in your application infrastructure. This capability improves collaboration and unifies the efforts of different engineering functions by creating a real-time single source of truth for monitoring your application environment.

This illustration shows a high-level overview Cloud Native Visualization:



Additionally, Cloud Native Visualization also introduces an improved AppDynamics user interface that includes Relationships maps, Interactions maps, and related metrics. By correlating application metrics and interactions to cloud infrastructure in a unified view, AppDynamics Cloud Native Visualization enables you to:

- Automatically discover services associated with a cloud platform account and ingest the relevant cloud platform metrics and metadata.
- Navigate cloud platform services in a holistic application landscape that automatically correlates the Application Performance Monitoring (APM) data with cloud platform data.
- Surface insights on the impact of cloud provider services on an application's performance.
- Compare key performance metadata and visualize data flow based on the application entities and interactions.
- Interact with a set of data points on the time-series graph to capture specific values tracked by both AppDynamics APM and Amazon CloudWatch.
- Explore the dynamic, data-flow based application object page and interactions views containing application services.
- Drill down to the cloud infrastructure layer to understand how two respective topologies intersect in the context of application services.
- View your application infrastructure data, service, and business transactions in one application landscape. Determine what infrastructure exists and where it is located.

Get Started

Cloud Native Visualization is available to all existing AppDynamics SaaS customers. To get started, contact your AppDynamics account representative.

The AppDynamics User Interface and Cloud Native Visualization

AppDynamics introduces an intuitive user interface for Cloud Native Visualization that enables you to monitor your applications using a simplified approach.

You can now view entities and data, hosted by Amazon Web Services (AWS) in Cloud Native Visualization by connecting your Amazon account to AppDynamics. See Supported AWS Services.

The differences between the existing AppDynamics user interface and the redesigned user interface within Cloud Native Visualization are:

Data Model and Terminology

With Cloud Native Visualization, AppDynamics has introduced a new data model to replace the app, tier, and node hierarchy (see Tiers and Nodes). T he redesigned approach includes these concepts:

- Relationships maps
- Interactions maps
- Services (formerly tiers)
- Service Instances (formerly nodes)
- Object pages

> Traditional AppDynamics elements such as flow maps, dashboards, metrics, and health rules are still available to a Cloud Native Visualization user. However, to interact with these elements, you must return to the existing AppDynamics user interface. The Cloud Native entities do not display in the existing AppDynamics user interface.

Concepts

When Cloud Native Visualization is enabled, you access the new AppDynamics user interface from the existing Controller user interface through a pin . If a pin does not exist in your user interface, then you have not configured the Controller properly for this feature. See Monitor Cloud Native Applications.

Three main elements of the Cloud Native Visualization feature are:

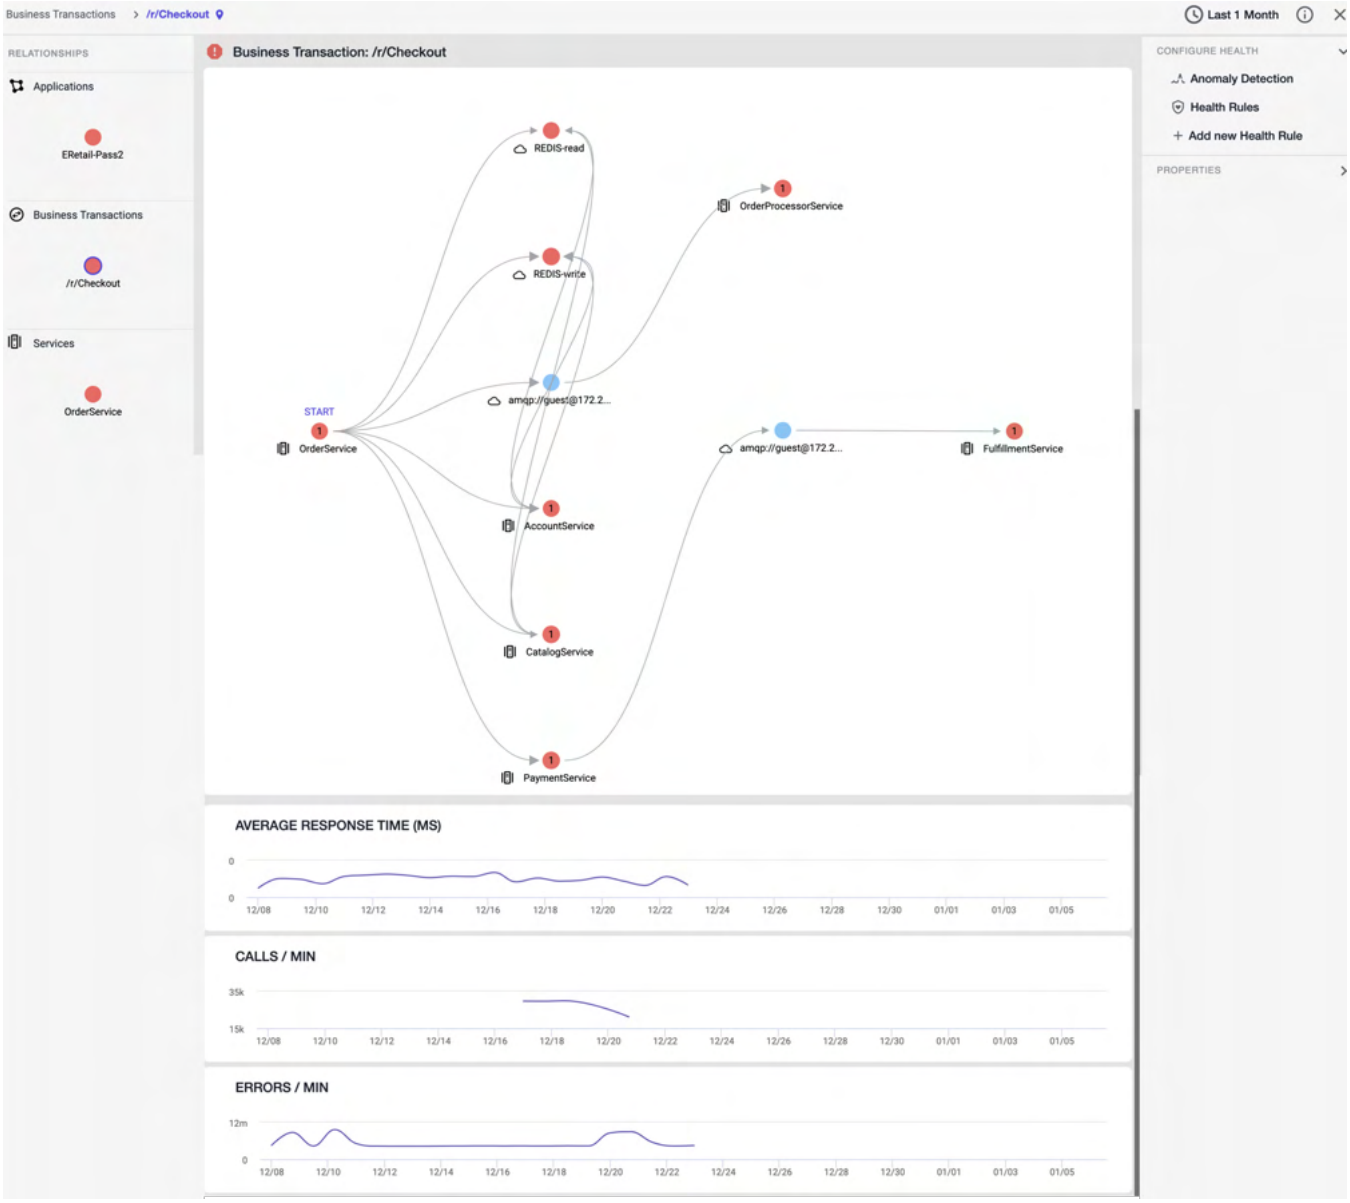
- Object page—Shows information in the context of an object or entity. This page is specific to the type of entity the user has selected, such as a service, business transaction, or database.
- Interactions map—Displays a visualization of how data is flowing in the system between different entities such as application services, databases, and load balancers where the application is the object in focus.
- Relationships map—Allows you to understand how Cloud Native entities are correlated to APM entities in one page. Additionally, it provides a view of the static topology of your hybrid APM and Cloud Platform application landscape.

Both the Interactions and Relationships maps enable you to click an entity and drill down to view more detailed information about the entity. See Cloud Native Visualization UI Overview.

Object Page

An Object page is a view that corresponds to an entity type, such as **Services**, **Applications**, or **Hosts**. Cloud Native Visualization models customer systems as a set of entities, relationships, interactions, and paths between those entities.

If an entity is unhealthy, Cloud Native Visualization depicts the entity in orange color or red color depending on the health state of the entity (`Warning` or `Critical`) as shown in this image:



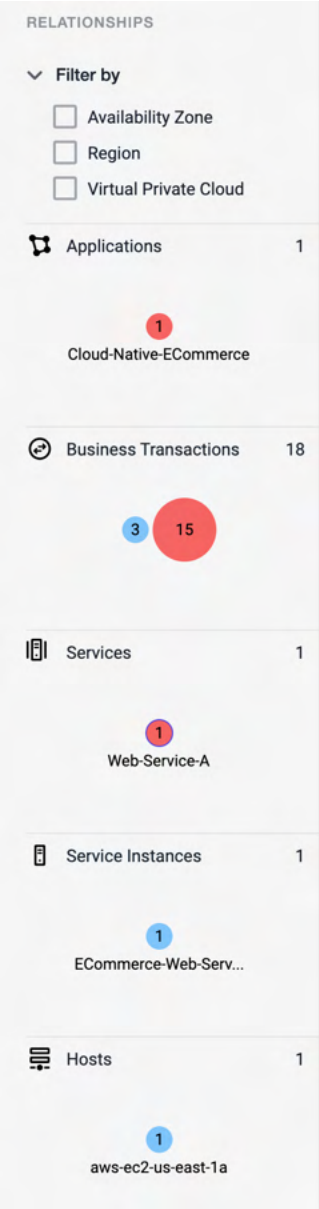
You can click the unhealthy entity to drill down and determine the affected business transactions, services, and service instances. You can view the associated health rules and modify them based on the performance data. In addition, you can use anomaly detection to automatically determine anomalies with the entities. This helps initiate remediation actions quickly. See Configure Entity Health.

Relationships Map

The Relationships map displays the relationships between an application and other service entities. The flexible visualization displays upstream and downstream connections to the type and number of entities and the health status of the objects in focus.

Objects are categorized as healthy or unhealthy using color-coded group circlets to depict health status. This allows you to quickly identify unhealthy entities and initiate remediation actions to resolve any critical issues. See Monitor the Health Status of Entities.

- Blue—indicates that the entities are healthy.
- Orange—indicates a health warning.
- Red—indicates that the entities have critical health issues.



Interactions Map

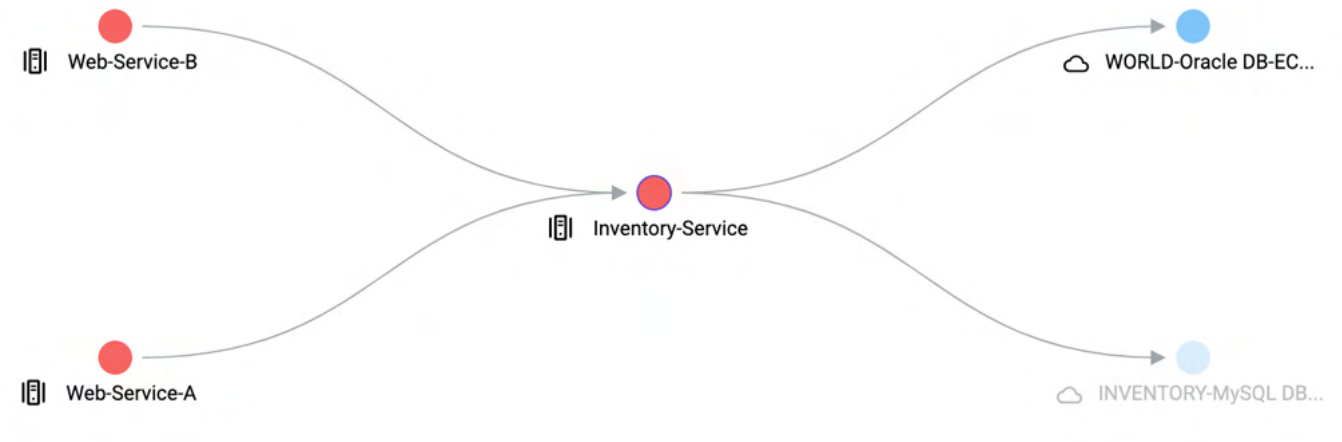
Interactions maps present a dynamic visual representation of entities and their interactions based on a specific context. You can use the **Filter by** optio ns in the Relationships map to refine the services that are part of the interaction in focus. The services that are not part of the filter display opaquely.

In this example, the **Inventory-Service** object has associated upstream and downstream objects with a **Virtual Private Cloud** filter selected in the Relationships map.

- A **Web-Service-B service** instance (unhealthy)
- A **Web-Service-A service** instance (unhealthy)

And downstream objects:

- A **WORLD-Oracle DB-ECOMM** instance
- An **INVENTORY-MySQL DB-ECOMM** instance that does not reside in the same VPC as the WORLD-Oracle DB



When an unhealthy entity is reported in the Relationships map or in the **List** view, you can drill down these entities and view details in the Interactions map to determine the affected business transactions, services or service instances. See Monitor the Health Status of Entities.

Supported AWS Services

Cloud Native Visualization supports these Amazon Web Services (AWS) services:

- Amazon Elastic Compute Cloud (EC2)
- Amazon Elastic Block Store (EBS)
- Amazon Relational Database Service (RDS) including the six types of database engines:
  - Amazon Aurora
  - PostgreSQL
  - MySQL
  - MariaDB
  - Oracle
  - Microsoft SQL Server
- Amazon Elastic Load Balancers (ELB) including three types of load balancers:
  - Classic Load Balancers (CLB)
  - Network Load Balancers (NLB)
  - Application Load Balancers (ALB)
- Virtual Private Cloud (VPC)

> Additional AWS services and support for other cloud platforms will be added in future releases.

Metrics in Cloud Native Visualization

For information about metrics, see Cloud Native Considerations on the Cloud Native Visualization Metrics Overview page.

AWS CloudWatch Specific API Rate Limits per Service

Cloud Native Visualization uses the Amazon CloudWatch APIs to provide data. AWS imposes hard rate limits on many of the AWS Service APIs. Connecting your AWS Account to AppDynamics may cause an increase in the usage and billing of these specific CloudWatch Service APIs. These hard rate limits also impact how quickly you reach your rate limit. These rate limits often display as a `503` error: `Request limit exceeded`. See API Request Throttling in Amazon's documentation.

Cost

AppDynamics makes metadata requests every fifteen (15) minutes and metric requests every five (5) minutes. The number of metrics is dependent on the instance type. See Monitoring your usage and costs in Amazon's documentation.

Cloud Native Visualization Requirements

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

Cloud Native Visualization simplifies the integration of service data from cloud platform providers. By visualizing relationships and dependencies, this feature helps you find the cause of performance issues in your applications or the related cloud platform services.

Cloud Native Visualization requires configuration performed by AppDynamics.

Before You Begin

Before you start, you must consider these system requirements and permissions.

AppDynamics Components

Cloud Native Visualization requires:

- SaaS Controller >= 20.10.0.
- Java Agent >= 20.9.0, .NET, and Node.js Agents >= 20.10.0 are required for Amazon EC2 to APM node correlation.
- Sufficient APM licenses to use the Java, .NET, or Node.js Agents.
- For the best experience, Java Agents should be configured to use `service-instance` (node) name reuse. See Use Node Name Reuse for Java Agents in Cloud Native Visualization. For details regarding Java Agent version compatibility, see Java Supported Environments.

You need permission to view at least one application, which can be accomplished by giving permission to view all applications or specific applications. See Configure Cloud Native Visualization Permissions and Create and Manage Custom Roles to set up View Infrastructure Entities account-level permission.

AWS Instance Metadata Permissions

If you are using an AppDynamics agent, the Java, .NET, or Node.js agent must have access to the AWS instance metadata. Some Amazon EC2 instances have metadata access restrictions. If access is restricted, you must configure firewall pass-through rules to allow metadata access for the application instance where the agent is running. See Retrieving instance metadata in Amazon's documentation.

Set Up Cloud Native Visualization

You must connect AWS services to AppDynamics and set up Cloud Native Visualization permissions. See Set Up Cloud Native Visualization.

This document contains links to Amazon Web Services (AWS) documentation. Amazon manages all linked Amazon documentation, therefore AppDynamics makes no representation as to the accuracy of such documentation.

Next Steps

Set Up Cloud Native Visualization.

Set Up Cloud Native Visualization

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

This page describes how to set up and use AppDynamics Cloud Native Visualization. Make sure that you:

1. Review the Cloud Native Visualization Requirements
2. Connect Amazon Web Services to AppDynamics
3. Configure Cloud Native Visualization Permissions

Cloud Native Visualization requires configuration performed by AppDynamics. The configurations have been rolled out gradually to SaaS Controllers since October 28, 2020.

Connect Amazon Web Services to AppDynamics

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

This page explains how to connect your AppDynamics account with Amazon Web Services (AWS) using Amazon CloudWatch to display Cloud Native Visualization. Cloud Native Visualization is available in SaaS Controller >= 20.10.0, see Cloud Native Visualization Requirements.

This page contains links to Amazon Web Services (AWS) documentation. AppDynamics makes no representation as to the accuracy of Amazon documentation because Amazon controls its own documentation.

AppDynamics supports connecting multiple AWS accounts using either of these methods:

- Use Role Delegation - Role delegation grants additional permissions to a new or existing role
- Use Access Key Credentials - Access key credentials to assign a user a new pair of access keys

Set Up Role Delegation

To set up role delegation, you must configure settings on your Controller and AWS account:

1. Create a Role Name and Copy External ID in the Controller
2. Create an AWS IAM Service Policy
3. Create an AWS IAM Role
4. Connect your AWS IAM Service Role to AppDynamics

Create a Role Name and Copy External ID in the Controller

To connect your AppDynamics Controller:

1. Go to https://accounts.appdynamics.com/subscriptions.
2. Sign in to your account.
3. Select the Controller that you want to connect to Amazon CloudWatch.
4. Navigate to **Home > Cloud Platform**.
5. Under **Cloud Platform**, select **Amazon CloudWatch**.
6. Select **Role Delegation**.
7. Enter your Amazon credentials:
    a. Enter a **Connection Name**, for example: **AppDynamicsMonitoring**.
    b. Enter your organization's **AWS Account ID** without the dashes.
    c. Enter an **AWS Role Name**. For example: **AppDynamicsMonitoringRole**.

        The AWS Role Name cannot contain spaces or special characters.

    d. Under **External ID**, select **Copy**.

        Make sure you save this External ID because you will need to enter it later in your AWS Identity and Access Management (IAM) console. If you close this window without capturing the External ID, you will have to generate a new ID for your **App DynamicsMonitoring** account.

8. Leave this browser window open. Open another separate browser window, and log in to your AWS Account.

Create an AWS IAM Service Policy

In the AWS IAM Management Console, you can attach permissions policies using either JSON or the AWS UI.

It is recommended to use JSON because it contains the minimum required permissions.

If you prefer to attach permissions policies manually, you can use the AWS UI. See Creating IAM Policies - AWS Identity and Access Management.

Attach Permissions Policies Using JSON

Navigate to the AWS Management Console and open the IAM Console.

1. Select **Create policy**.
2. Select **JSON**.
3. Copy this code:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": [
                "elasticloadbalancing:DescribeLoadBalancers",
                "ec2:DescribeInstances",
                "cloudwatch:GetMetricData",
                "ec2:DescribeVpcs",
                "ec2:DescribeRegions",
                "ec2:DescribeVolumes",
                "elasticloadbalancing:DescribeTargetHealth",
                "rds:DescribeDBInstances",
                "elasticloadbalancing:DescribeTargetGroups",
                "ec2:DescribeSubnets",
                "cloudwatch:ListMetrics",
                "rds:DescribeDBClusters"
            ],
            "Resource": "*"
        }
    ]
}
```

4. Paste the code under the JSON tab.
5. Select **Review policy**.
6. Enter a name for the policy, such as **AppDynamicsMonitoringPolicy**, and add a description (optional).
7. Click **Create policy**. A message displays: **AppDynamicsMonitoringPolicy** has been created.

Create an AWS IAM Role

1. In the Identity and Access Management (IAM) console left navigation pane, select **Roles**.
2. Select **Create role**.
3. Select **Another AWS account**.
4. For **Account ID**, enter AppDynamics Account ID: **932519523259**.
5. For **Options**, select **Require external ID**.
    a. Navigate to your AppDynamics Controller browser panel.
    b. Copy the **External ID**, if you have not already done so.
6. Return to the AWS Management Console browser panel.
7. Paste or enter the **External ID** generated by the AppDynamics Controller, and leave the **Require MFA** option disabled.
8. Select **Next: Permissions**.
9. Under **Attach permissions policies**, search for and select **AppDynamicsMonitoringPolicy**.
10. Select **Next: Tags** (optional).
11. Select **Next: Review**.
12. Enter a name for the role, such as **AppDynamicsMonitoringRole**, and add a description (optional).
13. Select **Create role**. A message displays: **The role AppDynamicsMonitoring role has been created**.

Connect Your AWS IAM Service Role to AppDynamics

1. Return to the Controller browser panel. The AppDynamicsMonitoring connection uses the **AppDynamicsMonitoringRole** to connect.
2. Ensure that the AWS role name in the Controller matches the role name with the permissions policy created in the AWS IAM Management Console. In the example, the name used is **AppDynamicsMonitoringRole.**
3. Select **Connect** to initiate the AppDynamics data connection with Amazon CloudWatch.
4. The **Home > Cloud Platform > Integration Status** displays the connection status of your Amazon CloudWatch integration.
5. Before navigating to the Network Dashboard, confirm that the integration status of your AWS account displays **Connected**.

Use Access Key Credentials

To integrate AppDynamics with Amazon CloudWatch:

1. Create an AWS IAM User within your AWS account.
2. Connect your AWS IAM User to AppDynamics and attach read-only policies to limit the permissions granted to the user.

Create an AWS IAM User

1. Navigate and sign in to the AWS Management Console.
2. Open the IAM Console.
3. In the Identity and Access Management (IAM) left navigation pane, select **Users**.
4. Select **Add user**. If you are unable to add a user, see Access Management.
5. Enter the **User name:** `appD_monitoring_user`, or a user name of your choice.
6. Under **Select AWS access type**, select **Programmatic access**.
7. Select **Next: Permissions**.
8. Under **Grant permissions**, select **Attach existing policies directly**.
9. Select appropriate policies for the `appD_monitoring_user` monitoring account. AppDynamics recommends `ReadOnlyAccess` policies. Additionally, you can select custom policies specific to the active resource that you want to ingest Amazon CloudWatch metrics. See Access Management and Example IAM Identity-Based Policies.
   For example, these polices are selected:
   - `ElasticLoadBalancingReadOnly`
   - `AmazonRDSReadOnlyAccess`
   - `AmazonEC2ReadOnlyAccess`
   - `CloudWatchReadOnlyAccess`

   You can optionally set the permissions boundary.
10. Select **Next: Tags** (optional).
11. Select **Next: Review**.
12. Select **Create user**.
13. Note the **Access Key ID** and the **Secret Access Key** for the user, or click **Download .csv**.

You will need the keys to add Amazon CloudWatch to your AppDynamics account. If you navigate away from this panel without capturing these keys, you cannot access them again. You will have to create a new **`appD_monitoring_user`** monitoring account. See Creating IAM Users (Console).

Connect Your AWS IAM User Account to AppDynamics

To connect your AWS IAM user account to AppDynamics:

1. Go to https://accounts.appdynamics.com/subscriptions.
2. Sign in to your account.
3. Select the Controller that you want to connect to Amazon CloudWatch.
4. Navigate to **Home > Cloud Platform**.
5. Under **Connect a Cloud Platform**, select **Amazon CloudWatch**.
6. Select **Access Key Credentials**.
7. Enter a Connection Name.
8. Enter your Amazon **appD_monitoring_user** Access Key ID.
9. Enter your Amazon **appD_monitoring_user** Secret Access Key.
10. Select **Connect** to initiate the AppDynamics data connection with Amazon CloudWatch.
11. Before navigating to the Cloud Native Visualization user interface, select **Home > Cloud Platform > Integration Status** to confirm that the integration status of your AWS account displays **Connected**.

After you finish enabling AWS, you are redirected to the Applications tab to review the information.

Next Steps

- (Optional) Administer Cloud Native Visualization
- Configure Cloud Native Visualization Permissions

Administer Cloud Native Visualization

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

This page describes how to edit and delete your AppDynamics account with Amazon Web Services (AWS). If you modify these settings, Cloud Native Visualization may not correctly display all Amazon CloudWatch API entities and metrics.

Edit an Amazon CloudWatch Connection

To edit an existing connection, an account administrator must perform these steps:

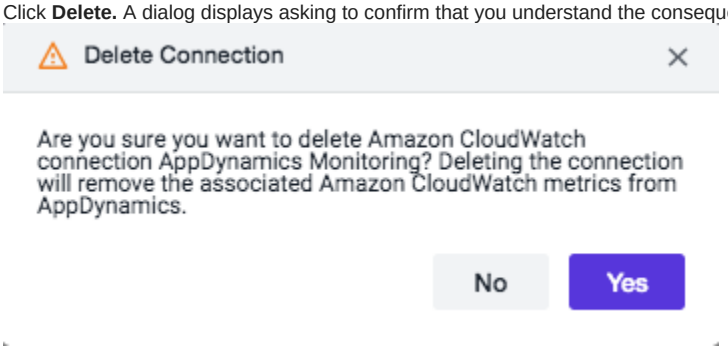
1. Go to https://accounts.appdynamics.com/subscriptions.
2. Sign in to your account.
3. Select the Controller that you want to connect to Amazon CloudWatch.
4. Navigate to **Home > Cloud Platform** to display a list of connections.
5. Select the connection name to edit.
6. Click .
7. Click **Connect**.

Confirm that the **Integration Status** of your Amazon account shows success before navigating to Cloud Native Visualization. To verify metrics are flowing in your AppDynamics account, navigate to the desired Object page.

Delete an AWS CloudWatch Connection

To delete an existing connection, an account administrator must perform these steps:

1. Go to https://accounts.appdynamics.com/subscriptions.
2. Sign in to your account.
3. Select the Controller that you want to connect to Amazon CloudWatch.
4. Navigate to the **Home > Cloud Platform** tab to display a list of connections.
5. Select the connection name to delete.
6. Click **Delete.** A dialog displays asking to confirm that you understand the consequences of deleting the connection.



7. Click **Yes**. The Amazon account is no longer monitored.

Next Steps

Configure Cloud Native Visualization Permissions

Configure Cloud Native Visualization Permissions

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

This page describes how to configure Role-Based Access Control (RBAC) to provide administrative user permissions for configuring Cloud Native Visualization. You can also grant non-administrative users permission to use or view Cloud Native Visualization.

To use or view Cloud Native Visualization:

1. Set up a **View Infrastructure Entities** account-level permission.
2. Set permission to view all applications or specific applications, see Cloud Native Visualization Requirements and Create and Manage Custom Roles.

To configure access and roles, you must either be the AppDynamics Account owner or have Administrator permissions.

Set up View Infrastructure Entities Permission

To use Cloud Native Visualization, you need **View Infrastructure Entities** account-level permission and at least one of the following:

- Any default role
- Any application-level permission
- Any dashboard permission

View Infrastructure Entities permission is not added to any default role. See Create and Manage Custom Roles.

You must set up **View Infrastructure Entities** permissions; otherwise databases and load balancers will not appear correctly in Cloud Native Visualization.

Create and Assign Role-Based Access to Cloud Native Visualization

Step 1: Create a Role to Access Cloud Native Visualization

To enable Cloud Native Visualization on a Controller:

1. Log in to the AppDynamics Controller as a user with Administrator permissions.
2. Click  .
3. Select **Administration**.
4. Select **Roles**.
5. Click **Create**.
6. Enter a role name, for example, **Cloud Native Visualization User**.
7. Enter **Description** (optional).
8. Select **Account**.
9. Click + **Add**. All Account permissions display.
10. Click the **View Infrastructure Entities** checkbox.
11. Click **Done**.

Step 2: Assign Users to the Cloud Native Visualization User Role

Using the role you defined previously, for example, **Cloud Native Visualization User**:

1. Go to **User and Groups with this Role.**
2. Click + **Add**.
3. Select the Users or Groups that you would like to grant this role.
4. Click **Done**.
5. Click **Save**.
   A security warning window displays.
6. Click **Accept** to save the role. A **Saved Successfully** message displays.
7. Refresh your browser to reflect the changes.

Next Steps

Monitor Cloud Native Applications.

Monitor Cloud Native Applications

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

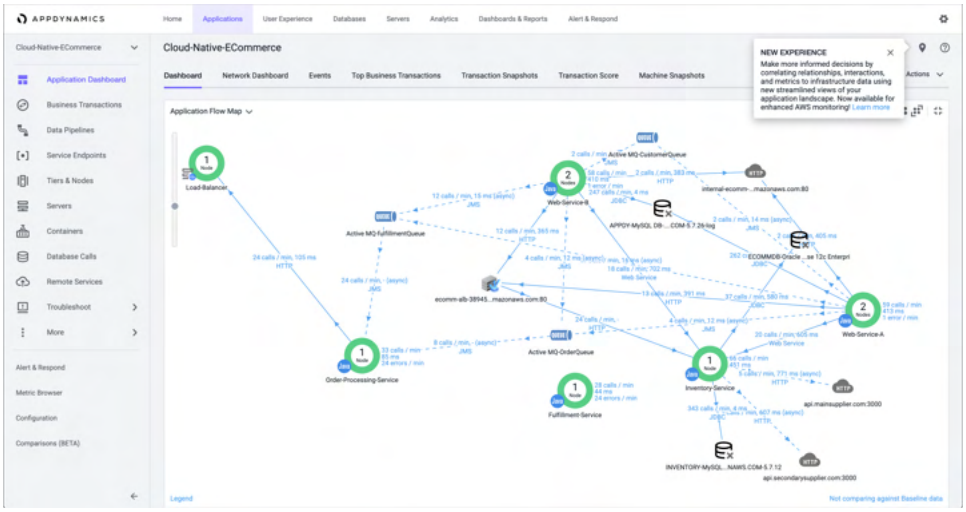
This page describes how to access, exit, and explore Cloud Native Visualization.

Access Cloud Native Visualization

Cloud Native Visualization access depends on the prerequisite configuration. See Set Up Cloud Native Visualization.

To access Cloud Native Visualization:

1. Go to https://accounts.appdynamics.com/subscriptions.
2. Sign in to your account.
3. Select the Controller that you connected to Amazon CloudWatch.
4. Go to **Applications** and select the desired application.
5. From the **Application Flow Map > Dashboard**, a **NEW EXPERIENCE** pin is introduced on the upper right corner of the AppDynamics application flow map page. You can explore your application's landscape using this new user interface.



6. Click the pin to enter Cloud Native Visualization. A Cloud Native Visualization **Applications** page displays.

Exit Cloud Native Visualization

To exit Cloud Native Visualization and return to the existing AppDynamics Controller interface, click **X** on the top bar of the upper-right corner of the page.

Next Steps

Cloud Native Visualization UI Overview.

Cloud Native Visualization UI Overview

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

This page describes the new Cloud Native Visualization User Interface (UI) features that you can use to monitor and analyze your holistic application landscape. With Cloud Native Visualization, AppDynamics has introduced a new data model with concepts such as Relationships maps, Interactions maps, and Object pages that display Application Performance Monitoring (APM) and AWS performance data for these objects.

New terms are introduced that replace old terminology:

- Services (formerly tiers)
- Service Instances (formerly nodes)

See Tiers and Nodes.

Services (Tiers)

The app, tier, and node model has been at the heart of AppDynamics APM since its inception. Cloud Native Visualization slightly modifies this model. In particular, what was formerly known as tiers are now called **Services;** nodes are now called **Service Instances**.

Service Instances (Nodes)

In contrast to a node, the service instance concept represents the process lifecycle of a single application process, with an explicit lifetime. However for a service/node, however, the data model changes are more extensive than simple renaming. See Use Node Name Reuse for Java Agents in Cloud Native Visualization.

Cloud Native Visualization User Interface

Cloud Native Visualization is a series of dependency graphs. The Relationships map and Interactions map display a visual representation of relationships between objects within a business application. Objects are visual representations of the components of your application. In the Relationships map, you can click on each entity to learn more about its unique properties and origin. You can view these entities in the Interactions map to understand how data flows among the application components. As monitored systems become increasingly complicated with multiple entities and finer granularity, it becomes challenging for users to manage such complex systems. Cloud Native Visualization delivers a unified experience of data exploration and navigation through Object pages.

Navigate Object Pages

An Object page is a view that corresponds to an object type, such as service instances, databases, or hosts. Cloud Native Visualization uses object pages to model systems as a set of entities, relationships, and paths between those entities. Object pages can represent aggregations of components, such as services (tiers), which are an aggregation of several service instances (nodes) and can also represent flows, such as business transactions. O bject pages correlate the most important information for a given object on one page.

For each object type, Cloud Native Visualization object pages display both:

- **Lists** view—Displays multiple objects of a particular entity type. The **Lists** view enables a user to click on a specific object to see a **Details** view.
- **Details** view—Displays one instance of an entity. Click on a specific object in a list to access the **Details** view.

Object Page Components

Top Bar:

- Browsing History Path
- Time Range Menu
- Close

Left Panel:

- Filter By
- Relationships Map

Main Content Area:

- Interactions Map
- Details View
- Lists View

Right Panel:

- Configure Health

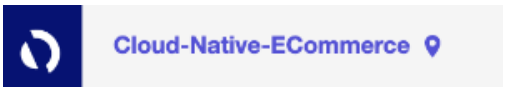
- Properties Panel

Top Bar

The Cloud Native Visualization top bar consists of a clickable Browsing History Path, a Time Range Menu, and a Close button **X** to exit the new UI experience.

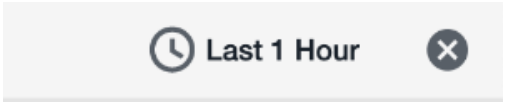
Browsing History Path

The Browsing History Path specifies the trail of recent navigation. You can click on names in the path to navigate to previous pages.



Time Range Menu

The Time Range Menu selects what data displays throughout the Cloud Native Visualization UI. The Time Range Menu does not have preconfigured time ranges. To create time ranges you must use the existing Controller user interface. After you create the time range, you can return to the new Cloud Native Visualization UI. When you select a new time range from the menu, it remains the active range as you navigate to other pages in the UI.



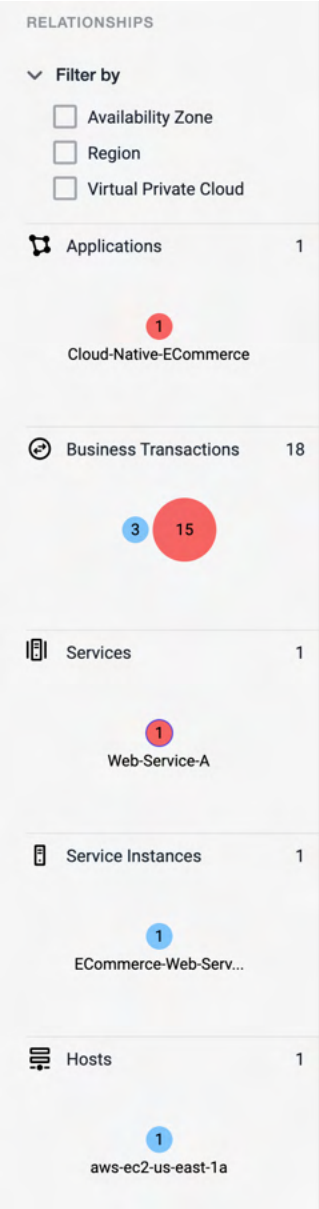
Close

The Close button **X** enables you to exit Cloud Native Visualization and return to the existing AppDynamics Controller user interface.

Left Panel

The Cloud Native Visualization left panel consists of a **Filter by** feature and the **Relationships** map. Objects are categorized as healthy or unhealthy using color-coded group circlets to depict health status for quick health issue identification. See Monitor the Health Status of Entities.

- Blue—indicates that the entities are healthy.
- Orange—indicates a health warning.
- Red—indicates that the entities have critical health issues.



Filter by

The **Filter by** feature in Cloud Native Visualization enables you to filter by zones, regions, or VPCs and is available for all entities that display on the **O bject** page, **Relationships** map, and **Interactions** map.

After you apply a filter, each section updates with a subset of corresponding business transactions, services, and so on, based on the object's context. The **Interactions** map displays services that are not part of the focused filter opaquely.

The available filters are:

- **Availability Zone (AZ)**: An Availability Zone (within a region) offers one or more unique data centers with redundant power, networking, and connectivity in a region to ensure resilience.
- **Region**: Regions are physical locations where data centers are geo-located to help businesses determine the correct geography for data compliance, service availability, and pricing.
- **Virtual Private Cloud**: VPCs contain multiple availability zones.

See Amazon VPC for On-Premises Network Engineers – Part 1.

> You can apply only one filter at a time. The **Filter by** selection does not persist through multiple selections. If you click on an entity, the filter is reset.

Relationships Map

The **Relationships** map enables you to navigate the vertical layers of entities that make up your application. At the highest level is **Applications**, then below Applications are **Business Transactions**, then **Services**, **Services Instances**, **Hosts**, **Databases**, and other relevant associated infrastructure entities. The entities are categorized as healthy and unhealthy based on their health status and display as group circlets. A blue-colored group circlet indicates that the entities are healthy, while a red-colored group circlet indicates that the entities are unhealthy.

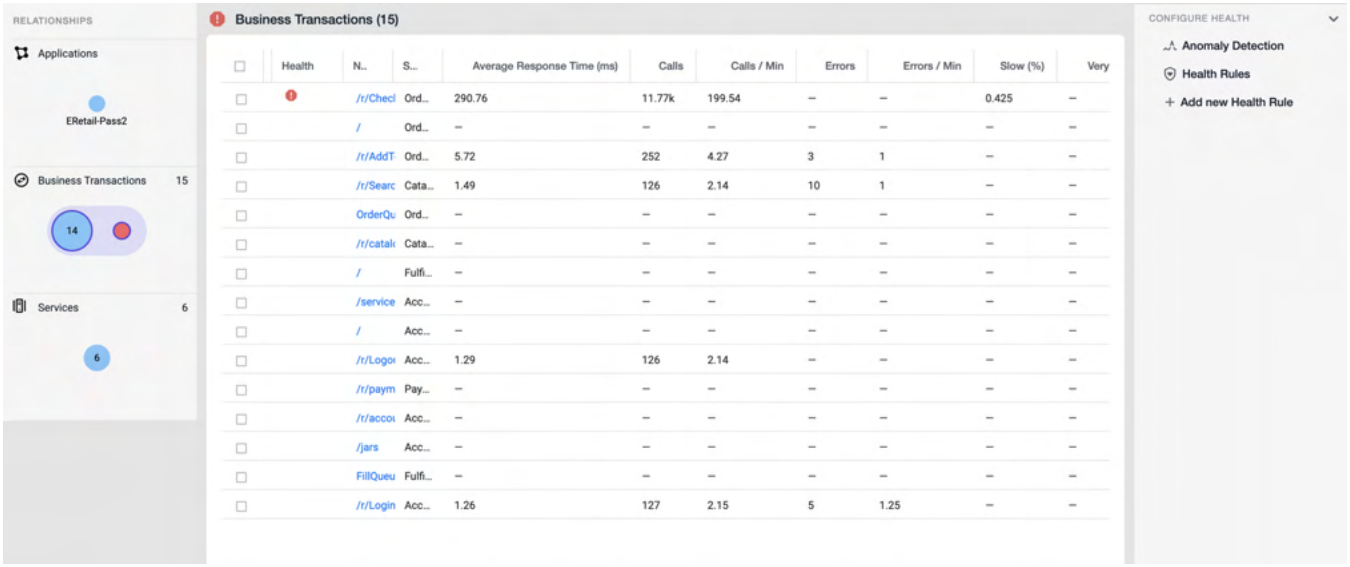
In the **Relationships** map, if you click any object, content is updated within the context of that object. Different types of entities display in the **Relationships** map depending on the entity you are viewing. For example, **Service Instances** do not display on the **Relationships** map when looking at **Applications**. **Service Instances** display when you reach the level of **Services**. If hosts and databases are not associated with an application, then those layers do not display.

Main Content Area

The middle panel is the main content area and consists of the **Lists** view, **Interactions** map, and **Details** view.

List View

The **List** view displays in the main content area. The **List** view displays a list of multiple instances of one entity type. In the following example, the entity type is **Business Transactions**, and there are six (6) **Business Transactions** associated with the **CloudMon-Staging** entity.



The **List** view changes based on the object in focus. It presents different columns and metrics depending on what object is selected. The **Health** column indicates the status of the entities. A dark red icon indicates that the entity is in a `Critical` state, while an orange icon indicates that the entity is in a `Warning` state. If the entity is healthy, then no icon displays in the **Health** column. In this example, the **Business Transactions Object** page displays Key Performance Indicator (KPI) metrics for each column.

You can select entities in the List view to view associated health rules or enable anomaly detection. See Configure Entity Health.

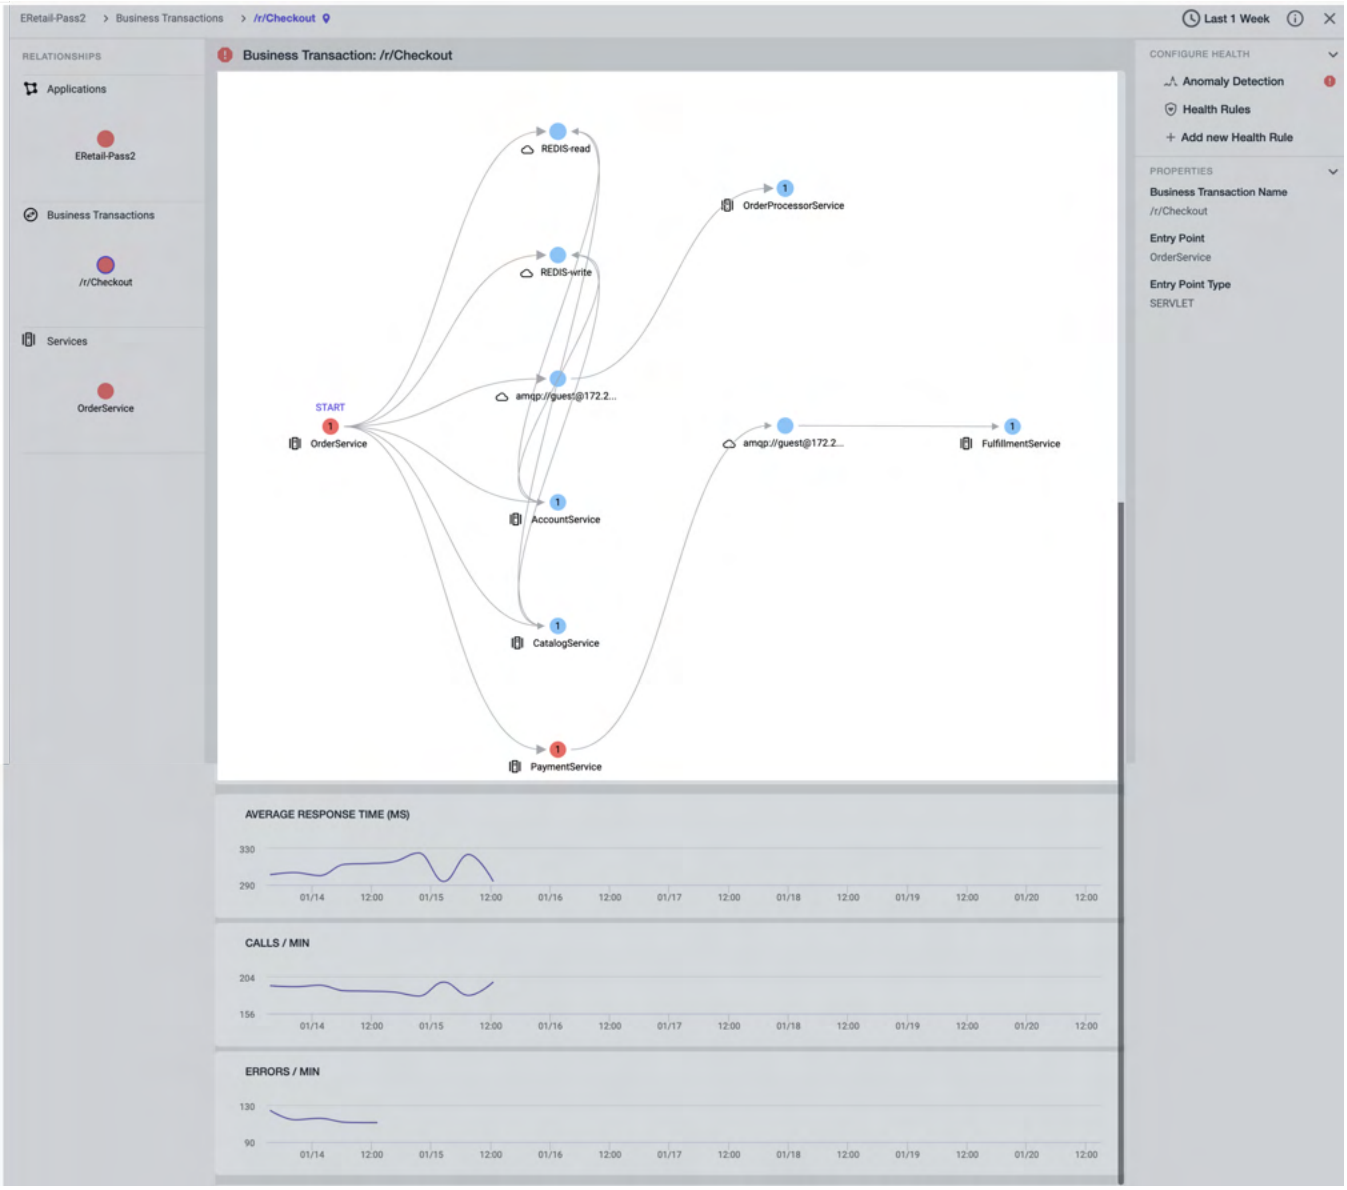
Interactions Map

The **Interactions** map displays in the main content area. An **Interactions** map is a graph that represents how services, databases, hosts, and other associated infrastructure entities within a business transaction, interact with each other. You can measure the entities' performance and track the origin and the destination of these interactions to trace a sequence of requests through your application. The **Interactions** map is only available in these three views:

- Business Transactions Details
- Services Details
- Service Instances Details

The **Interactions** map indicates the health status of the entities it displays. You can use the **Interactions** map to drill down an unhealthy entity to determine the affected services or service instances. Currently, the **Applications** page (Details view) only displays an Interactions list, not an Interactions map.

The **Configure Health** options available in the right panel help monitor the health and performance of the selected entity. You can configure health rules or use anomaly detection for the entity. The health and performance status of the entity appears adjacent to the **Configure Health** options. In the following example, the interaction map depicts the interactions for `/r/Checkout` business transaction. The critical icon ( ) adjacent to **Anomaly Detection** in the right panel indicates that anomaly detection is enabled for `/r/Checkout` business transaction and an anomaly is detected with `critical` severity.



Details View

The **Details** view displays one instance of an object's details. The **Details** view shows Key Performance Indicator (KPI) metric trends based on the object page context. In this example, these metrics display for the **Applications** page:

- **AVERAGE RESPONSE TIME (MS)**
- **CALLS / MIN**
- **ERRORS / MIN**

Right Panel

The Cloud Native Visualization right panel consists of these sections:

- **Configure Health**
- **Properties**

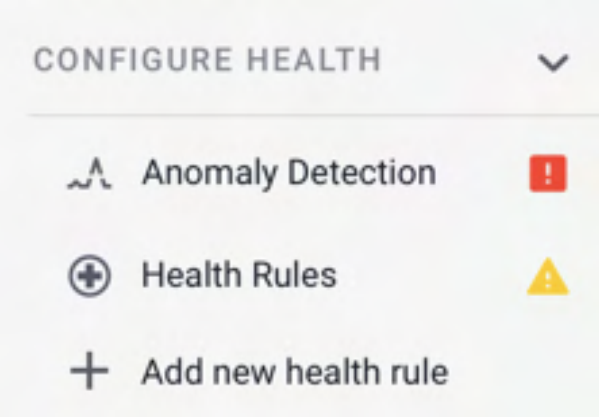
Configure Health

The **Configure Health** section provides options that help monitor the performance and the health of entities.

- **Anomaly Detection**—Automatically determines whether the selected entities (business transactions) in your application perform normally. It takes 48 hours for Anomaly Detection to model train the entities to monitor the performance. Model training is done to determine the normal operating range of parameters of an entity and report anomalies if the parameters vary from the established normal range. The **Anomaly Detection** view lists the entity names and indicates the model training status of the entities. The **Health** column in this view indicates the performance status of the entities as Critical state (icon), Warning state (icon) or Unknown (icon). If no icon is displayed in the column, the performance of the entity is in the normal operating range.
- **Health Rules**—Displays all health rules associated with the selected entities. The **Health Rules** view lists the health rule name, monitored objects, and indicates if the health rule is enabled. You can click the monitored objects in the **Health Rules** view to display a list of all the

monitored objects in the **Configure Health** section in the right panel. The **Health** column indicates the health status of the monitored entities as Critical state (icon) or Warning state (icon). If no icon displays in the column, the entity is healthy. You can create, modify, delete, or enable and disable a health rule based on the performance data.

- **Add new Health Rule**—Displays the **New Health Rule** dialog. Depending on the entities you select, some fields in this dialog are pre-populated with values. You can configure the other parameters to create a new health rule.



See Configure Entity Health.

Properties

Each object type has its own set of properties. **Properties** display the attributes of each instance of an object, such as the name and corresponding metadata. This area is context-sensitive; it displays information and tools relevant to the user context. From the **Lists** views, you can select a single instance of an object to view the **Properties** in the right panel. From the **Details** views, **Properties** display for the object in focus.

Applications Page

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

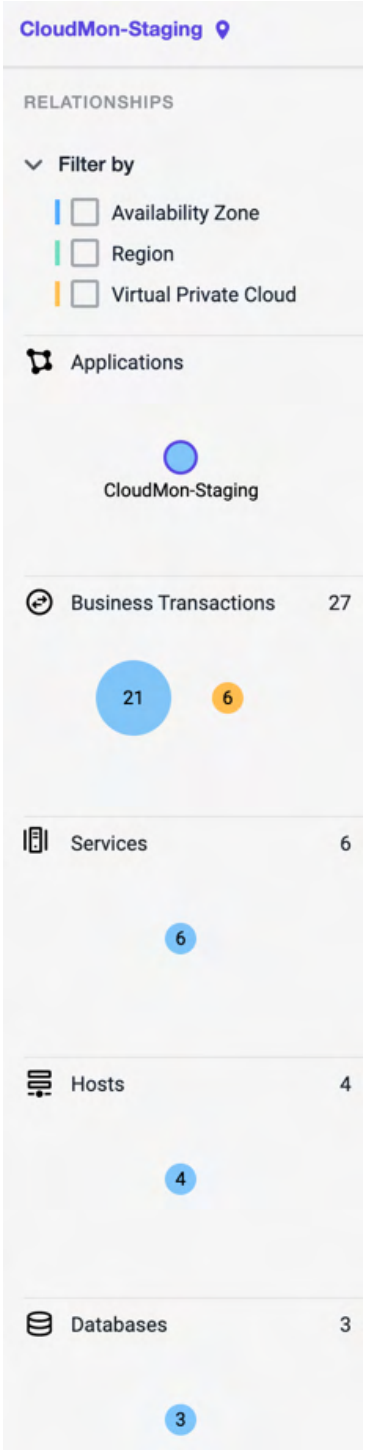
When you access a Cloud Native Visualization **Applications** page, the service application displays as the object of focus. An Application's **Object** page has four main components:

- Relationships map
- Interactions list
- Metrics
- Configure Health

Relationships Map

On the **Applications** page, in this example **CloudMon-Staging**, the **Relationships** map lists the objects related to the application and the count of each specific entity that comprises the service:

- **Applications**
- **Business Transactions (27)**
- **Services (6)**
- **Hosts (4)**
- **Databases (3)**

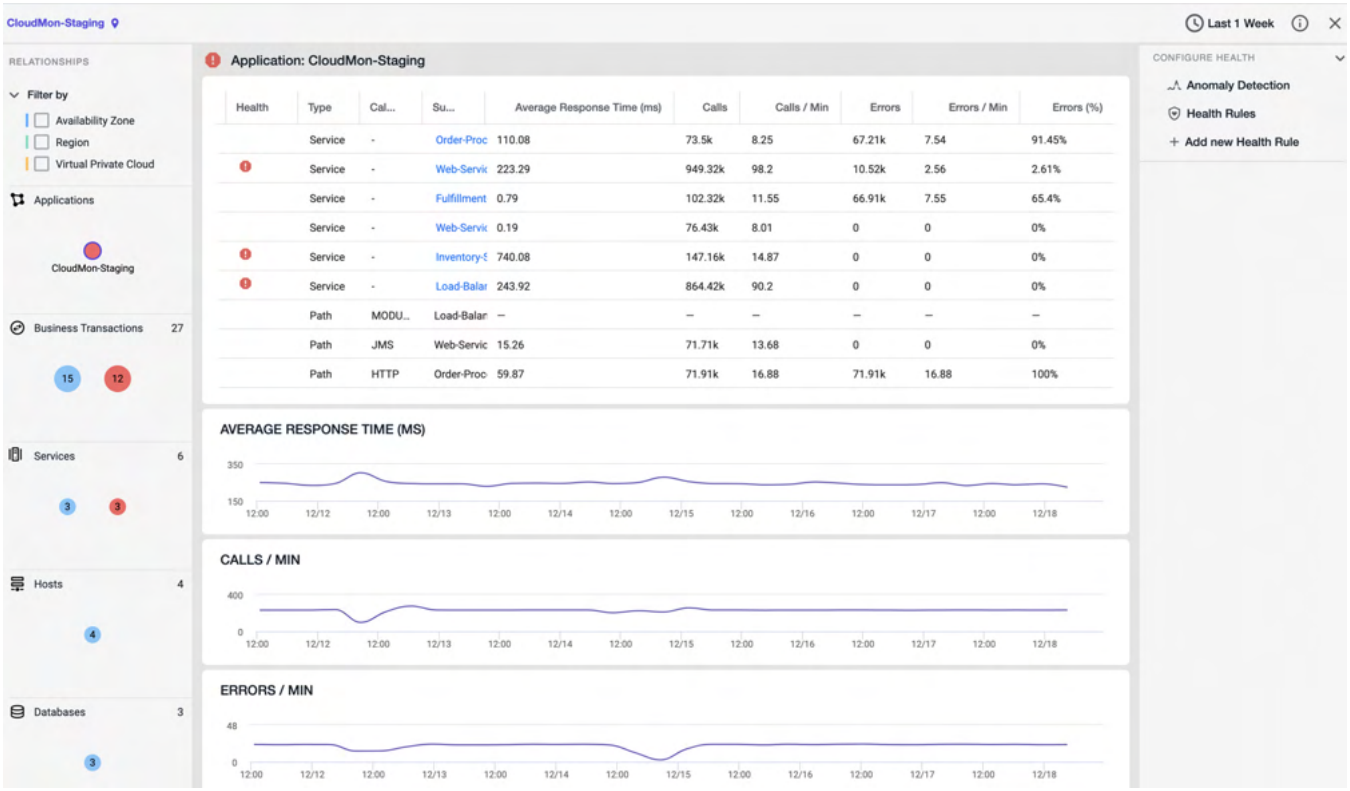


Health Status of the Entities

The **Relationships** map displays the health status of the listed entities. The entities are categorized as healthy or unhealthy based on their health status, and display as group circlets. A blue-colored group circlet indicates that the entities are healthy, while an orange-colored or a red-colored group circlet indicates that the entities are unhealthy. See Monitor the Health of Entities.

Interactions List

The Interactions list displays in the main content area. This list displays all of the associated objects and paths between object entities and related Key Performance Information (KPI) for each. It also indicates the status of the entities in the **Health** column.



The **Applications** page Key Performance Indicator (KPI) metrics are displayed for each column in a data grid.

Name	Description
Health	The **Health** column displays icons that indicate the health status of the entities: •  —Indicates that the entity is in a `Critical` state. You can click the entity to drill down and determine the affected business transactions, services, and service instances. •  —Indicates that the entity is in a `Warning` state. You can click the entity to drill down and determine the affected business transactions, services, and service instances. • No icon—Indicates that the entity is healthy.
Type	A call graph can be one of these types: • Full call graphs—Capture the entire call sequence for the business transaction invocation. In this case, call graphs exist for each monitored service instance involved in the processing of the business transaction. Periodically collected and diagnostic snapshots are always full call graphs. • Partial call graphs—Represent the subset of the call sequence for processing a business transaction, typically from the point at which the transaction has been determined to be slow or contain errors. Partial call graphs are identified as such in the transaction snapshot.
Call Type	A call graph in a transaction snapshot shows business transaction processing information on a particular service that participated in the business transaction. A call graph lists the methods in a call stack and provides information about each call.
Summary	Name of the associated entity.
Average Response Time (ms)	Response time-averaged over the time range in milliseconds; aggregated per application.
Calls	Total number of calls.
Calls / min	Average requests (calls) per minute (Load).
Errors	Total number of errors.
Errors / min	Number of errors per minute.

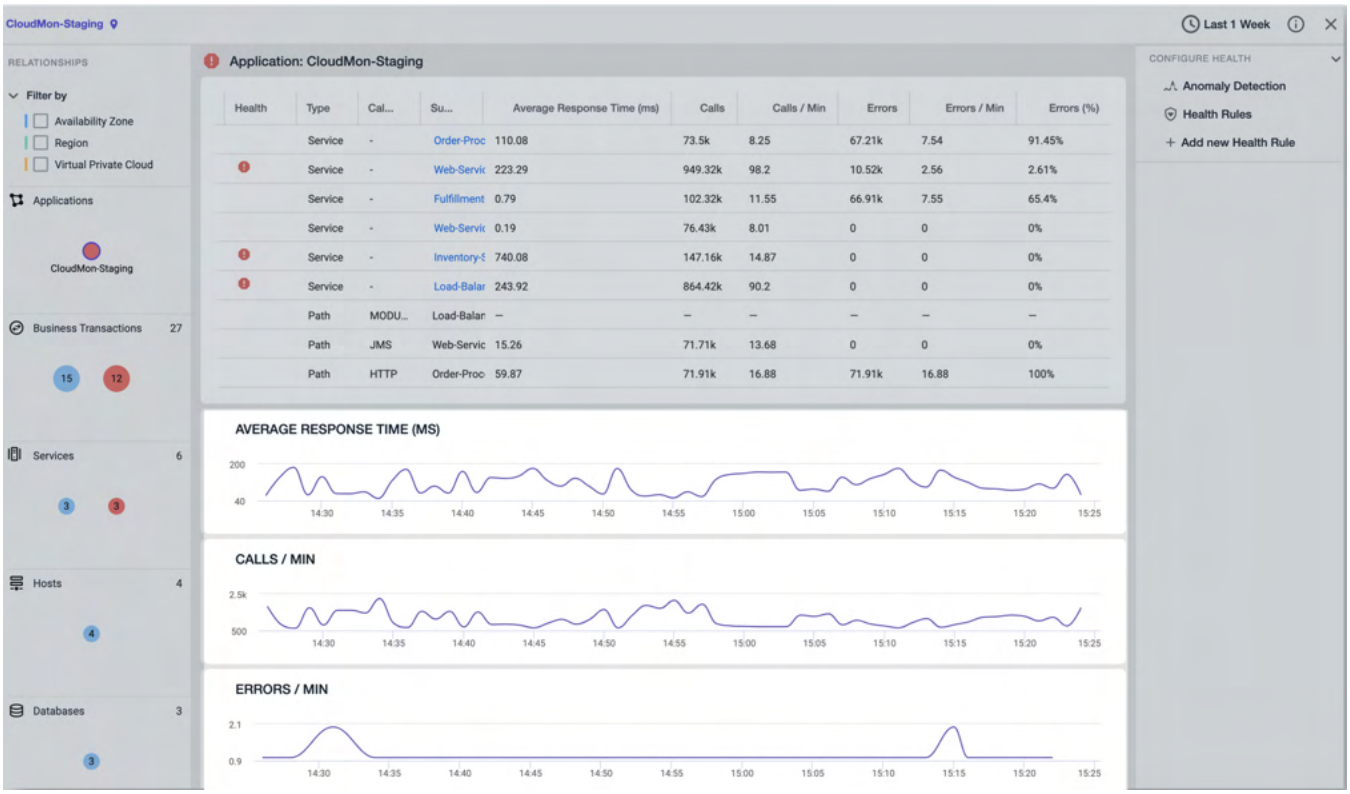
Errors (%)	Percentage of errors per minute.

When you navigate from an **Object** page to an Interactions list through the Relationships map, the Relationships map does not change. The Interactions list retains the context of the entity that you are viewing.

Metrics

The **Metrics** section displays three key application metrics:

- **Average Response Time (ms)**
- **Calls Per Minute (load)**
- **Errors Per Minute**

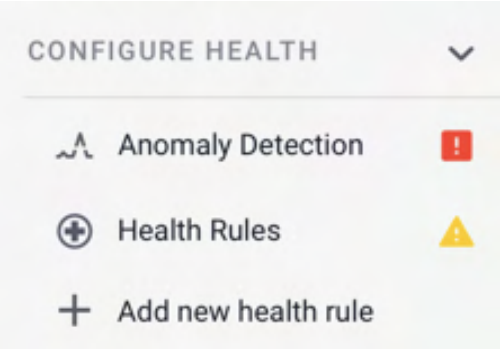


The cards display details in expandable rows. The data in these rows roll up information from all service instances (nodes) within a group.

Configure Health

The **Configure Health** section provides options that help monitor the performance and the health of entities.

- **Anomaly Detection**—Automatically determines whether the selected entities (business transactions) in your application perform normally. It takes 48 hours for Anomaly Detection to model train the entities to monitor the performance. Model training is done to determine the normal operating range of parameters of an entity and report anomalies if the parameters vary from the established normal range. The **Anomaly Detection** view lists the entity names and indicates the model training status of the entities. The **Health** column in this view indicates the performance status of the entities as Critical state (icon), Warning state (icon) or Unknown (icon). If no icon is displayed in the column, the performance of the entity is in the normal operating range.
- **Health Rules**—Displays all health rules associated with the selected entities. The **Health Rules** view lists the health rule name, monitored objects, and indicates if the health rule is enabled. You can click the monitored objects in the **Health Rules** view to display a list of all the monitored objects in the **Configure Health** section in the right panel. The **Health** column indicates the health status of the monitored entities as Critical state (icon) or Warning state (icon). If no icon displays in the column, the entity is healthy. You can create, modify, delete, or enable and disable a health rule based on the performance data.
- **Add new Health Rule**—Displays the **New Health Rule** dialog. Depending on the entities you select, some fields in this dialog are pre-populated with values. You can configure the other parameters to create a new health rule.



See Configure Entity Health.

Monitor the Health of Entities

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

Cloud Native Visualization groups entities in the **Relationships** map, **Interactions** map, and the **List** view based on their health status. All entities are grouped by color-coded health status, into healthy and unhealthy categories. This table shows how the color of the group circlet indicates the health status of entities:

Entity/Object Icon	Health Status Description
	Twenty entities are operating within normal parameters and are healthy. No alerts are reported for these entities.
	Twelve entities are unhealthy, in `Critical` state.
	Seven entities are unhealthy, in `Warning` state.

View the Health Status of Entities

The **Relationships** map displays the health status of entities. This helps you identify and focus on those entities (out of the thousands in your account) that need attention. You can initiate remediation actions to quickly resolve any critical issues.

Group circlets indicating healthy and unhealthy entities display in the **Relationships** map. You can click the circlets to view the health status details of all entities.

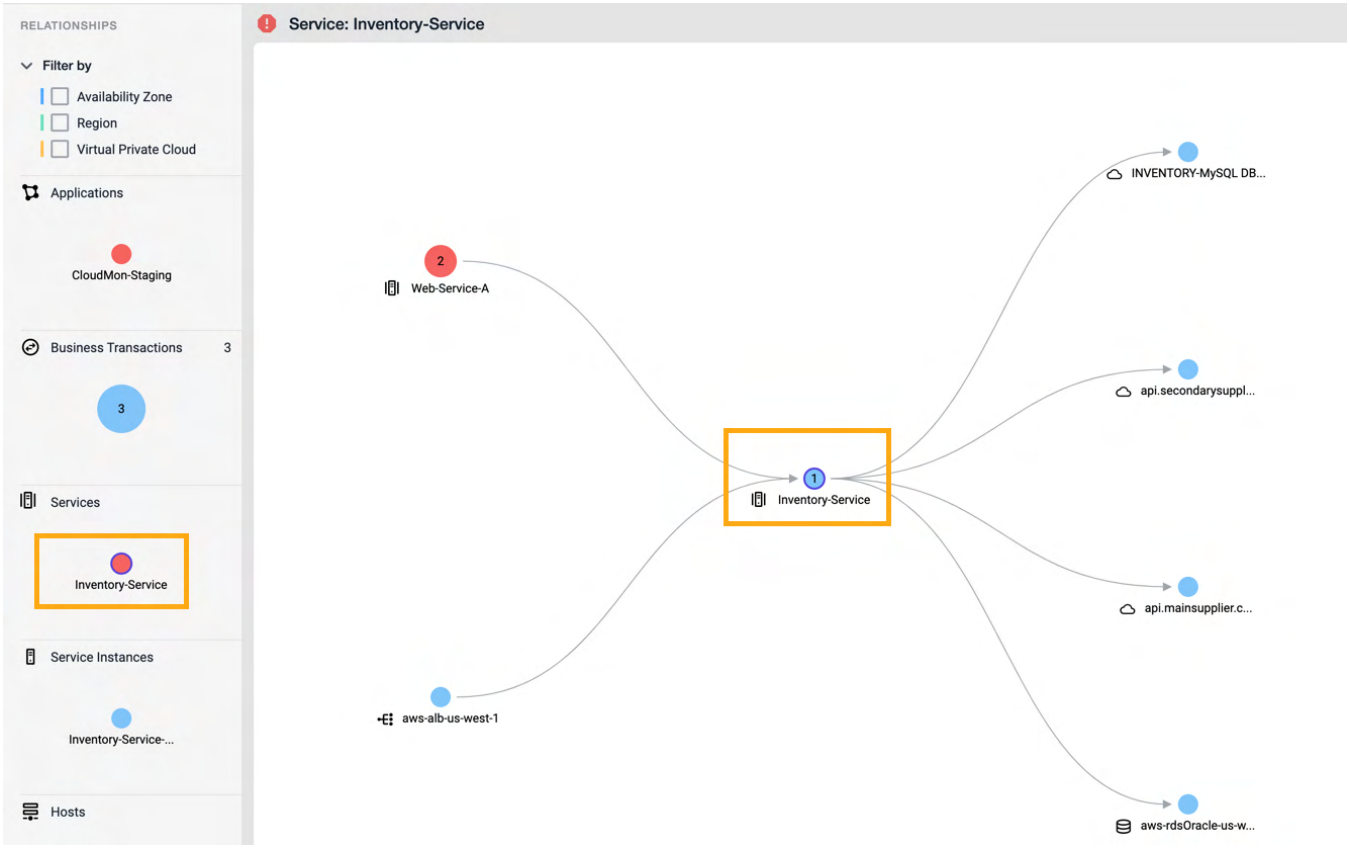
After you click the entity groups in the **Relationships** map, a list of entities associated with the parent entity and its corresponding details display in the **List** view. The **Health** column displays icons that indicate the health of the entities.

Health Icon	Description
	Indicates that the entity is in `Critical` state. You can click the entity to drill down and determine the affected business transactions, services, and service instances.
	Indicates that the entity is in `Warning` state. You can click the entity to drill down and determine the affected business transactions, services, and service instances.
No icon	Indicates that the entity is healthy.

Determine the Affected Entities

An unhealthy group circlet in the **Relationships** map displays the cumulative health status of all comprising entities. If one of the many services, or service instances within the object is unhealthy, the overall status is considered to be unhealthy.

In the following example, the status of **Inventory Service** in the **Relationships** map is unhealthy. However, **Inventory Service Instance** is healthy as shown in the **Interaction** map. This is because, though the parent entities are unhealthy, some of their child entities (service instances) remain healthy.



To determine the affected services or service instances:

1. Click the **Last 1Hour** dropdown list on the top right corner of the page and select a time period to retrieve data.
2. In the **List** view, click the hyperlinked name of the unhealthy entity. All associated entities (including services and service instances) display on the **Interaction** map.

   > The properties of the entity you select on the **Interaction** map display on the **Properties** pane on the right.

3. Note the affected entities.
4. Click each of the affected entities to determine the affected services or service instances.

View Performance Status of Affected Entities

To monitor the performance of the selected entities using anomaly detection:

1. In the **List** view, select the affected entities.
2. Click the **Anomaly Detection** option in the right panel. The **Anomaly Detection** view replaces the **List** view. It takes 48 hours for anomaly detection to start reporting performance data.
3. To return to the **List** view, close the **Anomaly Detection** view.

See Anomaly Detection.

View Health Rules Associated with Affected Entities

To view the health rules associated with the entities.

1. In the **List** view, select the affected entities.
2. Click the **Health Rules** option in the right panel. The **Health Rules** view replaces the **List** view. This view lists all the health rules that you have configured to monitor the selected entities.
3. If you want to view the entities that the health rule monitors, click **Applied on <> Objects** in the **Monitored Objects** column. A list of monitored entities displays in the right panel with the health status indicator icons.
4. If you want to edit the health rule, click the health rule name. The **Edit Health Rule** dialog displays. Make necessary updates and save the health rule.
5. To return to the **List** view, close the **Health Rules** view.

See Health Rules.

Configure Entity Health

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

The right panel on the **Cloud Native Visualization Object** page provides these options to configure the health rules and monitor the performance of the entities:

- Anomaly Detection
- Health Rules
- Add new Health Rule

To configure these options, select:

- a single entity or multiple entities from the **List** view, or
- an entity from the **Interaction** map

When you select an option, the **Configure Health** view replaces the **List** view or the **Interactions** map content area.

Anomaly Detection

Anomaly Detection uses machine learning capabilities to continuously monitor latency, errors, and throughput of business transactions to reduce the Mean Time to Detect (MTTD) when an anomaly occurs. It takes 48 hours for anomaly detection to become available. During that time, the machine learning model trains on the business transactions in your application. Model training determines the normal operating range of parameters of an entity and report anomalies if the parameters vary from the established normal range.

When you configure anomaly detection for business transaction entities, the **Anomaly Detection** view replaces the **List** view content area. This view lists the entities, their health status, and model training status.

The **Health** column in this view indicates the health status of the business transactions as follows:

-  —The entity has an anomaly and is in `Critical` state.
-  —The entity has an anomaly and is in `Warning` state.
-  —The health status is not yet available for various reasons such as the model training is in progress, or there is not enough data.
- no icon—The performance of the entity is in the normal operating range.

The **Model Training** column on the right displays the training statuses as follows:

- **In Training**—Model training is in progress for the business transaction. It takes 48 hours for anomaly detection to start reporting data.
- **Ready**—Model training is complete.
- **Not available**—Model training cannot proceed because there is not enough data for the select business transaction.

Model training data is refreshed every hour.

View Anomaly Detection Status

To view Anomaly Detection status for entities in the **List** view:

1. Select the required entities. You can select all the entities by checking the select all check box.
2. Click **Anomaly Detection** in the **Configure Health** section of the right panel. **Anomaly Detection** view replaces the **List** view content area.
3. Check the **Health** column to determine if any entities are unhealthy. If any of the entities are reported unhealthy, you can initiate remediation steps.

Health Rules

Cloud Native Visualization lists all the health rules configured to monitor the entities in your application. When you select the **Health Rules** option from the right panel, the **Health Rules** view replaces the **List** view content area. The total number of health rules configured for the selected entities is indicated in brackets. This view lists the health rule name, its description, the objects it monitors and also indicates if the health rule is enabled. When you click the monitored objects in the **Health Rules** view, a list of all the monitored objects displays in the **Configure Health** section in the right panel.

Health Rule Operations

The **Health Rules** view allows you to perform various CRUD operations. You can also enable or disable the evaluation of health rules. This table describes the health rule operations:

Operation	Description

+	Creates a new health rule for the selected entity.
	Deletes an existing health rule. ⓘ You can delete only one health rule at a time.
Monitoring	Enables or disables the evaluation of the health rule for the selected health rules or all the health rules. ⓘ If you disable the evaluation of all the health rules, you must confirm the action.
	Refreshes the list of health rules.
Filter 	Searches for health rules with the given keyword.

Create a New Health Rule

You can create a health rule to monitor a single entity or multiple entities.

ⓘ You can create a maximum of 50 health rules per account.

1. From the **List** view, select the entities to be monitored by the health rule you configure.

   ⓘ You can configure a maximum of 25000 entities to be monitored by a health rule. If you select more than 25000 entities, the health rule is not evaluated.

2. In the Cloud Native Visualization right panel, click **Add New Health Rule**. The **New Health Rule** dialog displays.

   Alternately, if you are already in the **Health Rules** view, click + (add new health rule icon).

   ⓘ The entities selected in the **List** view are pre-selected in the **New Health Rule** > **Select Object Type** dialog.

3. In the **Select Object Type** dialog, configure the object details and filter criteria:

   a. Select an object from the **Object Type** dropdown list to be monitored by the health rule.

      ⓘ If the list of health rules is lengthy, use the search box available on the top right corner to search for the required health rule.

   b. To apply filters to your selection:

      i. In the **FILTER BY PARENT OBJECT TYPE** area, select a parent object from the **Parent Object** dropdown.
      ii. To specify a filter condition:
         1. Specify a **Tag Key**.
         2. Select an operator.
         3. Define a value to be matched in the **Tag Value** field.
      iii. To add a related parent object to the filter, click **Add related parent object type** and select an object.

   c. Define the health rule evaluation scope:

      i. To trigger health rule violation alerts based on the performance of an individual object, for example, service instance, select **Apply to each <object> individually**.
      ii. To trigger health rule violation alerts based on the performance of a group of objects, and grouped by their parent object, for example, service instances grouped by a service:
         1. Select **Apply to groups of monitored objects**.
         2. Select an option from the **group objects by** dropdown.
         3. Select a parent object from the adjacent dropdown.

4. Click **Next**. The **Define Conditions** dialog displays.

> ⚠ Ensure that the configuration data you enter is accurate before you configure conditions. If you make changes to the object filter or evaluation scope after you configure conditions, the conditions are reset.

5. Define a condition or a set of conditions to evaluate the performance of the selected objects or group of objects:
    a. In the **Critical Criteria** tab, select a value from the **Use data from last <> min(s)** dropdown. The list displays numbers between 1 and 120 minutes. The data collected during this time interval is the minimum amount of data required to evaluate a health rule and determine if there is a health rule violation.

    > ⓘ If you define a persistence threshold for the health rule condition, ensure that you define an evaluation time frame of 30 minutes or less.

    b. Click **+ Add Condition** to add a new condition component. A row defining the condition displays.
    c. Configure the Condition as required.
    d. To add more conditions, repeat steps b and c.
    e. To evaluate multiple conditions within a health rule, use a boolean expression.
    f. To copy the critical criteria configuration to warning criteria, click **Copy from Critical Criteria**. You can modify the warning criteria if required.
6. Click **Next**. The **Display Health** dialog displays.
7. To mark the unhealthy status of the objects on dashboards:
    a. If you selected a single object to monitor in the health rule evaluation scope, select the **Mark <> as unhealthy** check box.
    b. If you selected a group of objects to monitor in the health rule evaluation scope, select the **Mark <> as unhealthy** check box and enter a % value. The dashboards report the unhealthy status of the group of objects only if % of objects exceeds the given value.
8. Click **Next**. The **Overview** dialog displays.
    a. Enter a name for the health rule. The health rule is enabled by default.
    b. In the **Wait Time after Violation** field, enter the number of minutes to wait (if the health status remains unchanged) before re-evaluating the health rule. See Health Rule Wait Time After Violation.
9. Click **Save**.

Configure a Condition

1. In the first field of the condition row, enter a name for the condition. This name is used in the generated notification text and in the AppDynamics Console to identify the violation.
2. From the dropdown below the **Add Condition** button, define metrics to evaluate the condition. Select:
    - a. From the adjacent dropdown, select a metric qualifier from the following options:

Qualifier Type	Description
Minimum	The minimum value reported across the configured evaluation time frame.
Maximum	The maximum value reported across the configured evaluation time frame.
Value	The arithmetic average of all metric values reported across the configured evaluation time frame. This value is based on the type of metric.
Sum	The sum of all the metric values reported across the configured evaluation time frame.

    b. From the adjacent dropdown list, select a metric to monitor.

    c. From the dropdown after the metric, select comparison type to evaluate the metric.

    - To limit the effect of the health rule to conditions during which the metric is within a defined range—standard deviations or percentages—from the baseline, select **Within Baseline**. To limit the effect of the health rule to when the metric is not within that defined range, select **Not Within Baseline**. Then, select the baseline to use, the numeric qualifier of the unit of evaluation, and the unit of evaluation. For example:

      ```
      Within Baseline of the Default Baseline by 3 Baseline Standard Deviations
      ```

    - To compare the metric with a static literal value, select **< Specific value** or **> Specific Value** from the menu, then enter the specific value in the text field. For example:

      ```
      Value of Errors per Minute > 100
      ```

    - To compare the metric with a baseline, select **< Baseline** or **> Baseline** from the dropdown, and then select the baseline to use, the numeric qualifier of the unit of evaluation, and the unit of evaluation. You can use the Baseline Standard Deviation or Baseline Percentage as the unit of evaluation. For example:

```
Maximum of Average Response Time is > Baseline of the Daily Trend by 3 Baseline Standard Deviations
```

See Dynamic Baselines for information about the baseline options.

> **Baseline Percentages**
>
> The *baseline percentage* is the percentage above or below the established baseline at which the condition is triggered. For example, if you have a baseline value of 850 and you have defined a baseline percentage of > 1%, then the condition is true if the value is > `[850+(850x0.01)]` or `859`.
>
> To prevent health rule violations from being triggered when the sample sets are too small, these rules are not evaluated if the load—the number of times the value has been measured—is less than 1000. For example, if you specify a very brief time slice, the rule may not violate even if the conditions are met, because the load is not large enough.

- or

a. Select the **Metric Expression** option from the dropdown and click **Add Expression**. The **Metric Expression** dialog displays that allows you to construct a mathematical expression to use as a metric.
b. Click **Add Variable** to add a variable.
c. In the **Variable Name** field enter a name for the variable.
d. From the dropdown, select a metric qualifier from the following options:

Qualifier Type	Description
Minimum	The minimum value reported across the configured evaluation time frame.
Maximum	The maximum value reported across the configured evaluation time frame.
Value	The arithmetic average of all metric values reported across the configured evaluation time frame. This value is based on the type of metric.
Sum	The sum of all the metric values reported across the configured evaluation time frame.

e. Select a metric from the adjacent dropdown.

> **Health Rule Evaluation Condition**
>
> A health rule is not evaluated if any metric in the expression has a null value. This is to avoid erroneous evaluations as shown in the following examples:

Expression	Null Value	Evaluation
`a-b-c`	a	`entire expression is evaluated negative`
a/b	b	`the number 'a' is divided by zero, evaluates to an error`
`a*b`	a or b	`entire expression is evaluated as zero`

f. Repeat steps 1 through 4 for each metric that you use in the expression.
You can remove a variable by clicking **X**.
g. In the **Expression** section, build the expression by clicking **Insert Variable** to insert variables you created and appropriate mathematical signs.
h. When the expression is complete, click **Submit**.
i. To compare the metric with a static literal value, select **< Specific value** or **> Specific Value** from the menu, and then enter the specific value in the text field.

3. If you want the condition to evaluate to `True` whenever a configured metric does not return any data during the evaluation time frame, expand **Advanced Settings** and check the **Evaluate to true on no data** option.
This option does not affect the evaluation of unknown when there is not enough data for the rule to evaluate. For example, if the health rule is configured to evaluate the last 30 minutes of data and a new node is added, the condition evaluates to unknown for the first 30 minutes even if the **Evaluate to true on no data** box is checked.
4. To define a Persistence Threshold for the condition to reduce false alerts:

a. Select **Trigger only when a violation occurs __ times in the last __ min(s)**.
b. Define the number of times metric performance data should exceed the defined threshold to constitute a violation.
c. If required, adjust the evaluation time frame by setting an alternate evaluation time frame.

> You can define a Persistence Threshold for a condition only if you have defined an evaluation time frame of 30 minutes or less.

Create a Custom Boolean Expression

Once you define all the conditions required for the health rule, create a custom boolean expression:

1. In the Critical Criteria tab, select **CUSTOM** from the **If <> of the following conditions are met** dropdown.
2. Enter a combination of conditions using `AND` and/or `OR` operators. For example, `(A OR B) AND C`.

Update a Health Rule

To update a health rule:

1. In the **Health Rules** view, click the health rule name. The **Edit Health Rule** wizard displays.
2. Make the necessary updates as the wizard guides you through the procedure.
3. Click **Save** to apply the updates.

This video describes the configurable entity health features in Cloud Native Visualization.

Sorry, your browser doesn't support embedded videos.

Cloud Native Visualization Metrics Overview

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

This page provides an overview of Cloud Native Visualization metrics in AppDynamics. Cloud Native Visualization provides a variety of graphs and tools that visualize metric data so that you can effectively analyze your application's performance. It also enables you to extend and adapt metrics in specific ways.

AppDynamics allows you to create metrics based on various domain-related data collected from applications, services, and endpoints. These metrics can be used for monitoring the health and performance of the entity as well as correlating different entities and domain data.

What is a Metric

Metrics are numerical measurements of an entity, or interactions measured or sampled over a period of time, typically with a fixed frequency. Because of this, Metrics are represented through time-series visualization. Metrics are inherently compressible and are summarized both through an entity's relationships and through an entity's attributes at any given time.

For information about variable granularity for the AWS monitoring, see Variable Ingestion Granularity for AWS Detailed Monitoring.

Metrics Data Model

AppDynamics Measurements are registered by a domain or feature in a type system. APM, Server, Network, Database are domain examples, and have measurements such as "Response Time" or "Message Size". A measurement has certain properties, and each measurement belongs to a category and content type as described in the Measurement Types table. A measurement packet can also have elements that belong to different content types, depending on whether measurements were ingested at read-time or post-aggregation.

Measurement Types

Measurement types determine how data is aggregated. There are five categories of measurement types:

- Counter
- Gauge
- Meter
- Monotonic
- Rate

The Content types at ingestion or post-aggregation are:

- Number: A single number that defines a measurement value at any particular timestamp. For example: `CPU = 65`.
- Distribution: A typical distribution of a measurement value for a particular timestamp will encompass `SUM, MIN, MAX, CURRENT, COUNT, GROUP_COUNT` fields.

For a measurement type that belongs to a category, aggregations performed by the AppDynamics platform are predefined.

Category	Description	Content Types at Ingestion	Content Types Post-aggregation	Default Consumption	Example	The Expression for Observed Value Computation
Counter	Measures discrete counts that need to be summed up for consumption.	• Number • Distribution	Distribution	The cumulative total of the count.	• Number of Slow Calls • Request Count • Event Count	`SUM`
Gauge	Measures, observes, or samples something that is constantly changing and is consumed as a per-instance value.	• Number • Distribution	Distribution	Typical Observed Sample per instance.	• CPU Idle %, • Memory Utilization % • Queue Length • Lag	`CURRENT / GROUP_COUNT`
Meter	Measures discrete metric values over a period.	• Number • Distribution	Distribution	Average value on a per-period basis.	• Response Time • Execution Time • Request Size • Message Size	`SUM/COUNT`

Monotonic	Measures monotonically increasing metric values.	• Number • Distribution	Distribution	Sum of all the monotonic counts.	• Total bytes consumed since the beginning of an hour • Total bytes received since the beginning of the day	`CURRENT`
Rate	Measures discrete counts, but is typically consumed as average per-period.	• Number • Distribution	Distribution	Average of the total count on a per-period basis.	• Calls per Minute • Errors per Minute	`(SUM * GROUP_COUNT) / COUNT`

Observed Value Computation Metrics results include the following fields:

Name	Definition
`CURRENT`	The last value of the metric in the time unit. This is taken based on the latest time for time roll ups.
`COUNT`	The number of values (or samples) recorded in the time unit. Varies based on metric type, such as CPM or ART.
`GROUP_COUNT`	The number of service instances (nodes) that participated in the rollup.
`SUM`	The sum of all the values (or samples) recorded in the time unit.

Observed Value

The Observed Value is the default value that is computed and displayed on the user interface. This table shows formulas for the observed value for **Cluster rollup** based on **Individual** and **Collective** clusters. The **Time Roll-up Type** displays how the metrics in the **Controller** map to the metrics in Cloud Native Visualization.

Time Rollup Type	Cluster rollup - Individual	Cluster rollup - Collective
Average	`SUM/COUNT`	`(SUM * GROUP_COUNT) / (COUNT *DEFAULT_GROUP_COUNT_MULTIPLIER(100))`
Sum	`(SUM / GROUP_COUNT) * DEFAULT_GROUP_COUNT_MULTIPLIER(100)`	`SUM`
Current	`(CURRENT / GROUP_COUNT) * DEFAULT_GROUP_COUNT_MULTIPLIER(100)`	`CURRENT`

Metric Time Series

This table illustrates how Metric Data Resolution over Time is displayed in the Cloud Native Visualization user interface:

> These are the initial numbers and are subject to change.

Query Time Range	Ingestion Granularity	Response Granularity	Max Number of Data points Per Metric
(<) 1 day	1 Min	1 Min	1440
(<) 1 day	5 Min	5 Min	288
2 days	1 Min	5 Min	1440
2 days	5 Min	5 Min	576
3 days to 8 days	1 Min, 5 Min	5 Min	864
3 months - 1 Year	1 Min, 5 Min	1440 Min (1 day)	365
8 days	1 Min, 5 Min	10 Min	1152
9 days - 3 Months	1 Min, 5 Min	60 Min	72

About Metric Visualization Tools

Cloud Native Visualization offers an Object page, which is the main interface that allows you to inspect metrics, even though metric data appears throughout the Controller. The Relationships and Interactions maps display metric values collected over a selected time period. In the browser, you can visualize and APM and Amazon CloudWatch metrics to compare and analyze patterns.

For understanding how AppDynamics ingests the AWS detailed monitoring data for the metrics with variable granularity, see Variable Ingestion Granularity for AWS Detailed Monitoring.

Variable Ingestion Granularity for AWS Detailed Monitoring

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

AppDynamics Cloud Native Visualization uses the Amazon CloudWatch API to collect metrics related to AWS Cloud Computing Services. When working with the AppDynamics platform, consider:

- AWS offers 5-minute and 1-minute granularity for metrics. You can change the granularity for a subset of the AWS CloudWatch metrics in a few AWS services from 1-minute to 5-minute granularity and vice versa.
  For example, Amazon EC2 allows customers to configure detailed monitoring, offered at 1-minute granularity and basic monitoring, offered at 5-minute granularity on a subset of EC2 metrics. The AppDynamics platform presents such metrics with variable granularity at a minimum granularity of five minutes. Other metrics that are either at 1-minute or 5-minute granularities will be presented at their respective granularities.
  An administrator can enable detailed monitoring on a specific EC2 instance in AWS. In a scenario where an administrator enables detailed monitoring on a specific EC2 instance in AWS for debugging, CloudWatch starts reporting data for this instance at a 1 minute granularity. After the administrator debugs the issue, the administrator turns off Detailed monitoring. CloudWatch now reports data every 5 minutes because of the default Basic monitoring.
  With Cloud Native >= 1.1, you can view this data on the Cloud Native Visualization interface with both 1-minute and 5-minute granularity.
  For example, when a AWS user is monitoring 10 EC2 instances (i-01 to i-10).

  > When a 1-minute granularity metric reports for a time range 10:00 to 10:01, the timestamp is 10:00 and granularity is 1 minute. However, a 5-minute granularity metric reported for time-range 10:05 to 10:10, the timestamp is 10:05 and granularity is 5 minutes.

  For the time period between 10:00 am to 10:15 am, all EC2s report at Basic monitoring (5-minute granularity). Therefore, there are three 5 minute data points timestamped at 10:00, 10:05, and 10:10. Between 10:15 and 10:20, the user changes the monitoring mode for two instances: i-05 and i-07 to Detailed monitoring (1-minute granularity). During this period, still, one 5-minute data point timestamped 10:15 is observed. Again, the user changes the AWS monitoring mode back to Basic monitoring between 10:20-10:45 for the two instances: i-05 and i-07. Here, 5-minute data points are timestamped: 10:20, 10:25, 10:30, 10:35, 10:40 for each instance with Basic Monitoring enabled. The following 1-minute data points are observed for the two instances i-05 and i-07:

  - 10:20+ (timestamped 10:20, 10:21, 10:22, 10:23, 10:24)
  - 10:25+ (timestamped 10:25, 10:26, 10:27, 10:28, 10:29)
  - 10:30+ (timestamped 10:30, 10:31, 10:32, 10:33, 10:34)
  - 10:35+ (timestamped 10:35, 10:36, 10:37, 10:38, 10:39)
  - 10:40+ (timestamped 10:40, 10:41, 10:42, 10:43, 10:44)

  When all monitoring returns to Basic monitoring, the platform switches to capture one 5-minute data point for each metric at 5-minute granularity.
- The AppDynamics platform floor metrics offered at a 5-minute granularity rounds up to the nearest 5th-minute timestamp.
  As an example, a 5-minute granular metric with a timestamp in AWS CloudWatch of "2020-08-20T07:47:00+00:00" and value 200 will have a timestamp of "2020-08-20T07:45:00+00:00" with value 200.
- AWS makes CloudWatch metrics available with some delays of up to 15 minutes. Therefore, you may encounter delays in metric availability on AppDynamics Cloud Native Visualization. Although AWS might update Amazon CloudWatch metrics after they are made available, AppDynamics uses the metric values that were made available at the time of reading.

  Due to these reasons, you may observe discrepancies between AWS CloudWatch metrics and those presented by AppDynamics Cloud Native Visualization.

See Cloud Native Visualization Metrics Overview.

Use Node Name Reuse for Java Agents in Cloud Native Visualization

As part of the Cloud Native launch program, early adopters will have access to the Cloud Native Visualization functionality on a trial basis. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the initial trial period.

The app, tier, node model has been at the heart of AppDynamics APM since its inception. Cloud Native Visualization slightly modifies this model. In particular, what was formerly known as tiers are now called **Services**, and the former nodes are now called **Service Instances**.

A tier represents a set of identical nodes, often load-balanced, so renaming tiers as services better reflects the intent of the construct. However in the case of the named concept node, the implications of the data model change are more complicated than simply renaming node to service instance.

Nodes

Each named node in AppDynamics APM represents a placeholder into which metrics are published when an instrumented application process is started with that node name. The node name identifies the "reporting slot". This model works well for cloud scale-up and scale-down use cases where some bounded elastic capacity is provided and provisioned on a fixed set of infrastructure resources.

This model does not work well with purely ephemeral nodes. Purely ephemeral nodes operate in a space where the whole environment from the operating system up the stack to the application code is spun up once, and only once, and is destroyed at the end of its working life. This is the definition of an ephemeral node, it is not meant to be static, nor long-lived.

To ease node naming issues in such ephemeral use cases, AppDynamics provides capabilities for node name reuse. Node name reuse marks nodes as "historical", allowing uniquely named placeholders to be re-used by different nodes over time. See Historical and Disconnected Nodes.

Service Instances

In contrast to a node, the service instance concept represents the process lifecycle of one application process, with an explicit lifetime. To maintain the proper service instance lifecycle in the Cloud Native Visualization application model a new node naming mechanism has been provided in the Java Agent. This naming mechanism allows service instances to be populated with data gathered from the traditional AppDynamics agents. The AppDynamics system automatically generates a node name for each process as it starts and clears the associated node history from the Controller database once it shuts down. This approach allows the Controller to track the lifecycle of each process while avoiding a build-up of historical nodes over time. Each node maps to a unique service instance with its own startup and shutdown time in the cloud native environment.

Dynamic Environment Considerations

An AppDynamics app agent operates in a dynamic environment much the same way it does in a traditional data center. The auto-naming behavior that defines a node name in the `controller-info.xml` file is optional. The node name can be arbitrary and is implemented for backward compatibility. This helps you understand when a node was started and when it stopped.

This table outlines the comparison of the ephemeral service instance (node) feature with the service instance (node) name reuse feature:

Ephemeral Service Instance (Node)	Service Instance (Node) Re-use and Mark as Historical
Pros • Node history is better retained in Cloud Native Visualization because the service instance (node) names are unique across container instance restarts. • Each service instance (node) or JVM is guaranteed to receive a unique service instance (node) name. • No need for a shutdown hook, JVM can be killed without shutdown hook invocation.	**Pros** This is the existing AppDynamics functionality and previously recommended approach.
Cons Historical data relating to churned ephemeral nodes is purged from the controller and can only be viewed for retrospective failure analysis in the Cloud Native Visualization.	**Cons** • This method is slated for deprecation. • Relies on a shutdown hook that must be invoked. If the shutdown hook is not invoked, the service instance (node) is not purged from the Controller. Nodes are very often forcibly terminated in container environments, causing nodes to not be purged. • Cloud Native service instance entities can incorrectly represent multiple different processes sharing a node name.

Configure the Agent for Dynamic Environments with Ephemeral Service Instance (Node) Auto Naming

You can configure the Java Agent to automatically name service instances (nodes) based on the platform. For automatic service instance naming to work, you must specify an application name and service (tier) name.

The ephemeral service instance (node) property is useful for monitoring environments where there are many JVMs with a short life span. When set to true, the service instance (node) name format is shown as:

```
<Hostname>-<Date time>-<5-character random string>
```

The property `-Dappdynamics.agent.node.use.as.ephemeral=true` (or the equivalent environment variable/XML tag) registers the service instance (node) as ephemeral.

Set this property to true to mark service instances (nodes) as ephemeral. You do not need to specify the service instance (node) name in `controller-info.xml` (<node-name></node-name> or as a system property (`-Dappdynamics.agent.nodeName`).

An example of how the service instance name is displayed:

```
jbossserver.local-2019-10-07 12:13:27.000132-JrQdU
```

The property for the Java Agent is as shown:

System Property: `-Dappdynamics.agent.node.use.as.ephemeral=true`

Environment Variable: `APPDYNAMICS_JAVA_AGENT_EPHEMERAL_NODE`

in controller-info.xml: `<use-as-ephemeral-node/>`

Analytics

You can use Analytics with the APM, Browser RUM, Mobile RUM, and Browser Synthetic Monitoring product modules for:

- Transaction Analytics
- Log Analytics
- Browser Analytics
- Mobile Analytics
- Browser Synthetic Analytics
- Connected Devices Analytics

Analytics extracts the data, generates baselines and dashboards, and provides perspective beyond traditional APM by enabling real-time analysis of business performance correlated with your application performance.

Installation and Administration

- Deploy Analytics Without the Analytics Agent
- Deploy Analytics With the Analytics Agent
- Analytics and Data Security
- Upgrade Analytics Agent
- Upgrade Platform Components
- Troubleshoot Analytics Issues

Analytics Data Collection

- Collect Log Analytics Data
- Collect Transaction Analytics Data
- Business Transaction and Log Correlation
- Collect Business Data From SQL Calls

Using Analytics

- Business Journeys
- Experience Level Management
- Search Analytics Data
- Visualize Analytics Data

Extensibility and Reference

- Create Analytics Metrics From Scheduled Queries
- Analytics Events API
- ADQL Reference

Overview of Analytics

This page describes Analytics. Analytics is built on the AppDynamics Application Performance Management (APM) platform, which includes the Events Service, the unstructured document store for the platform.

Analytics can answer business-oriented questions such as:

- How many users experienced failed checkout transactions in the last 24 hours?
- How much revenue was lost because of these failures?
- How is the lost revenue distributed across different product categories?
- What is your revenue for the day for a geographical region?
- What was the revenue impact, by product category, associated with the two marketing campaigns we ran last week?

The exact components you need to install depend upon your environment and your requirements.

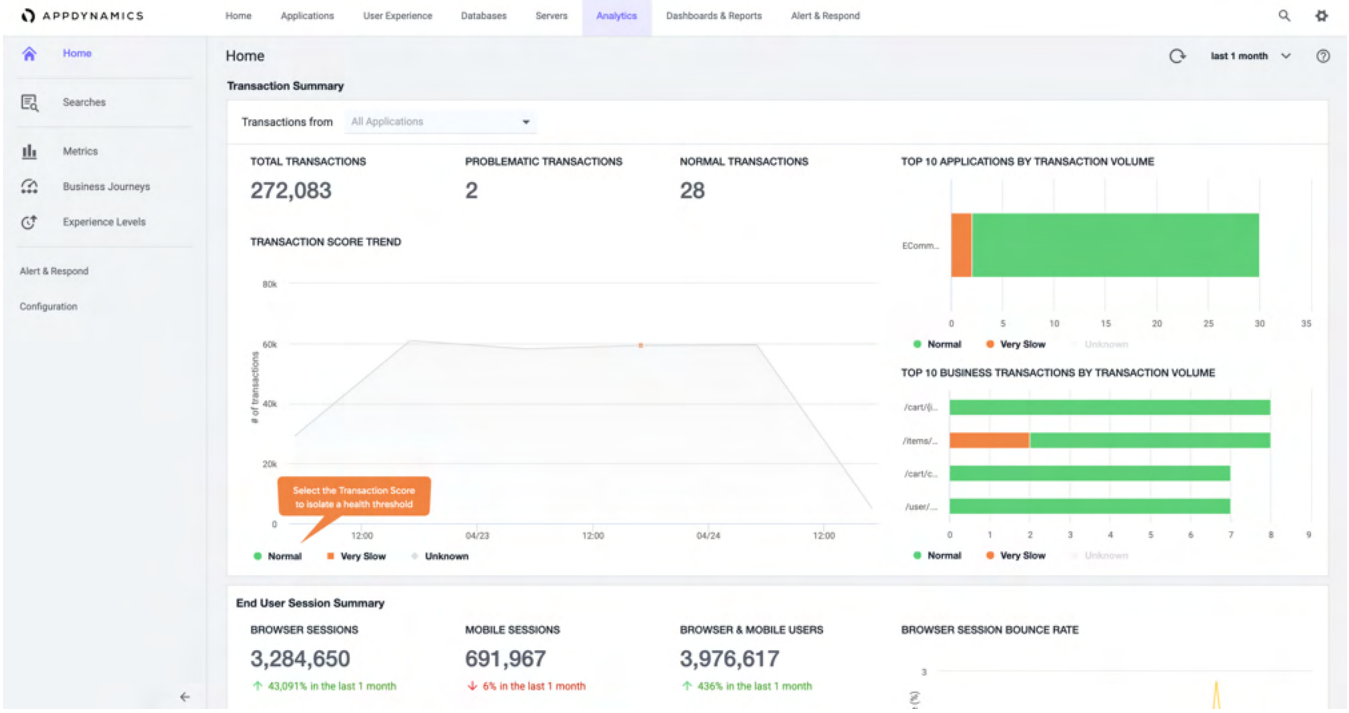
- To plan your deployment, see Deploy Analytics With the Analytics Agent.
- If you are upgrading from a previous version, see Upgrade Analytics Agent.
- If you have been using job files for Log Analytics and want to switch to using source rules (part of Configuration Log Management), see Migrate Log Analytics Job Files to Source Rules.
- To view Analytics Agents connected to your Controller, see View Analytics Agent Health.

Analytics Home Page

The **Analytics Home** page consolidates data from the transaction, browser, and mobile events. The **Home** page automatically generates **Transaction** and **End User Monitoring Summary** panels through queries that aggregate data into widgets.

To view the different widgets on the home page, you need the appropriate licenses and access. See Restrictions and Security.

You can access the AppDynamics home page by clicking the **Home** icon on the left navigation pane in **Analytics**. You can either use the left navigation pane, or click **Home** on the right pane to navigate to the Analytics modules (**Searches**, **Metrics**, **Business Journeys**, **Experience Levels**, **Alert & Respond**, and **Configuration**).



Home Page Data

AppDynamics Query Language (ADQL) queries are used to generate the data for each home page widget. You cannot access or edit the ADQL queries.

When you select a time range, each query automatically includes the time filter for the widgets. These widgets refresh every two minutes.

Transaction Summary

The **Transaction Summary** panel aggregates the Analytics data from applications and business transactions. **Transaction Summary** widgets are categorized by Transaction Threshold from normal to error. The **Transaction Summary** panel contains six widgets:

- **Total Transactions** - Count of all transactions.

- **Problematic Transactions** - Count of transactions that are not within normal threshold boundaries.
- **Normal Transactions -** Count of transactions that are within the normal threshold boundaries.
- **Top 10 Applications by Transaction Volume** - Graphical view of applications.
- **Top 10 Business Transactions by Transaction Volume** - Graphical view of transactions.
- **Transaction Score Trend** - Total number of transactions for all applications.

End User Session Summary

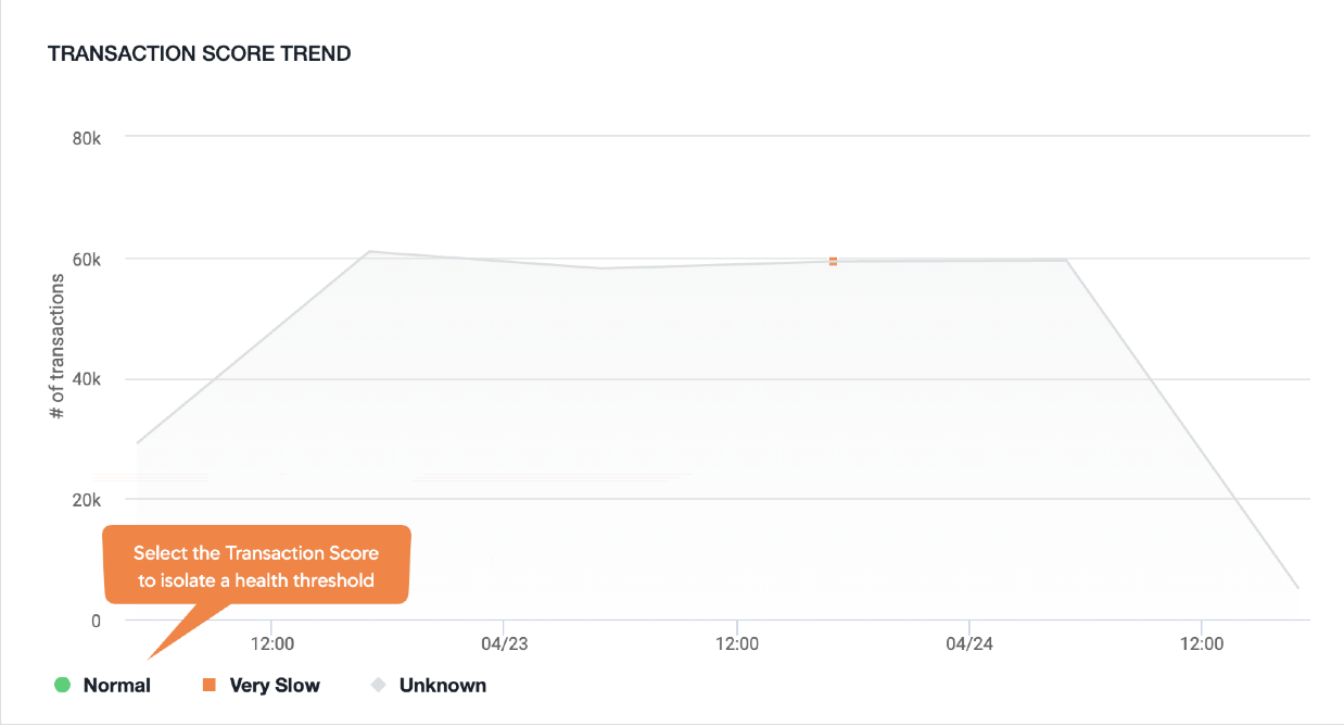
The **End User Session Summary** panel displays browser and mobile session data in widgets. The **End User Session Summary** panel contains six widgets:

- **Browser Sessions** - Count of unique browser sessions.
- **Mobile Sessions** - Count of unique mobile sessions.
- **Browser & Mobile Users** - Count of browser and mobile users.
- **Browser Session Bounce Rate** - Rate of bounces per total sessions.
  A bounce is a browser session where the page count is one. Bounces occur when a user opens a webpage and leaves the site without visiting additional pages.
- **Top Page Referrers by Session Volume** - Website visited by users before accessing your website. The referrer is an optional component of the Events Service. If you have not configured referrers, this widget does not contain data.
- **Session Trend** - Total number of sessions separated by browser and mobile sessions.

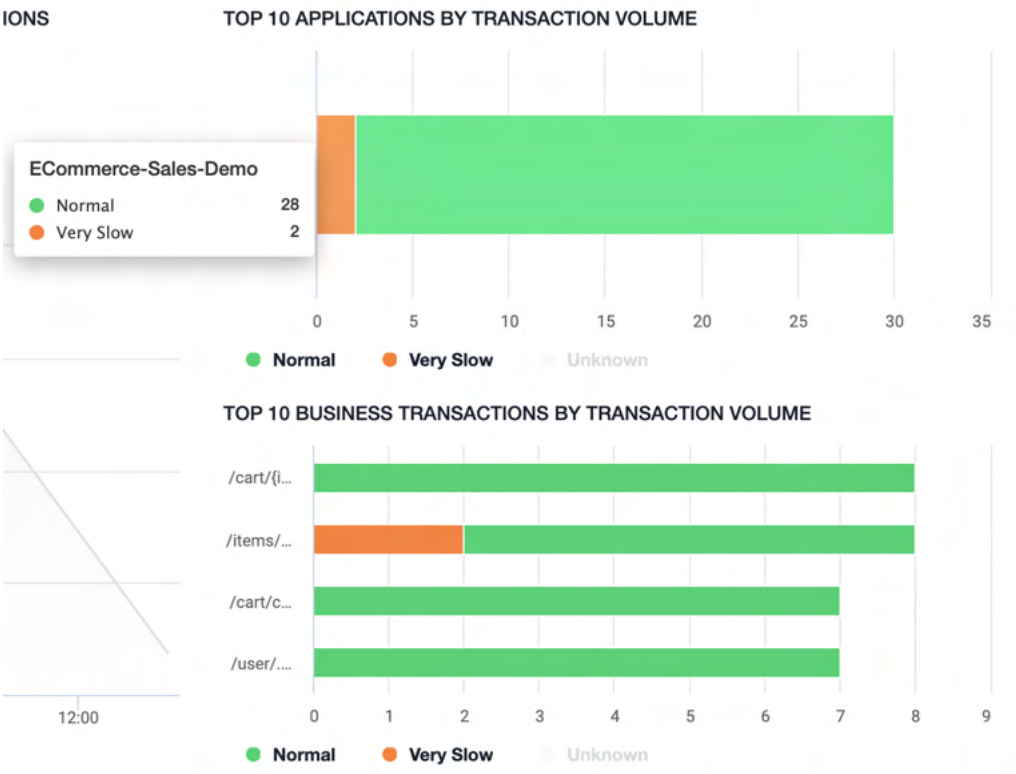
Options for Home Page Data

Transaction Score Options

You can select the transaction score in each chart to isolate metrics. For example, selecting **Normal** in **Transaction Score Trend** removes other transaction scores:

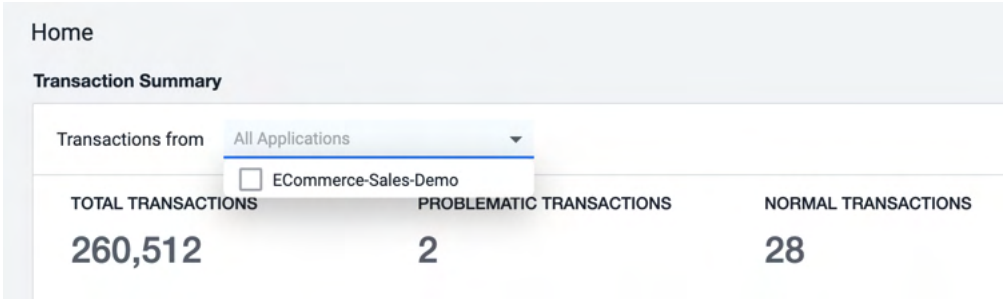


Next to the **Transaction Score Trend** are two horizontal bar graphs that display the top ten applications and business transactions by transaction volume. Hover over the graphs to see a breakdown of additional transaction information.



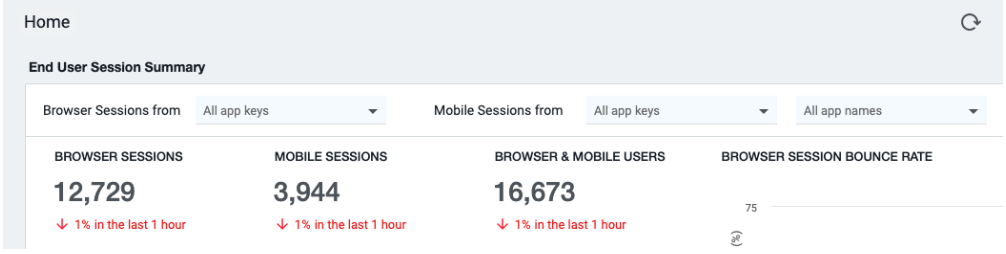
Transaction Filter Options

You can filter the view of each panel to display specific applications or application keys. Click the dropdown arrow at the top of each panel and select the desired fields.



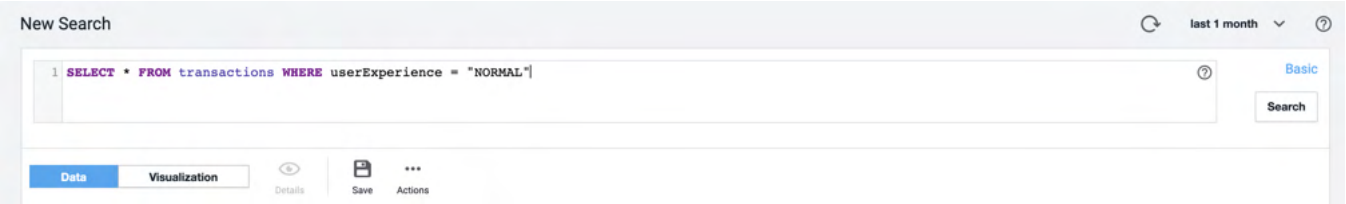
End User Monitoring Filter Options

You can filter browser sessions and mobile sessions to display application keys. For mobile sessions, selecting specific application names further filters the application keys.



Drill Down Options

You can drill down into each metric to open the ADQL search that generates the metric. For example, selecting **Normal Transactions** automatically displays the ADQL Query for normal transactions.



Restrictions and Security

If your **Analytics Home** page does not display data on widgets, there is either an error in retrieving data, or no data is available in the Events Service.

If panels or widgets are missing from your home page, confirm that you have sufficient licenses and have access to Analytics data.

Licenses

To view data on the **Transaction Summary** panel, you need:

- At least one application enabled for Analytics
- Active Transaction Analytics licenses

If your Transaction Analytics license expires, Analytics stops ingesting data for the **Analytics Home** page. The **Transaction Summary** panel still displays your existing data, but does not ingest any new data.

To view data in the **End User Session Summary** panel, you need:

- Browser Analytics and/or Mobile Analytics enabled. See Analytics Data Sources.
- Active EUM licenses to Mobile and/or Browser Real User Monitoring.

Some widgets may not be available depending on your End User Monitoring (EUM) licenses. For example, if you have a license to Mobile RUM only, your Analytics Home page will not contain browser-specific widgets (browser sessions, bounce rate, and referrers). Aggregated widgets such as Browser & Mobile Users and Session Trend only show the data to which you have an EUM license.

RBAC

Analytics enforces role-based access control (RBAC). As a result of RBAC, your **Analytics Home** page displays only the data to which you have access. See Analytics and Data Security.

In the **End User Session Summary** panel, numeric widgets and the **Session Trend** chart requires access to both Browser and Mobile Real User M these widgets, you must have access to **Browser Requests** and **Mobile Requests and Sessions** events.

ADQL Reference

The AppDynamics Query Language (ADQL) is a query language for searching available data in Analytics.

ADQL is similar to the SELECT statement in the prevalent Structure Query Language (SQL) but is designed solely for AppDynamics Analytics data. Just like the SELECT command in SQL, ADQL allows you to specify the data source (such as transaction events, EUM events, and logs), a list of fields to retrieve, and conditions for selecting events from the analytics data store.

With ADQL, you can construct queries in these environments:

- Analytics Search panel in the Controller with **Advanced Mode**.
- Analytics Query Events APIs in the body of the query request.

To simplify entering your queries in Analytics Search with **Advanced Mode**, the ADQL auto-complete feature displays keywords, a list of available fields, and functions based on the stage of your typed search. See Creating Advanced Searches for Analytics.

ADQL Typographical Conventions and Symbols

ADQL reference topics use custom typographical conventions and symbols to describe the syntax for ADQL queries.

Convention	Name	Usage
BOLD	Bold typeface	Bold typeface indicates ADQL keywords and operators, such as **SELECT**, **FROM**, **AND** and so on.
field_name and numeric_field_name	N/A	The terms field_name and numeric_field_name represent field names that appear in your analytics data. Field names depend on the event type. See ADQL Data.
`Monospace` typeface	Monospace typeface	Function names, such as count are indicated by `monospace` typeface.
event_type	N/A	The term event_type represents the available event types collected from your applications. Valid values are: • transactions • logs • browser requests • mobile requests • mobile crash reports • analytics custom events • synthetic sessions
Italic typeface	*Italics*	*Italics* represent variables or placeholders. You supply the actual value.
[ ]	Square brackets	Terms in square brackets are optional. Nested square brackets indicate that the term inside is optional and can only be included if the optional term in the outer square brackets is included.
|	Pipe	The pipe character separates alternate items to indicate one of the items may be included. You can read it as "or" in a syntax statement.
{ }	Curly braces	Curly braces are used to group items to disambiguate the definition of items.
( )	Parentheses	Parentheses are used to indicate the order of operation in an expression.
...	Ellipsis	An ellipsis indicates the preceding term may be repeated.

ADQL Queries

This page describes ADQL query syntax. ADQL uses the **SELECT** statement and filtering statements, otherwise referred to as queries, to return sets of data that you can add to **Custom Dashboards**.

ADQL search queries have a 5,000 character limit and reserve keywords in certain field names or milestones.

Reserved ADQL Keywords
SELECT
FROM
WHERE
ORDERBY
AND
OR
EXISTS
NOT
LIKE
REGEX
COMPARE
LIST
IN
BETWEEN
COUNT
DISTINCT
MIN
MAX
STATS
SUM
AVG
STDDEV
FILTER
PERCENTILE
RANGE
SERIES
SUBSTRING
INDEXOF
LENGTH
TRIM
CONCAT
NOW

The query syntax is:

```
SELECT * | {[DISTINCT] expression [AS alias] [, expression [AS alias]]...}
FROM event_type
[WHERE condition_expression]
[SINCE timevalue [UNTIL timevalue]]
[HAVING condition_expression]
[ORDER BY {field_name | alias} [ASC | DESC] [, {field_name | alias} [ASC | DESC]]...]
[LIMIT integer [, integer]...]
```

While the **SELECT** and **FROM** clauses are required, all other clauses are optional. Enter spaces around each keyword.

For **GROUP BY** functionality, see GROUP BY.

SELECT Clause

The ADQL event query begins with a **SELECT** clause, which can take one or more arguments.

SELECT * | {[**DISTINCT**] field_expression [**AS** alias] [, field_expression [**AS** alias]]...}

- A single asterisk * in the **SELECT** clause returns the list of fields for each event.
- To return specific fields for each event, specify a comma-separated list of fields. Optionally, each field_expression can be aliased to a label using the **AS** construct.
- Use the **DISTINCT** qualifier to return unique combinations of the specified field values. If no limit specified, the top ten results by count are returned. See LIMIT Clause.
  DISTINCT can not be applied to a wild card **SELECT** query, such as

  ```
  SELECT DISTINCT *
  ```

- String values must be surrounded by either single quotes or double quotes, such as 'hello' and "hello".

The field_expression can take several forms. See ADQL Expressions.

Query Examples with SELECT Clause

Query	Result
SELECT `count`(transactionName) **FROM** transactions **WHERE** application='*yourAppName*'	Returns a count of business transactions for the specified application.
SELECT * **FROM** logs **WHERE** sourceType='*yourLogFile*' **AND** message **LIKE** '*GET*'	Returns log events containing a specified keyword.
SELECT * **FROM** transactions **WHERE** application='*yourAppName*' **AND** transactionName='*yourBTName*'	Returns all fields for business transactions in the specified application matching the specified transaction name.
SELECT DISTINCT transactionName **FROM** transactions **WHERE** application='*yourAppName*'	Returns a list of unique transaction names from the specified application.
SELECT *customerName* **AS** "First And Last Name", *age* **AS** "Years Old", ...	Returns the specified fields relabeled as specified in the query statement. In this query, *customerName* and *age* are user-defined fields.

AS Clause

Use the **AS** clause to rename a field to a label of your choice. The label is also referred to as an alias.

field_expression **AS** alias

Returns the field with the specified alias. The alias may be any valid identifier (a letter followed by any number of letter or digit characters) or a value in quotes. If the value of the alias contains spaces or special characters, it must be in quotes. See ADQL Expressions.

AS Clause Example

SELECT eventTimestamp **AS** 'Time Stamp' **FROM** transactions **WHERE** application='*yourAppName*'

FROM Clause

Use the **FROM** clause to specify the event type. For example:

FROM event_type

Event Types

Event types describe the source of the analytics data, such as business transactions (transactions) or browser requests. Each event type has a UI field name and an Events Service internal name. The Events Service internal name is used in ADQL queries.

This table lists the event types with their UI names and Events Service internal names.

Event Type UI Label	Events Service Internal Name
Transactions	transactions
Logs	logs
Browser Requests	browser_records
Browser Sessions	session_records
Mobile Requests	mobile_snapshots
Mobile Sessions	mobile_session_records
Mobile Crash Reports	mobile_crash_reports
Synthetic Sessions	synth_session_records

FROM Clause Examples

For this result	Query
Return all fields for browser requests	**SELECT** * **FROM** browser_records **WHERE** appkey='E2E-AAB-AUM'
Return all fields for the business transactions in your application	**SELECT** * **FROM** transactions **WHERE** application='*yourAppName'*
Return all fields for the logs specified by "*yourLogFile*"	**SELECT** * **FROM** logs **WHERE** sourceType='*yourLogFile*'

WHERE Clause

Overview

Use the **WHERE** clause to specify one or more condition expressions separated by logical operators such as **AND**, **OR.**

The **WHERE** clause uses the following syntax:

```
[WHERE condition_expression]
```

See ADQL Expressions for a description of the condition expression syntax. Condition expressions use Comparison Operators.

> AppDynamics recommends that you do not use periods (.) in the field name, otherwise, the syntax will break.

Examples

To filter logs based on error or warning log level, use a query similar to the following:

```
SELECT * FROM logs WHERE sourceType='yourLogFile' AND (logLevel='ERROR' OR logLevel='WARN')
```

GROUP BY

ADQL does not have an explicit **GROUP BY** clause. However, queries containing field names in the **SELECT** clause behave as **GROUP BY** statements if the query contains metric functions or bucketing functions.

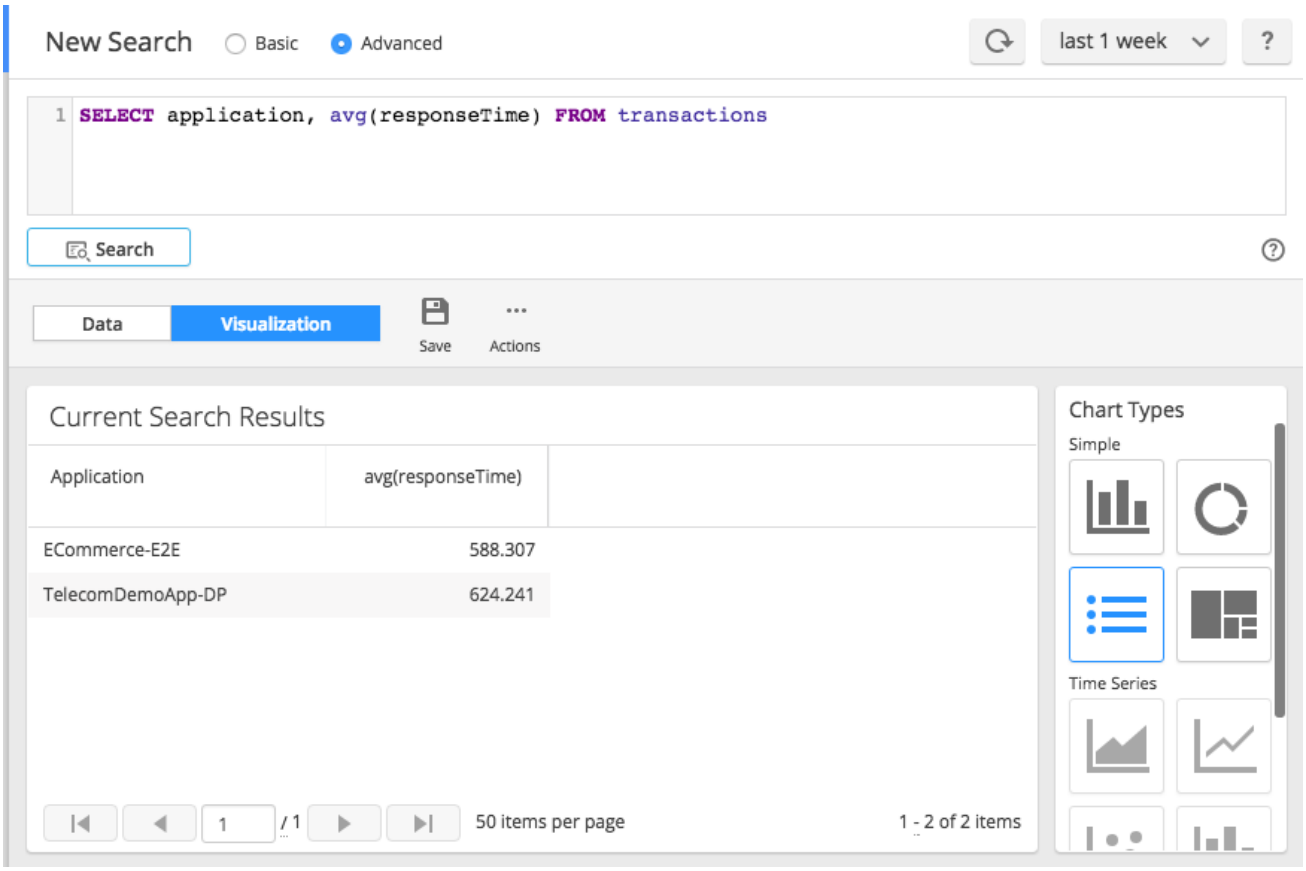
Group by queries are limited to containing up to five terms. Terms can be either fields (which use an implicit **GROUP BY**) or bucketing functions, such as `series`.

Aggregation Examples

In this example, the query groups the `avg(responseTime)` aggregation based on the non-aggregation field, application. So the result contains the average response time calculated for each application.

SELECT application, `avg(responseTime)` **FROM** transactions

Sample results:

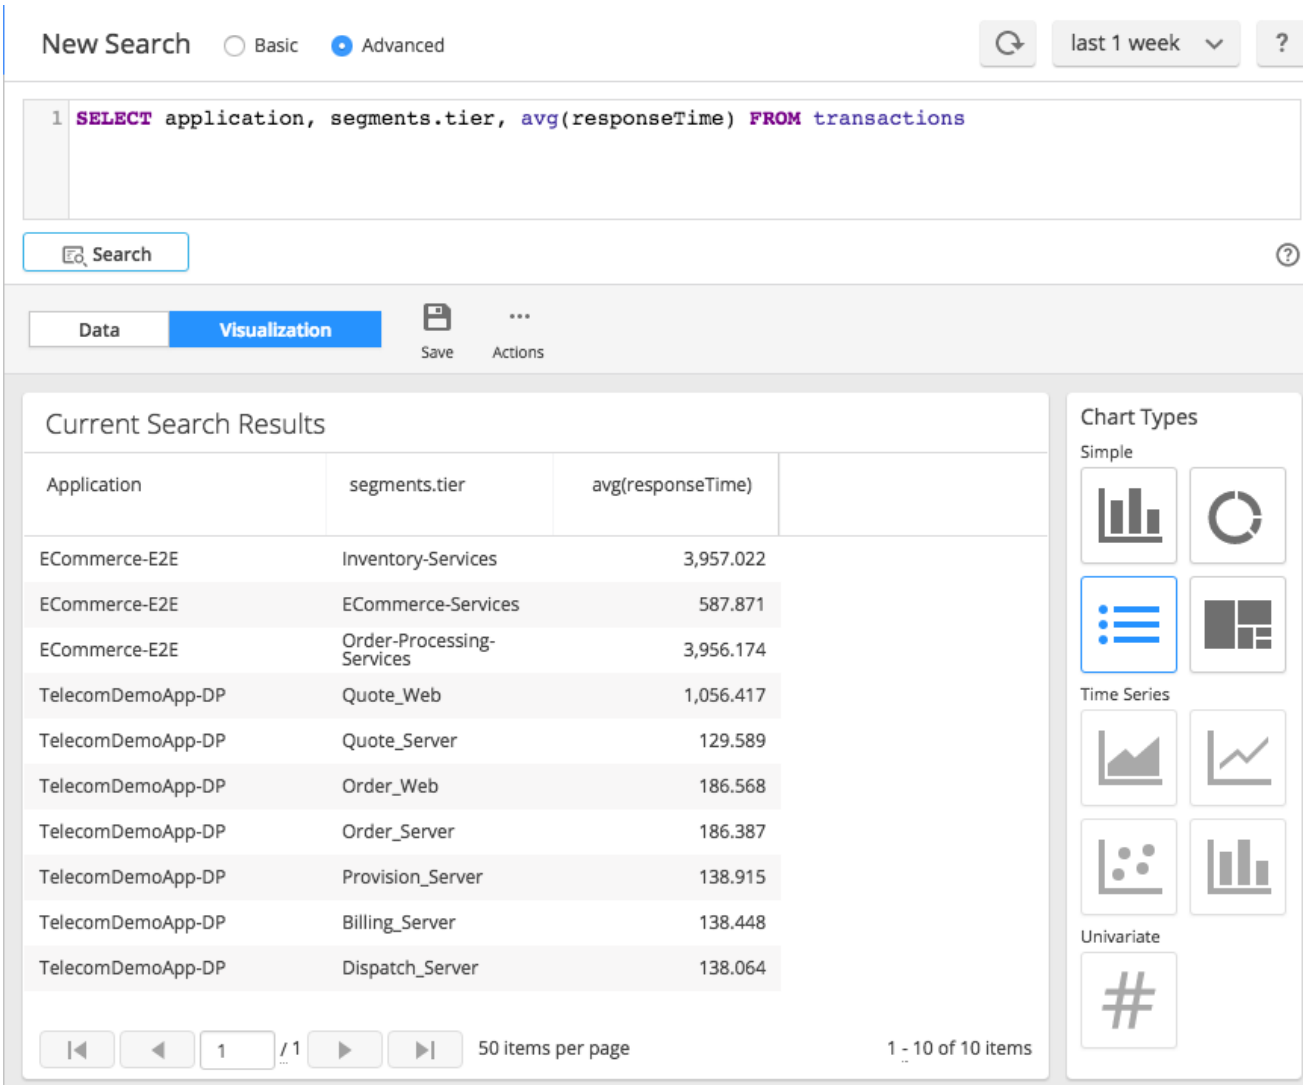


The implicit grouping can be extended by using multiple non-aggregation fields preceding an aggregation field. For example:

SELECT application, segments.tier, `avg(responseTime)` **FROM** transactions

By adding tier as a second non-aggregation field, the query groups the `avg(responseTime)` aggregation based on the non-aggregation fields, application, and tierName. Because there are multiple grouping fields, the second non-aggregation field, tier name, is sub-grouped under the application grouping. So each combination of application and tier name together forms a group over which the average response time is calculated.

Sample results:



For SQL users, these two statements produce similar results in their respective environments:

- ADQL query: **SELECT** application, segments.tier, `avg`(responseTime) **FROM** transactions
- SQL query: **SELECT** application, segments.tier, `avg`(responseTime) **FROM** transactions GROUP BY applicationName, segments.tier

Bucketing Function Example

Bucketing functions such as `series` and `range` define groups over which other aggregations can be calculated. The buckets are specified by the parameters of the respective functions and form groups over which subsequent aggregations are calculated.

For example, the following query calculates the average response time over two-minute intervals (or buckets):

SELECT `series`(eventTimestamp, '2m'), `avg`(responseTime)

Sample results:

```
1 SELECT series(eventTimestamp,'2m'), avg(responseTime) FROM transactions WHERE application = 'ECommerce-E2E'
```

Search

Data | Visualization | Save | Actions

series(eventTimest...	avg(responseTime)
08/22/16 3:40:00 PM	46.172
08/22/16 3:42:00 PM	56.328
08/22/16 3:44:00 PM	44.537
08/22/16 3:46:00 PM	50.068
08/22/16 3:48:00 PM	50.157
08/22/16 3:50:00 PM	43.767
08/22/16 3:52:00 PM	51.759
08/22/16 3:54:00 PM	37.514

You can also combine an aggregation with a bucketing function and implicit **GROUP BY**. The following query returns the average response time grouped by tier over the series of six-hour intervals.

SELECT `series`(eventTimestamp, '6h'), segments.tier, `avg`(responseTime) **FROM** transactions

Sample Results:

```
1 SELECT series(eventTimestamp, '6h'), segments.tier, avg(responseTime) FROM transactions
```

08/23/16 11:00:00 AM	ECommerce-Services	10.580

ORDER BY Clause

The **ORDER BY** clause enables you to sort the query results by one or more fields. The syntax is:

[**ORDER BY** {field_name | alias} [**ASC** | **DESC**] [, {field_name | `alias`} [**ASC** | **DESC**]]...]

Rules governing ordering include:

- Sort order, ascending (**ASC**) or descending (**DESC**) is applied per field. If not specified, the ascending (**ASC**) order is the default.
- **ORDER BY** is supported on fields or aliases specified in the **SELECT** clause.
- Aliases used in the **ORDER BY** clause should be surrounded with back quotes if they contain spaces or other special characters.
- **ORDER BY** works on single-value metric functions and single-value math expressions. **ORDER BY** can not be used with percentile or stats.
- **ORDER BY** on nested fields or metric aggregations that operate on nested fields is not supported. A nested field is any field that has a "." in the name, such as `segments.errorList.errorType` or `btdata.estimatedtime.`

Ordering functionality for metric and bucketing functions includes:

- **ORDER BY** can be used to order the buckets on a bucketed field in a bucketing function. For example, see the "Series aggregations - Ordering based on the keys of the series buckets." in the table below.
- **ORDER BY** can be used on metric functions that follow bucketing functions, including filtered metric functions. Ordering by the metric value orders the resulting buckets. The metric function must be aliased and referenced by its alias such as:

```
SELECT transactionName, avg(responseTime) AS averageResponseTime FROM transactions ORDER BY
averageResponseTime
```

- Compound orderings can be specified for functions that provide implicit **GROUP BY** functionality.
- A single ordering can be defined for the series function, no ordering is allowed for the range function.
- **ORDER BY** can accept math expressions on fields, but not math expressions on metric functions. If the value of a math expression is null it is ordered at the end of the results in ascending order. The following is an invalid query:
SELECT transactionName, `max`(discountValue) / `max`(cartTotal) **AS** ratio **FROM** transactions **ORDER BY** ratio

ORDER BY Clause Examples

For This Result	Query
An ordering of queries with no aggregations	**SELECT** field_name **FROM** event_type **ORDER BY** field_name **ASC**
Group By - Ordering by the lexicographic ordering of the terms. The fields included in the **ORDER BY** clause must be in the same order as in the query itself.	**SELECT** field_name, `count`(*) **FROM** event_type **ORDER BY** field_name **DESC**
Returns a sorted set of timestamp ranges	**SELECT** `series`(eventTimestamp, 10m), `count`(*) **FROM** transactions **ORDER BY** eventTimestamp **DESC**
Series aggregations - Ordering based on the keys of the series buckets.	**SELECT** `series`(salary, 20000), `count`(salary) **FROM** event_type **ORDER BY** salary **DESC**
Date series aggregations - Ordering based on the date value of the keys of the series buckets	**SELECT** `series`(eventTimestamp, '1h'), `count`(eventTimestamp) **FROM** transactions **ORDER BY** eventTimestamp
Order by an alias.	**SELECT** responseTime **AS** RT **FROM** transactions **ORDER BY** RT
Order by an aliased math expression.	**SELECT** discountValue / cartTotal **AS** ratio **FROM** transactions **ORDER BY** ratio

HAVING Clause

Use the **HAVING** clause on the output produced by another aggregation. The **HAVING** clause operates on an expression to determine the intervals to be shown in the response. The metric specified in the expression must be numeric and the expression must return a boolean value for the **HAVING** clause to work.

Additionally, the **HAVING** clause must be referenced by an alias in the query as follows:

```
SELECT customerName, count(*) as Requests, avg(responseTime) as ResponseTime FROM transactions HAVING Requests
> 10000
```

where `Requests` is the alias referenced in the query.

Syntax

```
SELECT selectItems
   FROM relation
   WHERE where=booleanExpression
   SINCE statement
   HAVING havingClause
   ORDER BY sortItems
   LIMIT limits
  ;
```

where `havingClause` is a boolean expression. The **WHERE**, **ORDER BY**, and **LIMIT** clauses and SINCE `statement` are optional.

HAVING Clause Examples

HAVING clause examples with different filters:

Simple Comparison Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type HAVING AVRT > 0
```

Simple Range Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type HAVING AVRT BETWEEN [10, 90)
```

Simple List Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type HAVING AVRT IN (20, 30, 40, 60)
```

Compound Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type HAVING AVRT > 20 AND AVRT < 90
SELECT transactionName, avg(responseTime) as AVRT FROM type HAVING AVRT < 20 OR AVRT > 90
SELECT transactionName, avg(responseTime) as AVRT FROM type HAVING AVRT > 20 AND AVRT < 90 AND AVRT IN (70, 80)
```

Not Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type HAVING NOT AVRT > 50
```

Not Compound Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type HAVING NOT (AVRT > 20 AND AVRT < 90)
```

Multi-Metric Filter

```
SELECT transactionName, avg(responseTime) as AVRT, max(responseTime) as MAXRT FROM type HAVING NOT (AVRT > 20
AND AVRT < 90) AND MAXRT > 130
```

Limitations

The **HAVING** clause is not supported for:

- Nested fields in Elasticsearch
- Multi-metric functions, such as `percentiles` and `stdev`
- Filtered metric functions (filter function)
- Invalid queries:

Unsuppported Conditions/Filters	Queries
Like	**SELECT** transactionName, avg(responseTime) as AVRT **FROM** transactions **HAVING** AVRT LIKE '10'
Exists	**SELECT** transactionName, avg(responseTime) as AVRT **FROM** transactions **HAVING** AVRT IS NOT NULL
Not Aliased	**SELECT** avg(responseTime) as avtr **FROM** type **HAVING** avg(responseTime) > 10 **SELECT** txName, count(*), node, count(*) **FROM** transactions **HAVING** count(*) > 10
Nested	**SELECT** transactionId, AVG(segments.numCalls) as av_numCalls, MIN(segments.numCalls), MAX(segments.numCalls), SUM(segments.numCalls) **FROM** transactions **HAVING** av_numCalls > 2
Filter Function	**SELECT** appraisalrating, filter(min(salary), where salary > 60000) as val **FROM** transactions **HAVING** val > 60000
Multi-Valued Metric Functions	Percentile: **SELECT** appraisalrating, percentile(salary, 94) as per_sal **FROM** transactions **HAVING** per_sal > 2 ORDER By appraisalrating Standard Deviation: **SELECT** appraisalrating, stdev(salary) as stdev_sal **FROM** transactions **HAVING** stdev_sal > 2 ORDER By appraisalrating
Missing Parent Aggregation	**SELECT** avg(responseTime) as AVRT **FROM** transactions HAVING AVRT > 2

SINCE...UNTIL Clause

Use the **SINCE**... **UNTIL** clause on a time range in a query. If the **UNTIL** portion is omitted, the query matches all the events that occurred after the time specified in the **SINCE** portion. A query can contain both a **SINCE**... **UNTIL** clause and a **WHERE** clause. In such cases, **WHERE** argument comes before **SINCE... UNTIL** and is applied in that order. The time range specified in the clause overrides any other time limits applied to the query, including the time range selection in the UI.

Syntax

```
SINCE timevalue [UNTIL timevalue]
```

where `timevalue` is a combination of an integer and (optionally) a time unit. If `timevalue` is omitted the value is interpreted as a Unix epoch timestamp in milliseconds.

Unit Symbols	Description
[m | minute | minutes]	minute
[h | hour | hours]	hour
[d | day | days]	day
[w | week | weeks]	week (7 days)

Examples

Query	Result
SELECT * FROM transactions SINCE 1 h UNTIL 15 m	All transactions that occurred between 1 hour and 15 minutes ago
SELECT * FROM transactions SINCE 1 h	All transactions that occurred after one hour ago
SELECT * FROM transactions SINCE 1502147143000 UNTIL 1502148043000	All transactions that occurred between the Unix timestamps 1502147143000 and 1502148043000

LIMIT Clause

The **LIMIT** clause enforces a limit on the returned search results. **LIMIT** works differently for non-aggregation and aggregation queries.

The syntax is:

[**LIMIT** integer [, integer]...]

An integer is a sequence of digits. If **ORDER BY** is not specified in the query, the results sort in descending timestamp order. The Analytics Search UI caps the number of search results at 10000 records.

Non-Aggregation Queries

Specify **LIMIT** *N* for non-aggregation queries to return the first N documents.

SELECT * **FROM** transactions **LIMIT** 10

For non-aggregation queries, using the Analytics Query API, can return a maximum of 10,000 results. If a limit value higher than 10,000 is specified, the value is overridden with the maximum value.

Aggregation Queries

For aggregation queries a list of values is allowed in the **LIMIT** clause. Each value applies to one "group by" term or bucketing function in the query. A "group by" term is a field name in an aggregation query. In the following example, *field1* and *field3* are group by terms, and `series`(*field2*, '1m') is a bucketing function:

SELECT *field1*, `series`(*field2*, '1m'), *field3*, `count`(*) ...

Bucketing functions consume a value from the **LIMIT** clause list of values, but that value is ignored because it doesn't apply to such functions. Because the default limit is 10, if there are more bucketing functions than user-specified limits, the **LIMIT** clause will use 10 buckets. For example, if there two limit values specified, but three functions or terms that could consume the limit values, the last one defaults to a limit of 10.

The maximum number of buckets is 1000 for the first group by term or bucketing function. Subsequent terms are limited to 100 buckets. A larger value is overridden and replaced with the maximums. Aggregation queries can return a maximum of 10000 results.

REST API usage for limits is slightly different. See Analytics Events API.

Aggregation Examples

Query	Result
SELECT transactionName, `avg`(responseTime) **FROM** transactions	No limit specified, shows a maximum of top 10 results by count.
SELECT DISTINCT requestGUID **FROM** transactions	No limit specified, shows the top 10 results by count.
SELECT transactionName, `avg`(responseTime) **FROM** transactions **LIMIT** 50	Returns the top 50 results by count.
SELECT application, transactionName, `avg`(responseTime) **FROM** transactions **LIMIT** 500, 50	Returns the top 500 applications by count. Within each of those buckets, the top 50 transactionNames by count.
SELECT application, transactionName, `avg`(responseTime) **FROM** transactions **LIMIT** 2000, 500	Because of the enforced limits, this query returns the top 1000 applications by count. Within each of those buckets, the top 100 transactionNames by count.
SELECT application, transactionName, `avg`(responseTime) **FROM** transactions **LIMIT** 20	Returns the top 20 applications by count. within each of those buckets the top 10 (using the default) transactionNames by count.
SELECT application, `series`(eventTimestamp, '1m'), transactionName, `avg`(responseTime) **FROM** transactions **LIMIT** 20, 25, 30	Returns the top 20 applications by count. Within those a date-time series with all the data. Within each date-time series bucket, shows the top 30 transactionNames by count. The value 25 is applied to the series function, but because series is a bucketing function, it does not actually use the limit.

SELECT application, `series`(eventTimestamp, '1m'), transactionName, `avg`(responseTime) **FROM** transactions **LIMIT** 20, 25	Returns the top 20 applications by count. Within those, shows a date-time series with all the data. Within each date-time series bucket the top 10 (using the default) transactionNames by count. The value 25 is applied to the series function, but because series is a bucketing function, it does not actually use the limit.
SELECT `series`(eventTimestamp, '1m'), `avg`(responseTime) **FROM** transactions **LIMIT** 20	**LIMIT** doesn't apply to the functions, only to the group by terms, therefore in this query, the limit value has no effect and the query returns all the data in the series function.

ADQL Expressions

ADQL uses two primary categories of expressions in ADQL queries:

- Field expressions used in the **SELECT** clause
- Condition expressions used in the **WHERE** clause

To build an expression, use field names, functions, numbers, and operators indicated in the described syntax.

Syntax of field_expression (SELECT clause)

- {field_name | function | numeric_literal}
- (expression): surround the expression with parentheses to denote the order of operation in the query
- Math expressions such as:
  - unary_operator expression
  - expression binary_operator expression
- A condition_expression such as [**NOT**] expression **COMPARISON_OPERATOR** value can also be an alias used in a field_expression in the **SELECT** clause.
  For example:

```
SELECT field_name AS myField... WHERE myField > 2
```

Syntax of condition_expression (WHERE clause)

- [**NOT**] expression **COMPARISON_OPERATOR** value
- (condition_expression)
- condition_expression **LOGICAL_OPERATOR** condition_expression

The field expression syntax in the **SELECT** clause can also contain functions. The syntax of a function_expression is: `function`(field_name, arguments, ...)

Syntax Element	Description
field_name or numeric_field_name	The name of a field in the specified event type. Field names require back quotes when the name contains spaces or special characters. For example, the field name, `full name`, is surrounded by back quotes because it contains a space. See Special Characters for the full list. Use the Events Service internal names in your ADQL queries. The list of default fields and their internal names are described under ADQL Data.
function	See Analytics Functions.
numeric_literal	A sequence of digits, optionally including a decimal point ". " or sign {+ | -}. Example: 2, -4, 3.14
unary_operator	The - **unary** operator negates the value of the operand.
binary_operator	Arithmetic operators: {*, /, %, +, -}. See Math Expressions.
COMPARISON_OPERATOR	A set of operators that compare values. See Comparison Operators for the full list.
LOGICAL_OPERATOR	See Logical Operators.
value	The syntax for a value = {numeric_literal | string | boolean}. Values are text, numbers, dates or boolean values used to compare with the value in the specified field_name. The data type of the value must match the type of the specified field. Text strings require quotes. Numbers, dates, boolean values (true or false) and null do not need quotes. Quotes can be either single or double quotes.

Instead of specifying that the expression applies to a particular array element, the expression can apply to any array element.

Fields with Spaces or Special Characters

If the Events Service internal name contains a special character, then the name must be surrounded by back quotes when it is used in a field expression in the **WHERE** clause. For a field name such as `segments.httpData.headers.User-Agent`, the ADQL query must use `segments.httpData.headers.`User-Agent``.

For example:

```
SELECT segments.httpData.headers.`User-Agent`, count(segments.httpData.headers.`User-Agent`) FROM transactions
WHERE segments.httpData.url = 'http://localhost:29990/packages'
```

The most likely situation in which spaces and other special characters may be used in naming are when field names are added with data collectors.

Special Characters

Special characters in ADQL are:

- equals : '='
- not equals : '<>' or '!='
- less than : '<'
- less than or equals : '<='
- greater than : '>'
- greater than or equals : '>='
- plus: '+'
- minus: '-'
- asterisk: '*'
- slash: '/'
- percent: '%'
- concatenation: '||'
- question mark: '?'
- open parens: '('
- open square bracket/brace: '['
- close parens: ')'
- close square bracket/brace: ']'

Analytics Functions

Functions serve as arguments in the **SELECT** clause. Function types in ADQL include:

- Metric functions
- Bucketing functions
- String functions
- Funnel functions
- Data type conversion functions
- Functions that modify other functions

For many functions, only numeric fields are valid. "All" data types means *integer, floating point, datetime,* and *string.*

Functions ignore null values, such as those resulting from integer division by zero or empty data fields.

To add a **WHERE** clause to a query, use the query box in the data tab of the Controller Analytics search UI. When you perform the search, the visualization tab under the table widget shows the results of any metric functions.

Each section below describes one type of function.

Metric Functions

Metric functions:

- Perform a calculation on a set of values for a field.
- Return a result such as a count or sum, or a set of results such as percentile.
- Can only be in the **SELECT** clause.
- Should always follow a field name if one exists—otherwise, not all visualizations may work.

The distinctcount() function is accurate for up to 3000 unique return values. For over 3000 unique return values, distinctcount() is approximate due to performance optimizations.

Function	Returns	Valid Field Type (s)	ADQL Query Examples
`avg(numeric_field_name)`	Average value for a numeric field.	*integer, floating point, datetime*	**SELECT** `avg`(btdata.estimatedtime) **FROM** browser_records **WHERE** appkey = '*your_appkey*'
`count (field_name)`	A count of events.	*all* The form count(*) is also valid.	**SELECT** `count`(orderID) **AS** '*Sales*' **FROM** logs **WHERE** method='*GET*' The following query returns the top 10 IP addresses sending HTTP requests to an application. **SELECT** ip, `count`(*) **FROM** web_session_records **WHERE** appkey = "*yourApp*" LIMIT 10
`distinctcount (field_name)`	A count of the number of unique values recorded for a field.	*all*	**SELECT** `distinctcount`(field_name) **FROM** logs
`max(numeric_field_name)`	The maximum recorded value of a numeric field.	*integer, floating point, datetime* Specify one field only.	**SELECT** `max`(numeric_field_name) **FROM** transactions **SELECT** nodeName, `max`(eventtimestamp) **FROM** logs
`min(numeric_field_name)`	The minimum recorded value of a numeric field.	*integer, floating point, datetime* Specify one field only.	**SELECT** `min`(numeric_field_name) **FROM** transactions
`stdev(numeric_field_name)`	The population standard deviation of a numeric field.	i*nteger, floating point*	**SELECT** `stdev`(numeric_field_name)**FROM** transactions

`sum(numeric_field_name)`	The sum of the values of a numeric field.	*integer, floating point, datetime* Specify one field only.	**SELECT** `sum`(numeric_field_name) **FROM** transactions
`percentile(numeric_field_name, percent)`	The specified percentile values between 0 and 100.	*integer, floating point, datetime* Specify one or more percentiles.	**SELECT** `percentile`(responseTime, 50, 75, 90, 95) **FROM** transactions
`stats(numeric_field_name)`	Statistics for a field: `count`, `min`, `max`, `average`, and `sum`.	*integer, floating point, datetime*	**SELECT** `stats`(numeric_fieldName) **FROM** transactions **WHERE** application='*yourApp*'
`totalResultCount()`	The total count of events.	Does not accept a field.	This query first selects all error transactions for the "ECommerce" application. It then calculates, for each unique transaction name, the ratio of instances of that transaction name to the total number of error transactions. (The assumption is that any given transaction name can appear in multiple error transactions.) **SELECT** `transactionName`, `count ( * ) / totalResultCount()` **FROM** transactions **WHERE** application = 'ECommerce' **AND** userExperience = 'ERROR'

Bucketing Functions

Bucketing functions operate on a field, and group data into buckets. Often, the data in the buckets are further aggregated by another function. For example, this query creates buckets that group an app's transactions by the hour, and then count how many transactions are in each bucket (hour):

SELECT `series`(eventTimestamp, '1h'), `count`(*) **FROM** transactions **WHERE** application='*yourAppName*'

To include a larger data set in your results, use the time range selector in the upper right corner of the Controller Analytics search UI.

Dates are different from datetime values. Units from weeks down to milliseconds are supported:

- `'1w'` for one week
- `'10d'` for ten days
- `'2h'` for two hours
- `'5m'` for five minutes
- `'36s'` for thirty-six seconds
- `'800ms'` for eight hundred milliseconds

When you use dates to define buckets, think about how many buckets your definition produces. The number of buckets for series() cannot exceed 2000, and much smaller numbers of buckets are the norm.

Function	Returns	Valid Field Type(s)	ADQL Query Examples
`range(field_name, n|(n1, n2), n3|(n4, n5), ...)`	One or more buckets.	*integer, floating point, dates* Use a single value `x` or pairs of values `(x,y)`. See below for explanation of how to define buckets.	This range query: **SELECT** `range`(segments.transactionTime, 0, 10, 20) **FROM** transactions Results in the following buckets: [-Inf, 0], [0, 10], [10, 20], [20, +Inf]

`series(field_name, interval_size)`
 	
`series(field_name, interval_size, lower_extended_bound, upper_extended_bound, [offset],[rangeStyleBucketKeys], [strictEndpoints])`
 	
If you specify bounds, then all buckets are returned, empty or not.
 	
If you do not specify bounds, then:
• If you are using the UI, the UI inserts default bounds.
• If you are using the API, then only non-empty buckets are returned.
	A series of buckets based on the provided interval.	*integer, floating point, dates*
		
		For numeric fields, specify the interval as an integer.
		
		See below for explanation of optional keyword arguments `offset`, `rangeStyleBucketKeys`, and `strictEndpoints`.
			SELECT `series`(metrics.`Application Server Time (ms)`,10), `count`(*) **FROM** browser_records **WHERE** appkey='*yourApp Key*'
			
			SELECT `series`(eventTimestamp, '1h'), `count`(*) **FROM** transactions **WHERE** application='*yourAppName*'

Defining Buckets for range()

Every bucket is defined as bounded by two single values, where the bucket includes the first value and excludes the second.

Pairs of values `(x, y)` define an explicit bucket from `x`, inclusive, to `y`, exclusive.

A single value `x` implicitly defines a bucket according to rules that depend on where the value is placed among the arguments to `range()`.

- Rules for using a single value to define a bucket:
    a. Immediately after the field (that is, as the second argument): The bucket starts at negative infinity.
    b. After another single value: The bucket starts at the previous argument, inclusive, and extends to `x`, exclusive.
    c. After a pair of values, and before another single value: The bucket starts at `x`, inclusive, and extends to the following argument, exclusive.
    d. At the end of the parameter list: The bucket ends at positive infinity. This is the one exception to the assumption that `x` is the second of two values.
    e. Between two pairs of values: No bucket can be defined, and the value is ignored.

Range Query Example

Here is a range query that exercises most of the rules above:

SELECT `range`(segments.transactionTime, 0, (10, 20), 30, (40, 50), 60, 70) **FROM** transactions

The query produces the following buckets:

- [-Inf, 0] because rule *a* applies to 0
- [10, 20] because (10, 20) defines that bucket explicitly
- no bucket for 30 because rule *e* applies so 30 is ignored
- [40, 50] because (40, 50) defines that bucket explicitly
- [60, 70] because rule *c* applies to 60
- [70, +Inf] because rule *d* applies to 70

Optional keyword arguments for `series()`: `offset`, `rangeStyleBucketKeys`, and `strictEndpoints`

Series supports the following optional keyword arguments.

`offset`

Changes the start value of each series from 0 by the specified positive (+) or negative offset (-) duration, such as 1h for an hour, or 1d for a day. The values `alignStart` and `alignEnd` align buckets to the start and end of the extended bounds arguments respectively. The function must have extended bounds specified to use these special values. Defaults to 0. Accepts both integer and string values.

Examples:

SELECT `series`(responseTime, 1, 1, 10, `offset`="*alignStart*"), `count`(*) **FROM** transactions

SELECT `series`(responseTime, 100, 1, 1000, offset=1), `count`(*) **FROM** transactions

`rangeStyleBucketKeys`

Converts the start and end values in a numeric series to "bucketStart - bucketEnd" format as a string type. For example, "0-10", "10-20", and so on. This output this argument returns is similar to what returned by the range function. The series function must be acting on a numeric type to use this keyword argument. Defaults to false. Accepts a boolean only.

Example:

SELECT `series`(responseTime, 100, 1, 1000, `rangeStyleBucketKeys`=*true*), `count`(*) **FROM** transactions

`strictEndpoints`

Adds a filter on the query starting at the minimum extended bound and extending to the maximum extended bound. This ensures that no buckets outside of the extended bounds are present in the results. Defaults to false. Accepts a boolean only. Extended bound forces the histogram aggregation to start building intervals on a specific minimum value and expands the interval up to a given maximum value.

Example:

SELECT `series`(responseTime, 2, 1, 5, strictEndpoints=true, rangeStyleBucketKeys=true), `count`(*) **FROM** transactions

Selecting the Top *n* Results for Time Series Queries

Deployment Support

Top *n* results is available for SaaS deployments only.
SELECT `series`(eventTimestamp, '1m'), transactionName, `count`(*) **FROM** transaction **LIMIT** 1, 12The series function can compute the global top *n* over an entire period. To set a top *n* limit, add a **LIMIT** clause to the end of your query:

This example limits the query to the top 12 results of transactionName. The value 1 is applied to the `series` function, but because series is a bucketing function, it does not actually use the limit. You must include a value for the `series` function.

The global top *n* limit does not apply when queries:

- Contain a selection before the series function
  SELECT application, `series`(eventTimestamp, '1m'), transactionName, `...`
- Have additional bucketing functions
  SELECT `series`(eventTimestamp, '1m'), `range`(responseTime, 0, 60, 120), transactionName, `...`
- Include a **HAVING** clause
  SELECT `series`(eventTimestamp, '1m'), transactionName, `avg`(responseTime), ... **HAVING** a >15

String Functions

ADQL string manipulation functions:

- Resemble their SQL counterparts.
- Are case-sensitive.
- Return null if any argument is null.
- Use 1-based, not 0-based, indexing.
  - For example, the `indexOf()` function gives the index of the first character of a string as 1, not 0.
  - As a result, 0 is not a valid value for any integer argument

String functions can transform any event data that resides in the Analytics Events Service. One important use case is doing ad hoc data transformation when the structure, serialization, or format in which data has been collected needs to be changed.

For AppDynamics < 4.5.2, fixing incorrectly-collected data requires adjusting collection settings.

You can use string functions to:

- Hone in on a `substring()` by working with string `length()` and/or the `indexOf()` characters in a string
  - For example, you can extract the domain name from a URL
- Combine multiple strings using the `concat()` operator
  - For example, you can combine values from multiple fields into a single value

- `trim()` whitespace from the beginnings and ends of fields
- Pair the output of the `substring()` function, item by item, with the output of another function

  - This implicit aggregation is the ADQL equivalent of GROUP BY in SQL
  - See the Implicit Aggregation Example:

Function	Returns	Valid Field Type(s)	ADQL Query Examples

`concat(inputString1, string inputString2, ... inputStringN)`	A single string which combines the input strings.	*string*
		
		Specify two or more strings.
			Function:
			`concat('foo', 'bar')`
			Result:
			`'foobar'`

`indexOf(inputString, substring, [occurrence])`	1-based start index of `substring` in `string`.
	
	If `substring` is not found, returns 0.
	
	If `occurrence` is supplied as *n*, returns index of nth occurrence of `substring`.
	
	If `occurrence` is supplied as -*n*, returns index of nth occurrence of `substring` counting backwards from the end of `inputString`.
		string for `inputString`, `substring`
		
		positive or negative *int* for `occurrence`
			Function:
			`indexOf('www.wikipedia.org', '.', 1)`
			Result:
			4
			
			Function:
			`indexOf('www.wikipedia.org', '.', -1)`
			Result:
			14
			
			Function (example of chaining and combining functions):
			SELECT `substring('www.wikipedia.org', indexOf('www.wikipedia.org', '.', 1)+1, indexOf('www.wikipedia.org', '.', -1) - indexOf('www.wikipedia.org', '.', 1) -1)` **FROM** transactions
			Result:
			`'wikipedia'`

`length(inputString)`	The number of characters including whitespace of the input string.	*string*	Function: `length(' foo bar ')` Result: 9

`substring(inputString, startIndex, numChars)`	The substring of `inputString` starting at (1-based) `startIndex`.
	
	If `startIndex` is negative, starts that number of characters from the end of the string.
	
	If `numChars` is supplied, returns substring of that length; if `numChars` runs past end of string, returns only up to end of string.
	
	If `startIndex` or `numChars` is invalid, returns an empty string.
		string for `inputString`
		
		positive or negative *int* for `startIndex`
		
		positive *int* for `numChars`
			This example extract the domain name from a URL.
			Function:
			`substring('https://example.com/home.htm', 9, indexOf('https://example.com/home.htm','/',3) - 9)`
			Result:
			`'example.com'`

`trim(inputString)`	A copy of the input string with leading and trailing whitespace removed.	*string*	Function:
			`trim(' foo bar ')`
			Result:
			`'foo bar'`

Implicit Aggregation Example

Consider this data:

Application ID	responseTime (ms)
SJC-001	500
SJC-002	600

SJC-003	700
LAX-001	200
LAX-002	300
LAX-003	400

The following ADQL query pairs each item from the output of `substring()` with a corresponding item from the output of `avg()`:

SELECT `substring(application, 1, 3)`, `avg(responseTime)` FROM transactions

The results are:

SJC, 600

LAX, 300

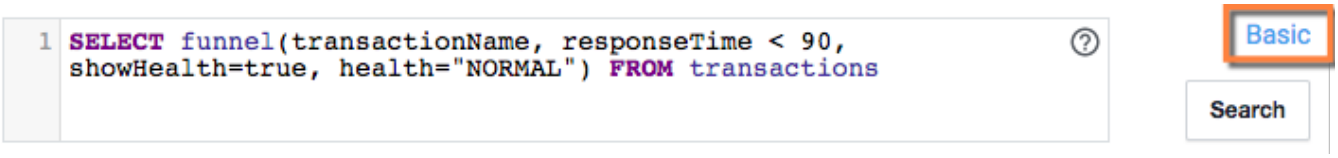
Notice how ADQL uses `substring()` to govern the groupings to which the second function, `avg()`, is applied.

Funnel Functions

You can create funnel widgets from an ADQL query using the funnel function. This query example creates a funnel widget of normal transactions:

```
SELECT funnel(transactionName, responseTime < 90, showHealth=true, health="NORMAL") FROM transactions
```

To see the funnel widget, enter your query and select **Search**. After you see the search results, select **Basic** at the top right of the query:



See AppDynamics Community.

Data Type Conversion Functions

> Data type conversion functions are only available for SaaS deployments.

Data type conversion functions can be used in the **SELECT** or **WHERE** clauses. Below are the available data type conversion functions. For `formatString` requirements, see Joda's `DateTimeFormat` documentation in the Classes section.

Function	Returns	ADQL Query Example
`toDate(string value, [string formatString])`	A string value formatted as a datetime.	**SELECT** `toDate(field_name, "MM/dd/yyyy")` **FROM** `transactions` *Returns* 2019-01-15T00:00:00.000Z for a `field_name` with string value "01/15/2019"
`toDate(int value)`	An integer value formatted as a datetime.	**SELECT** `toDate(12341234)` **FROM** `transactions` *Returns* Dec 31 1969 19:25:41 GMT-0800
`toString(datetime value, [string formatString])`	A datetime value formatted as a string.	**SELECT** `toString(field_name, "MMM dd, yyyy")` **FROM** `transactions` *Returns* "Jan 15, 2019" for a `field_name` with datetime value 2019-01-15T00:00:00.000Z

`toString(float/int/bool value)`	A value formatted as a string.	**SELECT** `toString(123.123)` **FROM**`transactions` *Returns* "123.123"
`toInt(datetime/float/string/bool value)`	An integer value, formatted as follows: • `datetime`- converts to milliseconds, • `float`- truncates • `string`- parses to floats and truncates to an integer • `bool`- converts to 0/1	**SELECT** `toInt(123.4)` **FROM**`transactions` *Returns* 123
`toFloat(int/string value)`	An integer or string value formatted as a float.	**SELECT** `toFloat(123123)` **FROM**`transactions` *Returns* 123123.0
`round(float value, int decimalPlaces)`	A value rounded off to `decimalPlaces`. `decimalPlaces` must be a non-negative integer.	**SELECT** `round(123.123123, 3)` **FROM**transactions *Returns* 123.123
`ifNull(object value, object replacementValue)`	A value if the value is non-null. If the value is null, returns `replacementValue`.	**SELECT** `ifNull(field_name, 10)`**FROM** `transactions` *Returns* 10 if the value of `field_name` is null *Returns* Value of `field_name` if the value is not null

⚠ For data type conversion functions (except `ifNull`), if the value of `field_name` returns null, the converted data type will also return null.

Use mathematical and `now( )` functions on datetimes

You can perform addition and subtraction mathematical functions on datetime and long values, for example:

```
SELECT toDate(field_name, "MMM, dd, yyyy") - toDate(field_name,"MMM, dd, yyyy") FROM transactions
```

The function will return a datetime value. Multiplication, division, and modulus mathematical functions are not supported. Addition and subtraction functions cannot be combined with floats.

You can use the `now( )` function to add or subtract the server's current time from a value, for example:

```
SELECT toInt(now() - field_name) FROM transactions
```

The above function determines how long ago `field_name` was created and converts the value to an integer.

Functions That Modify Other Functions

Function	Returns	Valid Field Type(s)	ADQL Query Examples

filter(metric_function (field_expression), ...) [**WHERE**] condition_expression)	Aggregations for specific subsets of data, computed by applying a filter to the input of a single metric function.	The metric function must be one of the following that returns a single value. {`count	avg	max	min	sum	distinctcount`}  The second argument has the same syntax as a **WHERE** clause and optionally begins with the **WHERE** keyword, for example:  **SELECT** filter(`avg`(responseTime), **WHERE** responseTime > 1) **FROM** transactions **WHERE** application = "Travel"	filter(`sum`(numeric_field_name), numeric_field_name > 100) **SELECT** 100.0 * filter(`count`(*), field_name = "value") / `count`(*) as "%" **FROM** transactions **WHERE** application = "*yourApp*" AND transactionName = "*yourValue*"

Combining Different Types of Functions

Here are some special cases to consider when combining functions of different types:

- The maximum accuracy of distinctcount() is reduced if it follows a bucketing function. Nested `distinctcount()` queries trade accuracy for memory savings, because the previous function establishes buckets, and distinctcount() creates sets of buckets within each of the previous function's buckets, and Elasticsearch automatically makes that tradeoff when that happens
    - For example, the first of the two example queries below returns less accurate results than the second:
        - `SELECT transactionName, distinctcount(userId) FROM transactions`
        - `SELECT distinctcount(userId) FROM transactions`
- The return value of `stdev(numeric_field_name)` cannot be used to sort or filter results.

Analyzed Fields

Selected fields in the analytics data are "analyzed". Analysis consists of tokenizing a block of text into individual terms suitable for use in an inverted index and normalizing these terms into a standard form to improve their searchability. The ADQL Comparison Operators behave differently for analyzed and non-analyzed fields. To construct queries on analyzed fields, you need to understand some concepts about how the tokens are built.

Uppercase letters in analyzed fields are all converted to lowercase to build tokens.

Delimiters and other factors (such as CamelCase terms) affect how strings are tokenized. For a string such as "myname@company.com", "@" is a delimiter, therefore myname and company.com are two separate tokens. Additionally, company.com is two separate tokens. Note that all non-alphanumeric characters are delimiters. A term that uses CamelCase, such as `VicePresident`, is tokenized into separate tokens based on recognition of the CamelCase nature of the term resulting in the tokens: `Vice` and `President` as well as `VicePresident`.

For an example string such as: `<VicePresident:SalesAndMarketing> - EMEAAustraliaUSA94107`, the tokens generated include the following:

- vicepresident
- vice
- president
- salesandmarketing
- sales
- and
- marketing
- emeaaustraliausa94107
- emeaaustraliausa
- emea
- australia
- usa
- 94107

Analytics Analyzed Fields

The analyzed fields in analytics events are:

- **Logs**: Message
- **Transactions**: Errors and Error Detail
- **Mobile**: stacktrace

Queries on Analyzed Fields

Full-text search is supported on analyzed fields, including the message field for logs, using the **LIKE** operator. See Comparison Operators.

On analyzed fields, the **REGEXP** operator matches exactly only the analyzed and processed tokens, so you cannot query across the complete message.

Consider this log message:

```
[2016-06-09 06:07:50,118] [INFO ] [org.springframework.jms.listener.DefaultMessageListenerContainer#0-1] [com.
appdynamics.provision.OrderMessageListener] [AD_REQUEST_GUID[2b8ce807-986c-45f9-a5b4-2fe5a6fd90f3]] Received a
message to process the order Order_3138 for the user myname@company.com
```

In this log message, myname and company.com are two separate tokens because "@" is a delimiter. To search a log message like this for results based on the email address requires searching across tokens.

A query such as the following using **REGEXP**, will **fail** because myname and company.com are two separate tokens.

```
SELECT FROM logs WHERE appName = 'yourAppName' AND sourceType = 'yourLogFile' AND message REGEXP
‘myname@company.*
```

The **LIKE** operator is not affected by delimiters, so an alternative query using **LIKE** operator is a better choice.

```
SELECT FROM logs WHERE appName = 'yourAppName' AND sourceType = 'yourLogFile' AND message LIKE ‘myname@company'
```

You can also use wildcards in the query because they work across tokens.

```
SELECT FROM logs WHERE appName = 'yourAppName' AND sourceType = 'yourLogFile' AND message LIKE ‘myname@company*'
```

Example Queries for Analyzed Fields

Searching the following analytics log events:

```
Jun 7 11:27:45 appd sshd[1032]: Illegal user test from 110.49.183.11
Jun 7 11:27:46 appd sshd[1032]: Failed password for illegal user test from 110.49.183.11 port 9218 ssh2
Jun 7 11:27:46 appd sshd[1032]: error: Could not get shadow information for NOUSER
```

Note the results from the following queries:

Query	Results
SELECT * **FROM** logs **WHERE** sourceType='*yourLogFile'* **AND** message **REGEXP** 'illegal.+user'	Does not match any log events in the sample because the query string spans across multiple tokens. Use LIKE for an instance like this.
SELECT * **FROM** logs **WHERE** sourceType='*yourLogFile'* **AND** message **REGEXP** 'illegal.*'	Matches the first two log events
SELECT * **FROM** logs **WHERE** sourceType='*yourLogFile'* **AND** message **REGEXP** 'Failed*'	Does not match any log events in the sample because the token has only lowercase 'failed'

To search for string : javaIOException

Query
SELECT * **FROM** transactions **WHERE** application = '*yourApp*' **AND** segments.errorList.errorCode **REGEXP** 'java[a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z]'

Math Expressions

Math expressions are field expressions that use arithmetic operators. These expressions can be used in ADQL queries in both the **SELECT** and **WHERE** clauses.

field_expression **BINARY_OPERATORS** field_expression

Arithmetic Operators

Math operators are valid on integer and float data fields, constants (for example, 3.14), and on functions that return a single integer or float value, with the exception of % (modulo). The operators `*, / and %` have higher precedence than + and `-`. Parentheses can be used to control the order of operations, a unary minus (`-`) is also supported.

Operator	Name	Description
*	asterisk	Multiplication
/	slash	Division of two integer types performed as integer division. Integer division by zero returns null.
%	modulo	Calculates the reminder after the division of two integers. Valid only for integers.
+	plus	Addition. Requires a space before a numeric literal.
-	minus	Subtraction. Requires a space before a numeric literal. Can also be used as unary_operator.

Math Expression Usage

Math expressions can be used in several ways.

Query	Result
SELECT regionId % 4, `count`(*) **FROM** transactions **WHERE** application = "*yourApp*"	Math expression is used as a **GROUP BY** term in an implicit group by query
SELECT field_name1, (field_name2 + field_name3) * 3.14 **FROM** transactions **WHERE** application = "*yourApp*"	Math expression is used as a composite field.
SELECT `sum`(field_name1) / `count`(field_name2) **FROM** transactions **WHERE** application = "*yourApp*" **SELECT** filter(`sum`(field_name1), **WHERE** field2 **IS NOT NULL**) / `count`(field_name3) **FROM** ...	Math expression used on an aggregation function.
SELECT `avg`(field1 + field2) **FROM** event_type **WHERE** ... **SELECT** `series`(field1 + field2, 1) **FROM** event_type **WHERE** ...	Math expression used within an aggregation function.
SELECT * **FROM** transactions **WHERE** (responseTime * cartValue) > 100 **SELECT** * **FROM** transactions **WHERE** (regionId % 3) **IN** (1, 2) **SELECT** * **FROM** transactions **WHERE** (responseTime * cartValue) **BETWEEN** (100, 200)	Math expression used in a **WHERE** clause with comparison operators.
SELECT segments.userData.itemTitle, (segments.userData.itemPrice / 100) **AS** *Price* **FROM** transactions **WHERE** application = 'ECommerce 2.0' **AND** transactionName = '/product_details.xhtml' **AND** Price > 20	Convert a value in cents to dollars. This query converts segments.userData.itemPrice from cents to dollars and shows results where the price is greater than $20.
SELECT transactionName, (responseTime / 1000) **AS** responseSeconds, userExperience, requestGUID **FROM** transactions **WHERE** application = "ECommerce 2.0" **AND** responseSeconds > 5	Convert a value such as average response time to seconds instead of milliseconds and view each transaction that is greater than X seconds.

Usage Notes

If any field or intermediate expression result for an expression is null, the entire expression will be null.

Math expressions in the **WHERE** clause are evaluated per record, not in aggregate.

Fields and metric functions can not be combined in the same expression, for example, a query for the following type is *not* valid:

SELECT responseTime + sum(cartValue) **FROM** ...

Mathematical operations that operate on every event (as opposed to on aggregation functions) will reduce query performance. Avoid statements such as:

WHERE (responseTime - 200) > 800 and use a construct such as **WHERE** responseTime > 1000 instead.

Comparison Operators

Comparison operators, such as =, !=, <, >, **LIKE**, and **IN**, can be used in condition_expressions of the **WHERE** clause in the ADQL query statement.

This page describes the comparison operators that you can use in the condition_expression syntax.

Operators

Comparisons on strings are case-insensitive.

Operator	Description	Supported Usage
=	Equals: True if the value of the specified field_name equals the specified value in the expression. String comparisons using the equals operator are case-sensitive.	non-analyzed fields
!=	Not equals: True if the value in the specified field_name does not equal the specified value.	non-analyzed fields
>	Greater than: True if the value in the specified field_name is greater than the specified value.	non-analyzed fields of t ype int, float and date
>=	Greater than or equal: True if the value in the specified field_name is greater than or equal to the specified value.	non-analyzed fields of t ype int, float and date
<	Less than: True if the value in the specified field_name is less than the specified value.	non-analyzed fields of t ype int, float and date
<=	Less than or equals: True if the value in the specified field_name is less than or equal to the specified value.	non-analyzed fields of t ype int, float and date
IN	Finds records where the value of a field equals any one of the specified values in a list of string or numeric values. The values for **IN** must be in parentheses. String values must be surrounded by single quotes. Wild card usage within the list of values provided to the **IN** operator is supported. For example: `SELECT transactionName, percentile(segments.transactionTime, 90) FROM transactions WHERE application = 'prd-analytics' AND transactionName IN ('api_v2./v2/events/* /search','api_v1./v1/events/*/search')`	non-analyzed fields only. Invalid for analyzed fields.
LIKE	The **LIKE** operator performs a full-text search that analyzes the string value and field value. If the string value contains multiple terms, separated by spaces, it is processed as an **AND** condition of the terms. Use **LIKE** to search values in analyzed fields. The **LIKE** operator supports the use of wild cards. **LIKE** is not supported for queries on mixed case strings. For example, querying against a log message that contains "pEer" will not match the search string 'peer', because "pEer" is tokenized by the search analyzer into two separate tokens - "p" and "eer").	for full-text search of analyzed fields
BETWEEN	Finds values of a field based on an inclusive or exclusive value range. For an inclusive range search, use square brackets [ ]. For an exclusive value range, use parentheses ( ).	Supported for data types int, float, and datetime (*New in 4.4.1*).
IS NULL	Finds records where a field does not contain a value.	non-analyzed fields and analyzed fields
IS NOT NULL	Finds records where a field contains a value.	analyzed and non-analyzed fields
NOT BETWEEN	Finds records where a field does not contain a value in an inclusive or exclusive value range. The reverse of **BE TWEEN**.	non-analyzed fields
NOT LIKE	The reverse of **LIKE**.	analyzed fields
NOT IN	Finds records where the value of a field does not match any value in a list of string or numeric values. The values for **NOT IN** must be in parentheses, and string values must be surrounded by single quotes. There is also a logical operator **NOT**, which is unrelated to this comparison operator.	non-analyzed fields

REGEXP	The **REGEXP** operator applies a regular expression pattern match of a string to the pattern passed as an argument. See REGEXP Operator for details of usage. This is an advanced feature and requires knowledge of regular expression patterns.	non-analyzed fields For analyzed fields: • Use lowercase input strings. • Do not use to search across tokens
* ?	The wild card operators. Use of wild cards is supported on queries of string fields. The asterisk, '*', character matches zero or more characters and the question mark, '?', character matches a single character. The wild card operator works similarly when used with the equals "=" or **LIKE** operator. The wild card operator is case sensitive for non-analyzed fields.	analyzed fields and non-analyzed fields

Examples

Query	Result
SELECT * **FROM** mobile_snapshots **WHERE** appkey='*your_appkey*' **AND** numeric_field_name **IN** (1419, 613, 748)	Returns all fields for mobile snapshots for the specified appkey where the value of the specified numeric field matches one of the values in parentheses.
SELECT count(*) **FROM** browser_records **WHERE** appkey='*your_appkey*' **AND** field_name **IN** ('string1','string2', 'string3')	Returns a count of browser records for the specified appkey where the value of the specified field matches one of the specified strings.
SELECT ip **FROM** browser_records **WHERE** ip **LIKE** "10.134.*"	By filtering on IP address range using wild card operator, finds records in the specified IP address range.
SELECT * **FROM** logs **WHERE** message **LIKE** 'DEBUG Adding operation'	Matches the sample log line "DEBUG com.appdynamics.operations. PublishTestService - Adding to bulk publish operation."
SELECT * **FROM** logs **WHERE** message **LIKE** 'error'	Finds all the log events containing the word 'Error' in any field
SELECT * **FROM** transactions **WHERE** application='*yourAppName*' **AND** cartTotal **BETWEEN** [10, 50]	Inclusive range: Returns all transactions with a cart total between 10 and 50, including 10 and 50.
SELECT * **FROM** transactions **WHERE** application='yourAppName' **AND** cartTotal **BETWEEN** (10, 50)	Exclusive range: Returns all transactions with cart total between 10 and 50, excluding 10 and 50.

Logical Operators

Logical operators can be used in the **WHERE** clause in an ADQL query to make compound condition expressions. These operators are **AND**, **OR**, and **NOT**.

Condition Expression Syntax

(condition_expression **LOGICAL_OPERATOR** condition_expression)

Examples

Expression	Result
(field_expression_1 **AND** field_expression_2)	Evaluates as true if both field_expressions are true.
(field_expression_1 **OR** field_expression_2)	Evaluates as true if either field_expression is true.
(field_expression_1 **AND NOT** field_expression_2)	Evaluates are true if field_expression_1 is true and field_expression_2 is false.

REGEXP Operator

This is an advanced feature and requires knowledge of regular expression patterns.

The regular expression operator, **REGEXP**, can be used in the **WHERE** clause to handle complex matching queries. This operator applies a regular expression pattern match of a string to the pattern passed as an argument. ADQL uses the Lucene regular expression engine to analyze the **REGEXP** exp ression. The search results for queries that use the **REGEXP** operator are dependent not only on regular expression syntax and rules but also on whether you are searching analyzed or non-analyzed fields. To use **REGEXP** on analyzed fields, see Analyzed Fields.

The **REGEXP** operator can only match with the lowercased tokens in the analyzed fields. To search for an uppercase string in an analyzed field using a wild card or **REGEXP**, you need to input a lowercase string. For example info, not INFO.

Allowed Characters

Any Unicode character may be used in the regular expression pattern, but certain characters are reserved and must be escaped. Any reserved character can be escaped with a backslash `"\*"` including a literal backslash character:`"\\"`.

The standard reserved characters are:

```
. ? + * | { } [ ] ( ) " \
```

For query performance reasons, before using any reserved character in a **REGEXP** pattern, you need to specify the first three characters of the string explicitly, such as specifying 123 before the brackets [0-9] in the following example:

SELECT * **FROM** logs **WHERE** sourceType='*yourLogFile*' **AND** id **REGEXP** '123 [0-9]'

A query such as the following is invalid.

SELECT * **FROM** logs **WHERE** sourceType='*yourLogFile*' **AND** id **REGEXP** '[0-9]'

Example Operations, Strings, and Associated Patterns

Supported Operation	Description	String	Pattern
Match any character	A period "." can be used to represent any character.	abcde	abc..
One or more	A plus sign "+" can be used to repeat the preceding shortest pattern one or more times.	aaabb	aaab+
Zero or more	An asterisk "*" can be used to match the preceding shortest pattern zero or more times.	aaaabbbcc	aaaab*c*
Zero or one	A question mark "?" makes the preceding shortest pattern optional. It matches zero or one times.	aaabbbc	aaa?b+c?
Min-to-max	Curly brackets "{}" can be used to specify a minimum and (optionally) a maximum number of times the preceding shortest pattern can repeat. Allowed forms: {5} # repeat exactly 5 times {2,5} # repeat at least twice and at most 5 times	aaaabbbcc	aaaab{3}c {2} aaaab{2,4} c{2,4}
Grouping	Parentheses "( )" can be used to form sub-patterns.	abababab	abab(ab)*
Alternation	The pipe symbol " | " acts as an OR operator. The match will succeed if the pattern on either the left-hand side OR the right-hand side matches.	aaabbb	aaa (ccc|bbb)

ADQL Data

This page describes data that ADQL captures in Analytics.

Analytics Type	Description
Transaction Analytics	Transaction Analytics is defined as event data collected by the Java and .NET Agents for every instance of a business transaction. Every instance of a business transaction that passes through a tier is defined as an event. You can view the raw data for any transaction instance that occurs within the data retention time. Transaction Analytics enables you to analyze the business impact of every event and observe how customers use your application.
Browser, Mobile, and IoT Analytics	Browser, Mobile, and IoT Analytics provide event data collected by the End User Monitoring (EUM) JavaScript Agent, Mobile, and IoT Monitoring SDKs.
Log Analytics	Log Analytics provides event data collected from log files.
Synthetic Sessions Analytics	Synthetic Sessions Analytics provides events data on sessions collected by Browser Synthetic Monitoring.

See AppDynamics Analytics Events API.

Analytics Transaction Data

Each instance of a business transaction passing through a single tier is an event, so the data associated with a single execution of a distributed business transaction (for example, Checkout) is stored as a series of events in Analytics. The data consists of the default transaction data and additional data from data collectors configured for that transaction. This data is organized and stored per business transaction.

Default Transaction Data

Event Type: transactions

Key (event type identifier): application

The following table lists the data collected by default for each instance of the business transactions that are enabled for Analytics. The table also lists the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

UI Field Name	Description	Events Service Internal Name
Application	Application name	`application`
Business Transaction	Business transaction name	`transactionName`
Error	Error details (deprecated) This field is replaced by the more granular fields: Error Code, Error Detail, and Error Type.	`deprecated`
Error Code	The value of this field depends on the Error Type. For example, if Error Type is an HTTP_Error_code, then the value is a string representing the corresponding HTTP error code such as 404, 503 and so on.	`segments.errorList.errorCode`
Error Detail	This is what the "Error" field represented in 4.1. Primarily the error message	`segments.errorList.errorDetail`
Error Type	Classification of errors into buckets done internally by the Agent. For example, the error type could be HTTP_ERROR_CODE, LOGGER_MESSAGE, THROWABLE and so on.	`segments.errorList.errorType`
Node	Node name	`segments.node`
Tier	Tier name	`segments.tier`
request GUID	GUID for this specific user request as assigned by AppDynamics	`requestGUID`
Response Time (ms)	Business transaction response time for this request in milliseconds	`responseTime`
Timestamp	Time the event occurred in the application	`eventTimestamp`
User Experience	Indicates if the transaction was marked as Normal, Slow, Very Slow, Stall, or Error	`userExperience`
Exit calls	Details of database and remote service calls. View Details flow map. Note that for partial snapshots, exit call information captured in call graphs can differ between the Analytics and APM UI. Each UI presents an appropriate level of contextual visibility while preserving low overhead. An APM snapshot, for example, may capture only the exit calls that are most pertinent to transaction performance.	Not Applicable

Custom HTTP Request Data

When HTTP data collectors are configured, the following information can be collected:

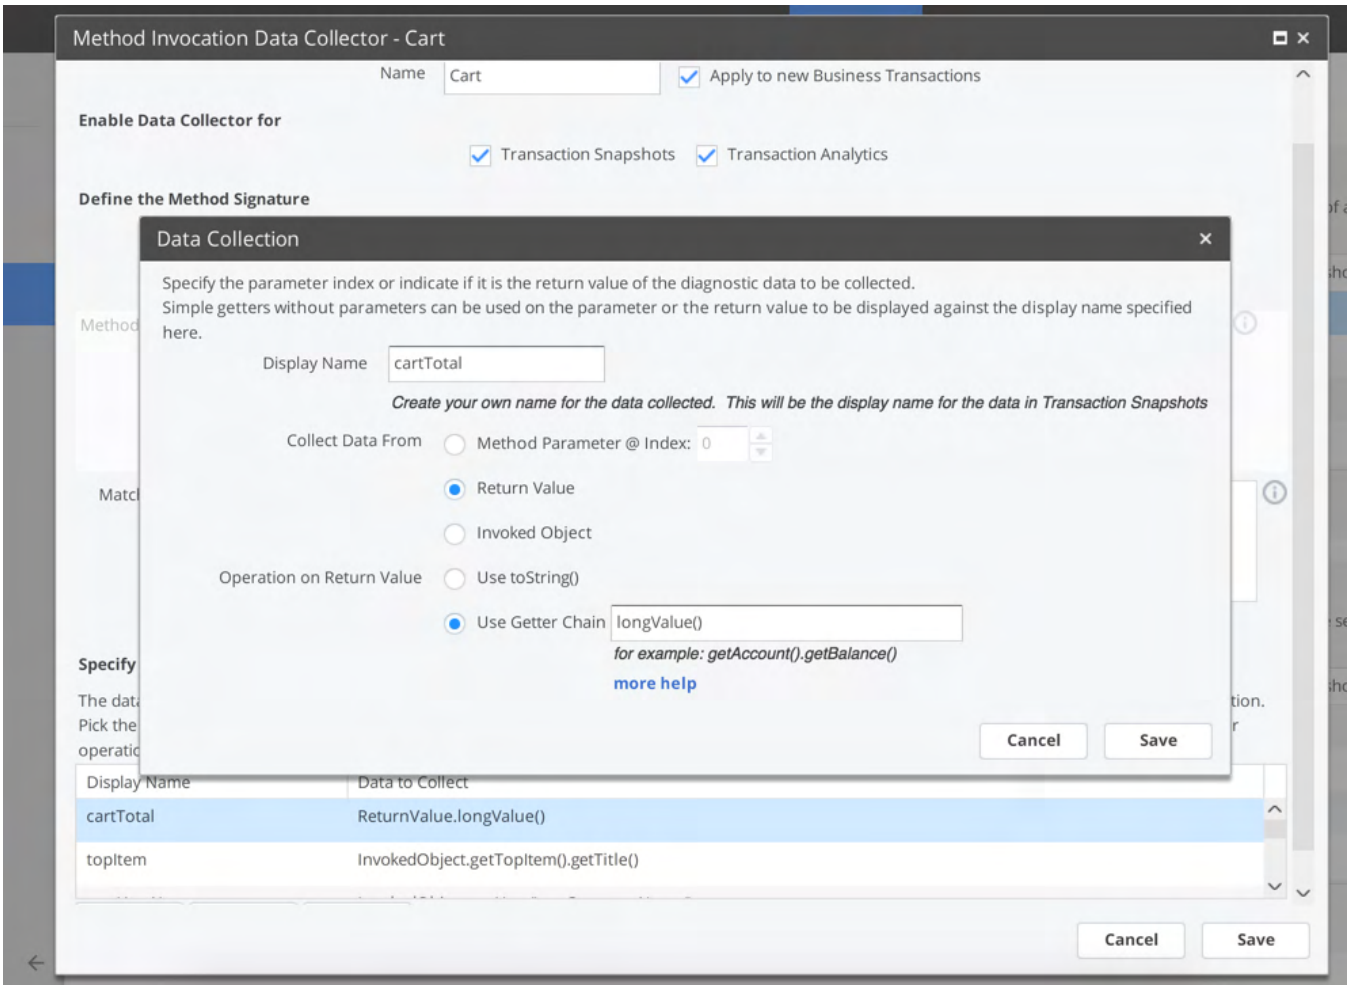
Field	Events Service Database Name
cookies	`segments.httpData.cookies`
headers	`segments.httpData.headers`
parameters	`segments.httpData.parameters`
principal	`segments.httpData.principal`
session ID	`segments.httpData.sessionId`
session Objects	`segments.httpData.sessionObjects`
URL	`segments.httpData.url`
URI path segments: segment0-*n*	`segments.httpData.uriPathSegments`

Analytics uses the configured display name as the field name for the HTTP parameters. In Controller versions prior to 4.3, Analytics displayed the data using the actual parameter name.

Custom Method Data

Custom data collected as specified in the method invocation data collector configuration. See Data Collectors.

To specify a custom data field when using the Analytics query APIs, prefix the field name with `segments.userData`. For example, if your field is cartTotal, such as shown in the following screenshot, the database name is `segments.userData.cartTotal`.



Deprecated Fields

AppDynamics deprecated the `Request Experience` and `Transaction Time` for Analytics Agents >= 4.2.x. Both fields are replaced with new fields:

Deprecated Field	Description	New Field
Request Experience	Indicates if the transaction was marked as Normal, Slow, Very Slow, Stall, or Error	User Experience
Transaction Time	Business transaction response time for this request in milliseconds	Response Time

Analytics Log Data

Log Analytics collects from log files depends on the source of the log file and the pattern that you specify to structure the data in the log with. Every log entry is an event in the Log Analytics event stream.

Log Analytics Data

Log Analytics only supports the UTF-8 encoding format.

Event Type: logs

Key (event type identifier): sourceType

These fields are captured by default; you can configure and capture optional data, but these fields are always present:

UI Field Name	Description	Events Service Internal Name
pickupTimestamp	The timestamp when the Java Agent picked up the event and sent it to the Analytics Agent.	`pickupTimestamp`
Message	The message body of the log event.	`message`
host	IP address or host name where the event was generated.	`host`
source	Location of the logs, usually a path or directory such as `/tomcat/logs`.	`source`
sourceType	The kind of log file, such as `apache-httpserver-access-log`.	`sourceType`
Timestamp	Timestamp of the log event.	`eventTimestamp`
Extracted Fields	Fields that were extracted using the Controller UI in previous versions appear in the Extracted Fields list. See Collect Log Analytics Data.	Varies

You can optionally configure these fields:

Optional Fields	Description
nodeName	Name of the node where the log event occurred.
tierName	Name of the tier where the log event occurred.
appName	Application name where the log event occurred.

Analytics Custom Events Data

Data collected for your Analytics custom events depends on the schema you create and manage.

The only default field is `eventTimestamp`. If custom events are used to configure Business Journeys, this field is mandatory. All other fields are defined by your schema.

If you are exporting data as a CSV file, a single quotation mark (`'`) prepends cells that begin with `=`, `+`, `–`, `@`, or `"`.

See Analytics Events API.

Analytics Browser Requests Data

Browser Analytics provides details about each browser user request. The data collected includes information about pages, performance metrics, location of your users, browser and device data, errors, and any custom data that you configured in your Browser RUM configuration.

This page lists the field names available for browser request Analytics data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query. See Browser RUM Metrics.

Event Type: browser_records

Key (event type identifier): appkey

UI Field Name	Events Service Internal Name
Page Info Fields	
Agent ID	`agentid`
appkey	`appkey`
Client GUID	`cguid`
IP address	`ip`
Page Experience	`pageexperience`
Page Name	`pagename`
Page Type	`pagetype`
Parent Page URL	`pageparenturl` ⚠ The `pageparenturl` is not available by default. On-premises customers need to run a special script on the EUM Server. SaaS customers need to file a ticket requesting AppDynamics to do this for them. See the Community article.
Page Referrer	`referrer` See the Community article.
URL	`pageurl`
Performance Time Fields	
Application Server Time	`metrics.`Application Server Time (ms)``
DOM Ready Time	`metrics.`DOM Ready Time (ms)``
Domain Lookup Time	`metrics.`Domain Lookup Time (ms)``
End User Response Time	`metrics.`End User Response Time (ms)``
Estimated BT Time	`btdata.estimatedtime`
First Byte Time	`metrics.`First Byte Time (ms)``
Server Connection Time	`metrics.`Server Connection Time (ms)``
SSL Handshake Time	`metrics.`SSL Handshake Time (ms)``

Location Fields	
City	`geocity`
Country	`geocountry`
Region	`georegion`
Browser and Device Data Fields	
Browser	`browser`
Browser Version	`browserversion`
Device	`device`
Device OS	`deviceos`
Errors Field	
AJAX Error	`ajaxerror`
Error Type	`errortype`
Script Error Field	
Line Number	`scripterrordata.linenumber`
Message	`scripterrordata.message`
Origin	`scripterrordata.origin`
timestamp	`scripterrordata.timestamp`
Custom User Data Field	

your_field_name	`userdata.your_field_name`
	`userdataBoolean.your_field_name`
	`userdataDate.your_field_name`
	`userdataLong.your_field_name`
	`userdataDouble.your_field_name`
	
	Note: if your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is `userdata.\`Item Purchased\``

Analytics Browser Sessions Data

This page describes the field names available for Analytics Browser Sessions data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name. You can view the Browser Sessions using the Analytics Query API. This page describes fields that are specific to Browser Sessions.

Event Type: web_session_records

Key (event type identifier): appkey

UI Field Name	Events Service Internal Name
Session Fields	
Browser	`browser`
Browser Version	`browserversion`
City	`geocity`
Closed	closed
Country	`geocountry`
Device	`device`
Device OS	`deviceos`
IP Address	`ip`
Page View Count	`pageviews`
Region	`georegion`
Session Duration (ms)	`metrics.durationMS`
Session Start Time	`startTimeMS`
User Experience	`experience`
Page View Fields	
Client GUID	`browserRecords.cguid`
Page Error Type	`browserRecords.errortype`
Page Experience	`browserRecords.pageexperience`
RUM Page Name	`browserRecords.pagename`
Custom User Data	

your_field_name	`userdata.your_field_name`
	`userdataBoolean.your_field_name`
	`userdataDate.your_field_name`
	`userdataLong.your_field_name`
	`userdataDouble.your_field_name`
	
	If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is `userdata.`Item Purchased`.`

Analytics Mobile Crash Reports Data

This page describes the field names available for Analytics Mobile Crash Reports data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: mobile_crash_reports

Key (event type identifier): appkey

UI Field Name	Events Service Internal Name
App Crash Time	`appcrashtimestamp`
App Key	`appkey`
Carrier	`carrier`
Connection Type	`connectiontype` For example: "wifi", "4g", "cell"
Country	`geocountry`
Crash Group ID	`groupid`
Crash Id	`crashid`
Crashed Function	`crashfunction` For example: "-[MTFirstViewController segFault413]", "com.appd.examples.android.instrumentation.MainActivity.d42" This value depends on your application.
Device / Manufacturer	`devicemanufacturer` For example: "Samsung", "Apple"
Mobile App Name	`mobileappname`
Mobile App Version	`mobileappversion`
Model	`devicemodel` For example: "iPhone 5" "iPad 2 WIFI"
OS Version	`osversion` For example: "iOS 6.0", "Android 4.2"
Platform	`platform` For example: "Android", "iOS"
Region	`georegion`
User Data	

your_field_name	`userdata.your_field_name`
	`userdataBoolean.your_field_name`
	`userdataDate.your_field_name`
	`userdataLong.your_field_name`
	`userdataDouble.your_field_name`
	
	If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is `userdata.`Item Purchased``

Analytics Mobile Requests Data

Mobile Analytics provides details about the performance of your mobile apps as experienced by your end users. The data collected includes information about the mobile app names and versions, network requests, performance times, locations, carrier and device data, errors, and any custom data that you configured in your Mobile RUM configuration.

This page describes the field names available for mobile requests Analytics data, along with the Events Service internal name. See Mobile RUM Metrics. W hen accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: mobile_snapshots

Key (event type identifier): appkey

UI Field Name	Events Service Internal Name
Mobile App Info Fields	
agentid	`agentid`
agentversion	`agentversion`
appkey	`appkey`
cguid	`cguid`
Mobile App Name	`mobileappname` For example: "com.appdynamics.eum.test.apps.E2E-PictureSharingApp"
Mobile App Version	`mobileappversion`
Platform	`platform`
Network Request Fields	
Background	`happenedinbackground`
Experience	`networkrequestexperience`
HTTP Status Code	`httpstatuscode`
Network Request Name	`networkrequestname`
Network Request Type	`networkrequesttype`
Request Content Length	`requestContentLength`
Response Content Length	`responseContentLength`
Performance Time Fields	
Estimated BT Time	`btdata.estimatedtime`
Network Request Time	`networkrequesttime`
Location Fields	
Country	`geocountry`
Region	`georegion`
Carrier and Device Data Fields	
Carrier	`carrier`

Connection Type	`connectiontype` For example: "wifi", "4g", "cell"
Device / Manufacturer	`devicename` For example: "Samsung", "Apple"
Model	`devicemodel` For example: "iPhone 5" "iPad 2 WIFI"
OS Version	`osversion` For example: "iOS 6.0", "Android 4.2"
Error Fields	
Network Type Error	`networkerror`
Custom User Data Fields	

your_field_name	`userdata.your_field_name`
	`userdataBoolean.your_field_name`
	`userdataDate.your_field_name`
	`userdataLong.your_field_name`
	`userdataDouble.your_field_name`
	
	If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is `userdata.`Item Purchased``

Analytics Mobile Sessions Data

This page describes the field names available for Analytics Mobile Sessions data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: mobile_session_records

Key (event type identifier): appkey

UI Field Name	Events Service Internal Name
Mobile Session Fields	
Mobile App Name	`mobileappname` example: "com.appdynamics.eum.test.apps.E2E-PictureSharingApp"
Carrier	`carrier` For example: "AT&T", "Verizon"
Closed	`closed`
Connection Type	`connectiontype` For example: "cell", "3g"
Country	`geocountry`
Device / Manufacturer	`devicename`
Duration	`metrics.durationMS`
IP Address	`ip`
Mobile App Version	`mobileappversion`
Model	`devicemodel` For example: "iPad 2 WIFI", "Kindle Fire"
OS Version	`osversion` For example: "iOS 5.1", "Android 4.2"
Region	`georegion`
Session Start Time	`startTimeMS`
Session Status	`closed` Note "closed" is a Boolean field. True means the session is closed. False means the session is still going on.
Event Count Fields	
Breadcrumb Count	`metrics.breadcrumbcount`
Crash Count	`metrics.crashcount`
Custom Metric Count	`metrics.custommetriccount`
Event Time Stamp	`eventTimestamp`
Info Point Count	`metrics.infopointcount`

Network Request Count	`metrics.networkrequestcount`
Timer Count	`metrics.timerCount`
UI Event Count	`metrics.uiCount`
User Data Count	`metrics.userdatacount`
Crash Fields	
App Crash Time	`crash.appcrashtimestamp`
Crash Exception	`crash.crashexception` For example: "java.lang.NullPointerException"
Crash File	`crash.crashfile` For example, "MainActivity.java"
Crash Group ID	`crash.groupid`
Crash Line Number	`crash.crashlinenumber`
Error Description	`error.description`
Symbolicated or Deobfuscate	`crash.symbolicateddeobfuscated` For example: false
User Data	

your_field_name	`userdata.your_field_name`
	`userdataBoolean.your_field_name`
	`userdataDate.your_field_name`
	`userdataLong.your_field_name`
	`userdataDouble.your_field_name`
	
	If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is `userdata.`Item Purchased``

Breadcrumb Fields	
Breadcrumb Text	`breadcrumb.bctext`
Network Request Fields	
Connection Type	`networkrequest.connectiontype`
End Time	`networkrequest.endTimeMS`
Experience	`networkrequest.networkrequestexperience`
HTTP Status Code	`networkrequest.httpstatuscode`
IP Address	`networkrequest.ip`
Network Error	`networkrequest.networkerror`
Network Request Name	`networkrequest.networkrequestname`
Network Request Time	`networkrequest.networkrequesttime`

Infopoint Fields	
Duration (ms)	`infopoint.duration`
infopname	`infopoint.infopname`
Is Dynamic	`infopoint.isdynamic`
UI Event Fields	
Activity	`ui.activity`
Class	`ui.uiclass` For example: "UITableView"
Label	`ui.uilabel` For example: "IOS TableCell"
Root View	`ui.rootview` For example: "SettingsScreen"
UI Event	`ui.uievent` For example: "Button Pressed", "Root View Change", "Table Cell Selected"

Analytics Mobile Non-Fatal Issues Data

This page describes the field names available for Analytics Mobile Non-Fatal Issues data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: mobile_non_fatal_issue_records

UI Field Name	Events Service Internal Name
Agent Info Fields	
Agent ID	`agentid`
Agent Version	`agentversion`
App Info Fields	
App Key	`appkey`
Mobile App Name	`mobileappname` For example: "com.appdynamics.eum.test.apps.E2E-PictureSharingApp"
Mobile App Version	`mobileappversion`
Device Info Fields	
Carrier	`carrier` For example: "AT&T", "Verizon"
Connection Type	`connectiontype` For example: "cell", "3g"
Device Manufacturer	`devicemanufacturer` For example: "Samsung"
Device Model	`devicemodel` For example: "Galaxy S5"
Device Name	`devicename`
IP Address	`ip`
jailbroken	`jailbroken`
OS Version	`osversion` For example: "5.1", "4.2"
Platform	`platform` For example: "iOS", "Android"
Code Issues	
description	`description` For example: "App Not Responding in Utils.formatData"
filename	`filename`
groupid	`groupid`
Line Number	`linenumber`
severity	`severity` For example: "Info", "warning"

symbolicateddeobfuscated	`symbolicateddeobfuscated` For example: false
symbolname	`symbolname` For example: "MainActivy.onResume"
pickupTimestamp	`pickupTimestamp`
Timestamp	`timestamp` For example: "03/15/18 5:32:33 PM"
Custom User Data Fields	

your_field_name	`userdata.your_field_name`
	`userdataBoolean.your_field_name`
	`userdataDate.your_field_name`
	`userdataLong.your_field_name`
	`userdataDouble.your_field_name`
	
	If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is `userdata.`Item Purchased``

Event Fields	
eventid	`eventid`
eventindex	`eventindex`
timestamp	`eventTimestamp`
eventtype	`eventtype` For example: "ANR", "Error"
Location Fields	
City	`geocity`
Country	`geocountry`
Region	`georegion` For example: "California", "Sichuan"

Analytics Synthetic Sessions Data

This page lists the field names available for Analytics Browser Synthetic Sessions data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query. For details on the meaning of each metric, see Browser Synthetic Metrics.

Event Type: `synth_session_records`

Key (event type identifier): Job Name (scheduleName)

UI Field Name	Events Service Internal Name
Session Fields	
Browser	`browser` For example: "Internet Explorer", "Chrome"
Browser Version	`browserversion` For example: "52.0.2743.116", "11.0.9600.18124"
City	`geocity`
Closed	`closed`
Country	`geocountry`
Devices	`device` The computer form factor of the device. For example: "Computer" or "Mobile & Tables"
Device Model	`devicemodel` The model of the device. For example: "Galaxy S8" or "iPhone 7"
Device OS	deviceos The operating system of the device. For example: "Windows" or "Android"
Duration (sec)	`metrics.`Session Duration (ms)``
End Time	`endTimeMS`
Error Type	`failureType` For example: "Timed out", "Test script crashed"
Job Name	`scheduleName` The name of the synthetic job.
Region	`georegion`
Result	`success`
Schedule ID	`measurementSpec.scheduleId`
Session Type	`sessionType` For example: "WEB_DRIVER", "URL"
Session Visual Time (sec)	`metrics:`Session Visual Time (ms)``
Start Time	`startTimeMS`
Status	`status`
Timestamp	`eventTimestamp`
Page View Fields	
Page Error Type	`browserRecords.pageerror`
RUM Page Name	`browserRecords.pagename`
URL	`pageurl`

Analytics Connected Device Data

Connected Device Data provides details about each IoT connected device. The data collected includes information about devices, network requests and error events, and any custom properties and events that you instrument in your IoT application.

This page describes the required field names for Analytics Connected Device data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query. Because IoT Monitoring largely depends on custom data, your connected device Analytics data will most likely include many more field names than given below.

Event Type: iot_records

Key (event type identifier): appkey

UI Field Name	Events Service Internal Name
Fields	
App Key	`appkey`
deviceguid	`deviceguid`
devicetype	`devicetype`
Timestamp	`eventTimestamp`
eventtype	`eventtype`
customevent Fields	
eventsummary	`customevent.eventsummary`
networkrequestevent Fields	
duration	`networkrequestevent.duration`
networkerror	`networkrequestevent.networkerror`
statuscode	`networkrequestevent.statuscode`
URL	`networkrequestevent.url`
errorevent Field	
Resource Name	`errorevent.name`

Analytics Data Sources

Related pages:

- ADQL Data

This page describes how Analytics can collect data from many sources in your AppDynamics APM Platform.

Transaction Analytics Data Sources

Transaction Analytics data is collected by the AppDynamics Java, .NET, PHP and Node.js App Agents. Collecting Transaction Analytics data requires no change to your application code. You enable analytics on the app server agents and Controller you already use.

Once you have enabled analytics on your application, you can collect and analyze several kinds of data:

- Default performance data collected by the app agents about your application's business transactions.
- HTTP-based data collected by HTTP data collectors.
- Custom data collected by method invocation data collectors.
- Business data collected from parameterized SQL calls.

See Collect Transaction Analytics Data.

Log Data Sources

You can collect Log Analytics data from many types of log files, including instrumented and non-instrumented applications as well as infrastructure. Log Analytics can be used as a standalone component. You can search and analyze log data just as you do transaction data. Log Analytics works by default with the syslog (log4j) format and can be configured for other log formats, including GZIP files (log files ending in .gz). You can capture other log formats by setting up regular-expression-based mapping. See Collect Log Analytics Data.

You can view correlated Log and Transaction Analytics Data. By configuring business transaction GUID injection, you can see logs that are related to specific business transaction requests. See Business Transaction and Log Correlation.

End User Monitoring Data Sources

Analytics can also use data collected by Browser Real User Monitoring, Mobile Real User Monitoring and IoT Monitoring. Analytics makes the data available in a more flexible search format. If you have enabled Browser RUM, Mobile RUM or IoT Monitoring *and* enabled Analytics, you see these event types on the Analytics search page.

For details on how analytics extends the capability of EUM, see the section "*Browser Analyze versus Browser Request Analytics*" in Browser RUM Analyze.

Browser Synthetic Data Sources

Sessions data captured through Browser Synthetic Analytics is available in Analytics.

Custom Event Sources

You can add custom events for Analytics using the AppDynamics Analytics Events API.

Deploy Analytics With the Analytics Agent

Related pages:

- Monitor JVMs
- Monitor .NET Nodes

This page describes the deployment options for Analytics, which includes the Events Service.

Transaction Analytics Only

You need an Analytics Agent to capture Transaction Analytics for:

- Java Agents <= 4.5.15
- Any version of .NET, Node.js, and PHP Agents
- Controller <= 4.5.15

To configure Transaction Analytics:

- Download and install either the Standalone Machine Agent or the Analytics Agent (standalone binary) on each machine. You can also use a shared Analytics Agent instance.
- Enable Analytics for applications in the Controller.

Log Analytics Only

To configure Log Analytics:

- Install either the Standalone Machine Agent or the Analytics Agent (standalone binary) on the machine.
- Enable Analytics for log sources in the Controller.

Transaction and Log Analytics

To configure Transaction and Log Analytics:

- Install either the Standalone Machine Agent or the Analytics Agent (standalone binary) on the machine.
- Enable Analytics for applications and log sources in the Controller.

SaaS/On-premises Analytics Configuration

When you deploy Analytics with the Analytics Agent, the configuration requirements differ based on your deployment.

- SaaS: The Events Service is provided as part of the SaaS service. AppDynamics stores the data and hosts the server components of the system for you. You need to install only the Analytics Agent components of the system described in Agent Side Components.
- On-premises: You host the components yourself, storing all data on-premises. You need to install the Agent Side Components, Controller Deployment Components, and Events Service Deployment Components. While the on-premises deployment involves additional setup and administration, you are able to retain the Analytics data in your own data center.

Encrypt Data on the Analytics Agent

You can encrypt any data on the Analytics Agent using `secure://<your-encrypted-credentials>`. You can encrypt data in the Analytics Agent properties file or in System Properties.

The following example demonstrates how to encrypt `http.event.accessKey` in the Analytics Agent properties file.

```
http.event.accessKey=secure://-001-24-Dr9FQGC179o4vPnuljnx8A==ZGVw/P4OONvpUidIhJ2u78FpRVVW8fbgr8J1HBHXwnE=
ad.secure.credential.store.filename=/opt/appdynamics/secretKeyStore
ad.secure.credential.store.password=s_gsnwR6+LDch8JBf1RamiBoWfMvjjipkrtJMZXAYEkw8=
```

See Encrypt Agent Credentials.

Separate Host for the Analytics Agent

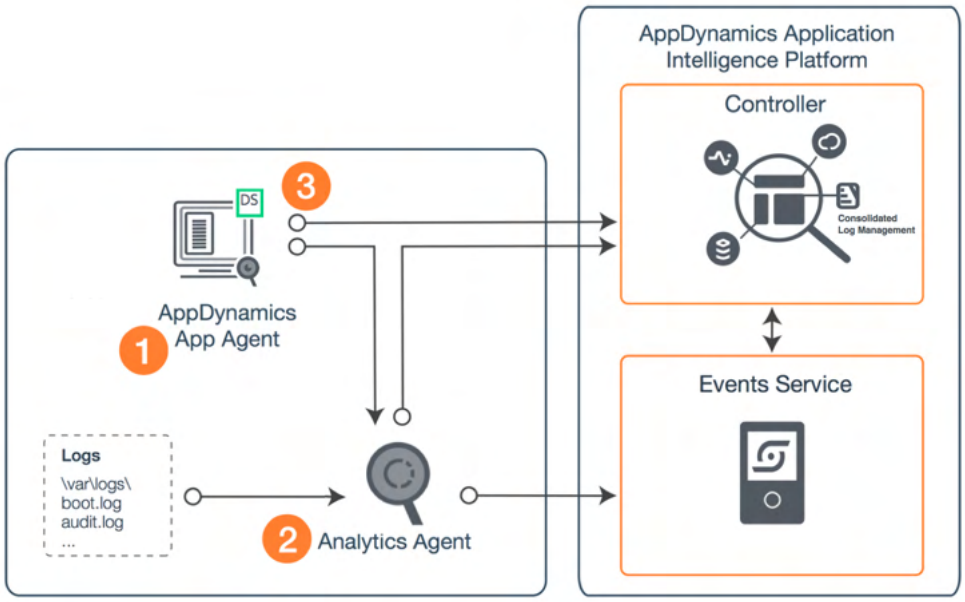
If your Analytics Agent is on a host separate from the monitored application, see Remote Analytics Agent Sizing.

Analytics Agent Components

This page describes Analytics Agent architecture.

Analytics Agent-Side Components

For both SaaS and on-premises Analytics, you need to deploy (or enable) agent-side Analytics components in your application environment.



Legend: Agent Components

1 AppDynamics App Agent: Analytics relies upon the same app server agents that AppDynamics APM uses. If you use AppDynamics APM, you likely already have these deployed to your monitored applications.

2 Analytics Agent: The Analytics Agent collects data from one or more app server agents and sends it to the Events Service. It also reads and transmits log data from log files from the local machine. The Analytics Agent is available as a standalone binary or as part of the Standalone Machine Agent download.

- As part of the Standalone Machine Agent download, the Analytics Agent runs as an extension (also called a monitor).
- A standalone binary distribution of the Analytics Agent is available for Windows environments or other environments that do not have the Standalone Machine Agent installed.

3 Analytics Dynamic Service: The Analytics Dynamic Service extends your app server agent functionality to collect and forward data to the Analytics Agent. It is built into the Java and .NET Agents but is not enabled by default. No additional download is needed.

Browser and Mobile Analytics

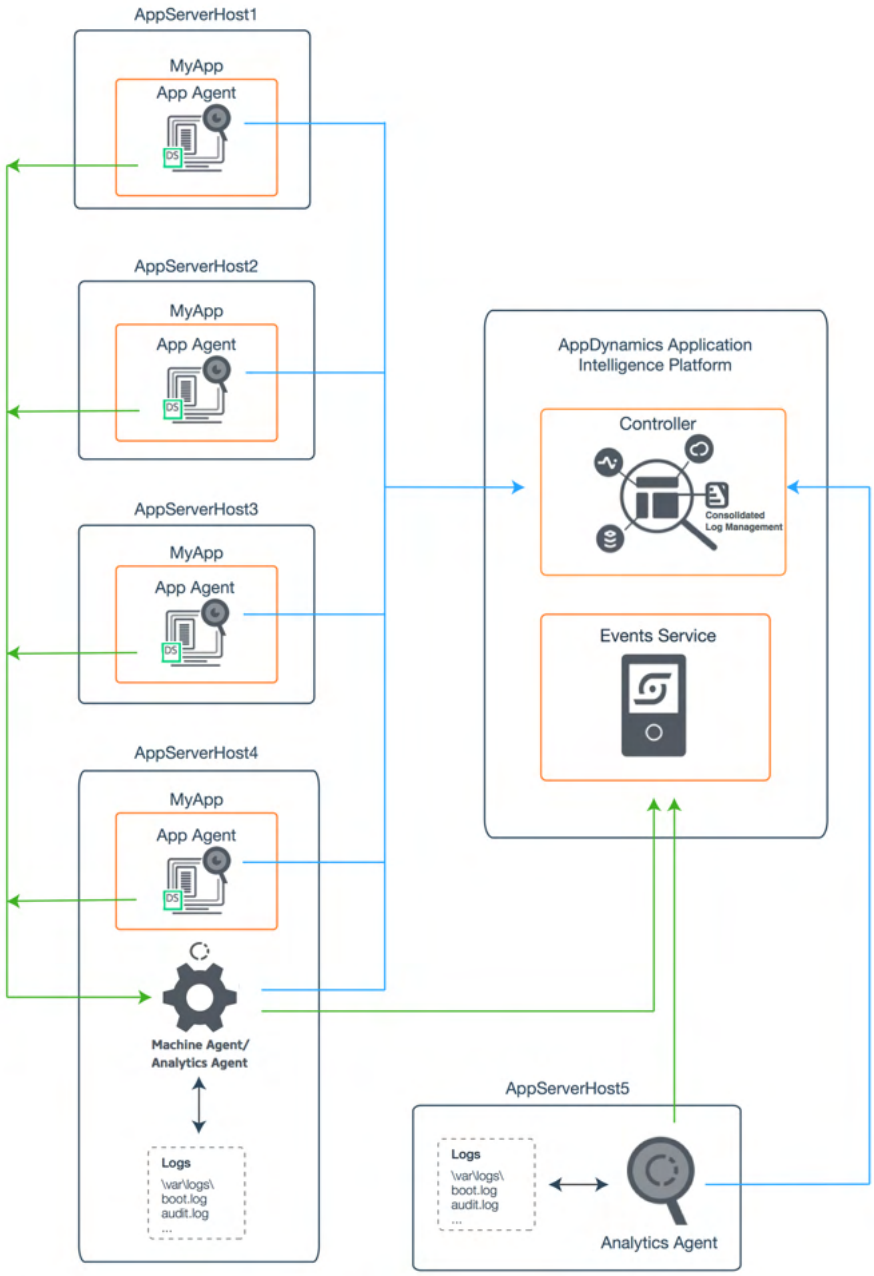
To see Analytics data from Browser and Mobile Real User Monitoring, you need to enable those components and enable Analytics. See EUM Server Deployment.

Deploying Analytics Agents to Multiple Nodes

A real-world scenario is unlikely to consist of a single monitored node, as shown in the diagram above. It usually consists of many applications deployed over many hosts.

While the APM app server agents continue to send data to the Controller in the normal way, the Analytics Dynamic Service sends its data to the Analytics Agent. This agent runs in a separate JVM process in the local environment or network, either as part of the Standalone Machine Agent or on its own.

There must be at least one Analytics Agent in the monitored environment, although multiple app server agents collecting only transaction data can share a single Analytics Agent, as shown in the diagram below. However, each machine where you want to gather log data must have its own Analytics Agent instance.

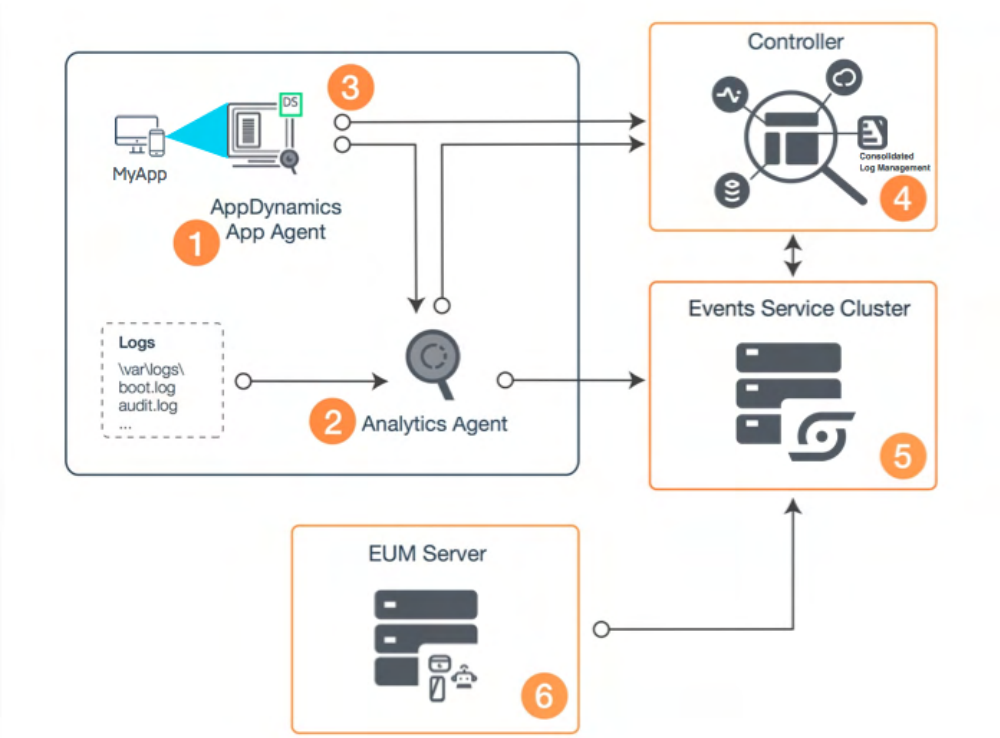


In this example, AppServerHost1-3 are collecting only Transaction data, so only app server agents are required. Each one connects to the Analytics Agent on AppServerHost4, where log information is also being collected. The Analytics Agents could also reside on the same machines as each app server agents. On AppServerHost5, only log data is being collected, so an Analytics Agent is also necessary there.

Server Side Components for On-premises

To set up AppDynamics Analytics on-premises, you also need to install the server parts of the system, the AppDynamics Controller, and the Events Service.

The following figure depicts the basic components of an on-premises deployment:



Legend: Server Components

> If you are using SaaS EUM, you must use the SaaS Events Service. If you are using the on-premises EUM Server, you must use an on-premises instance of the Events Service.

4 AppDynamics Controller: The heart of an AppDynamics deployment, the Controller processes and presents the information gathered by the agents.

5 Events Service: The unstructured document store, it gathers and stores data from the Analytics, Database, and Network Visibility Agents and, if you have End User Monitoring, from 6, the EUM Server. It allows the Controller UI to run queries on that data.

Install Agent-Side Components

On this page:

Related pages:

- Analytics Agent Components

This page provides an overview of how to configure Application Analytics components to collect business transaction data.

In most Application Analytics deployment scenarios, you must enable the Analytics Agent-side components. The agents are distributed as system-based operations or standalone bundles in the AppDynamics Downloads Portal.

If your app server agent supports Agentless Analytics, such as the Java Agent (4.5.15 and later) and .NET Agent (20.10 and later), you do not need to install the standalone Analytics Agent or Machine Agent extension for Transaction Analytics data collection. See Deploy Analytics Without the Analytics Agent for more information.

Prepare to Enable the Agents

Review the deployment options, agent-side component architecture, and components you will need to install in Deploy Analytics With the Analytics Agent.

Analytics Agent

The Analytics Agent collects and sends data from the AppDynamics App Agent and log files to the Events Service. The Analytics Agent is not enabled by default. You need to download and enable the desired bundle using a method of your choice.

To use Application Analytics:

1. Obtain a separate Application Analytics license.
2. Enable the Analytics Agent.
3. Point to the Event Service. See Revise the Analytics Agent Properties File for agent-specific configuration and Event Service Deployment for the Event Service.
4. Enable Analytics on the Controller.

AppDynamics App Agent

To access Analytics and collect transaction data from an application, you must deploy a supported app server agent version in all environments, such as the Node.js Agent or the PHP Agent. If you already use AppDynamics APM, agents may already be installed in your environment.

Install the Standalone Analytics Agent on Windows

As described in Analytics Deployment Options, the Analytics Agent can run on the same host or on a different host from the app server agent, depending on your use case.

The AppDynamics Downloads Portal provides the following distribution archives:

- Standalone Analytics Agent (no JRE)
- Analytics Agent with JRE 1.8 for both 32-bit and 64-bit Windows machines

Revise the Analytics Agent Properties File

The Analytics Agent properties file determine how your Analytics Agent communicate with other components, what type of data it gathers from the monitored application, and how the components of the Application Analytics deployment and the Controller authenticate to each other.

Modify the default configuration and set the desired values for the agent properties in the properties file. The location of this file depends on your exact deployment scenario.

1. Open the `<analytics-agent-home>/conf/analytics-agent.properties` file with a text editor. The Analytics Agent on Windows requires double backslash for paths.
   For example:

```
conf.dir=C:\\AppD\\analytics-agent\\conf
ad.dw.log.path=C:\\AppD\\analytics-agent\\logs
```

2. To run the Analytics Agent as a Windows service, modify the following properties:
    - `ad.dw.log.path=<analytics-agent-home>\\logs`
    - `conf.dir=<analytics-agent-home>\\conf`
    - ad.jvm.options.name=analytics-agent.vmoptions
    - `ad.jvm.heap.min=512m`
    - `ad.jvm.heap.max=1g`
3. Follow the instructions to enable the standalone Analytics Agent.
4. To install the Analytics Agent on Windows, run the `install` command:

```
bin\analytics-agent.exe service-install
```

Start and Stop the Analytics Agent

To start/stop the Analytics Agent on Windows, run the following commands in the Windows Services menu.

To start the agent, run:

```
bin\analytics-agent.exe service-start
```

To stop the agent, run:

```
bin\analytics-agent.exe service-stop
```

Uninstall the Analytics Agent

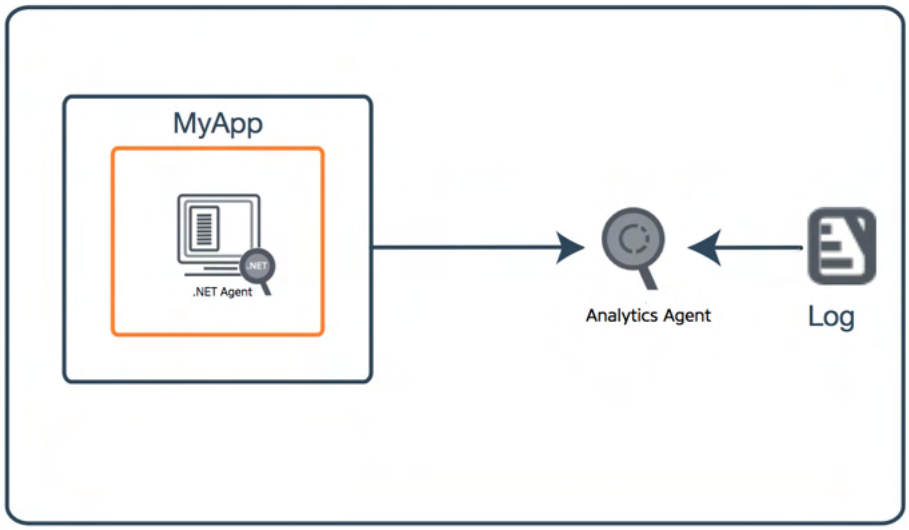
To uninstall the Analytics Agent, run the `.exe` file with the `uninstall` command:

```
bin\analytics-agent.exe service-uninstall
```

Enable Analytics Agent for a Local App Server Agent

This section assumes that you are installing the Analytics Agent on the same host as your app server agent.

In this deployment, the Analytics Agent reads and transmits log data in log files from the local machine. The app server agent transmits data from the monitored application to the Analytics Agent.

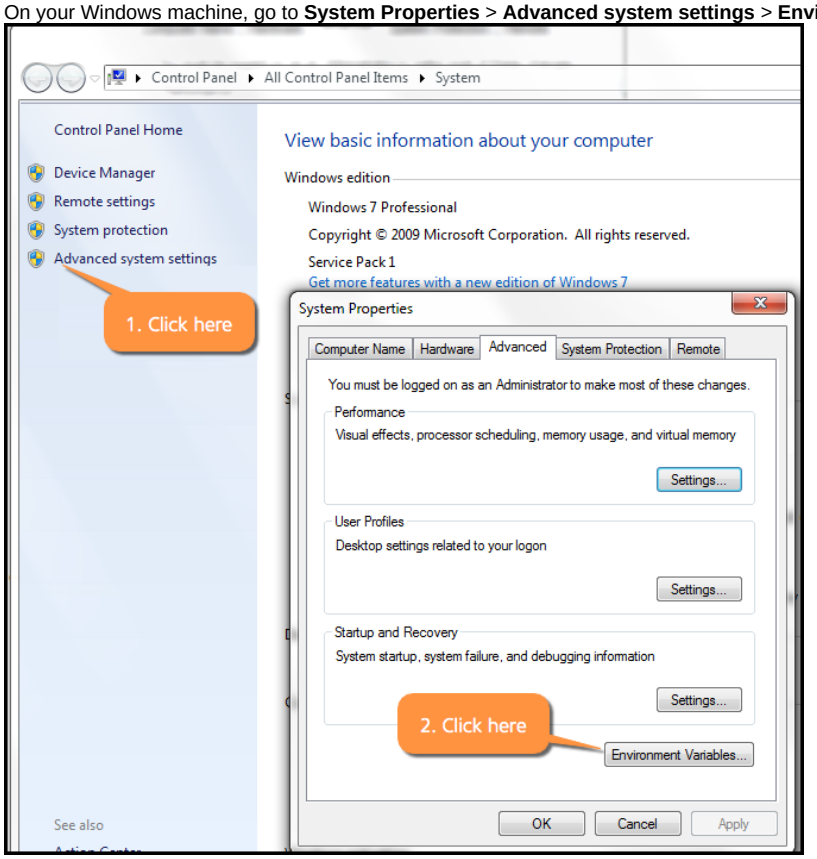


Install the Analytics Agent with the `.exe` and `analytics-agent.exe` files found in the *<analytics-agent-home>*`/bin` directory. Because the Analytics Agent is written in Java, you will run the agent in a Java Virtual Machine (JVM). The Analytics Agent runs as a Windows service.

Enable the App Server Agent for a Remote Analytics Agent

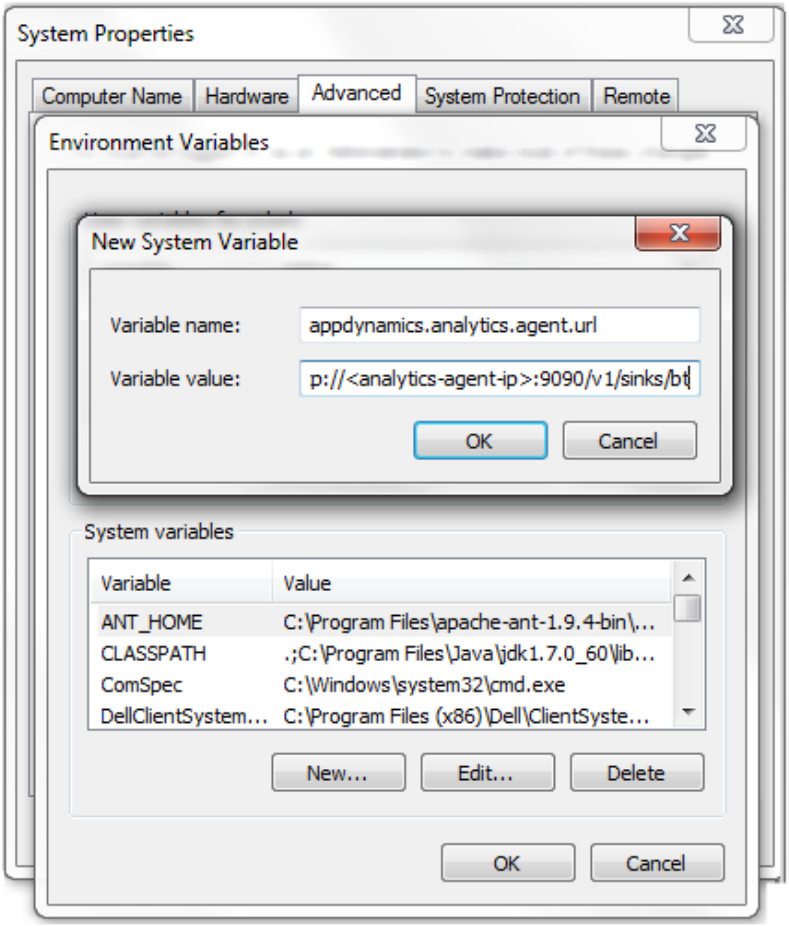
To specify the location of the remote Analytics Agent with an environment variable named `appdynamics.analytics.agent.url` on Windows:

1. On your Windows machine, go to **System Properties** > **Advanced system settings** > **Environment Variables**.



2. Under **System Variables**, click **New**. AppDynamics recommends a system environment variable approach as opposed to a user environment variable approach; in the environment variable approach, a user must have the same permissions as the user with all the instrumented applications running.

3. Set the value for the `appdynamics.analytics.agent.url` system variable to `http://<analytics-agent-ip>:9090/v2/sinks/bt`. Replace `<analytics-agent-ip>` with the hostname of the Analytics Agent for your environment.



4. Restart the applicable application or process where you want the new environment variables to take effect. While it is not required that you restart your machine, the parent process that invokes the monitored process must be restarted. For `w3wp` on Windows, restart IIS by running `iisreset` after the changes are made to the environment variables.

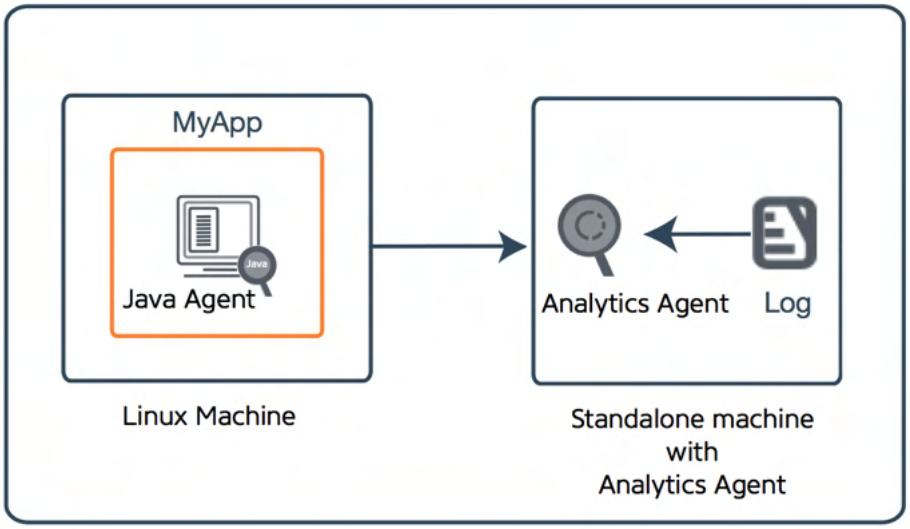
Install the Standalone Analytics Agent on Linux

As described in Analytics Deployment Options, the Analytics Agent can run on the same host or on a different host from the app server agent, depending on your use case.

The AppDynamics Downloads Portal provides the following distribution archives:

- Standalone Analytics Agent (no JRE)

The default settings of the app server agent typically assume that the Analytics Agent is on the same host and uses the default port. If your Analytics Agent is on a host separate from the app server agent, as shown in the diagram below, or you have changed the default port, you need to specify the new host and port values for the app server agent.



Revise the Analytics Agent Properties File

The Analytics Agent properties file determine how your Analytics Agent communicate with other components, what type of data it gathers from the monitored application, and how the components of the Application Analytics deployment and the Controller authenticate to each other.

Modify the default configuration and set the desired values for the agent properties in the properties file. The location of this file depends on your exact deployment scenario.

1. Open the `<analytics-agent-home>/conf/analytics-agent.properties` file with a text editor.
2. Follow the instructions to enable the standalone Analytics Agent.

Start and Stop the Analytics Agent

You can start and stop the Analytics Agent directly in the command line.

To start the agent, run:

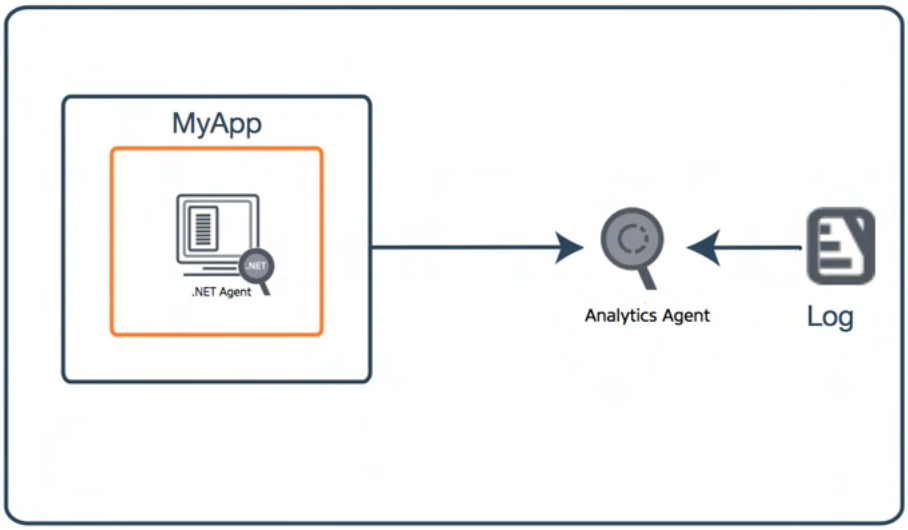
```
<analytics agent executable> start
```

To stop the agent, run:

```
<analytics agent executable> stop
```

Run the Analytics Agent From a Read-Only Filesystem

In this deployment, the Analytics Agent is installed and run from a read-only filesystem. To do so, you need to direct the Analytics Agent to write its log files to a writable partition.



By creating a directory for the Analytics Agent in a writable file system and symlinks for the content of the Analytics Agent in the read-only file system, you will have a writable top-level directory for the Analytics Agent and a writable logs directory under the top-level directory.

To run the Analytics Agent from a separate writable directory using artifacts from a read-only directory:

1. Provide necessary permissions to the read-only Analytics Agent directory.

```
# analytics-agent-readonly refers to the read-only analytics agent.
chmod -R 555 /tmp/analytics-agent-readonly/
```

2. Create a directory for the Analytics Agent in a writable file system.

```
mkdir /tmp/analytics-agent-writable
chmod 755 analytics-agent-writable/
cd /tmp/analytics-agent-writable
```

3. Create symlinks to the contents of the Analytics Agent in the read-only file system.

```
ln -s /tmp/analytics-agent-readonly/bin/ bin
ln -s /tmp/analytics-agent-readonly/lib/ lib
ln -s /tmp/analytics-agent-readonly/monitor.xml monitor.xml
```

4. Create a writable `conf` directory under that top-level directory.

```
cd /tmp/analytics-agent-writable
mkdir conf
chmod 755 conf/
cd conf
```

5. Create symlinks to the contents of the `conf` directory.

```
ln -s /tmp/analytics-agent-readonly/conf/analytics-agent.* .
ln -s /tmp/analytics-agent-readonly/conf/job/ job
ln -s /tmp/analytics-agent-readonly/conf/grok/ grok

cd /tmp/analytics-agent-writable
```

6. Create logs directory under the `analytics-agent-writable` directory.
7. Run the Analytics Agent from the `writable` directory.

```
cd /tmp/analytics-agent-writable
nohup bin/analytics-agent.sh start &
```

8. The resulting directories look similar to:

```
/tmp/
dr-xr-xr-x  6 ec2-user ec2-user 4096 Jul 17 20:45 analytics-agent-readonly
drwxr-xr-x  4 ec2-user ec2-user 4096 Jul 26 20:17 analytics-agent-writable

 /tmp/analytics-agent-writable/
total 24
drwxr-xr-x . . . 4096 Jul 27 19:41 .

```

Enable the App Server Agent for a Remote Analytics Agent

For most configurations, install the Analytics Agent on the same machine as the app server agent. In certain setups, such as installing an Analytics Agent extension, you will need a separate machine.

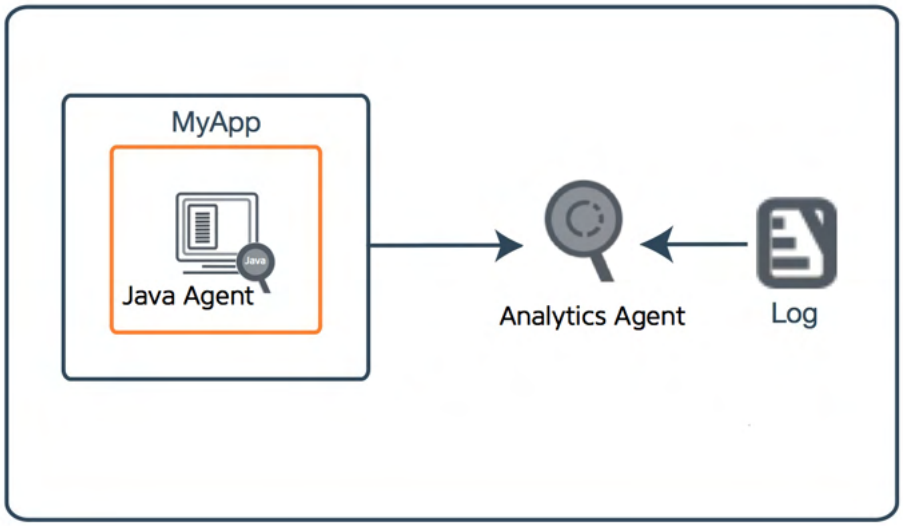
1. Specify the location of the remote Analytics Agent with a `-D` parameter. The argument is passed to the monitored application as follows:

```
-Dappdynamics.analytics.agent.url=http://<analytics-agent-ip>:9090/v2/sinks/bt
```

2. Replace `<analytics-agent-ip>` with the hostname of the Analytics Agent for your environment.

Enable the Standalone Analytics Agent

In this deployment, the Analytics Agent and app server agent runs on the same machine. The Analytics Agent reads and transmits log data from log files on the host machine. The app server agent transmits data from the monitored application to the Analytics Agent.



For environments that do not have a Machine Agent installed, install the Analytics Agent as a separate binary, `analytics-agent.sh`.

1. Unzip the Analytics Agent distribution archive to the installation directory on each target host.
   When you unzip this archive, you get three directories:
   - `bin`: contains the binary file for Linux, Solaris, and OSX
   - `lib`: contains all the jar files that need to be in the classpath
   - `conf`: contains all the configuration files, such as the properties and `vmoptions` files
2. Open the following file to configure connectivity from the Analytics Agent to the Events Service.

   ```
   <analytics-agent-home>/conf/analytics-agent.properties
   ```

3. In the `analytics-agent.properties` file, do the following:

   - Change the default URL and, if necessary, the port number to connect the Events Service by modifying the `http.event.endpoint` value.
     For example:

     ```
     http.event.endpoint=http://<events_service_host:events_service_port>
     ```

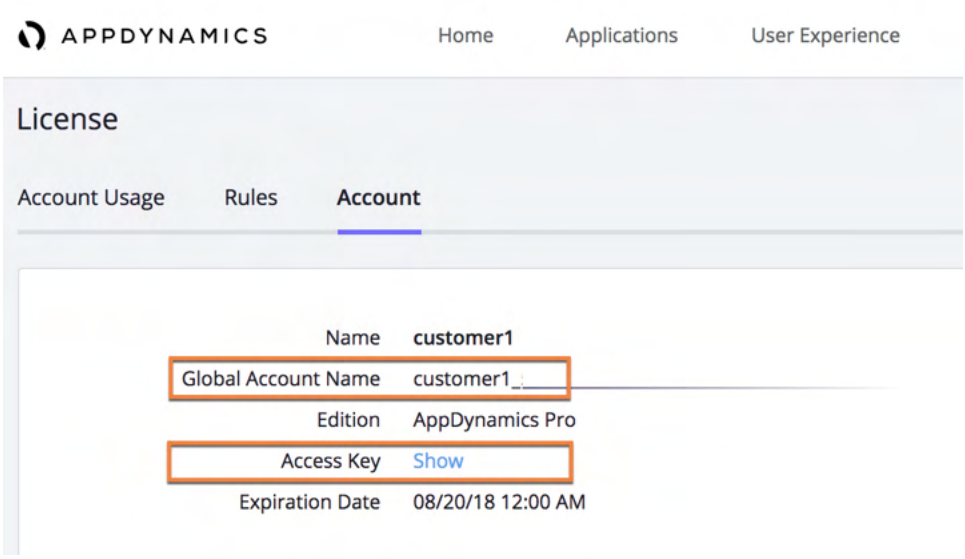
     For SaaS-based installations, the host and port are:

     - `https://analytics.api.appdynamics.com:443` (North America)
     - `https://fra-ana-api.saas.appdynamics.com:443` (Europe)
     - `https://sydn-ana-api.saas.appdynamics.com:443` (APAC)

     If your firewall rules use IP addresses, review firewall considerations in Troubleshoot Analytics Agent Issues. For on-premises installations, use any host and port that you have configured. In clustered environments, this is often a load balancer.
   - Change the default URL and the port number to point to the Controller by modifying the `ad.controller.url` property.
     For example:

     ```
     ad.controller.url=http://<application_server_host_name>:<http-listener-port>
     ```

     This is the URL and the port number you use to access the Controller UI.
4. The **Global Account Name** and **Access Key** values are found under **View License** in the Controller.



5. Configure the account and account key for which the agent should publish the business transaction data. Use the **Global Account Name** and **Access Key** values you have collected earlier. For example:

```
# The global_account_name in the Controller for this analytics data, similar to the following:
http.event.accountName=<customer1_74678b04-8a71-40ef-acaf-xxxxxxxxxxxx>
# Replace this value with the access key of the account name configured above.
http.event.accessKey=<3d58aba2-xxx-xxx>
```

   The `http.event.accountName` property specifies the **Global Account Name** of the account. The `http.event.accessKey` property specifies the **Access Key**, which provides an authentication mechanism between the Controller and the components of the Application Analytics deployment. The Controller installation process generates the **Access Key** value.
   For SaaS-based installations, set the `http.event.name` property to **Name** of the account. The default value is `customer1`. If the property is not configured correctly, the Analytics Agent will not be able to authenticate. The resulting errors are stored in the `analytics-agent.log` file.
6. If you are collecting log information on this host, you need to:
   - Configure your log sources. See Collect Log Analytics Data for details.
   - Update additional properties. See Configure Properties for Consolidated Log Management.
7. Save and close the file.
8. Start the Analytics Agent by running the following command.

```
bin\analytics-agent.sh start
```

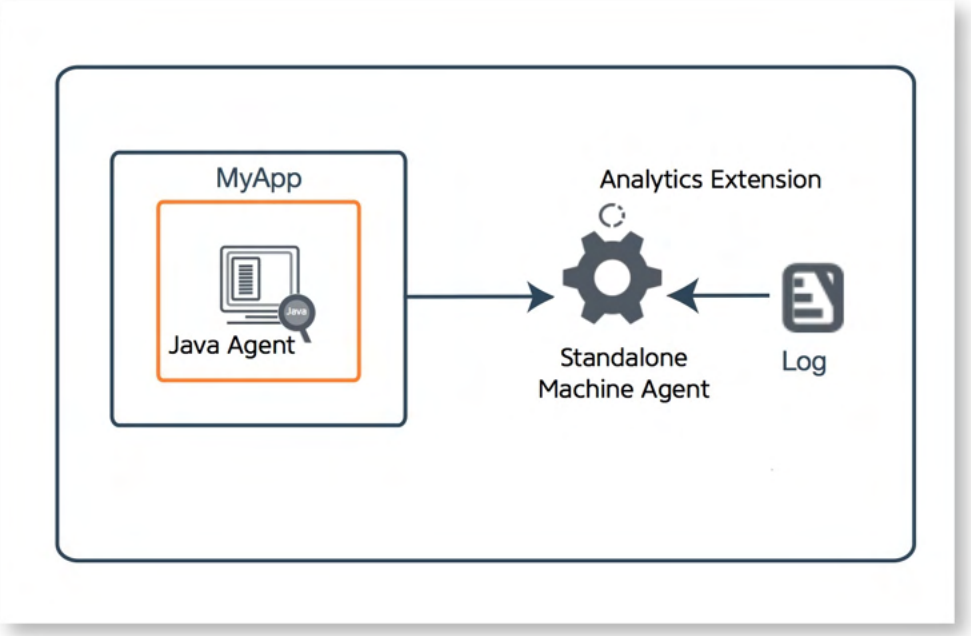
Enable the Analytics Agent as an Extension to the Standalone Machine Agent

This section describes how to configure the Analytics Agent as an extension to the Standalone Machine Agent and run as a Machine Agent monitor.

The AppDynamics Downloads Portal provides the following distribution archives:

- Machine Agent Bundle - 64-bit osx (zip)
- Machine Agent Bundle - for both 32-bit and 64-bit Linux machines (rpm)
- Machine Agent Bundle - for both 32-bit and 64-bit Linux machines (zip)
- Machine Agent Bundle - for 64-bit solaris (zip)
- Machine Agent Bundle - for 64-bit solaris-sparcv9 (zip)
- Machine Agent Bundle - for 64-bit solaris-x64 (zip)
- Machine Agent Bundle - for both 32-bit and 64-bit Windows machines (zip)

If the Machine Agent and app server agent are running on the same machine, installing a standalone Analytics Agent is not necessary. In environments with the standalone Machine Agent already running, you can enable and run the Analytics Agent as an extension.



Confirm that JRE 8 or later is installed on the host running the standalone Machine Agent. If the required version of JRE is not available on the host, then the Analytics Agent cannot be enabled.

1. On the host running the standalone Machine Agent, open `<machine-agent-home>/monitors/analytics-agent/monitor.xml` with a text editor.
2. Set the enabled tag to `true` and save the file when you are finished.

