**i** If you are sending the information to another analytics tool, such as Google Analytics, we recommend to include all three properties:

```
public class CrashReportSummary
{
 public string ExceptionId { get; }
 public string ExceptionName { get; }
 public string ExceptionReason { get; }
}
```

### Example

For example, to print the crash information to the console, you could subscribe to the `OnCrash` event like this:

```
IAgentConfiguration config = AgentConfiguration.Create(appKey);
config.OnCrash += (sender, crashReportSummaries) =>
{
 foreach (var crashReportSummary in crashReportSummaries) {
 Console.WriteLine($"Crash Detected: {crashReportSummary.ExceptionName}:
{crashReportSummary.ExceptionReason} ({crashReportSummary.ExceptionId})");
 }
};
Instrumentation.InitWithConfiguration(config);
```

## Programmatically Control Sessions

By default, a mobile session ends after a period of user inactivity. For example, when a user opens your application, the session begins and only ends after the user stops using the app for a set period of time. When the user begins to use the application again, a new session begins.

Instead of having a period of inactivity to define the duration of a session, however, you can use the following API to programmatically control when sessions begin and end:

```
static void AppDynamics.Agent.Instrumentation.StartNextSession()
```

When you call the method `StartNextSession`, the current session ends and a new session begins. The API enables you to define and frame your sessions so that they align more closely with business goals and expected user flows. For example, you could use the API to define a session that tracks a purchase of a product or registers a new user.

Excessive use of this API will cause sessions to be throttled (excessive use is > 10 calls per minute per Xamarin Agent, but is subject to change). When not using the API, sessions will fall back to the default of ending after a period of user inactivity.

### Example of a Programmatically Controlled Session

In the example below, the current session ends and a new one begins when an item is bought.

```

using AppDynamics.Agent;
...
public async Task BuySaleItemAsync(SaleItem item)
{
 try
 {
 bool buySucceeded = await this.MobileService.InvokeApiAsync<SaleItem, bool>("buy",
item);
 if (buySucceeded)
 {
 await UserDialogs.Instance.AlertAsync("Thanks for buying this item");
 Instrumentation.StartNextSession();
 }
 }
 catch (Exception e)
 {
 Debug.WriteLine(@"Unexpected error {0}", e.Message);
 }
}

```

### Start and End Session Frames

You can use the `ISessionFrame` API to create session frames that will appear in the session activity. Session frames provide context for what the user is doing during a session. With the API, you can improve the names of user screens and chronicle user flows within a business context.

### Use Cases

The following are common use cases for the `ISessionFrame` API:

- One screen performs multiple functions and you want more granular tracking of the individual functions.
- A user flow spans multiple screens or user interactions. For example, you could use the API to create the session frames "Login", "Product Selection", and "Purchase" to chronicle the user flow for purchases.
- You want to capture dynamic information based on user interactions to name session frames, such as an order ID.

### ISessionFrame API

The table below lists the two methods and one property you can use with session frames. In short, you start a session frame with `StartSessionFrame` and then use the returned `ISessionFrame` object to rename and end the session frame.

Class	Method/Property	Description
Instrument	Method: <pre>static ISessionFrame StartSessionFrame(string sessionFrameName)</pre>	Use this to start and name session frames. Naming session frames allows you to track the frames in the SaaS application.
ISessionFrame	Property: <pre>string Name</pre>	Rename the session frame. You assign the updated Name property from the ISessionFrame object returned from StartSessionFrame.
ISessionFrame	Method: <pre>static void End()</pre>	End the session frame. You call this method from the ISessionFrame object returned from StartSessionFrame.

### Session Frame Example

In the following example, the `ISessionFrame` API is used to track user activity during the checkout process.

```
using AppDynamics.Agent;
...

namespace ShoppingApp {
 public partial class ShoppingCart : ContentPage {
 private ISessionFrame sessionFrame;
 private string orderId;
 ...
 void checkoutCartButtonClicked(object sender, EventArgs e) {
 // The checkout starts when the user clicks the checkout button.
 // This may be after they have updated quantities of items in their cart, etc.
 sessionFrame = Instrumentation.StartSessionFrame("Checkout");
 }
 void confirmOrderButtonClicked(object sender, EventArgs e) {
 // Once they have confirmed payment info and shipping information, and they
 // are clicking the "Confirm" button to start the backend process of checking out,
 // we may know more information about the order itself, such as an order ID.
 sessionFrame.Name = $"Checkout: Order ID {this.orderId}";
 }
 void processOrderCompleted(object sender, EventArgs e) {
 // Once the order is processed, the user is done "checking out" so we end
 // the session frame.
 sessionFrame.End();
 }
 void checkoutCancelled(object sender, EventArgs e) {
 // If they cancel or go back, you'll want to end the session frame also, or else
 }
 }
}
```

```

 // it will be left open and appear to have never ended.
 sessionFrame.End();
 }
}

```

## Add User Data

You can set a key/value pair of strings to record important events or information. Below is the method signature for setting user data:

```
static void AppDynamics.Agent.Instrumentation.SetUserData(string key, string value)
```

For example, you might want to log the user ID when the method for logging in the user is called:

```

using AppDynamics.Agent;
...
void LogInUser(UserCredentials) {
 // Log in user
 ...
 // Set user data with the user name.
 Instrumentation.SetUserData("user_id", UserCredentials.ID);
}

```

This information is available in **Network Request Analyze** and is added to any crash snapshots that may be taken. Keys and values are limited to 2048 characters each.

You can also set user data with values of other types (long, boolean, double, DateTime) using the following methods:

- [SetUserDataBoolean](#)
- [SetUserDataDate](#)
- [SetUserDataDouble](#)
- [SetUserDataLong](#)

To remove user data, use the following methods:

- [RemoveUserData](#)
- [RemoveUserDataBoolean](#)
- [RemoveUserDataDate](#)
- [RemoveUserDataDouble](#)
- [RemoveUserDataLong](#)

## Set the Logging Level (Optional)

You can set the logging level with the configuration `LoggingLevel` as part of the class `IAgentConfiguration`.

You can set `LoggingLevel` to one of the levels listed in the table below.

Level	Description
Off	Agent will emit no messages at all.
Error	Only show errors and initial banner. This is the default.
Warn	Warning level messages and above.
Info	Information level messages and above May be useful to the developer.
Debug	Debug level messages and above. Useful for support personnel and developers.
Verbose	Verbose level messages and above. Use verbose logging only for troubleshooting. Be sure to disable for production.
All	All messages.

For example:

```
var config = AppDynamics.Agent.AgentConfiguration.Create("<#Your App Key#>");
config.LoggingLevel = AppDynamics.Agent.LoggingLevel.All;
AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
```

## Transform URLs for Network Requests

### Implement the Network Request Callback

The callback that modifies or ignore specific URLs should be assigned to the `Func` delegate below.

**i** The callback method `OnNetworkRequest` is synchronous, so we recommend that you return from the function quickly.

```
public Func<IHttpRequestTracker, bool> OnNetworkRequest { get; set; }
```

### Transforming URLs

To transform URLs, the `OnNetworkRequest` method should:

1. Identify specific URLs using techniques such as regex or pattern matching.

**i** This first step is optional because you can choose to transform the URLs of all network requests.

2. Modify the URL property of the `IHttpRequestTracker` object.
3. Assign a valid URL to the `url` property. Modifying other properties of the `IHttpRequestTracker` object will be ignored.
4. Return `true`.

For example:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
 var maskUrl = new Uri("http://networkrequest-mask.com/");
 tracker.Uri = maskUrl;
 return true;
}
```

### Transforming Sensitive URLs

You may want to identify and transform URLs that contain sensitive information.

For example:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
 var urlString = tracker.Uri.ToString();
 if (urlString.Contains("accountInfo"))
 {
 tracker.Uri = new Uri("http://customer-account.com/");
 }
 return true;
}
```

### Ignoring URLs

If the `onNetworkRequest` method returns `false`, the beacon is dropped. Generally, the process for ignoring beacons is:

1. Identify specific URLs using techniques such as regex or pattern matching.
2. Return `false`.

To ignore specific URLs, you would identify network requests that you didn't want to monitor and return `false` to ignore the network request.

For example:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
 if (tracker.Uri.ToString().Contains("avatar"))
 {
```

```

 //ignore calls for avatars
 return false;
 }
 return true;
}

```

To ignore all network requests, implement the following:

```

public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
 return false;
}

```

### Register a Network Request Callback

To register a network request callback:

1. Define your own method to handle the callback:

```

public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
 return true;
}

```

2. Pass it during the `AgentConfiguration` initialization phase:

```

IAgentConfiguration config = AgentConfiguration.Create(appKey);
config.OnNetworkRequest += NetworkRequestCallback; //Register the Callback
Instrumentation.InitWithConfiguration(config);

```

3. Or you can use an anonymous function:

```

IAgentConfiguration config = AgentConfiguration.Create(appKey);
config.OnNetworkRequest += (IHttpRequestTracker tracker) =>
{
 return true;
};
Instrumentation.InitWithConfiguration(config);

```

### Configure and Take Screenshots

By default, mobile screenshots are enabled on the agent-side but disabled on the Controller-side. These screenshots appear in the Controller in the [Sessions Details](#) dialog. To programmatically take manual screenshots, you must [enable screenshots in the Controller UI](#) and add the Screenshot API below.

```
Instrumentation.TakeScreenshot();Disable Screenshots
```

**i** The `takeScreenshot()` function limits screenshots to a maximum of 1 screenshot per 10 seconds.

## Disable Screenshots

You can disable screenshots from the Controller UI or with the Xamarin SDK. To disable screenshots with the Xamarin SDK, set the property `ScreenshotsEnabled` of the `IAgentConfiguration` object to `false`:

```
IAgentConfiguration config = AgentConfiguration.Create(appKey); config.ScreenshotsEnabled = false; Instrumentation.InitWithConfiguration(config);
```

## Block and Unblock Screenshots

You can also use the Xamarin SDK to block screenshots from being taken during the execution of a code block. This just temporarily blocks screenshots from being taken until you unblock screenshots. This enables you to stop taking screenshots in situations where users are entering personal data, such as on login and account screens.

The Instrumentation class provides the methods `blockScreenshots()` and `unblockScreenshots()` to block and unblock screenshots.

**i** If screenshots are disabled through the property `ScreenshotsEnabled` of the `IAgentConfiguration` object or through the Controller UI, these methods have no effect. You can also check the `Instrumentation.ScreenshotsBlocked` property to check if screenshots are being blocked.

```
public void LoginUser()
{
 if (!Instrumentation.ScreenshotsBlocked)
 {
 Instrumentation.BlockScreenshots();
 }
 LoginCredentials credentials = UserLogin.GetCredentials();

 if (credentials.Authorized)
 {
 RedirectToProfile(credentials.user);
 Instrumentation.UnblockScreenshots();
 }
}
```

## WebView Instrumentation (JavaScript Agent Injection)

WebView Instrumentation automatically injects our Javascript Agent into your WebViews, so that WebView navigation can also be instrumented. By default, Ajax calls are disabled, however, both WebView

instrumentation, and Ajax instrumentation can be configured using the properties `JsAgentEnabled` and `JsAgentAjaxEnabled`:

### Example

```
var config = AppDynamics.Agent.AgentConfiguration.Create("<#Your App Key#>");
config.JsAgentEnabled = true;
config.JsAgentAjaxEnabled = false;
AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
```

### Note

WebViews are automatically instrumented on Xamarin iOS. To use WebView instrumentation on Xamarin Android, you have the following options:

1. Use the `InstrumentedWebView: AppDynamics.Agent.Forms.InstrumentedWebView`.
2. Export our renderer globally for the `Xamarin.Forms.WebView` or your custom `WebView`.

```
[assembly: ExportRenderer(typeof(WebView),
typeof(AppDynamics.Droid.InstrumentedWebViewRenderer))]
```

You can do this in the Android project, above `MainActivity`:

```
[assembly: ExportRenderer(typeof(WebView),
typeof(AppDynamics.Droid.InstrumentedWebViewRenderer))]
namespace MyProject.Droid
{
 public class MainActivity : global::Xamarin.Forms.Platform.Android.FormsAppCompatActivity
 {
 ...
 }
}
```

### Fragment Tracking

 This applies to Android Native only.

While Android Activities are automatically tracked for you, you can also track Fragments using:

```
Instrumentation.TrackFragmentStart(this);
//and
Instrumentation.TrackFragmentEnd(this);
```

## Example

```

class MyFragment : Fragment
{
 public override View onCreateView(LayoutInflater inflater, ViewGroup container, Bundle
savedInstanceState)
 {
 ...
 }
 public override void onStart()
 {
 base.onStart();
 Instrumentation.TrackFragmentStart(this);
 }
 public override void onStop()
 {
 base.onStop();
 Instrumentation.TrackFragmentEnd(this);
 }
}

```

## View Controller Tracking

 This applies to iOS Native only.

You can track `ViewControllers` using the API below:

```

Instrumentation.TrackViewControllerDidAppear(this);
//and
Instrumentation.TrackViewControllerDidDisappear(this);

```

## Example

```

public partial class MyViewController : UIViewController
{
 ...
 public override void ViewDidAppear(bool animated)
 {
 base.ViewDidAppear(animated);
 Instrumentation.TrackViewControllerDidAppear(this);
 }
 public override void ViewDidDisappear(bool animated)
 {
 base.ViewDidDisappear(animated);
 Instrumentation.TrackViewControllerDidDisappear(this);
 }
}

```

## Instrument Xamarin.Forms

You can now instrument Xamarin.Forms elements using AppDynamics.Agent.Forms. To add the NuGet package Xamarin.Forms, see [Instrument Xamarin Applications](#).

## Page Tracking

Using Xamarin.Forms, you can track page usage and see the how your users interacts with your app in a session timeline.

To track pages, you must call `TrackPage` from the constructor on each page you want to monitor.

```
public partial class MyPage : ContentPage
{
 public MyPage()
 {
 InitializeComponent();
 AppDynamics.Agent.Forms.PageTracker.TrackPage(this);
 }
}
```

## Track UI Elements

You can track user interactions with these UI elements:

- Buttons
- Entries
- ListViews

To instrument a UI element:

1. Attach a property to your views:

```
appd:UiInstrumentation.IsInstrumented="True"
```

2. Include the namespace:

```
xmlns:appd="clr-namespace:AppDynamics.Agent.Forms;assembly=AppDynamics.Agent.Forms"
```

## Example

Example of an `xaml` file with instrumented UI elements:

```
<ContentPage
 xmlns:appd="clr-namespace:AppDynamics.Agent.Forms;assembly=AppDynamics.Agent.Forms" >
 <StackLayout>
 <Button
 appd:UiInstrumentation.IsInstrumented="True"
 Clicked="OnButtonClicked" />
 <Entry
 appd:UiInstrumentation.IsInstrumented="True" />
 </StackLayout>
</ContentPage>
```

```

 <ListView
 appd:UiInstrumentation.IsInstrumented="True">
 <ListView.ItemsSource>
 <x:Array Type="{x:Type x:String}">
 <x:String>Item 1</x:String>
 <x:String>Item 2</x:String>
 </x:Array>
 </ListView.ItemsSource>
 </ListView>
 </StackLayout>
</ContentPage>

```

You can also instrument properties from code behind (i.e. in the xaml.cs file):

```

using AppDynamics.Agent.Forms;

...

var button = new Button();
button.SetValue(UiInstrumentation.IsInstrumentedProperty, true);

```

The `IsInstrumented` property will track the following events:

1. Button - Button clicked
2. ListView - Item selected
3. Entry - Entry focused and entry unfocused

## Xamarin SDK Documentation

For the complete SDK API documentation, see the [latest Xamarin SDK documentation](#) or the previous versions listed below:

- <https://sdkdocs.appdynamics.com/xamarin-sdk/23.2/html/>
- <https://sdkdocs.appdynamics.com/xamarin-sdk/22.10/html/>
- <https://sdkdocs.appdynamics.com/xamarin-sdk/22.4/html/>
- <https://sdkdocs.appdynamics.com/xamarin-sdk/22.3/html/>
- <https://sdkdocs.appdynamics.com/xamarin-sdk/22.2/html/>
- <https://sdkdocs.appdynamics.com/xamarin-sdk/21.9/html/>
- <https://sdkdocs.appdynamics.com/xamarin-sdk/21.8/html/>
- <https://sdkdocs.appdynamics.com/xamarin-sdk/21.6/html/>

## Instrument Cordova Applications

### Related pages:

- [Hybrid Application Support](#)
- [Customize the Cordova Instrumentation](#)
- [Update Cordova Agent Configurations](#)

Follow the steps below to get your EUM App Key and instrument your Cordova-based apps.

- [Check Requirements](#)
- [Get Your Application Key](#)

[Install and Initialize the Cordova Plugin](#)  
[Customize the Cordova Application Instrumentation](#)

**i** For native mobile applications, follow either the iOS Instrumentation or Android Instrumentation instructions. The mobile agents will inject the JavaScript Agent and auto-instrument your mobile application including the auto-instrumentation of the WKWebView.

## Check Requirements

To use the AppDynamics Cordova plugin, your hybrid application must be using the following:

- Cordova  $\geq 8.0.0$
- npm  $\geq 3.10.10$
- Node.js  $\geq 6.11.3$
- WKWebView for iOS applications

## WkWebView Requirements

By default, the Cordova iOS platform command adds a version of `cordova-ios` that supports UIWebView. AppDynamics does not support UIWebView, so you must manually change this to WKWebView.

1. Run the following command:

```
(ionic) cordova platform add ios
```

2. Verify the log output returns:

```
Using WkWebView
```

3. If the log output returns `Using UIWebView`, you must manually change it to `Using WKWebView`.

## Get Your Application Key

After you completed the **Getting Started Wizard**, you were given an EUM App Key. You will need this key when you modify the source code. In some cases, multiple mobile applications can share the same key.

If you have completed the **Getting Started Wizard**, but don't have your EUM App Key, see [Get Your Application Key](#).

## Install and Initialize the Cordova Plugin

The AppDynamics Cordova plugin is certified to work with the Ionic and PhoneGap frameworks. Thus, the installation instructions below are for Ionic and PhoneGap applications. See the plugin installation instructions for your Cordova-based framework.

[Ionic](#)   [PhoneGap](#)

From the root directory of your Ionic application, run the following commands to install the plugin and build the mobile app. See the [Ionic Cordova plugin documentation](#) for more information.

1. Replace the values in brackets with the configurations for your app and run the command to add the configured plugin.

For SaaS deployments:

```
ionic cordova plugin add appd-plugin-eum-mobile --variable APP_KEY="<#EUM_APP_KEY#>" --variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --save
```

For on-prem deployments, replace the value for the variable `COLLECTOR_URL` with the URL to your EUM Server and the value for `SCREENSHOT_URL` with the URL to your on-prem Screenshot Service.

```
ionic cordova plugin add appd-plugin-eum-mobile --variable APP_KEY="<#EUM_APP_KEY#>" --variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --variable COLLECTOR_URL="http(s)://<on-prem_eum-server_url>:<PORT>" --variable SCREENSHOT_URL="http(s)://<on-prem_screenshot_service_url>" --save
```

2. (Optional) You can also disable or set the interaction capture mode ([iOS/Android](#)) and set the URL to test the network connectivity of Cordova iOS applications.
  - a. The interaction capture mode is on by default, but you can disable it by setting the variable `INTERACTION_CAPTURE_MODE` to `0` or specify the desired capture mode for the platform (see the interaction mode values for iOS and Android in the table below). Setting `INTERACTION_CAPTURE_MODE` only controls capturing of webview interactions. If you set `INTERACTION_CAPTURE_MODE` to `0`, interactions with webviews will no longer be captured. However, interactions with native UI elements, such as UI Buttons under iOS, will still be captured, as they always are captured by the underlying native agent for each platform.

```
ionic cordova plugin add appd-plugin-eum-mobile --variable APP_KEY="<#EUM_APP_KEY#>" --variable INTERACTION_CAPTURE_MODE=<see modes in table below> --variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --variable COLLECTOR_URL="http(s)://<on-prem_eum-server_url>:<PORT>" --variable SCREENSHOT_URL="http(s)://<on-prem_screenshot_service_url>" --save
```

[iOS](#)   [Android](#)

Capture Mode	Value	Description
Capture None	0	No user interactions are captured.
Button Pressed	1	Button presses are captured.
Table Cell Selected	2	Table cell selections are captured.
Text Field Selected	4	Text field selections are captured.

Capture Mode	Value	Description
Text View Selected	8	Text view selections are captured.
All	-1	All user interactions are captured.

iOS [Android](#)

Capture Mode	Value	Description
Capture None	0	No user interactions are captured.
Button Pressed	1	Button presses are captured.
Edit Text Selected	2	Selection of edited text is captured.
List Item Selected	4	Selection of list item is captured.
All	-1	All user interactions are captured.

- b. By default, the Cordova Plugin will use `http://google.com/` to test the connectivity of Cordova iOS applications. You can, however, use a different URL to test the connectivity by setting the variable `REACHABILITY_HOST` to the URL. In the example below, the Cordova Plugin is configured to use `http://example.com` to test the connectivity of the Cordova iOS application.

```
ionic cordova plugin add appd-plugin-eum-mobile --variable
APP_KEY="<#EUM_APP_KEY#" --variable REACHABILITY_HOST="http://example.com" --
variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --save
```

3. Build the mobile app:

```
ionic cordova build [android, ios]
```

Ionic [PhoneGap](#)

From the root directory of your PhoneGap application, run the commands below to install the plugin. See the [PhoneGap plugin documentation](#) for more information.

1. Replace the values in brackets with the configurations for your app and run the command to add the configured plugin.

For SaaS deployments:

```
phonegap cordova plugin add appd-plugin-eum-mobile --variable APP_KEY="<#EUM_APP_KEY#>"
--variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --save
```

For on-prem deployments, replace the value for the variable `COLLECTOR_URL` with the URL to your EUM Server and the value for `SCREENSHOT_URL` with the URL to your on-prem Screenshot Service.

```
phonegap cordova plugin add appd-plugin-eum-mobile --variable APP_KEY="<#EUM_APP_KEY#>"
--variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6] --variable
COLLECTOR_URL="http(s)://<on-prem_eum_server_url>:<PORT>" --variable SCREENSHOT_URL="ht
tp(s)://<on-prem_screenshot_service_url>" --save
```

2. (Optional) You can also set variables to enable user interaction capture mode ([iOS](#)/[Android](#)) and troubleshoot the network connectivity of Cordova iOS applications.
  - a. The interaction capture mode is on by default, but you can disable it by setting the variable `INTERACTION_CAPTURE_MODE` to `0` or specify the desired capture mode for the platform (see the interaction mode values for iOS and Android in the table below). Setting `INTERACTION_CAPTURE_MODE` only controls capturing of webview interactions. If you set `INTERACTION_CAPTURE_MODE` to `0`, interactions with webviews will no longer be captured. However, interactions with native UI elements, such as UI Buttons under iOS, will still be captured, as they always are captured by the underlying native agent for each platform.

```
phonegap cordova plugin add appd-plugin-eum-mobile --variable
APP_KEY="<#EUM_APP_KEY#>" --variable INTERACTION_CAPTURE_MODE=<see modes in table
below> --variable SCREENSHOTS_ENABLED=<true|false> --variable LOGGING_LEVEL=[0-6]
--save
```

[iOS](#)   [Android](#)

Capture Mode	Value	Description
Capture None	0	No user interactions are captured.
Button Pressed	1	Button presses are captured.
Table Cell Selected	2	Table cell selections are captured.
Text Field Selected	4	Text field selections are captured.
Text View Selected	8	Text view selections are captured.

Capture Mode	Value	Description
All	-1	All user interactions are captured.

iOS [Android](#)

Capture Mode	Value	Description
Capture None	0	No user interactions are captured.
Button Pressed	1	Button presses are captured.
Edit Text Selected	2	Selection of edited text is captured.
List Item Selected	4	Selection of list item is captured.
All	-1	All user interactions are captured.

- b. By default, the Cordova Plugin will use `http://google.com` to test the connectivity of Cordova iOS applications. You can, however, use a different URL to test the connectivity by setting the variable `REACHABILITY_HOST` to the URL. In the example below, the Cordova Plugin is configured to use `http://example.com` to test the connectivity of the Cordova iOS application.

```
phonegap cordova plugin add appd-plugin-eum-mobile --variable
APP_KEY="#EUM_APP_KEY#" --variable REACHABILITY_HOST=http://example.com --
variable SCREENSHOTS_ENABLED=true|false --variable LOGGING_LEVEL=[0-6] --save
```

3. Build the mobile app:

```
phonegap cordova build [android, ios]
```

**Customize the Cordova Application Instrumentation**

See [Customize the Cordova Application](#) showing how to use the Cordova SDK through examples and brief explanations.

**Update Cordova Agent Configurations**

To update the configurations set when you first added the Cordova plugin to your application, the suggested practice is to remove the values for configuration values and then add new configuration values.

See the following examples:

- [WkWebView Requirements](#)
- [Change the App Key](#)
- [Change the App Name](#)

## Change the App Key

To change the app key for your Ionic or PhoneGap applications:

1. Remove the old value for the variable `APP_KEY` with the `remove` command:

```
cordova plugin remove --variable APP_KEY="old-app-key" appd-plugin-eum-mobile
```

2. Add new value for the variable `APP_KEY` with the `add` command. Be sure to include the variables that you set when you first added the plugin (represented by `<variable_list>` below). For example, if you set `REACHABILITY_HOST=http://example.com` when you first added the plugin, you will need to reset the variable when running the `add` command again.

```
cordova plugin add --variable APP_KEY="new-app-key" <variable_list> appd-plugin-eum-mobile
```

## Change the App Name

To change the name of your Ionic or PhoneGap applications:

1. Remove the old value for the variable `APP_NAME` with the `remove` command:

```
cordova plugin remove --variable APP_NAME="old-app-name" appd-plugin-eum-mobile
```

2. Add new value for the variable `APP_NAME` with the `add` command. Be sure to include the variables that you set when you first added the plugin (represented by `<variable_list>` below). For example, if you set `REACHABILITY_HOST=http://example.com/` when you first added the plugin, you will need to reset the variable when running the `add` command again.

```
cordova plugin add --variable APP_NAME="new-app-name" <variable_list> appd-plugin-eum-mobile
```

## Customize the Cordova Instrumentation

### Related pages:

- [Instrument Cordova Applications](#)
- [Cordova SDK Documentation](#)

Once you have [instrumented your Cordova-based application](#) with the Cordova Plugin, you can also use the APIs to customize the data for your app that appears in the Controller UI. The following sections show you how to use the Cordova Plugin SDK API to customize your instrumentation:

- [Using the Cordova Plugin SDK API](#)
- [Change the App Key](#)
- [Collect Additional Types of Data](#)
- [Programmatically Control Sessions](#)
- [Start and End Session Frames](#)

- [Configure and Take Screenshots](#)
- [Block and Unblock Screenshots](#)
- [Enable Logging and Set Logging Level](#)
- [Cordova SDK Documentation](#)

## Using the Cordova Plugin SDK API

### Syntax

To call SDK API methods, use the following syntax: `window.plugins.ADEUMMobilePlugin.<method>`

### Arguments

The last two arguments for all of the SDK API methods should always be two functions. The first function should handle successful cases and the last method should handle failures.

For example:

```

window.plugins.ADEUMMobilePlugin.changeAppKey("<EUM_APP_KEY>",
 (success) => {
 this.showAlert("changeAppKey return: success");
 },
 (error) => {
 this.showAlert("changeAppKey error:" + error);
 }
);

```

### Add Methods to Call SDK APIs

To use the SDK APIs, you are recommended to create class methods that call the SDK APIs as shown below.

```

export class HomePage {
 ...
 someMethod(event) {
 window.plugins.ADEUMMobilePlugin.<method>(<arg1>, <success_function>,
 <failure_function>);
 }
 ...
}

```

### Example

Thus, for the `HomePage.js` file, your `HomePage` class could have the method `takeScreenshot` that calls the SDK API method `screenshot` as shown here.

```

export class HomePage {
 ...
 takeScreenshot(event) {
 // Call the Cordova plugin SDK methods
 window.plugins.ADEUMMobilePlugin.screenshot(

```

```

 (success) => {
 this.showAlert("crash return: success");
 },
 (error) => {
 this.showAlert("crash error:" + error);
 });
 }
 ...
}

```

## Change the App Key

To change the EUM application key, you use the method `changeAppKey` with the parameters below.

Parameter Name	Data Type	Description
<code>appKey</code>	string	The EUM application key.
<code>success</code>	function	A user-defined function that is called when <code>changeAppKey</code> is successful.
<code>error</code>	function	A user-defined function that is called when <code>changeAppKey</code> fails.

For example, you could create a new method that takes a new app key and passed it to the SDK API method `changeAppKey`.

```

changeAppKey(event, newAppKey) {
 window.plugins.ADEUMMobilePlugin.changeAppKey(newAppKey,
 (success) => {
 this.showAlert("changeAppKey return: success");
 },
 (error) => {
 this.showAlert("changeAppKey error:" + error);
 }
);
}

```

## Collect Additional Types of Data

You can use methods available in the `ADEUMMobilePlugin` class to collect five additional types of data:

- [Info points](#)
- [Custom timers](#)
- [Custom metrics](#)
- [User data](#)
- [Breadcrumbs](#)

## Info Points

Information points allow you to track how your own code is running. You can see how often a method is invoked, and how long it takes to run by calling `beginCall`. When the callbacks `success` or `error` are called, the call to track the info point ends.

- `beginCall(name, functionName, args, success, error)`

### Parameters

The table below describes the parameters for the two methods:

Name	Type	Description
<code>name</code>	string	The name of the file or module where the info point is being recorded.
<code>functionName</code>	string	The function that is invoking <code>beginCall</code> to track an info point.
<code>success</code>	function	The user-defined callback for successful cases.
<code>error</code>	function	The user-defined callback for failed cases.

### Example

For example, you can use create info points with something like the code below to determine how a method is invoked, and how long it takes to run:

```
beginCall(event) {
 window.plugins.ADEUMMobilePlugin.beginCall("home.ts", "callTrackerFunction", "event",
 (tracker) => {
 tracker.reportCallEndedWithReturnValue("Return from home.ts",
 (success) => { console.log("End call with return value success:" +
success);},
 (error) => { console.log("End call with return value error:" + error); });
 },
 (error) => {
 console.log("Begin call error:" + error);
 }
);
}
```

## Custom Timers

You can create custom timers to time any arbitrary sequence of events within your code, even spanning multiple methods. You create the custom timers using the SDK API methods `startTimer` and `stopTimer`.

- `startTimerWithName(name, success, error)`
- `stopTimerWithName(name, success, error)`

## Parameters

The two methods take the following parameters:

Name	Type	Description
name	string	The name of the custom timer. Allowed characters are [A-Za-z\s0-9]. Illegal characters are replaced by their ASCII hex value.
success	function	The user-defined callback for successful cases.
error	function	The user-defined callback for failed cases.

## Example

For example, to track the time a user spends viewing a screen, the instrumentation could look like this:

```

startTimer(event) {
 window.plugins.ADEUMMobilePlugin.startTimerWithName(data.name,
 (success) => {
 this.showAlert("startTimerWithName return: success");
 },
 (error) => {
 this.showAlert("startTimerWithName error:" + error);
 }
);
}
stopTimer(event) {
 window.plugins.ADEUMMobilePlugin.stopTimerWithName(data.name,
 (success) => {
 this.showAlert("stopTimerWithName return: success");
 },
 (error) => {
 this.showAlert("stopTimerWithName error:" + error);
 }
);
}

```

## Custom Metrics

You can also report custom metrics.

You create custom metrics with the `reportMetricWithName` :

- `reportMetricWithName(name, value, success, error)`

## Parameters

The `reportMetricWithName` method takes the following parameters:

Name	Type	Description
name	string	The name of the custom metric. The metric names must consist of alphanumeric characters. Illegal characters are replaced by their ASCII hex value.
value	number	if value is not a whole number an error will be returned.
success	function	User-defined success callback.
error	function	User-defined error callback.

### Example

For example, the following method could be used to report custom metrics:

```
reportMetric(event, data) {
 window.plugins.ADEUMMobilePlugin.reportMetricWithName(data.name, parseInt(data.value),
 (success) => {
 this.showAlert("reportMetricWithName : success");
 },
 (error) => {
 this.showAlert("reportMetricWithName error:" + error);
 }
);
};
```

### Breadcrumbs

Breadcrumbs allow you to situate a crash in the context of your user's experience. Set a breadcrumb when something interesting happens. If your application crashes at some point in the future, the breadcrumb will be displayed along with the crash report. Each crash report displays the most recent 99 breadcrumbs.

You create and leave breadcrumbs with the following SDK API method:

- `leaveBreadcrumb(breadcrumb, mode, success, error)`

### Parameters

The method `leaveBreadcrumb` takes the following parameters:

Name	Type	Description
breadcrumb	string	The string to include in the crash report and sessions. Truncated at 2048 characters; empty values are ignored.

Name	Type	Description
mode	number	The mode determining where the breadcrumb will be displayed: <ul style="list-style-type: none"> <li>• 0 - for crashes only</li> <li>• 1 - for crashes and sessions.</li> </ul> The mode defaults to crashes if the value is not parseable.
success	function	The user-defined callback for successful cases.
error	function	The user-defined callback for failed cases.

### Example

This code example shows how to use the SDK API to leave a breadcrumb:

```

breadcrumb(mode) {
 window.plugins.ADEUMMobilePlugin.leaveBreadcrumb("breadcrumb1", mode,
 (success) => {
 this.showAlert("leaveBreadcrumb return: success");
 },
 (error) => {
 this.showAlert("leaveBreadcrumb error:" + error);
 }
)

```

### Add Custom User Data

You can set and later remove any string key/value pair you think might be useful with the following methods:

- `setUserData(key, value, success, error)`
- `removeUserData(key, success, error)`

### Parameters

The following table describes the parameters:

Name	Type	Description
key	string	The key identifying the key-value pair.
value	string	The value associated with the key.
success	function	The user-defined callback for successful cases.

Name	Type	Description
<code>error</code>	function	The user-defined callback for failed cases.

### Example

The code example below shows how to set and remove user data with the SDK API:

```

setCustomData(event, data) {
 window.plugins.ADEUMMobilePlugin.setUserData(data.name, data.value,
 (success) => {
 this.showAlert("setUserData return: success");
 },
 (error) => {
 this.showAlert("setUserData error:" + error);
 }
);
};
removeUserData(event, key) {
 window.plugins.ADEUMMobilePlugin.removeUserData(key,
 (success) => {
 this.showAlert("removeUserData return: success");
 },
 (error) => {
 this.showAlert("removeUserData error:" + error);
 }
);
}

```

### Programmatically Control Sessions

By default, a mobile session ends after a period of user inactivity. For example, when a user opens your application, the session begins and only ends after the user stops using the app for a set period of time. When the user begins to use the application again, a new session begins.

Instead of having a period of inactivity to define the duration of a session, however, you can use the following API to programmatically control when sessions begin and end.

```
startNextSession(success, error)
```

When you call the method `startNextSession` from `ADEUMMobilePlugin`, the current session ends and a new session begins. The API enables you to define and frame your sessions so that they align more closely with business goals and expected user flows. For example, you could use the API to define a session that tracks a purchase of a product or registers a new user.

Excessive use of this API will cause sessions to be throttled (excessive use is >10 calls per minute, but is subject to change). When not using the API, sessions will fall back to the default of ending after a period of user inactivity.

## Example of a Programmatically Controlled Session

In the example below, the current session ends and a new one begins when the checkout is made.

```
completeCheckout() {
 if (this.validateAddress() && this.validatePayment()){
 let loader = this.loader.create({
 content: "Completing the checkout..."
 });
 loader.present();
 return this.order.create({
 shipping_address: this.address,
 billing_address: this.address,
 cart_id: Number(this.configuration.get('cart_id'))
 })
 ...
 window.plugins.ADEUMMobilePlugin.startNextSession(
 (success) => {
 console.log("startNextSession return: success");
 },
 (error) => {
 console.log("startNextSession error:" + error);
 }
);
 }
}
```

## Start and End Session Frames

You can use Cordova Plugin to create session frames that will appear in the session activity. Session frames provide context for what the user is doing during a session. With the API, you can improve the names of user screens and chronicle user flows within a business context.

### Use Cases

The following are common using session frames:

- One page performs multiple functions and you want more granular tracking of the individual functions.
- A user flow spans multiple pages or user interactions. For example, you could use the API to create the session frames "Login", "Product Selection", and "Purchase" to chronicle the user flow for purchases.
- You want to capture dynamic information based on user interactions to name session frames, such as an order ID.

### SessionFrame API

The table below lists the three methods you can use with session frames. In short, you start a session frame with `startSessionFrame` and then use `updateName` and `end` to rename and end the session frame.

Method	Parameters	Description
startSessionFrame(name, success, error)	<ul style="list-style-type: none"> <li><code>name</code> (string) - The name of the session frame.</li> <li><code>success</code> (function) - The user-defined success callback.</li> <li><code>error</code> (function) - The user-defined error callback.</li> </ul>	<p>Use this to start and name your session frame.</p> <p>You call this method from <code>window.plugins.ADEUMMobilePlugin</code>.</p>
updateName(name, success, error)	<ul style="list-style-type: none"> <li><code>name</code> (string) - The name of the session frame.</li> <li><code>success</code> (function) - The user-defined success callback.</li> <li><code>error</code> (function) - The user-defined error callback.</li> </ul>	<p>Rename the session frame name.</p> <p>You call this method from the <code>ADEUMMobilePlugin</code> object.</p>
end(success, error)	<ul style="list-style-type: none"> <li><code>success</code> (function) - The user-defined success callback.</li> <li><code>error</code> (function) - The user-defined error callback.</li> </ul>	<p>End the session frame.</p> <p>You call this method from the <code>ADEUMMobilePlugin</code> object.</p>

### Session Frame Example

In the following example, session frames are used to track user activity during the checkout process.

```

declare var window: any;
@Component({
 ...
})
export class OrderPage {
 sessionFrame: any;
 ...

 checkoutCartButtonClicked() {
 // The user starting to check out starts when the user clicks the checkout button
 // this may be after they have updated quantities of items in their cart, etc.
 window.plugins.ADEUMMobilePlugin.startSessionFrame("Checkout",
 (sessionFrame) => {
 // The returned object is saved to the class property 'sessionFrame' so
 // the SessionFrame API methods 'updateName' and 'end' can be called from it
 later.
 this.sessionFrame = sessionFrame;
 },
 (error) => {
 console.log("startSessionFrame call error:" + error);
 }
);
 }
 confirmOrderButtonClicked() {
 // Once they have confirmed payment info and shipping information, and they

```

```

// are clicking the "Confirm" button to start the backend process of checking out
// we may know more information about the order itself, such as an Order ID.
this.sessionFrame.updateName("Checkout: Order ID " + this.orderId,
 (success) => {
 console.log("Order has been placed and sessionFrame updated:" + this.orderId)
;
 },
 (error) => {
 console.log("Order has been placed but sessionFrame couldn't be updated
because of the error " + error);
 }
);
}
processOrderCompleted() {
 // Once the order is processed, the user is done "checking out" so we end
 // the session frame.
 this.sessionFrame.end(
 (success) => {
 console.log("Order was completed and sessionFrame ended: " + success);
 },
 (error) => {
 console.log("Order was completed but sessionFrame couldn't be ended because
of: " + error);
 }
);
}
checkoutCancelled() {
 // If they cancel or go back, you'll want to end the session frame also, or else
 // it will be left open and appear to have never ended.
 this.sessionFrame.end(
 (success) => {
 console.log("Order was cancelled and sessionFrame ended: " + success);
 },
 (error) => {
 console.log("Order was cancelled but sessionFrame couldn't be ended because
of: " + error);
 }
);
}
} // end of export class OrderPage

```

## Configure and Take Screenshots

By default, mobile screenshots are enabled on the agent-side but disabled on the Controller-side. These screenshots appear in the Controller in the [Sessions Details](#) dialog. To programmatically take manual screenshots, you must [enable screenshots in the Controller UI](#) and add the Screenshot API below.

```

screenshot(event) {
 // make a call to plugin

```

```

console.log("screenshot click handler");
window.plugins.ADEUMMobilePlugin.takeScreenshot(

(success) => {
 this.showAlert("screenshot return: success");
},
(error) => {
 this.showAlert("screenshot error:" + error);
});
}

```

**i** This will capture everything, including personal information, so you must be cautious of when to take the screenshot.

## Block and Unblock Screenshots

You can also block screenshots from being taken during the execution of a code block. This just temporarily blocks screenshots from being taken until you unblock screenshots. This enables you to stop taking screenshots in situations where users are entering personal data, such as on login and account screens.

```

logInScreen(event) {
 // Block Screen while getting user input
 window.plugins.ADEUMMobilePlugin.blockScreenshots(
 (success) => {
 console.log("blockScreenshots return: success");
 this.getUserInput();
 this.submitUserInput();
 },
 (error) => {
 console.log("blockScreenshots error:" + error);
 }
);
 // Unblock screen and return to home page
 window.plugins.ADEUMMobilePlugin.unblockScreenshots(
 (success) => {
 console.log("unblockScreenshots return: success");
 this.homePage()
 },
 (error) => {
 console.log("unblockScreenshots error:" + error);
 }
);
}
}

```

## Enable Logging and Set Logging Level

You use the method `loggingLevel` to enable and set the logging level. You can set logging to one of the following levels:

Value	Logging Level	Description
0	None	No logs are displayed. <b>This level disables logging.</b>
1	Error	Only error messages are displayed. <b>This is the default logging level.</b>
2	Warn	Warning and error messages are displayed.
3	Info	Warning, errors, and developer-focused messages are displayed.
4	Debug	Errors, warnings, developer information, and debugging messages are displayed.
5	Verbose	Errors, warnings, developer information, debugging, and troubleshooting messages are displayed.
6	All	All the supported log messages are displayed.

You enable logging by setting the logging level in the instrumentation configuration. For example, in this example, you are enabling logging and setting the logging level to `Info` :

```

window.plugins.ADEUMMobilePlugin.initWithConfiguration(
 {
 "appKey": "<EUM_APP_KEY>",
 "loggingLevel": 3
 },
 (success) => {
 this.showAlert("initWithConfiguration return: success");
 },
 (error) => {
 this.showAlert("initWithConfiguration error:" + error);
 }
);

```

## Cordova SDK Documentation

For the Cordova SDK API reference documentation, see the [latest JSDoc documentation](#) or the previous versions listed below:

- <https://sdkdocs.appdynamics.com/cordova-plugin/21.5/>
- <https://sdkdocs.appdynamics.com/cordova-plugin/21.2/>
- <https://sdkdocs.appdynamics.com/cordova-plugin/20.11/>

- <https://sdkdocs.appdynamics.com/cordova-plugin/20.10/>
- <https://sdkdocs.appdynamics.com/cordova-plugin/20.7/>

## Instrument React Native Applications

### Related pages:

- [Hybrid Application Support](#)
- [Manually install the React Native Package](#)
- [Point to an On-Premises EUM Server \(Optional\)](#)
- [Customize the React Native Instrumentation](#)

Follow these steps to get your EUM App Key and instrument your React Native application.

- [Requirements](#)
- [Get Your Application Key](#)
- [Eject Your React Native Application](#)
- [Install the React Native Agent](#)
- [Add Permissions \(Android Only\)](#)
- [Instrument Your Application Code](#)
- [Build and Run Your React Native Applications \(Optional\)](#)

### Requirements

- React Native  $\geq 0.60$  and  $\leq 0.70.6$
- (iOS only): Pod and Xcode deployment targets must be  $\geq 11$ . Find the pod target version in the Podfile in `<your_react_native_app>/ios/`.

### Get Your Application Key

From the Controller's **Getting Started Wizard**, create either an iOS or an Android application. You will be given a EUM App Key that you will use to instrument your application. In some cases, multiple mobile applications can share the same key.

If you have completed the **Getting Started Wizard**, but don't have your EUM App Key, see [Get Your Application Key](#).

### Eject Your React Native Application

If you created your React Native application with one of the commands in the following table, you must eject the application:

Command	Why Ejection Is Needed
<code>create-react-native-app</code>	This command lets you quickly set up and run a Native React application with no configuration. However, it does <i>not</i> provide the whole development environment required by the React Native Agent.
<code>expo init</code>	Currently, the React Native Agent module does not support Expo projects.

If you created your app with `create-react-native-app`, use `npm` to eject the app. If you used `expo`, run the `expo` command below to eject the app.

From your project directory, run the command appropriate for your use case:

npm expo

```
npm run eject
```

npm expo

```
expo eject
```

### Install the React Native Agent

This module injects the native AppDynamics agents into your application and offers a JavaScript bridge to the `Instrumentation` management interface.

1. Install the React Native Agent using any of the following commands:

NPM Yarn

```
npm install --save @appdynamics/react-native-agent
```

NPM Yarn

```
yarn add @appdynamics/react-native-agent
```

2. Build the configuration to enable the build-time instrumentation of your application:

```
node node_modules/@appdynamics/react-native-agent/bin/cli.js install
```

 The React Native Agent CLI assumes you've kept the default project structure created with the `react-native` CLI tools.

If the above commands failed, see [manually install the React Native package](#). Otherwise, proceed to [Add Permissions \(Android Only\)](#).

## Manually Install the React Native Package (Optional)

Most users do not have to manually install the package, but the command above may fail if you heavily modified your iOS and Android projects.

Follow these steps to manually install the React Native package:

[Android](#) [iOS](#)

1. Add the following line to your `android/build.gradle` :

```
apply from: '../node_modules/@appdynamics/react-native-agent/android/adeum.gradle'
```

2. Make sure the file `settings.gradle` contains a reference to the Appdynamics agent module as shown below.

```
include ':@appdynamics_react-native-agent'
project(':@appdynamics_react-native-agent').projectDir = new
File(rootProject.projectDir, '../node_modules/@appdynamics/react-native-agent/android')
```

3. Also, `android/app/build.gradle` should contain a reference to the Appdynamics agent module.

```
dependencies {
 implementation project(':@appdynamics_react-native-agent')
 // ...
}
```

[Android](#) [iOS](#)

For iOS, confirm that the following file exist:

File	File Location	Example
ADEUMReactNative.podspec	node_modules directory	<your_react_native_app>/ node_modules/@appdynamics/react-native-agent/ ADEUMReactNative.podspec

Make sure to add `libsqlite3` to your project as explained in [Add Required Libraries \(iOS Only\)](#).

## Add Permissions (Android Only)

Add the following permissions to your app's `AndroidManifest.xml` (which should be located under `android/app/src/main/`).

```
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
```

```

package="com.your.application">

// Add the following:
<uses-permission android:name="android.permission.ACCESS_NETWORK_STATE"/>

// ...
</manifest>

```

**i** The React Native Agent tries to minimize its network footprint. Without this permission, the agent always assumes poor network conditions and some metrics may not get reported.

## Instrument Your Application Code

In the `index.js` file of your React application:

1. At the top of the file near the other `import` statements, add the following line of code to import the agent:

```
import {Instrumentation} from '@appdynamics/react-native-agent';
```

2. a. In the same file and in the global scope, initialize the instrumentation with the following, making sure to replace `<EUM_APP_KEY>` with a string containing your [EUM App Key](#).

```
Instrumentation.start({
 appKey: <EUM_APP_KEY>,
});
```

**i** Whenever possible, we recommend you call `Instrumentation.start` in a context that permits awaiting for this async call and even enabling verbose logging for better debugging:

```

async function startInstrumentation() {
 await Instrumentation.start({
 appKey: <EUM_APP_KEY>,
 loggingLevel: LoggingLevel.VERBOSE
 });
}

```

3. Verify that your `index.js` file looks similar to the following:

```

import App from './src/App';
import {AppRegistry} from 'react-native';
import {name as appName} from './app.json';

```

```
import {Instrumentation} from '@appdynamics/react-native-agent';

Instrumentation.start({
 appKey: 'YOUR-APP-KEY',
});

AppRegistry.registerComponent(appName, () => App);
```

- (For older React Native setup builds) If you have `use_frameworks!` defined in your `ios/Podfile`, we recommend adding the following:

```
$ toggleADEUMRNStaticFramework = true
```

## Build and Run Your React Native Applications (Optional)

- Run the command to build and run the app for your platform.

[Android](#) [iOS](#)

```
npx react-native run-android
```

[Android](#) [iOS](#)

```
npx react-native run-ios
```

- From the Controller UI, [verify that the instrumentation was successful](#).

## Point to an On-Premises EUM Server (Optional)

To use an on-premises EUM Server, pass the URL to the on-premises EUM Server when you initialize the instrumentation with the EUM App Key from [Get Your Application Key](#).

```
Instrumentation.start({
 appKey: <EUM_APP_KEY>,
 collectorURL: <COLLECTOR_URL>
});
```

---

## Customize the React Native Instrumentation

The sections below describe how to use the React Native APIs to customize your instrumentation.

- [Using the React Native Agent APIs](#)
- [Change the App Key](#)
- [Collect Additional Types of Data](#)
- [Report Info Points](#)
- [Set Custom Timers](#)
- [Create Custom Metrics](#)
- [Add Custom User Data](#)
- [Leave Breadcrumbs](#)
- [Capture UI Events](#)
- [Disable the Agent to Stop Sending User Data to the Collector](#)
- [Programmatically Control Sessions](#)
- [Start and End Session Frames](#)
- [Configure and Take Screenshots](#)
- [Block and Unblock Screenshots](#)
- [Enable Logging and Set Logging Level](#)

### Using the React Native Agent APIs

After you have installed and initialized the React Native Agent, you instrument your application code by importing the class, interface, or enumeration and then calling API methods.

#### Import Syntax

To access the React Native Agent APIs, use an import statement at the top of the file. The following line imports the class `Instrumentation` :

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

#### API Method Syntax

Once the class, interface, or enumeration has been imported, call the API methods from the imported component. In this example, you set custom user data with `setUserDataBoolean` from the `Instrumentation` class.

```
Instrumentation.setUserDataBoolean("Boolean Key", true);
```

#### Change the App Key

You can use the React Native API to dynamically change the EUM App Key. You receive the app key when creating a mobile app in the Controller UI. See [Get Started with Mobile RUM](#) for more information about app keys.

## Class

The API to change app keys is available through the `Instrumentation` class.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

## Methods

The API consists of the following method:

- `changeAppKey(appKey)`

### Method Parameters

The `changeAppKey` method takes the following parameter:

Parameter Name	Data Type	Description
<code>appKey</code>	string	The EUM App Key.

## Examples

In this example, you create a method that takes a new app key and passes it to the API method `changeAppKey`.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
private updateAppKey(newAppKey) {
 Instrumentation.changeAppKey(newAppKey);
}
```

## Collect Additional Types of Data

The React Native APIs have methods that extend the application data types you can collect and aggregate with Mobile RUM. There are six basic kinds of extensions that you can create:

Type of Data	Description	Specifications	Where Data is Displayed
<a href="#">Info points</a>	How often a method is invoked, and how long it takes to run.	<ul style="list-style-type: none"> <li>• Data is numeric</li> <li>• Names must consist of alphanumeric characters and/or spaces</li> </ul>	<ul style="list-style-type: none"> <li>• <a href="#">Metric Browser</a></li> <li>• <a href="#">Custom Data</a></li> <li>• <a href="#">Network Request Snapshots</a></li> <li>• <a href="#">Mobile Sessions</a></li> <li>• <a href="#">Network Request Analyze</a></li> </ul>

Type of Data	Description	Specifications	Where Data is Displayed
<a href="#">Custom timers</a>	Any arbitrary sequence of events within your code timed, even spanning multiple methods.	<ul style="list-style-type: none"> <li>Data is numeric</li> <li>Metric names must consist of alphanumeric characters and/or spaces</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">Metric Browser</a></li> <li><a href="#">Custom Data</a></li> </ul>
<a href="#">Custom metrics</a>	Any integer-based data you wish to collect.	<ul style="list-style-type: none"> <li>Data is numeric</li> <li>Metric names must consist of alphanumeric characters and/or spaces</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">Metric Browser</a></li> <li><a href="#">Custom Data</a></li> </ul>
<a href="#">User data</a>	Any string key/value pair you think might be useful.	<ul style="list-style-type: none"> <li>Data can be any type</li> <li>Metric names have no restrictions</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">Network Request Snapshots</a></li> <li><a href="#">Mobile Sessions</a></li> <li><a href="#">Network Request Analyze</a></li> <li><a href="#">Crash Snapshots</a></li> </ul>
<a href="#">Breadcrumbs</a>	The context for a crash.	<ul style="list-style-type: none"> <li>Data can be any data type</li> <li>Metric names have no restrictions</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">Network Request Snapshots</a></li> <li><a href="#">Mobile Sessions</a></li> <li><a href="#">Network Request Analyze</a></li> <li><a href="#">Crash Snapshots</a></li> </ul>
<a href="#">User interactions</a>	Capture when users press buttons, click on lists, and select text.	<ul style="list-style-type: none"> <li>Data can be any data type</li> <li>Metric names have no restrictions</li> </ul>	<ul style="list-style-type: none"> <li><a href="#">Network Request Snapshots</a></li> <li><a href="#">Mobile Sessions</a></li> <li><a href="#">Network Request Analyze</a></li> </ul>

## Report Info Points

Information points allow you to track how your own code is running. Unlike the other React Native APIs that require importing a module and using a method from that module, you add annotations to your code to report info points.

### Class/Interface

The API is available through the `InfoPoint` function.

```
import { InfoPoint } from '@appdynamics/react-native-agent';
```

## Methods

With the `@InfoPoint` annotation, you only need to provide a function to report info points. The `@InfoPoint` annotation has two signatures:

- `@InfoPoint`
- `@InfoPoint({className: string, fnName: string})`

### Method Signatures

Methods	Parameters	Description
<code>@InfoPoint</code>	None	Automatically reports the info points of the method that is being annotated.
<code>@InfoPoint({className: string, fnName: string})</code>	Object <ul style="list-style-type: none"> <li>• <code>className</code> - The name of the file or module where the info point is recorded.</li> <li>• <code>fnName</code> - The function that invokes <code>beginCall</code> to track an info point.</li> </ul>	Manually specify the class and function names to annotate. For example: <pre>@InfoPoint({ className: 'Automobiles', fnName: 'checkInventory' })</pre>

## Examples

The following examples show you how to use automatic and manual reporting of info points. We recommend you use automatic reporting if your code will not be minified: it's simpler and reports the same information. If your code will be minified, however, you should manually report the class and function names to avoid reporting the useless class and function names created by minification.

### Automatic Reporting

Add the annotation `@InfoPoint` to automatically create an info point for the method below it. Info point reports how the method is invoked and how long it takes to run.

```
import { InfoPoint } from '@appdynamics/react-native-agent';

class InfoPointsScreen extends Component {

 @InfoPoint
 public infoPointMethod(arg1, arg2, value) {
 console.log("Executing infoPointMethod!");
 }
}
```

### Manually Reporting

To create an info point for a specific method in a class (the symbol names), pass an object to the `@InfoPoint` annotation that specifies the class and method name as shown below.

```
import { InfoPoint } from '@appdynamics/react-native-agent';

class InfoPointsScreen extends Component {

 @InfoPoint({ className: 'MyClass', fnName: 'infoPointMethod' })
 public infoPointMethod(arg1, arg2, value) {
 console.log("Executing infoPointMethod!");
 }
}
```

## Set Custom Timers

You create custom timers to time any arbitrary sequence of events within your code, even spanning multiple methods.

### Class/Interface

The Custom Timers API is accessible through the `Instrumentation` class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

### Methods

You create the custom timers using the following React Native Agent API methods:

- `startTimerWithName(name)`
- `stopTimerWithName(name)`

### Method Parameters

Both methods take the following parameter:

Name	Type	Description
<code>name</code>	string	The name of the custom timer. Allowed characters are [A-Za-z\s0-9]. Illegal characters are replaced by their ASCII hex value.

### Examples

For example, to track the time a user spends viewing a screen, the instrumentation could look like this:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
private startCustomTimer() {
 Instrumentation.startTimer("My timer");
}
```

```

}
private stopCustomTimer() {
 Instrumentation.stopTimer("My timer");
}

```

## Create Custom Metrics

The React Native API enables you to report custom metrics. You specify the name of the custom metric that will appear in the Controller UI.

### Class

The Custom Metrics API is accessible through the `Instrumentation` class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

### Methods

You create custom metrics with the `reportMetric`:

- `reportMetric(name, value)`

### Method Parameters

The `reportMetric` method takes the following parameters:

Name	Type	Requirements	Description
<code>name</code>	string	The metric names must consist of alphanumeric characters. Illegal characters are replaced by their ASCII hex value.	The name of the custom metric.
<code>value</code>	number	The value must be a whole number, otherwise, an error will be returned.	The numeric value associated with the custom metric.

### Examples

For example, the following method could be used to report custom metrics:

```

import { Instrumentation } from '@appdynamics/react-native-agent';
...
private reportMetrics() {
 Instrumentation.reportMetric("Normal metric", 23);
 Instrumentation.reportMetric("Large metric", Number.MAX_SAFE_INTEGER + 1);
 Instrumentation.reportMetric("Small metric", Number.MIN_SAFE_INTEGER - 1);
}

```

## Add Custom User Data

Use the Custom User Data API to set and remove key/value pairs of different data types. The key must be unique across your application.

### Class

The Custom User Data API is accessible through the `Instrumentation` class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

### Methods

The API provides the following methods for setting and removing custom user data:

Methods for Setting Custom User Data	Methods for Removing Custom User Data
<ul style="list-style-type: none"> <li><code>setUserData(key, value)</code></li> <li><code>setUserDataBoolean(key, value)</code></li> <li><code>setUserDataDate(key, value)</code></li> <li><code>setUserDataDouble(key, value)</code></li> <li><code>setUserDataInteger(key, value)</code></li> </ul>	<ul style="list-style-type: none"> <li><code>removeUserData(key)</code></li> <li><code>setUserDataBoolean(key)</code></li> <li><code>setUserDataDate(key)</code></li> <li><code>setUserDataDouble(key)</code></li> <li><code>setUserDataInteger(key)</code></li> </ul>

### Method Parameters

The following table lists the parameters for the methods for setting custom user data.

Methods for Setting Custom User Data	Parameters	Data Type
<code>setUserData</code>	key	string
	value	string    null
<code>setUserDataBoolean</code>	key	string
	value	boolean
<code>setUserDataDate</code>	key	string
	value	Date object
<code>setUserDataDouble</code>	key	string
	value	number
<code>setUserDataInteger</code>	key	string

Methods for Setting Custom User Data	Parameters	Data Type
	value	number

The following table lists the parameters for the methods for removing custom user data.

Methods for Removing Custom User Data	Parameters	Data Type
removeUserData	key	string
removeUserDataBoolean		
removeUserDataDate		
removeUserDataDouble		
removeUserDataInteger		

**i** The method `removeUserData` is called when setting custom data to the value `null`. For example, the method `Instrumentation.setUserData("name", null)` will call `Instrumentation.removeUserData("name")`.

### Examples

The following code example shows how to set and remove user data with the Custom User Data API:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
private setUserData() {
 Instrumentation.setUserData("userId", "AISJ1723871");
 Instrumentation.setUserDataBoolean("isVip", true);
 Instrumentation.setUserDataDate("purchaseDate", new Date(1234567890));
 Instrumentation.setUserDataDouble("monthlyVisits", 1.2345);
 Instrumentation.setUserDataInteger("totalPurchasedItems", 42);
}
private clearUserData() {
 Instrumentation.removeUserData("userId", null);
 Instrumentation.removeUserDataBoolean("isVip", null);
 Instrumentation.removeUserDataDate("purchaseDate", null);
 Instrumentation.removeUserDataDouble("monthlyVisits", null);
 Instrumentation.removeUserDataInteger("totalPurchasedItems", null);
}
```

## Leave Breadcrumbs

Breadcrumbs enable you to situate a crash in the context of your user's experience. Set a breadcrumb when something interesting happens. If your application crashes at some point in the future, the breadcrumb will be displayed along with the crash report. Each crash report displays the most recent 99 breadcrumbs.

### Class

The Breadcrumb API is accessible through the `Instrumentation` class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

### Methods

You create and leave breadcrumbs with the following API method:

- `leaveBreadcrumb(breadcrumb, mode)`

### Method Parameters

The method `leaveBreadcrumb` takes the following parameters:

Name	Type	Description
<code>breadcrumb</code>	string	The string to include in the crash report and sessions. Truncated at 2048 characters; empty values are ignored.
<code>mode</code>	Enumeration	<p>The mode determining where the <code>breadcrumb</code> will be displayed. You can report crashes only or crashes and sessions with the following modes:</p> <ul style="list-style-type: none"> <li>• <code>BreadcrumbVisibility.CRASHES_ONLY</code></li> <li>• <code>BreadcrumbVisibility.CRASHES_AND_SESSIONS</code></li> </ul> <p>The default mode is <code>BreadcrumbVisibility.CRASHES_ONLY</code>. If the value is invalid, the default mode will be applied.</p>

### Examples

#### Basic Usage

The following example shows the syntax and usage of the Breadcrumb API.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
private leaveBreadcrumb() {
 Instrumentation.leaveBreadcrumb("Drop a breadcrumb button implementation",
 BreadcrumbVisibility.CRASHES_AND_SESSIONS);
}
```

## Extended Use Case

Supposed your React Native app has a wizard that shows different steps of a process sequentially on the same screen. In the case of a crash or an "Application Not Responding" (ANR) error, you would want to know what step of the wizard caused the crash or ANR.

If your app had a wizard engine similar to the one below, you could leave a breadcrumb for each screen to track events and issues.

```

async function wizard(...screens) {
 let currentScreen = 0;
 while (true) {
 const screen = screens[currentScreen];
 if (screen == null) return;
 // Report the current screen with AppDynamics instrumentation
 Instrumentation.leaveBreadcrumb('wizard screen ' + screen.name);
 currentScreen += await screen.action();
 }
}

```

The wizard engine could be used for a checkout:

```

wizard(
 { name: 'review cart', action:reviewCartAction },
 { name: 'chose payment', action:chosePaymentAction },
 { name: 'chose address', action:choseAddressAction },
 { name: 'review order', action:reviewOrderAction },
 { name: 'checkout', action:checkoutAction }
)

```

If you receive an alert that your app is triggering a lot of ANRs, you can diagnose the problem through the mobile sessions where the ANRs occur. In the session, you will see the breadcrumbs associated with the ANRs. For example, you may discover that the breadcrumbs "review cart" and "chose payment" are associated with ANRs, but "chose address" is not. Further investigation of the payment screen could lead to the discovery that the process that is encrypting credit card numbers is running on the main thread and freezing the app.

## Capture UI Events

You can capture UI events using the following API:

### Methods

The API consists of the following method:

```
Instrumentation.trackUIEvent()
```

### Parameters

An object of type `UIEventInfo`

## Example

```

export interface UIEventInfo {
 /** Name of the current screen */
 screenName: string;

 /** Name of the action, e.g. "Button Pressed", "Text View Unfocused" */
 eventName: string;

 /** Class of the UI element, e.g. TouchableOpacity */
 className: string;

 /** Tag value for the component. */
 tag?: number;

 /** The title of a component. */
 label?: string;

 /** The accessibility label of the component. */
 accessibilityLabel?: string;

 /** Index in a FlatList. */
 index?: string;

 /** Name of the method called onPress. */
 uiResponder?: string;
}

```

## Supported User Interactions

You can capture when users do one or all of the following:

- press buttons
- select table cells
- select text fields
- select text views

## Security and Privacy Concerns

The interaction capture mode is disabled by default for security and privacy reasons, as user interactions may contain sensitive information. Moreover, this potential security and privacy issue may be compounded if you enable both the capturing of UI interactions and screenshots.

## Class

The Interaction Capture Mode API is accessible through the `InteractionCaptureMode` class, but you also need the `Instrumentation` class to start instrumentation with the configured user capture mode.

```
import { Instrumentation, InteractionCaptureMode } from '@appdynamics/react-native-agent';
```

## Properties

The following properties are accessed through the `InteractionCaptureMode` class and used to configure the user interaction capture. For example: `InteractionCaptureMode.All`

Property	Description	Platform Support
<code>All</code>	Track all the user interactions.	iOS, Android
<code>ButtonPressed</code>	Track button presses.	iOS, Android
<code>ListViewItemsSelected</code>	Track "List Item" clicks and focus changes for <code>android.widget.AbsListView</code> and its subclasses.	Android
<code>None</code>	Disables the tracking of any user interactions.	iOS, Android
<code>TableCellSelected</code>	Track table cell selection.	iOS
<code>TextFieldSelected</code>	Track text field selection.	iOS, Android
<code>TextViewSelected</code>	Track text view selection.	iOS

## Methods

The API methods take an array of user interaction capture modes and return an `InteractionCaptureMode` object that determines which user interactions will be captured. The methods do not mutate the object.

Method	Description
<code>with</code>	Combines the multiple user interaction capture modes.
<code>without</code>	Excludes the specified user interaction modes from being captured.

## Examples

### Set User Interaction Mode with API Properties

The following example configures the React Native Agent to capture all user interactions.

```
import { Instrumentation, InteractionCaptureMode } from '@appdynamics/react-native-agent';
...
Instrumentation.start({
 appKey: <EUM_APP_KEY>,
 // ...your other configurations
});
```

```

// Capture all user interactions
interactionCaptureMode: InteractionCaptureMode.All
})

```

### Combine User Interaction Modes

In the following example, the `with` method combines the `ButtonPressed` (button presses) and `TextFieldSelected` (text field selected) modes with the `None` mode, effectively just enabling those two user interaction modes.

```

import { Instrumentation, InteractionCaptureMode } from '@appdynamics/react-native-agent';
...
Instrumentation.start({
 appKey: <EUM_APP_KEY>,
 // ...your other configurations

 // Only enable "ButtonPressed" and "TextFieldSelected" interaction modes, and disable the
 rest.
 interactionCaptureMode: InteractionCaptureMode.None.with(
 InteractionCaptureMode.ButtonPressed,
 InteractionCaptureMode.TextFieldSelected
)
})

```

### Exclude User Interaction Modes

The following example excludes the user interaction modes `ButtonPressed` (button presses) and `TextFieldSelected` (text field selected) from the mode `InteractionCaptureMode.All` (all user interactions). Effectively, the React Native Agent would be configured to only capture `ListViewItemSelected` ("List Item" clicks), `TableCellSelected` (table cell selection), and `TextViewSelected` (text view selected) modes.

```

import { Instrumentation, InteractionCaptureMode } from '@appdynamics/react-native-agent';
...
Instrumentation.start({
 appKey: <EUM_APP_KEY>,
 // ...your other configurations

 // Include all capture modes except "ButtonPressed" and "TextFieldSelected".
 interactionCaptureMode: InteractionCaptureMode.All.without(
 InteractionCaptureMode.ButtonPressed,
 InteractionCaptureMode.TextFieldSelected
)
})

```

---

## Disable the Agent to Stop Sending User Data to the Collector

You can disable the agent to stop sending all data to the collector while the agent is initialized and running. For example, you can disable the agent if your app has an option for users to opt-out of monitoring for privacy reasons.

### `shutdownAgent`

The `shutdownAgent` call stops outgoing data to the collector, and does not persist data on the device.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
Instrumentation.shutdownAgent();
```

- The call only stops the traffic out of the agent.
- Once the agent has been initialized, the call cannot be removed, and a license will have been consumed.

### `restartAgent`

To re-enable the agent and reverse `shutdownAgent`, use `restartAgent`.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
Instrumentation.restartAgent();
```

- This call will respect the server side calls that can remotely shutdown the agent in a similar way.
- The call is only in effect while the app is running.
- The call will be ignored if the agent has been remotely disabled.
- If the call is removed from memory and the app restarts, or the device is rebooted, the agent will be initialized as normal.

## Programmatically Control Sessions

By default, a mobile session ends after a period of user inactivity. For example, when a user opens your application, the session begins and only ends after the user stops using the app for a set period of time. When the user begins to use the application again, a new session begins. Instead of having a period of inactivity to define the duration of a session, however, you can use this API to programmatically control when sessions begin and end.

### Class

The API is accessible through the `Instrumentation` class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

### Methods

The API provides the following method for ending the current session and starting a new session:

Method	Description
<code>startNextSession()</code>	When you call the method <code>startNextSession</code> from <code>Instrumentation</code> , the current session ends and a new session begins. The API enables you to define and frame your sessions so that they align more closely with business goals and expected user flows. For example, you could use the API to define a session that tracks a purchase of a product or registers a new user.

**i** Excessive use of this API will cause sessions to be throttled (excessive use is >10 calls per minute, but is subject to change). When not using the API, sessions will fall back to the default of ending after a period of user inactivity.

## Examples

In the following example, the current session ends and a new one begins when the check out is made.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
private checkoutCart(){
 if (currentCartItems!=null && currentCartItems.size()>0){
 CheckoutTask checkoutReq = new CheckoutTask();
 checkoutReq.execute(getEndpoint() + "cart/co");
 currentCartItemsMap.clear();
 convertItemsMaptoList();
 Instrumentation.startNextSession();
 } else {
 displayToast("There are no items in the cart");
 }
}
```

## Start and End Session Frames

You can use the React Native Agent API to create session frames that appear in the session activity. Session frames provide context for what the user is doing during a session. With the API, you can improve the names of user screens and chronicle user flows within a business context.

## Use Cases

The following are common use cases for session frames:

- One page performs multiple functions and you want more granular tracking of the individual functions.
- A user flow spans multiple pages or user interactions. For example, you could use the API to create the session frames "Login", "Product Selection", and "Purchase" to chronicle the user flow for purchases.
- You want to capture dynamic information based on user interactions to name session frames, such as an order ID.

## Class/Interface

The `SessionFrame` API is accessible through the `Instrumentation` class.

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

To update the name and end a session frame, you would use the `SessionFrame` interface.

## Methods

The following table lists the three methods you can use with session frames. In short, you start a session frame with `startSessionFrame` and then use `updateName` and `end` to rename and end the session frame.

Method	Description
<code>startSessionFrame(name)</code>	Starts the session frame. You call this method from <code>Instrumentation</code> , and it returns <code>SessionFrame</code> object.
<code>updateName(name)</code>	Updates the name of the session frame. You call this method from the <code>SessionFrame</code> object.

## Method Parameters

The methods `startSessionFrame` and `updateName` takes the following parameter:

Parameters	Data Type	Description
<code>name</code>	string	The name of the session frame.

## Session Frame Example

In the following example, session frames are used to track user activity during the checkout process.

```
let sessionFrame: SessionFrame | undefined;

private onCheckoutCartButtonClicked() {
 // The user starts the checkout by clicking the checkout button.
 // This may be after they have updated the quantities of items in the cart, etc.
 sessionFrame = Instrumentation.startSessionFrame("Checkout");
}

private onConfirmOrderButtonClicked() {
 // Once they have confirmed payment info and shipping information, and they
 // are clicking the "Confirm" button to start the backend process of checking out,
 // we may know more information about the order itself, such as an order ID.
 if (sessionFrame) {
 sessionFrame.updateName("Checkout: Order ID " + orderId);
 }
}

private onProcessOrderCompleted() {
```

```

 // Once the order is processed, the user is done "checking out", so we end the session
 frame.
 if (sessionFrame) {
 sessionFrame.end();
 sessionFrame = null;
 }
}
private onCheckoutCancelled() {
 // If the user cancels or returns to the cart, you'll want to end the session frame also,
 or else it will be
 // left open and appear to have never ended.
 sessionFrame.end();
 sessionFrame = null;
}
}
}

```

## Configure and Take Screenshots

By default, mobile screenshots are enabled on the agent-side but disabled on the Controller-side. These screenshots appear in the Controller in the [Sessions Details](#) dialog. To programmatically take manual screenshots, you must [enable screenshots in the Controller UI](#) and add the Screenshot API below.

### Class

The Screenshot API is accessible through the `Instrumentation` class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

### Methods

The Screenshot API provides the following methods:

Method	Return Value	Description
<code>takeScreenshot()</code>	None	<p>Asynchronously takes a screenshot of the current screen.</p> <p>This will capture everything, including personal information, so you must be cautious of when to take the screenshot.</p> <p>These screenshots will show up in the Sessions screen for this user.</p> <p>The screenshots are taken on a background thread, compressed, and only non-redundant parts are uploaded, so it is safe to take many of these without impacting the performance of your application.</p>

Method	Return Value	Description
<code>screenshotsBlocked()</code>	Promise<boolean>	Returns a Boolean indicating whether screenshot capture is blocked.
<code>blockScreenshots()</code>	Promise<void>	Blocks screenshot capture and returns a Promise that resolves when screenshots are effectively blocked.
<code>unlockScreenshots()</code>	Promise<void>	<p>Unblocks screenshot capture if it is currently blocked. Otherwise, this has no effect.</p> <p>If screenshots are disabled through <code>AgentConfiguration.screenshotsEnabled</code> or through the Controller UI, this method has no effect.</p> <p>If screenshots are set to manual mode in the Controller UI, this method unblocks for manual mode only.</p>

## Configure Screenshots

### Disable Screenshots

You can [disable screenshots from the Controller UI](#) or with the React Native API. To disable screenshots, set the property `screenshotsEnabled` to `false` when initializing the Native React Agent.

```
Instrumentation.start({
 appKey: <EUM_APP_KEY>,
 screenshotsEnabled: false,
 ...
});
```

### Set On-Prem Screenshot Service

If you have deployed an on-prem EUM Server, you will need to specify the URL to the EUM Server with the property `screenshotURL`.

```
Instrumentation.start({
 appKey: <EUM_APP_KEY>,
 screenshotURL: "https://<COLLECTOR_URL>:<PORT>",
 ...
});
```

## Examples

### Take Screenshots

You can configure the Controller UI to automatically take screenshots or use the React Native API to manually take a screenshot as shown below:

```
private loadShoppingCart() {
 // Load shopping cart
 this.setState({
 shoppingCart: this.state.cart
 });
 // Manually take screenshot
 Instrumentation.takeScreenshot();
}
```

**i** This will capture everything, including personal information, so precaution is necessary when taking screenshots

### Block and Unblock Screenshots

You can also block screenshots from being taken during the execution of a code block. This just temporarily blocks screenshots from being taken until you unblock screenshots. This enables you to stop taking screenshots in situations where users are entering personal data, such as on login and account screens.

```
private displayCustomerAccount() {
 // Check to see if screenshots are blocked
 if (!Instrumentation.screenshotsBlocked()) {
 // If screenshots aren't blocked, block them before showing customer details
 Instrumentation.blockScreenshots();
 }
 // Code to display customer details

 // After you're done, unblock screenshots
 Instrumentation.unblockScreenshots();
}
```

### Enable Logging and Set Logging Level

You enable logging by setting the logging level in the instrumentation configuration. You are recommended to disable logging for production.

#### Class

The Logging Level API is accessible through the `LoggingLevel` class:

```
import { LoggingLevel } from '@appdynamics/react-native-agent';
```

### Configuration Properties

You enable and set the logging level with the following configuration property:

- `loggingLevel`

## Logging Levels

You can set logging to one of the following levels:

Enumeration	Logging Level	Description
LoggingLevel.NONE	None	No logs are displayed. <b>This level disables logging.</b>
LoggingLevel.INFO	Info	Warning, errors, and developer-focused messages are displayed.
LoggingLevel.VERBOSE	Verbose	Errors, warnings, developer information, debugging, and troubleshooting messages are displayed.

## Examples

In the following example, logging is enabled and the logging level is set to `VERBOSE` :

```
private async start() {
 try {
 await Instrumentation.start({
 appKey: this.state.appKey,
 loggingLevel: LoggingLevel.VERBOSE,
 anrDetectionEnabled: true,
 interactionCaptureMode: InteractionCaptureMode.None.with(
 InteractionCaptureMode.ButtonPressed,
 InteractionCaptureMode.ListViewItemSelected,
 InteractionCaptureMode.TableCellSelected,
 InteractionCaptureMode.TextFieldSelected,
 InteractionCaptureMode.TextViewSelected
)
 })
 }
}
```

## Receive a Crash Report Summary for Native Crashes

You can use `CrashReportCallback` to receive a report for native crashes.

### Class

The `CrashReportCallback` API is accessible through the `Instrumentation` class:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
```

## How to Use

1. Submit the `CrashReportCallback` object as the `crashReportCallback` native agent configuration option.

```
Instrumentation.start({
 crashReportCallback: (summaries: CrashReportSummary[]) => {
 console.log(summaries);
 },
});
```

2. On application restart, you will receive a `CrashReportSummary` for each crash.

```
export type CrashReportSummary = {
 crashId: string;
 exceptionName: string;
 exceptionReason: string;
 signalName: string;
 signalCode: string;
};
```

## CrashReportSummary Properties

`CrashReportSummary` has the following properties:

Name	Type	Description
<code>crashId</code>	string	Uniquely defines the crash. Can be used as key to find the full crash report or look up the crash in the Controller UI.
<code>exceptionName</code>	string	The exception name, may be <code>null</code> if no exception occurred.
<code>exceptionReason</code>	string	The exception reason, may be <code>null</code> if no exception occurred.
<code>signalName</code>	string	The exception signal name.
<code>signalCode</code>	string	The exception signal code.

## Disable Crash Reporting

Crash reporting is enabled by default, but you can manually disable crash reporting through the instrumentation configuration. If you are using other crash reporting tools, you might disable crash reporting to minimize conflicts and optimize the crash report results.

You can disable crash reporting by configuring the instrumentation with the `crashReportingEnabled` property as shown in the following:

```
import { Instrumentation } from '@appdynamics/react-native-agent';

Instrumentation.start({
 appKey: <#EUM_APP_KEY#>,
 crashReportingEnabled: false
})
```

## Report Errors and Exceptions

You can report exceptions using the method `reportError` from the `Instrumentation` class. Reported exceptions will appear in session details.

You can also set one of the severity levels below for an issue. With the severity level, you can filter errors in the **Code Issues Dashboard** or **Code Issues Analyze**.

- `ErrorSeverityLevel.INFO`
- `ErrorSeverityLevel.WARNING`
- `ErrorSeverityLevel.CRITICAL`

The example below uses the API to report possible exceptions and sets the severity level to `ErrorSeverityLevel.CRITICAL` (critical) when writing to a file

```
import { Instrumentation, ErrorSeverityLevel } from '@appdynamics/react-native-agent';
...
try {
 await asyncTask();
} catch (error) {
 Instrumentation.reportError(error, ErrorSeverityLevel.CRITICAL);
}
...

```

## Log Silenced Errors

If you use React Native's `ErrorBoundary`, the errors are silently caught, but the agent will not receive and log them. If you want silenced crashes to be logged, we recommend you use `ErrorBoundary` provided in the AppDynamics React Native package:

```
import { ErrorBoundary } from '@appdynamics/react-native-agent'
```

## Use the Agent with a Custom HTTP Library

The agent automatically detects network requests when the underlying implementation is handled by `NSURLConnection / NSURLSession` classes (iOS) or `HttpURLConnection / OkHttp` (Android). This covers most network requests, but in some cases, mobile applications use custom HTTP libraries.

To enable the agent to detect requests from a custom library, add request tracking code to your application manually with the `RequestTracker` class.

 You must initialize the agent with a valid key using the `Instrumentation.start()` interface before using this method.

### Request Tracker Properties

The following properties should be set on the RequestTracker object to describe the parameters of the custom call.

Property	Description	Code
<code>error</code>	<p>Javascript error or <code>null</code></p> <p>An error describing the failure to receive a response, if one occurred. If the request was successful, this should be left <code>null</code>.</p>	<pre>tracker.setError(e);</pre>
<code>statusCode</code>	<p>Number or <code>null</code></p> <p>The status code of response, if one was received. If a response was received, this should be an integer. If an error occurred and a response was not received, this should remain <code>null</code>.</p>	<pre>tracker.setResponseStatusCode(response.statusCode);</pre>
<code>requestHeaders</code>	<p>Dictionary or <code>null</code></p> <p>A dictionary representing the keys and values from the client's request header.</p>	<pre>tracker.setRequestHeaders(headers);</pre>
<code>responseHeaders</code>	<p>Dictionary or <code>null</code></p> <p>A dictionary representing the keys and values from the server's response header. If an error occurred and a response was not received, this should be <code>null</code>.</p>	<pre>tracker.setResponseHeaders(headers);</pre>

### Track a Custom HTTP Request

To add manual request tracking, you must specify when the request begins, when it ends and what the status of the response is.

1. Create a `RequestTracker` object immediately before sending the request:

```
import { Instrumentation } from '@appdynamics/react-native-agent';
...
const tracker = new RequestTracker({ "My_URL" });
```

**i** "MY\_URL" is the URL being called. This parameter must not be `null`.

2. (Optional) Add your custom headers to the tracker before sending the request:

```
const headers = {
 'Content-Length': '5000',
};
tracker.setRequestHeaders(headers);
```

**i** `requestHeaders`: A dictionary (or `null`) representing the keys and values from the request headers.

3. (Optional) Enable correlation between your request and server-side processing. Add specific headers to outgoing requests that the server-side agent can detect and return the headers obtained from the server-side agent in the response to make them available to the agent:

```
tracker.addServerCorrelationHeaders()
```

4. Immediately after receiving a response or an error, set properties on the tracker object based on whether the request finished successfully or ended in error:

```
try {
 const response = await customRequest(url);
 tracker.setResponseStatusCode(response.statusCode);
 tracker.setResponseHeaders(response.headers);
} catch (e) {
 tracker.setError(e);
}
```

6. Call `reportDone()`:

```
tracker.reportDone();
```

 To track another request, instantiate a new tracker object again.

### Complete example

```
const tracker = new requestTracker({
 url: <MY_URL>
});

const headers = {
 'Content-Length': '5000',
};
tracker.setRequestHeader(headers);
tracker.addServerCorrelationHeaders();

try {
 const response = await customRequest(url);
 tracker.setResponseStatusCode(response.statusCode);
 tracker.setResponseHeaders(response.headers);
} catch (e) {
 tracker.setError(e);
} finally {
 tracker.reportDone();
}
```

### React Native API Documentation

For the React Native Agent API reference documentation, see the [latest React Native Agent API documentation](#) or the previous versions:

- <https://sdkdocs.appdynamics.com/react-native-agent/22.5/>
- <https://sdkdocs.appdynamics.com/react-native-agent/21.11/>
- <https://sdkdocs.appdynamics.com/react-native-agent/21.4/>
- <https://sdkdocs.appdynamics.com/react-native-agent/21.2/>

## Instrument Flutter Applications

The Flutter Agent monitors Flutter mobile applications. This page covers how to instrument the Flutter Agent in your Flutter application project.

### Instrument the Flutter Agent

To instrument the Flutter Agent:

1. Add the Flutter Agent to your project:

```
flutter pub add appdynamics_agent
```

2. Start the instrumentation at the start of the application (usually in `main.dart`):

```
import 'package:appdynamics_agent/appdynamics_agent.dart';
import 'package:flutter/material.dart';

Future<void> main() async {
 WidgetsFlutterBinding.ensureInitialized();

 final config = AgentConfiguration(
 appKey: "<EUM_APP_KEY>",
 loggingLevel: LoggingLevel.verbose, // optional, for better debugging.
 collectorURL: "<COLLECTOR_URL>", // optional, mostly on-premises.
 screenshotURL: "<SCREENSHOT_URL>" // optional, mostly on-premises.
);
 await Instrumentation.start(config);

 runApp(const MyApp());
}
```

3. (Android apps only) Add the following configurations:
  - a. Add the following changes to `android/build.gradle`:

```
dependencies {
 classpath "com.appdynamics:appdynamics-gradle-plugin:22.2.2"
 // ... other dependencies
}
```

- b. Apply the `adeum` plugin to the bottom of the `android/app/build.gradle` file:

```
dependencies {
 // ... project dependencies
}

// Bottom of file
apply plugin: 'adeum'
```

- c. Add the following permissions to your `AndroidManifest.xml` file (usually in `android/src/main/`):

```
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
 package="com.example.myawesomepackage">

 <!-- add these two permissions -->
 <uses-permission android:name="android.permission.INTERNET" />
 <uses-permission android:name="android.permission.ACCESS_NETWORK_STATE" />
```

```
<application>
<!-- other settings -->
```

## Next Steps

To further customize how data is collected and reported, see [Customize the Flutter Instrumentation](#).

## Customize the Flutter Instrumentation

Once you have [instrumented your Flutter application](#), you can make further manual customizations to the instrumentation.

- [Network Requests](#)
- [Crashes](#)
- [Crash Callback](#)
- [Session Frames](#)
- [Metrics](#)
- [Automatic Screenshots \(iOS Only\)](#)
- [User Data](#)
- [Breadcrumbs](#)
- [Timers](#)
- [Errors](#)
- [Application Not Responding \(ANR\)](#)
- [Info Points](#)
- [Sessions](#)
- [App Key](#)
- [Screen Tracking](#)
- [Device Metrics](#)
- [Flutter Agent API Documentation](#)

## Network Requests

To collect metrics on network requests, you can use the HTTP client wrapper:

### DART

```
import 'package:http/http.dart' as http;

try {
 final client = TrackedHttpClient(http.Client());
 final response = await client.get(Uri.parse("https://www.appdynamics.com"));
 print(response);
} catch (e) {
 print(e);
}
```

If you need more granular control over request tracking, such as adding user data to the request, you can manually create a tracker object that will register request information on completion:

```
try {
 final url = "www.appdynamics.com"
 final tracker = await RequestTracker.create(url);
```

```

final response = await http.get(url);

await tracker.setResponseStatusCode(response.statusCode)
 ..setRequestHeaders(response.request!.headers)
 ..setResponseHeaders(response.headers)
 ..setUserDataBool("shouldRespond", false);
} catch (e) {
 await tracker.setError(e.toString());
} finally {
 await tracker.reportDone();
}

```

## Add Server Correlation Headers

If another AppDynamics Agent is also used to instrument the backend of the application, you can add server correlation headers to pinpoint business transactions:

```

import 'package:http/http.dart' as http;

try {
 final headers = await RequestTracker.getServerCorrelationHeaders();
 final url = Uri.parse("https://www.appdynamics.com");
 final client = HttpClient(http.Client());
 final response = await client.get(url, headers: headers);
 print(response);
} catch (e) {
 print(e);
}

```

## Methods

`RequestTracker.create(url)`

Returns a `RequestTracker` object to be configured for manually tracking an HTTP request by providing a non-null `url` (after calling `Instrumentation.start()`).

### Parameters

Name	Type	Requirements	Description
url	String	Non-null.	The target URL of the request that will be tracked.

`setError(message, stackTrace)`

Sets an error message describing the failure to receive a response (if such a failure occurred). If the request was successful, this method should not be called. Additional `stackTrace` strings can be added.

## Parameters

Name	Type	Requirements	Description
message	String	Request did not finish successfully.	The error message or a string describing the error.
stackTrace	String	Request did not finish successfully.	The error stackTrace property (if any).

```
setResponseStatusCode(statusCode)
```

Sets the status code of the response (if any). If a response was received, this method should be an integer. If an error occurred and a response was not received, this method should not be called.

## Parameters

Name	Type	Requirements	Description
statusCode	Integer	Request finished successfully.	The status code of the response.

```
setRequestHeaders(requestHeaders)
```

Adds the request headers to the tracker object. If an error occurred and a response was not received, this method should not be called.

## Parameters

Name	Type	Requirements	Description
requestHeaders	Map<String, String>	Request finished successfully.	A map of key-value pairs representing the request's header values.

```
setResponseHeaders(responseHeaders)
```

Adds the request response to the tracker object. If an error occurred and a response was not received, this should not be called.

## Parameters

Name	Type	Requirements	Description
<code>responseHeaders</code>	<code>Map&lt;String, String&gt;</code>	Request finished successfully.	A map of key-value pairs representing the response's header values.

`reportDone()`

Signals that the HTTP request has finished and logged the appropriate information. If another request needs tracking, a new `RequestTracker` should be created.

`getServerCorrelationHeaders()`

Returns the server correlation headers to be used if an AppDynamics Agent is also used on the server-side. Headers should be appended on the tracked request.

`setUserdata`

You can append custom values to the request tracking object with each corresponding API:

- `setUserData(key, value)`
- `setUserDataBool(key, value)`
- `setUserDataDateTime(key, value)`
- `setUserDataDouble(key, value)`
- `setUserDataInt(key, value)`

#### Parameters

Name	Type	Requirements	Description
<code>key</code>	<code>String</code>	Max. 2048 characters. Unique (or will be overwritten).	Key name for the corresponding value.
<code>value</code>	<code>String, bool, DateTime, double, int</code>	Max. 2048 characters.	Custom info appended to the request.

## Crashes

### Report Native Crashes

The Flutter Agent automatically logs native crash information. This is already enabled when calling `Instrumentation.start()`. Native crashes can be symbolicated passing the corresponding `.dsym` or `ProGuard` files in the UI Controller. See [Get Human-Readable Crash Snapshots](#).

### Report All Crashes

For capturing all errors (Flutter and native), use zones:

```

import 'dart:async';
import 'package:flutter/material.dart';
import 'package:appdynamics_mobilesdk/appdynamics_mobilesdk.dart';

void main() {
 runZonedGuarded(() {
 WidgetsFlutterBinding.ensureInitialized();
 FlutterError.onError = Instrumentation.errorHandler;
 runApp(MyApp());
 }, (Object error, StackTrace stack) async {
 final details =
 FlutterErrorDetails(exception: error.toString(), stack: stack);
 await Instrumentation.errorHandler(details);
 });
}

```

## Report Dart Exceptions

Use the error handler provided by the Flutter Agent to intercept Dart exceptions and send them to the Controller:

```

import 'package:flutter/material.dart';
import 'package:appdynamics_mobilesdk/appdynamics_mobilesdk.dart';

void main() {
 WidgetsFlutterBinding.ensureInitialized();
 FlutterError.onError = Instrumentation.errorHandler;
 runApp(MyApp());
}

```

## Disable Crash Reporting

Crash reporting is enabled by default. Most applications should leave crash reporting enabled, but you can disable it only if issues occur from using a different crash reporting tool.

You can enable or disable the native crash reporting feature in the `AgentConfiguration` object:

```

AgentConfiguration config = AgentConfiguration(
 appKey: <EUM_APP_KEY>,
 crashReportingEnabled: false);
await Instrumentation.start(config);

```

## Crash Callback

The Flutter Agent supports using a callback function that will receive a crash report. The report contains an array of the Dart objects representing native crash information.

The callback function can be configured in the `AgentConfiguration` object:

```

void crashReportCallback(List<CrashReportSummary> summaries) async {

```

```

 print(summaries);
}

AgentConfiguration config = AgentConfiguration(
 appKey: <EUM_APP_KEY>,
 crashReportCallback: crashReportCallback);
await Instrumentation.start(config);

```

## Session Frames

Session frames provide context for what the user is doing during a session. You can either create custom user interaction frames in the Controller UI or in the `SessionFrame` API, in the agent instrumentation.

Some use cases for customizing session frames include:

- One page performs multiple functions, and you want more granular tracking of the individual functions.
- A user flow spans multiple pages or user interactions, and you want to categorize frames within a user flow. For example, if you have a user flow for purchasing, you could create session frames named "Login," "Product Selection," and "Purchase."
- You want to capture dynamic information based on user interactions to name session frames, such as an order ID.

## Methods

`Instrumentation.startSessionFrame(sessionFrameName)`

Starts and returns a `SessionFrame` object.

### Parameters

Name	Type	Requirements	Description
<code>sessionFrameName</code>	String	Non-null	A descriptive name for the session frame that will be captured.

`updateName(newName)`

Updates the session frame with a new name. This is generally used when the appropriate session frame name is not known when it was created.

### Parameters

Name	Type	Requirements	Description
<code>newName</code>	String	Non-null	A descriptive name for the session frame that will be captured.

`end()`

Reports the end of the session frame. The `SessionFrame` object will no longer be usable after this call.

This is an example of how to mark the end of a current shopping session when a user presses the checkout button:

```

class ShoppingCart {
 late SessionFrame _sessionFrame;
 late String _orderId;

 void onCheckoutCartButtonClicked() async {
 // The checkout starts when the user clicks the checkout button.
 // This may be after they have updated quantities of items in their
 // cart, etc.
 _sessionFrame = await Instrumentation.startSessionFrame("Checkout");
 }

 void onConfirmOrderButtonClicked() {
 // Once they have confirmed payment info and shipping information,
 // and they are clicking the "Confirm" button to start the backend
 // process of checking out, we may know more information about the
 // order itself, such as an order ID.
 _sessionFrame.updateName("Checkout: Order ID {this.orderId}");
 }

 void onProcessOrderComplete() {
 // Once the order is processed, the user is done "checking out" so we end
 // the session frame.
 _sessionFrame.end();
 }

 void onCheckoutCancel() {
 // If they cancel or go back, you'll want to end the session frame also, or
 // else it will be left open and appear to have never ended.
 _sessionFrame.end();
 }
}

```

## Metrics

You can associate numeric values with a metric name and report them via `Instrumentation.reportMetric`.

## Methods

```
Instrumentation.reportMetric(name, value)
```

Reports a custom metric.

Parameters

Name	Type	Requirements	Description
name	String	Only alphanumeric characters and spaces.	Representative name for the metric.
value	Integer	Numeric, non-null.	The metric value.

This is an example of how to track the number of times users click the checkout button:

```
import 'package:appdynamics_mobilesdk/appdynamics_mobilesdk.dart';
import 'package:flutter/material.dart';

class App extends StatelessWidget {
 _finishCheckout() {
 Instrumentation.reportMetric(name: "Checkout Count", value: 1);
 // ...rest of the checkout logic
 }

 @override
 Widget build(BuildContext context) {
 return Scaffold(
 appBar: AppBar(title: Text("Checkout screen")),
 body: Center(
 child:
 ElevatedButton(
 child: Text('Checkout'),
 onPressed: _finishCheckout,
)
));
 }
}
```

### Automatic Screenshots (iOS Only)

By default, screenshot capturing is enabled, but if you need to disable it (such as for privacy reasons), you can disable it in the `AgentConfiguration` object.

This is an example to disable screenshots:

```
AgentConfiguration config = AgentConfiguration(
 appKey: <EUM_APP_KEY>,
 screenshotsEnabled: false);
await Instrumentation.start(config);
```

### User Data

You can set key-value pair identifiers for custom user data that will be included in all snapshots. Some considerations:

- The key must be unique across your application.
- The key and the associated value are limited to 2048 characters.
- A `null` value will clear the data, and re-using the same key overwrites the previous value.
- The custom user data is not persisted across application runs. Once the application is destroyed, user data is cleared.

## Methods

```
setUserData(key, value)
```

Used to add the `string` types.

```
removeUserData(key)
```

Removes the `string` corresponding to the key set with `setUserData()`.

### Parameters

Name	Type	Requirements	Description
<code>key</code>	String	Maximum 2048 characters (non-null).	The name of the user data key.
<code>value</code>	String	Maximum 2048 characters.	The associated <code>string</code> value for the key.

```
setUserDataDouble(key, value)
```

Used to add the `double` types.

```
removeUserDataDouble(key)
```

Removes the `double` corresponding to the key set with `setUserDataDouble()`.

### Parameters

Name	Type	Requirements	Description
<code>key</code>	String	Maximum 2048 characters (non-null).	The name of the user data key.
<code>value</code>	Double	Maximum 2048 characters.	The associated <code>double</code> value for the key.

```
setUserDataInt(key, value)
```

Used to add the `int` types.

```
removeUserDataInt(key)
```

Removes the `int` corresponding to the key set with `setUserDataInt()`.

### Parameters

Name	Type	Requirements	Description
key	String	Max. 2048 characters, non-null.	The name of the user data key.
value	Integer	Max. 2048 characters.	The associated <code>int</code> value for the key.

```
setUserDataBool(key, value)
```

Used to add the `bool` types.

```
removeUserDataBool(key)
```

Removes the `bool` corresponding to the key set with `setUserDataBool()`.

Parameters

Name	Type	Requirements	Description
key	String	Max. 2048 characters, non-null.	The name of the user data key.
value	Boolean	-	The associated <code>bool</code> value for the key.

```
setUserDataDateTime(key, value)
```

Used to add the `DateTime` types.

```
removeUserDataDateTime(key)
```

Removes the `DateTime` corresponding to the key set with `setUserDataDateTime()`.

Parameters

Name	Type	Requirements	Description
key	String	Max. 2048 characters, non-null.	The name of the user data key.
value	DateTime	-	The associated <code>DateTime</code> value for the key.

This is an example of how to store a `DateTime` object as user data:

```
await Instrumentation.setUserDataDateTime("currentTransactionYear", DateTime.utc(2021));
```

## Breadcrumbs

You can report points of interest throughout the application via breadcrumbs. Breadcrumbs will be included in different reports depending on the mode:

- Use the `crashesOnly` mode (default) when you want breadcrumbs to appear only in crash reports (triggered on application restart).
- Use the `crashesAndSessions` mode if you also want breadcrumbs to appear on the session.

**i** Each crash report will display only the most recent 99 breadcrumbs.

## Methods

`leaveBreadcrumb(breadcrumb, mode)`

Sets the name of the breadcrumb and where it appears on the mobile session.

Parameters

Name	Type	Requirements	Description
<code>breadcrumb</code>	String	Max. 2048 characters (every extra character will be truncated).	A descriptive string for the breadcrumb.
<code>mode</code>	BreadcrumbVisibility (enum)	-	Configuring whether to see breadcrumb info on the session.

This is an example of how to leave breadcrumbs before and after switching to the sign-up screen:

```
Future<void> showSignUp() async {
 try {
 await Instrumentation.leaveBreadcrumb("Sign up button pressed.",
 BreadcrumbVisibility.crashesAndSessions);
 await pushSignUpScreen();

 await Instrumentation.leaveBreadcrumb("Sign Up screen pushed",
 BreadcrumbVisibility.crashesOnly);
 } catch (e) {
 ...
 }
}
```

## Timers

You can time events by using customer timers that span across multiple methods.

## Methods

`startTimer(name)`

Sets the timer.

Parameters

Name	Type	Requirements	Description
name	String	Only alphanumeric characters and spaces (non-null).	A unique identifier to correlate with the timer.

```
stopTimer(name)
```

Stops the timer.

Parameters

Name	Type	Requirements	Description
name	String	Only alphanumeric characters and spaces (non-null).	A unique identifier to correlate with the timer.

This is an example of how to start a timer to count time spent on checkout:

```
Future<void> doCheckout() async {
 final checkoutTimerName = "Time spent on checkout";
 try {
 await Instrumentation.startTimer(checkoutTimerName);
 await someCheckoutService();
 await someOtherLongTask();
 } finally {
 await Instrumentation.stopTimer(checkoutTimerName);
 }
}
```

## Errors

You can report Dart errors, exceptions, and custom messages.

There are three error severity levels:

- `info` : an error occurred, but it did not cause a problem.
- `warning` : an error occurred, but the application recovered gracefully.
- `critical` : an error occurred and caused problems to the app.

## Methods

```
reportException(exception, severityLevel)
```

Sets an error exception and the associated severity level.

Parameters

Name	Type	Requirements	Description
exception	Exception	-	Dart <code>Exception</code> type.
severityLevel	ErrorSeverityLevel (enum)	Default: <b>warning</b>	The corresponding level of severity.

```
reportError(error, severityLevel)
```

Creates an error report with an associated severity level.

Parameters

Name	Type	Requirements	Description
error	Error	-	Dart <code>Error</code> type.
severityLevel	ErrorSeverityLevel (enum)	Default: <b>warning</b>	The corresponding level of severity.

```
reportMessage(message, severityLevel)
```

Creates a message report (should be used if neither `reportError()` nor `reportException()` are suitable).

Parameters

Name	Type	Requirements	Description
message	String	-	Dart <code>String</code> type.
severityLevel	ErrorSeverityLevel (enum)	Default: <b>warning</b>	The corresponding level of severity.

This is an example of how to report `NoSuchMethodError` when calling an undeclared method:

```
try {
 final myMethod = null;
 myMethod();
} on NoSuchMethodError catch (e) {
 await Instrumentation.reportError(e, severityLevel: ErrorSeverityLevel.CRITICAL);
}
```

## Application Not Responding (ANR)

You can configure automatic detection and reporting of cases when the application is not responding (ANR) when creating the `AgentConfiguration` object.

This is an example of how to enable the automatic ANR detection feature:

```
AgentConfiguration config = AgentConfiguration(
 appKey: <EUM_APP_KEY>
);
await Instrumentation.start(config);
```

## Info Points

You can track specific points of interest in the app by using the `Instrumentation` class.

## Method

```
trackCall(className, methodName, methodBody, methodArgs, uniqueCallId)
```

Sets a tracker for a call.

## Parameters

Name	Type	Requirements	Description
<code>className</code>	<code>String</code>	-	Name of the class or object of the method call.
<code>methodName</code>	<code>String</code>	-	Name of the method.
<code>methodBody</code>	<code>FutureOr&lt;T&gt; Function()</code>	-	The body of the method that is being tracked.
<code>methodArgs</code>	<code>dynamic</code>	-	The arguments of the method.
<code>uniqueCallId</code>	<code>String?</code>	-	A unique custom ID for tracking this call.

This is an example of tracking an asynchronous method that updates the users' first and last names on the server:

```
const firstName = "John";
const lastName = "Peters";

final result = await Instrumentation.trackCall(
 className: "MyAccountScreen",
 methodName: "updateUserName",
 methodArgs: [firstName, lastName],
 methodBody: () async {
```

```

 await http.post(
 Uri.parse('https://jsonplaceholder.typicode.com/albums'),
 body: jsonEncode(
 <String, String>{'firstName': firstName, 'lastName': lastName}),
);
 }
);

```

## Sessions

You can start a new session and mark the end of the current one.

### Method

`startNextSession()`

Sets the beginning and end of a session.

This is an example of marking a new customer checkout session after the old one has ended:

```

Future<void> checkout(dynamic data) async {
 try {
 final response = http.post("https://server.com/checkout", data);
 await Instrumentation.startNextSession();
 } catch (e) {
 print(e);
 }
}

```

## App Key

You can change the app key after initialization. Older reports will be discarded when a new key is applied. Invoking this method has no effect unless the agent was already initialized by calling one of the start methods.

### Method

`changeAppKey(newKey)`

#### Parameters

Name	Type	Requirements	Description
<code>newKey</code>	<code>String</code>	Must respect app key format (must be valid).	A new key that will replace the old one.

This is an example of updating the app key to AA-BBB-CCC.

```

try {
 await Instrumentation.changeAppKey("AA-BBB-CCC");
}

```

```

} catch (e) {
 print(e);
}

```

## Screen Tracking

You can add the `NavigationObserver` to your app to automatically detect app widget transitions using [named routes](#). You can manually track screens via the `WidgetTracker` class if your app isn't implementing named routes.

### Methods

#### NavigationObserver

```

import 'package:appdynamics_mobilesdk/appdynamics_mobilesdk.dart';
import 'package:flutter/material.dart';

void main() {
 runApp(const MyApp());
}

class MyApp extends StatelessWidget {
 const MyApp({Key? key}) : super(key: key);

 @override
 Widget build(BuildContext context) {
 return MaterialApp(
 initialRoute: MyRoutes.mainScreen,
 onGenerateRoute: MyRouter.onGenerateRoute,
 navigatorObservers: [NavigationObserver()]);
 }
}

```

#### WidgetTracker

You can add tracking to Flutter widgets to monitor a specific UI element. For example, if your Flutter app isn't automatically implementing named routes, you could manually track screens via the `WidgetTracker` class.

### Methods

`trackWidgetStart()`

Starts tracking a widget.

`trackWidgetEnd()`

Stops tracking a widget.

### Parameters

Name	Type	Requirements	Description
widgetName	String	Must be unique.	Name of the class or object of the method call.

This is an example of tracking the widget `CheckoutPage.screenName`.

```
import 'package:appdynamics_mobilesdk/appdynamics_mobilesdk.dart';
import 'package:flutter/material.dart';

class CheckoutPage extends StatefulWidget {
 const CheckoutPage({Key? key}) : super(key: key);

 static String screenName = "Checkout Page";

 @override
 _CheckoutPageState createState() => _CheckoutPageState();
}

class _CheckoutPageState extends State<CheckoutPage> {
 @override
 void initState() async {
 super.initState();
 await WidgetTracker.instance.trackWidgetStart(CheckoutPage.screenName);
 }

 _backToMainScreen() async {
 await WidgetTracker.instance.trackWidgetEnd(CheckoutPage.screenName);
 Navigator.pop(context);
 }

 @override
 Widget build(BuildContext context) {
 return Center(
 child:
 Column(crossAxisAlignment: CrossAxisAlignment.stretch, children: [
 ElevatedButton(
 child: const Text('Proceed'),
 onPressed: _backToMainScreen,
)
]));
 }
}
```

## Device Metrics

Various metrics regarding device status are automatically tracked. See [Mobile Device Metric Collection](#).

## Flutter Agent API Documentation

See the [latest Flutter Agent API documentation](#) or the previous versions listed below:

- <https://sdkdocs.appdynamics.com/flutter-sdk/22.12/>
- <https://sdkdocs.appdynamics.com/flutter-sdk/22.6/>
- <https://sdkdocs.appdynamics.com/flutter-sdk/22.3/>

## Instrument .NET MAUI Applications

Before you can monitor your .NET MAUI application, you will need to instrument your application to enable the .NET MAUI Agent to collect mobile metrics.

To instrument your application, see the following sections:

- [Review MAUI Agent Support](#)
- [Limitations](#)
- [Choose a MAUI Agent Instrumentation Package](#)
- [Add the Maui Agent Package](#)
- [Add Initialization Code to your Application](#)
- [\(Android-only\) Add Required Permissions](#)
- [Initialize the Agent](#)
- [Build Your Application](#)
- [\(iOS-only\) Add Additional Arguments](#)
- [\(Optional\) Enable Automatic Instrumentation](#)
- [\(Optional\) Customize Your Instrumentation](#)

### Review MAUI Agent Support

The MAUI Agent supports the following:

- Platforms:
  - iOS
  - Android
- Libraries:
  - `net6.0-ios` ( `AppDynamics.Agent.MAUI` or `AppDynamics.Agent` version `>= 2022.9.0` )
  - `net6.0-android` ( `AppDynamics.Agent.MAUI` or `AppDynamics.Agent` version `>= 2022.9.0` )
- .NET version `>= 6`

### Limitations

The MAUI Agent has the following limitations for which crash data is reported:

- **Reported:** Managed crashes - crashes that occur on .NET Runtime).
- **Not reported:** Native crashes - crashes that occur on Objective-C runtime

### Choose a MAUI Agent Instrumentation Package

The MAUI Agent is an instrumentation package that you add to your .NET MAUI application. Depending on your application needs, choose one of the following instrumentation packages:

- `AppDynamics.Agent.MAUI` includes instrumentation for iOS and Android applications, as well as instrumentation of MAUI UI elements.
- `AppDynamics.Agent` includes instrumentation for iOS and Android applications, but without any MAUI dependencies.

### Add the Maui Agent Package

To add a MAUI Agent package from the [NuGet Gallery](#) to your application, see the instructions on [Install and use a package in Visual Studio](#).

## Add Initialization Code to your Application

To add initialization code to your application, call `UseAppDynamics()` on the `MauiApplicationBuilder` in `MauiProgram`, within `CreateMauiApp()`:

```
public static MauiApp CreateMauiApp()
{
 var builder = MauiApp.CreateBuilder();
 builder
 .UseMauiApp<App>()
 .UseAppDynamics();

 return builder.Build();
}
```

### Get an EUM App Key

The EUM App Key is a unique identifier used to associate end user data with specific End-User Monitoring applications. Each .NET MAUI application is usually associated with one EUM App Key. For your applications to be monitored, you must add the EUM App Key to the MAUI Agent instrumentation package.

To get the EUM App Key in the Controller:

1. Go to **User Experience**.
2. Under the **Mobile Apps** tab, click **Add App > Cross Platform**.
3. In Step 1, select a Mobile App Group.
4. In Step 2, select the Xamarin framework.

If you have completed the **Getting Started Wizard**, but don't have your EUM App Key, see [Get Your Application Key](#).

### (Android-only) Add Required Permissions

In your Android application's `Properties/AndroidManifest.xml` file, verify the following permissions (or add them if not present):

```
<uses-permission android:name="android.permission.INTERNET"></uses-permission>
<uses-permission android:name="android.permission.ACCESS_NETWORK_STATE"></uses-permission>
```

## Initialize the Agent

Depending on the type of your application, you have two options to initialize the agent:

- For cross-platform applications: Add this initialization code in the `App.xaml.cs` file, which is available to cross-platform applications (both iOS and Android):

```
public App()
{
 InitializeComponent();
 // This initialization code is used by both iOS and Android apps.
```

```

var config = AppDynamics.Agent.AgentConfiguration.Create(<EUM_APP_KEY>);
AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
MainPage = new MainPage();
}

```

- For native applications:
  - iOS: Add this initialization code in your application's AppDelegate's FinishedLaunching method:

```

public class AppDelegate : UIApplicationDelegate
{
 ...
 public override bool FinishedLaunching(UIApplication application, NSDictionary
launchOptions)
 {
 // The two lines below initialize the AppDynamics instrumentation.
 var config = AppDynamics.Agent.AgentConfiguration.Create(<EUM_APP_KEY>);
 AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
 ...
 return true;
 }
 ...
}

```

- Android: Add this initialization code under your application's MainActivity OnCreate method:

```

class MainActivity
{
 protected override void OnCreate(Bundle savedInstanceState)
 {
 // The two lines below initialize the AppDynamics instrumentation.
 var config = AppDynamics.Agent.AgentConfiguration.Create(<EUM_APP_KEY>);
 AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
 ...
 }
}

```

### (Optional) Point to an On-Premises EUM Server

To use an on-premises EUM Server, you pass the URL to the on-premises EUM Server when you initialize the instrumentation with the EUM App Key:

```

var config = AppDynamics.Agent.AgentConfiguration.Create(<EUM_APP_KEY>);
config.CollectorURL = <COLLECTOR_URL:PORT>;
AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);

```

For a list of on-premises EUM Server URLs per region, see <https://docs.appdynamics.com/paa/saas-domains-and-ip-ranges>.

### Build Your Application

Run and build your application from Visual Studio. From the Getting Started Wizard, you should see that the application has [connected and the instrumentation has been verified](#).

## (iOS-only) Add Additional Arguments

For iOS applications, you must add the additional `MtouchExtraArgs` `--registrar:static` for `simulator` configuration to avoid runtime errors. This is already the default for physical devices. Add the following arguments in your MAUI project:

```
<PropertyGroup Condition="$(TargetFramework.Contains('-ios'))">
 <MtouchExtraArgs>--registrar:static</MtouchExtraArgs>
</PropertyGroup>
```

## (Optional) Enable Automatic Instrumentation

The MAUI Agent can be configured to automatically inject specific instrumentation code into your project. This can be achieved using a different beta nuget package called `AppDynamics.Agent.AutoInstrument.Fody`.

Automatic instrumentation allows you to:

1. [Automatically track HttpClient or Refit network requests](#)
2. [Automatically track MAUI pages](#)
3. [Automatically track MAUI UI elements](#)

## Set Up the Automatic Instrumentation Package

Before you set up the automatic instrumentation package `AppDynamics.Agent.AutoInstrument.Fody`, make sure you completed the agent instrumentation setup above and have added the `AppDynamics.Agent` or `AppDynamics.Agent.MAUI` packages to your project.

1. Add the `AppDynamics.Agent.AutoInstrument.Fody` package.

**i** To install the `AppDynamics.Agent.AutoInstrument.Fody` beta package, check the "Include prereleases" option in order for the version to be displayed.

2. Build the solution.

After you build the solution, two files should be generated automatically:

- `FodyWeavers.xml`
- `FodyWeavers.xsd`

These files should be checked into source control.

**i** If the above files are not generated automatically, a new file called `FodyWeavers.xml` should be created manually with the following content:

```
<Weavers xmlns:xsi="http://www.w3.org/2001/XMLSchema-
instance" xsi:noNamespaceSchemaLocation="FodyWeavers.xsd">
 <AppDynamics.Agent.AutoInstrument />
</Weavers>
```

If the project is already using `Fody`, these files will already be there and only the `FodyWeavers.xml` file has to be updated to include the `AppDynamics.Agent.AutoInstrument` weaver. For example:

```
<Weavers xmlns:xsi="http://www.w3.org/2001/XMLSchema-
instance" xsi:noNamespaceSchemaLocation="FodyWeavers.xsd">
 ... Existing weavers ...
 <AppDynamics.Agent.AutoInstrument />
</Weavers>
```

### (Optional) Customize Your Instrumentation

You can make further customizations to the MAUI Agent instrumentation using the MAUI SDK. The SDK has additional classes to allow you to extend the kinds of application data you can collect and report to AppDynamics. See [Customize the MAUI Instrumentation](#).

### Customize the .NET MAUI Instrumentation

Once your application is instrumented with the MAUI Agent, you can make further customizations to the agent instrumentation using the MAUI SDK. The SDK has additional classes to allow you to extend the kinds of application data you can collect and report to AppDynamics. See the sections below for customization instructions.

- [Customize Automatic Instrumentation](#)
- [Track Calls](#)
- [Timing Events](#)
- [Report Metrics](#)
- [Add Tracking to HTTP Requests](#)
- [Leave Breadcrumbs](#)
- [Change the App Key](#)
- [Disable the Agent to Stop Sending User Data to the Collector](#)
- [Report Errors and Exceptions](#)
- [Report Aggregate Exceptions as Crashes](#)
- [Disable Crash Reporting](#)
- [Add a Crash Reporting Callback](#)
- [Start and End Session Frames](#)
- [Add User Data](#)
- [Set the Logging Level \(Optional\)](#)
- [Transform URLs for Network Requests](#)
- [Configure and Take Screenshots](#)
- [Disable Screenshots](#)
- [Block and Unblock Screenshots](#)
- [WebView Instrumentation \(JavaScript Agent Injection\)](#)
- [MAUI Specific Instrumentation](#)
- [MAUI SDK Documentation](#)

### Customize Automatic Instrumentation

You can customize automatic instrumentation of the following:

- [Automatic Network Request Instrumentation](#)
- [Automatic Page Tracking Instrumentation](#)
- [Automatic UI Tracking Instrumentation](#)

## Before you Begin

Make sure you have the `AppDynamics.Agent.AutoInstrument.Fody` package added to your project. See [Set Up Automatic Network Request Instrumentation](#).

## Customize Automatic Network Request Instrumentation

When automatic network request instrumentation is enabled, the weaver will automatically attach instrumentation code over `HttpClient` or `Refit` usages.

You can further customize the automatic instrumentation at the project level or class level (see sections below). For example, you could:

1. Enable the automatic instrumentation at a project level from the `FodyWeavers.xml` file, but exclude some files at the class level using the `DisableNetworkInstrumentation` attribute.
2. Disable the automatic instrumentation at a project level from the `FodyWeavers.xml` file, but include some files at the class level using the `EnableNetworkInstrumentation` attribute.

**i** If you are using [semi-automatic network request tracking](#) via the `HttpRequestTrackerHandler`, the network request will not be reported twice.

### Enable/Disable at the Project Level

You can enable or disable automatic instrumentation at the project level using the `NetworkInstrumentationEnabled` flag in the `FodyWeavers.xml` file.

For example, to enable automatic instrumentation, set `NetworkInstrumentationEnabled` to `"true"`:

```
<Weavers xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:noNamespaceSchemaLocation="
FodyWeavers.xsd">
 ... Existing weavers ...
 <AppDynamics.Agent.AutoInstrument NetworkInstrumentationEnabled="true"/>
</Weavers>
```

### Enable/Disable at the Class Level

You can enable or disable automatic instrumentation at the class level by using one of the following attributes per class:

1. `[EnableNetworkInstrumentation]`

```
[EnableNetworkInstrumentation]
public class MyClass
{
 ...
}
```

2. `[DisableNetworkInstrumentation]`

```
[DisableNetworkInstrumentation]
public class MyClass
{
 ...
}
```

## Recommendations

- If you are using [manual network request tracking](#), you will see duplicate entries for the same network request. To avoid this, you can either remove the manual instrumentation or use the `DisableNetworkInstrumentation` attribute on that class.
- If your HTTP requests are handled in a different project, you should add both the `AppDynamics.Agent` and `AppDynamics.Agent.AutoInstrument.Fody` to that project as well for instrumentation to work.
- If you are using a `HttpClient` instance generated in another library, you should only create and use the instance within the same project for instrumentation to work. Automatic instrumentation works by targeting new `HttpClient` instances within the project.

## Customize Automatic Page Tracking Instrumentation

When automatic page tracking instrumentation is enabled, the weaver will search the project for all instances of `Microsoft.Maui.Controls.Page` in the project and inject the instrumentation code.

### Enable/Disable at the Project Level

You can enable or disable automatic Page Tracking instrumentation at the project level using the `PageTrackingInstrumentationEnabled` flag in the `FodyWeavers.xml` file:

```
<Weavers xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:noNamespaceSchemaLocation="
FodyWeavers.xsd">
 ... Existing weavers ...
 <AppDynamics.Agent.AutoInstrument PageTrackingInstrumentationEnabled="true"/>
</Weavers>
```

### Enable/Disable at the Class Level

You can enable or disable automatic instrumentation at the class level by using one of the following attributes per class:

#### 1. `[EnablePageTracking]`

```
[EnablePageTracking]
public class MyPage : ContentPage
{
 ...
}
```

#### 2. `[DisableUITracking]`

```
[DisablePageTracking]
public class MyPage : ContentPage
{
```

```
} ...
```

## Automatic UI Tracking Instrumentation

When automatic UI tracking instrumentation is enabled, the weaver will search the project for all instances of `Button`, `Entry` and `ListView` in the project and inject the instrumentation code.

### Enable/Disable at the Project Level

You can enable or disable automatic instrumentation at the project level using the `UITrackingInstrumentationEnabled` flag in the `FodyWeavers.xml` file.

For example:

```
<Weavers xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:noNamespaceSchemaLocation="
FodyWeavers.xsd">
 ... Existing weavers ...
 <AppDynamics.Agent.AutoInstrument UITrackingInstrumentationEnabled="true"/>
</Weavers>
```

### Enable/Disable at the Class Level

You can enable or disable automatic instrumentation at the class level by using one of the following attributes per class:

1. `[EnableUITracking]`

```
[EnableUITracking]
public class MyPage : ContentPage
{
 ...
}
```

2. `[DisableUITracking]`

```
[DisableUITracking]
public class MyPage : ContentPage
{
 ...
}
```

## Automatic UI Tracking and XAML

Automatic UI Tracking works with both XAML and code-behind UI elements. But even though code-behind UIs are automatically instrumented, there's a required extra step to auto-instrument XAML. Add the following configuration to your `.csproj` file:

```
<PropertyGroup>
```

```
<FodyDependsOnTargets>
 XamlC
</FodyDependsOnTargets>
</PropertyGroup>
```

Automatic UI Tracking only works with pre-compiled XAML, so you will need to use `XamlCompilationOptions.Compile` :

```
[XamlCompilation(XamlCompilationOptions.Compile)]
```

See [XAML Compilation](#) for more information.

## Track Calls

You can instrument methods to see how often the instrumented a method is invoked and how long it takes to run. To do this, add a call at the beginning and end of the method you'd like to instrument.

In the example below, the code executed in the constructor for the class `ShoppingCart` will be tracked and reported. In your own code, start tracking calls by specifying the class and method in `BeginCall` and then complete the tracking and report the data by calling `ReportCallEnded` .

```
using AppDynamics.Agent;
...
public class ShoppingCart {
 public ShoppingCart() {

 // Code to create the shopping cart
 }
 void CheckOut(int custId, int transactionId) {
 var tracker = Instrumentation.BeginCall("ShoppingCart", "CheckOut", custId,
transactionId);
 // The code placed here will be tracked and reported.
 tracker.ReportCallEnded();
 }
}
```

## Timing Events

Sometimes you want to time an event in your application that spans multiple methods. You can do this by calling `StartTimerWithName` when the event starts, and then `StopTimerWithName` when it ends. For example, to track the time a user spends viewing a screen, the instrumentation might look something like the following:

```
using AppDynamics.Agent;
...
async private void StartCapturePreview_Click(object sender, RoutedEventArgs e) {
 capturePreview.Source = captureManager;
 Instrumentation.StartTimerWithName("CapturePreview");
```

```

 await captureManager.StartPreviewAsync();
 }
 async private void StopCapturePreview_Click(object sender, RoutedEventArgs e) {
 await captureManager.StopPreviewAsync();
 Instrumentation.StopTimerWithName("CapturePreview");
 }

```

## Report Metrics

To report other types of data, you can use a metric. The metric name should only contain alphanumeric characters and spaces. Illegal characters are replaced by their ASCII hex value. The metric value must be a long integer.

The snippet below shows how you might report a metric.

```

using AppDynamics.Agent;
...
Instrumentation.ReportMetricWithName("Database Rows", 5123);

```

## Add Tracking to HTTP Requests

### Semi-automatic HTTP Tracking

The `HttpMessageHandler` handles all the tracking and error handling. It can also include other inner handlers if you are already using a custom `HttpMessageHandler` for other purposes, such as for logging.

To add semi-automatic tracking, instantiate a `HttpClient` and pass the `HttpRequestTrackerHandler`:

```

var client = new HttpClient(new HttpRequestTrackerHandler());

```

Then, all the requests sent using the client will be already instrumented:

```

response = await client.GetAsync(uri);

```

**i** If you already have `HttpMessageHandler` passed to the `HttpClient` (for example, adding a logging handler), you must instantiate `HttpRequestTrackerHandler` and pass the existing handler to the constructor:

```

var loggingHandler = new MyLoggingHandler();
var client = new HttpClient(new
 HttpRequestTrackerHandler(loggingHandler));

```

### Manual HTTP Tracking

You can manually report a network request using the `AppDynamics.Agent.HttpRequestTracker` class.

The example below uses `HttpRequestTracker` with the `System.Net.Http.HttpClient` class. The `tracker` object synchronously captures and reports the network request as well as any network errors.

```

using AppDynamics.Agent;
...
public async Task<string> Fetch(Uri uri) {
 var client = new HttpClient();
 // Create AppDynamics Tracker
 var tracker = HttpRequestTracker.Create(uri);
 // Add AppDynamics Server Correlation Headers
 foreach (var header in ServerCorrelationHeaders.Generate) {
 // Each header could have multiple values
 foreach (var value in header.Value) {
 client.DefaultRequestHeaders.Add(header.Key, value);
 }
 }
 HttpResponseMessage response = null;
 try {
 response = await client.GetAsync(uri);
 } catch (Exception ex) {
 // Capture any network errors.
 tracker.Exception = ex;
 tracker.ReportDone();
 throw ex; //you decide to throw it or not
 }
 if (!response.Equals(null)) {
 // Capture request information such as the
 // status code, status message, and headers.
 tracker.ResponseCode = (int)response.StatusCode;
 tracker.StatusLine = response.ReasonPhrase;
 tracker.ResponseHeaderFields = response.Headers;
 tracker.ReportDone();
 return await response.Content.ReadAsStringAsync();
 }
 return null;
}

```

### Attach a Custom User Data Property to a Network Request

You can attach a [custom user data](#) property to a specific network request by adding user data to `HttpRequestTracker`.

```

public HttpRequestTracker withUserData(String key, String value)
public HttpRequestTracker withUserLong(String key, Long value)
public HttpRequestTracker withUserBoolean(String key, Boolean value)
public HttpRequestTracker withUserDouble(String key, Double value)
public HttpRequestTracker withUserDate(String key, Date value)

```

### Example

```

public byte[] sendRequest(URL url) throws HttpException {
 HttpRequestTracker tracker = Instrumentation.beginHttpRequest(url);
 try {
 // implementation omitted
 tracker.withResponseCode(theResponseCode)
 .withResponseHeaderFields(theResponseHeaderFields)
 .withUserData("key", "value")
 .withUserLong("number", 100)
 .withUserBoolean("boolean", true)
 .withUserDouble("double", 1.1234)
 .withUserDate("date", 1609488000)
 .reportDone();
 return responseBody;
 } catch (UnderlyingException e) {
 tracker.withException(e)
 .reportDone();
 throw new HttpException(e);
 }
}

```

## Leave Breadcrumbs

You can leave breadcrumbs to mark interesting events. For example, if your application crashes, the breadcrumbs you left with be displayed in the crash report and could provide context. You can also configure the breadcrumb to appear in sessions.

The following is the method signature for leaving breadcrumbs:

```

static void AppDynamics.Agent.Instrumentation.LeaveBreadcrumb(string breadcrumb,
BreadcrumbVisibility mode)

```

You use the mode to set the visibility of the breadcrumb. The visibility defines where you will see the breadcrumb in the Controller UI. The value of `mode` can be one of the following:

- `BreadcrumbVisibility.CrashesOnly` – The breadcrumb will only appear in crash snapshots.
- `BreadcrumbVisibility.CrashesAndSessions` – The breadcrumb will appear in crash snapshots and sessions.

Thus, you would use the method below to set breadcrumbs that are only reported in crash reports:

```

using AppDynamics.Agent;
...
Instrumentation.LeaveBreadcrumb("GetUserInfo", BreadcrumbVisibility.CrashesOnly);

```

If you would like to see the breadcrumb in crash reports and sessions:

```

using AppDynamics.Agent;
...
Instrumentation.LeaveBreadcrumb("GetUserInfo", BreadcrumbVisibility.CrashesAndSessions);

```

## Change the App Key

You can use the .NET MAUI Agent API to dynamically change the EUM app key. You receive the EUM App Key when creating a mobile app in the Controller UI. See [Set Up and Access Mobile RUM](#) for information about getting the EUM App Key.

The API to change app keys is available through the `Instrumentation` class.

```
Instrumentation.ChangeAppKey("NEW-APP-KEY");
```

## Disable the Agent to Stop Sending User Data to the Collector

You can disable the agent to stop sending all data to the collector while the agent is initialized and running. For example, you can disable the agent if your app has an option for users to opt-out of monitoring for privacy reasons.

### shutdownAgent

The `shutdownAgent` call stops outgoing data to the collector, and does not persist data on the device.

```
using AppDynamics.Agent;
...
Instrumentation.shutdownAgent();
```

- The call only stops the traffic out of the agent.
- Once the agent has been initialized, the call cannot be removed, and a license will have been consumed.
- If you want to make this state permanent for a device, add code in `UserDefaults` to save the state and use that flag to conditionally initialize the agent in your code.

### restartAgent

To re-enable the agent and reverse `shutdownAgent`, use `restartAgent`.

```
using AppDynamics.Agent;
...
Instrumentation.restartAgent();
```

- This call will respect the server side calls that can remotely shutdown the agent in a similar way.
- The call is only in effect while the app is running.
- The call will be ignored if the agent has been remotely disabled.
- If the call is removed from memory and the app restarts, or the device is rebooted, the agent will be initialized as

## Report Errors and Exceptions

You can report exceptions using the method `reportError` from the `Instrumentation` class. Reported exceptions will appear in session details.

You can also set one of the severity levels below for an issue. With the severity level, you can filter errors in the [Code Issues Dashboard](#) or [Code Issues Analyze](#).

- `ErrorSeverityLevel.INFO`
- `ErrorSeverityLevel.WARNING`
- `ErrorSeverityLevel.CRITICAL`

The example below uses the API to report possible exceptions and sets the severity level to `ErrorSeverityLevel.CRITICAL` (critical) when writing to a file

```
using AppDynamics.Agent;
...
try {
 // possible exception //
}
catch (Exception e){
 Instrumentation.ReportError(exception, ErrorSeverityLevel.CRITICAL);
}
```

### Report Aggregate Exceptions as Crashes

You can configure the .NET MAUI Agent to report aggregate exceptions (handled and unhandled) as crashes by setting the boolean property `EnableAggregateExceptionHandling` to `true`. When the property is set to `false`, only unhandled exceptions are reported. The default value is `false`.

The following code example configures the Agent to report aggregate exceptions (handled and unhandled) as crashes.

```
using AppDynamics.Agent;
...
var config = AppDynamics.Agent.AgentConfiguration.Create(<EUM_APP_KEY>);
AppDynamics.Agent.Instrumentation.EnableAggregateExceptionHandling = true;
AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
...
```

### Disable Crash Reporting

Crash reporting is enabled by default, but you can manually disable crash reporting through the instrumentation configuration. If you are using other crash reporting tools, you might disable crash reporting to minimize conflicts and optimize the crash report results.

You can disable crash reporting by configuring the instrumentation with the `crashReportingEnabled` property as shown in the following:

```
var config = AgentConfiguration.Create(<EUM_APP_KEY>);
config.CrashReportingEnabled = false;
Instrumentation.InitWithConfiguration(config);
```

## Add a Crash Reporting Callback

You may want to make crash report information (that the Agent collects) available to other parts of your code, such as to Google Analytics. To enable passing on summary crash information, you can set up a crash report runtime callback:

1. To get a callback when the Agent detects and then reports a crash, subscribe to the following event that is a part of the **IAgentConfiguration** interface:

```
event EventHandler<IEnumerable<CrashReportSummary>> OnCrash;
```

The `OnCrash` event is raised during the next initialization of the Agent after a crash has occurred. This event is raised on your app's UI thread, so any work should be done on a separate work thread.

2. The Agent sends a collection of crash report summaries instead of an individual callback in the event that there is more than one crash, producing multiple crash report summaries. Each `CrashReportSummary` has the following properties:
  - `ExceptionName` : useful for quick identification of the crash
  - `ExceptionReason` : useful for quick identification of the crash
  - `ExceptionId` : useful to look up the crash in the Controller UI

**i** If you are sending the information to another analytics tool, such as Google Analytics, we recommend to include all three properties:

```
public class CrashReportSummary
{
 public string ExceptionId { get; }
 public string ExceptionName { get; }
 public string ExceptionReason { get; }
}
```

### Example

For example, to print the crash information to the console, you could subscribe to the `OnCrash` event like this:

```
IAgentConfiguration config = AgentConfiguration.Create(appKey);
config.OnCrash += (sender, crashReportSummaries) =>
{
 foreach (var crashReportSummary in crashReportSummaries) {
 Console.WriteLine($"Crash Detected: {crashReportSummary.ExceptionName}:
{crashReportSummary.ExceptionReason} ({crashReportSummary.ExceptionId})");
 }
};
Instrumentation.InitWithConfiguration(config);
```

## Programmatically Control Sessions

By default, a mobile session ends after a period of user inactivity. For example, when a user opens your application, the session begins and only ends after the user stops using the app for a set period of time. When the user begins to use the application again, a new session begins.

Instead of having a period of inactivity to define the duration of a session, however, you can use the following API to programmatically control when sessions begin and end:

```
static void AppDynamics.Agent.Instrumentation.StartNextSession()
```

When you call the method `StartNextSession`, the current session ends and a new session begins. The API enables you to define and frame your sessions so that they align more closely with business goals and expected user flows. For example, you could use the API to define a session that tracks a purchase of a product or registers a new user.

Excessive use of this API will cause sessions to be throttled (excessive use is > 10 calls per minute per Agent, but is subject to change). When not using the API, sessions will fall back to the default of ending after a period of user inactivity.

### Example of a Programmatically Controlled Session

In the example below, the current session ends and a new one begins when an item is bought.

```
using AppDynamics.Agent;
...
public async Task BuySaleItemAsync(SaleItem item)
{
 try
 {
 bool buySucceeded = await this.MobileService.InvokeApiAsync<SaleItem, bool>("buy",
item);
 if (buySucceeded)
 {
 await UserDialogs.Instance.AlertAsync("Thanks for buying this item");
 Instrumentation.StartNextSession();
 }
 }
 catch (Exception e)
 {
 Debug.WriteLine(@"Unexpected error {0}", e.Message);
 }
}
```

### Start and End Session Frames

You can use the `ISessionFrame` API to create session frames that will appear in the session activity. Session frames provide context for what the user is doing during a session. With the API, you can improve the names of user screens and chronicle user flows within a business context.

## Use Cases

The following are common use cases for the `ISessionFrame` API:

- One screen performs multiple functions and you want more granular tracking of the individual functions.
- A user flow spans multiple screens or user interactions. For example, you could use the API to create the session frames "Login", "Product Selection", and "Purchase" to chronicle the user flow for purchases.
- You want to capture dynamic information based on user interactions to name session frames, such as an order ID.

## ISessionFrame API

The table below lists the two methods and one property you can use with session frames. In short, you start a session frame with `StartSessionFrame` and then use the returned `ISessionFrame` object to rename and end the session frame.

Class	Method/Property	Description
<code>Instrument</code>	Method: <pre>static ISessionFrame StartSessionFrame(string sessionFrameName)</pre>	Use this to start and name session frames. Naming session frames allows you to track the frames in the SaaS application.
<code>ISessionFrame</code>	Property: <pre>string Name</pre>	Rename the session frame. You assign the updated <code>Name</code> property from the <code>ISessionFrame</code> object returned from <code>StartSessionFrame</code> .
<code>ISessionFrame</code>	Method: <pre>static void End()</pre>	End the session frame. You call this method from the <code>ISessionFrame</code> object returned from <code>StartSessionFrame</code> .

## Session Frame Example

In the following example, the `ISessionFrame` API is used to track user activity during the checkout process.

```
using AppDynamics.Agent;
...

namespace ShoppingApp {
 public partial class ShoppingCart : ContentPage {
 private ISessionFrame sessionFrame;
 private string orderId;
 ...
 void checkoutCartButtonClicked(object sender, EventArgs e) {
 // The checkout starts when the user clicks the checkout button.
 // This may be after they have updated quantities of items in their cart, etc.
 sessionFrame = Instrumentation.StartSessionFrame("Checkout");
 }
 }
}
```

```

void confirmOrderButtonClicked(object sender, EventArgs e) {
 // Once they have confirmed payment info and shipping information, and they
 // are clicking the "Confirm" button to start the backend process of checking out,
 // we may know more information about the order itself, such as an order ID.
 sessionFrame.Name = $"Checkout: Order ID {this.orderId}";
}
void processOrderCompleted(object sender, EventArgs e) {
 // Once the order is processed, the user is done "checking out" so we end
 // the session frame.
 sessionFrame.End();
}
void checkoutCancelled(object sender, EventArgs e) {
 // If they cancel or go back, you'll want to end the session frame also, or else
 // it will be left open and appear to have never ended.
 sessionFrame.End();
}
}
}
}

```

## Add User Data

You can set a key/value pair of strings to record important events or information. Below is the method signature for setting user data:

```
static void AppDynamics.Agent.Instrumentation.SetUserData(string key, string value)
```

For example, you might want to log the user ID when the method for logging in the user is called:

```

using AppDynamics.Agent;
...
void LogInUser(UserCredentials) {
 // Log in user
 ...
 // Set user data with the user name.
 Instrumentation.SetUserData("user_id", UserCredentials.ID);
}

```

This information is available in **Network Request Analyze** and is added to any crash snapshots that may be taken. Keys and values are limited to 2048 characters each.

You can also set user data with values of other types (long, boolean, double, DateTime) using the following methods:

- [SetUserDataBoolean](#)
- [SetUserDataDate](#)
- [SetUserDataDouble](#)
- [SetUserDataLong](#)

To remove user data, use the following methods:

- [RemoveUserData](#)
- [RemoveUserDataBoolean](#)
- [RemoveUserDataDate](#)
- [RemoveUserDataDouble](#)
- [RemoveUserDataLong](#)

### Set the Logging Level (Optional)

You can set the logging level with the configuration `LoggingLevel` as part of the class `IAgentConfiguration`.

You can set `LoggingLevel` to one of the levels listed in the table below.

Level	Description
Off	Agent will emit no messages at all.
Error	Only show errors and initial banner. This is the default.
Warn	Warning level messages and above.
Info	Information level messages and above May be useful to the developer.
Debug	Debug level messages and above. Useful for support personnel and developers.
Verbose	Verbose level messages and above. Use verbose logging only for troubleshooting. Be sure to disable for production.
All	All messages.

For example:

```
var config = AppDynamics.Agent.AgentConfiguration.Create("<#Your App Key>");
config.LoggingLevel = AppDynamics.Agent.LoggingLevel.All;
AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);
```

### Transform URLs for Network Requests

#### Implement the Network Request Callback

The callback that modifies or ignore specific URLs should be assigned to the `Func` delegate below.

**i** The callback method `OnNetworkRequest` is synchronous, so we recommend that you return from the function quickly.

```
public Func<IHttpRequestTracker, bool> OnNetworkRequest { get; set; }
```

## Transforming URLs

To transform URLs, the `OnNetworkRequest` method should:

1. Identify specific URLs using techniques such as regex or pattern matching.

**i** This first step is optional because you can choose to transform the URLs of all network requests.

2. Modify the URL property of the `IHttpRequestTracker` object.
3. Assign a valid URL to the `url` property. Modifying other properties of the `IHttpRequestTracker` object will be ignored.
4. Return `true`.

For example:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
 var maskUrl = new Uri("http://networkrequest-mask.com/");
 tracker.Uri = maskUrl;
 return true;
}
```

## Transforming Sensitive URLs

You may want to identify and transform URLs that contain sensitive information.

For example:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
 var urlString = tracker.Uri.ToString();
 if (urlString.Contains("accountInfo"))
 {
 tracker.Uri = new Uri("http://customer-account.com/");
 }
 return true;
}
```

## Ignoring URLs

If the `onNetworkRequest` method returns `false`, the beacon is dropped. Generally, the process for ignoring beacons is:

1. Identify specific URLs using techniques such as regex or pattern matching.
2. Return `false`.

To ignore specific URLs, you would identify network requests that you didn't want to monitor and return `false` to ignore the network request.

For example:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
 if (tracker.Uri.ToString().Contains("avatar"))
 {
 //ignore calls for avatars
 return false;
 }
 return true;
}
```

To ignore all network requests, implement the following:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
 return false;
}
```

## Register a Network Request Callback

To register a network request callback:

1. Define your own method to handle the callback:

```
public static bool NetworkRequestCallback(IHttpRequestTracker tracker)
{
 return true;
}
```

2. Pass it during the `AgentConfiguration` initialization phase:

```
IAgentConfiguration config = AgentConfiguration.Create(appKey);
config.OnNetworkRequest += NetworkRequestCallback; //Register the Callback
Instrumentation.InitWithConfiguration(config);
```

3. Or you can use an anonymous function:

```
IAgentConfiguration config = AgentConfiguration.Create(appKey);
config.OnNetworkRequest += (IHttpRequestTracker tracker) =>
{
 return true;
};
Instrumentation.InitWithConfiguration(config);
```

## Configure and Take Screenshots

By default, mobile screenshots are enabled on the agent-side but disabled on the Controller-side. These screenshots appear in the Controller in the [Sessions Details](#) dialog. To programmatically take manual screenshots, you must [enable screenshots in the Controller UI](#) and add the Screenshot API below.

```
Instrumentation.TakeScreenshot();Disable Screenshots
```

**i** The `takeScreenshot()` function limits screenshots to a maximum of 1 screenshot per 10 seconds.

## Disable Screenshots

You can disable screenshots from the Controller UI or with the Agent. To disable screenshots with the Agent, set the property `ScreenshotsEnabled` of the `IAgentConfiguration` object to `false`:

```
IAgentConfiguration config = AgentConfiguration.Create(appKey); config.ScreenshotsEnabled = false; Instrumentation.InitWithConfiguration(config);
```

## Block and Unblock Screenshots

You can also use the Agent to block screenshots from being taken during the execution of a code block. This just temporarily blocks screenshots from being taken until you unblock screenshots. This enables you to stop taking screenshots in situations where users are entering personal data, such as on login and account screens.

The `Instrumentation` class provides the methods `blockScreenshots()` and `unblockScreenshots()` to block and unblock screenshots.

**i** If screenshots are disabled through the property `ScreenshotsEnabled` of the `IAgentConfiguration` object or through the Controller UI, these methods have no effect. You can also check the `Instrumentation.ScreenshotsBlocked` property to check if screenshots are being blocked.

```
public void LoginUser()
{
 if (!Instrumentation.ScreenshotsBlocked)
 {
 Instrumentation.BlockScreenshots();
 }
 LoginCredentials credentials = UserLogin.GetCredentials();

 if (credentials.Authorized)
 {
 RedirectToProfile(credentials.user);
 }
}
```

```

 Instrumentation.UnblockScreenshots();
 }
}

```

## WebView Instrumentation (JavaScript Agent Injection)

WebView Instrumentation automatically injects our Javascript Agent into your WebViews, so that WebView navigation can also be instrumented. By default, Ajax calls are disabled, however, both WebView instrumentation, and Ajax instrumentation can be configured using the properties `JsAgentEnabled` and `JsAgentAjaxEnabled`:

### Example

```

var config = AppDynamics.Agent.AgentConfiguration.Create("<#Your App Key#>");
config.JsAgentEnabled = true;
config.JsAgentAjaxEnabled = false;
AppDynamics.Agent.Instrumentation.InitWithConfiguration(config);

```

## MAUI Specific Instrumentation

You can instrument MAUI elements using `AppDynamics.Agent.Maui`. To add the NuGet package, see [Monitor .NET MAUI Applications](#).

### Page Tracking

**Note:** This can be automatically instrumented. Check the [Automatic Page Tracking](#) section.

Using the MAUI agent, you can track page usage and see the how your users interact with the app in the session timeline.

To track pages, you must call `TrackPage` from the constructor on each page you want to monitor.

```

public partial class MyPage : ContentPage
{
 public MyPage()
 {
 InitializeComponent();
 AppDynamics.Agent.Maui.PageTracker.TrackPage(this);
 }
}

```

## Track UI Elements

**Note:** This can be automatically instrumented. Check the [Automatic UI Tracking](#) section.

You can track user interactions with these UI elements:

- Buttons
- Entries
- ListViews

To instrument a UI element:

1. Attach a property to your views:

```
appd:UiInstrumentation.IsInstrumented="True"
```

2. Include the namespace:

```
xmlns:appd="clr-namespace:AppDynamics.Agent.Maui;assembly=AppDynamics.Agent.Maui"
```

## Example

Example of a `xaml` file with instrumented UI elements:

```
<ContentPage
 xmlns:appd="clr-namespace:AppDynamics.Agent.Maui;assembly=AppDynamics.Agent.Maui" >
 <StackLayout>
 <Button
 appd:UiInstrumentation.IsInstrumented="True"
 Clicked="OnButtonClicked" />
 <Entry
 appd:UiInstrumentation.IsInstrumented="True" />
 <ListView
 appd:UiInstrumentation.IsInstrumented="True">
 <ListView.ItemsSource>
 <x:Array Type="{x:Type x:String}">
 <x:String>Item 1</x:String>
 <x:String>Item 2</x:String>
 </x:Array>
 </ListView.ItemsSource>
 </ListView>
 </StackLayout>
</ContentPage>
```

You can also instrument properties from code behind (i.e. in the `xaml.cs` file):

```
using AppDynamics.Agent.Maui;

...

var button = new Button();
button.SetValue(UiInstrumentation.IsInstrumentedProperty, true);
```

The `IsInstrumented` property will track the following events:

1. Button - Button clicked
2. ListView - Item selected
3. Entry - Entry focused and entry unfocused

---

## MAUI SDK Documentation

For the complete SDK API documentation, see the [latest MAUI SDK documentation](#).

## Overview of the Controller UI for Mobile RUM

This page provides an overview of the Controller UI for Mobile RUM applications. Mobile RUM presents your application information in the following ways:

- [Mobile App Dashboard](#): An overview dashboard, with tabs for
  - Widgets for visually displaying common metrics
  - Map-based performance display
  - Usage statistics
- [Experience Journey Map](#): A map of top user journeys navigating your mobile application
- [Mobile Sessions](#): A detailed list of mobile sessions, following users as they interact with your application
- [Network Requests Lists](#): A detailed list of network requests with dashboards
- [Crashes](#): A dashboard displaying of application crash trends and detailed snapshots of individual crashes with stack traces
- [Custom Data](#): A dashboard specific data you want the agent to collect for you

### Access a Browser RUM Application

To see application data in the Controller UI:

1. In the top tab bar, select **User Experience**. The list of instrumented Browser and Mobile Apps displays.
2. Select the **Mobile App** tab.
3. Double-click a mobile application.

### Mobile App Dashboard

The **Mobile App Dashboard** provides a high-level overview of how your application is performing, including the following:

- [Widget-based overview](#)
- [Geo dashboard](#), displaying where your requests originate, including a variety of key performance metrics
- [Set of aggregated usage statistics](#), by device, carrier, connection type, OS version, and app version

### Access the Mobile App Dashboard View

1. Open the application you want.
2. From the left navigation bar of your application, select **Mobile App Dashboard**.
3. Click the tab for the view you want to access.

### Overview Dashboard

The **Overview Dashboard** displays a set of configurable widgets, showing multiple graphs and lists featuring common high-level indicators of application performance. You can delete widgets, re-add them, resize them, and drag them to different locations.

### Geo Dashboard

The Mobile App **Geo Dashboard** displays key performance metrics by geographic location.

The dashboard is divided into three panels:

- A main panel in the upper left that displays geographic distribution of mobile users on a map, if you clicked the map view icon, or on a grid, if you clicked the grid view icon.
- A panel on the right displaying key timings.
- A lower panel with dynamic trend graphs of KPIs.

The metrics displayed throughout the geo dashboard are for the country currently selected on the map or in the grid. For example, if you zoom down from the world view to France on the map, the panel on the right disappears and the trend graphs display data for France.

See [Mobile RUM Metrics](#) for definitions of the metrics.

### Map View Labels

The map view displays load circles with labels for countries that are in the key timing metrics given in the right panel. Some countries and regions, however, are only displayed in the grid view.

### Regions and Countries

Regions are subdivisions of a country, such as a state, province, or city. In the default map view, key performance metrics are displayed by country. The grid view, like the map view, by default displays key performance metrics by country, but can also be configured to show the metrics by region. Because the map view displays fewer regions than the grid view, if you do not see a region displayed in the map view, switch to the grid view.

See [Browser RUM Countries and Regions by Geo Dashboard](#) for a list of the countries and regions available in the map and grid views.

### Unknown Locations in Map and Grid Views

An unknown location is one for which the agent cannot determine the country from which the request originated.

You may also see metrics reported for a location named **Anonymous Proxy**. The data for **Anonymous Proxy** represents the aggregated metrics from one or more private IP addresses that the agent cannot identify.

One of the effects of Unknown regions is that it possible for a country to display as slow (red circles) on the global map, but when you drill down to the country all its regions appear normal (green circles). Or a country may display as normal on the global map, but some sub-regions may display as slow when you drill down.

### Usage Stats

This tab shows graphical and tabular breakdowns of usage by device, carrier, connection type, OS version, and app version. The breakdowns for the connection type are based on network requests. The other usage breakdowns are based on "app opens", *not* network requests. App opens are counted when a mobile application is booted or brought to the foreground. In the case of Android, the app opens occur when the method `onResume` is called for an activity. For iOS, the app opens occur when the method `applicationDidBecomeActive` is called.

**i** The Android Agent obtains the carrier name by calling the Android SDK method `android.telephony.TelephonyManager.getSimOperatorName` and obtains the device name with the Android SDK property `android.os.Build.MANUFACTURER`. If the value for either the carrier or device name is "unknown", this indicates that the method `getSimOperatorName` or the property `MANUFACTURER` did not return a value.

## Mobile Sessions

### Related pages:

- [EUM Data](#)
- [Mobile RUM Metrics](#)

In most cases, a user's interaction with your app is not limited to one action in one panel view. Sessions allow you to track your users' interactions across time, as they navigate an entire session with your app. By default, sessions begin when a user starts using your application and ends after a configurable period of user inactivity. You can also programmatically control sessions through the Mobile Agents SDKs ([Android](#), [iOS](#), [Xamarin](#), [Cordova](#)). Using Mobile Sessions, you can analyze *sessionized* results from all requests, as stored in the AppDynamics Events Service.

As in [Network Request Analyze](#), the main Sessions panel is comprised of these tabs:

- [Records](#)
- [Charts](#)

You can also view detailed information about each session in the [Session Details](#) dialog.

### Records

The Records tab lets you scan individual sessions and allows you to filter and sort to get exactly the data in which you are interested.

The screenshot displays the 'Sessions' interface in AppDynamics. At the top, there are navigation tabs for 'Records' and 'Charts'. Below the tabs is a search bar and a 'Manage searches' button. A chart area shows session activity over time, with a 'Filter results' annotation pointing to the filter criteria. Below the chart is a table of session records. The table has columns for 'Last Updated', 'Duration (sec)', 'Model', 'Device / Manufacturer', 'OS Version', 'Country', 'Connection Type', 'Carrier', and 'Mobile App Version'. A 'View Details' button is located above the table. On the left side, there is a 'Fields' list with checkboxes for various session attributes. An annotation 'Select fields to view.' points to this list. Another annotation 'View details of selected items.' points to a row in the table. At the bottom right, there is a pagination control showing '50 per page' and '1 of 200'.

## Session Details

Click **View Details** or double-click an item to see the information for a specific session.

### Session Timeline

The sequence of session frames for the session is shown on the session timeline and on the bottom of the panel. Select a specific frame by clicking on an icon on the timeline to see details highlighted at the bottom of the panel. You can also select a frame row at the bottom to see it highlighted on the timeline.

### Session Details Categories and Types

Categories	Subcategories	Type	About
Views	Activity	Activity/ Fragment	The current Activity in the foreground of an Android app. If the current Activity is not sufficient to understand what the user is doing, consider using the Session Frame APIs.

Categories	Subcategories	Type	About
	RootViews	 RootView	The current RootView in the foreground of the iOS App. If the current RootView is not sufficient to understand what the user is doing, consider using the Session Frame APIs.
	Session Frames	 Session Frame	A manual API to label large user activities that are not captured out of the box by Activity or RootView tracking.
Screenshots	-	 Screenshot	If you have configured mobile screenshots, they will appear in the timeline. They capture user events, and they can also be collected when in automatic mode.
User Interactions	Touches	 Event	If you have enabled the Mobile Agent to capture UI events, you can view the UI events triggered by user interactions in the <b>Timeline</b> . See "Enable User Interaction Capture Mode" ( <a href="#">iOS/Android</a> ) to learn how to capture UI events.
	Buttons		
	Table Cells		
	Text Views		
	Text Fields		
Network Requests	Network Requests Normal	 Network Request Normal	Network requests include the requested URL, duration, and status details of the HTTP request.
	Network Requests Slow	 Network Requests Slow	To jump to more Network Requests details, click  .

Categories	Subcategories	Type	About
	Network Requests Very Slow	 Network Requests Very Slow	
	Network Requests Stall	 Network Requests Stall	
Errors And Warnings	Application Not Responding Issues (ANRs)	 ANR	<p>You can view when the application was non-responsive in the timeline. ANRs are reported when the UI thread does not respond to an event for two seconds or more.</p> <p>To download or view the ANR Summary, click  or , respectively.</p>
	Crashes	 Crash	<p>When an app crashes the subsequent activity will appear in the timeline.</p> <p>To download or view the Crash Summary, click  or , respectively.</p>
	Errors	 Error	<p>If you have reported errors with the Mobile Agent SDKs, the errors will also appear in the timeline. See "Report Errors and Exceptions" (<a href="#">iOS/Android</a>) to learn how to instrument your mobile apps to report errors and exceptions.</p> <p>To download or view the Error Summary, click  or , respectively.</p>
Custom Data	Metrics	 Custom Metric	Custom metrics display integer-based data on any metric you define in your application.

Categories	Subcategories	Type	About
	Timers	 Custom Timer	Custom timers display how long something takes between any arbitrary start point and end point, even if they span multiple methods.
	Info Points	 Info Point	Information points display information on how a specific method in your code is performing.
	Breadcrumbs	 Breadcrumb	Breadcrumbs are short messages to mark interesting events in a session, controlled by the Breadcrumb APIs in the agent.
System Events	Connection Transition	 System Event	Connection transition indicates when a broadband transition has taken place, such as from Wifi to cellular.
	Agent Init	 System Event	Agent Init indicates when the Mobile Agent was first initialized. It can help with debugging the application lifecycle.

### View Options

You can filter the categories in your timeline view by clicking **View Options**. Check all relevant categories for your search. All view options are checked by default.

Timeline      Session Summary

**View Options**

Views

- Root Views
- User Interactions
- Text Fields
- Network Requests
- Network Requests No...

**Search Events**

You can search for a specific event **Description** using the search box located in the top right of the session timeline panel.

Timeline      Session Summary      Business Transactions

6 of 6 Sessions for this Agent

Search: login

Start Time ↑	Duration	Type	Description	Additional Details

### Business Transactions

You can see a list of business transactions in the session if applicable. This tab only appears if you have business transactions in the selected session.

Click the business transaction name to redirect to the transaction flow map.

Timeline	Session Summary	Business Transactions
Type	Name ↑	
	<a href="#">/cart/co.GET</a>	
	<a href="#">/cart/{id}.GET</a>	

### Charts

The **Charts** page provides you with a set of predefined widgets that offer visualizations of the data set you have created. As with the **Charts** pages of the other Analyze/Session features of the UI, you can delete, re-add, resize, and drag-and-drop to move all of the widgets.

-  **Active Sessions Over Time**  
Add a graph showing active sessions within the selected time range.
-  **Session Duration Time Distribution**  
Add a graph showing session duration times within the selected time range.
-  **Sessions By Region**  
Add a geographical map showing sessions counts as well as the top five locations.
-  **Device Name**  
Add a bar chart showing sessions by device names.
-  **Device Manufacturer**  
Add a bar chart showing sessions by device manufacturers.
-  **Application Version**  
Add a bar chart showing sessions by Application Versions.
-  **Carriers**  
Add a bar chart showing sessions by Carrier.
-  **OS Versions**  
Add a bar chart showing sessions by OS Versions.
-  **Connection Types**  
Add a bar chart showing sessions by connection types.
-  **Crashes By App Version - Top 5**  
Add a table showing top 5 crashed sessions by app versions.
-  **Crashes By Device Name - Top 5**  
Add a table showing top crashed sessions by device name.
-  **Crashes By Device Manufacturer - Top 5**  
Add a table showing top 5 crashed sessions by device manufacturer.
-  **Crashes By Carrier - Top 5**  
Add a table showing top 5 crashed sessions by carrier.
-  **Crashes By Connection Type - Top 5**  
Add a table showing top 5 crashed sessions by connection type.
-  **Crashes By OS Version - Top 5**  
Add a table showing top 5 crashed sessions by OS versions.
-  **Active Users By Region**  
Add a geographical map showing active users in session counts as well as the top five locations.
-  **Countries By Session Count - Top 5**  
Add a table showing top 5 countries by session count.
-  **Countries By Active Users - Top 5**  
Add a table showing top countries by active users.

## Mobile Screenshots

Mobile screenshots provide context to the data collected in the Controller UI. They also allow you to better understand the user experience.

Screenshots enable you to:

- **Verify Presentation:** Determine if an app is displaying correctly on different devices.
- **Understand User Behavior:** Determine where users are clicking on the screen.
- **Troubleshoot Bugs:** Analyze bugs and errors by correlating code issues with screenshots. You'll be able to see what the user is doing when issues happen.

## AppDynamics Version Requirements

You must use these AppDynamics software versions:

- Controller >= 4.3.2
- iOS/Android Agents >= 4.3.2

- AppDynamics Cordova Plugin >= 1
- Xamarin Agent >= 21.6.0

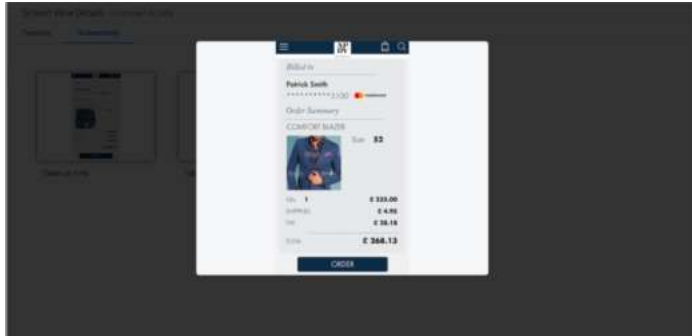

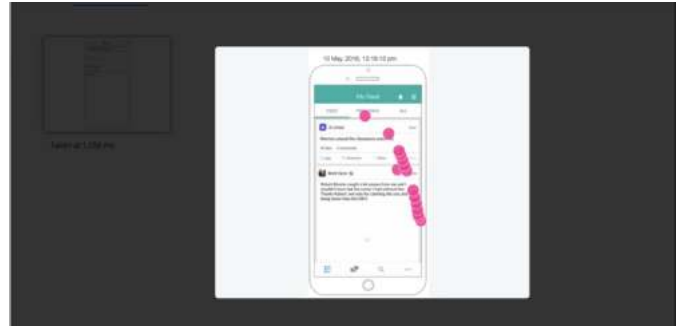

## Screenshot Limitations

Mobile screenshots have the following limitations:

- Only iOS/Android/Cordova platforms are supported.
- You can enable or disable screenshots or explicitly exclude screenshots for specific screens/activities.
- You cannot set a minimum/maximum number of screenshots per session.
- Touch points are not collected unless screenshots are in automatic mode.
- The touch points will not be included in screenshots from past sessions.
- The UI Event feature is not related to screenshots or touch points in any way. Thus, the screenshot will not be directly correlated with a UI event in the **Waterfall**.

## Types of Screenshots

Mobile RUM captures conventional screenshots and touch-point screenshots that capture user touch events. Both types of screenshots have timestamps, but the latter will also plot "user touches" on the panel.

Conventional Screenshots	Touch Point Screenshots
 <p>The conventional screenshot will simply show what your users viewing. These screenshots can be taken programmatically or by enabling automatic screenshots in the Controller UI.</p>	 <p>The touch point screenshot shows where users touched the screen when using your app. Touch points are only collected when automatic capture mode is enabled.</p>

## When Screenshots Are Taken

Screenshots can only be captured if the Mobile Agent and the Controller UI have enabled screenshots.

Once screenshots have been enabled, screenshots will be only taken if one or more of the following are true:

- The Mobile Agent uses the SDK API to manually take a screenshot.
- You have enabled automatic capture in the Controller UI.

## Configure Mobile Screenshots

You have several methods for controlling when screenshots are taken. This page lists the settings for disabling/enabling and taking screenshots.

## Screenshot Control Settings

This table lists the different settings for screenshots, the user tasks required for the settings, and a description of what the settings accomplish. Screenshots are enabled by default in the iOS and Android Agents, but disabled in the Controller UI. To use screenshots, you need to enable screenshots in the Controller UI.

Screenshot Setting	User Tasks	Result
<b>Disable Screenshots From Being Taken</b>	Perform one of the following: <ul style="list-style-type: none"> <li><input type="checkbox"/> Disable screenshots with the iOS/Android SDK.</li> <li><input type="checkbox"/> Disable screenshots in the Controller UI.</li> </ul>	<p><b>Only Disable Screenshots with the iOS/Android SDK</b></p> <p>Screenshots are globally disabled. The Controller UI cannot override the Mobile Agent setting.</p> <p><b>Only Disable Screenshots with the Controller UI</b></p> <p>The Controller will disable screenshot capture in the Mobile Agent. Because the Controller setting is propagated to the Mobile Agents through the EUM Server, the Mobile Agent may take screenshots before its screenshot setting has been updated. Once the Controller setting has been applied, however, the Mobile Agent will no longer take screenshots.</p>
<b>Enable Screenshots</b>	<ul style="list-style-type: none"> <li><input type="checkbox"/> Enable screenshots in the Controller UI.</li> </ul>	<p>The Mobile Agent can take screenshots, and the Controller UI will display them in the session results.</p>
<b>Enable Screenshots - Manual Screenshots (Wi-Fi)</b>	<ul style="list-style-type: none"> <li><input type="checkbox"/> Enable screenshots in the Controller UI.</li> <li><input type="checkbox"/> Manually take screenshots using the iOS/Android SDKs.</li> </ul>	<p>You call the Mobile SDK to take screenshots. The screenshots are only uploaded to the Controller when the device is using Wi-Fi.</p>
<b>Enable Screenshots - Automatic Screenshots (Wi-Fi)</b>	<ul style="list-style-type: none"> <li><input type="checkbox"/> Enable screenshots in the Controller UI.</li> <li><input type="checkbox"/> Configure the Controller UI to automatically take screenshots.</li> </ul>	<p>Screenshots are automatically taken periodically. The screenshots are only transmitted when the device is using Wi-Fi.</p>
<b>Enable Screenshots - Manual Screenshots (Wi-Fi / Cellular Data)</b>	<ul style="list-style-type: none"> <li><input type="checkbox"/> Enable screenshots in the Controller UI.</li> <li><input type="checkbox"/> Configure the Controller UI to allow the use of cellular data.</li> <li><input type="checkbox"/> Manually take screenshots using the iOS/Android SDKs.</li> </ul>	<p>You call the Mobile SDK to take screenshots.</p>

Screenshot Setting	User Tasks	Result
<b>Enable Screenshots - Automatic Screenshots (Wi-Fi / Cellular Data)</b>	<ul style="list-style-type: none"> <li><input type="checkbox"/> Enable screenshots in the Controller UI.</li> <li><input type="checkbox"/> Configure the Controller UI to automatically take screenshots.</li> <li><input type="checkbox"/> Configure the Controller UI to allow the use of cellular data.</li> </ul>	Screenshots are automatically taken periodically.

## Take Mobile Screenshots

### Related pages:

- [Customize the iOS Instrumentation](#)
- [Customize the Android Instrumentation](#)

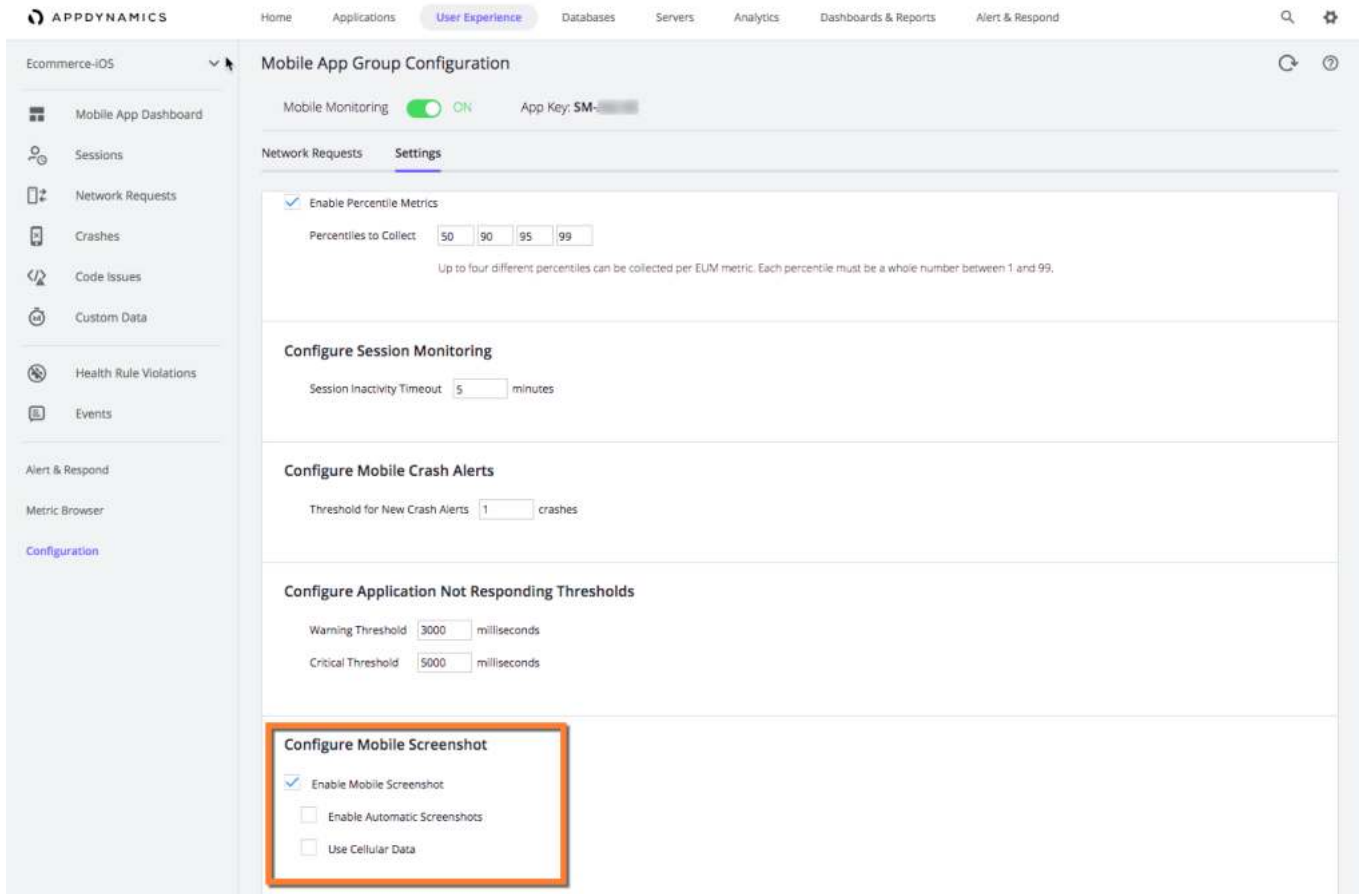

This page describes how to enable and disable screenshots and manual and automatic screenshots.

### Enable Mobile Screenshots

Mobile screenshots are disabled by default (in the Controller) for security and privacy reasons as screenshots may contain sensitive information.

To enable mobile screenshots:

1. Navigate to one of your mobile apps.
2. Open the **Configuration** page.
3. Click **Mobile App Group Configuration**.
4. Check the **Enable Mobile Screenshot** checkbox.

5. (Optional) If you want to allow the application to take screenshots when using cellular data, check the **User Cellular Data** check box.

### Enable Automatic Screenshots

Mobile screenshots are disabled by default (in the Controller) for security and privacy reasons as screenshots may contain sensitive information. If automatic screenshots are enabled, screenshots are taken every 10 seconds.

To enable automatic screenshots:

1. Navigate to one of your mobile apps in the Controller UI.
2. Open the **Configuration** page.
3. Click **Mobile App Group Configuration**.
4. Scroll down to **Configure Mobile Screenshot** and confirm that the **Enable Mobile Screenshot** checkbox is checked.

5. Check the **Enable Automatic Screenshots** check box.

### Configure Mobile Screenshot

- Enable Mobile Screenshot
  - Enable Automatic Screenshots
  - Use Cellular Data

6. (Optional) If you want to allow the application to take screenshots when using cellular data, check the **User Cellular Data** check box.

### Programmatically Take Screenshots

You can use the Android or iOS SDK to programmatically take screenshots. See:

- [Android: Configure and Take Screenshots](#)
- [iOS: Configure and Take Screenshots](#)

### View Mobile Screenshots

Mobile screenshots are included in the **Session Details**. You can view a timeline of the screenshots and touchpoints that were taken during the user's activity.

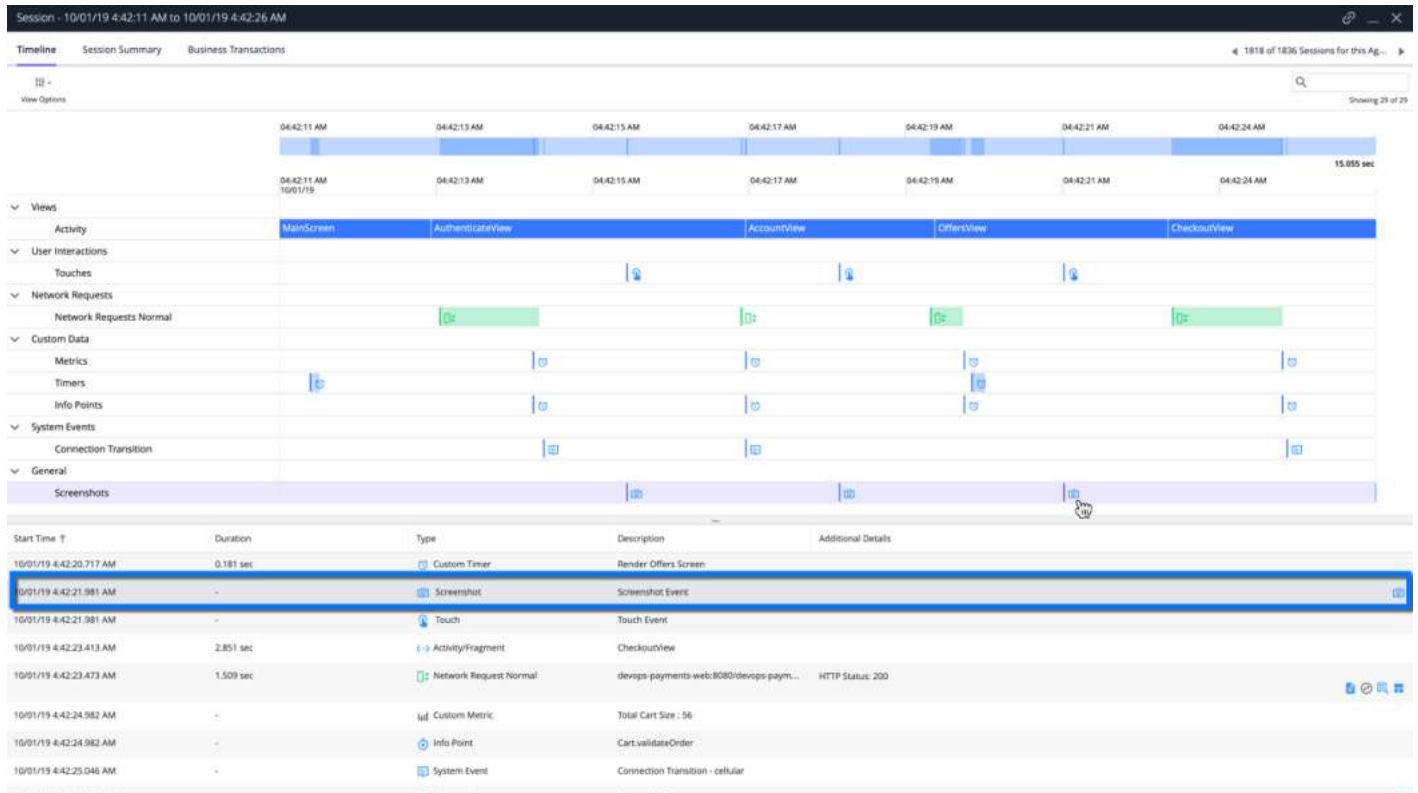

This page describes how to view screenshot and touch events in the timeline of the Timeline tab, and view thumbnails and full-size images of the screenshots and touches in the chronological event list.

### Screenshot Events in the Timeline

Both conventional and touch-point screenshot events appear in the Timeline tab at the time that it was taken.

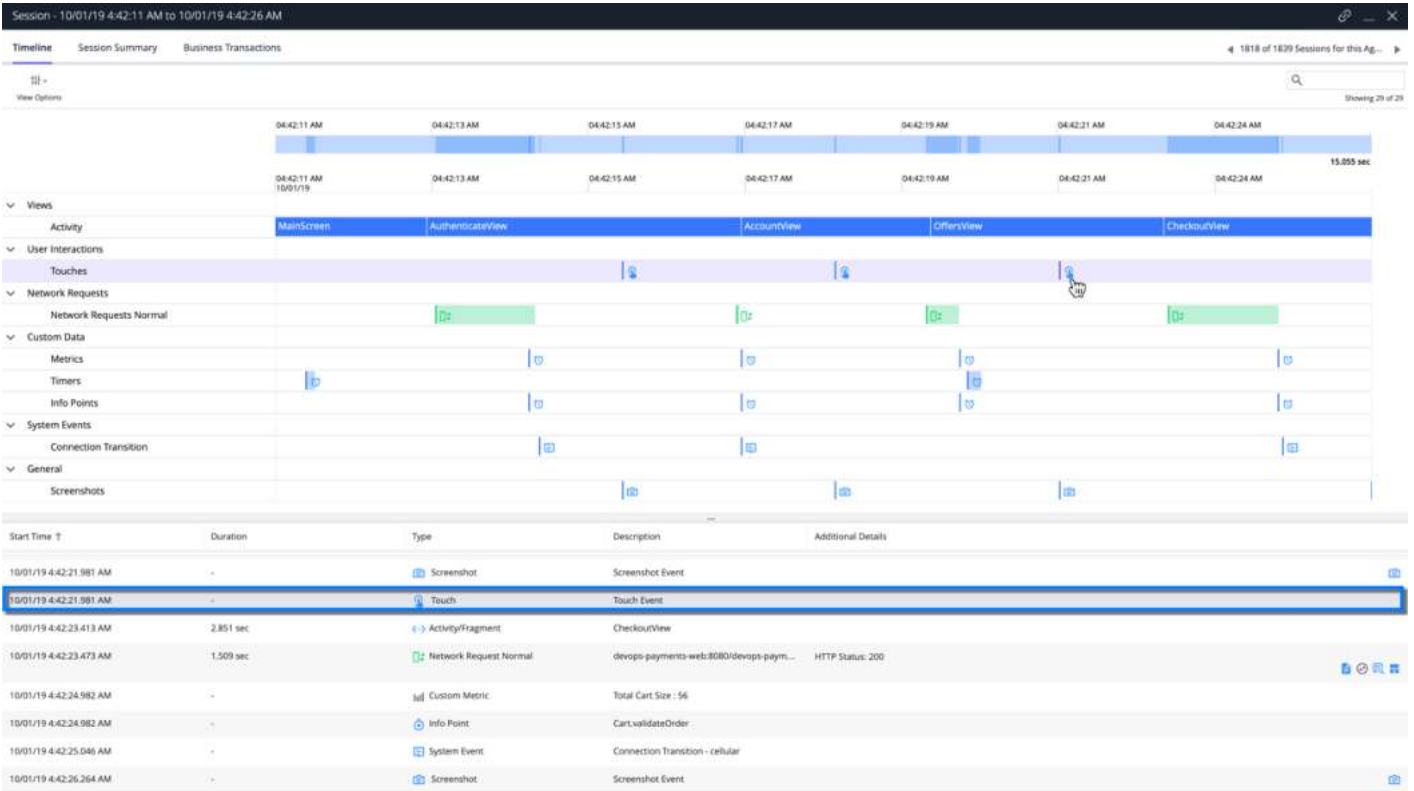

#### Conventional Screenshots

Conventional screenshots appear in **General > Screenshots**. Click the **camera** icon to view details of the screenshot event in the chronological event list at the bottom.

## Screenshots of Touches

Screenshots of touches appear in **User Interactions > Touches**. Click the **screen touch** icon to view details of the touch event in the chronological event list at the bottom.

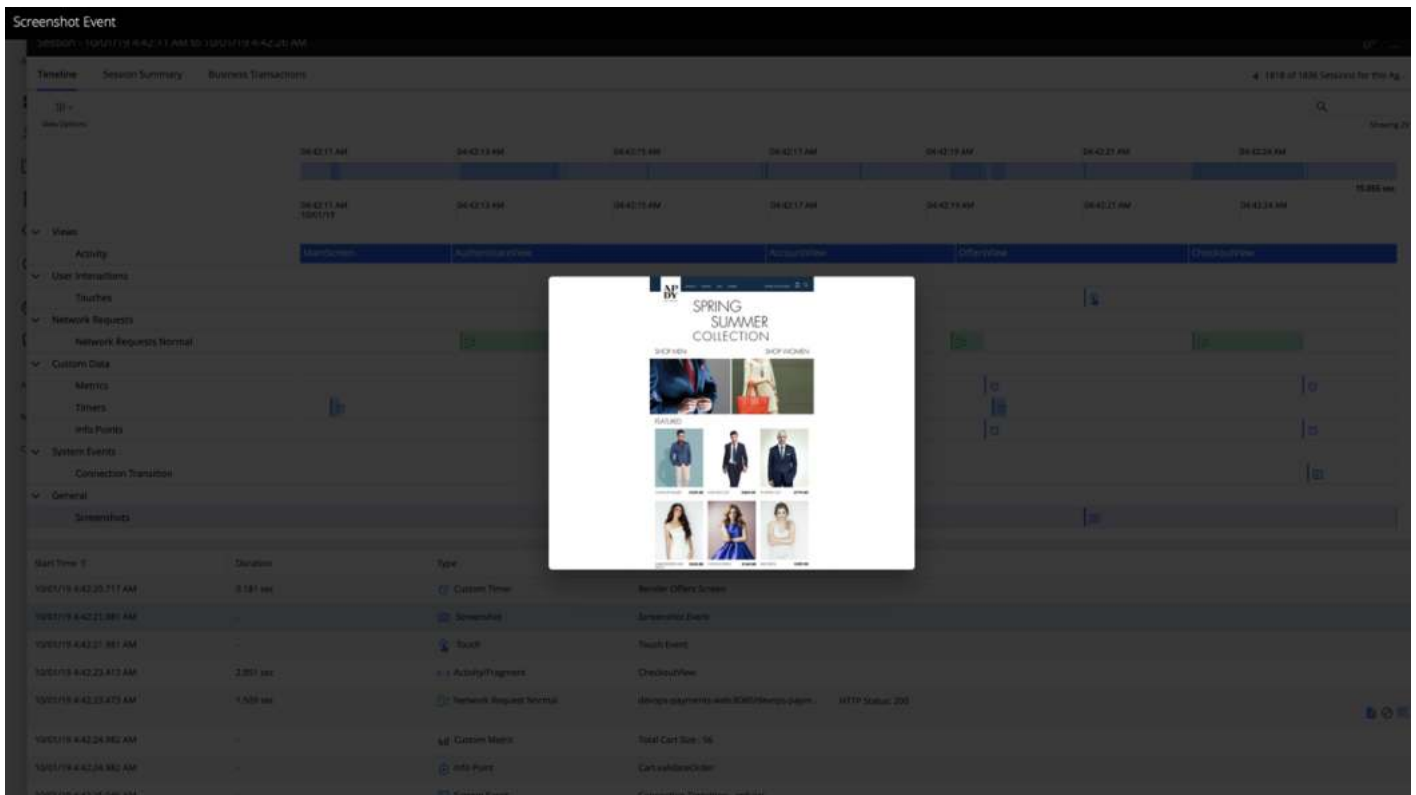

### Screenshot Thumbnails

From the chronological list of events at the bottom of the page, you can hover over a screenshot or touch event to view a thumbnail. The screenshot of the touches displays the touch locations in pink.

Conventional Screenshot Thumbnail					Screenshot Thumbnail of Touches

### Full-Size Screenshots

To view full-size images of the conventional screenshots, click the **camera** icon on the right of the event details in the chronological list. Full-sized images are not available for screenshots of touches.

## Mobile Health Rules

### Related pages:

- [Policies](#)
- [Troubleshoot Health Rule Violations](#)

You can set [mobile health rules](#) to trigger [actions](#) when certain conditions are met or exceeded based on configured thresholds for mobile application metrics.

To [configure alerts and responses](#), you can use the **Getting Started Wizard** or manually create alerting policies based on mobile health rules. Alerts and responses help you to anticipate and take action for problems with your mobile applications.

This page describes the two types of mobile health rules, how to select mobile health rule types, create new mobile health rules, and how to view the health results of your mobile applications.

### Mobile Health Rule Types

When you select the [health rule scope](#) for mobile applications, you are given a set of health rules based on the two [health rule types](#): **Mobile Apps** and **Network Requests**. You can create new health rules using the mobile health rule types or use a custom health rule type.

### Mobile Apps Health Rule Type

The **Mobile Apps** health rule type can be used to add conditions based on a wide range of mobile application metrics such as application starts, crashes, or network requests for the application. The network request metrics for the **Mobile Apps** health rule type refer to all the network requests of the application. For example, when you configure a threshold for the metric **Slow Network Requests**, the **Mobile App** type

---

health rule will evaluate all the network requests of the mobile application in determining which network requests are slow.

### Network Requests Health Rule Type

The **Network Requests** health rule can only be used to add conditions based on network-related metrics such as HTTP errors, network errors, network request time, and network requests per minute. The network request metrics for the **Network Requests** health rule type refers to specific network requests. For example, when you configure a threshold for the metric **Slow Network Requests**, the **Network Requests** type health rule will evaluate one network requests, such as calls to `http://google.com` in determining which network requests are slow.

### Custom Health Rule Type

The **Custom** health rule type allows you to use any metric. This enables you to set health rules that have metrics from different health rule types. For example, you could have a custom health rule that is based on configured thresholds for mobile metrics and business transaction metrics.

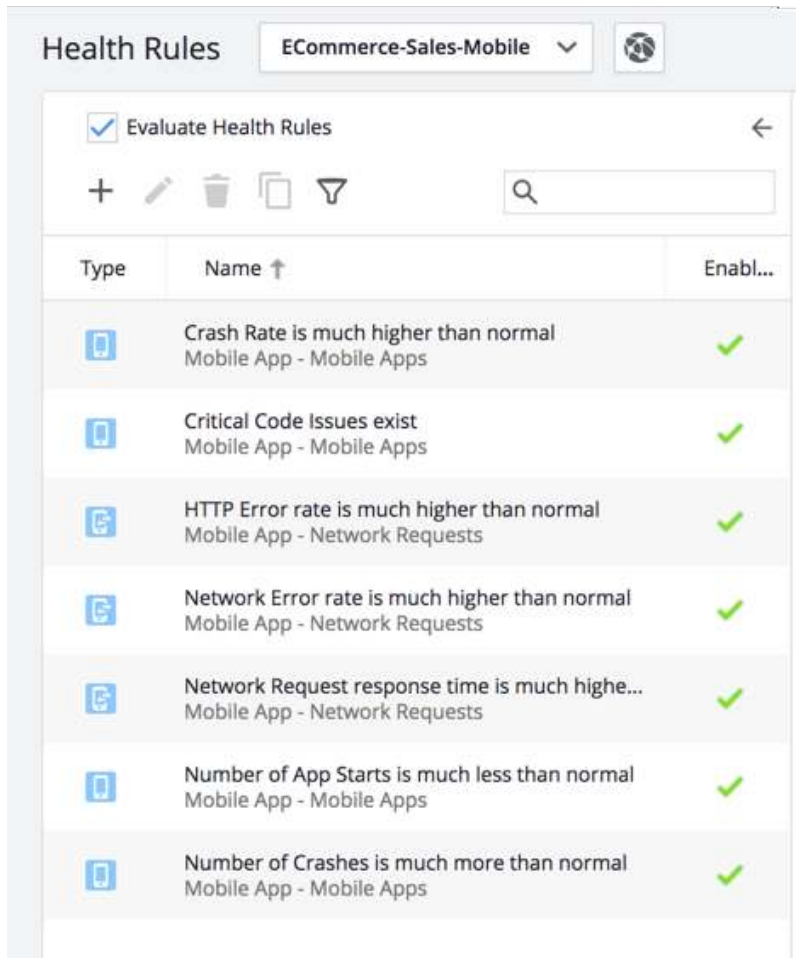

### Create Health Rules

The process and user flow for creating health rules for mobile applications are similar to creating health rules for other applications. Thus, if you haven't created policies or health rules before, see [Configure Policies](#) and [Configure Health Rules](#) for general instructions. The sections below are not going to cover creating policies, but instead focus strictly on the important differences when creating health rules for mobile applications.

The first example will show you how to use the default set of mobile health rules, modify one of the default mobile health rules, and finally, how to create a new health rule using one of the mobile health rule types.

### Using Default Health Rules

When you use the [health rule scope](#) for mobile applications, you are given a set of default health rules based on mobile health rule types. To enable these default health rules, click **Alert & Respond > Health Rules** to see the list of default health rules for mobile applications. You can use these default health rule types for your mobile applications by checking the **Evaluate Health Rules** checkbox:

### Modify Default Health Rules

The default health rules for mobile applications are based on mobile health rule types and have default conditions based on preset values for mobile metrics. You may want to retain the default health rules, but want to customize the conditions for your mobile application. To do this, click the default health rule you want to modify and navigate to either the **Critical Warning** or **Warning Condition** panel. You can then change the parameters of the existing conditions or add new conditions.

### Select Mobile Applications for the Health Rules

You can choose whether to apply the health rules for mobile applications. Depending on the mobile health rule type, you have different criteria to choose when to apply the health rules.

For health rules based on the health rule type **Network Requests**, you can apply the health rules for:

- All network requests in the mobile app group
- Specified network requests
- Network requests matching criteria
- Network requests for specific mobile applications

For health rules based on the health rule type **Mobile Apps**, you can apply the health rules for:

- All mobile applications in a mobile app group
- Specified mobile applications

- Mobile applications matching criteria

## Create New Health Rules

You may want to create additional health rules based on one of the mobile health rules or a custom health rule. You do this in the same way you would create any health rule, except from the **Create Health Rule** dialog, you would select either the mobile health rule type **Mobile Apps** or **Network Requests**:

**Create Health Rule** [X]

Overview **Affected Entities** Critical Criteria Warning Criteria

Select Health Rule Type

What does this Health Rule affect?

Select what Mobile Apps this Health Rule affects

Selected (1)

Name
<input type="checkbox"/> EcommAndroid

Available (3)

Name
<input type="checkbox"/> Ecommerce-IOS
<input type="checkbox"/> ECommerce
<input type="checkbox"/> ECommerce1

← →

Cancel Save

You can choose to apply the new health rule to mobile applications that you select, or those that match given criteria.

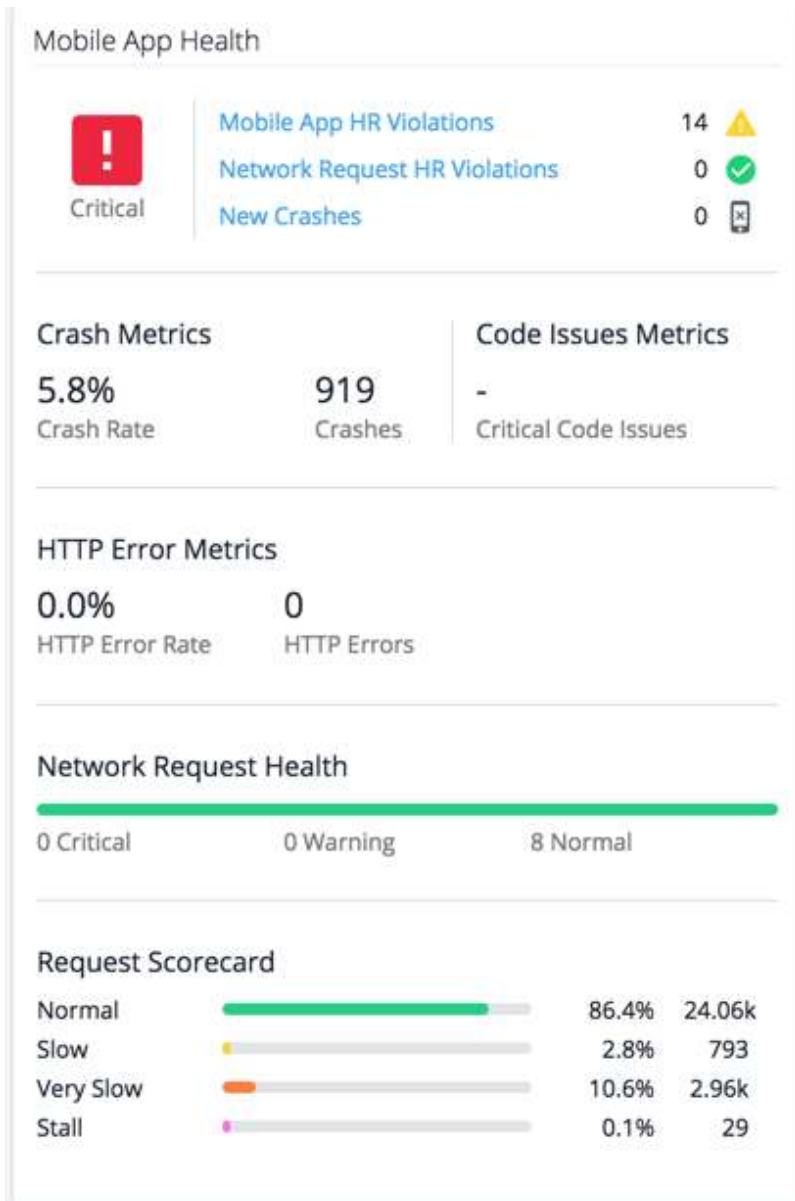

From the **Critical Criteria** and/or **Warning Criteria** panels, you can add conditions and define parameters with mobile metrics.

## View Health Results

In addition to getting alerts when mobile applications are unhealthy, you can also view the health of your mobile application from certain widgets the **Mobile App Dashboard** and in the Events and Health Rule Violations tabs.

## Overview Widgets

From the **Mobile Dashboard**, you should see the **Mobile App Health** widget. The widget displays health rule violations, crash metrics, and the network request health.

## Events

The Events tab displays the health rule violations for your mobile application. See [Monitor Events](#).

Type ↑	Summary	Time	Business Transaction
Health Rule Violation Sta...	Health Rule Crash Rate has violated	12/16/18 3:58:55 PM	-
Health Rule Violation Sta...	Health Rule Crash Rate has violated	12/18/18 2:06:55 PM	-
Health Rule Violation Sta...	Health Rule Crash Rate has violated	12/18/18 11:30:55 AM	-
Health Rule Violation Sta...	Health Rule Crash Rate has violated	12/18/18 11:27:55 AM	-
Health Rule Violation Sta...	Health Rule Crash Rate has violated	12/18/18 5:10:55 AM	-
Health Rule Violation Sta...	Health Rule Crash Rate has violated	12/18/18 2:25:55 AM	-
Health Rule Violation Sta...	Health Rule Crash Rate has violated	12/18/18 1:10:55 AM	-

You can sort the health rule violations for your mobile application by event types, health rules, or custom events you created.

### Health Rule Violations

The Health Rule Violations tab lists the health rule violations that have happened over the specified time or that are still open.

Health Rule	Affects	Sta...	Description ↑	Start Time	End Time	Duration
Crash Rate	EcommAndroid	Open	Crash Rate	12/18/18 2:06:55 PM	-	7 hours, 49 minutes Ongoing
Crash Rate	EcommAndroid	Res...	Crash Rate	12/09/18 5:31:55 AM	12/09/18 3:20:55 PM	9 hours, 49 minutes
Crash Rate	EcommAndroid	Res...	Crash Rate	12/17/18 10:57:55 AM	12/17/18 12:19:55 PM	1 hour, 22 minutes

Double-clicking one of the health rule violations in the list opens the **Health Rule Violation Details** dialog showing the type of health rule violation, the timeline, the events, and a description of the violation.

### Network Requests

A network request is an HTTP request from your mobile app to a server-side application.

The iOS Agent detects network requests when the underlying implementation is handled by the `NSURLConnection` or `NSURLSession` classes.

The Android Agent detects network requests when the underlying implementation is handled by the

`HttpURLConnection`, `HttpsURLConnection`, `HttpClient`, `OkHttp`, or `ch.boyer.httpclientandroidlib` classes.

**i** You can use the agent SDK to set up other HTTP classes.

## View Network Requests

There are different ways of viewing network request data in the **Network Requests View**:

- [The Network Requests list](#) displays current network request types to your applications. You can sort the list according to key metrics such as the slowest response time, highest error rate, highest load, etc. You can view a [network request dashboard](#) that summarizes aggregate performance for a specific network request type.
- [Network Request Analyze](#) allows you to sort and filter a store of *all* the network request data your agents have collected and to see visualizations based on that data.
- A [Network Request Snapshot](#) reports information on an individual instance of a network request. Snapshots are useful for examining the details of the worst-performing requests. Access these snapshots from the [network request snapshots list](#).

Network request data is also displayed in the [Mobile App Dashboard](#).

- The Overview tab has the following widgets showing information about network requests:
  - **Network Request Scorecard:** Displays the number and percentage of normal, slow, very slow, and stalled network requests. Clicking on the widget opens the [Network Requests list](#).
  - **Network Request Health:** Displays the number of network requests evaluated as normal, critical, or warning based on default or configured health rules. Clicking on the widget opens the [Network Requests list](#).
  - **Network Request Time By Country:** Displays a heat map of the world based on the number of network requests. Clicking on the widget opens the [geographic view](#).
  - **Requests Per Minute:** Displays a bar graph showing the number of requests per minute over the specified time period. Clicking on the widget opens the geographic view.
  - **Network Requests Time Distribution:** Displays a bar graph showing the number of requests made at different network request times. In addition, the graph gives the percentage rank of the number of network requests in its frequency distribution of network request time. For example, the **95th percentile (5,419 ms)** indicates that 95% of the network requests had a network request time of 5,419 ms or less. Clicking on the widget opens the [Charts](#) tab of [Network Request Analyze](#).
  - **Network Request Time Trend:** Displays a line graph showing the average network response time over a specified time period. Clicking on the widget opens the geographic view.
  - **HTTP Errors:** Displays the number and rate of HTTP errors. Clicking on the widget opens the [Network Requests list](#).
  - **HTTP and Network Errors Trend:** Displays a line graph comparing the number of HTTP and network errors over a specified time period. Clicking on the widget opens the geographic view.
- The [geographic view](#) reports aggregated mobile data by geographic location. Monitor the geographic view to learn which countries have the highest number of requests, the longest request times, and the most errors.
- [Usage stats](#) display key network request metrics by various criteria: device, carrier, operating system version, connection type, and application. For example, you can see which carriers are the slowest or which devices are producing the most errors.

**i** The Controller processes a maximum of **2000** network requests per mobile app group and **500** network requests per mobile application. See [Network Request Limits](#) for suggestions on how to configure network request detection to stay under this limit.

## Access the Network Requests View

1. Open the application you want.
2. In the left navigation bar, select **Network Requests**.
3. Click the tab for the view you want to access.

---

## Network Requests List

### Related pages:

- [Network Request Dashboard](#)
- [Network Request Limits](#)

The **Network Requests** list shows all the network requests types from your instrumented mobile application, along with their key performance indicators.

### Network Requests List Organization

The **Network Requests** list is a table that displays aggregated metrics for current requests, with one row for each request type. The columns display the name of the network request and the aggregated metrics associated with it. See [Mobile RUM Metrics](#) for descriptions of these metrics.

Click a column header to sort the list based on the column's metric. For example, if you want to sort by the slowest requests, click the **Network Request Time (ms)** column header. You can toggle the column to switch between ascending and descending order. Use **View Options** to configure the table. Check **With Load** if you want to show only network request types that have experienced active load, that is, those for which there were one or more measured network requests over the selected time period.

To view a network request dashboard:

1. Select the network request type in the list.
2. Click **Details** or double-click the network request.

## More Actions Menu

Use the **More Actions** menu to select one or more requests in the list and perform these actions:

- **Exclude Request(s):** Use this option to direct AppDynamics to ignore the selected request(s) and stop reporting metrics for them. You can use the **View Excluded Requests** option to see requests that have been excluded and then you can "un-exclude" them.
- **Rename Request:** Use this option to rename one selected request in the AppDynamics console.
- **Delete Request(s):** Use this option to remove the request(s) from the list. If AppDynamics discovers a deleted request again it will reappear in the list. To prevent it from re-appearing, use **Exclude Request(s)**.

## Network Request Dashboard

### Related pages:

- [Network Requests](#)
- [Network Requests List](#)
- [Network Request Analyze](#)
- [Mobile RUM Metrics](#)

Each network request type has its own dashboard that graphically displays key performance indicators for that type over the selected time range. To select the time range, use the general time range dropdown at the top right of the UI.

### Network Request Dashboard Organization

The **Network Request Dashboard** displays summary key network request metrics for the time selected. To see any particular metric in the metric browser, click the metric value (in link blue).

The trend graphs for the key performance indicators are:

- **Network Request Time:** Average times in milliseconds.
- **Total Server Time:** Displayed only If the mobile request is correlated with a server-side application.  
The total server time is the interval between the time that the server-side application receives the network request to the time that it finishes processing the request. Use this graph to determine, on average, how much time is spent on the network versus how much time is spent on the server to process the user's request.
- **Load:** Total Requests and Requests per Minute.
- **Errors:** Network Errors and HTTP Errors in total and per minute.
- **Related Business Transactions:** If the request is correlated with a server-side application, the dashboard lists business transactions associated with the request below the performance metrics.  
You can click the link to a related business transaction to see its business transaction dashboard.  
If transaction snapshots were taken at the same time as the network request, the dashboard lists the transaction snapshots below the business transactions. See [Troubleshoot Business Transaction Performance with Transaction Snapshots](#).

You can hover over any data point on any of the trend graphs to see the metric for a precise point:

## Network Request Analyze

Mobile RUM collects data on every network request that you have instrumented, and it also takes detailed snapshots periodically in case performance issues have been detected.

Based on network request performance data, Mobile RUM calculates metrics which are associated with each network request and with predefined aggregations across network requests. You can focus on certain aspects of the performance data using more specific or flexible criteria, such as all network requests from a specific country *and* originating from a specific carrier.

With **Analyze**, every single network request event is collected and stored by the AppDynamics Events Service. Using **Analyze**, you can see results based on this cumulative data in tabular form or as charts.

**Network Requests**

Network Requests | Analyze | Snapshots

Default Search / Visualization | Edited | Save | More Actions | **Manage searches.**

Network Request Time > 1000 | **Filter results.**

**Add widgets.**

The Network Requests Snapshots widget displays records in a table.

Mobile App Info (4)	Timestamp	Network Request (7)	Carrier	Request Time	Country	OS Version	Connection Type	HTTP Status Code	Response Size	Response Type

## Mobile RUM Network Request Analyze Versus Mobile Requests Analytics

The data shown in the **Analyze** page is processed and stored by Events Service. **Network Request Analyze** provides a number of widely used visualization types to let you explore your application's performance. A separate product, AppDynamics Mobile Analytics, has components called Mobile Requests and Mobile Crash Reports. These components are based on the same Events Service and use the same data, but offer additional capabilities, including:

- Additional predefined widgets, such as the funnel widget
- ADQL for searching the data
- Creating custom widgets
- Manipulating multiple dashboard types
- Longer retention time for storing data

AppDynamics Mobile Requests Analytics requires a license separate from the Mobile RUM license. See [Analytics Mobile Requests Data](#).

## Network Request Snapshots List

A network request snapshot captures the details of one instance of a network request. Examine these details to troubleshoot the causes of slow network request performance. See [Network Request Snapshots](#).

You access the list using the Network Request Snapshots tab. The network request snapshots list is a table that displays a row for each network request snapshot. The columns describe the properties of each snapshot.

To view a network request snapshot:

1. Select the network request snapshot in the list.
2. Click **Details** or double-click the request.

## Network Request Snapshots

### Related pages:

- [Network Request Snapshots List](#)
- [Troubleshoot Business Transaction Performance with Transaction Snapshots](#)

Network request snapshots capture detailed information about individual network request instances by your application. They can help you troubleshoot the causes of poorly performing mobile applications.

### When Network Request Snapshots are Captured

Mobile RUM starts capturing snapshots when user experience becomes slow, based on how you have configured the thresholds for slow, very slow, and stalled. See [Configure Mobile Network Request Thresholds](#).

Periodic snapshots of normal user experience are also captured at least once per minute.

### Network Request Snapshot Content

A network request snapshot contains summary data about the individual request as well as any business transactions associated with the request if correlation with an instrumented server-side application is available.

The snapshot contains extensive metrics for the request in the Summary data, including:

- **User Experience:** Normal, Slow, Very Slow, or Stalled.

- **Time:** When the request was received by the EUM Cloud or EUM Server collector, in UNIX epoch time.
- **Mobile Network Request:** Link to the network request dashboard for the network request of which this snapshot is an instance. See [Network Request Dashboard](#).

## Business Transactions in Network Request Snapshots

When a network request snapshot is associated with one or more business transactions on an instrumented server-side application, the business transactions are listed in the **Business Transactions** panel in the network request snapshot. You can click the link to see the business transaction dashboard for the associated business transaction.

If transaction snapshots for an associated business transaction were captured at the same time as the network request snapshot, they are linked in the **Transaction Snapshots** panel of the network request snapshot. If a call graph icon is displayed for a snapshot in the transaction snapshot list, a full or partial call graph is available for that transaction snapshot. This allows you to examine the cause of performance problems on the server side. Click the link to see the associated transaction snapshot.

Transaction snapshots are triggered on the server when slow or stalled business transactions are identified when a diagnostic session is started or periodically based on a configured interval. In general, slow, very slow, and stalled transactions are more likely to trigger a transaction snapshot on the server than transactions operating within the normal range. For more information about when server-side transaction snapshots are captured, see [Troubleshoot Business Transaction Performance with Transaction Snapshots](#).

## Access Network Request Snapshots from Transaction Snapshots

If a transaction snapshot seen from the server side also has generated a correlated network request snapshot, a mobile snapshot link appears in the top right of the transaction snapshot flow map. Click the link to open the network request snapshot.

## Archive Network Request Snapshots

Normally network request snapshots are purged after two weeks. You can archive a snapshot beyond the normal snapshot lifespan to retain it for future analysis.

To archive a snapshot, click the **Archive** button in the upper right corner of the snapshot panel.

You can view archived snapshots by checking **Archived** as a view option in the network request snapshots list.

Customers with on-premises Controllers can modify the default two-week period by configuring the `event.retention.period` property in the **Controller Settings** section of the Administration console.

## Crashes

### Related pages:

- [Crash Analyze](#)
- [Crash Snapshots](#)
- [Crash Snapshot Properties](#)

Use crashes to get trend and detailed information on mobile application crashes.

A crash snapshot is a detailed report on a particular crash including the code that was executing when the application crashed. Crash snapshots help you understand the causes of crashes.

## View Crash Information in Widgets

The **Crash Metrics** and **Events** widgets are on the **Mobile App Dashboard**. The **Crash Metrics** widget displays the crash rate and the number of crashes for your mobile application. The **Events** widget displays new crash events.

1. Open the application you want.
2. From the **Mobile App Dashboard**, both **Events** and **Crash Metrics Scorecard** widgets display.
3. Click **Crash Metrics** or click one of the new crash events in the **Events** widget to access the **Crash Dashboard**.

## Access the Crash Dashboard

The **Crash Dashboard** is where you can view both summary and detailed information about crashes.

1. In the Controller UI, go to the User Experience tab.
2. Select a mobile application.
3. In the left navigation bar, click **Crashes**.

## Configure Crashes

See the following pages for configuring crashes in the Controller UI:

- [Crash Alerts](#)
- [Disable Crash Reporting](#)
- [Disable Auto-Symbolication](#)

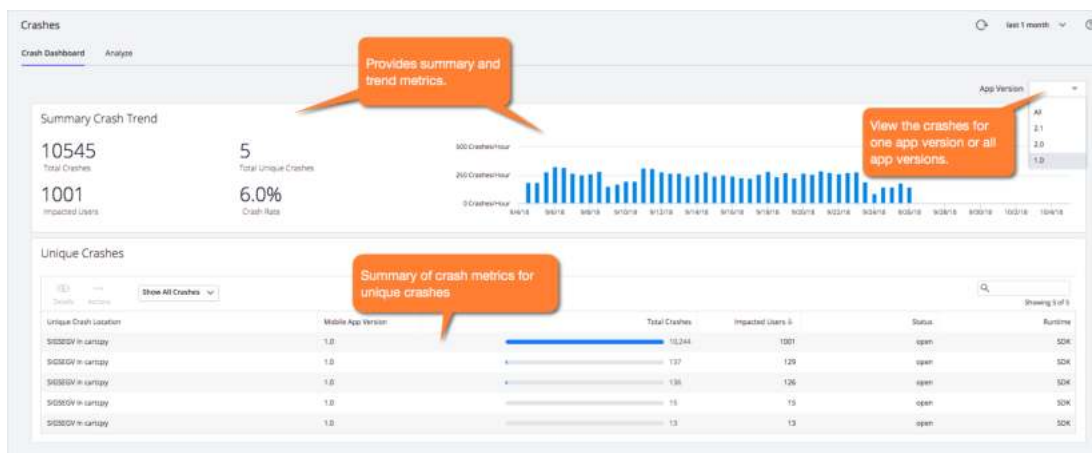

## Crash Dashboard

### Related pages:

- [Crash Snapshots](#)
- [Crash Snapshot Properties](#)

The **Crash Dashboard** aggregates mobile application crash data over time, using the Events Service. This service collects and stores *all* the data collected by the mobile agent.

The **Crash Dashboard** is divided into two panels and has the **App Version** dropdown that enables you to view crash data for different versions of your application.

## Summary Crash Trend

This panel displays a running total of crashes, unique crashes, impacted users, crash rate, and crash trends. The crash trends is a timeline of crash rates. It also reports any iOS crash reports that were uploaded without the accompanying dSYM file. For more information on how to use dSYM files with crashing reports, see [Get Human-Readable Crash Snapshots](#).

## Unique Crashes

Multiple crashes can be caused by the same underlying code issue. The **Unique Crashes** panel displays a list of crashes grouped by common characteristics and displays basic information about the crash. You can view open, closed, or all crashes.

The screenshot shows the 'Unique Crashes' panel with a table of crash data. Callouts highlight the following features:

- View crashes by status:** A dropdown menu with options: Show All Crashes, Show Open Crashes, and Show Closed Crashes.
- Search across all unique crashes by key word:** A search bar in the top right corner.
- View details by double-clicking unique crash:** A callout pointing to a row in the table.
- Use status to better manage crashes:** A callout pointing to the 'Status' column.

Unique Crash Location	Mobile App Version	Total Crashes	Impacted Users ↓	Status	Runtime
NullPointerException in Pr...		394	334	open	SDK
NullPointerException in Utilities.crashMe		360		open	SDK
NullPointerException in CartFragment.crashMe		353		open	SDK

## Unique Crash Details

To see more detail per crash, click the crash that interests you, in blue. The dashboard for that crash appears, with a header, trend bar graph, crash distribution charts, and a snapshot of the crucial details common to all the crash snapshots. See the [Crash Summary](#) section on the [Crash Analyze](#) page.

## Crash Status

In addition to viewing crash details, from the **Unique Crashes** panel, you can select a unique crash, click **Actions**, and set the status to either open or closed. You can set the status to mark those unique crashes that you want to ignore or have fixed the root cause of.

The screenshot shows the 'Unique Crashes' panel with a table of crash data. A callout explains how to change the status of a crash:

- To hide crashes, change the status of the selected crash to closed:** A callout pointing to the 'Actions' menu for a specific crash, which includes options: Set Status to Open and Set Status to Close.

Unique Crash Location	Mobile App Version	Total Crashes	Impacted Users ↓	Status	Runtime
NullPointerException in Utilities.crashMe		394	334	open	SDK
NullPointerException in Utilities.crashMe		360	301	open	SDK
NullPointerException in CartFragment.crashMe		353	298	open	SDK

When a crash is marked as closed, the crash will no longer trigger a new crash event, so you will not see the crash in the **Events** widget of the **Mobile App Dashboard**, the **Events** page, and it will not be included in alerts for new crashes.

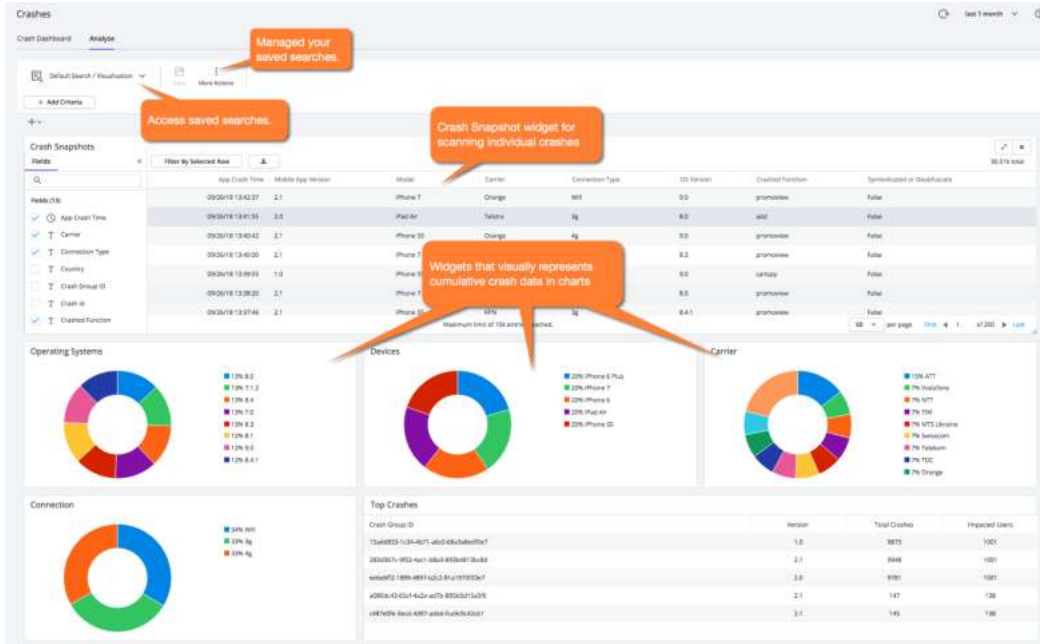

## Crash Analyze

### Related pages:

- [Instrument an iOS Application](#)
- [Instrument Android Applications](#)

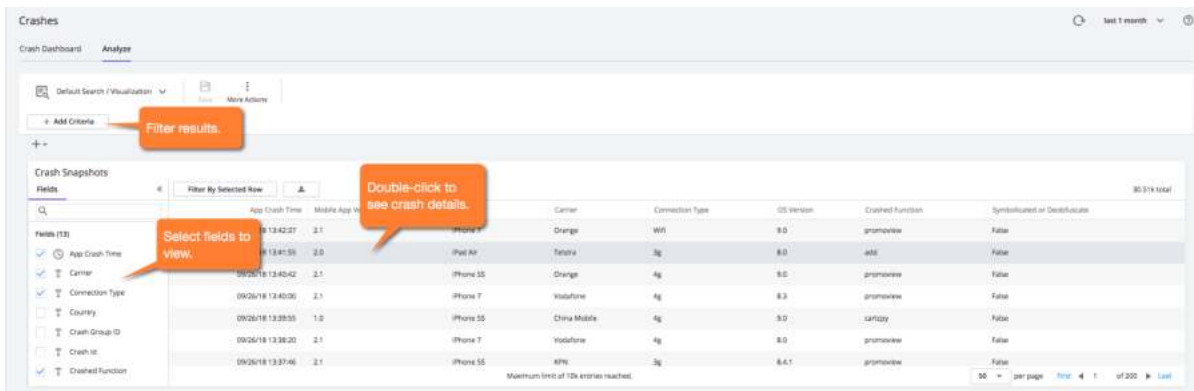

**Crash Analyze** lets you view and analyze the results based on the cumulative data. With **Crash Analyze**, every crash event is collected and stored by the AppDynamics Events Service.

The **Crash Analyze** page has the Crash Snapshots widget for viewing a list of current crash snapshots, with one row for each snapshot, and a selection of different widgets for visualizing the cumulative data in charts.

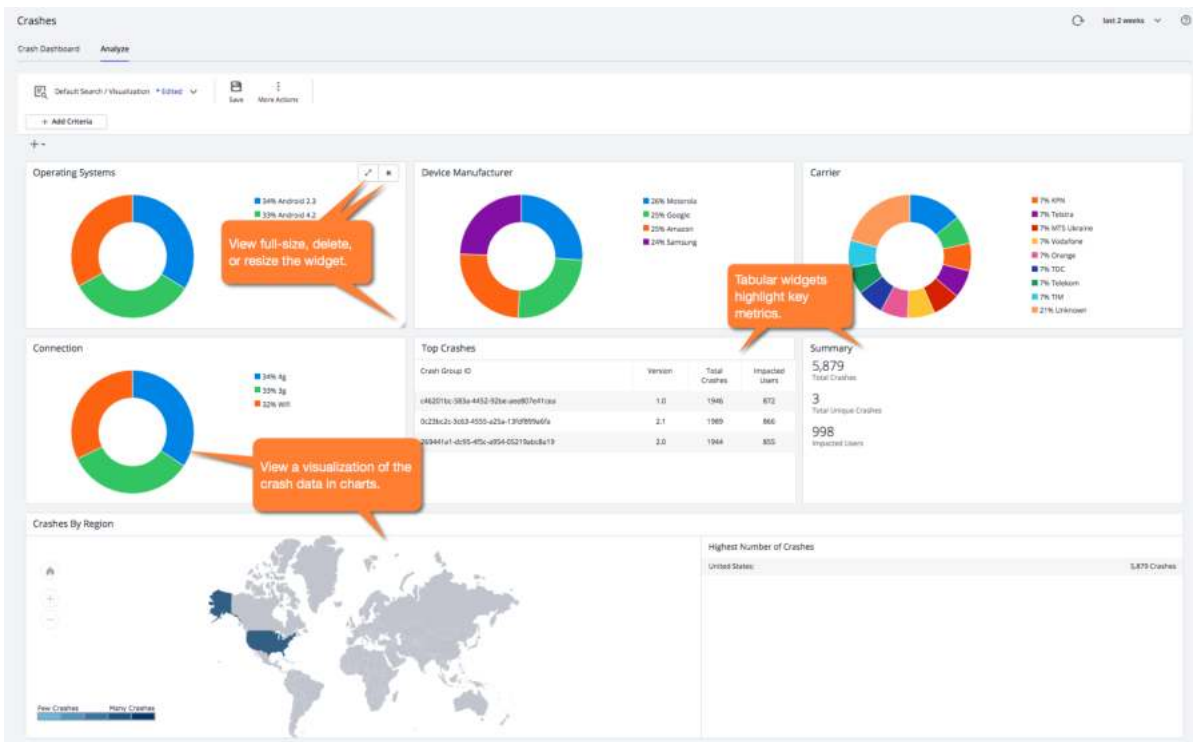

### Crash Snapshots Widget

The Crash Snapshots tab lets you scan individual crashes and allows you to filter and sort to get exactly the crash set in which you are interested. The columns of the table are fields representing the crash snapshot properties. See [Crash Snapshot Properties](#). Click **View Details** to see information for a specific crash.

### Chart and Tabular Widgets

The chart widgets provide you with a set of predefined widgets that offer visualizations of the data set you have created. The tabular widgets highlight key metric points such as top crashes. You can delete, re-add, re-size, and drag-and-drop to move all of the widgets. You can also set criteria to visualize a subset of the data.

**i** You can also view crash snapshots in the context of a separate product, AppDynamics Mobile Analytics. It offers additional mechanisms to analyze and visualize crash patterns, including:

- Additional predefined widgets, such as the funnel widget
- ADQL for searching the data
- Custom widgets
- Manipulating multiple dashboard types
- Longer retention time for storing data

AppDynamics Mobile Crash Report Analytics requires a license separate from the Mobile RUM license.

## Crash Snapshots

### Related pages:

- [Crash Analyze](#)
- [Crash Snapshot Properties](#)

Crash snapshots provide detailed information for one application crash. When an instance of an instrumented application crashes, a crash snapshot is created.

The snapshot provides information to help you analyze the cause of the crash, including:

- Crashed function
- Source file containing the crashed function
- Line number in the source file, if available
- Stack trace of the application at the time of the crash

For iOS applications, crash snapshots are based on:

- 
- Fatal signals (SIGSEGV, and so on)
  - Unhandled Objective-C exceptions

For Android applications, crash snapshots are based on unhandled Java exceptions.

### Crash Snapshot Details

The **Crash Snapshot Details** dialog has the two panels **Crash Summary** and **Crash Distribution**. The **Crash Summary** panel displays basic crash information and the stack trace. The **Crash Distribution** panel displays widgets with distributed crash metrics by the crash group and the stack trace.

To view crash snapshot details:

1. From the Records tab, select a crash snapshot in the list.
2. Click **View Details**.

#### Crash Summary

The **Crash Summary** panel of the snapshot displays the key properties of the snapshot. If you have customized your instrumentation ([Android/iOS](#)) to include breadcrumbs, they are displayed in the **Events Prior to Crash** panel. Up to 99 breadcrumbs display, beginning with the most recent. Not all of this information may be available. If you added user data ([Android/iOS](#)), it also displays here.

The **Stack Trace** panel displays the call stack of the crashed application, showing the thread in which the crash occurred. This is the full stack trace for this specific crash, not the aggregated stack trace shown in the **Unique Crash Dashboard**. You can view the formatted stack trace that groups threads and parses the output or the raw log output for the stack trace.

Click **Download** to access the stack trace in a file that you can forward to developers or port to logging platforms. To see the crash in the context of the mobile session, click **View Session**.

The screenshot shows the AppDynamics crash analysis interface for a SIGSEGV error in 'promoview : 327'. The interface includes a 'Crash Summary' section with 'Total Crashes' (8299) and 'Impacted Users' (1001). A 'Crash Trend' chart shows the number of crashes per hour from May 26, 2019, to June 7, 2019. A 'Stack Trace' is displayed for a crash on 05/24/19 at 7:00:55. The stack trace shows the following frames:

Address	Symbol	Module	Offset	Function
0-2	libsystem_platform.dylib - libsystem_c.dylib	0x35b09978 - 0x35a18ac0		__platform_memmove - __strcpy_chk
3	ECommerce-iOS	0x000ec9fe		promoview (Promo.m : 327)
4-18	UIKit - UIKit	0x27951cd6 - 0x2798218a		-[UIApplication sendAction:to:from:forEvent:] - UIApplicationMain
19	ECommerce-iOS	0x000e0d5a		
20	libdyld.dylib	0x359a1870		start

Other elements in the interface include a 'Crash Distribution' tab, a 'Find All Sessions' button, a 'Crash Trend' chart, a 'Stack Trace' view, and a 'Properties' section with 'Events Prior to Crash' and 'User Data'.

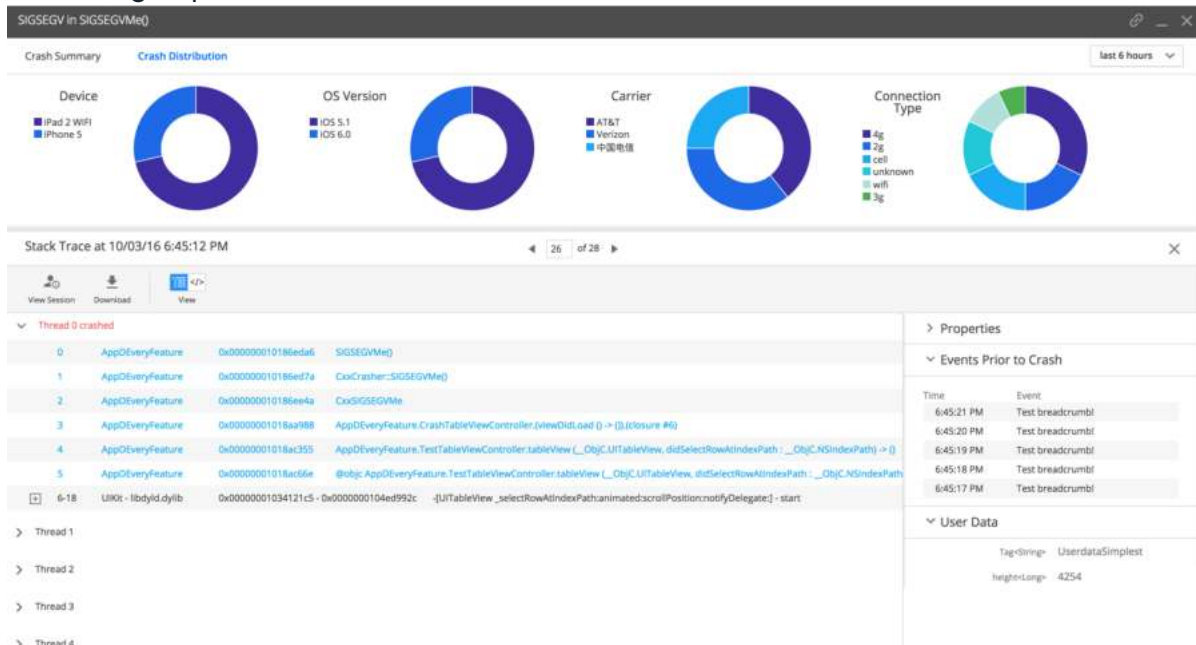

Callouts in the image highlight the following features:

- Basic crash information.** (Points to the Crash Summary section)
- View the session where the crash occurred or all sessions with this crash.** (Points to the Find All Sessions button)
- Upload missing dSYM files.** (Points to the Upload button in the Properties section)
- Toggle between the formatted and raw stack trace.** (Points to the View button in the Stack Trace section)

If the information in the stack trace is cryptic, it is possible that source code for your iOS app was not symbolicated or the source code for your Android app was obfuscated. See [Get Human-Readable Crash Snapshots](#) for information about why this happens and what you can do about it.

## Crash Distribution

The **Crash Distribution** panel displays smaller-sized widgets from the Charts tab with distributed metrics for the crash group and the stack trace.

## Crash Snapshot Properties

### Related pages:

- [Network Requests List](#)
- [Network Request Analyze](#)
- [Network Request Snapshots List](#)
- [Network Request Snapshots](#)
- [Analytics Mobile Crash Reports Data](#)

This page describes the list of crash snapshot properties. They display in the **Crash Snapshot Details** panel when you open a crash snapshot from **Crash Analyze**.

- Carrier:** Name of the mobile carrier.
- Connection Type:** Active connection type at the time of the crash, if known.
- Crashed File/Line/Function:** Name of the source file containing the crashed function, with the line number, if available. The name of the topmost function on the crashed thread's call stack. If this function is an Objective-C method, this name includes the class name. For Android, this name is the fully qualified name of the topmost method on the uncaught exception's stack trace.
- Crash Time:** Timestamp when the crash occurred, based on the mobile device's clock.
- Device/Manufacturer:** Model or manufacturer name of the mobile device on which the crash occurred.
- Events Prior to Crash:** Any breadcrumbs you might have set up.
- Exception Name:** Name of the fatal signal (iOS) or uncaught exception (Android) associated with the crash.
- Memory Usage:** Memory used by the app when the crash occurred.
- Mobile App:** Name of the app that crashed.
- OS Version:** Operating system version of the mobile device on which the crash occurred.
- Platform:** iOS or Android.
- Request Timestamp:** Time when the beacon arrived at the Collector. Snapshot only.
- User Data:** Any user data you might have added.
- Version:** Version string of the crashed application.

### Crash Snapshot list only

- **Country:** Originating country.
- **Crash id:** Unique identifier for the crash.
- **Deobfuscated:** For Android: true, if this crash report has been matched with a ProGuard mapping file and deobfuscated; otherwise, false.  
See [Manually Upload Mapping Files](#) and [Get Human-Readable Crash Snapshots](#). A **false** value for this property does not necessarily indicate that the crash report will not be human-readable since it is possible that the application in question was not obfuscated.
- **Symbolicated:** For iOS: **true**, if this crash report has been matched with a dSYM file and symbolicated; otherwise, **false**. The application must have been compiled with the **Debugging Information Format** set to **DWARF with dSYM File** for a crash report to exist. See [Upload the dSYM File](#) and [Get Human-Readable Crash Snapshots](#).

## Crash Alerts

[New crashes](#) appear in the Events widget. You can configure Mobile RUM to send you alerts when new crashes occur.

You can configure AppDynamics to send you alerts when your mobile application crashes. You can configure email alerts for health rule violations based on some default health rules or by manually creating a policy with a notification action or creating an email digest.

### Set Up Alerts for Crashes

Setting up alerts for crashes is similar to setting up alerts for other health rule violations:

1. Configure Mobile Crash Alerts. This will configure the default number of crashes:  
To set a threshold for crash alerts in the Controller UI:
  - a. Go to your MRUM application.
  - b. In the left-hand column, go to **Configuration > Mobile App Group Configuration > Settings**.
  - c. Under **Configure Crashes**, enter the minimum number of new crashes needed to send an alert. The default value is one crash.
  - d. Click **Save**.
2. If desired, update the **Critical Criteria** and **Warning Criteria** for the health rule **Crash Rate is much higher than normal**. See [Configure Health Rules](#).
3. Create a policy that will be triggered when the health rule for crashes is violated. You'll need to configure an [action](#) to be taken when the policy is triggered.
4. After you set up the email alerts, when a health rule is violated, an email will be sent indicating whether there was a warning or critical alert and providing links to view crash and session details.

 Crashes that have the status "Closed" do not trigger alerts.

### Create Email Digest for Crashes

You can create the same type of notification for crashes by creating an [email digest](#).

From the **Create Email Digest** dialog, check the **Mobile Crash** checkbox:

✕
**Create Email Digest**

---

Contents    Health Rule Scope    Object Scope    Recipients

---

Name:

Enabled:

Frequency:  Hours

---

This Email Digest will contain these Events

> Health Rule Violation Events

Other Events

- >  Slow Transactions
- >  Code Problems
- >  Application Changes
- >  Server Crashes
- >  AppDynamics Config Warnings
- >  Discovery
- >  Synthetic Availability
- >  Synthetic Performance
- >  Mobile Crash
- Errors

Custom Events ?

+ ✎ 🗑️

Type	Properties
No Custom Events Selected	

You can then use the **Email Digest** wizard to add recipients, a custom message, and schedule the frequency to send emails.

### Get Human-Readable Crash Snapshots

#### Related pages:

- [Crash Snapshots](#)

The information in most raw crash stack traces is not fully human-readable. To make your crash stack traces more easily understood, you need to provide a platform-specific mapping file that can translate the raw data into human-readable output. Normally, you upload the file at the time that you instrument your mobile application.

- For iOS, see [Upload the dSYM File](#).
- For Android, see [Manually Upload Mapping Files](#).

This page explains the advantages of providing these files.

#### iOS dSYM File

For iOS applications, the raw data in the stack traces in crash snapshots consists of memory addresses of stack frames that point to executable application code. It also includes symbols and memory offsets for the system library code used by the application. Such a partially symbolicated stack trace looks something like this:

```

Thread 11 Crashed:
0 libobjc.A.dylib 0x38cb50fc objc_retain + 12
1 SomeApp 0x003a2204 0xc6000 + 2998788
2 SomeApp 0x003a0854 0xc6000 + 2992212
3 SomeApp 0x003a09d4 0xc6000 + 2992596
4 SomeApp 0x003948e4 0xc6000 + 2943204
5 Foundation 0x2f3a2dc2 __NSThread__main__ +
1058
6 libsystem_pthread.dylib 0x392cec5a _pthread_body + 138
7 libsystem_pthread.dylib 0x392cebca _pthread_start + 98
8 libsystem_pthread.dylib 0x392cccc thread_start + 4

```

AppDynamics attempts to display stack traces with the names of functions with offsets into those functions to help you identify the line of code that was executing when the application crashed. To get the symbols that map to the executable code, it needs the dSYM (desymbolication) file for the crashed application.

If the dSYM file for the crashed application has been uploaded, the symbolicated stack trace shows the function name and the offset into the function where the app crashed. It looks something like this:

```

Thread 0 Crashed:
0 libobjc.dylib objc_release + 0x14
1 CoreFoundation CFStringCreateWithFormat + 0x4
2 UIKit -[UIButton init] + 0x96
3 MyApp createUI (MyAppDelegate.m:42)

```

The dSYM file is created when the application source code is compiled with the **Debugging Information Format** set to `DWARF with dSYM file`. AppDynamics recommends that you build all the iOS apps that you want to monitor using this option and then upload the dSYM file to AppDynamics. The best time to do this is when you instrument the app.

If a dSYM has been uploaded for a crashed application, in the crash list the **Symbolicated** column for the associated crash snapshot is true.

If the `symbolicated` property is `false` and you want to see user-friendly stack traces in your crash snapshots for this application, you need to locate and upload the dSYM file for the crashed application.

### ProGuard Mapping File for Android

If an Android app was not obfuscated to prevent reverse engineering, you should see human-readable stack traces in your crash snapshots by default.

If the code was obfuscated, however, AppDynamics needs the ProGuard mapping file to be able to deobfuscate the app. The best procedure is to upload this file at the time you build the app.

If a ProGuard mapping file has been uploaded for a crashed application, in the crash list the **Deobfuscated** column for the crash snapshot is `true`.

If the `deobfuscated` property is `false` and the stack traces you see in the crash snapshots are obfuscated, you need to locate and upload the mapping file for the application.

---

## Disable Auto-Symbolication

 This feature is available in SaaS Controller >= 22.5.0.

Auto-symbolication is enabled by default. If disabled, when you [upload a dSYM](#) or [mapping file](#) you must manually click **Symbolicate**. Incoming matching crash events are symbolicated and persisted when auto symbolication is enabled. When auto symbolication is disabled, incoming matching crash events are not symbolicated.

To disable auto-symbolication:

1. Open your mobile application in the Controller UI.
2. On the left navigation bar, select **Configuration**.
3. Click **Mobile App Group Configuration > Settings**.
4. Under **Configure Crashes**, uncheck **Enable Auto Symbolication**.

## Disable Crash Reporting

 This feature is available in SaaS Controller >= 22.5.0.

Crash reporting is enabled by default. To disable crash reporting:

1. Open your mobile application in the Controller UI.
2. On the left navigation bar, select **Configuration**.
3. Click **Mobile App Group Configuration > Settings**.
4. Under **Configure Crashes**, uncheck **Enable Crash Reporting**.

## Code Issues

Code issues consist of caught non-fatal exceptions or application not responding (ANR) issues. A code issue snapshot is a detailed report on a particular event including the code that was executing when the exception or ANR occurred.

Code issue snapshots help you understand the causes of these issues. Use **Code Issues** to get trend and detailed information on application non-responsive issues (ANRs) and caught errors and exceptions.

### Catch and Report Code Issues

All the Mobile Agents except the iOS Agent will automatically detect and report ANRs. For iOS, you have to [enable ANR detection](#). To catch and report errors and exceptions, you instrument your mobile applications with iOS, Android, and Xamarin SDKs.

See the section "Report Errors and Exceptions" ([iOS](#), [Android](#), [Xamarin](#)) to learn how to use the SDKs to manually catch and report errors and exceptions.

### Access the Code Issues Dashboard

The [Code Issues Dashboard](#) is where you can view both summary and detailed information about code issues.

1. Open the application you want.
2. On the left navigation bar of your application, select **Code Issues**.

## View Code Issue Widgets

The **Summary Code Issue Trend** and **Unique Code Issues** widgets are on the **Code Issues Dashboard**. The **Summary Code Issue Trend** widget displays the number of code issues, impacted users, and unique code issues as well as graph the code issues on a timeline. The **Unique Code Issues** widget displays details about the unique code issues such as the severity, the issue type, runtime, impacted users, and mobile app version.

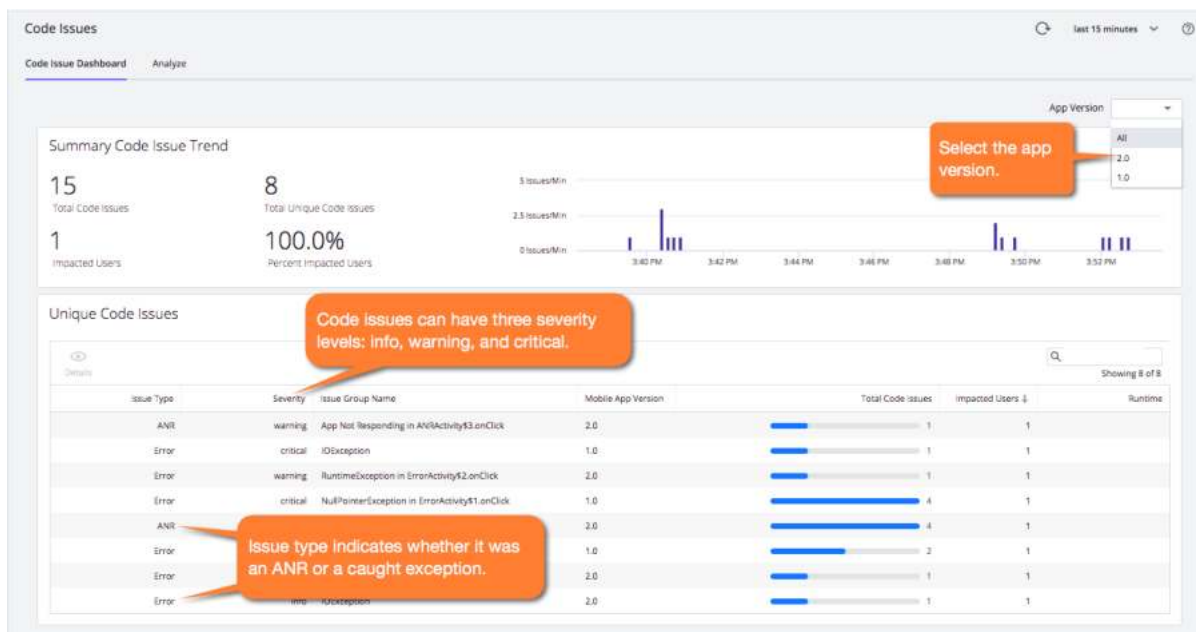

To view code issue information:

1. Open the application you want.
2. From the **Code Issues Dashboard**, both **Summary Code Issue Trend** and **Unique Code Issues** widgets display.
3. You can click one of the unique code issues in the **Unique Code Issues** widget to view the **Code Issues Details** dialog.

## Code Issues Dashboard

The **Code Issues Dashboard** aggregates mobile application caught exceptions and ANRs over time, using the Events Service. This service collects and stores *all* the data collected by the mobile agent.

The **Code Issues Dashboard** is divided into two panels and has the dropdown **App Version** to view code issues for different versions of your application.

## Summary Code Issue Trend

This panel displays a running total of code issues, unique code issues, impacted users, the percent of impacted users, and code issue trends. The code issues trends is a timeline of code issues.

Summary Code Issue Trend

50  
Total Code Issues

39  
Total Unique Code Issues

10  
Impacted Users

100.0%

Error	info	NSMachErrorDomain: 52 in baz	2.1.1	1	1	
ANR	warning	App Not Responding	2.1.1	1	1	
Error	warning	NSMachErrorDomain: 16 in bar	2.0.0	2	2	
ANR	info	App Not Responding in bar	2.1.1	1	1	
ANR	info	App Not Responding in foo	2.0.0	1	1	
ANR	info	App Not Responding in bar	1.9.3	1	1	

## Unique Issue Details

To see more detail per code issue, select the unique code issue that interests you and click **Details**. The **Unique Issue** dialog has the two tabs Issue Summary and Issue Distribution.

The screenshot displays the 'Unique Crash' interface. At the top, there are two tabs: 'Issue Summary' (selected) and 'Issue Distribution'. A dropdown menu shows 'last 30 minutes'. The 'Issue Summary' panel includes:
 

- Total Code Issues: 7
- Impacted Users: 1
- Find All Sessions button
- Code Issue Trend bar graph showing issues per minute from 3:30 PM to 3:55 PM.
- ErrorActivity.java in Line Number 44
- Description
- Error Issue Type: Runtime

 Below this is a 'Stack Trace at 10/11/18 3:36:10 PM' section with a '1 of 7' indicator. It contains a list of 10 stack frames, with the top one expanded to show:
 

```

 java.lang.NullPointerException: Attempt to invoke a virtual method on a null object reference
 0 com.appdynamics.everyfeatures.codeissues.ErrorActivity$1.onClick(ErrorActivity.java : 44)
 1 com.appdynamics.eumagent.runtime.private.bus.onClick(ButtonInstrumentationHandler.java : 136)
 2 android.view.View.performClick(View.java : 5637)
 3 android.view.View$PerformClick.run(View.java : 22429)
 4 android.os.Handler.handleCallback(Handler.java : 751)
 5 android.os.Handler.dispatchMessage(Handler.java : 95)
 6 android.os.Looper.loop(Looper.java : 154)
 7 android.app.ActivityThread.main(ActivityThread.java : 6119)
 8 java.lang.reflect.Method.invoke(Method.java)
 9 com.android.internal.os.ZygoteInit$MethodAndArgsCaller.run(ZygoteInit.java : 886)
 10 com.android.internal.os.ZygoteInit.main(ZygoteInit.java : 776)

```

 To the right of the stack trace are two sections:
 

- Properties:** Reported Time: 10/11/18 3:34:27 PM, Carrier: Android, Timestamp: 10/11/18 3:36:10 PM, OS Version: 7.1.1, Manufacturer: unknown, Model: Android SDK built for x86\_64, Connection Type: 4g.
- User Data:** A list of user identifiers and values, such as Many901+String> value 901, Many900+String> value 900, etc., up to Many915+String> value 915.

## Issue Summary

The Issue Summary tab has two main panels. The top panel shows summary information such as the total code issues, the issue type, impacted users, the runtime, and a code issue trend bar graph.

This is a smaller version of the screenshot above, showing the 'Issue Summary' and 'Stack Trace' sections. The stack trace shows the same sequence of threads as the larger screenshot, starting with the NullPointerException and ending with the ZygoteInit.main method.

The bottom panel shows a sequence of threads in the stack trace that you can expand for more information, a **Properties** section with general information about the device, and a **User Data** section with any set user data.

### [iOS](#)   Android

The stack trace for iOS applications shows the concatenated image and symbol names. For example, the concatenated "UIKit" (an image name) and "bar" (the symbol name) forms "UIKitbar".

## Issue Distribution

The Issue Distribution tab displays the same stack trace panel, but the top panel dashboard instead displays the distribution charts for the code issue.

## Code Issues Analyze

The **Code Issues Analyze** page has the **Code Issue Events** widget for viewing a list of current code issue snapshots, with one row for each snapshot, widgets for visualizing code issues data, and widgets for highlighting key data points.

**Code Issues Analyze** enables you to view and analyze the results based on cumulative data based on configured criteria. You can delete, re-add, re-size, and drag-and-drop to move all of the widgets. You can set criteria to visualize a subset of the data. Every code issue event in **Code Issues Analyze** is collected and stored by the AppDynamics Events Service.

- 23% warning
- 16% critical

**Operating Systems**

- 89% 9.0
- 6% 7.0
- 5% 8.0

**Code Issues By Region**

Highest Number of Code Issues

United States:	108 Code Issues
Turkey:	46 Code Issues
China:	35 Code Issues
Singapore:	23 Code Issues
Germany:	17 Code Issues

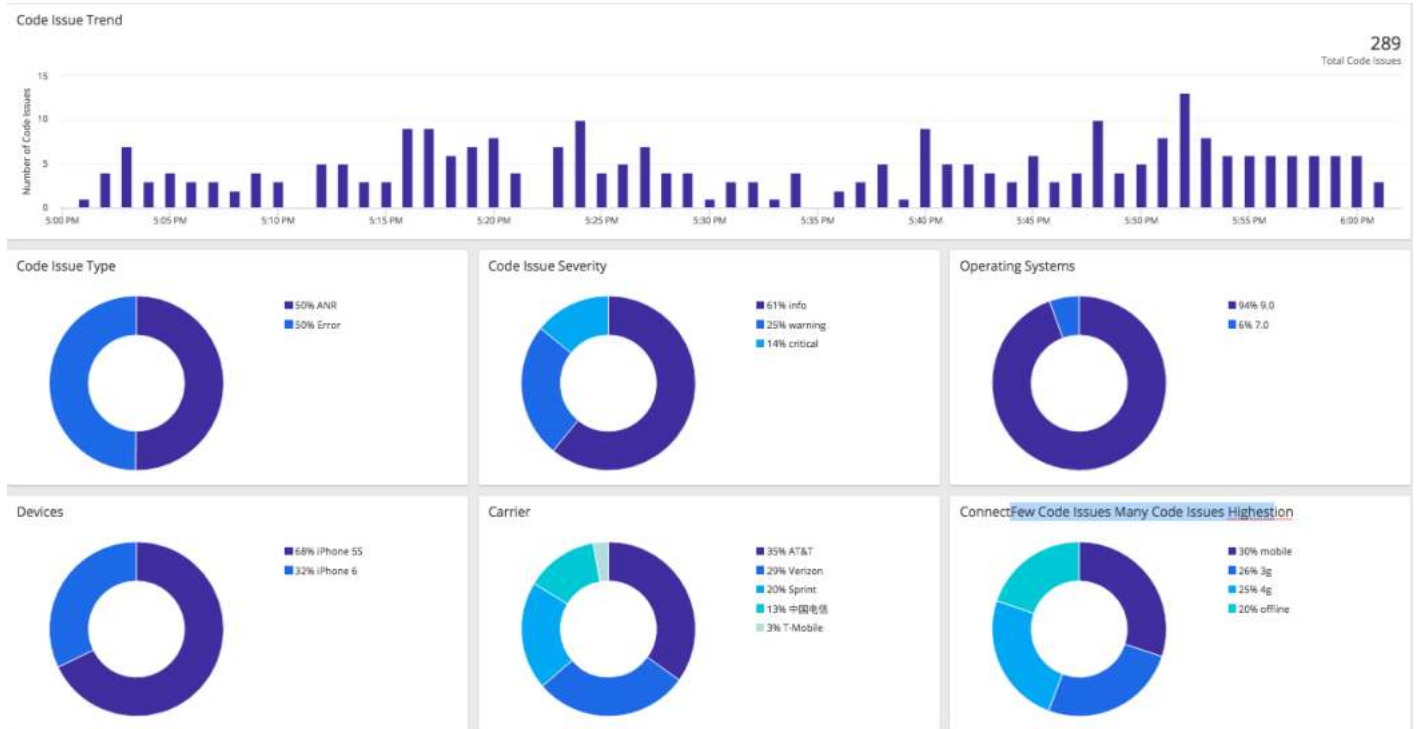

## Code Issue Events Widget

The **Code Issue Events** widget enables you to scan individual code issues, filter, and sort to get exactly the code issue in which you are interested. The columns of the table are fields representing the code issue properties. See [Code Issue Snapshot Properties](#).

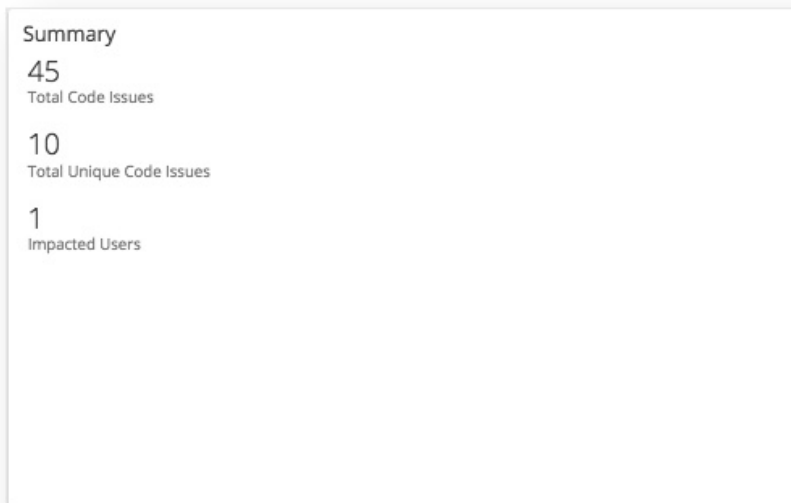

## Chart Widgets

The chart widgets visualize the code issue data. For example, you can view the code issues data in pie charts showing the ratio of ANRs to caught errors/exceptions, severity levels, operating systems, and so on.

## Summary Widget

The **Summary** widget lists totals for key statistics.

## Hybrid Widget

The **Code Issues By Region** widget is a hybrid, displaying geographic data in a map and listing the data points in a table.

## Code Issues in Mobile Analytics

Code issue snapshots can also be viewed in the context of a separate product, AppDynamics Mobile Analytics. It offers additional mechanisms to analyze and visualize code issue patterns, including:

- Additional predefined widgets, such as the funnel widget
- ADQL for searching the data
- Custom widgets
- Manipulating multiple dashboard types
- Longer retention time for storing data

AppDynamics [Analytics Mobile Non-Fatal Issues Data](#) requires a license separate from the Mobile RUM license.

## Code Issue Snapshots

Code issue snapshots provide the detailed information for one code issue. A code issue snapshot is created when an instance of an instrumented application experiences an ANR, slow UI, or manually reports a caught exception. To manually report caught exceptions, you use either the [iOS SDK](#) or the [Android SDK](#).

- Thread that contains a function that is not responding or has a caught exception
- Source file containing the function that is not responding or has the caught exception
- Line number in the source file, if available
- Stack trace of the application at the time of the code issue

For iOS applications, code issue snapshots are based on:

- ANRs
- Handled Objective-C exceptions
- Slow UI

For Android applications, crash snapshots are based on:

- ANRs
- Handled Java exceptions
- Slow UI

## Code Issue Snapshot Details

The **Issue Snapshot Details** dialog has the two panels **Issue Summary** and **Issue Distribution**. The **Issue Summary** panel displays basic information about the code issue and the stack trace. The **Issue Distribution** panel displays widgets with distributed issue metrics by code issue group as well as the stack trace.

View Code Issue Snapshot Details

1. Navigate to **Code Issues > Analyze**.
2. From the **Code Issue Events** widget, double-click one of the code issue snapshots.

### Issue Summary

The **Issues Summary** panel of the snapshot displays the key properties of the snapshot. Unlike with crashes, code issues do not include breadcrumbs.

The **Stack Trace** panel displays the call stack of the code issue, showing the thread in which the caught exception or ANR occurred. This is the full stack trace for this specific code issue, not the aggregated stack trace shown in the **Unique Issue Dashboard**. You can view the formatted stack trace that groups threads and parses the output or the raw log output for the stack trace.

The screenshot shows the 'Stack Trace at 10/11/18 3:36:10 PM' panel. It includes a 'View Session', 'Download', and 'View' button. The main area shows a call stack for 'Thread 0 has error' with 12 frames:

0	foo.dylibfoo
1	ZoomlinksomeUIFrame
2	Zoomlinksfoo
3	UIKitbar
4	foo.dylibmain
5	UIKitbar
6	foo.dylibfoo
7	UIKitfoo
8	Zoomlinksmain
9	Zoomlinksbaz
10	foo.dylibfoo
11	Zoomlinksbar
12	UIKitsomeUIFrame

On the right, there are two sections: 'Properties' and 'User Data'. The 'Properties' section includes:

- Reported Time: 07/05/18 7:34:41 PM
- Carrier: AT&T
- Timestamp: 07/05/18 7:34:42 PM
- OS Version: 9.0
- Manufacturer: iPhone 5S
- Model: iPhone 5S
- Connection Type: 3g

The 'User Data' section includes:

- userIsAGoat<Boolean>: true

Click **Download** to grab the stack trace in a file that you can forward to developers or port to logging platforms. To see the code issue in the context of the mobile session, click **View Session**.

## Issue Distribution

The **Issue Distribution** panel displays smaller-sized widgets from the **Analyze** tab with distributed metrics for the code issue group.

## Code Issue Snapshot Properties

This page lists the code issue snapshot properties. They appear in the **Code Issue Snapshot Details** panel when you open a code issue snapshot from **Code Issue Analyze**.

Property	Description
<b>Agent ID</b>	The ID of the Mobile Agent reporting the code issue.
<b>Agent Version</b>	The version of the Mobile Agent reporting the code issue.
<b>Application Key</b>	The application key.
<b>Carrier</b>	The name of the mobile carrier.
<b>City</b>	The originating city.
<b>Client Time</b>	The timestamp of a device when the beacon was made.
<b>Connection Type</b>	The active connection type at the time of the code issue, if known.
<b>Country</b>	The originating country.
<b>Description</b>	The type of code issue, such as an application not responding (ANR) or a caught non-fatal exception.
<b>Device/Manufacturer/Model</b>	The model or manufacturer name of the mobile device on which the code issue occurred.
<b>Event Type</b>	Type of code issue (for example, ANR, Caught Exception)
<b>Jailbroken</b>	Flag indicating whether the mobile device has been jailbroken.

Property	Description
Group ID	The event group id after grouping.
Mobile App	The name of the app that had the code issue.
OS Version	The operating system version of the mobile device on which the code issue occurred.
Platform	iOS or Android.
Region	The originating region, such as the province or state.
Request Timestamp	When the beacon arrived at the Collector. Snapshot only.
Severity	The severity level set for the code issue.
Symbolication/ Obfuscation	Flag indicating whether the application code has been symbolicated/ obfuscated.
User Data	Any user data you might have added.
Version	The version string of the application that had the code issue.

## Code Issue Alerts

You can configure AppDynamics to send you alerts when your mobile application has code issues. You can configure email alerts for health rule violates based on the default health rule or by manually creating a policy with a notification action.

### Set Up Alerts for Code Issues

This basic workflow describes how to set up alerts for code issues:

1. **Report Errors:** In your application code, use the iOS, Android, or Xamarin SDK to report errors. Set the severity to either `INFO`, `WARNING`, or `CRITICAL`. Only errors with the severity of `CRITICAL` trigger alerts with the default health rule.
2. **Configure Thresholds:** Set the warning and critical thresholds for application not responding issues:
  - a. Navigate to **Configuration > Mobile App Group Configuration > Settings**.
  - b. From **Configure Application Not Responding Thresholds**, set the values for **Warning Threshold** and **Critical Threshold**. Any value that is less than the warning threshold will be labeled as **Info**.
3. [View alerts for code issues.](#)

### Report Errors with the Mobile SDKs

See "Report Errors and Exceptions" ([iOS/Android/Xamarin](#)) to report errors and set the severity for iOS, Android, or Xamarin applications.

---

## Configure Threshold for Code Issue Alerts

You can configure the thresholds for ANRs that must be reached before you are alerted. See [Configure Application Not Responding Thresholds](#).

## View Code Issue Alerts

The health rule **Critical Code Issues exist** is used to send alerts when one of the following occurs:

- You have used the Android or iOS SDK to report an error with the severity of `CRITICAL`.
- The time that your application has not responded exceeded the critical threshold.

After you set up the email alerts, when a health rule is violated, an email will be sent indicating whether there was a warning or critical alert and providing links to view code issue and session details.

## Custom Data

Mobile RUM provides substantial information on crashes and network and server-related performance. You may want, however, to customize the Mobile Agent to collect other metrics and data to understand how your application is performing for your users.

For information on customizing the agent, including sample code, see:

- [Customize the iOS Instrumentation](#)
- [Customize the Android Instrumentation](#)

To see the results of your data collection, you use the **Custom Data** view.

## Custom Data Types

There are three kinds of custom data that you can collect:

- [Info Points](#)
- [Custom Timers](#)
- [Custom Metrics](#)

 There are two other types of custom data: the breadcrumb and user data. Breadcrumbs display only in Crash Snapshots. User data is available in **Crash Analyze** and **Network Request Analyze**. See the agent SDK docs for more information.

## Info Points

An information point allows you to collect information on how a specific method in your code is performing. How many times was a particular method executed? Was an exception thrown? If you need to monitor multiple methods, you can create multiple info points.

If you know there are important methods you always want to monitor, create static info points as described in [Customize the iOS Instrumentation](#) and [Customize the Android Instrumentation](#).

## Custom Timers

Custom timers allow you to time how long something takes between any arbitrary start point and end point, even if they span multiple methods. For example, how long did it take to repaint a frame buffer? How long did the app take to start up?

## Custom Metrics

Custom metrics allow you to collect data on any metric you define in your application. Metrics can be any integer-based data. Over the specified time frame, Mobile RUM calculates the minimum, maximum, average, sum, and count of these values.

### View Custom Data

Your data is shown in tabular format in two tabs.

### Custom Timers & Metrics

Click on any value (in blue) to display the same metric in the Metric Browser.

Custom Data | last 6 months

Timers & Metrics | Info Points

Select which columns to display.

Click to view in Metric Browser.

Filter results by criteria.

Name ↑	Mobile App	Total Data Points	Data Points per Minute	Sum	Average
llll Items Rendered	mAndroid	51,973	4	727,678	14
llll Login Attempts	mAndroid	57,039	5	57,034	1
llll Total Cart Size	EcommAndroid	30,685	3	1,718,248	56

### Info Points

The Info Points tab shows any current info points.

Custom Data | last 3 days

Timers & Metrics | Info Points

Click to view in the Metric Browser.

Name	Total Invocations	Invocations per Minute ↓	Average (ms)
Cart.checkCart	211	4	
Authenticate.login	253	4	
Catalog.parseCatalog	234	4	
Cart.validateOrder	140	3	
Settings.changeBillingAddress	19	1	

## Configure the Controller UI for Mobile RUM

Using the Controller UI, you can configure:

- [How to rename mobile requests](#)
- [Thresholds that cause network request snapshots to be considered slow, very slow or stalled](#)
- [Percentile levels to display, if any](#)
- [Which network requests are sent to the Event Service](#)
- [If the IP address from which the request comes should be stored](#)

 To configure Mobile RUM from the Controller UI, your user account must belong to a role that has the **Configure EUM** permission. See [End User Monitoring Permissions](#).

## Access the Mobile Container Configuration

To access mobile request configuration:

1. Open the mobile application in which you are interested.
2. From the left-hand navigation menu, click **Configuration**.
3. From the **Configuration** page, click **Mobile App Group Configuration >**.

### Configure Mobile Network Request Naming

This page describes how to modify the default naming configuration for [network requests](#) and create include/exclude naming rules for network requests.

 If you create a rule for capturing mobile network requests and later disable the rule, the URLs that were formerly captured by the rule will be displayed with the network request name "/" unless you have another rule that captures the URL. To avoid this from occurring, you can create a custom rule that serves as a catch-all for URLs that are not captured by custom rules. See [Network Request Limits](#).

## Default Network Request Naming Configuration

By default, AppDynamics names network requests using:

- Hostname
- First two segments of the URL

For example, if an application makes this HTTP request:

```
http://myapp.com/friends/profiles/12345
```

The default name that is displayed in the Controller UI for that request is:

```
myapp.com/friends/profiles
```

If this is adequate for your needs, you can leave the default setting.

 The naming rules you configure here apply to all the mobile applications that are in the same Mobile App Group.

### Modify the Default Naming Configuration Rule

You may want to configure a different default rule for naming your network requests to help you visualize the parts of your application more clearly. The task is similar to configuring naming rules for business

---

transactions on the server side. Try to group logically related requests together while keeping unrelated requests in separate groups.

- If the default hostname and first two segments of the URL for all your requests are identical, you might want to name the requests based on the last segments or a selection of non-contiguous segments of the URL to distinguish among requests in the network requests list.
- You can also name the requests based on query parameters. For example, if the request passes an order number, you could specify that the value of the `order-number` query parameter is used in the network request name.
- You can also base the name on a regular expression run on the URL. AppDynamics uses the Java libraries for regular expressions. See:
  - Tutorial: <http://download.oracle.com/javase/tutorial/essential/regex/index.html>
  - Javadoc: <http://download.oracle.com/javase/1.5.0/docs/api/java/util/regex/Pattern.html>

## Modify the Default Network Request Naming Rule

The default configuration covers how all your requests are named if you do not customize them further.

1. From the **Network Request** tab, scroll down to the **Include Rules** section.
2. Double-click **Default Naming Configuration**.
3. In the **Include Rule** dialog, select the elements you want to use for your default network request naming.
4. Click **OK**.
5. Click **Save**.

## Create Mobile Include Rules

By default, the same request naming rule is applied to every URL that your application requests. If you want to apply different naming rules to different URLs, create include rules.

For example, if some requests call your own in-house server and others call out to a third-party API, you may want to see all the third-party API calls as one network request and use the default naming rules for the calls to your own server. You would create a custom naming rule that matches the third party calls and uses only the host in the default rule name or perhaps also include certain query parameters.

## Create an Include Rule

1. From the **Network Request** tab, scroll down to the **Include Rules** section.
2. Click **Add**.
3. In the **Include Rule** dialog, enter a name for the custom rule that you are creating.
4. Check the **Enabled** check box to enable the rule.
5. Select the check boxes and radio buttons and enter the match criteria for AppDynamics to use to name network requests.
6. Click **OK**.

## Guidelines for Using Regular Expressions in Mobile Include Rules

When using regular expressions to match URLs in your include rules, you should note the following:

- URL strings are case-sensitive. So, although the page names displayed in the [Network Request Dashboard](#) are converted to lowercase, your regular expressions still need to match the case used in URLs that your include rule are trying to capture.
- Your regular expression should match the entire URL, from beginning to end, not just a section; otherwise, the rule will not match. This differs from using regular expressions in [custom match rules for naming transactions](#), which only need to match sections of the URL.

## Sample Include Rule

The following rule creates a custom match rule for requests in which the URL contains "ourpartner.com". This rule uses the protocol, the subdomain and the third and fourth segments of the URL in the network request name.

You can temporarily cancel the application of a custom naming rule by clearing the **Enabled** checkbox in the custom rule configuration. In this case, the default naming rule is applied to requests that would have been named by the disabled custom rule. To remove the rule permanently, select the custom rule in the **Custom Naming Rules** list and click the **Delete** icon.

## Create Mobile Exclude Rules

If there are certain types of requests that you do not want to monitor, create custom exclude rules for them based on the URL and/or the application name. Excluded network requests are not reported or counted toward the network request limit of 500 requests per controller application.

### Create an Exclude Rule

1. From the Network Request tab, scroll down to the **Exclude Rules** section.
2. Click **Add**.
3. In the **Exclude Rule** dialog, enter a name for the exclude rule that you are creating.
4. Check the **Enabled** check box to enable the rule.
5. Select the check boxes and radio buttons and enter the match criteria for AppDynamics to use to name network requests.
6. Click **OK**.

---

You can temporarily cancel the application of an exclude rule by clearing the **Enabled** checkbox in the exclude rule configuration. To remove the rule permanently, select the exclude rule in the **Exclude Rules** list and click the **Delete** icon.

## Change Priority of Rules

Rules are evaluated in the order that they appear in the include or exclude list. You can change the priority of the rules by dragging and dropping rules towards the top (higher priority) or towards the bottom of the list (lower priority). Custom rules are always evaluated before the default naming rule, beginning with the custom rule that has the highest priority.

## Configure Mobile Network Request Thresholds

### Related pages:

- [Network Request Limits](#)
- [Network Requests](#)

The Mobile Agent uses configurable thresholds to determine whether network request time is normal, slow, very slow or stalled. It uses these thresholds:

- To decide whether to create a mobile request snapshot
- For labeling network request experience in a network request snapshot

### Default Network Request Thresholds

By default, the Mobile Agent uses these default values to determine whether a request is slow or stalled:

- **Slow:** Greater than 3 standard deviations
- **Very slow:** Greater than 4 standard deviations
- **Stall:** Greater than 45000 ms

You should configure these defaults to conform to your own criteria for your mobile applications. An absolute threshold rather than one based on the standard deviation is often more appropriate for mobile applications.

### Configure Network Request Thresholds

1. From the **Mobile App Group Configuration** page, click the **Settings** tab.
2. In the **Thresholds for Slow End User Experience** section, set the thresholds for slow, very slow, and stalled in milliseconds or by standard deviations.
3. Click **Save**.

### Configure Mobile Percentile Metrics

Parts of the Controller UI for Mobile RUM rely on the processing done by the Events Service, including some of the widgets in the **Mobile App Dashboard Overview**, **Network Requests Analyze**, and **Crash Analyze**.

For the [Mobile App Dashboard](#), **Network Requests Analyze**, and **Crash Analyze**, you can choose widgets to display the metrics collected using either averages or percentiles.

A *percentile* is a measure that indicates a value below which a given percentage of values in a set falls: for example, the 99th percentile means that 99% of all values are below this level.

Using percentiles can be a good way to reduce the impact of extreme outliers in performance metrics, which can be useful in the often noisy environments of end-user experience monitoring. Percentiles also display in the **Metric Browser**.

You can:

- Enable or disable percentile display of metrics.
- Set up to four different percentile levels to be applied to metrics.

### Access Configure Percentile Metrics

From the **Configuration > Mobile App Group Configuration**, click the Settings tab and navigate to the **Configure Percentile Metrics** section.

### Configure Percentile Metrics

You can change the percentiles which are used to evaluate data via the Events Service.

#### Configure Percentile Metrics

Enable Percentile Metrics

Percentiles to Collect:

Up to four different percentiles can be collected per EUM metric. Each percentile must be a whole number between 1 and 99.

1. Check the box to enable percentile metric display.
2. Add up to four percentile levels to collect. Each value must be a whole number between 1 and 99.

**i** If you change the percentiles to collect new values, it takes time for the recalculation to occur. If you review the **Metric Browser**, you will see metrics based on the old percentiles until the moment that you update the values, when they change to reflect the change.

### Configure Which Network Requests Are Sent to the Event Service

#### Related pages:

- [Network Request Limits](#)

Your mobile app may make various kinds of **network requests**, and not all of them may be equally important to monitor in detail. For example, any requests to **Google Analytics** that your app may make are useful but probably aren't as important to analyze as the requests it makes to your backend.

To manage the impact on your overall Event Service usage, you can create rules which specify which of these network requests should be sent on to the Event Service, either by excluding a request entirely, including a particular request or a sample of that request types by percentage, or by simply allowing the request to be sent on.

The behavior follows this pattern:

- If no rules are specified, data on all network requests are sent on.
- If exclude rules are specified, and a network request satisfies a rule, that data is *not* sent on.
- If include rules are specified, any network request that satisfies a rule is sent on, based on sampling defined by the percentage indicated in the rule.
- If both include and exclude rules are specified, a network request that satisfies an include rule but does *not* satisfy an exclude rule is sent on.

## Access Network Requests Rules

From the **Mobile App Group Configuration** page, select the **Event Service** tab.

### Configure Include Rules

1. Click **Add** to create a new rule. The **Include Rule** popup displays.

2. Give your rule a display name.
3. Check **Enabled** to place the rule in force.
4. Specify the Network Request **URL** using any of the options in the dropdown.
5. If you want to sample this request type, select a percentage for sampling.
6. Click **OK**.

### Configure Exclude Rules

1. Click **Add** to create a new rule. The **Exclude Rule** popup displays.

2. Specify a display name for the rule.
3. Check **Enabled** to place the rule in force.
4. Specify the Network Request **URL** using any of the options in the dropdown.
5. Specify the percentage of URLs to sample.

6. Click **OK**.

### Change Priority of Rules

Rules are evaluated in the order that they appear in the include or exclude list. You can change the priority of the rules by dragging and dropping rules towards the top (higher priority) or towards the bottom of the list (lower priority). Custom rules are always evaluated before the default naming rule, beginning with the custom rule that has the highest priority.

### Configure Request IP Address Storage - Mobile

#### Related pages:

- [Network Request Limits](#)
- [Network Requests](#)

For security and privacy reasons, Mobile RUM does not store source IP addresses associated with network requests.

To have Mobile RUM store source IP addresses associated with network requests, following the instructions below.

1. From the **Mobile App Group Configuration** page, select the **Settings** tab.
2. Click the **Mobile Network Request Naming, Thresholds & Percentiles** tab.
3. Check the **Store IP Address** checkbox to enable IP address storage. (By default, the box is not checked.)

4. Click **Save**.

### Configure Session Monitoring

Sessions begin when a user starts using your application and ends after a configurable period of user inactivity. Increasing the period of user inactivity enables sessions to capture more user events, but this could impact the [session limits](#) of your account. See [Mobile Sessions](#).

#### Access Session Monitoring

1. Open the mobile application in which you are interested.
2. From the left-hand navigation menu, select **Configuration**.
3. Click **Mobile App Group Configuration >**.
4. Select the **Settings** tab.
5. Find the **Configure Session Monitoring** section.

#### Set Inactivity Timeout

From **Configure Session Monitoring**:

1. Set the number of minutes for the **Session Inactivity Timeout** field.
2. Click **Save**.

---

## Configure Application Not Responding Thresholds

The Mobile Agent uses configurable thresholds to set the severity level for application-not-responding (ANR) errors. The severity levels for ANRs are **warning** and **critical**, and these levels can be used to set health rules and receive alerts for health rule violations.

You can use Controller UI to configure thresholds for warning and critical severity levels. These thresholds will be propagated to the Mobile Agents without the need to redeploy the application.

### Default Network Request Thresholds

The Mobile Agent uses the following default values to determine the severity level:

- **Warning:** greater than 3000 ms
- **Critical:** greater than 5000 ms

You should set custom thresholds best suited for your mobile applications.

### Configure Application Not Responding Thresholds

1. From the **Mobile App Group Configuration** page, click the Settings tab.
2. In the **Configure Application Not Responding Thresholds** section, set the thresholds for **Warning Threshold** and **Critical Threshold** in milliseconds.
3. Click **Save**.

## Correlate Business Transactions for Mobile RUM

### Related pages:

- [Correlate Business Transactions for EUM](#)
- [Business Transactions](#)

You can correlate mobile network requests with business transactions. In actuality, the correlation is made between instances of network requests (network request snapshots) and instances of business transactions (transaction snapshots).

### Mobile Network Requests Correlation

When an end user takes an action with your mobile application that requires a network request:

1. The App Agent:
  - Sends HTTP headers identifying the business transaction to the end user's mobile device.
  - Aggregates backend metrics and sends them along with the business transaction identifiers to the Controller. This serves as the content for the transaction snapshot.
2. The Mobile Agent sends metrics and the business transaction identifiers (from the HTTP header) to the EUM Server. This serves as the content for the network request snapshot.
3. The Controller fetches the metrics and business transaction identifiers from the EUM Server. Using the business transaction identifiers, the Controller correlates the network request snapshot with the transaction snapshots.

### View Business Transactions Correlated with Mobile Applications

There are several ways to navigate from a mobile network request snapshot to its correlated business transaction. This procedure provides a sample navigation:

1. From the **Mobile App Dashboard**, click **Network Requests**.
2. Click **Snapshots**.

3. You should now see network transaction snapshots:

	↑	Timestamp	Mobile App Version	Network Request Name	Network Request Time (ms)	Device / Manufacturer	Model	OS Version	HTTP Status Code	Network Error
✓	📄	09/27/18 2:42:01 ...	1.0	www.ecommerce.com/rest/cart	16	Google	Nexus	Android 4.2	200	
✓	📄	09/27/18 2:30:01 ...	2.1	www.ecommerce.com/rest/cart	1,008	Amazon	Kindle Fire	Android 2.3	200	
✓	📄	09/27/18 2:29:02 ...	2.1	www.ecommerce.com/rest/cart	14	Google	Nexus	Android 4.1	200	
✓	📄	09/27/18 1:22:11 ...	2.0	www.ecommerce.com/rest/ite...	3,169	Samsung	Galaxy Nexus	Android 2.3	200	
⚠️	📄	09/27/18 1:12:24 ...	2.1	www.ecommerce.com/rest/user	24	Samsung	Galaxy Nexus	Android 2.3	200	
✓	📄	09/27/18 12:52:09...	1.0	www.ecommerce.com/rest/user	17	Amazon	Kindle Fire	Android 4.1	200	
✓	📄	09/27/18 12:14:07...	1.0	www.ecommerce.com/rest/ite...	3,219	Amazon	Kindle Fire	Android 4.1	200	

4. Double-click one of the browser snapshots to open the **Network Request Snapshot Details** dialog. If a correlated transaction snapshot exists, a link displays in the **Business Transactions** section:

Summary

Archive View Session

Mobile App: EcommerceAndroid  
 Version: 1.0  
 User Experience: Normal  
 Time: 09/27/18 2:42:01 PM  
 Request Content Length: 2,416 bytes

## Get More Information about Mobile RUM

Use the following to find out more about Mobile RUM.

- [Mobile RUM Metrics](#)
- [Mobile RUM Supported Environments](#)
- [Real User Monitoring Licenses](#)
- [Network Request Limits](#)

## Mobile RUM Metrics

AppDynamics displays key metrics for Mobile RUM on the various dashboards in the Mobile UI and in the **Metric Browser**.

-  With the exception of App Crashes per Minute, the crash information displayed in the Controller UI is based on data stored in the Events Store and does not display in the **Metric Browser**.

## Crashes

Crash measurements are created using the Analyze event store, and display in the **Crash Dashboard**.

- **Total Crashes:** total number of crashes over the selected time range
- **Total Unique Crashes:** total number of unique crash types over the selected time range
- **Impacted Users:** total number of unique users affected by a crash
- **Crashes by Usage Stats:** percentage of crashes based on device, OS version, carrier, and connection type
- **Crashes by Geo Location:** total number of crashes by origin over the selected time range

---

## Crash Metrics

- **App Crashes per Minute:** arithmetic average number of crashes

## HTTP Errors

An HTTP error occurs when an HTTP request is sent and a response is received, but the response status code indicates that an error occurred. These errors suggest that the network is working correctly, but a problem exists on the client side (4xx status codes) or the server side (5xx status codes) that prevented normal handling of the request.

- **HTTP Errors Per Minute:** arithmetic average of errors per minute for errors that return an HTTP response code between 400 and 599
- **HTTP Errors (total):** total number of HTTP errors over the selected time range (shown in the **Geo Dashboard**)

## Mobile Device Metrics

See [Mobile Device Metric Collection](#) for more information.

## Network Errors

A network error is any occurrence that prevents the HTTP request from being sent or the HTTP response from being received successfully.

- **Network Errors per Minute:** arithmetic average of network errors per minute
- **Network Errors (total):** total number of network errors over the selected time range (shown in the **Geo Dashboard**)

Typical causes of network errors include:

- Host cannot be resolved
- Host refused connection
- Connection timed out
- Device is offline
- General connectivity problems

## Network Requests

Network request metrics are reported for each platform and instrumented mobile application.

- **Network Request Time:** arithmetic average interval in milliseconds between the time that a mobile application initiates a request by calling the system API and the time that the system returns the response to the application
- **Requests per Minute:** arithmetic average number of HTTP requests per minute
- **Total Requests:** total of HTTP requests per minute over the selected time range (shown in the **Geo Dashboard**)
- **Request Content Length:** total number of bytes of data in the body of the request. The body is the part that comes after the blank line below the headers
- **Response Content Length:** total number of bytes of data in the body of the response

## Mobile RUM Supported Environments

This page lists the supported environments for the following mobile agents:

- [Android Agent](#)
- [iOS Agent](#)
- [Xamarin Agent](#)
- [Cordova Plugin](#)
- [React Native Agent](#)

## Android Agent

Supported Environments	Name	Supported Version(s)
Operating System	Android	>= 2.3.3
Architecture	arm64-v8a, armeabi, armeabi-v7a, mips, mips64, x86, and x86_64	-
Frameworks	Ant	-
	Gradle	0.6.3 - 8.0
	Maven	>= 3.1.1
Crash Reporters	Mobile RUM does not officially support 3rd-party crash reporters.	N/A
HTTP Libraries	URLConnection / HTTPSURLConnection	-
	HttpClient	-
	OkHttp	2.2.0 - 3.9.0
	ch.boye.httpclientandroidlib	-
	retrofit	-
	retrofit2	-
	Other HTTP libraries can be added by using the agent SDK. See <a href="#">Customize the Android Instrumentation</a> for more information.	-

Android Gradle Plugin Version	Minimum Android Agent Version
0.6.3	3.8.2.0
0.7.3 - 0.9.2	3.8.3.0
0.10.0 - 0.12.0	3.9.0.0

Android Gradle Plugin Version	Minimum Android Agent Version
1.1.2 - 1.1.3	4.0.3.3
1.3.0 - 1.4.0	4.0.7
1.5.0 - 2.2.0	4.2.0*
2.3.0 - 3.4.0 (forces <a href="#">Build Tools 25.0.0</a> or higher)	4.2.9
>= 3.4.1	>= 20.7.1
7.0	22.2.0
8.0	23.4.0

### Recommendations

- If your project uses Android Gradle Plugin version < 3.4.1, use Android Agent 20.4.0.
- If your project uses Android Gradle Plugin version >= 3.4.1, use Android Agent >= 20.7.1.

\*Android Agent Plugin versions before 4.2.9 are not compatible with Android Build Tools versions >=24 because of the Java 8 bytecode generated in class files.

### Android Studio Support

- Android Studio 2.1.0 - 2.9.9, 3.2.1 - 3.9.9 (Not supported: 3.0.0 - 3.2.0, >= 4.0)

### iOS Agent

Supported Environments	Name	Supported Version(s)
Operating System	iOS	>= 9
Architecture	Apple 32-bit ARM, Apple 64-bit A7	-
Framework	Xcode	>= 12.5
Crash Reporters	Mobile RUM does not officially support 3rd-party crash reporters.	N/A
Apple WatchKit Extension Environments	watchOS	1
HTTP Libraries	<code>NSURLConnection</code>	-

Supported Environments	Name	Supported Version(s)
	NSURLSession	-
	<a href="#">Alamofire</a> - Initialize the iOS Agent before initializing Alamofire to ensure that network requests are monitored. If you need to make a network request(s) prior to iOS Agent initialization, see <a href="#">Alamofire Guidelines</a> .	-
	Other HTTP libraries can be added by using the agent SDK. See <a href="#">Customize the iOS Instrumentation</a> for more information.	-

### Alamofire Guidelines

If you need to use Alamofire to make a network request(s) prior to initializing the iOS Agent, you can use the following sample code as a guideline for making the necessary changes.

To ensure that Alamofire network requests made after iOS agent initialization will be instrumented, you can initialize a custom instance of `Session` (the principle class defined in Alamofire 5, renamed from previous Alamofire versions). This will create a new instance of `URLSession`, which can be instrumented by the iOS Agent. Any Alamofire network requests made prior to the agent initialization and creation of the `Session` instance cannot be instrumented by the agent.

- The order of operations in this code is very important. See the inline comments.
- This code assumes you are initially creating a customized instance of `Session` (which is common practice). If not, you can eliminate the first usage of customized `Session` and defer its creation until after the iOS agent initialization.
- You can test this code by going to <https://www.google.com/?q=request%202>, which is instrumented because it occurs after the replacement of `mySession` with `instrumentedSession`. The other two requests are not instrumented.

```
import UIKit
import Alamofire
import ADEUMInstrumentation

var mySession:Session? // customized Session singleton

@UIApplicationMain
class AppDelegate: UIResponder, UIApplicationDelegate {

 func application(_ application: UIApplication, didFinishLaunchingWithOptions
launchOptions: [UIApplication.LaunchOptionsKey: Any]?) -> Bool {
 // Override point for customization after application launch.
 }
}
```

```

// create customized instance of AF Session
let myConfiguration = URLSessionConfiguration.af.default
mySession = Session(configuration: myConfiguration)

let myUrl1 = URL(string: "https://www.google.com/?q=request%201")!
let urlRequest1 = URLRequest(url: myUrl1)

// the first network request prior to ADEumInstrumentation.initWith will not be
instrumented
mySession?.request(urlRequest1 as URLRequestConvertible).response {
 response in debugPrint(response)

 // initialize iOS agent
 let config = ADEumAgentConfiguration(appKey: "XX-XXX-XXX-XXX")
 config.loggingLevel = .all
 ADEumInstrumentation.initWith(config)

 // update our Session instance singleton, instrumentedSession, so that URLSession
will be instrumented
 let myConfiguration = URLSessionConfiguration.af.default
 let instrumentedSession = Session(configuration: myConfiguration)
 // replace mySession with instrumentedSession
 mySession = instrumentedSession

 // subsequent requests use updated mySession from instrumentedSession, so should
be instrumented
 let myUrl2 = URL(string: "https://www.google.com/?q=request%202")!
 let urlRequest2 = URLRequest(url: myUrl2)
 mySession?.request(urlRequest2 as URLRequestConvertible).response {
 response in debugPrint(response)
 }
}
// has instrumentedSession been created yet? Indeterminate. If not, this request
won't be instrumented
let myUrl3 = URL(string: "https://www.google.com/?q=request%203")!
let urlRequest3 = URLRequest(url: myUrl3)
mySession?.request(urlRequest3 as URLRequestConvertible).response {
 response in debugPrint(response)
}
return true
}
}

```

## Xamarin Agent

Supported Environments	Name	Supported Version(s)
Operating System	Android	>= 2.3.3

Supported Environments	Name	Supported Version(s)
	iOS	>= 9
Architecture	<a href="#">Xamarin.Android Supported CPU Architectures</a>	-
	Apple 32-bit ARM, Apple 64-bit A7 - See <a href="#">32/64-bit platform considerations</a> for information regarding the correct architecture for your iOS version.	-
Framework	.NET - Mono	>= 4.8
Crash Reporters	Mobile RUM does not officially support 3rd-party crash reporters.	N/A
Apple WatchKit Extension Environments	Not supported	-
HTTP Libraries	N/A - The Xamarin Agent does not support automatic instrumentation for network requests made with any library. You will need to manually instrument HTTP network requests regardless of what library is used.	-

### Cordova Plugin

Supported Environments	Name	Supported Version(s)
Operating System	Android	4.4 - 8.1
	iOS	>= 9
Architecture	Android: arm64-v8a, armeabi, armeabi-v7a, mips, mips64, x86, and x86_64	-
	iOS: Apple 32-bit ARM, Apple 64-bit A7	-
Framework	<a href="#">Apache Cordova</a>	>= 7
Crash Reporters	Mobile RUM does not officially support 3rd-party crash reporters.	N/A

Supported Environments	Name	Supported Version(s)
Apple WatchKit Extension Environments	Not supported	-
HTTP Libraries	Android: <ul style="list-style-type: none"> <li>• <code>URLConnection / HTTPSURLConnection</code></li> <li>• <code>HttpClient</code></li> <li>• <code>OkHttp</code></li> <li>• <code>ch.boye.httpclientandroidlib</code></li> </ul>	-
	iOS: <ul style="list-style-type: none"> <li>• <code>NSURLConnection</code></li> <li>• <code>NSURLSession</code></li> </ul>	-

### React Native Agent

Supported Environments	Name	Supported Version(s)
Operating System	Android	$\geq 4.1$ (with React Native Agent $\geq 20.10.1$ )
	iOS	$\geq 11$ (with React Native Agent $\geq 20.10.1$ )
Architecture	Android: arm64-v8a, armeabi, armeabi-v7a, mips, mips64, x86, and x86_64	-
	iOS: Apple 64-bit A7 (with React Native Agent $\geq 20.10.1$ )	-
Framework	<a href="#">React Native</a>	$\geq 0.60$ (with React Native Agent $\geq 20.10.1$ ) $< 0.60$ (with React Native Agent 20.7.0)
Crash Reporters	Mobile RUM does not officially support 3rd-party crash reporters.	N/A
Apple WatchKit Extension Environments	Not supported	-

Supported Environments	Name	Supported Version(s)
HTTP Libraries	Android: <ul style="list-style-type: none"> <li>• HttpURLConnection / HttpsURLConnection</li> <li>• HttpClient</li> <li>• OkHttp</li> <li>• ch.boye.httpclientandroidlib</li> </ul>	-
	iOS: <ul style="list-style-type: none"> <li>• NSURLConnection</li> <li>• NSURLSession</li> </ul>	-

### Network Request Limits

The EUM Server (on-premises/SaaS) can process a maximum of 2000 network request types per mobile app group and 500 network requests per mobile application.

If the number of network requests for an application exceeds one of these limits, AppDynamics continues to monitor network requests that have already been discovered, but new network requests will not be discovered. Should a limit be exceeded, a warning appears on the network request list.

You can use these techniques to keep your usage under the two network request limits.

### Remove Network Requests Without Load

Removing network request types that have been discovered but are not receiving any load is a good place to start to reduce the number of your registered requests.

**i** Deleting network requests does not prevent them from being re-discovered in the future if the request once again comes under load. To prevent specific network requests from ever being discovered, you must create exclude rules. See the section "Creating Mobile Exclude Rules" in [Configure Mobile Network Request Naming](#).

### Delete network requests with no load

1. In the **Network Requests** list, uncheck the **With Load** checkbox.
2. Refresh the list.
3. Find the requests that have no load. They are candidates for removal.
4. Select the requests that you want to delete.
5. In the **More Actions** dropdown, click **Delete Request(s)**.

### Exclude Requests That Do Not Need to Be Monitored

The Mobile Agent may be detecting network requests types that are not interesting for you to monitor. You have two methods to exclude these types of network requests.

The first method is to add custom exclude rules from **Configuration > Mobile Request Naming, Thresholds, & Percentiles**. See [Creating Mobile Exclude in Rules](#) for explicit instructions.

Using custom exclude rules, network requests for new data that match the exclude rules will not be registered. The load on the existing network requests that match the exclude rule will drop to zero. To delete any network requests of the excluded type that have already been registered from the network request list, follow the procedure described in [Delete network requests with no load](#).

The second method is to select an existing network request from the **Network Requests** list and then exclude it. This will change the app's exclude rules so that incoming data matching that request will not be tracked. In addition, the historical data for that request will be deleted.

To use the second method for the exclude rules that prevent a network request from being tracked and remove historical data for that network request:

1. From **Network Requests**, select the network request you want to exclude.
2. Click **Actions > Exclude Requests** to open the **Exclude Requests** dialog.
3. Click **Exclude**.

### Group Network Requests of Similar Type

Review the default network request naming rule described in [Configure Mobile Network Request Naming](#). It is possible that the default rule is generating many more network requests types than are desirable.

For example, perhaps your application loads images dynamically and stores them on your server with URLs like `http://myapp.com/image/image1234.jpg`. This would cause a separate network request to be generated for each image, which is probably not what you want. You could create a custom naming rule to group all the image URLs as a single network request. See [Configure Mobile Network Request Naming](#).

After you have created custom rules to reduce the number of network requests detected, unregister the network requests for those are now covered by the custom rule, following the procedure described in [Delete network requests with no load](#).

### Mobile Agent Version and Deployment Support Matrix

#### Related pages:

- [Mobile RUM Supported Environments](#)

Using the AppDynamics Mobile Agents with the following recommended minimum Controller/EUM Server versions will ensure that all features for the specified releases will function correctly and that there will be no unexpected side effects.

For a list of Controller and EUM Server version requirements, see [Maintenance Support for Software Versions](#).

Although mobile agents may be compatible with future releases of the Controller and EUM Server, AppDynamics only provides support for mobile agent versions with the Controller and EUM Server for one year after the release of the mobile agent. Starting June 1 2022, all mobile agents older than 21.2 will not be supported.

Mobile Agent	Minimum Agent Version(s)	Download Site
Android Agent	20.3.x	<a href="https://mvnrepository.com/artifact/com.appdynamics/appdynamics-injector">https://mvnrepository.com/artifact/com.appdynamics/appdynamics-injector</a>
Cordova Plugin	20.3.x	<a href="https://www.npmjs.com/package/appd-plugin-eum-mobile">https://www.npmjs.com/package/appd-plugin-eum-mobile</a>
iOS Agent	20.3.x	<a href="https://cocoapods.org/pods/AppDynamicsAgent">https://cocoapods.org/pods/AppDynamicsAgent</a>
React Native Agent	20.3.1	<a href="https://www.npmjs.com/package/@appdynamics/react-native-agent">https://www.npmjs.com/package/@appdynamics/react-native-agent</a>

## Hybrid Application Support

AppDynamics supports monitoring for hybrid applications based on the iOS/Android native SDK or any Cordova-based framework.

### Hybrid Applications

Hybrid applications are web applications running inside an Android or iOS native shell. The web application can be in the form of an [Android WebView](#), an [iOS WKWebViews](#), or a Cordova web application that consists of HTML, CSS, JavaScript, and other resources just like a conventional web application.

### Hybrid Use Cases

Mobile RUM supports these two use cases.

- Native Mobile applications that run web applications or web views. Examples of this are Android WebViews and iOS WKWebView.
- Applications written in Cordova-based frameworks, such as Ionic, that provide a native shell for running a web application and an interface for native mobile APIs.

### Hybrid Application Instrumentation Requirements

For instrumenting hybrid apps, you are required to:

- Manually instrument the iFrames with the JavaScript Agent. For mobile native applications, the JavaScript Agent is injected into the top-level WebView or WKWebView instance, not in embedded web pages (iFrames).
- Manually report events for Cordova-based applications using the [plugin JavaScript API](#).
- Use Android WebViews or iOS WKWebView for hybrid applications with embedded web views. See [Instrument Cordova Applications](#).

### Instrumentation Steps

To monitor your hybrid applications, you will need to [set up and access Mobile RUM](#) and follow the steps below based on your hybrid use case:

Native iOS Application	Native Android Application	Cordova-Based Applications
<ol style="list-style-type: none"> <li>1. <a href="#">Instrument an iOS Application</a></li> <li>2. <a href="#">Configure Hybrid Support for the iOS Application</a></li> </ol>	<ol style="list-style-type: none"> <li>1. <a href="#">Customize the Android Build</a></li> <li>2. <a href="#">Instrument an Android Application</a></li> <li>3. <a href="#">Configure Hybrid Support for Android Applications</a></li> </ol>	<ol style="list-style-type: none"> <li>1. <a href="#">Instrument a Cordova Application</a></li> <li>2. <a href="#">Customize the Cordova Instrumentation</a></li> </ol>

### How it Works

For native Android/iOS applications, the Android Agent or iOS Agent will inject the JavaScript Agent into an [Android WebView](#) or [iOS WKWebView](#). For Cordova-based applications, the AppDynamics plugin will inject the JavaScript Agent into the web application.

The diagrams below provide an overview of how Mobile RUM is used to monitor mobile native applications and Cordova-based applications.

## Mobile Native Application Architecture

- 1 You instrument your mobile application with either the Android/iOS Agent.
- 2 When your mobile application instantiates a WebView or WKWebView instance, the Mobile Agent injects the JavaScript Agent into it.
- 3 The JavaScript Agent monitors the performance and WebView usage.
- 4 The JavaScript Agent reports the application activity by sending beacons to the Mobile Agent.
- 5 The Mobile Agent repackages the browser beacons into mobile beacons and sends the beacons to the EUM Server.

## Cordova-Based Application Architecture

- 1 The AppDynamics Cordova plugin injects the JavaScript Agent into the Cordova WebView.
- 2 The Cordova-based application uses the plugin's JavaScript binding to configure the Mobile Agent.
- 3 The JavaScript Agent injected into the WebView monitors the application activity and performance.
- 4 The JavaScript Agent sends browser beacons to the Mobile Agent.
- 5 The Mobile Agent parses and converts the browser beacons into mobile beacons.
- 6 The Mobile Agent sends the mobile beacons to the EUM Server.

### Mobile Agent and JavaScript Agent Compatibility

When hybrid app support is enabled, the Mobile Agents use an embedded JavaScript Agent to monitor mobile web pages. If you are already monitoring the same mobile web pages with a browser application, the JavaScript Agent version used to instrument the browser application may be different than the JavaScript Agent version used by the Mobile Agent. If the two versions of the JavaScript Agent are incompatible, the Mobile Agent will not be able to instrument web views or access event notifications from web views.

### How to Ensure Compatibility

To ensure compatibility, browser applications should use JavaScript Agent version  $\geq 4.5.4$  and mobile applications should use Mobile Agent versions  $\geq 4.5.5$ . When using compatible versions of the JavaScript Agents, the JavaScript Agent of the browser app will report beacons for a web page, and the embedded JavaScript Agent of the mobile app will be ignored and not report beacons because a web page cannot be instrumented with the JavaScript Agent multiple times.

**i** If you have disabled the Mobile Agent's hybrid app support, there will be no compatibility issues regardless of the JavaScript Agent version used by the browser application.

## Troubleshooting Incompatible JavaScript Agent Versions

If you are using incompatible versions of the JavaScript Agents, do one of the following to correct the problem:

- Upgrade the JavaScript Agent that you are using to instrument the browser application.
- In the mobile instrumentation, disable the hybrid support ([iOS/Android](#)), so that the mobile web pages are only instrumented by the browser application instrumented with the older version of the JavaScript Agent.

## Hybrid Application Network Requests

Network calls made in the context of the WebView for Cordova-based applications show up as Ajax calls from the JavaScript Agent.

## iOS Data Collection Disclosure

With the iOS 14 release, [Apple introduced a new data collection policy](#). This page describes how Apple's iOS 14 data use policy applies to AppDynamics.

## Data Collection with Screenshots

When you use the Mobile Screenshots feature, the iOS Agent captures an image of the your user's screen and may send a copy of the image to the AppDynamics server for the Controller to visualize app usage. These screenshots may capture anything your application displays, including any user data your user submits. It is your responsibility to review the data captured in the screenshots and determine where such captured data falls in Apple's categorization of types of disclosable data. See [Data Collection Details](#).

## Disable Mobile Screenshots

You can use `blockScreenshots()` to temporarily disable screenshots for any screen which may display such data. See [Customize the iOS Instrumentation](#).

## Data Collection Details

AppDynamics does not enable any targeted advertisements, data broker, or data combination as described in the Apple iOS 14 User Privacy and Data Use Policy. In addition, ID for Vendors (IDFV) as defined under such guidelines is not currently used in any AppDynamics Mobile features.

This table references <https://developer.apple.com/app-store/app-privacy-details/> and describes how AppDynamics does or does not collect data.

<b>A p p l e D a t a C a t e g o r y</b>	<b>Apple Data Description</b>	<b>AppDynamics Data Collection</b>
<b>C o n t a c t I n f o</b>	<p><b>Name</b> Such as first or last name</p> <hr/> <p><b>Email Address</b> Including but not limited to a hashed email address</p> <hr/> <p><b>Phone Number</b> Including but not limited to a hashed phone number</p> <hr/> <p><b>Physical Address</b> Such as home address, physical address, or mailing address</p> <hr/> <p><b>Other User Contact Info</b> Any other information that can be used to contact the user outside the app</p>	<a href="#">Subject to screen capture functionality</a>

### Mobile Device Metric Collection

This page covers what mobile device metrics are collected, and how to enable collection and view device metrics in the Controller UI.

To learn how Apple's iOS 14 data use policy applies to AppDynamics mobile device metric collection, see [iOS Data Collection Disclosure](#).

Mobile agents can capture the following mobile device metrics:

- **Memory (RAM):** total memory of the device (i.e. 8GB total memory) and the resource consumption (i.e. 34% of device memory has been consumed)
- **Disk Space:** total storage capacity of the device (i.e. 64GB total storage capacity) and storage usage (i.e. 65% of device storage has been consumed)
- **Battery:** battery level of the device (i.e. 50% battery)

### Support

- Available for both SaaS and on-premise deployments
- Controller >= 20.11.0
- Android Agent >= 20.10.0
- iOS Agent >= 20.10.0

## Enable and Configure Device Metric Collection

To configure device metric data collection in the Controller UI:

1. Go to a browser application.
2. In the left-hand panel, go to **Configuration > Mobile App Group Configuration > Settings**.
3. Under **Configure Mobile Device Metrics**, enable each metric type. It may take a few minutes for data to appear on the **Mobile App Dashboard**.
4. Set **Frequency of data collection** to how often device data is collected for the options you enabled. For example, if the frequency is set to 2, every 2 minutes the enabled device data is collected and [shown in the dashboard widgets](#).

### Warning

The maximum frequency is 2 minutes and collects the most data. However, sessions under 2 minutes or temporary metric spikes will not be captured.

## Add Device Metric Widgets to the Mobile App Dashboard

You can view device metric widgets on the **Mobile App Dashboard**. To add device metric widgets:

1. Go to the **Mobile App Dashboard**.
2. In the top-left corner, click +.
3. Add the widgets **Device Memory Capacity**, **Device Storage Capacity**, and **Device Battery Capacity**.
4. Click on a widget and view performance and sessions by battery, memory, and storage.

## View Sessions with Device Metrics

On the **Sessions** dashboard, you can add columns to sort sessions for each device metric. To add device metric columns:

1. Go to **Mobile Session Fields**.
2. Check the fields **Critical Battery Usage**, **Critical Memory Usage**, and **Critical Storage Usage**.

### Mobile Session Fields (14)

T Agent Version

T Country

Critical Battery Usage

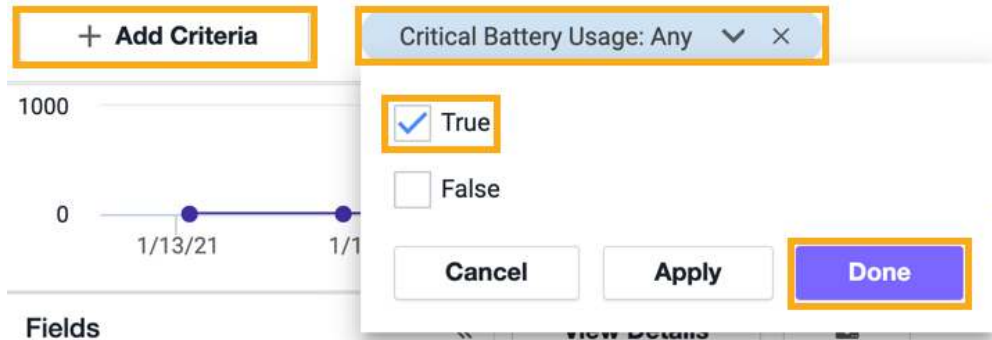

Critical Memory Usage

Critical Storage Usage

## Filter Sessions by Device Metric Values

You can filter sessions by [critical device states you configured](#). For example, if you want to look at sessions with low device battery:

1. Go to **Sessions**.
2. Click **+ Add Criteria**.
3. Select "Critical Battery Usage: Any".
4. Check "True."

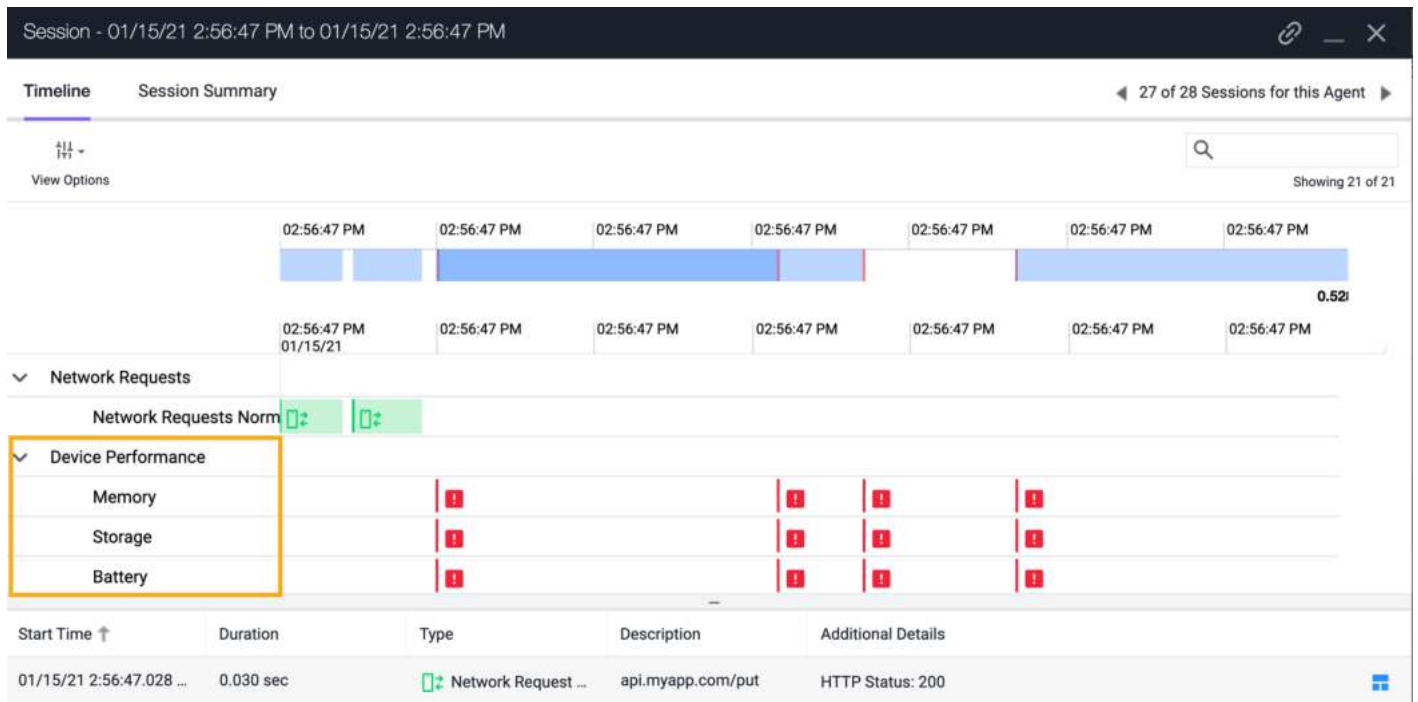

## Set Critical Usage Thresholds

You can set the usage threshold to trigger a critical event. To configure what usage percentage triggers a critical event:

1. Go to **Configuration > Mobile App Group Configuration > Settings**.
2. Under **Configure Mobile Device Metrics**, enter a value for each device metric threshold. For example, if you want to capture battery usage below 50%, set **Enable Battery Usage and Capacity Metrics** to 50%. When that configured threshold is reached, the resource consumption (percentage value) is captured by the agent and shown in session data.

When you look at a mobile session, you can see the critical events you configured.

## Known Issues

For Android devices, memory reported in the UI may not match the actual end-user device memory. Due to API limitations, the memory value that the Android Agent returns might not include segments on the device's reserved memory. For example, an Android device might have 64GB storage and 8GB memory, but the Android Agent might report only 53GB storage and 6.5GB memory. This discrepancy varies based on device type and manufacturer.

## Troubleshoot Mobile Applications

You can use Mobile RUM to investigate two different kinds of problems that can arise with your mobile applications:

- Slow network requests
- Mobile application crashes

## Identify Your Slowest Network Request Types

To identify slow network requests:

1. Open the application in which you are interested.
2. In the left navigation bar, click **Network Requests**.
3. Select the Network Requests tab.
4. Click the top of the **Network Request Time (ms)** column, then toggle it to sort the network requests with the slowest ones at the top.
5. Skip over network requests that you expect to run for a long time or that have very little load (low Requests per Minute).
6. Select and double-click one of the slow network requests that you want to investigate.
7. In the network request dashboard, view the **Key Performance Indicators** at the top of the **Network Request Dashboard**. For example:

- If the value for Network Request Time is large, the request or response body may be too large and is taking a while to transmit, or the data connection might be slow.
- If the backend server is instrumented and the value for Total Server Time makes up a significant amount of the delay, scroll down to the **Related Business Transactions** section to investigate related business transactions on the server side.

## Access Details of Individual Instances of Slow Requests

To investigate the cause of slow requests:

1. Select the Snapshots tab. The **Snapshots List** opens.
2. Click **Filters**.
3. In the **Network Request Names** dropdown under **Network in the Filters** panel, check the check box for the network request that you identified in [Identify your slowest network requests](#), then click **Search**. This restricts the list to snapshots for that network request only.
4. Click **Filters** again to close the filters panel.
5. In the list, click the top of the **Network Request Time (ms)** column, then toggle it to sort the network request snapshots with the slowest requests at the top.
6. Select and double-click one of the slow network requests. The network request snapshot displays the details of the slow request.
7. If this request is associated with a server-side application that is also instrumented, scroll down to see if transaction snapshots for this request are available on the server side. If transaction snapshots are available and if most of the time for this network request is spent on the server, click through to the related transaction snapshots to understand what is causing the slow performance on the server. See [Troubleshoot Business Transaction Performance with Transaction Snapshots](#).

## Identify Applications that Crash the Most or Affect the Most Users

To troubleshoot mobile application crashes with crash dashboards and crash snapshots:

1. Open the application in which you are interested.
2. On the left navigation bar, click **Crashes**.
3. Select the Crash Dashboard tab.
4. Check the **Unique Crashes** list.
5. Sort either by **Total Crashes** or **Impacted Users**, depending on what you want to know. In the screenshot below, the list is sorted by impacted users.

Unique Crashes

Unique Crash Location	Mobile App Version	Total Crashes	Impacted Users	Status	Runtime
SIGSEGV in promoviev	2.1	10,135	1001	open	SDK
SIGSEGV in add	2.0	9,943	1001	open	SDK
SIGSEGV in cartisy	1.0	10,046	1001	open	SDK
SIGSEGV in promoviev	2.1	147	138	open	SDK
SIGSEGV in promoviev	2.1	145	138	open	SDK
SIGSEGV in add	2.0	144	134	open	SDK
SIGSEGV in cartisy	1.0	137	129	open	SDK
SIGSEGV in cartisy	1.0	136	126	open	SDK
SIGSEGV in add	2.0	138	126	open	SDK
SIGSEGV in cartisy	1.0	15	15	open	SDK
SIGSEGV in cartisy	1.0	13	13	open	SDK
SIGSEGV in add	2.0	11	11	open	SDK
SIGSEGV in promoviev	2.1	10	10	open	SDK
SIGSEGV in promoviev	2.1	7	7	open	SDK
SIGSEGV in add	2.0	6	6	open	SDK

6. View the **Summary Crash Trend** graph to discover particularly problematic time periods.

7. To find crashes in the problematic timeframe, click **Analyze** and drag up on the timeline where the most crashes occurred.

8. You should see the crash list reduced to those that occurred during the custom time period.

Summary Crash Trend

31033 Total Crashes	15 Total Unique Crashes
1001 Impacted Users	6.3% Crash Rate

400 Crashes/hour  
200 Crashes/hour  
0 Crashes/hour

Showing 15 of 15

9. Double-click one of the unique crashes to open the **Crash Details** dialog.

- 10. From here, you can view the stack trace of the crash snapshot, note the thread and function in which the crash occurred. For some crashes, the crashed line number is also available. Optional: Click **Download** to get a text version of the stack trace to send to your application development team.
- 11. To access a complete data set for crashes that belong to this crash group, click **Find Sessions**. This opens the **Mobile Sessions** view with a filter for this **Crash Group** already selected.

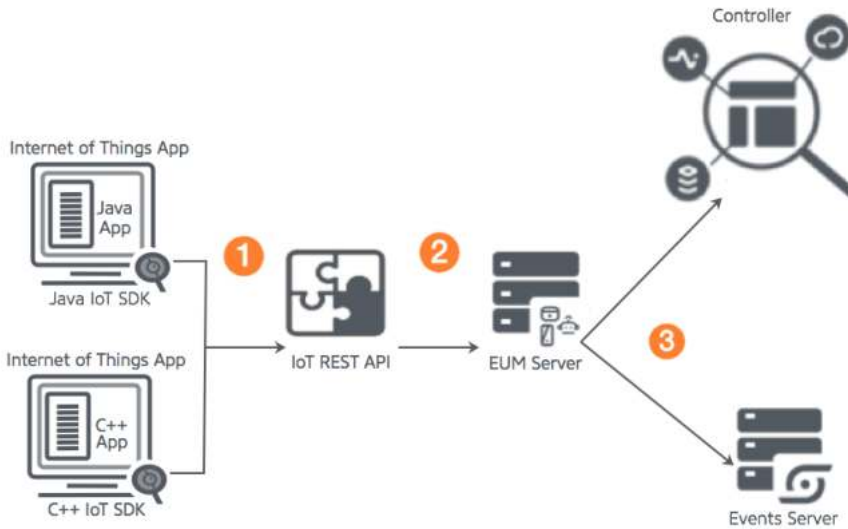

## IoT Monitoring

### Deployment Support

AppDynamics IoT Monitoring enables you to track and understand the transactions of your IoT applications. Because IoT devices are diverse, both in terms of the platforms they use and their business function, AppDynamics has developed a REST API in addition to language SDKs to provide the maximum flexibility for reporting IoT data. This API can be used from any device that supports HTTPS and is connected to the Internet.

IoT Monitoring requires application developers to instrument their code. To make this process easier, AppDynamics has developed C/C++ and Java SDKs, so that developers using the platforms supporting these languages can leverage the features of the SDK instead of using the REST API. The IoT SDKs **1** use the REST APIs to report IoT Data to the EUM Server **2**, where the data is aggregated and made available to the AppDynamics Controller and the Events Service **3** as shown in this diagram:

## Benefits of IoT Monitoring

IoT Monitoring enables you to capture and diagnose network requests, errors, and custom application and domain-specific events for applications running on devices that impact business objectives.

With IoT Monitoring, you can monitor the following for devices:

- Availability
- Network Performance:
  - Slow interaction
  - Latency between the device and backend services
- Usage: User and system behavior and patterns
- Errors and Exceptions

## IoT Monitoring Use Cases

IoT applications are typically embedded applications running on connected devices. This section focuses on how IoT Monitoring can collect and report data for the most common categories of IoT applications.

In the tabs below, you can view these IoT app categories and see how a typical example of each would use the three supported IoT Monitoring events to report data.

[Retail](#)   [Media](#)   [Connected Cars](#)   [Smart Homes](#)   [Travel](#)

This category of IoT apps process orders, payments, and manage product inventory. Examples include point of sale (PoS) devices, smart shelves, and gateways (local servers that aggregate information within certain geography/region).

Device Example	Device Information	Example Network Requests	Custom Events Examples	Handled Errors	Exceptions/ Crashes
Point of Sale	<ul style="list-style-type: none"> <li>• device ID</li> <li>• app version</li> <li>• hardware versions</li> <li>• firmware versions</li> </ul>	<ul style="list-style-type: none"> <li>• checkout</li> <li>• payment transaction</li> </ul>	<ul style="list-style-type: none"> <li>• total sales</li> <li>• number of items sold</li> <li>• discount applied</li> <li>• total checkout time</li> <li>• total processing time</li> </ul>	<ul style="list-style-type: none"> <li>• credit card declined</li> <li>• unable to read credit card</li> <li>• incorrect pin code</li> </ul>	<ul style="list-style-type: none"> <li>• crashes</li> <li>• reboots</li> <li>• frozen UI</li> <li>• timeouts</li> <li>• null point exceptions</li> </ul>

Retail [Media](#) Connected Cars Smart Homes Travel

IoT apps in this category enable users to seamlessly experience media content across different devices. An IoT app on a [set-top box \(STB\)](#) can quickly change the channel/content based on what the user was watching or listening to on their computer or phone.

Device Example	Device Information	Example Network Requests	Custom Events Examples	Handled Errors	Exceptions/ Crashes
Audio Streaming	<ul style="list-style-type: none"> <li>• device ID</li> <li>• app version</li> <li>• hardware versions</li> <li>• firmware versions</li> </ul>	<ul style="list-style-type: none"> <li>◦ media play</li> <li>◦ pause</li> <li>◦ stop requests</li> <li>◦ ad performance</li> </ul>	<ul style="list-style-type: none"> <li>◦ media downloads</li> <li>◦ media skips</li> <li>◦ subscribe details</li> <li>◦ total play time</li> </ul>	<ul style="list-style-type: none"> <li>◦ play errors</li> <li>◦ song not available</li> <li>◦ download errors</li> </ul>	<ul style="list-style-type: none"> <li>• crashes</li> <li>• reboots</li> <li>• frozen UI</li> <li>• timeouts</li> <li>• null point exceptions</li> </ul>

Retail Media [Connected Cars](#) Smart Homes Travel

Because automotive head units are often computers, IoT apps are used to manage user subscriptions and monitor the user experience.

Device Example	Device Information	Example Network Requests	Custom Events Examples	Handled Errors	Exceptions/ Crashes
Infotainment System	<ul style="list-style-type: none"> <li>• device ID</li> <li>• app version</li> <li>• hardware versions</li> <li>• firmware versions</li> </ul>	<ul style="list-style-type: none"> <li>◦ media play</li> <li>◦ pause</li> <li>◦ stop requests</li> <li>◦ ad performance</li> </ul>	<ul style="list-style-type: none"> <li>◦ media downloads</li> <li>◦ media skips</li> <li>◦ subscription details</li> <li>◦ total play time</li> </ul>	<ul style="list-style-type: none"> <li>◦ application loading errors</li> <li>◦ connectivity errors</li> <li>◦ audio errors</li> <li>◦ launching errors</li> </ul>	<ul style="list-style-type: none"> <li>• crashes</li> <li>• reboots</li> <li>• frozen UI</li> <li>• timeouts</li> <li>• null point exceptions</li> </ul>

Retail   Media   Connected Cars   [Smart Homes](#)   Travel

These IoT apps improve the security as well as reduce the energy and maintenance costs of intelligent buildings and smart homes. Examples include home security devices and smart thermostats, smart keyless locks, and smart lights.

Device Example	Device Information	Example Network Requests	Custom Events Examples	Handled Errors	Exceptions/ Crashes
Home Security	<ul style="list-style-type: none"> <li>• device ID</li> <li>• app version</li> <li>• hardware versions</li> <li>• firmware versions</li> </ul>	<ul style="list-style-type: none"> <li>◦ home sensor status</li> <li>◦ communication between gateway devices and sensors</li> <li>◦ health alerts</li> </ul>	<ul style="list-style-type: none"> <li>◦ sensor health</li> <li>◦ number of alerts</li> <li>◦ connectivity status</li> <li>◦ total roundtrip time to trigger an alarm</li> <li>◦ total time to set security status</li> </ul>	<ul style="list-style-type: none"> <li>◦ device wake-up/ sleep</li> <li>◦ alarm notification,</li> <li>◦ connectivity issues</li> </ul>	<ul style="list-style-type: none"> <li>• crashes</li> <li>• reboots</li> <li>• frozen UI</li> <li>• timeouts</li> <li>• null point exceptions</li> </ul>

Retail   Media   Connected Cars   Smart Homes   [Travel](#)

This category of IoT apps monitors and improves the travel experience. You can find IoT apps used in airport kiosks, luggage tracking devices, and embedded in cabin seats to monitor passenger comfort.

Device Example	Device Information	Example Network Requests	Custom Events Examples	Handled Errors	Exceptions/ Crashes
Airport Kiosk	<ul style="list-style-type: none"> <li>• device ID</li> <li>• app version</li> <li>• hardware versions</li> <li>• firmware versions</li> </ul>	<ul style="list-style-type: none"> <li>◦ fetching passenger records</li> <li>◦ payment processing</li> </ul>	<ul style="list-style-type: none"> <li>◦ number of users completing a transaction</li> <li>◦ number of issued boarding passes</li> <li>◦ total user activity time</li> <li>◦ total time spent on each screen</li> </ul>	<ul style="list-style-type: none"> <li>◦ passenger records not found</li> <li>◦ printer error</li> <li>◦ connectivity issues</li> </ul>	<ul style="list-style-type: none"> <li>• crashes</li> <li>• reboots</li> <li>• frozen UI</li> <li>• timeouts</li> <li>• null point exceptions</li> </ul>

## IoT SDKs

IoT Monitoring provides SDKs for C/C++ and Java languages. Some of the features of IoT SDKs are:

- APIs for reporting instrumentation data through custom events, error events, and network requests.
- Serialization of all events into JSON format before sending them to EUM Server
- API to plugin application HTTPS stack into SDK which will be used to communicate with EUM Server
- Business Transaction (BT) correlation
- Auto-disable when monitoring is turned off from the Controller UI

For languages other than C++ and Java, you can use the REST API to send custom events, error events, and network requests.

## IoT Monitoring UI

IoT Monitoring also provides the following features through the Controller UI:

- Dashboards for monitoring devices, network requests, as well as errors and exceptions
- Predefined and custom widgets to visualize reported application data
- Analytics for device application data through [AppDynamics Application Analytics](#)
- Configuration for naming and excluding network requests

## IoT Monitoring Workflow

The IoT SDKs and REST API enable you to report application data for a large number of different kinds of devices. This flexibility allows for a great deal of customization in the kind of the data you report, the quantity of data you report, and the timing of when the data is sent to the EUM Server.

To monitor customized data, you will need to better understand the data generated by your application and your device instrumentation. The goal of this page is to guide you through the process of understanding your application data, instrumenting your device application, and creating custom dashboards, so you can monitor device performance and activity.

We recommend that you follow this procedure as a guideline to monitor your devices:

1. Define your monitoring goals.
2. Identify what data needs to be captured.
3. Determine which events to use to report the data.
4. Obtain an EUM App Key.
5. Report events.
6. Monitor the availability, usage, and performance of your devices.
7. Build widgets.
8. Diagnose problems through filters.
9. Improve monitoring and troubleshoot.

### Define Monitoring Goals

AppDynamics IoT Monitoring enables you to monitor the availability, performance, and usage of your device. You should devise a plan that prioritizes your monitoring goals, considering the needs of all stakeholders (developers, DevOps, business units), and lists the resources that need to be monitored. Also, you should consider who will be instrumenting the device application, who will be performing the monitoring, and the parties who should be notified when something goes wrong.

### Identify Data to Capture

Next, you will need to analyze your device to identify what application data can be used to meet your monitoring goals. For example, if your device is a car, you would want to look at network requests to check device availability or report custom data for the wear and tear on its components or road conditions.

### Determine Which Event Types to Use to Report Data

You report app data through the three types of events shown in the table below. Based on this information, map the most suitable event types to the data you identified and your monitoring goals.

Event Type	Monitoring Objective
Custom	Usage
	Business
Network Request	Availability
	Performance
	Usage
Error	Performance

### Obtain an EUM App Key

Follow the instructions provided in [Get an EUM App Key](#).

---

## Report Events

You can use the IoT SDKs or REST API to capture and report key data points using one of the event types. If you are using a language other than C/C++ or Java, use the IoT REST API, which gives you the flexibility to report data from any platform.

Follow the getting started instructions to learn how to install the SDK and instrument your IoT application:

- [Instrument Applications with the IoT C/C++ SDK](#)
- [Instrument Applications with the IoT Java SDK](#)

## Monitor Your IoT Application

To monitor your IoT applications, you will need to understand the function and purpose of the three IoT dashboards. See [Monitor Applications with the IoT Dashboards](#) for a brief introduction of each dashboard and usage instructions.

## Build Widgets Based on Your Data Models

Each dashboard has a set of predefined widgets for basic performance and activity monitoring. You will need to create your own widgets, however, to optimize the monitoring capabilities of **IoT Monitoring**. Based on the events you reported, create custom widgets to monitor device activity and performance. See the section [Build Custom Dashboard Widgets](#) to learn how to build widgets with the **IoT Widget Builder Wizard**.

## Diagnose Problems

When you do discover deviations from expected behavior, you can then add criteria to filter results. This enables you to narrow the results to certain devices or possible causes.

## Troubleshoot Issues and Improve Monitoring

For performance issues, you can open the device details to analyze errors and slow network requests. The device details allow you to trace the error event you are interested in and even download the stack trace. The developer can then use this information to determine the root cause of the problem and devise a possible solution. Going back to our point-to-sale device example, you might discover that most of the failed payments were due to network request errors.

You can use the usage information to improve your monitoring or the devices themselves. For example, an inventory management application indicates that several stores sell a smaller quantity of a certain product. It turns out that this product is often out of stock at these stores. You could improve the monitoring of your IoT app by using custom events to report when a product is sold out and then creating custom widgets to let you know which stores need to restock.

## IoT Analytics

All IoT data is processed and stored by the Events Service. A separate product component, [AppDynamics Analytics](#), has an event type called Connected Device Data. This event type is based on the same Events Service and uses the same data. Viewing this event type from the Analytics UI offers additional capabilities, including:

- Additional predefined widgets, such as the funnel widget
- ADQL for searching the data
- Creating custom widgets
- Manipulating multiple dashboard types

- Longer retention time for data storage

IoT Analytics does *not* require a license separate from the IoT Monitoring license.

To view Analytics data for connected devices, users need **Connected Devices Permissions** for the application (identified by a specific App Key).

## IoT Licenses and Limits

Currently, AppDynamics only offers the **IoT PRO** license. To learn about the license entitlements and restrictions, contact your AppDynamics account representative.

## Set Up and Access IoT Monitoring

This describes when you should use an IoT SDK or the IoT REST API, get an EUM App Key, and direct you to instructions for capturing and reporting data.

### SDKs Versus REST API

The IoT SDKs use the REST API to transmit data to the EUM Server. By handling HTTP requests, serializing JSON, and managing events in memory, the SDKs make it easier to capture and report data, so you can focus on instrumenting your application. For platforms other than C++ or Java, you can take advantage of the wide variety of HTTP(S) and JSON libraries to use the IoT REST API to report data.

### Get an EUM App Key

To get an EUM App Key, you need to either create an IoT app manually or use the **Getting Started Wizard**, which is recommended if you are a new user. You will need the EUM App Key to use the IoT REST API or IoT SDKs to report device information and events to the EUM Server. Multiple IoT applications can share the same key.

### Create an IoT Application with the Getting Started Wizard

From the Controller:

[New Applications](#)    Using Existing Applications

1. Click **User Experience** from the top navigation bar.
2. Select the Connected Devices tab.
3. Click **Get Started**.
4. From the **Create Application** dialog, select **Create an Application using the Getting Started Wizard**.
5. Click **OK**.
6. For step one of the **Getting Started Wizard - Connected Devices** page, select **Create a new Application**.
7. Enter a name for your IoT app.
8. Click **Continue**.
9. From step two, select which method you want to use to report IoT data (Java SDK, C/C++ SDK, REST API).
10. Copy the values for the **App Key** and the **Collector URL**. You'll be using both to report IoT data.

New Applications [Using Existing Applications](#)

1. Click **User Experience** from the top navigation bar.
2. Select the Connected Devices tab.
3. Click **Get Started**.
4. From the **Create Application** dialog, select **Create an Application using the Getting Started Wizard**.
5. Click **OK**.
6. For step one of the **Getting Started Wizard - Connected Devices** page, select **Use an existing Application**.
7. Choose one of the existing applications from the dropdown.
8. From step two, select which method you want to use to report IoT data (Java SDK, C/C++ SDK, REST API).
9. Copy the values for the **App Key** and the **Collector URL**. You'll be using both to report IoT data.

 IoT applications created from existing applications cannot be deleted. You would need to delete the existing IoT application that was used to create the application.

## Manually Create an IoT Application

From your Controller:

1. Click **User Experience** from the top navigation bar.
2. Select the Connected Devices tab.
3. Click **Get Started**.
4. From the **Create Application** dialog, select **Create an Application manually**.
5. Enter a name for your IoT app.
6. Click **OK**.
7. From the **Connected Devices** tab, select IoT app and click  to copy the App Key to your clipboard.

## Report IoT Data

Based on the method you plan on reporting data, use your App Key and follow the instructions for one of these tutorials:

- [Instrument Applications with the IoT C/C++ SDK](#)
- [Instrument Applications with the IoT Java SDK](#)
- [Instrument Applications with the IoT REST APIs](#)

## Correlate Business Transactions for IoT Monitoring

**Related pages:**

- [Correlate Business Transactions for EUM](#)
- [Business Transactions](#)

You can correlate IoT network request events with business transactions. The correlation is made between beacons containing network request event information and instances of business transactions (transaction snapshots).

## IoT Network Requests Correlation

This procedure outlines how IoT applications correlate network requests with business transactions:

1. The IoT application attaches AppDynamics HTTP headers to a network request to the app server agent. These AppDynamics HTTP headers instruct the app server agent to send back correlation headers.
2. The app server agent:
  - Sends HTTP response headers identifying the business transaction to the IoT application.
  - Aggregates backend metrics and sends them along with the business transaction identifiers to the Controller. This serves as the content for the transaction snapshot.
3. The IoT Agent sends business transaction identifiers (from the HTTP response headers) as part of IoT network request event to the EUM Server. This serves as the content for the network request.
4. The Controller fetches the events and business transaction identifiers from the EUM Server. These business transaction identifiers are used to correlate the network request with the transaction snapshots.

## Correlate IoT Network Request Events with Business Transactions

Use the IoT SDKs or the IoT REST API to send the returned response headers from the business application with beacons to report IoT network request events and correlate those events with the business transaction.

For correlation instructions, see "Correlate Business Transactions with Network Requests" for either the [IoT C/C++ SDK](#), [IoT Java SDK](#), or the [IoT REST API](#).

## View Business Transactions Correlated with IoT Applications

There are several ways to navigate from a network request snapshot to its correlated business transaction. The following steps show you one possible way.

1. From the **IoT Device Dashboard**, double-click one of the device records in the **Unique Devices** widget:

The screenshot shows the 'Device Dashboard' interface. At the top right, there is a refresh icon and a dropdown menu set to 'last 30 minutes'. Below this is a search bar with 'Filters' and 'Edit' options. The main content area is titled 'Unique Devices' and shows a table with 4 total records. The table has the following data:

deviceguid	Device Name	Timestamp	softwareversion
6423	HondaCivic	10/18/18 7:04:02 PM	1.0
3423	MazdaMX-5	10/18/18 7:02:39 PM	1.0
2111	Toyota86	10/18/18 7:01:11 PM	1.0
1111	AudiS3	10/18/18 6:54:53 PM	1.0

At the bottom of the table, there is a pagination control showing '50 per page', 'First', '1 of 1', and 'Last'.

- You should now see a list of network requests in the Activity Stream tab. You can click a link in the activity stream to view the transaction flow map for a business transaction.

The screenshot displays the 'Activity Stream' tab for a device named 'HondaCivic' from 10/18/18 6:36:35 PM to 10/18/18 7:06:35 PM. The 'Activity Stream' is sorted by 'Start Time'. A list of events is shown, including 'Custom Event', 'Network Request', and 'Error'. A specific network request event is highlighted, and a detailed view is shown for it. The detailed view includes a 'General' tab and a 'Download Snapshot' button. The details for the network request are as follows:

Field	Value
Warning Light - Oil Change Reminder	<a href="#">View Snapshot</a>
Duration	0 ms
Timestamp	10/18/18 7:04:05.000 PM
Symbolicated	-
File	-
Function	-

- Click the Business Transactions tab to view a list of correlated business transactions.

The screenshot displays the 'Business Transactions' tab for a device named 'HondaCivic' from 10/18/18 5:12:32 PM to 10/18/18 7:12:32 PM. The 'Business Transactions' are listed in a table with the following data:

Name	Time (ms)
<a href="#">/sync</a>	
<a href="#">/secondDispatch</a>	
<a href="#">/async</a>	71

- You can then click a business transaction to view the **Transaction Flow Map** shown below, which provides a visual representation of the components and activities of the business application during the correlated business transaction.

## Instrument Applications with the IoT C/C++ SDK

The IoT C++ SDK provides APIs to instrument C++ applications running on connected devices such as industrial or home gateways, points of sale, smart TVs or car infotainment systems. This getting started will show you how to install the C++ SDK and instrument your IoT application.

Follow these steps to get your EUM App Key and instrument your IoT C/C++ apps.

**i** If you have ANSI-C application or if your platform is not Linux x86, please contact your AppDynamics account representative.

### Learn about the C/C++ SDK

You should know that the C++ SDK:

- Operates within the application thread and doesn't spawn any new threads.
- Keeps all the event data in memory and doesn't persist on disk.
- Provides an API to register for the network interface.
- Uses application's HTTPS stack to communicate with the EUM Server.
- Provides an API to fetch SDK log messages. Application developers have to manage logs by writing the log messages to `stderr` or to a log file.
- Uses the open-source [json-c](#) library that is statically linked.
- Makes synchronous blocking API calls that are not thread-safe. Application developers are responsible for making thread-safe calls.

### Review the Requirements

Before you begin, make sure you meet these requirements:

- GNU C++ Compiler (g++) version 4.2 for 32/64-bit architectures
- Any Linux distribution based on glibc  $\geq 2.20$
- HTTPS stack for sending beacons to the EUM Cloud
- EUM App Key

### Get the IoT C++ SDK

You can get the C++ SDK by cloning or downloading the [IoT C++ SDK from GitHub](#). Follow the instructions given in [Installation](#) to build the IoT C++ SDK.

### Upgrade the IoT C++ SDK

From the root directory of your clone of the [IoT C++ SDK from GitHub](#):

- Update the repository: `$ git pull origin master`
- Follow the instructions given in [Installation](#) to rebuild the IoT C++ SDK.

### Install the C++ SDK in Your Application

The C++ SDK is packaged as a tar zip file and contains the following:

- `include` - directory containing headers for the public API for use with the C++ SDK
- `lib` - the directory containing the shared object files for the C++ SDK

### Add the SDK Headers

Copy or move the `include` directory, which contains the SDK header files into your application directory, and include it in your code to access the SDK APIs.

```
#include "appd_iot_interface.h"
....
{
```

## Initialize the SDK

You must initialize the C++ SDK by providing the SDK and device configuration as input parameters and then calling the function `appd_iot_init_sdk` as shown below. The SDK configuration takes in parameters for the app key, log level, and the EUM Collector URL. The SDK uses the EUM Collector URL to send data to the EUM Server. The device configuration contains information to identify a unique device.

**i** See [SaaS Domains and IP Ranges](#) for EUM Collector URLs in each geographic region. If the EUM Collector URL is not specified, the default SaaS Collector URL is used.

```
#include "appd_iot_interface.h"
....
{
 // Declare config variables for the SDK and device.
 appd_iot_sdk_config_t sdkcfg;
 appd_iot_device_config_t devcfg;
 appd_iot_init_to_zero(&sdkcfg, sizeof(sdkcfg));
 appd_iot_init_to_zero(&devcfg, sizeof(devcfg));

 // Set the initialization configurations for the SDK
 sdkcfg.appkey = "<EUM_APP_KEY>";

 // Set the device configurations
 devcfg.device_id = "1111";
 devcfg.device_type = "SmartCar";
 devcfg.device_name = "AudiS3";

 // Initialize the instrumentation
 appd_iot_init_sdk(sdkcfg, devcfg);
}
```

## Register Network Interface

The SDK needs an HTTPS interface to send events to the EUM Server. The application developer has to provide callback functions for the SDK to execute the HTTPS request. Refer to [Run the Sample Application](#) for a sample network interface implementation using `libcurl`.

```
#include "appd_iot_interface.h"
....
{
 appd_iot_http_cb_t http_cb;
```

```

//Callback function triggered by SDK to send http request and receive http response
http_cb.http_req_send_cb = &your_network_interface_send_cb;

//Callback function triggered by SDK to indicate completion of http response processing
http_cb.http_resp_done_cb = &your_network_interface_resp_done_cb;

//register http interface callbacks
appd_iot_register_network_interface(http_cb);

...
}

```

## Add and Send Events

To understand the different types of events, you will work with the sample smart car IoT application given in the sections below.

### Custom Events

Custom event to capture technical stats of a "SmartCar".

```

#include "appd_iot_interface.h"
....

{
 appd_iot_custom_event_t custom_event;
 appd_iot_init_to_zero(&custom_event, sizeof(custom_event));

 custom_event.type = "SmartCar Stats";
 custom_event.summary = "Technical Stats of SmartCar";
 custom_event.timestamp_ms = ((int64_t)time(NULL) * 1000);
 custom_event.data = (appd_iot_data_t*)calloc(2, sizeof(appd_iot_data_t));
 appd_iot_data_set_integer(&custom_event.data[0], "Speed mph", 65);
 appd_iot_data_set_double(&custom_event.data[1], "Oil Temperature", 220);

 appd_iot_add_custom_event(custom_event);
 free(custom_event.data);

 appd_iot_send_all_events();
}

```

### Network Request Events

Network Request event to capture the performance of an HTTPS call to get weather information.

```

#include "appd_iot_interface.h"
....

```

```

{
 appd_iot_network_request_event_t network_event;
 appd_iot_init_to_zero(&network_event, sizeof(network_event));

 network_event.url = "https://apdy.api/weather";
 network_event.resp_code = 202;
 network_event.duration_ms = 10;
 network_event.req_content_length = 300;
 network_event.req_content_length = 100;
 network_event.timestamp_ms = ((int64_t)time(NULL) * 1000);
 network_event.data = (appd_iot_data_t*)calloc(1, sizeof(appd_iot_data_t));
 appd_iot_data_set_string(&network_event.data[0], "city", "San Francisco");

 appd_iot_add_network_request_event(network_event);
 free(network_event.data);

 appd_iot_send_all_events();
}

```

## Error Events

The Error event below is used to capture Bluetooth errors in the SmartCar app.

```

#include "appd_iot_interface.h"
....
{
 appd_iot_error_event_t error_event;
 appd_iot_init_to_zero(&error_event, sizeof(error_event));

 error_event.name = "Bluetooth Connection Error";
 error_event.message = "connection dropped due to bluetooth exception";
 error_event.severity = APPD_IOT_ERR_SEVERITY_CRITICAL;
 error_event.timestamp_ms = ((int64_t)time(NULL) * 1000);
 error_event.data = (appd_iot_data_t*)calloc(1, sizeof(appd_iot_data_t));
 appd_iot_data_set_integer(&error_event.data[0], "Bluetooth Error Code", 43);

 appd_iot_add_error_event(error_event);
 free(error_event.data);

 appd_iot_send_all_events();
}

```

## Correlate Business Transactions with Network Requests (Optional)

To correlate business transactions (BTs) with network requests, you need to instrument a business application and enabled business transactions in the Controller UI. See [Correlate Business Transactions for IoT Monitoring](#) to learn more.

The steps below show you how to get the BT response headers and use them to correlate the BT with an IoT Network Request event.

1. Set the AppDynamics HTTP headers `ADRUM` and `ADRUM_1` as part of a network request to your business application.

```

/* Initialize all the data structures for the request and response. */
appd_iot_http_req_t http_req;
appd_iot_http_req_t http_resp;

/* Initialize the request and response. */
appd_iot_init_to_zero(&http_req, sizeof(http_req));
appd_iot_init_to_zero(&http_resp, sizeof(http_resp));

/* Provide the URL to your instrumented business app that is enabled for business
transaction correlation. */
http_req.url = "<url-to-your-business-app-enabled-for-bt>";

/* Add your other HTTP request parameters here:
...
*/
/* Call the SDK method to get the headers for ADRUM and ADRUM_1. */
const appd_iot_data_t* correlation_headers = appd_iot_get_server_correlation_headers();

for (size_t i = 0; i < APPD_IOT_NUM_SERVER_CORRELATION_HEADERS; i++)
{
 appd_iot_data_set_string(&http_req.headers[i], correlation_headers[i].key,
 correlation_headers[i].strval);
}

/* Make the request, and assign the response to a variable. */
http_resp = http_curl_req_send_cb(&http_req);

```

2. The call will return response headers (i.e., `ADRUM_*`) that contain information for correlating the business transaction. If you were to print these BT response headers, you would see something like the following:

```

ADRUM_0: clientRequestGUID:0f5c7602-9b69-4e40-85a6-e0abf288accf
ADRUM_1: globalAccountName:eum-mobile_4debdbad-3f8e-4f6d-8faf-e5f5781ec0d7
ADRUM_2: btId:3867
ADRUM_3: serverSnapshotType:f
ADRUM_4: btDuration:829

```

3. Add these BT response headers to the network event that you send to the EUM Server:

```

/* Create a network event to report to the EUM Server. */
appd_iot_network_request_event_t network_event;
appd_iot_init_to_zero(&network_event, sizeof(appd_iot_network_request_event_t));

/* Add information about the network event that you want to report. */
network_event.url = "<url-to-your-business-app-enabled-for-bts>";
network_event.resp_code = http_resp->resp_code;

/* Assign the returned BT response headers from the call to the business app to the
headers of the request. */
network_event.resp_headers = http_resp->headers;

// Add the network event to beacon to send to the EUM Server. */
appd_iot_add_network_request_event(network_event);
appd_iot_send_all_events();

```

4. In the Controller UI, you should be able to [view the correlated business transaction](#) in the **Device Details** dialog.

### Compile and Run Your App with the SDK Library File

1. Compile your program. For example, if the driver file is `main.cpp`:

```
$ g++ -c main.cpp -I<appd_iot_sdk_dir>/include
```

2. Create the binary with the object code of your application and linking AppDynamics IoT C++ SDK library.

[Linux](#) [Mac](#)

```
$ g++ main.o <appd_iot_sdk_dir>/lib/libappdynamics_iot.so -o main
```

[Linux](#) [Mac](#)

```
$ g++ main.o <appd_iot_sdk_dir>/lib/libappdynamics_iot.dylib -o main
```

You can combine steps 1 and 2 into one step as below:

```
$ g++ main.cpp -o main -I<appd_iot_cpp_sdk_dir>/include -L<appd_iot_cpp_sdk_dir>/lib
-lappdynamics_iot
```

3. Set the environment variable `DYLD_LIBRARY_PATH` to the `PATH` where the SDK library is installed. This will let dynamic linker know the directory to search for shared libraries.

[Linux](#) [Mac](#)

```
$ export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:<appd_iot_cpp_sdk_dir>/lib
```

[Linux](#) [Mac](#)

```
$ export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:<appd_iot_cpp_sdk_dir>/lib
```

4. Run your program. For example:

```
$./main
```

### Verify the Instrumentation in the Controller UI

See [Confirm the IoT Application Reported Data to the Controller](#) to verify the instrumentation.

### Customize the IoT C++ Instrumentation (Optional)

You can further customize the IoT C++ instrumentation using the IoT C++ SDK. See the [latest IoT C++ SDK documentation](#) or the previous versions listed below:

- <https://sdkdocs.appdynamics.com/javadocs/iot-cpp-sdk/4.5/4.5.0/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-cpp-sdk/4.5/4.5.1/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-cpp-sdk/4.5/4.5.2/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-cpp-sdk/4.5/4.5.4/>

### Run the Sample C++ Application

The sample C++ application sends sample data for Custom, Network Request, and Error events. The data mocks a smart car application, capturing usage information, network performance, and errors.

To run the sample app, follow the instructions given in [Sample Application using IoT C++ SDK](#).

### Instrument Applications with the IoT Java SDK

The IoT Java SDK can be included in IoT Java applications running on an edge device like gateways, points of sale, car infotainment centers. This getting started will show you how to install the Java SDK and instrument your IoT application.

Follow these steps to get your EUM App Key and instrument your IoT C/C++ apps.

- [Review the Requirements](#)
- [Get the IoT Java SDK](#)
- [Add the SDK Dependencies to the Gradle Configuration](#)
- [Add the Instrumentation Code](#)
- [Add and Send Events](#)
- [Verify the Instrumentation in the Controller UI](#)
- [Correlate Business Transactions with Network Requests \(Optional\)](#)
- [Enable Logging for the SDK \(Optional\)](#)

Customize the IoT Java Instrumentation (Optional)  
Troubleshooting the IoT Java SDK

**i** This Java SDK differs from the AppDynamics Java Agent in that it is a very lightweight library specially designed for lower-end devices. A lot of flexibility is also built into the way event information can be extended and the instrumentation code configured as well as controlled.

## Review the Requirements

Before you begin, make sure you meet these requirements:

- A device running one of the following version of Java Runtime:
  - Java SE 7
  - Java SE Embedded 7
  - Java SE 8
  - Java SE Embedded 8
- HTTPS interface to send beacons to the EUM Server
- [EUM App Key](#)

## Get the IoT Java SDK

You can get the Java SDK by cloning or downloading the [IoT Java SDK from GitHub](#). Follow the instructions given in [Build the SDK](#) to build the IoT Java SDK.

If you're using the [IntelliJ IDE](#), add the file `lib/appd-iot-sdk.jar` to your project by following the instructions given in [Working with module dependencies](#). Confirm that the JAR file shows up under **External Projects** in your IntelliJ project.

## Upgrade the IoT Java SDK

From the root directory of your clone of the [IoT Java SDK from GitHub](#):

- Update the repository: `$ git pull origin master`
- Follow the instructions given in [Build the SDK](#) to rebuild the IoT Java SDK.

## Add the SDK Dependencies to the Gradle Configuration

Add the following to your `build.gradle` file:

```
dependencies {
 runtime group: 'org.slf4j', name: 'slf4j-api', version: '1.7.25'
 runtime group: 'com.google.guava', name: 'guava', version: '18.0'
 runtime group: 'com.google.code.gson', name: 'gson', version: '2.8.0'
}
```

## Add the Instrumentation Code

### Import the IoT SDK

In your application file, add the `import` statement that includes the Java IoT SDK:

```
import com.appdynamics.iot.Instrumentation;
```

## Configure the IoT Java Agent

Configure the instrumentation by providing the [EUM App Key](#) and the URL to the EUM Collector. If the EUM Collector URL is not specified, the default SaaS Collector URL is used.

**i** See [SaaS Domains and IP Ranges](#) for EUM Collector URLs in each geographic region. If the EUM Collector URL is not specified, the default SaaS Collector URL is used.

```
import com.appdynamics.iot.AgentConfiguration;
AgentConfiguration.Builder agentConfigBuilder = AgentConfiguration.builder();
AgentConfiguration agentConfig = agentConfigBuilder
 .withAppKey(<EUM_APP_KEY>)
 .build();
```

## Set Device Info

You are required to set the name and ID for devices. The name should consist of a short string that identifies the type and model of the device, such as "EV Model 3" or "Thermostat Model Star7". The device ID must be a unique identifier for the device, such as a UUID, the VIN number of a car, or the MAC address of the device.

The example code below sets the device ID to a random UUID and the name to "Smart Shelf".

```
import java.util.UUID;
import com.appdynamics.iot.DeviceInfo;
...
DeviceInfo.Builder deviceInfoBuilder = DeviceInfo.builder("Smart Shelf P1",
 UUID.randomUUID().toString());
DeviceInfo deviceInfo = deviceInfoBuilder.withDeviceName("Smart Shelf").build();
```

## Set Version Info

You can set the versions for the firmware, hardware, OS, and software as shown below.

```
import com.appdynamics.iot.VersionInfo;
...
VersionInfo.Builder versionInfoBuilder = VersionInfo.builder();
VersionInfo versionInfo = versionInfoBuilder
 .withFirmwareVersion("2.3.4")
 .withHardwareVersion("1.6.7")
 .withOsVersion("8.9.9")
 .withSoftwareVersion("3.1.1").build();
```

---

## Initialize the Agent

To initialize the agent, pass the `AgentConfiguration` object, the `DeviceInfo` object, and the `VersionInfo` object to the `start` method:

```
Instrumentation.start(agentConfig, deviceInfo, versionInfo);
```

## Build and Run the Application

Use your favorite Java IDE or CLI environment to build and run the application. Note that the AppDynamics IoT Java SDK needs to be in build and runtime classpath.

For instructions on adding libraries to the classpath:

- IntelliJ IDE: [Creating a library](#)
- Eclipse: [Classpath Variables](#)
- Linux/Mac/Windows: [PATH and CLASSPATH](#)

For instructions to build and run the app:

- IntelliJ: [Building and Running the Application](#)
- Eclipse: [Running your programs](#)
- Gradle: [Building Java Projects with Gradle](#)

## Add and Send Events

The following sections will show you how to create and send the supported events: Custom, Network Request, and Error.

### Create a Basic Custom Event

A custom event can be used to report any performance, device, or business logic data. It is the most general, configurable and flexible data type available.

The Custom Event Builder takes two required parameters.

- Event Type: A short human-readable description of the event, such as "FL Pressure Drop".
- Description: A string describing the event, such as "Front Left Tire Pressure Drop".

To make reporting this event meaningful, it is recommended that you provide a timestamp and at least one kind of datatype.

1. Create a basic custom event.

```
import com.appdynamics.iot.events.CustomEvent;
...
CustomEvent.Builder builder = CustomEvent.builder("FL Pressure Drop", "Front Left Tire
Pressure Drop");
long eventStartTime = System.currentTimeMillis();
long duration = 6000;
builder.withTimestamp(eventStartTime).withDuration(duration);
builder.addLongProperty("PSI Drop", 37);
CustomEvent customEvent = builder.build();
```

Additional information can be added to the `CustomEvent`. For details, see the `CustomEvent` class in the [latest Java IoT SDK documentation](#).

2. Add the custom event to the instrumentation (this adds it to the in-memory buffer).

```
Instrumentation.addEvent(customEvent);
```

3. Send all the events to the EUM Server. This is a blocking call, so the application can send it on a separate thread as shown above.

```
Instrumentation.sendAllEvents();
```

## Send a Network Event

1. Report a Network Request Event using the `HttpRequestTracker` class. This call automatically adds an event to the in-memory buffer, so you need to explicitly import the class.

```
import com.appdynamics.iot.HttpRequestTracker;
...
String url = "http://ip.jsontest.com/?callback=showMyIP";
// Add a Network Event
try {
 URL thisUrl = new URL(url);
 // [AppDynamics Instrumentation] Get a Tracker
 HttpURLConnection con = (HttpURLConnection) thisUrl.openConnection();
 final HttpRequestTracker tracker = Instrumentation.beginHttpRequest(thisUrl);
 con.setRequestMethod("POST");
 con.setRequestProperty("Accept-Language", "en-US,en;q=0.5");
 int responseCode = con.getResponseCode();
 con.setDoInput(true);
 con.setDoOutput(true);
 DataOutputStream wr = new DataOutputStream(con.getOutputStream());
 wr.flush();
 wr.close();
 System.out.println("Response Code :" + responseCode);
 // [AppDynamics Instrumentation] Retrieve the headers from the response
 Map<String, List<String>> headerFields = null;
 System.out.println("Sending 'POST' request to URL :" + url);
 BufferedReader in;
 String inputLine;
 new InputStreamReader(con.getErrorStream());
 if (responseCode >= 200 && responseCode < 300) {
 in = new BufferedReader(new InputStreamReader(con.getInputStream()));
 } else {
 in = new BufferedReader(
 }
 StringBuffer response = new StringBuffer();
 if (headerFields != null && headerFields.size() > 0){
 while ((inputLine = in.readLine()) != null) {
```

```

 response.append(inputLine);
 }
 in.close();
 // [AppDynamics Instrumentation] Initiate adding NetworkRequestEvent
 if (responseCode >= 200 && responseCode < 300) {

tracker.withResponseCode(responseCode).withError(response.toString()).reportDone();
 .withResponseHeaderFields(headerFields)
 .reportDone();
 } else {
 tracker.withResponseCode(responseCode).reportDone();
 }
} else {
 tracker.withResponseCode(responseCode)
}
// End: Add for AppDynamics Instrumentation - Initiate adding NetworkRequestEvent
} catch (MalformedURLException e) {
 e.printStackTrace();
} catch (Exception ex) {
 ex.printStackTrace();
}
}

```

2. Send all the events to the EUM Server. This is a blocking call. The application can send it on a separate thread. The recommendation is to batch a number of events together before calling the `sendAllEvents` method.

```
Instrumentation.sendAllEvents();
```

## Send an Error Event

1. Report an Error Event using the API.

```

try {
 //Force creating an exception
 float f = (5 / 0);
} catch (Throwable t) {
 Instrumentation.addErrorEvent(t, Instrumentation.Severity.ALERT);
}

```

2. Send all the events to the EUM Server. This is a blocking call. The application can send it on a separate thread.

```
Instrumentation.sendAllEvents();
```

## Verify the Instrumentation in the Controller UI

See [Confirm the IoT Application Reported Data to the Controller](#) to verify the instrumentation.

## Correlate Business Transactions with Network Requests (Optional)

To correlate business transactions (BTs) with network requests, you need to have instrumented a business application and enabled business transactions in the Controller UI. See [Correlate Business Transactions for IoT Monitoring](#) to learn more.

The steps below show you how to get the BT response headers and use them to correlate the BT with an IoT Network Request event.

1. Make a network request that includes the AppDynamics HTTP request headers `ADRUM` and `ADRUM_1` to one of your business applications:

```
import com.appdynamics.iot.HttpRequestTracker;
...
// Create a network request to the business app.
String url = "<url_to_business_application>";
URL thisUrl = new URL(url);
[AppDynamics Instrumentation] Get a Tracker
URLConnection con = (URLConnection) thisUrl.openConnection();
final HttpRequestTracker tracker = Instrumentation.beginHttpRequest(thisUrl);
con.setRequestMethod("POST"); // Some HTTP method: GET, POST, PUT...

// Add the AppDynamics HTTP headers ADRUM and ADRUM_1 to the request.
con.setRequestProperty("ADRUM", "isAjax:true");
con.setRequestProperty("ADRUM_1", "isMobile:true");

// Make the request to your business app.
con.setDoInput(true);
```

2. The call will return response headers that contain information for correlating business transactions. If you were to print these BT response headers, you would see something like the following:

```
{
 ADRUM_1=[globalAccountName:customer1_78203698-278e-428f-8726-bb381219c6cb],
 null=[HTTP/1.1 200 OK],
 ADRUM_0=[clientRequestGUID:2ff45113-6746-4c94-b6d0-4af26055613c],
 ADRUM_3=[btERT:269],
 ADRUM_2=[btId:4423],
 Server=[Jetty(9.4.z-SNAPSHOT)],
 ADRUM_5=[btDuration:327],
 ADRUM_4=[serverSnapshotType:f],
 Content-Length=[514],
}
```

3. Send a beacon containing the BT response headers to the EUM Server:

```
// Fetch the response headers, which will include the BT headers (ADRUM_0, ADRUM_1, ...).
Map<String, List<String>> headerFields = con.getHeaderFields();
```

```
// Add the BT response headers to the request body of the Network Request event.
// that you're reporting.
tracker.withResponseCode(responseCode).withError(response.toString()).reportDone();
 .withResponseHeaderFields(headerFields)
 .reportDone();

// Report the Network Request event to the EUM Server.
Instrumentation.sendAllEvents();
```

4. In the Controller UI, you should be able to [view the correlated business transaction](#) in the **Device Details** dialog.

### Enable Logging for the SDK (Optional)

The IoT Java SDK uses the [Simple Logging Facade for Java \(SLF4J\)](#) as the logging framework. You can use your favorite logging engine that is compatible with SLF4J.

If no binding is found on the classpath, then SLF4J will default to a no-operation implementation and display console messages like the following:

```
SLF4J: Failed to load class "org.slf4j.impl.StaticLoggerBinder".
SLF4J: Defaulting to no-operation (NOP) logger implementation //
SLF4J: See http://www.slf4j.org/codes.html#StaticLoggerBinder
for further details.
```

To use the `java.util.logging` engine, add the following line to the `build.gradle` file:

```
dependencies {

 runtime group: 'org.slf4j', name: 'slf4j-jdk14', version: '1.7.25'

}
```

To see all the debug messages from the library, append the following line to the bottom of the file `/Library/Java/JavaVirtualMachines/<your-jdk-version>/Contents/Home/jre/lib/logging.properties`:

```
com.appdynamics.iot.level = FINEST
```

### Customize the IoT Java Instrumentation (Optional)

You can further customize the IoT Java instrumentation using the IoT Java SDK. See the [latest IoT Java SDK documentation](#) or the previous versions listed below:

- <https://sdkdocs.appdynamics.com/javadocs/iot-java-sdk/4.5/4.5.0/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-java-sdk/4.5/4.5.1/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-java-sdk/4.5/4.5.2/>

- <https://sdkdocs.appdynamics.com/javadocs/iot-java-sdk/4.5/4.5.4/>

## Run the Sample Java Application

The sample Java application sends sample data for Custom, Network Request, and Error events. The data mocks a smart car application, capturing usage information, network performance, and errors.

To run the sample app, follow the [Getting Started instruction](#) given in the [iot-java-sdk](#) GitHub repository.

## Troubleshooting the IoT Java SDK

This section provides instructions for debugging common issues.

### Unable to Link the IoT Java Agent

If you are getting the following error when trying to link the IoT Java Agent, it's because of a dependency on `log4j`.

```
loader constraint violation: when resolving method
"org.slf4j.impl.StaticLoggerBinder.getLoggerFactory()Lorg/slf4j/ILoggerFactory;" the class
loader (instance of com/intellij/ide/plugins/cl/PluginClassLoader) of the current class, org/
slf4j/LoggerFactory, and the class loader (instance of com/intellij/util/lang/UrlClassLoader)
for the method's defining class, org/slf4j/impl/StaticLoggerBinder, have different Class
objects for the type org/slf4j/ILoggerFactory used in the signature
java.lang.LinkageError: loader constraint violation: when resolving method
"org.slf4j.impl.StaticLoggerBinder.getLoggerFactory()Lorg/slf4j/ILoggerFactory;" the class
loader (instance of com/intellij/ide/plugins/cl/PluginClassLoader) of the current class, org/
slf4j/LoggerFactory, and the class loader (instance of com/intellij/util/lang/UrlClassLoader)
for the method's defining class, org/slf4j/impl/StaticLoggerBinder, have different Class
objects for the type org/slf4j/ILoggerFactory used in the signature
 at org.slf4j.LoggerFactory.getLogger(LoggerFactory.java:273)
 at org.slf4j.LoggerFactory.getLogger(LoggerFactory.java:241)
 at org.slf4j.LoggerFactory.getLogger(LoggerFactory.java:254)
 at com.appdynamics.iot.Instrumentation.<clinit>(Instrumentation.java:39)
 ...
```

To correct the problem, you need to remove the dependency that you added to enable logging. Thus, *remove* the line specifying the group `org.slf4j` shown below from `dependencies`:

```
dependencies {

 runtime group: 'org.slf4j', name: 'slf4j-jdk14', version: '1.7.25'

}
```

## Instrument Applications with the IoT REST APIs

The IoT REST APIs enable you to report instrumentation data directly to the EUM Server. You can use any platform or language that has support for HTTPS requests and JSON.

This page describes how to create a JSON request body, form the resource URI, and make an HTTPS request to the IoT REST APIs to report instrumentation data for the three supported events.

---

Follow these steps to get your EUM App Key and use the IoT REST API:

- [Review the Requirements](#)
- [Form the IoT REST URLs](#)
- [Create the JSON Request Body](#)
- [Transmit the Beacon Data](#)
- [Verify the Instrumentation in the Controller UI](#)
- [Correlate Business Transactions with Network Requests \(Optional\)](#)
- [Customize the IoT REST API Instrumentation \(Optional\)](#)
- [Troubleshoot the IoT REST API Instrumentation](#)

## Review the Requirements

Before you begin, make sure you meet these requirements:

- [Get an EUM App Key](#)
- Platform/language that supports HTTPS requests
- JSON support

## Form the IoT REST URLs

To form the IoT Monitoring REST resource URL, you will need to know the IoT REST API base URL and port as well as your App Key.

### IoT REST API Base URL

The IoT REST API base URL depends on your Controller location.

 See [SaaS Domains and IP Ranges](#) for EUM Collector URLs in each geographic region. If the EUM Collector URL is not specified, the default SaaS Collector URL is used.

For example, the IoT base URL for the Americas region would be:

```
https://iot-col.eum-appdynamics.com/eumcollector/iot/v1
```

After creating your IoT Application, use your App Key to test your IoT endpoint and look for a HTTP 200 response. For example, for the Americas region, run the following command:

```
curl -I https://iot-col.eum-appdynamics.com/eumcollector/iot/v1/application/<APPKEY>/enabled
```

## IoT Endpoints

With your App Key, you can form the IoT resource endpoints. See the [Summary of the IoT endpoints](#) for the list of supported resource endpoints and their descriptions.

## Create the JSON Request Body

You report device information and events in a JSON request body. The JSON includes an array of beacon objects, with each beacon object containing device data and events. The array enables you to

transmit data from multiple devices in one request to the EUM Server. You can transmit up to 200 beacons per request.

Save the JSON below to a file (e.g., `testBeacon.json`) and replace the values for the timestamp properties with integers representing the [UNIX Epoch time](#) in milliseconds. The JSON contains the three supported events `customEvents`, `networkRequestEvents`, and `errorEvents` for a smart thermostat. In the next two steps, you will validate and send the JSON as a beacon to the IoT REST API.

**i** Make sure you save timestamps in milliseconds, and not seconds.

```
[
 {
 "deviceInfo": {
 "deviceType": "Thermostat",
 "deviceId": "4e75d70d-a3f9-474b-bacf-0f4a57fa944c"
 },
 "versionInfo": {
 "hardwareVersion": "Board Rev. 13A",
 "firmwareVersion": "123.5.31",
 "softwareVersion": "9.1.3",
 "operatingSystemVersion": "Linux 13.4"
 },
 "customEvents": [
 {
 "timestamp": <UNIX_Epoch_time_in_milliseconds>,
 "eventType": "Temperature Reading",
 "eventSummary": "Temperature: 25° c",
 "doubleProperties": {
 "celsius": 25.0
 }
 }
],
 "networkRequestEvents": [
 {
 "timestamp": <UNIX_Epoch_time_in_milliseconds>,
 "duration": 245,
 "url": "https://api.company.com/v1/temperature",
 "statusCode": 200,
 "requestContentLength": 32,
 "responseContentLength": 0,
 "doubleProperties": {
 "reportedTemperature": 25.0
 }
 }
],
 "errorEvents": [
 {
 "timestamp": <UNIX_Epoch_time_in_milliseconds>,
 "name": "SQLException",
 "message": "open() failed because db is locked"
 }
]
 }
]
```

```
}
]
}
]
```

### Transmit the Beacon Data

To send the beacon, you post the JSON request body to the `/beacons` endpoint. Again, in this cURL example, use the JSON you saved to the file `testBeacon.json` and replace `<appKey>` with your EUM App Key:

```
curl -v -X POST -d '@testBeacon.json' https://iot-col.eum-appdynamics.com/eumcollector/iot/v1/application/<appKey>/beacons
```

If the beacons were transmitted successfully, the IoT REST API will return the HTTP Status Code 202:

```
< HTTP/1.1 202 Accepted
```

### Verify the Instrumentation in the Controller UI

See [Confirm the IoT Application Reported Data to the Controller](#) to verify the instrumentation.

### Correlate Business Transactions with Network Requests (Optional)

To correlate business transactions (BTs) with network requests, you need to have instrumented a business application and enabled business transactions in the Controller UI. See [Correlate Business Transactions for IoT Monitoring](#) to learn more.

The steps below show you how to get the BT response headers and use them to correlate the BT with an IoT Network Request event.

1. Make a network request that includes the AppDynamics HTTP request headers `ADRUM` and `ADRUM_1` to one of your business applications:

```
curl -H "ADRUM: isAjax:true" -H "ADRUM_1: isMobile:true" -H "Accept: application/json" -H "Content-Type: application/xml" -H "Content-Length: 0" -X GET http://<url_to_business_app>
```

2. The business application will return response headers that contain information for correlating business transactions. If you were to print these BT response headers, you would see something like the following:

```
ADRUM_0: clientRequestGUID:a27ce4da-d4e6-4bf5-bbca-9b1751aa44a4
ADRUM_1: globalAccountName:customer1_78203698-278e-428f-8726-bb381219c6cb
ADRUM_2: btId:4423
ADRUM_3: btERT:267
ADRUM_4: btDuration:368
Content-Length: 469
```

Server: Jetty(9.4.z-SNAPSHOT)

3. Create a beacon file `btCorrelation.json` with the returned BT response headers (only those headers that include `ADRUM_*`). You assign the returned `ADRUM_*` response headers from the network event request to the business application to the object `responseHeaders` in the beacon as shown below.

```
[
 {
 'deviceInfo':{
 'deviceId':'1111',
 'deviceName':'AudiS3',
 'deviceType':'SmartCar'
 },
 'versionInfo':{
 'hardwareVersion':'1.0',
 'firmwareVersion':'1.0',
 'softwareVersion':'1.0',
 'operatingSystemVersion':'1.0'
 },
 'networkRequestEvents':[
 {
 'url':'<url_to_business_app>',
 'statusCode':200,
 'responseHeaders':{
 'ADRUM_0':[
 '<value_returned_from_business_app>'
],
 'ADRUM_1':[
 '<value_returned_from_business_app>'
],
 'ADRUM_2':[
 '<value_returned_from_business_app>'
],
 'ADRUM_3':[
 '<value_returned_from_business_app>'
]
 },
 'timestamp':1525226857000,
 'duration':0,
 'requestContentLength':0,
 'responseContentLength':457
 }
]
 }
]
```

4. Send the beacon containing the BT headers to the EUM Server with a cURL command similar to the one here:

```
curl -I -H "Content-Type: application/json" -H "Accept: application/json" -X POST -d
@btCorrelation.json -H https://iot-col.eum-appdynamics.com/eumcollector/iot/v1/
application/<appKey>/beacons
```

5. For a successful call, the response headers should be similar to the following:

```
HTTP/1.1 202 Accepted
Cache-Control: private, no-cache, no-store, must-revalidate, max-age=0, proxy-revalidate,
s-maxage=0
Expires: 0
Pragma: no-cache
Vary: *
Transfer-Encoding: chunked
Via: 1.1 sjc12-dmz-wsa-5.cisco.com:80 (Cisco-WSA/X)
Connection: keep-alive
```

6. In the Controller UI, you should be able to [view the correlated business transaction](#) in the **Device Details** dialog.

### Customize the IoT REST API Instrumentation (Optional)

You can further customize the IoT instrumentation using the IoT REST API. See the [latest IoT REST API documentation](#) or the previous versions listed below:

- <https://sdkdocs.appdynamics.com/javadocs/iot-rest-api/4.5/4.5.0/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-rest-api/4.5/4.5.1/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-rest-api/4.5/4.5.2/>
- <https://sdkdocs.appdynamics.com/javadocs/iot-rest-api/4.5/4.5.4/>

### Run the Sample Python Application

The sample Python application uses the IoT REST API to send sample data for Custom, Network Request, and Error events. The Network Request events include [correlated business transactions](#). The data mocks a smart car application, capturing usage information, network performance, and errors.

To run the sample app, follow the instructions given in the GitHub repository [iot-rest-api-sample-apps](#).

### Troubleshoot the IoT REST API Instrumentation

The sections below provide instructions for troubleshooting your IoT REST API Instrumentation.

### Verify Your IoT App Has Been Enabled

Using your App Key, verify that your IoT app has been enabled:

```
curl -v -X GET https://iot-col.eum-appdynamics.com/eumcollector/iot/v1/application/<appKey>/
enabled
```

If your App Key has been enabled, you should get the following response:

```
< HTTP/1.1 200 OK
< Cache-Control: private, no-cache, no-store, must-revalidate,
max-age=0, proxy-revalidate, s-maxage=0
< Date: Sat, 19 Aug 2017 01:20:39 GMT
< Expires: 0
< Pragma: no-cache
< Vary: *
< Content-Length: 0
< Connection: keep-alive
```

If the App Key does not exist:

```
< HTTP/1.1 403 Forbidden
```

### Validate Beacons

You can use the validate beacon endpoint ( `/validate-beacons` ) to verify that the beacon's JSON request body complies with the [REST API schema](#).

 You are not required or recommended to validate beacons before transmitting them. You should only use this endpoint in development for testing and troubleshooting.

In this cURL example, you are verifying that the JSON given in the file `testBeacon.json` is valid. Replace `<appKey>` with your EUM App Key.

```
curl -v -X POST -d '@testBeacon.json' https://iot-col.eum-appdynamics.com/eumcollector/iot/v1/application/<appKey>/validate-beacons
```

If the JSON request body containing the beacon data is valid, the IoT Monitoring REST API will return the HTTP Status 200:

```
HTTP/1.1 200 OK
```

If the JSON request body is invalid, the IoT REST API will return the HTTP Status 422 and a response body with the description of the error message.

```
< HTTP/1.1 422 Unprocessable Entity
```

## Verify Timestamps

When you create the JSON body and replace the values for the timestamp properties, make sure the timestamps are in milliseconds, not seconds.

## Confirm the IoT Application Reported Data to the Controller

### Related pages:

- [Instrument Applications with the IoT C/C++ SDK](#)
- [Instrument Applications with the IoT Java SDK](#)
- [Instrument Applications with the IoT REST APIs](#)

From the **Getting Started Wizard**, you will see your device listed in the table after the IoT application has reported data to the Controller.

### 3 Verify Your Instrumentation

Generate traffic on your device. Once it has been received by AppDynamics, then it will appear in the table below.

Select your device and [View the Dashboard](#)

Name ↑
SmartCar

If you left the **Getting Started Wizard**, you can always verify the IoT application has been enabled and reported data by doing the following:

1. In the Controller UI, open **User Experience > Connected Devices**.
2. Check the list of registered connected device applications to verify that the application is registered with the Controller. You can also use view some basic information about the app such as the number of devices, total events, and network request information.

Name ↓	Devices	Total Events	Network Requests	Avg Network Request Duration ...
<b>Oculus Go</b> <small>AD-AAB-AAM-MNW</small> <ul style="list-style-type: none"> <li>SmartCar</li> <li>Oculus Go</li> </ul>	1	110	27	149
<b>Movie Tickets Online - IoT</b> <small>AD-AAB-AAF-XEA</small> <ul style="list-style-type: none"> <li>Movie Ticket Kiosk</li> </ul>	13	177,978	0	0
<b>AD Movie Tickets Core - IoT</b> <small>AD-AAB-AAJ-PTD</small> <ul style="list-style-type: none"> <li>Movie Ticket Kiosk V2</li> </ul>	13	356,997	119,184	1,914

3. Start monitoring your application. See [Configure IoT Application Monitoring](#).

## Monitor Applications with the IoT Dashboards

IoT Monitoring provides you with three dashboards to view and analyze the performance and usage of your application. Each dashboard provides you with a different aspect of your application's performance. Within each dashboard, you can view data visualized as widgets or detailed records or create custom widgets based on your chosen parameters.

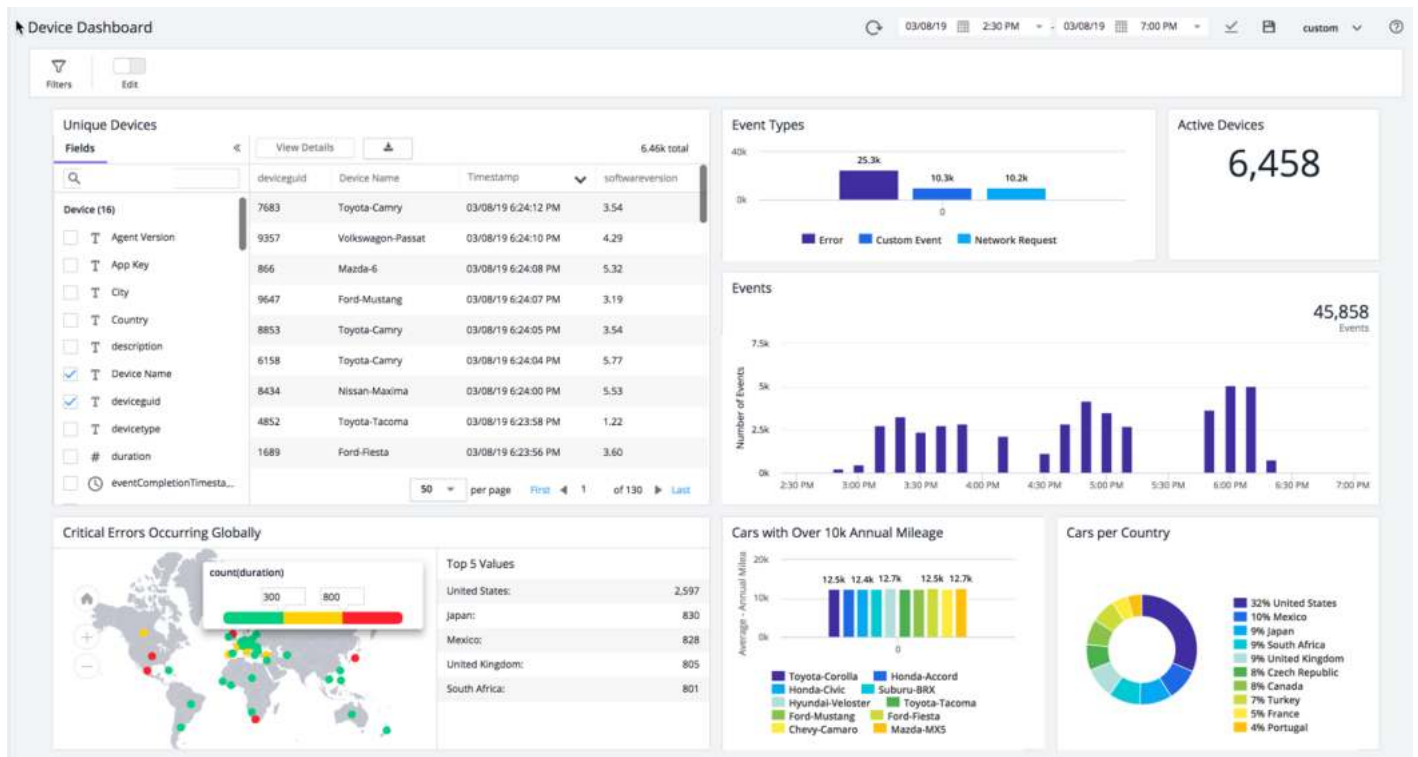

The page introduces the features, functionality, and goal of each of these dashboards:

- [Device](#)
- [Network Request](#)
- [Error](#)

### Device Dashboard

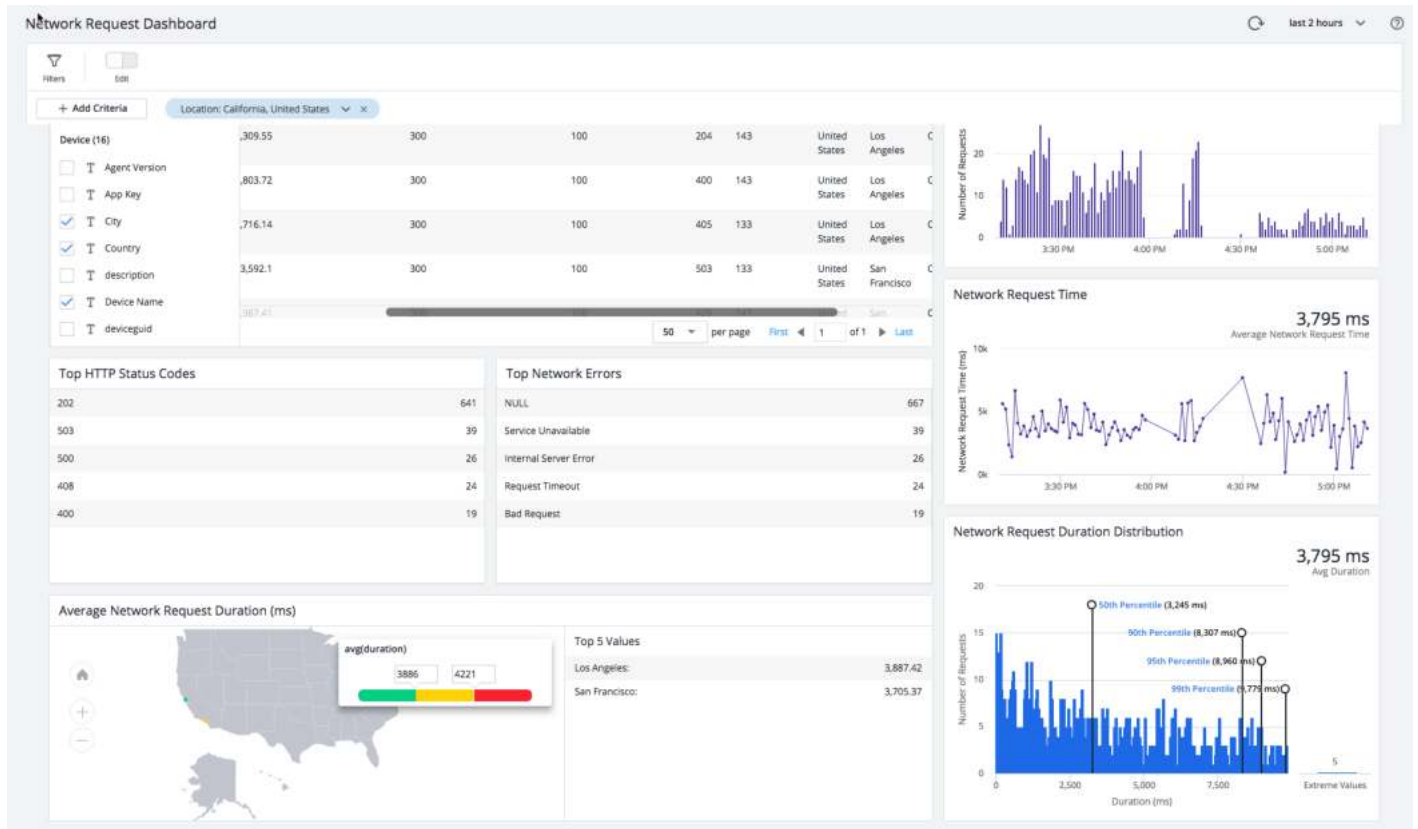

The **Device Dashboard** enables you to monitor your device status, custom information, and custom device application information. You can view summary activity or use filters to drill down to view metrics for a specific device.

Using the **Device Dashboard**, DevOps can ensure that devices are up and running, product managers and business stakeholders can examine device activity and trends, and developers can drill down into results to identify issues affecting single or multiple devices.

### Network Request Dashboard

The **Network Request Dashboard** enables you to view outgoing network requests, network request details, and analyze network requests.

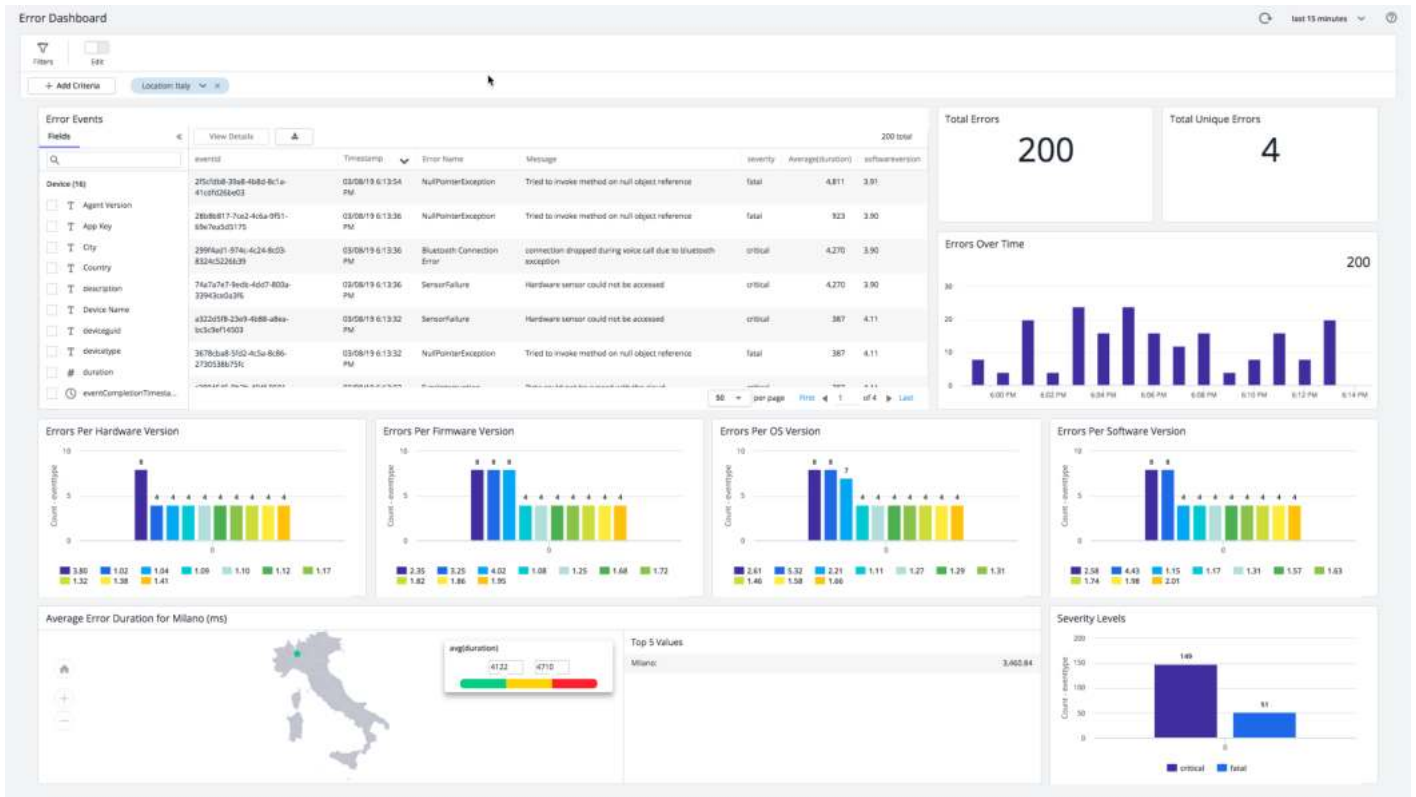

With the **Network Requests Dashboard**, you can:

- Check the availability of a device or service
- Discover slow network requests
- View failed network requests
- Analyze and sort network requests by criteria such as status code, app version, and so on
- Monitor network traffic over time

## Error Dashboard

The **Error Dashboard** enables you to view crashes, exceptions, and custom errors, both fatal and non-fatal. DevOps can monitor activity list and notify developers of error events. The developers can select the error event to view details and download the stack trace for debugging.

**i** The stack trace will only be available if it is reported with the IoT SDKs or through the IoT REST API.

**With the Error Dashboard, you can:**

- Discover new errors
- Assess the scope and impact of errors, such as how many devices are affected, what type of devices are affected, and how seriously affected are the devices.
- Monitor error patterns
- Download stack traces of errors to debug code
- Discover broken devices (failed hardware)

**How to Use IoT Dashboards**

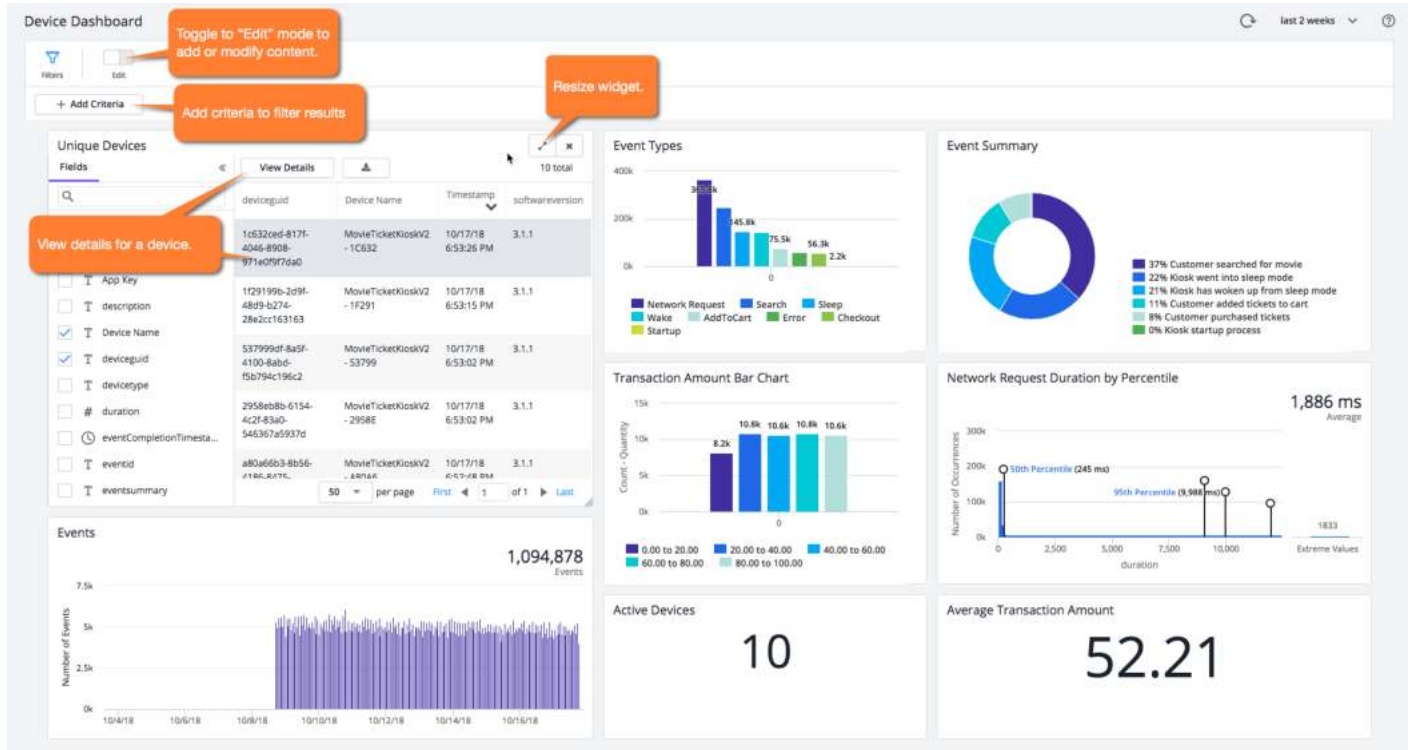

Although each dashboard presents different information, they all have the same UI functionality and features. This page provides an overview of the dashboard functionality to help you get started monitoring your devices.

**Access the IoT Dashboards**

1. Open the application you want.
2. Select one of the dashboards to view:
  - **Devices**
  - **Network Requests**
  - **Errors**

## View Dashboard Summaries

From each dashboard, you can view aggregated data in predefined and custom widgets. Each dashboard is in view mode by default, so data is read-only, although you can set filters, view details, and resize widgets.

## View Details

To view details, you select a row in one of the tables and click the **Details** icon. The **Device Details** dialog displays. You can view when the three types of events (Custom Event, Network Request, and Error) occurred on the timeline, or by duration. You can also click on the event bar in the waterfall for more details.

## Modify Content and Presentation

To modify the dashboard, you need to be in **Edit** mode. You simply change the toggle to **Edit**, and then you'll be able to add, move, resize, remove, and even create widgets.

The screenshot shows the 'Device Dashboard' in 'Edit' mode. The top toolbar includes 'Filters', 'Edit', 'Save', and 'Add Widget'. A 'Create a Widget' dialog is open, showing options to 'Use the Connected Device' or 'Create a new widget or add a widget to the dashboard.' The dashboard contains several widgets: a table of 'Unique Devices', an 'Event Types' bar chart, an 'Event Summary' donut chart, a 'Transaction Amount Bar Chart', a 'Network Request Duration by Percentile' line chart, an 'Events' time series graph, and two numeric widgets for 'Active Devices' (10) and 'Average Transaction Amount' (52.27). Callout boxes provide instructions on saving changes, creating widgets, and moving/resizing them.

## Build Custom Dashboard Widgets

Each dashboard has predefined widgets for basic monitoring, but because there are so many different devices and platforms, you will need to create custom widgets with the **Widget Builder**, which guides you through the creation of a widget. This page provides guidance for selecting graph types and using filters when you create widgets.

The 'Widget Builder' interface shows the 'Choose a graph type' step. The available graph types are: Pie Chart, Bar Chart, Time Series Graph, Histogram, Numeric, Table, and Geo. There are 'Cancel' and 'Save' buttons at the bottom right.

## How to Access the Widget Builder

1. Select a dashboard.
2. Change to **Edit** mode.
3. From the toolbar, click **Add Widget**.
4. From the dropdown, click **Create a Widget**.

## Choose the Best Graph Type

The **Widget Builder** allows you to choose from one of six types of graphs, you should try to use the best graph for your data set. The following is a guideline for choosing the graph type:

Graph Type	Graph Properties	Use Case(s)
Pie Chart	<ul style="list-style-type: none"> <li>Field</li> <li>Subfield</li> <li>Filters</li> <li>Name</li> </ul>	<p>Use pie charts to compare parts of a whole.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>For a retail device, the percentage of sales for each store.</li> <li>For a fitness device, the percentage of different types of activities such as running, bicycling, walking.</li> </ul>
Bar Chart	<ul style="list-style-type: none"> <li>Field</li> <li>Subfield</li> <li>Filters</li> <li>Name</li> </ul>	<p>Use bar charts to compare different items within the same category.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>For an inventory device, the number of items per store.</li> <li>For a smart car, the mileage of different cars.</li> </ul>
Time Series	<ul style="list-style-type: none"> <li>Field</li> <li>Filters</li> <li>Name</li> </ul>	<p>Use a time series to measure events over time.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>network errors</li> <li>sales</li> </ul>
Histogram	<ul style="list-style-type: none"> <li>Field</li> <li>Filters</li> <li>Name</li> </ul>	<p>Use histograms to analyze and understand the distribution of large sets of numerical data.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>The distribution of network request duration.</li> <li>For a smart home device, the distribution of temperatures.</li> </ul>
Number	<ul style="list-style-type: none"> <li>Field</li> <li>Filters</li> <li>Name</li> </ul>	<p>Use a number graph to highlight an important data point.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>active devices</li> <li>sales total</li> <li>network errors</li> </ul>

Graph Type	Graph Properties	Use Case(s)
Table	<ul style="list-style-type: none"> <li>• Field</li> <li>• Filters</li> <li>• Name</li> </ul>	<p>Use a table to view detailed data for a list of similar items.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>• customers</li> <li>• network requests</li> <li>• devices</li> </ul>
Geo	<ul style="list-style-type: none"> <li>• Field</li> <li>• Filters</li> <li>• Name</li> </ul>	<p>Use the Geo widget to analyze and understand performance across geographic areas.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>• Sales in different countries, regions, and cities</li> <li>• Network request durations across countries, regions, and cities</li> <li>• Device errors in different countries, regions, and cities</li> </ul>

### How to Use Filters

Filters enable you to narrow your results to meaningful information. For example, suppose you wanted to see the total number of items sold at each store, but you were particularly interested in those more expensive items. You could choose a bar graph and use the field **Device Name** and the subfield **Annual Mileage** with the filter **Location: Quebec, Canada** to view the average annual mileage of cars in Quebec, Canada, as shown in the example widget:

Widget Builder ✕

**1 Choose a graph type**

Pie Chart

## Configure IoT Application Monitoring

In addition to enabling and disabling **IoT Monitoring**, you can also configure the display names of network requests and exclude network requests matching given criteria from being monitored.

You can:

- Use the AppDynamics default naming rule, which you can leave as is or modify.
- Disable/modify the default naming configuration.
- Create custom include rules to override the default convention.
- Create custom exclude rules to exclude from monitoring network requests that meet certain criteria.

### Access the IoT App Configuration

To access connected device configuration:

1. Open the IoT application you want.
2. From the left-hand navigation menu, click **Configuration**.

### Enable/Disable IoT Monitoring

From the **Configuration** page, toggle the **Connected Device Monitoring** switch to **ON** to enable monitoring or **OFF** to disable monitoring.

### Connected Device Configuration

Connected Device Monitoring  ON App Key: XXXXXXXXXX

---

#### Network Requests

**Monitor**    Events Service

**Exclude Rules**    First, exclude the Network Request if any of the following are true:

Name	Enabled	Summary
Click the Add button to add a new rule		

**Include Rules**    Then, evaluate these rules in this order to name and monitor the Network Request: ⓘ

Name	Enabled	Summary
Default Naming Confi...	✔	Name the Network Request using: Full-Domain; first 2 segments of the URL.

## Name IoT Network Requests

The following sections show you how to modify the default naming configuration for network requests and create include naming rules for network requests.

### Access Network Requests Rules

From the **Configuration** page, click the Monitor tab if it's not selected already.

### Default Network Request Naming Configuration

By default, AppDynamics names network requests using:

- Hostname
- First two segments of the URL

For example, if an application makes this HTTP request: `http://myapp.com/friends/profiles/12345`

The default name that is displayed in the Controller UI for that request is: `myapp.com/friends/profiles`

If this is adequate for your needs, you can leave the default as is. The naming rules you configure here apply to all the IoT applications that are in the same IoT App Group.

---

## Modify the Default Naming Configuration Rule

You may want to configure a different default rule for naming your network requests to help you visualize the parts of your application more clearly. The task is similar to configuring naming rules for business transactions on the server side. Try to group logically related requests together while keeping unrelated requests in separate groups.

- If the default hostname and first two segments of the URL for all your requests are identical, you might want to name the requests based on the last segments or a selection of non-contiguous segments of the URL to distinguish among requests in the network requests list.
- You can also name the requests based on query parameters. For example, if the request passes an order number, you could specify that the value of the `order-number` query parameter is used in the network request name.
- You can also base the name on a regular expression run on the URL. AppDynamics uses the Java libraries for regular expressions. See:
  - Tutorial: <http://download.oracle.com/javase/tutorial/essential/regex/index.html>
  - Javadoc: <http://download.oracle.com/javase/1.5.0/docs/api/java/util/regex/Pattern.html>

## Modify the Default Network Request Naming Rule

The default configuration covers how all your requests are named if you do not customize them further.

1. From the **Network Request** tab, scroll down to the **Include Rules** section.
2. Double-click **Default Naming Configuration**.
3. In the **Include Rule** dialog, select the elements you want to use for your default network request naming.
4. Click **OK**.
5. Click **Save**.

## Create IoT Network Request Include Rules

By default, the same request naming rule is applied to every URL that your application requests. If you want to apply different naming rules to different URLs, create include rules.

For example, if some requests call your own in-house server and others call out to a third-party API, you may want to see all the third-party API calls as one network request and use the default naming rules for the calls to your own server. You would create a custom naming rule that matches the third party calls and uses only the host in the default rule name or perhaps also include certain query parameters.

### Creating an Include Rule

1. From the **Network Request** tab, scroll down to the **Include Rules** section.
2. Click **Add**.
3. In the **Include Rule** dialog, enter a name for the custom rule that you are creating.
4. Check the **Enabled** checkbox to enable the rule.
5. Select the checkboxes and radio buttons and enter the match criteria for AppDynamics to use to name network requests.
6. Click **OK**.

### Sample Include Rule

The following rule creates a custom match rule for requests in which the URL contains "inventory". This rule uses the protocol, the subdomain and the third and fourth segments of the URL in the network request name.

**Include Rule** ✕

Enabled

**Rule Name**

**Criteria**  
 This Include Rule applies to any URL that Contains ▼

**Name Pages**  
using parts of the URL ▼

Show Protocol (Ex: http, https, etc)

Show Domain (Ex: mywebsite.com)

Show Full Domain  
  Show Sub-domain

**Path Segments**

Don't use path segments  
 Use first  segments  
 Use last  segments  
 Use segment numbers  ⓘ

**QueryString Parameters to use in Page Name (Optional)**

**What part of anchor should be used in Page Name**

Don't use the anchor  
 Use first  segments  
 Use last  segments  
 Use segment numbers  ⓘ

Cancel
OK

You can temporarily cancel the application of a custom naming rule by clearing the **Enabled** checkbox in the custom rule configuration. In this case, the default naming rule is applied to requests that would have been named by the disabled custom rule. To remove the rule permanently, select the custom rule in the **Custom Naming Rules** list and click the **Delete** icon.

### Exclude IoT Network Requests

If there are certain types of requests that you do not want to monitor, create custom exclude rules for them based on the URL and/or the application name. Excluded network requests are not reported or counted toward the network request limit of 500 requests per controller application.

#### Create an Exclude Rule

1. From the Network Request tab, scroll down to the **Exclude Rules** section.
2. Click **Add**.
3. In the **Exclude Rule** dialog, enter a name for the exclude rule that you are creating.
4. Check the **Enabled** checkbox to enable the rule.
5. Select the check boxes and radio buttons and enter the match criteria for AppDynamics to use to name network requests.
6. Click **OK**.

---

You can temporarily cancel the application of an exclude rule by clearing the **Enabled** checkbox in the exclude rule configuration. To remove the rule permanently, select the exclude rule in the **Exclude Rules** list and click the **Delete** icon.

### Change Priority of Rules

Rules are evaluated in the order that they appear in the include or exclude list. You can change the priority of the rules by dragging and dropping rules towards the top (higher priority) or towards the bottom of the list (lower priority). Custom rules are always evaluated before the default naming rule, beginning with the custom rule that has the highest priority.

Your IoT app may make various kinds of network requests, and not all of them may be equally important to monitor in detail. For example, any requests to [Google Analytics](#) that your app may make are useful but probably aren't as important to analyze as the requests it makes to your backend.

To manage the impact on your overall Events Service usage, you can create rules which specify which of these network requests should be sent on to the Event Service, either by excluding a request entirely, including a particular request or a sample of that request types by percentage, or by simply allowing the request to be sent on.

In general, the behavior follows this pattern:

- If no rules are specified, data on all network requests are sent on.
- If exclude rules are specified, and a network request satisfies a rule, that data is *not* sent on.
- If include rules are specified, any network request that satisfies a rule is sent on, based on sampling defined by the percentage indicated in the rule.
- If both include and exclude rules are specified, a network request that satisfies an include rule but does *not* satisfy an exclude rule is sent on.

## IoT Custom Geo Mapping

By default, IoT Monitoring uses public geographic databases to resolve external IP addresses to geolocations. You can instead use IoT custom geo mapping to map internal IP addresses to geolocations for your IoT applications.

With custom geo mapping, you can monitor the performance of devices running in Virtual Private Clouds (VPCs) with internal addresses distributed across different geographies.

### Methods to Map IP Addresses

You can map one IP address, a range of IP addresses, or multiple IP addresses with a subnet mask to one geolocation, giving you a wide range of control over how to map internal IP addresses to geographic locations.

### Scope of Custom Geo Mapping

You can only use custom geo mapping in SaaS Controllers. You can provide one custom geo mapping for each app key. Each app key can include multiple applications, enabling them to use the custom geo mapping.

### Geo Mapping File

The geo-mapping file is an XML file used to map IP addresses to geolocations. You upload this file to the Controller for your IoT application.

## File Specification

The geo-mapping file size is limited to 1 GB, but there is no limit to the number of mapped IP addresses.

## Default Mapping

If you upload a custom geo-mapping file, IoT Monitoring will only resolve the IP addresses based on your mapped IP addresses and locations. Thus, if you are going to use a custom geo-mapping file, you should configure the default to cover the entire IP range.

## IP Addresses and Ranges

You can only specify IPv4 addresses in the custom geo-mapping file.

When using IP address ranges, you must list the addresses in ascending order. For example, if your geo-mapping file specifies the two ranges 1.1.1.1–2.2.2.2 and 2.2.2.2–3.3.3.3, you must list the first range before the second so that they are in ascending order.

## Example Geo Mapping Files

The example geo-mapping files below show you the scope of mapping geolocations and provide a general use case for each.

[Single Addresses](#) [Ranges](#) [IP Masking](#)

The simplest configuration maps one IP address to one geolocation.

```
< mappings >
 < mapping >
 < ip-range from="192.168.123.0" to="192.168.123.0" />
 < location country="United States" region="California" city="San Jose" />
 < /mapping >
 < default country="United States" region="California" city="San Francisco" />
< / mappings >
```

[Single Addresses](#) [Ranges](#) [IP Masking](#)

It's more common for a range of IP addresses to represent one geolocation. You can use the `range` attribute to specify a range of IP addresses.

```
< mappings >
 < mapping >
 < ip-range from='192.168.1.1' to='192.168.1.255' />
 < location country='USA' region='CA' city='Walnut Creek' />
 < /mapping >
 < default country='USA' region='NY' city='New York' />
< / mappings >
```

[Single Addresses](#) [Ranges](#) [IP Masking](#)

If you have a limited number of IP addresses, you can maximize the network connections by using IP subnet masking to split one IP address into many.

```
<mappings>
 <mapping>
 <subnet from="192.168.1.1" mask="255.255.255.0"/>
 <location country="United States" region="California" city="San Francisco"/>
 </mapping>
 <default country='China' region='Zhejiang' city='Hangzhou' />
</mappings>
```

## Geo Mapping File XML Schema

You can download the XML schema file [custom-geo-mapping.xsd](#) below to validate your geo-mapping XML file.

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<xs:schema version="1.0" xmlns:xs="http://www.w3.org/2001/XMLSchema">
 <xs:element name="mappings" type="config"/>
 <xs:element name="ip-range" type="explicitIpAddressRange"/>
 <xs:element name="subnet" type="subnetIpAddressRange"/>
 <xs:complexType name="config">
 <xs:sequence>
 <xs:element name="mapping" type="mapping" minOccurs="0" maxOccurs="unbounded"/>
 <xs:element name="default" type="geoLocation" minOccurs="0" maxOccurs="1"/>
 </xs:sequence>
 </xs:complexType>
 <xs:complexType name="mapping">
 <xs:sequence>
 <xs:choice>
 <xs:element ref="ip-range"/>
 <xs:element ref="subnet"/>
 </xs:choice>
 <xs:element name="location" type="geoLocation" minOccurs="1"/>
 </xs:sequence>
 </xs:complexType>
 <xs:complexType name="geoLocation">
 <xs:attribute name="country" type="xs:string" use="required"/>
 <xs:attribute name="region" type="xs:string" use="required"/>
 <xs:attribute name="city" type="xs:string" use="required"/>
 </xs:complexType>
 <xs:complexType name="explicitIpAddressRange">
 <xs:attribute name="from" type="xs:string" use="required"/>
 <xs:attribute name="to" type="xs:string" use="required"/>
 </xs:complexType>
 <xs:complexType name="subnetIpAddressRange">
 <xs:attribute name="from" type="xs:string" use="required"/>
 <xs:attribute name="mask" type="xs:string" use="required"/>
 </xs:complexType>
```

```
</xs:schema>
```

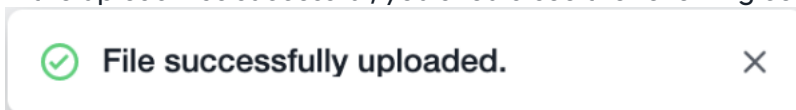

## Upload Geo Mapping Files

From your SaaS Controller, you can perform the following actions with your custom geo-mapping file:

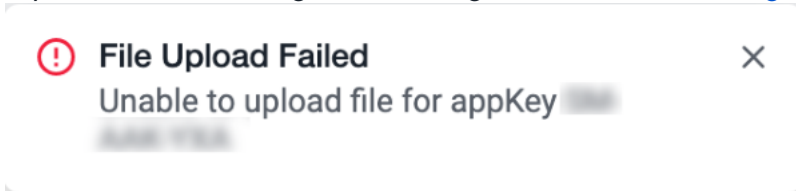

- [Upload New Geo Mapping File](#)
- [Overwrite Existing Geo Map File](#)
- [Reset Geo Map File](#)

### Upload New Geo Mapping File

1. Navigate to the **Configuration > Custom GeoMap**.
2. From the **Upload Custom GeoMap** file dialog, click **Choose File**.
3. Select a geo-mapping XML file.
4. Click **Upload**.
5. If the upload was successful, you should see the following confirmation.

6. If you see the following error message, see [Troubleshooting the Geo Map File](#).

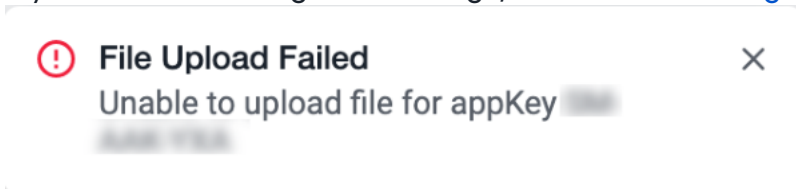

**i** After you have uploaded the geo-mapping file, it may take some time for IoT Monitoring to apply the new custom mapping to your applications.

### Overwrite Existing Geo Map File

1. Navigate to the **Configuration > Custom GeoMap**.
2. From the **Upload Custom GeoMap** file dialog, click **Overwrite Current Mapping**.
3. Select a geo-mapping XML file.
4. Click **Upload**.
5. If the upload was successful, you should see the following confirmation.

6. If you see the following error message, see [Troubleshooting the Geo Map File](#).

---

## Reset Geo Map File

1. Navigate to the **Configuration > Custom GeoMap**.
2. From the **Upload Custom GeoMap file** dialog, click **Reset to Default**.
3. From the **Reset Confirmation** dialog, click **Reset**.

## View Custom Geo Locations

You can add the **Geo** widget to one or more of the available dashboards to view the geolocation information of your devices. The Geo widget will display geo locations resolved with the public geographic databases or a custom IP address mapping. To view the geolocations from the **Device Dashboard**:

1. From your IoT application, navigate to **Devices**.
2. Scroll down to the **Geo** widget.
3. (Optional) Build a custom **Geo** widget. You can filter the devices by geodata such as city, region, or country.

In addition, you can filter data in the other widgets by geodata based on your geo-mapping file.

## Troubleshooting the Geo Map File

### Upload Issues

If you get an error message trying to upload the custom geo-mapping file, check the following:

- XML validity: Use an XML validation tool to determine if your XML of your geo-mapping file is valid.
- XML schema: Confirm that your custom geo-mapping file conforms to the XML schema.
- Invalid IP addresses: Confirm your IP addresses are valid.
- File size: Confirm that the custom geo-mapping file is less than 1 GB.

### Incorrect Geo Mapping

If IP addresses are not being resolved to the correct geolocations, confirm that the IP addresses and geolocations in your geo-mapping file are correct.

## ThousandEyes Integration with Browser Real User Monitoring

ThousandEyes integration with Browser Real User Monitoring (Browser RUM) combines application data from AppDynamics and internet network metrics from ThousandEyes to provide full-stack observability.

The internet network data in the context of Browser RUM enables you to observe and analyze the impact of network performance on application performance. Whenever there is an application issue, you can quickly identify whether the application issue is caused by a network issue.

## Use Cases

Observe ThousandEyes internet network data in the context of Browser RUM and Browser Synthetic Monitoring data in AppDynamics:

- Observe the network metrics (packet loss, latency, and jitter) from the following ThousandEyes tests in the context of browser application metrics:
  - agent-to-server
  - HTTP server
  - page load
  - transaction
- View the network health of each network path (Agent to target domain) in the context of browser application metrics.

- Analyze the impact of network performance on the browser application performance.

Identify the problematic domain whenever there is any application issue:

- When there is a high response time for end users, identify the root cause of the issue, and analyze the ThousandEyes network metrics to identify whether the network is the cause of the high response time for end users.
- When there is a performance issue from a specific domain, analyze whether the network is the cause of the performance issue of that domain.
- When there is a high response time in a specific geographic location, analyze the network metrics in those locations to check whether the network is the cause of the high response time in those locations.
- When there are errors in the browser applications, analyze whether the network is the cause of higher error rates in the browser applications.

Troubleshoot the network issues:

If you suspect that the network is the cause of the application issue, you can:

- Narrow down the network issue to specific network metrics, domain, time interval, and location and pass it on to the network team for further troubleshooting.
- Troubleshoot the network issue in ThousandEyes by selecting the appropriate ThousandEyes network tests from AppDynamics.

## License Requirements

To activate the integration, you need an active license of any of the following EUM licenses and an active subscription to [ThousandEyes Network and Application Synthetics](#):

- Real User Monitoring (SaaS) - Peak Edition
- Browser Real User Monitoring (SaaS) - Peak Edition

For the license entitlements, see [License Entitlements and Restrictions](#).

To enable this use case, you need to add ThousandEyes API credentials on the administration page. For detailed information, see [ThousandEyes Network Metrics in Browser RUM](#).

## ThousandEyes Network Metrics in Browser RUM

When you integrate ThousandEyes with Browser RUM, network metrics (packet loss, latency, and jitter) and network alerts are ingested from the following ThousandEyes tests into AppDynamics:

- agent-to-server
- HTTP server
- page load
- transaction

To ingest network metrics and network alerts from ThousandEyes, add the ThousandEyes API credentials in AppDynamics. You need:

- SaaS Controller  $\geq$  23.4.0
- A minimum of one browser application to sync the data from ThousandEyes.

 You must have an active subscription for [ThousandEyes Network and Application Synthetics](#) in addition to your AppDynamics license to use Customer Digital Experience Monitoring. If you choose to use Customer Digital Experience Monitoring, your data may get transferred and

processed in the United States. Please refer to your ThousandEyes ordering documentation and the [ThousandEyes Privacy Data Sheet](#) for more information.

Add ThousandEyes API credentials in AppDynamics:

1. Click the gear icon at the top-right corner of the Home page and select **Administration**.  
Or,  
Navigate to **User Experience > Browser Apps > Connect to ThousandEyes**, and click **Integration: ThousandEyes**.  
You need administration permission to access this page.
2. Under **Integrations > ThousandEyes**, turn on the **Enable ThousandEyes Integration** option.
3. Specify a bearer token under **Authorization Token**.

- i** You can obtain the token from ThousandEyes using the following steps:
- a. Click your username on the top-right corner, and then click **Profile**.
  - b. Under **User API Tokens**, click **Create** to generate an OAuth Bearer Token.  
The user should have access to all the account groups in ThousandEyes to ingest the network metrics and network alerts from All accounts groups.
  - c. Copy or make a note of the token.

- i** The ThousandEyes user whose credentials are used in AppDynamics for the integration must have ThousandEyes administrator privilege for ingesting the data into AppDynamics.

- i** The following table describes the user permissions required to sync ThousandEyes tests and domains and view the network data:

Permission	Description
Account Owner (Default)	The administrator user with this permission can save ThousandEyes tokens.
Analytics Administrator (Default) and Account Owner (Default)	The <b>Sync with ThousandEyes</b> button will be enabled for the administrator. The administrator can complete the sync with the ThousandEyes workflow.

Permission	Description
Edit, View, and Analytics permissions to Browser Applications	Non-administrator users must have these permissions to complete the sync with ThousandEyes workflow.

**i** If you added the ThousandEyes bearer token in AppDynamics before May 2, 2023, then add and save the bearer token again.

4. Click **Save**.

For creating ThousandEyes tests, see [ThousandEyes Documentation](#).

## View ThousandEyes Network Metrics

### Add User Role Permissions

1. Click the gear icon at the top-right corner of the Home page and select **Administration**.
2. Under **Roles**, click **Analytics > Events**.
3. Select **Browser Requests** from the dropdown.
4. Select **Can view browser requests data from all App Keys**.  
Or,  
Click **Add**, and add the relevant App Key and Application to the role.

### Add the ThousandEyes Widget

To view ThousandEyes network metrics in the context of browser application metrics, perform the following steps:

1. On AppDynamics Controller, navigate to **User Experience > Browser Apps > Sync with ThousandEyes**.

**i** When you click **Sync with ThousandEyes** for the first time:

- The domains and target URLs of ThousandEyes tests are compared with the domains of each browser application.
- If the domains from ThousandEyes tests match with the domains in the browser application, ThousandEyes network metrics and network alerts get ingested into the application.

Only the new tests get synced when you click **Sync with ThousandEyes** subsequently.

**i**

- If you have more than 200 ThousandEyes tests, the syncing process takes longer and runs in the background. ThousandEyes data appears on the dashboard in 5-10 minutes.
- AppDynamics supports syncing up to 3500 ThousandEyes tests.

2. Select `<application-name>`.  
This displays the **Browser App Dashboard** page.
3. Under **Overview**, click **+**.
4. Under **Widgets**, click **ThousandEyes Network Insights**.  
The ThousandEyes network metrics are displayed on the ThousandEyes widget in the browser application dashboard.

Field	Description
ThousandEyes Tests	Click <b>Show TE Tests</b> to view the list of ThousandEyes tests from where the network metrics are ingested into AppDynamics.
Domains	Click the <b>domains</b> dropdown to view the list of domains for which ThousandEyes network tests are configured.
Locations	Click the <b>locations</b> dropdown to view the list of agent locations from where the domains are monitored.

### Match ThousandEyes Tests Manually

If all the ThousandEyes tests are not synced, you can add specific ThousandEyes tests manually.

1. Navigate to **User Experience > Browser Apps**, and select `<application-name>`. This displays the **Browser App Dashboard** page.
2. Under **Network Monitoring**, click **Manually Match ThousandsEyes Tests**.
3. Select the tests that you want to add.
4. Click **Match and ingest data**.

### ThousandEyes Data Ingestion

When the Ingestion Limit is reached or the license expires, the ThousandEyes data ingestion into AppDynamics stops. When this happens, the **Sync with ThousandEyes** button is disabled. Each unit of Real User Monitoring (SaaS) - Peak Edition or Browser Real User Monitoring (SaaS) - Peak Edition can ingest up to 9 million network metrics.

For example, if you are provisioned with 10 unit licenses of Real User Monitoring (SaaS) - Peak Edition, the data ingestion limit is 90 million network metrics.

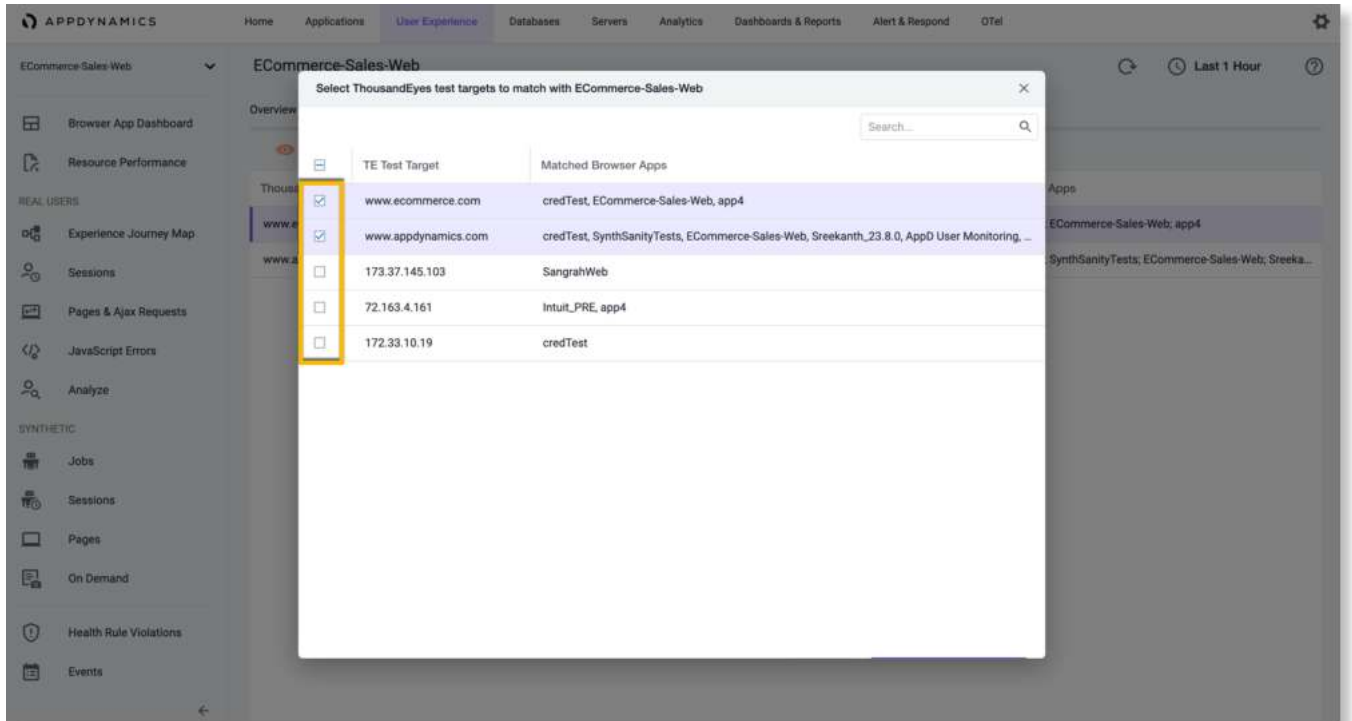

On the **License > Account Usage** page, you can view the ThousandEyes measurement count under **ThousandEyes Network Monitoring**.

Once you renew the license, the ThousandEyes data ingestion resumes automatically, and the ThousandEyes network metrics are visible on the widgets. For detailed information, see [License Entitlements and Restrictions](#).

If you no longer want to ingest data for a ThousandEyes test of a particular domain, uncheck the domain. This stops the data ingestion from the ThousandEyes test for that domain:

1. Navigate to **User Experience > Browser Apps**, and select `<application-name>`. This displays the **Browser App Dashboard** page.
2. Under **Network Monitoring**, click **Manually Match ThousandsEyes Tests**.

3. Deselect the ThousandEyes test for which you want to stop data ingestion, and click **Match and ingest data**.

## ThousandEyes Integration with Mobile Real User Monitoring

ThousandEyes integration with Mobile Real User Monitoring (Mobile RUM) combines application data from AppDynamics and internet network metrics from ThousandEyes to provide full-stack observability.

The internet network data in the context of Mobile RUM enables you to observe and analyze the impact of network performance on application performance. Whenever there is an application issue, you can quickly identify whether the application issue is caused by a network issue.

**i** You must have an active subscription for [ThousandEyes Network and Application Synthetics](#) in addition to your AppDynamics license to use Customer Digital Experience Monitoring. If you choose to use Customer Digital Experience Monitoring, your data may get transferred and processed in the United States. Please refer to your ThousandEyes ordering documentation and the [ThousandEyes Privacy Data Sheet](#) for more information.

### License Requirements

To activate the integration, you need an active license of any of the following EUM licenses and an active subscription to [ThousandEyes Network and Application Synthetics](#):

- Real User Monitoring (SaaS) - Peak Edition
- Mobile Real User Monitoring (SaaS) - Peak Edition

For the license entitlements, see [License Entitlements and Restrictions](#).

To enable this use case, you need to add ThousandEyes API credentials on the administration page. For detailed information, see [ThousandEyes Network Metrics in Mobile RUM](#).

## Use Cases

Observe ThousandEyes internet network data in the context of Mobile RUM data in AppDynamics:

- Observe the network metrics (packet loss, latency, and jitter) from the following ThousandEyes tests in the context of mobile application metrics:
  - agent-to-server
  - HTTP server
  - page load
  - transaction
- View the network health of each network path (Agent to target domain) in the context of mobile application metrics.
- Analyze the impact of network performance on the mobile application performance.

Identify the problematic domain whenever there is any application issue:

- When there is a high response time for end users, identify the root cause of the issue, and analyze the ThousandEyes network metrics to identify whether the network is the cause of the high response time for end users.
- When there is a performance issue from a specific domain, analyze whether the network is the cause of the performance issue of that domain.
- When there is a high response time in a specific geographic location, analyze the network metrics in those locations to check whether the network is the cause of the high response time in those locations.
- When there are errors in the mobile applications, analyze whether the network is the cause of higher error rates in the mobile applications.

Troubleshoot the network issues:

If you suspect that the network is the cause of the application issue, you can:

- Narrow down the network issue to specific network metrics, domain, time interval, and location and pass it on to the network team for further troubleshooting.
- Troubleshoot the network issue in ThousandEyes by selecting the appropriate ThousandEyes network tests from AppDynamics.

## ThousandEyes Network Metrics in Mobile RUM

When you integrate ThousandEyes with Mobile RUM, network metrics (packet loss, latency, and jitter) and network alerts are ingested from the following ThousandEyes tests into AppDynamics:

- agent-to-server
- HTTP server
- page load
- transaction

To ingest network metrics and network alerts from ThousandEyes, add the ThousandEyes API credentials in AppDynamics. You need:

- SaaS Controller >= 23.11.0
- A minimum of one mobile application to sync the data from ThousandEyes.

 You must have an active subscription for [ThousandEyes Network and Application Synthetics](#) in addition to your AppDynamics license to use Customer Digital Experience Monitoring. If you choose to use Customer Digital Experience Monitoring, your data may get transferred and

processed in the United States. Please refer to your ThousandEyes ordering documentation and the [ThousandEyes Privacy Data Sheet](#) for more information.

## Before You Begin

- The ThousandEyes user whose credentials are used in AppDynamics for the integration must have ThousandEyes administrator privilege for ingesting the data into AppDynamics.
- If you added the ThousandEyes bearer token in AppDynamics before May 2, 2023, then add and save the bearer token again.
- If you are using Browser RUM already, you need not save the authorization token again for the Mobile RUM integration.

## Obtain OAuth Bearer Token from ThousandEyes

You can obtain the token from ThousandEyes using the following steps:

1. Click your username on the top-right corner, and then click **Profile**.
2. Under **User API Tokens**, click **Create** to generate an OAuth Bearer Token.  
The user should have access to all the account groups in ThousandEyes to ingest the network metrics and network alerts from All accounts groups.
3. Copy or make a note of the token.

## Add ThousandEyes API Credentials in AppDynamics

1. Click the gear icon at the top-right corner of the Home page and select **Administration**.  
Or,  
Navigate to **User Experience > Mobile Apps > Connect to ThousandEyes**, and click **Integration: ThousandEyes**.  
You need administration permission to access this page.
2. Under **Integrations > ThousandEyes**, turn on the **Enable ThousandEyes Integration** option.
3. Specify a bearer token under **Authorization Token**. See [Obtain OAuth Bearer Token from ThousandEyes](#).
4. Click **Save**.

 If you are using Browser RUM already, then on the **Mobile Apps** list page, **Sync with ThousandEyes** button is displayed instead of **Connect with ThousandEyes**.

For creating ThousandEyes tests, see [ThousandEyes Documentation](#).

## View ThousandEyes Network Metrics

### Add User Role Permissions

1. Click the gear icon at the top-right corner of the Home page and select **Administration**.
2. Under **Roles**, click **Analytics > Events**.
3. Select **Mobile Requests and Sessions** from the dropdown.
4. Select **Can view browser requests data from all App Keys**.  
Or,  
Click **Add**, and add the relevant App Key and Application to the role.

**i** The following table describes the user permissions required to sync ThousandEyes tests and domains and view the network data:

Permission	Description
Account Owner (Default)	The administrator user with this permission can save ThousandEyes tokens.
Analytics Administrator (Default) and Account Owner (Default)	The <b>Sync with ThousandEyes</b> button will be enabled for the administrator. The administrator can complete the sync with the ThousandEyes workflow.
Edit, View, and Analytics permissions to Browser Applications	Non-administrator users must have these permissions to complete the sync with ThousandEyes workflow.

### Add the ThousandEyes Widget

To view ThousandEyes network metrics in the context of mobile application metrics, perform the following steps:

1. On AppDynamics Controller, navigate to **User Experience > Mobile Apps > Sync with ThousandEyes**.

**i** When you click **Sync with ThousandEyes** for the first time:

- The domains and target URLs of ThousandEyes tests are compared with the domains of each mobile application.
- If the domains from ThousandEyes tests match with the domains in the mobile application, ThousandEyes network metrics and network alerts get ingested into the application.

Only the new tests get synced when you click **Sync with ThousandEyes** subsequently.

**i**

- If you have more than 200 ThousandEyes tests, the syncing process takes longer and runs in the background. ThousandEyes data appears on the dashboard in 5-10 minutes.
- AppDynamics supports syncing up to 3500 ThousandEyes tests.

2. Select `<application-name>` .  
This displays the **Mobile App Dashboard** page.
3. Under **Overview**, click **+**.
4. Under **Widgets**, click **ThousandEyes Network Insights**.  
The ThousandEyes network metrics are displayed on the ThousandEyes widget in the mobile application dashboard.

Field	Description
ThousandEyes Tests	Click <b>Show TE Tests</b> to view the list of ThousandEyes tests from where the network metrics are ingested into AppDynamics.
Domains	Click the <b>domains</b> dropdown to view the list of domains for which ThousandEyes network tests are configured.
Locations	Click the <b>locations</b> dropdown to view the list of agent locations from where the domains are monitored.

### Match ThousandEyes Tests Manually

If all the ThousandEyes tests are not synced, you can add specific ThousandEyes tests manually.

1. Navigate to **User Experience > Mobile Apps**, and select `<application-name>`. This displays the **Mobile App Dashboard** page.
2. Under **Network Monitoring**, click **Manually Match ThoudsandEyes Tests**.
3. Select the tests that you want to add.
4. Click **Match and ingest data**.

### ThousandEyes Data Ingestion

When the Ingestion Limit is reached or the license expires, the ThousandEyes data ingestion into AppDynamics stops. Each unit of Real User Monitoring (SaaS) - Peak Edition or Mobile Real User Monitoring (SaaS) - Peak Edition can ingest up to 9 million network metrics.

For example, if you are provisioned with 10 unit licenses of Real User Monitoring (SaaS) - Peak Edition, the data ingestion limit is 90 million network metrics.

On the **License > Account Usage** page, you can view the ThousandEyes measurement count under **ThousandEyes Network Monitoring**.

 For the Controller 23.11 release, the **License > Account Usage** page displays only RUM Peak licenses.

Once you renew the license, the ThousandEyes data ingestion resumes automatically, and the ThousandEyes network metrics are visible on the widgets. For detailed information, see [License Entitlements and Restrictions](#).

If you no longer want to ingest data for a ThousandEyes test of a particular domain, uncheck the domain. This stops the data ingestion from the ThousandEyes test for that domain:

1. Navigate to **User Experience > Mobile Apps**, and select `<appliaction-name>`. This displays the **Mobile App Dashboard** page.
2. Under **Network Monitoring**, click **Manually Match ThoudsandEyes Tests**.
3. Deselect the ThousandEyes test for which you want to stop data ingestion, and click **Match and ingest data**.

## Database Visibility

Database Visibility in AppDynamics provides end-to-end visibility on the performance of your database, helps you troubleshoot problems such as slow response times and excessive load, and provides metrics on database activities, such as:

- SQL statements or stored procedures that are consuming most of the system resources
- Statistics on procedures, SQL statements, and SQL query plans
- Time spent on fetching, sorting, or waiting on a lock
- Activity from the previous day, week, or month
- Disk/CPU/memory utilization, and database availability

### Installation And Administration

- [Install the Database Agent](#)
- [Start and Stop the Database Agent](#)
- [Upgrade the Database Agent](#)

### Configuration

- [Configure the Database Agent](#)
- [Add Database Collectors](#)

### Using Database Visibility

- [Database Visibility](#)
- [Monitor Database Performance](#)
- [Monitor Database Server Hardware](#)

### Reference

- [Database Agent Configuration Properties](#)
- [Database Agent Events Reference](#)
- [Database Monitoring Metrics](#)

## Database Visibility Supported Environments

Related pages:

- [Add Database Collectors](#)
- [Database Visibility](#)

This page describes the application environments and versions supported by the Database Visibility Agent.

### Database Visibility Support

Once Database Visibility is available, you can create collectors that run on the Database Agent to monitor any of these systems:

Database	Supported through Amazon RDS	Version
Apache Cassandra		>= 3.11.4

Database	Supported through Amazon RDS	Version
Datastax Enterprise (DSE) Cassandra		5.1, >= 6.7.3
Couchbase		>= 4.5
IBM DB2 LUW		9.x, 10.x, 11.x
MongoDB, MongoDB cluster		>= 2.6
MySQL	Yes	All versions including MySQL Version 8.0, Percona, MariaDB, and Aurora
Microsoft SQL Server	Yes	2005, 2008, 2012, 2014, 2016, 2017, 2019, 2022, and SQL Azure
Microsoft SQL Server on Linux		SQL Server on Linux is currently available as a public preview and is not recommended for production use.  Database Visibility works well with this preview release, but monitoring results may vary until a stable version of SQL Server on Linux is available.
Oracle, Oracle RAC	Yes	10g (>= 10.2), 11g, 12c, 18c, and 19c
PostgreSQL	Yes	All the versions including Azure Database for PostgreSQL and Aurora
Sybase ASE		>= 15
Sybase IQ		All versions

If you enable hardware monitoring for MySQL and PostgreSQL RDS databases, then to fetch vCPU, use mapping of model vs vCPU from [Amazon RDS Instance Types](#). The fetched vCPU is used for IBL licensing model.

## Supported Operating Systems

Operating System	Version
Windows	64-bit   From 20.5 release, 32-bit is unsupported.
Linux	32-bit and 64-bit
Solaris	All versions
AIX	>= 6.1
Amazon RDS	All versions

To avoid metric value errors, use a 64-bit JRE with the 64-bit operating system.

### Recommended

If you use a third-party application along with Database Visibility to monitor Sybase, the data displayed in the controller may not display correctly. For accurate metrics, do not use both a third-party application and Database Visibility to monitor Sybase.

## Database Visibility System Requirements

This page describes the hardware and software requirements using Database Visibility.

### Hardware Requirements

Hardware requirements vary depending on database activity. If your database activity increases, you may need to adjust your hardware configuration.

The machine running the Database Agent should meet the following hardware requirements:

- 1 GB of heap space and an additional 512 MB of heap space for each monitored database instance. For less busy databases, you may reduce the heap space to 256 MB per monitored database instance.
- 2 GHz or higher CPU.

### Database Instance

A Database instance can be a node in the Oracle RAC, MongoDB, Couchbase cluster, standalone-collector, or a sub-collector.

This table shows sample calculations for heap space allocation:

Number of Database Instances Monitored	Heap Space Allocation
5	$(5 \times 512 \text{ MB}) + 1024 \text{ MB} = 3,584 \text{ MB}$
20	$(20 \times 512 \text{ MB}) + 1024 \text{ MB} = 11,264 \text{ MB}$
100	$(100 \times 512 \text{ MB}) + 1024 \text{ MB} = 52,224 \text{ MB}$

## AppDynamics Controller Sizing Requirements

The Controller database should meet the following hardware requirements:

- 500 MB of disk space per collector per day
- 500 MB of disk space for the Events Service per day. By default, the Events Service retains data for 10 days.

See [Controller System Requirements](#).

### Note

The Database Agent requires the [Events Service](#). Start Event Service before you start the Database Agent.

## Software Requirements

- The Database Agent runs on a Java Virtual Machine. You must have Java 1.8 - 15.
- For supported operating systems, see [Supported Operating Systems](#) in [Database Visibility Supported Environments](#).

## Network Requirements

- The machine on which the database is running or the machine you want to monitor must be accessible from the machine where the Database Agent is installed and running. This machine must have a network connection, internet, or intranet.
- If your databases are behind a firewall, you must configure the firewall to permit the machine running the Database Agent program access to the databases. The database listener port (and optionally the SSH or WMI port) must be open.
- The network bandwidth used between the agent and the controller is approximately 300 KB per minute per collector for a large database with 200 clients using 50 schemas, processing about 10,000 queries a minute. The actual numbers depend on the type of database server, the number of individual schemas on the server, and the number of unique queries executed daily, and therefore varies.

## Administer the Database Agent

Related pages:

- [Database Visibility](#)
- [Database Agent Configuration Properties](#)
- [Add Database Collectors](#)
- [Start the Database Agent Automatically on Linux](#)
- [Start the Database Agent Automatically on Windows](#)

The Database Agent is a standalone Java program that collects performance metrics about your database instances and database servers. You can view these performance metrics in the Metric Browser of the AppDynamics Controller UI.

---

To start monitoring your database, you must first install the Database Agent. You may want to install multiple agents for the following reasons:

- You have databases on multiple networks that are not accessible by one machine.
- You have multiple SQL Server instances that each require different credentials, and you want to connect to them through Windows Authentication.
- You want one or more agents to back up a primary agent. Backup agents ensure that your database instances are continually monitored during agent failure or machine downtime.

## Prepare to Install the Database Agent

### Related pages:

- [Database Visibility](#)
- [Database Agent Configuration Properties](#)
- [Add Database Collectors](#)
- [Start the Database Agent Automatically on Linux](#)
- [Start the Database Agent Automatically on Windows](#)

## Database Agent Installation Requirements

Ensure that your environment meets these requirements:

- Java 1.8 - 15
- The machine that you install the agent on has network access to the databases that you want to monitor.

For hardware requirements, see [Database Visibility System Requirements](#).

## Controller Communication Information

If you are installing using the Database Agent downloaded from the **Getting Started Wizard**, the Controller communications information is already configured for you in the agent `controller-info.xml` file.

To complete the **Getting Started Wizard - Databases**, you need:

- Controller Host Name
- Controller Port Number

If you are installing using the agent installation zip file downloaded from the AppDynamics portal, you need:

- Controller Host Name
- Controller Port Number
- Account Access Key

See [Agent-to-Controller Connections](#).