```
<monitor>
    <name>AppDynamics Analytics Agent</name>
    <type>managed</type>
    <!-- Enabling this requires JRE 8 or higher  -->
    <enabled>true</enabled>
...
```

3. Open the following file to configure connectivity from the Analytics Agent to the Events Service:

```
<machine-agent-home>/monitors/analytics-agent/conf/analytics-agent.properties
```

4. Follow the instructions to enable the standalone Analytics Agent.
5. If the Machine Agent is already running at this point, restart it to pick up the changes in the configuration.

> To connect to the Events Service through a proxy server, see Connect the Agent to the Events Service through a Proxy.

Tune Analytics Agent

This section describes the post-installation configuration of the Analytics Agent: configuring Analytics Agent to connect to an Event Service with a proxy server, collecting log files using Consolidated Log Management (CLM), setting resource usage limit, and changing JVM options.

Connect to the Events Service through a Proxy

If the Analytics Agent needs to connect to the Events Service through a proxy server:

1. Open *<analytics-agent-home>*`\conf\analytics-agent.properties` with a text editor.
2. Add this information:

```
# optional proxy properties
http.event.proxyHost=<your proxy host>
http.event.proxyPort=<your proxy port>
http.event.proxyUsername=<your proxy username, if authentication is required>
http.event.proxyPassword=<your proxy password, if authentication is required>
```

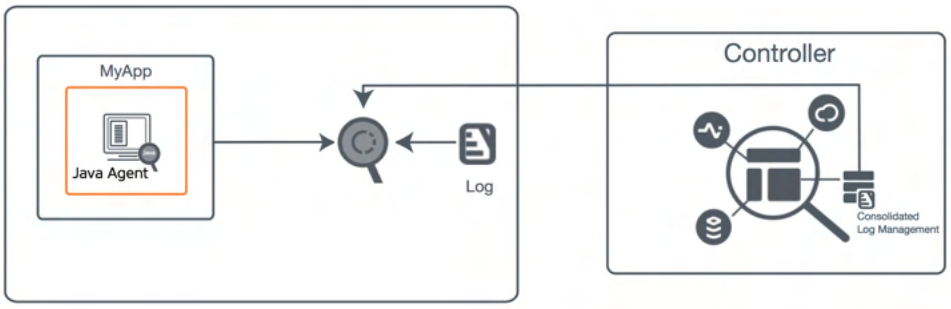
3. Save and close the file.

Configure Analytics Agent for Consolidated Log Management

If you want your Analytics Agent to work with CLM you need to configure a few properties in the Analytics Agent properties file.

Provide the Controller URL, customer name, and name of your Analytics Agent in the `analytics-agent.properties` file. The customer name is found under **View License** in the Controller.

If you are using CLM to configure your log files with source rules, you will need to provide these properties with the correct values.



The default values are the following:

```
# Format should be http://<host>:<port>
ad.controller.url=http://localhost:8090

# The customer name field from the AppDynamics license page.
http.event.name=customer1

# This is the friendly agent name that will show up in the controller when the agent registers and syncs
configuration.
ad.agent.name=analytics-agent1
```

Change Java Virtual Machine Options

If you need to change any JVM startup options, modify `<analytics-agent-home>/conf/analytics-agent.vmoptions` with a text editor.

The `vmoptions` file name is read from the `ad.jvm.options.name=analytics-agent.vmoptions` properties file. If you change the `vmoptions` file name, you will need to change the `ad.jvm.options.name` property as well.

If the Analytics Agent Windows service is installed and you need to change the properties file or the `vmoptions` file, you need to uninstall the service and reinstall it for the changes to take effect.

Configure Resource Usage Limit

To limit resource usage, you can enable the default limit on the number of job for a single Analytics Agent.

This limit can be overridden but is not recommended without a thorough understanding of the potential impact on resource usages, such as CPU usage, disk, and network I/O.

The property is `ad.max.enabled.jobs` and is found in the *<analytics-agent-home>*`/conf/analytics-agent.properties` file. By default, `ad.max.enabled.jobs` is set to 20.

Verify Analytics Agent Status

To verify that the Analytics Agent has started, look for the following entry in the App Agent log file: `Started [Analytics] collector`.

To connect to the Events Service through a proxy server, see Connect the Agent to the Events Service through a Proxy.

Troubleshooting Tips

- Ensure that the properties in `analytics-agent.properties` are properly set. See Enabled Job Files Limit.
- JRE version is >= 1.7 and the `JAVA_HOME` variable is set in the environment.
- All properties in `analytics-agent/conf/analytics-agent.vmoptions` are compatible with the JRE.

Install Agent-Side Components in Kubernetes

This page describes the deployment options for Transaction Analytics and Log Analytics instrumented with AppDynamics app server agents in Kubernetes applications. See Install Agent-Side Components.

> Transaction Analytics and Log Analytics require that an Analytics Agent is deployed with an app server agent. The Java Agent >= 4.5.15 or the .NET Agent >= 20.10 does not require deploying an Analytics Agent for Transaction Analytics. See Deploy Analytics Without the Analytics Agent.

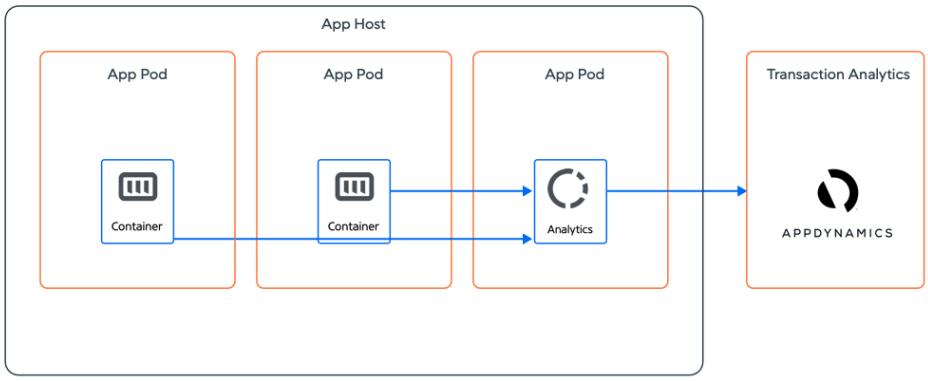
Transaction Analytics

The Analytics Agent acts as a proxy between the app server agent and the Events Service. See Deploy Analytics With the Analytics Agent.

There are two deployment options for the Analytics Agent to support Transaction Analytics on a Kubernetes application.

1. A sidecar to the application container.

   In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container.
2. A shared agent where a single Analytics Agent is deployed on each Kubernetes worker node. Each pod on the node will use that Analytics Agent to communicate with the Events Service.



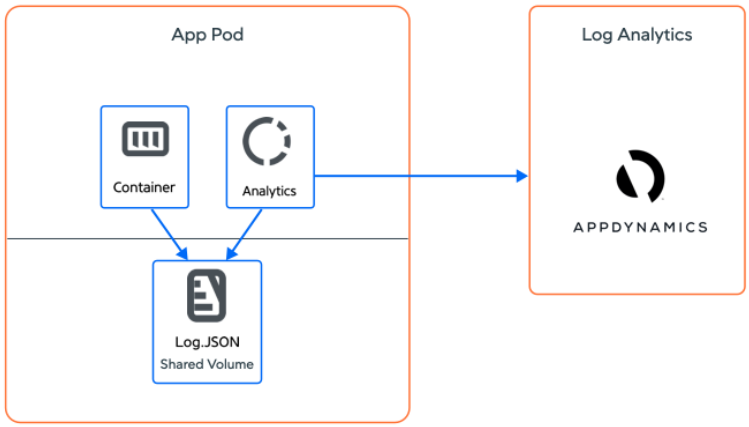
In this model, the Analytics Agent is deployed as a Daemonset.

Log Analytics

Once deployed, the Analytics Agent has access to the application's logs and can send log data to the Events Service.

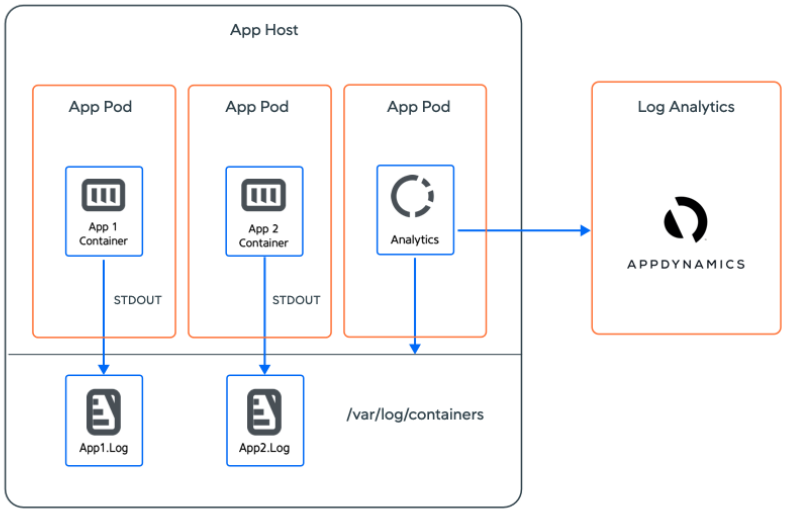
There are three deployment options for the Analytics Agent to support Log Analytics on a Kubernetes application.

1. A sidecar to the application container.



In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container. The Analytics Agent and application container are configured to share a volume where the application logs are written.

2. If the application bypasses the container filesystem and emits log data to `STDOUT` and `STDERR`, the Analytics Agent can be deployed on each Kubernetes worker node. The Analytics Agent can access the log output for every application container on the worker node's file system, stored by Kubernetes under `/var/log/containers` as a unique file per container.



In this model, the Analytics Agent is deployed as a Daemonset.

> For some Kubernetes distributions such as OpenShift, the Analytics Agent will require elevated permissions to access the files under `/var/log/containers`.

3. If a syslog provider is available in the Kubernetes cluster, the Analytics Agent can be deployed to receive syslog messages with TCP transport. A single Analytics Agent instance is required per syslog provider. See Collect Log Analytics Data from Syslog Messages.

For Transaction and Log Analytics, the sidecar approach is simpler to deploy, but consumes more cluster resources because it requires one additional container per application pod. The shared agent approach adds another deployment object to manage, but can significantly reduce the overall resource consumption for a cluster.

Example Configurations to Deploy the Analytics Agent

The following deployment specs are specific examples of how to implement the deployment options explained above. In addition, see Install the .NET Agent for Linux in Containers and Install the Node.js Agent in Containers for best practices on how to set the Analytics Agent host, port, and SSL environment variables.

Transaction Analytics: Deployment Spec Using A Sidecar

The following deployment spec defines two containers, the application container `flight-services`, which uses an image instrumented with an app server agent, and the Analytics Agent container `appd-analytics-agent`, which uses the Analytics Agent from Docker Hub, `docker.io/appdynamics/analytics-agent:latest`.

The `appd-analytics-agent` container leverages a ConfigMap and Secret to configure the Events Service credentials required by the Analytics Agent, including the account access key and global account name. See Install Agent-Side Components.

As a sidecar, the Analytics Agent is available at `localhost` and uses the default port 9090. The app server agent will connect automatically and no additional configuration is required.

```
apiVersion: apps/v1

...
```

The full spec can be found in the Flight Services YAML File. The `controller-info` ConfigMap can be found in the Controller Info YAML File. The command to create `appd-secret` can be found in Secret.

Transaction Analytics: Deployment Specs Using A Shared Analytics Agent

The following deployment spec is for the same `flight-services` application, but instead of using a sidecar, it references a shared Analytics Agent deployed separately as a Daemonset. The `flight-services` container sets the agent environment variables `APPDYNAMICS_ANALYTICS_HOST` and `APPDYNAMICS_ANALYTICS_PORT` to the `analytics-proxy` service for the shared Analytics Agent defined in the example below.

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: flight-services
spec:
  selector:
    matchLabels:
      name: flight-services
  replicas: 1
  template:
    metadata:
      labels:
        name: flight-services
    spec:
      containers:

        envFrom:
          - configMapRef:
              name: controller-info
        env:
        - name: APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY
          valueFrom:
            secretKeyRef:
              key: appd-key
              name: appd-secret
        - name: APPDYNAMICS_AGENT_TIER_NAME
          value: flight-services
        - name: APPDYNAMICS_ANALYTICS_HOST
          value: analytics-proxy
        - name: APPDYNAMICS_ANALYTICS_PORT
          value: "9090"
        ports:
        - containerPort: 8080
          protocol: TCP
      restartPolicy: Always
...
```

The full spec can be found in the Flight Services YAML File. Use this spec in conjunction with the following deployment spec.

In the `analytics-agent.yaml` file below, the shared Analytics Agent is deployed as a Daemonset. The file also defines a service `appd-infra-agent-service` that publishes an endpoint in the namespace where the shared Analytics Agent can be reached.

```
apiVersion: apps/v1
kind: DaemonSet
metadata:
  name: appd-infra-agent
spec:
  selector:
    matchLabels:
      name: appd-infra-agent
  template:
    metadata:
      labels:
        name: appd-infra-agent
    spec:
      serviceAccountName: appdynamics-infraviz
      containers:

  loadBalancer: {}
```

The full deployment spec can be found in the Machine Agent YAML File. The `appdynamics-infraviz` service account is defined in the RBAC YAML File . The ma-log-config ConfigMap is defined in the Machine Agent Log Config File.

A best practice is to deploy the shared Analytics Agent in a dedicated namespace (typically `appdynamics`) separate from the namespaces used by applications.

```
$ kubectl -n appdynamics apply -f analytics-agent.yaml
```

To provide access to the shared Analytics Agent from an application namespace:

1. An `ExternalName` service is required to map a service name (`analytics-proxy` in the example) to the DNS name of `appd-infra-agent-service` created previously:

```
kind: Service
apiVersion: v1
metadata:
  name: analytics-proxy
spec:
  type: ExternalName
  externalName: appd-infra-agent-service.appdynamics.svc.cluster.local
  ports:
  - port: 9090
    targetPort: 9090
```

2. Create this service in each application namespace where an App Server Agent is deployed:

```
$ kubectl -n <app namespace> apply -f analytics-proxy.yaml
```

3. Note that `analytics-proxy` is the value of `APPDYNAMICS_ANALYTICS_HOST` used in the `flight-services` deployment spec.

```
- name: APPDYNAMICS_ANALYTICS_HOST
  value: analytics-proxy
```

Log Analytics: Deployment Spec Using A Side Car

The following deployment spec snippet is for a Java application that defines an application container, `client-api`, and an Analytics Agent container, `appd-analytics-agent`, that acts as a sidecar to the application container. An init container, `appd-agent-attach`, is also defined, but the related definitions are removed to simplify the example.

A shared volume, `appd-volume`, is mounted to the application container and Analytics Agent container using the mount path `/opt/appdlogs`. The Java application is configured to write its logs to this path and the Analytics Agent is configured to read the logs from this path and send them to the Events Service.

The full spec can be found in the Java App YAML File.

Log Analytics: Deployment Spec For Shared Analytics Agent (STDOUT/STDERR Support)

The following deployment spec supports the use case where application containers are emitting logs to `STDOUT` and `STDERR`, not the application container filesystem.

Since Kubernetes writes the container logs to the host under `/var/log/containers`, the Analytics Agent can read them there. The Analytics Agent is deployed as a Daemonset. A volume `varlog` is defined with access to the host path `/var/log/containers` and mounted to the Analytics Agent container, `appd-analytics-agent`. The Analytics Agent is configured to read the container-specific logs written to `/var/log/containers`. See Configure Log Analytics Using Source Rules.

```

      - name: dockerlog
        hostPath:
          path: /var/lib/docker/containers
```

The full spec can be found in the Log Analytics YAML File. An OpenShift example can be found in the Log Analytics OpenShift YAML File.

Upgrade Analytics Agent

This page describes how to update the Analytics Agent standalone binary and includes some steps that are relevant only if you are collecting Log Analytics data.

If you are running the Analytics Agent through the Standalone Machine Agent, see Upgrade the Machine Agent for instructions.

> You should maintain a copy of the controller.xml file in addition to the `analytics-agent.properties`, job folder, and watermark folder.
>
> Preserving the watermark file and the job files is only necessary when you are collecting log data for analytics. The watermark file preserves information about the number of bytes read from the log sources by the Analytics Agent and is relevant only when Log Analytics is enabled. Job files contain the configuration for <= 4.3 log sources.

File Locations

After unzipping the Analytics Agent standalone binary, the file locations are:

- property file: *<analytics-agent-home>*`/conf/analytics-agent.properties`
- job files: *<analytics-agent-home>*`/conf/job`
- watermark file: *<analytics-agent-home>*`/conf/watermark`

Running Analytics Agent via the Standalone Machine Agent, the file locations are:

- properties file: *<machine-agent-home>*`/monitors/analytics-agent/conf/analytics-agent.properties`
- job file: *<machine-agent-home>*`/monitors/analytics-agent/conf/job`
- watermark file: *<machine-agent-home>*`/monitors/analytics-agent/conf/watermark`

Upgrade Procedure for Analytics Agent (Standalone Binary)

Use these steps to upgrade your Analytics Agent (standalone binary) to 4.5.

1. Stop the Analytics Agent.
2. Download the 4.5 Analytics Agent binary from the download site.
3. Extract the new zip. Be sure to extract into a new empty directory or confirm that the old directories are empty before extracting the new version. Otherwise, you may encounter errors starting the Analytics Agent.
4. (Windows only) If the Analytics Agent is installed as a Windows Service, you need to manually uninstall the old service before installing the 4.5 version.
5. Save a copy of your old analytics-agent.properties so you can copy values to the new analytics-agent.properties file.
6. Modify the new `analytics-agent.properties` file with in accordance with the steps here: Install Agent-Side Components, referring to your previous properties as needed.
7. If you have been collecting log analytics data:
    a. Copy the old watermark file to the corresponding location in the new *<analytics-agent-home>* directory structure.
    b. Copy your pre-existing job files to the corresponding location in the new *<analytics-agent-home>* directory structure.
8. Start the new Analytics Agent.
   You can observe that the agent starts the enabled job file, and starts tailing the logs from the last read position in the watermark file. Usually, a log message is displayed stating the start of the tailing from last read location. It matches with the watermark file. If at time printing log message gets out of sync, it can be manually validated through the UI that all logs have been tailed, and no duplicate logs have been tailed.

To move from job files to the new Consolidated Log Management source rules, see Migrate Log Analytics Job Files to Source Rules.

Analytics and Data Security

Related pages:

- Manage Field Visibility
- Manage API Keys
- Create and Manage Custom Roles

Application Analytics provides role-based access control (RBAC) to enable you to control and protect your data. The Analytics permissions enable you to provide granular, controlled access to features and analytics data in your environment. This topic outlines the available permissions.

Roles and Permissions

A predefined role called Analytics Administrator is provided with preset permissions for all Analytics-specific permissions.

You can clone predefined roles as a starting point for creating your own customized roles, but you should not assume the cloned roles have all of the permissions of the predefined role. In some cases, there may be hidden permissions, so you should add or remove permissions as needed for your customized role to ensure that you get the RBAC result you need.

To create roles and assign users to roles for Analytics, users need both the **Analytics Administrator** and the **Account Owner** role.

See Transaction Analytics Permissions.

Default Application

To ensure that your users have access to the full Analytics functionality they need, be sure to give them the view permission on the Default Application. This permission is given to all predefined admin roles and to the read-only role, **Applications & Dashboards Viewer**. If you create new roles for analytics, you need to grant this permission in addition to specific analytics permissions.

When you create a new role, this permission is not automatically given to that role. You can add the read-only role to new users. Alternatively, navigate to **A dministration** > **Applications** and select the **View** permission in the Default Application.

Analytics Administration UI Tabs

Access the Analytics tab in the Controller Administration UI when creating new roles to see the available permissions.

General Permissions

This section describes permissions that control access to analytics features:

- Manage Fields
- Manage APIs
- Manage Metrics
- Configure Log Analytics with Source Rules
- Manage Business Journeys
- Manage Experience Levels

Search Permissions

All the saved searches created in Analytics appear in this section. The admin role can assign View, Edit, and Delete permissions on a search by search level. The admin can create and save specific searches needed by various roles in your organization. In addition to enabling the permissions, View, Edit, and Delete, for a specific saved search, the admin must also enable access to the related application or log source type for the search. Otherwise, the data access level won't be granted to the role.

To create a new saved search, the user must have the **Can Create a Search** permission.

View permission: Assigning only the View permission for a saved search means users can not edit or delete the search.

Edit permission: Assigning Edit permission for a saved search means users can modify the filter criteria and save back to the same search.

Delete permission: Assigning Delete permission for a saved search means users can delete the search.

Event Type Permissions

Transactions Permissions: Enables the admin user to assign permissions for viewing application transaction data. Permissions can be granted to view all transaction data for the account or on an application-by-application basis. When creating new roles, remember that granting permissions to view transaction analytics data does not automatically grant permissions to see all application data associated with a specific transaction analytics record.

You need to grant at least read-only permissions to the application to enable the user to see associated transaction snapshot data such as flow maps.

Log Permissions: Enables the admin user to assign permissions for viewing log data. Permissions can be granted to view log data for all source types configured for the account or on a source by source basis.

Browser Requests Permissions: Enables the admin user to assign permissions for viewing browser request data. Permissions can be granted to view data for all applications for the account or for specific applications.

Mobile Requests Permissions: Enables the admin user to assign permissions for viewing mobile requests and crash report data. Permissions can be granted to view data for all applications for the account or for specific applications.

Custom Analytics Events: Enables the admin user to assign permissions for querying custom analytics events data. Permissions can be granted to view data for all custom analytics events or for specific applications.

Synthetic Permissions: Enables the admin user to assign permissions for querying Synthetic events data. Permissions can be granted to view data for all applications for the account or for specific applications.

Manage API Keys

Related pages:

- Create and Manage Custom Roles

This page describes how to manage REST API Keys.

The Analytics Events REST API provides three independent endpoints for these responsibilities:

- Schema Management
- Publish Events
- Query Events

API Keys provide a secure authentication mechanism for a caller to prove identity when using these public REST APIs.

Because call sites can vary across your infrastructure, departments, and geographic regions, these credentials could be widely distributed and hard to control. Publishing or querying events from different call sites, therefore, require fine-grained control over the keys and the operations allowed for a particular key. You may also need to revoke these keys on demand if they are found to be compromised.

For these reasons, managing access for the Analytics Events API uses API keys. Your organization can create multiple API keys, manage and distribute them based on your own internal policies. For instance, each department or geographic region may be assigned its own API key for distribution and control management. If an API key is compromised, it can be deleted and a new key created without other undesirable side effects.

API keys are only valid for calling the public Analytics Events REST API and can't be used to access the AppDynamics Controller or data in any other way. See Analytics Events API.

Permissions

API keys are used only for Analytics Events REST APIs. When you create an API key, you can specify read and write permissions for each API key.

Users with the **Manage API** permission can do the following actions:

- Add—Creates an API key
- Disable—Deactivates the calls using that key temporarily, but does not remove the key
- Enable—Re-enables a deactivated key
- Delete—Removes the key permanently

It may take up to 15 minutes for a key that has been deleted or deactivated to be detected and all operations using that key to be rejected.

When you create an API key, you see permissions for the various event types (logs, transactions, browser, and mobile) in our platform. By using these permissions you can limit or grant access to specific event types for each specific API key.

Examples:

Select **Publish all Custom Events** when you create their API key to generate an API key for your partners allowing them to only publish custom events.

Under **Log Permissions**, select **apache** as the **source type** to generate an API key to allow various users to only query Apache log data.

Once an API Key is created, you cannot change the permissions.

You can grant permissions for API Keys as follows:
Custom Analytics Events

- Manage Schema— Enables creation of schemas using the Analytics Events Schema Management APIs.
- Query Custom Events—Enables you to query all Analytics event types (with the appropriate permissions).
- Publish Custom Events—Enables you to publish Analytics custom events using the Analytics Events Publish APIs.

Transactions—Query all transactions or specific applications.

Logs—Query all logs or specific source types.

Browser Requests—Query all browser requests or specific applications.

Mobile Requests—Query all mobile requests or specific applications.

Synthetic Requests Permissions—Query all synthetic requests data or specific applications.

Connected Devices Permissions—Query all connected device requests data or specific applications.

If you have deployed EUM such that you are using an on-premises Events Service for transaction and log analytics data, and the SaaS Events Service for your EUM data, you can not query the browser or mobile request data using the Analytics API.

Create API Keys

1. Navigate to **Analytics > Configuration** > **API Keys**. You can view existing keys and access actions to manage the keys.
2. Click **+Add** to view the configuration panel.
3. Add a **Name** and **Description**.

   Do not click **Create** until you finish selecting all the necessary permissions for your use case, including any necessary analytics data permissions. You cannot change the permissions once create the key. You can only edit the description and whether the key is active or inactive.

4. Expand each permission section to select the permissions for this key.
5. Click **Create**.
6. Copy and save the key.
7. Select the checkbox indicating you have copied the key and click **Done**.

   You cannot retrieve the key once you dismiss this dialog.

Manage Field Visibility

Related pages:

- Create and Manage Custom Roles
- Analytics and Data Security

This page describes how to manage the visibility of fields in your analytics data. This capability enables you to prevent fields from being viewed by others in your organization.

You can set the visibility of the fields in most of the analytics event types with the exception of custom events. Hiding fields in custom events is not supported.

Permissions

The Manage Fields permission is required to manage field visibility. If a role has the Manage Fields permission, it means all the users with that role can manage all the fields they have access to. They can unhide the fields or see which fields have been hidden. For instance, if you have Manage Fields permission and View permission for the business transactions in the Ecommerce App, then you can only see and manage fields for that application.

Manage Fields

1. From the Analytics Search panel, click  next to each component grouping to open the Manage Fields panel.
2. Use the Manage Fields panel to show or hide fields. The list of fields varies based on the event type selected for the search.

Delete Extracted Fields

For >= 4.3, you may have two types of extracted fields, fields created in 4.2 where the Controller version has been upgraded to a higher version and fields extracted from logs with log source rules.

For fields created in 4.2, you can delete the fields:

1. Hover over the field and click on the view icon that appears.
2. Click on **Delete** in the popup.

For fields being extracted from logs using log source rules, you can delete the fields by editing the source rules. See Field Extraction for Source Rules.

Manage Business Journeys and Experience Levels

This page describes how to manage the visibility of business journeys and experience level management (XLM) with role-based access control (RBAC). Business journey and XLMRBAC is required to restrict access to sensitive information among your organization. If a user attempts to access restricted features, a message appears warning the user that access is denied.

Only the analytics admin can grant permissions to business journeys and XLM, as well as with their respective searches, event types, and sources. The admin authorizes access on an individual basis by assigning each user to the applicable role.

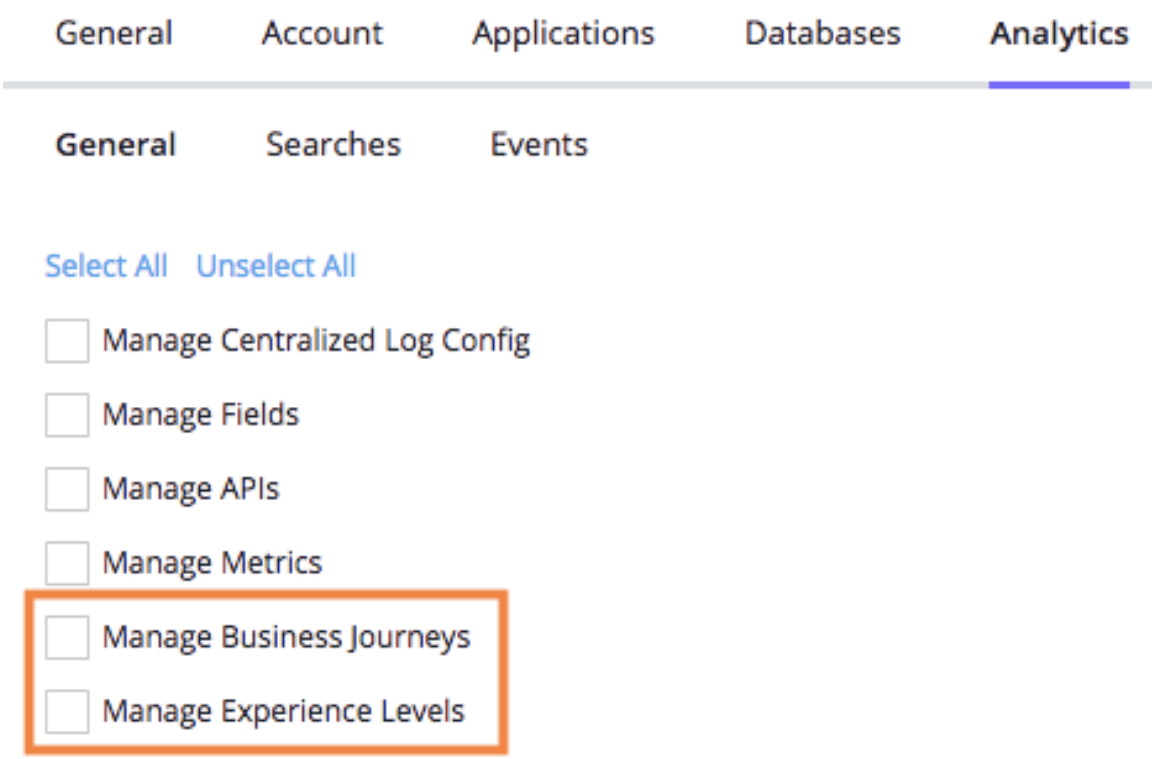
Creating Business Journey and XLM Roles

In the Controller UI, navigate to **Settings** > **Administration** > **Roles**.

The analytics admin can view and edit existing roles in the Analytics tab, which contains three sections: General, Searches, and Events. Select **+Create** to make a new role.

General Permissions

In the General tab, the analytics admin authorizes access to business journeys and/or XLM. This is required for the user to perform any actions on either business journeys or XLM. Check **Manage Business Journeys** and/or **Manage Experience Levels**:



With general permission, the user has feature level access to business journeys and/or XLM. However, the user cannot view the definition of existing events or saved searches, or create new events, with only general permission. See the below sections to enable these permissions.

> A user can access business journey data through searches without general permission to business journeys, as long as the user's role permits access to the underlying event type(s) used in business journey definition.
>
> In this way, you can restrict access to define business journeys while also allowing a user to query the data. Ensure the user has all necessary access to event type(s) in the Events tab and leave **Manage Business Journeys** unchecked.

Search Permissions

There are two search types in Analytics, drag and drop and query language. The analytics admin grants access to both types in the Searches tab.

Choose **Can Create a Search** to access both search types. Choose **+Add** to access specific saved searches.

Create search permission is required in order for a user to perform these operations:

- Save a search
- Create a metric
- Create a visual widget

Search access is dependent on event type access. A user has access to create and save searches only for the event type(s) and source(s) assigned in the user's role.

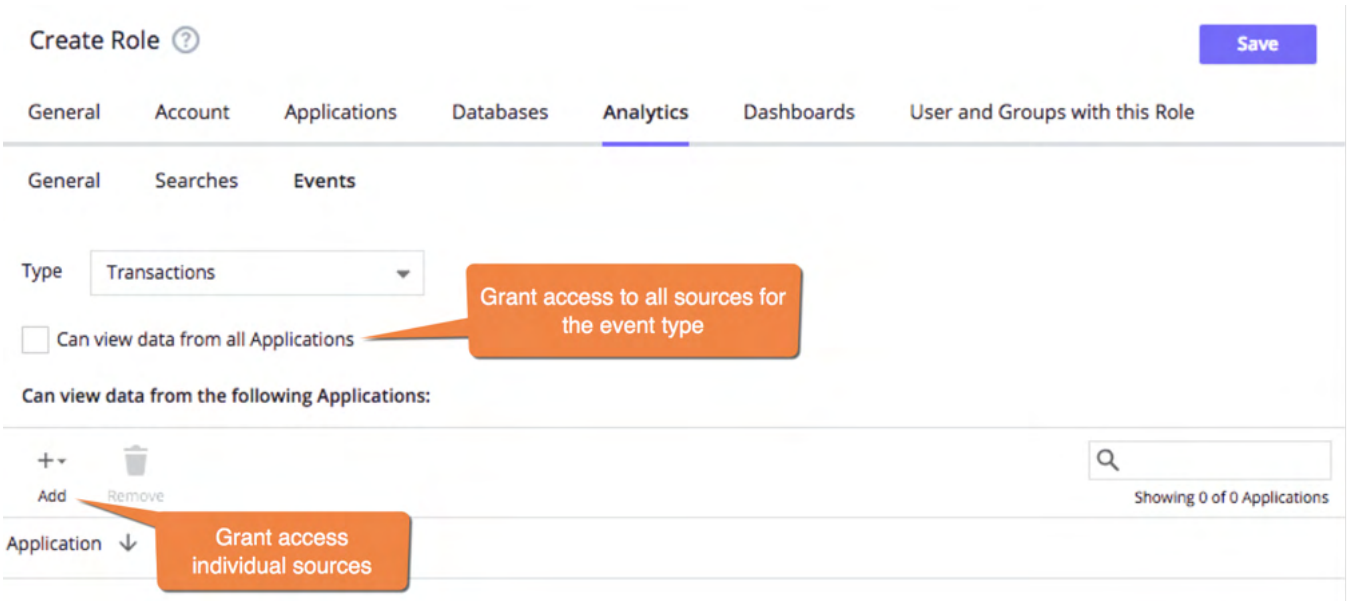
Event Type and Source Permissions

The section describes how to assign event type and source access. Granting permission to business journeys and/or XLM does not provide a user blanket access to all reports. Users have access only to the exact event type(s) and source(s) granted by the analytics admin. For example, transactions are an event type, and their source is applications. Therefore, if a user requires access to particular applications, the analytics admin must select transactions as well as each necessary application for the user.

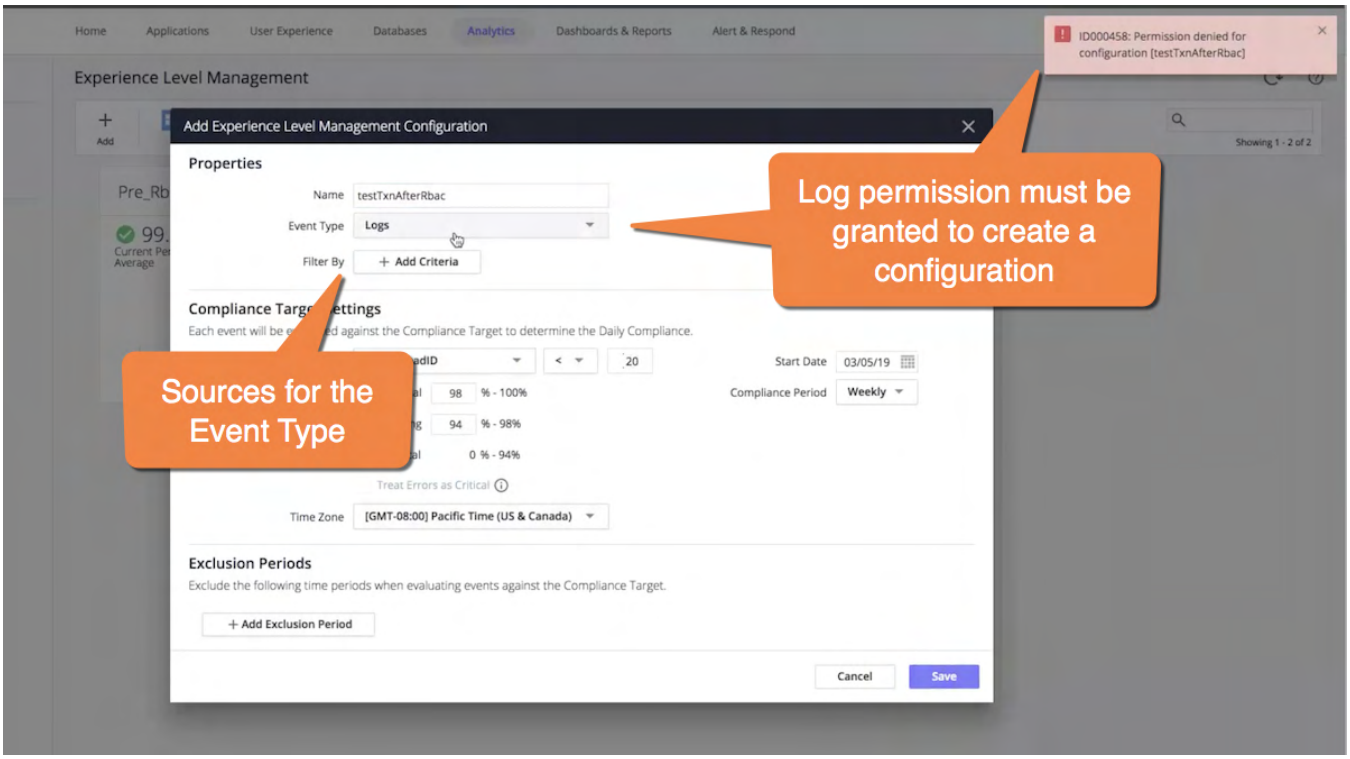
This table lists the available event types and their corresponding sources:

Event Type	Source
Transaction	Application
Log	Source Type
Browser Records	App Key
Mobile Records and Sessions	App Key
Synthetic Session	App Key
Connected Devices	App Key
Custom Analytics Events	Particular user-defined event type

You can specify exact access in the Events tab. Select the event type, then specify access for the relevant source. Check "**Can View Data from all** `[source]`**"** to grant blanket access to each source. To select individual sources, click **+Add**.



With the appropriate event type and source permissions, the user can access existing reports as well as create new reports. For example, a user with permissions to Transactions and all applications can now create a new configuration for any application. However, if this user attempts to create a configuration for Log events, the configuration does not save and an error message appears in the UI:



For XLM configurations, the **Filter By** field indicates the source(s) of the given **Event Type**. Users with limited permission to sources need to add their permitted source(s) as filter criteria. If you do not specify filter criteria, you must have permission to all sources for the event type to create the configuration.

Dashboard Access

Grant permission to dashboards in the Dashboard tab. In this tab, the admin specifies if a user can create dashboards and time permissions, as well as custom permissions.

If an Analytics dashboard contains data from business journeys and/or XLM, access to the dashboard depends on the above permissions. For example, a role that allows its users to create a dashboard, but contains no permission to business journeys, does not permit the user to access a business journey-related dashboard. Ensure that roles have the necessary permission to access Analytics data and general dashboard access.

View Analytics Agent Health

This page describes how to access the health list of Analytics Agents.

You can view Analytics Agents connected to your Controller in **Settings > AppDynamics Agent > Analytics Agents**. You can also view agent status and health information for the Log Analytics and Transaction Analytics pipelines.

When a new Analytics Agent starts and connects to the Controller, it registers with the Controller. Once the agent is registered, the agent requests configuration information every five minutes. As part of this request, the Analytics Agent reports health status information to the Controller. A healthy pipeline means analytics data is flowing from the Analytics Agent to the Events Service successfully.

Condition	Transaction Pipeline Health	Log Pipeline Health
Analytics Agent does not contact the Controller for more than five minutes.	Not connected	Not connected
No business transaction analytics data is flowing and there are no errors in the connection.	Connection is healthy, no data flowing	Not Applicable
Business transaction analytics data is flowing and the Agent is publishing to the Events Service successfully with no errors.	Healthy	Not Applicable
Business transaction analytics data is flowing, but the Agent is experiencing errors while publishing transactions to the Events Service.	Unhealthy	Not Applicable
No log analytics data is flowing and there are no errors in the connection.	Not Applicable	Connection is healthy, no data flowing
Log analytics data is flowing and the Agent is publishing to the Events Service successfully with no errors.	Not Applicable	Healthy
Log analytics data is flowing, but the Agent is experiencing errors while publishing transactions to the Events Service.	Not Applicable	Unhealthy

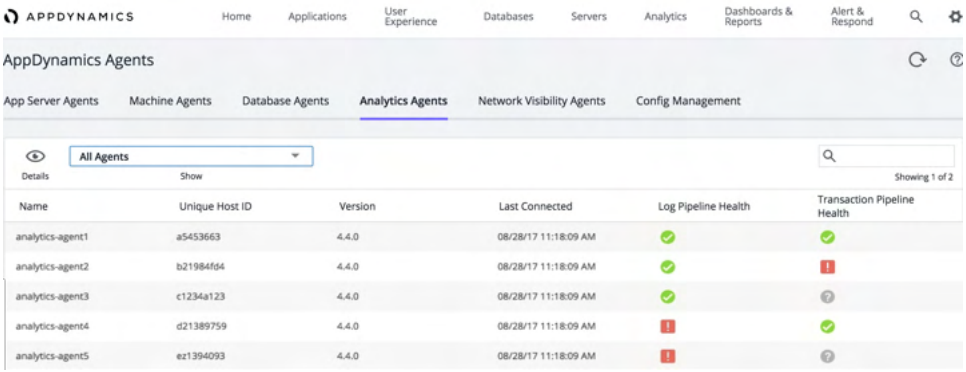
Permissions

To view the Analytics Agents list, you must belong to a role with the Account level **Administer users, groups, roles, authentication, etc. View Lic**
AppDynamics Agents. Use Agent Download Wizard permission. The default Account Owner and Analytics Administrator roles have this permissi

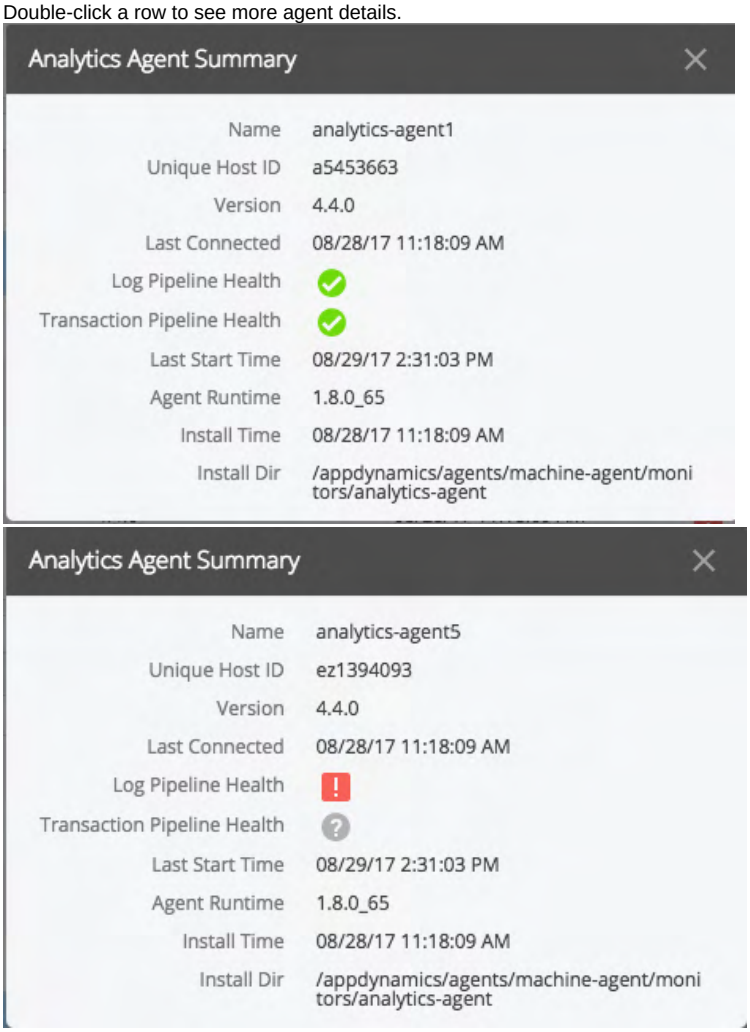
Access Analytics Agent Health List

To access Analytics Agents health view, navigate to **Settings > AppDynamics Agents > Analytics Agents**.

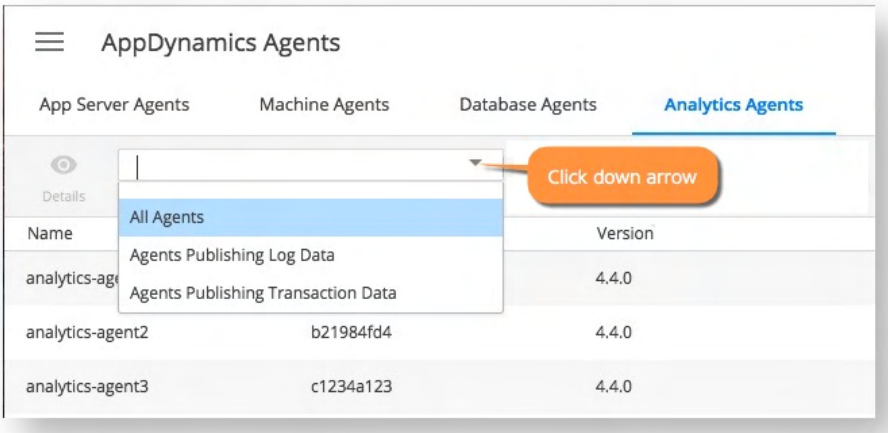
1. View information for connected Analytics Agents.



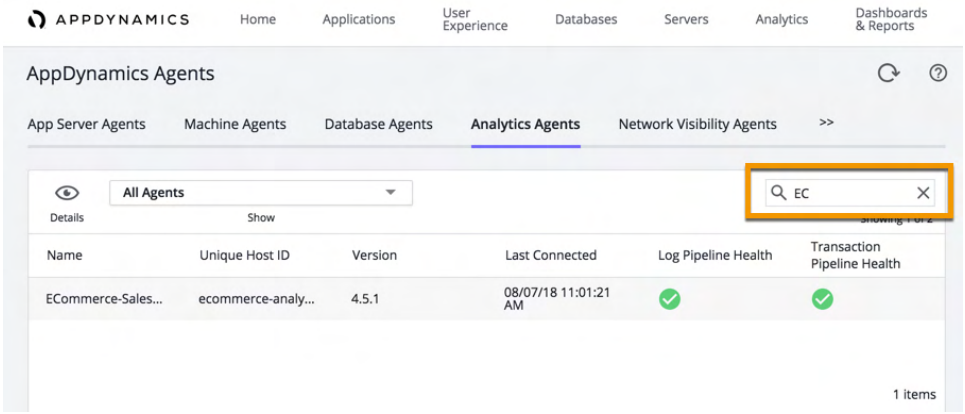
2. Double-click a row to see more agent details.



3. View Analytics Agents by event type (log data and business transaction data).



4. Perform a search on the list of registered Analytics Agents.



Analytics Licenses

Related Pages:

- License Management
- License Entitlements and Restrictions

This page describes how to interpret the details of your Analytics license. The information is split between Infrastructure-based Licensing and Agent-based Licensing. To see a complete list of licenses and packages, see License Entitlements and Restrictions.

Licensing for Analytics

Analytics licenses differ depending on what licenses you purchase. Under the Infrastructure-based Licensing model, Analytics licenses are part of monitoring packages, except for Log Analytics, which is a seperate license. Under the Agent-based model, each Analytics agent is licensed separately. Learn more about Licensing.

Remote Analytics Agent Sizing

Related pages:

- Deployment Options and Scenarios
- Install Agent-Side Components
- Event Service Sizing and Capacity

This page describes how to estimate the hardware requirements for a remote Analytics Agent deployment where a single Analytics Agent is aggregating transaction events from multiple APM Application Agents. This page describes transaction analytics only.

You should consider these two questions when sending analytics data to a remote Analytics Agent:

- How many APM agents can report to one remote Analytics Agent?
- What are the machine requirements for hosting the remote Analytics Agent?

Do not extract the numbers on this page to size for Log Analytics because you must install the Analytics Agent on the local machine to capture Log Analytics.

Analytics Agent Sizing Based on Event Volume

Based on our testing, the volume of events being sent to the Analytics Agent is the limiting factor in determining how many APM agents can report to one remote Analytics Agent.

The tests were conducted on virtual hardware and programmatically generated workload. Real-world workloads may vary. To best estimate your hardware sizing requirements, carefully consider the traffic patterns in your application and test in a test environment that closely resembles your production application and user activity.

Calculate Analytics Event Volume

One business transaction can traverse many tiers. In each tier, one business transaction traverses one node. One node produces one request per business transaction when the transaction is synchronous. For async transactions, multiple events may be generated by a node for a single request. One request equals one analytics event. To calculate how many events a business transaction generates, you need to count the number of tiers/nodes that are sending data into the Analytics Agent.

You can estimate the number of events using the following formula:

> One business transaction generates events at a rate = **calls per minute** times the **number of tiers** reporting analytics data for the business transaction.

In simple terms: #events for one business transaction = calls per minute times # of tiers.

Characteristics of the Amazon EC2 Instance Types

For complete information on Amazon EC2 instance types, see https://aws.amazon.com/ec2/instance-types/.

The testing was performed using c3.large, c3.xlarge, and c4.4xlarge.

Model	vCPU	Mem (GiB)	SSD Storage (GB)
c3.large	2	3.75	2 x 16
c3.xlarge	4	7.5	2 x 40
c4.4xlarge	16	30	EBS-Only

Enable SSL for the Analytics Agent

Related pages:

- Controller SSL and Certificates

This page describes how to configure the AppDynamics Analytics Agent to connect to your app server agents using SSL.

1. Run the `keytool` command to create a new key pair for the Analytics Agent in the keystore. Refer to the Oracle documentation for more details on using keytool. The following command creates a keystore if it doesn't exist and generates the public/private key pair:

   ```
   keytool -genkeypair -alias analytics-agent -keystore aa-keystore.jks -validity 1825
   ```

   Follow the on-screen instructions to configure the certificate. This generates a self-signed certificate in the keystore. The next step generates a signing request for the certificate. Note the following:

   a. For the first and last name, enter the domain name where the Analytics Agent is running.
      The domain name used in the `appdynamics.analytics.agent.url` property must match the Common Name (CN) of the certificate used by the Analytics Agent. For example, if the URL was `https://localhost:9090/v2/sinks/bt` then the CN of the certificate should be `localhost`. If the names don't match then the client marks the certificate as invalid and the HTTPS connection is not established".
   b. Enter a secure password for the key.
      This command creates a key pair with a validity of 1825 days (5 years). Replace 1825 with the validity period appropriate for your environment.
2. Generate a certificate signing request for the certificate you created as follows:

   ```
   keytool -certreq -alias analytics-agent -keystore aa-keystore.jks -file AppDynamics.csr
   ```

3. Submit the certificate signing request file generated by the command (`AppDynamics.csr` in the example command) to your Certificate Authority (CA) of choice.
4. When it's ready, the CA returns the signed certificate and any root and intermediary certificates required for the trust chain. The response from the CA should include any special instructions for importing the certificate if needed. If the CA supplies the certificate in text format, copy and paste the text into a text file.
5. Import the signed certificate:

   ```
   keytool -import -trustcacerts -alias analytics-agent -file mycert.cer -keystore aa-keystore.jks
   ```

   This command assumes the certificate is located in a file named `mycert.cer`.
6. If you see the error "Failed to establish chain from reply", install the issuing CA's root and any intermediate certificates into the keystore. The root CA chain establishes the validity of the CA signature on your certificate. Although most common root CA chains are included in the bundled JVM's trust store, you may need to import additional root certificates, such as certificates belonging to a private CA. To do so:

   ```
   keytool -import -alias [Any_alias] -file <path_to_root_or_intermediate_cert> -keystore <controller_home>
   /appserver/glassfish/domains/domain1/config/aa-keystore.jks
   ```

7. When done importing the certificate chain, try importing the signed certificate again.
8. Update the following properties in the analytics-agent.properties file:
   a. `ad.dw.https.enabled`=true to enable the HTTPS connector on the Analytics Agent. The HTTPS connection is exposed on the port defined by the `ad.dw.http.port` property.
   b. `ad.dw.https.keyStorePath`= absolute path to the Java keystore that contains the Analytics Agent public and private key.
   c. `ad.dw.https.keyStorePassword`= Java keystore password.
   d. `ad.dw.https.trustStorePath`=absolute path to the truststore that establishes the chain of trust for the Analytics Agent public key certificate.
   e. `ad.dw.https.trustStorePassword`=the truststore password.
   f. `ad.dw.https.certAlias`= alias of the public key certificate stored in the Java Key Store.
9. Start the Analytics Agent.
   The HTTPS connection should now be exposed.
10. Confirm that the app server agent is configured to trust the Analytics Agent certificate. See "*Enable SSL between the Java Agent and the Analytics Agent*" on the Enable SSL for the Java Agent page.

Analytics Agent Logging

Related pages:

- Troubleshoot Analytics Issues

By default, the AppDynamics Analytics Agent writes log files to the <*analytics_agent_home*>/logs directory. See Agent Log Files for how the logs are organized into sets that roll over.

Log File Sizes

Each log can grow to 64 MB in size before being compressed and renamed. A maximum of ten compressed files can be generated.

The default pattern for agent log naming is <*filename*>-<*date_compressed*>.log.gz as shown in this table:

Log File Name	Definition
analytics-agent.log	Current log
analytics-agent-2018-12-11.log.gz	Previous log
analytics-agent-2018-12-10.log.gz.log	Second previous log

Logging Level for the Analytics Agent

The default logging level for most log files is INFO. Higher logging levels consume more disk space.

You can control the logging level for the Analytics Agent by changing the value of the ad.dw.log.level parameter in the analytics-agent.properties file.

For example, to set the log level to DEBUG:

```
ad.dw.log.level=DEBUG
```

Deploy Analytics Without the Analytics Agent

Deployment Support

The Analytics Agent is not required to capture Transaction Analytics data. This page describes the requirements to use the "agentless" configuration of Analytics.

In this context, "agentless" refers to the configuration of Transaction Analytics without an Analytics Agent. An app server agent, such as Java or .NET, is still required to use this feature.

Agentless Analytics

To capture Transaction Analytics for Java or .NET Windows applications, you can configure Transaction Analytics without a dedicated Analytics Agent.

In this deployment model, Analytics retrieves data directly from your app agent. The data is reported to the Events Service and then the Controller. No separate Analytics Agent is required.

> If you upgrade the Java Agent to >= 4.5.15, and use Transaction Analytics, Agentless Analytics is automatically enabled. If you upgrade the .NET Agent to >= 20.10, and use Transaction Analytics, Agentless Analytics is automatically disabled; you can enable this feature in the Controller or with a node property. See Enable Agentless Analytics.
>
> You may notice unusual behavior (such as gaps in Analytics data) related to two known issues:
>
> - High CPU usage (in the Java Agent version 4.5.19 and below)
> - Blocked firewall requests
>
> See Troubleshoot Analytics Issues.

Requirements

Make sure you meet the following minimum requirements:

- Sufficient Transaction Analytics Licenses
- Java Agent >= 4.5.15
- .NET Agent >= 20.10
- Controller >= 4.5.16 (SaaS or on-premises)

To use Agentless Analytics, see this compatibility matrix for your agent deployment requirements.

Connect App Agents to the Events Service

See the following sections to ensure that your deployment can connect to the Events Service:

- Identify Internal Events Service Endpoints
- Connection Ports
- Enable SSL
- Proxy Configuration

Identify Internal Events Service Endpoints

The Controller uses the connection URL configured in `Admin.jsp` to the Events Service. Agentless Analytics also uses this URL. See Connect to the Events Service.

Connection Ports

If you have network policies that may prevent this connection, such as firewalls, you need to configure the policies to connect with the Events Service. See Troubleshoot Analytics Issues.

Enable SSL

If you use a custom trust store, see Enable SSL for the Java Agent or Enable SSL for the .NET Agent.

Proxy Configuration

Enable Agentless Analytics

You can enable Agentless Transaction Analytics at the Controller, node/tier, and agent level.

Disable Agentless Analytics

You can disable Agentless Transaction Analytics at the Controller, node/tier, and agent level.

> **Existing Analytics Agents**
>
> Once you upgrade to the minimum Controller and agent versions, existing Analytics Agents stops reporting data. Agentless Analytics does not duplicate data from the Analytics Agent. AppDynamics recommends when you see **Transaction Analytics** in the Controller, you can uninstall the Analytics Agent unless you are using Log Analytics.

Configure Analytics

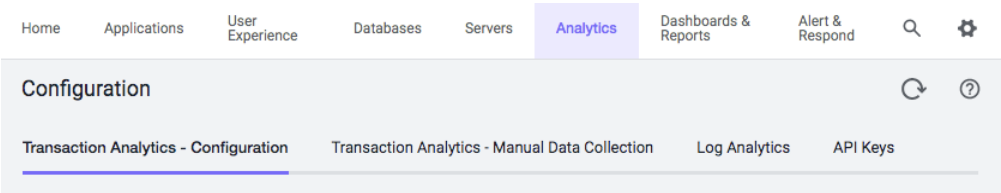
To generate information for Analytics, such as data collectors and log analytics, you need to configure the system to collect the applicable data.

Access Analytics in the Controller UI

In the Controller UI, navigate to **Analytics** > **Configuration**.

The Analytics configuration options include:

- **Transaction Analytics - Configuration**: Enable Analytics for specific applications and business transactions.
- **Transaction Analytics - Manual Data Collection**: Configure data collectors. Analytics supports three types of data collectors: method invocation data collector (MIDC), HTTP, and SQL.
- **Log Analytics**: Configure source rules to collect data for log analytics.
- **API Keys**: Create API authentication keys for users of the Analytics Events API.



End User Monitoring Data

Analytics monitors End User Monitoring (EUM) products. For SaaS deployments, Browser Request Analytics and Mobile Request Analytics, alternate views of EUM data, do not require configuration. If you are using an on-premises Events Service and an on-premises EUM Server, you need to configure the EUM Server to send data to the Events Service. See EUM Server Deployment.

Collect Transaction Analytics Data

Works with:

This page describes how to configure Transaction Analytics for Java and .NET applications. See Configure Transaction Analytics for Node.js and PHP Applications.

Before You Begin

If you have Java Agent >= 4.5.15, .NET Agent >= 20.10, and Controller >= 4.5.16, you do not need a local Analytics Agent to configure Transaction Analytics. See Deploy Analytics Without the Analytics Agent.

All other app agents and Controller versions require an Analytics Agent. See the appropriate documentation to ensure you have installed and configured the required components.

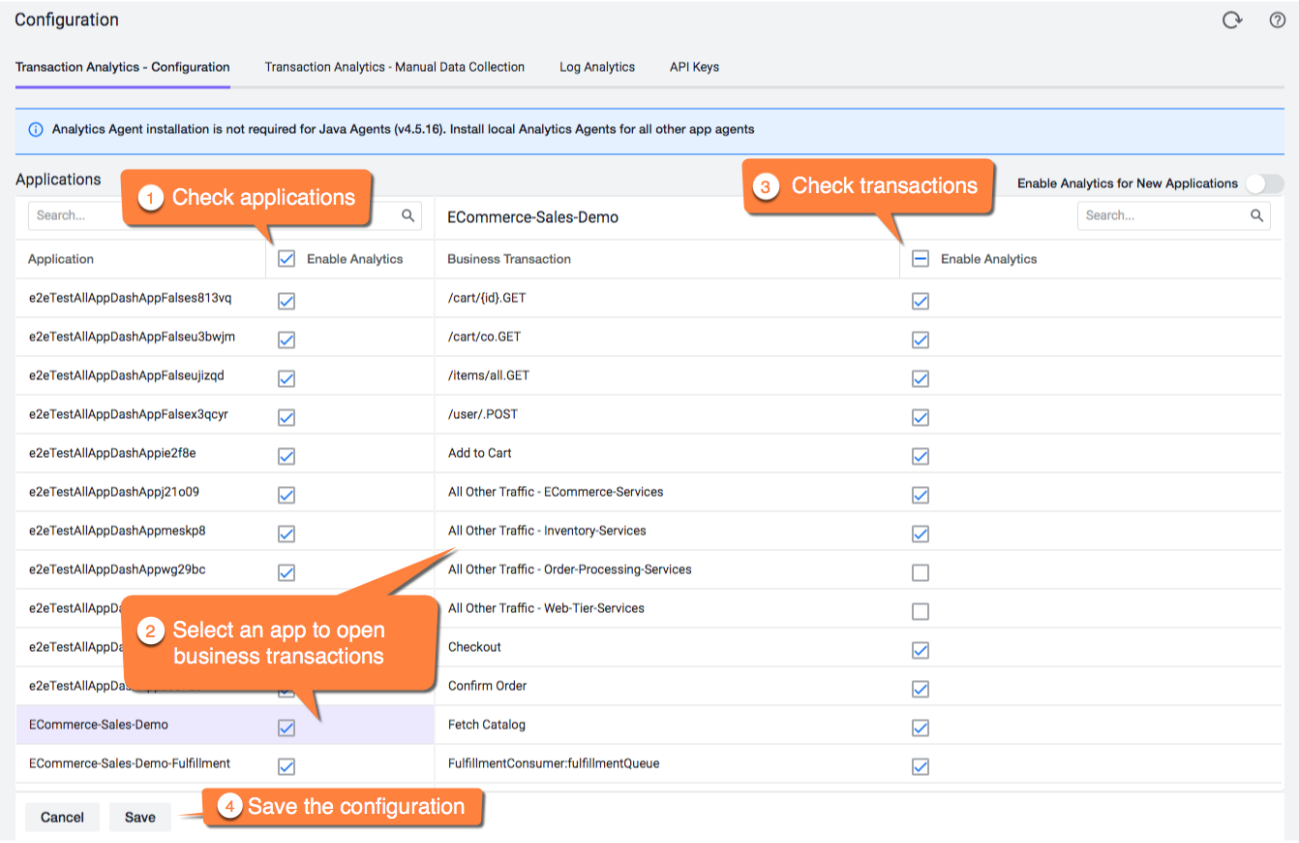
- SaaS deployments: Install Agent-Side Components
- On-premises deployments: Custom Install and Events Service Deployment

Configure Transaction Analytics

You need to configure Transaction Analytics for each desired application. Configuring Transaction Analytics consists of selecting the application and the specific business transactions that you want to analyze.

To configure Transaction Analytics:

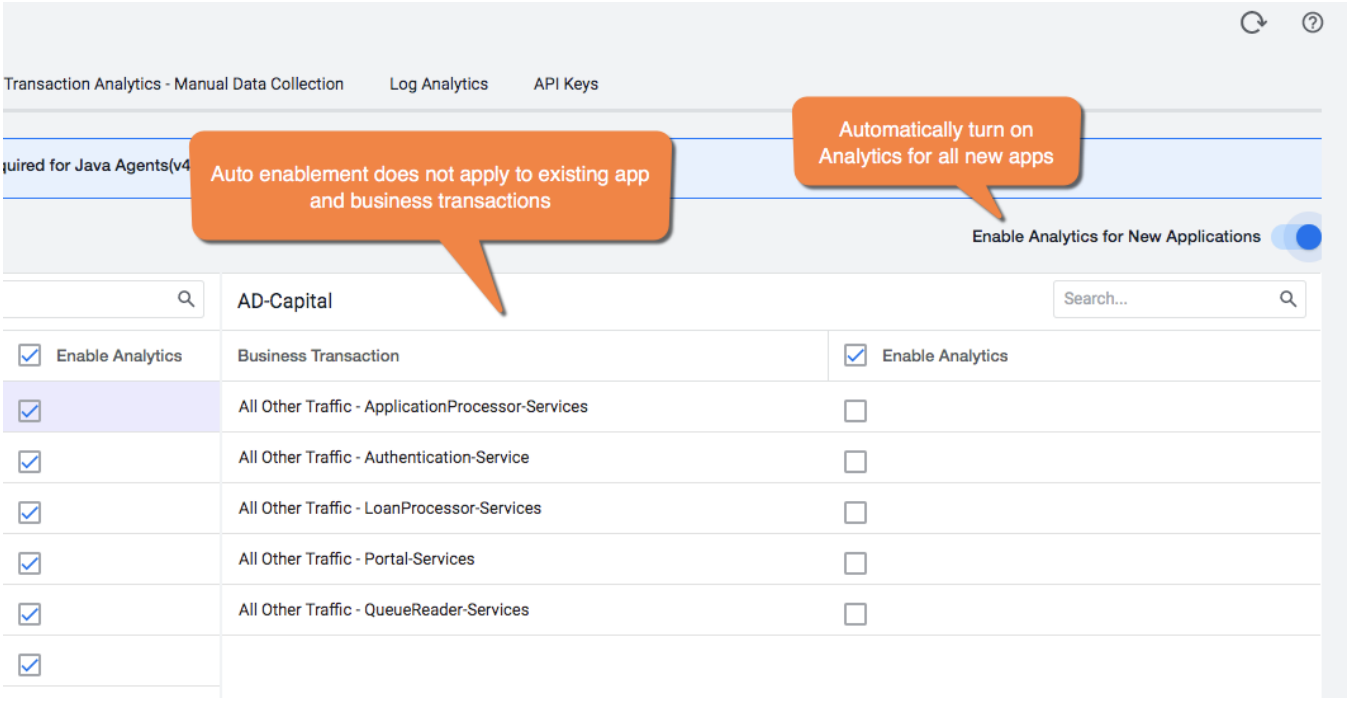
1. In the Controller UI, from the top navigation bar, select **Analytics**.
2. Select **Configuration** from the left panel.
3. Go to the Transaction Analytics - Configuration tab.
4. Check the application(s) from the left panel. You can select or deselect all applications by checking **Enable Analytics**. Find specific applications using the search box above **Applications**.
5. Select an application to open the business transactions in the right panel. By default, all business transactions, except All Other Traffic**,** are selected. You can deselect any business transactions you do not want to monitor. Find specific business transactions using the search box in the top right of the panel.
6. Click **Save**.



Automatically Enable Transaction Analytics

You can enable Transaction Analytics automatically for all applications >= 4.3.x. Click the toggle next to **Enable Analytics for New Applications**. This option configures Transaction Analytics for all new applications and all of each application's business transactions, except business transactions categorized as All Other Traffic.

Enable Analytics for New Applications applies to applications created after you select the feature. You need to manually configure Analytics for any applications and business transactions created before selecting **Enabled Analytics for New Applications**.



> You can configure Transaction Analytics for older agents manually. Go to **Transaction Analytics - Configuration** and locate the desired application. Uncheck and recheck the app, then select your business transaction(s).

Click the toggle again to turn off **Enable Analytics for New Applications**. The toggle becomes grey when the feature is turned off.

Edit Transaction Analytics Configuration

You can add or remove applications and business transactions from Transaction Analytics at any time.

To make changes to your Transaction Analytics configuration, select or deselect the desired applications and business transactions in **Transaction Analytics - Configuration**.

When you revert changes to Transaction Analytics, AppDynamics saves the previous configuration state. For example, you enable Transaction Analytics for an application and one specific business transaction. You later disable Transaction Analytics for the application, then re-enable it at a later date. When you re-enable the application, AppDynamics automatically selects the business transaction you originally selected.

Security Restrictions

The Analytics Administrator has complete access to all applications in Transaction Analytics. All other users can only view applications to which they have access based on RBAC permissions.

> The Analytics Dynamic Service loads Transaction Analytics for enabled applications after your JVM instance runs for at least two minutes.

Configure Recommended Data Collectors

Related pages:

- Configure Manual Data Collectors

This page describes Recommended Data Collectors in AppDynamics.

Recommended Data Collectors are potential Method Invocation Data Collectors (MIDC) suggested by Analytics. Recommended Data Collectors reduces the number of steps required to configure data collectors.

When you configure data collectors manually, provide the class and method parameters for each transaction that you want to monitor. Recommended Data Collectors automatically collects the event data from the Java Agent and publishes it to the Event Service. You can browse this data (transactions, classes, methods) and search for specific terms in the Controller.

> ⚠ Recommended Data Collectors does not support HTTP and SQL data collectors.

Before You Begin

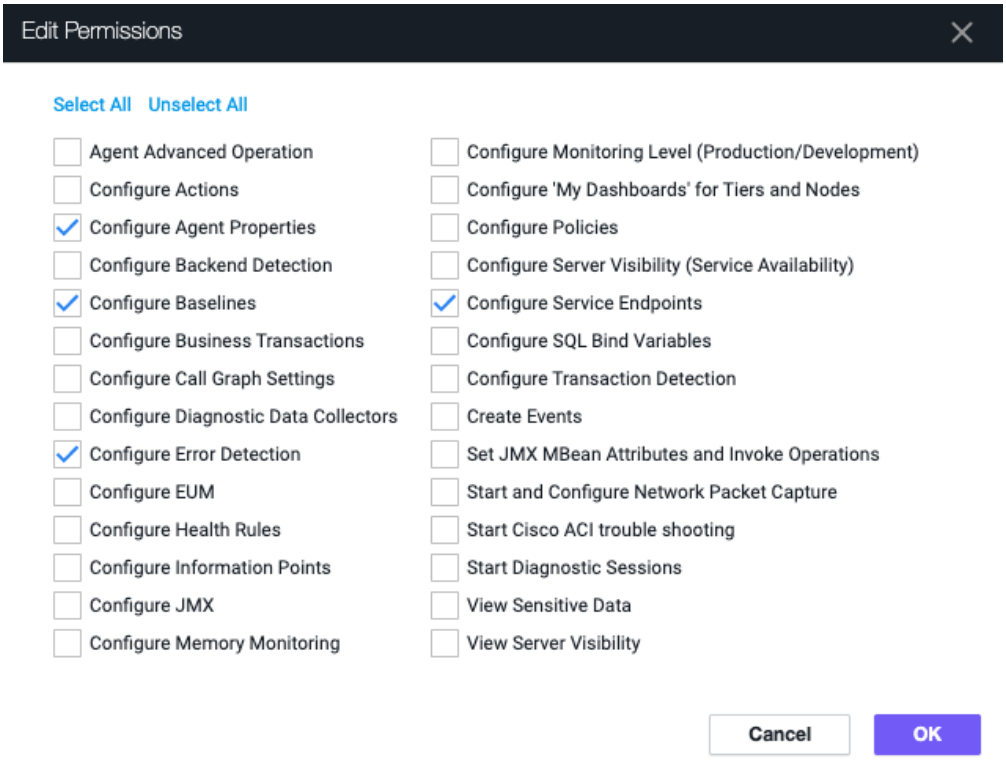
To use Recommended Data Collectors, ensure that your setup meets these requirements.

You need the **Configure Diagnostic Data Collectors** permission to access Recommended Data Collectors. The Analytics Administrator does not h default.

To view application data for Recommended Data Collectors, you need view access to the application and its transactions.

- For application permissions, configure user settings in **Administration** > **Roles** > **Applications**.
- For transaction permissions, configure user settings in **Administration** > **Roles** > **Analytics** > **Events**.

See Analytics and Data Security.



AppDynamics Components

- SaaS Controller >= 20.6.0
- Java Agent >= 4.5.19

Agentless Analytics

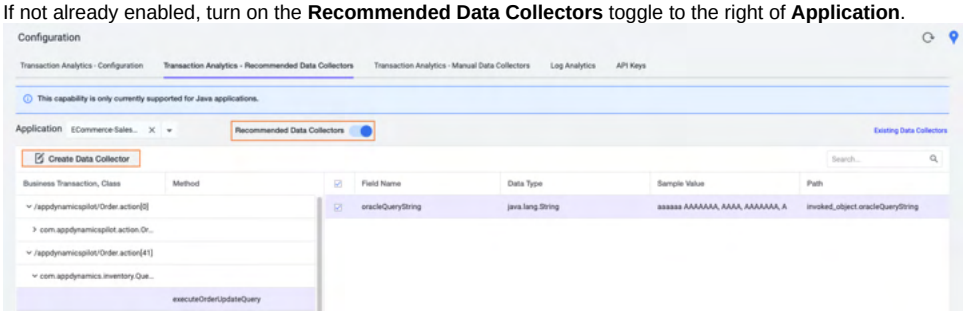
Recommended Data Collectors require Agentless Transaction Analytics. When you use the minimum supported versions of the Controller and Java Agent, Agentless Analytics is automatically enabled. See Deploy Analytics Without an Analytics Agent to ensure that your deployment works properly.

You must enable Agentless Analytics to use this feature. If you turn off Agentless Analytics, you cannot use Recommended Data Collectors.

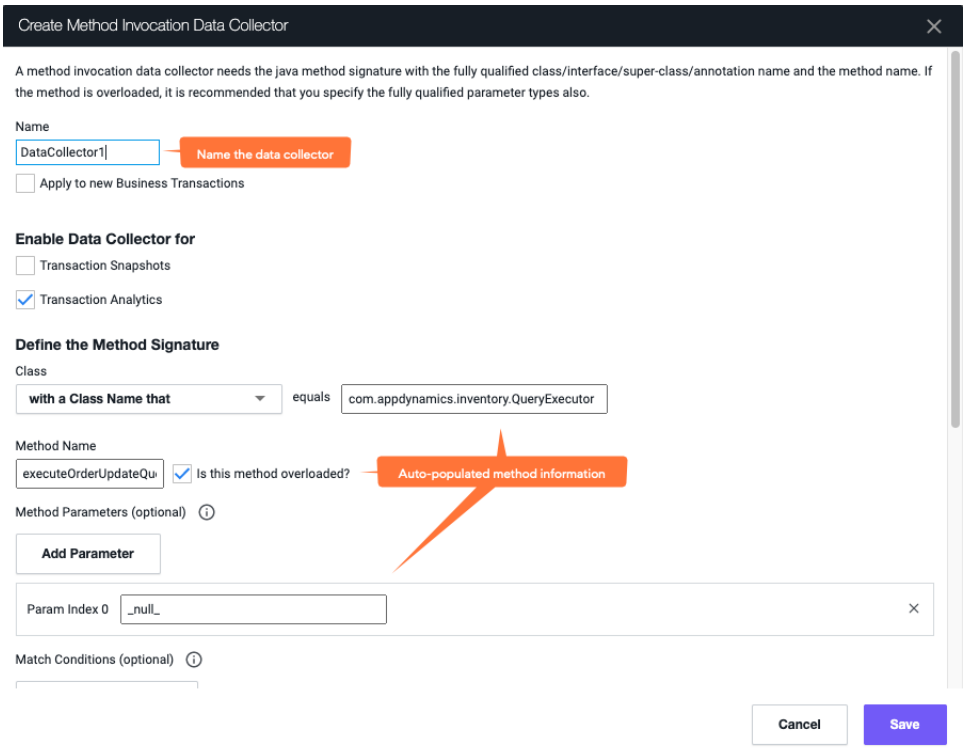
Create Recommended Data Collectors

To use Recommended Data Collectors:

1. In the Controller, select **Analytics** > **Configuration** > **Transaction Analytics - Recommended Data Collectors**.
2. Select an application from the **Application** dropdown menu. A list of business transactions appears in the left pane.
3. If not already enabled, turn on the **Recommended Data Collectors** toggle to the right of **Application**.



4. Select the dropdown arrow next to the desired business transaction name. A list of available classes appears in the left pane.
5. Select the desired class. A list of available methods appears.
6. Select the desired method.
7. Additional data appears in the right pane. Select the desired field name.
8. Above the business transaction list in the left pane, click **Create Data Collector**.
9. Enter a data collector name and confirm that the method signature information is correct. If you select multiple fields, enter a unique name for each data collector in the dialog.

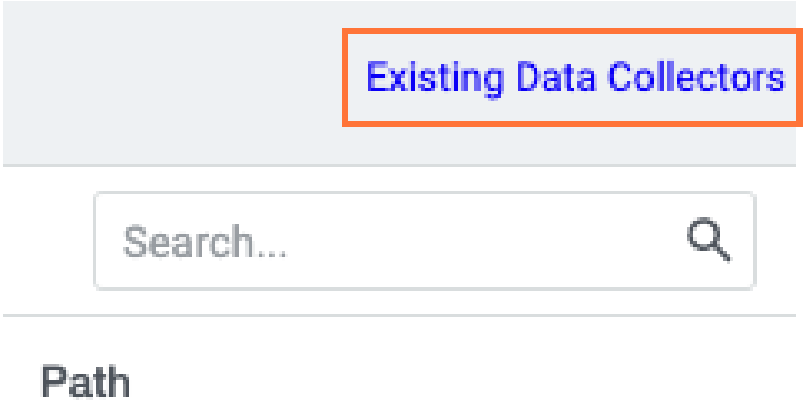


> To define a MIDC with method overloading in **Recommended Data Collectors**, you must re-select the **Is this method overloaded?** checkbox and redefine the parameters in **Manual Data Collectors** > **Edit Method Invocation Data Collector** > **Define the Method Signature**.

10. Click **Save**.

View Existing Data Collectors

Select **Existing Data Collectors** to view the created MIDCs. The **Transaction Analytics - Manual Data Collectors** tab appears.



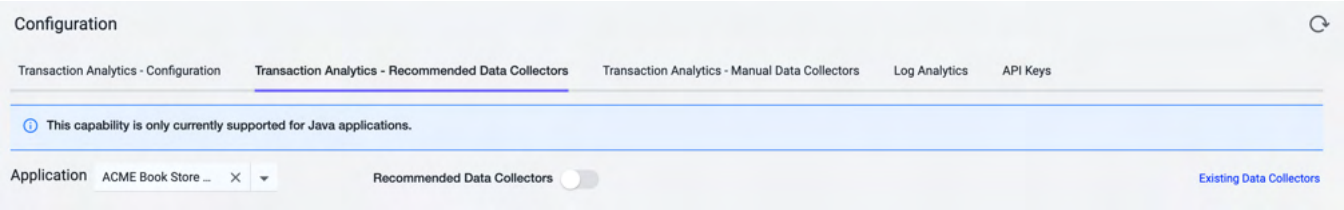
Recommended Data Collectors UI Overview

UI Term	Description
Business Transaction	The name of the business transaction(s) for the selected application. Business transaction names appear as: The relative path and business transaction ID in brackets []. For example, `/portal/Submit Application[65]`. If the Java Agent does not identify a relative path, the name is the business transaction ID only. For example, `Business Transaction 1`.
Class	The fully qualified class name of the selected business transaction.
Method	The method name of the selected class. Overloaded methods contain identifying data to distinguish each method. For example, if a class calls `method1` multiple times with different return values, the return value is displayed next to the method name: • `int method1()` • `void method1()` Variations in the method parameters are displayed in the parentheses: • `method1(str, ...)` • `method1(int, ...)`
Field Name	The name of the field of the selected method. The field name can be a parameter, return value, or invoked object.
Data Type	Type of the field name.

Sample Value	Shows an example field value. Special characters (`- , . @`) are not obfuscated. The following names are obfuscated for security: • Boolean: `aaaaaa` • Enums: the string value is pulled and obfuscated the same as upper and lower case letters • Lower case letters: a • Numbers: `0` • Upper case letters: A • All other characters: # In the case of arrays, collections, and maps, the values display a special format. • Array/Collection: `[Aaaa, ...]` • Map: `[{aaa=Aaaa}, ...]` The `Instance of <class_name>` value is displayed when the depth limit is obtained after introspecting the object. If you want to introspect further on this instance type, you can increase the introspection depth with the `analytics-runtime-introspection-depth` property. For example, in `method int getPrice(a)`, `a b c d e` where a has field b, b has field c, and so on. If the depth is 2, the value will be `Instance of c`. This case applies to arrays, collections, and maps. • Array/Collection: `[Instance of <class_name>, ...]` • Map: `[{Instance of <key_class_name>}={Instance of <value_class_name>}, ...]`
Path	Describes where the Java Agent has located the Recommended Data Collector in your code.

Disable Recommended Data Collectors for an Application

1. Go to **Transaction Analytics** > **Recommended Data Collectors**.
2. Select the application from the dropdown.
3. Turn off the **Recommended Data Collectors** toggle.



Troubleshoot Recommended Data Collectors Issues

Analytics Data Loss

When Recommended Data Collectors is enabled on an application with the Java Agent 4.5.19, restarting the agent may cause Analytics data loss. AppDynamics recommends that you upgrade to the Java Agent >= 20.3.

Recommended Data Collectors in the Controller UI

There are a few reasons why Recommended Data Collectors may not appear in the Controller UI:

- Auto-Refresh: In the Controller UI, data under the **Transaction Analytics - Recommended Data Collectors** tab does not refresh automatically. If you recently created an application and do not see it in the UI, refresh your browser.
- Deactivated Agentless Analytics: Recommended Data Collectors require Agentless Analytics. If a particular application is unavailable, confirm that Agentless Analytics is enabled for the tier or node.
- Permission: Recommended Data Collectors enforces RBAC. Without the **Configure Diagnostic Data Collectors** permission, you cannot create data collectors, but you can view suggested Recommended Data Collectors for the applications that you have access to.

Field Names Display Unavailable

Field names are not available for data captured on parameters, return values, and invoked objects, such as `int getNumber(intValue)`.

For example:

```
public class Calculator {
        public int getArea(int width, int height) {
        return width * height;
    }
}
```

Field Name	Explanation
Invoked Object	Refers to the object on which the method is invoked. In this example, the `Calculator` object is being invoked. The name of the `Calculator` object instance is not obtained, so **Invoked Object** displays **Unavailable**.
Parameters	Refers to the inputs to the method. In this example, the parameters are the width and the height. The parameter names are not obtained, so **Parameters** display **Unavailable**.
Return Value	Refers to the return value of the method. Return values do not have assigned names and **Return Value** displays **Unavailable**.

Customize Recommended Data Collectors

This page provides a list of system and node properties that customize Recommended Data Collectors.

Enable or Disable Recommended Data Collectors

You can enable or disable Recommended Data Collectors after restarting the Java Agent and setting the system properties as a JVM parameter. Recommended Data Collectors is enabled by default; the property `appdynamics.analytics.collection.feature.enabled` is optional.

System Property	Description	Default Value
`appdynamics.analytics.collection.feature.enabled`	Enable or disable Recommended Data Collectors on the Java Agent.	`true`

Customize Recommended Data Collectors

To customize Recommended Data Collectors, you can adjust the node properties in the Java Agent. See App Agent Node Properties.

Node Property	Description	Default Value
`analytics-collection-stack-traces-collected`	Number of stack traces collected per interval (time between stack trace collection limit resets).	`20`
`analytics-collection-stack-trace-collection-reset-interval`	Interval (in seconds) to reset stack trace collection limit.	`10`
`analytics-collection-special-characters`	List of characters which will not be sanitized from sample values. For example, `a^z` will not sanitize `a`, `^`, and `z`.	N/A
`analytics-collection-elements-scan-per-stack-trace`	Number of elements to scan per stack trace before stopping.	`20`

`analytics-collection-elements-retain-per-stack-trace`	Number of elements to collect per stack trace.
	
	For example, in this stack:
	
	`com.a`
	
	`-> com.b`
	
	`-> com.c`
	
	`-> com.d`
	
	`-> com.e`
	
	`-> com.f`
	
	`-> AppD exit point method`
	
	Elements `com.b` to `com.f` (bottom five) are analyzed by default.
		`5`

`analytics-collection-package-prefix`	Comma separated list of package names that will be treated preferably for suggestions.	N/A
`analytics-element-analysis-interval`	Interval (in seconds) for triggering element analysis.	`600`
`analytics-collection-reap-interval`	Interval (in seconds) to remove one suppressed collection instrumentation point. Removes the oldest suppressed point first.	`10`
`analytics-method-instrumentation`	Number of methods (unique class name/method name combinations) to instrument with Recommended Data Collectors. Overloaded variants are considered the same for this limit.	`10`

`analytics-maximum-num-rules-multiplier`	Average number of overloaded methods per instrumented method. The maximum number of instrumentation points is calculated with this formula: `analytics-method-instrumentation` * `analytics-maximum-num-rules-multiplier`.	`10`
`analytics-instrumentation-suppression`	Number of times Recommended Data Collectors is invoked and processed. For example, if `analytics-instrumentation-suppression` is set to 3 and a method is called four times, the fourth call does not collect data.	3
`analytics-runtime-attribute-value-length`	Maximum length of sample value string displayed.	32
`analytics-runtime-introspection-depth`	Level of depth in the object tree that Recommended Data Collectors extracts information.	2

Configure Manual Data Collectors

This page describes how to configure data collectors for Transaction Analytics.

There are three types of data collectors: HTTP, method invocation, and SQL. Data collectors enable you to add business context to a transaction. For example, a Method Invocation Data Collector (MIDC) can tell you if an order is slow based on method parameters.

Before You Begin

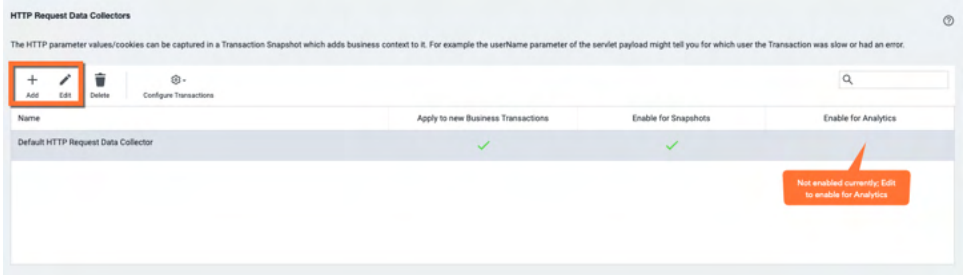
You must configure Transaction Analytics before you can configure data collectors. See Collect Transaction Analytics Data.

Configure HTTP Data Collectors

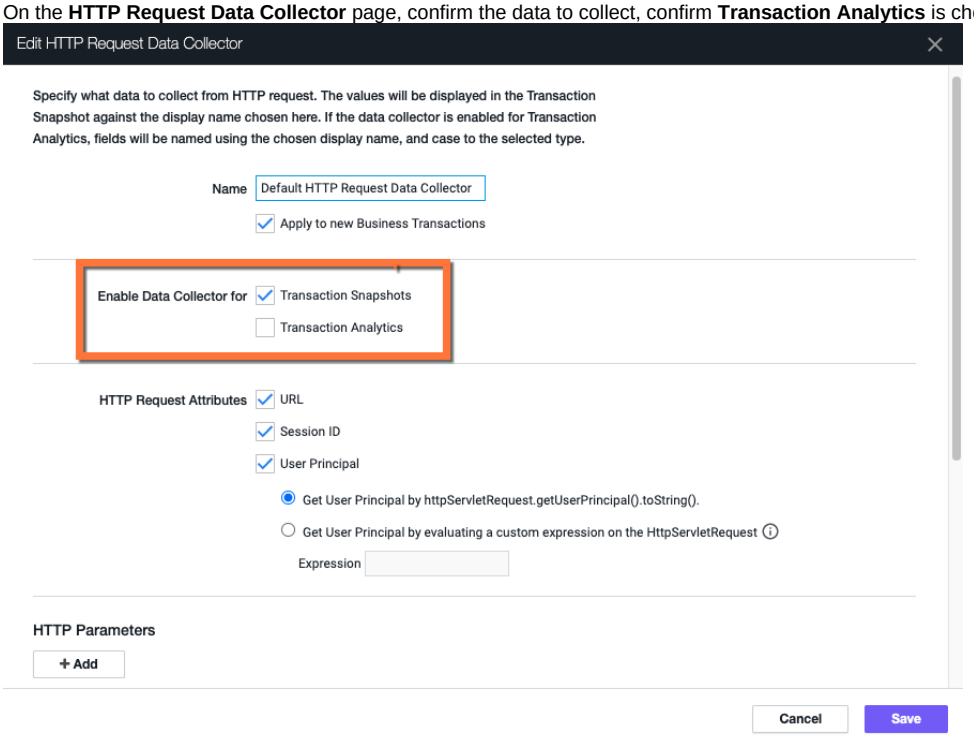
To collect HTTP request data, you can use the default HTTP Request Data Collector. You need to explicitly enable the collector for Analytics.

To configure HTTP Data Collectors for Analytics:

1. In the Controller UI, select **Analytics** > **Configuration** from the top navigation bar.
2. Go to the Transaction Analytics - Manual Data Collection tab.
3. Select the application of interest from the **Configure Analytics for Application** dropdown.
4. Navigate to **HTTP Request Data Collectors**. Select the HTTP Data Collector to enable and click **Edit** (or **Add** to create new collectors).



5. On the **HTTP Request Data Collector** page, confirm the data to collect, confirm **Transaction Analytics** is checked, and click **Save**.



6. Select **Configure Transactions** and confirm that the data collector is enabled on the appropriate business transactions. See Data Collectors.

Configure Method Invocation Data Collectors

You can also use the **Analytics** > **Configuration** page to enable existing or new Method Invocation Data Collectors. Open the **Method Invocation Data Collectors** panel. The process is essentially the same as described in Data Collectors.

- Check the **Transaction Analytics** check box to use this collector for Analytics.
- Check the **Configure Transactions** popup to confirm you have enabled the right Business Transactions.

- Check that the name of the MIDC does not exceed the 50 character limit.

Field Name Recommendations

While there are no requirements for MIDC field names, AppDynamics recommends using only alpha-numeric characters, hyphens, and underscores.

MIDC field names that start with special characters may cause application events to disappear from Analytics in the Controller. As a best practice, avoid the following characters in your MIDC field names:

- Dots
- Spaces
- Slashes
- Special characters (such as $, %, &)
- Regular expression characters

You can learn more about field name conventions and recommendations in Data Field Naming for Events Service >= 4.5.3.

> Changing the name of method invocation data collector will create a completely new field in Transaction Analytics. If you want to change the type of a data collector field, we recommend creating a new field instead to avoid conflicts with the old data.

Field Length Limit

The maximum number of characters allowed in a custom data field is 8,191.

Configure SQL Data Collectors

Transaction snapshots capture SQL queries. SQL data collectors provide a way to extract business data from parameters used in the SQL statements for use in analytics. See Collect Business Data From SQL Calls.

Enable Transaction Analytics Data Type Conversion for Data Collectors

> Transaction Analytics data type conversion requires Controller >= 4.5.6. For Java deployments, Transaction Analytics data type conversion is available for Java Agents >= 4.5.2. For .NET deployments, Transaction Analytics data type conversion is available for .NET Agents >= 4.5.5.

Data collectors determine field type (string, boolean, or number) at runtime. At times the data you collect may not be the type in which you want to use it. For example, you are not able to add metrics if any data collectors are field type string.

While field type cannot be changed, you can specify field type before runtime with Transaction Analytics data type conversion.

To enable Transaction Analytics data type conversion:

1. Log in to the administration console: `http:<controller-hostname>:8080/controller/admin.jsp or https:<controller-hostname>:45/controller/admin.jsp`.
2. On the **Controller Settings** page, change the value of `analytics.type.conversion.enabled` from `false` to true.
3. Click **Save**.

Data type conversion only appears when enabled in the **HTTP** and **Method Invocation Data Collector** configuration pages on your Controller. If this page was opened while you enabled data type conversion, you will need to refresh your page to see changes.

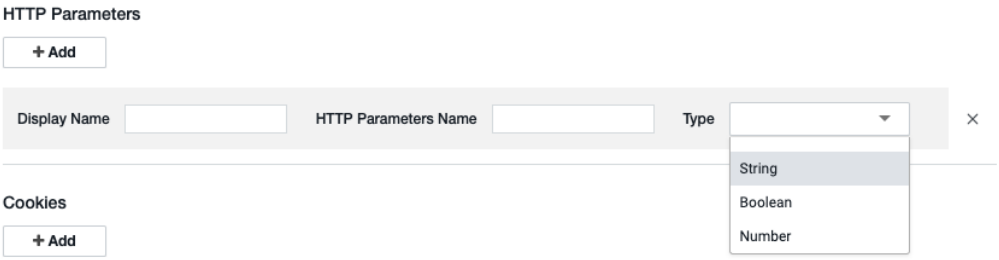
Data type conversion operates by the following rules:

- Available for new data collectors only.
- Select type manually for each data collector.
- Type cannot be changed once saved.

Transaction Analytics Data Type Conversion in HTTP Data Collectors

To use Transaction Analytics data type conversion, create a new HTTP parameter. You can add to an existing HTTP Request Data Collector or create a new one.

The process is essentially the same as creating an HTTP parameter. However, now that you've enabled Transaction Analytics data type conversion, you will see **Type** field with a dropdown.

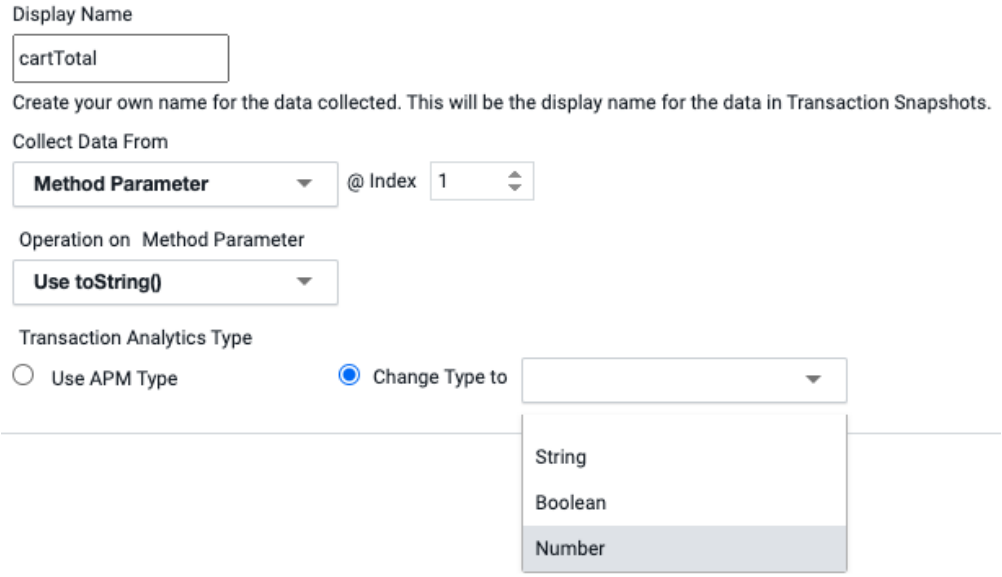


Select the desired field type for your HTTP parameter. If you do not want to specify a type, leave this field blank. The default type for HTTP data collectors is `string`.

Transaction Analytics Data Type Conversion in Method Invocation Data Collectors

To use Transaction Analytics data type conversion, create a new Method Invocation Data Collector (MIDC). You can add to an existing MIDC or create a new one.

The process is essentially the same as creating an MIDC. However, now that you've enabled Transaction Analytics data type conversion, you will see **Change Type to** field with a dropdown.



Select the desired field type for your MIDC.

Transaction Analytics Type defaults to **Use APM Type**, which determines type at runtime. If you do not want to specify a type, select **Use APM Type**.

Name Requirements For Transaction Analytics Data Type Conversion

Refer to these naming requirements when using Transaction Analytics data type conversion:

- Display Names must be unique within each data collector. Names are case sensitive.
- You can repeat Display Names across different data collector configurations, as long the field type is also the same.
- If you delete a field from a data collector and add it again with a different field type, you must rename the data collector.

Change Field Types

Field types cannot be changed once they have been saved to the data collector. To change the field type, we recommend to delete and recreate with a new name.

Configure Transaction Analytics for Node.js and PHP Applications

This page describes how to configure Transaction Analytics and Data Collectors for Node.js and PHP applications.

Before You Begin

Make sure you have installed and configured the components described in Installing Agent-Side Components and, for on-premises, Custom Install and Events Service Deployment before attempting to configure Transaction Analytics.

Configure Analytics for Node.js

Collect Default Node.js Transaction Data

To configure the Node.js Agent to send the default transaction data to the Analytics Agent, modify the require statement in your application.

Add these variables with the proper values to point to your Analytics Agent:

```
analytics: {
    host: <analyticsHostName>,
    port: <analyticsPort>,
    ssl: <true || false>
}
```

The Analytics Agent can be on the same host as the Node.js Agent or on a different host. See Install the Node.js Agent.

Configure Data Limits

You can also configure the Node.js Agent to set limits on data sent to the Analytics Agent with these properties correlated to environment variables.

Property Name	Description	Environment Variable
`analyticsMaxSegmentSizeInBytes`	The maximum size of a business transaction segment collected in an Analytics request. By default, the value is 0.1MB.	`APPDYNAMICS_ANALYTICS_MAX_SEGMENT_SIZE`
`analyticsMaxSegmentsPerRequest`	The maximum number of segments per Analytics request. By default, the value is 16.	`APPDYNAMICS_ANALYTICS_MAX_SEGMENTS_PER_REQUEST`
`analyticsMaxMessageSizeInBytes`	The size of a single request body sent to the Analytics Agent. By default, the value is 1MB.	`APPDYNAMICS_ANALYTICS_MAX_MESSAGE_SIZE`

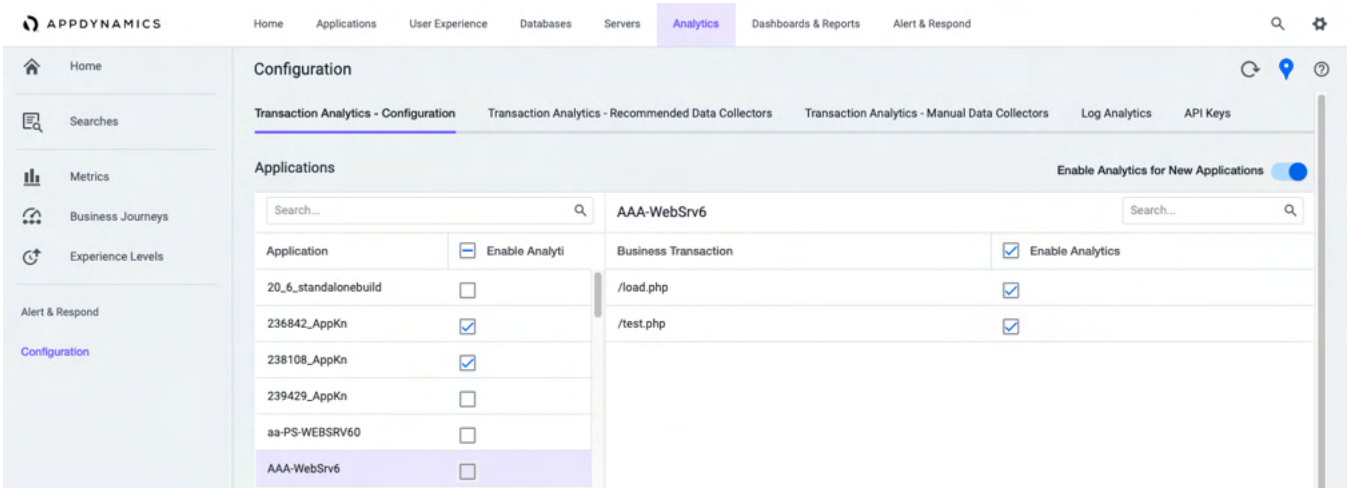
Your require statement should look similar to the following example where your Analytics Agent is on localhost and listening on Port 9090:

```
require ("appdynamics").profile({
    controllerHostName: '<Controller host name>',
    controllerPort: <Controller port number>,
    controllerSslEnabled: false, // Set to true if controllerPort is SSL
    accountName: '<AppDynamics account name>',
    accountAccessKey: '<AppDynamics account key>', // Required
    applicationName: '<Your application name>',
    debug: false,
    tierName: '<Choose a tier name>',
    nodeName: '<Choose a node name>', // The Controller appends the node name with a unique number
    analyticsMaxSegmentSizeInBytes: 20,
    analyticsMaxSegmentsPerRequest: 20,
    analyticsMaxMessageSizeInBytes: 100,
    analytics: {
        host: 'localhost',
        port: 9090 },
    logging: {
        'logfiles': [
        {'root_directory': '/tmp/appd', 'filename': 'echo_%N.log', 'level': 'TRACE', 'max_size': 5242880,
'max_files': 10 },
        { 'root_directory': '/tmp/appd', 'filename': 'protobuf_%N.log', 'level': 'TRACE', 'max_size': 5242880,
'max_files': 10, 'channel': 'protobuf' }]
            }
});
```

Collect Node.js Data Collectors

You can also collect additional data from your Node.js business transactions by using the Node.js API. To configure Transaction Analytics data collectors for Node.js, see `txn.addAnalyticsData()` in the Node.js Agent API Reference.

Configure Analytics for PHP Applications



1. In **Transaction Analytics - Configuration**, click the **Enable Analytics** checkbox to enable/disable Analytics on a PHP application.
2. To the right of **Business Transactions**, click the **Enable Analytics** checkbox to enable/disable Analytics on any Business Transaction(s) in the application.

> ⚠ Analytics data cannot be collected from PHP CLI programs.

To collect Transaction Analytics from the PHP Agent:

1. Configure the PHP Agent to send the default transaction data to the Analytics Agent. Modify the `.ini` file depending on the operating system under which your PHP Agent is installed.
   By default, your `.ini` file contains the following configuration where your Analytics Agent is on `localhost` and listens to Port 9090:

```
agent.analyticsHostName = localhost
agent.analyticsPort = 9090
```

Add the following variables with the proper values to point to your Analytics Agent:

```
agent.analyticsHostName = <analyticsHostName>
agent.analyticsPort = <analyticsPort>
```

The Analytics Agent can either be on the same host as the PHP Agent, or on a different host. For information about installing the PHP Agent, see Install the PHP Agent.

You must set the node level setting `analytics-dynamic-service-enabled=true` for reporting analytics.

2. HTTP/Method Invocation Data collectors for Analytics must be enabled for both transaction snapshots and Transaction Analytics to report data from the PHP Agent.
   In order to collect the method return value with an MIDC, the value must be assigned to a variable.

```
$ret = function()
```

If the return value is not stored in any variable, it displays as `null` in both snapshot and Analytics data.

Add Custom Fields to Transactions Using Java SDK

You can add custom data using the Java Agent SDK as an alternative to adding data collectors from the Controller UI.

The fields show up on Transaction Analytics under a section called "Custom Method Data".

Add the code similar the following to your application:

```
//include the app agent SDK packages

import com.appdynamics.apm.appagent.api.AgentDelegate;
import com.appdynamics.apm.appagent.api.DataScope;
import com.appdynamics.apm.appagent.api.IMetricAndEventReporter;

public void someMethod(String stringParam, int intParam, ComplexObject complexObjParam) {

    //Get the data reporter.
    IMetricAndEventReporter reporter = AgentDelegate.getMetricAndEventPublisher();

    //Define the scope for data collection.
    Set<DataScope> allScopes = new HashSet<DataScope>();
    allScopes.add(DataScope.ANALYTICS);
    allScopes.add(DataScope.SNAPSHOTS);

    Set<DataScope> analyticsScope = new HashSet<DataScope>();
    analyticsScope.add(DataScope.ANALYTICS);

    //Add data to different scopes based on the need.
    //Here both key1 and key2 are collected for both snapshots and analytics
    reporter.addSnapshotData("key1", stringParam, allScopes);
    reporter.addSnapshotData("key2", intParam, allScopes);

    //Here key3 is only collected for analytics.
    //Since the passed object is a complex java object and not a primitive type, toString() method is invoked
on it and the string value will
    //be collected.
    reporter.addSnapshotData("key3", complexObjParam, analyticsScope);

    .........
    Business logic.
```

The third parameter to the method is a set of enums, DataScope, that define the scope for collecting the custom data:

- To collect custom data only for snapshots, use DataScope.SNAPSHOTS as the third parameter.
- To collect the custom data for analytics, use DataScope.ANALYTICS as the third parameter.
- If custom data should be added to both snapshots and analytics then both the enums should be passed in a set as the third parameter.

Method details for `addSnapshotData()`

```
boolean addSnapshotData(java.lang.String key,
                        java.lang.Object value,
                        java.util.Set<DataScopes> dataScopes
```

Method Parameters

- key - key
- value - Primitive types can be passed as values and the types (int, boolean, etc) will be respected. Strings can be passed as values, however, note that if you pass composite objects then agent performs a .toString() operation on it.
- dataScopes - scope for the custom data collection:
    - Datascope.SNAPSHOTS
    - Datascope.ANALYTICS

Returns

true if the agent successfully collects the key-value pair for the given scope.

Collect Business Data From SQL Calls

Transaction snapshots capture SQL database calls. The SQL calls can contain useful business data. Analytics SQL data collectors are a way to collect the business data from SQL parameters for use in transaction analytics.

To configure an Analytics SQL data collector you need to know:

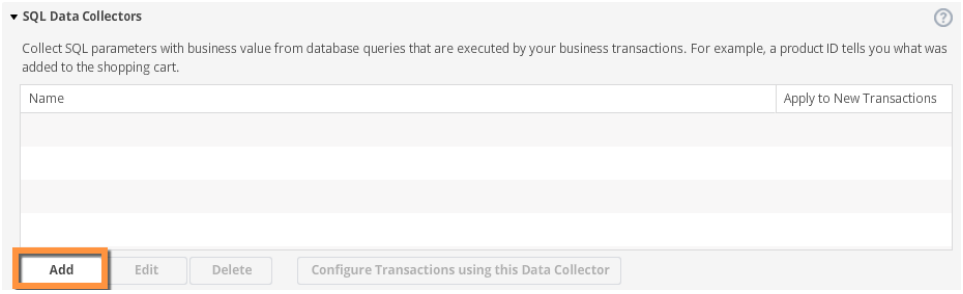
- Analytics-enabled application where the SQL call is executed.
- Database target of the SQL call.
- Specific SQL parameterized statement that contains the data of interest as a query parameter.
- Analytics-enabled business transactions making the database call.
- Parameters to be collected.

This feature is supported as:

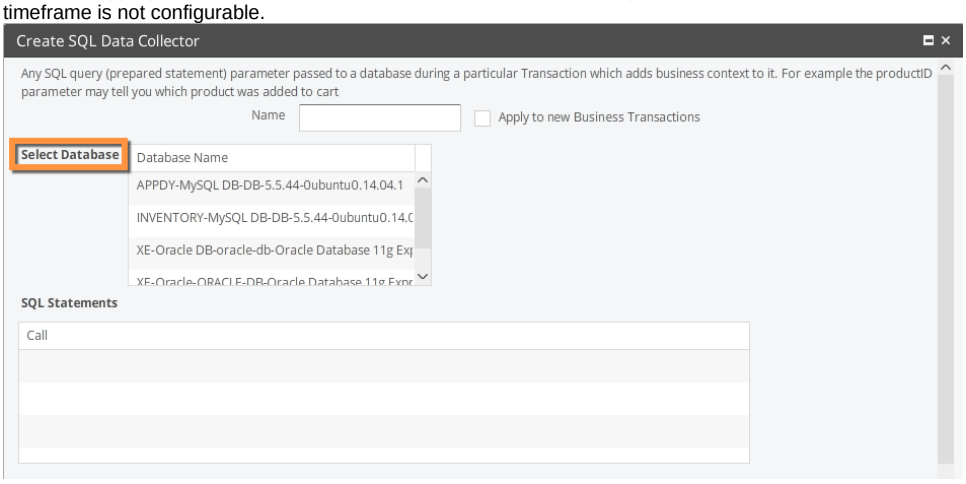
- The SQL data collector list shows the slowest database calls over the last 30 days. You can also create a SQL data collector directly from the **DB & Remote Service Calls** tab of a snapshot.
- Requires 4.3 Java Agent or 4.3 .NET Agent.
- Only prepared statements containing data of interest as binding variables can be used. Literal strings that are passed in can not be collected.
- There is a 500-character limit on the length of the SQL statement. Do not use any truncated queries that might appear in the SQL Statements list or a snapshot.
- The overall number of executions of SQL queries configured to collect Analytics data is limited to 10K. This is configurable using the `analytics-sql-cpm-limit` node property. See App Agent Node Properties.

Configure SQL Data Collectors From Analytics

1. In the Controller UI, from the top navigation bar, select **Analytics > Configuration**.
2. From the Transaction Analytics tab, select the application from the **Configure Analytics for Application** dropdown and confirm that analytics data collection is enabled.
3. Scroll down to expand the **SQL Data Collectors** section, and click **Add**.

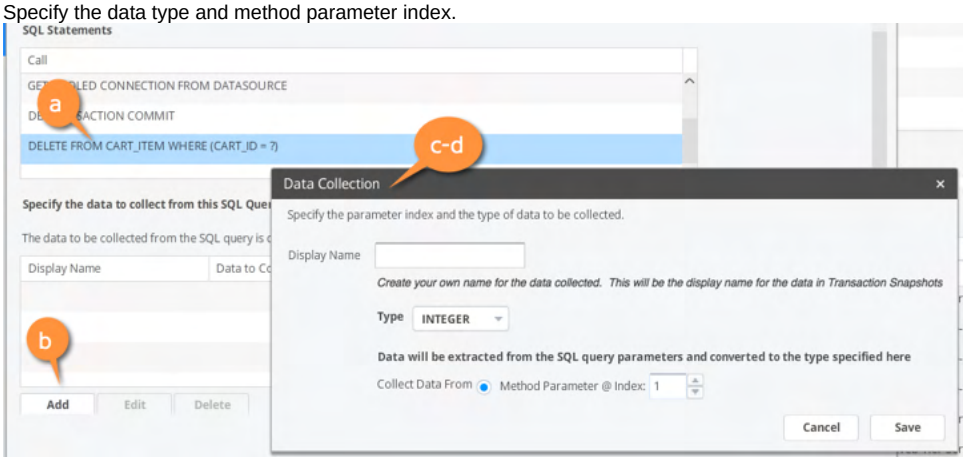


4. Name your data collector and indicate if the collector should apply to new business transactions.
5. Select the appropriate database. A list of available SQL statements displays showing the slowest database calls over the last 30 days. This timeframe is not configurable.



6. Define the data to collect.
    a. Select the SQL prepared statement containing the parameter that you want to capture for analytics.
    b. Click **Add** to specify the data to be collected.
    c. Type a display name for the data you are collecting.
    This name appears in the Analytics UI Fields list when the data is collected and passed to Analytics.

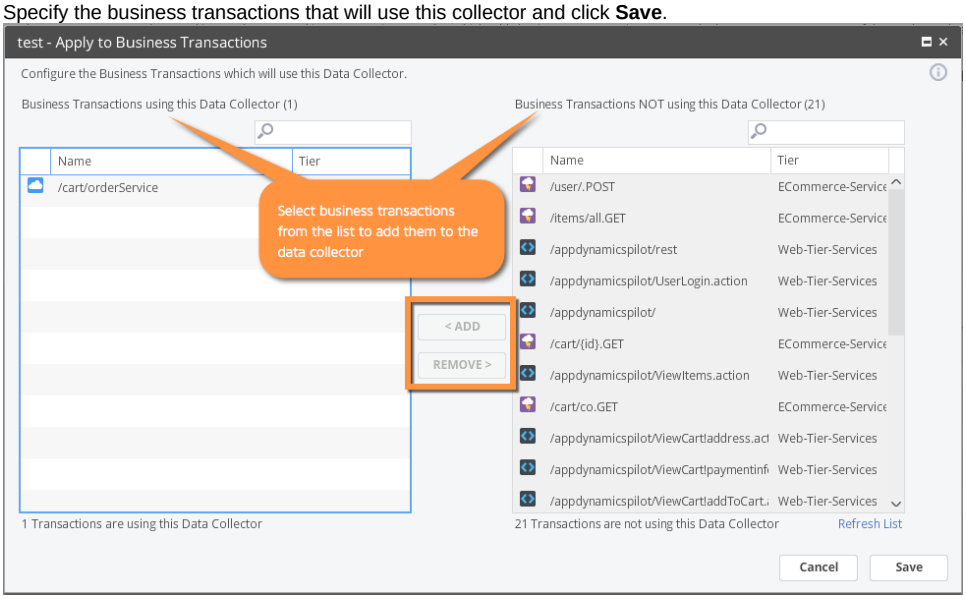
d. Specify the data type and method parameter index.



e. Click **Save**.

f. Click **Create SQL Data Collector**.

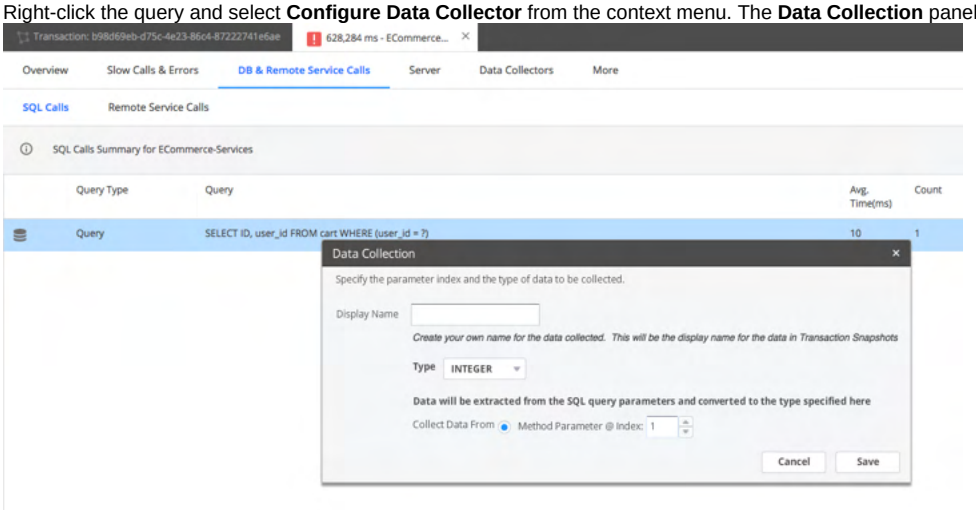
7. Specify the business transactions that will use this collector and click **Save**.



Configure SQL Data Collectors From Snapshots

This procedure provides a shortcut way to set up the configuration for an Analytics SQL data collector for a database call captured in an application transac tion snapshot. You need to find the transaction snapshot of interest and drill down to the node that contains the database call of interest.

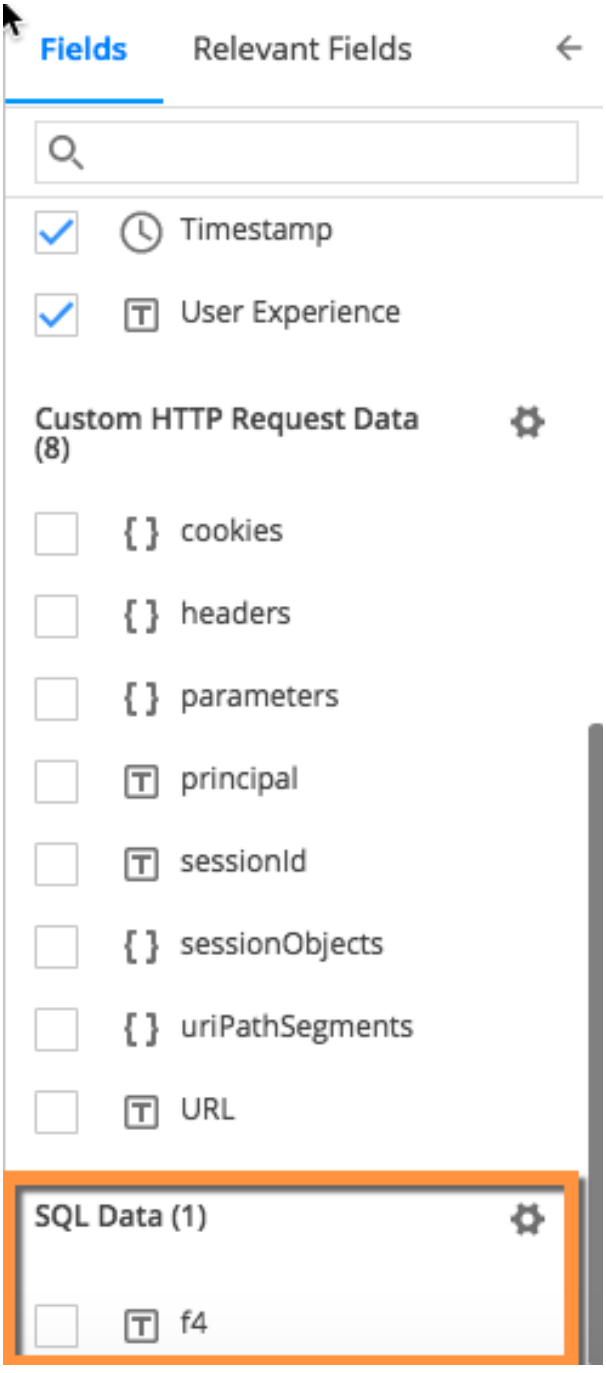
1. From the **DB & Remote Service Calls** tab of a snapshot containing the SQL call of interest, select the prepared statement that contains the data you want to collect for analytics.
2. Right-click the query and select **Configure Data Collector** from the context menu. The **Data Collection** panel displays.



3. Enter a display name for the data you are collecting.
4. Specify the type and the parameter to collect and click **Save**.
5. Select the business transactions from which to collect the data and click **Save**.

View SQL Data in Analytics

After the data is successfully collected for analytics, you see the fields in the **Fields** list in a section labeled SQL Data. This can take a few minutes depending on your application and the frequency of transactions executing the relevant SQL query.



Collect Log Analytics Data

Related pages:

- Configure Log Analytics Using Job Files
- Analytics Log Data

To capture and present log records as analytics data, you must configure one or more *log sources* for the Analytics Agent. The Analytics Agent uses the log source configuration to:

- Capture records from the log file
- Structure the log data according to your configuration
- Send the data to the Analytics Processor.

The Controller presents the Log Analytics data in the Analytics UI.

Before attempting to configure Log Analytics, confirm you have installed and configured the components described in Install Agent-Side Components and, for on-premises, Custom Install and Events Service Deployment.

Versions < 4.3 use *job files* to configure the log sources. You may continue to use job files that were created in previous versions. If you want to collect new log events into our platform, we recommend that you use the Centralized Log Management UI to define *source rules*. You may also find it useful to replace existing job file configurations with the new source rules so you can take advantage of new features introduced in 4.3. See Migrate Log Analytics Job Files to Source Rules.

To configure data collection for your log sources, see Configure Log Analytics Using Source Rules.

Manage Extracted Fields

In Controller < 4.3, you could extract fields from logs in the Controller UI. This is described on the Create Extracted Fields from Logs page. This option is not available >= 4.3. It is replaced entirely by Field Extraction in the Centralized Log Management UI. See Configure Log Analytics Using Source Rules for details.

Fields that were extracted by this mechanism in previous versions appear in the Extracted Fields list. Hovering over the field reveals a **View** icon. Click the **View** icon to delete the field or to see the configuration details:

- Regular expression used to extract the field
- Field name
- Field type
- Source type

Configure Log Analytics Using Source Rules

Related pages:

- Agent Scopes for Configuration Log Management
- Analytics Log Data
- Collect Log Analytics Data from Syslog Messages

The Centralized Log Management UI enables you to configure your log data sources using source rules.

Once you define source rules, you specify which Analytics Agents should use the rules by associating specific source rules with Agent Scopes. Agent Scopes are groups of Analytics Agents that you define. Using Agent Scopes simplifies the deployment of the log source configuration to multiple agents.

Log Analytics Source Rules

Analytics Agents collect logging information based on the log source rules you define in the Controller.

The primary function of a source rule is to specify the location and type of a log file, the pattern for capturing records from the log file, and the structure of the data of captured records. They can also specify field masking or sensitive data removal and manage time zones of captured records.

When the log source rules are enabled and associated with Agent Scopes, Analytics Agents automatically start collecting the configured logs as follows:

- Analytics Agents register with the Controller on startup
- Analytics Agents download log source rules to configure log collection (after registration)
- Log source rules are stored in the Controller data store and are configurable through the Centralized Log Management UI
- Analytics Agents start acting on log source rule changes within five minutes (this could be longer if there are any network communication issues)

Permissions

To configure log analytics source rules, you need the following permissions:

- Manage Centralized Log Config permission
- View access to the specific source types that you want to configure

See Analytics and Data Security.

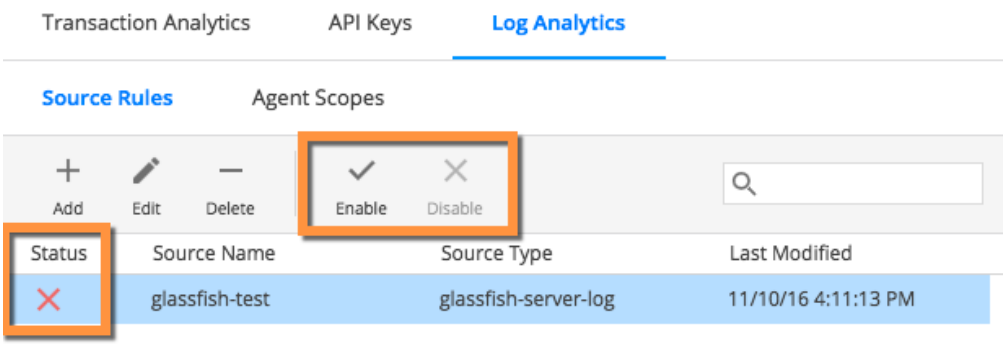
Analytics Agent Properties

If you are using Centralized Log Management (CLM), you need to configure additional properties in the `analytics-agent.properties` file. See information on configuring properties for consolidated log management in Install Agent-Side Components for details.

Managing Source Rules

When you create a source rule and save it, the rule is initially disabled. This is shown in the **Status** column on the source rule list page.

You can enable or disable a source rule by selecting it and choosing the corresponding option from the **Source Rules** menu, shown in the following screenshot:



You can also see which source rules use a specific agent scope. The Analytics Agent does not collect the log data until the source rule is enabled and assigned to an Agent Scope with active Analytics Agents.

Starting Point for Creating a Source Rule

You can create a source rule from any one of these starting points:

- AppDynamics template. Several templates for common log file formats are available.
- Existing source rule. You can use existing source rules as the starting point for new rules.
- New source rule. Start from scratch when your log file does not match one of the available templates.

Preview Extracted Log Data Using Sample Log Files

To improve validation of data collection and parsing of log messages, you can use a local log file with the Log Analytics Configuration UI to preview the field extraction that you want. Three types of field extraction are available.

- Grok patterns and key-value pair extraction
- Auto extraction using regular expressions
- Manual extraction using regular expressions

Best Practices for Source Rule Design

A few recommendations apply to making source rules.

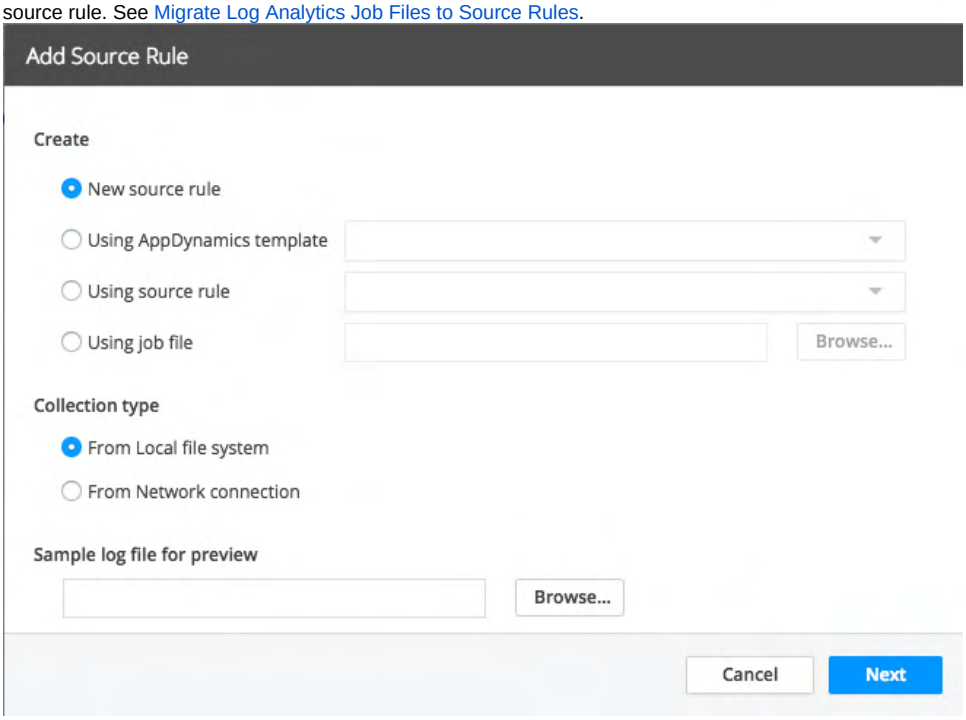
Use the simplest possible regular expressions and grok matching patterns possible. Do not make excessive use of wildcards or quantifiers as it can slow the responsiveness of the Controller UI. You can view examples of such greedy quantifiers on https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html.

If a regex pattern (including grok) is taking more than five seconds to match against a logline, extraction and further processing for those fields stop. If this occurs, some fields may be missing for that log line when viewed on the Controller. Other log lines are not impacted; however, this occurrence is often the result of an ineffective or faulty matching pattern in the first place, and processing is likely to take a long time for all log lines. This behavior is applicable to the dynamic Preview screens in the **Centralized Log Analytics Configuration** page as well.

The Controller limits the size of the records it retrieves to 32 KB by source rule in log analytics. This limit guards against excessive system resource burden, including potential resource burden that might be caused by excessive data collection due to faulty source rule patterns.

Create a Source Rule

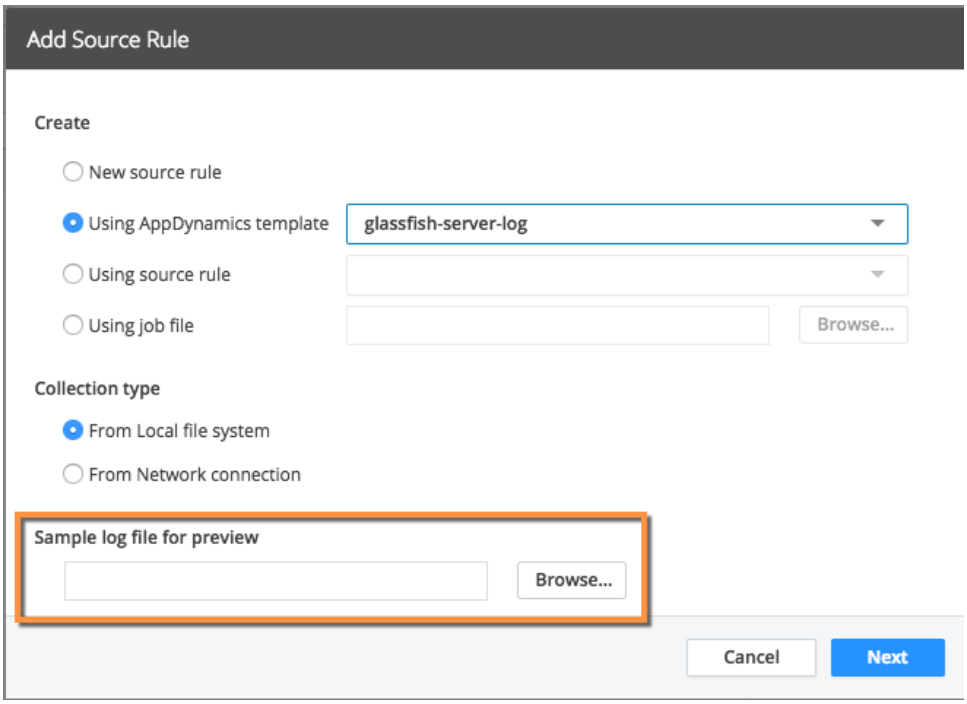
1. From the Controller top navigation bar, click **Analytics**.
2. From the left navigation panel, click **Configuration > Log Analytics**.
   You see two tabs, one for Source Rules and one for Agent Scopes.
3. From the Source Rules tab, click **+ Add .**
   You see the **Add Source Rule** panel.
4. In the **Add Source Rule** panel, select your starting point for the source rule. Note that you can also use a job file as the starting point for your source rule. See Migrate Log Analytics Job Files to Source Rules.



5. Use **Collection Type** to indicate if the source log file resides on the local filesystem or will be collected from a network connection.

> Collecting from a network connection is only used for a TCP source rule, which extracts log analytics fields from {{syslog}} messages over TCP. See Collect Log Analytics Data from Syslog Messages.

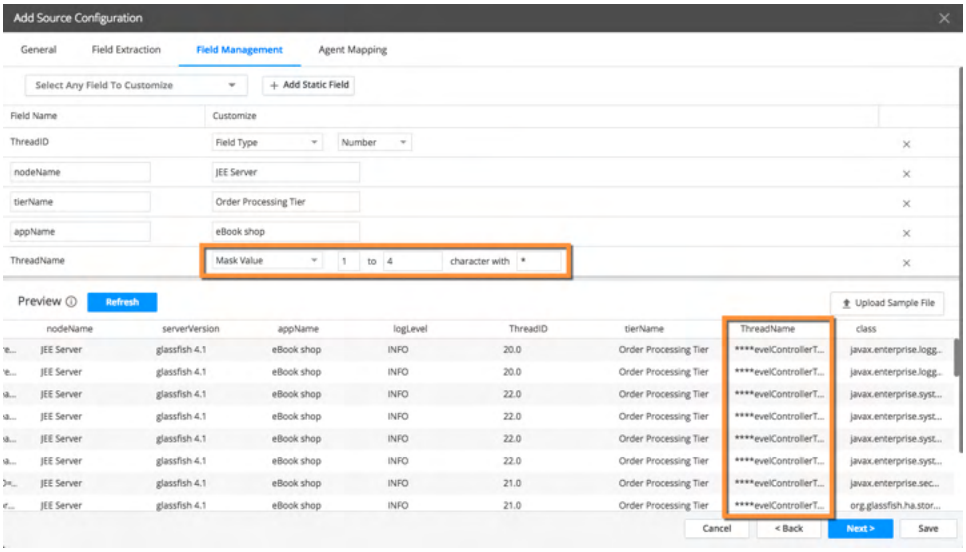
6. Use the **Browser** button to locate and specify a sample log file to preview the results of your configuration. You can also specify a sample file later in the configuration process during the field extraction step.



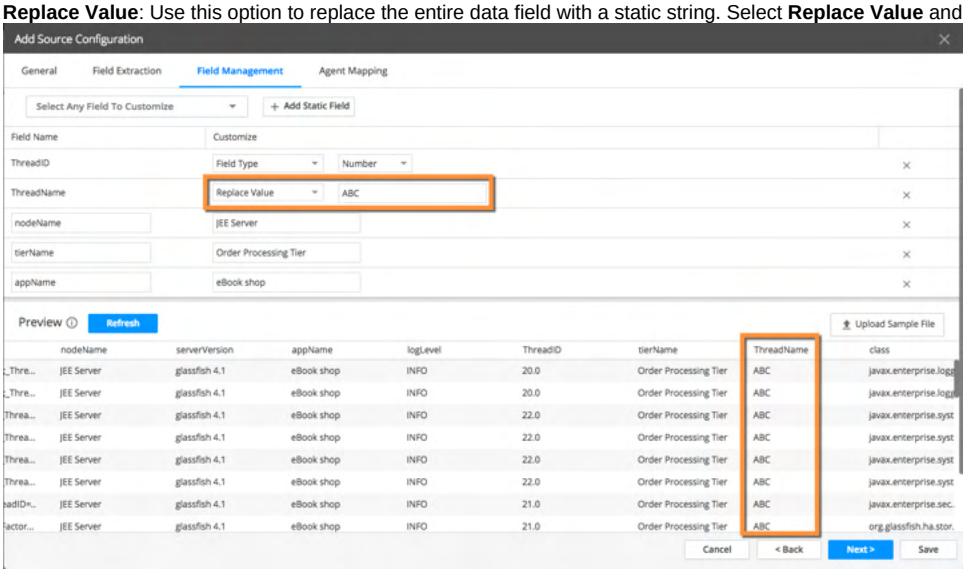
7. Click **Next** to see the **Add Source Configuration** page. Some fields may be prepopulated with data if you selected either an AppDynamics template or an existing source rule as your starting point. The four tabs are:
    - General
    - Field Extraction
    - Field Customization
    - Agent Mapping
8. On the General tab, name your rule, specify its location, timestamp handling, and other general characteristics. See General Configuration.
9. On the Field Extraction tab, configure the fields that you want to capture from your log file. For more details on the fields on this subtab, see Field Extraction. For a detailed procedure on using Auto Field Extraction, see Field Extraction for Source Rules.

    > Use the simplest possible regular expressions and grok matching patterns. Do not make excessive use of wildcards or quantifiers as it can slow the responsiveness of the Controller UI. Examples of expensive and greedy quantifiers can be found here https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html

10. On the Field Management tab, you can customize the handling of fields in a number of way including masking sensitive data, renaming fields, changing the data type and more. See Field Management.
    Mask Value: Use this option to mask values of sensitive data such as credit card numbers of social security numbers. Select **Mask Value** and enter the starting index and ending index (1 and 4 respectively for the example shown) and a character to use for masking in the display, such as an * asterisk.



Replace Value: Use this option to replace the entire data field with a static string. Select **Replace Value** and enter the string to use:



11. On the Agent Mapping tab, assign the source rule to specific Agent Scopes.
12. Click **Save** when you are finished. The source rule is saved in a disabled state.

Centralized Log Management UI Details

General Configuration Tab

Field	Description	Required
Source Name	Name of this source rule. This name must be unique. Appears in the list of defined source rules.	Yes
Source Type	Specifies the event type of log source file. This field is prepopulated when you start from an AppDynamics template or an existing source rule. If you are creating a new source rule from scratch, you can specify any value. This value is used to identify this specific type of log event and can be used in searching and filtering the collected log data. The value shows up in the field list for the log data.	Yes

Source File	The location and name of the log file to serve as a log source. The location must be on the same machine as the analytics-agent. You can use wild cards and you can specify whether to match files one level deep or all log files in the path directory structure. • Example for multi-level matching: path: /var/log/**/*.log This matches both /var/log/apache2/logs/error.log and /var/log/cassandra/system.log • Example for one level matching: path: /var/log/*/*.log This searches for .log files one level deep in the /var/log directory (matches on /var /log/cassandra/system.log but not on /var/log/apache2/logs/error.log).	Required when collection type is from the local filesystem.
Exclude Files	Exclude, or blocklist, files from the defined source rule(s). Input the relative path of the file (s) to exclude, using wildcards to exclude multiple files. • Example for a single file: **Source File**: /var/log/**/*.log **Exclude Files**: cassandra/system.log • Example for multiple files: **Source File**: /var/log/**/*.log **Exclude Files**: */system.log	No
TCP Port	Specifies the port for the analytics-agent to collect log files from a network connection. This field is not present if the collection type is **From local file system**. If no port number is provided, port 514 is used. Both the syslog utility and analytics-agent should have root access to send logs to port 514 (binding to ports less than 1024 requires root access).	Required when collection type is from a network connection.
Enable path extraction	This checkbox enables extraction of fields from the path name. Add a grok pattern in the text box. The syntax for a grok pattern is {%{SYNTAX:SEMANTIC}. For example, to extract `Admin Sever` from `/opt/apps/oracle/middleware/user_projects/domains /ouaf_domain1/servers/AdminServer/logs/AdminServer.log`, enter the following GROK pattern: servers/`%{DATA:servername}/%{GREEDYDATA},` where `%{DATA:server}` filters the server name and `%{GREEDYDATA}` filters rest of the message from the log path.	No
Start collecting from	Indicate where to begin tailing (collecting the log records). Options are: • From the beginning of the log file • From the end of the log file • A specific time range (in hours) - For example, if you set this to four hours, then when you enable the rule and analytics starts tailing the log data, only the last four hours of data is ingested. When tailing starts, the watermark state is maintained for that file. If the agent is now stopped and restarted, it will start tailing from where it left off for any old file. For new files, it will only tail the last four hours of data.	The default is to collect log records from the beginning of the file.
Override time zone	Use this to override the time zone for eventTimestamp in log events. If your log events don't have a time zone assigned and you are not overriding it, the host machine time zone is assigned to the log events. You cannot override the timezone in the pickupTimestamp field. If you override the time zone, you must provide a timestamp format. Time zone formats should conform to Joda-Time Available Time Zones, and the timestamp format should be created with the Joda-Time formatting system.	No
Override timestamp format	You can override the format if needed. Time zone formats should conform to Joda-Time A vailable Time Zones, and the timestamp format should be created with the Joda-Time formatting system.	Yes. The override timestamp format is needed to extract out time correctly from the log file. If you do not provide this field, the `ev entTimestamp` will be equal to `pickupTimestamp` despite log line having a timestamp.
Auto-Correct duplicate Timestamps	Enable this option to preserve the order of original log messages if the messages contain duplicate timestamps. This adds a counter to preserve the order.	No
Collect Gzip files	Enable this to also find gzip files in the specified path.	No

Field Extraction Tab

The following table describes the fields and actions on this tab. For a detailed procedure on using Auto or Manual Field Extraction, see Field Extraction for Source Rules.

Section /Field or Action	Description
Add Grok Pattern	
Message Pattern	This is the grok pattern used to extract fields from the log message. A pattern may be prepopulated when you use an AppDynamics template or an existing source rule as your starting point. You can add or remove grok patterns as needed.
Multiline Format	For log files that include log records that span multiple lines (spanning multiple line breaks), use this field to indicate how the individual records in the log file should be identified. You have two options: • **startsWith**: A simple prefix that matches the start of the multiline log record. • **regex**: A regular expression that matches the multiline log record. The multiline format is not supported when you are collecting log data from a network connection.
Extract Key-Value Pairs	
Field	Shows the field selected for key-value pair configuration.
Split	The delimiter used to separate the key from its value. In this example, "key=value": the split delimiter is the equal sign "=". Multiple comma-separated values can be added.
Separator	The delimiter used to separate out two key-value pairs. In this example, "key1=value1;key2=value2": the separator is the semi-colon ";". Multiple comma-separated values can be added.
Trim	A list of characters to remove from the starting and/or the end of the key/value before storing them. In this example, "_ThreadID_": you can specify the underscore "_" as the trim character to result in "ThreadID". Multiple comma-separated values can be added.
Include	A list of key names to capture from the "source". You must provide keys in the include field. If the include field is left blank no key-value pairs are collected.
Actions	
Upload Sample file	Browse to a local file to upload a sample log file.
Preview	Use to refresh the Preview grid to see the results of the specified field extraction pattern.
Auto Field Extraction	
Definer Sample	Select a message from the preview grid that is representative of the fields that you want to extract from the log records. You can select only one definer sample per source rule.
Refiner Samples	Refines the regular expression to include values that were not included in the original definer sample.
Counter Sample	This specifies something to ignore. Refines the regular expression to exclude values that were included by the original definer or refiner sample.
Manual Field Extraction	
Regular Expression	Add a regular expression to define the field you want to extract.
Field Type	Specify the type for the field.
Field Name	Automatically generated within the regular expression pattern. This name appears in the Fields list in the Analytics Search UI.
Actions	
Add Field	Use to add additional regular expressions for extracting more fields. You cannot add more than 20 fields.

Preview • All • Matching • Non-Matching	Use these buttons to filter the viewable results in the preview grid.
Upload Sample File	Upload a sample file from your local file system to use in the preview grid.

Field Management Tab

Field/Action	Description
Select Any Field to Customize	Select the field to add customizations. You can add multiple customizations to a single field.
Field Name	This column lists the fields that have customizations.
Customize	This column shows the specific customizations. For static fields, the display name is shown. Static fields cannot be further customized.
Mask Value	This customization option masks values in the collected data. Specify the starting and ending position in the data and the character to use as the masking value.
Replace Value	This customization option replaces the entire value of the field with a static string.
Rename	This customization option enables you to rename a field to a more recognizable display name.
Field Type	Use to change the data type of the field. For example, from string to number. Available types are String, Boolean, and Number. Note that after a source rule has been saved with a field of a specified data type, you cannot later change the data type of that field. Once the fields are indexed in the analytics database trying to specify a new type will cause a validation error.
Remove	This customization turns off data collection for the field. It can be reversed at a later time.
Add Static Field	This action allows you to add a static field to all the log events collected from this source. This field can then be used to search and filter the log data. For example, use this to add Tier, Node, and Application Name to the log data.

Field Extraction for Source Rules

This page describes how to use Auto and Manual Field Extraction to configure Log Analytics source rules. Field Extraction uses regular expressions to identify and format the fields for your Log Analytics data.

Auto Field Extraction enables you to upload a sample log file and select fields for extraction. The necessary regular expressions are automatically generated and highlighted in your sample messages. You can fine-tune the generated regular expressions using Refiner Sample and Counter Sample log messages.

Manual Field Extraction enables you to upload a sample log file and enter your own regular expressions to define fields and associate the fields with a data type.

Definitions

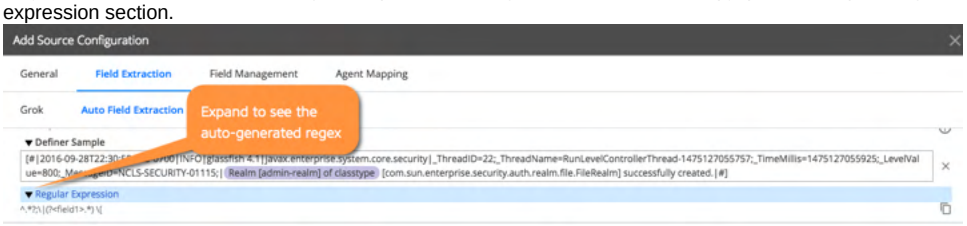
- Source Rule: a set of configuration settings for extracting analytics data from log files. You create source rules using the Centralized Log Management UI in the Controller. Source rules are stored in the Controller data store and periodically synced with the Analytics Agent. See Configure Log Analytics Using Source Rules.
- Sample File: a representative log file uploaded to the Controller that provides a way to test and fine-tune your log file source rules.
- Definer Sample: a specific log message selected from the sample log file used to define the fields that you want to extract from the log messages.
- Refiner Sample: an additional log message used to revise the auto-generated regular expression created in the Definer Sample step. The Refiner sample helps capture fields that were missed in the initial step.
- Counter Sample: an additional log message used to eliminate false positives while extracting the fields as defined in the Definer or Refiner steps.

Auto Field Extraction

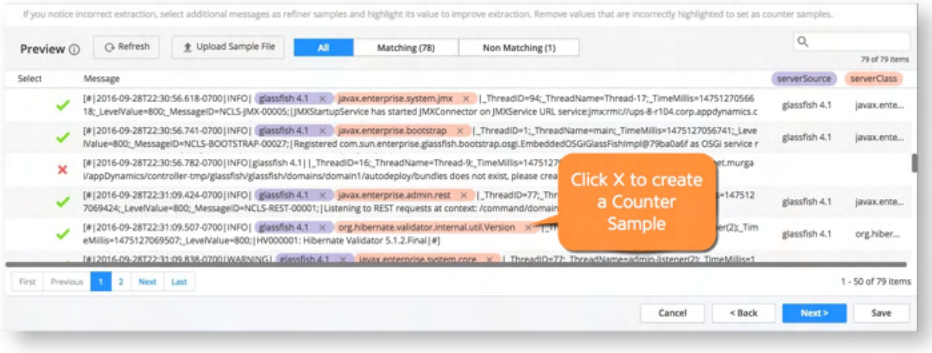
This section describes how to use Auto Field Extraction to extract fields from your log files.

To specify field extraction using a Definer Sample log message:

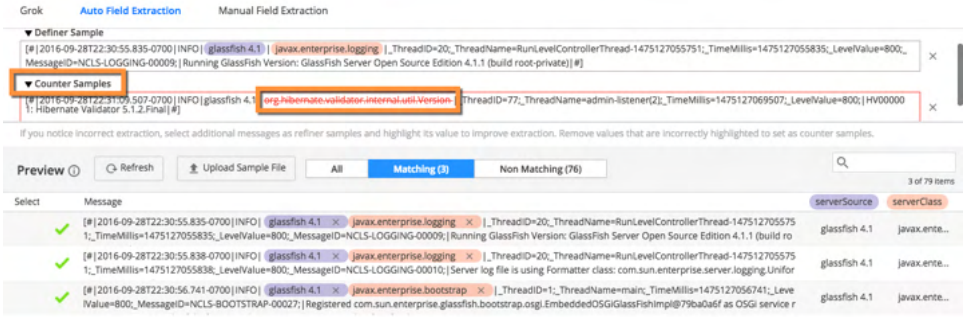
1. Using the Centralized Log Management UI, add a new source rule (or edit an existing source rule), and navigate to the Auto Field Extraction subtab within the Field Extraction tab. See the section "*Create a Source Rule*" in Configure Log Analytics Using Source Rules for detailed steps on accessing this UI.
2. If you do not see log messages in the grid, upload a sample file by clicking **Upload Sample File**.
   If you uploaded a sample file in a previous step in the configuration process or you started your new source rule using an existing source rule, you will see log messages in the grid.
3. Hover over any row on the grid and click **+Select as Definer Sample**.
   Choose a sample log message that contains the fields you want to extract from the log file. When you need to capture fields from dissimilar log messages, you can create more than one definer.
4. After you select the Definer Sample message, use the following steps to extract fields from the message. After selecting the Definer Sample and specifying the fields to extract, the preview grid displays rows with matching and non-matching results.
   a. Select text in the message. If you are defining key-value pairs, it is only necessary to highlight the key field.
      A popup appears where you can specify properties of the extracted field.
   b. Enter the field name, select the data type, and click **Extract**.
      The preview grid is updated to show matching rows with the selected text highlighted with a color.
   c. (Optional) To update the properties or delete the field, click the field you just created in the definer and the properties popup appears.
   d. Repeat steps a, b and c to create more fields.
      As you add additional fields, the regular expression changes. You can view or copy (but not edit) the regular expression in the regular expression section.



5. (Optional) Specify Refiner Samples: As you review the non-matching rows, if you notice a value that was not extracted and should have been extracted, then you can add that row as a Refiner Sample. A refiner sample is used to match the unmatched rows from the Definer step.
   a. On the grid, click **+Select as Refiner Sample.** You do not see this option unless you already selected the Definer Sample.
   b. Select the text.
   c. A popup appears. You can associate this portion of text with a field already created in the Definer step. When you extract, the regular expression changes and matching rows get updated in the Preview grid and will be shown as Matching. If necessary, you can add more than one Refiner Sample message.
6. (Optional) Specify Counter Samples: Counter samples eliminate false positives while extracting the fields. In the Preview grid, the highlighted values are shown along with an X button. Click the X next to a field to mark a value as a false positive (a Counter Sample).



The Counter Sample is shown below the Definer and Refiner Samples and the regular expression is updated to show the new set of matching and non-matching rows.



7. Click **Save** to save the fields to the source rule.
8. Continue to the other tabs of the Add Source Rule dialog to complete your source rule configuration.

Manual Field Extraction

You can specify your own regular expressions if needed using Manual Field Extraction.

1. Using the Centralized Log Management UI, add a new source rule (or edit an existing source rule), and navigate to the Manual Field Extraction subtab within the Field Extraction tab. See "*Create a Source Rule*" in Configure Log Analytics Using Source Rules for detailed steps on accessing this UI.
2. If you do not see log messages in the grid, upload a sample file by clicking **Upload Sample File**.
3. Click **Add Field**.
4. Click **Show Example** to review how to write regular expressions.
5. Type in your regular expression and associate it with a field type using the drop-down menu.
6. In the Preview grid, click Refresh.
   The preview grid is highlighted with the results of applying the regular expression to the sample log messages. You cannot add more than 20 fields.
7. (Optional) You can change the regular expression or the type and use **Refresh** to see the updated results.
8. Click **Save** to update your source rule.

Agent Scopes for Configuration Log Management

Related pages:

- Configure Log Analytics Using Source Rules

Agent Scopes are used to determine which agents use the CLM source rules. You can group your deployed Analytics Agents into scopes, then assign source rules to the scopes. While creating an agent scope, you are given an option to either choose agents from a static list or to add agents dynamically by specifying matching rules.

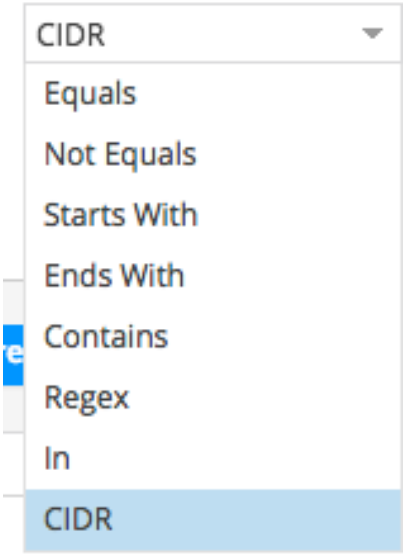
Static Agent Scopes

The Available Agents list is populated with the Analytics Agents reporting to your controller. You can use this list to add currently available agents to a scope.

Dynamic Agent Scopes

You can specify match conditions where registered Analytics Agents that match the rule are automatically added to, or excluded from, the scope. Analytics Agents that register with your Controller in the future, with characteristics that match the scope criteria, will also be added to the scope. You can match on agent name, unique host ID, or IP address.

The available operators for the matching conditions include regular expressions (regex) and Classless Inter-Domain Routing (CIDR) notation. CIDR is a compact notation for an IP address and its associated routing prefix.



The match conditions are additive, so exclusions will take precedence over inclusions. An agent must satisfy all conditions to be included. For example, an agent named *ABC* would not be included in the scope if you specify something similar to the following conditions:

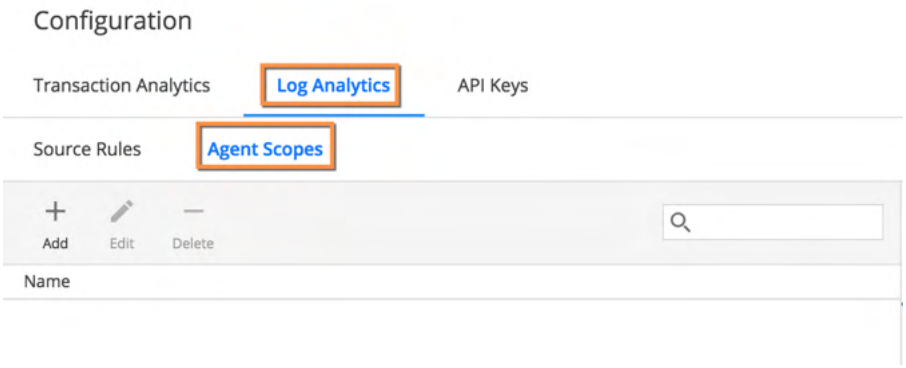
- include name equals '*ABC*'
- include name that ends with '*D*'

Define Agent Scopes

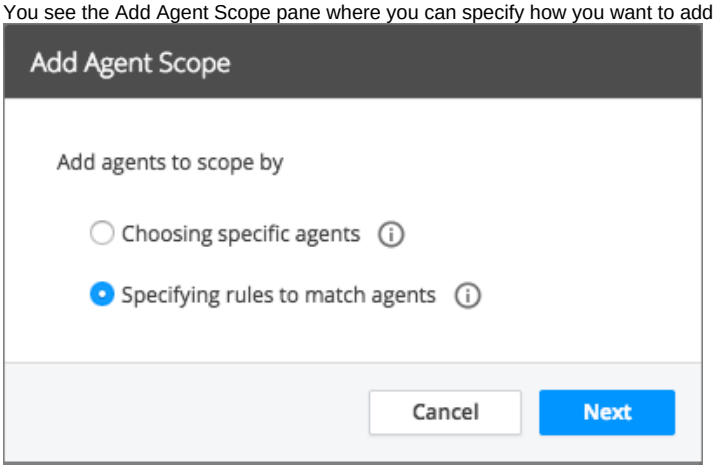
To add an Agent Scope:

1. From the Controller top navigation bar, click **Analytics**.

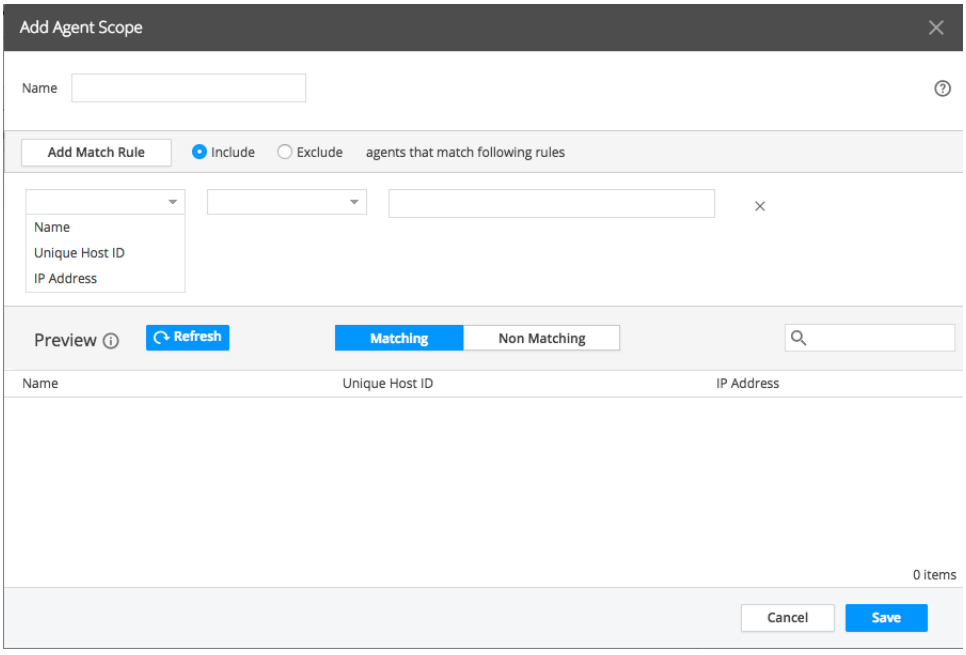
2. From the left navigation panel, click **Configuration > Log Analytics > Agent Scopes.**



3. **Click +Add.**
You see the Add Agent Scope pane where you can specify how you want to add agents: from a static list or dynamically by specifying match rules.



4. To add specific agents, select **Choosing specific agents** and move agents from the list of Available Agents to the list of Selected Agents to define the scope.
5. To add agents dynamically, select **Specifying rules to match agents** and specify your matching rules.



6. Name the **Agent Scope** and click **Save**.

Collect Log Analytics Data from Syslog Messages

Related pages:

- Configure Log Analytics Using Job Files
- Analytics Log Data

You can configure the Analytics Agent to receive syslog messages using TCP transport and standard syslog format adhering to RFC 5424. The Analytics Agent can listen on a TCP port for syslog messages coming from a remote source or from the same host on which the Analytics Agent is present.

To set this up:

- Configure your web server, such as Apache, to send logs to the Analytics Agent. There are two ways to direct the syslog data to the Analytics Agent:
  - Write the log messages to the usual log files and then read and forward to the agent from the log file. See Read syslog Messages From the Log File and Send to Analytics Agent.
  - Send the log data directly to the Analytics Agent without writing to a file first. See Send syslog Data Directly to the Analytics Agent.
- Configure the Analytics Agent to receive and parse the logs. There are two ways to configure syslog message collection for Log Analytics:
  - Job files (for <= 4.2), see Configure Log Analytics TCP Job File.
  - Source rules (for 4.3) Recommended for your new log file sources. See Configure Log Analytics TCP Source Rule.

Supported Environment Details

- Linux only
- Network protocol is TCP only
- A template for Apache Web Server syslog format is shipped with the Analytics Agent. You can bring any log data in through syslog over TCP as long as you provide the correct configuration to parse the log message.
- One job file per Analytics Agent can be enabled to receive syslog messages over TCP.

Both the syslog utility and analytics-agent should have root access if the port where the analytics-agent is listening for syslog messages is lower than 1024.

Send syslog Data Directly to the Analytics Agent

You can use the Linux Logger utility to direct your Apache access and error log messages to the syslog daemon directly. Using this method, the logs are not written to the usual access log and error log apache files or to the `/var/log/message` file. Instead, the log lines are sent directly to a syslog daemon which then forwards the data to the analytics-agent.

Configure:

1. Configure Apache to delegate logs to `/usr/bin/logger`.
   a. Locate and open `httpd.conf`, the Apache configuration file. This is typically located at `/etc/httpd/conf/`.
   b. Add a new CustomLog directive to send access logs and error logs to the syslog and comment out the line that sends to the access_logs.

```
#comment the following line to avoid logging to access_logs
#CustomLog logs/access_log combined

#Add a new CustomLog directive to send access logs and error logs to the syslog
CustomLog "|/usr/bin/logger -t httpd -p local6.info" combined
```

   This directive uses the logger utility to send messages with facility local6, tag 'httpd' and log format combined.
   The facility code specifies the type of program that is logging the message. Messages with different facilities may be handled differently.
   The tag 'httpd' in the httpd.conf directly relates to the program name in the rsyslog.conf (see next step) for filtering out which messages need to be sent. For example, there can be other programs writing to that particular port, but we only want to send the logs from the httpd program to analytics-agent.
2. Configure the rsyslog client.
   a. Edit `rsyslog.conf`, typically located at `/etc/`.
   b. Add the following lines above "RULES" or "var/log/messages" filter so Apache doesn't log to the `/var/log/message` file.

```
# log to analytics-agent
if $syslogfacility-text == 'local6' and $programname == 'httpd' then @@<analytics_agent_home>:514
# Prevent logging httpd to /var/log/messages
if $syslogfacility-text == 'local6' and $programname == 'httpd' then ~
```

   Make sure you replace 514 with the port where the analytics-agent is listening for syslog messages. This must match the port specified in the job file.
3. Restart apache and rsyslog, and look at /var/log/messages for any rsyslog errors.

Read syslog Messages From the Log File and Send to Analytics Agent

In this case, the Apache server writes logs to the usual access log and error log files, and the rsyslog daemon is configured to read from these log files and forward the log data to analytics agent. This method preserves the original log files. In this case, the access and the error log messages are logged in the `/var/log/message` file.

In this example, the rsyslog client is configured to read from a specific file and forward the message with facility local6 and severity level info over the specified port (default port is 514).

1. Locate and edit rsyslog.conf, typically located at `/etc/`.
2. In the begin forwarding section of the rsyslog.conf file, add the following lines:

```
# add these lines in the begin forwarding section
$ModLoad imfile
$InputFileName /etc/httpd/logs/access_log << your file
$InputFileTag apache-access
$InputFileStateFile stat-apache-access
$InputFileSeverity info
$InputFileFacility local6
$InputRunFileMonitor
local6.info @@localhost:514
```

   $InputFileName: path to the log file you want to tail.
   local6.info: Use the Analytics Agent IP address if your analytics agent is not local to the controller. If needed, replace 514 with the port where the analytics-agent is listening for syslog messages. This must match the port specified in the job file or the source rule.
3. Restart rsyslog and review /var/log/messages for any rsyslog errors.

Configure Log Analytics TCP Source Rule

Using the Centralized Log Management UI, you can configure a source rule to extract log analytics fields from syslog messages over TCP.

1. Access the Centralized Log Management UI from your Controller by clicking **Analytics > Configuration > Log Analytics**.
2. On the Source Rules tab, click **+ Add.**
3. In the Add Source Rule panel, select the **Create from** source template and select **From Network Connection** as the collection type. For example, select the default Apache syslog template `apache-httpserver-access-syslog`:

   Several log format templates are shipped with the Analytics Agent. You can create a new source rule for any log format over syslog TCP as long as you configure it correctly.
4. Click **Next** to see the Add Source Configuration wizard.
5. Specify the collection details, such as the name of the source rule, source type and enter the TCP Port where the Analytics Agent is listening.
6. When you specify **From Network Connection** as the collection type, the grok pattern for the syslog header (which is appended to the log messages) is automatically added at the beginning of the grok Message Pattern:

```
%{SYSLOG5424PRI}%{SYSLOGBASE2}
```

7. Confirm that the value for Multiline Format is **None**.
8. Configure field extraction and field management as for any other source rule. See Configure Log Analytics Using Source Rules.

Configure Log Analytics TCP Job File

When selecting and configuring the port where the analytics agent will listen for the syslog data, make sure it does not conflict with anything else active in the network. If no port number is provided, port 514 is used. Both the syslog utility and analytics-agent should have root access to send logs to port 514 (binding to ports less than 1024 requires root access).

To allow the analytics-agent to listen at a port, specify the log file **source** property and associated parameters for **type**=syslog. For example, add the following to the appropriate job file:

```
source:
    type: syslog
    port: 514
    protocol: tcp
        numThreads: 1
```

A job file for apache commons is included in the analytics distribution at `/<analytics-agent-home>/conf/job/sample-apache-httpserver-access-syslog.job.`

Your job file should look similar to the following:

```
version: 2
enabled: true

source:
    type: syslog
    port: 514
    protocol: tcp
        numThreads: 5

fields:
   sourceType: apache-httpserver-access-syslog
   nodeName: Node1
   tierName: Tier1
   appName: App1

grok:
  patterns:
    - "%{SYSLOG5424PRI}%{SYSLOGBASE2} %{COMBINEDAPACHELOG}"

eventTimestamp:
   pattern: "dd/MMM/yyyy:HH:mm:ss Z"
```

Configure Log Analytics Using Job Files

Related pages:

- Analytics Log Data
- Configure Log Analytics Using Source Rules

This page describes how to configure log sources using job files. If you are configuring new log sources, we recommend you use the Centralized Log Management UI to define source rules.

To configure log analytics using job files:

1. Describe the Log Source in a Job File
2. Map the Log File Data to Analytics Fields
3. Verify Analytics Agent Properties

Describe the Log Source in a Job File

Each log source is represented by a job file. A job file is a configuration file that specifies the following:

- Location of the source log file
- Pattern for capturing records from the log file
- Pattern for structuring the data from the captured log records
- Other options for capturing records from the log source

To define a source, you create a job file (or modify one of the samples) in the Analytics Agent configuration directory. The Analytics Agent includes sample job files for Glassfish, OSX log, and others. The Analytics Agent can also collect and parse GZIP files - (log files ending in .gz).

The job files are located in the following directory:

- `<Analytics_Agent_Home>/conf/job/`

The agent reads the job files in the directory dynamically, so you can add job files in the directory without restarting the agent.

To configure a job file, use these configurable settings in the file:

- **enabled**: Determines whether this log source is active. To capture analytics data from this log source, set the value to true.
- **source**: Specifies the source of the logs.
    - **type**: Specifies the type of log source. There are two types, file, and syslog. Additional parameters depend on the value of **type**.
        - **file**: The location and name of the log file to serve as a log source. The location must be on the same machine as the analytics-agent. File has the following parameters:
            - **path**: Path to the directory where the log files reside. On Windows, the path should be provided as if on Unix environments such as:
            - Example: demo/logs
            - Example: C:/app/logs
            - **nameGlob**: A string to use to match on the log file name. You can use wild cards and you can specify whether to match files one level deep or all log files in the path directory structure. If the wild card starts the value of nameGlob, you must enclose the value in quotes. The matching patterns that are supported can be found here: http://java.boot.by/ocpjp7-upgrade/ch06s05.html under "glob".
            - Example for multi-level matching:
              path: /var/log
              nameGlob: '**/*.log'
              This matches both /var/log/apache2/logs/error.log and /var/log/cassandra/system.log
            - Example of one level matching:
              path: /var/log
              nameglob: '*/*.log'
              This searches for .log files one level deep in the /var/log directory (matches on /var/log/cassandra/system.log but not on /var/log/apache2/logs/error.log).
            - **startAtEnd**: If set to true allows tailing the file from the end.
        - **syslog**: See Collect Log Analytics Data from Syslog Messages.
    - **multiline**: For log files that include log records that span multiple lines (spanning multiple line breaks) configure the multiline property and indicate how the individual records in the log file should be identified. A typical example of a multiline log record is one that includes a Java exception. You can use one of two options with the multiline property to identify the lines for a multiline log record:
        - **startsWith**: A simple prefix that matches the start of the multiline log record.
          Example 1: To capture the following multiline log as one record:

          ```
          [#|2015-09-24T06:33:31.574-0700|INFO|glassfish3.1.2|com.appdynamics.METRICS.
          WRITE|_ThreadID=206;_ThreadName=Thread-2;|NODE PURGER Completed in 14 ms|#]
          ```

          You could use this:

          ```
          multiline:
             startsWith: "[#|"
          ```

Example 2: To capture the following multiline log as one record:

```
May 5, 2016 6:07:02 AM com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)

May 5, 2016 6:07:03 AM com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit piId:1234B
May 5, 2016 6:07:03 AM com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit referenceNumber:4620346703956702001
May 5, 2016 6:07:03 AM com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit extData requestToken:alf
/7wSR9PBh3zSMQ+++IYTRlk3Ys2DOxOmM5jWLRTyFJaSggCTyFJaSgjSB1/2v0wyTWRV0ekb0X
```

You could use this:

```
multiline:
   startsWith: "INFO: Source deposit requested amount"
```

- **regex**: A regular expression that matches the multiline log record.
  Example: To capture this multiline log as one record:

```
2016-06-01 16:28:21.035 WebContainer : 8 TRANSTART> ======================================
2016-06-01 16:28:21.036 WebContainer : 8 MERCHCFG > merchantID=appD, sendToProduction=true,
targetAPIVersion=1.00, keyFilename=(null), serverURL=(null), namespaceURI=(null),
enableLog=true, logDirectory=logs, logFilename=(null), logMaximumSize=10,
useHttpClient=false, timeout=130
2016-06-01 16:28:21.037 WebContainer : 8 REQUEST  >
merchantID=appD
davService_run=true
clientLibraryVersion=2.0.1
clientEnvironment=OS/400/V7R1M0/LINUX
application_id=ff22
exportService_addressWeight=medium
merchantReferenceCode=appD
clientLibrary=Java Basic
billTo_customer=xxxxxxxxx
billTo_finance=true
billTo_postalCode=94105
billTo_country=US
```

You can use the following regex configuration to identify the start of each "record":

```
multiline:
   regex: "^\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2}\.\d{3} WebContainer : \d+ TRANSTART\u003E
======================================$"
```

The regex describes that the line should match 4 digits(2016) followed by followed by 2 digits (01), followed by a space, followed by 2 digit(16) ':' 2 digit (28) ':' 2 digits(21) '.' 3 digits(035) space followed by term 'WebContainer' space digit followed by term 'TRANSTART' folowed by '>'.

Whenever the Log tailer sees the matching pattern at the start of the line, it starts a new match and passes the previously collected data as one log record. Each matching pattern identifies when to start accumulating the log lines in a buffer until the matching pattern is found again at the beginning of another record.

If the particular format of a multiline log file does not permit reliable continuation line matching by regular expression, you may choose to use a single line format. For most types of logs, this would result in the capture of the majority of log records.

- **fields**: The fields are used to specify the context of the log data in the Controller UI, by application name, tier name, and so on. Specify the fields as free form, key-value pairs.
- **grok**: The grok parameter specifies the patterns by which the data in the unstructured log record is mapped to structured analytics fields. It associates a named grok expression (as defined in a .grok file that is bundled inside lib/analytics-shared-pipeline-core.jar) to a field in the data as structured by the agent. For example:

```
grok:
  patterns:
       - "\\[%{LOGLEVEL:logLevel}%{SPACE}\\]  \\[%{DATA:threadName}\\]  \\[%{JAVACLASS:class}\\]  %
{GREEDYDATA}"
       - "pattern 2"
       ...
```

In this case, the grok-pattern name LOGLEVEL is matched to an analytics data field named logLevel. The regular expression that is specified by the name LOGLEVEL is defined in the file `grok-patterns.grok` in the `grok` directory. See Specifying Grok Expressions.
Previous versions of Log Analytics used a single "pattern" rather than a pattern list. This mode is still supported for backward compatibility.
The log analytics grok processor does not allow underscores in the field names. For example, a field name "log_fields" will not work, Instead, use something like "logfields".

- **keyValue**: The keyValue parameter specifies how to parse the logs to identify key-value pairs with a user-defined delimiter. This enables you to configure the parsing for a message of the type "Key1 = Value1 Key2 = Value 2". See Specifying Key Value Pairs.
- **transform**: This parameter specifies how to change the type or alias name of any field extracted from the logs by grok or keyValue parameters.
- **eventTimestamp**: This setting defines the pattern for the timestamp associated with captured data.

Map the Log File Data to Analytics Fields

To specify how data in the unstructured log records should be mapped to structured analytics fields for log analytics, you provide the configuration in the job file. You can map unstructured log data in the following ways:

- grok patterns
- key value pairs
- transforms

Specify Grok Expressions

Grok is a way to define and use complex, nested regular expressions in an easy to read and use format. Regular expressions defining discrete elements in a log file are mapped to grok-pattern names, which can also be used to create more complex patterns.

Grok-pattern names for many of the common types of data found in logs are provided for you with the analytics agent. A list of basic grok-pattern names and their underlying structures are bundled inside `lib/analytics-shared-pipeline-core.jar`. You can list the grok files with a command such as the following:

```
unzip -l ./lib/analytics-shared-pipeline-core.jar|grep "\.grok"
```

To can view the definition of a grok file with a command such as the following:

```
unzip -p ./lib/analytics-shared-pipeline-core.jar grok/grok-patterns.grok
```

The `grok` directory also contains samples of more complex definitions customized for various common log types - `java.grok, mongodb.grok`, and so on. Additional grok patterns can be found here: https://grokdebug.herokuapp.com/patterns#.

Once the grok-pattern names are created, they are then associated in the jobs file with field identifiers that become the analytics keys.

The basic building block is `%{grok-pattern name:identifier}`, where `grok-pattern name` is the grok pattern that knows about the type of data in the log you want to fetch (based on a regex definition) and `identifier` is your identifier for the kind of data, which becomes the analytics key. So `%{IP:client}` would select an IP address in the log record and map it to the key `client.`

Custom Grok Patterns

Complex grok patterns can be created using nested basic patterns. For example, from the `mongodb.grok` file:

```
MONGO_LOG %{SYSLOGTIMESTAMP:timestamp} \[%{WORD:component}\] %{GREEDYDATA}
```

It is also possible to create entirely new patterns using regular expressions. For example, the following line from `java.grok` defines a grok pattern named JAVACLASS.

```
JAVACLASS (?:[a-zA-Z$_][a-zA-Z$_0-9]*\.)*[a-zA-Z$_][a-zA-Z$_0-9]*
```

Because JAVACLASS is defined in a .grok file in the `grok` directory can be used as if it were a basic grok pattern. In a jobs file, you can use the JAVACLASS pattern match as follows:

```
grok:
  pattern: ".... \[%{JAVACLASS:class}\\]
```

In this case, the field name as it appears in the Analytics UI would be "class". For a full example, see the following files:

- Job file: `<Analytics_Agent_Home>/conf/job/sample-analytics-log.job`
- Grok file: `java.grok` bundled inside `lib/analytics-shared-pipeline-core.jar`

Special Considerations for Backslashes

The job file is in YAML format, which treats the backslash as an escape character. Therefore, to include a literal backslash in the String pattern you need to escape the backslash with a second backslash. You can avoid the need to escape backslashes in the .job file grok pattern, by enclosing the grok pattern in single quotes instead of double quotes such as the following:

```
grok:
  patterns:
    - '\[%{DATESTAMP:TIME}%{SPACE}CET\]%{SPACE}%{NOTSPACE:appId}%{SPACE}%{NOTSPACE:appName}%{SPACE}%{NOTSPACE:
Severity}%{SPACE}%{NOTSPACE:messageId}:%{SPACE}%{GREEDYDATA}'
```

Numeric Fields

In Release 4.1.3, the grok definition syntax was enhanced to support three basic data types. When defining a pattern in the .grok file you can specify the data type as number, boolean, or string. If a Grok alias uses that grok definition in a .job file then the extracted field is stored as a number or boolean. Strings are the default. If the number or boolean conversion fails, then a log message appears in the agent's log file. No validations are performed as it is not possible to reverse engineer a regex reliably. These are pure runtime extractions and conversions.

Upgrade pre-4.1.3 Job Files

For 4.1.2 (or older) .job files in use that have fields that are unspecified or specified as NUMBER and now switch to the "type aware" files, the data inside Events Service will break. This is due to the type mapping. To avoid this, you need to modify the grok alias in your job files.
Examples:

```
Was:
grok:
  patterns:
    - "%{DATE:happenedAt},%{NUMBER:quantity}

Update job to:
grok:
  patterns:
    - "%{DATE:happenedAt},%{NUMBER:quantity_new}
```

```
Was:
grok:
  patterns:
    - "%{DATE:happenedAt},%{DATA:howMany}

Update job to:
grok:
  patterns:
    - "%{DATE:happenedAt},%{POSINT:howManyInt}
```

To Upgrade (Migrate) < 4.1.3 Job Files:

1. Stop analytics-agent.
2. Change .job files that use the enhanced grok patterns:

```
BOOL:boolean
INT:number
BASE10NUM:number
NUMBER:number
POSINT:number
NONNEGINT:number
```

   Change the grok alias so as not to conflict with the older aliases:

```
grok:
  patterns:
(Old)  - "%{DATE:quoteDate},%{NUMBER:open},%{NUMBER:high},%{NUMBER:low},%{NUMBER:close},%{NUMBER:
volume},%{NUMBER:adjClose}"

(New aliases)  - "%{DATE:quoteDate},%{NUMBER:openNum},%{NUMBER:highNum},%{NUMBER:lowNum},%{NUMBER:
closeNum},%{NUMBER:volumeNum},%{NUMBER:adjCloseNum}"
```

3. Start analytics-agent.

Specifying Key-Value Pairs

This section of the mapping configuration captures key-value pairs from fields specified by the `source` parameter. The values listed under source should refer to fields that were defined and captured by a grok pattern. For example, if you have a grok parameter that defines the following pattern "%{DATA:keyValuePairs}" then you can list the field "keyValuePairs" under the source parameter to capture any key-value pairs listed in the "keyValuePairs" string. If the `source` parameter is not specified then the agent attempts to extract key-value pairs from the entire log message. The result can be different than expected if the message contains more information than just key-value pairs.

The Key Value mapping contains these fields:

- **source**: A list of strings on which the keyValue filter should be applied. It is an optional field. If it is not provided the key-value pairs are parsed from the original log "message" string.
- **split**: The delimiter defined by the user to separate out the key from the value. In this example, key=value, the split delimiter between the key and the value is the equal sign =
- **separator**: The delimiter defined by the user to separate out two key-value pairs. In this example, key1=value1;key2=value2, the separator is the semi-colon ;
- **include**: A list of key names that the user wants to capture from the "source". If nothing is provided in "include" we capture all the key-value pairs.
- **trim**: A list of characters the user wants to remove from the starting and/or the end of the key/value before storing them.

The sample-glassfish-log.job file includes key-value pairs configuration. This file is found here: <*analytics_agent_home*>`/conf/job/`.

Key-Value Pairs Example

For a log file with the following entries:

> [#I2015-09-24T06:33:31:574-0700|INFO|glassfish3.1.2|com.appdynamics,METRICS.WRITE|_**ThreadID=200;_ThreadName=Thread-2;**|NODE PURGER Complete in 14 ms|#]
>
> [#I2015-09-24T06:33:46:541-0700|INFO|glassfish3.1.2|com.singularity.ee.controller.beans.license.LicenseUsageManagerBeanWRITE|_**ThreadID=202;_ThreadName=Thread-2**;|about to start persisting license usage data |#]

And the following grok pattern:

```
grok:
  patterns:
    - "\\[\\#\\|%{DATA}\\|%{LOGLEVEL:logLevel}\\|%{DATA:serverVersion}\\|%{JAVACLASS:class}\\|%{DATA:
keyValuePairs}\\|%{GREEDYDATA}"
```

The key-value parameter to extract the ThreadID and the ThreadName should look similar to the following:

```
keyValue:
  source:
        -"keyValuePairs"
  split: "="
  separator: ";"
  include:
        - "ThreadID"
        - "ThreadName"
  trim:
        - "_"
```

Specify Transform Parameters

This section of the mapping configuration enables you to change the type or alias name of any field previously extracted from the logs by your grok or key value configuration. The transform is applied after all fields have been captured from the log message. You can specify a list of field names, where you want to cast the value to a specific type or rename the field with an "alias".

The Transform mapping contains these fields:

- **field**: Specifies the name of the field to transform and can not be empty or null. If `field` is defined, either type or alias must be specified. If neither is specified, an error is written to the analytics-agent.log file.
- **alias**: The new name for the field.
- **type**: The value type for the field. Valid values are:
    - NUMBER
    - BOOLEAN
    - STRING - default is STRING

Verify Analytics Agent Properties

In addition to configuring the log source in the job file, you should verify the values in the `analytics-agent.properties` file found in the `conf` director y. Confirm these property values:

- `http.event.endpoint` should be the location of the Events Service.
    - For SaaS controllers the URL is one of the following:
        - `https://analytics.api.appdynamics.com:443` (North America)
        - `https://fra-ana-api.saas.appdynamics.com:443` (Europe)
        - `https://syd-ana-api.saas.appdynamics.com:443` (APAC)
    - For on-premises installations use whatever host and port you have configured. In clustered environments, this is often a load balancer.
- The `http.event.accountName` and `http.event.accessKey` settings should be set to the name and the key of the account in the Controller UI with which the logs should be associated. By default, they are set to the built-in account for a single tenancy Controller.
- The `pipeline.poll.dir` setting specifies where the log configuration files are located. This would not normally be changed unless you want to keep your files in a different location.
- `ad.controller.url` should match your AppDynamics controller URL and port.

Troubleshoot Logs

If log capture is working correctly, logs should start appearing in the Log tab in the Analytics UI. It can take some time for logs to start accumulating. Note the following troubleshooting points:

- If nothing appears in the log view, try searching over the past 24 hours.
- Timezone discrepancies between the logs and the local machine can cause log entries to be incorrectly excluded based on the selected timeframe in the Controller UI. To remediate, try setting the log files and system time to UTC or logging the timezone with the log message to verify.
- An inherent delay in indexing may result in the "last minute" view in the UI consistently yielding no logs. Increase the time range if you encounter this issue.

Troubleshoot Patterns

To help you troubleshoot the data extraction patterns in your job file, you can use the two debug REST endpoints in the Analytics Agent:

- http://<Analytics_Agent_host>:<Analytics_Agent_http_port>/debug/grok: For testing grok patterns
- http://<Analytics_Agent_host>:<Analytics_Agent_http_port>/debug/timestamp: For testing timestamp patterns

In the following examples, the Analytics Agent host is assumed to be `localhost` and the Analytics Agent port is assumed to be `9090`. To configure the port on your Agent, use the property `ad.dw.http.port` in `<Analytics_Agent_Home>/conf/analytics-agent.properties`.

The Grok Endpoint

The Grok tool works in two modes: extraction from a single line log and extraction from a multi-line log. To get a description of usage options:

```
curl -X GET http://localhost:9090/debug/grok
```

Single Line

In this mode, you pass in (as a POST request) a sample line from your log and the grok pattern you are testing, and you receive back the data you passed in organized as key/value pairs, where the keys are your identifiers.

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode "logLine=LOG_LINE" --data-urlencode
"pattern=PATTERN"
```

For example, the input:

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode "logLine=[2014-09-04T15:22:41,594Z]  [INFO ]
[main]  [o.e.j.server.handler.ContextHandler]  Started i.d.j.MutableServletContextHandler@2b3b527{/,null,
AVAILABLE}" --data-urlencode "pattern=\\[%{LOGLEVEL:logLevel}%{SPACE}\\]  \\[%{DATA:threadName}\\]  \\[%
{JAVACLASS:class}\\]  %{GREEDYDATA}"
```

would produce this output:

```
{
 threadName => main
 logLevel => INFO
 class => o.e.j.server.handler.ContextHandler
}
```

The input:

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode "logLine=2010-05-
05,500.98,515.72,500.47,509.76,4566900,509.76" --data-urlencode "pattern=%{DATE:quoteDate},%{DATA:open},%
{DATA:high},%{DATA:low},%{DATA:close},%{DATA:volume},%{GREEDYDATA:adjClose}"
```

would produce this output:

```
{
 open => 500.98
 adjClose => 509.76
 volume => 4566900
 quoteDate => 10-05-05
 high => 515.72
 low => 500.47
 close => 509.76
}
```

Multi-line

The multi-line version uses a file stored on the local filesystem as the source input.

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode "logLine=`cat FILE_NAME`" --data-urlencode
"pattern=PATTERN"
```

where FILE_NAME is the full path filename of the file that contains the multi-line log.

The Timestamp Endpoint

The timestamp tool extracts the timestamp from a log line in Unix epoch time.

To get a description of usage options:

```
curl -X GET http://localhost:9090/debug/timestamp
```

In this mode, you pass in (as a POST request) a sample line from your log and the timestamp pattern you are testing, and you receive back the timestamp contained within the log line.

```
curl -X POST http://localhost:9090/debug/timestamp --data-urlencode "logLine=LOG_LINE" --data-urlencode
"pattern=PATTERN"
```

For example, the input:

```
curl -X POST http://localhost:9090/debug/timestamp --data-urlencode "logLine=[2014-09-04T15:22:41,237Z]
[INFO ]  [main]  [io.dropwizard.server.ServerFactory]  Starting DemoMain" --data-urlencode "pattern=yyyy-MM-
dd'T'HH:mm:ss,SSSZ"
```

would produce this output Unix epoch time:

```
{
 eventTimestamp => 1409844161237
}
```

The input:

```
curl -X POST http://localhost:9090/debug/timestamp --data-urlencode "logLine=Nov 17, 2014 8:21:51 AM com.foo.
blitz.processor.core.hbase.coprocessor.endpoint.TimeRollupProcessEndpoint$HBaseDataFetcher callFoo1" --data-
urlencode "pattern=MMM d, yyyy h:mm:ss aa"
```

would produce this output Unix epoch time:

```
{
 eventTimestamp => 1416212511000
}
```

Sample Log Analytics Job Files

A number of sample job files are shipped with the Analytics Agent. These files can be found at `<analytics-agent-home>/conf/job`.

The sample job files include:

- Analytics logs: sample-analytics-log.job
- Analytics logs with requestGUID config example: sample-analytics-log-with-request-guid.job
- Apache access logs: sample-apache-httpserver-access-log.job
- Apache access logs with syslog config example: sample-apache-httpserver-access-sysloglog.job
- Apache error logs: sample-apache-httpserver-error-log.job
- Cassandra logs: sample-cassandra-log.job
- CouchDB logs: sample-couchdb-log.job
- Glassfish logs: sample-glassfish-log.job
- IIS logs: sample-iis-log.job
- Java Agent logs: sample-java-agent-log.job
- Jetty error logs: sample-jetty-error-log.job
- Jetty request logs: sample-jetty-request-log.job
- Log4J: sample-log4j.job
- MongoDB logs: sample-mongodb-log.job
- MySQL error logs: sample-mysql-error-log.job
- Nginx access logs: sample-nginx-access-log.job
- Nginx error logs: sample-nginx-error-log.job
- OS X system logs: sample-osx-system-log.job
- Postgres logs: sample-postgres-log.job
- Redis logs: sample-redis-log.job
- Stock quotes: sample-stock-quotes-csv.job
- WebLogic logs: sample-weblogic-log.job

Migrate Log Analytics Job Files to Source Rules

Related pages:

- Upgrade Analytics Agent

The Centralized Log Management UI enables you to configure your log data sources using source rules. Manually created job files are no longer needed.

We recommend that you convert your log source configuration from job files (job files were used for configuration < 4.3) to source rules.

1. Confirm that you have upgraded your Controller, Events Service, and Analytics Agent to 4.4. See these corresponding upgrade pages:
    - Upgrade the Controller Using the Enterprise Console
    - Upgrade the Events Service Using the Enterprise Console
    - Upgrade Analytics Agent
2. Use the Centralized Log Management UI to create source rules for your existing job files by importing the configuration from your old job file to a new source rule.

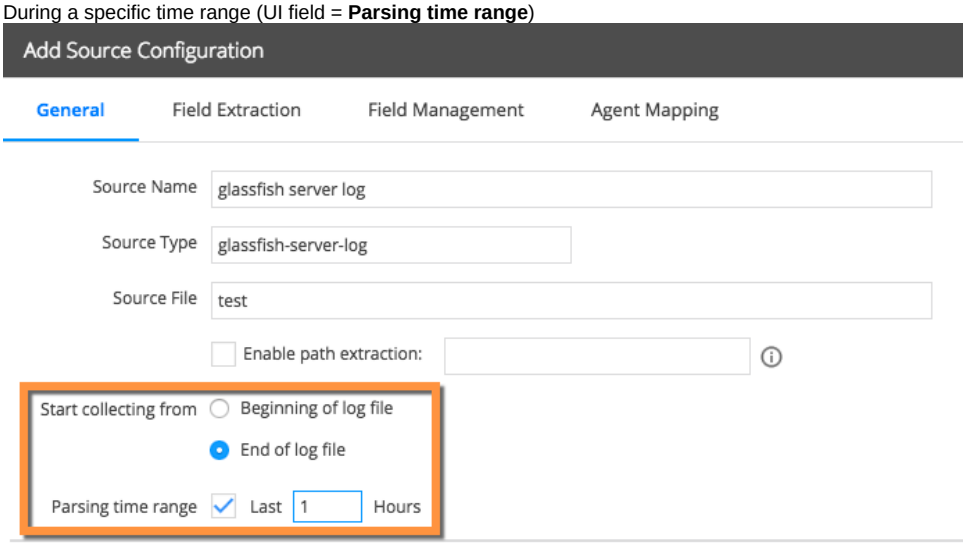
   Be sure to use either '**Parsing time range**' or '**End of log file**'. If you do not use this, you will double collect all the log files that have already been tailed by the job file. Read Timing Notes for more information to help you decide on your collection timing settings.
   When you save the source rules, they are in the disabled state by default.
3. Map the source rules to an Agent Scope.
4. Enable the new source rules through the UI.
5. Disable the job files that are actively collecting log analytics data. You do this by manually editing the job file and changing the `enabled` property to false. See Configure Log Analytics Using Job Files.
6. After you have migrated all your job file configurations to source rules, you can completely disable the use of job files by clicking "**Disable Field Extraction With Job Files**". This action can not be reversed and you will not be able to use job files after performing this action. Only trigger this action once you have completely moved to source rules created through the Centralized Log Management UI.

Timing Notes

By default, the controller communicates new configuration information to the Analytics Agent every five minutes. So it could be up to five minutes before the agent starts tailing your log file using the new source rule configuration. On the other hand, if you have both a job file *and* a source rule enabled for the same log data, the data is collected twice. To avoid this situation, you can use configuration settings to specify when to start collecting the log data:

- At the end of the file (UI field = **Start collecting from End of log file**)

- During a specific time range (UI field = **Parsing time range**)



See the section describing the configuration settings on the "*General Configuration Tab*" in Configure Log Analytics Using Source Rules.

Be sure to disable the job file once you have enabled the source rule to collect the Log Analytics data. You can verify that the new source rule is collecting data correctly by waiting until the new log records appear in the Analytics Search UI data grid. One way to distinguish between the log data collected by a job file or a source rule is to use a different source type in the source rule.

Business Transaction and Log Correlation

Works with:

This page provides instructions on the correlation between Business Transaction requests and logs.

When investigating the cause of slowdowns/outages in your business applications, the problem does not always originate in the application code. Any additional information from application or machine logs can be helpful in your DevOps teams' investigation. One way to see supporting data that impacts the business transaction is to analyze logs for that transaction.

By configuring business transactions for GUID Injection, you can correlate logs to specific business transaction requests. This can be helpful when you see slow transactions and the call graph does not give you enough information to get to the root cause. You can use this feature to get the full context related to a failed or slow transaction.

Correlating specific instances of your business transactions to the related logs works by injecting the same requestGUID of the business transaction into the associated logs through our Java Agent. This helps you to quickly find the relevant logs from multiple tiers and nodes for a specific business transaction.

Visibility for this correlation requires both Transaction Analytics and Log Analytics licenses. See License Entitlements and Restrictions.

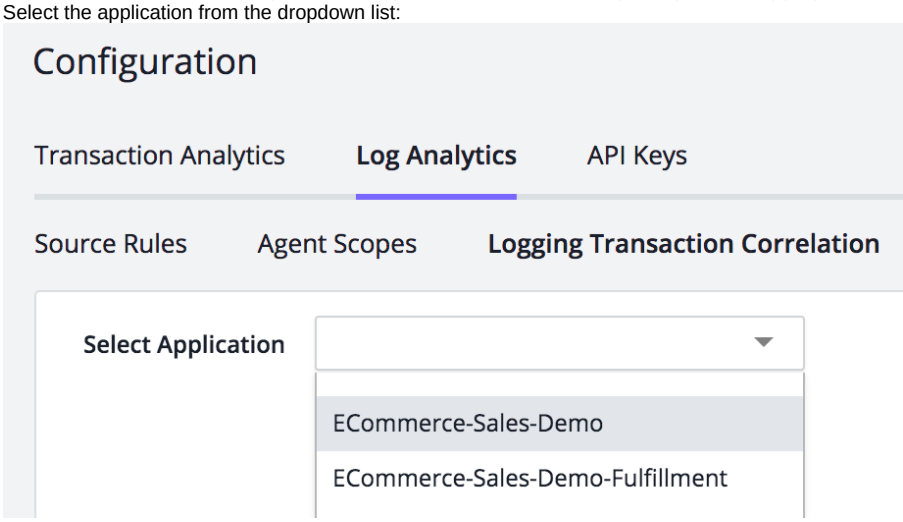
Configuring GUID Injection

This feature supports the following Java logging frameworks:

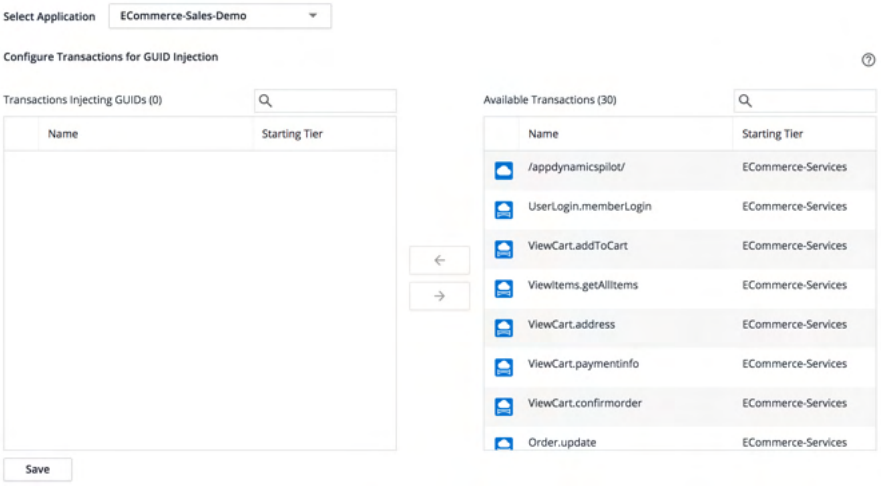
- Apache log4j versions 1.2.12 to 1.2.17 and 2.6.2 to 2.13.2.
- logback versions 1.0.0 to 1.1.3. Any version before 1.0.0 is not supported.

To enable transaction to log correlation, use the following steps. You must select the business transactions and specify the logging format.

1. Select business transactions for log correlation. This is how you specify to the Java Agent which business transactions you are interested in.
    a. In the Controller UI, click **Analytics** > **Configuration**. Then select **Log Analytics** > **Logging Transaction Correlation**.
    b. Select the application from the dropdown list:

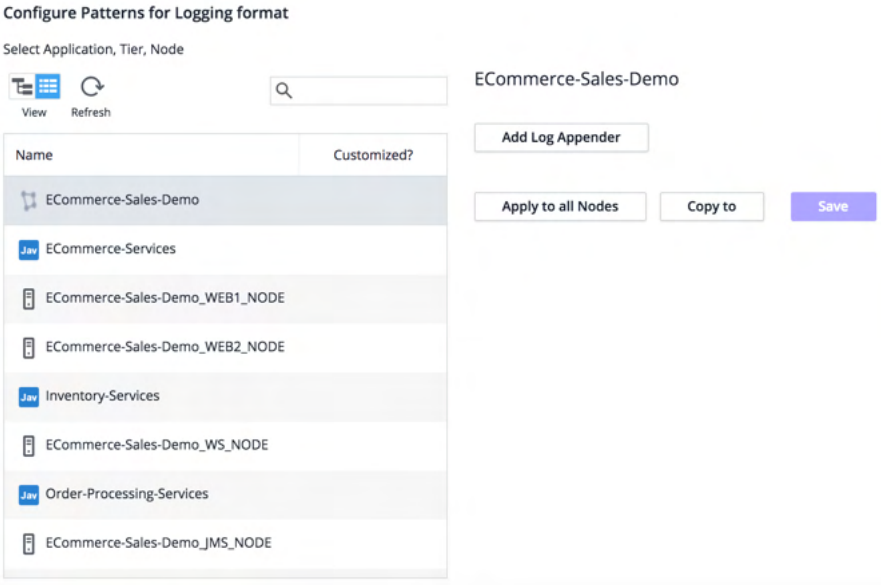


c. Scroll down to the section **Configure Transactions for GUID Injection**:

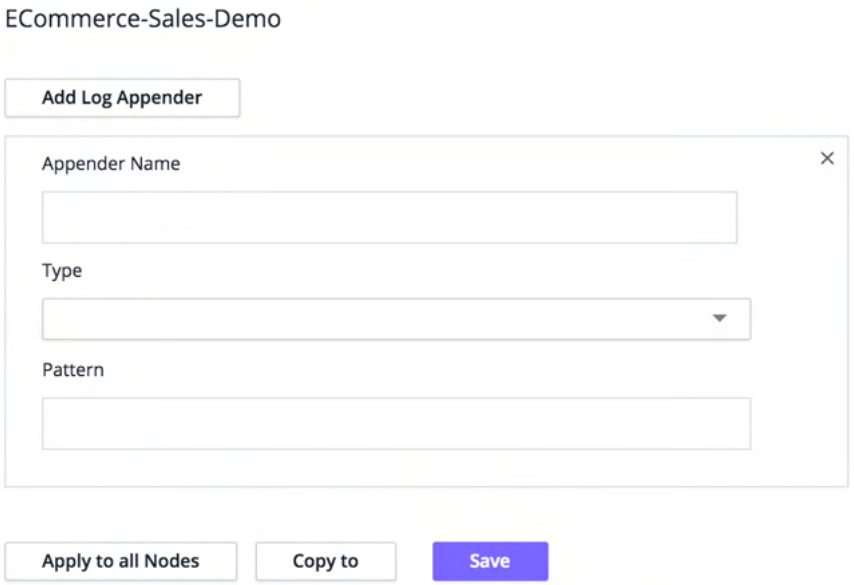


d. Add transactions from the right-hand list to the left-hand list and **Save**.
e. Proceed to the next step. You must also configure the logging patterns before you can see correlated logs.

2. Define how the injected information appears in the logs. You need to know the appender name and pattern for your application logging framework so you can properly configure this feature. In simple terms, a pattern is responsible for formatting a logging request and an appender takes care of output destination. You can configure this through the Controller UI as described here. You can also add the appender directly to your code. See Add Appender in Your Source Code.
   a. On the Analytics Configuration window, scroll to the section **Configure Patterns for Logging format.**
   b. Select application, tier, or node where you want to collect correlated logs.



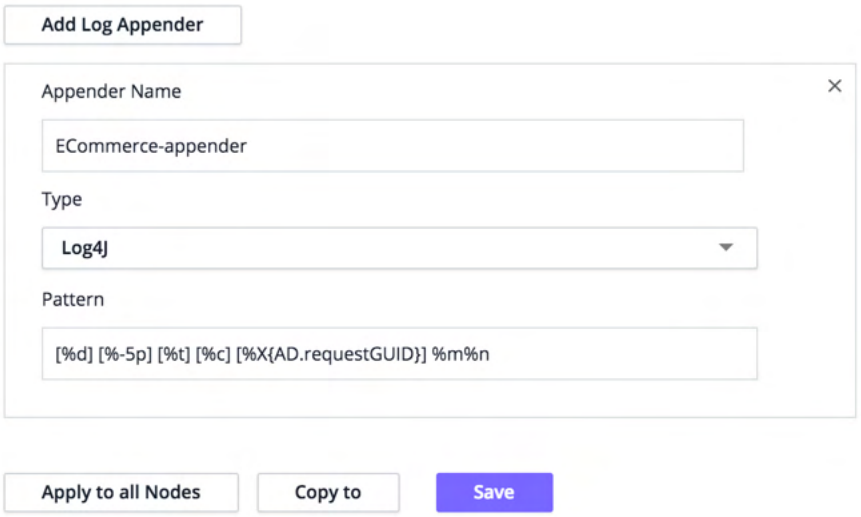
c. Enter the Appender name and choose the log framework.



d. Enter the pattern and the request GUID string. You can add the request GUID anyplace in the pattern. The request GUID must match the following exactly:

```
[%X{AD.requestGUID}]
```

For example, the following screenshot shows the standard log4j pattern plus the request GUID:



Detail of Log4j example with the request GUID string:

```
[%d]  [%-5p]  [%t]  [%c]  [%X{AD.requestGUID}]  %m%n
```

3. Restart the affected application to enable the logger to pick up the new logging configuration.

Add Appender in Your Source Code

If you have access to the source code for your application, you can also add the appender to the log4j.properties file directly. Here is an example of what that might look like with the request GUID in **BOLD**:

log4j.appender.order-file-appender=org.apache.log4j.FileAppender

log4j.appender.order-file-appender.File=logs/telecom-order.log

log4j.appender.order-file-appender.layout=org.apache.log4j.PatternLayout

log4j.appender.order-file-appender.layout.ConversionPattern=[%d] [%-5p] [%t] [%c] **[%X{AD.requestGUID}]** %m%n

log4j.logger.com.appdynamics.order=DEBUG, order-file-appender

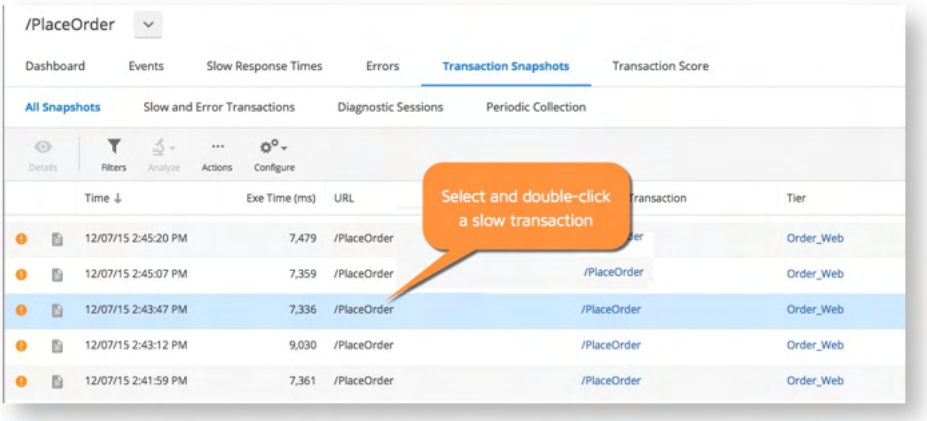
log4j.additivity.com.appdynamics.order=false

Viewing Correlated Logs and Transaction Data

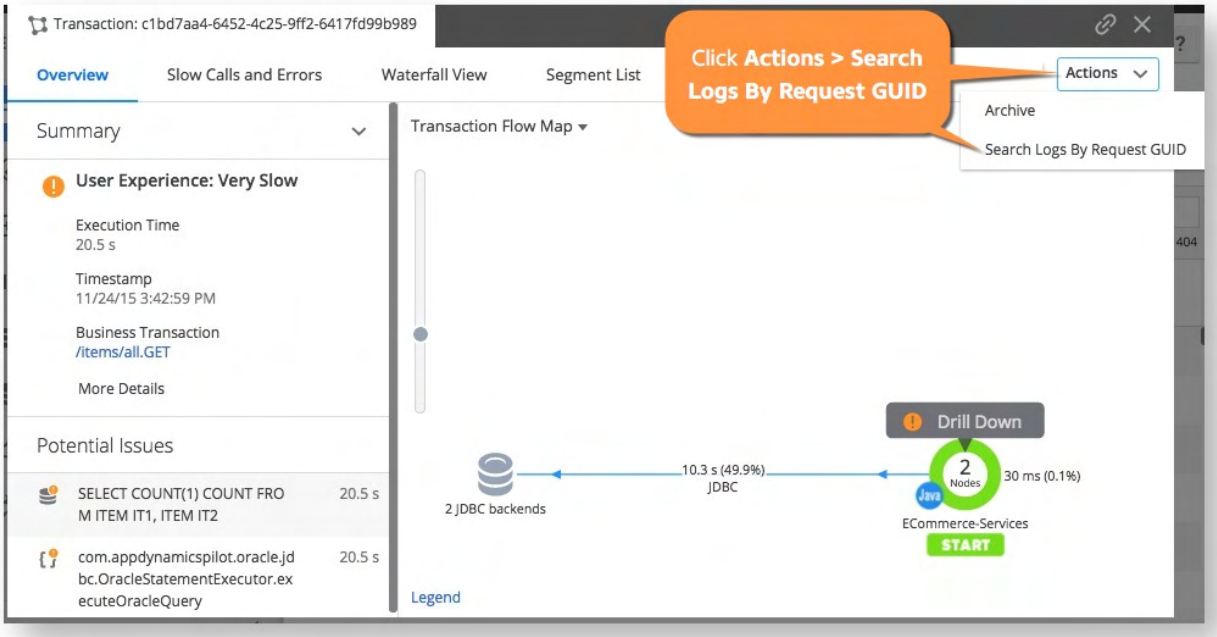
Once you have configured GUID injection, you can search the log files from a number of points in the Controller. Correlation only works when there are logs with the associated GUID in the given time range for an application where this feature is configured. The **Search Logs By Request GUID** button appears when there are logs for the snapshot request GUID in the snapshot time range.

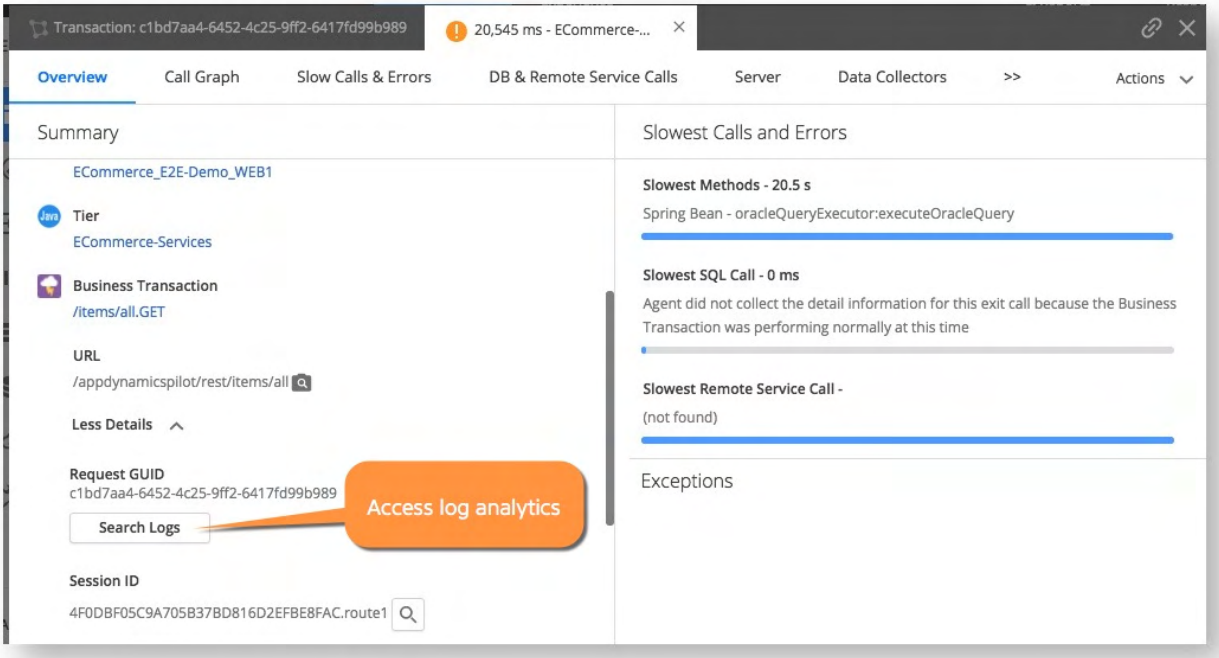
APM to Analytics: From a business transaction snapshot

1. Locate a slow transaction or other transaction that you want to troubleshoot.



2. Click **More Details** > **Search Logs** or use **Actions** > **Search Logs By Request GUID**.





From the log details in this example, you can see that the reason this transaction was slow is that the order processing queue was full and it took many retries before the order could complete.

12/07/15 2:43:56 PM	[2015-12-07 22:43:54,593] [INFO] [org.springframework.jms.listener.DefaultMessageListenerContainer#0-1] [com.appdynamics.provision.OrderMessageListener] [AD_REQUEST_GUID[8f34fb97-b5fa-4f80-93a9-b56e0c75d222]] Received a message to process the order Order_506932 for the user timmy@lamelectrics.com	8f34fb97-b5fa-4f80-93a9-b56e0c75d222

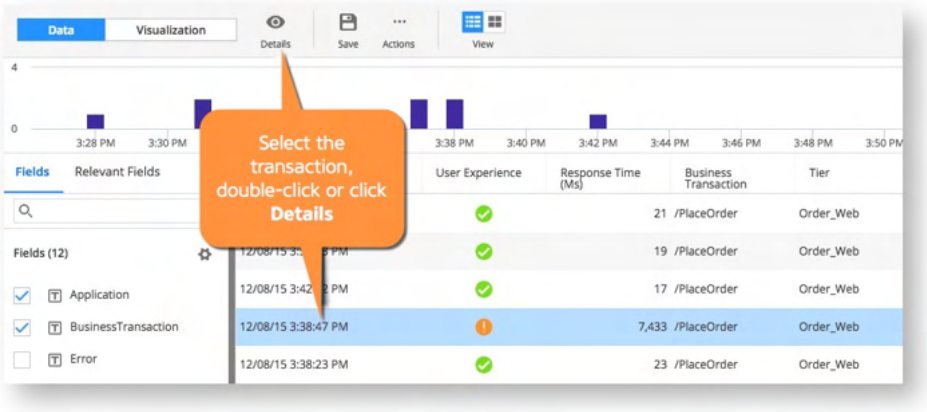
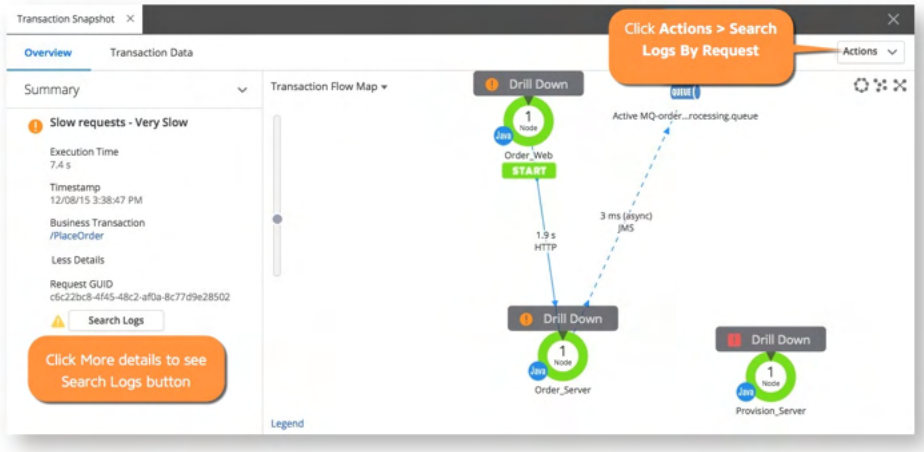
Transaction Analytics to Log Analytics

You can select relevant transactions from any transaction analytics search and see details.

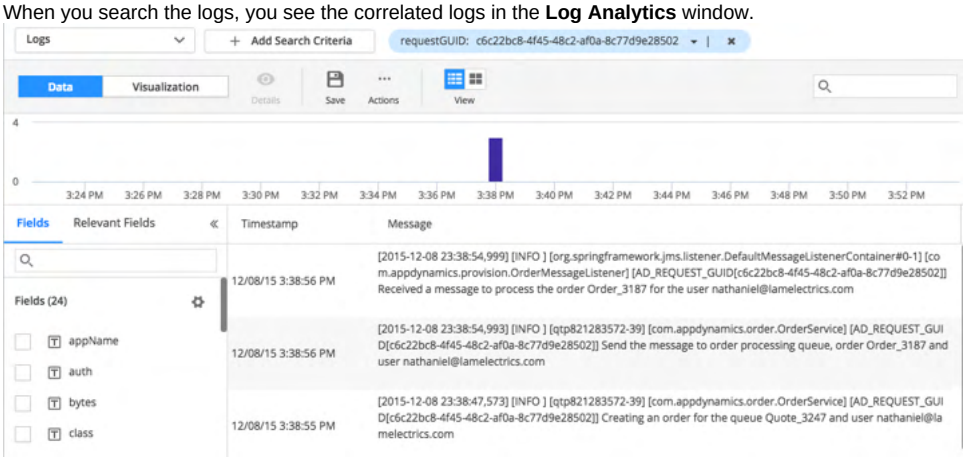
1. Select the transaction, then double-click or click **Details** in the **Action** toolbar.



2. On the **Overview** tab, you have two ways to search the logs by request GUID.



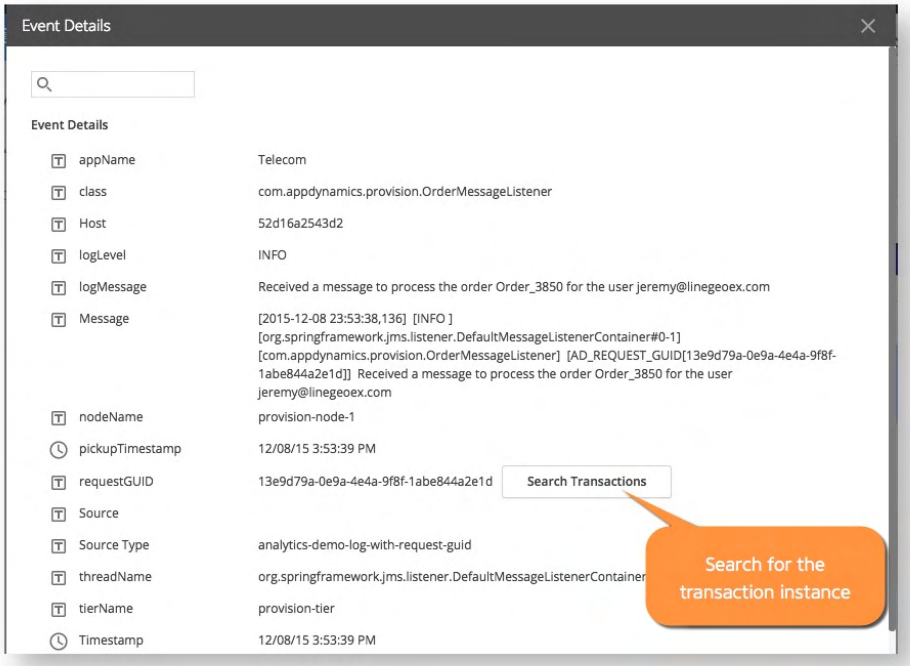
3. When you search the logs, you see the correlated logs in the **Log Analytics** window.



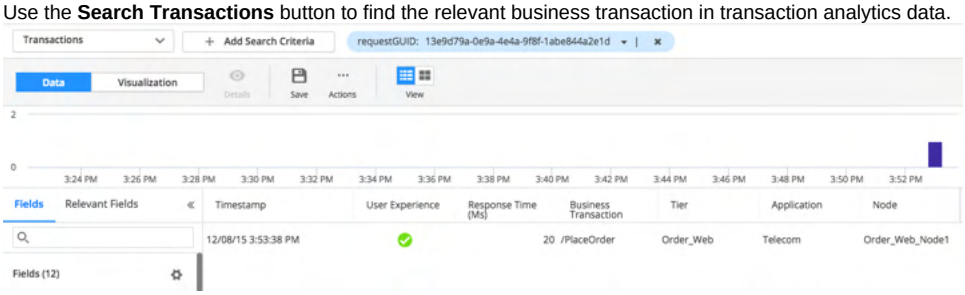
From Log Analytics to Transaction Analytics

You can select a log from any log analytics search and see the Event Details.

1. Select the log, then double-click or click **Details** in the **Action** toolbar. You can see the **Event Details** window.



2. Use the **Search Transactions** button to find the relevant business transaction in transaction analytics data.



Deploy Analytics in Kubernetes

This page describes deployment options for Transaction Analytics and Log Analytics instrumented with AppDynamics app server agents in Kubernetes applications.

Transaction Analytics (except for Java and .NET Agent) and Log Analytics require that an Analytics Agent is deployed with an app server agent.

> For Transaction Analytics, the Java Agent >= 4.5.15 or the .NET Agent >= 20.10 supports "agentless" analytics, which does not require that an Analytics Agent is deployed. See Deploy Analytics Without the Analytics Agent.

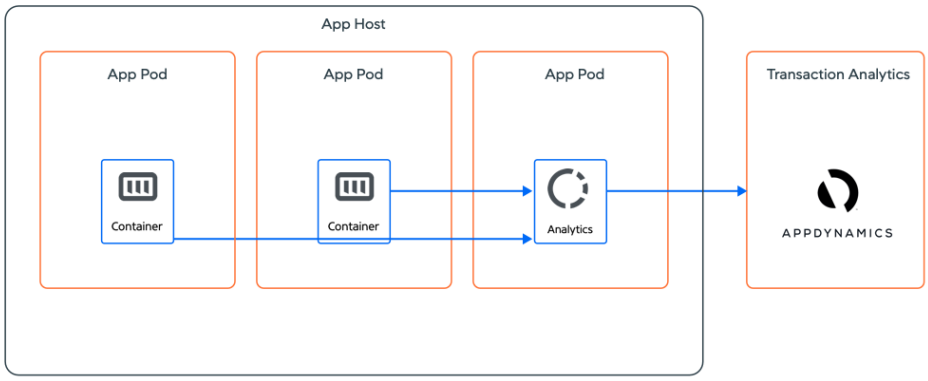
Transaction Analytics

The Analytics Agent acts as a proxy between the app server agent and the Events Service. See Deploy Analytics With the Analytics Agent.

There are two deployment options for the Analytics Agent to support Transaction Analytics on a Kubernetes application.

1. A sidecar to the application container.

   In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container.
2. A shared agent where a single Analytics Agent is deployed on each Kubernetes worker node. Each pod on the node will use that Analytics Agent to communicate with the Events Service.



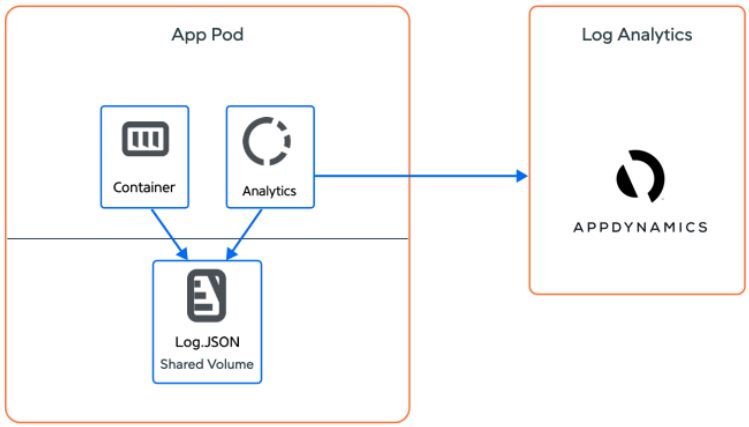
In this model, the Analytics Agent is deployed as a Daemonset.

Log Analytics

Once deployed, the Analytics Agent has access to the application's logs and can send log data to the Events Service.

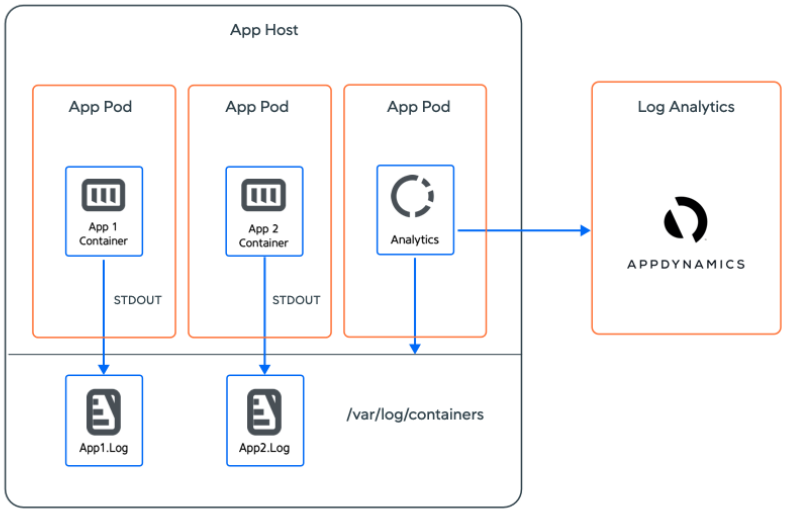
There are three deployment options for the Analytics Agent to support Log Analytics on a Kubernetes application.

1. A sidecar to the application container.



In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container. The Analytics Agent and application container are configured to share a volume where the application logs are written.

2. If the application bypasses the container filesystem and emits log data to `STDOUT` and `STDERR`, the Analytics Agent can be deployed on each Kubernetes worker node. The Analytics Agent can access the log output for every application container on the worker node's file system, stored by Kubernetes under `/var/log/containers` as a unique file per container.



In this model, the Analytics Agent is deployed as a Daemonset.

> For some Kubernetes distributions such as OpenShift, the Analytics Agent will require elevated permissions to access the files under `/var/log/containers`.

3. If a syslog provider is available in the Kubernetes cluster, the Analytics Agent can be deployed to receive syslog messages with TCP transport. A single Analytics Agent instance is required per syslog provider. See Collect Log Analytics Data from Syslog Messages.

For Transaction and Log Analytics, the sidecar approach is simpler to deploy, but consumes more cluster resources because it requires one additional container per application pod. The shared agent approach adds another deployment object to manage, but can significantly reduce the overall resource consumption for a cluster.

Example Configurations to Deploy the Analytics Agent

The following deployment specs are specific examples of how to implement the deployment options explained above. In addition, see Install the .NET Agent for Linux in Containers and Install the Node.js Agent in Containers for best practices on how to set the Analytics Agent host, port, and SSL environment variables.

Transaction Analytics: Deployment Spec Using A Sidecar

The following deployment spec defines two containers, the application container `flight-services`, which uses an image instrumented with an app server agent, and the Analytics Agent container `appd-analytics-agent`, which uses the Analytics Agent from Docker Hub, d`ocker.io/appdynamics/analytics-agent:latest`.

The `appd-analytics-agent` container leverages a ConfigMap and Secret to configure the Events Service credentials required by the Analytics Agent, including the account access key and global account name. See Install Agent-Side Components.

As a sidecar, the Analytics Agent is available at `localhost` and uses the default port 9090. The app server agent will connect automatically and no additional configuration is required.

            memory: 600M
...
```

The full spec can be found in the Flight Services YAML File. The `controller-info` ConfigMap can be found in the Controller Info YAML File. The command to create `appd-secret` can be found in Secret.

Transaction Analytics: Deployment Specs Using A Shared Analytics Agent

The following deployment spec is for the same `flight-services` application, but instead of using a sidecar, it references a shared Analytics Agent deployed separately as a Daemonset. The `flight-services` container sets the agent environment variables `APPDYNAMICS_ANALYTICS_HOST` and `APPDYNAMICS_ANALYTICS_PORT` to the `analytics-proxy` service for the shared Analytics Agent defined in the example below.

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: flight-services
spec:
  selector:
    matchLabels:
      name: flight-services
  replicas: 1
  template:
    metadata:
      labels:
        name: flight-services
    spec:
      containers:
      - name: flight-services
        image: sashaz/ad-air-nodejs-services-analytics:latest
        imagePullPolicy: IfNotPresent
        envFrom:
          - configMapRef:
              name: controller-info
        env:
        - name: APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY
          valueFrom:
            secretKeyRef:
              key: appd-key
              name: appd-secret
        - name: APPDYNAMICS_AGENT_TIER_NAME
          value: flight-services
        - name: APPDYNAMICS_ANALYTICS_HOST
          value: analytics-proxy
        - name: APPDYNAMICS_ANALYTICS_PORT
          value: "9090"
        ports:
        - containerPort: 8080
          protocol: TCP
      restartPolicy: Always
...
```

The full spec can be found in the Flight Services YAML File. Use this spec in conjunction with the following deployment spec.

In the `analytics-agent.yaml` file below, the shared Analytics Agent is deployed as a Daemonset. The file also defines a service `appd-infra-agent-service` that publishes an endpoint in the namespace where the shared Analytics Agent can be reached.

```
apiVersion: apps/v1
kind: DaemonSet
metadata:
  name: appd-infra-agent
spec:
  selector:
    matchLabels:
      name: appd-infra-agent
  template:

    targetPort: 9090
status:
  loadBalancer: {}
```

The full deployment spec can be found in the Machine Agent YAML File. The `appdynamics-infraviz` service account is defined in the RBAC YAML File . The ma-log-config ConfigMap is defined in the Machine Agent Log Config File.

A best practice is to deploy the shared Analytics Agent in a dedicated namespace (typically `appdynamics`) separate from the namespaces used by applications.

```
$ kubectl -n appdynamics apply -f analytics-agent.yaml
```

To provide access to the shared Analytics Agent from an application namespace:

1. An `ExternalName` service is required to map a service name (`analytics-proxy` in the example) to the DNS name of `appd-infra-agent-service` created previously:

```
kind: Service
apiVersion: v1
metadata:
  name: analytics-proxy
spec:
  type: ExternalName
  externalName: appd-infra-agent-service.appdynamics.svc.cluster.local
  ports:
  - port: 9090
    targetPort: 9090
```

2. Create this service in each application namespace where an App Server Agent is deployed:

```
$ kubectl -n <app namespace> apply -f analytics-proxy.yaml
```

3. Note that `analytics-proxy` is the value of `APPDYNAMICS_ANALYTICS_HOST` used in the `flight-services` deployment spec.

```
- name: APPDYNAMICS_ANALYTICS_HOST
  value: analytics-proxy
```

Log Analytics: Deployment Spec Using A Side Car

The following deployment spec snippet is for a Java application that defines an application container, `client-api`, and an Analytics Agent container, `appd-analytics-agent`, that acts as a sidecar to the application container. An init container, `appd-agent-attach`, is also defined, but the related definitions are removed to simplify the example.

A shared volume, `appd-volume`, is mounted to the application container and Analytics Agent container using the mount path `/opt/appdlogs`. The Java application is configured to write its logs to this path and the Analytics Agent is configured to read the logs from this path and send them to the Events Service.

```

The full spec can be found in the Java App YAML File.

Log Analytics: Deployment Spec For Shared Analytics Agent (STDOUT/STDERR Support)

The following deployment spec supports the use case where application containers are emitting logs to `STDOUT` and `STDERR`, not the application container filesystem.

Since Kubernetes writes the container logs to the host under `/var/log/containers`, the Analytics Agent can read them there. The Analytics Agent is deployed as a Daemonset. A volume `varlog` is defined with access to the host path `/var/log/containers` and mounted to the Analytics Agent container, `appd-analytics-agent`. The Analytics Agent is configured to read the container-specific logs written to `/var/log/containers`. See Configure Log Analytics Using Source Rules.