## Install the Database Agent

### Related pages:

- [Database Visibility](#)
- [Database Agent Configuration Properties](#)
- [Add Database Collectors](#)
- [Enable SSL and SSH for Database Agent Communications](#)
- [Start the Database Agent Automatically on Linux](#)
- [Start the Database Agent Automatically on Windows](#)

This page describes how to manually install the Database Agent. You can alternatively follow the steps in the **Download & Install Wizard**, which you can access from the Home page in the Controller UI. The wizard simplifies the install process.

To avoid permission issues, you should install the Database Agent as the same user who will run the agent, or as an administrator on the host machine. To run the Database Agent, you must have write privileges to the logging output directory and to the `conf` directory, which are located in the agent installation directory.

## Install the Agent Software

1. Download the version of the installation package that is appropriate for your OS environment from the AppDynamics Download Center (<http://download.appdynamics.com>).
2. Extract the zip file to the destination directory. Do not use spaces in the agent installation destination directory.
3. Log on as an administrator to the machine where you will be installing the Database Agent.

### Windows

Double-click the `db-agent-x.x.x.zip` file and extract the files to `<db_agent_home>`. If necessary, you can unblock the zip file before you extract it as follows: Right-click on the zip file, select **Properties** and choose **unblock**.

**i** There are two versions of the database agent: one that is 32-bit and one that is 64-bit (*as of 4.5.2*). Choose a version based on your OS requirements.

### Linux

Enter the following on the command line:

```
unzip db-agent-x.x.x.zip -d <db_agent_home>
```

### **i** Running Multiple Database Agents

You can have multiple Database Agents concurrently running the agent jar in the `<db_agent_home>` directory on the same machine. Some system properties may be required depending on how you'll be using the agents.

## Database Agent Licensing (On-premises Only)

Obtain a `license.lic` file with Database Monitoring licensing from your sales or support representative and put the license file in the directory where you installed the Controller. After placing the license in the directory, the Controller may take a minute or two to detect the new license. [Restarting the Controller](#) forces it to detect new licenses.

## Configure the Agent

You can [configure properties](#) for the Controller host name, port number, and account access key using either the `<db_agent_home>/conf/controller-info.xml` file or by adding system properties to the Database Agent startup script.

### Controller Host Name

**Configure using controller-info.xml:** `<controller_host>`

**Configure using System Properties:** `-Dappdynamics.controller.hostName`

**Required:** Yes

**Default:** None

### Controller Port

**Configure using controller-info.xml:** `<controller_port>`

**Configure using System Properties:** `-Dappdynamics.controller.port`

**Required:** Yes

**Default:** For On-premises Controller installations: Port 8090 for HTTP and 8181 for HTTPS communication.  
For SaaS Controller service: Port 80 for HTTP and port 443 for HTTPS communication.

### Account Access Key

**Configure using controller-info.xml:** `<account_access_key>`

**Configure using System Properties:** `-Dappdynamics.agent.accountAccessKey`

**Required:** Yes

**Default:** None

### Optional Configurations:

- Configure the agent to use SSL, see [Enable SSL for Communicating with the Controller](#).
- Configure the agent to use Proxy Settings, see [Proxy Settings for the Controller](#).
- Configure the agent to run automatically when the Machine starts on [Linux](#) or [Windows](#).
- Configure the agent to uniquely identify itself to the Controller, such as when you require multiple agents. See [Multiple Agent Environment Properties](#).
- Configure the agent to act as a backup to another Database Agent. See [Multiple Agent Environment Properties](#).
- Configure the logging level of the Database Agent running on the agent JVM. The [attached log file](#) shows an example of the agent log file when the agent logging is set to INFO level. This is the default. The log files are in `<db_agent_home>\logs`.

## Start the Controller Events Service (On-premises Only)

In an on-premises environment, for monitoring the database you must start the controller events service before starting Database Agent.

### Linux

```
bin/platform-admin.sh start-events-service
```

### Windows

```
bin\platform-admin.exe start-events-service
```

## Launch the Database Agent using System Properties

The following assumes that all the necessary parameters have been specified in the `controller-info.xml`.

## Method 1: Launch Agent with Start Script

You can use a script to start the agent. This is the recommended method.

### Linux

```
./start-dbagent -Xms<min_heap_size> -Xmx<max_heap_size> &
```

### Windows

```
start-dbagent.bat -Xms<min_heap_size> -Xmx<max_heap_size>
```

Alternatively, you can launch the agent as a Windows Service (*as of 4.5.4*). See [Install the Database Agent as a Windows Service](#).

## Method 2: Launch Agent with Java Command

Alternatively, you can launch the agent with these Java commands:

### Linux

```
java -XX:+HeapDumpOnOutOfMemoryError -XX:OnOutOfMemoryError="kill -9 %p" -jar db-agent.jar
```

### Windows

```
C:\java -Djava.library.path="<>db_agent_home>\auth\x64" -Ddbagent.name="Scarborough Network Database Agent" -jar <db_agent_home>\db-agent.jar
```

## System Properties

### Database Agent Name

**Configure using System Properties:** `-Ddbagent.name=<db_agent_name>`

**Type:** ASCII string, including spaces. If `<db_agent_name>` contains spaces, you must enclose the entire name in double quotes (" ").

**Required:** Yes, when you have multiple agents reporting to the same Controller.

**Default:** Default Database Agent

### Java Library Path

**Configure using System Properties:** `-Djava.library.path=<db_agent_home>\auth\x64`

**Type:** ASCII string, including spaces. If `<db_agent_home>` contains spaces, you must enclose the entire name in double quotes (" ").

**Required:** Yes, for Windows only

#### Specify:

For 64-bit systems: `<db_agent_home>\auth\x64`

For 32-bit systems: `<db_agent_home>\auth\x86`

## Increase the JVM Memory

To monitor multiple databases, you may need to increase the JVM memory allocation size. Increased activity on the databases you are monitoring results in increased memory usage.

Use one of the following commands to start the agent, and to initially allocate 1536 MB to the agent instead of the default of 64 MB.

### For Windows 64-bit

```
C:\>java -Xmx1536m -Djava.library.path="<db_agent_home>\auth\x64" -jar <db_agent_home>\db-agent.jar
```

### For Linux

```
% java -Xmx1536m -jar <db_agent_home>/db-agent.jar
```

## Install the Database Agent as a Container Image

Install the Database Agent container image as follows:

1. [Obtain the Database Agent Container Image](#)
2. [Deploy the Database Agent](#)

 You can install Database Agent as a non-root user.

## Obtain the Database Agent Container Image

You can obtain the container image in one of the following ways:

- [Download and Build the Database Agent Container Image](#)
- [Pull the Database Agent Image from Docker Hub](#)

## Download and Build the Database Agent Container Image

1. Download the Database Agent zip file from the [Download portal](#).
2. Unzip the Database Agent zip file.
3. Navigate to the directory where you unzipped the file and run this command:

```
docker build -t <image-name> .
```

## Pull the Database Agent Container Image from Docker Hub

1. Pull the latest Database Agent container image from the Docker hub:

```
docker pull appdynamics/db-agent:latest
```

2. (Optional) Tag the image:

```
docker tag appdynamics/db-agent:latest <image-name>
```

If you want to run the image on Docker, set certain environment variables:

### Sample command

```
docker run -e APPDYNAMICS_CONTROLLER_HOST_NAME="" -e APPDYNAMICS_CONTROLLER_PORT="" -e APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY=' ' -e APPDYNAMICS_AGENT_ACCOUNT_NAME="" -e APPDYNAMICS_CONTROLLER_SSL_ENABLED="" -e APPDYNAMICS_DB_AGENT_NAME="DatabaseAgent" -e APPDYNAMICS_DB_PROPERTIES="-Ddbagent.telemetry.enabled=true" -d <image-name>
```

**i** The environment variables specified in the preceding command are examples. You can set more environment variables as per your need. See [Database Agent Configuration Properties](#) for more details.

To add more properties to the `APPDYNAMICS_DB_PROPERTIES` parameter, add the property separated by a space.

For example:

```
APPDYNAMICS_DB_PROPERTIES: "-Ddbagent.telemetry.enabled=true -Dretry.on.auth.failure=false"
```

## Deploy the Database Agent

Perform these steps to deploy the Database agent:

1. [Deploy the Database Agent in EKS Cluster](#)
2. [Update the configMap](#)
3. [Provide the Account Access Key as a Parameter](#)

### Deploy the Database Agent in EKS Cluster

Update the following fields in the yaml files:

YAML File	Field
accessKey.secret.yaml	APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY
dbagentProperties.configMap.yaml	APPDYNAMICS_CONTROLLER_HOST_NAME APPDYNAMICS_CONTROLLER_PORT APPDYNAMICS_CONTROLLER_SSL_ENABLED APPDYNAMICS_DB_AGENT_NAME APPDYNAMICS_AGENT_ACCOUNT_NAME
dbagent.deployment.yaml	spec.template.spec.containers.image

Perform these steps to deploy the Database Agent:

1. Navigate to the `k8s-deploy` directory.
2. Create the configMap for db-agent properties:

```
kubectl create -f dbagentProperties.configMap.yaml --save-config
```

3. Create the secret for account access-key:

```
kubectl create -f accessKey.secret.yaml --save-config
```

4. Create the logs configMap:

```
kubectl create -f logs.configmap.yaml --save-config
```

5. Create the deployment for db-agent:

```
kubectl create -f dbagent.deployment.yaml --save-config
```

**i** You can edit the selectors and labels in the `deployment.yaml` file if the labels overlap with existing deployments in your cluster. Do not overlap the selectors or labels with other Controllers (including other Deployments and StatefulSets). Kubernetes do not stop you from overlapping. Hence, if multiple Controllers have overlapping selectors, then the Controllers might conflict and behave unexpectedly.

## Update the configMap

1. Change these configMap files used in the deployment:

- `appd-db-agent-properties`
- `appd-db-agent-log-config`

2. Reapply the configMap:

```
kubectl apply appd-db-agent-properties
```

```
kubectl apply appd-db-agent-log-config
```

3. Rollout and restart the `db-agent` deployment:

```
kubectl rollout restart deployment <deployment-name>
```

## Provide the Account Access Key as a Parameter

**!** AppDynamics recommends using a secret for the account access key.

By default, the `db-agent` deployment uses a secret for the account access key.

However, if you want to pass the account access key as a parameter, perform these steps:

1. Add the `APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY` property in `appd-db-agent-properties` configMap.

 Do not encode the property.

2. Reapply the `appd-db-agent-properties` configMap.

```
kubectl apply appd-db-agent-properties
```

3. Comment out the `spec.template.spec.containers.envFrom.secretRef` section in the `dbagent.deployment.yaml` file.
4. Reapply the `db-agent` deployment:

```
kubectl apply -f dbagent.deployment.yaml
```

## Verify the Database Agent Installation

### Related pages:

- [Database Agent Configuration Properties](#)
- [Agent and Controller Tenant Compatibility](#)

### Review the Agent Logs

After a successful install, your agent logs, located at `<db_agent_home>/logs`, should contain this message:

```
Started AppDynamics Database Agent Successfully
```

If the agent log file is not present, the Database Agent may not be accessing the Database Agent command properties. To troubleshoot, check the application server log file where STDOUT is logged. It will have the fallback log messages, useful for troubleshooting the agent.

### Verify that the Agent is Reporting to the Controller

1. Click **Settings > AppDynamics Agents**.
2. Click the Database Agents tab.

A list for each Database Agent reporting to the Controller should display. An agent can have one of the following statuses:

- Active: The agent is running
- Passive: The agent is used as a backup for active agents

If you don't see the Database Agent, check your `controller-info.xml` properties to ensure they have specified the correct host properties.

### Verify that the Agent is Running

Use the following command to verify that the agent process is running:

**Linux:**

```
ps -ef | grep db-agent
```

**Windows:**

1. Open a command-line console.
2. Start the **Task Manager** and click the Processes tab.
3. The agent process should be running. If it is not running, then stop and restart the agent.

## Upgrade the Database Agent

**Related pages:**

- [Database Agent Configuration Properties](#)
- [Agent and Controller Tenant Compatibility](#)

**Important Upgrade Notes**

- Before upgrading, ensure that you have all the required user permissions as mentioned in each database collector configuration.
- If you are upgrading the Controller and agents, first upgrade the Controller and then upgrade the Database Agents.
- **Shut down** the Database Agent process before you install the new agent. All Database Agents that are running from the same install location need to be shut down when updating that install location.
- Download the installation package that is appropriate for your OS environment from the [AppDynamics Download Center \(https://download.appdynamics.com/download/\)](https://download.appdynamics.com/download/).
- Back up the `<db_agent_home>` directory so you can revert to the previous installation if required. To maintain the same configuration information, you will also need the `<db_agent_home>\conf\controller-info.xml` file.
- If both the old and new agents are  $\geq 4.2$ , you can keep the old agent running while installing the new agent, allowing you to upgrade the agent with no downtime. Once you see the new agent showing up as "ACTIVE" in the agents page in the Controller, stop the old agent.

**Stop the Agent**

Stop the agent as described for your specific installation in [Start and Stop the Database Agent](#).

**Back up the Existing Agent Directory**

Make a copy of the existing agent directory, `<db_agent_home>`. Backing up allows you to revert to the previous agent installation if you need to. You can also copy over the `controller-info.xml` configuration file to the new installation to ensure the agent configuration is maintained.

**Install the Agent**

Install the Database Agent as described for your specific installation in [Administer the Database Agent](#).

**Copy the controller-info.xml File**

To ensure the agent configuration is maintained, copy the `<backup_db_agent_home>\conf\controller-info.xml` file to the new installation directory, `<db_agent_home>\conf`.

**Start the New Agent**

See [Start and Stop the Database Agent](#).

**Verify the Database Agent Installation**

See [Verify the Database Agent Installation](#).

## Uninstall the Database Agent

### Related pages:

- [Administer the Database Agent](#)
- [Database Agent Configuration Properties](#)
- [Manage App Agents](#)

To uninstall the database agent:

1. Shut down the JVM that the database agent runs on.
2. Delete the installation directory.

If you have the agent installed the agent as a service, you must also [stop the Database Agent](#) service.

To prevent a Database Agent from connecting to the Controller, ensure that it doesn't start up. This frees the license associated with the agent in the Controller and makes it available for use by another Database Agent.

## Configure the Database Agent

Once you have installed and launched the Database Agent, you can further customize the agent.

- [Database Agent Configuration Properties](#)
- [Enable SSL and SSH for Database Agent Communications](#)
- [Enable Snapshot Correlation for Oracle](#)
- [Increasing JVM Memory](#)
- [Database Agent Logging](#)

### Database Agent Configuration Properties

This page describes how configure a Database Agent.

### Related pages:

- [Administer the Database Agent](#)

### Where to Configure Database Agent Properties

You can configure agent properties in the following locations:

- The `controller-info.xml` file located in the `<db_agent_home>/conf` directory
- The system properties (`-D options`) section in the JVM start-up command. The system properties override the settings in the `controller-info.xml` file. System properties are case-sensitive.

```
java -XX:+HeapDumpOnOutOfMemoryError -XX:OnOutOfMemoryError="kill -9 %p" -jar db-agent.jar
```

Alternatively, you can use a script to start the agent.

<b>Windows</b>	<code>start-dbagent.bat -Xms&lt;min_heap_size&gt; -Xmx&lt;max_heap_size&gt;</code>
<b>Linux</b>	<code>./start-dbagent -Xms&lt;min_heap_size&gt; -Xmx&lt;max_heap_size&gt; &amp;</code>

### Example Database Agent controller-info.xml File

```
<?xml version="1.0" encoding="UTF-8"?>
<controller-info>

 <controller-host>192.10.10.10</controller-host>
 <controller-port>8090</controller-port>
 <account-access-key>165e65645-95c1-40e3-9576-6a1424de9625</
account-access-key>
 <!-- The following attribute enables or disables SSL
communications between the agent and the Controller.-->
 <controller-ssl-enabled>>false</controller-ssl-enabled>

 <!-- The following account-related parameters are necessary
only for SaaS installations-->
 <!--account-name></account-name-->

</controller-info>
```

### Example Startup Configuration Using System Properties

A bash example. Note that the system properties are case-sensitive.

```
-Dappdynamics.controller.hostName=192.168.1.20
-Dappdynamics.controller.port=8090
```

### Database Agent Properties

This section describes the Database Agent configuration properties, including their `controller-info.xml` elements and their system property options.

#### Required System Properties

Path to the Agent jar File

**Description:** Provides the absolute path to the jar file.

**System Property:** `-jar`

**Value:** `<db_agent_home>db-agent-jar`

**Type:** ASCII string, including spaces. If `<db_agent_home>` contains spaces, you must enclose the entire name in double quotes (" ").

**Required:** Yes

**Example:** `-jar="D:\AppDynamics\Database Agent\db-agent.jar"`

Path to the Java Library

---

**Description:** Provides the absolute path to `sqljdbc_auth.dll`.

**System Property:** `-Djava.library.path`

**Value:**

- For 64-bit systems: `<db_agent_home>\auth\x64`
- For 32-bit systems: `<db_agent_home>\auth\x32`

**Type:** ASCII string, including spaces. If `<db_agent_home>` contains spaces, you must enclose the entire name in double quotes (" ").

**Required:** Recommended. Required for SQL Server Windows Authentication on Windows 64-bit systems.

**Example:** `-Djava.library.path="D:\AppDynamics\Database Agent\auth\x64"`

### Optional System Properties

Disable Retry on Auth Failure

**Description:** Stops retrying to establish JDBC connection when JDBC authentication fails.

**System Property:** `-Dretry.on.auth.failure=false`

**Default:** The system property is set to true.

**Type:** String

Supported Locales for Parsing Numbers

**Description:** Specifies which locale to use for parsing numbers. See [Java 7 Supported Locales](#) or [Java 8 Supported Locales](#) for valid values. Use the values for the Java version that you are running in your environment.

**System Property:** `-Ddbagent.language`

**Default:** The system property is set to `en-US` or `en_US`.

**Type:** String

### Agent-Controller Communication Properties

Controller Host Property

**Description:** This is the host name or the IP address of the AppDynamics Controller, for example, 192.168.1.22 or myhost or myhost.abc.com. This is the same host that you use to access the AppDynamics Controller UI.

**Element in controller-info.xml:** `<controller-host>`

**System Property:** `-Dappdynamics.controller.hostName`

**Environment Variable:** `APPDYNAMICS_CONTROLLER_HOST_NAME`

**Type:** String

**Default:** None

**Required:** Yes

Controller Port Property

---

**Description:** This is the HTTP(S) port of the AppDynamics Controller. This is the same port that you use to access the AppDynamics browser-based user interface. If the Controller SSL Enabled property is set to true, specify the HTTPS port of the Controller; otherwise, specify the HTTP port. See **Controller SSL Enabled Property**.

**Element in controller-info.xml:** `<controller-port>`

**System Property:** `-Dappdynamics.controller.port`

**Environment Variable:** `APPDYNAMICS_CONTROLLER_PORT`

**Type:** Positive Integer

**Default:** For on premises installations, port 8090 for HTTP and port 8181 for HTTPS are the default ports the Controller listens to.

For the SaaS Controller Service, port 80 for HTTP and port 443 for HTTPS are the default ports the Controller listens to.

**Required:** Yes

Account Access Key Property

**Description:** This is the account access key used to authenticate with the Controller.

**Element in controller-info.xml:** `<account-access-key>`

**System Property:** `-Dappdynamics.agent.accountAccessKey`

**Environment Variable:** `APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY`

**Type:** String

**Default:** None

**Required:** Yes. Earlier than 4.1, this property was required only for SaaS and multi-tenant Controllers. The account access key property is now required to authenticate all agent to Controller communications.

**Example:** `-Dappdynamics.agent.accountAccessKey=165e65645-95c1-40e3-9576-6a1424de9625`

### Multiple Agent Environment Properties

The following properties are useful when you are configuring your system to include more than one Database Agent.

Database Agent Name Property

**Description:** This property uniquely identifies the Database Agent to the Controller.

**System Property:** `- Ddbagent.name=<db_agent_name>`

**Type:** ASCII string, including spaces. If `<agent_name>` contains spaces, you must enclose the entire name in double quotes (" ").

**Default:** Default Database Agent

**Required:** Required when you have more than one Database Agent reporting to the Controller.

You may want to run multiple **Database Agents** under the following conditions:

- When you have databases spread across multiple networks, and one machine cannot access all the databases on all the networks. In this case, you can have a uniquely named Database Agent in each network that monitors the databases only visible on that network.
- If you have multiple SQL Server instances that each require different credentials, and you want to connect to them via Windows Authentication. When using Windows Authentication, the Database Agent will use the credentials of the currently logged in user.
- When you want one or more agents to back up a primary agent. The database agent names for your backup agents must match the database agent name of your primary agent. The last agent you launch will be the primary agent.

**Example:** `-Ddbagent.name="Scarborough Network Database Agent"`

### Unique Host ID

**Description:** The Unique Host ID logically partitions a single physical host or virtual machine such that it appears to the Controller that the application is running on different machines. Set the value to a string that is unique across the entire managed infrastructure. The string must not contain any spaces. If you have a machine agent that is running on the same host as that of the database agent, then this property value must be different than that of the machine agent. If you are running multiple database agents from the same host with the same name, then this property value must be different for those agents.

**System Property:** `-Dappdynamics.agent.uniqueHostId`

**Type:** String

**Default:** None

**Environment Variable:** `APPDYNAMICS_AGENT_UNIQUE_HOST_ID`

### Multi-Tenant Mode Properties

If the AppDynamics Controller is running in multi-tenant mode or if you are using the AppDynamics SaaS Controller, specify the account name and account access key for this agent to authenticate with the Controller.

If the Controller is running in single-tenant mode (the default) there is no need to configure these values.

#### Account Name Property

**Description:** This is the account name used to authenticate with the Controller.

If you are using the AppDynamics SaaS Controller, the Account Name is in the Welcome email AppDynamics sent to you.

**Element in controller-info.xml:** `<account-name>`

**System Property:** `-Dappdynamics.agent.accountName`

**Environment Variable:** `APPDYNAMICS_AGENT_ACCOUNT_NAME`

**Type:** String

**Default:** None

#### Required:

Yes for AppDynamics SaaS Controller and other multi-tenant users

No for single-tenant users

---

## Proxy Properties for the Controller

These properties route data to the Controller through a proxy.

### Proxy Host Property

**Description:** This is the proxy host name or IP address.

**Element in controller-info.xml:** Not applicable

**System Property:** `-Dappdynamics.http.proxyHost`

**Type:** String

**Default:** None

**Required:** No

### Proxy Port Property

**Description:** This is the proxy HTTP(S) port.

**Element in controller-info.xml:** Not applicable

**System Property:** `-Dappdynamics.http.proxyPort`

**Type:** Positive Integer

**Default:** None

**Required:** No

### Proxy User Name

**Description:** The name of the user that is authenticated by the proxy host.

**Element in controller-info.xml:** Not applicable

**System Property:** `-Dappdynamics.http.proxyUser`

**Type:** String

**Default:** None

**Required:** No

### Proxy Password

**Description:** The absolute path to the file containing the password of the user that is authenticated by the proxy host. The password must be the first line of the file.

If [Use Encrypted Credentials](#) is false, enter the password in plain text. If Use Encrypted Credentials is true, encrypt the password. See [Encrypt Agent Credentials](#).

**Element in controller-info.xml:** Not applicable

**System Property:** `-Dappdynamics.http.proxyPasswordFile`

**Type:** String

**Default:** None

**Required:** No

## Other Properties

### Controller SSL Enabled Property

**Description:** This property specifies whether the agent should use SSL (HTTPS) to connect to the Controller. If SSL Enabled is true, set the Controller Port property to the HTTPS port of the Controller. See **Controller Port Property**.

**Element in controller-info.xml:** `<controller-ssl-enabled>`

**System Property:** `-Dappdynamics.controller.ssl.enabled`

**Environment Variable:** `APPDYNAMICS_CONTROLLER_SSL_ENABLED`

**Type:** Boolean

**Default:** False

**Required:** No

## Enable SSL and SSH for Database Agent Communications

### Enable SSL for the Database Agent

This page describes how to configure the Database Agent to connect to the Controller using SSL. It assumes that you use a SaaS Controller or have configured the on-premises Controller to use SSL.

The Database Agent supports extending and enforcing the SSL trust chain when in SSL mode.

#### Requirements

Gather this information:

- The Controller SSL port.
  - For SaaS Controllers the SSL port is 443.
  - For on-premises Controllers the default SSL port is 8181, but you may configure the Controller to listen for SSL on another port.
- The signature method for the Controller's SSL certificate:
  - A publicly known certificate authority (CA) signed the certificate. This applies for DigiCert, Verisign, Thawte, and other commercial CAs.
  - A CA internal to your organization signed the certificate. Some companies maintain internal certificate authorities to manage trust and encryption within their domain.
  - The Controller uses a self-signed certificate.

#### Establish Trust for the Controller's SSL Certificate

To establish trust between the Database Agent and the AppDynamics Controller, you must create an agent truststore that contains the root certificate for the authority that signed the Controller's certificate.

 If you secured your on-premises Controller with a self-signed certificate, see [Keystore Certificate Extractor Utility](#) for instructions to create the agent keystore.

1. Obtain the root certificate for the authority that signed the certificate for the Controller.
  - a. For SaaS Controller deployments: You can download the DigiCert root certificates from <https://www.digicert.com/digicert-root-certificates.htm>. Ensure to include at least the following certificates:

- DigiCert Global Root CA
- DigiCert Global Root G2
- DigiCert Global Root G3
- DigiCert TLS ECC P384 Root G5
- DigiCert TLS RSA4096 Root G5

b. For on-premises Controller deployments: Obtain one of the following root certificates:

- The root certificate for the publicly known certificate authority (CA) that signed the certificate for your on-premises Controller.
- The root certificate for the internal CA that signed the Controller certificate for your on-premises Controller.

2. Run the Java keytool command to create the Database Agent truststore:

```
keytool -import -alias rootCA -file
<root_certificate_file_name> -keystore cacerts.jks -storepass
<truststore_password>
```

For example:

```
keytool -import -alias rootCA -file /usr/home/appdynamics/
DigicertGlobalRootCA.pem -keystore cacerts.jks -storepass
MySecurePassword
```

 Make note of the truststore password, you need it to configure the Database Agent.

3. Install the agent truststore to the Database Agent configuration directory:

```
<db_agent_home>/conf/
```

## Secure the Database Agent Truststore

AppDynamics recommends you take the following security measures to prevent tampering with the Database Agent truststore:

- Secure the truststore file through file system permissions:
  - Make the Database Agent truststore readable by any user.
  - Make the truststore owned by a privileged user.
  - Make the truststore writable only by the specified privileged user.
- Secure the Database Agent configuration files so that they are only readable by the agent runtime user and only writable by a privileged user:
  - Global configuration file: `<db_agent_home>/conf/controller-info.xml`.

## Configure SSL System Properties for the Database Agent

1. Configure the following system properties in the versioned `controller-info.xml`: `<db_agent_home>/<version_number>/conf/controller-info.xml`. See "SSL Configuration Properties" on [Database Agent Configuration Properties](#) for full details on each property.
  - **Controller Port:** the SSL port for the Controller. 443 for AppDynamics SaaS.
 

```
<controller-port>443</controller-port>
```

- **Controller SSL Enabled:** true.  
`<controller-ssl-enabled>>true</controller-ssl-enabled>`
- **Controller Keystore Password:** the plain text password for the Database Agent truststore.  
`<controller-keystore-password>MySecurePassword</controller-keystore-password>`  
If you have enabled the Secure Credential Store, encrypt the password you enter here. See [Encrypt Agent Credentials](#).
- **Controller Keystore Filename:** path of the Database Agent truststore relative to `<db_agent_home>/<version>/conf`. Required if you use a truststore other than the default `<db_agent_home>/<version_number>/conf/cacerts.jks`.  
`<controller-keystore-filename>../../conf/cacerts.jks</controller-keystore-filename>`

**i** You can specify the Controller port and enable SSL for the Controller in the JVM startup script, but you must specify the truststore password and filename in the `controller-info.xml` file.

2. Save your change to the `controller-info.xml` file and restart the Database Agent.

### Sample SSL `controller-info.xml` Configuration

```
<?xml version="1.0" encoding="UTF-8"?>
<controller-info>
 <controller-host>mycompany.saas.appdynamics.com</controller-host>
 <controller-port>443</controller-port>
 <controller-ssl-enabled>true</controller-ssl-enabled>
 <controller-keystore-password>MySecurePassword</controller-keystore-password>
 <controller-keystore-filename>../../conf/cacerts.jks</controller-keystore-filename>
 ...
</controller-info>
```

### Keystore Certificate Extractor Utility

The Keystore Certificate Extractor Utility exports certificates from the Controller's Java keystore for the Database Agent truststore. It installs to the following location:

```
<agent_home>/utils/keystorereader/kr.jar
```

To avoid copying the Controller keystore to a Database Agent machine, you can run this utility from the Controller server. Access the agent distribution on the Controller at the following location:

1. Run the Keystore Certificate Extractor Utility from the Controller:

```
% /<full path to application JRE>/bin/java -jar <controller_home>/appserver/glassfish/
domains/domain1/appagent/<controller_version>/utils/keystorereader/kr.jar
```

2. Enter the following when prompted:

- The full path to the Controller's keystore:

```
Enter input keystore: <controller_home>/appserver/glassfish/domains/domain1/config/
keystore.jks
```

- The truststore output file name. By default the Database Agent looks for `cacerts.jks`.

Enter output agent truststore file name: <controller\_home>/appserver/glassfish/domains/domain1/config/keystore.jks

The password for the Controller's certificate, which defaults to "changeit". If you don't include a password, the extractor applies the password "changeit" to the output truststore.

◦ **Example command to execute kr.jar**

```
<full path to application JRE>/bin/java -jar kr.jar <controller_home>/appserver/glassfish/domains/domain1/config/keystore.jks cacerts.jks <controller_certificate_password>
```

3. Install the agent trust store to the agent configuration directory:

```
<db_agent_home>/conf/
```

### Enable SSH for the Database Agent

**i For Linux hosts only**

Applies only when Database Agent is running on a Linux host.

When the Database Agent is running on Linux and you want to monitor hardware, except to monitor the local host, authentication is required and a password is passed between the Database Agent and the database server.

**i SSH port option**

The SSH port option does not appear unless the Database Agent is running on Linux.

1. On the agent machine, generate the rsa or dsa key as follows:

**Generate rsa key**

```
% ssh-keygen -b 1024 -f id_rsa -t rsa
```

or

**Generate dsa key**

```
% ssh-keygen -b 1024 -f id_dsa -t dsa
```

This will create a rsa or dsa 1024-bit key and put the keys into `/home/<user_name>/.ssh/id_rsa` and `/home/<user_name>/.ssh/id_rsa.pub` or `/home/<user_name>/.ssh/id_dsa` and `/home/<user_name>/.ssh/id_dsa.pub` files. Do not change the names of these files.

- Copy the private key, `/home/<user_name>/.ssh/id_rsa` or `/home/<user_name>/.ssh/id_dsa` into the `<db-agent_home>/keys` directory.
- On both the monitored machine and the agent machine, verify that you have the correct permissions on the `.ssh` directory, or set them as follows:

#### .ssh directory permissions

```
% cd /home/<user_name>
% chmod 755 .ssh
```

- On the monitored machine, verify that you have a `/home/<user_name>/.ssh/authorized_keys` file. If you do not have this file, create the `authorized_keys` file on the monitored machine as follows:

#### Create authorized\_keys file

```
% cd /home/<user_name>/.ssh
% touch .ssh/authorized_keys
```

- Verify that you have the correct permissions to the `/home/<user_name>/.ssh/authorized_keys` file, or change the permissions as follows:

#### authorized\_keys file permissions

```
% cd /home/<user_name>/.ssh
% chmod 644 authorized_keys
```

- Append (do not copy) the file `'id_rsa.pub'` or the file `'id_dsa.pub'` to the file, `/home/<user_name>/.ssh/authorized_keys`, such as follows:

#### Append rsa public key to authorized key

```
% echo /home/<user_name>/.ssh/id_rsa.pub >> /home/<user_name>/.ssh/authorized_keys
```

or

#### Append dsa public key to authorized key

```
% echo /home/<user_name>/.ssh/id_dsa.pub >> /home/<user_name>/.ssh/authorized_keys
```

7. The SSH port of the database Collector is set to 22 by default. You can change it by navigating to the Monitoring Hardware section of the Collector configuration dialog. In the dialog, set the SSH port to the port you require.
8. Save your change to the Collector configuration and restart the Database Agent.

### Enable SSH via PEM certificate

For Linux, AppDynamics also supports certificate-based authentication via Privacy Enhanced Mail (PEM). To implement certificate-based authentication:

1. Enable the **Use certificate** option in the Monitoring hardware section of the Collector configuration dialog.
2. Copy the PEM file to the `<db_agent_home>/keys` directory. Note, if the `home/<user_home>/.ssh` directory exists, the agent will use the certificate found there.
3. Restart the agent.

### Monitor SSL-enabled PostgreSQL on Amazon RDS

To monitor a PostgreSQL instance that uses SSL connections, complete the following steps.

1. Create the `.postgresql` directory under the system home folder, then create a file, `root.crt` in the directory.  
`/home/<name>/.postgresql/root.crt`
2. Download PEM file from Amazon and copy to a local directory.
3. Convert the PEM file to a DER file using the following `openssl` command:

```
openssl x509 -outform der -in rds-combined-ca-bundle.pem -out rds-combined-ca-bundle.der
```

4. Add the certificate to the Java keystore using the following command:

```
sudo keytool -import -noprompt -trustcacerts -alias AmazonRDS -file rds-combined-ca-bundle.der -keystore $JAVA_HOME/jre/lib/security/cacerts -storepass changeit
```

You can verify that the certificate was added by running the following command:

```
keytool -list -keystore $JAVA_HOME/jre/lib/security/cacerts -storepass changeit
```

5. Re-start the dbagent process to register the certificate you added.
6. In the Controller, create a new collector for PostgreSQL.
  - a. In the **Custom JDBC Connection String** field, enter the following JDBC string:  
`jdbc:postgresql://<RDS-Hostname>:<RDS-Port>/postgres?ssl=true`
  - b. In the **ADVANCED OPTIONS** section, select **Connection Properties** and then specify these property details:

Property Name	Property Value
<code>sslrootcert</code>	The location of the downloaded PEM file

Property Name	Property Value
sslmode	verify-full

### Monitor SSL-enabled MySQL on Amazon RDS

To monitor a MySQL instance that uses SSL connections, enable MySQL in SSL mode, consulting the online documentation appropriate to your deployment.

Download the files shown below as they are required to complete this procedure:

- ca.pem
- server-cert.pem
- server-key.pem
- client-cert.pem
- client-cert.key

Run the following commands at the command line. Substitute URLs and other information from your deployment for the placeholders in the examples.

#### 1. Test your local SSL connection:

```
mysql -h ec2-11-111-111-11.us-west-2.compute.amazonaws.com -u Testssl --ssl-ca=/etc/certs/ca.pem --ssl-cert=/etc/certs/server-cert.pem --ssl-key=/etc/certs/server-key.pem -p
```

#### 2. Verify the remote connection:

```
mysql -h ec2-11-111-111-11.us-west-2.compute.amazonaws.com -u Testssl --ssl-ca=/home/appdynamics/cert/ca.pem --ssl-cert=/home/appdynamics/cert/client-cert.pem --ssl-key=/home/appdynamics/cert/client-key.pem -p
```

#### 3. Import the ca.pem file to the default truststore:

```
sudo keytool -importcert -alias MySQLCACert -file ca.pem -keystore $JAVA_HOME/jre/lib/security/cacerts -storepass changeit
```

- Do not forget the password, as you need it in step 7

#### 4. Convert the client key and certificate files to a PKCS #12 archive:

```
openssl pkcs12 -export -in client-cert.pem -inkey client-key.pem -name "mysqlclient" -passout pass:changeit -out client-keystore.p12
```

#### 5. Import the client key and certificate into a Java keystore:

```
sudo keytool -importkeystore -srckeystore client-keystore.p12 -srcstoretype pkcs12 -srcstorepass changeit -destkeystore $JAVA_HOME/jre/lib/security/cacerts -deststoretype JKS -deststorepass changeit
```

6. Verify that the certificate was added:

```
keytool -list -keystore $JAVA_HOME/jre/lib/security/cacerts -storepass mypassword
```

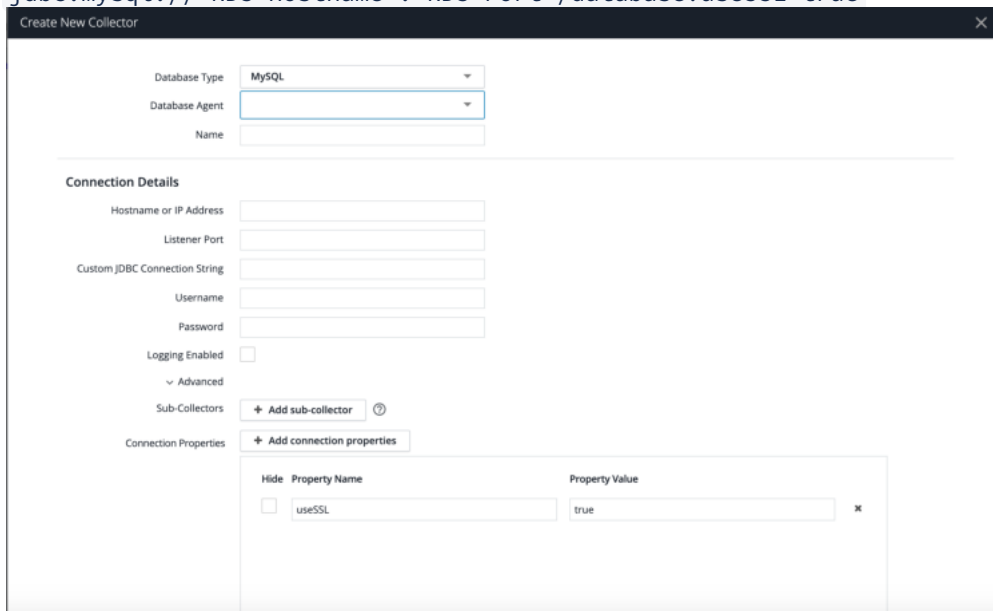

7. Start the db-agent after ensuring that the following properties are added:

```
/<full path to application JRE>/bin/java -jar -Djavax.net.ssl.trustStore=$JAVA_HOME/jre/lib/security/cacerts -Djavax.net.ssl.trustStorePassword=changeit -Djavax.net.ssl.keyStore=$JAVA_HOME/jre/lib/security/cacerts -Djavax.net.ssl.keyStorePassword=changeit db-agent.jar
```

8. In the Controller, create a new collector for MySQL

- In the Configuration panel, add the connection property with Property Name "useSSL" and Property Value "true"
- Alternatively, you can also use the following custom connection string:

```
jdbc:mysql://<RDS-Hostname>:<RDS-Port>/database?useSSL=true
```

### Monitor SSL-enabled MongoDB

You can configure your MongoDB instance to use SSL connections.

1. Create a keystore on the database agent host.
2. Import the SSL certificates to this keystore using the following command:

```
keytool -importcert -trustcacerts -file <mongodb certificate location> -keystore <keystore e.g. path/mongo.jks> -storepass <keystore password> -alias <alias>
```

3. Start the database agent with the following flags:

```
java -Ddbagent.name=<DBAgent Name> -Djavax.net.ssl.trustStore=<keystore e.g. path/mongo.jks> -Djavax.net.ssl.trustStorePassword=<keystore password> -jar db-agent.jar
```

4. Create the mongodb collector with custom URL:

```
mongodb://<mongodb-host>:27017/?ssl=true
```

## Monitor SSL-enabled Microsoft SQL Database

You can configure an MSSQL instance to use SSL connections.

**i** While executing the steps, enter the truststore password for any password prompt.

1. Create a keystore on the database agent host.
2. Import the SSL certificates to the keystore using this command:

```
keytool -import -v -trustcacerts -alias <alias> -file <MSSQL AA certificate location> -keystore <keystore e.g. path/sqlca.ks>
```

3. Create the mssql-AA collector with custom URL:

```
jdbc:sqlserver://
<host>:<port>;encrypt=true;trustServerCertificate=false;trustStore=<keystore e.g. path/
sqlca.ks> ;trustStorePassword=<Truststore Password>;hostNameInCertificate=<HostName In
certificate>
```

## Enable Snapshot Correlation for Oracle

For the Oracle Collector AppDynamics Database Visibility to collect database queries, sessions, clients, and schemas information that occurred during snapshots captured by the Java Agent, you need to set the `jdbc-dbcam-integration-enabled` App Agent property for the Java Agent.

For information on the `jdbc-dbcam-integration-enabled` property, see [App Agent Node Properties](#).

For information on snapshot correlation between the Oracle database Collector and a Java business transaction, see [Access Database Visibility from Application Monitoring Views](#)

## Increasing JVM Memory

To monitor multiple databases, you may need to increase the JVM memory allocation size. Increased activity on the databases you are monitoring results in increased memory usage.

Use one of the following commands to start the agent, and to initially allocate 1536 MB to the agent instead of the default of 64 MB.

### For Windows 64-bit

```
C:\java -Xmx1536m -Djava.library.path="<db_agent_home>\auth\x64" -jar <db_agent_home>\db-agent.jar
```

## For Linux

```
% java -Xmx1536m -jar <db_agent_home>/db-agent.jar
```

## Database Agent Logging

By default, the Database Agent writes log files to the *log* directory.

### Configure Agent Logging

You can configure the agent to generate log files.

1. From the agent home directory, navigate to log directory.
2. Open `log4j.xml`.
3. Find `<logger name="com "`. Inside this tag, set `level value` to `debug`, as shown below:

```
<logger name="com">
 <level value="debug"/>
</logger>
```

4. Let the agent run for 10 minutes to generate some logs.
5. From the agent home directory, navigate to the *log* directory to view your logs.

## Start and Stop the Database Agent

### Start the Agent

If you are using an on-premises version of Database Visibility, you must [start the Events Service](#) before you start the Database Agent. Before starting the agent, you must [configure the properties in this file](#). You must specify these properties:

- Controller Host Property
- Controller Port Property
- Account Access Key Property

### Start the Agent in a Command Shell

The following assumes that all the necessary parameters have been specified in the `controller-info.xml`. The `controller-info.xml` file describes the properties of agent to Controller communications. Note that `<db_agent_home>` is the absolute path to the location where the Database Agent is installed. Setting the heap size is recommended as shown below. See [Database Visibility System Requirements](#).

### Windows

```
cd <db_agent_home>
start-dbagent.bat -Xms<min_heap_size> -Xmx<max_heap_size>
```

## Linux

```
cd <db_agent_home>
./start-dbagent -Xms<min_heap_size> -Xmx<max_heap_size> &
```

### Start the Agent as a Service

See [Install the Database Agent as a Windows Service](#), [Start the Database Agent Automatically on Windows](#), and [Start the Database Agent Automatically on Linux](#).

### Stop the Agent

#### Stop the Agent in a Command Shell

If the Database Agent process is running in the background, you can stop it by simply entering the kill command with the process ID as the argument. If it is running in the foreground in a console, you can press Ctrl+C to shut down the agent.

#### Stop the Agent Service in Windows

In the Windows Services application, select **AppDynamics Database Agent** and click **Stop**.

### Start the Database Agent Automatically on Linux

#### Related pages:

- [Install the Database Agent](#)
- [Database Agent Configuration Properties](#)

To enable the Database Agent to start automatically whenever the machine starts up:

1. Create an initialization script that starts the agent, as in the sample [initialization script](#) that is an attachment to this page.  
In your script, set the `JAVA` and `AGENT_HOME` values to the paths for your system. Also, configure agent options and heap size, as needed.
2. Enable execution permissions for the script. For example, given an initialization script named `db-agent`, enter:

```
sudo chmod 775 db-agent
```

3. Place the script in the initialization directory on your system, typically `/etc/init.d`. Alternatively, create a symbolic link to the script from the `init.d` directory to the script if you want to keep it in another location.
4. Add the script as a service as follows:
  - For Red Hat and most Linux Operating Systems, run these commands, replacing `db-agent` with the name of your file or symbolic link:

```
chkconfig --add db-agent
chkconfig --level 2345 db-agent on
```

- For Ubuntu and Debian Operating Systems, run this command, replacing `db-agent` with the name of your file or symbolic link:

```
update-rc.d -f db-agent start 99 2 3 4 5 .
```

In the command:

- `start` is the argument given to the script (start, stop).
- 99 is the start order of the script (1 = first one, 99 = last one)
- 2 3 4 5 are the runlevels to start
- Be sure to include the dot (.) at the end of the command.

The Database Agent now starts automatically upon machine startup. When setting the agent to automatically start up using Task Scheduler when the machine starts or restarts, ensure the agent runs with the highest privileges available.

## Start the Database Agent Automatically on Windows

### Related pages:

- [Administer the Database Agent](#)
- [Database Agent Configuration Properties](#)
- [Database Visibility](#)

Most Windows server software runs as a service when the machine boots up. You can create a Windows service to run the Database Agent by executing a script bundled with the product.

### Install the Database Agent as a Windows Service

To create the Database Agent as a Windows service, run the following command as an administrator:

```
cscript <db_agent_home>\InstallService.vbs <jvm_options>
```

`<db_agent_home>` is the path to the install directory.

A Windows service named `Appdynamics Database Agent` is created.

`SilentInstall` and `serviceName` are optional parameters, which can be used along with the preceding command. The following syntax shows how to add these parameters:

```
cscript <db_agent_home>\InstallService.vbs SilentInstall serviceName=<name_of_the_service> <jvm_options>
```

`<db_agent_home>` is the path to install directory, and `<name_of_service>` is the name that you want to use for renaming the service.

You can use `SilentInstall` to create the Database Agent as a Windows service in the silent mode where the script skips user input for installation.

For database Agent  $\geq 20.5$ , you can add a service with a different name or change the name of the service by using the `serviceName` parameter. If you do not specify any value for this parameter, the service name is set to `Appdynamics Database Agent` by default.

**!** To use different Windows service name for different Database Agents, ensure that you run each Database Agent as a service from different install directories.

```

If you choose to use Windows authentication for Microsoft SQL Server, you must change your login credentials and restart the database agent service.

### Uninstall the Database Agent as a Service

To uninstall the database agent service, run the following command as an administrator:

```
cscript <db_agent_home>\UninstallService.vbs
```

```

c:\ Select Administrator: Command Prompt
Microsoft Windows [Version 10.0.17134.345]
(c) 2018 Microsoft Corporation. All rights reserved.

## Running the Agent on Windows Using the Task Scheduler

It is recommended to run the Database Agent as a Windows service. However, if you choose to run the agent using Task Scheduler, ensure the agent runs with the highest privileges available. When using Task Scheduler, if the host is restarted, the agent will not start automatically.

## Add Database Licenses

### Related pages:

- [Add Database Collectors](#)
- [Observe License Usage](#)

To monitor the databases concurrently, the Controller requires a license for the total number of databases. Though all the versions of the Database Agent are compatible, AppDynamics recommends Database Agent  $\geq 21.2$  for Infrastructure-based Licensing Model.

For Database Agent license details, see [License Entitlements and Restrictions](#).

### Add New Licenses

To add a new license, see [Apply or Update a License File](#).

### Manage Licenses in the Controller

To view and manage license consumption in the Controller, see [Observe License Usage](#).

### Transfer a License Between Databases

A database license is allocated to the first agents that register with the Controller up to the licensed limit.

To transfer a license for the Database Agent to another database, you simply remove the Collector for the old database and then add a new Collector for the database you want to monitor instead. See [Add Database Collectors](#).

 If you disable a collector, it still consumes a license.

## Configure Controller Settings for Monitoring Database

You can configure parameters for the controller, such as the number of events sent to the Events Service at a given time.

To change the Controller settings for Database Agents:

1. Log in to the [Administration Console](#).
2. Click **Controller Settings**.
3. Change the settings as needed and **Save**.

### Controller Settings

Property Name	Property Overview	Default	Minimum Value
dbmon.event.publisher.esclient.batch.size	Batch size for each Event Service client used by Database Monitoring.	1500	200
dbmon.event.publisher.queue.size	Maximum measurement queue size maintained by Database Monitoring.	100000	10000
dbmon.config.data.retentionperiod	Number of days to retain database monitoring data (queries, clients, users, sessions, schemas) excluding the current day. Data reported before the retention period might be unrecoverable, even for a momentary update of this property.	10	1
dbmon.config.max.custommetric	Number of custom metrics that can be created per collector.	40	0

## Configure the Agent Settings for Monitoring Database

This page provides information about the different agent properties that are used for database monitoring. For configuring the basic agent properties, see [Database Agent Configuration Properties](#).

You can update the following properties using the `controller-info.xml` file located in the `<db_agent_home>/conf` directory.

The following table includes the property names that can be used for any specific database or for all the databases along with the purpose of the properties.

### Agent Properties for Monitoring Relational Databases

Property Name	Database	Purpose	Default Value
<code>-Ddbagent.disable.sybase.ase.system.monitoring</code>	Sybase	<p>This property specifies whether the agent should disable Sybase. You may want to disable Sybase monitoring with Database Visibility if you are already using other tools to monitor Sybase. Refer to <a href="#">Sybase Database Permissions</a> for information on configuring Sybase permissions.</p> <p>If an agent is run with the <code>-Ddbagent.disable.sybase.ase.system.monitoring</code> flag, Database Visibility will stop executing <code>sp_sysmon</code> for Sybase databases. As a result, the following metrics might not show reliable data:</p> <ul style="list-style-type: none"> <li>• Calls per Minute (KPI)</li> <li>• All metrics under Server Statistic in the Metric Browser</li> <li>• The Load value on the Sybase dashboard</li> </ul>	false
<code>-Ddbagent.sampling.interval</code>	All relational database	<p>This is the interval at which queries are sampled. The interval can be 1s, 2s, 5s, 10s, 20s, or 30s. For example, if you have configured the property value as <code>2</code>, <b>Elapsed Time</b> is displayed for 2s, 4s, 6s, and so on (in the multiples of 2).</p>	1

 This property can be used for MongoDB and Couchbase.

Property Name	Database	Purpose	Default Value
<code>dbagent.postgresql.database.size.fetch.timeout.in.hrs</code>	PostgreSQL	This specifies the frequency of collecting the database size statistics for each Postgres SQL collector. This property is required for the environment where you monitor a Postgres SQL database that includes large number of objects. If the value of this property < 1, then the collector does not fetch the value for the size metric.	1

### Agent properties for monitoring Cassandra

Property Name	Purpose	Default Value
<code>dbagent.cassandra.sampling.interval.seconds</code>	The interval at which queries are sampled. According to the sampling interval (between 1 and 60), the sampling threshold is set (between 300 ms and 1000 ms).	10
<code>dbagent.cassandra.max.query.execution.time.seconds</code>	Maximum query execution time. Queries executing for more than this duration are not be sampled.	300
<code>dbagent.cassandra.query.sampling.limit</code>	The maximum number of queries to sample in a single sampling period. If this value is 0, query sampling is disabled.	100,000
<code>dbagent.cassandra.dse.skip.slow.query.table.for.sampling</code>	Whether to use sampling from query traces instead of the <a href="#">node_slow_log table</a> for DSE Cassandra.	false

Property Name	Purpose	Default Value
<code>dbagent.cassandra.apache.sampling.threshold.in.milliseconds</code>	<p>Defines the sampling threshold for Apache Cassandra. In other words, queries taking more than this threshold to execute, are sampled by the database agent.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p><b>i</b> This property sets a fixed sampling threshold. To use a dynamic sampling threshold based on the sampling interval set a negative value to this property.</p> </div>	-1

## Add Database Collectors

To enable the Database Agent to collect data, you must add and configure a Database Collector for each database that you want to monitor. The Database Collector is the process that runs within the Database Agent to collect performance metrics about your database instances and database servers.

### Required Database Permissions

You must have the required permissions to monitor your databases. See [Database Visibility Supported Environments](#).

### AppDynamics Permissions

To add, edit, and create collectors, users need a role with the proper permissions:

- Can Create Collectors
- Can Edit All Collectors
- Can Delete All Collectors

See [Database Permissions](#).

## Add a Database Collector

1. Click the Configuration tab in the left panel menu.
2. Click the **Collectors** option.
3. In the Collectors panel, click **Add (+)**.
4. Complete each field of the **Create New Collector** dialog
5. If you want to add a sub-collector to be monitored, click **Advanced >> +Add sub-collector** to enter host and port details.

**i** Sub-collectors are applicable only to relational database types.

6. Click **OK**. Your database administrator can provide you with the necessary details.

---

After you have added a collector, you can configure the collector for your database. You can also [link a database](#) on the application flow maps to a database instance monitored by Database Visibility.

## Hardware Monitoring

For information on the fields to complete in order for the Database Agent to monitor the server hardware in addition to the database, see [Configure the Database Agent to Monitor Server Hardware](#).

## Verify Collector Setup

Once the Collector is up and running, in just a short time you can start viewing the historical activity data.

The Collector configuration window now has a collector icon you can click to edit the details of the collector if required. The Collector will also appear in the list of Databases shown in the left navigation menu. It might take a few minutes before the Collector and its metrics are reported.

From the left navigation menu, click **Databases** to see a high-level view of the activity of all the configured Collectors.

Click the name of the database to see more details of the metrics AppDynamics Database Monitoring has captured.

For information on using and interpreting the Collector windows, see [Monitor Databases and Database Servers](#).

## Edit a Database Collector

From the Collectors panel, you can edit any of the details of the collector except the type of database platform to monitor.

For more information on collector fields, see the collector configuration page for your database.

- [Configure IBM DB2 Collectors](#)
- [Configure Microsoft SQL Server Collectors](#)
- [Configure Microsoft Azure Collectors](#)
- [Configure MongoDB Collectors](#)
- [Configure MySQL Collectors](#)
- [Configure Oracle Collectors](#)
- [Configure PostgreSQL Collectors](#)
- [Configure Sybase Collectors](#)
- [Configure Sybase IQ Collectors](#)

## Delete a Database Collector

From the Collectors panel, you can delete a database Collector.

## Export Database Collector Data

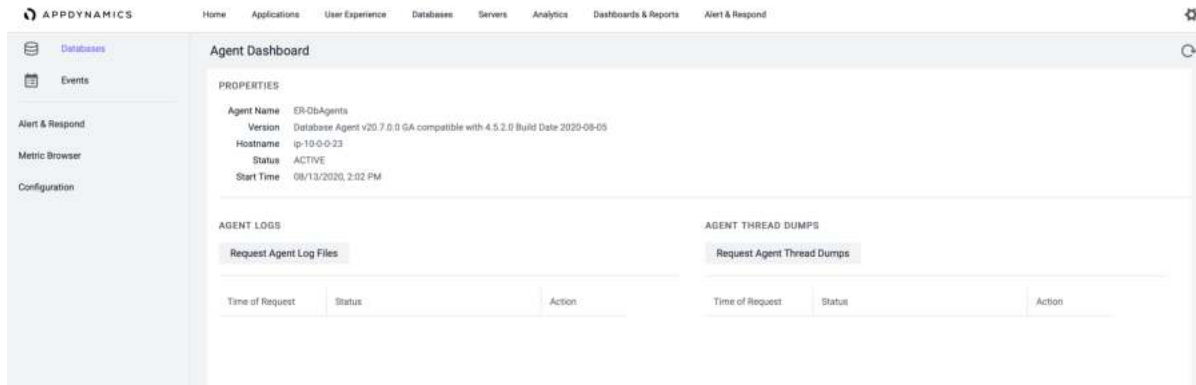

From the Collectors panel, you can click on **Actions > Export Data** to generate a CSV file containing the following data for each collector:

- Collector name
- Host name
- Port number
- Username
- Database type
- Agent name

## View Database Agent Properties and Logs

You can view the database agent properties along with the agent logs and thread dumps by accessing **Agent Dashboard**. These logs are required for debugging and troubleshooting the issues.

To access **Agent Dashboard**, click the agent name under **Agent Name** on the **Collectors** page.

You can click **Request Agent Log files** to either download logs from a specific logger by setting a specific log level for a specific duration or download all logs.

You can click **Request Agent Thread Dumps** to download the required number of thread dumps.

See [Agent Log Files](#) and [Request Agent Log Files](#).

## Troubleshooting Collector Problems

Collectors that have not been configured correctly, or that cannot connect to the database for any reason, will show an error on the **Databases** overview page and individual database dashboards. Hovering over the error icon displays the potential reason for the error.

If your Collector isn't reporting any metrics after a few minutes, and you know the database is up and running with activity, check the **Events** panel. [Agent Diagnostic Events](#) can appear if the password is incorrect or communication errors have occurred. The message summaries on the **Events** panel can help you diagnose and troubleshoot Collector problems.

Check the collector configuration to ensure all the values you entered are correct.

Ensure that your Database Agent has network connection to the databases you want to monitor along with the required permissions. See [Database Monitoring Requirements and Supported Environments](#).

## Configure Cassandra Collectors

This page provides configuration details for Cassandra collectors.

### **i** Prerequisites

To monitor Cassandra with Database Visibility, you must be running version:

- Apache Cassandra >= 3.11.4
- Datastax Enterprise (DSE) Cassandra 5.1, >= 6.7.3

## Connection Details

	Field	Description
Create New Collector	Database Type	The Database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent.
	JMX Port	The port to remotely connect through JMX (optional for DSE Cassandra). See <a href="#">JMX Configurations</a> .
	JMX Username	The name of the JMX user who is connecting to and monitoring the database using the Database Agent. See <a href="#">JMX configurations</a> .
	JMX Password	The password of the JMX user who is connecting to and monitoring the database through the Database Agent.
Username and Password	Username	The name of the user who is connecting to and monitoring the database using the Database Agent. The user must have the permissions described in: <ul style="list-style-type: none"> <li>• <a href="#">User Permissions for Apache Cassandra</a></li> <li>• <a href="#">User Permissions for DSE Cassandra</a></li> </ul>
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.

	Field	Description
Advanced Options	SSL Connection	<p>Click to enable SSL Connection:</p> <ul style="list-style-type: none"> <li>Truststore Location: Location of the certificate on the DB Agent host.</li> <li>Truststore Type: Type of SSL Connection. There are two truststore types: <ul style="list-style-type: none"> <li><b>PKCS12</b> (default)</li> <li><b>SSO</b>: Enables auto-login. If you use SSO, you only need to provide the <code>truststore</code> location and <code>truststore type</code></li> </ul> </li> <li>Truststore Password: Password for SSL Connection.</li> </ul> <p>If you also use client certificate authentication, then click the <b>Enable SSL Client Authentication</b> box.</p> <ul style="list-style-type: none"> <li>Keystore Location: location of the certificate on the DB Agent host</li> <li>Keystore Type: type of SSL Connection</li> <li>Keystore Password: password for SSL Connection</li> </ul> <p>You can set the context protocol for the SSL environment using the <code>CASSANDRA_SSL_CONTEXT_PROTOCOL</code> system variable. If you do not set the context protocol through the system variable, TLSv1.3 is used by default.</p> <p>These platforms support TLSv1.3:</p> <ul style="list-style-type: none"> <li>Oracle JDK <math>\geq 8u261-b12</math></li> <li>AdoptOpenJDK <math>\geq 8u262-b10</math></li> <li>Azul Platform Prime <math>\geq 20.07.0.0</math></li> </ul> <div style="border: 1px solid #00a0e3; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p><b>i</b> If a JDK version does not support TLSv1.3 or the specified context protocol, AppDynamics switches to TLSv1.2.</p> </div>
	Monitor Operating Systems	See <a href="#">Configure the Database Agent to Monitor Server Hardware</a> .

## Cassandra Configurations

These are the required configurations:

- **Query Capture Configurations**
  - [Apache Cassandra](#)
  - [DSE Cassandra](#)

- **JMX Configurations for Apache/DSE Cassandra**

- Open `cassandra-env.sh` file.
- To enable JMX for:
  - local connection, under the if [`"$LOCAL_JMX" = "yes"`]; then statement, set:

```
JVM_OPTS="$JVM_OPTS -Dcom.sun.management.jmxremote.authenticate=true"
```

- for remote connection, under the corresponding else statement, set:

```
JVM_OPTS="$JVM_OPTS -Dcom.sun.management.jmxremote.authenticate=true"
```

- Set the path to the credentials file, `jmxremote.password`:

```
JVM_OPTS="$JVM_OPTS -Dcom.sun.management.jmxremote.password.file=PATH TO FILE"
```

- In the `jmxremote.password` file, set JMX credentials to be the same as that of the database user credentials to be specified in the collector configuration:

```
username password
```

**i** You may choose to give ReadOnly JMX access to the database monitoring user by defining in the `jmxremote.access` file as mentioned in [Enabling JMX authentication and authorization](#).

- i** If DB and JMX have different SSL key stores, use:
- The DB SSL properties in the Controller collector configuration
  - The system properties to set the JMX SSL properties

Run command:

```
-Djavax.net.ssl.keyStore="<path-to-clientKeyStore>"
-Djavax.net.ssl.keyStorePassword=<keystore-password>
-Djavax.net.ssl.trustStore="<path-to-clientTruststore>"
-Djavax.net.ssl.trustStorePassword=<client-truststore-password>
```

**⚠** If JMX SSL is disabled, set `"-Dcassandra.jmx.ssl.enabled" = false` and if JMX SSL is enabled, then set `"-Dcassandra.jmx.ssl.enabled" = true`.

To monitor the JMX SSL-enabled Cassandra database, add the following properties:

```
Dcassandra.jmx.ssl.enabled=true -Djavax.net.ssl.trustStore="
<truststore location>"
-Djavax.net.ssl.trustStorePassword=<password>
```

If you are using a single Database Agent to monitor multiple Cassandra clusters where each Cassandra cluster has different root CAs.

Then, to monitor these Cassandra clusters with different keystore credentials, create one trust store that contains all root CAs of Cassandra clusters and Controller certificates.

For example, to import two root CAs, run the following command:

```
keytool -import -alias <alias-of-CA1> -file <root-CA-of-
DB1> -keystore <truststore-location1> -storepass
<truststore-password1>
keytool -import -alias <alias-of-CA2> -file <root-CA-of-
DB2> -keystore <truststore-location1> -storepass
<truststore-password1>
```

For more information, see [Enable SSL and SSH for Database Agent Communications](#).

If you cannot create a single trust store, use different Database Agents while monitoring different Cassandra clusters.

## Database Column Families Panel

To see the Top N Queries run on a column family, double-click or single-click the column family, and then click **View Top Queries**. For more details about a query, double-click a query to open the Query Details panel.

## Access the Column Lists Panel

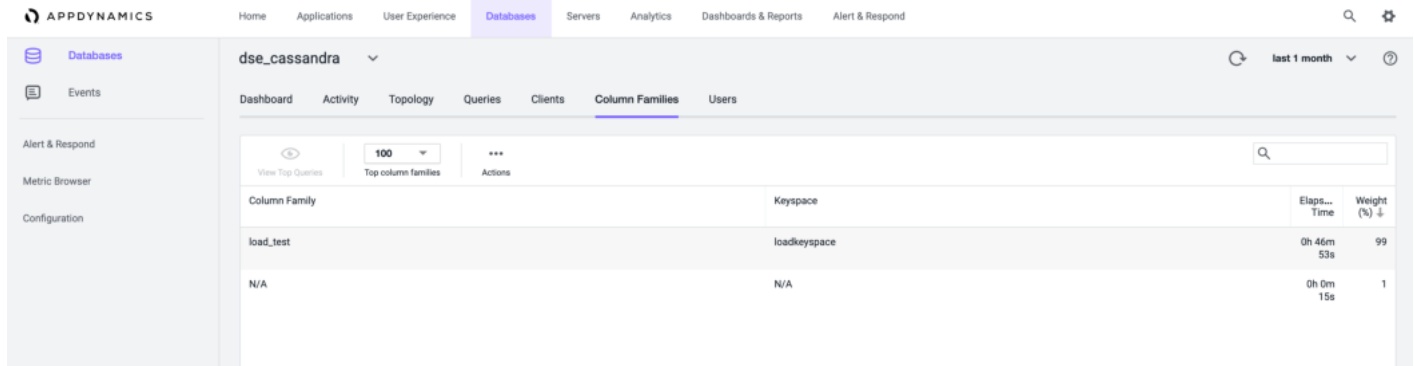

To access the **Column Lists** panel:

1. Click the name of the database from the list.
2. Click the Column Families tab. You may have to click the expand button (>>) to see the tab. Use the **Top column families** dropdown to view information for the top 10, 50, 100 or 200 column families sorted by total time spent in the database.

## Features of the Column Families Panel

On the **Database Column Families** panel, you can see this information:

- **Column Family:** The names of the column families on which queries have been executed in this database.
- **Keyspace:** The names of the keyspaces on which queries have been executed in this database.
- **Elapsed Time:** Duration of time queries executed in the column family.
- **Weight (%):** Time spent on executing queries on column families as a percentage of the total time spent by all column families.

**i** Click **Actions** to export the data on this panel in a `.csv` formatted file that is automatically downloaded to your specified downloads directory.

### Enable Cassandra Monitoring

Before you can enable Cassandra monitoring, you must meet these requirements:

- Controller  $\geq$  4.5.17
- Database Agent  $\geq$  4.5.16
- Set the account level property to " `dbmon.cassandra.monitoring.enabled` ":

To enable Cassandra monitoring :

1. Go to `<controller_url>/admin.jsp` , then click **Account Settings**. A list of accounts display.
2. Select an account from the list of options to enable Cassandra monitoring, then click **Edit**.
3. Click **+ Add Property**. Two blank fields display.
4. Enter `dbmon.cassandra.monitoring.enabled` and `true` in the first and second blank fields, respectively.

5. Select **Save**.

### Query Capture Configurations for Apache Cassandra

The Database Agent captures only traced queries. To enable query tracing:

1. [Turn on tracing in the CQLSH prompt](#)
2. [Enable tracing for the statement/prepared statement in the client application](#)
3. [Enable probabilistic tracing](#)

Add this configuration to the `cassandra.yaml` file:

```
TTL for different trace types used during logging of the repair process.
tracetype_query_ttl: 300
```

This reduces the persistence of entries in `system_traces` keyspace (sessions and events) from 24 hours to 30 minutes. You may allow longer retention based on the number of queries being traced.

### User Permissions for Cassandra

These are the user permissions to configure Cassandra:

```
CREATE ROLE appdynamics_role;
GRANT SELECT ON KEYSPACE system_traces TO appdynamics_role;
GRANT appdynamics_role TO appdynamics;
```

### Query Capture Configurations for DSE Cassandra

In the `dse.yaml` file, configure (or uncomment and edit) these parameters:

```
cql_slow_log_options:
 enabled: true
 # When t > 1, log queries taking longer than t milliseconds.
 # 0 <= t <= 1, log queries above t percentile
 threshold: 2000
 # Initial number of queries before percentile filter becomes active
 minimum_samples: 100
 ttl_seconds: 259200
 # Keeps slow queries in-memory only and doesn't write data to the database.
 # WARNING - if this is set to 'false' then set threshold >= 2000, otherwise there will be
 a
 # high load on the database.
 skip_writing_to_db: false
 # The number of slow queries to keep in-memory
 num_slowest_queries: 5
```

**i** You can adjust all of these parameters, except " enabled " and " skip\_writing\_to\_db ", per the monitoring requirements.

### User Permissions for DSE Cassandra

```
CREATE ROLE appdynamics_role;
GRANT SELECT ON KEYSPACE system_traces TO appdynamics_role;
GRANT SELECT ON TABLE dse_perf.node_slow_log TO appdynamics_role;
GRANT appdynamics_role TO appdynamics;
```

### Configure Couchbase Collectors

To monitor Couchbase with Database Visibility, you must have:

- Couchbase >= 4.5
- Database Agent >= 20.x

 SSL connection is not supported for Couchbase.

### Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in <a href="#">User Permissions for Couchbase</a> .
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
Advanced Options	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating Systems	See this page for more details, <a href="#">Configure the Database Agent to Monitor Server Hardware</a> .

### User Permissions for Couchbase

The monitoring user must have Full Administrator or Read-only Administrator privileges. Alternatively, if you do not want the monitoring user to have Administrator privileges, you can assign a combination of Data Monitoring and Query System Catalog privileges (available for Couchbase >= 5).

## Configure IBM DB2 Collectors

This page describes configuration details for IBM DB2 collectors.

### Prerequisites

To monitor IBM DB2 with Database Visibility, you must be running DB2 >= 9.x.

## Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Database	The name of the database instance that you want to monitor.   If the database instance hosts multiple databases, ensure to create separate collector for each database.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent.
	Custom JDBC Connection String	The JDBC connection string generated by the database agent, for example, <code>jdbc:db2://</code> . You can also specify a custom connection string, which is useful for setting custom authentication options.  If you are using the connection string for Kerberos authentication, ensure to select the <b>Kerberos</b> option under <b>Advanced Options</b> .
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in <a href="#">User Permissions for IBM DB2 LUW</a> .

Section	Field	Description
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	Cyberark	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the <code>JavaPasswordSDK.jar</code> file from the CyberArk web site and rename the file to <code>cyberark-sdk-9.5.jar</code> . Then, you must copy the JAR file to the lib directory of the database agent zip file.
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only through the <a href="#">Create Collector API</a>.</li> <li>You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data.</li> </ul> </div>

Section	Field	Description
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.  For monitoring the database using Kerberos authentication, follow the instructions mentioned at <a href="#">Monitor IBM DB2 Databases Using Kerberos Authentication</a> .
	Kerberos	Click to use Kerberos authentication to manage the database user and host user passwords.
	Monitor Operating System	See <a href="#">Configure the Database Agent to Monitor Server Hardware</a> .

### User Permissions for IBM DB2 LUW

The monitoring user needs SYSMON authority and connection privileges to monitor. This user must be a part of the sysmon\_group.

To generate an execution plan, you must create the associated EXPLAIN tables in the schema.

### DB2 >= 9.7

For complete Database Visibility functionality, the following monitoring switches of the DB2 server need to be enabled: "TIMESTAMP".

To enable the "TIMESTAMP" monitoring switch, enter:

```
update dbm cfg using dft_mon_timestamp on;
update db cfg using mon_act_metrics BASE
```

### Privileges

```
grant select on SYSIBMADM.MON_CURRENT_SQL to user DBMon_Agent_User
grant select on SYSIBMADM.MON_LOCKWAITS to user DBMon_Agent_User
grant execute on function SYSPROC.MON_GET_CONNECTION to user DBMon_Agent_User
grant execute on function SYSPROC.MON_GET_PKG_CACHE_STMT to user DBMon_Agent_User
(version 10.5 and above) grant execute on function SYSPROC.MON_GET_TRANSACTION_LOG to
DBMon_Agent_User
(version 10.5 and above) grant execute on function SYSPROC.MON_GET_DATABASE to
DBMon_Agent_User
```

Replace `DBMon_Agent_User` with the user name under which you run the Database Visibility Agent.

## DB2 9.5

For complete Database Visibility functionality, the following monitoring switches of the DB2 server need to be enabled: "STATEMENT", and "TIMESTAMP".

To enable these monitoring switches, enter:

```
update dbm cfg using dft_mon_stmt on;
update dbm cfg using dft_mon_timestamp on;
```

## Privileges

```
grant select on SYSIBMADM.SNAPSTMT to user DBMon_Agent_User
grant select on SYSIBMADM.SNAPAPPL_INFO to user DBMon_Agent_User
grant select on table SYSIBMADM.ENV_PROD_INFO to user DBMon_Agent_User
```

where `DBMon_Agent_User` is the user name under which you run the Database Visibility Agent.

## User Permissions When restrict\_access is Set to YES

If your database has the `restrict_access` parameter set to YES, you must grant these privileges:

```
grant select on SYSIBMADM.MON_CURRENT_SQL to user DBMon_Agent_User;
grant select on SYSIBMADM.MON_LOCKWAITS to user DBMon_Agent_User;
grant execute on function SYSPROC.MON_GET_CONNECTION to user DBMon_Agent_User;
grant select on SYSIBMADM.SNAPAPPL_INFO to user DBMon_Agent_User;
grant EXECUTE on function SYSPROC.MON_GET_PKG_CACHE_STMT to user DBMon_Agent_User;
grant execute on function SYSPROC.MON_GET_TRANSACTION_LOG to user DBMon_Agent_User;
grant EXECUTE on package NULLID.SQLC2K26 to user DBMon_Agent_User;
grant select on SYSIBM.SYSDUMMY1 to user DBMon_Agent_User;
grant select on SYSIBMADM.ENV_PROD_INFO to user DBMon_Agent_User;
grant select on SYSIBMADM.ENV_SYS_RESOURCES to user DBMon_Agent_User;
grant execute on function SYSPROC.SNAP_GET_STMT(varchar(),Integer) to user DBMon_Agent_User;
grant select on SYSCAT.STATEMENTS to user DBMon_Agent_User;
grant select on SYSIBMADM.DBCFG to user DBMon_Agent_User;
grant execute on function SYSPROC.SNAP_GET_DB(varchar(),Integer) to user DBMon_Agent_User;
grant EXECUTE on package NULLID.SYSSH200 to user DBMon_Agent_User;
grant select on SYSIBMADM.ENV_SYS_RESOURCESto user DBMon_Agent_User;
grant select on SYSCAT.DBAUTH to user DBMon_Agent_User;
grant execute on function SYSPROC.SNAP_GET_DBM(Integer) to user DBMon_Agent_User;
grant select on syscat.schemata to user DBMon_Agent_User;
```

Replace `DBMon_Agent_User` with the user name under which you run the Database Visibility Agent.

## Generate Execution Plans

To generate an execution plan in DB2, the monitoring user ID must have access to the `explain_*` tables.

1. Create the explain tables one of these methods:
  - Call the `SYSPROC.SYSINSTALLOBJECTS` procedure: `{{}}`

```
{{db2 CONNECT TO database-name
db2 }}
```

```
{{CALL SYSPROC.SYSINSTALLOBJECTS('EXPLAIN', 'C',
CAST (NULL AS VARCHAR(128)), CAST (NULL AS VARCHAR(128)))}}
```

This call creates the explain tables under SYSTOOLS schema. To create them under a different schema, specify a schema name as the last parameter in the call.

- Run the EXPLAIN.DDL command file:{{}}

```
{{db2 CONNECT TO database-name
db2 -tf EXPLAIN.DDL}}
```

```
{{}}
```

**i** Explain plans will not function properly unless the monitoring user ID is granted SELECT privilege on every table being accessed in the SQL as well as the necessary explain\_\* tables.

### Monitor IBM DB2 Databases Using Kerberos Authentication

For the Database Agent to connect to and monitor the DB2 databases using Kerberos authentication, these settings are required:

- Start the Database Agent using the `Djava.security.krb5.conf=<path of the Kerberos configuration file>`:

```
nohup java -Djavax.security.krb5.conf=<path to Kerberos configuration file>
```

- In the **CONNECTION DETAILS** section of the Collector configuration dialog, specify **Hostname or IP Address, Database, Listener Port**, and **Custom JDBC Connection String** with Kerberos details:

```
jdbc:DB2:Tds:<hostname>:<portnum>?<Kerberos connection details>
```

- In the **ADVANCED OPTIONS** section of the Collector configuration dialog, ensure to provide these details:
  - Select **Kerberos**.
  - Select **Connection Properties**, then specify these JDBC connection properties:

Property Name	Property Value
securityMechanism	11
kerberosServerPrincipal	<Specify the name of the Kerberos Principal>

### Configure Microsoft SQL Server Collectors

This page provides configuration details for Microsoft SQL Server collectors.

**i** Prerequisites

To monitor Microsoft SQL Server with Database Visibility, you must be running the 2005 version or newer.

To configure an Azure SQL Managed instance, follow the configuration procedures of a Microsoft SQL Server Collector described in this topic.

### Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	<p>The hostname or IP address of the machine that your database is running on.</p> <p>To monitor a cluster, specify the hostname or IP address of the listener of the cluster. See <a href="#">Monitor the Microsoft SQL Server Cluster</a> to enable monitoring the MSSQL cluster.</p>
	Listener Port	<p>The TCP/IP address of the port on which your database communicates with the Database Agent.</p> <p>If you are using a Microsoft SQL Server cluster, specify the listener port of the cluster.</p> <p>To enable monitoring of all the nodes in a cluster, you must enable the monitoring of the cluster. This allows the agent to automatically discover all the nodes present in a cluster. See <a href="#">Monitor the Microsoft SQL Server Cluster</a></p>
	Windows Authentication	Click to enable Windows authentication when connecting to the database.

Section	Field	Description
	Custom JDBC Connection String	The JDBC connection string generated by the database agent, for example, <code>jdbc:sqlserver://</code> . You can also specify a custom connection string, which is useful for setting custom authentication options.
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in User Permissions for Microsoft SQL Server.
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the <code>JavaPasswordSDK.jar</code> file from the CyberArk website and rename the file to <code>cyberark-sdk-9.5.jar</code> . Then, you must copy the JAR file to the <code>lib</code> directory of the database agent zip file.
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the Create Collector API.</li> <li>You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data.</li> </ul> </div>

Section	Field	Description
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.
	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating System	See this page for more details, <a href="#">Configure the Database Agent to Monitor Server Hardware</a> .

**i** By default, Database Agent uses TLSv1.1 for SSL connections. To prevent any SSL version error in the SQL server 2019 and later versions, set the `sslProtocol` to TLSv1.2 or TLSv1.3 (whichever is supported) by adding any one of the following connection parameters:

```
"sslProtocol=TLSv1.2"
```

```
"sslProtocol=TLSv1.3"
```

**i Note**

To handle High Availability (Multi-AZ) for Amazon RDS, set the `databaseName` JDBC connection string property to a user database.

### Monitor Microsoft SQL Server

You can monitor the SQL Server either using an existing user account or by creating a new user account, with relevant privileges.

### Monitor the Microsoft SQL Server Cluster

Database Visibility supports the Always On cluster discovery for the Microsoft SQL database. You can monitor all the nodes in the availability group of an MSSQL database server >= 2012.

To enable monitoring of all the nodes, you must enable the `dbagent.mssql.cluster.discovery.enabled` property either at the Controller level or at the agent level.

This property is disabled by default.

### Authentication Methods

You can monitor the SQL server using one of the following authentication methods:

- Windows authenticated account (if the Database Agent is running on Windows)
- SQL Server authenticated account (if the Database Agent is running on Windows or Linux)
- [Azure Active Directory Password](#)

### Before you Begin

To connect to the SQL Server database using a Windows authenticated account, perform the following:

- Select **Windows Authentication** checkbox when creating the collector using "Create New Collector" dialog.

**Note**

Do not specify the username and password when updating database connection details.

- Specify the path to the Database Agent authentication library as follows:

Version Details	Path
Windows 64-bit	<pre>java -Djava.library.path="C:\dbagent_install_dir\auth\x64" -jar db-agent.jar</pre>
Windows 32-bit	<pre>java -Djava.library.path="C:\dbagent_install_dir\auth\x86" -jar db-agent.jar</pre>

- Ensure that the Windows account user has appropriate privileges to authenticate the database server and can start the database agent.
- Change the logon credentials of the service to the Windows account with SQL Server access, if using a Windows service to run the Database Agent.

To connect to the SQL Server database using Azure Active Directory Password, add the following property while configuring the Microsoft SQL Server collector:

- Property: `authentication`
- Value: `ActiveDirectoryPassword`

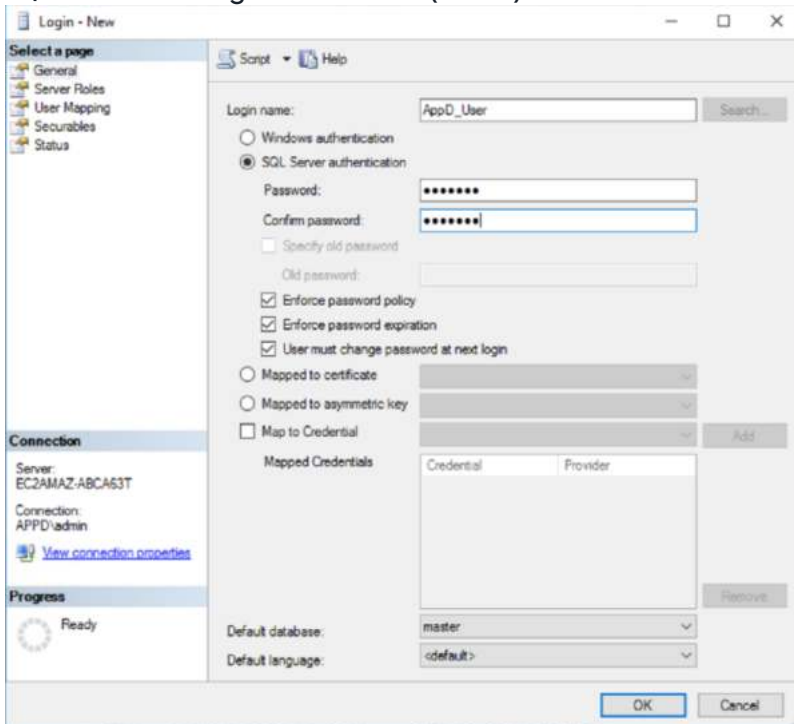

You can add the property using one of the following fields:

- Connection Details > Custom JDBC Connection String
- Advanced Options > Connection Properties

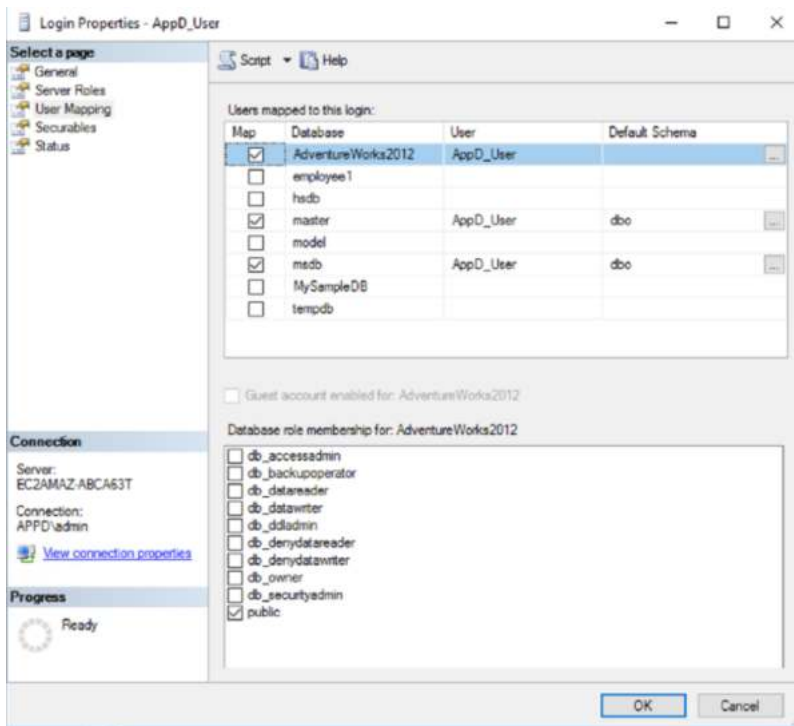

### Server Level Permissions for SQL Server Logon

To create a new SQL Server user (with minimum permissions required to monitor), perform the following steps:

1. Create a new login for the AppDynamics SQL Server Database Collector, such as `AppD_User`, using SQL Server Management Studio (SSMS).

2. To map the new user to "master" and "msdb" databases, click "master" and "msdb" under **Users mapped to this login**.

**i** User mapping to "master" and "msdb" are mandatory for monitoring. To view object information in the Object Browser screens, additional mapping to other databases is required.

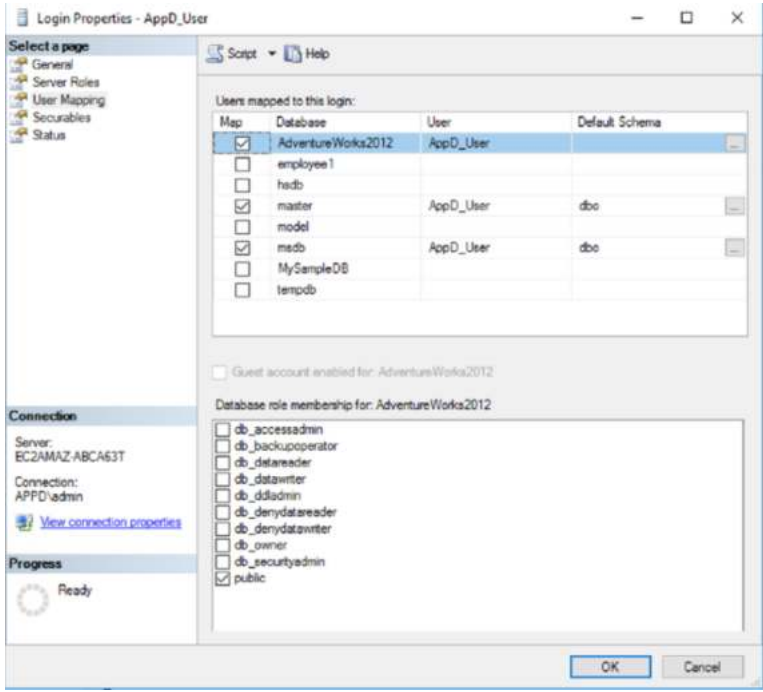

- After creating the login, grant the following privileges to the user by substituting `AppD_User` with the name you specified on the Login - New window:

```
use master
GRANT VIEW ANY DATABASE TO AppD_User;
GRANT VIEW ANY definition to AppD_User;
GRANT VIEW server state to AppD_User;
GRANT SELECT ON [sys].[master_files] TO AppD_User;
```

### Optional Object Permissions for SQL Server

The following object permissions are required for optional screens within the Database (DB) Visibility user interface:

Screen	Object Permissions
Object Browser > Users	<div data-bbox="740 359 1495 443" style="border: 1px solid black; padding: 5px;"> <pre>GRANT execute on sp_helplogins to AppD_User;</pre> </div> <div data-bbox="740 453 1373 590" style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> <b>Note</b> securityAdmin role is required</p> </div>
Object Browser > Storage	<p>To view object storage metadata, user mapping to other databases of interest is required.</p> <div data-bbox="740 711 1373 848" style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> <b>Note</b> public role is required</p> </div>
Object Browser > Job Status	<div data-bbox="740 907 1495 1089" style="border: 1px solid black; padding: 5px;"> <pre>use msdb GRANT SELECT on dbo.sysjobsteps TO AppD_User; GRANT SELECT on dbo.sysjobs TO AppD_User; GRANT SELECT on dbo.sysjobhistory TO AppD_User;</pre> </div>
Object Browser > Error Log	<p>For versions &lt;=2005:</p> <div data-bbox="740 1180 1495 1264" style="border: 1px solid black; padding: 5px;"> <pre>GRANT execute on sp_readErrorLog to AppD_User;</pre> </div> <p>For versions &gt; 2005:</p> <div data-bbox="740 1329 1495 1413" style="border: 1px solid black; padding: 5px;"> <pre>GRANT EXECUTE ON xp_readerrorlog</pre> </div> <div data-bbox="740 1423 1373 1560" style="background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <p> <b>Note</b> securityAdmin role required</p> </div>

Screen	Object Permissions																																				
<p>Object Browser &gt; Database</p>	<p>To view object storage metadata, user mapping to other databases of interest is required e.g. Table/View metadata.</p> <div data-bbox="740 449 1373 590" style="border: 1px solid #add8e6; padding: 5px; margin: 10px 0;"> <p><b>Note</b> public role required.</p> </div> <p>Following image shows how users are mapped to AdventureWorks2012 database:</p>  <p>The screenshot shows the 'Login Properties' dialog for 'AppD_User'. The 'Users mapped to this login' table is as follows:</p> <table border="1" data-bbox="951 789 1482 1014"> <thead> <tr> <th>Map</th> <th>Database</th> <th>User</th> <th>Default Schema</th> </tr> </thead> <tbody> <tr> <td><input checked="" type="checkbox"/></td> <td>AdventureWorks2012</td> <td>AppD_User</td> <td></td> </tr> <tr> <td><input type="checkbox"/></td> <td>employee1</td> <td></td> <td></td> </tr> <tr> <td><input type="checkbox"/></td> <td>hadr</td> <td></td> <td></td> </tr> <tr> <td><input checked="" type="checkbox"/></td> <td>master</td> <td>AppD_User</td> <td>dbo</td> </tr> <tr> <td><input type="checkbox"/></td> <td>model</td> <td></td> <td></td> </tr> <tr> <td><input checked="" type="checkbox"/></td> <td>msdb</td> <td>AppD_User</td> <td>dbo</td> </tr> <tr> <td><input type="checkbox"/></td> <td>MySampleDB</td> <td></td> <td></td> </tr> <tr> <td><input type="checkbox"/></td> <td>tempdb</td> <td></td> <td></td> </tr> </tbody> </table> <p>The 'Database role membership for AdventureWorks2012' section has the following roles checked:</p> <ul style="list-style-type: none"> <li><input checked="" type="checkbox"/> db_accessadmin</li> <li><input type="checkbox"/> db_backupoperator</li> <li><input type="checkbox"/> db_datareader</li> <li><input type="checkbox"/> db_datawriter</li> <li><input type="checkbox"/> db_dtsadmin</li> <li><input type="checkbox"/> db_denydatareader</li> <li><input type="checkbox"/> db_denydatawriter</li> <li><input type="checkbox"/> db_owner</li> <li><input type="checkbox"/> db_securityadmin</li> <li><input checked="" type="checkbox"/> public</li> </ul>	Map	Database	User	Default Schema	<input checked="" type="checkbox"/>	AdventureWorks2012	AppD_User		<input type="checkbox"/>	employee1			<input type="checkbox"/>	hadr			<input checked="" type="checkbox"/>	master	AppD_User	dbo	<input type="checkbox"/>	model			<input checked="" type="checkbox"/>	msdb	AppD_User	dbo	<input type="checkbox"/>	MySampleDB			<input type="checkbox"/>	tempdb		
Map	Database	User	Default Schema																																		
<input checked="" type="checkbox"/>	AdventureWorks2012	AppD_User																																			
<input type="checkbox"/>	employee1																																				
<input type="checkbox"/>	hadr																																				
<input checked="" type="checkbox"/>	master	AppD_User	dbo																																		
<input type="checkbox"/>	model																																				
<input checked="" type="checkbox"/>	msdb	AppD_User	dbo																																		
<input type="checkbox"/>	MySampleDB																																				
<input type="checkbox"/>	tempdb																																				

### Microsoft SQL Server on AWS RDS Permissions

The user account used for monitoring can be a Windows authenticated account (if the Database Agent is running on Windows) or SQL Server authenticated (if AppDynamics Database Visibility is running on Windows or Linux).

### Minimum Permissions Required for SQL Server Logon

You can use the procedure to create a SQL Server user with the minimum permissions required.

Use the following to create a SQL Server logon user that provides the minimal level of permissions required in order to gain full AppDynamics Database Visibility/SQL Server functionality.

**i** Master users created in the AWS RDS instance are the instance masters. If you want to provide access to a local user for monitoring, use the same master user and create a custom monitoring role and assign the same to the user.

1. Using SQL Server Management Studio, create a new login for the AppDynamics SQL Server Database Collector, such as `DBMon_Agent_User` .
2. (For users other than master user) Execute these commands as a batch from a query window in Management Studio. This example shows grants to the role assigned to `DBMon_Agent_User` to monitor the database:

```
USE master
GO
CREATE SERVER ROLE monitoring_role
USE master
GO
ALTER SERVER ROLE DBMon_Agent_User ADD MEMBER Monitoring_User
GRANT CONNECT SQL TO Monitoring_User
GRANT VIEW ANY DATABASE TO Monitoring_User
GRANT VIEW ANY DEFINITION TO Monitoring_User
GRANT VIEW SERVER STATE TO Monitoring_User
```

3. From the User Mapping tab, map the new user to the master and msdb databases.

**i** **Viewing Object Information**

To view object information on the **Database > Objects Browser**, map the monitoring user to the databases of interest.

4. Once you have created the login, give the following privileges to the user, substituting `DBMon_Agent_User` with the name you specified on the **Login - New** panel:

**i** You can execute the following as a batch from a query window in Management Studio. The example shows grants to `DBMon_Agent_User` ; remember to change this if you have set up a different login.

```
use master
ALTER SERVER ROLE processadmin ADD MEMBER DBMon_Agent_User;
GRANT VIEW ANY DATABASE TO DBMon_Agent_User;
GRANT VIEW ANY definition to DBMon_Agent_User;
GRANT VIEW server state to DBMon_Agent_User;
```

where `DBMon_Agent_User` is the name of the SQL Server user account specified in **Create New Collector, Connection Details, Username** field.

To generate an execution plan on AWS RDS, you need additional permissions. The SHOWPLAN permission must be provided explicitly for each database:

```
USE <DB NAME>
go
GRANT SHOWPLAN to DBMon_Agent_User;
go
```

## Configure Microsoft Azure Collectors

To monitor Microsoft Azure with Database Visibility, you must run Microsoft Azure >= 2008.

To configure an Azure SQL Managed Instance, follow the configuration procedures of a Microsoft SQL Server Collector. See [Configure Microsoft SQL Server Collectors](#). Procedures in this page are specific to an Azure SQL Database collector and **not** applicable for an Azure SQL Managed Instance.

### Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.

Section	Field	Description
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Database	The name of the database instance that you want to monitor.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent
	Custom JDBC Connection String	The JDBC connection string generated by the database agent. You can also specify a custom connection string, which is useful for setting custom authentication options.

Section	Field	Description
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in <a href="#">User Permissions for Microsoft Azure</a> .
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the <code>JavaPasswordSDK.jar</code> file from the CyberArk web site and rename the file to <code>cyberark-sdk-9.5.jar</code> . Then, you must copy the JAR file to the <code>lib</code> directory of the database agent zip file.
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div data-bbox="272 1360 1230 1738" style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the <a href="#">Create Collector API</a>.</li> <li>You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data.</li> </ul> </div>

Section	Field	Description
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.

### Authentication Methods

You can monitor the Azure SQL database using one of the following authentication methods:

- Windows authenticated account (if the Database Agent is running on Windows)
- SQL Server authenticated account (if the Database Agent is running on Windows or Linux)
- [Azure Active Directory Password](#)

### Before you Begin

To connect to the Azure SQL database using a Windows authenticated account, perform the following:

- Select **Windows Authentication** checkbox when creating the collector using "Create New Collector" dialog.

**Note**

Do not specify the username and password when updating database connection details.

- Specify the path to the Database Agent authentication library as follows:

Version Details	Path
Windows 64-bit	<pre>java -Djava.library.path="C:\dbagent_install_dir\auth\x64" -jar db-agent.jar</pre>
Windows 32-bit	<pre>java -Djava.library.path="C:\dbagent_install_dir\auth\x86" -jar db-agent.jar</pre>

- Ensure that the Windows account user has appropriate privileges to authenticate the database server and can start the database agent.
- Change the logon credentials of the service to the Windows account with SQL Server access, if using a Windows service to run the Database Agent.

To connect to the Azure SQL database using Azure Active Directory Password, add the following property while configuring the Azure SQL database collector:

- Property: `authentication`
- Value: `ActiveDirectoryPassword`

You can add the property using one of the following fields:

- **Connection Details > Custom JDBC Connection String**
- **Advanced Options > Connection Properties**

### User Permissions for Microsoft Azure

The user account used for monitoring can be an SQL Server authenticated account (if AppDynamics Database Visibility is running on Windows or Linux).

### Minimum Permissions Required for SQL Server Logon

You can create an SQL Server authenticated login or user with minimal level of permissions. To create a SQL Server login, you must be connected to the primary database from an admin account through SQL Server Management Studio (SSMS) or SQL Editor.

- i** The read-only access to the master database is required for the user account to monitor the database.

1. Run the command given below to create a login. Specify a secure password in the command.

```
CREATE LOGIN DBMon_Agent_User WITH PASSWORD = 'Password123'
```

2. Run the following command in your Azure SQL database to create a user account for the newly created login:

```
CREATE USER DBMon_Agent_User FOR LOGIN DBMon_Agent_User WITH DEFAULT_SCHEMA = dbo
```

3. While connected to your Azure SQL database, run the command given below to grant the pre-requisite roles and privileges:

```
grant VIEW DATABASE STATE to DBMon_Agent_User
```

### Configure MongoDB Collectors

To monitor MongoDB with Database Visibility, you must run MongoDB >= 2.2.

If you are configuring a collector for a MongoDB cluster, you only need to configure one collector for the entire cluster. You can choose any node in the cluster to connect to, and the entire cluster will automatically be detected.

### Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent
	Custom Connection String	<p>The connection string generated by the database agent. You can also specify a custom connection string, which is useful for setting custom authentication options.</p> <div style="border: 1px solid #00aaff; padding: 5px; margin-top: 10px;"> <p> Ensure that you do not specify the username and password in the custom connection string because it can cause a security risk.</p> </div>

Section	Field	Description
	SRV Record	Enable this field to use the SRV record, where the connection string includes <code>mongodb+srv.</code>
User name and password	User name	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in <a href="#">User Permissions for MongoDB</a> .
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the <code>JavaPasswordSDK.jar</code> file from the CyberArk web site and rename the file to <code>cyberark-sdk-9.5.jar</code> . Then, you must copy the JAR file to the <code>lib</code> directory of the database agent zip file.
Advanced configurations	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating Systems	See <a href="#">Configure the Database Agent to Monitor Server Hardware</a> .

**i** When configuring the collector, ensure that you encode the username and password that uses special characters.

### User Permissions for MongoDB

For MongoDB < 2.6.x, the readAnyDatabase and ClusterMonitor built-in roles are required to monitor using AppDynamics Database Visibility. For MongoDB shared clusters, the monitoring user must have access to all shards.

For MongoDB >= 2.6, the `clusterMonitor` built-in role in addition to read is required.

If you choose to create a new user to monitor MongoDB, the user must be created in the admin database.

You can configure user roles as shown in the sample query below:

```
use admin
db.createUser({ user: "tanujaAdmin",
pwd: "tanuja123",
roles: [
 { role: "clusterMonitor", db: "admin" },
 { role: "read", db: "admin" },
]
})
```

### Configure MySQL Collectors

To monitor MySQL with Database Visibility, you must run MySQL >= 2.2.

#### Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent

Section	Field	Description
	Custom JDBC Connection String	The JDBC connection string generated by the database agent, for example, <code>jdbc:mysql://</code> . You can also specify a custom connection string, which is useful for setting custom authentication options.
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in <a href="#">User Permissions for MySQL</a> .
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the <code>JavaPasswordSDK.jar</code> file from the CyberArk web site and rename the file to <code>cyberark-sdk-9.5.jar</code> . Then, you must copy the JAR file to the lib directory of the database agent zip file.

Section	Field	Description
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add the additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div style="border: 1px solid #0070C0; background-color: #E6F2FF; padding: 10px; margin-top: 10px;"> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the <a href="#">Create Collector API</a>.</li> <li>You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data.</li> </ul> </div>
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.
	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating System	See <a href="#">Configure the Database Agent to Monitor Server Hardware</a> .

### User Permissions for MySQL

The MySQL user the Database Agent uses to monitor the MySQL database must have "SELECT", "PROCESS", and "SHOW DATABASES" privileges on all databases.

The user must also have the "REPLICATION CLIENT" privilege to collect these metrics:

- Slave\_io\_running
- Slave\_sql\_running

- Seconds\_behind\_master
- SQL\_Delay

If you do not have a suitable existing user, you can use the command below to create a new user.

```
GRANT SELECT,PROCESS,SHOW DATABASES on *.* to 'DBMon_Agent_User'@'host' identified by 'password';
GRANT REPLICATION CLIENT ON *.* to 'DBMon_Agent_User'@'host';
FLUSH privileges;
```

Substitute `DBMon_Agent_User` with the username under which you run the Database Visibility Agent. Substitute `host` with the hostname or IP address of the machine running the AppDynamics Database Agent, and substitute `password` with a secure password.

Set the `max_allowed_packet` parameter to `1073741824` on the server.

## Troubleshooting MySQL Permissions

### View MySQL Error Logs

To view the error log file, these conditions must be met:

- `secure_file_priv` is either empty or the name of the folder containing the error log file. You must restart MySQL for changes in the `secure_file_priv` variable to take effect.
- The error log file is readable to all users.
- `max_allowed_packet` is larger than the error log file size.
- The user has FILE privileges.

## Configure Oracle Collectors

To monitor Oracle with Database Visibility, you must be running Oracle 10g or newer.

If you are configuring a collector for Oracle RAC, you only need to configure one collector for the entire cluster. You can choose any node in the cluster to connect to, and the entire cluster will automatically be detected.

**i** If you are using Oracle 12c as PDB, the query for system metrics is available from Oracle Database 12c Release 2 (12.2.0.1) onwards. See the Oracle documentation for more information.

### Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.

Section	Field	Description
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent
	SID or Service Name	<p>The SID or service name of the Oracle instance you want to monitor.</p> <p>For CDB (container database) monitoring, provide the CDB service name and for PDB (pluggable database) monitoring, provide the PDB service name.</p> <p>For PDB (pluggable database) monitoring, the service name must be present in all the nodes that have PDB so that all the nodes get monitored.</p>
	Custom JDBC Connection String	<p>The JDBC connection string generated by the database agent, for example, <code>jdbc:oracle:thin:@(DESCRIPTION=(ADDRESS=(PROTOCOL= . You can also specify a custom connection string, which is useful for setting custom authentication options.</code></p> <p>When using connection string for Kerberos, ensure that you select the <b>LDAP/Kerberos</b> option under <b>Advanced Options</b>.</p>
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in <a href="#">User Permissions for Oracle</a> .
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.

Section	Field	Description
	Cyberark	<p>Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the <code>JavaPasswordSDK.jar</code> file from the CyberArk web site and rename the file to <code>cyberark-sdk-9.5.jar</code>. Then, you must copy the JAR file to the lib directory of the database agent zip file.</p>
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div data-bbox="813 1083 1395 1661" style="border: 1px solid #0070C0; background-color: #E6F2FF; padding: 10px;"> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>• All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the <a href="#">Create Collector API</a>.</li> <li>• You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data.</li> </ul> </div>

Section	Field	Description
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.  For monitoring the database using Kerberos authentication, follow the instructions mentioned at <a href="#">Monitor Oracle Databases Using Kerberos Authentication</a> .
	Exclude Schemas	The schemas that you want to exclude, separated by commas.
	SSL Connection	Click to enable the SSL connection. You can use SSL Connection for authentication and signing credentials. <ul style="list-style-type: none"> <li>Truststore Location: location of the SSL certificate that is stored on the DB Agent host</li> <li>Truststore Type: type of truststore used for SSL certificate. There are two truststore types: <b>PKCS12</b> (default) <b>SSO</b>: enables auto-login. If you use SSO, you only need to provide the truststore location and truststore type.</li> <li>Truststore Password: password for SSL certificate.</li> </ul> <p>If the <code>SSL_CLIENT_AUTHENTICATION</code> parameter is set to true in <code>listener.ora</code> and <code>sqlnet.ora</code>, then click the Enable SSL Client Authentication box.</p> <ul style="list-style-type: none"> <li>Keystore Location: location of the SSL certificate on the DB Agent host</li> <li>Keystore Type: type of SSL certificate</li> <li>Keystore Password: password of SSL certificate</li> </ul>
	LDAP/Kerberos	Use LDAP/Kerberos authentication to manage the database user and the host user passwords.
	Monitor Operating System	See this page for more details, <a href="#">Configure the Database Agent to Monitor Server Hardware</a> .

## User Permissions for Oracle

### For versions of Oracle 10g and later

The following permissions are required for the Oracle user:

- CREATE SESSION
- SELECT\_CATALOG\_ROLE

To create a user with these permissions, you can run the following SQL. In this SQL, change "password" to a safe and secure password, and change the tablespace names, "users" and "temp" to those available in your Oracle instance.

```
CREATE USER DBMon_Agent_User IDENTIFIED BY password
default tablespace users
temporary tablespace temp;

GRANT CREATE SESSION, SELECT_CATALOG_ROLE TO DBMon_Agent_User;
```

where `DBMon_Agent_User` is the user name under which you run the Database Visibility Agent.

### For versions of Oracle 12c and later with Multitenant Container Database Option enabled

The following permissions are required for the Oracle user:

- CREATE SESSION
- SELECT\_CATALOG\_ROLE

To create a user with these permissions, you can run the following SQL. In this SQL, change "password" to a safe and secure password, and change the tablespace names, "users" and "temp" to those available in your Oracle instance.

```
CREATE USER C##DBMon_Agent_User IDENTIFIED BY password default tablespace users temporary
tablespace temp CONTAINER=ALL;
GRANT CREATE SESSION, SELECT_CATALOG_ROLE TO C##DBMon_Agent_User CONTAINER=ALL;
ALTER USER C##DBMon_Agent_User QUOTA 100M ON USERS;
alter user C##DBMON_AGENT_USER set container_data=all container=current;
```

### Permissions Required for Oracle Explain Plans

To generate an execution plan for a specified query, paste the query text into the **Explain another query** box. You must provide a plan table in the AppDynamics monitoring user's schema. You can find a sample output table named `PLAN_TABLE` in the `UTLXPLAN.SQL` script. To update or view the plan table, you need INSERT and SELECT privileges. To explain a query, you need access privileges for the tables and views included in that query.

The screenshot shows the AppDynamics interface with the 'Databases' section selected. The 'Query Details' view is open for a query with ID 'd696ea5a7e238316ea48a2a672d75e88c164f3f6'. The 'Execution Plan' tab is active, showing a 'Cached Execution Plan(s)' section. A table with columns 'Plan\_Hash\_Value', 'Last Used', 'Executions', and 'Average Elapsed Time (secs)' is present but empty. Below the table is a 'Plan Details' section with a text input containing the query: 'SELECT ID, city\_name, customer\_name, customer\_type, email, password FROM user WHERE (email = ?)'. The 'Schema' dropdown is set to 'SYSTEM', and there are optional fields for 'Username' and 'Password'. An 'Explain' button is at the bottom.

AppDynamics Database Visibility can generate explain plans within its SQL drill-down window. To enable this functionality, you must have a plan table accessible to the AppDynamics Database Visibility schema user. You can create this plan table with the following command from `sqlplus` when logged on as the AppDynamics Database Visibility user:

Windows:

```
@?\rdbms\admin\utlxplan.sql
```

Linux:

```
@?/rdbms/admin/utlxplan.sql
```

### Permissions for individual views and tables

You can grant permission to individual views and tables even if the `SELECT_CATALOG_ROLE` permission is not available to your organization.

1. Execute permissions on `dbms_application_info.set_module`.

---

2. Select permissions on the following privileges:

```
dba_data_files
dba_free_space
dba_ind_columns
dba_indexes
dba_objects
dba_procedures
dba_segments
dba_sequences
dba_synonyms
dba_recyclebin
dba_tab_columns
dba_tables
dba_users
dba_views
gv$instance
gv$containers
gv$parameter
gv$pdbs
gv$services
v$archive_dest
v$archive_dest_status
v$con_sysmetric
v$database
v$datafile
v$event_name
v$instance
v$license
v$log
v$osstat
v$parameter
v$process
v$rowcache
v$session
v$sesstat
v$session_wait
v$sga
v$sql
v$sql_plan
v$sqlstats
v$sqltext
v$statname
v$sysmetric
v$sysstat
v$system_event
```

**i** When you are granting access to `v$` views, you must grant `SELECT` on the underlying objects, which are named using the `v_` format, e.g. `GRANT SELECT on v_$archive_dest`.

## Configure Oracle RAC

### Related pages:

- [Database Topology Window](#)

If you are configuring a collector for Oracle RAC, you only need to configure one collector for the entire cluster. You can choose any node in the cluster to connect to, and the entire cluster is automatically detected.

If you have sub-collectors, it will disable automatic cluster discovery.

When the Database Visibility collector connects to the hostname or IP address defined in the collector configuration, it auto-discovers the RAC instance. Once a successful connection is made to a node within the RAC, then a query on `GV$INSTANCE` will be used to return the details of the other member nodes and to populate the [Topology Window](#).

When monitoring Oracle RAC, the Controller displays the aggregate data for the entire cluster.

### User Permissions for Oracle RAC

When you upgrade to 4.3, you may encounter the following error: Network access denied by access control list (ACL). You can resolve the error by enabling ACLs for the monitoring user.

```
begin
dbms_network_acl_admin.create_acl (
acl => 'Resolve_Access.xml',
description => 'Resolve Network Access using UTL_INADDR',
principal => '<DBMON USER>',
is_grant => TRUE,
privilege => 'resolve',
start_date => null,
end_date => null
);
commit;
end;
/

begin
dbms_network_acl_admin.assign_acl (
acl => 'Resolve_Access.xml',
host => '*',
lower_port => null,
upper_port => null);
commit;
end;
/
```

## Monitor Oracle Databases Using Kerberos Authentication

For the Database Agent to connect to and monitor the Oracle databases using Kerberos authentication, these settings are required:

- Start the Database Agent using the property, `java.security.krb5.conf` :

```
nohup java -Djava.security.krb5.conf="<path to Kerberos configuration file>"
```

- In the **CONNECTION DETAILS** section of the Collector configuration dialog, specify the JDBC connection string:

```
jdbc:Oracle:Tds:<hostname>:<portnum>?<Kerberos connection details>
```

- In the **ADVANCED OPTIONS** section of the Collector configuration dialog, ensure to provide these details:
  - Select **LDAP/Kerberos**.
  - Select **Connection Properties**, then specify these JDBC connection properties:

Property Name	Property Value
oracle.net.authentication_services	( KERBEROS5 )
oracle.net.kerberos5_mutual_authentication	true
oracle.net.kerberos5_cc_name	" <code>&lt;cache_file_path&gt;</code> " For example: "I:\\Kerberos\\ <code>&lt;krb5ccFile&gt;</code> "

## Configure PostgreSQL Collectors

You can monitor any version of PostgreSQL with Database Visibility.

### Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent.

Section	Field	Description
	Custom JDBC Connection String	<p>The JDBC connection string generated by the database agent, for example, <code>dbc:postgresql://</code>. You can also specify a custom connection string, which is useful for setting custom authentication options.</p> <p>To authenticate using an Azure Active Directory account, specify the following details:</p> <pre style="border: 1px solid black; padding: 5px;">jdbc:sqlserver:// &lt;server_name&gt;;port_number;database=&lt;dbname&gt; ;authentication=ActiveDirectoryPassword;Use r=&lt;user_id&gt;;Password=&lt;Password&gt;;encrypt=true; trustServerCertificate=false;</pre>
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in <a href="#">User Permissions for PostgreSQL</a> .
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the <code>JavaPasswordSDK.jar</code> file from the CyberArk web site and rename the file to <code>cyberark-sdk-9.5.jar</code> . Then, you must copy the JAR file to the lib directory of the database agent zip file.

Section	Field	Description						
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div style="border: 1px solid #0070C0; background-color: #E6F2FF; padding: 10px; margin-top: 10px;"> <p> • All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the <a href="#">Create Collector API</a>.</p> <p>• You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data.</p> </div>						
	Connection Properties	<p>Click to add a new JDBC connection property or edit an existing property for relational databases.</p> <p>To authenticate using an Azure Active Directory account, add the following details:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%;">Property Name</th> <th style="width: 50%;">Property Value</th> </tr> </thead> <tbody> <tr> <td>authentication</td> <td>&lt;ActiveDirectoryPassword&gt;</td> </tr> <tr> <td>database</td> <td>&lt;azure-ad-SQL-server-managed-db&gt;</td> </tr> </tbody> </table>	Property Name	Property Value	authentication	<ActiveDirectoryPassword>	database	<azure-ad-SQL-server-managed-db>
Property Name	Property Value							
authentication	<ActiveDirectoryPassword>							
database	<azure-ad-SQL-server-managed-db>							
	EnterpriseDB	<p>Click if your PostgreSQL database installation is an <a href="#">EnterpriseDB</a> distribution.</p>						

Section	Field	Description
	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating System	See <a href="#">Configure the Database Agent to Monitor Server Hardware</a> .

## Set up PostgreSQL for Monitoring

### User Permissions

 You must be a superuser to execute this section.

Create a non-superuser and grant monitoring permissions. To achieve this, perform the following steps to create a SECURITY DEFINER function. This allows non-superusers to view the contents of `pg_stat_activity` and `pg_stat_statements`.

1. Call the `get_sa()` function:

```
CREATE FUNCTION get_sa()
RETURNS SETOF pg_stat_activity LANGUAGE sql AS
$$ SELECT * FROM pg_catalog.pg_stat_activity; $$
VOLATILE
SECURITY DEFINER;

CREATE VIEW pg_stat_activity_allusers AS SELECT * FROM get_sa();
GRANT SELECT ON pg_stat_activity_allusers TO public;
```

2. Call the `get_querystats()` function:

```
CREATE FUNCTION get_querystats()
RETURNS SETOF pg_stat_statements LANGUAGE sql AS
$$ SELECT * FROM pg_stat_statements; $$
VOLATILE
SECURITY DEFINER;
CREATE VIEW pg_stat_statements_allusers AS SELECT * FROM get_querystats();
GRANT SELECT ON pg_stat_statements_allusers TO public;
```

The monitoring user must also be able to connect remotely to the PostgreSQL instance from AppDynamics for the database machine.

### Enable the `pg_stat_statements` Section

 You must be a superuser to execute this section.

Run the following command to create the `pg_stat_statements` extension:

```
create extension pg_stat_statements
```

### Validate the Setup

 Ensure that the newly created appduser (monitoring user) executes this section.

Run the following queries:

1. `SELECT * FROM pg_stat_activity_allusers`
2. `SELECT * FROM pg_stat_statements_allusers`

If the queries run successfully and you get an output, the setup is successful.

### Monitor SSL-enabled PostgreSQL Database

You can monitor the PostgreSQL database by configuring the database collector with the SSL client certificates.

Create the self-signed certificate using your domain, and then perform the following steps on Controller:

1. Go to **Databases > Add > Create New Collector**.
2. Under **Advanced Options > Connection Properties**, set the following JDBC connection properties:

 Ensure to enable the appropriate read permissions on the certificate files.

#### For One-way TLS

Property Name	Property Value
<code>ssl</code>	<code>true</code>
<code>sslmode</code>	<code>verify-ca</code>  When this parameter is set to <code>verify-ca</code> , <code>libpq</code> verifies that the server is trustworthy by checking the certificate chain up to a trusted certificate authority (CA).
<code>sslfactory</code>	<code>org.postgresql.ssl.jdbc4.LibPQFactory</code>
<code>sslrootcert</code>	<code>~/.postgresql/rootCA.crt</code>

#### For mTLS

Property Name	Property Value
ssl	true
sslmode	verify-full  <b>i</b> When this parameter is set to <code>verify-full</code> , libpq verifies that the server hostname matches its certificate. The SSL connection fails when the server certificate is not verified.
sslfactory	org.postgresql.ssl.jdbc4.LibPQFactory
sslrootcert	~/.postgresql/rootCA.crt
sslcert	~/.postgresql/postgres_client.crt
sslkey	~/.postgresql/postres_client.pk8

**i** You can also convert the `.key` certificate to `.pk8` format using the following command:

```
openssl pkcs8 -topk8 -inform PEM -outform DER -in postgres_client.key -out postgres_client.pk8 -nocrypt
```

## Configure Sybase Collectors

To monitor Sybase with Database Visibility, you must run Sybase  $\geq 15$ .

### Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.

Section	Field	Description
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent.
	Custom JDBC Connection String	The JDBC connection string generated by the database agent, for example, <code>jdbc:sybase:</code> . You can also specify a custom connection string, which is useful for setting custom authentication options.
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in <a href="#">User Permissions for Sybase</a> .
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the <code>JavaPasswordSDK.jar</code> file from the CyberArk web site and rename the file to <code>cyberark-sdk-9.5.jar</code> . Then, you must copy the JAR file to the lib directory of the database agent zip file.

Section	Field	Description
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div style="border: 1px solid #0070C0; background-color: #E6F2FF; padding: 10px; margin-top: 10px;"> <p> • All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the <a href="#">Create Collector API</a>.</p> <p>• You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data.</p> </div>
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.
	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating System	See <a href="#">Configure the Database Agent to Monitor Server Hardware</a> .

### User Permissions for Sybase

For complete AppDynamics Database Visibility functionality, the monitoring user requires the permissions listed in the table below.

Permission type	Permission
Role permission	<ul style="list-style-type: none"> <li>sa_role</li> <li>mon_role</li> </ul>
Select permission	<ul style="list-style-type: none"> <li>master.dbo.monWaitEventInfo</li> <li>master.dbo.sysconfigures</li> <li>master.dbo.sysmonitors</li> <li>master.dbo.monProcess</li> <li>master.dbo.monProcessLookup</li> <li>master.dbo.monProcessSQLText</li> <li>master.dbo.monProcessProcedures</li> </ul>
Execute permission	<ul style="list-style-type: none"> <li>sp_sysmon</li> </ul>

If you require to browse the objects of a custom database, use the following command:

```
use [custom-db-name]
sp_adduser <user-name>
```

To create a new dedicated user for AppDynamics Database Visibility, you can use following sample user creation script. Before running the script, change " password " to a more secure value.

```
create login 'DBMon_Agent_User' with password 'password' go
exec sp_locklogin 'DBMon_Agent_User', 'unlock'
go
exec sp_role 'grant', 'mon_role', 'DBMon_Agent_User'
go
```

where DBMon\_Agent\_User is the user name under which you run the Database Visibility Agent.

Also, the following configuration parameters must be set to 1 (true) to monitor the Sybase ASE database with AppDynamics Database Visibility: "enable monitoring", "wait event timing", "SQL batch capture", and "object lockwait timing". You should also set "max SQL text monitored" to at least 8192 (8kB).

Here is an example of the commands required to configure these settings:

```
sp_configure "enable monitoring", 1
go
sp_configure "wait event timing", 1
go
sp_configure "SQL batch capture", 1
go
sp_configure "object lockwait timing", 1
go
sp_configure "max SQL text monitored", 8192
go
```

If the value for "max SQL text monitored" was previously less than 4096, then increasing this setting will require that you restart the Sybase ASE instance.

To monitor Sybase >= 15.7 without the `sa_role` permission, run these commands:

```
use sybssystemprocs
grant execute on sp_sysmon to mon_role
```

**i** If you choose to monitor Sybase using `sp_sysmon`, you may encounter the following errors:

- Thread utilization is incorrectly reported. View the official report [here](#).
- Timeslice error in mmap64 or mda\_flush\_iostats. View the official report [here](#).

## Configure Sybase IQ Collectors

You can monitor any version of Sybase IQ with Database Visibility.

### Connection Details

Section	Field	Description
Create New Collector	Database Type	The database type that you want to monitor.
	Agent	The Database Agent that manages the collector.
	Collector Name	The name you want to identify the collector by.
Connection Details	Hostname or IP Address	The hostname or IP address of the machine that your database is running on.
	Listener Port	The TCP/IP address of the port on which your database communicates with the Database Agent.
	Custom JDBC Connection String	The JDBC connection string generated by the database agent, for example, <code>jdbc/sybaseiq:</code> . You can also specify a custom connection string, which is useful for setting custom authentication options.
Username and Password	Username	The name of the user who is connecting to and monitoring the database through the Database Agent. The user should have the permissions described in <a href="#">User Permissions for Sybase IQ</a> .

Section	Field	Description
	Password	The password of the user who is connecting to and monitoring the database through the Database Agent.
	CyberArk	Click to enable CyberArk for database username and password. When CyberArk is enabled, information about Application, Safe, Folder, and Object is required to fetch the username and password for your database. To use CyberArk with Database Visibility, you must download the <code>JavaPasswordSDK.jar</code> file from the CyberArk web site and rename the file to <code>cyberark-sdk-9.5.jar</code> . Then, you must copy the JAR file to the <code>lib</code> directory of the database agent zip file.
Advanced Options	Sub-Collectors	<p>Click to monitor multiple database instances in a consolidated view, and aggregate metrics of multiple databases. To monitor a custom cluster, you can add additional hostname or IP address, and port details for each sub-collector. You can add up to a total of 29 sub-collectors. Thereby, 30 databases can be monitored in a custom cluster. In addition to the licenses consumed by the main collector, each sub-collector consumes one or more licenses, depending on the database type.</p> <div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> • All connection parameters other than the hostname or IP address, and port details of the sub-collector are the same as the main collector. If you want to specify different parameters for the sub-collectors, while creating or editing the collector configuration, you can do that only via the <a href="#">Create Collector API</a>.</p> <p>• You cannot convert a custom cluster collector to a standalone collector. If you want to monitor a standalone database, delete the entire custom cluster collector and create a fresh standalone collector. However, note that deleting the custom cluster collector will delete all its historical data.</p> </div>
	Connection Properties	Click to add a new JDBC connection property or edit an existing property for relational databases.

Section	Field	Description
	Exclude Databases	The databases that you want to exclude, separated by commas.
	Monitor Operating System	See <a href="#">Configure the Database Agent to Monitor Server Hardware</a> .

## User Permissions for Sybase IQ

To monitor with a non-DBA account, you need:

- User account with SERVER OPERATOR system privilege.
- Execution privileges on several procedures which can be granted as follows:

```
grant execute on sp_iqconnection to DBMon_Agent_User
grant execute on sp_iqtransaction to DBMon_Agent_User
grant execute on sp_iqcontext to DBMon_Agent_User
grant execute on sp_iqstatus to DBMon_Agent_User
grant execute on sp_iqcolumn to DBMon_Agent_User
grant execute on sp_iqindex to DBMon_Agent_User
```

where `DBMon_Agent_User` is the user name under which you run the Database Visibility Agent.

- Grant DBA authority to `DBMon_Agent_User` :

```
grant DBA to DBMon_Agent_User
```

## Monitor Sybase Databases Using Kerberos Authentication

For the Database Agent to connect to and monitor Sybase databases using Kerberos authentication, these settings are required:

- In the Connection Details section of the **Collector** configuration dialog, specify the JDBC connection string:

```
jdbc:sybase:Tds:<hostname>:<portnum>?REQUEST_KERBEROS_SESSION=true&SERVICE_PRINCIPAL_NAME=<my server>
```

- Start the Database Agent using the `-Djavax.security.auth.useSubjectCredsOnly=false` option:

```
nohup java -Djavax.security.auth.useSubjectCredsOnly=false /<db_agent_home>/db-agent.jar &
```

## Configure the Database Agent to Monitor Server Hardware

Related pages:

- [Monitor Database Server Hardware](#)

In addition to monitoring the database server, the Database Agent can also monitor the hardware that hosts the database server. To configure the Database Agent to monitor the database server hardware, complete the **Hardware Monitoring** section of the [Collector configuration](#) dialog.

Click **Databases > Configuration > Collectors** and then choose an existing collector to monitor the hardware for that database server and click **Edit**, or click **Add** to set up a new collector to monitor a different database server and the hardware hosting that server.

### Complete the Hardware Monitoring Section

The following describes the fields in the **Collector Configuration** dialog that you must complete if you want to monitor the database server host hardware, in addition to the database server.

 For Oracle database, the **CPU** and the **Memory** metrics are monitored even when hardware monitoring is disabled.

 If you enable hardware monitoring for MySQL and PostgreSQL RDS databases, then to fetch vCPU, use mapping of model vs vCPU from [Amazon RDS Instance Types](#). The fetched vCPU is used for IBL licensing model.

**Monitor Operating System:** Select if you want CPU consumption metrics collected from the monitored host.

**Operating System:** Specify the operating system of the monitored host: Windows, Linux, Solaris, AIX, or RDS.

**Use Local WMI:** Check this box if you want to monitor the machine the Database agent is running on, i.e. localhost. When selected, the authorization fields are not used because no authorization is required.

**Domain:** For Windows only, specify the name of the domain in which the hardware resides.

**SSH Port:** For Linux, AIX, and Solaris only, specify the Secure Shell (SSH) port number the Controller should use for encrypted communications with the monitored host. The default port number of 22 will be used if you do not specify a different port number here.

**Use certificate:** For Linux, AIX, and Solaris only, AppDynamics also supports certificate-based authentication through Privacy Enhanced Mail (PEM). To implement certificate-based authentication, enable the **Use certificate** option and copy the PEM file to the `<db_agent_home>\keys` directory. Note, if the `$HOME/.ssh` directory exists, the agent will use the certificate found there. This option appears only if the agent is running on a machine running Linux, AIX or Solaris.

**Username:** Specify the name of the user the Database Agent uses to log on to the monitored host. To collect OS metrics from a Windows host, the configured user (or Collector Service user if using Windows Authentication) must be able to establish a WMI connection to the target host and collect Windows Performance Counters.

**Password:** Specify the password of the user the Database Agent uses to log on to the monitored host. The number of echo characters shown in the password text field should not be interpreted to imply the number of characters stored for the (encrypted) user password.

- Windows hardware monitoring is not supported by Database Agent installed on a Linux system. However, Database Visibility can support hardware metrics for SQL server through SQL query collection.
- Database Visibility does not collect hardware metrics for the following database servers because these database servers require SSH connection to collect hardware metrics:
  - Apache Cassandra
  - Datastax Enterprise (DSE) Cassandra
  - Couchbase
  - IBM DB2
  - MongoDB
  - MySQL
  - Sybase

You must enable **Monitor Operating System** to collect the hardware metrics for these database servers.
- For Oracle and MSSQL database, hardware metrics can be collected through either SQL query collection or SSH connection. However, Database Visibility does not support collecting hardware metrics using SQL query for the preceding list of database servers.

## Resolve Metric Reporter Type Mismatch Problem

Switch from the Java Hardware Monitor to the [Hardware Monitor](#) if you see messages similar to the following in the logs:

```
[Worker-7] 12 Sep 2014 07:27:49,449 WARN MonitorOutputHandler - Metric Reporter type mismatch

com.singularity.ee.agent.commonservices.metricgeneration.metrics.MetricReporterTypeMismatchEx
ception: Aggregator of OBSERVATION already exists for metric Metric Identifier[Hardware
Resources|Network|Incoming packets/sec] ID[0]
```

## Required Monitored Host Permissions

### Database Agent User Permissions

Database Visibility collects the stats from common commands like `vmstat/iostat` or gathering metrics from the file system such as `/proc` and as such the user that runs the Database Agent requires no special permissions, just the ability to run those common commands and write to files in the Database Agent directory.

### Database Agent Collector Authentication

When monitoring the database host, Database Visibility must log in to the host system to gather system information. There are three ways to authenticate the Database Collector to access the monitored host:

- Specify a username and password in the Collector configuration dialog
- Place a PEM file or an `id_rsa` file in the `<agent home>/keys` directory
- If the Database Agent is running on LINUX, Solaris or AIX, place SSH keys in the `<home>.ssh` directory of the user running the agent. You can create an SSH key using the same procedure as described for the Controller. See [Configure a Controller SSH Key](#).

---

## Required SSH Permissions

When monitoring the database host, Database Visibility uses SSH on Linux and Windows systems to gather system information. SSH access can be through either an authenticated username/password or a private key.

You can create an SSH key using the same procedure as described for the Controller. See [Configure a Controller SSH Key](#).

## Configure WMI Permissions and Security

### Related pages:

- [WMI and the Database Agent on the AppDynamics Community](#)

To monitor Windows-based machine hardware with AppDynamics Database Visibility, AppDynamics uses Windows Management Instrumentation (WMI) to remotely gather the metrics. WMI is often complicated to troubleshoot when the Database Agent is running on a Linux or Unix-like machine.

This page describes requirements for the target machine configuration that can help you avoid some problems and pitfalls. It also provides some additional considerations regarding using WMI to monitor a SQL Server database agent and preventing unauthorized remote access to WMI.

### **Named Windows Account:**

The user specified in the collector configuration that the AppDynamics Database Agent uses to connect to the target machine is referred to as <named Windows account>.

The following are required when the Database Agent is hosted on AIX, Linux or Solaris platforms to monitor Windows  $\geq 7$  systems.

- Ensure that the named Windows account is a member of the local Administrators group.
- [Ensure User Account Meets Minimum Security Requirements When Using WMI](#)
- [Enable Remote Registry Access](#)
- [Grant access to WBEM scripting locator](#)

The following are required when the Database Agent is hosted on AIX, Linux, or Solaris platforms to monitor Windows  $\geq 2012$  systems.

- [Grant full control permissions to select registry keys](#)

The following is required when the Database Agent is hosted on Windows.

- Ensure that the named Windows account is a member of the local Administrators group.

## Requirements to Monitor Windows $\geq 7$ Systems (Agent Running on Unix-like Platform)

The following are required when the Database Agent is hosted on AIX, Linux, or Solaris platforms to monitor Windows  $\geq 7$  systems.

### Ensure User Account Meets Minimum Security Requirements When Using WMI

Enable Security Options for Windows Systems are Part of a Domain

Ensure the named Windows account has the correct permissions for WMI Control.

1. Run the `wmimgmt.msc` program.
2. Right-click the **WMI Control** icon on the left and click **Properties**.
3. Click **Security**.
4. Click the root node of the tree, and click **Security**.
5.  The minimum permissions that your remote Windows account needs for the Database Agent are:

- Execute Methods
- Enable Account
- Remote Enable

If the named Windows account does not have all of these permissions, you may receive an access denied error or the following errors:

`Error=800706BA The RPC server is unavailable. SWbemLocator`

or

`Error=80070005 Access is denied SWbemLocator`

## Enable Classic Security Options for Local (Non-Domain) Windows Systems

Applies to Windows computers that are not part of a domain.

1. Open the **Control** panel, and go to **Administrative Tools > Local Security Policy**. The **Local Security Settings** panel appears.
2. Go to **Local Policies > Security Options**.
3. Change the value of **Network access: Sharing and security model for local accounts** to **Classic**.

## Enable Remote Registry Access

The Remote Registry service must be running on the target machine. If the Remote register service is off, you will receive the following error:

Message not found for errorCode: 0xC0000034

or

`Access is denied`

By default Windows >= 7 systems will still deny remote access to the registry, even if the Remote Registry service is started.

To test this:

1. Attempt to access the replica registry using Regedit on another machine.
2. If you get an error similar to `Access is denied`, run PowerShell as an administrator on the replica, and execute `Enable-PSRemoting`.
3. Restart the machine and try launching the replica again.

## Grant Access to WBEM Scripting Locator

The Database Agent requires full access to the WBEM Scripting Locator. On the target system, allow full access to the WBEM Scripting Locator as follows:

1. As an Administrator on the target machine, launch Regedit.

2. Locate the registry key:  
`76A64158-CB41-11D1-8B02-00600806D9B6` in `HKEY_CLASSES_ROOT\CLSID`
3. Right-click the key and click **Permissions**.
4. Click **Advanced**.
5. Click **Owner** and change the owner to the Administrators group. Click **Apply**.
6. Click **Permissions** and change the permissions for the Administrators group to **Full Control**. Click **Apply**.
7. Close Regedit.
8. Restart the Remote Registry Service, using **Administrative Tools > Services**.

## Configure the Firewall

WMI uses RPC which listens on port 135 but then allocates a dynamic port for subsequent communication. Configure your Firewall to always allow the TCP port 135 exception and follow the dynamic RPC ports. If there is a problem with the firewall, port 135 then you will probably see this error:

```
ERROR: Message not found for errorCode: 0xC0000001
```

See [How to configure RPC dynamic port allocation to work with firewalls](#).

## Additional Requirements to Monitor Windows >= 2012 Systems (Agent Running on Unix-like Platform)

In addition to the requirements described in [Requirements to Monitor Windows >=7 Systems](#), the following are also required when the Database Agent is hosted on AIX, Linux, or Solaris platforms to monitor Windows >= 2012 systems.

### Grant Full Control Permissions to Select Registry Keys

For the Database Agent running on AIX, Linux, or Solaris to monitor Windows >= 2012 (64-bit) systems, complete the following changes on the target system.

1. As an Administrator on the target machine, launch Regedit.
2. Change the permissions for both of these registry keys to **Full Control**:  
`72C24DD5-D70A-438B-8A42-98424B88AFB8`  
 in `HKEY_LOCAL_MACHINE\SOFTWARE\Classes\Wow6432Node\CLSID`  
`76A64158-CB41-11D1-8B02-00600806D9B6` in `HKEY_CLASSES_ROOT\CLSID`
3. Find this registry key:  
`72C24DD5-D70A-438B-8A42-98424B88AFB8` in  
`HKEY_LOCAL_MACHINE\SOFTWARE\Classes\Wow6432Node\CLSID`
4. Right-click and click **Permissions**.
5. Change the owner to the Administrators group.
6. Change the permissions for the Administrators group to **Full Control**.
7. Change owner back to **TrustedInstaller**. User is <NT Service\Trusted Installer> on the local machine.
8. Repeat steps 4 to 6 above for this registry key:  
`76A64158-CB41-11D1-8B02-00600806D9B6` in `HKEY_CLASSES_ROOT\CLSID`.
9. Close Regedit.
10. Restart the Remote Registry service, using **Administrative Tools > Services**.

## General Considerations for all Platforms

This information applies to the Database Agent running on Windows systems.

## Use Windows Authentication for Microsoft SQL Server

To use Windows Authentication for the Database Agent to connect to a Microsoft SQL Server database instance, you must use a command similar to the following to start the Database Agent; specifying the path to the Database Agent authentication library.

### Windows 64-bit

```
java -Djava.library.path="C:\dbagent404\auth\x64" -jar db-agent.jar
```

### Windows 32-bit

```
java -Djava.library.path="C:\dbagent404\auth\x86" -jar db-agent.jar
```

The Windows account used to start the Database Agent must be a Windows user who can authenticate with the database server.

## Monitor Databases and Database Servers

### Related pages:

- [Database Visibility](#)

For roles and permissions required to view Database Monitoring windows, see [Manage Custom Roles](#).

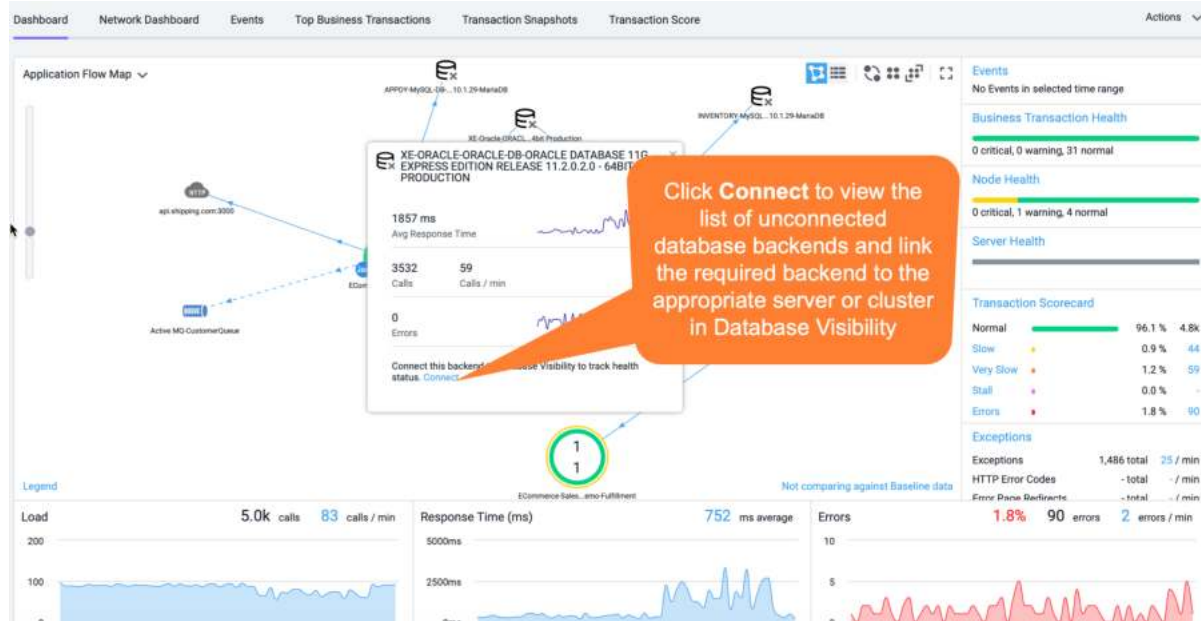

## Access Database Visibility from Application Monitoring Views

### Related pages:

- [Monitor Database Performance](#)
- [App Agent Node Properties](#)

To view the application dashboard of a specific application, click the application on the **Home** page. On the application dashboard, you can view the following:

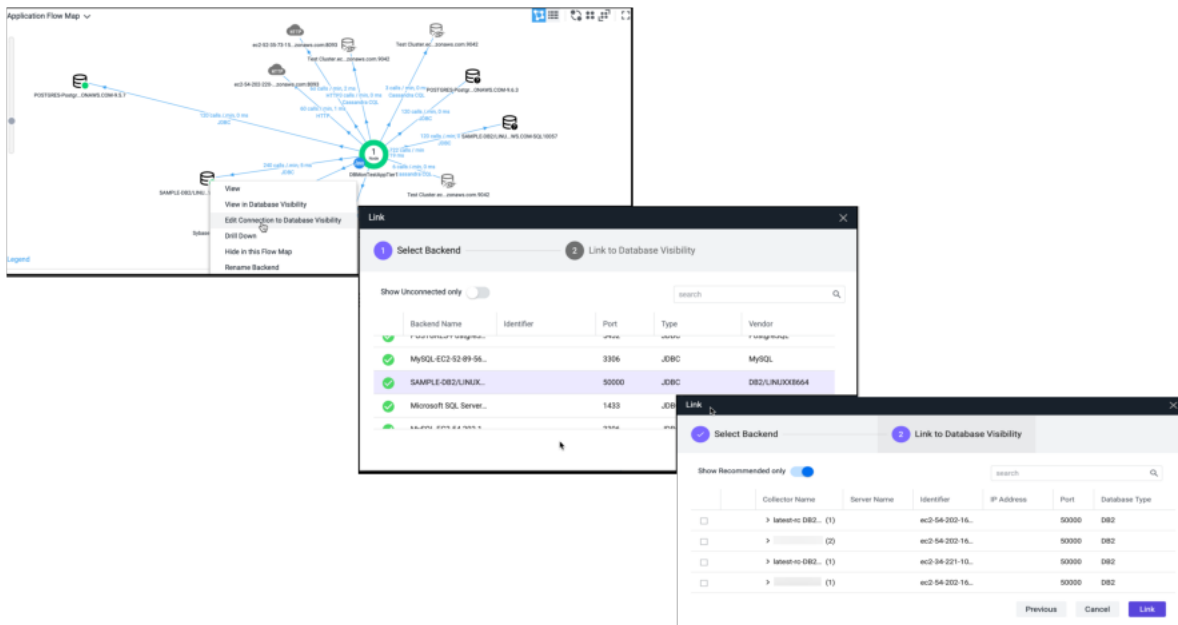

- **Unconnected Backends:** If there are any unconnected backend database servers, the flowmap displays the unconnected database server icon. You can click the icon, then click **Connect** to connect the backend database to the appropriate server or cluster in **Database Visibility**.
- **Status of the Database:** There are different icons to display different states of the database based on the health rule violation. For information about the different icons, see [Database Icons](#).
- **Quick View of Database Visibility:** If you require to view some of the main metrics without going to the **Database Visibility** UI, you can click the database icon and the quick view of the metrics is displayed. For detailed information, click **View in Database Visibility**.

### View Database Activity in Database Visibility

Once you have [configured a database Collector](#) in AppDynamics Monitoring, you can access Database Visibility either from the AppDynamics Home page or you can link to the Database Visibility database instance Dashboard by right-clicking the database and selecting **View in Database Visibility** on the Application Flow Map, Tier Flow Map or Node Flow Map.

Database backends with the same hostname, port number, and database type as a database server already configured in a database Collector are automatically matched with the Collector, and drilldowns from the Application Flow Map, Tier Flow Map or Node Flow Map to Database Visibility are enabled.

✓ The AppDynamics Database Visibility section in the Application Database Dashboard displays which database Collector is associated with the database. If you require to change this association, right-click the database and then click **Edit Connection to Database Visibility** and choose the appropriate server or cluster that is configured in **Database Visibility**.

### View Business Transaction Snapshot Correlated Database Details

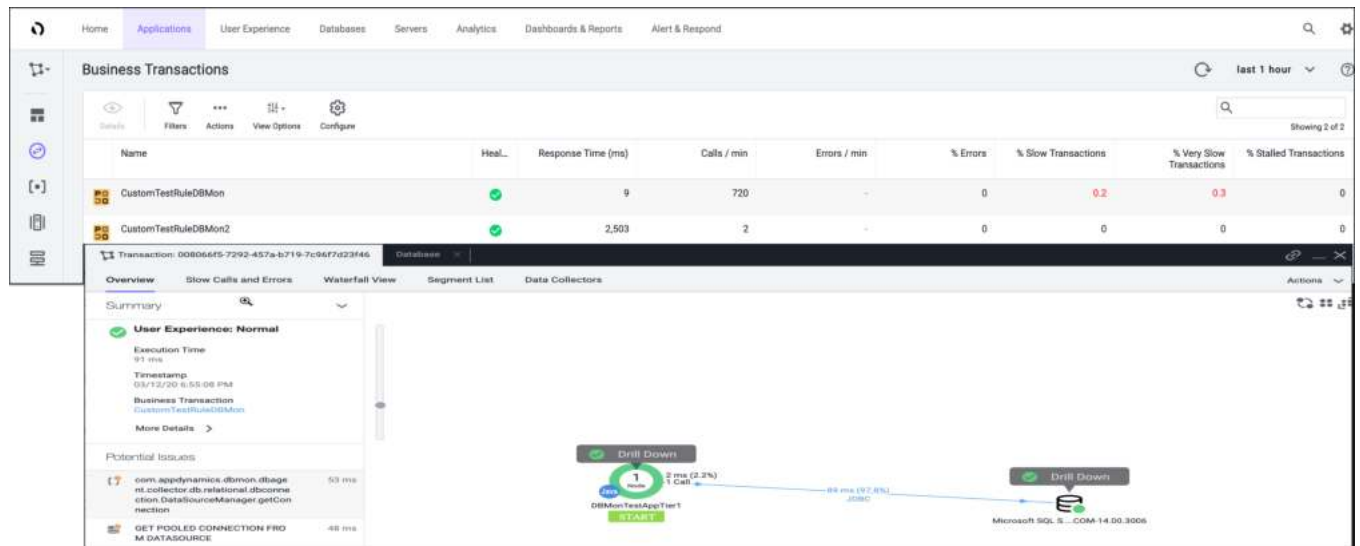

Available for Java, .NET, and PHP applications and their relational database backends, snapshot correlation shows the details of queries executed by the business transaction. It also shows the clients, sessions, and schemas in which those queries were executed.

### View Database Details

1. On the [Business Transactions](#) page, double click any business transaction to view the queries that are executed in that transaction.
2. Click the DB Queries tab. On this tab, you can view the queries that were issued by this business transaction.

### View Correlated Database Details

1. From a list of business transactions with snapshots, choose a long-running business transaction that accesses the database, one that takes a few seconds or more. These are more likely to have captured database details.
2. Double-click **Drill Down** above the database icon. The correlated database details window appears.
3. Click the Queries, Clients, Sessions, and Schema tabs to view details of database activity that occurred around the time when the snapshot was captured. For relational databases, these details reflect the database activity from the transaction snapshot. For non-relational databases, these details reflect the database activity that occurred around the time of the transaction snapshot.

**i** For Oracle backends only: If you want to list only the queries executed by the Transaction Snapshot in the Transaction Snapshot window, you can enable the `jdbcm-dbcam-integration-enabled` node property for the Java Agent.

## Discover Normal Database and Server Activity

### Related pages:

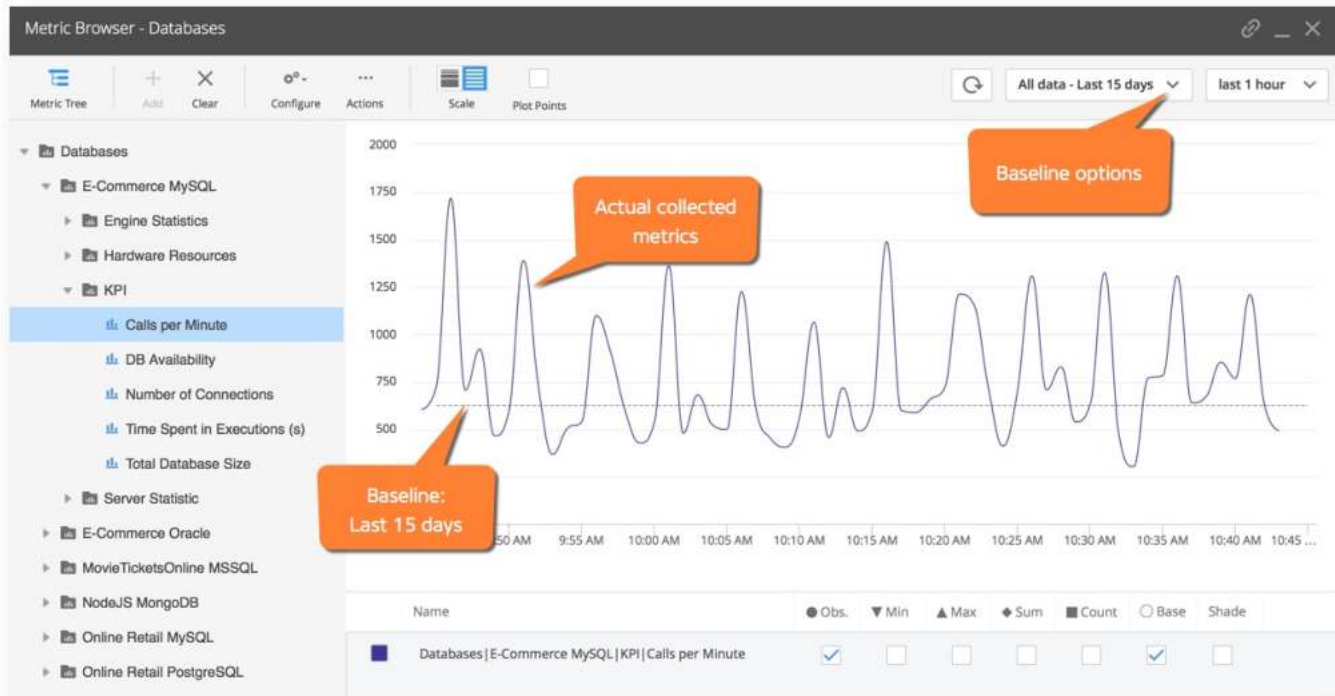

- [Dynamic Baselines](#)
- [Health Rules](#)

AppDynamics Database Visibility automatically learns to detect performance anomalies using baselines that are specific to your database and database server environments.

AppDynamics creates baselines by collecting metrics from your monitored databases and servers over defined periods of time. This establishes what is normal for your environment. You can also create your own baselines.

### View Performance Metrics on the Metric Browser

On the Metric Browser for Database Visibility, you can visualize performance metrics and see how they deviate from expected behaviors established by the baseline.

## Monitor Database Performance

### Related pages:

### Important information

Garbage collection affects all monitored entities, including database queries, sessions, clients, and schemas. Entities that are garbage collected will be displayed as unavailable.

## View Overall Database and Server Performance

### Related pages:

- [Access Database Visibility from Application Monitoring Views](#)

Database Visibility provides overall views of your databases that show key performance indicators.

## Access the Databases Window

From AppDynamics Home, click **Databases**.

## Features of the Databases Window

On the views of the Databases window you can:

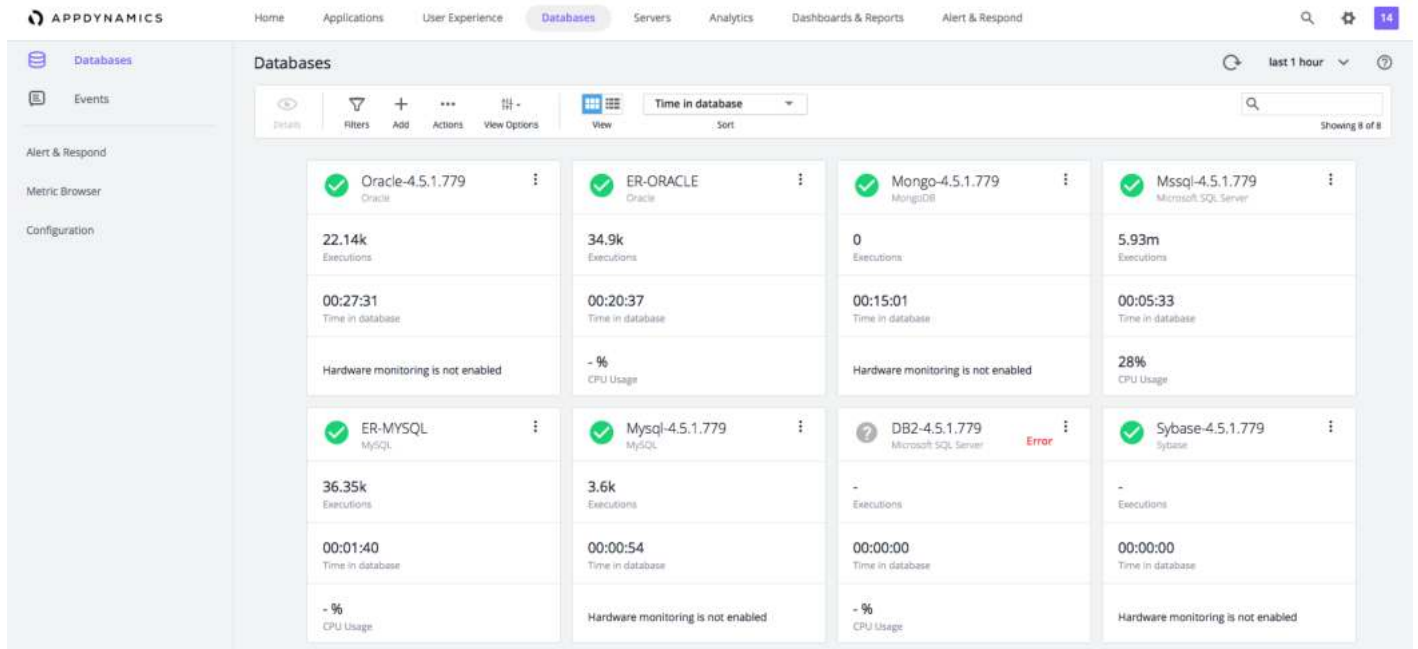

- Show only databases meeting certain criteria by entering search criteria in the search box on the top right of the page.
- Click **Filters** to show only databases meeting certain search criteria, such as criteria that describes Health, Load, Time in database or Type.
- Click **+** to add a new database Collector.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.
- Click **View** to switch between card and list view.
- See the overall performance of your databases and if there are any critical issues with them. The server health or status indicates whether criteria has been met for normal, warning or critical health rules. The green checkmark indicates that the database is operating within normal conditions, the red exclamation mark indicates that at least one critical health rule has been violated.
- Click the name of the database to switch to the Database Dashboard for that specific database.

## Databases Card View

From the Databases card view, you can view:

- The configured collectors along with the database type and the number of nodes used in the database cluster.
- The **Total Executions** graph that provides insight into the total number of calls (transactions for PostgreSQL databases) monitored for the database over the selected time period.
- The **Time in Database** graph that indicates the total time spent executing those calls during the selected time period. This metric is expressed in hours, minutes, and seconds.
- **CPU Usage** metrics that when enabled shows the percentage of CPU capacity consumed by the database.

## Databases List View

From the Databases list view, you can:

- View the number of database nodes under the **Nodes** column.
- Click **View Options** to turn the spark charts on and off.
- Get to the databases you want to see quickly if you are monitoring many databases.
- Click on any point in the spark charts to see a metric for that point in time. For example, clicking on a point in the calls Trend shows how many calls were monitored at that time.
- Click on a column name to sort the list on that key.

## Database Dashboard

### Related pages:

- [Access Database Visibility from Application Monitoring Views](#)
- [View Overall Database and Server Performance](#)
- [Discover Normal Database and Server Activity](#)
- [Database Health Rules and Alerts](#)
- [Monitor Database Performance](#)

The dashboard for each individual database provides detailed information about your database.

### Permissions

To view database collectors, users need a role with the **Can View All Collectors** permission.

### Access the Database Dashboard

You can access the Database Dashboard in one of these ways:

- In AppDynamics Home, on the **Databases** card, click the name of the database for which you want to see the Database Dashboard.
- In the Databases overview panel, click the name of the database for which you want to see the Database Dashboard.

## Features of the Database Dashboard

On the Database Dashboard you can:

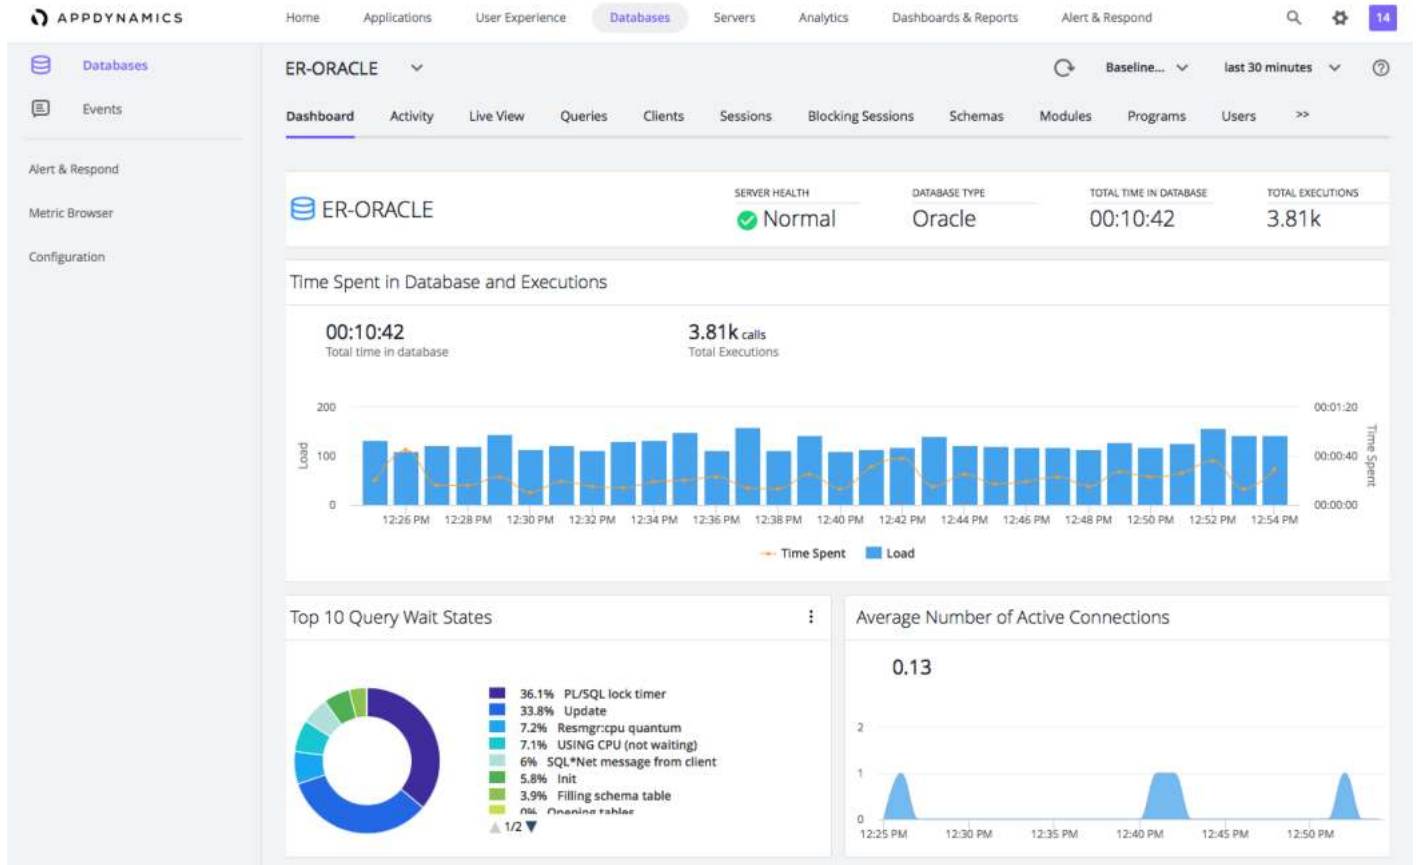

- Click the dropdown arrow next to the database Collector name at the top of the page to choose a database that you want to see the dashboard for.
- (From 21.5 onwards) For a clustered database, click the down-arrow below the collector name to navigate between different nodes of the cluster. By default, **All Nodes** is selected.
- Click the down-arrow next to the clustered database Collector name to navigate between different nodes of the cluster.
- Click the status icon below **SERVERS** in the top section of the dashboard to go directly to **Events** where you can see any recent events.

On the Database Dashboard, you can view:

- **Server Health:** Server Health at the top of this panel indicates the extent to which health rules are being violated:
  - Green - Healthy server
  - Yellow/orange - server with warning-level violations
  - Red - server with critical-level violations
- **Type:** The database type.
- **Time Spent in Database and Executions:**
  - Load - At a glance, you can see the total number of calls (transactions for PostgreSQL databases) during the specified time period and the number of calls for any point in time.
  - Time spent in Database - The total time spent executing SQL statements during the specified time period.
  - Changes - Changes made to the database configuration parameters.
  - Max CPU - It displays the CPU cores present in the database server and is disabled by default. The CPU core count is collected using SQL (for Oracle, DB2, and MSSQL) and Hardware monitoring (if enabled for MySQL, PostgreSQL and Sybase).
- **Top 10 SQL Wait States (not available for Couchbase):** Activities that contribute to the time it takes the database to service the request. The wait states consuming the most time may point to performance bottlenecks. For example, a db file sequential read wait state may be caused by segment header contention on indexes or by disk contention. See your database platform documentation for descriptions of the SQL wait states. For example:
  - Wait State - CHECKPOINT\_QUEUE
  - Description - Used by background worker that waits on events on queue to process checkpoint requests.
  - Recommended Action - You should be able to safely ignore this action because it indicates that the checkpoint background worker is waiting for work to do. If you thought you had issues with checkpoints not working or log truncation, you might see if this worker ever "wakes up". Expect higher wait times as this will only wake up when there is work to do.
- **Top 10 Phases (Couchbase only):** The phases that have processed the most documents.
- **Average number of active connections:** This is a derived metric. This calculates the average number of queries that execute every second in the period of one minute.  
The metric displays **Number of connections**, which represents the average number of active query execution.  
For example: If there are 3 queries running every second for a one-minute duration, then the number of connections is 3.

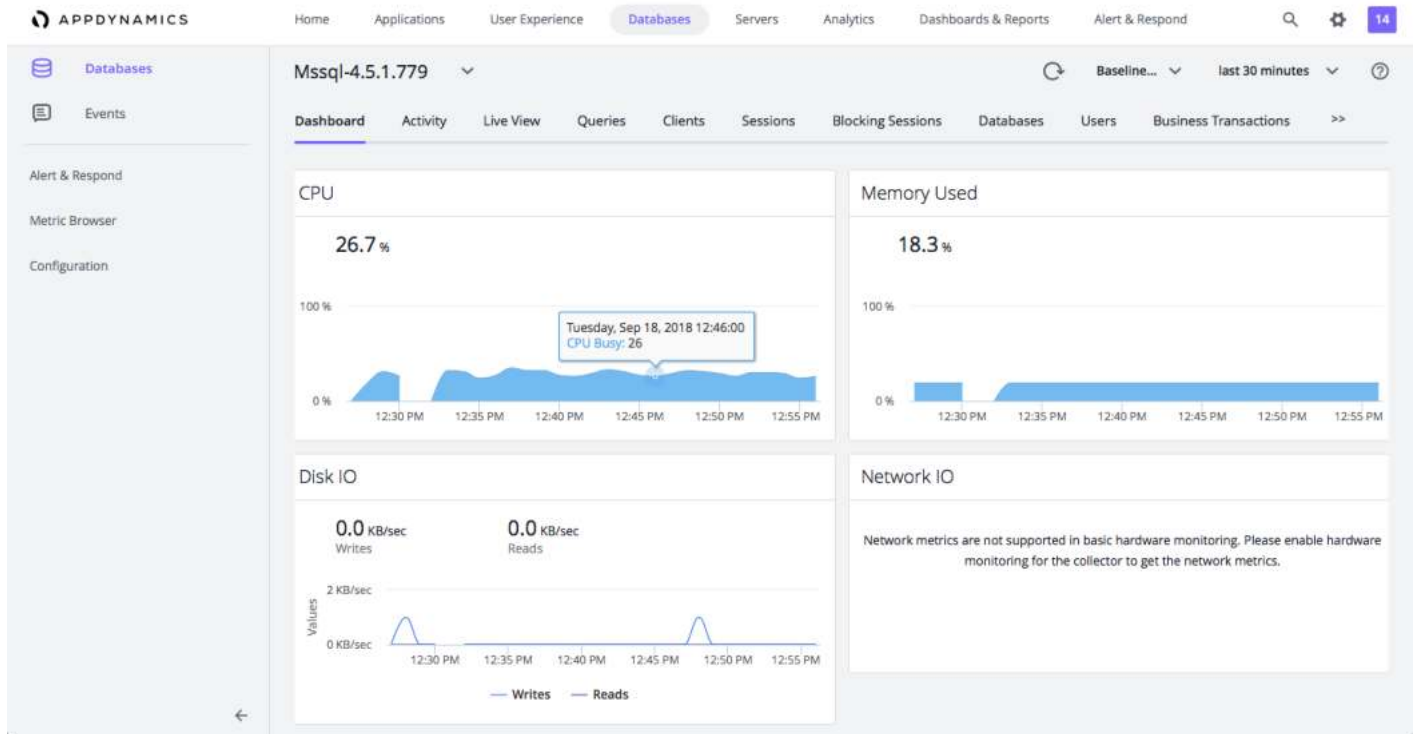

### Accessing the Comparison Report

Click on any data point to view the time comparison report, which shows query run times and wait states 15 minutes before, and 15 minutes after the selected time.

The **CPU**, **Memory**, **Disk I/O**, and **Network I/O** graphs display when the Database Agent has been configured to also monitor the database host hardware. See, "Configure the Database Agent to Monitor Server Hardware" on [Add Database Collectors](#).

- **CPU**: The CPU graph shows the relative percentages of CPU processing time used for handling system and users processes.
- **Memory**: The Memory graph shows the percentage of total memory in use at any point in time.
- **Disk I/O**: The Disk I/O graph shows disk usage, the volume of data read and written.
- **Network I/O**: The Network I/O graph shows network activity, the volume of data sent and received.

**✓ Accessing the Metric Browser**

To see more information about a specific metric, double click any point on the graph and the Metric Browser opens displaying that metric. You can then hover over a point on the graph in the Metric Browser for more information about the metric. This feature is available for all the graphs except the SQL wait states graph.

**Hardware Metrics**

Metrics	Description
<b>CPU</b>	
ActiveCPU	The percentage of CPU used in the server.
<b>Memory</b>	
UsedMemory	The amount of memory used in the server.
PercMemoryUsed	The amount of memory used (in percentage) in the server.
FreeMemory	The amount of memory available in the server.

Metrics	Description
TotalMemory	The total amount of memory in the server.
<b>Disk I/O</b>	
ReadOPS RATES	The number of disc reads per second.
ReadKBS RATES	The number of bytes read from the disc in kilobytes per second.
WriteOPS RATES	The number of disc writes per second.
WriteKBS RATES	The number of bytes written to the disc in kilobytes per second.

## Database Activity Window

### Related pages:

- [Access Database Visibility from Application Monitoring Views](#)
- [Database Visibility](#)
- [Monitor Databases and Database Servers](#)
- [Monitor Database Performance](#)

The following describes the reports available in Database Visibility on the Database Activity Window. The reports available depend on the database platform being monitored. The reports are listed in alphabetical order and indicate which database platform supports them.

### Access the Database Activity Window

#### To access the Database Activity window

1. To view a database's activity, click the name of the database.
2. Click the **Activity** tab.

### Features of the Database Activity Windows

To view the database reports of different databases, click the down arrow next to the database name at the top of the page. From the list, select the database you want to view or search for the database in the search bar. Click the refresh icon to show only databases that meet that search criterion.

The activity reports available are described below. The reports available are database-dependent. The reports are listed in alphabetical order and indicate which database platform supports them. The reports will only show 10 days of data, which is the Events Service limit.

---

## Wait State

**Description:** This report displays time-series data on Wait Events (states) within the database. Each distinct wait is color-coded, and the Y-axis displays time in seconds. This report also displays data in a table and highlights the time spent in each wait state for each SQL statement.

**Relevance:** The wait states consuming the most time may point to performance bottlenecks. For example, db file sequential reads may be caused by segment header contention on indexes or by disk contention.

**Platform:** IBM DB2, Microsoft SQL Server, MySQL, Oracle, PostgreSQL, Sybase, and Sybase IQ

**Max CPU** - It displays the CPU cores present in the database server and is disabled by default. The CPU core count is collected using SQL (for Oracle, DB2, and MSSQL) and Hardware monitoring (if enabled for MySQL, PostgreSQL and Sybase).

## Phase

**Description:** This report displays the elapsed time during a phase of query execution. If the Couchbase version < 7 and Database Agent < 21.9, then the report displays the number of documents processed.

To view the elapsed time for the phases instead of document count you require the following:

- Database Agent version >=21.9
- Controller version >=21.11
- Couchbase version >=7

**Relevance:** The phase processing the most documents may point to performance bottlenecks.

**Platform:** Couchbase

## Top Activity

**Description:** Display the top time in database SQL statements in a time-series view. This report also displays data in a table and highlights the time spent in the database for each of 10 top SQL statements. Only queries reported by newer agents are grouped; the queries reported by older agents may not appear upon grouping.

**Relevance:** Use this report to see which SQL statements are using the most database time. This helps to determine the impact of specific SQL statements on overall system performance allowing you to focus your tuning efforts on the statements that have the most impact on database performance.

**Platform:** IBM DB2, Microsoft SQL Server, MySQL, Oracle, PostgreSQL, Sybase, Sybase IQ, and Couchbase

## Time Comparison

**Description:** This report allows compares the performance of two databases during the same time period based on a specific statistic type. You can click Group Similar to group together queries with the same number of parameters. Only queries reported by newer agents are grouped; the queries reported by older agents may not appear upon grouping.

**Relevance:** You may want to compare the performance of your development and production databases before and after you tune the SQL queries or add an index or join. This report can help you determine the effectiveness of any performance tuning procedures you have implemented.

**Platform:** IBM DB2, Microsoft SQL Server, MySQL, Oracle, PostgreSQL, Sybase, and Sybase IQ

## I/O

**Description:** This report gives information on physical I/O performed by the database instance.

The SQL Server and PostgreSQL I/O reports include the following metrics:

- Time spent in the database
- Query throughput
- CPU usage (if hardware monitoring is enabled)
- Read and Write I/O. This metric is only available for SQL Server.
- Per file statistics (if the agent is run with the `dbagent.mssql.datafile.statistics` property). This metric is only available for SQL Server.
- Per database statistics. This metric is only available for PostgreSQL.

**Relevance:** Your physical disk I/O may be affecting database performance.

Poor response times may mean one of the following:

- You're doing too much physical I/O and need to adjust your I/O capacity
- You're scanning tables or indexes when you should be doing seeks
- Your database tables are missing indexes
- Your SQL needs to be tuned

**Platform:** Microsoft SQL Server, Oracle, PostgreSQL

### Top Query

**Description:** This report displays the top 10 SQL statements for the specified statistic in a time-series view.

You can filter queries by command type using the **Command Type** dropdown menu and by statistic type using the **Statistic Type** dropdown menu.

 With the Controller version 21.2.0 and later, some of the unused statistic types under the **Statistic Type** dropdown menu are removed from the list. You can filter queries using the most common statistic types.

**Relevance:** Use this report to see which SQL statements are using the most database resources. This helps to determine the impact of specific SQL statements on overall system performance allowing you to focus your tuning efforts on the statements that have the most impact on database performance. You can choose one of many statistics to base the report on.

**Platform:** IBM DB2, Microsoft SQL Server, Oracle

### Query Wait State

**Description:** This report displays the wait times for all queries.

**Relevance:** Use this report to see how much time queries are spending in different wait states.

**Platform:** IBM DB2, Microsoft SQL Server, MongoDB, MySQL, Oracle, PostgreSQL, Sybase, and Sybase IQ

### Parameter Changes

**Description:** This report displays changes to the database configuration parameters. You can select a parameter change and click one of the following options:

- **View Event Details:** Displays the parameter change event details, such as comments associated with the parameter change.
- **View Comparison Report:** Compares the query run times and wait states 15 minutes before and 15 minutes after the database parameter was changed. The comparison report is not available for clusters.

**Relevance:** Use this report to keep track of the changes you make to the database configuration parameters.

**Platform:** IBM DB2, Microsoft SQL Server, Microsoft Azure, MySQL, Oracle, PostgreSQL, Sybase ASE, and Sybase IQ

### BT Activity

**Description:** This report displays the top (Java or PHP) business transactions that make calls to the database.

**Relevance:** Use this report to see which business transactions are affected by the database.

**Platform:** IBM DB2, Microsoft SQL Server, Microsoft Azure, MySQL, Oracle, PostgreSQL, Sybase ASE, and Sybase IQ

### Database Topology Window

The Topology view displays current activity for the routing service and shards of a MongoDB database, Oracle RAC server or a custom cluster. The Topology view shows key performance metrics for the routing service and shards or nodes of the database.

#### Access the Database Topology Window

Access the Database Topology window:

1. To view a database's topology, click the name of the database.
2. Click the Topology tab.

#### Features of Database Topology Window

**i** This document contains links to MongoDB documentation. AppDynamics makes no representation as to the accuracy of MongoDB documentation because MongoDB controls its own documentation.

From the Database Topology window, you can:

- Select the **Auto Refresh** box. From the **Every** list, you can choose how often the system updates the live view.
- Click the dropdown arrow next to the database Collector name at the top of the page to choose a node or cluster that you want to see the metric views for. You can either select the database Collector name from the list or search for the database Collector by entering text in the search bar and then clicking the refresh icon to show only database Collectors that meet those search criteria.
- Hover over the sections of the trends to see their details.
- Click a column title on the **Topology** name list to sort the topologies using that column as the sort key.

From the Topology window, you can view:

- **Health:** Indicates whether any health rules for the routing service or shards of the replica set or nodes have been violated.
- **Role:** The role performed by the shard. The routing service routes the queries to the shards to balance the load. The members or shards of the replica sets can have either a primary or secondary shard role. For MongoDB, in addition to primary and secondary roles, the following roles are displayed for replica set and shard cluster in the `<role name> replica set` or `<role name> shard` format:
  - arbiter
  - down

- rollback
- recovering
- routing service
- startup
- standalone
- startup2
- unknown

For more information about these roles, see [MongoDB documentation](#).

 You require Database Agent version >= 21.9 to view these roles.

- **Num Queries:** The number of queries handled.
- **Queries Trend:** The trend of queries handled over time.
- **Time in Database:** The time required for the database to respond to the queries.
- **Time Spent in Database Trend:** The trend of time spent in the database over time.

You can also select a server and delete it.

 If you change the port number for a monitored database node, the Topology window shows a new node with the new port number, as well as the original node with the old port number. The original node remains in the Topology window for the duration of the retention period that you specify in [Controller Settings](#).

DBMON-MONGO ↻ Last 30 Minutes ?

Dashboard Activity Topology Live View Queries Clients Sessions Namespaces Databases Applications Object Browser

Name	Health	Role	Num Q...	Queries Trend	Time in Da...	Time Spent in Database Trend
▼ mongoset						
 mongoset: 172.17.0.4: 27017		secondary replica set	0	-	0h 0m 0s	-
 mongoset: 172.17.0.5: 27017		primary replica set	0	-	0h 0m 0s	-

## Database Live View Window

- [Monitor Databases and Database Servers](#)
- [Monitor Database Performance](#)

The Live View displays current activity for the database server. The live view shows key performance metrics for the last time period, which can be refreshed in a specified time interval between 10 seconds and 5 minutes.

---

## Access the Database Live Window

To access the Database Live window:

1. To view a database's current performance, click the name of the database.
2. Click the **Live View** tab.
3. For clustered databases, select the node to view its details.

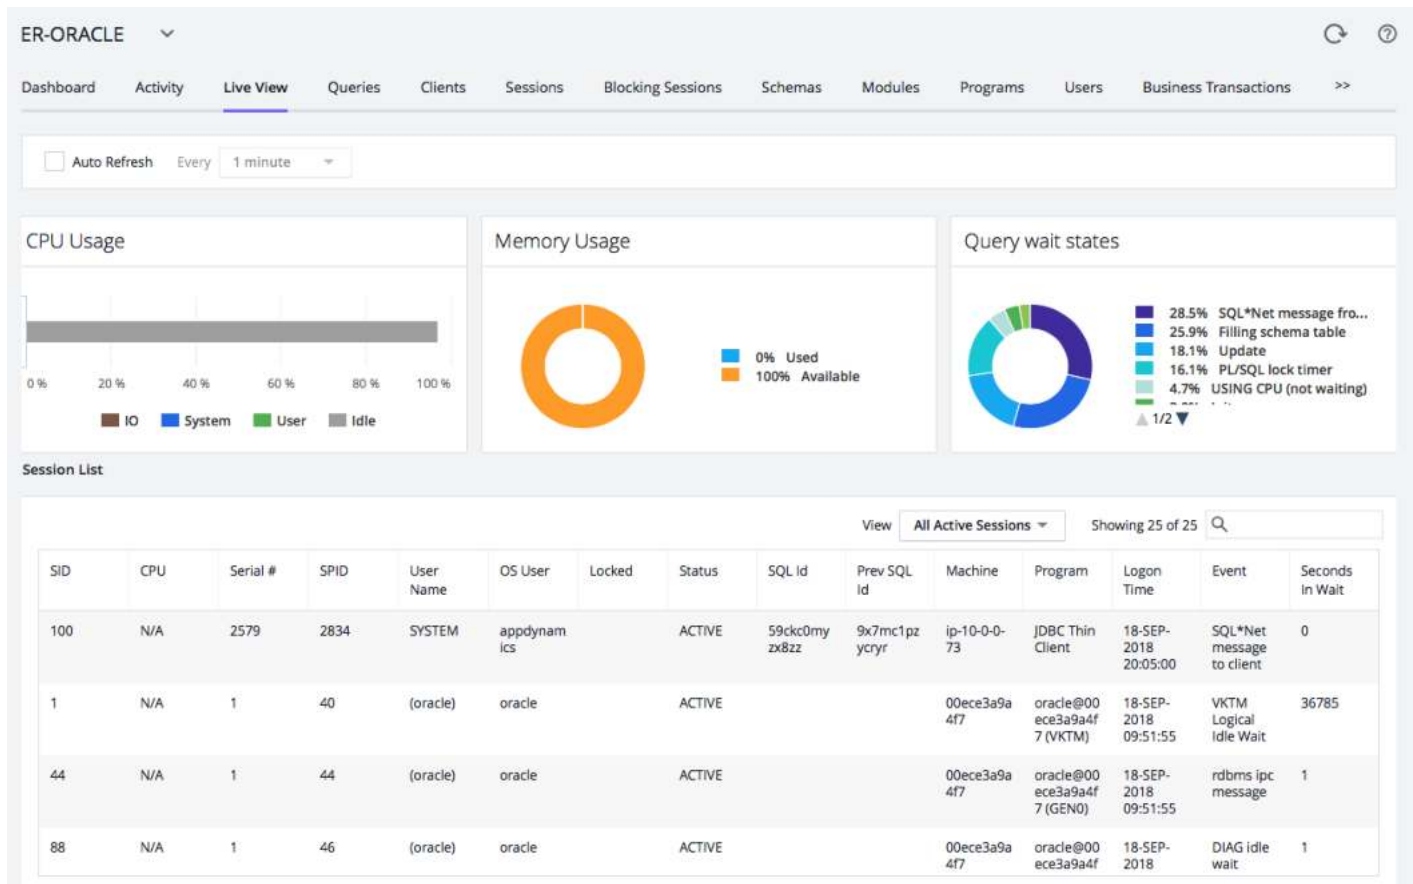

## Database Live Window Features

From the Database Live window, you can:

- Select the **Auto Refresh** box and then from the **Every** list, choose how often you want the system to update the live view.
- Click the down arrow next to the database collector name at the top of the page to choose to view the live view of a different database Collector by either selecting the database Collector name from the list or by searching for the database collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Hover over the sections of the charts to see their details.
- Click the **View** list to view **All Active Sessions** or **All Sessions**.
- Click a column title on the **Session List** to sort the Session List using the clicked column as the sort key.

From the Database Live window, you can view:

- **CPU Usage:** If you have enabled Hardware Monitoring for the server the chart shows the percentage of available CPU resources consumed by users and the system and a break down of how the CPU is being used.
  - IO - Disk input and output.
  - System - Database operating system activities.
  - User - User interaction with the database.
- **Memory Usage:** Displays how much memory is in use and how much is available.
- **Query wait states:** Activities that contribute to the time it takes the database to service the request. The wait states consuming the most time may point to performance bottlenecks. For example, database file sequential reads may be caused by segment header contention on indexes or by disk contention.
- **Session List:** A table describing database usage instances and their properties. The database session is the application interaction with the database, a new session is started for each request. The columns displayed are database dependent.
- **Blocking Tree:** A tree showing all the sessions causing blocks. Nested under each blocking session are the sessions being blocked and the corresponding queries and blocked objects.

For SQL Server, the **CPU Usage** and **Memory Usage** statistics are displayed in Live View even when hardware monitoring is disabled.

In the Live View for database clusters, you must select a node from the dropdown menu to view that node's activity.

## Database Queries Window

### Related pages:

- [Access Database Visibility from Application Monitoring Views](#)
- [Add Database Collectors](#)
- [Database Visibility](#)
- [Monitor Databases and Database Servers](#)
- [Monitor Database Performance](#)

The Queries window displays the SQL statements and stored procedures that consume the most time in the database. You can compare the query weights to other metrics such as SQL wait times to determine SQL that requires tuning.

### Access the Database Queries Window

To access the Database Queries window:

1. To view database queries, click the name of the database.
2. Click the Queries tab.

## Database Queries Window Features

 Database agent reports all the queries with execution time > 1 second. It captures queries with execution time <= 1 second only if the query is executed at the sampling time.

From the Database Queries window, you can:

- View the top N queries. These are the queries that consumed the greatest amount of database time to complete.
- Choose to display the top 5, 10, 100 or 200 queries.
- Click the name of a column to sort the **Query** list using that key.
- Click **Filter by Wait States** to choose wait states to filter the **Query** list. The filtered list only displays queries that caused the selected wait states.

 For Couchbase database, click **Filter by Phases** to choose the phases. This filters all the queries based on the selected phase.

- Check the **Group Similar** box to group together queries with the same syntax. Queries that share the same syntax but different 'IN' clause parameters are still grouped together. Query grouping is case-insensitive. Double-click a query group to dive into the Group Details for more information about that query group. Only queries reported by newer agents are grouped; the queries reported by older agents may not appear upon grouping.
- Search for a specific query, by entering text in the search bar that may appear in the Query. This is useful if you found a slow query in the Slow Database calls window of AppDynamics Application monitoring.
- Double-click a query or select a query and click **View Query Details** to dive into the **Query Details** for more detailed information about that specific query. If you see a message saying that query details are unavailable, you may need to update your permissions or extend your query retention period.
- Click the down arrow next to the database Collector name at the top of the page to choose to view the database queries of a different database Collector by either selecting the database Collector from the list or by searching for the database Collector by entering text in the search bar and then clicking the refresh icon to show only database Collectors that meet that search criteria.
- Click **Actions** to:
  - Export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.
  - Rename the selected query so that it is easier to identify. Note that the query name is associated with the query itself. Thus, when a query's retention period expires, both the query and the query name disappear.

From the Database Queries window, you can view:

- **Query Id:** This is the unique ID assigned to the query internally by the database.
- **Query:** The text of the query, custom query name, or, in the case of a stored procedure invocation, the name of the stored procedure. If the user does not have the ANY permission to view the stored procedure name, the definition of the stored procedure is shown instead of the stored procedure name.

For SQL Server, Azure, Oracle, PostgreSQL and DB2 the metrics Number of Executions, Average Response Time and Elapsed Time are inferred from the query index. When you are viewing the queries with Group Similar checked, the statistics reflect only the queries that have captured query statistics. Queries that do not have query statistics are excluded from the statistic values.

For databases such as MySQL and MongoDB which do not have a query index, no data will appear in the Number of Executions and Average Response Time columns. However, Elapsed Time can be inferred for MySQL and MongoDB databases using the wait state index. Elapsed Time can also be inferred using the wait state index when query statistics for a query run on an SQL Server, Azure, Oracle, PostgreSQL or DB2 database are otherwise not available. When query statistics are not available for a query run on an SQL Server, Azure, Oracle, PostgreSQL or DB2 database, the Number of Executions and Average Response Time statistics cannot be reported and are marked with a hyphen (-). This means that the database did not provide statistics for this query in the selected time range.

- **Elapsed Time:** The total time consumed by all executions of this query. Query statistics such as Number of Executions, Average Response Time and Elapsed time are available for databases supporting the query index, such as SQL Server, Azure, Oracle, PostgreSQL and DB2. For databases where the query index is not available, the elapsed time is inferred from the wait state index or phases.  
By default, the query sampling frequency is once every second. If a query takes less than one second and happens to occur in the time between sampling instances, its elapsed time is reported as 0 seconds.  
You can configure the sampling frequency by adding the `-Ddbagent.sampling.interval= <value>` property for Database Agent. For information about adding the system properties, see [Database Agent Configuration Properties](#).
- **Number of Sessions:** (supported for Oracle, MSSQL, PostgreSQL, MySQL, Sybase, DB2, MongoDB, and Couchbase) The number of sessions that are running the query.
- **Number of Executions:** (supported for SQL Server, Azure, Oracle, DB2, PostgreSQL) The number of times the query ran during the specified time period. If you are monitoring Greenplum, the number of executions appears as 0.
- **Average Response Time (hh:mm:ss):** (supported for SQL Server, Azure, Oracle, DB2, PostgreSQL) The average time required during the specified time period to respond to the query.
- **Weight (%):** The percentage of the total time consumed by the query.

The screenshot shows the Oracle Database Queries window in AppDynamics. The interface includes a navigation bar with tabs like Dashboard, Activity, Live View, Queries (selected), Procedures, Clients, Sessions, Blocking Sessions, Schemas, Modules, Programs, Containers, and Users. Below the navigation bar, there are controls for 'Top queries' (set to 100), 'Filter by Wait States', 'Group Similar', and 'Actions'. A search bar is also present. The main table displays the following data:

Query id	Query	Elapsed Time	Number of Sessio...	Number of Execut...	Average Response Time	Weight (%) ↓
bcztrz3h3zfwg	select count(?) count from item it1, item it2	4h 12m 1s	5	2502	0h 0m 6.04s	43
323nu5v5r9u1y	select COMPANY, CITY, COUNTRY, CONTACT, PHONE, to_char(sum(OrderTotal), ?) as Value_Shipped from ( select c.COMPANYNAME as COMPANY, c.CITY as CITY, c.COUNTRY as COUNTRY, c.CONTACTNAME as CONTACT, c.PHONE as	2h 20m 48s	7	1079	0h 0m 7.83s	24
9z25xxdmbh06m	SELECT ? as containerId, sess.sid as Id, sess.username as username, nvl(sess.SCHEMANAME, ?) as db, sess.OSUSER as osuser, sess.machine as Host, sess.PROGRAM as Program, sess.event as State, nvl(sess.sql_id,?) as Info, sess.module as	1h 11m 26s	1	10742	0h 0m 0.40s	12
9jt9ygv0mg0q	SELECT ? as containerId, sess.sid as Id, sess.username as username, nvl(sess.SCHEMANAME, ?) as db, sess.OSUSER as osuser, sess.machine as Host, sess.PROGRAM as Program, sess.event as State, nvl(sess.sql_id,?) as Info, sess.module as	0h 53m 6s	1	10201	0h 0m 0.31s	9
3s0f8kxjpmf4t	BEGIN addToCart(:1 ); END;	0h 23m 9s	3	1385	0h 0m 1.00s	4

Once you have identified the statements that are consuming the most resources, you can dig down deeper for details that can help you tune the SQL statement. For in-depth query details, click a SQL statement and then click **View Query Details**. See [Database Query Details Window](#).

## Database Query Details Window

### Related pages:

- [Access Database Visibility from Application Monitoring Views](#)
- [Add Database Collectors](#)
- [Database Visibility](#)
- [Monitor Databases and Database Servers](#)
- [Monitor Database Performance](#)

Once you have identified the statements on the [Database Queries window](#) that are spending the most amount of time in the database, you can dig down deeper for details that can help you tune those SQL statements. The database instance Query Details window displays details about the query selected on the [Database Queries window](#).

### Access the Database Query Details Window

To access the Database Query Details window:

1. To view a database's query details, click the name of the database.
2. Click the Queries tab.
3. Select a query and click **View Query Details**.

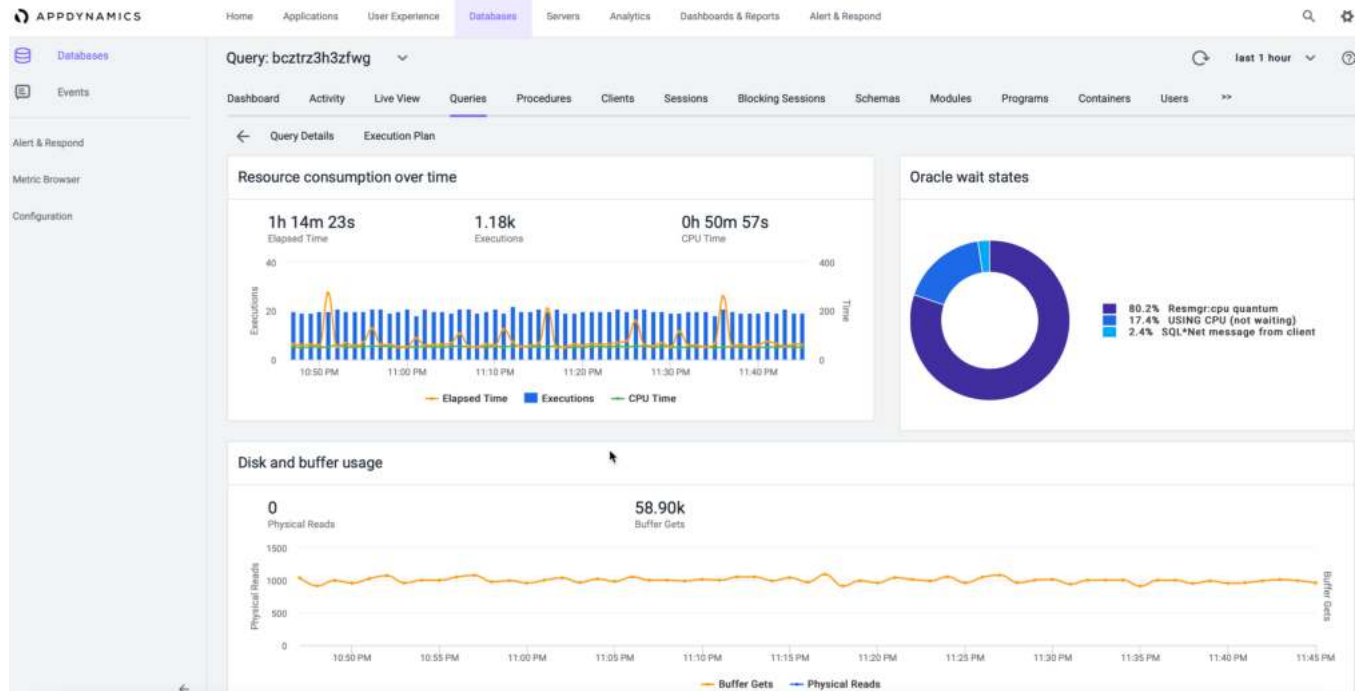

## Database Query Details Window Features

From the Database Query Details window, you can:

- Click **Execution Plan** to view an explanation plan for the query you selected on the Queries window if it was a SELECT query.
- Click on the graphs to see metrics for that specific point in time.
- Click the down arrow next to the database Collector name at the top of the page to choose to view the query details of a different database Collector.
- (From 21.5 onwards) Click the back arrow (  ) icon to return to the top queries view in the **Database Queries** window.

From the **Database Query Details** window, you can view:

- **Resource consumption over time:** For SQL Server, Azure, Oracle, and DB2, shows the amount of time the query spent in the database using resources, the number of executions, the number of sessions, and the amount of CPU time consumed. Query statistics are only available for the aforementioned database platforms.  
The resource consumption card is also available for query groups. If all queries in the group have query metrics (for example, elapsed time and number of executions), then the aggregate of the group's metrics are shown. If none of the queries in the group have query metrics, then the aggregate elapsed time of the queries in the group, taken from the wait state index, is shown. If some queries in the group have query metrics and others do not, then the aggregate value of the available query metrics is shown.
- **Business Transactions Executing Similar Queries:** Displays the Java or PHP business transactions that execute queries similar to this query.
- **Disk and buffer usage:** Displays data when hardware monitoring is enabled for this database collector. This graph shows at a glance how effectively the database buffer is used. SQL that runs frequently is best kept in the buffer as physical disk reads are much more time-consuming. You may need to optimize your buffer manager if you see that the ratio of physical reads to buffer gets is too high.
- **Clients:** Shows the machines that executed the selected SQL statement, elapsed time, and the percentage of the total time required to execute the statement performed by each machine. The table also shows the applications, nodes, and tiers of the machines.
- **Sessions:** Displays the session IDs opened by clients, elapsed time, and the percentage of the total time required to execute the statements.
- **<database\_type> wait states:** Activities that contribute to the time it takes the database to service the selected SQL statement. The wait states consuming the most time may point to performance bottlenecks. For example, a db file sequential read wait state may be caused by segment header contention on indexes or by disk contention. See your database platform documentation for descriptions of the SQL wait states and recommended actions.
- **Query Active in Database/Schema:** Shows the schemas that have been accessed by this SQL.
- **Query ID (Oracle) SQL Handle (SQL Server):** A unique ID that allows the database server to more quickly locate this SQL statement in the cache.
- **Query:** The entire syntax of the selected SQL statement. You can click the pencil icon in the top right corner of the Query card to edit the query name so that it is easy to identify.
- **Queries in Group (only in Group Details view):** The top 100 queries in the query group
- **Users:** The users that executed this query.
- **Programs/Applications:** The program/application from which this query was executed.
- **Procedures:** The list of procedures for the queries that you monitor.
- **Containers:** The containers on which the query runs.

To see how the SQL was executed internally within the database, click the Execution Plan tab. The statement execution plan is the sequence of operations the database performs to run the statement.

### **i** Oracle Explain Plan Limitations

For Oracle, AppDynamics Database Visibility displays execution plans for only SELECT, UPDATE, INSERT, and DELETE statements because Database Visibility relies on the [Oracle EXPLAIN PLAN](#) statement to obtain the execution plans and the Oracle EXPLAIN PLAN statement only provides the Oracle optimizer's execution plans for SELECT, UPDATE, INSERT, and DELETE statements. See also, [User Permissions for Oracle](#).

If you have a poorly performing piece of SQL that you are trying to tune, the obvious place to start is to look at the most costly step of the execution plan.

Tuning SQL is a vast topic, but a couple of things to look out for include:

- Index or table scans: May indicate a need for better or additional indexes.
- Bookmark Lookups: Consider changing the current clustered index, using a covering index and limiting the number of columns in the SELECT statement.
- Filter: Remove any functions in the WHERE clause, don't include views in your Transact-SQL code, may need additional indexes.
- Sort: Does the data really need to be sorted? Can an index be used to avoid sorting? Can sorting be done at the client more efficiently?

## Database Query Execution Plan Window

### Related pages:

- [Access Database Visibility from Application Monitoring Views](#)
- [Add Database Collectors](#)

- [Database Visibility](#)
- [Monitor Databases and Database Servers](#)
- [Monitor Database Performance](#)

The Database Query Execution Plan window can help you to determine the most efficient execution plan for your queries. Once you've discovered a potentially problematic query, you can run the EXPLAIN PLAN statement to check the execution plan that the database created. A query's execution plan reveals whether the query is optimizing its use of indexes and executing efficiently. This information is useful for troubleshooting queries that are executing slowly.

### Access the Database Query Execution Plan Window

To access the Database Query Execution Plan window:

1. To view a query execution plan, click the name of the database.
2. Click the Queries tab.
3. Click a **SELECT** statement to examine and click **View Query Details**.
4. Click the Execution Plan tab.

### Database Query Execution Plan Window Features

From the Database Query Execution Plan window, you can:

- Click **Explain** to view the execution plan for a query.
- Click **Schema** to choose a different schema and then explain the execution plan based on that schema. If you want to view the execution plan for a query that belongs to a schema outside the scope of your database account permissions, you can enter a username and password for a different database account that has access to the schema.
- If you want to improve a suboptimal query, you can modify the query and paste it into the **Explain another query** box. Click the **Explain** button to generate the execution plan for your modified query and determine whether the modified query is more efficient.
- Click the down arrow next to the query name at the top of the page to choose to view queries and query execution plans of a different database Collector. You can either select the database Collector name from the list or search for the database Collector in the search bar. Click the refresh icon to show only database Collectors that meet your search criteria.

If you are using SQL Server or Azure you can view the execution plan in one of the following ways:

- Select a cached execution plan and click **View Cached Plan** to view the plan details.
- Double-click a cached execution plan.

If you are using MySQL, you can also:

- Choose to explain the query on another schema. In **Plan Details**, from the list on the right, choose the schema name and then click **Explain**.
- Copy the text in the Parsed SQL output box and paste it into the **Explain another query** box where you can edit it and then explain the edited version of the query.

If you are using MSSQL, you can perform these steps to view the costly operations (the amount of work such as CPU usage, I/O, and memory required to complete the operation) in the execution plan along with the warnings (if any) in the plan:

1. Under **Query Plan Handle(s)**, select a cached execution plan.
2. Click **View Cached Plan**.

You can view the following details:

#### Top Plan Operations:

Field Name	Description
Operation	The object scan (table or index) operation in the execution plan
Database	The database name of the object
Schema	The schema of the object in the database
Object Name	The name of the object (table or index) that is scanned in the operation
Estimated I/O Cost	The estimated cost of the input/output ( I/O ) to perform the operation
Estimated CPU Cost	The estimated CPU cost to perform the operation
Estimated number of rows	The estimated number of rows in the object

**Warnings:** This table includes the warnings in the execution plan related to any issue such as Typecast. This table helps you in understanding the potential performance-degrading activities that happen during the query execution. This table includes these fields:

- **Issue:** The issue description for the warning.
- **Expression:** The query expression used in the execution plan that correlates to the issue.

If you are using Oracle database, you can view the cached execution plan details along with the top plan operations and the referenced objects. To view the details, double click a cached execution plan under **View Cached Plan(s)**. These details are displayed:

#### Top Plan operations

Field Name	Description
Operation	The name of the internal operation performed in the step (such as, TABLE ACCESS )
Options	A variation on the operation that is described in the <b>Operation</b> column (such as, FULL)

#### Referenced Objects

Field Name	Description
Tree Node	The step number in sequence used in the execution plan

Field Name	Description
Operation	The object scan operation (table or index) in the execution plan
Object Type	The type of the database object (index or table)
Object Name	The name of the database object

From the Database Query Execution Plan window, you can view:

- **Cached Execution Plan(s):** identifying details of the cached execution plan, which vary from one database to another. For SQL Server, the execution plan is rendered as a diagram.
- **Plan Details:** execution plan details, showing the step by step procedure the database followed to process the selected query.
- **Referenced Objects:** the database objects accessed by the execution plan.

## Database Procedures Window

The Database **Procedures** window is available for Oracle Server.

The Database **Procedures** window shows you the names of the Top N procedures on the database instance based on time. To see the Top N Queries that are executed in a procedure, click a procedure name and then click **View Top Queries**. From the **Procedures** top queries page, to see more details about a query you can double-click a query to open the [Query Details](#) window.

### Access the Database Procedures Window

To access the Database Procedures window:

1. To view a database's procedure, click the name of the database.
2. Click the Procedures tab.

## Database Procedures Window Features

From the Database Procedures window, you can:

- Choose to view information for the top 10, 50, 100 or 200 procedures that most frequently access the database server.
- Double click the name of a procedure to view the top queries for one procedure in particular, or select the procedure and then click **View Top Queries**.
- Click the down arrow next to the database collector name at the top of the page to choose to view the procedures of a different Oracle database collector by either selecting the database collector from the list or by searching for the database collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database **Procedures** window, you can view:

- **Procedure:** The name of the procedure run by an active session in the database.
- **Elapsed Time:** The time taken by the procedure.
- **Weight (%):** The percentage of time the procedure was consuming the database resources in comparison with the usage percentage of other procedures.

The screenshot shows the AppDynamics interface for the 'latest-rc Oracle Custom Cluster'. The 'Procedures' tab is selected, displaying a table of database procedures. The table has three columns: 'Procedure', 'Elapsed Time', and 'Weight (%)'. The 'Procedure' column lists various database procedures, with 'N/A' at the top. The 'Elapsed Time' column shows durations like '167h 4m 31s' for 'N/A' and '2h 11m 6s' for 'SHERLOCK'. The 'Weight (%)' column shows values like '98' for 'N/A' and '1' for 'SHERLOCK'. The interface includes a search bar, a dropdown for the number of top procedures (set to 100), and buttons for 'View Top Queries', 'Top procedures', and 'Actions'.

Procedure	Elapsed Time	Weight (%)
N/A	167h 4m 31s	98
SHERLOCK	2h 11m 6s	1
DBMS_STATS.GATHER_DATABASE_STATS_JOB_PROC	0h 43m 26s	0
DBMS_SPACE.AUTO_SPACE_ADVISOR_JOB_PROC	0h 11m 22s	0
DBMS_SQLTUNE.EXECUTE_TUNING_TASK	0h 9m 12s	0
DBMS_SPM.EXECUTE_EVOLVE_TASK	0h 0m 42s	0
DBMS_SCHEDULER.AUTO_PURGE	0h 0m 16s	0
BSLN_INTERNAL.MAINTAIN_STATISTICS	0h 0m 7s	0
MGMT_CONFIG.COLLECT_CONFIG	0h 0m 5s	0
DBMS_AQADM.SYS.REMOVE_ORPHMSG	0h 0m 3s	0
DBMS_PDB.CLEANUP_TASK	0h 0m 2s	0
DBMS_STATS	0h 0m 1s	0

The Database Clients window shows you the hostname or IP addresses of the Top N clients using the database. A database client is any host that accesses the database instance. To see the Top N Queries run by the client, click a client name and then click **View Top Queries**. From the client top queries page, to see more details about a query you can double-click a query to open the [Query Details](#) window.

---

## Access the Database Clients Window

To access the Database Clients window:

1. To view a database's clients, click the name of the database.
2. Click the Clients tab.

## Database Clients Window Features

From the Database Clients window, you can:

- Choose to view information for the top 10, 50, 100 or 200 clients sorted by total time spent in the database.
- Choose to view information for one client in particular.
- Click the down arrow next to the database name at the top of the page to choose to view the database clients of a different database by either selecting the database from the list or by searching for the database by entering text in the search bar and then clicking the refresh icon to show only databases that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Clients window, you can view:

- **Client:** The names of the machines that have connected to the database.
- **Elapsed Time:** The total time spent by the client executing queries.
- **Weight (%):** The percentage of time the client was connected to the database in comparison with connection times of other clients.

## Database Sessions Window

### Related pages:

- [Access Database Visibility from Application Monitoring Views](#)
- [Database Visibility](#)
- [Monitor Databases and Database Servers](#)
- [Monitor Database Performance](#)

The **Sessions** window shows you the Session ID of the Top N sessions using the database sorted by time spent. To see the Top N SQL run by a session, click the **Session ID** and then click **View Top Queries**. From the Client top queries page, to see more details about a query, double-click a query to open the Query Details window and from there see the Execution Plan of the query.

## Access the Database Sessions Window

To access the Database Sessions window:

1. To view a database's sessions, click the name of the database.
2. Click the Sessions tab.

## Database Sessions Window Features

From the Database Sessions window, you can:

- Choose to view information for the top 10, 50, 100 or 200 sessions consuming database resources.
- Double click a **Session ID** to view the queries run in that particular session.
- Click the down arrow next to the database name at the top of the page to choose to view the database sessions of a different database by either selecting the database from the list or by searching for the database by entering text in the search bar and then clicking the refresh icon to show only databases that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Sessions window, you can view:

- **Session ID:** the Session ID of each database instance usage.
- **Weight (%):** the percentage of time that instance was using the database in comparison with the database usage of other sessions.

Session ID	Client	Elap... Time	Weight (%) ↓
3	ip-10-0-0-33.us-west-2.compute.internal	00:53:00	99.9
787	cjiang-mac.corp.appdynamics.com	00:00:03	0.1
399	ip-10-0-0-91	00:00:01	0.0

## Database Blocking Sessions Window

The blocking tree displays a tree view of sessions that are blocking other sessions for Oracle, SQL Server, Sybase ASE, and DB2. You can use the blocking tree to determine the cause of deadlocks.

### Access the Database Blocking Sessions Window

To access the Database Topology window:

1. To view a database's blocking sessions, click the name of the database.
2. Click the Blocking Sessions tab.

### Database Blocking Tree Window Features

From the Database Blocking Tree window you can expand the tree of a blocking session to see the sessions it is blocking.

From the Database Sessions window, you can view:

- **Session ID:** the Session ID of the sessions causing the block, and the sessions being blocked
- **Client:** the names of the machines where the session is blocked
- **User:** the user of the blocked session
- **Query:** the query that is blocked or causing the block
- **Blocked Object:** the object that is blocked
- **First occurrence of block:** the time that the block first occurred in the specified time range
- **Block Duration:** the amount of time that the session was blocked or causing the block

## Database Schemas and Databases Windows

The Database Schemas window is available only for Oracle database servers.

The Database Databases window is available for other database servers.

The database Schemas or Databases window shows you the names of the Top N busiest schemas or databases on the database server. To see the Top N Queries run on a specific Database or Schema, click a name and then click **View Top Queries**. From the Schema or Database top queries page, to see more details about a query you can double-click a query to open the [Query Details](#) window.

### Access the Database Schemas or Databases Window

To access the Database Schemas or Database window:

1. From the AppDynamics Home page, on the **Databases** card, click the name of the database that you want to view the schemas or databases for.
2. Depending on the platform, click either the Schemas or Databases tab.

### Database Schemas or Databases Window Features

From the Database Schemas and Databases window you can:

- Choose to view information for the top 10, 50, 100 or 200 schemas or databases containing the most time spent executing queries by the database server.
- Double click the name of a schema or database to view the top queries for one schema database in particular, or select the schema or database and click **View Top Queries**.
- Click the down arrow next to the Database Collector name at the top of the page to choose to view the database schemas or databases of a different database Collector by either selecting the database Collector from the list or by searching for the database Collector by entering text in the search bar and then clicking the refresh icon to show only database Collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Schemas or Databases window, you can view:

- **Schema or database:** The names of the schemas or database on the database server.
- **Weight (%):** The percentage of time the schema or database was used by the database server in comparison with the usage percentage of other schemas or databases.

Schema	Elapsed Time	Weight (%) ↓
SYS	00:56:01	99.9
SYSTEM	00:00:03	0.1

### Database Modules Window

The Database Modules window is available only for Oracle database servers. The **Module** field is often identical to the **Program** field unless it has been programmatically set with a call to

DBMS\_APPLICATION\_INFO. Some packaged applications, such as Oracle E-Business Suite, automatically set the **Module** field with relevant identifiers.

The Database Modules window shows you the names of the Top N busiest modules on the Oracle database server. To see the Top N Queries run on the database by a module, click a module name and then click **View Top Queries**. From the Modules top queries page, to see more details about a query you can double-click a query to open the [Query Details](#) window.

### Access the Database Modules Window

To access the Database Modules window:

1. To view a database's modules, click the name of the database.
2. Click the Modules tab.

### Database Modules Window Features

From the Database Modules window, you can:

- Choose to view information for the top 10, 50, 100 or 200 modules most frequently accessing the database server.
- Double click the name of a module to view the top queries for one module in particular, or select the module and click **View Top Queries**.
- Click the down arrow next to the database collector name at the top of the page to choose to view the modules of a different Oracle database collector by either selecting the database collector from the list or by searching for the database collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Modules window, you can view:

- **Module:** The name of the module run by the active sessions in the database.
- **Weight (%):** The percentage of time the module was consuming the database resources in comparison with the usage percentage of other modules.

The screenshot shows the Oracle-4.5.1.779 Database Modules window. At the top, there is a navigation bar with tabs: Dashboard, Activity, Live View, Queries, Clients, Sessions, Blocking Sessions, and Schemas. Below the navigation bar, there are controls for 'View Top Queries', 'Top modules' (set to 100), and 'Actions'. A search bar is also present. The main content is a table with the following data:

Module	Elapsed Time	Weight (%) ↓
N/A	00:57:00	99.9
JDBC Thin Client	00:00:03	0.1
AppD4DB	00:00:01	0.0

### Database Programs Window

The Database Programs window is available for Oracle and SQL Server.

The Database Programs window shows you the names of the Top N programs on the database instance based on time. To see the Top N Queries run on the database by a program, click a program name and then click **View Top Queries**. From the Programs top queries page, to see more details about a query you can double-click a query to open the [Query Details](#) window.

### Access the Database Programs Window

To access the Database Programs window:

1. To view a database's programs, click the name of the database.
2. Click the Programs tab.

### Database Programs Window Features

From the Database Programs window, you can:

- Choose to view information for the top 10, 50, 100 or 200 programs most frequently accessing the database server.
- Double click the name of a program to view the top queries for one program in particular, or select the program and click **View Top Queries**.
- Click the down arrow next to the database collector name at the top of the page to choose to view the programs of a different Oracle database collector by either selecting the database collector from the list or by searching for the database collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Programs window, you can view:

- **Program:** The name of the program run by an active session in the database.
- **Weight (%):** The percentage of time the program was consuming the database resources in comparison with the usage percentage of other programs.

Program	Weight (%)
JDBC Thin Client	51.5
oracle@80c278fc0252 (j000)	48.5
oracle@80c278fc0252 (j001)	0.0
oracle@80c278fc0252 (j002)	0.0

### Database Containers Window

The Database **Containers** window is available for Oracle Server.

The **Containers** window displays the names of the Top N containers on the database instance based on time. To see the top N queries run on the container, click a container name and then click **View Top Queries**. From the **Containers** top queries page, to see more details about a query you can double-click a query to open the [Query Details](#) window.

## Access the Database Containers Window

To access the Database Containers window:

1. To view a database's containers, click the name of the database.
2. Click the Containers tab.

## Database Containers Window Features

From the Database Containers window, you can:

- Choose to view information for the top 10, 50, 100 or 200 containers most frequently accessing the database server.
- Double click the name of a container to view the top queries for one container in particular, or select the container and click **View Top Queries**.
- Click the down arrow next to the database collector name at the top of the page to choose to view the containers of a different Oracle database collector by either selecting the database collector from the list or by searching for the database collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Containers window, you can view:

- **Container:** The name of the container where queries run in the database.
- **Elapsed Time:** The time taken by the queries to run on the container.
- **Weight (%):** The percentage of time the Container was consuming the database resources in comparison with the usage percentage of other Containers.

Container	Elapsed Time	Weight (%) ↓
CDB\$ROOT	0h 7m 37s	79
CDB	0h 2m 0s	21

## Database Users Window

The Database **Users** window shows you the users using the database. To see the Top N Queries run by a user, double-click the User name, or single-click the User name and then click **View Top Queries**. From the User top queries page, to see more details about a query you can double-click a query to open the Query Details window.

## Access the Database Users Window

To access the Database Users window:

1. To view a database's users, click the name of the database.

2. Click the Users tab. You may need to click the expand button (>>) to see the Users tab.

## Database Users Window Features

From the Database Users window, you can:

- Use the **Top users** dropdown menu to view information for the top 10, 50, 100 or 200 users sorted by total time spent in the database.
- Click a user to view information for about that user.
- Click the down arrow next to the database name at the top of the page to choose to view the database users of a different database. You can either select the database from the list or search for the database by entering text in the search bar and clicking the refresh icon to show only databases that meet that search criterion.
- Search for the database by entering text in the search bar and then clicking the refresh icon to show only databases that meet that search criterion.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Database Users window, you can view:

- **User:** The names of the user accounts that have connected to the database.
- **Elapsed Time:** Duration of time that the user spent executing queries.
- **Weight (%):** Time the user spent executing queries as a percentage of the total time spent by all users.

User	Elapsed Time	Weight
APPDY	01:07:51	
WORLD	00:32:58	
SYSTEM	00:00:01	
APEX_040000	00:00:01	

## Database Buckets Window

The **Buckets** window is available only for Couchbase collector.

The **Buckets** window shows you the names of the top 200 buckets sorted in descending order based on operations. To see the details of a specific bucket, click a bucket name, and then click **View Bucket Details**.

## Access the Buckets Window

1. From the AppDynamics Home page, on the **Databases** card, click the name of the Couchbase collector that you want to view the buckets for.
2. Click the Buckets tab.

## Buckets Window Features

From the Buckets window, you can:

- Double click the name of the bucket to view the bucket statistics for the selected time range.
- Click the down arrow next to the Couchbase collector name at the top of the page to choose to view the buckets of a different Couchbase collector by either selecting the Couchbase collector from the list or by searching for the Couchbase collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a .csv formatted file that is automatically downloaded to your specified downloads directory.

From the Buckets window, you can view statistics for a bucket:

Operations ( `ops` ), Bytes Read ( `bytes_read` ), Bytes Written ( `bytes_written` ), Total Disk Size, in MB ( `couch_total_disk_size` ), Hit Ratio ( `hit_ratio` )

Bucket Name	Operations/min	Bytes Read	Bytes Written	Total Disk Size (MB)	Hit Ratio
travel-sample	31291.36	1659180.73	38013243.66	164.00	99.93
beer-sample	0.00	334.34	48899.80	51.00	0.00
gamesim-sample	0.00	363.66	52427.07	41.00	0.00
loadBucket	0.00	345.25	56813.57	10.00	0.00

## Database Business Transactions Window

The Database **Business Transactions** window shows you the top Java or PHP business transactions, ranked by their cumulative execution time on the database. To see the Top N SQL run by a business transaction, click the business transaction and then click **View Top Queries**. From the Business Transaction top queries page, you can double-click a query to open the Query Details window.

## Supported Platforms

AppDynamics supports Java as an application framework. Relational databases are supported as backends that need to be mapped on the Java APM to a monitored instance in database visibility. For more information, see [Linking Database with application backend](#).

## Access the Database Business Transactions Window

To access the Top Business Transactions window:

1. To view a database's business transactions, click the name of the database.
2. Click the Business Transactions tab.

## Database Business Transactions Window Features

From the Database Business Transactions window, you can:

- Choose to view information for the top 10, 50, 100 or 200 business transactions executing queries on the database.
- Double-click a business transaction to view the queries run in that particular transaction.

- Click the down arrow next to the database name at the top of the page to choose to view the business transactions that access a different database by either selecting the database from the list or by searching for the database by entering text in the search bar and then clicking the refresh icon to show only databases that meet that search criteria.
- Click **Actions** to export the data on this window in a `.csv` formatted file that is automatically downloaded to your specified downloads directory.

From the Database Business Transactions window, you can view:

- **Business Transaction:** the business transactions that run the most number of queries on the database.
- **Application:** the application that each business transaction is executing in.
- **Weight (%):** the percentage of time that business transaction took to execute compared to other business transactions.

Business Transaction	Application	Weight (%) ↓
Checkout	ECommerce-Sales-Demo	57.2
Checkout - Mobile	ECommerce-Sales-Demo	42.8

## Database Applications Window

The Database **Applications** window is available for Postgres, Sybase ASE, Sybase IQ, and DB2.

The **Applications** window shows you the names of the Top N Applications on the database instance based on time. To see the Top N Queries run on the database by an application, click the name of an application and then click **View Top Queries**. From the Applications top queries page, to see more details about a query you can double-click a query to open the Query Details window.

### Access the Database Applications Window

To access the Database Applications window:

1. To view a database's applications, click the name of the database.
2. Click the Applications tab.

### Database Applications Window Features

From the Database Applications window, you can:

- Choose to view information for the top 10, 50, 100 or 200 applications most frequently accessing the database server.
- Double click the name of an application to view the top queries for one application in particular, or select the application and click **View Top Queries**.
- Click the down arrow next to the database collector name at the top of the page to choose to view the applications of a different MongoDB database collector by either selecting the database collector from the list or by searching for the database collector by entering text in the search bar and then clicking the refresh icon to show only database collectors that meet that search criteria.
- Click **Actions** to export the data on this window in a `.csv` formatted file that is automatically downloaded to your specified downloads directory.

From the Database Applications window, you can view:

- **Applications:** The name of the application run by an active session in the database.
- **Weight (%):** The percentage of time the application was consuming the database resources in comparison with the usage percentage of other applications.

---

## Database Object Browser Window

### Related pages:

- [Access Database Visibility from Application Monitoring Views](#)
- [Database Visibility](#)
- [Monitor Databases and Database Servers](#)
- [Monitor Database Performance](#)

When you detect a problem with database performance, you may be able to correct the problem by adding an index, refusing access to certain users, or creating a new index on a table. You can browse through the database objects to find ways to tune the database, including the indexes that are currently available on the various tables. The contents of the **Database Object Browser** are updated when you access them or click **Refresh**.

 The objects available for browsing are database dependent. For clustered databases, select the node to browse its objects.

### Access the Database Objects Window

To access the Database Objects window:

1. To view a database's objects, click the name of the database.
2. Click the Objects tab.

### Database Objects Window Features

From the **Database Objects** window you can:

- Click an object type in the tree to see more information about it.
- For Oracle, search for a specific database item.
- Click the down arrow next to the database name at the top of the page to choose to view the database objects of a different database by either selecting the database from the list or by searching for the database by entering text in the search bar and then clicking the refresh icon to show only databases that meet that search criteria.

The screenshot shows the AppDynamics interface for Oracle-4.5.1.779. The top navigation bar includes Dashboard, Activity, Live View, Queries, Clients, Sessions, Blocking Sessions, Schemas, Modules, Programs, Users, and Business Transactions. A left sidebar contains menu items for Users, Parameters, Current Statistics, System Waits, and Database Objects. The main content area displays the following instance details:

Oracle-4.5.1.779	
Instance Number	1
Instance Name	orc12c
Host Name	ip-10-0-0-33.us-west-2.compute.internal
Version	12.2.0.1.0
Startup Time	2018-03-26 18:23:03.0
Status	OPEN
Parallel	NO
Thread#	1
Archiver	STOPPED
Log Switch Wait	
Logins	ALLOWED
Shutdown Pending	NO
Database Status	ACTIVE
Instance Role	PRIMARY_INSTANCE
Active State	NORMAL
Blocked	NO
Con Id	0
Instance Mode	REGULAR
Edition	EE
Family	
Database Type	SINGLE

The following are some examples of browsable content.

- Database uptime and version for all platforms
- **Users:** who has access to the database for all platforms (supported for Oracle, MySQL)
- **Job Status:** status of SQL agent job (supported for SQL Server)
- **Parameters:** database initialization parameters (supported for Oracle)
- **Variables:** system variables indicating how the database was configured.
- **Current Statistics:** the current value of statistics collected. The various statistics available are database dependent and are a superset of those shown in the **Database Monitoring - Metric Browser** page.
- **System Waits:** SQL waits experienced by the database
- **Database Objects:** search for specific objects, and browse through database schemas, tables, columns, and indices.

### Database Custom Metrics Window

The **Custom Metrics** window displays metrics for the custom queries that you specified for Database Visibility to monitor. See [Configure Custom Metrics](#).

### Access the Database Custom Metrics Window

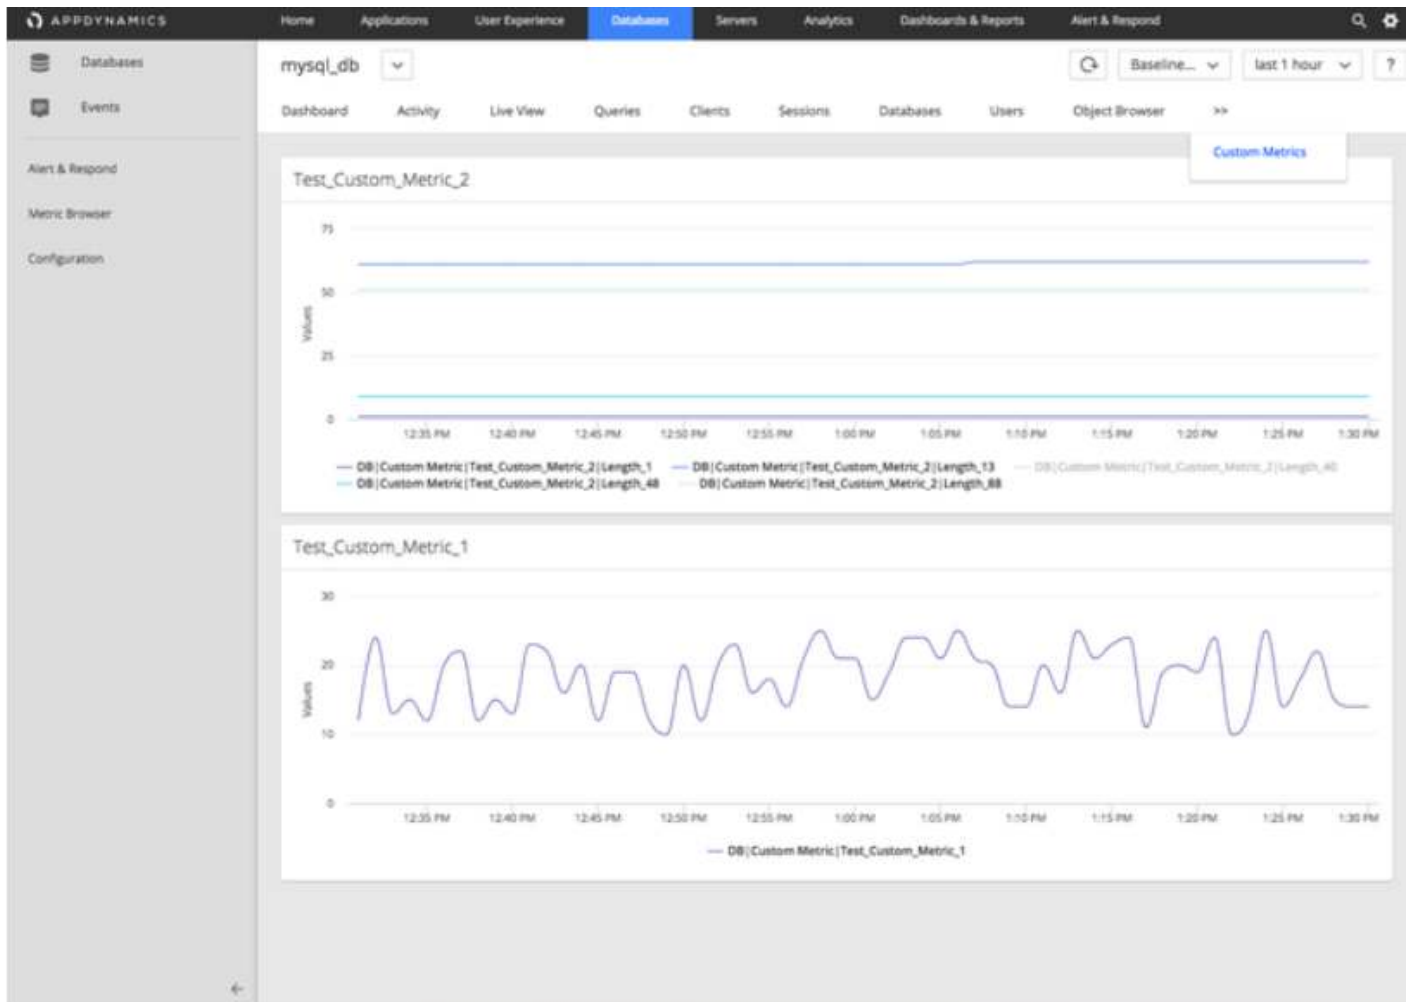

To access the Database **Custom Metrics** window:

1. To view a database's objects, click the name of the database.
2. Click the Custom Metrics tab.

## Database Custom Metrics Window Features

From the Database Custom Metrics window, you can:

- View the values for each row of the custom query output. For example, if the query returns four rows, then the graph displays four lines.
- Double-click the graph to view the custom metric in the **Metric Browser**.

## Monitor Database Server Hardware

### Access the Database Server Hardware Metrics Window

Hardware metrics are reported on:

- [Database Dashboard](#) window
- [Database Live](#) window
- [Metric Browser](#)

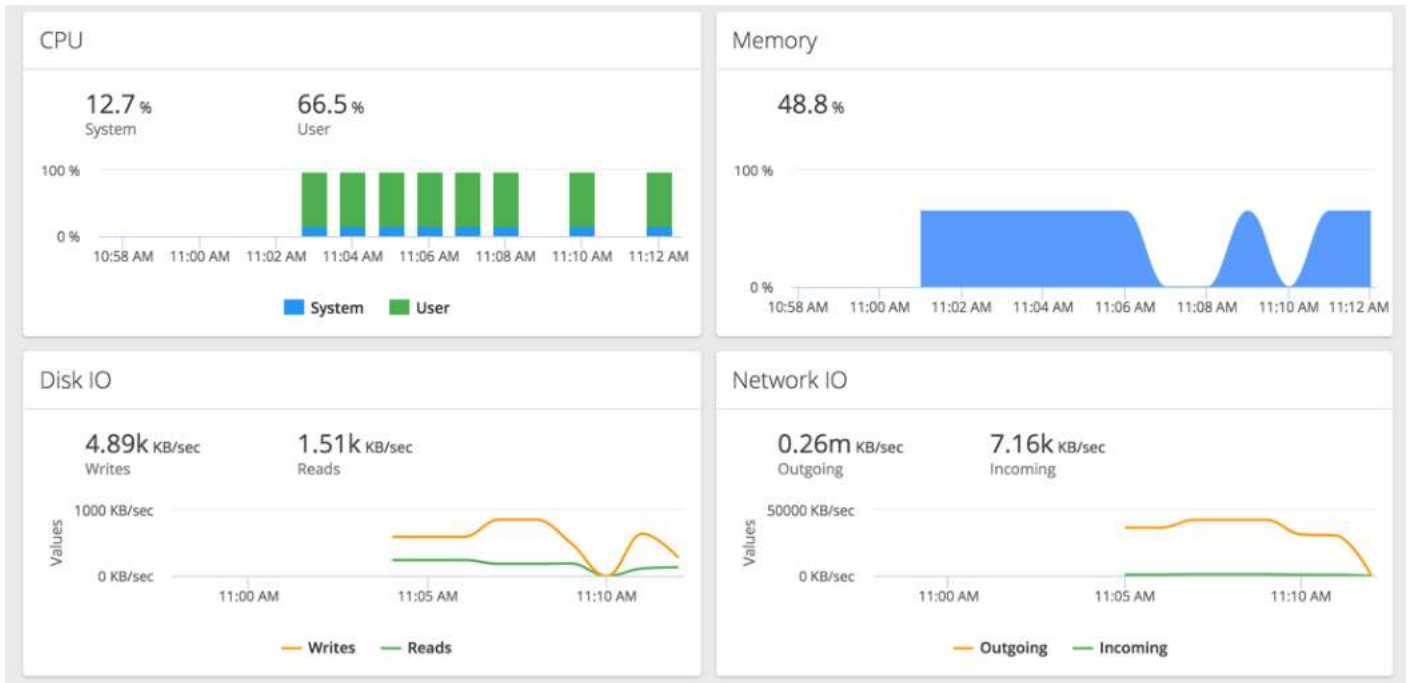

### Hardware Metrics Graphs Features

On the hardware metrics graphs, you can:

- Click anywhere on the graphs to get details about activity at that point in time.

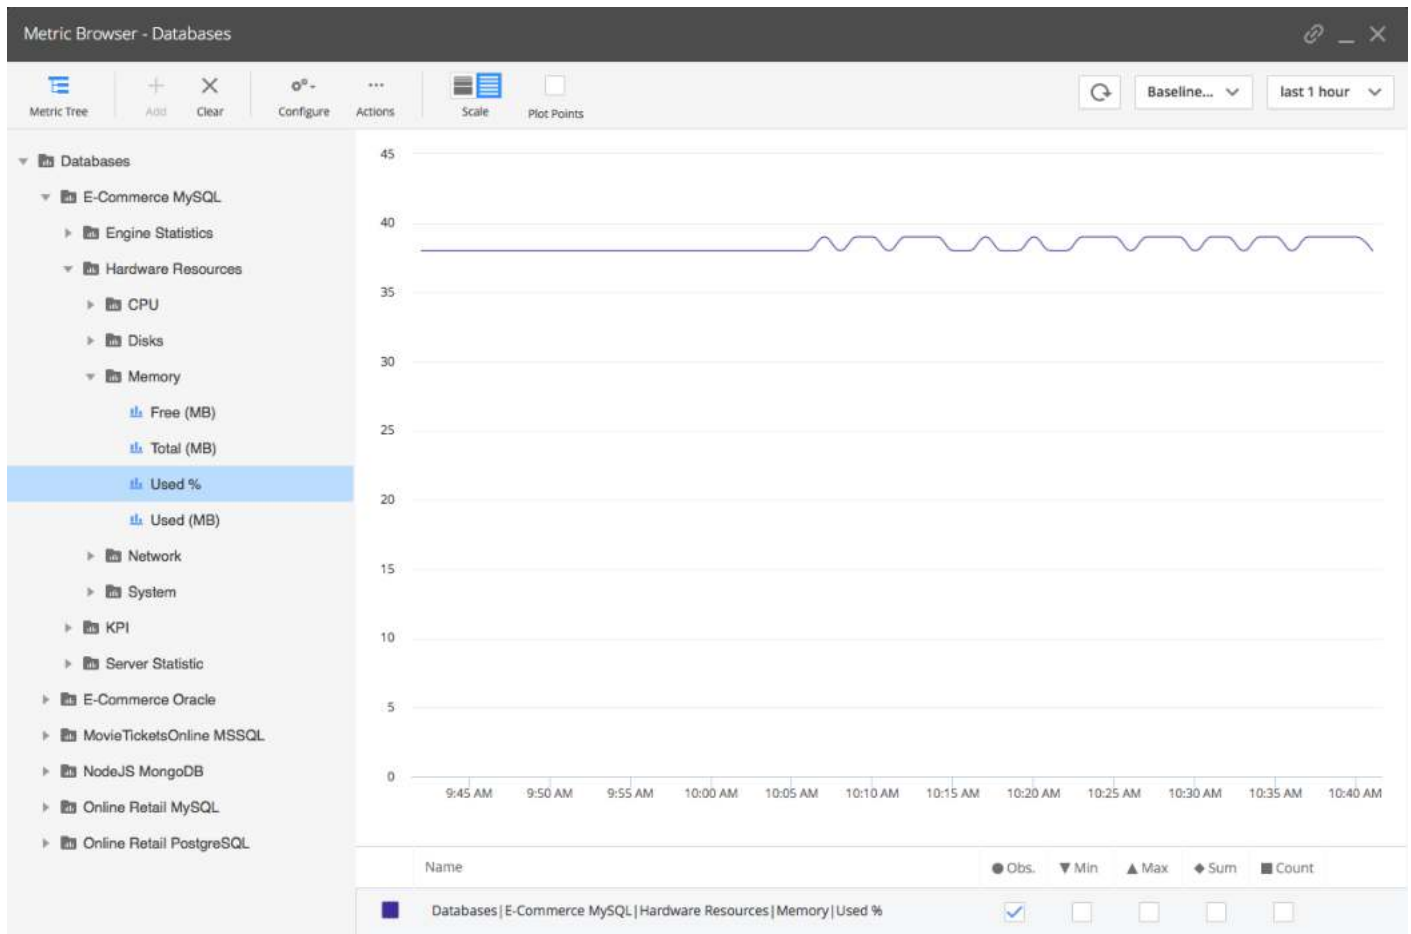

- Double-click KPI points in the graph to display the Metric Browser showing the selected metric. Metrics are collected by the agent and reported once a minute.

### Compare Server and Database Metrics

You can view and compare hardware and database metrics in the [Metric Browser](#). This can help you visualize the effect of server performance on database performance.

## Database Health Rules and Alerts

You can configure AppDynamics Database Visibility to alert you when certain conditions are met or exceeded for monitored databases, operating systems, and server hardware. Use the **Getting Started Wizard** to guide you through the process if you are a new AppDynamics Pro user.

You configure [Health Rules](#), [Actions](#), [Policies](#), and Email Digests for monitoring databases almost exactly as you would configure these for monitored applications.

To view the health rules for your databases, click **Alert & Respond > Health Rules** and select **Databases** from the dropdown at the top. Use the Affected Entities tab of the **Create Health Rule** dialog to specify the **Database Health** rules. See [Alert and Respond](#).

In the Affected Entities tab, you can apply a database health rule to all databases, all databases of a specific database type, or to select instances of a specific database type being monitored. You can select the metrics on which to base the health rule. The health rule is violated when specified critical or warning conditions are met.

Create Health Rule

Similarly, you can create the health rule for Database Agent (**DB Agent Health**) and the Affected Entities tab of the **Create Health Rule** dialog allows specifying the **DB Agent Health** rule. You can apply a Database Agent (**DB Agent Health**) rule to all the Database Agents or specific Database Agents. You can select the required metrics on which to base the health rule. The health rule is violated when specified critical or warning conditions are met.

✕
Create Health Rule

Overview Affected Entities Critical Criteria Warning Criteria

Select Health Rule Type

Database Health

DB Agent Health

Select Databases

All Databases

Cancel Save

**i** Each Health Rule is only evaluated for the subset of databases or database that you currently have permissions for. If your permissions have changed since you created the Health Rule, then your current permissions are applied to the Health Rule evaluation.

Database Policy Actions are limited to email or SMS message notifications, and custom actions that have been uploaded to the Controller.

Once you have defined Health Rules and Actions, you can create a Policy based on a Health Rule to send you an email or an SMS message when a Health Rule is violated.

## Database Monitoring Metrics

### Related page:

[Metric Browser](#)

This document describes metrics collected by the Database Agent. It shows the path to the metric from the main AppDynamics menu down to the relevant branch of the Metric Browser tree. Some of these metrics are displayed in the Database Visibility user interface and so are also documented with the name of the window, column, section, and metric name.

The Metric Browser window name uses the following format:

- Metric Browser - *application\_name*: When you access the Metric Browser from Applications.
- Metric Browser - Database Monitoring: When you access the Metric Browser from Infrastructure.

For most types of metrics in the browser, you can click any of the points in the graph to view more information about the metric observed at that point in time. The information shown includes the metric identifier, date and time of the observation, along with any of the following values relevant to the metric:

- **Obs** (observed value): the average of all data points seen for that interval. For a cluster or a time rollout, this represents the weighted average across nodes or over time.
- **Min**: the minimum data point value seen for that interval
- **Max**: the maximum data point value seen for that interval
- **Sum**: the sum of all data point values seen for that interval.
- **Count**: number of observations aggregated in that one point. For example, a count of 5 indicates that there were 5 1-minute data points aggregated into one point.

### Key Performance Indicators (KPI)

These metrics are available for all database platforms supported.

**Calls per Minute:** The number of SQL calls to the database per minute.

**DB Availability:** The times when the database is available (has an active connection). If the database is not available, nothing is reported.

**Number of Connections:** The number of connections established with the database at any point during the selected time period. A connection is a session established between a database client and a server. Since the value displayed is the average number of connections over a time range, it is common to see a very low number or 0 for this metric.

**Time Spent in Execution (s):** The current amount of time the database spent executing SQL statements.

**Total Database Size (PostgreSQL only):** The amount of disk space (in MB) that the database is using.

**Total Lock Time:** Total time the database was in lock state in seconds.

### Hardware Memory Metrics

These are the memory metrics that are available when you use hardware monitoring:

**Total (MB):** The total available memory.

**Free (MB):** The difference between the total and the used memory.

**Used (MB):** The amount of the memory used in MB.

**i** For the Database Agent versions  $\geq 21.2 \leq 21.6$ , the buffered memory and swap cache memory is a part of the used memory. For Database Agent  $\geq 21.7$ , the buffered memory and swap cache memory is not a part of the used memory, which is same as the Database Agent versions  $< 21.2$ .

### Cassandra Metrics

Metrics	Description
Average Read Write latency (microseconds)	Total Read Write divided Number of Reads Writes
Commands Completed(Only For DSE Cassandra)	Total read repair commands completed since startup.

Metrics	Description
Commands Pending(Only For DSE Cassandra)	A current number of the read repair commands pending.
Compaction Tasks Completed	The number of completed compactions since server start or restart.
Compaction Tasks Pending	The estimated number of compactions remaining to perform.
Disk Load (bytes)	The size (in bytes) of the on-disk data size the node manages.
Dropped Mutations	A dropped Write attempt on a node
Exceptions	The number of internal exceptions caught. Under normal exceptions, this should be zero.
GC Collection Count	The total number of collections that have occurred.
GC Collection Time (ms)	The time (in milliseconds) that Cassandra JVM takes to perform the garbage collection.
Heap Memory Used (bytes)	The heap Memory Used by JVM in bytes.
Key Cache Hit Percentage	The percentage of Key cache(Cache for partition to sstable offsets) hit rate.
Max Partition Size	The size of the largest compacted partition (in bytes).
Memtable Live Data Size (bytes)	The disk space used by SSTables that belongs to this table (in bytes).
Messaging Latency	The latency for inter-node communication.
Non Heap Memory Used (bytes)	The memory used by JVM other than heap memory (in bytes).
Number of Reads Writes	The number of the <a href="#">Reads Write</a> requests.
Prepared Statements Executed	A number of Prepared Statements executed.

Metrics	Description
Process CPU Load Percentage	The Percentage of the <code>recent cpu usage</code> for the Java Virtual Machine process.
Read Failures	The number of failed <code>Read</code> operations
Read Repair Attempted(Only For DSE Cassandra)	The read repairs attempted since startup.
Read Repaired Background(Only For DSE Cassandra)	A number of the read repairs performed asynchronously since startup.
Read Repaired Blocking(Only For DSE Cassandra)	A number of the read repairs performed synchronously since startup.
Read Timeout Exceptions	The number of timeouts encountered for the read request.
Read Unavailability Exceptions	The number of unavailable exceptions encountered for the read request.
Read Write Throughput	Derived from Number of Reads Writes metrics over 1 minute.
Regular Statements Executed	A number of nonprepared statements executed.
Repair Age Percentage	The percentage of the table data that is repaired on disk.
Responses Completed(Only For DSE Cassandra)	The current read repairs completed count.
Responses Pending(Only For DSE Cassandra)	The current read repair responses pending count.
System CPU Load Percentage	The Percentage of the <code>recent cpu usage</code> for the whole system.
ThreadPools Request Active Tasks Authz Stage	The number of tasks being actively worked on by AuthzStage thread pool.
ThreadPools Request Active Tasks Read Repair Stage	The number of tasks being actively worked on by Read Repair Stage thread pool.
ThreadPools Request Active Tasks Request Response Stage	The number of tasks being actively worked on by Request Response Stage thread pool.

Metrics	Description
ThreadPools Internal Active Tasks Anti Entropy Stage	The number of tasks being actively worked on by Anti Entropy Stage thread pool.
ThreadPools Internal Active Tasks Background IO Stage	The number of tasks being actively worked on by Background IO Stage thread pool.
ThreadPools Internal Active Tasks Gossip Stage	The number of tasks being actively worked on by Gossip Stage thread pool.
ThreadPools Internal Active Tasks Internal Response Stage	The number of tasks being actively worked on by Internal Response Stage thread pool.
ThreadPools Internal Active Tasks Migration Stage	The number of tasks being actively worked on by Migration Stage thread pool.
ThreadPools Internal Active Tasks Misc Stage	The number of tasks being actively worked on by Misc Stage thread pool.
ThreadPools Request Pending Tasks Authz Stage	The number of queued tasks queued up by AuthzStage thread pool.
ThreadPools Request Pending Tasks Read Repair Stage	The number of queued tasks queued up by the Read Repair Stage thread pool.
ThreadPools Request Pending Tasks Request Response Stage	The number of queued tasks queued up by Request Response Stage thread pool.
ThreadPools Internal Pending Tasks Anti Entropy Stage	The number of queued tasks queued up by Anti Entropy Stage thread pool.
ThreadPools Internal Pending Tasks Background IO Stage	The number of queued tasks queued up by Background IO Stage thread pool.
ThreadPools Internal Pending Tasks Gossip Stage	The number of queued tasks queued up by Gossip Stage thread pool.
ThreadPools Internal Pending Tasks Internal Response Stage	The number of queued tasks queued up by Internal Response Stage thread pool.
ThreadPools Internal Pending Tasks Migration Stage	The number of queued tasks queued up by Migration Stage thread pool.

Metrics	Description
ThreadPools Internal Pending Tasks Misc Stage	The number of queued tasks queued up by Misc Stage thread pool.
ThreadPools Request Currently Blocked Tasks Authz Stage	The number of tasks that were blocked due to queue saturation on AuthzStage thread pool.
ThreadPools Request Currently Blocked Tasks Read Repair Stage	The number of tasks that were blocked due to queue saturation on Read Repair Stage thread pool.
ThreadPools Request Currently Blocked Tasks Request Response Stage	The number of tasks that were blocked due to queue saturation on Request Response Stage thread pool.
ThreadPools Internal Currently Blocked Tasks Anti Entropy Stage	The number of tasks that were blocked due to queue saturation on Anti Entropy Stage thread pool.
ThreadPools Internal Currently Blocked Tasks Background IO Stage	The number of tasks that were blocked due to queue saturation on Background IO Stage thread pool.
ThreadPools Internal Currently Blocked Tasks Gossip Stage	The number of tasks that were blocked due to queue saturation on Gossip Stage thread pool.
ThreadPools Internal Currently Blocked Tasks Internal Response Stage	The number of tasks that were blocked due to queue saturation on Internal Response Stage thread pool.
ThreadPools Internal Currently Blocked Tasks Migration Stage";	The number of tasks that were blocked due to queue saturation on Migration Stage thread pool.
ThreadPools Internal Currently Blocked Tasks Misc Stage";	The number of tasks that were blocked due to queue saturation on Misc Stage thread pool.
Total Read Write latency (microseconds)	Total Read Write Latency
Write Failures	The number of failed <code>Write</code> operations
Write Timeout Exceptions	Number of timeouts encountered for write request.
Write Unavailability Exceptions	Number of unavailable exceptions encounteredfor write request.

---

## Couchbase Metrics

**Gc\_num:** Number of objects garbage collected

**Gc\_pause\_time:** Garbage collection pause time

**Gc\_pause\_percent:** Garbage collection pause percentage

**Memory\_usage:** Memory (in GB) currently used by Couchbase

**Memory\_total:** Memory (in GB) used by Couchbase over the total period of time

**Memory\_system:** Memory (in GB) used by the system.

**Cpu\_user\_percent:** Percentage of CPU used by the user

**Cpu\_sys\_percent:** Percentage of CPU used by the system

**Request\_completed\_count:** Number of requests completed

**Request\_active\_count:** Number of active requests

**Request\_per\_sec\_1min:** Requests per second in the last minute

**Request\_per\_sec\_5min:** Requests per second in the last 5 minutes

**Request\_per\_sec\_15min:** Requests per second in the last 15 minutes

**Request\_time\_mean:** Average request time

**Request\_time\_median:** Median request time

**Request\_time\_80:** 80th percentile request time

**Request\_time\_95:** 95th percentile request time

**Request\_time\_99:** 99th percentile request time

**Request\_prepared:** Number of requests prepared

**cpu\_utilization\_rate:** Rate of CPU utilization

**swap\_total:** Total amount of swap available

**swap\_used:** Amount of swap used

**mem\_total:** Total available memory

**mem\_free:** Total amount of free memory

**cmd\_get:** Compare and Swap gets

**couch\_docs\_actual\_disk\_size:** The physical memory used in the node

**couch\_docs\_data\_size:** Data size of couch documents associated with a node

**couch\_spatial\_data\_size:** Size of object data for spatial views

**couch\_spatial\_disk\_size:** Amount of disk space occupied by spatial views

**couch\_views\_actual\_disk\_size:** Amount of disk space occupied by Couch views

**couch\_views\_data\_size:** Size of object data for Couch views

**curr\_items:** Number of active items in memory

**curr\_items\_tot:** Total number of items

**ep\_bg\_fetched:** Disk reads per second

**get\_hits:** Number of get hits

**mem\_used:** Engine's total memory usage

**ops:** Spatial operations

**vb\_replica\_curr\_items:** Number of in memory items

**operations per second:** The total amount of operations per second (including XDCR) to this bucket

(measured from `cmd_lookup + cmd_set + incr_misses + incr_hits + decr_misses + decr_hits + delete_misses + delete_hits + ep_num_ops_del_meta + ep_num_ops_get_meta + ep_num_ops_set_meta`).

**active docs resident %:** The percentage of active items cached in RAM in this bucket (measured from

`vb_active_resident_items_ratio`).

**gets per sec:** The number of reads (get operations) per second from this bucket (measured from `cmd_get` ).

**sets per sec:** The number of writes (set operations) per second to this bucket (measured from `cmd_set` ).

**deletes per sec:** The number of delete operations per second for this bucket (measured from `delete_hits` )

**disk creates per sec:** The number of new items created on disk per second for this bucket (measured from `vb_active_ops_create + vb_replica_ops_create + vb_pending_ops_create` ).

**disk updates per sec:** The number of items updated on disk per second for this bucket (measured from `vb_active_ops_update + vb_replica_ops_update + vb_pending_ops_update` ).

**disk reads per sec:** The number of reads per second from disk for this bucket (measured from `ep_bg_fetched` ).

**disk read failures:** The number of disk read failures (measured from `ep_data_read_failed` ).

**disk write failures:** The number of disk write failures (measured from `ep_data_write_failed` ).

**temp OOM per sec:** The number of back-offs sent per second to client SDKs due to the out-of-memory situations from this bucket (measured from `ep_tmp_oom_errors` ).

**cache miss ratio:** The percentage of reads per second to this bucket from disk as opposed to RAM (measured from `ep_bg_fetches / cmd_lookup * 100` ).

**disk queue fill rate:** The total number of items per second being put on the disk queue in this bucket (measured from `ep_diskqueue_fill` ).

**disk queue drain rate:** The total number of items per second being written to disk in this bucket (measured from `ep_diskqueue_drain` ).

**disk write queue:** The number of items waiting to be written to disk in this bucket (measured from `ep_queue_size+ep_flusher_todo` ).

## DB2 Server Metrics

**ACTIVE\_SORTS:** The number of sorts in the database that currently have a sort heap allocated.

**AGENTS\_TOP:** At the database level, it is the maximum number of agents for all applications.

**APPLS\_CUR\_CONS:** The number of applications that are currently connected to the database.

**APPLS\_IN\_DB2:** The number of applications that are currently connected to the database, and for which the database manager is currently processing a request.

**BINDS\_PRECOMPILES:** The number of binds and pre-compiles attempted. You can use this element to gain insight into the current level of activity within the database manager. This value does not include the count of `int_auto_rebinds`, but it does include binds that occur as a result of the `REBIND PACKAGE` command.

**CONNECTIONS\_TOP:** The highest number of simultaneous connections to the database since the database was activated.

**COORD\_AGENTS\_TOP:** The highest number of coordinating agents. If the peak number of coordinating agents represents too high a workload for this node, you can reduce this upper boundary by changing the `max_coordagents` configuration parameter.

**DDL\_SQL\_STMTS:** The number of SQL Data Definition Language (DDL) statements that were executed.

**DEADLOCKS:** The number of deadlocks that have occurred.

**DIRECT\_READ\_REQS:** Use the following formula to calculate the average number of sectors that are read by a direct read: `direct_reads / direct_read_reqs`.

**DIRECT\_READ\_TIME:** Time spent doing direct read operations.

---

**DIRECT\_READS:** Direct reads are performed in units, the smallest being a 512-byte sector. They are used when: Reading LONG VARCHAR columns, Reading LOB (large object) columns, Performing a backup.

**DIRECT\_WRITE\_REQS:** Use the following formula to calculate the average number of sectors that are written by a direct write:  $\text{direct\_writes} / \text{direct\_write\_reqs}$ .

**DIRECT\_WRITE\_TIME:** Time spent doing direct write operations.

**DIRECT\_WRITES:** Direct writes are performed in units, the smallest being a 512-byte sector. They are used when: Writing LONG VARCHAR columns, Writing LOB (large object) columns, Performing a restore, Performing a load, Allocating new extents for SMS table space if MPFA is enabled (which is the default).

**DYNAMIC\_SQL\_STMTS:** The number of dynamic SQL statements that were attempted.

**ELAPSED\_EXEC\_TIME\_MS:** The total time (in milliseconds) required to execute all the statements for a particular application during the specified time period.

**ELAPSED\_EXEC\_TIME\_S:** The total time (in seconds) required to execute all the statements for a particular application during the specified time period.

**FAILED\_SQL\_STMTS:** The number of SQL statements that were attempted, but failed.

**INT\_AUTO\_REBINDS:** The number of commits initiated internally by the database manager.

**INT\_COMMITS:** The number of commits initiated internally by the database manager.

**INT\_DEADLOCK\_ROLLBACKS:** The number of forced rollbacks initiated by the database manager due to a deadlock. A rollback is performed on the current unit of work in an application selected by the database manager to resolve the deadlock.

**INT\_ROLLBACKS:** The number of rollbacks initiated internally by the database manager.

**INT\_ROWS\_DELETED:** The number of rows deleted from the database as a result of internal activity.

**INT\_ROWS\_INSERTED:** The number of rows inserted into the database as a result of internal activity caused by triggers.

**INT\_ROWS\_UPDATED:** The number of rows updated from the database as a result of internal activity.

**LOCK\_ESCALS:** The number of times that locks have been escalated from several row locks to a table lock.

**LOCK\_LIST\_IN\_USE:** The total number of bytes of lock list memory in use.

**LOCK\_TIMEOUTS:** The number of times that a request to lock an object timed-out instead of being granted.

**LOCK\_WAIT\_TIME:** The total elapsed time (in milliseconds) spent waiting for locks.

**LOCK\_WAITS:** The number of times that applications or connections waited for locks.

**LOCKS\_HELD:** The number of locks currently held.

**LOCKS\_WAITING:** The number of agents waiting on a lock.

**LOG\_HELD\_BY\_DIRTY\_PAGES:** The amount of log (in bytes) corresponding to the difference between the oldest dirty page in the database and the top of the active log.

---

**LOG\_READ\_TIME\_NS:** The total elapsed time spent by the logger reading log data from the disk. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type.

**LOG\_READ\_TIME\_S:** At the database level, this is the number of subagents for all applications.

**LOG\_READS:** The number of log pages read from disk by the logger.

**LOG\_TO\_REDO\_FOR\_RECOVERY:** The size of the log (in bytes) that will have to be redone for crash recovery.

**LOG\_WRITE\_TIME\_NS:** The total elapsed time spent by the logger writing log data to the disk. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type.

**LOG\_WRITE\_TIME\_S:** At the database level, this is the number of subagents for all applications.

**LOG\_WRITES:** The number of log pages written to disk by the logger.

**NUM\_ASSOC\_AGENTS:** At the database level, this is the number of subagents for all applications.

**NUM\_INDOUBT\_TRANS:** The number of outstanding indoubt transactions in the database. Indoubt transactions hold log space for uncommitted transactions, which can cause the logs to become full. When the logs are full, further transactions cannot be completed. The resolution of this problem involves a manual process of heuristically resolving the indoubt transactions. This monitor element provides a count of the number of currently outstanding indoubt transactions that must be heuristically resolved.

**NUM\_LOG\_BUFFER\_FULL:** The number of times agents had to wait for log data to write to disk while copying log records into the log buffer.

**NUM\_LOG\_DATA\_FOUND\_IN\_BUFFER:** The number of times log data was read from buffer instead of from disk, which is slower.

**NUM\_LOG\_PART\_PAGE\_IO:** Number of I/O requests issued by the logger for writing partial log data to disk. To determine if the current disk is adequate for logging, use this metric in conjunction with log\_writes, log\_write\_time, and num\_log\_write\_io.

**NUM\_LOG\_READ\_IO:** Number of I/O requests issued by the logger to read log data from disk. To determine if the current disk is adequate for logging, use this metric in conjunction with log\_reads and log\_read\_time.

**NUM\_LOG\_WRITE\_IO:** Number of I/O requests issued by the logger to write log data to disk. To determine if the current disk is adequate for logging, use this metric in conjunction with log\_writes and log\_write\_time.

**POOL\_ASYNC\_DATA\_READ\_REQS:** Number of asynchronous read requests by the prefetcher to the operating system. These requests are usually large block I/Os of multiple pages.

**POOL\_ASYNC\_DATA\_READS:** Number of data pages read in from the table space physical containers by asynchronous engine dispatchable units for all types of table spaces. To determine the number of physical read that were performed synchronously, use this metric along with the pool\_data\_p\_reads metrics.

**POOL\_ASYNC\_DATA\_WRITES:** Number of times a buffer pool data page was physically written to disk by either an asynchronous page cleaner or prefetcher. To determine how well the buffer page cleaners are performing, use this metric in conjunction with pool\_data\_writes and pool\_async\_data\_writes.

---

**POOL\_ASYNC\_INDEX\_READS:** Number of index pages read in from the physical table space containers by asynchronous engine dispatchable units for all types of table spaces. To determine how well the prefetchers are working, compare the ratio of asynchronous reads to total physical reads. Use this information to tune the `num_ioservers` configuration parameter.

**POOL\_ASYNC\_INDEX\_WRITES:** Number of times a buffer pool index page was physically written to disk by either an asynchronous page cleaner or prefetcher.

**POOL\_ASYNC\_READ\_TIME:** Total number of milliseconds spent reading in data and index pages from physical table space containers by asynchronous engine dispatchable units for all types of table spaces. Use this metric to analyze the I/O work being performed.

**POOL\_ASYNC\_WRITE\_TIME:** Total number of milliseconds spent writing data or index pages from the buffer pool to disk by database manager page cleaners. Use this metric to analyze the I/O work being performed.

**POOL\_DATA\_FROM\_ESTORE:** Number of buffer pool data pages read from the extended storage monitor.

**POOL\_DATA\_L\_READS:** Number of data pages which have been requested from the buffer pool (logical) for regular and large table spaces. The functionality to record buffer pool information at the statement level is supported for API and CLP snapshot requests.

**POOL\_DATA\_P\_READS:** Number of data pages read in from the table space containers (physical) for regular and large table spaces. The functionality to record buffer pool information at the statement level is supported for API and CLP snapshot requests.

**POOL\_DATA\_WRITES:** Number of times a buffer pool data page was physically written to disk.

**POOL\_DRTY\_PG\_STEAL\_CLNS:** Number of times a page cleaner was invoked because a synchronous write was needed during the victim buffer replacement for the database.

**POOL\_DRTY\_PG\_THRSH\_CLNS:** Number of times a page cleaner was invoked because a buffer pool had reached the dirty page threshold criterion for the database.

**POOL\_INDEX\_L\_READS:** Number of index pages which have been requested from the buffer pool (logical) for 9 regular and large table spaces. The functionality to record buffer pool information at the statement level is supported for API and CLP snapshot requests.

**POOL\_INDEX\_P\_READS:** Number of index pages read in from the table space containers (physical) for regular and large table spaces. The functionality to record buffer pool information at the statement level is supported for API and CLP snapshot requests.

**POOL\_INDEX\_WRITES:** Number of times a buffer pool index page was physically written to disk.

**POOL\_LSN\_GAP\_CLNS:** Number of times a page cleaner was invoked because the logging space used had reached a predefined criterion for the database.

**POOL\_NO\_VICTIM\_BUFFER:** Number of times an agent did not have a preselected victim buffer available.

**POOL\_READ\_TIME:** Number of milliseconds spent reading in data and index pages from the physical table space for all types of table spaces.

**POOL\_TEMP\_DATA\_L\_READS:** Number of data pages which have been requested from the logical buffer pool for temporary table spaces.

---

**POOL\_TEMP\_DATA\_P\_READS:** Number of data pages read in from the physical table space containers for temporary table spaces.

**POOL\_TEMP\_INDEX\_L\_READS:** Number of index pages which were requested from the logical buffer pool for temporary table spaces.

**POOL\_TEMP\_INDEX\_P\_READS:** Number of index pages read in from the physical table space containers for temporary table spaces.

**POOL\_WRITE\_TIME:** Number of milliseconds spent physically writing data or index pages from the buffer pool to disk.

**PREFETCH\_WAIT\_TIME:** Number of milliseconds spent waiting for an I/O prefetcher server to finish loading pages into the buffer pool.

**ROWS\_DELETED:** Number of row deletions attempted.

**ROWS\_INSERTED:** Number of row insertions attempted.

**ROWS\_READ:** Number of rows read from tables.

**ROWS\_SELECTED:** Number of rows that have been selected and returned to the application.

**ROWS\_UPDATED:** Number of row updates attempted.

**SEC\_LOG\_USED\_TOP:** The maximum number of bytes of secondary log space used.

**SEC\_LOGS\_ALLOCATED:** Number of secondary log files currently being used for the database.

**SELECT\_SQL\_STMTS:** The number of SQL SELECT statements that were executed.

**SORT\_HEAP\_ALLOCATED:** The number of allocated pages of sort heap space for all sorts at the level chosen and at the current time.

**SORT\_OVERFLOWS:** The number of sorts that ran out of sort heap and may have required disk space for temporary storage.

**SORT\_SHRHEAP\_ALLOCATED:** The total amount of shared sort memory allocated in the database.

**SORT\_SHRHEAP\_TOP:** Database-wide shared sort memory high-water mark in 4k pages.

**STATIC\_SQL\_STMTS:** The number of static SQL statements that were attempted.

**TOT\_LOG\_USED\_TOP:** The maximum number of bytes used for log space.

**TOTAL\_APP\_COMMITS:** Total number of commit statements issued by the client application.

**TOTAL\_APP\_ROLLBACKS:** Total number of rollback statements issued by the client application.

**TOTAL\_CONS:** Number of newly opened connections to the database.

**TOTAL\_LOG\_AVAILABLE:** Number of bytes of active log space in the database that is not being used by uncommitted transactions.

**TOTAL\_LOG\_USED:** Number of bytes of active log space currently used in the database.

**TOTAL\_SEC\_CONS:** The number of connections made by a subagent to the database at the node.

**TOTAL\_SORT\_TIME:** The total elapsed time (in milliseconds) for all sorts that have been executed.

**TOTAL\_LOCK\_TIME:** The total time for which database is in locked state.

---

**TOTAL\_SORTS:** The number of sorts that have been executed.

**TOT\_LOG\_USED\_TOP:** The maximum amount of total log space used (in bytes).

**UID\_SQL\_STMTS:** Number of SQL UPDATE, INSERT, and DELETE statements that were executed.

**UNREAD\_PREFETCH\_PAGES:** Number of pages that the prefetcher read in that were never used.

### MongoDB Server Metrics

**asserts\_msg:** The number of message asserts. These are internal server errors that have a well defined text string. Stack traces are logged for these.

**asserts\_regular:** The number of regular asserts raised since this process started.

**asserts\_user:** The number of user asserts. These are errors that can be generated by a user such as out of disk space or duplicate key.

**asserts\_warning:** The number of warnings raised since this process started.

**BackgroundFlushing\_flushes:** The number of times the database has flushed all writes to disk.

**BackgroundFlushing\_total\_ms:** The number of milliseconds (ms) that the mongod processes have spent writing (i.e. flushing) data to disk.

**Connections\_available:** The number of unused available connections that the database can provide. Consider this value in combination with the value of current to understand the connection load on the database, and the UNIX ulimit Settings document for more information about system thresholds on available connections.

**Connections\_current:** The number of connections to the database server from clients. This number includes the current shell session. Consider the value of available to add more context to this datum. This figure will include the current shell connection as well as any inter-node connections to support a replica set or sharded cluster.

**Cursor\_timedOut:** The number of cursors that have timed out since the server process started. If this number is large or growing at a regular rate, this may indicate an application error.

**Cursor\_totalOpen:** The number of cursors that MongoDB is maintaining for clients. Because MongoDB exhausts unused cursors, typically this value small or zero. However, if there is a queue, stale tailable cursors, or a large number of operations this value may rise.

**globalLock\_ActiveClients:** The number of connected clients.

**globalLock\_CurrentQueue:** The number of operations queued waiting for the lock. A consistently small queue, particularly of shorter operations should cause no concern. Also, consider this value in light of the size of queue waiting for the read lock (e.g. readers) and write lock (e.g. writers) individually.

**Mem\_mapped:** The number of megabytes of memory mapped by the database. Because MongoDB uses memory-mapped files, this value will be roughly equivalent to the total size of your databases.

**Mem\_resident:** The amount of RAM, in megabytes (MB), currently used by the database process. In normal use this value tends to grow. In dedicated database servers this number tends to approach the total amount of system memory.

**Mem\_virtual:** The quantity, in megabytes (MB), of virtual memory used by the mongod process. With journaling enabled, the value of virtual is at least twice the value of mapped. If virtual value is significantly larger than mapped (e.g. 3 or more times), this may indicate a memory leak.

---

**Network\_bytesIn:** The amount of network traffic, in bytes, received by this database. Use this value to ensure that network traffic sent to the mongod process is consistent with expectations and overall inter-application traffic.

**Network\_bytesOut:** The amount of network traffic, in bytes, sent from this database. Use this value to ensure that network traffic sent by the mongod process is consistent with expectations and overall inter-application traffic.

**Network\_numRequests:** The number of distinct requests that the server has received. Use this value to provide context for the bytesIn and bytesOut values to ensure that MongoDB network utilization is consistent with expectations and application use.

**OpCounters\_command:** The number of commands sent to MongoDB.

**OpCounters\_delete:** The number of Delete operations.

**OpCounters\_getmore:** The number of GetMore operations.

**OpCounters\_insert:** The number of Insert operations.

**OpCounters\_query:** The number of Query operations.

**OpCounters\_update:** The number of Update operations.

**Oplog\_Max\_Size** (*new in 4.5.4*): The maximum size of the operation log

**Oplog\_Size** (*new in 4.5.4*): The size of the operation log

**OplogTimeDiff\_in\_sec** (*new in 4.5.4*): The difference (in seconds) between the first entry in the log and the last entry in the log

**Repl\_command:** The number of Replicated Commands issued to the database.

**Repl\_delete:** The number of Replicated Delete operations.

**Repl\_getmore:** The number of GetMore operations. This counter can be high even if the query count is low. Secondary nodes send getMore operations as part of the replication process.

**Repl\_insert:** The number of replicated insert operations.

**Repl\_query:** The number of Replicated Queries.

**Repl\_update:** The number of Replicated Update Operations.

**Replication\_MyState** (*new in 4.5.4*): An integer between 0 and 10 that represents the replica state of the current member.

**Index\_missRatio:** Ratio of index hits to misses. If there are a lot of index misses then you should look at your queries to see if they are optimally using your indexes. You may need to add new indexes to make the queries run faster. You can explain the query to see which index queries are hitting and the total execution time so you can compare query performance before and after adding the new indexes.

### Microsoft SQL Server Metrics

**Active cursors:** The number of active cursors.

**Active Temp Tables:** The number of temporary tables/table variables in use.

**Active Transactions:** The number of active transactions for the database.

---

**Active Worker Threads:** The number of worker threads currently running out of the total available threads.

**AU cleanup batches/sec:** The number of batches per second that were completed successfully by the background task that cleans up deferred dropped allocation units.

**AU cleanups/sec:** The number of allocation units per second that were successfully dropped the background task that cleans up deferred dropped allocation units. Each allocation unit drop requires multiple batches.

**Auto-Param Attempts/sec:** The number of auto-parameterization attempts per second. Total should be the sum of the failed, safe, and unsafe auto-parameterizations. Auto-parameterization occurs when an instance of SQL Server tries to parameterize a Transact-SQL request by replacing some literals with parameters so that reuse of the resulting cached execution plan across multiple similar-looking requests is possible. Note that auto-parameterizations are also known as simple parameterizations in newer versions of SQL Server. This counter does not include forced parameterizations.

**Available Threads:** The difference between the total number of worker threads and the active worker threads.

**Average Latch Wait Time (ms):** Average latch wait time (in milliseconds) for latch requests that had to wait.

**Average Wait Time (ms):** Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.

**AWE Lookup Maps/sec:** The number of times a database page is requested by the server, found in the buffer pool, and mapped. When it is mapped, it is made a part of the server's virtual address space.

**AWE Stolen Maps/sec:** The number of times a buffer is taken from the free list and mapped.

**AWE Write Maps/sec:** The number of times it is necessary to map in a dirty buffer so it can be written to disk.

**Backup/Restore Throughput/sec:** Read/write throughput for backup and restore operations of a database per second. For example, you can measure how the performance of the database backup operation changes when more backup devices are used in parallel or when faster devices are used. Throughput of a database backup or restore operation allows you to determine the progress and performance of your backup and restore operations.

**Batch Requests/sec:** The number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.

**Buffer cache hit ratio:** Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups over the last few thousand page accesses. The ratio is displayed as a percentage. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.

**Bulk Copy Rows/sec:** The number of rows bulk copied per second.

**Bulk Copy Throughput/sec:** Amount of data bulk copied (in kilobytes) per second.

**By-reference Lob Create Count:** Count of large object (lob) values that were passed by reference. By-reference lobs are used in certain bulk operations to avoid the cost of passing them by value.

---

**By-reference Lob Use Count:** Count of by-reference lob values that were used. By-reference lobs are used in certain bulk operations to avoid the cost of passing them by-value.

**Cache Hit Ratio:** Ratio between cache hits and lookups. The ratio is displayed as a percentage.

**Cache Object Counts:** The number of cache objects in the cache.

**Cache Objects in use:** The number of cache objects in use.

**Cache Pages:** The number of 8-kilobyte (KB) pages used by cache objects.

**Cached Cursor Counts:** The number of cursors of a given type in the cache.

**Checkpoint pages/sec:** The number of pages flushed to disk per second by a checkpoint or other operation that require all dirty pages to be flushed.

**CLR Execution:** Total execution time in CLR (microseconds)

**Connection Memory (KB):** Total amount of dynamic memory the server is using for maintaining connections.

**Connection Resets/sec:** The total number of logins started from the connection pool.

**Count Lob Readahead:** Count of lob pages on which readahead was issued.

**Count Pull In Row:** Count of column values that were pulled in-row from off-row.

**Count Push Off Row:** Count of column values that were pushed from in-row to off-row.

**Cursor Cache use count/sec:** The total number of times each type of cached cursor is used.

**Cursor memory usage:** Amount of memory consumed by cursors in kilobytes (KB).

**Count/sec:** Times each type of cached cursor has been used. Cursor memory usage Amount of memory consumed by cursors in kilobytes (KB).

**Cursor Requests/sec:** The number of SQL cursor requests received by the server. Cursor worktable usage Number of worktables used by cursors. Data File(s) Size (KB) Cumulative size (in kilobytes) of all the data files in the database including any automatic growth. Monitoring this counter is useful, for example, for determining the correct size of Database pages Number of pages in the buffer pool with database content.

**Cursor worktable usage:** Number of worktables in use by cursors.

**Data File(s) Size(KB):** Cumulative size (Kb) of all data files in the database including any automatic growth. Monitoring this counter to determine the correct size of tempdb.

**Database pages:** Number of database pages in use.

**DBCC Logical Scan Bytes/sec:** The number of logical read scan bytes per second for database console commands (DBCC).

**Deferred Dropped Aus:** The number of allocation units waiting to be dropped by the background task that cleans up deferred dropped allocation units.

**Deferred Dropped rowsets:** The number of rowsets created as a result of aborted online index build operations that are waiting to be dropped by the background task that cleans up deferred dropped rowsets.

**Dropped rowset cleanups/sec:** The number of rowsets per second created as a result of aborted online index build operations that were successfully dropped by the background task that cleans up deferred dropped rowsets.

---

**Dropped rowsets skipped/sec:** The number of rowsets per second created as a result of aborted online index build operations that were skipped by the background task that cleans up deferred dropped rowsets created.

**Errors/sec:** The number of errors/sec.

**Event Notifications Delayed Drop:** The number of event notifications waiting to be dropped by a system thread.

**Extent Deallocations/sec:** The number of extents deallocated per second in all databases in this instance of SQL Server.

**Extents Allocated/sec:** The number of extents allocated per second in all databases in this instance of SQL Server.

**Failed AU cleanup batches/sec:** The number of batches per second that failed and required retry, by the background task that cleans up deferred dropped allocation units. Failure could be due to lack of memory or disk space, hardware failure, and other reasons.

**Failed Auto-Params/sec:** The number of failed auto-parameterization attempts per second. This should be small. Note that auto-parameterizations are also known as simple parameterizations in later versions of SQL Server.

**Failed leaf page cookie:** The number of times that a leaf page cookie could not be used during an index search since changes happened on the leaf page. The cookie is used to speed up the index search.

**Failed tree page cookie:** The number of times that a tree page cookie could not be used during an index search since changes happened on the parent pages of those tree pages. The cookie is used to speed up the index search.

**Forced Parameterizations/sec:** The number of successful forced parameterizations per second.

**Forwarded Records/sec:** The number of records per second fetched through forwarded record pointers.

**Free list stalls/sec:** The number of requests per second that had to wait for a free page.

**Free Log Space in tempdb (MB):** The total unused log space (in megabytes) in tempdb.

**Free pages:** The total number of free pages on the node.

**Free Space in tempdb (KB):** The amount of space (in kilobytes) available in FreeSpace Page.

**FreeSpace Page Fetches/sec:** Number of pages fetched/second by free space scans. These scans search for free space within pages already allocated to an allocation unit, to address requests to insert or modify record fragments.

**FreeSpace Scans/sec:** The number of scans per second that were initiated to search for free space within pages already allocated to an allocation unit to insert or modify record fragment. Each scan may find multiple pages.

**Full Scans/sec:** The number of unrestricted full scans per second. These can be either base-table or full-index scans.

**Granted Workspace Memory (KB):** Total amount of memory currently granted to executing processes such as hash, sort, bulk copy, and index creation operations.

**Guided Plan Executions/sec:** The number of plan executions per second in which the query plan has been generated by using a plan guide.

---

**HTTP Authenticated Requests:** The number of authenticated HTTP requests started per second. Index Searches/sec Number of index searches per second. These are used to start a range scan, reposition a range scan, revalidate a scan point, fetch a single index record, and search down the index to locate where to insert a new row.

**Index Searches/sec:** Number of index searches per second. These are used to start a range scan, reposition a range scan, revalidate a scan point, fetch a single index record, and search down the index to locate where to insert a new row.

**Latch Waits/sec:** The number of latch requests that could not be granted immediately.

**Lazy writes/sec:** The number of buffers written per second by the buffer manager's lazy writer. The lazy writer is a system process that flushes out batches of dirty, aged buffers (buffers that contain changes that must be written back to disk before the buffer can be reused for a different page) and makes them available to user processes. The lazy writer eliminates the need to perform frequent checkpoints in order to create available buffers.

**LobHandle Create Count:** Count of temporary lobs created.

**LobHandle Destroy Count:** Count of temporary lobs destroyed.

**LobSS Provider Create Count:** Count of LOB Storage Service Providers (LobSSP) created. One worktable created per LobSSP.

**LobSS Provider Destroy Count:** Count of LobSSP destroyed.

**LobSS Provider Truncation Count:** Count of LobSSP truncated.

**Lock Blocks:** Current number of lock blocks in use on the server (refreshed periodically). A lock block represents an individual locked resource, such as a table, page, or row.

**Lock Blocks Allocated:** Current number of allocated lock blocks. At server startup, the number of allocated lock blocks plus the number of allocated lock owner blocks depends on the SQL Server

**Lock Memory (KB):** Total amount of dynamic memory the server is using for locks.

**Lock Owner Blocks:** The number of lock owner blocks currently in use on the server (refreshed periodically). A lock owner block represents the ownership of a lock on an object by an individual thread. Therefore, if three threads each have a shared (S) lock on a page, there will be three lock owner blocks.

**Lock Owner Blocks Allocated:** Current number of allocated lock owner blocks. At server startup, the number of allocated lock owner blocks and the number of allocated lock blocks depend on the SQL

**Lock Requests/sec:** The number of new locks and lock conversions per second requested from the lock manager.

**Lock Timeouts (timeout > 0)/sec:** The number of lock requests per second that timed out, but excluding requests for NOWAIT locks.

**Lock Timeouts/sec:** The number of lock requests per second that timed out, including requests for NOWAIT locks.

**Lock Wait Time (ms):** Total wait time (in milliseconds) for locks in the last second.

**Lock Waits/sec:** The number of lock requests per second that required the caller to wait.

**Log Bytes Flushed/sec:** Total number of log bytes flushed.

---

**Log Cache Hit Ratio:** Percentage of log cache reads satisfied from the log cache.

**Log Cache Reads/sec:** Reads performed per second through the log manager cache.

**Log File(s) Size (KB):** Cumulative size (in kilobytes) of all the transaction log files in the database.

**Log File(s) Used Size (KB):** The cumulative used size of all the log files in the database.

**Log Flush Wait Time** Total wait time (in milliseconds) to flush the log.

**Log Flush Waits/sec:** The number of commits per second waiting for the log flush.

**Log Flushes/sec:** The number of log flushes per second.

**Log Growths:** Total number of times the transaction log for the database has been expanded.

**Log Shrinks:** Total number of times the transaction log for the database has been shrunk.

**Log Truncations:** Total number of times the transaction log for the database has been truncated.

**Logical Connections:** The number of logical connections to the system.

**Logins/sec:** Total number of logins started per second. This does not include pooled connections.

**Logouts/sec:** Total number of logout operations started per second.

**Longest Transaction Running Time:** The length of time (in seconds) since the start of the transaction that has been active longer than any other current transaction.

**Mars Deadlocks:** The number of Mars Deadlocks detected.

**Maximum Workspace Memory (KB):** Maximum amount of memory available for executing processes such as hash, sort, bulk copy, and index creation operations.

**Memory Grants Outstanding:** Total number of processes that have successfully acquired a workspace memory grant.

**Memory Grants Pending:** Total number of processes waiting for a workspace memory grant.

**Misguided Plan Executions/sec:** The number of plan executions per second in which a plan guide is not considered during plan generation. A normal compilation is used instead of the plan guide to execute the plan.

**Mixed page allocations/sec:** The number of pages allocated per second from mixed extents. These could be used for storing the IAM pages and the first eight pages that are allocated to an allocation unit.

**Non-atomic yield rate:** The number of non-atomic yields per second.

**NonSnapshot Version Transactions:** The number of currently active transactions that are not using snapshot isolation level and have made data modifications that have generated row versions in the Number of active cursor plans.

**Number of active cursor plans:** Number of cursor plans.

**Number of Deadlocks/sec:** The number of lock requests per second that resulted in a deadlock.

**Number of SuperLatches:** The number of latches that are currently SuperLatches.

**Optimizer Memory (KB):** Total amount of dynamic memory the server is using for query optimization.

---

---

**Page compression attempts/sec:** The number of pages evaluated for page-level compression. Includes pages that were not compressed because significant savings could be achieved. Includes all objects in the instance of SQL Server. For information about specific objects, see `sys.dm_db_index_operational_stats` (Transact-SQL).

**Page Deallocations/sec:** The number of pages deallocated per second in all databases in this instance of SQL Server. These include pages from mixed extents and uniform extents.

**Page life expectancy:** The number of seconds a page will stay in the buffer pool without references.

**Page lookups/sec:** The number of requests per second to find a page in the buffer pool.

**Page reads/sec:** The number of physical database page reads that are issued per second. This statistic displays the total number of physical page reads across all databases. Because physical I/O is expensive, you may be able to minimize the cost, either by using a larger data cache, intelligent indexes, and more efficient queries or by changing the database design.

**Page Splits/sec:** The number of page splits per second that occur as the result of overflowing index pages.

**Page writes/sec:** The number of physical database page writes issued per second.

**Pages Allocated/sec:** The number of pages allocated per second in all databases in this instance of SQL Server. These include pages allocations from both mixed extents and uniform extents.

**Pages compressed/sec:** The number of data pages that are compressed by using PAGE compression. Includes all objects in the instance of SQL Server. For information about specific objects, see `sys.dm_db_index_operational_stats` (Transact-SQL).

**Percent Log Used:** Percentage of space in the log that is in use.

**Percent Used Log Space in tempdb:** The ratio of the used log space to the total log space in tempdb. The ratio is displayed as a percentage.

**Probe Scans/sec:** The number of probe scans per second that are used to find at most one single qualified row in an index or base table directly.

**Processes blocked:** The number of currently blocked processes.

**Range Scans/sec:** The number of qualified range scans through indexes per second.

**Readahead pages/sec:** The number of pages read per second in anticipation of use.

**Repl. Trans. Rate:** The number of transactions per second read out of the transaction log of the publication database and delivered to the distribution database.

**Requests Waiting for Threads:** The total number of requests waiting to be allocated a thread.

**Reserved Pages:** The total number of pages reserved for the partition.

**Safe Auto-Params/sec:** The number of safe auto-parameterization attempts per second. Safe refers to a determination that a cached execution plan can be shared between different similar-looking Transact-SQL statements. SQL Server makes many auto-parameterization attempts some of which turn out to be safe and others fail. Note that auto-parameterizations are also known as simple parameterizations in later versions of SQL Server. This does not include forced parameterizations.

**Scan Point Revalidations/sec:** The number of times per second that the scan point had to be revalidated to continue the scan.

---

**Skipped Ghosted Records/sec:** The number of ghosted records per second skipped during scans.

**Snapshot Transactions:** The number of currently active transactions using the snapshot isolation level. N.B. The SOAP Empty Requests Number of empty SOAP requests started per second.

**SOAP Empty Requests:** The number of SOAP method invocations passed to the stored procedure (or template) with an empty string as its value (not a NULL value) in order to provide an included input parameter with no value assigned to it.

**SOAP Method Invocations:** The number of SOAP method invocations started per second.

**SOAP Session Initiate Requests:** The number of SOAP Session initiate requests started per second.

**SOAP Session Terminate Requests:** The number of SOAP Session terminate requests started per second.

**SOAP SQL Requests:** The number of SOAP SQL requests started per second.

**SOAP WSDL Requests:** The number of SOAP Web Service Description Language requests started per second.

**SQL Attention rate:** The number of attentions per second. An attention is a request by the client to end the currently running request.

**SQL Cache Memory (KB):** Total amount of dynamic memory the server is using for the dynamic SQL cache.

**SQL Compilations/sec:** The number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles caused by statement-level recompilations in SQL Server. After SQL Server user activity is stable, this value reaches a steady state.

**SQL Re-Compilations/sec:** The number of statement recompiles per second. Counts the number of times statement recompiles are triggered. Generally, you want the recompiles to be low. In later versions of SQL Server, recompilations are statement-scoped instead of batch-scoped recompilations in Microsoft SQL Server 2000. Therefore, direct comparison of values of this counter between SQL Server and earlier versions is not possible.

**SQL Re-Compilations/sec Percent:** (Total number of recompilations per second) / (Total number of compilations per second) \* 100

**Stolen Pages:** The number of pages used for miscellaneous server purposes (stolen from the buffer pool) on the node.

**Stored Procedures Invoked/sec:** This counter reports the total number of activation stored procedures invoked by all queue monitors in the instance per second.

**SuperLatch Demotions/sec:** The number of SuperLatches that have been demoted to regular latches in the last second.

**SuperLatch Promotions/sec:** The number of latches that have been promoted to SuperLatches in the last second.

**Table Lock Escalations/sec:** The number of times locks on a table were escalated to the TABLE or HoBT granularity. Target pages Ideal number of pages in the buffer pool.

**Target pages:** Ideal number of pages in the buffer pool.

**Target Server Memory (KB):** Total amount of dynamic memory the server can consume.

---

**Task Limit Reached:** The number of times that a queue monitor would have started a new task, but did not because the maximum number of tasks for the queue is already running.

**Task Limit Reached/sec:** The number of times per second that a queue monitor would have started a new task, but did not because the maximum number of tasks for the queue is already running.

**Tasks Aborted/sec:** The number of activation stored procedure tasks that end with an error or are aborted by a queue monitor for failing to receive messages.

**Tasks Running:** The number of activation stored procedures that are currently running.

**Tasks Started/sec:** The number of activation stored procedures started per second by all queue monitors in the instance.

**Temp Tables Creation Rate:** The number of temporary tables/table variables created per second.

**Temp Tables For Destruction:** The number of temporary tables/table variables waiting to be destroyed by the cleanup system thread.

**Total Latch Wait Time (ms):** Total latch wait time (in milliseconds) for latch requests in the last second.

**TOTAL\_LOCK\_TIME:** The total time for which database is in locked state.

**Total Pages:** The total number of pages in the buffer pool on the node that includes database, free, and stolen pages.

**Total Server Memory (KB):** The committed memory from the buffer pool (in kilobytes).

**Total Threads:** The total number of worker threads available.

**Trace Event Notifications Queue:** The number of trace event notification instances waiting in the internal queue to be sent through Service Broker.

**Transactions:** The number of currently active transactions of all types.

**Transactions/sec:** The number of transactions started for the database per second.

**Unsafe Auto-Params/sec:** The number of unsafe auto-parameterization attempts per second. For example, the query has some characteristics that prevent the cached plan from being shared. These are designated as unsafe. This does not count the number of forced parameterizations.

**Update conflict ratio:** The percentage of those transactions using the snapshot isolation level that have encountered update conflicts within the last second. An update conflict occurs when a snapshot isolation level transaction attempts to modify a row that last was modified by another transaction that was not committed when the snapshot isolation level transaction started.

**Update Snapshot Transactions:** The number of currently active transactions using the snapshot isolation level and have modified data.

**Used leaf page cookie:** The number of times a leaf page cookie is used successfully during an index search since no change happened on the leaf page. The cookie is used to speed up the index search.

**Used Log Space in tempdb (MB):** The total log space (in megabytes) used up in the tempdb.

**Used tree page cookie:** The number of times a tree page cookie is used successfully during an index search since no change happened on the parent page of the tree page. The cookie is used to speed up the index search.

**User Connections:** The number of users currently connected to SQL Server.

**User Processes Blocked (min):** The sum of the time processes (in minutes) that are waiting to run.

**Version Cleanup rate (KB/s):** The rate (in kilobytes per second) at which row versions are removed from the snapshot isolation version store.

**Version Generation rate (KB/s):** The rate (in kilobytes per second) at which new row versions are added to the snapshot isolation version store.

**Version Store Size (KB):** The amount of space (in kilobytes) in Version Store unit count The number of active allocation units in the snapshot isolation version store.

**Version Store unit count:** The number of active allocation units in the snapshot isolation version store in tempdb.

**Version Store unit creation:** The number of allocation units that have been created in the snapshot isolation store since the instance of the Database Engine was started.

**Version Store unit truncation:** The number of allocation units that have been removed from the snapshot isolation store since the instance of the Database Engine was started.

**Workers Waiting for CPU:** The total number of workers waiting to get the CPU time.

**Workfiles Created/sec:** The number of work files created per second. For example, work files could be used to store temporary results for hash joins and hash aggregates.

**Worktables Created/sec:** The number of work tables created per second. For example, work tables could be used to store temporary results for query spool, lob variables, XML variables, and cursors.

**Worktables From Cache Ratio:** Percentage of work tables created where the initial two pages of the work table were not allocated but were immediately available from the work table cache. (When a work table is dropped, two pages may remain allocated and they are returned to the work table cache. This increases performance.)

**Write Transactions/sec:** The number of transactions that wrote to the database and committed, in the last second.

IO Metrics	Description
Data File Average Read Size	Data file average read size in Kilobytes.
Data File Average Write Size	Data file average write size in Kilobytes.
Data File Bytes Read	Data file bytes read per second.
Data File Bytes Write	Data file bytes write per second.
Data File IO Stalls	Data file IO stalls , indicator of IO problem
Data File Read	Number of read per second from data file.
Data File Write	Number of write per second into data file.

IO Metrics	Description
Log File Average Read Size	Log file average read size in Kilobytes.
Log File Average Write Size	Log file average write size in Kilobytes.
Log File Bytes Read	Log file bytes read per second.
Log File Bytes Write	Log file bytes write per second.
Log File IO Stalls	Log file Io stalls , indicator of IO problem.
Log File Read	Number of read per second from log file.
Log File Write	Number of write per second from log file.

### Microsoft SQL Azure Metrics

**avg\_cpu\_percent:** Average compute utilization in the percentage of the limit of the service tier.

**avg\_data\_io\_percent:** Average data I/O utilization in percentage based on the limit of the service tier.

**avg\_log\_write\_percent:** Average write resource utilization in the percentage of the limit of the service tier.

**avg\_memory\_percent:** Average memory utilization in the percentage of the limit of the service tier.

### MySQL Server Metrics

**Aborted\_clients:** The number of clients that were aborted (because they did not properly close the connection to the MySQL server). For some applications, this can be OK, but for some other applications you might want to track the value, as aborted connects may indicate some sort of application failure.

**Aborted\_connects:** The number of failed attempts to connect to the MySQL server.

**Bytes\_received:** The number of bytes received from all clients.

**Bytes\_sent:** The number of bytes sent to all clients.

**Com\_alter\_table:** The number of times each ALTER TABLE statement has been executed.

**Com\_create\_index:** The number of times each CREATE INDEX statement has been executed.

**Com\_create\_table:** The number of times each CREATE TABLE statement has been executed.

**Com\_delete:** The number of times each DELETE statement has been executed.

**Com\_insert:** The number of times each INSERT statement has been executed.

**Com\_optimize:** The number of times each OPTIMIZE statement has been executed.

**Com\_select:** The number of times each SELECT statement has been executed.

**Com\_update:** The number of times each UPDATE statement has been executed.

---

**Connections:** The number of connection attempts (successful or not) to the MySQL server.

**Created\_tmp\_disk\_tables:** The number of temporary tables on disk created automatically by the server while executing statements.

**Created\_tmp\_files:** How many temporary files mysqld has created.

**Created\_tmp\_tables:** The number of in-memory temporary tables created automatically by the server while executing statements. If `Created_tmp_disk_tables` is large, you may want to increase the `tmp_table_size` value to cause temporary tables to be memory-based instead of disk-based.

**Handler\_delete:** The number of times that rows have been deleted from tables.

**Innodb\_buffer\_pool\_pages\_data:** The number of pages containing data (dirty or clean).

**Innodb\_buffer\_pool\_pages\_dirty:** The number of pages currently dirty.

**Innodb\_buffer\_pool\_pages\_flushed:** The number of buffer pool page-flush requests.

**Innodb\_buffer\_pool\_pages\_free:** The number of free pages.

**Innodb\_buffer\_pool\_pages\_misc:** The number of pages that are busy because they have been allocated for administrative overhead such as row locks or the adaptive hash index. This value can also be calculated as `Innodb_buffer_pool_pages_total`.

**Innodb\_buffer\_pool\_pages\_total:** The total size of the buffer pool, in pages.

**Innodb\_buffer\_pool\_read\_ahead\_rnd:** The number of random read-aheads initiated by InnoDB. This happens when a query scans a large portion of a table but in random order.

**Innodb\_buffer\_pool\_read\_requests:** The number of logical read requests InnoDB has done.

**Innodb\_buffer\_pool\_reads:** The number of logical reads that InnoDB could not satisfy from the buffer pool and had to do a single-page read.

**Innodb\_buffer\_pool\_wait\_free:** Normally, writes to the InnoDB buffer pool happen in the background. However, if it is necessary to read or create a page and no clean pages are available, it is also necessary to wait for pages to be flushed first. This counter counts instances of these waits. If the buffer pool size has been set properly, this value should be small.

**Innodb\_buffer\_pool\_write\_requests:** The number writes done to the InnoDB buffer pool.

**Innodb\_data\_fsyncs:** The number of `fsync()` operations so far.

**Innodb\_data\_pending\_fsyncs:** The current number of pending `fsync()` operations.

**Innodb\_data\_pending\_reads:** The current number of pending reads.

**Innodb\_data\_pending\_writes:** The current number of pending writes.

**Innodb\_data\_read:** The amount of data read so far, in bytes.

**Innodb\_data\_reads:** The total number of data reads.

**Innodb\_data\_writes:** The total number of data writes.

**Innodb\_data\_written:** The amount of data written so far, in bytes.

**Innodb\_dblwr\_pages\_written:** The number of doublewrite operations that have been performed.

---

**Innodb\_dblwr\_writes:** The number of pages that have been written for doublewrite operations.

**Innodb\_log\_waits:** The number of times that the log buffer was too small and a wait was required for it to be flushed before continuing.

**Innodb\_log\_write\_requests:** The number of log write requests.

**Innodb\_log\_writes:** The number of physical writes to the log file.

**Innodb\_pages\_created:** The number of pages created.

**Innodb\_pages\_read:** The number of pages read.

**Innodb\_pages\_written:** The number of pages written.

**Innodb\_row\_lock\_current\_waits:** The number of row locks currently being waited for.

**Innodb\_row\_lock\_time:** The total time spent in acquiring row locks, in milliseconds.

**Innodb\_row\_lock\_time\_avg:** The average time to acquire a row lock, in milliseconds.

**Innodb\_row\_lock\_time\_max:** The maximum time to acquire a row lock, in milliseconds.

**Innodb\_row\_lock\_waits:** The number of times a row lock had to be waited for.

**Innodb\_rows\_deleted:** The number of rows deleted from InnoDB tables.

**Innodb\_rows\_inserted:** The number of rows inserted into InnoDB tables.

**Innodb\_rows\_read:** The number of rows read from InnoDB tables.

**Innodb\_rows\_updated:** The number of rows updated in InnoDB tables.

**Key\_blocks\_used:** The number of used blocks in the key cache. This value is a high-water mark that indicates the maximum number of blocks that have ever been in use at one time.

**Key\_read\_requests:** The number of requests to read a key block from the cache. **Key\_writes** The number of physical writes of a key block to disk.

**Key\_reads:** The number of physical reads of a key block from disk. If **Key\_reads** is large, then your **key\_buffer\_size** value is probably too small. The cache miss rate can be calculated as  $\text{Key\_reads} / \text{Key\_read\_requests}$ .

**Key\_write\_requests:** The number of requests to write a key block to the cache.

**Key\_writes:** The number of physical writes of a key block from the MyISAM key cache to the physical disk.

**Open\_files:** The number of files that are open. **Open\_streams** The number of streams that are open (used mainly for logging).

**Open\_tables:** The number of table cache misses. If the value is large, you probably need to increase **table\_cache**. Typically you would want this to be less than 1 or 2 opened tables per second.

**Opened\_tables:** The number of tables that have been opened. The number of tables that have been opened. If **Opened\_tables** is big, your **table\_cache** value is probably too small.

**Qcache\_free\_blocks:** The number of free memory blocks in the query cache.

**Qcache\_free\_memory:** The amount of free memory for the query cache.

**Qcache\_hits:** The number of query cache hits.

---

**Qcache\_inserts:** The number of queries added to the query cache.

**Qcache\_lowmem\_prunes:** The number of queries that were deleted from the query cache because of low memory.

**Qcache\_not\_cached:** The number of non-cached queries (not cacheable, or not cached due to the query\_cache\_type setting).

**Qcache\_queries\_in\_cache:** The number of queries registered in the query cache.

**Qcache\_total\_blocks:** The total number of blocks in the query cache.

**Questions:** The number of statements that clients have sent to the server.

**Seconds\_Behind\_Master:** The number of seconds that the replica SQL thread is behind processing the primary binary log. This field directly drives MTTR. A high or increased number of Seconds\_Behind\_Master indicates a slow disk or poorly tuned machine running the database. If this value reaches 45 minutes or more, the ability to recover from a crash, or after a manual failover, is delayed. If this value is tracked by the Machine Agent through the MySQL extension and shows a generally positive slope, it indicates a death spiral.

**Select\_full\_join:** Joins performed without keys. This should be zero. This is a good way to catch development errors, as just a few such queries can decrease the system's performance.

**Select\_full\_range\_join:** The number of joins that used a range search on a reference table.

**Select\_range:** The number of joins that used ranges on the first table. This is normally not a critical issue even if the value is quite large.

**Select\_range\_check:** The number of joins without keys that check for key usage after each row. If this is not 0, you should carefully check the indexes of your tables.

**Select\_scan:** Number of queries that performed a full table scan. In some cases these are OK but their ratio to all queries should be constant. If you have the value growing it can be a problem with the optimizer, lack of indexes or some other problem.

**Slave\_IO\_Running:** Whether the I/O thread for reading the primary's binary log is running.

**Slave\_open\_temp\_tables:** The number of temporary tables that the replica SQL thread currently has open.

**Slave\_SQL\_Running:** Whether the SQL thread for executing events in the relay log is running.

**Slow\_launch\_threads:** The number of threads that have taken more than slow\_launch\_time seconds to create.

**Slow\_queries:** The number of queries longer than --long-query-time or that are not using indexes. These should be a small fraction of all queries. If it grows, the system will have performance problems.

**Sort\_merge\_passes:** The number of merge passes that the sort algorithm has had to do. If this value is large, you should consider increasing the value of the sort\_buffer\_size system variable.

**Sort\_range:** The number of sorts that were done using ranges.

**SQL\_Delay:** The number of seconds that the replica lags behind the primary

**Threads\_cached:** The number of threads in the thread cache.

**Threads\_connected:** The number of currently open connections.

---

**Threads\_created:** This should be low. Higher values may mean that you need to increase the value of `thread_cache` or you have the number of connections increasing, which also indicates a potential problem.

**Threads\_running:** The number of threads that are not sleeping.

### Oracle Server Metrics

**bytes received via SQL\*Net from client:** Total number of bytes received from the client over Oracle Net Services

**bytes received via SQL\*Net from dblink:** Total number of bytes received from a database link over Oracle Net Services

**bytes sent via SQL\*Net to client:** Total number of bytes sent to the client from the foreground processes

**bytes sent via SQL\*Net to dblink:** Total number of bytes sent over a database link

**CPU used by this session:** Amount of CPU time (in 10s of milliseconds) used by a session from the time a user call starts until it ends. If a user call completes within 10 milliseconds, the start and end user-call time are the same for purposes of this statistics, and 0 milliseconds are added.

**db block changes:** Closely related to consistent changes, this statistic counts the total number of changes that were part of an update or delete operation that were made to all blocks in the SGA. Such changes generate redo log entries and hence become permanent changes to the database if the transaction is committed. This approximates total database work. It statistic indicates the rate at which buffers are being dirtied (on a per-transaction or per-second basis, for example).

**db block gets:** The number of times a CURRENT block was requested. See Also: consistent gets

**db block gets from cache:** The number of times a CURRENT block was requested from the buffer cache. This is a subset of db block gets statistics value.

**DBWR checkpoint buffers written:** The number of buffers that were written for checkpoints

**DBWR checkpoints:** The number of times the DBWR was asked to scan the cache and write all blocks marked for a checkpoint or the end of recovery. This statistic is always larger than background checkpoints completed.

**DML statements parallelized:** The number of DML statements that were executed in parallel.

**enqueue conversions:** Total number of conversions of the state of table or row lock.

**enqueue deadlocks:** Total number of deadlocks between table or row locks in different sessions.

**enqueue releases:** Total number of table or row locks released.

**enqueue requests:** Total number of table or row locks acquired.

**enqueue timeouts:** Total number of table and row locks (acquired and converted) that timed out before they could complete.

**enqueue waits:** Total number of waits that occurred during an enqueue convert or get because the enqueue get was deferred

**exchange deadlocks:** The number of times that a process detected a potential deadlock when exchanging two buffers and raised an internal, restartable error. Index scans are the only operations that perform exchanges.

---

**execute count:** Total number of calls (user and recursive) that executed SQL statements.

**gc current block receive time:** The total time required for consistent read requests to complete. It records the round-trip time for all requests for consistent read blocks.

**index fast full scans (direct read):** The number of fast full scans initiated using direct read.

**index fast full scans (full):** The number of fast full scans initiated for full segments.

**index fast full scans (rowid ranges):** The number of fast full scans initiated with rowid endpoints specified.

**lob reads:** The number of LOB API read operations performed in the session/system. A single LOB API read may correspond to multiple physical/logical disk block reads.

**lob writes:** The number of LOB API write operations performed in the session/system. A single LOB API write may correspond to multiple physical/logical disk block writes.

**logons current:** Total number of current logons. Useful only in V\$SYSSTAT.

**Number of Small Reads:** The total number of **physical reads** less the number of **physical read total multi block requests**.

**Number of Small Writes:** The total number of **physical writes** less the number of **physical write total multi block requests**.

**opened cursors current:** Total number of current open cursors.

**Parallel operations not downgraded:** The number of times parallel execution was executed at the requested degree of parallelism.

**parse count (hard):** Total number of parse calls (real parses). A hard parse is a very expensive operation in terms of memory use, because it requires Oracle to allocate a workheap and other memory structures and then build a parse tree.

**parse count (total):** Total number of parse calls (hard and soft). A soft parse is a check on an object already in the shared pool, to verify that the permissions on the underlying object have not changed.

**parse time cpu:** Total CPU time used for parsing (hard and soft) in 10s of milliseconds.

**parse time elapsed:** Total elapsed time for parsing, in 10s of milliseconds. Subtract parse time cpu from this statistic to determine the total waiting time for parse resources.

**physical read bytes:** Total size in bytes of all disk reads by application activity (and not other instance activity) only.

**physical read IO requests:** The number of read requests for application activity (mainly buffer cache and direct load operation) which read one or more database blocks per request. This is a subset of physical read total IO requests statistic.

**physical read total bytes:** Total size in bytes of disk reads by all database instance activity including application reads, backup and recovery, and other utilities. The difference between this value and physical read bytes gives the total read size in bytes by non-application workload.

**physical read total IO requests:** The number of read requests which read one or more database blocks for all instance activity including application, backup and recovery, and other utilities. The difference between this value and physical read total multi block requests gives the total number of single block read requests.

---

**physical reads:** Total number of data blocks read from disk. This value can be greater than the value of physical reads direct plus physical reads cache as reads into process private buffers also included in this statistic.

**physical write bytes:** Total size in bytes of all disk writes from the database application activity (and not other kinds of instance activity).

**physical write IO requests:** The number of write requests for application activity (mainly buffer cache and direct load operation) which wrote one or more database blocks per request.

**physical write total bytes:** Total size in bytes of all disk writes for the database instance including application activity, backup and recovery, and other utilities. The difference between this value and physical write bytes gives the total write size in bytes by non-application workload.

**physical write total IO requests:** The number of write requests which wrote one or more database blocks from all instance activity including application activity, backup and recovery, and other utilities. The difference between this stat and physical write total multi block requests gives the number of single block write requests.

**physical writes:** Total number of data blocks written to disk. This statistics value equals the sum of physical writes direct and physical writes from cache values.

**physical writes direct:** The number of writes directly to disk, bypassing the buffer cache (as in a direct load operation).

**physical writes from cache:** Total number of data blocks written to disk from the buffer cache. This is a subset of physical writes statistic.

**process last non-idle time:** The last time this process executed.

**queries parallelized:** The number of SELECT statements executed in parallel.

#### Read Percent:

**recovery blocks read:** The number of blocks read during recovery.

**recursive calls:** The number of recursive calls generated at both the user and system level. Oracle maintains tables used for internal processing. When Oracle needs to make a change to these tables, it internally generates an internal SQL statement, which in turn generates a recursive call.

**recursive cpu usage:** Total CPU time used by non-user calls (recursive calls). Subtract this value from CPU used by this session to determine how much CPU time was used by the user calls.

**redo blocks written:** This is the total number of redo blocks written. This statistic divided by "redo writes" equals the number of blocks per write.

**redo buffer allocation retries:** Total number of retries necessary to allocate space in the redo buffer. Retries are needed either because the redo writer has fallen behind or because an event such as a log switch is occurring.

**redo log space requests:** The number of times the active log file is full and Oracle must wait for disk space to be allocated for the redo log entries. Such space is created by performing a log switch.

**redo log space wait time:** Total elapsed waiting time for redo log space requests in 10s of milliseconds.

**redo size:** Total amount of redo generated in bytes.

**redo synch time:** Elapsed time of all redo synch writes calls in 10s of milliseconds

---

**redo write time:** Total elapsed time of the write from the redo log buffer to the current redo log file in microseconds.

**redo writes:** Total number of writes by LGWR to the redo log files. redo blocks written divided by this statistic equals the number of blocks per write.

**session cursor cache count:** Total number of cursors cached. This statistic is incremented only if `SESSION_CACHED_CURSORS > 0`. This statistic is the most useful in `V$SESSTAT`. If the value for this statistic in `V$SESSTAT` is close to the setting of the `SESSION_CACHED_CURSORS` parameter, the value of the parameter should be increased.

**session cursor cache hits:** The number of hits in the session cursor cache. A hit means that the SQL statement did not have to be reparsed. Subtract this statistic from parse count (total) to determine the real number of parses that occurred.

**session logical reads:** The sum of db block gets plus consistent gets. This includes logical reads of database blocks from either the buffer cache or process private memory.

**session stored procedure space:** Amount of memory this session is using for stored procedures.

#### Small IO Percent:

**sorts (disk):** The number of sort operations that required at least one disk write.

**sorts (memory):** The number of sort operations that were performed completely in memory and did not require any disk writes.

**sorts (rows):** Total number of rows sorted.

**table scan rows gotten:** The number of rows that are processed during scanning operations.

**table scans (direct read):** The number of table scans performed with direct read (bypassing the buffer cache).

**table scans (long tables):** Long (or conversely short) tables can be defined as tables that do not meet the short table criteria as described in table scans (short tables).

**table scans (rowid ranges):** During a parallel query, the number of table scans conducted with specified ROWID ranges.

**transaction lock background get time:** Useful only for internal debugging purposes.

**transaction lock foreground wait time:** Useful only for internal debugging purposes.

**transaction rollbacks:** The number of transactions being successfully rolled back.

**TOTAL\_LOCK\_TIME:** The total time for which database is in locked state.

**user calls:** The number of user calls such as login, parse, fetch, or execute

**user commits:** The number of user commits. When a user commits a transaction, the redo generated that reflects the changes made to database blocks must be written to disk. Commits often represent the closest thing to a user transaction rate.

**user rollbacks:** The number of times users manually issue the ROLLBACK statement or an error occurs during a user's transactions.

**i** Some of the obsolete metrics were removed and the following metrics are included with 20.11 and later versions of Controller.

**DB|Server Statistic|DB time:** The sum of CPU consumption of all the Oracle process and the sum of non-idle wait time

**DB|Server Statistic|OS System time used:** The total CPU time used for system calls

**DB|Server Statistic|OS User time used:** The total CPU time used for user calls

**DB|Server Statistic|SMON posted for instance recovery:** The total count or number of times SMON posted for instance recovery

**DB|Server Statistic|SMON posted for txn recovery for other instances:** The total count or number of times SMON posted for other transactions recovery in an Oracle RAC or a cluster

**DB|Server Statistic|java call heap live size:** The Java call heap live size

**DB|Server Statistic|java call heap total size:** The total Java call heap size

**DB|Server Statistic|java call heap used size:** The Java call heap used size

**DB|Server Statistic|non-idle wait count:** The total count of non-idle wait events

**DB|Server Statistic|non-idle wait time:** The total elapsed time for non-idle events

Performance Metrics	Description
Average Active Sessions	Average Active Sessions (AAS) represents the sum of active sessions over all sessions, at any given time. AAS = (Database Time / Elapsed Time) Therefore, AAS is a time-normalized Database Time.
Average Synchronous Single-Block Read Latency(ms)	The average latency (in milliseconds) of a synchronous single-block read.
Buffer Cache Hit Ratio	The data block buffer cache efficiency as measured by the percentage of times the data block requested by the query is in memory.
CPU Usage Per Sec	The CPU usage per second (centi-seconds).
Current Logons Count	The total logon count at any instant of time in database.
Current OS Load	The operating system load metric at any time instance on DB server.

Performance Metrics	Description
Cursor Cache Hit Ratio	The ratio of the number of times an open cursor is found to the number of times a cursor is sought.
Database CPU Time Ratio	The ratio of the amount of CPU used in the database to the amount of total database time.
Database Wait Time Ratio	The ratio of the amount of wait time of all the sessions in the database to the amount of total database time
DB Block Changes Per Sec	The count of database blocks changed per second.
Enqueue Timeouts Per Sec	The total enqueue timeout count per second.
Executions Per Sec	The total executions by all the sessions in database per second.
Hard Parse Count Per Sec	The total hard parses done per second.
Host CPU Usage Per Sec	The percentage of CPU being used across hosts
Host CPU Utilization (%)	The percentage of CPU being used across hosts.
I/O Megabytes per Second	The total I/O throughput of the database for both reads and writes in megabytes per second.
I/O Requests per Second	The total rate of I/O read and write requests for the database.
Library Cache Hit Ratio	The library cache efficiency, as measured by the percentage of times the fully parsed or compiled representation of PL/SQL blocks and SQL statements are already in memory.
Logical Reads Per Sec	The number of logical reads (consistent gets, from the data buffer) per second during the sample period.
Logons Per Sec	The number of log in per second during the sample period.
Open Cursors Per Sec	The total number of cursors opened per second. Metric Summary.

Performance Metrics	Description
PGA Cache Hit %	The total number of bytes processed in the PGA versus the total number of bytes processed plus extra bytes read/written in extra passes.
Physical Read Total Bytes Per Sec	The number of data blocks read from disk per second during this sample period.
Physical Read Total IO Requests Per Sec	The number of read requests which read one or more database blocks for all instance activity.
Physical Reads Per Sec	The number of data blocks read from disk per second during this sample period.
Physical Write Total Bytes Per Sec	The total bytes written on disks per second during this sample period.
Physical Write Total IO Requests Per Sec	The number of write requests which writes one or more database blocks for all instance activity.
Physical Writes Per Sec	The number of disk writes per second during the sample period.
Redo Generated Per Sec	The amount of redo, in bytes, generated per second during this sample period.
Session Count	The number of session in database during this sample period.
SQL Service Response Time	The average elapsed time per execution of a representative set of SQL statements, relative to a baseline. It is expressed as a percentage.
User Commits Per Sec	The number of user commits performed per second during the sample period.
User Rollbacks Per Sec	The number of times per second during the sample period .

### PostgreSQL Server Metrics

**blks\_hit:** Number of times disk blocks were found already in the buffer cache, so that a physical disk read was not necessary. This only includes hits in the PostgreSQL buffer cache, does not include the operating system's file system (.cache).

**blks\_read:** Number of disk blocks read from the database.

**confl\_bufferpin:** Number of queries in the database that were canceled because of pinned buffers.

**confl\_deadlock:** Number of queries in the database that were canceled because of deadlocks

**confl\_lock:** Number of queries in the database that were canceled due because of timeouts.

**confl\_snapshot:** Number of queries in the database that were canceled because of old snapshots.

**confl\_tablespace:** Number of queries in the database that were canceled because of dropped tablespaces.

**numbackends:** Number of backends currently connected to the database.

**size\_mb:**

**tup\_deleted:** Number of rows deleted by queries in the database.

**tup\_fetched:** Number of rows fetched by queries in the database.

**tup\_inserted:** Number of rows inserted by queries in the database.

**tup\_returned:** Number of rows returned by queries in the database.

**tup\_updated:** Number of rows updated by queries in the database.

**xact\_commit:** Number of transactions in the database that have been committed.

**xact\_rollback:** Number of transactions in the database that have been rolled back.

## Sybase ASE and IQ Server Metrics

### Sybase ASE

Metrics	Description
BytesReceived	The number of bytes received during client/server communications. This value is updated for HTTP and HTTPS connections.
BytesSent	The number of bytes sent during client/server communications. This value is updated for HTTP and HTTPS connections.
Connections	The number of connections to the database.
Deletes	The number of deferred and direct row deletes from the allpages-locked tables.
DiskIOChecks	The number of times the engine checked for asynchronous disk I/O.  Modify the frequency of these checks with the i/o polling process count.

Metrics	Description
DiskIOCompleted	The number of asynchronous disk I/Os completed when the engine polled for outstanding asynchronous disk I/O.
DiskIOPolled	The number of times the engine polled for completion of outstanding asynchronous disk I/O. The polling occurs whenever disk I/O checks indicate that asynchronous I/O is posted but still not complete.
IndexAccesses	The number of pages read that Adaptive Server retrieves using an index.
Inserts	The total number of insert operations executed.
LogicalReads	The number of buffers read from the cache.
MaxOutstandingIOs	The current number of I/O requests initiated by the engine that are not completed.
Merges	The total number of merge operations executed.
PacketsReceived	The number of packets received.
PacketsSent	The number of packets sent.
PhysicalReads	The number of buffers read from disk.
PhysicalWrites	The numbers of buffers written to disk from the cache.
Rollbacks	The number of transactions rolled back by the process.
Selects	The total number of select operations executed.
TableAccesses	The number of pages read that Adaptive Server retrieves without using an index.
TempDbObjects	The total number of temporary tables created using the process.
Total Lock Time	The number of times a task waits for a lock and the transaction is rolled back during a session-level or server-level lock timeout.
Transactions	The currently running transaction.

Metrics	Description
ULCFlushes	The total number of times the user log cache is flushed.
ULCFlushFull	The number of times the user log cache is flushed because it was full.
Updates	The total number of <code>Update</code> operations executed.
WorkTables	The number of <code>Worktables</code> that are automatically created in <code>tempdb</code> by Adaptive Server.
Yields	The number of times a task is completed or yielded after running for the configured amount of time.

### Sybase IQ

Metrics	Description
ActiveReq	Returns the number of server threads that are currently handling a request.
ActiveVersionsCount	Count of Active Transaction Versions.
ActiveVersionsCreateMB	Size in Mb of versions for the active transaction.
ActiveVersionsDeleteMB	Size in Mb of versions for active transactions.
BytesReceived	Returns the number of bytes received during client/server communications. This value is updated for HTTP and HTTPS connections.
BytesReceivedUncomp	Returns the number of bytes that would have been received during client/server communications if compression was disabled. (This value is the same as the value for BytesReceived if compression is disabled.)
BytesSent	Returns the number of bytes sent during client/server communications. This value is updated for HTTP and HTTPS connections.

Metrics	Description
BytesSentUncomp	Returns the number of bytes that would have been sent during client/server communications if compression was disabled. (This value is the same as the value for BytesSent if compression is disabled.)
CacheFileDirty	Returns the number of cache pages that are dirty (needing a write).
CacheFree	Returns the number of cache pages not being used.
CacheHits	Returns the number of database page lookups.
CachePanics	Returns the number of times the cache manager has failed to find a page to allocate.
CachePinned	Returns the number of pinned cache pages.
CacheRead	Returns the number of cache reads.
CacheReplacements	Returns the number of pages in the cache that have been replaced.
CacheScavenges	Returns the number of times the cache manager has scavenged for a page to allocate.
Connections	The number of connections to the database.
DiskRead	Returns the number of disk reads.
OtherVersionsCount	Shows count of other db versions. These versions will eventually be dropped when they are no longer referenced or referencable by active transactions.
OtherVersionsMB	Shows space usage in MB of other db versions. These versions will eventually be dropped when they are no longer referenced or referencable by active transactions.
ProcessCPU	Returns CPU usage for the database server process. Values are in seconds. This property is supported on Windows and Unix. This property is not supported on Windows Mobile.

Metrics	Description
ProcessCPUSystem	Returns system CPU usage for the database server process CPU. This is the amount of CPU time that the database server spent inside the operating system kernel. Values are in seconds. This property is supported on Windows and Unix. This property is not supported on Windows Mobile.
ProcessCPUUser	Returns user CPU usage for the database server process. Values are in seconds. This excludes the amount of CPU time that the database server spent inside the operating system kernel. This property is supported on Windows and Unix. This property is not supported on Windows Mobile.
RequestsReceived	Requests received by the server.
TempBufferCapacityCount	Capacity count of Temporary Buffers.
TempBufferCapacityMB	Capacity in Mb of Temporary Buffers.
TempBufferLockedCount	The number of Temporary Buffers that are locked.
TempBufferUsedCount	The number of Temporary Buffers in use.
Total Lock Time	The total time for which database is in locked state.
Transactions	The number of transactions.

## Database Agent Events Reference

You can view Database Agent events on the **Database Monitoring > Events** window and in the `<agent_home>/logs/db-agent#.log` files. Database Agent events are of type Agent Diagnostic Event, with case-specific messages attached. See [Monitor Events](#).

### Agent Diagnostic Events

#### Initialize/re-initialize the DB Collector

**Summary:** Initialize/re-initialize the DB collector

**Description:** Sent when database collector has successfully started. This happens when you configure a new collector, start/restart the agent process (in which case you'll see this event once for each collector), or when the collector recovers from a failure to communicate with the monitored database (for example, when the database goes down for a while, then comes back).

**Severity:** Info

---

## Initialize/re-initialize the Hardware Metric Collector

**Summary:** Initialize/re-initialize the hardware metric collector

**Description:** Same as the above, but refers to a hardware collector, not a database collector.

This is sent when hardware collector has successfully started. This happens when you configure a new collector, start/restart the agent process (in which case you'll see this event once for each collector), or when the collector recovers from a failure to communicate with the monitored hardware (for example, when the system goes down for a while, then comes back).

**Severity:** Info

## Server Parameter [?] has been Changed from [?] to [?]

**Summary:** Server parameter [?] has been changed from [?] to [?]

**Description:** The Database Agent constantly monitors database configuration parameters. When a parameter changes, which generally means a database administrator made a deliberate change, the agent sends this event. AppDynamics Database Visibility users can use these events to track configuration changes in their databases.

**Severity:** Info

## JDBC Driver-related Agent Diagnostic Events

**Summary:** The text of the message is the error from the vendor's JDBC driver.

**Description:** When the agent fails to collect data from a monitored database, it sends this event, and goes into sleep mode for one minute. It will then retry contacting the database every minute until it succeeds. Once it succeeds, it will send an Agent Event "initialize/re-initialize" message, as described above. This happens when the database goes down, or when you add a collector with a wrong password, or wrong hostname, etc.

When the Collector is in sleep mode because of an error, you'll see an indicator next to the database on the **Infrastructure** and **Infrastructure > Databases**, on **Configure > Collectors** panel. You will also see the full text of the error in the **Infrastructure > Events** panel.

**Severity:** Error

## Database Events Reference

The Database Agent sends the database events to the Controller when the agent detects issues with database connection, failover, or database replication. You can view the details of the events on the **Databases > Events** page. This page displays the event summary, triggered time, and database type.

You can view the following information in the detailed view:

- **Summary:** Displays the details of the event
- **Details:** Displays the properties of the event.
- **Actions Executed:** Displays the executed actions if you have created a policy.

**i** If you do not want the Database Agent to send database events to the Controller, then set the `dbagent.event.trigger.enabled` property to `false` at the agent level. This property is enabled by default.

The following table lists the custom database events with the supported database:

Event	Database
FAILOVER	<ul style="list-style-type: none"> <li>• SQL Server</li> <li>• PostgreSQL</li> <li>• Oracle</li> <li>• MySQL</li> </ul>
DB_CONNECTION_DOWN	All database types supported by Database Agent. See <a href="#">Database Visibility Supported Environments</a> .
DB_CONNECTION_UP	All database types supported by Database Agent. See <a href="#">Database Visibility Supported Environments</a> .
REPLICATION_FAILURE	PostgreSQL
BLOCKING_SESSION	SQL Server

You can configure alert policies with the custom database events. See [Configure Policies](#).

### Failover

**Description:** This event is sent to the Controller when the primary node fails.

Database Type	Summary
Oracle	Failover occurred in <code>&lt;database-type&gt;</code> , <code>&lt;collector-name&gt;</code> - <code>&lt;database-collector-name&gt;</code> RAC cluster
<ul style="list-style-type: none"> <li>• PostgreSQL</li> <li>• SQL Server</li> <li>• MySQL</li> </ul>	Failover occurred for <code>&lt;database-type&gt;</code> , database instance <code>&lt;database-instance-name&gt;</code>

**Severity:** Error

**Custom Event Type:** FAILOVER

While [configuring alert policies](#), you can use the **Custom Events** panel to add a custom event filter.

1. Click + and specify the custom event type.
2. Filter the events by using a combination of the following properties:

Property	Description
availabilityGroupName	Availability group name of the cluster
<div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;">  This applies only to SQL server database.         </div>	
failedNode	Name of the failed node
port	Port of the node or failed node
dbCollectorName	Name of the database collector
databaseType	Database type
primaryNodesAfterFailover	Current primary nodes after failover
timeStamp	Time at which the event is triggered

### Database Connection Down

**Description:** This event is sent to the Controller when the collector cannot establish a connection with the database or if an existing connection fails. For a cluster, each node failure is sent as a separate event. This event is reported at an exponential time gap: 2, 4, 8, 16, 32 minutes, and so on for 24 hours. Then, the event is reported every 24 hours.

Node	Summary
Single	Connection failure in <database-type>, <database-collector-name, collector-name>
Cluster	Connection failure in <database-instance-name: node-name>

**Severity:** Error

**Custom Event Type:** DB\_CONNECTION\_DOWN

While [configuring alert policies](#), you can use the **Custom Events** panel to add a custom event filter.

1. Click + and specify the custom event type.
2. Filter the events by using a combination of the following properties:

Property	Description
dbCollectorName	Name of the database collector

Property	Description
nodeName	Name of the node
databaseType	Database type
timeStamp	Time at which the event is triggered
port	Port of the node

### Database Connection Up

**Description:** This event is sent to the Controller when databases get connected after the `DB_CONNECTION_DOWN` event is triggered.

**Severity:** Info

**Custom Event Type:** DB\_CONNECTION\_UP

While [configuring alert policies](#), you can use the **Custom Events** panel to add a custom event filter.

1. Click + and specify the custom event type.
2. Filter the events by using a combination of the following properties:

Property	Description
dbCollectorName	Name of the database collector
nodeName	Name of the node
databaseType	Database type
timeStamp	Time at which the event is triggered
port	Port of the node

### Replication Failure

**Description:** This event is sent to the Controller when the status property in the `pg_stat_replication` table changes to `stopping` or `failed`.

**Summary:** Replication failure occurred for database instance - `<database-instance-name>` , `<database-type>`

**Severity:** Error

**Custom Event Type:** REPLICATION\_FAILURE

While [configuring alert policies](#), you can use the **Custom Events** panel to add a custom event filter.

1. Click + and specify the custom event type.
2. Filter the events by using a combination of the following properties:

Property	Description
<code>confl_bufferpin</code>	Represents the number of times there was a conflict related to buffer pinning. Buffer pin conflicts occur when multiple transactions attempt to access the same buffer (cache page) concurrently.
<code>confl_deadlock</code>	Represents the number of times a deadlock situation was detected in the database. A deadlock occurs when two or more transactions are waiting for each other to release locks, resulting in a circular dependency.
<code>confl_lock</code>	Represents the number of times there was a conflict related to locking. Lock conflicts occur when one transaction attempts to acquire a lock that is already held by another transaction.
<code>confl_snapshot</code>	Represents the number of times there was a conflict related to concurrent snapshots. A snapshot conflict occurs when a transaction tries to access a row while another transaction is updating or deleting the same row.
<code>confl_tablespace</code>	Represents the number of times there was a conflict related to tablespace allocation. A tablespace conflict occurs when multiple transactions try to allocate space in the same tablespace concurrently.
<code>conninfo</code>	The connection string used by the WAL receiver process to connect to the primary server.
<code>databaseType</code>	Database type
<code>dbCollectorName</code>	Name of the database collector
<code>failedApplicationNode</code>	Represents the replication slot name used by the WAL receiver process, if applicable. Replication slots are used to track the progress of replication.
<code>failedNode</code>	Name of the node
<code>last_msg_receipt_time</code>	Indicates the timestamp of the last message received by the standby server from the master server

Property	Description
<code>last_msg_send_time</code>	Indicates the timestamp of the last message sent from the master server to the standby server
<code>latest_end_lsn</code>	Indicates the LSN of the most recent completed WAL record on the standby server. It represents the end of the last applied transaction.
<code>latest_end_time</code>	Indicates the timestamp of the most recent completed transaction on the standby server.
<code>port</code>	Port of the node
<code>reason</code>	Reason for the failure
<code>status</code>	Indicates the current status of the WAL receiver process. The possible values include: <ul style="list-style-type: none"> <li>◦ <code>stopped</code> : The WAL receiver is stopped</li> <li>◦ <code>streaming</code> : The WAL receiver is actively streaming WAL data from the master server</li> </ul>
<code>timeStamp</code>	Time at which the event is triggered

### Blocking Session

**Description:** This event is sent to the Controller when there is a session that is blocked by another session.

**Severity:** Error

**Custom Event Type:** BLOCKING\_SESSION

While [configuring alert policies](#), you can use the **Custom Events** panel to add a custom event filter.

1. Click + and specify the custom event type.
2. Filter the events by using a combination of the following properties:

Property	Description
<code>blockedObject</code>	The object that is blocked
<code>blockedSessionId</code>	ID of the session that is blocked
<code>blockedSqlStatement</code>	Blocked query text
<code>blockedSqlStatementHash</code>	Hash of the blocked query text

Property	Description
<code>blockingSessionId</code>	ID of the session that is blocking the session
<code>blockingSqlStatementHash</code>	Hash of the blocking query text
<code>databaseType</code>	Database type
<code>dbCollectorName</code>	Name of the database collector
<code>dbInstanceName</code>	Name of the database instance
<code>duration (hh:mm:ss)</code>	Duration for which the session is blocked
<code>eventRuleName</code>	Name of the event rule
<code>eventType</code>	Name of the reported event
<code>timeStamp</code>	Time at which the event is triggered
<code>violationID</code>	Unique ID of the violation

## Microsoft SQL Server Database Events Reference

The Database Agent sends the database events to the Controller when the agent detects that the listener IP is offline and the availability group replica is disconnected or does not synchronize.

You can view the details of the events on the **Databases > Events** page. This page displays the event summary, triggered time, and database type.

You can view the following information in the details view:

- **Summary:** Brief information about the event
- **Details:** Properties of the event.
- **Actions Executed:** Executed actions if you have created a policy.

**i** If you do not want the Database Agent to send database events to the Controller, then set the `dbagent.event.trigger.enabled` property to `false` at the agent level. This property is enabled by default.

The following database events are applicable for Microsoft SQL Server Cluster and Azure SQL Managed Instance Cluster:

- `AG_LISTENER_IP_NOT_ONLINE`
- `AG_REPLICA_DISCONNECTED`
- `AG_REPLICA_NOT_SYNCHRONIZING`

## Configure Event Rules

Configure an event rule before you create an alert policy.

1. Navigate to **Databases > Configuration** and click **Event Rules**.
2. Click **Add (+)** and specify an event rule name, select the database type and database, and the event type.

 You can specify the severity (Warning or Critical) for the Microsoft SQL Server availability group events.

3. Click **OK**.

### Availability Group Listener IP is Not Online

**Description:** This event is sent to the Controller when the Availability Group Listener IP is offline.

**Severity:** You can set the severity to the following severity types:

Type	Description
Warning	Set the warning threshold in minutes.
Critical	Set the critical threshold in minutes.

### Custom Event Type: AG\_LISTENER\_IP\_NOT\_ONLINE

While [configuring alert policies](#), you can use the **Custom Events** panel to add a custom event filter.

1. Click **+** and specify the custom event type.
2. Filter the events by using a combination of the following properties:

Property	Description
dbCollectorName	Name of the database collector
eventRuleName	Name of the event rule
eventType	Name of the reported event
ipAddress	Virtual IP address of the availability group listener
ipSubnetMask	IP subnet mask for the IPv4 address, if any, that is configured for the availability group listener.
is_dhcp	The listener uses a dynamic IP address that is assigned by a server running the Dynamic Host Configuration Protocol (DHCP). DHCP is limited to a single subnet.

Property	Description
listenerId	Resource GUID from Windows Server Failover Clustering (WSFC) cluster
stateDesc	One of the following states: <ul style="list-style-type: none"> <li>◦ ONLINE</li> <li>◦ OFFLINE</li> <li>◦ ONLINE_PENDING</li> <li>◦ FAILED</li> </ul>
timeStamp	Time at which the event is triggered
violationID	Unique ID of the violation

### Availability Group Replica Disconnected

**Description:** This event is sent to the Controller when the Availability Group replica is disconnected.

**Severity:** You can set the severity to the following severity types:

Type	Description
Warning	Set the warning threshold in minutes.
Critical	Set the critical threshold in minutes.

### Custom Event Type: AG\_REPLICA\_DISCONNECTED

While [configuring alert policies](#), you can use the **Custom Events** panel to add a custom event filter.

1. Click + and specify the custom event type.
2. Filter the events by using a combination of the following properties:

Property	Description
availabilityGroupName	Name of the availability group
connectedStateDesc	Status of the availability group connection
dbCollectorName	Name of the database collector
disconnectedReplicaHostName	Host name of the disconnected replica
eventRuleName	Name of the event rule
eventType	Name of the reported event

Property	Description
operationalStateDesc	Operational state of the replica
recoveryHealthDesc	Description of recovery health of the databases
replicaId	ID of the availability group replica
roleDesc	Primary or secondary node
synchronizationHealthDesc	Description of the replicas: not healthy, partially healthy, or healthy
timeStamp	Time at which the event is triggered
violationID	Unique ID of the violation

### Availability Group Replica Not Synchronizing

**Description:** This event is sent to the Controller when the Availability Group replica is not synchronizing.

**Severity:** You can set the severity to the following severity types:

Type	Description
Warning	Set the warning threshold in minutes.
Critical	Set the critical threshold in minutes.

**Custom Event Type:** AG\_REPLICA\_NOT\_SYNCHRONIZING

While [configuring alert policies](#), you can use the **Custom Events** panel to add a custom event filter.

1. Click + and specify the custom event type.
2. Filter the events by using a combination of the following properties:

Property	Description
availabilityGroupName	Name of the availability group
connectedStateDesc	Status of the availability group connection
dbCollectorName	Name of the database collector
disconnectedReplicaHostName	Host name of the disconnected replica

Property	Description
eventRuleName	Name of the event rule
eventType	Name of the reported event
operationalStateDesc	Operational state of the replica
recoveryHealthDesc	Description of recovery health of the databases
replicaId	ID of the availability group replica
roleDesc	Primary or secondary node
synchronizationHealthDesc	Description of the replicas: not healthy, partially healthy, or healthy
timeStamp	Time at which the event is triggered
violationID	Unique ID of the violation

## Wait State Filtering

Database wait states are pauses or delays in database activity. While Database Visibility collects data on all wait states, you may be more interested in some wait states than others. You can specify which wait states that you want to exclude from being reported by the agent so that you can focus on the critical wait states.

To specify wait states to exclude, navigate to **Configuration > Wait State Filtering**. Check the boxes of the wait states that you want to exclude. The wait states you exclude are no longer displayed in the Top 10 Query Wait States metric. In addition, any future queries that experience the wait states you exclude are not reported by the agent.

## Configure Custom Metrics

Database Visibility extends monitoring by specifying SQL queries to run on the monitored database and the queries run during normal database activity. You can schedule these custom queries to run on regular intervals and collect the results in a custom metric. See [Database Custom Metrics Window](#).

To specify custom queries to run:

1. Navigate to **Configuration > Custom Metrics > New**.
2. Complete the following fields:
  - a. **Name:** The name you want to name your custom metric. Once you create a custom metric/event, you cannot change its name.
  - b. **Custom Query Metric Type:** The type of result that you want from the query.

- i. Select the **Metric** type to generate metrics for which health rules can be defined. Metrics of this type are displayed in the **Metric Browser** or in the Custom Metrics tab of each collector.
- ii. Select the **Event Data** type to generate custom events whenever the custom query output is non-empty. If you want to be notified when a custom event occurs, you can create a policy that is triggered by that custom event. Custom events are displayed in the Events tab. If the custom query outputs multiple rows, the first 40 rows will be included in the event details. Each row displays a maximum of 5000 characters, including the column separators (|).
- c. **Database Type:** The database platform that you want to run the metric on.
- d. **Databases:** The database instances that you want to run the metric on. You can run the metric on all database instances of the specified database type, or on specific database instances that you specify.
- e. **Schedule:** The time interval at which you want to run the query. For metric type custom queries, the metric value reported in between the specified intervals is the value observed in the previous query execution.

The timeout for configured custom metric depends on the frequency of running the query. This table provides the timeout details based on the time interval:

Interval (minutes)	Timeout (seconds)
1	10
5	15
10	30
30	60
60	120
360	180
720	300
1440	300

- f. **Query Text:** The query that you want to execute. If you are creating a custom metric of Metric type, its query must have one of the following return types:
  - i. Positive integer. For example, the query below returns a positive integer.

```
SELECT COUNT(*) FROM employees
```

- ii. String and positive integer. For example, the query below returns a string and a positive integer.

```
SELECT name, salary FROM employees
```

Custom queries appear for all collectors, but the data only reflects the collector that you created it for. You can test the semantics of the query and also validate the results by clicking the **Test Query** button.

**i** Custom query results are validated if the Database Agent  $\geq 4.5.5$ .

The following points provide information about using limits when configuring custom metrics:

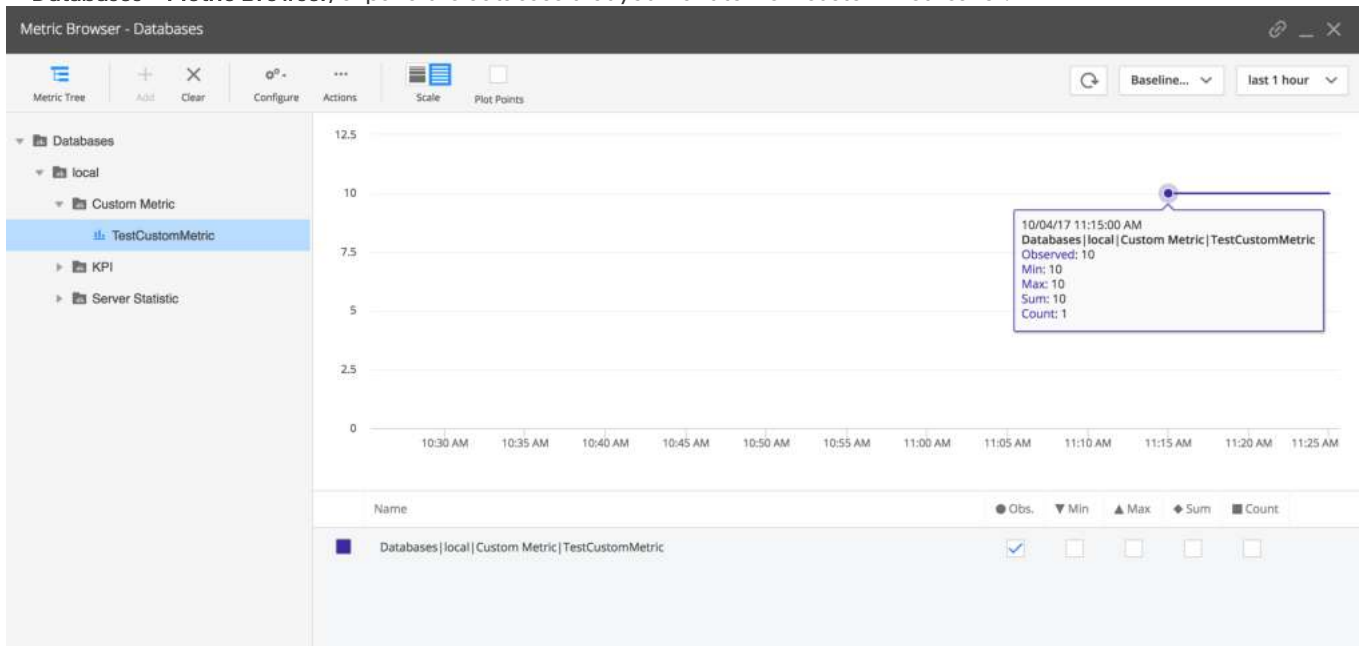

- Up to 150 custom metrics can be reported per collector per minute.
- You can increase the custom metrics limit from the agent configuration properties by using the key, `dbagent.custom.metric.reportable.per.server` and the `Max` value 150. See [Database Agent Configuration Properties](#) for information about the key value.
- The maximum limit configured in the agent takes precedence and overrides the maximum limit configured at the account level and Controller level. Therefore, the priority order is as following:
  - Agent-level configuration
  - Account-level configuration
  - Controller-level configuration

Custom metrics are supported for all relational databases: MySQL, Microsoft SQL Server, Oracle, PostgreSQL, DB2, and Sybase.

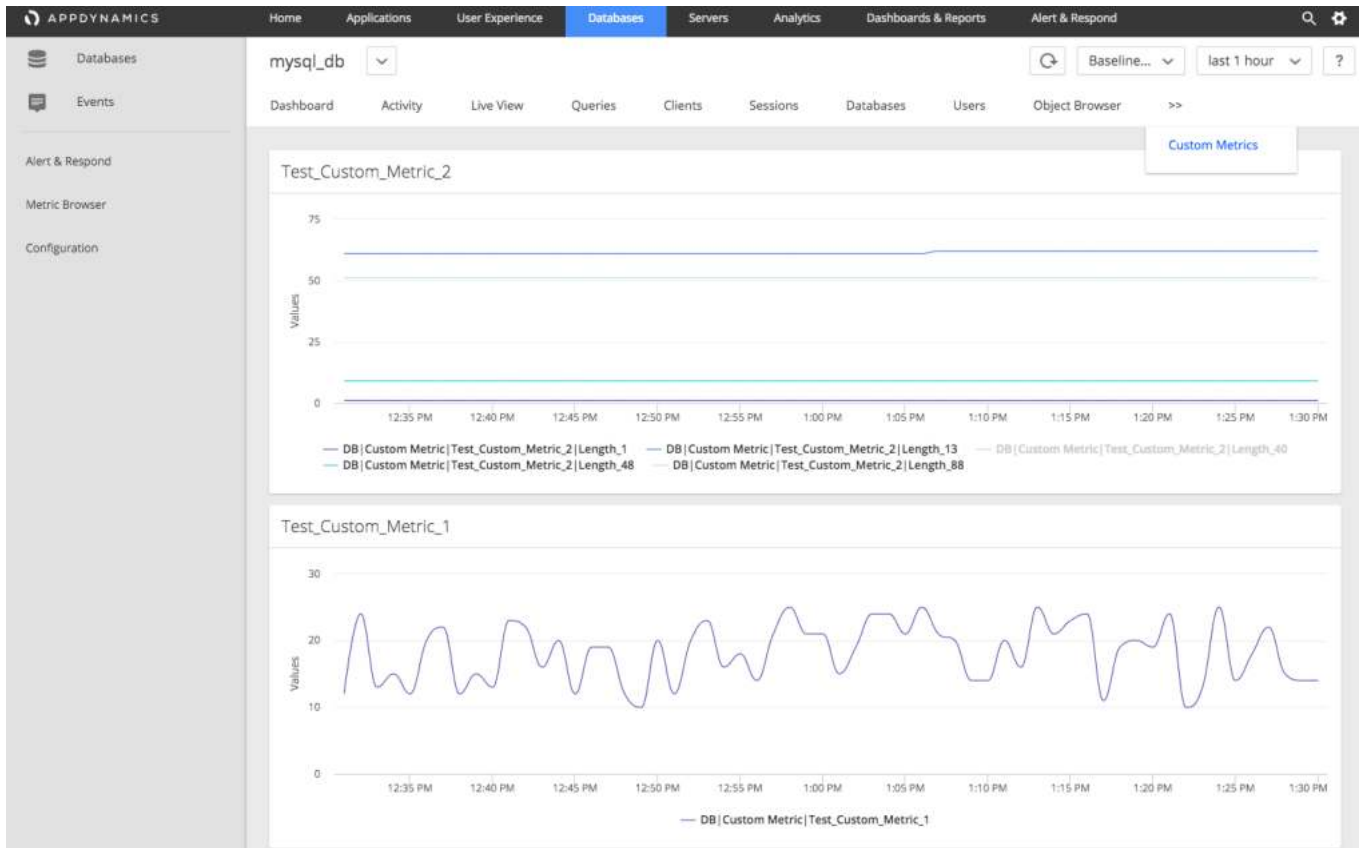

## View Custom Metrics

You can view your custom metrics in the following locations:

- In **Databases > Metric Browser**, expand the database that you want to view custom metrics for.

- In **Databases**, open a database instance and click the Custom Metrics tab.

## Configure Query Literals Security

In SQL, literals are the string or integer values representing data retrieved from the database. By default, literals are removed from SQL queries, as they can contain sensitive user data such as social security numbers, CC numbers, and so on.

To show literals in the queries, you can disable the **Remove literals from the queries** option.

1. Click **Databases**.
2. Click **Configuration**.
3. In the Security section, uncheck **Remove literals from the queries**.

Once you uncheck the option, literals will always be displayed in the queries. You can revert to hiding the literals by checking the option.

The Database Agent does not mask the literals that occur after an inline or single line comment. This limitation applies only to Oracle database. However, you can mask literals if you use block comments.

**i** To record the audit logs when this option is enabled or disabled, ensure to configure the Controller audit report with the object name as **Remove Literals** and object type as **DBMON\_ACCOUNT\_CONFIGURATION**. See [Controller Audit Log](#).

## Integrate Database Visibility with Server Visibility

You can integrate Database Visibility with Server Visibility to capture accurate hardware metric details from the Machine Agent (with Server Visibility) to the Database Visibility dashboard. These metrics display without the need for an SSH connection to the host machine. Additionally, this integration helps the Server Visibility machine to automatically connect to the Database Visibility server when both the Database Agent and the Server Visibility Agent capture the same IP address.

When you integrate Server Visibility with Database Visibility, you can view these metrics on the Database Dashboard:

- **CPU Busy%** instead of CPU System% and CPU User%
- **Memory Used%**
- **Disk IO** (in Ops/sec for Reads and Writes) instead of Disk IO in KB/sec
- **Network IO** (in KB/sec for Outgoing and Incoming)

### Requirements

To view the hardware metrics from Server Visibility to the Database Visibility dashboard, you must ensure to meet the following requirements:

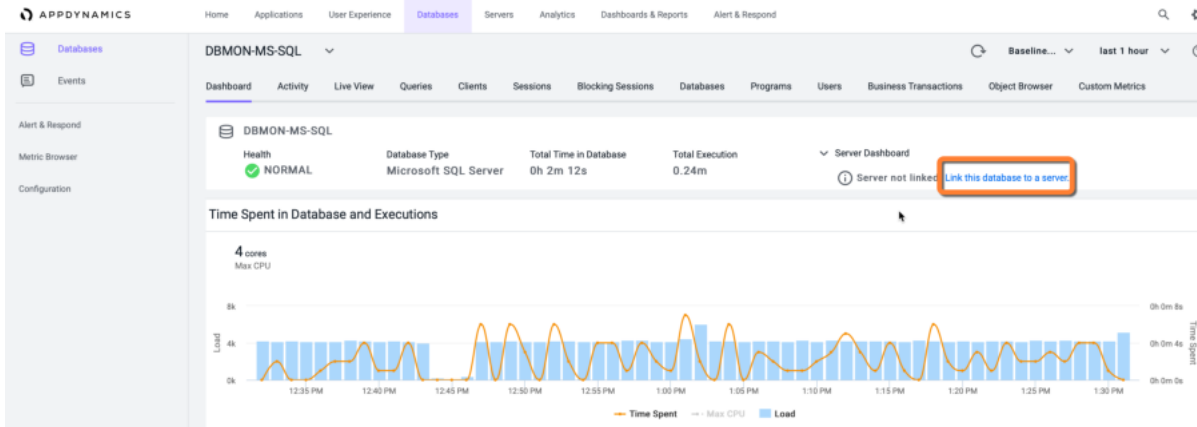

- Install and register Machine Agent.
- Enable Server Visibility on the Machine Agent. See [Server Visibility](#).
- Disable the Hardware Monitoring section for the database collector. If you [Configure the Database Agent to Monitor Server Hardware](#), then the Database Agent displays the hardware metrics based on the collector configuration using the SSH connection.

### View Hardware Metrics

You can view the Server Dashboard section on the Databases dashboard when the Machine Agent and the Database Agents are registered and connected.

You can manually connect or disconnect the Database Visibility Server with the Server Visibility Server by using the URL, **Link this database to a server**, described in the Server Dashboard section. You may require to manually connect the database node to the Server Visibility server in these scenarios:

- The IP addresses do not match and the servers are not connected automatically.
- You want to connect the database server to another Server Visibility machine.
- You do not require connecting a particular database server to a Server Visibility machine.

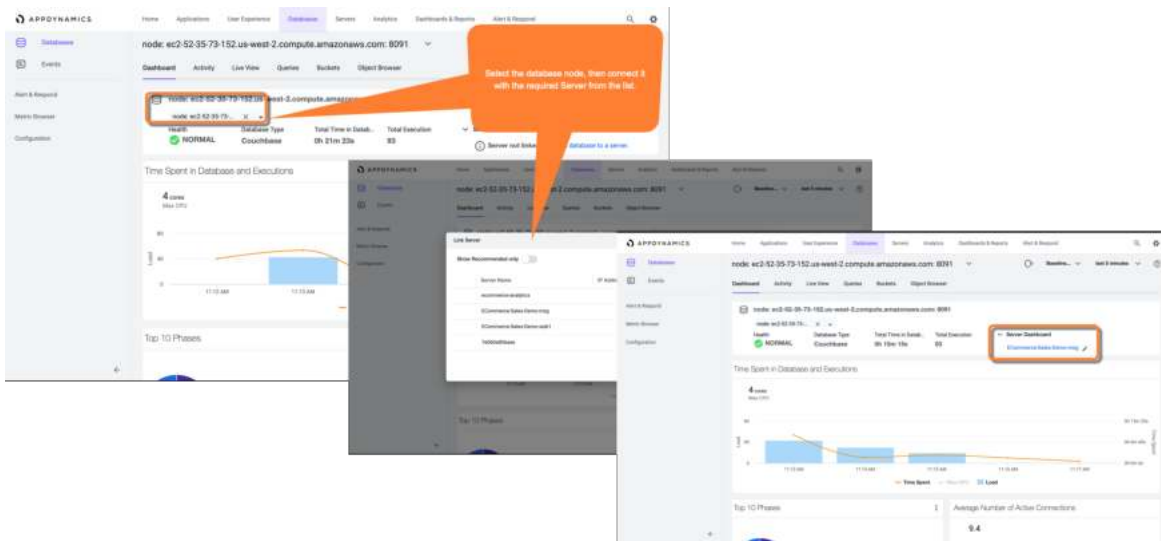

**i** You can map multiple database nodes to a single Server Visibility machine.

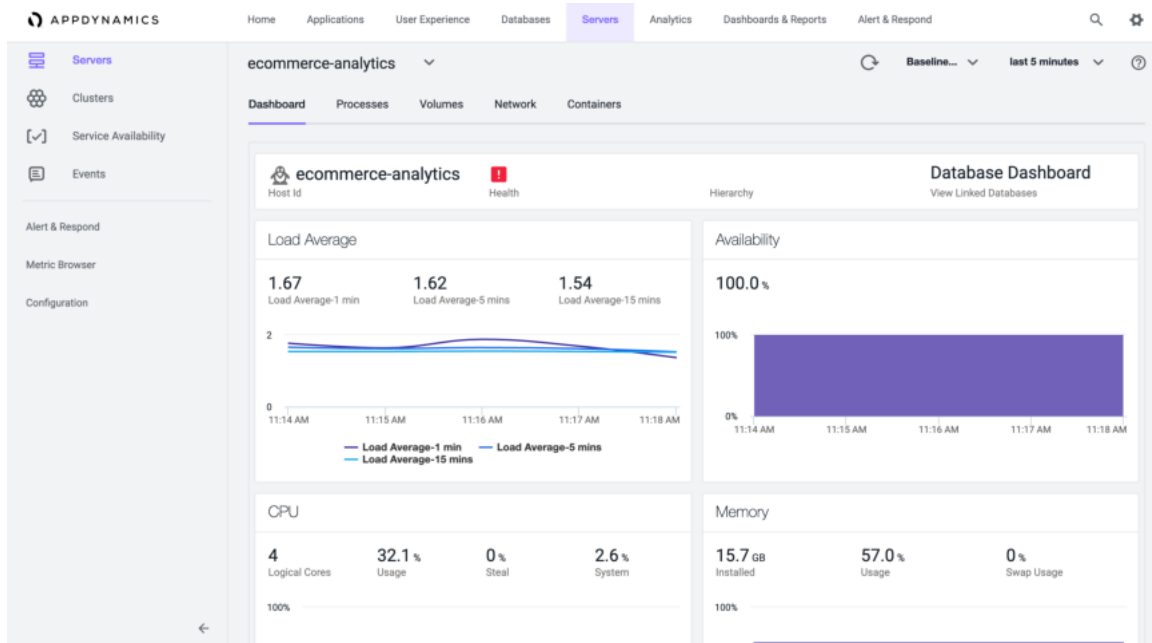

If the servers are connected, then you can find the link to the connected Server Dashboard under the **Server Dashboard** section.

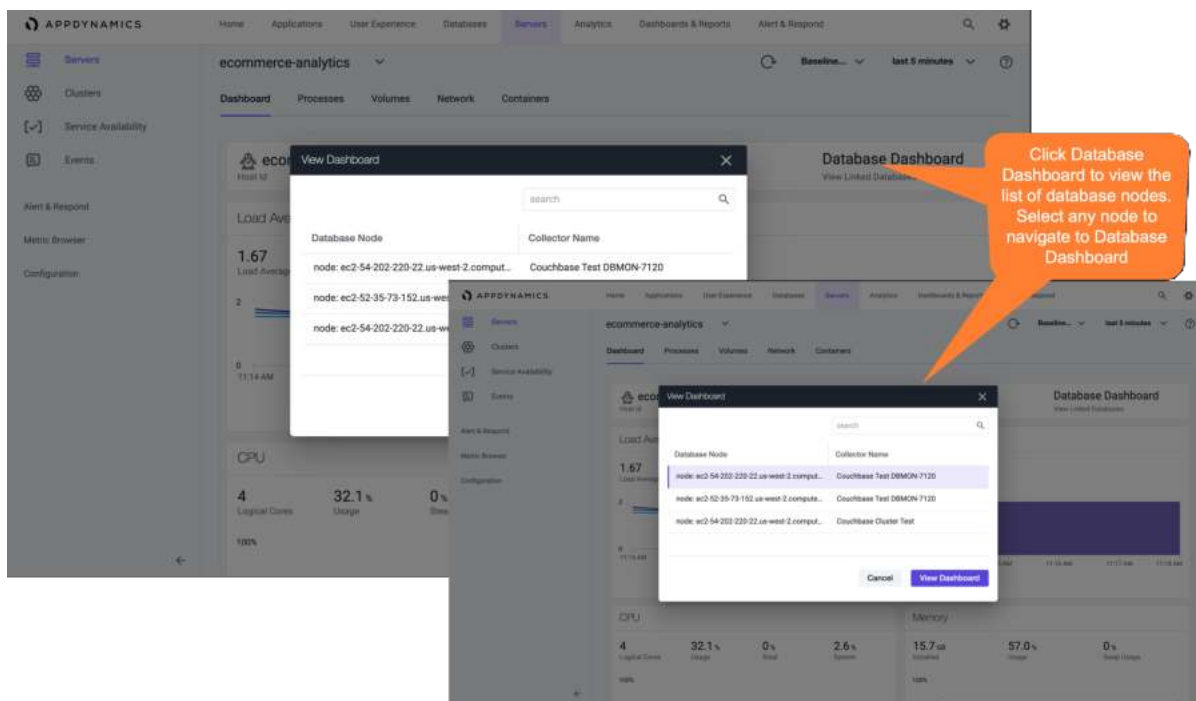

For a database cluster, you can find the link to each Server Dashboard corresponding to each database node.

When you click the connected server under the **Server Dashboard** section, the page redirects to the Server Visibility dashboard with all the hardware metrics.

On the Server Dashboard, you can click the **Database Dashboard**, which displays a dialog that includes the list of database nodes that are connected to the Server Visibility machine. You can select any database node to navigate to the Database Dashboard.

## Database Agent Telemetry

You can monitor the Database Agent metrics and configure health rules for the agent. To add a health rule or view the metrics along with the status of the agent, you must enable the agent telemetry property.

## Enable Database Agent Telemetry

You can enable the agent telemetry property at the account level on the Controller or at the agent level. If you configure the property on the Controller, all metrics display for each Database Agent. Whereas, if you configure the property in the agent configuration, the metrics display only for the configured agent.

For account level on Controller, use the Administration Console to add the `dbagent.telemetry.enabled` feature flag and set the value to `true`.

The screenshot shows the configuration page for 'customer1'. It includes various provisioning options for different languages and frameworks, all set to 10000 units. The license expiration date is set to 'On Date' with a date of 01/01/21. Under 'Additional Properties', there is a table with one entry:

Property Name	Value
dbagent.telemetry.enabled	true

Similarly, for only specific Database Agents, start the Database Agent with the `-Ddbagent.telemetry.enabled=true` system properties.

Each agent is associated with a unique host identifier and name. If two or more agents have the same name and unique identifier, the agents report metrics in the same node. Therefore, start a Database Agent with a different name and unique host identifier.

The unique host identifier is by default the host-name of the Database Agent host machine. You can override the unique host identifier by using the system property

`-Dappdynamics.agent.uniqueHostId=<Some_unique_identifier_name>`. See Unique Host ID at [Database Agent Configuration Properties](#).

To configure a health rule for Database Agent, see [Database Health Rules and Alerts](#).

## Monitor Database Agent Metrics

You can view the Database Agent metrics in the **Metric Browser**. After enabling the Database Agent telemetry, the metric tree displays the list of Database Agent names along with its status under **DB Agents**. Each Database Agent name includes the list of Database Agent metrics.

### JVM and Memory Metrics

This table lists the JVM and Memory metrics of Database Agent:

Metric Name	Description
DB AGENT Memory Heap Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the heap
DB AGENT Memory Heap Current Usage (MB)	Returns the amount of used memory in MB
DB AGENT Memory Heap Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management
DB AGENT Memory Heap Used %	$(\text{Current Usage} / \text{Max Available}) * 100$
DB AGENT Memory Non-Heap Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the non-heap
DB AGENT Memory Non-Heap Current Usage (MB)	Returns the amount of used memory in MB (for non-heap)
DB AGENT JVM Process CPU Burnt (ms/min)	CPU Time in milliseconds (ms) by this process
DB AGENT JVM Process CPU Usage %	$\text{CPU Used \% in that minute. } (\text{CPU Time in that min} / (\text{Up Time in that min} * \text{number of processors})) * 100$ This metric is cumulative
DB AGENT JVM Threads Current No. of Threads	Number of current live threads (including daemon and non-daemon)

### Garbage Collections and Memory Pool Metrics

This table lists the Garbage Collections (GC) and the memory pool metrics:

Metric Name	Description
DB AGENT Garbage Collection Major Collection Time Spent Per Min (ms)	Time taken by Major GC at time of the metric collection
DB AGENT Garbage Collection Number of Major Collections Per Min	Major GC Count at time of the metric collection
DB AGENT Garbage Collection Minor Collection Time Spent Per Min (ms)	Time taken by minor GC at time of the metric collection

Metric Name	Description
DB AGENT Garbage Collection Number of Minor Collections Per Min	Minor GC Count at time of the metric collection
DB AGENT Garbage Collection GC Time Spent Per Min (ms)	Major GC Time(if present) + Minor GC Time(if present)
DB AGENT Garbage Collection Memory Pools Code Cache Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the non-heap memory pools
DB AGENT Garbage Collection Memory Pools Code Cache Current Usage (MB)	Returns the amount of used memory in MB for non-heap memory pools
DB AGENT Garbage Collection Memory Pools Code Cache Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for non-heap memory pools
DB AGENT Garbage Collection Memory Pools Compressed Class Space Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the non-heap memory pools
DB AGENT Garbage Collection Memory Pools Compressed Class Space Current Usage (MB)	Returns the amount of used memory in MB for non-heap memory pools
DB AGENT Garbage Collection Memory Pools Compressed Class Space Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for non-heap memory pools
DB AGENT Garbage Collection Memory Pools Metaspace Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the non-heap memory pools
DB AGENT Garbage Collection Memory Pools Metaspace Current Usage (MB)	Returns the amount of used memory in MB for non-heap memory pools
DB AGENT Garbage Collection Memory Pools PS Eden Space Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the heap memory pools
DB AGENT Garbage Collection Memory Pools PS Eden Space Current Usage (MB)	Returns the amount of used memory in MB for heap memory pools

Metric Name	Description
DB AGENT Garbage Collection Memory Pools PS Eden Space Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for heap memory pools
DB AGENT Garbage Collection Memory Pools PS Old Gen Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the heap memory pools
DB AGENT Garbage Collection Memory Pools PS Old Gen Current Usage (MB)	Returns the amount of used memory in MB for heap memory pools
DB AGENT Garbage Collection Memory Pools PS Old Gen Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for heap memory pools
DB AGENT Garbage Collection Memory Pools PS Survivor Space Committed (MB)	Returns the memory in MB that is committed for the Java virtual machine (Database Agent) to be used for the heap memory pools
DB AGENT Garbage Collection Memory Pools PS Survivor Space Current Usage (MB)	Returns the amount of used memory in MB for heap memory pools
DB AGENT Garbage Collection Memory Pools PS Survivor Space Max Available (MB)	Returns the maximum amount of memory in MB that can be used for memory management for heap memory pools

**i** The listed metrics are for Java HotSpot(TM) 64-Bit Server JVM and 1.8.0\_212 Java version. These metrics might change depending on the JVM.

### Cache Usage Metrics

The following table lists the cache usage metrics that are accumulated metrics for all collectors that are monitored by the Database Agent.

The following details help in understanding the metrics mentioned in the table:

- `entities` stores all the entities with its hash and id
- `unregQueryCache` stores all unregistered query entities till its registration
- `unregCaches` stores all unregistered entities (except Server, Query, Query Plan) till its registration
- `unregQueryPlanCache` stores all unregistered query plan entities till its registration
- `counters` store all the unregistered wait states till they get converted to DTO's and get Uploaded to Controller/ES
- `catalog` stores all the unregistered query statistics till they get converted to DTO's and get Uploaded to Controller/ES

MetricName	Description
DB AGENT Entity Cache Total Entities	The total number of all types of entities stored in EntityCache All entity types are taken into account except Server
DB AGENT Entity Cache Registered Entities	Number of entities registered in that minute All entity types are taken into account except Server
DB AGENT Entity Cache Pending Entities	Number of pending entities waiting in unRegCache , unRegQueryCache , or unRegQueryPlanCache to get registered All entity types are taken into account except Server
DB AGENT Entity Cache Duplicate Entities	Number of entities that are for re-registration All entity types are taken into account except Server
DB AGENT Entity Cache Unregistered Query Cache Size (KB)	Total query size in KB of queries that are present in the cache( unregQueryCache ), waiting for registration Only the Query entity type is taken into account.
DB AGENT ES Data Cache Usage Number Of Wait Counters	Number of Wait Counters present in the cache, waiting to get uploaded
DB AGENT ES Data Cache Usage Number of Query Stats	Number of Query Stats present in the cache, waiting to get uploaded
DB AGENT ES Data Successful ES Uploads  Number of Wait Counters	Number of Wait Counters uploaded to ES in that min
DB AGENT ES Data Successful ES Uploads  Number of Query Stats	Number of Query Stats uploaded to ES in that min

## Monitor Database Agent Metrics on Database Custom Dashboard

You can monitor the Database Agent metrics on **Custom Dashboard**.

To create a custom dashboard:

1. Click **Dashboards & Reports > Create Dashboard**.

2. Add a widget.
3. Add the data by selecting the data source as **Database Agents**. See [Custom Dashboards](#).

## Infrastructure Visibility

AppDynamics Infrastructure Visibility provides end-to-end visibility on the performance of the hardware running your applications. You can use Infrastructure Visibility to identify and troubleshoot problems that can affect application performance such as server failures, JVM crashes, and network packet loss.

Infrastructure Visibility provides these metrics:

- CPU busy/idle times, disk and partition reads/writes, and network interface utilization (Machine Agents)
- Packet loss, round trip times, connection setup/tear down errors, TCP window size issues, and re-transmission timeouts (Network Visibility, additional license required)
- Disk/CPU/memory utilization, process, and machine availability (Server Visibility, additional license required)

## Overview of Infrastructure Visibility

You can determine the root cause of application issues by looking at application, network, server, and machine metrics that measure infrastructure utilization.

For example, the following infrastructure issues may slow down your application:

- Too much time spent in garbage collection of temporary objects (application metric)

- Packet loss between two nodes that results in re-transmissions and slow calls (network metric)
- Inefficient processes that result in high CPU utilization (server metric)
- Excessively high rates of reads/writes on a specific disk or partition (hardware metric)

Infrastructure Visibility enables you to isolate, identify, and troubleshoot these types of issues. Infrastructure Visibility is based on a Machine Agent that runs with an App Server Agent on the same machine. These two agents provide multi-layer monitoring:

1. The App Server Agent collects metrics about applications and identifies applications, tiers, and nodes with slow transactions, stalled transactions, and other application-performance issues.
2. The Network Agent monitors the network packets sent and received on each node and identifies lost/re-transmitted packets, TCP bottlenecks, high round trip times, and other network issues.
3. The Machine Agent collects metrics at two levels:
  - Server Visibility metrics for local processes, services, and resource utilization.
  - Basic machine metrics for disks, memory, CPU, and network interfaces.

This multi-layer monitoring enables you to determine possible correlations between application issues and service, process, hardware, network, or other issues on the machine.

This Agent Monitors...		Example Metrics
<b>1</b> App Agent 	apps app servers JVMs CLR's	Slow Transactions Stalled Transactions Response Times Wait Times Block Times Error %
<b>2</b> Network Agent 	network packets TCP connections TCP sockets	Performance Impacting Events Packet loss and retransmissions Round Trip Times for data transfers TCP Window Size (Limited or Zero) Connection setup/teardown errors
<b>3</b> Machine Agent 	<i>Server Visibility</i> processes services caching swapping paging queueing	Hardware/Software Interrupts Virtual memory/swapping Process faults CPU/disk/memory utilization by process
	<i>Hardware/OS</i> disks volumes partitions memory CPU network interfaces	CPU busy times Memory utilization Disk reads/writes JVM crashes

## Network Visibility

**Network Visibility** monitors traffic flows, network packets, TCP connections, and TCP ports. Network Agents leverage the APM intelligence of App Server Agents to identify the TCP connections used by each application. Network Visibility includes:

- Detailed metrics about dropped/re-transmitted packets, TCP window sizes (Limited/Zero), connection setup/tear down issues, high round trip times, and other performance-impacting issues

- 
- Network Dashboard that highlights network KPIs (Key Performance Indicators) for tiers, nodes, and network links
  - Right-click dashboards for tiers, nodes, and network links that enable quick drill-downs from transaction outliers to network root causes
  - Automatic mapping of TCP connections with application flows
  - Automatic detection of intermediate load balancers that split TCP connections
  - Diagnostic mode for collecting advanced diagnostic information for individual connections

## Server Visibility

[Server Visibility](#) monitors local processes, services, and resource utilization. You can use these metrics to identify time windows when problematic application performance correlates with problematic server performance on one or more nodes.

Server Visibility is an add-on module to the [Machine Agent](#). With Server Visibility enabled, the Machine Agent provides the following functionality:

- Extended hardware metrics such as machine availability, disk/CPU/virtual-memory utilization, and process page faults
- Monitor application nodes that run inside Docker containers and identify container issues that impact application performance
- The Tier Metric Correlator which enables you to identify load and performance anomalies across all nodes in a tier
- Import and define server tags used to query, filter, and compare related servers using custom metadata
- Monitor internal or external HTTP and HTTPS services
- Support for grouping servers so you can apply health rules to specific server groups
- Support for defining alerts that trigger when certain conditions are met or exceeded based on monitored server hardware metrics

## Basic Machine Metrics

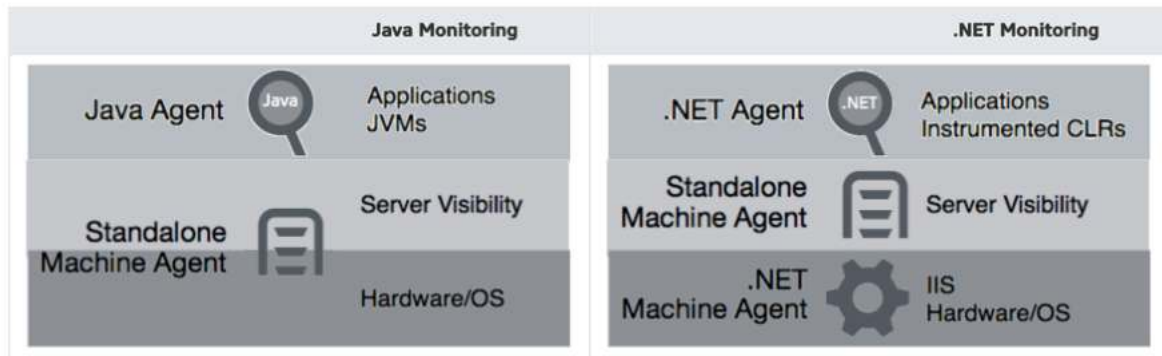

The Machine Agent collects basic hardware metrics from the server's OS and provides the following functionality:

- Basic hardware metrics from the server's OS such as CPU and memory utilization, throughput on network interfaces, and disk and network I/O
- Support for creating extensions to generate custom metrics
- Support for running remediation scripts to automate your runbook procedures. You can optionally configure the remediation action to require human approval before starting the script.
- JVM Crash Guard for monitoring JVM crashes and optionally running remediation scripts

## Java and .NET Infrastructure Monitoring

Infrastructure Visibility uses different agents to monitor Java and .NET environments:

- The Java Agent collects metrics for business applications and JVMs. The Machine Agent collects Server Visibility and hardware/OS metrics.
- The [.NET Agent](#) collects metrics for business applications and instrumented CLR. The .NET Agent includes a .NET Machine Agent that collects IIS and hardware/OS metrics (see [Monitor Windows Hardware Resources](#)). The Machine Agent collects Server Visibility metrics.

## Infrastructure Visibility Strategies

You can use these strategies to locate infrastructure issues that affect application performance:

- Transaction snapshots for slow or stalled transactions – Use snapshots to correlate infrastructure metrics for the specific node so that you can identify the root cause of slow or stalled transactions.
- Metric correlation –
  - One example workflow is to open the Node Dashboard for a mission-critical server with a machine agent installed and then cross-compare data in the following tabs:
    - JVM (application performance)
    - JMX (server performance)
    - Server (hardware resource consumption)
  - The [Network Dashboard](#) includes right-click dashboards for tiers, nodes, and network links. Use these dashboards to find correlations between application issues and network root causes.
  - The [Tier Metric Correlator](#) enables you to identify load and performance anomalies in a tier composed of a cluster of nodes running on containers or servers.
- Health rules – Configure health rules on metrics such as garbage collection time, connection pool contention, or CPU usage to catch issues early in the cycle before any impact on your business transactions.
- Infrastructure rules, policies, and alerts –
  - Create health rules on metrics such as garbage collection time, connection pool contention, or CPU usage to catch issues early in the cycle before any impact on your business transactions.
  - Define [policies](#) that trigger [actions](#) (such send an email, start diagnostics, or perform a thread dump) when Infrastructure metrics report a critical level.
  - You can configure alerts for JVM and CLR crashes respectively using [JVM Crash Guard](#) and the [.NET Machine Agent](#).
  - Configure the agent to [run scripts](#) in response to critical events (for example, restart an application or JVM in response to a crash).

With the right monitoring strategy in place, you can be alerted to problems and fix them before user transactions are affected.

## Hardware Resources Metrics

This page describes the basic hardware metrics collected by the Machine Agent and the additional metrics collected by the Machine Agent for Server Visibility. Not all of the metrics that appear in the Hardware Resources branch of the Metric Browser tree are provided by the Machine Agent; some are collected by the Database Agent and are used in the Database Monitoring UI, while others might be custom metrics added by another extension run by your Machine Agent.

For most metrics in the Metric Browser, you can select any point in the graph to view more information about the metric observed at that point in time. The information includes the metric identifier, date and time of the observation, along with any of the following values relevant to the metric:

- **Obs** (observed value): Average of all data points seen for that interval. For a cluster or a time rollup, this represents the weighted average across nodes or over time.
- **Min**: Minimum data point value seen for that interval.
- **Max**: Maximum data point value seen for that interval.
- **Sum**: Sum of all data point values seen for that interval. For the Percentile Metric for the App Agent for Java, this is the result of the percentile value multiplied by the Count.
- **Count**: Number of data points generated for the metric in that interval. The collection interval for infrastructure metrics varies by environment.

## CPU Metrics

Metric Name	Description	Basic or Server Visibility	Windows	Linux <sup>1</sup>	Solaris	AI X	Default Monitoring Mode <sup>3</sup>
%Idle	Percentage of time the CPU was idle; the CPU had completed its tasks and has nothing to do.	Basic	✓	✓	✓	✓	KPI
%Busy	Percentage of time the CPU was busy processing system or user requests; this metric includes CPU Stolen time.	Basic	✓	✓	✓	✓	KPI
%Stolen <sup>4</sup>	Usually, stolen time is the percentage of time a virtual CPU waits for a real CPU while the hypervisor is servicing another virtual processor.	Basic	✓	✓	✓	✓	KPI
%Nice	Percentage of CPU time spent on low priority processes.	Server Visibility	✗	✓	✗	✗	Advanced
System	Percentage of time the CPU was busy processing kernel code.	Server Visibility	✓	✓	✓	✓	KPI

Metric Name	Description	Basic or Server Visibility	Windows	Linux <sup>1</sup>	Solaris	AIX	Default Monitoring Mode <sup>3</sup>
User	Percentage of time the CPU was busy processing non-kernel code.	Server Visibility	✓	✓	✓	✓	KPI
IOWait	Percentage of CPU time spent waiting for an I/O request.	Server Visibility	✗	✓	✓	✗	KPI
%Irq	Percentage of CPU time spent servicing hardware interrupts.	Server Visibility	✗	✓	✗	✗	Diagnostic
%SoftIrq	Percentage of CPU time spent servicing software interrupts.	Server Visibility	✗	✓	✗	✗	Advanced
%Busy 95th Percentile <sup>2</sup>	The CPU %Busy percentage was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI
IOWait 95th Percentile <sup>2</sup>	The CPU %Busy percentage was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI

<sup>1</sup> See [Linux Kernel Processes](#).

<sup>2</sup> See [Percentile Metric Reporting must be Enabled](#).

<sup>3</sup> See [Default Monitoring Mode](#).

<sup>4</sup> See [Stolen Times are Reported Differently](#).

## Memory Metrics

Metric Name	Description	Basic or Server Visibility	Windows	Linux <sup>1</sup>	Solaris	AI X	Default Monitoring Mode <sup>3</sup>
Total (MB)	The total amount of memory.	Basic	✓	✓	✓	✓	KPI
Used %	The percentage of memory used.	Basic	✓	✓ <sup>4</sup>	✓	✓	KPI
Used (MB)	The amount of memory used.	Basic	✓	✓ <sup>4</sup>	✓	✓	Advanced
Free %	Percentage of free or unused memory available for processes.	Basic	✓	✓ <sup>4</sup>	✓	✓	Advanced
Free (MB)	The total amount of free or unused memory available for processes.	Basic	✓	✓ <sup>4</sup>	✓	✓	Advanced
Swap Free (MB)	The total amount of free swap space. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	Advanced
Swap Total (MB)	The total amount of allocated swap space. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	KPI
Swap Used (MB)	The amount of swap space used. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	Advanced

Metric Name	Description	Basic or Server Visibility	Windows	Linux <sup>1</sup>	Solaris	AI X	Default Monitoring Mode <sup>3</sup>
Swap Used %	The percentage of available swap space used. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	KPI
Swap Free %	Percentage of free swap space. Reported for each hierarchical group.	Server Visibility	✓	✓	✓	✓	Advanced
Pages Paged In 95th Percentile <sup>2</sup>	The paging-in rate to memory was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI
Pages Paged Out 95th Percentile <sup>2</sup>	The paging-out rate from memory was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI
Pages Swapped In 95th Percentile <sup>2</sup>	The swapping rate of pages from disks was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI
Pages Swapped Out 95th Percentile <sup>2</sup>	The swapping rate of pages to disks was at this level or lower 95% of the time.	Server Visibility	✗	✓	✗	✓	KPI

<sup>1</sup> See [Linux Kernel Processes](#).

<sup>2</sup> See [Percentile Metric Reporting must be Enabled](#).

<sup>3</sup> See [Default Monitoring Mode](#).

<sup>4</sup> See [Configure Free/Used Memory Metric Calculation on Linux](#).

## Disk and Partition Metrics

The agent reports metrics for each disk partition and for disks in aggregate. Only mounted partitions and local partitions are reported.

 SIGAR is not supported on Machine Agent.

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AI X	Default Monitoring Mode <sup>1</sup>
KB read/sec	The number of KB per second read from all disks and partitions.	Basic	✓	✓	✓	✓	Advanced
KB written/sec	The average amount of data per second written to all disks and partitions.	Basic	✓	✓	✓	✓	Advanced
Reads/sec	Number of read operations per second performed on all disks and partitions.	Basic	✓	✓	✓	✓	KPI
Writes/sec	Number of write operations per second performed on all disk and partitions.	Basic	✓	✓	✓	✓ 5	KPI

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode <sup>1</sup>
Avg IO Utilization (%)	The average time spent processing read/write requests on all disks and partitions as a percentage of the total reported time window. Databases often report high disk I/O utilization due to frequent read/write requests. For example, if the agent detects read/write processing in 55 out of 60 seconds, the Avg IO Utilization for that minute is 92%. This metric does not measure the amount of available disk space or read/write request sizes.	Server Visibility	✓	✓	✓	✓	KPI
<partition> %CPU Time	The percentage of CPU processing consumed by a partition during read and write operations.	Basic (HardwareMonitor) <sup>6</sup>	✗	✓	✗	✓	Diagnostic
<partition> Avg Service Time (ms)	Time in milliseconds spent performing read and write operations across one partition.	Basic (HardwareMonitor) <sup>6</sup>	✗	✓	✓	✓	Diagnostic
<partition> Avg Queue Time (ms)	Time in milliseconds that a read or write request is in the queue before it gets processed across one partition.	Basic (HardwareMonitor) <sup>6</sup>	✗	✓	✗	✗	KPI
<partition> KB read/sec	The average amount of data per second read from one specific partition.	Basic (HardwareMonitor) <sup>6</sup>	✓	✓	✓	✓	Diagnostic

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode <sup>1</sup>
<partition> KB written/sec	The average amount of data per second written to one specific partition.	Basic (HardwareMonitor) <sup>6</sup>	✓	✓	✓	✓	Diagnostic
<partition> Reads/sec	Number of read operations per second performed on one specific partition.	Basic (HardwareMonitor) <sup>6</sup>	✓	✓	✓	✓	KPI
<partition> Writes/sec	Number of write operations per second performed on one specific partition.	Basic (HardwareMonitor) <sup>6</sup>	✓	✓	✓	✓ 5	KPI
<partition> Space Available	The amount of unused or free disk space on a specific partition in KB.	Basic (HardwareMonitor) <sup>6</sup>	✓	✓ <sup>4</sup>	✓	✓	KPI
<partition> Space Used	The amount of used or unavailable disk space on a specific partition in KB.	Basic (HardwareMonitor) <sup>6</sup>	✓	✓ <sup>4</sup>	✓	✓	Advanced
<partition> Avg IO Utilization (%)	The average time spent processing read/write requests as a percentage of the total reported time window. Databases often report high disk I/O utilization due to frequent read/write requests. For example, if the agent detects read/write processing in 55 out of 60 seconds, the Avg IO Utilization for that minute is 92%. This metric does not measure the amount of available disk space or read/write request sizes.	Server Visibility	✓	✓	✓	✓	KPI

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode <sup>1</sup>
<partition> Avg read time (ms)	The average time in milliseconds required to service a read request by all disks or by one specific disk or across one partition.	Server Visibility	✓ <sup>2</sup>	✓	✓	✗	KPI
<partition> Avg write time (ms)	The average time in milliseconds required to service a write request across one partition.	Server Visibility	✓ <sup>2</sup>	✓	✓	✗	KPI
<partition> Queue Time 95th Percentile <sup>3</sup>	The queue time for read/write requests was this long or shorter 95% of the time for the reported time window.	Server Visibility	✗	✓	✗	✓	KPI

<sup>1</sup> See [Default Monitoring Mode](#).

<sup>2</sup> For some versions of Windows Server 2008 and Windows Vista, the Hardware Resources|Disks|<partition>|Avg Read Time (ms) and Hardware Resources|Disks|<partition>|Avg Write Time (ms) metrics will be reported as 0. This is due to a known bug with Windows. To resolve this issue, download the hotfix: <https://support.microsoft.com/en-us/kb/961435>.

<sup>3</sup> See [Percentile Metric Reporting must be Enabled](#).

<sup>4</sup> See [Configure Disk Usage Metric Collection on Linux](#).

<sup>5</sup> See [HardwareMonitor and JavaHardwareMonitor Calculate "Writes/Sec" Differently on AIX Machines](#)

<sup>6</sup>For Basic (HardwareMonitor) metrics, the following variables must be set as:

- <MA-Home>/monitors/JavaHardwareMonitor : false
- <MA-Home>/monitors/HardwareMonitor : true
- <MA-Home>/extensions/ServerMonitoring/conf/ServerMonitoring.yaml : Set basicEnabled to true

## Volume Metrics

AppDynamics Server Visibility retrieves the volume space metrics on POSIX systems using the `df` command. The volume metrics are reported across all listed volumes and for each volume at a specified mount point, such as `"/boot"`. Only local volumes are reported.

Metric Name	Description	Basic or Server Visibility	Windows	Linux <sup>1</sup>	Solaris <sup>2</sup>	AI X	Default Monitoring Mode <sup>3</sup>
Total (MB)	The amount of storage space available (used and free) across all listed volumes or at the specified mount point. On Linux, the space reserved for root is not counted in the available space.	Server Visibility	✓	✓	✓	✓	KPI
Free (MB)	The amount of unused or free space across all listed volumes or on the selected volume at the specified mount point. On Linux, the space reserved for root is not counted in the available space.	Server Visibility	✓	✓	✓	✓	Advanced ( <i>volume</i> )
Used (MB)	The amount of storage space in use across all listed volumes or on the selected volume at the specified mount point.	Server Visibility	✓	✓	✓	✓	Advanced ( <i>volume</i> )
Used (%)	The percentage of storage space in use across all listed volumes or on the selected volume at the specified mount point.	Server Visibility	✓	✓	✓	✓	KPI
Count	The number of partitions for which storage space metrics are collected.	Server Visibility				✓	KPI
<partition> Free (MB)	The amount of unused or free space for <partition>.	Server Visibility				✓	KPI

Metric Name	Description	Basic or Server Visibility	Windows	Linux <sup>1</sup>	Solaris <sup>2</sup>	AIX	Default Monitoring Mode <sup>3</sup>
<partition> Total (MB)	The amount of storage space available (used and free) for <partition>.	Server Visibility				✓	KPI
<partition> Used (%)	The percentage of storage space in use for <partition>.	Server Visibility				✓	KPI
<partition> Used (MB)	The amount of storage space in use for <partition>.	Server Visibility				✓	Advanced

<sup>1</sup> Only /dev volumes are monitored on Linux.

<sup>2</sup> Only /dev/dsk and /rpool volumes are monitored on Solaris.

<sup>3</sup> See [Default Monitoring Mode](#).

## Load Metrics

The load metrics are reported for each machine. The CPU % (reported as part of the basic Machine Agent metrics) is the percentage of the CPU consumed by processes that are currently running. Load takes into account processes that are waiting to run. These metrics are shown as percentages in the Server Dashboard and are [scaled by 100 in the Metric Browser](#).

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode <sup>1</sup>
Last 1 minute	CPU Load, presented as an average over the last 1 minute.	Server Visibility	✓	✓	✓	✓	KPI
Last 5 minutes	CPU Load, presented as an average over the last 5 minutes.	Server Visibility	✓	✓	✓	✓	KPI

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode <sup>1</sup>
Last 15 minutes	CPU Load, presented as an average over the last 15 minutes.	Server Visibility	✓	✓	✓	✓	KPI

<sup>1</sup> See [Default Monitoring Mode](#).

## Machine Metrics

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode <sup>1</sup>
Availability	The percentage of time the Machine Agent was reporting to the Controller. In the Server Visibility UI, this provides a percentage with 6 digits of precision (for example, 100.00000) to measure availability. The Machine Agent sends a heartbeat to the AppDynamics Controller once per minute to indicate the agent is reporting. Reported for each machine.	Server Visibility	✓	✓	✓	✓	KPI

<sup>1</sup> See [Default Monitoring Mode](#).

## Network Metrics

The Machine Agent is configured to ignore virtual networks by default. See [Machine Agent Settings for Server Visibility](#).

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode <sup>1</sup>
Incoming KB <sup>2</sup>	The volume of data received by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Incoming KB/sec	The amount of data per second received by all monitored network devices.	Basic	✓	✓	✓	✓	KPI
Incoming packets <sup>2</sup>	The number of packets received by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Incoming packets/sec	The number of data packets per second received by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Outgoing KB <sup>2</sup>	The volume of data sent by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Outgoing KB/sec	The volume of data sent per second by all monitored network devices.	Basic	✓	✓	✓	✓	KPI
Outgoing packets <sup>2</sup>	The number of packets sent by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced
Outgoing packets/sec	The number of data packets sent per second by all monitored network devices.	Basic	✓	✓	✓	✓	Advanced

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode <sup>1</sup>
Incoming Errors/min	The number of incoming packet errors the network incurs every minute.	Server Visibility	✓	✓	✓	✓	KPI
Outgoing Errors/min	The number of outgoing packet errors the network incurs every minute.	Server Visibility	✓	✓	✓	✓	KPI
Avg Utilization (%)	The average network utilization as a percentage of the maximum possible throughput. This metric is not reported if the agent cannot determine the throughput (not supported for some devices and Linux versions). The percentage is rounded to the nearest integer. Therefore, very low utilization may be reported as 0%. Reported for: <ul style="list-style-type: none"> <li>• Servers</li> <li>• &lt;group&gt;</li> <li>• &lt;network interface&gt;</li> </ul>	Server Visibility	✓	✓	✓	✓	KPI
<network interface> Incoming KB	The volume of data received by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Incoming KB/sec	The volume of data received per second by the selected network interface.	Basic	✓	✓	✓	✓	KPI

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AI X	Default Monitoring Mode <sup>1</sup>
<network interface> Incoming packets	The number of data packets received by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Incoming packets/sec	The number of data packets received per second by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Outgoing KB	The volume of data sent by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Outgoing KB/sec	The volume of data sent per second by all monitored network interface.	Basic	✓	✓	✓	✓	KPI
<network interface> Outgoing packets	The number of data packets sent per second by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Outgoing packets/sec	The number of data packets sent per second by the selected network interface.	Basic	✓	✓	✓	✓	Advanced
<network interface> Incoming Errors/min	The number of incoming packet errors the network incurs every minute.	Server Visibility	✓	✓	✓	✓	KPI
<network interface> Outgoing Errors/min	The number of outgoing packet errors the network incurs every minute.	Server Visibility	✓	✓	✓	✓	KPI

<sup>1</sup> See [Default Monitoring Mode](#).

<sup>2</sup> The ServerMonitoring and JavaHardwareMonitor extensions calculate unidirectional throughput (packet/KB) metrics differently. ServerMonitoring reports the total number of packets/bytes in the last minute. JavaHardwareMonitor reports the total number of packets/bytes from the time the Machine Agent started.

## Process Metrics

The following metrics are aggregated and reported for each process or process class (except Total Process Count, which measures all processes observed by the agent). See [Machine Agent Settings for Server Visibility](#) to modify the default process monitoring.

Metric Name	Description	Basic or Server Visibility	Windows	Linux <sup>1</sup>	Solaris <sup>2</sup>	AIX	Default Monitoring Mode <sup>3</sup>
Count	The number of processes in this class consuming CPU or memory resources or the total number of processes in this class.	Server Visibility	✓	✓	✓	✓	KPI
CPU Used (%)	Percentage of the CPU bandwidth used by all processes in a process class. A process using 100% CPU is executing on all processors on the system. If there are four cores on the machine and the process is executing four threads, each executing on one core, then the process can use up to 400% CPU. If there are four cores on the machine and the process is executing one thread on one core, then the process can use up to 25% CPU.	Server Visibility	✓	✓	✓	✓	KPI
Major Faults/sec	Number of major page faults caused by all processes in this class.	Server Visibility	✗	✓	✗	✓	Diagnostic
Minor Faults/sec	Number of minor page faults caused by all processes in this class.	Server Visibility	✗	✓	✗	✓	Diagnostic

Metric Name	Description	Basic or Server Visibility	Windows	Linux <sup>1</sup>	Solaris <sup>2</sup>	AI X	Default Monitoring Mode <sup>3</sup>
Memory Used (%)	Percentage of memory consumed by the top 10 consuming processes or the percentage of memory used by all processes in this class.	Server Visibility	✓	✓	✓	✓	KPI
Memory Used (KB)	Amount of memory used by all processes in this class.	Server Visibility	✓	✓	✓	✓	Advanced
Memory Virtual (KB)	Current size of the virtual address space that the process is using. Use of virtual address space does not necessarily imply a corresponding use of either disk or main memory pages. Virtual space is finite and, by using too much, the process can limit its ability to load libraries.	Server Visibility	✓	✓	✓	✓	Advanced
Thread Count	The number of kernel threads used by all processes in this class.	Server Visibility	✓	✓	✓	✓	Diagnostic

Metric Name	Description	Basic or Server Visibility	Windows	Linux <sup>1</sup>	Solaris <sup>2</sup>	AI X	Default Monitoring Mode <sup>3</sup>
Total Process Count	<p>All individual processes observed by the Machine Agent, <i>before</i> it filters out unreported processes and groups the remaining processes into classes. You can use this metric to identify anomalies in the number of processes running on a specific machine. For example, if the average Total Process Count on a machine is usually 200 to 300, and then suddenly rises to 2000 or more, this could indicate a problem on that machine.</p> <p>To collect this metric, the Machine Agent captures the number of processes every 30 seconds and calculates the average number of processes per minute.</p> <ul style="list-style-type: none"> <li>• Observed is the average number of processes per minute.</li> <li>• Min and Max are the 30-second buckets with the least and most processes.</li> <li>• Count and Sum are the number of process captures each minute and the sum of the processes in each capture for that minute (capture1 + capture2).</li> </ul>	Server Visibility	✓	✓	✓	✓	KPI

<sup>1</sup> See [Linux Kernel Processes](#).

<sup>2</sup> When collecting Process metrics on Solaris, the Machine Agent observes and captures only the first 80 characters of each process name and argument list. The agent considers only the first 80 characters of each process string when it applies allowlists ("always monitor this process") and blocklists ("never monitor this process") defined in [ServerMonitoring.yml](#).

<sup>3</sup> See [Default Monitoring Mode](#).

## Service Availability Metrics

Reported for each service that is configured.

Metric Name	Description	Basic or Server Visibility	Windows	Linux	Solaris	AIX	Default Monitoring Mode <sup>1</sup>
Response Time (ms)	The elapsed time between sending a request and receiving a response from the monitored service.	Server Visibility	✓	✓	✓	✓	KPI
Response Size (bytes)	The size of the response received from the monitored service.	Server Visibility	✓	✓	✓	✓	KPI
Success Rate (%)	The percentage of successful requests over all requests made to the service.	Server Visibility	✓	✓	✓	✓	KPI

<sup>1</sup> See [Default Monitoring Mode](#).

## Enable Percentile Metric Reporting

You must enable percentile metric reporting on both the Controller and the Machine Agent. By default, reporting is *disabled* on the Controller and *enabled* on the Machine Agent.

- To enable/disable reporting on the Controller, log in to the Controller Administration Console and set the `sim.machines.percentile.percentileMonitoringAllowed` property. See [Controller Settings for Machine Agents](#).
- To enable/disable reporting on the agent, open the `<machine_agent_home>/extensions/ServerMonitoring/conf/ServerMonitoring.yml` file and set the `percentileEnabled` property. See [Machine Agent Settings for Server Visibility](#).

## Configure Disk Usage Metric Collection on Linux

You can configure the Linux Machine Agent to calculate the following metrics similar to using the Linux `df` command:

- Servers > Volumes > /opt > Disk Usage
- Metric Browser > Disks and Partitions > <partition> > Space Available
- Metric Browser > Disks and Partitions > <partition> > Space Used

Linux includes a mechanism for reserving some disk space to ensure that the system remains functioning even if non-privileged users consume all other disk space. By default, these metrics include 5% of reserved space.

By default, the flag

`-Dappdynamics.machine.agent.extensions.calcVolumeFreeAndUsedWithDfCommand` is set to `true` to reserve 5% of disk space.

To override this default, set

`-Dappdynamics.machine.agent.extensions.calcVolumeFreeAndUsedWithDfCommand` to `false`.

This feature is supported for Linux versions of the Machine Agent only.

## Configure Free/Used Memory Metric Collection on Linux

You can configure how the Machine Agent calculates the amount of free and used memory on Linux machines. By default, the agent calculates any slab-reclaimable memory as used (not free) memory. To configure the agent to calculate slab-reclaimable memory as free (not used) memory, run Machine Agent with the following command-line argument:

`-Dappdynamics.machine.agent.extensions.countSlabReclaimableAsFreeMem=true`

This setting affects the following metrics:

- Memory Usage (in Server Dashboard)
- Memory Used %, Memory Used MB, Memory Free %, and Memory Free MB (in Metric Browser)

## Configure File Cache Memory Exclusion from Memory Usage

You can use the following system property to exclude the file cache memory while calculating memory usage on AIX with server visibility enabled.

System Property	Default	Possible Values
<code>-Dappdynamics.machine.agent.collect.memoryMetrics.using.vmstat.command</code>	<code>false</code>	<code>true/false</code>

If you set `<-Dappdynamics.machine.agent.collect.memoryMetrics.using.vmstat.command = true>` and `<sim_enabled = true>` for AIX, you get memory usage metrics on the Controller UI after excluding the file cache memory.

## Configure OSHI Data Collection on Windows

You can use the following two system properties to configure how the operating system and hardware information (OSHI) data is collected and sent to Controller.

System Property	Default	Possible Values
<code>-Dappdynamics.machine.agent.oshiCollectionTimeout.in.ms</code>	<code>10000</code>	Integer value
<code>-Dappdynamics.machine.agent.should.drop.complete.process.data.when.timeout</code>	<code>false</code>	<code>true/false</code>

### Example 1:

```
-Dappdynamics.machine.agent.oshiCollectionTimeout.in.ms=1000
-Dappdynamics.machine.agent.should.drop.complete.process.data.when.timeout=false
```

In this case, if the OSHI data collection process takes more than 10000 milliseconds, then the agent sends the OSHI data collected within 10000 milliseconds.

### Example 2:

```
-Dappdynamics.machine.agent.oshiCollectionTimeout.in.ms=1000
-Dappdynamics.machine.agent.should.drop.complete.process.data.when.timeout=true
```

In this case, if the OSHI data collection process takes more than 10000 milliseconds, then the agent does not send any data to Collector.

**i** If the OSHI data collection process completes within 10000 milliseconds, the data is sent to Controller and the `-Dappdynamics.machine.agent.should.drop.complete.process.data.when.timeout` system property is ignored.

## Viewing Server Visibility Metrics

You can only view Server Visibility metrics in the Server Visibility version of the Metric Browser. You see this when you access the Metric Browser from the Servers tab in the top navigation bar of the Controller UI.

### Machine Agent Versus .NET Machine Agent

If a server has both Machine and .NET Agents installed, there may be differences in metric values reported by the Machine Agent and the .NET Agent due to different averaging rates and measurement methods. See [.NET Compatibility Mode](#).

### Streamlined Browsing Mode

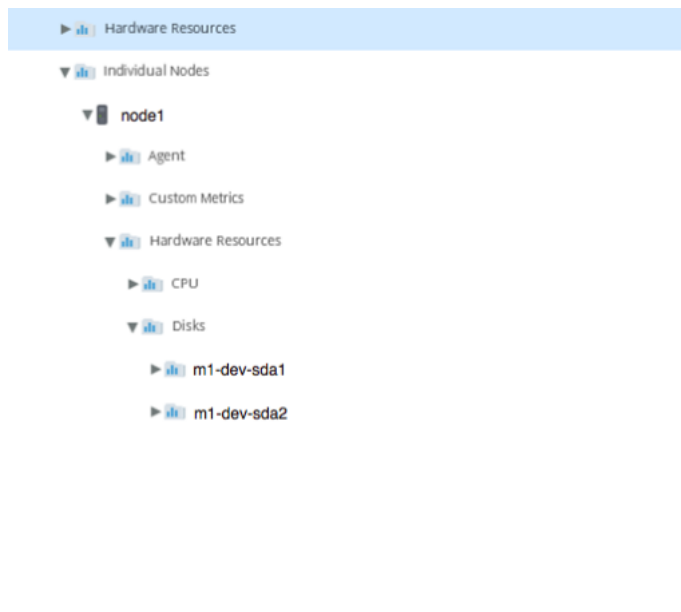

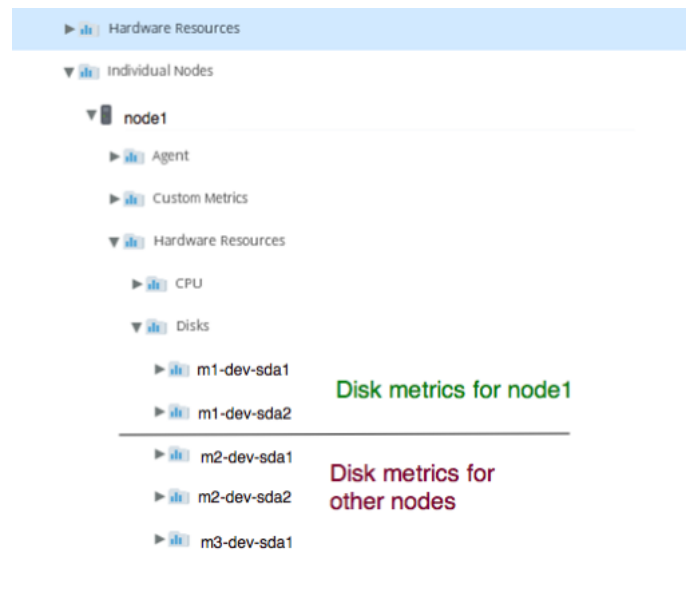

The Server Metric Browser includes a Streamlined Browsing option for node metrics. Use this option to browse metrics for tiers that contain multiple nodes.

- With Streamlined Browsing enabled, each node in the browser tree view shows only metrics reported by the Machine Agent on the corresponding node.
- With Streamlined Browsing enabled, the **Hardware Resources** and **Custom Metrics** folders do not display.
- With Streamlined Browsing disabled, each node in the browser tree view also shows metrics for other nodes in the same tier (with no indication of the node that corresponds to which tier group).

This streamlining option is not enabled by default. AppDynamics recommends that you enable this option. To enable this option, go to:

`http://<controller host>:<port>/controller/admin.jsp` and set `sim.metrics.metricBrowser.machineMetricMappings.enabled` to true.

Streamlined Browsing Enabled	Streamlined Browsing Disabled
	

## Linux Kernel Processes

The Machine Agent has a [processSelectorRegex](#) setting that specifies the set of processes monitored by the agent. The default `regex` filters out most kernel processes on Linux machines. The agent considers monitored processes only when it calculates CPU, Memory, and Process metrics. These metrics may differ from metrics reported by other sources such as Linux commands.

## Default Monitoring Mode

The **Default Monitoring Mode** column indicates the default category of each metric when [Dynamic Monitoring Mode](#) (DMM) is enabled. When this mode is enabled, a Machine Agent reports metrics based on the DMM setting on that server:

- KPI – Report Key Performance Indicator metrics only
- Diagnostic – Report KPI and Diagnostic metrics
- Advanced – Report all unfiltered metrics on the Machine Agent.

## Load Average Percentages are Scaled by 100 in the Metric Browser

Load Average metrics are shown as float values (such as `0.70` or `1.05`) in the [Server Dashboard](#). In the Metric Browser, these metrics are multiplied by `100` to provide two decimal points of precision. If a server has an average load of `7.67`, for example, the Server Dashboard shows the Load Average as `7.67` and the Metric Browser shows the Load as `767`. To use one of the metrics in a health rule or custom dashboard, divide the metric by `100`.

## Stolen Times are Reported Differently

On Windows Machine Agents, if CPU %Stolen is not matching values reported by AppDynamics, it may be because Windows Performance Monitor's (Perfmon) counters operate at a granularity of `100ns` for CPU

metrics. For CPU %Stolen, the counters are provided by the Hypervisor, which operates on a granularity of 1ms. Windows Perfmon divides the CPU %Stolen counter (operating on 1ms) directly by time (in units of 100ns), which results in the CPU %Stolen values being reported at a very low percentage (~0.01%).

AppDynamics makes the correction between different units of time, which is why values reported by AppDynamics are greater than Perfmon's values by a factor of 10,000 (time in 1ms \* 10,000 = time in 100ns). CPU %Stolen values reported by AppDynamics sometimes exceed 100% under high load. These CPU %Stolen values are a result of multiple cores being used by the guest machine, where %Stolen time is added across multiple cores.

To compute the %Stolen time:

1. On a PowerShell terminal in the monitored guest machine, run `Get-WmiObject Win32_PerfRawData_vmGuestLib_VCPU`.
2. Note the CpuStolenMs counter (in ms).
3. Note the Timestamp\_PerfTime counter (in ms, take a look at Frequency\_Perftime, this value should be 1000 (in hz)).
4. After a minute, run `Get-WmiObject Win32_PerfRawData_vmGuestLib_VCPU` again and take note of both the counters once more.
5.  $\text{CPU \%Stolen} = 100\% * (\text{CpuStolenMS (at T2)} - \text{CpuStolenMs (at T1)}) / (\text{Timestamp\_PerfTime (T2)} - \text{Timestamp\_PerfTime (T1)})$ .

### HardwareMonitor and JavaHardwareMonitor Calculate "Writes/Sec" Differently on AIX Machines

The Machine Agent calculates the Disk metric writes/sec on AIX machines differently, depending on whether the HardwareMonitor or the JavaHardwareMonitor extension is used. These extensions assume different block sizes when calculating these metrics. For HardwareMonitor, the block size is 4096 bytes. For JavaHardwareMonitor (based on SIGAR), the block size is 512 bytes. Because the number of writes/sec is calculated as  $\text{<kb\_written>/<block\_size>}$ , the HardwareMonitor results are lower than those calculated by JavaHardwareMonitor.

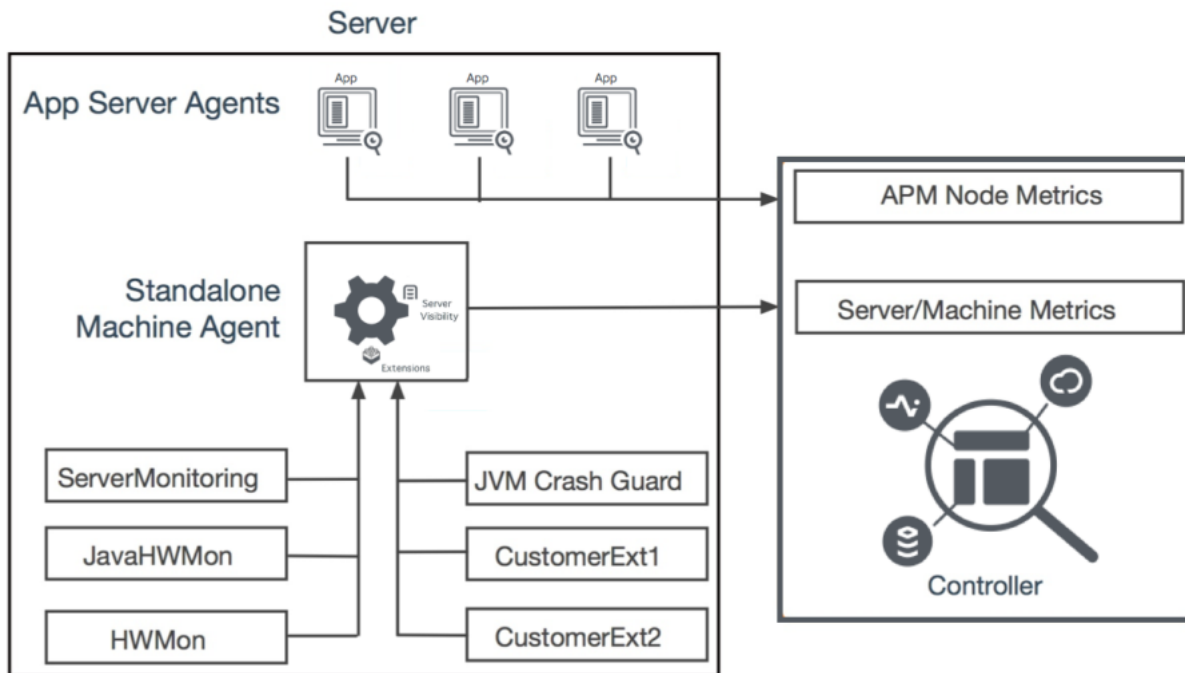

## Machine Agent

You use the Machine Agent to collect basic hardware metrics. The Machine Agent is a Java program that has an extensible architecture enabling you to supplement the basic metrics reported in the AppDynamics Controller UI with your own custom metrics. The Machine Agent is also the delivery vehicle for AppDynamics [Server Visibility](#), which provides an expanded set of hardware metrics and additional monitoring capability. See [License Entitlements and Restrictions](#) for a complete list of licenses for Server Visibility and the Machine Agent.

Functionality provided by the Machine Agent includes:

- Reporting basic [hardware metrics](#) from the server's OS, for example, %CPU and memory utilization, disk and network I/O
- Reporting metrics passed to the Controller by [extensions](#)
- Running [remediation scripts](#) for policy actions
- Running [JVM Crash Guard](#)

The Machine Agent collects infrastructure metrics from multiple extensions and forwards them to the Controller. You can also use these metrics to find correlations between infrastructure issues on one or more servers and application-performance issues reported by the App Agents.

## Machine Agent Requirements and Supported Environments

This page lists the application environments and versions supported by the Machine Agent. Any environments or versions that are not listed are not supported.

### Machine Agent Supported Platforms

Supported platforms and environments for the Machine Agent depend on the metric data collection extension and the machine's OS. See [Machine Agent Metric Collection](#). Machine Agent  $\geq 21.4.0$  collects `diskstats` from Linux kernels versions  $\geq 4.18$ .

The Azul JRE is included as a component in the AppDynamics products and modules. In response to how often Oracle produces and distributes JRE/JDK 8, AppDynamics replaced Oracle JRE with Azul JRE in the 20.5.0 Machine Agent.

### JRE Requirements

The Machine Agent requires a Java Virtual Machine (JVM). Downloads for Linux, Windows, and Solaris include the Azul JRE.

The Machine Agent supports the following JREs:

- AARCH64, Linux, Solaris (Solaris\_sparcv9), Solaris (Solaris\_X64), Windows: JRE 11 as Zulu
- AARCH64, Linux, Windows: JRE 17
- IBM: JRE 1.8 (Use the JRE 1.8 specific to AIX)
- AIX: Machine Agent without JRE (Use the JRE 1.8 specific to AIX)
- HP-UX: JRE 1.8.0.26-hp-ux

For tested platforms listed in the [Tested Platforms table](#), AppDynamics recommends using the latest available Machine Agent release from the [AppDynamics Downloads page](#).

If you upgrade the Linux Machine Agent to 21.1.0, then you must also upgrade all [extensions](#) to their latest versions to support Machine Agent 21.1.0.

- To run the Machine Agent on other platforms (such as AIX), use the unbundled Machine Agent ZIP without the JRE. For these platforms, you must install JRE 1.8 on the Machine Agent host.
- If you are using a 64-bit Operating System, use only a 64-bit JRE.

A 64-bit long has a maximum and minimum value of 9223372036854775807 and -9223372036854775808, respectively. To handle large values for metrics, run the Machine Agent using a 64-bit JDK.

JDK/JRE that is bundled with Machine Agent will work only if it meets the compatibility matrix requirements (JDK/JRE version, OS, architecture) listed here: <https://www.azul.com/downloads/?version=java-8-lts&os=rhel&architecture=x86-64-bit&package=jre>

If bundled JDK/JRE is not compatible with OS and architecture, then we suggest that you install the machine agent supported OS and architecture compatible JDK/JRE to run Machine Agent.

### Bash Requirements

Linux and Solaris Machine Agents require Bash >= 3.1.

### Required Libraries

Linux systems must include the `procps` library.

This table provides instructions on how to install the library on some common flavors of Linux operating systems.

Linux Flavor	Command
Red Hat and CentOS	Use <code>yum</code> to install the library, such as: <code>yum install procps</code>
Fedora	Install the library <code>RPM</code> from the Fedora website: <code>yum install procps</code>
Ubuntu	Use <code>apt-get</code> , such as: <code>sudo apt-get install procps</code>
Debian	Use a package manager such as <code>APT</code> to install the library (as described in the previous Ubuntu instructions).
SUSE 12	Use <code>zypper</code> to install the library, such as: <code>zypper install procps</code>

### Supported Environments

#### Tested Platforms

-  Platforms that are currently tested with every release are denoted with an asterisk (\*).

OS/Architecture	Architecture x64 (64-bit)	SPARC (64-bit)	POWER (64-bit)	Versions
AIX	No	No	Yes	7.1, 7.2*
Linux / ARM64 / AARCH64	Yes	No	No	AWS Graviton v2 (gp2)*
Linux / CentOS	Yes	No	No	6, 7*
Linux / Debian	Yes	No	No	8, 9*
Linux / Fedora	Yes	No	No	28*, 29*
Linux / openSUSE Leap	Yes	No	No	42.1*
Linux / Red Hat Enterprise Linux	Yes	No	No	6*, 7*, 8, 9
Linux / SUSE Linux Enterprise	Yes	No	No	12*, 15*
Linux / Ubuntu	Yes	No	No	14.04*, 16.04*, 18.04*
Solaris	Yes	Yes	No	10, 11*
Windows	Yes	No	No	2012, 2012 R2*, 2016*, 2019*, 2022
HP-UX (Unix)	Yes	No	No	11.31.x

## Other Platforms

These other platforms (supported by JRE 1.8), should also be compatible with the Machine Agent. However, AppDynamics has not fully tested them.

- Oracle JRE 1.8
- IBM SDK, Java Technology Edition, Version 8
- HP JDK/JRE 8

The bundled version of the Machine Agent has been tested successfully on machines based on Power Architecture processors, including PowerPC processors. Server Visibility is only supported on AIX when using the unbundled Machine Agent ZIP without the JRE. When Server Visibility is required, AppDynamics recommends to use the unbundled Machine Agent version.

## Hardware and Sizing Requirements

- Agent: One additional GB of RAM.
- Controller: Although we recommend that you install the AppDynamics Controller on a dedicated server, in some cases the Machine Agent can co-exist with the Controller on the same system. The exact number of Machine Agents that can be supported depends on whether other agents are reporting to the same Controller and whether the Machine Agents have Server Visibility enabled (more metrics are generated under Server Visibility). See [Controller System Requirements](#).

## JVM Memory Requirements

The lightweight Machine Agent consumes minimal resources of your computer.

To accommodate the Machine Agent, AppDynamics recommends these additional heap and PermGen space sizes:

- Maximum heap size (-Xmx): 256 MB
- Maximum PermGen heap size (-XX:MaxPermSize): 20 MB

By default, the JVM maximum heap size is set to 256 MB. To override this setting, you can set this flag through the `JAVA_OPTS` environment variable on your system. For example, if you enter: `export JAVA_OPTS="-Xms20m -Xmx128m "` on Linux, this sets the initial heap size to 20 MB and the max heap size to 128 MB.

## Extension Considerations

The exact CPU or memory overhead added by the agent can vary based on the extensions used and whether the extensions are Java. Java extensions require more heap space; the amount required depends on how you code the extension. If you start adding extensions, you should increase the maximum heap space to 256 MB or 512 MB. Additionally, you may need to increase the size of the initial memory allocation. Monitor the memory consumption of the agent to ensure that there are sufficient resources allocated to it. You can also enable Garbage Collection logging on the JVM to fine tune the heap size for the extensions.

These are example settings to increase the initial heap size:

- Linux and Unix systems: `<machine_agent_home>/bin/machine-agent -Xms64m`
- Windows: `cscript <machine_agent_home>\machine-agent.vbs -Xms64m`

## Federal Information Processing Standards (FIPS) Compliance

The Machine Agent  $\geq$  22.3.0 is FIPS 140-2 compliant.

To use the FIPS-compliant BCFKS truststore for the Machine Agent:

1. Provide the following JVM arguments:
  - a. `-Djavax.net.ssl.trustStore=<absolute_path_to_BCFKS_truststore>`
  - b. `-Djavax.net.ssl.trustStoreType=BCFKS`
  - c. `-Djavax.net.ssl.trustStorePassword=<password_for_truststore>`
2. Add the following security provider class in the `java.security` file for the JRE used by the Machine Agent:
  - a. `security.provider.<desired preference order>=org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider`
  - b. Replace `<desired preference order>` with your desired preference order.

## Machine Agent Metric Collection

The Machine Agent collects hardware metrics using default extensions appropriate to specific operating systems. The following table lists the metric collection extension and its supported OS information. In some limited cases, you may want to change the default collection extension. The table also lists the most common reasons for changing the default extension.

Supported environments, observation rates, configurability, some metric names, and definitions depend on the extension.

OS	Default Metric Collection Extension	Metrics Collected	Reason to Change the Default Extension	Supported Environments
Microsoft Windows	<ul style="list-style-type: none"> <li>• <a href="#">HardwareMonitor</a> (if Server Visibility is disabled)</li> <li>• <a href="#">ServerMonitoring</a> (if Server Visibility is enabled)</li> </ul>	<ul style="list-style-type: none"> <li>• Basic Metrics</li> <li>• Server Visibility Metrics</li> </ul>	<ul style="list-style-type: none"> <li>• To <a href="#">Customize Metrics for Virtual Disks and External Network Traffic</a></li> <li>• The <a href="#">HardwareMonitoring</a> extension is not recommended on Windows. See <a href="#">Monitoring Windows Guidelines</a>.</li> </ul>	<a href="#">Machine Agent Requirements and Supported Environments</a>
Linux	<a href="#">ServerMonitoring</a>	<ul style="list-style-type: none"> <li>• Basic Metrics</li> <li>• Server Visibility Metrics</li> </ul>	To <a href="#">Machine Agent Metric Collection</a>	<a href="#">Machine Agent Requirements and Supported Environments</a>
Solaris / SunOS	<ul style="list-style-type: none"> <li>• <a href="#">HardwareMonitor</a> (if Server Visibility is disabled)</li> <li>• <a href="#">ServerMonitoring</a> (if Server Visibility is enabled)</li> </ul>	<ul style="list-style-type: none"> <li>• Basic Metrics</li> <li>• Server Visibility Metrics</li> </ul>	To <a href="#">Machine Agent Metric Collection</a>	<a href="#">Machine Agent Requirements and Supported Environments</a>
AIX	<ul style="list-style-type: none"> <li>• <a href="#">JavaHardwareMonitor</a></li> <li>• <a href="#">ServerMonitoring</a> (if Server Visibility is enabled)</li> </ul>	<ul style="list-style-type: none"> <li>• Basic Metrics</li> <li>• Server Visibility Metrics</li> </ul>	SIGAR (System Information Gatherer And Reporter) is not supported for your OS or Linux Distribution	SIGAR
HP-UX	<a href="#">Machine Agent Metric Collection</a>	Basic Metrics	SIGAR is not supported for your OS or Linux Distribution	SIGAR
Mac OS X	<a href="#">Machine Agent Metric Collection</a>	Basic Metrics	SIGAR is not supported for your OS or Linux Distribution	SIGAR

OS	Default Metric Collection Extension	Metrics Collected	Reason to Change the Default Extension	Supported Environments
Solaris	<ul style="list-style-type: none"> <li>• <a href="#">HardwareMonitor</a> (if Server Visibility is disabled)</li> <li>• <a href="#">ServerMonitoring</a> (if Server Visibility is enabled)</li> </ul>	<ul style="list-style-type: none"> <li>• Basic Metrics</li> <li>• Server Visibility Metrics</li> </ul>	To <a href="#">Machine Agent Metric Collection</a>	<a href="#">Machine Agent Requirements and Supported Environments</a>

**i** In case of a time discrepancy issue on a server (not related to daylight savings time), where time is reset manually, the Machine Agent stops reporting. During this interruption, application and server data are not reported. To continue monitoring, you must restart the Machine Agent.

### Java Hardware Monitor

The JavaHardwareMonitor is based on SIGAR (System Information Gatherer And Reporter). SIGAR is a legacy method of collecting basic hardware metrics and is used in pre-4.1 versions and for machines running operating systems that are not supported by the ServerMonitoring extension. The following sections list scenarios where you might want to change the extension used to collect the machine metrics.

#### Customize Metrics for Virtual Disks and External Network Traffic

By default, the Machine Agent reports metrics for network-mounted and local disks only. Additionally, only the external network traffic is aggregated (to ensure backward compatibility with previous versions of AppDynamics). For operating systems using the ServerMonitoring extension, you can change to the JavaHardwareMonitor to configure specific disks and network interfaces to be monitored. See [Configure Metrics for Virtual Disks and External Network Traffic - JavaHardwareMonitor Extension Only](#) to customize the behavior of the JavaHardwareMonitor metrics

#### Metric Observation Rate

The JavaHardwareMonitor takes observations of metrics in two distinct ways:

- For disk and network metrics: One observation per minute. When you view the count for these metrics in the Metric Browser, you see the count of 1 per minute. If you select a 15-minute interval, the count would be 15 times 1 = 15 and so on.
- For CPU and memory metrics: One observation every two seconds. When you view the count for these metrics, you see the count of 30 per minute. If you select a 15-minute interval, the count would be 15 times 30 = 450 and so on.

#### Collect Basic Metrics Using JavaHardwareMonitor

Linux and Windows machines use the ServerMonitoring extension by default to report basic metrics. However if you have Server Visibility enabled, falling back to the JavaHardwareMonitor only affects the collection of the basic hardware metrics. The extended Server Visibility metrics are still collected correctly by the ServerMonitoring extension.

#### How to Change from ServerMonitoring to JavaHardwareMonitor

1. Stop the Machine Agent.
2. Disable basic ServerMonitoring:

- a. Edit the `ServerMonitoring.yml` file from `<machine_agent_home>/extensions/ServerMonitoring/conf/`.
- b. Change the value of `basicEnabled` to "false".  
The `basicEnabled` setting controls whether the Machine Agent reports basic hardware metrics through the `ServerMonitoring` extension. Setting this to `false` enables the `JavaHardwareMonitor` to report the basic hardware metrics using the legacy SIGAR-based reporting.
- c. Save the file.
3. Enable `JavaHardwareMonitor`:
  - a. Edit `monitor.xml` from `<machine_agent_home>/monitors/JavaHardwareMonitor/`.
    - For Linux, remove this line: `<enable-override os-type="linux">>false</enable-override>`.
    - For Windows, remove this line: `<enable-override os-type="windows">>false</enable-override>`.
  - b. Save the file.
4. Restart the Machine Agent.

## Hardware Monitor

The `HardwareMonitor` extension is a collection of OS-specific scripts. SunOS and Solaris machines use this extension by default. For the operating systems that use the `JavaHardwareMonitor` by default, you may want to switch to an OS-specific monitor. You can switch to the OS-specific monitors when the `JavaHardwareMonitor` fails to report statistics and you see error logs similar to the following:

```
[Agent-Scheduler-1] 28 Nov 2013 13:13:55,435 ERROR
SigarMinuteTask - Error fetching network statistics for
interface [eth0:17]. Blocklisting it.
[Agent-Scheduler-1] 28 Nov 2013 13:13:55,435 ERROR
SigarMinuteTask - Error fetching disk i/o statistics for
interface [eth0:17]. Blocklisting it.
```

## Collect Basic Hardware Metrics using HardwareMonitor

### How to Change from JavaHardwareMonitor to an OS-Specific Monitor

1. Stop the Machine Agent.
2. Disable the `JavaHardwareMonitor`:
  - a. Locate and edit `monitor.xml` from `<machine_agent_home>/monitors/JavaHardwareMonitor/`.
  - b. Change the value `<enabled>>true</enabled>` to `<enabled>>false</enabled>`.
  - c. Save the file.
3. Enable the `HardwareMonitor` for the OS you want to monitor:
  - a. Edit `monitor.xml` from `<machine_agent_home>/monitors/HardwareMonitor/`.
  - b. Change `<enabled>>false</enabled>` to `<enabled>>true</enabled>`.
  - c. Save the file.
4. Restart the machine agent.

### Modify Free Memory Metric Configuration

If your Machine Agent installation is using an OS-specific `HardwareMonitor` for metric collection, then by default the agent reports free memory as the memory that is not used by any process nor in an I/O buffer or

cache. It is more useful for the free memory metric to include memory that is in an I/O buffer or cache but can be available for new processes.

To include the memory in I/O buffers or cache that can be made available to new processes, modify the HardwareMonitor configuration:

1. Open `<machine_agent_home>/monitors/HardwareMonitor/config.sh`.
2. Set `REPORT_MEMORY_FREE_AS_MEMORY_AVAILABLE` to 1.
3. Restart the agent.

## Monitoring Windows Guidelines

When using the Machine Agent on Windows:

- Check the server frequently to ensure that it has the latest Windows updates installed.
- If you have a Server Visibility license, use the ServerMonitoring extension.
- If you do not have a Server Visibility license, or if you want to collect Basic metrics only, use the JavaHardwareMonitor extension.
  - There is a known Windows issue when using the HardwareMonitor extension to collect metrics on Windows 8: [The "Win32\\_Service" WMI class leaks memory in Windows Server 2008 R2 and in Windows 7](#). As a result, AppDynamics does not recommend using the HardwareMonitor extension on Windows. You should use JavaHardwareMonitor instead.

## Server Visibility on Windows

See [Server Visibility Requirements and Supported Environments](#).

## Running the Machine Agent and .NET Agent on the Same Machine

To collect Machine or Server metrics on a machine with Machine and .NET Agents installed, you must enable .NET Compatibility Mode on both the Controller and the Machine Agent. See [.NET Compatibility Mode](#).

## Configure Metrics for Virtual Disks and External Network Traffic - JavaHardwareMonitor Extension Only

By default, the Machine Agent reports metrics for network-mounted and local disks only. Additionally to ensure backward compatibility with previous versions of AppDynamics, only the external network traffic is aggregated.

You can customize the default behavior by modifying the auto-generated configuration file, `task-template.xml`. The `task-template.xml` file provides information about the current configuration of the Machine Agent and is created when you first start up the agent. It discovers the disks and network hardware on the machine where it is installed that the agent can monitor.

**i** This configuration applies to the JavaHardwareMonitor extension only. The ServerMonitoring extension is recommended if you have a Server Visibility license and the monitored system meets the system requirements. See [Server Visibility Requirements and Supported Environments](#)

## Customize the Default Machine Agent Metric Collection

1. Locate the `task-template.xml` file.  
This file is located in the `<machine_agent_home>/monitors/JavaHardwareMonitor/` directory when the Machine Agent starts the first time.
2. Edit the `task-template.xml` file:

- To enable aggregation operation for localhost (lo) network metrics, change the value of the aggregate attribute (for the network element "lo") to "true".
- To enable monitoring for a virtual disk, set the value of the enabled attribute to "true" for that disk.

The following is a sample `task-template.xml` file:

```
<config>
 <disk aggregate="false" enabled="false">sunrpc</disk>
 <disk aggregate="true" enabled="true">/dev/sdb1</disk>
 <disk aggregate="false" enabled="false">proc</disk>
 <disk aggregate="false" enabled="false">none</disk>
 <disk aggregate="false" enabled="false">devpts</disk>
 <disk aggregate="true" enabled="true">/dev/sda1</disk>
 <disk aggregate="false" enabled="false">nfsd</disk>
 <disk aggregate="true" enabled="true">/dev/mapper/saas4-binlog</disk>
 <disk aggregate="false" enabled="false">sysfs</disk>
 <disk aggregate="false" enabled="false">tmpfs</disk>

 <network aggregate="true" enabled="true">lo</network>
 <network aggregate="true" enabled="false">sit0</network>
 <network aggregate="true" enabled="true">eth0:1</network>
 <network aggregate="true" enabled="true">eth0</network>
 <network aggregate="true" enabled="false">eth1</network>
</config>
```

3. To prevent the Machine Agent from overwriting the file, rename the `task-template.xml` file to `task.xml`.
4. To monitor a special device that is not enabled, add a file named `task.xml` in the `<machine_agent_home>/monitors/JavaHardwareMonitor/` directory. The format of the `task.xml` file must be exactly the same format as the `task-template.xml` file. Not all disks and networks must be included in the `task.xml` file. If the Machine Agent finds a disk or a network that is not in the `task.xml` file, then it applies the default properties.
5. Restart the Machine Agent.

## View Hardware Metrics

Without having to enable Server Visibility, you can view basic machine metrics in these locations:

- **Metric Browser** – Go to **Application Infrastructure Performance > Hardware Resources**.
- **Node** page > Server tab – Go to **Tiers & Nodes**, select the node of interest, and go to the Server tab.
- **Custom Dashboards** – To add CPU metrics to your Custom Dashboard, add the metrics for any node on your target machine. Metrics collected for a node associated with the machine agent are for the server hosting that node. Any machine metrics collected will be the same for nodes that are on the same machine.

Server Visibility provides additional metrics and pages to view basic and server metrics. See [Monitor Your Servers Using Server Visibility](#).

[Hardware Resources Metrics](#) describes metrics collected by the Machine Agent.

## Customize Default Metrics

You can enable collection of metrics for [virtual disks and external network](#) traffic.

## Add Custom Metrics

You can add [script-based](#) and [Java-based](#) custom monitoring extensions to collect additional metrics. For example, the [ehCache monitoring extension](#) available from [AppDynamics Exchange](#) can collect metrics to monitor Ehcache performance. The metrics appear in **Application Infrastructure Performance | Custom Metrics** section of the Metric Browser and which you can use on custom dashboards.

You can also send metrics to the Machine Agent using the [HTTP listener](#). See [Extensions and Custom Metrics](#).

## Install the Machine Agent

This page provides requirements, permissions, and a procedure to install the Machine Agent. You can also use the [AppDynamics Agent Installer](#) to streamline the deployment of the Machine Agent. The Agent Installer simplifies the agent installation process.

To install Machine Agents in Kubernetes, see [Install the Cluster Agent with the Kubernetes CLI](#).

Make sure to thoroughly test your deployment in a staging or test environment before deploying it to production.

Currently, Machine Agent does not support containerd. We are working on adding the support in upcoming releases.

## JRE Requirements

- JRE 1.8 is required.
- Machine Agent installations with a bundled JRE include:
  - AARCH64, Linux, Solaris (Solaris\_sparcv9), Solaris (Solaris\_X64), Windows: JRE 11 as Zulu 11.62 (JDK 11.0.18)
  - AIX: Machine Agent without JRE (Use the JRE 1.8 specific to AIX)
- Machine Agent installations without a bundled JRE should use:
  - Linux: JRE 11
  - Other operating systems: JRE 8
- The Machine Agent starts within its own JVM.
- You can use an existing JRE previously installed in your environment.

## Permissions

- To avoid permission issues, install the agent as the same user who owns the Machine Agent files or as an administrator on the host machine.
- All files in the `<machine-agent-home>` installation directory should be readable by the Machine Agent.
- The user that runs the Machine Agent must have write privileges to the logging output directory and to the `/conf` directory in the agent installation directory.
- If you plan to enable the JVM Crash Guard, review the required permissions for [JVM Crash Guard](#).
- To create a non-root user to run the Machine Agent, see [Permissions Required to Run the Machine Agent](#).
- Windows permissions for files and subfolders are inherited by default from the parent folder ( `<machine-agent-home>` ). AppDynamics recommends that you restrict permissions to users authorized to start, stop, and configure the Machine Agent:
  - Read and Write permissions to all files and subfolders under `<machine-agent-home>` .
  - If running as a:
    - Terminal application, then restrict Read, Write, and Execute permissions for the file `<machine-agent-home>\bin\machine-agent.vbs` .
    - Service, then restrict Start, Stop, and Restart permissions for the Machine Agent service. You only need admin privileges to install the service. The Machine Agent runs under the local system account which has extensive

privileges on the local system. However, if WMI access is revoked, then you must run the Machine Agent as Administrator. Typically, users do have WMI access. See [User Account Control and WMI](#).

- Enable Windows Script Host for the Windows Machine Agent.

## Installation Directory and Path Name Requirements

The following table lists characters that are not supported for the `<machine-agent-home>` directory name or in any directory in the path:

Not Supported on any OS	Not Supported on Linux	Not Supported on Windows
Whitespace characters	% #	% # \ / : * ? " < >
An exclamation point at the end of the directory name		Control characters such as ASCII EOL, CR, etc.

## Configuration

The `controller-info.xml` file contains the properties used to specify agent to Controller communications. To specify the Controller host, port, and account access key properties, see [Plan the Machine Agent Configuration](#). Based on your installation requirements, you may need to configure additional properties.

## Installation for New Machine Agent

The following steps are for *new* installations. To upgrade Machine Agent <= 4.3, see [Upgrade the Machine Agent](#).

1. [Plan the Machine Agent Configuration](#).
2. From [AppDynamics Downloads](#), download the Machine Agent installation package for your OS environment onto the machine you want to monitor.

**i** If there is no download bundle for your OS, use the Machine Agent zip file without the JRE, and use a separately downloaded JRE to run it. You need to download a separate JRE if the one already installed on the machine is a version earlier than JRE 1.8.

- [Install Using the Non-JRE Zip File](#) - Use this for OS environments other than Linux, Solaris, Windows, and Mac OS X.
- [Linux Install Using the RPM Package](#)
- [Linux Install Using ZIP with Bundled JRE](#)
- [Solaris Install Using ZIP with Bundled JRE](#)
- [Windows Install Using ZIP with Bundled JRE](#)

3. [Verify the Machine Agent Installation](#).
4. Start the Machine Agent by executing `<machine_agent_home>/bin/machine-agent`. If you have `java` or `system` properties, you can add them to the end of the command. To review machine usage, enter `machine-agent -h`.

## Machine Agent Installation Scenarios

### Related pages:

- [Plan the Machine Agent Configuration](#)
- [Where to Specify Machine Agent Configuration](#)
- [Machine Agent Configuration Properties](#)

This page describes scenarios for new Machine Agent installations.

### Machine Agent Installation Scenario

This scenario contains a host server running one or more instrumented applications and one Machine Agent. When you install the Machine Agent on the same server with any app agent, do not specify the application name and tier name. The one Machine Agent reports the hardware metrics to each node where the app agent and the Machine Agent have matching host IDs.

If you plan to enable Server Visibility on a Windows server where an AppDynamics .NET agent is installed, you must enable .NET Compatibility Mode on both the Controller and the Machine Agent. See [.NET Compatibility Mode](#).

#### Licensing Note

>= 4.3 includes one Machine Agent license with each APM app agent. You can install this Machine Agent only on the same server with the app agent.

### Independent Machine Agent Installation

This scenario contains a host server running only the Machine Agent without app agents. You do not need to specify an application or tier. You can view the Machine Agent metrics from the Servers list or the metric browser. This scenario requires a Server Visibility license.

#### Licensing Note

>= 4.3 requires a Server Visibility license for a Machine Agent installation.

If you are doing an Independent Machine Agent installation and you want the hardware metrics reported to nodes in an application, then you must configure the application name, tier name, and node name where you want the metrics to appear.

Using the values for the application name, tier name, and node where you want to see the metrics reported, configure these properties:

- Application name
- Tier name
- Node name
- `uniqueHostId` for both the Machine Agent and app agent (use the same value)

### Unique Host ID Property

The `uniqueHostId` property is not required. However, if you do not define `uniqueHostId`, then the Machine Agent uses the Java API to retrieve the host ID. The results from the API can be inconsistent. The same JVM may return a different value for the same machine each time you restart the Machine Agent. As a workaround, AppDynamics recommends that you set the value of `uniqueHostId` to the host ID that you want to see in the UI. Use the same value for `uniqueHostId` for the App Agent.

## Plan the Machine Agent Configuration

AppDynamics provides multiple ways to configure the Machine Agent. As part of planning your installation, determine which options work best in your environment:

- Controller-info.xml
- System properties
- Environment variables

See [Configure the Machine Agent](#).

## Collect Configuration Information

Determine your configuration requirements and collect the necessary information. See [Machine Agent Configuration Properties](#).