```

```

The full spec can be found in the Log Analytics YAML File. An OpenShift example can be found in the Log Analytics OpenShift YAML File.

Using Analytics Data

Related Pages:

- Configure Analytics
- Create Analytics Metrics From Scheduled Queries
- Analytics and Data Security

This describes how to use the Analytics data. You have several strategies available for locating and using analytics data of interest. Once you have identifie d data that is useful for your business, you can use visualization or other features to represent and monitor that data.

Analytics enables you to:

- Configure data sources to collect data for analytics.
- Create and visualize searches and add them to custom dashboards.
- Create API Keys for users of the Analytics Events API.
- Create and view metrics created from analytics searches.
- Define and monitor Business Journeys.
- Define Experience Level reports.
- Export data to CSV files.

Strategies for Locating Data of Interest

- Use a saved search by selecting one from the list. Use the actions in the action bar to manage named searches by saving, duplicating, and so on.
- Create searches for specific use cases. See Search Analytics Data.
- Focus on a specific time range by dragging your mouse across the event stream or by using the time range dropdown.
- Select various fields from the data, targeting the kind of data of interest to you, then scan the event list. Double-click any specific event to display more information.
- Examine Top 10 Values. Click on a field to see the top 10 values of that field in your filtered dataset. The results are presented as a count and percentage of all data within the specified time range for that field. These values provide immediate insights from your data without having any predefined rules or previous knowledge of the data. You can add a value to the search criteria bar by hovering over the value and clicking the **+** icon.
- Relevant Fields. This feature helps you find fields with a high relevance score. A high relevance score indicates these fields are significantly more common in your filtered results than in the entire data set and may be useful to investigate. See Investigate Using Relevant Fields for a suggested workflow.

Visualize Analytics Data

Once you have defined your data, use the Visualization tab to explore specific aspects of the data that interests you and drill down into the relationships you need to understand.

Each visualization type is a widget and widgets can be added/removed. See Visualize Analytics Data.

Search Analytics Data

You can search Analytics data in two modes:

- Basic mode, where you can add search criteria to filter your data and return a subset of available events. In Basic mode, you see the list of events that match your search criteria, along with a count of those events. This mode is referred to in the UI as **Drag and Drop Search**.
- Advanced Mode, where you can use the AppDynamics Query Language (ADQL). ADQL is a SQL-like query language that provides additional operators and functions to enable more complicated searches. This mode is referred to in the UI as **Query Language Search.**

For each mode, you see the analytics data sources that are licensed and enabled for your application. The applications, data sources, and other fields that you see depend on how the administrator has set the permissions for your role. When creating new roles, remember that granting permissions to view transaction analytics data does not automatically grant permissions to see all application data associated with a specific transaction analytics record. You need to grant at least read-only permissions to the application to enable the user to see associated transaction snapshot data such as flow maps.

Search Results Limits

Search results in the UI can return up to 1000 records. By default, each page displays 50 results at a time. In Advanced mode, you can explicitly set a LIMIT to see more than 50 results on a page. Setting a limit disables pagination and shows up to 1000 records on a single page. The total number of records for the query shows at the bottom right. The UI caps the number of search results at 1000 regardless of mode or the value of an explicit LIMIT. To return more than 1000 records, you must use the Analytics Events Query API.

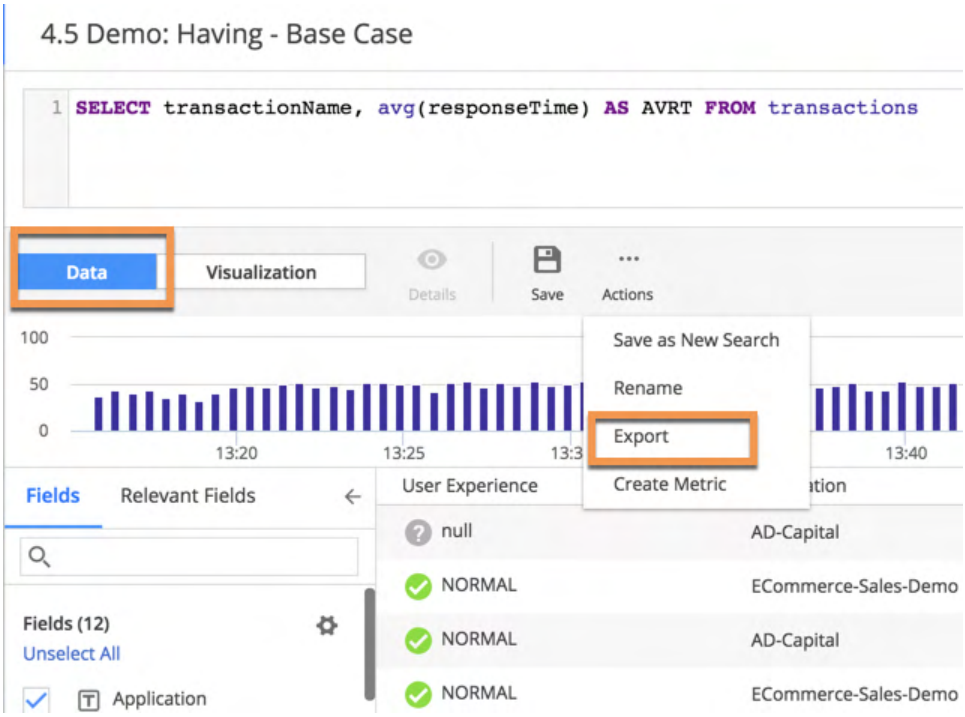
See LIMIT Clause.

Exporting Analytics Data

Analytics allows you to export data to a file in CSV format for external use.

Before you export a set of data, consider these guidelines:

- The maximum number of records exported for a non-aggregation query is 65000. Use the LIMIT clause to restrict the records to a number below the upper bound. The LIMIT clause does not return any additional records that satisfy the export selection criteria.
- The number of records exported for an aggregation query by default is 10. If you want more than 10 records, use the LIMIT clause. You can export up to 1000 records by using the LIMIT clause.
- The CSV file format is RFC4180.
- Response from all valid ADQL queries can be exported. The method of writing ADQL queries remains the same.
- Only the fields that you specify in the SELECT clause are exported to the CSV file. ADQL query supersedes the UI selection. The fields selected to be displayed in the Data tab has no impact on the exported data even if the query includes `SELECT *`.
- Fields having nested representation are flattened and appear as separate fields in the CSV file. Additionally, the corresponding unflattened nested fields also appear in the exported records. Flattening fields refers to separating nested fields into individual fields.
- The supported datetime format is ISO, `yyyy-MM-dd'T'HH:mm:ssZZ`, without the millisecond value. The timezone is local to the browser from which export is requested. A timestamp field in a nested field is converted to the local timezone only in the flatten fields, not in the unflattened nested field. The format in the UI, that is `MM/DD/YYYY HH:MM:SS AM/PM`, is different from the format that you see in the exported data.
- The time required to export data varies with the size of the record you are trying to export. Exporting tends to slow down for larger set of records because executing the query on and retrieving a large data set takes longer to complete.

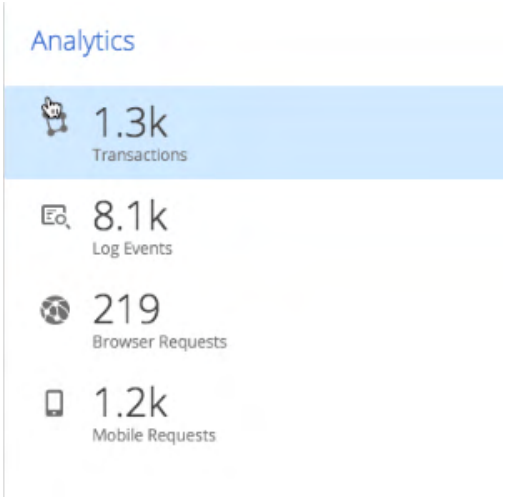


You can export metrics the Metric Browser and search results from the Searches screen. Use the **Export** option under **Actions** on the toolbar to do so. While you are on the Searches panel, use the **Data** mode to export your search result.

Access the Analytics Search UI

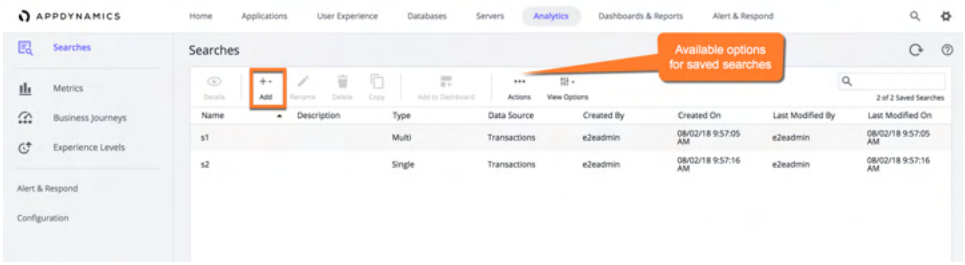
1. Navigate to the Analytics interface in the Controller UI by clicking **Analytics** in the top navigation bar.

   An alternate way to access Analytics is from the Home page: select a data source to see a default search for that event type.

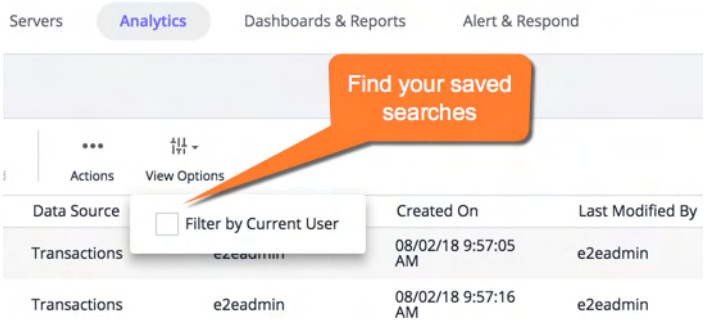


2. Click **Searches** to create new searches and see a list of previously saved searches.

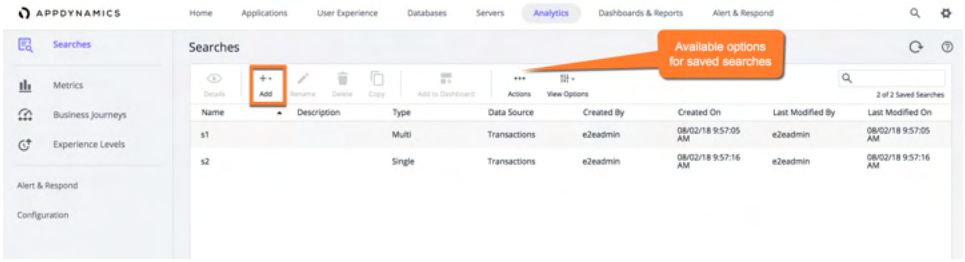
   The saved searches list displays any pre-existing, saved searches for which you have view permissions. The default sort order for the list is alphabetical by saved search name.



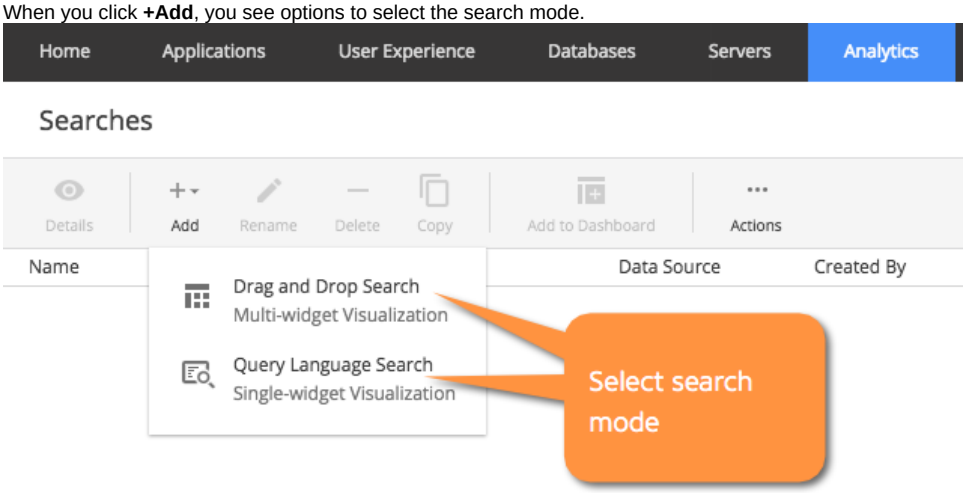
3. To view your saved searches, click **View Options** and select **Filter by Current User**.



4. Click **+Add** to create a new search or select an existing search to activate the actions on the action toolbar.



5. When you click **+Add**, you see options to select the search mode.



For details on the two search modes, see:

- Drag and Drop Search, see Create Basic Analytics Searches
- Query Language Search: see Create Advanced Analytics Searches

On the Search details page, you see two tabs for displaying the results for the Search.

- All event types share the same basic layout on the Data tab of the Search details page.
- Use the Data tab to search and filter the data that you want to review and analyze.
- Use the Visualization tab to create graphic representations based on that data.
- Search actions are available for each search. The actions vary according to the type of search and the tab you use. These actions are available:
  - Rename
  - Export (to CVS - only from the Data tab)
  - Create Metric
  - Add to Dashboard (only from the Visualization tab)

Basic and Advanced Search Comparison

This table provides a comparison of the functionality available in each search mode.

Functionality	Basic	Advanced
Drag and drop fields to the criteria search bar	yes	no
Type-ahead (auto-complete)	N/A	yes
Visualization canvas widget support	multiple widgets	one widget per search query
Grouping of events with the GROUP BY keyword	yes	yes
Wild cards with comma-separated text (Basic mode) or **IN** operator (Advanced mode)	no	no
Percentile Histogram widget	yes	no

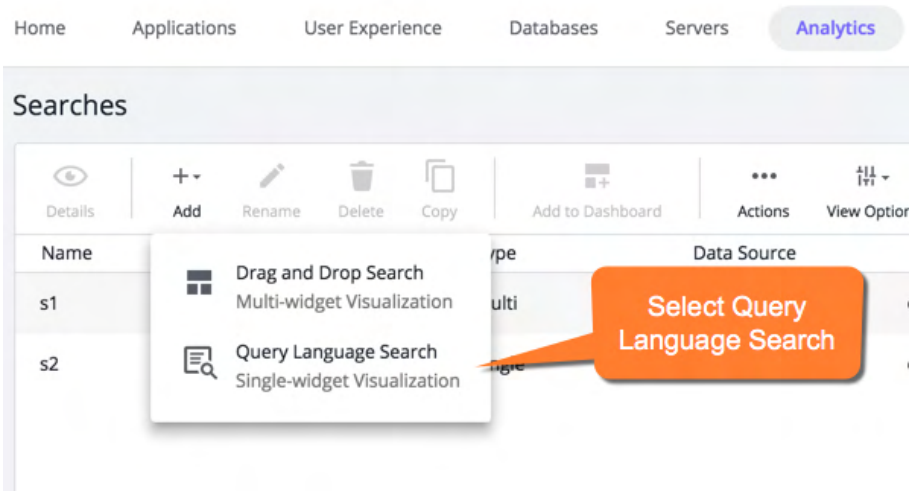
Create Advanced Analytics Searches

Related pages:

- Using Analytics Data
- ADQL Reference

This page describes how to use the AppDynamics Query Language (ADQL) to search analytics data using **Advanced** mode in the Analytics Search panel. If you have never used AppDynamics Analytics, you might want to start with basic mode before using Advanced mode for your searches.

Access Advanced mode by clicking **Add+** on the Analytics Search page. Select **Query Language Search**:



Construct ADQL Queries

Each ADQL event query begins with a **SELECT** statement that uses a **FROM** clause. Use the **FROM** clause to specify the data source you want to query. You can query one data source in each query.

Use the **SELECT** statement to further qualify the query using field_expressions and math_expressions. The **WHERE** clause adds conditions. For more details on specific ADQL syntax, keywords, functions, and operators, see the ADQL Reference.

When you click **Search** for queries other than select all fields (**SELECT** *), the results display on the visualization tab where the table widget accurately renders your query.

Use ADQL Auto-Complete

As you construct your query and type a space after a keyword, auto-complete offers suggestions for the next keyword or operator in the query. The display of auto-complete suggestions is based on the stage of your query and the event type you selected. Auto-complete offers suggestions for data values, such as event types and fields, when you type an equals sign "=" or other comparison operator after the event type name.

Note: The query box in the data tab is used only for adding **WHERE** clause differentiation. Aggregation functions are only available in the visualization tab under the table widget.

In advanced mode, when you type **SELECT**, the fields from the last specified event type display in the auto-complete list. Fields specific to a new event type display after you complete the **FROM** clause.

> Remember to type a space in front of the next keyword or you may see a validation error when executing the search or the search will be inexecutable.

Field Name Mapping

The field names in the auto-complete dropdown list correspond to UI labels and are obvious in most cases with minor differences in capitalization. When the field names have prepended database-related information, such as segments.errorList.errorType for Error Type or segments.httpData for HTTP data fields, they refer to data for individual segments of the transaction as it progresses from tier to tier. The segments fields do not represent data that refers to the overall business transaction instance. See ADQL Data for a list of fields, UI labels, and internal database names for each data source.

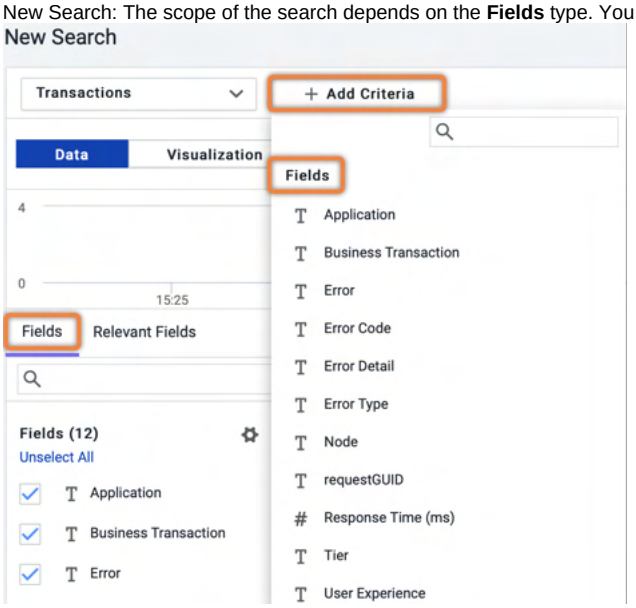
Create Basic Analytics Searches

This page describes UI elements available in the Analytics search panels and focuses on how to create searches in Basic mode. This mode is also called **D rag and Drop Search** in the UI and enables you to do multi-widget visualization of your search results. In this mode, you add search criteria based on the fields collected for the event type. Field search enables you to search for all values or a specific value of the field.

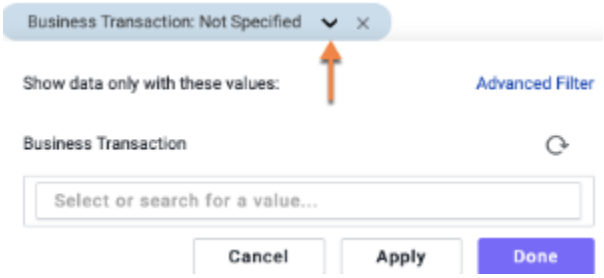
UI Elements

These UI elements are available to help construct your searches:

- New Search: The scope of the search depends on the **Fields** type. You can filter your search with the **+ Add Criteria** button.



- Field value dropdown: After you have selected a field, use the dropdown to add a list of values.



- Combination field selector and search: This field value selector combines a list of values with the ability to search for terms in the values list. It also has an **Advanced Filter** option.
- Text filter: Enables you to do an exact match on the term entered. Supports wild cards. See Search Options.

Basic Search

To create a search using a field:

1. From the Analytics Search list, click **+ Add**.

2. To use basic mode and multi-widget visualizations, select **Drag and Drop Search.**

   To use advanced mode (ADQL) and single-widget visualizations, see Create Advanced Analytics Searches.
3. On the Transactions tab, select the data source type that you want to search.
4. To add filters to your search, click **+ Add Criteria**.
   The field selector dropdown appears, so you can select the field you want to use.
5. Select a field. The field name appears in the search criteria line.
6. Click the dropdown next to the field name to open the field value selector. Select a value for the field.

   Fields such as application, business transaction, and node display a list of the values available. Some fields show a search box where you can enter criteria to filter the values of this field.

Search Options

This tables describes free text search and text filter behavior:

Type of entry	Analyzed	Non-analyzed
term	Find entries with this term. This search is case insensitive. For example, using the term "great" finds "great" and "AppDynamics is great".	Looks for an exact match and is case sensitive. For example, using the term "order" finds "order" but not "/PlaceOrder.
term1 term2	Returns results containing both *term1* and *term2* irrespective of the order the terms appear.	Terms are implicitly AND'd. Looks for an exact match and find results containing "*term1 term2"*.
term1, term2	This works the same as the space-separated list of terms.	Terms are implicitly OR'd. Looks for an exact match for either *term1* or *term2*.
*term** *term?*	Finds all fields where the value is this string plus one additional character <?> or multiple <*>. Because all non-alphanumeric fields are delimiters, the escape character has no effect.	Finds all fields where the value is this string plus one additional character <?> or multiple <*>. To search for a field containing a wild card character, escape with a "\".
NOT *term*	Use the **NOT** comparison operator to find everything except the term. NOT can be used with any of the entries in this table.	Use the **NOT** comparison operator to find everything except the term. NOT can be used with any of the entries in this table.

Free Text Search in Log Analytics

For log analytics, a free text search is available for searching the message field. This enables you to search for any keyword or string anywhere in the message field.

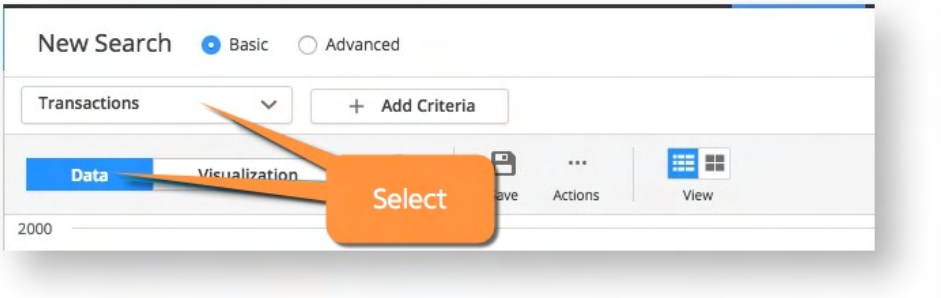
Investigate Using Relevant Fields

You can use Relevant Fields to find data fields that show a high Relevance Score. A high relevance score indicates these fields are significantly more common in your filtered dataset than in the entire dataset and may be particularly useful to analyze. Relevant field investigation may provide valuable insights and enable you to conduct better root cause analysis.

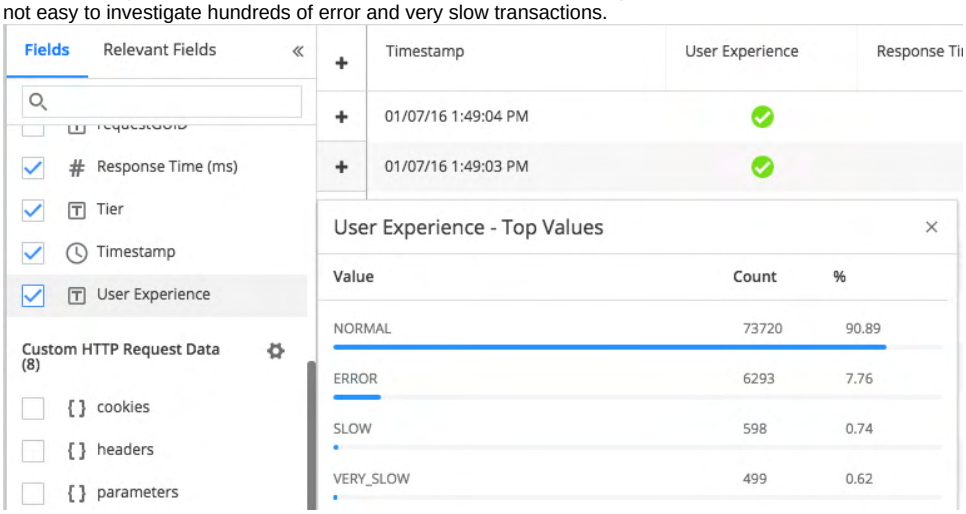
Relevant Fields investigation can be used with all event types.

As an example, you can use the following suggested workflow to investigate poor user experience.

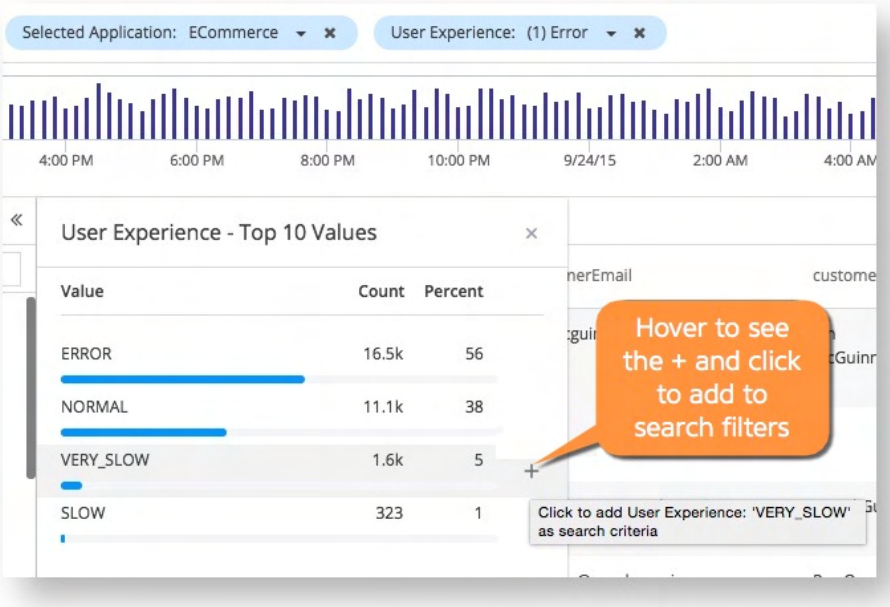
1. From the Analytics Search page, select the **Transactions** event type and the Data tab.



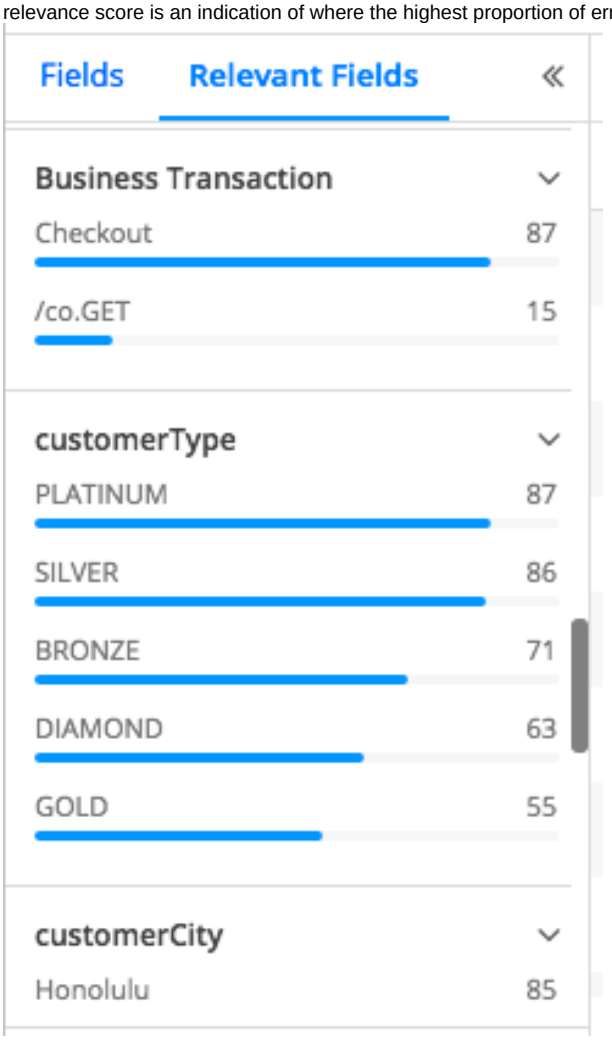
2. Click **Add Criteria** and select an application to investigate.
3. Click **User Experience** or another field in the **Fields** list to see the **Top Values**. If you see lots of error and very slow transactions, you realize it is not easy to investigate hundreds of error and very slow transactions.



4. Add **Error** and **Very Slow** values to your search criteria to narrow the total number of transactions to a smaller dataset. You can add the values quickly by hovering over the field in the **Top Values** list until the **+** sign appears at the right. Click the **+** to add to the search criteria. Now the focus is only on error/very slow transactions.



5. Click the **Relevant Fields** label and now you can see where to focus your investigation. In this example, you might start with the **Checkout** business transaction as the relevance score is 87. You can also see that **Platinum** and **Silver** customers have the two highest scores. The relevance score is an indication of where the highest proportion of error and very slow transactions are occurring.



6. Click a field in the **Relevant Field** list to see more details. You can continue to add relevant fields to your search criteria to keep narrowing the dataset. This process should enable you to find issues of significance for investigation.

Visualize Analytics Data

Related Pages:

- Create Basic Analytics Searches

After you have created a search for the Analytics data that you want to visualize, you can configure a widget to display the results of the search graphically.

Access the Analytics Widget Builders

You can access the Analytics visualization widgets from the Analytics Search UI or directly from **Dashboards & Reports**.

To access the Analytics widget builder from Analytics:

1. Select **Analytics > Searches** to view the saved searches list.
2. Double-click the search that you want to visualize or add a new search.

To access the Analytics widget builder from a Custom Dashboard:

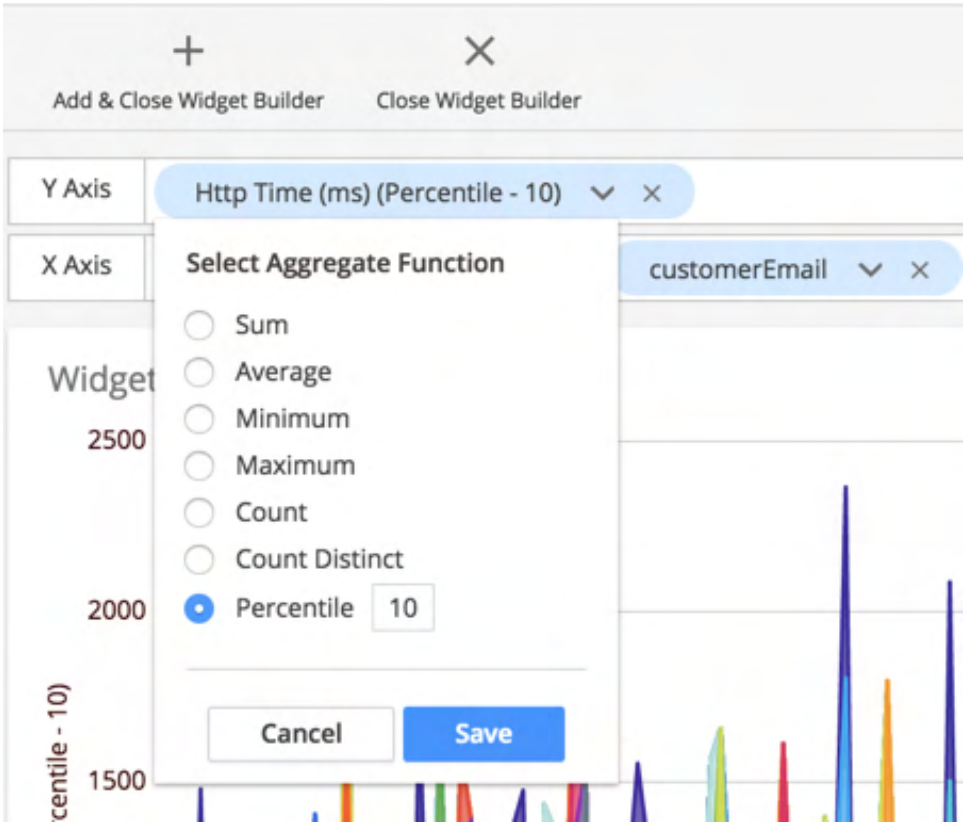
1. From the top navigation bar, click **Dashboards & Reports** to see the custom dashboard list.
2. Either double-click the dashboard where you want to add the Analytics widget or click **Create Dashboard** to create a new dashboard.
3. In the custom dashboard, click **Edit**, then **Add Widget**.
4. Click **Analytics**, **Saved Searches**, or **Experience Levels**.
5. Add Analytics widgets as needed to your dashboard.

Build a Widget

To use the Analytics widget builder:

1. Click the Visualization tab.
2. In the **Visualization** canvas, you can create widgets with one of the following modes:
    - In **Drag and Drop Search** (Basic) mode you can create multiple widgets on the canvas.
    - In **Query Language Search** (Advanced) mode you can generate one widget from your ADQL query at a time. In addition, when you use the Visualization tab in this mode, the order of functions and fields in the query matters. For all widgets (except table), the aggregate functions, such as count(*), avg(), sum(), percentile and so on, should always be preceded by a field. If the fields and functions in the query are not in this order, some visualizations do not work.

    See Conversion Analysis for an example of creating a conversion analysis using the funnel widget.
3. Click **Add Widget**, then select **Custom Widget Builder** or **Funnel Widget Builde**r depending on the type of widget that you want to create.
    In Basic mode, you can build custom widgets and drag fields to the canvas, which uses X and Y axes for configuration. After dragging a field to the axes, select a function from the drop-down next to the field name.
    In this example, the percentile function is applied to **HTTP Time (ms)**.



The funnel widget is configured differently from the other custom widgets, which use the Y and X axes as the basis of the configuration. A funnel widget is used to display data of progressively-staged proportions in a color-coded funnel.
You can add a title to the widget by over-writing **Widget Title** on the canvas.

4. After adding a widget and fields, you can right-click menu widget values to see other options. Select **Apply a global filter for *<field_value>*** to add a value to the existing search criteria.
   The supported boolean operators are **true**, **false**, **null**, and **is not null**. Use **is not null** to check both boolean and non-boolean fields, such as `lo an amount` or `IsReached`.
5. Click **Save & Close** to save the widget configuration.

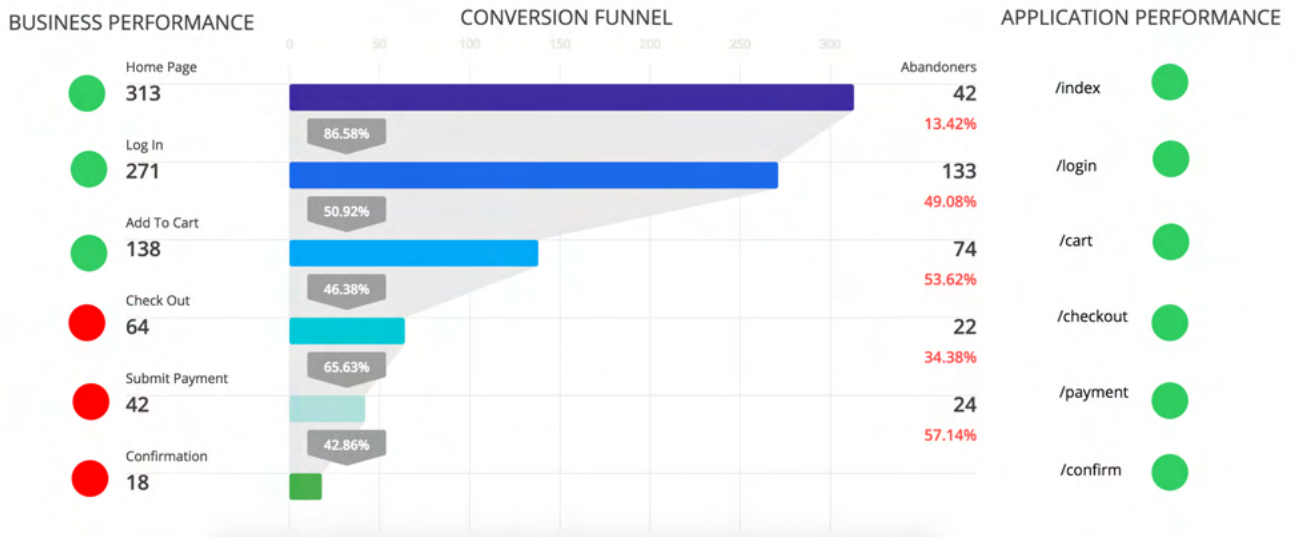
Conversion Analysis Using Funnel Widget

Funnel analysis include a series of events that lead towards a defined goal. For example, tracking user activity in a mobile app, a sale on an eCommerce website, online advertisements, and eventual purchase.

The funnel widget visualizes use cases such as:

- Retail application checkout drop-off rates from the point of adding items to the shopping cart to the actual purchase
- Business Journey drop-off rates from the point of applying for a loan to approving the loan
- Home mortgage loan approval drop-off rates from submitted application to approved applications
- Impact from performance issues by total sales, customer segment, location, and purchased products are gauged in a funnel with other health rule widgets

In this custom dashboard, the impact from performance issues by total sales, customer segment, location, and purchased products are gauged in a funnel with other health rule widgets.

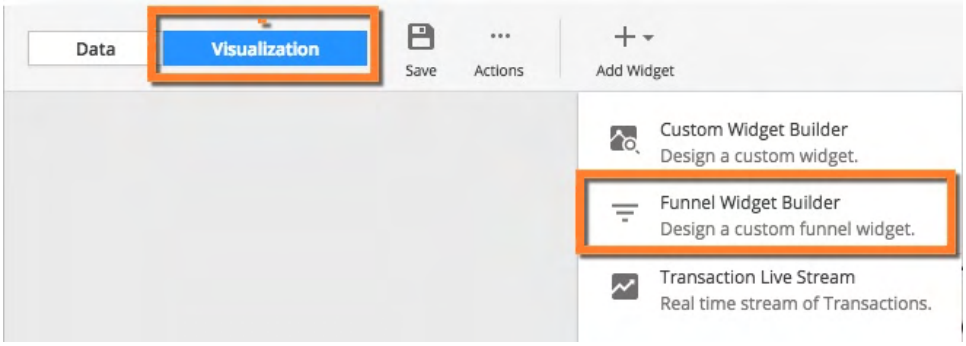


Funnels return the number of unique actors that successfully (or unsuccessfully) make it through a series of steps. Actors could mean users, devices, or any other identifiers that are meaningful to you. A funnel analysis reveals where a given flow loses the most actors. This helps identify areas for improvement, as well as the overall health of your business.

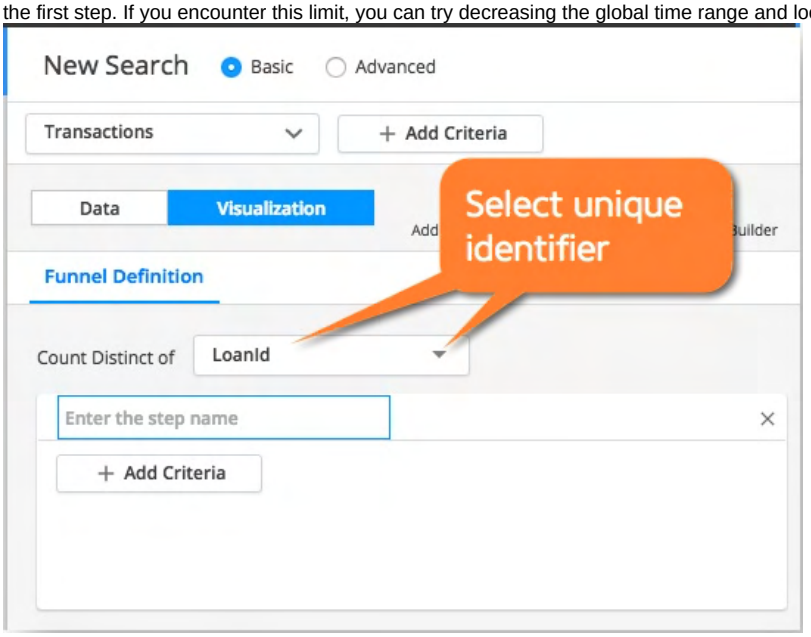
The first step in the funnel is the anchor step, and always represents 100% of the results. The filter criteria for the first step creates a set of unique values, and every subsequent step results in a subset of the values from the previous step and renders the corresponding drop-offs. The second and later steps describe the number of events that match the criteria for each step towards the goal. This number is typically less than 100%, but could be 100% if every event matches the subsequent steps.

Build a Funnel Widget

1. From the **Analytics Search** page using **Drag and Drop** (Basic) Mode, select the Visualization tab.
2. Click **Add Widget > Funnel Widget Builder**.

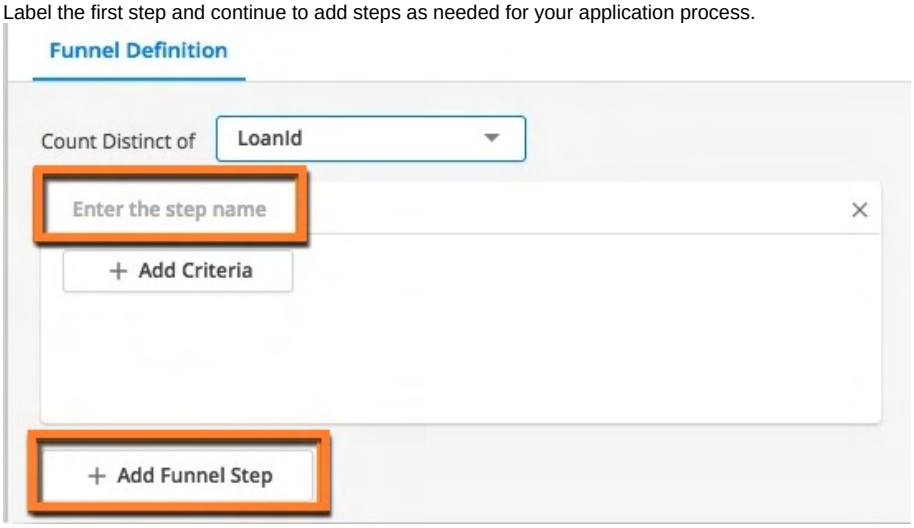


3. In the **Funnel Definition** pane, click the down arrow to select the unique field representing the items that you are counting. In this example, following the steps of a loan approval process, `LoanId` is used. The fields depend on your application. There is a limit of 50,000 unique values for the first step. If you encounter this limit, you can try decreasing the global time range and look at fewer values at a time.

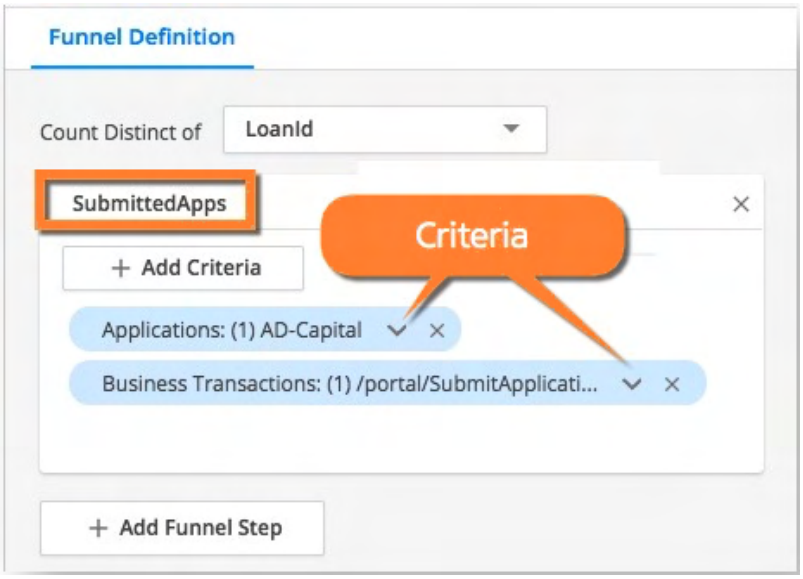


> Filtering on fields with null and empty values may cause more records in subsequent levels.

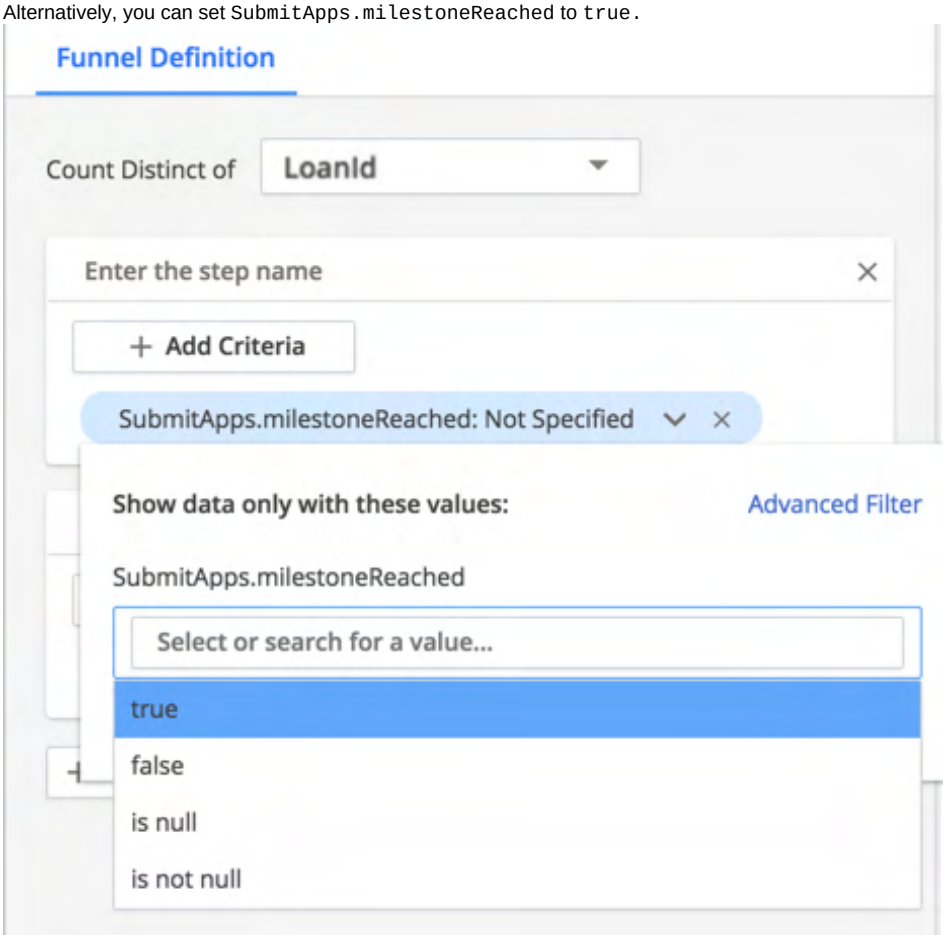
4. Label the first step and continue to add steps as needed for your application process.



For this example, the first step represents the number of submitted loan applications. The search criteria include the AD-Capital application and the `/portal/SubmitApplication` business transaction.



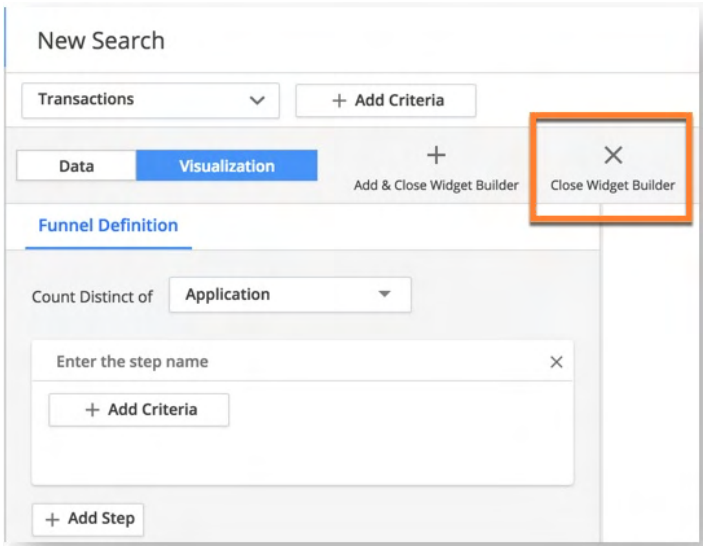
Alternatively, you can set `SubmitApps.milestoneReached` to `true`.



5. Continue to add and label your steps. This step represents the number of loan applications that reached the stage "Documents Verified."

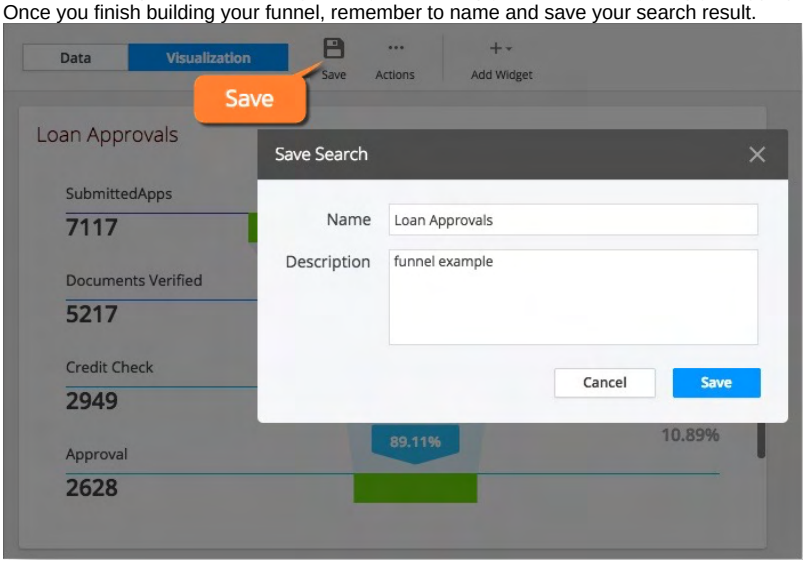
   Alternatively, use the `milestoneReached` field and set it to true.
6. After you have added all the necessary steps, click **Add & Close Widget Builder** to save the completed funnel widget. This example contains two additional steps representing loans that reached the credit check and approval stages.

   If you want to cancel editing and revert to the previous version, click **Close Widget Builder**.

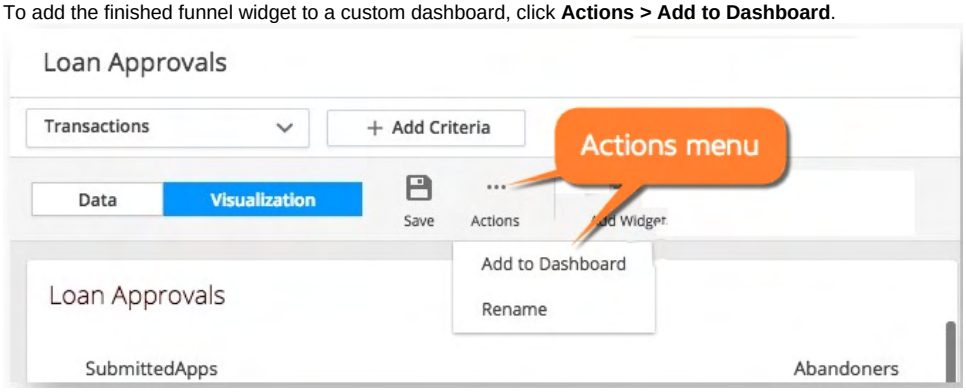


If the funnel steps need a rearrangement you can simply reorder them by simply dragging and dropping each step into appropriate positions.

7. Once you finish building your funnel, remember to name and save your search result.

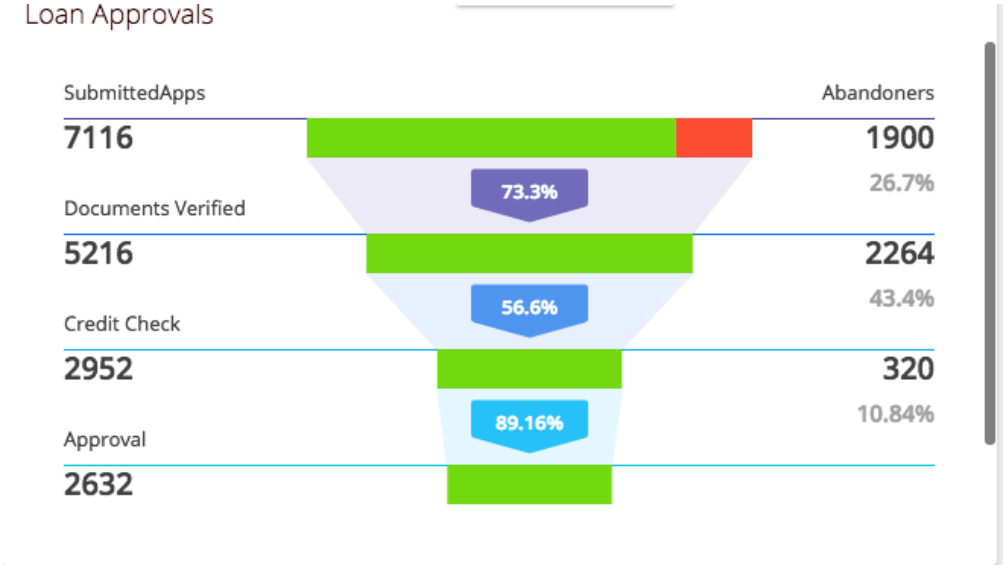


8. To add the finished funnel widget to a custom dashboard, click **Actions > Add to Dashboard**.



Use the Funnel to Troubleshoot

The finished funnel widget for the above example shows the drop-offs (Abandoners*)* in unique loan IDs from submission to approval. When creating the funnel, you can also select **Show Health** in the properties pane to display a health overlay that correlates application health data with the business conversion data. This helps to visualize performance for each step of the funnel widget.



The health overlay is supported for these events types with a user experience value:

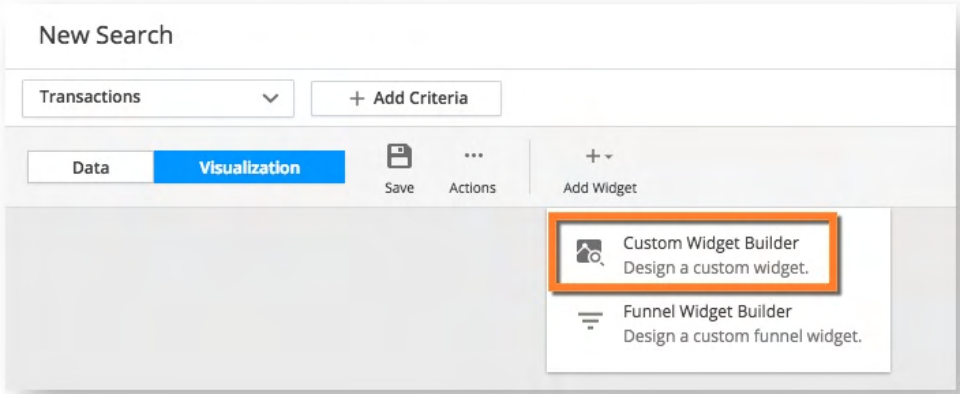
- Transaction Events – `userExperience`
- Browser Records – `pageexperience`
- Mobile Snapshots (Network Requests) – `networkrequestexperience`
- Web Session Records (Browser Sessions) – `experience`
- Mobile Session – `networkrequest.networkrequestexperience`

For enhanced troubleshooting, you can drill down to event data from any of the funnel steps by double-clicking the numbers on conversions and abandoners or by using Health Overlay and clicking on each health segment.

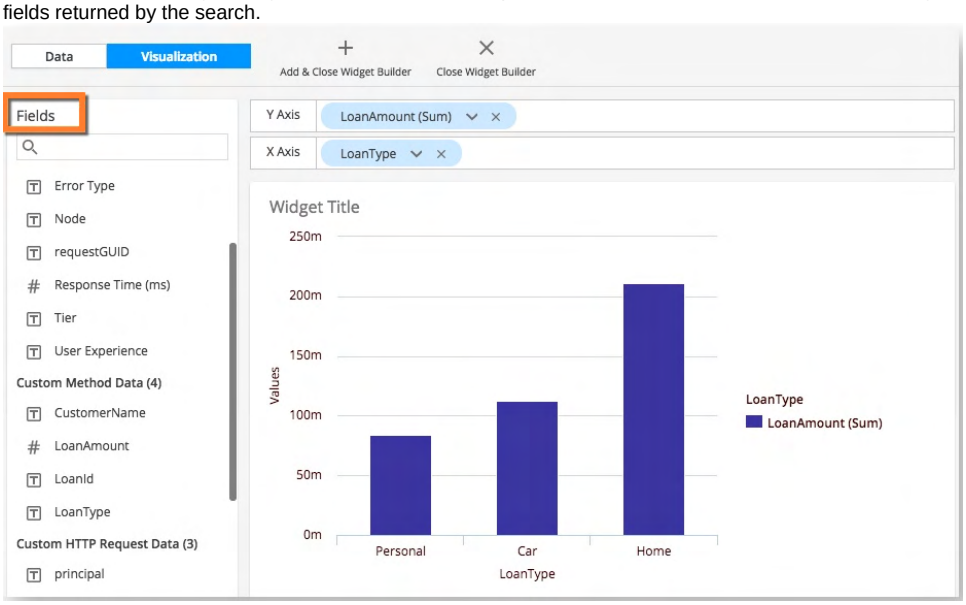
Configure Custom Widgets

To configure custom widgets for your analytics searches:

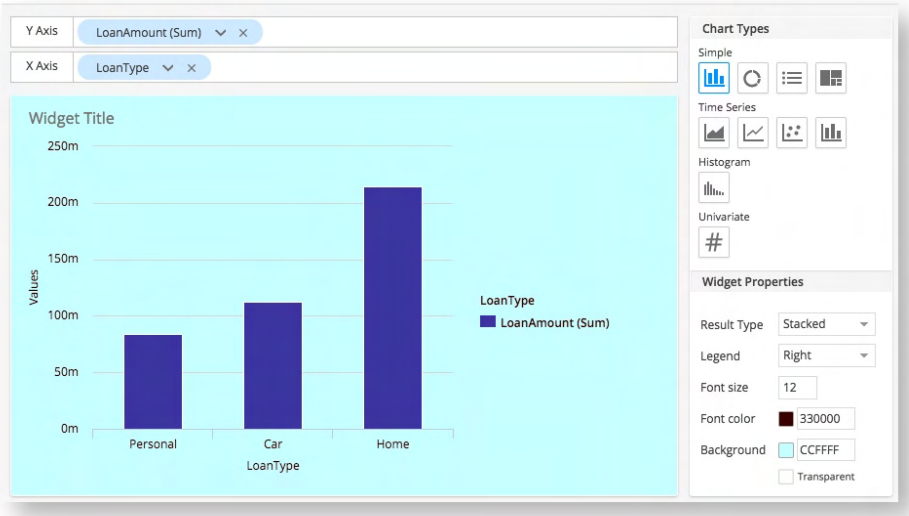
1. From the Analytics Search page using **Drag and Drop Search** (Basic) Mode, select the Visualization tab.
2. Click **Add Widget > Custom Widget Builder**.



3. To add a field to a widget, drag the field from the **Fields** panel on the left to the Y-axis or X-axis on the right. The available fields are based on the fields returned by the search.



4. From the **Chart Types** panel on the right, click the widget type to use for the display. The widget is previewed in the main panel. You can experiment previewing which widget type is best for visualizing a particular data set.



- Usage for the X and Y axes depends on the chart type. The UI prevents you from adding more fields than the widget supports. Different widgets have different limits for the maximum number of fields permitted on each axis.
- For the time series widgets (area, line, scatter, and histogram), you can use the **Resolution** field that appears on the X-axis to customize the frequency displayed if you do not want the widget to automatically select a default resolution based on the current time range. This time resolution field is not counted toward the field limit. The granularity of resolutions that can be chosen depends on the Global time range.

Custom Widget Builder Data Type and Field Restrictions

Widget Type	Data Type	Number of Fields on Y-axis	Number of Fields on X-axis
Column (simple)	any	zero	up to two
		one	up to two
		two or three	zero or one
Pie	any	one	up to two
Table	any	one	up to ten
Tree Map	any	one	up to two
Time Series (Area, Line, Points, Column)	any	zero	one
		one	one

		two or three	zero
Percentile Histogram (Not available in Advanced Mode)	numeric	zero	one
Numeric (Univariate)	any	one	zero

Visualize JavaScript Errors

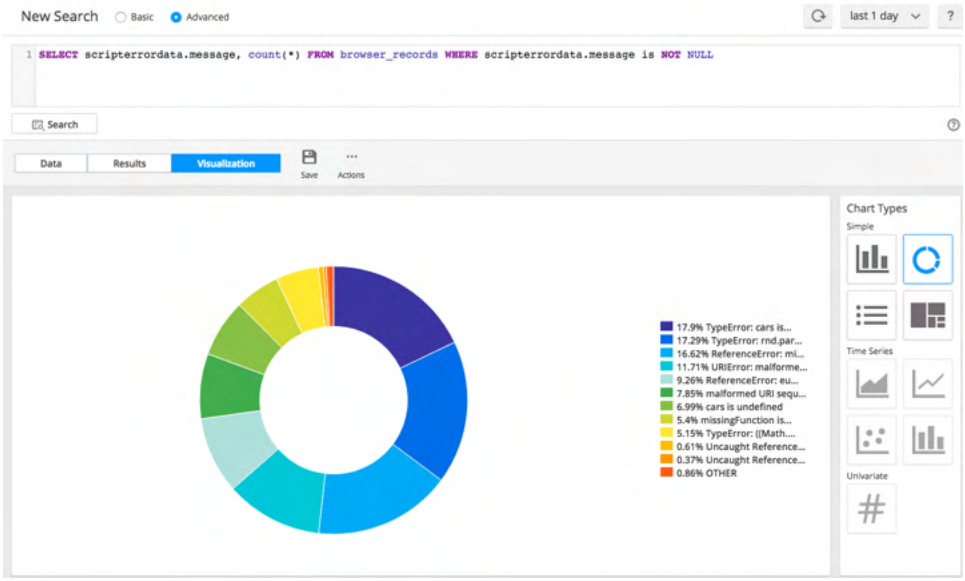
You can use Analytics to query your Browser Request event data and create a JavaScript exception and error summary dashboard.

This procedure assumes that you have configured and enabled the reporting of the JavaScript errors for Browser RUM and that JavaScript errors exist in the Events Service.

Using ADQL, you can search for the errors and then export a chart visualizing the results to a custom dashboard.

1. From the Analytics tab in the Controller UI, click **Add** to access the Analytics Search page.
2. Select Advanced mode and enter the following query:
   SELECT scripterrordata.message, count(*) **FROM** browser_records **WHERE** scripterrordata.message **IS NOT** NULL. The results are shown on the Visualization tab similar to the following:

3. Select the chart type you prefer to visualize the results.



4. From the **Actions** menu, click **Add to Dashboard** and either create a new dashboard or add it to your existing dashboard.
   Now you can customize the dashboard as needed with labels or other widgets and data.

You can also leverage additional fields such as scripterrordata.origin or pagename to group the errors together. The additional fields are:

- scripterrordata.linenumber
- scripterrordata.origin
- scripterrordata.timestamp

New Search ○ Basic ● Advanced

last 1 day

```
1 SELECT scripterrordata.linenumber, scripterrordata.message, scripterrordata.origin, count(*) FROM browser_records WHERE
scripterrordata.message is NOT NULL
```

Create Analytics Metrics From Scheduled Queries

Related pages:

- Using Analytics Data
- ADQL Reference
- Create and Manage Custom Roles

This page describes how to create analytics metrics from scheduled queries.

If you want to execute an analytics search repeatedly to monitor its value, you can create a metric from the search. The search will execute once per minute and report the results as a metric. You can create alerts on the metric in the usual way using Health Rules to trigger Policies and Actions. The analytics metric list is searchable.

You can create metrics for all Analytics event types - Browser, Mobile, Transaction, Log, and Custom.

Although the metrics calculated by scheduled queries may have decimal point precision, we only save and report whole numbers.

You can create a metric from an analytics search for the functions shown in this table. See Metric Data Resolution over Time.

Function	Metric Rollup Type	Example
count(* | field_name)	sum	SELECT count(activeMacUsers) FROM dummyTransactions
distinctcount (field_name)	average	SELECT distinctcount(activeMacUsers) FROM dummyTransactions
sum (numeric_field_name)	sum	SELECT sum(responseTime)where userExperience = "NORMAL" FROM transactions
avg (numeric_field_name)	average	SELECT avg(responseTime) FROM transactions
min (numeric_field_name)	average	SELECT min(responseTime) FROM transactions
max (numeric_field_name)	average	SELECT max(responseTime) FROM transactions
(exp1)/(exp2)	average	SELECT (count(activeMacUsers)) / (avg(activeWindowsUsers)) FROM dummyTransactions SELECT (avg(responseTime)*2)/((avg(segments.transactionTime)+3)/2) FROM transactions SELECT (sum(responseTime)*2)/(filter(sum(responseTime), where userExperience = "NORMAL") + 0.5) FROM transactions Each side of the expression must be enclosed in parenthesis.

You must have **Manage Metrics** permission and View access to Analytics to create metrics from analytics searches. See Analytics and Data Security and Transaction Analytics Permissions.

Create an Analytics Metric

1. Working in the **Analytics** > **Search** editor, set the search criteria to select the appropriate data.
2. Click **Actions** > **Create Metric** in the search action toolbar.
3. In the pop-up window, give your metric a name and a description.
   The name determines how the metric appears in the Metrics panel and the Metric Browser. Keep in mind:
   - Metrics are truncated to whole values. So values less than one are truncated to zero. To work around this, you can multiply a numeric_field_name by a factor of 10, 100, 1000, and so on, depending on the level of decimal accuracy you need. We recommend that you add this factor into the metric display name so other users can understand what the metric represents, for example, Display Name = Metric (Factor 1000). In cases where the value is a percentage, and you convert by multiplying by 100, you probably don't need to put the factor in the metric name because it would be implicit (Metric %).
   - Math operations are only supported inside the aggregation function. For example, `count(numeric_field_name * 10) from transactions.`

Metric Timestamps

Timestamp metrics always aggregate events from the current minute because metrics are created for events published in the last minute.

If you have specified a value for the `eventTimestamp` field, the timestamp value in the new metric uses an aggregation of events from the pickupTimestamp field.

For example, you set an `eventTimestamp` for an event on a previous day. You then create a metric for the event today. The metric does not use your explicit `eventTimestamp` because it is no longer from the current minute. The metric aggregates events using `pickupTimestamp`. This ensures that the metric timestamp is based on the current minute because `pickupTimestamp` cannot be explicitly changed.

See Analytics Events API.

Correlate Metrics from Multiple Events

When you create a query, AppDynamics produces a holistic metric. Because the queried data comes from different events, the Events Service has to retrieve this segmented data and stitch it together to produce a single metric. The Events Service waits for correlated events to arrive, where the maximum wait time depends on the event type:

- Mobile and Browser Session Events - two minutes.
- Transaction Events - ten seconds.

The wait time resets when the Events Service finds a correlated event.

If an event arrives after the maximum wait time, the event is not stitched together correctly in your query. For example in the following query `fieldA` and `fieldB` are separate but correlated events:

```
select count(*) from transactions where fieldA = "foo" and fieldB = "bar"
```

The Events Service finds `fieldA` and waits 10 seconds for a correlated event. If `fieldB` arrives 15 seconds after `fieldA`, the Events Services does not correlate both events. The count metric is now inaccurate because the events are not connected.

Monitor Analytics Metrics

For performance reasons, the scheduled queries used in analytics metrics can be disabled as follows:

- Queries are disabled if calling the Events Service results in any errors for ten consecutive times.
- Queries are not disabled if the Events Service is not reachable from the controller, such as during maintenance and upgrade windows.
- When the Controller is restarted, the queries which were previously disabled by the system due to consecutive failures are re-enabled.
- User-disabled queries remain disabled even after the system is restarted.

To monitor the metric:

1. Click **Metrics** in the left navigation bar.
2. Search, edit, enable, disable, or delete metrics from the **Metrics list**.

   ⚠ You can edit only the description of the selected metric.

3. To activate or deactivate metrics in a batch, select the corresponding rows in the grid and click the **Enable** or **Disable** button in the toolbar. Use Shift+ click or Command + click rows to select multiple rows.

   ⚠ If you see a status that says "Disabled due to repetitive failures", you can re-enable it by clicking **Enable**.

4. To see the metric in the Metric Browser, click the **Metric Browser**. For more details, see the section "*Metric Data Point Details*" in Metric Browser.

Business Journeys

Deployment Support

Related pages:

- Configure Business Journeys
- View Business Journeys
- Create an Example Business Journey

This page provides an overview of business journeys in AppDynamics.

Many industries have complex workflows and user journeys that span multiple transactions and event types, such as logs and End User Monitoring (EUM) data. These workflows typically manifest over long periods and cannot be measured using transactions alone. Business Journeys are a way to monitor and correlate the linear data flow across multiple event sources and track the total time for defined business workflows.

Typical multi-step workflows from different industries include:

- Payment transfers, credit card approval, and loan approval in financial services industries
- Cellphone activation and data recharge (pre-paid) in the Telco sector
- Insurance application through policy approval and insurance claims approval for insurance companies

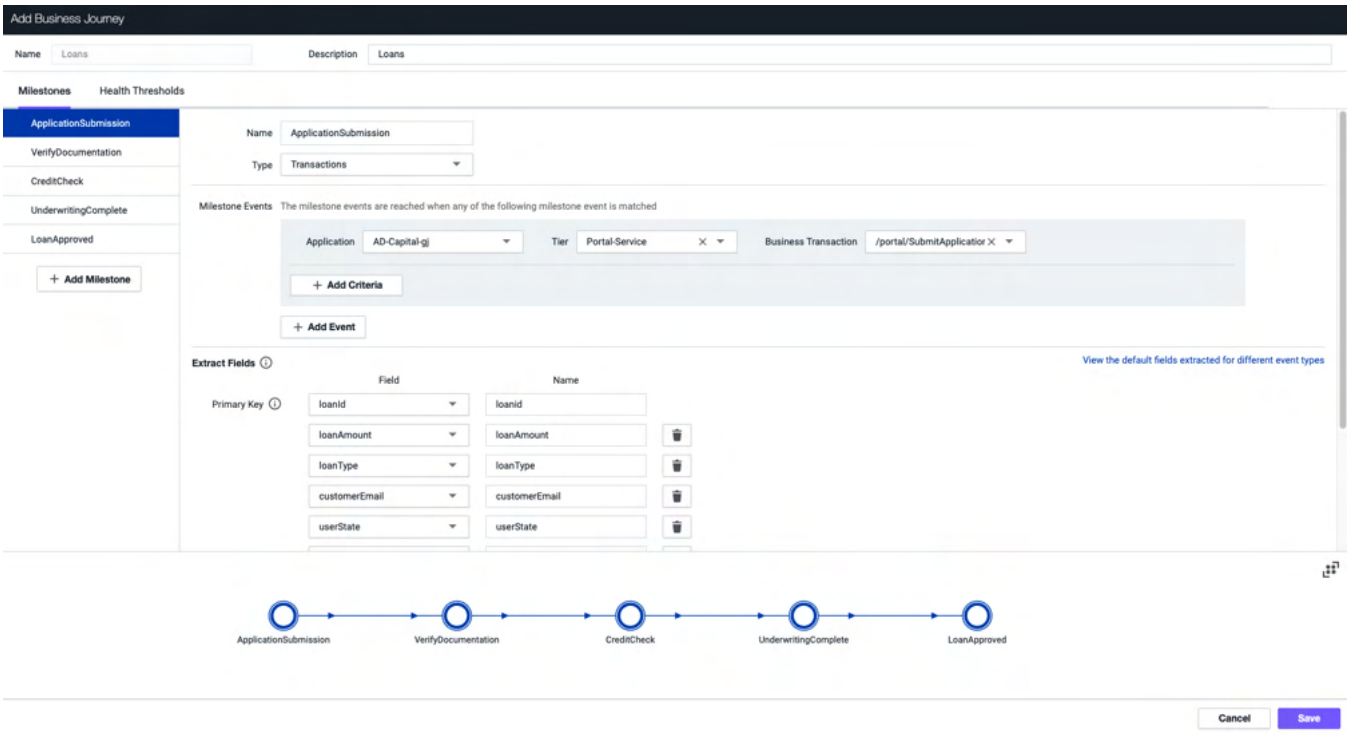
About Business Journeys

An AppDynamics Business Journey is a composite event type based on defined workflows. A Business Journey can include events from multiple analytics event types, such as logs, business transactions, custom events, and EUM data.

You will need at least one unit of the Transaction Analytics license for Business Journeys, even if none of the milestones use any of the Transaction

Business Journeys track linear processes. Branching, repetition, and loops are not allowed.

The following image depicts an example Business Journey definition.



You create a Business Journey, as shown above, by defining the following:

- Milestones and the events comprising the milestones. Milestones are the steps in your business workflow.
- Fields to be captured from each milestone event. A field indicates a category of information pertaining to the event.
- The primary key field that uniquely ties the events together. A primary key correlates the milestones for your Business Journey. The primary key value must be present in each milestone event.
- Additional fields that allow you to segment on different dimensions of the business workflow, such as loan types or payment amounts.
- Health thresholds for monitoring the Business Journey performance.

Application Analytics starts collecting the Business Journey events after you have defined and enabled a Business Journey. Analytics does not go back in time to collect Business Journey composite events. To define specific Business Journeys, you may need to configure the collection of additional fields from your source analytics events. See Data Prerequisites for Defining Business Journeys for more information.

Once the Business Journey events are being collected, you can view them from the Analytics Search UI in the same manner as other Analytics events. Because Business Journey events are, by their nature, potentially long-running processes, useful data might take some time to appear in the Analytics events list. Business Journey events are reported even when only one milestone is completed and the event is updated over time as subsequent events complete.

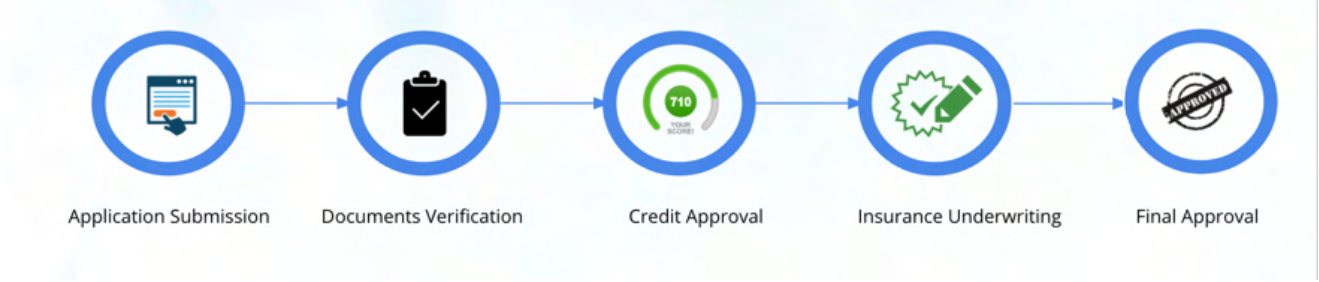
If you are already familiar with the fundamental concepts in Business Journeys clearly, proceed to either Configure Business Journeys or View Business Journeys as desired.

Business Journeys Milestones

A milestone is an event marking a significant stage in a business workflow. For example, in a loan application, the first milestone might be a user submitting a loan application. The second milestone might be document verification, followed by credit approval, insurance underwriting, and finally, loan approval. All milestones are mandatory; do not duplicate milestones.

The events in milestones are sequential. You need to create each milestone in the order that the event occurs. For example, in a loan Business Journey, a credit approval milestone cannot precede the loan application milestone.

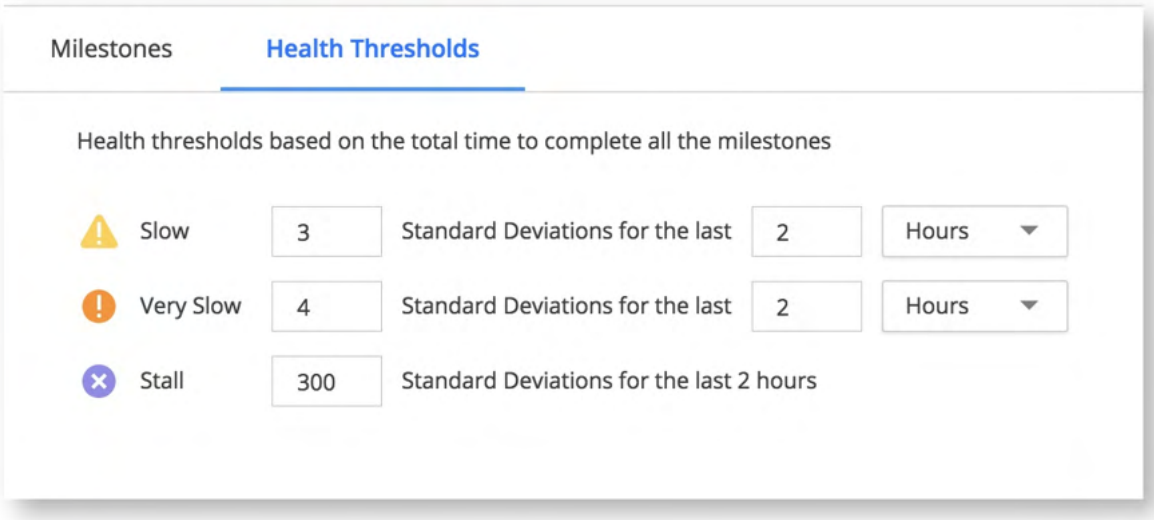
In each Business Journey milestone, you can add filters to specify the events that constitute a milestone and add fields to capture additional information about the workflow. You can use these events and fields to run ADQL queries and narrow down your searches.



As you create milestones, a flow map detailing the business workflow is automatically displayed in the Business Journey page. For more information, see Enable Flow Map.

Business Journeys Health Thresholds

A threshold is a boundary of acceptable or normal performance. Business Journey authoring provides default health thresholds against which it compares the performance of the business workflow. The health thresholds are based on the total time to complete all the milestones in your Business Journey. The threshold values are calculated by determining the standard deviation from the simple moving average over an interval of time. The default time interval is two hours. This means that if the average end-to-end time for the last two hours is N milliseconds, and if the Business Journey takes time equal to the standard deviation over N milliseconds (ms), it violates threshold.



Consider a simple moving average that is 1500 ms with a standard deviation of 100 ms. If you set the threshold to three, it means that the threshold is three times the standard deviation. In other words, a transaction that takes more than 1500 + (3*100) or 1800 ms violates the health threshold.

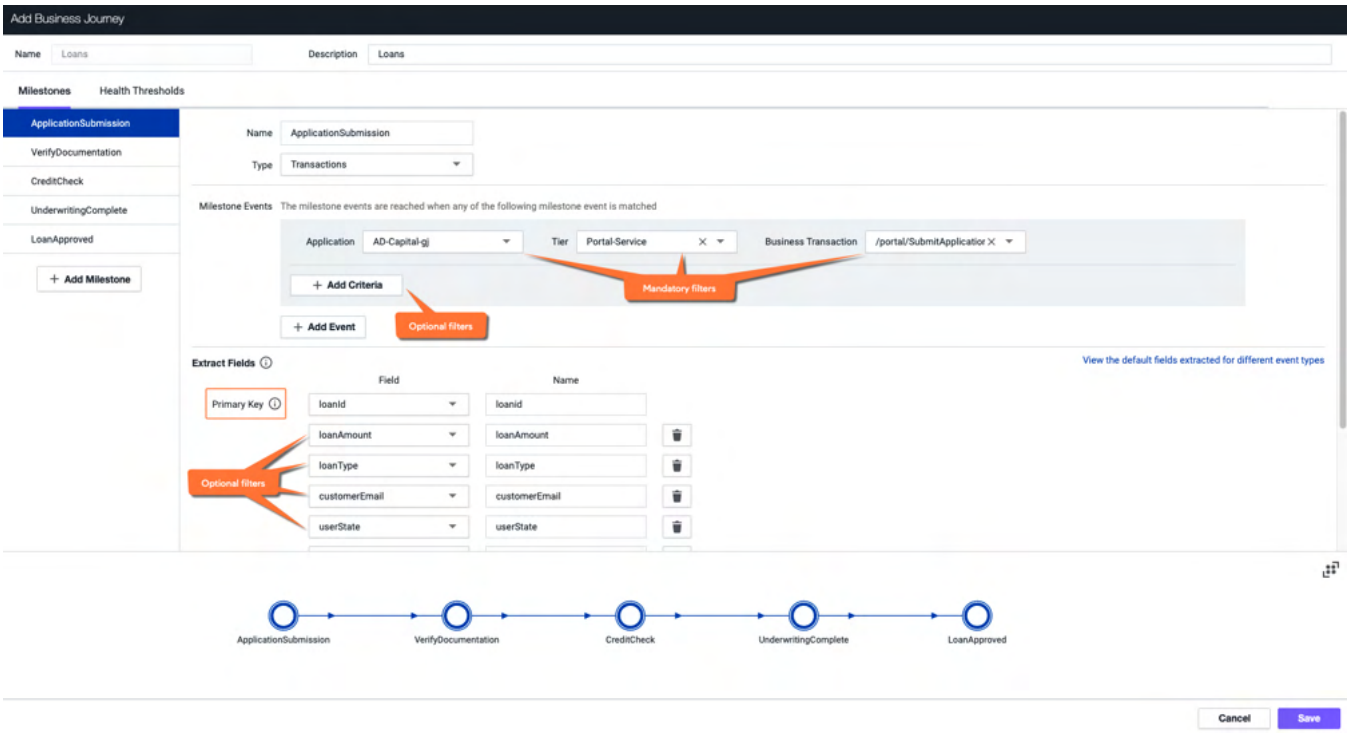
Before configuring the health threshold for a Business Journey definition, consider the following:

- A user experience (normal, slow, very slow, stall) is assigned for the Business Journey event when a value for `totalTime` is present and is greater than zero. Total time for the event could end up less than zero if the milestones are defined in an incorrect order. This can also happen even after the order is correctly defined, but the milestones are not in time order such that an early milestone has a future date compared to a later milestone.
- The total time for the Business Journey is calculated when both the first and the last milestones events have been reached. Therefore, the user experience cannot be determined and displayed until total time for the Business Journey is available.
- When a milestone encounters an error, for example, a transaction event where the `requestExperience` is Error, the user experience for the entire Business Journey event is marked as an Error. In this case, the total time is not available.
- Typically when a milestone has an error, the entire Business Journey workflow does not complete. However, if for some reason, all the milestones complete even when milestone errors exist, the total time for the Business Journey is available. However, in this case, we will retain overall user experience as an error and not change to Normal, Slow, and so on.
- After a Business Journey is initially enabled, Business Journey events are generated. The standard deviation is calculated every five minutes, so the first few Business Journey events will not have a user experience assigned to them.
- The minimum duration over which standard deviation is calculated is 30 minutes.

Filters and Fields

Filters allow you to extract event data for a select milestone based on selected criteria. For example, loan applications submitted in California. Filters define the scope of a milestone by limiting associated events. Fields extract additional relevant information from each milestone.

The mandatory filters are populated with the last 15 days of data. If no analytics data has been collected during the last 15 days, the drop-down menus for the mandatory fields will be empty. Besides the mandatory filters for each event type, Analytics allows you to optionally select additional filters by using the **Filter By** option. All the fields that are part of the filters and the additional filters that you optionally choose are automatically collected. You can use them to run ADQL queries later on.



A field indicates a category of information pertaining to the event. The **Extract Fields** section collects additional relevant information from each milestone. You can use data to query desired events and visualize matrices. The fields are categorized into mandatory and optional fields. The only mandatory field you must enter is the primary key. It is the unique identifier that ties milestones together.

In addition to the primary key, you can optionally add additional fields. These fields provide a context for your Business Journey definition. For example, loan amount, loan type, and customer name, customer id, and so on provide further details about a loan application. You can use these field values to slice and dice business transaction data later on. You must provide unique fields for each milestone. Validation fails if you create more than one milestone with the same set of fields or with the same set of mandatory and optional filters.

For each milestone, a field called `milestoneReached` is added to the associated event. The value is true if the milestone has been reached, otherwise it is null. You can use this field to query all events for which a milestone has been reached. You can also use `milestoneReached` to build a funnel widget that shows drop-offs for each milestone. The milestone name is appended to the field name as follows:

- *`milestone1_name`*`.milestoneReached`
- *`milestone2_name`*`.milestoneReached`

Likewise, the default fields and filters are also appended with and namespaced by milestone name.

At the Business Journey level, a field named `completed` tracks the status of the workflow using the boolean values. True represents a completed Business Journey, whereas False indicates that the journey is in progress or is incomplete. Use the Analytics Search UI or an ADQL query for the desired Business Journey with the query string `completed` to view the status of the associated events.

Milestone Timestamps

The `totalTime` and `timeTaken` fields represent the time it takes to reach a milestone. Timestamp fields are empty when the Business Journey is partially complete. As each milestone completes and the event data is captured in the Business Journey event, the total time is updated. The total time is calculated by subtracting the timestamp for the first event from the timestamp for the final event.

Timestamps are not exact fields. AppDynamics cannot calculate the exact time of events in a milestone because the event may occur at any point in method. For example, in the loan Business Journey above, the Credit Approval milestone may come from a log event. Your system may trigger a log at any point in the credit approval process. However, the start time of the Business Journey milestone can only be detected when the log event reaches AppDynamics. You may notice a slight difference in actual time due to this behavior.

Business Journey and Milestone Metrics

The table below lists the metrics that are calculated out of the box for Business Journeys and milestones, which are the only metrics supported by Business Journeys. You cannot use metric queries created from an ADQL search for Business Journeys.

	Metric	Description

Milestones	`Average time taken`	Average of time taken to reach the current milestone from the previous milestone. Not applicable for the first milestone.
	`Calls per minute`	Total number of Business Journeys that reached the milestone in the last one minute and started in the last 24 hours.
Business Journeys	`Average total time`	Average of time to reach to completion for all Business Journeys that started in last one day and completed in the last one minute. Calculated taking the average value of `totalTime` field stored in all Business Journey events.
	`Calls per minute`	Total number of Business Journeys that started in the last one minute. A Business Journey starts when AppDynamics detects the first milestone.

Mandatory Fields

Mandatory filters, mandatory fields, and fields extracted by default depend on the event type as shown in the following table.

Event Type	Mandatory Filters	Mandatory Fields	Fields extracted by Default

Transactions	Application Name
	Business Transaction Name
	Tier Name
		Primary Key	`eventTimestamp`
			`requestGuid`
			`requestExperience`

Logs	Source Type	Primary Key	`eventTimestamp`
			`logLevel`
			`logType`

Browser RUM	AppKey
	Page Name
	Page Type
		Primary Key	`eventTimestamp`
			`cguid`
			`pageexperience`

Mobile RUM	AppKey
	Network Request Name
		Primary Key	`eventTimestamp`
			`cguid`
			`networkrequestexperience`

Custom Events	Source Type	Primary Key	`eventTimestamp`

For custom events, you must include a date in the `eventTimestamp` field for the Business Journey to register the event. See Analytics Events API for more information.

Configure Business Journeys

Related pages:

- View Business Journeys
- Create an Example Business Journey

This page describes how to configure Business Journeys.

Before You Begin

Before creating Business Journeys, ensure that the feature is enabled in your environment. You also should review data prerequisites, validation rules, and limitations for names and Business Journey definitions.

Enable Business Journeys

By default, Business Journeys is enabled on SaaS environments. However, the feature is disabled for on-premises installations. To enable Business Journeys, an Administrator needs to configure certain properties in **Settings**.

Before starting the Event Service:

1. Open the `events-service-api-store.properties` file.
2. Change `ad.bizoutcome.enabled=false` to `true`.

The page displays a flow map detailing the business workflow across milestones. You can hide the flow map by changing the value of the `analytics.business.outcomes.flowmap.enabled` property to `false` in **Settings**.

Enable Flow Maps

As you create milestones, a flow map detailing the business workflow displays on the page. Selecting a Business Journey prompts a new window with the enabled flow map. This behavior is controlled by the `analytics.business.outcomes.flowmap.enabled` property in **Settings**. Setting its value to `true` indicates that flow maps are enabled for Business Journeys.

Data Prerequisites for Defining Business Journeys

Analytics creates Business Journey composite events by collecting events and fields that you have already captured as analytics data. In addition to built-in analytics data sources, custom event data can also be used to create Business Journeys. As you define the milestones in the Business Journey, you specify which events to use and which fields to extract from the events. You can extract fields collected by default or custom fields that you have configured for collection. You can also add milestones with custom events created from Analytics API Keys.

You need to know the starting event, ending event, and clearly-defined steps in between. To collect additional fields in the events being captured by Analytics, see:

- Analytics Custom Events Data
- Data Collectors
- Collect Business Data From SQL Calls
- Configure Log Analytics Using Source Rules

Restrictions and Caveats

- Business Journey names are case-insensitive and are stored as all lowercase. This means that two definitions named `application` and `Application` are considered a duplicate.
- The **Event Type** drop-down displays the lowercase definition name.
- Use the lowercase name for advanced queries.
- The primary key must be unique and not null. If the primary key holds null values, the underlying milestone events will not be stitched together to form a Business Journey event.
- Choose the primary key carefully; in particular, the cardinality of the values. The primary key is expected to uniquely identify and join milestone events together to form a meaningful business workflow. If the milestone events are misidentified by the primary key, inaccurate milestone events will join and produce faulty results.
- The primary key name cannot be changed unless the Business Journey definition is in the draft state.
- The Business Journey definition name cannot be changed after the definition is deployed. You can rename it while the definition is in the draft state.
- If a field related to a custom event is renamed, update the Business Journey definition created from the custom event for the renamed field to be correctly extracted.

Validation Rules

This section describes certain rules to validate Business Journey definition and naming convention for Business Journeys, milestones and extracted fields. You can save your work as a draft without invoking validation. When you are ready, you can use **Validate and Save** to check that your definition is acceptable. Saving the Business Journey definition does not enable the Business Journey. Data is not captured until you actually enable the Business Journey. See Business Journeys Life Cycle.

Validation Rules for Names

This section describes the validation rules for naming Business Journeys, milestones, and extracted fields. Validation rules are not applied when you save your Business Journey definition as a draft. Validation is only invoked when you use **Validate and Save**. The validation rules include the following:

- Names of Business Journeys, milestones, and extracted fields must have an alphanumeric string containing a-z, A-Z and 0-9. The only special character allowed is the underscore _.
- Special characters such as spaces, hyphens, dashes are not allowed in the names.
- Primary Key fields must have the same name (label) in all milestones in a Business Journey definition. The field name itself may vary in different event types.
- The primary key name cannot be changed unless the Business Journey definition is in the draft state. See Business Journeys Life Cycle for more information.
- The following reserved field names cannot be used to name milestones or fields in your Business Journey definition.
    - `pickupTimestamp`
    - `eventTimestamp`
    - `totalTime`
    - `userExperience`
- You cannot name milestones or field names with ADQL keywords. See ADQL Queries.

Validation Rules for Business Journey Definition

A Business Journey definition must contain:

- A minimum of two milestones.
- A unique set of filters. More than one milestone with the exact same set of required and optional filters is not allowed in the same definition.
- Unique milestone names.
- Extracted field names must be unique (except the Primary Key field).
- There must be one Primary Key field per milestone.
- Slow threshold duration must be greater than 30 minutes.

Create a Business Journeys Definition

1. In the Controller UI, navigate to **Analytics** > **Business Journeys**. A list of existing Business Journeys (if any) displays.
2. To define milestones, click **+ Add Milestone.**
3. Type a name.
4. From the **Type** dropdown, select the source of the analytics data, such as Transactions, Logs, Browser Requests, and Mobile Requests.
5. The **Milestone Events** section displays mandatory filters based on your selected data source. The fields vary based on your data source type.

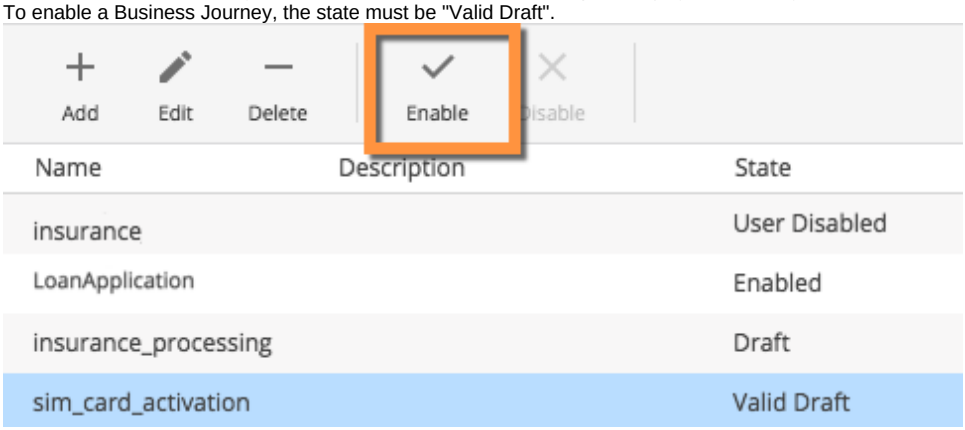
   For Transactions, specify the Application, Tier, and Business Transaction for each milestone you intend to create. For Analytics, the tier represents a Java Virtual Machine (JVM) service, such as an authentication service, in your application environment. Business Transaction is the cross-tier processing path representing the request for a service provided by the application.
6. You can optionally click **+ Add Criteria** to add additional filters based on your data source type.
7. You can define multiple milestone events of the same event type. Click **+ Add Event** to create another milestone event.
8. In the **Extract Fields** section, define your primary key field and name to specify which fields will be captured from the milestone event. You can click **Auto Fit** to auto-organize the milestone events or organize the events freely.

   Once you name the primary key, you can not change the name unless the definition is in the draft state. See Business Journey Life Cycle.
   The primary key field is not populated for subsequent milestones because the primary key might have different field names in the event type for different milestones.

   > Fields that are extracted by default in Business Journeys are not shown.

9. You can save the Business Journey with either:
    - **Save As Draft:** saves the definition in draft form. No validation is performed and you can return to the definition to complete it at a later time.
    - **Validate and Save**: Performs necessary validation. Use this option when you have completed all milestones. The definition is saved, but is not enabled.
10. In the **Health Thresholds** tab, you can specify the values that determine acceptable performance.
    See Business Journeys Health Thresholds to learn how the user experience value is calculated. When you finish creating the Business Journey definition, you are ready to enable it.

11. Select the Business Journey from the list and click **Enable**. The option is greyed out until you select a valid draft Business Journey from the list. To enable a Business Journey, the state must be "Valid Draft".



Business Journeys Life Cycle

This section provides information about the Business Journeys life cycle.

Draft

You might not have all the required details at the beginning and therefore, creating the definition may involve multiple temporary versions. Use **Save As Draft** to capture your initial, incomplete definition and place your Business Journey into a Draft state.

- No analytics data is processed and no Business Journey events are created in draft state, so there is nothing to query.
- The primary key can be changed when the Business Journey is in draft state.
- The draft state is less restrictive with respect to validations and supports most update operations.

Valid Draft

Once the definition has the required details, use **Validate and Save**, which transitions the definition into the Valid Draft state. You can still modify the definition in this state. Business Journey events are not captured until you enable the definition.

Enabled

When you are ready to process data, use the **Enable** action. This transitions the definition to the Enabled state. Most definitions will spend their lifetime in the Enabled state.

- Configuration changes are synced to the Analytics Servers every two minutes. Therefore, once you enable a Business Journey definition, there could be a delay of up to two minutes for events to be generated.
- Incoming events are processed, composite Business Journey events are created and stored. You can query for the Business Journey events.
- You can modify the definition in the following ways:
    - Add, rename, or delete fields for extraction (non-default fields)
    - Add, rename, or delete milestones

User Disabled

At some point, you may want to disable the Business Journey. The **Disable** action transitions the Business Journey definition to the User Disabled state. In this state, no incoming events are processed. Existing events can still be queried.

You can update the definition in the following ways:

- Add, rename or delete fields for extraction (non-default fields)
- Add, rename or delete milestones

Deleted

When you no longer need the Business Journey definition, use the **Delete** action. This is the final phase of the definition's lifecycle. In this state, no incoming events are processed for it. Existing Business Journey events are not available to query.

View Business Journeys

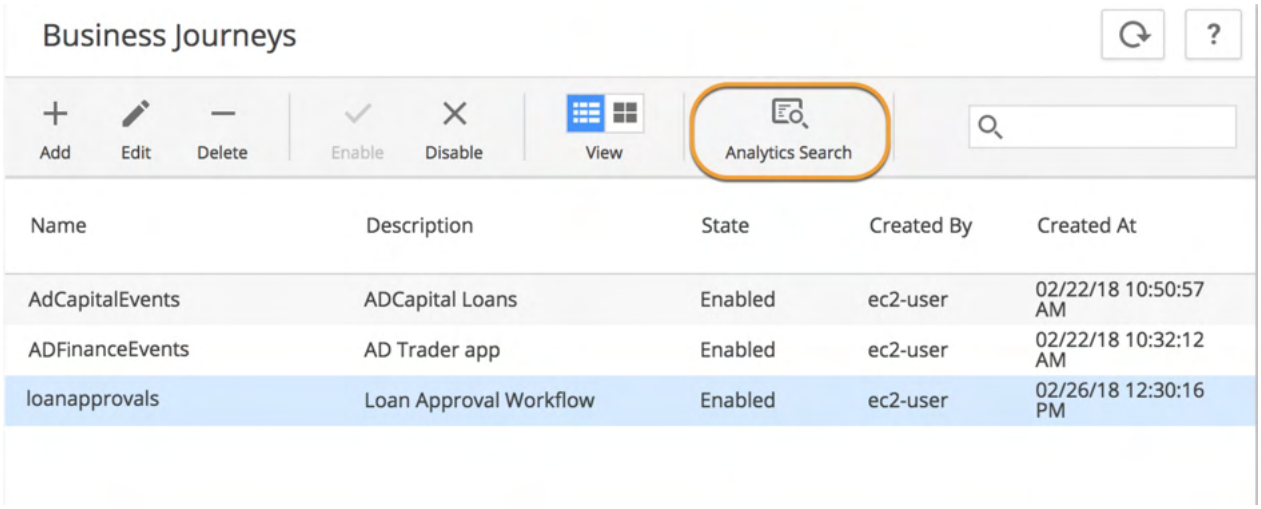
Related pages:

- Search Analytics Data
- ADQL Reference

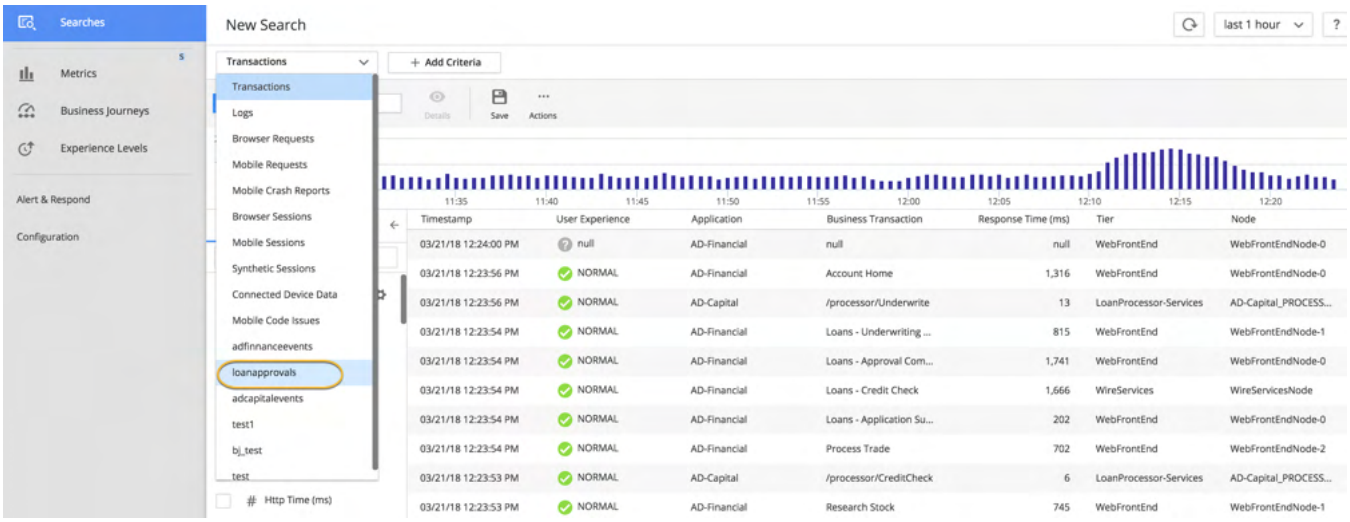
View Business Journey events from the Analytics Search UI in the same way as any other event type. Alternatively, use the **Analytics Search** button on the Business Journey UI.

Search for Business Journeys

Use the **Analytics Search** button in the Business Journeys UI for one-click access to the underlying events. Selecting an enabled Business Journey and clicking **Analytics Search** takes you directly to the Searches page in Basic mode. **Analytics Search** button is unavailable for definitions in Draft and Valid Draft states.

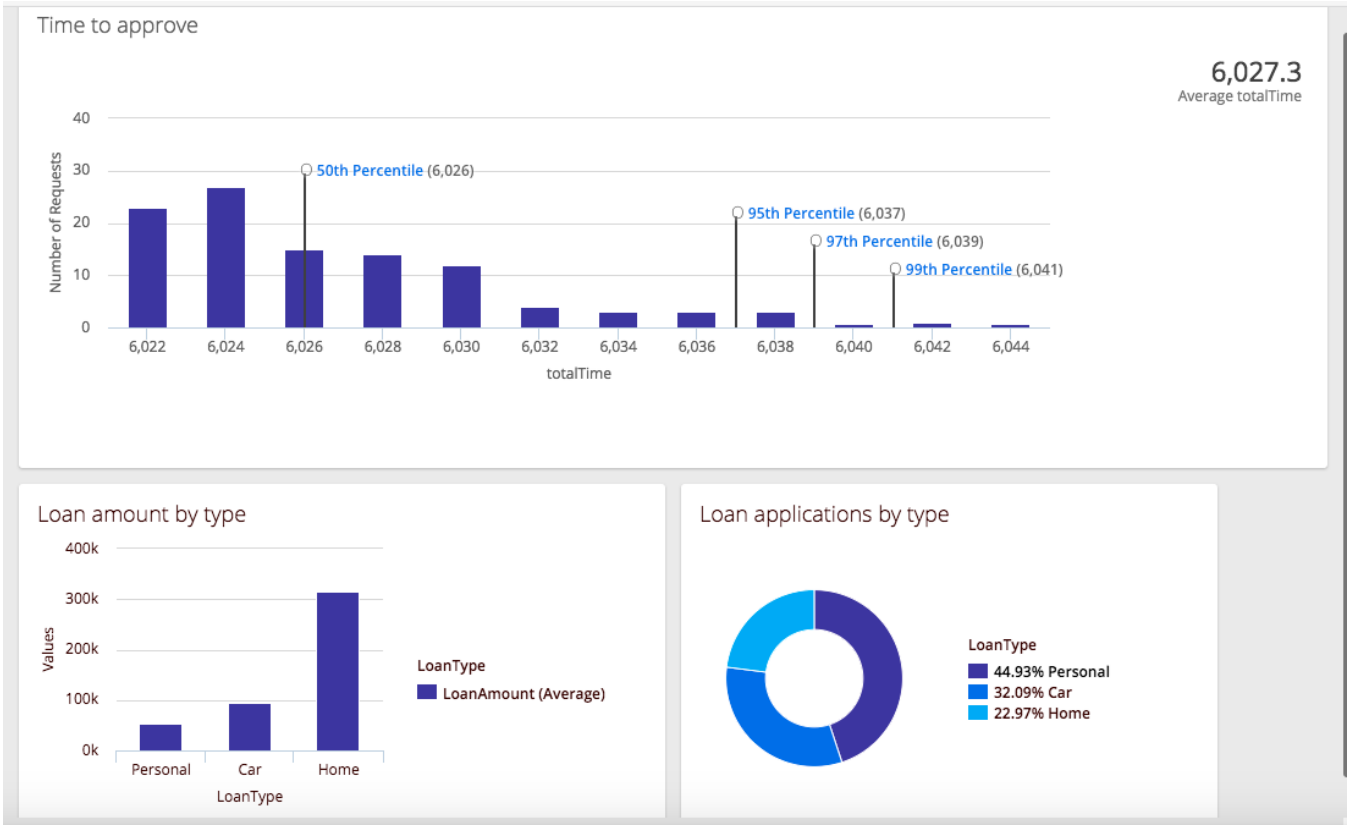


Alternatively, access the Analytics Search UI and use the event type dropdown to find your Business Journey event. The Business Journey name identifies the event type in the Search UI similar to custom events. In this example, it is "loanapprovals".



You can search the Business Journey data and create visualizations in the same fashion as for any other analytics event type.

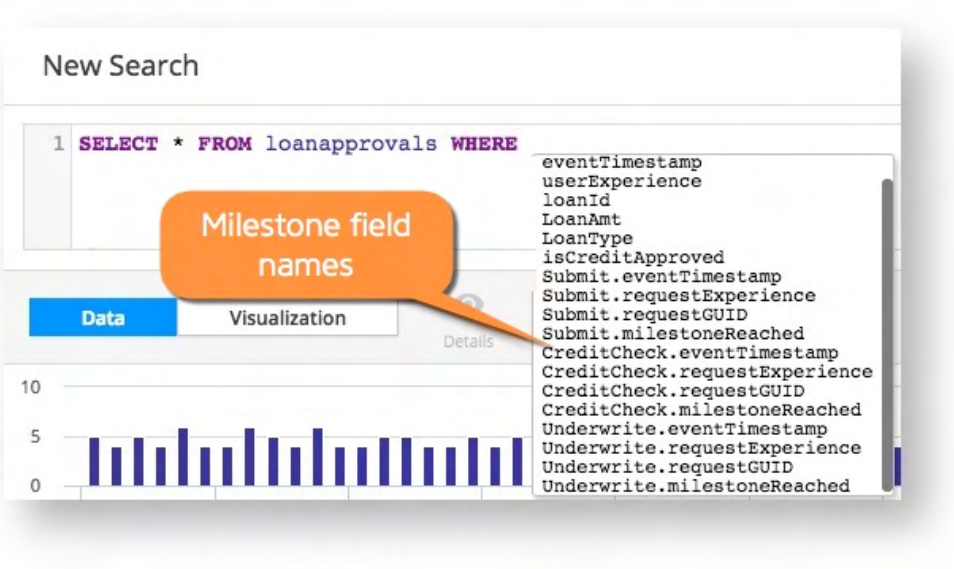
Business Journeys also gives you the ability to perform analytics, slice and dice data, and create widgets. For example, using the loan approval Business Journey, visualize percentile values of approval time, loan amount by type, and loan applications by type as follows:



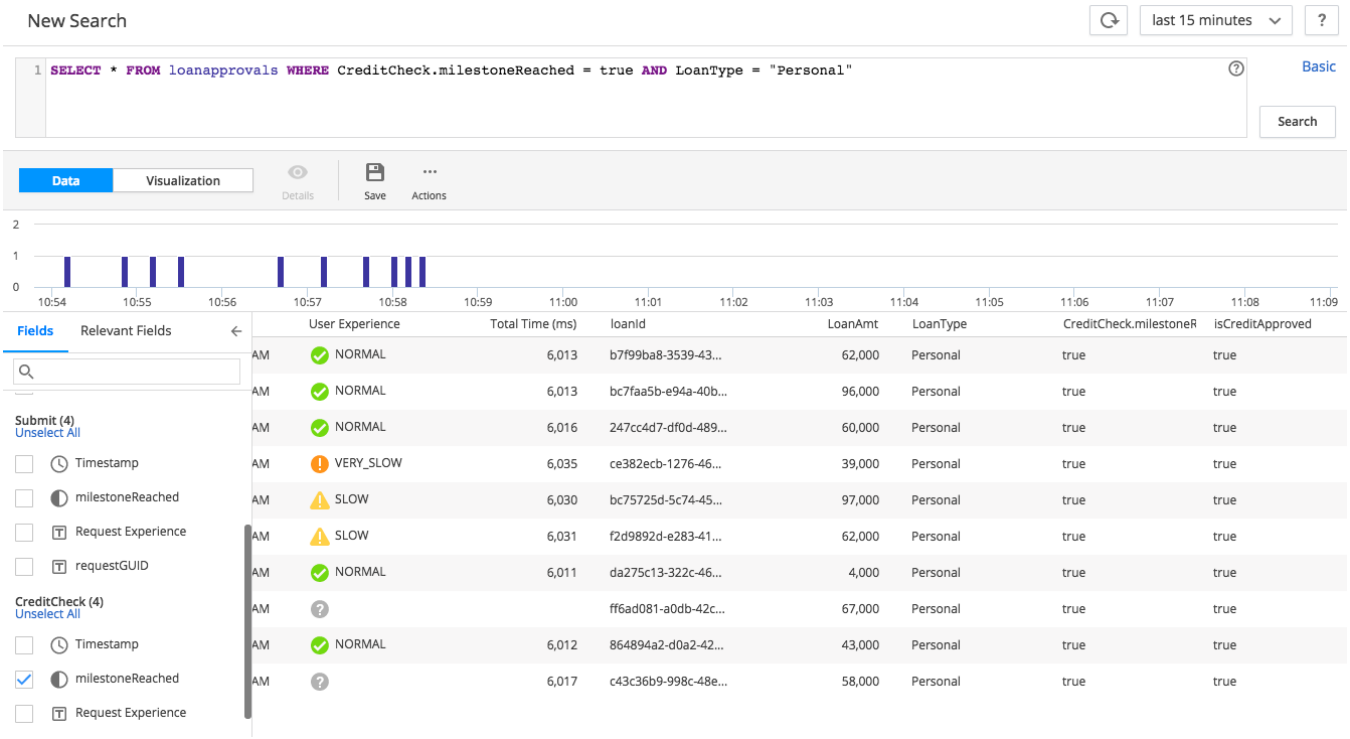
The 50th Percentile line indicates that 50% of the loan approvals occurred below this line. Similarly, each percentile line represents the corresponding percentage of loans approved below that line.

Business Journeys ADQL Queries

To use ADQL to query Business Journey events, you need to use the full namespaced field name for each milestone. The field names are constructed by appending the milestone name to the field. When constructing queries with ADQL in the Search UI, you must use the full name of the field. The following image shows constructing a sample ADQL query.



A sample ADQL query for the loanapproval Business Journey is:



Business Journeys Metrics

Analytics generates out-of-the-box metrics at the Business Journey definition and milestone levels. You can view these metrics in the Metric Browser. The metric values are reported per minute. For example, an observed value of 5 indicates that it's the count of the records received in the one-minute interval. If the number of records reported in the last five minute is 25, the Metric Browser reflects an approximate observed value, that is 5. To calculate metrics, Analytics adds two fields named `timeTaken` and `totalTime`.

The `timeTaken` field is added to the associated event for each milestone. This field represents the time taken for an event to reach a milestone from the previous milestone, and therefore, the first milestone will not have this value.

The `totalTime` field is added to the associated event for each Business Journey definition. `totalTime` represents the time for an event to cover all the milestones comprising the Business Journey. It is the time an event takes to reach the last milestone from the first one. If the first or the last milestone is missing, `totalTime` is not calculated for that event. For example, if the loan application is rejected in the CreditCheck stage, the workflow never reaches the approval stage. In this case, `totalTime` is not determined.

By using the above-mentioned fields, the following out-of-the-box metrics are generated.

Milestone Level

Average timeTaken: Average of the values measured for the `timeTaken` field. Evaluates the events that started in the last one day and reached the milestone in the last one minute.
Calls per minute: Number of events that started within the last one day and reached the selected milestone in the last one minute.

Definition level

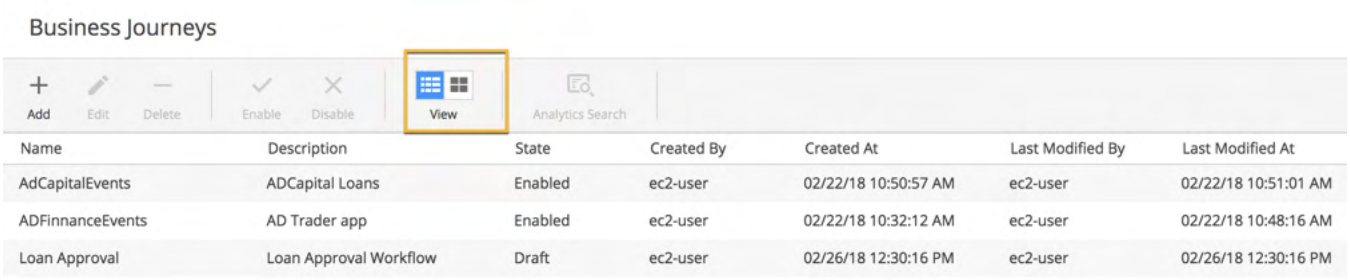
Average totalTime: Average of the values measured for the `totalTime` field. Evaluates the events that started in the last one day and reached the first milestone in the last one minute.
Calls per minute: Number of Business Journey events measured per minute. This number is equal to the calls per minute value of the first milestone. The value is calculated by evaluating the events that started in the last one day and reached the first milestone in the last one minute.

> The lookback period to generate out-of-the-box metrics is one day. The values for the metrics might not be accurate if events take more than a day to complete or to even reach the next milestone. This is due to the lack of sufficient event records for Analytics to generate correct values, leading to displaying incorrect values. For example, the average `totalTime` metrics will only be accurate if events finish within the lookback period, that is one day.

Note that the existing definitions will not have the out-of-the-box metrics created. You need to create new definitions to generate corresponding out-of-the-box metrics.

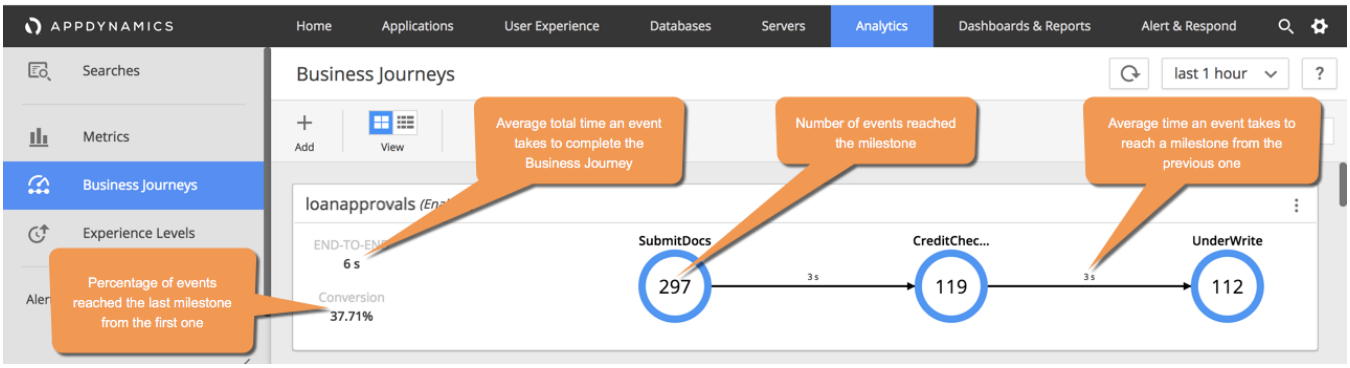
Business Journeys Dashboard

Analytics provides two Views for Business Journeys: Card View and Grid View. Business Journeys page defaults to the Grid View, but after switching to the Card View the UI makes it as the preference. The next time you log in, Business Journeys page defaults to the Card View. Use the **View** button on the toolbar to switch between the Views.



Name	Description	State	Created By	Created At	Last Modified By	Last Modified At
AdCapitalEvents	ADCapital Loans	Enabled	ec2-user	02/22/18 10:50:57 AM	ec2-user	02/22/18 10:51:01 AM
ADFinnanceEvents	AD Trader app	Enabled	ec2-user	02/22/18 10:32:12 AM	ec2-user	02/22/18 10:48:16 AM
Loan Approval	Loan Approval Workflow	Draft	ec2-user	02/26/18 12:30:16 PM	ec2-user	02/26/18 12:30:16 PM

The Card View displays an out-of-the-box dashboard for each Business Journey definition along with key metrics. The dashboard highlights the milestones associated with each Business Journey definitions and these metrics:



Dashboards for Business Journeys created prior to the release of Analytics 4.5 do not display the *Average time to reach the next milestone* metric. To workaround, edit the **Extract Field** section of one of the milestones and add the new field or remove an existing field. After the definition is saved Analytics starts generating the missing values. Within a few minutes, you should see values for *Average time to reach the next milestone* for the Business Journey you edited.

Time range menu determines what events are considered for calculating metrics. The events that are considered for calculating metrics are only those started in the selected time range.

- End-to-End: The average end-to-end time an event takes to complete the corresponding Business Journey. It is the average time taken by an event to reach the last milestone from the first one.
- Conversion: The conversion rate represents the percentage of events that reached the last milestone from the first one. It is calculated as (events reached the last milestone) * 100 / (events reached the first milestone).
- Average time to reach the next milestone: It is the average time an event takes to reach the next milestone from the current one. This value is represented by the number shown in between each milestone.
- Event count per milestone: It is the number of events that reached a particular milestone. This value is indicated by the number shown inside the circles representing each milestone.

Create Example Business Journeys

Related pages:

- Configure Business Journeys
- View Business Journeys

This page describes a loan application process, AD-Capital, to demonstrate the milestone workflow. Similar to a typical loan application process, the workflow in this Business Journey starts with application submission, followed by document verification, credit check, underwriting, and loan approval.

Milestones Data

The data for each milestone comes from different applications and event types, such as business transactions, logs, and end-user events.

In this workflow, the data associated with application submission comes from business transaction events while the document verification status comes from logs. Third-party service providers perform the credit check and underwriting. Then, the status is updated in logs and the loan approval status is updated in the transaction events.

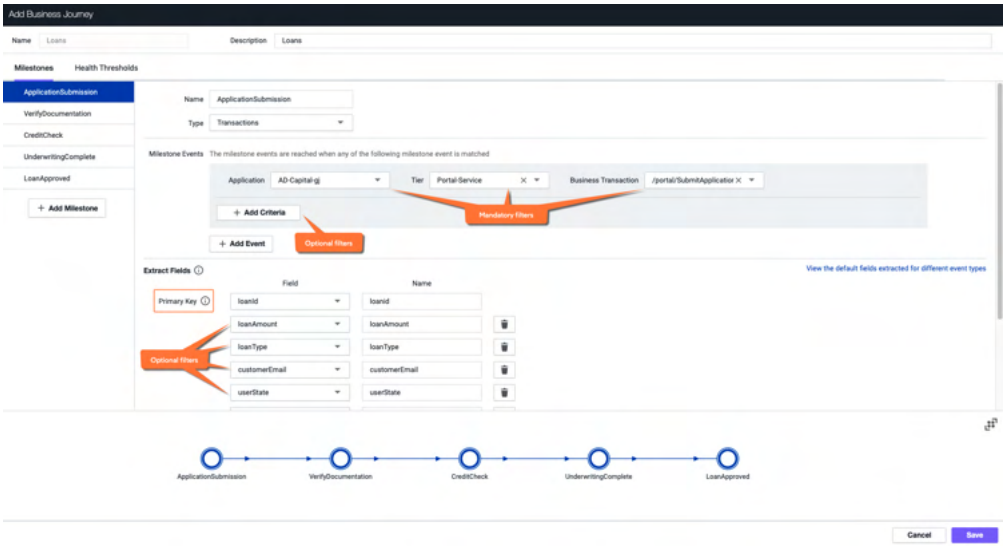
Extract Fields: Primary Key and Additional Fields

Choose a distinct primary key that uniquely identifies and ties together these independent milestones to represent loan application. In this example, `loanId` is used as the primary key. Enter `loanId` in the **Primary Key** field in each milestone. You must use the same data type as the primary key for all milestones in any given business journey.

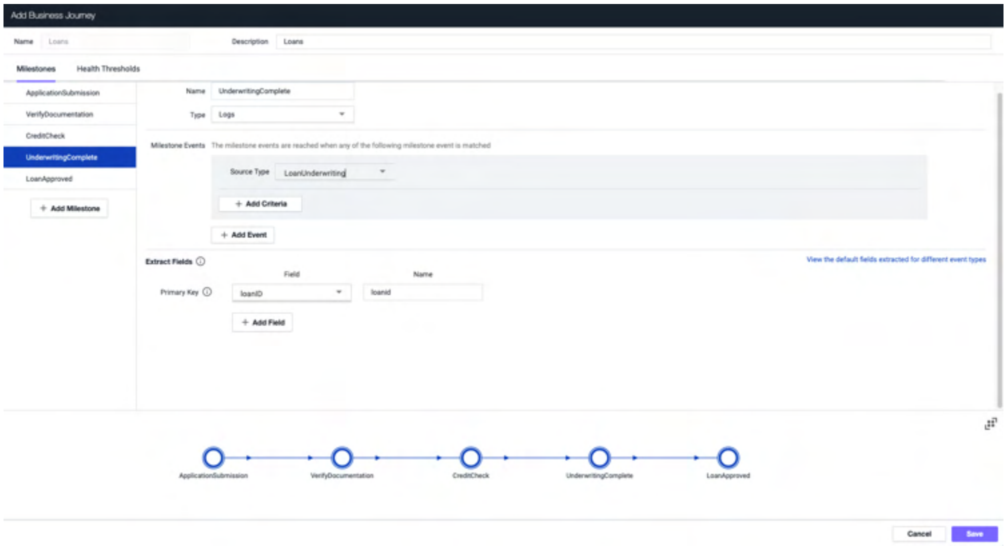
In addition to the default information collected by the Business Journey, such as event timestamp, you can extract additional business information, such as customer details, loan amount, loan type, bank name, and so on with the optional fields. These additional fields provide further context for your Business Journey definition. You can also use these fields to run ADQL queries.

Define Milestones

In the following example, you can define an application submission milestone by selecting an event type, primary key, and filters. The mandatory filters to limit the events for this milestones are **Type**, **Application**, **Tier**, and **Business Transaction**. The primary key is defined as `loanId`. Fields such as `loanA mount`, `loanType`, and `customerEmail`, are extracted in this milestone.



Similarly, the milestone for underwriting is defined with a different event type:



Since third-party service providers perform the underwriting, the status is updated in logs; **Logs** is considered the **Type** of event source. To define a milestone, click **+ Add Milestone**.

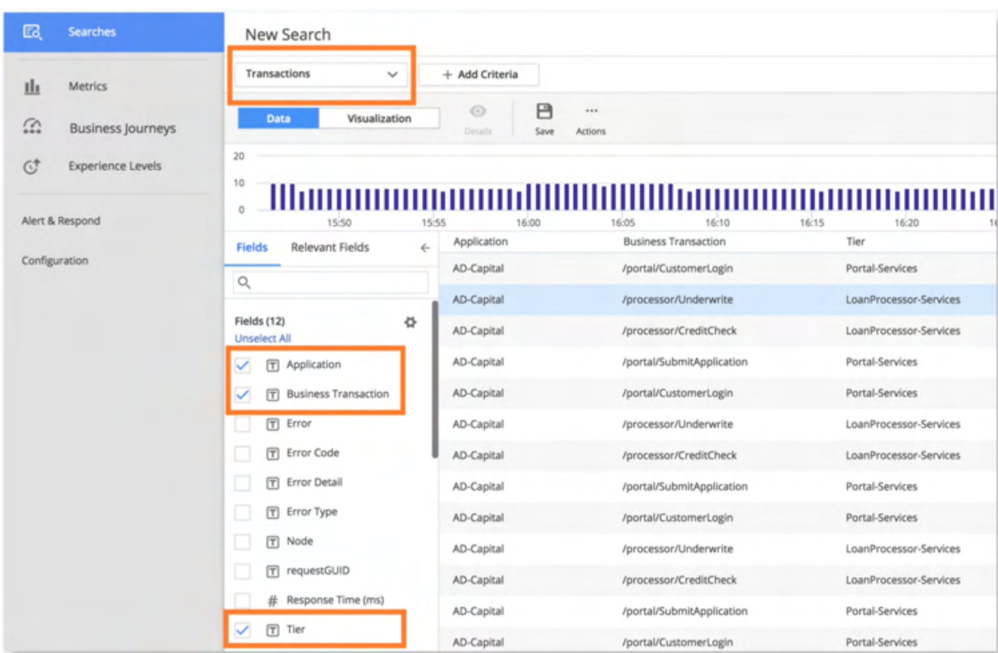
Occasionally the individual steps in a workflow, such as the application submission, can occur in different methods. You can differentiate these stages with unique filter conditions. For example, a user that submits an application through a browser performs the same action as a user that submits an application through mobile, but the filter conditions are uniquely defined. To track a milestone with several entry points, click **+ Add Event** and define your mandatory filters (application, tier, and business transaction), primary key, and optional filter conditions, including your custom fields.

You can only define the entry points for milestones if the entry points are of the same event type; if one entry point is in **Transaction** and the other is in **EUM**, you cannot track the entry points under the same milestone.

Define your remaining milestones, validate, and save the Business Journey. It takes a few minutes to display the generated records from the associated events.

Troubleshoot the Business Journey

If you think that the combination of selected fields and filters for each milestone is incorrect, you can validate with an ADQL query search or use the Analytics **Searches** widget:



You can see the valid Tiers and associated Business Transactions for AD-Capital in **Searches**, which displays all the valid values for your selection.

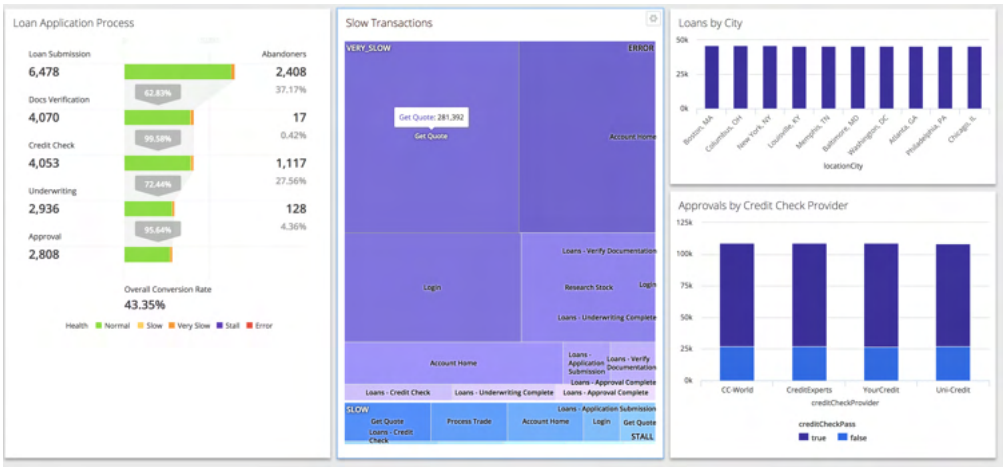
Alternatively, you can access **Tiers & Nodes** in the Controller for the AD-Capital application.

Run Analytics on the Business Journey

Use one of the search methods from **Searches** to view data, run Analytics, or visualize the performance of the Business Journey you just created.

View the Business Journey

You can view dashboards and widgets of the loan approval Business Journey in **Dashboards & Reports**. The visualization makes it easy to understand the performance of loan application workflow.



The funnel widget is located on the left side of the image. This widget represents the overall conversion rate, the health of participating events, and the number of abandoners at each critical step in the loan application process.

At the center of the dashboard, a widget illustrates slow business transactions at each step in the Business Journey.

The widget on the lower right side of the image compares credit check providers on the basis of credit approvals.

The widget on the upper right side displays the number of loans approved in different cities.

Experience Level Management

Related pages:

- View and Export XLM Compliance Data
- Configure Experience Level Management
- Migrate XLM Configurations Between Environments

The performance of business transactions and other types of events can affect user experience. Different levels of performance may correspond to service level agreements (SLAs), compliance targets, or compliance policies that your application must satisfy.

For example, an e-retailer might want to ensure that when customers add items to their carts, the transactions always complete within 100 milliseconds.

Experience Level Management (XLM) enables you to define experience levels. XLM shows you how your application is performing relative to those levels, in custom dashboards and in reports that you can view and export.

Working with XLM

Whether you speak of an experience level or a service level depends on whether your focus is user experience or SLAs, but you configure both through the same XLM UI. What this section says about experience levels applies equally to service levels.

You can define experience levels for any kind of data that meets the following criteria:

1. The data must be numerical.
2. The data must be individual (per event) values, not aggregates.

Since data collectors provide individual values, they are a good basis for experience levels as long as the values are numeric. By contrast, metrics and information points cannot be used as the basis for experience levels, because they provide aggregate values.

The following are all good bases for defining experience levels:

- Sales in dollars per week during the time an ad campaign is running
- Application response times calculated from business transaction events
- End-user response times calculated from RUM and synthetic events
- Custom analytics such as login times for platinum customers or item checkout response times for London customers

Compliance against the configured thresholds is calculated in daily intervals from the specified start date. The local time zone starting time for each day is converted to midnight of the equivalent Greenwich Mean Time (GMT) date. For example, *07/30* means *12:00 am GMT on 07/30*. The reporting job that calculates the XLM data runs every day at midnight and noon GMT. The results are updated the next time the reporting job runs.

XLM aggregates the results of reporting jobs into weekly or monthly periods, according to your choice of **Compliance Period** settings, including **Time Zone**

When viewing XLM data for a week or month, you can drill down into daily granularity. XLM also allows you to

- Create XLM reports in the time zone of your choice
- Export reports of however many reporting periods you choose, in CSV format
- Add your XLM report to a custom dashboard for periodic generation and delivery

You can export XLM configurations, and migrate them from one environment to another. You can also view and export the XLM Audit Trail, which automatically records XLM configurations and changes to them.

If you revise the configuration, the new configuration takes effect the next time the XLM reporting job runs. Past data is immutable and configuration changes do not affect the values.

To see which configuration was in effect at a particular moment in a reporting period, view the XLM Audit Trail.

Configuration Overview

In the XLM UI, you configure **Properties**, **Compliance Target Settings**, and optional **Exclusion Periods**.

- **Properties** specify what type of event to measure and what filters to apply.
- **Compliance Target Settings** specify the performance criteria you want XLM to report, through
    - the **Compliance Target**, which defines the desired level of performance for the properties
    - **Daily Target Thresholds** which define *Normal*, *Warning*, and *Critical* performance as percentages of the compliance target
    - **Treat Errors as Critical**, an option helpful for applications where apparently normal performance thresholds tend to conceal errors
- **Compliance Target Settings** also specify how you want your XLM reports structured in terms of time, through
    - the **Start Date**—the date you want the compliance calculation to begin
    - the **Compliance Period**, which
        - you can think of as the *reporting period*
        - can be weekly or monthly; choose one or the other according to your SLA requirements
    - the **Time Zone** of your choice
- **Exclusion Periods help you account for performance deviations caused by upgrades, maintenance, or usage patterns associated with weekends or holidays.**

Here is how our e-retailer example might look:

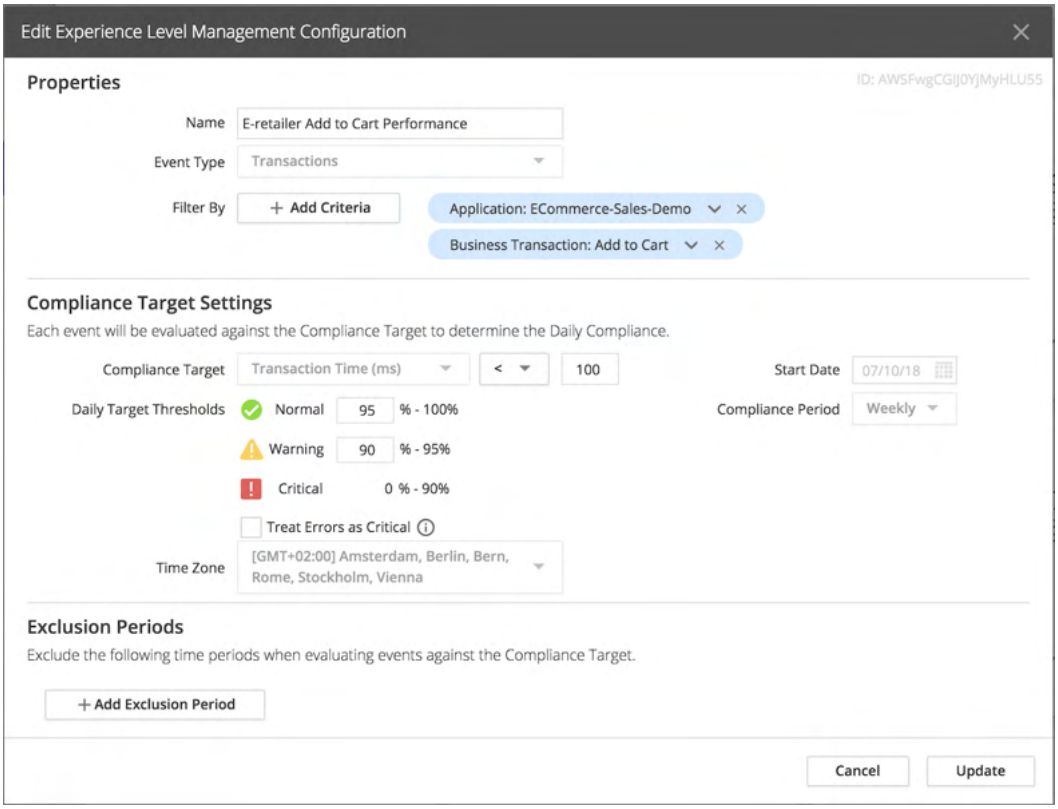
- The properties have *Transactions* as the event type, filtered to exclude all but an *Add to Cart* business transaction, for the relevant application
- The compliance target is *Response Time (ms)*, set to 100
- Values for daily target thresholds are 95% to 100% for *Normal*, 90% to 95% for *Warning*, and 0% to 90% for *Critical*
- The compliance period is *Weekly*
- The time zone is *GMT+02:00* for Amsterdam, where our hypothetical e-retailer has customers

Configured this way, XLM reports that performance is *Normal* for each week-long reporting period when the Add to Cart business transaction completes within 100 milliseconds greater than 95% of the time.

For periods when Add to Cart performance meets the target 95% of the time or less, but above 90% of the time, performance is at *Warning* level.

For periods when performance meets the target 90% of the time or less, performance is *Critical*.

This example configuration is illustrated below.



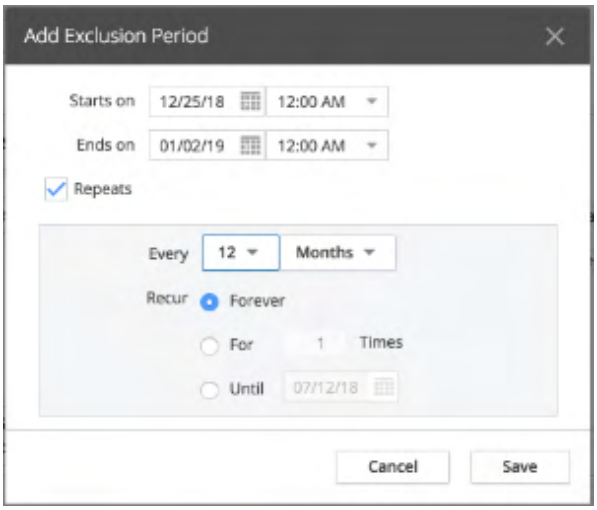
XLM Exclusion Periods

Exclusion periods are time periods which you want to exclude from an XLM report.

For example, scheduled upgrades and maintenance can disrupt performance, so you may not want those periods reflected in XLM reports. Likewise, you may want XLM reports to exclude weekends, holidays, or other times with atypical usage patterns.

XLM queries executed against your Analytics event data observe only the exclusion periods you explicitly configure in the XLM UI. You configure exclusion periods using the time zone of your choice. Under the hood, AppDynamics keeps track of the exclusion period in the corresponding GMT dates.

> XLM does not recognize exclusion and maintenance periods that you configure at the Controller level.

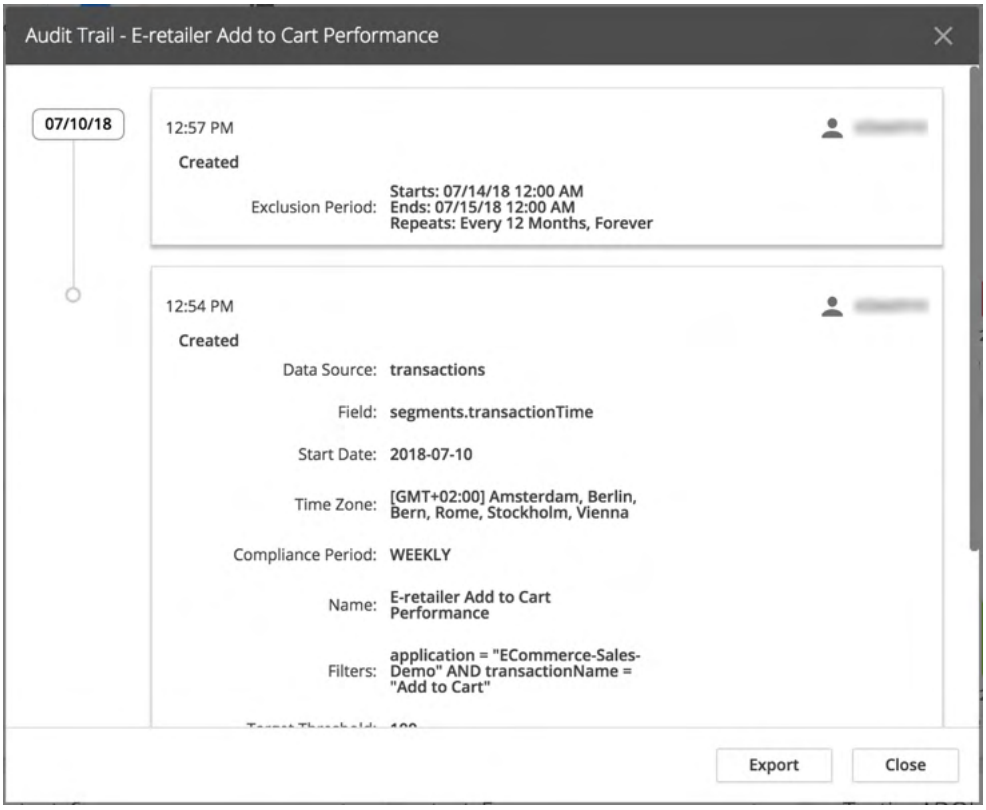


XLM Auditing

All changes to XLM configurations produce an immutable audit record called an XLM Audit Trail, which contains complete XLM configuration information. Since XLM audit reporting is separate from all other reporting in the AppDynamics Controller UI, the XLM Audit Trail is distinct from other available reports, such as the Controller Audit Report. You can export the XLM Audit Trail to a CSV file.

Each XLM configuration is limited to 1000 updates. If that limit is reached, the oldest audit records are dropped as new ones are added.

The XLM audit records contain information about what operations are performed and what fields are changed. The UI presents XLM audit records as a sequential timeline.



Configure Experience Level Management

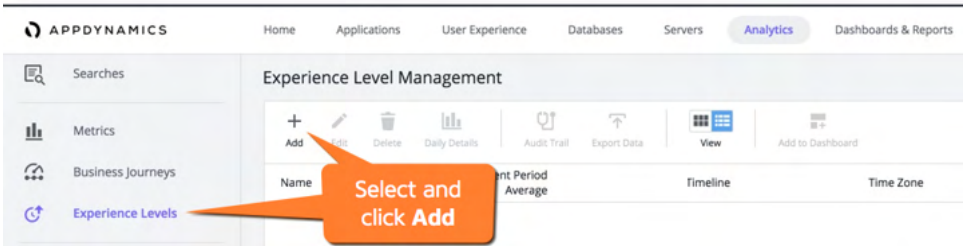
Related pages:

- View and Export XLM Compliance Data
- Migrate XLM Configurations Between Environments

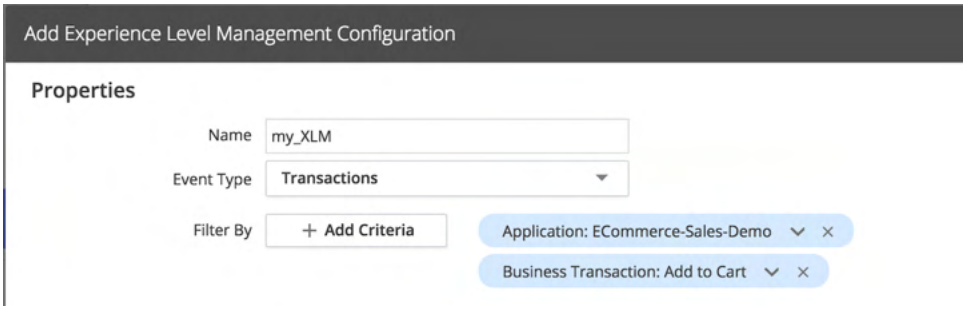
To configure Experience Level Management (XLM), you specify **Properties**, **Compliance Target Settings**, and optional **Exclusion Periods** as described earlier.

Configure an XLM report

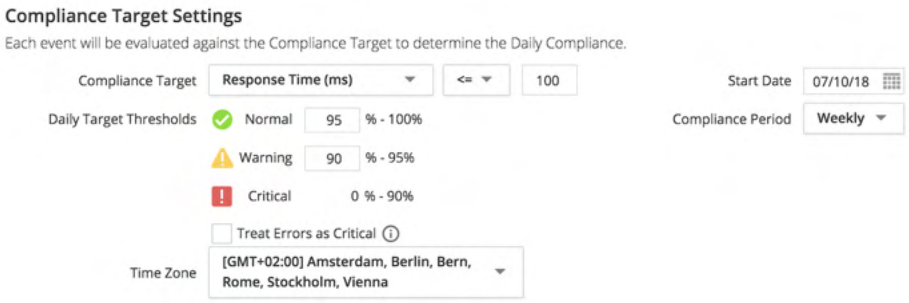
1. From the Controller UI, choose **Analytics > Experience Levels** and click **Add.**



2. In the **Properties** section, name your XLM report uniquely. Select the event type and any filters necessary for isolating the data that you want to evaluate.

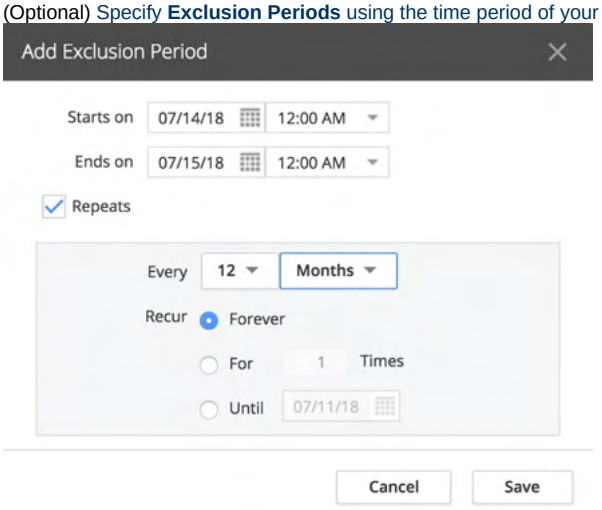


3. Select the desired field, target value, and daily target thresholds. Choose a time zone, report start date, and reporting period. Past dates are not allowed.



4. (Optional) Select **Treat Errors as Critical Failures.**

5. (Optional) Specify **Exclusion Periods** using the time period of your choice to denote periods during which data should be not collected.



6. Save the configuration. Data is collected and compliance is calculated in an automatic job that runs twice per day.

Treat Errors as Critical Failures

You can choose to treat events with errors as critical failures.

This enables you to identify instances where an event meets the compliance target but has a user experience status of Error.

For example, if you have defined Response Time of under 2000 milliseconds as the compliance target, an event with a response time of 100 milliseconds meets the compliance target, even if that event finished prematurely because of an error. In that case, XLM reporting that performance as Normal could be considered a false positive.

When you enable **Treat Errors as Critical Failures**, XLM will catch instances like this. Whether this option is optimal for your application is a subjective judgment for you to make.

Treat Errors as Critical Failures is only supported for event types that contain a user experience or similar field, as shown in the table below.

Event Type	Experience Field
Transaction Event	`userExperience`
Browser Record	`pageexperience`
Mobile Snapshot (Network Request)	`networkrequestexperience`
Browser Session	`pageexperience`
Mobile Session	`networkrequest.networkrequestexperience`

View and Export XLM Compliance Data

Related pages:

- Configure Experience Level Management
- Migrate XLM Configurations Between Environments

In the AppDynamics Controller UI, click **Analytics > Experience Level Management** to view or export XLM data.

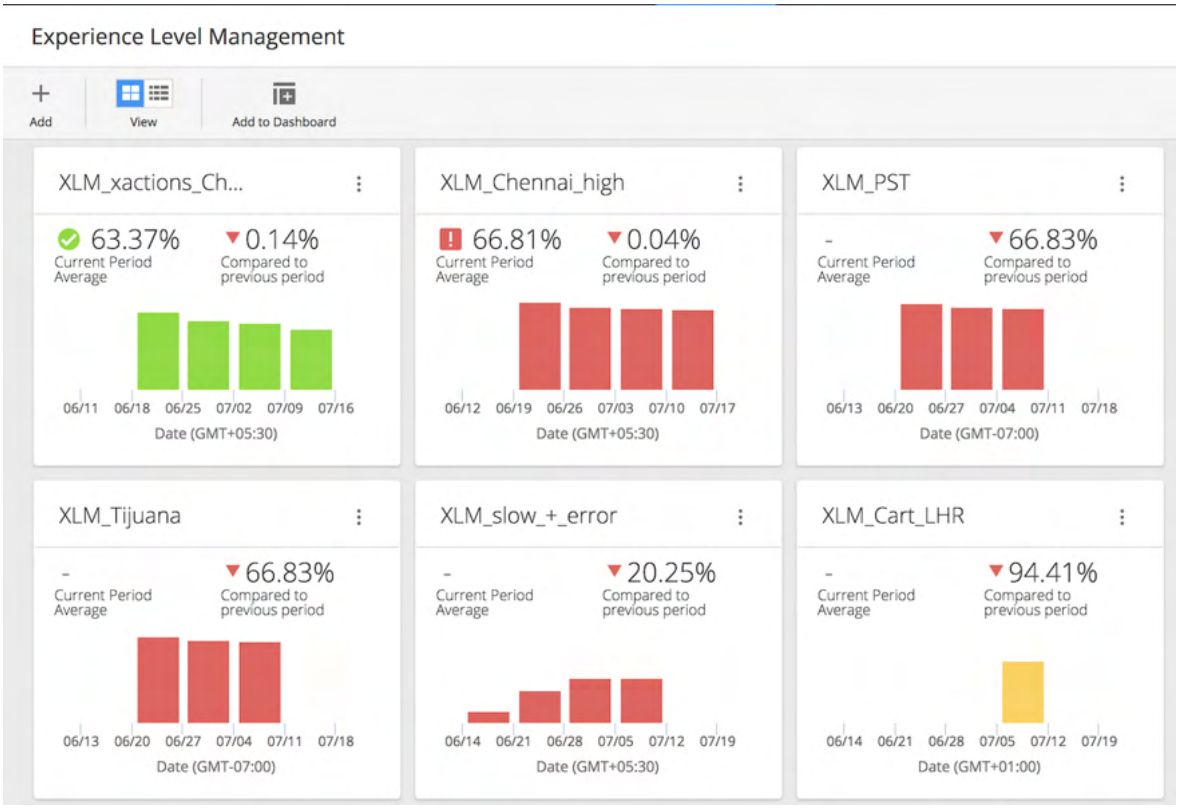
View XLM Data

You can view the last five reporting periods for your XLM data in a card or list view. To access data for earlier reporting periods, export the data as described below.

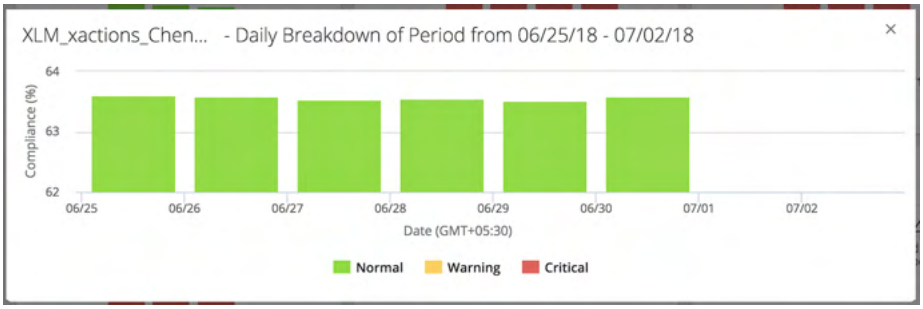
Timelines show dates in your local timezone and indicate how local time relates to Greenwich Mean Time. For example, if your local timezone is Pacific Standard Time, **Date (GMT-7:00)** appears beneath timelines.

Both views enable you to drill down from multiple reporting periods, to days, to individual events.

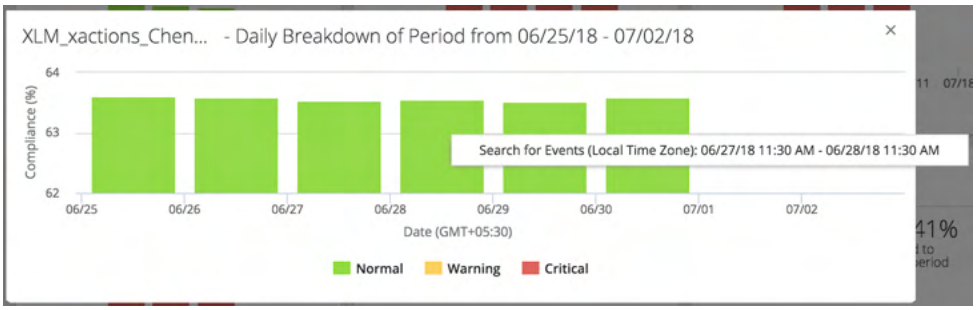
Card View



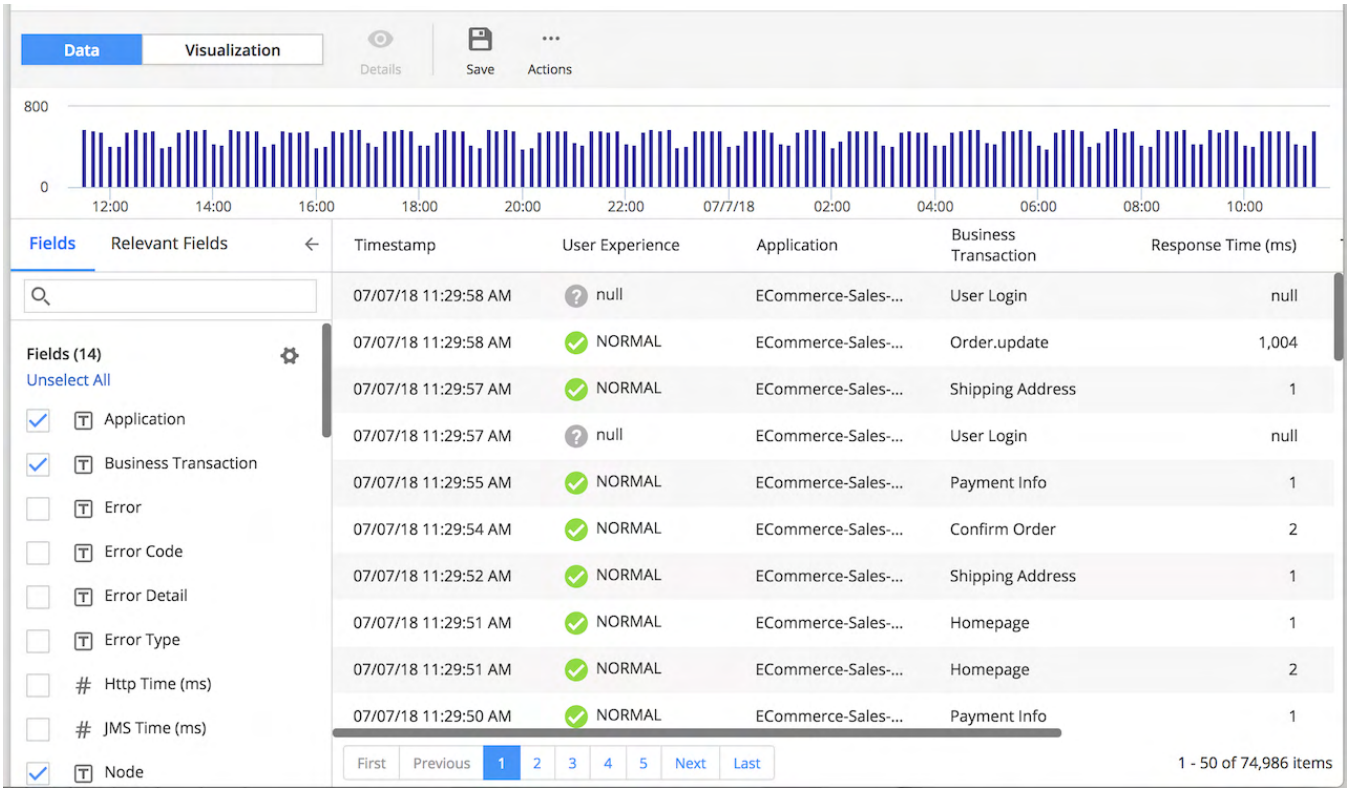
Click any reporting period for a daily breakdown.



Right-click any day to view associated events.



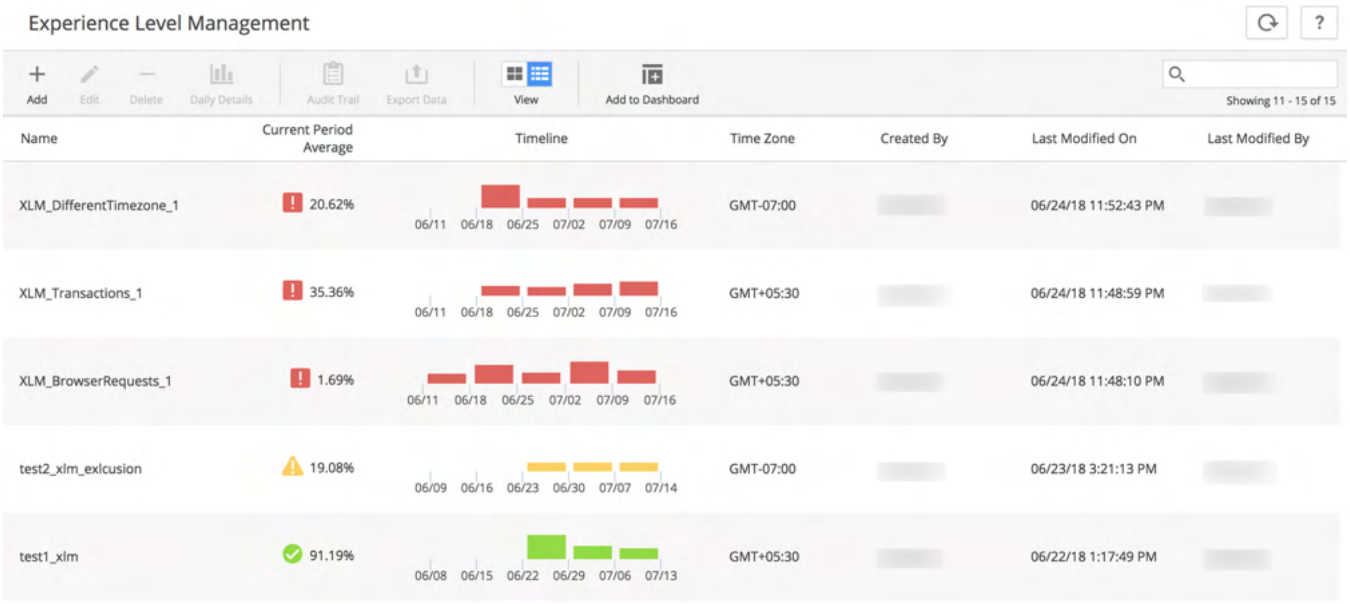
This brings you to an **Analytics > Searches** page where you can inspect the entire day's events.



List View

As in the card view, you can:

- Click any reporting period for a daily breakdown
- Right-click any day to view associated events

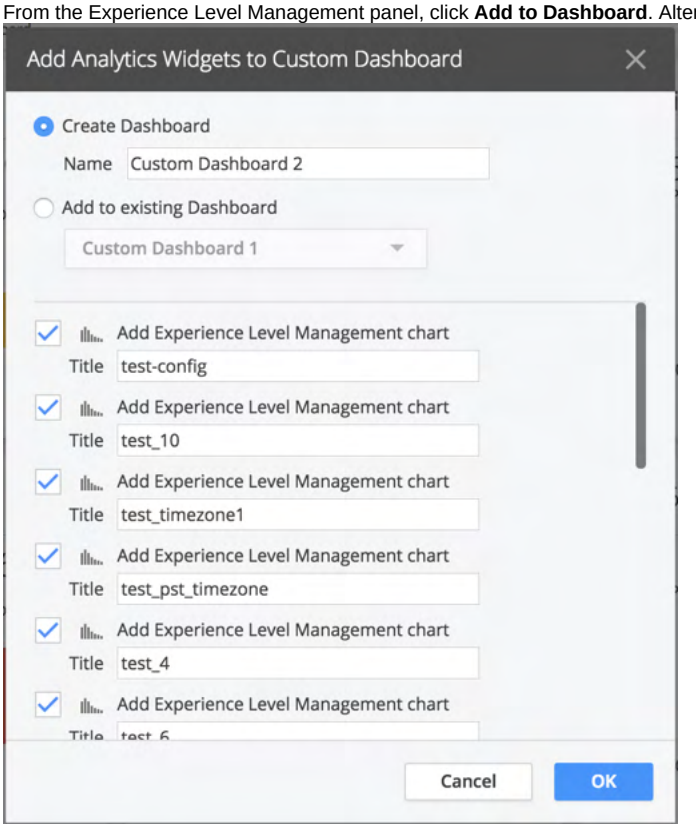


Add XLM Reports to Custom Dashboards

You can add XLM reports as read-only widgets to your custom dashboards:

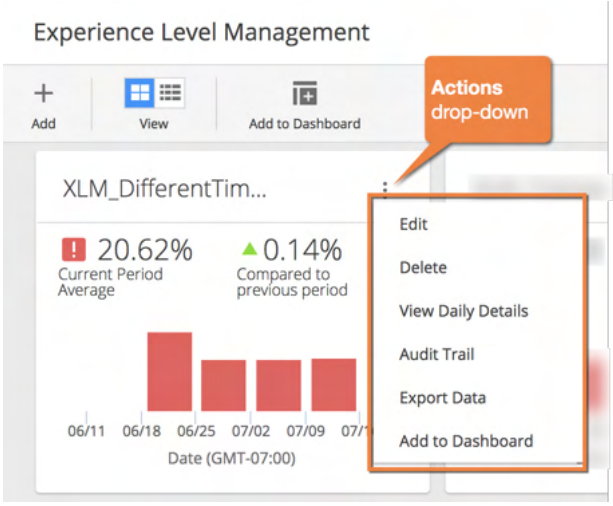
- One at a time, from the Actions drop-down, or
- One or more at once, from **Add to Dashboard** in the Experience Level Management panel

From the Experience Level Management panel, click **Add to Dashboard**. Alternatively, click the **Actions** dropdown on an individual XLM report.



Export XLM Data

You can export XLM data using the **Actions** dropdown, which also offers additional views and actions.



You can export as many reporting periods as you wish. The export format is CSV.

> The XLM export file shows the latest configuration along with compliance data.

Migrate XLM Configurations Between Environments

Related pages:

- Configure Experience Level Management
- View and Export XLM Compliance Data

You can migrate XLM configurations from one environment to another. For example, you might first deploy a configuration to a staging or test environment and later migrate it to production.

To migrate an XLM configuration, make two API calls:

1. Export XLM configuration(s) from one environment.

   `GET /controller/analytics/xlm/configuration`

   Optionally, supply a configuration ID, or a comma-delimited list of configuration IDs, as a query parameter.

   If this parameter is omitted, the API returns a bulk export of all XLM configurations.

2. Import a single XLM configuration into another environment.

   `POST /controller/analytics/xlm/configuration`

Troubleshoot Analytics Issues

Related pages:

- Agent Log Files
- Analytics Agent Logging
- .NET Agent on Windows Logging

This page provides general troubleshooting techniques for deployment issues and workarounds for certain scenarios in Application Analytics.

General Troubleshooting Issues

If you encounter problems with your Analytics deployment, check the logs for errors and warnings.

These logs are useful to:

- Determine if the Analytics Dynamic Service is enabled or disabled.
- Determine if the Analytics Dynamic Service encounters errors sending messages to the Analytics Agent. For example, when the Analytics Dynamic Service is not able to communicate with the Analytics Agent due to invalid connection configuration.
- Determine if messages are being dropped by the Analytics Dynamic Service because its internal buffers are full.
- View the configurations used on startup.

The following components write log information.

- Analytics Agent: The Analytics Agent writes log messages to files in the `<analytics_agent_home>/logs` directory.
- Events Service: The Events Service writes log messages to files in the `<events_service_home>/logs` directory. The `analytics-api-store.log` file can help with troubleshooting.
- Java Agent: The Analytics Dynamic Service is built into the Java Agent and writes logs to the same file as the app agent. The logs are in the `<application_home>/<app_agent_home>/logs` directory.
    - The primary log file to use for troubleshooting is the file named `agent.<timestamp>.log`. Search the file for messages written by the Analytics Dynamic Service.
- .NET Agent: The .NET Agent writes log messages to files in the `%ProgramData%\AppDynamics\DotNetAgent\Logs` directory. By default, the .NET Agent writes Analytics logs from the `com.appdynamics.ee.service.analytics.Analytics` logger to determine if the Analytics Dynamic Service is enabled/disabled and to view the configuration on startup. Errors are logged in the `warnfile`.
    - The `com.appdynamics.CONFIG.AnalyticsDynamicServiceConfigListener` logger gathers Analytics Dynamic Service configuration details from the Controller. Ensure that the `eventServiceURL` comes from the Controller.
    - The `com.appdynamics.analytics.EventsServiceSink` logger provides information about the communication between the .NET Agent and the Events Service.

  For additional logger information, see .NET Agent on Windows Logging.

Configuration Issues

Verify that your configuration settings are properly configured with the required account name and key. Slashes in account names and key values must be escaped.

Windows Commands

On Windows, you cannot delete a log file with the `del` command when the Analytics Agent is collecting log data from the file.

Do not use robocopy commands to move files on Windows. AppDynamics recommends that you use the move command instead.

Starting the Analytics Agent Issues

If you are running the Analytics Agent as an extension to the Machine Agent with JRE 1.8.0_171 or later, starting the Analytics Agent with encrypted credentials will fail. Workarounds include:

- Disable encryption in the Machine Agent
- Use a standalone Analytics Agent with encryption
- Use JRE 1.8.0_162 to run the Machine Agent with encryption

PID File

If an instance of the Analytics Agent terminates and leaves behind a process ID file (PID file), the next agent startup will fail with the following error:

```
java.lang.RuntimeException: Unable to create file [D:\AppDynamics\analytics-agent\analytics-agent.id] to store the process id because it already exists. Please stop any currently running process and delete the process id file
```

In agent versions prior to 4.3, you needed to delete the old process id file and restart the agent to work around this issue.

For versions 4.3 and later, you can use the `-f` flag option while starting the agent. This option causes a pre-existing process id file to be deleted. The flag is not required when you are starting the agent as a Windows service.

Use the `-f` flag as follows:

- UNIX type OS: `start -f`
- Windows CLI: `start -f`

> The `-f` flag option only works for the standalone Analytics Agent. This option does not work for the Analytics Agent embedded in the Machine Agent. In versions 20.6 and later of the Machine Agent, the bundled Analytics Agent no longer drops a PID file.
>
> For the Analytics Agent running inside the Machine Agent (embedded mode), upgrade the Machine Agent to 20.6. You no longer need to delete PID files from previous runs where the agent crashed.

High CPU Usage in Transaction Analytics without Analytics Agent (Agentless Analytics)

Reaching the Transaction Analytics license limit may cause high CPU usage in older Java Agents. AppDynamics recommends that you upgrade to the Java Agent version 20.3 and later. Look out for high CPU and memory usage in the .NET Agent.

Analytics Data Issues

Clock Management

AppDynamics recommends maintaining clock-time consistency throughout your monitored environment. If Analytics metrics are consistently reporting zero, confirm that clocks are synchronized across the application, Controller, and Events Service nodes.

Timestamps

There are potentially four time zones involved with Log Analytics:

1. The timestamp and time zone from the log file.
2. The event timestamp and pickup timestamp time zones can be different from those in the log for a number of reasons:
    a. When the time zone is overridden.
    b. The time zone is not provided correctly in the log.
    c. The timestamp and time zone parsing goes awry.
    d. When no time zone is specified in the log timestamp, then local time is assumed.
3. The Events Service time zone and the Events Service stores all timestamps in UTC time.
4. The browser used to view the Analytics data in the Controller UI (such as the **Event Timestamp** column in the UI search results or the **Time Picker** widget) converts all timestamps to the browser's local time.

Environment Variables

If you are not seeing or only seeing partial Analytics data in the Controller, configure the following environment variables.

Environment Variable	Description
`appdynamics.analytics.agent.send.attempt.max`	The maximum number of times that the Dynamic Service running in the APM Agent will try sending the Analytics data after a communication failure.
`appdynamics.analytics.agent.send.attempt.pauseMillis`	The wait time between attempts to send Analytics data to the Analytics Agent after a communication failure.
`appdynamics.analytics.numOfSinkWriterTasks`	The number of sinks used by the Dynamic Service running in APM Agent to send data to Analytics Agent. The default number is 2 and can be increased as needed.

Log Analytics Missing Field Extractions Issues

If you are missing fields in your Log Analytics data that you expect to see based on your source rule configuration or using regex (including grok patterns) in your field extraction, you may encounter a performance safeguard.

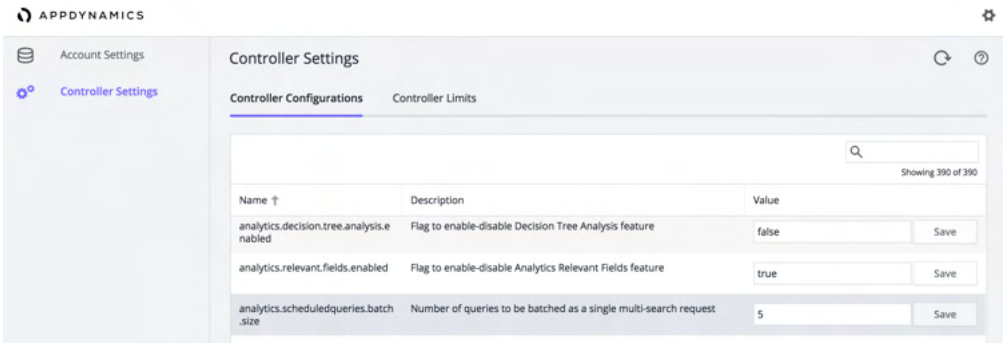
If a regex pattern takes more than five seconds to match against a log line, the attempt to extract the fields is terminated. No further processing that requires the extracted fields will occur. As a result, some fields may be missing when viewed on the Controller for that log line. In this case, the following error message appears in the Analytics Agent log:

```
[ERROR ] java.util.concurrent.TimeoutException: The current regex has spent 5 seconds attempting to match the
log line, further processing has been stopped for this log line.
```

Another reason for missing fields is if the log line doesn't contain the field to be extracted as defined in the pattern.

Custom Analytics Metrics Issues

If you are having issues with metrics created from saved searches or with the alerts performance for those metrics, try increasing the query batch size. You can increase the size using the `analytics.scheduledqueries.batch.size` Controller setting in **Controller Settings** > **Controller Configurations**. The default value for this setting is 5.



See Access the Administration Console for information about accessing the setting.

Business Transaction Events Limits

The Analytics Dynamic Service sends messages to the Events Service where the request body is an array of event segments. A business transaction event consists of one or more segments that are related to each other by the business transaction `requestGUID`. There are ingestion limits related to messages.

- Event (segment) size: The maximum size of an individual business transaction segment collected by the Analytics Dynamic Service is .1 MB. This limit is defined by the `appdynamics.analytics.message.maxSizeBytes` Java system property. To change this value, pass it on the command line as a system property when the Java Agent starts. For example:

  ```
  '-Dappdynamics.analytics.message.maxSizeBytes=1024000'
  ```

- Events per request: The maximum number of segments per request is defined by the `appdynamics.analytics.agent.send.batch.items.max` Java system property. The default value of this property is 16. To change this value, pass it on the command line as a system property when the Java Agent is started.
- Message Size: This limit refers to the size of a single request body sent to the Events Service, which is usually an array of event segments. Publish requests for all event types are limited to 1 MB. If the limit is exceeded, you will see exceptions in agent log file and messages in Events Service logs.

Agent-Side Metrics

Analytics components in the Java Agent reports performance metrics. These metrics can be used to monitor the health of Transaction Analytics reporting in the agent/node. These metrics are under the `Agent|Analytics|<Metric Name>` path in the Metric Browser.

Metric Name	Metric Time Rollup Type	Metric Cluster Rollup Type	Metric Description
Collector Objects Count	Current	Individual	The current count of Analytics data collectors in use.
Messages Sent	Sum	Collective	The number of messages sent.
Messages Dropped Since Input Queue Full	Sum	Collective	The number of dropped messages due to the input queue being full.
Messages Dropped Since Size Exceeded	Sum	Collective	The number of dropped messages due to message size exceeding limit.
Message Send Errors	Sum	Collective	The number of transient and permanent errors in event registration or publish.
Message Latency (ms)	Average	Individual	Latency calculated in milliseconds.
Pending Messages In Queue	Current	Individual	Messages pending in the buffer.
Sink Writers Count	Current	Individual	Number of active sink writer threads.

Firewall Considerations

Transaction Analytics without an Analytics Agent requires a connection between the Java/.NET Agent and the Events Service. If you have a firewall that blocks requests from the Java/.NET Agent to the SaaS or on-premises Events Service, you need to open the firewall to avoid gaps in Analytics data. See Connection Ports and Agent-to-Controller Connections.

For SaaS-based installations, configure the Analytics endpoint by modifying the `http.event.endpoint` setting in the `\conf\analytics-agent.properties` file (as described in Install Agent-Side Components). For example, `http.event.endpoint=http://analytics.api.appdynamics.com:443`.

If your firewall rules require you to use specific IP addresses, rather than hostnames, note the following information. If you are unable to see Transaction Analytics data collected as expected (even after configuring your firewall rules) and you see repetitive Connection Reset messages in the logs similar to the following, your firewall rules may not include the correct IP addresses.

```
[2015-12-18T16:08:39,907-06:00] [INFO ] [AD Thread Pool-Global0] [o.a.http.impl.execchain.RetryExec] I/O
exception (java.net.SocketException) caught when processing request to {s}->https://analytics.api.appdynamics.
com:443: Connection reset
```

Your firewall rules may not include the correct IP addresses.

In SaaS environments, `analytics.api.appdynamics.com`, `fra-ana-api.saas.appdynamics.com`, and `syd-ana-api.saas.appdynamics.com` are round-robin DNS aliases and may resolve to multiple DNS (54. vs 52.) in the following examples.

```
Name: analytics.api.appdynamics.
com
Address: 54.213.173.141
Name: analytics.api.appdynamics.
com
Address: 52.88.111.157
```

```
Name: fra-p-con-2.saas.
appdynamics.com
Address: 52.28.42.67
Name: fra-p-con-2.saas.
appdynamics.com
Address: 52.57.96.225
```

```
Name: syd-p-con-1.saas.
appdynamics.com
Address: 54.153.248.179
Name: syd-p-con-1.saas.
appdynamics.com
Address: 54.153.246.219
```

Amazon Web Services (AWS) controls the IPs used, so they may change from time to time. AWS publishes its current IP address ranges in JSON format, so if you are unable to open firewalls to hostnames, you can download the AWS IP address ranges. If you want to be notified whenever there is a change to the AWS IP address ranges, you can subscribe to receive notifications using Amazon SNS.

See Analytics IP Ranges for the AWS regions for the SaaS Analytics environments. You can view the AWS IP Ranges for each listed region.

Monitoring Analytics Agent Health

This describes monitoring the health of the Analytics Agent.

Check-Health Command Usage

Argument	Description
`-hp (--host-and-port) STRING[]`	Optional. Application host name or IP:HTTP admin port (Multiple values separated by space).
`-p (--properties) TYPE_PATH`	Optional. Path to the properties file (Multiple values separated by space).
`-v (--verbose) TYPE_BOOLEAN`	Optional. Verbose output.

The check-health command returns the status of the Analytics Agent. You can specify the agent to check using a properties file or IP address and port.

For example, using a properties file.

```
./bin/analytics-agent.sh check-health --properties conf/analytics-agent.properties
```

You can also use the -hp argument and pass the host IP address and the port number for the Analytics Agent.

For example, the default Analytics Agent port for the health check is 9091.

```
bin/analytics-agent.sh check-health -hp <ip-address>:9091
```

AppDynamics Application Performance Monitoring Platform

This page provides information on installing, configuring, and administering an on-premises AppDynamics Application Performance Monitoring (APM) Platform deployment.

Installation Overview

Before you install the platform, review the requirements for the components you plan to install and prepare the host machines. The requirements vary based on the components you deploy and the size of your deployment.

For the Controller and Events Service, you first need to install the AppDynamics Enterprise Console. You then use the application to deploy the Controller and Events Service. Note that the Events Service can be deployed as a single node or a cluster. The Enterprise Console is not only the installer for the Controller and Events Service; it can manage the entire lifecycle of new or existing AppDynamics Platforms and components.

You cannot use the Enterprise Console to perform the End User Monitoring (EUM) Server installation. Instead, you must use a package installer that supports interactive GUI or console modes, or a silent response file installation.

Follow these tasks before you start the installation process for the AppDynamics APM Platform:

- Review the Platform Requirements.
- Verify the Enterprise Console host meets the requirements to host the application and the Controller since they share the same host by default for Express Install. You do have the option to install the Enterprise Console on a different host than the Controller's using Custom Install.
- On Linux, verify that you have assigned execute permissions to the installation script with the following command:

```
chmod 775 platform-setup-64bit-linux.sh
```

You can get the software for installing the platform components from the AppDynamics download site. See Download AppDynamics Software

Platform Components and Tools

An on-premises AppDynamics Platform installation consists of several, separately installed and configured components. These include the Controller, MySQL database, Events Service, and optionally the EUM Server.

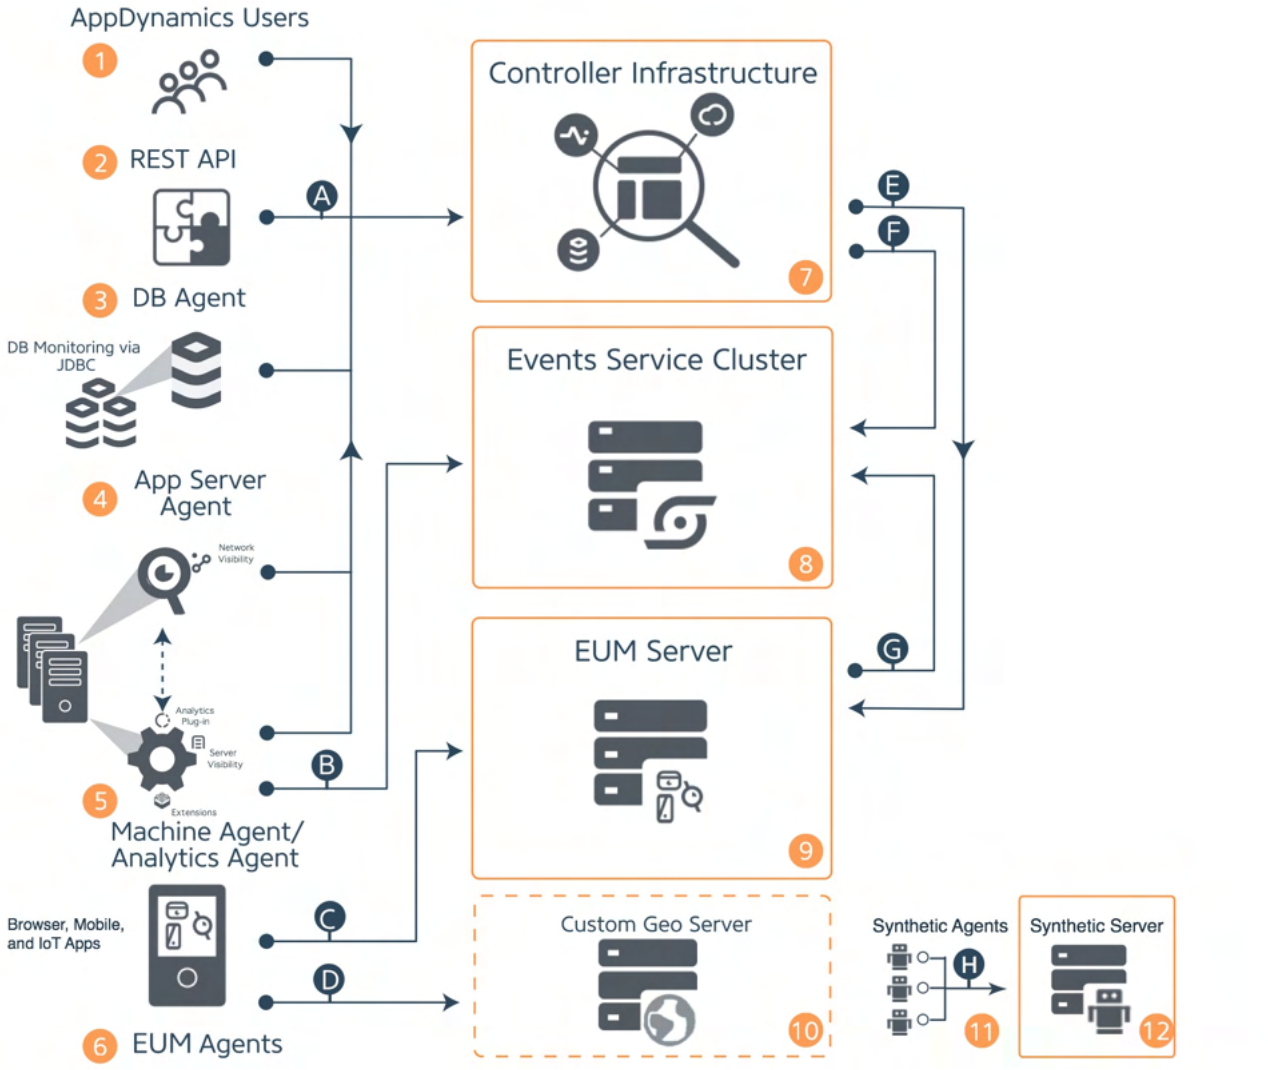
The AppDynamics Enterprise Console is a GUI and command-line based application that can manage the installation, configuration, and administration of the Controller and Events Service.

For the EUM Server, you must continue to use the package installer to deploy the EUM Cloud. See EUM Server Deployment

After you install the platform, you can configure and manage different components with component-specific scripts. Based on how you deploy the platform, you might use a combination of the Enterprise Console and package installers to install and manage the various components of the platform.

On-Premises Deployment Architecture

The following diagram depicts the components of a complete on-premises AppDynamics APM Platform deployment. It shows how the components interact to fulfill application, database, infrastructure, end-user monitoring, and more.



Depending on the scale of your deployment, your requirements, and the products you are using, your own deployment is likely to consist of a subset of the components shown in the diagram.

You can find a more detailed diagram, as well as a SaaS architecture diagram on PDFs. For a diagram of the Enterprise Console, see the Enterprise Console Platforms Architecture. For a diagram of the Synthetic Server Deployment, see the Synthetic Server Deployment Architecture.

Platform Components

The following table describes how the components work together in the AppDynamics platform.

Product Feature	Components Involved
Application Performance Management	4 App Server Agents attach to monitored applications and send data to the 7 Controller via connection A.
Server Visibility	5 Machine Agents reside on monitored servers and report data to the 7 Controller via connection A.
Application Analytics	The Analytics Dynamic Service (formerly called the Analytics plugin) on the 4 App Server agent communicates with a local 5 Analytics Agent instance. One or more Analytics Agents in a deployment send data to the 8 Events Service via connection B. The Analytics Agent is bundled with the Machine Agent but can be installed and run individually as well.

Database Visibility	The 3 Database Agent connects by JDBC to monitored databases. The agent sends data to the 7 Controller (via connection A), which uses the 8 Events Service to store certain types of data.
End-User Monitoring	For an on-premises EUM installation, you configure a connection to the web and mobile real user monitoring agents to the on-premises 9 EUM Server via connection C. The EUM Server sends data to the 8 Events Service cluster via connection G. The optional 10 Custom EUM Geo Server stores EUM Geo Resolution data taken via connection D. The optional 12 Synthetic Server receives synthetic job requests from the Controller, which are then fetched from the Synthetic Services via connection H.

Platform Connections

The following table lists and describes the traffic flow between AppDynamics platform components.

Connection	Source	Destination	Traffic	Protocol	Default Port(s)
A	1 AppDynamics users through the web GUI, 2 REST API, 3 Database Agent, 4 Application Server Agent, and 5 Machine and Analytics Agents	7 Controller	APM/Database Metrics	HTTP	8090
				HTTPS	8181
B	5 Analytics Agent	8 Events Service Cluster	Log and Transaction Analytics Event Data	HTTP	9080
C	6 Real User Monitoring (RUM) Agents	9 End-User Monitoring (EUM) Server	EUM Beacon Data	HTTP	7001
				HTTPS	7002
D	6 Real User Monitoring (RUM) Agents	10 Custom EUM Geo Server	EUM Geo Resolution Mapping Data	HTTP	80
				HTTPS	443
E	7 Controller	9 EUM Server	EUM Metric Data	HTTP	7001
				HTTPS	7002 (demo mode only)
F	7 Controller	8 Events Service Cluster	Events Service API Store	HTTP(S)	9080
			Events Service API Store Admin	HTTP(S)	9081
G	9 EUM Server	8 Events Service Cluster	Events Service API Store (EUM Event Data)	HTTP(S)	9080
			Events Service API Store Admin (EUM Event Data)	HTTP(S)	9081
H	11 Synthetic Agents	12 Synthetic Server	Synthetic Measurement Data	HTTP	10101
				HTTPS	10102

The default port 9081 is the Admin port (HTTP).

Data Storage Location

Data is stored in the following locations:

- APM configuration and metric data in the on-premises Controller MySQL database
- EUM event data in the Events Service
- Transaction and log analytics data in the Events Service
- EUM Geo Resolution data in the on-premises GeoServer
- EUM Synthetic data in the on-premises Synthetic Server

Installation and Upgrade Overview

The installation and upgrade process for the AppDynamics platform consists of pre-installation steps to prepare your network and host machines for installation, installation tasks, and post-install steps to complete the required configuration. See Planning Your Deployment

After this process, you can perform optional configurations and administrative tasks described in Secure the Platform.

To start the installation or upgrade process, see Platform Requirements for information about requirements and pre-installation tasks.

Planning Your Deployment

This section provides an overview of how to plan your on-premises deployment.

Related pages:

- Platform Requirements
- Controller System Requirements
- EUM Server Requirements
- Events Service Requirements

Before You Begin

Before you upgrade or install the platform, perform the following tasks:

- Choose your appropriate Enterprise Console install or upgrade path.
- Review the requirements for the components you plan to install and prepare the host machines. The requirements vary based on the components you deploy and the size of your deployment.
- Download the Enterprise Console and start your platform installation.
- Verify that a user account with write permissions for the installation directory you want to use exists. Install all components with the same user or a user with equivalent permissions.

You can refer to the child pages for the platform requirements and deployment guides.

Irrespective of the server's computing power, installing more than one controller on the same server is not supported.

Choose How You Want to Install

The deployment option you choose to follow should be based on the components of the AppDynamics platform that you want to deploy. Deployment options that include the Controller and Events Service installations require the Enterprise Console, while the EUM Server installation requires the use of package installers.

Based on your AppDynamics deployment, you may use the Enterprise Console for the following tasks:

- Install a Controller and an embedded Events Service.
- Install an HA pair and scaled-out Events Service.
- Install or upgrade the Events Service on Linux.
- Install or upgrade an Events Service on Windows that runs on a single host.
- Discover and manage a Controller and Events Service.
- Upgrade a Controller or HA pair and preserve customizations after the upgrade.
- Upgrade MySQL to the latest supported version.

The following tasks cannot be performed using the Enterprise Console, and therefore, must be performed manually:

- Install or upgrade an HA pair on Windows.
- Install or upgrade an Events Service on Windows that runs on multiple hosts as a cluster.
- Install the EUM Server.
- Install the Synthetic Server.

Installation and Upgrade Quick Starts

Based on how you deploy and what components of the AppDynamics you deploy, there are different installation and upgrade steps to follow.

New Installations Quick Start

This installation path describes the use of the Enterprise Console to install the Controller and Events Service. The EUM Server must be installed separately as it cannot be installed using the Enterprise Console.

1. Install the Enterprise Console.
2. Use the Enterprise Console to create the platform and add hosts.
3. Install the Controller and Events Service on the same host by using Express Install. Use Custom Install to install a scaled-out Events Service that runs on a host that is separate from the Controller. Custom installations give more flexibility on where and how to install Controller and Events Service.
4. Install the EUM Server.
5. Complete the post-install tasks for the Controller, Events Service, and EUM Server.

For a more detailed description of this path, see Platform Installation Quick Start.

Upgrade Quick Start

This is the upgrade path to follow using the Enterprise Console and EUM package installer:

1. Install the Enterprise Console.
2. Discover and upgrade an existing Events Service with the Enterprise Console.
3. Upgrade the Production EUM Server with the package installer.

For a more detailed description of this path, see Discovery and Upgrade Quick Start.

Platform Component Compatibility

For versions 4.5.x+, to ensure that the platform components work properly, be sure you install compatible component versions based on the following guideline:

Platform Version	Platform Component Version Compatibility	Example of Compatible Versions
4.5.0–4.5.1	Events Service version >= EUM Server version >= Controller version	• Events Service 4.5.1 • EUM Server 4.5.0 • Controller 4.5.0
4.5.2+	EUM Server version >= Controller version (Events Service 4.5.2+ is backward compatible with the other platform components.)	• EUM Server 4.5.3 • Controller 4.5.2

The Synthetic Server 4.5.x+ versions are compatible with any of the other component versions 4.5.0+ and the Synthetic Private Agent 4.5.4+.

To get the versions of the Events Service, Controller, and Events Service, see Getting Platform Versions. For the EUM Server and Synthetic Server, use the following endpoints:

- `http(s)://<on-prem-eum-server_domain-name>:7001/eumcollector/get-version`
- `http(s)://<on-prem-synthetic-server_domain-name>:10101/version`

Download the Software

To use the Enterprise Console to install the AppDynamics Platform, you need to download the Enterprise Console installer and, if needed, the EUM Server package installer.

For more information on downloading the software, see Download AppDynamics Software.

Platform Requirements

The requirements for different components in the AppDynamics platform are based on the performance profile you select. This page describes the different performance profiles and how to determine the profile size you need.

CPU and Memory Space Requirements

When the Enterprise Console host is shared with the Controller host, it should have enough space to match the Controller host requirements, since there is no need for additional memory for the Enterprise Console.

However, when the Enterprise Console host is not shared with the Controller host, then it requires additional memory and disk space.

See Enterprise Console Requirements and Prepare the Controller Host for additional space requirements.

Network Considerations

Your network or the host machine may have built-in firewall rules that you will need to adjust to accommodate the AppDynamics on-premises platform. Specifically, you may need to permit network traffic on the ports used in the system. For more information, see Port Settings.

For expected bandwidth consumption for the agents, see the requirements documentation for app agents, see Install App Server Agents.

System User Account

You need to install all platform components with a single user account or accounts that have equivalent permissions on the operating system. The user needs to have write permissions for the installation directory.

Operating System Support

These operating systems support the AppDynamics platform:

Linux (64 bit)	Microsoft Windows (64 bit)
• RHEL 7.x and 8.x • CentOS 7 and 8.x • Ubuntu 14, 16, 18.x, and 20.x • openSUSE Leap 12 and 15 • Amazon Linux 1 and 2	• Windows Server 2012 and 2012 R2 • Windows Server 2016 • Windows Server 2019

You can use the following file systems for machines that run Linux:

- ZFS
- EXT4
- XFS

On-premises controller deployments on Linux are only supported on x86-64.

Internationalization Support

The Controller and App Agents provide full internationalization support, with support for double- and triple-byte characters. This support provides the following abilities:

- Controller UI users can enter double- or triple-byte characters into text fields in the UI.
- The Controller can accept data that contains double- or triple-byte characters from instrumented applications.

Network Bandwidth Requirements

See Administer App Server Agents for information on bandwidth usage in an AppDynamics deployment.

More Information

For requirements that are specific to product components, see the following pages:

- Controller System Requirements
- EUM Server Requirements

Port Settings

When deploying AppDynamics, you may need to open ports in a network firewall or configure a load balancer to enable communication between the Controller and the rest of the AppDynamics platform.

For SaaS, you only need to adjust your infrastructure to accommodate the HTTPS port provided to you by AppDynamics. For an on-premises deployment, however, you may need to make additional adjustments based on the information here.

Platform Component Ports

The following ports are open in a platform deployment. The "external" column indicates whether connections to the port occur entirely within the Controller host or from outside the host, and therefore may require firewall or load balancer configuration changes.

Port Name	Default	External?
Enterprise Console port	9191	Yes. The application uses port 9191 for all traffic.
SSH port	22	The port needs to be open between the Enterprise Console and the remote hosts it manages. This is for Unix only and is not configurable. If you have a requirement to configure the port, contact AppDynamics support.
Database server port	3388	No
Default database port	3377	No
Application server admin port	4848	No
Application server JMS port	7676	No
Application server IIOP port	3700	No
Application server primary port (HTTP)	8090	Yes
Application server SSL port (HTTPS)	8181	Yes
Events Service REST API port	9080	If the Events Service and Controller are on different hosts, you need to configure the port in the firewall or load balancer.
Events Service REST API admin port	9081	If the Events Service and Controller are on different hosts, you need to configure the port in the firewall or load balancer.
Reporting service HTTP port	8020	No
Reporting service HTTPs port	8021	No
EUM server port (HTTP)	7001	If EUM and the Controller are on different hosts, you need to configure the port in the firewall or load balancer.
EUM server SSL port (HTTPS)	7002	If EUM and the Controller are on different hosts, you need to configure the port in the firewall or load balancer.

At installation time, you can enter different ports manually. After installation, you can change the port settings by either reinstalling the Controller or by editing the port configuration as defined on the **Enterprise Console Configurations** page or in the underlying GlassFish application server, as described in the following sections.

Editing Controller Port Configurations

You can modify connection settings through the Enterprise Console UI. The Enterprise Console will automatically update all occurrences in the controller for you. You do not need to manually update all the files and manage the sequence to restart services. See Update Platform Configurations.

You can also edit the ports manually by editing configuration files used by the application server for the Controller domain. Updating the ports manually, however, will cause the Enterprise Console to have no visibility into the updates and cause health-check errors.

The following sections list the settings you need to modify to change a port.

Change the Primary Server Listening Port

1. In `domain.xml`, change the port number as it appears in these locations:
    - The value of the `network-listener` element with the attribute id="`http-listener-1`" for the primary listening port, or `http-listener-2` for the secure listening port to the new port setting.
    - The JVM argument values for the Controller HTTP port and Controller services port under the config element named `server-config`.
2. For each deployed agent, navigate to proxy/conf in the agent home directory and change the `controller-port` value in `controller-info.xml`.

Change the Database Port

1. In `domain.xml`, change the database listening port where it appears under the `jdbc-connection-pool` element named `controller_mysql_pool`. It appears as the value of the property named `portNumbe`.
2. Edit the file `appserver/glassfish/domains/domain1/imq/instances/imqbroker/props/config.properties` to change the "`imq.persist.jdbc.mysql.property.url`" variable so that it includes the new port number. This variable is the JDBC connection string.
3. In `db/db.cnf`, set the "`port=`" variable to your new port setting.
4. In `bin/controller.bat (.sh)`, change the "`DB_PORT`" variable to your new port setting.

Change the Glassfish Admin Listening Port

1. In `domain.xml`, change the port attribute value of the `http-listener` element to the new port. This is the element with an id attribute value of "`admin-listener`".
2. Also in the Controller home directory, change the `adminPort` value in `.install4j/response.varfile`. This ensures that the new port number is not overwritten in a future Controller upgrade.

Change the JMS Port

1. In `domain.xml`, change the port attribute value for the `jms-host` element with the name attribute of `default_JMS_host`.
2. Change the `jmsPort` value in `.install4j/response.varfile`. This ensures that the new port number is not overwritten in a future Controller upgrade.

Change the IIOP Listening Port

1. In `domain.xml`, edit the port attribute value of the `iiop-listener` element with an id attribute of `orb-listener-1`.
2. Change the `iiopPort` value in `<controller_home>/.install4j/response.varfile`. This ensures that the new port number is not overwritten in a future Controller upgrade.

Enable Appserver Health Checks for HTTPS

If you disable or lock the Controller's HTTP port, you will need to configure the Appserver health check to contact the Controller's HTTPS port instead. You can do so by completing the following steps:

1. In `domain.xml`, set the HTTP listener, `http-listener-1`, to `enabled=false`.
2. Restart the Controller.
3. Use the Enterprise Console to discover and upgrade the Controller.
   The Enterprise Console will default to the HTTPS port.

Physical Machine Controller Deployment Guide

The following pages describe considerations and instructions for deploying the Controller on physical machines.

Prepare the Controller Host

Related Pages:

- Controller System Requirements

This page describes the common configuration, tuning, and environment requirements for the machine that hosts the Controller.

These considerations apply whether the machine runs Linux or Windows or is a virtual machine. For specific considerations for your operating system type, see the related pages links.

Time Synchronization Service

A time synchronization service, such as the Network Time Protocol daemon (ntpd), should be enabled on the Controller host machine.

MySQL Conflict

Certain Linux installation types include MySQL as a bundled package. No MySQL instances other than the one included in the Controller host should run on the Controller host. Verify that no such MySQL processes are running.

Virtual Memory Space

The virtual memory size (swap space on Linux or Pagefile space on Windows) should be at least 10 GB on the target system, and ideally 20 GB.

Verify the size of virtual memory on your system and modify it if it is less than 10 GB. Refer to the documentation for your operating system for instructions on modifying the swap space or Pagefile size.

Disk Space

In addition to the minimum disk space required to install the Controller for your profile size, the Enterprise Console writes temporary files to the system temporary directory, typically /tmp on Linux or c:\tmp on Windows. The Enterprise Console requires 1024 MB of free temp space on the controller host.

On Windows, in case of an error due to not meeting the above requirement, you can set the temporary directory environment variable to a directory with sufficient space for the duration of the installation process. You can restore the setting to the original temp directory when the installation is complete.

Network Ports

Review the ports that the Controller uses to communicate with agents and the rest of the AppDynamics platform. For more information, see Port Settings.

Note that on Linux systems, port numbers below 1024 may be considered privileged ports that require root access to open. The default Controller listen ports are not configured for numbers under 1024, but if you intend to set them to a number below 1024 (such as 80 for the primary HTTP port), you need to run the Enterprise Console as the root user.

Prepare Linux for the Controller

This page describes the configuration requirements and considerations for using a Linux system as a Controller host machine.

User Account Requirements

The user account you use to perform the installation must have the following permissions:

- read, write and execute permissions on the directory where you install the Controller
- write permission on the `/etc/.java/.systemprefs` directory

If you are installing other AppDynamics Platform server components, such as the EUM Server or Application Analytics Processor, on the same machine, it is recommended that you perform the installation as the same user or a user with the same permissions on the target machine.

Virus Scanners

Configure virus scanners on the target machine to ignore the AppDynamics Enterprise Console directory and database directory (or simply the entire Controller directory). Code is never executed from the data directory, so it is generally safe to exclude this directory from virus scanning. The default location of the data directory is `<controller_home>/db/data`.

Also configure virus scanners to trust the Controller launcher, database executable, reporting service launcher, and events service (analytics processor) launchers. The launcher names are:

- Controller launcher: `AppDynamicsDomain1Service.sh`
- MySQL executable: `mysqld.sh`
- Events service launcher: `analytics-processor.sh`
- Reporting service launcher: `appdynamicsreportingservice.sh`

Anti-virus Exclusions

If you are running an antivirus program on your Linux system, it must meet one of the following conditions:

- The anti-virus program is read-only; it only detects and reports issues but never modifies files
- The anti-virus program excludes the MySQL data directory (`datadir`), which is often set to the path `db/data`.

If the program does not meet either of those conditions, it can randomly corrupt the MySQL database and hence the controller.

netstat Network Utility

Verify that your distribution of Linux includes the `netstat` network utility. If it does not, install the utility. The Controller installation uses `netstat` to determine whether MySQL processes are running.

For example, you can install the package that includes `netstat` with the following command on CentOS:

```
yum install net-tools
```

libaio Requirement

The Controller requires the `libaio` library to be on the system. This library facilitates asynchronous I/O operations on the system. Note if you have a NUMA based architecture, then you are required to install the `numactl` package.

Install `libaio` on the host machine if it does not already have it installed. The following table provides instructions on how to install `libaio` for some common flavors of Linux operating system.

Linux Flavor	Command

<table>
<tr>
<td>

- Red Hat
- CentOS
- Amazon

</td>
<td>

Use yum to install the library, such as:

- yum install libaio
- yum install numactl
- yum install tzdata
- yum install ncurses-libs-5.x

For RHEL8, CentOS8, and Amazon2, you install the ncurses-libs-5.x library using a rpm file downloaded from a trusted source:

```
sudo rpm -ivh --force ncurses-base-5.x.rpm
sudo rpm -ivh --force ncurses-libs-5.x.rpm
```

Note: The ncurses-libs depends on the ncurses-base so you should install the ncurses-base first.

Example of a trusted source for rpm download:

http://mirror.centos.org/centos/7/os/x86_64/Packages/ncurses-base-5.9-14.20130511.el7_4.noarch.rpm

http://mirror.centos.org/centos/7/os/x86_64/Packages/ncurses-libs-5.9-14.20130511.el7_4.x86_64.rpm

- To install version 6, follow these steps:

You must either create symlinks for ncurses-libs-5 which points to ncurses-libs-6, or install the ncurses-compat-libs pac kage, to provide ABI version 5 compatibility.

RHEL8 symlink:

```
sudo ln /usr/lib64/libtinfo.so.6.1 /usr/lib64/libtinfo.so.5
sudo ln /usr/lib64/libncurses.so.6.1 /usr/lib64/libncurses.so.5
```

CentOS8 symlink:

```
sudo ln /usr/lib64/libtinfo.so.6.1 /usr/lib64/libtinfo.so.5
sudo ln /usr/lib64/libncurses.so.6.1 /usr/lib64/libncurses.so.5
```

Amazon2 symlink:

```
sudo ln -s /usr/lib64/libncurses.so.6.0 /usr/lib64/libncurses.so.5
sudo ln -s /usr/lib64/libtinfo.so.6.0 /usr/lib64/libtinfo.so.5
```

RHEL8 compat-libs:

```
sudo yum install -y ncurses-compat-libs
```

CentOS8 compat-libs:

```
sudo yum install -y ncurses-compat-libs
```

Amazon2 compat-libs:

```
sudo yum install -y ncurses-compat-libs
```

</td>
</tr>
<tr>
<td>Fedora</td>
<td>

Install the library RPM from the Fedora website:

- yum install libaio
- yum install numactl
- yum install tzdata

</td>
</tr>
</table>

<table>
<tr><td>Ubuntu</td><td>Use <code>apt-get</code>, such as:
<code>sudo apt-get install libaio1</code>
<code>sudo apt-get install numactl</code>
<code>sudo apt-get install tzdata</code>
<code>sudo apt-get install libncurses5</code> For Ubuntu20 you can install <code>libncurses5</code> or <code>libncurses6</code>. If you choose <code>libncurses5</code>:<pre>sudo apt-get install libncurses5</pre>
If you choose <code>libncurses6</code>:<pre>sudo apt-get install libncurses6</pre>Note: For <code>libncurses6</code> you need to create symlink for <code>libncurses5</code> pointing to <code>libncurses6</code>.<pre>sudo ln -s /usr/lib/x86_64-linux-gnu/libncurses.so.6.2 /usr/lib/x86_64-linux-gnu/libncurses.so.5
sudo ln -s /usr/lib/x86_64-linux-gnu/libtinfo.so.6.2 /usr/lib/x86_64-linux-gnu/libtinfo.so.5</pre></td></tr>
<tr><td>Debian</td><td>Use a package manager such as APT to install the library (as described for the Ubuntu instructions above).</td></tr>
<tr><td>SLES12 and SLES15</td><td>Use <code>zypper</code> to install the library, such as:<pre>sudo zypper install libxml2-2

sudo zypper install libxml2-tools

sudo zypper install libaio1

sudo zypper install numactl

sudo zypper install libcurses5

sudo zypper install tzdata</pre></td></tr>
</table>

tzdata Requirement

Ubuntu version 16 and higher requires the `tzdata` package in order to install the Enterprise Console and Controller.

The `tzdata` package is also required by the MySQL connector.

To install `tzdata`, use `apt-get`, such as:

- `sudo apt-get install tzdata`

Configure User Limits in Linux

AppDynamics requires the following hard and soft per-user limits in Linux:

- Open file descriptor limit (`nofile`): 65535
- Process limit (`nproc`): 8192

The following log warnings may indicate insufficient limits:

- Warning in database log: "Could not increase number of max_open_files to more than xxxx".
- Warning in server log: "Cannot allocate more connections".

To check your existing settings, as the root user, enter the following commands:

```
ulimit -S -n
ulimit -S -u
```

The output indicates the soft limits for the open file descriptor and soft limits for processes, respectively. If the values are lower than recommended, you need to modify them.

Where you configure the settings depends upon your Linux distribution:

- If your system has a `/etc/security/limits.d` directory, add the settings as the content of a new, appropriately named file under the directory.
- If it does not have a `/etc/security/limits.d` directory, add the settings to `/etc/security/limits.conf`.
- If your system does not have a `/etc/security/limits.conf` file, it is possible to put the `ulimit` command in `/etc/profile`. However, check the documentation for your Linux distribution for the recommendations specific for your system.

To configure the limits:

1. Determine whether you have a `/etc/security/limits.d` directory on your system, and take one of the following steps depending on the result:
    - If you *do not* have a `/etc/security/limits.d` directory:
        a. As the root user, open the `limits.conf` file for editing:

        ```
        /etc/security/limits.conf
        ```

        b. Set the open file descriptor limit by adding the following lines, replacing `<login_user>` with the operating system username under which the Controller runs:

        ```
        <login_user> hard nofile 65535
        <login_user> soft nofile 65535
        <login_user> hard nproc 8192
        <login_user> soft nproc 8192
        ```

    - If you *do* have a `/etc/security/limits.d` directory:
        a. As the root user, create a new file in the `limits.d` directory. Give the file a descriptive name, such as the following:

        ```
        /etc/security/limits.d/appdynamics.conf
        ```

        b. In the file, add the configuration setting for the limits, replacing `<login_user>` with the operating system username under which the Controller runs:

        ```
        <login_user> hard nofile 65535
        <login_user> soft nofile 65535
        <login_user> hard nproc 8192
        <login_user> soft nproc 8192
        ```

2. Enable the file descriptor and process limits as follows:

    > This step is not required for RHEL/CentOS version 5 and later. The below file has been combined into `/etc/pam.d/system-auth`, and already contains the required line.

    a. Open the following file for editing:

    ```
    /etc/pam.d/common-session
    ```

    b. Add the line:

    ```
    session required pam_limits.so
    ```

3. Save your changes to the file.

When you log in again as the user identified by `login_user`, the limits will take effect.

Fonts Needed for the Reporting Service

The Reporting Service depends upon certain system libraries and resources that are usually included in standard Linux distributions. However, certain lightweight flavors of Linux may be lacking the requirements, primarily font libraries. The Reporting Service requires Fontconfig and FreeType installed as well as at least one sans-serif font. Errors in the reporting server log will indicate missing components, such as a missing `libfontconfig.so` file.

The following table lists one operating systems and the commands to install the required libraries:

Operating System	Command

CentOS 6.1, 6.2; CentOS 6.3, 6.4, and 6.5, Fedora 14	`$ yum install fontconfig freetype urw-base35-fonts`
	
	`$ yum groupinstall hebrew-support`
	
	`$ yum langinstall he_IL`

CentOS 7.x, Redhat 7.x	`$ yum install fontconfig`
	
	`$ yum groupinstall Fonts # Only needed for Chinese/Japanese`

Ubuntu 8, 12, 14	`$ sudo apt-get update`
	
	`$ sudo apt-get install libfreetype6 libfreetype6-dev libfontconfig`
	
	`$ sudo apt-get install language-support-he language-pack-he`
	
	`$ sudo apt-get install culmus culmus-fancy xfonts-efont-unicode xfonts-efont-unicode-ib xfonts-intl-european msttcorefonts`

Ubuntu 13	`$ sudo apt-get install libfontconfig`
	
	`$ sudo apt-get install language-support-he language-pack-he`
	
	`$ sudo apt-get install culmus culmus-fancy xfonts-efont-unicode xfonts-efont-unicode-ib xfonts-intl-european msttcorefonts`

See Administer the Reporting Service for information on configuring the service.

GNU C Libraries

The Reporting Service requires GLIBCXX_3.4.9 or later and GLIBC_2.7 or later to run.

For more information and download instructions, see https://www.gnu.org/software/libc/.

Prepare Windows for the Controller

This page provides operational and setup guidelines for running the Controller on Windows.

User Account Requirements

The user account you use to install the Controller must have administrative privileges on the host Windows machine.

> If the host Windows machine is the Enterprise Console host, the Windows user account is configured to run with administrative privileges by default.

Virus Scanners

Configure virus scanners on the target machine to ignore the AppDynamics Enterprise Console directory and database directory (or simply the entire Controller directory). Code is never executed from the data directory, so it is generally safe to exclude this directory from virus scanning. The default location of the data directory is `<controller_home>\db\data`.

Also configure virus scanners to trust the Controller launcher, database executable, reporting service launcher, and events service (analytics processor) launchers. The launcher names are:

- Controller launcher: `AppDynamicsDomain1Service.exe`
- MySQL executable: `mysqld.exe`
- Events service launcher: `analytics-processor.exe`
- Reporting service launcher: `appdynamicsreportingservice.exe`

Windows Defender Scanning

Exclude the Controller data directory (`<controller_home>\db\data`), or simply the entire Controller directory, from scanning by Windows Defender. If you are not sure whether Windows Defender is running on the system, check for it in your local Services list. You can either configure the Controller data directory to be excluded in the Windows Defender Control Panel, or disable the service altogether if it is not needed.

For details on how to view services and exclude directories in Windows Defender, refer to the documentation for your version of Windows.

Windows Indexing Service

Ensure that the Windows indexing service is configured to ignore the Controller data directory (`<controller_home>\db\data`), or simply the entire Controller directory.

The data directory does not contain any files that are meaningful to the indexer, so it can be excluded from indexing. To exclude the directory from indexing, you can add the directory to the excluded directories list in the **Indexer Control Panel**, disable indexing in directory preferences, or stop the indexing service entirely.

To add the directory to the excluded directory list, follow these steps:

1. From the **Control Panel Indexing Options** dialog, click the **Modify** button.
2. In the **Indexed Locations** dialog, navigate to and select the **Controller** data directory.
3. Clear the checkbox for the data directory and click **OK**.

Windows Update

Configure the Windows Update preferences so that the server is not automatically restarted after an update. To configure the restart policy:

1. Open the **Local Group Policy Editor** dialog (search for and run the `gpedit` executable).
2. Navigate to the Windows Update component. In the tree, you can find it under **Local Computer Policy > Computer Configuration > Administrative Templates > Windows Components**.
3. Double-click on the **No auto-restart...** setting.
4. Select the **Enabled** option and click **Apply**.

.NET Framework

Components of the .NET Framework 3.5 are required to allow the Controller to be installed as a Windows service on the target machine. The installer checks your system and indicates if .NET 3.5 is not found. Follow the instructions on the Enterprise Console to get the required components.

Even if you have the latest version of .NET installed, you still have to install .NET 3.5. This is due to a Glassfish requirement where the Glassfish launcher explicitly requires .NET 3.5.

Windows 7

The Controller is automatically installed as a Windows service. Windows 7 operating system must have the hotfix described in http://support.microsoft.com/kb/2549760. This hotfix ensures that the Windows registry modifications made by the installer to extend the default service timeouts work as expected. The installer checks for the presence of the hotfix and warns you if it is not found.

Controller Data and Backups

This page provides an overview of how to configure and administer Controller data storage.

About Controller Data Storage

The Controller requires persistent data storage to store the following type of information:

- Design of your applications (all metadata about business transactions, tiers, policies, and so on)
- History of the performance of your applications (metric data)
- Transaction snapshot data and events
- History of incidents that occurred (both resolved and unresolved incidents)

Controller Data Directory Location

By default, the AppDynamics Controller uses MySQL as its storage mechanism. The Controller bundles a MySQL instance with the Controller. At installation time, the Enterprise Console creates the necessary tables and artifacts in the database.

By default, the database files and data are stored in: `<controller_home>/db`.

Manage the Database User Password

The Enterprise Console creates the user account that the Controller uses to log into the database to perform database-related operations. The username of the account is "root", and the password is the one you supply to the Enterprise Console during the Controller installation process.

When attempting to access the data, the Controller reads the database user password from these sources and in the priority shown:

- From the `MYSQL_ROOT_PASSWD` environment variable
- From user input to a command line prompt

If you do not keep the password in the environment variable, you will need to supply it in response to a command-line prompt whenever performing an operation that involves accessing the database, starting the database, stopping the database, or logging into the database.

Moving the Controller Data Directory

After installation, you can move the data directory to a new location. This may be necessary, for example, if there is not enough disk space available during Controller installation.

If you are using symlinks, you must create the symlink outside of the root Controller install directory and move the data directory to the new volume after you install the Controller.

Warning: Do not mount a file system on `<controller_home>/db/data`. During Controller upgrade, the Enterprise Console moves the data directory to `data_orig`. Upgrade will fail if the Enterprise Console cannot complete this move.

You can also update the `datadir` path on the Controller Database Configurations page of the Enterprise Console GUI.

To relocate the Controller data directory

1. Stop the Controller and its database. See Start or Stop the Controller.
2. Modify following properties in the `<controller_home>/db/db.cnf` file to point to the new location of the data directory.

   ```
   datadir
   tmpdir
   log
   slow_query_log_file
   ```

3. Copy (or move) the existing data directory `<controller_home>/db` to the new location.
   For example, to copy the data on Linux:

   ```
   cd <controller_home>/db/
   cp data <new-location>
   ```

4. Start the Controller. See Start or Stop the Controller.
5. Check the `database.log` and `server.log` for any errors related to the database connection.

Controller Data Backup and Restore

Related pages:

- Enterprise Console Back Up and Restore

AppDynamics strongly recommends that you perform routine data backups of the Controller.

One method of maintaining backups of the Controller is to implement high availability. With high availability, the database on the secondary Controller keeps a replicated copy of the data on the primary Controller. A secondary Controller also makes it practical to take cold copies of the Controller data, since you can shut down the secondary to copy its data without affecting Controller availability. For information on HA, see Controller High Availability (HA).

Other approaches include using a disk snapshot mechanism or using database backup tools. The BackupTools section describes tools that support each approach. In addition to regular backups, back up the Controller and Enterprise Console before upgrading or migrating them from one server to another.

This page provides an overview of the tasks and considerations related to backing up the Controller. Note that your Controller should be shut down before performing any import functions.

It is to be noted that controller versions 4.3 and later will work only on restoring and backing up the `<Controller Home>/.appd.scskeystore` file.

Best Practices for Backups

Backing up the entire system each night may not be feasible when dealing with the large amount of data typically generated by a Controller deployment. To balance the risk of data loss against the costs of performing backups, a typical backup strategy calls for backing up the system at different scopes at different times. That is, you may choose to perform partial backups more frequently and full backups less frequently.

The scope of a Controller backup can be categorized into these levels:

- Level 1: A light backup of the installation environment only
- Level 2: A metadata backup involving all metadata associated with the installation except for big data tables.
- Level 3: Backs up all data, either by performing a cold backup of the /data directory or a hot backup using a third-party tool.

A possible backup strategy may be to perform a level 1 and level 2 backup very frequently, say nightly, and a level 1 and level 3 backup about once a week. In addition to performing a level 1 or 2 backup, you should also back up the data for the Enterprise Console with `mysqldump` on a regular basis. A level 3 backup also backs up the Enterprise Console data. See Enterprise Console Back Up and Restore for more information.

Light Backup (Level 1)

A light backup targets Controller configuration files like `db.cnf` and `domain.xml`. This type of backup lets you avoid having to reconfigure the Controller in case of machine failure.

To perform this type of backup, simply copy everything in the Controller installation directory EXCEPT the data directory.

While it is recommended that you copy the entire Controller home except for the data directory when performing a light backup, particularly before performing a Controller upgrade, there are scenarios in which you may wish to copy only site-specific configuration files. This may be the case if you are migrating an existing Controller configuration to a new Controller installation, for example. For a list of those files, see Migrate the Controller.

Metadata Backup (Level 2)

A metadata backup exports the data that encapsulates the environment monitored by the Controller. Metadata defines the applications monitored by the Controller, business transactions, policies, and so on. It does not include what can be thought of as "runtime data", the big data tables that contain the metrics, snapshots, events, and top summary stats (top SQL, top URLs, and so on) generated in the monitored environment. By backing up metadata, you can avoid having to reconfigure monitored applications in the Controller in the event of a failure.

To perform this type of backup:

1. Run the script described in Using mysqldump to back up the Controller.
2. Then augment it with a copy of:
    a. The Controller Java keystore (600 byte file): `<controller install>/.appd.scskeystore`
    b. And the Enterprise Console keystore: `platform-admin/.appd.scs`

Complete Backup (Level 3)

A complete backup saves all runtime data associated with the Controller installation. It captures the actual metrics data, snapshots, and so on.

Some third-party backup tools, such as Percona XtraBackup, do not rely on transactions so you can perform a hot backup of your system (that is, back up the Controller database while it is running).

You can perform a complete backup as either:

- A cold backup of the `/data` directory. A cold backup means that, with the Controller app server and database shut down, you create an extra copy of the Controller database using, for example, the `cp -r` command, the `tar` utility, `rsync`, or others.

- A hot backup, which means the Controller is running. For a hot backup, use a third-party tool such as `Xtrabackup`.

This type of backup allows you to skip the Level 2 backup and the Enterprise Console backup. You still need to perform the Level 1 backup to back up the Controller home directory.

Backup Tools

This section lists a few third-party tools that you can use to back up Controller data. The list is not exhaustive; you can use any tool capable of backing up MySQL data with the Controller. It is up to you to test your backup and restore process. However, the tool you decide on should back up the data as binary data.

For Linux systems:

- Percona XtraBackup

For Windows systems:

- Zmanda Recovery Manager for MySQL

An alternative to using a database backup tool is to use a disk snapshot tool to replicate the disk or partition on which the Controller data resides. Options include:

- ZFS volume manager. For more information, see Using ZFS methods for data backup.

Details for performing this type of backup are beyond the scope of this documentation. For more information, refer to administration documentation applicable to your specific operating system.

Back Up the Controller with mysqldump

The `mysqldump` utility is a MySQL backup tool that is included with the Controller instance of MySQL.

While `mysqldump` is not recommended for use on large data tables, such as the Controller metric data tables, it is useful for backing up Controller metadata. Metadata defines the monitored domain for the Controller, including applications, business transactions, alert configurations, and so on.

The following instructions assume that the binary path for the Controller's MySQL instance is in the PATH variable. The path to the Controller's instance of MySQL must precede any other MySQL path on your system. This prevents conflicts with other database management systems on your machine, such as a MySQL instance included by default with Linux.

The database binary files for the Controller database are in `<controller_home>/db/bin`.

> ⚠ Before using `mysqldump`, first ensure that the Controller app server is stopped. If you attempt to run `mysqldump` while the app server is running, it will severely degrade the performance and stability of the Controller.

To use `mysqldump`, run the `mysqldump` executable, passing the root username, password, and output file. The executable is located in the following directory:

`<controller_home>/db/bin`

The command should be in the form:

```
mysqldump -u root -p<password> <ignore-table_statements> > /tmp/metadata_dump.sql
```

For a full example that shows which tables to exclude for a metadata backup, see the contents of the metadata backup script described in the next section.

Sample mysqldump Script

The following script illustrates how to use `mysqldump` to export Controller metadata while excluding runtime data tables by script.

- Linux: ControllerMetadataBackup.sh.txt

> ⚠ Backing up the Controller with a custom MySQL data directory location using mysqldump will result in an incomplete and unusable metadata dump. The default location for the Controller's MySQL data directory is `appd_install_dir/db/data`. If you do not see the data directory here then that means an alternate directory or mount point was selected and configured for your MySQL data directory.
>
> To fix this issue:
>
> 1. Examine `<Controller Home>/db/db.cnf`
>   a. Locate the `datadir` parameter. It contains the path to the MySQL data directory on your Controller host.
> 2. Edit the metadata backup script
>   a. Replace `$appd_install_dir/db/data` with the `datadir` path you located in `db.cnf`

To use the script:

1. Download the version appropriate for your operating system.
2. Rename the file to remove the .txt extension.
3. Modify the contents of the file as described in the script comments.

Import Controller Data with mysql

When you restore or migrate the Controller, you can import the data you exported with `mysqldump`.

Shut down your Controller before using the following command to import the data into a database:

```
$install/db/bin/mysql -u controller -p<ControllerDBpassword> < metadata_dump.sql
```

It will overwrite the tables. You can clone your installation to another host and test your restoration there.

A Controller that is installed with a custom MySQL data directory location requires additional flags.

Sample Data Backup Script

The following script uses Percona XtraBackup to back up Controller data. To use it, you need the `percona-xtrabackup` or `xtrabackup` and qpress pac kages. For information on installing XtraBackup, see the Percona installation documentation.

To use the script, download the following file:

- appdynamics-backup.sh.txt

Rename the script (by removing the .txt extension). In the script:

- Verify or edit the values of the `CONTROLLER_HOME` and `DESTINATION` variables at the beginning of the script for your environment.
- Edit the if/then/else clause at the end of the script if you want to implement backup file rotation, call your enterprise backup system to pick up the compressed Controller database image, or send an alert if the backup fails for any reason.

The following commands demonstrate how to restore a compressed backup image:

```
mkdir /path/to/big/staging/folder

# unpack the compressed backup archive
cd /path/to/big/staging/folder && xbstream -xv < /path/to/backups/dir/controller-yyyymmdd.xbstream

# decompress the backup image and apply the log taken during backup
CONTROLLER_HOME=/path/to/AppDynamics/Controller && cd /path/to/big/staging/folder \
&& innobackupex --decompress --parallel=16 . && innobackupex \
--defaults-file=$CONTROLLER_HOME/db/db.cnf --use-memory=1GB --apply-log --parallel=16 .

# Move a prepared backup into an empty controller data directory
CONTROLLER_HOME=/path/to/AppDynamics/Controller && cd /path/to/big/staging/folder \
&& innobackupex --defaults-file=$CONTROLLER_HOME/db/db.cnf --move-back .
```

For more information on these options, see the Percona innobackupex option reference.

Using a Backup to Migrate to a New Physical Server

You can use either a hot or cold backup procedure to migrate Controller data to a new server. However, we recommend performing cold backups. While a hot backup does not bring down the Controller for an extended amount of time, it does introduce the possibility of data loss, since hot backups capture the state of the data only when the hot backup starts.

To perform a cold backup, simply shut down the Controller and back up the data directory located in `<controller_home>/db`.

Controller Disk Space and the Database

This page discusses best practices for managing disk space for the MySQL database used by the Controller.

Disk Space Considerations

To ensure database integrity, the Controller automatically shuts itself down when available disk space falls below 1 GB.

Before it reaches that point, the Controller displays a low disk space alert in the UI and writes an error level event to server.log. The point at which the Controller generates the alert depends on its profile, as follows:

- For large and extra large profiles: 10 GB or less
- For all other profiles: 2 GB or less

The Controller shuts itself down when there is less than 1 GB on the disk regardless of the Controller profile type.

> ⚠ It's important to note that the Controller monitors the disk or partition that it is installed on. If the Controller data resides on a different disk or partition from the Controller home directory, you will need to monitor available space on that disk or partition separately.

Managing Disk Space

If the disk space is low, you need to reduce the size of the Controller database.

To manage how much disk space the Controller database uses, you can change the amount of data retained in the Controller database. See Database Size and Data Retention.

Database Size and Data Retention

This page provides both the on-premises and SaaS default data retention periods for data stored by the Controller and instructions for modifying on-premises values. AppDynamics manages SaaS Controller deployments, which eliminates the need for manual modifications.

Migrate the Controller

Related pages:

- Controller High Availability

This page describes how to migrate a Controller from a physical or virtual machine (VM) to a new physical machine.

Before Starting

Migrating the Controller often results from the need to move the Controller to new hardware due to increased load. Before starting, make sure that the new hardware meets the AppDynamics requirements as described in Controller System Requirements. Specifically, you should review the Controller hardware performance profiles and the hardware requirements per profile information to verify that the target Controller hardware meets the RAM size and Disk I/O requirements.

You will need to update the MAC address associated with your license since licenses are tied to the machine MAC addresses. You can also acquire new license files for the new Controller hardware. Send the MAC addresses to salesops@appdynamics.com and request a new license file or two new licenses, if upgrading to an HA pair. See Apply or Update a License File for more information.

If you are performing a migration and upgrade for a 4.3 version Controller, you should first migrate the Controller. Then, you can upgrade the Controller to 4.5 or higher by installing the Enterprise Console and using the Discover & Upgrade feature. This also applies to migrations involving different OS environments.

VMotioning, or migrating a VMware guest with a running Controller inside it from one host to another, is not supported. Doing so will lead to dropped metrics and UI performance problems.

Migrating a Linux Controller

You can use the high availability features provided by the Enterprise Console to migrate a Controller from one machine to another. It is assumed that the Controller you need to migrate is already managed by the Enterprise Console (it has been installed or discovered by the Enterprise Console). See Enterprise Console for more information.

You add the new host as an HA pair to the old host, set the new host as active, and then remove (decommission) the old host. When finished, the Controller will run on the new host.

Before starting, you should review the requirements and concepts related to Controller High Availability.

To migrate a Linux Controller:

1. Log in to the **Enterprise Console** UI interface.
2. Select the Platform containing the host you want to migrate.
3. In the **Hosts** page, add the new host (the one to serve as the new target host) and provide the credentials for connecting to that host.
4. In the **Controller** page, select **Add Secondary** and select the new target host. Provide the DB root password and Controller root password, and select **Submit**.
5. In the **Controller** page, select **HA failover**.
   The Primary Controller is now running on the new host.
6. Update the license MAC address or apply a new license for the new machine. See Before Starting for more information.
7. Decommission the old Controller from the **Controller** page:
   a. Select **Remove Controller**, or run the following command on the Enterprise Console host:

```
platform-admin.sh submit-job --job remove --service controller --args removeBinaries=false
```

   b. Select the **remove binaries** option. (Do not select **Remove entire cluster**.)

The Controller is now running on the newly provisioned host.

You can keep the same access key from the old Controller. To migrate or update your access key, see Controller Secure Credential Store.

You must update the license rule access keys.

Migrating a Windows Controller

Since high availability features are not available on Windows, you must use an alternative procedure to migrate a Controller from one machine to another. You use the Enterprise Console to manually install and move the `.appd.scskeystore` and the `datadir` from the old host to the new host. Once completed, the Controller will run on the new host.

Before starting, you should review the requirements and concepts related to Controller High Availability.

To migrate a Windows Controller:

1. Install the Enterprise Console on the new Controller host from where you are running the existing Controller host.
2. Use the Enterprise Console to install the same version of the Controller on your new Controller host using the same passwords as on the existing Controller host.
3. Shut down the Controller Appserver and database on both Controller hosts.
4. Move `<controller_home>/.appd.scskeystore` and the Controller's MySQL `datadir` on the new host.

   > When migrating the data, ensure that the destination MySQL version is the same as the source version.

5. Copy `<controller_home>/.appd.scskeystore` and the Controller's MySQL `datadir` from the old host to the correct locations on the new host.
6. Start the Controller Appserver and database on the new host.
   The Controller is now running on the newly provisioned host.

You can keep the same access key from the old Controller. To migrate or update your access key, see Controller Secure Credential Store.

> You must update the license rule access keys.

Prepare Virtual Machines for the Controller

The following are considerations and requirements for the machine hosting the Controller.

Controller Sizing Restrictions

Demo, small, and medium profile Controllers can run on virtual machines that meet the performance requirements otherwise specified. Large deployments are not supported except as indicated in Controller System Requirements.

> ⚠ The Controller is not supported on virtual machines with oversubscribed physical CPUs like T2 AWS instances. These Burstable Performance Instances are CPU-throttled and do not have dedicated storage bandwidth. We recommend you use a Fixed Performance Instance type instead.

Fully Reserved RAM

The memory allocation for the Controller's virtual machine must be fully reserved RAM. Reserve as much as possible of the total memory allocation.

On VMWare VMs

Reserved Memory Configuration

For information on how to configure reserved memory on VMWare, see Set Memory Reservation on a Virtual Machine.

Trend Micro Configuration

On vSphere platforms shipped with Trend Micro, the Trend Micro process needs to be disabled in order for replication jobs to work. You can also add the entire Enterprise Console and Controller directories to the exclusion list to avoid this conflict.

See Trend Micro and VMware Virtualization for more information.

On Hyper-V VMs

On Microsoft Hyper-V, "Dynamic Memory" needs to be disabled and "Static Memory" needs to be enabled.

To disable a Hyper-V VM from using Dynamic Memory:

1. Open the Hyper-V Manager.
2. Select the VM you want to configure in the **Virtual Machines** pane, making sure the VM is powered off.

   > ⓘ You cannot enable or disable Dynamic Memory if the VM is in either the Running or Saved state.

3. Right-click the VM to bring up the context menu.
   a. Select **Settings**.
   b. Click the **Memory** page.
4. Uncheck the **Enable Dynamic Memory** box.

See Virtualization: Optimizing Hyper-V Memory Usage for more information.

Licenses on VMs

The Controller license is bound to the MAC address of the host machine. To run the Controller on a virtual machine, you must ensure that the host virtual machine uses a fixed MAC address.

I/O Performance Requirements

A factor that often limits the performance of the Controller is the underlying disk I/O performance of the host machine.

Virtual machines, in particular, are less apt to provide sufficient I/O performance requirements for the Controller, compared to similarly specified physical machines. In any case, whether you are deploying the Controller to a physical or virtual machine, you need to ensure that the machine meets the I/O performance requirements set forth in Controller System Requirements.

Host Name Entry

The fully qualified hostname for the application server is the address at which Controller UI users and application agents will use to access the Controller. You specify this hostname when you install the Controller. The hostname needs to be in the /etc/hosts file on the machine.

The following example shows an entry in `/etc/hosts` with the IP 21.43.65.987, the fully qualified hostname `application1.mycompany.com` and the alias `app1`:

```
21.43.65.987 application1.mycompany.com app1
```

Elastic Network Interface (ENI)

For AWS, provision an ENI for each Controller host and link the license to the ENI. For more information about ENI, see the AWS documentation at the following link:

https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-eni.html.

AWS Controller Deployment Guide

The AppDynamics Controller is certified to run on an AWS environment with the Aurora Database. This page provides information on installing, configuring, and administering a Controller deployment on AWS with Aurora Database.

Installation Overview

You can deploy a medium- or large-scale Controller in AWS using Aurora. Aurora provides higher performance than MySQL, which allows you to scale your Controller to handle more metrics.

Before you install the Controller, review the requirements for the components you plan to install and prepare the host machines. The requirements vary based on the components you deploy and the size of your deployment.

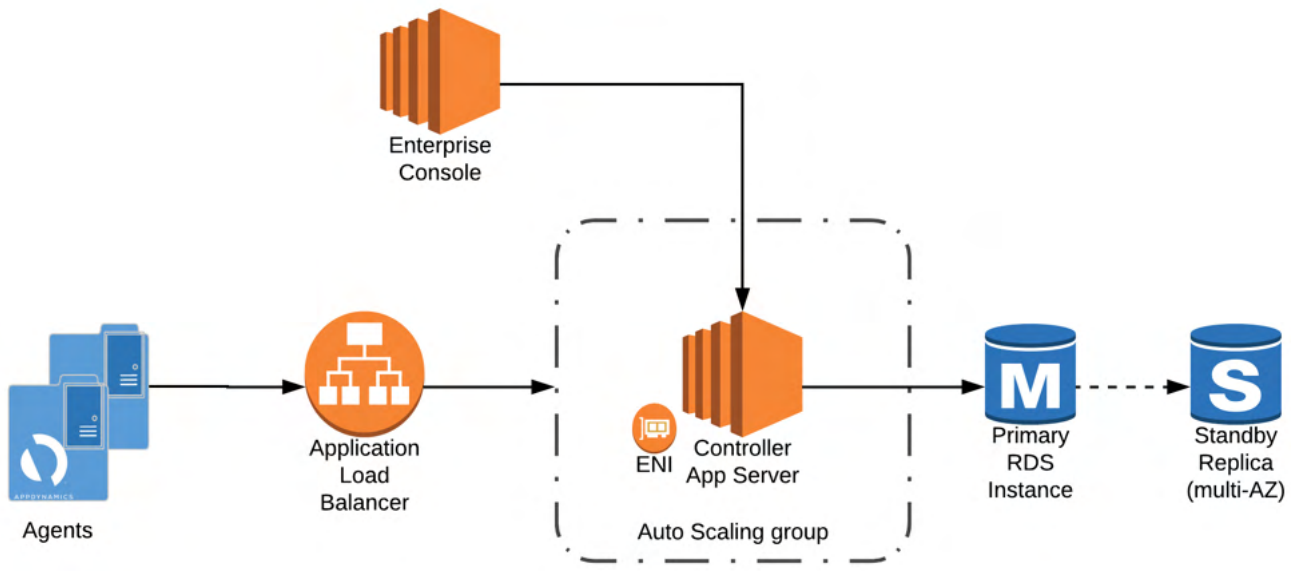
You can manually deploy your Controller on AWS. See Deploy the Controller on AWS
This deployment requires attention and time because you have to set up all of the configurations. However, this gives you freedom to customize your deployment.

You use the Enterprise Console to deploy the Controller by specifying Aurora as the database type. The Enterprise Console is the installer for the Controller, and you can use it to manage the entire lifecycle of new or existing AppDynamics Platforms and components.

You can get the software for installing the platform components from the AppDynamics download site. See Download AppDynamics Software

AppDynamics on AWS Architecture

The following diagram depicts the components of an AppDynamics Controller deployment on AWS.



Configure an Application Load Balancer in front of the Controller and ensure SSL terminates at the Elastic Load Balancer.

With Amazon Relational Database Service (RDS), you no longer need to worry about database backups, as it takes care of this for you. Also, you no longer need to implement high availability (HA) on your own, since you can instead leverage the Standby Replica that Aurora/RDS offers and the Aurora database is horizontally scalable. With the multi-AZ deployment option, Aurora offers 99.95% availability.

Controller High Availability and AWS

- If your data is migrated to the Aurora DB, you can create a new Controller from the Amazon Machine Image (AMI) in case of failure. With Aurora as the database, HA scenarios are not required because the Aurora database is horizontally scalable.
- It is a good practice to cut the new root AMI every time you make a configuration change to the Controller.
- You can configure a read replica instance while creating Aurora DB, which should satisfy most database replication requirements.
- You can configure the backup policy while creating the Aurora DB and modify it later.

Prepare the AWS Machine for the Controller

Related pages:

- Prepare Linux for the Controller
- Prepare Windows for the Controller

This page provides considerations and requirements for AWS instances that host the Controller.

Instance Sizing

For AWS instance sizing by metric ingestion rate, see the Controller Sizing table.

The actual metrics generated can vary greatly depending on the nature of the application and the AppDynamics configuration. Be sure to validate your sizing against the metric ingestion rate before deploying to production.

Elastic Network Interface (ENI)

For AWS, provision an ENI for each Controller host and link the license to the MAC address of the ENI. For more information about ENI, see the AWS documentation at the following link:

https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-eni.html.

Deploy the Controller on AWS

This page describes the procedure used to deploy the AppDynamics Controller to an AWS environment.

You can set custom configurations when you manually deploy the Controller to AWS. From these steps, you manually set up security groups, database parameter groups, Amazon Relational Database Service (RDS), Aurora DB instance, EC2 instance, Elastic Network Interface (ENI) for the Controller, DNS CNAMEs, and listeners for your load balancer.

Afterward, you install the Enterprise Console, and then use the Enterprise Console to install the Controller and configure it for the AWS environment.

Based on the Amazon Machine Image (AMI), you can provision a replacement EC2 instance for the Controller as needed.

For help with your deployment, contact your AppDynamics account, sales, or professional services representative.

Before You Begin

- Review if Amazon Aurora DB is available in your region – Check the AWS Region Table in the AWS documentation to see if the Amazon Aurora - MySQL-compatible service is available in your particular region.
- Amazon RDS Password Requirements – There are some naming constraints in the Amazon Relational Database Service (RDS). The master password for Aurora DB can be any printable ASCII character except "/", """, or "@", and must contain 8 to 41 characters. Master password constraints differ for each database engine.
  For details on naming constraints in Amazon RDS, see the AWS documentation.

Deploy the Controller on AWS

To manually deploy the Controller on AWS:

1. Create Security Groups
2. Create Custom DB Parameter Groups
3. Launch an Amazon RDS Aurora DB Instance
4. Create Database User for Controller
5. Launch an EC2 Instance for the Controller
6. Create the ENI for the Controller
7. Create DNS CNAMEs
8. Install the Enterprise Console in an AWS Environment
9. Install the Controller in AWS Using Aurora
10. Apply Controller Optimizations
11. Configure a Load Balancer
12. Configure Listener Rules

Troubleshooting the Installation

Issue: Controller EC2 Instance Stops

If the Controller EC2 instance stops almost immediately after you install the Controller, there may be an issue with your EBS devices. AWS may report that it is not able to boot from the volumes. If the EC2 machine stops, check and update your EC2 volumes so that they are mounted correctly.

Create Security Groups

A security group acts as a virtual firewall for your instance to control inbound and outbound traffic. For each security group, you add rules that control the inbound traffic to instances, and a separate set of rules that control the outbound traffic.

At a minimum, we recommend creating the following security groups when deploying AppDynamics in AWS using Aurora DB.

> You can create additional security groups to align with your organization's standards.

Required Security Groups

Use the instructions provided in the AWS security groups documentation to create these required security groups:

Security Group for the AppDynamics Enterprise Console

Security group name: `appd-ec-security-group`

Inbound rule: Allow all inbound TCP traffic on ports 22 and 9191

Outbound rules:

- Allow outbound TCP traffic to `appd-appserver-security-group` on port 22
- Allow outbound TCP traffic to `appd-db-security-group` on port 3388

Security Group for the AppDynamics Controller Appserver

Security group name: `appd-appserver-security-group`

Inbound rules:

- Allow all inbound TCP traffic on port 22
- Allow inbound TCP traffic on ports 8090-8097 from `appd-elb-security-group`

Outbound rule: Allow outbound TCP traffic to `appd-db-security-group` on port 3388

Security Group for AppDynamics Database Instances

Security group name: `appd-db-security-group`

Inbound rule: Allow inbound traffic on port 3388 from `appd-appserver-security-group` and `appd-ec-security-group`

Outbound rule: No outbound access allowed

Security Group for Load Balancer in Front of the AppDynamics Controller

Security group name: `appd-elb-security-group`

Inbound rule: Allow all inbound HTTPS traffic on port 443

Outbound rule: Allow outbound TCP traffic to `appd-appserver-security-group` on ports 8090-8097

Create Custom DB Parameter Groups

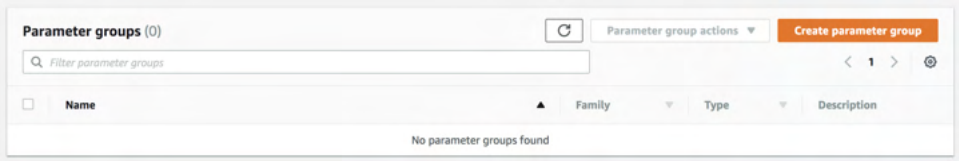
You must modify some of the parameters for your database instance.

> Any parameters not modified retain their default values.

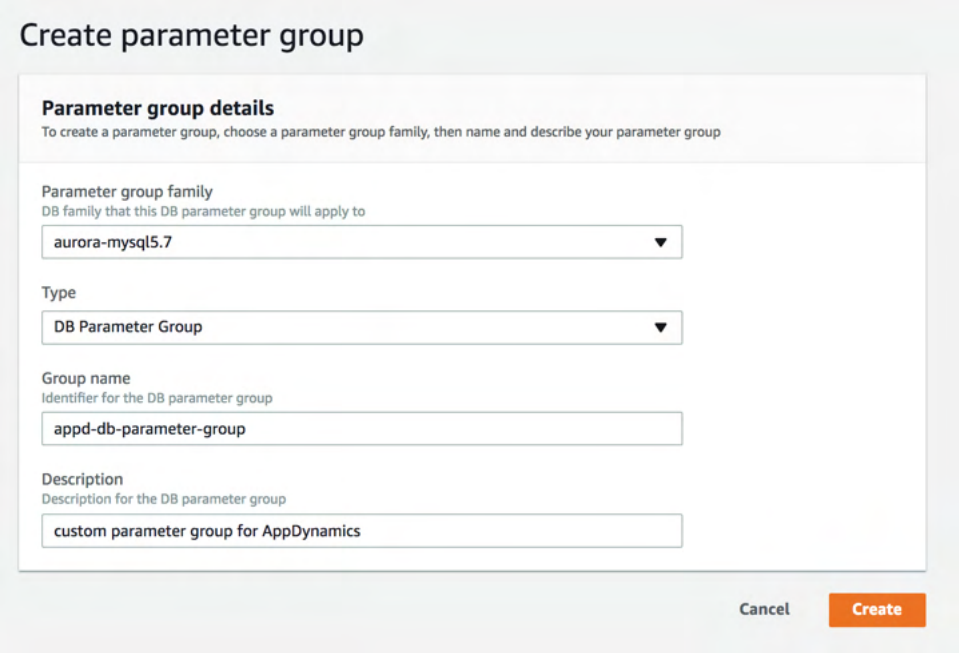
Parameter	Recommended Value
innodb_file_format	Barracuda
innodb_large_prefix	1 (0 for Aurora 5.6)
innodb_lock_wait_timeout	180
innodb_max_dirty_pages_pct	20
lock_wait_timeout	180
log_bin_trust_function_creators	1
max_allowed_packet	104857600
max_heap_table_size	1610612736
query_cache_type	0
sql_mode	0
tmp_table_size	67108864
wait_timeout	31536000

To create custom DB parameter groups:

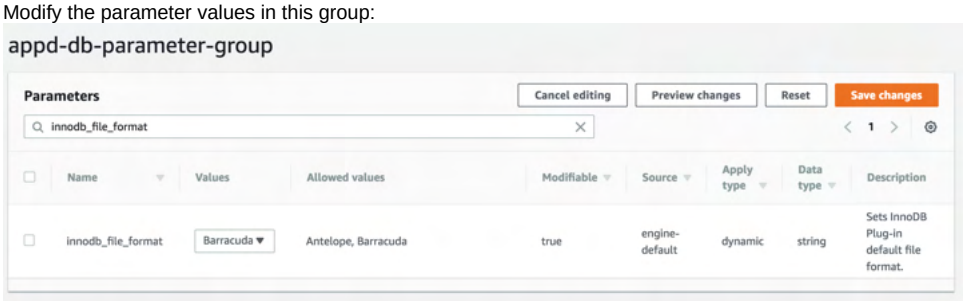
1. Navigate to the Parameter groups page on the Amazon RDS in the AWS console.
2. Click **Create parameter group** on the top right of the page.



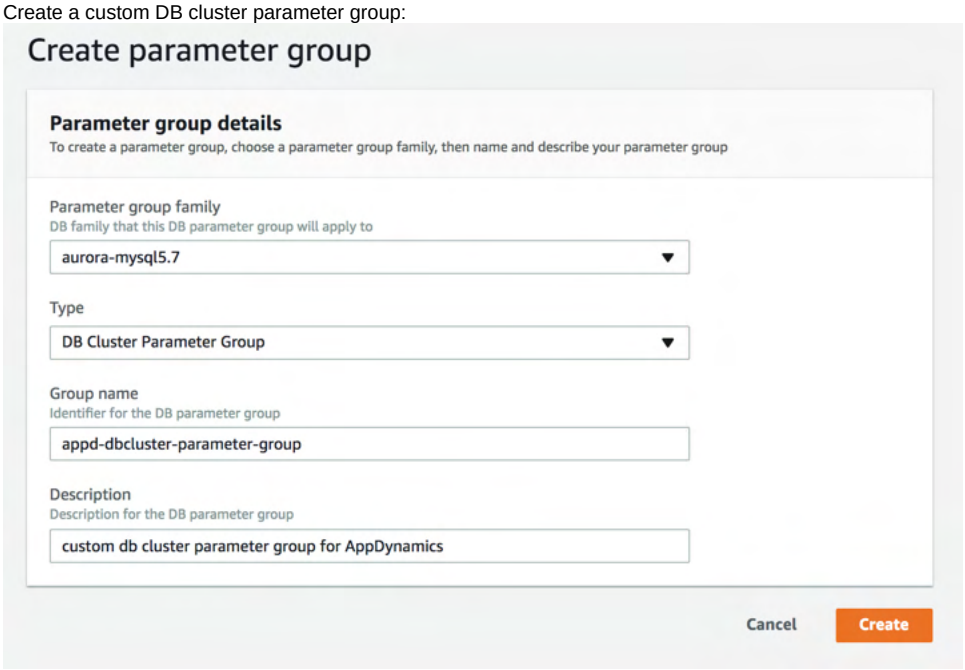
3. Enter the group details:



4. Modify the parameter values in this group:



5. Create a custom DB cluster parameter group:



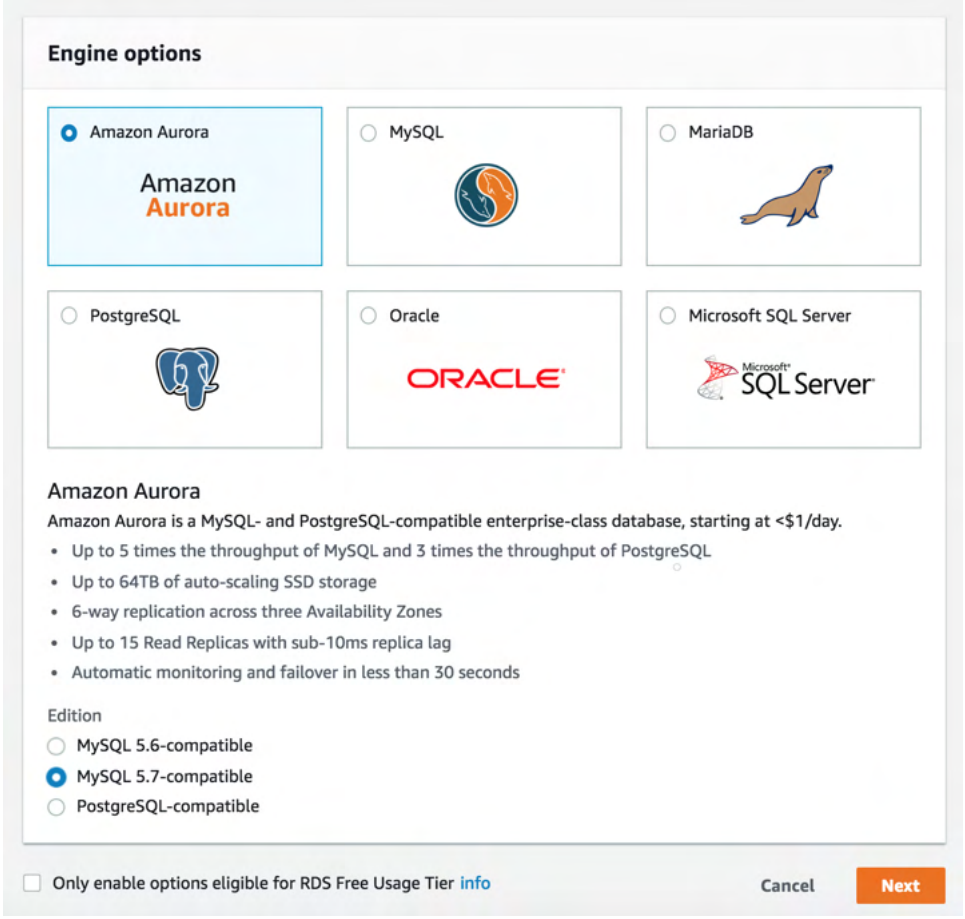
6. Modify the parameter values in this group as follows:

Parameter	Recommended Value
character_set_client	utf8
character_set_connection	utf8
character_set_database	utf8
character_set_filesystem	binary
character_set_results	utf8
character_set_server	utf8
collation_connection	utf8_general_ci
collation_server	utf8_unicode_ci
innodb_default_row_format	DYNAMIC
innodb_file_per_table	1
lower_case_table_names	1

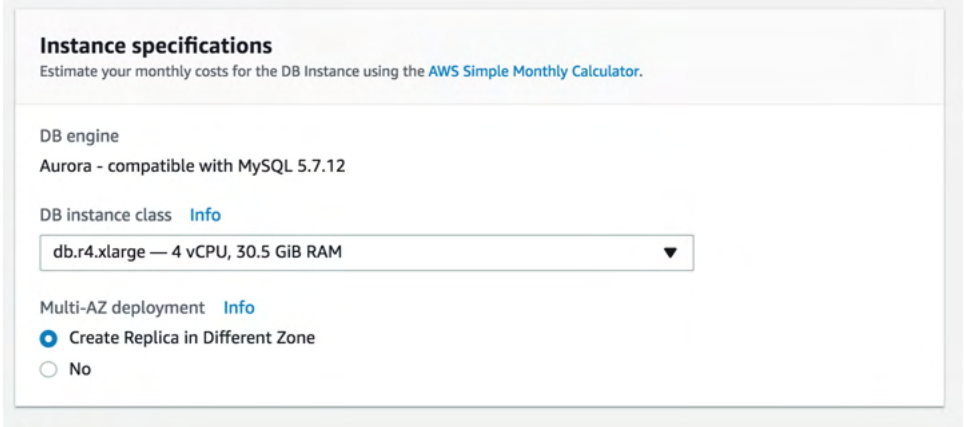
Launch an Amazon RDS Aurora DB Instance

You launch an Amazon RDS Aurora DB Instance from the AWS console.

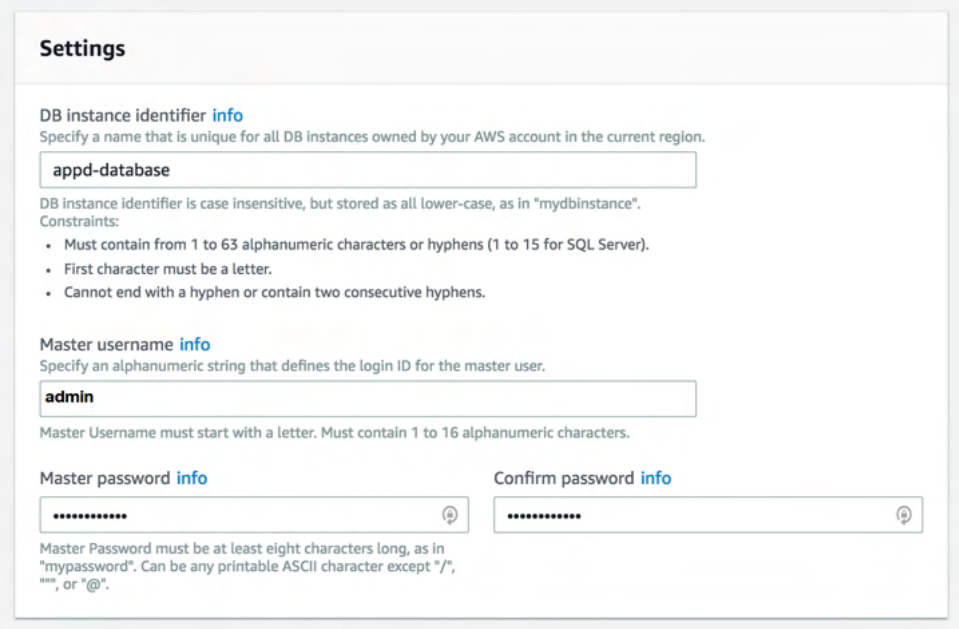
1. Select **Aurora** with the **MySQL 5.7-compatible** option.



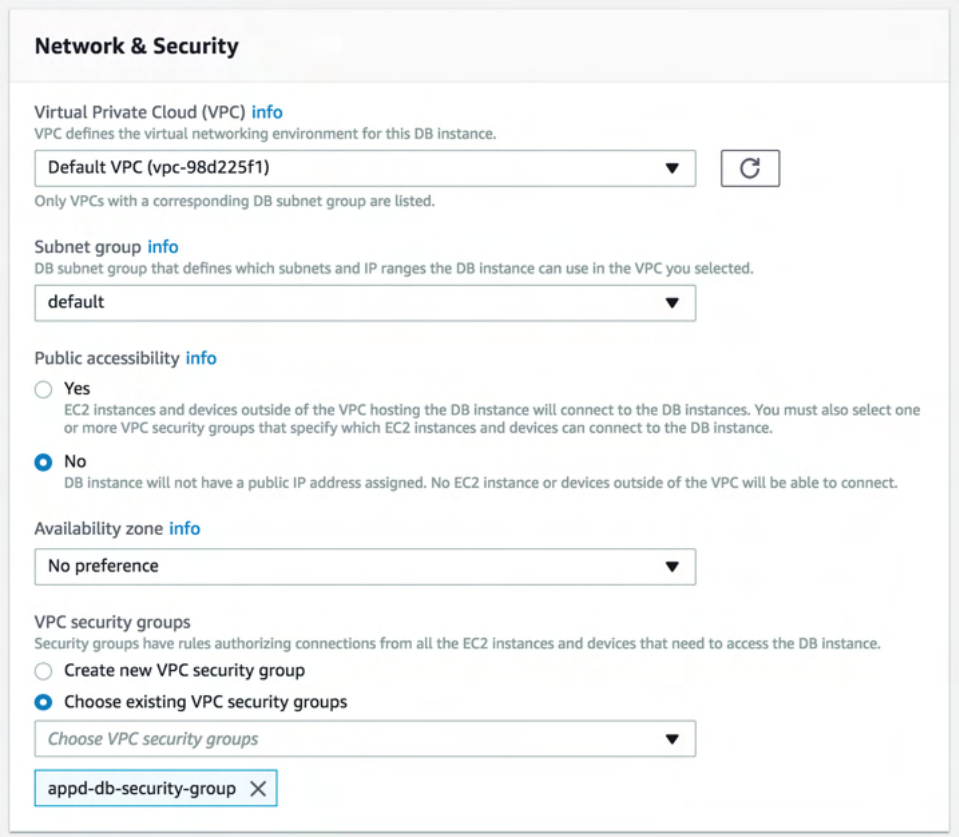
2. Select the desired DB Instance class. See Prepare the AWS Machine for the Controller for instance sizing information
3. Select **Create Replica in Different Zone** to have Amazon RDS maintain a synchronous standby replica in a different Availability Zone than the DB instance. If a planned or unplanned outage of the primary occurs, Amazon RDS will automatically fail over to the standby replica.



4. Enter an identifier for the DB instance. The master username must be `admin`.

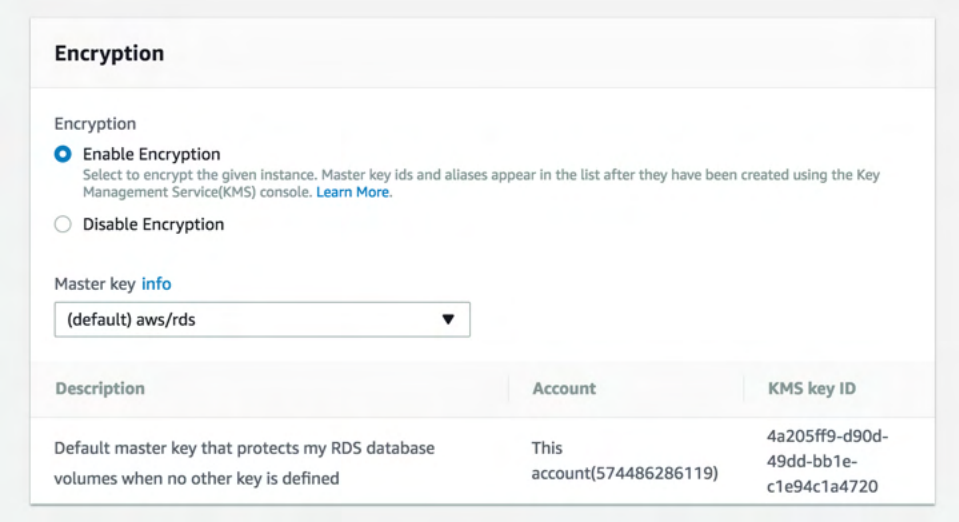


5. Select the Default VPC and subnet group. The DB should not be accessible publicly, so select **No** for this option.
6. For the security group, select the **appd-db-security-group** that you created previously.



7. For the database options, you do not need to specify the DB cluster identifier, nor enter a database name because the installer creates the necessary databases for you.
8. Use the default database port of 3388.
9. Specify the custom parameter groups that you created previously.

10. We recommend that you select **Enable Encryption** for data at rest.



11. Use the default options for the remaining settings.
12. Click **Launch DB Instance**, and your new database will be available in a few minutes.

Create Database User for Controller

During installation, AppDynamics must create additional databases and users in the Aurora database for the AppDynamics Controller application to interact with the Aurora database server.

To create the Aurora database:

1. Create the Aurora database using `admin` as the primary username.
2. After the Aurora database instance is created successfully, log in to the ec2 instance as `admin`:

```
mysql -u admin -h <rds-aurora-endpoint> -P 3388 -p
```

3. To create a new `'root'` user, enter:

```
CREATE USER 'root'@'%' IDENTIFIED BY 'controller';
```

4. To check for the grants of the primary username (`admin`), enter:

```
mysql> SHOW GRANTS FOR admin;
```

   Resulting output:

```
-----------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------
-------------------------------------------------
Grants for admin@%
-----------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------
-------------------------------------------------
GRANT SELECT, INSERT, UPDATE, DELETE, CREATE, DROP, RELOAD, PROCESS, REFERENCES, INDEX, ALTER, SHOW
DATABASES, CREATE TEMPORARY TABLES, LOCK TABLES, EXECUTE, REPLICATION SLAVE, REPLICATION CLIENT, CREATE
VIEW, SHOW VIEW, CREATE ROUTINE, ALTER ROUTINE, CREATE USER, EVENT, TRIGGER, LOAD FROM S3, SELECT INTO
S3, INVOKE LAMBDA ON *.* TO 'admin'@'%' WITH GRANT OPTION
-----------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------
-------------------------------------------------
 1 row in set (0.00 sec)
```

5. Apply the grants (listed in the output) for the new `root` user that you created in Step 1. The `root` user will have the same grants as the `admin` user.

```
mysql> GRANT SELECT, INSERT, UPDATE, DELETE, CREATE, DROP, RELOAD, PROCESS, REFERENCES, INDEX, ALTER,
SHOW DATABASES, CREATE TEMPORARY TABLES, LOCK TABLES, EXECUTE, REPLICATION SLAVE, REPLICATION CLIENT,
CREATE VIEW, SHOW VIEW, CREATE ROUTINE, ALTER ROUTINE, CREATE USER, EVENT, TRIGGER, LOAD FROM S3, SELECT
INTO S3, INVOKE LAMBDA ON *.* TO 'root'@'%' WITH GRANT OPTION
```

   Resulting output:

```
Query OK, 0 rows affected (0.01 sec)
```

6. Once the `root` user has the same privileges as the primary username `admin`, verify that you can log in to the database as `root`, and then continue with the installation.

   - If you do not have users "root@*x.x.x.x*" and "root@ip-*x-x-x-x*.ec2.internal", ignore these users and continue to work with the `root@%`.
   - If you have users "root@*x.x.x.x*" and "root@ip-*x-x-x-x*.ec2.internal", then instead of using the previous `GRANT` command, use this `GRANT` command:

```
mysql> GRANT ALL ON `%`.* TO 'root'@'ip-x-x-x-x.ec2.internal' identified by 'controller' WITH
GRANT OPTION;
mysql> GRANT ALL ON `%`.* TO 'root'@'x.x.x.x' identified by 'controller' WITH GRANT OPTION;
mysql> GRANT RELOAD ON *.* TO 'root'@'ip-x-x-x-x.ec2.internal' identified by 'controller' WITH
GRANT OPTION;
mysql> GRANT RELOAD ON *.* TO 'root'@'x.x.x.x' identified by 'controller' WITH GRANT OPTION;
```

After installation, you can revoke the primary-level privileges from the Aurora *root* user without interfering with the Controller. However, primary-level privileges for Aurora *root* user are required prior to upgrading the Controller.

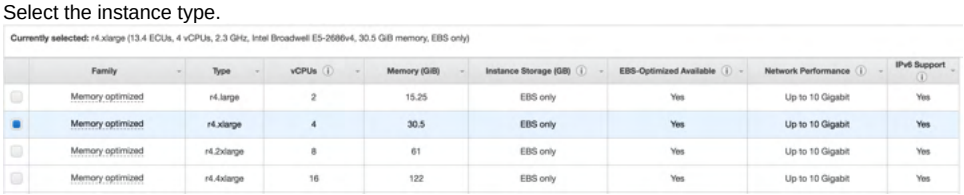
Launch an EC2 Instance for the Controller

This example uses an Amazon Linux AMI (which is provided by AWS: `Amazon Linux AMI 2017.09.1 (HVM), SSD Volume Type - ami-f63b1193`). The Amazon Linux AMI is an EBS-backed, AWS-supported image.

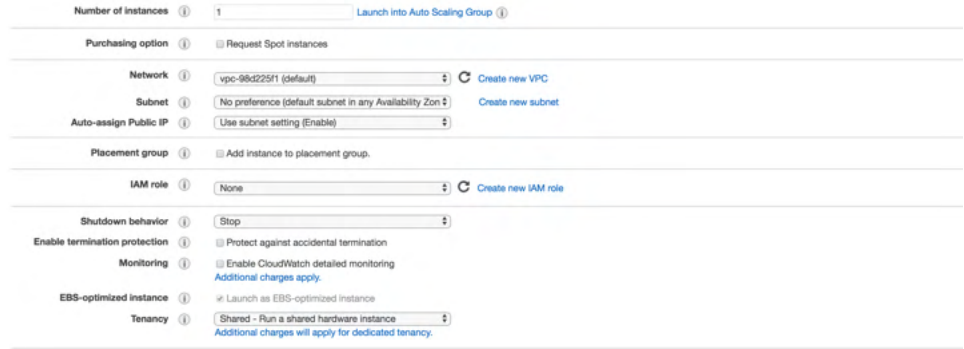
The default image includes AWS command-line tools: Python, Ruby, Perl, and Java.

The repositories include: Docker, PHP, MySQL, PostgreSQL, and other packages.

1. Select the instance type.



2. Use the default instance settings.



3. Increase the storage amount from the default 8 GB to 32 GB.

> ⚠ You will need considerably more space on a larger server.

4. Assign the instance to the `appd-appserver-security-group` that you previously created.

5. To launch the instance, you must specify a key pair. If you are using an existing key pair, ensure that you have access to the private key file; otherwise, generate a new key pair and download it from the AWS console. The private key file is required to connect to the instance using SSH. The new instance should be available after a few minutes. Once the instance is available, you can verify the status using the AWS console. Connect to it through SSH, enter:

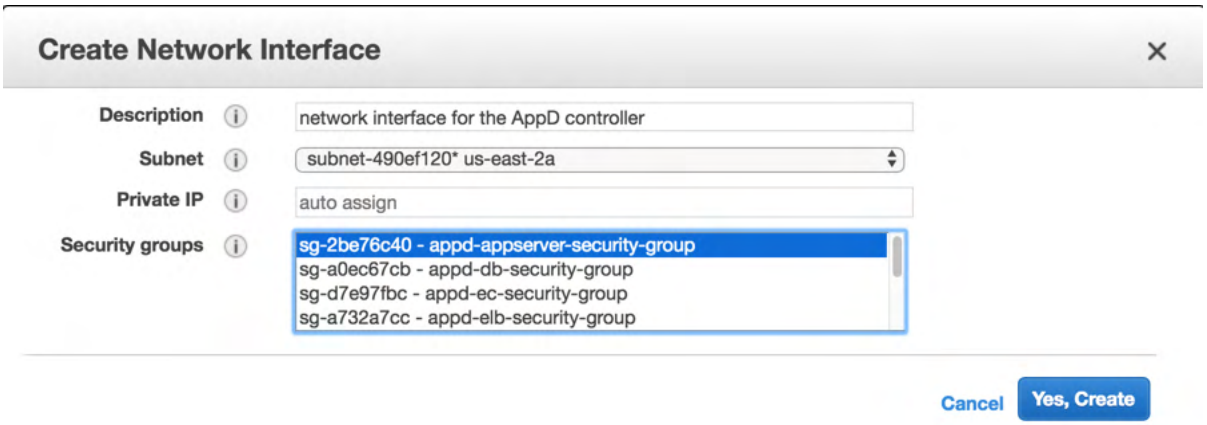
```
ssh -i "<private key file>.pem" ec2-user@ec2-18-222-75-189.us-east-2.compute.amazonaws.com
```

6. Substitute the appropriate path and filename for your private key file.

Create the ENI for the Controller

You need to introduce an ENI which acts as a secondary network interface that you can attach and detach from the Controller EC2 instance.

You then have to associate the AppDynamics license file to the MAC address of this network interface instead of the MAC address of the underlying EC2 instance.



Attach the new network interface to the Controller EC2 instance.

Create DNS CNAMEs

AppDynamics recommends that you create aliases used to connect the Aurora database instance to the Controller EC2 instance.

For example:

```
appdcontroller.mydomain.com  appdcontrollerdb.cxylwiexaqo2.us-east-2.rds.amazonaws.com (DNS name for the Aurora DB instance)

appd-database.mydomain.com  ip-172-31-22-161.us-east-2.compute.internal (private DNS name for the ENI attached to the Controller)
```

You should use these aliases when you install the Controller through the Enterprise Console. Using aliases prevents you from tightly coupling the Enterprise Console with the specific Aurora DB instance or EC2 instance hosting the Controller.

For example, if the database were to fail completely, and you needed to restore the database from a snapshot, then you would have a new DNS name for the Aurora DB instance. Pointing the Enterprise Console at an alias, instead of the DNS name for the Aurora DB instance itself, allows you to only update the DNS alias, and leave the Enterprise Console configuration unchanged.

However, if you need to move the Controller to a different EC2 instance, which resides in another Availability Zone (AZ), you can just update the DNS alias to point to the ENI in the new AZ.

For purposes of testing an AWS configuration, it may not be possible to increase DNS aliases. As a result, you can just add entries to the `/etc/hosts` file on both the Enterprise Console and Controller EC2 instances. For example:

```
172.31.17.84 appdcontroller
172.31.25.80 appd-database
```

Install the Enterprise Console in an AWS Environment

This page describes how to install the the Enterprise Console in an AWS environment using an EC2 instance. You then use the Enterprise Console to install the Controller on a separate EC2 instance (using Aurora DB as the backend).

Launch the EC2 Instance

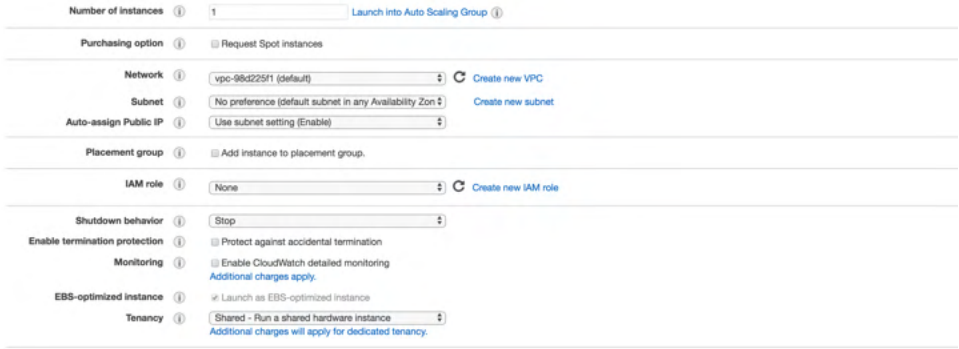
This example uses this AMI (which is provided by AWS): `Amazon Linux AMI 2017.09.1 (HVM), SSD Volume Type - ami-f63b1193`. The Amazon Linux AMI is an EBS-backed, AWS-supported image.

The default image includes AWS command-line tools: Python, Ruby, Perl, and Java.

The repositories include: Docker, PHP, MySQL, PostgreSQL, and other packages.

1. Select the Instance type. The Enterprise Console has only modest requirements, therefore you can select the **t2.medium** instance type.

2. Use the default instance settings.



3. Increase the storage amount from the default 8 GB to 32 GB.

4. Assign the instance to the `appd-ec-security-group` that you created previously.

Prepare the Instance

To launch the instance, you must specify a key pair. If you are using an existing key pair, ensure you have access to the private key file; otherwise, generate a new key pair and download it from the AWS console. The private key file is required to connect to the instance using SSH.

The new instance should be available after a few minutes. Once the instance is available, you can verify the status using the AWS console. Connect to it through SSH, enter:

```
ssh -i "<private key file>.pem" ec2-user@ec2-18-222-75-189.us-east-2.compute.amazonaws.com
```

Then, substitute the appropriate path and filename for your private key file.

Install the Enterprise Console

Use `scp` to transfer the Enterprise Console installer binary to your EC2 instance, enter:

```
scp -i "<private key file>.pem" platform_setup.sh ec2-user@ec2-18-222-75-189.us-east-2.compute.amazonaws.com:
/data
```

Then, SSH to your EC2 instance and run the `installer` to install Enterprise Console:

```
cd /data
chmod 700 platform_setup.sh
./platform_setup.sh -c
```

While installing the Enterprise Console, you are prompted to either select a database port, or accept the default port of 3377.

> Do not use port 3388 because it conflicts with the Controller database port which is used later in the installation process.

You must have write access to the Enterprise Console installation directory you select.

When installing one Controller in the AWS environment, it is easier to install both the Controller and Enterprise Console on the same host.

However if you plan to install multiple Controllers and want to manage them through a single Enterprise Console instance, then you should install the Enterprise Console and the Controller on separate hosts.

Complete the installation of Enterprise Console, and make a note of any passwords you specify during the installation process.

Install the Controller in AWS Using Aurora

This page describes how to install the Controller in an AWS environment using an EC2 instance for the Controller Appserver, and an AWS RDS Aurora instance for the database. This page uses the Enterprise Console that you previously installed.

> Before you install the Controller using Aurora as the database, you must adjust the time zone of the Aurora database to match the time zone of the Controller server. By default, AWS sets the time zone equal to the UTC time zone. See updating the Aurora RDS time zone

To install the Controller in an AWS environment using an EC2 instance for the Controller Appserver, and an AWS RDS Aurora instance for the database:

1. From the Enterprise Console instance, create a new platform:

   ```
   cd ./appdynamics/platform/platform-admin/bin
   ./platform-admin.sh create-platform --name <platform_name> --installation-dir /data/appdynamics/platform
   /product
   ```

2. Add a new host to the platform and install the Controller on the same host as the Enterprise Console:

   ```
   ./platform-admin.sh add-hosts --platform-name testplatform --hosts localhost
   ```

3. Install the Controller using Aurora as the database. Substitute the appropriate values for the `admin user name`, `passwords`, and `Controller host` and `port`. Ensure that `databaseType` is set to `Aurora`, and use the `private DNS name` of the network interface attached to the Controller EC2 instance instead of the `DNS name` for the EC2 instance itself.

   ```
   ./platform-admin.sh submit-job --platform-name testplatform --service controller --job install --args
   controllerProfile=<profile_size> controllerPrimaryHost=<network_interface_private_DNS_name>
   controllerTenancyMode=single controllerRootUserPassword="<password>" mysqlRootPassword="<password>"
   controllerAdminUsername="admin" controllerAdminPassword="<password>" databaseType=Aurora
   controllerDBPort=3388 controllerDBHost="<auroraHost>"
   ```

   The installer connects to the Aurora DB instance, and creates the necessary databases, tables, and other objects. After a few minutes, the Controller should be installed and ready to use.

Apply Controller Optimizations

This page describes how to apply optimizations to the Controller.

Glassfish Configuration

You can configure domain protocols, network listeners, transports, and thread pools from the Enterprise Console UI. You can edit them from the AppServer Configurations page by selecting the platform, and navigating to **Configurations > Controller Settings > Appserver Configurations**.

These files contain sample content for each of the profiles:

- `domain protocols.txt`
- `domain network listeners`
- `domain transports.txt`
- `domain thread pools.txt`

The Enterprise Console restarts the Controller after you submit your configurations.

Configure a Load Balancer

You can configure a load balancer after you have installed the Controller, and it is running in EC2. The load balancer distributes traffic across multiple ports on the Controller.

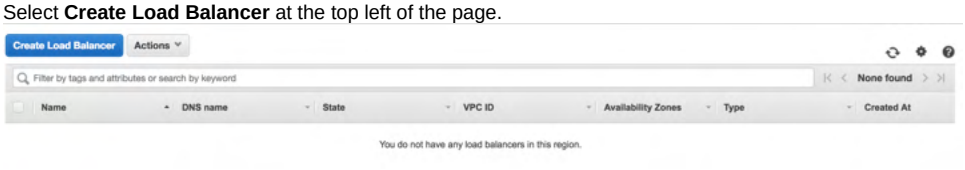
If using HTTPS, an SSL certificate should be available. For testing, you can generate a self-signed certificate using Open SSL (described here). You can then import that certificate using AWS Certificate Manager (ACM).

> ⚠ You can create a load balancer to align with your organization's standards.

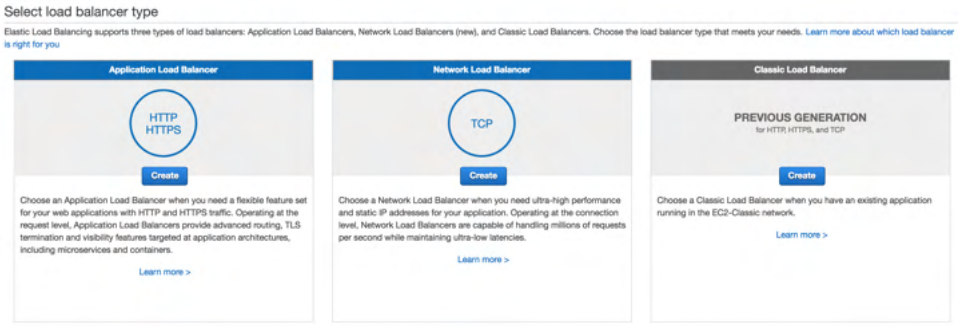
Create a Load Balancer

To create a load balancer:

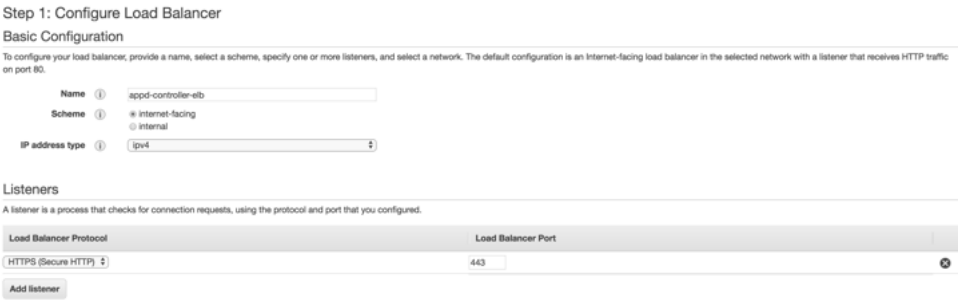
1. Navigate to the Load Balancers page on the EC2 Dashboard in the AWS console.
2. Select **Create Load Balancer** at the top left of the page.



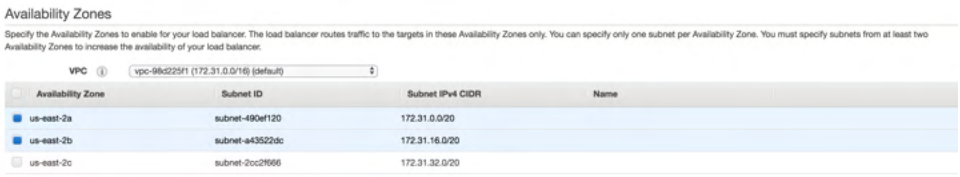
3. Select **Application Load Balancer** as the load balancer type to terminate SSL at the ELB.



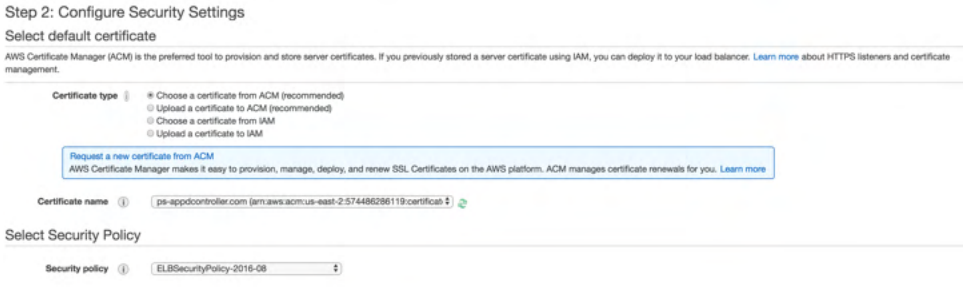
4. Enter a name for the new load balancer, and select **HTTPS (Secure HTTP)** as the load balancer protocol to accept HTTPS traffic only.



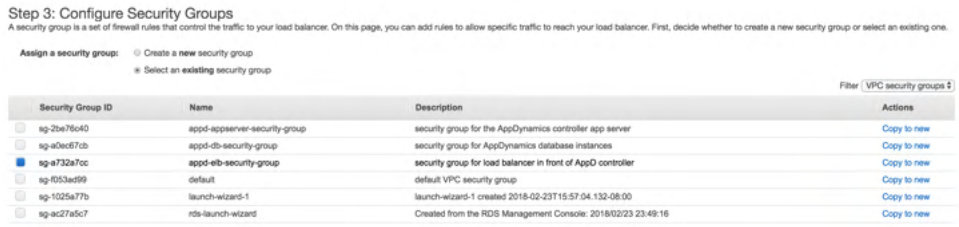
5. Select the availability zones to enable for the new load balancer. It should include the availability zone in which the Controller Appserver EC2 instance resides.



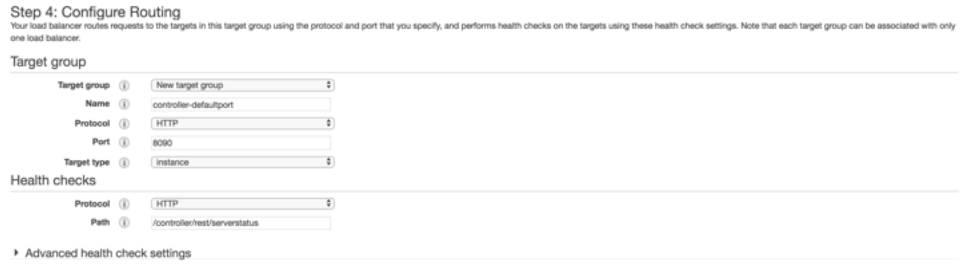
6. Select the certificate that was imported to the ACM.



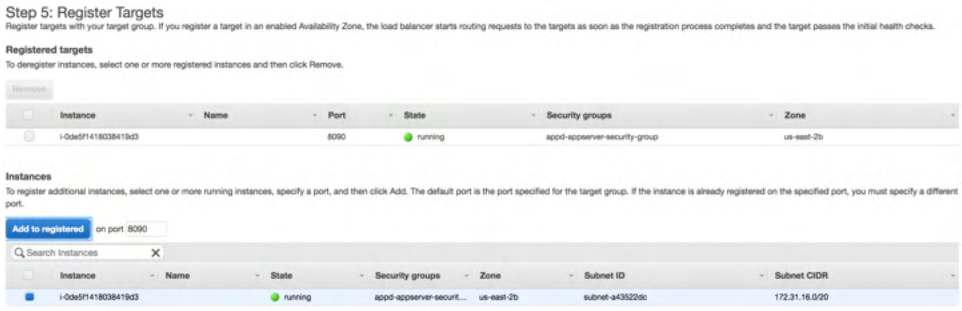
7. Specify the security group.



8. For the initial configuration, set the load balancer to route all traffic to port 8090 using HTTP, and define the standard health check for the Controller.



9. Add the Controller EC2 instance as a registered target.



10. Launch the new load balancer. It may take a few minutes before the load balance occurs.
11. Verify that you can access the Controller UI through the load balancer.

> If your SSL cert is self-signed, a browser warning displays. You can ignore this warning if you are testing the UI. However for Agent traffic, you need a valid certificate that is trusted by the Agent.

Specify the External Load Balancer URL

Use the Enterprise Console UI to update the Controller configuration and specify the external load balancer URL.

1. Open a browser and navigate to the UI:

```
http://<hostname>:<port>
```

   9191 is the default port.
2. Navigate to AppServer Configurations by selecting the platform: **Configurations > Controller Settings > Appserver Configurations**.
3. Enter the external load balancer URL in the appropriate field and select **Save**.

⚠ After applying the optimizations, you should create an AMI.

Configure Listener Rules

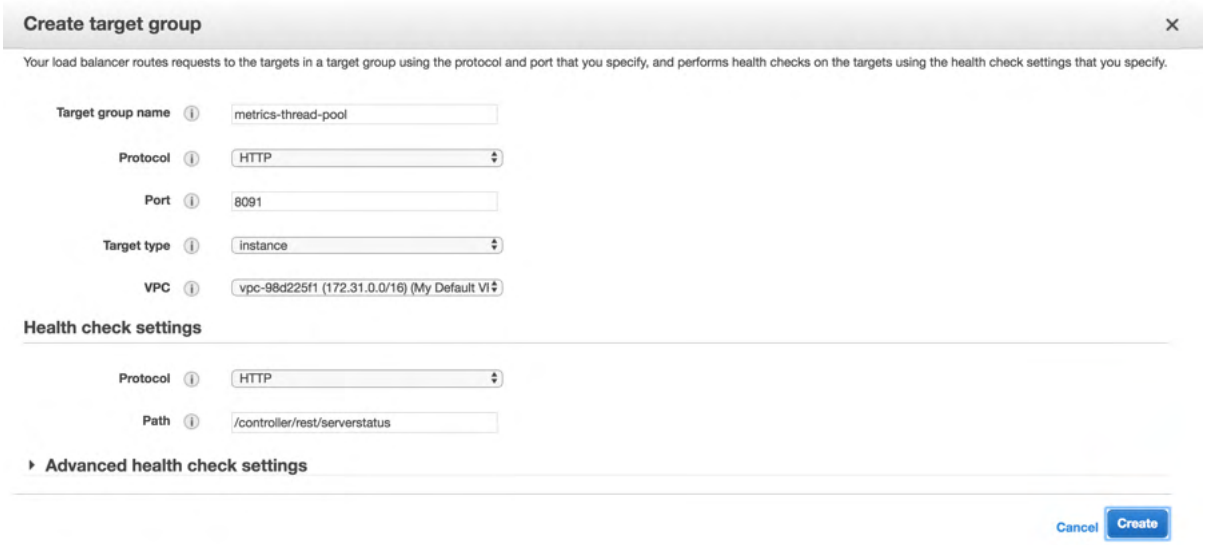
Depending on the type of request, you can define additional rules to route traffic to various ports on the Controller. This table defines rules that users typically include for their load balancer:

Pool Name	URL Pattern	Port Number	Description
`metrics-thread-pool`	`/controller/instance/*/metrics` `/controller/instance/*/metrics*`	8091	Agent metric data upload
`config-thread-pool`	`/controller/instance/*/applicationConfiguration*`	8092	Agent configuration requests
`agent-thread-pool`	`/controller/instance/*`	8093	Other Agent requests
`status-thread-pool`	`/controller/rest/serverstatus`	8094	Server status ping by load balancer
`http-thread-pool`	Default / User Traffic	8090	Default thread pool for all other traffic
`restui-default-thread-pool`	`/controller/restui/*`	8095	Default thread pool for all `restui` traffic
`restui-analytics-thread-pool`	`/controller/restui/analytics/*`	8096	Thread pool traffic for analytics traffic

Create Target Groups

You must create a target group for each of the rules listed in the table, with the exception of the default `http-thread-pool` rule (for which you can use the default target group).

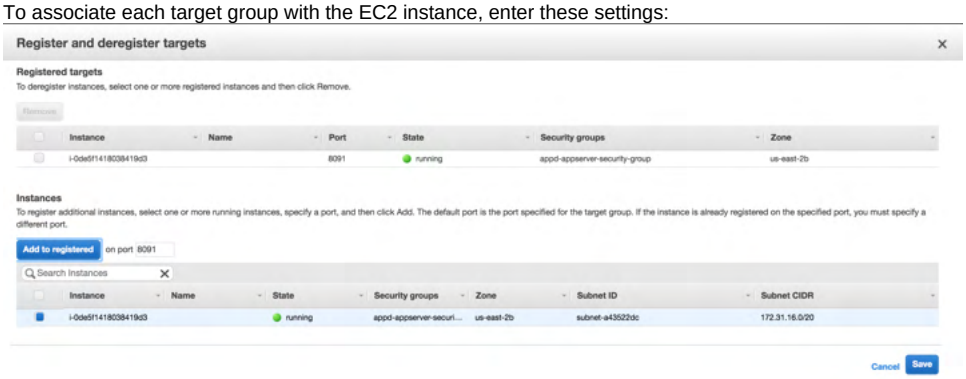
For example, you create a target group for the `metrics-thread-pool` with these settings:



> You can use the health check path for all of the target groups, however you may want to decrease the frequency because performing the same check on all ports every 30 seconds is not required.

Register Targets

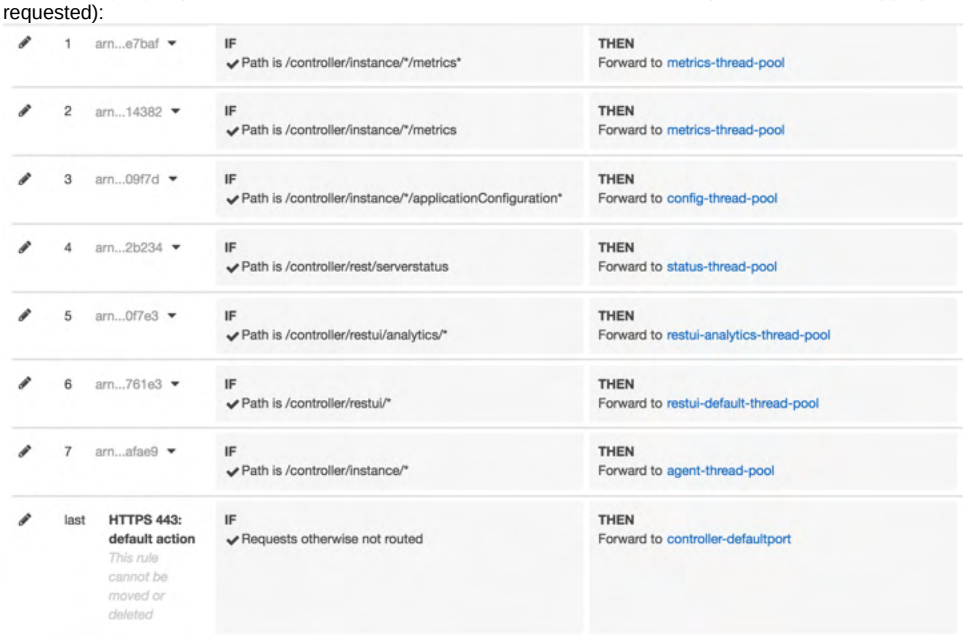
1. To associate each target group with the EC2 instance, enter these settings:



The full list of target groups should display:

Name	Port	Protocol	Target type	VPC ID
agent-thread-pool	8093	HTTP	instance	vpc-98d225f1
config-thread-pool	8092	HTTP	instance	vpc-98d225f1
controller-defaultport	8090	HTTP	instance	vpc-98d225f1
metrics-thread-pool	8091	HTTP	instance	vpc-98d225f1
restui-analytics-thread-pool	8096	HTTP	instance	vpc-98d225f1
restui-default-thread-pool	8095	HTTP	instance	vpc-98d225f1
status-thread-pool	8094	HTTP	instance	vpc-98d225f1

2. After the target groups have been defined, you can add new listener rules to map the traffic to the appropriate target group (based on the path requested):



The order of the rules is important because some paths may match multiple rules.

Create and Manage the AMI

You can create an Amazon Machine Image (AMI) to recover from an unexpected event or create a new Controller from the same image.

The AMI image should be created for the Controller, including required optimizations, and an auto-scaling group should be created based on the AMI. You can configure the Elastic Load Balancer (ELB) to send traffic to instances in the auto-scaling group, which will consist of one EC2 instance at a time.

Create an AMI and Auto Scaling Group

To ensure that you can recover from any interruptions, you need to create an AMI that includes the Controller. Then, you need to create an auto scaling group based on the AMI.

Creating an AMI and auto scaling group involves the following steps:

Step 1: Shut Down the Enterprise Console

You must stop the Enterprise Console before creating an AMI:

```
bin/platform-admin.sh stop-platform-admin
```

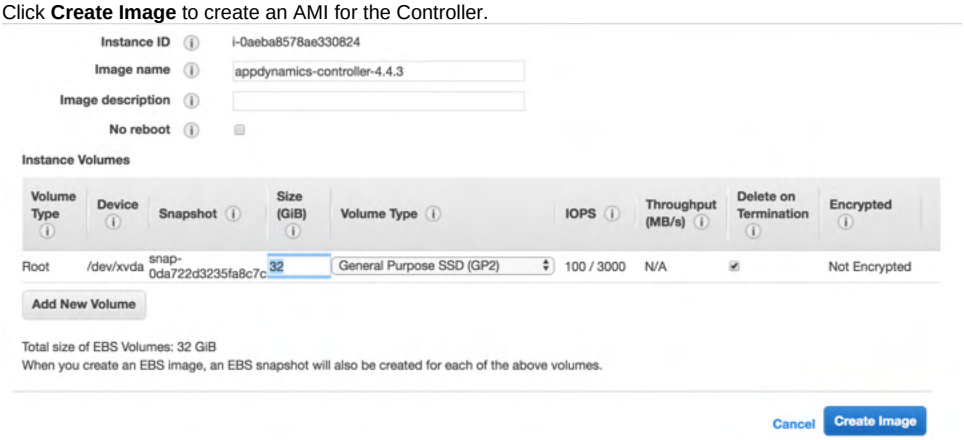
This ensures that all jobs and services are stopped in order to create a clean image.

Step 2: Create an AMI

You can create an AMI to use to deploy a new Controller without having to go through the installation steps again.

> A new AMI should be created whenever the Controller version is upgraded, or configuration changes are made. This ensures that the changes are propagated to the new EC2 instance, in the event that you need to move to a different availability zone, for example. At the same time, previous AMI instances should be retained as well, in case a rollback is required.

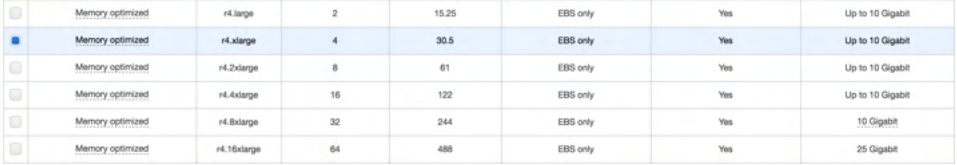
1. Stop the Controller Appserver once optimizations have been applied to it.
2. Click **Create Image** to create an AMI for the Controller.



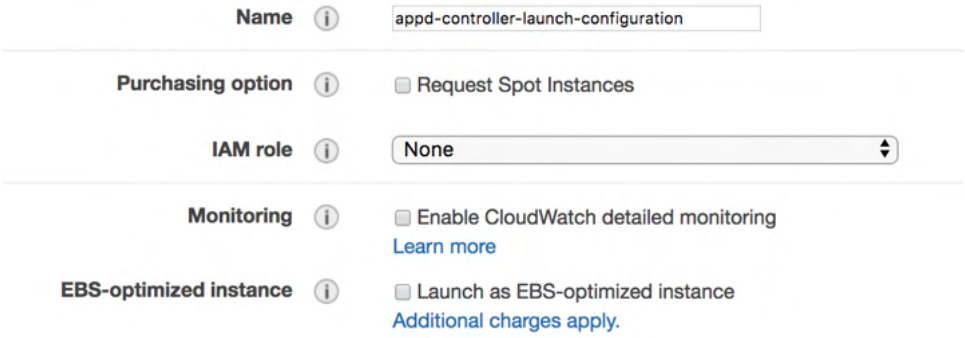
Step 3: Create the Launch Configuration

Once the AMI is created, you can create an auto scaling group that uses it. But first, you need to create the launch configuration:

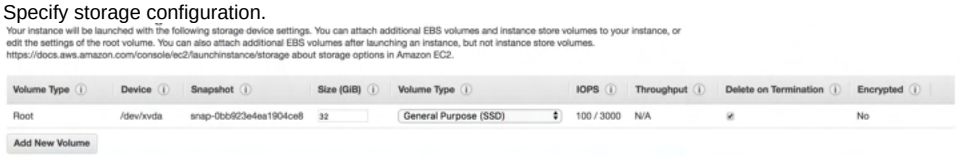
1. Select the appropriate instance type for the app server of your AMI.



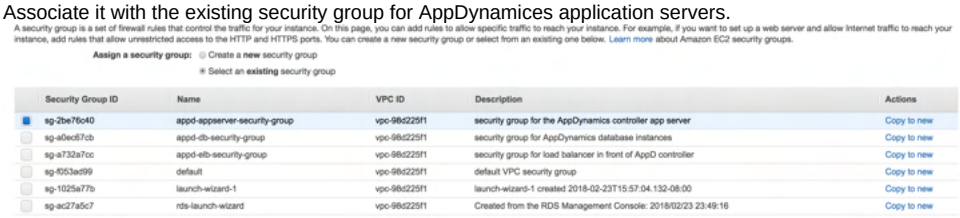
2. Specify a name for the launch configuration.



3. Specify storage configuration.



4. Associate it with the existing security group for AppDynamices application servers.



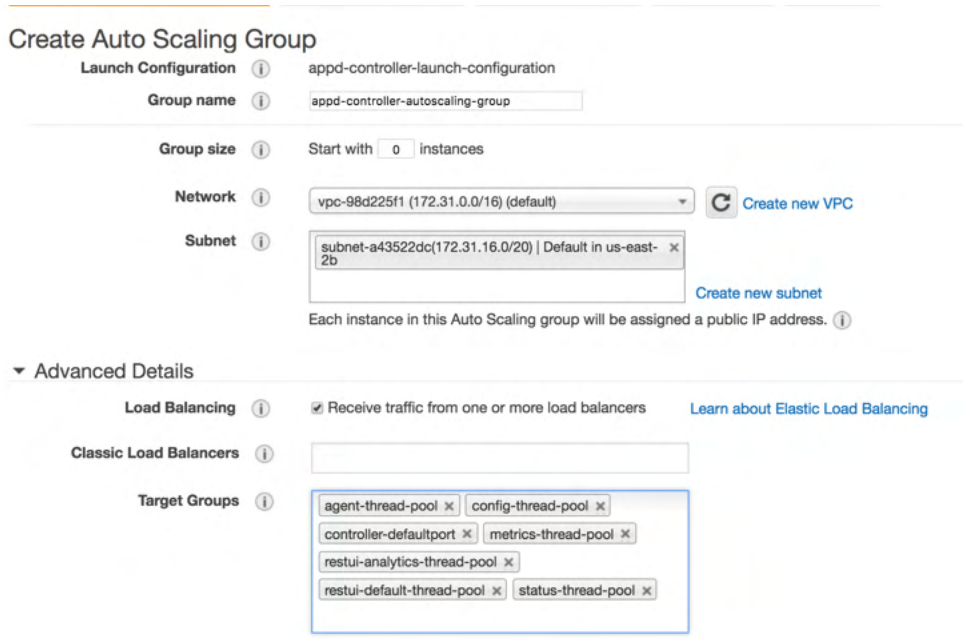
Step 4: Create an Auto Scaling Group

You should create an auto scaling group based on this AMI to ensure that one node is running at any given time.

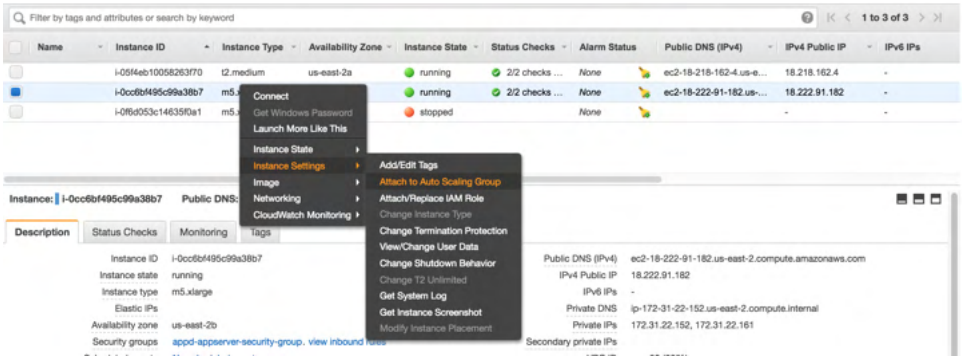
To create an auto scaling group:

1. Specify a name for the auto scaling group, enable traffic from the load balancer, and map the target groups created earlier.

> ⚠ Start with zero instances, as you will need to add your existing instance to the group later.
> Keep the group at its initial size of zero, as you do not want to add more than one Controller at any point in time.



2. Accept the default values for the rest of the settings, and create the auto scaling group.
3. Once the auto scaling group is successfully created, edit the properties to specify the max allowable instances as 1 (up from 0).
4. Go back to the list of EC2 instances, and add the EC2 instance for the Controller Appserver to the new auto scaling group.



Updating the AMI

The AMI should be updated whenever changes are made to the controller EC2 instance. For example:

- When a new license file is dropped on the Controller.
- When O/S configuration changes are made.
- When Controller configuration changes are made, either via the Enterprise Console or directly to domain.xml or other configuration files.

Migrate the Controller Database to Amazon Aurora

You have the option to migrate an existing 4.4.3 or latest on-premises Controller database to Aurora DB. The Controller might already reside in AWS, or in your data center.

Although the Controller already contains a MySQL database, you are recommended to migrate the MySQL database to Aurora because it offers replication, high availability, and elasticity. The Amazon Relational Database Service (RDS) tool handles provisioning, patching, backup, recovery, failure detection, and repair of the database. Also, Aurora DB offers encryption at rest, with encryption of all automated backups, snapshots, and replicas in the same cluster.

If your Controller is not already in AWS, then follow Migrate the Controller to migrate it. Once this is complete, you should have a Controller running on one or two EC2 instances in AWS, depending on whether or not your existing Controller deployment is high availability (HA), with the MySQL database hosted on those instances.

> ⚠ Commands to start and stop the database do not work with Aurora DB.

Migrate MySQL to an Aurora Database for 4.4.3 or Latest

You can create and configure Amazon Aurora to serve as the Controller database for 4.4.3 or the latest version. This process, which uses mysqldump to migrate the database, is required for Controllers running MySQL version 5.7. See Back Up the Controller with mysqldump for more information.

> ⓘ Since Controller upgrades to 4.4.3 from 4.3.x or earlier would use MySQL 5.5, it is important that you know what your Controller MySQL version is. Please refer to Bundled MySQL Database Version to learn how to check your MySQL version and upgrade it if necessary.

Note that running a Controller on AWS requires that some of the `cluster` parameter group and `db` parameter group settings be adjusted. See Deploy the Controller on AWS for more information.

Migrating MySQL to an Aurora Database involves the following steps:

> ⓘ If you attempt to upgrade or move a Controller migrated without its `liquibase-stored` procedures, the upgrade will fail. You must recreate these stored procedures manually in AWS.

1. Step 1: Provision an Empty Aurora Database
2. Step 2: Use mysqldump to Export from MySQL
3. Step 3: Use mysqldump to export stored procedures from the AppDynamics database
4. Step 4: Use mysql to Import to Aurora
5. Step 5: Configure the Controller to Use the Aurora Database

Step 1: Provision an Empty Aurora Database

You first need to start up a new instance of Aurora, using the desired instance type and other custom settings as explained in Deploy the Controller on AWS. Ensure that the database instance is created using port 3388.

Step 2: Use mysqldump to Export from MySQL

> ⚠ Before using `mysqldump`, first, ensure that the Controller app server is stopped. If you attempt to run `mysqldump` while the app server is running, it will severely degrade the performance and stability of the Controller.

To use `mysqldump`, run the `mysqldump` executable, passing the root username, password, and output file:

1. Run the following command to navigate to the executable directory:

   ```
   cd <controller_home>/db/bin
   ```

2. Use the following command to export the database from MySQL:

   ```
   ./mysqldump -u root --databases controller licensing mds_auth mds_configuration mds_entitysearch
   mds_infra_core mds_infra_server mds_license mds_metadata mds_metering mds_rbac mds_topology --single-
   transaction --compress --order-by-primary -p "<password>" > backup.sql
   ```

3. In order to import the resulting file into Aurora, you need to replace the following line:

```
/*!50013 DEFINER=`controller`@`localhost` SQL SECURITY DEFINER */
```

With:

```
/*!50013 DEFINER=`controller`@`%` SQL SECURITY DEFINER */
```

Step 3: Use mysqldump to export stored procedures from the AppDynamics database

Run the following command to export the stored procedures from the AppDynamics database.

```
./mysqldump -u root -p --protocol=TCP -h 127.0.0.1 -P <controller_mysql_port> --no-create-db --skip-add-drop-table --no-create-info --skip-disable-keys mysql proc --result-file=/staging/path/for/mysql.proc.sql
```

This command, through the `--result-file` option, dumps the stored procedures to `/staging/path/for/mysql.proc.sql`.

Step 4: Use mysql to Import to Aurora

1. Run the following command to navigate to the executable directory:

   ```
   cd <controller_home>/db/bin
   ```

2. Connect to the new Aurora instance:

   ```
   ./mysql -u root -p"<password>" -h <hostname>.<aws-region>.rds.amazonaws.com -P 3388 --protocol=TCP
   ```

3. Then create the Controller user, and grant it permissions:

   ```
   CREATE USER 'controller'@'%' IDENTIFIED BY 'controller';
   GRANT USAGE ON *.* TO 'controller'@'%';
   GRANT ALL PRIVILEGES ON `controller`.* TO 'controller'@'%';
   GRANT ALL PRIVILEGES ON `licensing`.* TO 'controller'@'%';
   GRANT ALL PRIVILEGES ON `mds_auth`.* TO 'controller'@'%';
   GRANT ALL PRIVILEGES ON `mds_configuration`.* TO 'controller'@'%';
   GRANT ALL PRIVILEGES ON `mds_entitysearch`.* TO 'controller'@'%';
   GRANT ALL PRIVILEGES ON `mds_infra_core`.* TO 'controller'@'%';
   GRANT ALL PRIVILEGES ON `mds_infra_server`.* TO 'controller'@'%';
   GRANT ALL PRIVILEGES ON `mds_license`.* TO 'controller'@'%';
   GRANT ALL PRIVILEGES ON `mds_metadata`.* TO 'controller'@'%';
   GRANT ALL PRIVILEGES ON `mds_metering`.* TO 'controller'@'%';
   GRANT ALL PRIVILEGES ON `mds_rbac`.* TO 'controller'@'%';
   GRANT ALL PRIVILEGES ON `mds_topology`.* TO 'controller'@'%';
   FLUSH PRIVILEGES;
   ```

   Note

   The Aurora database is protected by security groups to prevent access from unauthorized sources.

4. Import the database backup:

   ```
   ./mysql -u controller -P 3388 -H <hostname>.<aws-region>.rds.amazonaws.com -p "controller" --protocol=TCP < backup.sql
   ```

5. Import the stored procedures:

   The import must be made by an admin or root user.

```
./mysql -u admin -P 3388 -H <hostname>.<aws-region>.rds.amazonaws.com -p "controller" --protocol=TCP <
/staging/path/for/mysql.proc.sql
```

Step 5: Configure the Controller to Use the Aurora Database

1. Change the configuration in the Controller to use the Aurora DB:
    a. In the file `<controller_home>/appserver/mq/lib/props/broker/default.properties`, set the property `imq.persist.jdbc.mysql.property.url` to your Aurora database:

    ```
    imq.persist.jdbc.mysql.property.url=jdbc\:mysql\://<aurora-db>.<aws-region>.rds.amazonaws.com\:3388
    /controller
    ```

    b. In the file `<controller_home>/appserver/glassfish/domains/domain1/config/domain.xml`, set the property `serverName` to the value of your Aurora database:

    ```
    <property name="serverName" value="<aurora-db>.<aws-region>.rds.amazonaws.com"></property>
    <property name="portNumber" value="3388"></property>
    <property name="url" value="jdbc\:mysql\://<aurora-db>.<aws-region>.rds.amazonaws.com\:3388
    /controller?nullNamePatternMatchesAll=true&amp;allowLoadLocalInfile=true&amp;
    cachePrepStmts=true&amp;prepStmtCacheSize=25&amp;dumpQueriesOnException=true&amp;
    rewriteBatchedStatements=true&amp;useSSL=false&amp;maxAllowedPacket=104857600"/>
    ```

    Add the following line to the same file, right before the `javaagent` option:

    ```
    <jvm-options>-Dappdynamics.controller.use.global.datadir.query.for.disk.space.check=false</jvm-
    options>
    ```

    c. In the file `<controller_home>/bin/controller_maintenance.xml`, set the property `db-host` to the value of your Aurora database:

    ```
    <property name="db-host" value="<aurora-db>.<aws-region>.rds.amazonaws.com"/>
    <property name="db-port" value="3388"/>
    ```

    d. In the file `<controller_home>/bin/setup.xml`, set the property `db-host` to the value of your Aurora database:

    ```
    <property name="db-host"value="<aurora-db>.<aws-region>.rds.amazonaws.com"/>
    <property name="db-port" value="3388"/>
    ```

2. Remove the following cache folders from `<controller_home>/appserver/glassfish/domains/domain1` as follows:
    a. `rm -rf osgi-cache/`
    b. `rm -rf generated/`
3. With the Controller service installed, start the Controller with root:

    ```
    service controller start
    ```

4. Verify that the Controller is running successfully. The local MySQL database should be shut down, and you should see the migrated data in Aurora, which can be verified via the Controller UI.

Reset the Controller Database Root User Password

To reset the Controller Database root user password:

1. Log in to the RDS instance as admin:
    a. `./mysql -u admin -h <rds-aurora-endpoint> -P 3388 -p`
2. Use MySQL to run the commands:

a. To specify the Controller database, enter: `use mysql;`
b. To reload the MySQL grant tables, enter: `FLUSH PRIVILEGES;`
c. To determine your MySQL version, enter: `select version();`
d. If you are using MySQL version 5.5, to configure the new password for the root user, enter: `update mysql.user set password=password('<new-password-here>') where user like 'root%';`
e. If you are using MySQL version 5.7. to configure the new password for the root user, enter: `update mysql.user set authentication_string=password('<new-password-here>') where user like 'root%';`
f. To reload the MySQL grant tables, enter: `FLUSH PRIVILEGES;`
g. To exit MySQL, enter: `quit`

Change the Controller Database Root User Password

By default, the password for the controller user of the Aurora database used in your AppDynamics deployment is `controller`.

To change the Controller Database root user password:

1. Log in to the RDS instance as root:
   a. `./mysql -u root -h <rds-aurora-endpoint> -P 3388 -p`
2. Use MySQL to run the commands:
   a. To specify the Controller Database, enter: `use mysql;`
   b. To reload the MySQL grant tables, enter: `FLUSH PRIVILEGES;`
   c. To determine your MySQL version, enter: `select version();`
   d. If you are using MySQL version 5.5, to configure the new password for the root user, enter: `update mysql.user set password=password('<new-password-here>') where user like 'controller%';`
   e. If you are using MySQL version 5.7, to configure the new password for the root user, enter: `update mysql.user set authentication_string=password('<new-password-here>') where user like 'controller%';`
   f. To reload the MySQL grant tables, enter: `FLUSH PRIVILEGES;`
   g. To exit MySQL, enter: `quit`
3. Update the `controller-db-password` alias with the new Controller DB password in Glassfish:

```
cd <controller_home>/appserver/glassfish/bin
./asadmin update-password-alias controller-db-password
```

4. Restart the Controller AppServer for the changes to take effect:

```
cd <controller_home>/bin
./controller.sh stop-appserver
./controller.sh start-appserver
```

5. Verify the change in asadmin:

```
cd <controller_home>/appserver/glassfish/bin
./asadmin ping-connection-pool controller_mysql_pool
```

Upgrade or Move the Controller on AWS

If your Controller instance is deployed on AWS and uses Aurora for its database, you can use the Enterprise Console CLI commands to either *discover and update* or to just *upgrade* your Controller to the latest version. You *cannot* use the Enterprise Console UI, however, to perform the upgrade.

After backing up the Aurora database, use the upgrade method below that best meets your needs:

- Discover and Upgrade - Use this method if you are not sure if you need to upgrade.
- Upgrade - Use this method if you know you are using an older version and want to upgrade. For example, if you want to upgrade from 4.4.3 to the latest.

You can also move the Controller to a new EC2 instance to meet updated performance requirements. For platform-agnostic upgrade instructions, see Upgrade the Controller Using the Enterprise Console.

Back Up the Aurora Database

Before upgrading the Controller, you should back up the Aurora database instance. You should also ensure that you have an Amazon Machine Image (AMI) that accurately reflects the current Controller instance.

> The Enterprise Console upgrades the schema to the latest version. However, upgrading the Controller does not upgrade the Aurora DB server.

Discover and Upgrade the Controller on AWS

The Enterprise Console provides the `discover_upgrade` command that will discover your Controller, determine its version, and then upgrade it if needed.

1. Log in to the Enterprise Console:

   ```
   bin/platform-admin.sh login --user-name <admin_username> --password <admin_password>
   ```

2. Run the following command:

   ```
   bin/platform-admin.sh submit-job --service controller --job discover-upgrade --args
   controllerPrimaryHost="<hostname>" controllerRootUserPassword="<password>" mysqlRootPassword="
   <password>"  databaseType=aurora destinationDirectory="<controllerInstallationDirector>"
   ```

   If your upgrade fails, you can resume by passing the flag `useCheckpoint=true` as an argument after `--args.`
3. Update the AMI after the job finishes.

Upgrade the Controller on AWS

The Enterprise Console provides the `upgrade` command to upgrade the Controller to the latest version. For example, if you are using Controller 4.4.3 and want to upgrade to the latest, you can simply use the `upgrade` command.

1. Log in to the Enterprise Console:

   ```
   bin/platform-admin.sh login --user-name <admin_username> --password <admin_password>
   ```

2. Run the following command on the Enterprise Console host:

   ```
   bin/platform-admin.sh submit-job --service controller --job upgrade --args controllerRootUserPassword="
   <password>" mysqlRootPassword="<password>"
   ```

   If your upgrade fails, you can resume by passing the flag `useCheckpoint=true` as an argument after `--args.`
3. Update the AMI after the job finishes.

Rollback to a Previous AMI

If a rollback is required, complete the following steps:

1. Create a new Aurora instance, using the database snapshot you took earlier as the source.
2. Stop the upgraded Controller if it is still running:

```
bin/platform-admin.sh stop-controller-appserver
```

3. Repoint the database DNS alias to the new Aurora instance.
4. Terminate the EC2 instance hosting the current Controller. This should cause a new EC2 instance to be provisioned using the existing AMI, with the older Controller version.
5. Attach the ENI to the new EC2 instance.
6. Verify that the Controller is working as it was before the upgrade.

Move the Controller on AWS

You can move the Controller to a new EC2 instance by completing the following steps:

1. Terminate the EC2 instance hosting the current Controller. This should cause a new EC2 instance to be automatically provisioned using the AMI.

   > The auto-scaling group and launch configuration are defined with the AMI. Therefore, if the existing EC2 instance in the auto-scaling group dies, it is automatically replaced with a new EC2 instance based on the same AMI.

2. Attach the ENI to the new EC2 instance.
3. Verify that the Controller is working as expected.

Platform Installation Quick Start

This page provides a high-level view of using the Enterprise Console to install the AppDynamics platform, including the Controller and Events Service.

See Discovery and Upgrade Quick Start for the upgrade quick start guide.

About these Steps

The process described in this page uses the Enterprise Console to perform the following tasks:

- Install a Demo Controller and embedded Events Service.
- Install an Events Service that runs on hosts that are separate from the Controller.
- Switch the Controller to a high availability pair.

This quick start is intended to introduce you to the Enterprise Console and AppDynamics platform. Before you start, review the requirements pages for the platform components.

Install the Enterprise Console

1. Install the Enterprise Console with the following command:

   Linux

   ```
   ./platform-setup-64bit-linux.sh
   ```

   Windows

   ```
   platform-setup-64bit-windows.exe
   ```

   When the installation wizard launches, complete it to install the Enterprise Console. For more information about how to install the Enterprise Console, see Install the Enterprise Console.
2. Verify that the Enterprise Console successfully installed by opening the GUI using the host and port you specified during installation:

   ```
   http(s)://<hostname>:<port>
   ```

   9191 is the default port.
3. Complete the installation process with the GUI or command line.

GUI Installation Quick Start

After you install the Enterprise Console, you can complete the platform installation process with the GUI. The following steps describe how to install a Controller with an embedded Events Service. It then describes how to scale up the Events Service to run on a separate host. To install a Controller with a scaled-up (unembedded) Events Service, see Custom Install.

You can install the Events Service on a separate host directly by selecting a Custom Installation at step 2.

1. Open a browser and navigate to the GUI:

   ```
   http(s)://<hostname>:<port>
   ```

   9191 is the default port.
2. Select **Express Install** to install a Controller and Events Service on a shared host.
3. In the **Add a Host** section, choose **Use Enterprise Console Host**. This option installs a Controller with an embedded Events Service on the same host as the Enterprise Console.
4. Choose **Demo** as the Controller profile if you are just getting to know the system.
5. Fill out the Controller configuration fields as indicated. See Express Install for details.
   You now have a running, testable system and can deploy agents. Next, we'll walk you through the steps for scaling up the Events Service. A scaled-up deployment is strongly recommended for installations meant for something other than for demonstration or exploratory purposes.

Scale Up the Events Service

In this step, you expand your platform to use a scaled-up Events Service deployment. It is important to note that data is not migrated from an embedded instance to a scaled-up instance.

1. In the Enterprise Console UI home page, click on the Platform you created previously.

2. Click **Hosts** in the left navigation menu.
3. Add a least three hosts for a scaled-up Events Service, providing a host name and an SSH credential that enables the Enterprise Console to access the host.
4. When finished, go to the **Events Service** page.
5. From the more menu (...), choose **Scale Up Events Service**.
6. In the **Scale Up Events Service** dialog, choose the **Prod** profile and select the hosts you created previously from the **Host** drop-down menu.
7. Click **Submit**.
8. Now set up a load balancer for the Events Service hosts, as described in Load Balance Events Service Traffic.
9. When done configuring the load balancer, you need to indicate to the Controller the addressable URL for the Events Service. In the Controller Administration Console, set these Controller properties:
    - Set `appdynamics.non.eum.events.use.on.premise.events.service` to true.
    - Set `appdynamics.analytics.server.store.url` to the URL of the Events Service as exposed at the load balancer. For example, `appdynamics.analytics.server.store.url=http://es-master-host:9080/`.

Set Up Controller High Availability

Now that you have a running Controller and Events Service, try setting up high availability for the Controller.

Before proceeding, see Set Up a High Availability Deployment. Specifically, follow the steps indicated in the section on configuring Controller High Availability pair environment in for prerequisites.

Once you have fulfilled the prerequisites, follow these steps:

1. In the Enterprise Console UI home page, click on the Platform you created previously.
2. Click **Hosts** in the left navigation menu.
3. Add a single new host. Provide a hostname and an SSH credential that enables the Enterprise Console to access the host.
4. When finished, go to the **Controller** page.
5. Click **Add Secondary Controller**.
6. Provide the same passwords as the primary database and Controller root password, and click **Submit**.

Now you have two Controllers running in passive-active high availability mode. To complete the configuration, you need to set up a load balancer, so that you can easily switch traffic between the Controllers. See Use a Reverse Proxy. After configuring a load balancer, you would need to specify the URL address for reaching the Controller pair in the Enterprise Console UI by clicking **Configurations** > **Controller Settings** > **Appserver Configurations**, and specifying the URL in the **External URL** field.

You now have a functioning platform, consisting of Controller pair and a scaled up Events Service instance.

Install the EUM Server

If using EUM, you can continue by installing an EUM Server. The EUM Server is installed separately, not with the Enterprise Console.

Follow the steps below to get started:

1. Read an overview of the EUM Server in EUM Server Deployment.
2. Learn to install and configure the EUM Server by following the instructions in Install a Demo EUM Server.
3. Install the EUM Server for production.

Discovery and Upgrade Quick Start

Related pages:

- Upgrade Platform Components
- Discover Existing Components

This quick start guide describes how to use the Enterprise Console to discover existing AppDynamics components, such as a Controller, and use it to upgrade them.

Install the Enterprise Console

You can install the Enterprise Console on the same host as the Controller, or provide a separate host for installation.

1. Install the Enterprise Console with the following command:

   Linux

   ```
   ./platform-setup-64bit-linux.sh
   ```

   Windows

   ```
   platform-setup-64bit-windows.exe
   ```

   The installation wizard launches. Complete the wizard to install the Enterprise Console. For more information about how to install the application, see Enterprise Console.
2. Verify that the Enterprise Console successfully installed by opening the GUI using the host and port you specified during installation:

   ```
   http(s)://<hostname>:<port>
   ```

   9191 is the default port.

Discover and Upgrade with the Enterprise Console GUI

The options presented are based on the state of your platform. If you have not created a platform, choose Discovery from the options presented. Complete the wizard to create a platform, add hosts, and discover the Controller and Events Service.

If you created a platform already, such as with the CLI, complete the following steps:

1. Identify the host(s) where the Controller and Events Service are installed.
2. On the **Credentials** page, add credentials to the platform if you are using remote hosts.

   > Remember to provide the private key file for the Enterprise Console machine when adding a credential.

3. Navigate to the Hosts page and add hosts.
   a. If the Controller and Events Service are installed on the same host as the Enterprise Console, select **Add Enterprise Console Host**.
   b. If the Controller and Events Service are installed on different hosts than the Enterprise Console, input the host(s). Select a credential for the host(s) and add credentials to the platform.

Discover and Upgrade with the CLI

1. Navigate to the directory where you installed the Enterprise Console.
2. Create a platform with the following command:

   ```
   bin/platform-admin.sh create-platform --name <platform_name> --installation-dir
   <platform_installation_directory>
   ```

3. Add credentials that the platform can use to access hosts with the following command:

   ```
   bin/platform-admin.sh add-credential --credential-name <name> --type ssh --user-name <username> --ssh-
   key-file <file_path_to_the_key_file>
   ```

`<file path to the key file>` is the private key for the Enterprise Console machine. The installation process deploys the keys to the hosts.

4. Add hosts to the platform:

```
bin/platform-admin.sh add-hosts --hosts localhost host_2 host_3 --credential <credential_name>
```

At a minimum, make sure to bootstrap all of the hosts where the AppDynamics server-side components, namely the Controller and Events Service, are installed.

You may also use the loopback address '127.0.0.1' or the machine's actual hostname in place of 'localhost'.

Enterprise Console

Related pages:

- Install the Enterprise Console
- Administer the Enterprise Console

The Enterprise Console is the installer for the Controller and Events Service. You can use it to install and manage the entire lifecycle of new or existing on-premises AppDynamics Platforms and components. The application provides a GUI and command-line interface.

There is no customer-facing application for SaaS Controllers since they are managed by the AppDynamics Operations team.

If your Enterprise Console host goes down, it does not impact Controllers, Events Service, or High Availability (HA) pairs. Those services will continue to run independently of the application. You can then discover all platforms on a new Enterprise Console host without any impact on the components.

> ⚠ If the Enterprise Console is not available, the auto-failover option for HA pairs will also not be available when there is an issue with the primary Controller. Therefore, it is important to keep the Enterprise Console host in a healthy state.

Enterprise Console Details

The Enterprise Console encompasses management features, installation modes, and lifecycle monitoring.

Enterprise Console Features

The Enterprise Console allows you to perform the following tasks:

Multi-Platform Management

- Manage multiple platforms at the same time using the application

  > ⓘ The Enterprise Console does not require all services within a given platform to have the same major version number.

- Discover, install, and upgrade Controllers, Event Services, and MySQL nodes

  > ⚠ Note that all services on Windows machines must be installed on the Enterprise Console host when using the Enterprise Console since the application does not support remote operations on Windows.

HA-Lifecycle Management (Available on Linux only)

- Manage HA pair lifecycle without the use of the CLI based HA-toolkit or sudo privileges
- Perform failover management

Other Features

- Manage Controller and Events Service lifecycle
- Utilize GUI & CLI support
- Manage AppServer and database configurations

Platform Install Modes

There are two install types that you can use to deploy your platform:

Express Install

- The quickest way to get started for fresh Controller installations
- Install the Controller and an embedded Events Service on a single host

Custom Install

- Configure and customize user inputs and installation/data directories for the Controller and Events Service
- Install or upgrade single or HA Controllers and scaled-up Events Service in a distributed setup

> ⚠ Controller HA pairs and Events Service clusters are not available on Windows machines through the Enterprise Console since the application does not support remote operations on Windows.
>
> You can manually install or upgrade multi-node Events Service clusters. See Install the Events Service on Windows or Upgrade the Events Service Manually.

- Add one or more Events Service nodes
- Discover & Upgrade older platform services

Lifecycle Monitoring

On the Platforms page, you can see all of your platforms, their statuses, and the statuses of their services. Once you have selected a platform to view, the screen is separated into different tabs:

Hosts

Hosts are the actual hardware devices that are connected to the platform. You can add, remove, or change the credentials of your hosts in this tab.

> ⚠ You cannot add a host in a Windows Enterprise Console machine.

Controller

The Controllers page shows the primary and secondary roles of the Controllers and their MySQL nodes. The entire lifecycle operations of Controllers and MySQL nodes can be performed here. You can also see the External URL, which is the IP of the primary machine. Health statuses for the Controllers are also available. You can Add a Secondary Controller if you would like to create an HA pair, then initiate an HA failover if you want to trigger a failover. You can also start or stop a Controller, Upgrade a Controller and MySQL, and more.

Events Service

The Events Service page displays your Events Service cluster, which can be made using one to three machines. Again there is an entire lifecycle of operations you can do.

Credentials

Credentials are your host's usernames and private keys. They are required to SSH or connect to the hosts via system user name and private keys.

Jobs

All of the jobs that you perform on your platform can be seen on the Jobs page. It is a nice way to keep track of your jobs and also see which jobs have failed.

Configurations

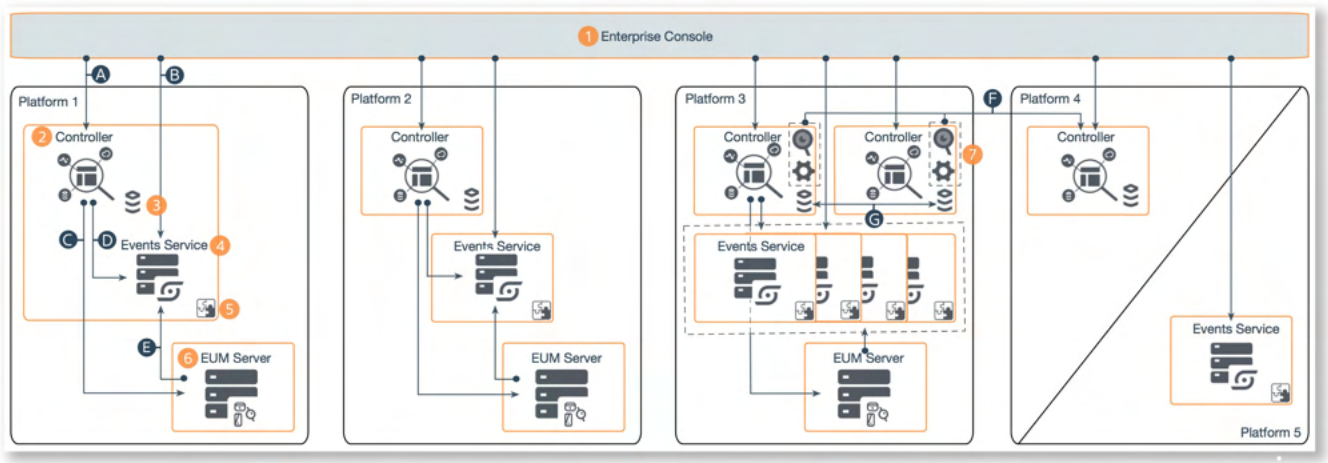
Configurations are important since they let you customize your installations. Configuration settings on the Enterprise Console are separated into three categories: Platform, Controller, and Events Service Settings.

The Controller Settings contains the most configurable settings. The AppServer Configurations under Controller Settings allows you to see all of the Domain configurations which you can initiate from this point or configure your ports. The Database Configurations lets you edit your MySQL settings. So you do not have to tweak the machine, you can do everything from the Console itself.

Enterprise Console Platforms Architecture

The following diagram depicts five platform examples that can be deployed and managed by the Enterprise Console.

> ⚠ You cannot use the Enterprise Console to install the End User Monitoring (EUM) Server. Instead, you must use a package installer that supports interactive GUI or console modes, or a silent response file installation.



Depending on the scale of your deployment, your requirements, and the products you are using, your own application environment is likely to consist of a subset of the components shown in the diagram.

You can find the full On-Premises Deployment Architecture diagram on Application Performance Monitoring Platform, as well as a more detailed On-Premises and SaaS architecture diagram on PDFs.

Enterprise Console Platforms

The following table describes how the components work together in the above platforms.

Platform Number	Components Involved
Platform 1	Platform 1 depicts a single 2 Controller with a local 4 Events Service and 6 EUM Server. The local Events Service contains an 5 API Store.
Platform 2	Platform 2 depicts a single 2 Controller with a remote, single host 4 Events Service and 6 EUM Server. The remote Events Service contains an 5 API Store and can be expanded to a cluster by adding two or more machines.
Platform 3	Platform 3 depicts an HA 2 Controller pair with a remote 4 Events Service cluster and 6 EUM Server. The Events Service cluster contains an 5 API Store on all nodes. The cluster must have three or more nodes.
Platform 4	Platform 4 depicts a single monitoring 2 Controller. This Controller monitors the HA pair in platform 3 by receiving metrics via connection F from the 7 App and Machine Agents. See Manage a High Availability Deployment for more information.
Platform 5	Platform 5 depicts a single shared 4 Events Service. A shared Events Service can connect to multiple 2 Controllers from other platforms, minimizing required maintenance and cost. See Events Service Deployment for more information.

Enterprise Console Platform Connections

The following table lists and describes the traffic flow between the above components in the platforms.

Connection	Source	Destination	Traffic		Protocol	Default Port(s)
A	1 Enterprise Console	2 Controller	Controller Health Checks / Controller Management		HTTP	8090
					HTTPS	8181
B	1 Enterprise Console	4 Events Service	Events Service API Store	Events Service Health Checks / Events Service Management	HTTP(S)	9080
			Events Service API Store Admin		HTTP(S)	9081
C	2 Controller	6 End User Monitoring (EUM) Server	EUM Metric Data		HTTP	7001
					HTTPS	7002 (demo mode only)
D	2 Controller	4 Events Service	Events Service API Store	Analytics Event Data	HTTP(S)	9080
			Events Service API Store Admin		HTTP(S)	9081
E	6 EUM Server	4 Events Service	Events Service API Store	EUM Event Data	HTTP(S)	9080
			Events Service API Store Admin		HTTP(S)	9081
F		2 Controller	Monitoring Metric Data		HTTP	8090

	7 App and Machine Agents			HTTPS	8181
	3 MySQL Database	3 MySQL Database	MySQL Database Replication	TCP	3388

There is no communication from the Controller to the Enterprise Console.

Enterprise Console Requirements

Related pages:

- Controller System Requirements
- Events Service Requirements

The Enterprise Console can run on the same host as the Controller and the embedded Events Service. If this is the case, the machine you choose to run the Enterprise Console must meet the requirements for all the components that run on that machine.

However, we recommend that you place the Enterprise Console on its own separate dedicated host, particularly if you deploy Controllers as High Availability pairs.

Supported Web Browsers

The AppDynamics Enterprise Console UI is an HTML 5-based browser application that works best with the latest version of any browser.

The Enterprise Console UI has been tested with and supports the last two versions of these browsers:

- Safari
- Chrome
- Firefox
- Microsoft Edge
- Internet Explorer

Certain types of ad blockers can interfere with features in the Enterprise Console UI. We recommend disabling adblockers while using the Enterprise Console UI.

CPU Requirements

The Enterprise Console is not CPU intensive and therefore can manage multiple platforms with two Cores.

Memory Space Requirements

The Enterprise Console requires an additional memory of one GB of free RAM for Java and MySQL processes.

Disk Space Requirements

The Enterprise Console requires ten GB of free space to install. After the Enterprise Console installation, there must be at least one GB of additional space on the Enterprise Console host in order to perform any operations, such as installing a remote Controller.

Network Protocol Requirements

The Enterprise Console requires SSH or Secure File Transfer Protocol (SFTP) to be properly configured and enabled for it to use remote hosts.

To access remote hosts, the Enterprise Console uses Java Secure Channel (JSch) API with the provided key file. The Enterprise Console does not support SSH Jump Server. If you use an SSH Jump Server, or have jump host configuration, please contact your AppDynamics representative for deployment options.

cURL

You must install cURL on systems that run Linux.

Required Libraries

Linux systems must include these libraries for Enterprise Console operation:

- `libaio`
- `numactl` package, which includes `libnuma.so.1` for RHEL, CentOS, and Fedora, and `libnuma1` for Ubuntu and Debian
- `glibc2.12`

  This `glibc` version is included into a given operating system release, and therefore cannot be updated.

- `tzdata` for RHEL, CentOS, Fedora, , openSUSE Leap 12 and Leap 15, and Ubuntu version 16 and higher

> The `tzdata` package is also required by the MySQL connector.

- `libncurses5` (and above) for Ubuntu, CentOS, Debian, openSUSE Leap 12 and Leap 15, and Amazon Linux 2

  > As of MySQL 5.5.57 and 5.7.19, `libtinfo.so.5` is a required prerequisite library.

- `ncurses-libs-5.x` for RHEL and CentOS

  > As of MySQL 5.5.57 and 5.7.19, `libtinfo.so.5` is a required prerequisite library.

- SLES12 and SLES15 using `libxml2-2` and `libxml2-tools`

This table provides instructions on how to install the libraries on some common flavors of the Linux operating system.

> If you cannot install the library, check that you have a supported version of your Linux flavor.

Linux Flavor	Command

<table>
<tr>
<td>

- Red Hat
- CentOS
- CentOS Stream
- Amazon

</td>
<td>

Use yum to install the library, such as:

- yum install libaio
- yum install numactl
- yum install tzdata
- yum install ncurses-libs-5.x

Ensure that only one package mgr for rpm and is installed before running the Enterprise Console installer.

For RHEL8, CentOS8, and Amazon2 you can either manually install version 5 of ncurses or use version 6.

- To install version 5, follow these steps:

1. sudo rpm -ivh --force ncurses-base-5.x.rpm
2. sudo rpm -ivh --force ncurses-libs-5.x.rpm

The ncurses-libs depends on the ncurses-base so you must install the ncurses-base first. These are examples of a trusted source for rpm download:

- http://mirror.centos.org/centos/7/os/x86_64/Packages/ncurses-base-5.9-14.20130511.el7_4.noarch.rpm
- http://mirror.centos.org/centos/7/os/x86_64/Packages/ncurses-libs-5.9-14.20130511.el7_4.x86_64.rpm

- To install version 6, follow these steps:

You must either create symlinks for ncurses-libs-5 which points to ncurses-libs-6, or install the ncurses-compat-libs package, to provide ABI version 5 compatibility.

RHEL8 symlink:

```
sudo ln /usr/lib64/libtinfo.so.6.1 /usr/lib64/libtinfo.so.5
sudo ln /usr/lib64/libncurses.so.6.1 /usr/lib64/libncurses.so.5
```

CentOS8 symlink:

```
sudo ln /usr/lib64/libtinfo.so.6.1 /usr/lib64/libtinfo.so.5
sudo ln /usr/lib64/libncurses.so.6.1 /usr/lib64/libncurses.so.5
```

Amazon2 symlink:

```
sudo ln -s /usr/lib64/libncurses.so.6.0 /usr/lib64/libncurses.so.5
sudo ln -s /usr/lib64/libtinfo.so.6.0 /usr/lib64/libtinfo.so.5
```

RHEL8 compat-libs:

```
sudo yum install -y ncurses-compat-libs
```

CentOS8 compat-libs:

```
sudo yum install -y ncurses-compat-libs
```

Amazon2 compat-libs:

```
sudo yum install -y ncurses-compat-libs
```

Use the following prerequisites to install on CentOS Stream:

- sudo yum install -y libaio.x86_64
- sudo yum install -y numactl.x86_64
- sudo yum install -y tzdata
- sudo yum install -y ncurses-compat-libs.x86_64

</td>
</tr>
<tr>
<td>Fedora</td>
<td>

Install the library RPM from the Fedora website:

- yum install libaio
- yum install numactl
- yum install tzdata

</td>
</tr>
</table>

<table>
<tr>
<td>Ubuntu</td>
<td>
Use <code>apt-get</code>, such as:

<code>sudo apt-get install libaio1</code>
<code>sudo apt-get install numactl</code>
<code>sudo apt-get install tzdata</code>
<code>sudo apt-get install libncurses5</code>

⚠ Ensure that only one package <code>mgr</code> between <code>dpkg</code> and <code>rpm</code> is installed before running the Enterprise Console installer. This <code>pkg</code> manager utility will be used to verify mandatory <code>pkgs</code> before the Enterprise Console installation.
ⓘ For Ubuntu20 you can install <code>libncurses5</code> or <code>libncurses6</code>.

If you choose <code>libncurses5</code>:

<code>sudo apt-get install libncurses5</code>
If you choose <code>libncurses6</code>:

<code>sudo apt-get install libncurses6</code>

Note: For <code>libncurses6</code> you need to create symlink for <code>libncurses5</code> pointing to <code>libncurses6</code>.

<code>sudo ln -s /usr/lib/x86_64-linux-gnu/libncurses.so.6.2 /usr/lib/x86_64-linux-gnu/libncurses.so.5</code>
<code>sudo ln -s /usr/lib/x86_64-linux-gnu/libtinfo.so.6.2 /usr/lib/x86_64-linux-gnu/libtinfo.so.5</code>

</td>
</tr>
<tr>
<td>Debian</td>
<td>Use a package manager (such as APT) to install the library (as previously described in the Ubuntu instructions).</td>
</tr>
</table>

<table>
<tr>
<td>openSUSE Leap 12 and Leap 15</td>
<td>
Use zypper to install the library, such as:

sudo zypper install libaio
sudo zypper install libnuma1
sudo zypper install tzdata
sudo zypper install libncurses5

For openSUE Leap 15, you can install libncurses5 or libncurses6.

If you choose libncurses5:
sudo zypper install libncurses5
If you choose libncurses6:
sudo zypper install libncurses6

Note: For libncurses6 you need to create symlink for libncurses5 pointing to libncurses6.
<pre>sudo ln /lib64/libncurses.so.6.1 /lib64/libncurses.so.5
sudo ln -s /lib64/libtinfo.so.6.1 /lib64/libtinfo.so.5ncurses-compat-libs</pre>
Ensure that only one package mgr for rpm and is installed before running the Enterprise Console installer. Also, you need to add the openSUSE machine repository before installing the tzdata package.
<pre>For openSUSE Tumbleweed run the following as root:
zypper addrepo https://download.opensuse.org/repositories/home:amshinde
/openSUSE_Tumbleweed/home:amshinde.repo
zypper refresh
zypper install tzdata

For openSUSE Leap 42.1 run the following as root:
zypper addrepo https://download.opensuse.org/repositories/home:amshinde
/openSUSE_Leap_42.1/home:amshinde.repo
zypper refresh
zypper install tzdata

For openSUSE 13.2 run the following as root:
zypper addrepo https://download.opensuse.org/repositories/home:amshinde/openSUSE_13.2
/home:amshinde.repo
zypper refresh
zypper install tzdata

For openSUSE 13.1 run the following as root:
zypper addrepo https://download.opensuse.org/repositories/home:amshinde/openSUSE_13.1
/home:amshinde.repo
zypper refresh
zypper install tzdata

You may run into file conflicts when two packages attempt to install files with the
same name but different contents. If you choose to continue, the old files and their
contents will be replaced.

See the openSUSE website (https://software.opensuse.org/download.html?project=home%
3Aamshinde&package=tzdata) to manually download and install the tzdata package.</pre>
</td>
</tr>
<tr>
<td>SLES12 and SLES15</td>
<td>
Use zypper to install the library, such as:

sudo zypper install libxml2-2
sudo zypper install libxml2-tools
sudo zypper install libaio1
sudo zypper install numactl
sudo zypper install libcurses5
sudo zypper install tzdata

</td>
</tr>
</table>

See Platform Requirements for operating system support information.

High Availability Requirements

You must install rsync if you plan on deploying a Controller (HA) pair. In addition, when using SSH or an SSH client, note that OpenSSH 5.3p1 is the minimum version supported by the Enterprise Console for HA.

Supported SSH Key Exchanges and Cipher Algorithms

You can use these `ssh` key exchanges and cipher algorithms to customize the `ssh` configuration on your host(s):

Supported ssh	Details
Key Exchanges	• `diffie-hellman-group-exchange-sha1` • `diffie-hellman-group1-sha1` • `diffie-hellman-group14-sha1` • `diffie-hellman-group-exchange-sha256` • `ecdh-sha2-nistp256` • `ecdh-sha2-nistp384` • `ecdh-sha2-nistp521`
Cipher Algorithms	• `blowfish-cbc` • `3des-cbc` • `aes128-cbc` • `aes192-cbc` • `aes256-cbc` • `aes128-ctr` • `aes192-ctr` • `aes256-ctr` • `3des-ctr` • `arcfour` • `arcfour128` • `arcfour256`

Install the Enterprise Console

This page provides information and instructions for installing the AppDynamics Enterprise Console to automate the task of installing and administering the Controller and Events Service. You must install the Enterprise Console to install these components.

About the Enterprise Console Installation

Though the Enterprise Console can run on the same host as the Controller and, if installed, the embedded Events Service, it is recommended that you install it on a separate host. Regardless, the machine that runs the Enterprise Console must meet the requirements for all the components that run on that machine, as outlined below.

The Enterprise Console and Controller must run on separate MySQL instances allowing the Enterprise Console to manage the Controller's instance independent of the Controller host, creating a lightweight setup that consumes less memory.

> ⚠ If you install the Enterprise Console on the Controller machine, it must be in a different directory in order to keep data separate. For instance, if the Controller is installed in `/opt/appdynamics/controller`, the Enterprise Console might be in `/opt/appdynamics/enterpriseconsole`.

You must also avoid port conflicts with the Controller database, which is 3388 by default, whereas the Enterprise Console database is 3377 by default.

The Enterprise Console installation path you choose must be writeable, i.e. the user who installed the Enterprise Console should have write permissions to that directory.

The Enterprise Console prevents multiple users from running commands at the same time. If a second user attempts to run a command while another command is in progress, the second command is not completed and an error message appears indicating that another command is in progress. To avoid such conflicts, the Enterprise Console should generally be used by a single user at a time.

You can enable HTTPS for the Enterprise Console during installation. See HTTPS Support for the Enterprise Console.

> ⚠ Cross-platform (OS) installation, e.g., installing the Enterprise Console on Linux and the Controller on Mac or Windows is not supported.

Installing on AWS Host

When installing the Enterprise Console on an AWS host, you must add the values for the following hostnames and IP addresses to the SAN:

- Public DNS (IPv4)
- IPv4 Public IP
- Private DNS
- Private IPs

Disk and Memory Space Requirements

The host must have enough disk space for the Enterprise Console and a platform, which includes a Controller. There is no need for additional memory for the Enterprise Console when it shares the same host as the Controller. However, when the Enterprise Console host is not shared with the Controller host, then it requires additional disk and memory space. See Enterprise Console Requirements and Prepare the Controller Host to make sure you meet the minimum space requirements.

Software Requirements

On systems that run Linux, you must have cURL and `netstat` installed. Linux systems must also have the `libaio` library installed. This library provides for asynchronous I/O operations on the system.

See Required Libraries for how to install `libaio` and other libraries on some common flavors of the Linux operating system.

Password Requirements

Due to browser incompatibilities, AppDynamics recommends using only ASCII characters for usernames, account names, and passwords

Configure your installation using these password settings:

GUI Mode Screen or Option Label	Response File variable	Description
Database Root User's Password	`mysqlRootUserPassword`	The password of the user account that the Controller uses to access its MySQL database. Do not use the single quotation mark ('), double quotation mark ("), or at sign (@) characters in this password.

Controller root User's Password	`rootUserPassword`	The Controller root user password. The root user is a Controller user account with privileges for accessing the system Administration Console. This password is used for the admin user of the built-in Glassfish application server as well. The Glassfish admin user lets you access the Glassfish console and the `asadmin` utility. See Access the Administration Console. Allowed characters in the password are: a-z, A-Z, 0-9, ., +, =, @, _, -, $, :, #, ,, (,), !, {, }
User Name (Admin User Setup)	`userName`	The username of the administrator account in the Controller UI. This is the administrator for the built-in account if single-tenant systems, or for the initial account for multi-tenant. See Update the Root User and Glassfish Admin Passwords. Usernames and passwords cannot include the @ or ! character. Also note that if this account will be used to access the REST API, additional limitations on the use of special characters in usernames apply. See Create and Manage Tenant Users.

In the password field, you may include the space character at the beginning as well as in the middle of the password string. However, you cannot start passwords with the space character when using the `response.varfile`.

GUI Installation

Before starting, get the Enterprise Console installer version appropriate for your target system. You can get the installer from the AppDynamics Downloads. When ready, follow these steps to install the Enterprise Console:

1. Navigate to the directory where you downloaded the install file.
2. Run the following commands:

   Linux

   ```
   ./platform-setup-64bit-linux.sh
   ```

   You can run the installer as non-root or root.

   Windows

   ```
   platform-setup-64bit-windows.exe
   ```

   It is recommended that you right-click the .exe file and select **Run as Administrator**.

3. After the GUI launches, use it to complete the installation. In Linux, you may also follow the steps in the installation wizard to complete the console installation.

   If you install the Enterprise Console on AWS, use the public DNS for the Enterprise Console hostname when prompted.

Silent Installation

To use the silent installation method, add the -q option, the response file, and the destination directory to the command to run the installer. For example, in Linux, run the following command:

```
./platform-setup-64bit-linux.sh -q -varfile ~/response.varfile
```

It is recommended that, if possible, you provide an absolute path as the installation path specified as the `dir` argument value and not a relative path as shown in the example.

For a Windows system:

```
platform-setup-64bit-windows.exe -q -varfile c:/response.varfile
```

Sample response files for silent installation

Linux

```
serverHostName=HOST_NAME
sys.languageId=en
disableEULA=true

platformAdmin.port=9191
platformAdmin.databasePort=3377
platformAdmin.dataDir=/opt/appdynamics/platform/mysql/data
platformAdmin.databasePassword=ENTER_PASSWORD
platformAdmin.databaseRootPassword=ENTER_PASSWORD
platformAdmin.adminPassword=ENTER_PASSWORD
platformAdmin.useHttps$Boolean=false
sys.installationDir=/opt/appdynamics/platform
```

The `sys.languageID` and `platformAdmin.dataDir` properties are optional. If not specified, the data directory will be in the `/mysql` directory under the platform directory.

Windows

```
serverHostName=HOST_NAME
sys.languageId=en
disableEULA=true
sys.adminRights$Boolean=true

platformAdmin.port=9191
platformAdmin.databasePort=3377
platformAdmin.dataDir=C\:\\AppDynamics\\Platform\\platform-admin\\mysql\\data
platformAdmin.databasePassword=ENTER_PASSWORD
platformAdmin.databaseRootPassword=ENTER_PASSWORD
platformAdmin.adminPassword=ENTER_PASSWORD
platformAdmin.useHttps$Boolean=false
sys.installationDir=C\:\\AppDynamics\\Platform
```

The `sys.languageID` and `platformAdmin.dataDir` properties are optional. If not specified, the data directory will be in the `\mysql` directory under the platform directory.

If you install the Enterprise Console on AWS, use the public DNS for the `serverHostName` value.

After the Installation

After you install the Enterprise Console, you can use the following methods to install the AppDynamics Platform:

- GUI: A graphical interface within a web browser to install the Controller and Events Service. You can select from Express Install or Custom Install of the platform, which includes the option to install a Controller and Events Service.
- Command-line: A CLI to install the Controller and Events Service.

After installing the Enterprise Console, you can select from the Express Install or Custom Install of the platform, which includes the option to install a Controller. For more information about those options, see Enterprise Console.

For information on installing the Controller or Events Service in unattended mode or via the command line, see Enterprise Console Command Line.

Accessing the Enterprise Console

Access the GUI for the Enterprise Console with the following URL:

```
http(s)://<hostname>:<port>
```

Specify the port and hostname you used when you installed the Enterprise Console. The default port is 9191. This port needs to be exposed from your firewall rules so you can access the port from any place. See Port Settings.

For example:

```
http(s)://aHost.aDomain:9191
```

With the GUI, you can install and manage the components of the AppDynamics platform, including tasks such as adding hosts or credentials, installing a Controller, and monitoring jobs.

If you cannot access the GUI, verify that the hostname and port number are correct. Additionally, ensure that the Enterprise Console is running.

The first time you access the GUI, the Enterprise Console shows the following options for installing the AppDynamics Platform:

- **Express:** Select this option for new installations of the Controller and Events Service. The services are installed on the same host.
- **Custom:** Select this option to customize your installation, including installing or upgrading the Controller and Events Service on separate hosts. By installing the Events Service on a separate host, you can create a 1 or 3+ node Events Service based on your needs. Installing an Events Service on a separate host with the Enterprise Console is only supported on Linux. If you want to install the Events Service on a separate host on Windows, see Install the Events Service on Windows.

  > The Events Service is installed by default with a Custom Installation unless you choose to unselect the Install Events Service option.

  - **Discover and Upgrade:** When performing a custom installation, you have the option to discover and upgrade an existing AppDynamics deployment, such as a Controller or Events Service. For example, if you use the package installer to install the Controller in a previous version of AppDynamics, you can use the discover and upgrade option to add the Controller to the AppDynamics platform that the Enterprise Console manages. The application will then upgrade the Controller to the same version of the Enterprise Console. Verify that the Controller and MySQL are running before you attempt to discover and upgrade them.

Troubleshooting the Installation

This section provides troubleshooting information for issues that may arise during the Enterprise Console installation.

Installation Stuck at License Agreement

If your installation becomes stuck at displaying the license agreement on the console, then the EULA may be having issues with special characters. To fix this issue, add the `-VdisableEULA=true` flag to your installation command or `response.var` file. For example:

```
./platform-setup-64bit-linux.sh -c -VdisableEULA=true
```

Enterprise Console Application Is in Use Error

If you get an error that states that the "Enterprise Console Application (9191/3377) is in use," you should check that you have specified the correct hostname during the installation.

Default Font Change on Linux Machines

If your Enterprise Console installation fails on a Red Hat system, it may be due to an install4j issue. If the default font has been changed, the JRE cannot interpret it, leading to a "could not display the GUI" error. You can fix this error by running the installation with `-VdisableEULA=true` and creating the file `/etc/fonts/local.conf` with the following contents:

```
<?xml version='1.0'?>
<!DOCTYPE fontconfig SYSTEM
'fonts.dtd'>
<fontconfig>
  <alias>
    <family>serif</family>

<prefer><family>Utopia</family></prefer>
  </alias>
  <alias>

<family>sans-serif</family>
    <prefer><family>Utopia</family></prefer>

</alias>
  <alias>
    <family>monospace</family>

<prefer><family>Utopia</family></prefer>
  </alias>
  <alias>

<family>dialog</family>
    <prefer><family>Utopia</family></prefer>

</alias>
  <alias>
    <family>dialoginput</family>

<prefer><family>Utopia</family></prefer>
  </alias>
</fontconfig>
```

Rename the Directory Error on Windows Machines

If the Enterprise Console installation fails with an error on "rename of the directory," it may be due to an antivirus scan. Stopping the antivirus scan on the machine fixes the issue. You should also exclude the Enterprise Console directory from the scan if it sits outside of the Controller directory. See Prepare Windows for the Controller.

Express Install

Related pages:

- Controller System Requirements
- Events Service Requirements

You can choose Express Install on the Install page when you first use the Enterprise Console or when you want to create a new platform. This install option provides you with a quick and simple way to install a fresh single node Controller and embedded Events Service.

This page guides you through the steps to perform an Express Install. Before you install the Controller with the Enterprise Console, verify that the Enterprise Console is running and the host machine meets the requirements for the Controller.

If you use the GUI to install the Controller, you can create the platform at the same time. If you use the command line, you must create the platform prior to installing the Controller. For more information, see Administer the Enterprise Console. Express Install does not give you the option to choose the version you would like to install, and instead automatically installs the latest version of each service. If you would like more control over your installation, see Custom Install.

Install the Platform Using GUI

Express Install is the quickest way to get started with setting up your own AppDynamics Platform. You can use it to install the Controller and an Events Service on a single host.

After you install the Enterprise Console, you can complete the platform installation process with the GUI:

1. Check that you have fulfilled the Enterprise Console prerequisites before starting.
2. Open a browser and navigate to the GUI:

   ```
   http(s)://<hostname>:<port>
   ```

   9191 is the default port.
3. Select **Express Install** to install a Controller and Events Service on a shared host.
4. Enter a Name and the Installation Path for your platform.

   > The Installation Path is an absolute path under which all of the platform components are installed. The same path is used for all hosts added to the platform. Use a path which does not have any existing AppDynamics components (Controller, Events Service, etc.) installed under it.
   > The path you choose must be writeable, i.e. the user who installed the Enterprise Console should have write permissions to that folder. Also, the same path should be writeable on all of the hosts that the Enterprise Console manages.
   >
   > Example path: `/home/appduser/appdynamics/product`

5. Add a host by entering host machine-related information: Host Name, Username, and Private Key. To add the Enterprise Console host, click **Add Enterprise Console Host,** which will automatically populate the text field with the hostname of the Enterprise Console machine. You do not need to provide a credential. The Controller and Events Service will be installed on the same host as the Enterprise Console.

   > If the Controller is to be installed on a Windows machine, the Enterprise Console should be on the same machine. This is because Windows hosts are not supported on the Enterprise Console.

   > If you use the Enterprise Console host to install the Controller, then no Username or Private Key is required. You can also install the Controller and Events Service on a remote host. In that case, the Username and Private Key of the remote host would be required.
   >
   > As of OpenSSH version 7.8, the `ssh` keys generated are in OpenSSH format using Ed25519. However, the Enterprise Console expects the `ssh` keys to be formatted using the older `pem` format.

6. Install the Controller:
   a. Select a Profile size for your Controller. See Controller System Requirements for more information on the sizing requirements.
   b. Enter the required Username and Passwords. The default Controller Admin Username is admin.
7. Click **Install**.

After clicking Install you can monitor the status of your platform creation jobs on the Jobs page, which include Add Hosts, Controller Install, and Events Service Install Jobs. Note that the Controller Install Job takes a considerably longer time to complete than the other two jobs. When the jobs successfully complete, you can check the status of your platform, obtain the URL of the Controller, update platform configurations, and manage the lifecycle of your services.

See Install the Events Service on Linux for additional setting requirements and to learn how to scale up an embedded Events Service.

Custom Install

Related pages:

- Controller System Requirements
- Events Service Requirements

The Controller is the central component of the AppDynamics platform. Other components such as the Events Service connect to the Controller and stream metrics to be displayed. The Enterprise Console Custom Install option provides you with a configurable way to install a fresh Controller and Events Service. You can also Discover & Upgrade older platform services using Custom Install.

This page describes how to use Custom Install to install the Controller. Before you install the Controller with the Enterprise Console, verify that the Enterprise Console is running and the host machine meets the requirements for the Controller.

If you use the GUI to install the Controller, you can create the platform at the same time. If you use the command line, you must create the platform prior to installing the Controller. For more information, see Administer the Enterprise Console. If instead, you would like to get started with your platform as soon as possible, see Express Install.

Install the Controller Using GUI

Installing a fresh Controller, HA-pair, or Events Service cluster is simple with Custom Install. You can use it to configure your platform deployment freely.

After you install the Enterprise Console, you can complete the platform installation process with the GUI:

1. Check that you have fulfilled the Enterprise Console prerequisites before starting.
2. Open a browser and navigate to the GUI:

   ```
   http(s)://<hostname>:<port>
   ```

   9191 is the default port.
3. Navigate to the **Install** homepage and click **Custom Install**.
4. Enter a name and installation path for your platform.

   > The Installation Path is an absolute path under which all of the platform components are installed. The same path is used for all hosts added to the platform. Use a path which does not have any existing AppDynamics components installed under it.
   > The path you choose must be writeable, i.e. the user who installed the Enterprise Console should have write permissions to that folder. Also, the same path should be writable on all of the hosts that the Enterprise Console manages.
   >
   > Example path: `/home/appduser/appdynamics/product`

5. Add a host by entering host machine-related information: Host Name, Username, and Private Key. This is where the Controller and Events Service will be installed onto.

   > As of OpenSSH version 7.8, the `ssh` keys generated are in OpenSSH format using Ed25519. However, the Enterprise Console expects the `ssh` keys to be formatted using the older `pem` format.

   For more information about how to add credentials and hosts, see Administer the Enterprise Console.

   > If the Controller is to be installed on a Windows machine, the Enterprise Console should be on the same machine. This is because Windows hosts are not supported on the Enterprise Console.

6. Install Controller:
   a. Select **Install**.
   b. Select an available Target Version from the dropdown list.

      > The list is populated by versions that the Enterprise Console is aware of. This means that you can install the Controller to any intermediate version or to the latest version as long as the Enterprise Console installer has been run for those versions.

   c. Select a Profile size for your Controller. See Controller System Requirements for more information on the sizing requirements.
   d. Enter the Controller Primary Host.
   e. Enter the Controller Secondary Host if you would like to install an HA pair.

> It is highly recommended that you have the Enterprise Console on its own separate dedicated host, especially in the case of HA installations. This means you would need three hosts for the recommended HA setup. If the Enterprise Console and Controller are on the same host and that host becomes unavailable, the Enterprise Console will not be able to failover to the other Controller.
> You can set up an HA pair at a later time. See Set Up a High Availability Deployment for additional setting requirements and to learn how to add a secondary controller after your initial installation.

f. Optional: Enter the Tenancy Mode.
g. Under Advanced, enter additional information for your HA pair.
h. Enter the required Username and Passwords. The default Controller Admin Username is admin.

> If you do not install a Controller at this time, you can always do so later by navigating to the **Controller** page in the GUI and clicking Install Controller.

7. Install Events Service:
   a. Select **Install**.
   b. Select the Profile size for your Events Service. See Controller System Requirements for more information on the sizing requirements.
   c. Optional: Enter the Installation and Data Directory.

> You do not need to specify the installation or data directory for the Events Service installation. If you do, use a different one from the platform or mysql data directory.

   d. Optional: Enter the Elastic Search, REST API Admin, REST API, and Unicast Ports.
   e. Enter the Events Service Host. You can deploy a single Events Service node or an Events Service cluster made up of three or more nodes. The minimum size of an Events Service cluster is three. You can always add more at a later time on the Events Service page.

> You can set up a scaled up Events Service at a later time. See Install the Events Service on Linux for additional setting requirements and to learn how to scale up an embedded Events Service.

> If you do not install an Events Service at that time, you can always do so later by navigating to the **Events Service** page in the GUI and clicking Install Events Service.

8. Click **Install**.

After clicking Install you can monitor the status of your platform creation jobs on the Jobs page, which include Add Hosts, Controller Install, and Events Service Install Jobs. Note that the Controller Install Job takes a considerably longer time to complete than the other two jobs. When the jobs successfully complete, you can check the status of your platform, obtain the URL of the Controller, update platform configurations, and manage the lifecycle of your services.

Once any high availability controllers are installed, they can be found under the Controller page. All high availability lifecycle operations such as start, stop, upgrade, and failover can be performed from this page.

Administer the Enterprise Console

You can use the GUI or command line to perform the following platform administration tasks with the Enterprise Console:

- Create new platforms
- Remove existing platforms
- Manage credentials
- Manage hosts

> Some tasks may not be available through both the GUI and command line. Most of the commands described here are based on the Linux command line and cover common tasks for managing the platform. You can run similar commands with the Windows command prompt by replacing the `platform-admin.sh` script with `platform-admin.exe cli`.

Run the commands from the `<Enterprise Console installation directory>/platform-admin` directory. This page contains the minimum options and parameters required to run a command.

Some commands may have more options and parameters. To see these additional options, run the command with `-h` specified. For example, run the following command to see all the options and parameters for the create a platform command:

Start or Stop the Enterprise Console

The Enterprise Console must be running before you can perform other tasks or use the GUI.

> The same user who installed the Enterprise Console should be the same user who starts or stops the Enterprise Console.

Use the following commands to start or stop the Enterprise Console:

To stop the Enterprise Console, replace `start` with `stop`.

Manage Platforms

The platform is the collection of AppDynamics components and their hosts. The Enterprise Console supports up to 20 platforms at a time by default.

Create a Platform

To use the Enterprise Console for end-to-end installation and management, you must first create a platform. The Enterprise Console creates the platform when you complete the Express or Custom installations or discover existing components in the GUI.

To use the command line to create a platform, run the following command:

The platform installation directory is the absolute directory where the Enterprise Console installs all AppDynamics components on all of its hosts. Once you add a host to the platform, you can no longer change the directory. Additionally, the directory cannot contain a space.

Delete a Platform

You can use the Enterprise Console to delete a platform that is no longer in use. You may also want to consider editing the Platform's configuration instead. You can perform either action on the Platform view page of the GUI.

To use the command line to delete a platform, run the following command:

> If you just deleted your current platform, you must clear the value of the `APPD_CURRENT_PLATFORM` variable to prevent unexpected errors when running future commands.

Manage Credentials

Manage the credentials that the Enterprise Console uses to access and perform tasks on hosts, such as adding a node to an Events Service. You can use the Credentials page in the GUI or the command line to manage credentials. You should add credentials to the platform before you add hosts.

Generate an RSA Key Pair

An RSA private key file is required to add credentials to a platform. The following steps will generate an RSA key pair that consists of the public key file `~/.ssh/id_rsa.pub` and the private key file `~/.ssh/id_rsa`.

1. Log in to the Enterprise Console host machine via SSH.

2. Switch to the user that is the owner of the Enterprise Console:

```
sudo -i -u <user-owner of the EC>
```

3. Create the RSA key pair:

```
ssh-keygen -t rsa -b 2048 -N '' -m pem
```

4. Accept the default location for the key pair at `~/.ssh`.
5. Confirm that the RSA public and private key files have been created:

```
ls ~/.ssh/
id_rsa
id_rsa.pub
```

Add Credential

When you add a credential, you need the following information:

- Credential name
- Username
- Private key file

The credential name is the unique identifier for a credential and is used to specify the credential when you perform tasks such as adding a host. AppDynamics recommends that you follow the naming convention for all of your credential names. The `id_rsa`, RSA private key, should be created using the OpenSSL PEM encoding format over the Open SSH standard encoding.

The Unix system user specified in the username field must have writeable access to the platform directory.

You can add a credential in the GUI by clicking **Add**.

```
bin/platform-admin.sh add-credential --credential-name <name> --type <ssh> --user-name <username> --ssh-key-
file <file path to the key file>
```

Where `<file path to the key file>` is the private key for the Enterprise Console machine. The installation process deploys the keys to the hosts.

Remove Credential

Remove a credential that is no longer used. You cannot remove a credential that is still used by a host. You can remove a credential in the GUI by selecting the credential and clicking **Delete**.

```
bin/platform-admin.sh remove-credential --credential-name <name>
```

List Current Credentials

```
bin/platform-admin.sh list-credentials
```

Manage Hosts

The hosts are the machines used to run AppDynamics components such as the Controller and Events Service. For example, the Events Service can run on the same host as the Controller, a single host, or a cluster of three or more hosts.

You must properly configure the credential you use to add a new host on a remote host. This means that for a private key that you have specified, you must add the corresponding public key to the remote host `~/.ssh/authorized_hosts` file.

The Controller and Events Service must reside on the same local network and communicate by internal network. Do not deploy the cluster to nodes on different networks, whether relative to each other or to the Controller where the Enterprise Console runs. When identifying cluster hosts in the configuration, you will need to use the internal DNS name or IP address of the host, not the externally routable DNS name.

For example, in terms of an AWS deployment, use the private IP address such as 172.31.2.19 rather than public DNS hostname such as `ec2-34-201-129-89.us-west-2.compute.amazonaws.com`. You must then go to the Appserver Configurations under Controller Settings in the Enterprise Console GUI, and edit the external URL so you can access the page.

The host that runs the Enterprise Console is automatically created and added to the platform as the hostname of the Enterprise Console machine if you use the GUI to install or discover components. If you do not use the GUI, you must manually add this host.

Hosts can be managed through the Enterprise Console GUI on the Hosts page or the command line.

The `id_rsa`, RSA private key, should be created using the OpenSSL PEM encoding format over the Open SSH standard encoding.

Set Up Remote Hosts

To set up seamless Enterprise Console communications with remote hosts, perform the following steps:

From the command line:

1. Set up the following passwordless SSH:
    - From the Enterprise Console to the Controller.
    - If HA then:
        - from the Enterprise Console to the primary Controller.
        - from the Enterprise Console to the secondary Controller.
        - From the primary Controller to the secondary Controller.
        - from the secondary Controller to the primary Controller.

From the Enterprise Console:

2. Identify the Enterprise Console Linux AppDynamics user's public/private key pair (usually in `~/.ssh`).

3. Add the Enterprise Console Linux AppDynamics user's public key (`~/.ssh/id_rsa.pub`) into the remote Controller server Linux user's `~/.ssh/authorized_keys`.

4. Then `chmod 600 /.ssh/authorized_keys`.

5. Test the SSH connection from the Enterprise Console server with the following:

```
ssh <remote user>@<remote-server> hostname
```

6. Verify that the remote hostname is printed. You may have to first answer yes to trust the server fingerprint.

7. Access the Enterprise Console UI Credential page, and add or edit the existing credentials.

8. Create a single credential, which will likely be the same for all remote hosts, with a name like: `EC-<ec linux user name>-<remote appd user name>` For example, `EC-ecappduser-appduser` , or `EC-appdyn` if the username is the same on the Enterprise Console and remote server.

9. Enter the remote server Linux username. It might be the same as the local Enterprise Console AppDynamics user.

10. Supply the Enterprise Console Linux user's `~/.ssh/id_rsa` contents as the private key as chosen in step 2.

Add Hosts

Before you add hosts to the platform, ensure that the required credentials are added to the platform.

You should also check that the user ID created matches those in the credentials. Additionally, the path you specify for the platform base directory must exist.

You can add a host in the GUI by clicking **Add**.

```
bin/platform-admin.sh add-hosts --hosts host_1 host_2 host_3 --credential <credential name>
```

Instead of listing the hosts with --hosts, you can specify a text file with a line-separated list using the following command:

```
bin/platform-admin.sh add-hosts --host-file <file path to host file> --credential <credential name>
```

If you do not use the GUI, you must add the host for the Enterprise Console. This is also the host used by the Controller and embedded Events Service. The host is named "localhost" and does not require credentials. For example, run the following command:

> You may also use the loopback address '127.0.0.1' or the machine's actual hostname.

Remove Hosts

Before you remove a host, ensure that you remove all AppDynamics components from the host. You can remove a host in the GUI by selecting the host and clicking **Remove**.

```
bin/platform-admin.sh remove-hosts --hosts host_1 host_2 host_3
```

Instead of listing the hosts with `--hosts`, you can specify a text file with a line-separated list using the following command:

```
bin/platform-admin.sh remove-hosts --host-file <file path to host file>
```

If a host becomes unreachable, you can use the following command to remove it:

```
bin/platform-admin.sh remove-dead-hosts --hosts <host name>
```

This removes the host and all of its associated metadata from the Enterprise Console database.

> Running `remove-dead-hosts` could leave various services in an inconsistent state.

List Current Hosts

Update Host Credentials

Change the credential that the Enterprise Console uses to access hosts. You can change the host credential in the GUI by selecting the host and clicking **Change Credentials**.

```
bin/platform-admin.sh update-host-credential --hosts host_1 host_2 host_3 --credential <credential name>
```

Similar to the add and remove host commands, you can specify a text file instead of providing a list of hosts within the command.

Manage the Enterprise Console Admin User Password

Change the Admin User Password

You can change the password for the admin user with the following command:

Reset the Admin User Password

You can reset the password for the Enterprise Console's root user with the following command:

Resetting the password sets it to "admin".

Manage the Enterprise Console Database Root User Password

Change the Database Root User Password

To change the `platformAdmin.databaseRootPassword`, follow these steps:

1. Stop the Enterprise Console by running the following command in <EC_home>/Platform/platform-admin/bin:

```
bin/platform-admin.sh stop-platform-admin
```

2. Run the following command in <EC_home>/Platform/mysql/bin:

```
bin/mysqld --defaults-file="/<EC_home>/Platform/mysql/db.cnf" --skip-grant-tables
```

   Replace <EC_home> before running the command.
3. Open a new command prompt window.
4. Connect to the database without using a password by running the following command in <EC_home>/Platform/mysql/bin:

```
bin/mysql -u root -h 127.0.0.1 -P 3377 --protocol=TCP
```

5. Execute the following queries:

```
update mysql.user set authentication_string=password('<new_password_here>') where user like 'root%';
flush privileges;
quit;
```

   Replace <new_password_here> before executing the queries.
6. Quit the command prompt.
7. Stop the Enterprise Console Database by running the following command in <EC_home>/Platform/platform-admin/bin:

```
bin/platform-admim.sh stop-platform-admin
```

   ⚠ This is to stop the MySQL DB and start it without using the --skip-grant-tables option that is in the next step.

8. Start the Enterprise Console by running the following command in <EC_home>/Platform/platform-admin/bin:

```
bin/platform-admin.sh start-platform-admin
```

9. Verify the login by running the following command in <EC_home>/Platform/mysql/bin:

```
bin/mysql -u root -p -P 3377 -h 127.0.0.1
```

Manage the Enterprise Console Database User Password

Change the platformAdmin Database User Password

To change the platformAdmin.databasePassword, follow these steps:

ⓘ Use the application ID that owns the AppDynamics platform installation when running the commands.

1. Start the Enterprise Console, if it is not already running.
   Run the following command, replacing <EC_home> before running the command:

```
<EC_home>/platform/platform-admin/bin: ./platform-admin.sh start-platform-admin
```

2. Navigate to the <EC_home>/platform/mysql/bin directory.
3. Log in to the database as the root user by running the following command:

```
./mysql -u root -p -h 127.0.0.1 -P 3377 --protocol=TCP
```

4. Execute the following queries, replacing <new_password_here> before executing the query.

```
update mysql.user set authentication_string=password('<new_password_here>') where user like
'platformadmin%'; flush privileges; quit;
```

5. Verify the login by running the following command in the <EC_home>/Platform/mysql/bin directory:

```
./mysql -u platformadmin -p -P 3377 -h 127.0.0.1
```

6. Navigate to the <EC_home>/platform/platform-admin/bin directory.
7. Run the command below to encrypt the new password that was set for platformadmin in step 4.

```
./platform-admin.sh encrypt --text '<new_password_here>'
```

   Take note of the encrypted password.
8. Navigate to the <EC_home>/Platform/platform-admin/conf directory.
9. Backup the PlatformAdminApplication.yml file.
10. Using a text editor, such as vi, open the PlatformAdminApplication.yml file and find the encrypted password: line in the database: section.
11. Update the encrypted password, replacing the text after the password: entry with the password noted after step 7 and save the changes.
12. Stop the Enterprise Console by running the following command in the <EC_home>/Platform/platform-admin/bin directory:

```
./platform-admin.sh stop-platform-admin
```

13. Start the Enterprise Console by running the following command in the <EC_home>/Platform/platform-admin/bin directory:

```
./platform-admin.sh start-platform-admin
```

14. Validate that the Enterprise Console started successfully.

Change the Installation Directory

The installation directory you specify when creating the platform is used to install all AppDynamics components. This directory can be changed but requires that you uninstall all AppDynamics components.

1. Uninstall all AppDynamics components that you installed.
2. Remove all hosts from the platform, including the localhost. For example, run the following command to remove the localhost:

```
bin/platform-admin.sh remove-hosts --hosts localhost
```

3. Change the installation directory:

```
bin/platform-admin.sh update-platform --installation-dir <directory>
```

> The installation directory cannot contain a space

After you change the installation directory, you must add hosts and reinstall AppDynamics components.

Troubleshooting Administration Tasks

Check Availability of the Enterprise Console

You can use the following API to check the availability of the Enterprise Console:

```
http://econsole-host:9191/service/version
```

Error While Adding Hosts

While adding hosts to your platform, you may run into an "Enterprise Console host expansion failed" error. If you do, you should ensure that SFTP is enabled in your `sshd_config`, and restart the SSH service.

Remove Unused Artifacts

The purge clean up script (`purge.sh`) is available from Enterprise Console version 4.5.17 or later.

To remove unused artifacts from a prior Enterprise Console installation, you can run a purge clean up script (`purge.sh`). The `purge.sh` script preserves any artifacts required to run and upgrade the components in your existing platform.

- The purge clean up script must be run with the same user who installed the Enterprise Console.
- Verify that there are no jobs currently running from the Enterprise Console.

From the CLI:

1. Use the `plan` command to show the purge script execution plan.

   ```
   <platform-admin>/pa-purger/purge.sh plan
   ```

   The execution plan shows you the exact commands to run when you use the `apply` command.
2. Use the apply command to run and apply the commands of the purge script execution plan.

   ```
   <platform-admin>/pa-purger/purge.sh apply
   ```

3. Restart the Enterprise Console.

Old JREs that are not being used by any product services (Events Service or Controller) are cleared during the implementation of job `upgrade-orcha` which is ran when the Enterprise Console is upgraded. You can use the `upgrade-orcha` job on the `adhoc` basis to clean up old JREs.

```
#linux
./platform-admin.sh upgrade-orcha
#windows
platform-admin cli upgrade-orcha
```

Enterprise Console Command Line

The Enterprise Console command line utility allows you to perform orchestration tasks in an automated way. It is designed with the following limitations in mind:

- There is not a complete match of all the functionalities provided by the web UI.
- The command line utility is only supported to run on the host where the Enterprise Console is installed.

Command Line Directory

The platform-admin.sh|bat script in the `<Enterprise Console home>/platform-admin/bin` directory on the host machine provides a set of commands to install and manage the AppDynamics platform.

To see the operations available for the Enterprise Console, from the command line, navigate to directory and run the script with -h specified:

And you can view the format for each command in the command line by specifying the -h argument for a specific command:

You can also use `bin/platform-admin.sh list-jobs --service <controller or events-service>` to see a list of jobs available for the provided service. You can then see what parameters are required for the provided job using `bin/platform-admin.sh list-job-parameters --job <job_name> --service <controller or events-service>.`

Not all commands available on Linux are available on Windows. Refer to the list of the Enterprise Console commands displayed with the `-h` parameter.

The Enterprise Console prevents multiple users from running commands at the same time. If a second user attempts to run a command while another command is in progress, the second command is not completed and an error message appears indicating that another command is in progress. To avoid such conflicts, the Enterprise Console should generally be used by a single user at a time.

Logging into and out of the Enterprise Console

Commands for logging in and out of the Enterprise Console are:

- `login --user-name <admin_username> --password <admin_password>`
  If it has been more than one day since your last session, you will have to log in before you are able to use the command line utility. You will also have to log in again if you see the following error message:

  ```
  error: Command failed due to an error: Unauthorized
  API code 401
  Session expired. Please login and run the command again.
  ```

- `logout`

Managing the Password of the Enterprise Console

Commands for resetting or changing your Enterprise Console password are:

- `reset-password`
  If you forget your admin password or run into a 401 error, run this command to reset your password to its default value, `admin`. You will need to log out then log back in for this change to take effect.
- `change-password --user-name <username> --password <old_password> --new-password <new_password>`

Starting and Stopping the Enterprise Console

Just as you can start and stop the Controller and Events Service, you can start and stop the Enterprise Console process. Commands for starting and stopping the Enterprise Console are:

- `start-platform-admin`
- `stop-platform-admin`

The Enterprise Console must be running to install or administer Events Service nodes.

Getting Platform Versions

You can get the version of the Enterprise Console and any other components that you installed with the Enterprise Console.

To get the version of the Enterprise Console:

To get the version of one of the platform components:

Setting the Current Platform

The optional parameter, `--platform-name`, can be passed in each of your commands to set the current working platform. However, you can set the environment variable, `APPD_CURRENT_PLATFORM`, so that you do not have to pass the current working parameter with each of your commands. You can set this variable using `setenv` or `export`. The Enterprise Console will pick up the value if it is present.

If you happen to provide the `--platform-name` parameter while `APPD_CURRENT_PLATFORM` is set, the value passed through the flag will override the environment variable.

All Platforms Flag

You can use the `--all` flag to denote that you want to modify all platforms with your command. For example, you can upgrade all platform binaries at once by running the following command:

Additional Enterprise Console Commands

The following is a list of frequently used Enterprise Console commands:

- `create-platform --name <platform_name> --description <description> --installation-dir <install_dir>`
- `delete-platform --name <platform_name>`
- `upgrade-orcha --platform-name <platform_name>`
  This command triggers an upgrade of the Orcha module binaries on all remote Orcha machines in the provided platform. The platform should not be running any jobs on its services when you run this command.
- `list-supported-services`
- `show-platform-admin-version`

Update Platform Configurations

Configurations are important since they let you customize your installations. The Enterprise Console enables you to configure these settings via GUI and CLI. However, note that there is limited support for updating service configurations through the CLI. Therefore, it is recommended that you use the GUI for updating configurations, especially for multi-line values.

Configuration settings on the Enterprise Console are separated into three categories: Platform, Controller, and Events Service Settings.

Platform Properties

The Platform configuration allows you to update platform description in the UI. Updating the Platform path is only allowed in the CLI.

Controller Settings

The Controller Settings pages allow you to tune your controller. You can configure settings such as database configurations, JVM options, listeners, and thread pools, for both single or high availability controllers.

Appserver Configurations

The AppServer Configurations page under Controller Settings allows you to edit most of the domain.xml configurations. You can also change the ports and update the controller from a smaller to a higher profile. The configurations are categorized under Basic, JVM Options, and SSL Certificate Management:

Basic

- Profile: Demo, small, medium, or large

  You can change the Controller profile from a smaller profile to a larger one. Before doing so, ensure that the host machine meets the requirements for the profile size you want to use.

  > The Enterprise Console checks the disk size for the transaction log dir and db data dir for medium and large profiles only. If the transaction log is in a separate mount, then it will check for half of the minimum recommended disk size.

  This process is not reversible, and you cannot move from a larger to a smaller profile size. If you tune the Controller heap settings or database configuration settings, even to be greater than the recommended settings for the new profile, those settings will be preserved. Otherwise, the AppDynamics recommended settings are applied.
  To increase the Controller profile size, navigate to AppServer Configurations by choosing the platform, **Configurations**, **Controller Settings**, and **Appserver Configurations**. At the top of the page, select a new profile, then click **Save**.
  Alternatively, you can also use the CLI to increase the Controller profile size to meet increased demand:

  ```
  bin/platform-admin.sh update-controller-profile --profile <profile size>
  ```

  For more information, see Controller System Requirements.
- Tenancy Mode
- External Load Balancer URL (HA only): This is the deep link URL.
- Internal Virtual IP Address (HA only)
- Ports: Server Port: 8090; Admin Port: 4848; SSL Port: 8181; IIOP Port: 3700; JMS Port: 7676
  To change the Controller ports, navigate to AppServer Configurations by choosing the platform, **Configurations**, **Controller Settings**, and **Appserver Configurations**. Near the top of the page, specify new ports and scroll down to click **Save**. This will restart the Controller. Note that the new ports should be available.
- Glassfish Admin Password
- Database User Password
  If you do not specify this password then it will use the default. Click How to Change the Controller Database Root User Password for detailed steps.

  > After a fresh installation or upgrade, the database user password will be hidden in `domain.xml` in the Appserver directory as an alias.

  Alternatively, you can also use the CLI to change your database user password:

  For MySQL DB:

  ```
  bin/platform-admin.sh submit-job --platform-name <platform_name> --service controller --job update-
  passwords --args newDatabaseUserPassword=<password>
  ```

- Advanced configurations
  - NUMA Controller Configuration: This setting is preserved upon upgrades.
  - NUMA Database Configuration: This setting is preserved upon upgrades.

JVM Options

- JVM Options: You can update the JVM options via this page without having to use the `modifyJvmOptions` utility or any other external scripts.
- Domain Http Services
- Domain Protocols
- Domain Network Listeners

> ⚠ Disabling the HTTPS listener is not allowed.

- Domain Transports
- Domain Thread Pools

You can also update the domain config settings using the CLI by following the steps below:

1. Download all four configurations to individual files. See Deploy the Controller on AWS for more information on the config file.
2. Create and load four variables:
    - `new_network=`cat domain-network-listeners.txt``
    - `new_protocol=`cat domain-protocols.txt``
    - `new_thread=`cat domain-thread-pools.txt``
    - `new_transports=`cat domain-transports.txt``
3. Go to `platform-admin/bin` and log in.

```
cd platform-admin/bin
```

```
./platform-admin.sh login --user-name=admin --password=password
```

4. Run the following command on the Enterprise Console host:

```
./platform-admin.sh update-service-configurations --service controller --job update-configs --args
domainProtocols="$new_protocol" domainTransports="$new_transports" domainNetworkListeners="$new_network"
domainThreadpools="$new_thread"
```

SSL Certificate Management

- You can view and edit the SSL Certificate here.

Controller Database Configurations

You can make database configuration changes using:

- Database Configuration UI Page
- Enterprise Console CLI

Database Configuration UI Page

Use the Database Configuration UI page to edit your MySQL settings. This is helpful since you do not have to tweak the configuration file on the database host.

If your RAM memory is greater than 200 GB and you are using a NUMA based architecture, you can specify the Linux nodes (typically CPU socket numbers) from which both processes and memory will be allocated for each AppDynamics component. For example on a two-socket motherboard, AppDynamics recommends the following node configuration settings:

- Glassfish should should allocate its threads/processes and memory on the first node: 0
- MySQL should allocate its threads/processes and memory on the second node: 1

> ⓘ For the node configuration settings, you can enter an integer or comma separated list of integers. For example, for Glassfish, you can enter **0** or **0,1**; for MySQL, you can enter **1** or **2,3**.

The configurations include:

- DB Configuration Settings
  Data Directory: You can change the `datadir` path and database port via this page.

> ⓘ You cannot change certain configurations, such as the MySQL root directory, through the Enterprise Console.

- DB Root Password
  The Enterprise Console does not allow you to change the MySQL root password. However, if you change the MySQL root password for the Controller, you should update the database root password in the Database Configurations page so that the Enterprise Console is aware of the new password.

Enterprise Console CLI

You can update the Controller database configuration programmatically using the Enterprise Console CLI. This enables you to preserve configuration settings during an upgrade.

- If you are using High Availability Toolkit (HATK), you must manually apply these settings on the secondary Controller and restart the secondary server.
- These instructions are specific to the UNIX operating system.

To update the database configuration using CLI:

1. Copy the `db.cnf` file from your primary Controller host onto the Enterprise Console host, for example `db.cnf.new` file.
2. Edit the `db.cnf.new` file to add new settings or update existing values.
3. Load the `db.cnf.new` file into an environment variable:

   ```
   new_db_cnf=`cat db.cnf.new`
   ```

4. Go to the `platform-admin/bin` directory and log in:

   ```
   ./platform-admin.sh login --user-name=admin --password=password
   ```

5. Run the following command on the Enterprise Console host:

   ```
   bin/platform-admin.sh submit-job --service controller --job db-update-config --args
   mysqlCnfContent="$new_db_cnf"
   ```

Reports Service Configurations

The Reports Service Configurations page allows you to update the reports service ports:

- Reporting Service HTTP Port: 8020
- Reporting Service HTTPS Port: 8021

You can also view and edit the SSL Certificate here.

Events Service Settings

The Events Service configurations are read-only. See Administer the Events Service to learn how you can manage your Events Service. You can see the following configurations:

- Profile: This value is either Dev or Prod.
- Installation Directory
- Data Directory
- Ports
  - Elastic Search Port: 9200
  - REST API Port: 9080
  - REST API Admin Port: 9081
  - Unicast Port: 9300

Update Controller Configurations

You can update Controller configurations such as the deep link URL, JVM options, and network listeners.

Update the Deep Link URL

To update the deep link URL:

1. Go to `platform-admin/bin` and log in.

```
cd platform-admin/bin
```

```
./platform-admin.sh login --user-name=admin --password=password
```

2. Run the following command on the Enterprise Console host:

```
./platform-admin.sh update-service-configurations --service controller --job update-configs --args
controllerExternalUrl=<server-protocol>://<controller-host>:<controller-port>
```

where `server-protocol` is http or https.

Update JVM Options

To update JVM options and network listeners:

1. Go to `platform-admin/bin` and log in.

```
cd platform-admin/bin
```

```
./platform-admin.sh login --user-name=admin --password=password
```

2. List all of the Controller configurations from the Enterprise Console:

```
./platform-admin.sh list-service-configurations --service controller > controller-configs.conf
```

3. Open `controller-configs.conf`, and copy all JVM options. Then paste them into a separate file, and edit the desired parameters.
4. Run the following command on the Enterprise Console host:

```
./platform-admin.sh update-service-configurations --service controller --job update-configs --args
controllerNonHostJvmOptions='All JVM options from the previous step including the updated fields'
```

For example:

```
./platform-admin.sh update-service-configurations --service controller --job update_configs --args
controllerNonHostJvmOptions='-Djava.awt.headless=true, -Djdk.corba.allowOutputStreamSubclass=true, ...'
```

Retaining Configuration Changes

The Enterprise Console recognizes and retains many common customizations to the `domain.xml`, `db.cnf`, and other configuration files, but is not guaranteed to retain them all. If you have made manual configuration changes to the files, verify the configuration after updating.

You can also remove the Controller from the Enterprise Console and rediscover it to preserve the configuration changes:

1. Go to `platform-admin/bin` and log in.

```
cd platform-admin/bin
```

```
./platform-admin.sh login --user-name=admin --password=password
```

2. On the Controller page, click on **Remove Controller**, or run the following commands on the Enterprise Console host:

If `removeBinaries=false` then the Enterprise Console forgets the Controller without impacting or uninstalling the Controller.

3. Discover the Controller by using the **Discover & Upgrade** feature as if you were upgrading the Controller using the Enterprise Console, or run the following command on the Enterprise Console host:

> You must specify and provide the full path to the existing Controller directory.

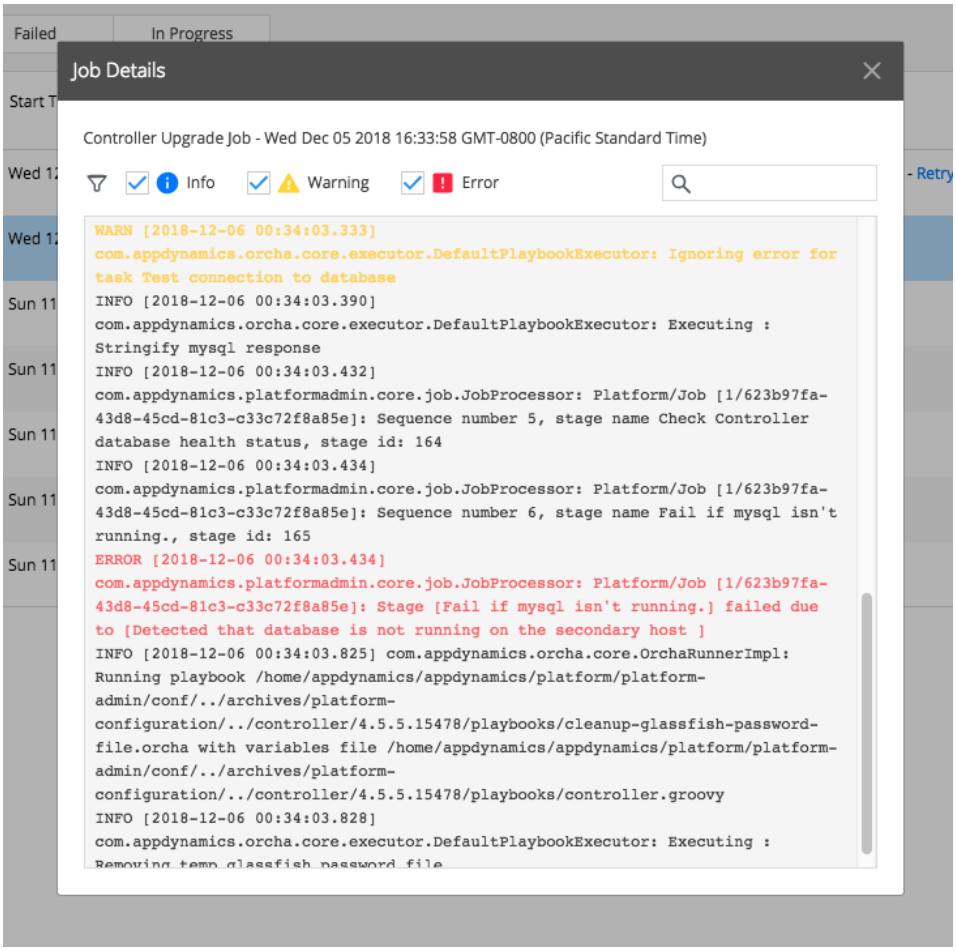
Enterprise Console Jobs

The Enterprise Console saves all jobs that you perform on the application on the Jobs page.

View Job Details

The Jobs page displays all of your jobs by their names, start times, last updated times, and statuses. You can classify the jobs based on their status: Successful, Failed, and In Progress. You can also search through all of your jobs.

You can view additional job details by clicking **View Details** in the Status column of the job.



If the job you are viewing failed, then you can see what the error was that caused it to fail, and retry it at its last checkpoint.

> Warnings and errors are color-coded in yellow and red, respectively.

View Job Progress

You can view job details on the UI while the job is in progress by selecting a job and clicking **View Details**. This should help with troubleshooting.

Platform Log Files

The platform log files include the following:

- **platform-admin-server.log:** Information about events of the install process such as extraction, preparation, and other post-processing tasks. It is located at `<platform_admin_home>/logs`.
- **server.log:** Information for the embedded Glassfish application server used by the Controller. It is located at `<controller_home>/logs`.
- **audit.log:** Information about Account/User/Group/Role CRUD/User login/logout/SSH connections, and all other operations. This can be used to forward auditable events from the AppDynamics controller into a central log management system or SIEM. It is located at `<controller_home>/logs`, and replicates the Controller Audit Report.
- **database.log:** Information for the MySQL database that is used by the Controller. It is located at `<controller_home>/db/logs`.
- **startAS.log**: Output generated by the underlying Glassfish domain for the Controller.
- **orcha-modules.log**: Information about all the tasks and commands that are run during installation. platform-admin-server.log has high-level information about the task executed. However, `orcha-modules.log` has more information on the specific command and output. It is located at `<platform-dir>/orcha/<version>/orcha-modules/logs/orcha-modules.log`.

Retrieve Log Files

You can use the Enterprise Console to retrieve log files for the Controller and Events Service. On the Controller or Events Service page, expand **More** options and click **Retrieve Log** to start a Retrieve Log job. When the job has successfully completed, it will retrieve and save the Controller or Events Service log files, which include AppServer, Reports Service, and DB logs, as a zip file to `/home/appdynamics/appdynamics/platform/platform-admin` on the Enterprise Console host.

You can also run the following command on the Enterprise Console host:

```
bin/platform-admin.sh submit-job --service <controller or events-service> --job retrieve-log --platform-name
<name_of_the_platform>
```

Manage Log Files

You can manage your log files by setting up log rotation and adjusting the retention periods.

Log Rotation

The application server is preconfigured to rotate the server.log file regularly, based on settings in the domain configuration file. On Windows, there is an additional log file for Glassfish service launcher that needs to be rotated.

For the other log files, such as database.log or audit.log, you may need to set up log rotation to prevent them from consuming excessive disk space. The audit.log file, in particular, may grow quickly because it contains SSH connections to Controller and Event Services hosts that occur every minute. You also need to set up log rotation for an additional log file, `<controller_home>/db/data/slow.log`. This log contains information about slow MySQL queries.

The tool you use to perform the rotation depends on your operating system. On Linux, you can use the `mysql-log-rotate` script. The script is included with the Controller database installation at `<controller_home>/db/support-files`. You need to modify the script for your environment since it is not set up to rotate the database.log file by default. On other systems, you need to create or install a script that performs log rotation and make sure that it get run regularly, for example, by cron or an equivalent task scheduler.

Retention Period

Enterprise Console logs in `platfom-admin/logs` are automatically archived in a .gz format with a date-time stamp after they grow too large. The size of each archived log is around 300 KB. Only the latest seven files are archived in the logs directory.

If you want to retain the archived logs for longer periods of time, you can configure the settings in the Dropwizard configuration file, `PlatformAdminApplication.yml`. Under the logging/appenders/type: file section, you need to specify a larger `archivedFileCount`, as well as `maxFileSize`. See the Drop wizard Configuration Reference for more information.

Change the Default Location or Names of the Controller Logs

1. In a web browser, log in to the Controller's Glassfish administration console, as described in Access the Administration Console.
2. From the left-side navigation tree, expand **Configurations -> server-config** and click **Logger Settings**.
3. Set the new location for server.log by modifying the **Log File** value.
   The default value points to the logs directory located at the root of the Controller home directory.

   ```
   ${com.sun.aas.instanceRoot}/../../../../logs/server.log
   ```

   If you specify a directory that does not exist, it is created when you restart the application server.

4. Change the `database.log` location by opening the `<controller_home>/db/db.cnf` file. You can also change the `db.cnf` file from the Enterprise Console GUI Database Configurations page. Doing so also restarts the database server.

   > The Enterprise Console takes a backup when you modify these configurations.

5. Set the value of the `log-error` property to the new location of the `database.log` file. This directory location must exist before you restart the Controller or you will get start-up errors.
6. From either Linux or Windows, change the log location to the new location:

   Linux File

   ```
   <controller_home>/bin/controller.sh
   nohup ./asadmin start-domain domain1 > $INSTALL_DIR/logs/startAS.log
   ```

   Windows File

   ```
   <controller_home>/bin/controller.bat
   call asadmin.bat start-domain domain1 > %INSTALL_DIR%\logs\startAS.log
   ```

7. Open the `<controller_home>/appserver/glassfish/domains/domain1/config/domain.xml` file, and change the log location specified in the following:

   - log-root attribute of the domain element.
   - file attribute of the log-service element.
   - tx-log-dir attribute of the transaction-service element.

8. Copy if desired any existing logs from the default directory (`<controller_home>/logs`) to the new location.
9. Restart the Controller. See Start or Stop the Controller.
10. Verify that the `database.log` and `server.log` files are being written to the new location and remove the old log files. The `database.log` location is `controller/db/logs/database.log`.

Log Level Granularity

The Controller logs provide information about possible errors in Controller operations. By default, the Controller writes to the log at the `INFO` level. When debugging your Controller deployment, you may need to increase the logging level to generate additional information.

You can set the logging level by Controller component, which include:

- Agents
- Business Transactions (BTS)
- Events
- Incidents
- Information Points (IPS)
- Metrics
- Orchestration
- Rules
- Snapshots

Change Default Logging Level by Component

By default, the Controller generates logs at the INFO level. You can change the level for one or all of the components. This may be needed, for example, when you are debugging your system, and want the Controller to generate more information in the form of logs. On the other hand, you may wish to reduce logging verbosity to minimize the reduce the rate of growth of log files. The following steps describe how to change the default log levels.

1. In a web browser, log in to the Controller's Glassfish administration console, as described in Access the Administration Console.
2. From the left navigation tree, expand **Configurations > server-config** and click **Logger Settings**.
3. Click the **Log Levels** tab.
4. Modify those components that start with "com.appdynamics". By sorting the list by name, you can quickly access the com.appdynamics components. For each component, modify the log level by choosing a new level from the **Log Level** menu. For example, to debug the system, we suggest setting the log level to `FINE`.
5. Click **Save**.

Enterprise Console Back Up and Restore

The Enterprise Console keeps all data pertaining to its managed AppDynamics platform deployment in a MySQL database. To back up an Enterprise Console installation, you use MySQL commands to export and restore data. You will also need to back up the Enterprise Console's secure credential store file.

> Backing up Enterprise Console data is a separate consideration from backing up a Controller. For more information on Controller backups, see Controller Data and Backups.

In the event that your Enterprise Console host fails, follow these steps to ensure that you can recover.

To back up the Enterprise Console:

1. Export the Enterprise Console data:

   ```
   mysqldump -u root -p <password> -h <mysql-hostname> -P <mysql-port> platform_admin > /tmp
   /platform_admin_dump.sql
   ```

   This puts the export file into a named file in the `/tmp` directory. Choose another location, if appropriate.
2. Change to the `mysql/bin` directory of Enterprise Console:

   ```
   cd <platform>/mysql/bin
   ```

3. Import the data into the backup Enterprise Console instance:

   ```
   mysql -u root -p <db_root_user_password> -h <mysql-hostname> -P <mysql-port> platform_admin < /tmp
   /platform_admin_dump.sql
   ```

4. Copy the Enterprise Console's secure credential store (SCS) file `<platform>/platform_admin/.appd.scs` to the same directory on your backup Enterprise Console instance. Make sure you retain the same file permissions for the SCS file (644) on the backup instance of the Enterprise Console.

Upgrade the Enterprise Console

Related pages:

- Upgrade Platform Components
- Install the Enterprise Console

To upgrade the Enterprise Console, you run the installer for the version of the application to which you want to upgrade on the Enterprise Console machine. The installer detects the Enterprise Console installation and upgrades that instance.

About the Upgrade

- You can upgrade across multiple versions at a time; that is, you do not need to run the installer individually for each intermediate version.
- If you upgrade the Enterprise Console to 4.5.x version, it will copy the Controller and Events Service artifacts into the `platform-admin/archives/<service>/<version>` folder. When you upgrade to the next version of the Enterprise Console, the same will be repeated for newer binary versions, e.g. 4.5.1, 4.5.2, 4.6. Note that it is not possible to downgrade the Enterprise Console to any intermediate version.

  If you are upgrading from Platform Admin 4.3.x to the Enterprise Console, make sure you specify a different installation path from the Platform Admin 4.3.x. This is will ensure that any existing Events Service managed by the Platform Admin 4.3.x can be discovered and upgraded using the Enterprise Console.

- You can enable HTTPS for the Enterprise Console during upgrades. See HTTPS Support for the Enterprise Console for more information.

Before Upgrading

- Before you start upgrading the Enterprise Console and your platform, make sure that you are using the correct upgrade order.
- The user upgrading the Enterprise Console should be the same user who installed the Enterprise Console.
- Make sure your Enterprise Console is running before you run the upgrade. This is to validate the Database Root User Password and Platform Admin Database Password. You will need to input the passwords when upgrading through the GUI.
- For first-time upgrades, you need to use the same response file you used for your silent install. See Silent Installation.
- Irrespective of first time or subsequent upgrades, you need to provide the relevant passwords in the response file.

Upgrade the Enterprise Console

The following steps describe how to upgrade the Enterprise Console on Linux and Windows. You use the Enterprise Console installer in GUI mode, console mode, or silent mode to perform the upgrade.

GUI Installation

If there is a newer version of Enterprise Console available, you can begin the upgrade process by downloading and installing the latest version from the AppDynamics download site on top of the existing application.

Before starting, get the Enterprise Console installer version appropriate for your target system. You can get the installer from the AppDynamics download site. When ready, follow these steps to install the Enterprise Console:

1. Navigate to the directory where you downloaded the install file.
2. Run the following commands:

   Linux

   ```
   ./platform-setup-64bit-linux.sh
   ```

   You can run the installer as non-root or root.

   Windows

   ```
   platform-setup-64bit-windows.exe
   ```

   It is recommended that you right-click the exe and select Run as Administrator.

3. After the GUI launches, use it to complete the installation. In Linux, you may also follow the steps in the installation wizard to complete the console installation.

If you install the Enterprise Console on AWS, use the public DNS for the Enterprise Console host name when prompted.

Silent Installation

To use silent mode, pass the response file that the installer generated at first installation to the installer. This response file is at the following location

- `<Enterprise_Console_home_directory>/.install4j/response.varfile`

If you have made any changes to the settings as originally configured by the installer—such as to the connection port numbers, tenancy mode, or data directory—make the same change in the response file before starting the upgrade.

You must also add the existing passwords to the file:

```
platformAdmin.databasePassword= ENTER_PASSWORD
platformAdmin.databaseRootPassword= ENTER_PASSWORD
platformAdmin.adminPassword= ENTER_PASSWORD
```

If you do not, the installer prompts you to add the password.

After Upgrading

After upgrading the Enterprise Console, you must first clear your browser cache before you can successfully log in to the Enterprise Console through the browser.

Uninstall the Enterprise Console

This page describes how to remove the Enterprise Console software and associated files using the uninstaller utility located in the Enterprise Console directory.

Before Starting

Uninstalling the Enterprise Console will not uninstall any of the components it has deployed or managed since the Enterprise Console installer is agnostic of the Controller and other services. Therefore, you do not need to first uninstall any components before uninstalling the Enterprise Console. However, if you accidentally uninstall the Enterprise Console without first uninstalling any components, then you will have to manually manage the remaining platforms and components. Leftover environments can be also be rediscovered using another Enterprise Console application.

Uninstall the Enterprise Console Manually

1. Open a console on the machine where the Enterprise Console is installed:
    - On Linux, open a terminal window and switch to the user who installed the Enterprise Console or to a user with equivalent directory permissions.
    - On Windows, open an elevated command prompt by right-clicking on the Command Prompt icon in the Windows Start Menu and choosing **Run as Administrator**.
2. From the command line, navigate to the Enterprise Console home directory.
3. Execute the uninstaller script to uninstall the Enterprise Console, as follows:
    - On Linux:

      ```
      ./installer/uninstallPlatform
      ```

    - On Windows:

      ```
      run installer/uninstallPlatfom.exe
      ```

    - To uninstall in quiet mode, add the `-q` option. For example:

      ```
      ./installer/uninstallPlatform -q
      ```

      With this option, you do not need to interact with the installer to complete the removal.

      > On the Enterprise console host and any of the hosts that the Enterprise Console manages, `<platform home dir>/jre` and `<platform home dir>/orcha` are not removed.

FAQs for the Enterprise Console

What is the difference between the Enterprise Console installer and the Controller installer?

The Enterprise Console installer only installs the Enterprise Console application. You need to use the Enterprise Console later on to install the Controller as well as other AppDynamics platform components.

The Controller Installer is used to install only the Controller application. From 4.4, AppDynamics does not support the Controller installer anymore. You should use the Enterprise Console instead to install, monitor, upgrade, and configure the Controller.

Where should I install the Enterprise Console application?

The Enterprise Console can be installed on the same host as the Controller. However, you should not install the Enterprise Console on the same host if the Controller is part of an HA pair. If the Enterprise Console and Controller are on the same host and that host becomes unavailable, the Enterprise Console will not be able to failover to the other Controller. For large deployments, it is also recommended that you install the Enterprise Console on a separate host.

Which hosts does the Enterprise Console need SSH access to?

The Controller and Events Service hosts.

How many SSH connections does the Enterprise Console make per minute?

For each single Controller node (HA Controller deployments will have two Controllers), the Enterprise Console will open approximately 10 SSH connections per minute. For each Events Services node (an Events Service cluster may have 3–5 nodes), the Enterprise Console will open 1 SSH connection per minute.

What protocols does the Enterprise Console use to connect to remote hosts?

The Enterprise Console uses Java Secure Channel (JSch) API with the provided key file to access remote hosts. In scenarios where you have an SSH jump server or jump host configuration, you will have to invest in additional provisions for your application to work. Consult your AppDynamics representative in such cases.

Can platforms share the same installation path?

No, platforms cannot share the same installation path or hosts. You must also choose an installation path that does not overlap with where the Enterprise Console is installed.

Can I use Express installation to discover and upgrade existing controllers and events services?

Express installation is a convenient way to create a complete platform on a single host in one step. It does not support discovering and upgrading an existing controller managed outside the Enterprise Console.

Can I make configuration changes outside of Enterprise Console?

It is not recommended that you make changes directly to AppDynamics configuration files, such as in domain.xml or db.conf. If you do make changes directly in configuration files, it is recommended that you make the equivalent change in the Enterprise Console. Note that such changes result in a restart the controller.

Do I need to back up the Enterprise Console database?

Yes, the Enterprise Console database is not automatically backed up. See Controller Data Backup and Restore for information on backing up the Controller and Enterprise Console databases.

Is Enterprise Console supported on Windows?

Yes, it is, but there are several differences between the Linux and Windows deployment. First, the platform components (Controller, MySQL database, Events Service, and EUM Server) all have to be installed on the same machine for Windows. The second difference is that the Enterprise Console on Windows does not support Controller High Availability. Finally, on Windows, you do not have the replication of the MySQL database and cannot install a second node through the Enterprise Console. On Linux, it is recommended to have at least three node clusters for the Events Service.

If you need to scale up the Events Service on Windows, see Install the Events Service on Windows for instructions.

How can I install the Controller without the Enterprise Console?

Starting from AppDynamics version 4.4, you can only install the Controller through the Enterprise Console. For earlier versions, you can still use the Controller installer.

Controller Deployment

Related pages:

- Install the Controller Using the CLI

This page introduces you to the tasks involved with deploying AppDynamics to its operating environment, including host preparation and Controller installation.

The system resources of the machine that hosts the Controller in a live environment must be able to support the expected workload.

Deployment Overview

Installing AppDynamics to a test or evaluation setting typically involves verifying system requirements, preparing the host, and then performing the Controller installation. These topics are described in Prepare the Controller Host and Install the Controller Using the Enterprise Console.

Deploying the Controller to its production operating environment normally introduces additional requirements and considerations. Security, availability, scalability, and performance all play an important role in production deployment planning. The following section lists the tasks related to deploying the Controller.

Deployment Tasks

Depending on your specific requirements and environment, deployment tasks may include:

- Ensure that target systems meet the Controller System Requirements for the Controller's expected workload.
- Implement Controller High Availability to ensure service continuity in the event of a failure of the Controller server.
- Configure the network environment. If deploying the Controller with a reverse proxy, configure passthrough of Controller traffic. Also, note other Network Requirements for the deployment environment.
- Implement security requirements for your environment. If clients will connect to the Controller by HTTPS, install your custom SSL server certificate on the Controller.
- Generate a password management strategy for the built-in system accounts in the Controller and platform.
- Make sure the mail server is properly configured for the Controller in the target environment and define your alerting strategy.
- Devise your backup strategy. A typical backup strategy consists of frequent partial backups with intermittent full backups.
- Plan your configuration maintenance and enhancement strategy. Changes to the configuration should be staged in a non-critical environment, and rolled into the live environment only after thorough testing. The AppDynamics UI and REST API offer the ability to export and import configuration settings from various contexts.
- Deploying App Agents is likely to be an ongoing task, especially in dynamic environments where monitored systems are regularly taken down and new ones brought up. There are two basic strategies for deploying large numbers of App Agents across a managed environment:
    1. Deploy the agents independently of the application inside the application server. This method ensures that re-deployments of the application do not overwrite the agent deployment.
    2. Integrate deployment of AppDynamics agents into the deployment of applications. This more sophisticated approach requires modifying the existing application deployment automation scripts.

  For details, see:
    - Automate Java Agent Deployment
    - Unattended Installation for .NET

Network Requirements

Deploying the Controller often calls for configuration changes to existing network components, such as firewalls or load balancers in the network. If the Controller will reside behind a load balancer or reverse proxy, you need to set up traffic forwarding for the Controller. You may also need to open ports used by AppDynamics on firewalls or any other device through which traffic must traverse.

The following are general considerations for the environment in which you deploy AppDynamics. See AppDynamics Quick Start for other network configuration requirements.

Correlation HTTP Header

AppDynamics adds a custom header to traffic in the monitored environment named `singularityheader`. This header enables AppDynamics to correlate traffic across tiers. It's important to ensure that any load balancer, proxy, or firewall in the network between monitored tiers or between the tiers and the Controller preserves the header added by AppDynamics.

Clock Management

To ensure consistent event time reporting across the AppDynamics deployment, App Agents attempt to synchronize their time with the Controller time.

They do so by retrieving the time from the Controller every five minutes. App Agents then compare the Controller's time to its own local machine's clock time. If the times are different, whether ahead or behind, it applies a time skew based on the difference to the timestamps for the metrics it reports to the Controller.

If, despite the agent's attempt to report metrics based on the Controller time, the Controller receives metrics that are time-stamped ahead of its own time, the Controller rejects the metrics. To avoid this possibility, AppDynamics recommends maintaining clock-time consistency throughout your monitored environment.

Admin Accounts Created at Installation

During the installation process, you need to configure several accounts for the Controller. These include the embedded MySQL database account, a root user account in the Controller, and an administrator in the Controller.

Usernames and passwords should not include the & or ! characters. If a user account needs to access the Controller REST API, additional limitations on the use of special characters in usernames apply. See Create and Manage Tenant Users.

About Controller Tenancy Mode

In most installations, the Controller operates in single-tenant mode. In multi-tenant mode, the Controller UI context is divided into separate accounts. Each account has its own set of users, agents reporting to it, and application monitoring configuration.

You choose the tenancy mode at installation time. You can switch the tenancy mode from single-tenant to multi-tenant mode later. It is not possible to switch from multi-tenant to single-tenant mode.

Having a single tenancy Controller is suitable for most installations. Only very large installations or installations that have very distinct sets of users may require multi-tenancy.

A summary of the differences between the modes follows:

- In multi-tenant mode:
  - You can create multiple accounts (tenants) in the Controller.
  - Each account will have its own set of users and applications.
  - The Controller login page includes an additional field where users need to choose an account to log in to.
  - Essentially, multi-tenant mode allows you to partition users and access application data in a logical, secure way.
- In single-tenant mode:
  - There is only one account (tenant) in the Controller system.
  - All users and applications are part of this single built-in account, so all users have access to all monitored Applications in this mode.
  - The account is not exposed to users in the Controller UI. The account field in the login page is omitted for single-tenant mode.
  - AppDynamics recommends a single-tenant mode for most installations.

For more information, see Multi-Tenant Controller Accounts.

Self-Monitoring the Controller

You can use the system account to self-monitor the Controller. When your system experiences noticeable performance issues with the Controller, you can log in to the system account to access and review the memory utilization trend for the last few hours.

Only the internal Java Agent bundled in the path: `<Controller_home>//appserver/glassfish/domains/domain1/appagent(-javaagent:${com.sun.aas.instanceRoot}/appagent/javaagent.jar)` with the controller, the application is supported for self-monitoring. Using a custom Java Agent from a different path is not supported for self-monitoring.

To self-monitor the Controller using the system account:

1. If you are already logged in to the Controller from your Browser, you must first log out as a non-administrative user of the Controller.
2. Log back into the Controller using the following credentials:
   - Account: `system`
   - User: `root`
   - password: `<root password>`
3. Select **Appdynamics Controller** application.
4. Select **Tiers and Nodes** > **Node1** > **Memory** to review the memory trend for the past 24 hours and locate the time when the performance issues occurred.

Controller System Requirements

Related pages:

- Prepare the Controller Host

This page describes hardware and software requirements for the Controller hosted on private or public cloud to help you prepare for your AppDynamics deployment.

> **Note**
>
> The Controller requirements do not include Enterprise Console and Event Service. You need to prepare memory for each of those components.

About Controller Sizing Information

Every deployment is unique. Factors such as the nature of the application, workload, and the AppDynamics configuration can all affect the resources required for your specific scenario. Be sure to test the performance of your system in a staging environment, so that you can fully understand your requirements before deploying AppDynamics to its live operating environment.

Before installation, it's usually easiest to estimate your deployment size based on the number of nodes. For Java, for example, a node corresponds to a JVM. However, the best indicator of the actual workload on your Controller is provided by the metric ingestion rate.

After initial installation, you should verify your Controller sizing using the metric upload rate. You then need to continue to monitor the Controller for changing workload brought about by changes in the monitored application, its usage patterns, or in the AppDynamics configuration.

General Hardware Requirements

The following general requirements that apply to the machine on which you install the Controller:

- The Controller should run on a dedicated machine. A production Controller *must* run on a dedicated machine. The requirements here assume that no other major processes are running on the machine where the Controller is installed, including no other Controllers.
- The Controller is not supported on machines that use Power Architecture processors, including PowerPC processors. The Controller is supported on amd64 / x86-64 architectures.
- Ensure that the Controller host has approximately 200 MB of free space available in the system temporary directory.
- Disk I/O is a key element to Controller performance, particularly low latency. See Disk I/O Requirements for more information.

Controller Sizing

The following table shows Controller installation profiles by metric ingestion rate and node count. As previously noted, the actual metrics generated by a node can vary greatly depending on the nature of the application on the node and the AppDynamics configuration. Be sure to validate your sizing against the metric ingestion rate before deploying to production.

General Sizing for On-Premises

Profile	Max Metrics /Minute	Max Agents (Approx)	OS	Compute	Storage
Demo	10,000	5	Linux or Windows	2 Cores, 8 GB RAM	50 GB Note: This profile is not supported when installing with Aurora DB.
Small	50,000	50	Linux or Windows	4 Cores, 16 GB RAM	400 GB Note: This profile is not supported when installing with Aurora DB.
Medium	1,000,000	1,500	Linux or Windows	Bare-metal: 8 Cores, 128GB RAM	5 TB SAS SSDs. Hardware-based RAID 5 configuration
			Linux or Windows	VM: 16 vCPUs, 128GB RAM	5 TB SSD-based SAN with 10 Gb/s FCoE
Large	5,000,000	10,000	Linux	Bare-metal: 28 cores, 512 GB RAM	• 2 x 800 GB write-intensive NVMe cards for MySQL redo logs. Software-based (mdadm) RAID 1 configuration. • 20 TB SAS SSDs for main data volume. Hardware-based RAID 5 configuration
Extra Large	**For deployments that exceed the Large profile configuration defined here, contact AppDynamics Professional Services for a thorough viability evaluation of your Controller.**				

Amazon Web Services (AWS) Sizing for On-Premises

AWS Profile with Aurora	Max Metrics /Minute	Max Agents (Approx)	OS	Compute	Instance Size for AWS Aurora Storage	Block Storage (for Controller application files only)*
Medium	1,000,000	1500	Linux	EC2: r4. 2xlarge	db.r4.4xlarge	10 GB GP2 EBS Volume. We recommend using a different volume than the instance's root volume.
Large	5,000,000	10000	Linux	EC2: r4. 8xlarge	db.r4.16xlarge	10 GB GP2 EBS Volume. We recommend using a different volume than the instance's root volume.

* The specified disk space must be available for use by the Controller. Specifications do not include overhead from the operating system, file system, and so on.

Elastic Network Interface (ENI)

The ENI numbers were last updated on Feb 28, 2018.

For AWS, provision an ENI for each Controller host and link the license to the MAC address of the ENI. For more information about ENI, see the AWS documentation at the following link:

https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-eni.html.

Additional Sizing Considerations

Note the following additional requirements:

- Large installations are not supported on virtual machines or systems that use network-attached storage.
- The RAM recommendations leave room for operating system processes. However, the recommendations assume that no other memory intensive applications are running on the same machine. While the Enterprise Console can run on the same host as the Controller in small or demo profile Controllers, it is not recommended for medium and larger profiles or for high availability deployments. Refer to the Enterprise Console Requirements if the Enterprise Console is on the same host as the Controller.
- Disk sizing shown in the sizing table represents the approximate space consumption for metrics, about 7 MB for each metric per minute.
- The motherboard should not have more than 2 sockets.
- See Calculating Node Count in .NET Environments for information related to sizing a .NET environment.
- The agent counts do not reflect additional requirements for EUM or Database Visibility. See the following sections for more information.

Disk I/O Requirements

A critical factor in a machine's ability to support the performance requirements of a Controller in a production environment is the machine's disk I/O performance.

There are two requirements related to I/O latency:

- This disk I/O must perform such that the maximum write latency for the Controller's primary storage must not exceed 3 milliseconds while the Controller is under sustained load. AppDynamics cannot provide support for Controller problems resulting from excessive disk latency.
- Self-monitoring must be set up for the Controller. Self-monitoring consists of a SIM agent that measures the latency of data partitions on the Controller host, and the configuration needs to include dashboard and health rule alerts that trigger when the maximum latency exceeds 3 ms. For details on Controller self-monitoring, contact your AppDynamics account representative.

Disk I/O Operations

The AppDynamics Controller performs two types of I/O operations important to Controller performance:

- The MySQL intent log is very sensitive to latency, and MySQL performs writes using varying block sizes.
- MySQL's InnoDB storage engine uses random, asynchronous, 16Kb reads and writes to move database pages between storage and cache. In a properly sized Controller, most reads are satisfied from one of the software caches.

It's important for best performance that the stripe size of the RAID configuration matches the write size. The two write sizes are 16Kb (for the database) and 128Kb (for the logs). You should use the smallest stripe size supported, but no smaller than 16Kb. If using a hardware-based RAID controller, be sure that it supports these stripe sizes. The stripe size can be determined by the number of data disks multiplied by the strip/segment/chunk (the portion of data stored on a single disk).

SAN-based Storage Limitations

While onboard disks typically satisfy I/O requirements, SAN-based storage could be hampered by poor I/O latency performance. In addition, AppDynamics discourages the use of an NFS-mounted filesystem. NFS adds latency and throughput constraints that can negatively affect Controller performance and even lead to data corruption. Similarly, you should avoid iSCSI or other SAN technologies that are subject to quality of service issues from the underlying network.

If you choose to deploy one of these latency-challenged storage technologies on a system that is expected to process 1M metrics/min or greater, a mirrored NVMe configured as a write-back cache for all storage accesses is recommended. Configuring such a device will hide some of the longer latencies that have been seen in these environments.

In all cases, be sure to thoroughly test the deployment with real-world traffic load before putting an AppDynamics Controller into a live environment.

End User Monitoring (EUM) Considerations

End User Monitoring (EUM) typically increases the number of metrics collected. Accordingly, the Small Controller profile is not supported for installations that use EUM. A Medium profile running 20+ high-traffic BRUM/MRUM agents should be sized at a specification closer to a Large profile for EUM.

Specifically, EUM impact metrics as follows:

- Web RUM can increase the number of individual metric data points per minute by up to 22000
- Mobile RUM can increase the number of individual metric data points per minute by as much as 15 to 25K per instrumented application if your applications are heavily accessed. The actual number depends on how many network requests your applications receive.
- Monitoring EUM is memory intensive and may require more space allocated to the metrics cache.

The number of separate EUM metric *names* saved in the Controller database can be larger than the kinds of individual data points saved. For example, a metric name for a metric for iOS 5 might still be in the database even if all your users have migrated away from iOS 5. So the metric name would no longer have an impact on resource utilization, but it would count against the default limit in the Controller for metric names per application. The default limit for *names* is 200,000 for Browser RUM and 100,000 for Mobile RUM.

Database Monitoring Considerations

The following guidelines can help you determine additional disk and RAM required for the machine hosting the Controller that is monitoring the Database Agent. For very large installations, you should work with your AppDynamics representative for additional guidelines.

For on-premises installations, the machine running the Controller and Event Service will require the following additional considerations, for a data retention period of 10 days:

- 1 – 10 collectors: 2 GB RAM, Single CPU
- 10 – 20 collectors: 4 GB RAM, 2 CPUs
- More than 20 collectors: 8 GB RAM, 4 CPUs

Sizing the Controller for the Events Service

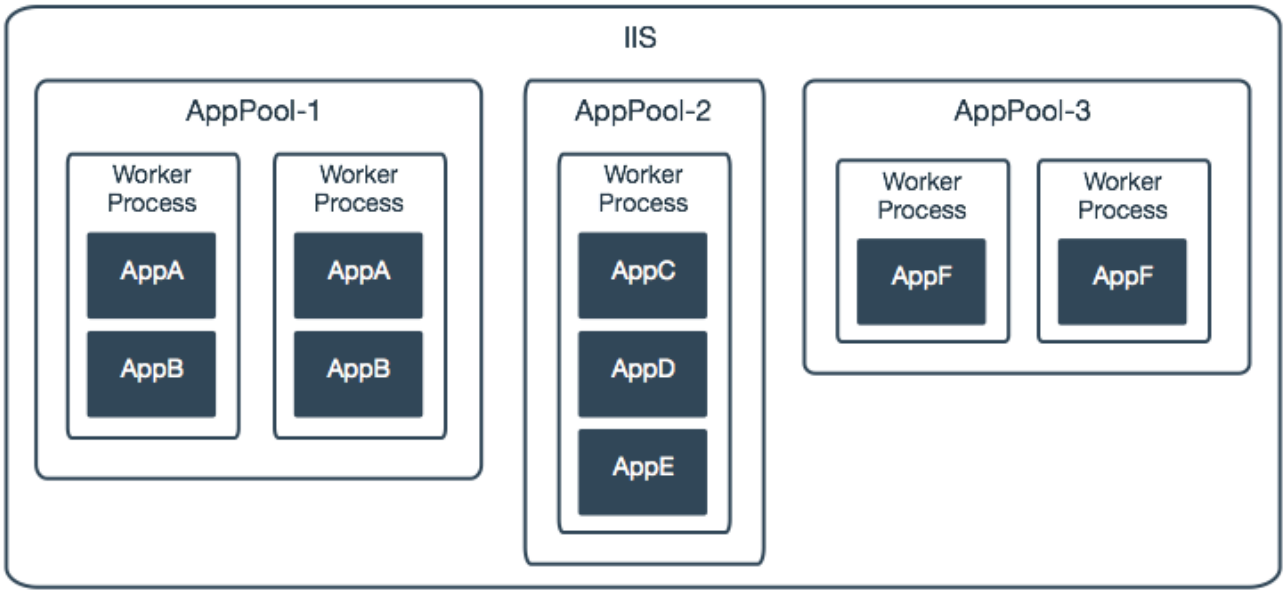
The Events Service is a file-based storage facility used by EUM, Database Monitoring, and Analytics. Database Monitoring uses the Events Service instance embedded in the Controller by default. The disk space required will vary depending upon how active the databases are and how many are being monitored.

For redundancy and optimum performance, the Events Service should run on a separate machine. For details on sizing considerations, see Events Service Requirements.

Calculating Node Count in .NET Environments

The .NET Agent dynamically creates nodes depending on the monitored application's configuration in the IIS server. An IIS server can create multiple instances of each monitored IIS application. For every instance, the .NET Agent creates a node. For example, if an IIS application has five instances, the .NET Agent will create five nodes, one for each instance.

The maximum number of instances of a particular IIS application is determined by the number of worker processes configured for its application pool, as illustrated in the following diagram:



The diagram shows three application pools — AppPool-1, AppPool-2, and AppPool-3 — with the following characteristics:

- AppPool-1 and AppPool-3 can have a maximum of two worker processes (known as a web garden), containing two applications (AppA, AppB) and one application (AppF), respectively.
- AppPool-2 can have one worker process. It has three applications.

To determine the number of nodes, for each AppPool, multiply the number of applications by the maximum number of worker processes. Add those together, as well as a node for the Windows service or standalone application processes.

The example would result in nine AppPool nodes. Adding one for a Windows service would result in a total of ten nodes, calculated as follows:

```
AppPool-1: 2 (applications) * 2 (max number of worker processes)  = 4
AppPool-2: 3 (applications) * 1 (max number of worker processes)  = 3
AppPool-3: 1 (application) * 2 (max number of worker processes)   = 2
Windows Service or standalone application process                 = 1
------
Total:                                                            = 10
```

To find the number of CLRs that will be launched for a particular .NET Application/App Pool:

1. Open the IIS manager and see the number of applications assigned to that AppPool.
2. Check if any AppPools are configured to run as a Web Garden. This would be a multiplier for the number of .NET nodes coming from this AppPool as described above.

Also see: http://technet.microsoft.com/en-us/library/cc725601(v=ws.10).aspx.

Asynchronous Call Monitoring Considerations

The Small profile is not supported for installations with extensive async monitoring. A Medium profile running 40+ agents may need to upgrade to a configuration closer to a Large profile if extensive async monitoring is added.

Specifically, monitoring asynchronous calls increases the number of metrics per minute to a maximum number of 23000 per minute.

Install the Controller Using the CLI

Related pages:

- Controller System Requirements

This page describes how to install the AppDynamics Controller using the CLI. You can also find information on settings you should have after installation. Al ternatively, you can use the Enterprise Console GUI to install the Controller. For information about how to use the Enterprise Console to install the Controller, see Enterprise Console.

The Controller can be installed on the same host as the one on which the Enterprise Console is running or a remote host. Installing on the same host is not recommended, however, particularly for medium and large scale profiles or for high availability deployments.

Install the Controller Using the Command Line

Determine which host you plan to install your Controller on before starting. The host that runs the Enterprise Console is "localhost".

> You may also use the loopback address '127.0.0.1' or the machine's actual hostname.

Complete the following steps carefully if you choose to install the Controller on this shared host rather than on a remote host. Note that all services on Windows machines must be installed on the Enterprise Console host since the Enterprise Console does not support remote operations on Windows.

In the `<Installation directory>/platform-admin` directory, run the following commands to install the Controller:

1. Create a platform:
2. Add the credential.

   For a remote host on Linux machines only:

   ```
   platform-admin.sh add-credential --credential-name <name> --type <ssh> --user-name <username> --ssh-key-
   file <file path to the key file>
   ```

   `<file path to the key file>` is the private key file. The installation process deploys the key to the Controller host.
   For the localhost:
   The localhost does not require credentials. You can, therefore, skip this step, especially for Windows deployments. For more information, see Man age Hosts.
3. Add the host.
   For a remote host on Linux machines only:

   ```
   platform-admin.sh add-hosts --hosts remotehost --credential <credential name>
   ```

   For the localhost:
4. Install the Controller on the host.
   On a remote host for Linux machines only:

   ```
   platform-admin.sh submit-job --service controller --job install --args
   controllerPrimaryHost=<remotehost> controllerAdminUsername=<user1> controllerAdminPassword=<password>
   controllerRootUserPassword=<rootpassword> mysqlRootPassword=<dbrootpassword>
   ```

   On the localhost:

Note that these are the required parameters for installing a Controller with a demo profile size. For information about optional configuration options, run the following command:

Installation Settings

The installation does some basic system checking of your environment as it performs the installation. It notifies you if it encounters conditions that need to be addressed.

Listening ports are configured for the Controller during installation. In GUI and CLI mode, the installation checks to make sure that each port it suggests is available on the system before suggesting it. You only need to edit a default port number if you know it will cause a future conflict or if you have some other specific reason for choosing another port.

Due to browser incompatibilities, AppDynamics recommends using only ASCII characters for usernames, passwords, and account names. The characters " %" and "|" are allowed in the Controller root password.

Verifying Controller Installation

Verify by navigating in a browser to the URL of the Controller UI:

```
http://<application_server_host_name>:<http-listener-port>/controller/rest/serverstatus
```

Log in using the credentials of the initial Controller administrator.

Licensing the Controller

Upon the first login, the Controller UI may prompt you that you need a valid license. You may have acquired the license file from AppDynamics.

To apply a license file manually, copy the license file to the Controller home directory. After moving the license file, allow up to 5 minutes for the license change to take effect.

Troubleshooting the Installation

A log for the installation process is automatically created in the platform-admin/logs/platform-admin-server.log. This file contains information for troubleshooting installation issues.

While installation is in progress, you can find the log file in the `platform-admin/logs/platform-admin-server.log`.

During installation and setup, the Enterprise Console tries to start the Controller. This procedure can take some time. If Controller installation fails, you can troubleshoot and identify the fix and retry from a checkpoint.

To diagnose the Controller, run the following command:

Refer to the Controller diagnostic data in `platform-admin-server.log`.

Controller High Availability

A High Availability (HA) Controller deployment helps you minimize the disruption caused by a server or network failure, administrative downtime, or other interruptions. An HA deployment is made up of two Controllers, one in the role of the primary and the other as the secondary.

The Enterprise Console automates the configuration and administration tasks associated with a highly available deployment on Linux systems. Controller HA pairs are not available on Windows Enterprise Console machines.

Essentially, to set up high availability for Controllers, you are configuring master-master replication between the MySQL instances on the primary and secondary Controllers.

An important operational point to note is that while the databases for both Controllers should be running, both Controller application servers should never be active (i.e., running and accessible by the network) at the same time. Similarly, the traffic distribution policy you configure at the load balancer for the Controller pair should only send traffic to one of the Controllers at a time (i.e., do not use round-robin or similar routing distribution policy at the load balancer).

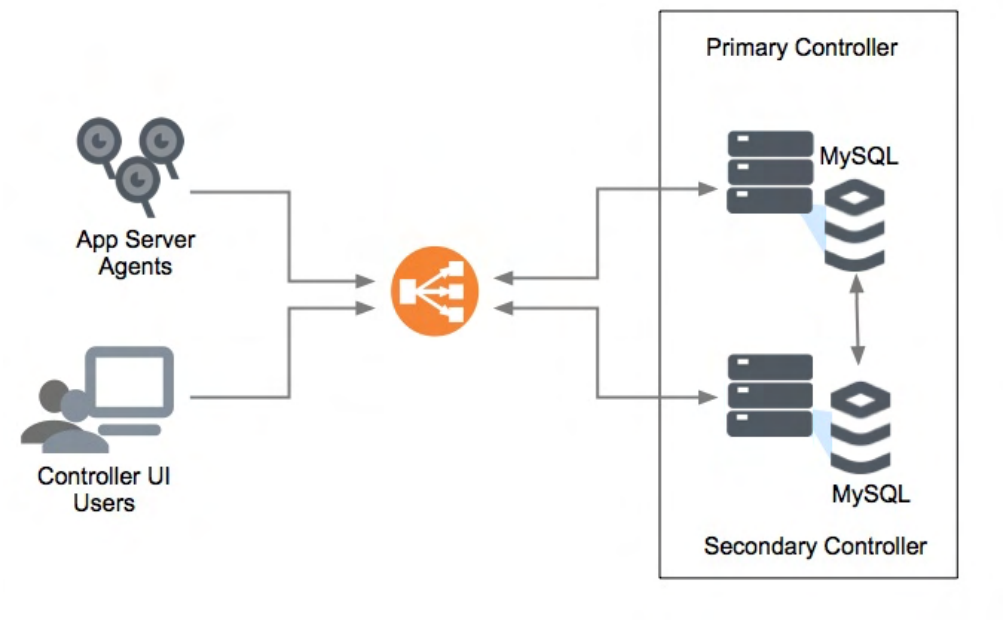
> The Controller supports encrypted database replication.

Overview of High Availability

Deploying Controllers in an HA arrangement provides significant benefits. It allows you to minimize the downtime in the event of a server failure and take the primary Controller down for maintenance with minimal disruption. It fulfills requirements for backing up the Controller data since the secondary maintains an updated copy of the Controller data. The secondary can also be used to perform certain resource-intensive operations that are not advised to be performed on a live Controller, such as performing a cold backup of the data or accessing the database to perform long-running queries, say for troubleshooting or custom reporting purposes.

In HA mode, each Controller has its own MySQL database with a full set of the data generated by the Controller. The primary Controller has the master MySQL database, which replicates data to the secondary Controller's replica MySQL database. HA mode uses a MySQL Master-Master replication type of configuration. The individual machines in the Controller HA pair need to have an equivalent amount of disk space.

The following figure shows the deployment of an HA pair at a high level. In this scenario, the agents connect to the primary Controller through a proxy load balancer. The Controllers in an HA pair must be equivalent versions, and be in the same data center.



In the diagram, the MySQL instances are connected via a dedicated link for purposes of data replication. This is an optional but recommended measure for high volume environments. It should be a high capacity link and ideally a direct connection, without an intervening reverse proxy or firewall. See Load Balancer Requirements and Considerations on Set Up a High Availability Deployment for more information on the deployment environment.

Operating Considerations

In a high availability deployment, it is important that only one Controller is the active Controller at one time. Only the database processes should be running on the secondary so that it can maintain a replicated copy of the primary database.

The Controller app server process on the HA secondary can remain off until needed. Having two active primary Controllers is likely to lead to data inconsistency between the HA pair.

When a failover occurs, the secondary app server must be started or restarted (if it is already running, which clears the cache).

To benefit from increased replication setup speeds, your server will need access to network resources capable of some hundreds of MB per second. By specifying replication setup parallelism, you can radically reduce setup times.

For example, if a single `rsync` is using only one-fifth of the available network capacity, you can achieve maximum throughput for setup by appending `-P r5` to end of the `replicate.sh` command. If this level of network traffic interferes with the ongoing Controller operation, you should monitor and adjust this setting.

- If you are using HA Toolkit version 3.54 and later, append `-P r5` to end of the `replicate.sh` command
- If you are using the HA module with Enterprise Console (version 4.5.17 and later), you must add the `--args numberThreadForRsync=5` to the CLI
- From the Enterprise Console UI, select **Number of parallel rsync threads** for incremental or finalize (depending on what stage you are performing)

Connecting Agents to Controllers in an HA Scenario

Under normal conditions, the App Agents and Machine Agents communicate with the primary Controller. If the primary Controller becomes unavailable, the agents need to communicate with the secondary Controller instead.

AppDynamics recommends that traffic routing be handled by a reverse proxy between the agents and Controllers, as shown in the figure above. This removes the necessity of changing agent configurations in the event of a failover or the delay imposed by using DNS mechanisms to switch the traffic at the agent.

If using a proxy, set the value of the Controller host connection in the agent configuration to the virtual IP or virtual hostname for the Controller at the proxy, as in the following example of the setting for the Java Agent in the `controller-info.xml` file:

```
<controller-host>controller.company.com</controller-host>
```

For the .NET Agent, set the Controller high availability attribute to true in `config.xml`. See .NET Agent Configuration Properties.

If you set up automation for the routing rules at the proxy, the proxy can monitor the Controller at the following address:

```
http://<controller>:<port>/controller/rest/serverstatus
```

An active node returns an HTTP 200 response to GET requests to this URL, with `<available>true</available>` in the response body. A passive node returns 503, Service Unavailable, with a body of `<available>false</available>`.

For more information, see Use a Reverse Proxy.

Prerequisites for High Availability

Before You Begin

Ensure that these requirements are met:

- Controller installation pre-requisites for both servers are met. See Platform Requirements
- Two dedicated machines running Linux. The Linux operating systems can be Fedora-based Linux distributions (such as Red Hat or CentOS) or Debian-based Linux distributions (such as Ubuntu).
- In a Controller HA pair, a load balancer should route traffic from the Controller clients (Controller UI users and App Agents) to the active Controller. Before starting, make sure that a load balancer is available in your environment and that the virtual IP address for the Controller pair is known as presented by the load balancer.
- Open port number 3388 between the machines in an HA pair.
- The login shell must be bash (`/bin/bash`).
- A network link connecting the HA hosts can support a high volume of data. The primary and replica must be in the same data center, and there must be a dedicated network link between the hosts.

> ⚠ IO Latency must be under 3 ms.

- Passwordless ssh has been set up between two Controller hosts. See Set Up the SSH Key.
- SSH keys on each host allow `ssh` and `rsync` operations by the AppDynamics user.
- The `hosts` file (`/etc/hosts`) on both Controller machines should contain entries to support reverse lookups for the other node in the HA pair.
- Because Controller licenses are bound to the network MAC address of the host machine, the HA replica Controller requires an additional HA license. You should request a secondary license for HA purposes in advance.
- While adding high availability hosts as part of the add host operation, you determine and provide the remote user, of which the Controller needs to be installed as. The platform path you specify (while creating the platform) must be writable on the two HA hosts for the remote user specified during add host operation.
- The following packages are installed on both Controller hosts, and the relevant installation commands are provided:

Command	Yum based installer (RH, Centos, Amazon Linux)	Apt based installer (Ubuntu)
`lsof`	`yum install lsof`	`apt-get install lsof`
`ssh`	`yum install openssh-server`	`apt-get install openssh-server`
`awk`	`yum install gawk`	`apt-get install gawk`
`scp`	`yum install openssh-clients`	`apt-get install openssh-client`
`rsync`	`yum install rsync`	`apt-get install rsync`
`curl`	`yum install curl`	`apt-get install curl`
`sed (GNU)`	`yum install sed`	`apt-get install sed`
`openssl`	`yum install openssl`	`apt-get install openssl`
`ps`	`yum install procps`	`apt-get install procps`
`xmllint`	`yum install libxml2-utils`	`apt-get install libxml2-utils`
`timeout/base64/tr`	`yum install coreutils`	`apt-get install coreutils`

Set Up a High Availability Deployment

This page describes how to set up and deploy Controllers as a high availability pair. For installation and upgrade details, see Custom Install and Upgrade an HA Pair.

> ⚠ The Enterprise Console HA deployment works on Linux systems only. Controller HA pairs are not available on Windows machines using Enterprise Console.

About the HA Deployment Using the Enterprise Console

The Enterprise Console automates HA-related setup and administration tasks for the Linux operating system. It does not require `sudo` privileges and can be deployed as a non-root user on Unix operating systems. It works with most flavors of Linux, including Ubuntu and Red Hat/CentOS.

> ⚠ The servers of Controllers in an HA pair must be identical in terms of OS, CPU, RAM, and Disk. See Controller System Requirements.

You can:

- Configure Controllers in a high availability pair arrangement.
- Use the Enterprise Console to monitor the health of the primary Controller, App Server, and database, and failover to the secondary when needed.
- Use scripts that allows you to install the Controllers as a Linux service, and gracefully stop and start service in the event of a machine reboot.
- Failover to a secondary Controller manually (for example, when you need to perform maintenance on the primary).
- Revive a Controller (restore a Controller as an HA secondary after its database is more than seven days behind the primary as a replica).
- Set up a Controller HA pair.

Deploying Controllers as an HA pair ensures that service downtime in the event of a Controller machine failure is minimized. It also facilitates other administrative tasks, such as backing up data. For more background information, including the benefits of HA, see Controller High Availability (HA).

Before Starting

For general guidelines and requirements on how to deploy HA in your environment, see Prerequisites for High Availability. Your environment must meet the prerequisites.

User Privilege Escalation Requirements

After installing a Controller high availability via the Enterprise Console, it is recommended to install MySQL as a Linux service. This is to prevent against MySQL data integrity issues. Installing the Controller and MySQL as a Unix service will ensure that whenever the machine reboots, the service will be shut down and started gracefully.

- `/etc/sudoers.d/appdynamics` contains entries to allow the AppDynamics user to access the `/sbin/service` utility using `sudo` without a password. This mechanism is not available if the AppDynamics user is authenticated by LDAP.
- `/sbin/appdservice` is a `setuid` root program distributed in source form in `<controller_home>/controller-ha/init/appdservice.c`. It is written explicitly to support auditing by security audit systems. The `install-init.sh` script compiles and installs the program. It is executable only by the AppDynamics user and the root user. The script requires a C compiler to be available on the system. You can install a C compiler using the package manager for your operating system. For example, on Yum-based Linux distributions, you can use the following command to install the GNU Compiler, which includes a C compiler:

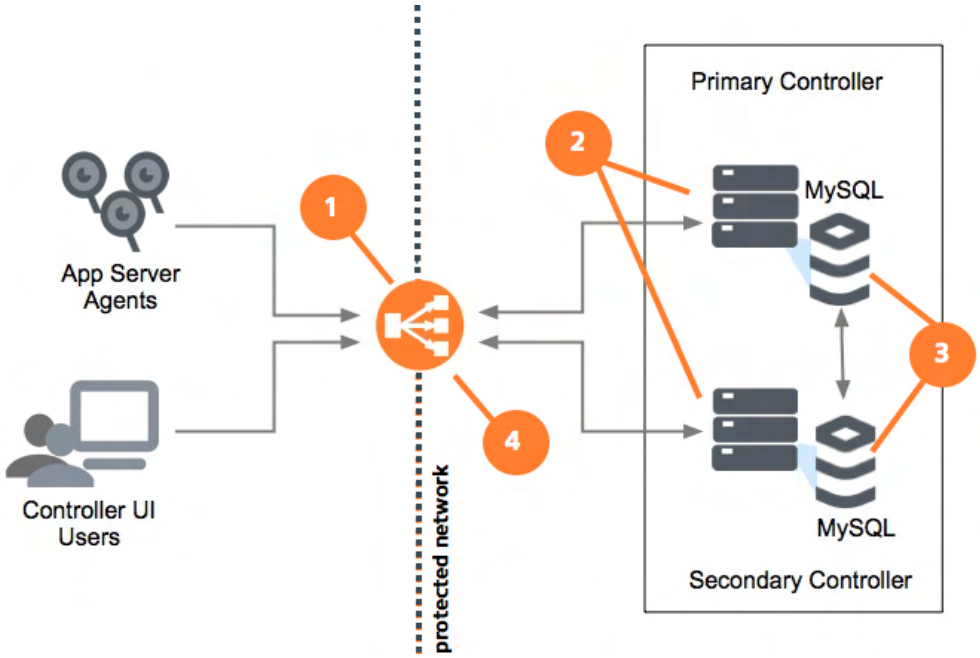
  ```
  sudo yum install gcc
  ```

Load Balancer Requirements and Considerations

Before setting up HA, a reverse proxy or load balancer needs to be available and configured to route traffic to the active Controller in the HA pair. Using a load balancer to route traffic between Controllers (rather than other approaches, such as DNS manipulation) ensures that a failover can occur quickly, without, for example, delays due to DNS caching on the agent machines.

An HA deployment requires the following IP addresses:

- One for the virtual IP of the Controller pair as presented by the load balancer used by clients, such as App Agents, to access the Controller. (Callout 1 in the following diagram.)
- Two IP addresses for each Controller machine, one for the HTTP primary port interface (2) and one for the dedicated link interface between the Controllers (3) on each machine. The dedicated link is recommended but not mandatory.
- If the Controllers will reside within a protected, internal network behind the load balancer, you also need an additional internal virtual IP for the Controller within the internal network (4).



When configuring replication, you specify the external address at which Controller clients, such as app agents and UI users, will address the Controller at the load balancer. The Controllers themselves need to be able to reach this address as well. If the Controller will reside within a protected network relative to the load balancer, preventing them from reaching this address, there needs to be an internal VIP on the protected side that proxies the active Controller from within the network. This is specified using the `-i` parameter.

The load balancer can check the availability of the Controller at the following address:

`http://<controller_host>:<port>/controller/rest/serverstatus`

If the Controller is active, it responds to a GET request at this URL with an HTTP 200 response. The body of the response indicates the status of the Controller in the following manner:

```
<serverstatus vendorid="" version="1">
   ...
   <available>true</available>
   ...
```

Ensure that the load balancer policy you configure for the Controller pair can send traffic to only a single Controller in the pair at a time (i.e., do not use round-robin or similar routing distribution policy at the load balancer). For more information about setting up a load balancer for the Controller, see Use a Reverse Proxy.

Set Up the Controller High Availability Pair

To set up high availability:

Step 1: Configure the Controller High Availability Pair Environment

The following sections provide more information on how to configure a few of the system requirements. They describe how to configure the settings on Red Hat Linux as a sample deployment. Note that the specific steps for configuring these requirements may differ on different systems. Consult your system documentation for specific details.

Host Reverse Lookups

You need to set up a reliable symmetrical reverse host lookup on each machine. To do this, enter the hostnames of the pair into the hosts files (`/etc/hosts`) on each machine. This is preferable over other approaches, such as using reverse DNS, which adds a point of failure.

To enable reverse host lookups, on each host:

1. In `/etc/nsswitch.conf`, enter `files` before `dns` to have the `hosts` file entries take precedence over DNS. For example:
   `hosts: files dns`
2. In `/etc/hosts` file, add an entry for each host in the HA pair. For example:
   `192.168.144.128 host1.domain.com host1`
   `192.168.144.137 host2.domain.com host2`

> To reduce errors, use the correct format of `/etc/hosts` files. If you have both dotted hostnames and short versions, you need to list the dotted hostnames with the most dots first and the other versions subsequently. This should be done consistently for both HA server entries in each of the two `/etc/hosts` files. Note that in the examples provided, the aliases are listed last.

Set Up the SSH Key

SSH must be installed on both hosts in a way that gives the user who runs the Controller passwordless SSH access to the other Controller system in the HA pair. You can accomplish this by generating a key pair on each node, and placing the public key of the other Controller into the authorized keys (authorized_keys) file on each Controller.

The following steps describe how to perform this configuration. The instructions assume an AppDynamics user named `appduser,` and the Controller hostnames are node1, the active primary, and node2, the secondary. Adjust the instructions for your particular environment. Also note that you may not need to perform every step (for example, you may already have the `.ssh` directory and don't need to create a new one).

Although not shown here, some of the steps may prompt you for a password.

On the primary (node1) host:

1. Change to the AppDynamics user, `appduser` in our example:

```
su - appduser
```

2. Create a directory for SSH artifacts (if it doesn't already exist) and set permissions on the directory, as follows:

```
mkdir -p .ssh
chmod 700 .ssh
```

3. Generate the RSA-formatted key:

```
ssh-keygen -t rsa -N "" -f .ssh/id_rsa -m pem
```

4. Secure copy the key to the other Controller:

```
scp .ssh/id_rsa.pub node2:/tmp
```

On the secondary (node2) host:

1. As you did for node1, run these commands:

```
su - appduser
mkdir -p .ssh
chmod 700 .ssh
ssh-keygen -t rsa -N "" -f .ssh/id_rsa -m pem
scp .ssh/id_rsa.pub node1:/tmp
```

2. Add the public key of node1 that you previously copied to the secondary Controller host's authorized keys and set permissions on the authorized keys file:

```
cat /tmp/id_rsa.pub >> .ssh/authorized_keys
chmod 700 ~/.ssh/authorized_keys
```

On the primary (node1) again:

1. Move the secondary's public key to the authorized keys

```
cat /tmp/id_rsa.pub >> ~/.ssh/authorized_keys
chmod 700 ~/.ssh/authorized_keys
```

To test the configuration, enter:

```
ssh -oNumberOfPasswordPrompts=0 <other_node> "echo success"
```

Verify that the `echo` command is successful.

Step 2: Install a Controller High Availability Pair

Once you have set up the environment, you can install a Controller HA pair on the primary machine. To add an HA secondary to an existing standalone Controller deployment, you only need to verify that the user who runs the Controller has write access to the Controller home.

To install a Controller HA pair:

1. Check that you have fulfilled the Enterprise Console prerequisites before starting.
2. Open a browser and navigate to the GUI:

   ```
   http(s)://<hostname>:<port>
   ```

   9191 is the default port.
3. Verify that the credentials and hosts you want to use are added to the AppDynamics platform. For more information, see Administer the Enterprise Console.

   a. On the **Credential** page, add the SSH credentials for the host you want to install the primary Controller on. You can also run the following command on the Enterprise Console host:

   ```
   bin/platform-admin.sh add-credential --credential-name <name> --type <ssh> --user-name <username>
   --ssh-key-file <file path to the key file>
   ```

   > Remember to provide the private key file for the Enterprise Console machine when adding a credential.

   b. On the **Hosts** page, add the host using the credentials from above. You can also run the following command on the Enterprise Console host:

   ```
   bin/platform-admin.sh add-hosts --hosts secondaryhost --credential <credential name>
   ```

4. Navigate to the **Install** homepage and click **Custom Install**.
5. Name the platform:

   a. Enter a Name and the Installation Path for your platform.

   > The Installation Path is an absolute path under which all of the platform components are installed. The same path is used for all hosts added to the platform. Use a path which does not have any existing AppDynamics components installed under it. The path you choose must be writeable, i.e. the user who installed the Enterprise Console should have write permissions to that folder. Also, the same path should be writable on all of the hosts that the Enterprise Console manages.
   >
   > Example path: `<path_to_AppD>/appdynamics/platform`

   Or run the following command on the Enterprise Console host:

   ```
   bin/platform-admin.sh create-platform --name <platform_name> --installation-dir
   <platform_installation_directory>
   ```

6. Add two hosts:

   a. For each of the two hosts, enter their host machine information: Host Name, Username, and Private Key.
   This is the location onto which the Controllers will be installed. For more information about how to add credentials and hosts, see Administer the Enterprise Console.
7. Install Controller:

a. Select **Install**.
b. Select a Profile size for your Controller. See Controller System Requirements for more information on the sizing requirements.
c. Enter the Controller Primary and Secondary hosts.
d. Enter the required Username and Passwords. The default Controller Admin Username is `admin`.

> If you do not install a Controller at this time, you can always do so later by navigating to the **Controller** page in the GUI and clicking Install Controller.

Or run the following command on the Enterprise Console host:

```
bin/platform-admin.sh submit-job --service controller --job install --args
controllerPrimaryHost=<primaryhost> controllerSecondaryHost=<secondaryhost>
controllerAdminUsername=<user1> controllerAdminPassword=<password>
controllerRootUserPassword=<rootpassword> mysqlRootPassword=<dbrootpassword>
```

8. Click **Install**.

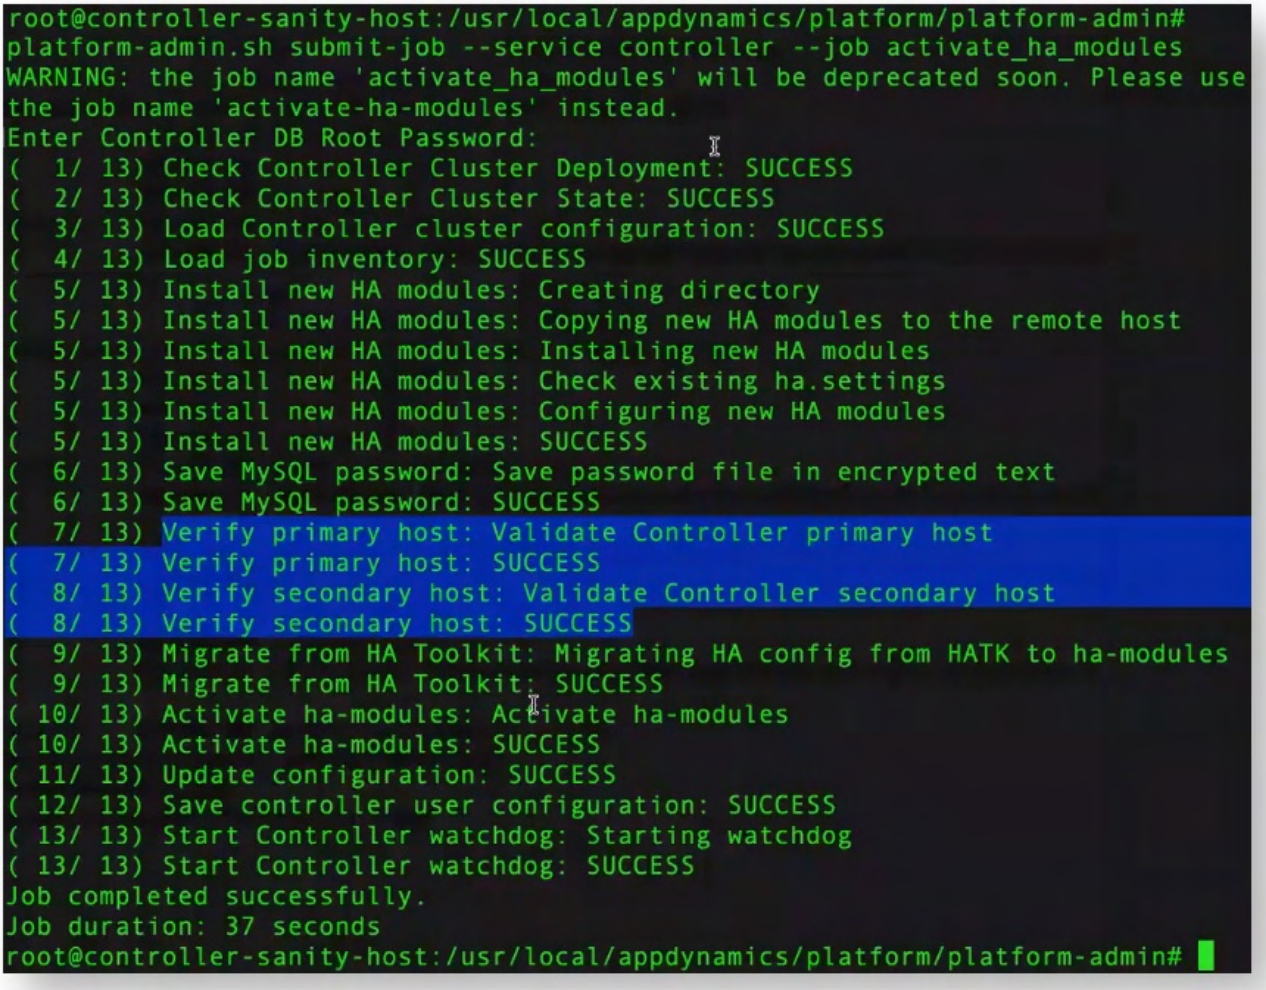
Step 3: Activate the Controller High Availability Pair

This step ensures that the Enterprise Console is no longer in the critical path of the HA Controller failover process.

Open a command shell on the Enterprise Console host and enter:

```
platform-admin.sh submit-job --service controller  --job activate-ha-modules
```

Your output should be similar to the following:



Step 4: Install as a Service

The Enterprise Console does not install the Controller as a service on Linux because it requires root user or `sudo` privileges. However, the Enterprise Console copies the `init` scripts on the Controller hosts in `<controller_home>/controller-ha`. To complete the installation, manually run the following:

1. Change directories to `<controller_home>/controller-ha`.
2. As the user who owns the Controller folder, run:

   ```
   set_mysql_password_file.sh -p <db root password> -s <secondary host>
   ```

   `-s` copies the file to the secondary host. Enter the MySQL database root user password in the command.
3. Change directories to `<controller_home>/controller-ha/init`.
4. Run `install-init.sh` as root user with one of the following options to select how to elevate the user privilege:

   - `-c` #use setuid c wrapper
   - `-s` #use sudo
   - `-p` #use prune wrapper
   - `-x` #use user privilege wrapper

You must run this script on both Controller HA pair servers. If you need to uninstall the service later, run the `uninstall-init.sh` script.

The status and progress of the deployment's various components are written to the logs.

Convert a Standalone Controller to a Controller High Availability Pair

You can convert a standalone Controller to a Controller HA pair through the Enterprise Console GUI. Ensure that you have completed the prerequisites in the above Configure the Controller High Availability Pair Environment section that requires both the primary and secondary hosts to talk to each other via passwordless SSH.

Additionally, you can use incremental replication to add a secondary Controller. See Initiate Controller Database Incremental Replication for more information.

If you are starting from a fresh installation, you will need to first create a platform, then add two credentials and hosts for your HA pair.

To convert a standalone Controller to a Controller HA pair:

1. Open the Enterprise Console GUI.
2. Verify that the credentials and hosts you want to use are added to the AppDynamics platform. For more information, see Administer the Enterprise Console.

    a. On the **Credential** page, add the SSH credentials for the host you want to install the secondary Controller on. You can also run the following command on the Enterprise Console host:

    ```
    bin/platform-admin.sh add-credential --credential-name <name> --type <ssh> --user-name <username>
    --ssh-key-file <file path to the key file>
    ```

    > Remember to provide the private key file for the Enterprise Console machine when adding a credential.

    b. On the **Hosts** page, add the host. You can also run the following command on the Enterprise Console host:

    ```
    bin/platform-admin.sh add-hosts --hosts secondaryhost --credential <credential name>
    ```

    The Enterprise Console uses this host for the HA pair.
3. On the **Controller** page, click **Add Secondary Controller**, and complete the wizard:

    a. Select the Controller Secondary Host that you added for the secondary Controller.
    b. Optional: Enter the External URL. This is the external load balancer URL, which should reflect this format: `http(s)://<external.vip>:<port>`
    c. Enter the DB Root Password, and re-enter it for confirmation.

    > Ensure to provide the same passwords during the secondary server installation as those that you provided for the primary server.

4. Select **Submit**.

Your HA pair will automatically set up, each with their own MySQL node.

Manage a High Availability Deployment

This page describes how to manage and troubleshoot Controllers as a high availability pair.

Set Up Monitoring for the HA Pair

You can set up monitoring for your HA pair by installing another Controller to act as the monitoring Controller.

1. If you do not already have an HA pair, set one up.
2. Install the monitoring Controller on the Enterprise Console host in a new platform by selecting Custom Install:
    a. Create a platform (e.g.: Controller Monitor Platform).

    > ⚠ This platform should not be used for installing any other services.

    b. Install a Controller.
    c. Make sure to unselect the Install Events Service option before clicking **Install**.
3. Complete the monitoring setup by installing and configuring the App Agents and Machine Agents on your HA pair:
    - Set Up App Agents for Monitoring
    - Install and Set Up Machine Agents for Monitoring

Set Up App Agents for Monitoring

You can set up App Agents, which are automatically installed on the Controller hosts by the Enterprise Console, on both Controllers of an HA pair to report to the monitoring Controller. This can be done by updating the JVM options of your HA pair platform. To set up your App Agents using the Enterprise Console, perform the following steps:

1. SSH into the primary Controller box and update the primary Controller App Agent's `controller-info.xml` by running the following commands:

    ```
    cd <controller-install-dir>/appserver/glassfish/domains/domain1/appagent
    cp conf/controller-info.xml ver<version#>/conf/
    ```

2. Repeat step 1 for the secondary Controller.
3. In the Enterprise Console UI, select your HA pair platform, and navigate to the JVM Options section by clicking **Configurations > Controller Settings** > **Appserver Configurations**.
4. Make the following updates to JVM Options:

    a. Update the `appdynamics.controller.hostName` to the monitoring Controller's IP.
    b. Add the following required `jvm-options` for monitoring:

    ```
    -Dappdynamics.agent.applicationName=<app_name>, -Dappdynamics.agent.tierName=<tier_name>,
    -Dappdynamics.agent.nodeName=<node_name>, -Dappdynamics.agent.accountName=<account_name>,
    -Dappdynamics.agent.accountAccessKey=<access_key>
    ```

    > ⓘ You can get your access key from the Controller UI: navigate to **Settings**> **License** > **Account**. Then click to show your access key. Note, when you log in to the Controller, use the account specified in `appdynamics.agent.accountName`.

5. Scroll down the page and click **Save**. The job will apply these properties and restart both the primary and secondary Controllers.
6. In the Enterprise Console UI, select your Controller Monitor Platform, and navigate to the Controller page.
7. Click on **External URL** on the widget to open the monitoring Controller's UI.
8. Log in to the Controller. You should be able to see the monitoring application for both the primary and secondary Controllers.

Install and Set Up Machine Agents for Monitoring

You must install Machine Agents on both Controllers of an HA pair to report to the monitoring Controller. These agents are Java programs that collect hardware metrics. To install and set up your machine agents, perform the following steps:

1. Install the Machine Agent on the primary Controller box. Do not start the agent.
2. Repeat step 1 for the secondary Controller.
3. Configure the Machine Agent properties for both Machine Agents by editing the `controller-info-xml` file located in the `<machine_agent_home>/conf` directory.
    a. Update the `<controller-host>` to the monitoring Controller's IP.
    b. Model the rest of your `controller-info-xml` file after the Example Configuration.
4. Start both Machine Agents.
5. In the Enterprise Console UI, select your Controller Monitor Platform, and navigate to the Controller page.
6. Click on **External URL** on the widget to open the monitoring Controller's UI.
7. Log in to the Controller. You should be able to see the monitoring application for both the primary and secondary Controllers.

Bouncing the Primary Controller Without Triggering Failover

The Enterprise Console does not allow you to stop and start the primary Controller without initiating failover. Therefore, to work around this, you will need to perform the following steps:

1. Log in to the Enterprise Console and navigate to the Appserver Configurations page by clicking through Configurations, followed by Controller Settings.
2. Deselect **Enable Auto Failover** and click **Save**.
3. SSH to the Controller machine where the Controller is installed.
4. Run the following commands on the Enterprise Console host:

   ```
   bin/platform-admin.sh stop-controller-appserver
   bin/platform-admin.sh start-controller-appserver
   ```

   This will bounce the primary Controller in HA mode.
5. Re-enable auto failover on the Enterprise Console Appserver Configurations page.

Starting and Stopping the Controller

The Enterprise Console does not allow you to shut down the primary Controller. However, you can restart the secondary Controller via the start and stop Controller commands.

To start or stop the Controller manually, use the following commands:

- To start:

  ```
  bin/platform-admin.sh start-controller-appserver --with-db
  ```

- To stop:

  ```
  bin/platform-admin.sh stop-controller-appserver --with-db
  ```

Automatic Failover

The Enterprise Console monitors the health of the primary Appserver and database. If the Appserver or database is unresponsive, the Enterprise Console will by default wait for five minutes before initiating a failover. This interval can be configured by updating the default value in the Domain Protocol text field on the Appserver Configurations page under Controller settings.

You can also disable or enable automatic failover through the CLI.

> Version 4.5.14 and above of the Enterprise Console comes with the High Availability (HA) modulewhich utilizes the Controller Watchdog for auto-failover. If you want to enable or disable the auto-failover, then the `watchdog` script needs to be running or stopped.

To disable and enable the Controller Watchdog with CLI using the following commands:

- To stop the Controller Watchdog:

```
./platform-admin.sh submit-job --job stop-controller-watchdog --service controller
```

- To start the Controller Watchdog:

```
./platform-admin.sh submit-job --job start-controller-watchdog --service controller
```

Performing a Manual Failover and Failback

To failover from the primary to the secondary manually, click the **HA Failover** option on the **Controller** page of the Enterprise Console or run the following command on the Enterprise Console host:

```
bin/platform-admin.sh submit-job --service controller --job ha-failover --platform-name <name_of_the_platform>
```

This changes the Appserver on the secondary as primary and database on the secondary as the replication master. It also changes the old primary to secondary.

The process for performing a failback to the old primary is the same as failing over to the secondary. Simply run the following command on the Enterprise Console host:

```
bin/platform-admin.sh submit-job --service controller --job ha-failover --platform-name <name_of_the_platform>
```

Note that if it has been down for more than seven days, you need to revive the database, as described in the following section.

Initiate Controller Database Incremental Replication

Re-enable Broken Replication

Incremental replication, replication via rsync when the primary database is up, is required in cases where the database replication on the secondary Controller is lagging behind the primary Controller by more than three days. This type of replication allows the primary Controller to keep operating while the disk contents are copied to the secondary node.

To initiate incremental replication:

1. Run the following command on the Enterprise Console host:

   ```
   bin/platform-admin.sh submit-job --service controller --job incremental-replication
   ```

   This launches a continuously running background job.
2. Make sure replication occurs four or more times, by checking `mysqlDir/incremental_sync.status` on the primary database host.

   Sample rsync status file output:

   ```
   rsync started at Mon Mar  5 11:49:56 PST 2018
   rsync completed at Mon Mar  5 11:50:56 PST 2018
   rsync started at Mon Mar  5 11:51:01 PST 2018
   rsync completed at Mon Mar  5 11:51:11 PST 2018
   ```

   If replication fails, go to the secondary host and stop all rsync and ha-replicate.sh processes. Then try running the incremental-replication job again.
3. Finalize the job by running the following command on the Enterprise Console host:

   ```
   bin/platform-admin.sh submit-job --service controller --job finalize-replication
   ```

   This stops the incremental replication loop. The command will restart the primary Controller, resulting in downtime.
4. Make sure replication is working by checking that there is no significant gap between the primary and secondary Controllers. You can run the following command on the Enterprise Console host to check the replication status:

   ```
   bin/platform-admin.sh show-service-status --platform-name <platform_name> --service controller
   ```

   It may take a few minutes for the secondary status to catch up.

Add a Secondary Controller Using Incremental Replication

You can convert a single Controller with a large amount of data to an HA pair by using incremental replication. This way, you can rsync most of the Controller's data while the Controller is still running, limiting the downtime of adding a secondary Controller.

To add a secondary Controller using incremental replication:

1. Start the incremental replication, giving host and rsync parameters:

   ```
   bin/platform-admin.sh submit-job --service controller --job incremental-replication --args
   controllerSecondaryHost=1.1.1.1 rsyncThrottle=40000 rsyncCompress=true
   ```

This launches a continuously running background job.

2. Make sure replication occurs four or more times, by checking `<controller_home>/controller-ha/tmp/replication.status` on the primary database host.
   Sample rsync status file output:

```
rsync started at Mon Mar  5 11:49:56 PST 2018
rsync completed at Mon Mar  5 11:50:56 PST 2018
rsync started at Mon Mar  5 11:51:01 PST 2018
rsync completed at Mon Mar  5 11:51:11 PST 2018
```

   > If replication fails, go to the secondary host and stop all rsync and ha-replicate.sh processes. Then try running the incremental-replication job again.

3. Run the add secondary job. The Enterprise Console will perform a final rsync and add the secondary.

```
bin/platform-admin.sh submit-job --service controller --job add-secondary --args
controllerSecondaryHost=secondary mysqlRootPassword=‘password'
```

   The command will restart the primary Controller, resulting in downtime.

   > Until you trigger the add-secondary command, the secondary Controller is not added to the Enterprise Console platform. Therefore, the Enterprise Console will not be able to perform any other operations on the secondary Controller.

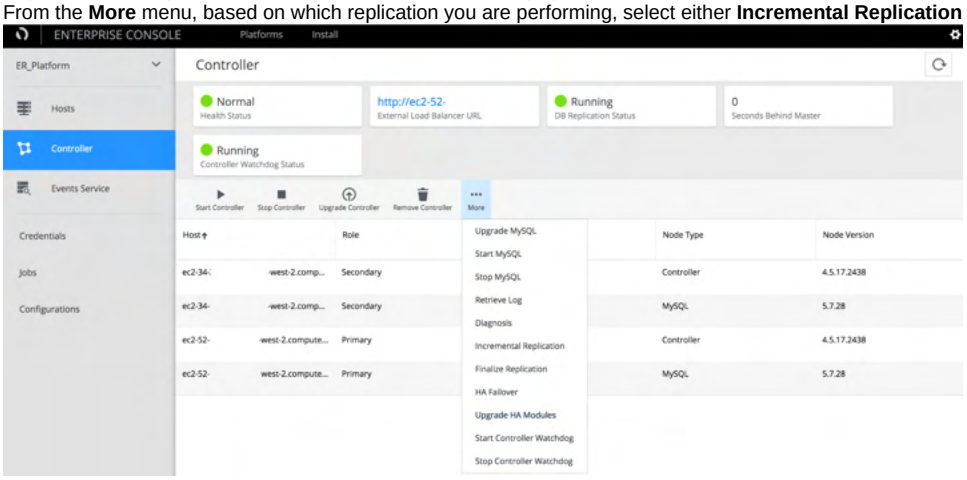
If you need to stop replication, you can run the following command:

```
bin/platform-admin.sh submit-job --service controller --job stop-incremental-replication
```

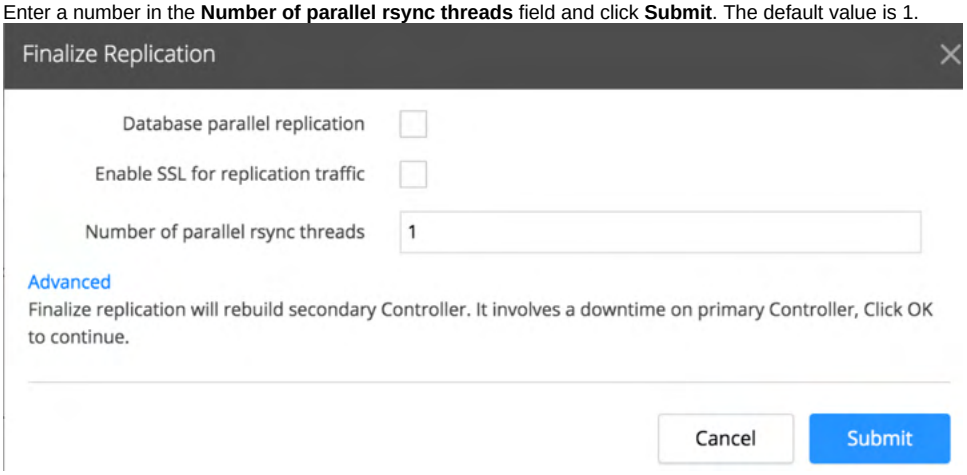
Set Replication Factors for Rsync Threads

Using the Enterprise Console UI or the CLI, you can set the number of parallel rsync threads as a job parameter when you perform incremental or finalize replication.

- From the Enterprise Console UI:
  1. Log in to the Enterprise Console and access the Controller page.
  2. From the **More** menu, based on which replication you are performing, select either **Incremental Replication** or **Finalize Replication**.



3. Enter a number in the **Number of parallel rsync threads** field and click **Submit**. The default value is 1.



- From the CLI, based on which replication you are performing, run either of the following commands from the Enterprise Console host and set the n umberThreadForRsync argument.

```
bin/platform-admin.sh submit-job --job incremental-replication --args numberThreadForRsync=<number> bin
/platform-admin.sh submit-job --job finalize-replication --args numberThreadForRsync=<number>
```

Enable MySQL5.7 Parallel Replication

Using the Enterprise Console UI or the CLI, you can enable MySQL5.7 parallel replication when you perform finalize replication.

- From the Enterprise Console UI:
  1. Log in to the Enterprise Console and access the Controller page.
  2. From the **More** menu, select **Finalize Replication**.

  3. Select the **Database parallel replication** check box to enable parallel replication with the MySQL5.7 database.

  4. Click **Submit**.
- From the CLI, run the following command from the Enterprise Console host to enable MySQL5.7 parallel replication. The default value is true.

```
bin/platform-admin.sh submit-job --job finalize-replication --args dbParallelReplication=true
```

Troubleshooting the Incremental Replication Status

If your first incremental replication run is taking longer than usual, you can refer to the status file, `<controller_home>/incremental_sync.status`, to review a detailed list of files that are being rsynced. You can find the file in the primary Controller host under the Platform folder: `mysqlDir /<controller_home>/incremental_sync.status`.

Re-enable Controller Database Replication

The Controller databases can be synchronized using the replicate script if they have been out of sync for more than seven days. Synchronizing a database that is more than seven days behind a master is considered reviving a Controller database. Reviving a database involves essentially the same procedure as adding a new secondary Controller to an existing production Controller, as described in Set Up the Secondary Controller and Initiate Replication. You can also follow these steps in the case of an HA failover that failed at replication.

To re-enable replication or revive a Controller database:

1. On the Controller page, click **Remove Controller**, or run the following command on the Enterprise Console host:

   ```
   bin/platform-admin.sh submit-job --job remove --service controller
   ```

2. Enter the database root credentials.
3. Check **Remove Binaries**, or run the following command on the Enterprise Console host:

   ```
   bin/platform-admin.sh submit-job --job remove --service controller --args removeBinaries=true
   ```

4. Uncheck **Remove Controller Cluster**. If it is already unchecked, remove the secondary server.
5. Click **Submit**.
6. Add a secondary controller from the Controller page, or run the following command on the Enterprise Console host:

   ```
   bin/platform-admin.sh submit-job --service controller --job add-secondary --args
   controllerSecondaryHost=secondary mysqlRootPassword='password'
   ```

   The command will restart the primary Controller, resulting in downtime.

The Enterprise Console will onboard the secondary Controller and re-enable replication.

Backing Up and Restoring Controller Data in an HA Pair

An HA deployment makes backing up Controller data relatively straightforward since the secondary Controller offers a complete set of production data on which you can perform a cold backup without disrupting the primary Controller service.

After setting up HA, perform a back up by stopping the Controller on the Enterprise Console and performing a file-level copy of the AppDynamics home directory (i.e., a cold backup). When finished, simply restart the Controller from the Enterprise Console. The secondary will then catch up its data to the primary.

When restoring the database from a back up in an HA or standalone environment, you should check that the primary and secondary servers ha.type and ha.mode are set properly to active and passive, respectively.

Updating the Configuration in an HA Pair

The Enterprise Console will copy any file-level configuration customizations made on the primary controller to the secondary controller, such as changes in domain.xml and `db.cnf`.

Over time, if you need to make modifications to the Controller configuration, always do those changes in the Enterprise Console on the Controller Settings page under Configurations. These changes will be preserved during upgrades. Any changes made outside the Enterprise Console will not be preserved after upgrade.

Troubleshooting HA

Controller Diagnostic Data

The Enterprise Console writes log messages pertaining to HA to the `platform-admin-server.log` on the Enterprise Console host.

To diagnose the Controller, run the following command:

```
bin/platform-admin.sh submit-job --platform-name <name_of_the_platform> --job diagnosis --service controller
```

Refer to the Controller diagnostic data in the `platform-admin-server.log`.

Sample Controller diagnostic data

Linux

```
Controller diagnostic data:
123.45.0.1:
controller_database: running
controller_appserver: running
reports_service: running
operating_system: Linux
controller_version: 004-004-001-000
controller_performance_profile: small
controller_ha_type: primary
controller_appserver_mode: active
controller_metric_data_per_min: N/A
slave_io_state: Waiting for master to send event
seconds_behind_master: 0
master_server_id: 567.
master_host: controller-secondary
master_ssl_allowed: No

123.45.0.2:
controller_database: running
controller_appserver: not running
reports_service: running
operating_system: Linux
controller_version: 004-004-001-000
controller_performance_profile: small
controller_ha_type: secondary
controller_appserver_mode: passive
```

Invalid HA Controller Roles

If your HA Controller roles in the Controller databases are incorrect, the Enterprise Console will prevent discover and upgrade jobs. An invalid HA Controller state is when both of your Controller role types are identical, such as in a primary/primary or secondary/secondary case.

To fix this issue:

1. Identify which server is the primary.
    a. Log in to one of the Controller databases by running the following command in the Controller installation directory:

    ```
    bin/controller.sh login-db
    ```

    b. Run the following command:

    ```
    select * from global_configuration_local where name='ha.controller.type';
    ```

2. Ensure that `ha.controller.type` is set correctly in the database.
    a. Log in to the Controller database you would like to change by running the following command in the Controller installation directory:

    ```
    bin/controller.sh login-db
    ```

    b. Run the following commands to set the database to the primary or secondary:

3. Restart the database for the change to take effect on the Appserver:

```
bin/platform-admin.sh stop-controller-appserver --with-db
bin/platform-admin.sh start-controller-appserver --with-db
```

If the secondary Appserver is already in a shutdown state, then there is no need to restart the database.

4. Verify the replication is healthy:

```
show slave status\G
```

`Slave_IO_Running` and `Slave_SQL_Running` should show `Yes`.

You may now retry the discover and upgrade job.

Failover Prevention

If failover is prevented on your Controller HA configuration, it may be due to one of two scenarios:

- The secondary database is down. Failover cannot occur when the secondary database is not running.
  To fix this issue:
  1. Restart the secondary database by running the following command on the secondary host:

     ```
     bin/controller.sh start-db
     ```

  If this does not enable failover, then it may be due to the second scenario.

- Database replication is not healthy. Failover is not allowed when the database replication is not healthy.
  There are various reasons why this may be the case. Please work closely with your AppDynamics account representative to correct the issue.

Migrate to the New HA Module Using Enterprise Console

As part of the new Controller HA Module in the Enterprise Console, Enterprise Console no longer manages the Controller failover. Instead, the new HA Module installs the Controller watchdog on the Controller hosts and the Controller hosts are now responsible for performing a failover. The new HA Module is packaged in Enterprise Console and allows you to migrate seamlessly from older HA implementations, such as the HA Toolkit (HATK), to this new HA Module. The new HA Module is included with the latest version of Enterprise Console, and is installed when you install or upgrade your Controller. However, it is not activated until you migrate an HA pair.

Who Should Use the HA Module?

- If you are a new user just starting to implement AppDynamics HA, then you should use the HA Module (this is the default option).
- If you are an existing user and you prefer to use the Enterprise Console UI integration instead of the command line (CLI) and HATK, then you should use the HA Module.
- If you are an existing user and you do not want to change existing DevOps, conduct additional training, or would like to continue using HATK features, then use HATK.

If your Controller version is earlier than version 4.5.13, then you must use the HA Toolkit (HATK) instead of the HA Module to install and configure High Availability.

Before You Begin

In addition the Prerequisites for High Availability, ensure the following requirements are met:

- Both servers have the same Linux username and groupname.
- Both servers have the same AppDynamics directory structure, same AppDynamics pathname on both servers without using symbolic links.

Migrate a Controller High Availability Pair

This section describes the Enterprise Console and Controller HA Pair upgrade processes required for two different scenarios:

- Scenario One: Deployment currently using both Enterprise Console and HA Toolkit
- Scenario Two: Deployment where Enterprise Console alone manages the HA Pair

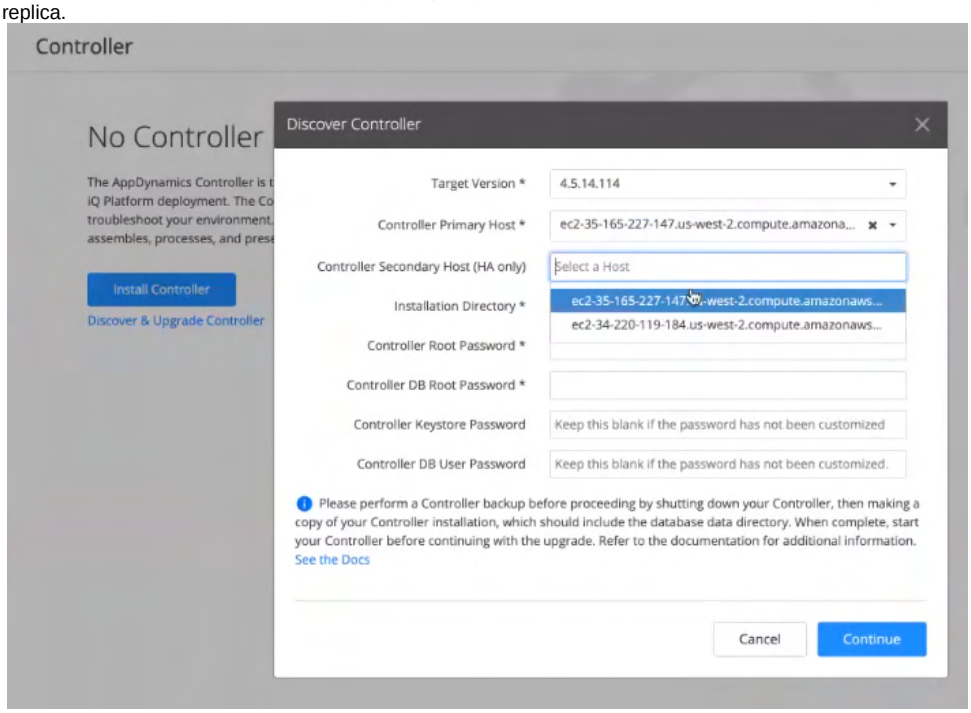
Scenario One: Upgrade Deployment that uses Enterprise Console and HA Tookit

1. Download and install the latest version of Enterprise Console from the Downloads page.
2. Open Enterprise Console and select **Controller**. In the Controller list, it displays only the primary Controller of the HA Pair. If you have an existing pair of HA Controllers which are not managed by Enterprise Console, you need to forget the Controller from within Enterprise Console. It will only show the primary Controller.
3. Select the Controller and select **Remove**.

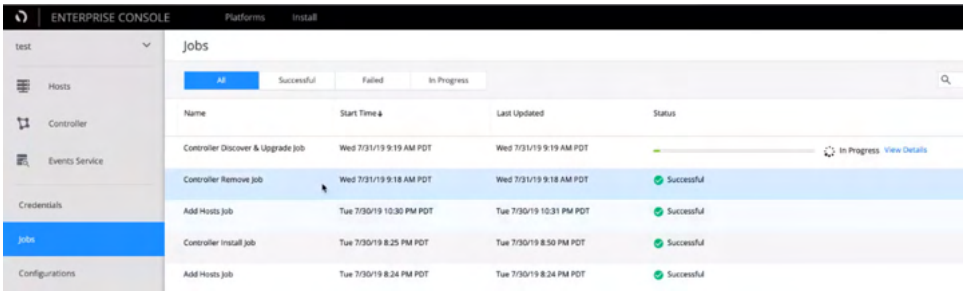
   In the Remove Controller dialog, deselect **Remove Binaries**. At this point, you are just removing the Controller from Enterprise Console but not the AppDynamics software that is running on the HA Controllers.

4. Before we can activate the new HA Module, we need to discover both Controllers from within Enterprise Console. Once the remove Controller job completes, select **Controller > Discover & Upgrade Controller**.

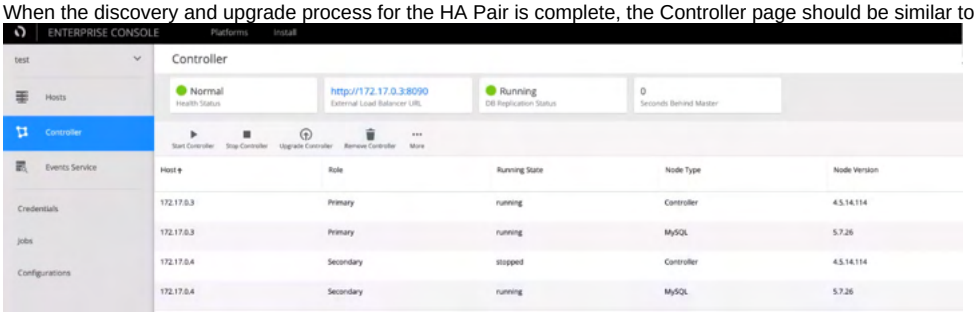
5. Note that in the Discover Controller dialog, you specify the hostnames of both the Controller Primary Host, and the Controller Secondary Host, or replica.



6. Complete the fields of the Discover Controller dialog and select **Continue**. This adds the HA Pair to Enterprise Console where you can then manage and upgrade.
   Access the Jobs page to see several jobs that have completed successfully. The Controller Discover & Upgrade Job will take a while to complete. Select **View Details** to track the progress of the tasks involved to discover and upgrade the Controller.



When the discovery and upgrade process for the HA Pair is complete, the Controller page should be similar to the following:

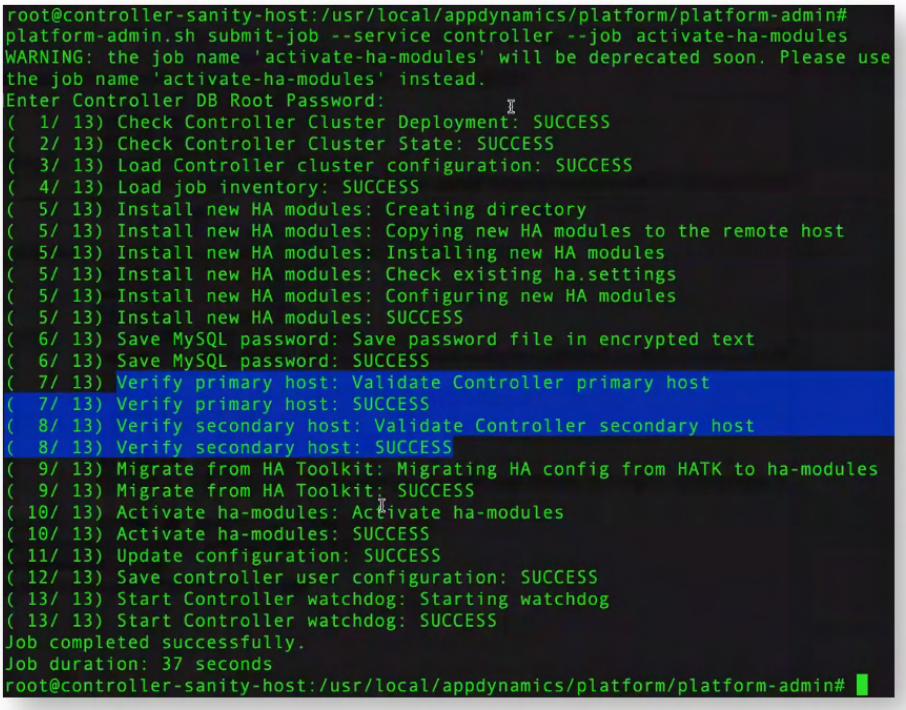


Now, Enterprise Console knows about the HA Pair and has copied the new HA Module to the primary and secondary Controllers in the HA Pair.

7. To activate the HA Pair, open a command shell on the Enterprise Console host and enter the following:

```
platform-admin.sh submit-job --service controller  --job activate-ha-modules
```

You should see output similar to the following:



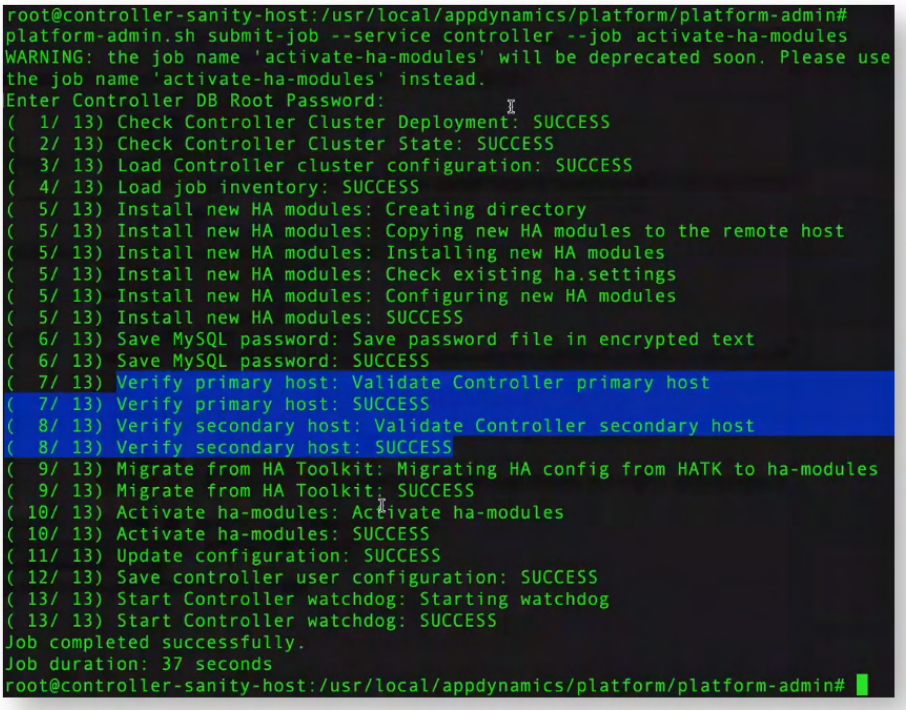
8. Verify that the Controller HA failover is working by terminating the Primary Controller and allow Controller Watchdog to trigger a failover. Then, wait a few minutes to ensure AppDynamics agents are reporting metrics to the Controller.

Scenario Two: Upgrade Deployment Managed by Enterprise Console Alone

1. Download and install the latest version of Enterprise Console from the Downloads page.
2. Upgrade the installed version of Enterprise Console by running the installer on the Enterprise Console host.
3. Upgrade both Controllers by selecting **Upgrade Controller**.
4. To activate the HA Pair, open a command shell on the Enterprise Console host and enter:

```
platform-admin.sh submit-job --service controller  --job activate-ha-modules
```

You should see output similar to the following:



5. Verify that the Controller HA failover is working by terminating the Primary Controller and allows Controller Watchdog to trigger a failover. Then wait a few minutes to ensure AppDynamics agents are reporting metrics to the Controller.
6. When you enable the HA module, the HATK folder is renamed which results in broken services.
   To re-install the services correctly on a pair of HA servers, you must enter the following on the primary and secondary servers:
   a. Log in with `root` privileges.
   b. Change directories to: `<controller_home>/controller-ha/init`
   c. Using the HA module, you must first remove the services installed by HATK by running this script:

      ```
      ./uninstall-init.sh
      ```

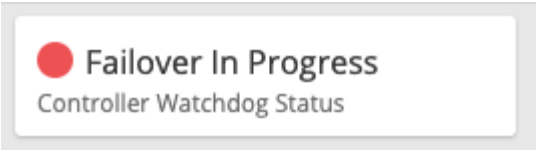
   d. Run `install-init.sh` and install the same services with one of the following options to elevate the user privilege:

      - `-c` #use setuid c wrapper
      - `-s` #use sudo
      - `-p` #use prune wrapper
      - `-x` #use user privilege wrapper

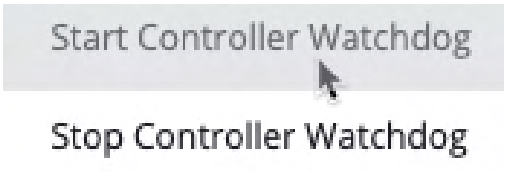
Watchdog Widget

After activating the HA Module, a new widget displays in the Enterprise Console UI indicating the Controller Watchdog status. It has three states:

Controller Watchdog Status	Definition
	The Controller watchdog process is constantly checking the health of your primary Controller. No user action is required.
	In the event that your primary Controller goes down, the failover is not automatic. AppDynamics recommends that you start the Controller watchdog using the *Start Controller Watchdog* option in Enterprise Console.
	Failover is currently in progress where your primary Controller and secondary Controller switch roles



Prior to performing any maintenance operations on your Primary Controller host (which could result in stopping the Controller), AppDynamics recommends that you select **Stop Controller Watchdog** to prevent a failover from initiating. Use the Enterprise Console UI to start and stop watchdog by clicking the watchdog widget, and then selecting **Stop** or **Start Controller Watchdog**.



Start and Stop the Controller Watchdog with CLI

You can start and stop the Controller Watchdog using the following commands:

Stop the Controller Watchdog

```
./platform-admin.sh submit-job --job stop-controller-watchdog --service controller
```

Start the Controller Watchdog

```
./platform-admin.sh submit-job --job start-controller-watchdog --service controller
```

Administer the Controller

This section contains pages on administering the Controller. Depending on how you installed and deployed the platform, you may have more than one method to administer the platform.

If you use the Enterprise Console, many tasks can be done through the GUI or command line. For information about how to use the Enterprise Console, see the pages in the Enterprise Console section.

Additionally, AppDynamics provides command-line tools for common operations, such as starting and stopping the platform components and their services. Some tasks involve using the administration interface for the underlying Glassfish application server, either the web interface or the command-line tool.

- Administer Controller configurations via the Enterprise Console.
- Other configurations:
    - `admin.jsp`: Access basic operational settings for the AppDynamics installation, including data retention settings, tenancy mode, and more.
    - Glassfish administration tool: Use the Glassfish admin tool, as admin, to configure settings in the underlying application server.

The pages in this section describe how to use the tools along with other administration tasks.

Start or Stop the Controller

You can start or stop the Controller, and also check the Controller health from the Enterprise Console GUI or CLI.

Scripts Used to Start or Stop the Controller

The scripts to start and stop the Controller and other AppDynamics platform processes are located in the `platform-admin/bin` directory for standalone or secondary HA Controllers. Using the `platform-admin` script, you can start the platform processes individually or all at once.

> To avoid the possibility of data corruption errors, be sure to stop the application server and database gracefully by using the stop scripts before shutting off or rebooting the machine on which the Controller is running.

You can start and stop the Controller and Controller services on the Controller page in the GUI or from the command line. When you start and stop the Controller, services and processes related to the Controller also start and stop, including the Reporting Service. If you use the GUI to start and stop the Controller, specify that you want to stop MySQL if you want to also stop the Controller Database.

> If your Enterprise Console manages multiple platforms, to distinguish the Controller platform, you must use the command line for standalone or secondary HA Controllers and specify the `--platform-name <name_of_the_platform>`.
>
> For example:
>
> ```
> platform-admin.sh start-controller-db --platform-name <name_of_the_platform>
> platform-admin.sh start-controller-appserver --platform-name <name_of_the_platform>
> ```
>
> To see all options, run `platform-admin.sh list-jobs --service controller --platform-name <platform-name>` from the command line. For more information, see Enterprise Console Command Line or Administer the Enterprise Console.

The Enterprise Console has a max wait time of 45 minutes when starting or stopping the Controller. You can set a timeout which exits the command and returns a failure by appending `--args controllerProcessTimeoutInMin=<minutes>` to the end of your start or stop command.

How to Start or Stop a Standalone or Secondary High Availability Controller

The commands below only apply to standalone and secondary HA Controllers. See Starting or Stopping a Primary Controller for information on how to start or stop primary Controllers.

Start and Stop the Controller App Server

> - When using the Enterprise Console, starting or stopping the Controller will also start or stop the Reporting Service.
> - You can only start or stop the Secondary Controller.

Start the Controller App Server

The `start-controller-appserver` command starts the database automatically.

Stop the Controller App Server

The `stop-controller-appserver` command does not stop the database.

Start and Stop the Controller Database

Start the Controller Database

Stop the Controller Database

How to Start or Stop a Primary Controller in High Availability Pairs

Use the following commands to start or stop primary Controllers in HA pairs. You must log in to the primary Controller host before running the scripts to start the `controller.sh` processes.

- You should disable auto-failover before restarting a primary Controller. Do not forget to reenable auto-failover afterward.
- If you enabled auto-failover in the Enterprise Console, and you stopped the app server to update certifications, the Enterprise Console will trigger a failover if it takes longer than five minutes to update.
- If you are using a combination of the Enterprise Console with the High Availability Toolkit (HATK), then you can start or stop the Controller using services.

Start and Stop the Controller

To start the Controller, run this script from the Controller home:

To stop the Controller:

Start and Stop the Controller App Server

To start the app server, run this script from the Controller home:

To stop the app server, run this command:

Start and Stop the Controller Database

On Linux

To start the database, run this script from the Controller home:

```
bin/controller.sh start-db
```

To stop the database:

```
bin/controller.sh stop-db
```

How to Check Controller Health

On Linux

To check on the health of the Controller, run:

```
bin/platform-admin.sh check-controller-health
```

The following output shows the status of the Controller and its uptime:

```
Controller status : HEALTHY; Started 6 seconds ago.
```

Use a Reverse Proxy

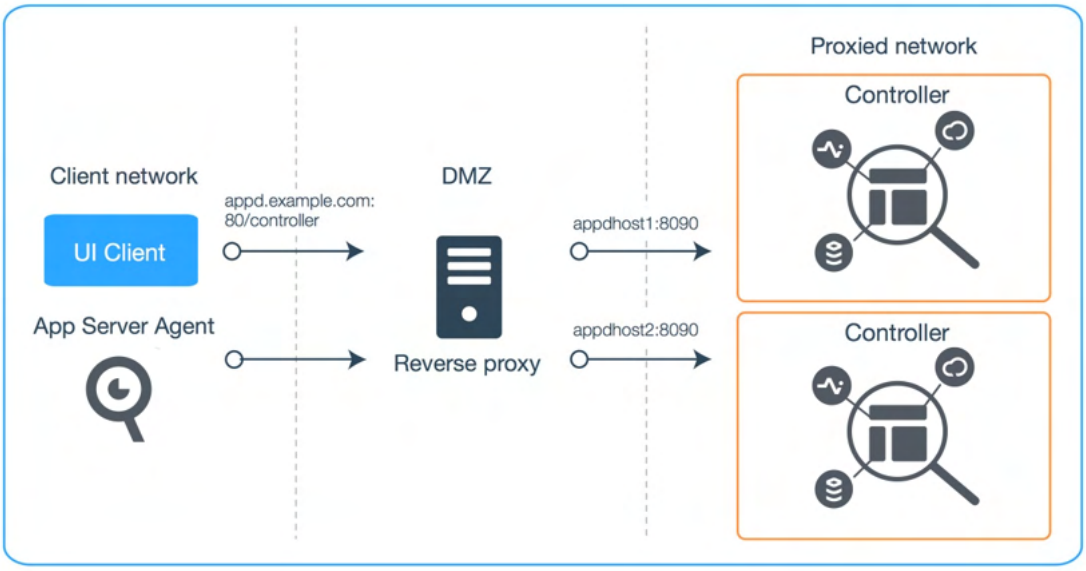
This page describes how to set up the Controller behind a reverse proxy.

Reverse Proxy Architectures

The AppDynamics Controller is often deployed behind a reverse proxy. The proxy presents a virtual IP address to external connections, such as agents and browser clients. The proxy often resides in the DMZ for the network, where it terminates SSL connections from external clients.

The proxy provides a security layer for the Controller, but it also enables you to move a Controller to another machine or switch between high availability pairs without having to reconfigure agents.

The following diagram illustrates the scenario:



As shown, the reverse proxy listens for incoming requests on a given path, /controller in this case, on port 80. It forwards matching requests to the HTTP listening port of the primary Controller at `appdhost1:8090`.

In terms of network impact in this scenario, switching active Controllers from the primary to the secondary in this scenario only requires the administrator to update the routing policy at the proxy so that traffic directed to the secondary instead of the primary.

These instructions describe how to set up the Controller with a reverse proxy. They also provide sample configurations for a few specific types of proxies, including NGINX and Apache Web Server.

This information is intended for illustration purposes only. The configuration requirements for your own deployment are likely to vary depending on your existing environment, the applications being monitored, and the policies of your organization.

While AppDynamics supports Controllers that are deployed with a reverse proxy, AppDynamics Support cannot guarantee help with specific set up questions and issues particular for your environment or the type of proxy you are using. For this type of information, please consult the documentation provided with your proxy technology. Alternatively, ask the AppDynamics community.

General Guidelines

The following describes general requirements, considerations, and features for deploying the AppDynamics Controller and App Agents with a reverse proxy.

- Set the deep link JVM option, `-Dappdynamics.controller.ui.deeplink.url`, to the value of the Controller URL. Use either the hostname or IP address of the Controller host (if directly accessible to clients) or to the VIP for the Controller as exposed at the proxy in the following format:

```
modifyJvmOptions add Dappdynamics.controller.ui.deeplink.url=http[s]://controller.corp.example.com[:port]
/controller
```

Use the URI scheme (http or https), hostname and port number appropriate for your Controller. The Controller uses the deep link value to compose URLs it exposes in the UI.

- If terminating SSL at the proxy, also set the following JVM options:

```
-Dappdynamics.controller.services.hostName=<external_DNS_hostname>
-Dappdynamics.controller.services.port=<external_port_usually_443>
```

- You should use the Enterprise Console's Controller Settings page to edit the JVM options to retain your settings. See Update Platform Configurations for more information.
- If the proxy sits between monitored tiers in the application, make sure that the proxy passes through the custom header that AppDynamics adds for traffic correlation, singularity header. Most proxies pass through custom headers by default.
- For App Agents, the Controller Host and Controller Port connection settings should point to the VIP or hostname and port exposed for the Controller at the reverse proxy. For details see Agent-to-Controller Connections.
- If using SSL from the agent to the proxy, ensure that the security protocols used between the App Agent and proxy are compatible. See the compatibility table for the SSL protocol used by each version of the agent.
- If the proxy (or another network device) needs to check for the availability of the Controller, it can use Controller REST resource at: `http://<host>:<port>/controller/rest/serverstatus`. If the Controller is active and if in high availability mode, is the primary, it returns an XML response similar to this one:

```
<serverstatus vendorid="" version="1">
   <available>true</available>
   <serverid/>
   <serverinfo>
       <vendorname>AppDynamics</vendorname>
       <productname>AppDynamics Application Performance Management</productname>
       <serverversion>003-008-000-000</serverversion>
   </serverinfo>
</serverstatus>
```

If the Controller is in standby mode, this resource returns a 503 response.

The following sections provide notes and sample configurations for a few specific types of proxies, including Nginx and Apache Web Server.

Using Nginx as a Simple HTTP Reverse Proxy

Nginx is a commonly used web server and reverse proxy available at http://nginx.org/.

To use Nginx as a reverse proxy for the Controller, simply include the Controller as the upstream server in the Nginx configuration. If deploying two Controllers in a high availability pair arrangement, include the addresses of both the primary and secondary Controllers in the upstream server definition.

The following steps walk you through the set up at a high level. It assumes you have already installed the Controller and have an Nginx instance, and you only need to modify the existing configuration to have Nginx route traffic to the Controller.

To route Controller traffic through an Nginx reverse proxy

1. Add a JVM option named `-Dappdynamics.controller.ui.deeplink.url`. Set its value to the URL for the Controller, as described in the guidelines above.
2. Shut down the Controller.
3. If terminating SSL at the proxy, also set the `-Dappdynamics.controller.services.hostName` and `-Dappdynamics.controller.services.port` JVM options to the external DNS hostname for the Controller and the external port number, typically 443.
4. In the Nginx home directory on the reverse proxy machine, open the `conf/nginx.conf` file for editing.
5. In the configuration file, add a cluster definition the specifies each Controller as an upstream server. For example:

```
 upstream appdcontroller {
  server 127.0.15.11:8090 fail_timeout=0;
}

server {
    listen 80;
    server_name appdcontroller.example.com;

    expires 0;
    add_header Cache-Control private;

    location / {
        proxy_set_header    Host $host;
        proxy_set_header    X-Real-IP $remote_addr;
        proxy_set_header    X-Forwarded-Proto https;
        proxy_set_header    X-Forwarded-For $proxy_add_x_forwarded_for;

        proxy_pass          http://appdcontroller;
    }
}
```

In the sample, the Controller resides on 127.0.15.11 and has the fully qualified domain name `appdcontroller.example.com`.

6. Restart the Nginx server to have the change take effect.
7. Restart the Controller.

After the Controller starts, it should be able to receive traffic through Nginx. As an initial test of the connection, try opening the Controller UI via the proxy, that is, in a browser, go to `http://<virtualip>:80/controller`. For the App Agents, you'll need to configure their proxy host and port settings as described in the general guidelines above.

Using Apache as a Reverse Proxy

To use Apache as a reverse proxy, you need to make sure the appropriate Apache module is installed and enabled in your Apache instance. For HTTP proxying, this is typically `mod_proxy_http`. The `mod_proxy_http` module supports proxied connections that use HTTP or HTTPS.

To configure Apache with mod_proxy_http

1. Add a JVM option named `-Dappdynamics.controller.ui.deeplink.url`. Set its value to the URL for the Controller, as described in the guidelines above.
2. Shut down the Controller.
3. If terminating SSL at the proxy, also set the `-Dappdynamics.controller.services.hostName` and `-Dappdynamics.controller.services.port` JVM options to the external DNS hostname for the Controller and the external port number, typically 443.
4. On the machine that runs Apache, check whether the required modules are already loaded by your Apache instance by running this command:

```
apache2ctl -M
```

In the output, look for proxy modules as follows:

```
proxy_module (shared)
proxy_http_module (shared)
```

The `proxy_module` is a dependency for `proxy_module_http`.

5. If they are not loaded, enable the Apache module as appropriate for your distribution of Apache. For example, on Debian/Ubuntu:
    a. Enter the following:

    ```
    sudo a2enmod proxy_http
    ```

    b. Restart Apache:

    ```
    sudo service apache2 restart
    ```

6. Add the proxy configuration to Apache. For example, a configuration that directs clients requests to the standard web port 80 at the proxy host to the Controller could look similar to this:

```
<Proxy *>
    Order deny,allow
    Allow from all
</Proxy>

ProxyRequests       Off
ProxyPreserveHost   On

ProxyPass /controller http://controller.example.com:8090/controller
ProxyPassReverse /controller  http://controller.example.com:8090/controller
```

7. Apply your configuration changes by reloading Apache modules. For example, enter:

```
sudo service apache2 reload
```

8. Start the Controller.

After the Controller starts, test the connection by opening a browser to the Controller UI as exposed by the proxy. To enable AppDynamics App Agents to connect through the proxy, be sure to set the proxy host and port settings in the proxy, as described in the general guidelines above. Also, be sure to apply any of the other general guidelines described in the general guidelines above.

Configure SSL Termination at the Reverse Proxy

This section describes how to set up security when the client-side connection to the proxy uses SSL that's terminated at the proxy. This assumes that the proxy and Controller are in a secured data center and the App Agents or UI browser client connections are from a potentially insecure network.

Terminating SSL at a proxy offloads the burden of SSL processing from the Controller to the proxy. This configuration is strongly recommended when deploying the Controller to large scale, high workload environments. Terminating SSL at a proxy also provides the benefit of having a central point in the data center for the security certificate and for key management.

This section provides a sample configuration for Nginx, but the concepts translate to other types of reverse proxies as well.

Configure the Proxy for SSL Termination

To perform SSL termination at the reverse proxy, you need to:

- Ensure that the App Agents can establish a secure connection with the proxy. See Agent and Controller Compatibility for SSL settings for various versions of the agent. Ensure that the proxy includes a server certificate signed by an authority that is trusted by the agent. Otherwise, you will need to install the proxy machine's server key.
- If using .NET App Agents in your environment, verify that the reverse proxy server uses a server certificate signed by a certificate authority (CA). The .NET App Agent does not permit SSL connections based on a self-signed server certificate.
- Configure the proxy to forward traffic between it and the Controller to a secure port between it and the client.
- The client App Agents and browser clients under this configuration *must use* the secure port to communicate with the Controller (i.e., the proxy). Configuring a mixed channel on the Controller as described here causes the agents to perform as if they were using a secure port. Therefore, you need to ensure that they use a secure port only.

A complete example configuration with Nginx performing SSL termination for the Controller would look something like this:

```
 upstream appdcontroller {
  server 127.0.15.11:8191 fail_timeout=0;
}

server {
    listen 80;
    server_name appdcontroller.example.com;
    return 301 https://$host$request_uri;
}
server {
    listen 443;
    server_name appdcontroller.example.com;

    ssl on;
    ssl_certificate /etc/nginx/server.crt;
    ssl_certificate_key /etc/nginx/server.key);

    ssl_session_timeout  5m;
    ssl_protocols  TLSv1 TLSv1.1 TLSv1.2;
    ssl_ciphers  ALL:!ADH:!EXPORT56:RC4+RSA:+HIGH:+MEDIUM:+LOW:+EXP;
    ssl_prefer_server_ciphers   on;

    expires 0;
    add_header Cache-Control private;

    location / {
        proxy_set_header    Host $host;
        proxy_set_header    X-Real-IP $remote_addr;
        proxy_set_header    X-Forwarded-Proto https;
        proxy_set_header    X-Forwarded-For $proxy_add_x_forwarded_for;
        proxy_redirect      http:// https://;
        proxy_pass          http://appdcontroller;
    }
}
```

TLSv1 should only be enabled if absolutely necessary.

This example builds on the configuration shown in the simple passthrough example. In this one, any request received on the non-SSL port 80 is routed to port 443. The server for port 443 contains the settings for SSL termination. The `ssl_certificate_key` and `ssl_certificate` directives should identify the location of the server security certificate and key for the proxy.

The configuration also indicates the SSL protocols and ciphers accepted for connections. The security settings need to be compatible with the AppDynamics App Agent security capabilities, as described on the Agent and Controller Compatibility page.

Cookie Security

The Controller sets the secure flag on the `X-CSRF-TOKEN` cookie sent over HTTPS. The secure flag ensures that clients only transmit the cookies on secure connections.

If you terminate HTTPS at a reverse proxy in front of the Controller, the Controller does not set cookie security by default because connections to the Controller would occur over HTTP.

To ensure cookie security, configure the reverse proxy to include the `secure` statement in the `set-cookie` statement. How to add the secure flag varies on the type of reverse proxy you use.

The following example shows how to set cookie security using HAProxy:

- If using HAProxy version 2.0 or earlier, enter:

  ```
  rspirep ^(set-cookie:.*) \1;\ Secure
  ```

- If using HAProxy version 2.1 or later, enter:

  ```
  acl secured_cookie res.hdr(Set-Cookie),lower -m sub secure
  http-response replace-header Set-Cookie (.*) \1;\ Secure if !secured_cookie
  ```

Using SSL from the Reverse Proxy to the Controller

Have the proxy connect to the Controller with SSL requires a minor modification to the proxy configuration. Simply specify the use of HTTPS as the protocol to connect to the backend or upstream server. In other words, for the Nginx configuration, this simply requires you to modify the `proxy_pass` value as follows:

```
proxy_pass          https://appdcontroller;
```

To complete the configuration, make sure you have configured SSL on the Controller as described in Controller SSL and Certificates.

Enable an Email Server

The SMTP email server must be configured to enable email and SMS notifications and digests to be sent by the Controller.

Permissions

For this activity, users need the predefined Account Owner role or another role with the **Configure Email / SMS** permission.

Configure an SMTP server

1. In the Controller UI, from the top navigation menu bar, click **Alert & Respond > Email/ SMS Configuration**.
2. Provide the connection information for the SMTP host and port.
    - A SaaS Controller should be preconfigured with the appropriate settings, but verify the settings as the following:
        a. **SMTP Host:** localhost
        b. **SMTP Port:** 25

      No authentication is needed.
    - For an on-premises controller, use a host and port settings for an SMTP server available in the controller deployment environment.
3. Customize sender address in notifications emails in the **From Address** field. By default, emails are sent by the root Controller user.
4. If the SMTP host requires authentication, configure the credentials in the **Authentication** settings.
5. If you want to add any text to the beginning of the notification, enter it in the **Notification Header Text** field.
6. If you are using SMS do one of the following:
    - Select **Default** and choose one of the available carriers from the pulldown menu.
    - Select **Custom** and enter the phone number receiving the message as <phone number>@<sms gateway>.

      For example, a mobile phone in the United States serviced by AT&T might be:

      ```
      4151234567@txt.att.net
      ```

      A mobile phone in the United Kingdom serviced by Textlocal might be:

      ```
      7412345678@txtlocal.co.uk
      ```

      See SMS gateway by country for information on most common SMS gateways.
7. Test the configuration by sending an email.
8. Save the settings.

Troubleshoot Notifications

If you do not receive notifications for health rule violations, it could be because the default SMTP server timeout period is too short. To troubleshoot, increase the value of the mail.smtp.socketiotimeout Controller Setting in the Administration Console. The default value is 30 seconds.

Update the Root User and Glassfish Admin Passwords

This page describes how to change the passwords for the root user and Glassfish admin for the Controller.

Root User and Account Owners

The root user is a built-in Controller user with global administrator privileges in the Controller environment. Only the root user can access the System Administration Console, where you can create and manage accounts in multi-tenant Controllers and configure global Controller settings in both single- or multi-tenant Controllers.

The root user is a superuser for the Controller. Unlike other types of users, you cannot remove the root user account or create other superuser accounts in the Controller. The password for the root user is set during installation but you can change the root password in the Administration Console.

While the root user has global administrative privileges, account administrators act as administrators only within individual accounts in a multi-tenant Controller. It's typically the role of the root user to create accounts and an initial administrator for the account, and the role of each account administrator to create additional users within the account. See Roles and Permissions and Manage Users and Groups

Change the Controller Root User Password

You can change the root user password from the AppDynamics Administration Console page.

To change the root user password

1. Log in to the administration console as described in Access the Administration Console.
2. Click **Settings** and choose **My Settings**.
3. Click **Edit > Change Password.**
4. Type the new password for the root user in the **New Password** and **Repeat New Password** fields.
5. Click **Save**.

> Logging in to the Administration Console requires you to have the root user password. If you do not have the root user password and need to reset it.

Reset Root User Password

If you have lost the AppDynamics root user password for your installation and need to reset it, follow these steps:

1. From the command line, change to the Controller's `bin` directory. For example, on Linux:

   ```
   cd <controller_home>/bin
   ```

2. Use the following script to log in to the Controller database of the Controller;
   - For Windows: `controller.bat login-db`
   - For Linux: `sh controller.sh login-db`

   You will see a MySQL prompt.
3. After running the script, you will be prompted to enter a password. Enter the root password for the Controller database.
4. From the MySQL prompt, enter the following SQL command to get root user details:

   ```
   select * from user where name='root' \G;
   ```

5. Use the following SQL command to change the password:

   ```
   update user set encrypted_password = sha1('<NewPassword>') where name = 'root';
   ```

   The hash for the password will be upgraded to PBKDF2 when you log in.
6. Restart the Appserver.

For information on setting the database root user password, see Controller Data and Backups.

Change the Glassfish Admin User Password

The Controller uses the built-in administrator account in the underlying GlassFish application server. Changes to the GlassFish admin user password must be made in GlassFish and the Enterprise Console.

Change the Password in GlassFish

1. Run the `change-admin-password` subcommand in remote mode, for example:

```
asadmin> change-admin-password --user <username>
```

2. Enter the existing password and new password when prompted.
3. Restart the Controller using the Enterprise Console.

Update the Password in the Enterprise Console

The Enterprise Console connects to your underlying GlassFish administration server via the GlassFish admin password during Controller upgrades. If you change the GlassFish admin user password, you need to update the password in the Enterprise Console as well to ensure successful Controller upgrades.

To update the GlassFish admin user password in the Enterprise Console, see the following steps:

1. Log in to the Enterprise Console and select the desired platform.
2. Select **Configurations** > **Controller Settings** > **Appserver Configurations**.
3. In the **Basic** tab, find **Glassfish Admin Password**. Enter the new password
4. Reenter the new password in **Confirm Glassfish Admin Password**.
5. Click **Save**.

The password change takes immediate effect.

Change the Controller Database Root User Password

Downtime is required to change the Controller database root user password. If you have installed a Controller HA pair, you must disable auto-failover to avoid an accidental failover while changing the password. For more details about disabling auto-failover, click Automatic Failover.

To change the Controller database root user password:

1. Log in to the Controller host. From a command line, enter:

```
cd <controller_home_dir>
```

2. To stop the App Server and the database, enter:

```
bin/controller.sh stop
```

If you are using MS Windows, you must use the Windows services to stop the Controller.

3. To start the database in insecure mode, enter:

```
bin/controller.{sh|bat} start-db insecure
```

The insecure option starts the database without password requirements. Use this option only to reset the password for the database. The option is similar to starting MySQL with the `--skip-grant-tables` option.

4. To log in to the database, enter:

```
bin/controller.{sh|bat} login-db insecure
```

5. Use MySQL to run the following commands:
    a. To specify the Controller database, enter:

```
use mysql;
```

    b. To reload the MySQL grant tables, enter:

```
FLUSH PRIVILEGES;
```

c. To determine your MySQL version, enter:

```
select version();
```

d. Based on which MySQL version you are using:
MySQL 5.5 version: Configure the new password for the root user by entering:

```
update mysql.user set password=password('<new-password-here>') where user like 'root%';
```

MySQL 5.7 version: Configure the new password for the root user by entering:

```
update mysql.user set authentication_string=password('<new-password-here>') where user like
'root%';
```

e. To reload the MySQL grant tables, enter:

```
FLUSH PRIVILEGES;
```

f. To exit MySQL, enter:

```
quit
```

6. To stop the database, enter:

```
bin/controller.{sh|bat} stop-db
```

7. To start the App Server, enter:

```
bin/controller.sh start
```

If you are using MS Windows, you must use the Windows services to start the Controller.

You need to change the password on both of the Controller HA pairs.

8. To update the Controller database root password and ensure that the Enterprise Console is aware of the new password:

a. Log in to the Enterprise Console and select the desired platform.
b. Select **Configurations** > **Controller Settings** > **Database Configurations**.
c. Enter the new password in **Controller DB Root Password**.
d. Reenter the password in **Confirm Controller DB Root Password**.
e. Select **Save**.

The password change takes immediate effect.

If you previously disabled auto-failover, you should now enable it.

Change the Controller DB User Password

Downtime is required to change the Controller database root user password. If you have installed a Controller HA pair, you must disable auto-failover to avoid an accidental failover while changing the password. For more details about disabling auto-failover, click Automatic Failover.

To change the Controller DB user password:

1. Log in to the Enterprise Console and select the desired platform.
2. Select **Configurations > Controller Settings > AppServer Configurations**.
3. In the **Basic** tab, enter the new password in **New password for Controller DB user**.
4. Re-enter the password in **Confirm New password for Controller DB user**.
5. Click **Save**.

The password change takes immediate effect.

Change the Controller Owner

This page provides instructions for changing the Controller owner.

You may need to change the user who is running the Controller services during a system migration or other event.

The procedure varies based on whether you are using the Enterprise Console.

In order to change the owner of the Controller, complete the following steps.

1. Stop all running Controller services using the following command in the machine terminal.
    - `./controller.sh stop`
2. Change the username and user group of the Controller directory.
    - `chown -R <New User>:<User Group> <Controller Folder>`
3. Update the new user in the `db.cnf` file located at `Controller/db/db.cnf`.
    - `user=<New User>`
4. Start the Controller.
    - `./controller.sh start`

If you are not using the Enterprise Console

1. As the current user running the Controller services, shut down the Controller process:

```
CONTROLLER_HOME_DIR/bin/controller.sh stop
```

2. Change the ownership (recursively) of the entire Controller directory to the new user. In this example, `appdynamics:admin` is the `user:group`, respectively:

```
chown -R appdynamics:admin CONTROLLER_HOME_DIR/
```

3. If the Controller's data directory is outside of the `root` Controller's folder, then you must also change the owner of the database data files:

```
chown -R appdynamics:admin .../data/
```

4. Change the user to the new username:

```
CONTROLLER_HOME_DIR/db/db.cnf
```

5. Log in as the new user and start the Controller services:

```
CONTROLLER_HOME_DIR/bin/controller.sh start
```

If you are using the Enterprise Console

1. Remove the Controller from the Enterprise Console by de-selecting the **Remove Binaries** option; otherwise, the binaries will be removed from the disk. To remove the Controller without uninstalling the Controller:

```
PLATFORM_HOME_DIR/bin/platform-admin.sh submit-job --service controller --job remove --args
removeBinaries=false --skip-confirm
```

2. As the current user running the Controller services, shut down the Controller process.

```
CONTROLLER_HOME_DIR/bin/controller.sh stop
```

3. Change the ownership (recursively) of the entire Controller directory to the new user. In this example, `appdynamics:admin` is the `user:group`, respectively:

```
chown -R appdynamics:admin CONTROLLER_HOME_DIR/
```

4. If the Controller's data directory is outside of the `root` Controller's folder, then you must also change the owner of the database data files:

```
chown -R appdynamics:admin .../data/
```

5. Change the user to the new username:

```
CONTROLLER_HOME_DIR/db/db.cnf
```

6. Log in as the new user and start the Controller services:

```
CONTROLLER_HOME_DIR/bin/controller.sh start
```

7. From the Enterprise Console, remove the hosts that were added:

```
PLATFORM_HOME_DIR/bin/platform-admin.sh remove-dead-hosts --hosts $CONTROLLER_HOST --skip-confirm
```

8. Remove the credentials because the credentials are connected to the previous user.
9. Add the credentials using the new user, and then add the host.
10. Perform a Discover and Upgrade for the Controller.
11. (Optional) If you have installed the Linux services, then:
    a. Logged in as root, uninstall the services:

```
HA/uninstall-init.sh
```

    b. Logged in as root, install the services using either the `-c` or `-s` options:

```
HA/install-init.sh
```

Change the User Running the Controller Services

This page provides instructions for changing the user running the Controller services.

You may need to change the user who is running the Controller services during a system migration or other event.

The procedure varies based on whether you are using the Enterprise Console.

If you are not using the Enterprise Console

1. As the current user running the Controller services, shut down the Controller process:

   ```
   CONTROLLER_HOME_DIR/bin/controller.sh stop
   ```

2. Change the ownership (recursively) of the entire Controller directory to the new user. In this example, `appdynamics:admin` is the `user:group`, respectively:

   ```
   chown -R appdynamics:admin CONTROLLER_HOME_DIR/
   ```

3. If the Controller's data directory is outside of the `root` Controller's folder, then you must also change the owner of the database data files:

   ```
   chown -R appdynamics:admin .../data/
   ```

4. Change the user to the new username:

   ```
   CONTROLLER_HOME_DIR/db/db.cnf
   ```

5. Log in as the new user and start the Controller services:

   ```
   CONTROLLER_HOME_DIR/bin/controller.sh start
   ```

If you are using the Enterprise Console

1. Remove the Controller from the Enterprise Console by de-selecting the **Remove Binaries** option; otherwise, the binaries will be removed from the disk. To remove the Controller without uninstalling the Controller:

   ```
   PLATFORM_HOME_DIR/bin/platform-admin.sh submit-job --service controller --job remove --args
   removeBinaries=false --skip-confirm
   ```

2. As the current user running the Controller services, shut down the Controller process.

   ```
   CONTROLLER_HOME_DIR/bin/controller.sh stop
   ```

3. Change the ownership (recursively) of the entire Controller directory to the new user. In this example, `appdynamics:admin` is the `user:group`, respectively:

   ```
   chown -R appdynamics:admin CONTROLLER_HOME_DIR/
   ```

4. If the Controller's data directory is outside of the `root` Controller's folder, then you must also change the owner of the database data files:

   ```
   chown -R appdynamics:admin .../data/
   ```

5. Change the user to the new username:

   ```
   CONTROLLER_HOME_DIR/db/db.cnf
   ```

6. Log in as the new user and start the Controller services:

```
CONTROLLER_HOME_DIR/bin/controller.sh start
```

7. From the Enterprise Console, remove the hosts that were added:

```
PLATFORM_HOME_DIR/bin/platform-admin.sh remove-dead-hosts --hosts $CONTROLLER_HOST --skip-confirm
```

8. Remove the credentials because the credentials are connected to the previous user.
9. Add the credentials using the new user, and then add the host.
10. Perform a Discover and Upgrade for the Controller.
11. (Optional) If you have installed the Linux services, then:
    a. Logged in as root, uninstall the services:

    ```
    HA/uninstall-init.sh
    ```

    b. Logged in as root, install the services using either the `-c` or `-s` options:

    ```
    HA/install-init.sh
    ```

Access the Administration Console

This page provides information and access instructions for the AppDynamics Administration Console.

Deployment Support

Related pages:

- Controller Settings for Machine Agents
- Controller Settings for Server Visibility
- Configure Controller Settings for Monitoring Database

Do not confuse the AppDynamics Administration Console with the GlassFish application server administration console or the general application administration page in the Controller UI.

The AppDynamics Administration Console lets you configure certain global settings such as metric retention periods, UI notification triggers, tenancy mode, and accounts in multi-tenancy mode.

AppDynamics recommends that you do not change Controller settings in the console unless under the guidance of an AppDynamics representative or as specifically directed by documentation.

Access the AppDynamics Administration Console

1. If you are logged into a Controller UI session with an account other than the root user, log out or open a new browser window in private (incognito) mode. If you do not, you will get an "Access Denied" error when you attempt to open the console page.
2. In the browser enter the URL of the Administration Console:

   ```
   http://<hostname>:<port>/controller/admin.jsp
   ```

   The console is served on the same port as the Controller UI, port 8090 by default.
3. Log into the system account with the root user password. The root user is a built-in global administrator for the Controller. Use the password you set for this user when installing. See Update the Root User and Glassfish Admin Passwords

   The root user password is different from a normal AppDynamics account password. It is not the same as the account owner or account administrator password. If you are logged into the Controller using your current account, you need to log out of that account and then back in as the root user to access the Administration Console. You can change the Controller root user password if you wish. See Update the Root User and Glassfish Admin Passwords

Access the Glassfish Administration Console

In rare cases, you may need to log in to the AppDynamics Administration Console for the application server underlying the GlassFish server. The GlassFish administration console provides a browser interface for performing many of the same tasks you can perform using the admin command-line utility. You can access the console for the GlassFish server using the built-in user account named admin.

For security reasons, access to the GlassFish browser interface is limited to local machine access by default, so the following steps should be performed from a browser on the Controller machine. Attempts to access the console remotely trigger the error message "Secure Admin must be enabled to access the DAS remotely."

To access the GlassFish administration console:

1. From a web browser on the Controller machine, open the following URL:

```
http://localhost:4848
```

Note that port 4848 is the default port number for the GlassFish administration console, but it may have been set to another value at installation time. If the default port doesn't work and you are unsure of what port number to use, you can check the port configured for the network-listener element named admin-listener in the domain.xml file.

2. Log in as user admin.
   By default, the GlassFish user admin password is the same as the root user password for the Administration Console. You can change the GlassFish user admin password if you wish. See Update the Root User and Glassfish Admin Passwords

Modify the User Session Timeout

The Controller logs users out of Controller UI sessions after 60 minutes of inactivity by default. For an on-premises Controller, it's possible to modify the default timeout value, as follows:

1. Log in to the Administration Console as the AppDynamics root user.
2. Find and set the values for these properties:

    - `http.session.inactive.timeout`: The amount of time without a client request to the Controller after which the user session times out and the user will need to log in again to continue. The default is 3600 seconds (60 minutes).
    - `ui.inactivity.timeout`: The amount of time without user activity in the Controller UI after which the user session times out and the user will need to log in again to continue. The default is -1 (disabled).

Customize System Notifications

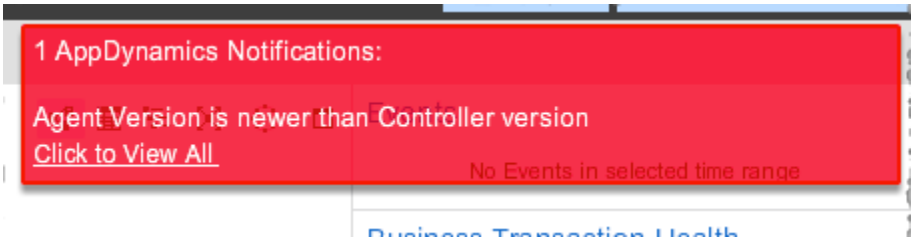
Related pages:

- Access the Administration Console

You can customize system events and system use notification messages from the Administration Console.

System Events Notification

Certain system events trigger event notification popups in the Controller UI.



You can configure which type of events appear as notifications in the UI, as described here.

Configure Events that Trigger UI Notifications

1. Log in to the Administration Console.
2. Go to the **Controller Settings**.
3. Search for the `system.notification.event.types` property. The value of this property determines which type of events result in UI notifications.
4. Set the types of events you want to see by adding them to the comma-separated string in the dialog box. To disable notifications of a particular type of event, remove it from the list. Do not use spaces between commas.

Notification Event Types

Event Value	What This Event Notification Means
`LICENSE`	There is an issue with the status of your license.
`DISK_SPACE`	There is an issue with the amount of disk space left on your system.
`CONTROLLER_AGENT_VERSION_INCOMPATIBILITY`	A mismatch between the version of the agent and the version of the controller has been detected.
`CONTROLLER_EVENT_UPLOAD_LIMIT_REACHED`	The limit on the number of events per minute that can be uploaded to the controller from this account has been reached. Once the limit is reached no more events — other than certain key ones — are uploaded for that minute.
`CONTROLLER_RSD_UPLOAD_LIMIT_REACHED`	The limit on the number of request segment data (RSDs) per minute that can be uploaded to the controller from this account has been reached. RSDs are related to snapshots. Once the limit is reached no more RSDs — other than certain key ones — are uploaded for that minute.
`CONTROLLER_METRIC_REG_LIMIT_REACHED`	The limit for registering metrics for this account has been reached. No further metric registrations are accepted.
`CONTROLLER_ERROR_ADD_REG_LIMIT_REACHED`	The limit for registering error Application Diagnostic Data (ADDs) for this account has been reached. No further error ADD registration is accepted.
`CONTROLLER_ASYNC_ADD_REG_LIMIT_REACHED`	The limit for registering async ADDs for this account has been reached. No further async ADD registration is accepted.
`CONTROLLER_STACKTRACE_ADD_REG_LIMIT_REACHED`	The limit for registering StackTrace ADDs for this account has been reached. No further StackTrace ADD registration is accepted.
`AGENT_ADD_BLACKLIST_REG_LIMIT_REACHED`	If the Agent attempts to register an ADD above the limit, the Controller rejects the attempt and adds the ADD to a blacklist. There is a limit to the size of the blacklist. This event indicates that that limit has been reached.

AGENT_METRIC_BLACKLIST_REG_LIMIT_REACHED	If the Agent attempts to register a metric above the limit, the Controller rejects the attempt and adds the metric to a blacklist. There is a limit to the size of the blacklist. This event indicates that that limit has been reached.

System Use Notification

The system use notification is an optional and configurable message that includes information on privacy and security notices. If enabled, the displayed message must be acknowledged before granting the user further access.

Configure System Use Notification

1. Log in to the Administration Console.
2. Go to the **Controller Settings**.
3. Search for the `system.use.notification.message` property. The value of this property is the message of the system use.
4. Enter your post-login message, which will be displayed every time a user logs in, informing the user of the system usage requirements. There is a 1000 character limit.
   Here is an example message:

```
This is a U.S. Government computer system, which may be accessed and used only for authorized Government
business by authorized personnel. Unauthorized access or use of this computer system may subject
violators to criminal, civil, and/or administrative action. All information on this computer system may
be intercepted, recorded, read, copied, and disclosed by and to authorized personnel for official
purposes, including criminal investigations. Such information includes sensitive data encrypted to
comply with confidentiality and privacy requirements. Access or use of this computer system by any
person, whether authorized or unauthorized, constitutes consent to these terms. There is no right of
privacy in this system.
```

Multi-Tenant Controller Accounts

This page describes how to create and manage accounts in a multi-tenant Controller. The tenant mode determines whether the Controller UI offers single or multiple environments. See Controller Deployment.

Switch from Single-Tenant to Multi-Tenant Mode

> Switching from single-tenancy to multi-tenancy mode is supported. However, switching from multi-tenancy to single-tenancy is not. Take precautions to ensure multi-tenancy is the correct mode for your environment.

If multi-tenancy is enabled for an on-premises Controller, users must enter the account name in the **Account** field when logging in to the Controller UI.

1. Navigate to the Administration Console.
2. Locate the `multitenant.controller` setting.
3. Set the value to `true`.

Create Accounts in Multi-Tenant Mode

In multi-tenant mode, you can add accounts as follows:

1. Log in to the AppDynamics Administration Console as the AppDynamics root user.
2. Click **Account Settings** and then **Add**.
3. Define the licensing entitlements that apply to the account.
   Account-level license unit limits let you prevent a particular account from using more licensing units than it should. You can view the total license units available through **Settings** > **Admin** > **License**. See License Management.

   > The overall license limits applicable at the Controller level are independent of any specific limits you apply at the account level.

   Agent-based Licensing: For example, if an account is set up with a Java Agent limit of 100, you can ensure that the new account never interferes with the license availability of another account by setting the **Java Units Provisioned** value for the account to a much smaller limit. However, if you set it to 100 and other accounts are also set to that amount, the first 100 agents that connect to the Controller would occupy those units, regardless of the accounts they report in to. Similarly, you can limit the lifespan of the account by setting an expiration date for the license.

   Infrastructure-based Licensing: For example, if an account is set up with an Infrastructure Monitoring limit of 100, you can ensure that the new account never interferes with the license availability of another account by setting the **Infrastructure Monitoring** value for the account to a much smaller limit. However, if you set it to 100 and other accounts are also set to that amount, the first servers with CPU cores totalling up to 100 would occupy those units, regardless of the accounts they report in to. Similarly, you can limit the lifespan of the account by setting an expiration date for the license.
4. When finished defining entitlements, click **Save**.

After enabling multi-tenant mode, users must specify the account they want to log into in the **Account** field in the Controller UI login screen. See:

- Java Agent Configuration Properties
- .NET Agent Configuration Properties
- Database Agent Configuration Properties
- Machine Agent Configuration Properties

Administer the Reporting Service

Related pages:

- Reports
- Port Settings

The Reporting Service is a standalone Controller process responsible for generating and transmitting reports. The Controller uses the Reporting Service to send both one-time reports and scheduled reports. For more information about the Reporting Service, see Fonts Needed for the Reporting Service and Inst allation Settings.

Configure the Service

You can configure the Reporting service with the files in the following directory: `<Controller home>/reporting_service/reports/config`. Configure Reporting Service behavior in the `user-config.json` file. Any configuration changes made in user-config.json override default behavior specified in default-config.json. You can configure properties such as the load timeout.

You can configure the Reporting Service with files in the following directory:

`<Controller home>/reporting_service/reports/config`

You can configure Reporting Service behavior in the *user-config.json* file. Any configuration changes made in `user-config.json` override default behavior specified in `default-config.json`.

Disabling HTTP or HTTPS Port

Some on-premise installations can disable the http or https connection. This is done using the same `reportServer:port` config value used to set the listening port. The `default-config.json` installation has the following values for port(s):

```
"reportServer": {
        "port": "8020",
        "portSecure": "8021",
    }
```

To disable https for a localhost system change the "portSecure" to "0":

```
"reportServer": {
        "port": "8020",
        "portSecure": "0",
    }
```

Alternatively, for security reasons if you want to force https, and http you can change the "port" to "0":

```
 "reportServer": {
        "port": "0",
        "portSecure": "8021",
    }
```

After making the change, stop and start the Reports Server as follows:

Windows:

```
cd <installroot>\controller\reporting_service\reports\bin
  reports-service.sh stop
  reports-service.sh start
```

Linux/Mac:

```
cd <installroot>/controller/reporting_service/reports/bin
  ./reports-service.sh stop
  ./reports-service.sh start
  ./reports-service.sh list
```

The reporting-server.log contains info on the port settings during startup.

Limit Reports Service Port Listening to Localhost

Many on-premise installations may want to limit port listening for the Reports Service node server and just listen for localhost connects. These requests do not go onto the network. This is done using the `reportServer:portHostname` and `reportServer:portSecureHostname` value used to set the `listen` hostname parameter. The `default-config.json` installation has these values for the port hostname values, shown below with their port(s):

Default values are:

```
"reportServer": {
      "port": "8020",
      "portHostname" : "",
      "portSecure": "8021",
      "portSecureHostname" : ""
    },
```

The `reporting-server.log` shows info on the hostname settings during startup.
Adding the port*Hostname fields to "localhost" as shown below in `user-config.json` limits the Report Service from connecting to a controller installed on the same host.