Planning Item	Description
Determine your installation scenario	For new installations, see <a href="#">Machine Agent Installation Scenarios</a> . For upgrades, see <a href="#">Upgrade the Machine Agent</a> .
Location of the startup script	You add startup arguments and system properties in the startup script. If you are using a Java service wrapper, you need to know the location of the wrapper configuration. See <a href="#">Where to Specify Machine Agent Configuration</a> .
Memory and CPU	See <a href="#">Machine Agent Requirements and Supported Environments</a> .
Connecting the agent to the Controller	You need to know the Controller host, Controller port, and account access key where you want your metrics to be reported. The account access key is generated at the Controller installation time and is located on the AppDynamics <a href="#">Administration Console</a> .
(Optional) SSL Communications	If you plan to use SSL to communicate with the Controller, see <a href="#">Enable SSL for Machine Agent</a> . SSL-related properties include: <ul style="list-style-type: none"> <li>• Controller SSL Enabled Property</li> <li>• Controller Keystore Password</li> <li>• Controller Keystore Filename</li> <li>• Force Default SSL Certificate Validation</li> </ul>
Proxy Settings	If you plan to connect to the Controller using a proxy server, you need to know the Proxy host, Proxy port, and the path to the Proxy Password file.

Planning Item	Description
Multi-tenant mode or SaaS Installations	In addition to the Account Access property, use the Account Name property to configure <a href="#">multi-tenant mode</a> or SaaS account Information. This information is provided in the Welcome email from the AppDynamics Support Team. You can also locate this information in the <code>&lt;controller_home&gt;/initial_account_access_info.txt</code> file.
Deploying from a common directory	See <a href="#">Deploy Multiple Machine Agents From a Common Directory</a> .
Extension considerations	If you plan to use a number of extensions in your environment, see the "Extension Considerations" section in <a href="#">Machine Agent Requirements and Supported Environments</a> .
Enabling Server Availability and Service Availability Monitoring	Server Availability requires a separate license. See <a href="#">Enable Server Visibility</a> .

### Install Using the Non-JRE Zip File

This page describes how to install the Machine Agent using the zip file that does not include the JRE. You can use this zip file if your environment already has Java  $\geq 1.8$ , or when installing on an OS environment that does not have an OS-specific installation package on the AppDynamics download site. The agent uses the JRE specified in the `$JAVA_HOME` environment variable or the default JRE for the server (enter `which java` in a terminal window).

**i** The following steps are for the Machine Agent with a bundled JRE. The standalone Machine Agent does not require these steps.

### Install the Machine Agent

1. Before installing, review [Install the Machine Agent](#).
2. Download and unzip the ZIP file. Extract the contents to the agent installation directory, `<machine_agent_home>`.
3. Gather your configuration details and configure the agent by editing the `<machine_agent_home>/conf/controller-info.xml` file or by adding system properties to the JVM startup script file. See [Plan the Machine Agent Configuration](#).
  - a. *(Required)* Configure the Controller host name, port number, and account access key.
  - b. *(Required for Multi-Tenant Mode or SaaS installations)* Configure the Agent Account Information. See [Multi-Tenant Controller Accounts](#).
  - c. *(Optional)* Review memory requirements. See [Machine Agent Requirements and Supported Environments](#).
  - d. *(Optional)* Configure the agent to use SSL. See [Enable SSL for Machine Agent](#).

- e. (Optional) Configure the agent to use proxy settings. See [Machine Agent Configuration Properties](#).
  - f. (Optional) For application and tier name, see [Machine Agent Installation Scenarios](#) to determine if you need to specify an application name and tier name. If you are installing the Machine Agent on the same server with any AppDynamics app agent, do not specify the application name and tier name.
4. Start the Agent:
- Windows in a terminal window: `<machine_agent_home> \bin\machine-agent.vbs`
  - Linux or Unix-like: `<machine_agent_home> /bin/machine-agent`

## Linux Install Using the RPM Package

### Related pages:

- [Where to Specify Machine Agent Configuration](#)
- [Start and Stop the Machine Agent](#)

This page describes how to install the Machine Agent on Linux systems that support the [RPM Package Manager](#):

- CentOS
- RHEL
- Fedora
- openSUSE
- SUSE Linux Enterprise Server
- AARCH

For Linux systems that do not support RPM, use the [JRE Bundled Zip Archive](#).

The RPM installer makes these changes to the host machine:

- Creates an `appdynamics-machine-agent` group and an `appdynamics-machine-agent` user
- Assigns ownership of certain files in the `machine-agent` directory to the `appdynamics-machine-agent` user

These changes are necessary to enable non-root users to configure and run an RPM-installed agent. To use a different user or group for the machine agent service, set the `MACHINE_AGENT_USER` and `MACHINE_AGENT_GROUP` environment variables in a shell for RPM installation.

```
sudo MACHINE_AGENT_USER=myuser MACHINE_AGENT_GROUP=mygroup rpm -ivh appdynamics-machine-agent.rpm
```

If the specified user or group does not exist, an error message appears and the RPM installation stops. To continue, you must define users and groups.

If this is an issue in your environment, then you install the agent using the ZIP archive (see [Linux Install Using ZIP with Bundled JRE](#)).

### Install the Machine Agent

1. Before installing, review [Install the Machine Agent](#).
2. Download and install the RPM Package. With administrative privileges, enter the following CLI code where `<pkg-name.rpm>` is the name of the package for your environment, such as `appdynamics-machine-agent-<version>.x86_64.rpm`.

```
sudo rpm -ivh <pkg-name.rpm>
```

The agent files are installed in `opt/appdynamics/machine-agent` and the agent is added as a service.

3. Gather your configuration details and configure the agent by editing <machine\_agent\_home>/conf/controller-info.xml file or by adding system properties to the JVM startup script file. See [Linux Install Using the RPM Package](#).
  - a. *(Required)* Configure the Controller host name, port number, and account access key.
  - b. *(Optional)* Review memory requirements. See [Machine Agent Requirements and Supported Environments](#).
  - c. *(Optional)* Configure the agent to use SSL. See [Enable SSL for Machine Agent](#).
  - d. *(Optional)* Configure the agent to use proxy settings. See [Machine Agent Configuration Properties](#).
  - e. *(Required for Multi-Tenant Mode or SaaS installations)* Configure the Agent Account Information. See [Multi-Tenant Controller Accounts](#).
  - f. *(Optional)* Determine if you need to specify an application name and tier name. See [Machine Agent Installation Scenarios](#).  
If you are installing the Machine Agent on the same server with any AppDynamics app agent, do not specify application name and tier name.
4. Start the Agent. You can start the agent as a service (requires sudo or root user) or from the command line. If `systemd` was detected during installation, you can use the `systemctl` command to start the agent service.
  - Using SysV – `service appdynamics-machine-agent start`
  - Using systemd – `systemctl start appdynamics-machine-agent`
  - From the Command Line – `<machine_agent_home> /bin/machine-agent`
  - From the Launcher – `<machine_agent_home> /etc/init.d/appdynamics-machine-agent start`

## RPM Package Function

The RPM package manager installs the agent files to `opt/appdynamics/machine-agent`, creates symbolic links, sets environment variables, and adds the agent as a service.

## Symbolic Links

The RPM package manager creates the symbolic links to agent scripts and configuration files in the `/etc` directory. You can edit these links to accommodate a different installation directory, JRE, or system user account running the agent.

### Link for SysV Service Script

```
/etc/init.d/appdynamics-machine-agent >> /opt/appdynamics/machine-agent/etc/init.d/appdynamics-machine-agent
```

This script provides these service commands:

- `Start` – Starts the service, runs a script that starts the agent
- `Stop` – Stops the service
- `Restart` – Restarts the service
- `Status` – Returns the status of the service.

For example: `service appdynamics-machine-agent start`

### Link for Environment Variables

SysV –

```
/etc/sysconfig/appdynamics-machine-agent >> /opt/appdynamics/machine-agent/etc/sysconfig/appdynamics-machine-agent
```

This script sets up the environment variables:

- `MACHINE_AGENT_HOME=/opt/appdynamics/machine-agent` - Specifies where the agent files are located.
- `JAVA_HOME=/opt/appdynamics/machine-agent/jre` - Specifies the JRE the agent uses. AppDynamics recommends that you use the RPM package installer that contains its own JRE. However, you can use a different JRE as long as it meets the [JRE requirements](#).
- `MACHINE_AGENT_USER=root` - Specifies the system user for starting the agent (default is root). AppDynamics recommends that you create a non-root user to run the machine agent. The new user needs to have read-access to controller-info.xml and write access to the log file. See [Permissions Required to Run the Machine Agent](#)

systemd – The environment variables are in the service file:

```
/etc/systemd/system/appdynamics-machine-agent.service >> /opt/appdynamics/machine-agent/etc/systemd/system/appdynamics-machine-agent.service
```

"MACHINE\_AGENT\_USER" variable doesn't exist in the systemd service file. The variable is just User .

### Link for Agent to Controller Communication

Sets up a link to the controller-info.xml file containing the properties for agent-to-controller communication.

```
/etc/appdynamics/machine-agent/controller-info.xml >> /opt/appdynamics/machine-agent/conf/controller-info.xml
```

### Logging Configuration

The log4j.xml file controls the detail of information logged by the agent. By default, the logging level is set to info .

```
/etc/appdynamics/machine-agent/logging/log4j.xml >> /opt/appdynamics/machine-agent/conf/logging/log4j.xml
```

### Adds the Agent as a Service

After the package is installed, the appdynamics-machine-agent runs `opt/appdynamics/machine-agent/bin/postInstall.sh` to add the agent to the services. The installer either copies the SysV script to add the service or, if systemd is detected, the installer copies the agent unit file `/etc/systemd/system/appdynamics-machine-agent.service` and adds the agent to the services using this unit file.

#### Installs a systemd Unit File for the Agent Service

If `systemd` is detected on the system when you install the RPM package or run the `postinstall.sh` script, the `systemd` unit file for the agent service is copied to the following location: `/etc/systemd/system/appdynamics-machine-agent.service`

ExecStart: This option in the `systemd` service file points to a script that starts the agent as a daemon. If you did not install the Machine Agent in `/opt/appdynamics/machine-agent`, then change the path to `<math>`

`achine-agent-home>/scripts/machine-agent-daemon` . If you did not edit the path, then it points to the correct place by default.

You can start and stop the agent service using the relevant `systemctl` commands. For information on all `systemctl` commands, see the [systemctl](#) man pages.

Command	Format
<code>start</code> <code>stop</code> <code>status</code> <code>restart</code>	<code>systemctl &lt;command&gt; appdynamics-machine-agent.service</code>
<code>disable</code> <code>enable</code> (Use the full path)	<code>systemctl &lt;command&gt; /etc/systemd/system/appdynamics-machine-agent.service</code>

### Linux Install Using ZIP with Bundled JRE

This page describes how to install the Machine Agent using the Linux ZIP archive that includes JRE 1.8. It is easier to download and use the RPM package if your Linux distribution supports the [RPM Package Manager](#).

#### Install the Agent

1. Before installing, see [Install the Machine Agent](#).

 Read/write privileges to the `<machine-agent-home>` installation directory are required.

2. Download and unzip the Agent zip bundle. From the command line, enter:

```
unzip <zip-bundle.zip> -d <machine_agent_home>
```

where `<zip-bundle.zip>` is the name of the zip archive for your environment and `<agent_home>` is the name of the directory where you want to install the agent.

3. Gather your configuration details and configure the agent by editing `<machine_agent_home>/conf/controller-info.xml` file or by adding system properties to the JVM startup script file. See [Linux Install Using ZIP with Bundled JRE](#).
  - a. *(Required)* Configure the Controller host name, port number, and account access key.
  - b. *(Optional)* Review memory requirements. See [Machine Agent Requirements and Supported Environments](#).
  - c. *(Optional)* Configure the agent to use SSL. See [Enable SSL for Machine Agent](#).
  - d. *(Optional)* Configure the agent to use proxy settings. See [Machine Agent Configuration Properties](#).

e. (Required for Multi-Tenant Mode or SaaS installations) Configure the Agent Account Information. See [Multi-Tenant Controller Accounts](#).

f. (Optional) Determine if you need to specify an application name and tier name. See [Linux Install Using ZIP with Bundled JRE](#).

If you are installing the Machine Agent on the same server with any app agent, do not specify application name and tier name.

4. To add the Machine Agent as a service, see [Add the Agent as a Service](#).

5. Start the Machine Agent by entering: `<machine_agent_home>/bin/machine-agent` . For example, from the `<machine_agent_home>` directory:

```
./bin/machine-agent
```

To review Machine Agent usage, enter: `machine-agent -h`

```
Usage: machine-agent [-dh] [-j JAVA_HOME] [-p pidfile] [-D prop] [-X prop]
Start the machine agent.
 -d daemonize (run in background)
 -p pidfile write PID to <pidfile>
 -h
 --help print command line options
 -D prop set JAVA system property
 -X prop set non-standard JAVA system property
```

6. (Optional) Verify the installation. See [Verify the Machine Agent Installation](#).

### Add the Agent as a Service Using SysV

1. Install the [Machine Agent](#).
2. Create a link to `/etc/sysconfig`:

```
ln -s <machine-agent-home>/etc/sysconfig/appdynamics-machine-agent /etc/sysconfig/appdynamics-machine-agent
```

3. Copy the machine agent to `/etc/init.d` . For example:

```
cp <machine-agent-home>/etc/init.d/appdynamics-machine-agent /etc/init.d/appdynamics-machine-agent
```

4. Edit the environment variables in `/etc/sysconfig/appdynamics-machine-agent` configuration file:
  - `MACHINE_AGENT_HOME` – Specifies where the Machine Agent files are located.
  - `JAVA_HOME` – Specifies the JRE the agent uses. AppDynamics recommends that you use the Machine Agent bundled with the JRE. However, you can use an existing JRE. (1.8 or later).
  - `MACHINE_AGENT_USER` – Specifies the system user used to start the Machine Agent. By default this is root. AppDynamics recommends that you create a non-root user to run the Machine Agent. The new user needs to have read-access to `controller-info.xml` and write access to the log file. See [Permissions Required to Run the Machine Agent](#).

5. Add the agent as a service. For example, enter:

```
chkconfig --add appdynamics-machine-agent
```

For Ubuntu, you can use `update-rc.d` or `sysv-rc-conf`. See the Ubuntu documentation for details.

6. Start the agent service: `service appdynamics-machine-agent start`.
7. Verify that the Agent is reporting to the Controller. See [Linux Install Using ZIP with Bundled JRE](#).

### Add the Agent as a Service Using systemd

1. Install the [Machine Agent](#).
2. Edit the environment variables and options in the service file as needed: `<machine-agent-home>/etc/systemd/system/appdynamics-machine-agent.service`
  - a. `MACHINE_AGENT_HOME` – Specifies where the Machine Agent files are located.
  - b. `JAVA_HOME` – Specifies the JRE the agent uses. AppDynamics recommends that you use the Machine Agent bundled with the JRE. However, you can use an existing JRE.
    - JRE `>= 1.7` for `= 4.3`
    - JRE `>= 1.8` for `>= 4.4`
  - c. `User` – This option in the service file specifies the system user to use to start the Machine Agent. By default this is root. AppDynamics recommends that you create a non-root user to run the Machine Agent. The new user needs to have read access to `controller-info.xml` and write access to the log files. See [Permissions for Non-Root User to Run the Machine Agent](#).  
The `systemd` service file does not include the "MACHINE\_AGENT\_USER" variable.
3. Copy the file:

```
cp <machine-agent-home>/etc/systemd/system/appdynamics-machine-agent.service \
/etc/systemd/system/appdynamics-machine-agent.service
```

4. Enable the Machine Agent to start at system startup:

```
systemctl enable appdynamics-machine-agent
```

5. Start the agent service:

```
systemctl start appdynamics-machine-agent
```

6. Check the service status:

```
systemctl status appdynamics-machine-agent
```

7. Verify that the Agent is reporting to the Controller. See [Linux Install Using ZIP with Bundled JRE](#).

## Solaris Install Using ZIP with Bundled JRE

This page describes how to install the Machine Agent on 64-bit Solaris using the ZIP archive that includes JRE 1.8.

**i** Adding the Machine Agent as a service is not supported on Solaris.

### Install the Agent

1. Before installing, see [Install the Machine Agent](#).
2. The Machine Agent on Solaris is supported only when you install it in Global zones.
3. The Solaris agent requires that the `nawk` (new awk) utility is installed. Verify that the Solaris host has the `nawk` utility installed.
4. Download one of the two installation Machine Agent Bundles for Solaris from the AppDynamics Download Site:
  - For Sparc machines: Machine - Agent Bundle - 64-bit `solaris-sparcv9.zip`
  - For x86 machine: Machine Agent Bundle - 64-bit `Solaris.zip`
5. Unzip the agent Zip bundle:

```
unzip <zip-bundle.zip> -d <machine_agent_home>
```

where `<machine_agent_home>` is the install directory.

6. Gather your configuration details and configure the agent by editing `<machine_agent_home>/conf/controller-info.xml` file or by adding system properties to the JVM startup script file. See [Plan the Machine Agent Configuration](#).
  - a. *(Required)* Configure the Controller host name, port number, and account access key.
  - b. *(Required for Multi-Tenant Mode or SaaS installations)* Configure the Agent Account Information. See [Multi-Tenant Controller Accounts](#).
  - c. *(Optional)* Review memory requirements. See [Machine Agent Requirements and Supported Environments](#).
  - d. *(Optional)* Configure the agent to use SSL. See [Enable SSL for Machine Agent](#).
  - e. *(Optional)* Configure the agent to use proxy settings. See [Machine Agent Configuration Properties](#).
  - f. *(Optional)* Determine if you need to specify an application name and tier name. See [Machine Agent Installation Scenarios](#).  
However, if you are installing the Machine Agent on the same server with any APM app agent, do not specify the application name and tier name.
7. Start the agent from the command line:

```
% <machine_agent_home>/bin/machine-agent
```

8. Verify that the Agent is reporting to the Controller.

## Windows Install Using ZIP with Bundled JRE

This page describes how to install Windows using ZIP with bundled JRE.

For some versions of Windows Server 2008 and Windows Vista, the Avg Read and Write Time disk metrics are reported as 0. This is due to a known Microsoft Windows bug. See [Microsoft Knowledge Base](#). If this affects you, download the available hotfix. This refers to the following metrics:

- Hardware Resources|Disks|<mount\_point>|Avg Read Time (ms)
- Hardware Resources|Disks|<mount\_point>|Avg Write Time (ms)

## Install the Agent

1. Before installing, see [Install the Machine Agent](#).
2. Install all available Windows updates.
3. If you have not restarted your machine recently, you must restart it. Failure to do so may cause your machine to experience a CPU spike when you start the Machine Agent.
4. Download and unzip the Windows ZIP bundle. Extract the contents to the agent installation directory <machine\_agent\_home>.
5. Gather your configuration details and configure the agent by editing the <machine\_agent\_home>/conf/controller-info.xml file or by adding system properties to the JVM startup script file. See [Plan the Machine Agent Configuration](#).
  - a. *(Required)* Configure the Controller host name, port number, and account access key.
  - b. *(Required for Multi-Tenant Mode or SaaS installations)* Configure the Agent Account Information. See [Multi-Tenant Controller Accounts](#).
  - c. *(Optional)* Review memory requirements. See [Machine Agent Requirements and Supported Environments](#).
  - d. *(Optional)* Configure the agent to use SSL. See [Enable SSL for Machine Agent](#).
  - e. *(Optional)* Configure the agent to use proxy settings. See [Machine Agent Configuration Properties](#).
  - f. *(Optional)* Determine if you need to specify an application name and tier name. See [Machine Agent Installation Scenarios](#).

However, if you are installing the Machine Agent on the same server with any APM app agent, do not specify the application name and tier name.

6. Start the agent. If no `-D` options are required on the command line, you can run the following `.vbs` scripts by selecting them from Windows Explorer.
  - a. As a Windows Service - Administrative privileges are required. You can specify AppDynamics-specific `-D` options from the command line or edit the controller-info.xml. You can also add other JVM properties as needed.

Open a terminal window and enter one of the following commands:

- Run this command to install the service. It doesn't automatically address the [Unquoted Service Path Enumeration Vulnerability](#).

```
cscript <machine_agent_home>\InstallService.vbs <jvm_options>
```

- Run this command to install the service and automatically address the [Unquoted Service Path Enumeration Vulnerability](#). It detects the space in the service path and adds double quotes (") to the service path.

```
script <machine_agent_home>\InsallServiceWrapper.vbs <jvm_options>
```

You can now start or stop the AppDynamics Machine Agent service from Windows Services.

- b. From an application in the terminal window, enter:

```
cscript <machine_agent_home>\bin\machine-agent.vbs.
```

The usage parameters for `machine-agent.vbs` are:

### Using machine-agent.vbs

```
> machine-agent.vbs -h
Usage: machine-agent.vbs[-h] [-j JAVA_HOME][-Dprop1 ...] [-Xprop2 ...]
Start the machine agent.
 -h print command line options
 -j JAVA_HOME set java home for the agent
 -Dprop1 set standard system properties for the agent
 -Xprop2 set non-standard system properties for the agent
```

The following is an example of machine-agent.vbs:

```
> cscript machine-agent.vbs -Dappdynamics.controller.hostName=192.168.1.20
-Dappdynamics.controller.port=8090
```

### Unquoted Service Path Enumeration Vulnerability

If you have installed Machine Agent primarily as a Windows service, you may encounter a security vulnerability known as Unquoted Service Path Enumeration Vulnerability.

Unquoted Service Path Enumeration Vulnerability occurs when the remote Windows host has at least one service installed that uses an unquoted service path, which contains at least one whitespace. A local attacker can gain elevated privileges by inserting an executable file in the path of the affected service.

To address this vulnerability, perform either of the following methods.

#### Method 1 (recommended)

Open a terminal window and run the following command:

```
script <machine_agent_home>\InstallServiceWrapper.vbs <jvm_options>
```

This command installs the service and if there is space in the service path, it adds double quotes to the service path.

#### Method 2

1. Navigate to `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Services\Appdynamics Machine Agent`.
2. Change the `ImagePath` data value to enclose `C:\Program Files\AppDynamics\AppD_Infra_Monitoring\bin\MachineAgentService.exe` in double quotation marks.

Example:

```
"C:\Program Files\AppDynamics\AppD_Infra_Monitoring\bin\MachineAgentService.exe"
```

### Method 3

1. Download the [Windows\\_Path\\_Enumerate.ps1](#) script and save it to a folder.
2. To list all vulnerabilities on the machine, open the powershell prompt and execute the following command:

```
<path containing downloaded Windows_Path_Enumerate.ps1>\Windows_Path_Enumerate.ps1
-FixUninstall -FixEnv -WhatIf
```

3. Fix all vulnerabilities on the machine by executing the following command:

```
<path containing downloaded Windows_Path_Enumerate.ps1>\Windows_Path_Enumerate.ps1
-FixUninstall -FixEnv
```

### Deploy Multiple Machine Agents From a Common Directory

You can deploy the Machine Agent on multiple hosts from one central directory. This setup provides an easier method to update the agent because each agent instance starts from one set of executables in one central location.

#### Workflow Description

1. Set up the central agent directory:
  - a. Install the Machine Agent executables and config files in a central directory, such as an NFS-mounted shared directory.
  - b. Specify properties common to all remote agents in this central directory.
2. Configure each remote host to start an instance of the agent from this central directory:
  - a. Specify properties that are unique to the agent on that host, either in a startup script or on the command line.
  - b. Configure a startup script to start an instance of the Machine Agent from the central agent directory.

#### Set Up the Central Agent Directory

1. Download the latest Machine Agent ZIP file. See [Download AppDynamics Software](#).
2. Unzip the downloaded file to the desired root directory (< [central-agent-root-directory](#) >) on the central host.
3. Specify the properties common to all Machine Agent instances running on all remote hosts. Examples of common properties include the account name, and the Controller host and port. You specify these properties in [<central-agent-root-directory>/conf/controller-info.xml](#).

#### Configure Each Remote Host to Start an Agent Instance

On each Machine Agent host, specify the properties unique to that agent such as: runtime directory, application name, tier name, and node name. To specify these properties, configure `-D` parameters in the startup script or on the command line. For example, the startup script on a remote host might include the following command:

```
<central_agent_root_directory>/bin/machine-agent
-Dappdynamics.agent.runtime.dir=<agent_runtime_dir>
-Dappdynamics.agent.applicationName=<application_name>
```

You should specify a unique runtime directory for each remote host to ensure that log files for each agent instance are saved to a separate directory. The agent log directory is located under the agent runtime directory, which you specify in the `-Dappdynamics.agent.runtime.dir` system property. The log directory is directly under the runtime directory ( `<agent-runtime-dir>/logs` ).

- Specify the runtime directory as an absolute path in the startup script on the remote host:

```
-Dappdynamics.agent.runtime.dir=<absolute_path_to_local_agent_runtime_directory>
```

- To change the log directory and file name from the default value, edit the file `<machine-agent-home>/confs/logging/log4.xml` . Change the value of the `"FileAppender" > "fileName"` and `"FileAppender" > "filePattern"` parameters to the desired directory and file name.
- The file-system permissions must allow creation of the log directory and file.

## Verify the Machine Agent Installation

### Related pages:

- [FAQs and Troubleshooting for the Machine Agent](#)
- [Machine Agent Configuration Properties](#)

### Check Agent Logs

After a successful install, the agent log at `<machine_agent_home>/logs` , should contain the following message:

```
Started AppDynamics Machine Agent Successfully
```

If the agent log file is not present, the Machine Agent may not be accessing the command properties. To troubleshoot, check the application server log file where STDOUT is logged. It has the fallback log messages, which are useful for troubleshooting the agent.

## Verify that the Agent is Reporting to the Controller

1. From the Controller Top Navigation Bar, select **Settings > AppDynamics Agents**.
2. Click the Machine Agents tab.  
The listing for the Machine Agent displays. If you do not see the Machine Agent listed, check your property settings in `<machine_agent_home>/conf/controller-info.xml` . See [Resolve Machine Agent Installation Problems](#).

### Machine Agent Not Reporting

If it seems that the Machine Agent is not reporting to the Controller, see [Machine Agent Not Reporting](#) article in the Community Knowledge Base.

## Resolve Machine Agent Installation Problems

### Related pages:

- [FAQs and Troubleshooting for the Machine Agent](#)
- [Machine Agent Configuration Properties](#)

### Verify That the Agent Process is Running

Use the following command to verify that the agent process is running:

#### Linux:

```
ps -ef | grep machine
```

#### Windows:

1. Open a command line console.
2. Start the Task Manager and click the Processes tab.
3. The [agent process](#) should be running. If it is not running, stop and then restart the agent.

### Resolve Agent Connectivity Problems

Make sure you have [configured](#) the Controller IP address, Controller port number, and Account Access Key in the agent startup command, script or plist, or in the controller-info.xml file.

After configuring, restart the agent and check the behavior. Machine Agent log files may also provide troubleshooting information.

If you start the Machine Agent, and it cannot register with the Controller or associate with the same node in the Controller, then the stack trace may indicate the reason.

For example, the following message in the stack trace may indicate that the application, tier, and node information was not provided during the Machine Agent startup command or in the controller-info.xml file.

```
<execution-output>System agent 239590 not associated with application, metric registration request refused.</execution-output>
```

## Start and Stop the Machine Agent

This page contains a summary of the `start` and `stop` commands for the Machine Agent. See [Permissions Required to Run the Machine Agent](#).

### Running the Machine Agent with a Non-Bundled JRE

To run the Machine Agent with the default JRE on the machine (rather than the JRE bundled with the agent), you should first install a non-JRE version of the Machine Agent, and then run the non-JRE agent instead. See [Install Using the Non-JRE Zip File](#).

### Start the Machine Agent

To start the Machine Agent with the bundled JRE, see [Install the Machine Agent](#).

To start the Machine Agent without the bundled JRE, specify the Java version and customize the `<path/to/java_location>` using the `-j` parameter and version `JRE >= 1.8`, see [Machine Agent Requirements and Supported Environments](#) and [Install Using the Non-JRE Zip File](#). Make certain the path is valid and accessible for all users who start the Machine Agent.

```
<machine_agent_home>/bin/machine-agent -j <path/to/java_location>
```

For information on additional Java arguments, see:

- [Machine Agent Configuration Properties](#)
- [Metrics Limits](#)
- [Machine Agent HTTP Listener](#)

## RPM-based Linux Systems

If you installed using the Linux RPM, start the Machine Agent:

- SysV systems: `service appdynamics-machine-agent start`
- systemd systems: Use the Machine Agent service launcher and enter: `systemctl start appdynamics-machine-agent`

## Linux and Solaris Systems

If you installed using the JRE bundled zip archive for Linux and Solaris, run the launcher:

- Linux: `<machine_agent_home>/bin/machine-agent -d -p <machine_agent_home>/pidfile`
- Solaris: `<machine_agent_home>/bin/machine-agent -d -p <machine_agent_home>/pidfile`

## Windows Systems

See [Windows Install Using ZIP with Bundled JRE](#).

## Stop the Machine Agent

### Non-JRE Bundled Zip Archive

If the Machine Agent process is running in the background, you can stop it by entering the `kill` command with the [process ID](#) as the argument. If it is running in the foreground in a console, press Ctrl+C to shut down the agent.

### RPM-based Linux Systems

SysV: Use the service launcher:

```
% service /etc/init.d/appdynamics-machine-agent stop
```

systemd: Use the systemd unit file:

```
% systemctl stop appdynamics-machine-agent
```

## Linux and Solaris Systems

Running in the Foreground: Press Ctrl+C to stop the agent process.

Running in the Background: Identify the process ID (PID) and use the `kill` command.

1. Identify the agent process: `ps -ef | grep machineagent`.  
 The output provides the process ID (PID) of the Machine Agent process.
2. Stop the agent process: `kill <machine_agent_PID>`.

## Windows

In the foreground in a console window: Use Ctrl+C to shut down the agent.

As a Windows Service: Stop the service using either of these methods:

- In the Windows Services application, select **AppDynamics Machine Agent** and click **Stop**.
- Use the `MachineAgentService` command:

```
C:\> <machine_agent_home>\bin\MachineAgentService.exe /stop
```

## Mac OS X

As a background process: Enter the `kill` command with the [process ID](#) as the argument.

As a service: From the bash command line:

```
> sudo launchctl unload -w <machine_agent_home>/com.appdynamics.machineagent.plist
```

## Permissions Required to Run the Machine Agent

This page describes the permissions needed to run the Machine Agent. During installation, the default user for running the Machine Agent is set to root. This is because the only user that is standard on a UNIX or Linux system is root and we do not want to create users on your system. We recommend that you create a non-root user, for example `<machine_agent_user>`, and assign the appropriate permissions to that user. See [Install the Machine Agent](#).

For all environments, create a specific user with the necessary read/write/execute permissions.

- All files in the `<machine-agent-home>` installation directory should be readable by the Machine Agent.
- The user that runs the Machine Agent must have write privileges to the logging output directory and to the `/conf` directory in the agent installation directory.
- Additionally, the user that runs the Machine Agent needs execute access.

## Important Notes

- You do not need to run the Machine Agent from a root or administrator account. However, if you enable the [JVM Crash Guard](#) on a monitored application running from a root or administrator account, then the Machine Agent requires root or administrator privileges to access the monitored application's JVM process and directory listings for crash files.
- You need to run with administrator or root privileges if you want to monitor networks or disks that are only available to the administrator or root user.
- The user that runs the Machine Agent must have write privileges to the `conf` and `logs` directories in the `<machine_agent_home>` directory.
- The Machine Agent implements a shutdown hook, so issuing the `kill` command (or Ctrl+C) from the operating system will cause the agent to perform a graceful shutdown.
- If the Machine Agent is not run by the root user or administrator user, the user that runs the Machine Agent should have permissions to execute the listed commands for the following environments. These commands are the source of metric collection.

---

## AIX

- awk
- cat
- cut
- date
- grep
- head
- ifconfig
- lparstat
- lsattr
- lsdev
- netstat
- ps
- svmon
- tail
- tr
- oslevel
- prtconf
- uname
- df
- iostat
- sed
- uptime

## Linux

- awk
- basename
- cat
- df
- chroot
- date
- free
- getconf
- ip
- lsblk
- ps
- readlink
- sed
- tail
- tr
- uname
- uptime
- vmstat

## Windows

Windows permissions for files and subfolders are inherited by default from the parent folder (<machine\_agent\_home>). You should restrict permissions to users authorized to start, stop, and configure the Machine Agent:

- Read and Write permissions to all files and subfolders under <machine-agent-home>
- (If running as a terminal application) Read, Write, and Execute permissions for the file <machine-agent-home>\bin\machine-agent.vbs
- (If running as a service) Start, Stop, and Restart permissions for the Machine Agent service. You only need admin privileges to install the service. The Machine Agent runs under the local system account which has extensive privileges on the local system,

---

so you do not need to run the Machine Agent as Administrator, unless WMI access is revoked. Normal users typically have WMI access. See <https://technet.microsoft.com/en-us/library/cc771551.aspx>.

## Mac OS X, AIX, HP-UX, and Z/OS

There are no particular execute privileges required.

## Solaris System Utilities

- awk
- cat
- cut
- df
- dladm
- grep
- head
- ifconfig
- iostat
- isainfo
- kstat
- mpstat
- nawk
- netstat
- pagesize
- ps
- psrinfo
- sed
- swap
- tail
- tr
- uname
- uniq
- uptime
- vmstat
- wc
- zpool

## JVM Crash Guard

If you plan to enable JVM Crash Guard, see [JVM Crash Guard](#) for additional required permissions.

## Configure the Machine Agent

### Related pages:

- [Plan the Machine Agent Configuration](#)
- [.NET Compatibility Mode](#)
- [Enable the Analytics Agent as an Extension to the Machine Agent](#)

AppDynamics provides flexibility for configuring the Machine Agent so that you can choose the best fit for your deployment environment.

Not all options are available for all properties. See [Machine Agent Configuration Properties](#).

## Configure the Machine Agent Properties

You can configure the Machine Agent by:

- Editing the `controller-info.xml` file located in the `<machine_agent_home>/conf` directory.
- Adding Agent system properties ( `-D<system_property>` ) to the Machine Agent start-up script or on the command line.
- Using environment variables. To configure the Agent with environment variables, set the value of the environment variable in the environment where the monitored application runs and restart the Agent. Environment variables exist for most of the Agent settings in the `controller-info.xml` file , but not all settings are configurable through environment variables. For those settings, you need to use system properties or `controller-info.xml` . See [Machine Agent Configuration Properties](#).

Empty spaces and special characters are not allowed in either the full path to the Machine Agent home directory, or in the directory name itself. If the Machine Agent does not start up, review the path to determine if it contains empty spaces or special characters. For example, the path `/opt/appdynamics/ machine agent` is problematic, however, the path `/opt/appdynamics/ machine-agent` works correctly.

The JVM system properties and environment variables override the settings in the `controller-info.xml` file. The Agent applies the first non-empty value for a configuration property. The Machine Agent applies configurations using the following sources (in order).

1. Environment variables
2. System properties passed in the `start` command for the JVM
3. Global configuration file: `<machine-agent-home>/conf/controller-info.xml`

See [Where to Specify Machine Agent Configuration](#) for OS environment and install package details

## Example Configuration

### Machine Agent controller-info.xml File

```
<?xml version="1.0" encoding="UTF-8"?>
<controller-info> <controller-host>your-controller-host</controller-host>
 <controller-port>your-controller-port</controller-port>
 <account-access-key>your-access-key</account-access-key>
 <controller-ssl-enabled>>true</controller-ssl-enabled>
 <enable-orchestration>>false</enable-orchestration>
 <sim-enabled>>false</sim-enabled>
 <unique-host-id>your-host-id</unique-host-id>
 <account-name>your-account-name</account-name>
</controller-info>
```

### bash command-line Example

```
<machine_agent_home>/bin/machine-agent -Dappdynamics.controller.hostName=your-controller-host
-Dappdynamics.controller.port=your-controller-port -Dappdynamics.agent.accountAccessKey=your-
access-key -Dappdynamics.agent.uniqueHostId=your-host-id
-Dappdynamics.agent.accountName=your-account-name
```

## Where to Specify Machine Agent Configuration

### Related pages:

- [Install the Machine Agent](#)
- [Plan the Machine Agent Configuration](#)
- [Machine Agent Configuration Properties](#)

You configure Agent system properties in different ways based on your operating system and whether you are starting the Agent from the command line or as a service.

### Linux As a Service

- SysV service launcher:  
Specify the Agent system properties in the `<machine_agent_home>/etc/sysconfig/appdynamics-machine-agent` configuration file, and edit the `JAVA_OPTS` environment variable.
- systemd:  
Specify the Agent system properties in the `<machine_agent_home>/etc/systemd/system/appdynamics-machine-agent.service` file, and edit the `JAVA_OPTS` environment variable.

### Any UNIX-like System

When starting the Agent application on the command line for an UNIX-like system ((Linux, Solaris, Mac, AIX, and so on) using the `machine-agent` command, specify the agent system properties on the command line:

- Run agent in the background:  
`% nohup <machine_agent_home>/bin/machine-agent -D<system_property1>=<value1> -D<system_property2>=<value2> ... &`
- Run agent in the foreground:  
`% <machine_agent_home>/bin/machine-agent -D<system_property1>=<value1> -D<system_property2>=<value2> ...`

### Windows

 Admin privileges are required to install and start a Windows service.

When installing and starting a Windows service, specify AppDynamics-specific `-D` options on the command line or in `controller-info.xml`.

If the Machine Agent is a VM (non-container), you can start or run it as a non-privileged user. Non-privileged users should have read access to the following WMI classes:

- Win32\_PerfRawData\_PerfDisk\_LogicalDisk
- Win32\_LogicalDisk
- Win32\_Processor
- Win32\_PerfRawData\_PerfOS\_Processor
- Win32\_NetworkAdapter
- Win32\_NetworkAdapterConfiguration
- Win32\_PerfRawData\_Tcpip\_NetworkInterface
- Win32\_Process
- Win32\_PerfRawData\_PerfProc\_Process
- Win32\_ComputerSystem
- Win32\_PerfRawData\_PerfOS\_System
- Win32\_OperatingSystem
- Win32\_PerfRawData\_vmGuestLib\_VCPU (VMWare)

## Mac OS X

Start the Agent service using the `<machine_agent_home>/osx-install.sh` script and specify the Agent system properties on the command line:

```
> sh <machine_agent_home>/osx-install.sh -D<system_property1>=<value1> -D<system_p
roperty2>=<value2> ...
```

When you run the `<machine_agent_home>/osx-install.sh` script, the `<machine_agent_home>/com.appdynamics.machineagent.plist.template` is updated with the installation directory and the java properties set for the Machine Agent.

## Machine Agent Configuration Properties

This page describes the Agent configuration properties, including `controller-info.xml` elements, system property options (on the command line or in the startup script), and environment variables (where applicable). You configure Agent system properties based on your operating system and installation package.

The Agent updates dynamically in response to Agent configuration property changes, so you do not need to restart the Agent.

### System Property Syntax

- System properties are case-sensitive
- Values that contain spaces must be enclosed with double-quotes

## Reference

### .NET Compatibility Mode

You must enable this mode if you want to collect and view Machine or Server metrics on a server with Machine and .NET Agents installed. See [.NET Compatibility Mode](#).

*Element in controller-info.xml:* `<dotnet-compatibility-mode>`

System Property:

```
- Dappdynamics.machine.agent.dotnetCompatibilityMode
```

*Environment Variable:* N/A

*Type:* boolean

*Default:* false

*Required:* This mode is required if you want to collect and view Machine or Server metrics on a server with Machine and .NET Agents installed.

### Account Access Key

The account access key used to authenticate with the Controller. This key is generated during installation, and you can locate the key by reviewing the license information in the Controller Settings. See [Observe License Usage](#).

*Element in controller-info.xml:* `<account-access-key>`

*System Property:* - `Dappdynamics.agent.accountAccessKey`

*Environment Variable:* APPDYNAMICS\_AGENT\_ACCOUNT\_ACCESS\_KEY

*Type:* String

*Default:* None

*Required:* Prior to version 4.1, this property was required only for SaaS and multi-tenant Controllers. For versions 4.1 and later, the account access key property is required to authenticate all agent to Controller communications.

*Example:* - Dappdynamics.agent.accountAccessKey=165e65645-95c1-40e3-9576-6a1424de9625

### Account Name

The account name used to authenticate with the Controller. If you are using the AppDynamics SaaS Controller, the Account Name is provided in the Welcome email sent by AppDynamics.

*Element in controller-info.xml:* <account-name>

*System Property:* - Dappdynamics.agent.accountName

*Environment Variable:* APPDYNAMICS\_AGENT\_ACCOUNT\_NAME

*Type:* String

*Default:* None

*Required:* For AppDynamics SaaS Controller and multi-tenant users, but not for single-tenant mode (the default).

### Agent Logging Directory

Deprecated. `appdynamics.agent.logs.dir` should be used instead. Behavior identical to Agent Logs Directory: <appdynamics.agent.logs.dir>/logs/ .

*System Property:* - Dappdynamics.agent.logging.dir

*Environment Variable:* N/A

*Type:* String

*Default:* None

*Required:* No

### Agent Logs Directory

Sets the logs directory for log files for nodes that use this agent installation. If this property is specified, all agent logs are written to <appdynamics.agent.logs.dir>/logs. See [Deploy Multiple Machine Agents From a Common Directory](#) when deploying multiple Machine Agents from a common directory. This property overrides the directory specified through the `appdynamics.agent.runtime.dir`. If `appdynamics.agent.logs.dir` property is not provided, the logs directory will be created on the same level as the Machine Agent installation folder. No changes are expected in `log4j.xml` file.

*System Property:* - Dappdynamics.agent.logs.dir

*Environment Variable:* N/A

*Type:* String

*Default:* None

*Required:* No

### Agent Runtime Directory

Sets the runtime directory for all runtime files (such as logs) for nodes that use this Agent installation. If you specify this property, then all Agent logs are written to `<agent-runtime-dir>/logs/node-name`. Use when deploying multiple Machine Agents from a common directory. See [Deploy Multiple Machine Agents From a Common Directory](#).

*Element in controller-info.xml:* `<agent-runtime-dir></agent-runtime-dir>`

*System Property:* - `Dappdynamics.agent.runtime.dir`

*Environment Variable:* N/A

*Type:* String

*Default:* None

*Required:* No

### Container Process Selector Blocklist Regex

Any container with a process matching this regex is ignored and is not registered in the Controller.

*System Property:* - `Dappdynamics.docker.container.process.selector.blacklist.regex`

*Environment Variable:* `APPDYNAMICS_DOCKER_CONTAINER_PROCESS_SELECTOR_BLACKLIST_REGEX`

*Type:* String

*Default:* None

*Required:* No

### Controller Host

This is the host name or IP address of the AppDynamics Controller, for example: `192.168.1.22` or `myhost` or `myhost.abc.com`. This is the same host used to access the AppDynamics browser-based user interface.

*Element in controller-info.xml:* `<controller-host>`

*System Property:* - `Dappdynamics.controller.hostName`

*Environment Variable:* `APPDYNAMICS_CONTROLLER_HOST_NAME`

*Type:* String

*Default:* None

*Required:* If the Enable Orchestration property is false.

If Enable Orchestration is true, and if the Agent is deployed in a compute cloud instance created by an AppDynamics workflow, do not set the Controller host unless you want to override the auto-detected value. See [Enable Orchestration Property](#).

## Controller Keystore Filename

By default, the Agent looks for a Java truststore file named `cacerts.jks` in the `conf` directory in the Agent home. Use this property to enable full validation of Controller SSL certificates with a different Java truststore file. See [Machine Agent Configuration Properties](#).

*Element in controller-info.xml:* `<controller-keystore-filename>`

*System Property:* N/A

*Environment Variable:* N/A

*Type:* String

*Default:* None

*Required:* No

## Controller Keystore Password

The plain text or encrypted value of the Controller certificate password. To encrypt or obfuscate passwords, see [Encrypt Agent Credentials](#).

*Element in controller-info.xml:* `<controller-keystore-password>`

*System Property:* N/A

*Environment Variable:* N/A

*Type:* String

*Default:* None

*Required:* No

## Controller Port

The HTTP(S) port of the AppDynamics Controller. This is the same port that you use to access the AppDynamics browser-based user interface. If the Controller SSL Enabled property is set to true, specify the HTTPS port of the Controller; otherwise, specify the HTTP port. See [Controller SSL Enabled Property](#).

*Element in controller-info.xml:* `<controller-port>`

*System Property:* - `Dappdynamics.controller.port`

*Environment Variable:* `APPDYNAMICS_CONTROLLER_PORT`

*Type:* Positive Integer

*On-premises Default:* port 8090 for HTTP and port 8181 for HTTPS

*SaaS Default:* For the SaaS Controller Service, use port 443 for HTTPS connections.

*Required:* If the Enable Orchestration property is false.

If Enable Orchestration is true, and if the Agent is deployed in a compute cloud instance created by an AppDynamics workflow, do not set the Controller port unless you want to override the auto-detected value. See [Enable Orchestration Property](#).

---

## Controller SSL Enabled

Specifies whether the Agent should use SSL (HTTPS) to connect to the Controller. If SSL Enabled is true, set the Controller Port property to the HTTPS port of the Controller. See [Controller Port Property](#).

*Element in controller-info.xml:* `<controller-ssl-enabled>`

*System Property:* - `Dappdynamics.controller.ssl.enabled`

*Environment Variable:* `APPDYNAMICS_CONTROLLER_SSL_ENABLED`

*Type:* Boolean

*Default:* false

*Required:* No

## Create Node if Absent

Force the Machine Agent to create an APM node when the Agent registers with the Controller.

*Element in controller-info.xml:* `<create-node-if-absent>`

*System Property:* - `Dappdynamics.machine.agent.registration.createNodeIfAbsent`

*Environment Variable:* N/A

*Type:* Boolean

*Default:* true

*Required:* No. If you set the app/tier/node in your `controller-info.xml` file (existing upgrades or by accident), you can prevent the Machine Agent from creating APM nodes by setting this flag to false. See [Machine Agent Installation Scenarios](#).

## Enable Docker Visibility

To enable [Docker Visibility](#) on the Agent, manually add the docker-enabled element in `controller-info.xml` setting, and set the flag to `true`.

*Element in controller-info.xml:* `<docker-enabled>true</docker-enabled>`

*System Property:* - `Dappdynamics.docker.enabled`

*Environment Variable:* `APPDYNAMICS_DOCKER_ENABLED`

*Type:* Boolean

*Default:* false

*Required:* Yes

## Enable HTTP Listener

When set to `true`, this property enables the Machine Agent HTTP listener. You can send metrics to the Machine Agent using its HTTP listener. You can report metrics through the Machine Agent by making HTTP calls to the Agent instead of piping to the Agent through `sysout`.

*Element in controller-info.xml:* N/A

*System Property:* - `Dmetric.http.listener`

---

*Environment Variable:* N/A

*Type:* Boolean

*Default:* false

*Required:* No

### Enable Orchestration

Enables the Machine Agent workflow task execution when set to `true`. It also enables auto-detection of the Controller host and port when the app server is a compute cloud instance created by an AppDynamics orchestration workflow. In a cloud computing environment, auto-detection is necessary for the Create Machine tasks in the workflow to run correctly. The Machine Agent polls for task executions only when orchestration is enabled. If the host machine on which this Agent resides is not created through AppDynamics workflow orchestration, this property should be set to `false`. See [Controller Host Property](#) and [Controller Port Property](#).

*Element in controller-info.xml:* `<enable-orchestration>`

*System Property:* N/A

*Environment Variable:* N/A

*Type:* Boolean

*Default:* false

*Required:* No

### Force Default SSL Certificate Validation

Used to override the default behavior for SSL validation.

This property has three states:

*true:* Forces the Agent to perform full validation of the certificate sent by the Controller, enabling the Agent to enforce the SSL trust chain. Use this setting when a public certificate authority(CA) signs your Controller SSL certificate.

*false:* Forces the Agent to perform minimal validation of the certificate. This property disables full validation of the Controller's SSL certificate. Use this setting when full validation of a SaaS certificate fails.

*unspecified:* The validation performed by the Agent depends on the context:

- If the Agent is connecting to a SaaS Controller, full validation is performed.
- If the Agent is connecting to an on-premises Controller and the `cacerts.jks` file is present, then full validation is performed using the `cacerts.jks` file.
- If the Agent is connecting to an on-premises Controller, and there is no `cacerts.jks` file, then minimal validation is performed

*Element in controller-info.xml:* N/A

*System Property:* - `Dappdynamics.force.default.ssl.certificate.validation`

*Environment Variable:* N/A

*Type:* Boolean

---

*Default:* None

*Required:* No

### Enable Dynamic Monitoring Mode (DMM)

When this option is enabled, the Agent reports metrics based on the Dynamic Monitoring Mode specified for that Agent in the Controller. When this option is disabled, the Agent reports all metrics based on its local configuration; DMM settings on the Controller have no effect. Disabling DMM on an Agent is recommended only for mission-critical servers and other machines for which you are sure you want to collect all available metrics at all times. See [Dynamic Monitoring Mode and Server Visibility](#).

*Element in controller-info.xml:* <dynamic-monitoring-enabled>

*System Property:* appdynamics.machine.agent.dynamicMonitoring.enabled

*Environment Variable:* APPDYNAMICS\_DYNAMIC\_MONITORING\_ENABLED

*Type:* Boolean

*On-premises Default:* True

*SaaS Default:* True

*Required:* No

### HTTP Listener Port

To enable the Machine Agent HTTP listener, you must also specify the HTTP listener port.

*Element in controller-info.xml:* N/A

*System Property:* - `Dmetric.http.listener.port`

*Environment Variable:* N/A

*Type:* Numeric

*Default:* 8293

*Required:* Only if the HTTP listener is enabled.

### Log4j

Logging functionality is done via Apache Log4j2. Use this property to provide a custom location for log4j configuration. In this case, you need to ensure that all file destinations are valid and contain absolute paths.

*Element in controller-info.xml:* N/A

*System Property:* - `Dlog4j.configurationFile`

*Environment Variable:* N/A

*Type:* Numeric

*Default:* None

*Required:* No

## Machine Hierarchy

You need a Server Visibility license to use this feature.

This setting enables you to group servers together into arbitrary hierarchies by specifying a hierarchical path to the server. The server hierarchy displays in the Metric Browser and on the Server Dashboard. The server hierarchy is also used to select subgroups of machines for health rules. The last element of the path indicates the server name (a name of your choice). This name appears as the Name on the Servers list. If the path contains spaces, then you must enclose it in double-quotes. See [Machine Agent Hierarchy](#).

*Element in controller-info.xml:* `<machine-path>`

*System Property:* - `Dappdynamics.machine.agent.hierarchyPath`

*Environment Variable:* `APPDYNAMICS_MACHINE_HIERARCHY_PATH`

*Type:* ASCII string with path elements that are separated by a "|" (bar).

*Default:* The value specified by [Unique Host ID](#). If the last part of the machine hierarchy is empty, the Unique Host ID is the machine name. For example, if machine hierarchy is "Data Center 1|Rack 2|" and Unique host ID is "Host ID 3", then the machine hierarchy will become "Data Center 1|Rack 2|Host ID 3".

*Required:* No

*Limitation:* The length of the characters composing the machine-path up to, but not including, the last pipe cannot exceed 95 characters.

*Examples:*

- *System Properties:* - `Dappdynamics.machine.agent.hierarchyPath= "Data Center 1|Rack 2|Machine3"`
- *controller-info.xml:*

```

<machine-path>
 "Data Center 1|Rack 2|Machine3"
</machine-path>
```

- *Environment Variable:* `APPDYNAMICS_MACHINE_HIERARCHY_PATH="Data Center 1|Rack 2|Machine3"`

## Proxy Host

The proxy host name or IP address. The HTTP property works for both http and https proxy configuration. Proxy authentication cannot be used with SSL.

*Element in controller-info.xml:* N/A

*System Property:*

- `Dappdynamics.http.proxyHost`

*Environment Variable:* N/A

*Type:* String

*Default:* None

*Required:* If using a proxy to connect to the Controller; otherwise this is not required.

---

## Proxy Password File

The absolute path to the file containing the password of the user that is authenticated by the proxy host. The password must be the first line of the file.

If `<use-encrypted-credentials>` is set to false, enter the password in plain text. If `<use-encrypted-credentials>` is set to true, encrypt the password. See [Encrypt Agent Credentials](#).

*Element in controller-info.xml:* N/A

*System Property:* - `Dappdynamics.http.proxyPasswordField`

*Environment Variable:* N/A

*Type:* String

*Default:* None

*Required:* No

*Example:* `-Dappdynamics.http.proxyPasswordField=/path/to/file-with-password`

## Proxy Port

The proxy HTTP(S) port. The proxy host name or IP address. The HTTP property works for both http and https proxy configuration. The default ports are 8090 (HTTP) and 443 (HTTPS).

*Element in controller-info.xml:* N/A

*System Property:*

- `Dappdynamics.http.proxyPort`

*Environment Variable:* N/A

*Type:* Positive Integer

*Default:* None

*Required:* Yes, if using a proxy to connect to the Controller. Otherwise, no.

## Proxy User Name

The name of the user that is authenticated by the proxy host.

*Element in controller-info.xml:* N/A

*System Property:* - `Dappdynamics.http.proxyUser`

*Environment Variable:* N/A

*Type:* String

*Default:* None

*Required:* No

## Server Visibility Enabled

Enable [Server Visibility](#) on the Agent. This requires a Server Visibility license.

*Element in controller-info.xml:* `<sim-enabled>`

*System Property:* - `Dappdynamics.sim.enabled`

*Environment Variable:* `APPDYNAMICS_SIM_ENABLED`

*Type:* Boolean

*Default:* false

*Required:* Required to enable Server Visibility. See [Enable Server Visibility](#).

### Service Availability Update Interval

This setting controls the time, in milliseconds, to wait between sending Service Availability periodic events to the Controller. See [Service Availability](#).

*Element in controller-info.xml:* `<sam-event-update-interval-millis>`

*System Property:* - `Dappdynamics.machine.agent.sam.event.updateIntervalMillis`

*Environment Variable:* N/A

*Type:* Positive integer

*Default:* 300000 ms (5 minutes)

*Required:* No

### Unique Host ID

This property logically partitions a single physical host or virtual machine. In the context of installing the Machine Agent, the unique Host ID property is not required. However, if you do not define a unique Host ID, then the Machine Agent uses the Java API to retrieve the host ID. The results from the API can be inconsistent, and may cause the same JVM to return a different value for the same machine, each time the Machine Agent is restarted. To avoid these issues, AppDynamics recommends that you set the value of unique Host ID to the host ID that you want to see in the UI.

*Element in controller-info.xml:* `<unique-host-id>`

*System Property:* - `Dappdynamics.agent.uniqueHostId`

*Environment Variable:* `APPDYNAMICS_AGENT_UNIQUE_HOST_ID`

*Type:* ASCII string without spaces and must be unique across the entire managed infrastructure.

*Default:* None

*Required:* Optional, but recommended.

### Use Simple Hostname

By default (unless overridden with the `uniqueHostId` system property), the Agent determines the host name of the OS it is running in using reverse DNS lookup. In some circumstances, this host name may be set as the fully qualified domain name of the host name. If this property is set to `true`, the Agent removes any domain name and uses the simple hostname to identify the host. In cases where the host name is an IP address (which happens if the DNS lookup fails) then the full IP address in string form is used. The host name is used in mapping metrics gathered by the Machine Agent to application nodes. See [Unique Host ID Property](#).

---

*Element in controller-info.xml:* `<use-simple-hostname>`

*Type:* Boolean

*Default:* False

*Required:* No

*For example:* If this property is set to true ' `server.mydomain.com` ' becomes 'server'.

### Independent Machine Agent Install Scenario

Typically, you only use the following properties if you are installing the Machine Agent on a server that does not have any AppDynamics App Agents installed.

#### Application Name

The name of the logical business application that this JVM node belongs to. This is not the deployment name (ear/war/jar) on the application server. If a business application of the configured name does not exist, it is created automatically.

*Element in controller-info.xml:* `<application-name>`

*System Property:* - `Dappdynamics.agent.applicationName`

*Environment Variable:* `APPDYNAMICS_AGENT_APPLICATION_NAME`

*Type:* String

*Defaults:* None

*Required:* No. See [Machine Agent Installation Scenarios](#).

#### Node Name

The name of the JVM node. When not specified, this defaults to `Node1` for the Machine Agent.

*Element in controller-info.xml:* `<node-name>`

*System Property:* - `Dappdynamics.agent.nodeName`

*Environment Variable:* `APPDYNAMICS_AGENT_NODE_NAME`

*Type:* String

*Defaults:* None

*Required:* No. See [Machine Agent Installation Scenarios](#).

#### Tier Name

The name of the logical tier that this JVM node belongs to. This is not the deployment name (ear/war/jar) on the application server. If a tier of the configured name does not exist, it is created automatically.

*Element in controller-info.xml:* `<tier-name>`

*System Property:* - `Dappdynamics.agent.tierName`

*Environment Variable:* `APPDYNAMICS_AGENT_TIER_NAME`

*Type:* String

*Defaults:* None

*Required:* No. See [Machine Agent Installation Scenarios](#).

### Exclude File Cache Memory from Memory Usage

You can use the following system property to exclude the file cache memory while calculating memory usage on AIX with server visibility enabled.

If you set `<-Dappdynamics.machine.agent.collect.memoryMetrics.using.vmstat.command = true>` and `<sim_enabled = true>` for AIX, you get memory usage metrics on the Controller UI after excluding the file cache memory.

*System Property:* `-Dappdynamics.machine.agent.collect.memoryMetrics.using.vmstat.command`

*Environment Variable:* N/A

*Type:* Boolean

*Default:* `false`

*Required:* No

### Controller Settings for Machine Agents

#### Related pages:

- [Database Size and Data Retention](#)
- [Controller Settings for Server Visibility](#)

This page describes Controller Admin settings that are specific to the Machine Agent. You need the root user password to change these settings.

You can change the amount of Machine Agent data you retain in the Controller database by changing the retention period for Machine Agent snapshots. Lowering the retention settings purges data that is aged out by the new retention setting and reduces the amount of data stored by the Controller on an ongoing basis. Consider the amount of Machine Agent data to retain when tuning the size of the Controller database.

#### Change the Controller Settings for Machine Agents

1. Log in to the Controller administration console using the root user password.  
See [2023-10-19\\_05-04-05\\_Access the Administration Console](#).

```
http://<controller host>:<port>/controller/admin.jsp
```

Use the root user password to access the Admin console when the Controller is installed in single- or multi-tenant mode. See [Update the Root User Password](#).

2. Select **Controller Settings**.
3. Change the settings as needed, and then select **Save**. Changes to the settings occur the next time you restart the Agent and it connects to the Controller.

## Controller Settings Reference for Machine Agent

Property Name	Property Description	Default	Allowed Values
<code>machine.agent.in-progress.actions.timeout</code>	This property determines the length of time the Controller waits for the Agent to perform an IN-PROGRESS action before it stops the action.	864000000 ms (1 day)	1 to 840 hours (5 weeks)
<code>machine.agent.max.new.actions.per.min</code>	Maximum number of new actions dispatched per minute for each Machine Agent. This is the maximum number of "runbook" actions sent to the Machine Agent. For example, you may request the Machine Agent to run a script because of a health rule violation, if the number of requests in a one minute period is greater than the preset value, then the action is executed the next minute.	15 per minute	1 to 2899999
<code>machine.agent.pending.actions.timeout</code>	Determines how long the Controller waits for the Agent to perform a PENDING action before it stops the action.	1800000 ms (12 hrs)	
<code>machine.agent.snapshots.buffer.size</code>	Size in Megabytes of the in-memory buffer storing machine snapshots uploaded from Agents prior to database flush.	50 MB	
<code>machine.snapshots.retention.period</code>	Time in hours to retain server snapshot data.	336 hours (2 weeks)	1 to 840 hours (5 weeks)

### Enable SSL for Machine Agent

#### Related pages:

- [Secure the Platform](#)
- [Controller SSL and Certificates](#)
- [Install the Machine Agent](#)

This page describes how to configure the AppDynamics Machine Agent to connect to the Controller using SSL. It assumes that you use a SaaS Controller or have configured the on-premises Controller to use SSL.

The Machine Agent supports extending and enforcing the SSL trust chain when in SSL mode.

## Plan SSL Configuration

Gather this information:

- The Controller SSL port:
  - For SaaS Controllers: SSL port is 443
  - For on-premises Controllers: Default SSL port is 8181, but you may configure the Controller to listen for SSL on another port
- The signature method for the Controller's SSL certificate:
  - A publicly known certificate authority (CA) signed the certificate. This applies for DigiCert, Verisign, Thawte, and other commercial CAs.
  - A CA internal to your organization signed the certificate. Some companies maintain internal certificate authorities to manage trust and encryption within their domain.
  - The Controller uses a self-signed certificate.

## Establish Trust for the Controller's SSL Certificate

To establish trust between the Machine Agent and the AppDynamics Controller, you must create an agent truststore that contains the root certificate for the authority that signed the Controller's certificate.

1. Obtain the root certificate for the authority that signed the certificate for the Controller.
  - a. For SaaS Controller deployments: You can download the DigiCert root certificates from <https://www.digicert.com/digicert-root-certificates.htm>. Ensure to include at least the following certificates:
    - DigiCert Global Root CA
    - DigiCert Global Root G2
    - DigiCert Global Root G3
    - DigiCert TLS ECC P384 Root G5
    - DigiCert TLS RSA4096 Root G5
  - b. For on-premises Controller deployments: Obtain one of the following root certificates:
    - The root certificate for the publicly known certificate authority (CA) that signed the certificate for your on-premises Controller.
    - The root certificate for the internal CA that signed the Controller certificate for your on-premises Controller.
2. Run the Java `keytool` command to create the Agent truststore:

```
keytool -import -alias rootCA -file
<root_certificate_file_name> -keystore cacerts.jks -storepass
<truststore_password>
```

For example:

```
keytool -import -alias rootCA -file /usr/home/appdynamics/
DigicertGlobalRootCA.pem -keystore cacerts.jks -storepass
MySecurePassnword
```

**i** Note the truststore password; you will need this later to configure the Machine Agent.

### 3. Install the Agent truststore to the Agent configuration directory:

```
<machine_agent_home>/conf/
```

## Secure the Machine Agent Truststore

AppDynamics recommends you take the following security measures to prevent tampering with the Machine Agent truststore:

- Secure the truststore file through filesystem permissions:
  - Make the Agent truststore readable by any user
  - Make the truststore owned by a privileged user
  - Make the truststore writable only by the specified privileged user
- Secure the `controller-info` configuration file so that it is only readable by the Agent runtime user and only writable by a privileged user:

```
<machine_agent_home>/conf/controller-info.xml
```

## Enable SSL for the Machine Agent

### 1. Configure the following system properties in the `controller-info.xml` : `<machine_agent_home>/conf/controller-info.xml` . See [Machine Agent Configuration Properties](#) for full details on each property.

- *Controller Host:* Should be the same as either the Common Name or the Subject Alternative Name (SAN) in the certificate configured for the Controller.  
`<controller-host>common_name_in_certificate.com</controller-host>`
- *Controller Port:* The SSL port for the Controller. It is 443 for AppDynamics SaaS.  
`<controller-port>443</controller-port>`
- *Controller SSL Enabled:* true  
`<controller-ssl-enabled>true</controller-ssl-enabled>`
- *Controller SSL Password:* The plain text password for the Agent truststore.  
`<controller-keystore-password>MySecurePassword</controller-keystore-password>`  
If you have enabled the Secure Credential Store, encrypt the password you enter here. See [Encrypt Agent Credentials](#).
- *Controller Keystore Filename:* The path of the Agent truststore relative to `<machine_agent_home>/conf` . This is required if you use a truststore other than the default `<machine_agent_home>/conf/cacerts.jks` .  
`<controller-keystore-filename>../conf/cacerts.jks</controller-keystore-filename>`

**i** You can specify the Controller port and enable SSL for the Controller in the Machine Agent startup script, but you must specify the truststore password and filename in the `controller-info.xml` file.

In JDK >= 9 (either JRE bundled with Machine Agent or a standalone JDK/JRE), the default keystore type in the `java.security` file has been changed from JKS to PKCS12. If a JKS truststore is used and the `<controller-keystore-password>` is not provided, the agent will use the JKS truststore. If a PKCS12 truststore is used and the `<controller-keystore-password>` is not provided, the agent will not use the PKCS12 truststore. If you are using a PKCS12 truststore, AppDynamics recommends that that you provide the `<controller-keystore-password>`. If you still want to work with a JKS-based truststore, you can convert a PKCS12 truststore to JKS format.

## 2. Restart the Machine Agent.

### Sample controller-info.xml with SSL and Secure Credential Store Encryption Enabled

```
<?xml version="1.0" encoding="UTF-8"?>
<controller-info>
 <controller-host>mycompany.saas.appdynamics.com</controller-host>
 <controller-port>443</controller-port>
 <controller-ssl-enabled>true</controller-ssl-enabled>
 <!-- Encrypted Controller keystore / agent trust store password -->
 <controller-keystore-password>Tw49bd0hdCMB0Q5pfMMuYA/cA5B4pouVPkv48ovRm6c</controller-keystore-password>
 <controller-keystore-filename>../../conf/cacerts.jks</controller-keystore-filename>
 ...
 <!-- Secure Credential Store configuration -->
 <!-- Enable the Secure Credential Store -->
 <use-encrypted-credentials>true</use-encrypted-credentials>
 <!-- Path to they secure credential keystore -->
 <credential-store-filename>/opt/appdynamics/secretKeyStore</credential-store-filename>
 <!-- Obfuscated secure credential keystore password -->
 <credential-store-password>n/8GvAZsKk4gM3Z6g+XQ1w==</credential-store-password>
</controller-info>
```

### Keystore Certificate Extractor Utility

The Keystore Certificate Extractor Utility exports certificates from the Controller's Java keystore and writes them to an Agent truststore. You can run this utility with the Agent distribution on the Controller:

```
<controller_home>/appserver/glassfish/domains/domain1/appagent
```

#### 1. Execute `kr.jar` and include the following parameters:

- The full path to the Controller's keystore:

```
<controller_home>/appserver/glassfish/domains/domain1/config/keystore.jks
```

- The truststore output file name. By default, the Machine Agent looks for `cacerts.jks`.
- The password for the Controller's certificate, which defaults to "changeit". If you do not include a password, the extractor applies the password "changeit" to the output truststore.

```
java -jar kr.jar <controller_home>/appserver/glassfish/domains/domain1/config/keystore.jks cacerts.jks <controller_certificate_password>
```

2. Install the Agent trust store to the Agent configuration directory:

```
<machine_agent_home>/conf/
```

## .NET Compatibility Mode

This page explains how to set compatibility mode for the .NET Agent. Compatibility mode allows you to collect and view machine or server metrics on a server with Machine and .NET Agents installed.

### Before You Begin

Review the list of requirements and general information about compatibility mode:

- .NET Compatibility Mode is required for metrics from a Machine Agent and a .NET Agent on the same server to be visibly associated with the same node in the Controller UI.
- Differences may exist between metric values reported by the Machine Agent and the .NET Agent due to different averaging rates and measurement methods.
- You must enable .NET Compatibility Mode on the Machine Agent.
- When .NET Compatibility Mode is enabled:
  - Events from Service Availability and Custom Extensions appear in the Servers tab, but are not associated with .NET applications in the Controller UI.
  - The Controller UI may show the server name with " -java-MA " appended to the host ID. Thus, a Machine Agent with a <unique-host-id> set to " ABC " might appear as " ABC-java-MA " in the Controller UI. This is expected behavior; the " -java-MA " suffix indicates that the host has a Machine Agent running in .NET Compatibility Mode.
- Do not specify the <application-name>, <tier-name>, or <node-name> properties on the Machine Agent. These properties are used with a Machine Agent on a host that has no other AppDynamics Agents installed.

### Enable Compatibility Mode

To enable .NET Compatibility Mode:

1. Enable .NET Compatibility Mode on the Agent using one of two methods:
  - Set these options in <machine\_agent\_home>/conf/controller-info.xml:
    - i. <dotnet-compatibility-mode> **true** </dotnet-compatibility-mode>  
You may need to add this line to the controller-info.xml file.
    - ii. <unique-host-id> <unique-host-id-of-dot-net-agent> </unique-host-id>  
For both Agents to report metrics to the same node, the Machine Agent must use the same case-sensitive Unique Host ID used by the .NET Agent. See [FAQs and Troubleshooting](#).
  - Set the ./bin/machine-agent system property to: ./bin/machine-agent -Dappdynamics.machine.agent.dotnetCompatibilityMode=true
2. Save the controller-info.xml file.
3. Start or restart the Machine Agent to apply the changes.

### Specify a Custom JRE Location on Windows

This page describes how to specify a custom JRE location for the Machine Agent on Windows for users who have an existing Windows service.

1. Set up an environment variable named APPD\_MACHINE\_AGENT\_JRE\_HOME and set its value to the JRE home folder.
2. Uninstall the existing Windows service for the Machine Agent. See [Uninstall the Machine Agent](#).

3. Unzip the development build.
4. Reinstall the Windows service for the Machine Agent. See [Windows Install Using ZIP with Bundled JRE](#). When the service restarts, it should pick up the specified JRE.
5. If the environment variable is changed again, restart the service. See step 6 on [Windows Install Using ZIP with Bundled JRE](#).

### Specify that the Machine Agent is Running on a SAP Environment

This page describes how to set a flag on the Machine Agent to inform licensing that the agent is running on a SAP environment.

**i** If you are running a RPM package, use method 1.

#### Method 1

1. Navigate to the `controller-info.xml` file.
2. Set a value of `true` for the tag `is-sap-machine`.

##### Example

```
<is-sap-machine>true</is-sap-machine>
```

#### Method 2

1. Set a value of `true` for the environment variable `APPDYNAMICS_IS_SAP_MACHINE`, OR
2. Set a value of `true` for the system property `-Dappdynamics.is.sap.machine`.

##### Example

```
<command>-Dappdynamics.is.sap.machine=true
```

### Access Machine Agent Docker Images

AppDynamics has published two sets of Machine Agent Docker images: one for the Machine Agent, and one for the Machine Agent with Analytics Support for Kubernetes. Each set of Docker images includes Debian and Alpine images for non-root and root users.

#### Machine Agent Docker Images

To access the Machine Agent docker images, see [appdynamics/machine-agent](#).

The Docker Hub repository uses the following file naming pattern:

- Debian:
  - Non-Root: `appdynamics/machine-agent:<version>`
  - Root: `appdynamics/machine-agent:root-<version>`
- Alpine:
  - Non-Root: `appdynamics/machine-agent:alpine-<version>`
  - Root: `appdynamics/machine-agent:alpine-root-<version>`

## Machine Agent with Analytics Support for Kubernetes Docker Images

To access the Machine Agent with Analytics Support for Kubernetes Docker Images, see [appdynamics/machine-agent-analytics](#).

The Docker Hub repository uses the following file naming pattern:

- Debian:
  - Non-Root: `appdynamics/machine-agent-analytics:<version>`
  - Root: `appdynamics/machine-agent-analytics:root-<version>`
- Alpine:
  - Non-Root: `appdynamics/machine-agent-analytics:alpine-<version>`
  - Root: `appdynamics/machine-agent-analytics:alpine-root-<version>`

### Access Docker Images for Non-Root Users

To access the non-root Docker images, add the `appdynamics` user to a Docker group with access to `docker.sock`.

## Extensions and Custom Metrics

Using the Machine Agent, you can supplement the existing metrics in the AppDynamics Controller UI with your own custom metrics. There are many extensions currently available on the [Cisco DevNet](#) site. Some are created by AppDynamics and some have been created by users.

Similar to built-in metrics, your custom metrics are subject to the following AppDynamics features:

- Automatic baselines and anomaly detection
- Availability to display on custom dashboards
- Availability to use in policies
- Visibility of all metrics in the Metric Browser and on the Infrastructure tab (where you can display external metrics and AppDynamics metrics on the same graph)

**i** The first reported metric value is visible in the **Server Visibility** metric browser, but not in the **Application Performance Monitoring** metric browser. This is an expected behavior designed to optimize metric reporting and prevent memory overhead.

### Add New Custom Metrics

To create custom metrics, you create a monitoring extension. In your extension, you define the name and path of your metric (where it appears in the metric browser tree), what type of metric it is (sum, average, and so on), and how the data for the metric should be rolled up as it ages. Any custom metric reported to the Controller through any mode must be reported at least once every 300 seconds (five minutes). One Agent can run many extensions, although you may need to increase the amount of [memory for the JVM](#) Agent. You can have multiple copies of the same extension if they are in different directories.

A custom metric can be common across nodes or associated with a specific tier. When you create a metric, you specify the path in which it will appear in the metric tree. To create a common custom metric, use the root tree path Custom Metrics in your metric declaration. To create a tier-specific metric, specify the metric path associated with that component.

If your application uses a large number of AppDynamics extensions with the Machine Agent, you may need to increase the size of the memory allocation:

### For Linux and Unix-like Systems

```
% <machine_agent_home>/bin/machine-agent -Xms64m
```

### For Windows

```
> <machine_agent_home>\bin\machine-agent.cmd -Xms64m
```

 The wildcard feature is not supported for custom metrics.

## Monitoring Extension Types

You can implement custom metrics using these mechanisms:

- Using a script:  
You can write a shell script (Linux and Unix-like systems) or batch file (Windows) to report custom metrics every minute to the Machine Agent. The Machine Agent passes these metrics on to the Controller. See [Build a Monitoring Extension Using Scripts](#).
- Using Java:  
Your custom metrics may be too complicated to collect using a script. For example, you may need to perform complex calculations or call a third-party API to retrieve the metrics. In this case, you can extend the `JavaServersMonitor` class to collect the metrics and report them to the Machine Agent. Your Java program extends the `JavaServersMonitor` class to provide your custom functionality. See [Build a Monitoring Extension Using Java](#).
- Using HTTP:  
If you enable the Agent HTTP listener, you can post HTTP requests to the Machine Agent to send it custom metrics every minute. To do this, start the Machine Agent with a Jetty HTTP listener. See [Machine Agent HTTP Listener](#).

## Build a Monitoring Extension Using Scripts

### Related pages:

- [Extensions and Custom Metrics](#)
- [Build a Monitoring Extension Using Java](#)
- [Machine Agent HTTP Listener](#)

You can write a monitoring extension script (also known as a custom monitor or hardware monitor) to add custom metrics to the metric set that AppDynamics already collects and reports to the Controller. Your script reports the custom metrics every minute to the Machine Agent. The Machine Agent passes these metrics to the Controller.

This page describes the steps for adding custom metrics using a shell script and includes an example.

## Review Existing Extensions

Before creating your own extension, review the extensions that have been created and shared among members of the AppDynamics community. New extensions are added continuously. It is possible that

someone has already created what you need or something close enough that you can download and use it after making a few modifications.

See the [AppDynamics Exchange](#) for free downloads.

## Agent Configuration Requirements

Confirm that you have correctly configured the Machine Agent in the `controller-info.xml` file and on the Agent `start` command on the command line. See [Machine Agent Configuration Properties](#).

## Create a Monitoring Extension

To create a monitoring extension using a script:

1. Create your script. See [Create the Script File](#).
2. Create a `monitor.xml` configuration file. See [Create the monitor.xml File](#).
3. Create a subdirectory, `<your_extension_dir>`, in `<machine_agent_home>/monitors`. See [Create a directory under the Machine Agent monitors directory](#).
4. Copy your script file and the `monitor.xml` file into the new subdirectory.
5. Restart the Machine Agent.

## Define Your Metrics

Metric names must be unique within the same metric path but need not be unique for the entire metric hierarchy. AppDynamics recommends using short metric names so that the whole name is visible when displayed in the Metric Browser. Prepend the metric path to the metric name when you upload the metrics to the Controller.

**i** Do not include a vertical bar (pipe symbol) at the end of the custom metric when you include a metric path.

## Metric Processing Qualifiers

The Controller has various qualifiers for how it processes a metric regarding aggregation, time rollup, and tier rollup. There are three types of metric qualifiers:

1. Aggregator qualifier
2. Time roll-up qualifier
3. Cluster roll-up qualifier

In the script, specify the metric qualifiers after the name-value pair for the metric. A typical metric entry in the script file has the following structure:

```
name=<metric name>,value=<long value>,aggregator=<aggregator type>, time-rollup=<time-rollup strategy>, cluster-rollup=<cluster-rollup strategy>
```

## Aggregator Qualifier

The *aggregator* qualifier specifies how the Machine Agent aggregates the values reported during a one-minute period. Specify the aggregator qualifier as `aggregator="aggregator type"`. This value is an

enumerated type. If no value is reported during that minute, no data is reported to the Controller, and an UNCHANGED notice appears in the Machine Agent log for that metric. Valid values are:

Aggregator Type	Description
AVERAGE	(Default) Average of all reported values in that minute
SUM	Sum of all reported values in the minute, causes the metric to behave like a counter
OBSERVATION	Last reported value in the minute

### Time Roll-Up Qualifier

The *time-rollup* qualifier specifies how the Controller rolls up the values when it converts from one-minute granularity tables to 10-minute granularity tables, and 60-minute granularity tables over time. The value is an enumerated type. Valid values are:

Roll Up Strategy	Description
AVERAGE	Average of all one-minute values when adding it to the 10-minute granularity table; the average of all 10-minute values when adding it to the 60-minute granularity table
SUM	Sum of all one-minute values when adding it to the 10-minute granularity table; the sum of all 10-minute values when adding it to the 60-minute granularity table
CURRENT	Last reported one-minute value in that 10-minute interval; the last reported 10-minute value in that 60-minute interval

### Cluster Roll-Up Qualifier

The *cluster-rollup* qualifier specifies how the Controller aggregates metric values in a tier (a cluster of nodes). The value is an enumerated type. Valid values are:

Roll up Strategy	Description
INDIVIDUAL	Aggregates the metric value by averaging the metric values across each node in the tier
COLLECTIVE	Aggregates the metric value by adding up the metric values for all the nodes in the tier

For example, if a tier has two nodes, Node A and Node B, and Node A has three errors per minute and Node B has seven errors per minute, then the INDIVIDUAL qualifier reports a value of five errors per minute, and

COLLECTIVE qualifier reports ten errors per minute. INDIVIDUAL is appropriate for metrics such as % CPU Busy, where you want the value for each node. COLLECTIVE is appropriate for metrics, such as Number of Calls, where you want a value for the entire tier.

### Add a Monitoring Extension Script

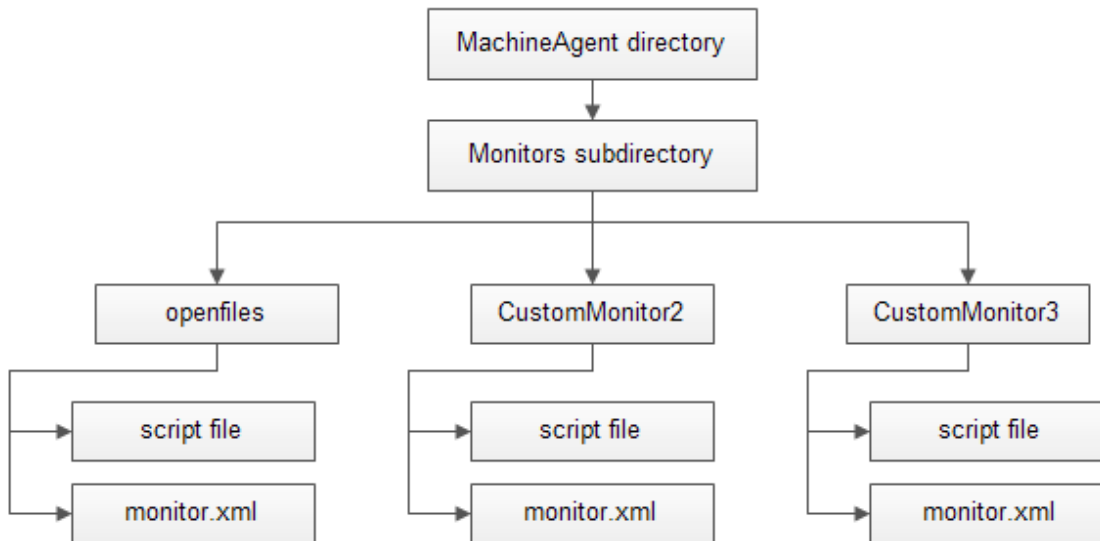

To add a monitoring extension script:

- Create a Subdirectory Under the Machine Agent Monitors Directory
- Create the Script File
- Copy the Script File to the Subdirectory Created in Step 1
- Create the monitor.xml File
- Copy the monitor.xml file to the Subdirectory Created in Step 1
- Restart the Machine Agent
- Verify Execution of the Monitoring Extension Script

### Create a Subdirectory Under the Machine Agent Monitors Directory

The `<machine_agent_home>/monitors` directory is the repository for the Machine Agent extensions. For each new extension, create a subdirectory under the `/monitors` directory. The user running the Agent requires read, write, and execute permissions to this subdirectory.

For example to create an extension that monitors open files in the JVM, create a subdirectory named "openfiles" under `<machine_agent_home>/monitors`. The structure looks like:

### Create the Script File

A script writes data to STDOUT. The Machine Agent parses STDOUT and sends information to the Controller every minute. Use these instructions to create the script file:

**i** For Windows custom metrics, PowerShell and VBScript are recommended over .bat files

To generate custom metrics on Windows, AppDynamics recommends that you use PowerShell and VBasic scripts instead of .bat files. When a standard Windows batch ( .bat ) script echoes metric names, it surrounds the names with quotes. The quotes will cause the Machine Agent to ignore these metrics. PowerShell and VBasic scripts do not have this issue.

1. Specify a name-value pair for the metrics.

Each metric has a name-value pair that is converted to a java 'long' value. A typical metric entry in the script file has this structure:

```
name=<metric name>,value=<long value>,aggregator=<aggregator type>, time-rollup=<time-rollup strategy>, cluster-rollup=<cluster-rollup strategy>
```

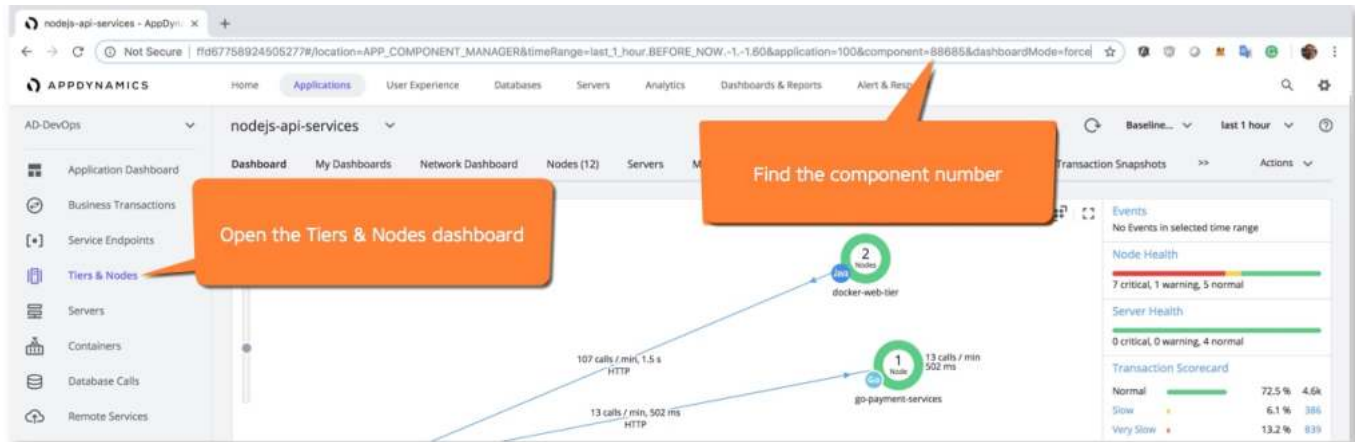

Use the following format:

Form	Format
Standard Form	Hardware Resources  Instrument Name=Instrument Value
Fully Qualified Form	Hardware Resources  <metric name>,value=<long value>

2. Define the category of the metric, for example:

- a. Infrastructure (for the default hardware metrics, see [Machine Agent](#))
- b. JVM
- c. Custom Metrics, where Custom Metrics must have the path prefixes:
  - Custom Metrics
  - Server|Component:<tier-name-or-tier-id>

3. Metrics with the Custom Metrics prefix are common across all tiers in your application. Metrics with the Server|Component:<tier-name-or-tier-id> prefix appear only under the specified tier. To find the component ID of a tier, open the dashboard for the tier and review the URL. The ID appears as the component value in the URL:

**⚠** The Machine Agent has to be associated with the target or destination for the metrics. If you attempt to publish metrics to a tier that is not associated with the Machine Agent, the metrics are not reported.

The " | " character separates the branches in the metric hierarchy notifying the Controller where the metric should appear in the metric tree:

```
Custom Metrics|Hardware Resources|Disks|Total Disk Usage %
Custom Metrics|Hardware Resources|Disks|Disk 1|Current Disk Usage %
```

You can insert a custom metric next to an existing type of metric. For example, the following declaration causes the custom metric named `pool usage` to appear next to the `JMX` metrics: `Server|Component:18|JMX|Pool|First|pool usage`

4. You can then use the metric in health rules as would other types of JMX metrics. To monitor multiple metrics with the same script file, edit the script to write a different line for each one to STDOUT. For example:

```
name=Custom Metrics|Hardware Resources|Disks|Total Disk Usage %, value=23
name=Custom Metrics|Hardware Resources|Disks|Disk 1|Current Disk Usage %, value=56
```

**Copy the Script File to the Subdirectory Created in Step 1**

Ensure that the Agent process has execute permissions for the script file and for the contents of the file.

## Create the monitor.xml File

For each custom monitoring extension script, create a `monitor.xml` file. The `monitor.xml` file executes the script file created in Step 2. You can edit the following sample file to create your own file:

```
<monitor>
 <name>HardwareMonitor</name>
 <type>managed</type>
 <description>Monitors system resources - CPU, Memory,
Network I/O, and Disk I/O.</description>
 <monitor-configuration> </monitor-configuration>
 <monitor-run-task>
 <!-- Edit execution-style as needed. -->
 <execution-style>continuous</execution-style>
 <name>Run</name>
 <type>executable</type>
 <task-arguments></task-arguments>
 <executable-task>
 <type>file</type>
 <!-- Use only one file element per os-type. -->
 <file os-type="linux">linux-stat.sh</file>
 <file os-type="mac">macos-stat.sh</file>
 <file os-type="windows">windows-stat.bat</file>
 <file os-type="solaris">solaris-stat.sh</file>
 <file os-type="sunos">solaris-stat.sh</file>
 <file os-type="aix">aix-stat.sh</file>
 </executable-task>
 </monitor-run-task>
</monitor>
```

The `os-type` attribute is optional for the `executable-task` file element when only one `os-type` is specified. One `monitor.xml` file executes one script per `os-type`.

1. Select the execution style: `continuous` or `periodic`.

Execution Style	Description	Example
<b>continuous</b>	Select <code>continuous</code> if you want data collection averaged over time. For example, average CPU usage over a minute. For the monitor to be declared as 'continuous', the script should also run in an infinite loop. This ensures that the script keeps running until the Machine Agent process is terminated.	<pre>while [ 1 ]; do ... the actual script goes here ... sleep 60 done</pre>
<b>periodic</b>	Select <code>periodic</code> to report data from system performance counters periodically. The periodic task runs every minute by default, and the data is aggregated. To specify a different frequency, use the <code>execution-frequency-in-seconds</code> element. The execution frequency must be less than 60. For periodic execution style, you can also specify the timeout setting (shown in the example).	<pre>&lt;monitor-run-task&gt; ... &lt;execution-style&gt;periodic&lt;/ execution-style&gt; &lt;execution-frequency-in- seconds&gt;30&lt;/execution- frequency-in-seconds&gt; &lt;execution-timeout-in- secs&gt;30&lt;/execution-timeout-in- secs&gt; ... &lt;/monitor-run-task&gt;</pre>

**i** Do not set the `<execution-frequency-in-seconds>` higher than 300 seconds (five minutes). The extension must collect metrics at least once every five minutes.

2. Add the name of your script file to the `<file>` element in the `monitor.xml` file. Be sure to use the correct `os-type` attribute. The `os-type` value should match the value returned from calling `System.getProperty("os.name")`.

```
<file os-type="your-os-type">{script file name}</file>
```

You can use either the relative or absolute path of the script.

**Copy the monitor.xml file to the Subdirectory Created in Step 1**

**Restart the Machine Agent**

**i** Required Agent Properties

Ensure that you have correctly configured the Agent in the `controller-info.xml` file and on the Agent `start` command on the command line. See [Database Agent Configuration Properties](#).

After restarting the Machine Agent, you should see following message in your log file:

```
Executing script [<script_name>] on the console to make sure
your changes work with the machine agent.
```

### Verify Execution of the Monitoring Extension Script

To verify the execution of extension, wait at least one minute and check the metric data in the [Metric Browser](#).

You can now create alerts based on any of these metrics.

### Example: Create a Monitoring Extension for Open Files in UNIX

To create a custom monitor for monitoring all the open files for JVMs:

1. Create a new directory in the custom monitor repository.
2. Create the script file by modifying this UNIX script for the specific process name (for example: Author, Publish, and so on).

```
lookfor="<process name 1>"
pid=`ps aux | grep "$lookfor" | grep -v grep | tr -s " " |
cut -f2 -d' '`
count1=`lsof -p $pid | wc -l | xargs`

lookfor="<process name 2>"
pid=`ps aux | grep "$lookfor" | grep -v grep | tr -s " " |
cut -f2 -d' '`
count2=`lsof -p $pid | wc -l | xargs`

echo "name=JVM|Files|<process name 1>,value="$count1
echo "name=JVM|Files|<process name 2>,value="$count2
```

3. Create the following `monitor.xml` file and point it to the UNIX script shown in Step 2.

```
<monitor>
 <name>MyMonitors</name>
 <type>managed</type>
 <description>Monitor open file count </description>
 <monitor-configuration>
 </monitor-configuration>
 <monitor-run-task>
```

```

 <execution-style>continuous</execution-style>
 <name>Run</name>
 <type>executable</type>
 <task-arguments>
 </task-arguments>
 <executable-task>
 <type>file</type>
 <file>openfilecount.sh</file>
 </executable-task>
</monitor-run-task>
</monitor>

```

### Example: Create a Monitoring Extension to Check Process Status in Windows

1. Create a new directory in the custom monitor repository.
2. Create the script file by modifying this Windows PowerShell script for the specific process name (for example: Author, Publish, and so on). The following Windows PowerShell script checks if a process instance is running on the machine.

**i** To generate custom metrics on Windows, AppDynamics recommends that you use PowerShell and VBasic scripts instead of .bat files. When a standard Windows batch ( .bat ) script echoes metric names, it surrounds the names with quotes. The quotes will cause the Machine Agent to ignore these metrics. PowerShell and VBasic scripts do not have this issue.

```

$procName='<PROCESS_NAME>'
$procStatus=Get-Process -Name $procName -ErrorAction
SilentlyContinue
if($procStatus) {
 write-output "name=Custom Metrics|Process|$procName|
Running, value=1"
} else {
 write-output "name=Custom Metrics|Process|$procName|
Running, value=0"
}

```

3. Create the following `monitor.xml` file and point it to the Windows PowerShell script shown in Step 2. If you experience an error, try [Example: Run Machine Agent Custom Extensions with Customized Commands and Arguments](#).

```
<monitor>
 <name>MyMonitors</name>
 <type>managed</type>
 <description>Monitor open file count </description>
 <monitor-configuration>
 </monitor-configuration>
 <monitor-run-task>
 <execution-style>continuous</execution-style>
 <name>Run</name>
 <type>executable</type>
 <task-arguments>
 <argument name="" value="-Command"></argument>
 <argument name="" value="C:\\absolute\\path\\to\\powershell\\script\\mp.ps1">
</argument>
 </task-arguments>
 <executable-task>
 <type>command</type>
 <command>C:\\absolute\\path\\to\\powershell\\executable\\powershell.exe</
command>
 </executable-task>
 </monitor-run-task>
</monitor>
```

If you have provided the PowerShell program for the Machine Agent and are unable to see custom metrics, follow these steps:

1. Create a `.bat` file in the same folder where you created the PowerShell script and `monitor.xml` file.

#### Example .bat file

```
process_checker.bat
```

2. Add the following lines of code into the `.bat` file. Ensure that you are using the correct PowerShell script file name. In this example, the PowerShell script file name is `process_status_checker.ps1`.

```
@echo off
Powershell.exe -executionpolicy remotesigned -File process_status_checker.ps1
```

3. Add the following lines of code to the `monitor.xml` file. Ensure that you are using the correct `.bat` file name. In this example, the `.bat` file name is `process_checker.bat`.

```
<monitor>
 <name>MyMonitors</name>
 <type>managed</type>
 <description>Monitor process status</description>
 <monitor-configuration>
 </monitor-configuration>
```

```

 <monitor-run-task>
 <execution-style>periodic</execution-style>
 <execution-frequency-in-seconds>60</execution-frequency-in-seconds>
 <execution-timeout-in-secs>60</execution-timeout-in-secs>
 <name>MyMonitors</name>
 <type>executable</type>
 <task-arguments></task-arguments>
 <executable-task>
 <type>file</type>
 <file os-type="windows">process_checker.bat</file>
 </executable-task>
 </monitor-run-task>
 </monitor>

```

### Example: Run Machine Agent Custom Extensions with Customized Commands and Arguments

By default, the Machine Agent runs a bash shell script as a shell script. This example shows how to run a bash shell script as a bash script.

For the script `example.sh`, creating the following `monitor.xml` file executes the script as `./example.sh`.

```

<monitor>
 <name>HardwareMonitor</name>
 <type>managed</type>
 <enabled>false</enabled>
 <enable-override os-type="solaris">true</enable-override>
 <enable-override os-type="sunos">true</enable-override>
 <description>Monitors system resources - CPU, Memory, Network I/O, and Disk I/O.
</description>
 <monitor-configuration>
 </monitor-configuration>
 <monitor-run-task>
 <execution-style>continuous</execution-style>
 <name>Run</name>
 <type>executable</type>
 <task-arguments>
 </task-arguments>
 <executable-task>
 <type>file</type>
 <file>example.sh</file>
 </executable-task>
 </monitor-run-task>
</monitor>

```

To execute the script as `"bash example.sh"`:

1. Modify the `monitor.xml` file as shown below. Adjust the `<task-arguments>` and `<executable-task>` options for changes in the implementation.

```

<monitor>
 <name>ExampleMonitor</name>
 <type>managed</type>
 <enabled>true</enabled>
 <description>Monitors system resources - CPU, Memory, Network I/O, and Disk I/O.
</description>
 <monitor-configuration>
</monitor-configuration>
 <monitor-run-task>
 <execution-style>continuous</execution-style>
 <name>Run</name>
 <type>executable</type>
 <task-arguments>
 <argument name="arg1" is-required="true" default-value="example.sh"/>
 </task-arguments>
 <executable-task>
 <type>command</type>
 <command>bash</command>
 <arguments-pattern>$arg1</arguments-pattern>
 <wait-for-process-exit>true</wait-for-process-exit>
 </executable-task>
</monitor-run-task>
</monitor>

```

## Build a Monitoring Extension Using Java

### Related pages:

- [Machine Agent Configuration Properties](#)
- [Build a Monitoring Extension Using Scripts](#)

You can create Java monitoring extensions that enable the Machine Agent and Server Visibility to collect custom metrics, which you define and provide, and report them to the Controller. This is an alternative to adding monitoring extensions using scripts.

When you capture custom metrics with a monitoring extension, they are supported by the same AppDynamics services that you receive for the standard metrics captured with the AppDynamics application and Machine Agents. These services include automatic baselining, anomaly detection, display in the Metric Browser, availability for display on custom dashboards, and availability for use in policies to trigger alerts and other actions.

This page describes how to create a monitoring extension in Java.

To the Agent, a monitoring extension is a task that runs on a fixed schedule and collects metrics.

### Before You Begin

Before creating your own extension from scratch, review the extensions on the [AppDynamics community](#). See [GitHub](#) for a free download of the extensions

New extensions are constantly being added. It is possible that someone has already created what you need, or something close enough, that you can download it and use it after making a few modifications.

## Create a Monitoring Extension in Java

To create a monitoring extension in Java:

1. Create your extension class. See [Create the Monitoring Extension](#).
2. Create a `monitor.xml` configuration file. See [Create the monitor.xml File](#).
3. Create a subdirectory ( `<your_extension_dir>` ) under `<agent_home>/monitors`.
4. Place the extension class file and the `monitor.xml` file (plus any dependent `jar` files) in `<your_extension_dir>`.
5. Enter the Controller access information and credentials. See [Configure the Machine Agent](#).

 Make sure that your `controller-info` and command line parameters are correctly configured. Required properties include: Controller name, port number, and account access key.

6. Restart the Machine Agent.

## Create the Monitoring Extension Class

Create a monitoring extension class by extending the `AManagedMonitor` class in the `com.singularity.ee.agent.systemagent.api` package. This package is included in the `MachineAgent.jar` file.

The monitoring extension class performs these tasks:

- Populates a hash map with the values of the metrics that you want to add to AppDynamics. You obtain these metrics based on your environment and the source from which you derive your custom metrics.
- Defines the type of metrics to collect using the `MetricWriter` class. See [Metric Processing Qualifier](#).
- Uploads the metrics to the Controller using the `execute()` method of the `AManagedMonitor` class.

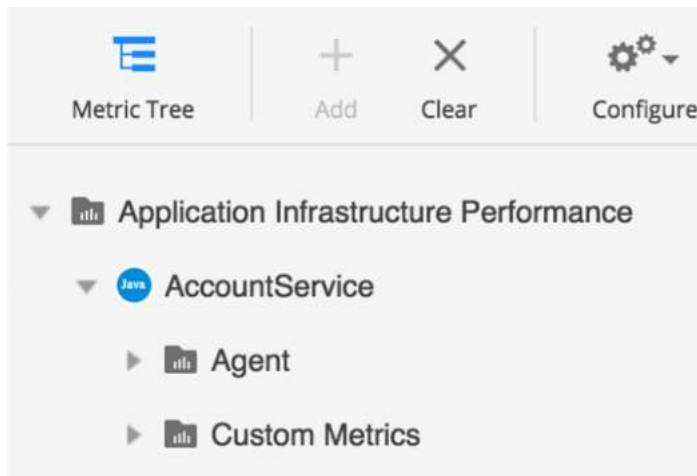

See [Extension\\_Class\\_Source.txt](#) for example source code.

## Metric Path

All custom metrics processed by the Machine Agent and Server Visibility appear in the **Metric Browser > Application Infrastructure Performance**. Use the "I" character to specify the path from Application Infrastructure Performance to the custom metric. If the metrics apply to a specific tier, use the metric path for the tier, with "Component" followed by a colon ":" and the tier name or tier ID.

For example to associate a metric with tier AccountService, you would specify the metric path as: `Server | Component:AccountService | Custom Metrics | Path |`

The metric would then appear under the tree in the Metric Browser:

**⚠** You can report a custom metric only to the tier that is associated with the Machine Agent. If you attempt to publish metrics to a different tier, the metrics are not reported.

You can insert a custom metric next to an existing type of metric. For example, the following declaration causes the custom metric named pool usage to appear next to the JMX metrics: `name="Server|Component:<tier-name>|JMX|Pool|First|pool usage",value=10`

You can then use the metric in health rules similar to other types of JMX metrics.

**✓** To test the appearance of your custom metric in the Controller API, post the metric data to the Machine Agent's REST API. Pass the path, name type and values of the metric as URL arguments. See [Machine Agent HTTP Listener](#).

### Metric Names

Metric names must be unique within the same metric path but need not be unique for the entire metric hierarchy.

AppDynamics recommends that you use short metric names so that they are visible when they are displayed in the Metric Browser.

Prepend the metric path to the metric name when you upload the metrics to the Controller.

### Metric Processing Qualifier

The Controller has various qualifiers for how it processes a metric regarding aggregation, time roll-up, and tier roll-up.

There are three types of metric qualifiers:

- Aggregator qualifier
- Time roll-up qualifier
- Cluster roll-up qualifier

You specify these options with the enumerated types provided by the MetricWriter class.

### Aggregation Qualifier

The *aggregator* qualifier specifies how the Machine Agent aggregates the values reported during a one-minute period.

Specify the aggregation qualifier as `aggregator="aggregator type"`

This value is an enumerated type. Valid values are:

Aggregator Type	Description
<code>METRIC_AGGREGATION_TYPE_AVERAGE</code>	Default. Average of all reported values in that minute.
<code>METRIC_AGGREGATION_TYPE_SUM</code>	Sum of all reported values in that minute, causes the metric to behave like a counter.
<code>METRIC_AGGREGATION_TYPE_OBSERVATION</code>	Last reported value in the minute. If no value is reported in that minute, the last reported value is used.

#### Time Roll-Up

The *time-rollup* qualifier specifies how the Controller rolls up the values when it converts from one-minute granularity tables to 10-minute granularity tables, and 60-minute granularity tables over time.

Roll up Strategy	Description
<code>METRIC_TIME_ROLLUP_TYPE_AVERAGE</code>	Average of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
<code>METRIC_TIME_ROLLUP_TYPE_SUM</code>	Sum of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
<code>METRIC_TIME_ROLLUP_TYPE_CURRENT</code>	Last reported one-minute data point in that 10-minute or 60-minute interval.

#### Cluster Roll-Up

The *cluster-rollup* qualifier specifies how the Controller aggregates metric values in a tier.

Roll up Strategy	Description
<code>METRIC_CLUSTER_ROLLUP_TYPE_INDIVIDUAL</code>	Aggregates the metric value by averaging the metric values across each node in the tier.
<code>METRIC_CLUSTER_ROLLUP_TYPE_COLLECTIVE</code>	Aggregates the metric value by adding up the metric values for all the nodes in the tier.

For example, if a tier has two nodes, Node A and Node B, and Node A has three errors per minute and Node B has seven errors per minute, the `INDIVIDUAL` qualifier reports a value of five errors per minute and

COLLECTIVE qualifier reports ten errors per minute. INDIVIDUAL is appropriate for metrics such as % CPU Busy where you want the value for each node. COLLECTIVE is appropriate for metrics such as Number of Calls where you want a value for the entire tier.

### Sample Monitoring Extension Class

The `NGinxMonitor` class retrieves the following metrics from the Nginx Web Server, and adds them to the metrics reported by AppDynamics:

- `Active Connections`: number of active connections
- `Accepts`: number of accepted requests
- `Handled`: number of handled requests
- `Requests`: total number of requests
- `Reading`: number of reads
- `Writing`: number of writes
- `Waiting`: number of keep-alive connections

The source for the extension class is included as an attachment.

### Create monitor.xml

Create a `monitor.xml` file with a `<monitor>` element to configure how the Machine Agent executes the extension.

1. Set the `<name>` to the name of your Java monitoring extension class.
2. Set the `<type>` to `managed`.
3. The `<execution-style>` can be `continuous` or `periodic`.
  - Continuous means to collect the metrics averaged over time; for example, average CPU usage per minute. In continuous execution, the Machine Agent invokes the extension once and the program runs continuously, returning data every 60 seconds.
  - Periodic means to invoke the monitor at a specified frequency. In periodic execution, the Machine Agent invokes the extension, runs it briefly, and returns the data on the schedule set by the `<execution-frequency-in-seconds>` element.

 Do not set the `<execution-frequency-in-seconds>` greater than 300 seconds (five minutes). The extension must collect metrics at least once every five minutes.

4. If you select `periodic` for the execution style, set the frequency of collection in `<execution-frequency-in-seconds>` element. The default frequency is 60 seconds. If you select `continuous`, this setting is ignored.
5. Set the `<type>` in the `<monitor-run-task>` child element to `java`.
6. Set the `<execution-frequency-in-seconds>` to the number of seconds before the extension times out.
7. Specify any task arguments required by the Java-based extension in the `<task-arguments>` element. The argument tag has three parameters: `name`, `default-value`, and `is_required`. `is_required` is always set to true. The task arguments can be any custom argument. The default arguments that are specified here are the only arguments that the extension uses. They are not set anywhere else.

Example `<task-arguments>` element:

```
<argument name="password" is-required="true" default-value="welcome" />
```

8. Set the `<classpath>` to the `jar` file that contains your extension's classes. Include any dependent `jar` files, separated by semicolons.
9. Set the `<impl-class>` to the full path of the class that the Machine Agent invokes.

### Sample monitor.xml Files

This [attached monitor.xml](#) file configures the NGinXMonitor monitoring extension. This extension executes every 60 seconds.

This [attached monitor.xml](#) file configures the MySQLMonitor. This monitor executes every 60 seconds, has four required task arguments and one optional task argument and one dependent `jar` file.

### Machine Agent HTTP Listener

You can send metrics to the Machine Agent using its HTTP listener. You can report metrics through the Machine Agent by making HTTP calls to the Agent instead of piping to the Agent through `sysout`.

#### Activate the HTTP Listener

The HTTP listener is not enabled by default. To activate the HTTP listener, restart the Machine Agent and set the `metric.http.listener` system property to `true`. Optionally, you can specify the host and port for the listener with system properties.

The `-D` system properties are:

- `metric.http.listener`: Required. Set to `true`.
- `metric.http.listener.port`: Optional. Set to the port to be used, defaults to 8293.
- `metric.http.listener.host`: Optional. This describes which interface to accept requests on. You can set it as follows:
  - If you do not specify the `metric.http.listener.host`, it defaults to `localhost`, which means requests are only accepted from `localhost`.
  - Set to `0.0.0.0` to accept on all interfaces (including from remote clients).
  - Set to the IP address of the specific interface to accept requests on. Not a recommended configuration.

```
<machine_agent_home>/bin/machine-agent -Dmetric.http.listener=true
-Dmetric.http.listener.port=<port_number> -Dmetric.http.listener.host=0.0.0.0
```

If starting the Agent by invoking the Machine Agent JAR, ensure that you place the options **before** the `JAR` name in your start up command. For example:

```
java -Dmetric.http.listener=true -jar MACHINE_AGENT_HOME/
machineagent.jar
```

### Create Metrics

The HTTP Listener can be used to post custom metrics to the Machine Agent for uploading to the Controller. Define one or more metrics in the body of the request as `JSON` data. Metrics must be uploaded at least once every 300 seconds (5 minutes).

## URI

POST /api/v1/metrics

## Metric Definition Fields

Parameter	Description
metricName	Name for the metric as it will appear in the Controller UI.
aggregatorType	How the metrics should be aggregated. Options are: <ul style="list-style-type: none"> <li><b>AVERAGE</b>: The average of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.</li> <li><b>SUM</b>: The sum of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.</li> <li><b>OBSERVATION</b>: Last reported one-minute data point in that 10-minute or 60-minute interval.</li> </ul>
Value	A 64-bit integer value for the metric.

## Format

```

POST /api/v1/metrics

[
 {
 "metricName": "Custom Metrics|Test|MetricFromRESTClient1",
 "aggregatorType": "AVERAGE",
 "value": 10
 }
]

```

## Create Events

The HTTP Listener can be used to post custom events to the Machine Agent for uploading to the Controller. Define one or more events in the body of the request as `JSON` data. Metrics must be uploaded at least once every 300 seconds (5 minutes).

## URI

POST /api/v1/events

## Event Definition Fields

Parameter Name	Description
eventSeverity	Severity of the event, from INFO, WARN, ERROR.
type	A string describing the event subtype. The event will be of type CUSTOM, subtype will be the value of this parameter.
summaryMessage	A summary of the event.
properties	Event properties. These properties are retrieved along with events by the Controller in a given query and provide a means for filtering the events. The maximum size of a key is 500 characters and the maximum size of a value is 5000 characters. The values can be a string value.
details	Arbitrary key-value details for the event; similar in constraints to properties but are retrieved in a separate call. Use this to store details that should only be retrieved when requested by the user, which avoids the expense of retrieving this data in the usual event calls.

## Format

```

POST /api/v1/events
[
 {
 "eventSeverity": <event_severity>,
 "type": "<event_type>",
 "summaryMessage": "<event_summary>",
 "properties": {
 "<key>": "value1",
 "<key2>": "value2"
 },
 "details": {
 "<key>": "<value>"
 }
 },
 {
 "eventSeverity": <event_severity>,
 "type": "<event_type>",
 "summaryMessage": "<event_summary>",
 "properties": {
 "<key>": "value1",
 "<key2>": "value2"
 },
 "details": {
 "<key>": "<value>"
 }
 }
]

```

```

 }
 },...
]

```

## Legacy Machine Agent HTTP APIs

The following API endpoints are supported for backward compatibility, but are not extended or enhanced in future versions.

### Upload Metrics

You can use `GET` or `POST` to upload metrics to the Metric Browser under **Application Performance > Tier**, where the tier is the one defined for the Machine Agent.

The format for `GET` is:

```
GET /machineagent/metrics
```

For example:

```
http://host:port/machineagent/metrics?name=Custom Metrics|Test|My
Metric&value=42&type=average
```

The format for `POST` is:

```
POST /machineagent/metrics
```

with header:

```
Content-Type: application/xml
```

with body content:

```
<?xml version="1.0"?>
<request>
<metric name="[name of metric 1]", type="[aggregation type]", value="[value of metric 1]" />
<metric name="[name of metric 2]", type="[aggregation type]", value="[value of metric 2]" />
...
<metric name="[name of metric n]", type="[aggregation type]", value="[value of metric n]" />
</request>
```

Example:

```
http://host:port/machineagent/metrics
```

Example of body content:

```
<request>
<metric name="Custom Metrics|Test|My Metric 1", type="AVERAGE", value="22" />
<metric name="Custom Metrics|Test|My Metric 2", type="SUM", value="98737" />
<metric name="Custom Metrics|Test|My Metric 3", type="CURRENT", value="93" />
</request>
```

Valid values for type are:

- **AVERAGE**: Average of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
- **SUM**: Sum of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
- **CURRENT**: Last reported one-minute data point in that 10-minute or 60-minute interval.

## Upload Events

Send events using HTTP **GET** requests to upload events to the Machine Agent. The format is:

```
GET /machineagent/event
```

For example:

```
http://localhost:8293/machineagent/event?type=<event_type>&summary=<summary_text>
```

Event\_type is one of the following:

- error
- info
- warning

## Administer the Machine Agent

These pages describe procedures and provide reference material relevant to the AppDynamics Pro Administrator.

- [Manage Machine Agents](#)
- [Upgrade the Machine Agent](#)
- [Uninstall the Machine Agent](#)
- [FAQs and Troubleshooting for the Machine Agent](#)

### Manage Machine Agents

This page describes how to manage Machine Agents.

#### View Details

Using an AppDynamics Administrator account, click **Settings > AppDynamics Agents > Machine Agents** to see details and manage your installed Machine Agents.

- **Hostname**: Name of the machine on which the Agent is installed.
- **Version**: Version of the installed Machine Agent software.
- **Applications**: Name of the application with which the Agent is associated.
- **Enabled**: Whether the Agent is enabled.

Unique Host ID	Version	Applications	Enabled
WIN-JE86B9GMSJF	4.3.0.0	MovieTicketsGirish	✓
ip-10-0-0-222	Machine Agent v4.5.2.1606 GA compatible with ...	(not associated with any applications)	✓
linuxkit-025000000001	Machine Agent v4.5.0.1270 GA Build Date 2018-...	(not associated with any applications)	✓
RPETTY2-WIN	4.5.2.0 compatible with 4.4.1.0	rpetty	✓

## Available Actions

### Reset Selected Machine Agent

Restarts the selected Machine Agent and runs it with any updated configuration files on the Agent host, and any changes made on the Controller that affect the Agent. The reset functionality is only available for Machine Agents <= 4.2.

### View Machine

Shows summary details about the Machine Agent:

- **Name:** Name of the machine on which the Agent is installed
- **IP Address:** IP address of the machine on which the Agent is installed
- **OS:** Operating system running the Agent
- **Status:** Field displays status information: Initialized
- **Install Time:** Date and time Agent was installed
- **Last Start Time:** Date and time Agent was last restarted

### Disable and Enable Agents

Disabling the Agent temporarily suspends its collection of metrics. You can quickly re-enable the Agent when desired.

#### Permission:

You must have the application-level permission, *configure agent properties*, to enable and disable Agents.

When the Machine Agent is disabled, the Agent stops reporting hardware metrics and metrics from any extensions installed on the Agent until you re-enable it. The disabled Machine Agent no longer reports events and any installed extensions are also stopped. While disabled, the Agent continues to consume a license. The Agent maintains a 'heartbeat' connection to the Controller so that it can be 'enabled' again quickly. The Agent persists its enabled/disabled state even after the Machine Agent is restarted. Once re-enabled, all normal Machine Agent activities resume.

### Delete Selected Machine Agent

The delete functionality on the admin page is to delete the underlying machine metadata for an orphaned machine. A machine is considered "orphaned" when it is no longer associated with any APM nodes or with

Server Availability. You cannot delete a machine that is not an orphan. To delete a machine that is not an orphan, you must first delete all nodes on that machine, and then delete the machine from the Servers list. You can select multiple machines to delete.

You can also delete a Machine Agent from the [Servers List](#).

- Server Visibility Administrator permission is required to delete machines.
- You can delete machines from the Servers list regardless of whether they have Server Visibility enabled. You can select multiple machines to delete.
- Deleting a machine from the Servers list deletes the underlying machine metadata that displays on the AppDynamics Agents Admin page, but only if no APM nodes are currently associated with the same machine.
- Deleting a machine that still has APM nodes currently associated with it removes the entry from the Servers list, but retains the underlying machine metadata. That information continues to display on the AppDynamics Agents admin page.

## Upgrade the Machine Agent

This page describes how to upgrade an existing installation of the Machine Agent. The instructions have been tested and certified to work for Machine Agent  $\geq 20.1$ .

For a new installation, see [Install the Machine Agent](#).

### Perform the Upgrade

1. Do the following (as needed) before you update the Agent:
  - a. Review the [Release Notes](#) for changes that affect your environment.
  - b. Back up the `<machine_agent_home>` directory to a `<machine_agent_home_BACKUP>` so you can revert to the previous installation, if required.
  - c. *If you are upgrading the Controller as well as the Agents:* [Upgrade the Controller Using the Enterprise Console](#), and then return to this procedure.
  - d. *If you have been collecting Log Analytics data by running the Analytics Agent via the Machine Agent:* Do the following.
    - i. Preserve the old watermark file so that you can copy it to the new `<analytics-agent-home>`.  
 Machine Agent location: `<machine-agent-home>/monitors/analytics-agent/conf/watermark`  
 Analytics Agent location: `<analytics-agent-home>/conf/watermark`
    - ii. Preserve your pre-existing job files so that you can copy them to the new `<analytics-agent-home>`.  
 Machine Agent location: `<machine-agent-home>/monitors/analytics-agent/conf/job`  
 Analytics Agent location: `<analytics-agent-home>/conf/job`
2. Download the installer suitable for your OS environment from the [AppDynamics Download Center](#).
3. Stop all instances of the Machine Agent that are currently running from the `<machine_agent_home>` that you want to upgrade. See [Start and Stop the Machine Agent](#)
4. Update your Machine Agent installation:
  - RPM-based Linux installation:  
Update the existing package. For example: `sudo rpm -U <package>`
  - RPM-based installation on a systemd Linux system (such as CentOS 7, Ubuntu, newer Fedora Core systems, newer OpenSUSE systems, and newer SUSE Enterprise Linux systems).  
If you don't know if your Linux installation is using systemd, do a clean install to avoid issues. Remove the old package and then install the new one.
  - For all other scenarios:  
First, delete the `<machine_agent_home>` for the old Agent. Make sure you retain the `<machine_agent_home_BACKUP>` you created in Step 1.

Then, install the Machine Agent as described [Linux Install Using the RPM Package](#) for your specific installation in [Install the Machine Agent](#).

**i** If you are running the Analytics Agent as an extension to the Machine Agent, failure to clear out the old directory or use a new location may cause your embedded Analytics Agent to fail to start.

5. Configure the Agent settings in `<machine_agent_home> /conf/controller-info.xml`. See [Machine Agent Configuration Properties](#)

**i** The RPM-based Linux installer retains the configuration settings for the previous Agent by default. If you used another installer and want to maintain your previous Agent configuration, copy the `<machine_agent_home_BACKUP>/conf/controller-info.xml` file to the new installation directory.

6. Before you start the updated Agent, perform the following steps (as required):
  - a. *If you are updating on Windows:* When you install the new Machine Agent in the existing directory, you may see two "InstallService" and "UninstallService" files. Use the `.vbs` files (VbScript) and delete the `.cmd` files (Windows Command Script), which are leftover from your previous version.
  - b. *If the agent install package includes a new JRE:* Update any related custom scripts that use the Machine Agent JRE.
  - c. Update all users who have the Account Administrator role for the account and add the appropriate SIM roles (SIM admin and SIM user) to other users in the account, as needed.
7. Start the Agent, verify the Agent installation, and verify that the Agent is reporting to the Controller as described for your specific installation in [Install the Machine Agent](#).

## Uninstall the Machine Agent

To uninstall the Machine Agent:

1. Stop the Machine Agent (or service). For the commands for your environment, see [Start and Stop the Machine Agent](#).
2. If you installed the Machine Agent as a service, delete the service using the commands described on this page.  
For Windows and Mac OS X, the commands to remove the service also stop the service cleanly.
3. Delete the `<machine-agent-install>` installation directory.

## Remove the Agent Service

### Linux RPM

Execute the following command:

```
sudo rpm -ev appdynamics-machine-agent
```

### Windows

Execute the following command:

```
> UninstallService.vbs
```

## Mac OS X

Execute the following command:

```
sudo launchctl unload -w <machine_agent_home>/com.appdynamics.machineagent.plist
```

## Delete Using AppDynamics Manage Agents

If you delete a Machine Agent from the Controller UI (as described in [Manage Machine Agents](#)), but do not shut down the JVM that the Machine Agent runs on, the Machine Agent reappears in the UI the next time it connects to the Controller. To prevent a Machine Agent from connecting to the Controller, you must remove the Machine Agent settings from the JVM configuration. This frees the license associated with the Agent in the Controller and makes it available for use by another Machine Agent.

## FAQs and Troubleshooting for the Machine Agent

### Machine Agent and App Agent on the Same Machine, but Report to Different Nodes

#### Issue

A machine has a Machine Agent and an App Server Agent running together, however, the Agents report to different nodes. When you review the Metric Browser, for example, the application metrics appear under node *abc* but machine metrics appear under node *abc.mydomain.com*.

#### Resolution

Check if the hostnames match. If they do not match, then:

1. Set the `<unique-host-id>` for the Machine Agent to the same `<unique-host-id>` as the App Server Agent.
2. Restart the Machine Agent to apply the previous changes.

The `<unique-host-id>` on the Machine Agent and the `<unique-host-id>` for the App Server Agent must match exactly. These settings are case-sensitive and ensure that both Agents report metrics to the same node.

To verify that the hostnames match:

1. Click the gear icon () in the Controller menu and select **AppDynamics Agents**.
2. Select the Machine Agents tab.
3. Review the **Applications** field for the Agent name.

In addition, for consistency in naming in the Servers tab, use the `<machine path>` attribute to set the hostname. By using the machine path, you do not need to use the fully qualified domain name (FQDN) for some Agents, and the hostname for others. The reported hostname is still available to view by checking the option in the Agents Admin view.

Unique Host ID	Version	Applications	Enabled
WIN-JE86B9GMSJF	4.3.0.0	MovieTicketsGirish	✓
ip-10-0-0-222	Machine Agent v4.5.2.1606 GA compatible with ...	(not associated with any applications)	✓
linuxkit-025000000001	Machine Agent v4.5.0.1270 GA Build Date 2018-...	(not associated with any applications)	✓
RPETTY2-WIN	4.5.2.0 compatible with 4.4.1.0	rpetty	✓

4. Review the ID for the App Server Agent:
  - a. Go to the App Server Agents tab.
  - b. Search for the App Server Agent to which you want to associate the Machine Agent.
  - c. Review the **Unique Host ID** field for the App Server Agent installed on that machine.
5. Set the `<unique-host-id>` for the Machine Agent to the same `<unique-host-id>` as the App Server Agent.
6. Restart the Machine Agent to apply the previous changes. Your Agents will appear as associated after a few minutes

### .NET Agent Doesn't Appear on Machine Agent List

Although .NET Agents can report Machine Agent metrics, they are not considered Machine Agents. .NET Agent-instrumented machines are not included under the list of Machine Agents in the Controller UI.

### Identify the Machine Agent Process

#### Linux and Unix-like Systems

To identify which process is running the Machine Agent, enter:

```
ps -ef | grep machine
```

#### Windows Systems

In the Windows Services Application, search for the AppDynamics Machine Agent service.

### Metric Values for Disk and Network are Zero

When a 32-bit JRE is used with a 64-bit operating system, you may see values of zero for disk and network metrics. To solve this problem, use a 64-bit JRE with the 64-bit operating system.

### Flow Maps and the Machine Agent

The Machine Agent monitors a particular machine (also called "host server") and not a particular application server; therefore, the Machine Agent can report to multiple nodes running on the same machine. However, a flow map displays the communication between different nodes during application execution, or the business transaction flow from tier to tier. A Machine Agent cannot be a part of the flow and is not shown in the flow map.

## Server Health Indicator

Health rule violations based on metrics monitored by the Machine Agent are included in the health indicator on the various application, tier, and node dashboards. The health indicator is driven by health rule violations in the given time period configured on hardware metrics collected by the Machine Agent. Some health rules are configured by default. To configure additional health rules, see [Configure Health Rules](#) and [Configure Health Rules to Monitor Servers](#).

## Server Visibility

### Related pages:

- [Enable Server Visibility](#)
- [Monitor Your Servers Using Server Visibility](#)
- [Hardware Resources Metrics](#)

The AppDynamics Server Visibility module uses the Machine Agent to provide extended hardware metrics. Server Visibility includes additional windows in the Controller UI that enable you to quickly see underlying infrastructure issues impacting your application performance and rapidly troubleshoot hardware performance problems.

### Requirements

- Linux, Windows, Solaris, and AIX
- [Server Visibility license](#) for monitored machines
- [Server Visibility enabled](#) on the Machine Agent

Before you enable Server Visibility:

- Review the [Server Visibility Requirements and Supported Environments](#).
- Install and configure the Machine Agent on a machine with a supported OS as described in [Install the Machine Agent](#).

Without having to enable Server Visibility, you can [view basic hardware metrics](#).

### Feature Comparison

Feature	Server Visibility	Machine Agent
Supported Platforms	Linux, Windows, Solaris, AIX	Linux and Unix-like systems, MacOS, Windows, AIX
Extensions and Custom Metrics	Yes	Yes
Monitor Docker container metrics from the Docker host	Yes	No
Tier Metric Correlator	Yes	No
Dynamic Monitoring Mode	Yes	No

Feature	Server Visibility	Machine Agent
JVM Crash Guard	Yes	Yes
Remediation Scripts	Yes	Yes
Graphical User Interface	Yes	Functionality is limited to viewing Machine Agent metrics in the Servers List
Extended Hardware Metrics	Yes	No
Server metrics in transaction snapshots	Yes	No
Server KPIs in application flow map	Yes	No
Health rules for extended hardware metrics	Yes	No
Licensing	<a href="#">Server Visibility</a>	<a href="#">Machine Agent</a>

## Permissions

Server Visibility provides two predefined roles, and two related permissions:

- Server Visibility Administrator
- Server Visibility User
- View Server Visibility permission
- Configure Server Visibility permission - enables configuring Service Availability

## Server Visibility User Interface

The [Servers list](#) provides key performance metrics for all your servers on a single panel.

The [Servers > Dashboard](#) shows key performance metrics for the selected machine, including the top ten consumers of CPU and memory.

The [Servers > Volumes](#) panel displays performance metrics for disks, partitions, and volumes for the selected machine.

The [Servers > Network](#) panel shows network performance metrics for network interfaces on the selected machine.

The [Servers > Processes](#) panel shows a configurable set of performance metrics for processes.

The [Servers > Containers](#) panel lists the monitored containers used by an application.

## Using the Server Visibility UI

The Server Visibility user interface uses many of the same mechanisms that are common to the various panels of the Controller UI. The sample image illustrates these mechanisms.

The screenshot shows the AppDynamics interface for monitoring processes on a host named 'ECommerce\_MA'. The 'Processes' tab is active, displaying a table of running processes. A sidebar on the left allows users to configure which columns are displayed in the table. Three callout boxes provide instructions: one points to a window name, another to a column heading, and a third to the configuration sidebar.

Current Process C...	Command Line	State	Start ...	End TI...	CPU (%)	Mem...	PID	PPID
1	/usr/sbin/acpid	🛡️	09/20...	-	0.0	0.0	2572	1

## Search Results and Sorting

Pagination is the default behavior on the **Servers** and **Containers** list pages. The information is retrieved on demand, and additional records are retrieved and displayed as you scroll. Search is only available for the **Name** and **Host ID** columns. Sorting is only available on the **Hostname**, **Container**, **Metric %**, and **Health** fields.

## Server Visibility Requirements and Supported Environments

To [enable Server Visibility](#), review these system requirements guidelines.

### System Requirements

Server Visibility requires a supported version of the Machine Agent to be installed on the monitored server. See [Machine Agent Requirements and Supported Environments](#).

Server Visibility features are available for AIX, Linux, Windows, and Solaris. You need a Server Visibility license to enable and use Server Visibility features. Server Visibility is enabled by default on AppDynamics Controllers. You must explicitly [enable Server Visibility on your Machine Agent](#) to start sending the expanded set of Server Visibility metrics.

You can install and run Machine Agents on other supported platforms, however, Server Visibility features are not available. For OS platforms like AIX or HP-UX, AppDynamics recommends using the unbundled Machine Agent ZIP without the JRE.

### Limitations

- Total number of Machine Agents and containers reporting to a single Controller is 30,000.
- Total number of App Agents reporting to a single Controller is 100,000.

- Monitored servers are considered stale 30 days after they go offline. They are purged from the Controller database when that time limit is reached.
- [Docker Visibility](#) is supported on Linux only.

## Server Visibility on Windows

Review these notes:

- It is good practice to check the server frequently to ensure that it has the latest Windows updates installed. WMI (Windows Management Instrumentation) updates are especially important because the Agent uses WMI to collect Server Visibility metrics.
- The monitored server should have at least four cores or multiple CPUs. WMI processes can be highly resource-intensive, especially on Windows Server 2012.
- If you do not have a Server Visibility license, or to collect Basic metrics only, configure the Agent to use the `JavaHardwareMonitor` extension. [Server Visibility](#) should not be enabled on the Agent.
- The Windows Machine Agent uses these extensions by default:
  - `JavaHardwareMonitor` (for Basic metrics)
  - `ServerMonitoring` (for Server Visibility metrics)
- The `HardwareMonitor` extension is not recommended on Windows.
- To enable Server Visibility on a Windows server with a .NET APM Agent installed, you must enable [.NET Compatibility Mode](#) on both the Controller and the Machine Agent.

## Enable Server Visibility

Before you enable Server Visibility:

1. Review the [Server Visibility Requirements and Supported Environments](#).
2. Install and configure the Machine Agent on a machine with a supported OS as described in [Install the Machine Agent](#).

### Server Visibility License Required

Infrastructure Visibility is an add-on module to the Machine Agent and requires a Server Visibility license on the Agent.

## Enable Server Visibility

1. Set the " `sim.enabled` " property to " `true` ". See [Where to Specify Machine Agent Configuration](#), and configure the value based on your configuration choice:
  - Element in `controller-info.xml`: `<sim-enabled>`
  - System Property: `-Dappdynamics.sim.enabled`
  - Environment Variable: `APPDYNAMICS_SIM_ENABLED`
2. Restart the Machine Agent. See [Start and Stop the Machine Agent](#).

## Monitor Your Servers Using Server Visibility

This page describes the Server Visibility panels in the Controller UI:

- [Discover Normal Server Activity](#)
- [Servers List](#)
- [Server Dashboard](#)
- [Server Process Metrics](#)
- [Server Volumes Metrics](#)
- [Server Network Metrics](#)
- [Navigating Between Server and Application Contexts](#)

## Discover Normal Server Activity

### Related pages:

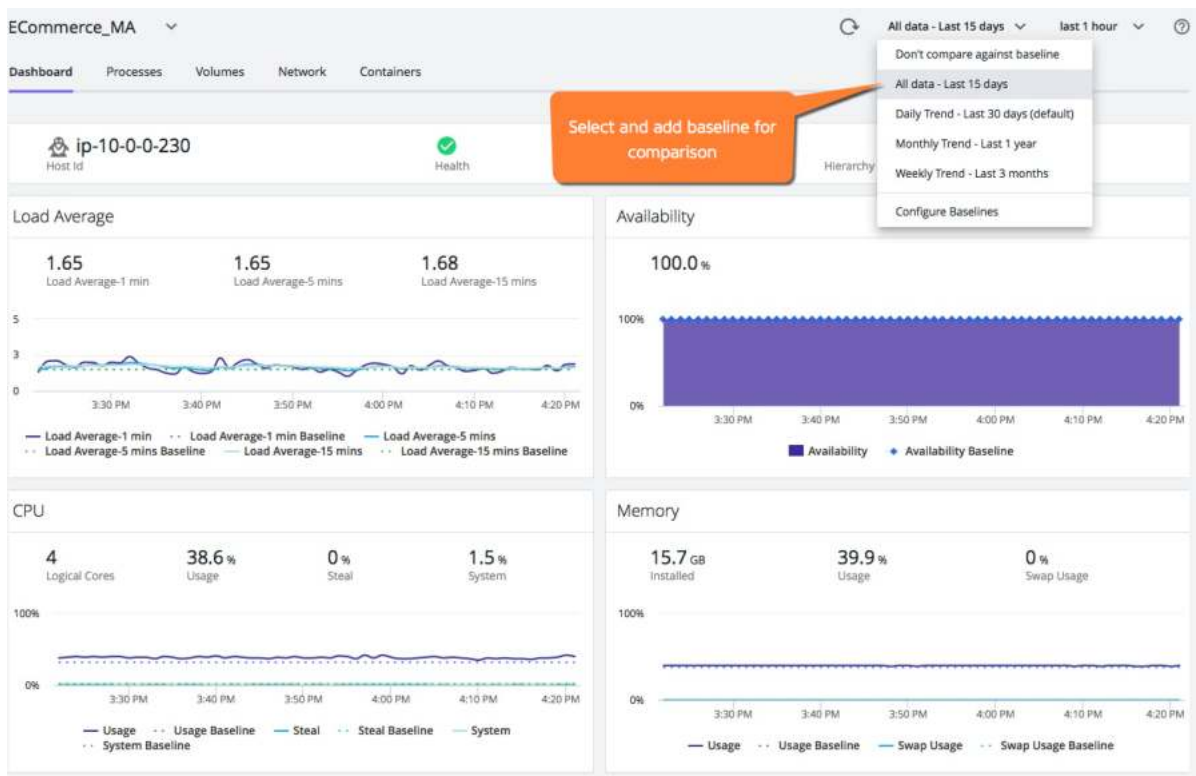

- [Dynamic Baselines](#)
- [Hardware Resources Metrics](#)

The Server Visibility module automatically learns to detect performance anomalies using baselines that are specific to your server environments.

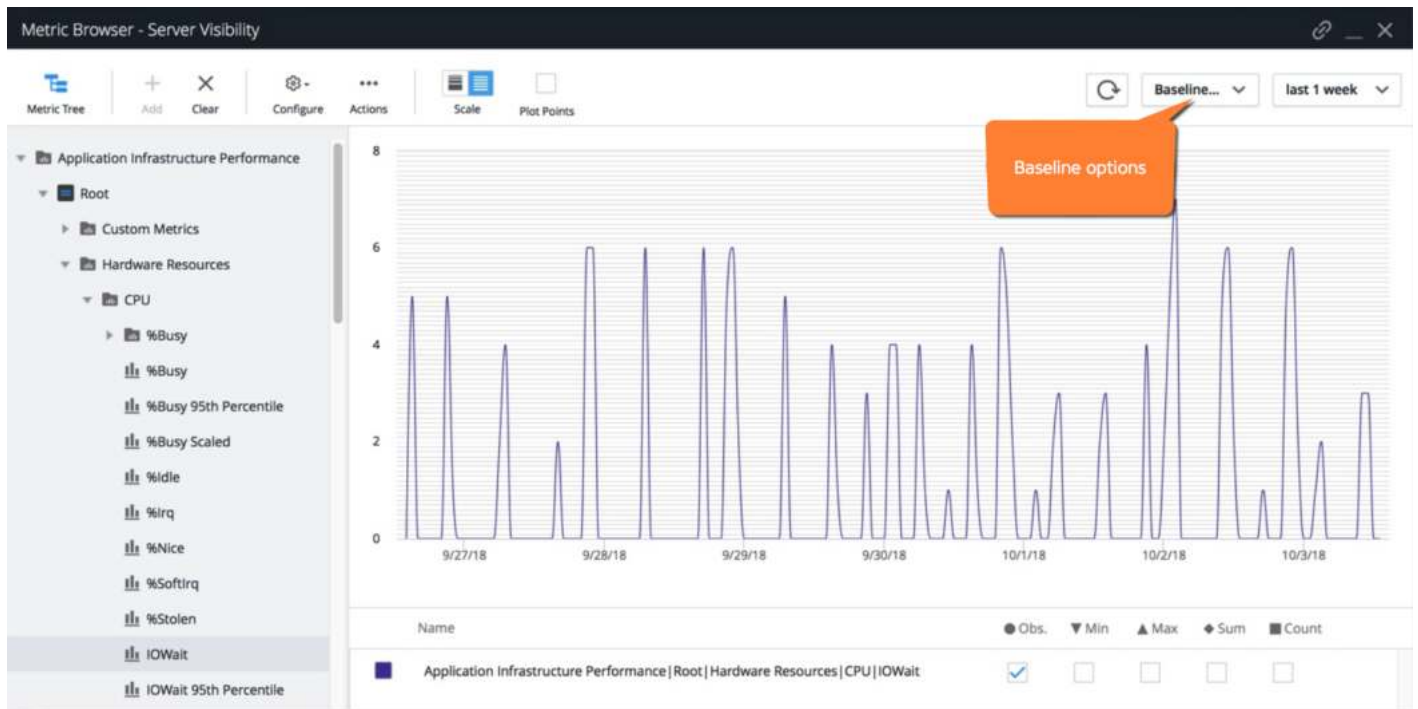

AppDynamics creates baselines by collecting metrics from your monitored servers over defined periods of time. This establishes what is normal for your environment so you can create [health rules](#) to alert you when metric deviations occur from the normal range. You can also create your own baselines.

### View Performance Metrics Compared to Baselines

You can compare performance metrics to their dynamic baselines on the Server Dashboard.

You can visualize performance metrics and review deviations from expected behaviors established by the baseline from the **Metric Browser - Server Visibility** panel.

## Servers List

To access: AppDynamics Home > **Servers**

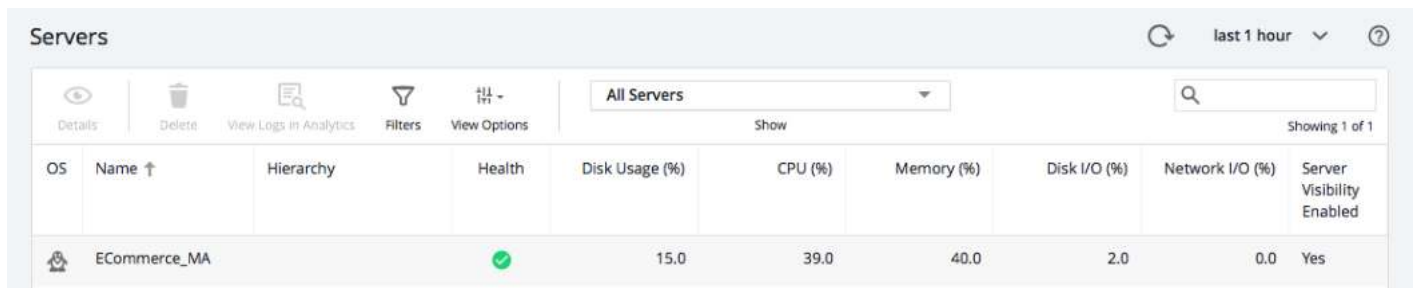

The **Servers** list shows all machines registered by a Machine Agent. This list shows metric data for Server-Visibility-enabled machines only. Machines registered with App or .NET Agents, with no Machine Agent running, do not appear in this list.

On the Servers list you can:

- See the complete list of Machine Agents reporting to this Controller. The **Name** is taken from the value in `<machine-path> in controller-info.xml`. The last string after the last | (pipe) is used. For example, if the value is `<machine-path>Group | myName<machine-path>`, then the name is `myName`. For `<machine-path>JustName<machine-path>`, then the name is `JustName`.
- Filter the list using the dropdown to show all servers (the default) or just servers with Server Visibility enabled or disabled.
- Use **View Options** to select the columns shown for each server in the table. You can show or hide metrics such as **CPU Steal**, **Load Average**, **Memory Swap Used**, and **Network I/O**. You can also show or hide properties such as Host ID and JVM version.
- See key performance metrics for your monitored servers at a glance.
- Change the time period of the metrics displayed.
- See an overview of the health of the servers, as determined by whether any health rules have been violated. See [View Health Rule Status in the UI](#).
- Click the violations icon (  ) to view health rule violations for a server.
- Click on any point on a spark chart to see the percentage usage at that time.
- Sort the chart by any of the columns.
- Right-click on a set of selected servers to
  - Delete the servers from the Servers list. See "Delete Selected Machine Agent" in [Manage Machine Agents](#).
  - View and analyze log data for the servers (if you have an Application Analytics license). See [Analytics](#).
  - Set the **Dynamic Monitoring Mode** on the servers. See [Dynamic Monitoring Mode and Server Visibility](#).
- See additional details of servers that are enabled for Server Visibility. Double-click a selected server to see server-specific [dashboard](#), and details of the server's [volumes](#), [network](#), and [processes](#).
- Filter data according to the "liveness" of servers. A Machine Agent that reports metrics from a server is considered live. Eventually, servers can transition to a terminated or unrecoverable state. By specifying a time range in the Server Dashboard,

you can filter servers which were live and reporting metrics during that time range. To enable this option for an individual account:

- a. Log in to the Controller admin page: `<controller-hostname>/controller/admin.jsp`
  - b. From **Accounts**, open the account page of interest.
  - c. Click **Controller Settings > Controller Configurations** and enter:
    - i. Name = `entity.liveness.filter.enabled`
    - ii. value = `true`
    - iii. Name = `entity.liveness.tracker.enabled`
    - iv. value = `true`
- Disable automatic sorting of the Servers List table when it first loads. This option is useful if the Controller is monitoring hundreds or thousands of Machine Agents and the table is taking a long time to load. This option disables the ability to sort the table by any metric or metric trend column. To enable this option for an individual account, do the following:
    - a. Log in to the Controller admin page: `<controller-hostname>/controller/admin.jsp`
    - b. From **Accounts**, open the account page of interest.
    - c. Click **+ Add Property** and enter:
      - i. Property = `SIM_DISABLE_MACHINE_SORTING`
      - ii. value = `true`

### Available Metrics in the Servers List

Metric Name	Description
Hierarchy	Specifies the root of the hierarchical path to the server. See the machine hierarchy property in this topic: <a href="#">Machine Agent Configuration Properties</a> .
Health	Indicates if server health rules have been violated on this machine.
Disk Usage % trend	The percentage usage trend over time of storage space in use across all listed volumes, partitions, and disks.
CPU (%)	The percentage of time the CPU was busy processing system or user requests.
CPU Trend	The trend over time of CPU usage.
Memory (%)	The percentage of memory used.
Memory Trend	The trend over time of memory usage.

Metric Name	Description
Disk I/O (%)	The percentage of time spent performing read and write operations across one or more disks, volumes, or partitions.
Disk IO Trend	The trend over time of disk usage.
Network I/O (%)	The average network utilization of network bandwidth for all monitored network devices. The network utilization percentage is the total incoming and outgoing bytes per second, divided by the maximum speed of the network interface. In some cases, if the Network I/O percentage value is too small compared to the network speed (10,000 Mb/s), the value is rounded to zero on the Servers List. In this case, the Network I/O % shows as zero, while the drilled-down details of the machine might show network traffic.
Network Trend	The trend over time of network usage.
Server Visibility Enabled	Indicates if Server Visibility is enabled for this machine. Values=Yes, No, and Not Supported. Not Supported indicates that Server Visibility is not available for that machine OS.
Icon	Representation of the machine's Operating System

## Server Dashboard

To access Server Dashboard, select **AppDynamics Home > Servers > Dashboard**.

Select a server from the list and double-click a server name to display its Dashboard. In this Dashboard, you can:

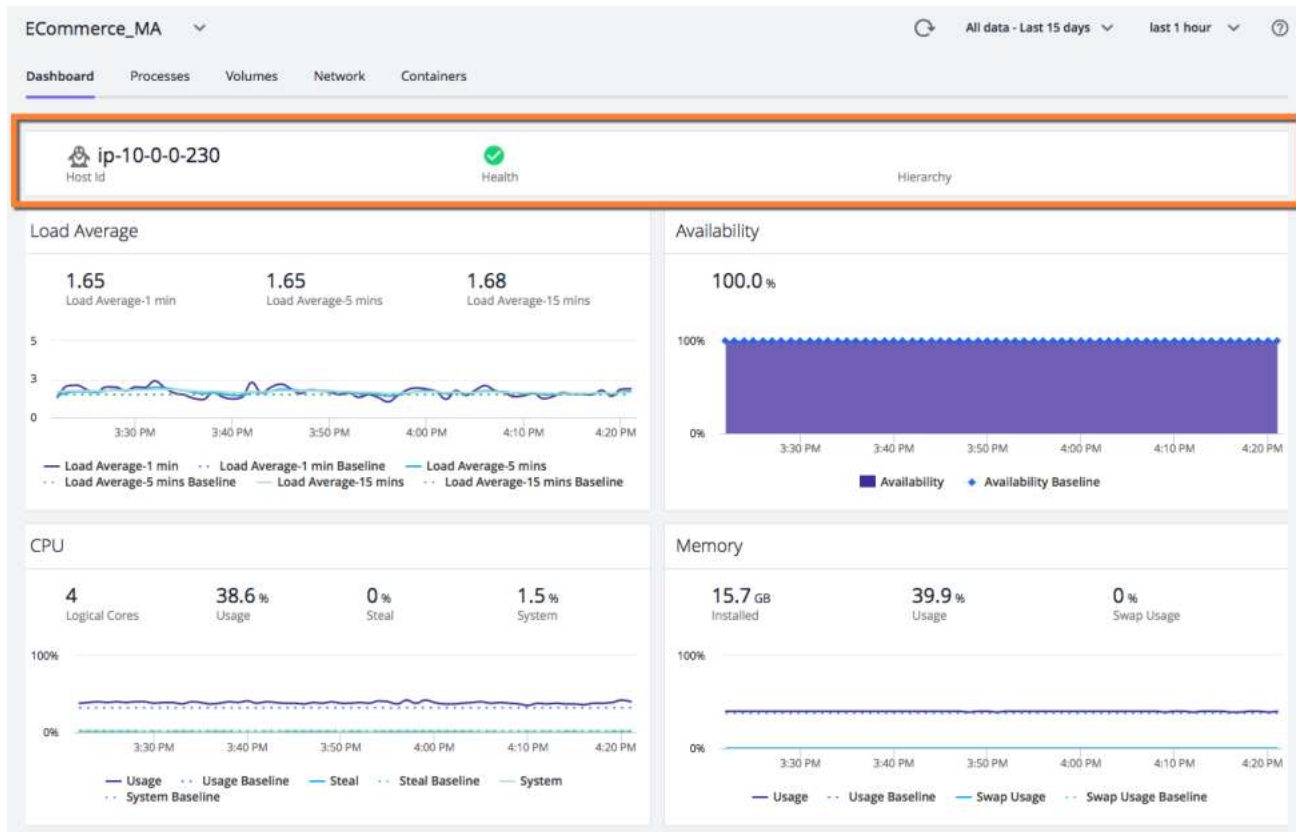

- View charts of key performance metrics for the selected monitored servers:
  - Server availability
  - CPU, memory, and network usage percentages
  - Server properties
  - Disk, partition, and volume metrics
  - Top ten processes consuming CPU resources and memory
- Change the time period of the metrics displayed.
- View an assessment of the overall health of the server based on any health rule violations. See [View Health Rule Status in the UI](#).
- View the hierarchy or grouping of the server as specified in the `controller-info.xml` using the `machine-path` configuration property.
- Click on any point on a chart to see the metric value for that time.
- Sort the chart using any of the columns as a sorting key.
- Find and switch to other Server Dashboards from the dropdown next to server tier.
- View an aggregate of the top ten processes by CPU usage, and top ten processes by memory.

## Server Dashboard Metrics

### Host ID, Health, Hierarchy (*Top Pane*)

- **Host Id:** This is an ID for the server that is unique to the AppDynamics Controller.
- **Health:** Shows the overall health of the server. Hover over the health icon for details; for example, the following appears when hovering over the exclamation mark (!) in a red box, "There are Critical Health Rule Violations on this machine during the time range."
- **Hierarchy:** This is an arbitrary hierarchy to group your servers together, specified by [Machine Hierarchy Property](#).

### Load Average

The [CPU load](#) presented as an average over the past 1 minute, 5 minutes, and 15 minutes. The CPU load is the percentage of the CPU consumed by processes that are currently running or that are waiting to run. These metrics are shown as percentages in the Server Dashboard and are [scaled by 100 in the Metric Browser](#).

### Availability

- **Availability:** Percentage of time the Machine Agent is able to communicate with the Controller. The Machine Agent sends availability information in the form of a heartbeat to the AppDynamics Controller once a minute to indicate the Agent is alive. The heartbeat may show as available when other functions of the Machine Agent and Server fail. The availability only indicates that the Machine Agent is communicating with the Controller, and does not indicate the overall health of the functions within the Machine Agent.
- **time series chart:** Shows the Machine Agent availability trend over time. There are situations where the Machine Agent is able to communicate with the Controller while other functions of the Machine Agent, or processes on the server, are non-functional. Do not use the time series metric to indicate the overall availability of the server.

## CPU

- **CPU Usage:** Average usage of CPU over the chosen time-range.
- **# of Cores:** Number of cores for the CPU.
- **time series chart:** Shows CPU busy percentage trend over time.

## Memory

- **Installed:** Total amount of memory, free and used, on the server.
- **Memory Usage:** Percentage of memory used.
- **Swap Usage:** Swap usage tracks the swap file utilization. A swap file enables an operating system to use hard disk space to simulate extra memory. When the system runs low on memory, it swaps a section of RAM being used by an idle program onto the hard disk to free up memory for other executing programs. When the idle, swapped out program begins executing again, it is moved back to RAM, potentially displacing some other idle program. This causes a large amount of hard disk reading and writing that can slow down the system considerably.
- **time series chart:** Shows the memory usage trend over time.

## Network

- **Interfaces:** Number of network interfaces on the server.
- **Outgoing:** Kilobytes of data sent per second for all monitored network devices.
- **Incoming:** Kilobytes of data received per second for all monitored network devices.
- **time series chart:** Shows the network incoming and outgoing volume trend over time.

The screenshot shows the AppDynamics monitoring dashboard for a host named 'ECommerce\_MA'. The dashboard is divided into several sections:

- Properties:** A table listing system information:
 

OS Architecture	x86_64
Hostname	ip-10-0-0-230
Bios Version	4.2.amazon
AppDynamics Agent Agent version	Machine Agent v4.5.2.1611 GA compatible with 4.4.1.0 Build Date 2018-09-19 21:01:18
AppDynamics Agent Install Directory	/appdynamics/machine-agent
OS Kernel Release	4.14.59-64.43.amzn1.x86_64
AppDynamics Agent Build	adf4dcd
- Volumes:** A table showing disk usage for the root partition:
 

Name	Partition	Total(MB)	Free(MB)	Usage (%)	Usage (%) Trend
/	xvda1	201,457	170,575.7	15	
- Top 10 Process Classes Consuming CPU:**

Class	Cur...	CPU (%)	Memory (%)	PID	PPID
oracle	41	155.0	14.0	MULTIPLE	30333
java	10	49.0	34.0	MULTIPLE	MULTIPLE
docker-containe	17	2.0	0.0	MULTIPLE	MULTIPLE
agetty	2	0.0	0.0	2885	1
acpid	1	0.0	0.0	2572	1
mysqld	2	0.0	1.0	31418	31241
dockerd	2	0.0	1.0	3998	1
appd-netagent	2	0.0	2.0	3303	3301
httpd	12	0.0	0.0	MULTIPLE	MULTIPLE
node	20	0.0	2.0	MULTIPLE	MULTIPLE
- Top 10 Process Classes Consuming Memory:**

Class	Cur...	CPU (%)	Memory (%)	PID	PPID
java	10	49.0	34.0	MULTIPLE	MULTIPLE
oracle	41	155.0	14.0	MULTIPLE	30333
appd-netagent	2	0.0	2.0	3303	3301
node	20	0.0	2.0	MULTIPLE	MULTIPLE
mysqld	2	0.0	1.0	31418	31241
dockerd	2	0.0	1.0	3998	1

acpid	1	0.0	0.0	2572	1
httpd	12	0.0	0.0	MULTIPLE	MULTIPLE
docker-containe	17	2.0	0.0	MULTIPLE	MULTIPLE

## Volumes

- **Total:** Storage space, free and used, on the disk, partition or volume. For Linux systems, this does not include disk space reserved by the kernel.
- **Free:** Total storage space available. For Linux systems, this does not include disk space reserved by the kernel.

- **Usage(%)**: Percentage of storage space in use across each disk, partition, and volume.
- **time series chart**: Shows the storage usage trend over time.

## Top 10 Processes Consuming CPU

- **Count**: Number of processes in this class.
- **CPU (%)**: Percentage of CPU resources consumed by all processes in this class.
- **Memory (%)**: Percentage of memory consumed by all processes in the class.
- **PID**: Process ID.
- **PPID**: Parent Process ID.

## Top 10 Processes Consuming Memory

- **Count**: The number of processes in this class consuming memory resources.
- **CPU (%)**: Percentage of CPU consumed by all processes in this class.
- **Memory (%)**: Percentage of memory consumed by all processes in this class.
- **PID**: Process ID.
- **PPID**: Parent Process ID.

## Server Process Metrics

### Related pages:

- [Hardware Resources Metrics](#)
- [Enable Server Visibility](#)
- [Machine Agent Settings for Server Visibility](#)

To access Server Process Metrics, select **AppDynamics Home > Servers >** (double-click a server) **> Processes**.

You can configure which processes AppDynamics monitors, how they are grouped, the number of processes to monitor, and how long they must be alive before monitoring them. See [Machine Agent Settings for Server Visibility](#)

From the Server Processes tab, you can:

- View all the processes active during the selected time period. The processes are grouped by class as specified in the [ServerMonitoring.yml](#) file.
- View the full command line that began this process by hovering over the process entry in the **Command Line** column.
- Expand a process class to see the processes associated with that class.
- Select **View Options** to configure which columns to display in the chart.
- Change the time period of the metrics displayed.
- Sort the chart using the columns as a sorting key. You cannot sort by CPU Trend or Memory Trend on sparkline charts.
- Review CPU and Memory usage trends.

## Metrics for Server Processes

The following information displays for each monitored class and process:

### Default Columns

- **Class:** The process class.
- **Count:** The number of processes in this class.
- **Command Line:** The command that began the process.
- **State:** An icon represents the process state: sleeping, running, terminated, zombie or multiple. Hover over the icon to discover its state. The State column displays a question mark when there is more than one process associated with the class. Expand the class to review the state of the related processes.
- **Effective User:** The name of the user account that started the process.
- **Start Time:** The time, as set on the Controller machine, when the process started.
- **End Time:** The time, as set on the Controller machine, when the process ended.
- **CPU (%):** The percentage of CPU resources by all processes in this class.
- **CPU Trend:** A chart that shows CPU usage over the selected time period.
- **Memory (%):** The percentage of memory resources by all processes in this class.
- **Memory Trend:** A chart that shows memory usage over the selected time period.
- **PID:** Process ID.
- **PPID:** ID of the parent process.

### OS-Specific Columns

The column information is specific to processes monitored on a Linux server.

- **pgid:** Process group ID.
- **Real Group:** The process real group ID.
- **Real User:** The process real user ID.
- **Effective Group:** The user ID the kernel uses to determine the process permissions when using shared resources such as: message queues, shared memory, and semaphores.
- **Nice Level:** The priority used to indicate the amount of CPU to afford the process or the process priority, where -20 is the highest priority, and 19 or 20, is the lowest priority.

## Windows Process Collection Configuration

When too many processes slow down the performance of the Machine Agent on Windows, you must adjust the system environment variables to accommodate. Specifically, in relation to Windows-based operating systems supported by AppDynamics, see System Requirements.

Microsoft Windows process collection is enabled by default in the Controller and is missing the Effective User value due to performance issues. To retrieve the Effective User value, set the `APPDYNAMICS_ENABLE_PROCESS_OWNER_INFORMATION` environment variable. Although you can retrieve this information, this will most likely slow your process collection and may lead to additional issues, such as high CPU usage and the failure to report metrics. To disable process collection, set the `APPDYNAMICS_MACHINE_AGENT_STOP_PROCESS_COLLECTION` to speed up your performance at the expense of losing process metrics and metadata.

## Windows System Environment Variables

This information is specific to processes monitored on a Windows server.

1. **Default:** Retrieve all Windows processes and metadata. Starting with Machine Agent 4.5.4, Effective User information is excluded by default to improve performance.
2. `APPDYNAMICS_ENABLE_PROCESS_OWNER_INFORMATION` : Retrieve all Windows processes and metadata, including the Effective User, but the Machine Agent may experience performance issues. This is available starting with Machine Agent 4.5.4.
3. `APPDYNAMICS_MACHINE_AGENT_STOP_PROCESS_COLLECTION` : Stops all Windows process metrics and metadata collection, but improves Machine Agent performance. If you set this variable, then the `APPDYNAMICS_ENABLE_PROCESS_OWNER_INFORMATION` variable is ignored. This is available starting with Machine Agent 4.4.0.

 These environment variables only need to be set; you do not need to assign a value to the variable.

You must restart the Machine Agent for these changes to take effect.

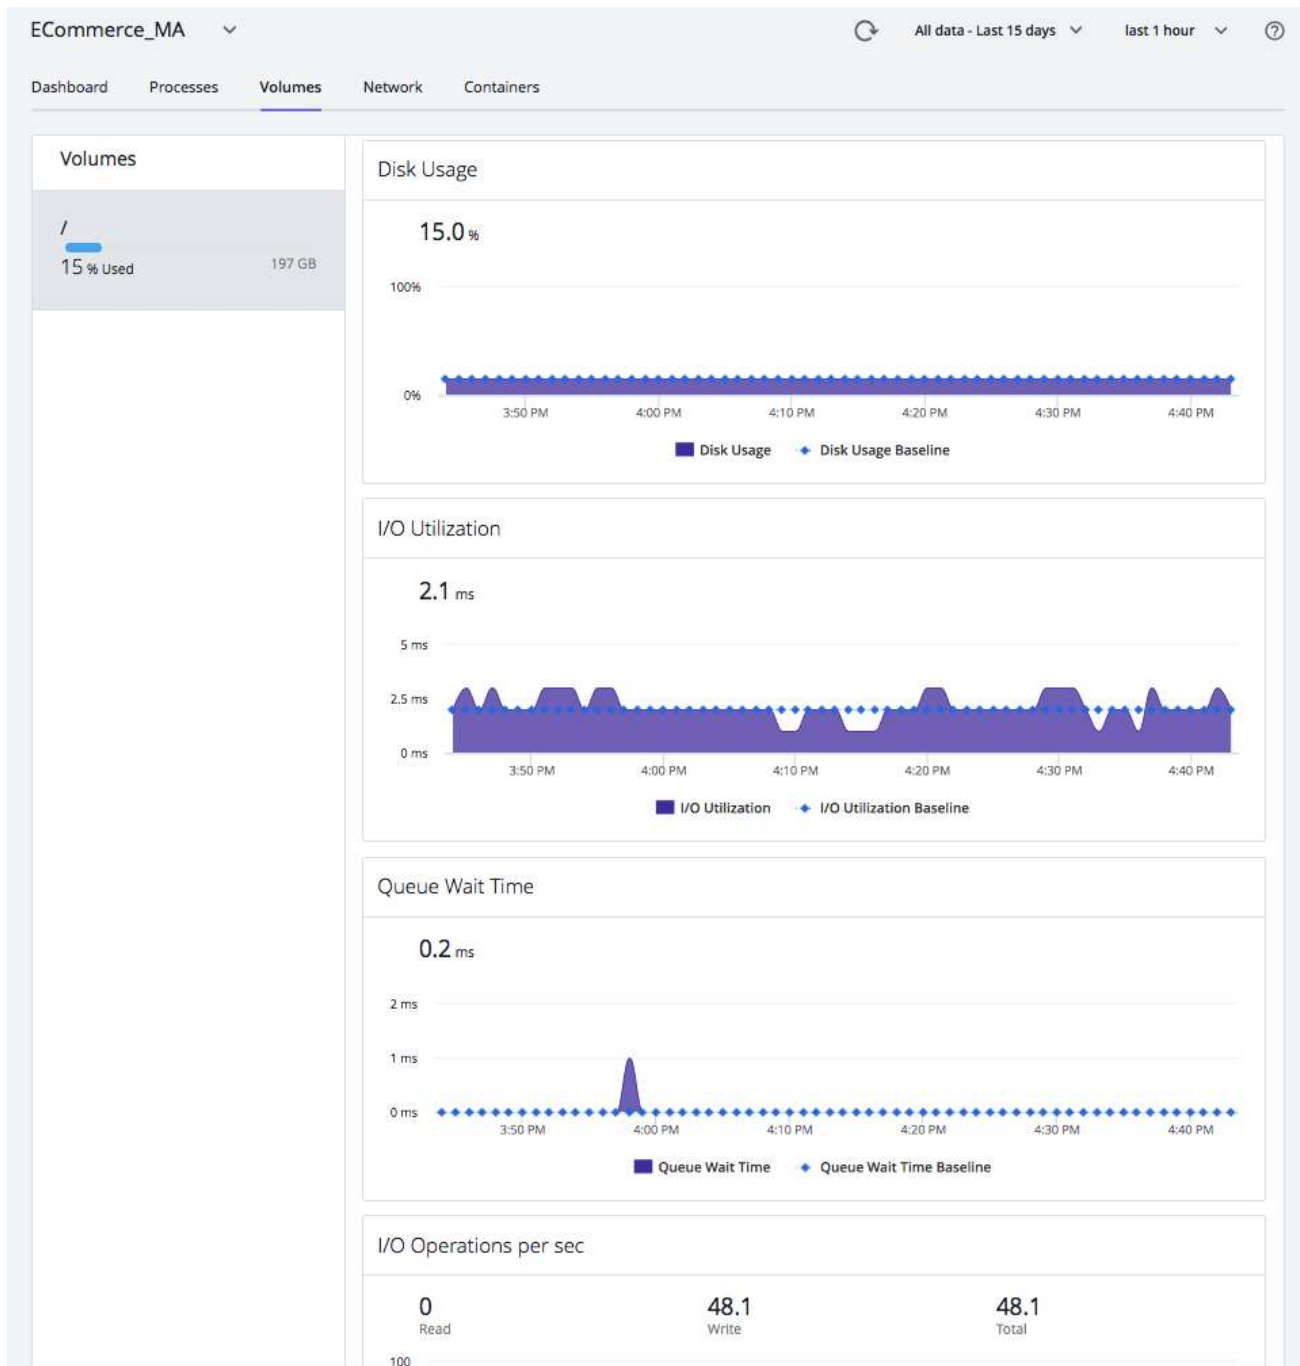

## Server Volumes Metrics

To access Server Volumes Metrics, select **AppDynamics Home > Servers > double-click server > Volumes**.

From the Server Volumes tab, you can:

- View the list of volumes, the percentage used, and total storage space available on the disk, partition, or volume
- View disk usage and I/O utilization, rate, operations per second, and wait time
- Change the time period of the metrics collected and displayed
- Click on any point on a chart to review the metric value for that time

 The Machine Agent does not monitor Linux remote volumes.

### Metrics in the Server Volumes Tab

For each selected disk, partition or volume, these columns are available for the **Server Volumes** panel.

- **Disk Usage %:** The percentage of storage space in use (To configure how this metric is calculated on Linux, see [Configure Disk Usage Metric Collection on Linux](#)).
- **I/O Utilization %:** The percentage of time spent performing read and write operations
- **I/O Rate read:** The number of kilobytes per second of data reads
- **I/O Rate write:** The number of kilobytes per second of data writes
- **I/O Operations per sec read:** The number of read operations per second

- **I/O Operations per sec write:** The number of write operations per second
- **I/O Wait Time read:** The percentage of time the CPU was waiting for read operations to complete
- **I/O Wait Time write:** The percentage of time the CPU was waiting for write operations to complete

- Volume space metrics on POSIX systems are obtained using the " df " command.
- On Linux, the space reserved for `root` is not counted in the available space.

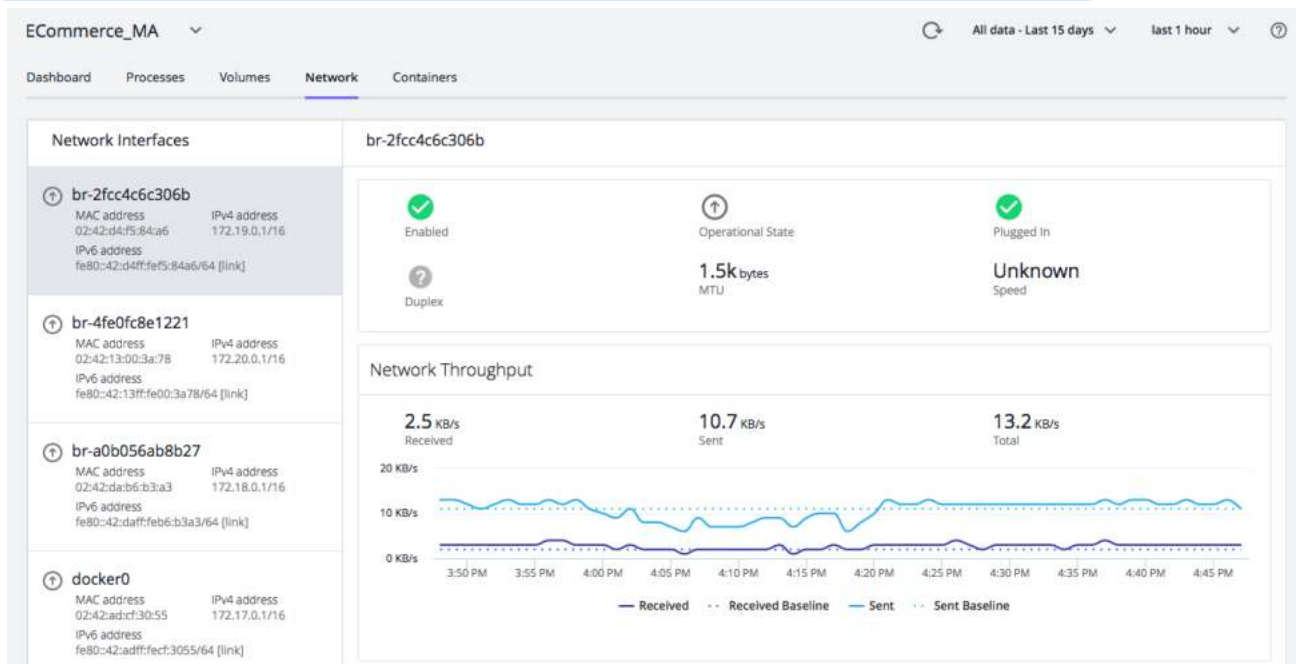

## Server Network Metrics

To access Server Network Metrics, select **AppDynamics Home > Servers > double-click server > Network**.

From the Server Network tab, you can:

- View the MAC, IPv4, and IPv6 IP address for each network interface.
- View the state of the network interface:
  - Enabled
  - Functional (its operational state)
  - Equipped with an Ethernet cable that is plugged in
  - Operating in full or half-full duplex mode
- View the maximum transmission unit (MTU) or size (in bytes) of the largest protocol data unit that the network interface can pass
- View the speed of the Ethernet connection in Mbit/sec
- View network throughput in kilobytes/sec and packet traffic
- Change the time period of the metrics displayed
- Hover over any point on a chart to review the metric value for that time

- If no metrics display, the network device speed cannot be found for some devices and some Linux versions.

## Server Network Metrics

These columns are available for the Server Network panel.

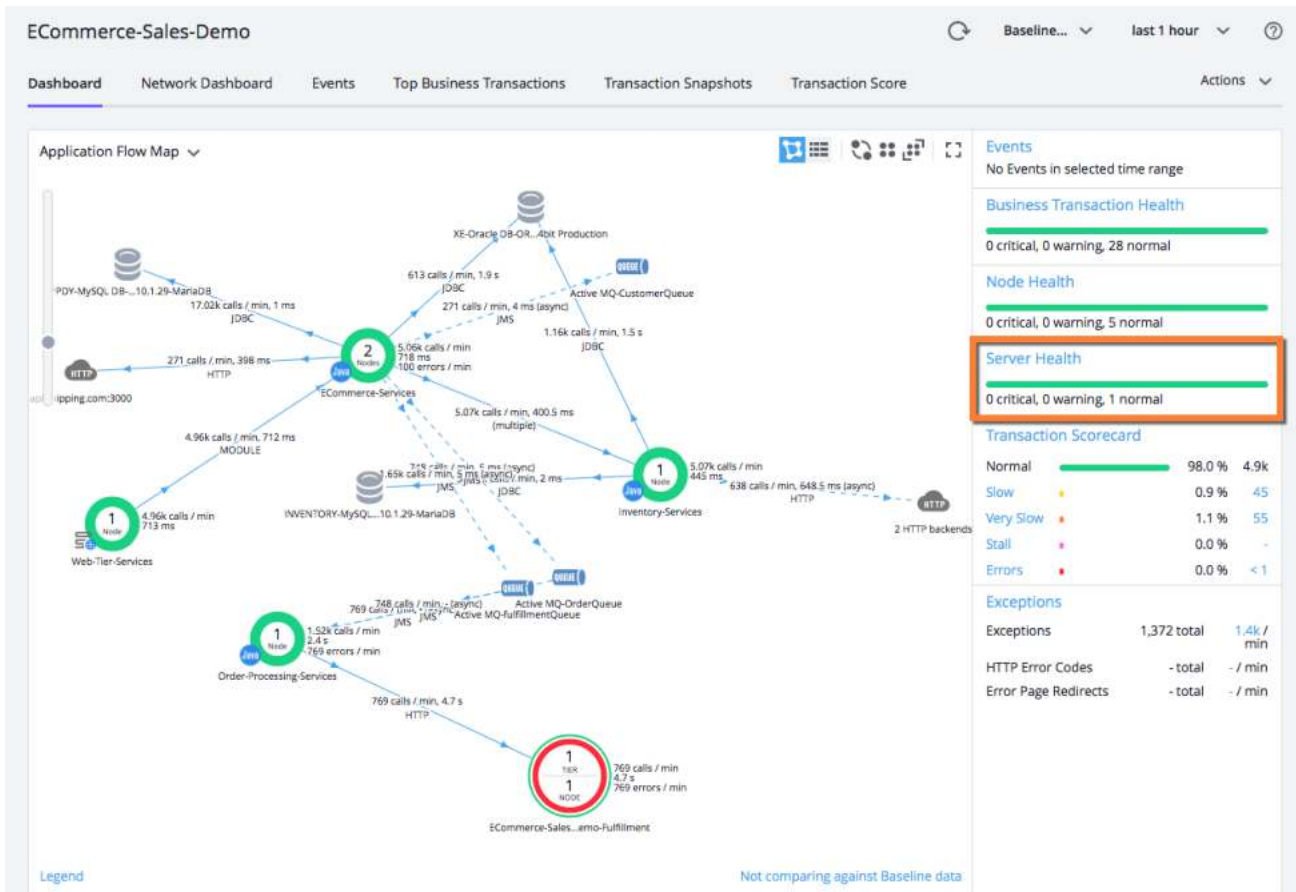

For the selected network interface:

- **Network Throughput received:** The volume of data received per second
- **Network Throughput sent:** The volume of data sent per second
- **Packets per sec incoming:** The number of data packets received per second
- **Packets per sec outgoing:** The number of data packets sent per second

## Navigating Between Server and Application Contexts

With Server Visibility enabled, you can access server performance metrics in the context of your applications. See [Monitor Your Servers Using Server Visibility](#).

After logging in to the AppDynamics Controller, and locating your application [flow maps](#), you can drill down to Server metrics for a selected tier or node. The Server health summary shows the number of critical/warning/normal conditions for the application’s servers.

Select a tier, such as in this example, *Inventory-Services*, to review the server details.

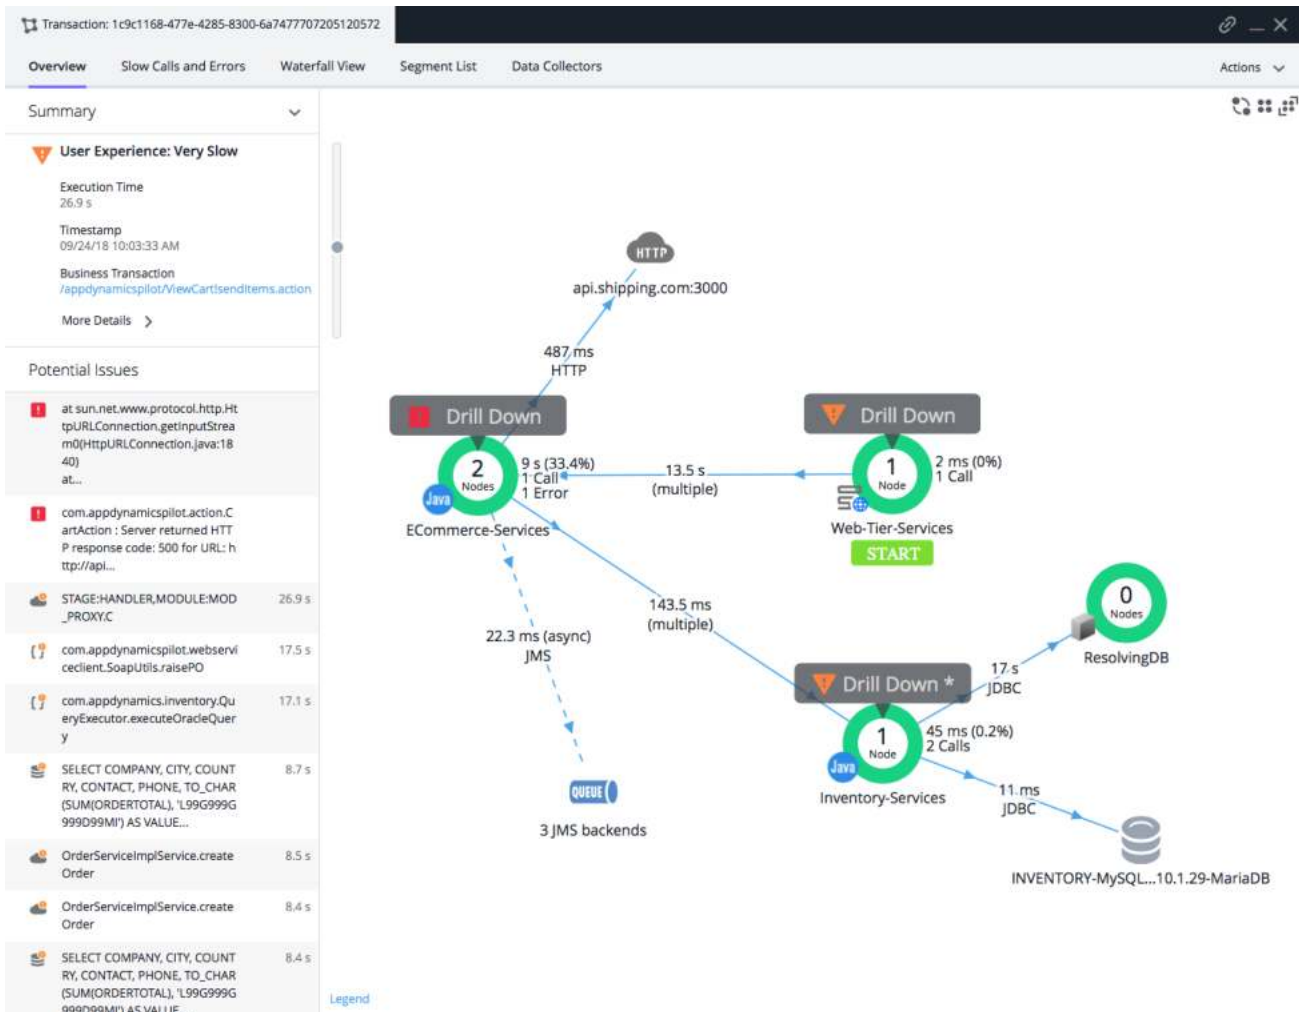

Java **Inventory-Services**

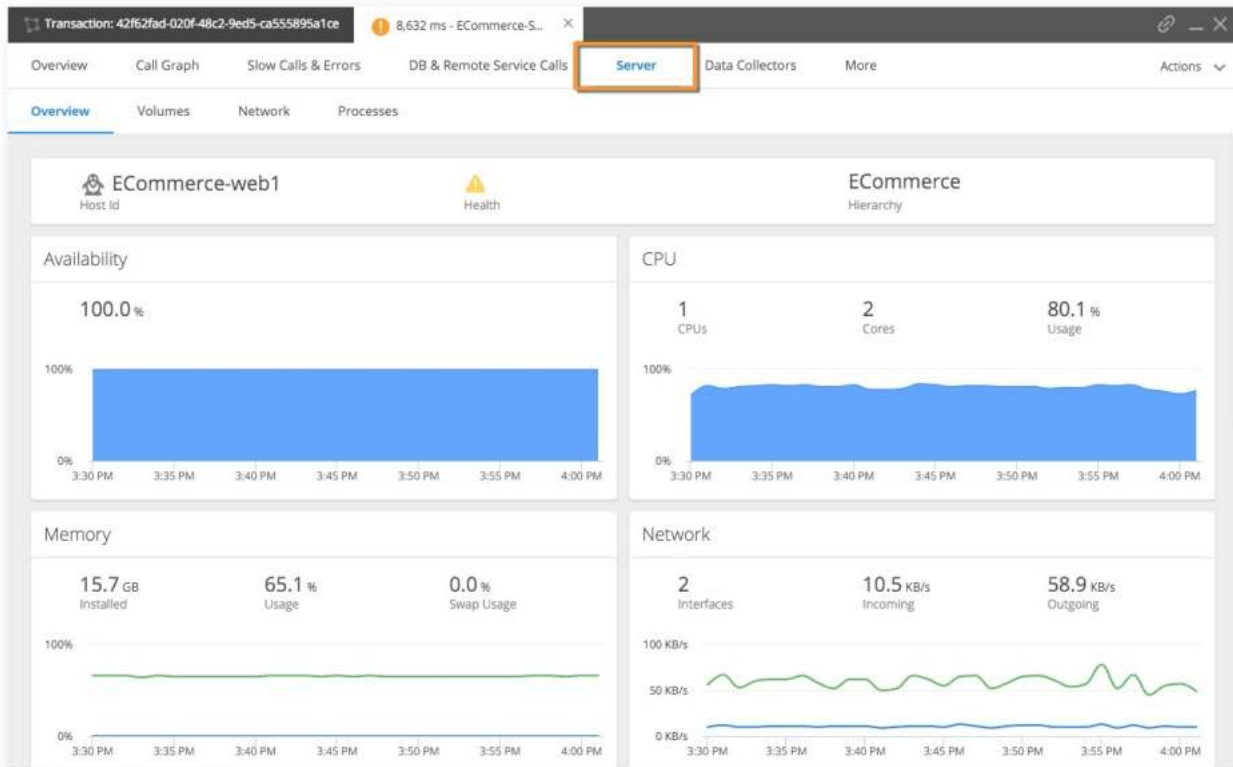

- Overview
- Nodes
- Servers**
- Slowest DB and Remote Calls
- Business Transactions
- Network
- Incoming
- Errors

OS	Name ↑	Hierarchy	Health	CPU (%)	Memory (%)	Disk I/O (%)	Network I/O (%)	Server Visibility Enabled
	ECommerce_MA		<span style="color: green;">✔</span>	39.0	40.0	2.0	0.0	Yes

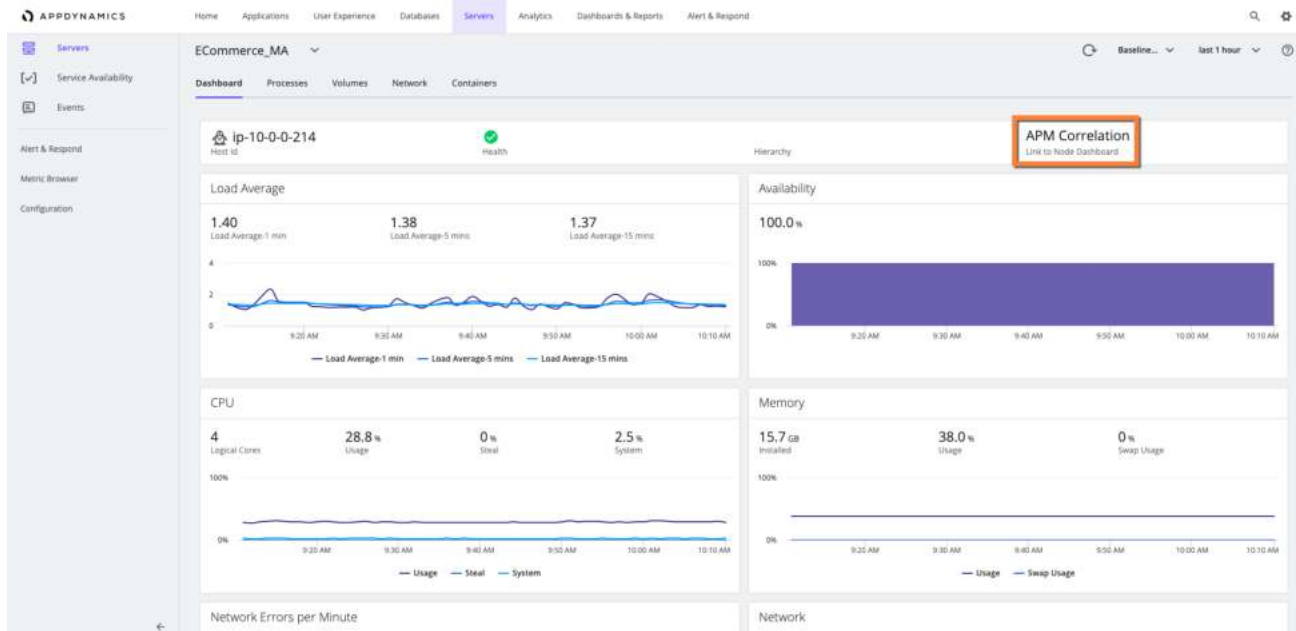

From the list of transaction snapshots, you can drill down to server metrics to determine if there is anything suspicious contributing to slow transactions. Double-click a snapshot of interest, drill down into the call to view the Server tab and its associated metrics.

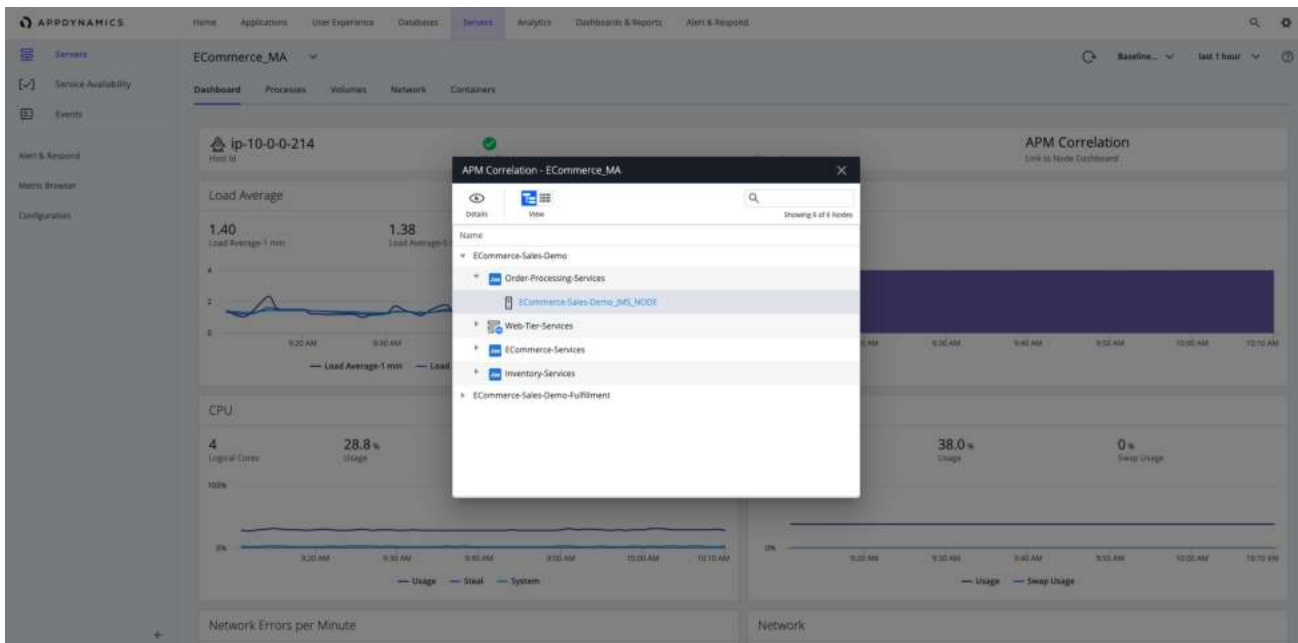

From the snapshot Server tab, you can review **CPU**, **Memory**, and **Network** utilization, and determine which processes are consuming server resources.

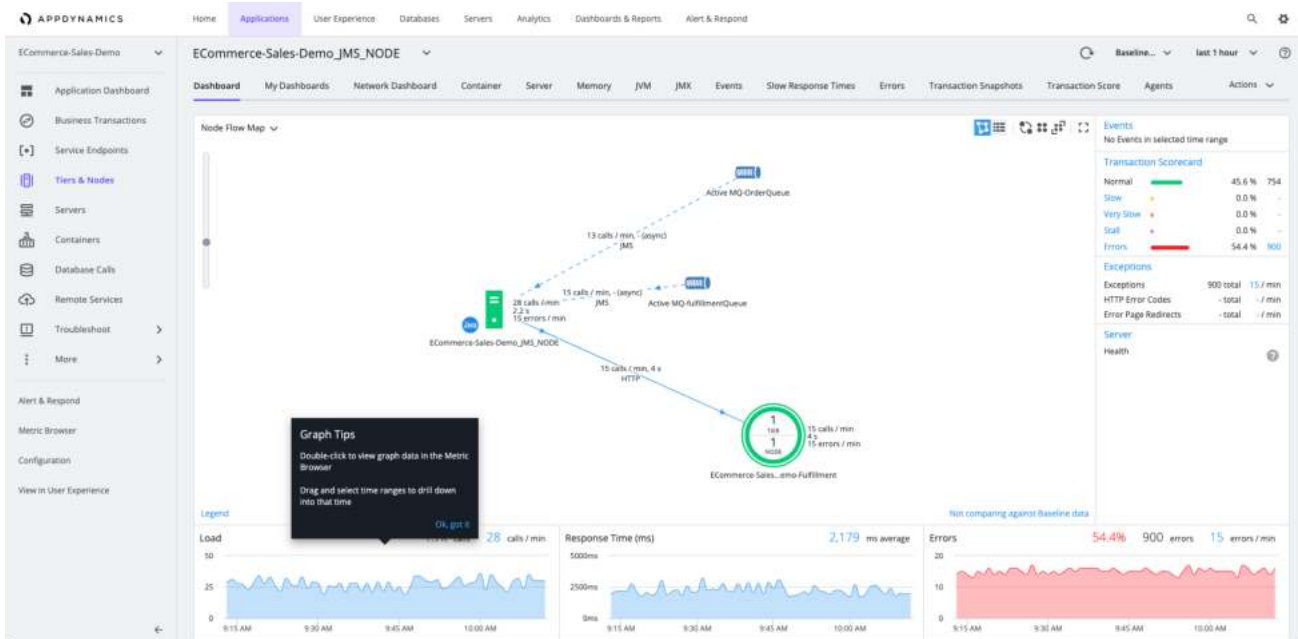

From the Servers Dashboard tab, select **APM Correlation**.

Select the **APM Correlation** link to review the APM node associated with the server. If there is more than one APM node running on the server, a dialog displays enabling you to select the APM node you want.

By selecting the APM node, its associated **Dashboard** displays.

## Dynamic Monitoring Mode and Server Visibility

You can selectively control the number of metrics reported by individual Machine Agents (including Server Visibility Agents). Rather than have all Agents report all the metrics all the time, you can configure individual Agents to collect metrics.

- Key Performance Indicator metrics only (*KPI mode*)
- KPI and Diagnostic metrics (*Diagnostic mode*)
- All available metrics (*Advanced Diagnostic mode*)

This provides the flexibility to report KPI metrics on most machines, and then increase the metric level on specific servers for deeper visibility to diagnose problems. You can increase scalability on the Controller and conserve metric bandwidth on the network with no sacrifice in visibility.

Every Basic and Server Visibility metric has a default Dynamic Monitoring Mode (DMM) class: KPI, Diagnostic, and Advanced Diagnostic. See [Hardware Resources Metrics](#).

### Important Notes

- You can disable DMM on individual Agents. When DMM is disabled on an Agent, that Agent will report all metrics regardless of whether DMM is enabled or disabled on the Controller. Disabling DMM on an Agent is recommended only for mission-critical servers and other machines for which you are sure you want to collect all metrics. See [Machine Agent Configuration Properties](#).
- If you switch the monitoring mode in the Controller from a more-inclusive to a less-inclusive mode, the Metric Browser will show values for the newly-excluded metrics for one hour after the switch. For example, if you switch from Diagnostic to KPI mode, for any Diagnostic metric, the Metric Browser will report a steady line (at 0 or the last-reported value) for one hour after the switch; then the line will disappear. This is standard behavior in the Metric Browser for an Agent when it stops reporting a specific metric.
- Each Machine Agent has a set of configurable settings that specify the volumes, networks, and processes to report and to ignore. For example, you can define a process allowlist (report on matching processes) and blacklist (ignore matching processes). An Agent will not report metrics for items excluded by its local settings, regardless of the monitoring mode. See [Machine Agent Settings for Server Visibility](#).
- If you have any custom health rules based on Diagnostic or Advanced Diagnostic metrics, DMM might cause these rules to generate "false-positive" alerts. (Standard, non-custom health rules are not affected.) If you have any health rules similar to this, edit the rule to use a KPI metric instead of the Diagnostic or Advanced Diagnostic metric.

### Initial Setup

DMM is enabled by default. To configure DMM:

1. Log in to the Controller administration console using the `root` user password. See [2023-10-19\\_05-04-05\\_Access the Administration Console](#).

```
http://<controller host>:<port>/controller/admin.jsp
```

2. Set these options:
  - a. `sim.machines.dmm.defaultMode` = KPI (Sets the default mode to KPI on all Machine Agents)
  - b. `sim.machines.dmm.dmmAllowed` = true (Enables Dynamic Monitoring Mode on the Controller)
3. For servers that require additional visibility, increase the monitoring mode to **Diagnostic** or **Advanced Diagnostic**. To change the monitoring mode of one or more agents:
  - a. Log in to the Controller UI.
  - b. Click **Servers**.
  - c. In the **Servers** table, check the box next to one or more servers whose monitoring mode you want to change.
  - d. Right-click the server and select **Set DMM Mode**. A dialog box appears.
  - e. Select the desired monitoring mode.
  - f. Click **Save**.

### Workflow Example

After you complete the initial setup, you can set the Dynamic Monitoring Mode on individual Machine Agents as required. The following is a workflow example:

- The DevOps team for a large enterprise monitors its IT infrastructure using Machine Agents (1,000-plus Agents monitoring servers in hundreds of locations). All Agents are initially set to KPI mode.
- One Agent reports a lot of disk read/write operations (KPI metric) on critical-server-A.
- Set the Agent DMM on critical-server-A to **Diagnostic**.
- Monitor the amount of data read and written for the entire disk, and for each partition (Diagnostic metrics), on critical-server-A.
- If the Diagnostic metrics do not indicate the source of the problem, and further investigation is needed, set the agent DMM to **Advanced Diagnostic**.
- Monitor average queue times and read/write times for each partition (Advanced Diagnostic metrics) on critical-server-A.
- When advanced diagnostics are no longer required on critical-server-A, set the agent DMM back to **KPI**.

## Tier Metric Correlator

The Tier Metric Correlator enables you to identify load and performance anomalies across all nodes in a tier. Suppose you have a tier composed of a cluster of nodes running on containers or servers. You expect all the nodes to behave exactly the same under the same load conditions. How can you monitor this cluster for anomalies and outliers? You can use the Tier Metric Correlator to answer the following questions:

- Are all the nodes behaving within the expected band of performance, or do some nodes have outliers (slow calls, stalls, and errors)?
- In what time windows, and on which nodes, are these outliers occurring?
- Are outliers associated with a specific node cluster—for example, a cluster running a canary release?
- Are any resource issues (such as high CPU I/O or paging) correlated with these outliers?
- Are calls getting distributed evenly across all nodes in the tier?

This page describes two [example use cases](#):

- Use Tier Metric Correlation to quickly identify balances and imbalances in the distribution of calls across all nodes in a tier.
- Use Tier Metric Correlation to monitor and troubleshoot a canary deployment scenario. This example shows how you can easily compare performance across node clusters, identify nodes with transaction outliers, and determine if any resource issues are causing these outliers.

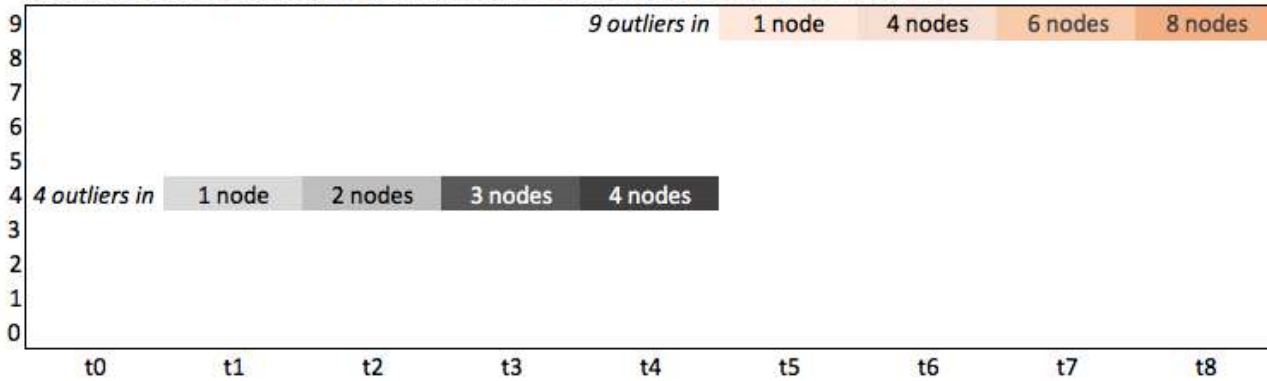

## Key Concepts

### Transaction Outliers

The first step in metric correlation is to determine the *transaction outliers* for a tier: the number of Slow Calls, Very Slow Calls, and Stalled Calls whose response times are significantly outside the norm for that tier. The Transaction Outliers Heatmap visualizes the rate of these outliers and their distribution across all nodes in the tier.

A heatmap is a time-series chart with an extra dimension: the color intensity of each bar shows the distribution of outliers across all nodes. The darker the hue, the more nodes have outliers. The chart colors the bars in shades of gray (fewer outliers) and orange (more outliers).

**Number and Distribution of Transaction Outliers in a Tier with 10 Nodes**

Heatmaps enable you to easily identify the normal bands of performance and any outliers for all nodes in a tier. In this example, all nodes fall within two bands:

This heatmap highlights two time windows where the performance metric is noticeably higher for 50% of the nodes:

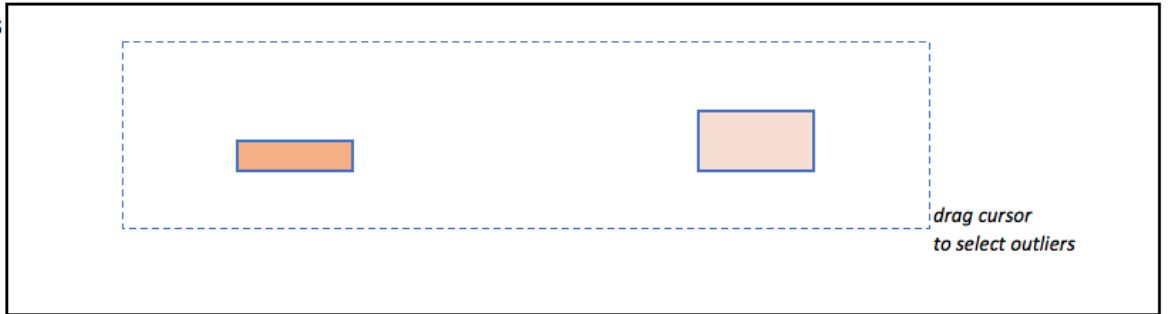

**Correlated Metrics**

The Correlated Metrics heatmaps enable you to correlate transaction outliers with specific resource metrics. The Correlate Metrics panel enables you to easily identify performance metrics that correlate (and do not correlate) with transaction outliers of interest. This example shows three heatmaps:

1. Transaction outliers
2. Correlated metric

### 3. Uncorrelated metric (no outliers)

Transaction Outliers

CPU (%) Busy

Pages Swapped in  
95th Percent

### Troubleshooting Nodes and Servers

When you select a set of transaction outliers, the Selected Nodes and Impacted Servers charts show the distribution of these outliers across all nodes in the tier. This makes it easy to determine if these outliers are associated with specific node clusters. Double-click a pie chart to troubleshoot the node or server.

Selected Nodes

Impacted Servers

### Example Use Cases

#### Comparing Load Distributions

In this example, a DevOps engineer wants to ensure that transaction calls are getting distributed evenly to all the nodes in a tier. The engineer accesses the **Tiers & Nodes** view, right-clicks a tier, and selects **Correlate Metrics**. Looking at the Calls Per Minute heatmap, the engineer can immediately see that the band of performance is 20-22 calls per minute, but for some nodes, the rate is higher during certain intervals. The engineer decides to investigate the relevant load balancer and finds that a simple misconfiguration is causing the device to distribute calls unevenly at certain times. Using heatmaps, they can identify and fix a minor issue before it has a significant impact on their team's mission-critical applications.

Calls Per Minute

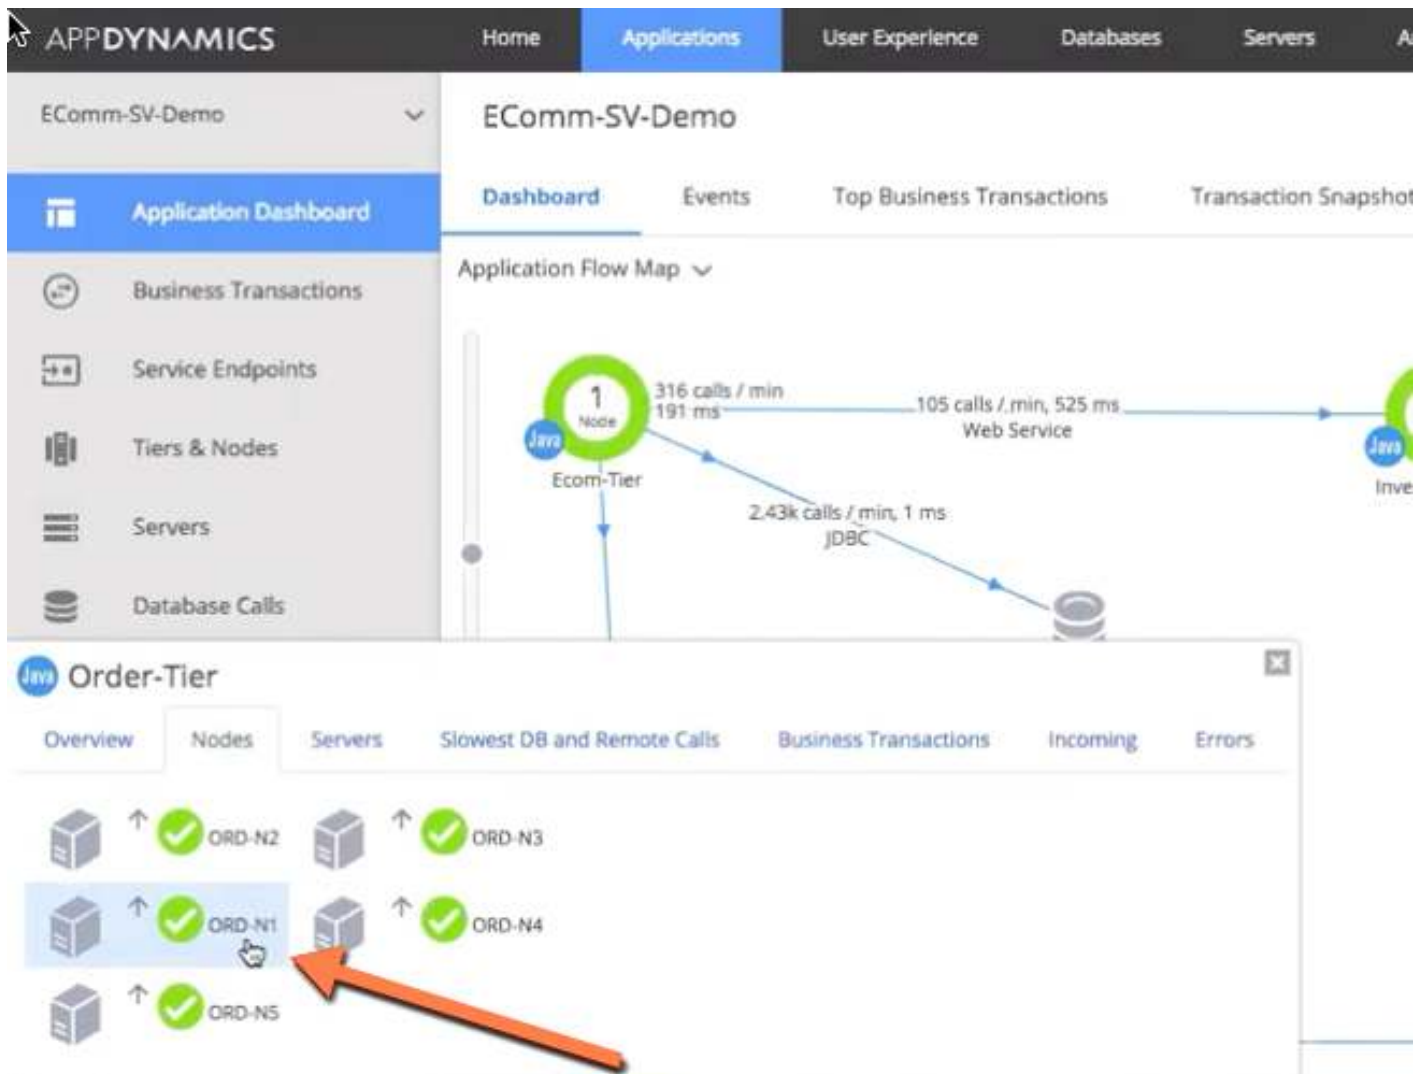

#### Canary Deployment Testing

A DevOps engineer is responsible for a four-tier e-commerce application. The Order-Tier has five nodes running version 1.0 of the service. The engineer deploys a "canary" (version 1.1 of the service) on one node.

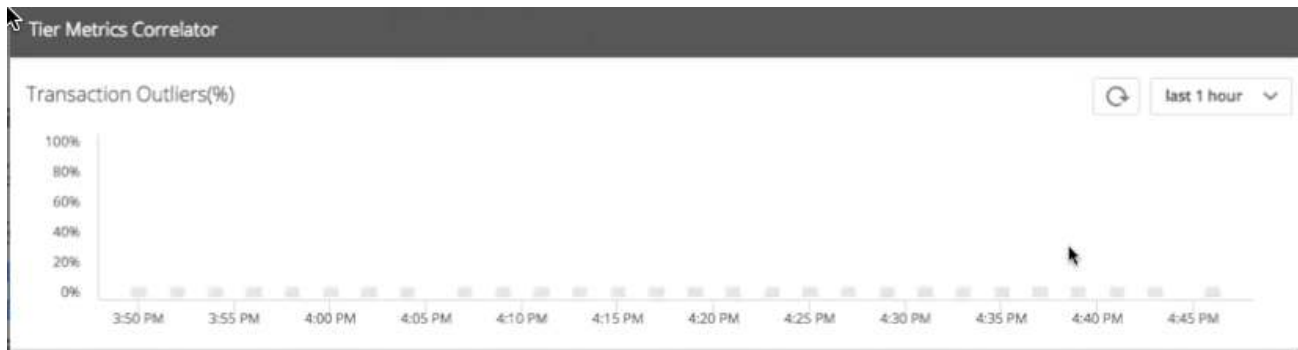

Before the engineer deploys 1.1 on all nodes, they want to determine if there is any performance degradation on this node.

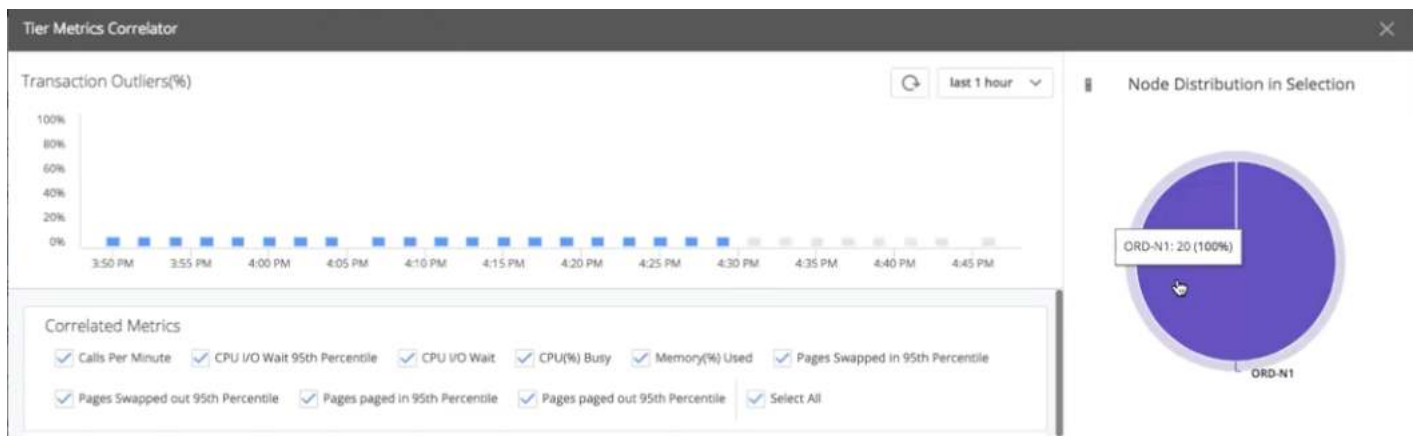

The engineer opens the Controller, accesses the **Tiers & Nodes** view for the application of interest, right-clicks the Order-Tier, and selects **Correlate Metrics**. The Tier Metric Correlator displays.

The [Transaction Outliers heatmap](#) shows that some calls are outliers: Errors, Slow Calls, Very Slow Calls, or Stalled Calls whose response times are significantly higher than the band of performance for that tier.

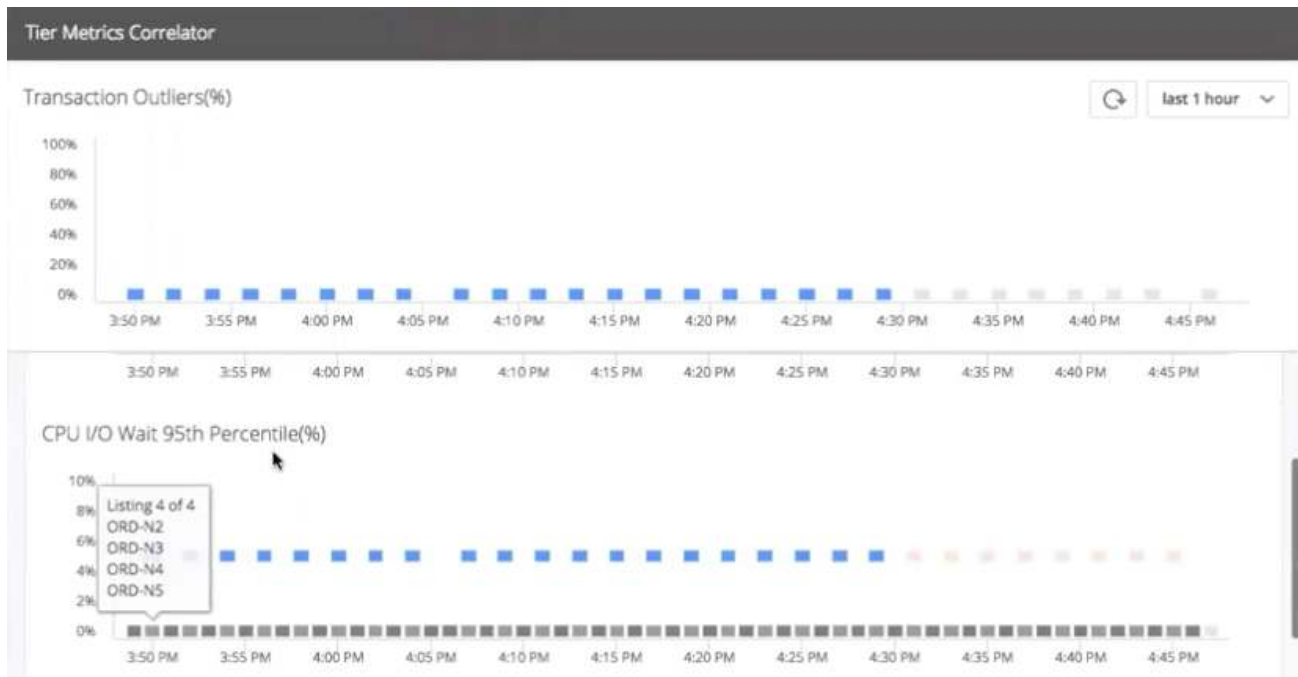

The first question is: *Are these outliers associated with our "canary node" (ORD-N1)?* The engineer drag-selects a set of these outliers. The **Node Distribution in Selection** pie chart (right) shows that all outliers are associated with the canary node. Clearly, the new code is not performing as well as the old code.

The next question is: *Are any resource issues causing these outliers?* The engineer examines the [Correlated Metrics](#) heatmaps to look for metrics that correlate with the outliers on the canary node. Most heatmaps show no correlation. For example, **CPU Busy%** shows that all nodes stay within the band of performance of 0-20%.

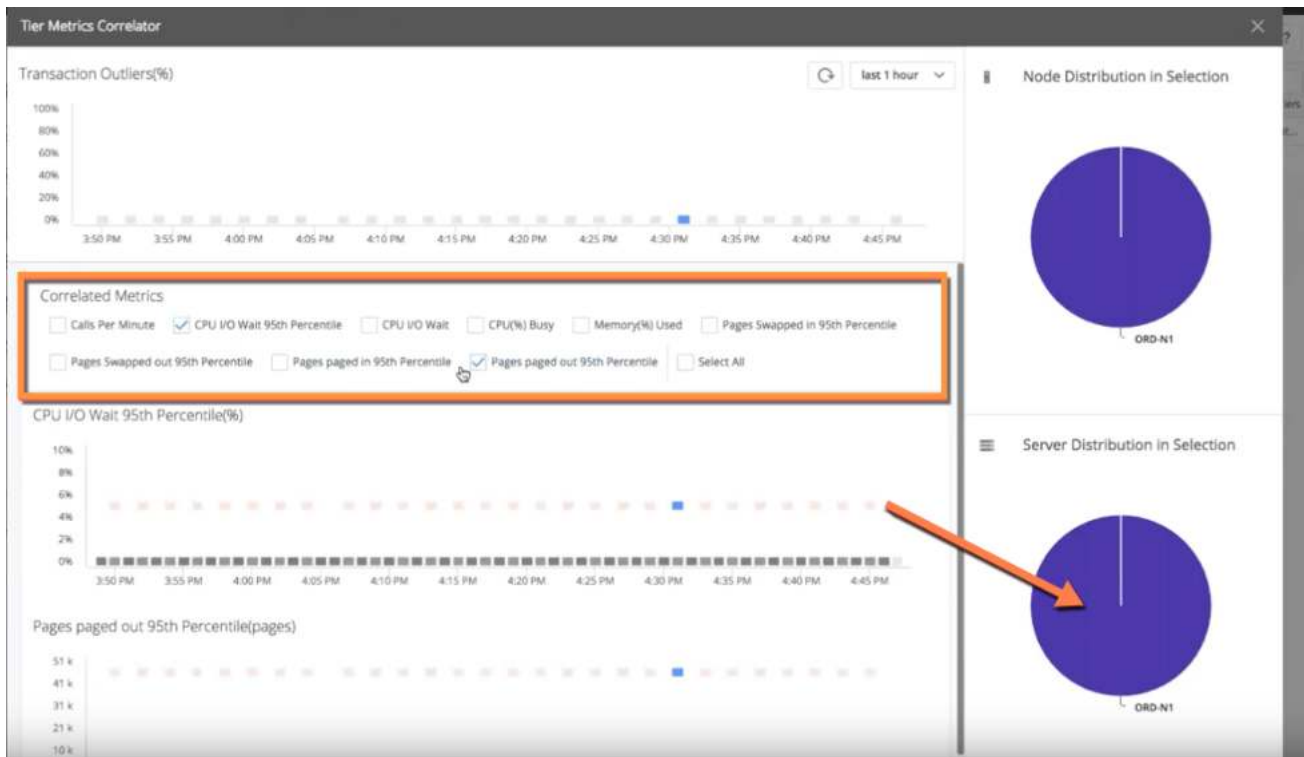

However, the CPU I/O Wait 95th Percentile(%) heatmap shows a strong correlation: All the metric outliers occur on the canary node, while all other nodes remain within the band of performance.