```
"reportServer": {
        "portHostname" : "localhost",
        "portSecureHostname" : "localhost"
    },
```

After making the change, stop and start the Reports Server as follows:

Linux/Mac:

```
cd <installroot>/controller/reporting_service/reports/bin
  ./reports-service.sh stop
  ./reports-service.sh start
  ./reports-service.sh list
```

Windows:

```
cd <installroot>\controller\reporting_service\reports\bin
  reports-service.bat stop
  reports-service.bat start
```

See `default-config.json` for more information about configurable properties.

Start and Stop the Service

You can start or stop the Reporting Service independent of the Controller. Run the following commands from the Controller home directory.

When using the Enterprise Console, starting or stopping the Controller will also start or stop the Reporting Service.

Check to see if the Reporting Service is running with the following command:

```
./reporting_service/reports/bin/reports-service.sh|bat list
```

Start the Reporting Service with the following command:

```
./reporting_service/reports/bin/reports-service.sh|bat start
```

Stop the Reporting Service with the following command:

```
./reporting_service/reports/bin/reports-service.sh|bat stop
```

View Logs

The Reporting Service uses the following logs in the Controller home directory:

- `/logs/reporting-server.log`. Prints if the report email was sent and details of the report object that was requested by the user.
- `/reporting_service/reports/logs/reporting-process.log`. Confirms the reporting service process started and whether or not exceptions occurred. Note that this log file is only used on Linux Controllers.

Troubleshooting the Reporting Service

To begin troubleshooting why a report failed to send, open the `server.log` file and find the runUUID for the report you tried to send. Then search for the log entry for the report.

Resolutions for common Reporting Service issues include the following:

- Verify that the Reporting Service is running.
- Verify the default ports for the service: 8020 for HTTP and 8021 for HTTPS
- Verify that the user account used to start the Reporting Service is the same as the account used to start the Controller.

Controller Audit Log

This audit capability creates an `audit.log` file and is used to monitor user activities and configuration changes in the Controller. Be aware that SaaS customers do not have access to the `audit.log` file as it is held on the AppD Controller server. The information is retrieved through the following actions.

Schedule a Controller Audit Report

You must have account-level permissions to view and configure scheduled reports. Use this report to view changes made to the user information, controller configuration, and application properties.

1. Click **Dashboards & Reports** > **Reports** > **Add Report**.
2. Enter **Report Title** and **Report Subtitle**.
    a. You can label a report CONFIDENTIAL using **Report Subtitle**.
    b. Optionally, select **Show Title Page** to include a title page at the beginning of your report file.
3. Select **Report Type** > **Controller Audit** to define the fields in the **Reports Data** tab.
4. Set the time ranges. You can create and manage custom time range if required.
    a. Note: Custom time range options are available for all the **Report Types**.
5. Select your report file format as PDF, JSON, or CSV.
    a. Optionally, uncheck the **Show Diff** box to remove the **Object Changes** column from your report file.
6. Choose the data to include or exclude from the drop-down list.
    a. Repeat as necessary with the following options:
7. Enter the attribute value.
8. Click **+ Add**.

You can create new, duplicate existing, or modify current reports as well as set an email delivery schedule to a defined list of recipients. You can also choose the **Send Report Now** right-click option for an immediate look at the audit details. Review the Reports documentation for more details on other types of reporting.

The Controller Audit reports on the following attributes:

`Date` and `time` range	`ObjectType`
`UserName`	`ObjectName`
`AccountName`	`ApiKeyId` (if applicable)
`Action`	`ApiKeyName` (if applicable)
`ApplicationName`	

Retrieve Controller Audit Log Report

The Controller Audit Log Report is sent by email according to the addresses added to the configurations page. This report captures the following information:

- User logins and information changes
- Controller configuration changes
- Application properties and object changes such as policies, health rules, and entities listed in the above table.
- Environment properties changes

AppDynamics supports PDF, JSON, and CSV output formats.

Retrieve Controller Audit History via API

You can retrieve Controller audit history through the ControllerAuditHistory API method, which returns the configuration and user activities record in a JSON or CSV file for the time range specified. This information is the same as that found in the file.

Format

```
GET /controller/ ControllerAuditHistory?startTime=<start-time>&endTime=<end-time>&include=<field>:
<value>&exclude=<field>:<value>
```

For example:

```
http://localhost:8080/controller/ControllerAuditHistory?startTime=yyyy-MM-dd&&endTime=yyyy-MM-
dd&include=filterName1:filterValue1&include=filterName1:filterValue1&exclude=filterName1:
filterValue1&exclude=filterName1:filterValue1
```

```
curl --user user1@customer1:welcome "http://demo.appdynamics.com:8090/controller/ControllerAuditHistory?
startTime=2015-12-19T10:50:03.607-0700&endTime=2015-12-19T17:50:03.607-
0700&timeZoneId=America&Francisco&include=userName:user1&include=action:LOGIN&exclude=accountName:
system&exclude=action:OBJECT_UPDATE"

20Francisco&include=applicationName:ACME"
[{"timeStamp":1559066415823,"auditDateTime":"2019-05-28T18:00:15.823+0000","accountName":"customer1","
securityProviderType":"INTERNAL","userName":"user1","action":"LOGIN","objectId":0,"applicationName":"ACME"}]
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`start-time`	Query	Start time in the format: "yyyy-MM-dd'T'HH:mm:ss.SSSZ"	Yes
`end-time`	Query	End time in the format: "yyyy-MM-dd'T'HH:mm:ss.SSSZ"	Yes
`time-zone-id`	Query	Time zone	No
`include`	Query	Restricted information in the Controller audit history	No
`exclude`	Query	Restricted information in the Controller audit history	No

To control the size of the output, the range between the start-time and end-time cannot exceed twenty-four hours. For periods longer than 24 hours, use multiple queries with consecutive time parameters.

- Multiple filters of the same type are allowed.
- The backend API treats include filters with the same <field> and relationship as "OR", and filters with different <field> and relationship as "AND".
- There is no direct interaction between include and exclude filters.
- Each filter needs to be a parameter, e.g., `include=filterName1:filterValue1&include=filterName2:filterValue2`. See the below examples.

Log File Information by Platform

What is Audited

The following entries are audited:

ACCOUNT	HTTP_REQUEST_ACTION
ACCOUNT_ROLE	HTTP_REQUEST_ACTION_MEDIA_TYPE_CONFIG
ACTION_SUPPRESSION_WINDOW	HTTP_REQUEST_ACTION_PLAN_CONFIG
AGENT_CONFIGURATION	HTTP_REQUEST_DATA_GATHERER_CONFIG
ANALYTICS_DYNAMIC_SERVICE_HIERARCHICAL_CONFIGURATION	INFO_POINT
APPLICATION	JIRA_ACTION
APPLICATION_COMPONENT	JMX_CONFIG
APPLICATION_COMPONENT_NODE	MEMORY_CONFIGURATION
APPLICATION_CONFIGURATION	METRIC_BASELINE

EMAIL_ACTION	WORKFLOW
ERROR_CONFIGURATION	WORKFLOW_ACTION
EUM_CONFIGURATION	
EVENT_REACTOR	
GLOBAL_CONFIGURATION	
GROUP	

- The Audit report supports the Application Name for the above entities when applicable.
- To fetch the audit log for the `Remove literal` flag in the report, ensure to specify the object name as **Remove Literals** with the object type as **DBMON_ACCOUNT_CONFIGURATION**.

Supported Audit Actions

Below is the list of actions supported in auditing.

> Not all of these actions are supported for all of the Audit Entries listed in the preceding table.

ACCOUNT_REENABLED	OBJECT_CREATED
ACCOUNT_ROLE_ADD_PERMISSION	OBJECT_DELETED
ACCOUNT_ROLE_REMOVE_PERMISSION	OBJECT_UPDATED
ACKNOWLEDGE_GDPR_DATA_PRIVACY	SAML_AUTHENTICATION_CONFIG_CREATED
ANOMALY_DETECTION_CONFIG_CHANGED	SAML_AUTHENTICATION_CONFIG_DELETED
FLOW_ICON_MOVED	SAML_AUTHENTICATION_CONFIG_UPDATED
GROUP_ADD_ACCOUNT_ROLE	USER_ADD_ACCOUNT_ROLE
GROUP_REMOVE_ACCOUNT_ROLE	USER_ADD_TO_GROUP
LDAP_CONFIG_CREATED	USER_EMAIL_CHANGED
LDAP_CONFIG_DELETED	USER_PASSWORD_CHANGED
LDAP_CONFIG_UPDATED	USER_PASSWORD_RESET
LOG_LEVEL_CHANGED	USER_PASSWORD_RESET_COMPLETED
LOGIN	USER_REMOVE_ACCOUNT_ROLE
LOGIN_FAILED	USER_REMOVE_FROM_GROUP
LOGOUT	
LOGOUT_FAILED	

Troubleshoot Controller Issues

This page provides troubleshooting information for issues that may arise during Controller installation and operation.

Controller Server Log

The primary log file for the Controller at the following location:

```
<controller_home>/logs/server.log
```

The first step in troubleshooting Controller issues typically involves checking the log file. Search the log for errors that may correspond to the issue you are encountering. If found, an error log may help you identify and resolve the issue.

Also, see installation troubleshooting information in Custom Install.

Identify Controller Performance Issues

The following are indications of Controller performance issues:

1. The Controller UI performs slowly. For short time ranges, such as 15 or 30 minutes, responses that take longer than 10 to 20 seconds can indicate that your Controller is under stress.
2. When the Controller's metric reporting lags 7 to 10 minutes behind the current time, it can be an indication that your Controller is under stress. A lag of about 3 to 5 minutes is normal.
3. When monitoring the Controller environment, you see that CPU, memory, and disk metrics are at about 75% capacity.

If you observe degradation in Controller performance, it may be due to one of the following:

- The hardware resources for the Controller might not match the correct Controller profile.
- The Controller performance profile may be incorrectly configured.

To troubleshoot Controller performance issues:

1. Confirm that the hardware matches the Controller profile you use. For details see Controller System Requirements.
2. Confirm that your disk performance matches the recommended thresholds for minimum disk performance. For details see Controller System Requirements.
3. Confirm that the Java SDK version is exactly the same as the Java version on the Controller. To display the version of Java used by the Controller:
    - Open the command-line utility.
    - Go to `<Controller_Installation_Directory>/jre/bin`
    - Run `java -version`.

Monitor heap usage

- On Windows, use the Task Manager to measure the memory usage for the Controller.
- On Linux, use the **top** command to get statistics for the memory data.

```
ps -elf (expect to see a "java" process and a "mysql" process)

top (expect to see java and mysql with cpu greater then 0)
```

Timeout errors during Controller installation

While installing the Controller, the Enterprise Console attempts to start up the Controller application server and database. At first database startup, the application attempts to create the database schema, tables, and other artifacts needed by the Controller.

By default, the Enterprise Console waits 45 minutes for the Controller app server or database to start. When installing a medium or large profile Controller or into certain types of environments such as virtual machines, the time it takes to start up the system can exceed the default startup timeout period.

Controller does not start properly on Windows

Your Controller may not be starting due to file extensions of transaction logs created by Glassfish. Excluding the Controller data directory from being scanned by virus scanners as specified on Prepare Windows for the Controller does not account for these extent files found in the `<AppDynamicsInstall>\Controller\appserver\glassfish\domains\domain1\logs\server\tx` directory. When your antivirus detects these extensions, such as WRY, it may mistakenly stop the process of using these files so the Controller ultimately does not start.

These transaction logs are used to recover any failed Glassfish transactions, so deleting these logs on startup is not advised. Instead, configure your virus scanners to ignore the entire Controller directory.

No data in the Metrics Browser

This may indicate that the agents are not correctly configured. Begin troubleshooting by looking at the `server.log` file.

All log files for Controller are located in the `<Controller_Installation_Directory>/logs` folder.

Error Message	Solution
Error receiving metrics (node not properly modeled yet: Could not find component for node.	This error means the app agent tried to upload metric data for a specific node, but the node does not belong to any tier. Nodes must belong to tiers and these tiers must belong to a business application in order to receive metric data for that node. See Overview of Application Monitoring.
Received Metric Registration request for a machine that is NOT registered to any nodes. Sending back null!	This error indicates that the Controller received a registration request for metrics for a Machine Agent that listed a machine ID not yet associated with any node. Configure the Machine Agent to associate with the correct application, tier, and node. See Install the Machine Agent.
Agent upload blocked, as its reporting a time well into the future.	The App Agents attempt to report metric data using Controller time. The agents retrieve the time from the Controller every five minutes and report times using a skew of the local machine time, if different. If for some reason the App Agent reports metrics that are time-stamped ahead of the Controller time, the Controller rejects the metrics. To avoid this event, ensure that the system times for the machine on which the Controller is running and the machines for the app agents are in synchronization.

Controller shutdown does not increase free memory on Linux

You do not generally need to be concerned about the "free memory" value, as it will always trend towards zero. The Linux kernel tries to keep its cache as large as possible. As a result, the Linux kernel does not release the memory even after process termination. The memory is freed only if it is required by another process.

Controller process unexpectedly shut down

On Linux, memory allocation failures may cause the Controller process to be shut down unexpectedly by the Linux Out-of-Memory (OOM) Killer. The Controller log, `server.log`, does not provide information about the shutdown. Instead, to diagnose this event, check the system log (usually `/var/log/messages`) for "out of memory" entries written by the OOM killer, for example, as follows:

```
grep -i "Out of memory" /var/log/messages
```

If you encounter this log entry, make sure that you have allocated sufficient swap space on the Controller machine. AppDynamics recommends allocating a minimum of 10 GB of swap space.

Controller server swapping too often

If you encounter unexpected swapping on the Controller machine, you can configure how aggressive the operating system swaps by configuring the `swappiness` parameter. The `swappiness` parameter controls how often the Linux kernel moves processes out of physical memory and onto the swap disk. The default value for the parameter is usually 60. When you decrease the value, you lower the tendency of the operating system to swap. This results in less default file caching.

See the documentation for your Linux distribution for recommendations on the value for the `swappiness` parameter. For example, RedHat recommends setting swappiness to 10 for CentOS and RedHat kernels version 2.6.32-303 or later if you encounter OOM issues even though swap space is still available.

Before you configure the `swappiness` parameter though, ensure that the machine has sufficient RAM and that the buffer pool size for MySQL is properly configured.

To configure swappiness

1. Check the current value for `swappiness`.

   ```
   /sbin/sysctl -a | grep swappiness
   ```

2. Set the `swappiness` parameter.

   For example, add the following line to set the `swappiness` parameter to 10.

```
echo 10 > /proc/sys/vm/swappiness
```

3. Set the `swappiness` parameter in the `/etc/sysctl.conf` file to the same value you used in step 2.

   For example, add the following line to the `/etc/sysct1.conf` file:

```
vm.swappiness = 10
```

Could not determine the IP address of this host error during installation

During the installation process, the Enterprise Console attempts to ping the Controller by the hostname or IP address you enter. If the ping is unsuccessful during the user input validation, the following error message appears: "Could not determine the IP address of this host. Please ensure that the IP address of the Controller host resolves to its hostname or to localhost. You may need to add an entry in the hosts file on the Controller host and retry the operation."

To make the hostname resolvable, add an entry for it to the hosts file on the machine on which you are installing the Controller. On Linux, the hosts file is typically at `/etc/hosts`. On Windows, look for the file at the following location, `C:\Windows\System32\Drivers\etc\hosts`, or the location appropriate for your version of Windows.

Add the entry in the form of the following example:

```
127.0.0.1 localhost myhostname
```

Use the IP address and hostnames appropriate for your system.

For example, the following shows the entry added as the third line of the default RedHat hosts file:

```
127.0.0.1    localhost.localdomain localhost
::1          localhost6.localdomain6 localhost6
198.51.100.2 myhost myhost.example.org
```

Controller Cannot Connect to the MySQL Database

The following exception message in server.log file indicates that the Controller cannot connect to its embedded database.

```
*Server log exception:* "Caused by: java.net.ConnectException: Connection refused"
```

If you encounter this error, verify that the Controller database is running properly. On Linux, you can do so using one of the following commands:

Linux	Windows	Description
`lsof -i:3388`	SysInternals Process Explorer, will provide a list of files opened by process with pid 3388.	List open files opened by process with pid 3388.
`netstat -anp | grep 3388`	`netstat -ano | find "3388"`	List all networking ports opened by process with pid 3388.
`ps -aef | grep mysql`	`tasklist /v | find "mysql"`	Lists all processes and then checks if the process with name "mysql" is active and alive.

If no processes are found, it indicates that the Controller database was incorrectly terminated. Start the Controller database again and verify the Controller `server.log` file for any error messages.

Stack overflow exception when installing the Controller installation on Windows

This exception is usually caused when you set the `-Xss` option to a lower value. We recommend changing this value to 96000.

Triggering automatic collection of Controller logs

Use the following console commands to trigger automatic capture of Controller log files:

- On Linux, run:

```
bin/platform-admin.sh submit-job --platform-name test --service controller --job retrieve-log
```

- On Windows, open an elevated command prompt (in the Windows start menu, right-click the **Command Prompt** icon and choose **Run as Administrator**) and run:

```
bin/platform-admin.exe cli submit-job --platform-name test --service controller --job retrieve-log
```

  The logs will be copied in the Enterprise Console host under `platform-admin/logs-controller-<platform-name>-<date-time-stamp>.zip`.

See Platform Log Files to learn how to manage your Controller logs.

Collecting Troubleshooting Information for the Controller

If opening a support case for Controller troubleshooting, you can facilitate the diagnosis of the problem by providing the following information:

- Submit all `platform-admin/logs/*` and `platform-admin/logs-controller-*.zip`, in particular the `server.log` files. You can also use the log file utility described in Triggering automatic collection of Controller logs to collect logs.
- If the Controller runs out of memory, it generates a heap dump. Submit all files in `<controller_home>/appserver/glassfish/domains/domain1/config/hprof`.
- Submit all `<controller_home>/appserver/glassfish/domains/domain1/config/gc.log` files.
- Submit information about the hardware and operating system configuration of the machine that is currently hosting the Controller, including operating system, bit version, CPU cores, clock speed, disk configuration, and RAM.
- Indicate the Performance profile of Controller. Run the controller diagnosis command which captures the information in `platform-admin-server.log`:

  Refer to the Controller diagnostic data in the `platform-admin-server.log`. See a sample Controller diagnostic data on Manage a High Availability Deployment page.

Issues Generating Audit Reports Immediately after Upgrading the Controller to 4.5

When the Controller upgrade is complete, audit reports may not work immediately. The audit database table is getting migrated only after the upgrade process and the migration takes at least an hour to complete. If audit reports are run before completing the migration process, audit table migration messages are logged in the `server.log` file.

No actions are required, try running the audit reports again after an hour.

Controller Dump Files

The following steps describe how to collect troubleshooting information for your Controller. You may be requested for the information when troubleshooting with the AppDynamics support team.

Get Heap and Histogram Dump Files

It is recommended that you install JDK on your system before using the following commands.

- Get the **process id of the Controller** to use in subsequent commands.

```
ps -ef | grep java
```

- Get the **heap dump before garbage collection** using the following command:

```
<java-jdk-install-dir>/bin/jmap -dump:format=b,file=heap_before_live.bin <Controller_pid>
```

- Get the **histogram before garbage collection** using the following command:

```
<java-jdk-install-dir>/bin/jmap -histo <Controller_pid> | head -200 > histo_before_live.txt
```

- Get the **histogram after garbage collection** using the following command:

```
<java-jdk-install-dir>/bin/jmap -histo:live <Controller_pid> | head -200 > histo_after_live.txt
```

Take Four Thread Dumps at Three Second Intervals

- Using the Controller process ID, execute the following command:

```
kill -3 <Controller_pid>
```

- Save the `<Controller_Installation_Directory>/appserver/glassfish/domains/domain1/logs/jvm.log` file.

Send the Files to the AppDynamics Support Team

If asked to provide the information to the AppDynamics support team, send the following files generated by these steps:

- `heap_before_live.bin`
- `histo_before_live.txt`
- `histo_after_live.txt`
- `jvm.log`

Controller Component Versions

This page describes how to check version information and the version of bundled components. This information is useful when troubleshooting the system or performing other administrative tasks.

> ⚠ AppDynamics maintains and updates the bundled components as part of the AppDynamics platform. Do not attempt to upgrade a bundled component independently of the platform upgrade procedure.

Controller Version

You can retrieve the Controller version in two ways:

1. From the AppDynamics UI:
    a. Click the **Settings** ⚙.
    b. Select **About AppDynamics.**
    c. Note the **Controller build** number.
2. From the command line of the Controller machine:
    a. Access the `README.txt` file located in the Controller home directory.

Bundled Glassfish Server Version

The Glassfish server is installed in `<controller_home>/appserver`.

The Glassfish server version is Glassfish 4.1.1.

Bundled MySQL Database Version

The AppDynamics Controller uses MySQL as its default database, where it stores configuration data, metrics data, transaction snapshot data and events, and the history of incidents that occurred (both resolved and unresolved incidents are stored). The MySQL database files are installed in `<controller_home>/db` by default.

The latest AppDynamics release bundles MySQL version 5.7.33.

Check MySQL Version

To check what your MySQL version is in your Controller, you can run the following command:

```
<controller_home>/bin/controller.sh login-db
select version();
```

Upgrade MySQL Version

Optionally, after you install or upgrade the Controller, you can upgrade the MySQL version with the Enterprise Console. Note that you cannot reverse this process.

> ⓘ A newly installed 4.5 Controller packages and uses MySQL 5.7. However, a Controller that is upgraded to 4.5 from a previous version where MySQL 5.5 is used, will also use version 5.5.

You can upgrade the MySQL version on the Controller page in the GUI or with the following command:

Bundled Java Version

The Controller bundles and uses Java Runtime Environment 8.0.282.

Enterprise Console Version

Run the command in the `<Enterprise Console installation directory>/platform-admin` to check the version:

Other Component Versions

See Legal Notices for the latest components included in the AppDynamics products and modules.

Upgrade the Controller Using the Enterprise Console

Related pages:

- Controller Data Backup and Restore
- Upgrade a Single Controller
- Upgrade an HA Pair

You can upgrade a Controller instance using the Enterprise Console. The Enterprise Console simplifies the upgrade process by allowing you to discover and upgrade single Controllers and HA-pairs.

About the Upgrade

- The Enterprise Console supports Controller upgrades (standalone and HA-pair) starting from 4.4.x and higher, to the latest version. Use the following table to determine your course of action based on your circumstances:

If your current Controller version is...	Controller version you want to upgrade to...	Actions to take...
Older than version 4.4.x (such as: 4.1.*x*, 4.2.*x, 4.3.x*)	Controller version 4.5.*x* or the latest version	1. Open a support help desk ticket. 2. Support will provide you a 4.3.8 installer for you to use in the upgrade process. 3. Use the Controller installer and upgrade the Controller to version 4.3.8. 4. Then, use Enterprise Console version 4.4.3 to upgrade the Controller from version 4.3.8 to version 4.4.3. 5. Finally, use Enterprise Console version 4.5.*x* to upgrade the Controller from version 4.4.3 to version 4.5.*x*.
Equal to version 4.4.x or later	Controller version 4.5.x or the latest version	1. Access the downloads portal to download the Controller version. 2. Use the Enterprise Console to upgrade from your existing Controller version to the Controller version you want.

- Discovering and upgrading a Controller from 4.1 and higher to the latest version will not upgrade the Events Service automatically. This must be done by a separate upgrade job.
- You can choose which version you would like to upgrade the Controller to as long as the Enterprise Console is aware of that version. This means that you can upgrade the Controller to any intermediate version or to the latest version as long as the Enterprise Console installer has been run for those versions. However, you cannot upgrade the Controller to an older version.
- If you have a license for the older version, the license should work when upgrading the Controller to a new version. However, if you have a temporary license for the old version and now have a new license, the new license will not work on the old Controller. In this case, you should upgrade the Controller to the latest version before applying the license.
- An upgrade results in Controller downtime, but it is not necessary to stop agents during the Controller upgrade.
- Starting in 4.5, during a Controller discover and upgrade scenario, the Enterprise Console expects a `.passwordfile` file to be present in the Controller home directory. The Enterprise Console reads this password and validates it against the Controller. Once the upgrade is complete, the Enterprise Console removes the file, and stores the password in its encrypted database.

> ⚠ If you change the Glassfish Admin Password manually, you also need to update it in the Enterprise Console Controller Settings.

Before Upgrading

- Before you start upgrading the Controller, make sure that you are using the correct update order. Remember, if you are upgrading from a pre-4.1 version to 4.4.x or the latest version, you must first manually upgrade any embedded Events Service, then upgrade the Controller.
- Review the latest Release Notes and the release notes for any intermediate versions between the current version of your instance and the version you are targeting to learn about issues and enhancements in those releases.
- Check the most recent Controller System Requirements and Troubleshoot Controller Issues to review your Controller's current workload and determine whether you need to change your performance profile and increase your hardware resources, if necessary.

> ⓘ You may change your Controller profile on the Platform Configurations pages of the Enterprise Console GUI, either before or after you upgrade your Controller. This process is not reversible, and you cannot move from a larger to a smaller profile size.

- Check the Controller's database.log for any errors. You can find the log at `<controller_home>/db/logs/database.log`. There should not be any `InnoDB: Error` lines in the log. If any errors are found, please reach out to AppDynamics Support before attempting the upgrade. Upgrading the Controller with a corrupt database may put the Controller in a bad state, with high recovery time.
- If you changed any Glassfish settings that are not JVM options, note your changes. You may need to configure them after an upgrade. The Enterprise Console recognizes and retains many common customizations to the domain.xml, db.cnf, and other configuration files, but is not

guaranteed to retain them all. If you have made manual configuration changes to the files, verify the configuration after updating. See Retaining Configuration Changes to learn how to preserve changes.
- If you uninstall the Enterprise Console that was previously managing the Controller and use a new Enterprise Console instance to discover and upgrade the Controller, you need to first manually create the `.passwordfile` file in order for the Enterprise Console to continue with the discover and upgrade process. You can create the file in the Controller home directory, and add the `AS_ADMIN_PASSWORD=<controllerRootUserPassword>` value in it.
- When performing an upgrade while enabling HTTPS, check that the hostname does not start with a digit. The upgrade will fail if the Enterprise Console hostname starts with a digit due to a JDK limitation with the DNS name in CN/SAN.
- The database user password storage mechanism changed in Release 3.8. If upgrading from 3.7.x or earlier, see the Upgrade the Controller page in the 3.8 documentation for considerations related to the database user password.
- Back up the existing Controller following the steps in the next section.

Back up the Existing Controller

The Enterprise Console retains agent data, reports, configuration, and other types of data through an upgrade, including a copy of commonly modified configuration files under `<controller_home>/backup`. Nevertheless, to mitigate the risk of data loss in the event of an unexpected failure, be sure to back up the existing installation directory before applying an upgrade to the Controller.

The Enterprise Console does not back up MySQL data. You need to back up the data before upgrading standalone installations.

If the upgrade does not finish successfully for any reason, see Troubleshooting the Upgrade for more information.

To back up the Controller instance

1. Stop the Controller application server and database.
   - For Linux, run:

     ```
     platform-admin.sh stop-controller-appserver
     ```

   - For Windows, run:

     ```
     platform-admin.exe cli stop-controller-appserver --with-db
     ```

2. Back up the Controller home by copying the entire Controller home directory to a backup location. Note the following points:
   - If the data home for the Controller is not under the Controller directory, be sure to back up the database directory as well.
   - If it's not possible to back up the entire data set, you can selectively back up the most important tables. Use the Metadata Backup SQL script described and attached to the Controller Data Backup and Restore page.
3. Restart your Controller after completing the backup and before upgrading.

After Upgrading

- If you have configured settings in the `domain.xml` file, `db.cnf` or other configuration files manually or by using the Glassfish `asadmin` utility, verify those changes in the configuration files or Controller Configurations page of the GUI after the upgrade and re-apply any customizations that were not preserved. The Enterprise Console preserves several recommended customizations. After the upgrade, you can find backup copies of common configuration files in the `<controller_home>/backup` directory.
- As an optional step, your MySQL version can be upgraded after you upgrade the Controller, through the Enterprise Console GUI or by using the `mysql-upgrade` job. See Bundled MySQL Database Version for more information.

Troubleshooting the Upgrade

If the upgrade does not succeed for any reason, the Enterprise Console does not roll back changes on disk. This gives you an opportunity to diagnose and troubleshoot the issue before reattempting the installation or upgrade.

To troubleshoot the issue, check the installation log at `platform-admin/logs/platform-admin-server.log`. The Controller `server.log` file may contain additional information.

Resuming from Checkpoint

The Enterprise Console provides a feature to resume the upgrade from the last point of failure (checkpoint). The application creates a checkpoint at several stages during installation. If the installation fails, resuming from checkpoint would skip all the prior successfully completed stages and restart the installation from the beginning of the specific stage where the last point of failure occurred.

You can also resume a failed Controller job from the CLI by passing the flag `useCheckpoint=true` as an argument after `--args` in your command.

If for some reason, the upgrade from the last checkpoint is not successful, you may retry the upgrade from the beginning. Simply click **Retry** instead of Resume from the checkpoint. However, please note that retrying from the beginning after a failed upgrade may overwrite your customizations to `db.cnf` and `domain.xml`.

Timing Out

A common upgrade issue involves the upgrade process timing out. The Enterprise Console attempts to restart the Controller and database after applying an update or installation. For large databases and depending on the system resources, this can take a considerable amount of time. If the Enterprise Console cannot finish starting up the Controller within a set time-out period (30 minutes by default), the operation will fail.

You can increase the default time out period for system startup. The timeouts are defined in `platform-admin/archives/controller/<version>/playbooks/controller.groovy`. You can update the `controllerStartRetryTimeout = 10 * 60 seconds = 10 minutes`, and then retry the upgrade from the checkpoint.

When the Controller upgrade is complete, audit reports may not work immediately. The audit database table is getting migrated only after the upgrade process and the migration takes at least an hour to complete. If audit reports are run before completing the migration process, audit table migration messages are logged in the server.log file. No actions are required, try running the audit reports again after an hour.

Upgrade a Single Controller

Related pages:

- Controller Data Backup and Restore
- Upgrade the Controller Using the Enterprise Console

You can use the Enterprise Console to onboard and upgrade a single node Controller instance. The **Custom Install Discover & Upgrade** option in the GUI allows you to create a platform and discover a Controller.

Alternatively, if you have already created a platform, you must add credentials and hosts to the platform before you can perform discovery.
Then, discover the Controller on the page. Discovering a Controller means that the Enterprise Console learns about your existing Controller deployment, such as profile, tenancy mode, existing domain configuration, and database configuration. This information is used to perform an upgrade.

About the Upgrade

The Enterprise Console supports Controller upgrades (standalone and HA-pair) starting from 4.4.x and higher, to the latest version. Use the following table to determine your course of action based on your circumstances:

If your current Controller version is...	Controller version you want to upgrade to...	Actions to take...
Older than version 4.4.x (such as: 4.1.*x*, 4.2.*x, 4.3.x*)	Controller version 4.5.*x* or the latest version	1. Open a support help desk ticket. 2. Support will provide you a 4.3.8 installer for you to use in the upgrade process. 3. Use the Controller installer and upgrade the Controller to version 4.3.8. 4. Then, use Enterprise Console version 4.4.3 to upgrade the Controller from version 4.3.8 to version 4.4.3. 5. Finally, use Enterprise Console version 4.5.*x* to upgrade the Controller from version 4.4.3 to the latest version.
Equal to version 4.4.x or later	Controller version 4.5.x or the latest version	1. Access the downloads portal to download the Controller version. 2. Use the Enterprise Console to upgrade from your existing Controller version to the Controller version you want.

Upgrade the Controller Using GUI

If there is a Controller upgrade available, you can begin the upgrade process either on the Custom Install or Controller page in the GUI.

> Ensure that the Controller and database are running prior to the upgrade. The Enterprise Console validates the database root password and Controller root passwords provided during the upgrade.

Upgrade the Controller from 4.1.x, 4.2.x, and 4.3.x to 4.5.x or Latest

To upgrade the Controller from 4.1.*x*, 4.2.*x*, and 4.3.*x* to 4.5.*x* or the latest version, you can use the Discover and Upgrade feature:

1. Open a support help desk ticket. Support will provide you a 4.3.8 installer for you to use in the upgrade process.
2. Use the Controller installer and upgrade the Controller to version 4.3.8.
3. Check that you have fulfilled the Enterprise Console prerequisites before starting.
4. Open a browser and navigate to the GUI:

   ```
   http(s)://<hostname>:<port>
   ```

   9191 is the default port.
5. Navigate to the **Install** homepage and select **Custom Install**.
6. Name the Platform:

   a. Enter a Name and the Installation Path for your platform.

   > The Installation Path is an absolute path under which all of the platform components are installed. The same path is used for all hosts added to the platform. Use a path which does not have any existing AppDynamics components installed under it. The path you choose must be writeable (the user who installed the Enterprise Console should have write permissions to that folder). Also, the same path should be writable on all of the hosts that the Enterprise Console manages.
   >
   > Example path: `/home/appduser/appdynamics/product`

7. Add a Host:

   > ⚠ If the Controller is running on a Windows machine, the Enterprise Console should be on the same machine. Windows hosts are not supported on the Enterprise Console.

   a. Enter the host machine-related information: Host Name, Username, and Private Key. This is where the Controller will be upgraded. Therefore, this needs to point to the host machine where the Controller is currently up and running. For more information about how to add credentials and hosts, see Administer the Enterprise Console.
8. Discover Controller:
   a. Select **Discover & Upgrade**.
   b. Select an available Target Version from the dropdown.

      > ⓘ The list is populated by versions that the Enterprise Console is aware of. Of those versions, the list will only show versions that are the same or greater than the current Controller version.

   c. Enter the Controller Primary Host.
   d. Enter the Controller root password and database root password.

      > ⓘ Your Controller and MySQL needs to be up and running before performing an upgrade. The Enterprise Console validates whether the input passwords are correct.
9. Make sure to unselect the Install Events Service option before selecting **Submit**.
10. Select **Submit**.

The Enterprise Console will onboard the controller on the selected host machine to the application build. When the Enterprise Console discovers a component, it also checks to see if an upgrade is available and performs the upgrade. Plan for a downtime of the Controller availability during this time. You can view the status of the upgrade job on the **Jobs** page.

Once the upgrade is complete, the URL of the controller and other controller related information can be accessed from the Controller page.

Then, repeat Steps 3 through 10 and use Enterprise Console version 4.4.3 to upgrade the Controller from version 4.3.8 to version 4.4.3.

Finally, repeat Steps 3 through 10 and use Enterprise Console version 4.5.*x* to upgrade the Controller from version 4.4.3 to version 4.5.*x*.

Upgrade the Controller from 4.4.x to Latest

To upgrade the Controller from 4.4.x to the latest version, you can use the Upgrade Controller feature:

1. Check that you have fulfilled the Enterprise Console prerequisites before starting.
2. Upgrade the Enterprise Console to the latest version.
3. Open a browser and navigate to the GUI:

   ```
   http(s)://<hostname>:<port>
   ```

   9191 is the default port.
4. Navigate to the **Controller** page of the platform.
5. Select the Controller host you would like to upgrade.
6. Select **Upgrade Controller**.
7. Select an available Target Version from the dropdown.

   > ⓘ The list is populated by versions that the Enterprise Console is aware of. Of those versions, the list will only show versions that are the same or greater than the current Controller version.

8. Enter the required passwords and select **Submit**.

Upgrade the Controller Using CLI

If there is a Controller upgrade available, you can begin the upgrade process using the application CLI.

> ⓘ Ensure that the Controller and database are running prior to the upgrade. The Enterprise Console validates the database root password and Controller root passwords provided during the upgrade.

Upgrade the Controller from 4.1.x, 4.2.x, and 4.3.x to 4.5.x or Latest

To upgrade the Controller from 4.1.x, 4.2.x, and 4.3.x to 4.5.x or the latest version:

1. Open a support help desk ticket. Support will provide you a 4.3.8 installer for you to use in the upgrade process.
2. Use the Controller installer and upgrade the Controller to version 4.3.8.
3. Use the Enterprise Console CLI commands to:
    a. Create a platform:

    ```
    bin/platform-admin.sh create-platform --name <platform_name> --installation-dir
    <platform_installation_directory>
    ```

    b. Create a credential:

    ```
    bin/platform-admin.sh add-credential --credential-name <name> --type <ssh> --user-name <username>
    --ssh-key-file <file path to the key file>
    ```

    > Remember to provide the private key file for the Enterprise Console machine when adding a credential.

    c. Add hosts:

    ```
    bin/platform-admin.sh add-hosts --hosts host_1 host_2 host_3 --credential <credential name>
    ```

    d. Discover and upgrade the Controller. For the option `--target-version`, either specify the desired upgrade version of the Controller or `latest` to install the latest Controller version available to the Enterprise Console.

    If you updated the Database user password from the default, you can provide it after `--args` by including the parameter `newDatabaseUserPassword=<password>`. The job uses the default password if this parameter is excluded. If you have forgotten your Database user password and need to reset it, click Reset the Controller DB User Password.
    If your upgrade fails, you can resume by passing the flag `useCheckpoint=true` as an argument after `--args.`

    > You must specify and provide the full path to the existing Controller directory.

4. Confirm that the installation directory is the same as the previous Controller installation directory on this machine. The Controller will automatically migrate the data only when the `discover_upgrade` option is specified.
   The Enterprise Console completes the upgrade and restarts the Controller.
5. If you made any manual changes to the configuration files listed, verify those changes to the equivalent files in the upgraded instance. The Enterprise Console preserves `domain.xml` customizations and database `cnf` customizations.
6. Open a browser and access the AppDynamics user interface:

    ```
    http://<Controller_Host>:<Controller_Port>/controller
    ```

    If the UI does not display the new Controller, refresh your browser cache to view the new UI.

Then, repeat Steps 3 through 6 and use Enterprise Console version 4.4.3 to upgrade the Controller from version 4.3.8 to version 4.4.3.

Finally, repeat Steps 3 through 6 and use Enterprise Console version 4.5.*x* to upgrade the Controller from version 4.4.3 to version 4.5.*x*.

Upgrade the Controller from 4.4.x to Latest

Upgrades from 4.4.x to the latest version can be performed on the Controller page of the Enterprise Console or with the following commands:

1. Upgrade the Enterprise Console to the latest version.
2. Navigate to the `<Enterprise Console home directory>/platform-admin directory`.
3. If it has been more than one day since your last session, you will have to log in with the following command:

    ```
    bin/platform-admin.sh login --user-name <admin_username> --password <admin_password>
    ```

4. Apply the upgrade to the Controller with the following command:

    If your upgrade fails, you can resume by passing the flag `useCheckpoint=true` as an argument after `--args.`

How to Reset the Database User Password

You can customize the database user password. However, if you are upgrading your system, you may have forgotten the password. How you reset the database user password depends on whether the Enterprise Console has discovered the Controller.

If the Enterprise Console has discovered the Controller

Use the Enterprise Console CLI commands to:

1. Log in to the Enterprise Console.

   ```
   platform-admin/bin/platform-admin.sh login --user-name admin --password EC_GUI_PASSWORD
   ```

   Replace `EC_GUI_PASSWORD` with your actual value.
2. Reset the database user password.

   ```
   platform-admin/bin/platform-admin.sh submit-job --platform-name <platform_name> --service controller --
   job update-passwords --args newDatabaseUserPassword=<password>
   ```

   Replace `<platform_name>` and `<password>` with your actual values.

As a result, an Enterprise Console job is generated where you can verify the success of the password reset.

If the Enterprise Console has NOT discovered the Controller

1. Log in to the database as the root user by running the following command:

   ```
   ./mysql --user=root -p --host=127.0.0.1 --port=3388 --protocol=TCP
   ```

2. Execute the following queries, replacing `<new_password_here>` before executing the query.

   ```
   update mysql.user set authentication_string=password('<new_password_here>') where user like
   'controller%'; flush privileges; quit;
   ```

3. Verify the login by running the following command in the `<controller_home>/db/bin` directory:

   ```
   ./mysql -u controller -p -P 3388 -h 127.0.0.1
   ```

Upgrade an HA Pair

Related pages:

- Upgrade the Controller Using the Enterprise Console
- Controller High Availability
- Controller Data Backup and Restore

You can use the Enterprise Console to onboard and upgrade an HA Controller pair. For HA pairs that are not managed by the Enterprise Console, use the discover and upgrade option; for HA pairs that are managed by the Enterprise Console, you must use the upgrade option.

This topic describes:

- Upgrade method benefits
- Available upgrade methods
- How to shut down the HA Toolkit (HATK) implementation

Upgrade Method Benefits

The upgrade method enables you to:

- Perform a set of pre-upgrade validations. A summary of validation errors is provided to you before you modify the system's state.
- Quickly restore the older Controller version from the preserved secondary version in case of any upgrade issues. As you upgrade the primary server, the secondary server is isolated, thereby providing you a backup from which to quickly restore the service.

Available Upgrade Methods

Use the CLI, or follow a step-by-step Upgrade wizard that guides you through the UI, to perform the upgrade.

Use the CLI Method to Upgrade

You can use the CLI to upgrade the HA Controller pair. For more details, select upgrade using the CLI.

Use the Upgrade Wizard Method to Upgrade

You can use the Upgrade Wizard to follow a step-by-step procedure that guides you through the UI to perform the upgrade. For more details, select upgrade using the Upgrade Wizard.

Shut Down the HA Toolkit (HATK) Implementation

Before you start the Controller HA upgrade from a pre-Enterprise Console deployment, you must first shut down the watchdog and assassin processes. This is only required if you have installed the HA Toolkit previously.

To shut down the HA Toolkit implementation:

- If the Controller services are installed with privilege escalation using setups option (-c option in install-init.sh) then running the following command on the secondary will stop the secondary appserver, watchdog, and assassin.

  ```
  /sbin/appdservice appdcontroller stop
  ```

  or
- If the Controller services are installed with privilege escalation using sudoers option (`-s` option in `install-init.sh`) then running the following command on the secondary will stop the secondary appserver, watchdog, and assassin.

  ```
  sudo /sbin/service appdcontroller stop
  ```

To check if the appserver, watchdog, and assassin stopped on the secondary, you can use the following commands based on the privilege escalation method used to install the Controller services:

```
/sbin/appdservice appdcontroller status
```

or

```
sudo /sbin/service appdcontroller status
```

For both stopping and checking the statuses, if you do not remember the privilege escalation method used to install services, then you can use both variants, one after the other, in any order.

Upgrade the HA Controller Pair Using the CLI

If are using the HA ToolKit (HATK) and made any customizations to it, AppDynamics recommends that you review your particular situation and determine if you should proceed with the migration. For more details, see HA module in the Enterprise Console.

Steps 1 through 3 consist of different procedures depending on your HA Controller pair deployment:

- Follow **Option 1 - Discover and Upgrade** for deployments that are not managed by the Enterprise Console.
  Use the discover and upgrade job to onboard your HA Controller pair to the Enterprise Console before upgrading the primary Controller.
- Follow **Option 2 - Upgrade** for HA pair deployments that are managed by the Enterprise Console.
  Use the upgrade option to upgrade your primary Controller managed by the current Enterprise Console instance.

To upgrade using the CLI:

Step 1: Prepare the Upgrade

Step 2: Perform a Failover and Check the HA Pair State

To begin the upgrade, perform a failover to the secondary Controller. Since the primary Controller is known to be working, this provides a stable configuration to fail back to in case of upgrade issues.

To perform a failover and check the HA pair state:

Step 3: Upgrade the Primary Controller

You can upgrade the primary Controller using one of the following commands:

See Troubleshooting the Upgrade if the primary upgrade fails.

Step 4: Verify the Primary Upgrade

A primary upgrade success message displays if the upgrade is successful. However, AppDynamics recommends that you perform your own in-house verification on the Controller before proceeding to the secondary upgrade. For example, you can check that your agents are continuing to report to your Controller.

The following describes the expected state in the Enterprise Console.

Run the following commands on the Enterprise Console host:

```
bin/platform-admin.sh list-platform-service --platform-name <name_of_the_platform>
```

The desired output is `Controller: primary_upgraded`.

```
bin/platform-admin.sh list-node --service controller --platform-name <name_of_the_platform>
```

The output will display the host versions.

Sample Output

```
Available nodes in the controller service:
        Controller: role Primary, host 172.12.0.1, version 4.5.5.0, state running
         MySQL: role Primary, host 172.12.0.1, version 5.7.24 state running
        Controller: role Secondary, host 172.12.0.2, version 4.5.0.2, state stopped
         MySQL: role Secondary, host 172.12.0.2, version 5.7.21, state running
```

Check that all hosts show the new versions, that the Controller is running on the primary and stopped on the secondary, and that MySQL is running on both hosts. If you are not satisfied with the upgrade, see Verify the Primary Upgrade is Unsatisfactory.

Step 5: Upgrade the Secondary Controller

To upgrade the secondary Controller, run the the `upgrade-secondary` command on the Enterprise Console host:

```
bin/platform-admin.sh submit-job --service controller --job upgrade-secondary --platform-name
<name_of_the_platform> --args controllerRootUserPassword=<controller_root_password>
mysqlRootPassword=<mysql_root_password>
```

If the secondary Controller upgrade fails, see Upgrade the Secondary Controller Fails for possible recovery options.

Step 6: Verify the Secondary Upgrade

A secondary upgrade success message displays if the upgrade is successful. However, AppDynamics recommends that you perform your own in-house verification on the Controller before completing the upgrade.

The following describes the expected state in the Enterprise Console.

Run the following commands on the Enterprise Console host:

```
bin/platform-admin.sh list-platform-service --platform-name <name_of_the_platform>
```

The desired output is "Controller: provisioned".

```
bin/platform-admin.sh list-node --service controller --platform-name <name_of_the_platform>
```

The output will display the host versions.

Sample Output

```
Available nodes in the controller service:
        Controller: role Primary, host 172.12.0.1, version 4.5.5.0, state running
         MySQL: role Primary, host 172.12.0.1, version 5.7.24 state running
        Controller: role Secondary, host 172.12.0.2, version 4.5.5.0, state stopped
         MySQL: role Secondary, host 172.12.0.2, version 5.7.24, state running
```

Ensure that the secondary host version has been upgraded. Also, the primary should be in a running state, while the secondary Controller appserver should remain stopped. However, its MySQL process should be running.

Troubleshooting the Upgrade

Failover Issues

If you experience failover issues before upgrading, determine the condition of the secondary Controller. You may need to fix a broken secondary Controller before you attempt an upgrade.

The Primary Controller Upgrade Fails

Verify the Primary Upgrade is Unsatisfactory

If the primary upgrade succeeded, but you discovered problems during manual verification, you can roll back the upgrade by performing a failover and rebuilding the secondary.

If the downtime maintenance window is closing, you need to restore the older deployment version and service. Due to the recently performed failover, the current secondary host is a known-good host because it had been functioning as the primary host. You can quickly restore service by failing over to it, and then repairing the host (which experienced the failed upgrade) by rebuilding it as a secondary host.

From the Enterprise Console host:

1. Enter the `ha-failover` command to revert the primary host to the older version:

```
bin/platform-admin.sh submit-job --service controller --job ha-failover --platform-name
<name_of_the_platform> --args forceFailover=true
```

2. Enter the `incremental-replication` command to reduce downtime. When dealing with large data, this is recommended because replication time and downtime depend on data size.

```
bin/platform-admin.sh submit-job --service controller --job incremental-replication --platform-name
<name_of_the_platform>
```

3. Enter the `finalize-replication` command to rebuild the secondary host:

```
bin/platform-admin.sh submit-job --service controller --job finalize-replication --platform-name
<name_of_the_platform>
```

Upgrade the Secondary Controller Fails

If you receive the following error confirming a failed secondary upgrade:

```
Controller: secondary_upgrade_error
```

You can try the following recovery options:

- Option 1: If the failure is recoverable, you can retry the upgrade by entering the following command on the Enterprise Console host:

```
bin/platform-admin.sh submit-job --service controller --job upgrade-secondary --platform-name
<name_of_the_platform> --args controllerRootUserPassword=<controller_root_password>
mysqlRootPassword=<mysql_root_password> useCheckpoint=true
```

- Option 2: If retrying the upgrade does not work, you can run the incremental-replication and finalize-replication jobs. This involves downtime on the primary. Enter the following commands on the Enterprise Console host:

```
bin/platform-admin.sh submit-job --service controller --job incremental-replication --platform-name
<name_of_the_platform>
bin/platform-admin.sh submit-job --service controller --job finalize-replication --platform-name
<name_of_the_platform>
```

  For more details, see Initiate Controller Database Incremental Replication.
- Option 3: If the machine dies or cannot be fixed by running the incremental-replication and finalize-replication jobs, you can remove the secondary Controller. This is a unique fix for an uncommon situation. Enter the following command on the Enterprise Console host:

```
bin/platform-admin.sh submit-job --service controller --job remove --platform-name
<name_of_the_platform> --args entireCluster=false removeBinaries=true
```

  > The flag, removeBinaries=true, is optional. The use of this flag depends on the situation of your deployment.
  > If `removeBinaries=false` then the Enterprise Console forgets the Controller without impacting or uninstalling the Controller.

How to Upgrade the HA Modules Without Upgrading the Controller

Using the Enterprise Console UI or the CLI, you can upgrade the HA modules without having to upgrade the Controller. When both Controllers are managed by the Enterprise Console, the HA module is automatically upgraded when you upgrade your HA Controllers.

The following procedure describes an example scenario:

1. You are currently running version 4.5.13 of both Enterprise Console and Controller.
2. You activate the HA modules.
3. You then perform an upgrade only for the Enterprise Console to the latest version (4.5.15 or later).
4. You can upgrade the HA modules from either the Enterprise Console UI or the CLI:

    - From the Enterprise Console UI:
        a. Log in to the Enterprise Console and access the Controller page.
        b. From the **More** menu, select **Upgrade HA Modules**.

    - From the CLI, run the following command on the Enterprise Console host to upgrade the HA modules:

```
bin/platform-admin.sh submit-job --job upgrade-ha-modules --service controller
```

The HA modules are upgraded to the latest version without upgrading the Controller. When you upgrade the HA modules, no downtime is required on the Controller, and all HA settings are preserved.

Upgrade the HA Controller Pair Using the Upgrade Wizard

You can use the HA Controller Upgrade Wizard once both of your Controllers (primary and secondary) have been onboarded into the Enterprise Console.

> If are using the HA ToolKit (HATK) and made any customizations to it, AppDynamics recommends that you review your particular situation and determine if you should proceed with the migration. For more details, see HA module in the Enterprise Console.

> Upgrading the HA Controller pair consists of different procedures based on your deployment:
>
> - Follow **Option 1 - Discover and Upgrade** for deployments that are not managed by the Enterprise Console.
>   Use the discover and upgrade job to onboard your HA Controller pair to the Enterprise Console before upgrading the primary Controller.
> - Follow **Option 2 - Upgrade** for HA pair deployments that are managed by the Enterprise Console.
>   Use the upgrade option to upgrade your primary and secondary Controllers managed by the current Enterprise Console instance.

To upgrade using the Upgrade Wizard:

Step 1: Prepare the Upgrade

Step 2: Enter Controller Credentials

Step 3: Perform a Failover

Step 4: Upgrade the Primary Controller

See Troubleshooting the Upgrade if the primary upgrade fails.

Step 5: Verify the Primary Controller Upgrade

This step pauses the upgrade process and allows you to manually verify the new Controller version.

> Before you proceed with upgrading the secondary Controller, AppDynamics recommends that you verify that the Controller is working by logging in to the Controller and checking that metrics have been received within the last five minutes. If you are not satisfied with the upgrade, you can roll back to the older version from which you started.

Step 6: Upgrade the Secondary Controller

Troubleshooting the Upgrade

Fail Over and Rebuild Secondary

This completes rebuilding the current secondary server so both Controllers in the HA pair are now replicating data.

The Secondary Controller Upgrade Fails

When the secondary Controller upgrade fails:

How to Improve and Optimize Controller Database Performance

> The following procedure only applies to those Controllers that have been upgraded from version 4.2.8 or earlier, to a later version. In such cases, after you upgrade to later version, you may experience performance issues with the Controller database. However, for all new Controller installations using version 4.2.9 or later, the metric data tables are optimized.

To improve database performance when querying metrics, the primary key used by the metric data tables is read *optimized*. As a result, the primary key changes as follows:

From	To
ts_min, node/tier/app, metric_id	metric_id, node/tier/app, ts_min

How to Run Database Optimization

You can use the Enterprise Console to run a database optimization job to optimize your database performance. To use this feature:

1. Upgrade your Enterprise Console to the latest version.
2. Upgrade your Controller to the latest version.
3. After the upgrade has completed, for any database table that can be optimized, you can run the database optimization job from the Enterprise Console.

   > No downtime is required and the database optimization job runs automatically.

   Select **Start Database Optimization** from the Controller page to start a process that runs in the background on your primary Controller host.

   
   The process performs several pre-checks to determine if there is enough disk space, and if any other database optimization process is running. The amount of disk space required is determined by the size of the tables to optimize. Based on the amount of Controller data, the database optimization job may take several hours to several days to complete.
4. Once all of the tables have been optimized successfully, the database optimization process completes and no longer displays on the page. To verify that all tables have been optimized, enter and run the following query:

```
cd <controller_home>/bin directory
./controller.sh login-db
        mysql>SELECT table_name
        FROM   information_schema.key_column_usage
        WHERE  table_name LIKE 'metricdata%'
     AND table_name != 'metricdata_min'
     AND table_name != 'metricdata_min_agg'
     AND column_name = 'ts_min'
     AND ordinal_position = 1;
```

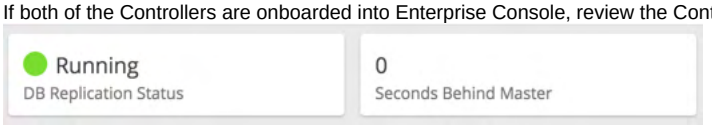
If the query returns any results, then those tables have not been optimized.
If the query returns zero records, then all of the tables were optimized successfully.

The database optimization job is supported on Linux OS only.

How to Run Database Optimization on a High Availability (HA) Controller Pair

Before you run database optimization on a HA Controller pair, you must ensure that the Controller database replication is in a healthy state.

- If both of the Controllers are onboarded into Enterprise Console, review the Controller page and note the following fields:



- If one of the Controllers is managed by HA toolkit (HATK):

a. Log in to the primary Controller host and enter:

```
cd <controller_home>/bin directory
```

b. Log in to the secondary Controller database and enter:

```
./controller.sh login-db
```

c. Enter:

```
SHOW SLAVE STATUS\G;
```

This results in the following output:

```
Seconds_Behind_Master: $Number_Of_Seconds_Behind_Master
```

If a non-zero number displays the output for this test, wait until the number changes to zero.

d. After you ensure that replication is working as expected, you can run the database optimization job from the Enterprise Console. Select **S tart Database Optimization** from the Controller page to start a process that runs in the background on your primary Controller host. The process performs several pre-checks to determine if there is enough disk space, and if any other database optimization process is running. The amount of disk space required is determined by the size of the tables to optimize. Based on the amount of Controller data, the database optimization job may take several hours to several days to complete.

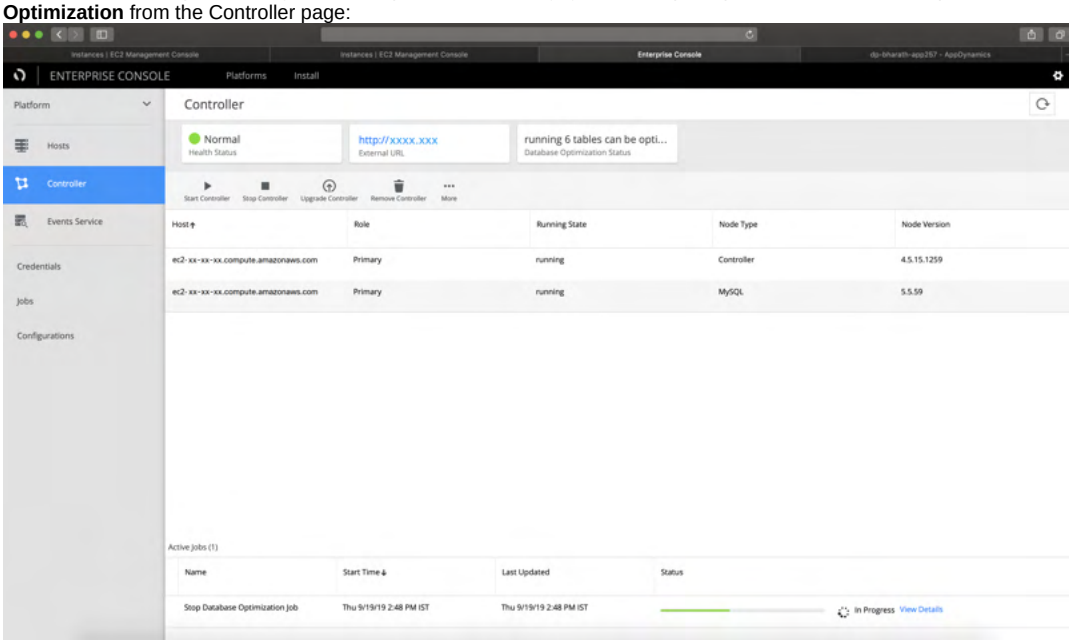
e. Once all of the tables have been optimized successfully, the database optimization process completes and no longer displays on the page. To verify that all tables have been optimized, enter and run the following query:

```
cd <controller_home>/bin directory
./controller.sh login-db
        mysql>SELECT table_name
        FROM   information_schema.key_column_usage
        WHERE  table_name LIKE 'metricdata%'
     AND table_name != 'metricdata_min'
     AND table_name != 'metricdata_min_agg'
     AND column_name = 'ts_min'
     AND ordinal_position = 1;
```

If the query returns any results, then those tables have not been optimized.
If the query returns zero records, then all of the tables were optimized successfully.

How to Stop Database Optimization

After the database optimization job has completed successfully, you can stop the process. From the Enterprise Console, select **Stop Database Optimization** from the Controller page:



> You may need to stop the database optimization process if it is using too many resources and you notice a performance impact on the Controller, or if you decide to reschedule the process to run at a later date.

Troubleshooting Database Optimization

The following table describes possible conditions that may cause errors to occur and actions to take to mitigate them:

Errors or Conditions	User Action
Job failed; `Database replication is broken` message displays.	Re-establish database replication incrementally, then finalize replication.
Ran out of disk space while the database optimization job was running, and job stops processing.	Free up disk space and restart database optimization job.

Uninstall the Controller

This page describes how to uninstall the Controller software and associated files from a platform using the Enterprise Console.

Before Starting

If you have installed the Events Service with the Enterprise Console, it is recommended that you uninstall the Events Service before you uninstall the Controller. See Uninstall the Events Service for more information.

In addition, if you have the EUM Server, Application Analytics, or other product modules installed, keep in mind that if you reinstall the Controller later, you will need to configure integration settings for the modules manually.

Optionally, stop the Controller before uninstalling as described in Start or Stop the Controller. If you do not stop the Controller, the uninstaller will do so for you. However, if your database or Controller generally take a long time to shut down, you can avoid the possibility of time-out errors during uninstallation by stopping the services manually.

Uninstall the Controller Using the Enterprise Console

You can uninstall the Controller on the Controller page in the GUI or by completing the following steps:

1. Open a console:
    - On Linux, open a terminal window and switch to the user who installed the Controller or to a user with equivalent directory permissions.
    - On Windows, open an elevated command prompt by right-clicking on the Command Prompt icon in the Windows Start Menu and choosing **Run as Administrator**.
2. From the command line, navigate to the Enterprise Console bin directory, `platform-admin/bin`.
3. Run the following command:

Note that you cannot use the other AppDynamics platform components without a Controller, so you must install a new Controller before you can resume using the platform.

EUM Server Deployment

The default End User Monitoring deployment assumes that EUM agents (Mobile and Browser) send their data to the EUM Cloud, a cloud-based processor. To deploy EUM completely on-premises, you need to install the EUM Server, the on-premises version of the EUM Cloud, as described here.

Installation Overview

The EUM Server receives data from EUM agents, processes and stores that data, and makes it available to the AppDynamics Controller. Certain EUM features—specifically, Browser Request Analytics and Mobile Request Analytics, features of Application Analytics that extend the functionality of Browser and Mobile Analyze—require access to the AppDynamics Events Service.

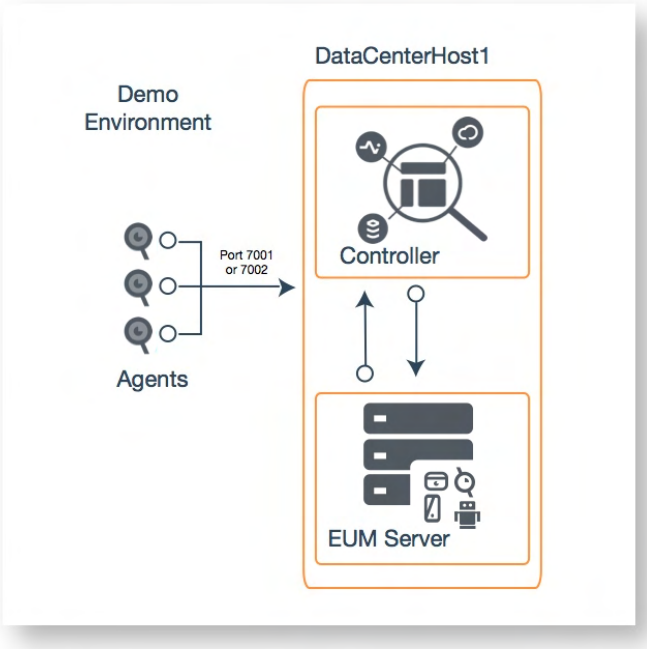
To set up a complete on-premises EUM Server deployment, therefore, you need to:

1. Determine which version of the EUM Server is compatible with your other platform components.
2. Install the on-premises Controller or prepare an in-service Controller to work with the EUM Server
3. Install the on-premises Events Service Deployment and configure it to work with your on-premises Controller
4. Install the on-premises EUM Server and configure it to work with your Events Service and Controller.

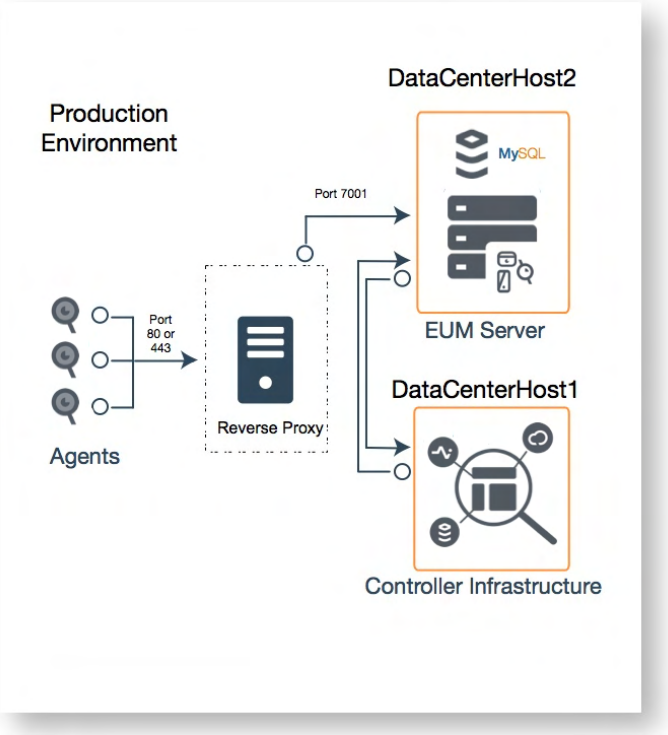
Deployment Modes for the EUM Server

For demonstration and light testing purposes, choose the Demo installation option, where the EUM Server and Controller are installed on the same host, and the EUM Server shares the Controller's MySQL instance. For production installation, choose the Product installation option, where the EUM Server and Controller sit on different hosts, and the EUM Server hosts its own MySQL instance.

In Demo mode, the EUM Server listens for connections on port 7001 or 7002. The secure port, 7002, uses a built-in, self-signed certificate, which is only used in demo mode.



In a production environment, the EUM Server is likely to operate behind a reverse proxy. A reverse proxy relieves the performance burden of SSL termination from the EUM Server. It also helps ease certificate management and security administration in general. Further, as the connection point for agent beacons, the Server needs to have the security layer of a proxy between itself and the external Internet.



Using a reverse proxy is the recommended method of setting up HTTPS connections for an on-premises EUM Server. If this is not possible in your installation, however, it is possible to set HTTPS support manually. See information on setting up a custom keystore in Secure the EUM Server.

Embedded Geo Server

The EUM Server includes an embedded Geo Server that provides the geo information. The Geo Server either obtains geo information from your custom Geo Server or by resolving incoming IPv4 address (IPv6 addresses are *not* supported) with Neustar data or custom geo data.

Add New Geo Data

To add new geo data, you can either add a new Neustar data file or create the custom geo data file geo-ip-mappings.xml and place it in the directory `eum-processor/bin/`. The EUM Server automatically detects and loads new geo data files.

Update the Geo Server

The Geo Server is updated when you update the EUM Server.

Host Your Own Geo Server

Follow the instructions given in Install and Host a Custom Geo Server for Browser RUM.

Check Controller Version

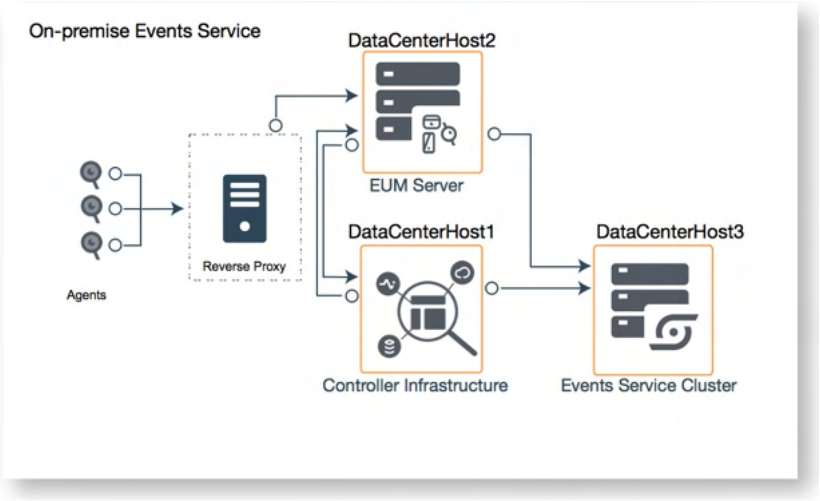
Before you run the EUM Server installer:

1. Check your Controller version. The 4.5 EUM Server works with the AppDynamics Controller version 4.5 or earlier. A Controller works with a EUM Server that is the same or a later version, which includes the major, minor, and patch version. Thus, a version 4.5.2 Controller works with a 4.5.2 or later version of the EUM Server, but that version 4.5.2 Controller does *not* work with a 4.5.1 or 4.5.0 version of the EUM Server. See Upgrade the Production EUM Server on information about upgrading the platform.
2. Back up the current version of your Controller.
3. Choose a time window that has minimum impact on service availability.

Install the On-Premises Events Service

The Analyze function in Browser RUM and the Crash Report and Analyze components in Mobile RUM rely on the AppDynamics Events Service, the Platform's unstructured document store. The Events Service that is configured by default for EUM is a cloud-based service.

If you are running on-premises and wish to keep all your processing on-premises, after installing and configuring the Controller, you must install an on-premises version of the Events Service as described in this section. Note that relying on the Events Service purely for use with the EUM UI does not require a separate Application Analytics license. Other uses *may* require a separate license.



There are multiple modes of deploying the Events Service. For detailed information on installing and configuring the Events Service, see Events Service Deployment.

Run the EUM Server Installer

Before starting, get the installer version appropriate for your target system. You can get the installer from the AppDynamics download site.

Run the EUM installer under the same user account on the target machine like the one used to install the Controller, or using an account that has read, write, and execute permissions to the Controller home directory. Installing with incompatible permission levels—for example, attempting to install the EUM Server as a regular user while the Controller was installed by root user—may result in installation or operation errors.

The EUM Server is automatically installed as a Windows service. All upgrades are automatically converted to a Window service.

The installer can be run in three modes:

- GUI
- Console
- Silent mode with `varfile`

See the following page for details on installing as appropriate for your deployment mode:

- For demo mode, see Install a Demo EUM Server.
- For production mode, see Install a Production EUM Server.

Update the Agents

You must update the address that agents use to send their beacons to the EUM Server based on your configuration. For Browser Real User Monitoring, the Controller updates the JavaScript agent. Simply re-download and deploy it, as described in Set Up and Configure Browser RUM. For Mobile RUM, the mobile applications themselves need to be updated, using the mobile SDKs. For more information, see Customize the Android Instrumentation and Customize the iOS Instrumentation.

Start and Stop the EUM Server and Database

The EUM Server is installed as a Windows service automatically. You can manage how you want this service to run using the Local Services dialog.

Start/Stop the EUM Server

On Linux, start the EUM server from the `eum-processor` directory in the EUM home as follows:

```
bin/eum.sh start
```

For a demonstration environment, run the command as sudo.

On Windows, if you ever need to start the EUM Server manually, you can do so by running:

```
bin\eum-processor.bat start
```

You can check if the server is running and accessible by going to `http://<hostname>:7001/eumaggregator/ping` with your browser. Your browser should display `ping`.

To stop the EUM Server, pass the stop command to the `eum` script. For example, on Linux, from the `eum-processor` directory, run:

```
bin/eum.sh stop
```

You can also start and stop the EUM database. On Windows, you can do so from the Windows Services.

Start/Stop the EUM MySQL Database

On Linux, you can start MySQL by navigating to the directory, `<EUM>/orcha/orcha-master/bin`, and running:

```
./orcha-master -d mysql.groovy -p ../../playbooks/mysql-orcha/start-mysql.orcha -o ../conf/orcha.properties -c
local
```

To stop MySQL on Linux, run:

```
./orcha-master -d mysql.groovy -p ../../playbooks/mysql-orcha/stop-mysql.orcha -o ../conf/orcha.properties -c
local
```

EUM Server Requirements

Related pages:

- On-premises EUM Server Sizing Guide
- Sizing XL profiles for on premises EUM Server and the Events Service: What's recommended?

This page lists the EUM Server requirements, offers sizing guidance, and shows you how to use configuration to modify the default settings. For additional EUM Processor sizing information, see Analytics' Recipe Book for on-prem configuration in the AppDynamics Community.

Hardware Requirements

The requirements and guidelines for the EUM Server machine (basic usage) are as follows:

- Minimum 50 GB extra disk space. See Disk Requirements Based on Resource Timing Snapshots to learn when more disk space is needed.
- 64-bit Windows or Linux operating system
- Processing: 4 cores
- 10 Mbps network bandwidth
- Minimum 8 GB memory total (4 GB is defined as max heap in JVM). See RAM Requirements Based on the Beacon Load to learn when more RAM is required.
- NTP enabled on both the EUM Server host and the Controller machine. The machine clocks need to be able to synchronize.

A machine with these specs can be expected to handle around 10K page requests a minute or 10K simultaneous mobile users. Adding on-premises Analytics capability requires increasing these requirements—particularly disk space—considerably, depending on the use case.

RAM Requirements Based on the Beacon Load

Beacons are sent to the EUM Server every 10 seconds, and each beacon can contain data for multiple events. You can configure the JavaScript Agent to limit the number of Ajax requests.

The table below specifies the required RAM based on your beacon load per minute and lists the content of a typical beacon.

Peak Beacons Per Minute	Typical Beacon Composition	RAM
~3K	• 600 sessions • 1K base pages • 2K virtual pages • 7K Ajax requests	8 GB
~16K	• 1.8K sessions • 5K base pages • 10K virtual pages • 40K Ajax requests	16 GB
~26K	• 3.6K sessions • 8K base pages • 17K virtual pages • 62 Ajax requests	16 GB
~33K	• 3.9K sessions • 10K base pages • 20K virtual pages • 74K Ajax requests	32 GB
>40K	12K base pages	32 GB

Disk Requirements Based on Resource Timing Snapshots

By default, the EUM Server accepts a maximum of 1K resource timing snapshots per minute and retains those snapshots for 15 days. On average, each snapshot takes 3 KB of disk space.

Because of the number of resource timing snapshots impact disk usage, you should follow the guidelines in the table below.

Number of Resource Timing Snapshots	Recommended Disk Space
~500	40 GB
~1000	64 GB
~1500	96 GB
~2000	128 GB

If needed, you can reduce the number of resource timing snapshots or reduce the disk space allotted for storing resource snapshots by doing one or more of the following:

- Configure the JavaScript Agent to modify and limit the number of resources to monitor.
- Use the EUM Server configuration `onprem.resourceSnapshotAllowance` to specify the maximum disk space allotted for storing resource snapshots. See EUM Server Configuration File for a complete list of configurations.
- Limit the number of snapshots retained by the EUM server by setting a global maximum, reducing the time that they are retained, or by filtering snapshots based on the network response time. See Limit the Number of EUM Snapshots for instructions.

Filesystem Requirements

The filesystem of the machine on which you install EUM should be tuned to handle a large number of small files. In practical terms, this means that either the filesystem should be allocated with a large number of inodes or the filesystem should support dynamic inode allocation.

Controller Version

The AppDynamics Platform you use with the EUM server must have a supported Controller version installed. Controllers only work with the same or later versions of the EUM Server. For example, the 4.5 EUM Server works with the AppDynamics Controller version 4.5 or earlier.

Open File Descriptor and User Process Limits

On Linux, also ensure that open file descriptor and user process limits on the EUM Server machine are set to a sufficient value. For the EUM Server, the hard and soft limits should be as follows:

- Open file descriptor limit (`nofile`): 65535
- Process limit (`nproc`): 8192

See "Configure User Limits in Linux" below for information on how to check and set user limits.

Configure User Limits in Linux

The following log warnings may indicate insufficient limits:

- Warning in database log: "Could not increase number of max_open_files to more than xxxx".
- Warning in server log: "Cannot allocate more connections".

To check your existing settings, as the root user, enter the following commands:

```
ulimit -S -n
ulimit -S -u
```

The output indicates the soft limits for the open file descriptor and soft limits for processes, respectively. If the values are lower than recommended, you need to modify them.

Where you configure the settings depends upon your Linux distribution:

- If your system has a `/etc/security/limits.d directory`, add the settings as the content of a new, appropriately named file under the directory.
- If it does not have a `/etc/security/limits.d` directory, add the settings to `/etc/security/limits.conf`.
- If your system does not have a `/etc/security/limits.conf` file, it is possible to put the `ulimit` command in `/etc/profile`. However, check the documentation for your Linux distribution for the recommendations specific for your system.

To configure the limits:

1. Determine whether you have a `/etc/security/limits.d` directory on your system, and take one of the following steps depending on the result:
    - If you *do not* have a `/etc/security/limits.d` directory:
        a. As the root user, open the `limits.conf` file for editing: `/etc/security/limits.conf`

b. Set the open file descriptor limit by adding the following lines, replacing `<login_user>` with the operating system username under which the EUM Server runs:

```
<login_user> hard nofile 65535
<login_user> soft nofile 65535
<login_user> hard nproc 8192
<login_user> soft nproc 8192
```

- If you *do* have a `/etc/security/limits.d` directory:
  a. As the root user, create a new file in the `limits.d` directory. Give the file a descriptive name, such as the following: `/etc/security/limits.d/appdynamics.conf`
  b. In the file, add the configuration setting for the limits, replacing `<login_user>` with the operating system username under which the EUM Server runs:

```
<login_user> hard nofile 65535
<login_user> soft nofile 65535
<login_user> hard nproc 8192
<login_user> soft nproc 8192
```

2. Enable the file descriptor and process limits as follows:
   a. Open the following file for editing: `/etc/pam.d/common-session`
   b. Add the line: `session required pam_limits.so`
3. Save your changes to the file.

When you log in again as the user identified by `login_user`, the limits will take effect.

Network Settings

The network settings on the operating system need to be tuned for high-performance data transfers. Incorrectly tuned network settings can manifest themselves as stability issues on the EUM Server.

The following command listing demonstrates tuning suggestions for Linux operating systems. As shown, AppDynamics recommends a TCP/FIN timeout setting of 10 seconds (the default is typically 60), the TCP connection keepalive time to 1800 seconds (reduced from 7200, typically), and disabling TCP window scale, TCP SACK, and TCP timestamps.

```
echo 5 > /proc/sys/net/ipv4/tcp_fin_timeout
echo 1800 >/proc/sys/net/ipv4/tcp_keepalive_time
echo 0 >/proc/sys/net/ipv4/tcp_window_scaling
echo 0 >/proc/sys/net/ipv4/tcp_sack
echo 0 >/proc/sys/net/ipv4/tcp_timestamps
```

The commands demonstrate how to configure the network settings in the `/proc` system. To ensure the settings persist across system reboots, be sure to configure the equivalent settings in the `etc/sysctl.conf`, or the network stack configuration file appropriate for your operating system.

libaio Requirement

The EUM processor requires the `libaio` library to be on the system. This library facilitates asynchronous I/O operations on the system. Note if you have a NUMA based architecture, then you are required to install the `numactl` package.

Install `libaio` on the host machine if it does not already have it installed. The following table provides instructions on how to install `libaio` for some common flavors of the Linux operating system.

Linux Flavor	Command
Red Hat and CentOS	Use `yum` to install the library, such as: • `yum install libaio` • `yum install numactl`
Fedora	Install the library RPM from the Fedora website: • `yum install libaio` • `yum install numactl`

Ubuntu	Use apt-get, such as: • `sudo apt-get install libaio1` • `sudo apt-get install numactl`
Debian	Use a package manager such as APT to install the library (as described for the Ubuntu instructions above).

Install a Production EUM Server

You can run the installer using one of three methods:

- Interactive console mode
- GUI Installer
- Silent Installer

The GUI and silent installation methods are described below. To start the installer using interactive console mode, start the installer with the `-c` switch. The console mode prompts you for the equivalent information that appears in the GUI installer screens.

Additionally, you can run the installer using a Response file (for unattended installations). See Installing with the Silent Installer.

Requirements

- Before starting, download the installer distribution and extract it on the target machine. You obtain the EUM installer from the AppDynamics Download Center.
- To secure connections from agents to the EUM Server, AppDynamics strongly recommends that SSL traffic is terminated at a reverse proxy that sits in front of the EUM Server in the network path, and forwards connections to the EUM Server. However if this is not possible in your installation, it is possible to connect with HTTPS directly to the EUM Server. For information on setting up a custom keystore for production, see Secure the EUM Server.

  > ⚠ If you install and configure the Events Service with HTTPS support, you must perform a workaround for your EUM Server installation to complete properly. After the Events Service certificate configuration, install the EUM Server without Analytics enabled. Then, install the certificate into the EUM Server keystore following the steps described on the Secure the EUM Server page. Configure Analytics in the Events Services Properties, and restart the EUM Server.

- Before you install the EUM Server, Linux systems must have the `libaio` library installed. See the EUM Server Requirements.

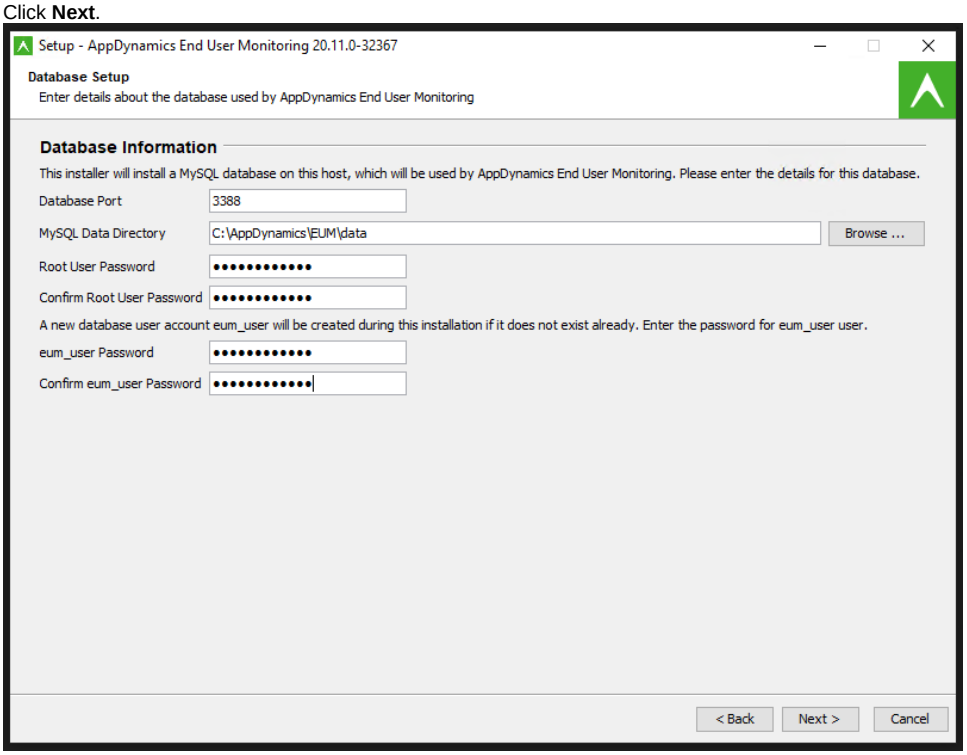
Install the EUM Server for a Production Deployment with the GUI Installer

Run the on-premises EUM installer on the machine on which you want to install the EUM Server.

1. Start the installer:

2. In the Welcome screen, click **Next** to continue.
3. Scroll to the end of the license agreement and accept the license agreement, then click **Next** to continue.
4. Select the destination directory, and click **Next** to continue.
5. Choose **Product** for the installation mode. This mode installs the EUM Server on this machine. Use this type if AppDynamics End User Monitoring and the AppDynamics Controller are installed on different hosts. Selecting this type will install a separate MySQL instance on this machine. Click **Next**.
6. In the Database Setup screen:
   a. Enter a new **Root User Password** and confirm it.
   b. Enter a new **eum_user Password** and confirm it.

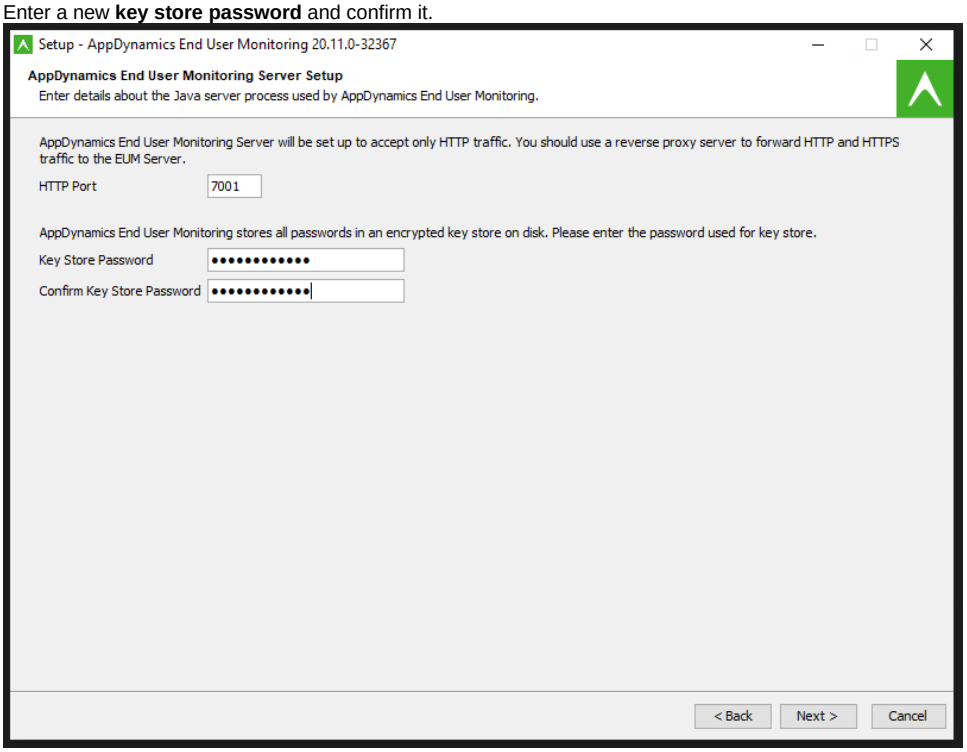
c. Click **Next**.



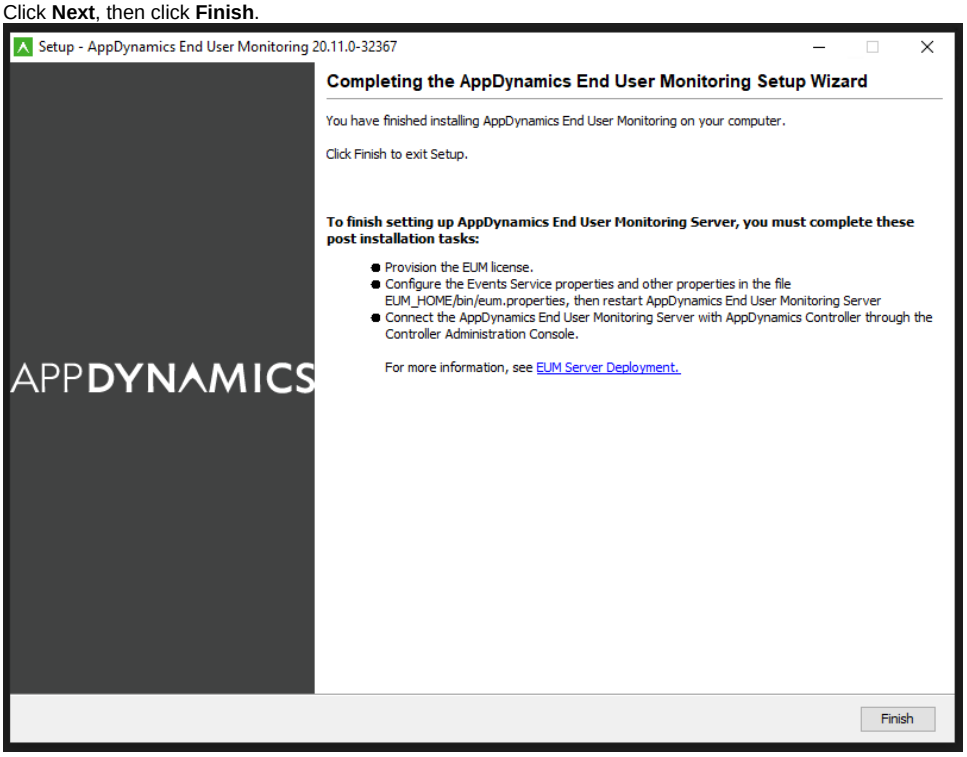
> Usernames and passwords can only consist of ASCII characters. In addition, passwords cannot include the characters '^', '/', or '$'.

7. In the AppDynamics End User Monitoring Setup screen:

a. Enter a new **key store password** and confirm it.



a. Click **Next**, then click **Finish**.



This completes the initial configuration and setup of the EUM Server. When finished, the EUM Server is running.

Post-Installation Tasks

To complete the AppDynamics EUM Server installation, you must perform these additional post-installation tasks (as shown in the last AppDynamics End User Monitoring Setup Wizard screen):

- Configure JVM options
- Provision the EUM license
- Configure the Events Services properties in the `eum.properties` file
- Connect the EUM Server with the AppDynamics Controller
- Secure the EUM Server by setting up a custom keystore

> The EUM Server Installer only configures the HTTP port. If you are installing the 4.5 EUM Server or upgrading to the 4.5 EUM Server, you must configure the EUM Server and update the AppDynamics Controller settings to connect to the HTTPS port. See Configure the HTTPS Port for the 4.5 EUM Server for instructions.

Configure JVM Options

Provision the EUM License

Follow the provision instructions based on your deployment type:

- Provision the EUM License for a Single-Tenant Controller
- Provision the EUM License for Multi-Tenant Controllers

Configure the Events Services Properties

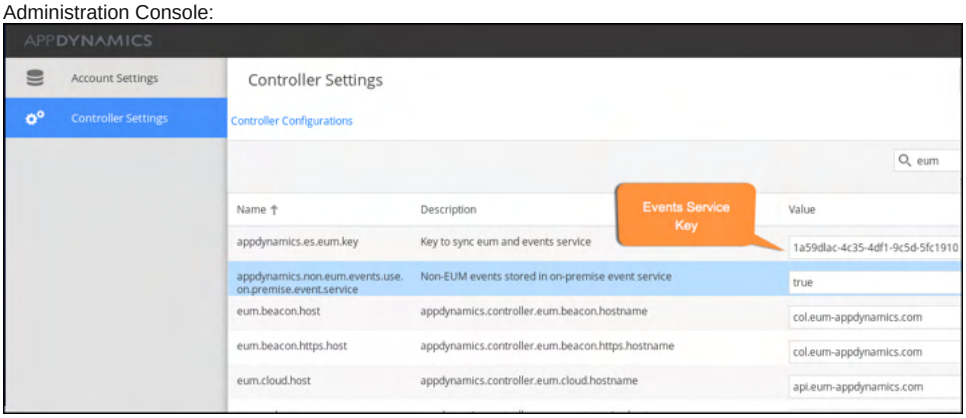
Configure the Events Services properties in the `eum.properties` file:

1. Ensure that Events Services is running.
2. Navigate to the `\EUM\eum-processor\bin` directory.
3. Open the `eum.properties` file to edit.
4. In the `eum.properties` file, enter these values:

Sample

```
analytics.enabled=true
analytics.serverScheme=http
analytics.serverHost=hostname-events-service (needs to be the hostname of your Events Service)
analytics.port=9080
analytics.accountAccessKey=1a59d1ac-4c35-4df1-9c5d-5fc191003441
```

The <analytics.accountAccessKey> is the Events Service key that appears as the appdynamics.es.eum.key value in the Administration Console:



The configuration should display similar to this example:

```
# Credential Key Store Information
onprem.useEncryptedCredentials=true
onprem.credentialKey=s_-001-12-F+ddxp+nzHI=dwDynZje09g=

# Web server properties
processorServer.httpPort=7001
processorServer.httpsPort=7002
processorServer.httpsProduction=true
processorServer.keyStorePassword=1wnl1u

# Analytics server properties
analytics.enabled=true
analytics.serverScheme=http
analytics.serverHost=events.service.hostname
analytics.port=9080
analytics.accountAccessKey=1a59d1ac-4c35-4df1-9c5d-5fc191003441

# Session properties
collection.sessionEnabled=true
crashProcessing.sessionEnabled=true
```

5. After updating the eum.properties file, restart the EUM Server.

Connect the EUM Server with the AppDynamics Controller

Connect the EUM Server with the AppDynamics Controller:

1. Log in to the Administration Console.
2. Set these Controller properties:
   - eum.cloud.host: http://eum-host-name:7001 – Location where the Controller will poll for EUM metrics.
   - eum.beacon.host: http://eum-host-name:7001 – Location where the JavaScript Agent will be configured to send out beacons over the HTTP protocol.
   - eum.beacon.https.host: https://eum-host-name:7002 – Location where JavaScript Agent will be configured to send out beacons over the HTTPS protocol.
   - eum.mobile.screenshot.host: http://host-name:7001 – Location where the Controller will search for mobile screenshots.

Installing with the Silent Installer

Instead of using the GUI installer, you can use the silent installer to perform an unattended installation. The silent installer uses a response file as a source for the initial configuration settings. It's useful for scripting installation or performing large scale deployments.

To use a response file for installation:

1. Create a file named `response.varfile` on the machine on which you will run EUM installer and include the following:

```
sys.adminRights$Boolean=false
sys.languageId=en
sys.installationDir=/AppDynamics/EUM
euem.InstallationMode=split
euem.Host=eumhostname
euem.initialHeapXms=1024
euem.maximumHeapXmx=4096
euem.httpPort=7001
euem.httpsPort=7002
mysql.databasePort=3388
mysql.databaseRootUser=root
mysql.dbHostName=localhost
mysql.dataDir=/usr/local/AppDynamics/EUM/data
mysql.rootUserPassword=singcontroller
mysql.rootUserPasswordReEnter=singcontroller
eumDatabasePassword=secret
eumDatabaseReEnterPassword=secret
keyStorePassword=secret
keyStorePasswordReEnter=secret
eventsService.isEnabled$Boolean=true
eventsService.serverScheme=http
eventsService.host=eventsservice_host
eventsService.port=9080
eventsService.APIKey=1a234567-1234-1234-4567-ab123456
```

2. Modify values of the installation parameters based on your own environment and requirements. Particularly ensure that the directory paths and passwords match your environment.
3. Run the installer with the following command:

Install a Demo EUM Server

You can run the installer in one of three modes. The GUI and silent installation methods are described below. To start the installer in interactive console mode, start the installer with the `-c` switch. The console mode prompts you for the equivalent information that appears in the GUI installer screens, as described below.

In addition, you can run the installer using a Response file (for unattended installations). See Installing with the Silent Installer.

About the Demo Installation

This mode is for demonstration and light testing only. If you are using the Events Service, it must be on a separate host.

If you do not already have an existing on-premises Controller, install it as described in Custom Install.

Installation Requirements

To install the Demo Installation, you are required to do the following:

- Install and run a Controller instance on the same host machine before starting the EUM Server installation.
- Install the EUM Server with the same user account used to install the Controller, or use an account that has read, write, and execute permissions to the Controller home directory.

Installing with the GUI Installer

1. Start the installer:
    - On Linux:
        a. From a command prompt, navigate to the directory to which you downloaded the EUM Server installer.
        b. Change permissions on the downloaded installer script to make it executable, as follows:

        ```
        chmod 775 euem-64bit-linux-4.5.x.x.sh
        ```

        c. Run the script as follows:

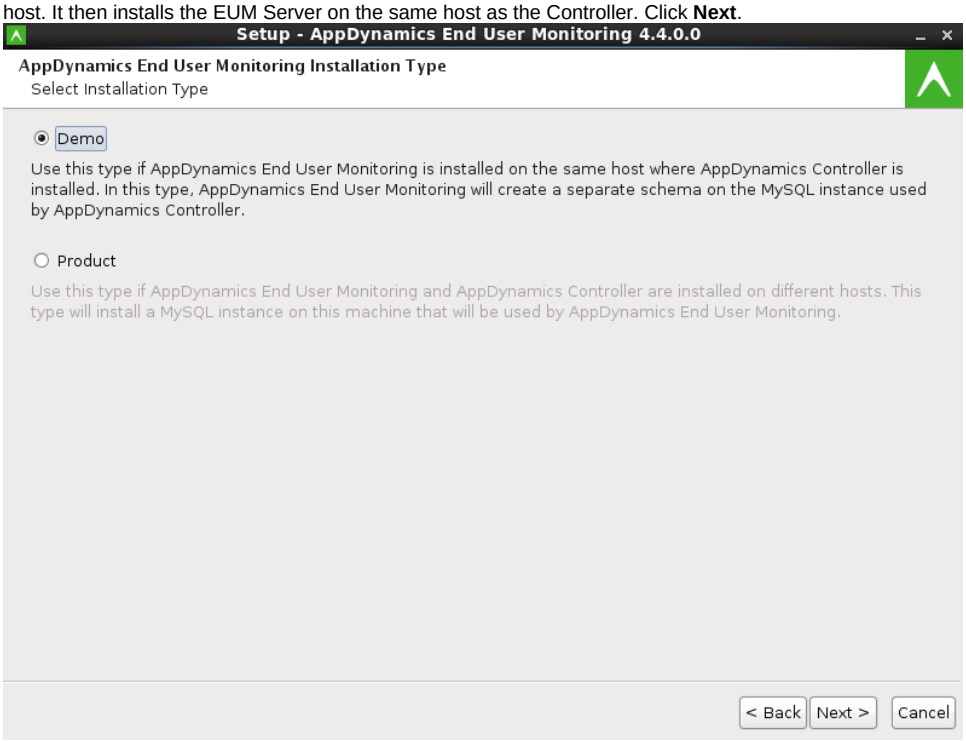
        ```
        ./euem-64bit-linux-4.5.x.x.sh
        ```

    - On Windows:
        a. Open an elevated command prompt (run as administrator) and navigate to the directory to which you downloaded the EUM Server installer.
        b. Run the installer:

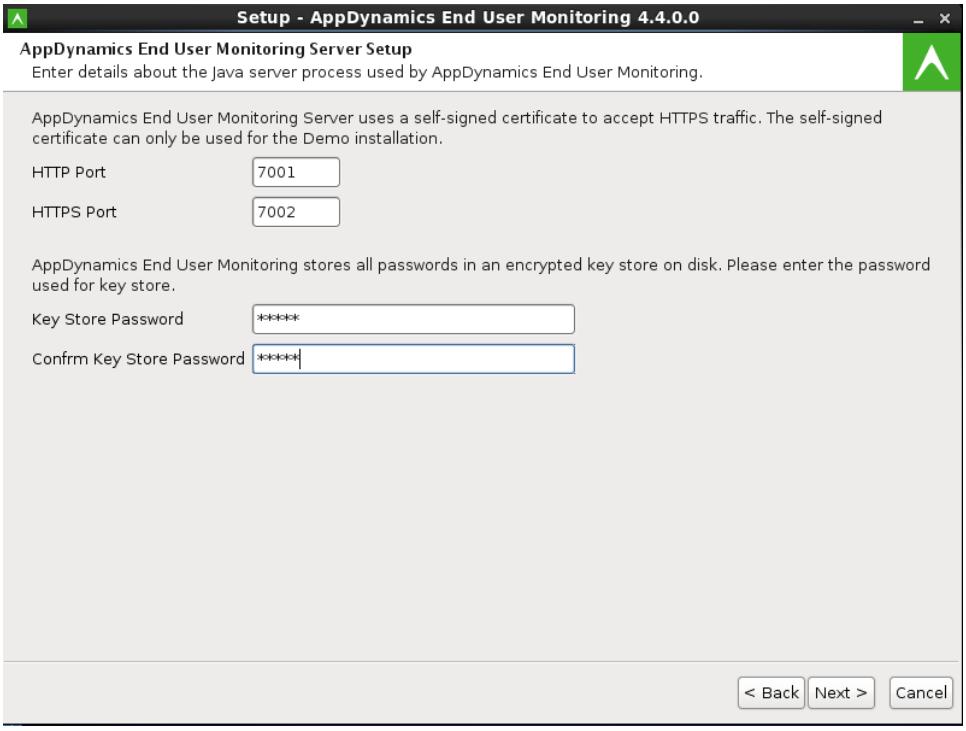
        ```
        euem-64bit-windows-4.5.x.x.exe
        ```

2. In the Welcome screen, click **Next**.
   The **License Agreement** page appears.
3. Scroll to the end of the license agreement, accept the license agreement and click **Next** to continue.
4. Select the directory in which you want to install the server and click **Next**.

5. Choose **Demo** for the installation mode. In this mode, the installer looks for a Controller on the current host and an Events Service on a separate host. It then installs the EUM Server on the same host as the Controller. Click **Next**.



6. In the **Database Setup** dialog box:
   a. Enter a password in the **Root User Password** field.
   b. Enter and confirm a password for the **eum_user** database user account.
7. In the End User Monitoring Server Setup screen:
   a. Enter the HTTP or HTTPs listening ports on the EUM Server at which the Controller will connect to the EUM Server (the default HTTP port is 7001 and HTTPS is 7002).
   b. Enter a new password in the **Key Store Password** and confirm it.



Usernames and passwords can only consist of ASCII characters. In addition, passwords cannot include the characters '^', '/', or '$'.

Note that ports shown here are the location both to which the EUM Agents send their beacons and from which the Controller fetches the processed beacon data. Click **Next** and click **Finish.**

Post-installation Tasks

After installing the EUM server, you must perform three additional post-installation tasks:

- Provision the EUM license
- Configure the Events Services properties in the `eum.properties` file (optional)
- Connect the EUM server with the AppDynamics Controller

Provision the EUM License

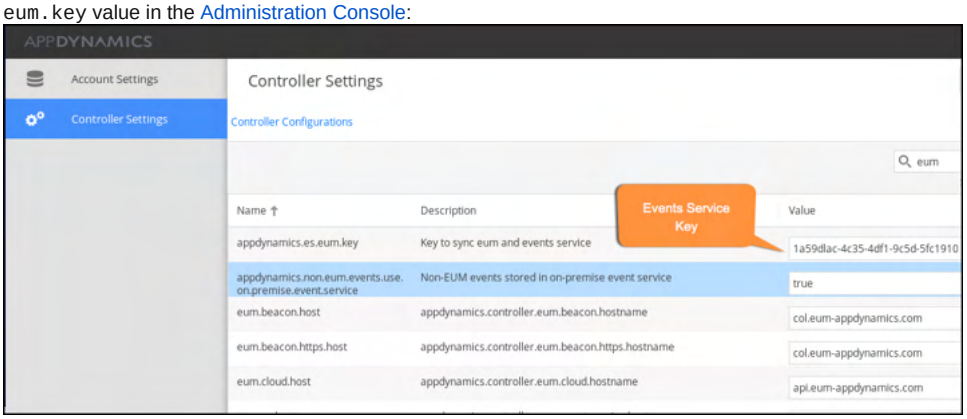
To provision the EUM license:

Configure the Events Service Properties

For the demo installation, Events Services configuration is not required for the EUM Server to start.

To configure the Events Service properties in the `eum.properties` file:

1. Navigate to and start your Controller.
2. Using the CLI, navigate to the `bin` directory.
3. Open the `eum.properties` file for editing.
4. In the `eum.properties` file, enter the following values:
    a. `analytics.enabled=true`
    b. `analytics.serverHost=<hostname>`, where `<hostname>` is the host where the event service is running
    c. `analytics.accountAccessKey=<eum_key>`, where `<eum_key>` is the Events Service key that appears as the `appdynamics.es.eum.key` value in the Administration Console:



The configuration should appear similar to the following example:

```
# Credential Key Store Information
onprem.useEncryptedCredentials=true
onprem.credentialKey=s_-001-12-F+ddxp+nzHI=dwDynZje09g=

# Web server properties
processorServer.httpPort=7001
processorServer.httpsPort=7002
processorServer.httpsProduction=true
processorServer.keyStorePassword=1wnl1u

# Analytics server properties
analytics.enabled=true
analytics.serverScheme=http
analytics.serverHost=events.service.hostname
analytics.port=9080
analytics.accountAccessKey=1a59d1ac-4c35-4df1-9c5d-5fc191003441

# Session properties
collection.sessionEnabled=true
crashProcessing.sessionEnabled=true
```

5. After updating the `eum.properties` file, restart the EUM Server.

Connect the EUM Server with the AppDynamics Controller

To connect the EUM server with the AppDynamics Controller:

1. Log in to the Administration Console.
2. Set the following Controller properties:
    a. `eum.cloud.host: http://localhost:7001` – This tells you where the Controller will poll for EUM metrics
    b. `eum.beacon.host: eum-host-name:7001` – This tells you where beacons are sent for page requests made with the HTTP protocol
    c. `eum.beacon.https.host: https://eum-host-name:7002` – This tells you where the beacons are sent for page requests made with the HTTPS protocol
    d. `eum.mobile.screenshot.host: eum-host-name:7001` – This tells you where the Controller will look for mobile screenshots

Installing with the Silent Installer

Instead of using the installer in GUI mode, you can use the silent installer to perform an unattended installation. The silent installer takes a response file as a source for the initial configuration settings. It's useful for scripting installation or performing large scale deployments.

To use a response file for a Demo installation:

1. Create a file named `response.varfile` on the machine on which you will run EUM installer with the following:

```
sys.adminRights$Boolean=false
sys.languageId=en
sys.installationDir=/AppDynamics/EUM
euem.InstallationMode=demo
euem.Host=controller
euem.initialHeapXms=1024
euem.maximumHeapXmx=4096
euem.httpPort=7001
euem.httpsPort=7002
mysql.databasePort=3388
mysql.databaseRootUser=root
mysql.dbHostName=localhost
mysql.dataDir=/usr/local/AppDynamics/EUM/data
mysql.rootUserPassword=singcontroller
mysql.rootUserPasswordReEnter=singcontroller
eumDatabasePassword=secret
eumDatabaseReEnterPassword=secret
keyStorePassword=secret
keyStorePasswordReEnter=secret
eventsService.isEnabled$Boolean=true
eventsService.serverScheme=http
eventsService.host=eventsservice_host
```

```
eventsService.port=9080
eventsService.APIKey=1a234567-1234-1234-4567-ab123456
```

2. Modify values of the installation parameters based on your own environment and requirements. Particularly ensure that the directory paths and passwords match your environment.
3. Run the installer with the following command:

```
./euem-64bit-linux-4.5.x.x.sh -q -varfile response.varfile
```

On Windows, use:

```
euem-64bit-windows-4.5.x.x.exe -q -varfile response.varfile
```

Provision EUM Licenses

Related pages:

- Install a Production EUM Server
- Troubleshoot EUM Server Installation
- Controller Deployment
- Multi-Tenant Controller Accounts

This page describes how to provision EUM licenses for single-tenant and multi-tenant Controllers.

Provision the EUM License for a Single-Tenant Controller

To provision the EUM license for a single-tenant Controller:

Provision the EUM License for Multi-Tenant Controllers

For each on-prem multi-tenant Controller account wanting EUM access, you are required to provision an EUM license. Provisioning EUM license units for different Controller accounts enable you to better track, manage, and limit license usage.

To enable the EUM Server to work with on-prem multi-tenant Controllers:

1. Complete the setup requirements.
2. Request EUM licenses for the Controller accounts requiring EUM access.
3. Provision EUM licenses for the Controller accounts.

Setup Requirements

- Deploy an on-premises AppDynamics Controller
- Set up multi-tenancy on the Controller

Request EUM Licenses

For each additional Controller account requiring EUM access, you will need to request EUM licenses from the AppDynamics Sales team. The AppDynamics Sales team can help you determine how many licenses and units per license will meet your needs.

Provision Licenses for Controller Accounts

To provision EUM licenses for each Controller account:

1. Log in to your EUM Server.
2. Change to the directory with the script for provisioning licenses:

3. Provision each license, one at a time, on the EUM Server by running the following command:

4. Log in as the administrator to your **Controller Admin Console** through `http://<hostname>:<port>/controller/admin.jsp`.
5. From **Account Settings**, select the Controller account that have EUM licenses and click **Edit**.
6. From the Controller account page:
    a. Enter the EUM license key and the EUM account name in the **EUM License Key** and the **EUM Account Name** fields.
    b. Click **Save**.
7. Repeat steps 5 and 6 for the other Controller accounts that have EUM licenses.
8. Verify that the EUM licenses are working and available in the Controller UI. There will be an error message if the new EUM Server is not connected properly.

Secure the EUM Server

If you use HTTPS connections in a production (split host) EUM Server installation, use a custom RSA security certificate for the EUM server. This page describes how to create an RSA security certificate, change the password for the credential keystore, and how to obfuscate a password for the security certificate keystore.

Set Up a Custom Keystore for Production

In demo mode, the EUM Server uses a default self-signed certificate named `ssugg.keystore`. This certificate is intended for demonstration and light testing only. Do not use self-signed certificates for production systems since they are less secure than Certificate Authority (CA) signed certificates. EUM requires that certificates use RSA as the key algorithm whether they are self-signed or CA-signed.

For Mobile Real User Monitoring, if you use the default or another self-signed certificate on your EUM Server for testing, you may receive the following error: "The certificate for this server is invalid". Ensure that your self-signed certificate is trusted by the simulator or device you use for testing. In real-world scenarios, a CA signed certificate should be used since a self-signed certificate needs to be explicitly trusted by every device that reports to your EUM processor.

To secure the EUM server with a custom certificate and keystore, generate a new JKS keystore and configure the EUM Server to use it.

The following instructions describe how to create a JKS keystore for the EUM Server with a new key-pair or an existing key-pair. Alternatively, you can also configure the EUM server to use an existing JKS keystore.

The instructions demonstrate the steps with the Linux command line, but the commands are similar to the commands used for Windows. Make sure to adjust the paths for your operating system.

Overview of the Steps

The procedure is made up of three parts:

1. Create a new certificate and keystore (1a) or import an existing certificate into a keystore (1b).
2. Configure the EUM Server to use the keystore.
3. Restart and test the new keystore.

Step 1a: Create a New Certificate and Keystore

1. At a command prompt, navigate to the `eum-processor` directory:

   ```
   cd <appdynamics_home>/EUM/eum-processor
   ```

2. Create a new keystore with a new unique key pair that uses RSA encryption:

   ```
   ../jre/bin/keytool -genkey -keyalg RSA -validity <validity_in_days> -alias 'eum-processor' -keystore bin
   /mycustom.keystore
   ```

   This creates a new public-private key pair with an alias of `'eum-processor'`. You can use any value you like for the alias.

   The "first and last name" required during the installation process becomes the common name (CN) of the certificate. Use the name of the server.

3. Configure the keystore.
4. Specify a password for the keystore. You need to configure this password in the EUM configuration file later.
5. Generate a certificate signing request (CSR):

   ```
   ../jre/bin/keytool -certreq -keystore bin/mycustom.keystore -file /tmp/eum.csr -alias 'eum-processor'
   ```

   This generates a certificate signing request based on the contents of the alias, in the example `'eum-processor'`. You should send the output file (`/tmp/eum.csr`, in the example) to a Certificate Authority for signing. After you receive the signed certificate, proceed as follows.
6. Install the certificate for the Certificate Authority used to sign the `.csr` file:

   ```
   ../jre/bin/keytool -import -trustcacerts -alias myorg-rootca -keystore bin/mycustom.keystore -file /path
   /to/CA-cert.txt
   ```

   This command imports your CA's root certificate into the keystore and stores it in an alias called `myorg-rootca`.
7. Install the signed server certificate as follows:

```
../jre/bin/keytool -import -keystore bin/mycustom.keystore -file /path/to/signed-cert.txt  -alias 'eum-processor'
```

This command imports your signed certificate over the top of the self-signed certificate in the existing alias, in the example, `'eum-processor'`.

8. Import the root certificate from step 6 to the Controller truststore:

```
keytool -import -trustcacerts -alias <alias_name> -file mycert.cer -keystore <complete_path_to_cacerts.jks>
```

Step 1b: Import an Existing Certificate into a JKS Keystore

If you have an existing public-private key pair that uses RSA, you must import them into a JKS keystore to use it for EUM.

1. At a command prompt, navigate to the `eum-processor` directory:

```
cd <appdynamics_home>/EUM/eum-processor
```

2. Stop the EUM process.

   Run the following command:

```
bin/eum.sh stop
```

3. If there is an existing custom JKS keystore, back it up:

```
mv <keystore>.jks <keystore>.jks.old
```

4. Import the private and public key for your certificate into a PKCS12 keystore:

```
openssl pkcs12 -inkey <private_key_file> -in <certificate_file> -export -out keystore.p12
```

5. Convert the PKCS12 keystore to JKS format:

```
keytool -importkeystore -srckeystore keystore.p12 -srcstoretype pkcs12 -destkeystore <JKS_keystore> -deststoretype JKS
```

   This command creates a JKS keystore with the name specified in the `-destkeystore` property.

6. Specify a password for the keystore. Use this password when you configure EUM to use the new keystore.

Step 2: Configure the EUM Server to Use the New Keystore

1. Place the new keystore file in the following directory: `<appdynamics_home>/EUM/eum-processor/bin`.
2. Edit the `eum.properties` file in the bin directory.
3. If the property `processorServer.keyStorePassword` is set, remove or uncomment it.
4. Add the keystore filename as the following property:

```
processorServer.keyStoreFileName=mycustom.keystore
```

5. Configure the password for the keystore. You can add the password to the file either in plain text or in the obfuscated form:
   - For a plain text password, add the password as the value for this property:

```
processorServer.keyStorePassword=mypassword
```

   - For an obfuscated password:
     a. Get the obfuscated password by running the following command in the `eum-processor` directory in a new command terminal:

```
bin/eum-credential-key.<bat|sh> obfuscate -plaintext <newpassword>
```

b. Copy the output of the command to your clipboard.
c. In `eum.properties`, paste the obfuscated password as the value of the `keyStorePassword` property:

```
processorServer.keyStorePassword=<obfuscated_key>
```

d. Add the `useObfuscatedKeyStorePassword` with the value set to true, as shown:

```
processorServer.useObfuscatedKeyStorePassword=true
```

6. Save and close the file.

Step 3: Restart and Test

1. Restart the EUM Server. From the `eum-processor` directory, run the following commands:

```
bin/eum.sh stop
bin/eum.sh start
```

2. Verify the new security certificate works by opening the following page in a browser:

```
https://<hostname>:7002/eumcollector/get-version
```

If you get a successful response, the configuration succeeded.

Change the Certificate Keystore Password

The previous steps describe how to create a new keystore which is likely to have a new password. To change the keystore password without creating a new keystore, perform the following steps:

1. At a command prompt, navigate to the `eum-processor` directory:

```
cd <appdynamics_home>/EUM/eum-processor
```

2. Run the `keytool` command for creating a new password:

```
../jre/bin/keytool -storepasswd -keystore bin/ssugg.keystore
```

The sample command creates the password for the default demo keystore, `ssugg.keystore`. In your command, use the name of your own keystore as the value for `-keystore`.
3. Enter the existing password and new password when prompted.
4. Get the obfuscated key by running the following command in the `eum-proccessor` directory:

```
bin/eum-credential-key.<bat|sh> obfuscate -plaintext <newpassword>
```

5. Copy the output of the previous command to your clipboard.
6. In the `eum.properties` file in the `eum-processor/bin` directory, paste the obfuscated password as the value for the `keyStorePassword` property:

```
processorServer.keyStorePassword=<obfuscated_key>
```

7. If you did not previously use an obfuscated password, add the following property:

```
processorServer.useObfuscatedKeyStorePassword=true
```

8. Save and close the file.
9. Restart the EUM Server.

Change the Credential Keystore Password for the EUM Database

When you install the EUM Server, you need to specify a password to use to secure the credential keystore for the EUM Server. After installation, you can change the password for the credential keystore. You may need to do this, for example, to comply with your organization's password rotation policy.

Note that completing these procedures requires a restart of the EUM Server.

To change the existing EUM server credential keystore password:

1. At a command prompt, navigate to the `eum-processor` directory:

   ```
   cd <appdynamics_home>/EUM/eum-processor
   ```

2. Generate a credential store with the new key using the following command:
   - On Linux:

     ```
     bin/eum-credential-key.sh generate_ks -storepass <new_password>
     ```

   - On Windows:

     ```
     bin\eum-credential-key.bat generate_ks -storepass <new_password>
     ```

   This creates and initializes a new credential file, `bin/credential.scs`.
3. Reencrypt the database password using the new credential store.
   - On Linux:

     ```
     bin/eum-credential-key.sh encrypt -storepass <new_password> -plaintext <DB_password>
     ```

   - On Windows:

     ```
     bin\eum-credential-key.bat encrypt -storepass <new_password> -plaintext <DB_password>
     ```

   The command prints out the encrypted form of the `DB_password` value you entered.
4. Copy the output from the previous command to your clipboard.
5. Open `bin/eum.properties` for editing, and replace the value of the `onprem.dbPassword` setting with the new encrypted password you copied to your clipboard.
6. Obfuscate the new credential key as follows:
   - On Linux:

     ```
     bin/eum-credential-key.sh obfuscate -plaintext <new_password>
     ```

   - On Window:

     ```
     bin\eum-credential-key.bat obfuscate -plaintext <new_password>
     ```

7. Copy the output of the previous command to your clipboard and in `eum.properties` replace the value of `onprem.credentialKey` with the value from your clipboard.
8. Save and close the properties file.
9. Restart the EUM server.

Change the EUM Database Password

At EUM Server installation time, you set a password for the EUM database. You can change it later as follows:

1. At a command prompt, navigate to the `eum-processor` directory:

   ```
   cd <appdynamics_home>/EUM/eum-processor
   ```

2. Encrypt the new database password using the credential key which you entered during installation:
   - On Linux:

```
bin/eum-credential-key.sh encrypt -storepass <plain_credential_key> -plaintext <New_DB_password>
```

- On Windows:

```
bin\eum-credential-key.bat encrypt -storepass <plain_credential_key> -plaintext <New_DB_password>
```

The command prints out the encrypted form of the `DB_password` value you entered.

3. Copy the output from the previous command to your clipboard.
4. Edit `bin/eum.properties` and replace the value of the `onprem.dbPassword` setting with the new encrypted password you copied to your clipboard.
5. Save and close the properties file.
6. Restart the EUM server.

Configure the EUM Server

This page describes administration and advanced configuration options for the EUM Server.

Configure Data Store Expiration

As part of the Analytics functionality used by EUM, the Server stores some data, like crash reports and resource snapshots, in a local blob store. The default setting of 30 days, but you can change the storage period to be longer or shorter by following these steps:

1. Open `$APPDYNAMICS_HOME/EUM/eum-processor/bin/eum.properties` with a text editor.
2. Open `$APPDYNAMICS_HOME/EUM/eum-processor/bin/eum.sample.properties` with a text editor.
3. Copy the `onprem.crashReportExpirationDays` property and the `onprem.resourceSnapshotExpirationDays` property from the sample file into `eum.properties` and set it to whatever value you wish. The unit is *days*.
4. Restart the Server.

Set the Maximum Length of Page URLs Read From Beacons

By default, after the EUM Collector receives beacons, the EUM Processor will only read 512 characters of page URLs contained in the beacon. If the page URL exceeds 512 characters, the EUM Processor will truncate the page URL. You can configure the EUM Processor to read a longer page URL with the configuration `beaconReader.maxUrlLength`. The maximum length that can be set is 2048, which is imposed by the JavaScript Agent creating the beacon.

To change the maximum length of the page URL read by the EUM Processor:

1. Open `$APPDYNAMICS_HOME/EUM/eum-processor/bin/eum.properties` with a text editor.
2. Add the property `beaconReader.maxUrlLength` to the desired length (maximum is 2048):

   ```
   beaconReader.maxUrlLength=<max_length>
   ```

3. Restart the Server.

Update the EUM Server's Geo Server

The on-prem EUM Server ships with Neustar's IP GeoPoint database for managing the geolocation of IP addresses. You can get daily updates of the Neustar IP GeoPoint from the AppDynamics download site.

To keep your version of the database current, you need to update your copy of the database manually:

Configure the Port for the EUM Agent

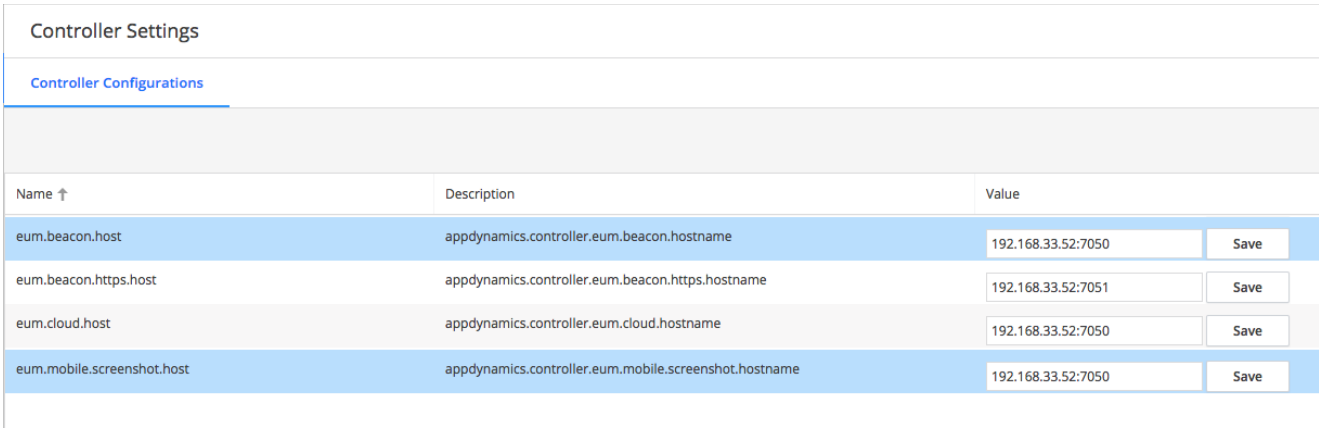
The on-prem EUM Server by default uses the same port to collect data from the EUM agent and to send data through the API server to the Controller. You can configure the EUM Server to use a different port to collect data from the EUM agent by following the instructions below.

1. Open `$APPDYNAMICS_HOME/EUM/eum-processor/bin/eum.properties` with a text editor.
2. Add the following lines to `$APPDYNAMICS_HOME/EUM/eum-processor/bin/eum.properties`, replacing `<PORT>` with the port you want the EUM server to listen to.

   ```
   processorServer.collectorHttpPort=<PORT>
   processorServer.collectorHttpsPort=<PORT>
   ```

3. Restart the EUM Server.
4. From the **Controller Admin UI**, change the ports for the properties `eum.beacon.host`, `eum.beacon.https.host`, `eum.cloud.host`, and `eum.mobile.screenshot.host` so that they are the same as those assigned to `processorServer.collectorHttpPort` and `processorServer.collectorHttpsPort`. This allows the beacon to communicate with the collector.

   For example, if you set `processorServer.collectorHttpPort=7050` and `processServer.collectorHttpsPort=7051`, you would then set the ports for the properties `eum.beacon.host` and `eum.mobile.screenshot.host` to `7050` for HTTP and `eum.beacon.https.host` to `7051` for HTTPS as shown below:



Limit the Number of EUM Snapshots

When an application has a high number of Ajax requests per page, the EUM Server retains a large number of snapshots that can include base, virtual, and Ajax pages as well as iFrames. You can limit the number of snapshots retained by the EUM server by setting a global maximum, reducing the time that they are retained, or by filtering snapshots based on the network response time.

Setting the Global Limit for Snapshots

You set the global limit on the number of snapshots to be retained per minute with the configuration `browserBeaconSampling.maxSamples`. The default value is `1000`. Once the limit is reached, all snapshots will be dropped indiscriminately. The limit can be globally configured through the `eum.properties` file.

1. Open `$APPDYNAMICS_HOME/EUM/eum-processor/bin/eum.properties` with a text editor.
2. Add the following line to `eum.properties`, replacing `<global_limit>` with the global maximum number of snapshots to retain.

```
browserBeaconSampling.maxSamples = <global_limit>
```

3. Restart the EUM Server.

Reduce the Lifespan of Event Snapshots

Another way to limit the number of EUM snapshots is to reduce the number of days that the event snapshots are retained. Event snapshots only apply to the crash reports, code issues, and IoT errors and are stored in the local blob store: `$APPDYNAMICS_HOME/EUM/eum-processor/store`

By default, the EUM Server retains the event snapshots for 90 days. If your Events Service retains events for fewer days (e.g., 14 days), you can safely change the EUM Server's retention period to be the same as the Events Service's retention period. If the EUM Server retains the event snapshots for fewer days than the Events Service, however, you may run into errors when viewing older events in the Controller UI.

> When reducing the lifespan of event snapshots, you are not modifying the retention period of the Controller or the Events Service.

Setting the Lifespan for the Event Snapshots

1. Open `$APPDYNAMICS_HOME/EUM/eum-processor/bin/eum.properties` with a text editor.
2. Add the following line to `eum.properties`, replacing `<no_of_days>` with the number of days that you'd like to retain the event snapshots. The default is 90.

```
eventSnapshotStore.lifespanInDays = <no_of_days>
```

3. Restart the EUM Server.

Filtering Snapshots Based on the Network Response Time

You set a threshold that filters the snapshots based on the network response time. If the network response time is at or below the configured threshold, the snapshot is then retained. You set the threshold with the configuration `browserBeaconSampling.hierarchyAwareSamplerPageUXThreshold`.

Below are the supported threshold values and the snapshots that would be retained. The default value is `Slow`.

- `Normal` - Using this threshold value will retain all snapshots.

- `Slow` - Using this threshold value will retain snapshots having a network response time of slow, very slow, and stalled.

Setting the Threshold for the Network Response Time

1. Open `$APPDYNAMICS_HOME/EUM/eum-processor/bin/eum.properties` with a text editor.
2. Add the following line to `eum.properties`, replacing `<threshold>` with one of the supported thresholds (`Normal` or `Slow`) for retaining snapshots.

```
browserBeaconSampling.hierarchyAwareSamplerPageUXThreshold = "<threshold>"
```

3. Restart the EUM Server.

Turn On Access Logs

By default, server access logging for the EUM Server's underlying application server is turned off. To turn it on, open `$APPDYNAMICS_HOME/EUM/eum-processor/conf/local-eum-processor.yml` with a text editor and find the following section under the `server` entry:

```
 requestLog:
        appenders: []
```

Add the following information:

```
requestLog:
        timeZone: UTC
        appenders:
          - type: file
            archive: true
            currentLogFilename: ../logs/access.log
            archivedLogFilenamePattern: ../log/accedd-%d.log.gz
```

Save the file and restart the EUM Server.

EUM Server Configuration File

You can configure the EUM Server by setting properties in the file `$APPDYNAMICS_HOME/EUM/eum-processor/bin/eum.properties`. You are recommended to copy the reference sample file `$APPDYNAMICS_HOME/EUM/eum-processor/bin/eum.sample.properties` to `$APPDYNAMICS_HOME/EUM/eum-processor/bin/eum.properties`, modify the settings to fit your needs, and then restart the EUM Server so that the new settings are applied.

The table below lists and describes the supported EUM properties, lists defaults, and specifies whether the property is required. The values for the database properties must conform with the MySQL syntax rules given in Schema Object Names.

EUM Property	Default	Required?	Description
`onprem.dbHost`	`dbHost`	Yes	The name of the database host.
`onprem.dbPort`	`3388`	Yes	The port to the database host.
`onprem.dbSchema`	`eum_db`	Yes	The name of the EUM database.
`onprem.dbUser`	`eum_user`	Yes	The user name for the EUM database.
`onprem.dbPassword`	N/A	Yes	The user password to the EUM database. The password can consist of any ASCII character except the characters '^', '/', or '$'.
`onprem.eventSnapshotDiskAllowance`	-1	No	The maximum disk space allotted for storing event snapshots. The default value of -1 allots unlimited disk space to store event snapshots. You can specify a positive integer representing the maximum number of bytes for storing event snapshots.
`onprem.fileStoreRoot`	`../store`	No	The path to the directory storing EUM data such as snapshots.
`onprem.crashReportExpirationDays`	365	No	The number of days that crash reports are retained.
`onprem.resourceSnapshotExpirationDays`	15	No	The number of days that resource snapshots are retained.

`onprem.resourceSnapshotDiskAllowance`	21474836480 (20 GB)	No	The maximum disk space allotted for storing resource snapshots. The default maximum disk space is 20 GB or 21474836480 bytes. You can specify a positive integer representing the maximum number of bytes for storing resource snapshots.
`processorServer.httpPort`	`7001`	No	The HTTP port to the EUM Processor. The EUM Processor runs in one process containing the collector, aggregator, crash-processor, and monitor services.
`processorServer.httpsPort`	`7002`	No	The HTTPS port to the EUM Processor.
`processorServer.httpsProduction`	`true`	No	The flag for turning enabling (true) or disabling HTTPS to the EUM Processor.
`processorServer.keyStorePassword`	N/A	No	The password to the Key Store for the EUM Processor.
`processorServer.keyStoreFileName`	`bin/ssugg.keystore`	No	The path to the file that stores the password to the Key Store for the EUM Processor.
`processorServer.collectorHttpPort`	`7001`	No	The HTTP port of the EUM Collector. By default, the EUM Collector shares the same port as the EUM Processor, but you can configure the port to be different. The EUM Collector receives the metrics sent from the JavaScript agent.
`processorServer.collectorHttpsPort`	`7002`	No	The HTTPS port of the EUM Collector.
`analytics.enabled`	`true`	Yes	The flag for enabling or disabling the Analytics Server.
`analytics.serverScheme`	`http`	No	The network protocol for connecting to the Analytics Server. It is only required with `analytics.enabled=true`.
`analytics.serverHost`	`events.service.hostname`	No	The hostname of the Analytics Server. It is only required with `analytics.enabled=true`.
`analytics.port`	`9080`	No	The port to the Analytics Server. It is only required when `analytics.enabled=true`.
`analytics.accountAccessKey`	`access-key`	No	The access key for connecting to the Analytics Server. It is only required with `analytics.enabled=true`.
`analytics.eventTypeLifeSpan.0.eventType`	`BrowserRecord`	No	The type of event to be saved. The following values are supported: • `BrowserRecord` • `MobileSnapshot` • `SessionRecord` • `MobileSessionRecord` If this property is set, you must also set `analytics.eventTypeLifeSpan.0.lifeSpan`.
`analytics.eventTypeLifeSpan.0.lifeSpan`	`8`	No	The number of days to retain the event records specified by `analytics.eventTypeLifeSpan.0.eventType`. If this property is set, you must also set `analytics.eventTypeLifeSpan.0.eventType`.
`analytics.eventTypeLifeSpan.1.eventType`	`MobileSnapshot`	No	The type of event to be saved. The following values are supported: • `BrowserRecord` • `MobileSnapshot` • `SessionRecord` • `MobileSessionRecord` If this property is set, you must also set `analytics.eventTypeLifeSpan.1.lifeSpan`.
`analytics.eventTypeLifeSpan.1.lifeSpan`	`8`	No	The number of days to retain the event records specified by `analytics.eventTypeLifeSpan.1.eventType`. If this property is set, you must also set `analytics.eventTypeLifeSpan.1.eventType`.
`analytics.eventTypeLifeSpan.2.eventType`	`SessionRecord`	No	The type of event to be saved. The following values are supported: • `BrowserRecord` • `MobileSnapshot` • `SessionRecord` • `MobileSessionRecord` If this property is set, you also must set `analytics.eventTypeLifeSpan.2.lifeSpan`.

analytics.eventTypeLifeSpan.2.lifeSpan	8	No	The number of days to retain the event records specified by analytics.eventTypeLifeSpan.2.eventType. If this property is set, you must also set analytics.eventTypeLifeSpan.2.eventType.
analytics.eventTypeLifeSpan.3.eventType	MobileSessionRecord	No	The type of event to be saved. The following values are supported: • BrowserRecord • MobileSnapshot • SessionRecord • MobileSessionRecord If this property is set, you also must set analytics.eventTypeLifeSpan.3.lifeSpan.
analytics.eventTypeLifeSpan.3.lifeSpan	8		The number of days to retain the event records specified by analytics.eventTypeLifeSpan.3.eventType. If this property is set, you must also set analytics.eventTypeLifeSpan.3.eventType.
onprem.mobileAppBuildTimeSeriesRequestCountRollupDays	7	No	The EUM Collector searches for the dSYM file in the beacon traffic for the configured number of days. If the dSYM file is not present during the configured time frame, a warning message is displayed in the Controller UI.
onprem.maxNumberOfMobileBuildsWithoutDsym	10	No	The maximum number of visible missing dSYM files in the Controller UI.
collection.sessionEnabled	true	No	The flag for enabling or disabling browser/mobile session collection. If you are upgrading the EUM Server from versions 4.2 and lower to 4.3 or higher, the default is false.
collection.accessControlAllowOrigins.{n}	*	No	By default, the EUM Collector responds with Access-Control-Allow-Origin: *. You can limit CORS to certain domains by using an integer property assigned to a URL as in the following: • collection.accessControlAllowOrigins.0=http://example1.com • collection.accessControlAllowOrigins.1=http://example2.com • collection.accessControlAllowOrigins.2=http://example3.com
eventSnapshotStore.lifespanInDays	90	No	The number of days that the event snapshots stored in the EUM Server's local blob store ($APPDYNAMICS_HOME/EUM/eum-processor/store) are retained. The event snapshots only apply to crash reports, code issues, and IoT errors.
sessionization.webSessionRetentionMins	5	No	The number of minutes that browser sessions are retained after they are closed. This allows browser sessions that begin and end at different times to be retained. The longer the configured retention time, the larger the number of closed sessions held in memory, resulting in higher memory usage.
sessionization.mobileSessionRetentionMins	5	No	The number of minutes that mobile sessions are retained after they are closed. This enables mobile sessions that begin and end at different times to be retained. The longer the configured retention time, the larger the number of closed sessions held in memory, resulting in higher memory usage.
throttling.resourceSnapshot.maxTotalPerMinPerAccount	1000	No	The maximum number of total resource snapshots retained each minute for an account.
throttling.resourceSnapshot.maxNormalPerMinPerAccount	800	No	The maximum number of resource snapshots of pages with a "Normal" user experience that are retained each minute for an account. In general, you want the number for this property to be smaller than that for throttling.resourceSnapshot.maxTotalPerMinPerAccount, so you can also retain resource snapshots of pages with a "Slow", "Very Slow", or "Stall" user experience.
throttling.session.maxTrackedSessionsPerAccount	50000	No	The maximum number of active sessions and unexpired closed sessions that are stored in memory for an account. When the maximum is reached, events that create new sessions will be dropped. This setting helps to control the memory used for sessions at the account level.

From EUM Server version 4.5.1 and later, the property crashProcessing.sessionEnabled is no longer supported. Instead, the association of crashes with sessions is enabled by default. If you are using an earlier version (<4.5.1) of the EUM Server and want to upgrade to 4.5.1 or higher, you will need to remove the property crashProcessing.sessionEnabled from the eum.properties file to prevent the EUM Server from throwing errors.

EUM Server Endpoints

Related pages:

- Port Settings
- Synthetic Server Endpoints

The EUM Server has different endpoints serving distinct functions. This page provides a reference for testing the health and getting information about on-prem EUM Servers.

The endpoints include the following:

- **EUM API** - acts as the interface between the EUM Server and the Controller. The Controller retrieves EUM data from the EUM Server through the EUM API endpoint.
- **EUM Collector** - collects metrics from the EUM agents. The JavaScript Agent and Mobile Agents transmit data to the EUM Server through the EUM Collector endpoint.
- **EUM Aggregator** - collects and rolls up all the metrics per application and provide an interface for Controllers to download the metrics by application and timestamp.
- **Screenshot Service** - collects and serves image tiles that form mobile screenshots. The Mobile Agents transmit the tiles to the Screenshot Service, and the Controller retrieves the tiles to display the screenshots in mobile sessions.

EUM Server Endpoint URLs

The table below lists the endpoints, the default URL, and the supported paths.

EUM Server Endpoint	Default URL	Paths / Description
EUM Collector	`http(s)://<domain-name>:7001/eumcollector`	`/adrum.gif` — Receives image beacons from the JavaScript Agent. `/beacons/browser` — Earliest endpoint for receiving CORS beacons from the JavaScript Agent. `/beacons/browser/v1/*` — The V1 endpoint for receiving CORS beacons from the JavaScript Agent. `/beacons/browser/v2/*` — The V2 and latest endpoint for receiving CORS beacons from the JavaScript Agent. `/get-version` — Returns the version, build, and commit, and timestamp of the EUM Processor. `/iot/v1/application/*` — The endpoint for IoT REST APIs. See the IoT REST API reference documentation for details. `/ping` — Returns whether the EUM Collector is accessible and running. `/mobileMetrics?version=2` — The endpoint used by the Mobile Agents to send mobile beacons via HTTP POST. `/whoami` — Returns the IP address, geo location, and information of the client making the request.
EUM Aggregator	`http(s)://<domain-name>:7001/eumaggregator`	`/currentTime` — Returns the current time of the EUM Aggregator as a Unix timestamp. `/get-version` — Returns the version, build, and commit, and timestamp of the EUM Processor. `/ping` — Returns whether the EUM Aggregator is accessible and running.
Screenshot Service	`http(s)://<domain-name>:7001/screenshots/v1`	`/version` — Returns the version, build, commit, and timestamp of the Screenshot Service.

Install and Host a Custom Geo Server for Browser RUM

Related pages:

- Host a Geo Server

By default, the locations of end-users are resolved using public geographic databases. You can host an alternate geo server for your countries, regions, and cities instead of using the default geo server hosted by AppDynamics.

You may prefer to host your own geo server because:

- You have intranet applications where the public IP address does not provide meaningful location information, but the user's private IP does.
- You have a hybrid application where some users access the application from a private location and some access it from a public one. If a user doesn't come from a specific private IP range mapped by the custom geo server, the system can be set to default to the public geo server.

To host a custom geo server:

1. Download the Geo Server File
2. Set the Location of the Geo Server
3. Create the IP Mapping File

Requirements for Geo Server Host

- 2 GB of memory
- Java 8

Download and Install the Geo Server File

Download the `GeoServer.zip` file from AppDynamics at https://download.appdynamics.com/download.

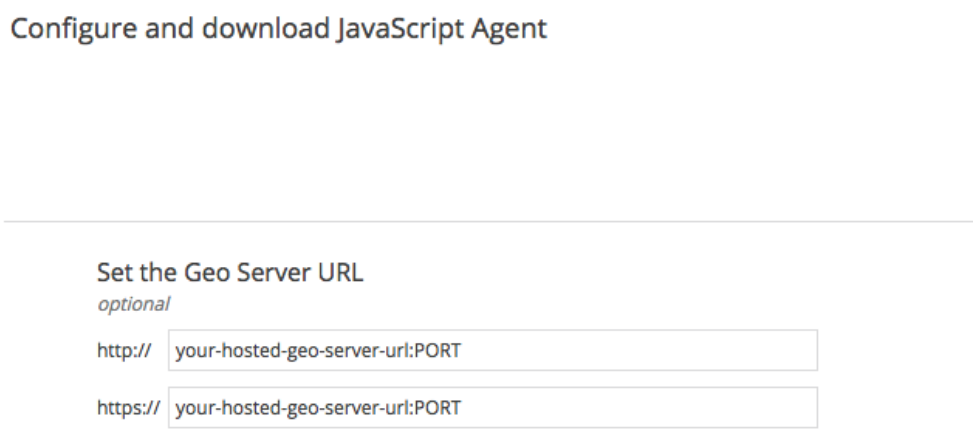
Uncompress the zip to a `GeoServer` folder with the following structure:

```
GeoServer
  schema.xsd                    <-- schema for geo-ip-mapping.xml configuration
  geo
     WEB-INF
        classes
           logback.xml       <-- configure logging in here
           ...
        web.xml               <-- other configurations here
        ...
  |    geo-ip-mappings.xml       <-- configure geo ip mapping here
   ...
```

To install the geo server, copy the `geo` folder to the `TOMCAT_HOME/webapps` of your Tomcat server. Do not deploy the server in the same container as the Controller.

Set the Location of the Geo Server

Enter the URL, including the context root, of your hosted geo server in the **Geo Server URL** field in the **Browser RUM** configuration screen in the Controller UI as shown below.



⚠️ If you are using manual injection for your JavaScript agent, you must make sure that the copy of the script that you use is one that you have downloaded *after* this URL is set.

Create the IP Mapping File

The `geo-ip-mappings.xml` IP mapping file specifies the locations for which Browser RUM provides geographic data. It maps IP addresses to geographic locations.

Use the sample file in the `geo` subdirectory as a template. Any modifications at runtime are reloaded without a restart.

This file contains a `<mapping>` element for every location to be monitored. The file has the following format.

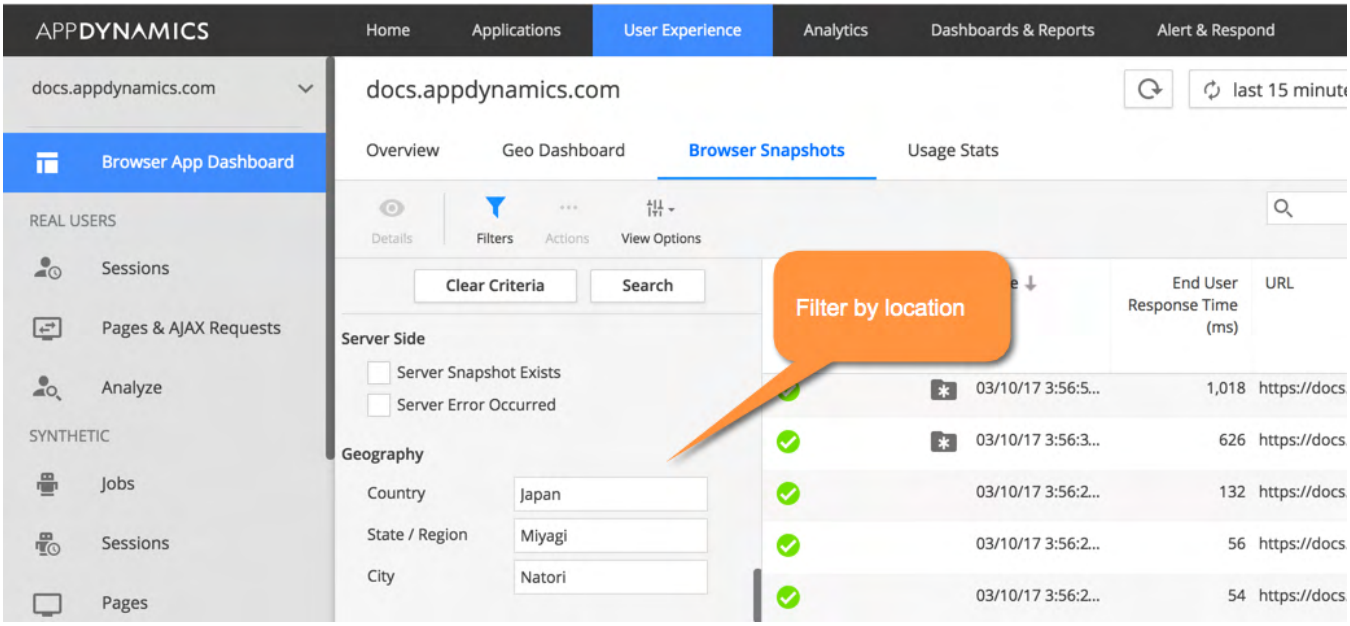
```
<mappings>
        <mapping>
                <subnet from="192.168.1.1" mask="255.255.255.0"/>
                <location country="United States" region="California" city="San Francisco"/>
        </mapping>

        <default country="United States" region="California" city="San Francisco"/>
</mappings>
```

You can also use IP-range-based mapping instead of subnet-based:

```
<mapping>
    <ip-range from="10.240.1.1" to="10.240.1.254" />
    <location country="France" region="Nord-Pas-de-Calais" city="ENGLOS" />
</mapping>
```

This data is visible in browser snapshots and can be used to filter browser snapshots for specific locations: The `<country>`, `<region>`, and `<city>` elem ents are required. If the values of <country> and <region> do not correspond to an actual geographic location already defined in the geographic database, map support is not available for the location in the map panel, but Browser RUM metrics are displayed for the location in the grid view of the geographic distribution, end user response time panel, trend graphs, browser distribution panel, and in the Metric Browser. The `<city>` element can be a string that represents the static location of the end-user. You will notice a `<default>` element. If there is an IP address that is not covered by your IP mapping file, this is the value that is used. To use a public geo server for non-covered IP addresses, see Using a Hybrid Custom-Public Geo Server Setup.



The valid names for country and region are those used in the map in the geo dashboard. You can hover over a region in the dashboard to see the exact name (including spelling and case) of the region. See The Browser Geo Dashboard View.

Using a Hybrid Custom-Public Geo Server Setup

If you want Browser RUM to evaluate any non-mapped IP address using the public geo server, remove the `<default>` element. In this case, locating any non-mapped IP address is done in the EUM cloud, not locally.

Customize File Locations

You can customize where certain files are stored in the GeoServer directory.

Change Log Location

By default, logs are written to `TOMCAT_HOME/logs`, but you can configure this using `TOMCAT_HOME/webapps/geo/WEB-INF/classes/logback.xml`. Open the file with a text editor and edit the `LOG_HOME` property.

```
<property name="LOG_HOME" value="{path-to-file}/logs"/>
```

Change Mapping File Location

By default, the geo server looks for `geo-ip-mappings.xml` in `TOMCAT_HOME/webapps/geo/`. To change the location, open `TOMCAT_HOME/webapps/geo/WEB-INF/web.xml` with a text editor and change value for `AD_GEO_CONFIG_FILE`.

```
<web-app ...>
    <!-- ... -->
    <servlet>
        <servlet-name>FrontControllerServlet</servlet-name>
        <servlet-class>com.appdynamics.eum.geo.web.FrontControllerServlet</servlet-class>
        <context-param>
            <param-name>AD_GEO_CONFIG_FILE</param-name>
            <param-value>{path-to-file}/geo-ip-mappings.xml</param-value>
        </context-param>
        <!-- ... -->
    </servlet>
    <!-- ... -->
</web-app>
```

In previous versions of the geo server, the enclosing tag was a `<context-param>`. This has now been changed to an `<init-param>`.

For On-Premises EUM Servers Only: Use geo-ip-mappings.xml

If your installation uses an on-premises EUM Server *and* you have internal browsers from the same network as the Server that you want to identify, instead of setting up a separate custom geo-server, you can choose to simply modify the EUM Server's `geo-ip-mappings.xml` file as described above. The sample is in the `bin` directory of the EUM Server. The EUM Server automatically reads the file and uses it first to try and resolve the location, before using the Neustar IP database.

Precedence in Resolving Locations

The custom geo server resolves locations based on the following precedence, from highest to lowest:

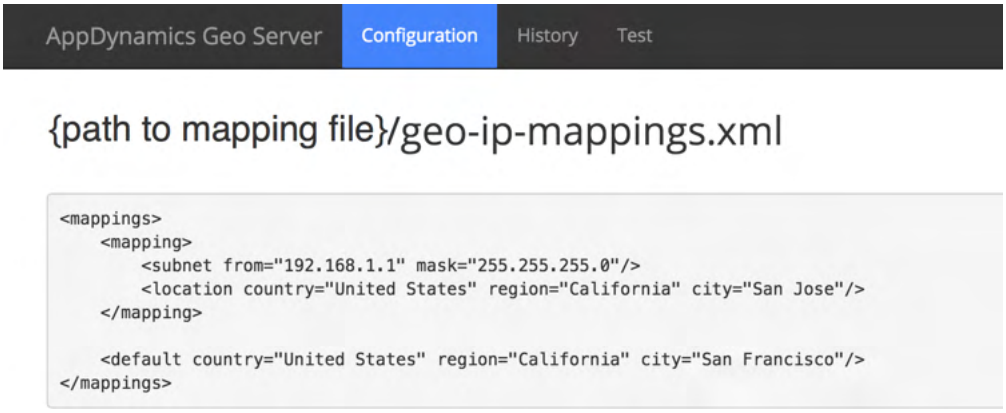
- An IP address set by customizing the JavaScript agent. For more information, see Set the Origin Location of the Request.
- An explicit query parameter: for example, `http://mycompany.com/geo/resolve.js?ip=196.166.2.1`.
- An IP provided using the `AD-X-Forwarded-For` header
- An IP provided using the `X-Real-IP` header
- An IP provided using the `X-Forwarded-For` header
- The remote address of the HTTP request

Debugging

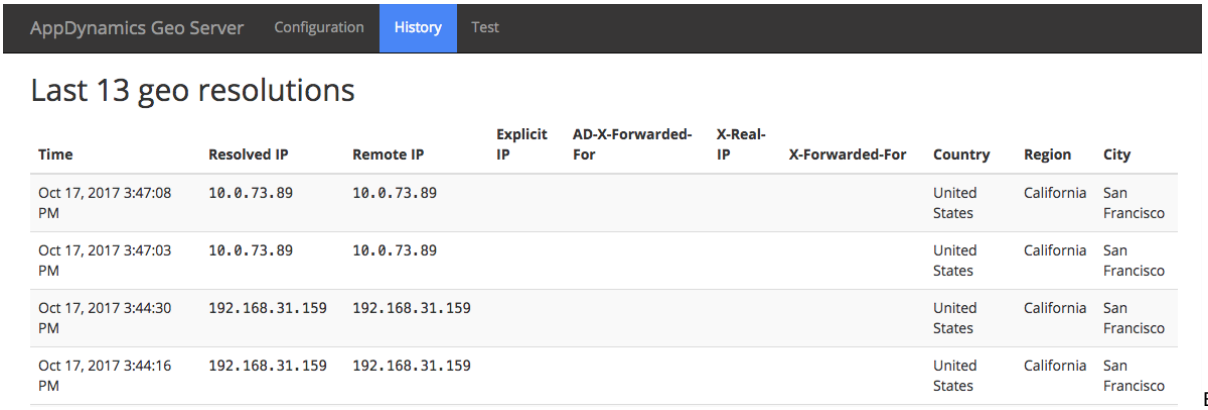
Because this debugging feature has a small performance impact, it should be turned off before putting the geo server into production.

To aid in debugging, the geo server ships with a debugging web interface enabled. You can reach this interface by navigating to `http://<host>:<port>/geo/debug` with a web browser.

The first tab, **Configuration**, displays the contents of the mapping file currently in use.



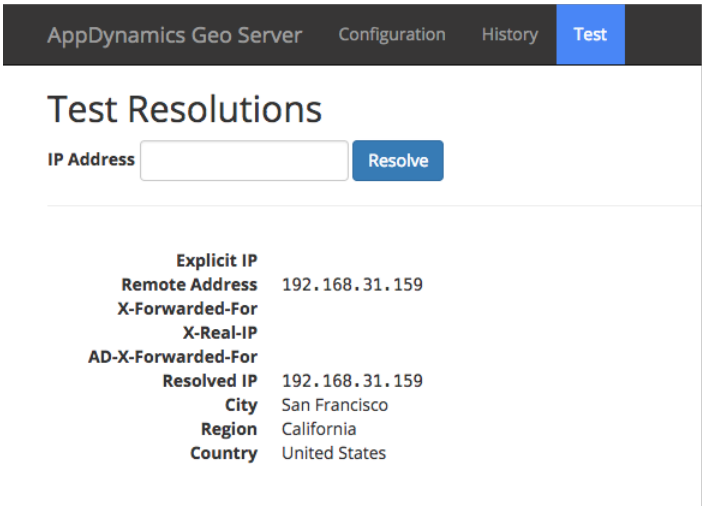
The second tab, **History**, shows the last few geo resolutions that have been performed.



By default, the last 20 resolutions are shown, but this can be configured in `TOMCAT_HOME/webapps/geo/WEB-INF/web.xml`.

```
<web-app ..>
    <!-- ... -->
    <servlet>
        <servlet-name>FrontControllerServlet</servlet-name>
        <servlet-class>com.appdynamics.eum.geo.web.FrontControllerServlet</servlet-class>
        <!-- ... -->
        <init-param>
            <param-name>HISTORY_MAX_COUNT</param-name>
            <param-value>20</param-value>
        </init-param>
    </servlet>
    <!-- ... -->
</web-app>
```

The third tab, **Test**, can be used to test the mapping file by trying to resolve an arbitrary IP address.



When you first navigate to this tab, it shows the geo resolution for your browser's IP address. The form in this tab can be used to try the resolution of another IP address.

Disabling debug

Open `TOMCAT_HOME/webapps/geo/WEB-INF/web.xml` and set `DEBUG_ENABLED` to `false`.

```
<web-app ..>
    <!-- ... -->
    <servlet>
        <servlet-name>FrontControllerServlet</servlet-name>
        <servlet-class>com.appdynamics.eum.geo.web.FrontControllerServlet</servlet-class>
        <!-- ... -->
        <init-param>
            <param-name>DEBUG_ENABLED</param-name>
            <param-value>false</param-value>
        </init-param>
    </servlet>
    <!-- ... -->
</web-app>
```

EUM Server Component Versions

This page describes how to check version information and the version of components bundled with the EUM Server. This information is useful when troubleshooting the system or performing other administrative tasks.

> ⚠ AppDynamics maintains and updates the bundled components as part of the AppDynamics Platform. Do not attempt to upgrade a bundled component independently of the platform upgrade procedure.

EUM Server Version

To view the version of your running EUM Server, run the following:

```
curl http(s)://<domain-name>:7001/v2/version
```

To get more information about the EUM Server, see EUM Server Endpoints.

Bundled MySQL Database Version

The AppDynamics EUM Server uses MySQL as its default database, where it stores license/account information, metadata, and applications names. The MySQL database files are installed in `<eum_home>/data` by default.

The latest AppDynamics release bundles MySQL version 5.7.33.

Bundled Java Version

The EUM Server bundles and uses Java 1.8.0_162.

Upgrade the Production EUM Server

This page describes how to upgrade an EUM Server to the latest production installation. This is usually done alongside an upgrade to the other platform components, such as the Controller and Events Service.

Who Should Use This Document

Anyone wanting to upgrade the EUM Server to the latest available version should use this document.

Before You Begin

Before you start upgrading the EUM Server, make sure that you are using the correct update order.

Upgrade Procedure

The instructions below show you how to upgrade your EUM Server to the latest version of the production EUM Server. Because in the EUM Server 4.4, the EUM MySQL database was moved from the Controller host machine to the EUM Server host machine, there are separate instructions below to help you migrate your data from versions earlier than 4.4 to the latest version. If you are upgrading from EUM Server 4.4 or higher to the latest version, you will not have to migrate your data, but you are advised to make a backup of your data.

Using SSL with the EUM Server

If you are upgrading to EUM Server 4.5.6 or higher, you are recommended to downgrade the version of the JRE bundled with the EUM Server to 1.8.0 _152 to avoid performance issues.

Troubleshoot EUM Server Installation

The following sections provide troubleshooting information for the EUM Server installation.

End User Data Does Not Appear in the Controller

If end user data does not appear in the Controller, follow these steps to troubleshoot the installation:

1. Check the Controller logs for errors in attempting to connect to the EUM Server. Also, see if the Controller UI allows you to enable EUM. If so, it's likely that the connection between the Controller and EUM Server is working.
2. Check the logs of the EUM Server, especially `<EUM_home>/logs/eum-processor.log`. In the log, verify that the server started successfully and is receiving beacons from agents.
3. Make sure that the EUM JavaScript Agent is actually injected into the monitored page and that the agent can load the remote JavaScript.
4. Use browser debugging tools to check for JavaScript errors in the monitored page.

License Not Installed

If the installer indicates that it was not able to install the license, or after installation, if the EUM Server fails to start with a license exception, try installing the license manually.

With the Controller running and accessible to the EUM Server machine, install the license manually. Before starting, make sure the `license.lic` file is at an accessible location on the EUM Server machine. Then install the license as follows:

1. Verify that the `JAVA_HOME/bin` is in the system PATH variable and points to a Java 1.7 instance.
2. In Windows, open an elevated command prompt (run as administrator).
3. From the command line, navigate to the `eum-processor` directory under your AppDynamics home.
4. From the `eum-processor` directory, run the following script:
    - On Linux:
      `./bin/provision-license <path_to_license_file>`
    - On Windows:
      `bin\provision-license.bat <path_to_license_file>`

EUM License Has Not Been Provisioned for an Account

Follow the instructions below to provision new EUM licenses for accounts on a multi-tenant Controller UI.

1. Navigate to the **Administration** page of your on-premises Controller: `http(s)://<hostname>:<port>/controller/admin.jsp`
2. Click **Accounts**.
3. Select the account name that you want to provision EUM for and click **Edit**.
4. Scroll down to the **End User Monitoring (EUM)** panel.
5. From the **Browser Real User Monitoring** section:
    a. Copy the EUM license key from your license file into the **EUM License Key** field.
    b. Select a license type (**EUM Lite** or **EUM Pro**) from the **License Type** dropdown.
    c. Enter your allotted Browser RUM units into the **Browser RUM Units Licensed** field.
    d. Set overages from the **Allow Overages** dropdown.
6. Complete the steps above for the **Mobile Real User Monitoring** section.
7. Click **Save**.

Exception When Updating Application Store

You may need to tune the database thread pool. The EUM Server ships with a blank c3p0 xml configuration file to help manage this. For information on using c3p0, see the docs here. You should make your changes to `<eum_server_home>/bin/c3p0.xml`.

"Too Many Open Files" Exception

Exception messages such as the following indicate insufficient open file descriptor limits on the EUM Server machine:

```
java.io.IOException: Too many open files
```

See EUM Server Deployment for operating system requirements, including recommended settings for `nofile` and `nproc` limits for the EUM Server operating system.

Controller Cannot Reach the Events Service

In the Administration Console, make sure that the Controller setting named `eum.es.host` is set to the correct connection settings for the Events Service instance, and that the Events Service is properly installed and running at that location. If the Events Service is a cluster with a load balancer in front of it, this should be the VIP of the Events Service as exposed at the load balancer.

For more information, see Connect to the Events Service.

Events Service Deployment

Related pages:

- Events Service Requirements
- Install the Events Service on Linux
- Install the Events Service on Windows

The AppDynamics Events Service is the on-premises data storage facility for unstructured data generated by Application Analytics, Database Visibility, and End User Monitoring deployments.

> The following information and instructions are intended for on-premises deployments only. SaaS deployments are managed by AppDynamics.

About the Events Service

The MySQL database embedded in the Controller stores application metric and configuration data generated by the Controller. While an embedded database is sufficient for storing this type of data, the high-volume, performance-intensive nature of analytics data requires dedicated, horizontally scalable storage. In an AppDynamics deployment, this role is served by the AppDynamics Events Service.

If you are installing the server components for End User Monitoring, Application Analytics, or Database Visibility, you need to use a scaled-out on-premises Events Service. Scaled-out means that the service is not installed on the Enterprise Console host. This type of Events Service can be deployed as a single node or a cluster of three or more nodes based on your needs. Additionally, you can add nodes to a scaled-out Events Service after you install it. It is not recommended that you add the Controller host as part of the cluster. For information, see Administer the Events Service.

However, for data redundancy and storage scalability or if you are using End User Monitoring, Application Analytics or Database Visibility in an on-premises Controller deployment, you need to deploy a dedicated Events Service installation.

Multiple AppDynamics components that depend on the Events Service should use the same Events Service instance or cluster.

Deployment Topology Overview

You can deploy the Events Service to a single node or to a cluster of three or more nodes. Clusters are horizontally scalable, so nodes can be added as your data storage requirements grow. A cluster also provides data replication and redundancy, helping to ensure data integrity in the event of a node failure.

The Controller includes an embedded Events Service instance used by the Database Visibility product by default. However, the embedded Events Service is not meant to be used with production Application Analytics or EUM installations, since it runs on the same machine as the Controller and does not offer data replication or scalability. It may be used for small-scale environments, especially those intended for demonstration or learning purposes. Note however that it's not possible to migrate data from the embedded Events Service to an external Events Service instance if upgrading later.

Your Events Service can be deployed to support multiple Controllers, becoming a shared Events Service.

Single Node Deployment

In a single node Events Service deployment, the Events Service runs on a dedicated machine. The Controller and other Events Service clients can connect directly to the Events Service node or through a load balancer. Deploying a single node Events Service behind a load balancer allows you to grow the deployment to a multi-node cluster easily, without having to modify the clients.

> Single node deployment is recommended for test environments only. Production environments should deploy a multi-node cluster (see below for details).

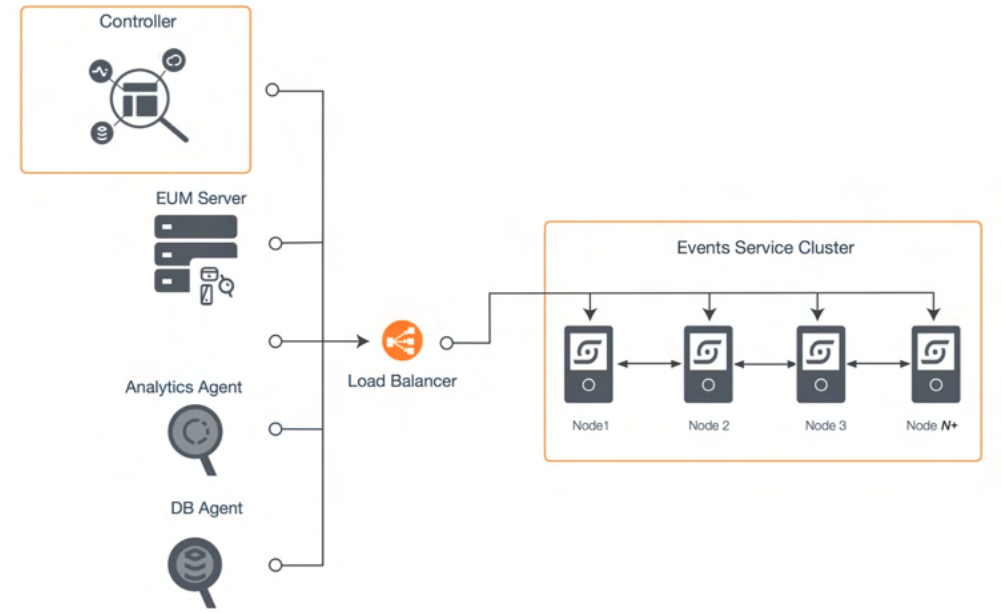
Multi-Node Cluster

A multi-node cluster is made up of three or more nodes. With a cluster, the Controller and other Events Service clients, the EUM Server and Analytics Agent connect to the Events Service through a load balancer, which distributes load to the Events Service cluster members.

AppDynamics recommends multi-node clusters for production environments. Multi-node clusters provide the following benefits:

- Safeguards against data loss: multi-node clusters replicate your data. If one node goes down in production, you would have at least two more nodes storing your data. Additionally, the Events Service continues to run as long as one node runs. Should a node go down in a single node deployment, the Events Service stops running and you would lose your data.
- Provides redundancy: in a multi-node cluster, you can swap nodes.

In a single-node deployment, connect through a load balancer or directly to the Events Service.



The nodes in a cluster swap a large amount of data. For this reason, when deploying a cluster, make sure to install all cluster nodes within the same local network, ideally, attached to the same network switch.

Supported Deployments

Use the following table to determine which deployment types and environments are supported for different versions of the Events Service.

Deployment Types	Development Environment	Production Environment
Controller Embedded Events Service (version 4.3.x)	Yes	No. Only shipped through the Controller installer.
Controller Embedded Events Service (version 4.4.x)		
Controller Embedded Events Service (version 4.5.x)		
Single Node Events Service (Dedicated Host) (version 4.3.x)		No
Single Node Events Service (Dedicated Host) (version 4.4.x)		
Single Node Events Service (Dedicated Host) (version 4.5.x)		
Multi-Node Clustered Events Service (3+ nodes) (version 4.3.x or later)		Yes
Multi-Node Clustered Events Service (3+ nodes) (version 4.4.x or later)		
Multi-Node Clustered Events Service (3+ nodes) (version 4.5.x or later)		

Shared Events Service

You can connect multiple Controllers to a single on-premises Events Service deployment using the same procedure that is required to connect a single Controller. You would need to configure the Controller URLs for the Events Service to point to the shared Events Service, and make sure the Controller keys are correct. The Controllers can then handle syncing to the shared Events Service. There are no additional requirements.

When compared to a multiple Events Service cluster configuration, a shared Events Service configuration requires less maintenance and lowers cost. Since the Events Service is horizontally scalable, having a single large instance provides the same functionality as multiple instances.

There is no limit to the number of Controllers that can share an Events Service. However, it is recommended that you use separate Events Services for dev and prod. Work with your AppDynamics account representative if you plan to expand your shared Events Service cluster.

Default Ports

The default ports used by the Events Service are:

- Events Service API Store Port: 9080
- Events Service API Store Admin Port: 9081

The Events Service cluster members use additional ports for internal communication among the cluster members. All the ports used within the cluster are listed in the Events Service configuration file, `conf/events-service-api-store.properties`.

Secure the Events Service

By default, the `ad.es.node.http.enabled` property in the Events Service configuration file is set to `false`. To debug or troubleshoot issues with the Events Service, you or the AppDynamics Support team can enable this property and allow HTTP requests (such as node stats) in ElasticSearch by changing the setting to `true`. Following the debugging session, immediately disable this property to prevent any (potential) security vulnerabilities and restart the Events Service. The downtime is dependent on the hardware and the service will be unavailable until it restarts.

Events Service Requirements

Related pages:

- Prepare the Events Service Host

This page describes general hardware and software requirements for the machines that host Events Service nodes.

General Requirements

- Determine which version of the Events Service that is compatible with your other platform components.
- Use a supported Windows 64-bit or Linux 64-bit based operating system supported by the platform. See Platform Requirements.
- Solid-state drives (SSD) can significantly outperform hard disk drives (HDD), and are therefore recommended for production deployments. Ideally, the disk size should be 1 TB or larger.
- The Events Service must run on dedicated machines with identical directory structures, user account profiles, and hardware profiles.
- For heap space allocation, AppDynamics recommends allocating half of the available RAM to the Events Service process, with a minimum of 7 GB up to 31 GB.
- When testing the events ingestion rate in your environment, it is important to understand that events are batched. Ingestion rates observed at the scale of a minute or two may not reflect the overall ingestion rate. For best results, observe ingestion rate over an extended period of time, several days at least.
- The Events Service requires Java 8u172.
- Keep the clocks on your application, Controller, and Events Service nodes in sync to ensure consistent event time reporting across the AppDynamics deployment.
- Your firewall should not block the Events Service REST API port 9080, otherwise, the Enterprise Console will not be able to reach the Events Service remotely.

Hardware Capacity and Resource Planning

When estimating your hardware requirements, the first step is to determine the event ingestion rate (for Transaction Analytics) or the amount of data being indexed (for Log Analytics). This helps you to determine the number of analytics license units you will need.

Once you determine your license units requirements, it is important to consider other factors that affect the hardware capacity, such as the processing load of queries run against the Events Service and the actual type of hardware used. A physical server is likely to perform better than a virtual machine. You should also take into account seasonal or daily spikes in activity in your monitored environment in your considerations.

An event is the basic unit of data in the events service. In terms of application performance management, a Transaction Analytics event corresponds to a call received at a tier. A business transaction instance that crosses three tiers, therefore, would result in three events being generated. In application performance management metrics, the number of business transaction instances is reflected by the number of calls metric for the overall application. In End User Monitoring, each page view equates to an event, as does each Ajax request, network request, or crash report.

Events Service Node Sizing Based on License Units

You can plan your hardware requirements with the data in the section. It describes recommended hardware configurations (in the context of Amazon EC2 instance types) corresponding to the number of license entitlement units for Log and Transaction Analytics. See License Entitlements and Restrictions for details about license units for Log and Transaction Analytics.

For additional Events Service sizing information, see the following AppDynamics Community articles:

- Understanding EUM and Events Service concepts (describes the concepts necessary to build the profile)
- Build the Analytics traffic profile
- Size the Events Service and EUM using the profile (contains the Analytics Recipe Book for on-premises configuration)
- Limit EUM and Analytics usage (describes how to configure rules to enforce Analytics trade-offs when deploying Analytics on-premises)

The hardware shown for each license amount represents the hardware capacity of a theoretical combined load of both Transaction Analytics and Log Analytics events. The numbers used were derived from actual tests that were performed with an uncombined load, from which the following numbers were extrapolated. Note that the test conditions did not include query load and so may not be representative of a true production analytics environment.

The following table shows sizing recommendations and describes the size of the cluster used for testing. This does not mean you are limited to a seven-node event service. If you need to go beyond seven nodes, contact your AppDynamics account representative to ensure proper sizing for your specific environment.

It is to be noted that the retention can be 8, 30, 60 or 90 days which will directly affect storage requirements.

Event Type	AWS Machine Instance Type										
	i2.2xlarge (61 GB RAM, 8 vCPU, 1600 GB SSD)				i2.4xlarge (122 GB RAM, 16 vCPU, 3200 GB SSD)				i2.8xlarge (244 GB RAM, 32 vCPU, 6400 GB SSD)		
	1 node	3 nodes	5 nodes	7 nodes	1 node	3 nodes	5 nodes	7 nodes	1 node	3 nodes	5 nodes

Transaction Analytics license units	20	37	44	63	22	41	84	113	53	94	120
Log Analytics license units	7	10	17	19	16	19	32	44	39	116	270

The following points describe the test conditions under which the license units-to-hardware profile mappings in the table were generated:

- Average Log event size in bytes: 350
- Average size of business transaction event: 1 KB
- Tiers in business transaction: 3

The tests were conducted on virtual hardware and programmatically generated workload. Real-world workloads may vary. To best estimate your hardware sizing requirements, carefully consider the traffic patterns in your application and test the Events Service in a test environment that closely resembles your production application and user activity.

Minimum Events Service Node Sizing

To configure the Events Service 3 nodes minimum are required.

Database Visibility Events Service Sizing

Database Visibility features use the Events Service for storage. The ingestion capacity and sizing profile for Database Visibility Analytics events are equivalent to that of Log Analytics, with the size of the raw event being about 2 kilobytes on average.

End User Monitoring Events Service Sizing

End User Monitoring includes Analytics-related features that send data to the Events Service.

In End User Monitoring, each page view equates to an event, as does each Ajax request, network request, or crash report. There can be a few dozen Ajax requests for every page load. In general, the ingestion capacity and sizing profile for EUM or Database Visibility Analytics events are equivalent to that for Log Analytics, with the size of the raw events being about 2 kilobytes on average.

To calculate the sizing for EUM, multiply the peak number of browser records in a day by 12 KB. If peak capacity is reached, the Events Service simply starts dropping traffic.

The table below provides details about the memory and storage of different types of browser records. The default retention period is configurable.

Browser Record Type	Memory Requirements Per Event	Optional	Default Retention
BasePage, iFrame, Virtual Page	1 KB / 1.5 KB (with sessions enabled)	No	8 days
Ajax requests	1 KB	Yes	

By default, Ajax requests are not stored in the Events Service.

Prepare the Events Service Host

Related pages:

- Events Service Requirements

This page describes how to prepare the machine that will host Events Service nodes, along with general requirements for the environment.

Network and Port Settings

The Controller and Events Service must reside on the same local network and communicate by the internal network. Do not deploy the cluster to nodes on different networks, whether relative to each other or to the Controller and the Enterprise Console. When identifying cluster hosts in the configuration, you will need to use the internal DNS name or IP address of the host, not the externally routable DNS name.

For example, in terms of an AWS deployment, use the private IP address such as `172.31.2.19` rather than public DNS hostname such as `ec2-34-201-129-89.us-west-2.compute.amazonaws.com`.

On each machine, the following ports need to be accessible to external (outside the cluster) traffic:

- Events Service API Store Port: 9080
- Events Service API Store Admin Port: 9081

For a cluster, ensure that the following ports are open for communication between machines within the cluster. Typically, this requires configuring iptables or OS-level firewall software on each machine to open the ports listed

- 9300 – 9400

The following shows an example of iptables commands to configure the operating system firewall:

```
-A INPUT -m state --state NEW -m tcp -p tcp --dport 9080 -j ACCEPT
-A INPUT -m state --state NEW -m tcp -p tcp --dport 9081 -j ACCEPT
-A INPUT -m state --state NEW -m multiport -p tcp --dports 9300:9400 -j ACCEPT
```

If a port on the Events Service node is blocked, the Events Service installation command will fail for the node and the Enterprise Console command output and logs will include an error message similar to the following:

```
failed on host: <ip_address> with message: Uri [http://localhost:9080/_ping] is un-pingable.
```

If you see this error, make sure that the ports indicated in this section are available to other cluster nodes.

Configure Cluster Nodes that Run Linux

If deploying to Linux machines, on each node in the Events Service cluster, make these configuration changes:

1. Using a text editor, open `/etc/sysctl.conf` and add the following:

   ```
   vm.max_map_count=262144
   ```

2. Raise the open file descriptor limit in `/etc/security/limits.conf`, as follows:

   ```
   <username_running_eventsservice>     soft    nofile          96000
   <username_running_eventsservice>     hard    nofile          96000
   ```

   Replace `username_running_eventsservice` with the username under which the Events Service processes run. So if you are running Analytics as the user `appduser`, you would use that name as the first entry.

Configure SSH Passwordless Login

For Linux deployments, you will use the Enterprise Console to deploy and manage the Events Service cluster.

The Enterprise Console needs to be able to access each cluster machine using passwordless SSH for a non-embedded Events Service. Before starting, enable key-based SSH access as described here.

This setup involves generating a key pair on the Enterprise Console and adding the public key as an authorized key on the cluster nodes. The following steps take you through the configuration procedure for an example scenario. You will need to adjust the steps based on your environment.

If you are using EC2 instances on AWS, the following steps are taken care of for you when you provision the EC2 hosts. At that time, you are prompted for your PEM file, which causes the public key for the PEM file to be copied to the authorized_keys of the hosts. You can skip these steps in this case.

On the host machine, follow these steps:

1. Log in to the Enterprise Console host machine or switch to the user you will use to perform the deployment:

   ```
   su - $USER
   ```

2. Create a directory for SSH artifacts (if it doesn't already exist) and set permissions on the directory, as follows:

   ```
   mkdir -p ~/.ssh
   chmod 700 ~/.ssh
   ```

3. Change to the directory:

   ```
   cd .ssh
   ```

4. Generate PEM public and private keys in RSA format:

   ```
   ssh-keygen -t rsa -b 2048 -v -m pem
   ```

5. Enter a name for the file in which to save the key when prompted, such as `appd-analytics`.
6. Rename the key file by adding the `.pem` extension:

   ```
   mv appd-analytics appd-analytics.pem
   ```

   You will later configure the path to it as the `sshKeyFile` setting in the Enterprise Console configuration file, as described in Deploying an Events Service Cluster.
7. Transfer a copy of the public key to the cluster machines. For example, you can use scp to perform the transfer as follows:

   ```
   scp ~/.ssh/myserver.pub host1:/tmp
   scp ~/.ssh/myserver.pub host2:/tmp
   scp ~/.ssh/myserver.pub host3:/tmp
   ```

   Continuing with the example, `myserver` should be appd-analytics.
   The first time you connect you may need to confirm the connection to add the cluster machine to the list of known hosts and enter the user's password.
8. On each cluster node (host1, host2, and host3), create the .ssh directory in the user home directory, if not already there, and add the public key you just copied as an authorized key:

   ```
   cat /tmp/appd-analytics.pub >> .ssh/authorized_keys
   chmod 600 ~/.ssh/authorized_keys
   ```

9. Test the configuration from the host machine by trying to log in to a cluster node by `ssh`:

   ```
   ssh host1
   ```

   If unable to connect, make sure that the cluster machines have the `openssh-server` package installed and that you have modified the operating system firewall rules to accept SSH connections. If successful, you can use the Enterprise Console to deploy the platform.

If you encounter the following error, use the instructions in this section to double-check your passwordless SSH configuration:

```
Copying JRE to the remote host failed on host: 172.31.57.204 with message: Failed to upload file: java.net.
ConnectException: Connection timed out
```

Install the Events Service on Linux

Related Pages:

- Events Service Requirements

This page describes how to install and administer the Events Service on Linux systems through the CLI. Steps for scaling up an embedded Events Service using the Enterprise Console are also included.

The AppDynamics Enterprise Console automates the task of installing and administering an Events Service deployment through either the GUI or CLI. For information on installing Events Service using the Enterprise Console, see Custom Install.

You do not need to specify the installation or data directory for the Events Service installation. If you do, use a different one from the platform directory.

Events Service Host Requirements

Before starting, be sure to review the Release Notes for known issues and late-breaking information on using the Events Service and Enterprise Console. Also, observe the following requirements:

- The Events Service can be deployed as a single node or as a multi-node cluster of 3 or more nodes.
- The versions of Linux supported include the flavors and versions supported by the Controller, as indicated by Prepare Linux for the Controller.
- The Events Service must run on a dedicated machine. The machine should not run other applications or processes not related to Events Service.
- Use appropriately sized hardware for the Events Service machines. The Enterprise Console checks the target system for minimum hardware requirements. For more information on these requirements, see the description of the profile argument to the Events Service install command in Install the Events Service Cluster.
- The Controller and Events Service must reside on the same local network and communicate by the internal network. Do not deploy the cluster to nodes on different networks, whether relative to each other or to the Controller where the Enterprise Console runs. When identifying cluster hosts in the configuration, you will need to use the internal DNS name or IP address of the host, not the externally routable DNS name.
  For example, in terms of an AWS deployment, use the private IP address such as `172.31.2.19` rather than public DNS hostname such as `ec2-34-201-129-89.us-west-2.compute.amazonaws.com`.
- Make sure that the appropriate ports on each Events Service host are open. See Port Settings for more information.
- The Enterprise Console uses an SSH key to access the Events Services hosts. See the section below for information on generating the key.
- Events Service nodes normally operate behind a load balancer. When installing an Events Service node, the Enterprise Console automatically configures a direct connection from the Controller to the node. If you deploy a cluster, the first primary node is automatically configured as the connection point in the Controller. You will need to reconfigure the Controller to connect through the load balancer VIP after installation, as described below. For sample configurations, see Load Balance Events Service Traffic.

Port Settings

Each machine must have the following ports accessible to external (outside the cluster) traffic:

- Events Service API Store Port: 9080
- Events Service API Store Admin Port: 9081

For a cluster, ensure that the following ports are open for communication between machines within the cluster. Typically, this requires configuring `iptables` or OS-level firewall software on each machine to open the ports listed

- 9300 – 9400

The following shows an example of `iptables` commands to configure the operating system firewall:

```
-A INPUT -m state --state NEW -m tcp -p tcp --dport 9080 -j ACCEPT
-A INPUT -m state --state NEW -m tcp -p tcp --dport 9081 -j ACCEPT
-A INPUT -m state --state NEW -m multiport -p tcp --dports 9300:9400 -j ACCEPT
```

If a port on the Events Service node is blocked, the Events Service installation command will fail for the node and the Enterprise Console command output and logs will include an error message similar to the following:

```
failed on host: <ip_address> with message: Uri [http://localhost:9080/_ping] is un-pingable.
```

If you see this error, make sure that the ports indicated in this section are available to other cluster nodes.

Create the SSH Key

When installing Events Service, you will need to provide the SSH key that the Enterprise Console can use to access Events Service hosts remotely. Before starting, create the PEM public and private keys in RSA format. The key file must not use password protection.

For example, using `ssh-keygen`, you can create the key using the following command:

```
ssh-keygen -t rsa -b 2048 -v -m pem
```

Configure SSH Passwordless Login

The Enterprise Console needs to be able to access each cluster machine using passwordless SSH. Before starting, enable key-based SSH access.

This setup involves generating a key pair on the Enterprise Console host and adding the Enterprise Console's public key as an authorized key on the cluster nodes. The following steps take you through the configuration procedure for an example scenario. You will need to adjust the steps based on your environment.

If you are using EC2 instances on AWS, the following steps are taken care of for you when you provision the EC2 hosts. At that time, you are prompted for your PEM file, which causes the public key for the PEM file to be copied to the `authorized_keys` of the hosts. You can skip these steps in this case.

On the Enterprise Console machine, follow these steps:

1. Log in to the Enterprise Console machine or switch to the user you will use to perform the deployment:

   ```
   su - $USER
   ```

2. Create a directory for SSH artifacts (if it doesn't already exist) and set permissions on the directory, as follows:

   ```
   mkdir -p ~/.ssh
   chmod 700 ~/.ssh
   ```

3. Change to the directory:

   ```
   cd .ssh
   ```

4. Generate PEM public and private keys in RSA format:

   ```
   ssh-keygen -t rsa -b 2048 -v -m pem
   ```

   The key file must not use password protection.
5. Enter a name for the file in which to save the key when prompted, such as `appd-analytics`.

6. Rename the key file by adding the `.pem` extension:

   ```
   mv appd-analytics appd-analytics.pem
   ```

   You will later configure the path to it as the `sshKeyFile` setting in the Enterprise Console configuration file, as described in Deploying an Events Service Cluster.
7. Transfer a copy of the public key to the cluster machines. For example, you can use `scp` to perform the transfer as follows:

   ```
   scp ~/.ssh/myserver.pub host1:/tmp
   scp ~/.ssh/myserver.pub host2:/tmp
   scp ~/.ssh/myserver.pub host3:/tmp
   ```

   Continuing with the example, `myserver` should be `appd-analytics`.
   The first time you connect you may need to confirm the connection to add the cluster machine to the list of known hosts and enter the user's password.
8. On each cluster node (host1, host2, and host3), create the `.ssh` directory in the user home directory, if not already there, and add the public key you just copied as an authorized key:

   ```
   cat /tmp/appd-analytics.pub >> .ssh/authorized_keys
   chmod 600 ~/.ssh/authorized_keys
   ```

9. Test the configuration from the Controller machine by trying to log in to a cluster node by `ssh`:

```
ssh host1
```

> If unable to connect, make sure that the cluster machines have the `openssh-server` package installed and that you have modified the operating system firewall rules to accept SSH connections. If successful, you can use the Enterprise Console on the Controller host to deploy the Events Service cluster, as described next.

If the Enterprise Console attempts to install the Events Service on a node for which passwordless SSH is not properly configured, you will see the following error message:

```
./bin/platform-admin.sh add-hosts --hosts <es_host_1> <es_host_2> <es_host_3> --credential <credential name> --
platform-name <name of platform>
...
Failed to connect to the remote host. Please verify that the host name and credentials you provided are correct.
For more information, consult the documentation: https://docs.appdynamics.com/display/PRO45
/Administer+the+Enterprise+Console#AdministertheEnterpriseConsole-manage-hostsManageHosts
```

If you encounter this error, use the instructions in this section to double-check your passwordless SSH configuration. Also, you need to and `add-hosts` firs t then install `event-service`. If SSH configuration is not setup correctly, `add-hosts` commands will fail.

> The `add-hosts` command is to add hostnames into platforms. During the `events-service` installation, the hosts come from the platform hosts, and then they are used on the `events-service`.

Tune the Operating System for Production Cluster Nodes

Before installing the Events Service cluster, you need to perform a few manual changes as described below. These are particularly relevant for production Events Service deployments. On each node in the cluster, make these configuration changes:

1. Using a text editor, open `/etc/sysctl.conf` and add the following:

```
vm.max_map_count=262144
```

2. Raise the open file descriptor limit in `/etc/security/limits.conf`, as follows:

```
<username_running_eventsservice>     soft    nofile          96000
<username_running_eventsservice>     hard    nofile          96000
<username_running_eventsservice>     soft    memlock         unlimited
<username_running_eventsservice>     hard    memlock         unlimited
```

3. Disable swap memory by running the following command. Remove swap mount points by removing or commenting the lines in `/etc/fstab` that contain the word swap.

```
swapoff -a
```

Installing the Events Service Using the GUI

In the GUI, the Express Install option automatically installs an Events Service on the same host as the Controller. The Custom Install option can install an embedded or scaled-up Events Service. If you install an embedded Events Service and want to switch to a scaled-up Events Service, complete the steps described in Scaling Up an Embedded Events Service.

Installing the Events Service Using the CLI

1. Set up load balancing. See Load Balance Events Service Traffic for information about configuring the load balancer.
2. At the command line, navigate to the `platform-admin` directory created at Enterprise Console installation. See Install the Enterprise Console.
3. If it has been more than one day since your last session, you will have to log in with the following command:

```
bin/platform-admin.sh login --user-name <admin_username> --password <admin_password>
```

4. Create a platform as follows:

```
bin/platform-admin.sh create-platform --name <platform_name> --installation-dir
<platform_installation_directory>
```

The installation directory is the directory where the Enterprise Console installs all platform components.

> The same installation directory should exist and is used on all remote nodes. This is done to maintain the homogeneity of the configuration across different nodes.

5. Add the SSH key that the Enterprise Console will use to access and manage the Events Service hosts remotely. (See Create the SSH Key for more information):

```
bin/platform-admin.sh add-credential --credential-name <name> --type ssh --user-name <username> --ssh-
key-file <file path to the key file> --platform-name <name of platform>
```

`<file path to the key file>` is the private key for the Enterprise Console machine. The installation process uses the keys to connect to the Events Service hosts. The keys are not deployed, but instead, encrypted and stored in the Enterprise Console database.

The `platform-name` parameter is optional.

6. Add hosts to the platform, passing the credential you added to the platform:

```
bin/platform-admin.sh add-hosts --hosts es_host_1 es_host_2 es_host_3 --credential <credential name> --
platform-name <name of platform>
```

The `platform-name` parameter is optional.

7. On each Events Service destination node in the cluster, create an installation directory for the Events Service. This is the directory you specified as the `installation-dir` argument while creating the platform in step (2).
8. Again at the command line for the Enterprise Console machine, run the following command from the `platform-admin` directory. Pass the cluster configuration settings as arguments to the command. The format for the command is the following:

```
bin/platform-admin.sh submit-job --platform-name <platform-name> --service events-service --job install
--target-version <latest> --args profile=<dev> serviceActionHost=<es_host_1>
serviceActionHost=<es_host_2> serviceActionHost=<es_host_3>
```

The `platform-name` and `jvmTempDir` parameters are optional.

Arguments are:

- `jvmTempDir`: Use this argument to override default JVM temporary `/tmp` directory in Linux installations.
- `hosts`: Use this argument or `host-file` to specify the internal DNS hostnames or IP addresses of the cluster hosts in your deployment. With this argument, pass the hostnames or addresses as parameters. For example:

  ```
  --hosts 192.168.32.105 192.168.32.106 192.168.32.107
  ```

- `host-file`: As an alternative to specifying hosts as `--hosts` arguments, pass them as a list in a text file you specify with this argument. Specify the internal DNS hostname or IP address for each cluster host as a separate line in the plain text file:

  ```
  192.168.32.105
  192.168.32.106
  192.168.32.107
  ```

- `profile`: By default (with profile not specified), the installation is considered a production installation. Specifying a developer profile (`profile dev`) directs the Enterprise Console to use a reduced hardware profile requirement, suitable for non-production environments only. The Enterprise Console checks for the following resources:
  - For a dev profile, 1 core CPU, 1 GB RAM, and 2 GB disk space.
  - Otherwise, 4 core CPU, 12 GB RAM, and 128 GB of disk space.

For example:

```
bin/platform-admin.sh add-hosts --hosts ip-172-31-20-21.us-west-2.compute.internal ip-172-31-20-22.us-
west-2.compute.internal ip-172-31-20-23.us-west-2.compute.internal
```

If using a hosts text file, use the following command:

```
bin/platform-admin.sh add-hosts --hosts --host-file=/home/appduser/hosts.txt
```

9. Log in to each Events Service node machine, and run the script for setting up the environment as follows:

   > The `tune-system.sh` script is used for optimizing your environment. It is optional.

   a. Add execute permission to the `tune-system.sh` script:

   ```
   chmod +x tune-system.sh
   ./tune-system.sh
   ```

   b. Run the script:

   ```
   sudo <installation_dir>/events-service/processor/bin/tool/tune-system.sh
   ```

10. If you are using a load balancer, use the virtual IP for the Events Service as presented at the load balancer. Configure the Controller connection to the Events Service as follows:

    a. Open the Administration Console.
    b. In the Controller settings pane, find `appdynamics.on.premise.event.service.url` and change its value to the URL of the virtual IP for the Events Service at the load balancer.

    It may take a few minutes for the Controller and Events Service to synchronize account information after you modify connection settings in the console.

When finished, use the Enterprise Console for any Events Service administrative functions. You should not need to access the cluster node machines directly once they are deployed. In particular, do not attempt to use scripts included in the Events Service node home directories.
The Enterprise Console automatically updates the Controller configurations after installation.

Scaling Up an Embedded Events Service

The following steps describe how to scale up an Events Service that is on a shared host with the Controller. This allows the embedded Events Service to run on a separate host. You can also install the Events Service on a separate host directly by using the Custom Install.

1. Set up load balancing. See Load Balance Events Service Traffic for information about configuring the load balancer.
2. Open the Enterprise Console GUI.
3. Verify that the credentials and hosts you want to use are added to the AppDynamics platform. For more information, see Administer the Enterprise Console.

   a. On the **Credential** page, add the SSH credentials for the hosts on which you want to install the Events Service.
   b. On the **Hosts** page, add the hosts. The Enterprise Console uses these hosts for the scaled-up Events Service, which requires at least one host or three or more hosts.

4. On the **Events Service** page, navigate to More link and select the Events Service and click **Scale Up Events Service** under More and complete the wizard. When you enter hosts to use for a scaled-up Events Service, do not include the Controller host.

   > You do not need to restart the Controller since that is automatically done for you by the scale-up job.

5. Log in to each node machine, and run the script for setting up the environment as follows:

   ```
   sudo <installation_dir>/events-service/latest/bin/tool/tune-system.sh
   ```

6. Navigate to the **Controller** page.
7. By default, the Enterprise Console configures the Events Service connection in the Controller to refer to the first primary node defined in the cluster. If you are using a load balancer, as recommended, you need to change this Controller setting to point to the Events Service VIP as presented at the load balancer instead, as follows:

   a. Open the Administration Console.
   b. In the **Controller settings** pane, find `appdynamics.on.premise.event.service.url.`
   c. Change the value of the setting for the URL to the VIP for the Events Service at the load balancer.

8. By default, Database Monitoring stores events data in the Events Service embedded in the Controller. To have it use the Events Service you just deployed, ensure that the `appdynamics.on.premise.event.service.key` value matches with `ad.accountmanager.key.controller` value inside the events-service-api-store.properties file.

> Note that only newly generated Database Monitoring data will be stored in the Events Service; previously collected data will remain in the embedded Events Service instance unless it is migrated to the new Events Service. See Connect to the Events Service.

9. It may take a few minutes for the Controller and Events Service to synchronize account information after you modify connection settings in the Enterprise Console.

Troubleshooting Installation

If the Enterprise Console crashes or shuts down while installing the Events Service, the GUI may display that the installation is in progress. To resolve this issue, uninstall the Events Service with the CLI. Then, install the Events Service with the CLI.

Install the Events Service on Windows

Related pages:

- Events Service Requirements

You can install and administer the Events Service on Microsoft Windows systems as a single node or a cluster. Common use cases include:

- **Single-node Events Service** — Good for demonstration purposes and other scenarios where data redundancy and high availability are not required.
- **Three-node cluster** — The minimum size for a production Events Service cluster.
- **Cluster of four nodes or more** — For deployments where increased load or expected sizing exceeds the capacity of a three-node cluster.

Contact AppDynamics customer support if you anticipate deploying a cluster of 10 or more nodes.

Creating more than one instance of the same service type is not supported on Windows.

You do not need to specify the installation or data directory for the Events Service installation. If you do, use a different one from the platform directory.

Decide Which Node(s) to Make Master Nodes

Every Events Service node is either a master node or a data node. In an Events Service cluster, the master node both acts as a storage node, and manages the state of the data across the cluster, including the state of the replica. In a single-node deployment, there's not much for the master to do.

The master node is the first node to start up. If the master node becomes unavailable, the worker nodes attempt to elect a new master.

As you install Events Service, you specify the configuration for each node, which consists of two pieces of information:

- Whether to enable the node to serve as a master, and
- How many nodes (minimum) must be available in the cluster for a new master to be elected

This table describes what values to specify as you install:

Order of Node in the Deployment	Master-enabled?	Minimum available nodes required to elect a new master
First (only) node in a single-node installation	true	1
First, second, and third nodes of a three-node cluster	true	2
Fourth (or higher) node of a cluster	false	2

Specifying the installation or data directory is optional for the Events Service. If you do this, the directory you specify must not be the platform directory.

Installation Quick Start

Before you can install the Events Service on Windows, you must use Enterprise Console to install the Controller. The EUM Server must be installed separately as it cannot be installed using the Enterprise Console.

1. Install the Enterprise Console.
2. Use the Enterprise Console to create the platform and add hosts.
3. To install the Controller and Events Service on the same host, use the Express Install option.
   Use the Custom Install to install a scaled-out Events Service that runs on a host that is separate from the Controller. Custom installations provide more flexibility on where and how to install Controller and Events Service.
4. (Optional) Install the EUM Server.
5. Complete the post-install tasks for the Controller, Events Service, and EUM Server.

Deploy a Single-Node Events Service

Ensure that you have met all of the current Events Service Requirements, including:

- Have Java Runtime Environment (JRE) version = 1.8
- Defined Java in the Windows environment variable path, or a JRE folder that is accessible by `events-service.exe` in the relative path `..\..\jre`

To manually install the Events Service on a single node:

1. Unzip the Events Service distribution archive to a directory on the target host. This creates the `events-service` directory with the Events Service artifacts.
2. Begin configuring the connection to the Events Service in the Controller.
    a. With the Controller running, open the Administration Console as the root user.
    b. In the **Controller Settings** page, search for `appdynamics.on.premise.event.service.url`.
    c. Replace the default value to the internal hostname for the Events Service machine, and the default value for the Events Service listen port, 9080.
    For example: http://*hostname:9080*. Select **Save**.

    If you are putting a load balancer in front of the Events Service (required for a cluster), this will be the VIP for the Events Service as exposed at the load balancer. In this case, it is likely you will need to return to this step after you finish deploying the node and configuring the load balancer.

3. Obtain the Controller key:
    a. While on the **Controller Settings** page, search for the `appdynamics.on.premise.event.service.key` setting.

    If you do not install the default Events Service, then the `appdynamics.on.premise.event.service.key` setting is blank. To create the `appdynamics.on.premise.event.service.key`, use a UUID generator.

    b. Copy the setting's value. You will need this to complete Step 4.
    c. Close the Administration Console.
4. Configure the connection from the Events Service to the Controller:
    a. From your Windows Explorer, open the `events-service\conf\events-service-api-store.properties` file to edit.
    b. Locate the `controller-key` property and add it:

    ```
    ad.accountmanager.key.controller=controller-key
    ```

5. Verify the heap settings for the Events Service processes:
    a. Verify that the minimum and maximum heap settings for the two Events Service processes (the Events Service JVM, and the Elasticsearch processes, respectively) are correct and sufficient for your deployment.
    The settings:
        - Are located in the `events-service-api-store.properties` file.
        - Use `g` for gigabyte (GB) and `m` for megabyte (MB).
    b. For the Events Service process, verify:

    ```
    ad.jvm.options.name=events-service.vmoptions
    ad.jvm.heap.min=1g
    ad.jvm.heap.max=1g
    ```

    c. For the ElasticSearch process, verify:

    ```
    ad.es.jvm.options.name=events-service.vmoptions
    ad.es.jvm.heap.min=8g
    ad.es.jvm.heap.max=8g
    ```

    A production Elasticsearch installation requires 8 GB. For a demonstration installation, you can retain the default of 1 GB.

6. Save and close the `events-service-api-store.properties` file.
7. Install the Events Service as a Windows service, and open the command prompt as an Administrator:

> Do not use PowerShell to do this.

Change the directory to `events-service`, and then enter:

```
bin\events-service.exe service-install -p conf\events-service-api-store.properties --auto-start
```

- This command also installs Elasticsearch (even though it contains no explicit reference to Elasticsearch).
- The optional `auto-start` flag causes the Events Service to be installed as an automatically started service; without this flag, the Events Service is installed as a manually started service.
- For verbose installation and operation logging (useful for troubleshooting), include the `log-verbose` flag.

8. Locate the service name for the Events Service:

```
bin\events-service.exe service-list
```

9. Open the Windows services and select the **AppDynamics Events Service AppStore *xxxxx***. Select **Start**.
10. Check the health of the new node and verify service status:
    - If "Healthy" appears as the service status, then it indicates that the process is operating normally:

      ```
      bin\events-service.exe check-health -hp localhost:9081
      ```

      For the port, pass the administration port for the Events Service, 9081 by default.

      ```
      [appduser@controller-one events-service]$ bin/events-service.exe check-health -hp 192.168.33.22:
      9081
      [2015-12-09T18:30:45,342-08:00] HV000001: Hibernate Validator 5.0.2.Final
      [2015-12-09T18:30:45,956-08:00] Individual statuses below:
      [2015-12-09T18:30:45,956-08:00] [192.168.33.22:9081] status is [200 OK]
      [2015-12-09T18:30:45,956-08:00] Overall status Healthy
      ...
      ```

    - If the service status does not display as `Overall status Healthy`, then the service is unhealthy. To correct it, you need to determine the correct key mappings between the following Events Service configuration and the Controller settings:
      - `appdynamics.es.eum.key` should map to: `ad.accountmanager.key.eum`
      - `appdynamics.saas.event.service.key should map to: ad.accountmanager.key.controller`
      - `appdynamics.saas.event.service.key should map to:  ad.accountmanager.key.mds`

      i. If the values of the key mappings are blank in the Admin Console, then use a UUID generator to create them.
      ii. Use a UUID generator to create a value for `ad.accountmanager.key.ops`.
      iii. Use a UUID generator to create a different value for the following keys (you can use the same UUID for all three keys)
        - `ad.accountmanager.key.slm`
        - `ad.accountmanager.key.jf`
        - `ad.accountmanager.key.service`
11. Configure the connections from the Analytics Agent, EUM Server, or Database Monitoring agents to the Events Service, as described in Connect to the Events Service.

Deploy an Events Service Cluster (Three Nodes)

The following steps describe how to deploy an Events Service cluster made up of three nodes, the minimum size of the Events Service cluster. These steps apply whether you are performing a new installation of a cluster or expanding a single node deployment into a three-node cluster. For information on expanding beyond a three-node cluster, see Adding Nodes to a Cluster.

> Note that all services on Windows machines must be installed on the Enterprise Console host since the Enterprise Console does not support remote operations on Windows. Therefore, you cannot use the Enterprise Console GUI to deploy an Events Service cluster.

Before starting, review the topology notes in Events Service Deployment and make sure that all machines in the cluster meet the system requirements.

When ready, perform these steps on each of the three nodes.

1. Follow the steps for configuring a single node cluster in the 1-node installation above. *Additionally*, configure the following settings in the `conf\events-service-api-store.properties` file:

   a. Change the value of the `ad.es.node.minimum_master_nodes` property to 2:

```
ad.es.node.minimum_master_nodes=2
```

The setting specifies the minimum number of master-eligible instances that must be available in order to elect a new master. Since an Events Service cluster has three master nodes, this value should be two for a cluster.

b. Set the value of `ad.es.event.index.shards` to the number of nodes, in this case, three:

```
ad.es.event.index.shards=3
```

You do not need to change this value if it is already higher than the number of nodes.

c. Set the replication factor to 1 by changing the `ad.es.event.index.replicas` and `ad.es.metadata.replicas` properties, as follows:

```
ad.es.event.index.replicas=1
ad.es.event.index.hotLifespanDays=10
ad.es.metadata.replicas=1
```

d. For the unicast `hosts` property, add the hostname or IP address, along with the port 9300, for each node in the cluster:

```
ad.es.node.unicast.hosts=node1.example.com:9300,node2.example.com:9300,node3.example.com:9300
```

e. Change the publish host to the IP address or hostname of this machine. For example:

```
ad.es.node.network.publish.host=node2.example.com
```

f. Configure heap space for the Events Service and ElasticSearch processes, as follows:

i. To set the Events Service process heap size to 1 GB, for example, use the following properties:

```
ad.jvm.options.name=events-service.vmoptions
ad.jvm.heap.min=1g
ad.jvm.heap.max=1g
```

For the setting value, g indicates gigabyte (GB), and m indicates megabyte (MB).

ii. For the ElasticSearch process, the heap size should be set to half the size of the available RAM on the system, up to a maximum of 31 GB. To set the ElasticSearch process heap size to 8 GB, for example, set the properties as follows:

```
ad.es.jvm.options.name=events-service.vmoptions
ad.es.jvm.heap.min=8g
ad.es.jvm.heap.max=8g
```

For the setting value, g indicates gigabyte (GB), and m indicates megabyte (MB).

g. Save and close the file.

2. Install the Events Service as a Windows service:

```
bin\events-service.exe service-install -p conf\events-service-api-store.properties  --auto-start
```

The optional auto-start flag causes the Events Service to be installed as an automatically started service. If you do not include the flag, the Events Service is installed as a manually started service. An additional option, `log-verbose`, increases the verbosity of installation and operation logging, which is useful for troubleshooting.

3. Enter the following command to find the service name for the Events Service:

```
bin\events-service.exe service-list
```

4. Pass the service name returned by the service-list command as the -s parameter argument in the following command:

```
bin\events-service.exe service-start -s "<Name from service-list>"
```

Be sure to enclose the name in double-quotes.

5. Check the health of the new node using the following command. At least two nodes must be running before you run the command.

   ```
   bin\events-service.exe check-health -hp localhost:9081
   ```

   For the port, pass the administration port for the Events Service, 9081 by default. Verify that "Healthy" appears as the service status, indicating that the process is operating normally:

   ```
   [appduser@controller-one events-service]$ bin/events-service.exe check-health -hp 192.168.33.22:9081
   [2015-12-09T18:30:45,342-08:00] HV000001: Hibernate Validator 5.0.2.Final
   [2015-12-09T18:30:45,956-08:00] Individual statuses below:
   [2015-12-09T18:30:45,956-08:00] [192.168.33.22:9081] status is [200 OK]
   [2015-12-09T18:30:45,956-08:00] Overall status Healthy
   ...
   ```

6. Configure a load balancer to distribute traffic to the Events Service cluster, as described in Load Balance Events Service Traffic.
7. Connect the Controller and other clients—Analytics Agent, EUM Server, or Database Monitoring agents—to the Events Service, as described in Connect to the Events Service.

Expand an Events Service Cluster

The Events Service cluster is horizontally scalable. You can add nodes to an existing cluster without affecting or having to restart the existing nodes.

> ⚠ Note that all services on Windows machines must be installed on the Enterprise Console host since the Enterprise Console does not support remote operations on Windows. Therefore, you cannot use the Enterprise Console GUI to expand an Events Service cluster.

Before starting, prepare the new cluster machine. Verify system requirements and prepare the environment as described above.

For each node beyond the original three master nodes, download and configure the nodes as previously described. The configuration steps for any nodes added to the cluster after the initial three master nodes are as follows:

1. For each cluster nodes beyond the initial three master nodes, open the `conf\events-service-api-store.properties` for editing and make these configuration changes:
   a. Set the `ad.es.node.master` value to false:

      ```
      ad.es.node.master=false
      ```

   b. Set the `ad.es.node.minimum_master_nodes` value to 2.

      ```
      ad.es.node.minimum_master_nodes=2
      ```

   c. Set the value of `ad.es.event.index.shards` to the number of nodes in the cluster. You do not need to change this value if it is already higher than the number of nodes.

      ```
      ad.es.event.index.shards=<number_of_nodes>
      ```

      You do not need to change this value if it is already higher than the number of nodes.
   d. For the unicast hosts property, add the hostnames or IP addresses of all nodes in the cluster, including the node you are adding. For each node specify the ports on which the nodes communicate, 9300-9400. For example:

      ```
      ad.es.node.unicast.hosts=node1.example.com[9300-9400],node2.example.com[9300-9400],node3.example.com[9300-9400],node4.example.com[9300-9400]
      ```

      You do not need to reconfigure the unicast hosts settings for existing cluster members, as the new node can join the cluster dynamically.
   e. Change the publish host to the IP address or hostname of this machine. For example:

      ```
      ad.es.node.network.publish.host=node4.example.com
      ```

   f. Configure heap space for the Events Service and ElasticSearch processes, as follows:
      i. To set the Events Service process heap size to 1 GB, for example, use the following properties:

```
ad.jvm.options.name=events-service.vmoptions
ad.jvm.heap.min=1g
ad.jvm.heap.max=1g
```

For the setting value, g indicates gigabyte (GB), and m indicates megabyte (MB).

ii. For the ElasticSearch process, the heap size should be set to half the size of the available RAM on the system, up to a maximum of 31 GB. To set the ElasticSearch process heap size to 8 GB, set the properties as follows:

```
ad.es.jvm.options.name=events-service.vmoptions
ad.es.jvm.heap.min=8g
ad.es.jvm.heap.max=8g
```

For the setting value, g indicates gigabyte (GB), and `m` indicates megabyte (MB).

g. Save and close the file.

2. Install the Events Service as a Windows service:

```
bin\events-service.exe service-install -p conf\events-service-api-store.properties --auto-start
```

The optional auto-start flag causes the Events Service to be installed as an automatically started service. If you do not include the flag, the Events Service is installed as a manually started service. An additional option, `log-verbose`, increases the verbosity of installation and operation logging, which is useful for troubleshooting.

3. Enter the following command to find the service name for the Events Service:

```
bin\events-service.exe service-list
```

4. Pass the service name returned by the service-list command as the -s parameter argument in the following command:

```
bin\events-service.exe service-start -s "<Name from service-list>"
```

5. Check the health of the new node:

```
bin\events-service.exe check-health -hp localhost:9081
```

Note: At least two nodes must be running before you run the command.

For the port, pass the administration port for the Events Service, 9081 by default. Verify that "Healthy" appears as the service status, indicating that the process is operating normally:

```
[appduser@controller-one events-service]$ bin/events-service.bin check-health -hp 192.168.33.22:9081
[2015-12-09T18:30:45,342-08:00] HV000001: Hibernate Validator 5.0.2.Final
[2015-12-09T18:30:45,956-08:00] Individual statuses below:
[2015-12-09T18:30:45,956-08:00] [192.168.33.22:9081] status is [200 OK]
[2015-12-09T18:30:45,956-08:00] Overall status Healthy
...
```

6. Modify your load balancer rules to include the new cluster node. For more information, see Load Balance Events Service Traffic.

Start and Stop the Events Service

At installation, the Events Service is installed as a service and is left running upon completion of the installation. You can stop and stop it as a service or as a foreground process, as described here or by using the GUI.

Start and Stop as a Foreground Process

To start the Events Service as a foreground process, however, use the following command:

```
bin\events-service.exe start -p conf\events-service-api-store.properties
```

To stop the Events Service as a foreground process, use this command:

```
bin\events-service.exe stop
```

Stop and Start as a Windows Service

You can stop and start the Events Service as a Windows service from the Services Manager. You can also stop and start it using the `events-service.exe` tool, as here:

1. Enter the following command to find the service name for the Events Service:

   ```
   bin\events-service.exe service-list
   ```

2. Pass the service name returned by the `service-list` command as the `-s` parameter argument to the following command. Enclose the service name in double-quotes.

   ```
   bin\events-service.exe service-start -s "<Name from service-list>"
   ```

To stop the service, run this command:

```
bin\events-service.exe service-stop -s "<Name from service-list>"
```

Remove a Node

To remove a node that is not enabled for operation as a master node from the cluster, simply stop the Events Services on the node or remove the machine it runs on from the network.

Note the following guidelines:

- You cannot remove nodes such that the resulting cluster size is two
- A cluster that consists of three or more nodes can't be reduced in size to a single node Events Service.

After you remove a node, be sure to adjust your load balancer rules to remove the old cluster member. See Load Balance Events Service Traffic for more information.

If you are not using a load balancer with a cluster deployment, keep in mind that the connection settings for the first master node that reports to the Controller at installation time are written to the Controller setting that identifies the Events Service to the Controller. If you remove a master node in that case, check whether the removed master node is node identified as the Events Service destination URL in the Controller connection settings; adjust the setting if so. See Connect to the Events Service for more information.

To reconfigure an existing node to enable operation as a master node, or add a new node with the master option enabled:

```
ad.es.node.master=true
```

If reconfiguring a node, restart the node after changing the configuration.

Administer the Events Service

This component is available for on-premises deployments only. SaaS deployments are managed by AppDynamics.

This page describes how to manage Events Service with the Enterprise Console. All of these tasks can be performed on the GUI or CLI.

Start and Stop the Events Service

The Events Service is an internal data storage engine used by the Database Visibility module. To use Database Monitoring, you need to start the Events Service.

The Events Service is automatically started after you install it.

On Linux

Start the Events Service on Linux by running this command:

```
bin/platform-admin.sh submit-job --platform-name <platform_name> --service events-service --job start
```

Stop the Events Service by running this command:

```
bin/platform-admin.sh submit-job --platform-name <platform_name> --service events-service --job stop
```

On Windows

Start the Events Service on Windows by running this command:

```
bin/platform-admin.exe cli submit-job --platform-name <platform_name> --service events-service --job start
```

Stop the Events Service by running this command:

```
bin/platform-admin.exe cli submit-job --platform-name <platform_name> --service events-service --job stop
```

Monitor Cluster Node Health

It is important to carefully monitor the health of the Events Service cluster, for a new deployment, especially to monitor disk consumption.

You can check the status of the cluster from the Controller page in the Enterprise Console GUI or the Controller machine using this command:

```
bin/platform-admin.sh show-events-service-health
```

The output shows possible issues and the steps you need to take to resolve them. For example, if the available disk is low, the resolution is to add nodes to the cluster.

The following are the potential errors and remediation steps:

Error	Explanation	Remediation
Cluster out of capacity	If the heap size of any Events Service Java process exceeds 80% utilization	Add Events Service nodes
Disk size remaining drops below 30%	The disk size of the identified node dropped below 30%	Add Events Service nodes
Events Service is not reachable but the host is reachable	The Events Service process on the identified node is not functioning properly	Restart the node
Machine is not reachable	The machine may be down, disconnected, or suffering failure	Try restarting the machine; if it continues, the node may need to be removed from the cluster
Cluster needs restart	A condition has been identified that requires a cluster restart	Restart the cluster

Cluster size is 2	Events Service cluster requires more than two nodes	Add a node

Expand the Cluster

You can use the Enterprise Console GUI or CLI to horizontally scale the Events Service cluster on Linux. To grow your existing deployment to contend with an increased workload, simply add nodes.

Before starting, prepare the new cluster machine. Verify system requirements and prepare the environment as described in Events Service Requirements.

It is important for any new machine in the cluster to have the same SSH-enabled user account as existing cluster members.

Once you have prepared the system, run the command for adding nodes:

```
bin/platform-admin.sh add-events-service-nodes --hosts host1  host2  host3
```

Alternatively, pass the hostnames of the new node as a file.

```
bin/platform-admin.sh add-events-service-nodes --host-file=/home/appduser/hosts.txt
```

The file you pass to the command (`hosts.txt` in the example) should contain the internal DNS hostnames or IP addresses of the nodes to add. It does not need to list existing nodes in the cluster. These hosts should be part of the platform. For more information about how to add a host to the platform, see Administer the Enterprise Console.

Be sure to modify your load balancer rules to include the new cluster member in its routing rules. See Load Balance Events Service Traffic for more information.

Restart the Node

You can use the Enterprise Console GUI or CLI to restart your node.

Once you have prepared the system, run the command for restarting your node:

```
bin/platform-admin.sh submit-job --platform-name <platform_name> --service events-service --job restart-node --
args nodeActionHost=<node_name>
```

where <node_name> is the hostname of the node from the command:

```
bin/platform-admin.sh list-nodes --platform-name <platform_name> --service events-service
```

Restart the Cluster

You can use the Enterprise Console GUI or CLI to restart your cluster.

Once you have prepared the system, run the command for restarting your cluster nodes:

```
bin/platform-admin.sh submit-job --platform-name <platform_name> --service events-service -job restart-cluster
```

Remove or Replace a Node

The `uninstall-events-service` command removes the Events Service software and data from all cluster nodes. The Controller and Events Service share a database, so if you are uninstalling the Controller instance under which you ran the Enterprise Console to install the Events Service, you need to uninstall the Events Service with this command *before* you uninstall the Controller.

The `remove-events-service-node` command removes the Events Service software and data from a single node that you specify by hostname. You should only use this command if you have at least four nodes in your cluster. Removing an Events Service node from a three-node cluster is not supported. Identify the node to remove using the `--node` command line parameter.

After you remove a node, be sure to adjust your load balancer rules to remove the old cluster member. See Load Balance Events Service Traffic for more information.

If you are not using a load balancer with a cluster deployment, keep in mind that the connection settings for the first primary node that reports to the Controller at installation time are written to the Controller setting that identifies the Events Service to the Controller. If you remove a primary node in that case, check whether the removed primary node is node identified as the Events Service destination URL in the Controller connection settings (e.g., `appdynamics.on.premise.event.service.url`) and adjust the setting if so. See Connect to the Events Service for more information.

Note the following guidelines:

- You cannot remove nodes such that the resulting cluster size is two
- A cluster that consists of three or more nodes can't be reduced in size to a single node Events Service.

The `remove-events-service-node` command removes the Events Service software and data from a single node that you specify by hostname. You should only use this command if you have at least four nodes in your cluster. Removing an Events Service node from a three-node cluster is not supported. Identify the node to remove using the `--node` command line parameter.

This command removes the node specified in the argument:

```
bin/platform-admin.sh remove-events-service-node  --node 10.0.100.51
```

If you attempt to remove a primary node using the command shown above, the Enterprise Console notifies you that you are attempting to remove a primary node and cancels the operation. As indicated in the output, you can proceed to remove the primary node by rerunning the command with the `-f` for ce flag. When you remove a primary node, the cluster elects a new primary node from the existing data nodes. The election process may take a few seconds, during which new events cannot be processed. Be sure to perform this operation at a time when the impact of a brief interruption of service will be minimal.

If you have an unreachable node you would like to remove, but cannot due to the above restrictions, you can choose to replace it instead.

This command replaces the old node specified in the argument with the new node:

```
bin/platform-admin.sh submit-job --service events-service --job replace-node --args
originalNode=<old_host_address> newNode=<new_host_address>
```

- After removing the Events Service nodes from the cluster, you may observe that the value `appdynamics.es.eum.key` changed in the Controller `admin.jsp` and in the Events Service properties file, but not in the EUM properties file, `analytics.accountAccessKey`.
- Check if the key value changed in the Controller and the Events Service, then replace the key value with the EUM properties file: `analytics.accountAccessKey`.

Enable the Events Service to Use SSL

You can use the Enterprise Console CLI to enable the Events Service to use SSL. You will need a KeyStore file in JKS format, the password and the alias for the KeyStore. See Create a Certificate and Generate a CSR for detailed instructions for creating the Keystore.

1. Log in to the Enterprise Console:

   ```
   bin/platform-admin.sh login --user-name <admin_username> --password <admin_password>
   ```

2. After successfully logging in, submit an `enable-ssl` job for the Events Service, providing the path to the KeyStore file, the KeyStore password, and KeyStore alias.

   ```
   bin/platform-admin.sh submit-job --platform-name <platform_name> --service events-service --job enable-
   ssl --args keystorePath=<path-to-keystore-jks-file> keystorePassword=<keystore_password>
   keystoreAlias=<keystore_alias>
   ```

3. Confirm that SSL has been enabled:

   ```
   curl -k -v -X GET https://<events-service-domain>:9080/_ping
   ```

4. The output of the cURL command should show the TLS handshakes and the HTTP status 200:

```
...
* TLSv1.2 (OUT), TLS handshake, Client hello (1):
* TLSv1.2 (IN), TLS handshake, Server hello (2):
...
< HTTP/1.1 200 OK
< Date: Fri, 10 May 2019 00:13:49 GMT
< X-Content-Security-Policy: default-src 'self'
...
```

Collect Events Service Logs

The Enterprise Console can collect logs from the nodes in the cluster. The following command retrieves node logs and bundles them, along with the Enterprise Console's own logs:

```
bin/platform-admin.sh retrieve-events-service-logs
```

When the command is finished, a ZIP file named `events-service.log.zip` is created in the location from which you ran the script. You can then extract the archive to troubleshoot or submit the archive for troubleshooting assistance to your AppDynamics representative. If the Enterprise Console failed to connect to one of the cluster nodes to retrieve logs for any reason, the connection error is written to a log file included in the archive.

Changing the SSH Key File

After initial installation, you may need up update the PEM file that gives the Enterprise Console access to node machines.

You can do so by creating the PEM file, as described in the discussion of configuring SSH passwordless login on Prepare the Events Service Host, and using the following command to install the new PEM file.

```
bin/platform-admin.sh set-user-credentials --ssh-key-file newkeyfile.pem
```

The change takes effect immediately.

Upgrade the Events Service

You can use the Enterprise Console to perform a rolling upgrade of the Events Service software on deployed nodes. For more information, see Upgrade the Events Service Using the Enterprise Console.

The general steps for upgrading an Events Service deployment are as follows:

1. Upgrade the Controller. (See Upgrade the Controller Using the Enterprise Console.)
2. Apply the upgrade to the Events Service nodes using the following command:

```
bin/platform-admin.sh upgrade-events-service
```

The Enterprise Console checks whether the Events Service is up to date relative to the current Controller version and, if not, performs the update.

Monitor Events Service Nodes with AppDynamics

You can use AppDynamics agents to monitor an Events Service node or cluster and generate diagnostic information for troubleshooting. The following steps outline the workflow.

1. Download the following agents from the AppDynamics Download Center:
    - Java Agent
    - Standalone Machine Agent
2. Install both agents on each node in the cluster: first the Java Agent, then the Standalone Machine Agent.
3. On each node in the cluster, update the VM options for the Java Agent:
    a. Open the following file in a text editor:
    `<controller_home>/platform_admin/events-service/conf/events-service.vmoptions`
    b. Add the following lines to the end of the file:

```
-javaagent:/opt/appdynamics/events-service/java_agent/ver4.5.0.0/javaagent.jar
-Dappdynamics.agent.accountName=<account_name>
-Dappdynamics.agent.applicationName=<events_service_app_name>
-Dappdynamics.controller.hostName=<controller_host>
-Dappdynamics.controller.port=443
-Dappdynamics.controller.ssl.enabled=true
-Dappdynamics.agent.nodeName=<events_service_node_name>
-Dappdynamics.agent.tierName=<events_service_tier_name>
```

Adjust the path to the Java Agent JAR, account name, and other values as appropriate.

> The business application name (`events_service_app_name`) and tier name (`events_service_tier_name`) should normally be the same for all nodes in an Events Service cluster, while each node must have a unique name (`events_service_node_name`).

For more information on modeling applications in AppDynamics, see Application Modeling.

4. On each node in the cluster, define the Node Name and Tier Name used by the Standalone Machine Agent, as described in Independent Machine Agent Installation.

   > The Node Name and Tier Name for each Standalone Machine Agent should be the same as the `events_service_node_name` and `events_service_tier_name` that you specify on each node.

5. Restart the Events Service on all nodes in the cluster: on the Controller host, navigate to `<controller_home>/platform_admin/events-service/` and enter the following command: `/bin/platform-admin.sh restart-events-service`
6. In the Controller UI, go to the Applications table and open the dashboard for the events_service_app_name application. (You might need to wait a few minutes for this application to appear as the Events Services on the nodes restart and begin sending data to the Controller.)
7. In the Application Dashboard, choose **Configure** > **Instrumentation**.
8. Select the `events_service_tier_name` tier and choose **Use Custom Configuration for this Tier**.
9. Under Custom Match Rules, create a new rule with the following attributes:

   - Entry Point = **Servlet**
   - Split Transactions Using Request Data = Use the first **4** segments in Transaction names

Update the Java Temporary Directory for Events Service Nodes

You can set up an optional override of the temporary Java directory for the Events Service by using the Platform Admin in the CLI. Complete the steps below to update the Java Temporary Directory for the Event Service.

> After the Events Service settings update, the Events Service will require a restart initiated from the Platform Admin CLI or Enterprise Console GUI.

1. Run the command after installation:

```
/root/install/pa/platform-admin/bin/platform-admin.sh submit-job --service events-service --job
update_jvm_temp_dir --args jvmTempDir=/var/tmp
```

2. Make sure that the configuration is effective by running the following command:

```
/root/install/pa/platform-admin/bin/platform-admin.sh list-service-configurations --service events-service
```

3. Add the configurations for job `update_jvm_temp_dir`:

```
jvmTempDir (STRING): [/var/tmp]
```

4. To undo, use the following command:

```
/root/install/pa/platform-admin/bin/platform-admin.sh submit-job --service events-service --job
update_jvm_temp_dir
```

5. To add configurations for job `update_jvm_temp_dir` use the following command:

```
jvmTempDir (STRING): [null]
```

Load Balance Events Service Traffic

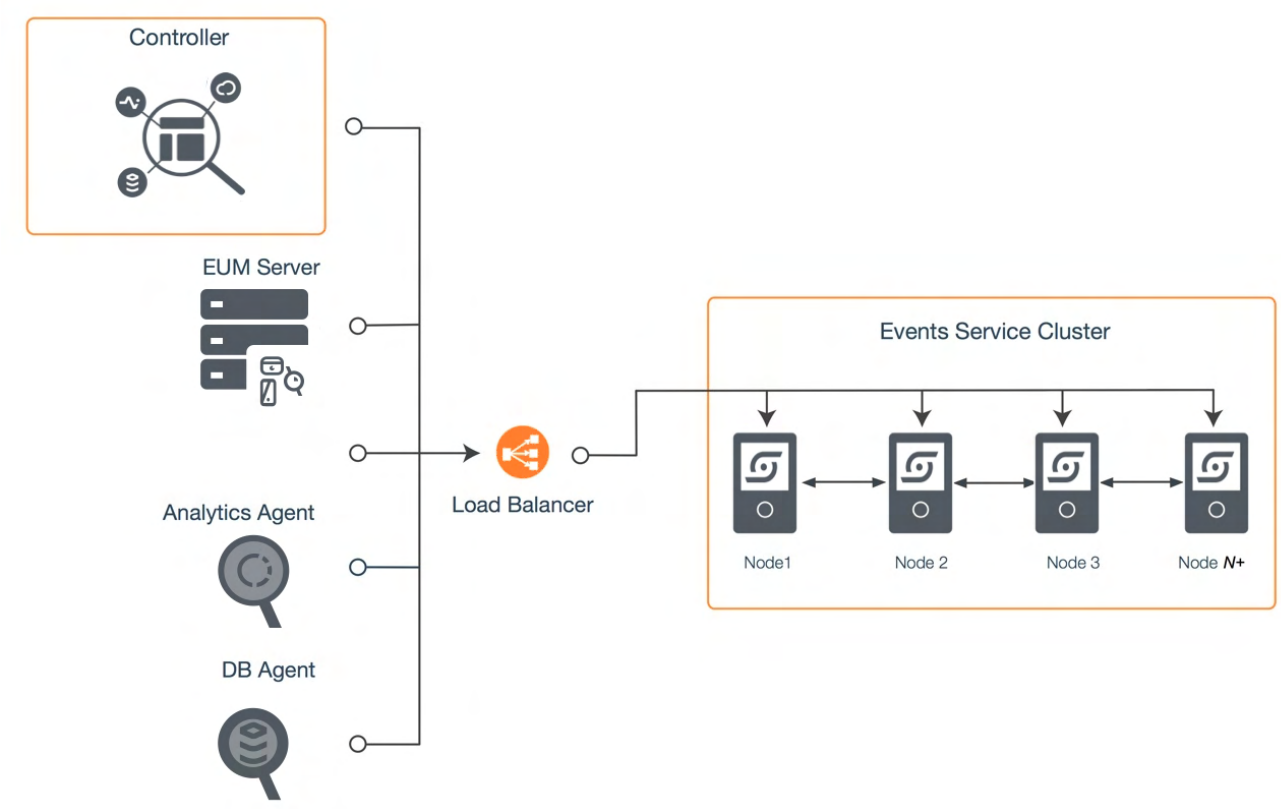
This page takes you through the sample configuration for a load balancer for the Events Service. It introduces you to the concepts and requirements around load balancing Events Service traffic.

Load Balancing Events Service Traffic Overview

To distribute load among the members of an Events Service cluster, you need to set up a load balancer. For a single node Events Service deployment, using a load balancer is optional but recommended, since it minimizes the work of scaling up to an Events Service cluster later.

To configure the load balancer, add the Events Service cluster members to a server pool to which the load balancer distributes traffic on a round-robin basis. Configure a routing rule for the primary port (9080 by default) of each Events Service node. Every member of the Events Service cluster, primary node or not, needs to be included in the routing rule. Keep in mind that increasing the size of the cluster will involve changes to the load balancer rules described here.

The following figure shows a sample deployment scenario. The load balancer forwards traffic for the Controller and any Events Service clients, Analytics Agents in this example.



About these Instructions

The following instructions describe how to install and configure a load balancer for the Events Service. The steps below provide two examples: load balancing with an Nginx and load balancing with HAProxy with SSL termination at the load balancer. The steps demonstrate commands in a CentOS 6.6 Linux operating system environment.

No two environments are exactly alike, so be sure to adapt the steps for your load balancer type, operating systems, and other site-specific requirements.

Nginx Sample Configuration

1. Install the Nginx software. You can install Nginx on most Linux distributions using the built-in package manager for your type of distribution, such as `apt-get` or `yum`. On a CentOS system, you can use `yum` as follows:

   ```
   sudo yum install epel-release
   sudo yum install nginx
   ```

2. Add the following configuration to a new file under the Nginx configuration directory, for example, to `/etc/nginx/conf.d/eventservice.conf`.

```
upstream events-service-api {
   server 192.3.12.12:9080;
   server 192.3.12.13:9080;
   server 192.3.12.14:9080;
   server 192.3.12.15:9080;
   keepalive 15;
}
server {
   listen 9080;
   location / {
      proxy_pass http://events-service-api;
      proxy_http_version 1.1;
      proxy_set_header Connection "Keep-Alive";
      proxy_set_header Proxy-Connection "Keep-Alive";
   }
}
```

In the example, there's a single upstream context for the API-Store ports on the cluster members. By default, Nginx distributes traffic to the hosts on a round-robin basis.

3. Check the following operating system settings on the machine:
   - Permit incoming connections in the firewall built into the operating system, or disable the firewall if it is safe to do so. On CentOS 6.6, use the following command to insert the required configuration in `iptables`:

     ```
     sudo iptables -I INPUT -p tcp --dport 9080 -j ACCEPT
     ```

     To turn off the firewall, you can run these commands

     ```
     sudo service iptables save
     sudo service iptables stop
     sudo chkconfig iptables off
     ```

   - Disable if necessary selinux security enforcement by editing `/etc/selinux/config` and setting `SELINUX=disabled`. Restart the computer for this setting to take effect.
4. Start Nginx:

   ```
   sudo nginx
   ```

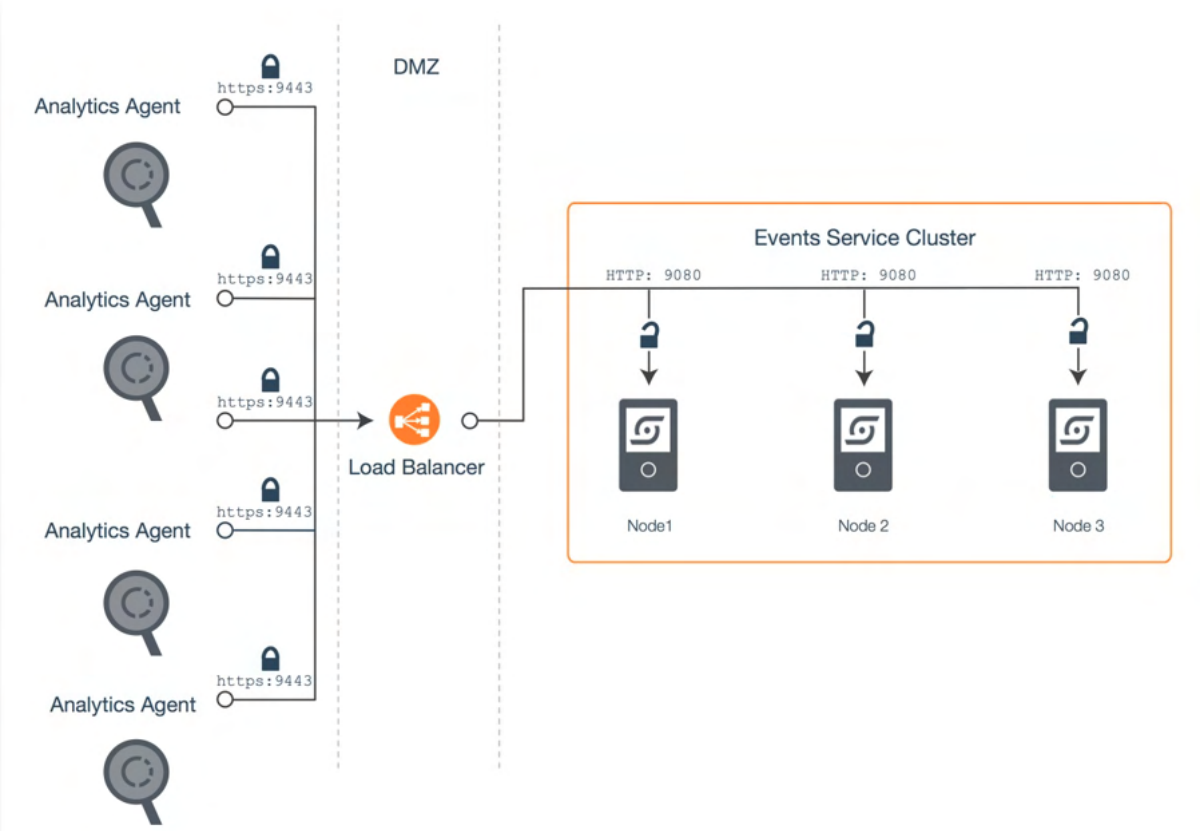
   Nginx starts and now direct traffic to the upstream servers. If you get errors regarding unknown directives, make sure you have the latest version of Nginx.

HA Proxy Sample Configuration: Terminating SSL at the Load Balancer

By terminating SSL at the load balancer in front of the Events Service cluster, you can relieve the Events Service machines from the processing burden of SSL. Since the connections between the load balancer and Events Service machines are not secured in this scenario, it is only suitable for deployments in which the load balancer and Events Service machines reside within an internal, secure network.

The following instructions describe how to set up SSL termination at the load balancer. These steps use HAProxy as the example load balancer. An overview of the steps are:

The following diagram shows a sample deployment reflected in the configuration steps:



Before Starting

To perform these steps, you need:

- Root access on the load balancer machine
- OpenSSL installed on the load balancer machine
- HAProxy software (minimum version HAProxy 1.5) on the load balancer machine

Step 1: Install the HAProxy Software

If not already installed, install HAProxy on the load balancer machine. The manner in which you install it depends on your operating system and the package manager it uses. If using `yum` package manager on Linux, for example, enter the following command:

```
sudo yum install haproxy
```

Step 2. Create the Security Certificate

The security certificate secures the connection between the load balancer and Events Service clients, including the Application Analytics Agent. You can use a self-signed certificate or a certificate signed by a certificate authority (CA) to secure the connection between the load balancer and clients. The following steps walk you through each scenario:

- Create a Self-Signed Certificate on the Load Balancer Machine
- Create a CA-Signed Certificate

For production use, AppDynamics strongly recommends the use of a certificate signed by a third-party CA or your own internal CA rather than a self-signed certificate.

Create a Self-Signed Certificate on the Load Balancer Machine

1. From the command line prompt on the Load Balancer machine, create a directory for the certificate resources and change to that directory:

   ```
   sudo mkdir -p /etc/ssl/private
   cd /etc/ssl/private/
   ```

2. Create the certificate by running the following command, replacing <number_of_days> with the number of days for which you want the certificate to be valid, such as 365 for a full year:

```
sudo openssl req -x509 -nodes -days <number_of_days> -newkey rsa:2048 -keyout ./events_service.key -out .
/events_service.crt
```

3. Respond to the prompts to create the certificate. For the Common Name, enter the hostname for the load balancer machine as identified by external DNS (that is, the hostname that agents will use to connect to the Events Service). This is the domain that will be associated with the certificate.
4. Put the certificate artifacts in a PEM file, as follows:

```
chmod 600 events_service.crt events_service.key
cat events_service.crt events_service.key > events_service.pem
chmod 600 events_service.pem
```

Create and Install a Certificate Signed by a Certificate Authority

1. From the command line prompt of the Load Balancer machine, create a directory for the certificate resources and change to that directory:

```
sudo mkdir -p /etc/ssl/private
cd /etc/ssl/private/
```

2. Generate a Certificate signing request (CSR) based on the private key. For example:

```
openssl req -new -sha256 -key /etc/ssl/private/events_service.key -out /etc/ssl/private/events_service.
csr
```

3. Submit the `events_service.csr` file to a third-party CA or your own internal CA for signing. When you receive the signed certificate, install it and the CA authority root certificate.
4. Depending on the format of the certificates returned to you by the Certificate Authority, you may need to put the certificate and key in PEM format, for example:

```
chmod 600 <ca_crt> events_service.key
cat <ca_crt> <intermediate_ca_crt_if_any> events_service.key > events_service.pem
chmod 600 events_service.pem
```

In the command, replace <ca_crt> with the certificate returned to you by the Certificate Authority. Include any intermediate CA certs, if present, when creating the PEM file.

Step 3. Configure the Load Balancer

1. Open the HAProxy configuration file for editing, `/etc/haproxy/haproxy.cfg`.
2. Insert the following configuration at the end of the file. Replace the placeholder addresses with the host names or IP addresses of the cluster machines. The port should be the primary listening ports of the Events Service nodes.

```
     frontend events_service_frontend
      bind *:9443 ssl crt /etc/ssl/private/events_service.pem
      mode tcp
      reqadd X-Forwarded-Proto:\ https
      default_backend events_service_backend

      backend events_service_backend
      mode tcp
      balance roundrobin
        server node1 192.3.12.12:9080 check
        server node2 192.3.12.13:9080 check
        server node3 192.3.12.14:9080 check
```

3. Start the HAProxy load balancer:

```
sudo service haproxy restart
```

Step 4: Configure the Agent

Perform these steps on each machine on which the Analytics Agent runs.

1. Transfer a copy of the signed certificate, `events_service.crt`, to the home directory (denoted as `$HOME` in the instructions below) of the machine running the agent using Secure Copy (`scp`) or the file transfer method you prefer.
2. Copy the certificate file to the directory location of the trust store used by the agent:

   ```
   cp $HOME/events_service.crt $JAVA_HOME/jre/lib/security/
   ```

3. Navigate to the directory and make a backup of the existing `cacerts.jks` file:

   ```
   cd $JAVA_HOME/jre/lib/security/
   cp cacerts.jks cacerts.jks.old
   ```

4. Import the certificate into the Java keystore:

   - If using a signed certificate, import the certificate as follows:

     ```
     keytool -import -trustcacerts -v -alias events_service -file /path/to/CA-cert.txt -keystore
     cacerts.jks
     ```

   - If using a self-signed cert, import the certificate as follows:

     ```
     keytool -import -v -alias events_service -file events_service.crt -keystore cacerts.jks
     ```

   When prompted, enter the password for the truststore (default is changeit) and enter yes when asked whether to trust this certificate.
5. Verify that the certificate is in the truststore:

   ```
   keytool -list -keystore cacerts.jks -alias events_service
   ```

6. Navigate to the installation folder of the Analytics Agent and edit `conf/analytics-agent.properties` to change the value of the HTTP endpoint property:

   ```
   http.event.endpoint=https://<External_DNS_hostname_Load_Balancer>:9080
   ```

7. Configure the following property names and pathways:

   ```
   https.event.trustStorePath=<absolute path to trust store>
   ```

   ```
   https.event.trustStorePassword=<base64 encoded password>
   ```

8. Start the Analytics Agent (or restart it, if it is already running).
9. Check the health of the agent. In a web browser, you can do so by going to the health check URL at `http://<analytics_agent_host>:9091/healthcheck?pretty=true`.

   If the agent is operating normally, the healthy field is set to true, as in the following example:

   ```
   "analytics-agent / Connection to https://<External_DNS_hostname_Load_Balancer>:9443/v1" :
   { "healthy" : true }
   ```

Step 5: Configure the Controller

If not already done, configure the connection from the Controller to the Events Service through the load balancer using a secure connection as well:

1. Transfer a copy of the signed certificate, `events_service.crt`, to the home directory (denoted as `$HOME` in the instructions below) of the machine running the Controller using Secure Copy (`scp`) or the file transfer method you prefer.
2. Navigate to the directory containing the Controller trust-store (as determined by the Controller startup parameter -Djavax.net.ssl.trustStore).
3. Make a backup of the existing `cacerts.jks` file:

```
cp cacerts.jks cacerts.jks.old
```

4. Import the certificate into the Java keystore:
    - If using a signed certificate, import the certificate as follows:

      ```
      keytool -import -trustcacerts -v -alias <ca_cert_name> -file /path/to/CA-cert.txt -keystore
      cacerts.jks
      ```

    - If using a self-signed cert, import the certificate as follows:

      ```
      keytool -import -v -alias events_service -file events_service.crt -keystore cacerts.jks
      ```

    When prompted, enter the password for the truststore (default is changeit) and enter yes when asked whether to trust this certificate.
5. Verify that the certificate is in the truststore:

   ```
   keytool -list -keystore cacerts.jks -alias events_service
   ```

6. Restart the Controller.
7. From the Administration Console, search for the following Controller Setting: `appdynamics.on.premise.event.service.url`.
8. Set its value to the Load Balancer URL value: `https://<External_DNS_hostname_Load_Balancer>:9443/v1`

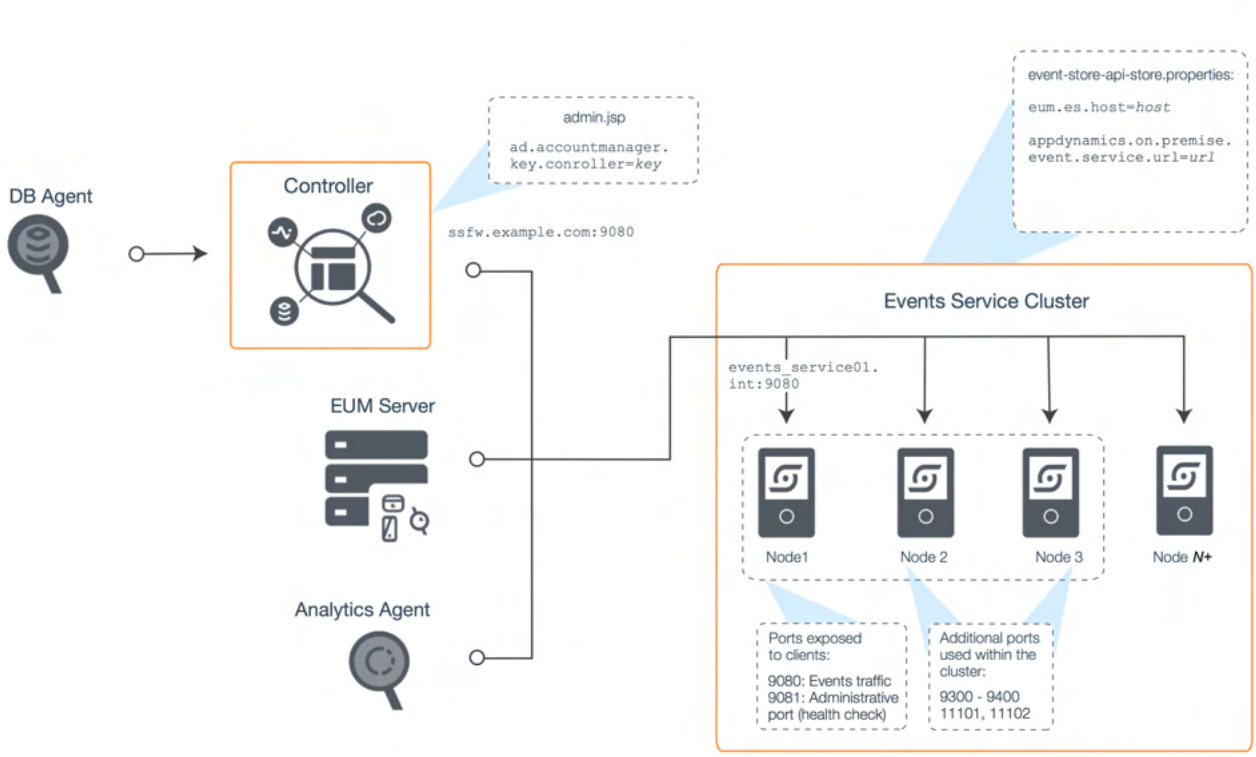
You can now verify that the Analytics UI is accessible and showing data.

Connect to the Events Service

This component is available for on-premises Controllers only. SaaS Controllers are managed by AppDynamics.

You must be connected to the AppDynamics Events Service to send data to it. AppDynamics uses API keys and connection URLs to establish connections between components.

You can configure these connection settings on the **Controller Settings** page of the **Admin Console** (see Access the Administration Console). The following sections describe the required connection settings for Database Visibility, Analytics, and End User Monitoring.



Database Visibility and Analytics Connection Settings

The Database Visibility module stores some of its data (such as wait state information and query information) in the Events Service. The Database Visibility module is the Database Monitoring product, which is already bundled with the controller. If you have both Analytics and Database Visibility installed, we recommend that they share an Events Service instance or cluster instance.

To connect these modules to the Events Service, open the **Admin Console** > **Controller Settings** and set values for the following properties:

- Set `appdynamics.on.premise.event.service.key` to the corresponding key in the properties file for Database Visibility.
- Set `appdynamics.on.premise.event.service.url` to the Events Service endpoint URL.
- Set `appdynamics.non.eum.events.use.on.premise.event.service` to `true`.

To set up the properties files required for Database Visibility:

1. Make note of the `appdynamics.on.premise.event.service.key` value from the **Admin Console**.
2. Open the file called `events-service-api.properties`, which you can find under the Events Service conf directory.
3. In the Events Service file, `events-service-api-store.properties`, ensure that the On-Premise Events key matches with the values of `ad.accountmanager.key.controller` and `ad.accountmanager.key.mds`
    a. See Configure the Events for details.
4. Stop and start the Analytics Service through the Enterprise Console or command line to pick up the new values.

End-User Monitoring Connection Settings

1. Open **Admin Console > Controller Settings**
2. Locate `eum.es.host` and verify it is set to the proper Events Service endpoint URL.
3. Navigate to the `<EUM_HOME>/eum-processor/bin/eum.properties` file
4. Set the following property values to connect the EUM to the Events Service:

Sample

```
analytics.enabled=true
analytics.serverScheme=http
analytics.serverHost=events.service.hostname
analytics.port=9080
analytics.accountAccessKey=1a59d1ac-4c35-4df1-9c5d-5fc191003441
```

5. Open the **Admin Console** > **Controller Settings**
6. Set the `eum.es.host` to the Events Service endpoint URL.

The value of `appdynamics.es.eum.key` will automatically be set to the property `analytics.accountAccessKey` of the file `<EUM_HOME>/eum-processor/bin/eum.properties`.

Proxy Connection Settings

If you are connecting Database Visibility or Analytics through a proxy, you must set values for the following properties:

- `appdynamics.on.premise.event.service.proxy.host`
- `appdynamics.on.premise.event.service.proxy.port`
- `appdynamics.on.premise.event.service.proxy.user`
- `appdynamics.on.premise.event.service.proxy.password.file`
- `appdynamics.on.premise.event.service.proxy.use.ssl`

If you are connecting EUM through a proxy, you must set values for the following properties:

- `appdynamics.controller.http.proxyHost`
- `appdynamics.controller.http.proxyPort`
- `appdynamics.controller.http.proxyUser`
- `appdynamics.controller.http.proxyPasswordFile`

Back Up Events Service Data

Backing up Events Service data helps you to recover from hardware or another type of failure of an Events Service machine. A snapshot represents the backed up data for the entire Events Service cluster. In addition to using it for failure recovery, you can use a snapshot to migrate Events Service to a new instance.

The Events Service tool—`events-service.sh` for Linux and `events-service.exe` for Windows—includes commands for preparing the system for backing up with snapshots, generating a snapshot, and restoring from a snapshot, as described below.

The following instructions show sample commands for Linux. If using Windows, be sure to use the `events-service.exe` form of the executable rather than the `.sh` form, and adjust the sample directory paths as needed.

Prepare the File System

When planning your backup strategy, it is important to consider the storage location and frequency of backups. The system that will serve at the repository for snapshots must be able to handle high I/O demands in a performant manner. SSD-based storage is recommended. Also, ensure you have enough disk space on the repository system.

Only the first snapshot results in a full copy of the data. Each subsequent snapshot is incremental, applying only the changes since the last snapshot. Backing up frequently, therefore, does not result in substantially more storage overhead than backing up infrequently.

The Events Service includes tools for setting up the snapshot repository. It supports the following snapshot repository location types:

- A file system location that is shared among the Events Service nodes.
- An Amazon S3 bucket

After choosing and preparing the system that will host the snapshot, set up each Events Service node as follows:

1. If using FS, mount the shared filesystem at the default location for the backup repository, `<appd_home>/events-service/appdynamics-events-service-backup`. To change this backup location, set the the `ad.es.backupmanager.path.repo` setting in `conf/events-service-api-store.properties`. Keep in mind, however, that changing the properties file requires a restart of the Events Service node to have the change take effect.
2. Set up the repository on each node. Use the appropriate command for your repository type:
    - For shared file system:

      ```
      bin/events-service.sh snapshot-configure-fs -p conf/events-service-api-store.properties
      ```

    - For Amazon S3:

      ```
      bin/events-service.sh snapshot-configure-s3 -p conf/events-service-api-store.properties -bucket "s3-bucket-name"
      ```

      The `snapshot-configure-s3` command accepts additional optional arguments, including arguments for passing the access key and secret key for S3. Run `"bin/events-service.sh -h"` to view all options.

    Look for a message similar to the following to verify that the configuration succeeded:

    ```
    [2015-12-17T15:43:04,092-08:00] Successfully configured snapshot repository!
    ```

Create a Snapshot

After setting up the repository, you can generate a snapshot of the Events Service data. If you are backing up a cluster, you only need to run the command from one of the primary nodes. If you have more than one cluster, generate a snapshot for each one. Snapshots are cluster-specific.

Generate a snapshot:

```
bin/events-service.sh snapshot-run -p conf/events-service-api-store.properties
```

You can use this command to script regular backups based on your backup policy. The following output indicates that backup was successful:

```
Take snapshot request executed successfully. Snapshot itself may still be in progress.
```

To check the progress of the snapshot, use `snapshot-status`.

```
bin/events-service.sh snapshot-status -p conf/events-service-api-store.properties
```

If you don't specify a snapshot ID, the command gets the status for the most recent snapshot. You can use the `snapshot-list` command to see a list of available snapshots.

Restore from a Snapshot

By restoring a snapshot, you replace the data store configured for the Events Service with one that was previously saved as a snapshot. When you restore from a snapshot, you restore from a snapshot for a specific cluster. Run the command for each cluster

To restore a snapshot, use the `snapshot-restore` command, passing the properties file for the Events Service instance you are backing up. The following shows an example with sample output:

```
bin/events-service.sh snapshot-restore -p conf/events-service-api-store.properties
[2015-12-17T17:02:52,264-08:00] HV000001: Hibernate Validator 5.0.2.Final
[2015-12-17T17:02:52,811-08:00] Restore snapshot request executed successfully. Restore is now in progress. Use
the snapshot-status command to view the current restore status.
```

Check the status of the snapshot restore using the `snapshot-restore-status` command. For example:

```
bin/events-service.sh snapshot-restore-status -p conf/analytics-api-store.properties
[2017-01-03T14:37:46,647-08:00] HV000001: Hibernate Validator 5.2.2.Final
[2017-01-03T14:37:47,027-08:00] Restore is complete, your cluster should be fully functional!
```

You can restore a specific snapshot by passing the snapshot ID with the command. Otherwise, the most recent snapshot is restored.

```
bin/events-service.sh snapshot-restore -p conf/events-service-api-store.properties -id <snapshot_id>
```

You can use the `snapshot-list` command to get a list of snapshot IDs.

Migrating Events Service Data

In addition to data backup and recovery, you can use the snapshot utility to migrate data from one Events Service instance to another.

The target Events Service needs to be a fresh installation; that is, data in two different Events Service instances cannot be merged. Be sure to avoid configuring the Events Service URL with the new instance location in the Controller configuration until you have completed these steps.

To migrate Events Service data, follow these general steps:

1. Prepare the new Events Service nodes, as described above.
2. On each new Events Service node, mount the shared directory where the repository is located.
3. From a primary node in the new cluster, restore the snapshot by ID, as described above, passing the property file that defines the new cluster as the `-p` argument.
4. When finished, change the connection from the Controller to the Events Service and any Events Service clients, as described in Connect to the Events Service, to use the new instance.

Upgrade the Events Service

On this page:

Related pages:

- Data Field Naming for Events Service 4.5.3 and Above

You can upgrade the Events Service either manually or by using the Enterprise Console.

You must upgrade manually if you:

- Do not use the Enterprise Console to deploy the Events Service
- Upgrade Events Service nodes hosted on remote Windows machines. The Enterprise Console does not support remote operations on Windows.

For on-premises deployments, 4.5.2 is the latest version of the Events Service. If you upgrade to a version of the Events Service other than the latest, run the Enterprise Console installer for the desired Events Service version.

For SaaS deployments upgrading to Events Service version 4.5.3 or later, modify your data field names to conform to the latest requirements, as described here.

Before the Upgrade

AppDynamics removed Search Guard from the on-premises Events Service version 4.5.2.20561. If your deployment requires Search Guard or a comparable feature, do not upgrade to this version of the Events Service.

AppDynamics will provide an alternative security feature with the next on-premises Events Service release.

See the Support Advisory for more details.

1. Download and install the new Enterprise Console.
2. Plan the order in which to upgrade platform components (not just Events Service).
3. Modify the `events-service-api-store.properties` file.
    - Replace the absolute path `APPLICATION_HOME` property in the file with an actual path.
    - This is required because while performing a discover and upgrade job, the Enterprise Console is unable to migrate the data directory for custom environment variables in the file. Failure to modify the file causes the upgraded Events Service to start with a new, blank data set.
4. Back up your `events-service.vmoptions` file.
    - This is required because the `events-service.vmoptions` file is not maintained when the Events Service is upgraded. After the upgrade completes, merge your backup copy of `events-service.vmoptions` into the new file.

Upgrading to a pre-4.1 Events Service

To upgrade the Events Service software to a version earlier than 4.1, you must first manually upgrade the service to 4.1, and then use the Enterprise Console to discover the Events Service nodes.

Upgrade the Events Service

1. Run the upgrade Events Service command.
2. Discover the Events Service nodes using the Enterprise Console.

Verify the Upgrade

Once the upgrade completes:

1. The Events Service process should have restarted—verify its health status in the Enterprise Console GUI.
2. Merge your backup copy of the `events-service.vmoptions` file into the new copy of the file created by the upgrade.

Startup Script Paths

After an upgrade, you will find the Events Service startup script paths below:

```
<installDir>/appdynamics/events-service/processor/bin/events-service.sh
```

This may be different from their paths before the upgrade.

Upgrade the Events Service Using the Enterprise Console

This page describes how to upgrade a scaled-out Events Service on primarily Linux machines using the Enterprise Console.

Upgrade the Events Service Using GUI

If there is a Events Service upgrade available, you can begin the upgrade process either on the Custom Install or Events Service page in the GUI.

> You do not need to stop the Events Service before upgrading because the Enterprise Console does this for you.

After you upgrade the Events Service, upgrade the EUM server if it is part of your deployment. Then, upgrade the Controller.

Upgrade the Events Service from 4.1.x, 4.2.x, and 4.3.x to 4.4.x or Latest

> The Enterprise Console supports the installation of the Events Service on a Windows environment for a single node install. If you have several remote nodes, you will need to do a manual upgrade of the Events Service cluster and set the keys manually. See Connect to the Events Service

> The Enterprise Console manages the Controller and Events Service together, so their keys found in `events-service-api-store.properties` are set and synced to each other upon upgrade. However, we recommend confirming that the keys were synced correctly: `appdynamics.on.premise.event.service.key == ad.accountmanager.key.controller`

To upgrade the Events Service from 4.1.x, 4.2.x, and 4.3.x to 4.4.x or the latest version, you can use the Discover and Upgrade feature:

1. Check that you have fulfilled the Enterprise Console prerequisites before starting.
2. Open a browser and navigate to the GUI:

   ```
   http(s)://<hostname>:<port>
   ```

   9191 is the default port.
3. Navigate to the **Install** homepage and click **Custom Install**.
4. Name the Platform:

   a. Enter a Name and the Installation Path for your platform.

   > The Installation Path is an absolute path under which all of the platform components are installed. The same path is used for all hosts added to the platform. Use a path which does not have any existing AppDynamics components installed under it. The path you choose must be writeable, i.e. the user who installed the Enterprise Console should have write permissions to that folder. Also, the same path should be writable on all of the hosts that the Enterprise Console manages.
   >
   > Example path: `/home/appduser/appdynamics/product`

5. Add a Host:

   > Note that all services on Windows machines must be installed on the Enterprise Console host since the Enterprise Console does not support remote operations on Windows. Therefore, you cannot add a host in a Windows Enterprise Console machine.

   a. Enter the host machine-related information: Host Name, Username, and Private Key. This is where the Events Service will be upgraded. Therefore, this needs to point to the host machine where the Events Service is currently up and running. For more information about how to add credentials and hosts, see Administer the Enterprise Console.
6. Click **Platforms**. Select the newly created platform and navigate to the **Events Service** page.
7. Discover Events Service:
   a. Select **Discover & Upgrade Events Service**.
   b. Select an available Target Version from the dropdown.

   > The list is populated by versions that the Enterprise Console is aware of. This means that you can upgrade the Events Service to any intermediate version or to the latest version as long as the Enterprise Console installer has been run for those versions.

   c. Enter the Installation Directory.
   d. Enter the Events Service Host.
8. Click **Submit**.

The Enterprise Console will onboard the Events Service on the selected host machine to the application build. When the Enterprise Console discovers a component, it also checks to see if an upgrade is available and performs the upgrade. Plan for a downtime of the Events Service availability during this time. You can view the status of the upgrade job on the Jobs page.

Once the upgrade is complete, the Events Service Health status and related information can be accessed from the Events Service page.

After upgrading to 4.4.x or the latest, the commands to start and stop the Events Service change. See Administer the Events Service for more information.

Upgrade the Events Service from 4.4.x to Latest

To upgrade the Events Service from 4.4.x to the latest version, you can use the Upgrade Events Service feature:

1. Check that you have fulfilled the Enterprise Console prerequisites before starting.
2. Upgrade the Enterprise Console to the latest version.
3. Open a browser and navigate to the GUI:

   ```
   http(s)://<hostname>:<port>
   ```

   The default port is 9191.
4. Navigate to the **Events Service** page of the platform.
5. Select the Events Service host you would like to upgrade.
6. Click **Upgrade Events Service**.
7. Select an available Target Version from the dropdown list.

   The list is populated by versions that the Enterprise Console is aware of. This means that you can upgrade the Events Service to any intermediate version or to the latest version as long as the Enterprise Console installer has been run for those versions.
8. Confirm the Upgrade.

Upgrade the Events Service Using CLI

If there is an Events Service upgrade available, you can begin the upgrade process using the application CLI.

You do not need to stop the Events Service before upgrading because the Enterprise Console does this for you.

After you upgrade the Events Service, upgrade the EUM server if it is part of your deployment. Then, upgrade the Controller.

Upgrade the Events Service from 4.1.x, 4.2.x, and 4.3.x to 4.4.x or Latest

To upgrade the Events Service software from 4.1.x, 4.2.x, and 4.3.x to 4.4.x or the latest version, you will need to first download and install the Enterprise Console installer before performing the following steps:

1. Create a platform as follows:

   ```
   bin/platform-admin.sh create-platform --name <platform_name> --installation-dir
   <platform_installation_directory>
   ```

   The installation directory is the directory where the Enterprise Console installs all platform components.

   To avoid any failures, do not use the 4.3 or earlier Platform Admin installation directory. Instead, provide a new/empty directory.
2. Add the SSH key that the Enterprise Console will use to access and manage the Events Service hosts remotely. (See Create the SSH Key for more information):

   ```
   bin/platform-admin.sh add-credential --credential-name <name> --type ssh --user-name <username> --ssh-
   key-file <file path to the key file>
   ```

   `<file path to the key file>` is the private key for the Enterprise Console machine. The installation process deploys the keys to the Events Service hosts.

3. Add hosts to the platform, passing the credential you added to the platform:

```
bin/platform-admin.sh add-hosts --hosts es_host_1 es_host_2 es_host_3 --credential <credential name>
```

4. Discover the Events Service nodes that are not yet integrated:

```
bin/platform-admin.sh submit-job --service events-service --job discover-upgrade --platform-name
<name_of_the_platform> --args destinationDirectory=<path_to_events_service> serviceActionHost=<es_host_1
es_host_2 es_host_3>
```

   This command integrates the nodes into the Enterprise Console and also upgrades them. If your upgrade fails, you can resume by passing the flag `useCheckpoint=true` as an argument after `--args.`

After upgrading to 4.4.x or the latest, the commands to start and stop the Events Service change. See Administer the Events Service for more information.

Upgrade the Events Service from 4.4.x to Latest

Upgrades from 4.4.x to the latest version can be performed on the Events Service page of the Enterprise Console or with the following commands:

1. Upgrade the Enterprise Console to the latest version.
2. Navigate to the `<Enterprise Console home directory>/platform-admin directory`.
3. If it has been more than one day since your last session, you will have to log in with the following command:

```
bin/platform-admin.sh login --user-name <admin_username> --password <admin_password>
```

4. Apply the upgrade to the Events Service nodes with the following command:

```
bin/platform-admin.sh submit-job --service events-service --job upgrade --platform-name
<name_of_the_platform>
```

   If your upgrade fails, you can resume by passing the flag `useCheckpoint=true` as an argument after `--args.`

Upgrade the Events Service Manually

This page describes how to manually upgrade an Events Service. This is useful for when you did not use the Platform Administration Application or the Enterprise Console to deploy the Events Service. The primary case for this would be for when you need to upgrade the Events Service nodes hosted on remote Windows machines.

Perform the Manual Upgrade

> **Prerequisite**
>
> Java 1.8 is required for `events-service.exe` to work.

To upgrade the Events Service manually:

1. Download the Events Service distribution, `events-service.zip`, from the AppDynamics download site to the Events Service machine.
2. Stop the Events Service processes:

   ```
   bin/events-service.sh stop
   ```

3. Rename the existing Events Service directory, for example, to `events-service-backup`.
4. Unzip the Events Service distribution archive you downloaded to the location where you want the Events Service to run.
5. Migrate configuration changes from the properties files in the backup Events Service directory to the `conf/events-store-api-store.properties` file in the new Events Service directory. Depending on which type of deployment you are using, this involves inspecting and migrating settings from:
   - `events-service-all.properties`, or
   - `events-service-api-store.properties`

   > If you are upgrading from 4.2 to 4.3.x or a later version you must edit the `events-service-api-store.properties` file by replacing the port ranges [9300-9400] with :9300.
   >
   > For example, in 4.2, the `events-service-api-store.properties` file looks like this:
   >
   > ```
   > ad.es.node.unicast.hosts=node1.example.com[9300-9400],node2.example.com[9300-9400],node3.example.com[9300-9400]
   > ```
   >
   > While in 4.3 or later, the file should look like this:
   >
   > ```
   > ad.es.node.unicast.hosts=node1.example.com:9300,node2.example.com:9300,node3.example.com:9300
   > ```

6. Configure the connection to the Events Service in the Controller, and get the Controller key for the Events Service configuration as follows:
   a. With the Controller running, open the Administration Console as the root user.
   b. In the Controller Settings page, search for `appdynamics.on.premise.event.service.url`.
   c. Replace the default value to the internal hostname for the Events Service machine and default Events Service listen port, 9080.
   d. Search for an additional setting, the one you will need to enable the connection from the Events Service to the Controller, `appdynamics.on.premise.event.service.key`.
   e. Copy the value of the property to your clipboard. You will need to configure this in the Events Service properties file next.
7. Configure the connection from the Events Service to the Controller:
   a. In a terminal, navigate to the `events-service` directory:

      ```
      cd events-service
      ```

   b. Open the `conf/events-service-api-store.properties` file for editing.
   c. Find the following property and replace `controller-key` with the copied key:

      ```
      ad.accountmanager.key.controller=controller-key
      ```

8. Ensure that the following critical properties are configured appropriately in the `events-service-api-store.properties` file:
   - `ad.accountmanager.keyNamesCSV=EUM,CONTROLLER,MDS,OPS,SLM,JF`
   - `ad.accountmanager.key.eum=`
   - `ad.accountmanager.key.controller=`

- ad.accountmanager.key.mds=
- ad.accountmanager.key.ops=
- ad.accountmanager.key.slm=
- ad.accountmanager.key.jf=
- ad.accountmanager.key.service=
- ad.jvm.heap.min=1g
- ad.jvm.heap.max=1g
- ad.es.jvm.heap.min=1g
- ad.es.jvm.heap.max=1g

9. Move ad.es.node.unicast.hosts property in events-services-api-store.properties while upgrading from 4.2 to 4.3.x or later.
10. Save and close the events-service-api-store.properties file.
11. Verify that the new Events Service home directory exists. The Event Service home directory is determined by the ad.es.path.home property in the property file used to start up the Events Service.
    If the directory does not exist, create it. For example, create the following directory: /opt/appdynamics/events-service/appdynamics-events-service
12. Move (do not copy) the old Events Service data directory to the new Events Service home directory. For example:

    ```
    mv /opt/appdynamics/events-service-backup/appdynamics-events-service/data /opt/appdynamics/events-service
    /appdynamics-events-service/
    ```

13. Restart the Events Service processes from the new directory:

    ```
    nohup bin/events-service.sh start -p conf/events-service-api-store.properties &
    ```

14. Check the health of the node.
    Windows
    `bin\events-service.exe check-health -hp localhost:9081`
    Linux
    `curl -XGET localhost:9081/healthcheck?pretty=true`

    Verify that "Healthy" appears as the service status, indicating that the process is operating normally:

    ```
    [appduser@controller-one events-service]$ bin/events-service.exe check-health -hp 192.168.33.22:9081
    [2015-12-09T18:30:45,342-08:00] HV000001: Hibernate Validator 5.0.2.Final
    [2015-12-09T18:30:45,956-08:00] Individual statuses below:
    [2015-12-09T18:30:45,956-08:00] [192.168.33.22:9081] status is [200 OK]
    [2015-12-09T18:30:45,956-08:00] Overall status Healthy
    ...
    ```

15. Configure the connections from the Analytics Agent, EUM Server, or Database Monitoring agents to the Events Service, as described in Connect to the Events Service.
    For information on performing these steps, see Install the Events Service on Windows.

If you upgrade to 4.4.x from 4.3.x or an earlier version, the commands to start and stop the Events Service change. See Administer the Events Service for more information.

Data Field Naming for Events Service 4.5.3 and Above

This page explains how to update data field names.

To use this procedure appropriately for your deployment, follow the guidelines below.

Deployment	Version	Required Action
SaaS	4.5.3 and later	Update data field names as described below.
On-premises	4.5.2 and older	No action is required, but AppDynamics strongly recommends that you update data field names to prepare for future Events Service releases.

Update Overview

Version 4.5.3 of the Events Service runs Elasticsearch 5.6, whereas previous Events Services run earlier versions of Elasticsearch. To upgrade to Events Service 4.5.3, you may need to rename some fields used in collecting transaction analytics, log analytics, or other types of data.

Review the requirements below and follow instructions where applicable. To understand the rationale for the changes, see More About Field Names.

Requirements

Do Not Use Empty Field Names

In pre-5.6 versions of Elasticsearch it was possible to create fields with empty names. This is no longer allowed. Empty field names now cause indexing errors.

Required action: Give alphanumeric names to any fields whose names are empty.

Do Not Use Dots in Field Names

In the past, some customers have used dots to separate name components in a semantically meaningful way. This is no longer recommended and may cause the upgrade to Events Service 4.5.3 to fail.

Strongly recommended action: Replace dots in field names with hyphens or underscores.

More About Field Names

This section discusses dotted field names, meaning field names with embedded periods ('.'), such as `a.b.c` or `transit.signals.yellow`.

Elasticsearch stores data in JSON documents whose structure is hierarchical. Dotted field names can be used to query into those JSON documents: the field name is treated as a path whose components are separated by dots. See https://www.elastic.co/guide/en/elasticsearch/reference/2.4/dots-in-names.html.

It can be impossible to know whether a dotted field name is intended as a path to a JSON element, or just a plain field name. To treat this problem in a consistent way, Elasticsearch, beginning with version 5.6, always automatically expands dotted field names into hierarchical JSON structures. Each dot creates another level nested lower in the hierarchy.

Events Service 4.5.3 attempts to gracefully handle dots in field names and allow the default behavior of Elasticsearch. However, in a few corner cases, Elasticsearch still fails to index events to which field names correspond. In these situations, the only recourse is to change the field names.

These corner cases can be avoided by following three rules:

1. Field names cannot contain multiple consecutive dots
2. Field names cannot start or end with dots
3. Field names cannot share prefixes

The rest of this section explains these rules.

Field Names Cannot Contain Multiple Consecutive Dots

Field names that contain multiple consecutive dots expand into structures where the name of some elements is the empty string. These are invalid as JSON objects. Note the empty names of the most deeply nested nodes in the following example:

```
"a.very.long.field.name.truncated.with.dots..." ->
"a": {
  "very": {
    "long": {
      "field": {
        "name": {
          "truncated": {
            "with": {
              "dots": {
                "": {
                 "": {
                  "": {
                    }
                  }
                }
              }
            }
          }
        }
      }
    }
  }
}
```

Field Names Cannot Start or End with Dots

Field names that start or end with dots expand into structures where the name of some elements is the empty string. These are invalid as JSON objects. Fo r example:

```
".a.b.c" ->
"": {
  "a": {
    "b": {
      "c": "value of field"
    }
  }
}

"a.b.c." ->
"a": {
  "b" : {
    "c": {
      "" : {
      }
    }
  }
}
```

Field Names Cannot Share Prefixes

When two or more field names have the same prefix, it becomes impossible to create valid JSON objects for them all.

Consider the following field names and values:

```
a.b = "alphabaker"

a.b.c = "alphabakercharlie"
```

Trying to share a prefix runs into trouble because:

- all the nodes that need to be created are text nodes, and
- some nodes need to be nested, but
- in JSON, text nodes are not allowed to contain other objects.

We'll demonstrate the problem by examining what happens when Elasticsearch tries to create the JSON objects for our example.

- The first field name results in "b" being mapped to a text node with the value "`alphabaker`."

```
"a": {
  "b": = "alphabaker"
}
```

- To expand the second name, Elasticsearch tries to map "c" to a text node with the value "`alphabakercharlie.`" This fails because "c" needs to be nested within "`b,`" which is a text node and cannot contain nested objects.

Use the Data Migration Tool

The Data Migration tool uses a collection of `Python3` files.

Install the Data Migration Tool

To install the Data Migration tool, download `migration_tool.zip`.

This example shows the unzipped structure:

```
tool/ main.py readme.txt requirements.txt src/ tool.json
```

Set Up the `python3` Environment

1. To verify if `python3` is installed on your system, enter:

   ```
   which python3
   ```

   ⚠ If `python3` is not found, then install `python3` by entering: `sudo yum install python36 -y`

2. To verify if the `pip3` package manager is installed, enter:

   ```
   which pip3
   ```

   ⚠ If the `pip3` package manager is not found, then see Installing Packages and enter: `sudopython3 -m pip install--upgrade pip setuptools wheel`

3. To install the libraries which run the migration python script, enter this command within the Data Migration tool directory:

   ```
   pip3 install -r requirements.txt --user
   ```

Configure the Data Migration Tool

Before you can run the migration script, you must configure it properly. All configuration is stored in the `tool/tool.json` file in JSON format. These sections provide guidance on how to configure each property.

Clusters

Clusters are defined as a collection of Events Service clusters. Each cluster has the following properties:

Properties	Description
`api_url`	URL pointing to one of the Events Service's API nodes or its load balancer.
`certificate_file`	Path to the PEM file.
`check_hostname`	(Optional) Indicates whether to check the hostname when verifying the certificate. Default is `true`.
`es_url`	URL pointing to one of the Elasticsearch's master nodes.
`es_url_internal`	Internal URL pointing to one of the Elasticsearch's master nodes. Used by other clusters for remote re-indexing.
`es_version`	Relates to the Elasticsearch version.
`keys`	Controller and OPS keys for Events Service. These keys are located in the `conf/events-service-api-store.properties` file.

This example defines Events Services: `es2`, `es6`, and `xpack_es6`.

⚠ `es6` has SSL enabled, while `xpack_es6` has Elasticsearch X-Pack enabled.

```
{
  "clusters": {
    "es2": {
      "keys": {
        "CONTROLLER": "27410b11-296a-49e1-b2d2-d2371ab94d64",
        "OPS": "45c25bad-636c-432f-b0bd-f8ec428c8db4"
      },
      "api_url": "35.162.126.253:9080",
      "es_url": "35.162.126.253:9200",
      "es_url_internal": "172.31.12.185:9200",
      "es_version": 2
    },
    "es6": {
      "keys": {
        "CONTROLLER": "7db43bff-97d3-4d5e-828a-a2eacb693e07",
        "OPS": "ac7424d1-ae96-4e10-ad82-a2eca50db133"
      },
      "api_url": "https://34.209.245.68:9080",
      "certificate_file": "/Users/jun.zhai/es6.pem",
      "check_hostname": false,
      "es_url": "34.209.245.68:9200",
      "es_version": 6
    },
    "xpack_es6": {
      "keys": {
        "CONTROLLER": "07b055f8-a97b-4ccb-a239-2267d452c4ea",
        "OPS": "c582cc8a-f3bc-419f-a42a-7bb8adad05b8"
      },
      "api_url": "52.89.86.93:9080",
      "es_url": "http://elastic:1234@52.89.86.93:9200",
      "es_version": 6
    }
  }
}
```

Migration

This section describes the migration properties:

Properties	Description
`accounts`	(Optional) Specify which accounts to migrate. Defaults to everything in source Events Service.
`search_hits`	Maximum documents fetched in the Elasticsearch query. Default is 5000.
`remote_reindex_concurrency`	Maximum number of remote re-index tasks launched concurrently. Default is 4.
`remote_reindex_scroll_batch_size`	Batch size for remote reindex. Default is 8000. See Re-index API.
`reindex_task_polling_interval`	Frequency in seconds of how often to check the status of ongoing remote reindex tasks. Default is 60 seconds.
`starting_max_fields_per_index`	Maximum fields allowed when creating a new index. Default is set to 1000. The value should be same as the `ad.es.event.index.startingMaxFieldsPerIndex` in `conf/events-service-api-store.properties` file.

Migration Properties Examples:

Example 1: Migrates everything from source Events Service:

```
{
  "migration": {
    "search_hits": 5000,
    "remote_reindex_concurrency": 6,
    "remote_reindex_scroll_batch_size": 8000,
    "reindex_task_polling_interval": 60,
    "starting_max_fields_per_index": 1000
  }
}
```

Example 2: Migrate all event types in accounts, `customer15_9611293a-c56f-4c9a-aa11-9f6bffcb42ce`, `log_v1`, and `custom_event` event types in account `customer1_229f6fbf-b42f-4d66-a56b-a2324d8b169d`. This example does not migrate any other accounts.

```
{
  "migration": {
    "accounts": {
      "customer15_9611293a-c56f-4c9a-aa11-9f6bffcb42ce": [],
      "customer1_229f6fbf-b42f-4d66-a56b-a2324d8b169d": [
        "log_v1",
        "custom_event"
      ],
    },
    "search_hits": 5000,
    "remote_reindex_concurrency": 4,
    "remote_reindex_scroll_batch_size": 8000,
    "reindex_task_polling_interval": 60,
    "starting_max_fields_per_index": 1000
  }
}
```

Upgrade the Events Service to >= 20.9.0

Upgrade Procedure

To upgrade the On-premises Events Service to >= 20.9.0, AppDynamics recommends that you follow this procedure.

The Events Service version 20.9.0 is packaged with the Enterprise Console version 21.2.4 or newer.

If the incoming data load is heavy, you may expect delays in Step 3d during the data migration process.

Data Migration

- If you choose not to migrate data, then continue with Steps 1 through 3c, and do not complete Step 3d.
- If you choose to migrate your data then data conflicts in may occur in Step 3d.

Upgrade Completion

- If the upgrade fails, then you should revert the Controller to the old cluster; data loss may occur.
- If the upgrade succeeds, then you can delete the old cluster.

1. Prepare the machine instances:
    a. Identify a utility machine running Linux, to run the Enterprise Console and data migration scripts. There are no strict hardware requirements

Make sure that the older (source) Events Service cluster, new (target) Events Service cluster, and utility machine all reside on the same network.

    b. Ensure the target Events Service cluster has similar or better hardware than that of the source Events Service cluster. Ensure that the operating system (OS) on the new machine has these settings:
        i. Increase the file descriptors limit in the `/etc/security/limits.conf` file, and then reboot the machine. Use `ulimit -n` to verify the value.

```
*               soft    nofile          66000
*               hard    nofile          66000
# End of file
```

        ii. Set `vm.max_map_count` in the `/etc/sysctl.conf` file, and then reboot the machine. Use `cat /proc/sys/vm/max_map_count` to verify the value.

```
vm.max_map_count=262144
```

2. Set up the new staging cluster:
    a. Download and install the latest Enterprise Console, which includes Events Service 21.2.4. See AppDynamics Downloads and Platform Installation Quick Start.
    b. In the Enterprise Console, install the On-premises Events Service. See Install Events Service on Linux.
    c. Enable the load balancer. See Load Balance Events Service Traffic.
    d. To enable the Secure Socket Layer (SSL) in the Events Service, see Enable the Events Service to Use SSL.
    e. To configure the Events Service for data migration, complete this procedure:
        i. Enable HTTP port in `events-service-api-store.properties`:

```
ad.es.node.http.enabled=true
```

        ii. Add the remote reindex `whitelist` in the `events-service-api-store.yml` file:

```
    - className: com.appdynamics.analytics.processor.elasticsearch.configuration.
ElasticsearchConfigManagerModule
      properties:
          nodeSettings:
              cluster.name: ${ad.es.cluster.name}
              ...
              indices.fielddata.cache.size: ${ad.es.fielddata.cache.size}
              reindex.remote.whitelist: "<IP address to one of the nodes in older cluster>:
9200"
```

iii. Restart the new Events Service cluster from the Enterprise Console.

3. Migrate the data:

a. See Use the Data Migration Tool to install and configure the data migration script on the utility instance.
b. Enter this command to migrate the metadata:

```
python main.py migrate metadata es2 es6
```

c. Navigate to the Controller **Admin** page and set your Controller to the new Events Service. See Connect to the Events Service.

If you choose to migrate your data, then proceed to Step 3d.

d. Enter this command to migrate data from the old cluster to the staging cluster:

```
python main.py migrate data es2 es6
```

Uninstall the Events Service

You can remove an on-premises Events Service from individual nodes or all at once. An embedded Events Service is uninstalled along with the Controller.

Uninstall the Events Service with the Enterprise Console

You can uninstall the Events Service through the GUI on the Events Service page.

To do so through the CLI, you can use the `uninstall-events-service command`, which removes the Events Service software and data from all cluster nodes:

After uninstalling Events Service, the only trace of the Events Service remaining on the host may be a file named `orcha-modules.log`. It appears in the logs directory at the former installation root directory. To remove all traces of the Events Service, manually remove the log file after removing the Events Service with the Enterprise Console.

To uninstall the Events Service from a single node with the Enterprise Console, see the Removing a Node section on Administer the Events Service.

Uninstall the Events Service as a Windows Service

You can remove the Events Service as a Windows service after installation through the GUI. You can also use the following command to retain the Events Service on the machine.

To remove the Events Service as a Windows service:

1. Use the list service command to find the service name for the Events Service: `bin\events-service.exe service-list`

   Starting the ZooKeeper alone only brings up the process that manages index rollover. The Events Service node is not fully started until you start the API-Store process as well, as described next.
2. Use the name returned for the service as the -s parameter argument to the following command: `bin\events-service.exe service-uninstall -s "<Name from service-list>"`

   Be sure to enclose the name in double-quotes.

Synthetic Server Deployment

The Synthetic Server dispatches and processes requests and depends on Synthetic Agents for executing and reporting measurements.

The Synthetic Server receives synthetic job requests from the Controller and then the jobs are fetched from the Synthetic Services by the Synthetic Agents. Once the measurement results are received from the Synthetic Agents, the Synthetic Server stores, processes, and transmits the results to the EUM Server.

Installation Overview

To set up a complete on-premises Synthetic Server deployment, therefore, you need to:

1. Install the on-premises Controller or prepare an in-service Controller to work with the EUM Server.
2. Install the on-premises Events Service and configure it to work with your on-premises Controller.
3. Install the on-premises EUM Server and configure it to work with your Events Service and Controller.
4. Install the on-premises Synthetic Server and configure it to work with the EUM Server and the Controller.
5. Install and configure one or both types of Synthetic Agents.
6. Secure the Synthetic Server (recommended).
7. Monitor the Synthetic Server (recommended).

Synthetic Server Components

The on-premises Synthetic Server consists of the following three services:

- Synthetic Scheduler
- Synthetic Shepherd
- Synthetic Feeder Client

This document also discusses the Synthetic Server Feeder, which communicates with the Synthetic Client Feeder, but is only a service of the SaaS Synthetic Server.

Synthetic Scheduler

The first service is the Synthetic Scheduler, which is a cron-like service that sends job requests at configured intervals. The Synthetic Scheduler handles the CRUD operations for jobs and manages the events generated for synthetic warnings and errors that occur in the measurement results. The Synthetic Scheduler also validates the beacons, triggers warning and error events if needed, and forwards the beacons to the EUM Server.

Synthetic Shepherd

The second service is Synthetic Shepherd. This service manages and dispatches jobs to the Synthetic Agents. In addition, the Synthetic Shepherd saves the measurement results to the filesystem and sends beacons containing the data to the Synthetic Scheduler.

Synthetic Feeder Client

The third service is the Synthetic Feeder Client that communicates with the SaaS Synthetic Feeder Server to access the Synthetic Hosted Agents. (If you are only deploying Synthetic Private Agents, you do not need to use the Synthetic Feeder Client.) These services use the WebSocket protocol to coordinate data transfer to your system without having to open any ports in the firewall.

Synthetic Agents

When deploying the on-premises Synthetic Server, you can deploy one or both Synthetic Agent types:

- Synthetic Hosted Agents - Synthetic Agents that are hosted and maintained by AppDynamics
- Synthetic Private Agents - Synthetic Agents that you install, configure, run, and maintain in your infrastructure

Comparison of the Synthetic Agent Types

The following table compares the two types of agents and provides the benefits and main use cases for both.

Synthetic Agent Type	Key Benefits / Use Cases

Synthetic Hosted Agent	• Access to a fleet of geographically distributed agents • Reduced ownership/resource costs: no hardware or cloud computing costs • Ease-of-use: no need to deploy/configure/manage agents • Scalability: Synthetic Hosted Agents are only deployed when needed, and more agents are readily available if the workload increases
Synthetic Private Agent	• Monitoring of internal sites and services that are not publicly accessible • Complete control over the agent configurations and environment

Overview of Installation and Configuration Steps

The following table provides an overview of the installation and configuration steps for each type of Synthetic Agent.

Synthetic Agent Type	Required Steps
Synthetic Hosted Agent	1. Acquire the license "Browser Synthetic User Monitoring - Hosted Agent - On-Premise". 2. Verify that the license has an HMAC key. 3. Configure SSL for the Synthetic Server (recommended). 4. Connect the on-premises Synthetic Server to the SaaS EUM API Server and SaaS Synthetic Server.

Synthetic Private Agent	1. Acquire one of the following licenses:
	  • Browser Synthetic Monitoring - Private Agent - Per Location (on-premises)
	  • Browser Synthetic Monitoring - Private Agent - Unlimited Locations (on-premises)
	2. Install Synthetic Private Agents.
	3. Connect the Synthetic Private Agent to the on-premises Synthetic Server .
	4. Configure SSL for the Synthetic Server (recommended).
	5. Start and maintain the Synthetic Private Agent.

Summary of Synthetic Server and Agents

The table below summarizes the function and ports used by each service and the Synthetic Agents:

Service/Agent	Functions	Protocol	Default Ports
Synthetic Scheduler	• Sends requests to execute jobs based on a configured frequency. • Validates the beacons containing the measurement results. • Handles the CRUD operations for jobs.	HTTP	12101
		HTTPS	12102
Synthetic Shepherd	• Registers the Synthetic Agents. • Creates and maintains the queue of all measurement requests. • Manages how the results arriving from the agents are processed, stored and forwarded. • Saves accompanying screenshots and generates thumbnails for each screenshot that go with the measurement.	HTTP	10101
		HTTPS	10102
Synthetic Feeder Server (Synthetic Hosted Agents)	• Deployed in SaaS. • Pushes screenshots and measurement results to the Synthetic Feeder-Client.	WebSocket (encrypted)	16001
Synthetic Feeder Client (Synthetic Hosted Agents)	• Deployed in on-premises. • Establishes a WebSocket connection with the SaaS Synthetic Server. • Sends the screenshots and measurement results it received from the SaaS Synthetic Server to the Synthetic Shepherd.	WebSocket (encrypted)	16101

Synthetic Agents	• Fetches jobs from the Synthetic Shepherd. • Uses WebDriver and Selenium to execute these jobs on browsers. • Registers with Synthetic Shepherd. • Uploads screenshots to Synthetic Shepherd. • Handles communication with Synthetic Shepherd.	N/A	The Synthetic Agents do not listen on any port. They only temporarily open internal random ports to fetch job requests from the Synthetic Shepherd and to send the measurement results of executed jobs to the Synthetic Shepherd.

Synthetic Service Data

The Synthetic Server stores data on the filesystem of the host machine and data in the EUM Server's MySQL database. The table below lists the types of data and the storage location.

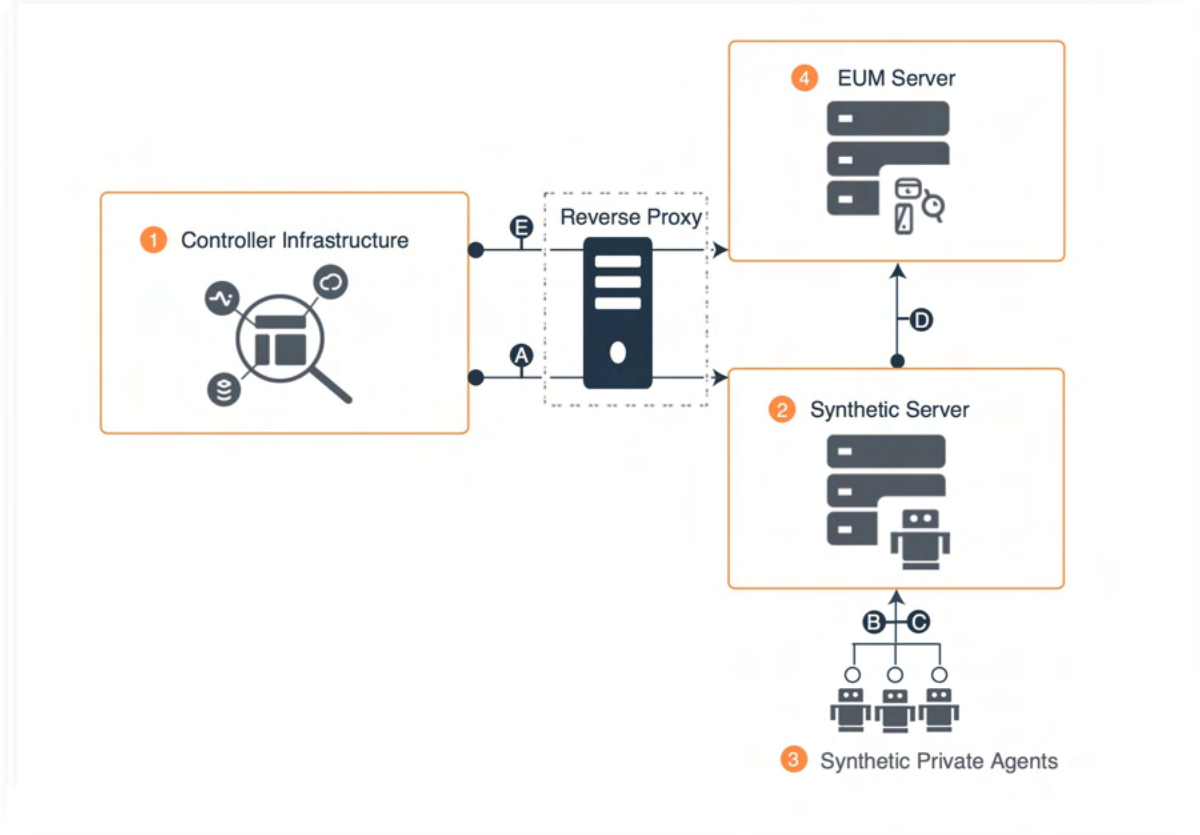
Data Storage Format	Data	Location of Data Storage
MySQL	• Information about the entire agent fleet. • Measurement request queues. • In-flight and archived measurements. • Schedules: a schedule is a configuration according to which the Synthetic Scheduler sends measurement requests to the Synthetic Shepherd. Those requests are queued until enough Synthetic Agents are available to process them, at which point they are dequeued and become measurements.	EUM Server's MySQL database
File System	• Resource snapshots • Script output • Measurement results • Screenshots	Host machine of the Synthetic Server

Synthetic Server Deployment Architecture

The following sections describe and provide diagrams of the different on-premises Synthetic Server deployments. The diagrams show the connections and data flow between the components of the deployments. For information about the other AppDynamics platform components, see Platform Components and Platform Connections.

Synthetic Private Agents Deployment

The following diagram shows the connections and data flow between the on-premises Synthetic Server and the EUM Server and Synthetic Private Agents.



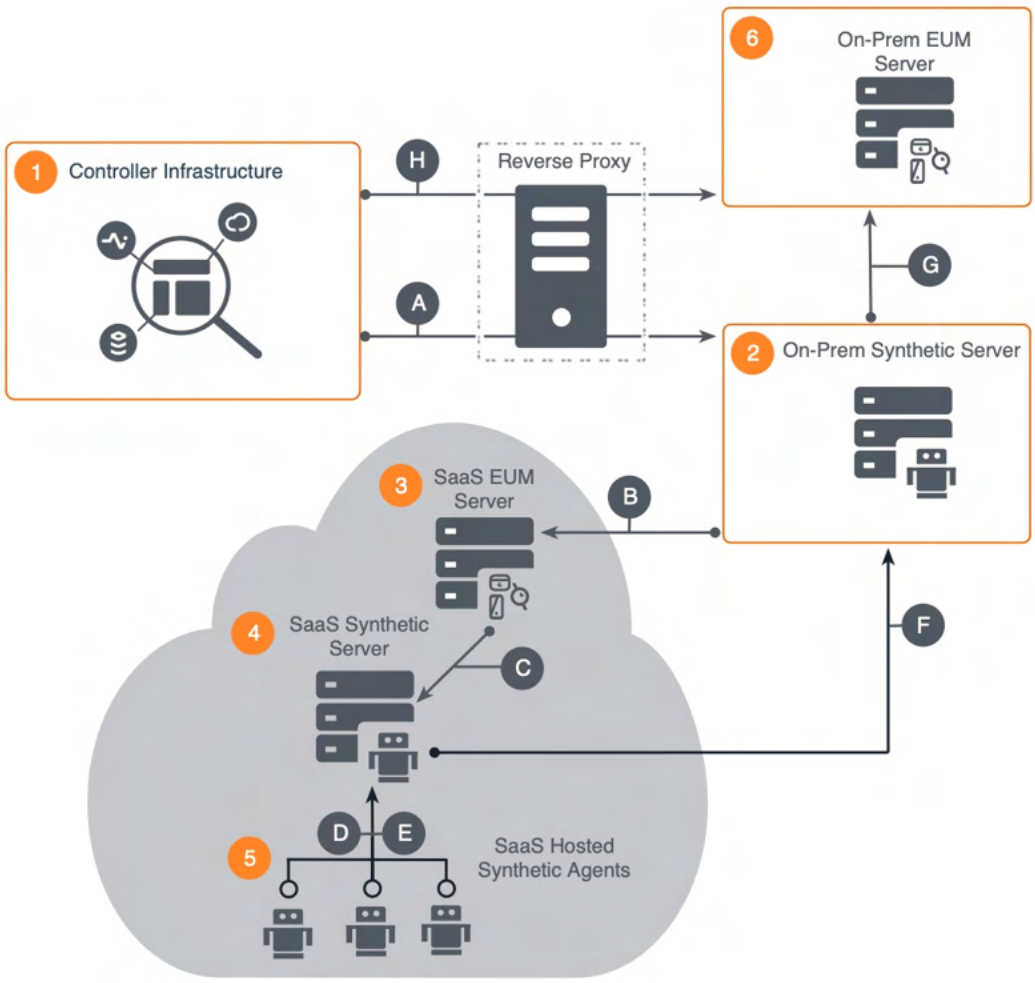
Synthetic Server Connections

The following table lists and describes the traffic flow between the Synthetic Server and the other components.

Connection	Source	Destination	Protocol	Default Port(s)
A	When a user creates a synthetic job, the 1 Controller sends a request for the job with its configured frequency to the 2 on-premises Synthetic Server. The synthetic jobs are then placed in a queue.	2 on-premises Synthetic Server	HTTP(S)	• 12101 /12102 • 10101 /10102
B	The 3 Synthetic Private Agent fetches the job requests from the Synthetic Server and then executes them on a browser using Selenium.	2 on-premises Synthetic Server	HTTP(S)	10101 /10102
C	The 3 Synthetic Private Agent then sends the measurement results to the Synthetic Server.	2 on-premises Synthetic Server	HTTP(S)	10101 /10102
D	The 2 on-premises Synthetic Server stores some data on file, and then processes and converts the data into a beacon, which is then transmitted to the 4 EUM Server through the EUM API. The Synthetic Server also writes data to the EUM Server's MySQL database.	4 on-premises EUM Server	HTTP(S) JDBC	7001/7002 3388
E	The 1 Controller polls the 4 EUM Server for the measurement results and displays them in the Synthetic Sessions.	4 on-premises EUM Server	HTTP(S)	7001/7002

Synthetic Hosted Agents Deployment

The following diagram shows the connections and data flow between the on-premises Synthetic Server, the SaaS EUM Server, the SaaS Synthetic Server, the Synthetic Hosted Agents, and the on-premises EUM Server.



Synthetic Server Connections

The following table lists and describes the traffic flow between the Synthetic Server and the other components.

Connection	Source	Destination	Protocol	Default Port(s)
A	When a user creates a synthetic job, the 1 Controller sends a request for the job with its configured frequency to the 2 on-premises Synthetic Server. The job requests are then placed in a queue.	2 on-premises Synthetic Server	HTTP(S)	12101 /12102
B	The 2 on-premises Synthetic Server sends the job requests to the 3 SaaS EUM Server.	3 SaaS EUM Server	HTTP(S)	7001/7002
C	The 3 SaaS EUM Server forwards the requests to the 4 SaaS Synthetic Server.	4 SaaS Synthetic Server	HTTP(S)	10001/10002

D	The 5 Synthetic Hosted Agents fetch the job requests from the 4 SaaS Synthetic Server and then executes them on a browser using Selenium.	4 SaaS Synthetic Server	WebSocket (encrypted)	16001
E	The 5 Synthetic Hosted Agents send the measurement results to the 4 SaaS Synthetic Server.	4 SaaS Synthetic Server	HTTP(S)	10001/10002
F	The 4 SaaS Synthetic Server Feeder sends the measurement results to the 2 on-premises Synthetic Client Feeder.	2 on-prem Synthetic Server	WebSocket (encrypted)	16101
G	The 2 on-premises Synthetic Server stores some data on file, and then processes and converts the data into a beacon, which is then transmitted to the 6 on-premises EUM Server through the EUM API. The on-prem Synthetic Server also writes data to the EUM Server's MySQL database.	6 on-premises EUM Server	HTTP(S) JDBC	7001/7002 3388
H	The Controller polls the 6 on-premises EUM Server for the measurement results and displays them in the Synthetic Sessions.	6 on-premises EUM Server	HTTP(S)	7001/7002

Synthetic Server Requirements

On this page:

This page lists the Synthetic Server requirements, offers sizing guidance, and shows you how to modify the default settings.

AppDynamics Platform Requirements

To deploy the Synthetic Server, you need to install the following AppDynamics platforms:

Component	Minimum Version
Controller	4.5.0 and higher
Events Service	4.5.0 and higher
Synthetic Agent	• Synthetic Private Agent 4.5.4 or higher • Synthetic Hosted Agent 4.5.13 or higher

Certain Synthetic Server features—specifically, Synthetic Sessions Analytics, features of Application Analytics that extend the functionality of Synthetic Sessions—require access to the AppDynamics Events Service.

Synthetic Agent Requirements

The following table lists the requirements for deploying Synthetic Private Agents and Synthetic Hosted Agents.

Synthetic Agent	Requirements
Synthetic Private Agents	See Requirements for the Synthetic Private Agent.
Synthetic Hosted Agents	• Synthetic Hosted Agent license • AppDynamics Access (HMAC) Key (part of the license file for Synthetic Hosted Agent)

Hardware Requirements

These requirements assume that the Synthetic Server is installed on a separate machine. If other AppDynamics platforms are installed on the same machine, the requirements (particularly for memory) could vary greatly and require many more resources.

- Storage: 50 GB free disk space
- Memory: 8 GB memory
- CPU: 64-bit CPU with at least 2 cores
- Network bandwidth: 50 Mbps

NTP should be enabled on both the EUM Server host and the Controller machine. The machine clocks need to be able to synchronize.

Scaling Requirements

You are required to have one EUM account for each on-premises deployment of the Synthetic Server. The machine hosting the Synthetic Server should be able to support 100 concurrent Synthetic Agents or 10 locations with 10 Synthetic Agents per location.

If you need the Synthetic Server to support more than 100 concurrent Synthetic Agents, see Increase the Synthetic Agent Support.

Operating System Support

The Synthetic Server is supported on the following operating systems:

Linux (64 bit)
• RHEL 6.x and 7.x • CentOS 6 and 7 • Ubuntu 14 and 16 • SUSE 12

You can use the following file systems for machines that run Linux:

- ZFS
- EXT4
- XFS

On-premises deployments on Linux are only supported on Intel architecture. Windows is not supported at this time.

Network Requirements

The network settings on the operating system need to be tuned for high-performance data transfers. Incorrectly tuned network settings can manifest themselves as stability issues.

The following command listing demonstrates tuning suggestions for Linux operating systems. As shown, AppDynamics recommends a TCP/FIN timeout setting of 10 seconds (the default is typically 60), the TCP connection `keepalive` time to 1800 seconds (reduced from 7200, typically), and disabling TCP window scale, TCP SACK, and TCP timestamps.

```
echo 5 > /proc/sys/net/ipv4/tcp_fin_timeout
echo 1800 >/proc/sys/net/ipv4/tcp_keepalive_time
echo 0 >/proc/sys/net/ipv4/tcp_window_scaling
echo 0 >/proc/sys/net/ipv4/tcp_sack
echo 0 >/proc/sys/net/ipv4/tcp_timestamps
```

The commands demonstrate how to configure the network settings in the `/proc` system. To ensure the settings persist across system reboots, be sure to configure the equivalent settings in the `etc/sysctl.conf` or the network stack configuration file appropriate for your operating system.

Software Requirements

The Synthetic Server requires the following software to run and function correctly. You are *required* to have outbound internet access to install Python, `pip`, and flake8.

Software	Required Version	Function
Java	8	The Synthetic Server requires JDK 8 to run services such as Synthetic Scheduler and Synthetic Shepherd. You need to set the environmental variable `JAVA_HOME` to the home directory of the JDK.
Python	2.7	The Synthetic Server relies on Python to validate scripts.

`pip`	9+	Python uses `pip` to install software. For example, `pip` could be used on some Linux distributions to install `flake8`, a Python utility used to lint scripts.
		
		If the machine where you're installing the Synthetic Server does *not* have Internet access, run the following steps to fetch and install `flake8`:
		
		1. From a machine with internet access and `pip` installed:
		a. Create a directory for the `flake8` library:
		`mkdir ~/flake8`
		b. Download the `flake8` package:
		c. Zip and tar the `flake8` package:
		`tar cvfz flake8.tgz ~/flake8`
		d. Copy `flake8.tgz` to the `$HOME` directory of the host machine of the Synthetic Server.
		2. From the host of the Synthetic Server that has no internet access, but does have `pip` installed:
		a. Unzip and extract the `flake8.tgz` file:
		`tar xvfz flake8.tgz ~/flake8`
		b. Change to the `flake8` directory.
		c. Install the `flake8` library with `pip` with the following command, replacing `<version>` with the correct version.

libaio	N/A	The Synthetic Server requires the `libaio` library to be on the system. This library facilitates asynchronous I/O operations on the system. See How to Install libaio for instructions.

How to Install libaio

Install `libaio` on the host machine if it does not already have it installed. You may require outbound internet access if you don't have a locally hosted repository.

The following table provides instructions on how to install `libaio` for some common flavors of the Linux operating system. Note, if you have a NUMA based architecture, then you are required to install the `numactl` package.

Linux Flavor	Command
Red Hat and CentOS	Use `yum` to install the library, such as: • `yum install libaio` • `yum install numactl`
Fedora	Install the library RPM from the Fedora website: • `yum install libaio` • `yum install numactl`
Ubuntu	Use apt-get, such as: • `sudo apt-get install libaio1` • `sudo apt-get install numactl`
Debian	Use a package manager such as APT to install the library (as described for the Ubuntu instructions above).

Install the Synthetic Server

You run the Synthetic Server installer from the command line. The installer relies on the`inputs.groovy` file to configure the network connections to the on-premises EUM Server, and if you are using Synthetic Hosted Agents, to the SaaS EUM Server and SaaS Synthetic Server as well.

To install the Synthetic Server, follow the steps below:

Prepare for the Installation

Before starting the installation, verify that you have:

- Successfully deployed the Controller, EUM Server, and the Events Service.
- Downloaded the Synthetic Server installer package from the AppDynamics Download Center. The installer package will be listed on the Downloads site as "Synthetic Server (zip)".

Grant Access to the EUM Server MySQL Database

The Synthetic Server installer modifies the EUM MySQL database schema and the Synthetic Server stores data in the EUM MySQL database. Thus, you will need to grant MySQL users from the machine hosting the Synthetic Server privilege to the EUM Server's MySQL database.

1. Log on to the machine where the EUM MySQL database is located.
2. Connect to the MySQL Server with the EUM Server database. For example, if you are using the default EUM MySQL database, do the following:
    a. Change to `<installDir>/AppDynamics/EUM`.
    b. Connect to the EUM MySQL database:

```
mysql/bin/mysql -u root -h <eum_server_hostname> -S <eum_server_mysql_sock> -P
<eum_server_mysql_port> -p
```

3. From the MySQL monitor, grant privileges to the MySQL user `root` of the Synthetic Server machine. The installer will use the MySQL user `root` t o update the EUM database schema. Be sure to replace `<on-prem-synthetic_server_hostname>` with the URL to your Synthetic Server.

```
mysql> GRANT ALL PRIVILEGES ON eum_db.* TO 'root'@'<on-prem_synthetic_server_hostname>' IDENTIFIED BY
<db-root-password>;;
```

> The MySQL `root` user from the Synthetic Server is not related to the Linux user account that is installing the Synthetic Server. For example, the Linux user account `ubuntu` can run the installer, but the installer will use the MySQL user `root` when connecting to the EUM Server MySQL database to update the database schema.

4. You will also need to grant access to the MySQL user `eum_user` to write data to the EUM database (`eum_db`). Be sure to replace `<on-prem-synthetic_server_hostname>` with the URL to your Synthetic Server.

```
mysql> GRANT ALL PRIVILEGES ON eum_db.* TO 'eum_user'@'<on-prem_synthetic_server_hostname>' IDENTIFIED
BY <db_eum_user_password>;
```

5. Set the password for the MySQL user `root.` The password should be the same as the one specified by the `db_root_pwd` in the `inputs. groovy` file.

```
mysql> SET PASSWORD FOR 'root'@'<on-prem-synthetic_server_hostname>' = PASSWORD('<root_password>');
```

6. Confirm that you have granted permission for `eum_user` and `root`:

```
show grants for eum_user@<on-prem_synthetic_server_hostname>;
show grants for root@<on-prem_synthetic_server_hostname>;
```

Unzip the Synthetic Server Installer Package

1. Copy the Synthetic Server installer package (`appdynamics-synthetic-server-<version>.zip`) to the machine that will be hosting the Synthetic Server.
2. Create a directory for storing the Synthetic Server installer, such as `synthetic-server`.
3. Move the Synthetic Server installer package to the directory you created.
4. Change to the directory you created for storing the Synthetic Server installer.
5. Unzip the Synthetic Server installer package.

Configure the Installation

1. From a command prompt, navigate to the directory where you unzipped the Synthetic Server installer package.
2. Copy the sample configuration file: `cp inputs.groovy.sample inputs.groovy`
3. Edit the file `inputs.groovy` and make changes to the properties listed below:

Property	Change to Make	Description
`db_host`	Assign the URL to the machine hosting your on-premises EUM Server to the `db_host` property.	The public DNS to the machine hosting the EUM Server.
`db_port`	Change the value to "3388". This is the default port for the EUM Server's MySQL database.	The port that the EUM Server's MySQL database is listening on.
`db_username`	Change the value to `eum_user`. This is the default user for the EUM Server.	The MySQL user that accesses the EUM Server's MySQL database.
`db_password`	Assign the password for the MySQL user `eum_user` to remotely access the EUM Server's MySQL database.	The password that you set for the user that is specified by `db_username`. The value of `db_username` should be `eum_user`.
`collector_host`	Assign the public DNS to the machine hosting your on-premises EUM Server to the `collector_host` property.	The public DNS to the machine hosting the EUM Server.
`collector_port`	Confirm that the value is "7001". This is the default port of the EUM Server.	The port that the EUM API Server and EUM Collector are listening on. The default is '7001'.
`key_store_password`	Assign the key store password you set when installing your on-premises EUM Server to the `key_store_password` property.	The key store password you set during the installation of the EUM Server.
`localFileStoreRootPath`	Assign a file path where you want the Synthetic Server to store data to the `localFileStoreRootPath` property. The Synthetic Server must be able to read and write to the path and the files in the path.	The path where the Synthetic Server stores data such as the measurement results and the screenshots.

Run the Installer

From the root directory of the installer, run the following command as the `root` user.

```
unix/deploy.sh install
```

In the output from the `install` command, you should see the log of completed tasks similar to the following:

```
Task [facts for localhost] completed executing in [274] ms.
Task [Create the encryption directory] completed executing in [78] ms.
Task [Create keystore for encryption] completed executing in [796] ms.
Task [Create the encrypted password] completed executing in [566] ms.
Task [Obfuscate the key store password] completed executing in [397] ms.
Task [Read created password] completed executing in [46] ms.
Task [Read the obfuscated key store password] completed executing in [43] ms.
Task [Change configurations for the shepherd and scheduler conf] completed executing in [81] ms.
Task [Read created password] completed executing in [24] ms.
Task [Read the obfuscated key store password] completed executing in [26] ms.
Task [Change configurations for the shepherd and scheduler conf] completed executing in [76] ms.
Task [Read created password] completed executing in [29] ms.
Task [Read the obfuscated key store password] completed executing in [20] ms.
Task [Change configurations for the shepherd and scheduler conf] completed executing in [31] ms.
Task [Delete the encryption directory] completed executing in [47] ms.
Task [Change configurations for the liquibase properties file] completed executing in [26] ms.
Task [Update schema of SQL DB to include synthetic schema] completed executing in [2412] ms.
Task [Install flake8 for script linting] completed executing in [1671] ms.
Task [Start the synthetic services] completed executing in [67] ms.
```

Verify the Installation Was Successful

1. Confirm that the Synthetic Server is running:

   ```
   ps aux | grep synthetic-processor
   ```

   > If you have `jps` installed, you can also just run it to verify the Synthetic Server are running.

2. Verify that the Synthetic Scheduler and Synthetic Shepherd are listening on the default ports:

   ```
   netstat -lan | grep "1[0,2,6]10[1,2]"
   ```

3. With `mysql` installed on the Synthetic Server machine, you can verify that the Synthetic Server machine can connect to the EUM Server MySQL e`um_db` database:

   ```
   mysql -h <eum_server_instance> -P 3338 -D eum_db -u eum_user -p
   ```

4. If you cannot connect to the EUM Server MySQL database, return to Grant Privileges to the EUM Server MySQL Database and complete the steps again.

Perform Post-installation Tasks

After installing the Synthetic Server, perform the following additional post-installation tasks:

1. Configure the Controller for the Synthetic Server
2. Install Synthetic Private Agents (Optional)
3. Make configurations to use one or both of the Synthetic Agents:
   a. Synthetic Private Agent
   b. Synthetic Hosted Agent
4. Secure the Synthetic Server (Recommended)
5. Monitor the Synthetic Server (Recommended)

Configure the Controller for the Synthetic Server

Related pages:

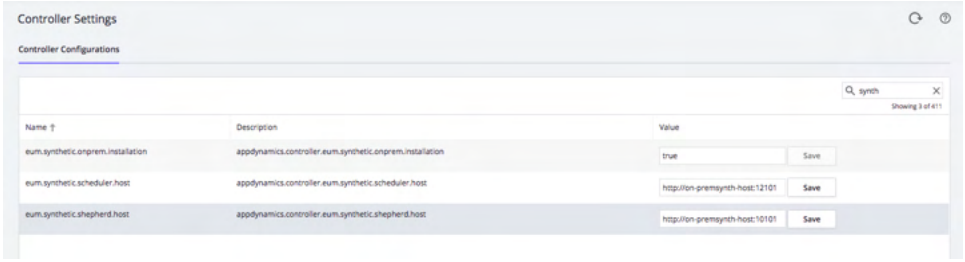
- Access the Administration Console
- Configure the EUM Server

For the Synthetic Server to function correctly, you need to set the URLs and ports of Synthetic Scheduler and Synthetic Shepherd in the Controller Administration Console.

1. Navigate to the Controller Administration Console: `http://<hostname>:<port>/controller/admin.jsp`
2. Click **Controller Settings**.
3. From the **Controller Configurations** pane, enter the correct values for the properties given in the table below. If no protocol is specified, the protocol defaults to `https://`.

Controller Configuration	Description	Example Value
`eum.synthetic.onprem.installation`	The flag for enabling on-premises Synthetic Server. This should be `true`.	`true`
`eum.synthetic.scheduler.host`	The URL and port to the Synthetic Scheduler on the machine hosting the Synthetic Server. The default port is 12101.	`http://<synthetic-server-domain>:12101`
`eum.synthetic.shepherd.host`	The URL and port to the Synthetic Shepherd on the machine hosting the Synthetic Server. The default port is 10101.	`http://<synthetic-server-domain>:10101`

4. Your configurations for the Synthetic Server should be similar to those in the screenshot of the **Controller Configurations** pane below.



Connect the Synthetic Private Agents to the Synthetic Server

The information and instructions below are intended for On-Premise deployments only. SaaS deployments are managed by AppDynamics.

Related pages:

- Install the Synthetic Private Agent

The Synthetic Private Agent fetches jobs from and reports measurement results to the Synthetic Shepherd service of the Synthetic Server. Thus, you must correctly configure the Synthetic Agent so it can connect to Synthetic Shepherd.

To connect the Synthetic Agent to on-prem Synthetic Server, follow the steps below:

Prepare for the Agent Configuration

Before you configure the connections:

- Confirm that you have installed the Synthetic Private Agent.
- Confirm that the EUM Server is running.
- Get the EUM account and the license key from the Controller Admin Console or the EUM Server properties file.

Configure the Synthetic Private Agent

1. Stop the Synthetic Private Agent if it's running by double-clicking the desktop icon 

.
2. Change to the directory `C:\appdynamics\synthetic-agent\synthetic-driver\conf`.
3. Edit the file `synthetic-driver.yml`.
4. Assign your EUM account and the license key to the properties `eumAccount` and `licenseKey`, and the URL to Synthetic Shepherd to `shepherdUrl` as shown below:

```
## Use the URL to your Synthetic Server and the port to the Synthetic Shepherd (10101)
shepherdUrl: http://<on-prem-synthetic-server-host>:10101
## You can get the values for this from the Controller Admin Console > Controller Settings
## or the properties 'property_eum-account-name' and 'property_eum-license-key' from your license file.
privateClient:
    eumAccount: "<eum_account>"
    licenseKey: "<license_key>"
```

5. Save the file.
6. Restart the Synthetic Private Agent by double-clicking the desktop icon 

.

Verify the Private Location in the Controller

Follow the instructions given in Create a Job and Choose Locations to create a synthetic job using the private location where your Synthetic Private Agent is running.

Connect to the SaaS Environment for the Synthetic Hosted Agent

Related pages:

- Synthetic Agent Locations

For your on-premises Synthetic Server to use Synthetic Hosted Agents, you need to configure the on-premises Synthetic Server to communicate with the SaaS EUM Server and SaaS Synthetic Server.

Follow these steps to use Synthetic Hosted Agents:

1 Verify the License Has an HMAC Key
2 Apply the License
3 Configure the Connection to the SaaS EUM and Synthetic Servers

For a complete list of Synthetic Hosted Agent browser locations, containers, and providers, go to Synthetic Agent Locations.

Verify the License Has an HMAC Key

After you have obtained a license to use the Synthetic Hosted Agent, be sure to check that the `license.lic` file has the `property_eum-hmac-key` field that is assigned a keyed-hash message authentication code (HMAC) similar to the following:

```
property_eum-hmac-key=1a88392cb0004b45b555a854b80f23f5
```

The HMAC key is used to authenticate your on-prem deployment to the SaaS EUM Server and the SaaS Synthetic Server. Without the HMAC key, your on-premises Synthetic Server will not be able to use Synthetic Hosted Agents.

Apply the License

To apply the license:

1. Copy the license file to the Controller home directory. After moving the license file, allow up to 5 minutes for the license change to take effect.
2. Follow the instructions given in Provision EUM Licenses based on your deployment.

Configure the Connection to the SaaS EUM and Synthetic Servers

Configure the connections from the on-prem Synthetic Server to the SaaS EUM and Synthetic Servers based on the region where you have an EUM account.

SaaS EUM Account in the Americas

If your SaaS EUM account is in the Americas, do not change the following default settings given in `inputs.groovy`:

```
feeder_server_url = "wss://synthetic-feeder.api.appdynamics.com"
saas_cloud_api_url = "https://api.eum-appdynamics.com"
```

SaaS EUM Account in Other Regions

If your SaaS EUM account is not in the Americas, follow these instructions to configure your on-premises Synthetic Server to use the SaaS EUM Server and SaaS Synthetic Server in your region.

1. From the on-premises Synthetic Server, edit the `inputs.groovy` file.
2. For the `feeder_server_url` and `saas_cloud_api_url` fields, enter the SaaS URLs for your region.

Administer the Synthetic Server

You can use the command line to perform platform administration tasks with the Synthetic Server, such as starting and stopping the services. This page describes the available commands, the log files, and the endpoints for testing the reachability and health of the Synthetic Server. Run the commands from the root directory of the Synthetic Server home.

Start and Stop the Synthetic Server

Start the Synthetic Server from the root directory of the Synthetic Server home as follows:

```
unix/deploy.sh start
```

To check if the Synthetic Server services are running and accessible, run the following command and confirm that there is output:

```
netstat -lan | grep "1[0,2,6]10[1,2]"
```

To stop the Synthetic Server:

```
unix/deploy.sh stop
```

Increase the Synthetic Agent Support

By default, the machine hosting the Synthetic Server should be able to support 100 concurrent Synthetic Agents. To support more than 100 concurrent Synthetic Agents, modify the throttle configuring for the Synthetic Shepherd and Synthetic Scheduler. The default maximum number of requests per second is 60. By increasing the maximum number of requests per second, the Synthetic Server can support more Synthetic Agents.

To increase the maximum number of requests per second that the Synthetic Server can receive:

1. Log on to the machine hosting the Synthetic Server.
2. Change to the root directory of the Synthetic Server home.
3. Edit the file `synthetic-processor/conf/synthetic-shepherd.yml` and increase the value for the property `maxRequestsPerSecondOverall`. In this example configuration, the value is increased to 80.

   ```
   throttleConfiguration:
       maxRequestsPerSecondOverall: 80
   ```

4. Edit the file `synthetic-processor/conf/synthetic-scheduler.yml` and increase the value for the property `maxRequestsPerSecondOverall`. Again, in this example configuration, the value is increased to 80.

   ```
   throttleConfiguration:
       maxRequestsPerSecondOverall: 80
   ```

5. Restart the Synthetic Server:

   ```
   unix/deploy.sh stop
   unix/deploy.sh start
   ```

6. You can verify that the settings have been updated by checking the logs for the Synthetic Server you changed:

   ```
   cat logs/scheduler/synthetic-scheduler.log | grep -oP -- "maxRequestsPerSecondOverall=\d+"
   cat logs/shepherd/synthetic-shepherd.log | grep -oP -- "maxRequestsPerSecondOverall=\d+"
   ```

7. You should also check the health of the Synthetic Server.

Create Preset Health Rules and Dashboards

Once you have monitored the Synthetic Server, run the following command to create the preset health rules and dashboards:

```
unix/post_deploy.sh
```

See Create Preset Dashboards and Health Rules to learn more about the preset health rules and dashboards.

Upgrade the Synthetic Server

You can update the Synthetic Server and the database schema without uninstalling and reinstalling the Synthetic Server using the `update` command. See Upgrade the Synthetic Server for instructions.

Check the Health of the Synthetic Server

To check if the Synthetic Server is running, you can run the following. You should receive the response `pong`.

```
curl <on-prem-synthetic_server_url>:10102/ping
curl <on-prem-synthetic_server_url>:12102/ping
curl <on-prem-synthetic_server_url>:16102/ping
```

To check the health of the Synthetic Server:

```
curl <on-prem-synthetic_server_url>:10102/healthcheck?pretty=true
curl <on-prem-synthetic_server_url>:12102/healthcheck?pretty=true
curl <on-prem-synthetic_server_url>:16102/healthcheck?pretty=true
```

If the Synthetic Server is healthy, the response should be similar to the following:

curl <on-prem-synthetic_server_url>:10102/healthcheck?pretty=true

```
{
  "authentication" : {
    "healthy" : true
  },
  "deadlocks" : {
    "healthy" : true
  },
  "httpClient" : {
    "healthy" : true
  },
  "quartzScheduler" : {
    "healthy" : true
  }
```

curl <on-prem-synthetic_server_url>:16102/healthcheck?pretty=true

```
{
  "deadlocks" : {
    "healthy" : true
  }
```

curl <on-prem-synthetic_server_url>:12102/healthcheck?pretty=true

```
{
  "authentication" : {
    "healthy" : true
  },
  "cluster" : {
    "healthy" : true
  },
  "deadlocks" : {
    "healthy" : true
  },
  "linter" : {
    "healthy" : true
  },
  "quartzSynthBackgroundScheduler" : {
    "healthy" : true
  },
  "quartzSynthJobScheduler" : {
    "healthy" : true
  }
```

Log Files for the Synthetic Server

The Synthetic Server creates the following error log files for each service:

- `<installDir>/logs/synthetic-scheduler.err`
- `<installDir>/logs/synthetic-shepherd.err`

- `<installDir>/logs/synthetic-feeder-client.err`

For general (non-error) log files, see the following directories:

- `<installDir>/logs/scheduler`
- `<installDir>/logs/shepherd`
- `<installDir>/logs/feeder-client`

The naming convention for the general log files is `<log>-YYYY-MM-DD.log`. You will need to set up a policy to archive or delete the general log files to prevent running out of disk space.

Secure the Synthetic Server

You are recommended to configure the Synthetic Server to use SSL to secure network connections. This page describes how to create a custom keystore and then configure the Synthetic Server to use it to implement SSL

Set Up a Custom Keystore for the Synthetic Server

The following sections describe and show an example of how to create a custom RSA security certificate, generate a new JKS keystore, and sign the certificate.

Install Prerequisite Libraries

Make sure the following libraries are installed on the Synthetic Server:

- `keytool`
- `openssl`

Create a Certificate and Keystore

Use the `keytool` command to create a keystore that uses RSA encryption then generate a certificate signing request (CSR).

The following steps show you an example of how to do both.

1. Log in to the Synthetic Server machine.
2. From a command-line shell, navigate to the root directory of the Synthetic Server:

   ```
   cd <synthetic_server_root>
   ```

3. Create a new keystore with a new unique key pair that uses RSA encryption:

   ```
   <path_to_jre>/jre/bin/keytool -genkey -keyalg RSA -validity <validity_in_days> -alias 'synthetic-server'
   -keystore ./mycustom.keystore
   ```

   This creates a new public-private key pair with an alias of "synthetic-server". You can use any value you like for the alias. The "first and last name" required during the installation process becomes the common name (CN) of the certificate. Use the name of the server.
4. Configure the keystore by entering the information requested at the command prompt.
5. Specify a password for the key store. You need to configure this password in the Synthetic Server configuration file later.
6. Generate a certificate signing request (CSR):

   ```
   <path_to_jre>/jre/bin/keytool -certreq -keystore ./mycustom.keystore -file /tmp/synthetic-server.csr -
   alias 'synthetic-server'
   ```

   This generates a certificate signing request based on the contents of the alias; in the example, it is "synthetic-server".

Sign and Install the Signed Certificate

Once you have a CSR, you request a Certificate Authority to sign it and then install the signed certificate.

The following steps are a continuation of the process from Create a Certificate and Keystore:

1. Send the output file from the last step (`/tmp/synthetic-server.csr` in this example) to a Certificate Authority for signing.
2. Install the certificate for the Certificate Authority used to sign the `.csr` file:

   ```
   <path_to_jre>/jre/bin/keytool -import -trustcacerts -alias myorg-rootca -keystore ./mycustom.keystore -
   file /path/to/<CA-root-cert>
   ```

   This command imports your CA's root certificate into the keystore and stores it in an alias called "myorg-rootca".
3. Install the signed server certificate as follows:

```
<path_to_jre>/jre/bin/keytool -import -keystore ./mycustom.keystore -file /path/to/<signed-cert>  -alias
'synthetic-server'
```

This command imports your signed certificate over the top of the self-signed certificate in the existing alias; in the example, it is "synthetic-server".

4. Import the root certificate to the other platform components connecting to the Synthetic Server through HTTPS:

```
keytool -import -trustcacerts -alias <alias_name> -file mycert.cer -keystore <complete_path_to_cacerts.
jks>
```

Configure the Synthetic Server to Use the Keystore

Follow the steps below to configure the Synthetic Server to use the signed certificate and its password.

1. Edit the Synthetic Scheduler configuration file at `<installation directory>/conf/synthetic-scheduler.yml` and add the `applicationConnectors` object shown below under `server`:

```
server:
    ...
    applicationConnectors:
        - type: https
          port: <port>
          keyStorePath: <path to JKS files>
          keyStorePassword: <jks file password>
          validateCerts: false
```

If you don't already have a signed certificate, see Create and Sign an RSA Security Certificate.

2. Edit the Synthetic Shepherd configuration file at `<installation directory>/conf/synthetic-shepherd.yml` and add the `applicationConnectors` object shown below under `server`:

```
server:
    ...
    applicationConnectors:
        - type: https
          port: <port>
          keyStorePath: <path to jks file>
          keyStorePassword: <jks file password>
          validateCerts: false
```

3. Restart the Synthetic Server.
4. Verify the connection to the HTTPS port.

Configure a Proxy for the Synthetic Server

Related pages:

- Use a Reverse Proxy

This page describes how to configure your on-prem Synthetic Server to use a proxy server to communicate with the SaaS EUM Server and SaaS Synthetic Server. You can set up a proxy to add a security layer for your on-prem Synthetic Server.

The configuration consists of the following steps:

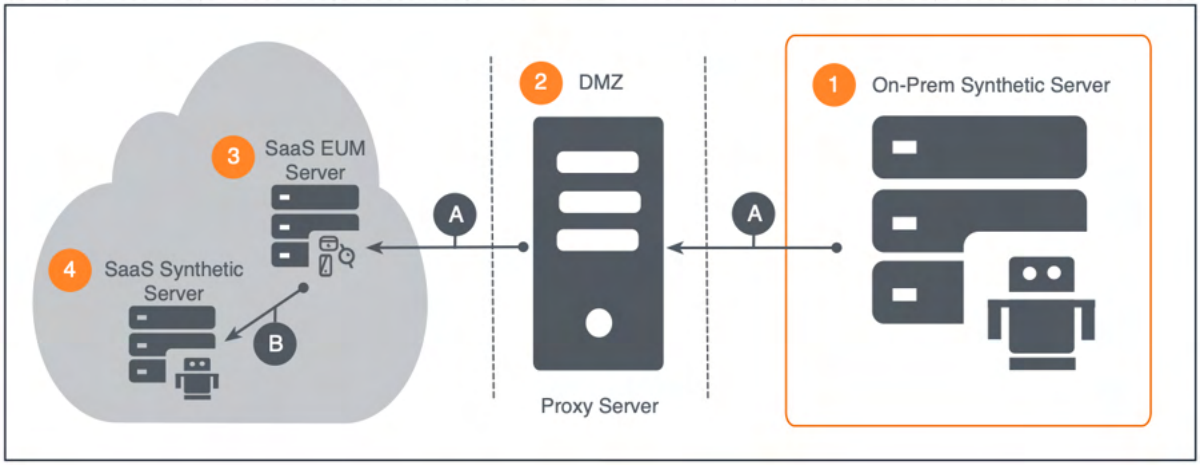
1 Configure the Synthetic Server to Use Proxy
2 Configure Your Proxy Server

Synthetic Server Proxy Architecture

You can also, optionally, set up a proxy to forward traffic from the SaaS Synthetic Server Feeder to the on-prem Synthetic Server Client Feeder, but your proxy server must support WebSockets.

Proxy for Downstream Traffic (Recommended)

The proxy often resides in the DMZ for the network and presents a virtual IP address to forward requests from the on-prem Synthetic Server to SaaS Synthetic Server through the SaaS EUM Server as shown below.

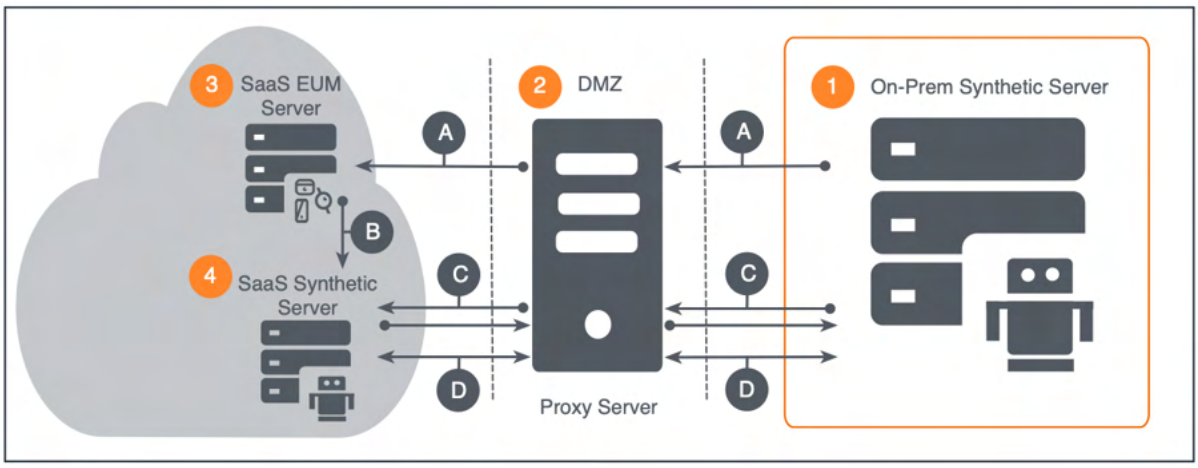


Connection	Source	Destination	Protocol	Default Port(s)
A	The 1 on-prem Synthetic Scheduler sends the job requests to the 2 proxy server, which then forwards the requests to the 3 SaaS EUM Server	3 SaaS EUM Server	HTTP(S)	7001/7002
B	The 3 SaaS EUM Server forwards the job requests to the 4 SaaS Synthetic Server.	4 SaaS Synthetic Server	HTTP(S)	N/A

The on-prem Synthetic Server Client Feeder communicates with the SaaS Synthetic Server Feeder through a bi-directional WebSocket connection that is not made through the proxy server.

Proxy for Downstream and Upstream (Optional)

When setting a proxy for downstream and upstream traffic, the proxy must support WebSocket. The on-prem Synthetic Server Client Feeder initializes the WebSocket connection with the SaaS Synthetic Server Feeder through the proxy server. Once the WebSocket connection is established, the on-prem Synthetic Server Client Feeder and the SaaS Synthetic Server Feeder can use the persistent connect to make bi-directional requests.



Connection	Source	Destination	Protocol	Default Port(s)
A	The 1 on-prem Synthetic Server (Scheduler) sends the job requests to the 2 proxy server, when then forwards the requests to the 3 SaaS EUM Server.	3 SaaS EUM Server	HTTP(S)	7001/7002
B	The 3 SaaS EUM Server forwards the requests to the 4 SaaS Synthetic Server.	4 SaaS Synthetic Server	HTTP(S)	N/A
C	The 1 on-prem Synthetic Server (Client Feeder) establishes a WebSocket connection with the 4 SaaS Synthetic Server (Synthetic Server Feeder) through the 2 proxy server.	4 SaaS Synthetic Server	HTTP(S)	80/443
		1 on-prem Synthetic Server	HTTP(S)	80/443
D	The 4 SaaS Synthetic Server (Synthetic Server Feeder) and 1 on-prem Synthetic Server (Client Feeder) communicate bi-directionally through the 2 proxy server. Most of the traffic is from the SaaS Synthetic Server Feeder to the on-prem Synthetic Client Feeder.	1 on-prem Synthetic Server	WebSocket	16101
		4 SaaS Synthetic Server	WebSocket	16001

Configure the Synthetic Server to Use Proxy

You need to configure the Synthetic Server to use the proxy to forward traffic to the SaaS EUM Server. In the examples configurations below, the proxy URL is `127.0.0.1` and the proxy port is `3128`. You will need to replace those values with the URL and port of your proxy server.

Synthetic Shepherd

From the host machine of the Synthetic Server, set the `proxyUrl` and `proxyPort` properties in the `<synthetic-server_installation_dir>/synthetic-processor/conf/synthetic-shepherd.yml` file to point to the URL and port of the proxy server, which the Synthetic Shepherd will send requests.

```
saasLink:
  proxyUrl: "127.0.0.1"
  proxyPort: 3128
```

Synthetic Scheduler

Set the `proxyUrl` and `proxyPort` properties in the `<synthetic-server_installation_dir>/synthetic-processor/conf/synthetic-scheduler.yml` file to point to the URL and port of the proxy server so that Synthetic Shepherd also sends requests to the proxy.

```
saasLink:
  proxyUrl: "127.0.0.1"
  proxyPort: 3128
```

Synthetic Feeder Client

Finally, set the `proxyUrl` and `proxyPort` properties in the `<synthetic-server_installation_dir>/synthetic-processor/conf/synthetic-feeder.yml` file to point to the URL and port of the proxy server so that Synthetic Server Client Feeder also sends requests to the proxy.

```
websocketConfiguration:
    proxyUrl: "127.0.0.1"
    proxyPort: 3128
```

> **Note**
>
> Feeder Client for Synthetic services does not support Proxy authentication.

Configure Your Proxy Server

You can use Squid, Apache, Nginx, or another proxy server, but these instructions only cover Squid. If you are using a proxy to forward traffic between the on-prem Synthetic Server Client Feeder and the Synthetic Server Feeder, your proxy will need to support the WebSocket protocol.

Squid

1. Add the following configurations to the Squid configuration file at `/etc/squid/squid.conf`.

   ```
   http_access allow localhost
   http_access allow all
   http_port 3128
   ```

2. Restart `squid`.

Monitor the Synthetic Server

AppDynamics recommends that you monitor the performance of the Synthetic Server with the Java Agent. Once you have instrumented the Synthetic Server, you can use preset capacity monitoring dashboards and health rules or create custom dashboards and health rules based on JMX and the Synthetic Server metrics.

Follow the steps below to monitor the Synthetic Server:

1 Install the Java Agent
2 Configure the Java Agent
3 Connect the Synthetic Server with the Controller
4 Attach the Java Agent to the Synthetic Server
5 Verify the Instrumentation of the Synthetic Server
6 Create Preset Dashboards and Health Rules
7 Create Custom Dashboards and Health Rules

Install the Java Agent

You should install the Java Agent in the same directory as the Synthetic Server installation directory. See Install the Java Agent for instructions.

Configure the Java Agent

Configure the Java Agent to report metrics to a specific Controller:

1. Change to `<agent_home>/conf/`.
2. Edit the `controller-info.xml` file so that the values for the following elements match your Controller information, application name, tier name, and node name:
    - `<controller-host>`
    - `<controller-port>`
    - `<application-name>`
    - `<tier-name>`
    - `<node-name>`
3. For example, your `controller-info.xml` file might look similar to the following:

```
<controller-info>
    <controller-host>192.168.1.20</controller-host>
    <controller-port>8090</controller-port>
    <application-name>SyntheticServer</application-name>
    <tier-name>SchedulerTier</tier-name>
    <node-name>SchedulerNode</node-name>
</controller-info>
```

> You must ensure that the application name, tier name, and node name are the same as the `javaagent.jar` parameters when you attach the Java Agent to the Synthetic Server.

Connect the Synthetic Server with the Controller

Before you installed the Synthetic Server, you needed to configure the Synthetic Server to connect to the EUM Server's MySQL database and the EUM Collector. In this section, you will set configurations in `inputs.groovy` to connect the Synthetic Server to the Controller, so that the predefined health rules and dashboards can be created.

In the `inputs.groovy` file, make sure you have set the following properties. Replace placeholders in brackets with information about your Controller as well as the application and tier that are being monitored.

```
controller_host = "http(s)://<url_to_machine_running_controller>"     // The URL to your on-prem Controller
controller_port = "<port_number>"                                     // The default is 8090.
controller_account = "<controller_account>"                           // Account used for running post-deploy
tasks
controller_username = "<controller_username>"                         // Username for making API calls to
controller
prompt_for_password = "false"                                         // When false, the password below will be
used without prompting.
controller_password = "<controller_password>"                         // Password used for username. It is not
stored in any config files.
controller_synth_app = "<app_name_set_in_controller-info.xml>"        // This is the application shown in the
Controller and is based on the value given in the <application-name> element in controller-info.xml.
controller_shepherd_entity = "<tier_name_set_in_controller-info.xml>" // This is the tier shown in the
Controller and is based on the value given in the <tier-name> element in controller-info.xml
```

Attach the Java Agent to the Synthetic Server

To attach the Java Agent to the Synthetic Server, set Java options through the variables `SCHEDULER_OPTS` and `SYNTHETIC_SHEPHERD_OPTS`. The node names and tier names given in the examples below can be modified for your use case. One JVM process requires one Java Agent to be attached.

1. Set the options for the Synthetic Scheduler so that the Java Agent is attached to the JVM process:

```
SCHEDULER_OPTS="-javaagent:./java_agent/javaagent.jar -Dappdynamics.agent.applicationName=synthonprem -
Dappdynamics.agent.nodeName=synthetic-scheduler -Dappdynamics.agent.tierName=scheduler-tier"
```

2. Set the options for the Synthetic Shepherd so that the Java Agent is attached to the JVM process:

```
SYNTHETIC_SHEPHERD_OPTS="-javaagent:./java_agent/javaagent.jar -Dappdynamics.agent.
applicationName=synthonprem -Dappdynamics.agent.nodeName=synthetic-shepherd -Dappdynamics.agent.
tierName=shepherd-tier"
```

3. Set the options for the Synthetic Feeder Client so that the Java Agent is attached to the JVM process:

```
FEEDER_CLIENT_OPTS="-javaagent:./java_agent/javaagent.jar -Dappdynamics.agent.
applicationName=synthonprem -Dappdynamics.agent.nodeName=synthetic-feeder-client -Dappdynamics.agent.
tierName=feeder-client-tier"
```

4. Export the variables for the Synthetic Server options:

```
export SYNTHETIC_SHEPHERD_OPTS
export SCHEDULER_OPTS
export FEEDER_CLIENT_OPTS
```

5. From the Synthetic Server installer directory, run the following to stop and start the Synthetic Server:

```
unix/deploy.sh stop
unix/deploy.sh start
```

Verify the Instrumentation of the Synthetic Server

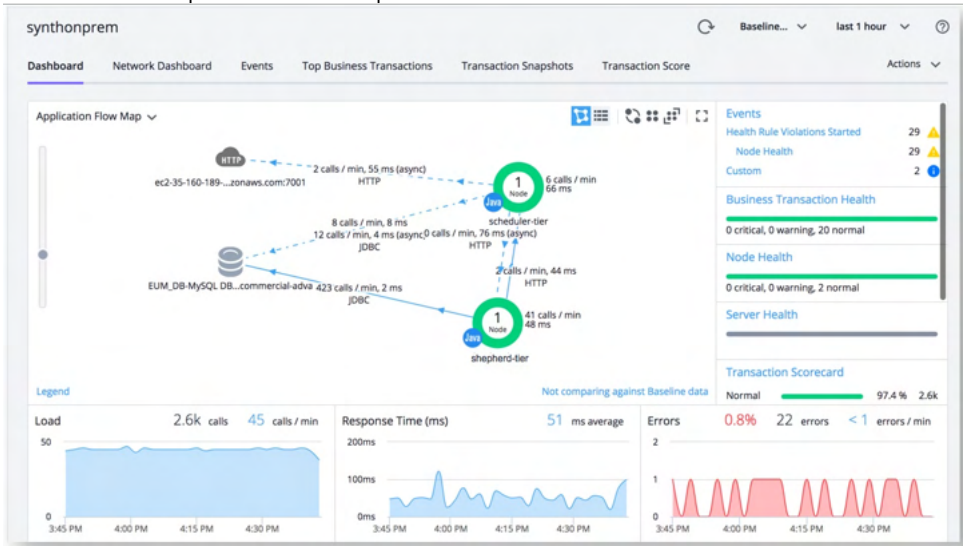
1. Confirm that the Java Agent is running:

```
ps -ef | grep javaagent
```

2. Check the Java Agent logs:

```
tail <java-agent>/ver<agent-version>/logs/<node-name>/agent-XXXX.log
```

3. Navigate to your Controller.
4. You should see a business application with the name assigned in the `controller-info.xml` file similar to the following. You should also see the tiers and nodes specified in the Java options.



Create Preset Dashboards and Health Rules

The Synthetic Server comes with the `post_deploy.sh` command to help create preset dashboards and health rules to monitor the Synthetic Server. The health rules are based on metrics generated by Synthetic Shepherd and not the host machine of the Synthetic Agent or the Java Agent, so they serve to complement the JMX health rules such as CPU usage, memory consumption, etc.

About the Preset Dashboards and Health Rules

The preset health rules issue warnings for when the Synthetic Server has a *busy* percentage of 80% and issue critical alerts when that busy percentage reaches 90%. The busy percentage is evaluated over the last 30 minutes.

Understanding the Busy Percentage

Each Synthetic Agent can only run one job at a time. When running a job, the Synthetic Agent is busy, and when it's not running, the Synthetic Agent is *not* busy. The busy percentage indicates the percentage of time that a Synthetic Agent is running jobs. For example, if a Synthetic Agent ran a job that took five minutes and no other jobs, then over the last 10 minutes, it was 50% busy. The busy percentage is based on a metric reported every minute and calculated using pages per minute (PPM). The busy percentage can be used to monitor one Synthetic Agent, a group of Synthetic Agents, or a location.

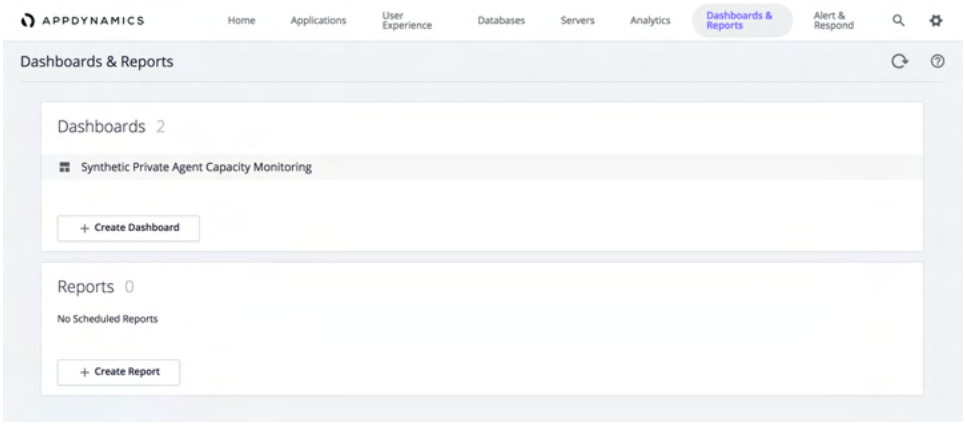
Create the Dashboards and Health Rules

Once you have verified that the instrumentation was successful and that business applications were created:

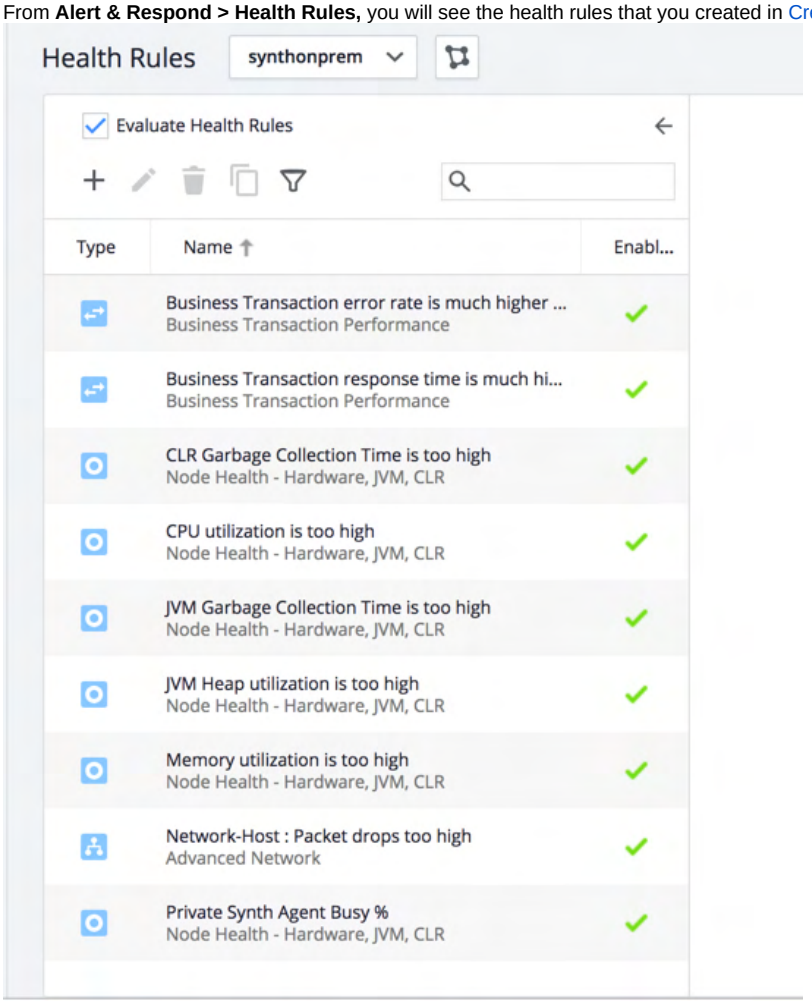
1. Log in to the machine hosting your Synthetic Server.
2. Change to the Synthetic Server home.
3. Run the following command to create the preset dashboards and health rules:

```
unix/post_deploy.sh
```

4. From the Controller UI, navigate to the **Dashboards & Reports** page.
5. You should see the dashboard **Synthetic Private Agent Capacity Monitoring** as shown here:



6. Open the business application for the on-premises Synthetic Server.
7. Navigate to **Alert & Respond > Health Rules**.
8. From **Alert & Respond > Health Rules,** you will see the health rules that you created in Create Preset Dashboards and Health Rules.



Create Custom Dashboards and Health Rules

The Java Agent will report metrics generated by Synthetic Server such as CPU usage, memory consumption, garbage collection, etc. You can use these metrics to create health rules and custom dashboards.

See the following pages for instructions:

- Custom Dashboards
- Configure Health Rules

Synthetic Server Endpoints

Related pages:

- Port Settings
- EUM Server Endpoints

The Synthetic Server has different endpoints serving distinct functions. This page provides a reference for testing the health and getting information about on-premises Synthetic Servers.

The endpoints include the following:

- **Synthetic Shepherd** - manages and dispatches jobs to the Synthetic Agents. In addition, the Synthetic Shepherd saves the measurement results to the filesystem and sends beacons containing the data to the Synthetic Scheduler.
- **Synthetic Scheduler** - handles the CRUD operations for jobs and manages the events generated for synthetic warnings and errors that occur in the measurement results.
- **Synthetic Feeder Client** - communicates with the SaaS Synthetic Feeder Server to access the Synthetic Hosted Agents.

Synthetic Server Endpoint URLs

The table below lists the endpoints, the default URL, and the supported paths.

Synthetic Server Endpoint	Default URL	Paths / Description
Synthetic Shepherd	`http(s)://<domain-name>:10101`	/version — Returns the version, build, commit, and timestamp of the Synthetic Shepherd.
Synthetic Scheduler	`http(s)://<domain-name>:12101`	/version — Returns the version, build, commit, and timestamp of the Synthetic Scheduler.
Synthetic Feeder Client	`http(s)://<domain-name>:16101`	/version — Returns the version, build, commit, and timestamp of the Synthetic Feeder Client.

Upgrade the Synthetic Server

This page describes how to upgrade the Synthetic Server to the latest version. This is often done alongside an upgrade to the other platform components, such as the EUM Server, the Controller, and the Events Service.

What the Upgrade Does

The upgrade procedure updates the schemas for the EUM Server database and the JAR files for the Synthetic Server if either is needed.

> The upgrade steps will not update 3rd-party software such as the Python library Flake8.

Who Should Use This Document

To upgrade the Synthetic Server to the latest available version, use this document.

Before You Begin

Before you upgrade the Synthetic Server:

1. Back up your current installation. There is no way to downgrade and changes are permanent.
2. Update platform components in the correct update order.

Upgrade Procedure

Follow the instructions below to upgrade your Synthetic Server.

Pre-requisite

The previous version of the Synthetic services database should be maintained.

Get the Latest Synthetic Server Installer

1. Go to the AppDynamics Downloads site and download the latest version of the Synthetic Server installer package.
2. Copy the Synthetic Server installer package (`synthetic-installer-linux-<version>.zip`) to the machine hosting your Synthetic Server.

Upgradation Steps

To upgrade Synthetic services first go to the installed Synthetic services path `cd <Synthetic_home>` and follow the steps given here:

1. Run the following command to stop Synthetic services:

```
"/unix/deploy.sh stop"
```

2. Take a back up of `inputs.groovy` file from `<Synthetic_home>` before deleting contents of `<Synthetic_Home>`. This is done to preserve previous configuration details.
3. Delete all the files and folders under `<Synthetic_home>.`
4. Copy and unzip the new Synthetic services installer under `<Synthetic_home>.`
5. Replace `inputs.groovy.sample` file with the backed up file (mentioned in step 2).
6. Run the following command to install new services:

```
"./unix/deploy.sh install"
```

Verify the New Version Has Been Installed

1. Once the installation is complete, confirm the Synthetic Server is running by entering:

```
ps aux | grep synthetic-processor
netstat -lan | grep "1[0,2,6]10[1,2]"
```

2. To view the updated version, curl to the `version` endpoint:

```
curl <on-prem-synthetic_server>:10101/version
curl <on-prem-synthetic_server>:12101/version
curl <on-prem-synthetic_server>:16101/version
```

Synthetic Private Agent Deployment

Related pages:

- Requirements for the Synthetic Private Agent
- Prepare the Host Machine for the Synthetic Private Agent
- Install the Synthetic Private Agent

Synthetic Private Agents enable you to monitor internal websites or services that aren't visible to the public Internet. You can also use Synthetic Private Agents to test from specific facilities on your network. For example, a bank might install a Synthetic Private Agent in each branch to monitor whether that branch can access the bank's applications.

The Synthetic Private Agent is a software package that you can install on Windows Server 2016, Windows Server 2012, or Windows Server 2012 R2. After installation, the Synthetic Private Agent connects to the Synthetic Server (on-premises or SaaS) and registers under your EUM account. Once this is done, you can configure synthetic jobs to run in your Synthetic Private Agent location.

Limitations

When using the Synthetic Private Agent, you will encounter the following limitations in the Controller UI:

- The **Synthetic Job Editor** displays options for all four browsers regardless of which are actually installed by your Synthetic Private Agent locations. If you select browsers that aren't available, you'll see an error when you save the job.
- When choosing a Synthetic Private Agent location from the **Synthetic Job Editor**, you will not be able to choose a connection speed because traffic shaping is not supported for Synthetic Private Agents.

Compatibility with 4.3 Controllers

Although you can use the Synthetic Private Agent with 4.3 Controllers, it is recommended that you upgrade to the 4.4 to avoid the following known issues seen in 4.3 Controllers:

- The **License** page will not display license usage for Synthetic Private Agents. The usage for Synthetic Hosted Agents will be correct.
- The **License** column on the **Synthetic Jobs** page will display incorrect information for jobs that use Synthetic Private Agents.
- The License information header at the top of the **Synthetic Jobs** page will be incorrect if you have any jobs that use Private Agents.
- In the **Synthetic Job Editor**, the locations for the Synthetic Private Agents and Synthetic Hosted Agents will be given in one flat list.

Requirements for the Synthetic Private Agent

To use the Synthetic Private Agent, make sure that you meet the requirements given in the table below:

Component	Requirement(s)	Notes
License	A license for Synthetic Private Agents.	The license for Browser Synthetic Monitoring does not include the usage of Synthetic Private Agents. You will need an additional license.
Hardware	• Processor: 2 GHz • Memory: 4 GB RAM • Disk Space: 40 GB	The machine should be a dedicated host.
Software	• Windows Server 2016 64-Bit (only supported for the Synthetic Private Agent 20.2 and higher) • Windows Server 2012 64-Bit or Windows Server 2012 R2 64-Bit (Only English version) • Microsoft .NET Framework 4.7 or greater	If you use Windows Server 2012, you'll be able to create jobs that test in IE10. If you use Windows Server 2012 R2, you'll be able to create jobs that test in IE11. If you need to test in both IE10 and IE11, then you can set up two Synthetic Private Agents (one on Windows Server 2012 and one on Windows Server 2012 R2) in the same location: They will automatically form a cluster that supports both browsers. Windows Server 2016 does not support synthetic tests of IE 10 browsers.
Network	Outbound network access to connect to the Synthetic Server: • SaaS: `https://synthetic.api.appdynamics.com:443` • On-Premises: `http://<on-prem-synthetic-server-host>:10101`	The Synthetic Server dispatches jobs from the Controller to your Synthetic Private Agent and collects the job results. For the on-premises Synthetic Server, you are recommended to use an HTTP proxy instead of directly connecting through SSL.

Prepare the Host Machine for the Synthetic Private Agent

Before you start installing the Synthetic Private Agent, you may need to make changes to the host machine. You should first try using the recommended settings for your host machine and then follow the steps for preparing the host machine based on your Windows environment.

Recommended Settings for the Host Machine

These are the recommendations for the host machine of the Synthetic Private Agent:

- Do not install other software on the Synthetic Agent machine. The Synthetic Private Agent measures performance, so running other software on the same server may adversely affect the measurement results. Also, the configuration changes for the installation might, conversely, adversely affect the other programs running on the machine.
- The host machine should be a Windows Workgroup and *not* part of a Windows Host Domain. See Windows Domains Versus Workgroups for an explanation.
- Do not run anti-virus software on the host machine.
- Use a password specific to the host machine.

Steps for Preparing the Host Machine

The table below lists the steps you will need to take to prepare your host machine based on the Windows environment.

Windows Environments	Running Anti-Virus Software?	Steps to Take
Workgroup (recommended)	Yes	1. Configure Local Policies for Workgroups 2. Remove Internet Browsers from Dedicated Machine 3. Prevent Anti-Virus Software from Affecting the Private Synthetic Agent
	No	1. Configure Local Policies for Workgroups 2. Remove Internet Browsers from Dedicated Machine
Windows Domain	Yes	1. Configure Group Policies for Windows Domains 2. Remove Internet Browsers from Dedicated Machine 3. Prevent Anti-Virus Software from Affecting the Private Synthetic Agent
	No	1. Configure Group Policies for Windows Domains 2. Remove Internet Browsers from Dedicated Machine

Windows Domains Versus Workgroups

The installer will create the user account `agent_user` that will be used to run the Synthetic Private Agent. You should *avoid* applying a Group Policy (GPO) on the host machine that will affect the `agent_user` account.

Machines that belong to Windows Domains generally have GPOs applied to them. Because of this, you are recommended to use a standalone Workgroup for the host machine when possible. In addition, if the host machine is a member of a Windows Domain, you will need to be a Domain Administrator to modify the GPOs. See Configure Group Policies for Windows Domains to learn which policy settings to change.

Ideally, in an enterprise deployment where Active Directory is set up, the host machine should be part of an Organizational Unit (OU) that has no interactive logon GPOs. This makes using Workgroups ideal. In addition, for Workgroups, you only need to be a Local Administrator to configure the Local Policies.

Configure Local Policies for Workgroups

The sections below show you how to change the following settings for Local Policies on Workgroups.

Remove Maximum Password Age

1. If the settings are not the same, from a PowerShell, open the **Local Security Policy** window:

```
> secpol.msc
```

2. From the **Local Security Policy** window, navigate to **Security Settings > Account Policies > Password Policy**.
3. Double-click **Maximum password age** to open the **Maximum password age Properties** dialog.
4. Set the value to **0** for the expiration date, so that the password never expires.
5. Click **OK**.

Add Users to the User Rights Assignment

1. From the **Local Security Policy** window, navigate to **Security Settings > Local Policies > User Rights Assignment**.
2. Double-click **Allow log on locally**.
3. If you don't see **Users** in the text area, click **Add User or Group**.
4. From the **Select Users or Groups** dialog, enter **Users** and click **Check Names**.
5. Click **OK**.

Configure Group Policies for Windows Domains

If the machine is a member of a Windows Domain, do the following:

Steps		Persona/User
1.	Check if the Group Policy settings are correct for installing the synthetic Private Agent.	Standard User Account, Local Administrator User Account, Domain Administrator Account
2.	Modify the Group Policy settings if needed.	Domain Administrator Account
3.	Verify that the Group Policies for interactive logon are not applied.	Domain Administrator Account

Check Group Policy Settings

1. From a PowerShell console, run the `gpresult` command to save the applied group policies to an HTML file:

   ```
   gpresult /H output.html
   ```

2. If one of the following is true, your Windows Domain is configured correctly:

   - The `output.html` file doesn't have any settings.
   - When you open `output.html` and navigate to **Settings > Policies > Windows Settings > Security Settings, you** see the policies and settings below.

Security Settings	Policy	Setting
Account Policies/Password Policy	Maximum password age	0 days
Local Policies/User Rights Assignments	Allow log on locally	Users (should be one of the settings)

3. If your Windows Domain is not configured correctly:

   a. Modify the relevant GPO settings
   b. Confirm that the interactive logon policies are not applied

Modify Group Policy Settings

Typically, the IT department will need to make GPO changes. The Domain Administrator in your IT department will need to change the following Group Policy settings that are applied to the host machine for the Synthetic Private Agent:

- No maximum password age is used for the Synthetic Private Agent account `agent_user`
- Permissions to log on have been granted to the `agent_user`

Confirm Interactive Logon Policies Are Not Applied

If you do apply Group Policies to the host machine, you will need to disable interactive logon Group Policies for autologon to work.

Verify that the **Interactive logon** policies below are not configured. If a policy has a setting, you will need to disable it.

Policy
Interactive logon: Message text for users attempting to log on
Interactive logon: Message title for users attempting to log on
Interactive logon: Prompt user to change the password before expiration

Remove Internet Browsers from Dedicated Machine

Before installing the Synthetic Private Agent, remove all internet browsers except Internet Explorer because the agent requires specific versions of the browsers.

Prevent Anti-Virus Software from Affecting the Private Synthetic Agent

Running anti-virus software may disrupt the operation or affect the performance of Private Synthetic Agents. If you are running anti-virus software on the same machine hosting the Synthetic Private Agent, you should do the following:

- exclude the agent's installation directory (the default is `C:\appdynamics\`) from virus scanning.
- do not allow your anti-virus software to quarantine the dynamic-link library `k9.dll`, which is injected into running processes for the Synthetic Private Agent to function properly.

If you have taken these precautions and are still having difficulty running anti-virus software, report your issue to your AppDynamics account representative.

Install the Synthetic Private Agent

The instructions below show you how to fetch and install a Synthetic Private Agent.

The installation of the Synthetic Private Agent will make the following changes to your system:

- Install the Synthetic Private Agent.
- Install browsers.
- Configure many aspects of Windows to make it amenable for collecting performance data from browsers, including changing several Windows registry settings.
- Turn on the Windows firewall and prevent any inbound network connections to the server.

Prerequisites

Before beginning the installation, confirm that you have completed the following:

- Met the requirements for the Synthetic Private Agent
- Prepared the Host Machine for the Synthetic Private Agent

Installation Steps

Follow the steps below to install the Synthetic Private Agent:

Fetch the Synthetic Private Agent

Navigate to the AppDynamics Downloads and download the Synthetic Private Agent.

Log in as the Administrator

Before you can copy and run the Synthetic Private Agent installer, you are required to log in as the *administrator* to the dedicated Windows machine for the Synthetic Private Agent.

Copy/Move the Synthetic Private Agent to Your Dedicated Machine

1. Move or copy the compressed archive file `SyntheticAgentInstaller.zip` containing the Synthetic Private Agent to this machine.
2. Unzip and decompress the archive file.
3. Confirm that the directory `SyntheticAgentInstaller` contains the installer script `install.ps1`.

Prepare Account and Location Information

Before you install the Synthetic Private Agent, you will need the following information:

- **EUM Account Name / EUM License Key**:
    1. Go to your SaaS Controller.
    2. Navigate to **License > Peak Usage**.
    3. Scroll down to the **User Experience** section.
    4. Copy the values for the **Account Name** and **License Key** fields.
- **Location name**: A user-friendly string for the location. You can use the same location information on multiple computers to add capacity to that location. For example, if the private location is for multiple machines running from the company office in SF, you might use "SF Office".
- **Location ID**: A unique alphanumeric string from 4-10 characters identifying a location where one or more agents may be running. You should create this ID based on the location name.
- **Latitude and longitude of the location**: Navigate to the **GPS Coordinates with Google Maps** tool at `https://www.gps-coordinates.net/` to get the latitude and longitude of your location.

Run the Installer

After you unzip and decompress the archive file:

1. Open a PowerShell console.

2. Change to the directory `SyntheticAgentInstaller`.
3. Set the PowerShell execution policy to `Unrestricted`:

```
> Set-ExecutionPolicy Unrestricted
```

4. Execute the PowerShell script `install.ps1` to install the Synthetic Private Agent, Internet browsers, and make changes to the Windows configuration:

```
> .\install.ps1
```

5. At the command prompts, enter the information that you prepared in the last step.

Connect the Agent to the Synthetic Server (Optional)

By default, the Synthetic Private Agent will report measurement results to the SaaS Synthetic Server located in the Americas business region. Thus, if your Synthetic Private Agent is located in the Americas business region and reporting to our SaaS Synthetic Server, continue to Start the Synthetic Private Agent.

If your Synthetic Private Agent is reporting measurement results to an on-prem Synthetic Server, see Connect Synthetic Agents to the Synthetic Server for configuration instructions.

To configure your Synthetic Private Agent to report to a SaaS Synthetic Server in the EMAC or APAC business regions, follow these instructions:

1. Select the **EMAC** or **APAC** tab in the following table to find the URL to the SaaS Synthetic Server in your region.

SaaS Domains and IP Ranges

2. Change to the directory `C:\appdynamics\synthetic-agent\synthetic-driver\conf`.
3. Edit the file `synthetic-driver.yml`.
4. Set the URL to SaaS Synthetic Shepherd in your region to the `shepherdUrl` as shown below:

```
## Use the SaaS Synthetic Server URL from the table above for EMAC or APAC.
shepherdUrl: http://<saas_synthetic-server_url>
```

5. Save your changes and close the `synthetic-driver.yml` file.

Start the Synthetic Private Agent

After installation is complete (the installer may restart your computer), start the Synthetic Private Agent by double-clicking the desktop shortcut **Start Agent**.

Confirm the Installation Was Successful

1. Go to your SaaS Controller and to the **Synthetic Job List.**
2. Click **Create a Job**.
3. From **Choose Locations**, select **Private** from the dropdown to view all the Synthetic Private Agents associated with your account.
4. Verify that your private location shows up as one of the available locations.

Configure Autologon

You should configure autologon so that the machine after booting up will automatically log on to the Administrator account. You are recommended to use the free Microsoft Sysinternals utility `Autologon.exe` for configuring autologon. `Autologon.exe` is easy to use, and more importantly, *encrypts* the account credentials stored in the Windows Registry.

To configure autologon:

1. Download `Autologon.exe` from https://docs.microsoft.com/en-us/sysinternals/downloads/autologon.
2. Double-click the executable **Autologon.exe**.
3. Enter the requested information (username, domain, password, etc.).
4. Click **Enable**.

You can also run `Autologon.exe` from the command line, but be sure to escape any special characters in your password.

To manually configure autologon by editing the registry, see How to turn on automatic logon in Windows. Note that the given instructions can change slightly depending on the version of Windows being used.

Schedule the Synthetic Private Agent to Start on Logon

After you have set up autologon, you still need to schedule the Synthetic Private Agent to automatically start after the machine logs on to the Administrator account.

1. Open a PowerShell console.
2. Right-click and save `startagent.xml` file to your `$HOME` directory.
3. Change to your `$HOME` directory.
4. If you are logged on as a different user than "Administrator", edit the `startagent.xml` file and replace the value "Administrator" for the following XML elements with your user name. (Remember, your user account still must have Administrator permissions.)
    - `<Author>`
    - `<UserId>`
5. Schedule the task of starting the Synthetic Private Agent:

    ```
    > schtasks /create /f /tn "Start the Synthetic Private Agent"/xml .\startagent.xml
    ```

6. Restart your machine.
7. After the machine boots up, you should see the Windows console open titled "Administrator: Windows PowerShell" that displays the log message "Synthetic-agent is running".

Advanced Options

Install Multiple Agents

After installing one Synthetic Private Agent, you should consider whether you need to install more Synthetic Private Agents.

Installing multiple agents is recommended for the following use cases:

- You want to **test multiple locations**. You need to install the Synthetic Private Agent on multiple machines and provide different location information during the installation. Each location will appear separately in the **Job Editor**.
- You need **more throughput to run more tests**. If you run a lot of synthetic jobs from a location, you may see errors like “Location is overloaded”. This means the machine is at capacity and you need to add another machine. You can simply install the agent on another machine and provide the same location information.
- You want **support for multiple versions of Internet Explore**r. See Software Requirements for more information.

Configure the Synthetic Private Agent

Related pages:

- Install the Synthetic Private Agent

This page describes the configuration options for the Synthetic Private Agent.

Configure Proxy for the Synthetic Private Agent

Although using a proxy for the Synthetic Private Agent is not mandatory, you can potentially improve security or provide load balancing.

Proxy Use Cases

The following are the various ways in which the Synthetic Private Agent could use a proxy to interact with an on-premises or SaaS Synthetic Server:

- Synthetic Private Agent interacting with a SaaS Synthetic Server
- On-premises Synthetic Server interacting with a SaaS Synthetic Server when Synthetic Hosted Agents are being used by the on-premises Synthetic Server
- Synthetic Private Agent interacting with an on-premises Synthetic Server

Proxy Configuration Steps

To configure the proxy:

1. Log on to the machine hosting the Synthetic Private Agent.
2. Change to the directory `C:\appdynamics\synthetic-agent\synthetic-driver\conf`.
3. Edit the file `synthetic-driver.yml`.
4. Find the setting `proxyConfig.`
5. Specify the proxy host and port with keys `proxyHost` and `proxyPort` as shown in the following example:

```
proxyConfig:
       proxyHost: <synthetic_server-hostname>
       proxyPort: 1501
       ...
```

6. (Optional) If you have enabled authentication with the proxy, specify the proxy username and password with the keys `proxyUsername` and `proxyPassword`:

```
proxyConfig:
       proxyHost: <synthetic_server-hostname>
       proxyPort: 1501
       proxyUsername: <proxy-username>
       proxyPassword: <proxy-password>
```

Set the Port for the Administration Console

The default port for the Administration connections is 8081. To avoid port conflicts, you can configure the Administration to listen to a different port.

In the file `C:\appdynamics\synthetic-agent\synthetic-driver\conf\synthetic-driver.yml`, navigate to the `server` section and modify the value of the `port` property for the `adminConnectors`.

```
server:
  applicationConnectors:
  - type: http
    port: 8888
  adminConnectors:
  - type: http
    port: 8091 # You can customize the port by changing the value here.
  requestLog:
    appenders: []
```

Filter Synthetic Traffic

You can configure the request headers in synthetic scripts to do the following:

Set Custom User Agent for Synthetic Scripts

You can set the user The EUM Server ignores requests for browser applications when the string "PTST/1.0" is part of the User Agent.

```
requestHeader:
   userAgent: "custom user agent"

driver.get('http://127.0.0.1:20000/green.html')
```

Include Synthetic Traffic in Browser RUM Traffic

The request header in synthetic scripts is tagged so that the requests are not included in Browser RUM pages. You can set the property `tagUserAgent` to `false` to include the synthetic traffic in the Browser RUM pages as shown below.

```
requestHeader:
   userAgent: "custom user agent"
   tagUserAgent: false

driver.get('http://127.0.0.1:20000/green.html')
```

Uninstall the Synthetic Private Agent

The following steps will delete the Synthetic Private Agent, but will not delete the third-party software packages installed with the Synthetic Private Agent. See Uninstall Third-Party Sofware Packages below for instructions.

1. From your desktop, double-click the **Stop Agent** shortcut icon.
2. From **Windows Explorer**, delete the directory `C:\appdynamics`.

Uninstall Third-Party Software Packages

When you install the Synthetic Private Agent, you also uninstall the following third-party software packages:

- chef-client
- Java runtime environment
- python

To delete these third-party software packages:

1. Navigate to **Control Panel > Programs > Uninstall**.
2. Select the software package(s) that you want to uninstall.
3. Click **Uninstall**.

Upgrade the Synthetic Private Agent

Follow these steps to upgrade the Synthetic Private Agent:

1. Sign on to the host machine of the Synthetic Private Agent.
2. From your desktop, double-click the **Stop Agent** shortcut icon.
3. Copy the file `C:\appdynamics\synthetic-agent\synthetic-driver\conf\synthetic-driver.yml` to `C:\Desktop\synthetic-driver.yml`.
4. Delete the directory `C:\appdynamics`.
5. From the AppDynamics Download site, download the latest version of the Synthetic Private Agent.
6. Move the zip file of the Synthetic Private Agent to the host machine.
7. Unzip the Synthetic Private Agent.
8. Prepare the following information for the installation:
    - EUM Account name
    - Location name
    - Location ID
    - Latitude/latitude of the location

    > If you don't recall this information, you can refer to the `location` and `privateClient` objects in the `C:\Desktop\synthetic-driver.yml` file.

9. Run the installer.
10. Once you've completed the installation, delete the YAML configuration file `C:\Desktop\synthetic-driver.yml.`

Troubleshoot the Synthetic Private Agent

This page provides troubleshooting instructions for some commonly experienced issues.

Authentication Errors

If you get authorization errors and do not see your private location in the **Synthetic Job Editor**, try the following:

- Check the log files for errors: `C:\appdynamics\synthetic-agent\log`
- Confirm that your account and location information is correct in the configuration file: `C:\appdynamics\synthetic-agent\synthetic-driver\conf\synthetic-driver.yml`

Update Account and Location Information

If you had to correct your account and location information, stop and restart the Synthetic Private Agent:

1. Stop the Synthetic Private Agent by double-clicking the desktop shortcut **`Stop Agent`**.
2. Restart the Synthetic Private Agent double-clicking the desktop shortcut **`Start Agent`**.

Administration Privilege Issues

If you have difficulty running the installer as a domain user with administrator privileges, create a local user account with administrative privileges and try again.

Anti-Virus Software Issues

See Using Anti-Virus Software for instructions on how to avoid anti-virus software scanning the Synthetic Private Agent files.

Add Users to Group Policy

If you encounter the following error message:

```
Users do not have allow logon permissions. Please add 'Users' to 'Allow log on locally' group policy. This is required because agent_user is a non administrator and is used to execute measurements.
```

1. Open a PowerShell console.
2. From the console, open the **Local Group Policy Editor**:

   ```
   > gedit.msc
   ```

3. Navigate to **Computer Configuration -> Windows Settings -> Security Settings -> Local Policies -> User Rights Assignment**.
4. Double-click the policy **Allow log on locally**.
5. Click **Add User or Group**.
6. From the **Select Users or Groups** dialog, enter **Users** as the object name.
7. Click **Object Types** to open the **Object Types** dialog.
8. Check the **Groups** checkbox.
9. Click **OK** to close the **Object Types** dialog.
10. Click **OK** to close the **Select Users or Groups** dialog.
11. From the **Allow log on locally Properties** dialog, click **Apply** to save your changes.
12. Click **OK** to close the **Allow log on locally Properties** dialog.
13. Close the **Local Group Policy Editor**.

Java Virtual Machine Issues

If you get errors from the Java Virtual Machine, verify the following details for your setup:

- Check if the Requirements for the Synthetic Private Agent are met, especially the amount of available memory. Also ensure that a 64-bit Operating System (OS) is installed.
- Check if there is any Java Runtime Environment (JRE) installed other than the one provided by the Synthetic Private Agent. Uninstall all other JREs if you find any.
- Make sure that you increase the maximum size of the memory allocation pool. For this:

    i. Open the following with an editor:

    ```
    C:\appdynamics\synthetic-agent\start_agent.bat
    ```

ii. Edit the following option set:

```
JVM_XMX=...
```

Synthetic Job Times Out for Internet Explorer 11

If you notice synthetic jobs running in Internet Explorer (IE) 11 in private agent locations are timing out, you may need to change the Protected Mode settings of IE 11 on the machine hosting your Synthetic Private Agent.

To diagnose and fix the potential issue with the Protected Mode settings:

1. From the **Synthetic Jobs** page, edit the job that is timing out to determine the private agent location.
2. Log on to the machine hosting the Synthetic Private Agent running in that private agent location.
3. Open the log file `C:\appdynamics\synthetic-agent\log\connector.log`.
4. If you see error messages similar to the one below, this verifies that you will have to update the Protected Mode settings for each of the four zones in IE 11.

```
CRITICAL 2018-06-25 15:13:26,019  ad.script.webdriver  measurementID=e325b030-c017-4155-bfd7-
19729b9ca3f1~8a0a5b3b-98a1-45e8-8746-9bxxxxx
      Failed to create WD Driver: unable to start remote browser: Message: Unable to create new remote
session. desired capabilities = Capabilities [\{ensureCleanSession=true, appdynamicsCapability=\
{flushSessions=true, outputDir=C:\appdynamics\synthetic-agent\measurements\1e0b7a1b-bffc-471d-8815-
1e40fxxxxx\results, commandWebhook=http://localhost:8888/v1/webdriver/action, testId=e325b030-c017-4155-

19729b9ca3f1~8a0a5b3b-98a1-45e8-8746-9bxxxxxx, browserName=internet explorer, initialBrowserUrl=about:
blank, javascriptEnabled=true, version=, platform=WINDOWS}], required capabilities = Capabilities [\{}]
```

5. Launch IE 11.
6. From IE 11, navigate to  **> Internet options**.
7. Select the **Security** tab and then make sure that each zone (**Internet**, **Local intranet**, **Trusted Sites**, and **Restricted Sites**) has the same setting for the **Enabled Protected Mode** checkbox shown below. For example, you can either check the box and enable protected mode for each zone or uncheck the protected mode to disable protected mode for each zone.
8. Restart IE 11.
9. From your Controller, verify that the problematic synthetic job is no longer timing out for IE 11. You can trigger the job to run by editing and saving changes for the job.

Secure the Platform

AppDynamics includes security features that help to ensure the safety and integrity of your deployment.

About Controller Security

The Controller is installed with an HTTPS port enabled by default. SSL secures client connections and allows clients to authenticate the Controller. The Controller UI supports HTTP Basic Authentication, along with SAML and LDAP authentication. Role-based access controls in the UI allow you to manage user privileges.

While the security features of the Controller are enabled out of the box, there are some steps you should take to ensure the security of your deployment. These steps include but are not limited to:

- The SSL port uses a self-signed certificate. If you intend to terminate SSL connection at the Controller, you should replace the default certificate with your own, CA-signed certificate. If you replace the default SSL certificate on the Controller, you will also need to establish trust for the Controller's public key on the App Agent machine.

  

  As an alternative to terminating SSL at the Controller, you can put the Controller behind a reverse proxy that terminates SSL, relieving the Controller from having to process SSL.

- Along with a secure listening port, the Controller provides an unsecured, HTTP listening port as well. You should disable the port or block access to the point from any untrusted networks.
- Make sure that your App Agents connect to the Controller or to the reverse proxy if terminating SSL at a proxy, with SSL enabled.
- The Controller and underlying components, Glassfish and MySQL, include built-in user accounts. Be sure to change the passwords for the accounts regularly and in general, follow best practices for password management for the accounts. For information on changing the passwords for built-in users, see Update the Root User and Glassfish Admin Passwords.

Proxy Controller Connections

The AppDynamics Controller is often deployed to a protected network behind a proxy, which presents a virtual IP address to external connections, including to agents and browser clients. The proxy itself resides in the DMZ for the network and often terminates SSL connections from the client connections.

If clients use SSL, the reverse proxy can terminate SSL connections or maintain SSL through to the Controller. Terminating SSL at the proxy removes the processing burden from the Controller machine.

Using a secure proxy can simplify administration as a whole, by centralizing SSL key management to a single point. It allows you to use alternative PKI infrastructures, like OpenSSL.

See Use a Reverse Proxy for more information.

Additional Security Topics

- Secure the EUM Server
- Analytics and Data Security
- Agent-to-Controller Connections (for information on Securing Agent Connections)
- Roles and Permissions (for information regarding potentially sensitive user permissions)

HTTPS Support for the Enterprise Console

There is built-in HTTPS support for the Enterprise Console using a self-signed keystore file. The Enterprise Console supports either HTTP or HTTPS based on your choice during fresh installation or upgrade. You can reconfigure the Enterprise Console to revert from HTTPS back to HTTP, or vice versa, at any time.

About Enterprise Console SSL and Certificates

For the HTTPS client, the Enterprise Console packages the latest Mozilla truststore `cacerts.jks`, as it contains standard certificates. The Enterprise Console creates a `keystore.jks` file which contains a self-signed certificate. This certificate is imported into `cacerts.jks` during installation or upgrade.

For production use, AppDynamics strongly recommends that you replace the self-signed certificate with a certificate signed by a third-party Certificate Authority (CA) or your own internal CA.

This page describes how to:

- enable HTTPS for the Enterprise Console during installation or upgrade.
- update the certificate to a signed one.
- customize keystore credentials.

> ⚠ Replacing the entire keystore is not recommended unless you first export the existing artifacts from the default keystore and import them into your own keystore.
>
> It is also not recommended that you create your own self-signed certificate.

The exact steps to implement security typically vary depending on the security policies for the organization. For example, if your organization already has a signed certificate to use, such as a wildcard certificate used for your organization's domain, you can import it into the keystore using the Enterprise Console's update-certificate command. Otherwise, you can obtain a new one along with a certificate signing request.

Before Starting

On Linux machines, the Enterprise Console uses curl to check the responsiveness of the application URL. Therefore, SSL needs to have the latest NSS package to work.

For example, you can update the NSS package to the latest with the following command on CentOS:

```
yum update nss
```

> ⓘ Your update procedure or NSS package name may differ depending on your Linux operating system.

Enable Enterprise Console HTTPS for Fresh Installation

You can enable HTTPS during the Enterprise Console installation by selecting HTTPS as your preferred connection type:

1. Follow the steps to install the Enterprise Console:
   - For GUI Installation, click the HTTPS checkbox.

     > ⚠ If the checkbox is left unselected, then the installation will default to HTTP.

     The Enterprise Console will create a self-signed certificate and use it for your HTTPS connection.
   - For Silent Installation, edit the platform admin response `varfile` with the following parameter:

     ```
     platformAdmin.useHttps$Boolean=true
     ```

     This enables HTTPS connection and is the same as checking **Enable Https Connection** in the wizard installation option. Setting the parameter to false uses HTTP.
2. Optional: The Enterprise Console will create a self-signed certificate and use it for HTTPS connection. You can replace it with a certificate signed by a third-party CA. See Update to a Signed Certificate.

The Enterprise Console then configures the HTTPS protocol and disables HTTP in the Dropwizard configuration file, PlatformAdminApplication.yml. See the Dropwizard Configuration Reference for more information.

Example Enterprise Console HTTPS connector configuration:

```
server:
  type: simple
  connector:
    type: encrypted-https # encrypted-https is a customized HTTPS connector type in Enterprise Console, with
keystore password encrypted.
    port: 9191 # DO NOT REMOVE alternatives are 8080
    keyStorePath: /appdynamics/platform-admin/conf/keys/keystore.jks
    keyStorePassword: s_-001-12-v/yKyIweuGQ=iLpBEDTqfP7vj++WP+MKEg==
    trustStorePath: /appdynamics/platform-admin/conf/keys/cacerts.jks
    trustStorePassword: s_-001-12-hdLwJEOZbns=kDmS/pLvq2A43iCWLJEcTg==
    certAlias: ec-server # DO NOT change cert alias name in keystore files.
    validateCerts: false
    supportedProtocols: [TLSv1.2]
    bindHost: 0.0.0.0
  applicationContextPath: /
```

The Enterprise Console encrypts all plain text passwords in the configuration file.

Enable Enterprise Console HTTPS for Upgrades

You can enable HTTPS from HTTP during upgrades from 4.4.3 to 4.5 and post-4.5 upgrades. You can also enable HTTPS for an existing Enterprise Console instance by reinstalling the Enterprise Console application:

1. Follow the steps to upgrade the Enterprise Console.
    a. Change the platform admin response varfile with:

    ```
    platformAdmin.useHttps$Boolean=true
    ```

2. Complete the upgrade.
3. Optional: A self-signed certificate is created by the Enterprise Console and SSL is configured, just like it is with a fresh installation. You can replace it with a certificate signed by a third-party CA. See Update to a Signed Certificate.

When you upgrade your HTTPS supported Enterprise Console to future release versions, the Enterprise Console will follow the below protocols:

- **Upgrades with a self-signed certificate (the Enterprise Console installed certificate)**: The Enterprise Console will always recreate the new `keystore.jks`, with a new self-signed certificate in it, and update the `cacerts.jks` file with the new self-signed certificate under the `<EC_installationDir>/conf/keys` folder.
- **Upgrades with a signed certificate**: The Enterprise Console will not modify your signed certificate, leaving it as it was before the upgrade.
  Note: Do not change the `serverHostName` in the admin response varfile from a private IP/hostname (if you used a private IP /hostname as the `serverHostName` for a previous Enterprise Console fresh install or upgrade) to a public IP as the Enterprise Console will not support the signed certificate afterwards. This restriction only applies to upgrades with a signed certificate.
- **Upgrades with customized keystore/truststore path and passwords**: The Enterprise Console will back up the `.jks` files only if they are under the `<EC_installationDir>/conf/keys` folder. The Enterprise Console will restore your keystore/truststore paths and passwords in `PlatformAdminApplicationl.yml` before the upgrade, even if you move the `.jks` files or change the password.

  Changing the .jks files location is not recommended as they will not be backed up by the Enterprise Console if they are in another location.

Configure HTTPS for Enterprise Console in SAN Deployments

To configure HTTPS for the Enterprise Console deployed for a Subject Alternative Name (SAN) on AWS, you will need to generate keys from the `san.cnf` file. The instructions below show you how to enter multiple hostnames and aliases for the Enterprise Console in the `san.cnf` file and then generate the keys with it.

1. Create your `san.cnf` file for the SAN. In the following example `san.cnf` file, multiple domain names and aliases are defined in `[ alt_names ]`.

```
[ req ]
default_bits       = 2048
distinguished_name = req_distinguished_name
req_extensions     = req_ext
prompt             = no
[ req_distinguished_name ]
countryName            = IN
stateOrProvinceName    = Karnataka
localityName           = Bangalore
organizationName       = Appdynamics
commonName             = ECserver
[ req_ext ]
subjectAltName = @alt_names
[alt_names]
DNS.1   = ECserver.com
DNS.2   = ECserver.secondary.com
DNS.3   = ECserver.alias1.com
DNS.4   = ECserver.alias2.com
IP.1        = 10.10.10.10
IP.2        = 10.10.10.9
```

2. Using the san.cnf file, generate the private key and CSR with the following openssl command:

```
openssl req -new -newkey rsa:2048 -nodes -out sslcert.csr -keyout private.key -config san.cnf
```

3. Check the CSR to confirm the SANs are correct:

```
openssl req -noout -text -in sslcert.csr | grep DNS
openssl req -noout -text -in sslcert.csr | grep IP
```

4. Sign the CSR by a certified authority (CA).
5. Update the certificate for the Enterprise Console:

```
./platform-admin.sh update-certificate --private-key <privateKeyfile> --ssl-cert <sslCertFile> --ssl-
chain <sslChainfile1> <sslChainfile2> <...>
```

Customize Keystore Credentials

You can customize keystore credentials. The Enterprise Console preserves your customized keystore/truststore passwords.

> ⚠ To keep your customized files backed up, place them under the `<EC_installationDir>/conf/keys` directory. Placing your files anywhere besides `<EC_installationDir>/conf/keys` is not recommended because they may not be backed up.

If you change the keystore content for the Enterprise Console, you must re-run the `change-keystore-password` command and re-encrypt. Then, you need to restart the Enterprise Console. See Controller Secure Credential Store for more information.

Get Encrypted Password

You can update the password for the `.jks` files. If you do, you must also update the password in the `PlatformAdminApplication.yml` file.

> ⚠ Do not change the `supportedProtocols` in the `PlatformAdminApplication.yml` file.

To get an encrypted password:

> ⓘ - Make a note of the generated password to use in Step 4.
>
> - For the `keystore.jks` file to work for the Enterprise Console, the `storepass` and `keypass` must be the same.

1. Use the Enterprise Console CLI to encrypt the new password:

```
./platform-admin.sh encrypt -t '<plain_text_password>'
```

2. Change the storepass in keystore.jks by using the <plain_text_password> from Step 1:

```
keytool -storepasswd -keystore keystore.jks
```

3. Change the ec-server keypass in keystore.jks by using the <plain_text_password> from Step 1:

```
keytool -keypasswd -alias ec-server -keystore keystore.jks
```

4. Use the encrypted password to update the Enterprise Console Dropwizard confirmation yml file (PlatformAdminApplication.yml) for the key "keyStorePassword".
5. Restart the Enterprise Console.

Update to a Signed Certificate

You can update the built-in self-signed certificate created by the Enterprise Console with a CA signed certificate from an eligible CA authority.

> ⚠ If you want to reuse the existing public key from the Java keystore to generate a CSR request, you must import the signed certificates manually. See step 6 to 9 in Create a Certificate and Generate a CSR for more information.

Most Linux distributions include OpenSSL. If you are using Windows or your Linux distribution does not include OpenSSL, you may find more information on the OpenSSL website.

1. Obtain a signed certificate:
   a. Create a csr request.

```
//Some CAs will create everything for you, including the private key. You may use the following
keytool command to create a csr request from existing keystore.jks.
keytool -certreq -alias ec-server -keystore keystore.jks -file AppDynamics.csr
```

or

```
//You can also use the following openssl command to create your own private key and csr request.
openssl req -new -newkey rsa:2048 -nodes -out <name of csr request file>.csr -keyout <name of
private key>.key -subj "/C=<custom>/ST=<custom>/L=<custom>/O=<custom>/OU=<custom>/CN=<hostname>"
```

   b. Submit the certificate signing request file generated by the command (AppDynamics.csr in our example command) to your Certificate Authority of choice. When it's ready, the CA will return the signed certificate and any root and intermediate certificates required for the trust chain. The response from the Certificate Authority should include any special instructions for importing the certificate, if needed. If the CA supplies the certificate in text format, just copy and paste the text into a text file.
2. Run the Enterprise Console update certificate CLI command:

```
./platform-admin.sh update-certificate --private-key <privateKeyfile> --ssl-cert <sslCertFile> --ssl-
chain <sslChainfile1> <sslChainfile2> ...
```

> ⚠ Refer to the following help points when running this command:
>
> - The privateKeyfile, sslCertFile, and ssl-chain files do not have any file format restrictions. Any file format, such as .pkey and .txt, should work, as long as it is readable.
> - The privateKeyfile file content must follow the PKCS8 format.
> - sslCertFile is your SSL certificate file.
> - ssl-chain files are additional certificates, such as intermediate certificates. These are optional, and you may provide as many of them as you would like.

This command updates the certificate in the keystore and truststore in the configuration yml file.

3. Restart the Enterprise Console for the new SSL configurations to take effect.

Verify the Use of SSL

You can test that your HTTPS support works by logging into the Enterprise Console GUI.

To make sure the configuration works, use a browser to connect to the Enterprise Console over the default secure port, port 9191:

```
https://<hosthame>:9191
```

Specify the hostname you used when you installed the Enterprise Console. The default port is 9191. This port needs to be exposed from your firewall rules so you can access the port from any place. See Port Settings for more information.

Make sure the Enterprise Console entry page loads in the browser correctly.

Depending on your browser, you may have to perform additional steps to verify your connection. For instance, for self-signed certificates on Chrome, you have to click to proceed. On Firefox, you have to create a security exception to proceed.

You can also verify that your configuration works by running commands on the Enterprise Console CLI.

Expired Certificate

In case of an expired certificate, the Enterprise Console CLI will still continue to work, but the CLI will also print out a warning, notifying you that the certificate has expired.

Upgrades to the Enterprise Console remain unaffected by expired certificates; when you try to upgrade the Enterprise Console without knowing that the certificate has expired, the upgrade should still succeed.

You can update the Enterprise Console self-signed certificate by reinstalling the application. For your own signed certificate, you can obtain a new one from CA and run the CLI command from Update to a Signed Certificate.

Revert the Enterprise Console to HTTP

You can fall back to HTTP from HTTPS support by reinstalling the Enterprise Console application.

1. Follow the steps to upgrade the Enterprise Console.
    a. Change the platform admin response varfile with:

    ```
    platformAdmin.useHttps$Boolean=false
    ```

2. Complete the upgrade.

The Enterprise Console backs up any self-signed or signed certificate that is under `<EC_installationDir>/conf/keys`. However, if you manually move the `keystore.jks` and `truststore.jks` to your own location, then you will need to back up your customized certificates and SSL related files on your own before the upgrade.

Troubleshooting Common SSL Related Issues

This section covers a few of the most common Enterprise Console SSL related issues. It may help to enable `-Djavax.net.debug=ssl` in the platform-admin.sh execute CLI command section before troubleshooting.

Enterprise Console CLI Issue

If the installation or upgrade succeeds but the Enterprise Console CLI does not work, the CLI will remind you to check if the serverHostName you entered in the installer varfile is valid. The error will state that the `Hostname %s not verified.`

Certificates Without an Extension Field Issue

Certificates without an extension field, especially free signed certificates, will not work. They will lead to a KeyUsage error. Only signed certificates from an eligible CA authority should be used.

Enterprise Console Restart Issue

NSS package needs to be updated to the latest version on Linux machines. The Enterprise Console may not be able to restart if the NSS package is not updated to the latest version on Linux machines. See Before Starting for more information.

Controller SSL and Certificates

The Controller comes with a preconfigured HTTPS port (port 8181 by default) that is secured by a self-signed certificate. This page describes how to replace the default certificate with your own custom certificate.

About Controller SSL and Certificates

For production use, AppDynamics strongly recommends that you replace the self-signed certificate with a certificate signed by a third-party Certificate Authority (CA) or your own internal CA. If you are deploying .NET Agents, you must replace the self-signed certificate with one signed by a CA, since the .NET agents do not work with self-signed certificates.

Controller SSL Certificates

You can manage your Controller SSL certificate on the Enterprise Console UI under Configurations. The Appserver Configurations and Reports Service Configurations pages both contain sections that display the SSL certificate information and provide an Edit Certificate option.

Controller Keystore and Artifacts

This page describes how to replace the existing key in the default keystore. Replacing the entire keystore is not recommended unless you first export the existing artifacts from the default keystore and import them into your own keystore.

The default Controller keystore includes the following artifacts:

- **glassfish-instance**: A self-signed private key provided the Glassfish application server.
- **s1as**: A self-signed private key provided with the Glassfish application server used by the Controller for secure communication on port 8181.
- **reporting-instance**: A private key used by the reporting service, the service that enables scheduled reports.

Update Keystore Passwords

You can modify the password for the `keystore.jks` and `cacert.jks` files that are used to generate the keystore artifacts. The password for both files must be the same.

You cannot modify, however, the password for the `reporting-service.pfx` file that is generated by the keystore artifact `reporting-instance` and used by the Reporting Service.

How to View the Keystore

You can view the contents of the keystore yourself using the keytool utility. To do so, from the <controller_home>/jre/bin directory, run the following command. Enter the default keystore password changeit when prompted.

```
keytool -list -v -keystore /home/ec2-user/appDplatform/product/controller/appserver/glassfish/domains/domain1
/config/keystore.jks
```

The exact steps to implement security typically vary depending on the security policies for the organization. For example, if your organization already has a certificate to use, such as a wildcard certificate used for your organization's domain, you can import the existing certificate into the Controller keystore. Otherwise, you'll need to generate a new one along with a certificate signing request. The following sections take you through these scenarios.

Before Starting

The following instructions describe how to configure SSL using the Java `keytool` utility bundled with the Controller installation. You can find the `keytool` utility in the following location:

- `<controller_home>/jre/bin`

The steps assume that the keytool is in the operating system's path variable. To run the commands as shown, you first need to put the `keytool` utility in your system's path. Use the method appropriate for your operating system to add the `keytool` to your path.

While the directory paths in this topic use forward slashes, the instructions apply to both Linux and Windows Operating System environments. The steps note where there are differences in the use of commands between operating systems.

Create a Certificate and Generate a CSR

If you don't have a certificate to use for the Controller, create it as follows.

AppDynamics requires using a X.509 digital certificate, which works with any file type.

In these steps, you generate a new certificate within the Controller's active keystore, so it has immediate effect.

The steps are intended to be used in a staging environment, and require the Controller to be shut down and restarted. Alternatively, you can generate the key as described here but in a temporary keystore rather than the Controller's active keystore. After the certificate is signed, you can import the key from the temporary keystore to the Controller's keystore.

1. At a command prompt, change directories to the following location:

   ```
   <controller_home>/appserver/glassfish/domains/domain1/config
   ```

2. Create a backup of the keystore file. For example, on Linux, you can run:

   ```
   cp keystore.jks keystore.jks.backup
   ```

   On Windows, you can use the copy command in a similar manner.
3. If it's still running, stop the Controller.
4. Delete the existing certificate with the alias s1as from the keystore:

   ```
   keytool -delete -alias s1as -keystore keystore.jks
   ```

5. Create a new key pair in the keystore using the following command. This command creates a key pair with a validity of 1825 days (5 years). Replace 1825 with the validity period appropriate for your environment, if desired.

   ```
   keytool -genkeypair -alias s1as -keyalg RSA -keystore keystore.jks -keysize 2048 -validity 1825
   ```

   Follow the on-screen instructions to configure the certificate. Note that:

   - For the first and last name, enter the domain name where the Controller is running, for example, `controller.example.com`.
   - Enter the default password for the key, `changeit`.

   This generates a self-signed certificate in the keystore. We'll generate a signing request for the certificate next. You can now restart the Controller and continue to use it. Since it still has a temporary self-signed certificate, browsers attempting to connect to the Controller UI will get a warning to the effect that its certificate could not be verified.

   > See Change Keystore Password for information on changing the default password for the keystore and certificates.

6. Generate a certificate signing request for the certificate you created as follows:

   ```
   keytool -certreq -alias s1as -keystore keystore.jks -file AppDynamics.csr
   ```

7. Submit the certificate signing request file generated by the command (`AppDynamics.csr` in our example command) to your Certificate Authority of choice.
   When it's ready, the CA will return the signed certificate and any root and intermediary certificates required for the trust chain. The response from the Certificate Authority should include any special instructions for importing the certificate if needed. If the CA supplies the certificate in text format, just copy and paste the text into a text file.
8. Import the signed certificate:

   ```
   keytool -import -trustcacerts -alias s1as -file mycert.cer -keystore keystore.jks
   ```

   This command assumes the certificate is located in a file named `mycert.cer`.
9. If you get the error "Failed to establish chain from reply", install the issuing Certificate Authority's root and any intermediate certificates into the keystore. The root CA chain establishes the validity of the CA signature on your certificate. Although most common root CA chains are included in the bundled JVM's trust store, you may need to import additional root certificates, such as certificates belonging to a private CA. To do so:

   ```
   keytool -import -alias [Any_alias] -file <path_to_root_or_intermediate_cert> -keystore <controller_home>
   /appserver/glassfish/domains/domain1/config/cacerts.jks
   ```

When done importing the certificate chain, try importing the signed certificate again.

Import an Existing Keypair into the Keystore

These steps describe how to import an existing public and private key into the Controller keystore. We'll step through this scenario assuming that the existing public and private keys need to be converted to a format compatible with Java Keystore, say from DER format to PKCS#12. You'll need to use OpenSSL to combine the public and private keys, and then use `keytool` to import the combined keys into the Controller's keystore.

Most Linux distributions include OpenSSL. If you are using Windows or your Linux distribution does not include OpenSSL, you may find more information on the OpenSSL website.

This assumes that we have the following files:

- private key: `private.key`
- signed public key: `cert.crt`
- CA root chain: `ca.crt`

The private key you use for the following steps must be in plain text format. Also, when performing the following procedures, do not attempt to associate a password to the private key as you convert it to PKCS12 keystore form. If you do, the following steps can be completed as described, but you will encounter an exception when starting up the Controller, with the error message: `java.security.UnrecoverableKeyException: Cannot recover key`.

To import an existing keypair into the Controller keystore

1. Use OpenSSL to combine your existing private key and public key into a compatible Java keystore:

   ```
   openssl pkcs12 -inkey private.key -in cert.crt -export -out keystore.p12
   ```

2. If the Controller is still running, stop it.
3. Change to the `keystore` directory:

   ```
   cd <controller_home>/appserver/glassfish/domains/domain1/config/
   ```

4. Create a backup of the `keystore` file. For example, on Linux, you can run:

   ```
   cp keystore.jks keystore.jks.backup
   ```

   On Windows, you can use the copy command in a similar manner.
5. Delete the self-signed certificate with alias `s1as` from the default keystore:

   ```
   keytool -delete -alias s1as -keystore keystore.jks
   ```

6. Import the PKCS #12 key into the default keystore:

   ```
   keytool -importkeystore -srckeystore keystore.p12 -srcstoretype pkcs12 -destkeystore keystore.jks -
   deststoretype JKS
   ```

7. Update the alias name on the key pair you just imported:

   > ⚠ The alias name should be `s1as`. Do not change it from this name.

   ```
   keytool -changealias -alias "1" -destalias "s1as" -keystore keystore.jks
   ```

8. Change the password of the imported private key:

   ```
   keytool -keypasswd -keystore keystore.jks -alias s1as -keypass <.p12_file_password> -new <password>
   ```

   For the new private key password, use the default (`changeit`) or the master password set as described in Change Keystore Password, if changed.
9. If you get the error "Failed to establish chain from reply", install the issuing Certificate Authority's root and any intermediate certificates into the keystore. The root CA chain establishes the validity of the CA signature on your certificate. Although most common root CA chains are included in the `cacerts.jks` truststore, you may need to import additional root certificates. To do so:

```
keytool -import -alias <Any_alias> -file <path_to_root_or_intermediate_cert> -keystore <controller_home>
/appserver/glassfish/domains/domain1/config/cacerts.jks
```

When done, try importing the signed certificate again.

10. Start the Controller.

Verify the Use of SSL

To make sure the configuration works, use a browser to connect to the Controller over the default secure port, port 8181:

```
https://<controller_host>:8181/controller
```

Make sure the Controller entry page loads in the browser correctly. Also, verify that the browser indicates a secure connection. Most browsers display a lock icon next to the URL to indicate a secure connection.

After changing the certificate on the Controller, you will need to import the public key of the certificate to the agent truststore. For information on how to do this, see the topic specific for the agent type:

- EUM aggregator: Troubleshoot Your EUM Setup
- Java Agent: Enable SSL (Java)
- .NET: Enable SSL (.NET)

If there is no proxy configured and the agent is reporting to the Controller itself, then the following changes are also mandatory:

1. Run the following command:

   ```
   platform-admin.sh stop-controller-appserver
   ```

   On Windows, run this command from an elevated command prompt (which you can open by right-clicking on the Command Prompt icon in the Windows Start menu and choosing **Run as administrator**):

   ```
   platform-admin.exe cli stop-controller-appserver
   ```

2. Search for the following properties in `<controller_home>/appserver/glassfish/domains/domain1/config/domain.xml`, and replace the port with the SSL port, as the non-secure port is disabled:

   > ⚠ You should also edit the domain.xml configurations on the Controller Settings page of the Enterprise Console to retain your settings. See Update Platform Configurations for more information.

   ```
   -Dappdynamics.controller.port=
   -Dappdynamics.controller.services.port=
   ```

3. In the following property, change the protocol from HTTP to HTTPS, and change the port to the secure port.

   ```
   -Dappdynamics.controller.ui.deeplink.url=
   ```

   You can also use REST API to update the deeplink URL:

   ```
   curl -k --basic --user root@system --header "Content-Type: application/json" --data '
   { "controllerURL": "https://<controller>:<ssl_port>" }' https://<controller>:<ssl_port>/controller/rest
   /accounts/<ACCOUNT-NAME>/update-controller-url
   ```

4. Add the following JVM argument anywhere above or below the above JVM arguments to ensure the internal agent connects using SSL.

   ```
   -Dappdynamics.controller.ssl.enabled=true
   ```

5. Run the following command:

```
platform-admin.sh start-controller-appserver
```

On Windows, run the following in an elevated command prompt:

```
platform-admin.exe cli start-controller-appserver
```

You can also use the `modifyJVMOptions.sh` script to make the changes.

Change Keystore Password

The default password for the keystore used by the Controller is `changeit`. This is the default password for the Glassfish keystore, and is a well-known (and thus insecure) password. For a secure installation, you need to change it.

> Changing the password in this manner does not affect the administration password you use to access the Glassfish administration console. See Update the Root User and Glassfish Admin Passwords for information on changing this password.

To change the password you must use the Glassfish administration tool (rather than the `keytool` utility directly). Using the Glassfish administration tool allows the Glassfish instance to access the keys at runtime.

If you change the keystore password directly using the `keytool`, the Controller generates the following error message at start up:

```
Caused by: java.lang.IllegalStateException: Keystore was tampered with,
or password was incorrect
```

If you encounter this scenario, change the password using the `asadmin` utility.

To change Glassfish passwords

1. Stop the Controller.
2. Change the Glassfish master password:

```
<controller_home>/appserver/glassfish/bin/asadmin change-master-password --savemasterpassword=true
```

Changing the master password with `asadmin` changes the password for the domain-passwords, `cacerts.jks`, and `keystore.jks` stores (including the s1as, reporting-instance, and glassfish-instance private keys in `keystore.jks`).

However if you customized any additional keys or existing key passwords, and they do not match the master password, when you change the master password, the following error is generated:

```
./asadmin change-master-password --savemasterpassword=true
Enter the new master password>
Enter the new master password again>
Caught an Exception: {0}
Command change-master-password executed successfully.
```

This indicates that the store password for `keystore.jks` has been set to the master password, but one or more of the private keys still has a different key password and do not match the master password. This prevents the Controller application from starting and generates the following error:

```
java.lang.Error: java.security.UnrecoverableKeyException: Cannot recover key
```

1. To resolve this issue, update each of the private key passwords in `keystore.jks` (s1as, reporting-instance, and glassfish-instance) to ensure that they match the master password by entering the following `keytool` command:

> Replace the `<JRE_HOME>`, `<alias_name>`, and `<controller_home>` variables with your information before executing the `keytool` command.

```
<JRE_HOME>/bin/keytool -keypasswd -alias <alias_name> -keystore <controller_home>/appserver/glassfish
/domains/domain1/config/keystore.jks -storepass <master_password>
```

2. To confirm that the default values for `<alias_name>` are `s1as`, reporting-instance, and glassfish-instance, execute the following command to list the contents of `keystore.jks`:

> Replace the <JRE_HOME>, <alias_name>, and <controller_home> variables with your information before executing the keytool command.

```
<JRE_HOME>/bin/keytool -list -keystore <controller_home>/appserver/glassfish/domains/domain1/config
/keystore.jks -storepass <master_password>
```

If the key password matches the master password, the message "Passwords must differ*"* displays when entering the new key password. This validates that the key password was set correctly.

3. Restart the Controller and ensure it starts without errors.

Updating an Expired Certificate

The steps to renew an expired or soon-to-expire certificate are similar to those for replacing the default certificate, as documented in Create a Certificate and Generate a CSR. To update the expired certificate:

1. Back up the existing keystore.
2. At a command prompt, change directories to the following location:

```
<controller_home>/appserver/glassfish/domains/domain1/config
```

3. Create a backup of the keystore file.
    a. On Linux, you can run the following command:

    ```
    cp keystore.jks keystore.jks.backup
    ```

    b. On Windows, you can use the copy command in a similar manner.

    > If the controller is still running, stop the controller.

4. Since you already have a Java keystore, run the following command to issue a certificate signing request. You should use this keystore for the csr and **not create a new one**. You will be importing the new certificate into this keystore.

```
keytool -certreq -alias s1as -keystore keystore.jks -file AppDynamics.csr
```

5. Submit the certificate signing request file Appdynamics.csr generated by the above example command to your Certificate Authority of choice.
    a. When it's ready, the Certificate Authority will return the signed certificate and any root and intermediary certificates required for the trust chain.
    b. The response from the Certificate Authority should include instructions for importing the certificate if needed.

> If the Certificate Authority supplies the certificate in text format, copy and paste the text into a text file.

6. You can list out the obtained certificate as follows if it is not in text format.

```
keytool -printcert -v -file <your obtained certificate>
```

7. Import the signed certificate obtained into the keystore that you already have.

```
keytool -import -alias s1as -file <your obtained certificate> -keystore keystore.jks
```

    a. The imported certificate will replace the old one, provided you use the same alias as the previous one.
    b. Sometimes the root and intermediate certificates of the certification authority are also expired. If that's the case, you will see the message Failed to establish chain from reply.

8. If the root and intermediate certificates of the certification authority are expired, they also have to be imported in your cacerts.jks so that the chain of trust can be established. You can follow your certification authority's instructions to download the root and intermediate certificates.
    a. Keep the same alias as before for root and intermediate when you import these certificates into cacerts.jks.

```
keytool -import -alias <previous alias used for the certificate> -file
<path_to_root_or_intermediate_cert> -keystore <controller_home>/appserver/glassfish/domains/domain1
/config/cacerts.jks
```

Trust Stores and Keystores

- Java trust store, cacerts, contain root certificates of well-known certification authorities. The validity of a certificate presented during the TLS/SSL (Transport Layer Security/Secure Sockets Layer) session is checked from `cacerts.jks`. There are no private keys or passwords in cacerts. They will contain the intermediate and root certificates of certification authorities.
- Java Keystore is used to store private key and the identify certificate for the server, which means that the keystore is used to store your server's credentials.

Set the Security Protocol

Related Pages:

- Agent-to-Controller Connections

This page describes the security protocol used by an on-premises Controller, and how you can modify it.

Default Security Protocol

The Controller secures connections using TLSv1.2 by default. However, you can change the security protocols used by the Controller if needed. For instance, you need to change the protocol if you are using agents that don't support TLSv1.2. These agents include:

- Java Agent version 3.8.1 or earlier (see Agent and Controller Compatibility for complete SSL compatibility information)
- .NET Agent running on .NET Framework 4.5 or earlier

If upgrading the agents or .NET framework is not possible, you will need to enable TLSv1 and SSL3 on the Controller using the `asadmin` command-line utility. To use the utility, you will need to supply the password configured for the root user for the Controller.

These changes require a restart of the Controller application server, which results in a brief service downtime. You may wish to apply these change when the downtime will have the least impact.

To maintain a secure environment, APIs that are downstream of the Controller should also use TLS. If SSL3 is required, you can enable it. See the Oracle JDK 8 documentation.

Enable TLS for a Controller

1. Open a browser and navigate to the Enterprise Console GUI:

   ```
   http(s)://<hostname>:<port>
   ```

   9191 is the default port.
2. Navigate to AppServer Configurations by choosing the platform, **Configurations**, **Controller Settings**, and **Appserver Configurations**.
3. In the Domain Protocols box on the JVM Options tab, edit the `configs.config.server-config.network-config.protocols.protocol.http-listener-2.ssl.tls-enabled=false` parameter to `true`.
4. Click **Save**.

You do not need to restart the Controller application server since the configuration change job automatically does so for you.

Enabling Stronger Encryption Keys

By default, the Controller's embedded Java runtime only supports up to 128-bit encryption key lengths for secure connections. You can, however, enable up to 256-bit encryption keys so the Controller can establish connections using the stronger ciphers.

To enable stronger keys in encryption keys in the Controller, follow the instructions for the Controller version you are running.

After restarting the Controller app server, the following cipher suites become available:

- `TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384`
- `TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384`
- `TLS_RSA_WITH_AES_256_CBC_SHA256`
- `TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA384`
- `TLS_ECDH_RSA_WITH_AES_256_CBC_SHA384`
- `TLS_DHE_RSA_WITH_AES_256_CBC_SHA256`
- `TLS_DHE_DSS_WITH_AES_256_CBC_SHA256`
- `TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA`
- `TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA`
- `TLS_RSA_WITH_AES_256_CBC_SHA`
- `TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA`
- `TLS_ECDH_RSA_WITH_AES_256_CBC_SHA`
- `TLS_DHE_RSA_WITH_AES_256_CBC_SHA`
- `TLS_DHE_DSS_WITH_AES_256_CBC_SHA`

Configure a Controller SSH Key

You can set up SSH (Secure Shell) with public/private key pairs so that you do not have to type the password each time you access a Controller machine by SSH. Setting up keys allows scripts and automation processes to access the Controller easily. You can generate DSA or if you want stronger encryption, RSA keys.

Set up SSH Key Pairs Using DSA

1. Run the `ssh` command that sets up the key pair:

   ```
   % ssh-keygen -t dsa
   ```

2. At the following prompt, press **Enter** to accept the default key location, or type another:

   ```
   Generating public/private dsa key pair.

   Enter file in which to save the key (~/.ssh/id_dsa):
   ```

3. Press return at the password prompt:

   ```
   Enter passphrase (empty for no passphrase):
   ```

4. Press **Return** again to confirm the password:

   ```
   Enter same passphrase again:
   ```

   You should see the following information:

   ```
   Your identification has  been saved in ~/.ssh/id_dsa

   Your public key has been saved in  ~/.ssh/id_dsa.pub

   The key fingerprint is: <Some really long string>
   ```

   If SSH continues to prompt you for your password, verify your permissions in your remote `.ssh` directory. It should have only your own read/write /access permission (octal 700):

   ```
   % chmod 700 ~/.ssh
   ```

5. Open the local `~/.ssh/id_dsa.pub` file and paste its contents into the `~/.ssh/authorized_keys` file on the remote host.
6. Update the permissions on the `authorized_keys` file on the remote host as follows:

   ```
   % chmod 600 ~/.ssh/authorized_keys
   ```

Set up SSH Key Pairs Using RSA

Run the `ssh` command that sets up the key pair:

```
% ssh-keygen -t rsa
```

The generated files will be named `id_rsa` and `id_rsa.pub`, instead of `id_dsa` and `id_dsa.pub`.

Otherwise, the remaining steps are identical to those beginning with step 2 in the steps above.

Controller Secure Credential Store

Related pages:

- Controller Data and Backups

The Controller creates a secure credential keystore that holds a secret key used to encrypt credentials.

Stored Credentials

The secure credential store manages the following credentials:

- LDAP authentication user password. See LDAP Authentication.
- Database collector credentials, including database user password and the machine user password.
- SMTP server/Email passwords.
- AppDynamics account access keys.

Back up the credential store as part of your normal backup procedures for the Controller, as described in the following section.

Secure Credential Store Backup

Make sure your Controller backup plan includes the secure credential keystore file `.appd.scskeystore.` In the case that the secure credential keystore file should become corrupted, restore the `.appd.scskeystore` file from backup.

If you run the Controller in high availability mode, both the primary Controller and the secondary Controller must use the same secure credential keystore file. If you use an HA deployment strategy, verify that it propagates the secure credential keystore file from the primary to the secondary.

Replace a Compromised Secure Credential Store

The following steps describe how to replace a secure credential store. It assumes the following:

- You have a single-tenant Controller installation.
- You know the plain-text value of your Account Access Key. You can view the access key in the Controller under **Settings > License**.

As detailed in the sections that follow, the steps are broken into these parts:

1. Create a new secure credential store.
2. Update the Controller with the password of the new secure credential store.
3. Update the account access key.
4. Update the account access key for the system account.
5. Restart the Controller and update passwords.

Create a new Secure Credential Store

1. Rename the existing secure credential keystore file.
2. Initialize a new secure credential keystore using the secure credential store utility.

   By default the utility installs to: `<controller_home>/tools/lib/scs-tool.jar`

   For example:

   ```
   /controller/jre8/bin/java -jar ./scs-tool.jar generate_ks -filename '<controller_home>/.appd.
   scskeystore' -storepass 'MyCredentialStorePassword'
   ```

   The secure credential store utility confirms it created and initialized the keystore:

   ```
   Successfully created and initialized new KeyStore file: /opt/appdynamics/Controller/.appd.scskeystore
   Verification - New KeyStore file: /opt/appdynamics/Controller/.appd.scskeystore is properly initialized.
   ```

Update the Controller with the new Secure Credential Store Password

1. Shut down the Controller.
2. Obfuscate the password you used to initialize the secure credential keystore:

   ```
   /controller/jre8/bin/java -jar <controller_home>/tools/lib/scs-tool.jar obfuscate -plaintext
   '<Secure_Credential_Store_Password>'
   ```

For example:

```
/controller/jre8/bin/java -jar /opt/appdynamics/Platform/controller/tools/lib/scs-tool.jar obfuscate -
plaintext 'MyCredentialStorePassword'
```

The secure credential store utility writes out an obfuscated password for use in the Controller configuration. For example:

```
s_gsnwR6+LDch8JBf1RamiBoWfMvjjipkrtJMZXAYEkw8=
```

3. Log in as the root user:

```
<controller_home>/bin/controller.sh login-db
```

> On Windows, use controller.bat.

4. Update the secure credential keystore password to the newly obfuscated password:

```
UPDATE global_configuration_cluster
SET value = '<obfuscated_secure_credential_keystore_password>'
WHERE name = 'scs.keystore.password';
```

Update the Account Access Key

1. Log in as the root user:

```
<controller_home>/bin/controller.sh login-db
```

> On Windows, use controller.bat.

2. Update the account access key for the account to the plain text string. When the Controller starts, it will encrypt the account access key:

```
UPDATE account
SET access_key = '<plain_text_account_access_key>',
    encryption_scheme = NULL
WHERE id = <account_id>;
```

> You can get the account id by running the following query: `select id account_id,name account_name,access_key, encryption_scheme from account;`

3. Only if you changed the plain text value of the account access key. Update the account access key for the agent users:

```
UPDATE user
SET encrypted_password = SHA1('<plain_text_account_access_key>')
WHERE account_id = <account_id>
AND name = 'singularity-agent';
```

If you changed the plain text value of the account access key, you need to update the access key for all the agents.

> The access key belongs to the "customer1" account in a single-tenant Controller and the "default" account in a multi-tenant Controller. In addition, `account_id` is the account id of the "customer1" account in a single-tenant Controller and the "default" account in a multi-tenant Controller.

4. If you have default license rules, update the account access key using `v1_license_rules` API.

> ⚠ For earlier Controller versions, you must use browser tools to migrate license rules.

Update the Account Access Key for the System Account

1. Generate the new access key for the system account:

```
../jre/1.8.0_152/bin/java -jar ./tools/lib/scs-tool.jar encrypt -filename ./.appd.scskeystore -storepass
'REPLACE_TO_NOT_OBFUSCATED_STOREPASS_VALUE' -plaintext 'NEW_SYSTEM_ACCOUNT_ACCESS_KEY'
```

2. Once you have generated the system account access key:
    a. Edit the `controller-info.xml` file to add your specific information:

```
<controller-dir>/appserver/glassfish/domains/domain1/appagent/ver4.X.X.X/conf/controller-info.xml
```

    b. Edit the `credential-store-password` value with the obfuscated `storepass` value.
    c. Edit the `account-access-key` with new encrypted access key value.
    d. Run SQL:

```
update account set access_key='ENCRYPTED_SYSTEM_ACCOUNT_ACCESS_KEY' where id=1; update mds_account.
account set access_key='ENCRYPTED_SYSTEM_ACCOUNT_ACCESS_KEY' where id='00000000-0000-0000-0000-
000000000001'; update mds_account.account set access_key='ENCRYPTED_SYSTEM_ACCOUNT_ACCESS_KEY'
where id='00000000-0000-0000-0000-000000000002';
```

    e. Stop `appserver`.
    f. Start `appserver`.

> ⓘ If you use LDAP, DBmon, or HTTP Request Actions and Templates, then you must also reconfigure those components with the same passwords to ensure that they are encrypted with new SCS key.

Restart the Controller and Update Passwords

1. Restart the Controller.
2. Log in to the Controller as a user with the following permissions:
    - Administer users, groups, roles, authentication, etc.
    - Configure Email / SMS.
3. As necessary, re-enter the following passwords:
    - LDAP authentication user password. See Configure Authentication Using LDAP.
    - Database collector credentials:
        - database user password. See "Add a Database Collector" on Configure Database Collectors.
        - machine user password. See "Configure the Database Agent to Monitor Server Hardware" on Configure Database Collectors.
    - SMTP server / Email password. See Enable an Email Server.

Mutual Authentication

In addition to implementing Server Authentication, you can also implement mutual (client and server) authentication. Client authentication enables the Controller to ensure that only authorized and verified agents can establish connections. These procedures outline the workflow to implement mutual authentication.

Before Starting

- Theses agents support client authentication:
  - Java Agent
  - Database Agent
  - Standalone Machine Agent
  - .NET Agent for Windows
- It is good practice to set up and verify client authentication on one agent first. After you confirm that client authentication is working for that agent, proceed with configuring additional agents.
- If you have a "hybrid" environment, with Server Authentication only for some agents and Server and Client Authentication for others, you might want to set up and configure multiple HTTP Listeners in Glassfish: one for Server Authentication only, and another for both Server and Client Authentication.
- The procedures described on this page use the default key and keystore password (`changeit`) for the keystore. Before you proceed with this workflow, it is good practice to:
  1. Change this default password, as described in "Change Keystore Password" under Controller SSL and Certificates.
  2. Use the new password when you perform these procedures.
- Instead of using plain text passwords in the procedures, you can specify encrypted or obscured passwords as described in Encrypt Agent Credentials.

Set Up Client Authentication

These steps describe how to set up Client-based Authentication:

1. Set up server authentication on the Controller.
2. Set up server authentication on agents.
3. Set up a client keystore on the Controller.
4. Configure agents to access the client keystore on the Controller.
5. Enable client authentication on the Controller.

Set Up Server Authentication on the Controller

1. Open a CLI window on the Controller host and `cd` to the `<controller-keystore-home>` directory: `<controller-home>/appserver/glassfish/domains/domain1/config`
2. Create a trusted root certificate store to preserve the Controller public key. The following command exports the public key (`s1as`) and stores it in the new certificate store file `server.cer`.

```
<java-home>/bin/keytool -export -alias s1as -file server.cer \
                            -keystore keystore.jks
                            -storepass changeit
```

3. (*Optional*) To view information about the public and private keys in `keystore.jks`, enter the following command:

```
<java-home>/bin/keytool -list -v -alias s1as  \
                        -keystore ./keystore.jks \
                        -storepass  changeit
```

4. Import the Controller public key from `server.cer` into an agent keystore. The following command creates a new keystore (`agent-truststore.jks`); the Controller sends the public key from this keystore to agents when they set up an SSL connection.

```
<java-home>/bin/keytool -import -v -alias controller_alias -file server.cer \
                        -keystore agent_truststore.jks \
                        -storepass changeit
```

5. This command displays the certificate and asks if you trust it. Answer **yes**.

Set Up Server Authentication on Agents

For each authorized agent:

1. Copy the `agent_truststore.jks` file from the Controller to the root directory of the agent (`<machine-agent-home>` or `<java-agent-home>` or `<database-agent-home>`).
2. For each authorized agent, specify the following properties in the `<agent-home>/conf/controller-info.xml` file as follows:
    - `<controller-ssl-enabled>true</controller-ssl-enabled>`
    - `<controller-port>443</controller-port>`
    - `<controller-keystore-filename>agent_truststore.jks</controller-keystore-filename>`
    - `<controller-keystore-password>changeit</controller-keystore-password>`

Set Up a Client Keystore on the Controller

In this procedure, you create a signed certificate and import it into the client keystore. These steps use the Controller to sign the certificate, but you can also use a third-party Certificate Authority (CA).

1. (*Optional*) To view information about the public and private key in the Controller keystore, enter:

```
<java-home>/bin/keytool -list -v -alias s1as  \
                        -keystore ./keystore.jks \
                        -storepass changeit
```

2. Create a keystore (`clientkeystore.jks`) that includes the Controller public/private keypair. In `<controller-keystore-home>`, enter:

```
<java-home>/bin/keytool -genkey -alias client-alias -keyalg RSA \
                        -keystore clientkeystore.jks \
                        -storepass changeit \
                        -keypass changeit
```

   The keytool prompts you for your name, organization, and other information it needs to generate the key. AppDynamics App Agents use SunX509 as the default keystore factory algorithm. If keystores in your environment use something other than SunX509, you need to specify the algorithm to the App agent. You can do so using the system property `appdynamics.agent.ssl.keymanager.factory.algorithm`. For example, to set the algorithm to PKIX, add this to the startup command of the agent-monitored JVM:

```
-Dappdynamics.agent.ssl.keymanager.factory.algorithm=PKIX
```

3. Generate a certificate signing request (`client.csr`) that can be signed by a Certificate Authority (CA).

```
<java-home>/bin/keytool -certreq -v -alias client-alias -file client.csr \
                        -keystore clientkeystore.jks \
                        -storepass changeit \
                        -keypass changeit
```

4. Get the request (`client.csr`) signed by a trusted CA. This command uses the Controller as a CA, which creates a new file (`signedClient.cer`) with the Controller-signed certificate.

```
<java-home>/bin/keytool -gencert -infile ./client.csr -outfile signedClient.cer -alias s1as \
                        -keystore ./keystore.jks \
                        -storepass changeit \
                        -keypass changeit
```

5. (*Optional*) To view information about the signed certificate, enter:

```
<java-home>/bin/keytool -printcert -v -file ./signedClient.cer
```

6. Verify that the certificate is signed by the authentic Certificate Authority. You can:
    - Copy the public key of the signing authority into the trusted root set, or
    - Import the public key of the signing authority into the client keystore.

   This command does the latter by importing the Controller public key from `server.cer` into `clientkeystore.jks`.

```
<java-home>/bin/keytool -import -v -alias controller_alias -file server.cer \
                        -keystore clientkeystore.jks \
                        -storepass changeit
```

   This command asks if you trust the certificate; when you enter `yes`, this message should display:

```
        Certificate was added to keystore
        [Storing clientkeystore.jks]
```

7. (*Optional*) To view the contents of `clientkeystore.jks`, enter:

```
<java-home>/bin/keytool -list -v -keystore clientkeystore.jks -storepass changeit
```

   The keystore should show entries for `controller-alias` and `client-alias` (which is still unsigned).
8. Import the signed public key certificate into the client keystore. This command imports `signedClient.cer` into `clientkeystore.jks`.

```
<java-home>/bin/keytool -importcert -v -alias client-alias -file ./signedClient.cer \
                        -keystore clientkeystore.jks \
                        -storepass changeit \
                        -keypass changeit
```

   You now have a password-protected `clientkeystore.jks` file on the Controller with a signed certificate that verifies the Controller's authenticity.
9. Verify that the trusted root certificate on the Controller includes the public key of the signing authority. This procedure used the Controller as the Certificate Authority, so the public key is already included. To verify, enter:

```
<java-home>/bin/keytool -list -v -alias client-alias \
                        -keystore clientkeystore.jks -storepass changeit
```

   The public key of the signing authority should now be part of the agent's public key certificate.

Configure Agents to Access the Client Keystore on the Controller

For each authorized agent:

1. Copy the `clientkeystore.jks` file from the Controller to the following directory on the agent:
   - Database agent: `<database agent home>/conf`
   - Java agent: `<java-agent-home>/conf`
   - Machine Agent: `<machine-agent-home>`
2. Specify these properties in the `<agent-home>/conf/controller-info.xml` file as follows:

   - `<use-ssl-client-auth>`**`true`**`</use-ssl-client-auth>`
   - `<asymmetric-keystore-filename>`**`clientkeystore.jks`**`</asymmetric-keystore-filename>`
   - `<asymmetric-keystore-password>`**`changeit`**`</asymmetric-keystore-password>`
   - `<asymmetric-key-password>`**`changeit`**`</asymmetric-key-password>`
   - `<asymmetric-key-alias>`**`client-alias`**`</asymmetric-key-alias>`

Enable Client Authentication on the Controller

From the Controller:

1. If it is not currently running, start the Controller.
2. Open a CLI panel and `cd` to `<controller-home>/appserver/glassfish/bin`.
3. To start the AppServer Admin tool, enter: `./asadmin`
   You should now see the asadmin prompt: `asadmin>`
4. Enter: `list-http-listeners`
   This lists the available set of HTTP listeners. For example:
   ```
   http-listener-1
   http-listener-2
   admin-listener
   ```
5. Configure one of these listeners by running the following commands. In this example, we are configuring `http-listener-2`:

```
set configs.config.server-config.network-config.protocols.protocol.http-listener-2.ssl.key-
store=keystore.jks
set configs.config.server-config.network-config.protocols.protocol.http-listener-2.ssl.client-auth-
enabled=true
set configs.config.server-config.network-config.protocols.protocol.http-listener-2.ssl.trust-
store=cacerts.jks
```

6. To verify that the properties are set correctly, run the following command. Again, this example assumes `http-listener-2`.

```
 get configs.config.server-config.network-config.protocols.protocol.http-listener-2.*
```

7. Restart the Controller.

Upgrade Platform Components

The information and instructions below are intended for On-Premise deployments only. SaaS deployments are managed by AppDynamics.

Related pages:

- Upgrade the Controller Using the Enterprise Console
- Upgrade the Events Service
- Upgrade the Production EUM Server
- Upgrade the Controller Using the Enterprise Console
- Discovery and Upgrade Quick Start

Before Upgrading

Before you upgrade to a newer version of the platform, complete the following tasks:

- Review the Product Announcements and Alerts page.
- Review the latest Release Notes, as well as the release notes for intermediate versions between the current version and the version you are upgrading to.
- Review the compatibility support page.
- Verify that you meet the requirements described in the Platform Requirements for the components you use.

Upgrade Order

Follow the instructions for each service in this order:

1. Upgrade the Enterprise Console
2. Upgrade the Events Service
3. Upgrade the EUM Server
4. Upgrade the Controller

Discover Existing Components

Related pages:

- Discovery and Upgrade Quick Start
- Administer the Enterprise Console

You can use the Enterprise Console to discover and upgrade existing AppDynamics components, such as a Controller or Events Service. After you discover the components, they can be added to the platform and be managed by the application. This process can be performed with the GUI or command line. You can discover Controllers that are version 4.1 or later.

Before you discover existing components, you need the following information:

Controller

- Controller root user password
- Installation directory
- Database password
- Host name or IP address

Events Service

- Host names or IP addresses
- Installation directory. Note that if you have an Events Service cluster, this directory is the same on every node.
- Host credentials (SSH key file and username)

Using the GUI

You can use the Custom Install Discover & Upgrade option in the GUI to create a platform and discover a Controller and Events Service. Alternatively, if you have already created a platform, you must add credentials and hosts to the platform before you can perform discovery. Then, discover the Controller or Events Service on the page for that component. For more information about how to add credentials and hosts, see Administer the Enterprise Console.

When the Enterprise Console discovers a component, it also checks to see if an upgrade is available and performs the upgrade.

Using the Command Line

Controller

Use the discover-upgrade-controller command to discover and upgrade a Controller:

```
bin/platform-admin.sh discover-upgrade-controller --host <host> --controller-root-password <root user password
for Controller> --installation-dir <Controller installation directory> --db-root-password <password for
Controller database>
```

If your upgrade fails, you can resume by passing the flag `useCheckpoint=true` as an argument after `--args.`

Events Service

The discover-events-service command can discover and upgrade an Events Service.

```
bin/platform-admin.sh discover-events-service --hosts <host 1> <host 2> <host 3> --installation-dir <Events
Service installation directory>
```

Instead of listing each host, you can specify a line-separated list in a text file:

```
bin/platform-admin.sh discover-events-service -n <file path for the host file> --installation-dir <Events
Service installation directory>
```

If your upgrade fails, you can resume by passing the flag `useCheckpoint=true` as an argument after `--args.`

Extend AppDynamics

This page describes how to extend and customize the AppDynamics Application Performance Management (APM) Platform.

The AppDynamics Community Exchange includes many pre-built extensions you can use to customize AppDynamics and integrate with other systems.

You can also use AppDynamics REST APIs to create custom integrations and automation tasks.

AppDynamics REST APIs

- AppDynamics APIs
- Using the Controller APIs

AppDynamics Extensions

- Integration Modules

- Integrate AppDynamics with Scalyr

AppDynamics APIs

Related pages:

- Extensions and Custom Metrics
- AppDynamics Exchange

This page provides an overview of AppDynamics APIs, which let you extend and customize various aspects of the AppDynamics Application Performance Monitoring (APM) Platform.

Overview of AppDynamics APIs

The AppDynamics APM Platform exposes various APIs for customizing and extending its features on the platform-side, which are served by the Controller and Events Service, and on the agent-side.

The AppDynamics platform server components and agents offer the following APIs:

- Controller APIs: Administer the Controller, configure, monitor, query metrics, and more. See the Platform API Index
- Accounts APIs: Manage and monitor accounts, users, and other aspects of AppDynamics licensing. Accounts APIs are made up of these modules:
    - actionsuppressions
    - businesstransactions
    - healthrules
    - licensemodules
    - mdsconfig
    - nodes
    - policies

  See License Management.
- Analytics Events API: Send custom analytics events from your data sources to the Events Service. See the Analytics Events API section in the Platform API Index.
- Standalone Machine Agent APIs: HTTP APIs available at the machine agent for uploading custom metrics. See Machine Agent HTTP Listener.
- Database Agent APIs: Get, create, update, and delete Database Monitoring database Collectors. See Database Visibility API.
- Application Agent Instrumentation APIs: Control and customize transaction detection and correlation, along with exit point detection. Agent APIs include:
    - PHP Agent API
    - Python Agent API
    - Node.js Agent API Reference
    - C/C++ SDK
- Java Agent API: Customize agent instrumentation. See the SDK folder in the agent home directory.
- Mobile RUM: Instrument mobile applications for real user performance monitoring. See Instrument iOS Applications.

Platform API Index

These methods are Below is a list of all the methods in the AppDynamics Controller and Events Service APIs:

- **Accounts API**
    - Retrieve Controller Audit History
    - Configure Metric Retention by Account
    - Configure Metric Retention by Application
- **Application Model API**
    - Retrieve All Business Applications
    - Retrieve All Business Transactions in a Business Application
    - Retrieve All Tiers in a Business Application
    - Retrieve All Registered Backends in a Business Application with Their Properties
    - Retrieve Node Information for All Nodes in a Business Application
    - Retrieve Node Information by Node Name
    - Retrieve Node Information for All Nodes in a Tier
    - Retrieve Tier Information by Tier Name
- **Metric and Snapshot API**
    - Retrieve Metric Hierarchy
    - Retrieve Metric Data
    - Retrieve Transaction Snapshots
- **Alert and Respond APIs**
    - **Health Rule API**
        - Create a Health Rule
        - Retrieve a List of Health Rules for an Application
        - Retrieve Details of a Specified Health Rule
        - Update a Health Rule
        - Delete a Health Rule
    - **Schedule API**
        - Create a New Schedule
        - Retrieve a List of Schedules for a Given Application
        - Retrieve the Details of a Specified Schedule
        - Update a Schedule
        - Delete a Schedule

    - Create Role
    - Add Role to User
    - Remove Role from User
    - Add Role to Group
    - Remove Role from Group
    - Get Role by ID
    - Get Role by Name
    - Get All Roles
    - Update Role
    - Delete Role
- **License Rules API**
    - Creates a New License Rule
    - Returns a Summary of All License Rules for the Current Account
    - Updates a License Rule
    - Deletes a License Rule
    - Retrieve a License Rule via its Id
    - Retrieves a License Rule by Access Key
    - Retrieve a License Rule by Name

API Clients

This page describes how to create and use the API Clients identity type to provide secure access to the Controller through AppDynamics Controller REST API calls. These calls use Open Authorization (OAuth) token-based authentication.

Open Authorization (OAuth) Mechanisms

OAuth is an open protocol to allow secure authorization in a simple and standard method from web, mobile, and desktop applications. See https://oauth.net/

It acts as the intermediary on your behalf by providing third-party applications with an access token that authorizes sharing specific account information. Using the OAuth protocol with AppDynamics Controller REST APIs is the best way to securely grant access to your Controller information.

The OAuth authentication process authenticates a request token and uses it to obtain an encrypted access token from your Controller. Once the access token is available, you can use it to make requests to your Controller until the token expires or is revoked.

The tokens are based on JSON Web Tokens (JWT) authentication format, which is the industry standard RFC 7519 method for representing claims securely between two parties.

Accessing Authentication Provider Settings

Users with the **Account Owner** role or the **Administer users, groups, roles ...** permission can view API Clients settings in the **Settings** > **Administration** page.

Creating API Clients

You can create new API Client identity types that can be used to generate OAuth tokens.

1. Log in to the Controller UI as an **Account Owner** or other roles with the **Administer users, groups, roles ...** permission.
2. Click  (gear icon) > **Administration**.
3. Click the API Clients tab to view the list of existing clients.
4. Click **+ Create**.
5. Enter the Client Name and Description.
6. Click **Generate Secret** to populate the Client Secret.
   This will generate a UUID as the secret of the API Client.

   

   This API Client secret acts as a password. It does not generate the authentication token.

7. Set the Default API-generated Token Expiration. This expiration only applies to authentication tokens generated through the `/controller/api/oauth/access_token` REST API, not to Temporary Access Tokens generated from the UI. See Using the Access Token.

   

   Every API-generated access token has an expiration. Although the default is 5 minutes, you can set it to any second, minute, or hour limit. The Default API-generated Token has a shorter expiration than the authentication token generated through the Administration UI.

8. Add the **Roles** you would like to associate with this API Client. You can add or remove roles at any time. See Roles and Permissions.

   

   The REST APIs will use the identity which the access token represents to pull up RBAC permissions and check those permissions at the underlying API level.

9. Click **Save** at the top right.

Using the Access Token

You can generate and use the access token for each API access call into your Controller by generating the token through one of the following means:

- Administration UI: These tokens usually have a longer expiration. The account administrator can generate and distribute to parties/teams who need Controller access, but do not want to refresh such tokens frequently.
- API: These tokens usually have a relatively short expiration. The program generates and refreshes regularly before expiration. These tokens are visible from the UI and are not individually tracked and managed.

Generate the Token Through the UI

When you are ready to use the access token, you will generate it through the Administration UI:

1. Click **Generate Temporary Access Token** when you are ready to use the access token.

   > Remember that temporary token expirations are usually longer than the Default API-generated Token Expiration.

2. Copy and paste the access token from the **Temporary Access Token** field into the TOKEN portion of your curl command. For example:

   ```
   curl -H "Authorization:Bearer <AUTH_TOKEN>" "http://master-onprem-controller.e2e.appd-test.com:8090
   /controller/rest/applications"
   ```

3. Check that your call is successful. It should look like this:

Generate the Token Through an API

You can use REST APIs to generate a short-lived access token. This default, on-demand token is not tracked on the UI.

Use POST `/controller/api/oauth/access_token`. You will need the API Client name and Client Secret to generate the token. For example:

```
curl -X POST -H “Content-Type: application/vnd.appd.cntrl+protobuf;v=1” “https://<controller address>/controller
/api/oauth/access_token” -d
‘grant_type=client_credentials&client_id=<apiClientName>@<accountName>&client_secret=10d5-573e-4a75-8396-
afa006fd8f19’
```

> Be aware that:
>
> - For Controllers < 4.5.9, an authentication header is required in the request as shown below:
>
> ```
> curl -X POST -H "Content-Type: application/vnd.appd.cntrl+protobuf;v=1" -u 'TestApiClient@customer:
> face10d5-573e-4a75-8396-afa006fd8f19' "https://<controller address>/controller/api/oauth/access_token" -
> d 'grant_type=client_credentials&client_id=TestApiClient@customer&client_secret=face10d5-573e-4a75-8396-
> afa006fd8f19'
>
> {
> "access_token": "eyJraWQiOiIxIiwiYWxnIjoiSFMyNTYifQ.
> eyJpc3MiOiJBcHBEeW5hbWljcyIsImF1ZCI6IkFwcERfQVBJcyIsImV4cCI6MTUzNjI3MjI1NiwianRpIjoiT2twZHVDdmduSDdwMmdu
> Mnc4MFRtQSIsImlhdCI6MTUzNjI3MTk1NiwibmJmIjoxNTM2MjcxODM2LCJzdWIiOiJUZXN0QXBpQ2xpZW50IiwidHlwZSI6IkFQSV9D
> TElFTlQiLCJpZCI6ImFmZTQxMzg5LTJlNjMtNDQyYS1hY2U2LTEyYzU5NGFlOGM2OCIsImFjY3RJZCI6IjhlMGQ3NjI1LTY4YzEtNDE4
> Mi1hMmFmLWFhMTY1MzllZDg0OCIsImFjY3ROYW1lIjoiZTJlLWN1c3RvbWVyIn0.
> 95EyDNV5muTN_4zGOXIPQQHOdVDSiEynKSgk08UHlh0",
> "expires_in": 300
> }
> ```
>
> - The token generation API requires an authentication header with username and password and the oAuth request body to successfully request a token.

Use the generated token to list all applications. For example:

```
curl -H "Authorization:Bearer <AUTH_TOKEN>" https://master-controller.e2e.appd.com/controller/rest/applications
```

- In the case of success: all applications are returned.
- In the case of failure: `HTTP 401 Unauthorized "Failed to authenticate: invalid access token."` is returned.

Managing Access Tokens

Access tokens are based on JWT, therefore decoding them will not show sensitive information.

However, if you believe that your token has become compromised, you can revoke it by clicking **Revoke** or by deleting the API Client to invalidate the token. Calls using revoked access tokens fail to authenticate with a 401 Unauthorized error HTTP status code. You can click **Regenerate** to refresh a token.

Regenerated tokens do not disable older tokens. The older tokens will remain active until they expire.

When you regenerate a token, you can set the Temporary Token Expiration.

The default value is 1 day and the maximum limit is 30 days.

There is no way to retrieve previous or currently valid tokens. Therefore, only the current token can be revoked.

Also, API generated tokens that have Default API-generated Token Expiration, cannot be viewed nor revoked through the UI or REST API.

Using the Controller APIs

This page describes API usage information. The Controller APIs are served by the Controller instance, rather than by the Events Service or an agent component. They include:

- Accounts API
- Application Model API
- Metric and Snapshot API
- Alert and Respond API
- Configuration API
- Configuration Import and Export APIs
- Analytics Events API

Controller API Base URI

Except as indicated in the format listing for a particular method, URIs in the Controller API use the following base URI:

```
http://<controller_host>:<controller_port>/controller/rest/<REST_URI>
```

The port that serves the API is the same primary port for the Controller used by Controller UI and agents.

Retrieving Data in JSON Format

The AppDynamics Controller APIs return data in eXtensible Markup Language (XML) or JavaScript Object Notation (JSON). The default output format is XML.

Any Controller API with a URI in the `/controller/rest/` format shown in Controller API Base URI can return data in JSON format.

To retrieve data in JSON, call the API with the output query parameter set to JSON, as follows:

```
curl --user user1@customer1:secret http://demo.appdynamics.com/controller/rest/applications?output=JSON
[
    {
    "description": "",
    "id": 5,
    "name": "ECommerce_E2E"
  },
    {
    "description": "",
    "id": 8,
    "name": "ECommerce_E2E-Fulfillment"
  },
]
```

You can specify JSON output format for any of the Controller APIs.

When a client uses HTTP 1.1 and accepts gzip content-encoding, the Controller returns JSON responses using `gzip` compression.

Authentication

You can use OAuth identity types for authentication. See API Clients.

To invoke the REST APIs using basic HTTP authentication, you must provide the authentication credentials as well as your account information. These are:

- Account: the AppDynamics tenant account name
- Username: a user in that account
- Password: the password for that account

Pass the credentials in the following form:

```
<your_username>@<your_accountname>:<your_password>
```

Most on-premises Controllers are single-tenant Controllers that use `customer1` as the primary default account name. The account name should be left as default. For example:

```
<your_username>@customer1:<your_password>
```

Most SaaS Controllers are multi-tenant Controllers and allow you to replace `customer1` with your own, instance-specific account name. See License Management.

Invalid Characters for Usernames and Passwords

REST API calls will not authenticate usernames and passwords that contain these characters:

\ / " [ ] : | < > + = ; , ? * , ' % tab space @

If you have already created user credentials that contain any of the disallowed characters, such as "user:customer66", create new credentials without the disallowed character for the purpose of accessing the REST APIs.

For usernames or passwords containing the "@" symbol, URL encode the "@" character as %40.

Copying a Metric URL in the Metric Browser

1. Right-click a metric in the **Metric Browser**.
2. Copy the full REST URL of the metric.
3. Paste the REST URL into your code or onto the command line.

For security reasons, AppDynamics only supports making API calls programmatically or at the command line. Do not attempt to paste the REST URL into a browser.

Application Model API

This page describes how application APIs let you retrieve information about the monitored environment as modeled in AppDynamics. This information includes, for example, the names and IDs of the business applications, business transactions, tiers, and nodes in the modeled environment.

Retrieve All Business Applications

The application API method returns the business application names and internal numeric identifier. Many of the operations in the Controller APIs occur in the context of a business application. Use this method to discover the application names or IDs to use before invoking other methods.

Format

```
GET /controller/rest/applications
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or `JSON`.	No
`time-range-type`	Time	A time parameter to filter data based on time range options (`time-range-type`, `startTime`, `endTime`). If a time-range-type option is specified, the query returns alive applications on that GMT day, otherwise, the query returns all applications. • Case 1 : If `time-range-type` is last T mins and the `time-range-type` just falls into one GMT day then the API returns all the applications which are alive on that GMT day. • Case 2 : If `time-range-type` is last T mins and the `time-range-type` falls into 2 GMT days (for example if the current time is 4:05 PST and `time-range-type` specified is last 10 mins then the API returns applications which are alive on this and the previous GMT day). This feature is available for SaaS only and the API returns all applications for on-premises. For more information see Metric and Snapshot API.	No

An *alive applicatio*n is an application with at least one node that submits at least one metric to the Controller in the provided time range.

Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/rest/applications

<applications>
   <application>
     <id>5</id>
     <name>ECommerce_E2E</name>
   </application>
   <application>
     <id>8</id>
     <name>ECommerce_E2E-Fulfillment</name>
   </application>
   <application>
     <id>11</id>
     <name>jimix12110919</name>
     <description></description>
     <accountGuid>429c7884-3f36-4b5a-9412-fdf827e6c86e</accountGuid>
   </application>
</applications>
```

Retrieve All Business Transactions in a Business Application

Format

```
GET /controller/rest/applications/application_name/business-transactions
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_name`	URI	The application name or application ID.	Yes
`exclude`	Query	• `false`: the query retrieves only the business transactions that are included for monitoring. • `true`: the query retrieves only the excluded business transactions. Excluded business transactions have been configured to be excluded from monitoring either from the UI or through the REST interface. • The default is `false`.	No
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are `XML` (default) or `JSON`.	No
`time-range-type`	Time	Time parameter to filter data based on time range options (`time-range-type`, `startTime`, `endTime`). If a `time-range-type` option is specified, the query returns alive business transactions on that GMT day, otherwise, the query returns all business transactions. • Case 1 : If `time-range-type` is last T mins and the `time-range-type` just falls into one GMT day then the API returns all the business transactions which are alive on that GMT day. • Case 2 : If `time-range-type` is last T mins and the `time-range-type` falls into 2 GMT days (for example if the current time is 4:05 PST and `time-range-type` specified is last 10 mins then the API returns business transactions which are alive on this and the previous GMT day). This feature is available for SaaS only and the API returns all business transactions for on-premises. See Metric and Snapshot API.	No

An *alive business transaction* is a transaction that submits at least one metric to the Controller in the provided time range.

Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/rest/applications/5/business-transactions

<business-transactions>
   <business-transaction>
     <id>92</id>
     <name>/user/.POST</name>
     <entryPointType>WEB_SERVICE</entryPointType>
     <internalName>/user/.POST</internalName>
     <tierId>9</tierId>
     <tierName>ECommerce-Services</tierName>
     <background>false</background>
   </business-transaction>
   ...
   <business-transaction>
     <id>184</id>
     <name>OrderServiceImplService.createOrder</name>
     <entryPointType>WEB_SERVICE</entryPointType>
     <internalName>OrderServiceImplService.createOrder</internalName>
     <tierId>12</tierId>
     <tierName>Inventory-Services</tierName>
     <background>false</background>
   </business-transaction>
</business-transactions>
```

Retrieve All Tiers in a Business Application

Format

```
GET /controller/rest/applications/application_name/tiers
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory

`application_name`	URI	The application name or application ID.	Yes
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are `XML` (default) or `JSON`.	No
`time-range-type`	Time	Time parameter to filter data based on time range options (`time-range-type`, `startTime`, `endTime`). If a `time-range-type` option is specified, the query returns alive tiers on that GMT day, otherwise, the query returns all tiers. • Case 1 : If `time-range-type` is last T mins and the `time-range-type` just falls into one GMT day then the API returns all the tiers which are alive on that GMT day. • Case 2 : If `time-range-type` is last T mins and the `time-range-type` falls into 2 GMT days (for example if the current time is 4:05 PST and `time-range-type` specified is last 10 mins then the API returns tiers which are alive on this and the previous GMT day). This feature is available for SaaS only and the API returns all tiers for on-premises. See Metric and Snapshot API.	No

An *alive tier* is a tier with at least one node in this tier that submits at least one metric to the Controller in the provided time range.

Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/rest/applications/5/tiers

<tiers>
<tier>
  <id>8</id>
  <name>Address-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
  <id>16</id>
  <name>Customer-Survey-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
  <id>9</id>
  <name>ECommerce-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>2</numberOfNodes>
</tier>
<tier>
  <id>12</id>
  <name>Inventory-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
  <id>17</id>
  <name>Order-Processing-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
  <id>18</id>
  <name>Web-Tier-Services</name>
  <type>Web Server</type>
  <agentType>NATIVE_WEB_SERVER</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
</tiers>
```

Retrieve All Registered Backends in a Business Application With Their Properties

Format

```
GET /controller/rest/applications/application_name/backends
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_name`	URI	Provide either the application name or application id.	Yes
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are `XML` (default) or `JSON`.	No

Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/rest/applications/5/backends

<backends><backend>
  <id>10</id>
  <name>INVENTORY-MySQL DB-DB</name>
  <exitPointType>JDBC</exitPointType>
  <properties>
    <name-value>
      <id>0</id>

</backends>
```

Retrieve Node Information for All Nodes in a Business Application

Format

```
GET /controller/rest/applications/application_name/nodes
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_name`	URI	Provide either the application name or application id.	Yes
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are `XML` (default) or `JSON`.	No
`time-range-type`	Time	Time parameter to filter data based on time range options (`time-range-type`, `startTime`, `endTime`). If a `time-range-type` option is specified, the query returns alive nodes on that GMT day, otherwise, the query returns all nodes. • Case 1 : If `time-range-type` is last T mins and the `time-range-type` just falls into one GMT day then the API returns all the nodes which are alive on that GMT day. • Case 2 : If `time-range-type` is last T mins and the `time-range-type` falls into 2 GMT days (for example if the current time is 4:05 PST and `time-range-type` specified is last 10 mins then the API returns nodes which are alive on this and the previous GMT day). This feature is available for SaaS only and the API returns all nodes for on-premises. See Metric and Snapshot API.	No

An *alive node* is a node that submits at least one metric to the Controller in the provided time range.

Example

```
curl --user user1@customer1:welcome http://demo.appdynamics.com:8090/controller/rest/applications/5/nodes

<nodes><node>
  <id>7</id>
  <name>Node_8000</name>

  <tierId>14</tierId>
  <tierName>Inventory Server</tierName>
  <machineId>6</machineId>
  <machineName>TIER3TOMCAT</machineName>
  <machineOSType>Linux</machineOSType>
  <machineAgentPresent>true</machineAgentPresent>
  <machineAgentVersion>Machine Agent v4.2.0.0 GA Build Date 2015-12-18 18:47:15</machineAgentVersion>
  <appAgentPresent>true</appAgentPresent>
  <appAgentVersion>Server Agent v4.2.0.0 GA #10145 r514d60d3122bd992e7152820d2ca5fb5ff4e45c1 8409-master-build<
/appAgentVersion>
  <ipAddresses>
    <ipAddress>10.0.32.138</ipAddress>
  </ipAddresses>
  <agentType>APP_AGENT</agentType>
</node>
</nodes>
```

Retrieve Node Information for All Nodes in a Tier

Format

`GET /controller/rest/applications/application_name/tiers/tier_name/nodes`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_name`	URI	The application name or application ID.	Yes
`tier_name`	URI	The tier name or ID.	Yes
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are `XML` (default) or `JSON`.	No
`time-range-type`	Time	Time parameter to filter data based on time range options (time-range-type, `startTime`, `endTime`). If a time-range-type option is specified, the query returns alive nodes on that GMT day, otherwise, the query returns all nodes. • Case 1 : If `time-range-type` is last T mins and the `time-range-type` just falls into one GMT day then the API returns all the nodes which are alive on that GMT day. • Case 2 : If `time-range-type` is last T mins and the `time-range-type` falls into 2 GMT days (for example if the current time is 4:05 PST and `time-range-type` specified is last 10 mins then the API returns nodes which are alive on this and the previous GMT day). This feature is available for SaaS only and the API returns all nodes for on-premises. See Metric and Snapshot API.	No

Example

```
curl --user user1@customer1:welcome http://demo.appdynamics.com:8090/controller/rest/applications/25/tiers/70
/nodes

<nodes><node>
  <id>81</id>
  <name>PHP_Node</name>
  <type>Other</type>
  <tierId>70</tierId>
  <tierName>PHP_Tier</tierName>
  <machineId>65</machineId>
  <machineName>232fe50b8f9c</machineName>
  <machineOSType>Linux</machineOSType>
  <machineAgentPresent>false</machineAgentPresent>
  <appAgentPresent>true</appAgentPresent>
  <appAgentVersion>Proxy v4.2.0.0 GA SHA-1:.c86ec090f4ff77195df065fe56dade4dfc3913aa #9909 8869-master-build<

  <ipAddresses>
    <ipAddress>fe80:0:0:0:42:acff:fe11:2%eth0</ipAddress>
    <ipAddress>172.17.0.2</ipAddress>
  </ipAddresses>
  <agentType>PHP_APP_AGENT</agentType>
</node>
</nodes>
```

Retrieve Tier Information by Tier Name

Format

`GET /controller/rest/applications/application_name/tiers/tier_name`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_name`	URI	The application name or application ID.	Yes
`tier_name`	URI	Tier name or ID.	Yes
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are `XML` (default) or `JSON`.	No

Example

```
curl --user user1@customer1:welcome http://demo.appdynamics.com:8090/controller/rest/applications/5/tiers/14

<tiers><tier>
  <id>14</id>
  <name>Inventory Server</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
</tiers>
```

Metric and Snapshot API

This page describes the Controller Metrics and Events API methods that allow you to retrieve information on metric data and various types of activities in your monitored environment. You can also configure how long you retain the metrics.

> The AppDynamics Dexter Data Extraction Enhanced Reporting (DEXTER) extension provides an alternative to using a REST client to get metric data by makes AppDynamics data queryable in the manner of a data warehouse.

Retrieve Metric Hierarchy

This API returns information about the metric tree structure. Because it retrieves the first generation of child elements, you can only expand the children of the folder type.

- If a child element is a container item in the response, its type value is `folder`.
- Otherwise, the type value for the child element is `leaf`.

You can recurse the metric tree structure further by using the `metric-path` parameter as described in the Metric Data API.

Format

```
GET /controller/rest/applications/application_name/metrics
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_name`	URI	The name or ID of the business or EUM (`browser/mobile/IoT`) application. Use the call to get the application ID in the Application Model API.	Yes
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are `XML` (default) or `JSON`.	No
`metric-path`	Query	The path to the metric in the metric hierarchy. > When including the pipe (`|`) or backslash (`\`) special characters in the `metric-path`, you must include an additional backslash to indicate escape.	No

Example

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications
/ECommerce_E2E/metrics"

<metric-items><metric-item>
  <type>folder</type>
  <name>Backends</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Service Endpoints</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>End User Experience</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Errors</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Business Transaction Performance</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Information Points</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Overall Application Performance</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Application Infrastructure Performance</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Mobile</name>
</metric-item></metric-items>
```

Retrieve Metric Data

The metric data method lets you get values generated for metrics. To use this method, specify the following parameters to the API:

- The path of the metric to retrieve.
- The time frame for the data.

Using the Controller UI is the simplest way to learn how to construct the metric path and time range-related parameters.

1. Right-click on the metric in the Metric Browser.
2. Select **Copy REST URL**. The copied URL includes the path to this metric and time range selected in the UI.
3. Certain clients can accept and properly encode the full path value as the metric path parameter.
4. Hover over the metric in the tree or copy it using the **Copy Full Path** option in the right-click menu.

Certain examples below are shown with the **full path value** rather than the fully encoded URL value. If you test calls with the full path, avoid using a pipe character at the start or end of the path.

These sections provide additional details and examples for the metric data method:

- Metric Response Values
- Using Wildcards
- Using Time Ranges
- Retrieving All Other Traffic Business Transaction Metrics

Format

`GET /controller/rest/applications/`*`application_name`*`/metric-data`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`metric-path`	Query	The path to the metric in the metric hierarchy. When including the pipe (|) or backslash (\ ) special characters in the `metric-path`, you must include an additional backslash to indicate escape.	Yes
`rollup`	Query	By default, the values of the returned metrics are rolled up into a single data point (`rollup=true`). To get separate results for all values within the time range, set the **Rollup** parameter to `false` in the query.	No

Additional mandatory parameters for specifying time ranges are described in Using Time Ranges.

Example

Retrieve metric values for a metric at an absolute path:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications
/ECommerce_E2E/metric-data?metric-path=Overall%20Application%20Performance%7CAverage%20Response%20Time%20%28ms%
29&time-range-type=BEFORE_NOW&duration-in-mins=15"

<metric-datas><metric-data>
  <metricId>2339</metricId>
  <metricPath>Overall Application Performance|Average Response Time (ms)</metricPath>
  <metricName>BTM|Application Summary|Average Response Time (ms)</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
      <startTimeInMillis>1450562160000</startTimeInMillis>
      <value>302</value>
      <min>0</min>
      <max>15212</max>
      <current>15212</current>
      <sum>97800</sum>
      <count>324</count>
      <standardDeviation>0.0</standardDeviation>
      <occurrences>0</occurrences>
      <useRange>true</useRange>
    </metric-value>
  </metricValues>
</metric-data>
</metric-datas>
```

Metric Response Values

Metrics results include the following fields:

Name	Definition
`current`	The value for the current minute. This is used only when the time rollup type used by the Controller is current.
`count`	The number of times the agent collected the metric over the selected time period.
`min, max`	The minimum and maximum values reported across the selected time period. These are not used for all metric types.
`occurrences`	The number of data samples taken by the Controller to calculate the standard deviation.
`standardDeviation`	The intermediate values calculated by the Controller during time rollup used to calculate standard deviation. See Dynamic Baselines.
`startTimeInMillis`	The `startTimeInMillis` is the start time of the time range to which the result metric data applies in UNIX epoch time.
`sum`	The total accumulated value for the metric over the selected time period.
`useRange`	Used internally by the Controller to process the metric.

`value`	The `value` value is one of the following for all metric values reported across the configured evaluation time length: • Arithmetic average: if the metric time rollup type is average. • Sum: if the metric time rollup type is sum. • Latest: if the metric time rollup type is current.

`min` and `max` values are not available for any count-based or sum-based metric except when the metric is rolled up to hourly or daily data points. These metrics include errors per minute, calls per minute, and so on.

Using Wildcards

When you copy the REST URL in the Metric Browser, you get the path to a specific metric within a specific application and tier. Alternatively, you can use wildcard characters in one or more steps in the URL path to get metric data for entities, including multiple business transactions, tiers, or nodes.

The following format examples show where to put wildcard characters in various metric paths to achieve particular results. For reading clarity, these format examples use the **Full Path** for the metric rather than the REST URL. For a full working example, click the expanding link under each format listing:

- Retrieve the **app agent availability time** for all tiers in the application using a wildcard for the tier name:

```
/controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-path=Application
Infrastructure Performance|*|Agent|App|Availability&time-range-type=BEFORE_NOW&duration-in-mins=15
```

Disabling Data Rollup

By default, metric data is rolled up for the time frame you request. You can set the rollup parameter to false to get all data points within the time frame. For example:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications
/ECommerce_E2E/metric-data?rollup=false&metric-path=Overall%20Application%20Performance%7CAverage%20Response%
20Time%20%28ms%29&time-range-type=BEFORE_NOW&duration-in-mins=15"

<metric-datas><metric-data>

  </metricValues>
</metric-data>
</metric-datas>
```

Using Time Ranges

You can fetch metric data for any time range, including for a range between specific points, such as from 2:00 to 2:15 pm Monday, or for a relative time range.

Time-based input parameters for the metric data API method let you specify a time range in several ways, as described in the following table.

Time Range Input Parameters

Parameter Name	Parameter Type	Value	Mandatory

`time-range-type`	Query	Possible values are: • `BEFORE_NOW`—must specify the duration-in-mins parameter. • `BEFORE_TIME`—must specify the duration-in-mins and end-time parameters. • `AFTER_TIME`—must specify the duration-in-mins and start-time parameters. • `BETWEEN_TIMES`—must specify the start-time and end-time parameters. The `BETWEEN_TIMES` range includes the start- time and excludes the end-time.	Yes
`duration-in-mins`	Query	Duration (in minutes) to return the metric data.	If time-range-type is `BEFORE_NOW`, `BEFORE_TIME`, or `AFTER_TIME`
`start-time`	Query	Start time (in milliseconds) from which the metric data is returned in UNIX epoch time.	If time-range-type is `AFTER_TIME` or `BETWEEN_TIMES`
`end-time`	Query	End time (in milliseconds) until which the metric data is returned in UNIX epoch time.	If time-range-type is `BEFORE_TIME` or `BETWEEN_TIMES`

Examples

Most examples on this page use the previous 15 minutes as the request time range. The following format examples show other ways you can define the time range for the request.

- Time range of the 15 minutes after December 19, 2015 5:40:00 AM GMT:

```
?time-range-type=AFTER_TIME&start-time=1450532400000&duration-in-mins=15
```

- Time range of the 15 minutes before December 19, 2015 6:00:00 AM GMT.

```
?time-range-type=BEFORE_TIME&end-time=1450533600000&duration-in-mins=15
```

- Time range between December 19, 2015 6:00:00 AM GMT and December 19, 2015 6:30:00 AM GMT:

```
?time-range-type=BETWEEN_TIMES&start-time=1450533600000&end-time=1450535400000
```

Retrieving All Other Traffic Business Transaction Metrics

The **All Other Traffic** business transaction is a type of business transaction that aggregates traffic for new transactions once the business transaction registration limits are reached and uses the special identifier, `_APPDYNAMICS_DEFAULT_TX_`, in API URI paths. See Business Transactions.

The following shows an example of retrieving the average CPU used by the **All Other Traffic** business transaction:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com:8090/controller/rest/applications/ACME%
20Book%20Store%20Application/metric-data?metric-path=Business%20Transaction%20Performance%7CBusiness%
20Transactions%7CECommerce%20Server%7C_APPDYNAMICS_DEFAULT_TX_%7CAverage%20CPU%20Used%20%28ms%29&time-range-
type=BEFORE_NOW&duration-in-mins=15"

<metric-datas><metric-data>
  <metricId>4000</metricId>
  <metricPath>Business Transaction Performance|Business Transactions|ECommerce
Server|_APPDYNAMICS_DEFAULT_TX_|Average CPU Used (ms)</metricPath>
  <metricName>BTM|BTs|BT:78|Component:12|Average CPU Used (ms)</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
      <startTimeInMillis>1450570800000</startTimeInMillis>
      <value>22</value>
      <min>0</min>
      <max>50</max>
      <current>20</current>
      <sum>3140</sum>
      <count>146</count>
      <standardDeviation>0.0</standardDeviation>
      <occurrences>0</occurrences>
      <useRange>true</useRange>
    </metric-value>
  </metricValues>
</metric-data>
</metric-datas>
```

Retrieve Transaction Snapshots

Snapshots contain details on transactions, by request segment. The time range parameters are the same for snapshots as for retrieving metrics. You can similarly specify a relative time range or a specific range. See Using Time Ranges.

Format

`GET /controller/rest/applications/`*`application_name`*`/request-snapshots`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_name`	URI	Provide either the application name or application id.	Yes
`time-range-type`	Query	Possible values are: • `BEFORE_NOW`—must specify the duration-in-mins parameter. • `BEFORE_TIME`—must specify the duration-in-mins and end-time parameters. • `AFTER_TIME`—must specify the duration-in-mins and start-time parameters. • `BETWEEN_TIMES`—must specify the start-time and end-time parameters. The `BETWEEN_TIMES` range includes the start- time and excludes the end-time.	Yes
`duration-in-mins`	Query	Duration (in minutes) to return the data.	If time-range-type is BEFORE_NOW, BEFORE_TIME, or AFTER_TIME
`start-time`	Query	Start time (in milliseconds) from which the data is returned.	If time-range-type is AFTER_TIME or BETWEEN_TIMES
`end-time`	Query	End time (in milliseconds) until which the data is returned.	If time-range-type is BEFORE_TIME or BETWEEN_TIMES
`guids`	Query	Array of comma-separated GUIDs for the transaction snapshots. If not specified, retrieves all snapshots in the specified time range.	No
`archived`	Query	True to retrieve archived snapshots. Default is false.	No

`deep-dive-policy`	Query	Array of comma-separated snapshot policy filters to apply. Valid values are: • `SLA_FAILURE` • `TIME_SAMPLING` • `ERROR_SAMPLING` • `OCCURRENCE_SAMPLING` • `ON_DEMAND` • `APPLICATION_STARTUP` • `SLOW_DIAGNOSTIC_SESSION` • `ERROR_DIAGNOSTIC_SESSION` • `POLICY_FAILURE_DIAGNOSTIC_SESSION` • `DIAGNOSTIC_SESSION` • `INFLIGHT_SLOW_SESSION`	No
`application-component-ids`	Query	Array of comma-separated tier IDs to filter. The default is all the tiers in the application.	No
`application-component-node-ids`	Query	Array of comma-separated node ID filters. Default is all the nodes in the application	No
`business-transaction-ids`	Query	Array of comma-separated business transaction ID filters. Default is all the business transactions in the application.	No
`user-experience`	Query	Array of comma-separated user experiences filters. Valid values are: • `NORMAL` • `SLOW` • `VERY_SLOW` • `STALL` • `ERROR`	No
`first-in-chain`	Query	If `true`, retrieve only the first request from the chain. Default is `false`.	No
`need-props`	Query	If `true`, the values of the following snapshot properties are included in the output. These values correspond to the values of the `data-collector-type` parameter. If `false`, the default, these values are empty in the output. • `errorDetails` • `errorIDs` • `httpParameters` • `businessData` • `cookies` • `httpHeaders` • `sessionKeys` • `responseHeaders` • `logMessages` • `transactionProperties` • `transactionEvents` • `dotnetProperty`	No
`need-exit-calls`	Query	If `true`, exit calls are included in the result. Default is `false`.	No
`execution-time-in-milis`	Query	If set, retrieves only data for requests with execution times greater than this value.	No
`session-id`	Query	If set, retrieves data only for this session id.	No
`user-principal-id`	Query	If set, retrieves data only for this user login.	No
`error-ids`	Query	Array of comma-separated error codes to filter by. The default is to retrieve all error codes.	No
`starting-request-id, ending-request-id`	Query	If set, retrieves data only for this range of request IDs.	No
`error-occurred`	Query	If `true`, retrieves only error requests. Default is `false`.	No
`diagnostic-snapshot`	Query	If `true`, retrieves only diagnostic snapshots. Default is `false`.	No
`bad-request`	Query	If `true`, retrieves only slow and error requests. Default is `false`.	No
`diagnostic-session-guid`	Query	Array of comma-separated diagnostic session GUIDs to filter.	No
`data-collector-name`	Query	Used with `data-collector-value` to filter snapshot collection based on the value of a data collector.	No
`data-collector-value`	Query	Used with `data-collector-name` to filter snapshot collection based on the value of a data collector.	If data-collector-name is set.

`data-collector-type`	Query	Used with `data-collector-name` and `data-collector-value` to filter snapshot collection based on the value of a data collector. Some of the values contain spaces. All are case-sensitive and where indicated the spaces are required. Valid values are: • `Error IDs` • `Stack Traces` • `Error Detail` • `Http Parameter` • `Business Data` (This type is a method invocation data collector.) • `Cookie` • `Http Header` • `Session Key` • `Response Header` • `Log Message` • `Transaction Property` • `Transaction Event` • `Dotnet Property` • `isProtoBuf` • `EUM Request GUID`	
`output`	Query	HTTP Request parameter included as part of the URL to change the output format Valid values are `XML` (default) or `JSON`.	No
`maximum-results`	Query	If specified, the number of maximum results will be returned. If not specified, a default of 600 results can be returned at most.	No

Examples

- Retrieve list of transaction snapshots for the ACME Book Store:

```
/controller/rest/applications/ECommerce_E2E-Fulfillment/request-snapshots?time-range-
type=BEFORE_NOW&duration-in-mins=5
```

Full Example:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications
/ECommerce_E2E-Fulfillment/request-snapshots?time-range-type=BEFORE_NOW&duration-in-mins=5"

Retrieve Controller Audit History

The Controller audit history is a record of the configuration and user activities in the Controller configuration. The `ControllerAuditHistory` API method returns the audit log for the time range specified. The output format can be `JSON` or `CSV`. This information is the same as that found in the `audit.log` file. See Platform Log Files and Log File Information by Platform

Format

```
GET /controller/ ControllerAuditHistory?startTime=<start-time>&endTime=<end-time>&include=<field>:
<value>&exclude=<field>:<value>
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`start-time`	Query	Start time in the format: `yyyy-MM-dd'T'HH:mm:ss.SSSZ`	Yes
`end-time`	Query	End time in the format: `yyyy-MM-dd'T'HH:mm:ss.SSSZ`	Yes
`time-zone-id`	Query	Time zone	No
`include`	Query	Restricted information in the Controller audit history	No
`exclude`	Query	Restricted information in the Controller audit history	No

- To control the size of the output, the range between the `start-time` and `end-time` cannot exceed 24 hours. For periods longer than 24 hours, use multiple queries with consecutive time parameters.
- Multiple filters of the same type are allowed.
  - The backend API treats included filters with the same `<field>` with relationship `OR`
  - Filters with different `<field>` with relationship `AND`. There is no direct interaction between `include` and `exclude` filters.
- Each filter needs to be a parameter, e.g. `include=filterName1:filterValue1&include=filterName2:filterValue2`. See the below examples:

```
http://localhost:8080/controller/ControllerAuditHistory?startTime=yyyy-MM-dd&HH:mm:ss.SSSZ&endTime=yyyy-MM-
dd&HH:mm:ss.SSSZ?include=filterName1:filterValue1&include=filterName1:filterValue1&exclude=filterName1:
filterValue1&exclude=filterName1:filterValue1
```

```

```

Configure Metric Retention by Account

You can configure the Controller to purge stale metrics once a day based on the account.

- Stale metrics are metrics that have not had new data reported based on the number of days configured.
- This only deletes EUM and SIM metrics that are more than two days old.

To configure this option, you must be the account owner.

Format

```
POST /controller/api/accounts/<account_id>/metricstaleduration/<number_of_days>
```

Input Parameters

Parameter Name	Parameter Type	Value
account_id	URI	The account ID.
number_of_days	Integer	The number of days you want to retain stale metrics.

Example

```
curl -X POST -u user1@customer1:your_password "http://demo.appdynamics.com:8090/controller/api/accounts/2
/metricstaleduration/3"
```

Configure Metric Retention by Application

You can configure the Controller to purge stale metrics once a day based on application.

- Stale metrics are metrics that have not had new data reported based on the number of days configured.
- This only deletes EUM and SIM metrics that are more than two days old.

To configure this option, you must have administrator permissions or higher.

Format

```
POST /controller/api/accounts/<account_id>/applications/<application_name>/metricstaleduration/<number_of_days>
```

Input Parameters

Parameter Name	Parameter Type	Value
`account_id`	URI	The account ID.
`application_id`	URI	The application ID.
`number_of_days`	Integer	The number of days you want to retain stale metrics.

Example

```
curl -X POST -u user1@customer1:your_password "http://demo.appdynamics.com:8090/controller/api/accounts/2
/applications/12/metricstaleduration/3"
```

Alert and Respond API

This page provides links to the Alert and Respond APIs that allow you to create, configure and manage:

- Health Rules
- Schedules
- Policies
- Actions
- Email Digests
- Action Suppression
- Events and Action Suppression

You can create and use the identity type, `API Clients`, to provide secure access to the AppDynamics controller using REST API calls. These calls use Open Authorization (OAuth) token-based authentication. You can create new API Client identity types that can be used to generate OAuth tokens. See API Clients.

Health Rule API

Related pages:

- Health Rules

This page describes the Health Rule API methods you can use to create, configure, update, and delete health rules for multiple applications simultaneously. This API allows you to programmatically update and maintain single or multiple health rules and migrate them across applications or Controllers.

- Minimal syntax validation of the JSON payload is done when creating the health rule.
- Path validation for a specified metric is not done. Ensure that you provide valid paths for all the metrics you define.
- If metrics are not resolved during the health rule evaluation, the health rule attains an unknown (?) state. Ensure that you provide valid metrics for all the affected entities you define.

Create a Health Rule

Creates a new health rule from the specified JSON payload. See Property Details

Resource URL

```
POST <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules
```

Request/Response Format

JSON

Example

This example creates a health rule with an affected entity type `business transaction performance` and defines the evaluation criteria for the health rule. See Download Examples

Retrieve a List of Health Rules for an Application

This API returns a list of all the health rule IDs and names for the specified application ID. To retrieve complete details of the health rule, use `GET //health-rule/{health-rule-id}`. See Property Details

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules
```

Response Format

JSON

Example Response

```
[
    {
        "id": 1,
        "name": "Machine Availability is too low",
        "enabled": true
    },
    {
        "id": 2,
        "name": "Overall Disk Space Available is too low",
        "enabled": true
    },
    {
        "id": 3,
        "name": "CPU Usage is too high",
        "enabled": true
    },
    {
        "id": 4,
        "name": "Memory Usage is too high",
        "enabled": true
    },
    {
        "id": 5,
        "name": "Swap Usage is too high",
        "enabled": true
    },
    {
        "id": 6,
        "name": "Disk Usage is too high on at least one partition",
        "enabled": false
    }
]
```

Retrieve Details of a Specified Health Rule

This API Returns the health rule details for the specified health rule ID.

JMX Health Rules are not supported.

Resource URL

`GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules/{health-rule-id}`

Response Format

JSON

Example Response

```
{
    "id": 26,

    }
}
```

Update a Health Rule

This API updates an existing health rule (required fields) with details from the specified health rule ID. See Property Details

Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules/{health-rule-id}
```

Request/Response Format

JSON

Example

Delete a Health Rule

Deletes an existing health rule with the specified ID.

Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules/{health-rule-id}
```

Update a Health Rule Configuration

This API updates one or more configuration setting(s) of a health rule. See Property Details

You can enter one or both of the following field(s) in the request:

- Enable/disable the health rule.
- Update the schedule of the health rule.

Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules/{health-rule-id}
/configuration
```

Request/Response Format

JSON

Example

Response Codes

Code	Description
200	Fetched successfully
201	Created successfully
204	Deleted successfully
400	Bad request
401	Unauthorized
403	Forbidden
404	Resource not found
409	Already exists

Property Details

HealthRule

Property Name	Type and Valid Values	Description
`id`	integer	Auto-generated by the system and returned in the response. It is a `readOnly` value.
`name`	string Minimum length: 1	Name of the health rule.
`enabled`	boolean Default value: `true`	Sets the health rule to enabled/disabled state. A health rule is evaluated only if it is in `enabled` state.
`useDataFromLastNMinutes`	integer Minimum value: 1 Maximum value: 360	The time interval (in minutes) during which the data collected is considered for health rule evaluation. Enter a value between 1 to 9 or a multiple of 10 that is less than 360.
`waitTimeAfterViolation`	integer Minimum time: 1 minute	The wait time after a violation in minutes.
`scheduleName`	string Default option: `Always`	Name of schedule to be associated with the health rule for evaluation.
`affects`*		Describes entities affected by the health rule. For example, business transactions, servers, or databases. **Affects** `affectedEntityType` (string): `OVERALL_APPLICATION_PERFORMANCE`, `BUSINESS_TRANSACTION_PERFORMANCE`, `TIER_NODE_TRANSACTION_PERFORMANCE`, `TIER_NODE_HARDWARE`, `SERVERS_IN_APPLICATION`, `BACKENDS`, `ERRORS`, `SERVICE_ENDPOINTS`, `INFORMATION_POINTS`, `CUSTOM`, `DATABASES`, `SERVERS`

evalCriterias*		Defines a condition or a set of conditions (maximum of 8) expressed as a boolean expression to evaluate the health rule. Depending on affectedEntityType a condition may or may not contain evalMatchingCriteria. Conditions are classified as: • critical or • warning

HealthRuleSummaryArray

Property	Type
id*	integer
name	string minLength: 1
enabled*	boolean

HealthRuleConfiguration

The configuration details of a health rule that you can update individually without the need to send the complete health rule JSON payload. You can mention one or more properties and all those properties are set to the new specified values.

Property	Type
enabled	boolean
scheduleName	string

MetricEvalDetail

Property	Type	Enums
metricEvalDetailType*	string	BASELINE_TYPE SPECIFIC_TYPE

BaselineMetricEvalDetail

The deviation of a metric from the baseline used to evaluate the health rule.

Property	Type	Enums
metricEvalDetailType*	string	BASELINE_TYPE SPECIFIC_TYPE
baselineCondition*	string	WITHIN_BASELINE NOT_WITHIN_BASELINE GREATER_THAN_BASELINE LESS_THAN_BASELINE
baselineName*	string minLength: 1	
compareValue*	number minimum: 0	

baselineUnit*	string	STANDARD_DEVIATIONS PERCENTAGE

SpecificValueMetricEvalDetail

The deviation of a metric from a specific value used to evaluate the health rule.

Property	Type	Enums
metricEvalDetailType*	string	BASELINE_TYPE SPECIFIC_TYPE
compareCondition*	string	GREATER_THAN_SPECIFIC_VALUE LESS_THAN_SPECIFIC_VALUE
compareValue*	number minimum: 0	

MetricAggregateFunction

Metrics aggregated to determine the deviation and evaluate the health rule.

Property	Type	Enums
MetricAggregateFunction*	string	MINIMUM MAXIMUM VALUE SUM COUNT CURRENT GROUP_COUNT

SingleMetricEvalDetail

The deviation of a single metric from the aggregated value used to evaluate the health rule.

Property	Type	Enums
evalDetailType*	string	SINGLE_METRIC METRIC_EXPRESSION
metricAggregateFunction*	string	MINIMUM MAXIMUM VALUE SUM COUNT CURRENT GROUP_COUNT
metricPath*	string minLength: 1	
metricEvalDetail*	string	BASELINE_TYPE SPECIFIC_TYPE

MetricExpressionEvalDetail

The metric expression used to evaluate the health rule.

Property	Type	Enums
`evalDetailType`*	string	`SINGLE_METRIC` `METRIC_EXPRESSION`
`metricExpression`*	string minLength: 1	
`metricExpressionVariables`*	string minItems: 2	**MetricDetailWithVariableName** `variableName`* — string, minLength: 1 `metricAggregateFunction`* — string — `MINIMUM` `MAXIMUM` `VALUE` `SUM` `COUNT` `CURRENT` `GROUP_COUNT` `metricPath`* — string, minLength: 1

`metricEvalDetail`*	string	**SpecificValueMetricEvalDetail**
		`metricEvalDetailType`* — string — `BASELINE_TYPE` `SPECIFIC_TYPE`
		`compareCondition`* — string — `GREATER_THAN_SPECIFIC_VALUE` `LESS_THAN_SPECIFIC_VALUE`

NodeEvalMatchingCriteria

Property	Type	Enums
matchType	string	AVERAGE ANY_NODE PERCENTAGE_NODES NUMBER_OF_NODES
value Enter the matching criteria only when you select PERCENTAGE_NODES or NUMBER_OF_NODES as matchType. If you select NUMBER_OF_NODES, enter an integer; else if you select PERCENTAGE_NODES, enter a number.	number minimum: 0	

Condition

A single condition that can be independently evaluated to `true` or `false`. List of conditions (maximum 8) along with other properties form a criteria.

Property	Description	Type/Enums
name*	Name of the condition.	string
shortname*	A short name used in conditionExpression to evaluate CUSTOM conditionType.	string pattern: ^[A-Z]{1,3}$ Enums A B C D E F G H
evaluateToTrueOnNoData	Controls the evaluation of the condition in cases where any metric on which the condition is based, returns no data. The condition evaluates to unknown by default when no data is returned. If the health rule is based on all the conditions evaluating to true, having no data returned may affect whether the health rule triggers an action.	boolean default: false

`evalDetail`*	Details of metric(s) considered for evaluation of the condition. Use `SINGLE_METRIC` to evaluate a single metric. Use `METRIC_EXPRESSION` to evaluate a metric expression.	**ConditionEvalDetail** **Property** / **Type** / **Enums** `evalDetailType` / string / `SINGLE_METRIC`, `METRIC_EXPRESSION`
`triggerEnabled`	If set to `true`, the value in field `minimumTriggers` is considered for evaluation.	boolean default: `false`
`minimumTriggers`	If you set a non-zero value, persistence thresholds are considered when evaluating the conditions. Ensure that you define a value less than `useDataFromLastNMinutes`.	integer default: 0 minimum: 0 maximum: 30

ConditionEvalDetail

Property	Type	Enums
`evalDetailType`	string	`SINGLE_METRIC` `METRIC_EXPRESSION`

Criteria

Property	Description	Type/Enums

`conditionAggregationType`	Condition evaluation criteria that constitute a health rule violation.	string
		default: ALL
		Enums
		`ALL`
		`ANY`
		`CUSTOM`

`conditionExpression`	Use only when you set the `conditionAggregationType` variable to `CUSTOM`. Use the `ShortName` of the condition to define the boolean expression.	String minLength: 1

`errorScope`*	string	`ALL_ERRORS`

SpecificErrors

The scope of errors is set to specific errors.

Property	Type	Description/Enums
`errorScope`*	string	`SPECIFIC_ERRORS`
errors*	string minItems: 1	
tiers	string minItems: 1	Use if error names belong to multiple tiers. Provide the tier names as a list in `affects.affectedErrors.tiers` in the same order as the error names. In the following example, 'Page Not Found: 404' corresponds to `Tier1`, while 'Error2' corresponds to `SomeOtherTier`. - If the error names are unique to each tier, tiers map errors one to one. You need not specify the tier name in this case. - If errors have same name but belong to different tiers, duplicate names are handled by appending tier names with the delimiter '|'. - If there is a mismatch between the number of error names and tier names, then the list `affects.affectedErrors.tiers` is ignored. - If an error belongs to multiple tiers, and you do not specify the tier names, the error name cannot be uniquely identified. Hence, an error is displayed.

EvalCriterias

Property	Type/Enums
`criticalCriteria`	**Criteria** Critical conditions are evaluated before warning conditions. If you have defined a critical condition and a warning condition in the same health rule, the warning condition is evaluated only if the critical condition is not `true`.

Property	Description	Type/Enums

`conditionAggregationType`	Condition evaluation criteria that constitute a health rule violation.	String
		
		default: ALL
		
		Enums
		
		`ALL`
		
		`ANY`
		
		`CUSTOM`

`conditionExpression`	Use only when you set the `conditionAggregationType` variable to `CUSTOM`. Use the `ShortName` of the condition to define the boolean expression.	String minLength: 1

conditions*	A single condition that can be evaluated independently to `true` or `false`. OR
	
	A list of conditions (maximum of 8) along with other properties to form a criteria.
		String
		
		minItems: 1
		
		Condition
		
		Property / **Description** / **Type/Enums**
		
		`name`* — Name of the condition. — string
		
		`shortname`* — A short name used in `conditionExpression` to evaluate `CUSTOM conditionType`. — string
		
		pattern: ^[A-Z]{1,3}$
		
		Enums
		
		A
		
		B
		
		C
		
		D
		
		E
		
		F
		
		G
		
		H
		
		`evaluateToTrueOnNoData` — Controls the evaluation of the condition in cases where any metric on which the condition is based, returns no data. The default when no data is returned is for the condition to evaluate to `unknown`. If the health rule is based on all the conditions evaluating to `true`, having no data returned may affect whether the health rule triggers an action. — boolean
		
		default: `false`
		
		`evalDetail`* — Details of metric(s) considered for evaluation of the condition. Use `SINGLE_METRIC` to evaluate a single metric. Use `METRIC_EXPRESSION` to evaluate a metric expression. — **ConditionEvalDetail**
		
		Property / **Type** / **Enums**
		
		`evalDetailType` — `string` — `SINGLE_METRIC`, `METRIC_EXPRESSION`
		
		`triggerEnabled` — If set to `true`, the value in field `minimumTriggers` is considered for evaluation. — `boolean`
		
		`default: false`
		
		`minimumTriggers` — If you set a non-zero value, persistence thresholds are considered when evaluating the conditions. Ensure that you define a value less than `useDataFromLastNMinutes`. — `integer`
		`default: 0`
		`minimum: 0`
		`maximum: 30`

`evalMatchingCriteria`	The criteria for evaluating a condition for the following health rule types:
	• Business Transaction
	• Node health-hardware
	• Node health-transaction performance
	
	It defines how many nodes in the affected entities must violate the condition before the health rule is considered to violate.
		NodeEvalMatchingCriteria
		
		Property / **Type /Enums** / **Description**
		
		`matchType` — String
		Enums
		`AVERAGE`
		`ANY_NODE`
		`PERCENTAGE_NODES`
		`NUMBER_OF_NODES`
		The evaluation scope type that defines how many nodes in the affected entities must violate the condition before the health rule is considered violated.
		Enter the matching criteria only when you select `PERCENTAGE_NODES` or `NUMBER_OF_NODES` as `matchType`.
		
		`value` — The number or percentage of nodes that must violate the condition to constitute a health rule violation. If you select `NUMBER_OF_NODES`, enter an integer. If you select `PERCENTAGE_NODES`, enter a number.

`warningCriteria`

Criteria

If you have defined a critical condition and a warning condition in the same health rule, the warning condition is evaluated only if the critical condition is not `true`.

Property	Description	Type/Enums

`conditionAggregationType`	Condition evaluation criteria that constitute a health rule violation.	String
		default: ALL
		Enums
		`ALL`
		`ANY`
		`CUSTOM`

`conditionExpression`	Use only when you set the `conditionAggregationType` variable to `CUSTOM`. Use the `ShortName` of the condition to define the boolean expression.	String minLength: 1

<table>
<tr>
<td>conditions*</td>

Schedule API

This page describes the Schedule API methods you can use to create, configure, and manage the evaluation time frame for the health rules of an application. The metrics associated with a health rule are evaluated according to a schedule that you control. See Health Rule Schedules.

- Syntax validation of the JSON payload is done when creating the schedule.
- Ensure that you pick a time zone the Time Zone List.

Create a New Schedule

Creates a new schedule with the specified JSON payload. See Property Details.

Resource URL

```
POST <controller_url>/controller/alerting/rest/v1
/applications/<application_id>/schedules
```

Request/Response Format

JSON

Example

This example creates a health rule schedule that evaluates the health rule once. See Download Examples.

Retrieve a List of Schedules for a Given Application

Returns a list of schedule(s) details for a health rule associated with the specified application ID. This API returns the schedule ID, name, and description of the schedule. See Property Details.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/schedules
```

Response Format

JSON

Example Response

This example returns a list of schedules applicable to a given application ID.

```
[
    {
        "id": 62,
        "name": "Daily Schedule",
        "description": "Daily Schedule",

        "timezone": "Asia/Kolkata"
    }
]
```

Retrieve the Details of a Specified Schedule

Retrieves a schedule with a specified ID. See Property Details.

Resource URL

`GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/schedules/{schedule-id}`

Response Format

`JSON`

Example Response

This example retrieves the details of a schedule. See Download Examples.

```
{
    "id": 12,
    "name": "End of Business Hour: 5pm-6pm, Mon-Fri",
    "description": "This schedule is active Monday through Friday, during end of business hour",
    "timezone": "Asia/Kolkata",
    "scheduleConfiguration": {
        "scheduleFrequency": "WEEKLY",
        "days": [
            "MONDAY",
            "TUESDAY",
            "WEDNESDAY",
            "THURSDAY",
            "FRIDAY"
        ],
        "startTime": "17:00",
        "endTime": "18:00"
    }
}
```

Update a Schedule

Updates an existing schedule with a specified JSON payload. See Property Details.

Resource URL

`PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/schedules/{schedule-id}`

Request/Response Format

`JSON`

Example

This example updates a schedule that evaluates the health rule once. See Download Examples.

Delete a Schedule

Delete a schedule with the specified ID. See Property Details.

Resource URL

`DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/schedules/{schedule-id}`

Response Codes

Code	Description
200	Fetched successfully
201	Created successfully
204	Deleted successfully
400	Bad request
401	Unauthorized
403	Forbidden
404	Resource not found
409	Already exists

Property Details

Schedule

Payload details for the health rule schedule.

Property Name	Type	Description and Valid Values
`id`	integer	Auto-generated by the system and returned in the response. It is a `ReadOnly` value.
`name`*	string	Name of schedule to be associated with the health rule for evaluation. Minimum length: 1
`description`	string	Description of the schedule with evaluation details. Example: Health rules are evaluated daily at 12 noon. Default value: `true`
`timezone`*	string	Timezone Id - Unique identifier of the time zone. See Time Zones. Example: America/Los_Angeles

`scheduleConfiguration`*		**Property Name** / **Type** / **Description**
		`scheduleFrequency` / string / The health rule(s) evaluation frequency specified in the schedule.
		Enums:
		`ONE_TIME`
		`DAILY`
		`WEEKLY`
		`MONTHLY_SPECIFIC_DATE`
		`MONTHLY_SPECIFIC_DAY`
		`CUSTOM`

OneTimeSchedule

This schedule evaluates the health rule once.

Property Name	Type	Description
`scheduleFrequency`*	string	The frequency to evaluate the health rule(s). See Enums.
`startDate`*	string	The scheduled start date in DD/MM/YYYY format. Pattern: `^(?:(?:31(\/|-|\.)(?:0?[13578]|1[02]))\1|(?:(?:29|30)(\/|-|\.)(?:0?[13-9]|1[0-2])\2))(?:(?:1[6-9]|[2-9]\d)?\d{2})$\|^(?:29(\/\|-\|\.)0?2\3(?:(?:(?:1[6-9]\|[2-9]\d)?(?:0[48]\|[2468][048]\|[13579][26])\|(?:(?:16\|[2468][048]\|[3579][26])00))))$|^(?:0?[1-9]|1\d|2[0-8])(\/|-|\.)(?:(?:0?[1-9])|(?:1[0-2]))\4(?:(?:1[6-9]|[2-9]\d)?\d{2})$`
`startTime`*	string	The scheduled start time in a 24-hour format. Pattern: `^([01]\d|2[0-3]):([0-5]\d)$`

endDate*	string	The scheduled end date in DD/MM/YYYY format. Pattern: ^(?:(?:31(\/|-|\.)(?:0?[13578]|1[02]))\1|(?:(?:29|30)(\/|-|\.)(?:0?[13-9]|1[0-2])\2))(?:(?:1[6-9]|[2-9]\d)?\d{2})$\|^(?:29(\/\|-\|\.)0?2\3(?:(?:(?:1[6-9]\|[2-9]\d)?(?:0[48]\|[2468][048]\|[13579][26])\|(?:(?:16\|[2468][048]\|[3579][26])00))))$|^(?:0?[1-9]|1\d|2[0-8])(\/|-|\.)(?:(?:0?[1-9])|(?:1[0-2]))\4(?:(?:1[6-9]|[2-9]\d)?\d{2})$
endTime*	string	The scheduled end time in a 24-hour format. Pattern: ^([01]\d|2[0-3]):([0-5]\d)$

DailySchedule

A recurring schedule to evaluate the health rule every day.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums.
startTime*	string	The scheduled start time in a 24-hour format. pattern: ^([01]\d|2[0-3]):([0-5]\d)$
endTime*	string	The scheduled end time in a 24-hour format. pattern: ^([01]\d|2[0-3]):([0-5]\d)$

WeeklySchedule

A recurring schedule to evaluate the health rule every week.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums.
days*	string	The day of the week to evaluate the health rule. minItems: 1 maxItems: 7
startTime*	string	The scheduled start time in a 24-hour format. pattern: ^([01]\d|2[0-3]):([0-5]\d)$

Property Name	Type	Description
DayOfWeek	string	**Enums** SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY

endTime*	string	The schedule end time in 24-hour format. pattern: ^([01]\d|2[0-3]):([0-5]\d)$

MonthlySpecificDateSchedule

A recurring schedule to evaluate the health rule every month on a specific date.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums.
startDate*	string	The schedule start date in DD/MM/YYYY format. pattern: ^(?:(?:31(\/|-|\.)(?:0?[13578]|1[02]))\1|(?:(?:29|30)(\/|-|\.)(?:0?[13-9]|1[0-2])\2))(?:(?:1[6-9]|[2-9]\d)?\d{2})$\|^(?:29(\/\|-\|\.)0?2\3(?:(?:(?:1[6-9]\|[2-9]\d)?(?:0[48]\|[2468][048]\|[13579][26])\|(?:(?:16\|[2468][048]\|[3579][26])00))))$|^(?:0?[1-9]|1\d|2[0-8])(\/|-|\.)(?:(?:0?[1-9])|(?:1[0-2]))\4(?:(?:1[6-9]|[2-9]\d)?\d{2})$
startTime*	string	The scheduled start time in a 24-hour format. pattern: ^([01]\d|2[0-3]):([0-5]\d)$
endDate*	string	The scheduled end date in DD/MM/YYYY format. pattern: ^(?:(?:31(\/|-|\.)(?:0?[13578]|1[02]))\1|(?:(?:29|30)(\/|-|\.)(?:0?[13-9]|1[0-2])\2))(?:(?:1[6-9]|[2-9]\d)?\d{2})$\|^(?:29(\/\|-\|\.)0?2\3(?:(?:(?:1[6-9]\|[2-9]\d)?(?:0[48]\|[2468][048]\|[13579][26])\|(?:(?:16\|[2468][048]\|[3579][26])00))))$|^(?:0?[1-9]|1\d|2[0-8])(\/|-|\.)(?:(?:0?[1-9])|(?:1[0-2]))\4(?:(?:1[6-9]|[2-9]\d)?\d{2})$
endTime*	string	The scheduled end time in a 24-hour format. pattern: ^([01]\d|2[0-3]):([0-5]\d)$

MonthlySpecificDaySchedule

A recurring schedule to evaluate the health rule every month on a specific date.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums.
startTime*	string	The scheduled start time in a 24-hour format. pattern: ^([01]\d|2[0-3]):([0-5]\d)$
endTime*	string	The schedules end time in a 24-hour format. pattern: ^([01]\d|2[0-3]):([0-5]\d)$

<table>
<tr><td>day*</td><td>string</td><td>The day of the week to evaluate the health rule.
minItems: 1
maxItems: 7<table><tr><th>Property Name</th><th>Type</th><th>Description</th></tr><tr><td>DayOfWeek</td><td>string</td><td>Enums
SUNDAY
MONDAY
TUESDAY
WEDNESDAY
THURSDAY
FRIDAY
SATURDAY</td></tr></table></td></tr>
<tr><td>occurrence*</td><td>string</td><td>The occurrence of the day within a month.
Enums:
FIRST
SECOND
THIRD
FOURTH
LAST</td></tr>
</table>

CustomSchedule

A custom schedule to evaluate the health rule based on specific requirements and timezone. Use UNIX cron expressions to define properties.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums.
startCron*	string	The beginning of the UNIX cron expression.
endCron*	string	The end of the UNIX cron expression.

ScheduleSummaryElement

The details of the schedule you have defined that are returned when you retrieve the schedules API.

Property Name	Type	Description
id	integer	Auto-generated by the system and returned in the response.
name*	string	Name of the schedule associated with the health rule for evaluation.
description	string	Description of the schedule and evaluation details.
timezone*	string	Timezone ID - Unique identifier of the time zone.

***This property is required (mandatory).**

Policy API

This page describes the Policy API methods you can use to create, configure, and manage policies for an application.

A policy consists of a *trigger* based on one or more events and an *action* in response to that trigger. You use policies to automate monitoring, alerting, and problem remediation.

- Syntax validation of the JSON payload is done when creating the policy.
- Objects/Entities corresponding to EUM applications are not supported.

Create a Policy

Creates a new policy using the given JSON payload.

Resource URL

```
POST <controller_url>/controller/alerting/rest
/v1/applications/<application_id>/policies
```

Request/Response Format

JSON

Example

Retrieve a list of Policies associated with an Application

This API returns a list of all policies associated with the given application, policy names, IDs, and enable flag details. To fetch the complete details of a policy, use `GET /policies/{policy-id}`.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies
```

Response Format

JSON

Example Response

```
[
    {
        "id": 1,
        "name": "Policy json update example",
        "enabled": true
    },
    {
        "id": 2,
        "name": "Policy json create example",
        "enabled": true
    }
]
```

Retrieve Details of a Specified Policy

Returns a `JSON` representation of a policy for the given policy ID.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies/{policy-id}
```

Response Format

JSON

Example Response

This example retrieves the configuration details of a policy.

```
{
    "id": 1,
    "name": "Policy REST get json example",
    "enabled": true,
    "executeActionsInBatch": true,
    "actions": [
        {
            "actionName": "your@email.com",
            "actionType": "EMAIL",
            "notes": "example notes"
        },
        {
            "actionName": "1234567890",
            "actionType": "SMS"
        },
        {

                    "JVM Garbage Collection Time is too high",
                    "Memory utilization is too high"
                ]
            }
        },
        "otherEvents": [
            "VERY_SLOW",
            "STALL",
            "SLOW",
            "ERROR"
        ],
        "anomalyEvents": null,
        "customEvents": []
    },
    "selectedEntities": {
        "selectedEntityType": "SPECIFIC_ENTITIES",
        "entities": [
            {
                "entityType": "BUSINESS_TRANSACTION",
                "selectedBusinessTransactions": {
                    "businessTransactionScope": "SPECIFIC_BUSINESS_TRANSACTIONS",
                    "businessTransactions": [
                        "/home/auctions"
                    ]
                }
            },
```

```
            {
                "entityType": "TIER_NODE",
                "tierOrNode": {
                    "tierOrNodeScope": "NODE_SELECTED_ENTITIES",
                    "typeofNode": "ALL_NODES",
                    "selectedNodes": {
                        "selectedNodeScope": "SPECIFIC_NODES",
                        "nodes": [
                            "node1"
                        ]
                    }
                }
            }
        ]
    }
}
```

Update a Policy

Updates the configuration settings of an existing policy with the values of a specified policy ID.