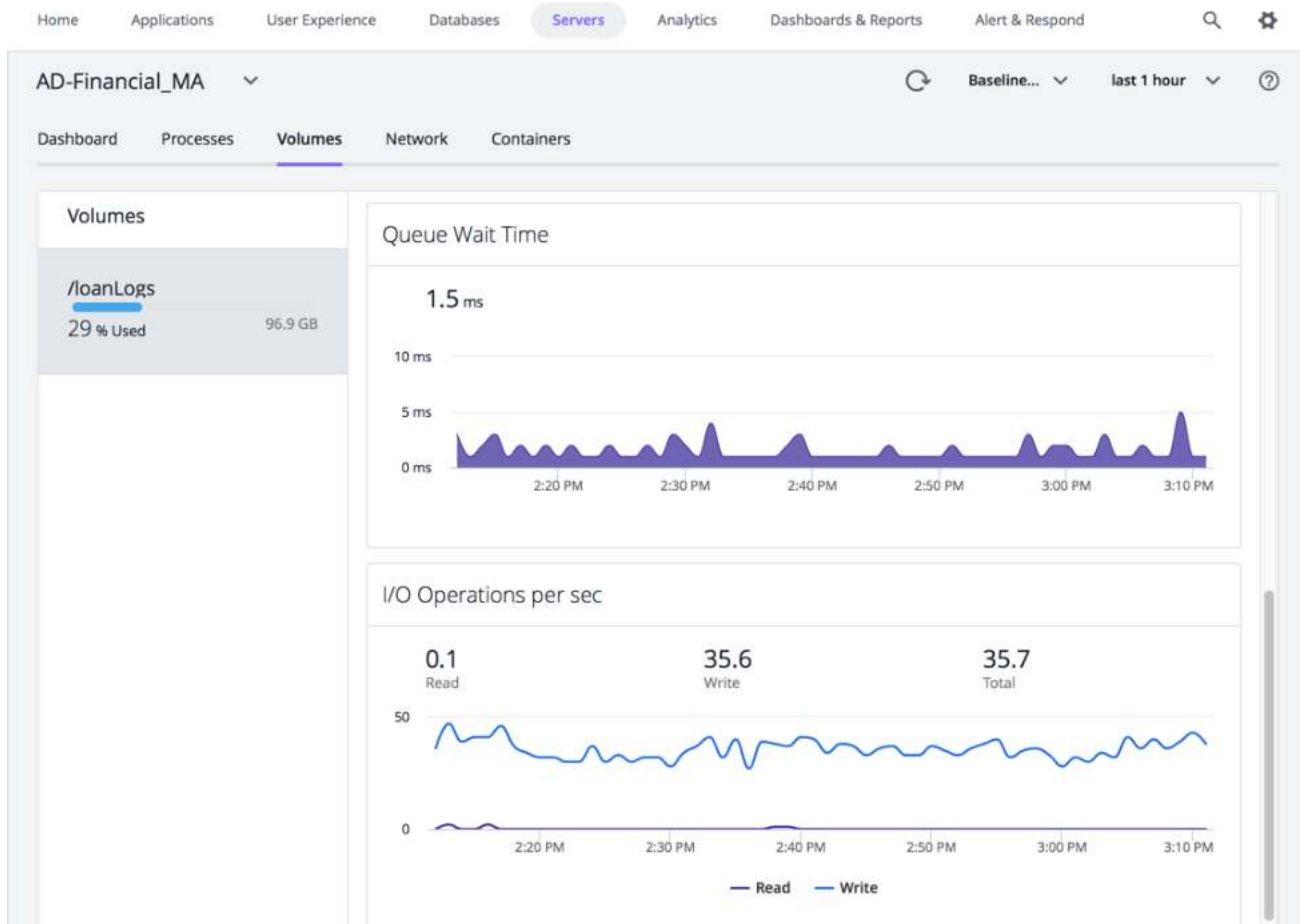

The **Pages paged out 95th Percentile (pages)** heatmap also shows a strong correlation with the transaction outliers on the canary node. With just a few clicks, they can immediately see that the canary node is performing worse; that the node has a CPU I/O problem; and that the CPU I/O problem is related to paging, which indicates a disk problem.

To reduce the visual noise and highlight the correlations, the engineer unchecks all the uncorrelated metrics. The next step is to investigate and troubleshoot the underlying server. To drill down into the canary node, they double-click on the **Server Distribution in Selection** pie chart (bottom right).

The Server Dashboard for the canary node displays. The engineer selects the Volumes tab and sees many spikes in I/O operations and queue wait times. They decide that the canary code is not ready to deploy to the entire tier, and need to re-examine the canary code, fix the regression, and re-test.

## Enabling Tier Metric Correlation

You enable Tier Metric Correlation per account on the Controller. If you are using a SaaS Controller, contact [AppDynamics Support](#). If you are using an on-premises Controller:

1. Log in to the Controller administration console using the `root` user password:  
`http://<controller host>:<port>/controller/admin.jsp`
2. Access the Accounts page, and select the account for which you want to enable this feature.
3. Select **Add Property** in the accounting settings and add:  
`ENABLE_SIM_HEATMAPS = true`

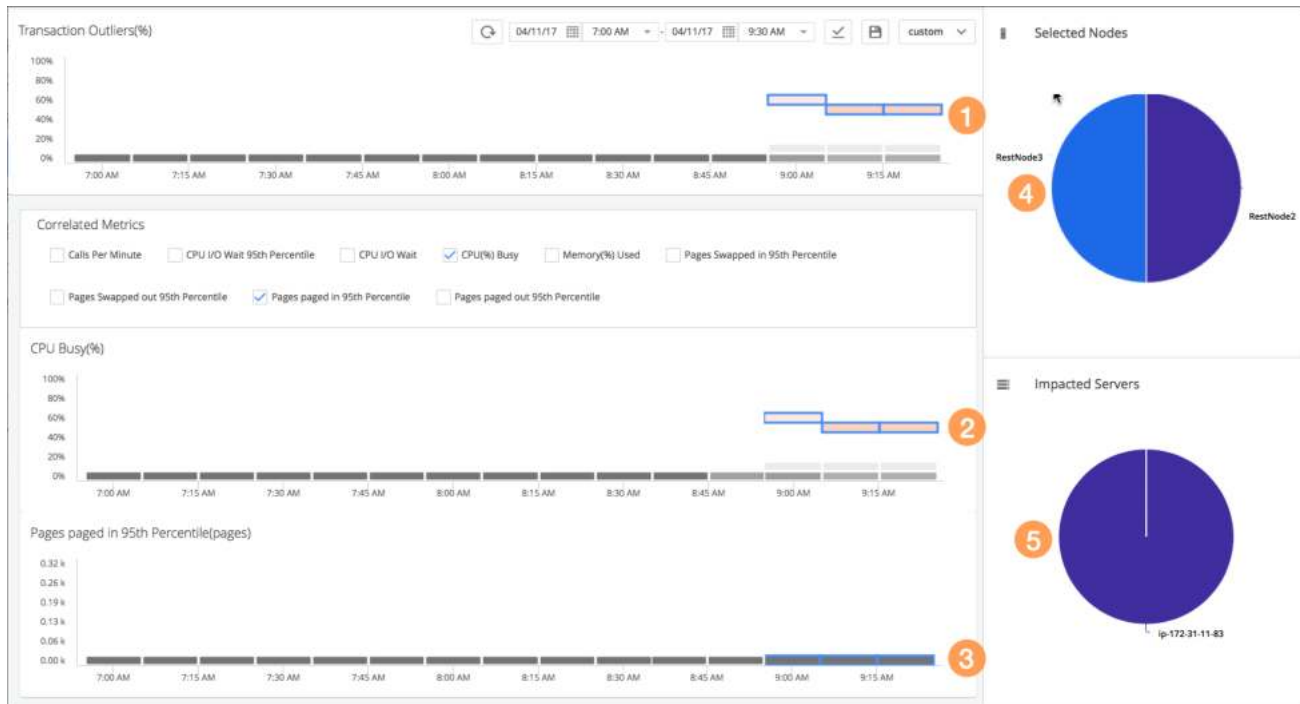

To correlate percentile metrics, you must enable percentile metric reporting on both the Controller and the Machine Agent. By default, reporting is *disabled* on the Controller and *enabled* on the Agent.

- To enable/disable reporting on the Controller, log in to the Controller administration console and set the `sim.machines.percentile.percentileMonitoringAllowed` property. See [Controller Settings for Machine Agents](#)
- To enable/disable reporting on the Agent, open the `<machine_agent_home>/extensions/ServerMonitoring/conf/ServerMonitoring.yml` file and set the `percentileEnabled` property. See [Machine Agent Settings for Server Visibility](#)

## Workflow Description

These steps outline the workflow description:

- Access the **Tiers & Nodes** view for the application of interest.
- Right-click the tier and select **Correlate Metrics**. The Tier Metric Correlator displays.
- Identify **transaction outliers** **1** for the tier – calls flagged as Slow, Very Slow, Stalls, or Errors (see [Monitor the Performance of Business Transactions](#)).
- Drag the cursor to select the outliers of interest. The pie charts on the right show the distribution of these outliers by node and server.
- Identify any **correlated metrics** **2** for the outliers. Unselect checkboxes for non-correlated metrics **3**.
- Identify and troubleshoot the nodes **4** and servers **5** where the outliers are occurring. Double-click a pie slice to open the dashboard view. You can use the correlated metrics to guide your troubleshooting.

## Service Availability Monitoring

Effective immediately, AppDynamics is ending support for Service Availability Monitoring. Customers who have never purchased SAM will no longer be able to do so. Renewals and additional licenses by existing customers of SAM that are purchased before June 2021, for a one-year term only, are permitted. All existing users of SAM can continue to use it. See [Support Advisory: Service Availability Monitoring End of Life \(EOL\) Notice](#).

To access Service Availability Monitoring, select **AppDynamics Home > Servers > Service Availability** (left navigation menu).

The Service Availability Monitoring feature of Server Visibility enables you to monitor internal or external HTTP and HTTPS services. You configure service monitoring from the Controller UI. After you configure monitoring for a service, Service Availability Monitoring evaluates the service:

- The Agent evaluates each response, based on your specified violation rules, and flags each response as failed (rule violation) or successful (no violation).
- The service monitor maintains a rolling buffer of evaluated responses. This buffer has a configurable window size (number of evaluated responses), success threshold (number of successful responses), and failure ratio (number of failed responses).

- The monitor collects evaluated responses until the response buffer is full. Then, it evaluates the service as:
  - NORMAL - Successful responses are greater than or equal to the success threshold.
  - CRITICAL - Failed responses are greater than or equal to the failure threshold.
- When the buffer is full, the monitor re-evaluates the service every time it evaluates a new response.

For example, with the following values:

- Success threshold = 3
- Failure threshold = 1
- Results window size = 5

The Agent waits until five check results are received, and from these five results, if there is one failure, then the target state is CRITICAL. If there are at least three successful results, then the target state is NORMAL.

## Licensing and System Requirements

Service Availability Monitoring requires a separate license and a Server Visibility license. Server Visibility is currently available for Linux, Windows, and Solaris. See [Observe License Usage](#) and [Server Visibility Requirements and Supported Environments](#)

## Viewing the Monitored Services

You can view the monitored services in the Monitored Services list. The state is determined by evaluating the Response Validators during the results window. Response Validators are rules you configure that are used to evaluate against the responses received from the service.

The possible states are:

- NORMAL - The number of successful responses in the result window is greater than or equal to the configured success threshold.
- CRITICAL - The number of failed responses in the result window is greater than or equal to the configured failed threshold.
- UNKNOWN - If the Machine Agent does not provide any data.

## Monitored Services List

From the top navigation bar, select **Servers > Service Availability** to view a list of monitored services. Use the action toolbar to manage your monitored services by adding new ones, viewing details, and so on.

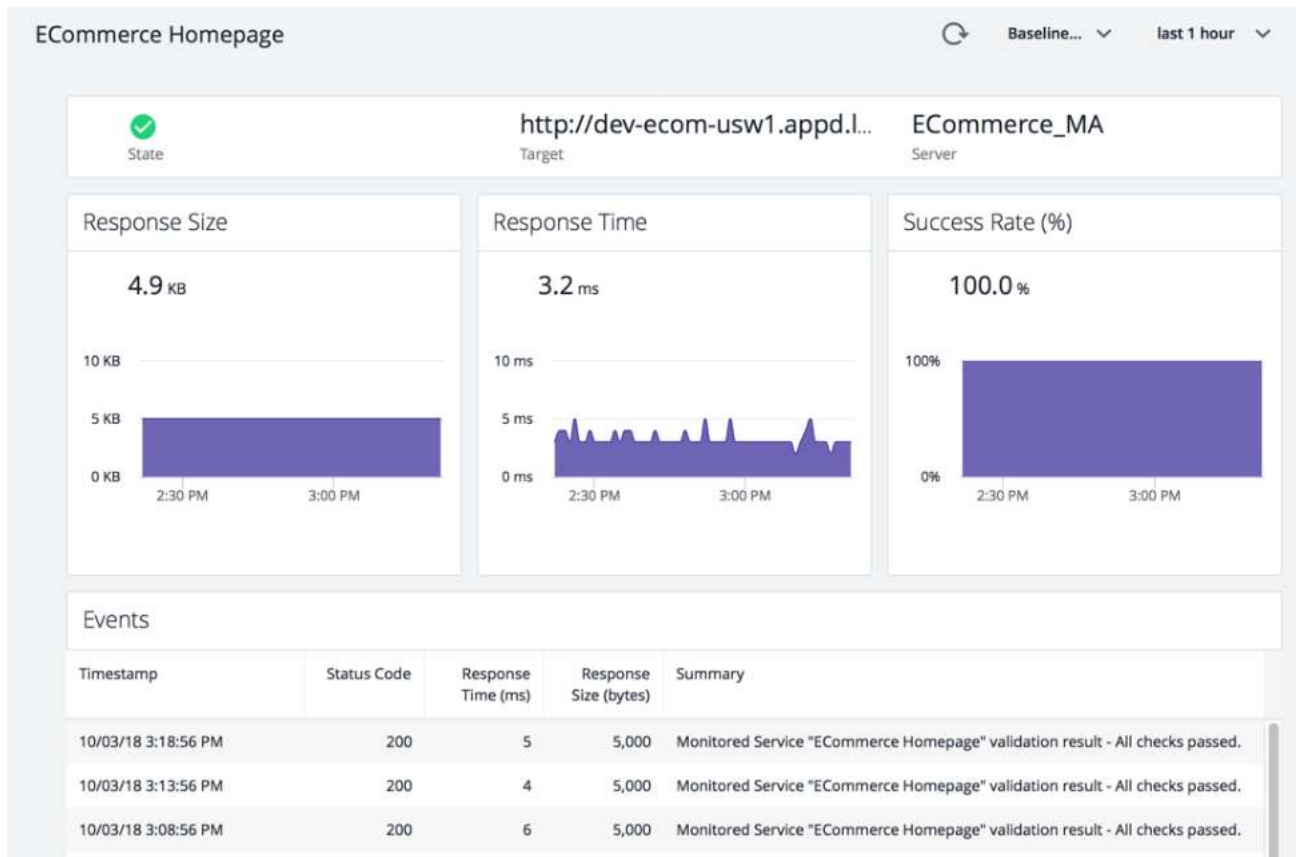

The screenshot shows the 'Service Availability' interface. At the top, there is a title 'Service Availability', a refresh icon, a time filter 'last 1 hour', and a help icon. Below the title is an action toolbar with icons for 'Details', 'Add', 'Edit', 'Delete', 'Copy', and 'View Options', along with a search bar. The main content is a table with the following data:

Monitored Service ↑	Server	State	Success Rate (%)	Response Time (ms)	Response Size (bytes)
ECommerce Homepage	ECommerce_MA	✓	100.0	3	5.0k
ECommerce Marketing Landing Page	ECommerce_MA	✗	0.0	2	1.5k

Showing 2 of 2

## Monitored Service Details

Select a monitored service, and double-click to view the associated details.

## Configure Service Availability

 To configure this feature, users need the *Configure Server Visibility* permission.

To access the configuration panel:

1. From the Controller top navigation bar, select **Servers > Service Availability**.  
A list of monitored services display, if any are configured.

- To add a service, select **Add**.

The Add Service Monitoring Configuration panel displays with three tabs.

- From the Main tab, specify the required fields and save the configuration. Each field has an associated tooltip that provides help. See [Main Configuration Panel](#).
- From the Request Configuration tab, specify your request headers. See [Request Configuration](#)
- From the Response Validators tab, configure your validation rules. See [Response Validators](#)

### Main Configuration Panel

Field	Description	Default	Required
<b>Name</b>	Your name for this target configuration. This name displays in the Service Availability list.	N/A	Yes
<b>Target</b>	The resource to be monitored, for example, <a href="http://myThirdPartyService.com/data">http://myThirdPartyService.com/data</a> . Specify which HTTP method to use to send the request ( GET , POST , HEAD )	N/A	Yes
<b>Server</b>	Name of the Machine Agent performing the monitoring. Only servers that are enabled for Server Visibility display in the dropdown.	N/A	Yes

Field	Description	Default	Required
Socket Timeout	How long to wait, in milliseconds, after a successful connection for a complete HTTP response.	30000	Yes
Success threshold	Number of required successes within the results panel for a NORMAL state.	3	Yes
Check Interval	Interval time in between checks in seconds.  <div style="border: 1px solid #add8e6; padding: 5px; margin: 5px 0;"> <p><b>i</b> Setting this interval to more than 60 seconds will result in visible gaps in the metric graphs for monitored services.</p> </div>	10	Yes
Results Window Size	Number of most recent results to use in determining the state of the service.	5	Yes
Connect Timeout	How long to wait (in ms) for the service to respond to a connection request.	30000	Yes
Failure threshold	Number of required failures within the result window for a CRITICAL state.	1	Yes
Max response size	Maximum response size to collect in bytes.	5000	Yes
Follow redirects	Deprecated. Follow redirect to determine the state of service.	No	No

### Restricted Addresses

By default, these addresses are restricted:

- Loop back address: localhost, 127.0.0.1, ::1(IPv6)
- Site local address: 192.168.0.0/16, 10.0.0.0/8, 172.16.0.0/12, fec0::/8(IPv6)
- Link local address: 169.254.0.1 - 169.254.255.254, fe80::/10(IPv6)
- Any local address: 0.0.0.0, ::(IPv6)
- Multicast address: 224.0.0.0/4(224.0.0.0 to 239.255.255.255), ff00::/8(IPv6)

### Request Configuration

You can define a list of customized headers to send with requests. For example, the list can mimic desktop or mobile browsers. You can also define a request body for POST requests. You can specify an "Authorization" header", if credentials are required.

Protocol	Field	Value Type	Default	Description
HTTP	header name and value pair	String	empty	Customized header to send with requests.
	body	String	empty	Any data to send with the request. Usually used for POST.

## Response Validators

You can provide a list of rules for the Machine Agent to use to validate the health of a monitored service. If any rule is violated, the response is considered failed.

For each rule you can specify:

- HTTP property
- operator
- value

The list of operators varies depending on the property selected in the first dropdown.

## Monitoring the Service Health

An event is sent to the Controller for every state change and periodically (by default every 5 minutes). You can change the update interval by setting the `System` property:

`appdynamics.machine.agent.sam.event.updateIntervalMillis`. See [Configuration Property Reference](#)

The events are visible from the Monitored Service details panel and from the Server Visibility Events list.

Type	Summary	Time ↓	Subgroups	Server	Act...
Health Rule Violation ...	Health Rule Machine Availability is too lo...	10/03/18 3:30:55 PM	-	accountMan...	-
Health Rule Violation ...	Health Rule Machine Availability is too lo...	10/03/18 3:30:55 PM	-	ECommerce...	-
Health Rule Violation ...	Health Rule Machine Availability is too lo...	10/03/18 3:30:55 PM	-	Inventory-N...	-
Health Rule Violation ...	Health Rule Machine Availability is too lo...	10/03/18 3:30:55 PM	-	blq-mt-saas...	-

Double-click the event to review details.

**Available actions**

- Start a War Room
- Copy a Link to this Event
- Delete
- Archive
- Test Action Execution

The event properties are as follows:

- Category: CUSTOM
- Event Type: Service Availability
- Property: severity Values can be ERROR (failure) or INFO (passing).

### Configuring Alerts

To create alerts for your monitored services:

1. From the Servers panel, select **Alert & Respond**.
2. Select **Policies**.
3. Select **Create Policy Manually**.  
If policies already exist, you may not see this option. Click + to add a policy manually.

- Under Custom Events, click + to **Add Custom Event**.

Add Custom Event Filter
✕

Find Custom Events matching these criteria:

Custom Event Type

Properties (Optional)

+ Add Property

[📘 Learn more about custom events](#)
Cancel
Save

- In the Actions section of the Policy panel, add the action you want to execute if the policy violates and save the policy.

## Server Visibility Events

To access Server Visibility Events, from the top navigation bar > **Servers > Events**.

You can view Machine Agent events on the Server Events list, and on the Application Events list for applications associated with the Machine Agent. See [Monitor Events](#).

Machine Agent events include:

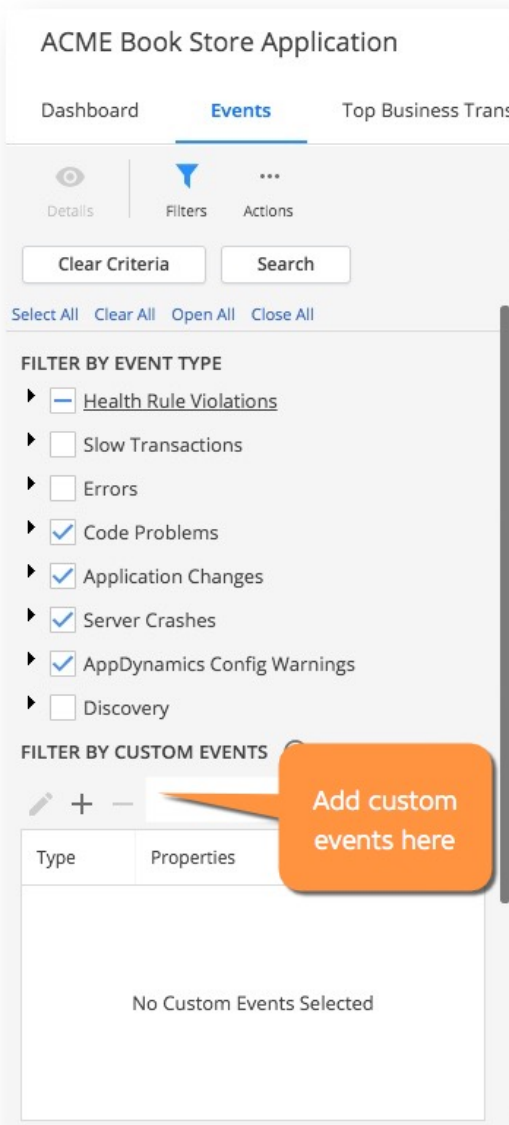

- [Custom Events](#)
- [Agent Internal Diagnostic Events](#)

### Custom Events

Custom events include events generated by the extensions, and Service Availability Monitoring events. Service Availability Monitoring events are custom events that are sent to the Controller periodically, and for every state change in the service's health.

Events triggered by extensions are custom events and also display on the **Servers > Events** list.

To view custom events in the application Events list, you can add them to the event list filters.

## Agent Internal Diagnostic Events

### AGENT\_DIAGNOSTICS

- Description – Diagnostic information concerning Agent activity, such as resetting a Machine Agent. The reset functionality is available for pre-4.2 version Machine Agents only.
- Category – AppDynamics Internal Diagnostics
- Name – `EventMessage.MACHINE_AGENT_RESET_SUCCEEDED`

## Machine Agent Settings for Server Visibility

You can modify the default configuration for Server Visibility. This page describes the configurable settings and their default values.

Edit this configuration file: `<machine-agent-home>/extensions/ServerMonitoring/conf/ServerMonitoring.yml`

### Edit YML Files

When editing YML files:

- If you make any changes to `ServerMonitoring.yml`, or to any other YML file, make sure that the modified file meets standard YML syntax rules.  
Follow these important YML good practices:
  - Do not include any tab characters. Use whitespace characters only to indent fields.
  - Use the exact same number of whitespace characters to indent entries that are on the same level.
  - Use a plain-text editor, not a WYSIWIG editor, to edit the file. Use a monowidth/monospaced font to view the contents.
  - Always save using UTF-8 encoding.
  - Test and verify the edited file using an online YML syntax tester.
- The safest way to edit a setting in a YML file is to:
  - Copy the line you want to edit, and paste the copy into a new line. Make sure that you select, copy, and paste the entire line.
  - Comment out the original line and edit the copy, as desired.
- To add or edit a regular expression in this file, you should test and verify the regular expression using an online regex tester.
- Before you make any changes to this file, review the option descriptions on this page, and the comments in the file, carefully before you change a setting.
- The Agent updates dynamically in response to Agent configuration property changes, so you do not need to restart the Agent after you update this file.

### Configurable Server Visibility Settings

Setting	Description
<code>basicEnabled</code>	Indicates whether the Machine Agent should report the basic metrics through the SIM extension. Set this to <code>false</code> to use Sigar to report basic metrics. This setting only affects monitoring on Linux.  Default = <code>true</code>
<code>volumeMonitorConfig:</code> <code>  maxNumberVolumes</code>	Do not report more than <i>N</i> volumes, where <i>N</i> = <code>maxNumberVolumes</code> .  Default = 5  <div style="border: 1px solid red; padding: 5px; background-color: #ffe6e6;">  Changing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can process the increased resource requirements.                 </div>
<code>volumeMonitorConfig:</code> <code>  whitelistSelectorRegex</code>	Volumes with names that match this regular expression are always reported, up to the maximum specified by <code>maxNumberVolumes</code> .  Default = ""

Setting	Description
<p>volumeMonitorConfig:     blacklistSelectorRegex</p>	<p>Volumes with names that match this regular expression are excluded. This setting is useful for filtering out irrelevant metrics.</p> <p>If a volume name matches both the blacklist and allowlist regexes, metrics for that network are reported (the allowlist takes priority) up to the maximum specified by <code>maxNumberVolumes</code>.</p> <p>The default <code>ServerMonitoring.yml</code> file does not include a <code>blacklistSelectorRegex</code> field for volumes. If you want to add one, use the same indentation and formatting as the <code>volumeMonitorConfig:whitelistSelectorRegex</code> field.</p>
<p>volumeMonitorConfig:     samplingInterval</p>	<p>Specifies a custom sampling interval for collecting volume metrics on Linux.</p> <p>Default = 3000</p>
<p>networkMonitorConfig:     maxNumberNetworks</p>	<p>Do not report more than <math>N</math> networks, where <math>N = \text{maxNumberNetworks}</math>.</p> <p>Default = 5</p> <div style="border: 1px solid red; background-color: #ffe6e6; padding: 10px; margin-top: 10px;"> <p><b>!</b> Changing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can handle the increased resource requirements.</p> </div>
<p>networkMonitorConfig:     whitelistSelectorRegex</p>	<p>Networks with names that match this regular expression are always reported, up to the maximum specified by <code>maxNumberNetworks</code>.</p> <p>To report metrics for one or more virtual networks, specify a regex that matches the virtual network names.</p> <p>When collecting Process metrics on Solaris, the Machine Agent observes and captures only the first 80 characters of each process name and argument list. This means that the Agent considers only the first 80 characters of each process string when it applies allowlists.</p> <p>Default = ""</p>

Setting	Description
<p>networkMonitorConfig:     blacklistSelectorRegex</p>	<p>Networks with names that match this regular expression are excluded. This setting is useful for filtering out irrelevant metrics.</p> <p>If a network name matches both the blacklist and allowlist regexes, metrics for that network are reported (the allowlist takes priority) up to the maximum specified by <code>maxNumberNetworks</code> .</p> <p>The default regex excludes virtual networks. To monitor a set of one or more virtual networks, edit <code>whitelistSelectorRegex</code> to include the networks of interest. To monitor all virtual networks, change the <code>blacklistSelectorRegex</code> to an empty string.</p> <p>When collecting Process metrics on Solaris, the Machine Agent observes and captures only the first 80 characters of each process name and argument list. This means that the Agent considers only the first 80 characters of each process string when it applies blocklists.</p> <p>Default = "<code>^veth.* ^vnet.*</code>"</p>
<p>defaultProcessClassSelector</p>	<p>The default "class selector" based on a <code>class_selector_regex</code>. If this regex is defined, and a match is found in the process command line, the class name is the first group occurrence of that regex in the command line.</p> <p>Default = ""</p>

Setting	Description
<p><code>processClassSelectorRegexList</code></p>	<p>A list of <code>class_name: regex</code> mappings. If the command line for a process matches regex, the metrics for that process are assigned to <code>class_name</code>. This setting is useful when you want to ensure that high-priority processes get reported, even if the number of defined classes is higher than the <code>maxNumberMonitoredClasses</code> setting.</p> <p>For example:</p> <pre>processMonitorConfig:   processClassSelectorRegexList :     machineAgentTasks: '.*java.*machineagent.*'     controllerTasks: '.*java.*controller.*'     nextOne: '.*svchost.*'</pre> <p>The Machine Agent assigns a process to a class as follows:</p> <ol style="list-style-type: none"> <li>1. Assign to the first match in <code>processClassSelectorRegexList</code>.</li> <li>2. If there is no match for the <code>processClassSelectorRegexList</code> (step1), apply the <code>defaultProcessClassSelector</code> regex to the command line.</li> <li>3. If there is no match for the <code>defaultProcessClassSelector</code> regex (step 2), use the process name (truncated if the name exceeds the <code>maxClassIdLength</code>).</li> </ol> <p>These steps outline the recommended workflow for updating this list:</p> <ol style="list-style-type: none"> <li>1. The default <code>ServerMonitoring.yml</code> file includes an example that is commented out. If you are updating the default list for the first time, you should:       <ol style="list-style-type: none"> <li>a. Create a copy of the example.</li> <li>b. Uncomment the copy (remove the <code>&lt;!--</code> and <code>--&gt;</code> comment tags), and edit it as needed.</li> </ol> </li> <li>2. Choose the process(es) that you want to monitor on the host machine.</li> <li>3. Create a regex to match the process name(s) of interest. You should test the regex using an online regex validator.</li> <li>4. Add the regex to the list. You should order the mappings by priority, highest to lowest. If a command line matches multiple regexes, the first match is used.</li> <li>5. Save the <code>ServerMonitoringConfiguration.yml</code> file.</li> </ol>

Setting	Description
	<p>6. Wait 15 minutes or longer for the updated list to take effect, and then verify that the matching process(es) display in the Controller UI.</p>
<code>samplingInterval</code>	<p>Indicates how often to gather metric data. Units in milliseconds.            Default = 30000 (30 seconds)</p>
<code>maxClassIdLength</code>	<p>Specifies the maximum process class name length. Any process class name that is longer than the specified maximum is truncated. The global maximum of the process class name is 100. If this variable is set to be greater than 100, then the process name is truncated at 100.            Default = 50</p>
<code>processSelectorRegex</code>	<p>Contains a regular expression that specifies which processes should be monitored by the Machine Agent. The regular expression is compared against the full command line that was used to start the process.</p> <p>The default regular expression will filter out any processes where the command line ends with a close bracket (']').</p> <p>For Linux, the process arguments could not be found, which usually indicates a kernel process.</p> <p>For Windows, no processes should end with a bracket character, so the regex should include all processes on Windows.</p> <p>Default = <code>""^.[^]]\$""</code></p>
<code>minLiveTimeMillisBeforeMonitoring</code>	<p>Specifies the minimum amount of time a process must be alive before it is monitored by the Machine Agent. Use this to prevent the Machine Agent from being overloaded by monitoring short-lived processes. Units in milliseconds.            Default = 60000 (60 seconds)</p>

Setting	Description
<code>maxNumberMonitoredClasses</code>	<p>Specifies the maximum number of process classes that the Machine Agent monitors.</p> <p>The processes that are reported are using the highest CPU and memory that match the regex specified by <code>processSelectorRegex</code>.</p> <p>Default = 20</p> <div style="border: 1px solid red; background-color: #ffe6e6; padding: 5px; margin-top: 10px;"> <p><b>!</b> Changing this setting can affect the resource consumption of your deployment. Before you change this setting verify your application environment and Controller can process the increased resource requirements.</p> </div>
<code>defaultDiskSectorSize</code>	<p>Specifies the default sector size (in bytes) for each disk if the Machine Agent cannot determine the sector size. This value is used to calculate the number of bytes read/written for the disk.</p> <p>Default = 512</p>
<code>memoryMonitorConfig</code>	<p>Specifies a custom sampling interval for collecting memory metrics on Linux.</p> <p>Default = 3000</p>
<code>cpusMonitorConfig</code>	<p>Specifies a custom sampling interval for collecting CPU metrics on Linux.</p> <p>Default = 3000</p>
<code>tag</code>	<p>A list of user-defined tags for the individual server. Use these tags to query, filter, aggregate, and compare related servers. See <a href="#">Server Tagging</a></p> <p>Each tag is specified by a <code>key-value</code> pair. You can define tag names up to 127 unicode characters, and tag values up to 255 unicode characters. Define each key on a separate line. All key-value strings should be within single quotes. If a key has multiple values, delineate the list with commas:</p> <pre>&lt;key&gt;: [ &lt;value&gt; ] tags:   'Location': ['NYC', 'Data Center', 'Server Room 7']   'Environment': ['preProduction']</pre>

---

## Docker Visibility Settings

See [Configure Docker Visibility](#).

## Process Limits

These additional configurable settings are available in the Controller Admin UI:

- Total number of processes displayed in the UI for a single query is 5000 processes per call.
- Total number of processes tracked per account. The default value is 10000 processes per account.

See [Controller Settings for Server Visibility](#).

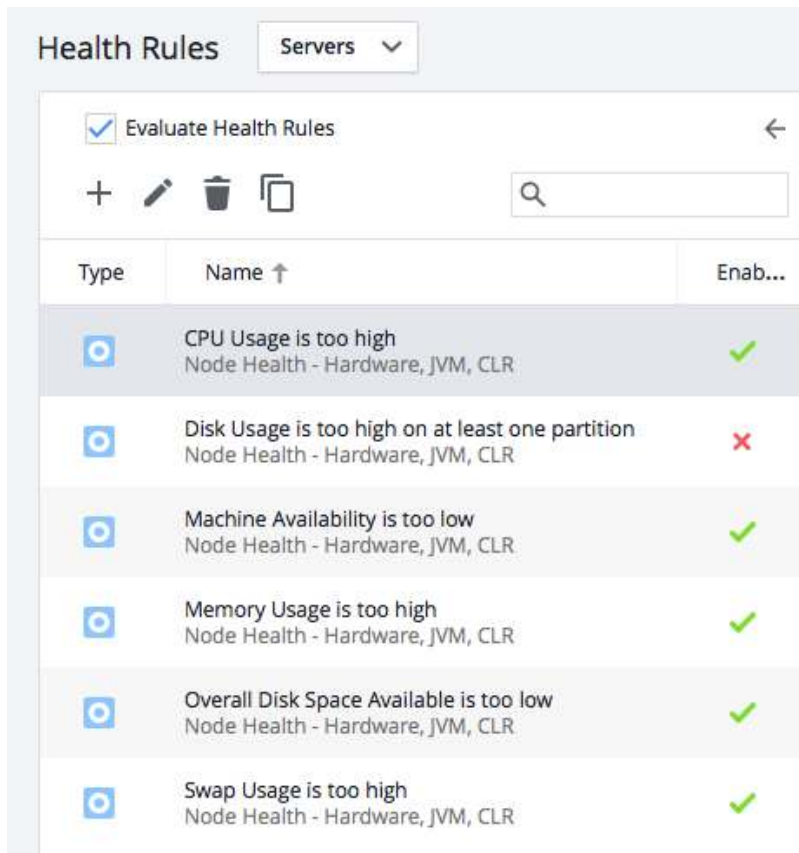

## Configure Health Rules to Monitor Servers

You can configure Server Visibility to alert you when certain conditions are met or exceeded based on monitored server hardware metrics. If you are new to AppDynamics, the Getting Started Wizard can help you through the process. Alternatively, you can create alerting policies manually if you are already familiar with the process.

You configure [Configure Health Rules to Monitor Servers](#), [Actions](#), [Policies](#), and Email Digests for monitoring servers similar to how you would configure these for monitored applications, with some minor changes.

### Health Rules

Default health rules based on several usage metrics are enabled for Server Visibility. You can modify these and set up your own health rules. Select **Alert & Respond** > **Health Rules** to view a list of the rules on the Controller.

From the Affects tab of the **Health Rule** wizard, you can choose to apply the Server Health Rule to:

- Subgroups (All or selected [subgroups](#))
- Machines
  - All machines in the active account
  - Machines within selected subgroups
  - Selected machines
  - Machines whose names match certain criteria

The health rule is violated when specified critical or warning conditions are met.

### Hierarchies, Groups, and Subgroups

You can apply health rules to subgroups or machines within selected subgroups. Subgroups available on the Affects tab of the Health Rules wizard are machines that are grouped into hierarchies based on the [Machine Hierarchy Property](#) configuration for the Machine Agent. See [Machine Agent Hierarchy](#).

The subgroups are the leaf group a machine is in. For example, there are three machines:

- A is in group Data Center 1|Rack 1
- B is in group Data Center 1|Rack 2
- C is in group Data Center 1|Rack 1

A and C are in the same subgroup, B is in a different one.

### Policies

Server [Policy](#) Actions are triggered when any or select Health Rule Violation Events occur. Unlike Application Policies, Server Policies cannot be based on custom events.

## Actions

**Actions** are performed when a health rule is violated and a policy is triggered. Actions can be email or SMS message notifications, HTTP requests, or custom actions that have been uploaded to the Controller. You can also use [email](#) and [HTTP request](#) templates for alert and respond actions.

## Email Digests

Email Digests enables you to send notification of chosen health rule violation events to specific email addresses at a specified frequency, such as every 2 hours.

## Controller Settings for Server Visibility

This page describes Controller Admin settings that are specific to Server Visibility. You can apply these Controller settings and permissions from either the **Account** or **Controller** tabs. Changes to the settings take effect the next time the Agent is restarted and connects to the Controller.

 You need the [root user](#) password to change these settings.

You cannot set all configuration properties at the account-level. Check the Description column for each property to determine whether you can enable a specific Server Visibility Property. See [Roles and Permissions](#) and [Manage Controller Users and Groups](#).

To change the Controller Admin settings for Machine Agents, see [Controller Settings for Machine Agents](#).

Server Visibility Property	Description	Default
<code>sim.docker.enabled</code>	Enable <a href="#">Docker Visibility</a> . See <a href="#">Monitor Containers with Docker Visibility</a> .	true
<code>sim.docker.machine.container.limit</code>	The global limit for the number of containers to monitor per machine. You can specify this in the <a href="#">2023-10-19_05-04-05_Access the Administration Console</a> as a Controller setting (all accounts) or as an account setting for individual accounts. The maximum limit you can specify is 120 containers.	15
<code>sim.docker.monitorAPMContainersOnly</code> (previously known as <code>sim.docker.infraMode.enabled</code> )	When set to <code>true</code> , allows you to monitor APM containers only. If the value is set to <code>false</code> , monitors all the containers on the machine except the Machine Agent container. You can apply this property at an account level and enable the monitoring of containers with and without APM. This property was formerly named <code>sim.docker.infraMode.enabled</code> .	true

Server Visibility Property	Description	Default
<code>sim.exceptions.stacktrace.enabled</code>	<p>When this setting is enabled, Controller stack traces are sent in the error response when a client request encounters an error.</p> <div style="border: 1px solid red; padding: 5px; margin-top: 10px;"> <p><b>!</b> Setting this to <code>true</code> is a security risk, and should only be set to <code>true</code> if you understand the consequences, and if directed by a Support Engineer.</p> </div>	<code>false</code>
<code>sim.machines.agent.process.maxClasses</code>	<p>The global maximum for the number of process classes collected per machine.</p> <ul style="list-style-type: none"> <li>• If <code>maxClasses</code> (global setting in Controller) is lower than <code>maxNumberMonitoredClasses</code> (local setting in <code>serverMonitoringConfig.vml</code>), the local setting is overridden and the global <code>MaxClasses</code> is the effective maximum for that machine.</li> <li>• If <code>maxClasses</code> (global) is higher than <code>maxNumberMonitoredClasses</code> (local), the local setting is the effective maximum for that machine.</li> </ul> <p>See <a href="#">Machine Agent Settings for Server Visibility</a>.</p> <div style="border: 1px solid red; padding: 5px; margin-top: 10px;"> <p><b>!</b> Increasing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can process the increased resource requirements.</p> </div>	<code>20</code>
<code>sim.machines.container.host.tid.conflict.check.enabled</code>	<p>When using Docker Visibility, if the <code>unique host ID</code> setting is not configured to use <code>container ID</code> in host network mode, the Machine Agent automatically registers the container using the <code>container ID</code> as the <code>host ID</code>.</p> <p>This setting was introduced in version 20.8 of the Controller, with the default value = <code>false</code>. As of Controller <math>\geq 20.11</math> the default value is <code>true</code>. If set to <code>true</code> any container with setting <code>--network=host</code> and Machine Agent version is <math>\leq 20.6</math> the container does not register.</p>	<code>true</code>

Server Visibility Property	Description	Default
<code>sim.machines.count.maxPerAccount</code>	<p>A maximum number of machines allowed per account. Any additional machines will not appear. If you have more than 2000 machines reporting to one Controller and need to increase this number, be aware that you might need to increase the <code>sim.machines.registrations.maxPerSecondPerAccount</code> setting as well.</p> <div style="border: 1px solid red; padding: 5px; background-color: #ffe6e6;"> <p><b>!</b> Changing this setting can affect the resource consumption of your deployment. Before you change this setting, verify your application environment and Controller can process the increased resource requirements.</p> </div>	2000/account
<code>sim.machines.deleteStaleMachines.maxLimit</code>	<p>Set the number of machines to be deleted every 10 minutes, which is one cycle of the purger. For better performance, you can purge up to 700 machines per cycle.</p>	100
<code>sim.machines.dmm.defaultMode</code>	<p>Sets the <a href="#">Dynamic Monitoring Mode and Server Visibility</a> default on the Controller. The allowable settings are:</p> <ul style="list-style-type: none"> <li><code>KPI</code> – Collect Key Performance Indicator metrics only</li> <li><code>DIAGNOSTIC</code> – Collect KPI and Diagnostic metrics</li> <li><code>ADVANCED_DIAGNOSTIC</code> – Collect All available metrics</li> </ul> <p><i>You must enter one of these exact strings. If you enter a different value (such as "advanced-diagnostic"), the Controller will not update the setting and some servers might not appear in the Servers list.</i></p>	KPI
<code>sim.machines.dmm.dmmAllowed</code>	<p>With this option enabled, the Controller collects metrics from each Machine Agent based on the <a href="#">Dynamic Monitoring Mode and Server Visibility</a> setting on that Agent. If this option is disabled, the Controller collects all available metrics from each Agent.</p>	false

Server Visibility Property	Description	Default
<code>sim.machines.dotNet.HostIdConflictCheckAllowed</code>	<p>With this option enabled, the Controller throws an exception if a Machine Agent tries to register with the Controller while both of the following conditions are true:</p> <ol style="list-style-type: none"> <li>1. A .NET Agent on the same machine is already registered with the same <code>&lt;host-id&gt;</code> specified for the Machine Agent, and</li> <li>2. <a href="#">.NET Compatibility Mode</a> is disabled on either the Controller or the Machine Agent.</li> </ol> <p>The generated exception acts as a reminder that that .NET Compatibility Mode mode must be enabled on both the Controller and the Machine Agent.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p> Do not disable this option unless instructed by AppDynamics Support.</p> </div>	<p>true</p>
<code>sim.machines.hostidMappingAllowed</code>	<p>You must enable this mode if you want to collect and view Machine or Server metrics on a server with Machine and .NET Agents installed. See <a href="#">.NET Compatibility Mode</a>.</p>	<p>true</p>

Server Visibility Property	Description	Default
<code>sim.machines.offline.toStaleTimeoutMillis</code>	<p>How much time, in milliseconds, to wait before considering an offline machine to be stale and marked for deletion. If this value is too high, it prevents fresh data from coming in. If the value is too low, it means less history.</p> <p>As of Controller <math>\geq</math> 21.2.0 two properties are used in conjunction to purge stale machines. These properties are used in tandem to determine how to display the <b>Servers</b> list in the user interface:</p> <ul style="list-style-type: none"> <li>• use <code>sim.machines.offline.toStaleTimeoutMillis</code> (172800000 ms) to determine which machines are considered stale.</li> <li>• the <code>sim.machines.registrations.update.frequency</code> setting ( 86400000 ms ) determines the frequency at which a server's <code>lastSeenTimeStamp</code> is updated, if there are no changes in the properties of the monitored host. This setting can not be modified.</li> </ul> <p>You may wish to change the <code>sim.machines.offline.toStaleTimeoutMillis</code> setting according to your needs. You can specify this setting in the <a href="#">2023-10-19_05-04-05_Access the Administration Console</a> as a Controller setting (all accounts) or as an account setting for individual accounts. If this setting is modified in the Controller then a restart is required. If this setting is modified at the account level, you do not need to restart.</p> <p>Under rare circumstances old logic leads to a machine being deemed eligible for purge earlier than customer configuration.</p>	<p>172800000 ms (2 days)</p>
<code>sim.machines.registrations.hashCache.enabled</code>	<p>Prevent subsequent registration requests from fetch data and compare if nothing has changed in the request payload.</p>	<p>true</p>

Server Visibility Property	Description	Default
<code>sim.machines.registrations.maxPerSecondPerAccount</code>	<p>Set the maximum number of registrations allowed per second per account. This setting controls the rate at which concurrent registrations are processed and prevents one account on a multi-tenant Controller from monopolizing resources needed to register the Agents.</p> <p>The default value assumes that the Machine Agents are started evenly across a minute. If you are running 2000 or more machines, you may need to increase this setting to 600/sec. A suggested formula is: ( (number of Machine Agents, version 4.2 or higher / 60) ).</p> <p>If you use a deployment script that starts all your Agents within a few seconds of each other, you may need to further adjust the max registrations per second.</p> <div style="border: 1px solid red; background-color: #ffe6e6; padding: 5px; margin-top: 10px;"> <p><b>!</b> Changing this setting can affect the resource consumption of your deployment. Before you change this setting, verify your application environment and Controller can process the increased resource requirements.</p> </div>	<p>60</p>
<code>sim.machines.registrations.update.frequency</code>	<p>Updates the timestamp of the machine on a specific frequency, regardless of stale timeout value. Determines the frequency at which a server's <code>lastSeenTimeStamp</code> is updated, if there are no changes in the properties of the monitored host. This setting can not be modified.</p> <p>As of Controller <math>\geq</math> 21.2.0 two properties are used in conjunction to purge stale machines. These properties are used in tandem to determine how to display the <b>Servers</b> list in the user interface. See <code>sim.machines.offline.toStaleTimeoutMillis</code> property.</p> <p>Under rare circumstances old logic leads to a machine being deemed eligible for purge earlier than customer configuration.</p>	<p>86400000 ms (1 day)</p>

Server Visibility Property	Description	Default
<code>sim.machines.reuse.enabled</code>	Reuse SIM Machine entities to handle the ephemeral environment. Support is currently limited to Docker container machines.  If set to <code>false</code> , every new container will be considered a new machine.	<code>true</code>
<code>sim.machines.simAllowed</code>	This setting allows you to enable or disable Server Visibility from the Controller.	<code>true</code>
<code>sim.machines.stale.purgeIntervalMillis</code>	An interval in milliseconds that determines when stale machines are deleted from the Controller database. If the duration of this value is too short, it might overload the server. If the value is too high, then stale machines are deleted more slowly.	<code>21600000 ms</code> (6 hours)
<code>sim.machines.tags.maxPerAccount</code>	The maximum number of unique tags per account.	<code>1000</code>
<code>sim.machines.tags.maxPerMachine</code>	The maximum number of tags per machine.	<code>50</code>
<code>sim.metrics.metricBrowser.machineMetricMappings.enabled</code>	Enables or disables the Metric Browser to display the metrics reported per machine. When this feature is enabled, tier level aggregated metrics, available under Tier node in the Server metric browser, are not visible. With Streamlined Browsing enabled, the <b>Hardware Resources</b> and <b>Custom Metrics</b> folders do not display.	<code>true</code>

Server Visibility Property	Description	Default
<code>sim.metrics.store.customMetrics.simNodeEnabled</code>	<p>Enables or disables the persistence of custom metric values to machines monitored by Server Visibility.</p> <p>If the setting is:</p> <ul style="list-style-type: none"> <li><code>true</code> : The collector stores and displays custom metric values for applications and machines. Custom metrics are displayed in Metric Browsers for both Applications and Server Visibility.</li> <li><code>false</code> : The collector stores and displays custom metric values for applications only. Custom metrics are displayed in the Metric Browser for Applications only (not for Server Visibility).</li> </ul> <p>Disable this setting if you are collecting a lot of custom metrics. This will prevent potential spikes in the number and rate of metric values stored for individual machines.</p>	<code>true</code>
<code>sim.metrics.trackRegisteredEnabled</code>	<p>Enable <a href="#">Streamlined Browsing</a> for node metrics. Use this option when you are browsing metrics for tiers that contain multiple nodes.</p>	<code>false</code>
<code>sim.perAccountProperty.enabled</code>	<p>Enables a user to configure properties at an account level.</p>	<code>true</code>
<code>sim.perAccountProperty.syncFrequencyInMillis</code>	<p>The interval in milliseconds for the per Account Property data to sync with a database.</p>	<code>300000</code>
<code>sim.perAccountProperty.syncInBackground</code>	<p>Enables syncing the per Account Property data with a database in the background. For better performance, set this value to <code>true</code>.</p>	<code>true</code>
<code>sim.processes.bulkDelete.enabled</code>	<p>Delete processes in bulk instead of fetching one by one. For better performance, set this value to <code>true</code>.</p>	<code>true</code>
<code>sim.processes.delete.maxCount</code>	<p>Set the maximum number of processes to be deleted every 10 minutes, which is one cycle of the purger. For better performance, set the delete <code>maxCount</code> processes value to 55000 per cycle.</p>	<code>10000</code>
<code>sim.processes.count.maxPerAccount</code>	<p>The maximum number of processes stored per account.</p>	<code>300000</code>

Server Visibility Property	Description	Default
<code>sim.processes.count.maxPerMachine</code>	<p>The maximum number of processes that each Machine Agent can monitor.</p> <div style="border: 1px solid red; background-color: #ffe6e6; padding: 5px; margin-top: 10px;"> <p><b>!</b> Increasing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can process the increased resource requirements.</p> </div>	1000
<code>sim.processes.creation.maxConcurrent</code>	<p>The maximum number of processes that can be registered simultaneously by the Controller. The default is 5000 processes. The Machine Agent will retry to register the processes if the first attempt fails. Until the process request is accepted and processed by the Controller, processes within that request will be missing from the Process Details page. The limit works as follows:</p> <p>Case 1: Machine Agent sends a request with 6000 processes to register, and the limit is set to 5000, then this request is rejected until the limit is increased.</p> <p>Case 2: Two Machine Agents (MA1 and MA2) each try to register 3000 processes and the limit is set to 5000. Both MA1 and MA2 requests are received by the Controller and only one of the requests will be processed (3000 + 3000 &gt; 5000). So, the Controller can only process one request and rejects the other one.</p> <p>Case 3: Two Machine Agents (MA1 and M2) each try to register 500 processes and the limit is set to 5000. Both requests arrived at the Controller and since 500 + 500 &lt; 5000, then both requests are processed, and the processes are registered.</p>	5000

Server Visibility Property	Description	Default
<code>sim.processes.query.maxResultLimit</code>	The maximum number of processes that the UI can show (for example, in the <b>Server Dashboard</b> > Processes tab). Suppose the time range is 2 weeks and the Agent reported over 10000 processes during that interval. If <code>maxResultLimit = 5000</code> , the UI will show 5000 processes.	5000
<code>sim.processes.registration.s.maxPerSecondPerAccount</code>	Set the maximum number of process requests handled per second per account. For better performance, set to 600/sec. On a multi-tenant Controller, the total number of Agents per second should not exceed 600/sec.	60/sec
<code>sim.processes.stale.purgeIntervalMillis</code>	The number of milliseconds between consecutive deletes of stale processes for an account.	3600000 ms (1 hour)
<code>sim.processes.terminated.toStaleTimeoutMillis</code>	The number of milliseconds before a terminated process is considered stale and can be deleted to make space for new data. You can specify these in the <a href="#">2023-10-19_05-04-05_Access the Administration Console</a> as a Controller setting (all accounts) or as an account setting for individual accounts.	172800000 ms (2 days)

## Machine Agent Hierarchy

To group servers together so that you can apply health rules to the specific server groups, use the [Machine Hierarchy](#) property. This property enables you to group servers into arbitrary hierarchies by specifying a hierarchical path to the server. You can group servers based on departments, geographical locations, such as data centers, or other organizational units. You can then create health rules that apply to these departments.

The server hierarchy displays in the Metric Browser, on the Servers list, and on Server Visibility dashboard.

You need a Server Visibility license to use this feature.

You can specify the [Machine Hierarchy](#) property using `controller-info.xml`, a system property, or an environment variable.

For example, to group servers into geographical locations, perhaps representing different data centers, you could group the following:

OS	Name ↑	Hierarchy	Health	Disk Usage (%)	Disk Usage (%) Trend	CPU (%)	CPU (%) Trend	Memory (%)	Memory (%) Trend	Disk I/O (%)	Disk I/O (%) Trend	Network I/O (%)	Network I/O (%) Trend	Server Visibility Enabled
	AD-Financial_MA	AD-Financial	🔴	29.0		45.0		91.0		0.0		0.0		Yes
	AD-Travel_MA	AD-Travel	🔴	-		-		-		-		-		Yes
	AD-Travel_MA	AD-Travel	🔴	100.0		3.0		47.0		0.0		0.0		Yes
	ECommerce_MA	ECommerce	🔴	29.0		22.0		48.0		0.0		0.0		Yes

Use the `machine-path` element in the `controller-info.xml` configuration file to specify the tier and node:

```
<machine-path>AD-Financial|Node1</machine-path>
```

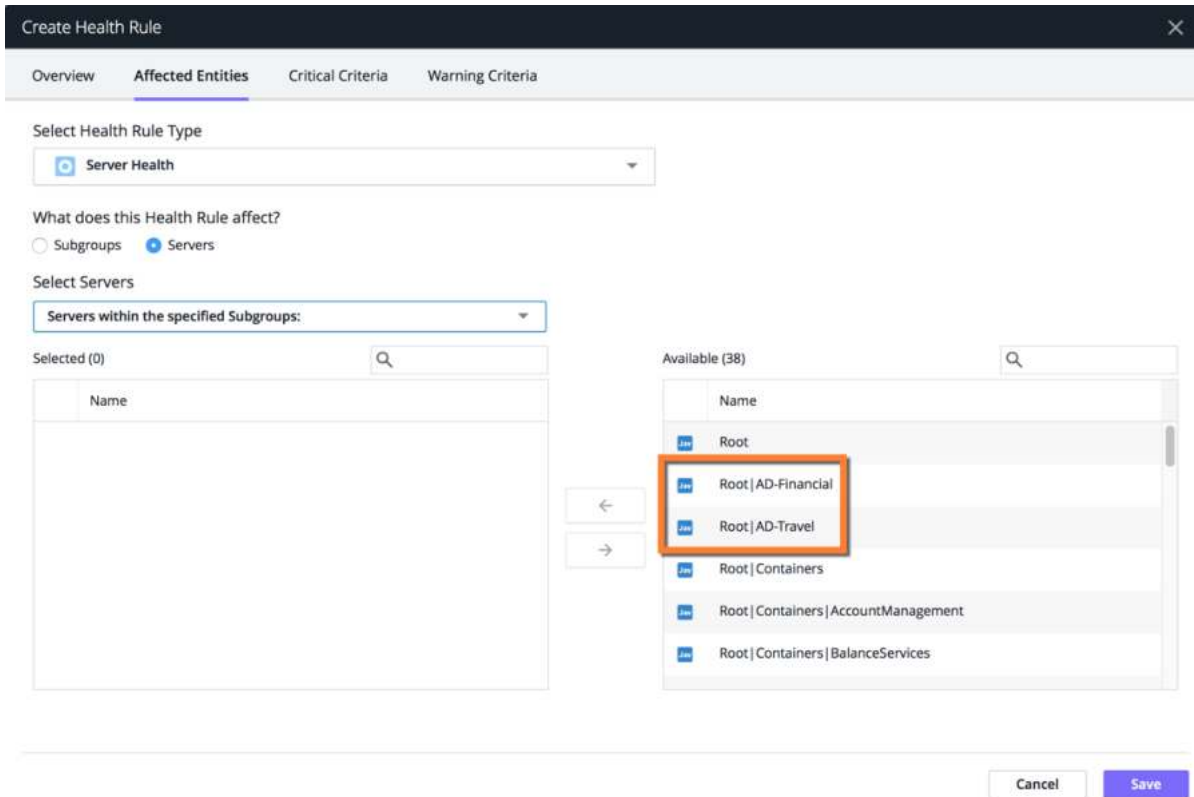

The Metric Browser view for this example:

Metric Browser - Server Visibility

Metric Tree | Add | Clear | Configure | Actions

- Application Infrastructure Performance
  - Root
  - Root|AD-Financial
  - Root|AD-Travel
  - Root|Containers
  - Root|Containers|AccountManagement
  - Root|Containers|BalanceServices
  - Root|Containers|Commerce

When creating health rules, you can select one or more subgroups from the Affected Entities tab:

## Server Tagging

Use Server Tagging to query, filter, and compare related servers using custom metadata. You can tag related servers based on OS, location, tier, owner, or any other relevant criteria. Server tags provide additional context to server metrics.

For example, you may want to specify deployment-version tags to the servers in a specific cluster, and then use those tags to identify anomalies in server metrics during a new deployment.

Server Tagging requires a Server Visibility license. Server Tagging is currently available for Linux, Windows, and Solaris.

Server Visibility can import the tags (described in the table) automatically.

Source	Tags	Controller and Agent Requirements
Custom	<p>Server Visibility can import:</p> <ul style="list-style-type: none"> <li>• Custom tags defined in <code>ServerMonitoringConfig.yml</code>. See <a href="#">Defining and Viewing Tags for a Server</a>.</li> <li>• Custom tags defined in Amazon EC2 (See <a href="#">Tagging EC2 Resources</a> in the Amazon AWS documentation).</li> <li>• Custom tags defined in Azure Virtual Machines (VM) for Linux and Windows. (See <a href="#">How to tag a VM using the Azure CLI</a> in the Microsoft Azure documentation.)</li> </ul>	<ul style="list-style-type: none"> <li>• <code>ServerMonitoringConfig.yml</code> and Amazon EC2: <ul style="list-style-type: none"> <li>◦ Controller <math>\geq 20.3</math></li> <li>◦ Machine Agent <math>\geq 20.1</math></li> </ul> </li> <li>• Azure VM: <ul style="list-style-type: none"> <li>◦ Controller <math>\geq 20.3</math></li> <li>◦ Machine Agent <math>\geq 22.12</math></li> </ul> </li> </ul>
Machine Agent	<p>These tags display in the Server Dashboard under Tags:</p> <ul style="list-style-type: none"> <li>• OS Architecture</li> <li>• OS Kernel</li> <li>• AppDynamics Agent Version</li> </ul>	<ul style="list-style-type: none"> <li>• Controller <math>\geq 20.3</math></li> <li>• Machine Agent <math>\geq 20.1</math></li> </ul>
Amazon Web Services	<p>These tags display in the Server Dashboard under Tags as <code>AWS &lt;tag&gt;</code>. See <a href="#">Importing Tags from Amazon Web Services</a>.</p> <ul style="list-style-type: none"> <li>• <code>resource-id</code></li> <li>• <code>availability-zone</code></li> <li>• <code>region</code></li> <li>• <code>ami-id</code></li> <li>• <code>instance-type</code></li> <li>• <code>security-group</code></li> </ul>	<ul style="list-style-type: none"> <li>• Controller <math>\geq 20.3</math></li> <li>• Machine Agent <math>\geq 20.1</math></li> </ul>
Microsoft Azure	<p>These tags display in the Server Dashboard under Tags as <code>Azure &lt;tag&gt;</code>. Microsoft Azure tags are enabled by default and do not have Controller or Agent configuration options.</p> <ul style="list-style-type: none"> <li>• <code>vmId</code></li> <li>• <code>location</code></li> </ul>	<ul style="list-style-type: none"> <li>• Controller <math>\geq 20.3</math></li> <li>• Machine Agent <math>\geq 22.12</math></li> </ul>
Docker	<p>Server Visibility can import user-defined tags and system container-level tags. These display under <b>Container Details &gt; Tags</b> as <code>Docker &lt;tag&gt;</code>.</p> <p>The exact set of tags imported can vary depending on the system on which the container is running.</p>	<ul style="list-style-type: none"> <li>• Controller <math>\geq 20.3</math></li> <li>• Machine Agent <math>\geq 20.1</math></li> </ul>

Source	Tags	Controller and Agent Requirements
Kubernetes OpenShift	Server Visibility can import ReplicaSet and pod tags. These appear under <b>Container Details &gt; Tags</b> as <code>K8s &lt;tag&gt;</code> .	<ul style="list-style-type: none"> <li>Controller &gt;= 20.3</li> <li>Machine Agent &gt;= 20.1</li> </ul>
ServiceNow CMDB	Server Visibility can import Configuration Management Database (CMDB) server tags. These appear under <b>Container Details &gt; Tags</b> as <code>ServiceNow &lt;tag&gt;</code> .  See <a href="#">Configuration Options for ServiceNow CMDB Tags</a> .	<ul style="list-style-type: none"> <li>Controller &gt;= 20.3</li> <li>Machine Agent &gt;= 23.8</li> </ul>

### View Servers by Tag in the Controller UI

To view filter servers by tag in the Servers list, select **Filters** and add the criteria you want for the tag filter. If you specify multiple criteria, the filter performs an AND search (for criteria with different keys) and an OR search (for criteria with the same key). This example shows the tag criteria filters for all servers with:

1. A **Tier** tag that equals **ECommWeb** OR **ECommInventory**, AND
2. An **OS Architecture** tag that equals **x86\_64**.

Home Applications User Experience Databases **Servers** Analytics Dashboards & Reports Alert & Respond

**Servers**

Details Delete View Logs in Analytics Filters View Options All Servers Show

+ Add Criteria OS Architecture: x86\_64

OS	Name ↑	Hierarchy	He...	Disk Usage (%)	Disk Usage (%) Trend	CPU (%)	CPU (%) Trend	Memory (%)	Memory (%) Trend
AD-Travel_MA	AD-Travel		!	100.0		4.0		47.0	
ECommerce_MA	ECommerce		!	29.0		23.0		48.0	

### Define and View Tags for a Server

You can specify custom tags as a set of key-value strings in the Agent config directory. Each Agent can support up to 50 tags by default.

**i** Follow these suggested best practices to define server tags:

If an Agent is deployed in Amazon Web Services, the Agent can auto-detect and import tags defined in AWS. The Controller also auto-assigns a set of default tags to each server.

*The primary use case for custom tags is to specify information that is not already specified in AWS and auto-assigned tags.* Before you specify custom tags in the Agent config directory, you should review the current set of tags. Access the Server Dashboard and view the Tags pane at the bottom of the page:

The screenshot shows the 'Servers' dashboard for 'AD-Financial\_MA'. It displays two tables: 'Top 10 Process Classes Consuming CPU' and 'Top 10 Process Classes Consuming Memory'. Below these is a 'Tags' section with 7 tags. The tags are:

Tag Name	Tag Values
AWS instance-type	m5.4xlarge
AppDynamics Agent version	Machine Agent v4.5.0.1270 GA Build Date 2018-05-30 08:26:34
AWS region	us-west-1
AWS arn-id	arn:511f332
AWS security-group	Demo_Apps
AWS availability-zone	us-west-1b
AWS Name	Financial Test

Be careful not to define duplicate tags in the YML file.

Configure the following option in `<machine_agent_home>/extensions/ServerMonitoring/ServerMonitoringConfig.yml`:

Setting	Description
tag	<p>A list of user-defined tags for the individual server. You can use these tags to query, filter, aggregate, and compare related servers.</p> <p>Each tag is specified by a key-value pair. You can define tag names up to 127 Unicode characters and tag values up to 255 Unicode characters. Define each key on a separate line. All key-value strings should be within single quotes. If a key has multiple values, delineate the list with commas:</p> <pre>&lt;key&gt;: [ &lt;value&gt; ]</pre> <p>tags:</p> <pre>'Location': ['NYC', 'Data Center', 'Server Room 7'] 'Environment': ['preProduction']</pre>

## Import Tags from Amazon Web Services

**i** Detailed information about Amazon Web Services is outside the scope of AppDynamics documentation.

Before Server Visibility can import tags from AWS, you must set up IAM roles:

1. Log in to the AWS console: <https://console.aws.amazon.com/iam/>
2. Create a role with read access to EC2 tags.  
Specifically, the role must have an AWS Managed Policy with the required permissions (such as, AmazonEC2ReadOnlyAccess) attached.
3. Add this role to your EC2 instance.  
For information about these steps, search for "To create an IAM role using the IAM console" and "Attaching an IAM Role to an Instance" in this [page](#).
4. Run the Machine Agent with Amazon Web Services enabled.

### Configuration Options for Server Tagging

To edit these settings, log in to the Controller administration console using the `root` user password. See [2023-10-19\\_05-04-05\\_Access the Administration Console](#).

Server Visibility Property	Description	Default
<code>sim.machines.tags.enabled</code>	Enable or disable server tags for all servers	True
<code>sim.machines.tags.aws.enabled</code>	Enable or disable the collection of AWS tags for all servers	True
<code>sim.machines.tags.aws.pollingInterval</code>	Length of time in milliseconds between each polling of AWS tags	21600000 (6 hours)
<code>sim.machines.tags.maxPerMachine</code>	Maximum number of unique tags per account	50
<code>sim.machines.tags.maxPerAccount</code>	Maximum number of unique tags per account	500

### Configuration Options for Docker Tags

You can configure the Machine Agent to collect different types of tags. By default, all tags are collected. To turn off tag collection, set `dockerTagsEnabled` to "false".

1. Edit the `<machine_agent_home>/extensions/DockerMonitoring/DockerMonitoringConfig.yml` file.
2. Under the `containerMonitoringConfig` section, set `dockerTagsEnabled: "false"`

```

WARNING: Before making any changes to this file read the following section carefully
#
After editing the file, make sure the file follows the yml syntax. Common issues
include
- Using tabs instead of spaces
- File encoding should be UTF-8
#
The safest way to edit this file is to copy paste the examples provided and make the
necessary changes using a plain text editor instead of a WYSIWYG editor.
#

samplingInterval indicates how often to gather metric data. Units in milliseconds.
samplingInterval: 30000

containerMonitoringConfig:
 # containerProcessSelectorRegex defines regular expression to evaluate the processes
in
 # each running container to be monitored by the machine agent. The regular expression
is
 # compared against each process full command line within running
 # If the pattern matches, then the machine agent start monitoring it.
 containerProcessSelectorRegex: ".*[]-Dappdynamics.*"
 dockerTagsEnabled: "false"

```

## Configuration Options for AWS Tags

You can configure the Machine Agent to collect different types of tags. By default, all tags are collected. To turn off tag collection, set `awsTagsEnabled` to "false".

1. Edit the `<machine_agent_home> /extensions/ServerMonitoring/conf/ServerMonitoring.yml` file.
2. Set `awsTagsEnabled: "false"`

```

//ServerMonitoring.yml
WARNING: Before making any changes to this file read the following section carefully
#
After editing the file, make sure the file follows the yml syntax. Common issues
include
- Using tabs instead of spaces
- File encoding should be UTF-8
#
The safest way to edit this file is to copy paste the examples provided and make the
necessary changes using a plain text editor instead of a WYSIWYG editor.
#
awsTagsEnabled: "false"
samplingInterval indicates how often to gather metric data. Units in milliseconds.
samplingInterval: 30000
...

```

## Configuration Options for Kubernetes and OpenShift Tags

You can configure the Machine Agent to collect different types of tags. By default, all tags are collected. To turn off tag collection, set `k8sTagsEnabled` to "false".

1. Edit the `<machine_agent_home> /extensions/ServerMonitoring/conf/ServerMonitoring.yml` file.
2. Set `k8sTagsEnabled: "false"`

```
//ServerMonitoring.yml
WARNING: Before making any changes to this file read the following section carefully
#
After editing the file, make sure the file follows the yml syntax. Common issues
include
- Using tabs instead of spaces
- File encoding should be UTF-8
#
The safest way to edit this file is to copy paste the examples provided and make the
necessary changes using a plain text editor instead of a WYSIWYG editor.
#
k8sTagsEnabled: "false"
samplingInterval indicates how often to gather metric data. Units in milliseconds.
samplingInterval: 30000
...
```

3. (Optional) To get the `Master` and `Worker` tags, you must apply the following cluster role. Ensure to apply this cluster role before you run the Cluster Agent.

```
apiVersion: rbac.authorization.k8s.io/v1
kind: ClusterRole
metadata:
 name: node-viewer
rules:
- apiGroups: [""]
 resources: ["nodes"]
 verbs: ["get", "list", "watch"]
```

## Configuration Options for ServiceNow CMDB Tags

By default, the Machine Agent does not collect the ServiceNow CMDB tags even when the tag collection is enabled at a global level. To enable the CMDB tags collection:

1. Edit the `<machine_agent_home> /extensions/ServerMonitoring/conf/ServerMonitoring.yml` file.
2. Under the `serviceNowTagsConfig:` section, set `enabled: "true"`.
3. Specify the required OAuth token authentication details and the OAuth URL to query the ServiceNow `cmdb_ci_server` table.

```
//ServerMonitoring.yml
serviceNowTagsConfig:
```

```
the enabled flag, by default this is false, set to true to enable this tags extension
enabled: false
update interval in milliseconds, minimum is 300,000 or 5 minutes, recommended(default)
1200000 or 20 minutes
samplingInterval: 1200000
oauthURL: "https://< site >/v1/auth/token"
clientId: "your client id"
clientSecret:
 encrypted: false
 value: "your client secret"
clientScope: "the client scope"
cmdburl: "https://< service now cmdb host >/now/table/cmdb_ci_server"
only override the hostname if the hostid does not match what is in the cmdb
#hostname: "over ride host name"
```

## Tagged Metrics

### Beta Disclaimer

This documentation mentions features that are currently beta. AppDynamics reserves the right to change the features at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

## Tagged Metrics

The **Tagged Metrics** panel enables you to aggregate all nodes in a tier based on a server tag (user-defined, or imported from AWS or Kubernetes) and then compare performance metrics between the node groups in one set of charts. For example, you can quickly compare the performance on all "blue nodes" and "green nodes" during a canary deployment.

1. In the Controller left-side panel, select **More > Tagged Metrics**.
2. In the **Tagged Metrics** panel, select the server tag and the tier of interest.
3. Compare the response times, call rates and transaction outliers (errors, slow calls, very slow calls) between the tag-based node groups.

The following chart shows how you can easily compare performance between different sets of nodes. For example, you want to analyze node performance for a tier with 26 nodes running v1 of the software, and one node running v2. You select the "version" tag, which represents a Kubernetes label. The charts show very clearly that the rate of slow and very slow calls has increased dramatically on the v2 node.

This feature is disabled by default.

To enable Tagged Metrics:

1. Log in to the administration console: `http:<controller-hostname>:8080/controller/admin.jsp` or `https:<controller-hostname>:443/controller/admin.jsp`
2. In Controller Settings, search for " `tagged.metrics.enabled` " and set this field to `true` .
3. In Account Settings:
  - a. Select the account to enable.
  - b. Under **Account > Additional Properties**, select **Add Property**, add the " `tagged.metrics.enabled` " property, and set it to `true` .

## Network Visibility

With Network Visibility, you can:

- Answer the key question quickly and easily: *Is the network to blame for any performance issues in my application?*
- Identify the root cause of performance issues in the application, the network, or in application/network interactions (for example, how an application or server utilizes the network).
- Pinpoint the traffic flows, individual nodes, and transport connections where network or application/network issues are occurring.
- Collect detailed metrics that show how the network is performing, and how well your application uses network connections and resources.
- Collect and report targeted troubleshooting information to network, IT, DevOps, and other teams.

## Network Visibility Overview

### Application Intelligence and Network Visibility

Network Visibility extends the application intelligence of APM down the stack from the application to the network. With the app-only visibility, it can be easy to mistakenly blame (or not blame) the network when an application issue arises. Network Visibility can help reduce or eliminate the guesswork involved in identifying root causes. Network Agents and App Agents, working together, automate the work of mapping TCP connections to the application flows that use them. Network Agents can identify intermediate load balancers (which often split TCP connections) and correlate the connections on either side of these devices.

The Agent-based approach of Network Visibility provides these advantages over standard approaches to network monitoring:

- More cost-efficient than using network monitoring appliances, which often view traffic from a few central locations
- Especially useful for distributed environments and multi-tier applications that span multiple network segments
- Works in cloud and hybrid networks, unlike most network-monitoring solutions

### Drill Down to the Root Cause

If network issues are affecting your application, Network Visibility can help you determine the cause.

- You see a spike in transaction outliers in the Application Dashboard. Are network issues to blame?
- Switch over to the [Network Dashboard](#). Each tier, node, and link shows network KPIs (Key Performance Indicators) that measure the network health of that element. Use baselining to highlight network elements with KPIs outside the baseline.

- To diagnose a tier, node, or network link, right-click and select **View Metrics**. In the right-click dashboard, look for network metrics with spikes that correlate with the spikes in your transaction outliers. This is often provides direction to the network root cause.
- If a network element requires more in-depth troubleshooting, [configure the relevant Network Agents](#) to collect metrics on the individual Connections used by that element. You can then
  - Click a node or link and view KPIs for the Connections used by the relevant nodes.
  - Right-click a Connection and view detailed metrics in a right-click dashboard or in the Metric Browser.

## Network Visibility Metrics

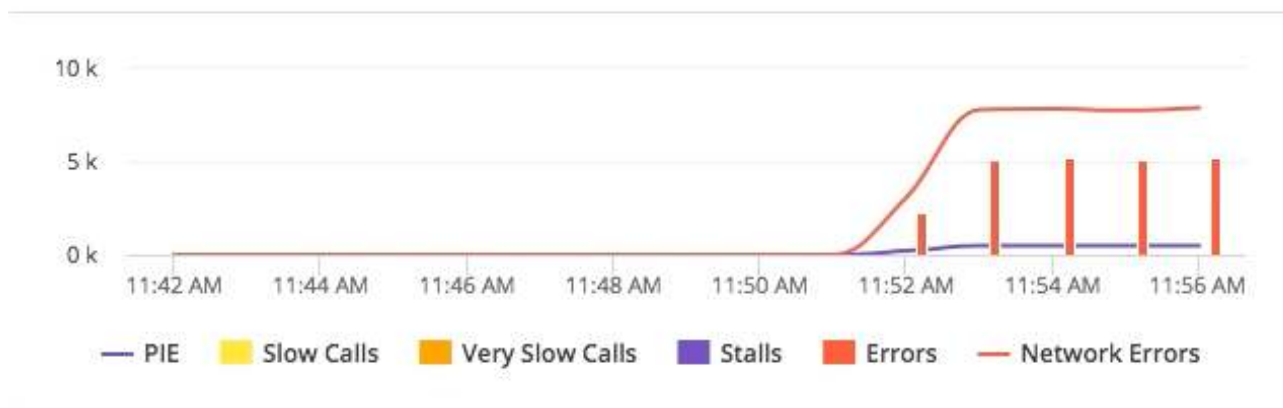

Network Visibility collects and displays these metric types:

- [Network KPIs \(Key Performance Indicators\)](#) provide high-level, at-a-glance measures of whether the network is affecting the performance of the monitored application. The Network Flow Map shows KPIs for each tier, node, and link.
- The [PIE \(Performance Impacting Events\)](#) metric enables you to see immediately if there are any such events on a connected client, server, or network link.

- If the KPI metrics indicate an issue with a specific element, you can view [additional metrics](#) for that element to identify root causes. Right-click an element and select **View Metrics**. The metrics and charts in the right-click dashboard are all designed to answer the question: *Are there any bottlenecks on this element that are affecting my applications?*

## Network Impact on Transactions

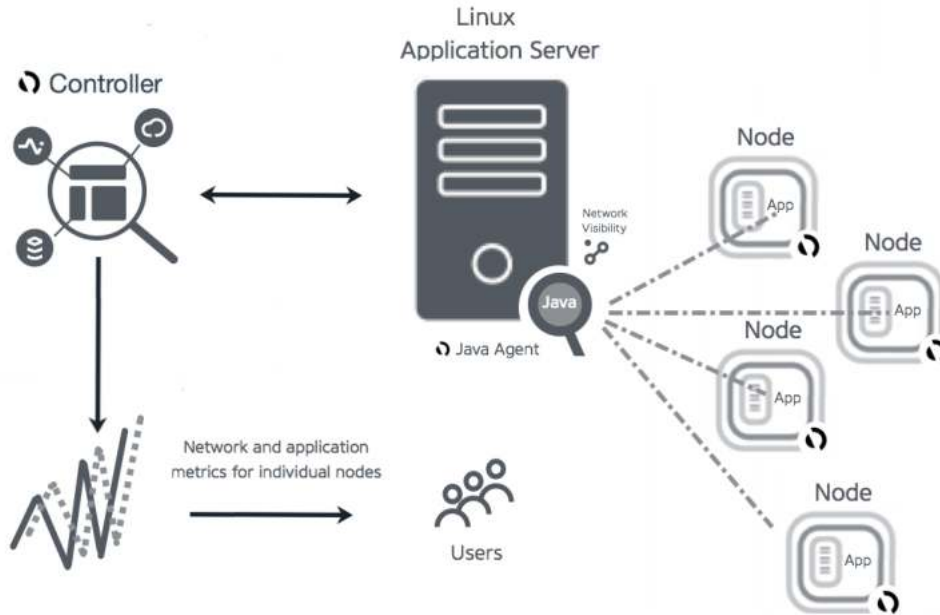

- To perform in-depth analysis, you can view detailed [TCP Flow metrics](#) in the Metric Browser.
- You can view [node metrics](#) to evaluate the health of TCP sockets and network interfaces.

## Network Visibility for Multiple App Nodes on the Same Server

Network Agents can monitor multiple nodes that are associated with the same IP address because they run on the same physical or virtual server. The Agent monitors each node individually and calculates network

metrics for each node. These metrics are based on the ingress/egress traffic for each individual node, not aggregate traffic for the IP address of the host on which the node is running.

## Network Visibility Supported Environments

### Related pages:

- [Observe License Usage](#)
- [Java Supported Environments](#)
- [App Server Agent Supported Environments](#)

This page describes application environments, operating systems, and version support for the Network Agent.

### General Requirements

With a Network Visibility license, you can use Network Visibility features on Linux and Windows. You must have a supported version of the Network Agent to be installed on the monitored server. See [License Entitlements and Restrictions](#).

By default, Network Visibility is disabled in the Controller. To enable Network Visibility, set the agent node property `socket-enabled=true`. See [App Agent Node Properties \(S\)](#).

Network Visibility is not supported on JDK 1.6. To run the Network Agent, upgrade to JDK  $\geq 1.8$ .

Network Visibility is compatible with Kubernetes and Docker, but not Docker Swarm.

### Network Visibility on Linux

#### Operating System Requirements

Network Visibility is only supported on Linux hosts where Java applications are being monitored with the Java Agent.

---

Each host on Linux must have:

- Network Visibility Agent  $\geq$  23.3.0
- Java Agent  $\geq$  4.4 with an App Agent license
- Controller  $\geq$  4.4 with a Network Visibility license

You must have `sudo` or `root` access permissions on the Agent host to install the Network Agent. You do not need `sudo` or `root` access to run the agent.

### Distributions

The following Linux distributions support the Network Agent based on glibc  $\geq$  2.12:

- CentOS  $\geq$  6 (64-bit)
- Ubuntu  $\geq$  14 (64-bit)
- Red Hat Enterprise Linux  $\geq$  6 (64-bit)
- Fedora  $\geq$  24 (64-bit)

You must install these required libraries before installing the Network Agent host:

- libdl.so.2
- libpthread.so.0
- librt.so.1
- libm.so.6
- libc.so.6
- libncurses.so.5
- libtinfo.so.5
- libstdc++.so.6
- libgcc\_s.so.1

### Network Visibility on AIX

#### Operating System Requirements

Network Visibility is only supported on AIX (Advanced Interactive eXecutive) 7.2 (7200-05-03-2148) or later hosts where the Java Agent monitors the Java applications.

Each host on Linux must have:

- Network Visibility Agent  $\geq$  23.8.0
- Java Agent  $\geq$  23.7 with an App Agent license
- Controller  $\geq$  23.7 with a Network Visibility license

You must have `sudo` or `root` access permissions on the Agent host to install the Network Agent.

### Distributions

The Network Agent installation requires the following libraries from the IBM-supported portals:

- libdl.a
- libpthread.a
- librt.a
- libm.a
- libc.a
- libstdc++.a
- libgcc\_s.a
- libgcc10
- libstdc++10

---

## Network Visibility on Windows

### Operating System Requirements

Each Windows host must have:

- Network Visibility Agent  $\geq$  23.3.0.
- An account with administrative privileges on the Windows machine where you want to install the Network Agent.

Additionally, each Windows host must also have:

- .NET Agent  $\geq$  4.5.15 with an App Agent License. See [Install the .NET Agent](#) and [Observe License Usage](#).
- Controller  $\geq$  4.5.14 compatible with the .NET Agent.

OR

- Java Agent  $\geq$  4.5.4.24386 with an App Agent license. See [Install the Java Agent](#) and [Observe License Usage](#).
- Controller  $\geq$  4.5.4.24386 compatible with the Java Agent. See [Agent and Controller Tenant Compatibility](#).

 To install AppDynamics for testing, you need to verify system requirements, prepare the host, and perform the Controller installation. See [Upgrade the Controller Using the Enterprise Console](#) and [Install the Controller Using the CLI](#).

### Distributions

The following Windows distributions support the Network Agent on Java applications:

- Windows Server 2019 (64-bit)
- Windows Server 2016 (64-bit)
- Windows Server 2012 (64-bit)
- Windows Server 2012 R2 (64-bit)

The following Windows runtime environments support the Network Agent on .NET applications (starting with .NET Framework version 3.5):

- Microsoft IIS versions 6.0, 7.0, 7.5, 8.0, 8.5, 10
- Managed Windows Services
- Managed Standalone Applications

You can use the Network Visibility features with the .NET Agent if you have installed:

- Network Agent  $\geq$  23.3.0
- .NET Agent  $\geq$  4.5.15
- AppDynamics Controller  $\geq$  4.5.14

 Network Visibility is not supported for .NET core based applications. Ensure to set `socket-enabled` node property to `false` to such nodes.

You can monitor .NET applications that are implemented using synchronous calls. However, Directory Search and ADO.NET are not supported.

 AppDynamics does not currently support monitoring network traffic for asynchronous .NET calls.

### Limitations

The following **Network Flow Map** features are not supported:

- Federated Flow Maps
- Visualization of flows between web servers and APM entry tiers

The Network Flow Map does not filter out connections on the selected time range.

Cross-application correlation of a .NET application with Network Visibility is not supported for .NET environments.

The Network Agent cannot monitor multiple app server agents on the same host if these agents report to different Controllers. All app server agents must report to the same Controller.

The **Network Dashboard** does not show data for Health Rules or Health Rule violations. To view any Health Rule violations, including those based on Network Visibility data, access the **Application Dashboard**.

### Potential Issues

Network Visibility cannot monitor cross-application flows that use Jersey web servlets. As a workaround, disable Jersey servlet instrumentation and business transactions on the flows will be recognized as servlets instead of web services:

1. Select the application of interest in the Controller UI.
2. Select **Configuration > Instrumentation > Transaction Detection**.
3. Disable instrumentation for Jersey Servlet and Jersey 2.x Servlet.

If you open the **Network Flow Map** for an individual node, the KPI metrics for `node-to-load-balancer` and `node-to-TCP-endpoint` links show network KPIs for all nodes in the parent tier (instead of KPIs for the individual node only). To view KPIs for the individual node, open the link popup and review the Connection KPIs.

## Set Up Network Visibility on Linux

To set up Network Visibility on Linux, see:

1. [Network Visibility Supported Environments](#)
2. [Install the Network Agent on Linux](#)
3. [Set Up the Network and App Agents on Linux](#)
4. [Administer the Network Agent on Linux](#)

### Install the Network Agent on Linux

#### Install the Network Agent Independent of Machine Agent

You can install and run the Network Agent independently of the Machine Agent using the ZIP, RPM, or DEB installers.

#### ZIP Network Agent Install

##### Important Notes

- If you are using Network Visibility to monitor applications running in Docker containers, you must install the Network Agent in a container as well. See [Docker and Network Visibility](#).
- To run the install script, log in as `root`.
- For all other operations, log in as the designated agent administrator ( `<appd-agent-administrator>` ) for that host.

1. Check System Requirements. See [Network Visibility Supported Environments](#).
2. Download and unzip the Agent installer:

**i Login User = Agent Administrator**

- a. Log in to the Agent host as `< appd-agent-administrator >`.
- b. Access the [AppDynamics Downloads Portal](#), download the Network Agent installer, and unzip it.
- c. In a terminal window, `cd` to the folder where you downloaded the Network Agent ZIP package.
- d. Enter the following command, where `<network_agent_home>` is the folder where you want to install the agent software:  

```
unzip <installer.zip> -d <network_agent_home>
```

The parent path should not include any directory names with spaces:

```
/opt/appdynamics/
networkVisibility (correct)
/opt/appdynamics/network
visibility (incorrect)
```

3. Install the Agent:

**i Login User = root**

- a. Log out, and then log in as `root`.
- b. Go to `<network_agent_home>` and run the install script:  

```
cd <network-agent-home>
./install.sh
```

4. Start and verify the Agent:

**i Login User = Agent Administrator**

- a. Log out, and then log in as `appd-agent-administrator`.
- b. Open a CLI window and enter these commands:
  - i. `<network-agent-home>/bin/start.sh` (starts the Agent)
  - ii. `<network-agent-home>/bin/appd-netviz.sh status` (verifies that the Agent is running and shows PID of the Agent process)

5. If you experience any problems or issues, see [FAQs for Network Visibility](#).
6. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#) workflow, proceed to [Set Up the Network and App Agents on Linux](#).

## RPM Network Agent Install

### **i** Important Note

If you are using Network Visibility to monitor applications running in Docker containers, you must install the Network Agent in a container as well. See [Docker and Network Visibility](#).

1. Check System Requirements. See [Network Visibility Supported Environments](#).
2. If you are logged in to the Agent host as a non-root user, log out and then log back in as `root`.
3. Access the [AppDynamics Downloads Portal](#) and download the Network Agent installer.
4. Open a terminal window and enter these commands:
  - a. `sudo rpm -ivh <installer.rpm>` (installs the Agent under `opt/appdynamics/netviz`)
  - b. `sudo service appd-netviz start` (starts the Agent)
  - c. `sudo service appd-netviz status` (verifies that the Agent is running)
5. If you experience any problems or issues, see [FAQs for Network Visibility](#).
6. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#) workflow, proceed to [Set Up the Network and App Agents on Linux](#).

## DEB Network Agent Install

### **i** Important Note

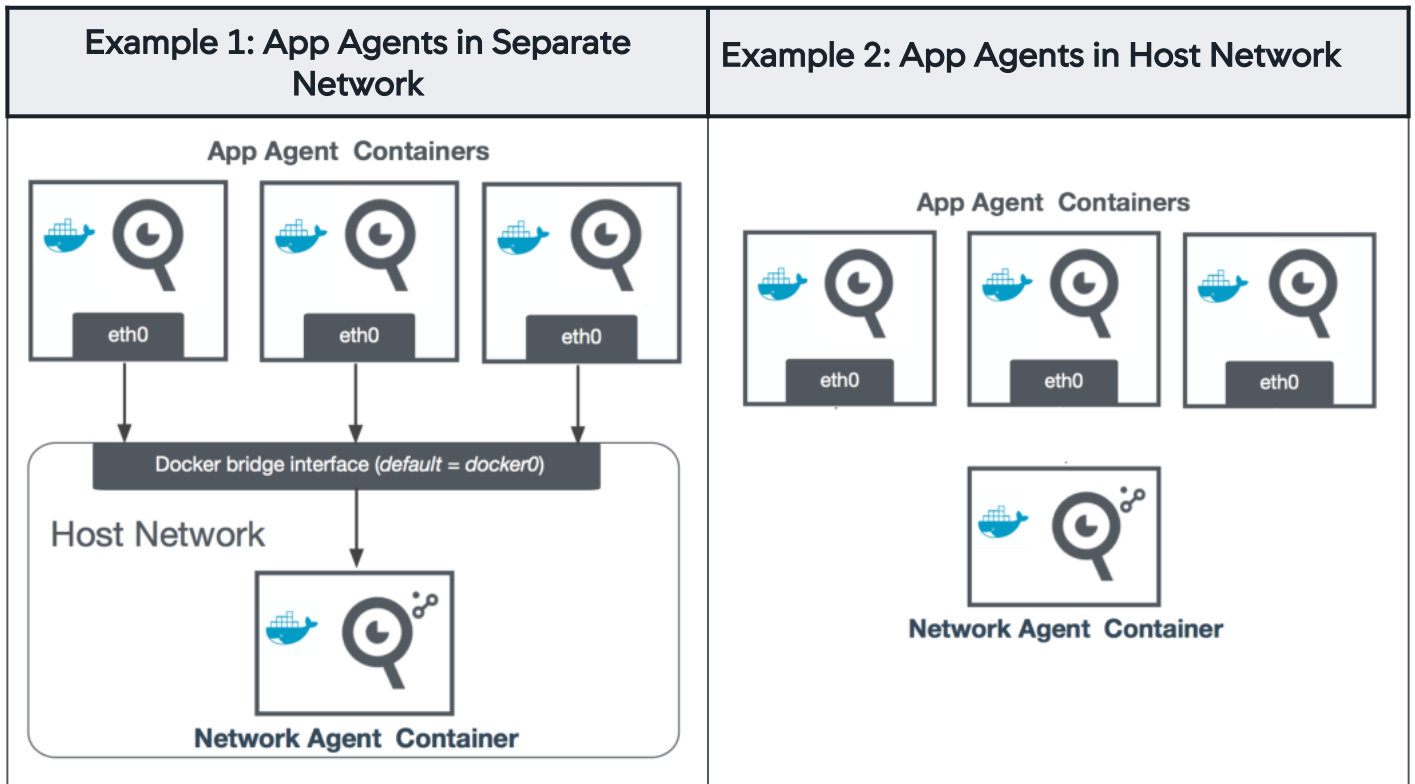

If you are using Network Visibility to monitor applications running in Docker containers, you must install the Network Agent in a container as well. See [+ Docker and Network Visibility](#).

1. Check System Requirements. See [Network Visibility Supported Environments](#).
2. If you are logged in to the Agent host as a non-root user, log out and then log back in as `root`.
3. Access the [AppDynamics Downloads Portal](#) and download the Network Agent installer.
4. Open a terminal window and enter the following commands:
  - a. `sudo dpkg -i <installer.deb>` (installs the Agent under `opt/appdynamics/netviz`)  
(starts the agent, outputs "`appd-netviz start/running. process <pid #>`")
  - b. `sudo service appd-netviz status` (verifies the Agent status)
5. If the Agent does not start, enter: `sudo service appd-netviz start`.
6. If you experience any problems or issues, see [FAQs for Network Visibility](#).
7. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#) workflow, proceed to [Set Up the Network and App Agents on Linux](#).

### Install the Network Agent in a Docker Container

The Network Agent can monitor applications running in Docker containers on the same host. You can deploy one Network Agent per host and collect individual metrics for every local application monitored by a Java App Agent in a container.

AppDynamics recommends that you install the Network Agent in a separate container in [Docker Host](#) network mode on the same host as the application containers. This recommendation applies when the App Agent containers are running in [Docker Bridge](#) or Docker Host mode.

### Install the Network Agent and App Agents

1. Paste the sample Dockerfile into a text file and save the file. This sample Dockerfile contains commands for installing the Network Agent.

```
FROM centos:centos7

RUN yum update -y && yum install -y \
 net-tools \
 iproute \
 tcpdump \
 curl \
 unzip \
 sysvinit-tools \
 openssh-clients

WORKDIR /netviz-agent

ARG NETVIZ_ZIP_PKG

copy NetViz agent contents
ADD ${NETVIZ_ZIP_PKG} .

run the agent install script
RUN unzip *.zip && ./install.sh \
 && sed -i -e "s|enable_netlib = 1|enable_netlib = 0|g" ./conf/agent_config.lua \
```

```
&& sed -i -e "s|WEBSERVICE_IP=.*|WEBSERVICE_IP=\"0.0.0.0\"|g" ./conf/agent_config.lua

default command to run for the agent
CMD ./bin/appd-netagent -c ./conf -l ./logs -r ./run
```

2. Navigate to the directory where you saved the Dockerfile. Build the Docker image by entering:

```
docker build --build-arg NETVIZ_ZIP_PKG=/path/to/netviz-agent-pkg.zip -t appd-netviz .
```

3. Push the Docker image to your Docker Trusted Registry.
4. Deploy your Docker image using this sample Docker Compose file:

```
version: '2'
services:
 appd-netviz-agent:
 image: path/to/your/docker/image # docker registry image
 network_mode: "host"
 restart: unless-stopped
 ports:
 - '3892:3892'
 cap_add:
 - NET_ADMIN
 - NET_RAW
```

Alternatively, enter:

```
docker run -d --network=host --cap-add=NET_ADMIN --cap-add=NET_RAW path/to/your/netviz/
docker/image
```

5. Set up the Network Agent. Follow the single-tenant setup instructions on [Set Up the Network and App Agents on Linux](#).

 For single-tenant setup, you do not need to enable netlib.

### Specify the Docker Host Gateway IP on the App Agent

If you are running the App Agent in a Docker container outside of the [Docker Host](#) network (as shown in [Example 1](#) in the diagram), complete these steps.

1. In the host for your App Agent, enter these environment variables:

```
export APPDYNAMICS_NETVIZ_AGENT_HOST=$(ip -4 addr show docker0 | grep -Po 'inet \K[\d.]+')
export APPDYNAMICS_NETVIZ_AGENT_PORT=3892
```

2. Set the values for the port and host address. Run the application Docker image by passing the AppDynamics environment variables which were exported in Step 1. For example:

```
docker run --env "APPDYNAMICS_NETVIZ_AGENT_HOST=$APPDYNAMICS_NETVIZ_AGENT_HOST"
--env "APPDYNAMICS_NETVIZ_AGENT_PORT=$APPDYNAMICS_NETVIZ_AGENT_PORT"
<application_docker_image>
```

## Install the Network Agent as an Extension of the Machine Agent (Bundled)

You can install and run the Network Agent as an extension of the Machine Agent (ZIP only) if you want to install both Agents at the same time.

### Important Notes

- If you are using Network Visibility to monitor applications running in Docker containers, you must install the Network Agent in a container as well. See [+ Docker and Network Visibility](#).
- To run the install script, log in as `root`.
- For all other operations, log in as the designated agent administrator `<appd-agent-administrator>` for that host.

1. Check System Requirements. See [Network Visibility Supported Environments](#).
2. Download and unzip the Machine Agent:

### Login User = Agent Administrator

- a. Log in to the Agent host as `< appd-agent-administrator >`.
- b. Access the [AppDynamics Downloads Portal](#), download the Machine Agent installer, and unzip it.
- c. Install the Machine Agent using the Linux ZIP installer as described in the [Linux Install Using ZIP with Bundled JRE](#) page.

3. Install the Machine Agent and Network Visibility extension:

### Login User = root

- a. Log out and then log in as `root`.
- b. Open a CLI window and enter:
  - i. `cd <machine-agent-home>/extensions/NetVizExtension`
  - ii. `./install-extension.sh`

4. Enable the Network Visibility extension and start the Agent:

### Login User = Agent Administrator

- a. Log out and then log in as `< appd-agent-administrator >`.
- b. Enter the CLI command:
  - i. `< machine-agent-home >/bin/machine-agent -d -p < machine-agent-home >/pidfile` (starts the Machine Agent)

5. If you experience any problems or issues, see [FAQs for Network Visibility](#).
6. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#) workflow, proceed to [Set Up the Network and App Agents on Linux](#).

## Set Up the Network and App Agents on Linux

**i** Network Agent 4.5.7 and Java Agent 4.5.11 eliminate the need to separately configure the Network Agent in a multi-tenant setup when running multiple nodes on the same machine. If you use the Network Agent 4.5.7 with Java Agent  $\leq 4.5.10$ , you need to configure the Network Agent in a multi-tenant setup. See [Network Agent and Java Agent Installation Instructions](#).

### Network Agent and Java Agent Installation Instructions

If you are using	then
Network Agent $\geq 4.5.7$ and Java Agent $\geq 4.5.11$	<a href="#">Install the Network Agent</a> .
Network Agent $\geq 4.5.7$ and Java Agent $\leq 4.5.10$	Install the Network Agent in a <a href="#">multi-tenant setup</a> or a <a href="#">single tenant setup</a> . You do not need to manually enable the <code>netlib</code> parameter during the multi-tenant setup, it is enabled by default.
Network Agent $\leq 4.5.6$	Install the Network Agent in a <a href="#">multi-tenant setup</a> or a <a href="#">single tenant setup</a> . You need to manually <a href="#">enable the</a> <code>netlib</code> parameter during the multi-tenant setup.
Java App Agent $\leq 4.4$	<a href="#">Update the Java Agent</a> .

### Install the Network Agent

**i** If you are using Java Agent  $\geq 4.5.13$ , you do not need to manually enable the socket collection. It is enabled automatically. You can skip Step 1 and proceed to Step 2.

1. [Enable Socket Collection on the App Agent](#)
2. [Specify the Docker Host Gateway IP on the App Agent](#)
3. [Restart the App \(IBM JVM Only\)](#)

### Enable Socket Collection on the App Agent

1. Configure the Java App Agent startup command to perform these tasks, as shown in the example:
  - Enable `appdynamics.socket.collection.bci.enable` for the Network Agent to map network metrics to application flows.

For example:

```
java -javaagent:< app_server_agent_home > /javaagent.jar \
-Dappdynamics.socket.collection.bci.enable=true
```

2. The following examples illustrate how editing the Agent startup command can differ, depending on the framework of the monitored application. See [Agent Installation by Java Framework](#) and its relevant framework documentation.

Framework	Example (App Agent ZIP)
<p><a href="#">IBM WebSphere and InfoSphere</a></p>	<p>In the WebSphere/InfoSphere UI, navigate to the Java Virtual Machine properties page for the monitored server. Then, add <code>javaagent</code> and <code>appdynamics.socket.collection.bci.enable=true</code> as a Generic JVM argument. For example:</p> <pre>javaagent:/usr/appd/agents/apm/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true</pre>
<p><a href="#">Apache Tomcat</a></p>	<p>Add the full command as a Catalina environment variable in file <code>CATALINA_BASE/bin/setenv.sh</code> (Tomcat 6 and later). For example:</p> <pre>export CATALINA_OPTS="\$CATALINA_OPTS -javaagent:/usr/appd/agents/apm/ javaagent.jar -Dappdynamics.socket.collection.bci.enable=true"</pre>
<p><a href="#">Glassfish</a></p>	<p>Add the full command as a <code>-javaagent</code> JVM option in the GlassFish domain. You can add the Agent using the <code>asadmin</code> tool. For example:</p> <pre>export LD_PRELOAD=/usr/appd/agents/netviz/ lib/appd-netlib.so  glassfish4\bin\asadmin create-jvm-options "- javaagent\:/usr/appd/agents/apm/ javaagent.jar:- Dappdynamics.socket.collection.bci.enable=true"</pre>
<p><a href="#">JBoss Standalone</a></p>	<p>Add the full command to the <code>standalone.sh</code> file. For example:</p> <pre>export JAVA_OPTS="\$JAVA_OPTS -javaagent:/usr/appd/agents/apm/ javaagent.jar  -Dappdynamics.socket.collection.bci.enable=true"</pre>

Framework	Example (App Agent ZIP)
<p>Jetty</p>	<p>Add the full command to the <code>start.ini</code> config file in the Jetty base directory. For example:</p> <pre>--exec -javaagent:/usr/appd/agents/apm/ javaagent.jar -Dappdynamics.socket.collection.bci.enable=true</pre>

- To verify that the App Agent is running correctly, enter:

```
strings /proc/<app_pid>/environ
```

### Specify the Docker Host Gateway IP on the App Agent

**i** These steps are required only if the App Agent is running in a Docker container outside of the [Docker Host](#) network.

- Open the following file: `<app-agent-install-dir>/<version-number>/external-services / netviz/netviz-service.properties`  
(You might need to unzip `external-services/ netviz.zip` to access this file.)
- For the `netviz.agent.host.address`, specify the Gateway IP of the [Docker Host](#) network interface. To determine this IP, enter this command on the Docker host:  
`docker inspect <app_container_name> | grep Gateway`
- Restart the App Agent.
- To determine if the [Docker Host](#) network is connected, enter this command from within the container:  
`curl -k -v <host-network-IP >:3892`  
If you receive a response, even if it is `404 Not Found`, then the network is connected.

### Restart the App (IBM JVM Only)

If the monitored app is running in an IBM JVM, you must restart the app for the Network Agent to detect and monitor any persistent connections.

### Multi-Tenant Setup (Multiple Apps on the Agent Host)

If you want the Network Agent to [monitor multiple app nodes on the same host](#), you perform the following steps *for each App Agent*.

- [Install or Update the App Agent \(if needed\)](#)
- [Extract the NetViz External Services Folder on the App Agent](#)
- [Preload NetLib and Enable Socket Collection on the App Agent](#)
- [Specify the Docker Host Gateway IP on the App Agent](#)
- [Restart the App \(IBM JVM Only\)](#)

**⚠** If you are using Network Agent <= 4.5.6, enable the `netlib` parameter manually as described in [Step 1](#).

## Enable Netlib on the Network Agent

1. Open the following file in a text editor: `<network_agent_home>/conf/agent_config.lua`
2. Edit the `enable_netlib` parameter:

```
npm_config = {
 log_destination = "file",
 log_file = "agent.log",
 debug_log_file = "agent-debug.log",
 disable_filter = 1,
 mode = "Advanced",
 enable_netlib = 1,
 lua_scripts_path = ROOT_DIR .. "/scripts/netagent/lua/",
}
```

## Install or Update the App Agent (if needed)

The Network Agent requires Java App Server Agent >= 4.4. Update each App Agent that is running an earlier version. See [Install the Java Agent](#)

## Extract the NetViz External Services Folder on the App Agent

1. Navigate to the folder: `<app-agent-install-dir>/<version-number>/external-services`
2. If not already extracted, extract the `netviz.zip` archive so that the ZIP contents are under this folder:

```
<app-agent-install-dir>/<version-number>/external-services
```

## Preload NetLib and Enable Socket Collection on the App Agent

1. You must configure the Java App Agent startup command to perform two additional tasks, as shown in the following:
  - Preload the `appd-netlib` library so the Network Agent can collect network metrics for each individual node (rather than for the entire host)
  - Enable `appdynamics.socket.collection.bci.enable` for the Network Agent to map network metrics to application flows

For example:

```
LD_PRELOAD=/ <network-agent-home> /lib/appd-netlib.so \
 java -javaagent:< app_server_agent_home > /javaagent.jar \
 - Dappdynamics.socket.collection.bci.enable=true
```

The following examples illustrate how editing the Agent startup command can differ, depending on the framework of the monitored application. See [Agent Installation by Java Framework](#) and its relevant framework documentation.

Framework	Example (App Agent ZIP)
<p><a href="#">IBM WebSphere and InfoSphere</a></p>	<p>In the WebSphere/InfoSphere UI, navigate to the Java Virtual Machine properties page for the monitored server. Then add <code>javaagent</code> and <code>appdynamics.socket.collection.bci.enable=true</code> as a Generic JVM argument. For example:</p> <pre>javaagent:/usr/appd/agents/apm/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true</pre> <p>You can add <code>LD_PRELOAD</code> as a JVM environment variable. This example describes how to add an environment variable on a Cognos server using IBM Connections 6.0.0:</p> <ol style="list-style-type: none"> <li>Log in to the WebSphere Application Server administrative console of the Cognos server.</li> <li>Click <b>Servers &gt; Server Types &gt; WebSphere application servers</b>.</li> <li>Click the <code>cognos_server</code> link.</li> <li>Click <b>JAVA &gt; Process Management &gt; Process definition &gt; Environment Entries &gt; New</b> to add this entry:             <pre>LD_PRELOAD=/usr/appd/agents/netviz/lib/appd-netlib.so</pre> </li> </ol> <ol style="list-style-type: none"> <li>In the WebSphere/InfoSphere UI, navigate to the Java Virtual Machine properties page for the monitored server.</li> <li>Add <code>javaagent</code> and <code>appdynamics.socket.collection.bci.enable=true</code> as a Generic JVM argument. For example:             <pre>javaagent:/usr/appd/agents/apm/javaagent.jar - Dappdynamics.socket.collection.bci.enable=true</pre> </li> </ol> <p>You can add <code>LD_PRELOAD</code> as a system environment variable. This example describes how to add an environment variable on a Cognos server using IBM Connections 6.0.0:</p> <ol style="list-style-type: none"> <li>Log in to the WebSphere Application Server administrative console of the Cognos server.</li> <li>Go to <b>Servers &gt; Server Types &gt; WebSphere Application Servers</b>.</li> <li>Click <code>cognos_server</code>.</li> </ol>

Framework	Example (App Agent ZIP)
	<p>4. Go to <b>Java &gt; Process Management &gt; Process Definition &gt; Environment Entries &gt; New</b> to add this entry:</p> <pre>LD_PRELOAD=/usr/appd/agents/netviz/lib/appd-netlib.so</pre>
<p>Apache Tomcat</p>	<p>Add the full command as a Catalina environment variable in file <code>CATALINA_BASE/bin/setenv.sh</code> (Tomcat 6 and later). For example:</p> <pre>export LD_PRELOAD=/&lt;network-agent-home-directory&gt;/lib/appd-netlib.so  export CATALINA_OPTS="\$CATALINA_OPTS -javaagent:/&lt;java-agent-home-directory&gt;/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true"</pre>
<p>Glassfish</p>	<p>Add the full command as a <code>-javaagent</code> JVM option in the GlassFish domain. You can add the Agent using the <code>asadmin</code> tool. For example:</p> <pre>export LD_PRELOAD=/&lt;network-agent-home-directory&gt;/lib/appd-netlib.so  glassfish4\bin\asadmin create-jvm-options "-javaagent\:/&lt;java-agent-home-directory&gt;/javaagent.jar:-Dappdynamics.socket.collection.bci.enable=true"</pre>
<p>JBoss Standalone</p>	<p>Add the full command to the <code>standalone.sh</code> file. For example:</p> <pre>export LD_PRELOAD=/&lt;network-agent-home-directory&gt;/lib/appd-netlib.so  JAVA_OPTS="\$JAVA_OPTS -javaagent:/&lt;java-agent-home-directory&gt;/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true"</pre>

Framework	Example (App Agent ZIP)
<p>Jetty</p>	<p>For a standalone Jetty using <code>start.jar</code> :</p> <ol style="list-style-type: none"> <li>Add the full command to the <code>start.ini</code> config file in the Jetty base directory. For example: <pre>exec javaagent:/usr/appd/agents/apm/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true</pre> </li> <li>Create a script to start Jetty. For example, <code>startJetty.sh</code>: <pre>export LD_PRELOAD=/usr/appdynamics/agents/netviz/lib/appd-netlib.so java -jar start.jar</pre> </li> </ol> <p>For service with embedded Jetty:</p> <ol style="list-style-type: none"> <li>Create a script to start Jetty. For example, <code>startJetty.sh</code>: <pre>export LD_PRELOAD=&lt;network-agent-home-directory&gt;/lib/appd-netlib.so java -javaagent:&lt;java-agent-home-directory&gt;/javaagent.jar -Dappdynamics.socket.collection.bci.enable=true -jar &lt;embedded_jetty_jar&gt;</pre> </li> </ol>

To verify that the App Agent is running correctly, enter:

```
strings /proc/<app_pid>/environ
```

### Specify the Docker Host Gateway IP on the App Agent

**i** These steps are required only if the App Agent is running in a Docker container outside of the [Docker Host](#) network.

- Open the file: `<app-agent-install-dir>/<version-number>/external-services /netviz/netviz-service.properties`  
(You might need to unzip `external-services/ netviz.zip` to access this file.)
- For the `netviz.agent.host.address`, specify the Gateway IP of the [Docker Host](#) network interface. To determine this IP, run this command on the Docker host:

```
docker inspect <app_container_name> | grep Gateway
```
- Restart the App Agent.
- To determine if the [Docker Host](#) network is connected, run this command from within the container:

```
curl -k -v < host-network-IP >:3892
```

If you receive a response, even if it is `404 Not Found`, then the network is connected.

---

## Restart the App (*IBM JVM Only*)

If the monitored app is running in an IBM JVM, you must restart the app for the Network Agent to detect and monitor any persistent connections.

## Single-Tenant Setup (*One App Only on the Agent Host*)

If you want the Network Agent to monitor one app node only on the same host, perform these steps:

- [Install or Update the App Agent \(if needed\)](#)
- [Extract the NetViz External Services Folder on the App Agent](#)
- [Enable Socket Instrumentation](#)
- [Specify the Docker Host Gateway IP on the App Agent](#)
- [Restart the App \(IBM JVM Only\)](#)

## Install or Update the App Agent (if needed)

Network Visibility requires a Java App Agent >= 4.4 installed on the same host as the Network Agent. See [Install the Java Agent](#).

## Extract the NetViz External Services Folder on the App Agent

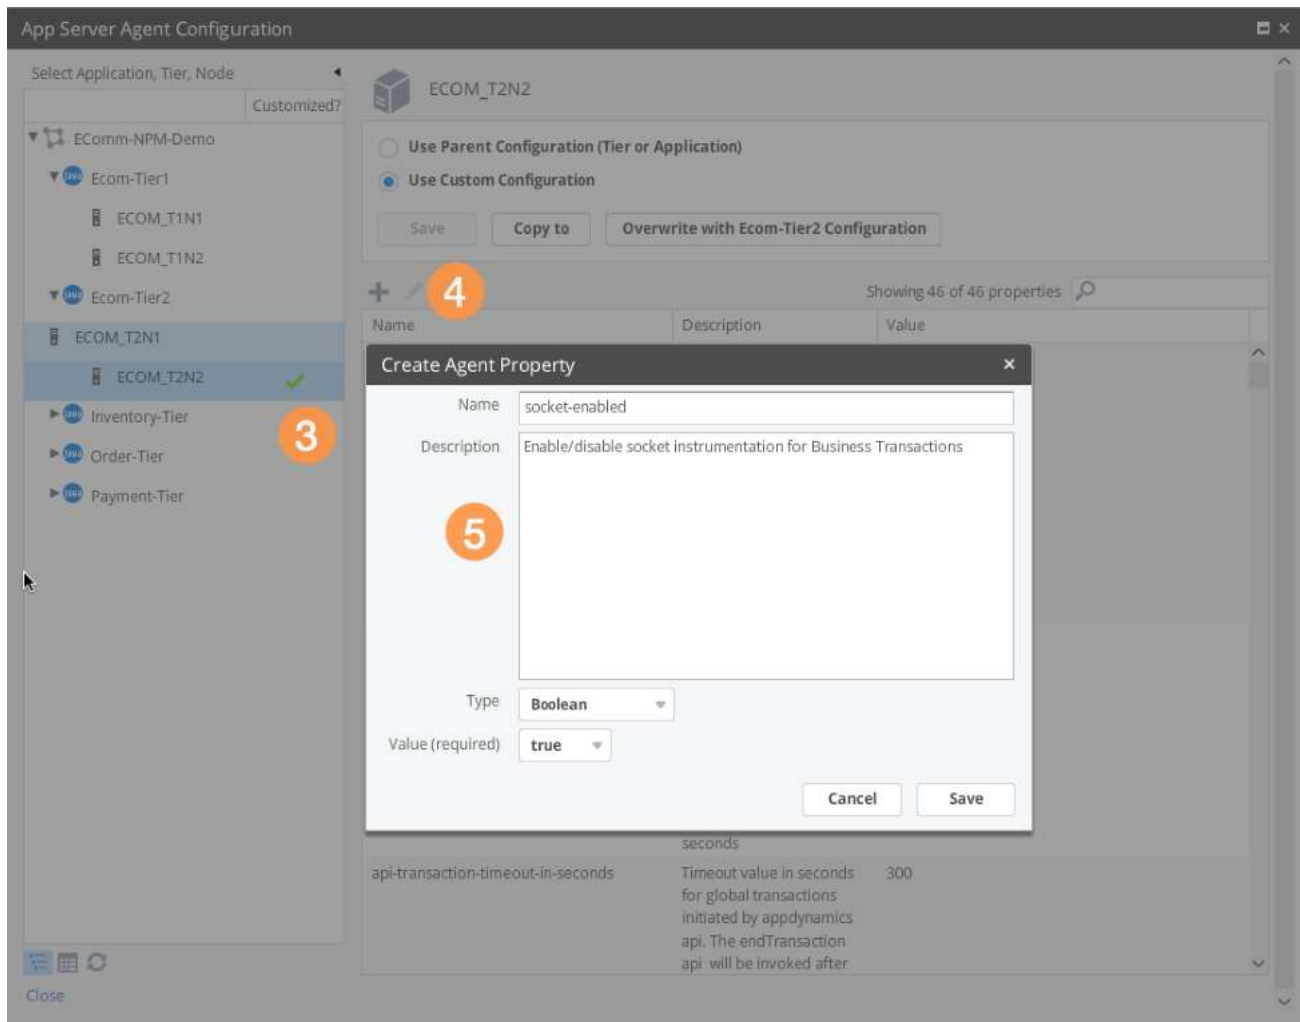

1. Navigate to folder: `<app-agent-install-dir>/<version-number>/external-services`
2. If not already extracted, extract the `netviz.zip` archive so that the ZIP contents are under this folder:

```
<app-agent-install-dir>/<version-number>/external-services
```

## Enable Socket Instrumentation

This is required for the Agent to map network metrics to application flows.

1. In the Controller, click the gear icon () and select **AppDynamics Agents > App Server Agents**.
2. Select the Agent in the table and click **Configure**. The App Server Agent Configuration page appears.
3. Select the application, tier, and node in the treeview (left).
4. Select **Use Custom Configuration** and then click **+ Create Agent Property**.
5. In the Edit Agent Property dialog, specify:
  - a. Name = **socket-enabled**
  - b. Type = **Boolean**
  - c. Value = **true**

## Specify the Docker Host Gateway IP on the App Agent

**i** These steps are required only if the App Agent is running in a Docker container outside of the [Docker Host](#) network.

1. Open the file: `<app-agent-install-dir>/<version-number>/external-services/netviz/netviz-service.properties`  
(You might need to unzip `external-services/netviz.zip` to access this file.)
2. For the `netviz.agent.host.address`, specify the Gateway IP of the [Docker Host](#) network interface.  
To determine this IP, run this command on the Docker host:  
`docker inspect <app_container_name> | grep Gateway`
3. Restart the App Agent.
4. To determine if the [Docker Host](#) network is connected, run this command from within the container:  
`curl -k -v <host-network-IP>:3892`  
If you receive a response, even if it is `404 Not Found`, then the network is connected.

## Restart the App (*IBM JVM Only*)

If the monitored app is running in an IBM JVM, you must restart the app for the Network Agent to detect and monitor any persistent connections.

## Administer the Network Agent on Linux

See the following pages for details:

- [ZIP Network Agent Operations](#)
- [RPM Network Agent Operations](#)
- [DEB Network Agent Operations](#)
- [Managing Network Agents in the Controller](#)

## ZIP Network Agent Operations

You install the Network Agent as part of an overall workflow for setting up Network Visibility. The supported workflows are:

- [Multi-Tenant Setup](#)
- [Single-Tenant Setup](#)

See [Set Up Network Visibility on Linux](#).

The NetViz Agent needs to be started separately from the Machine Agent when using a bundled approach.

## Install the ZIP Network Agent

You can install the Agent using the Machine Agent or the Network Agent ZIP.

- [Install Using the Machine Agent ZIP](#)
- [Install Using the Network Agent ZIP](#)

### Install Using the Machine Agent ZIP

You can install the Network Agent as an extension using the Machine Agent installer. This option is available on Linux 32-bit and 64-bit ZIP installers, >= 4.4.2, only.

1. Check System Requirements. See [Network Visibility Supported Environments](#).
2. If you are installing the Network Agent as part of the [Multi-Tenant Install](#) workflow, stop each application of interest if it is monitored by an installed App Agent. You will restart each application after you install and set up the Network Agent.
3. Install the Machine Agent using the Linux ZIP installer as described in the [Linux Install Using ZIP with Bundled JRE](#) page.
4. Run the install script using `sudo` :

```
cd <machine-agent-home>/NetVizExtension/agent/
sudo ./install.sh
```

5. Enable the `NetVizMonitoring` extension:
  - a. Open this file in a plain-text editor such as `vi` or `Notepad++`:

```
<machine-agent-home>/NetVizExtension/conf/netVizExtensionConf.yml
```
  - b. Set the `start` setting to `true` and save the file.
6. Start the Machine Agent. The `NetVizMonitoring` extension should start automatically. To start the Agent on Linux, enter:

```
<machine_agent_home>/bin/machine-agent -d -p <machine_agent_home>/pidfile
```

7. Verify that the Network Agent is running:

```
<machine-agent-home>/NetVizExtension/agent/bin /appd-netviz.sh status
```

The output provides the process ID (PID) of the Network Agent process.

See [FAQs for Network Visibility](#).

8. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#) workflow, proceed to the next step in the workflow:
  - [Multi-Tenant Setup](#)
  - [Single-Tenant Setup](#)

### Install Using the Network Agent ZIP

1. Check System Requirements. See [Network Visibility Supported Environments](#).
2. If you are installing the Network Agent as part of the [Multi-Tenant Install](#) workflow, stop each application of interest if it is monitored by an installed App Agent. You will restart each application after you install and set up the Network Agent.
3. Verify that you have `sudo` or `root` access permissions on the host where you want to install the Network Agent. (You do not need `sudo` or `root` access to run the Agent.)
4. Open a command prompt on the host, enter the `mount` command, and check the mounted file system for the directory where you plan to install the agent. The file system should not have the `noexec` and `nosuid` flags set.
5. Download the `network-agent` package to the machine.
6. In a terminal window, `cd` to the folder where you downloaded the Network Agent ZIP package.
7. Enter the following command, where `<network_agent_home>` is the folder where you want to install the Agent software:

```
unzip <installer.zip> -d <network_agent_home>
```

The parent path should not include any directory names with spaces:

```
/opt/appdynamics/networkVisibility (correct)
```

```
/opt/appdynamics/network visibility (incorrect)
```

8. Run these commands as the administrator or root user on the host machine:
  - a. This command is required *only* if you are logged in as a different user from the one that will configure and run the Agent:
 

```
chown -R <network-agent-user-group>: <network-agent-user> <network-agent-home>
```
  - b. Go to `<network_agent_home>` and run the install script:
 

```
cd <network-agent-home>
./install.sh
```
9. Start the Agent by running the following command as the `<network_agent_user>`:
 

```
<network-agent-home>/bin/start.sh
```
10. Verify that the Network Agent is running:
  - a. Identify the agent process: `<network-agent-home>/bin/appd-netviz.sh status`  
The output provides the process ID (PID) of the Network Agent process.
  - b. See [FAQs for Network Visibility](#)
11. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#) workflow, proceed to the next step in the workflow:
  - [Multi-Tenant Setup](#)
  - [Single-Tenant Setup](#)

## Administer the ZIP Network Agent

### Run commands as <network\_agent\_user>

You should run the following commands as a <network\_agent\_user> with permissions to configure and run the Agent on the host machine.

Operation	Command	Notes
Start Agent	<code>&lt;network-agent-home&gt;/bin/start.sh</code>	If the Agent starts successfully, the following displays: <pre>Starting AppDynamics Network Monitoring appd-netviz... OK appd-netviz running.. &lt;pid_of_process&gt;</pre>
Stop Agent	<code>&lt;network-agent-home&gt;/bin/stop.sh</code>	If the Agent stops successfully, the following displays: <pre>Stopping AppDynamics Network Monitoring appd-netviz... OK</pre>
Check Agent status	<code>&lt;network-agent-home&gt;/bin/appd-netviz.sh status</code>	This command shows whether the Agent is running or not. The following displays: <pre>appd-netviz start/running, process &lt;pid #&gt;</pre>
Restart Agent	<code>&lt;network-agent-home&gt;/bin/appd-netviz.sh restart</code>	If the Agent restarts successfully, the following displays: <pre>Stopping AppDynamics Network Monitoring appd-netviz... OK Starting AppDynamics Network Monitoring appd-netviz... OK appd-netviz running.. &lt;pid_of_process&gt;</pre>

## Uninstall the ZIP Network Agent

1. Open a terminal and `cd` to the `<network-agent-home >` directory.
2. Stop the Agent by entering: `./bin/stop.sh`
3. `cd` to the `<network-agent-home>` parent directory: `cd ..`

4. Remove the Agent directory by entering: `rm -rf <network-agent-home>`

## RPM Network Agent Operations

You install the Network Agent as part of an overall workflow for setting up Network Visibility. The three supported workflows are:

- [Multi-Tenant Install](#)
- [Single-Tenant Install](#)

See [Set Up Network Visibility on Linux](#).

### Install the RPM Agent

1. Check System Requirements. See [Network Visibility Supported Environments](#).
2. Stop each application of interest if it is monitored by an installed App Agent. You will restart each application after you install and set up the Network Agent.
3. Verify that you have `sudo` or `root` access permissions on the machine where you want to install the Network Agent. (You do not need `sudo` or `root` access to run the Agent.)
4. Open a command prompt on the host, enter the `mount` command, and check the mounted file system for the directory where you plan to install the Agent. The file system should not have the `noexec` and `nsuid` flags set.
5. Download the `network-agent` package to the machine.
6. Verify that you have `sudo` or `root` access permissions on the machine where you want to install the Agent.
7. Download the Agent package to the machine.
8. Open a terminal window and enter: `sudo rpm -ivh <installer.rpm>`  
The Network Agent software is installed under `/opt/appdynamics/netviz`.
9. To start the Agent, enter: `sudo service appd-netviz start`
10. Verify that the Network Agent is running: `sudo service appd-netviz status`
11. If you experience any problems or issues, see [FAQs for Network Visibility](#).
12. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#) workflow, proceed to the next step in the workflow:
  - [Multi-Tenant Install](#)
  - [Single-Tenant Install](#)

### Administer the RPM Agent

You should run the following commands as a `<network_agent_user>` with permissions to configure and run the Agent on the host machine.

Operation	Command	Notes
Start Agent	<code>sudo service appd-netviz start</code>	If the Agent starts successfully, the following displays:  <code>Starting appd-netviz (via systemctl): [ OK ]</code>

Operation	Command	Notes
Stop Agent	sudo service appd-netviz stop	If the Agent stops successfully, the following displays:  Stopping appd-netviz (via systemctl): [ OK ]
Restart Agent	sudo service appd-netviz restart	If the Agent restarts successfully, the following displays:  Stopping appd-netviz (via systemctl): [ OK ]

---

Operation	Command	Notes
Check Agent status	<pre>sudo service appd-netviz status</pre>	The following example illustrates status output:

Operation	Command	Notes
		<pre> appd-netviz.service - Appdynamics Network Monitoring   Loaded: loaded (/usr/lib/ systemd/system/appd- netviz.service; disabled; vendor   Active: active (running) since Thu 2016-09-29 14:52:42 PDT; 14s ago   Process: 3981 ExecStart=/ opt/appdynamics/netviz/bin/ appd-netmon (code=exited,   Process: 3973 ExecStartPre=/bin/chown -R appd-netviz:appd-netviz /opt/ appdynam   Process: 3968 ExecStartPre=/bin/mkdir -p / opt/appdynamics/netviz/run/ (code=ex   Main PID: 3983 (appd-netmon)   Tasks: 12 (limit: 512)   CGroup: /system.slice/ appd-netviz.service       └─3983 /opt/ appdynamics/netviz/bin/appd- netmon           └─3984 appd- netagent -l /opt/appdynamics/ netviz/scripts/netagent/lua/               └─3985 appd- netcor -l /opt/appdynamics/ netviz/scripts/netcor/lua/  Sep 29 14:52:42 localhost.localdomai n systemd[1]: Starting Appdynamics Network M Sep 29 14:52:42 localhost.localdomai n systemd[1]: Started Appdynamics Network Mo lines 1-15/15 (END) </pre>

---

## Uninstall the RPM Agent

To uninstall the Network Agent, enter:

```
sudo rpm -e appd-netviz
```

This command generates no output. To confirm that the Agent is removed, enter the status command again: `sudo service appd-netviz status`

## DEB Network Agent Operations

You install the Network Agent as part of an overall workflow for setting up Network Visibility. The three supported workflows are:

- [Multi-Tenant Install](#)
- [Single-Tenant Install](#)

To determine the best workflow for your environment, see [Set Up Network Visibility on Linux](#).

## Install the DEB Network Agent

1. Check System Requirements. See [Network Visibility Supported Environments](#).
2. If you are installing the Network Agent as part of the [Multi-Tenant Install](#) workflow, stop each application of interest if it is monitored by an installed App Agent. You will restart each application after you install and set up the Network Agent.
3. Verify that you have `sudo` or `root` access permissions on the machine where you want to install the Agent. (You do not need `sudo` or `root` access to run the Agent.)
4. Open a command prompt on the host, enter the `mount` command, and check the mounted file system for the directory where you plan to install the Agent. The file system should not have the `noexec` and `nosuid` flags set.
5. Download the Agent package to the machine.
6. Enter:

```
sudo dpkg -i <installer.deb>
```

The Network Agent software is installed under `/opt/appdynamics/netviz`.  
The Agent should start automatically with the following message: `appd-netviz start/running. process <pid #>`  
To verify the Network Agent status, enter: `sudo service appd-netviz status`
7. If the Agent does not start, enter: `sudo service appd-netviz start`
8. If you experience any problems or issues, see [FAQs for Network Visibility](#).
9. If you are installing the Network Agent as part of a [Set Up Network Visibility on Linux](#) workflow, proceed to the next step in the workflow:
  - [Multi-Tenant Install](#)
  - [Single-Tenant Install](#)

## Administer the DEB Network Agent

Operation	Command	Notes
Start Agent	<code>sudo service appd-netviz start</code>	If the Agent starts successfully, the following displays: <code>appd-netviz start/running.</code> <code>process &lt;pid #&gt;</code>
Stop Agent	<code>sudo service appd-netviz stop</code>	If the Agent stops successfully, the following displays: <code>appd-netviz stop</code> <code>appd-netviz stop/waiting</code>
Restart Agent	<code>sudo service appd-netviz restart</code>	
Check Agent Status	<code>sudo service appd-netviz status</code>	This command shows whether the Agent is running or not. The following displays: <code>appd-netviz start/running,</code> <code>process &lt;pid #&gt;</code>

## Uninstall the DEB Network Agent

The Network Agent software is installed under `/opt/appdynamics/netviz`. To uninstall the Agent, enter:

```
sudo dpkg -P appd-netviz
```

## Managing Network Agents in the Controller

### Controller Operations for Network Agents

Using an AppDynamics Administrator account, select **Settings > AppDynamics Agents > Network Visibility Agents** to see details and manage your installed Machine Agents. You can perform most operations on multiple Agents: Shift or Ctrl+Click the Agents of interest, right-click, and select the operation. These Agent settings are defined in the Controller and retain their state when an Agent is stopped and restarted.

Right-click one or more Agents to:

- [View Packet Capture Configuration](#)
- [Start Packet Capture](#)
- [Disable Agent\(s\) or Enable Agent\(s\)](#)
- [Change Dynamic Monitoring Mode](#)
- [Delete Agent from System](#)

### View Packet Capture Configuration

View and edit configuration settings for a single network Agent. See [Packet Captures](#).

---

## Start Packet Capture

Start a packet capture on one or more Agents.

## Disable Agent(s) or Enable Agent(s)

When disabled, the Agent temporarily suspends its collection of network metrics. You can quickly re-enable the Agent when you want.

While disabled, the Agent continues to consume a Network Visibility license. The Agent maintains a "heartbeat" connection to the Controller so you can enable it again quickly. The Agent persists its enabled/disabled state after it restarts and resumes all normal activities after it is re-enabled.

To stop the Agent and remove the license, run the **Stop Agent** command for your operating system:

- [Administer the ZIP Network Agent](#)
- [Administer the RPM Agent](#)
- [Administer the DEB Network Agent](#)

## Change Dynamic Monitoring Mode

Defines the set of metrics that the Agent collects. In general, you should run the Agent in **KPI** unless you need to diagnose network performance on the node or Connections monitored by that Agent. See [Dynamic Monitoring Mode and Network Visibility](#).

## Delete Agent from System

Deletes the underlying Network Visibility metadata for an orphaned Network Agent. A Network Agent is considered "orphaned" when the Agent host no longer has any App Server Agents installed or running. To delete a Network Agent, you must first delete all APM nodes on that host. Account Administrator privileges are required to delete Network Agents.

## Check Network Agent Status

To check the status of your Network Agents, access **Tiers & Nodes** and then select **Network** in the Show Data pulldown.

## Network Visibility with Kubernetes

This page describes how to configure Network Visibility to monitor applications running on Kubernetes.

Network Visibility monitors an application's network interactions and reports key performance metrics. These metrics isolate an application's network issues from its application issues.

The Network Agent uses a REST API to open a TCP port in each node for the application containers to communicate with the Network DaemonSet container. This communication enables monitoring between pods and nodes. You can deploy the agent as a DaemonSet in each node that has the host mode enabled.

## Before You Begin

Before you create a Docker image for the DaemonSet and configure the agent, verify the following requirements:

- You have at least one pod with a Java Agent  $\geq 4.4$  deployed to the same cluster as the Network Agent.
- The TCP port 3892 is not already used by the node. The application pods use port 3892 to communicate with the DaemonSet.

## Create a Network Visibility DaemonSet Docker Image

To configure Network Visibility with Kubernetes, you must first create a Docker image for the Network Visibility DaemonSet and push the image to your Docker Trusted Registry.

1. Paste this sample Dockerfile into a text file and save the file.

```
FROM ubuntu:14.04

ARG NETVIZ_ZIP_PKG
RUN groupadd -r appd-netviz && useradd -r -g appd-netviz appd-netviz

RUN apt-get update && apt-get install -y \
 net-tools \
 tcpdump \
 curl \
 unzip \
 ssh-client \
 binutils \
 build-essential

WORKDIR /netviz-agent

copy NetViz agent contents
COPY $NETVIZ_ZIP_PKG .

run the agent install script and disable netlib
RUN unzip $NETVIZ_ZIP_PKG && ./install.sh \
 && sed -i -e "s|enable_netlib = 1|enable_netlib = 0|g" ./conf/agent_config.lua \
 && sed -i -e "s|WEBSERVICE_IP=.*|WEBSERVICE_IP=\"0.0.0.0\"|g" ./conf/agent_config.lua

RUN chown -R appd-netviz:appd-netviz /netviz-agent
RUN setcap cap_net_raw=eip /netviz-agent/bin/appd-netagent
USER appd-netviz

default command to run for the agent
CMD ./bin/appd-netagent -c ./conf -l ./logs -r ./run
```

2. Navigate to the directory where you saved the Dockerfile and build the Docker image by entering the following command:

```
$ docker build --build-arg NETVIZ_ZIP_PKG=/path/to/netviz-agent-pkg.zip -t appd-netviz .
```

3. Push the Docker image to your Docker Trusted Registry.

## Configure Network Visibility with Kubernetes

1. Create a `yaml` file with the following configuration:

```
apiVersion: apps/v1 # for versions before 1.9.0 use apps/v1beta2
```

```

kind: DaemonSet
metadata:
 name: appd-netviz-agent
spec:
 selector:
 matchLabels:
 name: appd-netviz-agent
 template:
 metadata:
 name: appd-netviz-agent
 labels:
 name: appd-netviz-agent
 spec:
 hostIPC: true
 hostNetwork: true
 containers:
 - name: appd-netviz-agent
 image: path/to/your/Docker/image # docker registry image
 resources:
 requests:
 memory: "250Mi"
 cpu: "0.5"
 limits:
 memory: "2Gi"
 cpu: "1"
 securityContext:
 capabilities:
 add: ["NET_RAW"]
 ports:
 - containerPort: 3892
 hostPort: 3892
 imagePullSecrets:
 - name: your-registry-key # add the registry key, kubectl create secret ...

```

2. In the configuration file, update the following fields:
  - `image` (under `containers`): the file path to the DaemonSet image in your Docker Trusted Registry.
  - `name` (under `imagePullSecrets`): the key for your Docker Trusted Registry.
3. Deploy the Network Agent in Kubernetes by entering the following command:

```
$ kubectl apply -f MyConfigFile.yaml
```

## Configure Network Visibility to Monitor Application Pods

After deploying Network Visibility in Kubernetes, you must deploy at least one pod with a Java Agent  $\geq 4.4$  to the same cluster as the Network Agent. This allows you to map network metrics to application flows.

1. Open the application's deployment configuration `yaml` file with Kubernetes in a text editor and set the `APPDYNAMICS_NETVIZ_AGENT_HOST` and `APPDYNAMICS_NETVIZ_AGENT_PORT` values:

```
- name: APPDYNAMICS_NETVIZ_AGENT_HOST
```

```
valueFrom:
 fieldRef:
 fieldPath: status.hostIP
- name: APPDYNAMICS_NETVIZ_AGENT_PORT
 value: 3892
```

**i** If you are using a version of the Java Agent that is  $\leq 4.5.2$ , you must open the `<app-agent-install-dir>/<version-number>/external-services/netviz/netviz-service.properties` file to set these values.

2. In the Controller UI, enable socket instrumentation to map network metrics to application flows. See [Set Up the Network and App Agents](#).

## Install the Network Agent on AIX

Install and run the Network Agent independently of the Machine Agent.

### **i** Important

- Network Agent on AIX does not support multi-tenant setup.
- Do not install the Network Agent on AIX as an extension of the Machine Agent.
- Ensure the administrator ( `appd-agent-administrator` ) has root privileges to install and run the agent.

1. Check System Requirements. See [Network Visibility Supported Environments](#).
2. Download and unzip the Agent installer:

### **i** Login User = Agent Administrator

- a. Log in to the Agent host as `< appd-agent-administrator >`.
- b. Access the [AppDynamics Downloads Portal](#), download the Network Agent installer, and unzip it.
- c. In a terminal window, `cd` to the folder where you downloaded the Network Agent ZIP package.
- d. Enter the following command, where `<network_agent_home>` is the folder where you want to install the agent software:

```
unzip <installer.zip> <network_agent_home>
```

The parent path should not include any directory names with spaces:

```
/opt/appdynamics/netviz (correct)
```

```
/opt/appdynamics/net viz (incorrect)
```

3. Run the following command to load the necessary libraries before starting the Network Agent.

### Command

```
export LIBPATH=/opt/freeware/lib/gcc/powerpc-ibm-aix7.2.0.0/10/pthread:<agent-install-path>/lib:$LIBPATH
```

**i** The agent install path should not include any directory names with spaces.

```
/opt/appdynamics/netviz (correct)
/opt/appdynamics/net viz (incorrect)
```

4. Run the following command to identify the interface name.

### Command

```
ifconfig -a
```

The interface name must be `en0` or `lo0`. You can change the interface name by editing the `ifname` value in the `agent_config.lua` file.

5. Start and verify the Agent:

### **i** Login User = Agent Administrator

- a. Log out, and then log in as `appd-agent-administrator`.
- b. Open a CLI window and enter these commands:
  - i. `<network-agent-home>/bin/start.sh` (starts the Agent)
  - ii. `<network-agent-home>/bin/appd-netviz.sh status` (verifies that the Agent is running and shows PID of the Agent process)

6. If you experience any problems or issues, see [FAQs for Network Visibility](#).

## Set Up Network Visibility on Windows

To set up Network Visibility on Windows, see:

1. [Network Visibility Supported Environments](#)
2. [Install the Network Agent on Windows](#)
3. [Install the App Agents on Windows](#)

**i** Network Visibility on Windows supports both Java and .NET applications.

4. [Administer the Network Agent on Windows](#)

## 5. Verify the Network Visibility Installation on Windows

### Install the Network Agent on Windows

The Network Visibility on Windows requires a supported version of the Network Agent to be installed on the server.

To monitor Java applications in your Controller, install the AppDynamics Java Agent on each server that hosts applications that you want to monitor.

You need a Network Visibility license to enable the Network Agent and its features.

No additional configuration is required on your AppDynamics Controller; Network Visibility is enabled by default.

### Agent Install Directory

Network Agent is packaged as a zip bundle. The Network Agent install directory `<network_agent_home>` is the directory where you install the Agent. You can unzip the bundle at any location which is your `<network_agent_home>` directory.

It contains these administrative files:

**i** Network Agent 23.3.0 might not contain some of these files. If you need these files, upgrade to Network Agent 23.5.0 or later.

- `install.bat` to install and start the Network Visibility Agent
- `start.bat` to start the Network Visibility Agent
- `status.bat` to check the status of the Network Visibility Agent
- `stop.bat` to stop the Network Visibility Agent
- `uninstall.bat` to uninstall the Network Visibility Agent

As part of the installation, `install.bat` installs the required VC redistributable on the system along with NPcap (if it does not already exist). If NPcap does exist on the system, then the installation of NPcap is skipped. To listen to the traffic on localhost, NPcap should be running in LoopBack mode. If NPcap is already installed on the system and not running in loopback mode, you must re-install it using loopback mode.

### Network Agent and Java Agent Installation Instructions

Depending on the Network Agent version and Java Agent version, you can install the Network Agent in a multi-tenant or single-tenant setup:

If you are using	Multi-tenant Setup	Single-tenant Setup
Network Agent $\geq$ 4.5.7, and Java Agent $\geq$ 4.5.11	<a href="#">Install</a>	<a href="#">Install</a>
Network Agent $\geq$ 4.5.7, and Java Agent $\leq$ 4.5.10	Not supported	<a href="#">Install</a>

## Install Network Agent on Windows using the ZIP Installer

These steps describe how to install and run the Network Agent for Windows using the ZIP installer.

1. Review the [Network Visibility Requirements and Supported Environments](#).
2. Download the Network Agent Windows ZIP package from the [AppDynamics Downloads Portal](#) and unzip the package.
  - a. Verify your `administrator` permissions on the host where you want to install the Network Agent.
  - b. Extract the contents to the Agent installation directory `<network_agent_home>`.
3. Double-click the `install.bat` file to install the Network Agent and start the AppDynamics Network Visibility Service.

**i** If you run the `install.bat` script without `administrator` privileges, a dialog displays this message: "Do you want to allow this app to make changes to your device?"  
Click **Yes** to continue with the installation.

4. To verify if the Network Agent is running, navigate to the folder that contains the `status.bat` file.
  - a. Double-click the `status.bat` file.
  - b. Locate the AppDynamics Network Visibility Service and verify its status in the **Status** column.  
Alternately, check if AppDynamics NetViz Service is listed in `services.msc`.

See [Administer the Network Agent on Windows](#).

## Uninstall Network Agent Using the ZIP

To uninstall the Network Agent:

1. Open a Windows command prompt and `cd` to the `<network-agent-home >` directory.
2. Uninstall the Network Agent by entering: `\<network-agent-home>\uninstall.bat`.

## Install Network Agent on Windows using the MSI Package

To install the Network Agent using the MSI package:

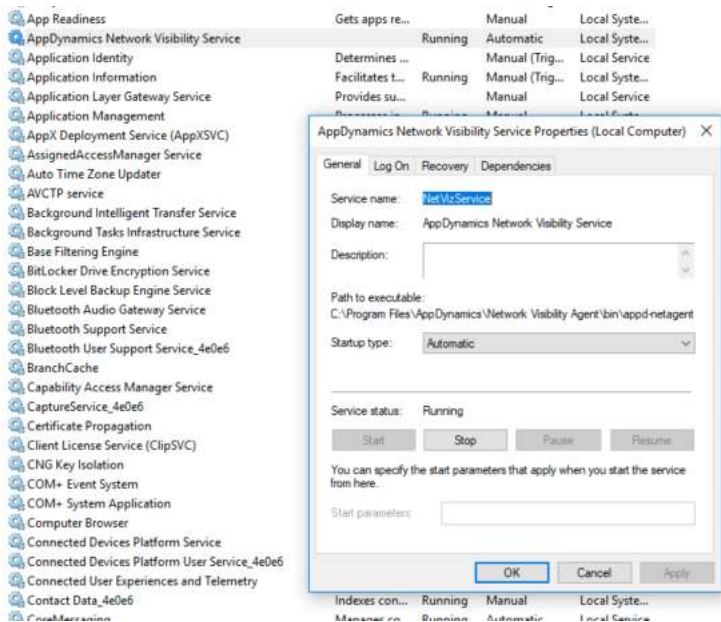

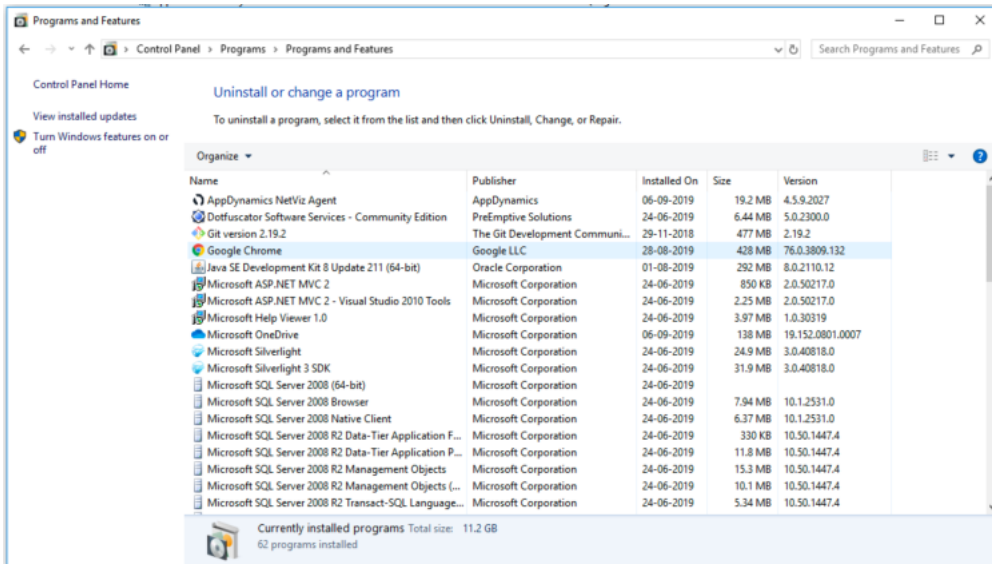

1. Review the [Network Visibility Requirements and Supported Environments](#).
2. Download the MSI installer package from the [AppDynamics Download Center](#).
3. Run the MSI installer package.
4. Read the End User License Agreement and accept the terms. Click **Next**.
5. If required, change the Network Agent installation directory on the **Destination Folder** panel.

**i** You can also change the destination of the logs directory later using the [AppDynamics Agent Configuration utility](#).

6. Click **Next**. The **Ready to install** page displays.
7. Click **Install**. The **User Account Control** panel displays and prompts you for permission to install.
8. From the **User Account Control** panel, click **Yes** to allow the installer to make changes to the device. Wait for the installation to complete.

**i** If you do not have administrator privileges, the installer prompts you to provide the password for an administrator account.

9. Click **Finish**.
10. Verify the installation by reviewing the Control Panel for AppDynamics NetViz Agent and `service.msc` for NetVizService.

## Uninstall Network Agent Using the MSI Package

To uninstall the Network Agent:

1. Open the Windows Control Panel and select **AppDynamics NetViz Agent**.
2. Click **Uninstall**.

3. From the **User Account Control** panel, click **Yes** to uninstall the Network Agent.

### Install the App Agent on Windows

Instrumenting an application adds the AppDynamics Application Agent, known as an App Agent, into the runtime process of the application. An App Server is a server application that is constantly running. You can deploy applications on the App Server.

### Install the Java App Agent on Windows

To monitor Java applications in the Controller, you need to install the AppDynamics Java Agent  $\geq 4.5.4$ , on each server that hosts applications that you want to monitor.

- To install using the Agent Download Wizard in the Controller, see [Java Agent](#).
- To install and configure the AppDynamics Java Agent into the application JVM, see [Install the Java Agent](#).

### Set Up the Java App Agent on Windows

If you want the Network Agent to monitor an App Node on the same host:

1. Enable Socket Instrumentation.
2. Restart the App (*IBM JVM only*).

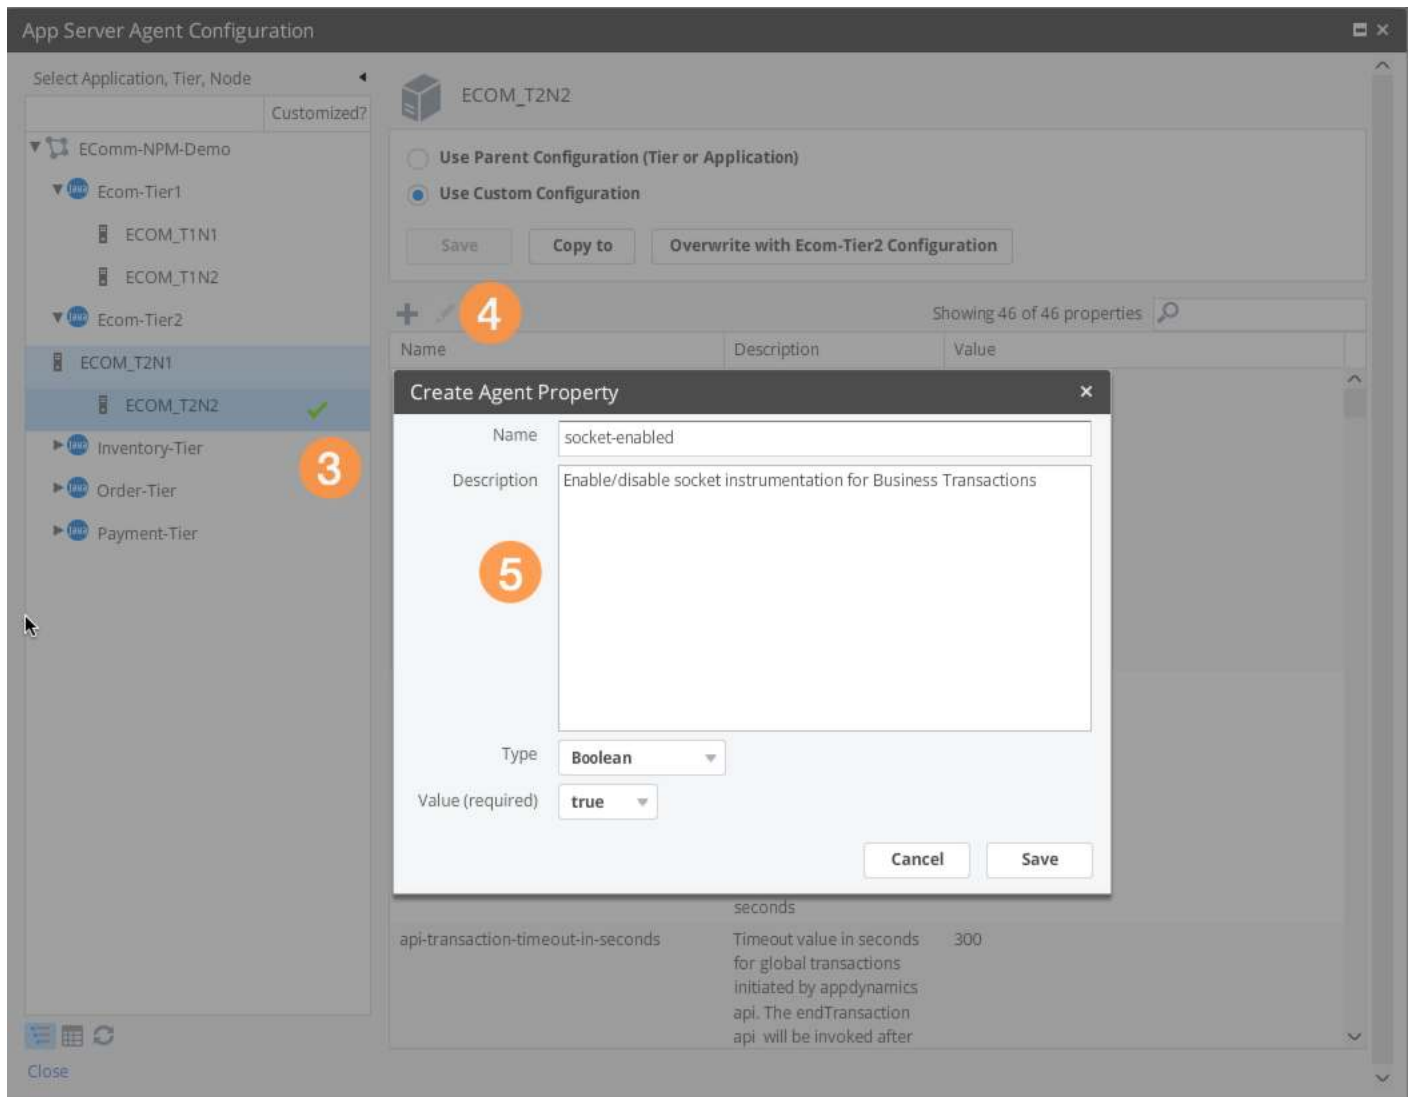

### Enable Socket Instrumentation

**i** If you are using Java Agent  $\geq 4.5.13$ , you need not manually enable the socket collection. It is enabled automatically. You can skip Step 1 and proceed with Step 2.

For the Agent to map network metrics to application flows, perform these steps:

1. In the Controller, click the gear icon () and select **AppDynamics Agents > App Server Agents**.
2. Select the Agent in the table and click **Configure**. The App Server Agent Configuration page appears.
3. Select the application, tier, and node in the tree-view (left).
4. Select Use Custom Configuration and then click **+**. The **Create Agent Property** dialog appears.
5. From the **Create Agent Property** dialog, specify:
  - a. Name = **socket-enabled**
  - b. Type = **Boolean**
  - c. Value = **true**

Restart the App (*IBM JVM only*).

If the monitored App is running in an IBM JVM, you must restart the App for the Network Agent to detect and monitor any persistent connections.

### Install and Set Up .NET App Agent on Windows

To monitor .NET applications with AppDynamics, you need to install the .NET Agent on the servers where the applications run.

You only need to install the Agent once per server (even if you want to monitor more than one application on the server).

- To install the .NET agent for IIS applications using the Getting Started wizard in the Controller, see [.NET Agent](#).
- To install and configure the AppDynamics .NET Agent using the MSI package, see [Install .NET Agent](#).

### Set Up the .NET App Agent on Windows

If you want the Network Agent to monitor an app node on the same host, [Enable Socket Instrumentation](#).

## Enable Socket Instrumentation

For the Agent to map network metrics to application flows, perform these steps:

1. In the Controller, click the gear icon (⚙️) and select **AppDynamics Agents > App Server Agents**.
2. Select the Agent in the table and click **Configure**. The App Server Agent Configuration page appears.
3. Select the application, tier, and node in the tree-view (left).
4. Select Use Custom Configuration and then click +. The **Create Agent Property** dialog appears.
5. In the **Create Agent Property** dialog, specify:
  - a. Name = **socket-enabled**
  - b. Type = **Boolean**
  - c. Value = **true**

The screenshot shows the 'App Server Agent Configuration' window for agent 'ECOM\_T2N2'. On the left, a tree view shows the hierarchy: EComm-NPM-Demo > Ecom-Tier2 > ECOM\_T2N2 (selected). A 'Create Agent Property' dialog is open in the foreground with the following details:

- Name:** socket-enabled
- Description:** Enable/disable socket instrumentation for Business Transactions
- Type:** Boolean
- Value (required):** true

Buttons for 'Cancel' and 'Save' are visible at the bottom of the dialog. In the background, a table of properties is partially visible, including 'api-transaction-timeout-in-seconds' with a value of 300.

## Administer the Network Agent on Windows

### Related pages:

- [Observe License Usage](#)

- [Java Supported Environments](#)

Depending on how you installed and deployed the Network Agent, there may be more than one method to administer the Network Agent. AppDynamics provides both GUI and command-line tool for common operations, such as starting and stopping Network Agents and their services. See [Managing Network Agents in the Controller](#).

This page describes how to administer the Network Agent using command-line tools for the Network Agent ZIP. You can manage the Network Agent using these commands:

- `install`
- `start`
- `status`
- `stop`
- `uninstall`

Ensure that you run all the scripts using administrator privilege. If you run the scripts without administrator privilege, the scripts prompt for the privilege request after a three second timeout. You can start these scripts from Windows Explorer or from the command line. If you run the scripts from the command line, the `install`, `start` and `stop` scripts have a `-quiet` option. The `-quiet` option runs the scripts without prompts, messages, or dialogs.

Operation	Command	Notes
Install Agent	<code>\&lt;network-agent-home&gt;\install.bat</code>	The <code>install.bat</code> installs the Network Visibility Agent and starts the AppDynamics Network Visibility Service.
Start Agent	<code>\&lt;network-agent-home&gt;\start.bat</code>	<p>If the Agent starts successfully, this message displays:</p> <pre>Starting the network agent service SERVICE_NAME: NetVizService TYPE : 10 WIN32_OWN_PROCESS STATE : 4 RUNNING (STOPPABLE, NOT_PAUSABLE, ACCEPTS_PRESHUTDOWN) WIN32_EXIT_CODE : 0 (0x0) SERVICE_EXIT_CODE : 0 (0x0) CHECKPOINT : 0x0 WAIT_HINT : 0x0 PID : 7556 FLAGS :</pre>

Operation	Command	Notes
Check Agent status	<code>\&lt;network-agent-home&gt;\status.bat</code>	<p>This command shows if the Agent is running or not.</p> <pre>SERVICE_NAME: NetVizService TYPE : 10 WIN32_OWN_PROCESS STATE : 4 RUNNING (STOPPABLE, NOT_PAUSABLE, ACCEPTS_PRESHUTDOWN) WIN32_EXIT_CODE : 0 (0x0) SERVICE_EXIT_CODE : 0 (0x0) CHECKPOINT : 0x0 WAIT_HINT : 0x0</pre>
Stop Agent	<code>\&lt;network-agent-home&gt;\stop.bat</code>	<p>If the Agent stops successfully, this message displays:</p> <pre>SERVICE_NAME: NetVizService TYPE : 10 WIN32_OWN_PROCESS STATE : 1 STOPPED WIN32_EXIT_CODE : 0 (0x0) SERVICE_EXIT_CODE : 0 (0x0) CHECKPOINT : 0x0 WAIT_HINT : 0x0</pre>
Uninstall Agent	<code>\&lt;network-agent-home&gt;\uninstall.bat</code>	<p>If the Agent uninstalls successfully, this message displays:</p> <pre>Stopping service NetVizService. NetVizService is stopped. Service AppDynamics NetViz Service uninstalled.</pre>

## Manage Network Agent on Windows

You can start or stop the Network Agent using `start.bat` or `stop.bat`. You require admin privileges to start or stop the Network Agent.

You can view the services that are currently running on the system using AppDynamics NetViz Service.

## Network Visibility Metrics

Network Visibility can collect these types of metrics:

- [KPI Metrics in Network Dashboard and Application Flow Map](#)
- Key Performance Indicator (KPI) metrics are essential measures of whether a network element is performing successfully. The Network Browser shows KPIs for tiers, nodes, network links, and the entire application
- [KPI Metrics in Right-Click Dashboards](#)  
You can right-click on a network element and perform network troubleshooting in the right-click dashboard. These dashboards make it easy to drill down to network elements and metrics that correlate with application-performance issues.

- [TCP Connection Metrics in Metric Browser](#)  
When you narrow down a network problem to a specific network location, you can configure Network Agents to collect advanced metrics for the relevant connections.
- [Node Metrics in Network Dashboard and Metric Browser](#)  
The Network Agent also collects node-level metrics for monitoring the TCP stack health, collisions, and errors on physical interfaces.

## KPI Metrics in Network Dashboard and Application Flow Map

Some network metrics are considered Key Performance Indicators (KPIs) because they are essential measures of whether the network or a specific part of the network, is performing successfully. Network Agents collect network KPIs for all monitored tiers, nodes, network links, and application flows. You can view KPI metrics for these elements:

### View Network KPIs

#### For the Entire Application

The **Network Dashboard** includes Throughput, TCP Loss, and PIE charts that measure network health for the entire application.

#### For a Network Link

- **Network Dashboard** – The flow map shows KPIs for each link. Click a link to view KPI time charts and KPIs per Connection.
- Right-click dashboard – Right-click a link in the Network Dashboard and select **View Metrics**. See [KPI Metrics in Right-Click Dashboards](#).

#### For a Tier

- **Network Flow Map** – Click a tier to view KPI time charts.
- Right-click dashboard – Right-click a tier in the Network Dashboard and select **View Metrics**. See [KPI Metrics in Right-Click Dashboards](#).

#### For a Node

- **Tiers & Nodes** page – Set the Show Data menu to **Network**. The table shows network KPIs and the Network Agent status for each node.
- **Node Dashboard** – Right-click the node and select **View Metrics**. See [KPI Metrics in Right-Click Dashboards](#).

#### For a Connection

- **Network Agents do not collect metrics for Connections by default. To collect metrics for the Connections used by a specific node, change the Monitoring Mode on the Agent. See [Dynamic Monitoring Mode and Network Visibility](#).**

**Connections Explorer** – Access the Network Dashboard and select **Connections**. The Explorer shows network KPIs for all network links. Drill down into a network link to view the Connections used on that link. If a Network Agent has collected metrics for a Connection, you can:

- View network KPIs in the Explorer table.
- Right-click and select **View Metrics**. See [KPI Metrics in Right-Click Dashboards](#).
- Right-click and select **View Metric Browser**. See [TCP Connection Metrics in Metric Browser](#).

## KPI Metric Descriptions

Metric	Description	Default Monitoring Mode
Throughput	<p>The average rate of Application X traffic sent and received over one Connection, or a set of Connections.</p> <p>Correlated spikes along with Response Time indicate bottlenecks.</p>	KPI
Latency	<p>The average TCP Latency (round-trip time) for a packet to go from one application tier the other, and back again. When TCP effects are not significant, Latency primarily measures <i>network</i> round trip times. Network latency is primarily a factor of the physical distance between two nodes and remains consistent over time.</p> <p>Correlated spikes along with Response Time indicate that TCP effects between two tiers (such as packet queueing and delayed acknowledgments) are affecting application performance.</p>	KPI
TCP Loss (mille)	<p>The average number of packets (per 1000) that were sent but never received. Packet loss can degrade application performance significantly. TCP detects and re-transmits lost packets; this ensures reliable transmission but introduces delays.</p> <ul style="list-style-type: none"> <li>• Correlated spikes with Response Time indicates that network congestion between the sender and receiver is affecting application performance.</li> <li>• Correlated spikes with Throughput indicates that a tier is sending more data than the receiving tier or the network can handle.</li> </ul>	KPI
Errors	<p>The number of TCP messages sent indicating an error in setting up the connection (<b>SYN errors</b>) or tearing down the connection (<b>FIN errors</b>) for a specific TCP session.</p>	KPI

Metric	Description	Default Monitoring Mode
PIE (Performance Impacting Events)	<p>The rate of PIE (Performance Impacting Events), which indicate performance issues on one node, both nodes, or the network between two nodes:</p> <ul style="list-style-type: none"> <li>• <a href="#">Client Limited</a> and <a href="#">Client Zero Window</a> events indicate that the Client node is receiving data at a higher rate than it can process.</li> <li>• <a href="#">TCP Retransmission Timeouts (RTO)</a> events indicate that the network is losing packets between the client and the server node. RTOs can cause severe performance degradations.</li> <li>• <a href="#">Server Limited</a> and <a href="#">Server Zero Window</a> events indicate that the Server node is receiving data at a higher rate than it can process.</li> </ul>	KPI

### KPI Metrics in Right-Click Dashboards

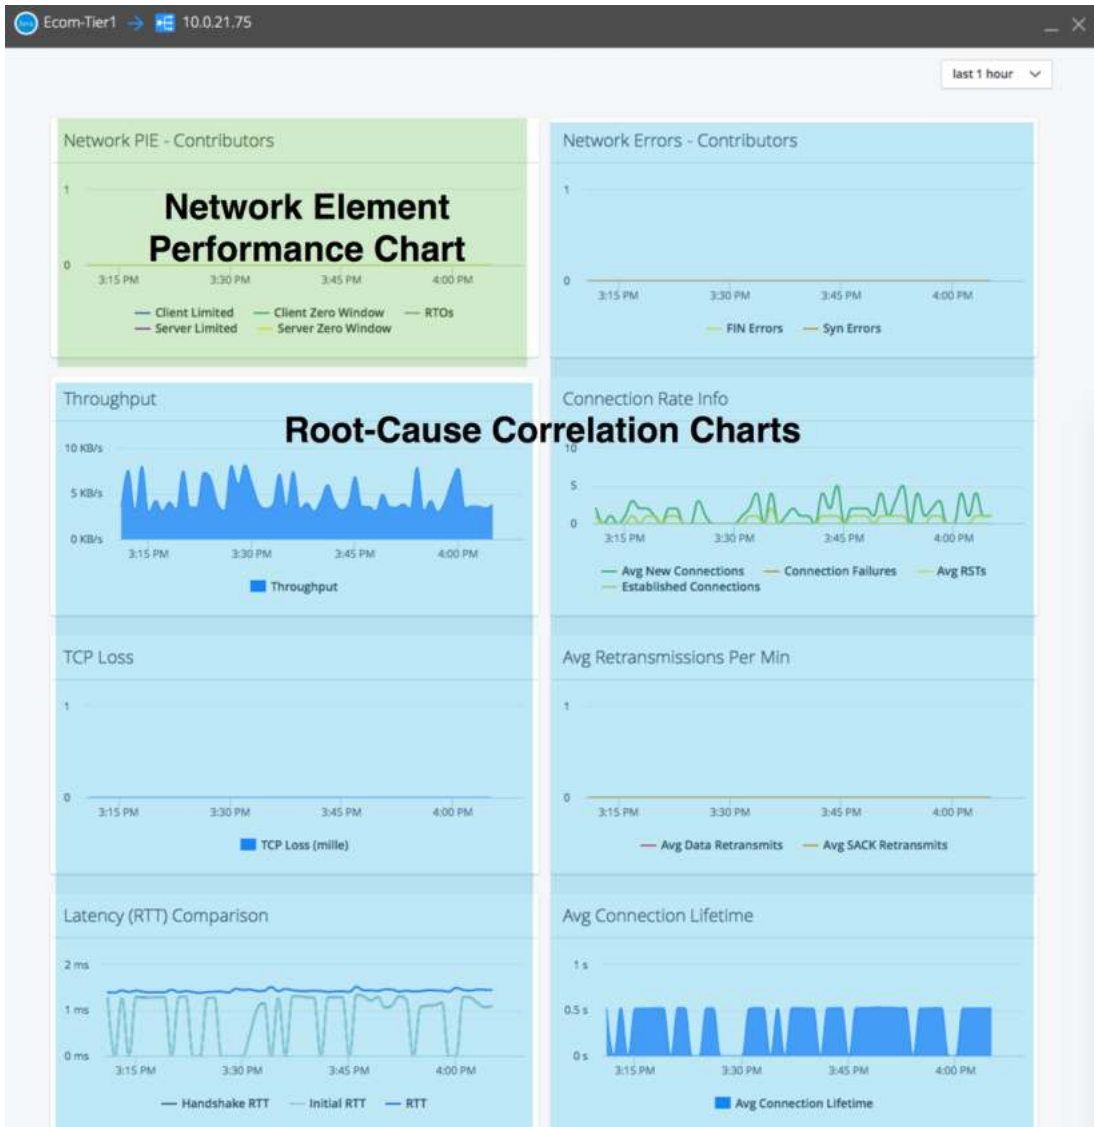

To diagnose a network element, right-click and select **View Metrics**. You can troubleshoot these network elements:

- Tier – The performance chart (top left) shows the rate or application performance outliers on the relevant nodes (Errors and Slow/Very Slow/Stalled Calls) and the Key Performance Indicators for all connections used by those nodes (Errors and PIE).
- Network Link – The performance chart (top left) shows the rate of Performance Impacting Events for all member connections of that link.
- Network Connection – You can troubleshoot a connection from the Connection Explorer or from the Connections tab in a link popup.
- You can troubleshoot a transaction from a Transaction Snapshot.
  - You can right-click an application flow and select **View Network Metrics**.
  - You can also drill down to a node where a transaction delay/stall/error occurred and access the Network tab.

To troubleshoot a tier, link, or connection in the Network Dashboard, right-click the network element and select **View Metrics**. The top-left chart in the dashboard shows the overall network or network/application performance of the element. To troubleshoot the element, search for correlations between the performance chart (top left) and the other charts on the page.

**i Tip**

To best highlight metric spikes and variations, you can switch between the linear and logarithmic scale in each chart. Click the **settings** button (top-right corner of the chart) to switch between scales.

## Right-Click Chart Descriptions

Chart	Description	Default Monitoring Mode
Network Impact on Transactions (Tiers)	<p>This chart highlights the possible impact of <a href="#">Performance Impacting Events</a> on the app-transaction outliers (Transaction Errors and Slow, Very Slow, and Stalled Calls shown in the <a href="#">Transaction Scorecard</a>).</p> <p>If you see spikes in transaction outliers and correlated spikes in PIE or errors, this indicates that the network is affecting application performance. Search for correlated spikes in the other charts to identify specific issues and root causes: connection errors, packet loss, re-transmissions, high-latency connections, and so on.</p>	KPI
Host Stack KPIs	<p>Interface errors indicate issues on the node's physical interfaces. See <a href="#">Node Metrics in Network Dashboard and Metric Browser</a>.</p> <p><a href="#">TCP Wait sockets</a> can result in significant delays or errors for the application, or service, that relies on that socket. Many simultaneous WAIT sockets can prevent applications and services from creating new connections.</p>	KPI
Network PIE - Contributors	<p>Use Performance Impacting Elements (PIE) to identify the location of actual or potential bottlenecks:</p> <ul style="list-style-type: none"> <li>• <a href="#">Client Limited</a> and <a href="#">Client Zero Window</a> events indicate a possible problem on the client node</li> <li>• <a href="#">RTOs</a> indicate a possible problem on the network path between two nodes</li> <li>• <a href="#">Server Limited</a> and <a href="#">Server Zero Window</a> events indicate a possible problem on the server node</li> </ul>	KPI
Network Errors - Contributors	<p>Use this chart to identify network errors that can affect application performance:</p> <ul style="list-style-type: none"> <li>• <a href="#">FIN Errors</a> – Errors when tearing down a TCP connection</li> <li>• <a href="#">Syn Blackholes</a> - Connection attempts that went unanswered and resulted in a failure</li> <li>• <a href="#">Syn Resets</a> – Connection attempts that were explicitly refused by the other host</li> <li>• <a href="#">RST on Established</a> - TCP connection resets</li> </ul>	KPI

Chart	Description	Default Monitoring Mode
Throughput	Traffic throughput for the application of interest on the network element. This chart measures application payload data only; TCP, IP, and other packet headers are excluded.	KPI
Connection Rate Info	<p>Spikes in this chart, that coincide with spikes in slows calls or applications errors, indicate a possible issue with how the application is using TCP.</p> <ul style="list-style-type: none"> <li>• New Connections – Number of new connection attempts</li> <li>• Connection Errors – The rate of TCP connection setup (SYN) errors and connection teardown (FIN) errors</li> <li>• RSTs (resets) – A TCP reset is an immediate closing of a connection. Not all connection resets indicate a problem, but you should investigate any spike in resets that coincides with a spike in application errors or slow transactions/calls. Connection resets can occur for various reasons, such as: <ul style="list-style-type: none"> <li>◦ Inability to create connections by the server</li> <li>◦ Intermediate network elements, such as load balancers, firewalls, and so on, due to misconfiguration or other errors</li> </ul> </li> <li>• Current Established Connections</li> </ul>	KPI
TCP Loss (mille)	The number of packets lost (sent but not received) per 1000 packets sent. "Per mille" is a percentage with one additional digit of precision. TCP detects lost packets and retransmits each lost packet until it receives an ACK (acknowledgment) from the peer. Spikes in TCP Loss indicate that the network is over utilized.	KPI
Retransmissions per Minute	<ul style="list-style-type: none"> <li>• Data Retransmits – The percentage of packets that were retransmitted. This metric includes SYN and FIN retransmissions</li> <li>• SACK Retransmits – The percentage of data packets that were retransmitted due to selective acknowledgments (SACK, a TCP Feature)</li> </ul>	KPI

Chart	Description	Default Monitoring Mode
Latency (RTT) Comparison	<p>This chart compares the average TCP round-trip times (RTTs) for different types of packet request and responses.</p> <ul style="list-style-type: none"> <li>• Handshake RTT – Average RTT for the initial 3-way handshake (SYN, SYN/ACK, ACK) to set up a connection. If Handshake RTTs are significantly higher than Initial RTTs, this indicates that the client node is taking a long time to set up the connection.</li> <li>• Initial RTT – Average RTT for the initial SYN packets (between SYN and SYN-ACK or SYN-ACK and ACK). If Initial RTTs are high, the delay may be due to an intervening firewall, asymmetric routing, or other network issues that causes the network to treat SYN packets differently from data packets.</li> <li>• RTT – Average TCP RTT for data request/responses— Time for TCP Data segments to be transmitted and acknowledged from the peer. This is different from Application Response Time metrics that measure the time an application takes to process a request.</li> </ul>	KPI
Connection Lifetime	<p>TCP is most efficient when using long, stable connections. Connection setups and teardowns are very time-consuming and resource-intensive. The more short-term connections are generated, the worse TCP performance will be because most of the time is spent creating connections and because "Slow-Start" in TCP optimal TCP bandwidth is not achieved.</p>	KPI

### Node Metrics in Network Dashboard and Metric Browser

The Network Agent collects various TCP socket metrics at the host level for the local node on which it is installed. Use these metrics to monitor the TCP stack health, collisions, and errors on all the physical interfaces, and CPU consumption of the Network Agent.

### TCP Socket Metrics in the Network Dashboard

These metrics measure the overall TCP socket health of an individual node. To view these metrics, select a node: access the Network Dashboard, click a tier, select the Nodes tab, and select the node of interest. The TCP Socket metrics for the selected node appear on the right side of the dashboard.

Metric	Description	Default Monitoring Mode
<b>Established</b>	The number of sockets that are in the established state	KPI
<b>Embryonic</b>	The number of sockets that are in the process of being set up	KPI
<b>Wait</b>	<p>The number of sockets that are unavailable for new connections because they are in the process of being closed. When a socket sends a Connection Close (FIN) message, the socket goes through three states:</p> <ol style="list-style-type: none"> <li>1. FIN_WAIT1 – Socket has sent the FIN and is waiting for an ACK from the remote socket</li> <li>2. FIN_WAIT2 – Socket receives ACK, and waits for FIN (final connection close) from the remote socket</li> <li>3. TIME_WAIT – The socket remains open to handle any packets for the TCP connection that might still be in the network. The TIME_WAIT state can last from one to four minutes, depending on the implementation.</li> </ol> <p>A WAIT socket can result in significant delays or errors for the application, or service, that relies on that socket. Many simultaneous WAIT sockets can prevent applications and services from creating new connections.</p>	KPI
<b>Time Wait</b>	The FIN_WAIT states are relatively short (in milliseconds), while the TIME_WAIT state is relatively long (one to four minutes). As a result, the Wait and Time Wait metrics should be fairly similar. Significant differences indicate a significant network or other delays between the selected node and another host.	KPI

### Interface Metrics in the Metric Browser

These metrics measure the number of collisions and errors on the physical interfaces of the node. To view these metrics, drill down in the Metric Browser by selecting:

Application Infrastructure Performance > <tier-name> > Individual Nodes > <node-name> > Host > Interface

Metric Name	Description / Notes	Monitoring Mode
# Collisions	Number of collision errors seen on all the interfaces, when an interface was blocked from sending a frame due to an Ethernet collision detection	KPI
# Receive Drops	Number of packets dropped while receiving by all interfaces on the host	KPI
# Receive Errors	Number of collision errors seen on all the interfaces, when an interface could not receive a frame due to a physical problem on the interface or the connected cable	KPI
# Transmit Drops	Number of packets dropped while transmitting by all interfaces on the host	KPI
# Transmit Errors	Number of collision errors seen on all the interfaces, when an interface could not send a frame due to a physical problem on the interface or the connected cable	KPI
# Total Errors	The total number of Ethernet or physical errors detected on the interface	KPI

### TCP Connection Metrics in Metric Browser

Network Visibility Agents can calculate an extensive set of metrics based on the TCP flows observed by the Network Agents. In addition to KPI, PIE, and Troubleshooting metrics, you can view advanced metrics for network elements of interest (tiers, nodes, links, and connections) in the Metric Browser. Using time-based charts, you can detect and analyze these behavior traits:

- TCP flow setup/teardown times and errors
- Distribution of TCP flows for an element by throughput, setup time, lifetime, and round-trip time
- Flows closed by TCP resets
- Distribution of flows based on TCP configuration options (Selective Acknowledgement, Timestamp)

- For these metrics, the Metric Browser uses the terms *Connection* and *Flow* interchangeably. See [Flows, Links, and Connections](#).
- Network Agents do not collect metrics for individual Connections by default. The recommended workflow is to enable TCP Flow metric collection only when you need to diagnose a performance issue on an associated node or Connection. See [Dynamic Monitoring Mode and Network Visibility](#).

## Viewing TCP Flow Metrics

To view advanced network metrics, open the Metric Browser and navigate to Application Infrastructure Performance. The Metric Browser shows connection/flow metrics for the following aggregations (highlighted in red):

- Application Infrastructure Performance >
  - Advanced Network >
    - Flows >
      - **All Connections/Flows for Application**
  - tier-name
    - Advanced Network >
      - Flows >
        - Call from <tier> to <service>
          - Call from <node> to <node-or-service>
            - **Individual Connection/Flow (<node> to <service>)**
            - **All Connections/Flows for Network Link (<tier> to <service>)**
          - **All Connections/Flows for tier**

## TCP Flow Metric Descriptions

Metric Name	Description and Notes	Default Monitoring Mode
# Client Limited	The number of TCP window updates sent by a client node indicating that it is receiving data at a faster rate than the application can process	KPI
# Client Zero Window	<p>If a client's TCP buffer is full, it sends Zero as the TCP receive window size to indicate that it cannot receive more data. The data transfer then stops until the client can process the data in its buffer.</p> <p>A high rate of Client TCP Zero Window messages indicates a problem with either:</p> <ul style="list-style-type: none"> <li>• The TCP configuration on the node, or</li> <li>• The client-side application using that flow</li> </ul>	KPI
# Connection Errors	The sum of <b>Syn Resets + Syn Blackholes + TCP Resets - Established</b>	KPI
# Connection Requests	The total number of connection requests (successful and unsuccessful) sent during the selected time window	KPI
# Current Established Connections	The number of established (setup) flows/connections	KPI

Metric Name	Description and Notes	Default Monitoring Mode
# Data Retransmits	Number of TCP data packets that were retransmitted for all TCP Connections	KPI
# Delayed Acks (Data Piggy Back)	The average number of times a receiving node sent an ACK (acknowledgment) by "piggybacking" the ACK onto another message	Advanced
# Delayed Acks (Timeouts)	<p>The average number of times a receiving node sent an ACK (acknowledgment) because the Delayed ACK timer expired</p> <p>This is a "worst-case" delay for the Delayed ACK algorithm and occurs most often when Nagle's algorithm and Delayed ACK are enabled on the sending and receiving node, respectively. A high rate of delayed ACKs may contribute significantly to the average <a href="#">Latency</a> on a Connection.</p>	Advanced
# Errors	The number of TCP messages sent indicating an error in setting up the connection (SYN errors), or tearing down the connection (FIN errors)	KPI
# Fin Errors	The number of errors generated while tearing down the connections (TCP FIN errors). Many connections in FIN wait states can cause delays in creating new connections.	KPI
# Flows (<1KB) # Flows (1k - 10k) # Flows (10k - 100k) # Flows (100k-1MB) # Flows (1MB - 10MB) # Flows (>10MB)	Use these metrics to analyze the distribution of flows by throughput	Advanced

Metric Name	Description and Notes	Default Monitoring Mode
<p># Flows - Handshake (1SD) # Flows - Handshake (2SD) # Flows - Handshake (3SD)</p>	<p>The number of TCP flows with connection-setup times that are 1, 2, or 3 Standard Deviations outside (higher or lower than) the average for that connection group</p> <p>Under ideal conditions, all flows should be within 1SD of the average</p>	<p>Advanced</p>
<p># Flows - Lifetime (1SD) # Flows - Lifetime (2SD) # Flows - Lifetime (3SD)</p>	<p>The number of TCP flows with lifetimes that are 1, 2, or 3 Standard Deviations outside (higher or lower than) the average.</p> <p>Under ideal conditions, all flows should be within 1SD of the average. 2SD or 3SD flows indicate inconsistent flow treatment along the network path. These inconsistencies can occur when a network service decreases the available bandwidth intentionally (<i>bandwidth throttling</i>) or prioritizes some types of traffic over others (<i>traffic shaping</i>).</p> <p>Short-lived connections, even if they are intermittent, may indicate an issue worth investigating. The more short-lived connections get generated, the more resources are spent setting up and tearing down these connections.</p>	<p>Advanced</p>
<p># Flows - RTT (1SD) # Flows - RTT (2SD) # Flows - RTT (3SD)</p>	<p>Number of flows whose Round Trip Times are 1, 2, or 3 Standard Deviations higher than the average for all flows in the parent group. Under ideal conditions, all flows should be within 1SD of the average.</p> <p>High-RTT connections, even if they are intermittent, may indicate an issue worth investigating. If the average response time for an eCommerce web app is two seconds (acceptable), but 5% of transactions are 20 seconds or higher (not acceptable), this can result in a significant number of unhappy customers and lost revenue.</p>	<p>Advanced</p>
<p># Flows - TCP Data Rxmt</p>	<p>Number of flows within which any packet was retransmitted. Retransmissions are an indication of packet loss.</p>	<p>Advanced</p>

Metric Name	Description and Notes	Default Monitoring Mode
# Flows - TCP Resets	The average number of flows that were closed by a TCP Reset	KPI
# Flows - w/o TCP SACK	Number of flows with the TCP Selective Acknowledgment (SACK) option disabled. With SACK enabled, a receiver can send SACK packets to acknowledge receipt of multiple data packets in the case of lost segments. This improves network performance by reducing the number of retransmissions. With SACK disabled, the receiver must resend all the packets after the last lost segment, even if they were received by the peer.	Advanced
# Flows - w/o TCP Timestamp	Number of flows with the TCP Timestamp option disabled. Use this option to calculate more accurate Round Trip Times.	Advanced
# IP Fragment Count	The total number of IP fragments attributes to this TCP connection group. A high level of fragmentation indicates network issues which can severely affect application performance.	KPI
# Loss Pkts	The total number of packets that were lost (sent but never received)	Advanced
# Nagle Delays	The number of times a message-send event was delayed because the sending node had to wait for previously-sent data to be acknowledged (ACK'd). This occurs most often when Nagle's algorithm and Delayed ACK are enabled on the sending and receiving node, respectively.	Advanced
# PIE Events	<p>Use Performance Impacting Elements (PIE) to identify the location of actual or potential bottlenecks:</p> <ul style="list-style-type: none"> <li>• <a href="#">Client Limited</a> and <a href="#">Client Zero Window</a> events indicate a possible problem on the client node</li> <li>• <a href="#">RTOs</a> indicate a possible problem on the network path between two nodes</li> <li>• <a href="#">Server Limited</a> and <a href="#">Server Zero Window</a> events indicate a possible problem on the server node</li> </ul>	KPI

Metric Name	Description and Notes	Default Monitoring Mode
# RetransmissionTimeouts	<p>Retransmission Timeouts (RTOs) indicate network packet loss which results in retransmission of data when the TCP retransmission timer expires (Timer to make sure data is ACK'ed)</p> <ul style="list-style-type: none"> <li>• This timer varies from 200ms-3 sec by default (different for each operating systems and their versions)</li> <li>• It causes severe performance degradations because a considerable amount of time is wasted resending lost data</li> <li>• TCP falls back to the "Slow Start" phase impacting the performance even more</li> </ul>	KPI
# SACK Retransmits	Average number of packets that were retransmitted due to a SACK message that indicated an unreceived packet	KPI
# Server Limited	The number of TCP window updates sent by a server node indicating that it is receiving data at a faster rate than the application can process	KPI
# Server Zero Window	<p>If a server's TCP buffer is full, it sends Zero as the TCP receive window size to indicate that it cannot receive more data. The data transfer then stops until the server can process the data in its buffer.</p> <p>A high rate of Server TCP Zero Window messages indicates a problem with either:</p> <ul style="list-style-type: none"> <li>• The TCP configuration on the node, or</li> <li>• The client-side application using that flow</li> </ul>	KPI
# Syn Blackholes	The number of connection attempts that went unanswered and resulted in a failure. Syn blackholes can severely impact application performance.	KPI
# Syn Resets	The number of connection attempts that were explicitly refused by the other host. Syn resets can severely impact application performance.	KPI
# TCP Resets - Established	The average number of times an established TCP flow was reset	KPI

Metric Name	Description and Notes	Default Monitoring Mode
# TCP Resets - Fin	The average number of times a TCP flow was reset while it was in the process of getting closed	KPI
# TTL Changes (1 - 2 hops) # TTL Changes (3 - 4 hops) # TTL Changes (>=5 hops)	The number of routing-hop changes experienced by this connection. Frequent variations in routing-hop changes indicate routing problems in the network and can severely affect app performance.  Under ideal conditions, the number of hops should be consistent.	Advanced
Avg # TTL Hops	The average number of routing-hop changes experienced by this connection	Advanced
Delayed Acks Lag (usec)	The average amount of lag that Delayed ACKs are adding to the overall Latency of the Connection	Advanced
Initial RTT (usec)	Round trip time for the initial two SYN packets (between SYN and SYN-ACK, or SYN-ACK and ACK depending upon whether the Agent is running on client or server)	KPI
Latency - RTT (usec)	Average round-trip latency (from packet transmission to acknowledgment) for all packets	KPI
Lifetime (usec)	Average lifetime (from initial setup to final teardown) for TCP sessions in the Connection group	KPI
Loss (per mille)	The number of packets lost per 1000 packets sent. "Per mille" is a percentage with one additional digit of precision.	KPI
Nagle Delays Lag (usec)	The average amount of lag that Nagle delays are adding to the overall <a href="#">Latency</a> of the Connection	Advanced
Pkts per Sec	Average rate of packets sent and received	KPI
Rx Pkts per Sec	Average rate of packets received	Advanced

Metric Name	Description and Notes	Default Monitoring Mode
Rx Throughput (BPS)	Average rate of bytes received	Advanced
TCP Handshake (usec)	Round trip time for the initial three-way connection setup for all flows in the parent group: <ol style="list-style-type: none"> <li>1. SYN (client --&gt; server)</li> <li>2. SYN-ACK (client &lt;-- server)</li> <li>3. ACK (client --&gt; server)</li> </ol>	KPI
Throughput (BPS)	Throughput (bytes per second) for the application of interest on all TCP sessions	KPI
Tx Pkts per Sec	Rate of packets sent	Advanced
Tx Throughput (BPS)	Rate of traffic received	Advanced

## FAQs for Network Visibility

### General

- Why are there no connection metrics for a tier, node, or network link?

By default, Network Agents do not collect connection metrics. The recommended workflow is to identify the link with the network issue and configure the relevant agents to collect metrics for the relevant connections. See [Dynamic Monitoring Mode and Network Visibility](#).

- The Network Agent cannot register with the Controller. What should I do?

If a Network Agent cannot register with the Controller:

- Check that the user account has a Network Visibility product license.
- If the user account has license rules defined, verify that the correct number of license units have been allocated.
- To change the number of allocated units in a rule:
  - Go to **Controller Settings > License > Rules**.
  - Edit the **License Rule** of interest. (There may be only one License Rule, named **Default**.)
  - In **General**, set the **Allocated Units** field for the Network Visibility license and apply the change.
- In some cases, I see that an application flow for a JMS queue goes in one direction but a TCP connection used by that queue goes in the opposite direction. Why is that?

Typically, the network links and TCP connections used by an application flow have the same direction (source → destination) as the flow itself. You may notice different directions, however, if two tiers transfer data through a JMS queue. In some JMS implementations, the individual nodes in each tier initiate the TCP connection to the queue, so the direction is always: node (source) → queue (destination).

Some of these connections may be used by an application flow in the opposite direction: queue (source) → tier (destination).

- How do I change the Network Agent communications port?

When you start the Network Agent, the `appd_netmon` process spawns the `appd-agent` process. By default, these two processes communicate over TCP port 3892. If this port is already in use, you should see a log message in one or both files. To configure the Network Agent to use a different port:

1. Use the `netstat` command to verify that the new port is not in use.
2. Update the Network Agent:
  - a. Use a text editor to open this file: `<network_agent_home>/conf/agent_config.lua`.
  - b. Set the `port` option to the new TCP port number (under `webserver_config`).

```
webserver_config = {
 port = <new-port-number>,
 request_timeout = 10000,
 threads = 2,
}
```

- c. Save the file and restart the Network Agent.
3. Update the App Agent:
    - a. Use a text editor to open this file: `<app_agent_home>/<version-number>/external-services/netviz/netviz-service.properties`.
    - b. Set the `netviz.agent.api.service.port` option to the new TCP port number.
    - c. Save the file and restart the App Agent.

- The application I want to monitor uses TCP port 32768 or higher. How do I configure the Network Agent to monitor this port?

1. Use a text editor to open this file: `<network_agent_home>/conf/agent_config.lua`
2. If you plan to monitor any application or service that uses any TCP ports higher than 32767, uncomment the `application_service_ports` block and specify these ports as a comma-separated list in the `ports` option:  
Original:

```
--[[
application_service_ports = {
ports = "",
}
--]]
```

Edited:

```
application_service_ports = {
ports = "40000, 41000",
}
```

- How can I replace the `AppDynamicsNetMQ.dll` with another version of NetMQ?

1. Download the `NetMQ.dll` version and its dependencies.
2. ILMerge them into one `dll` file named `AppDynamicsNetMQ.dll`.
3. Include the `AppDynamicsNETMQ.dll` file in the .NET Agent home directory, such as `c:\Program Files\AppDynamics\AppDynamics .NET Agent`.
4. Restart the monitored application.

- Why does running the Dynamic Service increase the DNS resolution time of the application?

If you specify `FQDN/hostname` as a value to define the Network Visibility property `netviz.agent.host.address` in the `netviz-service.properties` file, the Dynamic Service resolves the FQDN/hostname to its respective IP address frequently, resulting in increased resolution time.

To resolve this problem, use IP Address as a value to define the Network Visibility property `netviz.agent.host.address`. Alternately, you can also increase the value of `networkaddress.cache.ttl` depending on your application requirements.

- Are there any additional fully qualified domain name (FQDN) configurations for the `agent_config.lua` file?

```
ip_config = {
expire_interval = 20,
retry_count = 5,
}
```

**Refresh Timeout:** `expire_interval` defines when an IP in the .NET Agent IP cache needs to be re-resolved for FQDN or flushed if not associated to any flowgroup. The expire interval ranges from 1 to 30 mins (maximum).

**Retry Count:** `retry_count` defines how many times an IP tried to resolve for FQDN. Every resolution happens after `expire_interval` time. you can update the default value in situations where the DNS record for the IP is created and there is a lot of churn in the IP to FQDN mappings.

## Logs

- How do I resolve the error, "ERROR MsgZmq::Bind: zmq\_bind failed: File name too long"?

This error occurs when the file name is too long. The complete path to the file is included in the file name.

To resolve this error, move the Network Agent to a smaller absolute path.

1. Create a soft (symbolic) link for the longer directory name: `$ ln -s /long/dir/name /short/dir/name`.
2. Go to the short directory: `$ cd /short/dir/name`.

3. Run the install.sh script: `$ sudo ./install.sh`.
4. Change the LD\_PRELOAD parameter in application to use the library from the short directory name: `$ LD_PRELOAD=/short/dir/name/lib/appd-netlib.so <command to start app>`.
  - Why do I see the error, "ERROR cw\_flowgroup\_uri\_cb: Failed to write data on connection"?

This error occurs when the Network Agent supports a large number of AppServer Agents. If this error occurs frequently, restart the Agent using an increased number of thread counts in `webserver_config` in `agent_config.lua` config file.

- Why do I see the error, "ERROR ip\_flowgrp\_lookup: flowgrp alloc failed"?

Connections ( Source IP : Source Port : Destination IP : Destination Port ) in Network Agent are represented as flows. Aggregating these connections on a source port provides flow group, represented as ( Source IP : Destination IP : Destination Port ). The Network Agent can monitor only a certain number of flow groups. This error occurs when the maximum number of flow groups is reached and the Network Agent cannot monitor any new incoming flow groups.

- Why do I see the error, "DEBUG adns\_resolve: ip resolve error: Name or service not known"?

AppDynamics resolves IP addresses to provide fully qualified domain name (FQDN) information to the Controller for the IP addresses visible in the system. This error occurs when some IP addresses cannot be resolved.

## Network Visibility Concepts

The these concepts are central to Network Visibility:

- Network Visibility can identify two types of [performance bottlenecks](#):
  - Network-performance bottlenecks
  - App/Network-interaction bottlenecks (for example, how an application tier or node uses network resources)
- The [Network Dashboard](#) shows the network-level view of a monitored application. You can quickly identify network elements with performance issues (red/yellow links or tiers), view Key Performance Indicators for each network element, and troubleshoot individual elements (right-click an element and select **View Metrics**).
- Network Agents can detect [load balancers and TCP endpoints](#), which appear in network flow maps (but not application flow maps), and sometimes function as traffic sources and destinations.
- Network Visibility can collect metrics for individual [application flows, TCP connections, and network links](#).
- To support in-depth troubleshooting, you can [configure Network Agents to collect detailed diagnostic metrics](#) for nodes and connections with performance issues.

## Identifying Performance Bottlenecks

### Performance Bottleneck Categories

Network Visibility can pinpoint performance bottlenecks down to a specific tier, node, or network path. Either of these bottlenecks can slow down an application significantly:

- Application/Network bottlenecks
 

Many bottlenecks identified as "network issues" actually have their root cause defined by how an application or a server uses network resources. Network Visibility can detect [many different types of app/network bottlenecks](#), as well as bottlenecks due to [TCP socket issues on a specific node](#).
- Network bottlenecks
 

A network bottleneck indicates that a specific section of the network cannot process the application loads between the source and destination nodes. Symptoms of a network bottleneck include a [high rate of packet loss](#) or [high round-trip times \(RTTs\)](#) between two nodes.

### Load Balancers and TCP Endpoints

You may notice objects in a Network Flow Map that do not show up in an Application Flow Map. This is because these Network Flow Map objects represent devices that are detected by the Network Agents, and are relevant to the monitored application, but the detected devices do not have Network Agents installed.

### Load Balancers

Network Visibility detects load balancers (LB) automatically, and displays them in Network Flow Maps. Load balancers seek to optimize the distribution of network traffic and often hide internal IP addresses from external nodes. Application Flow Maps do not show load balancers because these devices do not function as application nodes.

An intermediate load balancer splits an application message into two separate connections: node A connection to a load balancer, and the load balancer connection to node B (node A -> LB, and LB -> node B). This additional layer of detail in the Network Browser makes it easier to identify network segments that have specific performance issues.

### TCP Endpoints

The Controller uses TCP endpoints to represent flows where the monitoring vantage point is from one end. The Network Agent monitors the connection between a monitored node and a TCP endpoint. However, the Network Agent cannot determine if this endpoint is on another node, or on an intermediate device (such as a load balancer) that splits the connection in two.

These diagrams show two different views of the same application:

The **Application Dashboard** shows two tiers connecting to two MySQL instances. The Application Flow Map shows application messages between monitored nodes that are directly visible to App Agents.

The **Network Dashboard** shows TCP endpoints on links between tiers and nodes. The Network Flow Map shows Network Agents installed (left) and nodes that the Network Agents cannot see directly (right).

This example shows how a Network Agent monitors a connection between an Inventory-Tier node (left), and an Inventory Database service. A TCP endpoint divides the link into:

- 1 A colored line representing the connection visible to the Network agent, and
- 2 A gray line representing a connection that is not instrumented by Network Visibility. A gray line connection link without Network Visibility indicates one of two things:
  - The TCP endpoint and an Inventory Database service are *on the same device* with an intermediate device that splits the connection in two.
  - The TCP endpoint and an Inventory Database service are *on two devices* using a separate connection that does not allow for network visibility.

For these reasons, gray line connection links do not have associated metrics.

## Flows, Links, and Connections

Network Visibility can collect metrics for these object types:

- Network links between tiers, or between tiers and load balancers/TCP endpoints
- Connections between nodes, or between nodes and load balancers/TCP endpoints

Troubleshooting a performance issue in Network Visibility often involves drilling down from an application issue (flow) to a network issue (link) to the root cause (connection). See [Workflows and Example Use Cases](#).

## Application Flows

App Agents collect metrics for *application flows* between tiers, as shown in the Application Flow Map. This diagram shows the calls, transactions, and messages for application *x* between tier 1 and tier 2.

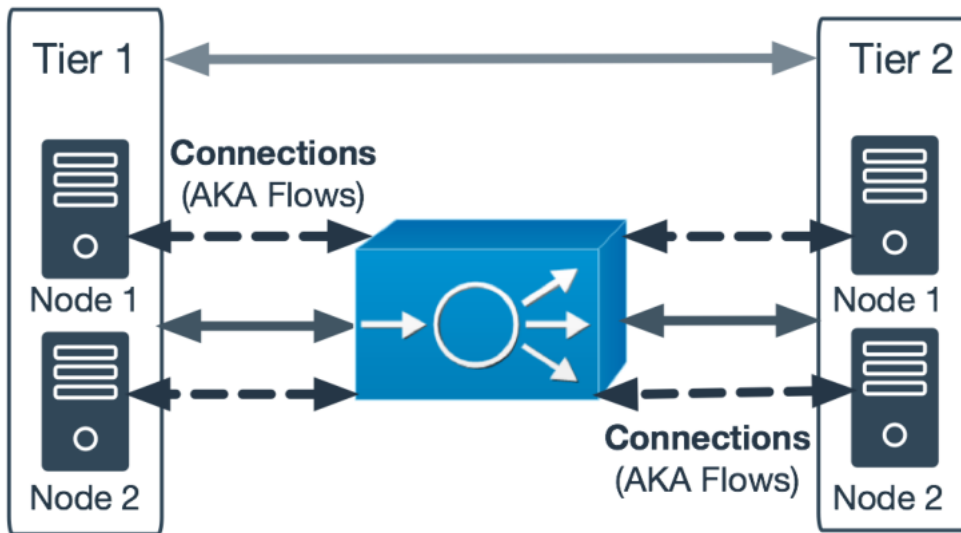

### Network Links

Network Agents collect metrics for *network links*, which you can view in the **Network Dashboard**. A network link is the set of all traffic between two tiers, or between a tier and an intermediate load balancer, or TCP endpoint. If an application flow transports traffic through a load balancer, Network Visibility creates a link on each side and calculates metrics for each link. This diagram shows the network traffic for application *x* sent and received by the two tiers through a load balancer.

### TCP Connections

Individual nodes send and receive traffic over connections. In Network Visibility, a *connection* is a set of all traffic with the same source IP address, destination IP address, destination port, and protocol. This diagram shows the individual connections used by the four nodes to send and receive traffic for application *x* through the load balancer.

### Dynamic Monitoring Mode and Network Visibility

Like Server Visibility Agents, Network Agents support Dynamic Monitoring Mode (DMM). Rather than have all Network Agents report all metrics all the time, you can run each Agent in one of three modes:

- KPI Mode – Network KPI metrics for all monitored objects (application flows, tiers, nodes, and network links) except individual connections
- Diagnostic Mode – Network KPI metrics for all monitored objects, including connections
- Advanced Diagnostic Mode – All network metrics for all monitored objects, including connections

Every Network Visibility metric has a default DMM class (KPI, Diagnostic, and Advanced Diagnostic). See [Network Visibility Metrics](#)

By default, all Network Agents run in KPI mode. The recommended workflow is to:

1. Run all Network Agents in KPI mode.
2. When you notice a performance issue on a specific node or network link, increase the metric level on the associated Network Agents to Diagnostic, and collect KPI metrics for the connections.
3. Based on the connection KPIs, identify the connections with performance issues.
4. To troubleshoot an individual connection, increase the metric level on the associated Network Agents to Advanced Diagnostic, and collect advanced metrics for the connection.
5. When the issue is resolved, reset the Agents back to KPI mode.

### Change the DMM on a Network Agent

1. Click the gear icon (⚙️) in the top-right corner of the Controller page, select **AppDynamics Agents**, and go to the Network Visibility Agents table.
2. Select the Agents of interest, right-click, and select **Change Dynamic Monitoring Mode**.

The Network Agent retains its DMM setting even if the Agent is stopped and restarted. See [Managing Network Agents in the Controller](#).

### Connection Diagnostics and Network Bottlenecks

Network Agents can collect an extensive set of individual connection metrics within a network link. Network Visibility can detect these TCP performance issues:

- The data-receive window is too small (or zero) on the [client](#) or the [server](#), which slows down the transfer of data.
- One or more servers are experiencing errors [setting up](#) or [tearing down](#) the connection for an individual TCP session.
- The client and server take a [long time](#) to set up an individual session.
- The application is using many [short-lived connections](#). TCP is most efficient when long, stable connections are used.
- Some TCP sessions have [unusually high round-trip times \(RTTs\)](#). When TCP is performing well, RTTs are stable and determined by the network path between two nodes.

The Network Agent does not collect any connection metrics in KPI mode (the default setting). To diagnose a node or network path that is monitored by an Agent, you can change the Dynamic Monitoring Mode on a Network Agent.

### Example Workflow

After you complete the initial setup, you can set the Dynamic Monitoring Mode on individual Network Agents, as needed. This is an example workflow:

- The DevOps team for a large enterprise monitors its IT infrastructure using Network Agents on critical servers. All Agents are initially set to KPI mode.
- The Network Dashboard shows a spike in latency on a network link between tier-A and tier-B.
- A DevOps team member:
  - Sets the Network Agent DMM on the tier-A and tier-B servers to Diagnostic.
  - Collects KPI metrics for the connections between the tier-A and tier-B nodes.
  - Identifies one high-latency connection between nodes TA-N1 and TB-N3, based on the Connection KPIs. The KPIs for all other connections are within acceptable bounds.
  - Sets the Network Agent DMM on TA-N1 and TB-N3 to Advanced Diagnostic, and the DMM on all other Agents to KPI.
  - Notes a set of spikes in Nagle delays on this connection. These spikes correspond to the latency spikes noticed on the network link.
  - Reconfigures TCP on the two nodes, and monitors the connection. The Nagle and latency spikes no longer occur.
  - Resets DMM on the TA-N1 and TB-N3 Agents back to KPI.

## Workflows and Example Use Cases

Network Visibility makes it easy to answer the question: *Is the network impacting my application's performance?*

This page describes the high-level troubleshooting workflows and includes several examples of how to use these workflows to solve real-world network problems.

### Application Troubleshooting

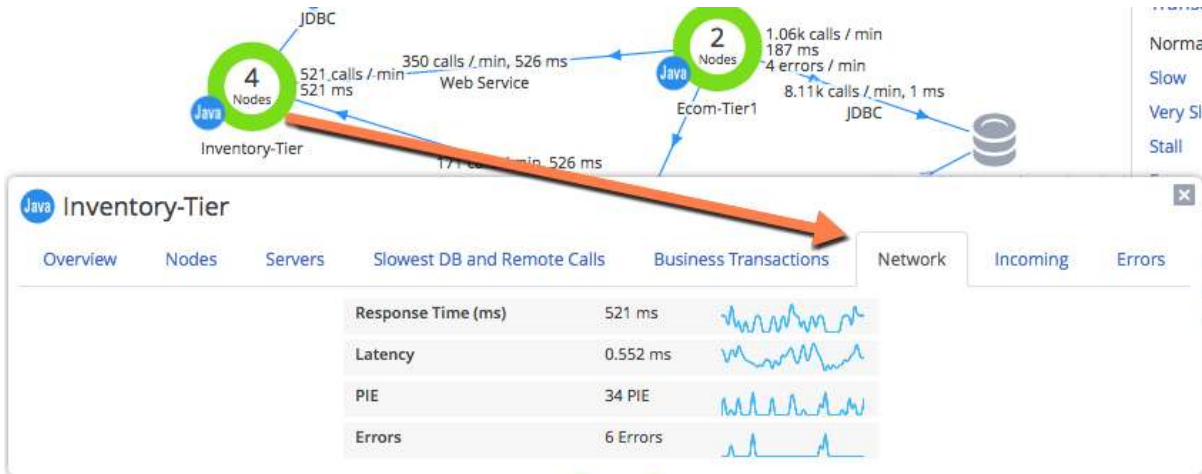

From the Application Dashboard and I see slow, very slow, error, or stalled transactions. Are network conditions to blame?

- [Application Dashboard: Are network conditions to blame for the issue?](#)
- [Network Dashboard: Which network tiers and links are associated with these network conditions?](#)
- [Tier Dashboard: Which network metrics on this tier correlate with my outlier transactions?](#)
- [Network Dashboard \(Advanced Diagnosis\): On which TCP connections are these network issues occurring?](#)

#### ***Application Dashboard: Are network conditions to blame for the issue?***

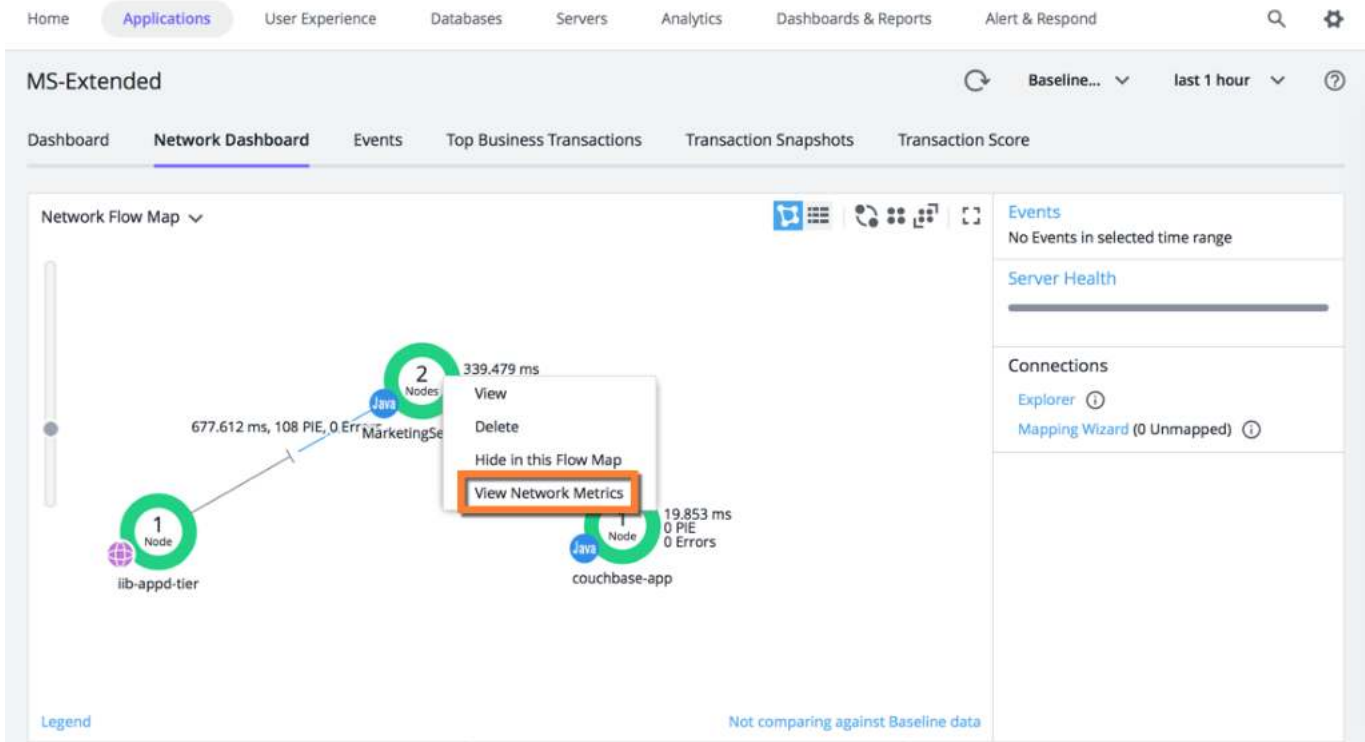

Network Agents collect network-performance metrics for each application tier. If you notice performance issues in the Application Flow Map, open a popup and click Network tab. Do you see correlations between the Response Time and the other charts? If so, it indicates that the Response Time is affected by:

- TCP effects between the two tiers (Latency)
- Performance Impacting Events at the client tier, server tier, or the network path between the tiers (PIE)
- Errors setting up or tearing down TCP connections (Errors)

**Network Dashboard:** Which network tiers and links are associated with these network conditions?

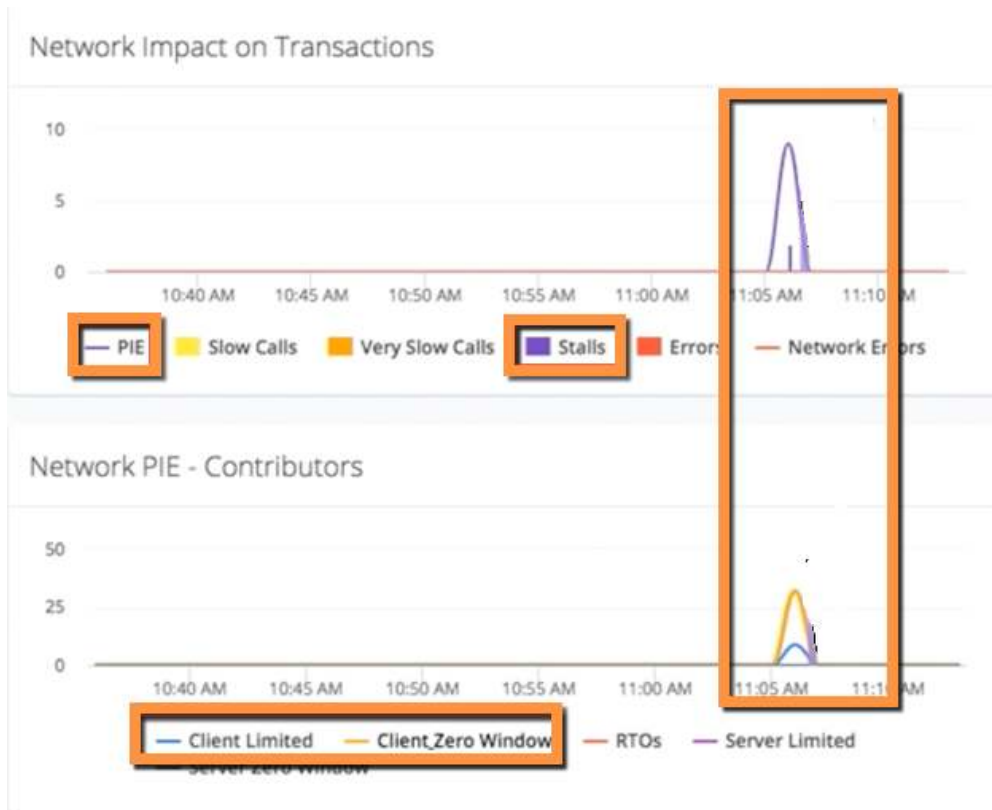

Go to the Network Dashboard, which shows the TCP and network context for the application. Each tier and link has a View Metrics right-click option that opens a context-sensitive dashboard. The dashboard charts make it easy to determine network root causes. Start from the top-left chart in each dashboard, then search for metric correlations in the other charts.

**Tier Dashboard:** Which network metrics on this tier correlate with my outlier transactions?

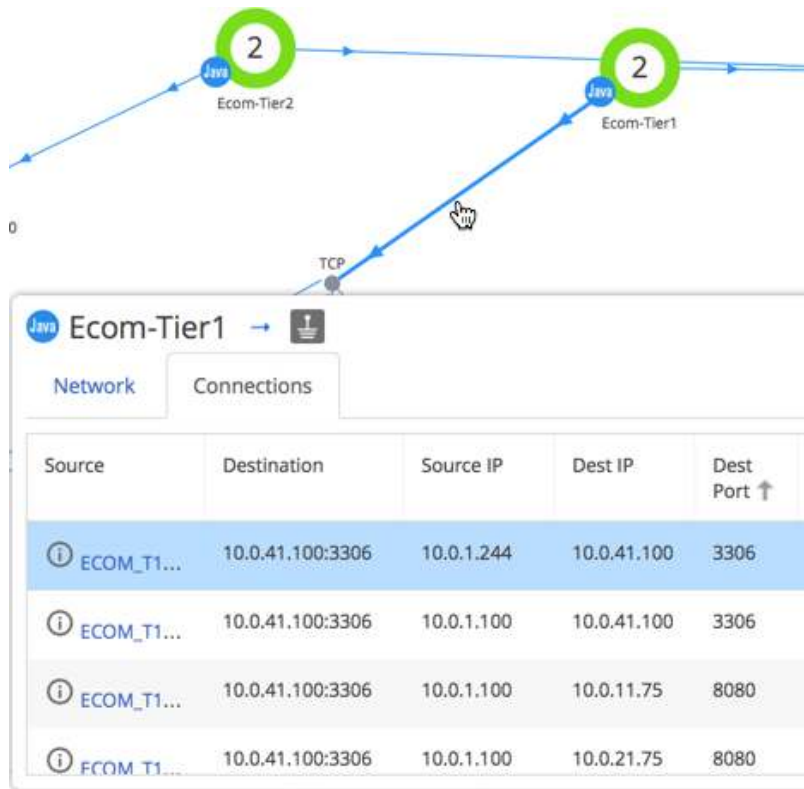

The link and tier dashboards both have a Network Pie - Contributors chart, which answers the question: *Where are these network conditions occurring – on the client tier, server tier, or the network link?*

In this example, the top chart shows that a spike in Stalled transactions is correlated with a spike in [PIE \(Performance Impacting Events\)](#); the bottom chart shows that these events occurred on the client tier. With this information, you can then locate other correlated metrics and identify the issues on the client tier.