This request requires a complete JSON payload as input. AppDynamics recommends

1. Retrieving the JSON payload using `GET /policies/{policy-id}` and update the required fields.
2. Send the modified payload as part of the `PUT` request.

Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies/{policy-id}
```

Request/Response Format

JSON

Example

Delete a Policy

Deletes an existing policy with the specified ID.

Ensure that you provide a valid existing policy ID.

Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies/{policy-id}
```

Update a Policy Configuration

Updates one or more specific configuration setting(s) of a policy. You can update the **Name** and **Enabled** fields using this API.

Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies/{policy-id}/configuration
```

Request/Response Format

JSON

Property Details

Policy

Payload details of a policy.

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.
`name`*	string	Name of the policy. Minimum length: 1
`enabled`	boolean	Sets the policy to enabled/disabled state. Default value: `true`
`executeActionsInBatch`*	boolean	Executes the actions configured for a policy, once for all the triggering events that occurred during the last minute. Default value: `true`

<table>
<tr>
<td>actions*</td>
<td>minItems : 1</td>
<td>
Action
Describes the predefined, reusable, and automated response to an event to be taken when the policy is triggered.
<table>
<tr><th>Property Name</th><th>Type</th><th>Description</th></tr>
<tr><td>actionName*</td><td>string</td><td>Name of the action defined for a policy.</td></tr>

SpecificBusinessTransactions

The scope of business transactions is set to select business transactions.

Property Name	Type	Description
businessTransactionScope*		Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING_PATTERN
businessTransactions*	string minItems: 1	Name(s) of the business transactions.

BusinessTransactionsInSpecificTiers

The scope of business transactions is set to business transactions associated with a specific tier.

Property Name	Type	Description
businessTransactionScope*		Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING_PATTERN
specificTiers*	string minItems: 1	Name of the specified tier.

BusinessTransactionsMatchingPattern

The scope of business transactions is set to business transactions that match a specific pattern.

Property Name	Description
businessTransactionScope*	Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING_PATTERN

`patternMatcher`*	**EntityMatchingPattern**
	Business transactions that match the specified pattern are included in the scope.
	Property Name / **Type** / **Description**
	`matchTo`* — Enums: `STARTS_WITH`, `ENDS_WITH`, `CONTAINS`, `EQUALS`, `MATCH_REG_EX`
	`matchValue`* — string, minLength: 1
	`shouldNot` — boolean, default: `false`

SelectedTierOrNodeEntities

Specific tiers or nodes are considered for policy evaluation.

Property Name	Type	Description
`entityType`*	string	Enums `BUSINESS_TRANSACTION` TIER_NODE ERRORS SERVICE_ENDPOINTS INFORMATION_POINTS DATABASES_IN_APPLICATION SERVERS_IN_APPLICATION
`tierOrNode`*	string minLength: 1	**TierOrNode** **Property Name** / **Type** / **Description** `tierOrNodeScope`* — string — **Enums**: `TIER_SELECTED_ENTITIES`, `NODE_SELECTED_ENTITIES`

TierOrNode

Property Name	Type	Description

`tierOrNodeScope`*	string	**Enums**
		`TIER_SELECTED_ENTITIES`
		`NODE_SELECTED_ENTITIES`

TierSelectedEntities

Property Name	Type	Description

`tierOrNodeScope`*	string	**Enums**
		`TIER_SELECTED_ENTITIES`
		`NODE_SELECTED_ENTITIES`

`selectedTiers`*		**SelectedTiers** **Property Name** / **Type** / **Description** `selectedTierScope`* / string / Enums: `ALL_TIERS`, `SPECIFIC_TIERS`

SelectedTiers

Property Name	Type	Description

`selectedTierScope`*	string	Enums
		`ALL_TIERS`
		`SPECIFIC_TIERS`

AllTiers

Property Name	Type	Description

`selectedTierScope`*	string	Enums
		`ALL_TIERS`
		`SPECIFIC_TIERS`

SpecificTiers

Property Name	Type	Description

`selectedTierScope`*	string	Enums
		`ALL_TIERS`
		`SPECIFIC_TIERS`

`tiers`*	string minItems: 1	Name(s) of the specified tier(s).

NodeSelectedEntities

Property Name	Type	Description

`tierOrNodeScope`*	string	Enums
		`TIER_SELECTED_ENTITIES`
		`NODE_SELECTED_ENTITIES`

typeofNode*	string	Enums ALL_NODES JAVA_NODES DOT_NET_NODES PHP_NODES
selectedNodes*		**SelectedNodes** **Property Name** / **Type** / **Description** selectedNodeScope* — string — Enums: ALL_NODES, SPECIFIC_NODES, NODES_OF_SPECIFIC_TIERS, NODES_MATCHING_PATTERN, NODE_PROPERTY_VARIABLE_MATCHER

SelectedNodes

Property Name	Type	Description
selectedNodeScope*	string	Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER

AllNodes

Property Name	Type	Description
selectedNodeScope*	string	Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER

SpecificNodes

Property Name	Type	Description

`selectedNodeScope`*	string	Enums
		`ALL_NODES`
		`SPECIFIC_NODES`
		`NODES_OF_SPECIFIC_TIERS`
		`NODES_MATCHING_PATTERN`
		`NODE_PROPERTY_VARIABLE_MATCHER`

`nodes`*	string minItems: 1	Name(s) of the specified node(s).

NodesOfSpecificTiers

Property Name	Type	Description

`selectedNodeScope`*	string	Enums
		`ALL_NODES`
		`SPECIFIC_NODES`
		`NODES_OF_SPECIFIC_TIERS`
		`NODES_MATCHING_PATTERN`
		`NODE_PROPERTY_VARIABLE_MATCHER`

`specificTiers`*	string minItems: 1	Name(s) of tier with the associated nodes.

NodesMatchingPattern

Property Name	Type	Description

`selectedNodeScope`*	string	Enums
		`ALL_NODES`
		`SPECIFIC_NODES`
		`NODES_OF_SPECIFIC_TIERS`
		`NODES_MATCHING_PATTERN`
		`NODE_PROPERTY_VARIABLE_MATCHER`

`patternMatcher`*	string
	minItems: 1
		EntityMatchingPattern
		Nodes that match a specified pattern are included in the scope.
		Property Name / **Type** / **Description**
		`matchTo`* — Enums: `STARTS_WITH`, `ENDS_WITH`, `CONTAINS`, `EQUALS`, `MATCH_REG_EX`
		`matchValue`* — string, minLength: 1
		`shouldNot` — boolean, default: `false`

NodePropertyVariableMatcher

Property Name	Type	Description

`selectedNodeScope`*	string	Enums
		`ALL_NODES`
		`SPECIFIC_NODES`
		`NODES_OF_SPECIFIC_TIERS`
		`NODES_MATCHING_PATTERN`
		`NODE_PROPERTY_VARIABLE_MATCHER`

`propVarPairs`*	minItems: 1	**propVarPairs** **Property Name** / **Type** / **Description** `propertyType`* — string — NodePropertyTypeEnum: `META`, `ENV`, `JVM` `name`* — string, minLength: 1 `value`* — string, minLength: 1

Errors

Specific errors are considered for policy evaluation.

Property Name	Type	Description

entityType*	string	Enums BUSINESS_TRANSACTION TIER_NODE ERRORS SERVICE_ENDPOINTS INFORMATION_POINTS DATABASES_IN_APPLICATION SERVERS_IN_APPLICATION
selectedErrors*		**SelectedErrors** **Property Name** / **Type** / **Description** errorScope* — string — Enums: ALL_ERRORS, SPECIFIC_ERRORS, ERRORS_OF_SPECIFIC_TIERS, ERRORS_MATCHING_PATTERN

SelectedErrors

Property Name	Type	Description
errorScope*	string	Enums ALL_ERRORS SPECIFIC_ERRORS ERRORS_OF_SPECIFIC_TIERS ERRORS_MATCHING_PATTERN

AllErrors

Property Name	Type	Description
errorScope*	string	Enums ALL_ERRORS SPECIFIC_ERRORS ERRORS_OF_SPECIFIC_TIERS ERRORS_MATCHING_PATTERN

SpecificErrors

Property Name	Type	Description

`errorScope`*	string	Enums
		`ALL_ERRORS`
		`SPECIFIC_ERRORS`
		`ERRORS_OF_SPECIFIC_TIERS`
		`ERRORS_MATCHING_PATTERN`

`errors`*	string minItems: 1 Example: `NullPointerException`	

ErrorsOfSpecificTiers

Property Name	Type	Description

`errorScope`*	string	Enums
		`ALL_ERRORS`
		`SPECIFIC_ERRORS`
		`ERRORS_OF_SPECIFIC_TIERS`
		`ERRORS_MATCHING_PATTERN`

`specificTiers`*	string minItems: 1	

ErrorsMatchingPattern

Property Name	Type	Description

`errorScope`*	string	Enums
		`ALL_ERRORS`
		`SPECIFIC_ERRORS`
		`ERRORS_OF_SPECIFIC_TIERS`
		`ERRORS_MATCHING_PATTERN`

`patternMatcher`*		**EntityMatchingPattern**
		Property Name / **Type** / **Description**
		`matchTo`* — string — Enums: `STARTS_WITH`, `ENDS_WITH`, `CONTAINS`, `EQUALS`, `MATCH_REG_EX`
		`matchValue`* — string, minLength: 1
		`shouldNot` — boolean, default: `false`

ServiceEndpoints

Specific service endpoints are considered for policy evaluation.

Property Name	Type	Description

`entityType`*	string	Enums
		`BUSINESS_TRANSACTION`
		`TIER_NODE`
		`ERRORS`
		`SERVICE_ENDPOINTS`
		`INFORMATION_POINTS`
		`DATABASES_IN_APPLICATION`
		`SERVERS_IN_APPLICATION`

`selectedServiceEndpoints`*		**SelectedServiceEndpoints** See table below

Property Name	Type	Description

`serviceEndpointScope`*	string	Enums
		`ALL_SERVICE_ENDPOINTS`
		`SPECIFIC_SERVICE_ENDPOINTS`
		`SERVICE_ENDPOINTS_IN_SPECIFIC_TIERS`
		`SERVICE_ENDPOINTS_MATCHING_PATTERN`

SelectedServiceEndpoints

Property Name	Type	Description

`serviceEndpointScope`*	string	Enums
		`ALL_SERVICE_ENDPOINTS`
		`SPECIFIC_SERVICE_ENDPOINTS`
		`SERVICE_ENDPOINTS_IN_SPECIFIC_TIERS`
		`SERVICE_ENDPOINTS_MATCHING_PATTERN`

AllServiceEndpoints

Property Name	Type	Description

`serviceEndpointScope`*	string	Enums
		`ALL_SERVICE_ENDPOINTS`
		`SPECIFIC_SERVICE_ENDPOINTS`
		`SERVICE_ENDPOINTS_IN_SPECIFIC_TIERS`
		`SERVICE_ENDPOINTS_MATCHING_PATTERN`

SpecificServiceEndpoints

Property Name	Type	Description

`serviceEndpointScope`*	string	Enums
		`ALL_SERVICE_ENDPOINTS`
		`SPECIFIC_SERVICE_ENDPOINTS`
		`SERVICE_ENDPOINTS_IN_SPECIFIC_TIERS`
		`SERVICE_ENDPOINTS_MATCHING_PATTERN`

`serviceEndpoints`*	string minItems: 1	

ServiceEndpointsInSpecificTiers

Property Name	Type	Description
`serviceEndpointScope`*	string	Enums ALL_SERVICE_ENDPOINTS SPECIFIC_SERVICE_ENDPOINTS SERVICE_ENDPOINTS_IN_SPECIFIC_TIERS SERVICE_ENDPOINTS_MATCHING_PATTERN
`specificTiers`*	string minItems: 1	

ServiceEndpointsInSpecificTiers

Property Name	Type	Description
`serviceEndpointScope`*	string	Enums ALL_SERVICE_ENDPOINTS SPECIFIC_SERVICE_ENDPOINTS SERVICE_ENDPOINTS_IN_SPECIFIC_TIERS SERVICE_ENDPOINTS_MATCHING_PATTERN

`patternMatcher`*		**EntityMatchingPattern**
		Property Name / **Type** / **Description**
		`matchTo`* — string — Enums: `STARTS_WITH`, `ENDS_WITH`, `CONTAINS`, `EQUALS`, `MATCH_REG_EX`
		`matchValue`* — string, minLength: 1
		`shouldNot` — boolean, default: `false`

InformationPoints

Specific information points are considered for policy evaluation.

Property Name	Type	Description

`entityType`*	string	Enums
		`BUSINESS_TRANSACTION`
		`TIER_NODE`
		`ERRORS`
		`SERVICE_ENDPOINTS`
		`INFORMATION_POINTS`
		`DATABASES_IN_APPLICATION`
		`SERVERS_IN_APPLICATION`

`selectedInformationPoints`*		**SelectedInformationPoints** See the SelectedInformationPoints table below.

SelectedInformationPoints

Property Name	Type	Description
`informationPointScope`*	string	Enums ALL_INFORMATION_POINTS SPECIFIC_INFORMATION_POINTS INFORMATION_POINTS_MATCHING_PATTERN

AllInformationPoints

Property Name	Type	Description

`informationPointScope`*	string	Enums
		`ALL_INFORMATION_POINTS`
		`SPECIFIC_INFORMATION_POINTS`
		`INFORMATION_POINTS_MATCHING_PATTERN`

SpecificInformationPoints

Property Name	Type	Description

`informationPointScope`*	string	Enums
		`ALL_INFORMATION_POINTS`
		`SPECIFIC_INFORMATION_POINTS`
		`INFORMATION_POINTS_MATCHING_PATTERN`

`informationPoints`*	string minItems: 1	

InformationPointsMatchingPattern

Property Name	Type	Description

`informationPointScope`*	string	Enums
		`ALL_INFORMATION_POINTS`
		`SPECIFIC_INFORMATION_POINTS`
		`INFORMATION_POINTS_MATCHING_PATTERN`

`patternMatcher`*		**EntityMatchingPattern**
		Property Name / **Type** / **Description**
		`matchTo`* — string — Enums: `STARTS_WITH`, `ENDS_WITH`, `CONTAINS`, `EQUALS`, `MATCH_REG_EX`
		`matchValue`* — string, minLength: 1
		`shouldNot` — boolean, default: `false`

DatabasesInApplication

Specific databases associated with the application are considered for policy evaluation.

Property Name	Type	Description

`entityType`*	string	Enums
		`BUSINESS_TRANSACTION`
		`TIER_NODE`
		`ERRORS`
		`SERVICE_ENDPOINTS`
		`INFORMATION_POINTS`
		`DATABASES_IN_APPLICATION`
		`SERVERS_IN_APPLICATION`

selectedApplicationDatabases*		**SelectedApplicationDatabases** **Property Name** / **Type** / **Description** applicationDatabaseScope — string — Enums: ALL_APPLICATION_DATABASES, SPECIFIC_APPLICATION_DATABASES, APPLICATION_DATABASES_MATCHING_PATTERN

SelectedApplicationDatabases

Property Name	Type	Description
applicationDatabaseScope*	string	Enums ALL_APPLICATION_DATABASES SPECIFIC_APPLICATION_DATABASES APPLICATION_DATABASES_MATCHING_PATTERN

AllApplicationDatabases

Property Name	Type	Description
applicationDatabaseScope*	string	Enums ALL_APPLICATION_DATABASES SPECIFIC_APPLICATION_DATABASES APPLICATION_DATABASES_MATCHING_PATTERN

SpecificApplicationDatabases

Property Name	Type	Description
applicationDatabaseScope*	string	Enums ALL_APPLICATION_DATABASES SPECIFIC_APPLICATION_DATABASES APPLICATION_DATABASES_MATCHING_PATTERN
applicationDatabases*	string minItems: 1	

ApplicationDatabasesMatchingPattern

Property Name	Type	Description
applicationDatabaseScope*	string	Enums ALL_APPLICATION_DATABASES SPECIFIC_APPLICATION_DATABASES APPLICATION_DATABASES_MATCHING_PATTERN

`patternMatcher`*		**EntityMatchingPattern**
		Property Name / **Type** / **Description**
		`matchTo`* — string — Enums: `STARTS_WITH`, `ENDS_WITH`, `CONTAINS`, `EQUALS`, `MATCH_REG_EX`
		`matchValue`* — string, minLength: 1
		`shouldNot` — boolean, default: `false`

ServersInApplication

Specific servers associated with the application, are considered for the policy evaluation.

Property Name	Type	Description

`entityType`*	string	Enums
		`BUSINESS_TRANSACTION`
		`TIER_NODE`
		`ERRORS`
		`SERVICE_ENDPOINTS`
		`INFORMATION_POINTS`
		`DATABASES_IN_APPLICATION`
		`SERVERS_IN_APPLICATION`

`selectedServers`*	string	**ApplicationSelectedServers** **Property Name** / **Type** / **Description** `serversScope`* — string — Enums: `ALL_SERVERS_IN_APPLICATION`, `SPECIFIC_SERVERS_IN_APPLICATION`, `ALL_SERVERS_IN_SPECIFIC_TIERS`

ApplicationSelectedServers

Property Name	Type	Description

`serversScope`*	string	Enums
		`ALL_SERVERS_IN_APPLICATION`
		`SPECIFIC_SERVERS_IN_APPLICATION`
		`ALL_SERVERS_IN_SPECIFIC_TIERS`

AllServersInApplication

Property Name	Type	Description

`serversScope`*	string	Enums
		`ALL_SERVERS_IN_APPLICATION`
		`SPECIFIC_SERVERS_IN_APPLICATION`
		`ALL_SERVERS_IN_SPECIFIC_TIERS`

SpecificServersInApplication

Property Name	Type	Description

`serversScope`*	string	Enums
		`ALL_SERVERS_IN_APPLICATION`
		`SPECIFIC_SERVERS_IN_APPLICATION`
		`ALL_SERVERS_IN_SPECIFIC_TIERS`

`specificServers`*	string minLength: 1 minItems: 1	

AllServersInSpecificTiers

Property Name	Type	Description

`serversScope`*	string	Enums
		`ALL_SERVERS_IN_APPLICATION`
		`SPECIFIC_SERVERS_IN_APPLICATION`
		`ALL_SERVERS_IN_SPECIFIC_TIERS`

`specificTiers`*	string minItems: 1	

Events

Different types of events that trigger a policy.

Property Name	Type	Description

`healthRuleEvents`		**HealthRuleEvent**
		
		Events associated with health rules that trigger the policy.
		
		Property Name / **Type** / **Description**
		
		`healthRuleEventTypes`* — string, minItems: 1 — **HealthRuleEventType**
		Enums
		`HEALTH_RULE_CONTINUES_CRITICAL`
		`HEALTH_RULE_OPEN_CRITICAL`
		`HEALTH_RULE_OPEN_WARNING`
		`HEALTH_RULE_UPGRADED`
		`HEALTH_RULE_DOWNGRADED`
		`HEALTH_RULE_CONTINUES_WARNING`
		`HEALTH_RULE_CLOSE_WARNING`
		`HEALTH_RULE_CLOSE_CRITICAL`
		`HEALTH_RULE_CANCELED_WARNING`
		`HEALTH_RULE_CANCELED_CRITICAL`
		
		`healthRuleScope`* — string — Events associated with specific health rules or all health rules that trigger the policy.
		HealthRuleScopeType
		Property Name / **Type** / **Description**
		`healthRuleScopeType` — string — `ALL_HEALTH_RULES`, `SPECIFIC_HEALTH_RULES`

otherEvents	string	**OtherEventType** Enums CLR_CRASH APPLICATION_CRASH DEADLOCK RESOURCE_POOL_LIMIT APPLICATION_DEPLOYMENT APP_SERVER_RESTART APPLICATION_CONFIG_CHANGE AGENT_CONFIGURATION_ERROR APPLICATION_DISCOVERED TIER_DISCOVERED NODE_DISCOVERED MACHINE_DISCOVERED BT_DISCOVERED SERVICE_ENDPOINT_DISCOVERED BACKEND_DISCOVERED EUM_CLOUD_SYNTHETIC_HEALTHY_EVENT EUM_CLOUD_SYNTHETIC_WARNING_EVENT EUM_CLOUD_SYNTHETIC_CONFIRMED_WARNING_EVENT EUM_CLOUD_SYNTHETIC_ONGOING_WARNING_EVENT EUM_CLOUD_SYNTHETIC_ERROR_EVENT EUM_CLOUD_SYNTHETIC_CONFIRMED_ERROR_EVENT EUM_CLOUD_SYNTHETIC_ONGOING_ERROR_EVENT EUM_CLOUD_SYNTHETIC_PERF_HEALTHY_EVENT EUM_CLOUD_SYNTHETIC_PERF_WARNING_EVENT EUM_CLOUD_SYNTHETIC_PERF_CONFIRMED_WARNING_EVENT EUM_CLOUD_SYNTHETIC_PERF_ONGOING_WARNING_EVENT EUM_CLOUD_SYNTHETIC_PERF_CRITICAL_EVENT EUM_CLOUD_SYNTHETIC_PERF_CONFIRMED_CRITICAL_EVENT EUM_CLOUD_SYNTHETIC_PERF_ONGOING_CRITICAL_EVENT MOBILE_NEW_CRASH_EVENT SLOW VERY_SLOW STALL ERROR

HealthRuleEvent

Events associated with health rules that trigger the policy.

Property Name	Type	Description

`healthRuleEventTypes`*	string
	minItems: 1
		HealthRuleEventType
		Enums
		`HEALTH_RULE_CONTINUES_CRITICAL`
		`HEALTH_RULE_OPEN_CRITICAL`
		`HEALTH_RULE_OPEN_WARNING`
		`HEALTH_RULE_UPGRADED`
		`HEALTH_RULE_DOWNGRADED`
		`HEALTH_RULE_CONTINUES_WARNING`
		`HEALTH_RULE_CLOSE_WARNING`
		`HEALTH_RULE_CLOSE_CRITICAL`
		`HEALTH_RULE_CANCELED_WARNING`
		`HEALTH_RULE_CANCELED_CRITICAL`

`healthRuleScope`*	string	Events associated with specific health rules or all health rules that trigger the policy. healthRuleScopeType **Property Name** / **Type** / **Description** `healthRuleScopeType`* — string — Enums: `ALL_HEALTH_RULES`, `SPECIFIC_HEALTH_RULES`

HealthRuleScope

Events associated with specific health rules or all health rules that trigger the policy.

Property Name	Type	Description

`healthRuleScopeType`*	string	Enums
		`ALL_HEALTH_RULES`
		`SPECIFIC_HEALTH_RULES`

AllHealthRules

Events associated with all health rules within an application, trigger the policy.

Property Name	Type	Description

`healthRuleScopeType`*	string	Enums
		`ALL_HEALTH_RULES`
		`SPECIFIC_HEALTH_RULES`

AllHealthRules

Events associated with specific health rules within an application, trigger the policy.

Property Name	Type	Description

`healthRuleScopeType`*	string	Enums
		`ALL_HEALTH_RULES`
		`SPECIFIC_HEALTH_RULES`

`healthRules`*	string minItems: 1	

HealthRuleEventTypes

Property Name	Type	Description

`healthRuleEventTypes`*	string	Enums
		`HEALTH_RULE_CONTINUES_CRITICAL`
		`HEALTH_RULE_OPEN_CRITICAL`
		`HEALTH_RULE_OPEN_WARNING`
		`HEALTH_RULE_UPGRADED`
		`HEALTH_RULE_DOWNGRADED`
		`HEALTH_RULE_CONTINUES_WARNING`
		`HEALTH_RULE_CLOSE_WARNING`
		`HEALTH_RULE_CLOSE_CRITICAL`
		`HEALTH_RULE_CANCELED_WARNING`
		`HEALTH_RULE_CANCELED_CRITICAL`

OtherEvents

Property Name	Type	Description

AnomalyEvents

Events generated due to anomaly detection that trigger the policy.

Property Name	Type	Description

anomalyEvents	string minItems: 1	**AnomalyEventType** Enums ANOMALY_OPEN_WARNING ANOMALY_OPEN_CRITICAL ANOMALY_UPGRADED ANOMALY_DOWNGRADED ANOMALY_CLOSE_WARNING ANOMALY_CLOSE_CRITICAL ANOMALY_CANCELED_WARNING ANOMALY_CANCELED_CRITICAL

Action

A list of actions that are taken when a policy is triggered.

Property Name	Type	Description
actionName*	string	
actionType*	string	**ActionType** Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

SimpleActionType

A simple action that is taken when the policy is triggered.

Property Name	Type	Description
actionName*	string	

actionType*	string	**ActionType** Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

EmailActionType

An email is sent when the policy is triggered.

Property Name	Type	Description
actionName*	string	
actionType*	string	**ActionType** Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
notes	string	

ActionOnSpecifiedEntities

A simple action that is taken for specific entities when the policy is triggered.

Property Name	Type	Description
actionName*	string	

actionType*	string	**ActionType** Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
specifiedEntityActionDetails*	string	**SpecifiedEntityActionDetails** Property Name / Type / Description specifiedEntityActionScope — string — **SpecifiedEntityActionScope** Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES

SpecifiedEntityActionDetails

Property Name	Type	Description
specifiedEntityActionScope	string	**SpecifiedEntityActionScope** Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES

ActionOnPercentageEntities

The scope of entities on which the action is performed is set to 'percentage'.

Property Name	Type	Description
specifiedEntityActionScope	string	**SpecifiedEntityActionScope** Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES
value*	integer	

ActionOnPercentageEntities

The scope of entities on which the action is performed is set to **absolute**.

Property Name	Type	Description
specifiedEntityActionScope	string	**SpecifiedEntityActionScope** Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES
value*	integer	

ActionOnPercentageEntities

A list of nodes on which the action is performed.

Property Name	Type	Description
specifiedEntityActionScope	string	**SpecifiedEntityActionScope** Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES
nodes*	string minItems: 1	

PolicySummaryArray

Property Name	Type
id*	integer
name*	string minLength: 1
enabled*	boolean

KeyValuePair

Property Name	Type
key*	string
value*	string

PolicySummary

Property Name	Type
id*	integer
name*	string minLength: 1
enabled*	boolean

PolicyConfiguration

Property Name	Type
`enabled`*	boolean
`policyName`	string

EntityMatchingPattern

Entities that match the specified pattern.

Property Name	Type	Description

`matchTo`*	string	Enums
		`STARTS_WITH`
		`ENDS_WITH`
		`CONTAINS`
		`EQUALS`
		`MATCH_REG_EX`

`matchValue`*	string minLength: 1	
`shouldNot`	boolean default: `false`	

ErrorResponse

Property Name	Type
`statusCode`	integer
`message`	string

PropertyMatchCriteria

Property Name	Type	Description

`propertyMatchCriteria`	string
	default: ANY
		Enums
		`ANY`
		`ALL`

EntityMatchingPatternEnum

Property Name	Type	Description

`EntityMatchingPatternEnum`	string	Enums
		`STARTS_WITH`
		`ENDS_WITH`
		`CONTAINS`
		`EQUALS`
		`MATCH_REG_EX`

Actions API

This page describes the Action API methods you can use to create, configure, and manage various actions that are to be triggered as a response to events. Use this API to create these types of actions:

- Notification
- Diagnostic
- Remediation
- JIRA
- HTTP Request
- Custom

Syntax validation of the JSON payload is done when creating the action.

Create a New Action

Creates a new action with the specified JSON payload. See Property Details.

Resource URL

```
POST <controller_url>/controller/alerting/rest/v1
/applications/<application_id>/actions
```

Request/Response Format

JSON

Example

Retrieve a List of Actions for a Given Application

Returns the action ID, name, and description of the action pertaining to a specified application ID. See Property Details.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/actions
```

Response Format

JSON

Example Response

This example returns a list of actions pertaining to a given application ID.

```
[{"id":1,"name":"Thread Dump Action","actionType":"THREAD_DUMP"}]
```

Retrieve Details of a Specified Action

Retrieves the details of action with a specified ID. See Property Details.

Ensure that you provide a valid action ID.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/actions/{action-id}
```

Response Format

JSON

Example Response

This example retrieves the details of an action. See Download Examples.

```
{
 "id": 1,
 "actionType": "THREAD_DUMP",
 "name": "Thread Dump Action",
 "numberOfThreadDumps": 2,
 "intervalInMs": 500,
 "approvalBeforeExecution": {
 "requireApproval": true,
 "approverEmail": "email@website.com"
 }
}
```

Update an Action

Updates an existing action with a specified JSON payload. See Property Details.

> This request requires a complete JSON payload as input. Hence, it is recommended that you retrieve the JSON payload using, `GET /action/{action-id}` and update the required fields. Then, send the modified payload as part of a `PUT` request.

Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action/{action-id}
```

Request/Response Format

JSON

Example

This example updates an action. See Download Examples.

Delete an Action

Deletes an action with the specified ID. See Property Details.

> Ensure that you provide a valid action ID.

Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action/{action-id}
```

Response Codes

Code	Description
200	Fetched successfully
201	Created successfully
204	Deleted successfully
400	Bad request
401	Unauthorized
403	Forbidden

404	Resource not found
409	Already exists

Property Details

Action

Payload details for an action triggered as a response to an event.

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.
`actionType`*	string	The type of action triggered as a response to an event. **Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

SmsAction

An SMS notification is triggered as a response to an event.

> **Note**
>
> Ensure that you have configured the email and SMS settings for AppDynamics. See Configure the SMTP Server.

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.

`actionType`*	string	The type of action triggered as a response to an event. **Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
`phoneNumber`*	string pattern: `^\d{10,}$`	

EmailAction

An email notification is triggered as a response to an event.

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.
`actionType`*	string	The type of action triggered as a response to an event. **Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
`emails`*	string pattern `^[a-zA-Z0-9_.+-]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-.]+$`	

CustomEmailAction

An email notification based on a predefined template is triggered as a response to an event.

The template must already exist before you can use it in an action. See Email Templates.

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.
`actionType`*	string	The type of action triggered as a response to an event. **Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
`name`*	string minLength: 1	**ActionName** The name you assign to the action.
`emailTemplateName`*	string minLength: 1	The name of the template to be used for email notification.
`to`*	string pattern: `^[a-zA-Z0-9_.+-]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-.]+$`	**EmailArray** A list of email IDs.
`cc`*	string pattern: `^[a-zA-Z0-9_.+-]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-.]+$`	**EmailArray** A list of email IDs.
`bcc`*	string pattern: `^[a-zA-Z0-9_.+-]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-.]+$`	**EmailArray** A list of email IDs.
`customTemplateVariables`*	string	**KeyValuePair** Property Name / Type `key`* — string `value`* — string

ThreadDumpAction

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.

`actionType`*	string	The type of action triggered as a response to an event. **Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
`name`*	string minLength: 1	**ActionName** The name you assign to the action.
`numberOfThreadDumps`*	integer minimum: 1 maximum: 50	The number of thread dump samples you want the 'action' to collect.
`intervalInMs`*	integer minimum: 500	The time interval in milliseconds between the thread dump samples collected.
`approvalBeforeExecution`*		**ApprovalBeforeExecution** Mandate an approval before the thread dump action is started. **Property Name** / **Type** `requireApproval` — boolean `approverEmail` — string pattern: `^[a-zA-Z0-9_.+-]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-.]+$`

HttpRequestAction

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.

`actionType`*	string	The type of action triggered as a response to an event. **Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
`name`*	string minLength: 1	**ActionName** The name you assign to the action.
`httpRequestTemplateName`	string minLength: 1	An existing HTTP request template to be used in an HTTP request action.
`customTemplateVariables`		**KeyValuePair** **Property Name** / **Type** `key`* — string `value`* — string

CustomAction

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.
`actionType`*	string	The type of action triggered as a response to an event. **Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
`name`*	string minLength: 1	**ActionName** The name you assign to the action.
`customActionName`*	string minLength: 1	

ScriptAction

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.
`actionType`*	string	The type of action triggered as a response to an event. **Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
`name`*	string minLength: 1	**ActionName** The name you assign to the action.
`scriptPath`*	string minLength: 1	The relative path of the script. Enter the part after `${machine.agent.directory}/local-scripts/`
`logFilesPath`		The absolute path of the log file(s).
`scriptTimeout`*	string integer minimum: 1 maximum: 1440	
`approvalBeforeExecution`*		Mandate approval before the script action is started. **Property Name** / **Type** `requireApproval` — boolean `approverEmail` — string pattern: `^[a-zA-Z0-9_.+-]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-.]+$`

DiagnosticAction

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.

`actionType`*	string	The type of action triggered as a response to an event. **Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
`name`*	string minLength: 1	**ActionName** The name you assign to the action.
`duration`*	integer minimum: 1 maximum: 10	The duration in minutes to run the diagnostic session.
`snapshotRate`*	integer minimum: 1 maximum: 10	The rate at which diagnostic snapshots are captured.
`businessTransactions`*	string	Runs the diagnostic session on the specified Business Transactions. **Enums** ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

JiraAction

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.
`actionType`*	string	The type of action triggered as a response to an event. **Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
`name`*	string minLength: 1	**ActionName** The name you assign to the action.

`jiraActionDetails`*	string	**jiraActionType** The JIRA action type triggered as a response to an event. **Enums** CREATE_JIRA UPDATE_JIRA

JiraActionDetails

The JIRA action type triggered as a response to an event.

Property Name	Type	Description and Valid Values
`jiraActionType`	string	**Enums** CREATE_JIRA UPDATE_JIRA

JiraCreateAction

The Jira action type `create JIRA` is triggered as a response to an event.

Property Name	Type	Description and Valid Values
`jiraActionType`*	string	**Enums** CREATE_JIRA UPDATE_JIRA
`assignee`*	string minLength: 1	
`project`*	string minLength: 1	
`priority`*	string minLength: 1	
`issueType`*	string minLength: 1	

JiraUpdateAction

The Jira action type `update JIRA` is triggered as a response to an event.

Property Name	Type	Description and Valid Values
`jiraActionType`*	string	**Enums** CREATE_JIRA UPDATE_JIRA
`changePriorityTo`*	string minLength: 1	

ActionName

The name you assign to the action.

Property Name	Type	Description and Valid Values
`ActionName`	string minLength: 1	

ApprovalBeforeExecution

Mandate email approval before the action execution is initiated.

Property Name	Type
`requireApproval`	boolean
`approverEmail`	string pattern: `^[a-zA-Z0-9_.+-]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-.]+$`

BusinessTransactions

Run the diagnostic session on the specified Business Transactions.

Property Name	Type	Description and Valid Values
`businessTransactionScope`	string	**Enums** ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

AllAffectedBusinessTransactions

Run the diagnostic session on all Business Transactions.

Property Name	Type	Description and Valid Values
`businessTransactionScope`	string	**Enums** ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

SpecificBusinessTransactions

Run the diagnostic session on the Business Transactions that match the specified criteria.

Property Name	Type	Description and Valid Values
`businessTransactionScope`	string	**Enums** ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS
`businessTransactionNames`*	string minItems: 1	

EmailArray

Property Name	Type
`EmailArray`	string pattern: `^[a-zA-Z0-9_.+-]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-.]+$`

KeyValuePair

Property Name	Type
`key`*	string
`value`*	string

Email

Property Name	Type
`Email`	string pattern: ^[a-zA-Z0-9_.+-]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-.]+$

ActionSummaryArray

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.
`name`*	string minLength: 1	**ActionName** The name you assign to the action.
`actionType`*	string	The type of action triggered as a response to an event. **Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

ActionSummary

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.
`name`*	string minLength: 1	**ActionName** The name you assign to the action.

`actionType`*	string	The type of action triggered as a response to an event. **Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

StringIntegerPair

Property Name	Type
`id`	integer
`name`*	string minLength: 1

JiraActionTypeEnum

Property Name	Type	Description and Valid Values
`jiraActionTypeEnum`	string	CREATE_JIRA UPDATE_JIRA

BusinessTransactionScopeEnum

Property Name	Type	Description and Valid Values
`BusinessTransactionScopeEnum`	string	ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

ActionTypeEnum

Property Name	Type	Description and Valid Values
`ActionTypeEnum`	string	**Enums** SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

ErrorResponse

Property Name	Type
`statusCode`	integer
`message`	string

***This property is required.**

Download actions_api.zip for a set of examples that help you configure an action.

Download SWAGGER YAML file

Download the Swagger actions_openapi.yml.

Email Digest API

This page provides Email Digest API methods you can use to report a summary of a specific event(s) to a recipient list configured on a health rule schedule. Email digests are triggered as a response to a health rule violation event.

> ⚠ Syntax validation of the JSON payload is done when creating the email digest.

Create a New Email Digest

Creates a new email digest with the specified JSON payload. See Property Details.

Resource URL

```
POST <controller_url>/controller/alerting/rest/v1
/applications/<application_id>/email-digests
```

Request/Response Format

JSON

Example

Retrieve a List of Email Digests for an Application

This API returns the email digest names, IDs, and enable flag details pertaining to the specified application. See Property Details.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests
```

Response Format

JSON

Example Response

This example returns a list of email digests pertaining to the specified application ID.

```
[
  {
    "id": 12,
    "name": "some email digest name",
    "enabled": true
  }
]
```

Retrieve Details of an Email Digest

Retrieves the details of an email digest with a specified ID. See Property Details.

> ⓘ Ensure that you provide a valid email digest ID.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}
```

Response Format

JSON

Example Response

```
{
  "id": 0,
  "name": "My new email digest",
  "enabled": true,
  "executeActionsInBatch": true,
  "frequency": 2,
  "actions": [
    {
      "actionName": "My action 1",
      "actionType": "SMS"
    }
  ],
  "events": {
    "healthRuleEvents": {
      "healthRuleEventTypes": [
        "HEALTH_RULE_CONTINUES_CRITICAL",
        "HEALTH_RULE_UPGRADED"
      ],
      "healthRuleScope": {
        "healthRuleScopeType": "ALL_HEALTH_RULES"
      }
    },
    "otherEvents": [
      "CLR_CRASH",
      "DEADLOCK"
    ],
    "anomalyEvents": [
      "ANOMALY_OPEN_WARNING",
      "ANOMALY_CLOSE_CRITICAL"
    ],
    "customEvents": [
      {
        "eventName": "string",
        "propertyMatchCriteria": "ANY",
        "keyValuePairArray": [
          {
            "key": "key1",
            "value": "value1"
          }
        ]
      }
    ]
  },
  "selectedEntities": {
    "selectedEntityType": "ANY_ENTITY"
  }
}
```

Update an Email Digest

Updates an existing email digest with a specified JSON payload. See Property Details.

This request requires a complete JSON payload as input. It is recommended that you retrieve the JSON payload using, `GET email-digests/{email-digest-id}` and update the required fields. Then, send the modified payload as part of `PUT` request.

Resource URL

`PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}`

Request/Response Format

JSON

Example

Delete an Email Digest

Deletes an email digest with the specified ID. See Property Details.

> Ensure that you provide a valid email digest ID.

Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}
```

Update one or more properties of an Email Digest

Updates the properties of an existing email digest with a specified JSON payload. See Property Details

Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}
/configuration
```

Request/Response Format

JSON

Example

Response Codes

Code	Description
200	Fetched successfully
201	Created successfully
204	Deleted successfully
400	Bad request
401	Unauthorized
403	Forbidden
404	Resource not found
409	Already exists

Property Details

Email Digest

Payload details of an email digest.

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.
`name`*	string Minimum length: 1	Name of the email digest.

<table>
<tr><td>enabled</td><td>boolean

Default value: true</td><td>Sets the email digest to enabled/disabled state.</td></tr>
<tr><td>frequency</td><td>integer
minimum: 1
maximum: 168</td><td>The frequency in hours at which emails are sent as a response to an event.</td></tr>
<tr><td>actions*</td><td>minItems: 1</td><td>Action

Describes the predefined, reusable, and automated response to an event to be taken when the event is triggered.

<table><tr><th>Property Name</th><th>Type</th><th>Description</th></tr><tr><td>actionName*</td><td>string</td><td>Name of the action defined for an email digest.</td></tr><tr><td>actionType*</td><td>string</td><td>ActionTypeEnum

Creates the following types of actions:

SMS

EMAIL

CUSTOM_EMAIL

THREAD_DUMP

HTTP_REQUEST

CUSTOM

RUN_SCRIPT_ON_NODES

DIAGNOSTIC_BUSINESS_TRANSACTIONS

CREATE_UPDATE_JIRA</td></tr></table></td></tr>
<tr><td>events*</td><td></td><td>Events

Describes the events that trigger the email digest.

<table><tr><th>Property Name</th><th>Description</th></tr></table></td></tr>
</table>

healthRuleEvents	**HealthRuleEvents** Describes the trigger event type(s) generated due to health rule issues. **Property Name** / **Description** healthRuleEventTypes* — HealthRuleEventTypes Describes the event type related to health rule that triggers the email digest. minItems: 1 HealthRuleEventTypeEnum HEALTH_RULE_CONTINUES_CRITICAL HEALTH_RULE_OPEN_CRITICAL HEALTH_RULE_OPEN_WARNING HEALTH_RULE_UPGRADED HEALTH_RULE_DOWNGRADED HEALTH_RULE_CONTINUES_WARNING HEALTH_RULE_CLOSE_WARNING HEALTH_RULE_CLOSE_CRITICAL HEALTH_RULE_CANCELED_WARNING HEALTH_RULE_CANCELED_CRITICAL healthRuleScope* — **HealthRuleScope** Describes the scope of the health rule based on which, the events are triggered. Enums ALL_HEALTH_RULES SPECIFIC_HEALTH_RULES

otherEvents	**OtherEvents** Describes the trigger event type(s) generated due to other issues.

Property Name	Description
OtherEventType	Lists the event type that triggers an action. Enums CLR_CRASH APPLICATION_CRASH DEADLOCK RESOURCE_POOL_LIMIT APPLICATION_DEPLOYMENT APP_SERVER_RESTART APPLICATION_CONFIG_CHANGE AGENT_CONFIGURATION_ERROR APPLICATION_DISCOVERED TIER_DISCOVERED NODE_DISCOVERED MACHINE_DISCOVERED BT_DISCOVERED SERVICE_ENDPOINT_DISCOVERED BACKEND_DISCOVERED EUM_CLOUD_SYNTHETIC_HEALTHY_EVENT EUM_CLOUD_SYNTHETIC_WARNING_EVENT EUM_CLOUD_SYNTHETIC_CONFIRMED_WARNING_EVENT EUM_CLOUD_SYNTHETIC_ONGOING_WARNING_EVENT EUM_CLOUD_SYNTHETIC_ERROR_EVENT EUM_CLOUD_SYNTHETIC_CONFIRMED_ERROR_EVENT EUM_CLOUD_SYNTHETIC_ONGOING_ERROR_EVENT EUM_CLOUD_SYNTHETIC_PERF_HEALTHY_EVENT EUM_CLOUD_SYNTHETIC_PERF_WARNING_EVENT EUM_CLOUD_SYNTHETIC_PERF_CONFIRMED_WARNING_EVENT EUM_CLOUD_SYNTHETIC_PERF_ONGOING_WARNING_EVENT EUM_CLOUD_SYNTHETIC_PERF_CRITICAL_EVENT EUM_CLOUD_SYNTHETIC_PERF_CONFIRMED_CRITICAL_EVENT EUM_CLOUD_SYNTHETIC_PERF_ONGOING_CRITICAL_EVENT MOBILE_NEW_CRASH_EVENT, SLOW, VERY_SLOW, STALL ERROR

<tr><td>SelectedEntityType*</td><td>string</td><td>Enums
ANY_ENTITY
SPECIFIC_ENTITIES</td></tr>
</table>

</td></tr>
</table>

SelectedEntityType

Scope of entities considered for the email digest.

Property Name	Type	Description

`SelectedEntityType`*	string	Enums
		`ANY_ENTITY`
		`SPECIFIC_ENTITIES`

SpecificEntities

Scope of specific entities considered for the email digest.

Property Name	Type	Description
`selectedEntityType`*	string	Enum `SPECIFIC_ENTITIES`
`entities`	minItems: 1	**Entity** **Property name** / **Type** / **Description** `entityType`* — string, minItems: 1 — Enums: `BUSINESS_TRANSACTION`, `TIER_NODE`, `ERRORS`, `SERVICE_ENDPOINTS`, `INFORMATION_POINTS`, `DATABASES_IN_APPLICATION`, `SERVERS_IN_APPLICATION`, `PAGE`, `AJAX_REQUEST`, `SYNTHETIC_JOBS`, `IFRAME`, `VIRTUAL_PAGE`, `MOBILE_APPS`, `MOBILE_NETWORK_REQUESTS`

Entity

Property name	Type	Description

`entityType`*	string
	minItems: 1
		Enums
		`BUSINESS_TRANSACTION`
		`TIER_NODE`
		`ERRORS`
		`SERVICE_ENDPOINTS`
		`INFORMATION_POINTS`
		`DATABASES_IN_APPLICATION`
		`SERVERS_IN_APPLICATION`
		`PAGE`
		`AJAX_REQUEST`
		`SYNTHETIC_JOBS`
		`IFRAME`
		`VIRTUAL_PAGE`
		`MOBILE_APPS`
		`MOBILE_NETWORK_REQUESTS`

AnyEntity

Scope of entities considered for the email digest.

Property Name	Type	Description
`SelectedEntityType`*	string	Enums `ANY_ENTITY`

SelectedMobileApps

Property name	Type	Description

`mobileAppsScope`*	string	Enums
		`ALL_MOBILE_APPS`
		`SPECIFIC_MOBILE_APPS`
		`MOBILE_APPS_MATCHING_PATTERN`

AllMobileApps

Property name	Type	Description
`mobileAppsScope`*	string	Enum `ALL_MOBILE_APPS`

SpecificMobileApps

Property name	Type	Description
`mobileAppsScope`*	string	Enum `SPECIFIC_MOBILE_APPS`
`mobileApps`	string minItems: 1	

MobileAppsMatchingPattern

Property name	Type	Description
`mobileAppsScope`*	string	Enum MOBILE_APPS_MATCHING_PATTERN

`patternMatcher`*		**EntityMatchingPattern**
		Business transactions that match the specified pattern are included in the scope.
		
		Property Name / **Type** / **Description**
		`matchTo`* — Enums: `STARTS_WITH`, `ENDS_WITH`, `CONTAINS`, `EQUALS`, `MATCH_REG_EX`
		`matchValue`* — string, minLength: 1
		`shouldNot` — boolean, default: `false`

MobileNetworkRequests

Property name	Type	Description
`entityType`*	string minItems: 1	Enum `MOBILE_NETWORK_REQUESTS`

`selectedMobileNetworkRequests`*	string	**MobileNetworkRequestsScope**
		Enums
		`ALL_MOBILE_NETWORK_REQUESTS`
		`SPECIFIC_MOBILE_NETWORK_REQUESTS`
		`SPECIFIC_MOBILE_APPS_NETWORK_REQUESTS`
		`MOBILE_NETWORK_REQUESTS_MATCHING_PATTERN`

SelectedMobileNetworkRequests

Property name	Type	Description

`mobileNetworkRequestsScope`*	string	**MobileNetworkRequestsScope**
		Enums
		`ALL_MOBILE_NETWORK_REQUESTS`
		`SPECIFIC_MOBILE_NETWORK_REQUESTS`
		`SPECIFIC_MOBILE_APPS_NETWORK_REQUESTS`
		`MOBILE_NETWORK_REQUESTS_MATCHING_PATTERN`

AllMobileNetworkRequests

The scope of mobile network requests is `ALL_MOBILE_NETWORK_REQUESTS`.

Property name	Type	Description
`mobileNetworkRequestsScope`*	string	**MobileNetworkRequestsScope** Enum `ALL_MOBILE_NETWORK_REQUESTS`

SpecificMobileNetworkRequests

The scope of mobile network requests is `SPECIFIC_MOBILE_NETWORK_REQUESTS`.

Property name	Type	Description
`mobileNetworkRequestsScope`*	string	**MobileNetworkRequestsScope** Enum `SPECIFIC_MOBILE_NETWORK_REQUESTS`
`mobileNetworkRequests`*	string minItems:1	

SpecificMobileAppsNetworkRequests

The scope of mobile network requests is `SPECIFIC_MOBILE_APPS_NETWORK_REQUESTS`.

Property name	Type	Description
`mobileNetworkRequestsScope`*	string	**MobileNetworkRequestsScope** Enum `SPECIFIC_MOBILE_APPS_NETWORK_REQUESTS`
`mobileApps`*	string minItems:1	

MobileNetworkRequestsMatchingPattern

The scope of mobile network requests is `MOBILE_NETWORK_REQUESTS_MATCHING_PATTERN`.

Property name	Type	Description
`mobileNetworkRequestsScope`*	string	**MobileNetworkRequestsScope** Enum `MOBILE_NETWORK_REQUESTS_MATCHING_PATTERN`

patternMatcher*		**EntityMatchingPattern** Business transactions that match the specified pattern are included in the scope. **Property Name** / **Type** / **Description** matchTo* / / Enums: STARTS_WITH, ENDS_WITH, CONTAINS, EQUALS, MATCH_REG_EX matchValue* / string, minLength: 1 / shouldNot / boolean, default: false /

Page

The scope of entities considered for the email digest is page for EUM applications.

Property name	Type	Description
entityType*	string minItems: 1	Enum PAGE
selectedPages*	string	**pageScope** Enums ALL_PAGES SPECIFIC_PAGES PAGES_MATCHING_PATTERN

SelectedPages

The scope of entities considered for the email digest is selected pages for EUM applications.

Property name	Type	Description
pageScope*	string	Enums ALL_PAGES SPECIFIC_PAGES PAGES_MATCHING_PATTERN

AllPages

The scope of entities considered for the email digest is ALL_PAGES for EUM applications.

Property name	Type	Description
pageScope*	string	Enum ALL_PAGES

SpecificPages

The scope of entities considered for the email digest is `SPECIFIC_PAGES` for EUM applications.

Property name	Type	Description
`pageScope`*	string	Enum `SPECIFIC_PAGES`
`pages`*	array of strings minItems: 1	

PagesMatchingPattern

The scope of entities considered for the email digest is `SPECIFIC_PAGES` for EUM applications.

Property name	Type	Description
`pageScope`*	string	Enum `PAGES_MATCHING_PATTERN`
`pages`*		**EntityMatchingPattern** Business transactions that match the specified pattern are included in the scope. **Property Name** / **Type** / **Description** `matchTo`* / / Enums: `STARTS_WITH`, `ENDS_WITH`, `CONTAINS`, `EQUALS`, `MATCH_REG_EX` `matchValue`* / string, minLength: 1 / `shouldNot` / boolean, default: `false` /

VirtualPage

Property name	Type	Description
`entityType`*	string minItems: 1	Enum `VIRTUAL_PAGE`

`selectedVirtualPages`*	string	**SelectedVirtualPages**
		Enums
		`ALL_VIRTUAL_PAGES`
		`SPECIFIC_VIRTUAL_PAGES`
		`VIRTUAL_PAGES_MATCHING_PATTERN`

SelectedVirtualPages

Property name	Type	Description

`virtualPageScope`*	string	**SelectedVirtualPages**
		Enums
		`ALL_VIRTUAL_PAGES`
		`SPECIFIC_VIRTUAL_PAGES`
		`VIRTUAL_PAGES_MATCHING_PATTERN`

AllVirtualPages

Property name	Type	Description
`virtualPageScope`*	string	**SelectedVirtualPages** Enum `ALL_VIRTUAL_PAGES`

SpecificVirtualPages

Property name	Type	Description
`virtualPageScope`*	string	**SelectedVirtualPages** Enum `SPECIFIC_VIRTUAL_PAGES`
`virtualPages`	string minItems: 1	

VirtualPagesMatchingPattern

Property name	Type	Description
`virtualPageScope`*	string	**SelectedVirtualPages** Enum `VIRTUAL_PAGES_MATCHING_PATTERN`

patternMatcher		**EntityMatchingPattern** Business transactions that match the specified pattern are included in the scope. **Property Name** / **Type** / **Description** matchTo* — Enums: STARTS_WITH, ENDS_WITH, CONTAINS, EQUALS, MATCH_REG_EX matchValue* — string, minLength: 1 shouldNot — boolean, default: false

SyntheticJob

Property name	Type	Description
entityType*	string minItems: 1	Enum SYNTHETIC_JOBS
selectedSyntheticJobs*	string	**SelectedSyntheticJobs** Enums ALL_SYNTHETIC_JOBS SPECIFIC_SYNTHETIC_JOBS SYNTHETIC_JOBS_MATCHING_PATTERN

SelectedSyntheticJobs

Property name	Type	Description
syntheticJobScope*	string	**Enums** ALL_SYNTHETIC_JOBS SPECIFIC_SYNTHETIC_JOBS SYNTHETIC_JOBS_MATCHING_PATTERN

AllSyntheticJobs

Property name	Type	Description
syntheticJobScope*	string	**Enum** ALL_SYNTHETIC_JOBS

SpecificSyntheticJobs

Property name	Type	Description
`syntheticJobScope`*	string	**Enum** `SPECIFIC_SYNTHETIC_JOBS`
`syntheticJobs`*	string minItems: 1	

SyntheticJobsMatchingPattern

Property name	Type	Description
`syntheticJobScope`*	string	**Enum** `SYNTHETIC_JOBS_MATCHING_PATTERN`
`patternMatcher`*		**EntityMatchingPattern** Business transactions that match the specified pattern are included in the scope. **Property Name** / **Type** / **Description** matchTo* — Enums: `STARTS_WITH`, `ENDS_WITH`, `CONTAINS`, `EQUALS`, `MATCH_REG_EX` matchValue* — string, minLength: 1 shouldNot — boolean, default: `false`

IFrame

Property name	Type	Description
`entityType`*	string minItems: 1	Enum `IFRAME`

`selectedIFrames`*	string	**iFrameScope**
		Enums
		`ALL_IFRAMES`
		`SPECIFIC_IFRAMES`
		`IFRAMES_MATCHING_PATTERN`

SelectedIFrames

Property name	Type	Description

`iFrameScope`*	string	Enums
		`ALL_IFRAMES`
		`SPECIFIC_IFRAMES`
		`IFRAMES_MATCHING_PATTERN`

AllIFrames

Property name	Type	Description
`iFrameScope`*	string	Enum `ALL_IFRAMES`

SpecificIFrames

Property name	Type	Description
`iFrameScope`*	string	Enum `SPECIFIC_IFRAMES`
`iFrames`*	string minItems: 1	

IFramesMatchingPattern

Property name	Type	Description
`iFrameScope`*	string	Enum `IFRAMES_MATCHING_PATTERN`
`patternMatcher`*		**EntityMatchingPattern** Business transactions that match the specified pattern are included in the scope.

Property Name	Type	Description

`matchTo`*		Enums
		`STARTS_WITH`
		`ENDS_WITH`
		`CONTAINS`
		`EQUALS`
		`MATCH_REG_EX`

`matchValue`*	string minLength: 1	
`shouldNot`	boolean default: `false`	

AjaxRequest

Property name	Type	Description

`entityType`*	string minItems: 1	Enum `AJAX_REQUEST`

`selectedAjaxRequests`*	string	**AjaxRequestsScope**
		Enums
		`ALL_AJAX_REQUESTS`
		`SPECIFIC_AJAX_REQUESTS`
		`AJAX_REQUESTS_MATCHING_PATTERN`

SelectedAjaxRequests

Property name	Type	Description

`selectedAjaxRequests`*	string	**Enums**
		`ALL_AJAX_REQUESTS`
		`SPECIFIC_AJAX_REQUESTS`
		`AJAX_REQUESTS_MATCHING_PATTERN`

AllAjaxRequests

Property name	Type	Description
`selectedAjaxRequests`*	string	**Enum** `ALL_AJAX_REQUESTS`

SpecificAjaxRequests

Property name	Type	Description
`selectedAjaxRequests`*	string	**Enum** `SPECIFIC_AJAX_REQUESTS`
`ajaxRequests`*	array of strings minItems: 1	

AjaxRequestsMatchingPattern

Property name	Type	Description
`ajaxRequestScope`*	string	**Enum** `AJAX_REQUESTS_MATCHING_PATTERN`

`patternMatcher`*		**EntityMatchingPattern**
		Business transactions that match the specified pattern are included in the scope.
		Property Name / **Type** / **Description**
		`matchTo`* — Enums: `STARTS_WITH`, `ENDS_WITH`, `CONTAINS`, `EQUALS`, `MATCH_REG_EX`
		`matchValue`* — string, minLength: 1
		`shouldNot` — boolean, default: `false`

BusinessTransaction

All entities of type `BUSINESS_TRANSACTION` are considered for email digest.

Property Name	Type	Description
`entityType`*	string	Enum BUSINESS_TRANSACTION
`selectedBusinessTransactions`*	string	**BusinessTransactionScope** **Property Name** / **Description** `businessTransactionScope`* — Enums: `ALL_BUSINESS_TRANSACTIONS`, `SPECIFIC_BUSINESS_TRANSACTIONS`, `BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS`, `BUSINESS_TRANSACTIONS_MATCHING_PATTERN`

SelectedBusinessTransactions

Property Name	Description

`businessTransactionScope`*	Enums
	`ALL_BUSINESS_TRANSACTIONS`
	`SPECIFIC_BUSINESS_TRANSACTIONS`
	`BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS`
	`BUSINESS_TRANSACTIONS_MATCHING_PATTERN`

AllBusinessTransactions

The scope of business transactions is set to all business transactions.

Property Name	Description

`businessTransactionScope`*	Enum `ALL_BUSINESS_TRANSACTIONS`

SpecificBusinessTransactions

The scope of business transactions is set to select business transactions.

Property Name	Type	Description
`businessTransactionScope`*	string	Enum `SPECIFIC_BUSINESS_TRANSACTIONS`
`businessTransactions`*	array of strings minItems: 1	Name(s) of the business transactions.

BusinessTransactionsInSpecificTiers

The scope of business transactions is set to business transactions associated with a specific tier.

Property Name	Type	Description
`businessTransactionScope`*		Enum `BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS`
`specificTiers`*	string minItems: 1	Name of the specified tier.

BusinessTransactionsMatchingPattern

The scope of business transactions is set to business transactions that match a specific pattern.

<table>
<tr><th>Property Name</th><th>Description</th></tr>
<tr><td><code>businessTransactionScope</code>*</td><td>Enum
<code>BUSINESS_TRANSACTIONS_MATCHING_PATTERN</code></td></tr>
<tr><td><code>patternMatcher</code>*</td><td>EntityMatchingPattern
Business transactions that match the specified pattern are included in the scope.
<table>
<tr><th>Property Name</th><th>Type</th><th>Description</th></tr>
<tr><td><code>matchTo</code>*</td><td></td><td>Enums
<code>STARTS_WITH</code>
<code>ENDS_WITH</code>
<code>CONTAINS</code>
<code>EQUALS</code>
<code>MATCH_REG_EX</code></td></tr>
<tr><td><code>matchValue</code>*</td><td>string
minLength: 1</td><td></td></tr>
<tr><td><code>shouldNot</code></td><td>boolean
default: <code>false</code></td><td></td></tr>
</table>
</td></tr>
</table>

SelectedTierOrNodeEntities

Specific tiers or nodes are considered for the email digest.

Property Name	Type	Description
`entityType`*	string	Enum `TIER_NODE`

`tierOrNode`*	string
	minLength: 1
		TierOrNode
		Property Name / **Type** / **Description**
		`tierOrNodeScope`* — string — **Enums**
		`TIER_SELECTED_ENTITIES`
		`NODE_SELECTED_ENTITIES`

TierOrNode

Property Name	Type	Description

`tierOrNodeScope`*	string	**Enums**
		`TIER_SELECTED_ENTITIES`
		`NODE_SELECTED_ENTITIES`

TierSelectedEntities

Property Name	Type	Description
`tierOrNodeScope`*	string	**Enums** `TIER_SELECTED_ENTITIES`

`selectedTiers`*		**SelectedTiers**
		Property Name / **Type** / **Description**
		`selectedTierScope`* — string — Enums
		`ALL_TIERS`
		`SPECIFIC_TIERS`

SelectedTiers

Property Name	Type	Description

`selectedTierScope`*	string	Enums
		`ALL_TIERS`
		`SPECIFIC_TIERS`

AllTiers

Property Name	Type	Description
`selectedTierScope`*	string	Enum `ALL_TIERS`

SpecificTiers

Property Name	Type	Description
`selectedTierScope`*	string	Enum `SPECIFIC_TIERS`
`tiers`*	string minItems: 1	Name(s) of the specified tier(s).

NodeSelectedEntities

Property Name	Type	Description
`tierOrNodeScope`*	string	Enum NODE_SELECTED_ENTITIES
`typeofNode`*	string	Enums ALL_NODES JAVA_NODES DOT_NET_NODES PHP_NODES
`selectedNodes`*		**SelectedNodes** **Property Name** / **Type** / **Description** `selectedNodeScope`* — string — Enums: `ALL_NODES`, `SPECIFIC_NODES`, `NODES_OF_SPECIFIC_TIERS`, `NODES_MATCHING_PATTERN`, `NODE_PROPERTY_VARIABLE_MATCHER`

SelectedNodes

Property Name	Type	Description

`selectedNodeScope`*	string	Enums
		`ALL_NODES`
		`SPECIFIC_NODES`
		`NODES_OF_SPECIFIC_TIERS`
		`NODES_MATCHING_PATTERN`
		`NODE_PROPERTY_VARIABLE_MATCHER`

AllNodes

Property Name	Type	Description
`selectedNodeScope`*	string	Enum `ALL_NODES`

SpecificNodes

Property Name	Type	Description
`selectedNodeScope`*	string	Enum `SPECIFIC_NODES`
`nodes`*	string minItems: 1	Name(s) of the specified node(s).

NodesOfSpecificTiers

Property Name	Type	Description
`selectedNodeScope`*	string	Enum `NODES_OF_SPECIFIC_TIERS`
`specificTiers`*	string minItems: 1	Name(s) of tier with the associated nodes.

NodesMatchingPattern

Property Name	Type	Description
`selectedNodeScope`*	string	Enum `NODES_MATCHING_PATTERN`
`patternMatcher`*		**EntityMatchingPattern** Nodes that match a specified pattern are included in the scope.

Property Name	Type	Description

`matchTo`*		Enums
		`STARTS_WITH`
		`ENDS_WITH`
		`CONTAINS`
		`EQUALS`
		`MATCH_REG_EX`

`matchValue`*	string minLength: 1	
`shouldNot`	boolean default: `false`	

NodePropertyVariableMatcher

Property Name	Type	Description
`selectedNodeScope`*	string	Enum `NODE_PROPERTY_VARIABLE_MATCHER`

propVarPairs*	minItems: 1	**propVarPairs** **Property Name** / **Type** / **Description** propertyType* — string — NodePropertyTypeEnum: META, ENV, JVM name* — string, minLength: 1 value* — string, minLength: 1

Errors

Specific errors are considered for email digest.

Property Name	Type	Description
entityType*	string	Enum ERRORS
selectedErrors*		**SelectedErrors** **Property Name** / **Type** / **Description** errorScope* — string — Enums: ALL_ERRORS, SPECIFIC_ERRORS, ERRORS_OF_SPECIFIC_TIERS, ERRORS_MATCHING_PATTERN

SelectedErrors

Property Name	Type	Description
errorScope*	string	Enums ALL_ERRORS SPECIFIC_ERRORS ERRORS_OF_SPECIFIC_TIERS ERRORS_MATCHING_PATTERN

AllErrors

Property Name	Type	Description
errorScope*	string	Enum ALL_ERRORS

SpecificErrors

Property Name	Type	Description
`errorScope`*	string	Enum `SPECIFIC_ERRORS`
`errors`*	string minItems: 1 Example: `NullPointerException`	

ErrorsOfSpecificTiers

Property Name	Type	Description
`errorScope`*	string	Enum `ERRORS_OF_SPECIFIC_TIERS`
`specificTiers`*	string minItems: 1	

ErrorsMatchingPattern

Property Name	Type	Description
`errorScope`*	string	Enum ERRORS_MATCHING_PATTERN
`patternMatcher`*		**EntityMatchingPattern** See table below

Property Name	Type	Description

`matchTo`*	string	Enums
		`STARTS_WITH`
		`ENDS_WITH`
		`CONTAINS`
		`EQUALS`
		`MATCH_REG_EX`

`matchValue`*	string minLength: 1	
`shouldNot`	boolean default: `false`	

ServiceEndpoints

Specific service endpoints are considered for email digest.

Property Name	Type	Description
`entityType`*	string	Enum `SERVICE_ENDPOINTS`

`selectedServiceEndpoints`*		**SelectedServiceEndpoints** **Property Name** / **Type** / **Description** `serviceEndpointScope`* — string — Enums: `ALL_SERVICE_ENDPOINTS`, `SPECIFIC_SERVICE_ENDPOINTS`, `SERVICE_ENDPOINTS_IN_SPECIFIC_TIERS`, `SERVICE_ENDPOINTS_MATCHING_PATTERN`

SelectedServiceEndpoints

Property Name	Type	Description

`serviceEndpointScope`*	string	Enums
		`ALL_SERVICE_ENDPOINTS`
		`SPECIFIC_SERVICE_ENDPOINTS`
		`SERVICE_ENDPOINTS_IN_SPECIFIC_TIERS`
		`SERVICE_ENDPOINTS_MATCHING_PATTERN`

AllServiceEndpoints

Property Name	Type	Description
`serviceEndpointScope`*	string	Enums `ALL_SERVICE_ENDPOINTS`

SpecificServiceEndpoints

Property Name	Type	Description
`serviceEndpointScope`*	string	Enum `SPECIFIC_SERVICE_ENDPOINTS`
`serviceEndpoints`*	string minItems: 1	

ServiceEndpointsInSpecificTiers

Property Name	Type	Description
`serviceEndpointScope`*	string	Enum `SERVICE_ENDPOINTS_IN_SPECIFIC_TIERS`
`specificTiers`*	string minItems: 1	

ServiceEndpointsMatchingPattern

Property Name	Type	Description

`serviceEndpointScope`*	string	Enum `SERVICE_ENDPOINTS_MATCHING_PATTERN`

`patternMatcher`*		**EntityMatchingPattern**
		Property Name / **Type** / **Description**
		`matchTo`* — string — Enums: `STARTS_WITH`, `ENDS_WITH`, `CONTAINS`, `EQUALS`, `MATCH_REG_EX`
		`matchValue`* — string, minLength: 1
		`shouldNot` — boolean, default: `false`

InformationPoints

Specific information points are considered for email digest.

Property Name	Type	Description
`entityType`*	string	Enum INFORMATION_POINTS
`selectedInformationPoints`*		**SelectedInformationPoints** **Property Name** / **Type** / **Description** `informationPointScope`* — string — Enums: `ALL_INFORMATION_POINTS`, `SPECIFIC_INFORMATION_POINTS`, `INFORMATION_POINTS_MATCHING_PATTERN`

SelectedInformationPoints

Property Name	Type	Description

`informationPointScope`*	string	Enums
		`ALL_INFORMATION_POINTS`
		`SPECIFIC_INFORMATION_POINTS`
		`INFORMATION_POINTS_MATCHING_PATTERN`

AllInformationPoints

Property Name	Type	Description

`informationPointScope`*	string	Enums `ALL_INFORMATION_POINTS`

SpecificInformationPoints

Property Name	Type	Description
`informationPointScope`*	string	Enum `SPECIFIC_INFORMATION_POINTS`
`informationPoints`*	string minItems: 1	

InformationPointsMatchingPattern

Property Name	Type	Description
`informationPointScope`*	string	Enum `INFORMATION_POINTS_MATCHING_PATTERN`
`patternMatcher`*		**EntityMatchingPattern** See table below

EntityMatchingPattern

Property Name	Type	Description

`matchTo`*	string	Enums
		`STARTS_WITH`
		`ENDS_WITH`
		`CONTAINS`
		`EQUALS`
		`MATCH_REG_EX`

`matchValue`*	string minLength: 1	
`shouldNot`	boolean default: `false`	

DatabasesInApplication

Specific databases associated with the application are considered for email digest.

Property Name	Type	Description
`entityType`*	string	Enums `DATABASES_IN_APPLICATION`

selectedApplicationDatabases*		**SelectedApplicationDatabases** **Property Name** / **Type** / **Description** applicationDatabaseScope — string — Enums: ALL_APPLICATION_DATABASES, SPECIFIC_APPLICATION_DATABASES, APPLICATION_DATABASES_MATCHING_PATTERN

SelectedApplicationDatabases

Property Name	Type	Description
applicationDatabaseScope*	string	Enums ALL_APPLICATION_DATABASES SPECIFIC_APPLICATION_DATABASES APPLICATION_DATABASES_MATCHING_PATTERN

AllApplicationDatabases

Property Name	Type	Description
applicationDatabaseScope*	string	Enum ALL_APPLICATION_DATABASES

SpecificApplicationDatabases

Property Name	Type	Description
applicationDatabaseScope*	string	Enum SPECIFIC_APPLICATION_DATABASES
applicationDatabases*	string minItems: 1	

ApplicationDatabasesMatchingPattern

Property Name	Type	Description
applicationDatabaseScope*	string	Enum APPLICATION_DATABASES_MATCHING_PATTERN

patternMatcher*		**EntityMatchingPattern** **Property Name** / **Type** / **Description** matchTo* — string — Enums: STARTS_WITH, ENDS_WITH, CONTAINS, EQUALS, MATCH_REG_EX matchValue* — string, minLength: 1 shouldNot — boolean, default: false

ServersInApplication

Specific servers associated with the application are considered for the email digest.

Property Name	Type	Description
entityType*	string	Enum SERVERS_IN_APPLICATION
selectedServers*	string	**ApplicationSelectedServers** **Property Name** / **Type** / **Description** serversScope* — string — Enums: ALL_SERVERS_IN_APPLICATION, SPECIFIC_SERVERS_IN_APPLICATION, ALL_SERVERS_IN_SPECIFIC_TIERS

ApplicationSelectedServers

Property Name	Type	Description
serversScope*	string	Enums ALL_SERVERS_IN_APPLICATION SPECIFIC_SERVERS_IN_APPLICATION ALL_SERVERS_IN_SPECIFIC_TIERS

AllServersInApplication

Property Name	Type	Description
serversScope*	string	Enum ALL_SERVERS_IN_APPLICATION

SpecificServersInApplication

Property Name	Type	Description
`serversScope`*	string	Enum `SPECIFIC_SERVERS_IN_APPLICATION`
`specificServers`*	string minLength: 1 minItems: 1	

AllServersInSpecificTiers

Property Name	Type	Description
`serversScope`*	string	Enum `ALL_SERVERS_IN_SPECIFIC_TIERS`
`specificTiers`*	string minItems: 1	

Events

Different types of events considered for an email digest.

Property Name	Type	Description
`healthRuleEvents`		**HealthRuleEvent** Events associated with health rules that trigger the email digest.

HealthRuleEvent

Events associated with health rules that trigger the email digest.

Property Name	Type	Description

`healthRuleEventTypes`*	string
	minItems: 1
		HealthRuleEventType
		Enums
		`HEALTH_RULE_CONTINUES_CRITICAL`
		`HEALTH_RULE_OPEN_CRITICAL`
		`HEALTH_RULE_OPEN_WARNING`
		`HEALTH_RULE_UPGRADED`
		`HEALTH_RULE_DOWNGRADED`
		`HEALTH_RULE_CONTINUES_WARNING`
		`HEALTH_RULE_CLOSE_WARNING`
		`HEALTH_RULE_CLOSE_CRITICAL`
		`HEALTH_RULE_CANCELED_WARNING`
		`HEALTH_RULE_CANCELED_CRITICAL`

healthRuleScope*	string	Events associated with specific health rules or all health rules that trigger the email digest. HealthRuleScopeType

HealthRuleScopeType

Property Name	Type	Description
`healthRuleScopeType`	string	`ALL_HEALTH_RULES` `SPECIFIC_HEALTH_RULES`

otherEvents	string	**OtherEventType** Enums CLR_CRASH APPLICATION_CRASH DEADLOCK RESOURCE_POOL_LIMIT APPLICATION_DEPLOYMENT APP_SERVER_RESTART APPLICATION_CONFIG_CHANGE AGENT_CONFIGURATION_ERROR APPLICATION_DISCOVERED TIER_DISCOVERED NODE_DISCOVERED MACHINE_DISCOVERED BT_DISCOVERED SERVICE_ENDPOINT_DISCOVERED BACKEND_DISCOVERED EUM_CLOUD_SYNTHETIC_HEALTHY_EVENT EUM_CLOUD_SYNTHETIC_WARNING_EVENT EUM_CLOUD_SYNTHETIC_CONFIRMED_WARNING_EVENT EUM_CLOUD_SYNTHETIC_ONGOING_WARNING_EVENT EUM_CLOUD_SYNTHETIC_ERROR_EVENT EUM_CLOUD_SYNTHETIC_CONFIRMED_ERROR_EVENT EUM_CLOUD_SYNTHETIC_ONGOING_ERROR_EVENT EUM_CLOUD_SYNTHETIC_PERF_HEALTHY_EVENT EUM_CLOUD_SYNTHETIC_PERF_WARNING_EVENT EUM_CLOUD_SYNTHETIC_PERF_CONFIRMED_WARNING_EVENT EUM_CLOUD_SYNTHETIC_PERF_ONGOING_WARNING_EVENT EUM_CLOUD_SYNTHETIC_PERF_CRITICAL_EVENT EUM_CLOUD_SYNTHETIC_PERF_CONFIRMED_CRITICAL_EVENT EUM_CLOUD_SYNTHETIC_PERF_ONGOING_CRITICAL_EVENT MOBILE_NEW_CRASH_EVENT SLOW VERY_SLOW STALL ERROR

AnomalyEvents

Events generated due to anomaly detection considered for an email digest.

Property Name	Type	Description

anomalyEvents	string minItems: 1	**AnomalyEventType** Enums ANOMALY_OPEN_WARNING ANOMALY_OPEN_CRITICAL ANOMALY_UPGRADED ANOMALY_DOWNGRADED ANOMALY_CLOSE_WARNING ANOMALY_CLOSE_CRITICAL ANOMALY_CANCELED_WARNING ANOMALY_CANCELED_CRITICAL

Action

A list of actions that are taken in response to an event.

Property Name	Type	Description
actionName*	string	
actionType*	string	**ActionType** Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

SimpleActionType

A simple action that is taken when the policy is triggered.

Property Name	Type	Description
actionName*	string	

actionType*	string	**ActionType** Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

EmailActionType

An email is sent when the policy is triggered.

Property Name	Type	Description
actionName*	string	
actionType*	string	**ActionType** Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
notes	string	

ActionOnSpecifiedEntities

A simple action that is taken for specific entities when the policy is triggered.

Property Name	Type	Description
actionName*	string	

`actionType`*	string	**ActionType**
		Enums
		`SMS`
		`EMAIL`
		`CUSTOM_EMAIL`
		`THREAD_DUMP`
		`HTTP_REQUEST`
		`CUSTOM`
		`RUN_SCRIPT_ON_NODES`
		`DIAGNOSTIC_BUSINESS_TRANSACTIONS`
		`CREATE_UPDATE_JIRA`

`specifiedEntityActionDetails`*	string	**SpecifiedEntityActionDetails**
		Property Name / **Type** / **Description**
		`specifiedEntityActionScope` / string / **SpecifiedEntityActionScope**
		Enums
		`PERCENTAGE`
		`ABSOLUTE`
		`SPECIFIC_NODES`

SpecifiedEntityActionDetails

Property Name	Type	Description

`specifiedEntityActionScope`	string	**SpecifiedEntityActionScope**
		Enums
		`PERCENTAGE`
		`ABSOLUTE`
		`SPECIFIC_NODES`

ActionOnPercentageEntities

The scope of entities on which the action is performed is set to `percentage`.

Property Name	Type	Description
`specifiedEntityActionScope`	string	**SpecifiedEntityActionScope** Enum `PERCENTAGE`
`value`*	integer	

ActionOnAbsoluteEntities

The scope of entities on which the action is performed is set to `absolute`.

Property Name	Type	Description

specifiedEntityActionScope	string	**SpecifiedEntityActionScope** Enum ABSOLUTE
value*	integer	

ActionOnSpecificNodes

A list of nodes on which the action is performed.

Property Name	Type	Description
specifiedEntityActionScope	string	**SpecifiedEntityActionScope** Enum SPECIFIC_NODES
nodes*	string minItems: 1	

EmailDigestSummaryArray

Property Name	Type
id*	integer
name*	string minLength: 1
enabled*	boolean

KeyValuePair

Property Name	Type
key*	string
value*	string

EmailDigestSummary

Property Name	Type
id*	integer
name*	string minLength: 1
enabled*	boolean

EmailDigestConfiguration

Property Name	Type
enabled*	boolean
EmailDigestName	string

`frequency`	integer minimum: 1 maximum: 168

EntityMatchingPattern

Entities that match the specified pattern.

Property Name	Type	Description

`matchTo`*	string	Enums
		`STARTS_WITH`
		`ENDS_WITH`
		`CONTAINS`
		`EQUALS`
		`MATCH_REG_EX`

`matchValue`*	string minLength: 1	
`shouldNot`	boolean default: `false`	

Enums

PropertyMatchCriteria

Property Name	Type	Description

`propertyMatchCriteria`	string
	default: ANY
		Enums
		`ANY`
		`ALL`

EntityMatchingPatternEnum

Property Name	Type	Description

`EntityMatchingPatternEnum`	string	Enums
		`STARTS_WITH`
		`ENDS_WITH`
		`CONTAINS`
		`EQUALS`
		`MATCH_REG_EX`

PageScopeEnum

Property Name	Type	Description

`PageScopeEnum`	string	Enums
		`ALL_PAGES`
		`SPECIFIC_PAGES`
		`PAGES_MATCHING_PATTERN`

VirtualPageScopeEnum

Property Name	Type	Description

Action Suppression API

This page describes the Action Suppression API methods you can use to temporarily suspend the automatic trigger of actions and alerts by a policy in response to an event. This API is useful when performing maintenance activities or troubleshooting a component.

> **Note**
>
> Syntax validation of the JSON payload is done when creating action suppression.

Create a New Action Suppression

Creates a new action suppression with the specified JSON payload. See Property Details.

Resource URL

```
POST <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions
```

Request/Response Format

JSON

Example

Retrieve a List of Action Suppressions Configured for a Given Application

Returns all the action suppressions that are configured for a given application. The required fields are action suppression IDs and names. Details such as `timezone`, `startTime`, `endTime` and `recurringSchedule` of configured action suppressions are returned. See Property Details.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions
```

Response Format

JSON

Example Response

```
[
 {
        "id": 11,
        "name": "TestAS1",
        "timezone": "Asia/Kolkata",
        "startTime": "2020-08-19T12:06:00",
        "endTime": "2020-08-19T13:06:00"
 }
 {
        "id": 12,
        "name": "TestAS2",
        "timezone": "Asia/Kolkata",
        "startTime": "2020-08-19T12:27:00",
        "endTime": "2020-08-19T13:27:00"
 }
 {
        "id": 13,
        "name": "TestAS3",
        "timezone": "Asia/Kolkata",
        "startTime": "2020-08-19T12:08:00",
        "endTime": "2020-08-19T13:08:00"
 }
]
```

Retrieve the Details of an Action Suppression

Returns JSON representation of action suppression for the given action suppression ID. See Property Details.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions/{action-suppression-id}
```

Response Format

JSON

Example Response

```
{
  "id": 9,
  "name": "TestAS",
  "disableAgentReporting": false,
  "suppressionScheduleType": "ONE_TIME",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-08-19T11:43:00",
  "endTime": "2020-08-19T12:43:00",
  "recurringSchedule": null,
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

Update an Action Suppression

Updates an existing action suppression with a specified JSON payload. See Property Details.

Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions/{action-suppression-id}
```

Request/Response Format

JSON

Example

Delete an Action Suppression

Deletes an action suppression with the specified ID. See Property Details.

Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions/{action-suppression-id}
```

Retrieve the Details of an Action Suppression by Name

Returns JSON representation of action suppression for the given action suppression name. See Property Details.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions/action-suppression-by-name/?name=<ActionSuppressionName>
```

Replace `<ActionSuppressionName>` with a name you specified for the action suppression. For example, `ACTION_SUP_15`.

Response Format

JSON

Example Response

```
{
    "id": 9,
    "name": "TestAS1",
    "timezone": "Asia/Kolkata",
    "startTime": "2020-08-19T12:05:00",
    "endTime": "2020-08-19T13:05:00",
    "recurringSchedule": null
  }
```

Response Codes

Code	Description
`200`	Fetched successfully
`201`	Created successfully
`204`	Deleted successfully
`400`	Bad request
`401`	Unauthorized
`403`	Forbidden
`404`	Resource not found
`409`	Already exists

Property Details

Action Suppression

Payload details for action suppression.

Property Name	Type	Description and Valid Values
`id`	integer	This is auto-generated by the system and returned in the response. It is a `readOnly` value.
`name`*	string minLength: 1 maxLength: 100	The name of action suppression.
`disableAgentReporting`	boolean default: `false`	If enabled, the agents defined in the scope do not report any metric data during the specified time frame.
 You cannot define a recurring action suppression if you set `disableAgentReporting` to `true`.		
`suppressionScheduleType`	string default: ONE_TIME	The available scheduling options for action suppression. **Enums**

<table>
<tr><td></td><td></td><td>ONE_TIME

RECURRING</td></tr>
<tr><td>timezone</td><td>string</td><td>The timezone ID. The default time zone is the controller timezone.</td></tr>
<tr><td>startTime</td><td>string

format: yyyy-MM-ddTHH:mm:ss</td><td>The time at which the action suppression is initiated. Specify startTime only if suppressionScheduleType is set to ONE_TIME. If you do not specify the startTime, action suppression starts from the current time. The expected format is yyyy-MM-ddTHH:mm:ss conforming to rfc3339.</td></tr>
<tr><td>endTime</td><td>string

format: yyyy-MM-ddTHH:mm:ss</td><td>The time at which the ongoing action suppression ends. Specify startTime only if suppressionScheduleType is set to ONE_TIME. If not specified, action suppression ends at 60 minutes from the current time. The expected format is yyyy-MM-ddTHH:mm:ss conforming to rfc3339.</td></tr>
<tr><td>recurringSchedule</td><td>string</td><td>The recurring schedule details to initiate an action suppression.

<table><tr><th>Property Name</th><th>Type</th><th>Description</th></tr><tr><td>scheduleFrequency*</td><td>string</td><td>The frequency of invoking action suppression.

Enums

DAILY

WEEKLY

MONTHLY_SPECIFIC_DATE

MONTHLY_SPECIFIC_DAY</td></tr></table></td></tr>
<tr><td>affects*</td><td></td><td>Describes entities affected by action suppression. For example, applications, business transactions, servers, or databases.

<table><tr><th>Property Name</th><th>Type</th><th>Description</th></tr><tr><td>affectedInfoType*</td><td>string</td><td>The affected entity type.

Enums

APPLICATION

BUSINESS_TRANSACTIONS

TIERS_NODES

SERVERS

DATABASES</td></tr></table></td></tr>
<tr><td>healthRuleScope*</td><td></td><td>The scope of the health rules applicable to action suppression.

<table><tr><th>Property Name</th><th>Type</th><th>Description</th></tr><tr><td>healthRuleScopeType*</td><td>string</td><td>The health rule types affected by action suppression.

Enums

SPECIFIC_HEALTH_RULES</td></tr></table></td></tr>
</table>

Action Suppression Schedule Type

Use this property to schedule a one-time or recurring action suppression.

Property Name	Type	Description
ActionSuppressionScheduleType	string	**Enums**

		ONE_TIME RECURRING

Example for one-time action suppression

```
{
    "name": "Action Suppression With One Time Schedule",
    "disableAgentReporting": false,
    "suppressionScheduleType": "ONE_TIME",
    "timezone": "Asia/Kolkata",
    "startTime": "2020-06-18T13:33:37",
    "endTime": "2021-06-30T16:48:37",
    "recurringSchedule": null,
    "affects": {
        "affectedInfoType": "APPLICATION"
    },
    "healthRuleScope": null
}
```

Recurring Schedule Frequency Details

Use this property to define the frequency of invoking action suppression on a recurring basis.

Property Name	Type	Description

`scheduleFrequency`*	string	Describes how often action suppression is invoked.
		
		Enums
		
		`DAILY`
		
		`WEEKLY`
		
		`MONTHLY_SPECIFIC_DATE`
		
		`MONTHLY_SPECIFIC_DAY`

Example for recurring action suppression scheduled on a daily basis

```
{
    "name": "Action Suppression With Daily Schedule",
    "disableAgentReporting": false,
    "suppressionScheduleType": "RECURRING",
    "timezone": "Asia/Kolkata",
    "startTime": null,
    "endTime": null,
    "recurringSchedule": {
        "scheduleFrequency": "DAILY",
        "startTime": "01:00",
        "endTime": "01:22"
    },
    "affects": {
        "affectedInfoType": "APPLICATION"
    },
    "healthRuleScope": null
}
```

Daily Schedule - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a daily basis.

Property Name	Type	Description
`scheduleFrequency`*	string	Action suppression is invoked daily.

		Enum `DAILY`
`startTime`*	Time string pattern: ^([01]\d|2[0-3]):([0-5]\d)$	The time at which the action suppression is initiated. The time in 24 hour format.
`endTime`*	Time string pattern: ^([01]\d|2[0-3]):([0-5]\d)$	The time at which the ongoing action suppression ends. The time in 24 hour format.

Example

```
{
    "name": "Action Suppression With Daily Schedule",
    "disableAgentReporting": false,
    "suppressionScheduleType": "RECURRING",
    "timezone": "Asia/Kolkata",
    "startTime": null,
    "endTime": null,
    "recurringSchedule": {
        "scheduleFrequency": "DAILY",
        "startTime": "01:00",
        "endTime": "01:22"
    },
    "affects": {
        "affectedInfoType": "APPLICATION"
    },
    "healthRuleScope": null
}
```

Weekly Schedule - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a weekly basis.

<table>
<tr><th>Property Name</th><th>Type</th><th>Description</th></tr>
<tr><td><code>scheduleFrequency</code>*</td><td>string</td><td>Action suppression is invoked on a specific day of the week.
Enum
<code>WEEKLY</code></td></tr>
<tr><td><code>days</code>*</td><td>string
minItems: 1
maxItems: 7</td><td>The day(s) of the week to suppress actions.
<table>
<tr><th>Property Name</th><th>Type</th><th>Description</th></tr>
<tr><td>DayOfWeek</td><td>string</td><td>Enums
<code>SUNDAY</code>
<code>MONDAY</code>
<code>TUESDAY</code>
<code>WEDNESDAY</code>
<code>THURSDAY</code>
<code>FRIDAY</code>
<code>SATURDAY</code></td></tr>
</table></td></tr>
<tr><td><code>startTime</code>*</td><td>Time string
pattern: <code>^([01]\d|2[0-3]):([0-5]\d)$</code></td><td>The time at which the action suppression is initiated.
The time in 24 hour format.</td></tr>
<tr><td><code>endTime</code>*</td><td>Time string
pattern: <code>^([01]\d|2[0-3]):([0-5]\d)$</code></td><td>The time at which the ongoing action suppression ends.
The time in 24 hour format.</td></tr>
</table>

Example

```
{ "name": "Action Suppression With Weekly Schedule", "disableAgentReporting": false,
    "suppressionScheduleType": "RECURRING",
    "timezone": "Asia/Kolkata",
    "startTime": null,
    "endTime": null,
    "recurringSchedule": {
        "scheduleFrequency": "WEEKLY",
        "startTime": "06:00",
        "endTime": "18:00",
        "days": [
            "SUNDAY",
            "MONDAY"
        ]
    },
    "affects": {
        "affectedInfoType": "APPLICATION"
    },
    "healthRuleScope": null
}
```

Monthly Schedule, Specific Date - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a monthly basis, on a specific date.

Property Name	Type	Description
`scheduleFrequency`*	string	Action suppression is invoked on a specific date every month. **Enum** `MONTHLY_SPECIFIC_DATE`
startDate*	string pattern: `^(0[1-9]|[12][0-9]|3[01])$\|^Last Day$`	The start date of the month to suppress actions.
`startTime`*	Time string pattern: `^([01]\d|2[0-3]):([0-5]\d)$`	The time at which action suppression is initiated. The time in 24 hour format.
`endDate`*	string pattern: `^(0[1-9]|[12][0-9]|3[01])$\|^Last Day$`	The end date of the month to suppress actions.
`endTime`*	Time string pattern: `^([01]\d|2[0-3]):([0-5]\d)$`	The time at which the ongoing action suppression ends. The time in 24 hour format.

Example

```
{
    "name": "Action Suppression With Monthly Specific Date Schedule",
    "disableAgentReporting": false,
    "suppressionScheduleType": "RECURRING",
    "timezone": "Asia/Kolkata",
    "startTime": null,
    "endTime": null,
    "recurringSchedule": {
        "scheduleFrequency": "MONTHLY_SPECIFIC_DATE",
        "startDate": "01",
        "startTime": "06:00",
        "endDate": "Last Day",
        "endTime": "18:00"
    },
    "affects": {
        "affectedInfoType": "APPLICATION"
    },
```

```
    "healthRuleScope": null
}
```

Monthly Schedule, Specific Day - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a monthly basis, on a specific date.

Property Name	Type	Description
`scheduleFrequency`*	string	Action suppression is invoked on a specific day of the month. **Enum** `MONTHLY_SPECIFIC_DAY`
`startTime`*	Time string pattern: `^([01]\d|2[0-3]):([0-5]\d)$`	The time at which action suppression is initiated. The time in 24 hour format.
`endTime`*	Time string pattern: `^([01]\d|2[0-3]):([0-5]\d)$`	The time at which the ongoing action suppression ends. The time in 24 hour format.
`days`*	string	The day of the month to suppress actions.

`occurrence`*	string	**Enums**
		`FIRST`
		`SECOND`
		`THIRD`
		`FOURTH`
		`LAST`

`days`* — nested properties:

Property Name	Type	Description

DayOfWeek	string	**Enums**
		`SUNDAY`
		`MONDAY`
		`TUESDAY`
		`WEDNESDAY`
		`THURSDAY`
		`FRIDAY`
		`SATURDAY`

Example

```
{
    "name": "Action Suppression With Monthly Specific Day Schedule",
    "disableAgentReporting": false,
    "suppressionScheduleType": "RECURRING",
    "timezone": "Asia/Kolkata",
    "startTime": null,
    "endTime": null,
    "recurringSchedule": {
        "scheduleFrequency": "MONTHLY_SPECIFIC_DAY",
        "startTime": "06:00",
        "endTime": "18:00",
        "day": "SUNDAY",
        "occurrence": "FIRST"
    },
```

```
    "affects": {
        "affectedInfoType": "APPLICATION"
    },
    "healthRuleScope": null
}
```

Schedule Frequency Details

Use this property to define the frequency of invoking an action suppression.

Property Name	Type	Description

`scheduleFrequency`*	string	**Enums**
		`DAILY`
		`WEEKLY`
		`MONTHLY_SPECIFIC_DATE`
		`MONTHLY_SPECIFIC_DAY`

Example

```
{
   "recurringSchedule":{
      "scheduleFrequency":"WEEKLY",
      "startTime":"06:00",
      "endTime":"18:00",
      "days":[
         "SUNDAY",
         "MONDAY"
      ]
   }
```

Occurrence Details

The occurrence of the day of the month to suppress actions.

Property Name	Type	Description

`occurrence`	string	**Enums**
		`FIRST`
		`SECOND`
		`THIRD`
		`FOURTH`
		`LAST`

Example

```
{
   "recurringSchedule":{
      "scheduleFrequency":"MONTHLY_SPECIFIC_DAY",
      "startTime":"06:00",
      "endTime":"18:00",
      "day":"SUNDAY",
      "occurrence":"FIRST"
   }
}
```

Monthly Action Suppression - Day

The day of the month to suppress actions.

Property Name	Type	Description

`DayOfWeek`	string	**Enums**
		`SUNDAY`
		`MONDAY`
		`TUESDAY`
		`WEDNESDAY`
		`THURSDAY`
		`FRIDAY`
		`SATURDAY`

Example

```
{
   "recurringSchedule":{
      "scheduleFrequency":"MONTHLY_SPECIFIC_DAY",
      "startTime":"06:00",
      "endTime":"18:00",
      "day":"SUNDAY",
      "occurrence":"FIRST"
   }
}
```

Action Suppression Time Details

Use this property to define the time details to suppress an action.

Property Name	Type	Description
`Time`	string pattern: `^([01]\d|2[0-3]):([0-5]\d)$`	The time in 24 hour format.

Example

```
{
        "recurringSchedule": {
        "scheduleFrequency": "MONTHLY_SPECIFIC_DATE",
        "startDate": "01",
        "startTime": "06:00",
        "endDate": "Last Day",
        "endTime": "18:00"
    }
}
```

Timezone

Property Name	Type	Description
`Timezone`	string	Timezone Id. The default time zone is the controller timezone.

Example

```
{
    "name": "Action Suppression With One Time Schedule",
    "disableAgentReporting": false,
    "suppressionScheduleType": "ONE_TIME",
    "timezone": "Asia/Kolkata",
    "startTime": "2020-06-18T13:33:37",
    "endTime": "2021-06-30T16:48:37",
    "recurringSchedule": null,
    "affects": {
        "affectedInfoType": "APPLICATION"
    },
    "healthRuleScope": null
}
```

Entities Affected by Action Suppression

Information pertaining to entities affected by action suppression.

Property Name	Type	Description and Valid Values

`affectedInfoType`*	string	**Enums**
		`APPLICATION`
		`BUSINESS_TRANSACTIONS`
		`TIERS_NODES`
		`SERVERS`
		`DATABASES`

Example

```
{
            "affectedInfoType": "TIERS_NODES",
            "affectedEntities": {
                "tierNodeType": "NODE",
                "nodeType": "ALL_NODES",
                "affectedNodes": {
                    "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
                    "specificTiers": ["Tier1"]
                }
            }
  }
```

Application-level Entities Affected by Action Suppression

Use to suppress actions for entities at the application-level.

Property Name	Type	Description and Valid Values
`affectedInfoType`*	string	**Enum** `APPLICATION`

Example

```
{
    "affectedInfoType": "APPLICATION"
}
```

Business Transactions Affected by Action Suppression

Use this to suppress actions for entities at the business transaction (BT) level.

Property Name	Type	Description and Valid Values
`affectedInfoType`*	string	**Enum** `BUSINESS_TRANSACTIONS`
`affectedBusinessTransactions`*		The scope of the business transactions affected by action suppression.

Property Name	Type	Description and Valid Values

`businessTransactionScope`*	string	**Enums**
		`ALL_BUSINESS_TRANSACTIONS`
		`SPECIFIC_BUSINESS_TRANSACTIONS`
		`BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS`
		`BUSINESS_TRANSACTIONS_MATCHING_PATTERN`

Example

```
{
   "affectedInfoType":"BUSINESS_TRANSACTIONS",
   "affectedBusinessTransactions":{
         "businessTransactionScope":"BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS",
         "specificTiers":["DefaultTier1"]
      }
}
```

Scope of Business Transactions **Affected**

Use this to suppress actions for entities at the BT level for the selected BT types.

Property Name	Type	Description and Valid Values

`businessTransactionScope`*	string	**Enums**
		`ALL_BUSINESS_TRANSACTIONS`
		`SPECIFIC_BUSINESS_TRANSACTIONS`
		`BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS`
		`BUSINESS_TRANSACTIONS_MATCHING_PATTERN`

All Types of Business Transactions

Use this to suppress actions for entities at the BT level for all BTs.

Property Name	Type	Description and Valid Values
`businessTransactionScope`*	string	**Enum** `ALL_BUSINESS_TRANSACTIONS`

Example

```
{
                "affectedInfoType": "BUSINESS_TRANSACTIONS",
                "affectedBusinessTransactions": {
                        "businessTransactionScope": "ALL_BUSINESS_TRANSACTIONS"
                }
}
```

Specific Business Transactions

Use this to suppress actions for entities at the BT level for the specific BTs only.

Property Name	Type	Description and Valid Values
`businessTransactionScope`*	string	**Enum** `SPECIFIC_BUSINESS_TRANSACTIONS`
`businessTransactions`*	array of strings minItems: 1	Specific business transactions affected by action suppression. For example: `[CheckoutBt, LoginBt]`

Example

```
{
                "affectedInfoType": "BUSINESS_TRANSACTIONS",
                "affectedBusinessTransactions": {
                        "businessTransactionScope": "SPECIFIC_BUSINESS_TRANSACTIONS",
                        "businessTransactions": ["/BT/", "/BT/rest"]
}
```

Business Transactions Associated with Specific Tiers

Use this to suppress actions for entities at the BT level for BTs within specific tiers only.

Property Name	Type	Description and Valid Values
`businessTransactionScope`*	string	**Enum** `BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS`
`specificTiers`*	array of strings minItems: 1	Business transactions associated with specific tiers affected by action suppression. For example: `[CheckoutTier, LoginTier]`

Example

```
{
   "affectedInfoType":"BUSINESS_TRANSACTIONS",
   "affectedBusinessTransactions":{
         "businessTransactionScope":"BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS",
         "specificTiers":["DefaultTier1"]
      }
}
```

Business Transactions Matching a Pattern

Use this to suppress actions for entities at the BT level for BTs with properties that match a given pattern.

Property Name	Type	Description and Valid Values
`businessTransactionScope`*	string	**Enums** `BUSINESS_TRANSACTIONS_MATCHING_PATTERN`
`patternMatcher`*		**EntityMatchingPattern** `matchTo`* (string) — **Enums**: `STARTS_WITH`

		ENDS_WITH CONTAINS EQUALS MATCH_REG_EX
matchValue*	string minLength: 1	The pattern match value.
shouldNot	boolean default: false	Select this to reverse the pattern match condition.

Example

```
{
                "affectedInfoType": "BUSINESS_TRANSACTIONS",
                "affectedBusinessTransactions": {
                        "businessTransactionScope": "BUSINESS_TRANSACTIONS_MATCHING_PATTERN",
                        "patternMatcher": {
                                "matchTo": "STARTS_WITH",
                                "matchValue": "E",
                                "shouldNot": false
                        }
                }
        }
```

Tiers/Nodes Entities Affected

Use this to suppress actions for entities at the Tier/Node level.

Property Name	Type	Description and Valid Values
affectedInfoType*	string	**Enum** TIERS_NODES
affectedEntities*		**TierNodeEntities** **Property Name** / **Type** / **Description and Valid Values** tierNodeType* / string / **Enums**: TIER, NODE

Example

```
{
            "affectedInfoType": "TIERS_NODES",
            "affectedEntities": {
                "tierNodeType": "NODE",
                "nodeType": "ALL_NODES",
                "affectedNodes": {
                    "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
                    "specificTiers": ["Tier1"]
                }
            }
  }
```

Tier or Node Entities Affected

Use this to suppress actions for entities at the tier level or node level.

Property Name	Type	Description and Valid Values

`tierNodeType`*	string	**Enums**
		`TIER`
		`NODE`

Tier-level Entities **Affected**

Property Name	Type	Description and Valid Values
`tierNodeType`*	string	**Enum** `TIER`
`affectedTiers`*		**AffectedTiers** **Property Name** / **Type** / **Description and Valid Values** `affectedTierScope`* — string — **Enums**: `ALL_TIERs`, `SPECIFIC_TIERS`

Example

```
{
                "affectedInfoType": "TIERS_NODES",
                "affectedEntities": {
                        "tierNodeType": "TIER",
                        "affectedTiers": {
                                "affectedTierScope": "SPECIFIC_TIERS",
                                "tiers": ["ECommerce-Services", "Inventory-Services"]
                                        }
                                }
}
```

Node-level Entities Affected

Property Name	Type	Description and Valid Values
`tierNodeType`*	string	**Enum** `NODE`

`nodeType`*	string	**Enums**
		`ALL_NODES`
		`JAVA_NODES`
		`DOT_NET_NODES`
		`PHP_NODES`

`affectedNodes`*		**AffectedNodes** **Property Name** / **Type** / **Description and Valid Values** `affectedNodeScope`* — string — **Enums**

				ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER

Example

```
{
            "affectedInfoType": "TIERS_NODES",
            "affectedEntities": {
                "tierNodeType": "NODE",
                "nodeType": "ALL_NODES",
                "affectedNodes": {
                    "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
                    "specificTiers": ["Tier1"]
                }
            }
  }
```

Affected Tier Scope

Property Name	Type	Description and Valid Values
affectedTierScope*	string	**Enums** ALL_TIERs SPECIFIC_TIERS

All Tiers

Use this to suppress actions for entities at the tier level for all tiers.

Property Name	Type	Description and Valid Values
affectedTierScope*	string	**Enum** ALL_TIERS

Example

```
{
                "affectedInfoType": "TIERS_NODES",
                "affectedEntities": {
                        "tierNodeType": "TIER",
                        "affectedTiers": {
                                "affectedTierScope": "ALL_TIERS"
                                }
                        }
}
```

Specific Tiers

Use this to suppress actions for entities at the tier level for specific tiers only.

Property Name	Type	Description and Valid Values
affectedTierScope*	string	**Enum** SPECIFIC_TIERS

`tiers`*	array of strings minItems: 1	

Example

```
{
                "affectedInfoType": "TIERS_NODES",
                "affectedEntities": {
                        "tierNodeType": "TIER",
                        "affectedTiers": {
                                "affectedTierScope": "SPECIFIC_TIERS",
                                "tiers": ["ECommerce-Services", "Inventory-Services"]
                                        }
                                }
}
```

Affected Nodes

Property Name	Type	Description and Valid Values

`affectedNodeScope`*	string	**Enums**
		
		`ALL_NODES`
		
		`SPECIFIC_NODES`
		
		`NODES_OF_SPECIFIC_TIERS`
		
		`NODES_MATCHING_PATTERN`
		
		`NODE_PROPERTY_VARIABLE_MATCHER`

Example

```
{
   "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
   "specificTiers": ["Tier1"]
 }
```

All Nodes

Use this to suppress actions for entities at the node level for all nodes.

Property Name	Type	Description and Valid Values
`affectedNodeScope`*	string	**Enum** `ALL_NODES`

Example

```
{
                "affectedInfoType": "TIERS_NODES",
                "affectedEntities": {
                        "tierNodeType": "NODE",
                        "nodeType": "ALL_NODES",
                        "affectedNodes": {
                                "affectedNodeScope": "ALL_NODES"
                        }
                }
        }
```

Specific Nodes

Use this to suppress actions for entities at the node level for specific nodes only.

Property Name	Type	Description and Valid Values
`affectedNodeScope`*	string	**Enum** `SPECIFIC_NODES`
`nodes`*	array of strings minItems: 1	A list of nodes considered as affected entities for action suppression. For example: `[Node1, Node2]`

Example

```
{
                "affectedInfoType": "TIERS_NODES",
                "affectedEntities": {
                        "tierNodeType": "NODE",
                        "nodeType": "ALL_NODES",
                        "affectedNodes": {
                                "affectedNodeScope": "SPECIFIC_NODES",
                                "nodes": ["Node1", "Node2"]
                        }
                }
        }
```

Nodes within Specific Tiers

Use this to suppress actions for entities at the node level for nodes within specific tiers only.

Property Name	Type	Description and Valid Values
`affectedNodeScope`*	string	**Enum** `NODES_OF_SPECIFIC_TIERS`
`specificTiers`*	array of strings minItems: 1	

Example

```
{
                "affectedInfoType": "TIERS_NODES",
                "affectedEntities": {
                        "tierNodeType": "NODE",
                        "nodeType": "ALL_NODES",
                        "affectedNodes": {
                                "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
                                "specificTiers": ["ECommerce-Services", "Inventory-Services"]
                        }
                }
        }
```

Nodes that Match a Pattern

Use this to suppress actions for entities at the node level for nodes with properties that match a pattern.

Property Name	Type	Description and Valid Values
`affectedNodeScope`*	string	**Enum** `NODES_MATCHING_PATTERN`

`patternMatcher`*

EntityMatchingPattern

Property Name	Type	Description

`matchTo`*	string	**Enums**
		`STARTS_WITH`
		`ENDS_WITH`
		`CONTAINS`
		`EQUALS`
		`MATCH_REG_EX`

`matchValue`*	string minLength: 1	The pattern match value.
`shouldNot`	boolean default: `false`	Select this if you want to reverse the pattern match condition.

Example

```
{
                "affectedInfoType": "TIERS_NODES",
                "affectedEntities": {
                        "tierNodeType": "NODE",
                        "nodeType": "ALL_NODES",
                        "affectedNodes": {
                                "affectedNodeScope": "NODES_MATCHING_PATTERN",
                                "patternMatcher": {
                                        "matchTo": "STARTS_WITH",
                                        "matchValue": "A",
                                        "shouldNot": false
                                }
                        }
                }
}
```

Node Property Variable Matcher

Use this to suppress actions for entities at the node level for nodes that match specified environment variables.

Property Name	Type	Description and Valid Values
`affectedNodeScope`*	string	**Enum** `NODE_PROPERTY_VARIABLE_MATCHER`
`propVarPairs`*		

Property Name	Type	Description

`propertyType`*	string	**Enums**
		`META`
		`ENV`
		`JVM`

`name`*	string minLength: 1	
`value`*	string minLength: 1	

Example

```
{
        "affectedInfoType": "TIERS_NODES",
        "affectedEntities": {
                "tierNodeType": "NODE",
                "nodeType": "ALL_NODES",
                "affectedNodes": {
                        "affectedNodeScope": "NODE_PROPERTY_VARIABLE_MATCHER",
                        "propVarPairs": [{
                                "propertyType": "ENV",
                                "name": "CLASSPATH",
                                "value": "C:\\Users\\Java\\Classes"
                        }]
                }
        }
}
```

Servers Affected

Use this to suppress actions for entities at the server level.

Property Name	Type	Description and Valid Values
`affectedInfoType`*	string	**Enum** SERVERS
`affectedServers`*		**ApplicationAffectedServers** **Property Name** / **Type** / **Description** `serversScope`* / string / **Enum** `SPECIFIC_SERVERS_IN_APPLICATION`

Example

```
{
   "affectedInfoType":"SERVERS",
    "affectedServers":{
       "serversScope":"SPECIFIC_SERVERS_IN_APPLICATION",
       "specificServers":["DropWizardTestApplicationDropWizardDefaultNode1"]
     }
}
```

Specific Servers within an Application

Use this property to suppress actions for entities at the server level for specific servers within an application.

Property Name	Type	Description
`serversScope`*	string	**Enum** `SPECIFIC_SERVERS_IN_APPLICATION`
`specificServers`*	array of strings minItems: 1 MinLength: 1	A list of servers considered as affected entities for action suppression. For example: `[server1, server2]`

Example

```
{
   "affectedInfoType":"SERVERS",
    "affectedServers":{
       "serversScope":"SPECIFIC_SERVERS_IN_APPLICATION",
       "specificServers":["DropWizardTestApplicationDropWizardDefaultNode1"]
     }
}
```

Databases Affected

Use this property to suppress actions for entities at the database level.

Property Name	Type	Description and Valid Values
`affectedInfoType`*	string	**Enum** `DATABASES`
`affectedDatabases`*		**AffectedDatabases** **Property Name** / **Type** / **Description** `databaseScope`* — string — **Property Name** / **Type** / **Description** AffectedDatabaseType — string — **Enums**: `ALL_DATABASES`, `SPECIFIC_DATABASES`

Example

```
{
   "affects":{
      "affectedInfoType":"DATABASES",
      "affectedDatabases":{
         "databaseScope":"ALL_DATABASES"
}
```

Scope of Affected Databases

Use this property to define the scope of action suppression at the database level.

Property Name	Type	Description
`databaseScope`*	string	**Property Name** / **Type** / **Description** `AffectedDatabaseType` — string — **Enums**: `ALL_DATABASES`, `SPECIFIC_DATABASES`

Scope of Affected Databases—All Databases

Use this property to suppress actions for entities of all the databases.

Property Name	Type	Description
`databaseScope`*	string	**Property Name** / **Type** / **Description**

		AffectedDatabaseType	string	**Enums** ALL_DATABASES

Scope of Affected Databases—Specific Databases

Use this property to suppress actions for entities of specific databases.

Property Name	Type	Description
databaseScope*	string	**Enums** SPECIFIC_DATABASES
databases*	array of strings minItems: 1	**DbServer** serverName* (string, minLength: 1) collectorConfigName* (string, minLength: 1)

Example

```
{
"affects":{
      "affectedInfoType":"DATABASES",
      "affectedDatabases":{
         "databaseScope":"SPECIFIC_DATABASES",
         "databases":[
            {
               "serverName":"MongoNewKC",
               "collectorConfigName":"MongoNewKC"
            },
            {
               "serverName":"Collector41",
               "collectorConfigName":"Collector41"
            }
         ]
      }
   }
}
```

Database Server Details

Use this property to define database server details.

Property Name	Type
serverName*	string minLength: 1
collectorConfigName*	string minLength: 1

Affected Database Types

Use this property to define the scope of affected databases.

Property Name	Type	Description

`AffectedDatabaseType`	string	**Enums**
		`ALL_DATABASES`
		`SPECIFIC_DATABASES`

Health Rule Scope

Use this to suppress actions triggered as a response to health rule violation events.

Property Name	Type	Description
`healthRuleScopeType`*	string	**HealthRuleScopeType** Enum `SPECIFIC_HEALTH_RULES`

Example

```
{
   "healthRuleScopeType": "SPECIFIC_HEALTH_RULES",
   "healthRules": ["CPU utilization is too high", "JVM Garbage Collection Time is too high"]
}
```

Health Rule Scope Type

Property Name	Type	Description
`healthRuleScope`*	string	**Enum** `SPECIFIC_HEALTH_RULES`

Specific Health Rules

Property Name	Type	Description
`healthRuleScopeType`*	string	**HealthRuleScopeType** Enum `SPECIFIC_HEALTH_RULES`
`healthRules*`	array of strings minItems: 1	

Example

```
{
   "healthRuleScopeType": "SPECIFIC_HEALTH_RULES",
   "healthRules": ["CPU utilization is too high", "JVM Garbage Collection Time is too high"]
}
```

Action Suppression Summary

Property Name	Type
`id`*	integer

`name`*	string minLength: 1

Error Response

Property Name	Type
`statusCode`	integer
`message`	string

***This property is required.**

Download Examples

Download Appdynamics Action Suppression examples.zip to get a set of examples that help you configure a schedule.

Download SWAGGER YAML file

Download the Swagger YAML spec action_suppression_openapi.yml.

Events and Action Suppression API

This page describes the Events and Suppression API methods you can use to create, manage, and monitor events and action suppression.

Retrieve All Health Rule Violations in a Business Application

Returns all health rule violations that have occurred in an application within a specified time frame.

URI

`/controller/rest/applications/application_id/problems/healthrule-violations`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_id`	URI	Provide either the application name or application id.	Yes

`time-range-type`	Query	Possible values are:
		`BEFORE_NOW`
		To use the "`BEFORE_NOW`" option, you must also specify the "`duration-in-mins`" parameter.
		`BEFORE_TIME`
		To use the "`BEFORE_TIME`" option, you must also specify the "`duration-in-mins`" and "`end-time`" parameters.
		`AFTER_TIME`
		To use the "`AFTER_TIME`" option, you must also specify the "`duration-in-mins`" and "`start-time`" parameters.
		
		`BETWEEN_TIMES`
		
		To use this option, you must also specify the "`start-time`" and "`end-time`" parameters. The "`BETWEEN_TIMES`" range includes the start-time and excludes the end-time.
			Yes

`duration-in-mins`	Query	Duration (in minutes) to return the metric data.	If time-range-type is `BEFORE_NOW, BEFORE_TIME, or AFTER_TIME`
`start-time`	Query	Start time (in milliseconds) from which the metric data is returned.	If time-range-type is `AFTER_TIME` or `BETWEEN_TIMES`
`end-time`	Query	End time (in milliseconds) until which the metric data is returned.	If time-range-type is `BEFORE_TIME` or `BETWEEN_TIMES`
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are `XML` (default) or `JSON`.	No

  <description>AppDynamics has detected a problem with Node &lt;b&gt;FulfillmentClient&lt;/b&gt;.&lt;br&gt;&lt;
b&gt;CPU utilization is too high&lt;/b&gt; started violating and is now &lt;b&gt;warning&lt;/b&gt;.&lt;br&gt;
All of the following conditions were found to be violating&lt;br&gt;For Node &lt;b&gt;FulfillmentClient&lt;
/b&gt;:&lt;br&gt;1) Hardware Resources|CPU|%Busy Condition&lt;br&gt;&lt;b&gt;%Busy's&lt;/b&gt; value &lt;b&gt;
76.0&lt;/b&gt; was &lt;b&gt;greater than&lt;/b&gt; the threshold &lt;b&gt;75.0&lt;/b&gt; for the last &lt;b&gt;
30&lt;/b&gt; minutes&lt;br&gt;</description>
</policy-violation>
</policy-violations>
```

Retrieve Event Data

You can capture data for the event types listed in the `eventtypes` parameter.

URI

`/controller/rest/applications/application_id/events`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory

`application_id`	URI	Provides either the application name or application id.	Yes
`summary`	Query	Provides the summary for the event.	Yes
`comment`	Query	Provides the comments (if any) for the event.	No
`eventtype`	Query	`APPLICATION_DEVELOPMENT`	Yes

`time-range-type`	Query	Possible values are:
		`BEFORE_NOW`
		To use the "`BEFORE_NOW`" option, you must also specify the "`duration-in-mins`" parameter.
		`BEFORE_TIME`
		To use the "`BEFORE_TIME`" option, you must also specify the "`duration-in-mins`" and "`end-time`" parameters.
		`AFTER_TIME`
		To use the "`AFTER_TIME`" option, you must also specify the "`duration-in-mins`" and "`start-time`" parameters.
		
		`BETWEEN_TIMES`
		
		To use this option, you must also specify the "start-time" and "end-time" parameters. The "BETWEEN_TIMES" range includes the start-time and excludes the end-time.
			Yes

`duration-in-mins`	Query	Specify the duration (in minutes) to return the metric data.	If time-range-type is `BEFORE_NOW, BEFORE_TIME,` or `AFTER_TIME`
`start-time`	Query	Specify the start time (in milliseconds) from which the metric data is returned.	If time-range-type is `AFTER_TIME` or `BETWEEN_TIMES`
`end-time`	Query	Specify the end time (in milliseconds) until which the metric data is returned.	If time-range-type is `BEFORE_TIME` or `BETWEEN_TIMES`
`event-types`	Query	Specify the comma-separated list of event types for which you want to retrieve event information. See Events Reference.	Yes
`severity`	Query	Provides the severity level. Specify the comma-separated list of severities for which you want to retrieve event information. Allowed values are: • `INFO` • `WARN` • `ERROR` In the UI these values become `Info, Warning, and Critical`.	Yes
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are `XML` (default) or `JSON`.	No
`tier`	Query	Name of the tier in the application	No

This API can retrieve 600 events at a time.

Example

Retrieve the list of events of type `APPLICATION_ERROR` or `DIAGNOSTIC_SESSION` of any severity that occurred in the specified time range:

```
curl --user user1@customer1:your_password http://demo.appdynamics.com//controller/rest/applications/6/events?
time-range-type=BEFORE_NOW\&duration-in-mins=30\&event-types=%20APPLICATION_ERROR,
DIAGNOSTIC_SESSION\&severities=INFO,WARN,ERROR

<events><event>
  <id>44658</id>
  <type>DIAGNOSTIC_SESSION</type>
  <subType>ERROR_DIAGNOSTIC_SESSION</subType>
  <eventTime>1451343453085</eventTime>
  <severity>WARN</severity>
  <summary>Starting Diagnostic Session after series of errors for a Business Transaction 18% (2/11) of requests
had errors in the last minute starting 12/28/15 10:57 PM local time</summary>
  <affectedEntities>
    <entity-definition>
      <entityType>APPLICATION</entityType>
      <entityId>6</entityId>
      <name>ECommerce</name>
    </entity-definition>
    <entity-definition>
      <entityType>APPLICATION_COMPONENT</entityType>
      <entityId>11</entityId>
      <name>ECommerce-Services</name>
    </entity-definition>
    <entity-definition>
      <entityType>APPLICATION_COMPONENT_NODE</entityType>
      <entityId>19</entityId>
      <name>ECommerce_WEB2</name>
    </entity-definition>
    <entity-definition>
      <entityType>BUSINESS_TRANSACTION</entityType>
      <entityId>35</entityId>
      <name>/items/all.GET</name>
    </entity-definition>
    <entity-definition>

    </entity-definition>
  </affectedEntities>
  <triggeredEntity>
    <entityType>APPLICATION_COMPONENT_NODE</entityType>
    <entityId>19</entityId>
    <name>ECommerce_WEB2</name>
  </triggeredEntity>
  <markedAsRead>false</markedAsRead>
  <markedAsResolved>false</markedAsResolved>
  <archived>false</archived>
  <deepLinkUrl>http://demo.appdynamics.com:8090/controller/#location=APP_EVENT_VIEWER_MODAL&amp;
eventSummary=44658</deepLinkUrl>
</event>
</events>
```

Create Events

Application deployment events notify AppDynamics when you upgrade your application, push new code, etc. This lets you correlate these application deployment activities with other data inside AppDynamics. This is useful for regression analysis, root cause analysis, and performance studies. It is beneficial to inject your application deployment event into AppDynamics as part of the build process for deploying a new version of your application.

The AppDynamics REST API lets you integrate events of type `APPLICATION_DEPLOYMENT` with other systems.

For example, to create an event automatically in your AppDynamics monitored system for every new release you would integrate these systems and use the following REST API to create an event of type "`APPLICATION_DEPLOYMENT`" in your managed environment.

You should receive the event ID after the successful invocation of the request.

Roles and Permissions

Creating events requires the **Create Events** permission. See Application Permissions.

URI

```
POST /controller/rest/applications/application_id/events
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_id`	URI	Provide either application name or application id.	Yes
`summary`	Query	Provide a summary describing the event.	Yes
`comment`	Query	Provide the comments (if any) for the event.	No
`eventtype`	Query	`APPLICATION_DEPLOYMENT`	Yes
`severity`	Query	Provide a severity level. Allowed values include: • `"INFO"` • `"WARN"` • `"ERROR"` In the UI, these become `"Info", "Warning"`, and `"Critical"`	Yes

Create a Custom Event

You can create custom events to be reported in the AppDynamics event viewer and in the event panels on the AppDynamics dashboards. See Monitor Events to learn how to filter on your custom events. Then you can create alerts triggered by these events as you do for AppDynamics standard events.

You should receive the event ID after the successful invocation of the request.

Roles and Permissions

Creating a custom event requires the **Create Events** permission. See Application Permissions.

URI

```
POST /controller/rest/applications/application_id/events
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_id`	URI	Provide either application name or application id.	Yes
`summary`	Query	Provide a summary describing the event.	Yes
`comment`	Query	Provide a comment for the event.	No
`severity`	Query	Provide a severity level. Allowed values include: • `"INFO"` • `"WARN"` • `"ERROR"` In the UI, these become `"Info", "Warning"`, and `"Critical"`	Yes
`eventtype`	Query	CUSTOM	Yes
`customeventtype`	Query	Provide a name for the `"type"`. For example, the source could be `"nagios"`.	No
`node`	Query	Provide the affected node name.	No
`tier`	Query	Provide the affected tier name.	Yes, if `node` and `bt` are specified
`bt`	Query	Provide the affected business transaction name.	No
`propertynames`	Query	Provide a property name as a pair, i.e., the `"key"`.	No, but if one element of the pair is defined, the other must be defined also

`propertyvalues`	Query	Provide the property value as a pair, i.e., the "`value`".	No, but if one element of the pair is defined, the other must be defined also

Example

```
curl -X POST --user user1@customer1:your_password 'http://demo.appdynamics.com/controller/rest/applications/5
/events?
severity=INFO&summary=test1&eventtype=CUSTOM&customeventtype=mycustomevent&propertynames=key1&propertynames=key2
&propertyvalues=value1&propertyvalues=value'
```

Notice the pattern for custom properties: `propertynames` and `propertyvalues` get matched up by order position, so to set N property values, you need N occurrences of `propertynames` and N occurrences of `propertyvalues`.

Create Custom URLs for Notifications

Single tenants in a multi-tenant Controller instance should use this API method to specify a custom or vanity URL for notification purposes. Instead of a URL such as `paid8.appdynamics.com` being displayed as the host, the custom URL can be displayed as `yourcompany.appdynamics.com` in the notification.

URI

`POST /controller/rest/accounts/customer_name/update-controller-url`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`customer_name`	URI	The customer account name	Yes

Body Parameter

As Application/JSON content:

```
{
   "controllerURL": "http://<my-custom-hostname:port>"
}
```

If the URL in the alerts is invalid, you can set it using the following curl command:

```
curl -k --basic --user root@system --header "Content-Type: application/json" --data '{ "controllerURL":
"http://<controller>:<port>" }' http://<controller>:<port>/controller/rest/accounts/<ACCOUNT-NAME>
/update-controller-url
```

```
curl -k --basic --user root@system --header "Content-Type: application/json" --data '{ "controllerURL":
"http://<controller>:<port>" }' http://<controller>:<port>/controller/rest/accounts/<ACCOUNT-NAME>
/update-controller-url
```

For example:

```
curl -k --basic --user root@system --header "Content-Type: application/json" --data '{ "controllerURL":
"https://myVIP:443" }' https://myhost:8181/controller/rest/accounts/customer1/update-controller-url
```

There is no need to reset the Controller as upgrading it will reset the deep link URL settings.

Create and Delete Action Suppressions

By default any response is in JSON, although XML can be requested by using the following header:
`Name : Accept`
`Value : application/vnd.appd.cntrl+xml;v=1`

Retrieve All Existing Action Suppressions

Use this to retrieve a list of all existing action suppressions.

URI

`GET /controller/api/accounts/account_id/applications/application_id/actionsuppressions`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`account_id`	URI	The account ID	Yes
`application_id`	URI	The application ID	Yes

Example request to get all action suppressions:

```
/controller/api/accounts/2/applications/9/actionsuppressions
```

Example response:

```
Status : 200 ok
Output Data :
{"actionSuppressions": [{"id": "15","name": "App-ASW","timeRange": {"startTimeMillis": "2014-10-25T04:16:
30+0000","endTimeMillis": "2014-10-25T06:16:30+0000"},"affects": {"type": "APP"}},{"id": "16","name": "Node-
ASW","timeRange": {"startTimeMillis": "2014-10-25T04:16:57+0000","endTimeMillis": "2014-10-25T05:16:57+0000"},"
healthRuleIds": [60,61],"affects": {"type": "NODE","nodeAffectedEntities": {"type": "SPECIFIC","nodeType":
"ALL","nodes": [17,18]}}}],"actions": [{"href": "http://demo.appdynamics.com:8090/controller/api/accounts/2
/applications/9/actionsuppressions/%7Bactionsuppressions.id%7D/%7Bactions.name%7D","method": ["POST","DELETE"],"
name": "enabled"}],"links": [{"href": "http://ec2-54-80-163-175.compute-1.amazonaws.com:8090/controller/api
/accounts/2/applications/9/actionsuppressions/%7Bactionsuppressions.id%7D","name": "actionsuppressions"}]}
```

Retrieve a Specific Action Suppression by ID

Use this to get an action suppression by the specified ID.

URI

`/controller/api/accounts/account_id/applications/application_id/actionsuppressions/actionsuppression_id`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`account_id`	URI	The account id.	Yes
`application_id`	URI	The application id.	Yes
`actionsuppressions_id`	URI	The action suppression id.	Yes

Example request:

```
/controller/api/accounts/2/applications/9/actionsuppressions/15
```

Example response:

```
Status : 200 ok
Output Data :
{"id": "15","name": "App-ASW","timeRange": {"startTimeMillis": "2014-10-25T04:16:30+0000","endTimeMillis":
"2014-10-25T06:16:30+0000"},"affects": {"type": "APP"}}
```

Create a New Action Suppression

This is a POST request that should return a 201 - created response.

URI

```
POST /controller/api/accounts/account_id/applications/application_id/actionsuppressions
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`account_id`	URI	The account ID.	Yes
`application_id`	URI	The application ID.	Yes
`name`	body key	The name of the action suppression window.	Yes
`timeRange`	body key	The start and end time of the window. Includes: `startTimeMillis`, eg 2014-10-25T04:16:57+0000 `endTimeMillis`, eg 2014-10-25T05:16:57+0000	Yes
`healthRuleIds`	body key	The ids of the affected health rules. If not provided, all rules affected	No

<table>
<tr>
<td><code>affects</code></td>

<code>REGEX_VALUE</code></td></tr>
<tr><td>Machine</td><td>MACHINE</td><td>Covers one or more machines</td><td><code>"affects": {"type": "MACHINE","machineAffectedEntities": {"type": "SPECITIC","machines": [4,5]}}</code> where 4,5 are Machine Ids
You must spell the value as "SPECITIC" due to a typo in the underlying code.</td></tr>
</table>
</td>
<td>Yes</td>
</tr>
</table>

Example request

```
/controller/api/accounts/2/applications/9/actionsuppressions
```

Header

- `Name: Content-Type`
- `Value: application/vnd.appd.cntrl+json;v=1`

Body

```
{"name": "App-ASW_2","timeRange": {"startTimeMillis": "2014-10-25T04:16:30+0000","endTimeMillis": "2014-10-25T06:16:30+0000"},"affects": {"type": "APP"}}
```

or

```
{"name": "Node-ASW_1","timeRange": {"startTimeMillis": "2014-10-25T04:16:57+0000","endTimeMillis": "2014-10-25T05:16:57+0000"},"healthRuleIds": [60,61],"affects": {"type": "NODE","nodeAffectedEntities": {"type": "SPECIFIC","nodeType": "ALL","nodes": [17,18]}}}
```

Delete a Specific Action Suppression by ID

This is a `DELETE` request that should return a `204 - No Content` message.

URI

`DELETE /controller/api/accounts/account_id/applications/application_id/actionsuppressions/actionsuppression_id`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`account_id`	URI	The account ID	Yes
`application_id`	URI	The application ID	Yes
`actionsuppression_id`	URI	The ID of the action suppression to be deleted	Yes—The Alert and Respond APIs let you manage and monitor events, health rules, and other aspects of the AppDynamics alert and respond features.

Configuration API

This page describes the Configuration API methods you can use to read and modify selected Controller configuration settings programmatically. You can use it to script or automate tasks that must be performed frequently or in large batches, such as adding users.

> The Configuration Export and Import API provides the ability to perform select configuration changes as well as you can edit and import Controller configuration definition files.

Create and Modify AppDynamics Users

Use this to create or modify user accounts in the Controller.

You pass the user configuration settings as query parameters to the API call. The format of the create and modify user calls are identical except for the `user-id` parameter, which is not passed for the create operation. The `user-id` is generated by the `create` operation.

Format

```
POST /controller/rest/users
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`user-name`	Query	user name	Yes
`user-id`	Query	user id	No for a `create`; yes for an `update`
`user-display-name`	Query	display name	Yes
`user-roles`	Query	comma-separated list of roles	No
`user-password`	Query	user password	Yes for a `create`; optional for an `update`
`user-email`	Query	user email	Yes

Example

```
curl -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller/rest/users?user-
name=user2\&user-display-name=User%20Two\&user-password=welcome\&user-email=user2\@example.com
```

Include or Exclude a Business Transaction from Monitoring

You can exclude or include business transactions for monitoring by passing the exclude parameter to the business-transactions retrieval API described in the Application Model API.

To exclude a business transaction, pass the XML-represented ID of the business transaction to be excluded with the exclude parameter set to `true`. To turn on monitoring for a currently excluded business transaction, set the exclude parameter to `false`.

Send the list of business transactions to be excluded or re-included as the XML-formatted `POST` payload. A sample business-transaction list is:

```
<business-transactions>
    <business-transaction>
        <id>15</id>
    </business-transaction>
    <business-transaction>
        <id>16</id>
    </business-transaction>
</business-transactions>
```

> Ensure that the `Content-Type` header is set to `application/xml`.

Format

```
POST /controller/rest/applications/application_id/business-transactions
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_id`	URI	Provide either the application name or application id.	Yes
`exclude`	Post	`true|false`	Yes

Example

```
curl -X POST -H "Content-Type:text/xml" --user user1@customer1:your_password http://demo.appdynamics.com
/controller/rest/applications/6/business-transactions\?exclude=true -d @businesstransaction.xml
```

Retrieve All Controller Settings

The Controller global configuration values are made up of the Controller settings that are presented in the Administration Console.

Format

`GET /controller/rest/configuration`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are `XML` (default) or `JSON`.	No

Example

```
curl --user admin@customer1:your_password http://demo.appdynamics.com/controller/rest/configuration

<configuration-items><configuration-item>
  <name>eventsvc.request.segment.data.max.retrieval.size</name>
  <value>5000</value>
  <description>Max number of request segment data that can be retrieved from event service in a query<

  <description>Comma separated list of Event Types (with no spaces between each) that will shown as System
Notifications in the UI.</description>
  <updateable>true</updateable>
  <scope>cluster</scope>
</configuration-item>
</configuration-items>
```

Retrieve a Controller Setting by Name

Use this to get the value of a given Controller configuration setting.

Format

```
GET /configuration?name=controller_setting_name
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`name`	Query	Name of the Controller setting to retrieve	Yes
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are `XML` (default) or `JSON`.	No

Example

```
curl --user admin@customer1:your_password http://demo.appdynamics.com/controller/rest/configuration?
name=metrics\.min\.retention\.period

<configuration-items><configuration-item>
  <name>metrics.min.retention.period</name>
  <value>4</value>
  <description>Time (in hours) to retain minute metric data values before they are purged from the system.<
/description>
  <updateable>true</updateable>
  <scope>cluster</scope>
</configuration-item>
</configuration-items>
```

Configure Global Controller Settings

Use this to set a Controller setting to a specified value.

You cannot use this REST API to modify Controller settings on SaaS.

Format

`POST /controller/rest/configuration`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`name`	Query	Name of the Controller setting to get.	Yes
`value`	Query	Value to set.	Yes

Mark Nodes as Historical

Use this to mark nodes as historical, which directs AppDynamics to stop collecting metrics for the nodes. By default, AppDynamics marks as historical (soft deletes) a node that has lost contact with the Controller for the number of hours configured in the `node.retention.period` Controller setting. The default is 500 hours.

Pass one or more identifiers of the node to be marked as historical, up to a maximum of 25 nodes. Multiple IDs should be comma-separated.

Format

`POST /controller/rest/mark-nodes-historical?application-component-node-ids=value`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`application-component-node-ids`	Query	Comma-separated list of node IDs	Yes

Example

```
curl -X POST --user admin@customer1:your_password http://demo.appdynamics.com/controller/rest/mark-nodes-historical?application-component-node-ids=44,45

<application-component-node-id>
<44/>
<45/>
</application-component-node-id>
```

Configuration Import and Export API

This page describes the AppDynamics API methods you can use to import and export various types of configuration settings in the Controller.

About the Configuration Import/Export APIs

The Configuration Import/Export APIs enable you to migrate configuration settings across Controller accounts, business applications, or Controller instances. You can also use it to add configuration artifacts like transaction detection rules, health rules, or custom dashboards to an existing configuration programmatically.

An exported configuration is an XML or JSON representation of the configuration artifact. After exporting the file, you can upload it to another account or application, optionally modifying the configuration.

Export Actions from an Application

Use this to export all actions in the specified application to a JSON file.

The user account you use to make the API call must have permission to view an action or action template in the application you are exporting from.

Format

```
GET /controller/actions/application_id
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_id`	URI	The application name or application ID.	Yes

Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/actions/7

[
   {
      actionType: "EmailAction",
      name: "6DA8942B-DF4A-417A-E1NF-59F14231D670",
      priority: 1,
      description: null,
      toAddress: "user1@example.com",
      subject: "",
      timeZone: null
   },
   {
      actionType: "DiagnosticSessionAction",
      name: "MyDiagnotic",
      priority: 0,
      description: null,
      businessTransactionTemplates: [ ],
      numberOfSnapshotsPerMinute: 5,
      durationInMinutes: 10,
      adjudicate: false,
      adjudicatorEmail: null
   }
]
```

Import Actions into an Application

After you have exported actions, you can import them to a different application passing the JSON file created by the export operation as the payload to a POST request.

The user account you use to make the API call must have permission to create an action or action template in the account.

Actions in the import file that have conflicting names with actions in the existing configuration are not imported. The import for those actions fails, while new actions are imported successfully.

This call takes data as multipart/form-data content. Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Format

```
POST /controller/actions/application_id
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_id`	URI	The application name or application ID.	Yes

Example

```
curl  -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller/actions/38 -F
file=@ExportActions.json

{"success":true,"errors":[],"warnings":[]}
```

If there are actions in the file with the same name as ones in the configuration, those actions are not imported, and the response indicates the success of the request as `false`. For example:

```
{"success":false,"errors":["Not importing Action with name: DuplicateExportedDiagnosticAction, since it already
exists."],"warnings":["Imported 1 out of 2 actions"]}
```

Export Email Action Templates from an Account

This API exports all the email action templates in the current account in JSON format.

Format

```
GET /controller/actiontemplate/email
```

Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/actiontemplate/email

[ {
  "actionPlanType" : "email",
  "name" : "MyCustomEmailTemplate",
  "oneEmailPerEvent" : true,
  "eventClampLimit" : 100,
  "defaultCustomProperties" : [ {
    "id" : 0,
    "version" : 0,
    "name" : "env",
    "value" : "%OS"
  } ],
  "allowCustomRecipients" : true,
  "toRecipients" : [ ],
  "ccRecipients" : [ ],
  "bccRecipients" : [ ],
  "headers" : [ ],
  "subject" : "We've got a situation...",
  "includeTextBody" : true,
  "textBody" : "<h1>Summary of events occurring during the ${policy.digestDurationInMins}+ minute(s) prior to
${action.triggerTime}:</h1> <table> #foreach(${eventList} in ${fullEventsByTypeMap.values()}) #foreach(${event}
in ${eventList}) <tr> <td> <!-- Event icon --> <img src="${event.severityImage.mimeContentRef}" alt="${event.
severity}" /> </td> <td> <!-- Event name with event link --> <a href="${event.deepLink}">${event.displayName}<
/a> </td> <td> <!-- Event message --> ${event.eventMessage} </td> </tr> #end #end </table>"",
  "includeHtmlBody" : true,
  "htmlBody" : "<p>Please look into it.</p>",
  "testLogLevel" : "DEBUG",
  "testPropertiesPairs" : [ ],
  "testToRecipients" : [ ],
  "testCcRecipients" : [ ],
  "testBccRecipients" : [ ],
  "eventTypeCountPairs" : [ ]
} ]
```

Import Email Action Templates

Use this to import email action templates to an account as a JSON file.

> The import will fail if you attempt to import a template with the same name as an existing template of the same type in the destination account.

Data for this call should be in the form of multipart/form-data. Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Format

```
POST /controller/actiontemplate/email
```

Example

```
curl  -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller/actiontemplate/email -
F file=@emailactiontemplate.json

{"success":true,"errors":[],"warnings":[]}
```

Export HTTP Request Action Templates from an Account

This API exports all the HTTP request action templates in the current account to a JSON file.

Format

```
GET /controller/actiontemplate/httprequest/
```

Example:

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/actiontemplate/httprequest

[ {
  "actionPlanType" : "httprequest",
  "name" : "MyCustomHTTPTemplate",
  "oneRequestPerEvent" : false,
  "eventClampLimit" : -1,
  "defaultCustomProperties" : [ ],
  "method" : "GET",
  "scheme" : "HTTP",
  "host" : "http",
  "port" : 0,
  "path" : "//demo.appdynamics.com//controller/rest/applications/${latestEvent.application.name}/nodes
/${latestEvent.node.name}",
  "query" : "",
  "urlCharset" : "UTF_8",
  "authType" : "BASIC",
  "authUsername" : "user1",
  "authPassword" : "your_password",
  "headers" : [ ],
  "payloadTemplate" : {
    "httpRequestActionMediaType" : "text/plain",
    "charset" : "UTF_8",
    "formDataPairs" : [ ],
    "payload" : ""
  },
  "connectTimeoutInMillis" : 5000,
  "socketTimeoutInMillis" : 15000,
  "maxFollowRedirects" : 0,
  "responseMatchCriteriaAnyTemplate" : [ ],
  "responseMatchCriteriaNoneTemplate" : [ ],
  "testLogLevel" : "DEBUG",
  "testPropertiesPairs" : [ ],
  "eventTypeCountPairs" : [ ]
} ]
```

Import HTTP Action Templates into an Account

After you have exported HTTP request action templates, you can import them to a different account by logging into the destination account and passing the JSON file created by the export operation as the payload to the `POST` request.

You can modify the exported file before you import it. You might want to do this to remove one or more template configurations or to change their names.

The import will fail if you attempt to import a template with the same name as an existing template of the same type in the destination account.

Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Format

```
GET /controller/actiontemplate/httprequest
```

Example

```
curl  -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller/actiontemplate
/httprequest -F file=@httpactiontemplate.json

{"success":true,"errors":[],"warnings":[]}
```

Export Custom Dashboards and Templates

You can export and import custom dashboards and custom dashboard templates interactively from the Controller UI or by using this API call. See Import and Export Custom Dashboards and Templates Using the UI.

To export the dashboard, the user making the API call must have permission to view the custom dashboard.

In the export call, you must identify the dashboard to export by its ID. When you open the dashboard in the UI, the ID appears as the dashboard parameter at the end of the URL.

For example, in this URL snippet, the custom dashboard ID is 3: `location=CDASHBOARD_DETAIL&mode=MODE_DASHBOARD&dashboard=3`

Format

```
GET /controller/CustomDashboardImportExportServlet?dashboardId=dashboard_id
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`dashboardId`	Query	The numeric ID of the custom dashboard.	Yes

Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller
/CustomDashboardImportExportServlet?dashboardId=8

{
  "schemaVersion" : null,
  "dashboardFormatVersion" : "3.0",
  "name" : "Analytics-BrowserData",
   ...
  "warRoom" : false,
  "template" : false
}
```

View a complete response example:

```
{
  "schemaVersion" : null,
  "dashboardFormatVersion" : "3.0",
  "name" : "Analytics-BrowserData",
  "description" : null,
  "properties" : null,
  "templateEntityType" : "APPLICATION_COMPONENT_NODE",
  "associatedEntityTemplates" : null,
  "minutesBeforeAnchorTime" : 15,
  "startDate" : null,
  "endDate" : null,
  "refreshInterval" : 120000,
  "backgroundColor" : 15395562,
  "color" : 15395562,
  "height" : 768,
  "width" : 1024,
  "canvasType" : "CANVAS_TYPE_GRID",
  "layoutType" : "",
  "widgetTemplates" : [ {
    "widgetType" : "AnalyticsWidget",
    "title" : "Browser_data",
    "height" : 4,
    "width" : 4,
    "x" : 0,
    "y" : 0,
    "label" : "",
    "description" : "",
    "drillDownUrl" : "",
    "useMetricBrowserAsDrillDown" : false,
```

```
    "backgroundColor" : 16777215,
    "backgroundColors" : null,
    "backgroundColorsStr" : null,
    "color" : 4210752,
    "fontSize" : 12,

    "dataFetchSize" : null,
    "percentileLine" : null,
    "timeRangeInterval" : null,
    "pollingInterval" : null,
    "unit" : null
  } ],
  "warRoom" : false,
  "template" : false
}o
```

Import Custom Dashboards and Templates

You can import custom dashboards and templates based on a previously exported JSON definition, which has optionally been modified. Import the definition as an `application/json` content type.

The user making the API call must have permission to create dashboards in the Controller.

Data for this call should be in the form of multipart/form-data. Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Prior to version 4.1, exported custom dashboards were in XML format. You can import custom dashboards previously exported as XML data into the current Controller; however, custom dashboards can only be exported as JSON data.

Format

```
POST /controller/CustomDashboardImportExportServlet
```

Example

```
curl  -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller
/CustomDashboardImportExportServlet -F file=@customdashboards.json

{"success":true,"errors":[],"warnings":[],"createdDashboardName":"Uploaded-Analytics-BrowserData"}
```

Export Health Rules from an Application

Returns all health rules in XML format.

The user account you use to make the API call must have permission to view the health rule.

Format

```
GET /controller/healthrules/application_id?name=health_rule_name
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_id`	URI	The application name or application ID.	Yes
`name`	Query	The name of the health rule to export. If not specified, exports all health rules.	No

Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/healthrules/38?
name=MyCustomHealthRule

<health-rules controller-version="004-002-000-000">
    <health-rule>
        <name>MyCustomHealthRule</name>
        <type>BUSINESS_TRANSACTION</type>
        <description/>
        <enabled>true</enabled>
        <is-default>false</is-default>
        <always-enabled>true</always-enabled>
        <duration-min>30</duration-min>
        <wait-time-min>30</wait-time-min>
        <affected-entities-match-criteria>
            <affected-bt-match-criteria>
                <type>ALL</type>
            </affected-bt-match-criteria>
        </affected-entities-match-criteria>
        <warning-execution-criteria>
            <entity-aggregation-scope>
                <type>ANY</type>
                <value>0</value>
            </entity-aggregation-scope>
            <policy-condition>
                <type>leaf</type>
                <display-name>CPU</display-name>
                <condition-value-type>BASELINE_STANDARD_DEVIATION</condition-value-type>
                <condition-value>2.0</condition-value>
                <operator>GREATER_THAN</operator>
                <condition-expression/>
                <use-active-baseline>true</use-active-baseline>
                <metric-expression>
                    <type>leaf</type>
                    <function-type>VALUE</function-type>
                    <value>0</value>
                    <is-literal-expression>false</is-literal-expression>
                    <display-name>null</display-name>
                    <metric-definition>
                        <type>LOGICAL_METRIC</type>
                        <logical-metric-name>Average CPU Used (ms)</logical-metric-name>
                    </metric-definition>
                </metric-expression>
            </policy-condition>
        </warning-execution-criteria>
    </health-rule>
</health-rules>
```

Import Health Rules into an Application

You can import health rules defined in an XML file into a business application.

Data for this call should be in the form of multipart/form-data. In the POST request, use UTF-8 URL encoding for the URI; for example, do not replace a space (" ") with "%20" in the URI.

By default, a health rule in the posted data with an identical name to one in the existing configuration does not overwrite the existing health rule. If you want to overwrite an existing health rule of the same name, use the overwrite parameter.

The syntax is the same for importing one health rule configuration or several. All the health rule configurations in the posted XML file are imported.

Format

```
POST /controller/healthrules/application_id?overwrite=true_or_false
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory

application_id	URI	The application name or application ID.	Yes
overwrite	Query	Set to true to have health rules in the posted data overwrite existing health rules with the same name. The default is false.	No

Example

```
curl -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller/healthrules/38 -F
file=@uploadhealthrule.xml

Imported 1 health rules successfully.
```

If the health rule exists and you have not enabled the overwrite parameters, you will get the following response:

```
Not importing the health rule: healthrulename since it already exists.
```

Export Transaction Detection Rules

Use this to get all transaction detection rules in XML format. This call returns different types of detection rule configurations when MDS is enabled.

You can get transaction detection rules from a number of different configurations, including the configuration for a specific scope by name.

The URI used by clients for this call should be UTF-8 encoded.

Format

```
GET /controller/transactiondetection/application_id/[scope_name]/rule_type/[entry_point_type]/[rule_name]
>> xml_name.xml
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID. It can be found in the URL in the address bar if you click the specified application. It is an Integer value. It will return an error if you do not specify.	Yes
scope_name	URI	The name of the scope from which you are exporting the entry point configuration. The scope name cannot be custom and auto. If the scope name contains a space, type %20 instead of space. For example: curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/10/default%20scope/custom >> result.xml It will export all the rules under all the scopes if you do not specify.	No
rule_type	URI	The type of rule to export, from these options: • auto: Automatic detection rules • custom: Custom detection rules in the configuration It will return an error if you do not specify.	Yes
entry_point_type	URI	The POJO, Servlet, EJB, Spring Bean, etc. It will export the rules which belong to all the entry point types if you do not specify.	No
rule_name	URI	The name of the rule which you are exporting. It will export all the rules under a scope or all the scopes if you do not specify.	No

- The order of the parameters cannot be changed. The order of the parameters should be: application_id/[scope_name]/rule_type/[entry_point_type]/[rule_name].
- It will return an XML file with error content if you use the wrong name(s) in all the parameters.
- Tier information is provided in the scope list.
- If you do not specify the scope when exporting, then you should also not specify it when importing.
- Please check the server.log file if you do not get the expected result after exporting.

Scenarios:

- Export the rules from all the scopes.

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection
/applicationID/{rule_type} >> {xml_name}.xml
```

Example:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/10
/custom >> result.xml
```

If you do not include `scope_name`, the output is divided into three parts under `<mds-config-data>: scope-list, rule-list,` and `scope-rule-mapping-list.`

```
<mds-data>
    <mds-config-data>
        <scope-list>
            <scope scope-description="" scope-name="scope0"
                scope-type="ALL_TIERS_IN_APP" scope-version="0"/>
            <scope scope-description="" scope-name="scope1"
                scope-type="SELECTED_TIERS" scope-version="0"/>
        </scope-list>
        <rule-list>
            <rule agent-type="APPLICATION_SERVER" enabled="true"
                priority="1"
                rule-description="ruleInScope1_SERVLET"
                rule-name="ruleInScope1_SERVLET" rule-type="TX_MATCH_RULE" version="0">

            <rule agent-type="APPLICATION_SERVER"
                enabled="true" priority="0"
                rule-description="whatever_SERVLET"
                rule-name="whatever_SERVLET"
                rule-type="TX_MATCH_RULE" version="0">
                <tx-match-rule>{"type":"CUSTOM","txcustomrule":{"type":"EXCLUDE","txentrypointtype":"
SERVLET","matchconditions":[{"type":"HTTP","httpmatch":{"parameters":[],"headers":[],"classmatch":
{"type":"MATCHES_CLASS","classnamecondition":{"type":"EQUALS","matchstrings":["System.Web.Optimization.
BundleHandler"],"isnot":false}},"cookies":[]}}],"actions":[{"type":"HTTP_SPLIT","httpsplit":{}}],"
```

```
properties":[]},"agenttype":"APPLICATION_SERVER"}</tx-match-rule>
            </rule>
        </rule-list>
        <scope-rule-mapping-list>
            <scope-rule-mapping scope-name="scope1">
                <rule rule-description="ruleInScope1_SERVLET" rule-name="ruleInScope1_SERVLET"/>
            </scope-rule-mapping>
            <scope-rule-mapping scope-name="scope0">
                <rule rule-description="ASP.NET MVC5 Resource Handler" rule-name="ASP.NET MVC5 Resource
Handler"/>
                <rule rule-description="whatever_SERVLET" rule-name="whatever_SERVLET"/>
                <rule rule-description="testPOJO" rule-name="testPOJO"/>
            </scope-rule-mapping>
        </scope-rule-mapping-list>
    </mds-config-data>
</mds-data>
```

- Export the rules under the specified scope:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection
/applicationID/scope_name/{rule_type} >> {xml_name}.xml
```

Example:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/10
/scope0/custom >> result.xml
```

If you include `scope_name` then only `rule-list` is included in the output.

```
<mds-data>
    <mds-config-data>
        <rule-list>
            <rule agent-type="DOT_NET_APPLICATION_SERVER"
                enabled="true" priority="0"
                rule-description="ASP.NET MVC5 Resource Handler"
                rule-name="ASP.NET MVC5 Resource Handler"
                rule-type="TX_MATCH_RULE" version="0">
                <tx-match-rule>{"type":"CUSTOM","txcustomrule":{"type":"EXCLUDE","txentrypointtype":"

properties":[]},"agenttype":"APPLICATION_SERVER"}</tx-match-rule>
            </rule>
```

```
        </rule-list>
    </mds-config-data>
</mds-data>
```

- Export the rules belonging to the specified entry point under all the scopes.

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection
/applicationID/{rule_type}/{entry_point_type} >> {xml_name}.xml
```

Example:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/10
/custom/servlet >> {xml_name}.xml
```

If you do not include `scope_name` then the output is divided into three parts under `<mds-config-data>: scope-list, rule-list, and scope-rule-mapping-list.`

```
<mds-data>
    <mds-config-data>
        <scope-list>
            <scope scope-description="" scope-name="scope0"
                scope-type="ALL_TIERS_IN_APP" scope-version="0"/>
            <scope scope-description="" scope-name="scope1"
                scope-type="SELECTED_TIERS" scope-version="0"/>
        </scope-list>
        <rule-list>
            <rule agent-type="APPLICATION_SERVER" enabled="true"
                priority="1"
                rule-description="ruleInScope1_SERVLET"
                rule-name="ruleInScope1_SERVLET" rule-type="TX_MATCH_RULE" version="0">
                <tx-match-rule>{"type":"CUSTOM","txautodiscoveryrule":{"autodiscoveryconfigs":[]},"
txcustomrule":{"type":"INCLUDE","txentrypointtype":"SERVLET","matchconditions":[{"type":"HTTP","
httpmatch":{"uri":{"type":"IS_NOT_EMPTY","matchstrings":[""]},"parameters":[],"headers":[],"cookies":

properties":[]},"agenttype":"APPLICATION_SERVER"}</tx-match-rule>
            </rule>
        </rule-list>
        <scope-rule-mapping-list>
            <scope-rule-mapping scope-name="scope1">
                <rule rule-description="ruleInScope1_SERVLET" rule-name="ruleInScope1_SERVLET"/>
            </scope-rule-mapping>
            <scope-rule-mapping scope-name="scope0">
                <rule rule-description="whatever_SERVLET" rule-name="whatever_SERVLET"/>
            </scope-rule-mapping>
        </scope-rule-mapping-list>
    </mds-config-data>
</mds-data>
```

- Export the rules belonging to the specified entry point under the specified scope.

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection
/applicationID/scope_name/{rule_type}/{entry_point_type} >> {xml_name}.xml
```

Example:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/10
/scope0/custom/servlet >> {xml_name}.xml
```

```
<mds-data>
    <mds-config-data>
        <rule-list>
            <rule agent-type="APPLICATION_SERVER" enabled="true"
                priority="1"
                rule-description="ruleInScope1_SERVLET"
                rule-name="ruleInScope1_SERVLET" rule-type="TX_MATCH_RULE" version="0">
                <tx-match-rule>{"type":"CUSTOM","txautodiscoveryrule":{"autodiscoveryconfigs":[]},"
txcustomrule":{"type":"INCLUDE","txentrypointtype":"SERVLET","matchconditions":[{"type":"HTTP","
httpmatch":{"uri":{"type":"IS_NOT_EMPTY","matchstrings":[""]},"parameters":[],"headers":[],"cookies":
[]}}],"actions":[],"properties":[]},"agenttype":"APPLICATION_SERVER"}</tx-match-rule>
            </rule>
        </rule-list>
    </mds-config-data>
</mds-data>
```

- Export the single rule belonging to the specified entry point under the specified scope.

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection
/applicationID/scope_name/{rule_type}/{entry_point_type}/{rule_name} >> {xml_name}.xml
```

Example:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/10
/scope0/custom/servlet/rule_name >> {xml_name}.xml
```

```
<mds-data>
    <mds-config-data>
        <rule-list>
            <rule agent-type="APPLICATION_SERVER" enabled="true"
                priority="1" rule-description=""
                rule-name="ruleInScope1" rule-type="TX_MATCH_RULE" version="0">
                <tx-match-rule>{"type":"CUSTOM","txautodiscoveryrule":{"autodiscoveryconfigs":[]},"

[]}}],"actions":[],"properties":[]},"agenttype":"APPLICATION_SERVER"}</tx-match-rule>
            </rule>
        </rule-list>
    </mds-config-data>
</mds-data>
```

Import Transaction Detection Rules

Use this to import automatic detection rules in XML format. This call returns different types of detection rule configurations when MDS is enabled.

Importing action will overwrite a rule or add the new rule to the all/specified scopes.

Data for this call should be in the form of multipart/form-data. The URI for this call should be UTF-8 encoded.

Format

```
POST /controller/transactiondetection/application_id/[scope_name]/rule_type/[entry_point_type]/[rule_name] -F
file=@exported_file_name.xml
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory

`application_id`	URI	The application name or application ID. It can be found in the URL in address bar if you click the specified application. It is an Integer value. It will return an error if you do not specify.	Yes
`scope_name`	URI	The name of the scope from which you are importing the entry point configuration. It will import the rules to all the scopes if you do not specify.	No
`rule_type`	URI	The type of rule to import, from these options: • auto: Automatic detection rules • custom: Custom detection rules in the configuration • exclude: Custom exclude rules for transaction detection It will return an error if you do not specify.	Yes
`entry_point_type`	URI	The POJO, Servlet, EJB, Spring Bean, etc	No
`rule_name`	URI	The name of the rule which you are importing. It will import all the rules under a scope or all the scopes if you do not specify.	No

- When you import, if the XML file does not have `<scope-list>`, then you should type the scope name, otherwise, it will fail, and vice versa.
- It will return an error if you use the wrong name(s) in all the parameters.
- If you do not specify the scope when importing, then you should not specify it when exporting.
- Check the `server.log` file if you do not get the expected result after exporting.

Examples

- Import the rule(s) to the application without scopes specified:

```
curl -X POST --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/
{application_id}/{rule_type} -F file=@{exported_file_name}.xml
```

- Import the rule(s) to the application with scopes specified:

```
curl -X POST --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/
{application_id}/{scope_name}/{rule_type} -F file=@{exported_file_name}.xml
```

- For more scenarios to import, see Export Transaction Detection Rules.

Export Policies

You can export policies to a JSON file. Before you export policies, export any actions or health rules with their respective APIs.

Format

`GET /controller/policies/application_id`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_id`	URI	The application name or application ID.	Yes

Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/policies/application_id

[ {
  "applicationName" : "ECommerce-Books",
  "name" : "My Policy",
  "reactorType" : "IMMEDIATE",
  "enabled" : true,
  "batchActionsPerMinute" : true,
  "durationInMin" : 1,
```

```
  "eventFilterTemplate" : {
    "applicationName" : "ECommerce-E2E",
    "healthRuleNames" : null,
    "eventTypes" : [ "POLICY_OPEN_WARNING", "POLICY_OPEN_CRITICAL", "POLICY_CONTINUES_WARNING",
"POLICY_CONTINUES_CRITICAL" ],
    "rsdTypes" : null,
    "customEventFilters" : null,
    "specificEntityNamesByType" : null
  },
  "entityFilterTemplates" : [ ],
  "actionWrapperTemplates" : [ {
    "actionTag" : "ops_viewer@acme.com",
    "type" : null,
    "value" : 0,
    "notes" : "Policy: My Policy",
    "entityIdentifierTemplates" : [ ]
  } ]
} ]
```

Import Policies

You can import policies that you exported with the Export Policies API. Before you import policies, import any actions or health rules with their respective APIs.

You can import a policy after modifying the defined parameter(s) and overwrite the existing policy with the updated one.

Format

`POST /controller/policies/application_id ?overwrite=true_or_false`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`application_id`	URI	The application name or application ID.	Yes
`overwrite`	Query	Set to true to have updates to a policy overwrite the existing policy with the same name. The default is `false` .	No

Example

```
curl  -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller/policies/38 -F
file=@ImportPolicies.json

{"success":true,"errors":[],"warnings":[]}
```

Example to Overwrite a Policy

```
curl  -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller/policies/38\?
overwrite\=true -F file=@ImportPolicies.json

{"success":true,"errors":[],"warnings":[]}
```

Export Application Analytics Dynamic Service Configuration

The Analytics Dynamic Service is an AppDynamics app agent plugin that performs Analytics client functions for the agent. Enabling the Dynamic Service enables AppDynamics Analytics for an app agent type. You can export the Dynamic Service configuration to back up the configuration or for later import into another Controller.

Format

`GET /controller/analyticsdynamicservice/application_id`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes
filename	Query	The name of a file to which the configuration will be exported.	No

Example

```
curl -i --user user1@customer1:your_password http://demo.appdynamics.com/controller/analyticsdynamicservice/10

<analytics-dynamic-service-configurations controller-version="004-003-000-000">
    <analytics-dynamic-service-configuration>
        <override>true</override>
        <agent-type>APP_AGENT</agent-type>
        <enabled>true</enabled>
    </analytics-dynamic-service-configuration>
    <analytics-dynamic-service-configuration>
        <override>true</override>
        <agent-type>DOT_NET_APP_AGENT</agent-type>
        <enabled>true</enabled>
    </analytics-dynamic-service-configuration>
    <analytics-dynamic-service-configuration>
        <override>true</override>
        <agent-type>NODEJS_APP_AGENT</agent-type>
        <enabled>true</enabled>
    </analytics-dynamic-service-configuration>
</analytics-dynamic-service-configurations>
```

Import Application Analytics Dynamic Service Configuration

The Analytics Dynamics Service configuration determines whether AppDynamics Analytics is enabled for an app agent type. You use this API to import a previously exported configuration to another Controller.

Data for this call should be in the form of multipart/form-data.

Format

```
POST /controller/analyticsdynamicservice/application_id
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The name or ID identifier of the application to which the Analytics Dynamic Service configuration should be applied.	Yes

Example

```
curl -i -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller
/analyticsdynamicservice/10 -F file=@dynamicservice.xml
```

The following example shows sample contents of the `dynamicservice.xml` file. Notice that the `agent-type` element indicates the type of app server agent to which the enabled state of the dynamics service applies. The `APP_AGENT` type represents the Java Agent, the `DOT_NET_APP_AGENT` the .NET Agent, and so on.

```
<analytics-dynamic-service-configurations controller-version="004-003-000-000">
    <analytics-dynamic-service-configuration>
        <override>true</override>
        <agent-type>APP_AGENT</agent-type>
        <enabled>false</enabled>
    </analytics-dynamic-service-configuration>
    <analytics-dynamic-service-configuration>
        <override>true</override>
        <agent-type>DOT_NET_APP_AGENT</agent-type>
        <enabled>false</enabled>
    </analytics-dynamic-service-configuration>
```

```
    <analytics-dynamic-service-configuration>
        <override>true</override>
        <agent-type>NODEJS_APP_AGENT</agent-type>
        <enabled>true</enabled>
    </analytics-dynamic-service-configuration>
</analytics-dynamic-service-configurations>
```

Database Visibility API

This page describes the Database Visibility API methods you can use to get, create, update, and delete Database Visibility Collectors.

Include the following headers for all Database Visibility API requests:

```
Accept: application/json; Content-type: application/json
```

JSON is currently the only supported format.

Get All Collectors

```
GET /controller/rest/databases/collectors
```

Get a Specific Collector

```
GET /controller/rest/databases/collectors/{configurationId}
```

Create a Collector

```
POST /controller/rest/databases/collectors/create
```

The JSON you send must contain the relevant Collector information. The required fields describing the Collector vary based on the type of database. See UI Collector versus JSON Collector Configuration Field Names

Example JSON Request

```
{
    "type":"MYSQL",
    "name":"localdocker_dbagent-MySQLCollector",
    "hostname":"mysql",
    "port":"3306",
    "username":"root",
    "password":"appdynamics_redacted_password",
    "enabled":true,
    "excludedSchemas":null,
    "databaseName":null,
    "failoverPartner":null,
    "connectAsSysdba":false,
    "useServiceName":false,
    "sid":null,
    "customConnectionString":null,
    "enterpriseDB":false,
    "useSSL":false,
    "enableOSMonitor":false,
    "hostOS":null,
    "useLocalWMI":false,
    "hostDomain":null,
    "hostUsername":null,
    "hostPassword":"",
    "dbInstanceIdentifier":null,
    "region":null,
    "certificateAuth":false,
    "removeLiterals":true,
    "sshPort":0,
    "agentName":"localdocker_dbagent",
    "dbCyberArkEnabled":false,
    "dbCyberArkApplication":null,
    "dbCyberArkSafe":null,
    "dbCyberArkFolder":null,
    "dbCyberArkObject":null,
```

```
    "hwCyberArkEnabled":false,
    "hwCyberArkApplication":null,
    "hwCyberArkSafe":null,
    "hwCyberArkFolder":null,
    "hwCyberArkObject":null,
    "orapkiSslEnabled":false,
    "orasslClientAuthEnabled":false,
    "orasslTruststoreLoc":null,
    "orasslTruststoreType":null,
    "orasslTruststorePassword":"",
    "orasslKeystoreLoc":null,
    "orasslKeystoreType":null,
    "orasslKeystorePassword":"",
    "ldapEnabled":false,
    "customMetrics":null,
    "subConfigs":[
        {
            "type":"MYSQL",
            "name":"localdocker_dbagent-MySQLCollector sub-collector",
            "hostname":"mysql-remote",
            "port":"3388",
            "username":"root",
            "password":"different-password",
            "enabled":true,
            "excludedSchemas":null,
            "databaseName":null,

            "useServiceName":false,
            "sid":null,
            "customConnectionString":null,
            "enterpriseDB":false,
            "useSSL":false,
            "enableOSMonitor":false,
            "hostOS":null,
            "useLocalWMI":false,
            "hostDomain":null,
            "hostUsername":null,
            "hostPassword":"",
            "dbInstanceIdentifier":null,
            "region":null,
            "certificateAuth":false,
            "removeLiterals":true,
            "sshPort":0,
            "agentName":"localdocker_dbagent",
            "dbCyberArkEnabled":false,
            "dbCyberArkApplication":null,
            "dbCyberArkSafe":null,
            "dbCyberArkFolder":null,
            "dbCyberArkObject":null,
            "hwCyberArkEnabled":false,
            "hwCyberArkApplication":null,
            "hwCyberArkSafe":null,
            "hwCyberArkFolder":null,
            "hwCyberArkObject":null,
            "orapkiSslEnabled":false,
            "orasslClientAuthEnabled":false,
            "orasslTruststoreLoc":null,
            "orasslTruststoreType":null,
            "orasslTruststorePassword":"",
            "orasslKeystoreLoc":null,
            "orasslKeystoreType":null,
            "orasslKeystorePassword":"",
            "ldapEnabled":false,
            "customMetrics":null
        }
    ]
}
```

extraProperties: To configure the frequency for sampling queries from the database (except Cassandra), you can use the `extraProperties` parameter in the JSON request payload. The following JSON sample can be used in the request payload to configure the sampling interval:

```
{
    "type":"POSTGRESQL",
    "agentName":"UpgradeTest204",
    "name":"SamplingInterval",
    "hostname":"ec2-54-202-140-213.us-west-2.compute.amazonaws.com",
    "port":"5432",
    "username":"postgres",
    "password":"Appd123",
    "removeLiterals":"true",
    "enableOSMonitor":"true",
    "hostOS":"LINUX",
    "sshPort":"22",
    "hostUsername":"ec2-user",
    "hostPassword":"",
    "certificateAuth":true,
    "enabled":"true",
    "enterpriseDB":"false",
    "extraProperties":[
        {
            "key":"dbagent.sampling.interval",
            "value":"10",
            "sensitive":false
        }
    ]
}
```

The following JSON key-value pair is used in `extraProperties` for configuring the interval:

key: `dbagent.sampling.interval`

value: positive integer

The value can be 1, 2, 5, 10, 20, or 30.

You can configure this property through the agent. See Configure the Agent Settings for Monitoring Database.

Update a Collector

1. Make a `GET` request for the collector that you want to update.
2. Copy the JSON response body that is returned by the `GET` request to a text editor, and modify the fields that you want to update.
3. Make a `POST` request for the collector that you want to update, and include the updated JSON.

```
POST /controller/rest/databases/collectors/update
```

Example JSON Request

```
{
    "id":1,
    "type":"MYSQL",
    "name":"localdocker_dbagent-MySQLCollector",
    "hostname":"mysql",
    "port":"3306",
    "username":"root",
    "password":"appdynamics_redacted_password",
    "enabled":true,
    "excludedSchemas":null,
    "databaseName":null,
    "failoverPartner":null,
    "connectAsSysdba":false,
    "useServiceName":false,
    "sid":null,
    "customConnectionString":null,
    "enterpriseDB":false,
    "useSSL":false,
```

```
"enableOSMonitor":false,
"hostOS":null,
"useLocalWMI":false,
"hostDomain":null,
"hostUsername":null,
"hostPassword":"",
"dbInstanceIdentifier":null,
"region":null,
"certificateAuth":false,
"removeLiterals":true,
"sshPort":0,
"agentName":"localdocker_dbagent",
"dbCyberArkEnabled":false,
"dbCyberArkApplication":null,
"dbCyberArkSafe":null,
"dbCyberArkFolder":null,
"dbCyberArkObject":null,
"hwCyberArkEnabled":false,
"hwCyberArkApplication":null,
"hwCyberArkSafe":null,
"hwCyberArkFolder":null,
"hwCyberArkObject":null,
"orapkiSslEnabled":false,
"orasslClientAuthEnabled":false,
"orasslTruststoreLoc":null,
"orasslTruststoreType":null,
"orasslTruststorePassword":"",
"orasslKeystoreLoc":null,
"orasslKeystoreType":null,
"orasslKeystorePassword":"",
"ldapEnabled":false,
"customMetrics":null,
"subConfigs":[
    {
        "id":2,
        "type":"MYSQL",
        "name":"localdocker_dbagent-MySQLCollector sub-collector",
        "hostname":"mysql",
        "port":"3388",
        "username":"root",
        "password":"appdynamics-redacted-password",
        "enabled":true,
        "excludedSchemas":null,
        "databaseName":null,
        "failoverPartner":null,
        "connectAsSysdba":false,
        "useServiceName":false,
        "sid":null,
        "customConnectionString":null,
        "enterpriseDB":false,

        }
    ]
}
```

The JSON you send must contain all the details of the existing collector with only the fields that you want to modify changed. To ensure you have all the fields, use the Get a Specific Collector call.

To add a new sub-collector to an existing collector, provide the sub-collector details without the `id` field.

> To configure the interval for sampling queries, refer to the `extraProperties` parameter in the JSON request payload as mentioned in extraProperties under Create a Collector.

Delete a Specific Collector

```
DELETE /controller/rest/databases/collectors/{configurationId}
```

Example Delete Request

```
DELETE /controller/rest/databases/collectors/{1}
```

Batch Delete Multiple Collectors

```
POST /controller/rest/databases/collectors/batchDelete
```

Send an array of the configuration Ids of the Collectors.

Below is an example of a batch delete command.

```
curl --user {username}@{account_name}:{password} -H "Accept: application/json" -H "Content-type: application
/json" -X POST -d '[1,2,3]' {Controller_URL}/controller/rest/databases/collectors/batchDelete
```

Get All Monitored Database Servers

```
GET /controller/rest/databases/servers
```

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/databases/servers
```

The output is a list of database servers and their details.

Get Database Server Details

```
GET /controller/rest/databases/servers/{dbserver_id}
```

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/databases/servers/
{dbserver_id}
```

The output contains a list of the database's details, including name, node ID, and database type.

Get all Database Agent Events

```
GET /controller/rest/applications/_dbmon/events
```

For a list of query string parameters, see Retrieve Event Data.

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/applications/_dbmon/events?
time-range-type=BEFORE_NOW&duration-in-mins=30&event-types=%20AGENT_EVENT,
DB_SERVER_PARAMTER_CHANGE&severities=INFO,WARN,ERROR
```

The output gives you a list of events. For each event element, you can determine the node that the event is mapped to by looking for the entity-definition element.

Get all Database Monitoring Application Nodes

```
GET /controller/rest/applications/_dbmon/nodes
```

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/applications/_dbmon/nodes
```

UI Collector versus JSON Collector Configuration Field Names

Use the table below to ensure you use the correct field names for your API calls. The Collector configuration field names are described in Configure the Database Agent to Monitor Server Hardware and Add Database Collectors.

Section	UI Collector Configuration Field Name	JSON Collector Configuration Field Name
		id (AppDynamics assigns this ID to the Collector when you configure the Collector. You need this ID when doing a batch delete.)
	Database Type	`type`
	Database Agent	`agentName`
	Database	`name`
Connection Details	**Hostname/IP Address**	`hostname`
	EnterpriseDB	`enterpriseDB`
	Failover Partner	`failoverPartner`
	Listener Port	`port`

	Custom JDBC Connection String	`customConnectionString`
	Use Service Name	`useServiceName`
	SID or SERVICE_NAME	`sid`
	Connect as a sysdba	`connectAsSysdba`
	Username	`username`
	Password	`password`
	Logging Enabled	
Hardware Monitoring	**Monitor Operating System**	`enableOSMonitor`
	Operating System	`hostOS`
	Use Local WMI	`useLocalWMI`
	Domain	`hostDomain`
	SSH Port	`sshPort`
	Use certificate	`certificateAuth`
	Username	`hostUsername`
	Password	`hostPassword`

SSL field

In addition to JSON Configuration Fields, there is the SSL field. SSL is a configurable property for the Database Agent. If the Database Agent has been configured to use SSL, then you must also provide the SSL field and its value in your Database Visibility API calls.

Get Health Rule Violations for a Collector

```
GET /controller/rest/databases/servers/healthrule-violations/<server-id>
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
`server_id`	URI	Provide the databse server name or ID.	Yes

`time-range-type`	Query	Possible values are:
		`BEFORE_NOW`
		To use the "`BEFORE_NOW`" option, you must also specify the "`duration-in-mins`" parameter.
		`BEFORE_TIME`
		To use the "`BEFORE_TIME`" option, you must also specify the "`duration-in-mins`" and "`end-time`" parameters.
		`AFTER_TIME`
		To use the "`AFTER_TIME`" option, you must also specify the "`duration-in-mins`" and "`start-time`" parameters.
		
		`BETWEEN_TIMES`
		
		To use this option, you must also specify the "`start-time`" and "`end-time`" parameters. The "`BETWEEN_TIMES`" range includes the start-time and excludes the end-time.
			Yes

`duration-in-mins`	Query	Duration (in minutes) to return the metric data.	If time-range-type is `BEFORE_NOW, BEFORE_TIME, or AFTER_TIME`
`start-time`	Query	Start time (in milliseconds) from which the metric data is returned.	If time-range-type is `AFTER_TIME` or `BETWEEN_TIMES`
`end-time`	Query	End time (in milliseconds) until which the metric data is returned.	If time-range-type is `BEFORE_TIME` or `BETWEEN_TIMES`
`output`	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are `XML` (default) or `JSON`.	No

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/databases/servers/healthrule-violations/<server-id>?time-range-type=BEFORE_NOW&duration-in-mins=<required_duration>
```

Analytics Events API

AppDynamics Analytics provides built-in support for collecting analytics data from various types of sources, such as agent-instrumented Java applications, .NET applications, browser applications, and more. The Analytics Events API supplements built-in analytics data sources with your custom data sources and event types.

In addition to the transaction events published by the app agents, custom events collected by the Analytics Events API are metered.

Publishing custom events requires Transaction Analytics licensing. Transaction Analytics license units determine the limit on the volume of custom e publish.

About the Analytics Events API

In Analytics, an event encapsulates a unit of analytics data. In APM, for example, each event corresponds to a method or service invocation, whether it be an entry point service or downstream service.

With the Analytics API, you define the structure of your own custom event in the data store, capture the event records as they occur in your custom source, and send them to the Events Service, the data store for Analytics. Once your data is in the Events Store, users can query your data through the Controller UI or the Analytics Events API.

Analytics Events API uses a shared key to authenticate clients to the Events Service. As a Controller or Analytics Administrator, you can generate API keys from the Controller UI. See Manage API Keys.

A Transaction Analytics license is required to use the Events Service API. The same licensing model that applies to business transactions for custom events (based on the number of events per unit/day) applies to the API.

Addressing the Events Service Data Store

Unlike most AppDynamics REST APIs, which are presented at the Controller, you access the Analytics Events API by addressing the Events Service instance in the AppDynamics platform.

You address the Events Service at one of the following URLs:

For an on-premises Events Service, address the Events Service instance host (or more likely, the virtual IP presented by a load balancer for the Events Service cluster). Use the primary default listening port for the Events Service, 9080.

Calls to the Analytics Events API need to specify the <global_accountp_name> for the Controller account being address, and the <api_key> generated by the administrator for this client. The API expects the values as headers, property-value pairs that are separated by a colon. As cURL arguments, for example, the values would be passed with curl through the `-H` or `--header option` as follows:

```
-H"X-Events-API-AccountName:<global_account_name>" -H"X-Events-API-Key:<api_key>"
```

You can get the global account name to use from the License page in the Controller UI. The API keys are described in Manage API Keys.

The content type, also as a cURL argument, is:

```
-H"Content-type: application/vnd.appd.events+json;v=2"
```

AppDynamics strongly recommends the use of SSL/HTTPS to access the API. Otherwise, the API key is sent in plain text.

For security reasons, the Analytics Events API, by default, does not accept cross-origin HTTP requests. For example, from links embedded directly in web pages.

Data Format

The Analytics Events API takes events as JSON-formatted name-value pair data.

Before sending data that conforms to a custom events schema, you need to define the data structure for the custom schema. The Events Service matches incoming events data to the appropriate schema.

Supported Data Types

- Boolean
- Date – Supported time formats include:
  - ISO 8601 format: `yyyy-MM-dd'T'HH:mm:ss.SSSZZ`.
  - UNIX epoch date format: A 13-digit number representing the number of seconds/milliseconds since UNIX epoch time (Jan 1, 1970). For example, (GMT): Mon, 17 Apr 2017 23:46:22 GMT would be 1492472782000.
- Float
- Integer
- Object
- String

Naming Restrictions

Custom event names and field names must conform to the following:

- Contain only a-z, A-Z, _ (underscore), 0-9.
- Names can not start with a number.

Timestamp Fields

Two implicit timestamp fields are automatically added to custom schemas:

- `eventTimestamp`
- `pickupTimestamp`

The `eventTimestamp` field represents the time an event occurred. An API client can specify a value for the timestamp field when it creates an event. If it does not, the Analytics Events API uses the same value for `eventTimestamp` as it uses for another implicit field, `pickupTimestamp`.The `pickupTimestamp` field, which is always populated by the Events Service, represents the time the event was received by the Events Service.

When configuring a milestone in Business Journeys, you need to supply a date in the `eventTimestamp` field in order for the event to register. In order to use Custom Events to define Business Journey, the custom events should send the `eventTimestamp` field. If not, the Business Journeys will not work.

AppDynamics uses another timestamp, `eventcompletionTimestamp`, which is not automatically added to custom schemas. The `eventcompletionTimestamp` field represents the time an event ends. Generally, AppDynamics uses this field internally to accurately report long-running events.

You can express all timestamp fields using ISO 8601 or UNIX epoch time (64-bit milliseconds) format.

Example API Call Flow

The following steps take you through an on-premises API call workflow for using the Analytics Events API. The steps show cURL examples for creating a schema, publishing an event to that schema, and then querying the event.

For SaaS deployments, replace the value for the URL and port in the examples (`<events_service_endpoint>:9080`) to your SaaS URL.

1. Define the schema by associating field names with data types. For example, the following defines a Purchase event type:

```
curl -X POST "<events_service_endpoint>:9080/events/schema/myProducts" -H"X-Events-API-AccountName:
customer1_1234-567a-bccc-123" -H"X-Events-API-Key:a123b456-c789-1d23-e456-nnn" -H"Content-type:
application/vnd.appd.events+json;v=2" -d '{"schema" : { "id": "string", "productBrand": "string",
"userRating": "integer", "price": "float", "productName": "string", "description": "string" } }'
```

2. Publish an event based on the schema you created:

```
curl -X POST "<events_service_endpoint>:9080/events/publish/myProducts" -H"X-Events-API-AccountName:
customer1_1234-567a-bccc-123" -H"X-Events-API-Key:a123b456-c789-1d23-e456-nnn" -H"Content-type:
application/vnd.appd.events+json;v=2" -d '[{"id": "5653b879ab33a","productBrand": "ACME","userRating":
3,"price": 2006.41,"productName": "Watch","description": "new watch"},{"id": "5653b879700","
productBrand": "Widget","userRating": 1,"price": 3800.13,"productName": "Watch","description": "2015
watch"}]'
```

3. Query the event data:

```
curl -X POST "http://<events_service_endpoint>:9080/events/query" -H"X-Events-API-AccountName:
customer1_7xxx-467a-bccc-xxx" -H"X-Events-API-Key:a123b456-c789-1d23-e456-nnn" -H"Content-type:
application/vnd.appd.events+text;v=2" -d 'SELECT * FROM myProducts'
```

If including fields with ADQL keywords, enclose the keywords in single quotes. These keywords include, for example, `between`, `in`, `select`, and others.

For a single query request, use this content type:

```
-H"Content-type: application/vnd.appd.events+text;v=2"
```

In a multi-query request, the queries are passed as JSON body text. In this case, use the following content type header:

```
-H"Content-type: application/vnd.appd.events+json;v=2"
```

Custom Event Ingestion Limits

Controller ingestion of custom events has the following limits:

- Fields: 255 maximum per event type
- String attributes: 4 kb maximum length
- Batch total count: 1000 events per call
- Batch total size: 5 Mb maximum per call
- Max custom events for an account: 20

Custom Events Limit Increase

> Custom events limit increases are available for SaaS Events Service version 4.5.13 and later. On-premises Events Services cannot exceed a maximum of 1500 custom field events.

By default, the Events Service allows you to create up to 1500 custom fields. If you reach 80% capacity of custom fields (1200 fields), the maximum field limit increases by 500 fields at the next index rollover.

For example, if you reach 1400 custom fields, your maximum field limit will increase from 1500 to 2000 fields. If you later reach 1800 custom fields, and maximum increases to 2500 fields.

You can create an absolute maximum of 3000 custom fields. Reaching or exceeding the maximum fields could result in lag or outages.

Publish Events

The Publish Events API call takes an array of events and stores them in the Events Service storage. The data must comply with an existing schema. A single request cannot publish to multiple event types.

If the event data doesn't match an event schema, the Events Service makes a best-effort attempt to match the data to the schema and returns a 400 bad request if unsuccessful.

Format

Query Params

N/A

Path Parameters

Name	Description
`accountId`	Account ID
`schemaName`	Event schema name

Headers

Name	Description
`X-Events-API-AccountName`	The global account name, as shown in the Controller UI **License** page.
`X-Events-API-Key`	The Analytics API key. See Manage API Keys
`Content-Type`	The `Content-Type` of the request body. The default is `application/vnd.appd.events+json;v=2` which also versions the resource representation (v=2).

Example SaaS Publish

Error Codes

Error Code	Description
400	The given request was invalid.
401	The given authentication information provided in the authorization header was invalid.
404	No event type could be found for this account.
406	The `Accept` header was not `application/vnd.appd.events+json;v=2` .
413	The request body is larger than the max allowed size.
415	The `Content-Type` header was not `application/vnd.appd.events+json;v=2` .
429	Too many requests. Returned when `account` or `event` reaches limits.

Create Event Schema

Use this API to create your own event schema. The schema defines the overall structure of an event type by field and type.

You only need to use this API if the event you are uploading does not match an existing schema for first-class event types (such as logs or transactions). Events that conform to an existing schema automatically match that schema. Review the supported data types and naming restrictions described prior to this topic.

Format

Path Params

Name	Description
`accountId`	Account ID
`schemaName`	Event schema name

Query Params

N/A

Headers

Name	Description
`X-Events-API-AccountName`	The global account name, as shown in the Controller UI **License** page.
`X-Events-API-Key`	The Analytics API key. See Manage API Keys
`Accept`	The `Content-Type` of the response body. The supported value is `application/vnd.appd.events+json;v=2`.
`Content-type`	The `Content-Type` of the request body. The default is `application/vnd.appd.events+json;v=2` which also versions the resource representation (v=2).

Example SaaS Create

Retrieve Event Schema

Use this API to retrieve an existing event schema.

Format

Path Params

Name	Description
`accountId`	Account ID
`schemaName`	Event schema name

Query Params

N/A

Headers

Name	Description
`X-Events-API-AccountName`	The global account name, as shown in the Controller UI **License** page.
`X-Events-API-Key`	The Analytics API key. See Manage API Keys
`Accept`	The `Content-Type` of the response body. The supported value is `application/vnd.appd.events+json;v=2`.

Example SaaS Retrieve

Update Event Schema

Use this API to update an existing event schema by field. The request body defines the updates to be applied to the event schema.

As shown in the following example, you specify each field update action as a named section in the request body. The actions are represented by these fields:

- Add field
- Rename field

For the Add field definition, you need to specify the data format for the new field, as you would when creating the event schema.

The response to this call should be the complete event schema as modified.

Format

Path Parameters

Name	Description
`accountId`	Account id
`schemaName`	Event schema name

Query Params

N/A

Headers

Name	Description
`X-Events-API-AccountName`	The global account name, as shown in the Controller UI **License** page.
`X-Events-API-Key`	The Analytics API key. See Manage API Keys.
`Accept`	The `Content-Type` of the response body. The supported value is `application/vnd.appd.events+json;v=2`.
`Content-type`	The `Content-Type` of the request body. The default is `application/vnd.appd.events+json;v=2` which also versions the resource representation (v=2).

Example SaaS Update

Delete Event Schema

Use this API to delete an existing event schema.

Format

Path Params

Name	Description
`accountId`	Account id
`eventType`	Event schema name

Query Params

N/A

Headers

Name	Description
`X-Events-API-AccountName`	The global account name, as shown in the Controller UI **License** page.
`X-Events-API-Key`	The Analytics API key. See Manage API Keys
`Accept`	The `Content-Type` of the response body. The following is the supported value: `application/vnd.appd.events+json;v=2`

Example SaaS Delete Request

```
DELETE http://analytics.api.example.com/events/schema/{schemaName} HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Accept: application/vnd.appd.events+json;v=2
```

Querying Events

When querying analytics events data, the following applies:

- Every Events Service API has a limit of 200 searches per minute by each account on each event type.
- The Multi-Query Events API is limited to twenty queries per HTTP request.
- The Analytics Query API can return a maximum of 10,000 results. If you would like to retrieve and paginate over the data, you can use the scroll mode. Scroll mode is limited to 1,000 results per batch.

  ⚠ Scroll mode cannot be used in Query Events (Multiple Queries).

- Limits work differently for aggregation and non-aggregation queries. Because we use the limits specified in the ADQL query as the bucket count limit, it is not possible to also use it as the overall result count limit. Therefore, the URL parametric limit is used for the overall limit. In the case of non-aggregation queries, there is no bucket limit, so the limit specified in the ADQL query is taken as the row count limit and the URL parametric limit becomes the second place to look for it if the ADQL query does not specify a limit.
  - Aggregation queries: the total returned row count is limited by the limit in the URL query parameter, and is not directly related to the limits specified in the ADQL query statement itself. The limits in the ADQL query apply only to bucket counts in aggregations.
  - Non-aggregation queries: If `LIMIT` is not specified in the `SELECT` statement, the value specified in the URL query parameter is used. If the limit query parameter is also absent, the default is 100.

Query Events (Single Query)

This API can be used either as a simple text-formatted query or as a JSON-formatted query. The JSON-formatted query can accommodate multiple queries per call and is described in Query Events (Multiple Queries).

An event type might search against multiple event types. Therefore, the event type is not provided in the URL path or as a query parameter, but as part of the ADQL query provided in the request body itself. Your ADQL queries must adhere to the syntax described in the ADQL Reference.

This section describes the single query form for querying events.

Format

Query Params

Name	Description
`start`	Filter results based on the minimum event timestamp, specified in ISO 8601 time (https://en.wikipedia.org/wiki/ISO_8601) or Unix time (http://en.wikipedia.org/wiki/Unix_time). If not specified, then the default is no minimum timestamp filtering. Note that data returned will always be limited by the data retention. Specify the time in combined UTC date and time format or epoch milliseconds. Start time is inclusive of limiting timestamps.
`end`	Filter results based on the maximum event timestamp, specified in ISO 8601 time (https://en.wikipedia.org/wiki/ISO_8601) or Unix time (http://en.wikipedia.org/wiki/Unix_time). If not specified, then the default is no maximum timestamp filtering. ⓘ Data returned will always be limited by the data retention. Specify the time in combined UTC date and time format or epoch milliseconds. End time is inclusive of limiting timestamps.
`limit`	Limits the number of results returned. The default value is 100. The upper limit on the results that can be fetched is 1,000.
`mode`	The default mode is none. You can use the scroll mode to fetch bulk data and paginate over 10,000 ADQL results. Unless a limit is specified in the query, the API enables the Events Service to fetch beyond the maximum limit. The default mode supports aggregation but the scroll mode does not support aggregation or math operations. Order by queries is supported in scroll mode. Scroll queries returns results in batches. Every request response contains results along with a `scrollid`, which needs to be passed in the next request to fetch the next batch of results.

Headers

Name	Description
`X-Events-API-AccountName`	The global account name, as shown in the Controller UI **License** page.
`X-Events-API-Key`	The Analytics API key. See Manage API Keys.
`Accept`	The `Content-Type` of the response body. The supported value is `application/vnd.appd.events+json;v=2`.
`Content-type`	The `Content-Type` of the request body. The default is `application/vnd.appd.events+json;v=2` which also versions the resource representation (v=2).

Example SaaS Query

Query Events (Multiple Queries)

Use this API to execute multiple queries against a particular account and event type in parallel. A query event that specifies multiple queries does so by including multiple ADQL queries in the body of the request. Your ADQL queries must adhere to the syntax described in the ADQL Reference.

Using queries in this form takes advantage of certain backend optimizations in query performance. Query filter criteria, such as time range and limit, can be overridden by each inner query.

ⓘ The Multi-Query Events API is limited to twenty queries per HTTP request.

Format

Path Params

None

Query Params

Name	Description
`start`	Filter results based on the minimum event timestamp, specified in ISO 8601 time or Unix time. If not specified, then the default is no minimum timestamp filtering. Specify the time in combined UTC date and time format or epoch milliseconds. Start time is inclusive of limiting timestamps.
`end`	Filter results based on the maximum event timestamp, specified in ISO 8601 time or Unix time. If not specified, then the default is no maximum timestamp filtering. Specify the time in combined UTC date and time format or epoch milliseconds. End time is inclusive of limiting timestamps.
`limit`	Limits the number of results returned. The default value is 100. The upper limit on the results that can be fetched is 10,000.

Headers

Name	Description
`X-Events-API-AccountName`	The global account name, as shown in the Controller UI **License** page.
`X-Events-API-Key`	The Analytics API key. See Manage API Keys.
`Accept`	The `Content-Type` of the response body. The supported value is `application/vnd.appd.events+json;v=2`.
`Content-type`	The `Content-Type` of the request body. The default is `application/vnd.appd.events+json;v=2` which also versions the resource representation (v=2).

Payload

Field	Description
label	(Optional) Friendly name to identify the query.
query	ADQL query to execute.
start	(Optional) Overrides the start parameter value provided as a query parameter.
end	(Optional) Overrides the end parameter value provided as a query parameter.
limit	(Optional) Overrides the limit provided as a query parameter.

Example SaaS Multiple Query

RBAC API

This page describes the Role-Based Access Control (RBAC) API methods you can use to manage users, groups, and roles for AppDynamics features. These operations provide more flexibility and automation with RBAC management. Relationship settings such as `addUserToGroup` and `removeUserToGroup` are supported.

You must be the account owner or have **administer user** permissions to use the RBAC API.

SAML and LDAP user creations are not supported. You can only create permissions through the UI. See Manage Users and Groups.

Create User

Use this to create users in the current account. The request payload should specify `name`, `security_provider_type`, `displayName`, and `password`. The user ID is generated by the server.

Format

```
POST /controller/api/rbac/v1/users
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`name`	Request payload		Yes
`security_provider_type`	Request payload	`"INTERNAL"`	Yes
`displayName`	Request payload		Yes
`password`	Request payload		Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X POST -d '{"name": "user10",
"security_provider_type": "INTERNAL", "displayName": "user10", "password": "welcome"}' -u user1@customer1
http://localhost:8080/controller/api/rbac/v1/users

Response status code 200 :
{
  "id": 10,
  "name": "user10",
  "displayName": "user10",
  "security_provider_type": "INTERNAL"
}
```

Get User by ID

Use this to get full user information, including a summary of affiliated groups and roles, using the `userId` in the current account.

Format

```
GET /controller/api/rbac/v1/users/userId
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/4

Response status code 200 :
{
   "id": 4,
   "name": "user1",
   "email": "user1@customer1.com",
   "displayName": "user1",
   "security_provider_type": "INTERNAL",
   "roles":
      [
        {"id": 17,"name": "Workflow Executor"},
        {"id": 18,"name": "DB Monitoring Administrator"},
        {"id": 19,"name": "DB Monitoring User"},
        {"id": 20,"name": "Analytics Administrator"},
        {"id": 21,"name": "Server Monitoring Administrator"},
        {"id": 22,"name": "Server Monitoring User"},
        {"id": 23,"name": "Universal Agent Administrator"},
        {"id": 24,"name": "Universal Agent User"},
        {"id": 13,"name": "Account Administrator"},
        {"id": 14,"name": "Administrator"},
        {"id": 15,"name": "User"},
        {"id": 16,"name": "Dashboard Viewer"}
      ],
   "groups":
      [
        {"id": 1,"name": "group_01"}
      ]
}
```

This API only supports retrieving internal users and not SAML or LDAP.

Get User by Name

Use this to get full user information, including a summary of affiliated groups and roles, using the `userName` in the current account.

Format

`GET /controller/api/rbac/v1/users/name/name`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/name/user1

Response status code 200 :
{
   "id": 4,
   "name": "user1",
   "email": "user1@customer1.com",
   "displayName": "user1",
   "security_provider_type": "INTERNAL",
   "roles":
      [
        {"id": 17,"name": "Workflow Executor"},
        {"id": 18,"name": "DB Monitoring Administrator"},
        {"id": 19,"name": "DB Monitoring User"},
        {"id": 20,"name": "Analytics Administrator"},
        {"id": 21,"name": "Server Monitoring Administrator"},
        {"id": 22,"name": "Server Monitoring User"},
        {"id": 23,"name": "Universal Agent Administrator"},
        {"id": 24,"name": "Universal Agent User"},
        {"id": 13,"name": "Account Administrator"},
        {"id": 14,"name": "Administrator"},
        {"id": 15,"name": "User"},
        {"id": 16,"name": "Dashboard Viewer"}
      ],
   "groups":
      [
        {"id": 1,"name": "group_01"}
      ]
```

- This API only supports retrieving internal users and not SAML or LDAP.
- You have to include an optional parameter (securityProviderType**)** to find SAML/LDAP users.

Get All Users

Use this to get a list of all users in the current account. The list includes user summaries, which includes `userId` and `userName`.

Format

```
GET /controller/api/rbac/v1/users
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users

Response status code 200 :
{
   "users":
      [
         {"id": 4,"name": "user1"},
         {"id": 10,"name": "user10"}
      ]
}
```

Update User

Use this to update a user by `userId` in the current account. Only the user object itself is updated, with the relationship to roles and groups remaining unaffected.

Format

```
PUT /controller/api/rbac/v1/users/userId
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	Request payload		Yes
name	Request payload		Yes
displayName	Request payload		Yes
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X PUT -d '{"id": 11,"name": "updated_user9","
displayName": "user9","security_provider_type": "INTERNAL"}' -u user1@customer1 http://localhost:8080/controller
/api/rbac/v1/users/11

Response status code 200 :
{
   "id": 11,
   "name": "updated_user9",
   "displayName": "user9",
   "security_provider_type": "INTERNAL"
}
```

Delete User

Use this to delete a user by `userId` in the current account.

Format

`DELETE /controller/api/rbac/v1/users/userId`

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/11

Response status code 200 :
```

Create Group

Use this to create a group in the current account. The `groupId` is generated by the server.

Format

`POST /controller/api/rbac/v1/groups`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
description	Request payload		No
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X POST -d '{"name": "group100","description": "new
description", "security_provider_type": "INTERNAL"}' -u user1@customer1 http://localhost:8080/controller/api
/rbac/v1/groups

Response status code 200 :
{
   "id": 2,
   "name": "group100",
   "security_provider_type": "INTERNAL",
   "description": "new description"
}
```

Get Group by ID

Use this to get full group information by `groupId` in the current account.

Format

`GET /controller/api/rbac/v1/groups/groupId`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/1

Response status code 200 :
{
   "id": 1,
   "name": "group_03",
   "security_provider_type": "INTERNAL"
   "description": "",
   "roles":
      [
         {"id": 19,"name": "DB Monitoring User"},
         {"id": 20,"name": "Analytics Administrator"},
         {"id": 21,"name": "Server Monitoring Administrator"},
         {"id": 22,"name": "Server Monitoring User"},
         {"id": 23,"name": "Universal Agent Administrator"},
         {"id": 13,"name": "Account Administrator"},
         {"id": 16,"name": "Dashboard Viewer"}
      ]
}
```

Get Group by Name

Use this to get full group information by `groupName` in the current account.

Format

`GET /controller/api/rbac/v1/groups/name/name`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/name/group_03

Response status code 200 :
{
   "id": 1,
   "name": "group_03",
   "security_provider_type": "INTERNAL"
   "description": "",
   "roles":
      [
         {"id": 19,"name": "DB Monitoring User"},
         {"id": 20,"name": "Analytics Administrator"},
         {"id": 21,"name": "Server Monitoring Administrator"},
         {"id": 22,"name": "Server Monitoring User"},
         {"id": 23,"name": "Universal Agent Administrator"},
         {"id": 13,"name": "Account Administrator"},
         {"id": 16,"name": "Dashboard Viewer"}
      ]
}
```

Get All Groups

Use this to get all groups in the current account. This only returns group summaries, which includes `groupId` and `groupName`.

Format

`GET /controller/api/rbac/v1/groups`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups

Response status code 200 :
{
   "groups":
      [
         {"id": 1,"name": "group_03"},
         {"id": 2,"name": "group100"}
      ]
}
```

Update Group

Use this to update a group by `groupId` in the current account. Only the group itself is updated, while the relationships with users and roles remain unaffected.

Format

`PUT /controller/api/rbac/v1/groups/groupId`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`id`	Request payload		Yes
`name`	Request payload		Yes
`description`	Request payload		No
`security_provider_type`	Request payload	`"INTERNAL"`	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X PUT -d '{"id": 1, "name": "group2","
description": "new description", "security_provider_type": "INTERNAL"}' -u user1@customer1 http://localhost:8080
/controller/api/rbac/v1/groups/1

Response status code 200 :
{
   "id": 1,
   "name": "group2",
   "security_provider_type": "INTERNAL",
   "description": "new description",
   "roles":
      [
         {"id": 19,"name": "DB Monitoring User"},
         {"id": 20,"name": "Analytics Administrator"},
         {"id": 21,"name": "Server Monitoring Administrator"},
         {"id": 22,"name": "Server Monitoring User"},
         {"id": 23,"name": "Universal Agent Administrator"},
         {"id": 13,"name": "Account Administrator"},
         {"id": 16,"name": "Dashboard Viewer"}
      ]
}
```

Delete Group

Use this to delete a group by `groupId` in the current account.

Format

```
DELETE /controller/api/rbac/v1/groups/groupId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/1

Response status code 200 :
```

Add User to Group

Use this to add a user to a group by `userId` and `groupId`.

Format

```
PUT /controller/api/rbac/v1/groups/groupId/users/userId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X PUT -u user1@customer1 http://localhost:8080
/controller/api/rbac/v1/groups/2/users/10

Response status code 200 :
```

Remove User from Group

Use this to remove a user from a group by `userId` and `groupId`.

Format

```
DELETE /controller/api/rbac/v1/groups/groupId/users/userId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/2/users/10

Response status code 200 :
```

Create Role

Use this to create a role in the current account. The ID is generated by the server.

Format

`POST /controller/api/rbac/v1/roles`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`name`	Request payload		Yes
`description`	Request payload		No
permissions	Request payload		No

Example

```
curl -X POST /controller/api/rbac/v1/roles \
-H 'Content-Type: application/vnd.appd.cntrl+json;v=1' \
-d '{
 "name": "SampleRole2",
  "permissions": [
   {
     "entityType": "APPLICATION",
     "entityId": 24,
     "action": "CONFIG_ACTIONS"
   },
   {
     "entityType": "APPLICATION",
     "entityId": 24,
     "action": "CONFIG_BASELINES"
   },
   {
     "entityType": "APPLICATION",
     "entityId": 24,
     "action": "CONFIG_BUSINESS_TRANSACTIONS"
   },
   {
     "entityType": "APPLICATION",
     "entityId": 24,
     "action": "CONFIG_ERROR_DETECTION"
   },
   {
     "entityType": "APPLICATION",
     "entityId": 24,
     "action": "CONFIG_EUM"
   },
   {
     "entityType": "APPLICATION",
     "entityId": 24,
     "action": "CONFIG_EVENT_REACTOR"
   },
   {
     "entityType": "APPLICATION",
     "entityId": 24,
     "action": "CONFIG_POLICIES"
   },
   {
     "entityType": "APPLICATION",
     "entityId": 24,
     "action": "CONFIG_TRANSACTION_DETECTION"
   },
   {
     "entityType": "APPLICATION",
     "entityId": 24,
     "action": "VIEW"
   }
 ]
}’
```

```
200 OK
{
  "id": 87,
  "name": "SampleRole2"
}
```

Add Role to User

Use this to add a role to a user by `roleId` and `userId`.

Format

`PUT /controller/api/rbac/v1/roles/roleId/users/userId`

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X PUT -u user1@customer1 http://localhost:8080
/controller/api/rbac/v1/roles/50/users/10

Response status code 200 :
```

Remove Role from User

Use this to remove a role from a user by `roleId` and `userId`.

Format

```
DELETE /controller/api/rbac/v1/roles/roleId/users/userId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/50/users/10

Response status code 200 :
```

Add Role to Group

Use this to add a role to a group by `roleId` and `groupId`.

Format

```
PUT /controller/api/rbac/v1/roles/roleId/groups/groupId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X PUT -u user1@customer1 http://localhost:8080
/controller/api/rbac/v1/roles/50/groups/2

Response status code 200 :
```

Remove Role from Group

Use this to remove a role from a group by `roleId` and `groupId`.

Format

```
DELETE /controller/api/rbac/v1/roles/roleId/groups/groupId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/50/groups/2

Response status code 200 :
```

Get Role by ID

Use this to get full role information by `roleId` in the current account. This only returns the `role` object.

Format

```
GET /controller/api/rbac/v1/roles/[roleId]?include-permissions=true
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`id`	Request payload		Yes
`include-permissions (>= v4.5.14)`	Request payload	`"true"`	No

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/15?include-permissions=true

Response status code 200 :

{
 "id": 15,
 "name": "SampleRole",
 "permissions": [
   {
     "id": 2619,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_ACTIONS"
   },
   {
     "id": 2621,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_BASELINES"
   },
   {
     "id": 2620,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_BUSINESS_TRANSACTIONS"
   },
   {
     "id": 2610,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_ERROR_DETECTION"
   },
   {
     "id": 2615,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_EUM"
   },
   {
     "id": 2618,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_EVENT_REACTOR"
   },
   {
     "id": 2617,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_POLICIES"
   },
   {
     "id": 2608,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_TRANSACTION_DETECTION"
   },
   {
     "id": 2606,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "VIEW"
   }
 ]
}
```

Get Role by Name

Use this to get full role information by `roleName` in the current account.

Format

```
GET /controller/api/rbac/v1/roles/name/[RoleName]?include-permissions=true
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
`include-permissions (>= v4.5.14)`	Request payload	`"true"`	No

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/name/SampleRole?include-
permissions=true

Response status code 200 :

{
 "id": 15,
 "name": "SampleRole",
 "permissions": [
   {
     "id": 2619,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_ACTIONS"
   },
   {
     "id": 2621,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_BASELINES"
   },
   {
     "id": 2620,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_BUSINESS_TRANSACTIONS"
   },
   {
     "id": 2610,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_ERROR_DETECTION"
   },
   {
     "id": 2615,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_EUM"
   },
   {
     "id": 2618,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_EVENT_REACTOR"
   },
   {
     "id": 2617,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_POLICIES"
   },
   {
     "id": 2608,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "CONFIG_TRANSACTION_DETECTION"
   },
   {
     "id": 2606,
     "entityType": "APPLICATION",
     "entityId": 27,
     "action": "VIEW"
   }
 ]
}
```

Get All Roles

Use this to get all roles in the current account. This only returns role summaries, which includes `roleId` and `roleName`.

Format

```
GET /controller/api/rbac/v1/roles
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles

Response status code 200 :
{
   "roles":
      [
         {"id": 13,"name": "Account Administrator"},
         {"id": 14,"name": "Administrator"},
         {"id": 20,"name": "Analytics Administrator"},
         {"id": 16,"name": "Dashboard Viewer"},
         {"id": 18,"name": "DB Monitoring Administrator"},
         {"id": 19,"name": "DB Monitoring User"},
         {"id": 21,"name": "Server Monitoring Administrator"},
         {"id": 22,"name": "Server Monitoring User"},
         {"id": 23,"name": "Universal Agent Administrator"},
         {"id": 24,"name": "Universal Agent User"},
         {"id": 15,"name": "User"},
         {"id": 17,"name": "Workflow Executor"}
      ]
}
```

Update Role

Use this to update a role by `roleId` in the current account. This only updates the `role` object itself, while leaving the relationship with users and groups unaffected.

You cannot update permissions within a role through this API. You can only update the `name` and `description` parameters.

Format

```
PUT /controller/api/rbac/v1/roles/roleId
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`id`	Request payload		Yes
`name`	Request payload		Yes
`description`	Request payload		No

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X PUT -d '{"id": 49, "name": "role1","
description": "new description" }' -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/49

Response status code 200 :
{
   "id": 49,
   "name": "role1",
   "description": "new description"
}
```

Delete Role

Use this to delete a role in the current account.

Format

```
DELETE /controller/api/rbac/v1/roles/roleId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/49

Response status code 200 :
```

Create Central Identity User API

This page describes the Create Central Identity User API methods you can use to create central identity(ci) users in the current account. This API is only available when the current account is configured with the `CI_USER_CREATION` property.

You must be the account owner or have the **administer user** permissions to use the Create Central Identity User API.

SAML and LDAP user creations are not supported. You can only create permissions through the UI. See Create and Manage Custom Roles.

Create User

The request payload should specify `email`, `security_provider_type`, and `displayName`. The server generates the user ID.

Format

```
POST /controller/api/rbac/v1/ci-user
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`email`	Request payload		Yes
`security_provider_type`	Request payload	`"INTERNAL"`	Yes
`displayName`	Request payload		Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X POST -d '{"email": "user10@domain.com",
"security_provider_type": "INTERNAL", "displayName": "user10"}' -u user1@customer1 http://localhost:8080
/controller/api/rbac/v1/ci-user

Response status code 200 :
{
  "id": 10,
  "name": "user10@domain.com",
  "email": "user10@domain.com",
  "displayName": "user10",
  "security_provider_type": "INTERNAL"
}
```

Get User by ID

Use this to get full user information, including a summary of affiliated groups and roles, using the `userId` in the current account.

Format

```
GET /controller/api/rbac/v1/users/userId
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/4

Response status code 200 :
{
   "id": 4,
   "name": "user1",
   "email": "user1@customer1.com",
   "displayName": "user1",
   "security_provider_type": "INTERNAL",
   "roles":
      [
        {"id": 17,"name": "Workflow Executor"},
        {"id": 18,"name": "DB Monitoring Administrator"},
        {"id": 19,"name": "DB Monitoring User"},
        {"id": 20,"name": "Analytics Administrator"},
        {"id": 21,"name": "Server Monitoring Administrator"},
        {"id": 22,"name": "Server Monitoring User"},
        {"id": 23,"name": "Universal Agent Administrator"},
        {"id": 24,"name": "Universal Agent User"},
        {"id": 13,"name": "Account Administrator"},
        {"id": 14,"name": "Administrator"},
        {"id": 15,"name": "User"},
        {"id": 16,"name": "Dashboard Viewer"}
      ],
   "groups":
      [
        {"id": 1,"name": "group_01"}
      ]
}
```

Get User by Name

Use this to get full user information, including a summary of affiliated groups and roles, using the `userName` in the current account.

Format

`GET /controller/api/rbac/v1/users/name/name`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/name/user1

Response status code 200 :
{
   "id": 4,
   "name": "user1",
   "email": "user1@customer1.com",
   "displayName": "user1",
   "security_provider_type": "INTERNAL",
   "roles":
      [
        {"id": 17,"name": "Workflow Executor"},
        {"id": 18,"name": "DB Monitoring Administrator"},
        {"id": 19,"name": "DB Monitoring User"},
        {"id": 20,"name": "Analytics Administrator"},
        {"id": 21,"name": "Server Monitoring Administrator"},
        {"id": 22,"name": "Server Monitoring User"},
        {"id": 23,"name": "Universal Agent Administrator"},
        {"id": 24,"name": "Universal Agent User"},
        {"id": 13,"name": "Account Administrator"},
        {"id": 14,"name": "Administrator"},
        {"id": 15,"name": "User"},
        {"id": 16,"name": "Dashboard Viewer"}
      ],
   "groups":
      [
        {"id": 1,"name": "group_01"}
      ]
```

Get All Users

Use this to get a list of all users in the current account. The list includes user summaries, which includes `userId` and `userName`.

Format

`GET /controller/api/rbac/v1/users`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users

Response status code 200 :
{
   "users":
      [
         {"id": 4,"name": "user1"},
         {"id": 10,"name": "user10"}
      ]
}
```

Update User

Use this to update a user by `userId` in the current account. Only the user object itself is updated, with the relationship to roles and groups remaining unaffected.

Format

`PUT /controller/api/rbac/v1/users/userId`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`id`	Request payload		Yes

name	Request payload		Yes
displayName	Request payload		Yes
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X PUT -d '{"id": 11,"name": "updated_user9","
displayName": "user9","security_provider_type": "INTERNAL"}' -u user1@customer1 http://localhost:8080/controller
/api/rbac/v1/users/11

Response status code 200 :
{
   "id": 11,
   "name": "updated_user9",
   "displayName": "user9",
   "security_provider_type": "INTERNAL"
}
```

Delete User

Use this to delete a user by `userId` in the current account.

Format

`DELETE /controller/api/rbac/v1/users/userId`

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/11

Response status code 200 :
```

Create Group

Use this to create a group in the current account. The `groupId` is generated by the server.

Format

`POST /controller/api/rbac/v1/groups`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
description	Request payload		No
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X POST -d '{"name": "group100","description": "new
description", "security_provider_type": "INTERNAL"}' -u user1@customer1 http://localhost:8080/controller/api
/rbac/v1/groups

Response status code 200 :
{
   "id": 2,
   "name": "group100",
   "security_provider_type": "INTERNAL",
   "description": "new description"
}
```

Get Group by ID

Use this to get full group information by `groupId` in the current account.

Format

`GET /controller/api/rbac/v1/groups/groupId`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/1

Response status code 200 :
{
   "id": 1,
   "name": "group_03",
   "security_provider_type": "INTERNAL"
   "description": "",
   "roles":
      [
         {"id": 19,"name": "DB Monitoring User"},
         {"id": 20,"name": "Analytics Administrator"},
         {"id": 21,"name": "Server Monitoring Administrator"},
         {"id": 22,"name": "Server Monitoring User"},
         {"id": 23,"name": "Universal Agent Administrator"},
         {"id": 13,"name": "Account Administrator"},
         {"id": 16,"name": "Dashboard Viewer"}
      ]
}
```

Get Group by Name

Use this to get full group information by `groupName` in the current account.

Format

`GET /controller/api/rbac/v1/groups/name/name`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/name/group_03

Response status code 200 :
{
   "id": 1,
   "name": "group_03",
   "security_provider_type": "INTERNAL"
   "description": "",
   "roles":
      [
         {"id": 19,"name": "DB Monitoring User"},
         {"id": 20,"name": "Analytics Administrator"},
         {"id": 21,"name": "Server Monitoring Administrator"},
         {"id": 22,"name": "Server Monitoring User"},
         {"id": 23,"name": "Universal Agent Administrator"},
         {"id": 13,"name": "Account Administrator"},
         {"id": 16,"name": "Dashboard Viewer"}
      ]
}
```

Get All Groups

Use this to get all groups in the current account. This only returns group summaries, which includes `groupId` and `groupName`.

Format

```
GET /controller/api/rbac/v1/groups
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups

Response status code 200 :
{
   "groups":
      [
         {"id": 1,"name": "group_03"},
         {"id": 2,"name": "group100"}
      ]
}
```

Update Group

Use this to update a group by `groupId` in the current account. Only the group itself is updated, while the relationships with users and roles remain unaffected.

Format

```
PUT /controller/api/rbac/v1/groups/groupId
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`id`	Request payload		Yes
`name`	Request payload		Yes
`description`	Request payload		No
`security_provider_type`	Request payload	`"INTERNAL"`	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X PUT -d '{"id": 1, "name": "group2","
description": "new description", "security_provider_type": "INTERNAL"}' -u user1@customer1 http://localhost:8080
/controller/api/rbac/v1/groups/1

Response status code 200 :
{
   "id": 1,
   "name": "group2",
   "security_provider_type": "INTERNAL",
   "description": "new description",
   "roles":
      [
         {"id": 19,"name": "DB Monitoring User"},
         {"id": 20,"name": "Analytics Administrator"},
         {"id": 21,"name": "Server Monitoring Administrator"},
         {"id": 22,"name": "Server Monitoring User"},
         {"id": 23,"name": "Universal Agent Administrator"},
         {"id": 13,"name": "Account Administrator"},
         {"id": 16,"name": "Dashboard Viewer"}
      ]
}
```

Delete Group

Use this to delete a group by `groupId` in the current account.

Format

```
DELETE /controller/api/rbac/v1/groups/groupId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/1

Response status code 200 :
```

Add User to Group

Use this to add a user to a group by `userId` and `groupId`.

Format

```
PUT /controller/api/rbac/v1/groups/groupId/users/userId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X PUT -u user1@customer1 http://localhost:8080
/controller/api/rbac/v1/groups/2/users/10

Response status code 200 :
```

Remove User from Group

Use this to remove a user from a group by `userId` and `groupId`.

Format

```
DELETE /controller/api/rbac/v1/groups/groupId/users/userId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/2/users/10

Response status code 200 :
```

Create Role

Use this to create a role in the current account. The ID is generated by the server.

Format

```
POST /controller/api/rbac/v1/roles
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`name`	Request payload		Yes
`description`	Request payload		No

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X POST -d '{"name": "role2","description": "new
description"}' -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles

Response status code 200 :
{
   "id": 49,
   "name": "role2",
   "description": "new description"
}
```

Add Role to User

Use this to add a role to a user by `roleId` and `userId`.

Format

```
PUT /controller/api/rbac/v1/roles/roleId/users/userId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X PUT -u user1@customer1 http://localhost:8080
/controller/api/rbac/v1/roles/50/users/10

Response status code 200 :
```

Remove Role from User

Use this to remove a role from a user by `roleId` and `userId`.

Format

```
DELETE /controller/api/rbac/v1/roles/roleId/users/userId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/50/users/10

Response status code 200 :
```

Add Role to Group

Use this to add a role to a group by `roleId` and `groupId`.

Format

```
PUT /controller/api/rbac/v1/roles/roleId/groups/groupId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X PUT -u user1@customer1 http://localhost:8080
/controller/api/rbac/v1/roles/50/groups/2

Response status code 200 :
```

Remove Role from Group

Use this to remove a role from a group by `roleId` and `groupId`.

Format

`DELETE /controller/api/rbac/v1/roles/roleId/groups/groupId`

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/50/groups/2

Response status code 200 :
```

Get Role by ID

Use this to get full role information by `roleId` in the current account. This only returns the role object.

Format

`GET /controller/api/rbac/v1/roles/roleId`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/15

Response status code 200 :
{
   "id": 15,
   "name": "User",
   "description": "Can view applications and dashboards but not modify their configuration"
}
```

Get Role by Name

Use this to get full role information by `roleName` in the current account.

Format

`GET /controller/api/rbac/v1/roles/name/name`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/name/User

Response status code 200 :
{
   "id": 15,"name":
   "User",
   "description": "Can view applications and dashboards but not modify their configuration"
}
```

Get All Roles

Use this to get all roles in the current account. This only returns role summaries, which includes `roleId` and `roleName`.

Format

`GET /controller/api/rbac/v1/roles`

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles

Response status code 200 :
{
   "roles":
      [
         {"id": 13,"name": "Account Administrator"},
         {"id": 14,"name": "Administrator"},
         {"id": 20,"name": "Analytics Administrator"},
         {"id": 16,"name": "Dashboard Viewer"},
         {"id": 18,"name": "DB Monitoring Administrator"},
         {"id": 19,"name": "DB Monitoring User"},
         {"id": 21,"name": "Server Monitoring Administrator"},
         {"id": 22,"name": "Server Monitoring User"},
         {"id": 23,"name": "Universal Agent Administrator"},
         {"id": 24,"name": "Universal Agent User"},
         {"id": 15,"name": "User"},
         {"id": 17,"name": "Workflow Executor"}
      ]
}
```

Update Role

Use this to update a role by `roleId` in the current account. This only updates the role object itself, while leaving the relationship with users and groups unaffected.

Format

`PUT /controller/api/rbac/v1/roles/roleId`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
`id`	Request payload		Yes
`name`	Request payload		Yes
`description`	Request payload		No

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X PUT -d '{"id": 49, "name": "role1","
description": "new description" }' -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/49

Response status code 200 :
{
   "id": 49,
   "name": "role1",
   "description": "new description"
}
```

Delete Role

Use this to delete a role in the current account.