### Basic Diagnosis

You now have a set of correlated network metrics and associated tiers/links. In many cases, this information is enough to identify and resolve the issue. You can contact your network team and say: *I see the following network issues on tier X, link Y, and so on, and these issues correlate with performance issues in my application.* You can send them a URL to the Network Dashboard and say: *Click on link Y and look at the connections. The issues are happening on one or more of these connections.* This often provides enough information for the networking team to identify and resolve the issue.

**Network Dashboard (Advanced Diagnosis):** On which TCP connections are these network issues occurring?

If you need to collect more information, you can drill down to the TCP connection(s) where the network conditions are occurring. Click the relevant network link and select **Connections** in the popup. Sort the table based on the KPI metrics for the monitored connections (Throughput, TCP Loss, PIE, Errors). You can then right-click a connection and view metrics in the Metric Browser, or in a context-sensitive dashboard.

**i** By default, Network Agents do not monitor individual connections. The recommended workflow is to enable connection monitoring only after you narrow an issue down to a specific set of links. See [Dynamic Monitoring Mode and Network Visibility](#)

Java Order-Tier → Java Payment-Tier

Network | Connections

Source Tier / Node	Destination Tier / Node	Source IP	Destination IP	Destinat... Port ↑	L... (...)	Through... (KB/s)	TCP Loss (mille)	PIE	Errors
ORD-N1_1	PAY-N1_0	10.0.11.100	10.0.31.100	8080	0...	98.0	1	40	40
ORD-N1_0	PAY-N1_0	10.0.11.100	10.0.31.100	8080	0...	98.0	1	40	40
ORD-N5_1	PAY-N1_0	10.0.11.101	10.0.31.100	8080	0...	48.6	1	18	18
ORD-N5_0	PAY-N1_0	10.0.11.101	10.0.31.100	8080	0...	48.6	1	18	18

## Transaction Diagnosis

*I'm troubleshooting a specific outlier (Slow, Very Slow, Error, or Stalled) transaction. Are network conditions to blame?*

- [Transaction Snapshots list](#): Is the network to blame for a specific slow, stalled, or error transaction?
- [Network Dashboard for Transaction Snapshot](#): Are there any correlations between problematic transactions and network-performance issues around the time of this transaction?

**Transaction Snapshots list**: Is the network to blame for a specific slow, stalled, or error transaction?

You can diagnose the network performance for an individual transaction in the transaction viewer. Double-click a snapshot in a Transaction Snapshots list.

*Transaction Snapshot viewer*: Where (at which tier) are the delays, stalls, or errors occurring?

When the Transaction viewer appears, click **Drill Down** on the tier where the delays, stalls, or errors are occurring.

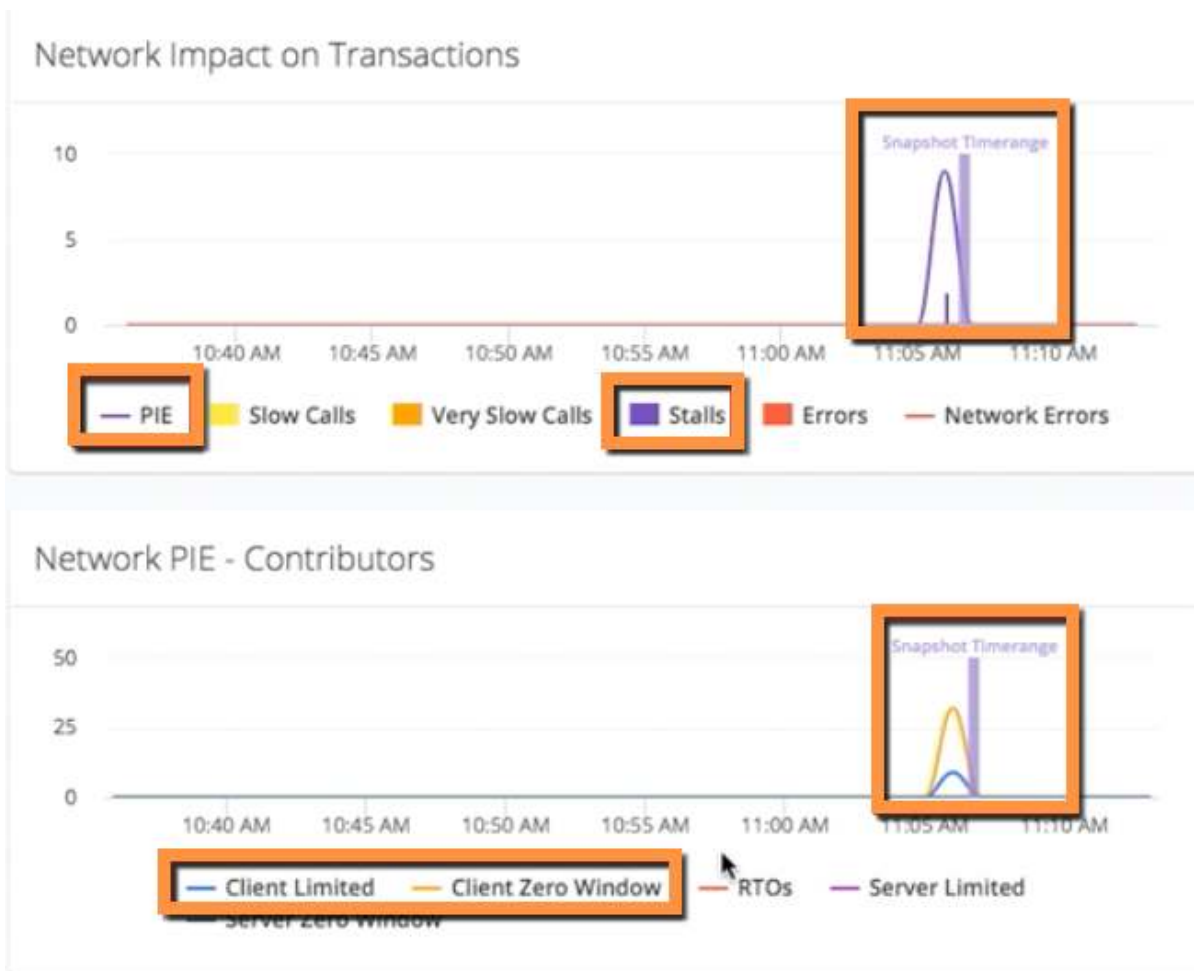

In the Tier Overview tab, click **Network**.

**Network Dashboard for Transaction Snapshot: Are there any correlations between problematic transactions and network-performance issues around the time of this transaction?**

The transaction dashboard shows the rate of transaction outliers, Performance Impacting Events, and Network Errors when the transaction occurred. Each chart has the Snapshot Time range highlighted. The Network Impact on Transactions chart (top left) highlights any correlations between transaction outliers, Network Errors, and Performance Impacting Events. You can then look for correlations in other charts and drill down to the root cause.

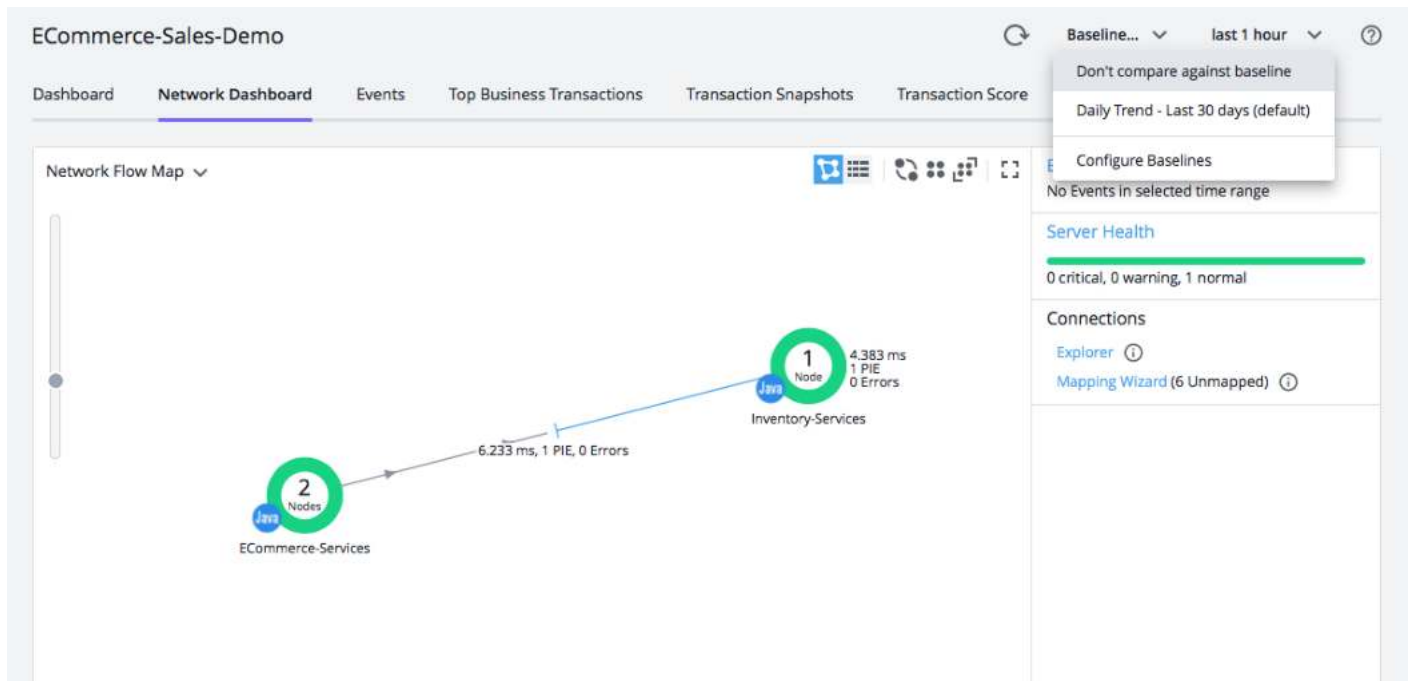

**Network Health Check**

Currently, I do not see any application issues, however, I would like to monitor my network and identify any potential issues before they start to affect my applications.

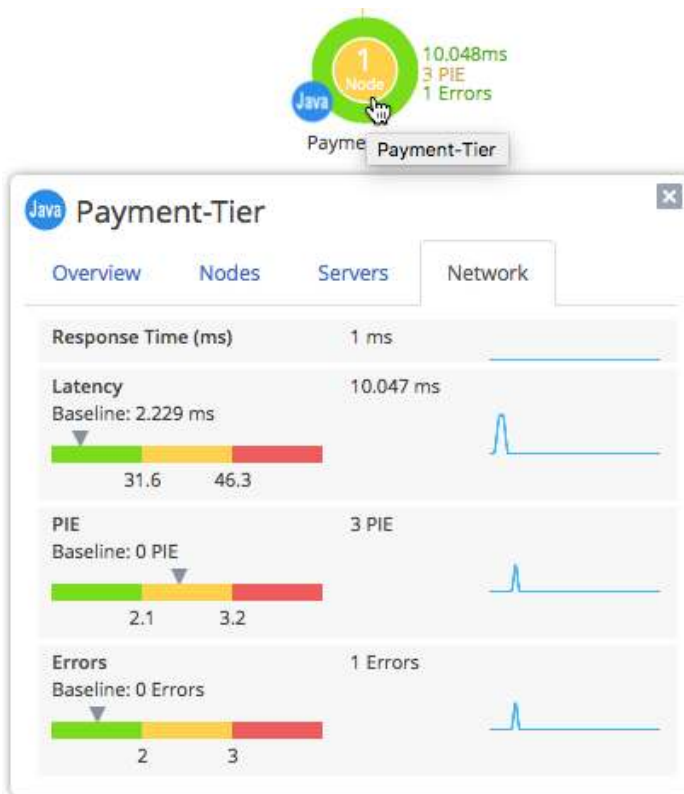

- Network Dashboard: Is any tier or link performing outside its baseline?
- Network Dashboard: Do any network links or connections have significant performance issues?

**Network Dashboard: Is any tier or link performing outside its baseline?**

To perform a quick network health check, go to the Network Dashboard and enable baselining. Elements with network KPIs that exceed the baseline for that element are colored yellow or red.

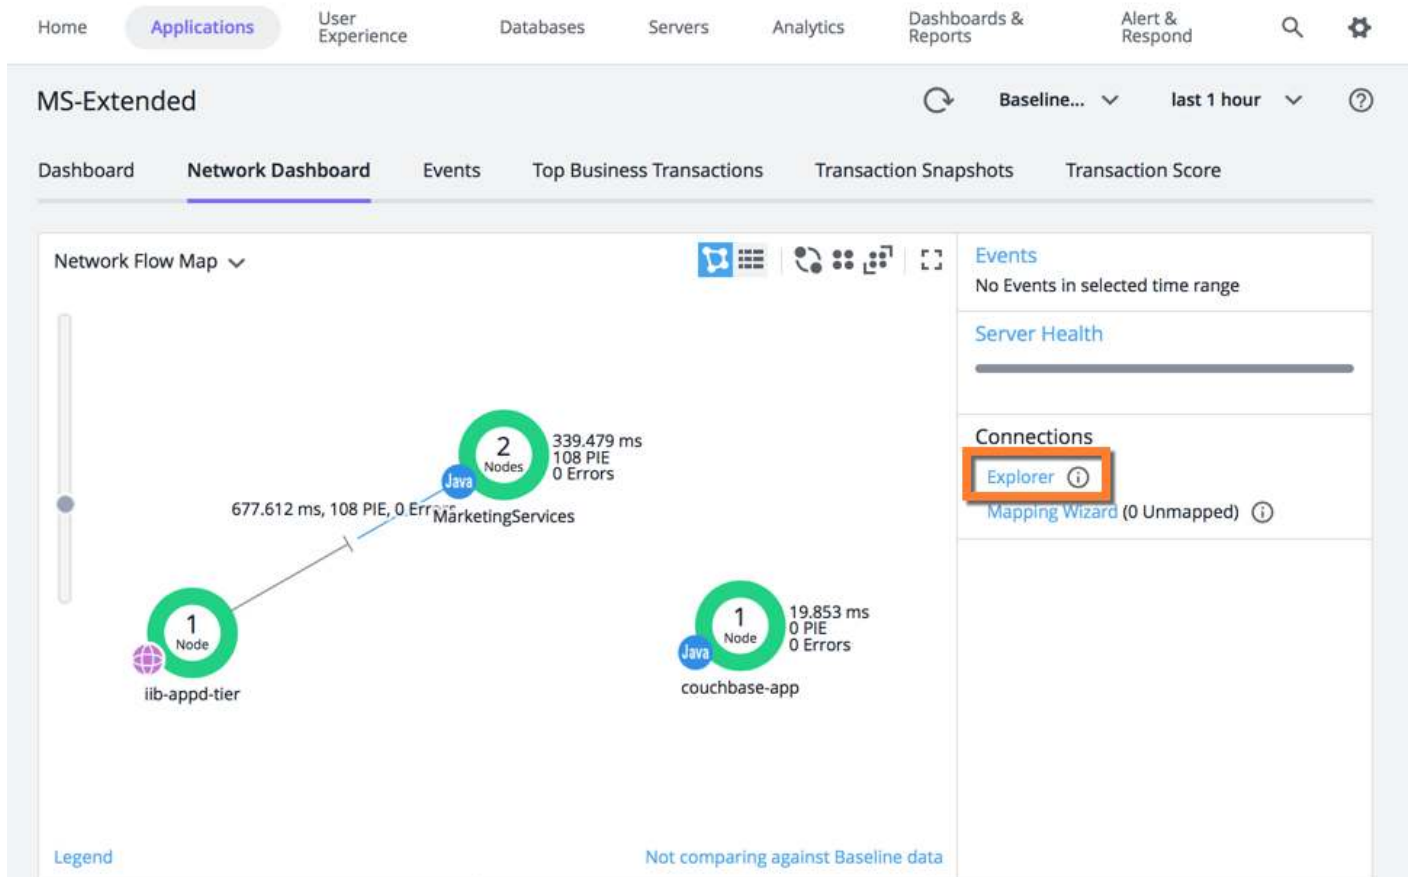

If the network KPIs for a tier or link are outside the performance baseline for that element, you can view baselines and outliers for that element in the Network tab of the popup. If an element has KPI outliers, you can also diagnose that element in a context-sensitive dashboard (right-click and select **View Metrics**).

**Network Dashboard: Do any network links or connections have significant performance issues?**

To see immediately if any links or connections have performance issues, open the Connections Explorer (click the **Explorer** link to the immediate right of the Network Flow Map). The KPIs of all network links and connections display in one table. You can sort the table based on KPIs or Errors, and expand each network-link to view KPIs for all connections within that link.

**Example Use Cases**

- [Network Congestion - Example Use Case](#)
- [Packet Loss - Example Use Case](#)
- [TCP Port Exhaustion - Example Use Case](#)
- [TCP Window Bottlenecks - Example Use Case](#)
- [Traffic Throttling - Example Use Case](#)

**Network Congestion - Example Use Case**

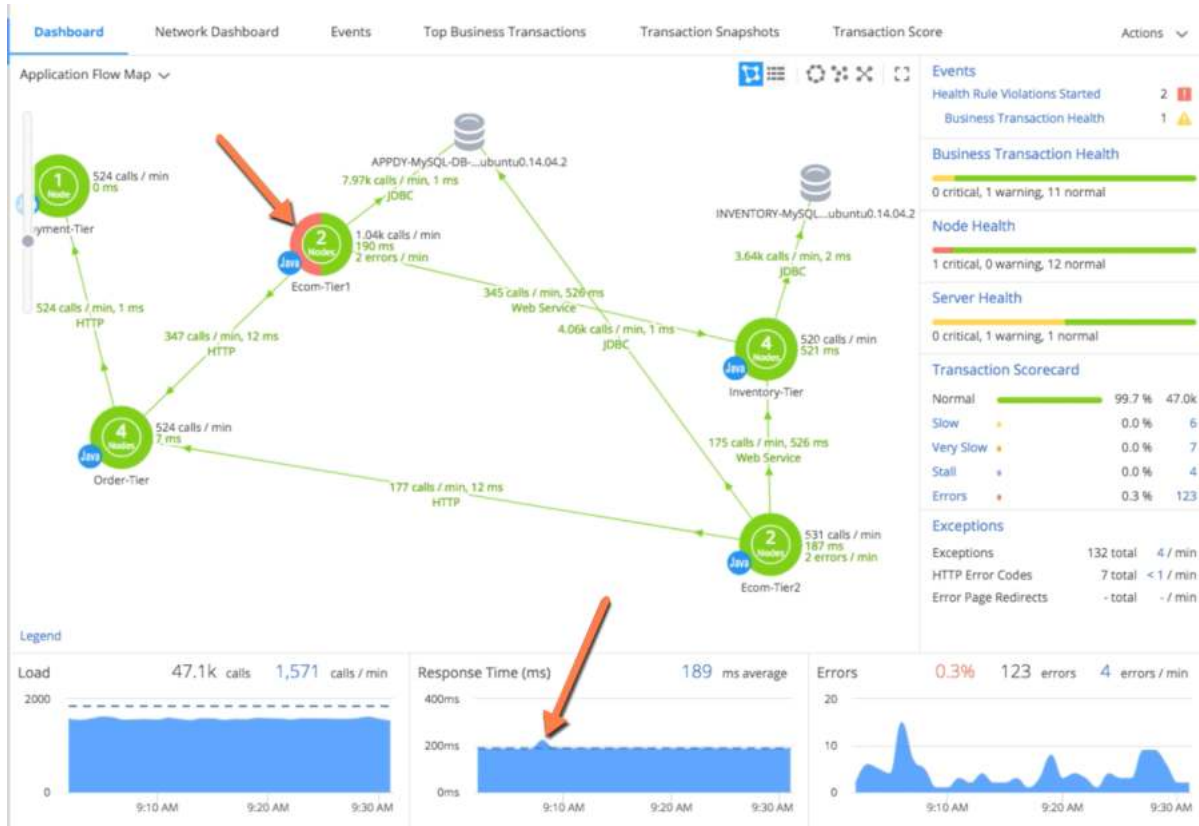

Network congestion may be caused by:

- A user may launch a "bandwidth-hogging" backup job during a period of peak network utilization.
- A server may drop packets at seemingly random intervals due to a TCP misconfiguration.

Traditional monitoring tools such as SNMP are good at detecting persistent network bottlenecks, but often miss intermittent bottlenecks. With Network Visibility, you can easily identify and diagnose intermittent network bottlenecks that affect application performance.

## Application Symptoms

A DevOps engineer is responsible for monitoring a mission-critical app. One day, she opens the Application Dashboard and notices that Ecom-Tier1 has suddenly gone partially red, which indicates performance degradation on one of the nodes in this tier. She also sees a small spike in response times for the overall application. She decides to investigate.

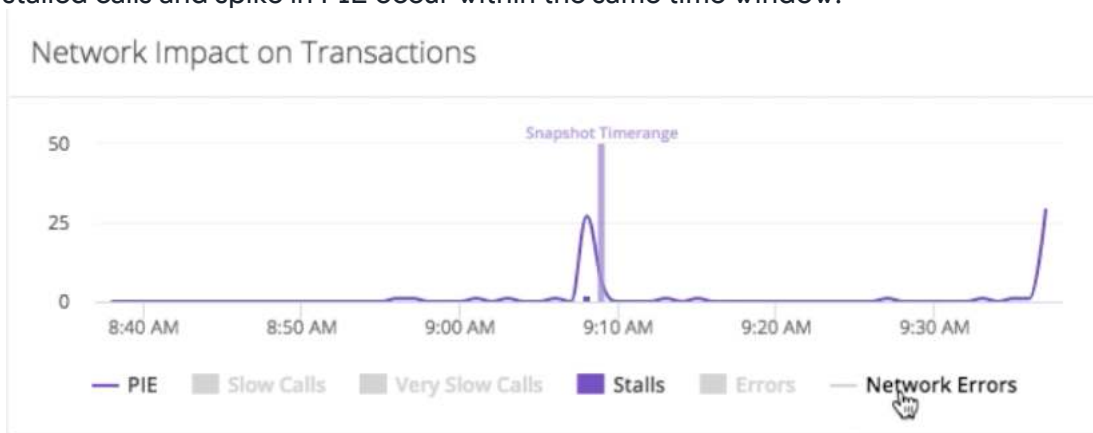

## Network Diagnosis

1. To determine if there is a network problem, she:
  - a. Goes to the Transaction Snapshots page and filters the list to show only stalled calls.
  - b. Double-clicks a specific call to view the transaction flow map. Because it was a stalled call, the entire flow map does not display.

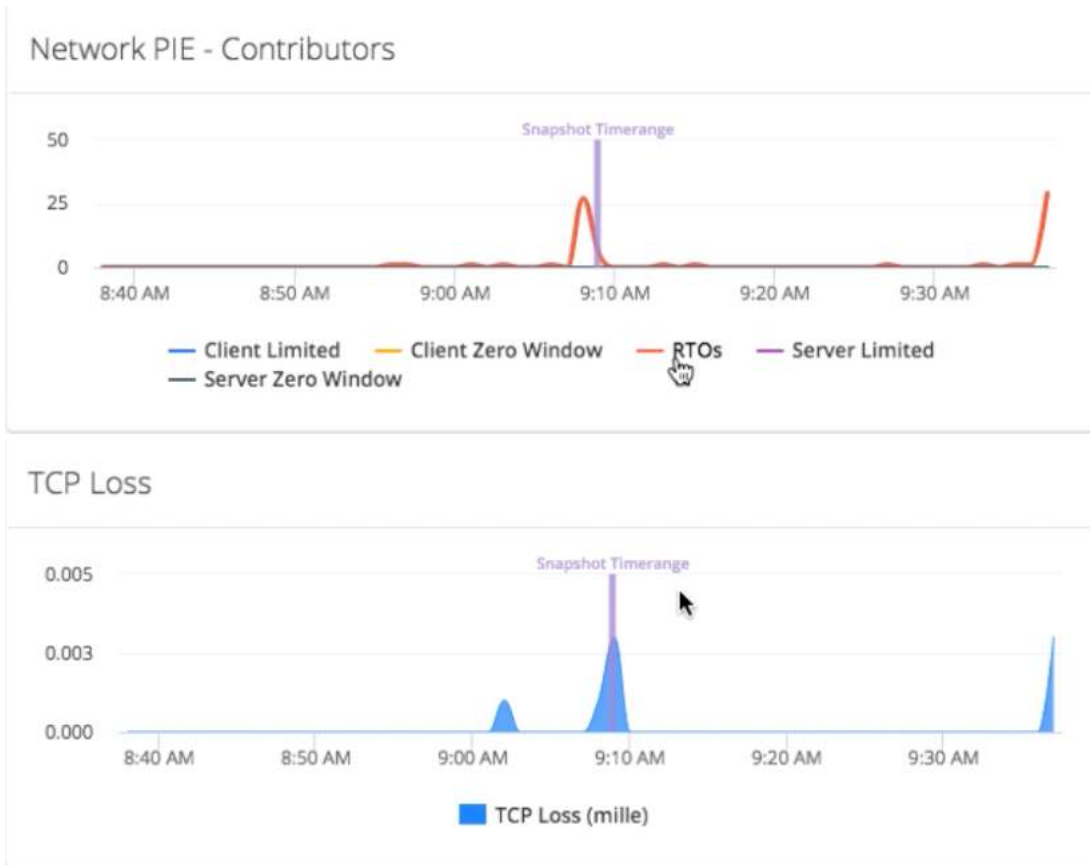

- c. Clicks **Drill Down** to open the Transaction Dashboard, and then switches to the Network tab to analyze the network performance during this call.

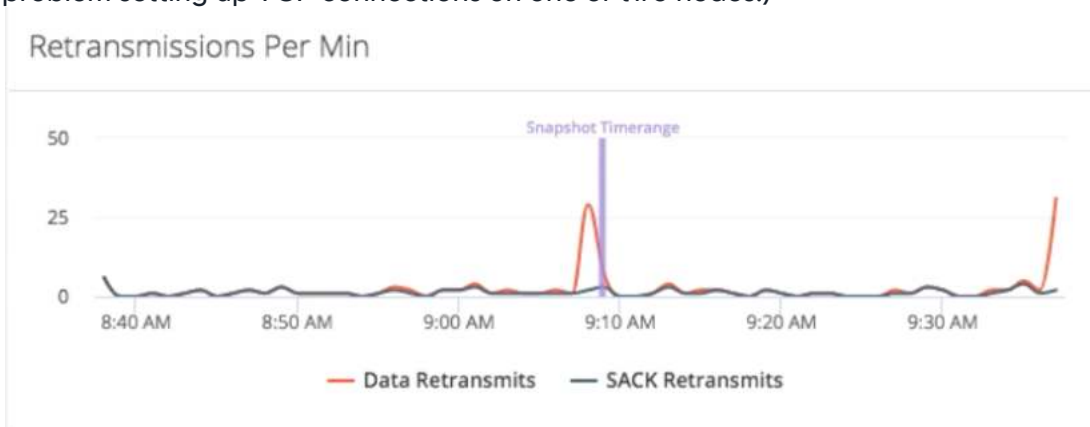

2. The Network Impact on Transactions chart (top left) shows a spike in Performance Impacting Events (PIE) around the time of the transaction snapshot. By showing only PIE and Stalls, she can see that the stalled calls and spike in PIE occur within the same time window.

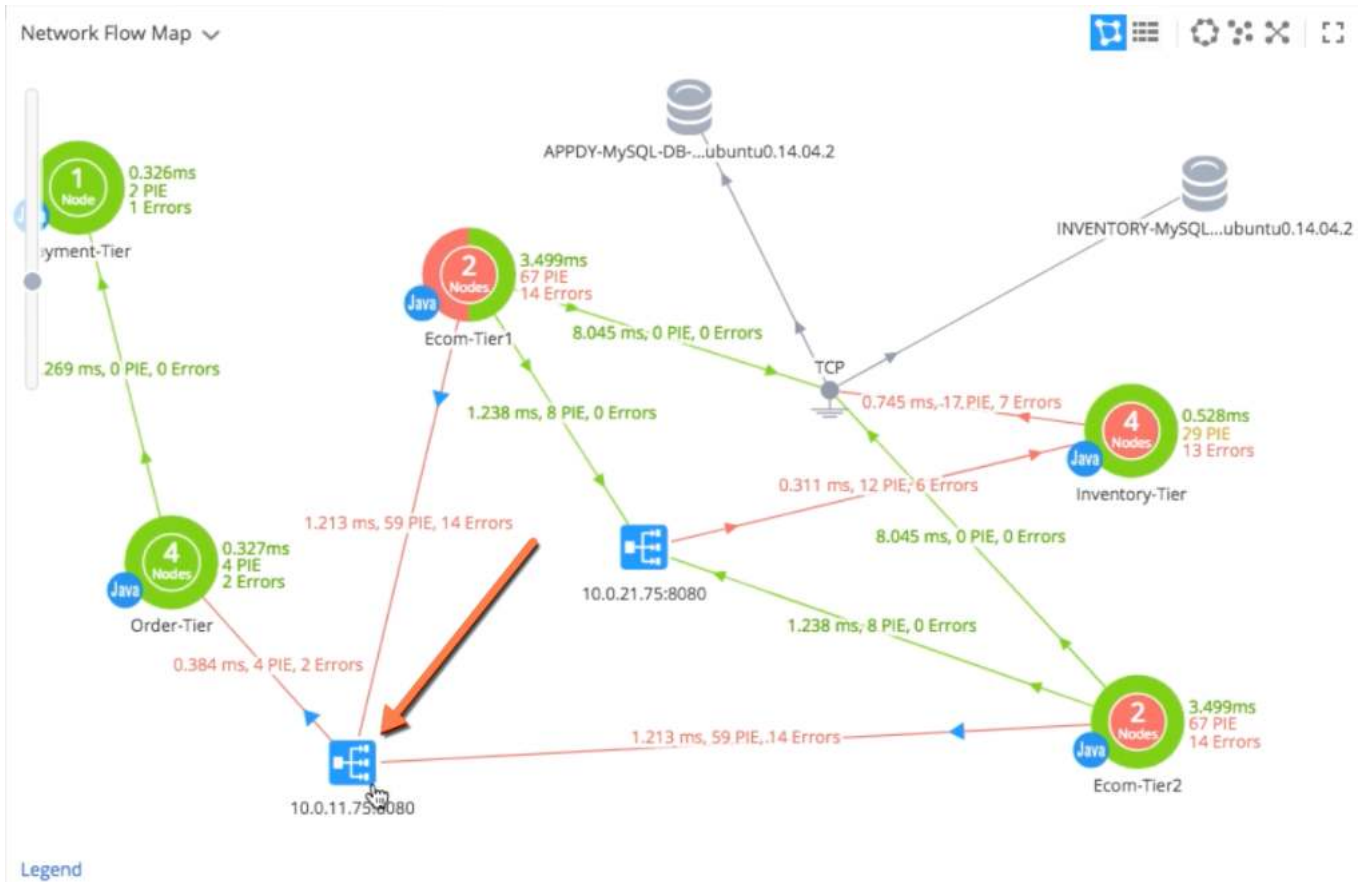

3. In the Network Pie - Contributors chart, she can see that all the Performance Impacting Events are retransmission timeouts (RTOs). This indicates packet loss on the network paths between the two tiers, which is confirmed by the spike in TCP Loss that occurs within the same time window.

4. She knows there is a correlation between stalled calls and retransmissions, and wants to learn more about these events. The Retransmissions Per Min chart indicates that all these are all data retransmits, which indicate a problem on the network path between two nodes. (SACK retransmits indicate a problem setting up TCP connections on one or two nodes.)

5. In a few seconds, she has identified a chain of correlation: stalled calls > PIE > Retransmissions > Data retransmissions on a network path. The next step is to identify where in the network these retransmissions are occurring. She switches over to the Network Dashboard, and looks for network links with high PIE scores. She sees the PIE scores on two links are 59 (much higher than any other links). Both of these links are used by ECom-Tier1 and Ecom-Tier2 to connect with Order-Tier through a load balancer.

- Given this information, she decides to investigate one of these tiers. She right-clicks Ecom-Tier1 and selects **View Metrics**. The Dynamic Dashboard for this tier appears. The dashboard shows the same metric correlations for the entire tier that she saw for the individual transaction.

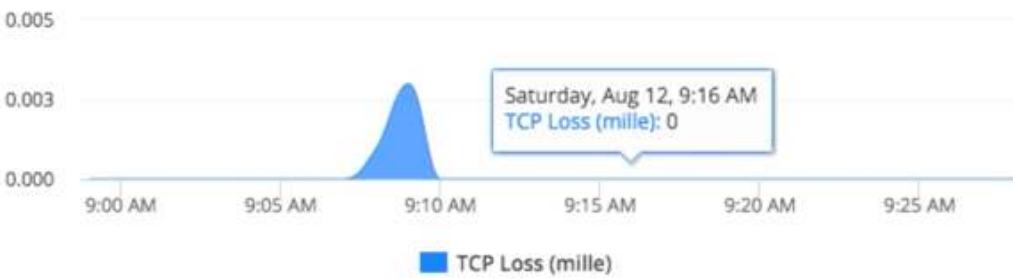

### Network Impact on Transactions

### Network PIE - Contributors

### TCP Loss

7. Now that she has confirmed that data retransmissions are spiking for the entire tier, she wants to identify the TCP connections on which these events are occurring. She clicks the network link between Ecom-Tier and the load balancer. She can see that that PIE is occurring on both connections:  
 ECOM\_T1N1:8080 < - > Load\_Balancer\_10.0.11.77:8080  
 ECOM\_T1N2:8080 < - > Load\_Balancer\_10.0.11.77:8080
8. Given this information, she contacts the network-management team in her organization and says: "I can see that there was intermittent loss from 9:07-9:10 AM on the following TCP connections, and that these correlate with a spike in stalled calls." The network team can now investigate the network paths used by these connections and determine if the problem exists on the load balancer or elsewhere.

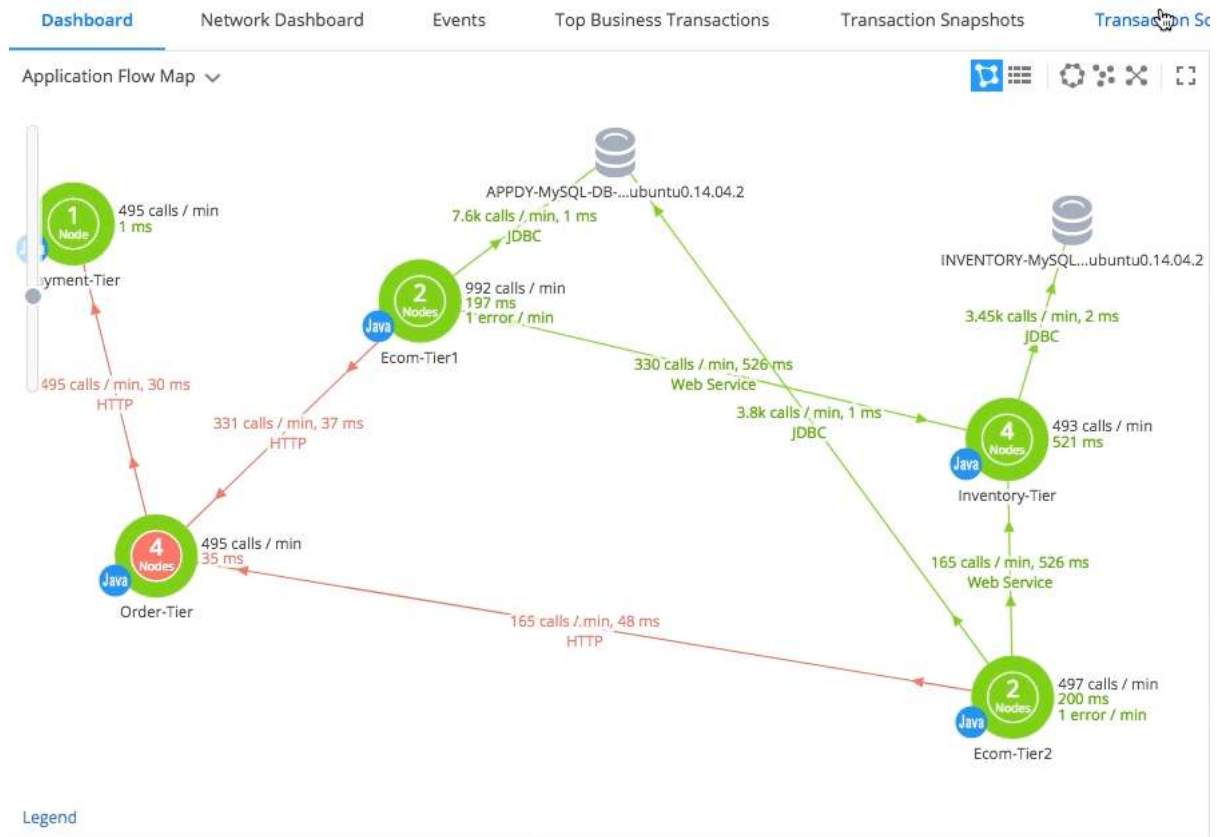

### Packet Loss - Example Use Case

In some cases, packet loss can occur on a server or intermediate device. The problem may be hardware-related; perhaps the device simply cannot handle peak traffic loads, or there may be faulty cabling on one or more network interfaces.

The problem may be software-related; a bug or misconfiguration that results in intermittent packet loss at seemingly random intervals. When packet loss affects application performance, you can use Network Visibility to pinpoint the nodes, devices, and TCP connections where the packets are getting dropped.

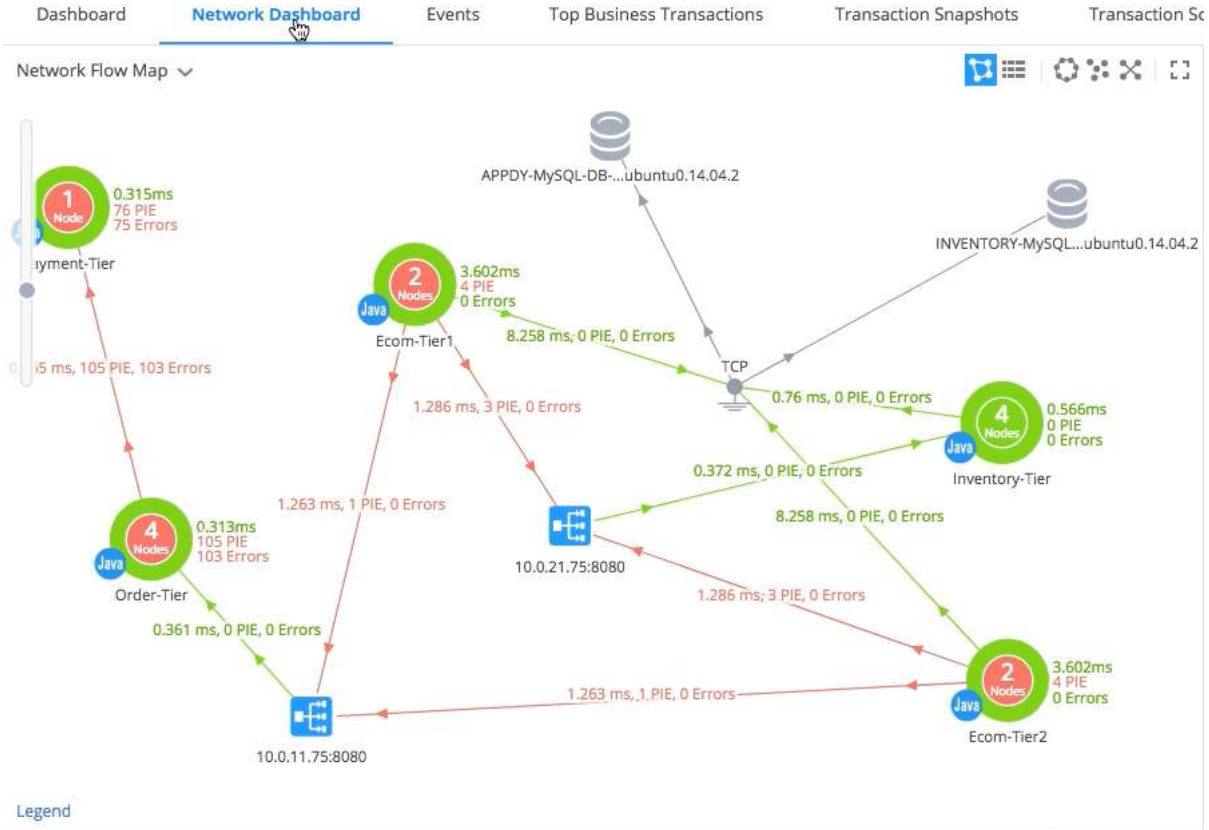

### Application Symptoms

A DevOps engineer is responsible for monitoring the performance of a mission-critical app. She opens the **Application** Dashboard notices that the Order-Tier, and the application flows to and from this tier, have suddenly turned red. She decides to investigate.

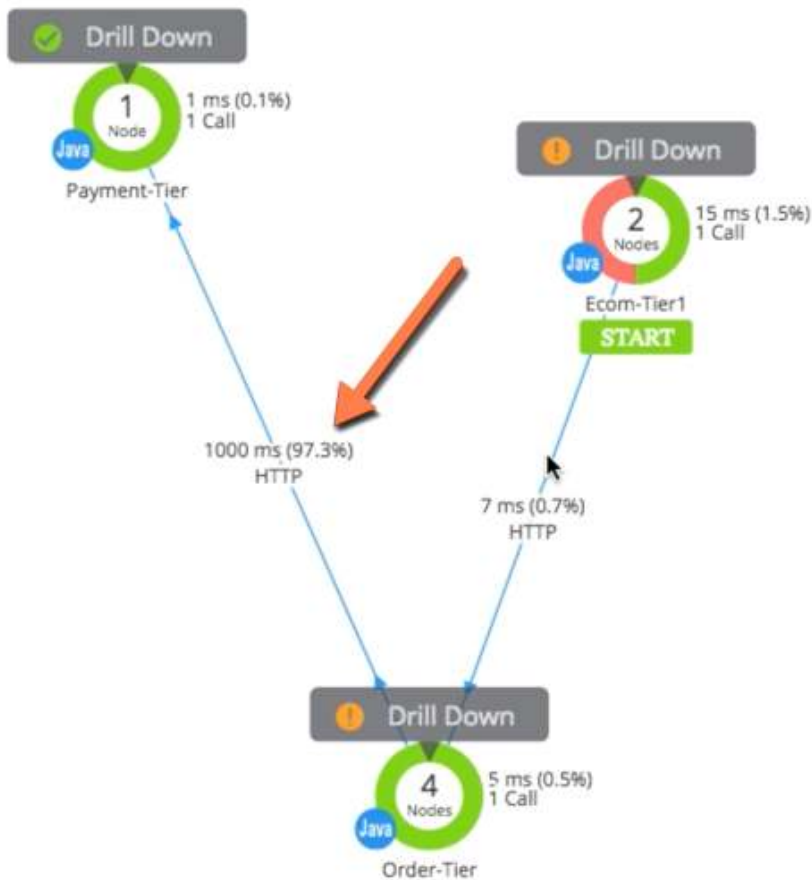

## Network Diagnosis

1. She switches over to the **Network** Dashboard and sees that the Order-Tier and Payment-Tier, and the network link between them, show a spike in PIE and network errors.

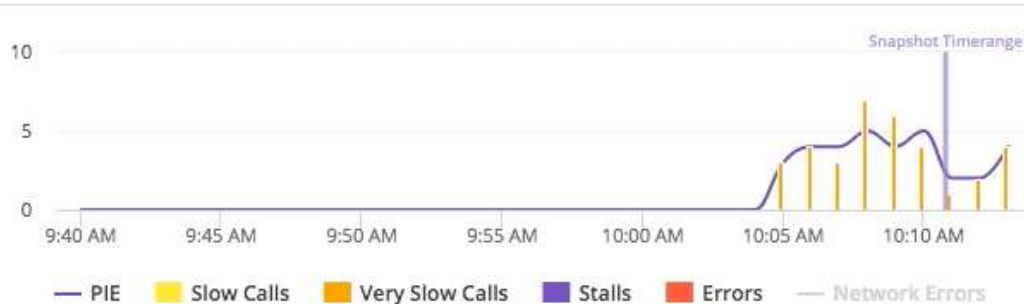

2. She decides to analyze an individual transaction. She goes to the **Transaction Snapshots** page and double-clicks a Very Slow transaction. The **Transaction Overview** shows that 97% of the delay is on the link between Order-Tier and Payment-Tier. She drills down into the Order-Tier and goes to the Network

tab.

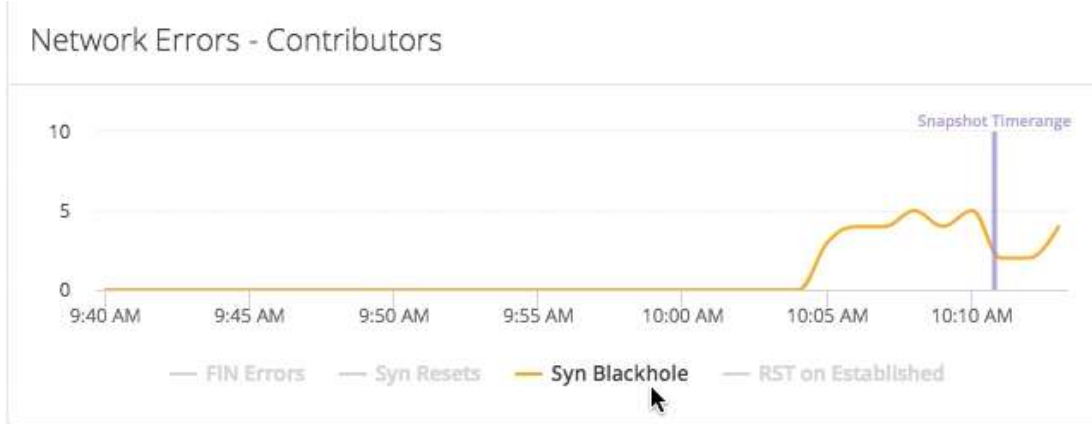

3. Scanning the dashboard for this transaction, she sees immediately that:
  - a. The Network Impact on Transactions graph (top left) shows a spike in PIE and Very Slow Calls around the snapshot time range.

Network Impact on Transactions

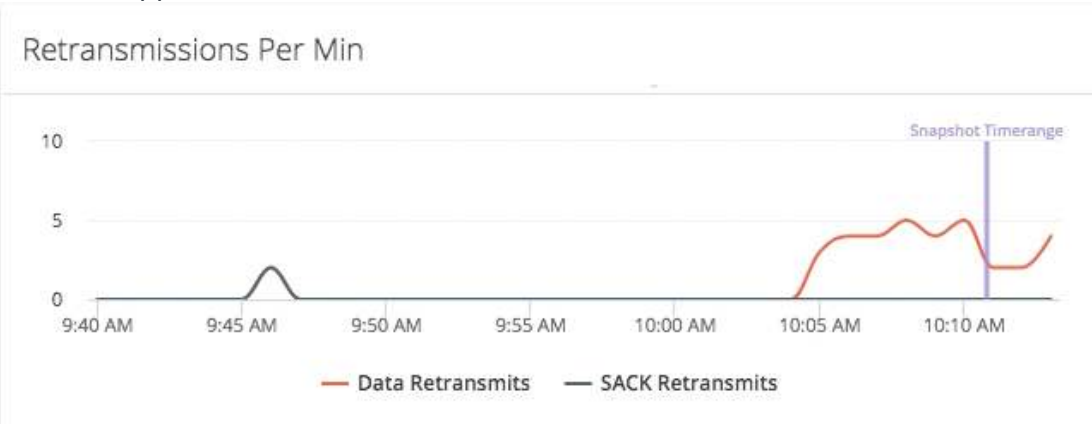

- b. She sees the correlation between Errors and Very Slow Calls, so she reviews the Network Errors - Contributors chart. She sees immediately that all these errors are Syn Blackholes. The Order-Tier node is trying to establish connections to the Payment-tier node, but something in the middle is silently

dropping the connection. When this happens, it usually indicates that a firewall or other intermediate device is dropping packets. The requesting tier tries and retries to re-establish the connection, which introduces significant delays.

- c. The Retransmissions Per Min chart confirms that the retransmissions during the time window of interest are all Data Retransmits, which means that the drops are occurring on an intermediate device rather than at an application node.

- 4. She now wants to pinpoint the specific TCP connections where the packet drops are occurring. She enables **Advanced Diagnostic** monitoring on the relevant Network Agents to collect TCP diagnostic metrics. She then goes to the **Network** Dashboard and clicks the links between Order-Tier and Payment-Tier. This provides all of the connections with elevated PIE and errors.

Source Tier / Node	Destination Tier / Node	Source IP	Destination IP	Destination Port ↑	L... (...	Through... (KB/s)	TCP Loss (mille)	PIE	Errors
ORD-N1_1	PAY-N1_0	10.0.11.100	10.0.31.100	8080	0...	98.0	1	40	40
ORD-N1_0	PAY-N1_0	10.0.11.100	10.0.31.100	8080	0...	98.0	1	40	40
ORD-N5_1	PAY-N1_0	10.0.11.101	10.0.31.100	8080	0...	48.6	1	18	18
ORD-N5_0	PAY-N1_0	10.0.11.101	10.0.31.100	8080	0...	48.6	1	18	18

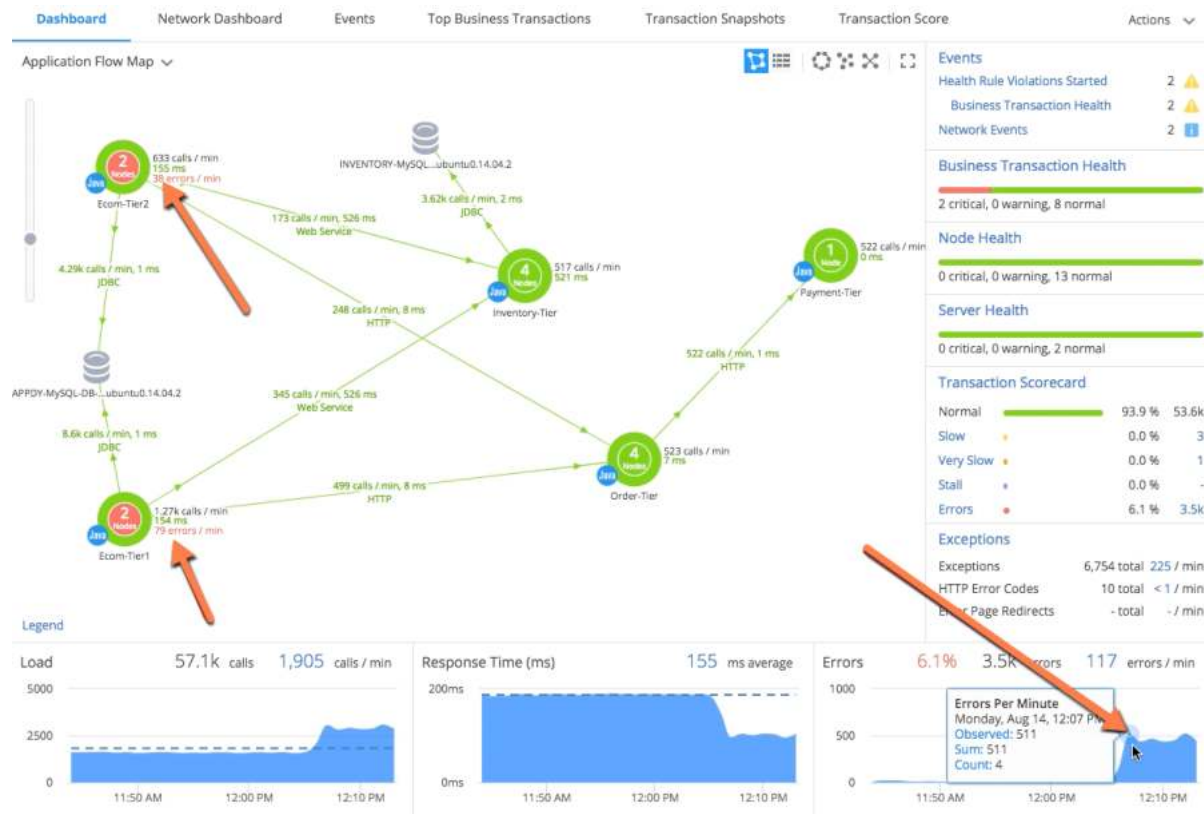

As a result, she contacts the network-management team in her organization and says: "We're seeing intermittent SYN blackholes and retransmissions on these connections, can you please investigate and fix."

### TCP Port Exhaustion - Example Use Case

A TCP socket is a specific TCP port on a specific node. Port exhaustion occurs when a node runs out of available ports. When an application stops using a specific port, the port enters a "time-wait state" before it becomes available for use by another application. If a node runs out of available ports to create new connections, the symptom appears as a spike in application errors.

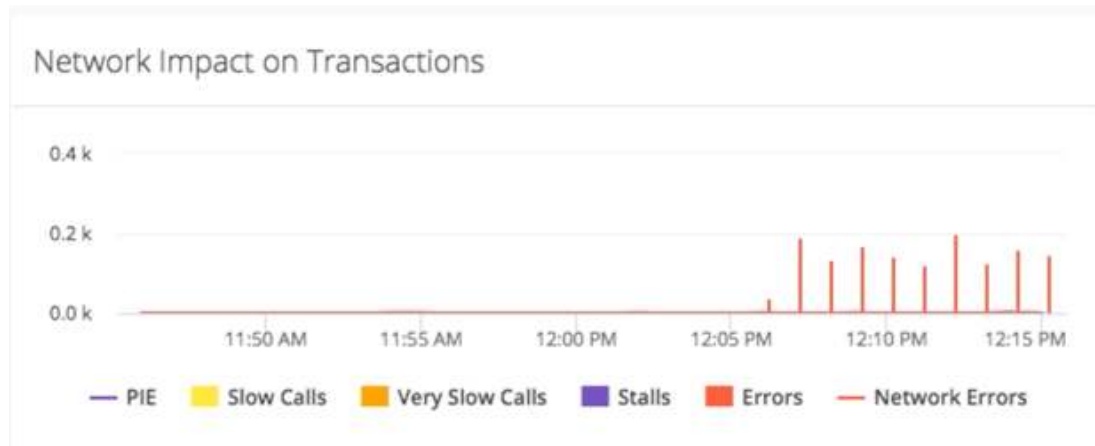

### Application Symptoms

A DevOps engineer is responsible for monitoring the performance of a mission-critical app. She opens the **Application** Dashboard and notices a sudden spike in transaction errors on the Ecom-Tiers and for the entire application. She also sees that response times for the entire App are going down and load is increasing. She decides to investigate.

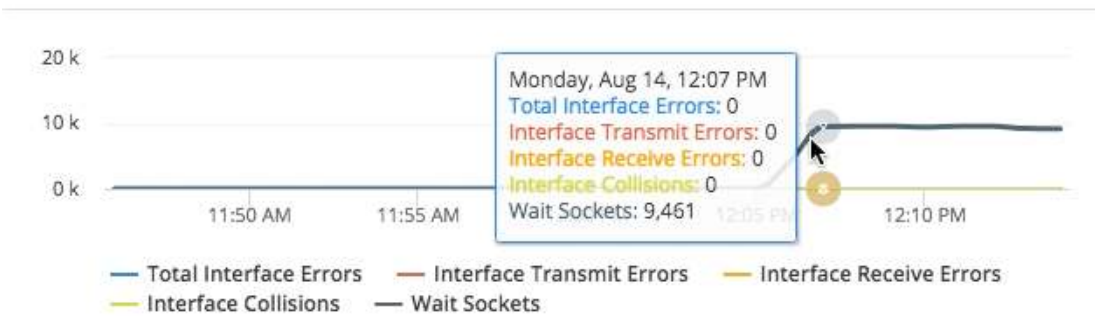

## Network Diagnosis

1. She switches over to the **Network** Dashboard, right-clicks Ecom-Tier2, and selects **View Metrics**. The Host Stack KPIs show an increase in wait sockets at the same time as the increase in Error transactions.

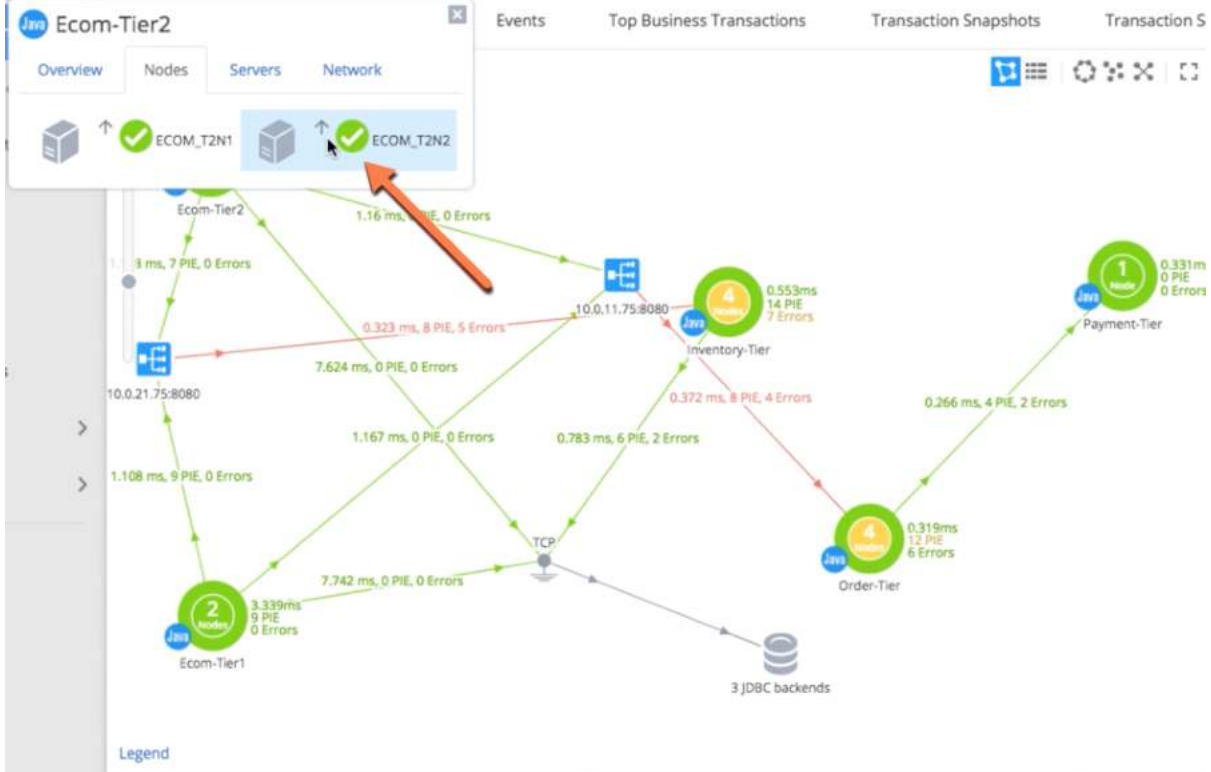

### Host Stack KPIs

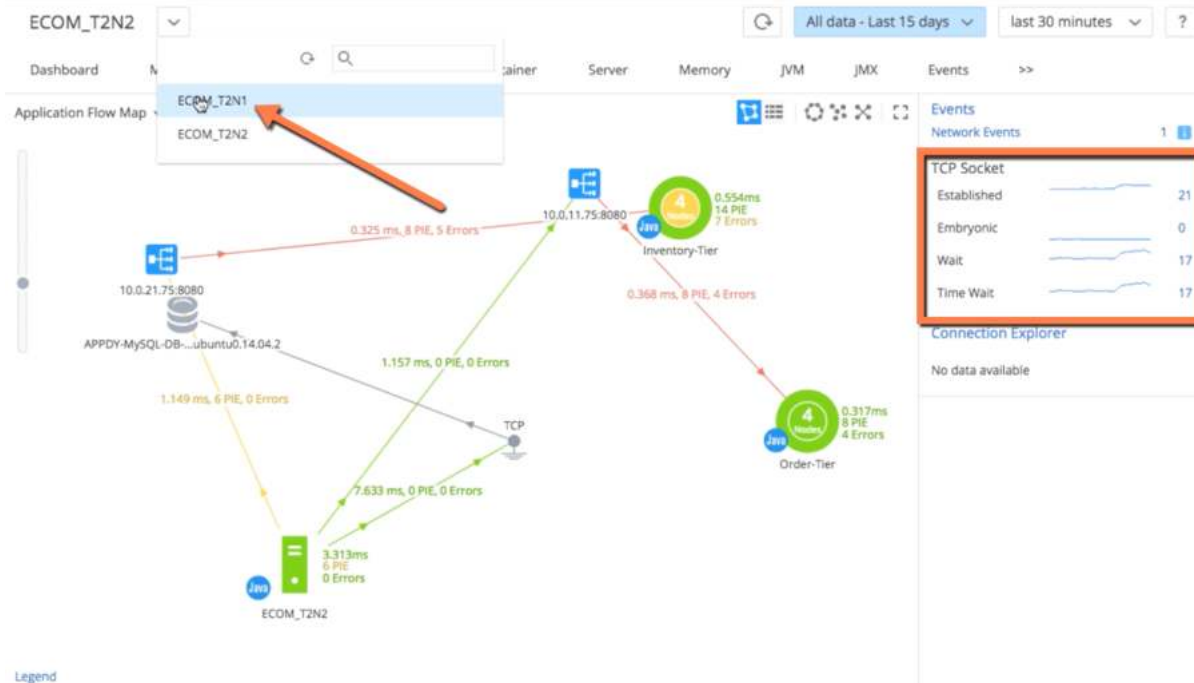

2. She knows there are many wait sockets for the entire tier. She wants to pinpoint the specific node (or nodes) where these wait sockets are occurring. She returns to the **Network** Dashboard, clicks Ecom-

Tier2, and clicks ECOM\_T2N1 in the Nodes tab.

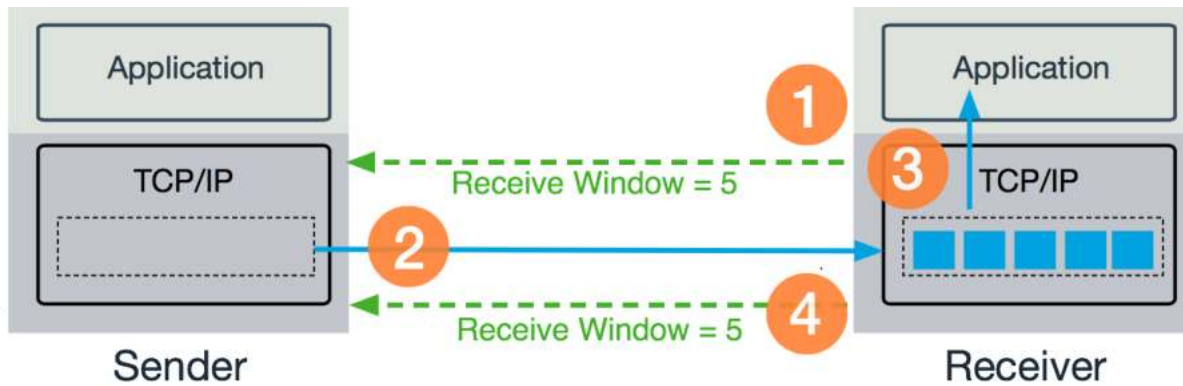

3. The TCP Socket chart (right) for node ECOM\_T2N2 shows that the level of wait sockets is in an acceptable range. She switches over to view ECOM\_T2N1.

4. The TCP Socket chart for this node shows a significantly high number of wait sockets. She knows now that the spike in application errors is occurring because this node is running out of available sockets.

## TCP Window Bottlenecks - Example Use Case

Back pressure is common in microservices and service-oriented applications, especially in distributed environments. Back pressure occurs when two services communicate and one service gets overwhelmed. This diagram shows the sequence of events:

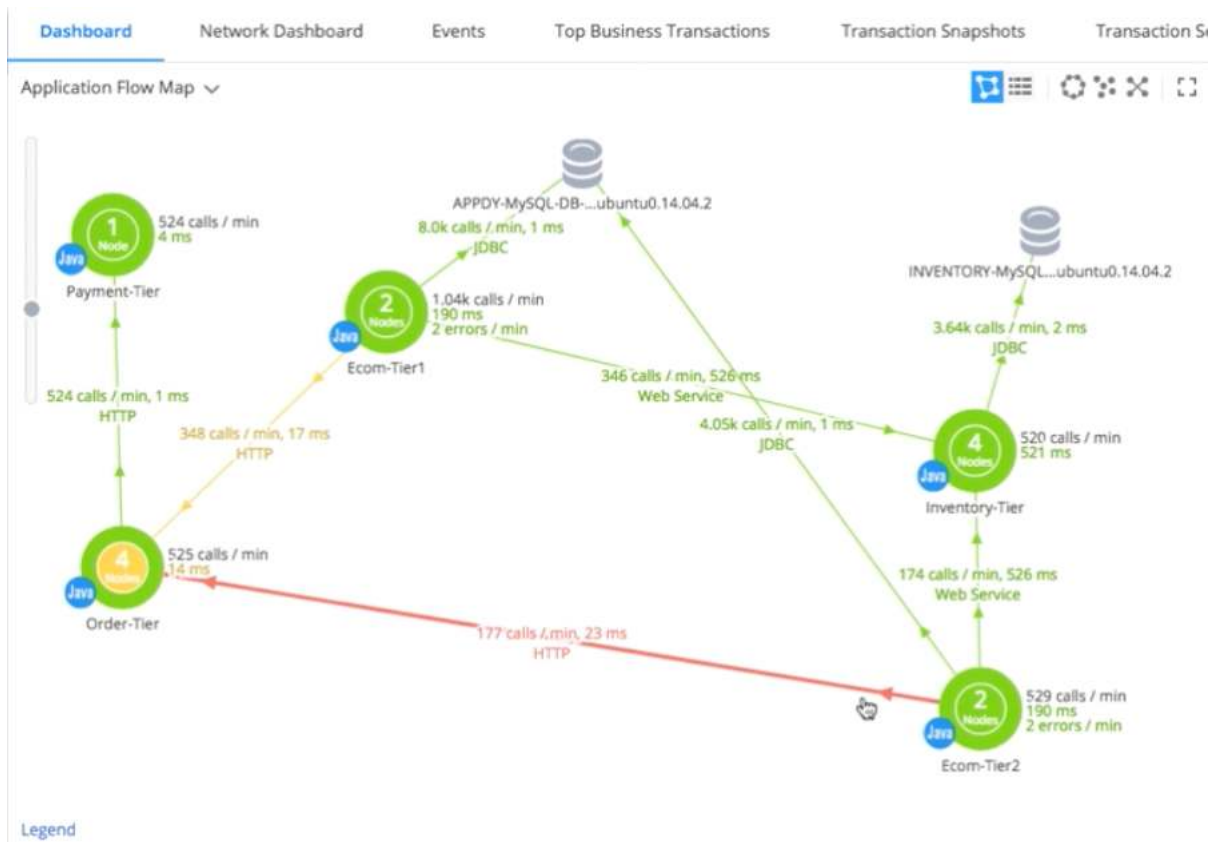

1. Receiver has a TCP Receive buffer for incoming packets. It advertises the available buffer space to the sender.
2. Sender sends a chunk of data based on the advertised window size.
3. Application on the receiver processes the packets in the buffer and frees up space in the buffer.
4. Receiver advertises the new window size.

This process works smoothly until the receiving node cannot process incoming packets quickly enough. In this case, the receiver sends TCP Limited or TCP Zero messages to the sender and the transfer slows down.

## Application Symptoms

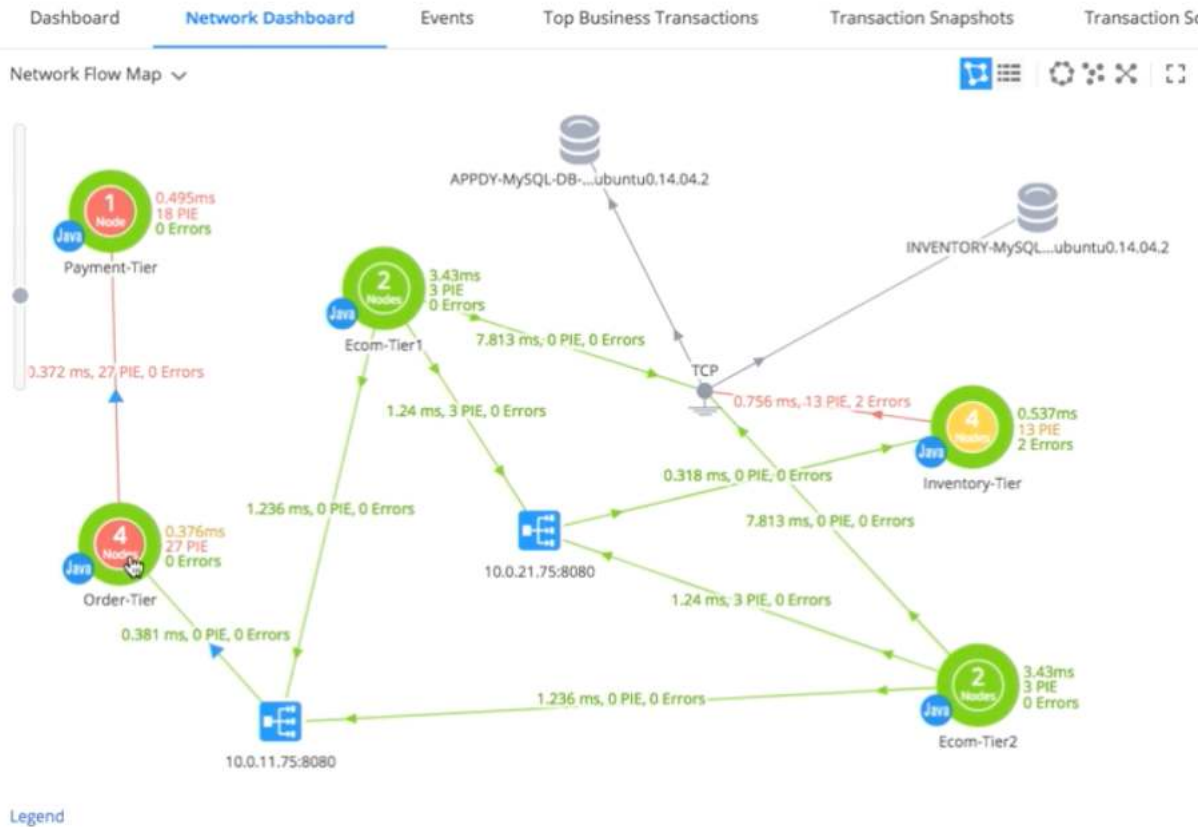

A DevOps engineer is responsible for monitoring a mission-critical app. She scans the **Application** Dashboard and notices that a link and tier have turned yellow and another link has turned red. She decides to investigate.

## Network Diagnosis

1. She switches over to the **Network** Dashboard and sees a significant increase in Performance Impacting Events (PIE) between the Order-Tier and the Payment-Tier. While the **Application** Dashboard shows performance issues on the upstream Order-Tiers, the **Network** Dashboard implies that the problem is

further downstream—between the Order-Tier and Payment-Tier.

- To troubleshoot further, she goes to the **Transaction Snapshots** list, filters on stalled transactions, and double-clicks on a transaction to drill down.

AD-DevOps last 2 weeks

Dashboard Network Dashboard Events Top Business Transactions **Transaction Snapshots** Transaction Score

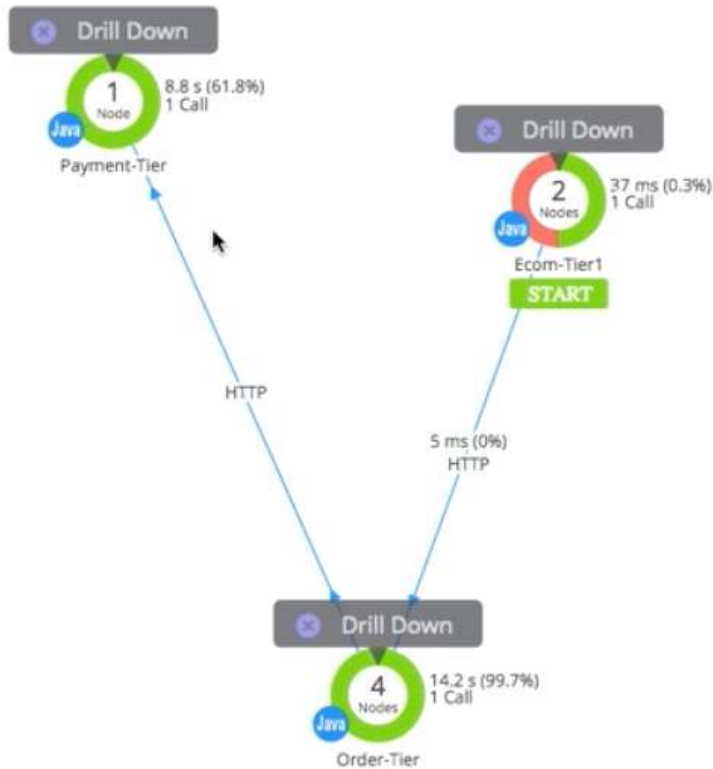

All Snapshots Slow and Error Transactions Diagnostic Sessions Periodic Collection

Showing 600 of 600 Fetch more...

3. She drills down into the Order-Tier, since nearly all of the transaction time (99.7%) occurred at this tier.

4. In the **Transaction Drilldown** page, she switches over to the **Network** view. Scanning the dashboard, she can see immediately that:
  - a. The transaction correlates with a spike in stalled calls and Performance Impacting Events.

- b. All of these events (Client Limited and Client Zero Window) took place on the client (Order-Tier) node.

5. She returns to the **Network** Dashboard, right-clicks on the Order-Tier, and chooses **View Metrics**. She immediately sees that the Client Limited and Client Zero Window events are spiking for the entire tier

and correlate with the spike in stalled calls.

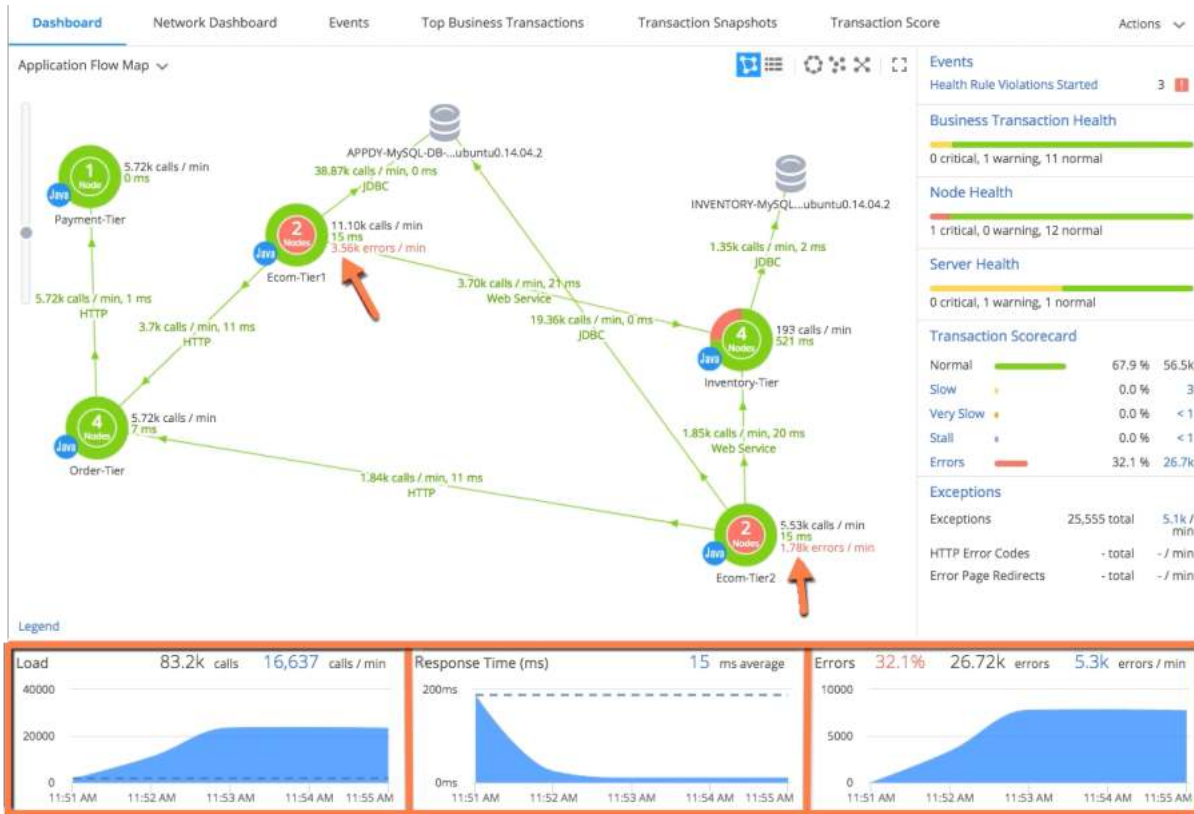

### Traffic Throttling - Example Use Case

Firewall throttling occurs when a firewall or other intermediate device prioritizes some connections over others, or denies some connections. This may be due to traffic policies explicitly defined on the device, or to one or more misconfigurations.

### Application Symptoms

A DevOps engineer is responsible for monitoring the performance of a mission-critical app. She scans the **Application Dashboard** and notices that:

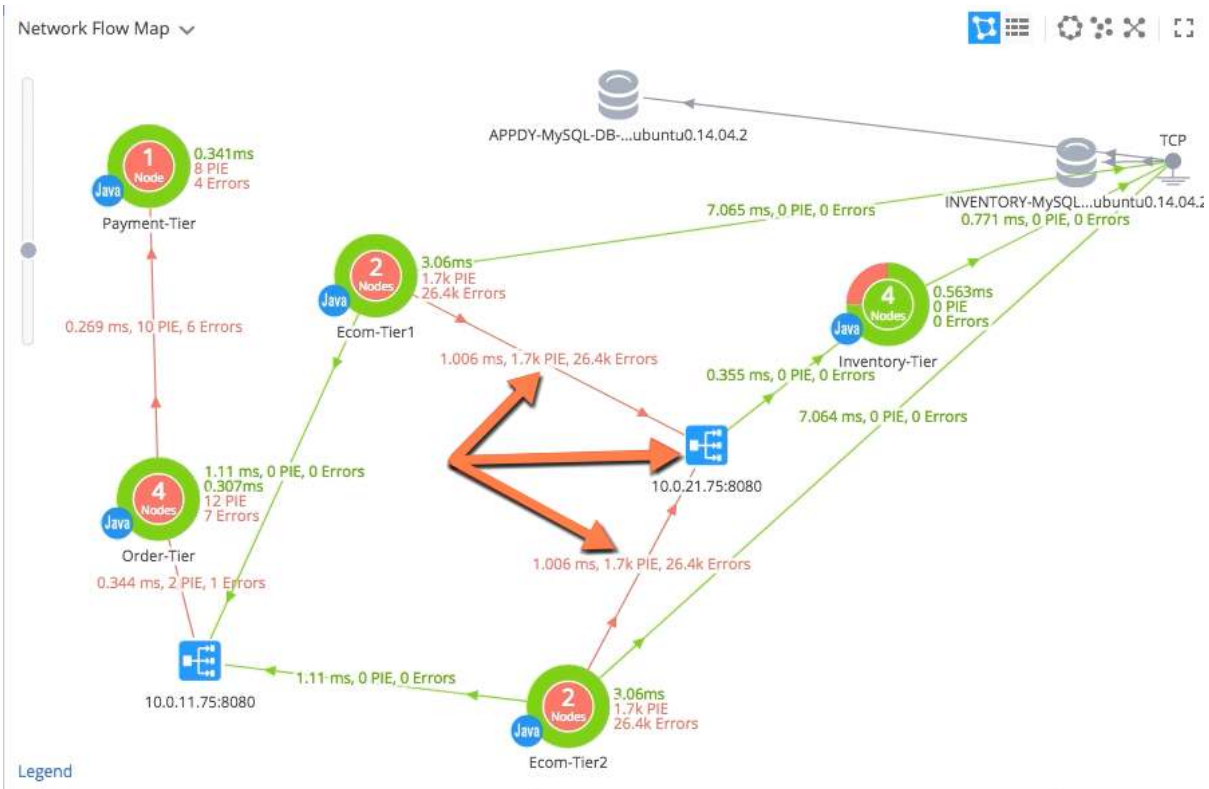

- Ecom-Tier1 and Ecom-Tier2 are showing many errors
- Traffic Loads and Errors are increasing, while response times are decreasing (bottom charts)

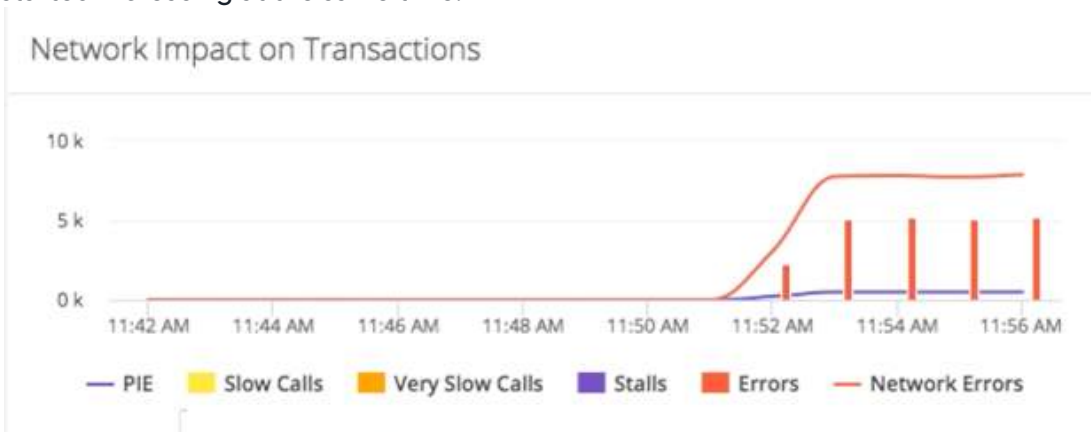

## Network Diagnosis

1. She switches over to the **Network** Dashboard and sees immediately that many network errors are occurring on the links between the Ecom-Tiers and the load balancer in the center.

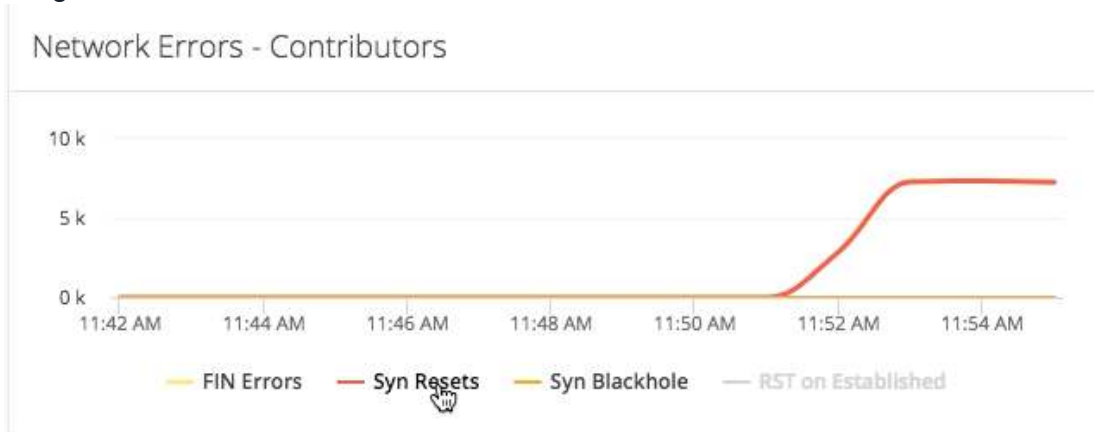

2. She right-clicks Ecom-Tier1 and selects **View Metrics**. She notices:
  - a. The **Network Impact on Transactions** chart shows that transaction Errors and Network Errors have started increasing at the same time.

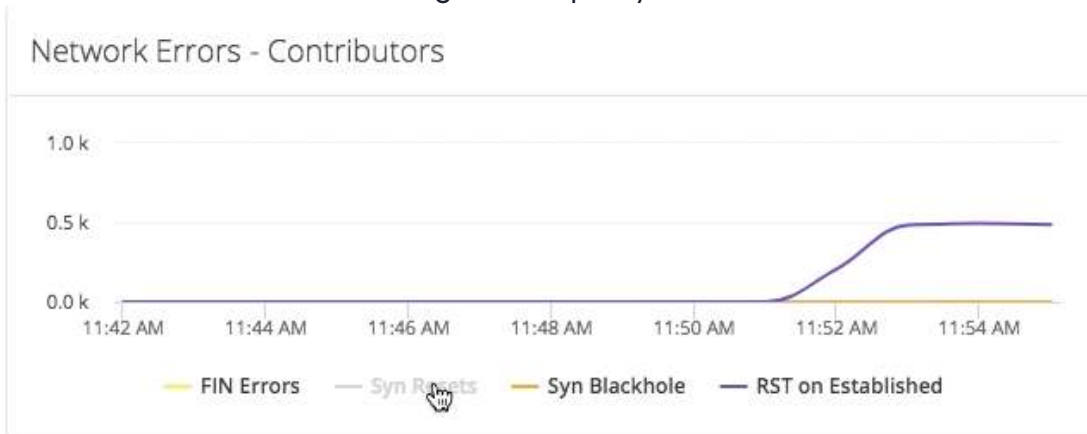

- b. The **Network Errors - Contributors** chart shows that two types of Network Errors are increasing:

- i. Syn Resets — This reset occurs when the firewall explicitly rejects a connection request before it can get established.

- ii. RST on Established — This reset occurs when the firewall shuts down an established connection due to traffic-throttling or other policy on the device.

- c. The **Connection Rate Info** chart shows that the rate of Connection Errors and Resets are exactly the same where every connection error is a connection reset. This shows that the firewall in the load balancer is rejecting connections.

## User Interface

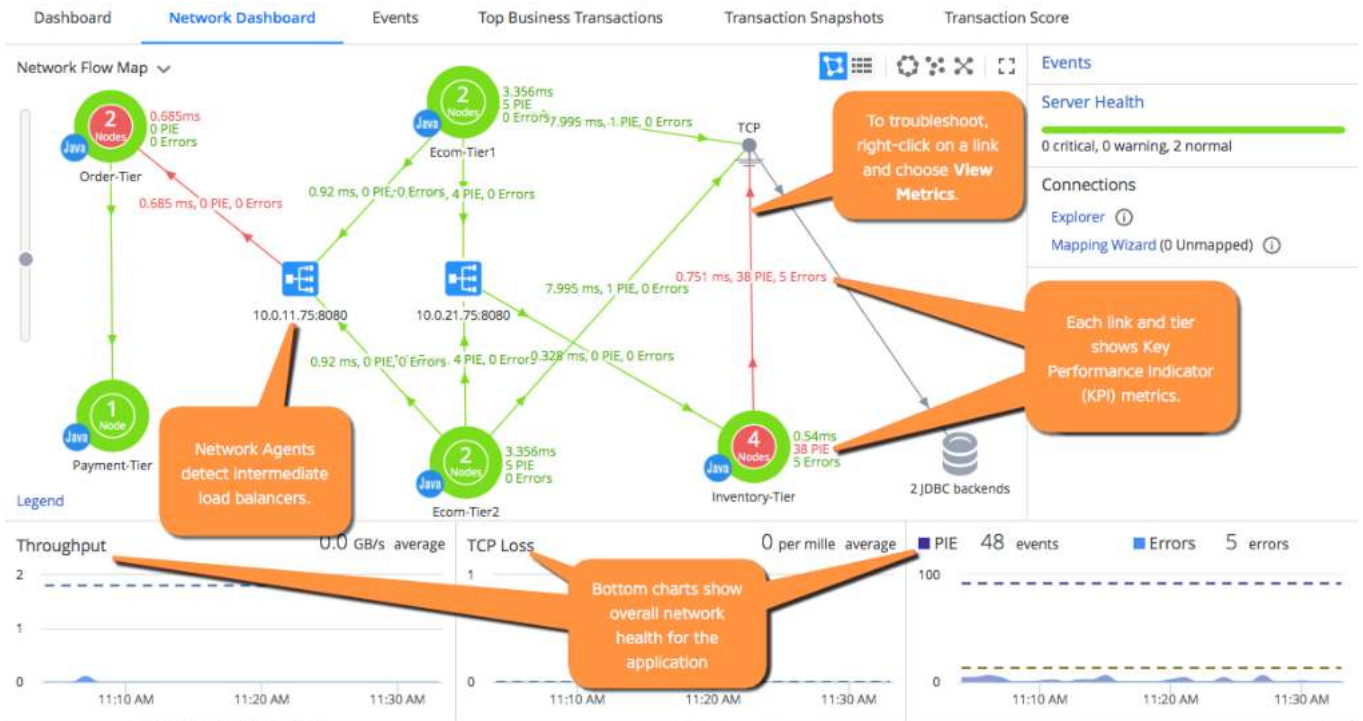

This page describes:

- [Network Dashboard](#)
- [Connection Explorer](#)
- [Custom Dashboards for Network Visibility](#)

### Network Dashboard

The **Network** Dashboard provides a network-layer view of your application where you can quickly determine if any part of the network is impacting application performance. The bottom charts show the overall network health. Each tier and link shows network KPI (Key Performance Indicator) metrics. Network Agents detect intermediate load balancers and TCP endpoints. You can:

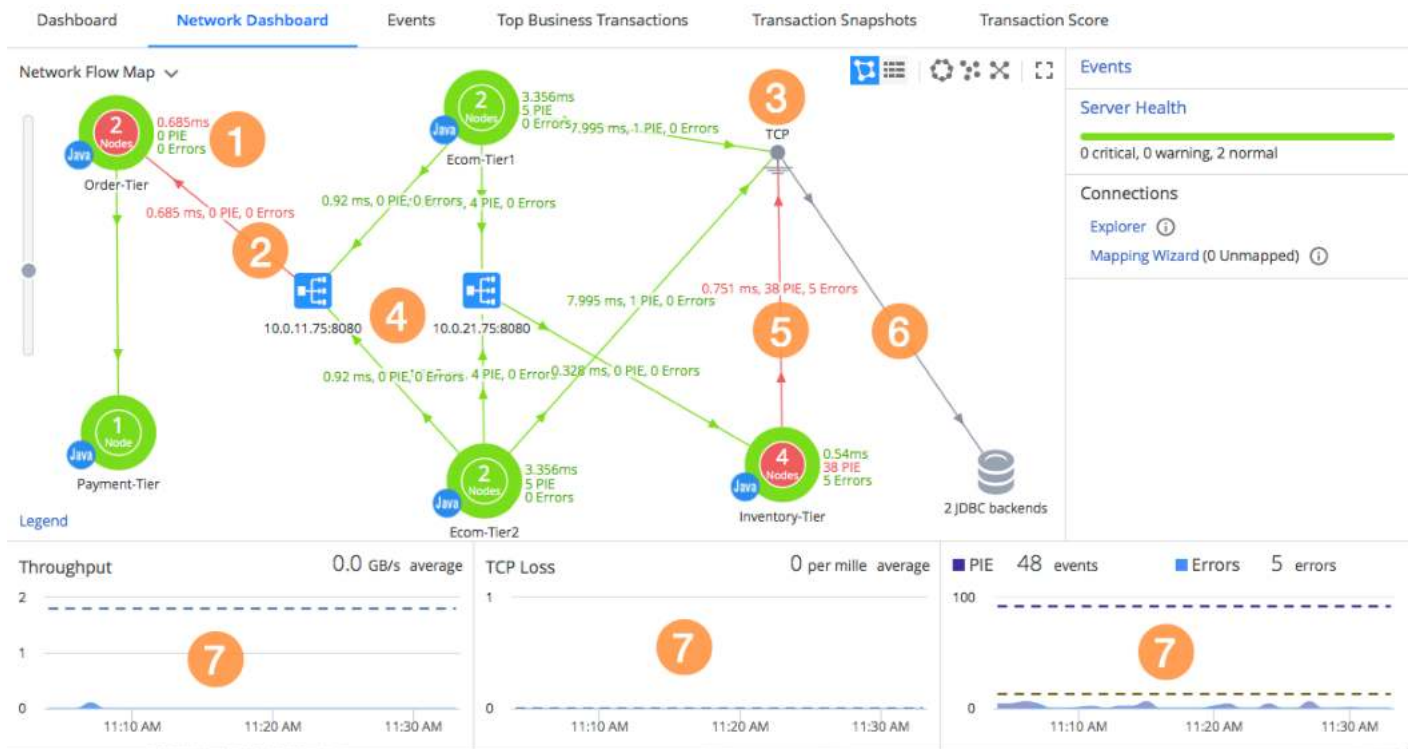

- Enable baselining to visualize network elements with performance issues (red/yellow links and tiers)
- View network metric charts in tier/link popups
- Find root causes in a specific network link. Right-click and select **View Metrics** to open a context-sensitive dashboard for the element.
  - The tier dashboard shows correlations between outlier (Slow/Very Slow/Stalled/Error) transactions and network-performance metrics
  - The link dashboard shows network-performance issues on the client tier, server tier, and network path
- Find root causes in a specific connection. When you narrow the issue down to a specific network link, you can:
  - Configure the Network Agents to collect detailed metrics for the individual Connections used on that link.
  - Drill down to find the root cause in an individual Connection.
- Copy IP addresses and ports for individual connections from the **Network** Dashboard enabling you to forward this information to operations and other personnel when troubleshooting an issue. To copy IP addresses and ports:
  - a. Click a link to open the link popup, and go to the Connections tab.
  - b. Select the connections of interest (use Ctrl-click to select multiple connections).
  - c. Right-click the selection and select **Copy IP addresses to clipboard**.

## Important Notes

- In many cases, the **Application** Dashboard and **Network** Dashboard might show different topologies for the same application. This is the expected behavior. Unlike App Server Agents, Network Agents detect intermediate network devices between nodes, and consider these devices when collecting metrics. The two dashboards show the same application but from different perspectives: an application perspective and a multi-layer, network/application perspective.
- This release does not support these Network Flow Map features:
  - Federated Flow Maps
  - Visualization of flows between web servers and APM entry tiers
  - The Network Flow Map does not filter out connections based on the selected time range
- In some cases, the KPIs for a tier or link might be different in the Network tab versus the Flow Map. The popup shows the latest data; the Flow Map updates data every two minutes. Any discrepancy between KPI values is due to this difference in reporting times.
- If you open the Network Flow Map for an individual node, the KPI metrics for node-to-load-balancer and node-to-tcp-endpoint links show KPIs for all nodes in the parent tier (instead of KPIs for the individual node only). To view KPIs for the individual node, open the link popup and review the Connection KPIs.

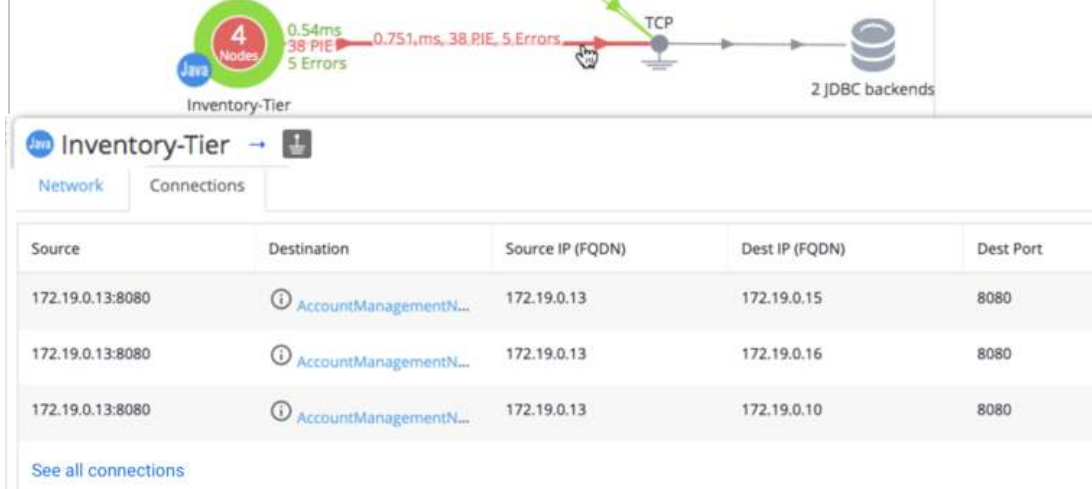

## Network Dashboard Reference

The Network Dashboard shows:

- Network-based **key performance Indicators (KPIs)** **1** for the monitored nodes in each tier:
  - Average **Latency (#ms)** for individual packets
  - Number of **Performance Impacting Events (PIE)**
  - Number of **Errors**
- KPIs for all **network links** **2**. Click a load balancer or a network element to review the set of five associated **Connections**. (A gray link indicates a connection that a Network Agent detected but did not directly monitor.) If a link or load balancer is

associated with more connections, click **See all connections**. The **Connections** page lists the details of all the connections.

- The **Network** Dashboard shows a **TCP endpoint** <sup>3</sup> icon when a Network Agent observes traffic between a monitored node and an endpoint (IP address, TCP port, and protocol), but cannot determine if the endpoint represents:
  - An application node that sends or receives traffic for the application, or
  - An intermediate device (proxy or load balancer) that transfers traffic to and from another node over a separate connection
- Network Agents automatically detect **load balancers** <sup>4</sup>, which often mask internal IP addresses and have the effect of splitting an in-flight application message into two separate TCP connections. The auto-detection of TCP endpoints and load balancers between application nodes enable you to easily identify the exact locations where network issues are occurring.
- Links are colored in the **Network** Dashboard as:
  - Green/yellow/red, to visualize the network performance compared to the overall performance baseline for that link <sup>5</sup>
  - Blue, if baselining is disabled
  - Gray, for connections between application nodes and TCP endpoints. <sup>6</sup> In this example, the gray link indicates "The connected node and endpoint are either the same device, or two devices exchanging traffic over a separate, unmonitored connection."
- The **Network** Dashboard also shows KPIs <sup>7</sup> for the entire application. You can review:
  - Overall **throughput** that the application places on the network
  - Rate of **network packet loss** (packets sent but never received)
  - Number of **Performance Impacting Events (PIE)**, which indicate potential problems on one or more nodes or connections
  - Number of **errors** for the entire application

## Connection Explorer

### Related pages:

- [KPI Metrics in Right-Click Dashboards](#)
- [Network Visibility Metrics](#)

The Connection Explorer (**Explorer** link, right side of **Network** Dashboard) shows all application flows and TCP Connections for an application in one table. Use the Connection Explorer for large, complex applications. You can sort the table based on network KPIs to locate flows with performance issues; then you can drill down and analyze the supporting connections in right-click Connection Dashboards. See [Flows, Links, and Connections](#).

The Connection Explorer shows information for:

- [Network Links](#)

- [Connections](#)

## Network Links

The Explorer shows this information for each network link. Select **View Options** to show or hide information as appropriate.

- Source
- Destination
- Network Element

### Tip

If two flows connect through a Load Balancer (LB), the table shows the LB IP:port and the connection source:

Flow direction: LB --> Tier

Flow direction: Tier --> LB

To see the relationships between application tiers and intermediate Load Balancers (LBs) more clearly, you can drag the Network Element heading so that the columns are ordered **Source | Network Element | Destination**.

Network Links last 1 hour

View Options Search...

Source	Network Element	Destination	Connections

- [Errors](#)
- [PIE](#)
- [TCP Loss \(Mille\)](#)

## Connections

To view the load balancer details for a connection, click the connection. Select **View Options** to show or hide information as appropriate.

- Source IP, or Fully Qualified Domain Name (when available) for Load Balancers and TCP Endpoints
- Destination IP, or Fully Qualified Domain Name (when available) for Load Balancers and TCP Endpoints

## Custom Dashboards for Network Visibility

You can create [Custom Dashboards](#) based on Network Visibility metrics using the standard workflows. To add a Network Visibility metric to a custom dashboard:

1. In the Add Widget pane, click + (under **Data**).
2. Under **Data Source**, select the application of interest.
3. Under **Select a Metric Category**, select **Custom (use any metrics)**.
4. Under Select a Metric, navigate to the metric of interest under one of these:
  - **Application Infrastructure Performance > Advanced Network**
  - **Application Infrastructure Performance > <tier-name> > Advanced Network**

See [Network Visibility Metrics](#).

## Network Visibility Events

This page lists the Network Visibility events and severity.

## Packet Capture Events

Sub-type: PCAP (set by Network Agent)

Description	Severity
Packet capture successful, Packet capture ID: < id > , Captured file: < file.pcap >	Info
Packet capture already active, Packet capture ID: < id >	Info
Packet capture couldn't be started, Storage location < /loc/path > does not exist, Packet capture ID: < id >	Err
Not enough space to start packet capture, Packet capture ID: < id >	Err
Packet capture failed. Capture directory < / loc / path > does not exist, Packet capture ID: < id >	Err
Packet capture successful and exported, Packet capture ID: < id > , Captured file: < file.pcap >	Info
Packet capture successful but export failed, Packet capture ID: < id > , Captured file: < file.pcap >	Err
Packet capture not started. Agent Disabled, Packet capture ID: < id >	Err

## Dynamic Monitoring Mode Events

Sub-type: Config (set by Network Agent)

Description	Severity
Network Visibility Agent mode change successful, Last DMM: <Kpi/Diagnostic/Advanced> , Current DMM: <Kpi/Diagnostic/Advanced>	Info
Network Visibility Agent mode change failed, Current DMM: < Kpi/Diagnostic/Advanced >	Err

### State-Change Events

Sub-type: Config (set by Network Agent)

Description	Severity
Network Visibility Agent state change successful, Current state: < Enabled/Disabled >	Info
No change in Network Visibility Agent state, Current state: < Enabled/Disabled >	Info
Network Visibility Agent state change failed as Packet capture active, Current state: < Enabled/Disabled >	Err
Network Visibility Agent state change failed, Current state: < Enabled/Disabled >	Err
Network Visibility Agent started successfully, Current state: < Enabled/Disabled >	Info

### Start Events

Description	Severity
Network Visibility Agent registered successfully	Info
Network Visibility Agent registration failed due to an invalid ID	Err
Network Visibility Agent started successfully, PID: < pid >	Info

### Advanced Operations

Network Visibility includes these advanced operations:

- [Resolve Unmapped Connections](#) – In some cases, there is not enough context to map a TCP Connection to an application flow automatically. This page describes how to resolve these connections manually.
- [Packet Captures](#) – A packet capture is a snapshot of live network traffic. Packet captures are very useful for advanced, in-depth network diagnostics and troubleshooting.
- [Limit Core File Production or Size](#) – You can enable the creation of core files and/or control the core file size settings. Core files can be used to view diagnostic data about Network Agent crashes.

## Packet Captures

A packet capture is a snapshot of live network traffic. Use packet captures for in-depth network diagnostics and troubleshooting. When you discover a network issue that affects your applications, you can capture traffic using Network Visibility Agents and send the resulting data to your network or Ops team for further analysis.

Network Agents save packet captures as [pcap](#) files. A wide variety of network analysis tools support pcap: [Wireshark](#), [tcpdump](#), [Windump](#), and so on. Packet captures are supported on Linux platforms only.

### Restrict packet capture privileges to authorized users only

Packet capture files include "raw" application data that might contain sensitive information. Any user with [Account Owner](#) or [Administrator](#) privileges can perform packet captures. For this reason, these roles should be assigned to authorized users only. See [Roles and Permissions](#).

## Before You Begin

 You must perform this setup *on each host* before you can capture packets on that host.

1. In the Controller, click the gear icon in the top right () and select **AppDynamics Agents > Network Visibility Agents**.
2. Right-click the Agent to set up and select **View Packet Capture Configuration**.
3. Set the capture settings:
  - **Duration (sec)** – Make it long enough to capture at least one Business Transaction over the link that you want to troubleshoot
  - **Size** – The maximum size for any single capture file
  - **Packet Capture Filename Prefix** – You must specify a prefix. It is good practice to include the hostname or another string that clearly identifies the node. The resulting pcap filename includes the prefix, the IP address, the interfaces captured, and the timestamp.  
For example, if you specify a prefix of `DataCenterNYC--`, the resulting pcap will have filename: `DataCenterNYC--ip-10-0-21-101_any_1_2017_09_28_17_58_03.pcap`
4. Set the storage settings:
  - **Path** – If remote storage is disabled, the Agent stores capture files in this folder on the Agent host
    - The specified folder must exist on the Agent host. The default path is `/opt/appdynamics/netviz/pcap`.
    - The `<network-agent-user>` account (the one used to install and run the Network Agent) should have read and write permissions to this folder
  - **Maximum Allotted Space** – Maximum storage allotted for all capture files. This setting applies to both the Agent host and the remote server. As new capture files are created, the Agent deletes older files to free up space.
5. Set the storage settings (SCP server):
  - **Remote Storage (upload to SCP Server)** – With this option enabled, the Agent uploads the capture file to the specified server when the packet-capture operation ends
  - **Host/Port/Username/Password/Path**
    - The local path must be defined on the remote server
    - The specified user account must have write permissions on the specified path

## Best Practices for Packet Captures

Packet Capture files can get very large, very quickly. When a capture job is in progress, the Network Agent captures all bytes in all packets on all network interfaces that it monitors. The size of the capture file depends on the capture duration, and the rate of packets sent and received on the network interfaces of the node. The duration should be long enough to capture a few Business Transaction calls between the two nodes, but no longer.

If you want to retain any capture file for archiving or extended analysis, copy the file from the storage folder as soon as the capture completes. This ensures that it does not get overwritten by newer files.

Packet capture operations generate a number of [Network Visibility Events](#) that you can use for monitoring and troubleshooting.

### Create a Packet Capture

- [Determine the Nodes to Capture](#)
- [Start the Packet Capture](#)

### Determine the Nodes to Capture

- Go to the Network Dashboard, set the reporting duration to the last five minutes, and verify that the network issue you need to troubleshoot is currently active.
- Note the node(s) where you need to capture packets.
  - To troubleshoot a node, capture on the node (**A**).
  - To troubleshoot a link, capture on the two connecting nodes on each side of the link (**B**).
  - If the link is bisected by a load balancer, capture on both sides of the load balancer (**C**).

### Start the Packet Capture

When you start a capture, the Agent captures all packets sent and received by all network interfaces on the Agent host. When the Agent stops capturing (as specified by the **Duration (sec)** capture setting), it saves the pcap file in the folder specified by **Storage** settings).

There are two capture methods:

- [From the Agents Page](#)
- [From the Node Dashboard](#)

### From the Agents Page

Use this method to capture on one or more nodes:

1. In the Controller, click the gear icon in the top right () and select **AppDynamics Agents > Network Visibility Agents**.
2. Select the Agents on the nodes where you want to capture. Use Ctrl-click or Shift-click to select multiple Agents.
3. Right-click a selected Agent and select **Start Packet Capture**.

From the Node Dashboard

Use this method to capture on a single node:

1. Drill down to the node in the Network Browser:
  - a. Go to **Tiers & Nodes**, right-click the node, and select **View**.
  - b. When the Node view appears, go to the Network Browser.
2. Right-click the node and select **Start Packet Capture**.

### Resolve Unmapped Connections

After you set up the App Server Agent and the Network Agent together, the Network Agent automatically:

- Monitors TCP connections
- Identifies the application flow that uses each connection
- Maps the connection to the flow

However in some cases, there is not enough context to associate a connection with a specific application flow resulting in an *unmapped* connection. In this case, you need to map the connection manually. If a connection remains unmapped, the Network Agent collects metrics for that connection but cannot associate these metrics with any monitored application flow.

To resolve an unmapped connection:

1. Go to the **Network** Dashboard and select **Mapping Wizard** (under **Connections** on the right). You can also open this wizard directly from a **Tier** Dashboard, if that tier has any unmapped connections.
2. The **Connection Mapping Wizard** appears. The left pane shows all tiers with unmapped connections. When you select a tier, the **Connections** list (right pane) shows all the unmapped connections for that tier. The workflow is to iterate through each tier, and specify the mapping for each connection for that tier.

For each unmapped connection:

- a. Determine the application flow that uses the unmapped connection.

 You need to know the source tier, destination tier, and the call type ( **ENTRY/EXIT** ) for the application flow. If you do not know this information, contact someone else who knows the application well.

- b. Select a tier in the left pane.
- c. In the right pane, group the IP addresses by Destination VIP or Prefix (bit mask).
- d. Right-click a connection and select **Map Connection(s)**.

- e. Specify the **Call Type**, **Source Tier**, and **Destination Tier** for the application flow that uses that connection.

### Limit Core File Production or Size

This feature is only available for Linux installations.

Using the `appd-diagnostics.lua` file, you can determine:

- If the core file will be produced on aborting.
- The maximum soft and hard core file size settings.

**i** In Network Agent < 23.3.0, core file creation defaulted to the system settings. In Network Agent >= 23.3.0, by default, core files are not created unless otherwise configured. To allow the creation of core files, you must configure the values in the `appd-diagnostics.lua` file as shown below. These values must be set before the Network Agent is started. Modifying values while the Agent is running will have no effect.

1. Navigate to the `appd-diagnostics.lua` file, located in the `<root installation>/conf` directory for the Network Agent (Example: `/opt/appdynamics/netviz/conf`).
2. Navigate to the following structure within the `appd-diagnostics.lua` file. The two other structures in the file are unrelated.

```
appd_netagent_diagnostics = {
 rlimit_soft = 0,
 rlimit_hard = 0,
 pr_set_dumpable = 0,
 init_pause = 0,
}
```

3. Modify the values for the following settings.
  - `rlimit_soft/rlimit_hard`: Defines the maximum size in bytes of the core file.

- `pr_set_dumpable` : Defines if a core file is created ( =1 ) or not created ( =0 ).

For more information on these settings, see the Linux man-pages documentation for `ulimit` settings.

## Troubleshooting Network Visibility Problems

### How do I troubleshoot the Network Agent?

- [Network Agent Logs](#)
- [Network Agent Health Rule](#)

### Network Agent Logs

If you notice any performance issues related to the Agent:

1. Stop the Network Agent:
  - a. For ZIP packages: Identify the Agent process and enter: `ps ef | grep \ appd-netagent`  
The output provides the process ID ( `PID` ) of the Network Agent process: `kill <network_agent_PID>`
  - b. For RPM and DEB packages, enter: `sudo service appd-netviz stop`
2. Review these log files under `<network-agent-install>/logs` :
  - a. `appd-netmon.log`
  - b. `appd-netagent.log.log`

### Network Agent Health Rule

Use this default Health Rule to troubleshoot Network Agents: `Network-Host: Packet drops too high`  
This rule triggers an alert when packets get dropped between a Network Agent and the host interface. A high rate of packet drops on the host can result in inaccurate metrics.

**i** If the issue persists, run the `collect.sh` script available in the `bin/` folder in the `agent` directory, and share the logs with your support contact to expedite troubleshooting. This script is available for Network Agent  $\geq$  4.5.9.

## Monitor Containers with Docker Visibility

Use the Machine Agent to monitor application nodes running inside Docker containers and to identify container issues that impact application performance. By viewing and comparing APM metrics with the underlying container and server/machine metrics, you can easily answer the question: Is my application problem purely an application problem, or is the root cause in the container or the server?

**i** Container monitoring requires a Server Visibility license  $\geq$ 4.3.3, for both the Controller Tenant and the Machine Agent.

You should deploy the Machine Agent inside a Docker container. The Machine Agent collects metrics for Docker containers on the same host, and server and machine metrics for the host itself. The Controller Tenant shows all monitored containers, for each host, and the container and host IDs, for each container.

In a BRIDGE networking mode, the containers take on the container ID as the hostname. If networking is in host mode, then the containers take on the node name of the host ID. This means every container on that

node has the same host ID. In this case, you need to use the unique host ID settings. See [Register the Container ID as the Host ID](#). When using Docker Visibility, if the unique host ID setting is not configured to use container ID in host network mode, the Machine Agent automatically registers the container using the container ID as the host ID. If you have an older version of the Controller Tenant or Machine Agent, AppDynamics recommends that you upgrade to Machine Agent version 20.7 or later. See [Using Docker Visibility with Kubernetes](#).

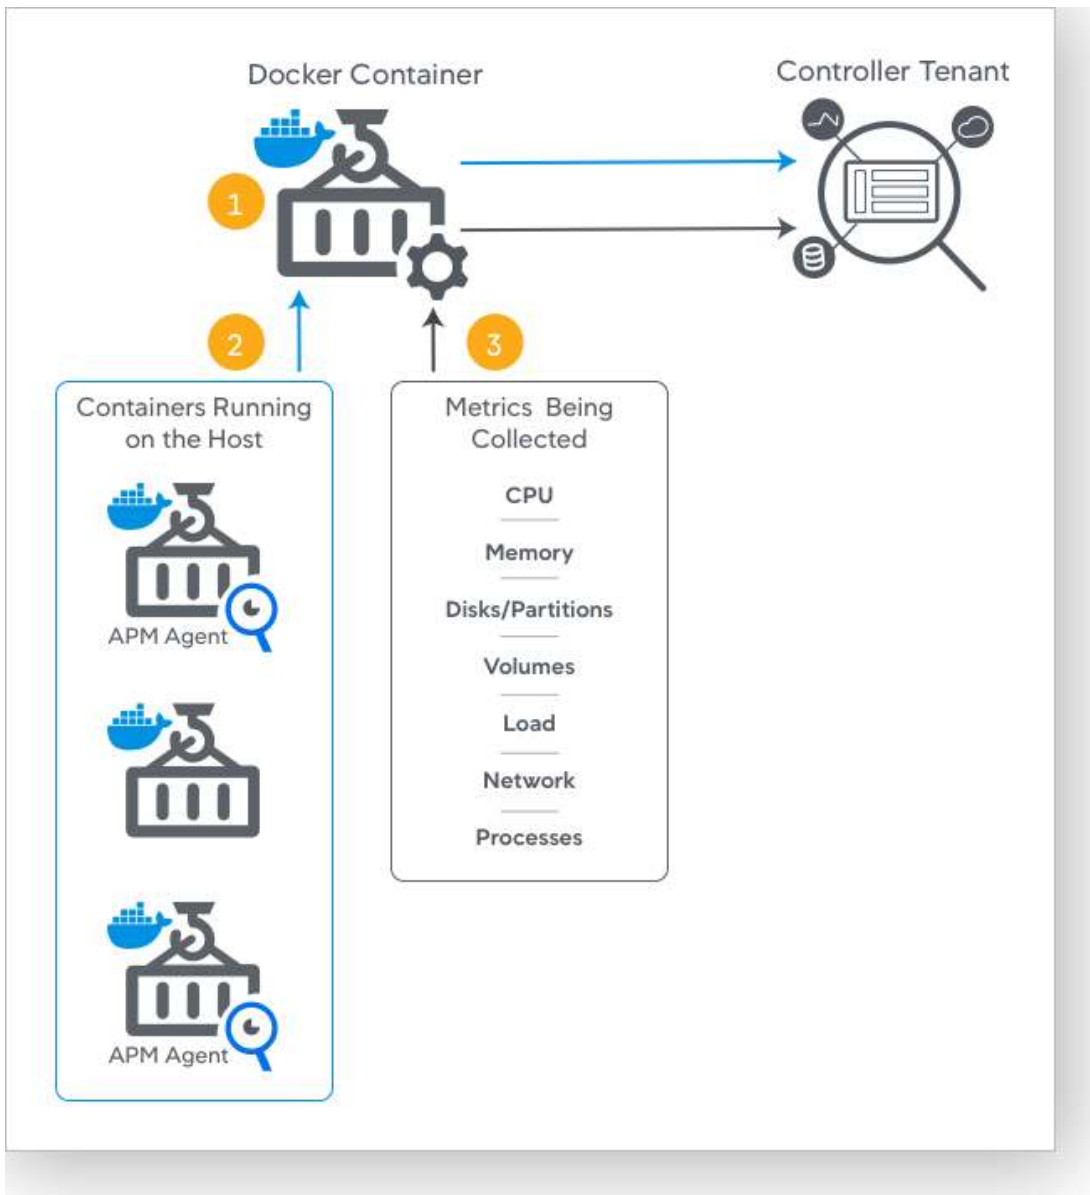

With Controller Tenant >=20.11.0:

- If the Machine Agent >=20.7.0, the Machine Agent automatically registers the container using the container ID as the host ID. No further action is needed.
- If the Machine Agent <=20.6.0 is configured incorrectly, the Controller Tenant rejects the misconfigured container registration.

By default, the Machine Agent only monitors containers that have a running APM Agent. You can change this by setting the `sim.docker.monitorAPMContainersOnly` property on the Controller Tenant. See [Controller Settings for Server Visibility](#).

**i** To deploy a Machine Agent on a host outside a Docker container, create a symbolic link: `ln -s / /hostroot` on the host. This symbolic link enables the Machine Agent to collect host metrics with Docker container metrics. When you deploy a Machine Agent inside a Docker container for monitoring, the symbolic link is automatically created when the volume mounts. To grant more restrictive permissions, enter this command to create symbolic links: `ln -s /proc /hostroot/proc; ln -s /sys /hostroot/sys; ln -s /etc /hostroot/etc`. You can make these links read-only because the AppDynamics Agent does not need write privileges to these directories.

This diagram illustrates how to deploy container monitoring:

- Install the Machine Agent **1** in a standalone container. The Machine Agent collects hardware metrics for each monitored container, as well as Machine and Server metrics for the host **3**, and forwards the metrics to the Controller Tenant.
- The Machine Agent can monitor all containers that are running on that host, subject to established limits, and will report runtime metrics and metadata for every container. Additionally, if any of the containers have an APM Agent installed **2**, then the Machine Agent also correlates the container metadata and runtime metrics with the associated APM Node.

## Before You Start

1. AppDynamics recommends that you use Docker CE/EE 17.03 or Docker Engine 1.13 with this product. Some data might be missing if you use previous versions of Docker.
2. Container Monitoring is not supported on Docker for Windows or Docker for Mac.
3. AppDynamics strongly recommends that you follow these guidelines, [Instrument JVMs in a Dynamic Environment](#) when monitoring container-based applications.

4. The Machine Agent can monitor up to 120 running containers per host. The default maximum number of containers per host is 100. With the [cgroup enabled](#) flag set to true, the Machine Agent can monitor up to 600 containers per host. See [Configure Docker Visibility](#).
5. The Machine Agent collects metrics from containers with one or more running processes whose command line matches a configurable regex. By default, this regex matches all processes (\*). To override this behavior, edit this regex in `<machine_agent_home>/extensions/DockerMonitoring/conf/DockerMonitoring.yml` :  

```
containerMonitoringConfig:containerProcessSelectorRegex: ".*"
```
6. The maximum number of containers you can monitor in one Controller Tenant depends on the Controller Tenant size, the total number of App Agents, and the current load.
7. Please review:
  - a. Best Practices for setting up [App Agents and Machine Agents](#).
  - b. Docker Visibility issues in the latest [Release Notes](#).

## Enable Container Monitoring

To enable Container Monitoring:

1. On the Controller Tenant, log in to the [Administration Console](#) and verify that `sim.docker.enabled` is set to **true**.
2. On the Agent, [enable Server Visibility](#) and [Docker Visibility](#).

## Container Monitoring Setup

The quickest and easiest way to run the Machine Agent with Container Monitoring enabled is to use one of the official images from the Docker Store: <https://hub.docker.com/u/appdynamics>. These images are produced by AppDynamics, based on certified base images from the Docker Community, and can either be run directly or used as base images for your own application containers. For full details of how to download and run containers based on these official images, see the documentation posted on the Docker Store. To build your own base images, the full source code for building these images is posted to GitHub. You can use this as a pattern for your own builds: <https://github.com/Appdynamics/appdynamics-docker-images>.

For the Machine Agent to monitor containers running on the server, configure these settings (See [Configure Installation Options](#)):

- [Server Visibility Enabled](#) – [Enable Server Visibility](#)
- [Docker Enabled](#) – [Enable Docker Visibility](#)
- **Volume Mounts** – Specify:
  - Volume mounts to allow read-only access to the underlying file system ( `/proc` , `/etc` and `/sys` ). This allows the Server Agent to collect host-level metrics for containers running on the server.
  - The UNIX domain socket on which the Docker daemon is configured to listen for API calls.

## View Container Details

To view container metadata and metrics in the Controller Tenant:

- In the **Applications** Dashboard, go to **Containers** to see all monitored containers used by the application.

The screenshot shows the AppDynamics interface for the 'ECommerce-Sales-Demo' application. The 'Containers' tab is selected in the left-hand navigation menu. The main area displays a table of containers with their respective CPU usage and trend graphs over the last hour.

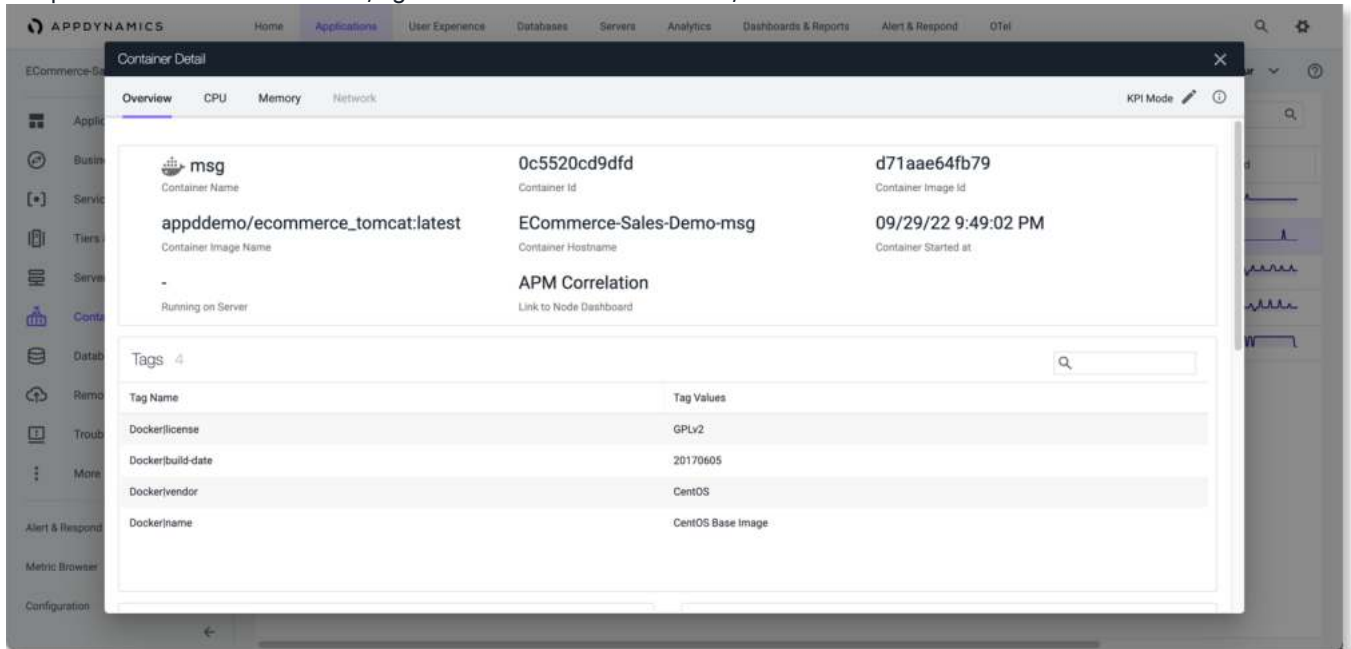

Container Name	Container Host...	Container Id	Container Image Id	Container Image Na...	Container Started At	CPU (%)	CPU (%) Trend
lbr	ECommerce-Sales-...	287aebf65059	4d19b091e46f	appdemo/ecommerce_...	2022-09-30T03:49:02...	1.02

- To open the Container Dashboard, right-click on the container name, and choose **View Details**.

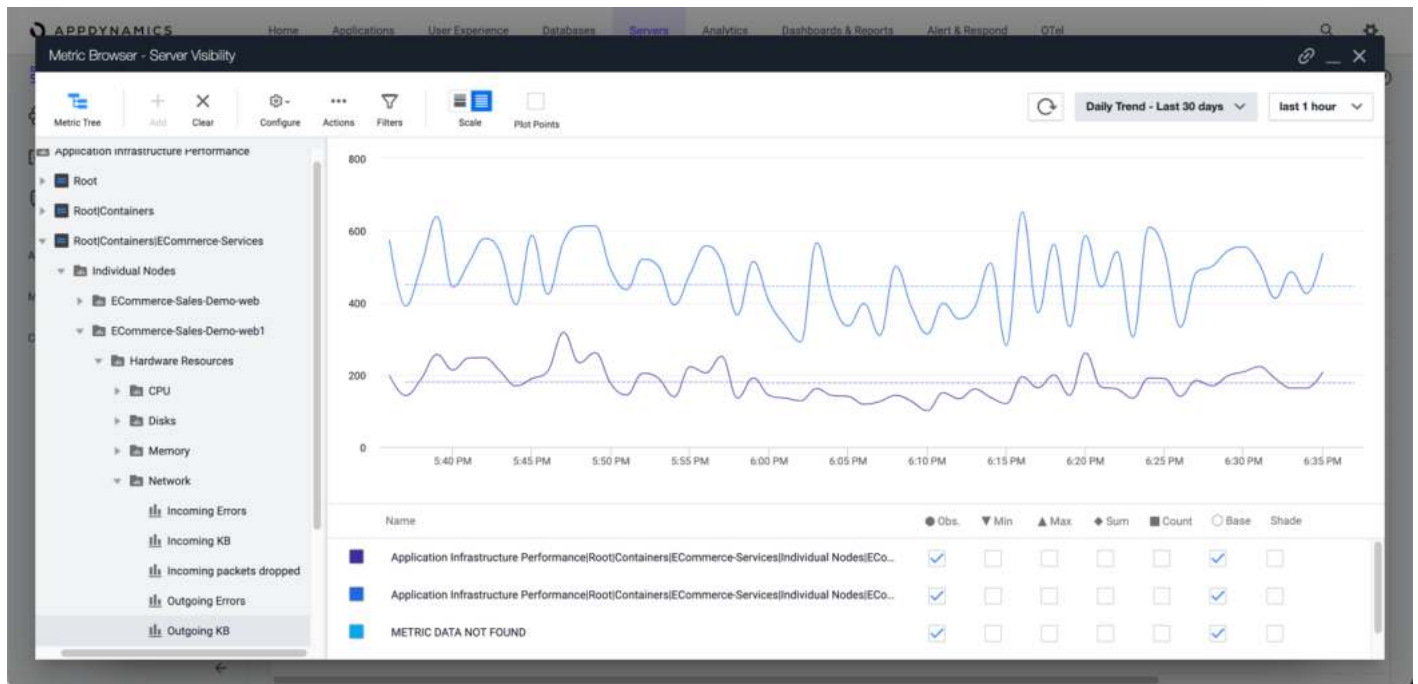

The Container Details view contains these tabs, which provide an overview of the health and resource usage for the container:

- **Overview** - Container metadata, Tags (name-value pairs derived from Docker/Kubernetes) plus AWS tags where applicable, and single chart views for CPU, memory, network and disk usage
  - **CPU** - CPU Usage and Throttled Time metrics
  - **Memory** - Memory Usage and Memory Fault metrics
  - **Network** - Network Usage metrics (only available when running in Diagnostic mode), see "Enable Dynamic Monitoring Mode (DMM)" under [Machine Agent Configuration Properties](#).
- The Node Dashboard also includes a Containers tab for the container in which that node is running.

## View Container Metrics Using the Metric Browser

To view time-series metric data for containers, double-click one of the container metric graphs (CPU, Memory, Network, Disk) to open the Metric Browser with the displayed metric selected. The Metric Browser tree displays the full set of metrics available for that container, and you can add these to the Metric Browser display by double-clicking the metric you wish to select. See [Container Metrics](#).

## Troubleshooting Containers Using Dynamic Monitoring Mode

Using Dynamic Monitoring Mode (DMM), you can selectively control the number of Container metrics reported for individual containers. Rather than have all Agents report all metrics for all containers all the time, you can configure individual Agents to collect:

- Key Performance Indicator metrics only (*KPI mode*)
- KPI and Diagnostic metrics (*Diagnostic mode*)
- All available metrics (*Advanced Diagnostic mode*)

This provides the flexibility to report KPI metrics only on most containers, and then increase the metric level on specific containers when you need deeper visibility to diagnose problems. You can increase scalability on the Controller Tenant and conserve metric bandwidth on the network with no sacrifice in visibility. Every Docker Visibility metric has a default DMM class (KPI, Diagnostic, and Advanced Diagnostic). For details, consult the Container Metrics table: the Default Monitoring Mode column indicates the default category of each metric when Dynamic Monitoring Mode is enabled.

When you notice a container that requires additional analysis or troubleshooting, change the DMM on that container to collect more metrics:

1. Open the **Container Detail** panel for the container of interest: Open the Containers table (**Containers**, left menu) and double-click the container.
2. Click the **Edit** (pen) button in the top-right corner, change the mode to **Diagnostic** or **Advanced Diagnostic**, and click the checkmark to apply the changes.
3. Collect additional metrics for your analysis or troubleshooting.
4. When you no longer need to collect additional metrics for that container, click  to set the DMM on that container back to KPI.

Note:

- Depending on the type of metrics collected by the Agent, the Controller Tenant has three different DMM defaults. These defaults are all set to KPI (the lowest setting):
  - `sim.machines.dmm.containerAware.defaultMode`  
Default for [Hardware Resources Metrics](#) on servers with Docker Visibility enabled
  - `sim.machines.dmm.container.defaultMode`  
Default for [Docker Container Metrics](#) on containers
- The default for both settings is KPI (the lowest setting).
- AppDynamics recommends that you leave these global settings at their defaults. If you need to collect advanced metrics for a specific server or container, increase the DMM on an "as-needed" basis.
- When a container monitored by a Java App Agent shuts down and restarts, any overridden DMM specified for the shut-down container is lost. The DMM for the restarted container automatically resets to the global default specified by `sim.machines.dmm.container.defaultMode`.
- If you switch the monitoring mode in the Controller Tenant from a more-inclusive to a less-inclusive mode, the Metric Browser will show values for the newly-excluded metrics for one hour after the switch. For example, if you switch from Diagnostic to KPI mode. For any Diagnostic metric, the Metric Browser will report a steady line (at 0, or the last-reported value) for one hour after the switch; then the line will disappear. This is standard behavior in the Metric Browser for an Agent when it stops reporting a specific metric.

## Configure Docker Visibility

- [Machine Agent Settings for Docker Visibility](#)
- [Controller Settings for Docker Visibility](#)

### Machine Agent Settings for Docker Visibility

You can configure the Docker Visibility settings in the file: `<machine-agent-home>/extensions/DockerMonitoring/conf/DockerMonitoring.yml`

**i** Before you edit this file, please review "Editing YAML Files: Important Notes" in [Machine Agent Settings for Server Visibility](#).

Property	Description	Default
<code>cgroupEnabled</code>	<p>The Machine Agent can collect Memory and CPU metrics for Docker containers using <code>cgroupdata</code>. This method is much faster than using the Docker API (the default metric-collection method). You can enable <code>cgroupmetriccollection</code> on all platforms except Amazon Linux OS. With the <code>cgroupEnabled</code> flag set to <code>true</code>, the Machine Agent can monitor up to 600 containers per host. When <code>cgroup</code> is enabled, you do not have to update the Docker Metric Collector Pool Size. The max container limit is independent of this.</p> <p>This mode is disabled by default. To enable <code>cgroupmetriccollection</code>, run the agent with the following command-line option set to <b>true</b>:</p> <pre>java -Dappdynamics.docker.container.collection.cgroup.enabled=true -jar machineagent.jar</pre>	<code>true</code>
<code>containerProcessSelectorRegex</code>	<p>The Machine Agent can monitor up to 150 running containers (depending on the pool size configuration, described below). The agent collects metrics from containers with one or more running processes whose command line matches a configurable regex. By default, the value of this regex is <code>".*" </code> and matches all containers irrespective of the processes running in them. If you cannot restart the APM agents, or if you want to filter APM agents based on another command-line argument, you can override this behavior by editing this regex. Default = <code>".*" </code></p>	<code>".*" </code>

Property	Description	Default
<code>docker.metric.collector.pool.size</code>	<p>Specify the local limit for the number of containers the agent can monitor. The effective limit for each agent is the minimum amount for:</p> <ul style="list-style-type: none"> <li>The <code>sim.docker.machine.container.limit</code> on the Controller (default limit = 15 containers), or</li> <li>The Docker Metric Collector Pool Size on the agent (default pool size = 3, or 90 containers).</li> </ul> <p>You can change this setting to monitor up to 120 containers (pool size = 4) or 150 containers (pool size = 5). The trade-off is that increasing the pool size might lead to higher resource consumption on the agent host.</p> <p>To change the pool size, set these properties:</p> <p><b>System Property</b></p> <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> <code>-Dappdynamics.docker.metric.collector.pool.size</code> </div> <p><b>Environment Variable</b></p> <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> <code>APPDYNAMICS_DOCKER_METRIC_COLLECTOR_POOL_SIZE</code> </div>	<p>default limit = 15 containers</p> <p>default pool size = 3, or 90 containers</p>
<code>dockerTagsEnabled</code>	<p>Enable (default) or disable the collection of Docker tags from containers monitored by the Machine Agent.</p>	

Property	Description	Default
<code>docker.use.container.name.selector</code>	<p>Use the Machine Agent to identify containers by container names only.</p> <p>By default for Docker monitoring, the Machine Agent obtains a list of containers. For each container, the Machine Agent retrieves all running processes inside the container. Then, the Machine Agent matches the container to be monitored by the process full command line. Because there are many containers, the selection process lasts longer than a minute, causing gaps in reporting container metrics.</p> <p>The Docker Use Container Name Selector configuration option provides an alternative way to select containers to be monitored by using the container's name. This option allows the Machine Agent to run significantly faster since the Machine Agent does not have to gather all the processes for each container.</p> <p>To enable matching with the container name, you can either use an environment variable or a JVM property. If both are defined, the environment variable is used.</p> <p><b>System Property</b></p> <pre>-Dappdynamics.docker.use.container.name.selector=false</pre> <p><b>Environment Variable</b></p> <pre>APPDYNAMICS_DOCKER_USE_CONTAINER_NAME_SELECTOR=false</pre> <p>You can select which containers to be monitored by providing the regular expression, <code>containerNameSelectorRegex</code>, to match the container names. By default, the Machine Agent matches all container names. Regular expressions are part of the <code>extensions/DockerMonitoring/conf/DockerMonitoring.yml</code> file.</p> <p>To exclude containers from monitoring, use an environment variable or the JVM property. If both are defined, the environment variable is used.</p>	<pre># default value ".*(machine-agent machineagent) .*"</pre>

Property	Description	Default
	<pre># default value ".*(machine-agent machineagent).*"  # environment variable export APPDYNAMICS_DOCKER_CONTAINER_NAME_SELECTOR_BLACKLIST_REGEX=".*(machine-agent machineagent).*"  # JVM property -Dappdynamics.docker.container.name.selector.blacklist.regex=".*(machine-agent machineagent).*" </pre>	

### Controller Settings for Docker Visibility

For information about how to configure these settings, see [Controller Settings for Machine Agents](#).

Property	Description	Default
<code>sim.docker.apmNode.markHistorical.enabled</code>	Enables configuration to mark the APM node historical when a container running the app agent is stopped.	true
<code>sim.docker.enabled</code>	Enable the Docker Monitoring feature.	true
<code>sim.docker.machine.container.limit</code>	<p>Global limit for the number of containers that each Machine Agent can monitor. The effective limit for each agent is a minimum of</p> <ul style="list-style-type: none"> <li>The <code>sim.docker.machine.container.limit</code> on the Controller (default limit = 15 containers), or</li> <li>The <a href="#">Docker Metric Collector Pool Size</a> on the agent (default pool size = 3, or 90 containers).</li> </ul> <p>You can specify this in the <a href="#">Administration Console</a> as a Controller setting (all accounts) or as an Account setting for individual accounts. 150 is the maximum limit you can specify.</p>	15

Property	Description	Default
<code>sim.machines.reuse.enabled</code>	Reuse SIM Machine entities to handle an ephemeral environment. Support is currently limited to Docker container machines.  If set to <code>false</code> , each new container is considered a new machine.	<code>true</code>
<code>sim.machines.tags.enabled</code>	Enable or disable the import of Docker tags to the Controller.	<code>true</code>

## Use Docker Visibility with Kubernetes

This page describes how to set up the Machine Agent with Docker Visibility enabled to run as a `DaemonSet` on a Kubernetes cluster.

Container visibility enables you to monitor containerized applications running inside Kubernetes pods and identify container issues that impact application performance. You deploy the Machine Agent as a Kubernetes `DaemonSet` in every node of a Kubernetes cluster. Deploying the Machine Agent as a `DaemonSet` ensures that every Kubernetes worker node runs the Machine Agent to collect critical resource metrics from the node host and associated Docker containers.

**!** Using Docker Visibility to monitor Kubernetes containers is no longer the preferred option and will be deprecated. Use the Cluster Agent instead as described in [Monitor Kubernetes with the Cluster Agent](#). The Cluster Agent supports Kubernetes container visibility, as well as visibility into cluster health and capacity.

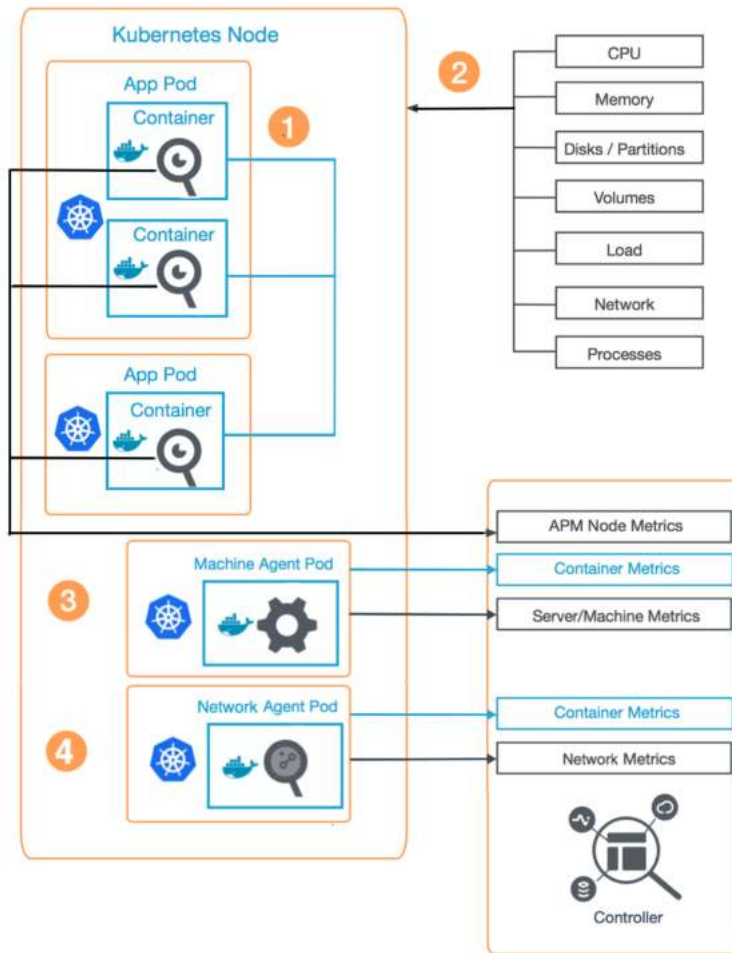

### Container Visibility with Kubernetes

Deploy the Machine Agent in Docker-enabled mode. To configure and run the Machine Agent using Docker, see [Configure Docker Visibility](#).

The Machine Agent:

- Identifies the containers managed by Kubernetes.
- Determines if these containers contain app server agents.
- Correlates containers with app server agents with the APM nodes for that application.

This diagram depicts the deployment scenario for container visibility in Kubernetes:

- Install the Machine Agent container (1) as a `DaemonSet` on each Kubernetes node.
- To collect APM metrics from any container in a pod, install the correct App Server Agent (2) in the container before deploying the pod.
- The Machine Agent collects resource usage metrics for each monitored container (3), as well as Machine and Server metrics for the host, and forwards the metrics to the Controller.
- (Optional) Install the Network Agent (4) as a `DaemonSet` on the node you want to monitor. The Network Agent collects metrics for all network connections between monitored application components and sends these metrics to the Controller.

## Before You Begin

Review the requirements for Container Visibility with Kubernetes:

- A Machine Agent must run as a `DaemonSet` on every Kubernetes node you want to monitor.
- Every node to be monitored must have a Server Visibility license.
- Docker Visibility must be enabled on each Machine Agent.
- Both App Server Agents and Machine Agents are registered by the same account and are using the same Controller.
- If you have multiple App Server Agents running in the same pod, register the container ID as the host ID on each App Server Agent and Machine Agent.

## Limitations

- Only the Docker Container Runtime is supported.
- Only Pod and ReplicaSet labels are supported.

## Procedure

1. [Enable Container Visibility](#)
2. [Register the Container ID as the Host ID](#)
3. [Configure the Cluster Role](#)
4. [Deploy the Machine Agent on Kubernetes](#)

After the Machine Agent has been deployed on Kubernetes, you can add the App Server Agent into your image:

- [Instrument Applications with Kubernetes](#)
  - [Resource Limits](#)

## Enable Container Visibility

Update the Controller to  $\geq 4.4.3$ .

To enable Kubernetes Visibility in your environment, edit these parameters:

- Controller
  - `sim.machines.tags.k8s.enabled`: The value defaults to `true`. The global tags enabled flag has priority over this.
  - `sim.machines.tags.k8s.pollingInterval`: The value defaults to one minute. The minimum value you can set for the polling interval is 30 seconds.
- Machine Agent
  - `k8sTagsEnabled`: The value defaults to `true` and is specified in the `ServerMonitoring.yml` file.

Continue with [Use Docker Visibility with Red Hat OpenShift](#). You can use the example `DaemonSet`, the sample Docker image for Machine Agent, and the sample Docker start script to set up the Machine Agent.

## Register the Container ID as the Host ID

Install an app server agent in every container in a Kubernetes pod to collect application metrics. If multiple app server agents are running in the same pod, for example, in the RedHat OpenShift platform, you must register the container ID as the unique host ID, on both the app server agent and the Machine Agent, to collect container-specific metrics from the pod. Kubernetes pods can contain multiple containers and they share the same host ID. The Machine Agent cannot identify different containers running in a pod unless each container ID is registered as the host ID.

To register the container ID as the host ID:

1. Get the container ID from the `cgroup`.

```
cat /proc/self/cgroup | awk -F '/' '{print $NF}' | head -n 1
```

2. Register the app server agents.

```
-Dappdynamics.agent.uniqueHostId=$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup)
```

3. Register the Machine Agent.

```
-Dappdynamics.docker.container.containerIdAsHostId.enabled=true
```

## Configure the Cluster Role

This sample cluster role definition provides read access to various Kubernetes resources. These permissions enable Kubernetes extensions to the Machine Agent and pod metadata collection. The role is called `appd-cluster-reader`, but you can rename it. The cluster role definition outlines various API groups that will be available for members of this role. For every API group, we define a list of resources that will be accessed and the access method. Because we need to retrieve information from these API endpoints, we need the read-only access, expressed by "get", "list", and "watch" verbs.

```
kind: ClusterRole
apiVersion: rbac.authorization.k8s.io/v1
metadata:
 name: appd-cluster-reader
rules:
- nonResourceURLs:
 - '*'
 verbs:
 - get
- apiGroups: ["batch"]
 resources:
 - "jobs"
 verbs: ["get", "list", "watch"]
- apiGroups: ["extensions"]
 resources:
 - daemonsets
 - daemonsets/status
 - deployments
 - deployments/scale
 - deployments/status
 - horizontalpodautoscalers
 - horizontalpodautoscalers/status

 - apiservices/status
 verbs:
 - get
 - list
 - watch
- apiGroups:
 - events.k8s.io
 resources:
 - events
 verbs:
 - get
 - list
 - watch

```

Once the role is defined, you must create cluster role bindings to associate the role with a service account. This example of a ClusterRoleBinding spec makes `appd-cluster-reader` service account a member of the `appd-cluster-reader-role` in the project "myproject". The naming is purely coincidental. The names of the service account and the cluster role do not have to match.

```

kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1
metadata:
 name: cluster-reader-role-binding
subjects:
- kind: ServiceAccount
 name: appd-cluster-reader
 namespace: myproject
roleRef:
 kind: ClusterRole
 name: appd-cluster-reader
 apiGroup: rbac.authorization.k8s.io

```

## Deploy the Machine Agent on Kubernetes

You can deploy the AppDynamics Machine Agent in a single container image without an init container. By default, the Machine Agent is deployed to the cluster as a `DaemonSet` and distributes every Agent instance evenly across all cluster nodes. When required, you can configure the `DaemonSet` with node affinity rules or node anti-affinity rules to ensure that it is deployed to a desired set of nodes and not across the entire cluster. See [Assigning Pods to Nodes](#) to learn about node affinity.

To harvest pod metadata, the service account used to deploy the Machine Agent must have the `cluster-reader` role in OpenShift. The `cluster-reader` role is also required for the Kubernetes extensions to the Machine Agent.

```
assigning cluster-reader role in OpenShift
oc adm policy add-cluster-role-to-user cluster-reader -z appd-account
```

If you are working with a vanilla Kubernetes distribution, it may not have a pre-built cluster role similar to `cluster-reader` in OpenShift. See [ClusterRole Configuration](#).

## Instrument Applications with Kubernetes

There are several approaches to instrumenting applications deployed with Kubernetes; the method you choose depends on your particular requirements and DevOps processes. To monitor an application container with AppDynamics, you must include an App Server Agent in that container by:

- Using an appropriate base image which has the App Server Agent pre-installed.
- Loading the App Server Agent dynamically as part of the container startup using an init container.
- Loading the App Server Agent and dynamically attaching it to a running process (where the language runtime supports it).

The third option is usually applicable only to Java-based applications since the JVM supports Dynamic Attach, a standard feature of the AppDynamics Java APM Agent. See [Dynamic Java Instrumentation](#).

For the other options, it is common practice to make use of standard Kubernetes features such as Init Containers, ConfigMaps, and Secrets (as described in [Deploying AppDynamics Agents to OpenShift Using Init Containers](#)).

## Resource Limits

The main application being monitored should have resource limits defined. Provide 2% padding for CPU and add up to 100 MB of memory.

To support up to 500 containers, you can configure the Machine Agent with the following resource requests and limits: `Mem = 400M, CPU = "0.1"` and `Mem = 600M, CPU = "0.2"`

**i** AppDynamics provides a [Kubernetes Snapshot Extension](#) to monitor the health of the Kubernetes Cluster. When deploying this extension, only a single version of the extension should be deployed to the cluster. Do not include it in the `DaemonSet` to avoid duplicates and potential cluster overload. Instead, consider deploying the Machine Agent instance with this extension, in addition to the `DaemonSet`, as a separate deployment with a single replica for Server Visibility. In this case, you can drop the memory request to 250 M and disable the Machine Agent SIM and Docker.

## Use Docker Visibility with Red Hat OpenShift

This page describes how to set up the Machine Agent with Docker Visibility enabled to run as a `DaemonSet` on an OpenShift cluster.

Docker Visibility supports OpenShift Version 3. With the Machine Agent, you can collect performance data from OpenShift clusters. By installing the agent as a `DaemonSet` on each host in the OpenShift cluster, the

`DaemonSet` monitors each host on the OpenShift cluster and the corresponding containers that have an AppDynamics App Agent running. This process is similar to that of monitoring the Kubernetes cluster.

**!** Using Docker Visibility to monitor OpenShift containers is no longer the preferred option and will eventually be deprecated. Use the Cluster Agent instead as described in [Monitor Kubernetes with the Cluster Agent](#). The Cluster Agent supports OpenShift container visibility, as well as visibility into cluster health and capacity.

## Before You Begin

 This functionality requires a Server Visibility license.

- You must have an OpenShift user account with a `cluster-admin` role, such as `system:admin`.
- Install the OpenShift command line tool (`oc`)
- AppDynamics recommends that you use Docker CE/EE v17.03 or Docker Engine  $\geq$  v1.13 with this product. Some data may be unavailable if you are using previous versions of Docker.

## Set the Java Options

By default, the `MaxMetaspaceSize` is set to 100 MB in OpenShift. If your application operates within a small margin of its existing memory resource allocation, increase the allocation for the application. AppDynamics recommends allocating additional Metaspace Size space to accommodate the machine agent. Directly configure the environment variable `GC_MAX_METASPACE_SIZE` to set the `MaxMetaspaceSize` parameter in the deployment through a config map.

## Register the Container ID as the Host ID

Install an App Server Agent in each container in a Kubernetes pod to collect application metrics. If multiple App Server agents are running in the same pod (for example, in the RedHat OpenShift platform), you must register the container ID as the unique host ID on both the App Server Agent and the Machine Agent to collect container-specific metrics from the pod. Kubernetes pods can contain multiple containers and they share the same host ID. The Machine Agent cannot identify different containers running in a pod unless each container ID is registered as the host ID.

To register the container ID as the host ID:

1. Get the container ID from the `cgroup`.

```
cat /proc/self/cgroup | awk -F '/' '{print $NF}' | head -n 1
```

2. Register the App Server Agents.

```
-Dappdynamics.agent.uniqueHostId=$(sed -rn '1s#.*/#; 1s/docker-(.{12}).*/\1/p' /proc/self/cgroup)
```

3. Register the Machine Agent.

```
-Dappdynamics.docker.container.containerIdAsHostId.enabled=true
```

## Create Project and Service Account

In OpenShift terminology, a *project* is a mechanism to isolate a group of users and their resources. An administrator can provide individual users or groups with permission to create projects and/or manage specific projects.

To isolate the Machine Agent from other projects, create a machine agent project:

```
oc new-project machine-agent
```

To create a service account, `ma`, with necessary privileges for the Machine Agent to obtain metrics:

1. Verify that the current project is `machine-agent`.

```
oc status
```

2. Create a service account.

```
oc create serviceaccount ma
```

Service accounts provide a secure way to control OpenShift API access without sharing a regular user's credentials.

3. Assign the privileged security context constraints (SCC) to the service account. SCC determines the permissions and abilities of pods.

```
oc adm policy add-scc-to-user privileged -z ma
```

See [Security Permissions for the Service Account](#) for the detailed list of permissions for the service account.

4. Add the `cluster-reader` role to the service account.

```
oc adm policy add-cluster-role-to-user cluster-reader -z ma
```

## Secure the Machine Agent

You can deploy the Machine Agent with tighter security. Determine the level of security for the project and leverage security permissions to secure the Machine Agent.

### Run the Machine Agent Without cluster-reader Role

Without the `cluster-reader` role, the Machine Agent cannot read information such as Pod and ReplicaSet from the OpenShift cluster. The agent can, however, collect other metrics except for the tags in the app server agent container.

## Run the Machine Agent Without Privileged Container Mode

To disable this privilege, remove the section below from the `DaemonSet` YAML file.

```
securityContext:
 privileged: true
```

Without the Privileged Container mode, the Machine Agent cannot read files like `/hostroot/etc/passwd` and `/hostroot/proc/<pid>/etc`. Therefore, it cannot collect metrics such as processes and network.

Disabling this privilege has no effect on collecting the App Server Agent container metrics.

## Security Permissions for the Service Account

The Service Account requires the following security permissions to provide maximum isolation to the project under which the Machine Agent is running:

Permission	Description
The cluster-reader role	<p>This cluster-reader role allows the Machine Agent to read tags from the OpenShift cluster.</p> <p>For example:</p> <pre>oc adm policy add-cluster-role-to-user cluster-reader -z ma</pre>
The privileged SCC	<p>The privileged SCC allows the Machine Agent to be run as the root user.</p> <p>For example:</p> <pre>oc adm policy add-scc-to-user privileged -z ma</pre>
Run as privileged container	<p>Running as the privileged container allows the Machine Agent to perform operations such as reading files from <code>/etc</code> and reading process information from <code>/proc</code>.</p> <p>This privilege is configured in the <code>DaemonSet</code> YAML file as follows.</p> <pre>securityContext:   privileged: true</pre>

## Create a Docker Image of the Machine Agent

Copy the following files to a directory on a machine that can build the Docker image.

- Machine Agent Bundle - 64-bit Linux (zip)  
Download this [bundle](#) and rename it to `machine-agent.zip`.
- Dockerfile  
See the [sample Docker file](#) below.
- `start-appdynamics` script  
See the [sample script](#) below.

Build the image with your desired method and make it available in your image registry.

## Deploy the Machine Agent as `DaemonSet`

1. Modify the sample `DaemonSet` to point to your Controller:
  - a. Select the worker node.

```
nodeSelector:
 node-role.kubernetes.io/compute: "true"
```

- b. Change the following Controller information in the sample `DaemonSet`.

```
containers:
 - env:
 - name: APPDYNAMICS_CONTROLLER_HOST_NAME
 value: "<controller-host-name>"
 - name: APPDYNAMICS_CONTROLLER_PORT
 value: "<controller-port>"
 - name: APPDYNAMICS_CONTROLLER_SSL_ENABLED
 value: "true"
 - name: APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY
 value: "<account-access-key>"
 - name: APPDYNAMICS_AGENT_ACCOUNT_NAME
 value: "<your-account>"
 - name: APPDYNAMICS_SIM_ENABLED
 value: "true"
 - name: APPDYNAMICS_DOCKER_ENABLED
 value: "true"
```

- c. Specify the Docker image.

```
image: "<your image>"
```

- d. Enable the Machine Agent to run as the privileged user.

```
securityContext:
 privileged: true
```

- e. If you have a different service account name, replace it with the existing one.

```
serviceAccount: ma
serviceAccountName: ma
```

2. Create `DaemonSet` below:
  - a. Verify that the current project is machine-agent.

```
oc status
```

- b. Create the machine-agent `DaemonSet` .

```
oc create -f machine-agent-daemonset.yaml
```

The Machine Agent appears in the UI.

### Verify Machine Agent Status

If the Machine Agent does not appear in the UI, check the status as follows:

1. Check the machine-agent `DaemonSet` .

```
oc get ds
```

2. Check the machine-agent pod.

```
oc get pod
```

The pod name is `machine-agent-daemonset-<XXXX>` .

3. Check logs whether the last line is "Started AppDynamics Machine Agent Successfully."

```
oc get logs -f <machine-agent-daemonset-<XXXX>>
```

### Sample Machine Agent Deployment Files

Below are sample `DaemonSet` , Dockerfile and Start Script that you can use as a reference for deploying the Machine Agent.

#### Sample `DaemonSet`

Modify the sample `DaemonSet` to suit your deployment scenario.

```
apiVersion: extensions/v1beta1
kind: DaemonSet
metadata:
 name: machine-agent-daemonset
 namespace: machine-agent
spec:
 selector:
 matchLabels:
 name: appdynamics-machine-agent
 template:
 metadata:
 labels:
```

```

 name: appdynamics-machine-agent
spec:
 nodeSelector:
 node-role.kubernetes.io/compute: "true"
 containers:
 - env:
 - name: APPDYNAMICS_CONTROLLER_HOST_NAME
 value: "<your-hostname>"
 - name: APPDYNAMICS_CONTROLLER_PORT
 value: "<your-port>"
 - name: APPDYNAMICS_CONTROLLER_SSL_ENABLED
 value: "true"
 - name: APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY
 value: "<your-access-key>"
 - name: APPDYNAMICS_AGENT_ACCOUNT_NAME
 value: "<your-account>"
 - name: APPDYNAMICS_SIM_ENABLED
 value: "true"
 - name: APPDYNAMICS_DOCKER_ENABLED
 value: "true"
 image: <your-image>
 name: machine-agent
 securityContext:
 privileged: true
 volumeMounts:
 - mountPath: /hostroot
 name: hostroot
 readOnly: true
 - mountPath: /var/run/docker.sock
 name: docker-sock
 restartPolicy: Always
 imagePullPolicy: Always
 serviceAccount: ma
 serviceAccountName: ma
 volumes:
 - name: hostroot
 hostPath:
 path: /
 - name: docker-sock
 hostPath:
 path: /var/run/docker.sock

```

## Sample Dockerfile

You can use this Dockerfile sample or the one in [OpenShift Visibility Manifests](#).

```

Sample Dockerfile for the AppDynamics Machine Agent
This is provided for illustration purposes only

FROM ubuntu:16.04
Install required packages

```

```

RUN apt-get update && \
 apt-get install -y unzip && \
 apt-get clean
Install AppDynamics Machine Agent
ENV MACHINE_AGENT_HOME /opt/appdynamics/machine-agent/
ADD machine-agent.zip /tmp/machine-agent.zip
RUN mkdir -p ${MACHINE_AGENT_HOME}
Include start script to configure and start MA at runtime
ADD start-appdynamics ${MACHINE_AGENT_HOME}
RUN chmod 774 ${MACHINE_AGENT_HOME}/start-appdynamics
change files and directories to be owned by root so MA container user in root
group can access
RUN chgrp -R 0 /opt && \
 chmod -R g=u /opt
RUN chgrp -R 0 /tmp/machine-agent.zip && \
 chmod g=u /tmp/machine-agent.zip
Changing directory to MACHINE AGENT HOME
WORKDIR ${MACHINE_AGENT_HOME}
Configure and Run AppDynamics Machine Agent
CMD "./start-appdynamics"

```

### Sample start-appdynamics Script

```

#!/bin/bash
unzip -oq /tmp/machine-agent.zip -d ${MACHINE_AGENT_HOME} && \
 rm /tmp/machine-agent.zip
Start Machine Agent
./bin/machine-agent -j jre/

```

## Monitor VMware Tanzu

### VMware Tanzu Application Service (PCF)

VMware Tanzu Application Service (TAS), formerly known as Pivotal Cloud Foundry (PCF), is an open-source cloud computing Platform as a Service (PaaS). Developers can develop, deploy, operate, and scale cloud-native applications for public and private clouds.

AppDynamics provides an Application Performance Monitoring tile to support VMware TAS 2.x (>= v2.0.7) and is available on the [VMware Tanzu Network](#) to download and install in a TAS foundation.

### VMware Tanzu Kubernetes Grid Integrated (PKS)

VMware Tanzu Kubernetes Grid Integrated (TKGI), formerly known as Pivotal Container Service (PKS), is VMware's product used to deploy and manage open-source Kubernetes. The Kubernetes monitoring that AppDynamics provides has been tested to with TKGI. See [Monitor Kubernetes with the Cluster Agent](#) to set up container and cluster visibility within TKGI.

## AppDynamics Application Performance Monitoring for VMware Tanzu

To simplify APM setup, the [AppDynamics Application Performance Monitoring for VMware Tanzu](#) tile delivers a service broker to support an AppDynamics marketplace service. You can configure the Controller parameters in the tile and automatically publish to the marketplace after you install the tile.

To bind a TAS app to the marketplace service to consume the Controller credentials, enter:

```
$ cf bind my-tas-app my-appd-marketplace-service
```

To use the integrated AppDynamics buildpack support to start the APM Agent based on the parameters from the marketplace service, and start sending performance metrics to the Controller, perform a push:

```
$ cf push
```

The tile also installs the AppDynamics extension buildpack in the TAS environment. See the [tile documentation](#) for buildpack support and language-specific workflows to enable APM.

## Container Metrics

To access the **Containers** Dashboard, select: AppDynamics Home > **Servers** > **Containers**.

The **Containers** Dashboard shows resource utilization metrics of your containerized applications and the underlying host machine. You can access the **Containers** Dashboard from the Servers tab in the Controller UI. The **Containers** page lists all monitored containers used by an application that is registered to the Controller.

### Container Metrics

- [CPU](#)
- [Disks](#)
- [Memory](#)
- [Network](#)

#### CPU

Name	Description	Default Monitoring Mode
%Busy	Percentage of time the CPU was busy processing system or user requests from this container; this metric includes CPU Stolen time.	KPI

Name	Description	Default Monitoring Mode
%Busy Scaled	<p>If the <code>-cpus=&lt;value&gt;</code> option is set in the container, this metric measures the scaled value of the CPUs property. If this value is not set, this metric measures the scaled value of the Logical CPUs property.</p> <p>To enable CPU Scaling:</p> <ul style="list-style-type: none"> <li>◦ Log in to the Administration Console: <code>http://&lt;controller host&gt;:&lt;port&gt;/controller/admin.jsp</code></li> <li>◦ Select the user account you want.</li> <li>◦ Select <b>Add Property</b> and add: key = <code>sim.docker.container.cpuScaling</code> value = <code>true</code></li> </ul>	KPI
Logical Cores	Number of logical cores on the host machine that are available to the container.	KPI
Shares	The <code>-c</code> or <code>cpu-shares</code> setting used to start the container.	KPI
Throttle Count	Number of times the container CPU is throttled. Use <b>Advanced</b> mode to view this metric as Throttled Time. If Throttled Time is less and the container is limited on computation, then this metric is available for you to review.	KPI
Throttled Time (ms)	Total amount of time the container CPU was throttled but did not receive enough host CPU. High throttle times indicate that the <code>-c</code> or <code>cpu-shares</code> setting (used to start the container) was too low.	KPI
Total %	Average utilization, of all available CPUs, by the container.	KPI

## Disks

Name	Description	Default Monitoring Mode
Average IO Utilization %	Average disk utilization for read/write operations. This metric may be unavailable on some platforms.	KPI
< <i>disk</i> > Reads/sec	Number of read operations by the container on < <i>disk</i> >.	Diagnostic
< <i>disk</i> > Writes/sec	Number of write operations by the container on < <i>disk</i> >.	Diagnostic
KB Read/sec	The rate of data read by the container from all disks and partitions.	KPI
KB Written/sec	The rate of data written by the container to all disks and partitions.	KPI
MB Reads/sec (MB)	Number of read operations by the container on all disks and partitions.	KPI
MB Writes/sec	Number of write operations by the container on all disks and partitions.	KPI
Queue Size	Average number of container requests queued during the time bucket. Consistently high queue sizes indicate that the container is not receiving enough IO resources. This metric may be unavailable on some platforms.	KPI

## Memory

Name	Description	Default Monitoring Mode
Cache Size (MB)	Total amount of data cached in memory.	Diagnostic

Name	Description	Default Monitoring Mode
Failed Count	Number of times a memory allocation failure occurred because it exceeded the pre-set memory limit for that container; or, number of times the hard limit for the container was reached.	KPI
Page Major Fault Count	Number of major page faults caused by the container. Docker metric is <code>pgmajfault</code> . A high rate of page faults could indicate that the specified memory constraints for the container are too low.	KPI
Reservation	Soft limit based on the <code>--memory-reservation</code> used to start the container.	KPI
Resident Set Size (MB)	Total amount of memory that belongs to stacks, heaps, and anonymous memory maps.	KPI
Usage	Memory usage by the container, in bytes.	KPI
Used %	Memory utilization by the container as a percentage of the memory hard limit, based on the <code>--memory</code> option used to start the container.	KPI
Used MB	Memory utilization by the container, in MB.	KPI

## Network

Name	Description	Default Monitoring Mode <sup>1</sup>
Count (KB)	Network Volume, count (KB), incoming from an external network and outgoing to an external network.	KPI
Rate (KB/s)	Network Rate, rate (KB/s), incoming from an external network and outgoing to an external network.	Diagnostic

Name	Description	Default Monitoring Mode <sup>1</sup>
Incoming (KB)	Network traffic received by the container.	KPI
Outgoing (KB)	Network traffic sent by the container.	KPI
Incoming (KB/sec)	Rate of network traffic received by the container.	Diagnostic
Outgoing (KB/sec)	Rate of network traffic sent by the container.	Diagnostic
Incoming Packets	Number of packets received by the container.	Diagnostic
Outgoing Packets	Number of packets sent by the container.	Diagnostic
Incoming Packets Dropped	Number of incoming packets dropped before reaching the container. A high count of dropped packets may indicate high congestion or an issue on the network path.	KPI
Outgoing Packets Dropped	Number of outgoing packets dropped after leaving the container. A high count of dropped packets may indicate high congestion or an issue on the network path.	KPI
Incoming Errors	Number of packets received with errors.	KPI
Outgoing Errors	Number of packets sent with errors.	KPI
< eth0 > Incoming Errors	Number of collision errors when < eth0 > could not receive a frame due to a problem on the interface.	Diagnostic
< eth0 > Outgoing Errors	Number of collision errors when < eth0 > could not send a frame due to a problem on the interface.	Diagnostic
< eth0 > Incoming KB	Average KB of traffic received on < eth0 >.	Diagnostic
< eth0 > Outgoing KB	Average KB of traffic sent on < eth0 >.	Diagnostic
< eth0 > Incoming KB/sec	Average rate of traffic received on < eth0 >.	Diagnostic

Name	Description	Default Monitoring Mode <sup>1</sup>
< eth0 > Outgoing KB/sec	Average rate of traffic sent on < eth0 >.	Diagnostic
< eth0 >Incoming Errors	Number of packets received on < eth0 > with errors.	Diagnostic
< eth0 > Outgoing Errors	Number of packets sent on < eth0 > with errors.	Diagnostic
< eth0 > Incoming Packets Dropped	Number of incoming packets dropped before reaching < eth0 >. A high count of dropped packets may indicate high congestion or an issue on the network path.	Diagnostic
< eth0 > Outgoing Packets Dropped	Number of outgoing packets dropped after leaving < eth0 >. A high count of dropped packets may indicate high congestion or an issue on the network path.	Diagnostic

## Monitor Kubernetes with the Cluster Agent

### Deployment Support

The Cluster Agent monitors the health of Kubernetes and OpenShift clusters and is supported on all major Kubernetes distributions. The Cluster Agent collects metrics and metadata for the entire cluster, including every node and namespace down to the container level. When you instrument applications with AppDynamics APM Agents, you can use the Cluster Agent to view both Kubernetes and APM metrics for those pods (if both the Cluster Agent and the APM Agents are reporting data to the same account on a Controller).

You can use the Cluster Agent to:

- Gain visibility into key Kubernetes metrics and events, and detect uptime and availability issues
- Track resource usage of pods relative to the defined requests and limits
- Diagnose issues that may prevent uptime or scalability issues, such as:
  - Pod failures and restarts
  - Node starvation
  - Pod eviction threats and pod quota violations
  - Image and storage failures
  - Pending or stuck pods
  - Bad endpoints (detects broken links between pods and application components)
  - Service endpoints in a failed state
  - Missing dependencies (Services, ConfigMaps, and Secrets)

---

## Deploy On Kubernetes

- [Install the Cluster Agent](#)
- [Configure the Cluster Agent](#)
- [Install Infrastructure Visibility with the Kubernetes CLI](#)

## Cluster Agent

- [Use the Cluster Agent](#)
- [Cluster Metrics](#)
- [Administer the Cluster Agent](#)
- [Monitor Cluster Health](#)

## Reference And Troubleshooting

- [Install the Cluster Agent](#)
- [Validate the Cluster Agent Installation](#)
- [Troubleshoot the Cluster Agent](#)
- [Overview of Cluster Monitoring](#)
- [Cluster Agent Requirements and Supported Environments](#)
- [Cluster Metrics](#)

## Overview of Cluster Monitoring

The AppDynamics Cluster Agent is a lightweight Agent written in Golang used to monitor Kubernetes and OpenShift clusters. You can use the Cluster Agent to monitor and understand how Kubernetes infrastructure affects your applications and business performance. With the Cluster Agent, you can collect metadata, metrics, and events for a Kubernetes cluster. The Cluster Agent is supported on Red Hat OpenShift and cloud-based Kubernetes platforms, such as Amazon EKS, Azure AKS, and Rancher.

### Cluster Monitoring in the Controller

The Cluster Agent monitors events and metrics of Kubernetes or OpenShift clusters. It also tracks the state of most Kubernetes resources: pods, replica sets, deployments, services, persistent volumes, nodes, and so on. The data is received through the Kubernetes API server and is sent to the AppDynamics Controller. See [Cluster Metrics](#).

### Cluster Agent and Server Visibility with Docker Monitoring

AppDynamics Server Visibility monitors the worker nodes at a more detailed level. Server Visibility includes the ability to monitor running containers through Docker Monitoring. However, the Cluster Agent also monitors the same containers through the Kubernetes API server. You cannot run Server Visibility with Docker Monitoring enabled, and the Cluster Agent concurrently. Doing so may result in your data being overwritten, and may lead to unpredictable behaviors. See [Install Infrastructure Visibility with the Kubernetes CLI](#).

 When you deploy both Agents to the cluster, ensure that you deploy the Machine Agent with Docker Visibility disabled. See [Monitor Containers with Docker Visibility](#).

## Cluster Dashboard Metrics

The Cluster Dashboard provides an overview of potential issues with cluster health, grouped by category and severity. It shows error events, evictions, node resource starvation, distribution of pod phases, and issues associated with:

- Applications
- Cluster configuration
- Image or storage access
- Security access errors
- Quota violations

The dashboard contains cluster resource capacity stats and resource usage data relative to the deployment requests and limits for CPU, Memory, and Storage. The dashboard also provides real-time statistics on the state of monitored objects on the cluster, best-practice violations, and missing dependencies. See [Monitor Cluster Health](#).

## Cluster Agent Health Rules

You can create Cluster Agent Health Rules based on cluster metrics. Because Health Rules for clusters are created using server health rules, the health rule violations for clusters show as a server health rule violation. When creating the Health Rule, in the **Affected Entities** section, select **Custom**, and then select your Cluster Agent from the list of machines. When setting the Critical/Warning conditions, the entire metric tree displays. Select the Cluster Agent metrics for which to create the Health Rule. To create Health Rules for Cluster Agent metrics, follow the [Create a Health Rule](#) procedures.

You can create Health Rules for these metrics:

- Number of error events
- Number of evictions
- Number of threats
- Nodes with disk pressure
- Nodes with memory pressure
- CPU/Memory utilization

## Cluster Agent Requirements and Supported Environments

This page describes the resource requirements, compatibility with different Kubernetes-based software, Cluster Agent distribution, licensing, and performance specifications.

### Hardware Requirements

The default requirement for the hardware is as following:

- CPU: 1250m
- Memory: 300Mi

**i** These values are applicable when you use Cluster Agent without auto-instrumentation. The values can change when you perform auto-instrumentation.

With auto-instrumentation, you need to increase the memory limits by 50Mi for every 100 pods. For Example, If 500 pods are instrumented through the agent, add 550Mi (300Mi + 250Mi) to the memory limits value.

You need to increase the CPU limits by 100m (1350m) when auto-instrumentation is enabled.

## Software Requirements

The Cluster Agent is designed to run on Linux and deployed using the AppDynamics Operator.

The Cluster Agent requires:

- AppDynamics Controller >= 20.3.0.
- Kubernetes versions >=1.19, with the Kubernetes [metrics-server](#) deployed and enabled on the cluster.
- A cluster that you can access and monitor.
- Sufficient Server Visibility licenses. The Cluster Agent consumes one [Server Visibility license](#). See [License Management](#).
- Access to Docker Hub or Red Hat Container Registry to pull the Cluster Agent Operator and Cluster Agent images, or access to an internal repository where these images are maintained. See [Install the Cluster Agent](#).

**i** If you deploy the Cluster Agent to monitor your Kubernetes Cluster, it does not monitor worker nodes. To monitor worker nodes, you must install the Machine Agent which consumes additional Server Visibility licenses (one Machine Agent per node). See [Install Infrastructure Visibility with the Kubernetes CLI](#)

The Cluster Agent is compatible with these cloud platforms:

Cloud Platform	Version
Rancher Kubernetes Engine (RKE)	<ul style="list-style-type: none"> <li>• 1.2.1 with Kubernetes 1.19.3</li> <li>• 1.3.1 with kubernetes 1.21.5</li> <li>• 1.3.9 with kubernetes 1.22</li> <li>• 1.3.12 with Kubernetes 1.23.7</li> <li>• 1.3.14 with Kubernetes 1.24.4</li> <li>• 1.4.1 with Kubernetes 1.24.8</li> <li>• 1.4.6 with Kubernetes 1.26.4</li> <li>• 1.4.10 with Kubernetes 1.26.8</li> </ul>
RKE Government (RKE2)	1.26, 1.27, and 1.28
Kubernetes	1.19, 1.20, 1.21, 1.22, 1.23, 1.24, 1.25, 1.26, and 1.27 with the Kubernetes <a href="#">metrics-server</a> deployed

Cloud Platform	Version
Amazon EKS	<ul style="list-style-type: none"> <li>AMD: 1.19, 1.20, 1.21, 1.22, 1.23, 1.24, and 1.25, 1.26, 1.27, and 1.28 with the Kubernetes <a href="#">metrics-server</a> deployed</li> <li>ARM: 1.27, and 1.28 with the Kubernetes <a href="#">metrics-server</a> deployed</li> </ul> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p><b>i</b> Auto-instrumentation is not supported on ARM platform.</p> </div>
Azure AKS	1.19, 1.20, 1.21, 1.22, 1.23, 1.24, 1.25, 1.26, 1.27 and 1.28 with the Kubernetes <a href="#">metrics-server</a> deployed
Google GKE	1.19, 1.20, 1.21, 1.22, 1.23, 1.24, 1.25, 1.26, 1.27 and 1.28
Red Hat OpenShift	<p>Azure: 4.6, 4.7, 4.8, 4.9, 4.10, 4.11, 4.12, and 4.13</p> <p>AWS: 4.11, 4.12, and 4.13</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p><b>i</b> The metrics-server is not shipped with OpenShift, you must deploy it separately. The CRI-O container runtime is supported on &gt;=4.2.7.</p> </div>
<a href="#">kubectl</a>	>=1.19
Tanzu Kubernetes Grid Integrated Edition (TKGI)	1.14.4 1.16, and 1.17

**i** Installing AppDynamics to test or evaluate involves verifying system requirements, preparing the host, and then installing the Controller. See [Install the Controller Using the CLI](#).

## Cluster Agent Distribution

You can download the Cluster Agent from the [AppDynamics Download site](#) as a zip archive. The archive also contains distribution-specific configuration files for the deployment.

## Licensing

The Cluster Agent requires a [Server Visibility license](#). To get started, see [Enable Server Visibility](#). If you already have a Server Visibility license, see [Install the Cluster Agent](#) for installing Cluster Agent on a Kubernetes cluster.

## Cluster Agent Performance Certification

Cluster Agent Version	Performance Certification
<=20.10	You can monitor the certified stable limit of 750 pods and 1500 containers
>=20.11	<ul style="list-style-type: none"> <li>Cluster Agent Vertical Scaling: This is the certified stable limit: If you run one container per pod then you can monitor 2250 pods and 2250 containers. If you run two containers per pod, then you can monitor 1500 pods and 3000 containers.</li> <li>Cluster Agent Horizontal Scaling: If the number of pods per cluster exceeds the limit, then you can deploy multiple Cluster Agents to monitor the cluster using Helm charts. See <a href="#">Install the Cluster Agent with Helm Charts</a>. For the limit of Cluster Agents per Controller, see <a href="#">Cluster Agent and Pod Limits</a>.</li> </ul>

### Cluster Agent and Pod Limits

To configure the limits, create an [AppDynamics Support](#) ticket.

## Permissions for Cluster Agent and Infrastructure Visibility

This page includes the permissions (RBAC authorization) that are created when Cluster Agent, AppDynamics Operator, and Infrastructure Visibility pods are deployed in a cluster.

**i** You do not require to add these permissions. These are created automatically during installation.

- [Cluster Agent](#)
- [AppDynamics Operator](#)
- [Infrastructure Visibility](#)

### Cluster Agent

The following permissions are created when you deploy Cluster Agent:

Resources	View/Edit	Permissions Required
Cluster-Agent	View	<ul style="list-style-type: none"> <li>• get</li> <li>• list</li> <li>• watch</li> </ul>

Resources	View/Edit	Permissions Required
Cluster Agent/status	View	get
Cluster-Agent	Edit	<ul style="list-style-type: none"> <li>• get</li> <li>• list</li> <li>• watch</li> <li>• create</li> <li>• update</li> <li>• delete</li> <li>• patch</li> </ul>
Cluster-Agent/status	Edit	get

### AppDynamics Operator

The following permissions are created when you deploy AppDynamics Operator:

Resources	Permissions Required
Cluster-Agent	<ul style="list-style-type: none"> <li>• get</li> <li>• list</li> <li>• watch</li> <li>• create</li> <li>• update</li> <li>• delete</li> <li>• patch</li> </ul>
Clusteragents/finalizers	update
Clusteragents/status	<ul style="list-style-type: none"> <li>• get</li> <li>• update</li> <li>• patch</li> </ul>
Infravizs	<ul style="list-style-type: none"> <li>• get</li> <li>• list</li> <li>• watch</li> <li>• create</li> <li>• update</li> <li>• delete</li> <li>• patch</li> </ul>
Infraviz/status	update
Infraviz/finalizers	<ul style="list-style-type: none"> <li>• get</li> <li>• update</li> <li>• patch</li> </ul>

## Infrastructure Visibility

The following permissions are created when you deploy Infrastructure Visibility:

Resources	View/Edit	Permissions Required
Infravizs	View	<ul style="list-style-type: none"> <li>• get</li> <li>• list</li> <li>• watch</li> </ul>
Infravizs/status	View	get
Infravizs	Edit	<ul style="list-style-type: none"> <li>• get</li> <li>• list</li> <li>• watch</li> <li>• create</li> <li>• update</li> <li>• delete</li> <li>• patch</li> </ul>
Infraviz/status	Edit	get

## Install the Cluster Agent

This page describes how to install the Cluster Agent. For optional post-installation steps, including instrumenting applications with App Server Agents, see [Post-Install Workflow](#).

### Installation Overview

You can install the Cluster Agent using either the Kubernetes CLI ( `kubectl` ) or Cluster Agent Helm. In both cases, the Cluster Agent Operator is installed first, followed by the Cluster Agent. The exact configuration applied during the installation differs slightly based on whether the cluster is an OpenShift or Kubernetes cluster.

### Installation Workflow

You must make these decisions during the installation workflow:

- The first decision is to use the officially released pre-built Appdynamics Operator images published on DockerHub and Redhat Registry or If you want to build a custom Appdynamics Operator image. See [Build the Custom AppDynamics Operator Image](#).
- The second decision is whether to use the officially released pre-built Cluster Agent images published on DockerHub and Redhat Registry or If you want to build a custom Cluster Agent image. See [Cluster Agent Container Image](#).
- The third decision is whether to install the Cluster Agent using the Kubernetes CLI or the Cluster Agent Helm Chart. See [Install the Cluster Agent with the Kubernetes CLI](#) and [Install the Cluster Agent with Helm Charts](#).

The Cluster Agent requires that you install the [Metrics Server](#) in the cluster. If the metrics server is not already installed under the `kube-system` namespace, then you can install it using the Kubernetes CLI, as described in [Install the Cluster Agent with the Kubernetes CLI](#). If you are using the Cluster Agent Helm chart, you can set the `install.metrics-server` Helm value to `true` to install the Metrics Server subchart. See [Install the Cluster Agent with Helm Charts](#).

---

After the installation completes, see [Validate the Cluster Agent Installation](#) for validation and troubleshooting procedures.

### Post-Install Workflow

After you install and [Validate the Cluster Agent](#), you can instrument the Kubernetes applications in the cluster with AppDynamics Server Agents. See [Container Platforms](#) for an overview of the options.

To install the AppDynamics Server Visibility Agent or Network Agent on cluster nodes, see [Install Infrastructure Visibility with the Kubernetes CLI](#).

To enable log collection for failing pods on on-premises Controllers, see [Enable Log Collection for Failing Pods](#).

### Next Steps

[Install the Cluster Agent with the Kubernetes CLI](#)

[Install the Cluster Agent with Helm Charts](#)

This page describes how to install the Cluster Agent. For optional post-installation steps, including instrumenting applications with App Server Agents, see [Post-Install Workflow](#).

### Install the Cluster Agent with the Kubernetes CLI

This page describes how to install the Cluster Agent using the Kubernetes CLI which is an alternative to [Install the Cluster Agent with Helm Charts](#).

### Requirements

Before you begin, verify that you have:

- Installed [kubectl](#) >= 1.16
- Met the requirements described here: [Cluster Agent Requirements and Supported Environments](#)

### Installation Procedure

1. If you have not already installed the `metrics-server`, then install it. See <https://github.com/kubernetes-sigs/metrics-server> for the most recent installation instructions.

```
kubectl apply -f https://github.com/kubernetes-sigs/metrics-server/releases/latest/download/components.yaml
```

2. Download the Kubernetes or OpenShift Cluster Agent bundle from the [Download portal](#), unzip the contents of the bundle to the current directory:

```
unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
```

3. Create a `namespace` for `appdynamics` in your cluster:

```
kubectl create namespace appdynamics
```

4. Install the Cluster Agent Operator using the correct Kubernetes and OpenShift version (where applicable):

[Kubernetes >= 1.16](#)   [OpenShift with Kubernetes >= 1.16](#)   [OpenShift with Kubernetes <= 1.15](#)

```
kubectl create -f cluster-agent-operator.yaml
```

[Kubernetes >= 1.16](#)   [OpenShift with Kubernetes >= 1.16](#)   [OpenShift with Kubernetes <= 1.15](#)

```
kubectl create -f cluster-agent-operator-openshift.yaml
```

[Kubernetes >= 1.16](#)   [OpenShift with Kubernetes >= 1.16](#)   [OpenShift with Kubernetes <= 1.15](#)

```
kubectl create -f cluster-agent-operator-openshift-1.15-or-less.yaml
```

**i** You can also install Cluster Agent Operator from [OpenShift OperatorHub](#) in your OpenShift cluster.

5. Based on the Account Access Key for the Controller, create the Controller Access Key Secret that the Cluster Agent reports to:

```
kubectl -n appdynamics create secret generic cluster-agent-secret --from-literal=controller-key=<access-key>
```

6. Edit `cluster-agent.yaml` to set the AppDynamics Controller details for the Cluster Agent to report to.
- Set the `nsToMonitor` (deprecated) or `nsToMonitorRegex` options to include the namespaces you want to monitor.
  - Set the image tag to the version you are installing. Refer to Docker Hub for the latest version of the image tag.

For additional configuration tasks, such as configuring SSL for on-premises Controllers, proxy support, or pull secrets, see [Configure the Cluster Agent](#).

This example assumes the use of the pre-built Cluster Agent image on Docker Hub. See [Cluster Agent Container Image](#) to build your own image.

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
```

```

name: k8s-cluster-agent
namespace: appdynamics
spec:
 appName: "dev-cluster"
 controllerUrl: "http://mycontroller.com:8080"
 account: "my-account"
 # docker image info where, <version> is the image tag version that you are installing
 image: "docker.io/appdynamics/cluster-agent:<version>"
 serviceAccountName: appdynamics-cluster-agent
 nsToMonitor: [appdynamics,namespace1,namespace2]
 stdoutLogging: "true"

```

## 7. Install the Cluster Agent:

```
kubectl create -f cluster-agent.yaml
```

See [Validate the Cluster Agent Installation](#) to validate and troubleshoot the installation. Once the install is validated, see [Container Platforms](#) for options to install App Server Agents in applications in the cluster.

## Install the Cluster Agent with Helm Charts

This page describes how to use Cluster Agent Helm Charts to deploy the Cluster Agent.

Helm is a package manager for Kubernetes. Helm charts are a collection of files that describe a set of Kubernetes resources. The Cluster Agent Helm chart is a convenient method to deploy the AppDynamics Operator and Cluster Agent. You can also use the Cluster Agent Helm chart to deploy multiple Cluster Agents in a single cluster. This may be necessary for larger clusters that exceed the pod monitoring limit for a single Cluster Agent. See [Cluster Agent Requirements and Supported Environments](#).

### Requirements

- Cluster Agent version  $\geq 20.6$
- Controller version  $\geq 20.6$
- Cluster Agent Helm charts are compatible with Helm 3.0

- It is recommended to use Cluster Agent Helm Charts version  $\geq v1.1.0$ .
- Use Cluster Agent Helm Charts version  $\geq v1.10.0$  to install Cluster Agent  $\geq 23.2.0$  and AppDynamics Operator version  $\geq 23.2.0$ .
- Use Cluster Agent Helm Charts version  $\geq v1.1.0$  to install Cluster Agent  $\geq 21.12.0$  and AppDynamics Operator version  $\geq 21.12.0$ .
- You can install Cluster Agent version  $\leq 21.10.0$  and AppDynamics Operator version  $\leq 0.6.11$  using the older major version of Cluster Agent Helm Charts ( $\leq 0.1.19$ ).

## Install a Single Cluster Agent in a Cluster

1. Delete all the previously installed CustomResourceDefinition (CRDs) related to AppDynamics Agent by using these commands:

```

$ kubectl get crds
$ kubectl delete crds <crd-names>

```

2. Add the chart repository to Helm:

```
helm repo add appdynamics-cloud-helmcharts https://appdynamics.jfrog.io/artifactory/
appdynamics-cloud-helmcharts/
```

3. Create a namespace for `appdynamics` in your cluster:

```
kubectl create namespace appdynamics
```

4. Create a Helm values file, in the example called `values-ca1.yaml`. Update the `controllerInfo` properties with the credentials from your Controller. Update the `clusterAgent` properties to set the namespace and pods to monitor. See [Configure the Cluster Agent](#) for information about the available properties `nsToMonitor`, `nsToMonitorRegex`, `nsToExcludeRegex` and `podFilter`.

#### values-ca1.yaml

```
To install Cluster Agent
installClusterAgent: true

AppDynamics controller info
controllerInfo:
 url: https://<controller-url>:443
 account: <appdynamics-controller-account>
 username: <appdynamics-controller-username>
 password: <appdynamics-controller-password>
 accessKey: <appdynamics-controller-access-key>

Cluster agent config
clusterAgent:
 nsToMonitorRegex: dev-.*
```

Set the username and password to a local user from the Controller with the Server Monitoring Administrator role. Cluster Agent uses these credentials to mark the associated node in the Controller as historical upon pod deletion. See [Configuration Options for values.yaml](#) for more information regarding the available options. Also, you can download a copy of `values.yaml` from the Helm Chart repository using this command:

```
helm show values appdynamics-cloud-helmcharts/cluster-agent
```

5. If you have not installed the Kubernetes `metrics-server` in the cluster (usually located in the `kube-system` namespace), then set `install.metrics-server` to `true` in the values file to invoke the subchart to install it.

```
install:
 metrics-server: true
```

**i** Setting `install.metrics-server` installs `metrics-server` in the namespace with the `--namespace` flag which is located in the same namespace as the Cluster Agent.

6. Deploy the Cluster Agent to the `appdynamics` namespace:

```
helm install -f ./values-ca1.yaml "<my-cluster-agent-helm-release>" appdynamics-cloud-helmcharts/cluster-agent --namespace=appdynamics
```

### Enable Auto-Instrumentation

Once you have validated that the Cluster Agent was successfully installed, you can add additional configuration to the `instrumentationConfig` section of the values YAML file to enable auto-instrumentation. In this example, `instrumentationConfig.enabled` has been set to `true`, and multiple `instrumentationRules` have been defined. See [Auto-Instrument Applications with the Cluster Agent](#).

#### values-ca1.yaml with Auto-Instrumentation Enabled

```
To install Cluster Agent
installClusterAgent: true

AppDynamics controller info
controllerInfo:
 url: https://<controller-url>:443
 account: <appdynamics-controller-account>
 username: <appdynamics-controller-username>
 password: <appdynamics-controller-password>
 accessKey: <appdynamics-controller-access-key>

Cluster agent config
clusterAgent:
 nsToMonitorRegex: ecom|books|groceries

instrumentationConfig:
 enabled: true
 instrumentationMethod: Env
 nsToInstrumentRegex: ecom|books|groceries
 defaultAppName: Ecommerce
 tierNameStrategy: manual
 enableInstallationReport: false
```

```

imageInfo:
 java:
 image: "docker.io/appdynamics/java-agent:latest"
 agentMountPath: /opt/appdynamics
 imagePullPolicy: Always
instrumentationRules:
- namespaceRegex: groceries
 language: dotnetcore
 tierName: tier
 imageInfo:
 image: "docker.io/appdynamics/dotnet-core-agent:latest"
 agentMountPath: /opt/appdynamics
 imagePullPolicy: Always
- namespaceRegex: books
 matchString: openmct
 language: nodejs
 imageInfo:
 image: "docker.io/appdynamics/nodejs-agent:20.5.0-alpinev10"
 agentMountPath: /opt/appdynamics
 imagePullPolicy: Always
analyticsHost: <hostname of the Analytics Agent>
analyticsPort: 443
analyticsSslEnabled: true

```

After saving the `values-ca1.yaml` file with the added auto-instrumentation configuration, you must upgrade the Helm Chart:

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-cloud-helmcharts/cluster-agent --namespace appdynamics
```

## Configuration Options

Config option	Description	Required
<code>installClusterAgent</code>	Used for installing Cluster Agent. This must be set to true.	Optional (Defaults to true)
<b>Image config options (Config options under <code>imageInfo</code> key in <code>values.yaml</code> )</b>		
<code>imageInfo.agentImage</code>	Cluster agent image address in format <code>&lt;registryUrl&gt;/&lt;registryAccount&gt;/&lt;project&gt;</code>	Optional (Defaults to the Docker Hub image)
<code>imageInfo.agentTag</code>	Cluster agent image tag/version	Optional (Defaults to latest)

<code>imageInfo.operatorImage</code>	Operator image address in format <code>&lt;registryUrl&gt;/&lt;registryAccount&gt;/&lt;project&gt;</code>	Optional (Defaults to the Docker Hub image)
<code>imageInfo.operatorTag</code>	Operator image tag/version	Optional (Defaults to latest)
<code>imageInfo.imagePullPolicy</code>	Image pull policy for the operator pod	Optional
<b>Controller config options (Config options under <code>controllerInfo</code> key in <code>values.yaml</code> )</b>		
<code>controllerInfo.accessKey</code>	AppDynamics Controller accessKey	Required
<code>controllerInfo.account</code>	AppDynamics Controller account	Required
<code>controllerInfo.authenticateProxy</code>	true/false if the proxy requires authentication	Optional
<code>controllerInfo.customSSLCert</code>	Base64 encoding of PEM formatted SSL certificate	Optional
<code>controllerInfo.password</code>	AppDynamics Controller password	Password for local user from the Controller to mark the associated node in the Controller as historical upon pod deletion.  Required only when auto-instrumentation is enabled.
<code>controllerInfo.proxyPassword</code>	Password for proxy authentication	Optional
<code>controllerInfo.proxyUrl</code>	Proxy URL if the Controller is behind some proxy	Optional
<code>controllerInfo.proxyUser</code>	Username for proxy authentication	Optional
<code>controllerInfo.url</code>	AppDynamics Controller URL	Required

<code>controllerInfo.username</code>	AppDynamics Controller username	Username for local user from the Controller to mark the associated node in the Controller as historical upon pod deletion  Required only when auto-instrumentation is enabled.
<b>RBAC config</b>		
<code>agentServiceAccount</code>	Service account to be used by the Cluster Agent	Optional
<code>createServiceAccount</code>	Set to true if <code>ServiceAccounts</code> mentioned are to be created by Helm	Optional
<code>operatorServiceAccount</code>	Service account to be used by the AppDynamics Operator	Optional
<b>Agent pod config</b>		
<code>agentPod.nodeSelector</code>	Kubernetes node selector field in the Cluster Agent pod spec	Optional
<code>agentPod.tolerations</code>	Kubernetes tolerations field in the Cluster Agent pod spec	Optional
<code>agentPod.resources</code>	Kubernetes CPU and memory resources in the Cluster Agent pod spec	Optional
<code>agentPod.labels</code>	Adds any required pod labels to the Cluster Agent pod.	Optional
<b>Operator pod config</b>		
<code>operatorPod.nodeSelector</code>	Kubernetes node selector field in the AppDynamics Operator pod spec	Optional
<code>operatorPod.tolerations</code>	Kubernetes tolerations field in the AppDynamics Operator pod spec	Optional
<code>operatorPod.resources</code>	Kubernetes CPU and memory resources in the AppDynamics Operator pod spec	Optional

## Install switches

<code>install.metrics-server</code>	True if metrics are to be installed. Metrics-server is installed in the same namespace as the agent.	Optional
-------------------------------------	------------------------------------------------------------------------------------------------------	----------

### Install Multiple Cluster Agents in a Cluster

The Cluster Agent Helm Chart supports multiple Cluster Agents installation in a cluster. This may be necessary for larger clusters that exceed the pod monitoring limit for a single Cluster Agent. See [Cluster Agent Requirements and Supported Environments](#).

Each Cluster Agent that is deployed must have different configuration. This is achieved by limiting the monitoring to a distinct set of namespaces and pods using the `nsToMonitor`, `nsToMonitorRegex`, `nsToMonitorExcludeRegex` and `podFilter` properties. See [Configure the Cluster Agent](#).

To install Cluster Agents:

1. Create a new values file, called `values-ca2.yaml` as the example, that uses the same `controllerInfo` properties as the first Cluster Agent. Add additional properties, such as `nsToMonitorRegex` and `podFilter`, to set the monitoring scope for this Cluster Agent.

#### values-ca2.yaml

```
To install Cluster Agent
installClusterAgent: true
AppDynamics controller info
controllerInfo:
 url: https://<controller-url>:443
 account: <appdynamics-controller-account>
 username: <appdynamics-controller-username>
 password: <appdynamics-controller-password>
 accessKey: <appdynamics-controller-access-key>

Cluster agent config
clusterAgent:
 nsToMonitorRegex: stage.*

podFilter:
 allowlistedLabels:
 - label1: value1
 - label2: value2
 blocklistedLabels: []
 allowlistedNames: []
 blocklistedNames: []
```

2. Create a namespace distinct from the previous namespace used for the first installation:

```
kubectl create ns appdynamics-ca2
```

### 3. Install the additional Cluster Agent:

```
helm install -f ./values-ca2.yaml "<my-2nd-cluster-agent-helm-release>" appdynamics-
cloud-helmcharts/cluster-agent --namespace=appdynamics-ca2
```

## Cluster Agent Helm Chart Configuration Examples

These examples display various configurations for the Cluster Agent Helm chart:

### Use the Cluster Agent Helm Chart to Enable Custom SSL

#### user-values.yaml

```
controllerInfo:
 url: https://<controller-url>:443
 account: <appdynamics-controller-account>
 username: <appdynamics-controller-username>
 password: <appdynamics-controller-password>
 accessKey: <appdynamics-controller-access-key>

#####
customSSLCert: "<base64 of PEM formatted cert>"
#####

agentServiceAccount: appdynamics-cluster-agent-ssl # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl # Can be any valid name
```

### Use the Cluster Agent Helm Chart to Enable the Proxy Controller

Without authentication:

#### user-values.yaml

```
To install Cluster Agent
installClusterAgent: true

controllerInfo:
 url: https://<controller-url>:443
 account: <appdynamics-controller-account>
 username: <appdynamics-controller-username>
 password: <appdynamics-controller-password>
 accessKey: <appdynamics-controller-access-key>
```

```

#####
proxyUrl: http://proxy-url.appd-controller.com
#####

agentServiceAccount: appdynamics-cluster-agent-ssl # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl # Can be any valid name

```

With authentication:

#### user-values.yaml

```

To install Cluster Agent
installClusterAgent: true

controllerInfo:
 url: https://<controller-url>:443
 account: <appdynamics-controller-account>
 username: <appdynamics-controller-username>
 password: <appdynamics-controller-password>
 accessKey: <appdynamics-controller-access-key>

#####
authenticateProxy: true
proxyUrl: http://proxy-url.appd-controller.com
proxyUser: hello
proxyPassword: world
#####

agentServiceAccount: appdynamics-cluster-agent-ssl # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl # Can be any valid name

```

Use the Cluster Agent Helm Chart to add **nodeSelector** and **tolerations**

#### user-values.yaml

```

agentPod:
 nodeSelector:
 nodeLabelKey: nodeLabelValue
 tolerations:
 - effect: NoExecute
 operator: Equal
 key: key1
 value: val1
 tolerationSeconds: 11

```

```
operatorPod:
 nodeSelector:
 nodeLabelKey: nodeLabelValue
 anotherNodeLabel: anotherNodeLabel
 tolerations:
 - operator: Exists
 key: key1
```

## Best Practices for Sensitive Data

We recommend using multiple `values.yaml` files to separate sensitive data in separate `values.yaml` files. Examples of these values are:

- `controllerInfo.password`
- `controllerInfo.accessKey`
- `controllerInfo.customSSLCert`
- `controllerInfo.proxyPassword`

Each `values` file follows the structure of the default `values.yaml` enabling you to easily share files with non-sensitive configuration properties yet keep sensitive values safe.

## Default `user-values.yaml` File Example

### `user-values.yaml`

```
To install Cluster Agent
installClusterAgent: true

imageInfo:
 agentImage: dtr.corp.appdynamics.com/sim/cluster-agent
 agentTag: latest
 operatorImage: docker.io/appdynamics/cluster-agent-operator
 operatorTag: latest
 imagePullPolicy: Always

controllerInfo:
 url: https://<controller-url>:443
 account: <appdynamics-controller-account>
 username: <appdynamics-controller-username>
 password: <appdynamics-controller-password>
 accessKey: <appdynamics-controller-access-key>

agentServiceAccount: appdynamics-cluster-agent-ssl # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl # Can be any valid name
```

### user-values-sensitive.yaml

```
controllerInfo:
 password: welcome
 accessKey: abc-def-ghi-1516
```

When installing the Helm Chart, use multiple `-f` parameters to reference the files:

```
helm install -f ./user-values.yaml -f ./user-values-sensitive.yaml "<my-cluster-agent-helm-release>" appdynamics-cloud-helmcharts/cluster-agent --namespace ca-appdynamics
```

## Install the Cluster Agent with OpenShift OperatorHub Bundle

This page describes how to install the Cluster Agent using the AppDynamics OpenShift OperatorHub Bundle which is an alternative to [Install the Cluster Agent with Kubernetes CLI](#).

AppDynamics OpenShift OperatorHub Bundle is available at [RedHat catalog](#).

### Requirements

Before you begin, verify that you have:

- OpenShift Cluster environment
- Met the requirements described in [Cluster Agent Requirements and Supported Environments](#)

### Installation Procedure

1. If you have not already installed the `metrics-server`, then install it. See <https://github.com/kubernetes-sigs/metrics-server> for the most recent installation instructions.

```
kubectl apply -f https://github.com/kubernetes-sigs/metrics-server/releases/latest/download/components.yaml
```

2. Download the Kubernetes or OpenShift Cluster Agent bundle from the [Download portal](#), unzip the contents of the bundle to the current directory:

```
unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
```

3. Create a `namespace` for `appdynamics` in your cluster:

```
kubectl create namespace appdynamics
```

4. Install the AppDynamics Operator:
  - a. Go to your openshift cluster console
  - b. Go to **Operators > OperatorHub**
  - c. Search with the `appdynamics` filter
  - d. Click **Install**

5. Based on the Account Access Key for the Controller, create the Controller Access Key Secret that the Cluster Agent reports to:

```
kubectl -n appdynamics create secret generic cluster-agent-secret --from-
literal=controller-key=<access-key>
```

6. Edit `cluster-agent.yaml` to set the AppDynamics Controller details for the Cluster Agent to report to.
  - a. Set the `nsToMonitor` or `nsToMonitorRegex` options to include the namespaces you want to monitor.
  - b. Set the image tag to the version you are installing. Refer to [AppDynamics Cluster Agent Redhat image](#) for the latest version tag.

For additional configuration tasks, see [Configure the Cluster Agent](#).

This example assumes the use of the pre-built Cluster Agent image on RedHat Registry. See [Cluster Agent Container Image](#) to build your own image.

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 appName: "dev-cluster"
 controllerUrl: "http://mycontroller.com:8080"
 account: "my-account"
 # docker image info where, <version> is the image tag version that you are installing
 image: "docker.io/appdynamics/cluster-agent:<version>"
 serviceAccountName: appdynamics-cluster-agent
 nsToMonitor: [appdynamics,namespace1,namespace2]
 stdoutLogging: "true"
```

7. Install the Cluster Agent:

```
kubectl create -f cluster-agent.yaml
```

8. Check `appdynamics-operator` and `appdynamics-cluster-agent` pods are running. Also, Check `Catalogsource`, `Subscription` and `Clusterserviceversion` are created:

```
Appdynamics Operator pod status
kubectl get pods -n appdynamics

CA pod status
kubectl get pods -n appdynamics

catalogsources should be created
kubectl get catalogsources -n appdynamics
```

```
subscriptions should be created
kubectl get subscriptions -n appdynamics

ClusterServiceVersion should be created
kubectl get clusterserviceversion -n appdynamics
```

To uninstall, see [Uninstall the Cluster Agent](#).

See [Validate the Cluster Agent Installation](#) to validate and troubleshoot the installation. Once the install is validated, see [Container Platforms](#) for options to install App Server Agents in applications in the cluster.

## Validate the Cluster Agent Installation

This page describes how to validate a Cluster Agent installation using the Kubernetes CLI or Helm chart.

### Cluster Agent Validation

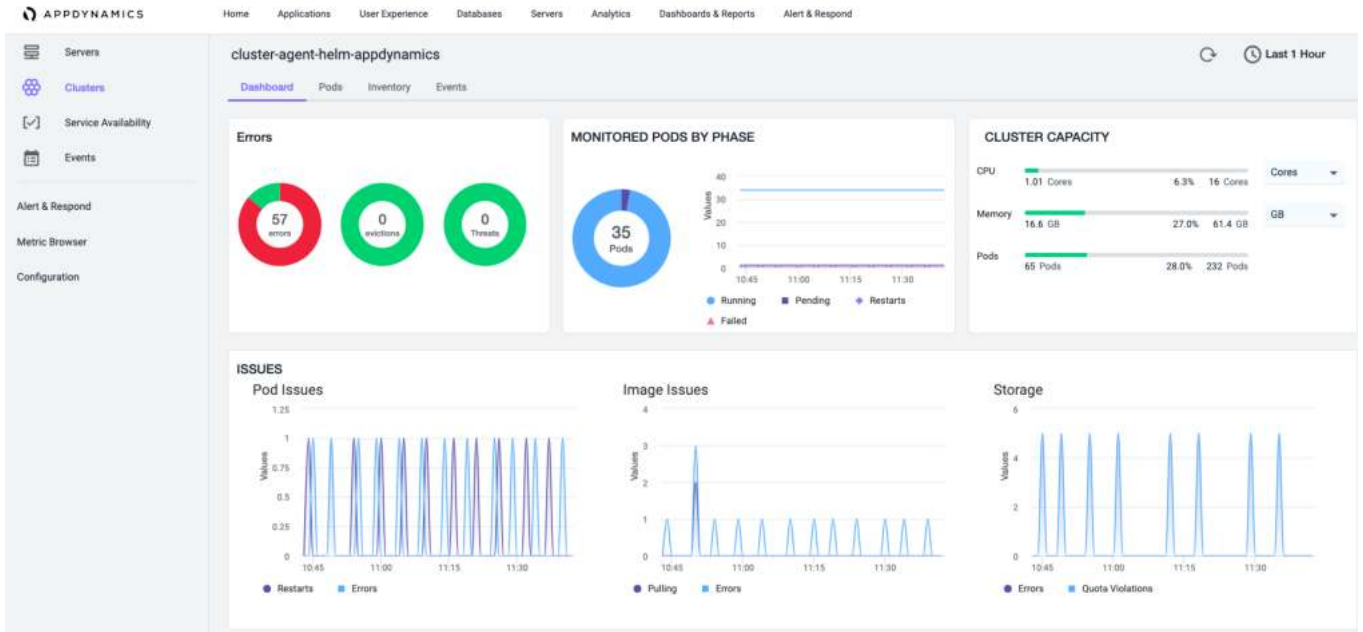

1. Verify that the Cluster Agent and Cluster Agent Operator pods are running by reviewing the status:

```
kubectl -n appdynamics get pods
```

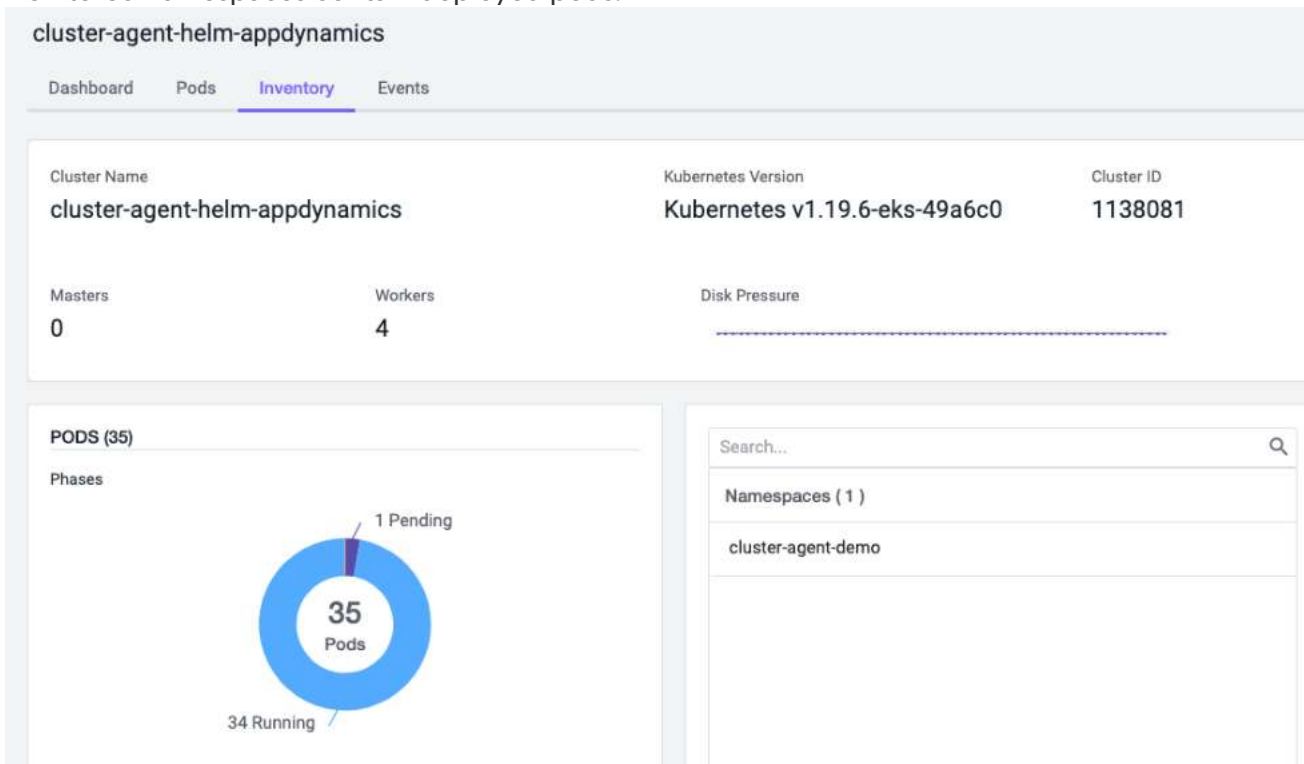

NAME	READY	STATUS	RESTARTS
AGE			
appdynamics-operator-7958f676d9-gvdcw 4d21h	1/1	Running	0
k8s-cluster-agent-5967c9b7b9-rkwzt 4d21h	1/1	Running	0

2. Verify that the Cluster Agent is reporting to the Controller. If the Cluster Agent successfully registers with the Controller based on the credentials you entered in the `cluster-agent.yaml` file, and the `cluster-agent-secret` you created in the `appdynamics` namespace (which contains the Controller Account Access Key), then the Cluster Agent displays in the Controller UI under **Servers/Cluster** using the `appName` from `cluster-agent.yaml`.

 It may take 5-10 minutes for the data to populate.

- Verify the monitored namespaces. Under the **Inventory** dashboard, check that the monitored namespaces match the namespace configuration in the `cluster-agent.yaml` file and that the monitored namespaces contain deployed pods.

If necessary, update the namespace configuration (`nsToMonitor`, `nsToMonitorRegex`) in `cluster-agent.yaml` and re-create the Cluster Agent.