Format

`DELETE /controller/api/rbac/v1/roles/roleId`

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/49

Response status code 200 :
```

License API

Related pages:

- License Management
- Licensing
- License Entitlements and Restrictions

This page describes the License APIs you can use to perform functions related to licensing and accounts including uploading license files, allocating licenses, getting license and account usage information as well as creating, updating, and deleting license rules.

The License APIs below are separated by licensing model. To learn about licenses within each model, see License Entitlements and Restrictions.

Integration Modules

Related pages:

- AppDynamics Exchange

The AppDynamics Community Exchange includes many extensions that supplement the capabilities of the AppDynamics Application Performance Monitoring (APM) Platform. Documentation on setting up and using the integration module appears with the module.

Some integrations listed here do not display on the Controller UI Integrations page. This is because not all integrations require configuration at the Controller (e.g., Rookout, Apica) level or they can only be configured at the underlying Glassfish Admin Console level (e.g., DB CAM).

The following integration modules are built into the AppDynamics platform and described on the pages linked here.

Integration Module	More information
Rookout	Deep Code Insights powered by Rookout
Apica	Apica & AppDynamics
DB CAM	Integrate AppDynamics with DB CAM
Scalyr	Integrate AppDynamics with Scalyr
Splunk	Integrate AppDynamics with Splunk
Compuware Strobe	Integrate AppDynamics with Compuware Strobe
AppDynamics for Databases	Integrate AppDynamics for Databases with AppDynamics Pro 3.7 and higher
Cisco® Application Centric Infrastructure (Cisco ACI™)	Integrate AppDynamics with Cisco ACI™
ServiceNow®	Integrate AppDynamics with ServiceNow®CMDB and Event Management

Integrate AppDynamics with Cisco Application Centric Infrastructure

> ⚠ AppDynamics is ending support for Application Centric Infrastructure (ACI). The feature will not work once customers upgrade their Controllers beyond > 21.1. See Support Advisory: Application Centric Infrastructure (ACI) End of Life (EOL) Notice.

This page describes the advantages of the integration of AppDynamics with Cisco® Application Centric Infrastructure (Cisco ACI™). This solution provides a unified view from the application code to underlying network layers for business-critical applications running in a data center. This enables the network operations Admin and the application operations Admin to quickly troubleshoot issues at the application and the network levels.

> ⚠ You can integrate the Cisco ACI™ solution with select AppDynamics Controllers only. If you are interested in using the integrated solution, contact help@appdynamics.com. See Troubleshoot Using the Integrated Solution.

Getting Started with AppDynamics- Cisco ACI Integration

> AppDynamics is ending support for Application Centric Infrastructure (ACI). The feature will not work once customers upgrade their Controllers beyond > 21.1. See Support Advisory: Application Centric Infrastructure (ACI) End of Life (EOL) Notice.

This page provides instructions for integrating AppDynamics with Cisco ACI™ solution and verifying interoperability between the applications. This integration provides end-to-end visibility into the application and network layers within a data center.

Before You Begin

Ensure that your environment meets these minimum system requirements:

- Controller >= 4.5.2 with a Network Visibility license per OS instance. See Controller System Requirements.
- Hosts with Network Visibility Agents >= 4.5.2. See Network Visibility Requirements and Supported Environments.
- Hosts with Java Agents >= 4.5.2 or .NET Agent for Windows >= 4.5.15 with an App Agent license. See Install Java Agent or .NET Agent.
- `sudo` or `root` access permissions on the agent host to install the Network Agent.
- Network Visibility is supported on Linux and Windows operating systems. See Network Visibility Supported Environments.

> If your applications are running in a Kubernetes environment, enable the Kubernetes-ACI integration before you proceed with the AppDynamics and Cisco ACI™ integration. See Cisco ACI and Kubernetes Integration.

Enable SSL for Cisco ACI Integration

The Cisco Application Policy Infrastructure Controller (APIC) supports the import and storage of an SSL certificate and private key into the Controller to create a secure and trusted environment with AppDynamics.

1. Access the AppDynamics Controller using the SSH.
2. At a command prompt, change directories to the following location:

```
<controller_home>/appserver/glassfish/domains/domain1/config
```

3. Import the self-signed certificate from the appropriate directory as follows:

```
keytool -import -keystore cacerts.jks -file /path/to/RootCA.crt
```

Enable Cisco ACI Integration (Controller <= 4.5.10)

> The Cisco ACI Integration is enabled by default for >= 4.5.11.

1. Log in to the Administration Console:

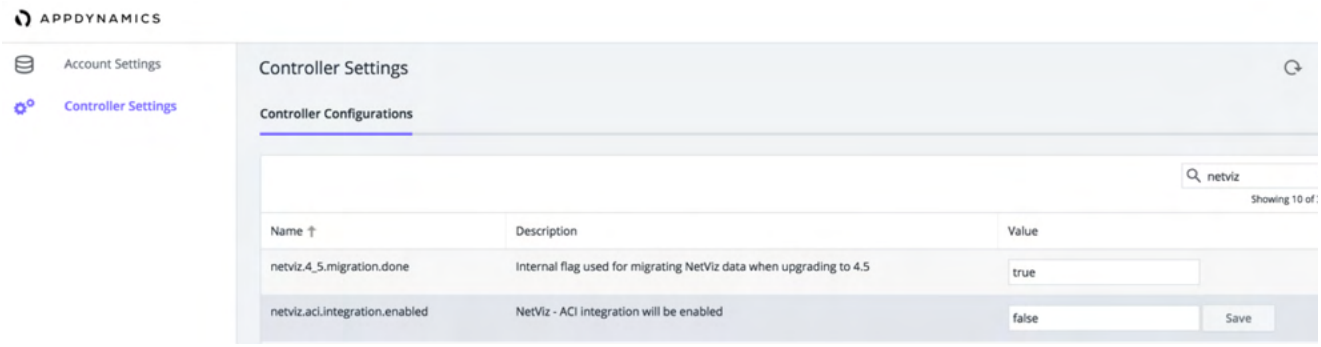
```
http:<controller-hostname>:<controller-port>/controller/admin.jsp
```

   For example:

```
https:<controller-hostname>:8800/controller/admin.jsp
https:<controller-hostname>:443/controller/admin.jsp
```

> You must use the password that was set for the root user of the Controller when the Controller was installed. See User Manageme

2. In **Controller Settings**, search for **netviz.aci.integration.enabled** and set this field to **true**.
3. Click **Save**.



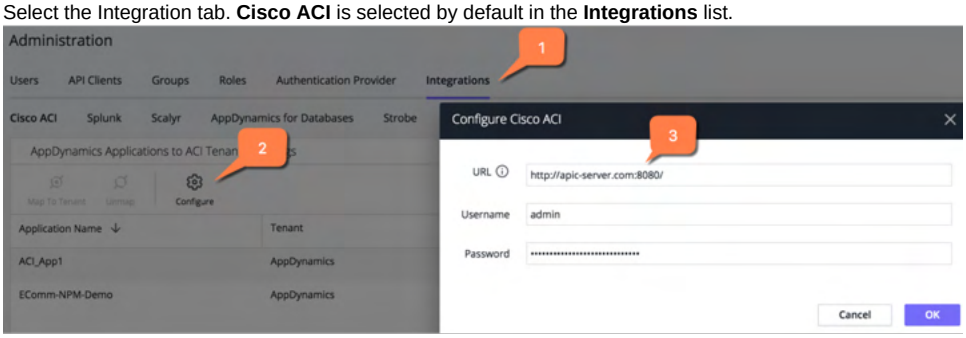
Configure Cisco ACI Credentials

If you are using an AppDynamics Controller >= 4.5.11, the Cisco ACI Integration feature is enabled by default. If you are using an AppDynamics Controller <= 4.5.10, you must enable Cisco ACI Integration manually before you configure your credentials.

1. Log in to the AppDynamics Controller as an administrator:

   ```
   http:<controller-hostname>:<controller-port>/controller
   ```

2. Click **Settings > Administration**.
3. Select the Integration tab. **Cisco ACI** is selected by default in the **Integrations** list.



4. Click **Configure** and enter these details:
   a. Full URL along with the port details to the Cisco APIC Server. For example,

      ```
      http://apic-server.com:8080/
      ```

   b. User credentials to the Cisco APIC.
5. Click **OK**.

AppDynamics initiates the background processes required to integrate with the Cisco ACI solution.

Correlate AppDynamics and Cisco ACI Components

The AppDynamics integration with Cisco ACI brings together the logical constructs of both solutions. This enables the network operations admin and the application operations admin to obtain a comprehensive end-to-end view from the application to the network. Correlating or mapping the components of both solutions helps the admins triage and troubleshoot issues quickly.

AppDynamics Components

The AppDynamics application model serves as the framework around which AppDynamics organizes and presents application performance information. A typical application environment consists of different components that interact in multiple ways.

- Application—The top-level container in the AppDynamics model. A business application contains a set of related services and business transactions.
- Tier—A grouping of one or more nodes in the AppDynamics application model. There is no interaction among nodes within a single tier.
- Node—The smallest unit of the modeled environment. A node corresponds to a monitored server or JVM in the application environment. A node may correspond to an individual application server, JVM, CLR, PHP application, and Apache Web server.

AppDynamics components are logically arranged as Application > Tiers > Nodes.

Cisco ACI Components

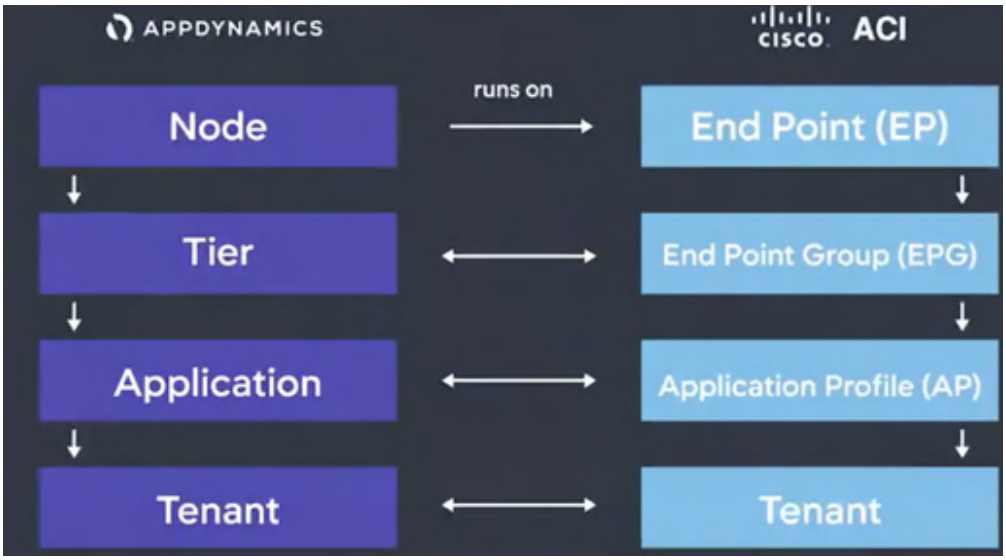
Cisco ACI is a Software-Defined Networking (SDN) solution that simplifies, optimizes, and accelerates infrastructure deployment and governance, and expedites the application deployment lifecycle.

Cisco ACI implements Cisco's intent-based networking framework. It captures higher-level business and user intent in the form of a policy and converts this intent into the network constructs necessary to dynamically provision the network, security, and infrastructure services.

- Cisco APIC—The infrastructure Controller is the main architectural component of the Cisco ACI solution. It is the unified point of automation and management for the Cisco ACI fabric, policy enforcement, and health monitoring.
    - The APIC appliance is a centralized, clustered controller that optimizes performance and unifies the operation of physical and virtual environments. The controller manages and operates a scalable multi-tenant Cisco ACI fabric.
- Tenant—A logical container for policies that enable an administrator to exercise domain-based access control.
- Application Profile—Defines the policies, services, and relationships between endpoint groups (EPGs).
- EPG—A managed object that is a named logical entity. It is a collection of endpoints (EPs).
- Endpoints—Devices that are connected to the network directly or indirectly. They have an address (identity), a location, and attributes (such as version).

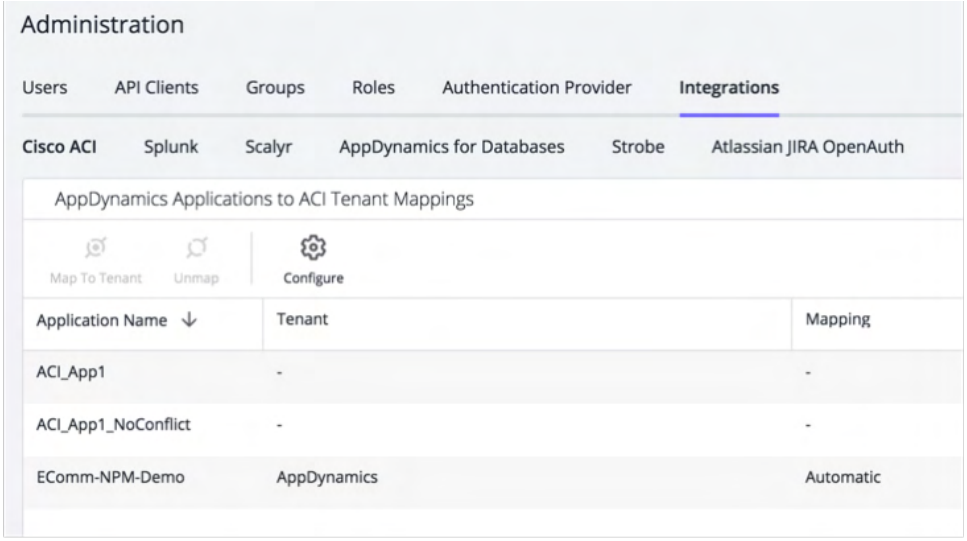
Cisco APIC components are logically arranged as Application profile > EPGs > EPs.

This figure shows the correlation of AppDynamics and Cisco ACI components.



AppDynamics Applications to ACI Tenant Mapping

After you configure Cisco ACI credentials, all AppDynamics applications display in the **AppDynamics Applications to ACI Tenant Mappings** page.



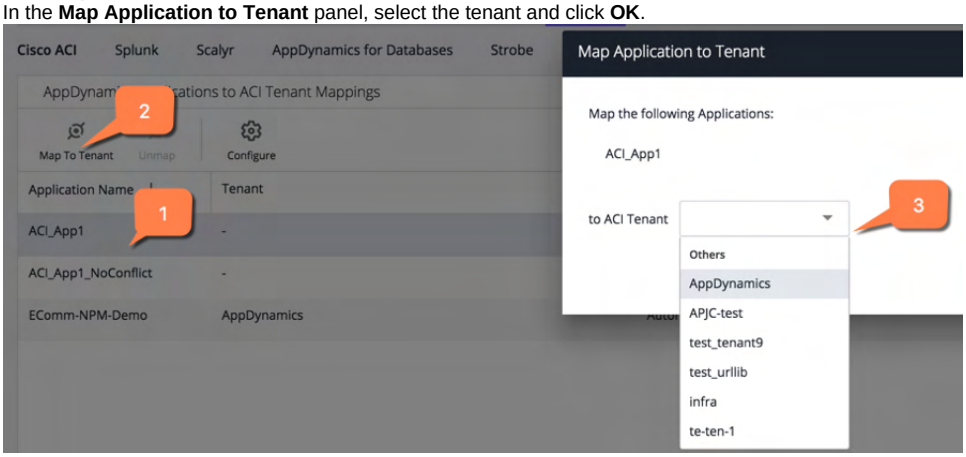
These mappings are based on the mappings between AppDynamics nodes and Cisco ACI endpoints.

When the endpoints in different tenants have the same IP address, a node-to-endpoint mapping conflict occurs. AppDynamics resolves these conflicts based on heuristic data. However, if the conflicts persist, you must resolve these conflicts manually.

Map AppDynamics Application to Cisco ACI Tenant Manually

The application to Cisco ACI tenant map is left blank in **AppDynamics Applications to ACI Tenant Mappings** page when there is a conflict in auto-mapping. You can map applications to Cisco ACI tenants manually.

1. Select the AppDynamics application you want to map manually. Multiple applications can be mapped to a tenant at a given time.
2. Click **Map to Tenant**.
3. In the **Map Application to Tenant** panel, select the tenant and click **OK**.



Override Auto-Mapping

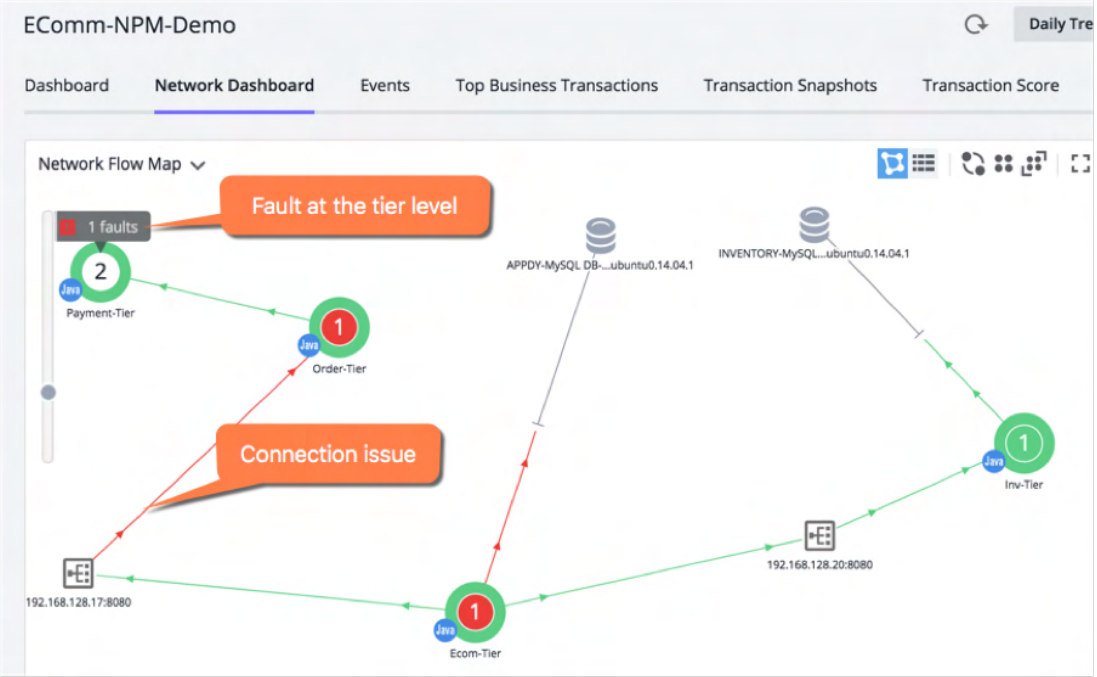
You can override the auto-map and map the application to another Cisco ACI tenant using the **Map Application to Tenant** panel. To override the auto-map, **Unmap** the application to tenant map and map it to another Cisco ACI tenant.

To revert to auto-map, **Unmap** the application to tenant map and refresh the page. AppDynamics auto-maps the application to the corresponding Cisco ACI tenant.

Troubleshoot Using the Integrated Solution

> AppDynamics is ending support for Application Centric Infrastructure (ACI). The feature will not work once customers upgrade their Controllers > 21.1. See Support Advisory: Application Centric Infrastructure (ACI) End of Life (EOL) Notice.

This page describes how to troubleshoot applications using the Cisco APIC integration. The AppDynamics Network Dashboard displays a network-layer view of the monitored application. Based on the runtime state of the application, AppDynamics automatically fetches the faults and connection issues and displays them in the network dashboard:



Faults display at the tier level. The number of faults displayed indicates an aggregate of faults occurring at all EPGs within the tier. You can view the number of faults at a given point of time in the Network Dashboard.

A connection is the set of all traffic for an application that has the same Source IP, Destination IP, Destination Port, and Protocol. AppDynamics detects if there is an issue in the traffic flow and indicates the connection issue on the network dashboard.

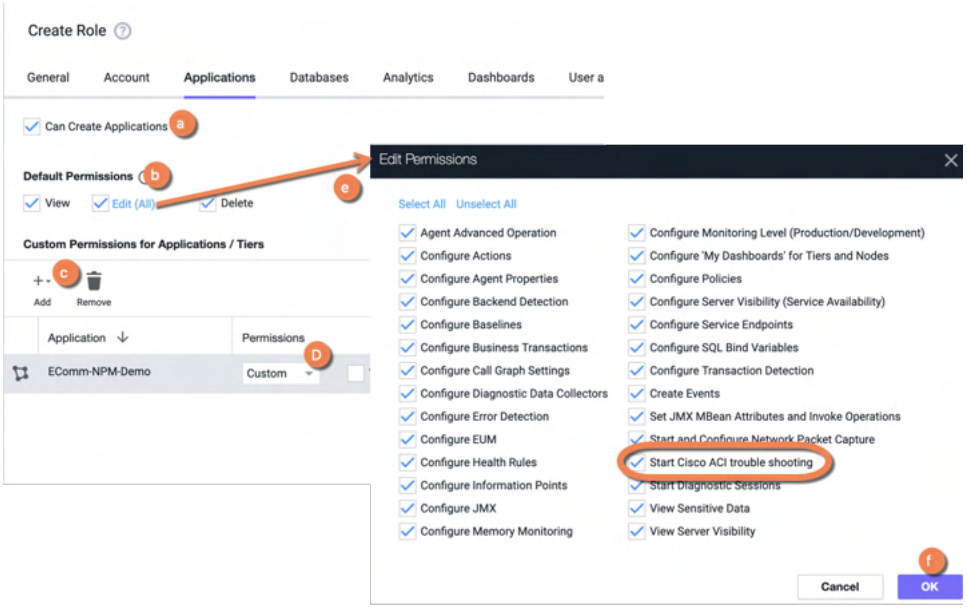
You can initiate a diagnosis to determine the exact location of the connection issue within the network by cross-launching the connection in Cisco APIC Controller.

Set Custom Permission to Cross-Launch Cisco APIC Controller

To include permission to cross-launch Cisco APIC Controller:

1. Log in to the Controller UI as an Administrator or Account Owner.
2. Click the gear icon ( ) > **Administration**.
3. Click the Roles tab.
4. Click **+ Create**.
5. Specify a **Name** and a **Description** for the newly created role.
6. Customize the business application level permission according to these guidelines:
    a. On the **Applications** tab, click **Can Create Applications**.
    b. Under **Default Permissions**, select **View**, **Edit,** and **Delete**.
    c. Click **+ Add** to add a new custom permission and click **Done**.
    The custom permission is added.
    d. Select **Custom** from the **Permissions** menu for the application (replacing the value of Inherited).
    e. Click **Edit(All)** and ensure that **Start Cisco ACI trouble shooting** is selected.

f. Click **OK**.



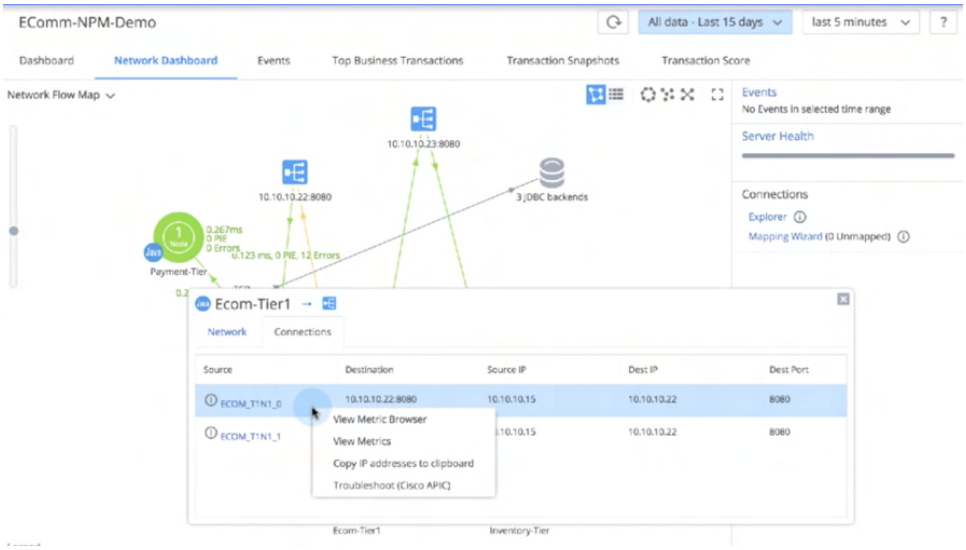
Customize Permissions to Cross-Launch a Connection Issue in Cisco APIC Controller

As an AppDynamics administrator, you can now customize the permissions for various roles to include permission to cross-launch a connection issue in the Cisco APIC Controller. See Set Custom Permission to Cross-Launch Cisco APIC Controller.

Launch Affected Connection in Cisco APIC

After collecting the connection issue information, you can cross-launch the connection in the Cisco APIC Controller.

1. Click on the affected connection on the **Network flow Map**.
2. Click the Connections tab.
3. Select the connection you want to troubleshoot.
4. Right-click on the selection and select **Troubleshoot (Cisco APIC)**.



5. Enter your Cisco APIC login credentials. After the initial entry, your credentials will be cached. The connection opens in the Cisco APIC Controller with the correct contracts (Visibility & Troubleshooting wizard) and the right set of endpoints.

> ⚠ If you are using the Cisco ACI Release 4.0, you need not enter the login credentials. The authentication happens automatically. You must enter the login credentials only if you are using a lower version of the Cisco ACI.

6. Troubleshoot the issue in Cisco APIC.

Integrate AppDynamics with Compuware Strobe

This page describes how to integrate AppDynamics with Compuware Strobe. This integration allows you to drill down from a SQL Call of a transaction snapshot to view and analyze the calls in Strobe.

Configure Compuware Strobe Integration

1. Log in to the Controller UI as an administrator.
2. Select **Settings > Administration**.
3. Select **Integration > Strobe**.
4. Click the **Enabled** checkbox.
5. For the **URL**, enter the Strobe URL and port number.
6. For the **Strobe LPAR**, enter the name of the logical partition where Strobe is running.
7. Click **Save**.

Launch Strobe from AppDynamics

You can access the **View in Strobe** option from a transaction snapshot.

1. Navigate to the Business Transactions dashboard.
2. From the **Transaction Snapshot** tab, select a transaction snapshot containing DB2 z/OS database access.
3. Select the **SQL Calls** tab.
4. Right-click a SQL query and select **View in Strobe**.

Integrate AppDynamics with DB CAM

Related pages:

- Access the Administration Console
- Monitor Databases

This page describes how to integrate AppDynamics with DB CAM. You can link to DB CAM for any DB CAM-monitored database that is discoverable by AppDynamics. This integration provides access to the database performance metrics provided by DB CAM.

Before You Begin

To use this integration you must have a DB CAM license. DB CAM must be configured to monitor the databases that you want to link to from AppDynamics.

Configure AppDynamics to Interface with DB CAM

You configure DB CAM integration at the account level and app agent level.

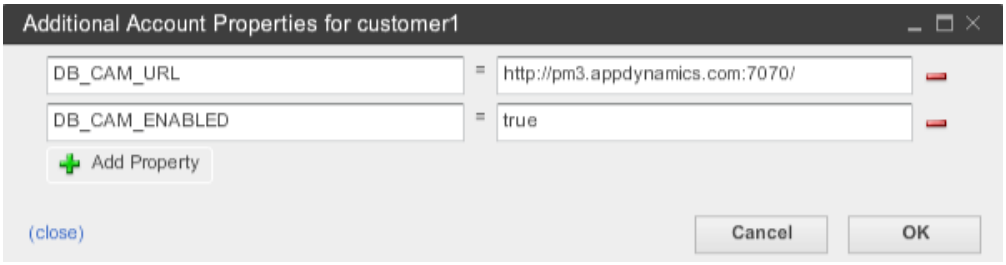
Configure DB CAM at the Account Level

Configure the integration at the account level using the Administration Console at `<host>:<port>/controller/admin.jsp`.

Create two new properties as name-value pairs in each account for which you want to enable DB CAM integration.

Configure One AppDynamics Account for DB CAM Integration

1. Log in to the Administrator Console with the administrator root password.
2. Select **Accounts**.
3. Double-click the account for which you want to configure DB CAM integration.
4. Click **Additional Account Properties** in the upper right.
5. Click **Add Property**.
6. In the left dialog, enter "DB_CAM_URL".
7. In the right dialog, enter the URL of the AppDynamics Controller that you are configuring using the syntax: http[s]://<host>:<port>
8. Click **Add Property** again.
9. In the left dialog, enter "DB_CAM_ENABLED".
10. In the right dialog, enter "true".
11. Click **OK**.
12. Log out of the Administrator Console.



Configure DB CAM at the Agent Level

Perform this procedure for each app agent for which you want to enable access to deep diagnostics from DB CAM:

1. Open the `AppServerAgent/conf/app-agent-config.xml` file for the app agent.
2. Locate the `TransactionMonitoringService` element, `<agent-service name="TransactionMonitoringService" enabled="true">`.
3. Add the `jdbc-dbcam-integration-enabled` property for the service:

```
<agent-service name="TransactionMonitoringService" enabled="true">
    <service-dependencies>BCIEngine,SnapshotService</service-dependencies>
        <configuration-properties>
            <property name="jdbc-dbcam-integration-enabled" value="true"/>
```

4. Save the file.

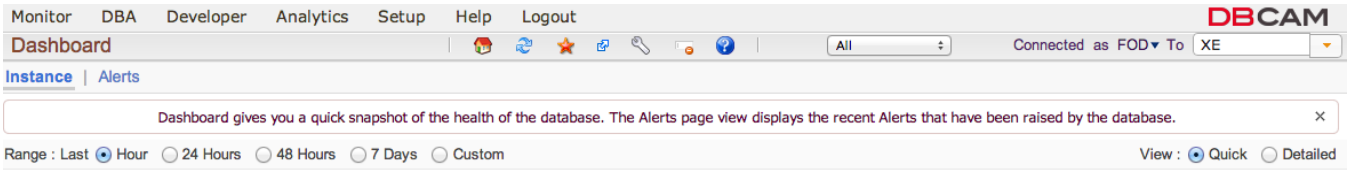
Link to DB CAM from AppDynamics

You can link to DB CAM from any AppDynamics flow map that displays a discovered DB CAM-monitored database. The flow map could be in a dashboard or a transaction snapshot.

If you link to DB CAM from a dashboard, you gain access to the DB CAM instance dashboard. If you link to be DB CAM from a transaction snapshot, you gain access to the DB CAM Session Drill Down pane.

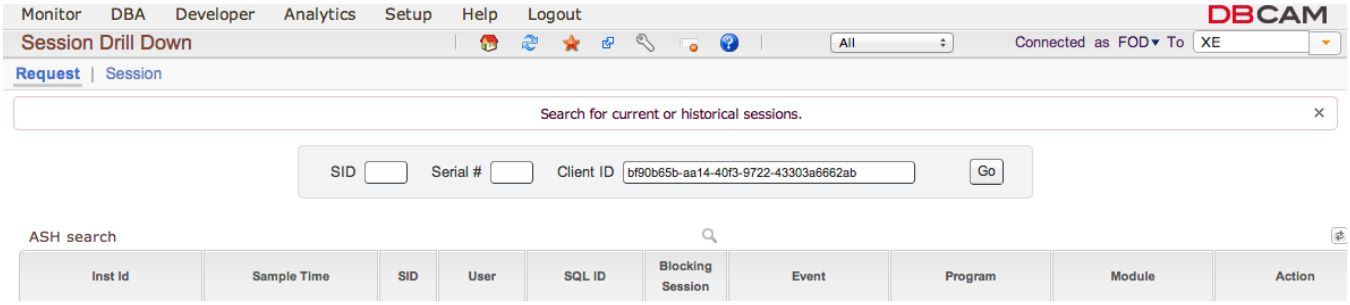
To Link to DB CAM from a Dashboard

1. In the flow map of a dashboard, right-click on the link below a database icon.
2. Select **Search in DBCam**. DB CAM launches and displays the instance dashboard for the selected database.



To Link to DB CAM from a Transaction Snapshot

1. In the flow map of a transaction snapshot, right-click on the link below the database icon.
2. Select **Search in DBCam**. DB CAM launches and displays the session drill down for the selected database.



Integrate AppDynamics with Scalyr

This page describes how to integrate AppDynamics with the Scalyr module. This integration gives you a single entry point for viewing and analyzing data gathered by AppDynamics and Scalyr. With the Scalyr integration module enabled, you can launch Scalyr searches directly from the AppDynamics Console.

The Scalyr search includes context from the AppDynamics UI session, including the time range and IP or hostname of the node being investigated in the AppDynamics UI.

Enable the Scalyr Integration Module

To enable and configure the Scalyr integration:

1. Log in to the Controller UI as an administrator.
2. Select **Settings > Administration**.
3. Select **Integration > Scalyr**.
4. Click the **Enabled** checkbox.
5. For the **URL**, enter `https://www.scalyr.com`.
6. Click **Save**.

Search Scalyr Data from AppDynamics

To launch a Scalyr search, Controller UI users must have:

- An active browser session in the Scalyr UI.
- Scalyr credentials.
- Popups permitted in the browser.

Controller users can search Scalyr logs from the node dashboard, business transaction dashboard, or from segments of a transaction snapshot. The time frame passed to Scalyr varies for each context.

Node Dashboard Access

1. Navigate to a node dashboard.
2. Select **Actions > Search Scalyr**.

This passes a search for that node with the timeframe currently selected in the Controller UI.

Business Transaction Dashboard

1. Select the Transaction Snapshot tab.
2. Select **Actions** or right-click a transaction snapshot**.**
3. Select **Search Scalyr**.

This generates a search on the nodes where the transaction occurred within the general time frame of the transaction execution. The time frame spans from 30 minutes before the transaction start time to 30 minutes after.

Call Drilldown Access

1. Select a **Call** in the drilldown view.
2. Select **Actions > Search Scalyr**.

This generates a search on the machine on which the snapshot was generated for the time frame of that segment.

Integrate AppDynamics with ServiceNow CMDB and Event Management

This page describes how to integrate the AppDynamics for ServiceNow® application with ServiceNow®.

Download

To download, visit the AppDynamics Community Exchange.

Version 20.7

AppDynamics has released a new version of the sync utility to integrate with the Orlando Release of ServiceNow®. To review version-specific configuration details, see New Version 20.7.

Please review this version compatibility matrix to guide your installation and upgrade decision:

Integration Version	AppDynamics	ServiceNow®
20.7	>= 4.5.0.1	Orlando and later
3.1	>= 4.5.0.1	New York and earlier

Use Case

AppDynamics Application Performance Monitoring traces every transaction and builds real-time application topology. The ServiceNow® integration provides these capabilities:

- AppDynamics application topology feeds data into the *AppDynamics for ServiceNow®* application as custom tables in the CMDB.

  > In this version, monitored servers can be reconciled with the ServiceNow® appropriate CMDB Server CIs.

- AppDynamics can send alerts to the *ServiceNow® Event Management* application and use the AppDynamics created entities. The AppDynamics for ServiceNow® application imports the AppDynamics alerts as entities. These entities can be used only when they are added to the ServiceNow® table. The AppDynamics for ServiceNow® application then creates a ServiceNow® table that maps with the entities.

This table lists these entities along with the ServiceNow® table that is created to represent them:

AppDynamics Entity Installed	ServiceNow® Table Created
Application	`x_apd_appdynamics_application`
Business Transaction	`x_apd_appdynamics_business_transaction`
Controller	`x_apd_appdynamics_controller`
Database	`x_apd_appdynamics_database`
Node	`x_apd_appdynamics_node`
Remote Service	`x_apd_appdynamics_remote_service`
Tier	`x_apd_appdynamics_tier`

Before You Begin the Integration

This integration requires that you download, install, and complete the following tasks, in this order, before starting the integration.

1. Download and install the AppDynamics for ServiceNow® application from the ServiceNow® Store.
   This application creates the custom AppDynamics tables in the Configuration Management Database (CMDB).
2. Download, install, and configure the Data Sync Utility.
   This utility makes API calls to AppDynamics and ServiceNow® to push our topology into the CMDB tables.
3. Once the data sync utility has been configured, go back to the utility and choose to download and install the Alerting template.
   The template contains the proper settings for AppDynamics to send alerts to the event service in ServiceNow®.
4. Install Java >= 1.8 on the machine that runs this program.
5. Start Java with 512 MB of initial memory (`-Xms512m`).

Add AppDynamics Discovery Source to ServiceNow®

You must create an AppDynamics Discovery Source before installing the integration from the ServiceNow® Store:

1. Log in to the ServiceNow® store.
2. In the left menu, select **System Definition** > **Choice Lists**.
3. Click **New**.
4. Specify the following details only. Do not change the values of other fields.

Table	`Configuration Item [cmdb_ci]`
Element	`discovery_source`
Label	`AppDynamics`
Value	`AppDynamics`

Download AppDynamics for ServiceNow® Application

Download the AppDynamics for ServiceNow® application from the ServiceNow® store and install it on your ServiceNow® instance.

> Ensure that you follow the instructions under the *System Requirements* and *Other Requirements* sections of the ServiceNow® download page.

To use Node-to-Server CI Reconciliation in ServiceNow® >= 3.1, you must have:

- AppDynamics Machine Agents with Server Visibility enabled installed and running on each host supporting AppDynamics Nodes to be imported.
- AppDynamics Controller and Machine Agent >= 4.5.0.1 with Server Visibility enabled.
- If you have issues, see Troubleshooting.

Download AppDynamics-ServiceNow® Data Sync Utility

Download the Data Sync Utility zip file from the AppDynamics Exchange.

You can download this utility either as a standalone Java application or as a JAR file. The standalone Java application can run on a Windows or Linux host and the JAR file can run as a Java program on any host machine.

> This host must have connectivity to both the target ServiceNow® instance and the target AppDynamics Controller.

The downloaded file includes a lightweight web server that has a basic web application to configure the integration. You can also run the integration in CLI mode only.

Server Options

Download and unzip the `appdynamics-cmdb-service-$version.zip` Data Sync Utility file.

1. Unzip the `appdynamics-cmdb-service-$version.zip` file.
2. Start the Server.
    a. **init.d service (System V)**

    ```
    sudo ln -s /path/to/appdynamics-cmdb-service/appdynamics-cmdb-service.jar /etc/init.d/appdynamics-cmdb-service
    sudo /etc/init.d/appdynamics-cmdb-service start
    ```

    The java options can be configured in the `$HOME/appdynamics-cmdb-service.conf` file.
    The application logs are created in the `$HOME/logs` directory.
    The system out logs are created in the `/var/log/appdynamics-cmdb-service.log` file.

    b. **Windows (winsw):**

    Open a terminal and navigate to the `appdynamics-cmdb-service` folder where you extracted the zip file:

```
cd C:\Path-to\appdynamics-cmdb-service
```

Run the following command:

```
javaw -jar appdynamics-cmdb-service.jar
```

The Java options can be configured in the `%$HOME%/bin/appdynamics-cmdb-service-win.xml` file.

The logs are created in the `$HOME/logs` directory.

c. **Other platforms:**

```
java -Xms512m -jar /path/to/appdynamics-cmdb-service.jar
```

The application logs are created in the `$HOME/logs` directory.

Upgrades

1. Backup the data directory `data/` where the java sync utility is installed.
2. Overwrite the existing installation with the new file.

Setup

1. init.d service: The configuration file is located at `$HOME/appdynamics-cmdb-service.conf`. Add the params to the `JAVA_OPTS` property.
2. Windows service: The configuration file is located at `$HOME/bin/appdynamics-cmdb-service-win.xml`. Add the params to the `<arguments>` property.
3. jar: Add the params directly to the command preceding `-jar ...`

Options

- Use a different port:

```
-Dserver.port=8080
```

- Enable authentication:

```
-Dplatform.security.enabled=true  # This will create a local login with the following credentials.
-Dplatform.username=user
-Dplatform.password="deFAultPwd4P1atfrm"
-Dplatform.security.encryption-key=mykey
-Dplatform.security.encryption-salt=mysalt
```

The `encryption-key` and `encryption-salt` are optional.

Configure the Data Sync Utility

User Roles and Permissions

The Sync Utility needs to communicate with both an AppDynamics Controller and a ServiceNow® instance. We recommend using a service account for this access:

- **AppDynamics Controller:**

The service account user requires these roles with rights to all applications to be synchronized.

  - Applications and Dashboards Viewer

    - Server Monitoring User—Optional if you want to enable node-to-server CI reconciliation

- **ServiceNow®**: These roles should be assigned to the ServiceNow® user account that will be posting data to ServiceNow®:

  > This user can be set to **web service access only** on the user form.

- If Event Management is activated in your ServiceNow® instance, add these roles:
    - `x_apd_appdynamics.appdynamics_role`
    - `evt_mgmt_user`
    - `evt_mgmt_integration`
    - `mid_server`—Optional if you want to do server CI reconciliation.
    - `app_service_admin`—Required for sync utility v20.7.
- If Event Management is *not* activated, add these roles:
    - `x_apd_appdynamics.appdynamics_role`
    - `itil`
    - `mid_server`—Optional if you want to do server CI reconciliation.
    - `app_service_admin`—Required for sync utility v20.7.

Domain Separated ServiceNow® Instances

If your ServiceNow® instance is domain-separated, a unique user account is required for each domain you want to update in the CMDB. For each domain:

1. Create a user account as described in User Roles and Permissions with the required roles.
2. Assign this user to the appropriate domain for the applications that it needs to access.
3. Create a new ServiceNow® instance with the appropriate user for each domain.
4. Set up synchronization for the applications appropriate for each domain user.

Synchronize with the CMDB

The integration supports the synchronization of one or more ServiceNow® instances with one or more AppDynamics Controllers.

1. Log in to the Sync Utility.
    a. Open `http://<host>:8080` on a browser.
    b. The default username is `user` and the default password is `deFAultPwd4P1atfrm`.

    > This can be overridden by the java startup property `-Dplatform.password=welcome`. See Server Options.

2. Select the **Service Model Integration** left menu bar.
3. Click **AppDynamics Controllers** and add your Controller(s).

    > If your Controller is on-premises or dedicated SaaS (single-tenant), the **Account Name** will be `customer1.`

4. Click **ServiceNow® Instances** and add your ServiceNow® instance(s).
5. Click **Synchronize** from the top menu.
6. Choose applications from the **Applications** list to export to ServiceNow®.
7. Select which **AppDynamics Relationships to Synchronize** to include:
    - **Tier to Tier**
    - **Tier to Remote** (Remote Services)
    - **Tier to Application**
    - **Node-to-Server CI**
        - Reconciles the node host with an existing Server CI and builds a **Runs** relationship with the `x_apd_appdynamics_node` runni ng on it. See Node-to-Server CI Reconciliation.
    - **Create Business Service**
        - Creates a Business Service CI (`cmdb_ci_service`) and builds a **Runs** relationship to the `x_apd_appdynamics_applicati` on CI. See Create Business Service CI.
8. Click **Run Diagnostics** to begin verification without creating any data.
    - If successful, click **Synchronize** to run a one-time synchronization.
    - If not successful, address the issues in the diagnostic messages provided.

Most integration users may like the synchronization to run at regular intervals to keep the service models. The integrated scheduler function allows for the creation and running of synchronization automatically.

UI Tab	Description

Schedules	Allows schedule creation using a cron expression. The **Synchronize** options on this page are the same as the other configuration panes.
History	Provides a graphical view of prior runs. You can expand each run to get details of the run, including error messages.
Settings	Provides additional settings for connection timeouts, SSL, proxy configuration, and additional static values that can be added to fields in various CMDB tables.

After the synchronization is complete, log in to ServiceNow® instance and select the AppDynamics menu item to view the tables and data associated with the integration.

Node-to-Server CI Reconciliation

In >= 3.1, the **Node-to-Server CI** checkbox in the sync utility builds a relationship between an AppDynamics Node (`x_apd_appdynamics_node`) and the underlying host Server CI (`cmdb_ci_linux_server, cmdb_ci_windows_server`) in the ServiceNow® CMDB.

To use this feature, a Machine Agent with Server Visibility enabled must be installed and running on each host that supports an imported AppDynamics Node. See Machine Agent with Server Visibility.

The integration uses the default ServiceNow® hardware identification rules for reconciliation:

- **Name**: AppDynamics uses the operating system-reported hostname as the value for this field, which is subject to the following **Discovery Property** settings in ServiceNow®, whether Discovery is installed or not:

  The `mid_server` role must be assigned to the ServiceNow® user for the integration to read these properties.

  - `glide.discovery.hostname.case`
  - `glide.discovery.hostname.include_domain`
  - `glide.discovery.fqdn.regex`

  Refer to the ServiceNow® product documentation for more information about these properties.

- **IP Address + MAC address** (Network Adapter Table): AppDynamics uses any adapter with a valid IPv4 or IPv6 address and a MAC address.

These attributes are provided by Machine Agents with Server Visibility enabled for Controller and Machine Agent >= 4.5.0.1.

1. To avoid duplicate Server CIs being created by this integration, any discovery sources employed must adhere to the same hardware identification rules:
   a. **Name** in the Server CI should match the system reported hostname subject to the Discovery properties described above.
   b. For each **Server Network Adapter**, the `ip_address` and `mac_address` must be populated in the Network Adapter table and related to the Server CI.

   ServiceNow® CMDB Identification and Reconciliation will not consider IP Address and MAC Address values populated on the Server CI form directly.

2. This integration identifies Linux and Windows servers and reconciles them to their respective CI classes on update or create (`cmdb_ci_linux_server & cmdb_ci_windows_server`).

   If a server is not Windows or Linux, no CMDB relationships will be created.

Fields Populated in ServiceNow® by Node-to-Server CI Reconciliation

For the appropriate Server Class (`cmdb_ci_*_server`) and related to the parent AppDynamics Node:

ServiceNow® Server CI Field	AppDynamics Server Visibility Attribute Used
Name (`name`)	The reported Hostname—the Sync Utility reads and uses the discovery properties listed above to determine the hostname.
Hostname (`host_name`)	The reported Hostname.

Each Network Adapter reported populates the Network Adapter CI (`cmdb_ci_network_adapter`) and related parent Server CI:

ServiceNow® Network Adapter CI Field	AppDynamics Server Visibility Attribute Used
IP Address (`ip_address`)	IP Address with /x removed. Using either IPv4 or IPv6 Address as reported. If neither is populated, the adapter is not synced.
MAC Address (`mac_address`)	The reported MAC address.

Add Static Values to Required Fields

If there are required fields in your CMDB that AppDynamics does not populate, you can use the **CMDB Additional Fields** to add multiple static values per table.

1. Navigate to the AppDynamics-ServiceNow® Sync Utility.
2. Select **Settings.**
3. Select **CMDB Additional Fields.**
4. For the desired CI table, click **Add Field**.
5. Enter the ServiceNow® **Field Name** (not the label).
6. Enter the static value to populate all records of this type. For example, if you are required to populate the `hardware_status` field on all `cmdb_ci_server` and child class records, enter "`hardware_status`" and then "`Installed`".
7. Click **Save**.

Considerations for Dynamic Application Environments

If the application environments you are monitoring with AppDynamics change frequently, you may end up with artifacts in the ServiceNow® CMDB that no longer reflect the current state of your application topology.

In order to address this, ServiceNow® provides documentation on how to configure "data refresh rules" in the CMDB so that irrelevant AppDynamics CIs can be removed. For the New York release, see Create data refresh rules.

Create Business Service CI

AppDynamics Application to ServiceNow® Application Service Relationships

Health rule violation alerts related to a ServiceNow® Application Service are shown in the Event Management Dashboard. There are two ways to build this relationship based on the current state of the ServiceNow® CMDB:

If Business Services do not exist:

1. If there are no Business Service CIs in the CMDB, ensure that the **Create Business Service** checkbox is checked when initially synchronizing an application. Follow the instructions in the Sync Utility documentation that explain how to convert that CI to an Application Service (`cmdb_ci_service_discovered`) CI that can be shown on the ServiceNow® Event Management Dashboard.
   You must select six (6) levels of CIs to include in the model.

This step requires the `app_service_admin` role. See the ServiceNow® Convert a business service to an application service.

If Business Services exist:

If the Business Service entities are Application Service class CIs, a relationship can be manually created between the AppDynamics Application and the ServiceNow® Application Service. To create the relationship:

1. Open the AppDynamics Application CI (`x_apd_appdynamics_application`).
2. Click **Add CI relationship.**
3. In the filter, set the "**Class**" - "**is**" - "**Application Service**".
4. Click **Run Filter**.
5. Select the **Application Service CI**.
6. Select the **Runs On::Runs** relationship.
7. Click **Create new relationships with selected configuration item(s)**.

AppDynamics Tier to ServiceNow® Application Service Relationships

In some cases, an AppDynamics Tier may be the correct entity to relate to a ServiceNow® Application Service. To build this relationship in the ServiceNow® CMDB:

1. Open the **AppDynamics Tier CI** (`x_apd_appdynamics_tier`).
2. Click **Add CI relationship.**

3. In the filter, set the "**Class**" - "**is**" - "**Application Service**".
4. Click **Run Filter**.
5. Select the **Application Service CI**.
6. Select the **Runs On::Runs** relationship.
7. Click **Create new relationships with selected configuration item(s)**.

Additional Application Relationships

The AppDynamics Application description and Tier description fields are populated in the AppDynamics Application CI (`x_apd_appdynamics_application`) and AppDynamics Tier CI (`x_apd_appdynamics_tier`) respectively:

Table	Application CI Field	AppDynamics Field Used
`x_apd_appdynamics_application`	Description (`short_description`)	Application description

Table	Tier CI Field	AppDynamics Field Used
`x_apd_appdynamics_tier`	Description (`short_description`)	Tier description

Troubleshooting

Logs

The logs are generated in the `logs/` directory where the application is installed.

Debug Logs:

To enable debug logging, edit the file `conf/log4j2.xml` and change the level of the logger `com.appdynamics` to `DEBUG`.

Read Timeouts

If you encounter any Read Timeout errors while doing the sync:

1. Increase the **Socket Timeout** value in the Settings tab up to `60,000` initially and higher if needed.
2. Reduce the **Sync Batch Size** of entities to ServiceNow® Instance.
3. Navigate to the `Installation` directory.
4. Find the `conf/application.properties` file and adjust the size value.
5. Restart the AppDynamics ServiceNow® Sync Utility service or daemon (Required).

Events Integration

This section assumes that you are familiar with the configuration of HealthRules, Policies, and Actions in AppDynamics. See Alert and Respond.

The Events integration uses the HTTP templates feature in the Controller to push events to the ServiceNow® Events API. The details of the ServiceNow® Events API can be found here. See HTTP Request Actions and Templates.

Prerequisites

- Download and install the AppDynamics for ServiceNow® application on your ServiceNow® instance.
- Run the AppDynamics-ServiceNow® Data Sync Utility and verify that the entities are imported into your ServiceNow® instance. See Data Sync Utility.
- Activate the ServiceNow® Event Management plugin.

Events Installation and Configuration

In this section, you will create an Action, configure Health Rule Violations, and create binding Policies.

Create an Action on the AppDynamics Controller

1. Log in to the web UI for the AppDynamics-ServiceNow® Data Sync Utility.
2. Select **Service Model Integration** > **Event Integration.**
3. Select the Controller you would like to configure. If one is not configured, see Data Sync Utility Configuration.
4. Click **Download Template.**

Use the downloaded file to configure the HTTP Request template in AppDynamics. You will then create an Action and apply that action to a policy that specifies a health rule and action. To create the new Action:

1. Navigate to the **Alert & Respond** top menu in your AppDynamics Controller.

2. Click **Alert & Respond** > **HTTP Request Templates** in the left navigation.
3. Select the resource on which the action is to be created.
4. Click **New** and fill out the following fields:
    a. **Name**: Any name to uniquely identify the template
    b. **Request URL**
        i. **Method**: `POST`
        ii. **Raw URL**: `https://<your-instance>.service-now.com/em_event.do?JSONv2&sysparm_action=insertMultiple.` Replace `<your-instance>` with the id of the actual instance.
    c. **Authentication**
        i. **Type**: `BASIC`
        ii. Enter the `user name` and `password` of your ServiceNow® instance.

        > Ensure you have already configured the ServiceNow® User and Roles as described in User Roles and Permissions.

    d. **Payload**
        i. **MIME Type**: `application/json`
        ii. Copy the contents from the downloaded file, `event-request-template.txt`, and then paste it in the **Payload** text area
        iii. Update the `controllerName` in the first line of the file. It must be the same value that you set while adding the `AppDynamics Controller Name` in the Sync Utility.
5. Save the HTTP Template.

Configure Health Rules on the AppDynamics Controller

1. Select the Alert & Respond tab.
2. Select **Health Rules**.
3. Use the **Select** dropdown to choose an application on which you want to alert.
4. Review the list of **Health Rules** configured out-of-the-box for that application. Add more **Health Rules** if needed.

Create a Policy on the AppDynamics Controller to Bind Health Rules to Actions

1. Select **Alert & Respond** > **Policies**.
2. Select **Create a Policy Manually** if there are no policies configured already.
3. Select the type of scenarios on which you want to receive alerts.

    > Checking all the boxes might lead to an alert storm on your ServiceNow® instance.

4. Click **Save**.
5. Select the **Health Rule Scope** defining which tiers and nodes the Health Rule should cover and click **Save**.
6. Select the **Object Scope** and choose the **Tiers and Nodes** to be covered in this policy and click **Save**.
7. Select **Actions**.
8. Click **Add +** sign to create a new **Action**.
9. Select the ServiceNow® **Action** you created Create an Action on the AppDynamics Controller and click **Save**.

Create a Manual Entry Point for the AppDynamics Monitored Application on the Application Service CI

> If you are connecting to a ServiceNow® instance running Orlando or later, skip this section and refer to the New Version 20.7 instructions.

For AppDynamics alerts to impact the health of an application service in ServiceNow® Event Management, you must create a manual entry point.

1. If you chose to have the Sync Utility create a Business Service:
    a. Make sure you convert the service to an application service by following the prompts in the sync utility after synchronizing the application.
    b. This conversion will add the manual entry point automatically.
2. If you already have Application Service CIs that you want to associate with an AppDynamics monitored application (or application tier):
    a. Open the **Application Service CI** record.
    b. Click **Add Entry Point**.
    c. Select the AppDynamics monitored **Application** or **Tier CI Type**.
    d. Select the name of the AppDynamics monitored application or tier to associate.
    e. Click **Save**.
    f. Click the **Additional Info** link.
    g. Click the **Update with changes from CMDB UI Action** link.
    h. Select the number of levels of related CIs to include in the new application service.
    i. Click **OK**.

New Version 20.7

Requirements

Versions

- AppDynamics >= 4.5.0.1 is required.
- ServiceNow® instances to be synchronized must be running Orlando or greater.

New Roles

- No additional roles are needed for the service account in AppDynamics.
- The service account in ServiceNow® will also need the `app_service_admin` role.

Upgrade to Version 20.7

To upgrade an existing sync utility, follow the upgrade section. Below are some answers to questions about upgrading an existing sync utility:

What happens to existing applications that have already been synchronized?

Existing AppDynamics monitored applications and related entities that have been synchronized to a ServiceNow® CMDB from previous versions of the sync utility will remain in the CMDB. When the same application is re-synchronized using 20.7, a calculated service CI is created for those applications (or tiers) as configured. See Creating Calculated Application Service CIs.

What happens to existing manual entry points?

If you created manual entry points for Application Service CIs using AppDynamics monitored application CIs `x_apd_appdynamics_application` will remain as-is. After synchronizing using 20.7 of the sync utility, a new calculated application service CI will be added to the relationships.

AppDynamics recommends that you remove any previously created entry points and create a manual entry point to the new Calculated Application Service `cmdb_ci_service_calculated` CI. To do this:

1. To remove the existing manual entry point:
    a. Open the **Application Service CI** you are monitoring with Event Management
    b. Click - next to the **Manually Added CI** link and click **Remove**.
2. Add a manual entry point for the calculated application service:
    a. Open the application service CI you are monitoring in ServiceNow.
    b. Click **Add Entry Point**.
    c. Select **Manually Created**.
    d. For **CI Type**, select **Calculated Application Service**.
    e. For **CI Name**, select the name for the application you synched.

Create Calculated Application Service CIs

Orlando introduces a new CI class called Calculated Application Service `cmdb_ci_service_calculated`. This new class is dynamic and provides additional capability to automatically update a service map when relationships in the CMDB change for CIs that are part of the application service.

Some AppDynamics customers monitor applications as Tiers. With the new version 20.7, you can map AppDynamics Applications or AppDynamics Tiers to `cmdb_ci_service_calculated` CIs in ServiceNow®.

Select Tiers to Monitor as Application Services in ServiceNow®

By default, all applications monitored by an AppDynamics controller relate to a new calculated application service when synchronized for the first time with 20.7 with a **Used By::Depends On** relationship.

To sync monitored tiers to a calculated Application Service CI in ServiceNow®:

1. Navigate to **Application Mappings**.
2. Add a Controller if none exists, or select the Controller from the dropdown. A list of all the AppDynamics monitored applications in the selected Controller display in the left panel.
3. To map each tier of a monitored application to a Calculated Application Service CI, move that application to the right bucket as an **Application Group**.

Synchronize the Application Services in ServiceNow®

ServiceNow® requires that each Calculated Application Service CI (`cmdb_ci_service_calculated`) has a unique name. When synchronized for the first time using 20.7, a new Calculated Application Service CI is created with this naming convention:

- By default, each monitored application will have a Calculated Application Service CI named:
    - AppD - AppNameGoesHere (`controllerName`)
- If an application is designated as an Application Group, each monitored tier will have a Calculated Application Service CI named:
    - AppD - AppnameGoesHere:TierNameGoesHere (`controllerName`)

AppDynamics Application & ServiceNow Calculated Application CI Dashboard

Use the **View Mapped Applications** dashboard to view the mappings between AppDynamics Applications (and Tiers) and ServiceNow® Calculated Application CI.

To delete a mapping from ServiceNow®, click the red '**X**' to delete the mapping from this panel. This will delete both the Calculated Application CI and the relationship displayed. The AppDynamics entities in the CMDB will remain.

Event Integration Enhancements

The Event Integration Template has several enhancements in the 20.7 release. Alerts are more easily bound to Business Transaction and Node CIs.

Support

For questions or feature requests, please contact AppDynamics Help.

Integrate AppDynamics with Splunk

Related pages:

- Splunkbase Apps
- Splunk documentation

This page describes how to integrate AppDynamics and Splunk. This integration provides a single, cohesive view of data and allows you to:

- Launch Splunk searches using auto-populated queries from the AppDynamics Console based on criteria such as time ranges and the node IP address.
- Push notifications on policy violations and events from AppDynamics to Splunk.
- Mine performance data from AppDynamics using the Controller REST API and push it into Splunk.

Configure Splunk Integration

1. Log in to the Controller UI as an administrator.
2. Select **Settings > Administration**.
3. Select **Integration > Splunk**.
4. Click the **Enabled** checkbox.
5. For the **URL**, enter the Splunk URL and port number.
6. Optionally, enter **Extra Query Parameters**. These parameters are appended to each Splunk search initiated from AppDynamics.
7. Click **Save**.

Launch a Splunk Search from AppDynamics

You can launch a search of Splunk logs for a specific time frame associated with a transaction snapshot from several places in AppDynamics.

To launch a Splunk search:

- You need Splunk credentials. You will only enter your credentials the first time that you launch a Splunk search. Your credentials are cached by the browser after the first login.
- Ensure the Splunk Server is running.
- Configure your browser to allow popups.

> **Enable Pop-ups**
>
> If you do not see a login prompt at first login, either your browser is blocking the Splunk login popup or the Splunk Server is not running.

You can access the **Search Splunk** option from the node dashboard or the business transaction dashboard.

Node Dashboard Access

1. Navigate to a node dashboard.
2. Select **Actions** > **Search Splunk**.

Business Transaction Dashboard

1. Select the **Transaction Snapshot** tab.
2. Right-click a transaction snapshot.
3. Select **More Actions**.
4. Select **Search Splunk**.

Product and Release Announcements

This table lists the agent, Controller, and on-premises releases. Note that some releases will not have resolved issues or enhancements. For other types of announcements, see Product Announcements and Alerts Home.

Date	Announcement
May 31, 2021	21.4.0 (Synthetic Server) released. See 21.4 On-premises Platform Enhancements.
May 28, 2021	21.5.0 (.NET Agent) released. See 21.5 Agent Enhancements.
May 28, 2021	21.5.0 (Node.js Agent) released. See 21.5 Agent Enhancements.
May 27, 2021	21.5.0 (Analytics Agent) released. See 21.5 Agent Enhancements.
May 26, 2021	21.5.0-2052 (Cluster Agent) released. See 21.5 Agent Enhancements.
May 25, 2021	21.5.0 (Private Synthetic Agent - K8S Container-Based Agent) released. See Past On-premises Platform Releases.
May 18, 2021	21.5.1 (Xamarin Agent) released. See 21.5 Agent Enhancements.
May 18, 2021	21.5.0 (Cordova Plugin) released. See 21.5 Agent Enhancements.
May 18, 2021	21.5.0-3130 (Machine Agent) released. See 21.5 Agent Enhancements.
May 17, 2021	21.5.0 (Android Agent) released. See 21.5 Agent Enhancements.
May 17, 2021	21.5.0 (General) released. See 21.5 Controller Enhancements and Controller Resolved Issues.
May 12, 2021	21.5.0 (iOS Agent) released. See 21.5 Agent Enhancements.
May 10, 2021	AppDynamics AWS Lambda Extension for Serverless APM. See Use the AppDynamics AWS Lambda Extension to Instrument Serverless APM at Runtime.
May 10, 2021	21.5.286 (Node.js Serverless Tracer) released. See 21.5 Agent Enhancements.
May 3, 2021	21.2.7-24387 (Enterprise Console) released. See 21.2 On-premises Platform Enhancements and 21.2 On-premises Platform Resolved Issues.
April 29, 2021	21.4.3-24599 (Enterprise Console) released. See 21.4 On-premises Platform Enhancements and 21.4 On-premises Platform Resolved Issues.
April 28, 2021	21.4.0 (.NET Agent) released. See 21.4 Agent Enhancements.
April 25, 2021	21.4.0 (Experience Journey Map) UIC released. See 21.4 Controller Enhancements.
April 26, 2021	21.4.0 (ThousandEyes Integration with AppDynamics) released. See 21.4 Controller Enhancements.
April 23, 2021	21.2.6-24377 (Enterprise Console) released. See 21.2 On-premises Platform Enhancements and 21.2 On-premises Platform Resolved Issues.
April 22, 2021	21.4.2-24588 (Enterprise Console) released. See 21.4 On-premises Platform Enhancements and 21.4 On-premises Platform Resolved Issues.
April 22, 2021	21.4.0-385 (Analytics Agent) released. See 21.4 Agent Enhancements.
April 22, 2021	21.4.0-3075 (Machine Agent) released. See 21.4 Agent Enhancements.
April 21, 2021	21.4.0-2358 (Database Agent) released. See 21.4 Agent Enhancements.
April 21, 2021	21.4.0 (Java Agent) released. See 21.4 Agent Enhancements.
April 16, 2021	21.4.0 (Node.js Agent) released. See 21.4 Agent Enhancements.
April 16, 2021	21.4.0 (JavaScript Agent) released. See 21.4 Agent Enhancements.
April 12, 2021	21.3.1 (.NET Agent) released. See Past Resolved and Known Issues by Release.
April 7, 2021	21.4.0 (Apache Agent) released. See 21.4 Agent Enhancements.
April 5, 2021	21.4.0 (IBM Integration Bus Agent (IIB) Agent) released. See 21.4 Agent Enhancements.
April 5, 2021	21.4.0 (General) released. See 21.4 Controller Enhancements and 21.4 Controller Resolved Issues.
April 5, 2021	21.4.0 (React Native) released. See 21.4 Agent Enhancements.
March 29, 2021	21.3.0 (.NET Agent) released. See 21.3 Agent Enhancements and 21.3 Agent Resolved Issues.
March 26, 2021	21.3.278 (Node.js Serverless Tracer) released. See 21.3 Agent Enhancements and 21.3 Agent Resolved Issues.

March 26, 2021	21.3.1-2042 (Cluster Agent) released. See 21.3 Agent Enhancements and 21.3 Agent Resolved Issues.
March 25, 2021	21.3.0-3059 (Machine Agent) released. See 21.3 Agent Enhancements and 21.3 Agent Resolved Issues.
March 25, 2021	21.3.0-2038 (Cluster Agent) released. See 21.3 Agent Enhancements and 21.3 Agent Resolved Issues.
March 25, 2021	21.3.0-9590 (Analytics Agent) released. See 21.3 Agent Enhancements and 21.3 Agent Resolved Issues.
March 25, 2021	21.3.0-2181 (Network Agent) released. See 21.3 Agent Enhancements and 21.3 Agent Resolved Issues.
March 15, 2021	21.2.3-24315 (Enterprise Console) released. See 21.2 On-premises Platform Enhancements and 21.2 On-premises Platform Resolved Issues.
March 8, 2021	21.3.0 (Dash Studio) UIC release. See 21.3 Controller Enhancements.
March 8, 2021	21.2.2-24308 (Enterprise Console) released. See 21.2 On-premises Platform Enhancements and 21.2 On-premises Platform Resolved Issues.
February 26, 2021	21.2.0 (Synthetic Server) released. See 21.2 On-premises Platform Enhancements and 21.2 On-premises Platform Resolved Issues.
February 25, 2021	21.2.0-3052 (Machine Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 25, 2021	21.2.0 (Node.js Agent) Released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 25, 2021	21.2.1 (Analytics Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 25, 2021	21.2.0 (Network Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 24, 2021	21.2.0-1997 (Cluster Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 24, 2021	21.2.1-24293 (Enterprise Console) released. See 21.2 On-premises Platform Enhancements and 21.2 On-premises Platform Resolved Issues.
February 24, 2021	21.2.0 (.NET Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 24, 2021	21.2.0 (PHP Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 22, 2021	21.2.0 (Enterprise Console) released. See 21.2 On-premises Platform Enhancements and 21.2 On-premises Platform Resolved Issues.
February 22, 2021	21.2.0 (General) released. See 21.2 Controller Enhancements.
February 19, 2021	21.2.1 (React Native Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 19, 2021	21.2.1 (Cordova Plugin) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 19, 2021	21.2.1351 (Xamarin Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 18, 2021	21.2.0 (Android Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 18, 2021	20.11.9-23919 (Enterprise Console) released. See 20.x On-premises Platform Enhancements and 20.x Resolved and Known Issues.
February 17, 2021	21.2.0 (JavaScript Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 17, 2021	21.2.0-2285 (Database Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 16, 2021	21.2.0 (Dash Studio) UIC release. See 21.2 Controller Enhancements.
February 16, 2021	21.2.0 (iOS Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 16, 2021	21.2.0 (Synthetic Monitoring: Hosted agents) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.

February 15, 2021	21.2.0 (Java Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
February 4, 2021	20.11.8-23902 (Enterprise Console) released. See 20.x Past On-premises Platform Releases and 20.x Past Resolved and Known Issues.
February 2, 2021	21.2.0 (Python Agent) released. See 21.2 Agent Enhancements and 21.2 Agent Resolved Issues.
January 29, 2021	21.1.0 (Node.js Agent) released. See 21.1 Agent Resolved Issues.
January 29, 2021	20.11.7-23894 (Enterprise Console) released. See 20.x Past On-premises Platform Releases and 20.x Past Resolved and Known Issues.
January 29, 2021	21.1.0 (.NET Agent) released. See 21.1 Agent Resolved Issues.
January 28, 2021	21.1.0 (Dash Studio) UIC release. See 21.1 Controller Enhancements.
January 28, 2021	21.1.1 (Java Agent) released. See 21.1 Agent Enhancements and 21.1 Agent Resolved Issues.
January 26, 2021	20.11.1-3044 (Machine Agent) released. See 20.x Past Agent Releases.
January 25, 2021	20.11.6-23887 (Enterprise Console) released. See 20.x Past On-premises Platform Releases and 20.x Past Resolved and Known Issues.
January 22, 2021	21.1.0-3041 (Machine Agent) released. See 21.1 Agent Enhancements and 21.1 Agent Resolved Issues.
January 18, 2021	21.1.0 (Java Agent) released. See 21.1 Agent Enhancements and 21.1 Agent Resolved Issues.
January 8, 2021	20.10.10-23638 (Enterprise Console) released. See 20.x Past On-premises Platform Releases and 20.x Past Resolved and Known Issues.
December 18, 2020	20.12.1-1948 (Cluster Agent) released. See 20.x Past Resolved and Known Issues.
December 18, 2020	20.11.5-23850 (Enterprise Console) released. 20.x Past On-premises Platform Releases and 20.x Past Resolved and Known Issues.
December 18, 2020	20.10.9-23633 (Enterprise Console) released. See 20.x Past On-premises Platform Releases and 20.x Past Resolved and Known Issues.
December 18, 2020	20.12.0 (.NET Agent) released. See 20.x Past Resolved and Known Issues.
December 18, 2020	20.12.0 (Python Agent) released. See 20.x Past Resolved and Known Issues.
December 17, 2020	20.12.0-1937 (Cluster Agent) released. See 20.x Past Resolved and Known Issues.
December 17, 2020	20.11.4-23846 (Enterprise Console) released. See 20.x Past On-premises Platform Releases and 20.x Past Resolved and Known Issues.
December 16, 2020	20.12.0-3016 (Machine Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
December 16, 2020	20.12.0-2183 (Database Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
December 15, 2020	20.12.0 (iOS Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
December 11, 2020	20.12.0 (JavaScript Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
December 8, 2020	20.12.0 (Node.js Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
December 8, 2020	20.11.3-23827 (Enterprise Console) released. See 20.x Past On-premises Platform Releases and 20.x Past Resolved and Known Issues.
December 3, 2020	20.10.8-23600 (Enterprise Console) released. See 20.x Past On-premises Platform Releases and 20.x Past Resolved and Known Issues.

December 2, 2020	20.11.2-23819 (Enterprise Console) released. See 20.x Past On-premises Platform Releases and 20.x Past Resolved and Known Issues.
November 30, 2020	20.11.1-23806 (Enterprise Console) released. See 20.x Past On-premises Platform Releases and 20.x Past Resolved and Known Issues.
November 27, 2020	20.11.0 (Java Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 25, 2020	20.11.0 (Python Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 25, 2020	20.11.0-1877 (Cluster Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 24, 2020	20.11.0 (PHP Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 23, 2020	20.11.0 (SAP Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 20, 2020	20.11.0 (React Native Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 20, 2020	20.11.0 (.NET Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 19, 2020	20.11.0 (Cordova Plugin) released. SSee 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 19, 2020	20.11.0-2915 (Machine Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 19, 2020	20.11.0 (Xamarin Agent) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 18, 2020	20.11.0 (Android Agent) released. See 20.x Agent Enhancements and 20.x Resolved and Known Issues.
November 16, 2020	20.11.0 (General) released. See 20.x Past Controller Releases and Past Resolved and Known Issues by Release.
November 13, 2020	20.10.7-23585 (Enterprise Console) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 10, 2020	20.10.0 (Xamarin Agent) released. See 20.x Agent Enhancements and 20.x Resolved and Known Issues.
November 10, 2020	20.10.6-23577 (Enterprise Console) released. See 20.x Past On-premises Platform Releases and 20.x Past Resolved and Known Issues.
November 2, 2020	20.11-1400 (Java Serverless Tracer) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 2, 2020	20.11-242 (Node.js Serverless Tracer) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 2, 2020	20.11-411 (Python Serverless Tracer) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 2, 2020	20.10.5-23565 (Enterprise Console) released. See 20.x Past Agent Releases and 20.x Past Resolved and Known Issues.
November 2, 2020	20.10.5-23565 (Application Analytics) released. See Past On-premises Platform Releases and Past Resolved and Known Issues by Release.
November 2, 2020	20.10.0 (Cloud Native Visualization) released. See 20.x Past Controller Releases.

Release Notes

On this page:

Related pages:

- Product Announcements and Alerts Home
- Past Releases

AppDynamics provides release information for Controller and agent releases, resolved issues, system requirements, and all current product updates.

Resolved and Known Issues

These are the resolved issues for the agents and the Controller (SaaS) in the 21.6 release.

When artifacts are updated, they are listed with their new version numbers in the tables below. Version numbers are also shown in the AppDynamics Downloads Portal.

You can sort the table of resolved issues by key, version, and product, or use the search field to find resolved issues. The most recent releases appear at the top of the page.

Agent Resolved Issues

There are no agent resolved issues for 21.6 release yet.

Controller (SaaS) Resolved Issues

There are no Controller resolved issues for 21.6 release yet.

Known Issues

There are no known issues in the 21.6 release as of yet.

Agent Enhancements

Filter table:

Agent	Summary	Version/Date
Analytics Agent	There is no release for 21.6.0 yet.	
Android Agent	There is no release for 21.6.0 yet.	
Apache Web Server Agent	There is no release for 21.6.0 yet.	
AppDynamics AWS Lambda Extension for Serverless APM	There is no release for 21.6.0 yet.	
C/C++ SDK	There is no release for 21.6.0 yet.	
Cluster Agent	There is no release for 21.6.0 yet.	
Cordova Plugin	There is no release for 21.6.0 yet.	
Database Agent	There is no release for 21.6.0 yet.	
Go SDK	There is no release for 21.6.0 yet.	
IBM Integration Bus Agent	There is no release for 21.6.0 yet.	
iOS Agent	There is no release for 21.6.0 yet.	

Java Agent	There is no release for 21.6.0 yet.	
JavaScript Agent	There is no release for 21.6.0 yet.	
Java Serverless Tracer	There is no release for 21.6.0 yet.	
Machine Agent	There is no release for 21.6.0 yet.	
.NET Agent	There is no release for 21.6.0 yet.	
Network Agent	There is no release for 21.6.0 yet.	
Node.js Agent	There is no release for 21.6.0 yet.	
Node.js Serverless Tracer	There is no release for 21.6.0 yet.	
PHP Agent	There is no release for 21.6.0 yet.	
Python Agent	There is no release for 21.6.0 yet.	
Python Serverless Tracer	There is no release for 21.6.0 yet.	
React Native Agent	There is no release for 21.6.0 yet.	
SAP	There is no release for 21.6.0 yet.	
Synthetic Hosted Agent	There is no release for 21.6.0 yet.	
Xamarin Agent	There is no release for 21.6.0 yet.	

Controller Enhancements

There are no new features for 21.6.0 release yet.

System Requirements and Supported Environments

See the relevant page for the component you want to install or upgrade.

Platform Requirements	Agent Requirements

• Controller System Requirements
• Enterprise Console Requirements
• Platform Requirements
• Events Service Requirements
• EUM Server Requirements
	• App Agents:
	  • Java Supported Environments
	  • .NET Supported Environments
	  • .NET Core Microservices Agent Support
	  • .NET Core for Linux SDK Supported Environments
	  • Node.js Supported Environments
	  • PHP Supported Environments
	  • Python Supported Environments
	  • Supported Apache Web Servers
	  • C/C++ Agent Supported Platforms
	  • Go SDK
	• Analytics Agent Environments
	• Browser RUM Supported Environments
	• Mobile RUM Supported Environments
	• Database Visibility Supported Environments
	• Machine Agent Requirements and Supported Environments
	• Network Visibility Supported Environments

Calendar Versioning

This page describes the versioning format used for product releases.

We use a calendar-based version format with a syntax of *YY.M.X* to reflect the date of release. For example, a release in October 2020 was 20.10.0, November was 20.11.0, and so on. If another version releases in the same month, the last number of the version increments by one, for example 20.11.1.

Controller and Agent Releases

The versioning of AppDynamics language agents is done independently of each other and the Controller. Starting in release 4.5.0, agents are backward-compatible with any Controller 4.4.1 and later, so you can download and install the latest version of the agent without having to keep track of your agent versions. See Agent and Controller Compatibility.

Maintenance Support for Software Versions

AppDynamics maintains and supports every software version for one calendar year after the next major software release is generally available. For example, support and maintenance of the 20.3 release will continue for 12 months after the 20.4 release.

See Product Announcements and Alerts.

For specific maintenance and support terms, refer to your license agreement(s).

Controller GA End of Maintenance and Support

This table lists generally available AppDynamics versions, release dates, and end of maintenance and support dates:

Controller Version	Release Date	End of Maintenance and Support
21.5	May 17, 2021	To be determined
21.4	April 5, 2021	May 17, 2022
21.2	February 22, 2021	April 5, 2022
20.11	November 16, 2020	February 22, 2022
20.10	October 5, 2020	November 16, 2021
20.8	August 24, 2020	October 5, 2021
20.7	July 16, 2020	August 24, 2021
20.6	June 2, 2020	July 16, 2021
20.4	April 21, 2020	June 2, 2021
20.3	March 9, 2020	April 21, 2021
4.5	July 11, 2018	March 9, 2021
4.4	November 1, 2017	July 11, 2019
4.3	April 5, 2017	November 1, 2018

AppDynamics Artifacts End of Maintenance and Support

Artifacts are generally available AppDynamics agent and platform components on the AppDynamics Downloads Portal or AppDynamics Accounts Downloads.

Artifact end of maintenance and support dates are one calendar year after the next generally available artifact release. For example, the .NET Agent 20.11 has an end of maintenance and support date of December 18, 2021 because 20.12 released on December 18, 2020.

Hotfixes are not considered major releases, and therefore do not affect the end of maintenance and support dates. Certain AppDynamics platform components have diverged from calendar versioning, such as the Events Service.

These components operate on semantic calendar versioning and will continue to release in the 4.5.x version convention. For example, the Events Service version 4.5.2.20640 will be maintained and supported for 12 months after the next major release.

Agent and Controller Compatibility

This page describes the compatibility mapping between Agent and Controller versions.

Agent and Controller Compatibility Mapping

Please refer to the Language Agent Backward Compatibility table for AppDynamics Agents and AppDynamics Controller compatibility.

As long as all agents are compatible with the Controller version, a monitored environment may have different agent versions deployed in it at a given time. However, the oldest agents should be on originating tiers of any business transactions. This ensures that agents on downstream nodes can process the correlation header created by the originating tier.

When rolling out agent upgrades, be sure to start upgrading the agents on the nodes of downstream tiers first, and then upgrade the agents on the originating tier nodes last.

Language Agent Backward Compatibility

As of release 4.5, AppDynamics language agents are backward-compatible with any Controller >= 4.4.1. This enables you to upgrade your language agents and take advantage of the latest agent-side enhancements, features, and bug fixes, without having to upgrade your 4.4 Controller. This table outlines the Controller and language agent releases that are compatible.

Starting in release 20.2, the AppDynamics language agents are backward-compatible with any Controller >= 4.5.0, including Controllers using Calendar Versioning >= 20.3.

> The Database Agent >= 20.7 is compatible only with the Controller >= 4.5.2.

Controller Release	Language Agent Release	Notes
>= 20.3	>= 4.4 >= 20.2 >= 20.3	Controllers >= 20.3 can accept connections from Agents >= 4.4, as well as Agents >= 20.2 and Agents >= 20.3 that use Calendar Versioning. As of 20.3, Controllers cannot accept connections from 4.1 Agents.
4.5.x	>= 4.1 >= 20.2 >= 20.3	Controller 4.5.x can accept connections Agents >= 4.1, including agents that use Calendar Versioning.
>= 4.4.1	>= 4.1	Controllers >= 4.4.1 can accept connections from newer agents.
4.3.x	4.1.x – 4.3.x	Controllers 4.3.x cannot accept connections from newer agents.

> The above table is only a reference for general software compatibility. For specific maintenance and support terms, refer to your specific EULA.

Backward compatibility is supported on these agents since the 4.5 release:

- C/C++ SDK
- Cluster
- Go SDK
- Java
- IBM Integration Bus (IIB)
- Machine
- .NET
- Node.js
- PHP
- Python

> While using the Enterprise Console to upgrade the Controller, several folders (including the `appagent` folder) are removed and reinstalled. If you deployed a Java Agent with a newer version than the Controller in the `controller/appserver/glassfish/domains/domain1/appagent` folder, the upgrade will fail and internal monitoring will be lost. To prevent this, you must update the `domain.xml` file to point to the new Java Agent or avoid using customized installation for Java Agents.

For notes on SSL protocol compatibility between versions of the agent and Controller, see SSL Compatibility Matrix for App Agent for Java - Controller.

Agent Versions Supported by Controller 20.x

Agent Version /Agent Type	Languages Agents								Cluster Agent	Database Agent	AppDynamics for Databases	Machine Agent	Network Agent	Analytics Agent
	Java Agent	.NET Agent	Node.js Agent	PHP Agent	Python Agent	Web Server Agent	Go SDK	C /C++ SDK						
>= 20.x	✓	✓	✓	✓	✓		✓	✓	✓	✓		✓	✓	✓
4.5.x	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓		✓	✓	✓
4.4.x	✓	✓	✓	✓	✓	✓	✓	✓		✓		✓	✓	✓

The ability to customize Business Transaction detection, supported by .NET Agent for Linux 4.5.9, requires Controller >= 4.5.2. The .NET Agent 4.5.9 works with Controller >= 4.4.1, but the customizable transaction detection and configuration capabilities require Controller >= 4.5.2. See .NET Agent for Linux Business Transaction Configuration.

SSL Compatibility between Java Agent and Controller

The default protocol used by the Controller is TLSv1.2. See Secure the Platform for information on changing the default security protocol used by the Controller or agent.

For the Java Agent, the default protocols are:

- For Java 8 SE applications: TLSv1.2.
- For Java >= 7 applications: TLSv1.2.

SSLv3 has been disabled for SaaS Controllers because of the CVE-2014-3566 vulnerability. SSLv3 connections are no longer supported.

Introduction of New Agent Features

Even when new and old agents are supported by the same up-to-date Controller, new functionality introduced by later agents is not available on the older agents.

Past Releases

See the following for the release notes of past versions:

- Past Resolved and Known Issues by Release
- Past Agent Releases
- Past Controller Releases
- Past On-premises Platform Releases

Past Resolved and Known Issues by Release

This page lists the resolved issues for the agents, the Controller (on-premises or SaaS), and the on-premises platform since the 20.2 release.

When artifacts are updated, they are listed with their new version numbers in the tables below. Version numbers are also shown in the AppDynamics Downloads Portal.

You can sort the table of resolved issues by key, version, and product, or use the search field to find resolved issues. The most recent releases appear at the top of the page.

21.5 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary
CDM-7188	Android Agent	**Apply code changes** UI function is not working in Android studio when the `appdynamicsGeneratedBuildId_` field is added or removed
CLUSTERMON-2663	Cluster Agent	Even though the auto-instrumentation fails for an application, the environment is updated with some changes
DOTNET-4246	.NET Agent	"Console" as a logging configuration directs logs to STDERR instead of to STDOUT
DOTNET-4793	.NET Agent	HTTP request body removed for certain cases when ASP.NET Legacy instrumentation is enabled in .NET Agent for Alpine Linux
DOTNET-5344	.NET Agent	By default, the Unique Host ID should be set to the Container ID
DOTNET-5377	.NET Agent	There is a `System.TypeLoadException` exception on POCOs with nullable arguments
DOTNET-5490	.NET Agent	The Linux Agent does not correctly instrument generic value types
DOTNET-5551	.NET Agent	When the `site-regex` attribute is set to `true` for an IIS site configuration in the `config.xml` file, the full Windows agent now applies the cc to all site names matching the provided regular expression, instead of to just one site name.
JAVA-9254	Java Agent	Instrumentation point gets disabled for Netty exits
JAVA-8827	Java Agent	Agent does not sync with Controller appropriately for the purged application diagnostic ids
NODEJS-501	Node.js Agent	Agent does not show the correct number of nodes when starting the process manager.
PHP-1396	PHP Agent	One of the third-party libraries for the PHP Agent is upgraded
PHP-1357	PHP Agent	The `ADRUM_BT` cookie is sent across only for secure connections (HTTPS)

Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary
ANALYTICS-13291	Analytics	Selecting multiple source to create Business Journey Maps prevents the retrieving of data for selectors
ANLYTCS_ES-4881	Event Service	Resolve the discrepancy between Metric Processor parsing of control characters and Elasticsearch
ANLYTCS_ES-5121	Event Service	Elasticsearch analyzer does not match the current Metric Processor Lucene analyzer
DBMON-7665	Database Visibility	The health rule violation details are not displayed when you click the health status in "Databases">"Dashboard" tab
DBMON-7879	Database Visibility	For some database, the "Object Browser">"Error log" screen does not render the log data
DBMON-7925	Database Visibility	JMX connection not working for Cassandra cluster with SSL enabled
DBMON-7931	Database Visibility	Database Agent naming convention prevents collectors from reporting data

DBMON-8032	Database Visibility	Add Controller flag to control metric filtering for configurations such as Cassandra's keyspace metrics and Couchbase's bucket m
DBMON-8037	Database Visibility	`DBMonEventBus` POST event caused thread pool saturation
DIAGPLAT-1130	APM	Snapshots filter for data collectors when collector type is "Any" is not working
DIAGPLAT-1151	APM	Missing end-to-end latency time in the "Business Transaction" view
METADATA-9610	APM	Corrected caching issue to ensure the setting of the Strict-Transport-Security header

Known Issues

There are no known issues in the 21.5 release.

21.4 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
BRUM-6565	JavaScript Agent	Error in Visually Complete Time calculation when element is detached from DOM in IE11	21.4.0
BRUM-6613	JavaScript Agent	Calling the `ADRUM` command `addUserData` adds an entry even when the key/value pair is null or undefined	21.4.0
DBMON-7950	Database Agent	The `pg_database_size` metric for Postgres system statistics was computed every minute causing high CPU utilization. With this release, the `pg_database_size` value is computed at an interval of 1hr approximately	21.4.0
DBMON-8026	Database Agent	The Pluggable Database monitoring (PDB) does not work with the Database Agent 21.2	21.4.0
DOTNET-5406	.NET Agent	.NET Agent correctly reports all HTTP errors	21.4.0
DOTNET-5555	.NET Agent	When restarting the application using the MicroServices Agent, the node reuse environment variables now use the correct values	21.4.0
JAVA-9448	Java Agent	After upgrading Java Agent from 4.5.9 to 20.x or 21.x, the servlet business transactions are not displayed. The node property `osb-enable-webservice-entry` value has to be set to false (true by default)	21.4.0
JAVA-9433	Java Agent	An upgrade required for the agent such that the legacy agent uses `commons-io-2.5` and non-legacy agent uses `commons-io-2.8` library for `singularity-commons` dependency	21.4.0
JAVA-9361	Java Agent	When you use action suppression for disabling agent reporting, the suppression is not performed for the complete configured duration	21.4.0
JAVA-9261	Java Agent	Update the agent to allow splitting of business transaction on Spring Web Service entry by creating a custom configuration	21.4.0
JAVA-9235	Java Agent	The name of a node is generated multiple times for ephemeral nodes	21.4.0
JAVA-9110	Java Agent	Snapshot reporting stops after a few minutes post the agent-reset	21.4.0
LIBAGENT-442	Node.js Agent	Node.js Agent does not report HTTP data collector to Analytics	21.4.0
NODEJS-245	Node.js Agent	Node.js Agent fails HTTP tunneling for secure connections	21.4.0
WEBSRV-398	Apache Agent	`HttpClient` library for the Apache Agent is upgraded	21.4.0

Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary
ALERT-8667	Alert & Respond	**Affects** column not available in the **Health Rule** widget
ALERT-86678	Alert & Respond	Behavior of the Controller's **Email Template Editor** is confusing
ANALYTICS-13434	Analytics	Optimize the Analytics Agent status call by using AnalyticsAgentConfigurationCache
BRUM-6548	Browser RUM	Null Point Error preventing the Controller UI from loading the dashboard data
DBMON-7397	Database Visibility	Remove incorrect max heap size information from the **Getting Started Wizard - Databases**
DBMON-7533	Database Visibility	HTTP thread pool saturation preventing access to the Controller UI
DBMON-7843	Database Visibility	No auditing for database collectors (update/delete/create)
DBMON-8033	Database Visibility	Add Controller flag to control metric filtering for configurations such as Cassandra's keyspace metrics and Couchbase's metrics
DBMON-8038	Database Visibility	`DBMonEventBus` POST event caused thread pool saturation
DIAGPLAT-1280	APM	Service Endpoints returns an HTTP 500 status and emits the error message **Error handling snapshot data**
L4A-17233	License Management	Usage views not displaying proper data granularity
METADATA-9564	Dashboard	**Export Custom Dashboard** should check for null widgets and not include them in the export
METADATA-9614	Dashboard	Corrected caching issue to ensure the setting of the Strict-Transport-Security header
PLATSE-132	Platform Engineering	Display the correct node information in the flow map
SVCMON-1253	APM	Null Pointer Error is preventing the deletion of business transactions and applications
SVCMON-1273	APM	**Service Endpoints** page displays **No Data Available** message or blank screen after scrolling
SVCMON-1277	APM	Improved the loading of **Custom Dashboards** by optimizing business transaction queries
SVCMON-1278	APM	New **Service Endpoints** table does not fit on the screen size
SYNTH-7058	Synthetic Browser Monitoring	Synthetic Agent is not displaying in the **Job Editor**

On-Premises Platform Resolved Issues

Filter table:

Key	Product	Summary	Version
ECONSOLE-6426	Enterprise Console	The upgrade process after the glassfish password change is fixed	21.4.0
ECONSOLE-6436	Enterprise Console	The HA Module final replication process is fixed	21.4.0
ECONSOLE-6438	Enterprise Console	The Database data directory downtime is fixed	21.4.0
ECONSOLE-6440	Enterprise Console	The HA Module now shows rsync errors for the Database replication	21.4.0
SYNTH-7154	Synthetic Server	Synthetic jobs get deleted when there are connection issues between the Synthetic Server and EUM database	21.4.0

Known Issues

There are no known issues in the 21.4 release.

21.3 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
			Controller (SaaS/On-

DOTNET-4992	.NET Agent	Fixed process hang when capturing the thread snapshots under some conditions	21.3.1
DOTNET-5382	.NET Agent	(For Full Windows .NET Agent) You can now use the `APPDYNAMICS_CONTROLLER_HOST_NAME` , `APPDYNAMICS_CONTROLLER_PORT`, and `APPDYNAMICS_CONTROLLER_SSL_ENABLED` configuration environment variables to override properties in the `config.json` file for "controller host", "controller port", and "enable controller ssl connection", respectively.	21.3.1
DOTNET-5417	.NET Agent	Sensitive URL filter has been fixed for stalled transactions in .NET Core MicroServices Agent	21.3.0
DOTNET-5453	.NET Agent	.NET Agent for full Windows now reports correct Average CPU Time	21.3.0
DOTNET-5455	.NET Agent	Able to switch to different DMM modes from KPI for .NET application through Netviz Agent on Windows	21.3.0
DOTNET-5456	.NET Agent	Can start pcap for .NET application through Netviz Agent on Windows	21.3.0
DOTNET-5492	.NET Agent	Memory leak due to NetViz has been fixed	21.3.0
JAVA-9297	Java Agent	Issue with the commons-io library that is packaged with the Java Agent	21.3.0
DOTNET-5527	.NET Agent	TypeCache implementation is now safe for threading	21.3.1
DOTNET-5534	.NET Agent	Fix for proper handling of empty application configuration in .NET Agent configuration	21.3.1
DOTNET-5536	.NET Agent	Optimization for CPU usage when NetViz is not enabled	21.3.1
JAVA-8997	Java Agent	Servlet Split rule based on the selected parameter in the request does not work for the Reactor Netty framework	21.3.0
JAVA-8748	Java Agent	Duplicate backends are created with Java Agent API	21.3.0
LIBAGENT-442	Node.js Agent	Node.js Agent does not report HTTP data collector to Analytics	21.3.0
LIBAGENT-494	C/C++ SDK	Frame calls are abruptly failing	21.3.0
NETWORK-6264	Network Agent	The Network Agent Npcap version is upgraded to 1.20	21.3.0
NETWORK-6269	Network Agent	The Network Agent installation of Visual C++ is fixed	21.3.0
SRVLESS-1537	Node.js Serverless Tracer	Updated appdynamics-lambda-trace package dependencies	21.3.0

Premises) Resolved Issues

There was no Controller release for 21.3.

On-Premises Platform Resolved Issues

There was no on-premises platform release for 21.3.

21.2 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
ANALYTICS-13226	Java Agent	Enabling recommended data collection intermittently affects Transaction Analytics reporting	21.2.0
BRUM-6539	JavaScript Agent	`ReferenceError`: `hideCookieBanner` is not defined when page is injected with `adrum-latest.js`	21.2.0
BRUM-6552	JavaScript Agent	Extra value at the end of the app URL set by the ADRUM cookie	21.2.0
BRUM-6553	JavaScript Agent	JavaScript statements inside `setTimeout` and `setInterval` run in local scope when adrum is enabled	21.2.0

CDM-7032	React Native Agent	Networking request responses are corrupted	21.2.0
CDM-7033	iOS Agent	iOS Agent disables SwiftUI previews	21.2.0
CDM-7175	Android Agent	Events are stored on `EventBus` even when agent is not initialized	21.2.0
DBMON-7552	Database Agent	The Database Agent sends the health rule data of a MongoDB replica node even after the node is stopped	21.2.0
DBMON-7568	Database Agent	The Database Agent log file includes the error, invalid USERENV parameter, for an Oracle collector	21.2.0
DBMON-7739	Database Agent	The custom metrics value drops to zero intermittently	21.2.0
DBMON-7654	Database Agent	The Oracle collector log displays an error when Sysmetrics query is used	21.2.0
DBMON-7745	Database Agent	The **Explain another query:** field under **Execution Plan** displays an error without any details for MariaDB	21.2.0
DOTNET-4538	.NET Agent	Optimizations for Async tracking in .NET Core and .NET Framework applications	21.2.0
DOTNET-4834	.NET Agent	Fix for high thread contention in certain Async-heavy applications	21.2.0
DOTNET-5175	.NET Agent	Fix for analytics data loss in certain cases when the Analytics Agent is recycled and loses communication with the .NET Agent	21.2.0
JAVA-9093	Java Agent	The **User Experience** value based on the set threshold limit is incorrect only for those records that do not have a matching transaction snapshot on the APM	21.2.0
JAVA-9037	Java Agent	Upgrading the Java Agent to 20.11 displays an exception `Error instantiating DispatcherServletInterceptor` in the logs	21.2.0
LIBAGENT-490	Node.js Agent	Unregistered backend metrics appear in the **Metric Browser**	21.2.0
METADATA-9624	APM	Ensure that the HTTP header `Strict-Transport-Security` is set	21.2.5
NETWORK-6227	Network Agent	Network Agent does not support host metrics on Windows	21.2.0
NODEJS-324	Node.js Agent	HTTP Request Data Collectors collect **HTTP Parameters Name** instead of **Display Name**	21.2.0
PYTHON-498	Python Agent	Java proxy caches stale agent data	21.2.0
PHP-1170	PHP Agent	PHP Agent does not support using an environment variable for defining a unique host ID	21.2.0

Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary
ALERT-7111	Alert & Respond	Garbled characters appear in email template instead of cyrillic string
ALERT-7786	Alert & Respond	Health rules not available in cache after Controller upgrade
AMCSEV-1260	App Monitoring Cloud Services	Tiers Page does not show node details for the nodes after the 10th registered node
ANALYTICS-13205	Analytics	From the **Dashboard**, double-clicking "business journey" transactions directs user to **Overview** page instead of **Details** dialog
ANALYTICS-13219	Analytics	When changing the date format in **My Preferences** to "DD/MM/YY" and then opening a transaction snapshot in Analytics the er **has illegal timeRange** is displayed
ANLYTCS_ES-3474	Events Service	Some logically incorrect ADQL is validated
BRUM-6410	Browser RUM	Review of health rules violations from **User Experience** applications redirects to health rules for **Application Performance**
CLUSTERMON-2060	Cluster Monitoring	Agent registration is prevented while storing Cluster Agent properties in the database
DBMON-7131	Database Visibility	An Incorrect Database Agent version is displayed in the **Database Agents** setting after upgrading the agent and starting the ne the same name

DBMON-7222	Database Visibility	When configuring **Monitoring Operating System** for an AWS RDS collector, the required region is not displayed in the list. Now, the required regions are included and some unnecessary regions are removed from the list.
DBMON-7302	Database Visibility	**Disk Usage** within the database **Queries** displays an incorrect error message for the PostgreSQL database
DBMON-7308	Database Visibility	The **Live view** session list displays all the active sessions when the **View** filter is set to **All Sessions**, but active sessions are n when the filter is set to **All Active**
DBMON-7354	Database Visibility	The Invalid DB error is displayed when saving an action suppression on one of the nodes of the database cluster
DBMON-7373	Database Visibility	A blank window is displayed when you click **Drill Down** for a database on the **Transactions** snapshot
DBMON-7517	Database Visibility	Inconsistent **Custom Metric** permissions
DBMON-7535	Database Visibility	The **Exclude Schemas** option gets checked after upgrading from old Controller to new Controller
DBMON-7549	Database Visibility	Duplicate IO Metric entries are displayed for Microsoft SQL Server on the **Health Rule** configuration page
DBMON-7604	Database Visibility	Custom Metric not displayed in **Custom Metrics** tab even though data is displayed in **Metric Browser**
DBMON-8034	Database Visibility	Added the `dbmon.config.metrics.filtering.enabled` Controller flag to control the Database metric filtering for Cassar Keyspace and Couchbase's bucket-level metrics
DBMON-8039	Database Visibility	`DBMonEventBus` post-event call results in thread pool saturation
DIAGPLAT-1080	APM	Searching for snapshots yields inaccurate results for **Standard Time Range** from **Transaction Snapshot**
DIAGPLAT-1229	APM	Correct the data population for the "Snapshots Summary View"
LIC-648	Licensing	Database Monitoring license usage reporting does not work with Agent-based license rules
L4A-17796	Accounts	Increase the container-app version in the Controller
L4A-17838	Accounts	Multiple entries with same key
L4A-17959	Accounts	SAML and LDAP users without email address are not able to edit or add roles
PLATSE-120	Platform Maintenance	Reset counter when restarting Developer mode
SVCMON-1303	APM	NPE in BtServiceImpl#registerDeleteMdsBtEntityTransactionListener does not allow purge of applications and Business Transa
UISVCS-1063	Accessibility	The color of blue links in data grids, such as the **Business Transactions** list, has been updated to #0040B6 for improved contr
USERIMPACT-714	Experience Journey Map	Bad Link when clicking **View All Applications** in Experience Journey Map

On-Premises Platform Resolved Issues

Filter table:

Key	Product	Summary	Version
ANLYTCS_ES-5166	Enterprise Console	Update the Enterprise Controller to use Events Service 20.9	21.2.4
ECONSOLE-6395	Enterprise Console	The Controller monitoring setting in the AppServer configuration is fixed	21.2.0
ECONSOLE-6518	Enterprise Console	Correct the Enterprise Console's discovery for the latest version of the Events Service	21.2.7

Known Issues

Synthetic Services (Version 21.2.0)

Change in Synthetic job failure events behaviour (in the 20.7.0. version) affects the alerting configurations. This change triggers alerts for wrong events.

In this release:

- The events behaviour is reverted to the standard behaviour in Chrome, IE, and Firefox browsers. The issue still persists in Mobile Browser Emulation.
- Non-alphanumeric characters are not displayed in script logs of the Synthetic sessions.

21.1 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
DOTNET-5316	.NET Agent	Sensitive Message Filter has been fixed when including parameters message-pattern FOUND but redaction-regex NOT MATCHED	21.1.0
DOTNET-5372	.NET Agent	Improvements to Azure Service Bus async error tracking	21.1.0
JAVA-7603	Java Agent	An error is reported when the maximum analytics collector limit exceeds	21.1.0
JAVA-8137	Java Agent	A Null Pointer Exception occurs if no regex pattern is provided in the custom backend naming config	21.1.0
JAVA-8255	Java Agent	Agent reset through the controller does not reset Dynamics Service (ADS) runtime state	21.1.0
JAVA-8380	Java Agent	EUM does not work appropriately with request match rules in non-servlet environments	21.1.0
JAVA-8407	Java Agent	Snapshots are not generated due to SQL parsing, even though the snapshots are reported to the controller	21.1.0
JAVA-8595	Java Agent	The transformation limit is reached due to the Analytics data collection interceptor	21.1.0
JAVA-8878	Java Agent	Business transaction data is not displayed if the business transaction lockdown is enabled in a service-proxy enabled environment	21.1.0
NODEJS-378	Node.js Agent	Unhandled `TypeError` exception terminates the Node.js Agent	21.1.0
PHP-1210	PHP Agent	PHP Agent does not report metrics after the Business Transaction lockdown in the Controller	21.1.0
PYTHON-640	Python Agent	Applied changes from JAVA-8878 to the Python Java proxy	21.1.0
SERVER-8458	Machine Agent	Server Agent no longer purges machines inadvertently before the expected purge time	21.1.0

Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary	
ALERT-7111	Alert & Respond	Garbled characters are appearing in email template instead of a Cyrillic string	2
ALERT-7682	Alert & Respond	Action suppression time selector value is reset once you navigate away from the tab	2(1.
AMCSEV-575	App Monitoring Cloud Services	Not able to create custom **Service Endpoint** for JMS type with property type **Integer**	2
AMCSEV-927	App Monitoring Cloud Services	Long thread names are difficult to read	2
AMCSEV-1075	App Monitoring Cloud Services	Popup on flow map does not show the calls per minute/response as per grouped JDBC	2
AMCSEV-1099	App Monitoring Cloud Services	Filter UI For **Tiers & Nodes** in application need to close on **Cancel** or **Apply**	2
AMCSEV-1187	App Monitoring Cloud Services	Machine Agents screen displays the error `unnecessary keys are empty error`	2
ANALYTICS-12060	Analytics	Automatic field extraction does not permit adding a definer sample for more than one field	2
ANALYTICS-12912	Analytics	Missing start tier causes TypeError in Business Transaction flow map with EUM and BT node	2
ANALYTICS-12846	Analytics	Better handling of fields to display from originating tier in Analytics data table	2
ANALYTICS-12938	Analytics	Funnel Dashboard UI: Access to the specified resource forbidden	2
ANALYTICS-12953	Analytics	When editing the **Analytics Search** widget on the **Dashboard**, the toggle **Use Dashboard Time Range** is not responding	2
ANALYTICS-13003	Analytics	From **Analytics Search**, the array of Booleans and numbers display incorrect values	2
ANALYTICS-13031	Analytics	From **Analytics Search**, the **Tier** filter is incorrectly initialized by the **Node** filter	2

ANALYTICS-13070	Analytics	From **Transaction Snapshots**, the Analytics timestamp is incorrect if the customer changed **Display Time Zone** in **Preferences**	2
ANALYTICS-13090	Analytics	NodeJS does not receive Analytics HTTP config	2
BRUM-6390	Browser RUM	From **Timing Breakdown**, the SSL/TLS bar is not rendering correctly	2
CDM-7016	Mobile RUM	Accessing warning snapshots from **Code Issues** causes a java.lang.exception	2
DIAGPLAT-1001	APM	Snapshots are sometimes not displaying the potential issue information	2
DIAGPLAT-1043	APM	Query executed in `getSummariesAndAppendBlobsIfNeeded` times out	2
DIAGPLAT-1081	APM	Searching for snapshots yields inaccurate results for **Standard Time Range** from **Transaction Snapshot**	2
L4A-16565	Accounts	After migrating to Infrastructured-based Licensing, the Premium package had the wrong license consumption	2
METADATA-9467	APM	The security header response (HSTS) is fixed	2
METADATA-9483	APM	Health rule status precedence is fixed	2
REPORTS-799	Reports	Scheduled reports are sent on clicking Save	2
REPORTS-811	Reports	Reports (scheduled or one time) with a custom time range are delivered with the Login page	2
TMNT-952	APM	Customer time range does not display time as per the timezone configured in the preferences	2
UISVCS-1011	UI Services	Creation of error detection configuration field for the HTTP return codes for the PHP Agent	2

Filter table:

Key	Product	Summary	Version
ECONSOLE-6162	Enterprise Console	The Enterprise Console now selectively calls the create-xxx commands and sets the alias equal to s1as (the default for the Controller)	21.1.0
ECONSOLE-6245	Enterprise Console	`check-ec-dir-owner.orcha` now runs a task on all inventory hosts	21.1.0
ECONSOLE-6303	Enterprise Console	The lsof package check on controller.sh has been updated with a non-pipe (|) implementation	21.1.0
ECONSOLE-6304	Enterprise Console	Function to check privileged ports in install-init.sh has been fixed	21.1.0
ECONSOLE-6344	Enterprise Console	EC Installer copies mysql 5.5 binaries to null in 4.5.17+ versions	4.5.17, 20.3.0, 20.4.0, 20.7.0 20.6.10, 21.1.0
ECONSOLE-6368	Enterprise Console	The Controller diagnosis job has been fixed and no longer fails in a Windows implementation	21.1.0
ECONSOLE-6370	Enterprise Console	Installation of Enterprise Console fails on some time zone settings	21.1.0
EUMPLAT-1280	EUM Server	HMAC key is not available for Synthetic Hosted Agent license	21.1.1
EUMPLAT-1320	EUM Server	Unified license terms not properly provisioned on Controller with license file	21.1.0

Known Issues

There are no known issues in the 21.1 release.

20.12 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
ANALYTICS-13154	Java Agent	`toString()` method displays `["[Ljava.lang.String;@23377943"]` error for Java arrays in **Data Collectors**	20.12.0
BRUM-6403	JavaScript Agent	Page renders slowly for AngularJS apps if there is no `onreadystatechange` handler for AJAX calls	20.12.0
BRUM-6438	JavaScript Agent	ADRUM cookie triggers `sameSite` attribute warning in Firefox	20.12.0
CLUSTERMON-2259	Cluster Agent	The `cluster-agent-operator-openshift.yaml` file fails to deploy the pod on OpenShift and the log displays the `no matches for kind "Clustercollector" in version` error	20.12.1
CLUSTERMON-2088	Cluster Agent	The auto-instrumentation does not work when there is a space in the `appname` configuration within the `cluster-agent.yaml` file	20.12.0
DBMON-7391	Database Agent	The Network IO metrics value displays an unreasonable number for the AIX servers	20.12.0
DBMON-7561	Database Agent	When configuring **Monitoring Operating System** for an AWS RDS collector, the **eu-north-1** region is not displayed	20.12.0
DBMON-7495	Database Agent	When the IP address of the host machine keeps changing, the database metrics drop to zero and the **Events** page displays that the collectors are reinitialized	20.12.0
DBMON-7444	Database Agent	When a database uses the Database Partitioning Feature (DPF), the Calls per Minute metric on the Metric Browser displays incorrect data	20.12.0
DBMON-7428	Database Agent	The hardware monitoring stops working and the log displays the `com.jcraft.jsch.JSchException: session is down` error	20.12.0
DOTNET-5047	.NET Agent	Ability to download latest .NET Agent from the Controller	20.12.0
DOTNET-5108	.NET Agent	Fixed issue of incorrect CPU% reporting in certain cases	20.12.0
DOTNET-5111	.NET Agent	Download link for .NET has been updated on the Getting Started Wizard page	20.12.0
DOTNET-5270	.NET Agent	Ability to add headers to ASP.NET Core HTTP responses is now available	20.12.0
DOTNET-5300	.NET Agent	Agent MSI MA registration request with vCPU information was extended to support IBL licensing	20.12.0
DOTNET-5340	.NET Agent	Unhandled exception in timer thread may cause application crash in some situations	20.12.0
NODEJS-199	Node.js Agent	Standalone 64-bit Node.js Agent versions 10 and 12 fail in Linux with a `Segmentation Fault` error	20.12.0
NODEJS-284	Node.js Agent	Node.js Agent errors in Alpine-based Docker images	20.12.0
PHP-999	PHP Agent	PHP Agent does not detect ports when a client uses `CURLOPT_PORT` instead of placing it in the URL	20.12.0
PHP-1187	PHP Agent	Analytics snapshot data is missing for continuing and terminating the PHP Tiers snapshots	20.12.0
PYTHON-518	Python Agent	Upstream application is not visible on Controller when the downstream application is Python	20.12.0
SERVER-8351	Machine Agent	Machine Agent works with user-defined `JAVA_HOME` with `-j` flag	20.12.0

Controller (SaaS/On-Premises) Resolved Issues

There are no Controller releases for 20.12 yet.

On-Premises Platform Resolved Issues

There are no on-premises platform releases for 20.12.

Known Issues

There are no known issues in the 20.12 release as of yet.

Filter table:

Key	Product	Summary	Version

Resolved Issues

BRUM-6350	JavaScript Agent	Visually Complete Time sometimes reports as a Page Complete Time	20.11.0
CDM-6991	Android Agent	Issue parsing the mobile agent token that registers the agent with the Controller, causing extra licenses to be consumed	20.11.0
CLUSTERMON-2089	Cluster Agent	Agent registration is prevented while storing Cluster Agent properties in the database	20.11.0
CLUSTERMON-2057	Cluster Agent	The terminologies blacklist and whitelist are replaced with blocklist and allowlist to follow neutral usage of words	20.11.0
DOTNET-4986	.NET Agent	Fix for race condition in tracking CLR instances for IIS in-processes hosted by .NET Core 3.1 applications	20.11.0
DOTNET-5159	.NET Agent	To prevent correlation headers from becoming too long, the Linux Agent now limits the number of in-process call chain segments for thread correlation to ten segments per node. To disable this limit, set the node property track-all-async = true.	20.11.0
DOTNET-5244	.NET Agent	Fix for application crash if more than one URL filter is configured	20.11.0
JAVA-8599	Java Agent	Upgrading the Java Agent to use Agentless Analytics results in custom data not getting reported to analytics	20.11.0
JAVA-8536	Java Agent	A significant number of threads are blocked in the Java Agent UUID generation	20.11.0
JAVA-8456	Java Agent	Issue with the snapshot generation post-JVM restarts	20.11.0
JAVA-8441	Java Agent	When JVM is restarted before the end of Action suppression rule created with disable agent reporting, the agent is not re-enabled automatically and the metrics are not reported	20.11.0
JAVA-8283	Java Agent	A `Null Pointer Exception` error is reported when retrieving JMX attribute	20.11.0
JAVA-7944	Java Agent	Issue with the Average Response Time and reporting of Thread Task metrics	20.11.0
JAVA-7603	Java Agent	An error is reported when the maximum analytics collector limit is exceeded	20.11.0
PYTHON-517	Python Agent	Python agent does not group all methods (GET, POST, PUT, and DELETE) when custom transaction detection rules are applied without HTTP method criteria	20.11.0
PYTHON-581	Python Agent	Individual Business Transactions are formed even in the presence of Custom Transaction Rule	20.11.0
SERVER-8419	Machine Agent	Machine Agent installed with RPM does not honor settings for user and user group	20.11.0
SERVER-8465	Machine Agent	JVM options provided via service installation is set in `vmoptions` file	20.11.0
SERVER-8471	Machine Agent	CPU usage reporting fix for Solaris 11	20.11.0
SERVER-8530	Machine Agent	Correct CPU used percentage reported for each processor group	20.11.0
SRVLESS-1305	Serverless Tracer	The Java, Node.js, and Python Serverless Tracers now default HTTP calls made by the tracer to timeout after `2000ms`	20.11.0

Filter table:

Key	Product	Summary
ALERT-6830	Alert & Respond	Incorrect link destination during remediation script action creation
ALERT-6990	Alert & Respond	`Only application object scope is supported for application` error displays when you suppress an action (one an EUM enabled APM application
ALERT-7088	Alert & Respond	Health Rule for the User Experience Application does not automatically include new pages
ALERT-7828	Alert & Respond	Health rules not available in cache after Controller upgrade
AMCSEV-727	App Monitoring Cloud Services	Automatic Leak detection session duration shows 60 minutes when the agent default is 30 minutes
AMCSEV-1023	App Monitoring Cloud Services	Unable to export the call graph
AMCSEV-1328	App Monitoring Cloud Services	Tiers page does not display node details after the 10th node is registered

ANALYTICS-12780	Application Analytics	ADQL basic search filter does not escape double quotation
ANALYTICS-13089	Application Analytics	Incorrect Browser Sessions/Mobile Sessions details in the **Analytics Home** page
ANALYTICS-13095	Application Analytics	Node.js Agent does not receive the Analytics HTTP configuration
ANALYTICS-13067	Application Analytics	From **Analytics Search**, the **Tier** filter is initialized incorrectly by the **Node** filter
CLUSTERMON-2089	Cluster Monitoring	Agent registration is prevented while storing Cluster Agent properties in the database
DBMON-7170	Database Visibility	The database health rule is not evaluated for the custom metric name that has more than two | (pipe) symbols
DBMON-7256	Database Visibility	Some Sybase custom metrics do not display when the SQL query returns multiple result sets
DBMON-7268	Database Visibility	You cannot update the Advanced Options for a collector because the collector is automatically updated when you select the **Ad Options** on the Collector configuration page
DBMON-7269	Database Visibility	The values cannot be added in **Advanced Options** on the **Edit Collector** page
DBMON-6620	Database Visibility	The Oracle collector cannot be created with a custom connection string and sub-collectors
DBMON-7615	Database Visibility	Custom Metric appears in the Metric Tree for all the configurations regardless of the configuration it belongs to in the Metric Bro
DBMON-7618	Database Visibility	Unable to create action suppression on single node for database with multiple nodes (topology)
DIAGPLAT-879	APM	Retrieve Event Data API is not filtered by the tier ID
DIAGPLAT-891	APM	Event creation locked because of a thread pool saturation
DIAGPLAT-907	APM	Filtering is incorrect for the Service Endpoints in getRequestSegmentsByFilterHandle API
DIAGPLAT-947	APM	Some TSS bound its detail string with the wrong ID
DIAGPLAT-950	APM	Providing JavaScript to purge bad TSS detail IDs from the cache
DIAGPLAT-1061	APM	Query executed in `getSummariesAndAppendBlobsIfNeeded` timed out
DIAGPLAT-1082	APM	Search for snapshots gives inaccurate results for **Standard Time Range** under **Transaction Snapshot**
JAVA-8865	APM	ServiceProxy feature for Controllers upgraded to 20.11.0 are disabled
L4A-14347	Accounts	Improper Authorization allows access to `admin.jsp`
METADATA-9402	APM	REST API has added load historical liveness data for a tier, its node, and its parent app based on a anchor metric ID provided b
METADATA-9485	APM	Ensure that the HTTP header `Strict-Transport-Security` is set
METADATA-9488	APM	Health rule status precedence is incorrect
MQS-1247	Metric Query Service	**Metric Browser** does not display data for some random window sizes
REPORTS-813	Reports	Reports with custom time ranges getting delivered with login page
SVCMON-1301	APM	Improve queries for business transactions to optimize performance
SYNTH-5864	Synthetic Browser Monitoring	Synth Credential vault shows EUM App name in the dropdown instead of the app name
TMNT-707	APM	When exporting metric data, the browser does not show data points after the Daylight Savings Time (DST) change

Filter table:

Key	Product	Summary	Version
ECONSOLE-5932	Enterprise Console	The `.properties` files are no longer included in the Enterprise Console Installer	20.11.0
ECONSOLE-6190	Enterprise Console	Enterprise Console successfully changes the `http-listener-2.port` after the `update_config` job completes	20.11.0
ECONSOLE-6196	Enterprise Console	The Controller DB user password has been updated with Aurora DB	20.11.0
ECONSOLE-6201	Enterprise Console	Customizations to the `domain.xml` file are no longer lost during upgrade to 20.4	20.11.0
ECONSOLE-6216	Enterprise Console	The Enterprise Console recognizes timeouts in Windows Stop Service from playbooks	20.11.0
ECONSOLE-6344	Enterprise Console	MySQL 5.5 and 5.6 binaries are fixed in the Enterprise Console packaging for Windows	20.11.0

Known Issues

There were no known issues in the 20.11 release.

20.10 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary
BRUM-6375	JavaScript Agent	Invalid pointer error for JavaScript Agent in Internet Explorer/Edge is caused by `HTMLImageElement` URI length
BRUM-6230	JavaScript Agent	`updateFetchEventResponseHeaders` throws the error message "forEach is not a function.." intermittently
BRUM-6351	JavaScript Agent	A virtual page event is triggered when there is a call to push or replace states, even when there is no URL change
CDM-5817	iOS Agent	MAT is retained across calls when `config.collectorChannel` is set
DBMON-7057	Database Agent	The database events summary displays an error, `Maximum custom metric limit 40 is reached`, even when the number of custom met than 40
DBMON-7280	Database Agent	**Metric Browser** does not display the performance metrics for Oracle Pluggable Database (PDB)
DBMON-7423	Database Agent	The Topology tab displays incorrect port numbers for the non-default ports of Microsoft SQL and Oracle clusters
DBMON-7255	Database Agent	Oracle Database failover issue with the SCAN IP in a custom JDBC string
DBMON-6900	Database Agent	Even when an SQL query is updated to include a label for a column within a custom metric, the **Details** tab of the event displays the column nam the label
DOTNET-4860	.NET Agent	.NET Agent logging has been fixed and no longer shows extraneous Socket error messages
DOTNET-4990	.NET Agent	When you split a URI using a custom exit call naming rule with method parameters, the string length has been expanded to 100 characters
DOTNET-5082	.NET Agent	Fix for 20.4 .NET Agent for Windows causing high CPU in some scenarios
DOTNET-5141	.NET Agent	Added a new configuration option (set `APPDYNAMICS_AGENT_MASK_ENV_VARS environment variable = true`) to mask environment va the Linux agent before sending information to the Controller
DOTNET-5171	.NET Agent	Fix for .NET Agent for Windows where diagnostic messages from the agent were failing on malformed Regex rules
DOTNET-5205	.NET Agent	Fix for BT level error metrics not including HTTP errors in some situations
JAVA-8537	Java Agent	After upgrading the Java Agent version 4.5.9 to 20.8, the OSB Rules are not applied correctly
JAVA-8436	Java Agent	When Java Agent 20.9 is instrumented with JDK 15, the agent does not start and throws a Null Pointer Exception error
JAVA-8399	Java Agent	Snapshots are not generated, even though they are reported to the controller
JAVA-8009	Java Agent	The agent is unable to find the matching `AgentBackendDiscoveryConfig` as it is unable to extract the database names for the Oracle RAC c
JAVA-7898	Java Agent	The Java Agent cannot be dynamically attached to the Java 11 process
JAVA-7775	Java Agent	The JVM tab displays empty contents for the Java Agent installed on Docker and instrumented with JDK11
JAVA-7713	Java Agent	`java.lang.IllegalStateException` is reported due to incomplete instrumentation and a race condition seen under heavy load
NODEJS-10	Node.js Agent	`Mark Nodes as Historical` API causes C++ Rest SDK errors on shutdown

NODEJS-245	Node.js Agent	Remove `request` package from the Node.js Agent
NODEJS-261	Node.js Agent	Upgrade Java proxy to version 20.7.0.30393
NODEJS-285	Node.js Agent	Remove `console.log(process.env);` from Node.js Installer script
PHP-1044	PHP Agent	PHP Agent does not capture Postgres queries when an explicit connection handle is passed to the query functions
PHP-1040	PHP Agent	The PHP Agent crashes due to a null reference, when accessing a call graph node on the request shutdown
PHP-1001	PHP Agent	The PHP Agent crashes applications during the call graph collection
PHP-987	PHP Agent	There is no way to filter expected error codes resulting from an outgoing service call using `drupal_http_request`
PYTHON-324	Python Agent	Python Agent collects all the errors in one bucket when custom error codes are configured
SERVER-8435	Machine Agent	Resolved high CPU usage caused while executing `WmiPrvSE.exe` process commands
SERVER-8466	Machine Agent	Reports correct CPU usage date for AIX systems
SERVER-8469	Machine Agent	English Locale set for AIX collector to parse output correctly
WEBSRV-298	Apache Agent	Issue with the backend naming for a large number of virtual hosts.

Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary
ALERT-6669	Alert and Respond	Drill down for health rule violation and affected entities display blank results
ALERT-6767	Alert and Respond	`Application with id:-1 does not exist` error is displayed when you access the health rules using the dash click on **Critical** or **Warning** tab
ALERT-6781	Alert and Respond	Support **Overall Application Performance** type health rules through **Alerting Templates** for EUM-enabled APM app
ALERT-7379	Alert and Respond	Unable to save action suppression for EUM-enabled applications
AMCSEV-743	App Monitoring Cloud Services	Node count on the Dashboard does not match the node count on the **Node** panel
AMCSEV-768	App Monitoring Cloud Services	Custom transaction match rules cannot be created from **Snapshot** screen
AMCSEV-808	App Monitoring Cloud Services	Java Agent version not displayed correctly on **Tier & Nodes**
AMCSEV-862	App Monitoring Cloud Services	Backend discovery rules losing data upon enabling or disabling
AMCSEV-885	App Monitoring Cloud Services	Java Agent version not displayed correctly on **Tier & Nodes**. Backport to 20.8
AMCSEV-1170	App Monitoring Cloud Services	Enable **Automated Transaction Diagnostics** in the Controller by default
ANALYTICS-11516	Application Analytics	UI not setting start and end timestamps correctly in ADQL aggregation query
ANALYTICS-12809	Application Analytics	Selected options do not attach the correct options in **Add Business Journeys**
ANALYTICS-12926	Application Analytics	Limit error messages and stack traces in Business Transactions to 8191 characters
ANALYTICS-13094	Application Analytics	Node.js Agent does not receive the Analytics HTTP configuration
BRUM-6243	Browser RUM	Creating EUM Application using **Getting Started Wizard** fails with error
BRUM-6223	Browser RUM	EURT column on Pages and AJAX request UI is too slim and column sizing does not persist
CDM-6544	Mobile RUM	Correct `Fragment Start Event` type typo in the Collector
CDM-6571	Mobile RUM	Create unit test cases for IP Header and Geo resolution handling for mobile beacons
CLUSTERMON-1948	Cluster Monitoring	The **Pods** tab does not display data

CLUSTERMON-2090	Cluster Monitoring	Cluster Agent runs out of database space when persisting the agent registration request
DBMON-6275	Database Visibility	When you edit the query text of a custom metric, the changes get saved without clicking **Save**
DBMON-6816	Database Visibility	The Metric Browser displays a `504` Error when you launch it for the first time
DBMON-6937	Database Visibility	The **Custom Metrics** tab displays a `500 internal` error
DBMON-6947	Database Visibility	The database health rules are not evaluated for the collectors with the view permissions
DBMON-7055	Database Visibility	The memory metrics are not displayed for the Oracle 11g database
DBMON-7060	Database Visibility	The Transaction Snapshot is not displayed for the Oracle Cluster
DBMON-7600	Database Visibility	Only add custom metrics to the configuration which it belongs to in the **Metric Browser**
DBMON-7617	Database Visibility	Unable to create action suppression on single node for database with multiple nodes (topology)
DIAGPLAT-767	APM	No RSD found for filter error in `/snapshot/getRequestSegmentDatav2`
DIAGPLAT-925	APM	Filtering incorrect for the Service Endpoints in the `getRequestSegmentsByFilterHandle` API
DIAGPLAT-961	APM	Some top summary stats (TSS) are bound to the wrong ID
DIAGPLAT-994	APM	Added a filter to the REST endpoint `/restui/events/query` to curtail unexpected results
DIAGPLAT-1018	APM	Incorrect join for archive queries when getting potential problems for snapshots
DIAGPLAT-1060	APM	Query executed in `getSummariesAndAppendBlobsIfNeeded` timed out
DIAGPLAT-1083	APM	Search for snapshots gives inaccurate results for **Standard Time Range** under **Transaction Snapshot**
L4A-8473	Accounts	When passing multiple groups, the `SAML Access Attribute` does not work
L4A-13281	Accounts	Account key is appearing in the Controller audit report
METADATA-9355	APM	MDS connection pools no longer ignore JDBC parameters in domain.xml
METADATA-9372	APM	MDS connection pools no longer ignore JDBC parameters in domain.xml
METADATA-9486	APM	Ensure that the HTTP header `Strict-Transport-Security` is set
METADATA-9489	APM	Health rule status precedence is incorrect
MOBILE-1619	Mobile App	Fetch push server URL from the Configuration Manager in each notification request
METADATA-5428	Dashboards	Dashboard health status widget appears green even when the health rule shows grey
REPORTS-799, REPORTS-814	Reports	Scheduled reports are sent on clicking **Save**
REPORTS-812	Reports	Reports with a custom time range are delivered with the login page
SVCMON-963	APM	Exit calls to resolved backends now display on **Flow Maps**
SVCMON-1252	APM	Query updating a flow map preference causes high CPU usage

On-Premises Platform Resolved Issues

Filter table:

Key	Product	Summary
ECONSOLE-6221	Enterprise Console	Enterprise Console now honors timeouts in Windows Stop Service during upgrade
ECONSOLE-6343	Enterprise Console	Upgrading the Enterprise Console from 20.8 to 20.10 no longer hinders the JRE upgrade on Controller nodes during an orcha upg
EUMPLAT-1104	EUM Server	Upgrade MySQL to 5.7.31
EUMPLAT-1231	EUM Server	Threads blocked in JSON parsing in the `gson` library

Known Issues

There are no known issues in the 20.10 release.

20.9 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary
BRUM-6321	JavaScript Agent	`promise.then()` throws an error when receiving non-function parameters
CLUSTERMON-1910	Cluster Agent	Cluster Agent is unable to monitor the namespaces that include the `config` string
CLUSTERMON-1869	Cluster Agent	The auto-instrumentation of Java applications fail when using the 20.6 version of the Redhat Java Agent image
DBMON-7160	Database Agent	The **Disk IO** hardware metric is not displayed for a Linux machine
DBMON-7231	Database Agent	The monitoring of Oracle database is affected when the `v$osstat` permission is missing
DBMON-7232	Database Agent	Issues with Oracle topology resolution when using a specific LDAP connection string or a specific `local_listener` value
DBMON-7127	Database Agent	The **CPU** metric value is displayed incorrectly when the instance caging is enabled in Oracle
DOTNET-4397	.NET Agent	Business Transaction name now registers as the `ControllerName.ActionName`
DOTNET-4942	.NET Agent	Business Transaction correlation for EUM has been fixed so that the .NET Agent appends the Business Transaction ID cookie
DOTNET-4954	.NET Agent	Windows service does not stall after a few days of instrumentation
DOTNET-4973	.NET Agent	The .NET Linux Agent no longer crashes with a `seqfault` error. To avoid potential crashes, you can disable snapshots by entering the following code: `"profiler": { "eventMask": 2149842980 }`
IIB-316	IBM Integration Bus Agent (IIB)	Business Transactions are missing for some of the message flows on the **AppDynamics Business Transaction** view
JAVA-8110	Java Agent	Java Agent is unable to register an application and send metrics because an `InstantiationException` with `NettyMarkerInter` observed on the console or agent logs when the Servlet monitoring is disabled
JAVA-8052	Java Agent	A `Snapshot call graph contains CPU times - This is a Hotspot call graph` message is displayed on some of the snapshots
JAVA-8047	Java Agent	A large number of AppDynamics threads are found on the applications using Vert.x
JAVA-7947	Java Agent	A `ClassCastException` is observed when the Live Preview session is started with the Custom Servlet rule
JAVA-7601	Java Agent	Ignored errors or exceptions are still counted towards Service Endpoint errors per minute
LIBAGENT-46	C/C++ SDK	**Thread Name** shows `-1` for C/C++ SDK segments in the **Waterfall View** tab
LIBAGENT-53	C/C++ SDK	Cross-application correlation displays incorrectly in the primary **Application Flow Map** dashboard
LIBAGENT-54	C/C++ SDK	C/C++ SDK Agent on Windows fails to connect and logs an `Open failed` error
PHP-988	PHP Agent	PHP Drupal application crashes when handling an outgoing HTTP request
PHP-985	PHP Agent	PHP packages fail the Aqua security scan
PHP-974	PHP Agent	PHP Agent crashes PHP applications on Drupal7 HTTP interception
PYTHON-493	Python Agent	Jackson jars dependency removed from Python Agent
PYTHON-473	Python Agent	Python Agent reports misleading error format
SERVER-8437	Machine Agent	Machine Agent now extracts numerical addresses for network interfaces without symbolic host, port or user names
SERVER-8443	Machine Agent	Machine Agent for AIX no longer gets stuck on remote volumes command and reports only local volumes metrics

SERVER-8446	Machine Agent	Removed `perfstat_partition_config()` call due to AIX bug crashing the Machine Agent
WEBSRV-256	Apache Agent	Agent crashes the worker process when the Backend ID is `NULL`

Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary	Version
ALERT-6835	Alert and Respond	Alerting template popup status does not change as per the template progress status	uic-20.9.0
SYNTH-6536	Synthetic Browser Monitoring	Cookies not visible in request headers of Chrome v83	20.9.0

20.8 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary
BRUM-6191	JavaScript Agent	`adrum.js` beacon response fails due to multiple Access-Control-Allow-Origins headers being set
BRUM-6216	JavaScript Agent	Console error cannot read property url of undefined on a fetch call
BRUM-6207	JavaScript Agent	`adrum.js` beacon contains more events than the graphql events call
CDM-6144	iOS Agent	Inconsistent crash report time stamp in Controller
DOTNET-4089	.NET Agent	Applications no longer generate invalid token exceptions
DOTNET-4579	NET Agent	Access violation in Redis backend resolution attempt to retrieve host name
DOTNET-4599	NET Agent	Two lines of the console output that appeared when the Windows agent started up no longer appear. To restore them, create and set an `appdynamics.outputMode` environment variable.
DOTNET-4659	.NET Agent	Reporting service from the Microsoft Power BI Tools no longer fails
DOTNET-4707	.NET Agent	Analytics transaction metrics are not starting unless Micro Services APM Agent is restarted
DOTNET-4811	.NET Agent	OWIN cookies no longer lost after agent upgrade
DOTNET-4898	.NET Agent	IPC timeout configurability between coordinator and .NET Agent
JAVA-7625	Java Agent	A null message passed causes a Null Pointer Exception in the `ALoggerMessageInterceptor`
JAVA-7569	Java Agent	Sensitive message filter does not work appropriately when the message-pattern is `FOUND` but redaction-regex is `NOT MATCHED`
JAVA-7939	Java Agent	Vertx exit interceptor fails to create exit call due to a bad URI
JAVA-7950	Java Agent	In certain scenarios, `ServerTransactions`, which are started before all required classes get instrumented, remain in the agent memor they get aborted
JAVA-8007	Java Agent	After a tier is deleted, JMX rules are not re-registered and therefore the JMX metrics are not displayed on the Metric Browser
JAVA-8013	Java Agent	The auto-discovered spring web service names display multiple duplicate names with different `ns` numbers when auto-detection is enabl
NETWORK-6171	Network Agent	Network Agent now reports data in low throughput environments
PHP-984	PHP Agent	A large number of errors are displayed in the agent logs due to `No URL filter config found in filterUrl`
PYTHON-244	Python Agent	MongoDB Transaction snapshots expose sensitive data
SERVER-8361	Machine Agent	AIX CPU metrics calculation now uses proper timestamp
SERVER-8367	Machine Agent	The Controller has been enhanced to not allow registration of misconfigured container type Server Visibility or Docker Visibility Agents (r

		mode)
SERVER-8420	Machine Agent	Add default heap JVM options in `InstallService.vbs` for Windows MA installer
SERVER-8450	Machine Agent	Default heap JVM options now default to -Xms256m and -Xmx256m in the `InstallService.vbs` script for the Windows Machine Age

Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary
ALERT-6676	Alert and Respond	The third-party Bzip2 library used by the Controller has been updated to version 1.0.8
ALERT-6761	Alert and Respond	Upon clicking the **View Dashboard During Health Rule Violation** for a BT, you are redirected to a non-existing entit
ALERT-6860	Alert and Respond	When you access a health rule using the health status widget on the dashboard, `Application with id:-1 does` displayed
ALERT-6916	Alert and Respond	Upgrade to Kafka Streams 2.3.1
ALERT-6996	Alert and Respond	Actions are not getting triggered after **Recurring Action Suppression** time has expired
AMCSEV-62	App Monitoring Cloud Services	Unable to save an exception match condition
AMCSEV-90	App Monitoring Cloud Services	**Create Method Invocation Data Collector** dialog from call graph does not autofill
AMCSEV-519	App Monitoring Cloud Services	Unable to save **Java Error Detection Configuration** because of an `OptimisticLockException`
AMCSEV-543	App Monitoring Cloud Services	Unable to delete archived machine snapshots
AMCSEV-607	App Monitoring Cloud Services	Error counts for the URLs in the **Error Occurrence Details** table are not getting refreshed for different time ranges
AMCSEV-755	App Monitoring Cloud Services	Failed to create a backend detection `Custom Exit Point` via the right-right-click
AMCSEV-885	App Monitoring Cloud Services	Java Agent version is not displayed correctly with the Controller version on **Tier & Nodes**
ANALYTICS-12711	Application Analytics	Overloaded method checkbox becomes unchecked in **Create Data Collector** dialog box
ANALYTICS-12730	Application Analytics	Analytics widget size is setting wrong when add to absolute layout dashboard
ANALYTICS-12900	Application Analytics	Analytics Home page displays inconsistent EUM charts
ANALYTICS-12912	Application Analytics	Missing start tier causes `TypeError` in Business Transaction flow map with EUM and BT node
ANALYTICS-12935	Application Analytics	When you add a Business Journey and select a Business Transaction, the BT name is replaced with the BT ID upon s Journey
ANALYTICS-13024	Application Analytics	The Business Transactions are not filtered based on the tier selected in the **Business Journey** page
ANALYTICS-13093	Application Analytics	Node.js Agent does not receive the Analytics HTTP configuration
ANLYTCS_ES-3766	Events Service	The third-party netty library used by the Controller has been updated to 4.1.48
ANLYTCS_ES-3804	Events Service	User is unable to see data in the Metric Browser because of the error message `last run failed`
ANLYTCS_ES-3861	Events Service	The `third-party search-guard-ssl` library used by the Event Service is updated to version 24.0 and kibana pl version 5.6.8.7
APMPLAT-11061	APM	App and Machine Agent Status now correctly display percentages for Nodes and Tiers in the user interface
BRUM-6161	Browser RUM	Analyze records can fail to load
CLUSTERMON-1870	Cluster Monitoring	Collect Cluster Agent adoption and usage data
COGENG-901	Cognition Engine	The third-party `netty` library used by the Controller has been updated to 4.1.48
DBMON-6596	Database Monitoring	The Oracle Collector does not work when the **Oracle Wallet** option is enabled during the Oracle Collector configuratio
DBMON-6764	Database Monitoring	The **Hardware Monitoring** option includes an outdated region for **Amazon RDS**
DBMON-7005	Database Monitoring	The third-party `netty` library used by the Controller has been updated to 4.1.48
DBMON-7111	Database Monitoring	The Controller does not display any data when you open the Metric Browser for the first time
DBMON-7140	Database Monitoring	Upgrade the JAR `singularity-xml` to include Apache Xerces 2.12.0

DIAGPLAT-798	APM	Snapshots do not get loaded, `500 Internal Server Error` is displayed
DIAGPLAT-828	APM	Call to `/snapshot/getRequestSegmentDatav2` returns the error `No RSD found for filter`
DIAGPLAT-893	APM	Correct the exit call mapper RSD v2
DIAGPLAT-916	APM	When reviewing a Business Transaction Snapshot, the display of **Potential Issues** takes time of 30 to 60 seconds
DIAGPLAT-926	APM	Service Endpoints do not filter corresponding transaction snapshots when you use the `getRequestSegmentsByFil`
DIAGPLAT-942	APM	Correct the Service Endpoints filter for snapshots at the front-end layer
DIAGPLAT-960	APM	Modify query for loading the TSS detail string to cache
DIAGPLAT-963	APM	Some TSS bound its detail string with the wrong ID
JAVA-8021	Java Agent - Controller	Upgrade the Java Agent to 20.6.0-30555 in the Controller
L4A-12908	Accounts	Reset password via email does not work for single tenant
L4A-14101	Accounts	Upgrade `platform-rbac` to 20.4.0-170
L4A-14454	Accounts	Upgrade the dropwizard library to 20.4.0-170
L4A-14543	Authentication	LDAP group sync fails due to deleted groups being included in results
METADATA-9008	APM	Socket timeout and number of connections in Jedis pool are configurable
METADATA-9384	APM	MDS connection pools no longer ignore JDBC parameters in `domain.xml`
METADATA-9397	APM	Upgrade the JAR `singularity-xml` to include Apache Xerces 2.12.0
METADATA-9397	APM	The context is not reset post an exception in some dashboard flows
METADATA-9453	APM	REST API loads historical liveness data for a tier, its node, and its parent app based on an anchor metric ID provided
METADATA-9487	APM	Ensure that the HTTP header Strict-`Transport-Security` is set
METRICSVC-5021	Metric Service	App and Machine Agent Status now correctly display percentages for Nodes and Tiers in the user interface
METRICSVC-5758	Metric Service	Upgrade the PostreSQL JDBC Driver library to 42.2.14
MQS-1139	Metric Query Service	App and Machine Agent Status now correctly display percentages for Nodes and Tiers in the user interface
NETWORK-5403	Network Visibility	User with **Administration, Agents, Getting Started Wizard** permission is not allowed to view the **Network Visibility**
REPORTS-791	Reports	Controller changes made all reports fail if any had scheduling fails on startup
REPORTS-795	Reports	NodeJs used by controller has been updated to v14.8
REPORTS-777	Reports	Upgrade the version of Node.js in the Controller to 8.17.0
SERVER-8174	Machine Agent	App and Machine Agent Status now correctly display percentages for Nodes and Tiers in the user interface
SVCMON-827	APM	In Controller UI, **Web Service Exit Call** showing as `ui:ms_TransactionExitPointType_null`
SVCMON-864	APM	Controller logs full of the Redis error `Cache unavailable issue`
SYNTH-5965	Synthetic Browser Monitoring	`Problem Ended` event should be generated only after Error/Warning is confirmed
TMNT-720	APM	Time changes randomly in the **Custom Time** range component

On-Premises Platform Resolved Issues

Filter table:

Key	Product	Summary	Version
ECONSOLE-862	Enterprise Console	User who installed Enterprise Console is the only user permitted to upgrade the Enterprise Console	20.8.0
ECONSOLE-6083	Enterprise Console	Windows Controller upgrade fails	20.8.0

Known Issues

There were no known issues in the 20.8 release.

20.7 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary
CDM-6426	Android Agent	Screenshot tiles are not properly sent to the collector and as a result, screenshots may not be rendered correctly in the c
CLUSTERMON-1758	Cluster Agent	The Cluster Agent Pod does not start and remains in the **Pending** state when taint is defined in the nodepool This release adds support to set tolerations. See *tolerations* in the Configure the Cluster Agent YAML File section.
DBMON-7036	Database Agent	The literals are unmasked for a CREATE statement even after selecting **Remove literals from the queries** in the **Secu** ation
DOTNET-4728	.NET Agent	Unable to see complete stacktrace after upgrading to MSI-based 20.5 agent from .NET Microservice agent
IIB-253	IBM Integration Bus (IIB) Agent	IIB Agent log files grow continuously for un-instrumented execution groups
IIB-280	IBM Integration Bus (IIB) Agent	Nodes are not getting discovered by the IIB Agent on ACE (IIB 11)
IIB-294	IBM Integration Bus (IIB) Agent	Shutdown of the broker that runs multiple execution groups might result in a crash on some execution groups
IIB-287	IBM Integration Bus (IIB) Agent	The Broker on AIX crashes during startup when instrumented with IIB Agent version 20.7.0
JAVA-7825	Java Agent	Java Agent stops reporting analytics data on the agent version 20.4
JAVA-7820	Java Agent	Running Corretto with Java Agent results in an `Unrecognized Vendor` message
JAVA-7800	Java Agent	End User Monitoring (EUM) correlation with ADRUM headers does not work for Akka HTTP
JAVA-7569	Java Agent	The slowest database and remote calls are not displayed for any time slice (current or historical) for one hour or less
JAVA-7504	Java Agent	The `ApacheLog4` library in appserver agent shipped with controller installer is upgraded
JAVA-7234	Java Agent	The Servlet filter API is displayed as a POJO type in the call graph in place of Servlet entry point
NODEJS-39	Node.js Agent	Agent detects proxy server as HTTP Backend and displays it in the **Flow Map**
PHP-947	PHP Agent	PHP Agent reports incorrect HTTP response code when exceptions are thrown
PYTHON-323	Python Agent	Python Agent affects the request header of Application API when using `pyagent`
PYTHON-20	Python Agent	`def get_proxysupport_dir()` error is displayed when instrumenting ODOO application using the Python Agent
PYTHON-228	Python Agent	CVE-2019-17571 vulnerability found in the Python AppDynamics proxy
SERVER-8322	Machine Agent	Windows: OSHI process CPU utilization metric displays correctly when compared to WMI-based metrics
SERVER-8348	Machine Agent	CPU User metric now shown in KPI mode
SYNTH-5620	Synthetic Agent	Resource errors are not excluded when authentication protocol determines synthetic job session status
SYNTH-5313	Synthetic Agent	In certain cases of network failure in Chrome, the Synthetic Agent records retried network requests as two distinct pages session
SYNTH-6495	Synthetic Agent	Synthetic job results in the error `Invalid SSL/TLS certificate: INET_E_INVALID_CERTIFICATE' in IE11` for Azure Agents
WEBSRV-241	Apache Agent	The `install.sh` script unnecessarily creates an entry in the `/etc/ld.so.conf.d` directory

Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary
ALERT-3800	Alert and Respond	The audit.log and REST API response include a typo, `helathRuleIds`
ALERT-4781	Alert and Respond	When you update an existing action, `OBJECT_UPDATED` events in the audit log file show old values as `0` instead of the previously conf value
ALERT-5940	Alert and Respond	When you update a global health rule checkbox for an application, the application name is missing in the audit log
ALERT-6106	Alert and Respond	Action suppression does not work for health rules with status `Ended – Critical`; this happens for events of the type `Database`
ALERT-6139	Alert and Respond	Alerting template does not get applied to applications, it gets stuck with a status `In Queue`

ALERT-5349	Alert and Respond	When you open an Event UI and reload the background UI, the refreshed background UI display is distorted
ALERT-6028	Alert and Respond	Remove Alerting Template RBAC constraints
ALERT-6684	Alert and Respond	The third-party Bzip2 library used by the Controller has been updated to version 1.0.8
ALERT-6764	Alert and Respond	Deep link for **Affected Entity** and **View Dashboard During Health Rule Violation** is taking -1 instead of the correct entity ID
ALERT-6857	Alert and Respond	Accessing the **Health Status** widget returns the `Application with id:-1 does not exist` error
ALERT-6915	Alert and Respond	Upgrade to Kafka Streams 2.3.1
AMCSEV-49	App Monitoring Cloud Services	Missing information when exporting JMX Rule
AMCSEV-191	App Monitoring Cloud Services	Customization of **Automatic Leak Detection** settings transforms `APP_AGENT` configuration
AMCSEV-470	App Monitoring Cloud Services	500 Internal Server Error occurs while loading **Application Dashboard**
AMCSEV-512	App Monitoring Cloud Services	**User Getter Chain** not working correctly when `\.` operator is found
AMCSEV-518	App Monitoring Cloud Services	Deleting backend throws the error message `Invalid unresolved backend call id`
AMCSEV-521	App Monitoring Cloud Services	Snapshots link broken in **Transaction Summary Statistics** UI with RSD V2 enabled
ANALYTICS-11038	Applications Analytics	ADQL with substring function does not work for fields with hyphen
ANALYTICS-11634	Applications Analytics	MIDC configuration incorrectly stores method chains from APM configurations
ANALYTICS-12263	Applications Analytics	BO definition in draft state with duplicate names will loop forever in UI
ANALYTICS-12441	Applications Analytics	Analytics: UI Fails To Handle Long Queries
ANALYTICS-12571	Applications Analytics	Page Name filter in Add Business Journey dialog does not display by App Key and does not use ADQL
ANALYTICS-12675	Applications Analytics	BO grid view API call should include an additional param `flowmapDetails` set to false
ANALYTICS-12878	Applications Analytics	Selected options do not attach the correct options in **Add Business Journeys**
ANLYTCS_ES-3415	Events Service	Cannot create Analytics metrics from an ADQL query that contains a comma
ANLYTCS_ES-3803	Events Service	Unable to see metric data on the Metric Browser, last run failed message is displayed
ANLYTCS_ES-3860	Events Service	The third-party `search-guard-ssl` library used by the Event Service is updated to v24.0 and kibana plugin is updated to v5.6.8.7
ANLYTCS_ES-3938	Events Service	Upgrade the Controller HTTP Client, HTTP Core, and AsyncHTTP Client library versions
APMPLAT-11934	APM	JMX `create metric` operation to auto-fill domain name in UI popup and JMX rule using the `create metric` operation have been
APMPLAT-13274	APM	This event warning has been updated: "Automatic Service Proxy Discovery functionality has minimum agent version requirements for upstream of discovered proxies. Please check the documentation for details."
CLUSTERMON-1358	Cluster Monitoring	The **Pods** tab does not display the pod list after the re-registration of Cluster Agent
DBMON-6529	Database Visibility	The `Connect backends to Database Visibility to track health status` message is displayed every time, even wher required
DBMON-6628	Database Visibility	The **Network Dashboard** flowmap does not display the backend nodes of the database
DBMON-6601	Database Visibility	The **Events** tab for the MySQL collector displays the error, `Error processing InnoDB metrics for config`
DBMON-7141	Database Visibility	The third-party Apache xerces library used by the Database Agent is updated to 2.12.0
DIAGPLAT-807	APM	Snapshots do not get loaded, 500 Internal Server Error is displayed
DIAGPLAT-809	APM	`ArrayIndexOutOfBoundsException` is displayed for RSD V2 enabled Controllers

DIAGPLAT-815	APM	Allow a list of GUIDs in `SnapshotListFilter` to view multiple GUIDs in the snapshot list view
DIAGPLAT-857	APM	No RSD found for filter error is displayed for the REST API call `/snapshot/getRequestSegmentDatav2?`
DIAGPLAT-892	APM	Correct the exit call mapper RSD v2
DIAGPLAT-915	APM	Correction of a query for the RSD v2
DIAGPLAT-927	APM	Service Endpoints do not filter corresponding transaction snapshots when you use the `getRequestSegmentsByFilterHandle` AP
DIAGPLAT-943	APM	Correct the Service Endpoints filter for snapshots at the front-end layer
EUMPLAT-593	EUM	Archived Browser Snapshot does not open when the linked Transaction Snapshot does not exist
EUMPLAT-831	EUM	Account credential is not updated when hitting `renew-license-key` endpoint
JAVA-8020	APM	The third-party Apache xerces library used by the Java Agent is updated to 2.12.0
L4A-12097	Accounts	No audit log entry created for license changes
L4A-12444	Accounts	`NullPointerException` when using REST API to generate an access token for API Client
L4A-12447	Accounts	Encountered LDAP sync failure while updating user outside Hibernate session
L4A-13981	Accounts	The third-party Jackson `databind` library used by `platform-rbac` is updated to 2.9.10.5
L4A-14453	Accounts	Upgrade the dropwizard to 20.7
L4A-14542	Accounts	LDAP group sync fails due to deleted groups being included in results
METADATA-7833	APM	Anchor metrics for business transactions are getting lost causing issues in entity liveness
METADATA-8834	Metric Browser	ADDs display correctly in the Metric Browser without a name conflict
METADATA-9035	APM	Able to use native query to find Business Transaction IDs and their tier IDs from the database correctly
METADATA-9171	APM	No snapshots are created because the `ADD` stacktrace purger takes more than 20 hours to complete and holds the read-only lock for t metadata table
METADATA-9381	APM	MDS connection pools ignore the JDBC parameters in `domain.xml` including `useSSL`, which impacts the the AppDynamics GovAPM deployment
METADATA-9393	APM	Upgrade the JAR `singularity-xml` to include Apache Xerces 2.12.0
METADATA-9430	APM	Context is not reset in some dashboard flows post an exception
METRICSVC-5472	Metric Service	Reader client version was updated to version 2.12.0.5959 for Controller primary
METRICSVC-5776	Metric Service	The third-party PostgreSQL JDBC Driver library used by the Controller has been updated to version 4.2.13
METRICSVC-5972	Metric Service	Client connection pool saturated
MQS-1100	Metric Query Service	Missing business transaction specific graphs in the **Expression Dashboard**
REPORTS-792	Reports	Scheduled reports not working after Controller upgrade if any invalid report definitions exist when `appserver` is restarted
REPORTS-796	Reports	NodeJS used by controller has been updated to v14.7.0
SERVER-8232	Server Visibility	Service availability check interval in the Controller UI now displays minutes instead of seconds
SERVER-8271	Server Visibility	Server metrics no longer disappear in the UI when scrolling
SVCMON-883	APM	`WebService` type exit call is displayed as `ui:ms_TransactionExitPointType_null`
SVCMON-900	Controller UI	ResourceManager renders package:key strings when a key is not found instead of the locale strings, with a log message `package o string not found`
TMNT-580	Machine Agent	Unable to download the Machine Agent from **Getting Started Wizard - Servers**

On-Premises Platform Resolved Issues

Filter table:

Key	Product	Summary
ECONSOLE-5645	Enterprise Console	Controller Upgrade button has been fixed and is now responsive after Enterprise Console upgrade
ECONSOLE-6070	Enterprise Console	Add secondary job now verifies JRE version and updates the JRE configuration on both primary and secondary Controllers
SYNTH-4759	Synthetic Server	On-premises Controller with hosted license is unable to create jobs due to SaaS API call failures
SYNTH-5678	Synthetic Server	Private synthetic agent jobs do not consume synthetic license units if webpages are not loaded
SYNTH-5685	Synthetic Agent	TEMP directory `C:\users\agent_user\AppData\Local\Temp` does not get deleted automatically
SYNTH-5636	Synthetic Server	Synthetic jobs are auto-disabled even when sufficient license units are left
SYNTH-5554	Synthetic Server	Synthetic job editor becomes unresponsive when it receives errors from AJAX calls
SYNTH-5458	Synthetic Server	Capacity-related error messages displayed for private agents are now different from the error messages displayed for SaaS agent
SYNTH-5445	Synthetic Server	Waterfall graph displays duplicate tick labels in the timeline on the **Session Summary** page
ALERT-4182	Alert and Respond	`NullPointerException` is displayed when configuring the Email SMS for an on-premises Controller

Known Issues

There were no known issues in the 20.7 release.

20.6 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary
ANALYTICS-4256	Analytics Agent	Analytics Agent inside Machine Agent does not drop PID file
ANALYTICS-12717	Analytics Agent	Recommended Data Collectors field name appears as `null`
ANALYTICS-12739	Analytics Agent	Upgraded SCS Tool library
ANALYTICS-12740	Analytics Agent	Upgraded common-codec-1.14 library
DBMON-6873	Database Agent	The TOTAL_LOG_USED metrics value displayed on the Metric browser does not match with the value in Database server
DBMON-6074	Database Agent	The agent logs display `org.apache.http.NoHttpResponseException` when connecting to the Controller
DBMON-7037	Database Monitoring	The Database Agent fails to monitor Oracle version 11
DBMON-4943	Database Monitoring	**Execution Plan** is not displayed on the dashboard for MySQL Server 8
DBMON-6936	Database Monitoring	The hardware metrics are not displayed on the dashboard when enhanced monitoring is enabled on Microsoft SQL Server on A
DOTNET-3457	.NET Agent	Integer and Boolean type of SQL data gatherer for Analytics is not working
DOTNET-3640	.NET Agent	Unable to configure apps running on .NET Core due to incorrect assembly reference
DOTNET-4410	.NET Agent	IIS Ping failure/hang in presence of AppDynamics Agent
DOTNET-4513	.NET Agent	Sensitive URL filters not working on HTTP exits
DOTNET-4574	.NET Agent	Agent Coordinator service throwing unhandled exception
DOTNET-4678	.NET Agent	Controller application name in config.xml is case sensitive
DOTNET-4710	.NET Agent	Service End Point is not identifying in .NET Agent version 20.5
DOTNET-4717	.NET Agent	Exclude rules not working with .NET Agent 20.3.0 and later
DOTNET-4723	.NET Agent	AppDynamics coordinator service no longer fails with a system management exception
DOTNET-4745	.NET Agent	HTTP request collection fails for all transactions once a stalled transaction is identified

DOTNET-4711	.NET Agent	Error in CLR Version shown in Controller UI
NODEJS-91	Node.js Agent	Agent capturing disabled snapshots with node-level properties crashes
NODEJS-103	Node.js Agent	MongoDB queries fail
SERVER-6143	Machine Agent	No longer runs multiple `awk` commands resulting in system resource exhaustion
SERVER-8091	Machine Agent	Registered Machine Agents no longer report metrics after default account access keys are changed
SERVER-8207	Machine Agent	AIX Machine Agent should not have `JavaHardwareMonitor` enabled
SERVER-8272	Machine Agent	AIX collector was reviewed and produces well-formed JSON to prevent script errors
SERVER-8279	Machine Agent	Windows: OSHI reported processes now list multiple processes sharing the same name
SERVER-8318	Machine Agent	`java.net.UnknownHostException: kubernetes.default.svc` exception is fixed

Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary
ALERT-5349	Alert & Respond	When you open an Event UI and re-load the background UI, the refreshed background UI display is distorted
ALERT-5731	Alert & Respond	Alert link in the email notification is broken and does not display the alert details, post Controller upgrade
ALERT-6220	Alert & Respond	When you apply an alerting template, it gets stuck in a queue and is not applied
ALERT-6355	Alert & Respond	Alerting Templates not showing in 20.6 Controllers
ALERT-6377	Alert & Respond	Editing or deleting custom roles for Alerting Templates causes the error `CONFIG_ALERTING_TEMPLATES_PLANS does exists`
ALERT-6518	Alert & Respond	Unable to add dashboards to the admin role, error `permission action is not specified` due to missing `CONFIG CHEDULE` permission
ALERT-6914	Alert & Respond	Upgrade to Kafka Streams 2.3.1
AMCSEV-979	App Monitoring Cloud Services	Customization of **Automatic Leak Detection** settings transforms `APP_AGENT` configuration
ANALYTICS-12073	Analytics Events Service (SaaS)	Inconsistency in counting business transaction segments for Analytics licensing
ANALYTICS-12775	Analytics	BizOutcome Grid View API call should include the parameter flowmapDetails set to false
ANALYTICS-12644	Analytics	Business Journeys are failing to load
ANLYTCS_ES-3536	Events Service	Update the Events Service version in Controller to get library updates for Apache Kafka, Google Guava, and `snakeyml`
ANLYTCS_ES-3859	Events Service	Remove the search-guard library from the Events Service
ANLYTCS_ES-3937	Events Service	Upgrade the Controller HTTP Client, HTTP Core, and AsyncHTTP Client library versions
BRUM-6022	Browser RUM	Grid columns appear when user sorts some EUM paginated grids
CLUSTERMON-1257	Cluster Monitoring	The **Succeeded** pod count includes the number of deleted pods on the **Pods** page
DBMON-6477	Database Monitoring	The queries that correlate with standalone collectors are not displayed when you drill-down **Business Transactions**
DBMON-6628	Database Monitoring	The **Network Dashboard** flowmap does not display the backend nodes of the database
DBMON-4676	Database Monitoring	Collectors display multiple nodes with the same name when creating a health rule
DBMON-6718	Database Monitoring	The `Connect backends to Database Visibility to track health status` message is displayed every tim when it is not required
DBMON-5508	Database Monitoring	Sorting does not work as expected for the **Queries, Time in database,** or **CPU Usage(%)** metrics in the **Databases** pag
DBMON-6948	Database Monitoring	Removed a singleton from an Enterprise JavaBean (EJB) to prevent a Database Monitoring thread pool saturation
DBMON-6983	Database Monitoring	After upgrading to 20.6, the Database Dashboard is missing the CPU and Network I/O graphs
DBMON-7142	Database Monitoring	Upgrade the Apache Xerces third-party library to 2.12.0

EUMPLAT-601	End User Monitoring	Update the Neustar map library to correct geodata
EUMPLAT-776	End User Monitoring	Metrics missing intermittently due to an SocketTimeoutException when EUM tries to download metrics
JAVA-8019	Controller - APM	Update the Java Agent in the Controller
L4A-14102	Accounts	Upgrade `platform-rbac` to 20.4.0-170
L4A-14452	Accounts	Upgrade dropwizard to 20.6
L4A-14541	Accounts	Customization of **Automatic Leak Detection** settings transforms `APP_AGENT` configuration
METADATA-9220	APM	No snapshots are created because the `ADD` stack trace purger takes more than 20 hours to complete and holds the read- the `metadata` table
METADATA-9399	APM	Upgrade the Apache Xerces third-party library in the Controller to 2.12.0
METRICSVC-5901	Metric Service	Client connection pool saturated
MQS-1131	Metric Query Service	**Server|Component:tearName** metrics not supported by new implementation of **Custom Dashboards**
MQS-1163	Metric Query Service	Missing graphs specific to business transactions in the **Expression Dashboard**
SERVER-6833	Server Visibility	Server page displays the total number of servers in the bottom right footer
SERVER-7785	Server Visibility	Searching using the Hierarchy field is now possible
SERVER-8250	Server Visibility	Upgraded Apache `httpclient` to 5.0
SERVER-8279	Server Visibility	The dashboard now displays all processes, even if they share the same name
WEBSRV-6	Apache Agent	Apache Agent injects ADRUM headers when Business Transaction correlation is disabled
WEBSRV-22	Apache Agent	Using `AppDynamicsLaunchProxy` directive with the apachectl reload (graceful) option does not delete a previous proxy
WEBSRV-228	Apache Agent	The Webserver Agent version is displayed in place of the proxy version on the Controller UI

On-Premises Platform Resolved Issues

Filter table:

Key	Product	Summary	V
ECONSOLE-5466	Enterprise Console	The `check-controller-health` CLI command from the Enterprise Console now reads results correctly	20.
ECONSOLE-5825	Enterprise Console	The `appserver-admin-console-password` is no longer used nor displays in setup.xml	20.
ECONSOLE-5832	Enterprise Console	Enterprise Console no longer allows an older Enterprise Console platform installer to be used to upgrade to a newer version	20.
ECONSOLE-5889	Enterprise Console	MySQL root permissions have been fixed to allow upgrade	20.
ECONSOLE-5906	Enterprise Console	Controller upgrade from 4.5.x to 20.3 no longer fails with `mysql_upgrade` version	20.
ECONSOLE-6183	Enterprise Console	Upgrade MySQL to 5.7.31	20.
EUMPLAT-903	EUM Server	Use jetty-util 9.4.18 to resolve the issue upgrading SSLContextFactory	20.

Known Issues

There were no known issues in the 20.6 release.

20.5 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary
ANALYTI	Analytics	Health Check commands failed due to deprecated method

CS-12608	Agent	
CDM-5998	Android Agent	Server is returning null response headers for correlated requests
DBMON-6508	Database Monitoring	After upgrading the Database Agent, the database collectors fail to retrieve data. Hence, the summary of each event on the **Events** page displ `.sql.SQLException: Connection property: format error: Property is 'v$session.program` error
DBMON-6805	Database Monitoring	For Mongo database, Database Agent includes its own monitoring query
DLNATIVE-2544	Node.js Agent	Customer Transaction Naming based on HTTP headers and cookies is now enabled.
DOTNET-4608	.NET Agent	.NET Agent Nuget package for Azure App Service does not support .NET Core 2.2+
DOTNET-4465	.NET Agent	BT detection stopped working after upgrade to .NET core 3.1 version and disable MVC naming
DOTNET-3654	.NET Agent	MVC Controller/Action BT naming with Linux full agent is not working with endpoint-based routing
DOTNET-4063	.NET Agent	`A request container already exists on the request` error when implementing .NET Core Agent with oData
DOTNET-4286	.NET Agent	ASP_DOTNET Core Interceptors reporting sporadic stalled/abandoned transaction
DOTNET-4621	.NET Agent	Azure WebApp is crashing with agent version 20.4.1
DOTNET-4442	.NET Agent	AccessViolationException crashes applications with .NET Agent 4.5.18.1
IIB-256	IBM Integration Bus Agent	IIB Broker starts up with the instrumented Appdynamics Agent but crashes after sometime
JAVA-6431	Java Agent	The correlation between client and server is not reported for Spring Boot RMI
JAVA-6793	Java Agent	Applications using the SAP wily Agent along with Java Agent fail to start
JAVA-6876	Java Agent	Akka Http Exit call does not report correct `average response time`
JAVA-6993	Java Agent	Agent fails to collect logs through the Controller in the **Debug** level mode
JAVA-7005	Java Agent	A verification error results in the application failure to run the database calls
JAVA-7164	Java Agent	Java Agent throws the exception `java.lang.reflect.InaccessibleObjectException` with `jdk-11.0.6.jdk`
JAVA-7257	Java Agent	AppDynamics Opentracer library is incorrectly published to Maven
JAVA-7338	Java Agent	Java Agent reports insecure Deserialization Arbitrary CodeExecution due to htpclient-cache third party library vulnerability
JAVA-7368	Java Agent	ASM is updated to the latest version, 8.0
JAVA-7389	Java Agent	The following Apache commons packages have been upgraded: • `apache-fileupload` to 1.4 • `apache-commons-codec` and `httpclient` to 4.5.12
JAVA-7471	Java Agent	Running an application server with Java Agent 20.4+ throws a `NullPointerException` in the Java Agent logs
NODEJS-83	Node.js Agent	Node.js Agent fails when variables pass through the Express middleware
NODEJS-89	Node.js Agent	Node.js Agent does not capture the cookie value for HTTP Data Collector configuration if the specific cookie is not first in the cookie header.
PHP-171	PHP Agent	PHP Agent causes a CLI process to crash during batch processing
PHP-822	PHP Agent	SQL query does not get masked when a comment is included in the actual query
PHP-852	PHP Agent	Agent shows increased Response Time for the socket connection with JAVA proxy
PHP-863	PHP Agent	PHP RPM files do not have the relevant version numbers
PHP-891	PHP Agent	Wordpress and Drupal Frameworks are not detected in the downstream app when the downstream app receives a call from the upstream app `le_get_contents` function

SERVER-6824	Machine Agent	Machine Agent ignores IPv6 network interface if it is not available
SERVER-8182	Machine Agent	OSHI CPU utilization metric displays correctly when compared to WMI-based metrics
SERVER-8205	Machine Agent	The Windows collector script exits gracefully if it times out
SERVER-8273	Machine Agent	Support of runtime system properties for logging functionality
SERVER-8284	Machine Agent	Machine Agent for Linux no longer gets stuck on remote volumes command and continues to report metrics
WEBSRV-20	Apache Agent	Upgrade Java version for proxy to fulfil security audit requirements
WEBSRV-24	Apache Agent	Crash in the destruction of the exit call under heavy load
WEBSRV-63	Apache Agent	Apache aborts under high load and worker thread counts
WEBSRV-66	Apache Agent	Unix Socket Limitation in Apache Agent
WEBSRV-69	Apache Agent	Apache worker thread crashes within ZeroMQ calls

Cloud Monitoring Resolved Issues

Filter table:

Key	Product	Summary
CLUSTERMON-1576	Cluster Agent	Cluster Pods list is populating correctly for SaaS Controllers
SERVER-8264	Controller UI	When navigating to the cluster dashboard, the dashboard no longer displays a 500 Internal Server Error while fetching High Metric Reten level data for more than 1 hour
SERVER-8271	Machine Agent	Server metrics no longer disappear in the UI when scrolling

Controller (SaaS/On-Premises) Resolved Issues

There are no resolved issues for the Controller in this release.

Known Issues

Android Agent (Version 20.5.2)

Screenshot tiles are not properly sent to the collector and as a result, screenshots may not be rendered correctly in the collector.

20.4 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary
CLUSTERMON-168	Cluster Agent	After Cluster Agent pod restarts, it does not preserve the configuration for monitored namespaces
CLUSTERMON-1164	Cluster Agent	ClusterAgent v4.5.16.780 on a K8s Cluster v1.11 crashes with `panic: runtime error: integer divide by zero`
CLUSTERMON-	Cluster Agent	Cluster Error Graph: Shows an incorrect number of Error Events

6628		
DBMON-6219	Database Monitoring	Database Agent cannot connect to Sybase Adaptive Server Enterprise 16.0 SP03
DBMON-6553	Database Monitoring	Database Agent does not capture details from Sybase 15.5 database.
DBMON-6303	Database Monitoring	The metric browser does not capture the buffer and the cache memory metrics for a Linux collector
DBMON-6460	Database Monitoring	Database Agent cannot resolve the different nodes of Oracle RAC by using LDAP authentication
DOTNET-4521	.NET Agent	Agent does not report Http Status codes in Asp.Net core in-process hosted app
DOTNET-4448	.NET Agent	Coordinator taking longer to start when set as `Earlystartservices`
DOTNET-4508	.NET Agent	.NET Core 3.1 based application is failing to instrument with .NET Agent version 20.3
BRUM-5979	JavaScript Agent	`node.type` not supported in IE11 and throws an error
JAVA-6355	Java Agent	Server Transaction times out and is abandoned in `projectreactor.io` based application with executor mode thread tracing enabl
JAVA-6560	Java Agent	Java Agent does not start when trying to instrument an application running with JDK1.6 due to log4j
JAVA-6965	Java Agent	In the dynamic agent attach scenario, the agent throws a `NullPointerException` and is unable to start due to a cached system p
JAVA-6617 and JAVA-7263	Java Agent	JMX attributes are marked as ignored if they are de-registered from the Mbean server. The attributes are not registered by the agent registered again with the Mbean server
JAVA-7139	Java Agent	Object Instance Tracking (OIT) does not work for all the Adopt JDK versions with both Hotspot and OpenJ9 distributions, the OIT wor AdoptJDK9-Hotspot
JAVA-7225	Java Agent	Fixed the VerifyError that is displayed on the application startup
JAVA-7279	Java Agent	Thread dump files captured are reported with a length of zero bytes
JAVA-7312	Java Agent	Upgrade the `commons-io:commons-io` library to 2.6 version
JAVA-7322	Java Agent	An exception is reported when Java Agent runs with an application that has JDK9+ and the application makes SQL calls
JAVA-7342	Java Agent	An error is reported in the agent when instrumenting apps deployed on jetty 6.x because the class `org.mortbay.jetty.Response#getHeaders` returns an enumeration object
SERVER-6167	Machine Agent	Machine Agent shows wrong IPV4 address for the network interface card

Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary
ALERT-2307	Alert & Respond	Import of Action API fails with a `Could not import Actions: Transaction marked for rollback` error
ALERT-4482	Alert & Respond	Action suppression with object scope set to `node` resets to scope `application` when saved
ALERT-6028	Alert & Respond	Remove Alerting Template RBAC constraints
ALERT-6366	Alert & Respond	Editing or deleting custom roles for Alerting Templates causes the `CONFIG_ALERTING_TEMPLATES_PLANS doesn` error
AMCSEV-544	App Monitoring Cloud Services	Snapshots link broken in **Top Summary Lists** UI when RSD V2 is enabled
AMCSEV-941	App Monitoring Cloud Services	Customization of **Automatic Leak Detection** settings transforms `APP_AGENT` configuration
ANALYTICS-10310	Application Analytics	SQL data collectors are not enabled for Analytics when saved from new HTML screens
ANALYTICS-12272	Application Analytics	Cannot save Analytics searches if the search name exists in another account
ANALYTICS-12322	Application Analytics	No access to Mobile Code Issues event type on Analytics search screen
ANALYTICS-12397	Application Analytics	Option to create SQL Data collector from APM snapshot is missing from 4.5.10 Controller version
APMPLAT-11662	APM	Excessive logging of error messages has been fixed
APMPLAT-13124	APM	Filters for Transaction Snapshots has been fixed and is working correctly
CDM-6119	iOS	AppD sessions do not end post 10 mins inactivity as per the defined timeout, leading to long-running events

CDM-6198	Mobile RUM	**Crash Snapshot Details** dialog fails to open
CLUSTERMON-868	Controller	Some Cluster Agent metrics are listed even when there are not enough Server Visibility licenses
CLUSTERMON-1177	Controller	High load on Controller when monitoring the deleted and the succeeded pods in a cluster
COGENG-110	Cognition Engine	Selecting the business transaction in filters does not change the list of violations
COGENG-438	Cognition Engine	Variables are not being replaced with values intermittently, within an email template for anomaly events
COGENG-703	Cognition Engine	UI does not invoke the API to plot the abstract syntax tree (AST) graph intermittently
DBMON-3906	Database Visibility	The hardware metrics are not captured on the **MS SQL Database** dashboard or on the **Metric Browser** when using cluster
DBMON-6115	Database Visibility	The controller displays access key mismatch event when the database agents start with license rule access key
DBMON-6119	Database Visibility	The details pane on the **Queries Statistics Report** page is too small to view the data
DBMON-6307	Database Visibility	Remote DB Service with meta-info `jdbc|db|adodotnet` cannot be mapped to a database collector
DBMON-6529	Database Visibility	The `Connect backends to Database Visibility to track health status` message is displayed ever when it is not required
DBMON-6628, DBMON-6641	Controller	Missing the database nodes in the **Network Dashboard** flow map
DIAGPLAT-58	Controller	Optimizing `EventManagerBean.getEventDetailsInBatch` to prevent Internal Service and Event details errors
DIAGPLAT-425	Controller	Receiving 500 internal errors when attempting to view snapshots in an application
L4A-10645	Authentication	SAML encryption key is updated when a role is deleted
L4A-11010	Authentication	LDAP TLS client contexts should default to the newest TLS version supported by the Controller's bundled JRE
L4A-11361	Authentication	Nested group functionality not working
L4A-11846	Authentication	Reset password button is disabled
L4A-12066	Authentication	Optimizing LDAP sync
L4A-13322	Authentication	Unable to set an expiry date for account license
L4A-14540	Authentication	LDAP group sync fails due to deleted groups being included in results
METADATA-8112	Dashboards and Reports	Show error in Controller UI when a user doesn't have permission to create dashboards
METADATA-8228	Controller - Platform	The `CustomDashboardImportExportServlet` no longer writes a reply to the client before committing the transa
METADATA-9221	APM	No snapshots are created because the ADD stacktrace purger takes more than 20 hours to complete and holds the r lock for the metadata table
METRICSVC-5902	Metric Service	The client connection pool gets saturated as the connections to the Controller are not cleared after a task is performe
MQS-1028	Metadata	Expression widget with business transactions with `MetricHierarchy` shows no data
MQS-1203	Metric Query Service	Availability metric appears to be different in MySQL when querying for 10 minutes after the 10 minute boundary
MQS-1201	Metric Query Service	MQDC may not return the right metric data for a given time range
MQS-1207	Metric Query Service	Fix availability is below 100% for high retention enabled case
MQS-1209	Metric Query Service	Availability metric appears less than 100% even when it is 100%
REPORTS-591	Reports Service	Application Health Reports show `APPDYNAMICS_INTERNAL_DIAGNOSTICS` events
SERVER-6833	Controller UI	Server page displays total number of servers in the bottom right footer
SERVER-7505	Controller - Machine Agent	AppDynamics Agents UI displays `java.lang.NullPointerException` error for Machine Agents
SERVER-7725	Controller - Machine Agent	Machine Agent reports data continuously, but health rules on those metrics remain in a `Cancelled` status
SERVER-7855	Controller - Machine Agent	Metric hierarchy REST API returns empty response for `Root|*` in hierarchy path
SERVER-8249	Controller UI	OS icons are not displaying properly on on-premises Controller UI
SVCMON-639	Controller	Creating a business transaction group causes a `NullPointException`
SYNTH-5024	Synthetic Browser Monitoring	Synthetic Private Agent license usage for SaaS customers is incorrect
SYNTH-5027	Synthetic Browser Monitoring	500 Internal Server Error caused by null pointer exception
UIPLATF-9947	Custom Dashboards	Custom Time Range seems to be broken
UIPLATF-6208	Custom Dashboards	Absolute Layout: Widgets aren't saved correctly after creation
USERIMPACT-258	Controller	Read-only users cannot access the **Experience Journey Maps** UI

On-Premises Platform Resolved Issues

Filter table:

Key	Product	Summary	Ve
BRUM-5973	EUM Server	Method needed to specify domains or subdomains when setting the `access-control-allow-origin` HTTP header	20.4
CDM-6234	EUM Server	Change default ANR threshold value when `AnrSeverityThresholdConfig` is missing	20.4
ECONSOLE-2824	Enterprise Console	If error occurs, Enterprise Console job fails immediately instead of waiting 45 minutes	20.4
ECONSOLE-5553	Enterprise Console	A check was added to the AWS Controller installation with Aurora to help prevent database misconfiguration	20.4
ECONSOLE-5779	Enterprise Console	Controller installation no longer fails due to timeout	20.4
ECONSOLE-5906	Enterprise Console	Controller upgrade from 4.5.x to 20.3 no longer fails with `mysql_upgrade` version	20.4
ECONSOLE-5933	Enterprise Console	Upgrading Controller from 4.5.x to 20.3 fails with `mysql_upgrade` version check failure	20.4
EUMPLAT-778	EUM Server	Mobile Dashboard fails to load	20.4
EUMPLAT-790	EUM Server	License Service keeps making calls for individual account usage and terms	20.4
EUMPLAT-800	EUM Server	More usage data needs to be included into the `EUM Usage Trend` API	20.4
SYNTH-5140	Synthetic Private Agent	Firefox measurements fail for some specific URLs	20.4

Known Issues

End User Monitoring

License service makes individual accounts' usage and term calls to the Events Service.

20.3 Resolved and Known Issues

Agent Resolved Issues

Filter table:

Key	Product	Summary
ANALYTICS-12329	Analytics Agent	Denial of Service vulnerability found in Jackson libraries
ANALYTICS-12448	Java Agent	Node CPU spikes when running in Agentless Analytics mode after hitting Transaction Analytics license limit
CDM-5998	Android Agent	Add null protection while processing null response headers from the server
DBMON-6131	Database Monitoring	The ASC keyword in a custom metric query causes a query validation error
DBMON-6004	Database Monitoring	The Metric Browser displays incorrect hardware memory usage when the hardware monitoring for MS SQL server is disal
DBMON-4515	Database Monitoring	DB Agent does not capture the cursor metrics from Mongo DB
DBMON-5628	Database Monitoring	The Metric Browser does not capture the buffer and the cache memory metrics for a Linux collector
DOTNET-4309	.NET Agent	MSMQ backends resolving to downstream tiers
DOTNET-4000	.NET Agent	.NET Agent reports MSMQ Entrypoint as an exit call
DOTNET-4242	.NET Agent	.NET Agent throws excessive errors on ADO.NET exit calls
DOTNET-3536	.NET Agent	.NET Agent does not report WCF transactions if completion of asynchronous tasks result in an exception
DOTNET-4452	.NET Agent	Applications crash in HTTP data collection due to changes in .NET Core 3.0.3 and 3.1.2
DOTNET-4524	.NET Agent	Agent is logging for Netviz `Controller is not supported` even when customer is not using Network Agent
DOTNET-4230	.NET Agent	POCO instrumentation crashing instrumented application
IIB-228	IBM Integration Bus Agent	The App Agent Version column lists the release number of the agent as 0.0.0.0 in place of 4.5.5.0

IIB-36	IBM Integration Bus Agent	Agent initialization is extremely slow when instrumenting IIB9
JAVA-6554	Java Agent	Length of a string is limited to only 50 characters, when a URI is split using custom exit call naming rule with method para
JAVA-6631	Java Agent	Snapshot data added using the Agent API that is omitted from snapshots
JAVA-6923	Java Agent	E2E latency column missing for snapshots in the executor mode
JAVA-6975	Java Agent	Defer bytecode transformation logging after class loader lock is released
JAVA-7010	Java Agent	Java Agent API snapshot data collectors do not report statistics after the agent upgrade from 4.5.13 to 4.5.18
JAVA-7031	Java Agent	BT level error statistics exclude HTTP errors
JAVA-7091	Java Agent	Enabling EUM for Java Agent 4.5.18 for the `undertow-io` throws an error
JAVA-7160	Java Agent	False stall transactions reported with webflux and Reactor netty
JSNODE-19	Node.js Agent	`jackson -databind` library upgrade for the Node.js Agent
NETWORK-6054	Network Agent	Network Agent installed on Windows installs the NPCAP loopback adapter that can sometimes affect user traffic
NETWORK-6108	Network Agent	Network Agent installation on Windows Server 2008 R2 fails
NETWORK-6109	Network Agent	Network Agent crashes if port 3898 is being listened to by another application
NETWORK-6146	Network Agent	Request to fix read timeout and provide option to customize logging changes
NETWORK-6156	Network Agent	Network Agent installation fails if a higher version of the Visual C++ Redistributable is already installed on the machine
PHP-812	PHP Agent	PHP Agent installation on Apache logs irrelevant error messages
PHP-806	PHP Agent	PHP Agent does not detect DB queries with PHP Data Objects (PDO)
PHP-766	PHP Agent	Custom Match Regex Rule does not work with PHP 7.3
PHP-757	PHP Agent	Intermittent crash caused by SOAP client call interception in the PHP-FPM process
PYTHON-6	Python Agent	Avoid issues with functools.wraps on Python 2
PYTHON- 39	Python Agent	Remove unused third-party Java library from python-agent-proxy
SERVER-8069	Machine Agent	Update the JRE bundled with Machine Agent from 1.8.0_212 to 1.8.0_241
SERVER-6366	Machine Agent	Machine Agent RPM upgrade from 4.5.6 to later versions is now working correctly
SERVER-6705	Machine Agent	Machine Agent init.d start up scripts error is fixed
SERVER-8100	Machine Agent	`jackson-databind` library upgrade for the Machine Agent

Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary
ALERT-3645	Health Rules	No audit log is captured when you disable or enable the health rule from Controller UI
ALERT-4482	Alerting	Action suppression with object scope set to `node` resets to scope `application` when saved
ALERT-4489	Health Rules	`OBJECT_UPDATED` events show old values as 0 when a condition is updated in health rule
ALERT-4581	Health Rules	X of Y health rule based on wildcard custom metrics does not work when one metric is not reported
ALERT-4919	Alerting	Logs from alerts is noisy and affecting the connection to node
ALERT-5753	Alerting	Alert/event links do not open and display an error, post controller upgrade
ALERT-5800	Alerting	Upgrade the Java library `C3P0` to version 0.9.5.2
ALERT-6064	Alerting	Upgraded the `C3P0` library in the Controller to version 0.9.5.5
ALERT-6489	Alerting	Hibernate session cache becomes excessively large when the event reactor index is refreshed
ALERT-6503	Alerting	Enable writing to digest tables based on flags
AMCSEV-145	Browser RUM	ZDT Controller restarts trigger re-transformation
AMCSEV-45	App Monitoring Cloud Services	Intermediate page is loaded briefly when user double-clicks an exception
AMCSEV-47	App Monitoring Cloud Services	Process snapshots are not filtered by a custom time range
AMCSEV-433	App Monitoring Cloud	Search option is not available the first time in **Transaction Snapshots** and filter options will not display

	Services	
AMCSEV-942	App Monitoring Cloud Services	Customization of **Automatic Leak Detection** settings transforms `APP_AGENT` configuration
ANALYTICS-12426	Analytics	SQL data collectors are not enabled for analytics when saved from new HTML screens
ANALYTICS-12489	Analytics	Option to create SQL Data collector from APM snapshot is missing from 4.5.10 Controller version
ANALYTICS-12485	Analytics	Cannot collect SQL parameters from Analytics when you use the new HTML screens
ANALYTICS-12121	Analytics	Page Name control in Browser Request Business Journey milestone unresponsive
ANALYTICS-12157	Analytics	XLM export does not have values in daily reporting.
ANALYTICS-12183	Analytics	Cannot remove Business transactions from Transaction Analytics UI
ANALYTICS-12202	Analytics	Table widget is missing progress bar and toolbar
ANALYTICS-12273	Analytics	Missing widget titles in Analytics Search Visualization
ANALYTICS-12519	Analytics	Time series chart won't remove data series which exists in the previous page but disappears in new response
ANLYTCS_ES-3484	Analytics	Client connection pool gets corrupted and cannot recover, requiring Controller restart
ANLYTCS_ES-3635	Analytics	Recreation of the client when the connection pool is corrupted
APMPLAT-12551	APM	Error graph shows correct information for time range greater than four hours
APMPLAT-13084	APM	Libagent-based agents reporting version as `0.0.0.0` are unable to register with the Controller
APMPLAT-13154	APM	Customer time range selection is incorrect
APMPLAT-13154	APM	Unable to filter the transaction snapshots list using the filter option in the UI
BRUM-5926	Browser RUM	**Page Limit Ajax Request Warning** documentation link does not work
CDM-5729	Mobile RUM	Health rule violation summaries are not rendered when the health rule name contains HTML/XML elements
CDM-5818	Mobile RUM	Health rule violation descriptions display incorrect health rule name containing HTML/XML elements
CLUSTERMON-74	Cluster Monitoring	Metrics are now available when the time range filter is set to `8 days`
CLUSTERMON-866, CLUSTERMON-34, CLUSTERMON-342	Cluster Monitoring	Cluster Agent should respect pod limit set by the Controller
CLUSTERMON-1137	Cluster Monitoring	Incoming Cluster Agent requests are directed to the wrong threadpool
CLUSTERMON-1173	Cluster Monitoring	AppDynamics Metric Browser stops responding when cluster monitoring is enabled and a large number of nodes registered
CLUSTERMON-1183	Cluster Monitoring	Default SIM health rules are being evaluated for clusters and pods leading to incorrect evaluation and health rule depicted in the UI
CLUSTERMON-1199	Cluster Monitoring	Normal pods count is negative
CUSTOMDASH-9325	Custom Dashboards	Custom widget title is no longer displaying after upgrading to 4.5.16
DBMON-6193	Database Monitoring	None of the DB collectors are reporting after Controller upgrade to 4.5.17
DBMON-6672	Database Monitoring	Removed the DBMon Service from the Controller
DBMON-6694	Database Monitoring	Upgrade the `mysql-connector-java:8.0.13` library for the DBMon Service to 8.0.20
DIAGPLAT-516	Health Rules	**Event Summary** page shows exception when accessed via link from email
DIAGPLAT-554	Events	Several ID blockers are skipped during the activation of the Controller
DIAGPLAT-556	Events	`Invalid Account: Principal` error is displayed when you load the events, post controller upgrade
DIAGPLAT-664	Events	Upgrade the H2 database engine library in the Controller
DIAGPLAT-667	Events	Upgrade the Apache Commons library `beanutil:1.8.3` in the Controller to 1.9.4
DIAGPLAT-681	Events	Upgrade the `mysql-connector-java` library in the Controller to 8.0.20
EUMPLAT-811, EUMPLAT-823	Controller - EUM	Upgrade the library `jackson-databind` to 2.11.0, and the libraries `dropwizard-core` and `dropwizard-val` 1.3.23 in the EUM client for the Controller
JAVA-7529	Controller	Update the Java Agent in the Controller to 20.4
L4A-7824	Accounts	New permissions added in a later release are not saved when added to existing roles
L4A-9790	RBAC	Cannot assign roles to the LDAP users when user attribute is updated on LDAP
L4A-9822	Accounts	Read-only user can access admin pages and see some admin entities
L4A-10035	Accounts	Error saving LDAP configuration if nested group attribute is an empty string in DB
L4A-10463	Accounts	User update operation leads to extra references in `AuthEntityHelper.CacheRepository`
L4A-12140	Admin Console	Optimize account listing for the Controller Admin Console

L4A-12311	Accounts	Email alerts are not generated as the notification configuration for AppDynamics account moves to invalid state
L4A-12292	Authentication	Including SAML config in Account DTO causes performance problems on controllers with many accounts
L4A-12065	Authentication	LDAP sync takes a lot of time in case there are more than 1,000 users with multiple groups assigned
L4A-12508	Authentication	LDAP sync fails while updating user outside of session
L4A-12712	Authentication	Update the OneLogin SAML version to 2.5.0 in the Controller
L4A-13321	Authentication	Unable to set an expiry date for the account license
L4A-13321	Authentication	LDAP group sync fails due to deleted groups being included in results
METADATA-7800	APM	Flowmap view and Detail screen no longer show mismatched data
METADATA-7922	Accounts	The accounts to application cache is now consistent with applications cache and database
METADATA-7956	APM	Server Health Status now shows correctly when the same dashboard is exported and imported
METADATA-7980	APM	BT liveness data now loads correctly from Blitz
METADATA-8305	Accounts	Admins can now enable the HSTS header as a setting
METADATA-8433	Dashboards	Metric Expression corrected in Custom dashboard
METADATA-8903	Metrics	Downgrade metric ID log level to debug to 20.3.0
METADATA-8999	Metrics	Upgraded the libraries `netty` to version 4.1.48.Final and `lettuce-core` to 5.1.8.RELEASE
METADATA-9120	Metrics	Upgrade the libraries `apache-tomcat` to 9.0.31, `dropwizard-validation` to 1.3.2, and `mysql-connector-` 8.0.20 for the Controller
METADATA-9149	Metrics	Upgrade the `mysql-connector` Java library to 8.0.20 in modules of the Controller
METADATA-9168	Metrics	Upgrade the `dom4j` library to 2.1.3 in the GlassFish application server of the Controller
MQS-1032	Metric Query Service	No data available when the custom time range is less than 30 minutes
MQS-1161	Metric Query Service	Split an insert statement for the Metric Hierarchy Store into smaller partitions
NETWORK-5276	Network Visibility	Error message needs to improve when user does not have permission to view Network agents tab
PLATCPS-14052	Controller	jsessionid no longer appears in URL and server log
REPORTS-715	Reports	Audit Report shows inconsistency when data is displayed in PDF and CSV formats
REPORTS-738	Reports	Unable to save the custom time range using the schedule report calendar fields
REPORTS-754	Reports	Remove older unused version of the AppDynamics Node.js Agent from the Reports Service bundle
SERVER-7017	Server Visibility	Server Visibility health rules work correctly with .NET compatible-mode enabled
SERVER-8254	Server Visibility	Upgrade the Apache `commons-httpclient` library used by the Controller to version 5.0
SVCMON-552	APM	Divide by Zero exception creates 500 error in Controller flowmap
SVCMON-597	APM	Slow application dashboard flowmap
SERVER-7017	Server Visibility	SIM API not working for .NET agent in compatibility mode
SERVER-7345	Server Visibility	ID column in SIM table changed from int type to BigInt type
SYNTH-4791	Browser Synthetic Monitoring	Business Transactions Missing Scroll Bar
SYNTH-5403	Browser Synthetic Monitoring	Synthetic Private Agent license usage for SaaS customers is incorrect
TMNT-27	APM	Functionality to set default landing screen is not working

On-Premises Platform Resolved Issues

Filter table:

Key	Product	Summary
ANALYTICS-12472	Enterprise Console	Stacktrace propagated in status code while handling ADQL exceptions
ANLYTCS_ES-3496	Events Service	Index compaction causing client timeouts

APMPLAT-13185	Enterprise Console - Controller	Upgrade of the Controller 20.3.0 fails when attempting to modify the database table `unresolved_backend_call_in`
ECONSOLE-4479	Enterprise Console	tzdata check is now correct
ECONSOLE-5691	Enterprise Console	Replication script no longer fails if the file group name contains whitespace
ECONSOLE-5718	Enterprise Console	MySql configuration no longer disables the recovery of InnoDB pages
ECONSOLE-5720	Enterprise Console	Running the final replication after incremental replication from the Enterprise Console UI causes the Enterprise Console
ECONSOLE-5804	Enterprise Console	Upgrade/Add Secondary HA directory validation fails because of a trailing forward slash in Controller path
ECONSOLE-5828	Enterprise Console	Add secondary job no longer fails when the volume mounted has a wider name
ECONSOLE-5934	Enterprise Console	Upgrading the Controller from version 4.5.x to version 20.3 fails with `mysql_upgrade` version check failure
ECONSOLE-5978	Enterprise Console	Upgrade the `mysql-connector` Java library to 8.0.20
ECONSOLE-5982	Enterprise Console	Upgrade the `dropwizard-validation` and `dropwizard-core` libraries to 2.0.8 for the Enterprise Console
ECONSOLE-5986	Enterprise Console	Upgrade the `jinjava` library to 2.5.3 for the Enterprise Console
ECONSOLE-5990	Enterprise Console	Upgrade the `okhttp` Java library to 4.5.0
ECONSOLE-5994	Enterprise Console	Upgrade the Apache `tomcat-jdbc` Java library to 9.0.31
ECONSOLE-5999	Enterprise Console	Upgrade the `dom4j` Java library to 2.1.3
ECONSOLE-6013	Enterprise Console	Retain the `internal_tmp_disk_storage_engine=MYISAM` setting in the `db.cnf` file through the upgrades of the and MySQL
ECONSOLE-6044	Enterprise Console	Purge script to remove unused artifacts from a prior Enterprise Console installation
EUMPLAT-572	EUM Server	Updated mysql-connector-java to 8.0.19 and mysql-version to 5.7.29
EUMPLAT-901	EUM Server	Use `jetty-util 9.4.18` to resolve the issue upgrading `SSLContextFactory`
SYNTH-4959	Synthetic Server	Prevent schedules from being deleted when MySQL is down in on-prem environments
SYNTH-5291	Synthetic Private Agent	The Page Load Time metric is sometimes captured in events.json but not captured in the HAR
SYNTH-5339	Synthetic Private Agent	Revert Chrome to version 64

20.2 Resolved and Known Issues

Controller Resolved Issues

There are no resolved issues for the Controller in this release.

Agent Resolved Issues

Filter table:

Key	Summary	Vers
BRUM-5889	`wrap()` changes the context of Event Listener while calling `pushApplyPopFromCausalityChain`()	20.2.0
CDM-5873	Fixed a bug in the iOS dSYM upload script that would have caused an error when attempting to set the correct timestamp for the uploaded metadata	20.2.0

On-Premises Resolved Issues

Filter table:

Key	Product	Summary	Version
SYNTH-4919	Page count error for Synthetic Private Agent license consumption	20.2.0	Synthetic Private Agent
SYNTH-5291	**Page Load Time** metric is sometimes captured in events.json but not in the HAR	20.2.1	Synthetic Private Agent
SYNTH-5333	Chrome upgrade to version 79 broke many non-W3C selenium commands	20.2.1	Synthetic Private Agent

Known Issues

There were no known issues in the 20.2 release.

Past Agent Releases

This page lists the agent enhancements for all calendar-versioned agent releases.

21.x Agent Releases

Analytics Agent

Version 21.5.0 - May 27, 2021

This release includes the third-party library upgrades:

- Jetty upgrade to version 2.34.
- Netty upgrade to version 4.1.63.Final.

Version 21.4.0 - April 22, 2021

This release includes the Jetty third-party library upgrade to version 9.4.39.v20210325.

Version 21.3.0 – March 25, 2021

This release includes the following enhancements:

- The Analytics Agent bundled in Machine Agent 20.8 has enhanced improvements
- The Analytics Agent Jetty libraries are upgraded
- The Analytics Agent Jersey is upgraded
- The Dropwizard and Hibernate Validator libraries are upgraded
- The unused HTTP methods in Analytics Agent have been disabled

Version 21.2.1 – February 25, 2021

The following third-party libraries have been upgraded.

- `com.fasterxml.jackson.core:jackson-databind:2.12.0`
- `com.google.guava:guava:30.0-jre`
- `commons-io:commons-io:2.8.0`
- `guava: 30.0-jre`
- `httpclient: 4.5.13`
- `jackson-core: 2.12.0`
- `jackson-databind: 2.12.0`
- `jetty-server to 9.4.30.v20200611.jar`
- `jetty-webapp to 9.4.33.v20201020.jar`
- `junit:junit:4.13.1`
- `netty-all: 4.1.55`
- `org.apache.ant:ant:1.10.9`
- `org.apache.httpcomponents:httpclient:4.5.13`
- `org.bouncycastle: bcprov-jdk15on:1.67`
- `org.eclipse.jetty:jetty-server:9.4.35.v20201120`
- `org.eclipse.jetty:jetty-webapp:9.4.35.v20201120`
- `org.exist-db.thirdparty.xerces:xercesImpl:2.12.1`
- `org.hibernate: hibernate-validator:6.1.6.Final`

Version 21.1.0

There was no release for 21.1.

Android Agent

Version 21.5.0 - May 17, 2021

Android Agent 21.5.0 released with minor enhancements and fixes.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.0.

Version 21.2.0 – February 18, 2021

Android Agent 21.2.0 released with minor bug fixes and API enhancements:

- Disable the agent to stop sending user data to the collector
- Disable crash reporting

Manual and automatic screenshots are limited to one screenshot per 10-second interval.

Version 21.1.0

There was no release for 21.1.

Apache Web Server Agent

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

AppDynamics AWS Lambda Extension for Serverless APM

Version 21.5.0 - May 10, 2021

To use AppDynamics AWS Lambda Extension for Serverless APM, choose ARN 10 which corresponds to these versions

- Node (npm) 21.5.286
- Python (PyPI) 20.11.411

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

C/C++ SDK

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

Cluster Agent

Version 21.5.0 - May 25, 2021

You can now use `resourcesNetViz` parameter within the `infraviz.yaml` filet to set the resources for the Network Visibility container.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.1 – March 26, 2021

This release includes the support for Infrastructure Visibility with Cluster Agent. You can now use the `infraviz.yaml` file with Cluster Agent Operator. For more information, see Install Infrastructure Visibility with the Cluster Agent Operator.

Version 21.3.0 – March 25, 2021

This release of Cluster Agent does not include any enhancement but fixes some minor issues.

Version 21.2.0 – February 24, 2021

This release of Cluster Agent includes the following updates:

- Cluster Agent is available with the 0.6.7 version of the operator. You can find the list of supported operators for each Cluster Agent at Cluster Agent and the Operator Compatibility Matrix.
- The deployment modes for the Cluster Agent Helm chart are now `PRIMARY` and `NAMESPACED` instead of `MASTER` and `NAMESPACED`. See Install the Cluster Agent with Helm Charts.

Version 21.1.0

There was no release for 21.1.

Cordova Plugin

Version 21.5.0 - May 18, 2021

Cordova Plugin 21.5.0 release includes iOS and Android Agents 21.5.0

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.1 – February 19, 2021

Cordova Plugin 21.2.1 released with minor fixes and enhancements, and includes the latest version of the iOS and Android Agents.

Version 21.1.0

There was no release for 21.1.

Database Agent

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0 - April 21, 2021

This release includes the following enhancements:

You can now view:

- Costly operations in execution plan along with the warnings in the execution plan. See Database Query Execution Plan Window
- Additional Cassandra metrics such as Dropped Mutations, Max Partition Size, Messaging Latency, Read Failures, Repair Age Percentage, and Write Failures. See Database Monitoring Metrics.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0 – February 17, 2021

This release of Database Agent collects additional Couchbase metrics. For the list of resolved issues, see Past Agent Resolved Issues.

Version 21.1.0

There was no release for 21.1.

Go SDK

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

IBM Integration Bus Agent

Version 21.5.0 - May 27, 2021

The IIB Agent 21.5.0 is released with bug fixes for cross-app BT correlation.

Version 21.4.1 - April 27, 2021

The IIB Agent 21.4.1 release introduces the Flow Visibility feature. The timings are collected only for flow start and end and any external calls made from within a flow. Therefore, the expected CPU cost of instrumenting the flows with the agent is reduced, especially for complex flows. See IIB Agent Flow Level Visibility.

Version 21.4.0 - April 5, 2021

The IIB Agent 21.4.0 release introduces the cross-application Business Transaction correlation feature that helps you to correlate the business transactions passing through an IIB application.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

iOS Agent

Version 21.5.0 - May 12, 2021

iOS Agent 21.5.0 released with minor enhancements and fixes.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0 – February 16, 2021

Manual and automatic screenshots are limited to one screenshot per 10-second interval. See See Past Resolved and Known Issues by Release. and iOS SDK Documentation.

Version 21.1.0

There was no release for 21.1.

Java Agent

Version 21.5.0 - May 26, 2021

Java Agent 21.5.0 released with minor enhancements and fixes.

Version 21.4.0 - April 20, 2021

- Java Agent 21.4.0 adds entry and exit support for Vert.x 4.0. See Java Supported Environments.
- This release adds exit support for WSO2 API Microgateway. See Java Supported Environments.
- An option to rediscover MBean servers periodically using a node property is introduced. See App Agent Node Properties.
- Support has been added for JDK16. See Java Supported Environments.

Version 21.3.0 – March 23, 2021

- Java Agent 21.3.0 adds entry and exit support for Micronaut 2.0. See Java Supported Environments.
- This release adds entry support for WSO2 API Microgateway. See Java Supported Environments.

Version 21.2.0 – February 15, 2021

The Java Agent 21.2.0 adds a new property to truncate the length of SQL statements. For more information, see App Agent Node Properties.

Version 21.1.1 - January 28, 2021

- Java Agent 21.1.1 adds support for Tomcat 10. For more information, see Java Supported Environments.
- This release adds support for Ktor and Netty frameworks. For more information, see Java Supported Environments.
- This release adds exit support for Couchbase database. For more information, see Java Backend Detection.

Version 21.1.0 - January 18, 2021

Java Agent 21.1.0 adds support for OOTB Detection for Maria DB. For more information, see Java Supported Environments.

JavaScript Agent

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0 – February 17, 2021

See Past Resolved and Known Issues by Release.

Version 21.1.0

There was no release for 21.1.

Java Serverless Tracer

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

Machine Agent

Version 21.5.0-3130 - May 19, 2021

Machine Agent 21.5.0 release:

- Deprecates the `metric.http.listener.host` property.

Upgrades these third-party libraries:

- `Ant 1.10.10`
- `Dropwizard 2.0.21`
- `Fabric8-Kubernetes 4.13.3`
- `Jackson 2.12.3`
- `Jetty 9.4.40.20210413`
- `OSHI 5.7.2`

Version 21.4.0-3075 - April 22, 2021

This release of Machine Agent :

- has updated Java 8 Azul to build version 8.52 and Java 11 Azul to build version 11.45.
- supports `diskstats` output for Linux kernel versions >= 4.18

The following third-party libraries have been upgraded.

- `dropwizard: 2.0.20`
- `guava: 30.0-jre`
- `Fabric8 Kubernetes: 4.13.2`
- `jackson-core: 2.12.0`
- `jackson-databind: 2.12.0`
- `jetty-server to 9.4.39.20210325`
- `Log4j2: 2.14.1`

Version 21.3.0-3059 – March 25, 2021

The Machine Agent release is bundled with the latest releases of the Analytics Agent and Network Agent.

Version 21.2.0 – February 25, 2021

The Machine Agent has been updated, tested, and certified to work with the following:

- `org.eclipse.jetty:jetty-server 9.4.36.v20210114`
- `org.eclipse.jetty:jetty-servlet 9.4.36.v20210114`
- `org.eclipse.jetty:jetty-servlets 9.4.36.v20210114`

- `org.bouncycastle:bcprov-jdk15on 1.68`
- `commons-net:commons-net 3.7.2`
- `commons-codec:commons-codec 1.15`
- `commons-validator:commons-validator 1.7`
- `io.dropwizard:dropwizard-jetty 2.0.18`
- `io.dropwizard:dropwizard-util 2.0.18`
- `com.google.guava:guava 30.1-jre`
- `com.fasterxml.jackson.* 2.12.1`
- `io.fabric8:kubernetes-client 4.13.1`

Version 21.1.0 – January 22, 2021

- The Machine Agent and Server Visibility on Linux bundles have been updated to Java 11 Azul JRE. If you upgrade the Linux Machine Agent to 21.1.0, then you must also upgrade all extensions to their latest versions to support Machine Agent 21.1.0. See Machine Agent Requirements and Supported Environments for details.
- The Machine Agent has updated the bundled Analytics Agent to version 20.10.0-7428.

.NET Agent

Version 21.5.0 - May 28, 2021

.NET Agent for Linux 21.5 incorporates significant architectural changes to accelerate the development of missing features in the Linux Agent relative to .NET Agent for Windows. These architectural changes do not affect .NET Agent for Windows (MSI and Microservices).

Because .NET Agent for Linux 21.5 is a significant architectural update, some issues may arise despite extensive testing performed. If you experience any blocking issues, please open a high priority support ticket where AppDynamics will provide workarounds or alternate options.

Generally, .NET Agent for Linux 21.5 maintains parity with existing features in .NET Agent for Linux < 21.5. However due to architectural updates, there are differences between .NET Agent for Linux >= 21.5 and .NET Agent for Linux < 21.5. Before you upgrade to .NET Agent for Linux 21.5, see Upgrade the .NET Agent for Linux.

Enhancements:

- Sensitive data filters for Linux. See Filter Sensitive Data with the .NET Agent.
- Custom exit points for Linux. See Exit Point Detection Rules.
- Instrumentation configuration enhancements for: `classIgnore`, `typeMatch 'Signature'`, `'IsSubClass' list` and `regex for Linux`.
- ASP.NET instrumentation enhancements for Linux. See ASP.NET Core Instrumentation Options.
- Redis backend detection for IP address endpoint for all platforms.
- EUM for .NET Core for Linux. See Browser RUM Supported Environments.
- .NET extends support for `BasicPublish` and `BasicConsume` in the RabbitMQ client >= 6.0.0 for all platforms.
- .NET Agent supports SSL mutual authentication for Azure PaaS app services for Windows only.
- The download package options for .NET Agent on Linux have been updated. The ".NET Agent - 64-bit alpine-linux" package has been discontinued and is replaced with the ".NET Agent - 64-bit linux" package.
- .NET Agent supports custom trusted certificate validation for all .NET Core Linux and Windows.

Version 21.4.0 - April 28, 2021

.NET Agent supports mutual authentication (mTLS) for Windows Agent for both .NET Full Framework and .NET Core applications; excluding Azure PaaS environments such as Azure App Services. See Resolved and Known Issues.

Version 21.3.0 – March 29, 2021

- .NET Agent for Windows running on .NET Core >= 3.1 supports async exit calls over HTTP to WCF services. The remote address, full URL, host, and port identifying properties and correlation are supported.
- .NET Agent supports the Controller service proxy feature.
- New instrumentation options for ASP.NET Core.

See Past Resolved and Known Issues by Release for details

Version 21.2.0 – February 24, 2021

he .NET 21.2.0 release includes:

- .NET Agent for Windows on .NET Core now automatically captures errors for loggers implementing the Microsoft.Extensions.Logging.ILogger API. The standard Error Detection configuration options apply.
- **CosmosDB for .NET Core on Windows is supported.**
- Added optimizations for Async Task tracking and Netviz socket tracking.

See Past Resolved and Known Issues by Release.

Version 21.1.0 – January 29, 2021

- Windows Agents now support End User Monitoring (EUM) for ASP.NET Core Web applications running on .NET Core 3.1 and .NET 5, including automatic Business Transaction correlation and automatic JavaScript Agent injection. Both MVC and Razor Pages are supported.
- Redis instrumentation is now supported on both .NET Full Framework and Core Framework on Windows.

- The Windows Agents can now automatically set the `HttpOnly` flag to `false` for EUM cookies on ASP.NET. To enable, set the `eum-auto-httponly-false` boolean node property to `true`.

Network Agent

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.0.

Version 21.3.0 – March 25, 2021

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release.

Version 21.2.0 – February 25, 2021

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 21.1.0

There was no release for 21.1.

Node.js Agent

Version 21.5.0 - May 28, 2021

This release includes:

- Support for gRPC. See gRPC Support for the Node.js Agent.
- Availability for cross-application Business Transactions.

Version 21.4.0 - April 16, 2021

This release includes no new features, but bug fixes. See Resolved and Known Issues.

Version 21.3.0

There was no release for 21.3.

Version 21.2.0 – February 25, 2021

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 21.1.0 – January 29, 2021

- You can now use Node.js 15.
- You can also tune Analytics data limits with the agent settings.

Node.js Serverless Tracer

Version 21.5.286 - May 10, 2021

The Node.js Serverless Tracer has been updated to 21.5.286

Version 21.4.0

There was no release for 21.4.

Version 21.3.278 – March 26, 2021

The Node.js Serverless Tracer has removed `request 2.88.0` library and added axios `0.21.1` library. See Past Resolved and Known Issues by Release for details.

Version 21.2.0

There was no release for 21.2.

Version 21.1.0

There was no release for 21.1.

PHP Agent

Version 21.5.0 - May 26, 2021

PHP Agent 21.5.0 released with bug fixes.

Version 21.4.0

There was no release for 21.4.

Version 21.3.0

There was no 21.3 release.

Version 21.2.0 – February 24, 2021

This release introduces an environment variable to set a unique host ID for the PHP Agent. See PHP Agent Configuration Settings.

Version 21.1.0 – January 27, 2021

This release includes no new features, but bug fixes. See Past Resolved and Known Issues for details.

Python Agent

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.

Version 21.3.0

There was no 21.3 release.

Version 21.2.0 – February 2, 2021

This release includes no new features, but bug fixes. See Past Resolved and Known Issues for details.

Version 21.1.0

There was no 21.1 release.

Python Serverless Tracer

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.

Version 21.3.0

There was no 21.3 release.

Version 21.2.0

There was no 21.2 release.

Version 21.1.0

There was no 21.1 release.

React Native Agent

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0 - April 5, 2021

This release includes an API to manually track custom HTTP requests. See Customize the React Native Instrumentation.

Version 21.3.0

There was no 21.3 release.

Version 21.2.1 – February 19, 2021

React Native Agent 21.2.1 supports `CrashReportCallback` to receive a report for native crashes. See Customize the React Native Instrumentation.

Version 21.1.0

There was no 21.1 release.

SAP

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.

Version 21.3.0

There was no 21.3 release.

Version 21.2.0 – February 26, 2021

See Release Notes Version 21.2.0.

Version 21.1.0

There was no 21.1 release.

Synthetic Hosted Agent

Version 21.5.0

There was no release for 21.5.0.

Version 21.4.0

There was no release for 21.4.

Version 21.3.0

There was no 21.3 release.

Version 21.2.0 – February 16, 2021

Chrome browser version 86 is now available. See Chrome Version 86 for details.

Xamarin Agent

Version 21.5.1 - May 18, 2021

The Xamarin 21.5.1 Agent includes newly exposed APIs to:

- Configure a semi-automatic HTTP tracker using the `HttpMessageHandler`
- Transform URLs for network requests
- Configure, disable, block, and unblock screenshots

See Customize the Xamarin Instrumentation.

Other enhancements:

- When setting up the Xamarin Agent, you must add the AppDynamics.Agent package and call an extra line of code in `MainActivity.cs` under `OnCreate`. See Instrument Xamarin Applications.

Version 21.4.0

There was no release for 21.4.

Version 21.3.0

There was no 21.3 release.

Version 21.2.0 – February 19, 2021

Xamarin Agent 21.2.0 release includes fixes from the 21.2.0 JavaScript Agent, iOS, and Android Agent.

Version 21.1.0

There was no 21.1 release.

20.x Agent Releases

Analytics Agent

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no release for 20.11.

Version 20.10.0

There was no release for 20.10.

Version 20.9.0

There was no release for 20.9.

Version 20.8.0

There was no release for 20.8.

Version 20.7.0

There was no release for 20.7.

Version 20.6.0 – June 25, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.5.0 – May 26, 2020

- Oracle JRE has been replaced with Azul's Zulu JRE in the Window Analytics Agent Bundle.
- Third-party libraries have been upgraded.

Version 20.4.0

There was no 20.4 release for the Analytics Agent.

Version 20.3.0 – March 4, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.2.0

There was no release for the Analytics Agent.

Android Agent

Version 20.12.0

There was no release for 20.12.

Version 20.11.1 - November 17, 2020

Android Agent 20.11.0 released with minor enhancements and fixes.

Version 20.10.0 – October 9, 2020

Android Agent 20.10.0 captures mobile device metrics with which you can filter performance data, such as network requests, crashes and code issues, based on device specifications, such as CPU type, memory, disk space, and battery. See Mobile RUM Metrics for details.

Version 20.9.0

There was no 20.9 release for Android Agent.

Version 20.8.0

There was no 20.8 release for Android Agent.

Version 20.7.1 – July 2, 2020

Android Agent 2020.7.0.1710 is released. See Past Resolved and Known Issues by Release.

Recommendations

- If your project uses Android Gradle Plugin version < 4.5.1, use Android Agent 20.4.0.
- If your project uses Android Gradle Plugin version >= 4.5.1, use Android Agent >=20.7.1.

Version 20.6.0

There was no 20.6.0 release for the Android Agent.

Version 20.5.0 – May 13, 2020

The Android Agent has updated the Android Gradle plugin dependency to version 3.4.1 or higher. If you are unable to update to Android Gradle Plugin 3.4.1 or higher, you are recommended to use Android Agent 20.4.0 or earlier.

Version 20.4.0

There was no 20.4.0 release for the Android Agent.

Version 20.3.1 - March 31, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release.

Version 20.3.0 – March 4, 2020

This release includes optimizations and small code changes.

Version 20.2.0

There was no 20.2.0 release for the Android Agent.

Apache Web Server Agent

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no release for 20.11.

Version 20.10.0

The release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release.

Version 20.9.0 – September 21, 2020

The release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release.

Version 20.8.0

There was no 20.8 release for the Apache Web Server Agent.

Version 20.7.0 – July 27, 2020

Apache Agent 20.7.0 is released with small code changes and optimizations. See Past Resolved and Known Issues by Release.

Version 20.6.0 – June 24, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release.

Version 20.5.0 – May 14, 2020

This release includes optimizations and small code changes.

Version 20.4.0

There was no 20.4.0 release for the Apache Web Server Agent.

Version 20.3.0

There was no 20.3.0 release for the Apache Web Server Agent.

Version 20.2.0

There was no 20.2.0 release for the Apache Web Server Agent.

AppDynamics AWS Lambda Extension for Serverless APM

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no 20.10 release for the AppDynamics AWS Lambda Extension for Serverless APM.

Version 20.10.0 – October 8, 2020

AppDynamics AWS Lambda Extension for Serverless APM released. See Use the AppDynamics AWS Lambda Extension to Instrument Serverless APM at Runtime.

C/C++ SDK

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no 20.11 release for the C/C++ SDK.

Version 20.10.0

There was no 20.10 release for the C/C++ SDK.

Version 20.9.0 – September 30, 2020

This release includes new features and bug fixes.

- The C/C++ SDK is now compatible with calendar versioning.
- `appd_sdk_add_app_context` now logs Controller and application information. See C/C++ SDK Reference.
- The C/C++ SDK now supports Custom Events. You can create a custom event, add data to the event, and report the event to the Controller. See C/C++ Agent SDK Resource Management.
- You can enable/disable Analytics reporting. When disabled, the Analytics-related logging messages are suppressed. See C/C++ SDK Reference.

Version 20.8.0

There was no 20.8 release for the C/C++ SDK.

Version 20.7.0

There was no 20.7.0 release for C/C++ SDK.

Version 20.6.0

There was no 20.6.0 release for the C/C++ SDK.

Version 20.5.0

There was no 20.5.0 release for the C/C++ SDK.

Version 20.4.0

There was no 20.4.0 release for the C/C++ SDK.

Version 20.3.0

There was no 20.3.0 release for the C/C++ SDK.

Version 20.2.0

There was no 20.2.0 release for the C/C++ SDK.

Cluster Agent

Version 20.12.1-1948 – December 18, 2020

There are no enhancements in this release. For the resolved issue, see Past Resolved and Known Issues by Release.

Version 20.12.0-1937 – December 17, 2020

There are no enhancements in this release. For the resolved issue, see Past Resolved and Known Issues by Release.

Version 20.11.0-1877 – November 25, 2020

This release provides the following enhanced capabilities:

- The Cluster Agent can now monitor 1500 pods and 3000 containers (for 2 containers per pod) or 2250 pods and 2250 containers (for 1 container per pod). See Cluster Agent Performance Certification.
- You can configure the requests and limits of CPU and memory resources for the Cluster Agent. See the `resources` parameter at Configure the Cluster Agent.
- The `instrumentationRules` parameter is now mandatory to enable auto-instrumentation of supported applications. This ensures auto-instrumentation is enabled for the required application deployment. See Enable Auto-Instrumentation for the Supported Applications.
  If you do not specify any value for the `matchString` parameter within the `instrumentationRules`, the Cluster Agent takes into account the value specified in the `defaultInstrumentMatchString` and instruments all the deployments that satisfy the default value. See Cluster Agent Configuration for Instrumentation Rules.

Version 20.10.0 – October 23, 2020

- This release of Cluster Agent provides enhanced configuration for auto-instrumentation.
  - You can use the custom configuration for instrumenting the supported applications by using the `customAgentConfigSource` parameter within instrumentation rules. See Cluster Agent Configuration for Instrumentation Rules.
  - The `imagePullPolicy` option of the `imageInfo` parameter can now be used within the instrumentation rules. See Cluster Agent Configuration for Instrumentation Rules.
- This release supports custom SSL for instrumenting the supported applications. For Node.js you must use the custom configuration to use the custom SSL certificate. See, Supported Applications for Auto-Instrumentation.

Version 20.9.1-1675 – September 30, 2020

The AppDynamics Operator that is to be used by the Cluster Agent has been updated to version 0.6.2.

Version 20.9.0-1662 – September 25, 2020

This release of Cluster Agent provides the following enhancements:

- You can now auto-instrument the `Node.js` and the `.Net` Core on Linux applications along with the Java applications. See Enable Auto-Instrumentation of Supported Applications.
- You can now limit the number of auto-instrumentation tasks that Cluster Agent can run simultaneously. See the `numberOfTaskWorkers` property at Cluster Agent Configuration for Auto-Instrumentation. By default, Cluster Agent can perform two auto-instrumentation deployments simultaneously.

Version 20.8.0 – August 26, 2020

Cluster Agent released with minor enhancements and fixes.

Version 20.7.0 – July 23, 2020

With this release of Cluster Agent, you can:

- Use auto-instrumentation for the Java applications that are deployed using the DeploymentConfig resource. See Supported Resources for Instrumentation.
- Set tolerations on Cluster Agent pod. See tolerations in Configure the Cluster Agent YAML File.
- Deploy the Cluster Agent with Helm Charts. See Deploy the Cluster Agent with Helm Charts.
- Monitor the cluster-specific events from the **Clusters** dashboard. See the **Events** tab in Monitor Cluster Health.

Version 20.6.0 – June 26, 2020

- Cluster Agent now supports instrumenting the Java applications that are deployed as StatefulSet. This release introduces the parameter `resourcesToInstrument` to configure auto-instrumentation based on the resource that is used for deploying the Java application. See Cluster Agent Configuration for Auto-Instrumentation.
- You can now configure `runAsUser` and `runAsGroup` as instrumentation rules. This configuration takes precedence over the default configuration. See Cluster Agent Configuration for Instrumentation Rules.
- You can use the `appNameStrategy` parameter to choose the option for naming the AppDynamics Application. See Options for Naming the Appdynamics Application.

Version 20.5.0 – May 29, 2020

Cluster Agent can now enable auto-instrumentation for Java applications. See Enable Auto-Instrumentation of Java Applications.

Version 20.4 – April 28, 2020

This release includes the following enhancements:

- Support for Cluster Agent on Rancher Kubernetes Engine (RKE) 1.0.4 with Kubernetes 1.17. See Cluster Agent Requirements and Supported Environments.
- Support for Cluster Agent on Google GKE 1.14
- Support for monitoring Kubernetes stateful sets
- Changes have been made to preserve the configuration for monitored namespaces. See the `nstoMonitor` property in Configure the Cluster Agent and Use the Cluster Agent.

Version 20.3.0 – March 6, 2020

- The Cluster Agent can blocklist and allowlist pods based on regular expression and domains.
- You can configure the maximum number of Cluster Agents that can report to an account.
- You can configure the maximum number of pods that can be associated with any Cluster Agent.

Version 20.2.0

There was no release for the Cluster Agent.

Cordova Plugin

Version 20.12.0

There was no release for 20.12.

Version 20.11.0 – November 19, 2020

Cordova Plugin 20.11.0 released with minor fixes and optimizations. Cordova Plugin 20.11.0 is integrated with Android Agent 20.11.1.

Version 20.10.0 – October 16, 2020

This release includes optimizations and small code changes.

Version 20.9.0

There was no 20.9 release for the Cordova Plugin.

Version 20.8.0

There was no 20.8 release for the Cordova Plugin.

Version 20.7.0 – July 13, 2020

Cordova Agent 20.7.0 captures `hybridAgentType` and `hybridAgentVersion`.

Version 20.6.0

There was no 20.6.0 release for the Cordova Plugin.

Version 20.5.0

There was no 20.5.0 release for the Cordova Plugin.

Version 20.4.0

There was no 20.4.0 release for the Cordova Plugin.

Version 20.3.0 – March 18, 2020

The Cordova Plugin has now been tested and certified to work with the following:

- Cordova 9.0.0
- Cordova iOS 4.5.5/5.0.0
- Cordova 8.0.0
- Ionic CLI 6.1.0
- Node 12.16.1
- npm 6.13.4

Version 20.2.0

There was no 20.2.0 release for the Cordova Plugin.

Database Agent

Version 20.12.0-2183 – December 16, 2020

- Database Agent now supports mutual (client and server) authentication. See Mutual Authentication.
- You can now use the service record (SRV record) within the connection string while configuring the MongoDB collector. See **SRV Record** at Configure MongoDB Collectors.

Version 20.11.0

There was no 20.11 release for the Database Agent.

Version 20.10.0 – October 27, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.9.0 – September 16, 2020

The release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release.

Version 20.8.0

There was no 20.8 release for the Database Agent.

Version 20.7.0 – July 28, 2020

The Database Agent 20.7 and later are not compatible with Controller versions 4.5.0 and 4.5.1. Therefore, some of the features may not work when the Controller version is 4.5.0 or 4.5.1.

For the resolved issue, see Past Resolved and Known Issues by Release.

Version 20.6.0

There was no 20.6.0 release for Database Agent.

Version 20.5.0 – May 26, 2020

- You can now create multiple Database Agents as different Windows services with different names. For more information, see Start the Database Agent Automatically on Windows.
- Database Agent adds support for Windows 64-bit. See Database Visibility Supported Environments.
  From 20.5 release onwards, Database Visibility is not supported on Windows 32-bit.

Version 20.4 – April 28, 2020

This release includes the following new features:

- Support for Microsoft SQL Server 2019
- Support for Cassandra database
- Customize the sampling interval
- Capture details to integrate Database Visibility with the Application Flow Map

For the issues that are fixed in this release, seePast Resolved and Known Issues by Release.

Version 20.3.0 – March 20, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.2.0

There was no 20.2.0 release for Database Agent.

Go SDK

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no release for 20.11.

Version 20.10.0

There was no 20.10.0 release for the Go SDK.

Version 20.9.0

There was no 20.9.0 release for the Go SDK.

Version 20.8.0

There was no 20.8.0 release for the Go SDK.

Version 20.7.0

There was no 20.7.0 release for the Go SDK.

Version 20.6.0

There was no 20.5.0 release for the Go SDK.

Version 20.5.0

There was no 20.5.0 release for the Go SDK.

Version 20.4.0

There was no 20.4.0 release for the Go SDK.

Version 20.3.0

There was no 20.3.0 release for the Go SDK.

Version 20.2.0

There was no 20.2.0 release for the Go Agent.

IBM Integration Bus Agent

Version 21.1.0

There was no release for 21.1.

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no release for 20.11.

Version 20.10.0

There was no 20.10 release for the IBM Integration Bus Agent.

Version 20.9.0 – September 24, 2020

The release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release.

Version 20.8.0

There was no 20.8 release for the IBM Integration Bus Agent.

Version 20.7.0 – July 2, 2020

AppDynamics IIB Agent introduces a configurable setting for the log file size. See Install the IIB Agent.

Version 20.6.0

There was no 20.6.0 release for the IBM Integration Bus Agent.

Version 20.5.0 – May 14, 2020

- The Appdynamics IIB Agent now adds support for ACE 11 on the AIX platform. See IIB Supported Environments.
- This release also includes optimizations and small code changes.

Version 20.4.0

There was no 20.4.0 release for the IBM Integration Bus Agent.

Version 20.3.0 – March 31, 2020

The tracer's version is now compatible with calendar versioning. This release includes no new enhancements.

Version 20.2.0

There was no 20.2.0 release for the IBM Integration Bus Agent.

iOS Agent

Version 20.12.0 – December 15, 2020

You can now disable the iOS Agent to stop sending user data to the collector. See Customize the iOS Instrumentation.

Version 20.11.0

There was no release for the iOS Agent.

Version 20.10.0.2298 – October 7, 2020

iOS Agent 20.10.0 captures mobile device metrics with which you can filter performance data, such as network requests, crashes and code issues, based on device specifications, such as CPU type, memory, disk space, and battery. See Mobile RUM Metrics for details.

For information on the iOS 14 privacy guidelines, see iOS Data Collection Disclosure. For bug fixes, see Past Resolved and Known Issues by Release.

Version 20.9.0

There was no release for the iOS Agent.

Version 20.8.0 – August 20, 2020

The iOS Agent released with minor enhancements and fixes. See Past Resolved and Known Issues by Release.

Version 20.7.0.2209 – July 8, 2020

Filtered URLs are logged when the logging level is set to `verbose`.

Version 20.6.0

There was no release for the iOS Agent.

Version 20.5.0

There was no release for the iOS Agent.

Version 20.4.0

There was no release for the iOS Agent.

Version 2020.3.0-2006 – March 2, 2020

This release includes optimizations and small code changes.

Version 20.2.0

There was no release for the iOS Agent.

Java Agent

Version 20.12.0

There was no release for 20.12.

Version 20.11.0 - November 27, 2020

- Java Agent 20.11.0 adds exit support for Vertx 3.9. For more information, see Java Supported Environments.
- This release makes the *Executor* mode the default mode for handling asynchronous transactions. See Configure the Thread Correlation in Java Agent.
- This release adds a property for optimized heap mode enabling. See Optimize Heap Mode.

Version 20.10.0 – October 20, 2020

- This release adds an asynchronous entry and exit support for gRPC. For more information, see Java Supported Environments.
- This release certifies support for Java 15. For more information, see Java Supported Environments.
- This release adds exit support for the HTTP4 blaze client.

Version 20.9.0 – September 22, 2020

- This release adds the synchronous entry and exit support for gRPC. For more information, see Java Supported Environments.
- This release adds support for the following thread handoff across Reactive Extension for Java (RxJava 2): **Observable** in addition to the thread handoff **Single**.

Version 20.8.0 – August 21, 2020

This release verifies support for GraalVM using the Graal compiler as a HotSpot JIT.

Version 20.7.0 – July 31, 2020

- This release adds support for MYSQL 6.0 and 8.0. See Java Supported Environments.
- This release adds support for MongoDB drivers (synchronous, asynchronous, and reactivestreams) up to v4.x. See Java Supported Environments.
- This release verifies support for Spring 5.2. See Java Supported Environments.
- This release adds support for Spring Cloud Gateway.
- This release adds support for the following thread handoffs across Reactive Extension for Java (RxJava 2): **Maybe**, **Completable**, and **Flowable** in addition to the thread handoff **Single**.
- An additional artifact for Java Agent to include the security compliant versions of the third-party dependencies is included. An agent compatible with Java version 7 will no longer be available for Java applications running on PCF.

Version 20.6.0 – June 23, 2020

- Java Agent 20.6.0 adds support for Oracle 10, 11, 12, 18, and 19 drivers. See Java Supported Environments.
- Support for Spring WebFlux and WebClient 5.2 is added. See Java Supported Environments.
- A node property is added to prevent duplicate ADRUM headers from being injected in the HTTP response. See App Agent Node Properties (D-E).
- Java Agent 20.6.0 adds support to the service proxy feature. See Service Proxy Overview.

Version 20.5.0 – May 21, 2020

- Java Agent 20.5.0 adds support for Vertx 3.8. See Java Supported Environments.
- You can now capture the raw SQL queries for databases such as MongoDB, DynamoDB, and CassandraDB. See Call Graph Settings.

Version 20.4.0 – April 22, 2020

- Java Agent 20.4.0 adds support for netty version 4.x async exit. See Java Supported Environments.

- This release adds Java 14 certification for AdoptOpenJDK, Azul Zulu OpenJDK, Oracle, and Open Source OpenJDK. See Java Supported Environments.

Version 20.3.0 – March 20, 2020

- Java Agent version 20.3.0 adds support for netty version 4.x async entry.
- Support added for Rx Java 2 Single.
- Support added for Akka HTTP Non-Route DSL.
- Support to enable business transaction correlation using `SOAP:Header` with JBoss. To enable the correlation only for JBoss, you must create a Servlet exclude rule.

Agentless Transaction Analytics

- You can now disable agentless Transaction Analytics at the tier and node level.

Version 20.2.0

There was no release for the Java Agent.

JavaScript Agent

Version 20.12.0

There was no release for 20.12.

Version 20.11.0

There was no 20.11.0 release for the JavaScript Agent.

Version 20.10.0 – October 21, 2020

JavaScript Agent 20.10.0 released with minor optimizations, including to how Visually Complete Time (VCT) is calculated. For bug fixes, see Past Resolved and Known Issues by Release.

Version 20.9.0 – September 15, 2020

JavaScript Agent 20.9.0 was released. See Past Resolved and Known Issues by Release for more information.

Version 20.8.0 – August 5, 2020

JavaScript Agent released with bug fixes. See Past Resolved and Known Issues by Release for more information.

Version 20.7.0

There was no 20.7.0 release for the JavaScript Agent.

Version 20.6.0.3177 – June 17, 2020

Angular 9 is now supported.

Version 20.5.0.3144 – May 15, 2020

Images without extensions or dots (.) are now classified as "images" instead of "other."

Version 20.4.0.3090 – April 14, 2020

This release includes bug fixes but no new features. See Past Resolved and Known Issues by Release for details.

Version 20.3.0-3009 – March 18, 2020

The JavaScript Agent, by default, limits the number of Ajax requests reported per page. Starting with this version, you can configure the JavaScript Agent to report an unlimited number of Ajax requests per page.

Version 20.2.0-2928 – February 13, 2020

This release includes bug fixes but no new features. See Past Resolved and Known Issues by Release for details.

Java Serverless Tracer

Version 20.12.0

There was no release for 20.12.

Version 20.11.1400

The Java Serverless Tracer has added an environment variable, `APPDYNAMICS_HTTP_TIMEOUT_MS`, which allows you to set the timeout in milliseconds for all the HTTP calls made by the tracer. See Past Resolved and Known Issues by Release for details.

Version 20.10.0

There was no 20.10 release for the Java Serverless Tracer.

Version 20.9.0

There was no 20.9 release for the Java Serverless Tracer.

Version 20.8.0

There was no 20.8 release for the Java Serverless Tracer.

Version 20.7.0

There was no release for 20.7.

Version 20.6.0

There was no release for the Java Serverless Tracer Agent.

Version 20.5.0

There was no release for the Java Serverless Tracer Agent.

Version 20.4.0

There was no release for the Java Serverless Tracer Agent.

Version 20.3.1391 – March 17, 2020

The tracer's version is now compatible with calendar versioning. This release includes no new enhancements or resolved issues.

Version 20.2.0

There was no release for the Java Serverless Tracer Agent.

Machine Agent

Version 20.12.0-3016 - December 16, 2020

This release provides the following enhancements:

- The Machine Agent now prepends the hostname in the log files.
- The Machine Agent has been updated, tested, and certified to work with the following:
    - `com.fasterxml.jackson.core:jackson-databind:2.12.0`
    - `com.google.guava:guava:30.0-jre`
    - `commons-io:commons-io:2.8.0`
    - `junit:junit:4.13.1`
    - `org.apache.ant:ant:1.10.9`
    - `org.apache.httpcomponents:httpclient:4.5.13`
    - `org.bouncycastle: bcprov-jdk15on:1.67`
    - `org.eclipse.jetty:jetty-server:9.4.35.v20201120`
    - `org.eclipse.jetty:jetty-webapp:9.4.35.v20201120`
    - `org.exist-db.thirdparty.xerces:xercesImpl:2.12.1`
    - `org.hibernate: hibernate-validator:6.1.6.Final`

Version 20.11.1-3044 - January 26, 2021

This release provides the following enhancements:

- The Machine Agent has been updated, tested, and certified to work with the following:
    - `com.fasterxml.jackson.core:jackson-databind:2.12.0`
    - `com.google.guava:guava:30.0-jre`
    - `commons-io:commons-io:2.8.0`
    - `junit:junit:4.13.1`
    - `org.apache.ant:ant:1.10.9`
    - `org.apache.httpcomponents:httpclient:4.5.13`
    - `org.bouncycastle: bcprov-jdk15on:1.67`

- `org.eclipse.jetty:jetty-server:9.4.35.v20201120`
- `org.eclipse.jetty:jetty-webapp:9.4.35.v20201120`
- `org.exist-db.thirdparty.xerces:xercesImpl:2.12.1`
- `org.hibernate: hibernate-validator:6.1.6.Final`

Version 20.11.0.2915 - November 19, 2020

The Machine Agent Azul Zulu JRE version has been updated to 8.50 (maps to OpenJDK version 8u272). Machine Agent OSHI library upgraded to version 5.3.5.

Version 20.10.0-2813 - October 22, 2020

This release includes optimizations and small code changes. For bug fixes, see Past Resolved and Known Issues by Release.

Version 20.9.0 – September 21, 2020

Machine Agent 20.9.0-2763 was released. Machine Agent OSHI library upgraded to version 5.2.5. See Past Resolved and Known Issues by Release.

Version 20.8.0.2713 – August 20, 2020

Machine Agent released with bug fixes. See Past Resolved and Known Issues by Release for more information.

Version 20.7.0-2694 – July 23, 2020

When using Docker Visibility, if the unique host ID setting is not configured to use container ID in host network mode, the Machine Agent now automatically registers the container using the container ID as the host ID. See Using Docker Visibility with Kubernetes.

Version 20.6.0-2676 – June 25, 2020

The Machine Agent now has the ability to identify container processes by container names only. See Configuring Docker Visibility.

Version 20.5.1-2635 – May 29, 2020

The Machine Agent has been updated, tested, and certified to work with the following:

- `ant v1.10.8`
- `commons-fileupload v1.4.0`
- `hibernate-validator v6.1.5`
- `snakeyaml v1.26`

Version 20.5.0-2617 – May 20, 2020

Azul JRE 8.0.252 is replacing Oracle JRE as a component included in the Machine Agent. See Machine Agent Requirements and Supported Environments.

Version 20.4.0-2571 – April 27, 2020

The Machine Agent has been updated, tested, and certified to work with the following:

- `ch.qos.logback:logback-core:1.2.3`
- `commons-codec:commons-codec:1.14`
- `commons-io:commons-io:2.6`
- `commons-net:commons-net:3.6`
- `dropwizard-jetty 2.0.7`
- `log4j-api:2.13.1`
- `log4j-core:2.13.1`
- `org.antlr:antlr4-runtime:4.8-1`
- `org.apache.httpcomponents:httpclient:4.5.12`
- `org.bouncycastle:bcprov-jdk15on:1.62`
- `org.hibernate:hibernate-validator:6.1.2.Final`
- `org.javassist:javassist:3.21.0-GA`
- `org.jboss.logging:jboss-logging:3.4.1.Final`

Version 20.3.2 – March 27, 2020

The Machine Agent has been updated, tested and certified to work with the following:

- okhttp 3.12.6
- log4j-api 2.13.1
- log4j-core 2.13.1
- log4j-slf4j-impl 2.13.1

log4j_log4j 1.2.17 has been removed.

Version 20.3.1-2476 – March 16, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.0-2468 – March 9, 2020

This release includes optimizations and small code changes.

Version 20.2.0

There was no 20.2.0 release for the Machine Agent.

.NET Agent

Version 20.12.0 – December 18, 2020

There are no enhancements in this release. For the resolved issue, see Past Resolved and Known Issues by Release.

Version 20.11.0 - November 20, 2020

.NET Agent now supports the .NET 5.0 environment.

Version 20.10.0 - October 28, 2020

.NET Agent includes these enhancements:

- .NET Agent supports Agentless Analytics on Windows. See Agentless Analytics Overview.
- .NET Agent is now supported on Windows Server 2019.
- The ASP.NET business transactions configuration feature has been removed as a preview feature in the Linux Agent. You now have the ability to perform custom backend naming for HTTP backends in the Linux Agent in your production environment.

For bug fixes, see Past Resolved and Known Issues by Release.

Version 20.9.0 – September 24, 2020

Azure Cosmos DB

The .NET Linux Agent now supports the Azure Cosmos DB through the SQL API. Both of these Azure versions are supported:

- Microsoft.Azure.DocumentDB.Core (2.x)
- Microsoft.Azure.Cosmos (3.x)

Note the following:

- The backend naming of the Azure Cosmos DB is detected as `{host}.{port}`.
- The backend properties of the `exit` type shows Database Account with `host` and `port`.
- The Snapshot properties of "Query through LINQ" call does not contain the SQL Query Statement.
- The `ConnectionString` of the Azure Cosmos DB is not shown in any of the Snapshot properties, nor in the backend properties.
- The following is *not supported*:
    - Instrumentation of `BulkExecution`
    - Sensitive data filters on Query

See Past Resolved and Known Issues by Release for details.

Version 20.8.0 – August 24, 2020

The.NET Agent now supports the transport layer security (TLS) 1.2 and proxy-related environment variables for the Micro Services Agent on Windows. See Configure the Agent Using Environment Variables for details.

Version 20.7.0 - July 23, 2020

The .NET Agent for Linux now:

- Partially supports the detection of WCF exit calls on .NET Core 3.1 and later. See .NET Backend Detection for more details.
- Supports setting `APPDYNAMICS_AGENT_UNIQUE_HOST_ID` as an environment variable.

This release also includes bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.6.1 - July 17, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.6.0 - July 1, 2020

- The .NET Agent for Windows now correlates business transactions with End User Monitoring by default.

- Improvements have been added to instrumentation in full-no-dependency mode. You can now instrument non-NGen assemblies when MSCorlib is loaded as NGen.
- Internal library upgrades and code improvements added to the .NET Agent for Linux.
- Improvements added to the .NET Agent to detect RabbitMQ Async entry points.

This release also includes bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.5.0 – May 20, 2020

- Sensitive information for MongoDB query expressions is now filtered out by default. You can enable raw query collections for MongoDB in Call Graph Settings.
- RabbitMQ backend detection is now compatible with RabbitMQ Client version 6. See RabbitMT Backends for .NET for more details.

Version 20.4.1 (.NET Agent for Windows) - April 29, 2020

Due to a signing issue, the 20.4.0 version of the .NET Agent for Windows has been replaced with 20.4.1. It has no feature difference with 20.4.0.

Version 20.4.0 - April 28, 2020

This release includes log improvements in the Linux profiler and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.1 - April 7, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.0 - March 26, 2020

This release contains the .NET Agent for Linux only. The .NET Agent for Linux now supports .NET Core 3.1.

Version 20.3.0 – March 25, 2020

This release contains the .NET Agent for Windows only.

The .NET Agent MSI installer for Windows now includes support for .NET Core applications, enabling unified management of .Net Core and full framework applications on Windows. The agent monitors .NET Core applications for IIS out of the box, if automatic IIS mode is configured.

- The MSI Installer bundles .NET Core agent with the existing .NET framework agent and creates appropriate environment variables.
- Supported environments are identical to the previous .NET Agent.
- .NET Core versions 2.0 and later are supported.
- IIS-hosted .NET Core applications are monitored similar to the .NET frameworks configured in automatic mode.
- You can configure .NET Core applications in the `config.xml` file, just as you would configure .NET framework applications.

You have to manually configure .NET Core applications in the `config.xml` file in either of the following scenarios:

- You monitor ASP .NET core applications that are not hosted in process, but are hosted in `dotnet.exe`
- You currently monitor standalone applications

The .NET Agent for Windows supports Azure Functions 3.x and the following:

- Supports Netviz entry calls for non-IIS applications.
- Filters sensitive data in environment variables.
- Reports CoreCLR runtime to the Controller.
- Includes WCF entry points with the agent's network visibility support, if the WCF service is operating in ASP.NET compatibility mode. If the WCF service is not using ASP.NET compatibility mode, or if the service receives requests that do not use this mode, the agent logs a warning that network visibility is currently not supported for this setup.

Version 20.2.0

There was no 20.2.0 release for the .NET Agent.

Network Agent

Version 20.12.0

There was no 20.12.0 release for the Network Agent.

Version 20.11.0

There was no 20.11.0 release for the Network Agent.

Version 20.10.0

There was no 20.10.0 release for the Network Agent.

Version 20.9.0

There was no 20.9.0 release for the Network Agent.

Version 20.8.0.2169 – August 26, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.7.0

There was no 20.7.0 release for the Network Agent.

Version 20.6.0 – June 25, 2020

This release includes optimizations and small code changes.

Version 20.5.0 – May 21, 2020

This release includes optimizations and small code changes.

Version 20.4.0

There was no 20.4.0 release for the Network Agent.

Version 20.3.0-2139 – March 9, 2020

This release includes optimizations and small code changes.

Version 20.2.0

There was no 20.2.0 release for the Network Agent.

Node.js Agent

Version 20.12.0 – December 8, 2020

- You can attach existing Analytics data generated for any given transaction to an exit call. For more information, see Node.js Agent API Reference.
- Docker init container images are now available on Dockerhub for Linux and Alpine environments. For all other environments, see Build the Node.js Agent Init Container Image.

Version 20.11.0

There was no 20.11.0 release for the Node.js Agent.

Version 20.10.1 – October 16, 2020

This release includes optimizations and small code changes.

Version 20.10.0 – October 15, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.9.0

There was no 20.9.0 release for the Node.js Agent.

Version 20.8.0-2169 – August 27, 2020

You can now separate Business Transactions into multiple queries with GraphQL. For more information, see Custom Match Rules.

Version 20.7.0 – July 29, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.6.0 – June 12, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.5.0 – May 29, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.0 – April 29, 2020

This release includes optimizations and small code changes.

Version 20.3.1 – March 27, 2020

This release includes optimizations and small code changes.

Version 20.3.0 – March 26, 2020

This release includes optimizations and small code changes.

Version 20.2.0

There was no release for the Node.js Agent.

Node.js Serverless Tracer

Version 20.12.0

There was no 20.12.0 release for the Node.js Serverless Tracer.

Version 20.11.242

The Node.js Serverless Tracer has added an environment variable, `APPDYNAMICS_HTTP_TIMEOUT_MS`, which allows you to set the timeout in milliseconds for all the HTTP calls made by the tracer. See Past Resolved and Known Issues by Release for details.

Version 20.10.0

There was no 20.10.0 release for the Node.js Serverless Tracer.

Version 20.9.221 – September, 2020

This release includes minor enhancements and bug fixes.

Version 20.8.0

There was no 20.8.0 release for the Node.js Serverless Tracer.

Version 20.7.0

There was no 20.7.0 release for the Node.js Serverless Tracer.

Version 20.6.0

There was no 20.6.0 release for the Node.js Serverless Tracer.

Version 20.5.0

There was no 20.5.0 release for the Node.js Serverless Tracer.

Version 20.4.0

There was no 20.4.0 release for the Node.js Serverless Tracer.

Version 20.3.178 – March 16, 2020

The tracer's version is now compatible with calendar versioning. This release includes no new enhancements or resolved issues.

Version 20.2.0

There was no 20.2.0 release for the Node.js Serverless Tracer.

PHP Agent

Version 20.12.0 – December 16, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.11.0 - November 24, 2020

This release supports the Node Reuse feature. For more information, see Node Reuse for PHP Agent.

Version 20.10.0 – October 22, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.9.0 – September 15, 2020

The release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release.

Version 20.8.0.4083 – August 26, 2020

PHP Agent released with bug fixes. See Past Resolved and Known Issues by Release.

Version 20.7.0 – July 16, 2020

The PHP Agent 20.7.0 release enhances the General Data Protection Regulation (GDPR) compliance for data filtering.

This helps you to redact any sensitive data (URLs, Exit calls, or cookies), which is shown in the Controller. For more information, see Redaction of URL Segments and Query Parameters.

Version 20.6.0 – June 23, 2020

The PHP Agent 20.6.0 release implements the General Data Protection Regulation (GDPR) compliance for data filtering.

This helps you to redact any sensitive data (URLs, Exit calls, or cookies), which is shown in the Controller. For more information, see Redaction of URL Segments and Query Parameters.

Version 20.5.0 – May 29, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.0.3759 – April 29, 2020

This release adds support to CakePHP 4.0 and Magento 2.3 for the PHP Agent. See PHP Supported Environments.

Version 20.3.1 – March 26, 2020

This release supports PHP Agent for CentOS version 8 and adds support to the following frameworks:

- FuelPHP 1.8.1
- Zend 3
- Laravel 6
- CodeIgnitor4

Version 20.3.0 – March 3, 2020

- PHP 7.4 support is added to the AppDynamics PHP Agent. See PHP Supported Environments.
- The PHP Agent now supports Symfony versions 3 and 4. See PHP Supported Environments.

Version 20.2.0

There was no 20.2.0 release for the PHP Agent.

Python Agent

Version 20.12.0 – December 18, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.11.411

The Python Serverless Tracer has added an environment variable, `APPDYNAMICS_HTTP_TIMEOUT_MS`, which allows you to set the timeout in milliseconds for all the HTTP calls made by the tracer. See Past Resolved and Known Issues by Release for details.

Version 20.11.0 - November 25, 2020

The Python Agent has released with minor fixes and optimizations. See Past Resolved and Known Issues by Release.

Version 20.10.0 - October 21, 2020

- This release supports Node Reuse feature.
- This release supports Tornado 6 for Python Agent 3.7 and later versions.

For bug fixes, see Past Resolved and Known Issues by Release.

Version 20.9.0

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.8.0

There was no 20.8 release for the Python Agent.

Version 20.8.0

There was no 20.8 release for the Python Agent.

Version 20.7.0.2292 – July 7, 2020

Python Agent artifacts can now be downloaded from the AppDynamics Downloads Portal. For more information, see Install the Python Agent.

Deprecation Notice

Support for Mac OS X has been removed for Python Agent.

Version 20.6.0

There was no 20.6.0 release for the Python Agent.

Version 20.5.0

There was no 20.5.0 release for the Python Agent.

Version 20.4.0

There was no 20.4.0 release for the Python Agent.

Version 20.3.0

There was no 20.3.0 release for the Python Agent.

Version 20.2.0

There was no 20.2.0 release for the Python Agent.

Python Serverless Tracer

Version 20.12.0

There was no 20.12.0 release.

Version 20.11.411

The Python Serverless Tracer has added an environment variable, `APPDYNAMICS_HTTP_TIMEOUT_MS`, which allows you to set the timeout in milliseconds for all the HTTP calls made by the tracer. See Past Resolved and Known Issues by Release for details.

Version 20.10.0

There was no 20.10.0 release for the Python Serverless Tracer.

Version 20.9.0

There was no 20.9.0 release for the Python Serverless Tracer.

Version 20.8.0

There was no 20.8.0 release for the Python Serverless Tracer.

Version 20.7.383 - July 29, 2020

The Python Serverless Tracer is now generally available to monitor AWS Lambda functions written in Python. The tracer is available on the PyPi repository. See Python Serverless Tracer to get started.

React Native Agent

Version 20.12.0

There was no 20.12.0 release.

Version 20.11.0 - November 20, 2020

The React Native Agent has released with minor fixes and optimizations.

Version 20.10.0 – October 16, 2020

This release includes minor enhancements and bug fixes. React Native 0.60 is now supported.

Version 20.9.0

There was no 20.9.0 release for the React Native Agent.

Version 20.8.0

There was no 20.8.0 release for the React Native Agent.

Version 20.7.0 – July 8, 2020

React Native Agent 20.7.0 captures `hybridAgentType` and `hybridAgentVersion`.

Version 20.6.0

There was no 20.6.0 release for the React Native Agent.

Version 20.5.0

There was no 20.5.0 release for the React Native Agent.

Version 20.4.0

There was no 20.4.0 release for the React Native Agent.

Version 20.3.0

There was no 20.3.0 release for the React Native Agent.

Version 20.2.0

There was no 20.2.0 release for the React Native Agent.

SAP

Version 20.12.0

There was no 20.12.0 release.

Version 20.11.0 - November 23, 2020

SAP Agent has released. See Release Notes Version 20.11.0.

Version 20.10.0

There was no 20.10.0 release for SAP.

Version 20.9.0

There was no 20.9.0 release for SAP.

Version 20.8.0

SAP 20.8.0 is released. See Release Notes Version 20.8.0.

Version 20.7.0

SAP 20.7.0 is released. See Release Notes Version 20.7.0.

Version 20.6.0

There was no 20.6.0 release for SAP.

Version 20.5.0

SAP 20.5.0 is released. See Release Notes Version 20.5.0.

Version 20.4.0

There was no 20.4.0 release for SAP

Version 20.3.0

There was no 20.3.0 release for SAP.

Version 20.2.0

There was no 20.2.0 release SAP.

Synthetic Agent (Hosted Agents)

Version 20.6.0 - June 25, 2020

Synthetic monitoring: ‘os’, ‘socket’, and, ‘subprocess’ modules will not be allowed for any new job. See Import Python Packages in Synthetic Scripts for details.

Xamarin Agent

Version 20.12.0

There was no 20.12.0 release.

Version 20.11.0 - November 10, 2020

The Xamarin Agent has released with minor fixes and optimizations.

Version 20.10.0

There was no 20.10.0 release for the Xamarin Agent.

Version 20.9.0

There was no 20.9.0 release for the Xamarin Agent.

Version 20.8.0

There was no 20.8.0 release for the Xamarin Agent.

Version 20.7.0

There was no 20.7.0 release for the Xamarin Agent.

Version 20.6.0

There was no release for the Xamarin Agent.

Version 20.5.0

There was no release for the Xamarin Agent.

Version 2020.4.0 – April 6, 2020

You can set the boolean property `EnableAggregateExceptionHandling` to `true` to configure the Xamarin Agent to report aggregate exceptions as crashes. When the property is set to `false`, only unhandled exceptions are reported. The default value is `false`.

Version 2020.3.3 – March 16, 2020

This release includes optimizations and small code changes.

Version 2020.3.2 – March 13, 2020

By default, the Xamarin Agent reports exceptions as crashes. You can now set a configuration to disable the reporting of crashes as exceptions.

Version 2020.3.1 – March 10, 2020

This release includes optimizations and small code changes.

Version 2020.2.0

There was no 20.2.0 release for the Xamarin Agent.

Past Controller Releases

The Controller releases occur every six weeks. This page lists the past SaaS and on-premises Controller enhancements since 20.2.

21.5 Release

License Management

For infrastructure-based licenses in Controller 21.5.0:

- The license summary drill-down dashboard allows you to filter usage data by time and view a list of agents connected to a license rule.
- When looking at license usage and license rules, you can view and sort applications with analytics enabled.

Database Visibility

The Controller audit report can fetch the audit log for the Remove literal flag. See Controller Audit Log and Configure Query Literals Security.

The user interface is updated. You can:

- Return to **Queries** page from the **Query Details** page. See Database Query Details Window.
- Check the number of database nodes for each collector on the **Databases** page. The number of nodes is included in both card and list view. See View Overall Database and Server Performance.
- Navigate between different nodes of the cluster on the database **Dashboard**. See Database Dashboard.

21.4 Release

Account Management Enhancements

AppDynamics has enhanced user management and security for customers choosing to use AppDynamics to authenticate their users.

Enhanced Security

- You can now have a single user identity for all your SaaS Tenants and across your entire SaaS environment.
- You can have a single identity extended to the Account Management Portal.
- All first user accounts authorize using a validated email.
- Administrators can no longer create or update user passwords. Users now create and update their own passwords using an updated password security policy.

Enhanced User Management

Administrators can now:

- Use a single interface to centrally manage all their users regardless if they have rights on the Tenants themselves.
- Delete users that have an inactive status.
- View Tenants and licenses associated with users.

Experience Journey Map

- (SaaS only) You can create custom views to filter the Experience Journey Map by specified user journeys. See Create a Custom View.
- You can filter the Experience Journey Map by custom user data. See Using the Custom User Data Filter.

Database Visibility Enhancement

- You can now monitor the MS SQL cluster instances. See Configure Microsoft SQL Server Collectors.
- You can now use the Kerberos authentication for the DB2 and Oracle Collector. See Configure IBM DB2 Collectors and Configure Oracle Collectors.

License Management

- When viewing license usage, you can customize the time range on the **License Summary** dashboard.

ThousandEyes Integration with AppDynamics

AppDynamics and ThousandEyes integration delivers a full-stack solution, which enables you to identify network-related performance issues to reduce the impact on critical applications. See ThousandEyes Integration with AppDynamics.

21.3 Release

Dash Studio (21.3.1)

Simple Navigations

You can now navigate from one dashboard to the other using **Single Click Action** option. See Dash Studio Widgets.

Dash Studio (21.3.0)

You can now set performance baselines in a Time Series widget by adding a **Threshold** value. See Dash Studio Widgets.

Cisco Secure Application

AppDynamics introduces Cisco Secure Application to monitor the security of APM-managed applications. The data from the managed application is scanned for any security issues and displayed in a real-time dashboard. Secure Application is bundled within the Java Agent and is available from the 21.3.0 release onwards with the purchase of an additional SKU.

21.2 Release

Agent Installer

- Machine Agent is supported in `non-sudo` installations.
- Agent Installer supports the Infrastructure Agent.
- A new `watchdog` process is included with the Agent Installer Platform installation to monitor and ensure that agents are running properly.
- When installing the Agent Installer Platform with `systemd`, a profile is created for the `watchdog` process instead of for individual agents.
- `bash` profiles for `non-sudo` installations are no longer created.

Analytics

- You can add alternative milestone events of the same event type.
- You can configure agent-side metrics in the Metric Browser. For more information, see Troubleshoot Analytics Issues.

Cloud Native Visualization

- Cloud Native Visualization introduces options to monitor the health and performance of entities. You can create and configure health rules to monitor the health of the entities. You can use anomaly detection to automatically detect anomalies with entities. This helps initiate remediation actions quickly. See Configure Entity Health
- You can now monitor the metrics of AWS instances with both basic (5 minute granularity) and detailed (1 minute granularity) monitoring. See Cloud Native Visualization Metrics Overview

Database Monitoring

- The top query statistics report for Oracle database now displays only the following statistic type data:
  - Buffer Gets
  - Cpu Time
  - Disk Reads
  - Elapsed Time
  - Executions
  - Parse Calls
  - Rows Processed

  See Database Activity Window
- You can use the **SRV Record** option for MongoDB. See Configure MongoDB Collectors
- Additional Couchbase metrics are added for the database monitoring. See **Couchbase Metrics** at Database Monitoring Metrics

End User Monitoring

Experience Journey Map

- You can customize how you analyze user journeys.
- You can customize naming of mobile views/activities with the `SessionFrame` API.
- You can filter by Internet Service Provider (ISP) for browser apps.

License Management

Controller 21.2.0 includes a new UI for managing infrastructure-based licenses.

Dash Studio (21.2.0)

Gauge Widget

You can now present metric data on a relative scale using the Gauge widget. See Dash Studio Widgets.

Time Range Comparison

This feature is now available for Metric Number widget. See Time Range Comparisons.

21.1 Release

Dash Studio (21.1.0)

Grouped Widgets

You can now group two or more widgets on a single card or on their respective cards. See Dash Studio Widgets.

Label Widget

You can now apply these properties to modify the appearance of the Label widget:

- Font Color
- Font Size
- Horizontal Alignment
- Vertical Alignment

See Dash Studio Widgets.

20.12 Release

Dash Studio (uic-20.12.1)

Auto Refresh Interval

You can now enable the **Auto Refresh Interval** option to automatically refresh the dashboard at regular intervals. For more information, see Visual Dashboard Editor.

Group Time Range

You can now set the time range for a set of grouped widgets. For more information, see Dash Studio Widgets.

Cloud Native Visualization (uic-20.12.0)

You can now monitor the health status of entities in Cloud Native Visualization. Entities in the Relationships map, Interactions map, and the List view are grouped into healthy and unhealthy categories based on their health status. To initiate remediation actions quickly, you can click the unhealthy entity to drill down and determine the affected business transactions, services, and service instances to resolve any critical issues. For more information, see Monitor the Health of Entities.

20.11 Release

Agent Installer

Monitoring Settings

- The content of the Monitoring Settings page has been reorganized into three tabs: **Managed Processes**, **Unmanaged Processes**, and **Uninstrumented Processes**.
- The ability to paginate has been added to the Monitoring Settings page eliminating the previous 1000 record limitation.

End User Monitoring

Mobile Real User Monitoring

You can filter performance data, such as network requests, crashes and code issues, based on device specifications, such as CPU type, memory, disk space, and battery. See Mobile RUM Metrics for details.

Dash Studio

Mobile Applications Metrics

Mobile Applications metrics in the **Data** panel of the Dash Studio allows you to filter and create customized metrics to view the performance of mobile applications. See Data Binding.

Browser Applications Metrics

Browser Applications metrics in the **Data** panel of the Dash Studio allows you to filter and create customized metrics to view the performance of the web applications. See Data Binding.

Simple Navigations

Simple navigation actions in Dash Studio allow you to drill down into complex and detailed information about a selected entity. See Dash Studio Widgets.

Database Visibility

You can now integrate Database Visibility with Server Visibility. See Integrate Database Visibility with Server Visibility.

There are new Oracle Server metrics available with this Controller release. See Database Monitoring Metrics.

Service Endpoints

The Service Endpoints page includes these enhancements:

- A new grid display is available that includes a total count of entries at the bottom right of the grid. This information was previously located below the Search text box.
- The top toolbar on the page includes buttons for: **Details**,  (Delete), **Exclude**, **View Excluded**, **Configure**, and **Filter** (replacing the previous Actions sub-menu that included these buttons).
- When you select the Filter icon, the **Filter** menu panel is overlaid on top of the grid on the left side of the page and includes additional filter options.

20.10 Release

Agent Installer

Improvements to the **Agent Installer** page have been implemented to improve the customer experience:

- Overall installation process has been streamlined to reduce manual input
- Two installation options are available:
  - **Express** - for new installations
  - **Custom** - provides options you can customize

APM Platform

The Automated Transaction Diagnostics (ATD) capability is now available for SaaS. This feature exposes periods of anomalous behavior in your business transactions and pinpoints the causal factor to facilitate a more efficient root cause analysis process.

Using the already collected transaction snapshots, the diagnostic process:

- Analyzes business transaction response time data to determine if there was an issue and the time period impacted.
- Analyzes metrics data across the business transaction path to identify the suspected cause and type of issue.
- Provides a guided root cause analysis that diagnoses the business transaction anomaly allowing you to manage the issue before it becomes visible to customers.

Cloud Native Visualization

AppDynamics new Cloud Native Visualization services are generally available today. Cloud Native Visualization provides new streamlined views of your application landscape enabling you to make informed decisions. By correlating application metrics and interactions to cloud infrastructure, Cloud Native Visualization enables you to explore deployments, and examine the cloud infrastructure impact on application performance.

> As part of the launch program, early adopters have access to the Cloud Native Visualization functionality for six months free of charge. After six months, a purchase of new licenses is required to continue using the functionality. AppDynamics reserves the right to charge separately for Cloud Native Visualization after the end of the six month period.

Cloud Native Visualization is available for versions:

- SaaS Controller >= 20.10.0
- Java Agent >= 20.9.0
- .NET Agent >= 20.10.0
- Node.js Agent >= 20.10.0

Note: Java Agent, .NET Agent, and Node.js Agent are required for Amazon EC2 to APM node correlation.

Cloud Native Visualization requires:

- Applications to be deployed in Amazon Web Services (AWS).

- Configuration changes in the AppDynamics SaaS platform to be performed by AppDynamics.

> Controller configuration is being rolled out gradually to SaaS customers beginning on October 28, 2020.

Cloud Native Visualization Benefits:

- Correlates APM data fully with cloud platform data to help you make informed decisions.
- Ingests cloud platform metrics and metadata automatically using the AIOps platform, thereby introducing new holistic views of your cloud application landscape.
- Displays application services (formerly known as tiers), and related infrastructure entities such as load balancers, databases, and business transactions, in a single unified view.

Cloud Native Visualization provides full-stack correlation with these AWS services:

- Amazon Elastic Compute Cloud (EC2)
- Amazon Elastic Block Store (EBS)
- Amazon Relational Database Service (RDS)
- Amazon Aurora
- Amazon Elastic Load Balancers (ELB) including NLBs, ALBs and CLBs
- Virtual Private Cloud (VPC) metadata

End User Monitoring

- Experience Journey Map can be filtered in the Controller UI by fields such as device, OS, and location.
- Automatic business transaction correlation for .Net Agent 20.6.0 and higher is enabled by default. You can also manually enable and disable business transaction correlation with older APM agents or applications with frameworks other than .Net and Java. See Correlate Business Transactions for EUM Monitoring for more information.

Browser Real User Monitoring

- When configuring the JavaScript Agent in the Controller, you can set a custom page title to an arbitrary string. See Configure the JavaScript Agent .

Mobile Real User Monitoring

- You can filter performance data, such as network requests, crashes and code issues, based on device specifications, such as CPU type, memory, disk space, and battery. See Mobile RUM Metrics for details.

20.9 Release

There was no 20.9.0 Controller release.

20.8 Release

Alert and Respond

Action Suppression

You can now suppress a policy's automatic invocation of actions and alerts on a recurring basis. For example, if you have scheduled maintenance every month and would not like to be notified of any event violations or trigger any actions for these events during the maintenance period, you can schedule to suppress the alerts and actions. For more information, see Configure and Manage Action Suppressions. For corresponding API updates, see Action Suppression API.

HTTP/HTTPS Proxy for On-premise Controller

You can now configure an HTTP/HTTPS proxy for an on-premise Controller. When you configure a proxy, the HTTP request actions or JIRA actions are routed through the HTTP proxy if the endpoint is an HTTP endpoint or HTTPS proxy if the endpoint is an HTTPS endpoint. You can configure the HTTP /HTTPS proxy settings in the `domain.xml` global configuration file. For more information, see Configure HTTP/HTTPS Proxy.

> You can configure an HTTP/HTTPS proxy for an on-premise Controller only.

Database Monitoring

- You can now view the Database Agent telemetry on the **Metric Browser** window. See Database Agent Telemetry for details.
- For Oracle database, you can view the procedure for queries and view the container where the query is running. Also, you can view the CPU and Memory metrics without enabling hardware monitoring. For more information about containers and procedures, see Database Containers Window and Database Procedures Window respectively.
  To view these you must be using Database Agent 20.6 or later.

- You can view the Database Agent related logs for debugging and resolving issues. For more information about the agent logs, see View Database Agent Properties and Logs.

Cluster Monitoring

You can now use filters to view the required event details from the list of cluster events. See Monitor Kubernetes Events.

End User Monitoring

- You can customize Experience Journey Map by toggling performance markers on or off, and by setting values for performance thresholds and drop-off rates. See Configure Experience Journey Map for details.
- You can filter mobile crashes based on the following agent version fields: agent version, hybrid agent version, and hybrid agent type.
- All Synthetic Agent IBM SoftLayer locations have been migrated to Azure and AWS. Agents in Dallas, Texas, Houston, TX, and Quéretaro, Mexico are no longer available and have been replaced with San Antonio, TX with Azure. See Synthetic Agent Locations for details.
- Browser Synthetic Monitoring has transitioned all hosted Synthetic Agent IBM locations to Azure and AWS. See Synthetic Agent Locations for an up-to-date list of agent locations and providers.

Transaction Detection for Node.js Applications

GraphQL Business Transactions, a feature that enables transaction detection on the Node.js Agent, is now available. You can define a custom match rule that separates a business transaction into several GraphQL queries with GraphQL Business Transactions. See Node.js Business Transaction Detection.

20.7 Release

Alert and Respond

Alerting Template

You can now export a configured alerting template and save it for later use. You can import a saved template and apply it to applications. For more information, see Configure and Manage Alerting Templates.

Alert Sensitivity Tuning

You can now define a metric expression to evaluate a health rule condition and use Alert Sensitivity Tuning to fine-tune the configuration. For more information, see Create a Health Rule and Fine-tune Metric Evaluation.

Application Analytics

The End User Monitoring (EUM) filter has been added to the Analytics Home page with options to display browser and mobile sessions. See Overview of Application Analytics.

End User Monitoring

- Experience Journey Map is supported for on-prem Controller 20.7.0 and later and requires a EUM PEAK license.
- You can now custom configure the JavaScript Agent in the Controller UI. This UI-based configuration is only available for SaaS Controller 20.7.0 and later. See Configure the JavaScript Agent.

20.6 Release

Agent Installer

The Agent Installer requires microservices configuration performed by AppDynamics. The configurations will be rolled out gradually to SaaS Controllers beginning on June 8, 2020.

The Agent Installer is now available. The Agent Installer simplifies the installation process for the Java and Machine Agents. The installer provides two lines of script that:

- deploy the Java and (optionally) Machine Agents,
- automatically instrument applications, and
- assign unique names to tiers and nodes

The Agent Installer is available for SaaS deployments and Linux operating systems. See Agent Installer documentation for more information.

Analytics Events Service (SaaS only)

The `eventcompletionTimestamp` field has been introduced for ADQL queries. `eventcompletionTimestamp` indicates the time that the event was received by the Events Services. See Analytics Events API for details.

The metric processor will be rolled out gradually to SaaS Controllers. Contact AppDynamics Support for more information.

Application Analytics

Recommended Data Collectors, a feature that simplifies data collector configuration, is now available for SaaS deployments. Instead of manually configuring data collectors, you can browse and search for event data displayed in the Controller that Recommended Data Collectors automatically collects from the Java Agent.

Cluster Monitoring

The **Cluster Event** summary dialog is enhanced with the following additional details:

- The **Affects** and the **Cluster Agent Version** fields are added to provide information about the affected entity and the version of the Cluster Agent respectively.
- The **Cluster Name** field displays the name of the cluster along with an option to drill down. Therefore, you can launch the Cluster Agent dashboard by clicking the name.

End User Monitoring

Experience Journey Map visualizes real-time user journeys, providing performance metrics and traffic data for browser and mobile applications. This feature is only available for customers with a SaaS Controller and EUM PEAK license.

Service Proxy

A new service proxy feature (represented by this icon ) has been added to enable the system to discover the backend (remote service) as a service proxy, and display the correct component structure in a flow map. The service proxy feature is enabled in the Controller. Once the Controller has identified the backend as a service proxy, it sends the configuration information to an Agent (Java Agent version 20.5.0 and later, is the only Agent supported with this release).

20.5 Release

The Controller release occurs every six weeks. There was no Controller release for 20.5. For bug fixes, see Past Resolved and Unknown Issues by Release.

20.4 Release

Alert and Respond

Alerting Template

AppDynamics 20.4 introduces 'Alerting Template' that allows you to efficiently maintain and manage alerting configuration at scale. An Alerting Template is a configuration of features like Health Rules, Policies, Actions, Action Suppression, Schedules, and Email digests. Templates eliminate the need to configure or update individual applications. You can easily update a template and ensure that updates are consistently applied across multiple applications. For more information, see:

- Alert and Respond
- Alerting Templates
- Configure Alerting Templates
- Alerting Template Questions and Answers

Action Suppression and Email Digest APIs

AppDynamics introduces REST APIs to perform CRUD operations for action suppression and policy email digest. For more details, see:

- Action Suppression API
- Email Digest API

Alert Sensitivity Tuning

AppDynamics introduces 'Alert Sensitivity Tuning (AST) that helps you visualize the impact of the alerting configuration you define. AST provides historical data for the metric or the baseline being configured. Instant insights are provided in a graphical format when you configure the alerts. Based on this data, you can set up alerts with the appropriate sensitivity and avoid false alerts. For more information, see:

- Alert Sensitivity Tuning
- Create a Health Rule and Fine-tune Metric Evaluation
- AST Questions and Answers

Database Monitoring

- The controller provides the following visual context for the backend database on the flow map:

    - The database icon with green mark shows that the status of the database is healthy. If there are any health rule violations, the icon changes accordingly.
    - If there are any disconnected backend database servers, a message is displayed to connect to the appropriate server or cluster in Database Visibility.
- The Metric browser now displays the buffer and the cache memory metrics for a Linux collector.
- The controller now supports monitoring Apache Cassandra.

End User Monitoring

- Business transaction correlation is enabled by default for business applications instrumented with the Java Agent 4.5.0 or higher.
- Admin-level users can configure read-only user permissions for the Synthetic Credential Vault.
- Python 3 is supported in Synthetic Scripts to create Synthetic Jobs.
- AppDynamics offers a unified Real User Monitoring license that can be allocated to both Browser and Mobile Real User Monitoring usage.

Known Issues

- License service makes individual accounts' usage and term calls to the Events Service.

SAML Authentication

The AppDynamics Controller now supports HTTP GET as well as POST for the authentication request to the identity provider for the sign-out message to the identity provider.

20.3 Release

Alert and Respond

AppDynamics introduces REST APIs to perform CRUD operations for various actions that are triggered as a response to events. For more details, see Actions API.

Anomaly Detection

AppDynamics root cause analysis (RCA) algorithms have been refined considerably to determine and isolate faulty components while reducing false positives. This new algorithm greatly improves the time taken to fetch metrics and hence RCA response for any anomaly event. For more information, see Troubleshooting Anomalies.

My Preferences

Time Zone

The time zone controller setting helps adjust the time zone enabling you to collaborate and troubleshoot issues with more accuracy. This setting also eliminates issues such as translating timestamp of your location to another user's time zone. See Time Zone Controller, for more details. In the 20.3.0 release, enable the ui.platform.timezone.enabled flag for the time zone capability to work. The flag will be enabled by default for the upcoming releases.

20.2 Release

The Controller release occurs every six weeks. There is no Controller release for 20.2. For bug fixes, see Past Resolved and Unknown Issues by Release.

Past On-premises Platform Releases

This page lists all the past on-premises releases since the 20.2 release.

21.5 Release

Synthetic Private Agent (K8S Container Based Agent)

Version 21.5.0 - May 25, 2021

New Private Synthetic Agent (K8S Container Based Agent) is available now. See Private Synthetic Agent.

21.4 Release

Enterprise Console

Version 21.4.3 – April 29, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 21.4.2 – April 22, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 21.4.0 – April 5, 2021

The following enhancements have been added to the Enterprise Console:

- MySQL version 5.7.33 is now supported.
- Java Runtime Environment (JRE) version 8.0.28 is now supported.

EUM Server

Version 21.4.0 – April 5, 2021

MySQL version was upgraded to 5.7.33.

Events Service

There was no 21.4.0 release of the Events Service.

Geo Server

There was no 21.4.0 release of the Geo Server.

Synthetic Private Agent

There was no 21.4.0 release of the Synthetic Private Agent.

Synthetic Server

There was no 21.4.0 release of the Synthetic Server.

21.3 Release

There was no on-premises platform release for 20.3.

21.2 Release

Enterprise Console

Version 21.2.7 – May 3, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 21.2.6 – April 23, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 21.2.3 – March 15, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 21.2.2 – March 8, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 21.2.1 – February 24, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 21.2.0 – February 22, 2021

The following enhancements have been added to the Enterprise Console:

- MySQL version 5.6.50 and 5.7.32 is now supported.
- `Libncurses` and `ncurses` version 5 and 6 is now supported.
- Java Runtime Environment (JRE) version 8u172 is now supported.

EUM Server

There was no 21.2.0 release of the EUM Server.

Events Service

There was no 21.2.0 release of the Events Service.

Geo Server

There was no 21.2.0 release of the Geo Server.

Synthetic Private Agent

There was no 21.2.0 release of the Synthetic Private Agent.

Synthetic Server

Version 21.2.0 – February 26, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

21.1 Release

Enterprise Console

There was no 21.1.0 release of the Enterprise Console.

EUM Server

There was no 21.1.0 release of the EUM Server.

Events Service

There was no 21.1.0 release of the Events Service.

Geo Server

There was no 21.1.0 release of the Geo Server.

Synthetic Private Agent

There was no 21.1.0 release of the Synthetic Private Agent.

Synthetic Server

There was no 21.1.0 release of the Synthetic Server.

20.12 Release

Enterprise Console

There was no 20.12.0 release of the Enterprise Console.

EUM Server

There was no 20.12.0 release of the EUM Server.

Events Service

There was no 20.12.0 release of the Events Service.

The current version, 4.5.2.20640, is available as a standalone artifact or as a bundle with the Enterprise Console. This version contains hotfixes. See 4.5.x Hotfixes for details.

Geo Server

There was no 20.12.0 release of the Geo Server.

Synthetic Private Agent

There was no 20.12.0 release of the Synthetic Private Agent.

Synthetic Server

There was no 20.12.0 release of the Synthetic Server.

20.11 Release

Enterprise Console

Version 20.11.9 – February 18, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.11.8 – February 4, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.11.7 – January 29, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.11.6 – January 25, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.11.5 – December 18, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.11.4 – December 17, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.11.3 – December 8, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.11.2 – December 2, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.11.1 – November 30, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.11.0 – November 16, 2020

These additional operating systems (OS) now support the AppDynamics platform:

Linux (64 bit)	Microsoft Windows (64 bit)
• RHEL 8.x • CentOS 8.x • Ubuntu 18.x and 20.x • openSUSE Leap 15 • Amazon Linux 2	• Windows Server 2019

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

EUM Server

Version 20.11.0 – November 16, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Events Service

There is no 20.11.0 release of the Events Service.

The current version, 4.5.2.20640, is available as a standalone artifact or as a bundle with the Enterprise Console. This version contains hotfixes. See 4.5.x Hotfixes for details.

Geo Server

Version 20.11.0 – November 16, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Synthetic Private Agent

There is no 20.11.0 release of the Synthetic Private Agent.

Synthetic Server

There is no 20.11.0 release of the Synthetic Server.

20.10 Release

AppDynamics Cluster Manager

There is no 20.10 release of the AppDynamics Cluster Manager.

Enterprise Console

Version 20.10.10 – January 8, 2021

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.10.9 – December 18, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.10.8 – December 3, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.10.7 – November 13, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.10.6 – November 10, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.10.5 – November 2, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.10.4 – October 22, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.10.3 – October 19, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.10.2 – October 16, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.10.1 – October 13, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.10.0 – October 6, 2020

The Azul JRE version has been updated to 1.8.0_262 used by the Enterprise Console Installer.

EUM Server

Version 20.10.1-32458 – October 12, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.10.0 – October 6, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Events Service

There is no 20.10.0 release of the Events Service.

The current version, 4.5.2.20634, is available as a standalone artifact or as a bundle with the Enterprise Console. This version contains hotfixes. See 4.5.x Hotfixes for details.

Geo Server

Version 20.10.0 – October 6, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Synthetic Private Agent

There is no 20.10.0 release of the Synthetic Private Agent.

Synthetic Server

There is no 20.10.0 release of the Synthetic Server.

20.9 Release

AppDynamics Cluster Manager

There was no release of the AppDynamics Cluster Manager.

EUM Server

There was no 20.9.0 release for EUM Server.

Events Service

Version 20.9.0 – April 12, 2021

This release includes optimizations and bug fixes.

Synthetic Private Agent

Version 20.9.0 – September 30, 2020

You can use the `privateMode:true` flag to remediate the disk filling up issue on private agents. Private Synthetic Agents do not run the `webdriver-server` component if `privateMode:true` is set in the file `C:\appdynamics\synthetic-agent\synthetic-driver\conf\synthetic-driver.yml`. Note that the Internet Explorer (IE) needs the webdriver-server component to run, therefore setting the `privateMode` flag to true causes all IE measurements to fail.

Synthetic Server

There was no 20.9.0 release for Synthetic Server.

20.8 Release

AppDynamics Cluster Manager

There was no release of the AppDynamics Cluster Manager for 20.8.

Enterprise Console

Version 20.8.9-23271 – October 28, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.8.8-23269 – October 21, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.8.7-23267 – October 7, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.8.6-23263 – October 1, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.8.5-23257 – September 23, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.8.4-23255 – September 15, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.8.3-23251 – September 14, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.8.2-3834 – September 10, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.8.1-23241 – September 1, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.8.0-23236 – August 27, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

EUM Server

Version 20.8.0.31802 – August 27, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Events Service

There is no release of the Events Service for 20.8.

The current version, 4.5.2.20634, is available as a standalone artifact or as a bundle with the Enterprise Console. This version contains hotfixes. See 4.5.x Hotfixes for details.

Geo Server

Version 20.8.0-31802 – August 27, 2020

This release includes optimizations and bug fixes.

Synthetic Private Agent

There was no release of the Synthetic Private Agent for 20.8 yet.

Synthetic Server

There was no release of the Synthetic Server for 20.8 yet.

20.7 Release

AppDynamics Cluster Manager

There was no release of the AppDynamics Cluster Manager.

Enterprise Console

Version 20.7.6-22956 – September 29, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.7.5-22944 – September 14, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.7.4-22931 – August 13, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.7.3-22924 – August 7, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.7.2-22914 – July 24, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.7.1-22912 – July 21, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.7.0-22903 – July 16, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

EUM Server

Version 20.7.0-31650 – July 16, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Events Service

There was no release of the Events Service for July 2020.

The current version, 4.5.2.20634, is available as a standalone artifact or as a bundle with the Enterprise Console and contains hotfixes. See 4.5.x Hotfixes f or details.

Geo Server

Version 20.7.0-31650 – July 16, 2020

This release includes small code changes and optimizations.

Synthetic Private Agent

There is no release of the Synthetic Private Agent.

Synthetic Server

Version 20.7.0-31 – June 24, 2020

This release includes small code changes and optimizations. See Past Resolved and Known Issues by Release for details.

20.6 Release

AppDynamics Cluster Manager

There was no release of the AppDynamics Cluster Manager for June 2020.

Enterprise Console

Version 20.6.10-22689 – September 16, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.6.9-22674 – August 13, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.6.8-22664 – July 24, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.6.7-22661 – July 21, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.6.6-226586 – July 15, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Releasefor details.

Version 20.6.50-22646 – July 9, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.6.3-22635 – June 25, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.6.2-22624 – June 12, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.6.1-22620 – June 8, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.6.0-22615 – June 2, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

EUM Server

Version 20.6.1-31662 – June 30, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.6.0-31157 – June 2, 2020

This release includes small code changes and optimizations.

Events Service

Version 4.5.2.20602

There was no release of the Events Service for June 2020.

The current version, 4.5.2.20602, is available as a standalone artifact or as a bundle with the Enterprise Console. This version contains hotfixes. See 4.5.x Hotfixes for details.

Geo Server

Version 20.6.0-31157 – June 2, 2020

This release includes small code changes and optimizations.

Synthetic Private Agent

There was no release of the Synthetic Private Agent.

Synthetic Server

Version 20.6.0-31157 – June 2, 2020

This release includes small code changes and optimizations.

20.5 Release

AppDynamics Cluster Manager

Version 20.5.0 – May 29, 2020

AppDynamics Cluster Manager is an optional service that AppDynamics administrators and end users can install in an on-premises environment. It is an orchestrated set of software components which run on multiple server nodes. AppDynamics Cluster Manager provides on-premises customers improved platform, metrics, and database scalability.

AppDynamics Cluster Manager is compatible with Controller version 20.4.3 and later.

20.4 Release

Enterprise Console

Version 20.4.10-22377 – October 8, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.9-22374 – September 16, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.8-22353 – June 12, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.7-22350 – June 8, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.6-22344 – May 29, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.5.22338 – May 26, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.4.22335 – May 21, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.3-22332 – May 19, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.2-22301 – May 4, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.1-22292 – April 28, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.0-22285 – April 21, 2020

Azul JRE 1.8.0_242 is replacing Oracle JRE as a component included in the AppDynamics products for:

- Enterprise Console upgrade
- Controller upgrade
- Events Service upgrade

EUM Server

Version 20.4.2-31620 – June 30, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.1-31303 – May 13, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.4.0-31010 – April 21, 2020

The Oracle Java Runtime Environment (JRE) for the EUM Server has been replaced with Azul's Zulu OpenJDK 8 JRE.

Events Service

There was no release of the Events Service.

Synthetic Private Agent

Version 20.4.0 – April 21, 2020

- The Oracle Java Runtime Environment (JRE) bundled with the Synthetic Private Agent has been replaced with the OpenJDK 8 JRE.
- Support is now available for Python 3.

Synthetic Server

Version 20.4.0-30998 – April 21, 2020

This release includes optimizations and small code changes.

20.3 Release

Enterprise Console

Version 20.3.13-22001 – September 16, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.12-21986 – June 29, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.11-21983 – June 24, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.10-21980 – June 22, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.9-21977 – June 10, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.8-21967 – May 21, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.7-21963 – May 20, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.6-21932 – April 20, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.5-21927 – April 13, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.4-21917 – April 7, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.3-21908 – April 2, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.2-21899 – March 27, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.1-21882 – March 18, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.0 – March 9, 2020

The HA Controller Upgrade Wizard is now automatically enabled when you choose to upgrade your Controllers.

EUM Server

Version 20.3.1-31617 – June 30, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Version 20.3.0-30600 – March 9, 2020

This release includes optimizations and small code changes.

Events Service

There was no release of the Events Service.

Synthetic Private Agent

Version 20.3.0 – March 17, 2020

This release includes optimizations and bug fixes. See Past Resolved and Known Issues by Release for details.

Synthetic Server

Version 20.3.0-30600 – March 9, 2020

This release includes no new features, but bug fixes. See Past Resolved and Known Issues by Release for details.

20.2 Release

Enterprise Console

There was no release of the Enterprise Console.

EUM Server

There was no release of the EUM Server.

Events Service

There was no release of the Events Service.

Synthetic Private Agent

Version 20.2.1560 – February 11, 2020

- Synthetic Private Agent now supports Windows Server 2016.
- Synthetic Private Agent Installer has been upgraded to support regional clouds.

Synthetic Server

There was no release of the Synthetic Server.

Glossary

Familiarize yourself with a list of common terms you may come across as an AppDynamics user.

An automatic response to an event based on a policy.

Examples include sending alerts, taking diagnostic snapshots, remediation through scripts, or making a REST API call to integrate with other tools. Actions are customizable.
Related Pages

- Actions
- Alert and Respond

Code that collects and reports data.

Agents can refer to languages (Java, Node.js, Python, etc), machines (hardware and network data), and databases, etc.
Related Pages:

- Install App Server Agents

Email, SMS, or customized external notification interface that notifies you of a problem or event.
Related Pages:

- Alert and Respond

A named collection of tiers representing a monitored environment. Also referred to as Business Application.

See also: Tier, Node
Related Pages:

- Business Applications

Databases, remote services, and any detected out of process components that are involved in business transaction processing.
Related Pages:

- Backend Detection Rules

An action of your application. Business transactions represent your critical business functions.

Examples include login, browse, and checkout.
Related Pages:

- Business Transactions

Collects, stores, analyzes, and baselines performance data collected by agents.
Related Pages:

- Getting Started
- Controller UI Overview

Enables you to collect supplemental application data for business transaction snapshots and/or analytics.

There are three types of data collectors: Method Invocation (MIDC), HTTP, and SQL.
Related Pages:

- Data Collectors

Any object that AppDynamics monitors. Entities typically have associated metrics, events, and a health status.

Examples of entities are applications, tiers, nodes, and business transactions.
Related Pages:

- Overview of Application Monitoring

Unstructured data that represents an action or occurrence detected by the agent.

Examples include JVM restart, deadlock, and error.
Related Pages:

- Monitor Events

Graphical view of information flow within a business application.
Related Pages:

- Flow Maps

Allows you to select specific metrics as key to the overall health of an application and to define ranges for acceptable performance of those metrics.

You can customize default health rules or create new ones.
Related Pages:

- Health Rules
- Alert and Respond

Instruments a method in application code outside the context of any business transaction.

Used for monitoring the performance of the method itself, or for capturing numerical data from the method's input parameters or return value.
Related Pages:

- Information Points

Numerical measurement over a time interval. A data point is a numerical value that an agent measures and reports.
Examples include "calls per minute" and "average response time."
Related Pages:

- Metrics and Graphs

The smallest unit of the AppDynamics modeling environment.

See also: Application, Tier
Related Pages:

- Tiers and Nodes

Provides a mechanism to automate monitoring, alerting, and problem remediation.

Consists of:

1. A trigger based on events
2. An action in response to the trigger

Related Pages:

- Policies
- Alert and Respond

Provides basic metrics for one application service, or group of services, provided by a tier.
Related Pages:

- Service Endpoints

A named collection of nodes, typically representing a service.

See also: Application, Node
Related Pages:

- Tiers and Nodes

A collection of detailed diagnostic information captured during a single invocation of a business transaction.
Examples include call graphs and timing during a single user login, where login is the business transaction.
Related Pages:

- Call Graphs
- Diagnostic Sessions
- Browser Snapshots
- Network Request Snapshots