```
kubectl -n appdynamics delete -f cluster-agent.yaml
kubectl -n appdynamics create -f cluster-agent.yaml
```

If you are still experiencing problems with the installation, see [Troubleshoot the Cluster Agent](#).

## Troubleshoot the Cluster Agent

This page describes steps to troubleshoot the Cluster Agent install. See [Install the Cluster Agent](#) and [Validate the Cluster Agent Installation](#).

### Troubleshoot a Cluster Agent Not Reporting to the Controller

If after installing the Cluster Agent the Cluster Dashboard does not appear in the Controller, it could be the result of a connectivity issue with the Controller.

1. Verify that a Server Visibility license is available. The Cluster Agent requires an available Server Visibility license to register successfully. See [Cluster Agent Requirements and Supported Environments](#). From the Controller UI, check that a license is available under **Administration/License/Account Usage**.
2. Review the Cluster Agent events. If the Cluster Agent or Cluster Agent Operator fails to start, then review the events in the `appdynamics` namespace:

```
kubectl -n appdynamics get events

to sort by most recent events:
kubectl -n appdynamics get events --sort-by='.lastTimestamp'
```

You can review the Cluster Agent pod specification for additional events:

```
kubectl -n appdynamics get pod <cluster-agent-pod> -o yaml
```

3. Review the Cluster Agent logs for errors regarding Controller communication. Open a command-line prompt and enter:

```
kubectl -n appdynamics logs <cluster-agent-pod-name>
```

4. Verify the Cluster Agent configuration. The Cluster Agent checks for configuration changes once a minute. To verify that your configurations have been applied and that the Cluster Agent is using the new values, open a command-line prompt and enter:

```
kubectl -n appdynamics describe cm cluster-agent-mon cluster-agent-log cluster-agent-config
```

5. Verify that the latest Cluster Agent is installed. If you are upgrading the Cluster Agent from a previous version, then the previous Operator YAML or image may not be compatible. You must reinstall the Cluster Agent Operator and Cluster Agent using the procedure described in [Upgrade the Cluster Agent](#).

## Troubleshoot a Cluster Agent Not Reporting Metrics

If the Cluster Agent does not report metrics for certain containers, pods, or nodes, it may be due to a problem with the Kubernetes [Metrics Server](#). If metrics are not reported by the Metrics Server, then the Cluster Agent is unable to report them.

To verify that the Metrics Server is sending metrics, enter this command from your cluster's primary node:

```
$ kubectl get --raw /apis/metrics.k8s.io/v1beta1/pods
```

If the output of the command does not show metrics for the container, there may be a problem with the Metrics Server. This example shows output from the Metrics Server:

```
{
 "kind": "PodMetricsList",
 "apiVersion": "metrics.k8s.io/v1beta1",
 "metadata": {
 "selfLink": "/apis/metrics.k8s.io/v1beta1/pods"
 },
 "items": [
 {
 "metadata": {
 "name": "replicaset-test-cjnsc",
 "namespace": "test-qe",
 "selfLink": "/apis/metrics.k8s.io/v1beta1/namespaces/test-qe/pods/replicaset-test-cjnsc",
 "creationTimestamp": "2019-09-23T10:24:46Z"
 },
 "timestamp": "2019-09-23T10:23:38Z",
 "window": "30s",
 "containers": [
 {
 "name": "appagent",
 "usage": {
 "cpu": "1667384n",
 "memory": "258672Ki"
 }
 }
]
 }
]
}
```

As the Metric Server collects metrics from nodes, pods, and containers, it logs all issues. To retrieve and view logs for the Metric Server, enter:

```
$ kubectl logs <metric-server pod name> -n <namespace for metric-server (default value is: "kube-system")> --tail <number of required lines of logs>
```

For example:

```
$ kubectl logs metrics-server-6764b987d-mtn7g -n kube-system --tail 20
```

The Metric Server logs may reveal why it could not collect metrics. For example:

```
E0920 11:44:54.204075 1 reststorage.go:147] unable to fetch pod metrics for pod test-
qe/replicaset-test-9k7rl: no metrics known for pod
E0920 11:44:54.204080 1 reststorage.go:147] unable to fetch pod metrics for pod test/
replicaset1-458-g9n2d: no metrics known for pod
E0920 11:44:54.204089 1 reststorage.go:147] unable to fetch pod metrics for pod kube-
system/kube-proxy-t54rc: no metrics known for pod
E0920 11:45:19.188033 1 manager.go:111] unable to fully collect metrics: unable to
fully scrape metrics from source kubelet_summary:ip-111.111.111.111: unable to fetch metrics
from Kubelet ip-111.111.111.111 (111.111.111.111): Get https://111.111.111.111:2222/stats/
summary/: dial tcp 111.111.111.111:2222: i/o timeout
```

## Cluster Agent Restarts

If the Cluster Agent restarts, you can verify that a restart occurred from the pod details. To retrieve the pod details, enter:

```
kubectl get pods -n appdynamics
```

Sample output:

NAME	READY	STATUS	RESTARTS	AGE
appdynamics-operator-6fff76b466-qtx57	1/1	Running	0	4h18m
k8s-cluster-agent-perf-jg-6fc498d557-q7zst	1/1	Running	1	83m

If the Cluster Agent unexpectedly restarts, the **RESTARTS** count value will be greater than zero. You will have to explicitly reset both namespaces and the logs.

**i** AppDynamics strongly recommends that you do not overwrite the default `stdoutLogging: true` property value in the `cluster-agent.yaml` file. If you set this property to `false`, the `kubectl logs command` does not return logs.

Cluster Agent logs persist even if the Cluster Agent is restarted by Kubernetes. To view the Cluster Agent logs for the Cluster Agent pod (that restarted), enter:

```
kubectl -n appdynamics logs --previous ${CLUSTER_AGENT_POD_NAME}
```

If the Cluster Agent pod has restarted, the monitored namespaces (that you configured through the UI) are not preserved. If you configured namespaces through the UI, you should add the same namespaces to

your `cluster-agent.yaml` file under `nsToMonitor`, and then apply the configuration. As a result, the Cluster Agent pod will retain the monitored namespaces when it restarts.

If you did not add namespaces to the `cluster-agent.yaml` file, you can reconfigure your monitored namespaces:

1. Go to **Appdynamics Agents > Cluster Agents > {CLUSTER\_AGENT} > Configure**.
2. Add the namespaces to monitor.

See [Add or Remove Namespaces](#).

### APM Correlation on OpenShift 4.x

Container Runtime Interface using OCI (Open Container Initiative) compatible runtimes (CRI-O), is the default container runtime on Red Hat OpenShift 4.x. If you use APM Agents with OpenShift 4.x, you must update the `UNIQUE_HOST_ID` to support the syntax required for CRI-O containers. This setting applies to both new and existing application containers. If you are running App Agents, then you must modify the App Agent `YAML` file.

To run App Agents with APM correlation on OpenShift 4.x:

1. Open your App Agent `YAML` file.
2. Locate the `spec: > args:` section within the file.
3. Update the `UNIQUE_HOST_ID` argument in the `containers spec` using this example as a guide:

```
spec:
 containers:
 - name: client-api
 command: ["/bin/sh"]
 args: ["-c", "UNIQUE_HOST_ID=$(sed -rn '1s#.#/##; 1s/(.{12}).*/\\1/p' /proc/self/cgroup) && java -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
 envFrom:
 - configMapRef:
 name: agent-config
```

If APM Correlation is working correctly, when you click the **Pod Details** link, the link opens the APM Node Dashboard for that node.

### Cluster Agents or Pods are not Visible in the Controller

If Agents or pods are not visible in the Controller, or if Agents or pods are not registered and reporting, review the `sim.cluster.agent.limit` and `sim.cluster.pod.limit` descriptions in [Controller Settings for the Cluster Agent](#).

### Cluster Agent Pods are not Created When Security Policy is Enabled

If you have Pod Security Policies applied in the cluster, add the following to the `cluster-agent-operator.yaml` file:

```
securityContext:
 runAsUser: 1000
```

This YAML file example displays the security context:

```
apiVersion: apps/v1
kind: Deployment
metadata:
 name: appdynamics-operator
 namespace: appdynamics
 .
 .
spec:
 .
 .
 .
 template:
 .
 .
 securityContext:
 runAsUser: 1000
```

**i** For Agent 20.4 and 20.5, add the `runAsUser: 1000` field in the `cluster-agent.yaml` file.

## Cluster Agent Configuration Files

This page provides a reference for these internal configuration files used by the Cluster Agent:

- `agent-monitoring.yaml`
- `bootstrap-config.yaml`
- `logger-config.yaml`

**!** AppDynamics recommends that you do not change the default values unless asked to do so by AppDynamics Support. Values supplied by the AppDynamics Operator always take precedence over the internal configuration files.

## Agent Monitoring Configuration Reference

The `agent-monitoring.yaml` file contains configuration information that can be modified by the Cluster Agent. The table lists the fields expected by the `agent-monitoring.yaml` file. Use these fields to configure pods and containers monitored by the Cluster Agent:

Field name	Description	Default
<code>blocklisted-label</code>	(Optional) Field used to specify a Kubernetes label (a <code>key-value</code> pair). If this label exists, then the container, or pod, is not monitored. In the example, any pods with the label <code>appdynamics.exclude</code> set to <code>true</code> are blocklisted.	<code>appdynamics.exclude: true</code>
<code>blocklisted-names</code>	(Optional) Field used to specify which pods and containers are not monitored. In the example, the pod <code>ignored-pod</code> with associated containers <code>container3</code> and <code>container4</code> are not monitored.	Empty
<code>cluster-metric-collection-interval-seconds</code>	How often the Agent collects metrics in seconds Do not set this value to less than 30 seconds	60
<code>container-filter</code>	(Optional) Blocklist or allowlist pods and containers, based on the container names	Empty
<code>container-registration-batch-size</code>	Maximum number of containers per batch in one registration cycle	25
<code>container-registration-max-parallel-requests</code>	Maximum number of batches in one registration cycle	3
<code>metadata-collection-interval-seconds</code>	How often metadata is collected for containers and pods	60

Field name	Description	Default
<code>metric-collection-interval-seconds</code>	<p>Sampling interval at which metrics should be collected periodically</p> <p>Do not set this value to less than 15 seconds</p> <div style="border: 1px solid #007bff; padding: 5px; margin-top: 10px;"> <p><b>i</b> The Kubernetes <a href="#">Metrics Server</a>'s sampling interval must be the same as this configuration value. Any change to this configuration requires a re-deployment of the <a href="#">Kubernetes metrics-server</a> add-on.</p> </div>	<ul style="list-style-type: none"> <li>• Default metric collection sampling interval is 30 seconds</li> <li>• Default collection interval in <code>kubelet</code> is 15 seconds</li> </ul>
<code>metric-upload-retry-count</code>	Number of times metric upload action to be attempted, if unsuccessful for the first time	3
<code>metric-upload-retry-interval-milliseconds</code>	Interval between consecutive metric upload retries, in milliseconds	5
<code>pod-registration-batch-size</code>	Maximum number of pods per batch in one registration cycle	30
<code>allowlisted-names</code>	(Optional) Field used to specify pods and containers to monitor. In the example, the pod <code>monitored-pod</code> with its containers <code>container1</code> and <code>container2</code> are monitored.	Empty

`agent-monitoring.yml` example:

```
metric-collection-interval-seconds: 30
container-filter:
 blocklisted-label:
 appdynamics.exclude:
 true
allowlisted-names:
pod-name1:
container-name1
container-name2
pod-name2:
container-name1
```

```

container-name2
pod-name3:
container-name1
container-name2
blocklisted-names:
pod-name:
container-name1
container-name2
pod-name2:
container-name1
container-name2

```

### Bootstrap Configuration Reference

The `bootstrap-config.yml` file contains configuration information read by the Cluster Agent during start up. The table lists the fields expected by the `bootstrap-config.yml` file:

Field name	Description	Default
<code>account</code>	Name of the account on the Controller	Empty
<code>account-access-key</code>	Account access key	Empty
<code>cluster-name</code>	Unique name assigned to the monitoring cluster	Empty
<code>container-registration-interval-seconds</code>	How often the Cluster Agent sends container information to the Controller. The interval at which the Cluster Agent checks for running containers.  Modify the default value only if you want to discover running containers more frequently; use the default value for most environments.	120
<code>controller-host</code>	Controller host name	Empty
<code>controller-port</code>	Controller port	Empty
<code>controller-ssl-enabled</code>	Denotes if the Controller is SSL-enabled	false
<code>event-upload-interval-seconds</code>	How often events are uploaded to the Controller, in seconds	10
<code>http-client-timeout-seconds</code>	Number of seconds after which the server call is terminated if no response is received from the Controller	30

Field name	Description	Default
log-output-directory	Directory to which the logs should be written	logs
monitored-namespaces	Namespaces to be monitored in the cluster; comma-separated strings	default

bootstrap-config.yml example:

```

account: <account-name>
account-access-key:<account-access-key>
controller-host: localhost
controller-port: 8090
cluster-name: <cluster-name>
monitored-namespaces: default
event-upload-interval-seconds: 10
container-registration-interval-seconds: 120
http-client-timeout-seconds: 30
log-output-directory: logs
SSL configuration
controller-ssl-enabled: false

```

### Logging Configuration Reference

By default, the AppDynamics Cluster Agent writes log files to the `<cluster_agent_home>/logs/<node_name>` directory.

You can control the logging level for the Cluster Agent by changing the value of the `log-level` parameter. For maximum debugging information, set the `logger-config.yml` logging level to `DEBUG`.

You can modify the `logger-config.yml` file and set values for these attributes:

Attribute	Description	Default	Type
log-level	Number of log details: <code>INFO</code> , <code>WARNING</code> , <code>DEBUG</code> or <code>TRACE</code>	INFO	String
max-filesize-mb	Maximum file size of the log in MB	5	Integer
max-backups	Maximum number of backups the log saves. When the maximum number of backups is reached, the oldest log file after the initial log file is deleted.	3	Integer
write-to-stdout	Write logging information to <code>stdout</code> . Options: <code>true</code> , <code>false</code> .	true	String

logger-config.yml example:

```
log-level: INFO
max-filesize-mb: 5
max-backups: 3
write-to-stdout: true
```

## Configure the Cluster Agent

This page describes the contents of the Cluster Agent bundle downloaded from the [Download portal](#), and how to perform common configuration tasks:

- [Configure Proxy Support](#)
- [Configure the Cluster Agent to use SSL for on-premises Controllers](#)
- [Configure Secret](#)

See [Cluster Agent YAML File Configuration Reference](#) for configuration option details.

**i** This page contains links to Kubernetes documentation. AppDynamics makes no representation as to the accuracy of Kubernetes documentation because Kubernetes controls its own documentation.

## Directory Structure of the Cluster Agent Bundle

An unzipped Cluster Agent bundle contains this directory structure:

[Alpine Linux AMD](#)   [Alpine Linux ARM](#)   [Rhel Linux 7](#)

```
cluster-agent
├── cluster-agent-operator.yaml
├── appdynamics-operator-alpine-linux-amd64-<version>

## Cluster Agent Bundle Files

This table describes the Cluster Agent directory files:

File Name	Description
<code>appdynamics-operator-alpine-linux-amd64-&lt;version&gt;</code>	The AppDynamics Operator artifacts contain Dockerfile, operator binary, licenses and scripts, which are used to build Alpine AMD-based Operator Images.
<code>appdynamics-operator-alpine-linux-arm64-&lt;version&gt;</code>	The AppDynamics Operator artifacts contain Dockerfile, operator binary, licenses and scripts, which are used to build Alpine ARM-based Operator Images.
<code>appdynamics-operator-rhel-linux-amd64-&lt;version&gt;</code>	The AppDynamics Operator artifacts contain Dockerfile-rhel, operator binary, licenses and scripts, which are used to build Rhel-based Operator Images.
<code>cluster-agent.yaml</code>	File used to configure and deploy the Cluster Agent. <ul style="list-style-type: none"> <li>The <code>cluster-agent.yaml</code> file provides Controller details and starts the Cluster Agent.</li> <li>Where values are specified in the AppDynamics Operator configuration, these values always take precedence over any internal configuration file.</li> </ul>
<code>cluster-agent-operator.yaml</code>	Files used to deploy the Cluster Agent Operator. These files set the default values for Kubernetes, Amazon EKS, and AKS, including a minimal set of RBAC permissions.
<code>cluster-agent-operator-openshift.yaml</code> <code>cluster-agent-operator-openshift-1.15-or-less.yaml</code>	Files used to deploy the Cluster Agent on Red Hat OpenShift. These files set the default values for Red Hat OpenShift, including a minimal set of RBAC permissions.
<code>docker</code>	Docker directory contains all files required to create the Cluster Agent image.
<code>Dockerfile</code>	<code>dockerfile</code> used to create the Alpine-based Cluster Agent image.
<code>Dockerfile-rhel</code>	<code>dockerfile</code> used to create the Rhel-based Cluster Agent image.

File Name	Description
<code>infraviz.yaml</code>	File used to configure and deploy the InfraViz. <ul style="list-style-type: none"> <li>The <code>infrviz.yaml</code> file provides Controller details and starts the Infrastructure Visibility Agent and Network Visibility Agents.</li> <li>Here, values are specified in the AppDynamics Operator configuration, these values always take precedence over any internal configuration file.</li> </ul>
<code>LICENSE</code>	Latest EULA file attached with the Cluster Agent image.
<code>cluster-agent.zip</code>	Zip archive containing the Cluster Agent binaries and configuration files.
<code>helm-charts</code>	Folder used to build the charts for deploying the Cluster Agent using Helm in Kubernetes.
<code>README-rhel.md</code> <code>README-alpine.md</code>	Contains instructions on how to start the Cluster Agent using your preferred operating system.
<code>start-appdynamics</code>	Script used to run the Cluster Agent within Docker.

### Configure Proxy Support

To understand proxy in Kubernetes, see the Kubernetes documentation ([Proxies in Kubernetes](#)).

1. Locate and edit the `cluster-agent.yaml` file.
2. Add a `proxyUrl` parameter to the `cluster-agent.yaml` file:

```
proxyUrl: <protocol>://<host>:<port>
```

3. (Optional) If the proxy server requires authentication:
  - a. Add a `proxyUser` :

```
proxyUser: <user>
```

- b. Create a `secret` with a `proxy-password` :

```
kubectl -n appdynamics create secret generic cluster-agent-proxy-secret --from-literal=proxy-password='<password>'
```

4. (Optional) If you are using SSL only for your proxy:
  - a. Create a `secret` from a `.pem` certificate file (the certificate file must be named `proxy-ssl.pem`)

```
kubectl -n appdynamics create secret generic ssl-cert --from-file=proxy-ssl.pem
```

- b. Set a secret filename in the `cluster-agent.yaml` file:

```
customSSLSecret: "ssl-cert"
```

To use SSL with your proxy and your Controller, see [Proxy and On-Premises Certificates Combined](#).

### Configure the Cluster Agent to Use SSL for On-Premises Controllers

**i** Cluster Agent SSL is automatically handled for SaaS Controllers.

#### Controllers with Public and Self-Signed Certificates

To configure SSL with a public or self-signed certificate, use `kubectl` to generate a secret. Enter this `kubectl` command, and include the path to your public or self-signed certificate:

```
kubectl -n appdynamics create secret generic ssl-cert --from-file=<path-to-your-self-signed-certs>/custom-ssl.pem
```

The certificate file must be named: `custom-ssl.pem`.

After your secret is created, you must add the `customSSLSecret` property with the secret name specified in the previous step to the `cluster-agent.yaml` file:

```
customSSLSecret: "ssl-cert"
```

#### Proxy and On-Premises Certificates Combined

If you have two different SSL certificates (one for the proxy server, and a different one for the on-premises Controller), then you can encapsulate both of them into a single secret:

```
kubectl -n appdynamics create secret generic ssl-cert --from-file=proxy-ssl.pem --from-file=<path-to-your-self-signed-certs>/custom-ssl.pem
```

The Cluster Agent pulls each certificate from the secret identified in the `customSSLSecret` attribute and uses it appropriately.

This example shows a `cluster-agent.yaml` file with the `customSSLSecret` attribute defined:

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent-manual
 namespace: appdynamics
spec:
 # init agent configuration
 appName: "test-k8s-cluster-agent"
```

```

controllerUrl: "https://<controller-url>:443" # always schema and port
account: "<account-name>" # account
agent related properties
custom SSL secret name
customSSLSecret: "ssl-cert"
logging properties
logLevel: INFO
logFileSizeMb: 7
logFileBackups: 6
docker image info
image: "<image-url>"

```

## Create Secret

If the Cluster Agent requires a secret to pull images from a container registry, use the Kubernetes API to create the secret and reference it in `cluster-agent.yaml`.

[Kubernetes](#) [OpenShift](#)

```

$ kubectl -n appdynamics create secret docker-registry myregcred --docker-server=https://
index.docker.io/v1 --docker-username=<docker-username> --docker-password=<docker-password>
--docker-email=unused

```

[Kubernetes](#) [OpenShift](#)

```

$ oc -n appdynamics create secret docker-registry myregcred --docker-server=https://
index.docker.io/v1 --docker-username=<docker-username> --docker-password=<docker-password>
--docker-email=unused
$ oc -n appdynamics secrets link appdynamics-operator regcred --for=pull

```

Set the `imagePullSecret` property in `cluster-agent.yaml` to the name of the secret created above (myregcred):

```

kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 appName: "mycluster"
 controllerUrl: "http://<appdynamics-controller-host>:8080"
 account: "<account-name>"
 image: "<your-docker-registry>/appdynamics/cluster-agent:tag"
 serviceAccountName: appdynamics-cluster-agent
 imagePullSecret: "myregcred"

```

## Cluster Agent `YAML` File Configuration Reference

To configure the Cluster Agent, use the `cluster-agent.yaml` file included with the download package as a template. You can modify these parameters:

Parameter	Description	Example	Default
<code>account</code>	AppDynamics account name.	admin	N/A
<code>appName</code>	Name of the cluster; displays in the Controller UI as your cluster name.	k8s-cluster	N/A

Parameter	Description	Example	Default
controllerUrl	Full AppDynamics Controller URL, including protocol and port.	HTTP: http:// appd- contr oller .com: 8090/ HTTPS : https :// appd- contr oller .com: 443	N/A

Parameter	Description	Example	Default
customSSLSecret	Provides the self-signed or public certificates to the Cluster Agent.	"ssl-cert"	N/A
eventUploadInterval	How often Kubernetes warning and state-change events are uploaded to the Controller in seconds. See <a href="#">Monitor Kubernetes Events</a> .	10	10
httpClientTimeout	If no response is received from the Controller, number of seconds after which the server call is terminated.	30	30

Parameter	Description	Example	Default
image	Cluster Agent image.	your-docker-registry/appdynamics/cluster-agent:latest	N/A

Parameter	Description	Example	Default
imagePullSecret	Credential file used to authenticate when pulling images from your private Docker registry or repository. Based on your Docker registry configuration, you may need to create a secret file for the AppDynamics Operator to use when pulling the image for the Cluster Agent. See <a href="#">Create a Secret by providing credentials on the command line</a> .	regcred	N/A
instrumentationMaxPollingAttempts	The maximum number of times Cluster Agent checks for the successful rollout of instrumentation before marking it as failed.	instrumentationMaxPollingAttempts: 15	10

Parameter	Description	Example	Default
labels	Adds any required pod labels to the Cluster Agent pod.	<pre>labels:   key1: value 1   key2: value 2</pre>	<p>The following labels are the default and cannot be changed:</p> <pre>name: cluster-agent cluster-agent: cluster-agent pod-template-hash: &lt;hash&gt;</pre> <p><i>Kubernetes&gt;</i></p> <div style="border: 1px solid #007bff; padding: 5px; background-color: #e6f2ff;"> <p><b>i</b> The key values specified for labels are added to the pod along with the default values.</p> </div>
logFileSizeMb	Maximum file size of the log in MB.	5	5

Parameter	Description	Example	Default
logFileBackups	Maximum number of backups saved in the log. When the maximum number of backups is reached, the oldest log file after the initial log file is deleted.	3	3
logLevel	Number of log details. INFO , WARNING , DEBUG , or TRACE .	"INFO"	INFO
maxPodLogsTailLinesCount	<p>Number of lines to be tailed while collecting logs.</p> <p>To use this parameter, enable the log capturing feature. See <a href="#">Enable Log Collection for Failing Pods</a>.</p>	500	500

Parameter	Description	Example	Default
nodeSelector	The Cluster Agent pod runs on the node that includes the specified <code>key-value</code> pair within its labels property. See <a href="#">nodeSelector</a> .	nodeSelector: kubernetes.io/e2e-az-name: az1	N/A

Parameter	Description	Example	Default
<p>nsToMonitor</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p><b>i</b> This parameter is deprecated. It is recommended to use nsToMonitorRegex</p> </div>	<p>Namespaces to be monitored in the cluster.</p>	<pre>nsToMonitor:   - "default"   - "appdynamics"</pre>	<p>default</p>

Parameter	Description	Example	Default
<code>nsToMonitorRegex</code>	<p>The regular expression for selecting the required namespaces to be monitored in the cluster.</p> <p>If you require to monitor multiple namespaces, separate the namespaces using <code> </code> without spaces.</p> <p>This parameter supersedes <code>nsToMonitor</code>. If you do not specify a value for this parameter, then the Cluster Agent uses the default value of <code>nsToMonitor</code>. However, it is recommended to use <code>nsToMonitorRegex</code> instead of <code>nsToMonitor</code>.</p> <div style="border: 1px solid #00aaff; padding: 5px; margin-top: 10px;"> <p> This parameter is supported in Cluster Agent <math>\geq 20.9</math>, and Controller <math>\geq 20.10</math>.</p> </div> <p>See <a href="#">Edit Namespaces</a>.</p>	<ul style="list-style-type: none"> <li>• <code>nsToMonitorRegex:.*</code></li> <li>• <code>nsToMonitorRegex:namespace1 namespace2</code></li> </ul>	<p>N/A</p>

Parameter	Description	Example	Default
<code>nsToExcludeRegex</code>	<p>The regular expression for the namespaces that must be excluded from the selected namespaces that match the regular expression mentioned for <code>nsToMonitorRegex</code>.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin: 10px 0;"> <p> This parameter is supported in Cluster Agent &gt;= 20.9, and Controller &gt;= 20.10.</p> </div> <p>This parameter can be used only if you have specified a value for the <code>nsToMonitorRegex</code> parameter.</p>	<code>nsToExcludeRegex: ns.*</code>	N/A

Parameter	Description	Example	Default
podFilter	<p>Blocklist or allowlist pods based on:</p> <ul style="list-style-type: none"> <li>Regular expressions for pod names</li> <li>Pod labels</li> </ul> <p>Blocklisting or allowlisting by name takes preference over blocklisting or allowlisting by labels. For example, if you have the podFilter as:</p> <pre>podFilter: blocklistedLabels: - release: v1 allowlistedNames: - ^podname</pre> <p>This blocks all the pods which have the label 'release=v1' except for the ones which have the names starting with 'podname'.</p> <ul style="list-style-type: none"> <li>When a pod is listed as allowed by name and blocked by name, it will be allowlisted.</li> </ul>	<pre>podFilter: blocklistedLabels: - label 1: value 1 allowlistedLabels: - label 1: value 1 - label 2: value 2</pre>	N/A

Parameter	Description	Example	Default
	<ul style="list-style-type: none"> <li>When a pod is listed as allowed by a label and blocked by a label, it will be allowlisted.</li> </ul>		
<code>priorityClassName</code>	The name of the pod priority class, which is used in the pod specification to set the priority.	<code>priorityClassName: system-node-critical</code>	N/A
<code>proxyUrl</code>	Publicly accessible host name of the proxy.	<code>https://myproxy.example.com:8080</code>	N/A

---

Parameter	Description	Example	Default
proxyUser	Username associated with the basic authentication credentials.	"user 1"	N/A

Parameter	Description	Example	Default
resources	Requests and limits of CPU and memory resources for the Cluster Agent.	<pre>resources:   limits:     cpu:       300m      memory:       "200Mi"    requests:     cpu:       200m      memory:       "100Mi"</pre>	<ul style="list-style-type: none"> <li>• CPU           <ul style="list-style-type: none"> <li>◦ request: 7</li> <li>◦ limit: 1250</li> </ul> </li> <li>• Memory           <ul style="list-style-type: none"> <li>◦ request: 1</li> <li>◦ limit: 3000</li> </ul> </li> </ul>

Parameter	Description	Example	Default
<code>stdoutLogging</code>	<p>By default, the Cluster Agent writes to a log file in the <code>logs</code> directory. Additionally, the <code>stdoutLogging</code> parameter is provided to send logs to the container <code>stdout</code>.</p>	<pre>"true", "false"</pre>	<p>true</p>

Parameter	Description	Example	Default
<code>tolerations</code>	An array of tolerations required for the pod. See <a href="#">Taint and Tolerations</a> .	<pre>tolerations: - effect: NoSchedule</pre>	N/A

---

Parameter	Description	Example	Default
		key : type value : test	

Parameter	Description	Example	Default
		<pre>-   effect:   NoExecute   key:   node.   kubernet</pre>	

---

Parameter	Description	Example	Default
		s .i o / n o t - r e a d y o p e r a t o r: E x i s t s t o l	

**i** For specific auto-instrumentation configurations, see [Auto-Instrument Applications with the Cluster Agent](#). Also the `.yaml` file includes the permissions for auto-instrumentation, which is enabled by default. If you do not want to use auto-instrumentation, you can remove the following text from the `.yaml` file:

```
kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1
metadata:
 name: appdynamics-cluster-agent-instrumentation
subjects:
 - kind: ServiceAccount
 name: appdynamics-cluster-agent
 namespace: appdynamics
roleRef:
 kind: ClusterRole
 name: appdynamics-cluster-agent-instrumentation
 apiGroup: rbac.authorization.k8s.io
```

## Cluster Agent File Example

This example shows a `cluster-agent.yaml` configuration file:

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 appName: "<app-name>"
 controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
 account: "<account-name>"
 # docker image info
 image: "<your-docker-registry>/appdynamics/cluster-agent:tag"
 nsToMonitor:
 - "default"
 eventUploadInterval: 10
 containerRegistrationInterval: 120
 httpClientTimeout: 30
 customSSLSecret: "<secret-name>"
 proxyUrl: "<protocol>://<domain>:<port>"
 proxyUser: "<proxy-user>"
 metricsSyncInterval: 30
 clusterMetricsSyncInterval: 60
 metadataSyncInterval: 60
 containerBatchSize: 25
 containerParallelRequestLimit: 3
```

```

podBatchSize: 30
metricUploadRetryCount: 3
metricUploadRetryIntervalMilliseconds: 5
podFilter:
 # blocklistedLabels:
 # - label1: value1
 # allowlistedLabels:
 # - label1: value1
 # - label2: value2
 # allowlistedNames:
 # - name1
 # blocklistedNames:
 # - name2
logLevel: "INFO"
logFileSizeMb: 5
logFileBackups: 3
stdoutLogging: "true"
resources:
 limits:
 cpu: 300m
 memory: "200Mi"
 requests:
 cpu: 200m
 memory: "100Mi"
labels:
 key1: value1
 key2: value2

```

## Install Infrastructure Visibility with the Kubernetes CLI

This page describes how to install the Machine Agent and Network Agents in a Kubernetes cluster where the Cluster Agent Operator is installed.

The Cluster Agent Operator provides a custom resource definition called `InfraViz`. You can use `InfraViz` to simplify deploying the Machine and Network Agents as a `daemonset` in a Kubernetes cluster. Additionally, you can deploy these agents by creating a `daemonset` YAML which does not require the Cluster Agent Operator. For more information, see [these examples](#).

To deploy the Analytics Agent as a `daemonset` in a Kubernetes cluster, see [Install Agent-Side Components in Kubernetes](#).

Windows Containers are not supported for this deployment.

## Requirements

Before you begin, verify that you have:

- Installed `kubectl`  $\geq$  1.16

- Cluster Agent >= 21.3.1
- Met these requirements: [Cluster Agent Requirements and Supported Environments](#).
- If Server Visibility is required, sufficient Server Visibility licenses based on the number of worker nodes in your cluster.
- Permissions to view servers in the AppDynamics Controller.

## Installation Procedure

1. **Install the Cluster Agent.** From this Alpine Linux example:
  - a. Download the Cluster Agent bundle.
  - b. Unzip the Cluster Agent bundle.
  - c. Deploy the Cluster Agent Operator using the CLI specifying the correct Kubernetes and OpenShift version (if applicable):

```
unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
kubectl create namespace appdynamics
```

[Kubernetes >= 1.16](#)   [OpenShift with Kubernetes >= 1.16](#)   [OpenShift with Kubernetes <= 1.15](#)

```
kubectl create -f cluster-agent-operator.yaml
```

[Kubernetes >= 1.16](#)   [OpenShift with Kubernetes >= 1.16](#)   [OpenShift with Kubernetes <= 1.15](#)

```
kubectl create -f cluster-agent-operator-openshift.yaml
```

[Kubernetes >= 1.16](#)   [OpenShift with Kubernetes >= 1.16](#)   [OpenShift with Kubernetes <= 1.15](#)

```
kubectl create -f cluster-agent-operator-openshift-1.15-or-less.yaml
```

**i** You can also install Cluster Agent Operator from [OpenShift OperatorHub](#) in your OpenShift cluster.

2. Create a Cluster Agent secret using the Machine Agent access key to connect to the Controller. If a `cluster-agent-secret` does not exist, you must create one, see [Install the Cluster Agent with the Kubernetes CLI](#).

```
kubectl -n appdynamics create secret generic cluster-agent-secret --from-literal=controller-key=<access-key>
```

3. Update the `infraviz.yaml` file to set the `controllerUrl`, and `account` values based on the information from the Controller's **License** page.

To enable Server Visibility, set `enableServerViz` to `true` (shown in the `infraviz.yaml` configuration on example).

To deploy a Machine Agent without Server Visibility enabled, set `enableServerViz` to `false`.

#### infraviz.yaml Configuration File with Server Visibility Enabled

```
apiVersion: v1
kind: ServiceAccount
metadata:
 name: appdynamics-infraviz
 namespace: appdynamics

apiVersion: cluster.appdynamics.com/v1alpha1
kind: InfraViz
metadata:
 name: appdynamics-infraviz
 namespace: appdynamics
spec:
 controllerUrl: "https://mycontroller.saas.appdynamics.com"
 image: "docker.io/appdynamics/machine-agent:latest"
 account: "<your-account-name>"
 globalAccount: "<your-global-account-name>"
 enableContainerHostId: true
 enableServerViz: true
 resources:
 limits:
 cpu: 500m
 memory: "1G"
 requests:
 cpu: 200m
 memory: "800M"
```

The `infraviz.yaml` configuration file example deploys a `daemonset` that runs a single pod per node in the cluster. Each pod runs a single container from where the Machine Agent, or Server Visibility Agent runs.

- To enable the Network Visibility Agent to run in a second container in the same pod, add the `netVizImage` and `netVizPort` keys and values as shown in this configuration file example:

#### infraviz.yaml Configuration File with Second Container in a Single Pod

```
apiVersion: v1
kind: ServiceAccount
metadata:
 name: appdynamics-infraviz
 namespace: appdynamics

apiVersion: cluster.appdynamics.com/v1alpha1
```

```
kind: InfraViz
metadata:
 name: appdynamics-infraviz
 namespace: appdynamics
spec:
 controllerUrl: "https://mycontroller.saas.appdynamics.com"
 image: "docker.io/appdynamics/machine-agent:latest"
 account: "<your-account-name>"
 enableContainerHostId: true
 enableServerViz: true
 netVizImage: appdynamics/machine-agent-netviz:latest
 netVizPort: 3892
resources:
 limits:
 cpu: 500m
 memory: "1G"
 requests:
 cpu: 200m
 memory: "800M"
```

## 5. Use kubectl to deploy infraviz.yaml

- For environments where Kubernetes  $\geq 1.25$ , PodSecurityPolicy is removed from Kubernetes  $\geq 1.25$  (<https://kubernetes.io/blog/2022/08/23/kubernetes-v1-25-release/#pod-security-changes>). Pod security restrictions are now applied at the namespace level (<https://kubernetes.io/docs/concepts/security/pod-security-admission/>) using [Pod Security Standard levels](#). Therefore you must set the level as **Privileged** to the namespace in which Infrastructure Visibility pod is running.
- For environments where Kubernetes  $< 1.25$ , PodSecurityPolicies block certain pod security context configuration, such as privileged pods, you must deploy the `infraviz-pod-security-policy.yaml` before editing the `infraviz.yaml` file. You must attach PodSecurityPolicy to `appdynamics-infraviz` serviceaccount explicitly.
- For environments where OpenShift SecurityContextConstraints block certain pod security context configuration, such as privileged pods, you must deploy the `infraviz-security-context-constraint-openshift.yaml` before editing the `infraviz.yaml` file.

Kubernetes

Kubernetes $<1.25$  with Pod Security Policy

Kubernetes $\geq 1.25$  with Pod Security Admission

OpenShift

```
kubectl create -f infraviz.yaml
```

Kubernetes

Kubernetes $<1.25$  with Pod Security Policy

Kubernetes $\geq 1.25$  with Pod Security Admission

OpenShift

```
kubectl create -f infraviz-pod-security-policy.yaml
kubectl create -f infraviz.yaml
```

[Kubernetes](#)
[Kubernetes<1.25 with Pod Security Policy](#)
[Kubernetes>=1.25 with Pod Security Admission](#)
[OpenShift](#)

a. Specify the following Kubernetes labels to the namespace where Infrastructure Visibility is installed:

- pod-security.kubernetes.io/<MODE>: <LEVEL> (Required)
  - pod-security.kubernetes.io/<MODE>-version: <VERSION> (Optional)
- For more info see, <https://kubernetes.io/docs/tasks/configure-pod-container/enforce-standards-namespace-labels/>.

**sample-namespace.yaml**

```

apiVersion: v1
kind: Namespace
metadata:
 name: appdynamics
 labels:
 pod-security.kubernetes.io/enforce: privileged
 pod-security.kubernetes.io/enforce-version: v1.27
 pod-security.kubernetes.io/audit: privileged
 pod-security.kubernetes.io/audit-version: v1.27
 pod-security.kubernetes.io/warn: privileged
 pod-security.kubernetes.io/warn-version: v1.27

```

b. Run the following command:

```
kubectl create -f infraviz.yaml
```

[Kubernetes](#)
[Kubernetes<1.25 with Pod Security Policy](#)
[Kubernetes>=1.25 with Pod Security Admission](#)
[OpenShift](#)

```
kubectl create -f infraviz-security-context-constraint-openshift.yaml
kubectl create -f infraviz.yaml
```

6. Confirm that the `appdynamics-infraviz` pod is running, and the Machine Agent, Server Visibility Agent, and Network Agent containers are ready:

```

kubectl -n appdynamics get pods
NAME READY STATUS RESTARTS AGE
appdynamics-infraviz-shkhj 2/2 Running 0 18s

```

7. To verify that the agents are registering with the Controller, review the logs and confirm that the agents display in the **Agents Dashboard** of the Controller Administration UI. In the Controller, if Server Visibility is enabled, the nodes are visible under **Controller > Servers**.

```
kubectl -n appdynamics logs appdynamics-infraviz-shkhj -c appd-infra-agent
```

...  
 Started AppDynamics Machine Agent Successfully

### InfraViz Configuration Settings

To configure Infrastructure Visibility, you can modify these parameters in the `infraviz.yaml` file included with the download package. After changing the file, delete and re-create the `InfraViz` deployment to ensure the changes are applied.

Parameter	Description	Required/Optional	Default
<code>account</code>	AppDynamics account name	Required	N/A
<code>args</code>	List of command arguments	Optional	N/A
<code>controllerUrl</code>	URL of the AppDynamics Controller	Required	N/A
<code>enableContainerHostId</code>	Flag that determines how container names are derived; specify either <code>true</code> or <code>false</code> .	Required	<code>true</code>
<code>enableMasters</code>	By default, only Worker nodes are monitored. When set to <code>true</code> , Server Visibility is provided for Master nodes. For managed Kubernetes providers, the flag has no effect because the Master plane is not accessible.	Optional	<code>false</code>
<code>enableServerViz</code>	Enable Server Visibility	Required	<code>false</code>
<code>enableDockerViz</code>	Enable Docker Visibility	Required	<code>false</code>
<code>env</code>	List environment variables	Optional	N/A
<code>eventServiceUrl</code>	Event Service Endpoint	Optional	N/A
<code>globalAccount</code>	Global account name	Optional	N/A

Parameter	Description	Required/ Optional	Default
<code>image</code>	Retrieves the most recent version of the Machine Agent image.	Optional	<code>appdynamics/ machine- agent:latest</code>
<code>imagePullSecret</code>	Name of the pull secret image	Optional	N/A
<code>logLevel</code>	Level of logging verbosity. Valid options are: <code>info</code> or <code>debug</code> .	Optional	<code>info</code>
<code>metricsLimit</code>	Maximum number of metrics that the Machine Agent sends to the Controller.	Optional	N/A
<code>netVizImage</code>	Retrieves the most recent version of Network Agent image.	Optional	<code>appdynamics/ machine-agent- netviz:latest</code>
<code>netVizPort</code>	When $> 0$ , the Network Agent is deployed in a sidecar with the Machine Agent. By default, the Network Visibility Agent works with port <code>3892</code> .	Optional	<code>3892</code>
<code>nodeSelector</code>	OS specific label that identifies nodes for scheduling of the <code>daemonset</code> pods.	Optional	<code>linux</code>
<code>overrideVolumeMounts</code>	The list of volumeMounts.	Optional	<code>overrideVolumeMounts:</code>  <ul style="list-style-type: none"> <li>- <code>proc</code></li> <li>- <code>sys</code></li> <li>- <code>etc</code></li> </ul>
<code>priorityClassName</code>	Name of the priority class that determines priority when a pod needs to be evicted.	Optional	N/A
<code>propertyBag</code>	String with any other Machine Agent parameters	Optional	N/A
<code>proxyUrl</code>	URL of the proxy server ( <code>protocol://domain:port</code> )	Optional	N/A

Parameter	Description	Required/ Optional	Default
proxyUser	Proxy user credentials ( user@password )	Optional	N/A
resources	Definitions of resources and limits for the Machine Agent	Optional	N/A
resourcesNetViz	Set resources for the Network Visibility (NetViz) container	Optional	<b>Request</b> <ul style="list-style-type: none"> <li>• CPU: 100m</li> <li>• Memory: 150Mi</li> </ul> <b>Limit</b> <ul style="list-style-type: none"> <li>• CPU: 200m</li> <li>• Memory: 300Mi</li> </ul>
runAsUser	<p>The UID (User ID) to run the entry point of the container process. If you do not specify the UID, this defaults to the user id specified in the image.</p> <p><a href="https://docker.io/appdynamics/machine-agent">docker.io/appdynamics/machine-agent</a></p> <p><a href="https://docker.io/appdynamics/machine-agent-analytics:latest">docker.io/appdynamics/machine-agent-analytics:latest</a></p> <p>If you require to run on any other UID, change the UID for runAsUser without changing the group ID.</p>	Optional	UID: 1001 Username: appdynamics
runAsGroup	<p>The GID (Group ID) to run the entry point of the container process. If you do not specify the ID, this uses the UID specified in the image,</p> <p><a href="https://docker.io/appdynamics/machine-agent">docker.io/appdynamics/machine-agent</a></p> <p><a href="https://docker.io/appdynamics/machine-agent-analytics:latest">docker.io/appdynamics/machine-agent-analytics:latest</a></p>	Optional	UID: 1001 Username: appdynamics
stdoutLogging	Determines if logs are saved to a file or redirected to the Console.	Optional	false
tolerations	List of tolerations based on the taints that are associated with nodes.	Optional	N/A

Parameter	Description	Required/Optional	Default
uniqueHostId	Unique host ID in AppDynamics. Valid options are: <code>spec.nodeName</code> , <code>status.hostIP</code> .	Optional	<code>spec.nodeName</code>

## Install Infrastructure Visibility with Helm Charts

This page describes how to use the Cluster Agent Helm Charts to deploy Infrastructure Visibility (InfraViz).

Helm is a package manager for Kubernetes. Helm charts are a collection of files that describe a set of Kubernetes resources. The Cluster Agent Helm Chart is a convenient method to deploy the Appdynamics Operator and InfraViz.

 Windows Containers are not supported for this deployment.

## Requirements

- Machine Agent version  $\geq 21.9.0$
- NetViz version  $\geq 21.3.0$
- Controller version  $\geq 20.6.0$
- Cluster Agent Helm charts are compatible with Helm 3.0

 Cluster Agent Helm Charts version should be  $\geq 1.1.0$  to install InfraViz using Cluster Agent Helm Charts. Older version ( $\leq v0.1.19$ ) of Cluster Agent Helm Charts does not work.

- 
- For environments where Kubernetes  $\geq 1.25$ , PodSecurityPolicy is removed from K8s  $\geq 1.25$  (<https://kubernetes.io/blog/2022/08/23/kubernetes-v1-25-release/#pod-security-changes>). Pod security restrictions are now applied at the namespace level (<https://kubernetes.io/docs/concepts/security/pod-security-admission/>) using Pod Security Standard levels. Therefore, you require to set the level as **Privileged** for the namespace in which Infrastructure Visibility pod is running.
  - For environments where Kubernetes  $< 1.25$ , PodSecurityPolicies block certain pod security context configuration, such as privileged pods, you must deploy the `infraviz-pod-security-policy.yaml` before editing the `infraviz.yaml` file. You require to attach PodSecurityPolicy to the `appdynamics-infraviz` serviceaccount explicitly.
  - For environments where OpenShift SecurityContextConstraints block certain pod security context configuration, such as privileged pods, you must deploy the `infraviz-security-context-constraint-openshift.yaml` before editing the `infraviz.yaml` file.

## Install Infrastructure Visibility in a Cluster

1. Delete all the previously installed CRDs related to Appdynamics Agent by using these commands:

```
$ kubectl get crds
```

```
$ kubectl delete crds <crd-names>
```

## 2. Add the chart repository to Helm:

```
$ helm repo add appdynamics-cloud-helmcharts https://appdynamics.jfrog.io/ui/native/appdynamics-cloud-helmcharts/cluster-agent/
```

## 3. Create a namespace for appdynamics in your cluster:

```
$ kubectl create namespace appdynamics
```

4. Create a Helm values file in this example of values-ca1.yaml. Update the `controllerInfo` properties with the credentials from the Controller. Update the `InfraViz` and `netviz` properties. See [InfraViz Configuration Settings](#) for information about the available properties like `enableMasters`, `enableContainerHostId`, `enableServerViz` and so on.

### values-ca1.yaml

```
To install InfraViz
installInfraViz: true

AppDynamics controller info
controllerInfo:
 url: https://<controller-url>:443
 account: <appdynamics-controller-account>
 username: <appdynamics-controller-username>
 password: <appdynamics-controller-password>
 accessKey: <appdynamics-controller-access-key>
 globalAccount: <appdynamics-controller-global-account>

InfraViz config
infraViz:
 nodeOS: "linux"
 enableMasters: false
 stdoutLogging: false
 enableContainerHostId: true
 enableServerViz: true
 enableDockerViz: false
 runAsUser: <UID of runAsUser>
 runAsGroup: 1001 # Netviz config
netViz:
 enabled: true
 netVizPort: 3892
```

See [Configuration Options](#) for `values.yaml` for more information regarding the available options. Also, you can download a copy of `values.yaml` from the Helm Chart repository using this command:

```
helm show values appdynamics-cloud-helmcharts/cluster-agent
```

5. Deploy the InfraViz to the appdynamics namespace:

```
$ helm install -f ./values-ca1.yaml "<my-cluster-agent-helm-release>" appdynamics-cloud-helmcharts/cluster-agent --namespace=appdynamics
```

**Configuration Options**

Configuration option	Description	Required
<code>installInfraViz</code>	Used for installing InfraViz. This must be set to true.	Required (Defaults to false)
<b>Image configuration options (options under <code>imageInfo</code> key in <code>values.yaml</code>)</b>		
<code>imageInfo.operatorImage</code>	Operator image address in format <code>&lt;registryUrl&gt;/&lt;registryAccount&gt;/cluster-agent-operator</code>	Optional (Defaults to the <a href="#">Docker Hub</a> image)
<code>imageInfo.operatorTag</code>	Operator image tag/version	Optional (Defaults to 22.1.0)
<code>imageInfo.imagePullPolicy</code>	Image pull policy for the operator pod	Optional
<code>imageInfo.machineAgentImage</code>	Machine Agent image address in format <code>&lt;registryUrl&gt;/&lt;registryAccount&gt;/machine-agent</code>	Optional (Defaults to <a href="#">Docker Hub</a> image)
<code>imageInfo.machineAgentTag</code>	Machine Agent image tag/version	Optional (Defaults to latest)
<code>ImageInfo.netVizImage</code>	NetViz Agent image address in format <code>&lt;registryUrl&gt;/&lt;registryAccount&gt;/machine-agent-netviz</code>	Optional (Defaults to the <a href="#">Docker Hub</a> image)
<code>ImageInfo.netvizTag</code>	NetViz Agent image tag/version	Optional (Defaults to latest)
<b>Controller configuration options (Config options under <code>controllerInfo</code> key in <code>values.yaml</code>)</b>		

<code>controllerInfo.accessKey</code>	AppDynamics Controller accessKey	Required
<code>controllerInfo.globalAccount</code>	AppDynamics Controller globalAccount	Required
<code>controllerInfo.account</code>	AppDynamics Controller account	Required
<code>controllerInfo.authenticateProxy</code>	true/false if the proxy requires authentication	Optional
<code>controllerInfo.customSSLCert</code>	Base64 encoding of PEM formatted SSL certificate	Optional
<code>controllerInfo.password</code>	AppDynamics Controller password	Required only when auto-instrumentation is enabled.
<code>controllerInfo.proxyPassword</code>	Password for proxy authentication	Optional
<code>controllerInfo.proxyUrl</code>	Proxy URL if the Controller is behind some proxy	Optional
<code>controllerInfo.proxyUser</code>	Username for proxy authentication	Optional
<code>controllerInfo.url</code>	AppDynamics Controller URL	Required
<code>controllerInfo.username</code>	AppDynamics Controller username	Required only when auto-instrumentation is enabled.

### RBAC configuration

<code>infraVizServiceAccount</code>	Service account to be used by the InfraViz	Optional
<code>createServiceAccount</code>	Set to true if ServiceAccounts mentioned are to be created by Helm	Optional
<code>operatorServiceAccount</code>	Service account to be used by the AppDynamics Operator	Optional

### NetViz config

netViz.resourcesNetViz	Set resources for the Network Visibility (NetViz) container	Optional
netViz.netVizPort	When > 0, the Network Agent is deployed in a sidecar with the Machine Agent. By default, the Network Visibility Agent works with port 3892.	Optional
<b>InfraViz config</b>		
infraViz.enableContainerHostId	Flag that determines how container names are derived; specify either true or false.	Required
infraViz.enableMasters	By default, only Worker nodes are monitored. When set to true, Server Visibility is provided for Master nodes. For managed Kubernetes providers, the flag has no effect because the Master plane is not accessible.	Optional
infraViz.enableServerViz	Enable Server Visibility	Required
infraViz.enableDockerViz	Enable Docker Visibility	Required
infraViz.runAsUser	<p>The UID (User ID) to run the entry point of the container process. If you do not specify the UID, this defaults to the user id specified in the image.</p> <ul style="list-style-type: none"> <li><a href="https://docker.io/appdynamics/machine-agent">docker.io/appdynamics/machine-agent</a></li> <li><a href="https://docker.io/appdynamics/machine-agent-analytics:latest">docker.io/appdynamics/machine-agent-analytics:latest</a></li> </ul> <p>If you require to run on any other UID, change the UID for runAsUser without changing the group ID.</p>	Optional
infraViz.runAsGroup	<p>The GID (Group ID) to run the entry point of the container process. If you do not specify the ID, this uses the UID specified in the image,</p> <p><a href="https://docker.io/appdynamics/machine-agent">docker.io/appdynamics/machine-agent</a></p> <p><a href="https://docker.io/appdynamics/machine-agent-analytics:latest">docker.io/appdynamics/machine-agent-analytics:latest</a></p>	Optional

infraViz.stdoutLogging	Determines if logs are saved to a file or redirected to the Console.	Optional
<b>InfraViz pod config</b>		
infravizPod.nodeSelector	Kubernetes node selector field in the InfraViz pod spec.	Optional
infravizPod.resources	Kubernetes CPU and memory resources in the InfraViz pod spec.	Optional
infravizPod.imagePullSecret	The credential file used to authenticate when pulling images from your private Docker registry or repository.	Optional
infravizPod.priorityClassName	The name of the pod priority class, which is used in the pod specification to set the priority.	Optional
infravizPod.env	List environment variables.	Optional
infravizPod.overrideVolumeMounts	The list of volumeMounts.	Optional
infravizPod.tolerations	List of tolerations based on the taints that are associated with nodes.	Optional
<b>InfraViz pod config</b>		
infravizPod.nodeSelector	Kubernetes node selector field in the InfraViz pod spec	Optional
infravizPod.resources	Kubernetes CPU and memory resources in the InfraViz pod spec	Optional
infravizPod.imagePullSecret	The credential file used to authenticate when pulling images from your private Docker registry or repository.	Optional
infravizPod.priorityClassName	The name of the pod priority class, which is used in the pod specification to set the priority.	Optional
<b>Operator pod config</b>		

<code>operatorPod.nodeSelector</code> or <code>operatorPod.tolerations</code>	Kubernetes node selector field in the AppDynamics Operator pod spec	Optional
<code>operatorPod.tolerations</code>	Kubernetes tolerations field in the AppDynamics Operator pod spec	Optional
<code>operatorPod.resources</code>	Kubernetes CPU and memory resources in the AppDynamics Operator pod spec	Optional

### Best Practices for Sensitive Data

We recommend using multiple `values.yaml` files to separate sensitive data in separate `values.yaml` files. Examples of these values are:

- `controllerInfo.password`
- `controllerInfo.accessKey`
- `controllerInfo.customSSLCert`
- `controllerInfo.proxyPassword`

Each `values` file follows the structure of the default `values.yaml` enabling you to easily share files with non-sensitive configuration properties yet keep sensitive values safe.

### Default `user-values.yaml` File Example

```

user-values.yaml

To install InfraViz
installInfraViz: true

imageInfo:
 operatorImage: docker.io/appdynamics/cluster-agent-operator
 operatorTag: 22.1.0
 imagePullPolicy: Always # Will be used for operator pod
 machineAgentImage: docker.io/appdynamics/machine-agent
 machineAgentTag: latest
 netVizImage: docker.io/appdynamics/machine-agent-netviz
 netvizTag: latest

controllerInfo:
 url: https://<controller-url>:443
 account: <appdynamics-controller-account>
 username: <appdynamics-controller-username>
 password: <appdynamics-controller-password>
 accessKey: <appdynamics-controller-access-key>

infravizServiceAccount: appdynamics-infraviz-ssl # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl # Can be any valid name

```

### user-values-sensitive.yaml

```
controllerInfo:
 password: welcome
 accessKey: abc-def-ghi-1516
```

When installing the Helm Chart, use multiple `-f` parameters to reference the files:

```
helm install -f ./user-values.yaml -f ./user-values-sensitive.yaml "<my-cluster-agent-helm-release>" appdynamics-cloud-helmcharts/cluster-agent --namespace ca-appdynamics
```

## Install Cluster Agent and Infrastructure Visibility in a Cluster

To install Cluster Agent and Infrastructure Visibility simultaneously, follow the same steps listed in [Install Infrastructure Visibility in a Cluster](#) along with the following updates:

1. Specify the following in the yaml file (for example, values.ca1):

```
installClusterAgent: true
installInfraViz: true
```

2. Update the `controllerInfo` properties with the credentials from the Controller. Update the `clusterAgent` properties to set the namespace and pods to monitor. See [Configure the Cluster Agent](#) for information about the available properties such as `nsToMonitor`, `nsToMonitorRegex`, `nsToExcludeRegex` and so on. Update the `InfraViz` and `NetViz` properties. See [Install Infrastructure Visibility with Helm Charts](#) for information about the available properties such as `enableMasters`, `enableContainerHostId`, `enableServerViz`, and so on in `values.yaml`.

## Install Infrastructure Visibility with OpenShift OperatorHub Bundle

This page describes how to install the Infraviz (Machine Agent and Network Agent) using AppDynamics OpenShift Operatorhub Bundle which is an alternative to [Install Infrastructure Visibility with Kubernetes CLI](#).

AppDynamics OpenShift OperatorHub Bundle is available at [RedHat Catalog](#).

### Requirements

Before you begin, verify that you have:

- OpenShift Cluster environment
- Met these requirements: [Cluster Agent Requirements and Supported Environments](#).
- If Server Visibility is required, sufficient Server Visibility licenses based on the number of worker nodes in your cluster.
- Permissions to view servers in the AppDynamics Controller.

### Installation Procedure

1. Create a namespace for appdynamics in your cluster:

```
kubectl create namespace appdynamics
```

2. Install AppDynamics Operator:
  - a. Go to your openshift cluster console
  - b. Go to **Operators > OperatorHub**
  - c. Search with the `appdynamics` filter
  - d. Click **Install**
3. Update the `infraviz.yaml` file to set the `controllerUrl`, `account`, and `globalAccount` values based on the information from the Controller's **License** page.  
 To enable Server Visibility, set `enableServerViz` to `true` (shown in the `infraviz.yaml` configuration on example).  
 To deploy a Machine Agent without Server Visibility enabled, set `enableServerViz` to `false`.

#### infraviz.yaml Configuration File with Server Visibility Enabled

```
apiVersion: v1
kind: ServiceAccount
metadata:
 name: appdynamics-infraviz
 namespace: appdynamics

apiVersion: cluster.appdynamics.com/v1alpha1
kind: InfraViz
metadata:
 name: appdynamics-infraviz
 namespace: appdynamics
spec:
 controllerUrl: "https://mycontroller.saas.appdynamics.com"
 image: "docker.io/appdynamics/machine-agent:latest"
 account: "<your-account-name>"
 globalAccount: "<your-global-account-name>"
 enableContainerHostId: true
 enableServerViz: true
 resources:
 limits:
 cpu: 500m
 memory: "1G"
 requests:
 cpu: 200m
 memory: "800M"
```

The `infraviz.yaml` configuration file example deploys a `daemonset` that runs a single pod per node in the cluster. Each pod runs a single container from where the Machine Agent, or Server Visibility Agent runs.

4. To enable the Network Visibility Agent to run in a second container in the same pod, add the `netVizImage` and `netVizPort` keys and values as shown in this configuration file example:

### infraviz.yaml Configuration File with Second Container in a Single Pod

```

apiVersion: v1
kind: ServiceAccount
metadata:
 name: appdynamics-infraviz
 namespace: appdynamics

apiVersion: cluster.appdynamics.com/v1alpha1
kind: InfraViz
metadata:
 name: appdynamics-infraviz
 namespace: appdynamics
spec:
 controllerUrl: "https://mycontroller.saas.appdynamics.com"
 image: "docker.io/appdynamics/machine-agent:latest"
 account: "<your-account-name>"
 enableContainerHostId: true
 enableServerViz: true
 netVizImage: appdynamics/machine-agent-netviz:latest
 netVizPort: 3892
 resources:
 limits:
 cpu: 500m
 memory: "1G"
 requests:
 cpu: 200m
 memory: "800M"

```

#### 5. Use `kubectl` to deploy `infraviz.yaml`

**i** For environments where Kubernetes `PodSecurityPolicies` block certain pod security context configuration, such as privileged pods, you must deploy the `infraviz-pod-security-policy.yaml` before editing the `infraviz.yaml` file.

For environments where OpenShift `SecurityContextConstraints` block certain pod security context configuration, such as privileged pods, you must deploy the `infraviz-security-context-constraint-openshift.yaml` before editing the `infraviz.yaml` file.

[Kubernetes](#)   [Kubernetes with Pod Security Policy](#)   [OpenShift](#)

```
kubectl create -f infraviz.yaml
```

[Kubernetes](#)   [Kubernetes with Pod Security Policy](#)   [OpenShift](#)

```
kubectl create -f infraviz-pod-security-policy.yaml
kubectl create -f infraviz.yaml
```

Kubernetes    Kubernetes with Pod Security Policy    [OpenShift](#)

```
kubectl create -f infraviz-security-context-constraint-openshift.yaml
kubectl create -f infraviz.yaml
```

6. Check appdynamics-operator and appdynamics-infraviz pods are running. Also, Check Catalogsource, Subscription and Clusterserviceversion are created:

```
Appdynamics Operator pod status
kubectl get pods -n appdynamics

Infraviz pod status
kubectl get pods -n appdynamics

catalogsources should be created
kubectl get catalogsources -n appdynamics

subscriptions should be created
kubectl get subscriptions -n appdynamics

ClusterServiceVersion should be created
kubectl get clusterserviceversion -n appdynamics
```

7. To uninstall Infraviz and AppDynamics Operator:
- a. Delete the Infraviz:

```
kubectl delete -f infraviz.yaml
```

- b. Delete AppDynamics Operator:
  - i. Go to your OpenShift cluster console
  - ii. Go to **Operators > Installed Operators**
  - iii. Click on **AppDynamics Operator for Kubernetes > Actions > Uninstall Operator**

Check Infraviz Configuration Settings [here](#).

### AppDynamics Operator Container Image

This page describes how to build a custom AppDynamics Operator container image or use the pre-built images and store it in an internal registry.

This procedure is necessary when you:

- Require building custom AppDynamics Operator container image

- Require using the pre-built AppDynamics Operator Image on DockerHub or RedHat Registry, and store it in the internal registry.

Otherwise, by default Appdynamics Operator pod can directly pull and use the latest pre-built AppDynamics Operator Container Images on the AppDynamics DockerHub repository or AppDynamics RedHat registry.

### Build the Custom AppDynamics Operator Image

The download packages from the AppDynamics [Download Portal](#) include files you need to build and deploy the AppDynamics Operator container image.

Depending on the base Image that was used to build the AppDynamics Operator image, there are two package types available on the portal:

- Alpine Linux-based
- Rhel Linux-based (recommended for Openshift cluster only)

The directory structure of the download packages for the Alpine and Rhel Linux are:

[Alpine Linux AMD](#)   [Alpine Linux ARM](#)   [Rhel Linux ubi8](#)

```

## Build the Custom AppDynamics Operator Image

1. Change the directory to the Operator directory:

```
$ cd appdynamics-operator-alpine-linux-amd64-21.12.0-88/
```

2. Build and tag a `docker` image using this syntax:

[Alpine Linux](#) [Rhel Linux ubi8](#)

```
$ docker build -t <registryname>/<accountname>/cluster-agent-operator:<Operator_Version> .
```

[Alpine Linux](#) [Rhel Linux ubi8](#)

```
$ docker build -t <registryname>/<accountname>/cluster-agent-operator:<Operator_Version> -f Dockerfile-rhel .
```

For example, to build and tag the image version 21.12.0 using the latest alpine version on Docker Hub registry for the account name `johndoe`:

[Alpine Linux](#) [Rhel Linux ubi8](#)

```
$ docker build -t docker.io/johndoe/cluster-agent-operator:21.12.0 .
```

[Alpine Linux](#) [Rhel Linux ubi8](#)

```
$ docker build -t docker.io/johndoe/cluster-agent-operator:21.12.0 -f Dockerfile-rhel .
```

3. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent-operator:<Operator_Version>
```

For example, pushing the image version 21.12.0 to Docker Hub registry for the account name Johndoe :

```
$ docker push docker.io/johndoe/cluster-agent-operator:21.12.0
```

## Use Pre-Built AppDynamics Operator Image

You can also use pre-built Alpine-based or RHEL-based AppDynamics Operator images to an internal registry.

### Alpine AppDynamics Operator Image

You can use the pre-built Alpine-based AppDynamics Operator image from the [AppDynamics DockerHub](#) account.

1. Log in to your Docker Hub account:

```
$ docker login docker.io -u <your-username> -p <your-password>
```

2. Pull the image:

```
$ docker pull docker.io/appdynamics/cluster-agent-operator:<Operator_Version>
```

For example, to pull the Alpine-based AppDynamics Operator image version 21.12.0:

```
$ docker pull docker.io/appdynamics/cluster-agent-operator:21.12.0
```

To push this image to the internal registry or accounts:

1. Rename the image:

```
$ docker tag docker.io/appdynamics/cluster-agent-operator:<Operator_Version>
<registryname>/<accountname>/cluster-agent-operator:<Operator_Version>
```

For example:

```
$ docker tag docker.io/appdynamics/cluster-agent-operator:21.12.0 docker.io/johndoe/
cluster-agent-operator:21.12.0
```

2. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent-operator:<Operator_Version>
```

For example, to push the image version 21.12.0 to the Docker Hub registry for the account name Johndoe:

```
$ docker push docker.io/johndoe/cluster-agent-operator:21.12.0
```

### Rhel AppDynamics Operator Image

Alternatively, you can use the pre-built Rhel-based AppDynamics Operator Image from the [Appdynamics Redhat Container Registry](#) account.

**i** To use Redhat-based AppDynamics Operator, you may need to adjust your firewall settings as suggested by Redhat. Hence, you need to enable outbound connections to the following hostnames:

- cdn.quay.io
- cdn01.quay.io
- cdn02.quay.io
- cdn03.quay.io

1. Log in to Red Hat Registry using your Customer Portal credentials:

```
$ docker login registry.connect.redhat.com -u <your-username> -p <your-password>
```

2. Pull the image:

```
$ docker pull registry.connect.redhat.com/appdynamics/cluster-agent-operator:<Operator_Version>
```

For example, to pull the Rhel-based AppDynamics Operator version 21.12.0:

```
$ docker pull registry.connect.redhat.com/appdynamics/cluster-agent-operator:21.12.0
```

You can now use the AppDynamics Operator image.

To push this image to the internal registry, or to other accounts:

1. Rename the image:

```
$ docker tag registry.connect.redhat.com/appdynamics/cluster-agent-operator:<Operator_Version> <registryname>/<accountname>/cluster-agent-operator:<Operator_Version>
```

For example:

```
$ docker tag registry.connect.redhat.com/appdynamics/cluster-agent-operator:21.12.0 scan.connect.redhat.com/johndoe/cluster-agent-operator:21.12.0
```

2. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent-operator:<Operator_Version>
```

For example, to push the image version 21.12.0 to Redhat Registry for account name johndoe :

```
$ docker push scan.connect.redhat.com/johndoe/cluster-agent-operator:21.12.0
```

## Configure the Image in AppDynamics Operator YAML Specification

Make sure to reference the image in the `cluster-agent-operator.yaml` or `cluster-agent-operator-openshift.yaml` spec:

```
apiVersion: cluster.appdynamics.com/v1alpha1
apiVersion: apps/v1
kind: Deployment
metadata:
 name: appdynamics-operator
 namespace: appdynamics
spec:
 replicas: 1
 selector:
 matchLabels:
 name: appdynamics-operator
 template:
 metadata:
 labels:
 name: appdynamics-operator
 spec:
 serviceAccountName: appdynamics-operator
 containers:
 - name: appdynamics-operator
 image: <registryname>/<username>/cluster-agent-operator:<Operator_Version>
 ports:
 - containerPort: 60000
 name: metrics
 command:
 - appdynamics-operator
 imagePullPolicy: Always
 resources:
 limits:
 cpu: 200m
 memory: 128M
 requests:
 cpu: 100m
 memory: 64M
 env:
 - name: WATCH_NAMESPACE
 valueFrom:
 fieldRef:
 fieldPath: metadata, namespace
```

```

-name: POD_NAME
 valueFrom:
 fieldRef:
 fieldPath:-metadata.name
-name: OPERATOR_NAME
 value: appoynamics-operator

```

For assistance, contact [AppDynamics Support](#).

### Cluster Agent and the Operator Compatibility Matrix

The compatibility matrix describes which Operator (Kubernetes or OpenShift) version is required for each Cluster Agent version.

- To view the list of features for the latest agent, see [Release Notes](#).
- To view the list of features for older agents, see [Past Agent Releases](#).

- Appdynamics Operator has major release starting from version 21.12.0 and is compatible with Cluster Agent >= 21.12.0 only. The operator release versions <= 0.6.11 will only work with Cluster Agent <= 21.10.0.
- Cluster Agent Helm Charts have major release starting from version 1.1.0 and is compatible with Cluster Agent >= 21.12.0 and AppDynamics Operator >= 21.12.0 only. The helm charts version <= 0.1.19 will only work with Cluster Agent <= 21.10.0 and Appdynamics Operator <= 0.6.11
- Cluster Agent Helm Charts version >= 1.10.0 is compatible with Cluster Agent >= 23.2.0 and AppDynamics Operator >= 23.2.0 only.

AppDynamics recommends that you upgrade the Operator with the Cluster Agent upgrade. See [Upgrade the Cluster Agent](#). Ensure that use the latest YAML configuration files for the Operator and Cluster Agent from the upgraded version because the Cluster Agent may support new or modified configuration. If you do not update the Operator or YAML configuration file, and the Cluster Agent is upgraded, then the Cluster Agent may not work properly.

This table lists the Operator version with its supported Cluster Agent version:

Operator (Kubernetes/ OpenShift)	Cluster Agent
23.8.0	23.8.0
23.7.0	23.7.0
23.6.0	23.6.0
23.5.0	23.5.0
23.4.0	23.4.0

Operator (Kubernetes/ OpenShift)	Cluster Agent
23.2.0	23.2.0
22.12.0	22.12.0
22.11.0	22.11.0
22.9.0	22.9.0
22.7.0	22.7.0
22.6.0	22.6.0
22.4.0	22.4.0
22.1.0	22.1.0
21.12.0	21.12.0
0.6.11	21.10.0
0.6.10	21.7.0
0.6.9	21.5.0
0.6.8	21.3.1, 21.3.0
0.6.7	21.2.0
0.6.6	20.12.0, 20.12.1
0.6.5	20.11.0
0.6.4	20.11.0
0.6.3	20.10.0
0.6.2	20.9.1, 20.9.0
0.6.1	20.9.1, 20.9.0
0.5.4	20.8.0

Operator (Kubernetes/ OpenShift)	Cluster Agent
0.5.3	20.7.0
0.5.2	20.6.0

### Cluster Agent Container Image

This page describes how to build a custom Cluster Agent container image or use an officially released pre-built images and store it to an internal registry.

This procedure is required when you:

- Require to build custom Cluster Agent container image
- Require to use the pre-built Cluster Agent Image from DockerHub, or the RedHat Container Registry, and store it in the internal registry.

Otherwise, you can directly pull and use the pre-built Cluster Agent Container Images on the AppDynamics DockerHub repository or AppDynamics RedHat registry in the `cluster-agent.yaml` or `values.yaml` Helm file.

This example uses the pre-built Cluster Agent Image 21.12.0 published to DockerHub:

[Yaml](#) [values.yaml](#)

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 controllerUrl: "http://<account>.saas.appdynamics.com"
 account: "<account-name>"
 appName: "Cluster1"
 image: docker.io/appdynamics/cluster-agent:21.12.0
```

[Yaml](#) [values.yaml](#)

```
deploymentMode: PRIMARY

installclusteragent: true
installInfraviz: false

Docker images
```

```

imageInfo:
agentImage: docker.io/appdynamics/cluster-agent
agentTag: 21.12.0
operatorImage: docker.io/appdynamics/cluster-agent-operator
operatorTag:21.12.0
imagePullPolicy: Always
machineAgentImage: docker.io/appdynamics/machine-agent-analytics
machineAgentTag:21.9.0
machineAgentWinTag:21.9.0-win-ltsc2019
netVizImage: docker.io/appdynamics/machine-agent-netviz

```

## Build the Custom Cluster Agent Image

The download packages from the AppDynamics [Download Portal](#) include files you need to build and deploy the Cluster Agent container image.

Depending on the base Image that was used to build the Cluster Agent Image, there are two package types available on the portal:

- Alpine Linux-based
- RHEL Linux-based (recommended for OpenShift cluster only)

The directory structure of the download packages for the Alpine and RHEL Linux is:

[Alpine Linux AMD](#)   [Alpine Linux ARM](#)   [RHEL Linux ubi8](#)

```

 ├── templates
 └── values.yaml

```

## Build the Custom Cluster Agent Image

1. Change directories into the `docker` directory:

```
$ cd docker
```

2. Build and tag a `docker` image using this syntax:

[Alpine Linux](#) [Rhel Linux ubi8](#)

```
$ docker build -t <registryname>/<accountname>/cluster-agent:<Agent-version> --build-arg version=<alpine-version> .
```

[Alpine Linux](#) [Rhel Linux ubi8](#)

```
$ docker build -t <registryname>/<accountname>/cluster-agent:<Agent-version> -f Dockerfile-rhel .
```

**i** To use a specific Alpine Image version, specify the version using `--build-arg version=<alpine-version>`. If you do not specify an image version, then the build command takes the *latest* Alpine image version automatically.

For example, to build and tag the image version `21.12.0` using the latest alpine version on Docker Hub registry for the account name `johndoe`:

[Alpine Linux](#) [Rhel Linux ubi8](#)

```
$ docker build -t docker.io/johndoe/cluster-agent:21.12.0 .
```

[Alpine Linux](#) [Rhel Linux ubi8](#)

```
$ docker build -t docker.io/johndoe/cluster-agent:21.12.0 -f Dockerfile-rhel .
```

3. When the build is successful, verify that the image appears in your local Docker repository.
4. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example, pushing the image version 21.12.0 to Docker Hub registry for the account name Johndoe :

```
$ docker push docker.io/johndoe/cluster-agent:21.12.0
```

## Use Pre-Built Cluster Agent Image

You can also use a pre-built Alpine-based Cluster Agent or Rhel-based Cluster Agent to an internal registry.

### Alpine Cluster Agent Image

You can use the pre-built Alpine-based Cluster Agent image from the [AppDynamics Docker Hub](#) account.

1. Log in to your Docker Hub account:

```
$ docker login docker.io -u <your-username> -p <your-password>
```

2. Pull the image:

```
$ docker pull docker.io/appdynamics/cluster-agent:<Agent-version>
```

For example, to pull the Alpine based cluster agent image version 21.12.0:

```
$ docker pull docker.io/appdynamics/cluster-agent:21.12.0
```

To push this image to internal registry or accounts:

1. Rename the image:

```
$ docker tag docker.io/appdynamics/cluster-agent:<Agent-version> <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example:

```
$ docker tag docker.io/appdynamics/cluster-agent:21.12.0 docker.io/johndoe/cluster-agent:21.12.0
```

2. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example, to push the image version 21.12.0 to Docker Hub registry for the account name Johndoe:

```
$ docker push docker.io/johndoe/cluster-agent:21.12.0
```

## Rhel Cluster Agent Image

Alternatively, you can use the pre-built RHEL based Cluster Agent Image from the [Appdynamics Redhat Container Registry](#) account.

**i** To use Redhat-based Cluster Agent, you may need to adjust your firewall settings as suggested by Redhat. Hence, you need to enable outbound connections to the following hostnames:

- cdn.quay.io
- cdn01.quay.io
- cdn02.quay.io
- cdn03.quay.io

1. Log in to Red Hat Registry using your Customer Portal credentials:

```
$ docker login registry.connect.redhat.com -u <your-username> -p <your-password>
```

2. Pull the image:

```
$ docker pull registry.connect.redhat.com/appdynamics/cluster-agent:<Agent-version>
```

For example, to pull the RHEL based Cluster Agent version 21.12.0:

```
$ docker pull registry.connect.redhat.com/appdynamics/cluster-agent:21.12.0
```

You can now use the Cluster Agent image.

To push this image to internal registry, or to other accounts:

1. Rename the image:

```
$ docker tag registry.connect.redhat.com/appdynamics/cluster-agent:<Agent-version>
<registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example:

```
$ docker tag registry.connect.redhat.com/appdynamics/cluster-agent:21.12.0
scan.connect.redhat.com/johndoe/cluster-agent:21.12.0
```

2. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example, to push the image version 21.12.0 to Redhat Registry for account name johndoe :

```
$ docker push scan.connect.redhat.com/johndoe/cluster-agent:21.12.0
```

## Configure the Image in Cluster Agent YAML Specification

Make sure to reference the image in the `cluster-agent.yaml` spec:

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 controllerUrl: "http://<account>.saas.appdynamics.com"
 account: "<account-name>"
 appName: "Cluster1"
 image: <registryname>/<username>/cluster-agent:<Agent-version>
```

For assistance, contact [AppDynamics Support](#).

## Auto-Instrument Applications with the Cluster Agent

This page describes how to auto-instrument Kubernetes workloads running in a cluster where the Cluster Agent is deployed. See [Install the Cluster Agent](#).

For instrumentation options, see [Container Platforms](#).

AppDynamics recommends using auto-instrumentation to simplify operations.

With auto-instrumentation, you can dynamically add an App Server Agent to workloads for these application types:

- Java
- .NET Core on Linux
- Node.js

We support these Kubernetes workloads: `Deployments`, `DeploymentConfigs` and `StatefulSets`.

### Auto-Instrumentation Overview

To enable auto-instrumentation, you:

- Add additional configuration to the `cluster-agent.yaml` file, or
- Add configuration to the Cluster Agent Helm Chart `values.yaml` file. See [Install the Cluster Agent with Helm Charts](#).

Then, you can apply the changes using `kubectl` or upgrade the Cluster Agent Helm Chart.

When the Cluster Agent detects a supported workload, and the workload matches the configured auto-instrumentation rules, the Cluster Agent modifies the workload's spec using the Kubernetes API. The Cluster Agent attaches an init container with the AppDynamics .NET Core, Node.js, or Java Agent image to the workload. If a volume has the prefix as `appd`, the Cluster Agent deletes the volume from the workload to ensure that during the next auto-instrumentation there is no error. When the application restarts, the required agent is copied into the application container. As a result, the application container references the AppDynamics agent (Node.js Agent, .NET Core on Linux Agent, or Java Agent) in an auto-instrumented application.

## Requirements

### AppDynamics Requirements

- Cluster Agent  $\geq$  20.5. See [Cluster Agent Requirements and Supported Environments](#).
- Installed the latest Cluster Agent and Operator versions in the cluster. The `cluster-agent-operator.yaml` sets up the permissions required by the Cluster Agent to perform auto-instrumentation. See [Install the Cluster Agent](#).
- At least one application is deployed to the cluster that was not previously instrumented with the required AppDynamics agent.
- A Controller with sufficient agent licenses based on the number of applications that will be auto-instrumented.
- Create a local user in the Controller with the Server Monitoring Administrator role. The Cluster Agent uses the credentials for this user to mark the nodes as historical when an auto-instrumented pod is deleted. Use these credentials to set the `api-user` during your first step when you [Enable Auto-instrumentation for Cluster Agent](#). You can also use these credentials to set the username and password values when using the Helm Chart to enable auto-instrumentation.
- Ensure that you have sufficient cluster capacity to process pod restarts. See [Minimize the Impact of Pod Restarts](#).
- Ensure that you have specified the app, the tier, and the node name tuple to be unique across all the Kubernetes instances. If the name is not unique, the nodes may not report properly. This is applicable to those agents on which app, tier, and node uniqueness is required such as Java and Node.js Agents.

### Language-Specific Requirements

- Node.js  $\geq$  8.6
- Java
  - Java applications must support including the `-javaagent` argument in the Java command using an environment variable. By default, the Cluster Agent uses `JAVA_TOOL_OPTIONS`; however, you can change this using the `defaultEnv` property.
  - Based on Java Agent resource requirements, it may be necessary to adjust the configured memory requests or limits for the application pods (see [Install the Java Agent](#)).
- .NET Core on Linux and Node.js
  - Ensure that the application base image Operating System (OS) matches the App Server Agent base image OS (Linux versus Alpine). For example, if your .NET Core on Linux application uses an Ubuntu base image, then you must set the `imageInfo.image` tag to the Linux version. In this example, the image tag is `20.11.0-linux`. If the application used an Alpine Linux base image OS, then the tag would be `20.11.0-alpine`. See the [AppDynamics Docker Hub page](#).

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 # content removed for brevity
 instrumentationRules:
 - namespaceRegex: dev
 language: dotnetcore
```

```
appName: MyDotNetAppOnUbuntu
imageInfo:
 image: "docker.io/appdynamics/dotnet-core-agent:20.11.0-linux"
 agentMountPath: /opt/appdynamics
```

If the base image Operating Systems do not match, then the App Server Agent may not start. See [Validate Auto-Instrumentation](#). The Node.js Agent also has specific Node.js runtime requirements that may prevent the agent from starting. See [Node.js Supported Environments](#).

- For .NET Core and Node.js applications that communicate with an on-premises Controller, see [Use Auto-Instrumentation with an On-Premises Controller](#).
- If transaction analytics data is required, then you must configure the Cluster Agent `analyticsHost` and `analyticsPort` properties.

## Enable Auto-Instrumentation for the Cluster Agent

To set up the Cluster Agent feature:

1. Remove any deleted pods from the **Tiers & Nodes** Controller Dashboard. Then, re-create the `cluster-agent-secret` that was created in [Install the Cluster Agent](#) to include `api-user` :

```
kubectl -n appdynamics delete secret cluster-agent-secret
kubectl -n appdynamics create secret generic cluster-agent-secret --from-literal=controller-key=<access-key> --from-literal=api-user="<username>@<customer>:<password>"
```

**i** Set the `api-user` value to a local user from the Controller with the Server Monitoring Administrator role. Cluster Agent uses the `api-user` to mark the associated node in the Controller as historical on pod deletion.

2. Add auto-instrumentation configuration to the `cluster-agent.yaml` or the Helm `values.yaml` file. The configuration determines which `Deployments`, `DeploymentConfigs` and `StatefulSets` workloads to target for auto-instrumentation and which agent types and versions to use. See [Auto-Instrumentation Configuration](#).
3. After you save the configuration, apply or upgrade the Cluster Agent deployment. The related pods and containers restart based on the deployment rollout strategy associated with the applications.

[Kubernetes CLI](#) [Helm Chart](#)

```
kubectl apply -f cluster-agent.yaml
```

[Kubernetes CLI](#) [Helm Chart](#)

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/
cluster-agent --namespace appdynamics
```

To validate and troubleshoot auto-instrumentation, see [Validate the Cluster Agent Installation](#).

- If a workload does not match the properties defined in `instrumentationRules`, then auto-instrumentation is not enabled.
- If an auto-instrumentation property is not defined as a default, or in `instrumentationRules`, then the Cluster Agent uses the corresponding default value specified in [Auto-Instrumentation Configuration](#). If there are no corresponding default values, then auto-instrumentation is not enabled.

## Configuration Examples

Example 1 targets Java applications in the namespaces that match the `ecom.*` pattern. Each matching application will be instrumented with a `20.20.1` Java Agent and will report to the `Ecommerce` application in the AppDynamics Controller. By default, the tier name is the name of the Kubernetes workload, but you can override it by setting the `tierName` property.

### Example 1: cluster-agent-auto-1.yaml

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 appName: "<cluster-name>"
 controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
 account: "<account-name>"
 image: "docker.io/appdynamics/cluster-agent:20.12.1"
 serviceAccountName: appdynamics-cluster-agent
 nsToMonitorRegex: ecom.*
 #
 # auto-instrumentation config
 #
 instrumentationMethod: Env
 nsToInstrumentRegex: ecom.*
 defaultAppName: Ecommerce
 instrumentationRules:
 - language: java
 imageInfo:
 image: docker.io/appdynamics/java-agent:20.20.1
 agentMountPath: /opt/appdynamics
```

Example 2 targets namespaces that contain Java and .NET Core on Linux applications, and incorporates these advanced configurations:

- Uses multiple `instrumentationRules` to target Java applications versus .NET Core on Linux applications.
- Uses the `labelMatch` strategy to determine the agent type and associated agent image based on the value of the `framework` label in the workload spec `auto-instrumented-dotnet-app.yaml` and `auto-instrumented-java-app.yaml` below.
- Rather than assigning a Controller application name in the `YAML` file, the configuration uses `appNameStrategy: label` to assign an application name based on a label from the workload spec.
- For the Java applications, it uses `instrumentContainer: select` and `containerMatchString: .*service` to instruct the Cluster Agent to auto-instrument only the application service container only, and ignore any other defined containers defined.

### Example 2: cluster-agent-auto-2.yaml

```

apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 appName: "<cluster-name>"
 controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
 account: "<account-name>"
 image: "docker.io/appdynamics/cluster-agent:20.12.1"
 serviceAccountName: appdynamics-cluster-agent
 nsToMonitorRegex: ecom.*
 #
 # auto-instrumentation config
 #
 instrumentationMethod: Env
 nsToInstrumentRegex: stage
 appNameStrategy: label
 instrumentationRules:
 - namespaceRegex: stage
 language: dotnetcore
 labelMatch:
 - framework: dotnetcore
 appNameLabel: appName
 imageInfo:
 image: "docker.io/appdynamics/dotnet-core-agent:20.11.0-linux"
 agentMountPath: /opt/appdynamics
 - namespaceRegex: stage
 language: java
 labelMatch:
 - framework: java
 appNameLabel: appName
 instrumentContainer: select
 containerMatchString: .*service
 imageInfo:

```

```
image: "docker.io/appdynamics/java-agent:21.3.0"
agentMountPath: /opt/appdynamics
```

Examples 3 and 4 show Deployment specs for .NET and Java services that define the `appName` and framework labels, based on the auto-instrumentation configuration from the `cluster-agent-auto-2.yaml`:

[Example 3: auto-instrumented-dotnet-app.yaml](#)

[Example 4: auto-instrumented-java-app.yaml](#)

## .NET

```
apiVersion: apps/v1
kind: Deployment
metadata:
 name: dotnet-profile-service
 labels:
 appName: backend-services
 framework: dotnetcore
spec:
 containers:
 - image: myrepo/profile-service:v2
 name: profile-service
...
```

[Example 3: auto-instrumented-dotnet-app.yaml](#)

[Example 4: auto-instrumented-java-app.yaml](#)

## Java

```
apiVersion: apps/v1
kind: Deployment
metadata:
 name: java-account-service
 labels:
 appName: backend-services
 framework: java
spec:
 containers:
 - image: myrepo/account-service:v2
 name: account-service
 - image: myrepo/proxy-util:v1
 name: proxy-util
...
```

The value of `containerMatchString` in `cluster-agent-auto-2.yaml` indicates that only the `account-service` container will be auto-instrumented in `auto-instrumented-java-app.yaml`.

For additional configuration examples, see [Auto-Instrumentation Configuration Examples](#).

### Correlate Application Containers with App Agents (For Kubernetes version >=1.25)

When you establish application correlation with the agents, the monitored application containers are displayed in the Controller under the **Application/Container** view. The **Cluster Agent Pod** Dashboard also provides a link to the **APM Node** Dashboard in the **Pod Details** page. To enable APM and container correlation during auto-instrumentation, you must configure the `containerAppCorrelationMethod` property under the `spec` section in the configuration file. This property is applicable for the environments that use Kubernetes >=1.25 because from Kubernetes 1.25 onwards, support for cgroup v1 runtimes are replaced by cgroup v2 enabled runtimes.

You can choose one of the following values for the correlation method:

- `proxy` (recommended): This is the default value. When you specify this value, the App agents query for the container ID from the Cluster Agent.
- `kubeapi`: When you specify this value, the App agents query for the container ID from the Kubernetes API server. However, to use this method you require extra permissions. For information about permissions, see [Permission required to query from Kubernetes API Server](#).
- `none`: When you specify this value, there is no correlation.

Example:

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 containerAppCorrelationMethod: proxy
 appName: "<cluster-name>"
 controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
 account: "<account-name>"
 image: "docker.io/appdynamics/cluster-agent:20.12.1"
 serviceAccountName: appdynamics-cluster-agent
 nsToMonitorRegex: ecom.*
 #
 # auto-instrumentation config
 #
 instrumentationMethod: Env
 nsToInstrumentRegex: ecom.*
 defaultAppName: Ecommerce
 instrumentationRules:
 - language: java
 imageInfo:
 image: docker.io/appdynamics/java-agent:20.20.1
 agentMountPath: /opt/appdynamics
```

### Permission Required to Query Container ID from Kubernetes API Server

The following permissions are required when `containerAppCorrelationMethod` property is specified as the `kubeapi`:

apiGroups	resources	Permissions
""	serviceaccounts	<ul style="list-style-type: none"> <li>• get</li> <li>• create</li> <li>• delete</li> </ul>
rbac.authorization.k8s.io	<ul style="list-style-type: none"> <li>• roles</li> <li>• rolebindings</li> </ul>	<ul style="list-style-type: none"> <li>• get</li> <li>• create</li> <li>• update</li> <li>• delete</li> </ul>

## AppDynamics Application Name Strategies

The Controller's **Application Dashboard** provides three application name strategies. Select a strategy by assigning the `appNameStrategy` property to one of these values:

- **manual**: Use the `defaultAppName` or `appName` parameters in the `cluster-agent.yaml` file to set the application name.
- **label**: Use a label from the workload's spec as the application name.
- **namespace**: Use the Kubernetes namespace as the application name.

### Manual Strategy

By default, the `appNameStrategy` is `manual`, which uses the `defaultAppName` or `appName` parameter to set the application name.

- If `defaultAppName` is provided, then use it (unless overwritten in an instrumentation rule).
- If `appName` is provided in an instrumentation rule, then use it.

For example in this spec, `ECommerce` is the default application name applied to the `ecom` and `groceries` namespaces, and `BookStore` is the application name applied to the `books` namespace.

```

apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 appName: "<cluster-name>"
 # ...
 # auto-instrumentation config
 instrumentationMethod: Env
 nsToInstrumentRegex: ecom|books|groceries
 appNameStrategy: manual
 defaultAppName: ECommerce
 instrumentationRules:
 - namespaceRegex: books
 appName: BookStore

```

## Label Strategy

This option uses the `label` parameter as the application name strategy. To use the label option, specify a value in the `appNameLabel` parameter. The `appNameLabel` value refers to a label specified in the workload spec.

- If `spec.appNameLabel` is provided, then use it (unless overwritten in an instrumentation rule).
- If `appNameLabel` is provided in an instrumentation rule, then use it.

For example in this spec, the workload spec label `appname` is used to set the application name in the `ecom` and `groceries` namespaces, and the label `app` is used in the `books` namespace.

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 appName: "<cluster-name>"
 # ...
 # auto-instrumentation config
 instrumentationMethod: Env
 nsToInstrumentRegex: ecom|books|groceries
 appNameStrategy: label
 appNameLabel: appname
 instrumentationRules:
 - namespaceRegex: books
 appNameLabel: app
```

For an application deployed to the `ecom` or `groceries` namespaces that sets the label `appname` (shown in this Deployment spec snippet), it reports to the `eCommerce` application in the Controller's **Application Dashboard**.

```
apiVersion: apps/v1
kind: Deployment
metadata:
 name: ecom-app
 labels:
 appname: eCommerce
spec:
 ...
```

## Namespace Strategy

This option uses the Kubernetes `namespace` parameter as the application name strategy and allows you to use the namespace name where an application is deployed as the application name in the Controller's **Application Dashboard**.

In this spec, each application in `ecom`, `books`, and `groceries` namespace uses the application name based on the namespace that it is deployed to.

```

apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 appName: "<cluster-name>"
 # ...
 # auto-instrumentation config
 instrumentationMethod: Env
 nsToInstrumentRegex: ecom|books|groceries
 appNameStrategy: namespace

```

## AppDynamics Tier Name Strategies

The Controller's **Application Dashboard > Tiers and Nodes** provides two tier name strategies. Select a strategy by assigning the `tierNameStrategy` property to one of these values:

- **manual:** Use the `tierName` parameters in the `cluster-agent.yaml` file to set the tier name.
- **label:** Use a label from the workload's spec as the tier name.

### Manual Strategy

By default, the `tierNameStrategy` is `manual`, which uses the deployment name or `tierName` parameter to set the tier name.

- If `tierName` is not provided, then use deployment name as `tiername`.
- If `tierName` is provided in an instrumentation rule, then use it.

For example in this spec, `<deployment name>` is the default tier name applied to the `ecom` and `groceries` namespace, and `BookStore` is the tier name applied to the `books` namespace.

```

apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 appName: "<cluster-name>"
 # ...
 # auto-instrumentation config
 instrumentationMethod: Env
 nsToInstrumentRegex: ecom|books|groceries
 tierNameStrategy: manual
 instrumentationRules:
 - namespaceRegex: books
 tierName: BookStore

```

## Label Strategy

This option uses the `label` parameter as the tier name strategy. To use the `label` option, specify a value in the `tierNameLabel` parameter. The `tierNameLabel` value refers to a label specified in the workload spec.

- If `spec.tierNameLabel` is provided, then use it (unless overwritten in an instrumentation rule).
- If `tierNameLabel` is provided in an instrumentation rule, then use it.

For example in this spec, the workload spec label `tiername` is used to set the tier name in the `ecom` and `groceries` namespaces, and the label `tier` is used in the `books` namespace.

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 appName: "<cluster-name>"
 # ...
 # auto-instrumentation config
 instrumentationMethod: Env
 nsToInstrumentRegex: ecom|books|groceries
 tierNameStrategy: label
 tierNameLabel: tiername
 instrumentationRules:
 - namespaceRegex: books
 tierNameLabel: tier
```

For an application deployed to the `ecom` or `groceries` namespaces that sets the label `tiername` (shown in this Deployment spec snippet), it reports to the `eCommerce` tier in the Controller's **Dashboard**.

```
apiVersion: apps/v1
kind: Deployment
metadata:
 name: ecom-app
 labels:
 tiername: eCommerce
spec:
 ...
```

## Minimize the Impact of Pod Restarts

When auto-instrumentation is enabled, the related pods restart based on the deployment rollout strategy associated with the workload. Pod restarts often create CPU and memory usage spikes that may adversely impact performance or exhaust available capacity. To accommodate pods restarts, you may need to increase memory and CPU quotas associated with the impacted namespaces. To reduce the impact of restarting a large number of pods, the Cluster Agent (by default) allows only two concurrent auto-instrumentation tasks. The subsequent workloads ( `resourcesToInstrument` ) are auto-instrumented after the rollout of an instrumented workload. However, you can configure the

parameter, `numberOfTaskWorkers`, to specify the number of concurrent auto-instrumentation tasks based on your cluster's requirements.

## Auto-Instrumentation Configuration

This page describes the properties available in the `cluster-agent.yaml` and the Helm `values.yaml` file that you can use to configure auto-instrumentation.

### Configuration Structure for Auto-Instrumentation

The structure of the auto-instrumentation configuration is based on a set of default properties, which you can override by using properties defined in one or more `instrumentationRules`.

[cluster-agent.yaml](#) `values.yaml`

```

apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 # cluster agent properties
 # ...
 # required to enable auto-instrumentation
 instrumentationMethod: Env
 # default auto-instrumentation properties
 # may be overridden in an instrumentationRule
 nsToInstrumentRegex: dev|stage|prod
 enableInstallationReport: false
 image: "docker.io/appdynamics/java-agent:21.7.0"
 # ...
 # one or more instrumentationRules
 instrumentationRules:
 - nsToInstrumentRegex: dev
 imageInfo:

 imageInfo:
 image: "docker.io/appdynamics/java-agent:21.5.0"
 agentMountPath: /opt/appdynamics
 imagePullPolicy: Always
 # ...

```

## Overriding Default Properties with InstrumentationRules

The Cluster Agent uses a combination of `namespaceRegex`, `matchString`, and `labelMatch` properties in an `InstrumentationRule` to target `Deployments`, `DeploymentConfigs` and `StatefulSets` in a namespace for auto-instrumentation. The first matching `InstrumentationRule` is used. If no matching rule is found, then the default properties are used to determine if auto-instrumentation should be applied:

- `nsToInstrumentRegex`
- `defaultInstrumentationLabelMatch`
- `defaultInstrumentMatchString`

For example, the following `InstrumentationRule` with `-matchString "<string>"` is added to the Cluster Agent configuration file:

```

instrumentationRules:
 - matchString: "<string>"

```

**i** You must have a deployment for auto-instrumentation to work.

If the deployment name matches this string, then the remaining properties under the matching `instrumentationRule` are applied and will override any default properties that are set. If the string does not match, then the Cluster Agent defaults to the properties `nsToInstrumentRegex`, `defaultInstrumentationLabelMatch`, and `defaultInstrumentMatchString` to determine the instrumentation rules.

### Common Auto-Instrumentation Tasks

These properties are available to support common auto-instrumentation configuration tasks:

- To set the namespaces that are in scope for auto-instrumentation:
  - `nsToInstrument`
  - `nsToInstrumentRegex`
- (Optional) To filter and target the set of applications within a namespace that are in scope for auto-instrumentation:
  - `instrumentationMatchString`
  - `labelMatch`
- To assign an application and tier name to an instrumented application:
  - `appNameStrategy`
  - `tierNameStrategy`
  - `tierName`

See [Application Naming Strategies](#).
- To instrument which containers are in a multi-container application:
  - `instrumentContainer`
  - `containerMatchString`

The `instrumentContainer` default is to instrument the first container based on the ordering returned by the Kubernetes API.

- If transaction analytics is required for Node.js applications, then specify the analytics host and port:
  - `analyticsHost`
  - `analyticsPort`

See [Deploy Analytics Without the Analytics Agent](#). Configuration of transaction analytics is not required for .NET and Java applications. You can deploy the Analytics Agent using the sidecar model where you add an Analytics Agent container to each application pod, and then start/stop with the application container. If you use the sidecar approach, the App Server Agent uses the default host `localhost` and port `9090` and connects automatically. No additional configuration is required. See [Install Agent Side Components in Kubernetes](#).

### Default Auto-Instrumentation Properties

This table describes the default properties available to configure auto-instrumentation, defined in the `cluster-agent.yaml` spec :

Parameter Name	Default Value	Description
<code>appNameLabel</code>	N/A	The value of this label will be the AppDynamics application name.

Parameter Name	Default Value	Description
<code>appNameStrategy</code>	manual	<p>The option to specify a name for the AppDynamics application. You can specify any of these values for this parameter:</p> <ul style="list-style-type: none"> <li>• manual</li> <li>• namespace</li> <li>• label</li> </ul> <p>See <a href="#">Application Naming Strategies</a>.</p>
<code>defaultAnalyticsHost</code>	N/A	<p>The hostname of the Analytics Agent.</p> <p>This parameter is required if you require the Node.js Agent to send the default transaction data to the Analytics Agent.</p> <p>The default value is applied to all instrumented resources unless it is overwritten by the <code>instrumentationRules</code> configuration.</p>
<code>defaultAnalyticsPort</code>	N/A	<p>The listening port for Analytics Agent.</p> <p>For example, if the Analytics Agent is listening on port <code>9090</code>, then the value of this parameter is <code>9090</code>.</p> <p>The default value is applied to all instrumented resources unless it is overwritten by the <code>instrumentationRules</code> configuration.</p> <p>This parameter is required with <code>defaultAnalyticsHost</code> if you require the Node.js Agent to send the default transaction data to the Analytics Agent.</p>

Parameter Name	Default Value	Description
<code>defaultAnalyticsSslEnabled</code>	N/A	<p>This value is based on whether the Analytics Agent port is SSL enabled. If the port is SSL enabled, specify the value as <code>true</code>; else, specify as <code>false</code>.</p> <p>This parameter is required with <code>defaultAnalyticsPort</code> and <code>defaultAnalyticsHost</code>, if you require the Node.js Agent to send the default transaction data to the Analytics Agent.</p> <p>The default value is applied to all instrumented resources unless it is overwritten by the <code>instrumentationRules</code> configuration.</p>
<code>defaultAppName</code>	""	(Required) Application name used by the agent to report to the Controller.
<code>defaultCustomConfig</code>	N/A	<p>This parameter is specific to Java applications.</p> <p>You can add any custom system property if your application framework requires any specific configuration for instrumentation.</p> <p>This value is appended to the <code>env</code> or <code>defaultEnv</code> variable as configured with other Java Agent properties.</p> <p>When you upgrade your deployment using Helm, you can use this parameter instead of <code>defaultEnv</code> to avoid re-instrumentation issues. See <a href="#">Troubleshoot Re-instrumentation Issues for Upgraded Deployment</a> under <a href="#">Validate Auto-Instrumentation</a>.</p>

Parameter Name	Default Value	Description
defaultContainerMatchString	N/A	<p>This is a regex value to choose the containers to instrument. This parameter requires you to use the <code>select</code> option within the <code>instrumentContainer</code> (specified in the instrumentation rules).</p> <p>When the <code>select</code> option is used with this parameter, Cluster Agent instruments the containers that match the regex value.</p>
defaultEnvironment	JAVA_TOOL_OPTIONS	<p>This parameter is specific to Java applications.</p> <p>Environment variable to which the <code>-javaagent</code> argument and App Agent system properties are added.</p> <p>You can override this variable to use any other environment variable best suited for the deployment.</p> <p>However, if you override this value for upgrading the deployment, Cluster Agent does not re-instrument. This happens because both Java Agent and the deployment uses <code>JAVA_TOOL_OPTIONS</code> environment variable. Therefore, when you override this during an upgrade, the annotations do not get updated and re-instrumentation fails.</p> <p>For more information to troubleshoot, see <a href="#">Troubleshoot Re-instrumentation Issues for Upgraded Deployment</a> under <a href="#">Validate Auto-Instrumentation</a>.</p>

Parameter Name	Default Value	Description
defaultInstrumentationLabelMatch	[]	<p>Specific deployment labels marked for instrumentation.</p> <p>This parameter accepts a list of <code>key-value</code> pairs to instrument.</p> <p>You must match a minimum of one label for instrumentation.</p> <p>For example:</p> <pre>defaultInstrumentationLabelMatch: - label1: value1 - label1: value2 - label2: value2</pre> <p>For example, if only <code>label1: value2</code> matches, then the instrumentation works as expected.</p>

Parameter Name	Default Value	Description
defaultInstrumentMatchString	.*	<p>Names of deployments targeted for instrumentation.</p> <p>This parameter is used as the default value for the <code>matchstring</code> parameter that is specified within <code>instrumentationRules</code>. If <code>matchstring</code> is not specified, then Cluster Agent uses this parameter value.</p> <p>This parameter accepts deployment names as a regular expression or regex.</p> <p>If there are multiple deployments to instrument, you can separate names with a <code> </code> without spaces.</p> <p>By default, this parameter instruments all deployments configured by <code>nsToInstrumentRegex</code>. Therefore, if there is no value specified for <code>matchString</code> in the instrumentation rules and if you do not specify any value for this parameter, then Cluster Agent instruments every deployment.</p>

Parameter Name	Default Value	Description
enableFor ceReInstru mentation	false	<p>This property needs to be set to true if the newly introduced instrumentation properties should overwrite the old configuration on the successfully instrumented pods.</p> <p>By default this property is set to false.</p> <p>Set the value to true if you require to update the instrumentation configuration to the successfully instrumented deployments during Cluster Agent upgrade.</p> <p>Set the value to false if you require to retain the instrumentation configuration to the successfully instrumented deployment. However, updated configurations will be applied if the instrumentation state of the existing deployment is either failed or new.</p> <div data-bbox="565 1100 1066 1360" style="border: 1px solid #0070C0; background-color: #D9E1F2; padding: 5px;"> <p> When you upgrade Cluster Agent you must set this value to true to apply the updated configurations to the successfully instrumented deployment.</p> </div>

Parameter Name	Default Value	Description
enableInstallationReport	"false"	<p>Enables or disables the collection of installation information. It generates a summarized report with the following details:</p> <ul style="list-style-type: none"> <li>• PodName</li> <li>• Namespace</li> <li>• AppName</li> <li>• TierName</li> <li>• NodeName</li> <li>• AgentType</li> <li>• AgentVersion</li> <li>• Status</li> <li>• Timestamp</li> </ul> <p>To view the installation report, see <a href="#">View Installation Report</a>.</p>

Parameter Name	Default Value	Description
imageInfo	<pre> java:   image:     "docker.io/ appdynamics /java- agent:lates t"  agentMountP ath: "/opt/ appdynamics "  imagePullPo licy: "IfNotPrese nt"  dotnetcore:   image:     "docker.io/ appdynamics /dotnet- core- agent:lates t"  agentMountP ath: /opt/ appdynamics  imagePullPo licy: "IfNotPrese nt"  nodejs: </pre>	<p>The Docker repository from where the Node.js Agent, .NET Core for Linux, and Java Agent is pulled.</p> <p>Supported values are:</p> <ul style="list-style-type: none"> <li>• <code>image</code> : Location of the agent image, with its <code>tag/version</code>.</li> <li>• <code>agentMountPath</code> : Location of image artifacts in the image file system. The default is <code>/opt/appdynamics</code>. You must change this configuration if the path is different.</li> <li>• <code>imagePullPolicy</code> : The pull policy required for the agent's docker image. You can choose one of these pull policies based on your requirement: <ul style="list-style-type: none"> <li>▪ Always</li> <li>▪ IfNotPresent</li> <li>▪ Never</li> </ul> </li> </ul> <p>This parameter is used in the init containers that are added during auto-instrumentation.</p>

Parameter Name	Default Value	Description
	<pre> image:   "docker.io/   appdynamics   /nodejs-   agent:20.8.   0-stretch-   slimv14"  agentMountP ath: /opt/ appdynamics  imagePullPo lICY:   "IfNotPrese   nt"           </pre>	
instrumentationMethod	None	<p>The instrumentation method used for instrumenting Apps.</p> <p>Supported values are:</p> <ul style="list-style-type: none"> <li>• None : Instrumentation is disabled.</li> <li>• Env : Attach the instrumentation properties to the container environment variables. If a value is not set, the instrumentation will not start.</li> </ul>
instrumentationRules	[ ]	<p>Required. This parameter is used to enable auto-instrumentation. This includes the list of specific instrumentation rules. You can apply the rules to one or more namespaces, and can filter on deployment names and labels. Instrumentation rules are granular to support targeting specific deployments.</p> <p>See <a href="#">Cluster Agent Configuration for Instrumentation Rules</a>.</p>

Parameter Name	Default Value	Description
nsToInstrumentRegex	""	<p>Required. If you do not specify a value, auto-instrumentation will not work.</p> <p>Specify the namespaces to be instrumented as a regex.</p> <p>If there are multiple namespaces to instrument, separate namespaces using " " without spaces.</p> <p>By default, namespaces are not instrumented.</p>
numberOfTaskWorkers	2	<p>To configure the rate limit for the number of deployments that are auto-instrumented at the same time.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p> Increasing this value may lead to a larger number of concurrent pod restarts in the cluster.</p> </div>

Parameter Name	Default Value	Description
netvizInfo	<pre>bciEnabled: true port: 3892</pre>	<p>To configure the Network Visibility App Agent, <code>netviz</code>, you must deploy a Network Agent separately and set this parameter. See <a href="#">Install Infrastructure Visibility with the Kubernetes CLI</a> on how to install the Network Agent.</p> <p>By default, <code>netviz</code> is enabled. In the absence of a Network Agent, this property does not have any impact. You can enable or disable the <code>netviz</code> Agent.</p> <p>Supported values are:</p> <ol style="list-style-type: none"> <li>1. <code>bciEnabled</code>: Boolean flag denoting whether <code>netviz</code> is enabled.</li> <li>2. <code>port</code>: The port the Network Agent is listening on (default is <code>3892</code>). Override this value only when running the Network Agent on a port other than the default port.</li> </ol>
runAsGroup	0	<p>If you configured the application container as a non-root user, provide the group ID (GID) of the corresponding group.</p> <p><code>runAsGroup</code> is used to set the appropriate file permission on the agent artifacts.</p> <p>The default <code>runAsGroup</code> value is applied to all the instrumented resources, unless it is overwritten by the <code>instrumentationRules</code> configuration.</p>

Parameter Name	Default Value	Description
<code>runAsUser</code>	0	<p>If you configured the application container as a non-root user, provide the user ID (UID) of the corresponding user.</p> <p><code>runAsUser</code> is used to set the appropriate file permission on the agent artifacts.</p> <p>The default <code>runAsUser</code> value is applied to all the instrumented resources unless it is overwritten by <code>instrumentationRules</code> configuration.</p>
<code>resourcesToInstrument</code>	Deployment	<p>Cluster Agent instruments the resources that are listed in this parameter. The supported values are:</p> <ul style="list-style-type: none"> <li>• <code>Deployment</code></li> <li>• <code>StatefulSet</code></li> <li>• <code>DeploymentConfig</code></li> </ul> <p>For example, to instrument <code>Deployments</code> and <code>StatefulSets</code>, configure:</p> <pre>resourcesToInstrument: - Deployment - StatefulSet</pre>
<code>tierNameLabel</code>	N/A	The value of this label will be the AppDynamics tier name.
<code>tierNameStrategy</code>	manual	<p>The option to specify a name for the tier. You can specify any of these values for this parameter:</p> <ul style="list-style-type: none"> <li>• manual</li> <li>• label</li> </ul>

### View the Installation Report

You can view the summarized installation report if you have enabled the `enableInstallationReport` parameter in the `cluster-agent.yaml` file. See [Default Auto-Instrumentation Properties](#). Perform the following steps to view the installation report:

1. Run the `kubectl exec` command to get to the Cluster Agent pod.

```
kubectl exec -it <cluster-agent-pod-name> -n <namespace> sh
```

2. Navigate to the logs directory.
3. Open the `InstallationReport.csv` file to view the report.

### InstrumentationRule Properties

This table describes the properties available to configure auto-instrumentation in an `InstrumentationRule`.

Parameter Name	Default Value	Description
<code>analyticsHost</code>	N/A	The hostname of the Analytics Agent.  This parameter is required if you require the Node.js Agent or the .NET Core Agent to send the default transaction data to the Analytics Agent.
<code>analyticsPort</code>	N/A	The listening port for Analytics Agent.  For example, if the Analytics Agent is listening on port <code>9090</code> , then the value of this parameter is <code>9090</code> .  This parameter is required with <code>defaultAnalyticsHost</code> if you require the Node.js Agent to send the default transaction data to the Analytics Agent.
<code>analyticsSslEnabled</code>	N/A	This value is based on whether the Analytics Agent port is SSL enabled. If the port is not SSL enabled, specify the value as <code>false</code> .  This parameter is required with <code>defaultAnalyticsPort</code> and <code>defaultAnalyticsHost</code> if you require the Node.js Agent to send the default transaction data to the Analytics Agent.

Parameter Name	Default Value	Description
<code>containerMatchString</code>	N/A	<p>This is a regex value to choose the containers with the name that satisfies the value. This parameter requires you to use the <code>select</code> option within <code>defaultInstrumentContainer</code> or <code>instrumentContainer</code>.</p> <p>When the <code>select</code> option is used with this parameter, Cluster Agent instruments the containers that match the regex value.</p> <p>This parameter overrides the default value specified for <code>defaultContainerMatchString</code>.</p>

Parameter Name	Default Value	Description
<code>customAgentConfigSource</code>	N/A	<p>This parameter provides an option to use the custom configuration of the instrumenting agents through ConfigMaps. This parameter requires that you create the required ConfigMaps in the Cluster Agent namespace. This parameter is dynamically configurable from the Cluster Agent YAML file. The changes that you make in the YAML file are updated to all the instrumented agents without restarting the application. Similarly, the changes that you make to the configuration in the ConfigMap is updated to all the instrumented agents without restarting the application.</p> <ul style="list-style-type: none"> <li>• <code>configMapName</code> : Specify the name of the ConfigMap. This allows the agent to use the same custom ConfigMap to update all the instrumented agent namespace.</li> <li>• <code>subDir</code> : (Required for Java Agent) Specify the relative path where the ConfigMaps are mounted. For example: <code>/ver20.8.0.3686/conf</code>, where <code>20.8.0.3686</code> is the version of the Java Agent. This directory may differ based on the Java Agent version. See <a href="#">Example 6</a>. The absolute mount path for the ConfigMap is <code>&lt;agent home path&gt;/subDir</code> This <code>ConfigMap</code> replaces any ConfigMap of the same name in the target application's namespace.</li> </ul> <div style="border: 1px solid #007bff; padding: 10px; margin-top: 10px;"> <p><b>i</b> If you need to remove a ConfigMap file (used in the rules) from your deployment, then you must first remove this parameter from the Cluster Agent YAML file, and then remove the ConfigMap from the Cluster Agent's namespace.</p> </div>

Parameter Name	Default Value	Description
<code>instrumentContainer</code>	<code>first</code>	<p>This parameter provides an option to choose the container that must be instrumented. You can specify any of these values:</p> <ul style="list-style-type: none"> <li><code>first</code>: This is the default value. When you specify this value, Cluster Agent instruments the first container in the pod.</li> <li><code>all</code>: When you specify this value, Cluster Agent instruments all the containers in the pod.</li> <li><code>select</code>: When you specify this value, Cluster Agent instruments only those containers with the name that matches a regex specified in the <code>defaultContainerMatchString</code> parameter or the <code>containerMatchString</code> parameter.</li> </ul>
<code>language</code>	N/A	<p>The language of the application to be instrumented.</p> <p>These languages are supported:</p> <ul style="list-style-type: none"> <li><code>dotnetcore</code></li> <li><code>java</code></li> <li><code>nodejs</code></li> </ul>
<code>matchString</code>	N/A	<p>Regular expression to match on deployment name on which the rule applies.</p> <p>If you do not specify a value for this parameter, then the Cluster Agent uses the value specified in the <code>defaultInstrumentMatchString</code>, and instruments all the deployments that satisfy the value.</p>
<code>namespaceRegex</code>	<code>""</code>	<p>Regular expression to specify the namespaces that are to be instrumented as part of this rule. You can separate namespaces using the pipe symbol ( <code> </code> ) without any spaces.</p>

Parameter Name	Default Value	Description
<code>labelMatch</code>	<code>{}</code>	<p>A list of <code>key-value</code> pairs of labels to include in this rule. It is sufficient to match any one of the labels.</p> <p>For example:</p> <pre>labelMatch: -label1: value1 -label1: value2 -label2: value2</pre> <p>If only <code>label1: value2</code> matches, then instrumentation works as expected.</p>
<code>appName</code>	<code>&lt; defaultAppName &gt;</code>	<p>Application name used by the Java Agent to report to the Controller. This overrides <code>defaultAppName</code>.</p> <p>If no value is provided, then the configured <code>defaultAppName</code> is used.</p>
<code>appNameLabel</code>	N/A	The value of this label is the AppDynamics application name.
<code>customAgentConfig</code>	N/A	<p>This parameter is specific to Java applications.</p> <p>You can add any custom system property if your application framework requires any specific configuration for instrumentation. This value takes precedence over the default value specified in the <code>defaultCustomConfig</code> parameter.</p> <p>This value is appended to the <code>env</code> or <code>defaultEnv</code> variable as configured with other Java Agent properties.</p>
<code>tierName</code>	<code>""</code>	<p>Tier name used by the Java Agent to report to the Controller.</p> <p>If no tier name is provided, then the deployment name is used as the default if the tier name strategy is manual.</p>
<code>tierNameLabel</code>	N/A	The value of this label is the AppDynamics tier name.

Parameter Name	Default Value	Description
nodeName	""	<p>This parameter is used to sequentially name a node under a tier.</p> <p>If no node name is provided, then the deployment name is used as the default. For example, consider that there are two nodes used within a tier and your application environment uses the deployment name as <code>abc</code>. If you do not specify the value for the node name in the configuration file, then Cluster Agent takes into account the following node names:</p> <ul style="list-style-type: none"> <li>• <code>abc-1</code></li> <li>• <code>abc-2</code></li> </ul>
env	""	<p>This parameter is specific to Java applications.</p> <p>Environment variable to which the App Agent system properties will be added. When specified, this overrides <code>defaultEnv</code> for the deployments matching this instrumentation rule.</p> <p>If none are provided, it defaults to the <code>defaultEnv</code> (if configured), or to the default <code>env JAVA_TOOL_OPTIONS</code> (if not configured at the default cluster level).</p>

Parameter Name	Default Value	Description
<p>imageInfo</p>	<pre> image: "docker.io/ appdynamics/java- agent:latest" agentMountPath: "/opt/ appdynamics" imagePullPolicy: "IfNotPresent"  dotnetcore: image: "docker.io/ appdynamics/dotnet-core- agent:latest" agentMountPath: /opt/ appdynamics alpineInitContainerImage: alpine imagePullPolicy: "IfNotPresent"  nodejs: image: "docker.io/ appdynamics/nodejs- agent:20.8.0-stretch- slimv14" agentMountPath: /opt/ appdynamics imagePullPolicy: "IfNotPresent" </pre>	<p>You can select one of these properties:</p> <ul style="list-style-type: none"> <li>• <code>image</code> : Location of the agent image, and its tag/version.</li> <li>• <code>agentMountPath</code> : Location of image artifacts in the image file system. The default is <code>/opt/appdynamics</code> . This configuration is required only if the path differs from the default path.</li> <li>• <code>alpineInitContainerImage</code> : Location of alpine image and its tag/version to be used for the .NET instrumentation of init container.</li> <li>• <code>imagePullPolicy</code> : The pull policy required for the agent's Docker image. The default is <code>IfNotPresent</code> . You can choose one of these pull policies based on your requirement: <ul style="list-style-type: none"> <li>◦ <code>Always</code></li> <li>◦ <code>IfNotPresent</code></li> <li>◦ <code>Never</code></li> </ul> </li> </ul> <p>This parameter is used in the init containers that are added during auto-instrumentation. The default value is <code>IfNotPresent</code> .</p> <p>For the specific language mentioned in this rule, this overrides <code>image-info</code> for the deployments matching this instrumentation rule.</p> <p>You must configure this if you want to override the default cluster-level configuration and use a custom agent version for this specific rule selection.</p>

Parameter Name	Default Value	Description
netvizInfo	<pre>bciEnabled: true port: 3892</pre>	<p>To configure the Network Visibility App Agent, <code>netviz</code>, you must deploy a Network Agent separately and set this parameter.</p> <p>See <a href="#">Install Infrastructure Visibility with the Kubernetes CLI</a> to install the Network Agent.</p> <p>By default, <code>netviz</code> is enabled. This property has no impact without a Network Agent.</p> <p>You can enable or disable the <code>netviz</code> Agent.</p> <p>Supported values are:</p> <ol style="list-style-type: none"> <li><code>bciEnabled</code>: Boolean flag denoting whether <code>netviz</code> is enabled or not.</li> <li><code>port</code>: The port the Network Agent is listening on (default is <code>3892</code>). Override this value only when running the Network Agent on a port other than the default port.</li> </ol>
runAsGroup	0	<p>If you configured the application container as a non-root user, provide the <code>groupId</code> of the corresponding group.</p> <p>This sets the appropriate file permission on the agent artifacts.</p> <p>This value is applied to all the instrumented resources.</p> <p>Add this parameter, if you require to override the default value of <code>runAsGroup</code> that is configured for default instrumentation, or if you require a specific value for the resources that satisfy this rule.</p>

Parameter Name	Default Value	Description
<code>runAsUser</code>	0	<p>If you configured the application container as a non-root user, it provides the <code>userId</code> of the corresponding user.</p> <p>This sets the appropriate file permission on the agent artifacts.</p> <p>This value is applied to all the instrumented resources.</p> <p>Add this parameter, if you require to override the default value of <code>runAsUser</code> that is configured for default instrumentation, or if you require a specific value for the resources that satisfy this rule.</p>
<code>allowPrivilegeEscalation</code>	NA	<p>To control if a process can get more privileges than its parent process. The value is true when the container runs as:</p> <ul style="list-style-type: none"> <li>Privileged container</li> <li>CAP_SYS_ADMIN</li> </ul> <div style="border: 1px solid #00aaff; padding: 5px; margin-top: 10px;"> <p> • This parameter is unavailable when <code>spec.os.name</code> is Windows.</p> <p>• This parameter is currently available for Deployment and DeploymentConfig mode.</p> </div>
<code>capabilities</code>	NA	<p>To add or remove POSIX capabilities from the running containers. This uses the default set of capabilities during container runtime.</p> <div style="border: 1px solid #00aaff; padding: 5px; margin-top: 10px;"> <p> • This parameter is unavailable when <code>spec.os.name</code> is Windows.</p> <p>• This parameter is currently available for Deployment and DeploymentConfig mode.</p> </div>

Parameter Name	Default Value	Description
<code>privileged</code>	False	<p>To run container in privileged mode, which is equivalent to root on the host.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p> • This parameter is unavailable when <code>spec.os.name</code> is Windows.</p> <p>• This parameter is currently available for Deployment and DeploymentConfig mode.</p> </div>
<code>procMount</code>	DefaultProcMount	<p>The type of proc mount to use for the containers.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p> This parameter is currently available for Deployment and DeploymentConfig mode.</p> </div>
<code>readOnlyRootFilesystem</code>	False	<p>To specify if this container has a read-only root filesystem.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p> • This parameter is unavailable when <code>spec.os.name</code> is Windows.</p> <p>• This parameter is currently available for Deployment and DeploymentConfig mode.</p> </div>
<code>runAsNonRoot</code>	False	<p>To specify if the container must run as a non-root user.</p> <p>If the value is true, the Kubelet validates the image at runtime to ensure that the container fails to start when run as root. If this parameter is not specified or if the value is false, there is no validation.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p> This parameter is currently available for Deployment and DeploymentConfig mode.</p> </div>

Parameter Name	Default Value	Description
<code>seLinuxOptions</code>	NA	<p>To apply the SELinux context to the container. If this parameter is not specified, the container runtime allocates a random SELinux context for each container.</p> <div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;"> <p> • This parameter is unavailable when <code>spec.os.name</code> is <code>Windows</code>.</p> <p>• This parameter is currently available for Deployment and DeploymentConfig mode.</p> </div>
<code>seccompProfile</code>	NA	<p>To specify the seccomp options used by the container. If seccomp options are specified at both the pod and container level, the container options override the pod options.</p> <div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;"> <p> • This parameter is unavailable when <code>spec.os.name</code> is <code>Windows</code>.</p> <p>• This parameter is currently available for Deployment and DeploymentConfig mode.</p> </div>
<code>windowsOptions</code>	NA	<p>To specify Windows-specific options for every container.</p> <div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;"> <p> • This parameter is unavailable when <code>spec.os.name</code> is <code>Windows</code>.</p> <p>• This parameter is currently available for Deployment and DeploymentConfig mode.</p> </div>

### Auto-Instrumentation Configuration Examples

This page describes examples for common auto-instrumentation configuration scenarios.

- **Example 1:** Instrument all the deployments in the `ecom` namespace. The Java Agents running in each pod will register to the Controller with the `Ecommerce` application, and the tier names will default to the Kubernetes deployment names.
- **Example 2:** Instrument only those deployments with names starting with `Payment` and with the label `module=payment` in any namespace.
- **Example 3:** Instrument all deployments in namespaces `ecom` and `books`. For applications in the `books` namespace, use the `BookStore` application name in the Controller and a specific version of the Java Agent.

- **Example 4:** Override the configuration in Example 3 for the `groceries` namespace to use a different Controller application name, and the `JAVA_OPTS` environment variable to inject the `-javaagent` Java argument.
- **Example 5:** Instrument a Node.js application in namespace `books` and a .NET Core Linux application in namespace `groceries`. Also, the Node.js application must send the transaction data to the Analytics Agent.
- **Example 6:** Instrument the containers with the names that start with `str` for the Java application in namespace `ecom`. Also, use the custom agent configurations in `controller-info.xml` and `app-agent-config.xml` configuration files that are in the `controllerConf` ConfigMap along with the `log4j2.xml` file for logging settings of the agent in the `logConf` ConfigMap. These ConfigMaps are in the Cluster Agent's namespace.
- **Example 7:** Instrument all the deployments in the `groceries` namespace and instrument only those deployments with names starting with `Payment` in the `books` and `ecom` namespace.
- **Example 8:** Instrument all deployments in namespaces `books`. For applications in the `books` namespace, use the `BookStore` application name and `tier` as tier name in the Controller and a specific version of the Java Agent.

## Use Auto-Instrumentation with an On-Premises Controller

The .NET Core and Node.js applications support certificates signed by a certificate authority (CA) only. The applications do not support self-signed certificates. If your Controller is using a self-signed certificate, then only auto-instrumentation for Java applications is supported.

To support auto-instrumentation with an on-premises Controller, configure the Cluster Agent `customSSLSecret` property to set the SSL certificates that the Cluster Agent uses to communicate with the on-premises Controller. See [Configure the Cluster Agent to Use SSL for On-Premises Controllers](#). The Cluster Agent copies the certificates to the auto-instrumented pods where they are used by App Server Agents to establish connections with the on-premises Controller.

## Configuration for Node.js and an On-Premises Controller

In addition to configuring the Cluster Agent `customSSLSecret` property, you must perform these steps for auto-instrumented Node.js applications that use an on-premises Controller.

1. Create a file named `shim.js` that sets the `certificateFile` property used by the Node.js Agent. See [Node.js Settings Reference](#).

```
require("appdynamics").profile({
 certificateFile: "/opt/appdynamics-nodejs/custom-ssl.pem"
});
```

2. Create a `ConfigMap` in the `appdynamics` namespace from the `shim.js` file:

```
kubectl create cm nodejs-cert-configmap --from-file ./shim.js -n appdynamics
```

3. Edit the `cluster-agent.yaml` file to set the `customAgentConfigSource/configMapName` property to the name of the `ConfigMap` (`nodejs-cert-configmap`):

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 # content removed for brevity
 # ...
 instrumentationRules:
 - namespaceRegex: dev
 appName: MyNodeJSApp
 language: nodejs
 customAgentConfigSource:
 - configMapName: nodejs-cert-configmap
 imageInfo:
 image: "docker.io/appdynamics/nodejs-agent:20.12.0-10.0.0-alpine"
 agentMountPath: /opt/appdynamics
```

4. Apply the updated Cluster Agent configuration:

```
kubectl apply -f cluster-agent.yaml
```

The Cluster Agent updates the Node.js workload spec which recreates the pods and copies the certificate file to the pods. The certificate file is referenced by the Node.js Agent through the `NODE_OPTIONS` environment variable and `shim.js` file.

## Validate Auto-Instrumentation

This page describes how to validate and troubleshoot Cluster Agent auto-instrumentation.

### Prerequisites

- Cluster Agent is reporting to the Controller. See [Validate the Cluster Agent Installation](#).
- If you upgraded the Cluster Agent, you followed the [Upgrade the Cluster Agent](#) procedure and used a compatible set of images and YAML files.

### Validate Auto-Instrumentation

- After applying auto-instrumentation, confirm that the application is reporting to the Controller using the application name assigned based on the name strategy you chose. See [Auto-Instrument Applications with the Cluster Agent](#).
- Verify that the application pods targeted for auto-instrumentation have been recreated. As auto-instrumentation is being applied, use `kubectl get pods` with the `-w` flag to print out updates to pod status in real-time. A successfully auto-instrumented application shows that the app pod was recreated, and the correct init container was applied and copied the App Server Agent to the application container.

```
kubectl -n <app ns> get pods -w
NAME READY STATUS RESTARTS AGE
dotnet-app-85c7d66557-s8hzm 1/1 Running 0 3m11s
dotnet-app-6c45b6d4f-fpp75 0/1 Pending 0 0s
dotnet-app-6c45b6d4f-fpp75 0/1 Init:0/1 0 0s
dotnet-app-6c45b6d4f-fpp75 0/1 PodInitializing 0 5s
dotnet-app-6c45b6d4f-fpp75 1/1 Running 0 6s
dotnet-app-85c7d66557-s8hzm 1/1 Terminating 0 20m\
```

You can also use `kubectl get pods -o yaml` to check whether the application spec was updated to include the init container and the state of the init container:

```
kubectl -n <app-ns> get pod <app-pod> -o yaml
...
initContainers:
- command:
 - cp
 - -r
 - /opt/appdynamics/.
 - /opt/appdynamics-java
 image: docker.io/appdynamics/java-agent:latest
...
```

```

initContainerStatuses:
- containerID: docker://
8bb892f322e5a043866d038631392a2272b143e54c8c431b3590312729043eb9
 image: appdynamics/java-agent:20.9.0
 imageID: docker-pullable://appdynamics/java-
agent@sha256:077ac1c4f761914c1742f22b2f591a37a127713e3e96968e9e570747f7ba6134
 ...
state:
 terminated:
 containerID: docker://
8bb892f322e5a043866d038631392a2272b143e54c8c431b3590312729043eb9
 exitCode: 0
 finishedAt: "2021-02-03T22:39:25Z"
 reason: Completed

```

 The pod annotation may display `APPD_POD_INSTRUMENTATION_STATE` as `failed` for Node.js and .NET Core (Linux) applications even when the instrumentation is successful.

### Troubleshoot Auto-Instrumentation When Not Applied

If the application pod was not recreated, and an init container was not applied, there may be an issue with the namespace and application matching rules used by the Cluster Agent.

1. First, confirm that the Cluster Agent is using the latest auto-instrumentation configuration.

```
kubectl -n appdynamics get cm instrumentation-config -o yaml
```

If the YAML output does not reflect the latest auto-instrumentation configuration, then validate the Cluster Agent YAML configuration, and apply or upgrade the Cluster Agent:

[Kubernetes CLI](#) [Helm Chart](#)

```
kubectl apply -f cluster-agent.yaml
```

[Kubernetes CLI](#) [Helm Chart](#)

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/
cluster-agent --namespace appdynamics
```

2. If the pods are still not recreated, then enable `DEBUG` logging in the Cluster Agent configuration:

[Cluster Agent YAML](#) [Helm Values YAML](#)

### cluster-agent.yaml

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 # content removed for brevity
 logLevel: DEBUG
```

[Cluster Agent YAML](#) [Helm Values YAML](#)

### ca1-values.yaml

```
clusterAgent:
 # content removed for brevity
 logProperties:
 logLevel: DEBUG
```

3. Apply or upgrade the Cluster Agent to update the `DEBUG` logging configuration:

[Kubernetes CLI](#) [Helm Chart](#)

```
kubectl apply -f cluster-agent.yaml
```

[Kubernetes CLI](#) [Helm Chart](#)

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --namespace appdynamics
```

4. After you update the Cluster Agent logging configuration, tail the logs to search for messages indicating that the Cluster Agent has detected the application, and considers the application in scope for auto-instrumentation:

```
apply grep filter to see instrumentation related messages:
```

```
kubectl -n appdynamics logs <cluster-agent-pod> -f | grep -E 'instrumentationconfig.go|
deploymenthandler.go'
```

However, if output displays (similar to this example) for the application you want to auto-instrument, then the Cluster Agent does not consider the application in scope for auto-instrumentation:

```
[DEBUG]: 2021-03-30 21:22:09 - instrumentationconfig.go:660 - No matching rule found for
Deployment dotnet-app in namespace stage with labels map[appName:jah-stage
framework:dotnetcore]
[DEBUG]: 2021-03-30 21:22:09 - instrumentationconfig.go:249 - Instrumentation state for
Deployment dotnet-app in namespace stage with labels map[appName:jah-stage
framework:dotnetcore] is false
```

Review your auto-instrumentation configuration to determine any necessary updates and save the changes. Then, delete and re-create the Cluster Agent as described previously. For example, if you overwrote the namespace configuration in an `instrumentationRule` using `namespaceRegex`, be sure that you use a value that is included in `nsToInstrumentRegex` (`dev` in the example):

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 # content removed for brevity
 nsToInstrumentRegex: stage|dev
 instrumentationRules:
 - namespaceRegex: dev
```

After you update the configuration and the Cluster Agent has been recreated, your output should be similar to this example indicating that the Cluster Agent recognizes the application as in scope for auto-instrumentation:

```
[DEBUG]: 2021-03-30 21:22:10 - instrumentationconfig.go:645 - rule stage matches
Deployment spring-boot-multicontainer in namespace stage with labels map[appName:jah-
stage acme.com/framework:java]
[DEBUG]: 2021-03-30 21:22:10 - instrumentationconfig.go:656 - Found a matching rule
{stage map[acme.com/framework:[java]] java select .* JAVA_TOOL_OPTIONS map[agent-moun
t-path:/opt/appdynamics image:docker.io/appdynamics/java-agent:21.3.0 image-pull-
policy:IfNotPresent] map[bci-enabled:true port:3892] 0 0 appName 0 false []} for
Deployment spring-boot-multicontainer in namespace stage with labels map[appName:jah-
stage acme.com/framework:java]
[DEBUG]: 2021-03-30 21:22:10 - instrumentationconfig.go:249 - Instrumentation state for
Deployment spring-boot-multicontainer in namespace stage with labels map[appName:jah-
stage acme.com/framework:java] is true
[DEBUG]: 2021-03-30 21:22:10 - deploymenthandler.go:312 - Added instrument task to queue
stage/spring-boot-multicontainer
```

## Troubleshoot Auto-Instrumentation When it Fails to Complete

If the application pod was re-created but the instrumented application is not reporting to the Controller, then auto-instrumentation did not complete successfully, or the App Server Agent failed to register with the Controller.

1. If the application pods are being restarted, but the init container is not completing successfully, then check for events in the application namespace using the **Cluster Agent Events** dashboard or `kubectl get events`. Some common issues that may prevent the init container from completing are: image pull or resource quotas issues.

```
kubectl -n <app ns> get events
```

2. Verify that the application deployment spec was updated with an init container, and if the status information includes any errors:

```
kubectl -n <app-ns> get pod <app-pod> -o yaml
```

3. Start a shell inside the application container to confirm the auto-instrumentation results. Check if the App Server Agent environment variables are set correctly and if the logs are free of errors.

```
kubectl -n <app-ns> exec -it <app-pod> /bin/sh
Issue these commands in the container
env | grep APPD

For Java app
env | grep JAVA_TOOL_OPTIONS # or value of defaultEnv
ls /opt/appdynamics-java
cat /opt/appdynamics-java/ver<version>/logs/<node-name>/agent.<date>.log

For .NET Core app
ls /opt/appdynamics-dotnetcore
cat /tmp/appd/dotnet/1_agent_0.log

For Node.js app
ls /opt/appdynamics-nodejs
cat /tmp/appd/<id>/appd_node_agent_<date>.log
```

If you are instrumenting a Node.js or .NET Core application, and the auto-instrumentation files have been copied to the app container, but the App Server Agent logs do not exist, or errors regarding binary incompatibilities display, then you may have a mismatch between the app image and the App Server Agent Image (referenced in the `image` property of the auto-instrumentation configuration).

For .NET Core, the image OS versions must match (Linux for example).

For Node.js, the image OS versions must match, as well as the Node.js version. To confirm, check the image tags, Dockerfiles, or exec-ing into the app container:

```
$ kubectl -n <app-ns> exec -it <app-pod> /bin/sh
cat /etc/os-release # (or /etc/issue)
```

```
NAME="Alpine Linux"...
for Node.js app
node -v
```

## Troubleshoot Re-instrumentation Issues for Upgraded Deployment

- When you edit the deployment specification using Helm upgrade, the Cluster Agent does not re-instrument the upgraded deployment. If your changes to Cluster Agent-applied specification interferes with instrumentation properties, instrumentation stops working.  
This issue occurs mostly in case of Java instrumentation, when your Java application uses `JAVA_TOOL_OPTIONS` and there is a possibility that helm upgrade results in overriding `JAVA_TOOL_OPTIONS` environment variable in the deployment specification.  
The overriding happens because the Java Agent uses this environment variable to consume the system properties, causing instrumentation to fail.
- Cluster Agent uses annotations to check the instrumentation state of the deployment. The annotations on the deployment are not updated when the deployment tool or script uses the edit or the patch Kubernetes APIs to edit the deployment specification. Therefore, when there is no change in the instrumentation state the re-instrumentation does not happen. You can workaround this issue by removing the annotation `APPD_DEPLOYMENT_INSTRUMENTATION_STATE` on the deployment specification.

## Uninstall Auto-Instrumentation from an Instrumented Application

This page describes how to uninstall instrumentation changes from an application that has been auto-instrumented using the Cluster Agent.

### Uninstall Auto-Instrumentation

1. To remove the application from auto-instrumentation scope, update `cluster-agent.yaml` by using the `nsToInstrument`, `nsToInstrumentRegex`, `instrumentationMatchString` and `labelMatch` properties (depending on which properties you initially used).  
To completely disable auto-instrumentation, set the `instrumentationMethod` to `None`. See [Auto-Instrument Applications with the Cluster Agent](#).
2. To update the auto-instrumentation configuration, apply or upgrade the Cluster Agent.

[Kubernetes CLI](#) [Helm Chart](#)

```
kubectl apply -f cluster-agent.yaml
```

[Kubernetes CLI](#) [Helm Chart](#)

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --namespace appdynamics
```

3. Delete and re-create the application deployment.

## Manually Configure App Agents to Correlate with the Cluster Agent

This page describes how to configure APM container correlation with the Cluster Agent when manually instrumenting Kubernetes applications. See [Kubernetes](#).

When you establish APM correlation, the application containers monitored by the Cluster Agent display in the Controller under the **Application/Container** view. The **Cluster Agent Pod** Dashboard also provides a link to the **APM Node** Dashboard in the **Pod Details** page.

**i** For Kubernetes >=1.25

The following configuration is required only for Kubernetes >= 1.25 .

To correlate app agents with Cluster Agent on Kubernetes >= 1.25 , you must perform the following steps:

1. Upgrade the Cluster Agent to version >= 23.9
2. Add the following environment variables (env) on the pod on which the application is running:
  - APPDYNAMICS\_CONTAINER\_NAME : <name of the instrumented container>
  - APPDYNAMICS\_CONTAINERINFO\_FETCH\_SERVICE : cluster-metadata-service.appdynamics:9090
  - APPDYNAMICS\_POD\_NAMESPACE : <namespace of the application pod>
3. Configure the `containerAppCorrelationMethod` parameter under the `spec` section in the configuration file with the value as `proxy` . For more information about this parameter, see [Correlate Application Containers with AppAgents \(For Kubernetes version >=1.25\)](#)
4. Enable auto-instrumentation by adding the following parameter:
  - (In cluster-agent.yaml) `instrumentationMethod: Env`

**Sample cluster-agent.yaml**

```
apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 instrumentationMethod: Env
```

- (In values.yaml) `enabled: true` for `instrumentationConfig`

**Sample values.yaml**

```
deploymentMode: MASTER
clusterAgent:
 nsToMonitorRegex: .*
instrumentationConfig:
 enabled: true
 instrumentationMethod: Env
```

For more information about enabling auto-instrumentation, see [Auto Instrumentation Configuration](#).

**i For Kubernetes <1.25**

The following configuration is applicable only for Kubernetes <1.25. This configuration is required only when you use init containers or Dockerfiles to manually instrument applications in a cluster where the Cluster Agent is running. When you use Cluster Agent auto-instrumentation, APM container correlation is processed automatically. See [Auto-Instrument Applications with the Cluster Agent](#).

APM container correlation uses the `UNIQUE_HOST_ID` ( or `APPDYNAMICS_AGENT_UNIQUE_HOST_ID`) property of specific language agents. For examples of how to set this property, see the language-specific container installation page:

- Install the Java Agent in Containers
- Install the .NET Core Agent for Linux in Containers
- Install the Node.js Agent in Containers

The table lists the commands required to assign the `UNIQUE_HOST_ID` value based on runtime, platform, and App Agent type:

Platform	Container Runtime	Command for Container ID
Kubernetes	Docker	<code>UNIQUE_HOST_ID=\$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup)</code>
OpenShift 3.11	Docker	<code>UNIQUE_HOST_ID=\$(sed -rn '1s#.*/#; 1s/docker-(.{12}).*/\1/p' /proc/self/cgroup)</code>
OpenShift 4.x	CRI-O	<code>UNIQUE_HOST_ID=\$(cat /proc/self/cgroup   head -1   awk -F '/' '{print \$NF}'   awk -F '-' '{print \$2}'   cut -c 1-12) ; if [ -z \$UNIQUE_HOST_ID]; then UNIQUE_HOST_ID=\$(cat /proc/self/cgroup   head -1   awk -F '/' '{print \$NF}'   cut -c 1-12) ; fi ;</code>

**Kubernetes with Docker**

Java APM correlation works out-of-the-box because the Agent retrieves the `UNIQUE_HOST_ID` value automatically. For other Agents with the `UNIQUE_HOST_ID` property, you must set the property using this command: `UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup)`

For all language Agents with a `uniqueHostId` property, set the property using this method when building the App image:

```
UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup)
```

```
JAVA_OPTS="$JAVA_OPTS -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID"
```

If you cannot change the application image, you can assign the `UNIQUE_HOST_ID` in the Kubernetes deployment specification by modifying the `command` attribute:

```
command: ["/bin/sh"]
args: ["-c", "UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup) &&
java -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
```

This approach implies that the entry point of the application is known. In the example, the original entry point is:

```
java $JAVA_OPTS -jar /java-services.jar
```

### OpenShift 3.11 with Docker Runtime

For all language Agents with the `UNIQUE_HOST_ID` property in OpenShift v3.10 and v3.11 with Docker runtime, set the property using this method when building the App image:

```
UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/docker-(.{12}).*/\1/p' /proc/self/cgroup)
```

If you cannot change the application image, you can assign the `UNIQUE_HOST_ID` in the OpenShift v3.10 or v3.11 deployment specification by modifying the `command` attribute:

```
command: ["/bin/sh"]
args: ["-c", "UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/docker-(.{12}).*/\1/p' /proc/self/cgroup) && java -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
```

This approach implies that the entry point of the application is known. In the example, the original entry point is:

```
java $JAVA_OPTS -jar /java-services.jar
```

### OpenShift 4.x with CRI-O Runtime

For all language Agents with the `UNIQUE_HOST_ID` property in OpenShift v4.x with CRI-O runtime, set the property using this method when building the App image:

```
UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' '
{print $NF}' | awk -F '-' '{print $2}' | cut -c 1-12) ; if [-z $UNIQUE_HOST_ID]; then
UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' '{print $NF}' | cut -c 1-12) ;
fi ;
```

If you cannot change the application image, you can assign the `UNIQUE_HOST_ID` in the OpenShift v4.x deployment specification by modifying the `command` attribute:

```
command: ["/bin/sh"]
args: ["-c", "UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' '{print $NF}' |
awk -F '-' '{print $2}' | cut -c 1-12) ; if [-z $UNIQUE_HOST_ID]; then UNIQUE_HOST_ID=$(
cat /proc/self/cgroup | head -1 | awk -F '/' '{print $NF}' | cut -c 1-12) ; fi ; java
-Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
```

This approach implies that the entry point of the application is known. In the example, the original entry point is:

```
java $JAVA_OPTS -jar /java-services.jar
```

## Use the Cluster Agent

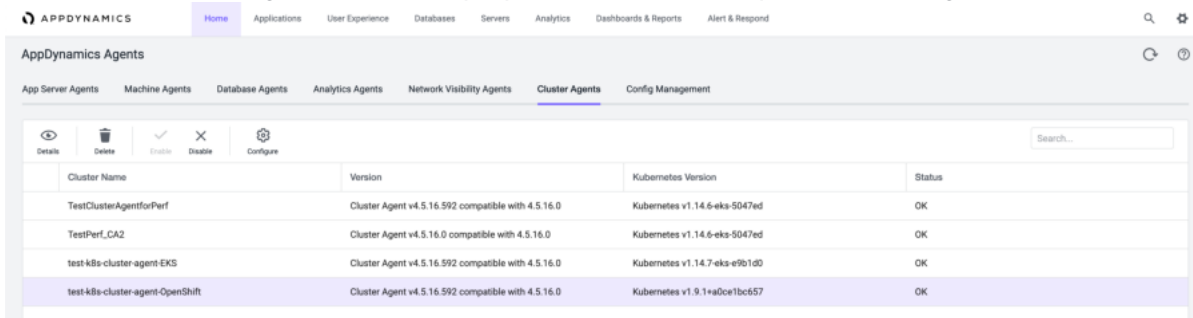

You administer the Cluster Agent from the AppDynamics Controller where you can enable, disable, configure, and delete the Cluster Agent. You can also change which namespaces to monitor.

Any configuration change you make in the Controller also applies to the Cluster Agent. These changes take a couple of minutes, and the status displays with a progress indicator.

### View the Cluster Agent Summary

From the **Controller UI** panel:

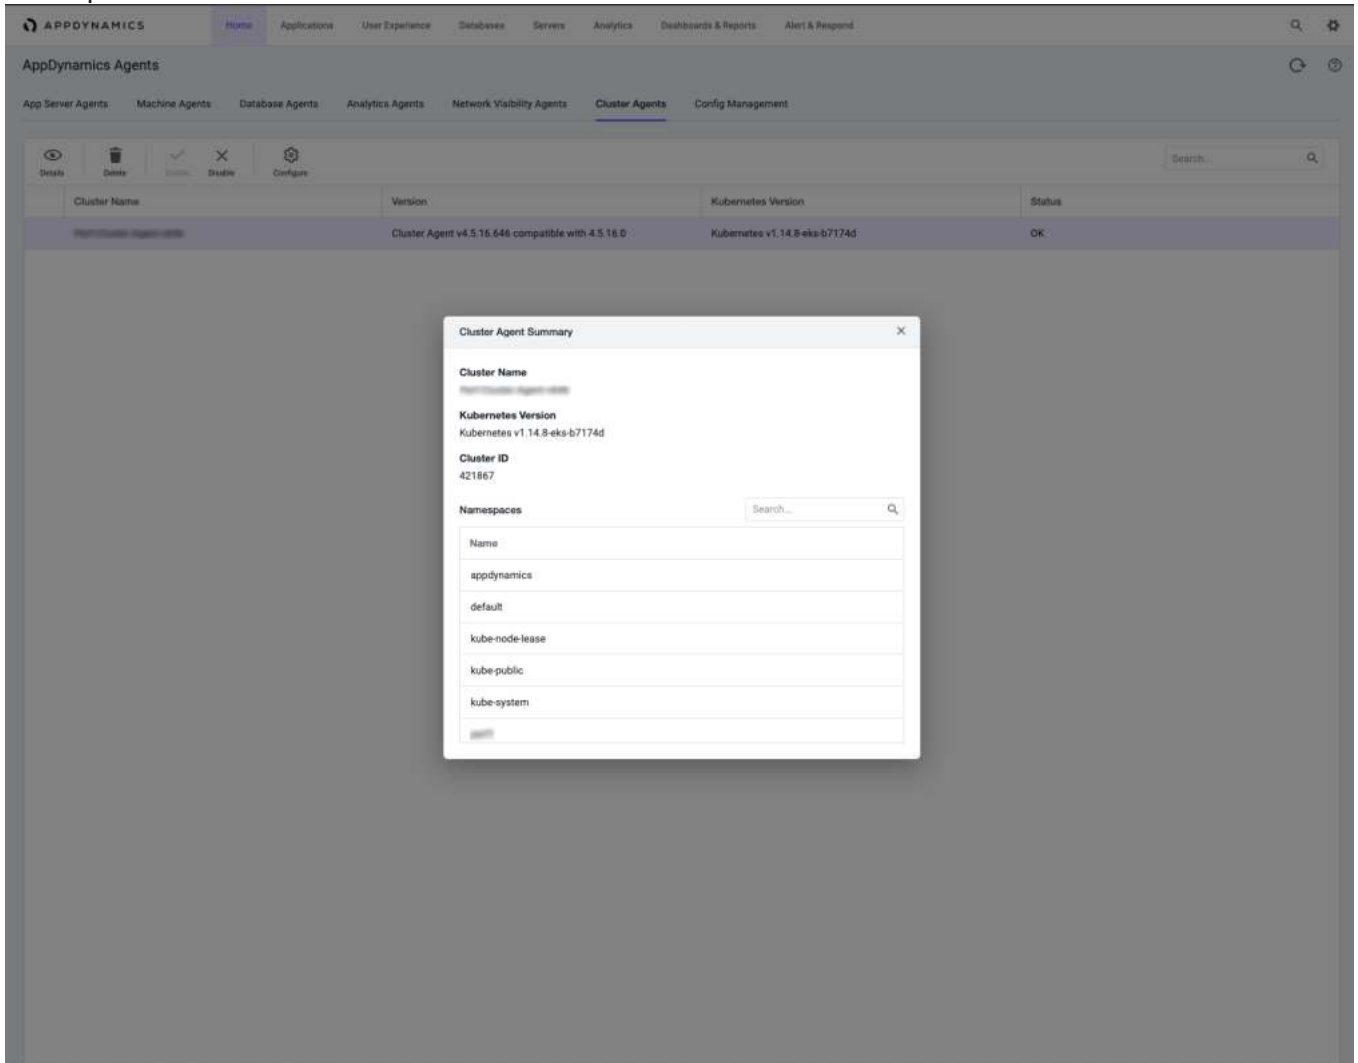

1. In the upper-right corner, click Settings  > **AppDynamics Agents**.
2. Select the Cluster Agents tab to display a list of clusters. By default, all Agents are enabled.

Cluster Name	Version	Kubernetes Version	Status
TestClusterAgentforPerf	Cluster Agent v4.5.16.592 compatible with 4.5.16.0	Kubernetes v1.14.6-eks-5047ed	OK
TestPerf_CA2	Cluster Agent v4.5.16.0 compatible with 4.5.16.0	Kubernetes v1.14.6-eks-5047ed	OK
test-k8s-cluster-agent-EKS	Cluster Agent v4.5.16.592 compatible with 4.5.16.0	Kubernetes v1.14.7-eks-e9b1d0	OK
test-k8s-cluster-agent-OpenShift	Cluster Agent v4.5.16.592 compatible with 4.5.16.0	Kubernetes v1.9.1+a0ce1bc657	OK

3. Double-click a Cluster Agent. A dialog appears showing a **Cluster Agent Summary** of your current settings. The summary card shows the **Cluster Name**, **Kubernetes Version**, **Cluster ID**, and currently monitored **Namespaces**. To the right of the **Namespaces** table is a Search bar, where you can search by

namespace.

4. Click X to close the Cluster Agent Summary card.

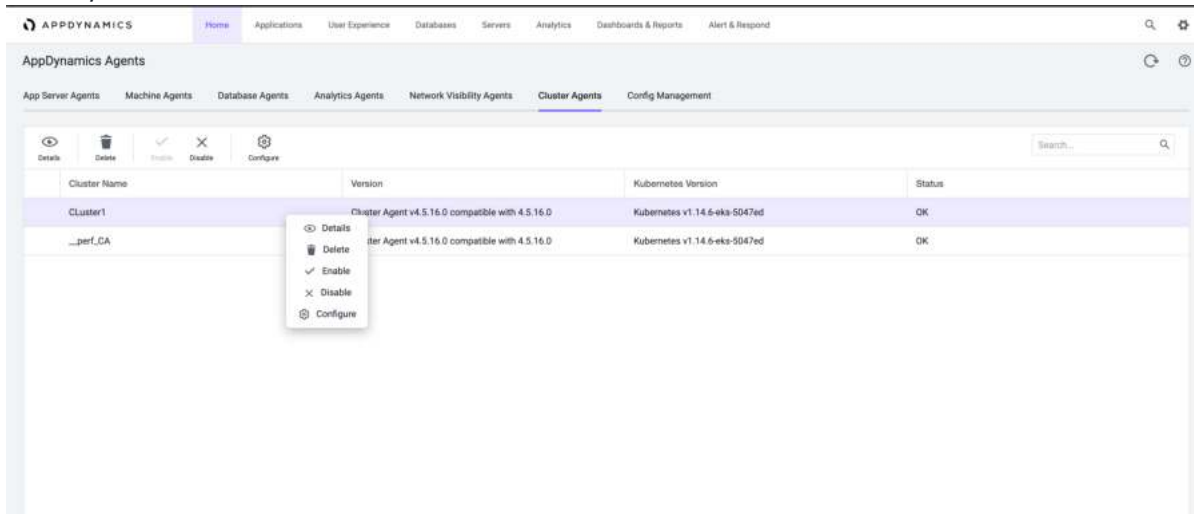

### Disable the Cluster Agent

1. Select a Cluster Agent from the list.
2. Click Disable **X**. You can also select the Cluster name, right-click, and select **Disable**. A dialog appears confirming that you disabled the agent successfully. These changes take a couple of minutes, and the status displays with a progress indicator. When you disable the Cluster Agent, it does not report metrics or events, nor monitor pods or containers. You can re-enable a disabled Cluster Agent.

## Enable the Cluster Agent

1. Select a Cluster Agent from the list.
2. Click Enable ✓. You can also select the Cluster name, right-click, and select **Enable**. A dialog appears confirming that you enabled the agent successfully. These changes take a couple of minutes, and the status displays with a progress indicator. When you enable the Cluster Agent, it reports metrics and events, and monitors containers.

## Edit Namespaces

You can modify the namespaces by using either `nsToMonitor` or `nsToMonitorRegex` fields. However, it is recommended to use `nsToMonitorRegex`.

These are common namespace behavior scenarios with the `nsToMonitor` field:

- After the Cluster Agent's initial registration, the namespaces are retrieved from the Cluster Agent `YAML` file.
- After initial registration, if the Cluster Agent restarts and the Controller is running, the Controller UI's user namespace settings take precedence.
- After initial registration, if the Controller restarts and the Cluster Agent is running, any previous changes made to the namespaces in the Controller UI are preserved.
- If both the Cluster Agent and the Controller restart, the namespaces are retrieved from the `YAML` file.

The following are common namespace behavior scenarios with `nsToMonitorRegex` field:

**i** To use the `nsToMonitorRegex` field, ensure that you are using Controller `>= 20.10` and Agent `>= 20.9`.

- After initial registration, at every subsequent minute the agent checks for the `nsToMonitorRegex` field to match the namespaces. If there is `nsToExcludeRegex` mentioned, those namespaces are excluded from the monitored namespaces.
- If a namespace configuration is to be monitored or ignored from the Controller, it takes precedence over the agent configuration (Cluster Agent `YAML` file). Therefore, if a namespace satisfies the regular expression that is configured for `nsToExcludeRegex`, but the Controller configuration includes that namespace under monitored namespaces, then the namespace is monitored.

To exclude this namespace from being monitored, you must delete the namespace in the Controller configuration. In this scenario, where there is a conflict between the agent configuration and the Controller configuration, the addition or removal of the relevant namespace from the Cluster Agent configuration does not have any effect.

- If the Cluster Agent is restarted, the `nsToMonitorRegex` and `nsToExcludeRegex` fields are read from the agent configuration file along with the namespaces configured in the Controller.
- If the Controller is restarted, the monitored and ignored namespaces included in the Controller configuration are retained and reapplied along with the agent configuration.
- If both the Cluster Agent and the Controller are restarted at the same time, the `nsToMonitorRegex` and `nsToExcludeRegex` fields are read from the agent configuration file. The namespaces to be monitored are determined based on the agent configuration.
- If a new namespace matching the configured regex is added, the namespace is monitored without any additional configuration. Similarly, when a namespace does not match the configured regex, it is not monitored.

You can modify namespaces in a Cluster by:

- [Updating Namespaces in the Cluster Agent Configuration File](#) - Modify the `nsToMonitor` or the `nsToMonitorRegex` field in the `cluster-agent.yaml` file before deploying the Cluster Agent. Namespaces mentioned in the `nsToMonitor` field are considered only during initial registration. You can update the `nsToMonitorRegex` field in the `cluster-agent.yaml` file even after the registration.  
You can specify regular expressions (regex) for the namespaces that you want to monitor by using the `nsToMonitorRegex` field. If you do not require the Cluster Agent to monitor some of the namespaces that match the regex specified in the `nsToMonitorRegex` field, then you can specify `nsToExcludeRegex` along with `nsToMonitorRegex`. For example, if Cluster Agent must monitor all the namespaces except the namespace that has the name starting with `exclude`, specify `nsToMonitorRegex` as `.*` and `nsToExcludeRegex` as `^exclude`.
- [Editing Namespaces in the User Interface](#) - Edit namespaces after you deploy the Cluster Agent. Once deployed, the cluster is listed under AppDynamics Agents/Cluster Agents. Open the AppDynamics browser-based configuration user interface and edit namespaces.

### Update Namespaces in the Cluster Agent Configuration File

To update namespaces in a cluster, use the `nsToMonitor` or the `nsToMonitorRegex` field in the `cluster-agent.yaml` before deploying the Cluster Agent. However, it is recommended to use `nsToMonitorRegex`.

Updating namespaces using the `nsToMonitor` field in the `cluster-agent.yaml` file does not change your currently monitored namespaces. However, updating namespaces using the `nsToMonitorRegex` changes the currently monitored namespaces. The scenarios are mentioned at [Edit Namespaces](#).

If the Cluster Agent pod unexpectedly restarts, the namespaces stored in the Controller take precedence and are preserved. See [Troubleshoot the Cluster Agent](#).

To update namespaces:

1. Open the `cluster-agent.yaml` file in a text editor.
2. Locate the `nsToMonitor` field:

```
nsToMonitor:
 - "default"
 - "appdynamics"
```

Or

To specify namespaces based on regular expressions, include the `nsToMonitorRegex` field:

```
nsToMonitorRegex: <regular expression>
nsToExcludeRegex: <regular expression> #This is an optional field
```

3. Verify the list of namespaces. If it is not correct, add or remove namespaces in the `cluster-agent.yaml` file.

4. Open a command prompt. To apply the namespaces changes, enter:

```
kubectl apply -f cluster-agent.yaml
```

5. To verify that the AppDynamics Operator registered the monitored namespace value, enter:  
When using the `nsToMonitor` field:

```
kubectl -n appdynamics describe cm cluster-agent-config | grep
APPDYNAMICS_CLUSTER_MONITORED_NAMESPACES -A 2
```

When using the `nsToMonitorRegex` field:

```
kubectl-app describe cm cluster-agent-mon
```

This is the expected output from the `nsToMonitor` example:

```
APPDYNAMICS_CLUSTER_MONITORED_NAMESPACES:

default
```

If you use the `nsToMonitorRegex` field, the default value of `nsToMonitor` is ignored.

### Edit Namespaces in the User Interface

Once you have deployed the Cluster Agent, the **Selected** namespaces column displays the currently monitored namespaces.

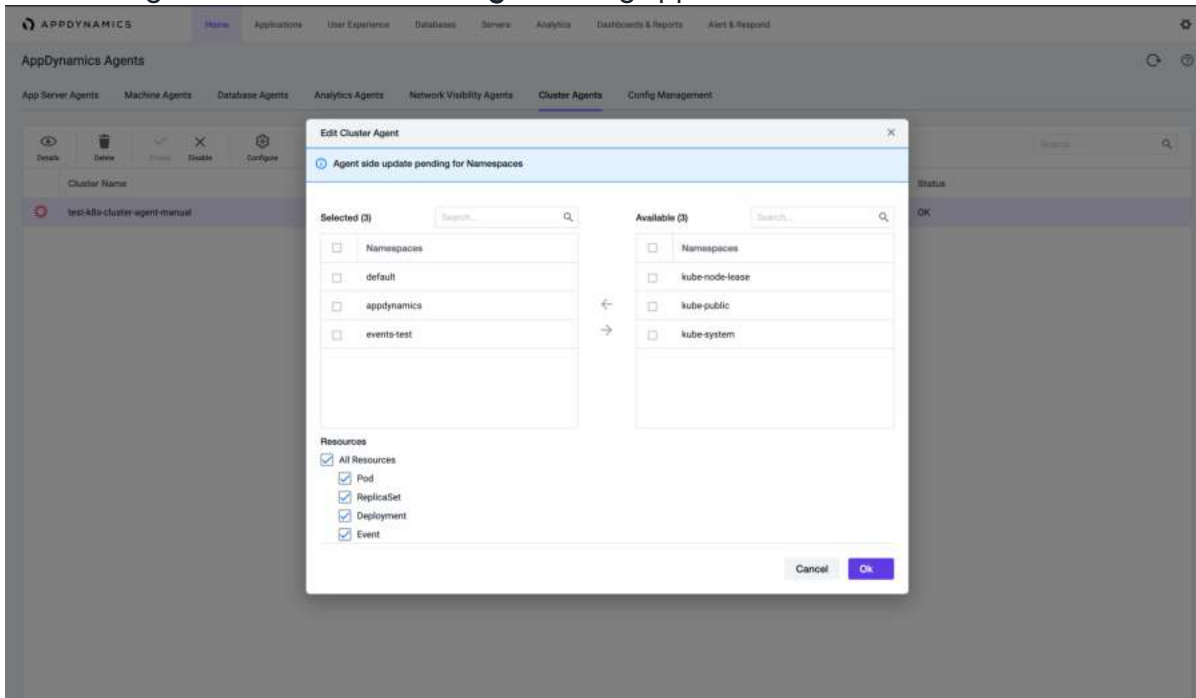

To edit a namespace from the cluster, you must have administrator permissions:

---

To edit a namespace:

1. Double-click a cluster from the list.

2. Click **Configure** . An **Edit Cluster Agent** dialog appears.

3. To modify namespaces, select a namespace by checking the corresponding box.
4. Once the desired namespace box is checked, click the arrow to move it to either the **Selected** namespace table or the **Available** namespace table.
5. Click **OK** to close the dialog box. These changes take a couple of minutes and the status displays in a banner notification.

 Updating namespaces in the `cluster-agent.yaml` file does not change your currently monitored namespaces. It assures that if the Cluster Agent pod unexpectedly restarts, that your namespaces are preserved. See [Troubleshoot the Cluster Agent](#).

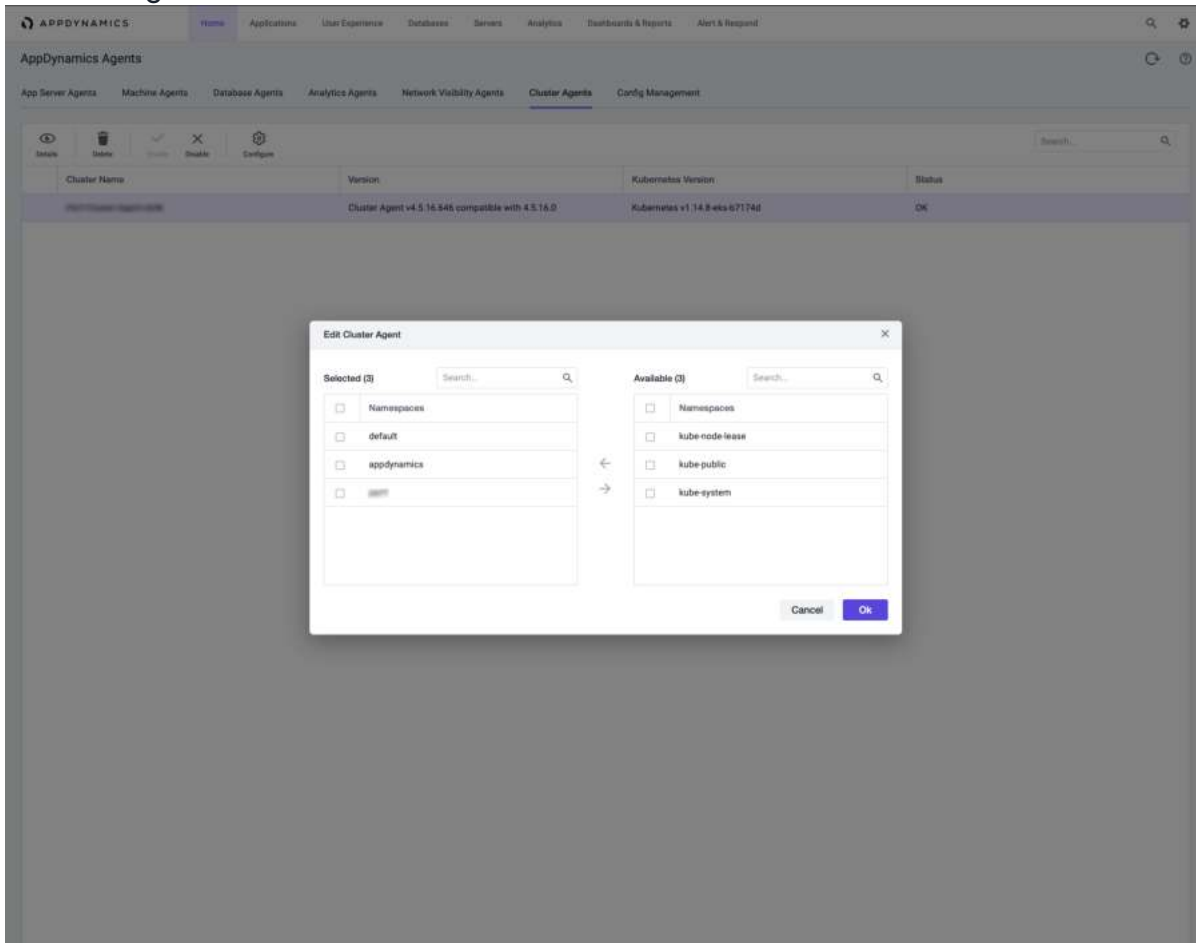

## Add or Remove Namespaces

 To add or remove a namespace from the cluster, you must have administrator permissions:

To add or remove a namespace from the cluster:

1. Double-click a cluster from the list.

## 2. Click Configure .

3. To modify namespaces, select a namespace by checking the corresponding box. Once the desired namespace box is checked, click the arrow to move it to either the **Selected** namespace table, or the **Available** namespace table.
4. Click **OK** to close the dialog box. These changes take a couple of minutes and the status displays with a progress indicator..

### Delete a Monitored Namespace

To delete a Cluster Agent monitored namespace:

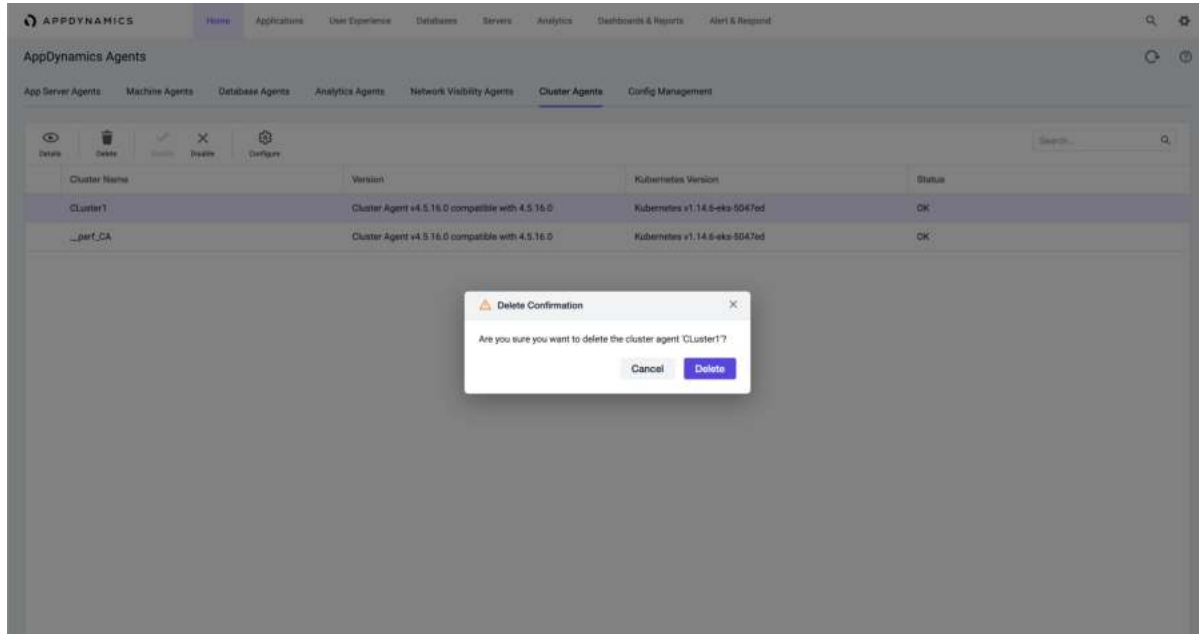

1. Double-click a cluster from the list.
2. Click Configure . The **Edit Cluster Agent** dialog appears.
3. Select a namespace by checking the corresponding box.
4. Click the arrow to move to either the **Available** namespace, or to the **Selected** namespace table.
5. Delete the namespace from your Kubernetes cluster.

### Delete the Cluster Agent

To delete a Cluster Agent:

1. Select the Cluster Agent name that you want to delete.

2. Click Delete . A dialog asks you to confirm that you want to delete the Cluster Agent.
3. Click **Delete**. If you delete a Cluster Agent, you will lose all historical data.

## Cluster Metrics

The **Cluster Agent Dashboard** metrics derive from the Kubernetes API, and they report information for the clusters and pods. For any defined set of namespaces, the Cluster Agent reports events on these Kubernetes and hardware resources.

AppDynamics monitors cluster health and Kubernetes objects for:

- [Cluster Summary Metrics](#)

- [Storage Quota](#)

## Cluster Summary Metrics

Metric Name	Description	UI Location	Metric Path
Error events count	Number of error events	<b>Dashboard &gt; Errors</b>	Hardware Resources Cluster Error events count
Evicted pods count	Number of evicted pods	<b>Pods &gt; Evicted</b>	Hardware Resources Cluster Evicted pods count
Eviction threats count	Number of events that represent pod evictions	<b>Dashboard &gt; Errors</b>	Hardware Resources Cluster Eviction threats count
Image pull errors	Number of image pull errors	<b>Dashboard &gt; Issues &gt; Image Issues</b>	Hardware Resources Cluster Image pull errors
Image pulls	Number of image pulls	<b>Dashboard &gt; Issues &gt; Image Issues</b>	Hardware Resources Cluster Image pulls
Info events count	Number of informational events	<b>Dashboard &gt; Errors</b>	Hardware Resources Cluster Info events count
Pod errors	Number of errors related to pods	<b>Dashboard &gt; Issues &gt; Pod Issues</b>	Hardware Resources Cluster Pod errors
Pod Kills	Number of pods that were killed	<b>Inventory &gt; Pods &gt; Pod Kills</b>	Hardware Resources Cluster Pod Kills
Pod restarts	Number of times the pods restarted	<b>Dashboard &gt; Issues &gt; Pod Issues</b>	Hardware Resources Cluster Pod restarts
Pods Scaledowns	Count of scaledowns; you can scale down your deployments and replica sets.	<b>Inventory &gt; Pods &gt; Scaledowns</b>	Hardware Resources Cluster Pods Scaledowns
Pods count	Total count of pods	<b>Inventory &gt; Pods &gt; Phases &gt; Normal</b>	Hardware Resources Cluster Pods count

Metric Name	Description	UI Location	Metric Path
Pods failed	Number of failed pods	<b>Pods &gt; Failed</b>	Hardware Resources  Cluster Pods failed
Pods pending	Number of pods in a pending state. Pending status normally indicates an issue. See the <a href="#">Kubernetes documentation</a> .	<b>Pods &gt; Pending</b>	Hardware Resources  Cluster Pods pending
Pods running	Number of pods in a running state	<b>Pods &gt; Running</b>	Hardware Resources  Cluster Pods running
Pods succeeded	Number of pods in Succeeded phase	<b>Dashboard &gt; Pods By Phase</b>	Hardware Resources  Cluster Pods succeeded
Pods unknown	Number of pods in Unknown state	<b>Dashboard &gt; Pods By Phase</b>	Hardware Resources  Cluster Pods unknown
Pods with Missing Dependencies - Config Maps and Secrets	If a pod is dependent on any Config Maps & Secrets, then those dependencies are missing.	<b>Inventory &gt; Pods &gt; Missing Dependencies - Config Maps and Secrets</b>	Hardware Resources  Cluster Pods With Missing Dependencies - Config Maps And Secrets (Pod Metrics for Inventory tab)
Pods with Missing Dependencies - Services	If a pod is dependent on any Services, then those dependencies are missing.	<b>Inventory &gt; Pods &gt; Missing Dependencies - Services</b>	Hardware Resources  Cluster Pods With Missing Dependencies (Pod Metrics for Inventory Tab)
Pods with No Limits	Number of pods with no limits (on CPU/memory) set. If you specified limits on any pod that you are starting, this metric indicates how many pods do not have a limit defined (Displays in the Inventory tab, under Pod Metrics).	<b>Inventory &gt; Pods &gt; No Limits</b>	Hardware Resources  Cluster Pods With No Limits

Metric Name	Description	UI Location	Metric Path
Pods With No Liveness Probe	Number of pods with no liveness probe. If you configured a probe in Kubernetes to monitor liveness, the values display in the Inventory tab, under Pod Metrics.	<b>Inventory &gt; Pods &gt; No Probes -Liveness</b>	Hardware Resources Cluster Pods With No Liveness Probe
Pods With No Readiness Probe	Number of pods with no readiness probe. If you configured a probe in Kubernetes to monitor readiness, the values display in the Inventory tab, under Pod Metrics.	<b>Inventory &gt; Pods &gt; No Probes -Readiness</b>	Hardware Resources Cluster Pods With No Readiness Probe
Privileged Pods	Number of privileged pods that run with root access (Displays in the Inventory tab, under Pod Metrics).	<b>Inventory &gt; Pods &gt; Privileged</b>	Hardware Resources Cluster Privileged Pods
Storage errors	Overall number of errors related to storage for the cluster.	<b>Inventory &gt; Pod Metrics</b>	Hardware Resources Cluster Storage errors
Storage quota violations	Number of storage quota violations; if someone exceeds that quota.	<b>Inventory &gt; Pod Metrics</b>	Hardware Resources Cluster Storage quota violations

## CPU

### CPU Capacity

Metric Name	Description	UI Location	Metric Path
Total (MilliCores)	Total CPU capacity for the cluster in MilliCores	<b>Cluster Capacity &gt; CPU</b>	Hardware Resources Cluster CPU Capacity Total (MilliCores)
Used (MilliCores)	CPU capacity already used by the cluster in MilliCores	<b>Cluster Capacity &gt; CPU</b>	Hardware Resources Cluster CPU Capacity Used (MilliCores)

## CPU Quota

Metric Name	Description	UI Location	Metric Path
Limit Used (%)	Percentage of CPU limit quota used	<b>Dashboard &gt; Quotas &gt; CPU Limit</b>	Hardware Resources Cluster CPU Quota Limit Used (%)
Limit Used (MilliCores)	MilliCores value for CPU limit quota used	<b>Dashboard &gt; Quotas &gt; CPU Limit</b>	Hardware Resources Cluster CPU Quota Limit Used (MilliCores)
Request Used (%)	Percentage of CPU request quota used	<b>Dashboard &gt; Quotas &gt; CPU Request</b>	Hardware Resources Cluster CPU Quota Request Used (%)
Request Used (MilliCores)	MilliCores value for CPU request quota used	<b>Dashboard &gt; Quotas &gt; CPU Request</b>	Hardware Resources Cluster CPU Quota Request Used (Millicores)

## CPU Utilization

Metric Name	Description	UI Location	Metric Path
Limit (MilliCores)	<p>Limit of CPU which can be used by the pods. Only the pods belonging to monitored namespaces are used to calculate this metric.</p> <p>If this value is not specified for any pod, then the value is calculated as the CPU limit of the node.</p> <p>For example:</p> <ul style="list-style-type: none"> <li>• If node limit is 24m with five pods without any CPU limit, then this value is displayed as 24m.</li> <li>• If node limit is 24m with five pods and each pod has a limit of 5m, this value displays the limit as 25m.</li> </ul>	<b>Dashboard &gt; Utilization &gt; CPU</b>	Hardware Resources Cluster CPU Utilization Limit (MilliCores)

Metric Name	Description	UI Location	Metric Path
Request (MilliCores)	MilliCore value of CPU for which all the pods in monitored namespaces have requested.	<b>Dashboard &gt; Utilization &gt; CPU</b>	Hardware Resources  Cluster CPU Utilization  Request (MilliCores)
Used (MilliCores)	Actual CPU which the pods from monitored namespaces are currently using.	<b>Dashboard &gt; Utilization &gt; CPU</b>	Hardware Resources  Cluster CPU Utilization  Used (MilliCores)

### DaemonSets

Metric Name	Description	UI Location	Metric Path
Count	Number of daemon sets that exist	<b>Inventory &gt; Objects &gt; DaemonSets &gt; (Count)</b>	HardwareResources  Cluster DaemonSets  Count
Nodes Available	Number of nodes that are running and available on the cluster	<b>Inventory &gt; Objects &gt; DaemonSets &gt; Available</b>	HardwareResources  Cluster DaemonSets  Nodes Available
Nodes MissScheduled	Number of nodes that are running, but should not be running	<b>Inventory &gt; Objects &gt; DaemonSets &gt; MissScheduled</b>	HardwareResources  Cluster DaemonSets  Nodes MissScheduled
Nodes Unavailable	Number of nodes that should be running, but are not running	<b>Inventory &gt; Objects &gt; DaemonSets &gt; Unavailable</b>	HardwareResources  Cluster DaemonSets  Nodes Unavailable

### Deployments

Metric Name	Description	UI Location	Metric Path
Count	Number of deployments that exist in the cluster	<b>Inventory &gt; Objects &gt; Deployments &gt; (Count)</b>	HardwareResources  Cluster Deployments  Count
Replicas	Number of pod replicas in the cluster that are not in a terminated state	<b>Inventory &gt; Objects &gt; Deployments &gt; Available</b>	HardwareResources  Cluster Deployments  Replicas

Metric Name	Description	UI Location	Metric Path
Replicas Unavailable	Total number of unavailable pod replicas across all deployments in the cluster	<b>Inventory &gt; Objects &gt; Deployments &gt; Unavailable</b>	HardwareResources Cluster Deployments ReplicasUnavailable

## Endpoints

Metric Name	Description	UI Location	Metric Path
Count	Number of endpoints in the cluster	<b>Inventory &gt; Services &gt; Endpoints &gt; Count</b>	HardwareResources Cluster Endpoints Count
Not Ready Address	Total number of not ready addresses for all the endpoints in the cluster	<b>Inventory &gt; Services &gt; Endpoints without ready IP</b>	HardwareResources Cluster Endpoints Not Ready Address
Orphans	Total number of endpoints in the cluster which do not have any ready, nor any not ready addresses	<b>Inventory &gt; Services &gt; Orphan Endpoints with no IP</b>	HardwareResources Cluster Endpoints Orphans
Ready Address	Total number of ready addresses for all the endpoints in the cluster	<b>Inventory &gt; Services &gt; Endpoints</b>	HardwareResources Cluster Endpoints Ready Address

## Jobs

Metric Name	Description	UI Location	Metric Path
Count	Total number of jobs in the cluster	<b>Inventory &gt; Objects &gt; Jobs &gt; (Count)</b>	Hardware Resources Cluster Jobs Count
Pods Active	Total number of active pods for all the jobs in the cluster	<b>Inventory &gt; Objects &gt; Jobs &gt; Active</b>	Hardware Resources Cluster Jobs Pods Active
Pods Failed	Total number of pods which reached phase Failed for all the jobs in the cluster	<b>Inventory &gt; Objects &gt; Jobs &gt; Failed</b>	Hardware Resources Cluster Jobs Pods Failed
Pods Succeeded	Total number of pods which reached phase Succeeded for all the jobs in the cluster	<b>Inventory &gt; Objects &gt; Jobs &gt; Succeeded</b>	Hardware Resources Cluster Jobs Pods Succeeded

## Memory

### Memory Capacity

Metric Name	Description	UI Location	Metric Path
Total (MB)	Total Memory capacity for the cluster in MBs	<b>Dashboard &gt; Cluster Capacity &gt; Memory</b>	Hardware Resources Cluster Memory Capacity Total (MB)
Used (MB)	Memory capacity already used by the cluster in MBs	<b>Dashboard &gt; Cluster Capacity &gt; Memory</b>	Hardware Resources Cluster Memory Capacity Used (MB)

### Memory Quota

Metric Name	Description	UI Location	Metric Path
Limit Used (%)	Percentage of Memory limit quota used	<b>Dashboard &gt; Quotas &gt; Memory Limit</b>	Hardware Resources Cluster Memory Quota Limit Used (%)
Limit Used (MB)	MB value for Memory limit quota used	<b>Dashboard &gt; Quotas &gt; Memory Limit</b>	Hardware Resources Cluster Memory Quota Limit Used (MB)
Request Used (%)	Percentage of Memory request quota used	<b>Dashboard &gt; Quotas &gt; Memory Request</b>	Hardware Resources Cluster Memory Quota Request Used (%)
Request Used (MB)	MB value for Memory request quota used	<b>Dashboard &gt; Quotas &gt; Memory Request</b>	Hardware Resources Cluster Memory Quota Request Used (MB)

## Memory Utilization

Metric Name	Description	UI Location	Metric Path
Limit (MB)	<p>Limit of Memory which can be used by the pods. Only the pods belonging to monitored namespaces are used to calculate this metric.</p> <p>If this value is not specified for any pod, then the value is calculated as the memory limit of the node.</p> <p>For example:</p> <ul style="list-style-type: none"> <li>• If node limit is 24MB with five pods without any memory limit, then this value is displayed as 24MB.</li> <li>• If node limit is 24MB with five pods and each pod has a limit of 5MB, this value displays the limit as 25MB.</li> </ul>	<b>Dashboard &gt; Utilization &gt; Memory</b>	Hardware Resources Cluster Memory Utilization Limit (MB)
Request (MB)	MB value of Memory for which all the pods in monitored namespaces have requested.	<b>Dashboard &gt; Utilization &gt; Memory</b>	Hardware Resources Cluster Memory Utilization Request (MB)
Used (MB)	Actual Memory which the pods from monitored namespaces are currently using.	<b>Dashboard &gt; Utilization &gt; Memory</b>	Hardware Resources Cluster Memory Utilization Used (MB)

## Nodes

Metric Name	Description	UI Location	Metric Path
Master Count	Number of master nodes in the cluster	<b>Inventory &gt; Masters</b>	Hardware Resources Cluster Nodes Master Count
Worker Count	Number of worker nodes in the cluster	<b>Inventory &gt; Workers</b>	Hardware Resources Cluster Nodes Worker Count

Metric Name	Description	UI Location	Metric Path
Memory Pressure Count	Number of nodes that are under memory pressure in the cluster	<b>Inventory &gt; Memory Pressure</b>	Hardware Resources Cluster Nodes Memory Pressure Count
Disk Pressure Count	Number of nodes that are under disk pressure in the cluster	<b>Inventory &gt; Disk Pressure</b>	Hardware Resources Cluster Nodes Disk Pressure Count

## Pods

### Pods Capacity

Metric Name	Description	UI Location	Metric Path
Total Count	Total number of pods that a cluster can support	<b>Pods &gt; Total Count</b>	Hardware Resources Cluster Pods Capacity Total Count
Used Count	Number of pods already created in the cluster	<b>Pods &gt; Count</b>	Hardware Resources Cluster Pods Capacity Used Count

### Pods CPU Usage

Metric Name	Description	UI Location	Metric Path
%Busy Scaled	This percentage is calculated based on the used CPU relative to its pod limit.	<b>Server &gt; Metric Browser</b>	Root Individual Nodes <namespace>/<pod-name> Hardware Resources CPU %Busy Scaled
%Busy	The percentage of the CPU cores used by a pod.  When CPU used (CPU Utilization) is more than 1000 millicores, this value can be more than 100%.	<b>Server &gt; Metric Browser</b>	Root Individual Nodes <namespace>/<pod-name> Hardware Resources CPU %Busy

### Pods Memory Usage

Metric Name	Description	UI Location	Metric Path
Used (MB)	The amount of memory used by a pod.	<b>Server &gt; Metric Browser</b>	Root Individual Nodes <namespace>/<pod-name> Hardware Resources Memory Used (MB)

### PVC

#### PVC Quota

Metric Name	Description	UI Location	Metric Path
Used	PVC quota already being used in the cluster (count)	<b>Dashboard &gt; Quotas &gt; PVC</b>	Hardware Resources Cluster PVC Quota Used
Used %	Percentage of PVC quota already being used in the cluster	<b>Dashboard &gt; Quotas &gt; PVC</b>	Hardware Resources Cluster PVC Quota Used (%)

#### PVC Utilization

Metric Name	Description	UI Location	Metric Path
Capacity (MB)	Total PVC available for the pods in the monitored namespaces	<b>Dashboard &gt; Utilization &gt; PVCs</b>	Hardware Resources Cluster PVC Utilization Capacity (MB)
Request (MB)	Value for PVC requested by pods in monitored namespaces	<b>Dashboard &gt; Utilization &gt; PVCs</b>	Hardware Resources Cluster PVC Utilization Request (MB)

### ReplicaSets

Metric Name	Description	UI Location	Metric Path
Count	Number of replica set resources in the cluster	<b>Inventory &gt; Objects &gt; ReplicaSets &gt; Count</b>	Hardware Resources Cluster Count

Metric Name	Description	UI Location	Metric Path
Replicas	Total number of replicas for all the replica sets in the cluster	<b>Inventory &gt; Objects &gt; ReplicaSets &gt; Count</b>	Hardware Resources Cluster ReplicaSets Replicas
Replicas Available	Total number of available replicas for all the replica sets in the cluster	<b>Inventory &gt; Objects &gt; ReplicaSets &gt; Available</b>	Hardware Resources Cluster ReplicaSets Replicas Available
Replicas Unavailable	Total number of unavailable replicas for all the replica sets in the cluster	<b>Inventory &gt; Objects &gt; ReplicaSets &gt; Unavailable</b>	Hardware Resources Cluster ReplicaSets Replicas Unavailable

### Services

Metric Name	Description	UI Location	Metric Path
Count	Total number of Kubernetes Services running in the cluster	<b>Inventory &gt; Services &gt; Services</b>	Hardware Resources Cluster Services Count

### StatefulSets

Metric Name	Description	UI Location	Metric Path
Count	Number of statefulsets in monitored namespaces	<b>Inventory &gt; Objects &gt; StatefulSets &gt; (Count)</b>	Hardware Resources Cluster StatefulSets Count
Replicas Ready	Number of replicas in a ready state across all statefulsets in monitored namespaces	<b>Inventory &gt; Objects &gt; StatefulSets &gt; Replicas Ready</b>	Hardware Resources Cluster StatefulSets Replicas Ready
Replicas Desired	Number of replicas across all statefulsets in monitored namespaces which are specified as desired in statefulset spec	N/A	Hardware Resources Cluster StatefulSets Replicas Desired
Replicas Not Ready	Number of replicas across all statefulsets in monitored namespaces which are not ready and are yet to be created or started	<b>Inventory &gt; Objects &gt; StatefulSets &gt; Replicas Not Ready</b>	Hardware Resources Cluster StatefulSets Replicas Not Ready

Metric Name	Description	UI Location	Metric Path
Collisions	Number of hash collisions for statefulsets across all namespaces monitored	N/A	Hardware Resources Cluster StatefulSets Collisions

### Storage Quota

Metric Name	Description	UI Location	Metric Path
Used (MB)	Storage quota used by the cluster in MB	Dashboard > Quotas > Storage	Hardware Resources Cluster Storage Quota Used (MB)
Used (%)	Percentage of storage quota used by the cluster	Dashboard > Quotas > Storage	Hardware Resources Cluster Storage Quota Used (%)

### Monitor Cluster Health

The **Cluster Dashboard** provides visibility into your cluster's health to quickly determine any impact on performance. Each dashboard indicator corresponds to a different aspect of cluster performance.

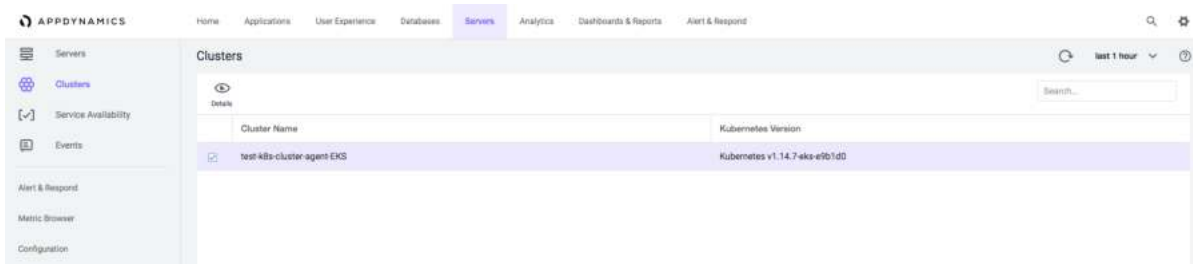

### Important Notes

- The **Cluster Inventory Dashboard** may display 0 (zero) for Master Nodes; this is expected behavior. Unlike on-premises clusters, cloud providers develop and release at a different pace compared to the Kubernetes project and evolve independently. This master node, or a number of master nodes, in Amazon EKS, AKS, and other cloud-based environments or clusters, hides the master node of the cluster. The reported cluster results are similar to the results generated by the `kubectl get nodes` command. To verify your reported results, enter the `kubectl get nodes` command to review node information, and if master nodes are shown as zero.
- Cluster-level resource utilization metrics are the sum of resources consumed by each of the pods. These metric values may reach hundreds of thousands because the Cluster Agent reports sums for individual pods.
- Pod utilization metrics are the sum of each of the containers running within a pod.
- Pod count and pod state (running, pending, evicted, and failed pods) metrics show real-time values (not historical values averaged over a designated period of time). Whatever pods are running "now", are reported.

### Clusters Dashboard

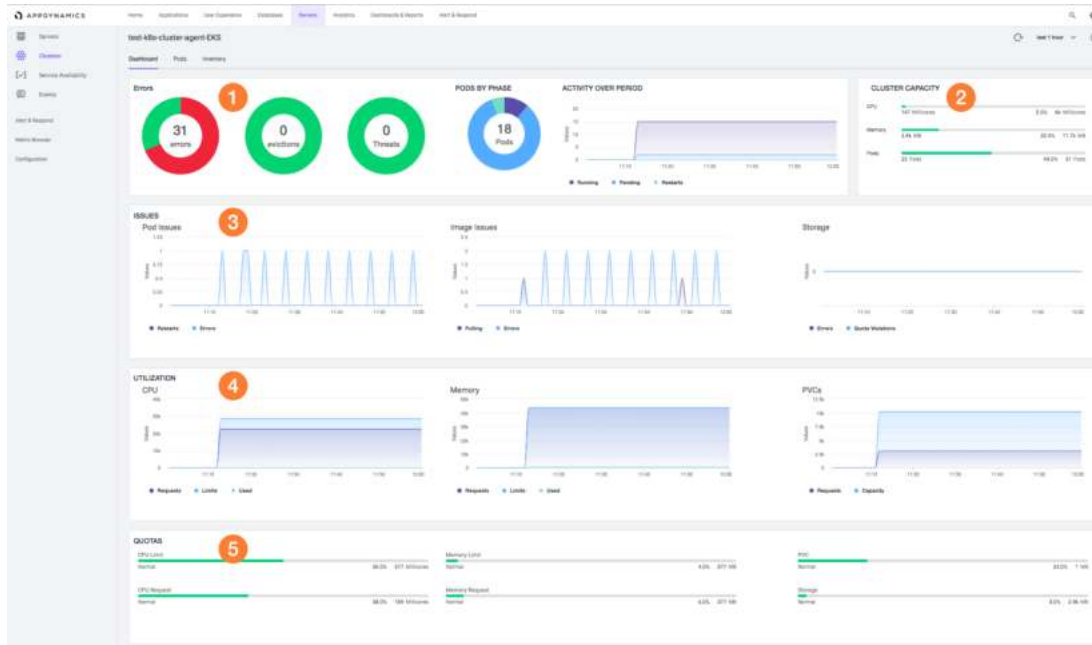

To access your cluster from the Controller:

1. Select **Servers > Clusters > Cluster Name**.

2. Select a Cluster Agent and double-click. The cluster interface displays the Dashboard, Pods, Inventory, and Events tabs.

## Dashboard Tab

- **Errors card:** 1 Displays pie chart graphs for the monitored namespaces in each cluster:
  - **Errors:** Number of **Errors** (Error events count), **Evictions** (Evicted pods count), and **Threats** (Eviction threats count) for individual pods.
  - **Pods by phase:** Number of pods that are in various states: **Failed**, **Pending**, **Running**, **Succeeded**, and **Unknown**.
  - **Activity over period:** Time-series chart that shows the number of pods in **Running**, and **Pending** states for a given time period.
- **Cluster Capacity:** 2 Score bar displays **CPU**, **Memory**, and **Pods**. A green line indicates the capacity usage. The Dashboard indicates the percent usage of **CPU**, **Memory**, and **Pod** capacity of the cluster which you can use to plan the resource capacity for this cluster.
- **Issues card:** 3 Displays:
  - **Pod issues:** When a Cluster Agent observes pod restarts and errors.
  - **Image issues:** Image pulling and errors.
  - **Storage:** Storage capacity issues such as errors and quota violations.
- **Utilization card:** 4 Displays:
  - **CPU:** Requests, limits, and used.
  - **Memory:** Requests, limits, and used.
  - **PVCs:** Requests and capacity.
- **Quotas card:** 5 Displays % utilization of resources relative to the respective quotas. The Agent tracks these resources:
  - Percentage of CPU Limit Quota Used.
  - Memory Limit of Quota Used.
  - Percentage of PVC Quota Used.
  - Percentage of CPU Request Quota Used.
  - Percentage of Memory Request Quota Used.
  - Percentage of Storage Quota Used.

Numbers are cumulative for the entire cluster. Use these indicators to track the availability of specific resources based on the imposed quotas and use in cluster capacity planning.

### Pods Tab

The Pods tab displays pods in various states and shares a high-level summary of their status. This example shows pods running in Amazon EKS. All pods are displayed based on their registered **Namespace** and **Pod Name**.

**i** Terminated pods continue to display in the Pods list until they have been purged from the AppDynamics Controller, however, their metrics are not updated. Purging occurs automatically at regular intervals. See [Administer the Cluster Agent](#).

The top card displays a summary of the monitored pods and their status in each cluster:

- **Total Pods:** Total number of pods in the monitored cluster.
- **Running:** Percentage and number of pods in a running state.
- **Pending:** Percentage and number of pods in a pending state. Pending status normally indicates an issue. See [Kubernetes documentation](#).
- **Evicted:** Percentage and number of evicted pods.
- **Failed:** Percentage and number of failed pods.

The screenshot shows the AppDynamics interface for a cluster named 'test-k8s-cluster-agent-EKS'. The 'Pods' tab is selected, displaying a summary card with the following data:

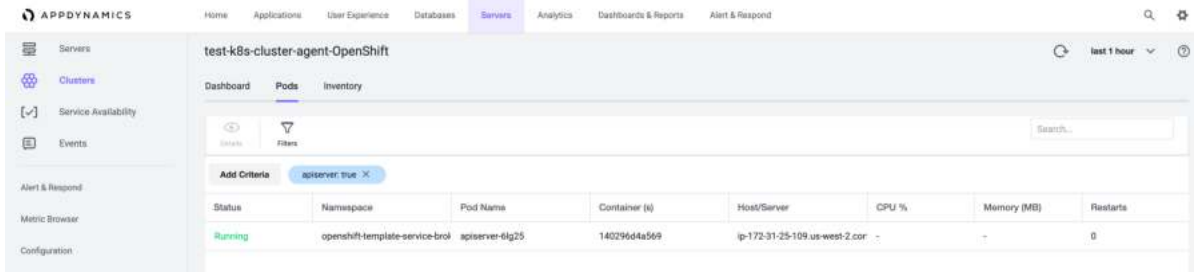

- Total Pods:** 18
- Running:** 89% (16 Pods)
- Pending:** 11% (2 Pods)
- Evicted:** 0% (0 Pods)
- Failed:** 0% (0 Pods)

Below the summary is a table listing individual pods with the following columns: Status, Namespace, Pod Name, Container (s), Host/Server, CPU %, Memory (MB), and Restarts.

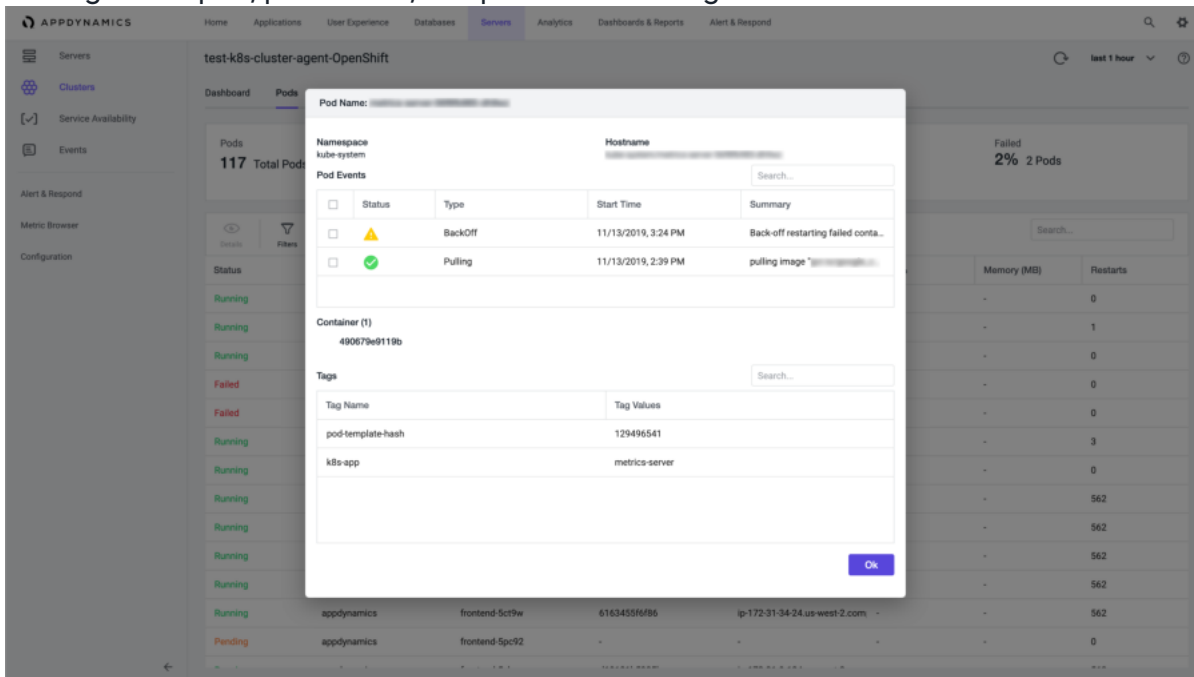

Status	Namespace	Pod Name	Container (s)	Host/Server	CPU %	Memory (MB)	Restarts
Running	appdynamics	appdynamics-operator-6938f04b7c-c92c4	723ae78273f	ip-10-177-0-149.us-west-2.compute.internal	0	11	0
Running	k8s-obj-test	fluentd-es-demo-4evmp	4399e15c097f	ip-10-177-0-229.us-west-2.compute.internal	0	146.98	0
Running	k8s-obj-test	fluentd-es-demo-dv888	d9c044e15c16	ip-10-177-0-233.us-west-2.compute.internal	0	91	0
Running	k8s-obj-test	fluentd-es-demo-f867f	75ab14818528	ip-10-177-0-149.us-west-2.compute.internal	0	133	0

Successful	k8s-obj-test	prig1b0	05a67d0a3c1	ip-10-177-0-149.us-west-2.compute.internal	-	-	0
Running	k8s-obj-test	privileged	230418911c0f	ip-10-177-0-229.us-west-2.compute.internal	0	1	0

You can search based on **Namespace** or **Pod Name**.

You can further filter based on pod tags and labels:

Double-click any pod to display its **Pod Details** panel. From the **Pod Details** panel, you can review containers running in that pod, pod events, and pod labels and tags.

The Cluster Agent automatically detects a pod's:

- Status
- Namespace
- Pod name
- Container IDs
- Host or server
- CPU % (sum of running containers within the pod)
- Memory MB (sum of running containers within the pod)
- Restarts

Pods are deleted for these reasons:

- When the namespace is un-monitored.
- When pods are deleted from the cluster, except for the failed pods.
- When the pod count exceeds the pod limit.
- If the pod is blocklisted.

### Pod Details Panel

The **Pod Details** panel displays:

- **Namespace:** In which namespace the pod is running.
- **Hostname:** Namespace or pod name.
- **Pod Events:** List of the most-recent events generated from the `kubectl describe pods` command.
- **Container (count):** List of running containers displayed by Container ID in this pod. Click each container to display individual container metrics.
- **Tags:** Kubernetes labels provided to this pod.

## Inventory Tab

The Inventory tab displays a high-level snapshot or inventory view of your cluster. It displays the contents of the cluster which enables you to troubleshoot applications running in the cluster.

The Cluster card displays:

- **Cluster Name:** Name of the cluster.
- **Kubernetes Version:** Kubernetes version running on the cluster.
- **Cluster ID:** ID of the Cluster Agent.
- **Pods:** Number of monitored pods.
- **Namespaces:** Number of monitored namespaces.
- **Masters:** Number of master nodes.
- **Workers:** Number of worker nodes.
- **Disk Pressure:** Snippet of disk pressure trend in the cluster.
- **Memory Pressure:** Snippet of memory pressure trend in the cluster.

The Pods card displays:

- **Pods by Phases:** Whether a pod is running, evicted, pending or failed. This number is the same count as the pods in a "running" state in the Pods tab.
- **Privileged Pods:** The pods run as root.
- **No Limits:** You can specify limits to any pod that you are starting. The No Limits metric indicates how many pods do not have a limit defined.
- **No Readiness Probe:** If you configured a probe in Kubernetes to monitor readiness, the values display here.
- **No Liveness Probe:** If you configured a probe in Kubernetes to monitor liveness, the values display here.
- **Missing Dependencies - Config Maps & Secrets:** If a pod is dependent on any Config Maps & Secrets, then those dependencies are missing.
- **Missing Dependencies - Services:** If a pod is dependent on any Services, then those dependencies are missing.
- **Scaledowns:** Count of scaledowns of your deployments and replicaset.
- **Pod Kills:** Number of pods that were killed.

**Namespaces:** List of namespaces that you can search from the Search bar

The Objects card displays:

- **Jobs:** Total number of jobs in the monitored namespaces, and the number of failed, active, and succeeded job counts.
- **Deployments:** Number of deployments in monitored namespaces, and the total available and unavailable replica counts.
- **ReplicaSets:** Number of replicaset in monitored namespaces, and the total available and unavailable replica counts.

- **DaemonSets:** Number of daemonsets in monitored namespaces, and the total available, unavailable, and mis-scheduled pod counts.
- **StatefulSets:** Number of statefulsets in monitored namespaces, and the total ready and not ready replica counts.

The Services card displays the health of the entire cluster:

- **Services:** Total number of services being monitored.
- **Endpoints:** Total number of endpoints being monitored.
- **Readiness:** Number of endpoints without a ready IP address.
- **Orphans:** Number of orphaned endpoints with no IP address.

## Events Tab

The Events tab displays the cluster events that are specific to the selected cluster. You can use **Filters** to view any specific event.

Filters	Summary	Time
	Back-off restarting failed container	07/28/20, 2:48:02 PM
	Back-off restarting failed container	07/28/20, 2:47:58 PM
	Back-off restarting failed container	07/28/20, 2:47:56 PM
	Error: ImagePullBackOff	07/28/20, 2:47:19 PM
	Error: ImagePullBackOff	07/28/20, 2:47:13 PM
	Error: ImagePullBackOff	07/28/20, 2:47:10 PM
	Back-off restarting failed container	07/28/20, 2:44:35 PM
	Back-off restarting failed container	07/28/20, 2:43:07 PM
	Back-off restarting failed container	07/28/20, 2:43:01 PM
	Back-off restarting failed container	07/28/20, 2:42:59 PM
	Error: ImagePullBackOff	07/28/20, 2:42:18 PM
	Error: ImagePullBackOff	07/28/20, 2:42:16 PM
	Error: ImagePullBackOff	07/28/20, 2:42:13 PM
	Error: ImagePullBackOff	07/28/20, 2:42:10 PM
	Back-off restarting failed container	07/28/20, 2:39:37 PM

## Monitor Kubernetes Events

There are two event types in Kubernetes:

- Normal events
- Warning events

See [Application Introspection and Debugging](#) for more information on Kubernetes events. AppDynamics reports a subset of these as Cluster Events. They are comprised of Kubernetes warning events and important informational notices concerning state changes in the cluster. An example of a state change is a pod transitioning from a pending to a running state.

**i** This document contains links to Kubernetes documentation. AppDynamics makes no representation as to the accuracy of Kubernetes documentation because Kubernetes controls its own documentation.

---

A **Cluster Event** of type warning displays a  yellow warning icon. When a Pod, Replicaset, or Deployment gets added, updated, or deleted, otherwise known as a state change, the Cluster Agent reports it as an Info type event and displays a  blue info icon.

### Configure Policy for Kubernetes Events

When you configure the policy for Kubernetes events, the **Events** page will display the details with the event type as **Custom**.

You can configure alert policies with the custom Kubernetes events. For more information about configuring policies, see [Configure Policies](#).

You can use **Triggers > Custom Events** panel in the lower right corner to configure Kubernetes-specific custom events to trigger the policy. See, [Configure Policy Triggers](#).

In **Add Custom Event Filter**, you can include the following:

- **Custom Event Type:** Specify any of the [supported event types](#).
- **Properties:** Filter the events by using a combination of the following properties:
  - **clustername** : the name of the cluster
  - **namespace**: the namespace of the cluster
  - **kind**: the kind used in the required cluster environment
  - **reason**: the event reason
  - **name**: the name of the event

### Supported Event Types

- Kubernetes New Warning
- Kubernetes Updated Warning
- Deployment Added
- Deployment Deleted
- Replicaset Added
- Replicaset Deleted
- Pod Added
- Pod Deleted
- Pod Phase Changed

### Monitor Cluster Event data

1. Click the **Servers** tab.

- On the navigation bar, select **Events**. A panel displays a list of events that have been reported from both servers and clusters. To check for specific events, you can use the **Filters** option.

Type	Sub Type	Summary	Time	Actions	Subgroups	Server	Cluster
Custom	Kubernetes Update...	Back-off restarting...	10/09/23, 4:20:41 PM	-	-	-	cluster-local
Custom	Kubernetes Update...	0/1 nodes are avail...	10/09/23, 4:17:54 PM	-	-	-	cluster-local
Custom	Kubernetes Update...	0/1 nodes are avail...	10/09/23, 4:17:54 PM	-	-	-	cluster-local
Custom	Deployment Added	Deployment nodej...	10/09/23, 4:15:00 PM	-	-	-	cluster-local
Custom	Deployment Added	Deployment javaap...	10/09/23, 4:14:59 PM	-	-	-	cluster-local
Custom	Deployment Added	Deployment javaap...	10/09/23, 4:14:59 PM	-	-	-	cluster-local
Custom	Replicaset Added	ReplicaSet nodejs...	10/09/23, 4:14:59 PM	-	-	-	cluster-local
Custom	Replicaset Added	ReplicaSet nodejs...	10/09/23, 4:14:59 PM	-	-	-	cluster-local
Custom	Replicaset Added	ReplicaSet nodejs...	10/09/23, 4:14:59 PM	-	-	-	cluster-local
Custom	Replicaset Added	ReplicaSet nodejs...	10/09/23, 4:14:59 PM	-	-	-	cluster-local
Custom	Replicaset Added	ReplicaSet nodejs...	10/09/23, 4:14:59 PM	-	-	-	cluster-local
Custom	Replicaset Added	ReplicaSet nodejs...	10/09/23, 4:14:59 PM	-	-	-	cluster-local
Custom	Replicaset Added	ReplicaSet nodejs...	10/09/23, 4:14:59 PM	-	-	-	cluster-local

- Click **Add** to add a filter and select the desired filters from the available list.

Filters	Summary	Time	Actions	Subgroups	Server	Cluster
<input checked="" type="checkbox"/> Event Types	nagePulBa...	07/28/20, 2:47:19 PM	-	-	-	agent1

<input type="checkbox"/> Cluster Event Severity	If restarting ...	07/28/20, 2:44:35 PM	-	-	-	agent1
<input type="checkbox"/> Threat Error Events	If restarting ...	07/28/20, 2:43:07 PM	-	-	-	agent1
<input type="checkbox"/> Other Error Events	If restarting ...	07/28/20, 2:43:01 PM	-	-	-	agent1
<input type="checkbox"/> Info events	If restarting ...	07/28/20, 2:42:59 PM	-	-	-	agent1
Cluster Name: Contains agent1	nagePulBa...	07/28/20, 2:42:18 PM	-	-	-	agent1
Namespace	nagePulBa...	07/28/20, 2:42:16 PM	-	-	-	agent1
Tag	nagePulBa...	07/28/20, 2:42:13 PM	-	-	-	agent1
	nagePulBa...	07/28/20, 2:42:10 PM	-	-	-	agent1
	If restarting ...	07/28/20, 2:39:37 PM	-	-	-	agent1
	If restarting ...	07/28/20, 2:38:04 PM	-	-	-	agent1
	If restarting ...	07/28/20, 2:38:00 PM	-	-	-	agent1
	If restarting ...	07/28/20, 2:37:57 PM	-	-	-	agent1
	nagePulBa...	07/28/20, 2:37:14 PM	-	-	-	agent1

- Click **Apply**. The list of events is filtered to show only the selected events.
- Double-click the individual **Cluster Event**. A dialog displays showing a **Cluster Event** summary. The **Logs** tab displays the log details. See [Enable Log Collection for Failing Pods](#).
- Click **X** to close the dialog.

## View Container Information

### Related pages:

- [Container Metrics](#)
- [Administer the Cluster Agent](#)
- [Hardware Resources Metrics](#)

The AppDynamics Cluster Agent runs within your Kubernetes cluster. Metrics reported for containers are taken from the Kubernetes [Metrics Server](#). Users need to install the metrics-server on their cluster to see container metrics. Once deployed, it discovers nodes in your cluster and starts collecting metrics from the Kubelet API. The Containers Dashboard shows the resource utilization metrics of your containerized applications.

The Containers page lists all containers to be monitored that are used by an application that is registered to the Controller.

### View Container Metrics

To view Container metrics:

1. Navigate to **Servers > Clusters**.
2. Double-click a cluster to view the cluster agent **Dashboard**.
3. Navigate to the **Pods** tab.
4. Double-click a pod to view the pod details and the containers that are running in the pod.  
A list of Container names is displayed.
5. Click a **Container Name** to expand and view the metrics for that specific container.

**Namespace**  
cluster-agent-demo

**Container (1)**

▼ devops-offers-mock-service

**CPU Usage**

**2.02%**  
Usage

**Memory Usage**

**45.48%**  
Usage

## Measure Resource Usage

Two metrics are reported per container:

- **CPU Usage:** Hardware Resources|CPU|%Busy
- **Memory Usage:** Hardware Resources|Memory|Used %

### CPU

Name	Description
%Busy	Percentage of time the CPU was busy processing system or user requests from this container; this metric includes CPU Stolen time. This %Busy value can exceed 100%. For example, if a system has 16 cores the %Busy can go to 1600%.

### Memory

Name	Description
Used %	Memory utilization by the container as a percentage of the memory hard limit.

## Administer the Cluster Agent

You can use several settings in the Controller to administer the Cluster Agent.

### Plan the Cluster Agent Deployment

If you have more than one Cluster Agent on your Controller, you must start your Cluster Agents in a staggered fashion. This procedure ensures that the Controller responds optimally. Use the table to determine the stagger start time for each cluster. Based on the cluster size, it may take a few minutes for the Cluster Agent to fully register with the Controller.

### Plan capacity for Clusters

Capacity planning is important when preparing to deploy the Cluster Agent. The Cluster Agent and the Machine Agent share the capacity of the same Controller. The total number of pods and containers in your cluster is equal to the number of Machine Agents slots that are used. For example, if you have 250 pods and 250 containers, that is equivalent to using 500 Machine Agents in the Controller. See [Controller Sizing](#).

### Controller Settings for the Cluster Agent

These properties are recommended for a Controller supporting the Cluster Agent. Certain Server Visibility properties will apply to all instances of Server Visibility and the Cluster Agent.

Property	Description	Recommend
<code>sim.cluster.agent.limit</code>	Maximum number of Cluster Agents per account. Configurable at the account level. For example, if you set the <code>sim.cluster.agent.limit</code> to a value of five, and you have ten Cluster Agents reporting, then the Controller randomly selects a subset of Cluster Agents. These random Cluster Agents will not be registered and reported. If the configured limit is reached, any new Cluster Agent will not be registered.	10
<code>sim.cluster.pod.limit</code>	Maximum number of pods per Cluster Agent per account. Configurable at the account level. If the number of pods exceeds the configured limit, the Cluster Agent randomly selects a set of pods that will not register or report.	1500
<code>sim.machines.registrations.maxPerSecondPerAccount</code>	Maximum number of machine registrations allowed per account, per second. This property applies to all instances of Server Visibility and the Cluster Agent.	10000
<code>sim.cluster.container.limit</code>	Controller level limit for the number of containers per cluster. This is used if there is no account-level configuration. To overwrite at account-level, add an additional property to the corresponding account. This property only affects the Cluster Agent.	3000
<code>sim.machines.offline.toStaleTimeoutMillis</code>	Length of time in milliseconds before an offline machine is considered stale, and eligible for purging. This property applies to all instances of Server Visibility and the Cluster Agent.	172,800,000 ms
<code>sim.machines.registrations.update.frequency</code>	Machine's timestamp update frequency in milliseconds. This property applies to all instances of Server Visibility and the Cluster Agent.	86,400,000 ms
<code>sim.cluster.events.maxPerMinute</code>	Controller level limit for the number of cluster events that are allowed per minute. This property only affects the Cluster Agent.	4000

Property	Description	Recommend
<code>sim.machines.simAllowed</code>	Availability of Server Visibility features. This property must be set to true to send the data (metrics) from Cluster Agent to Controller.	true
<code>sim.cluster.monitoring.enabled</code>	This property enables the Cluster Agent on the Controller. If set to false, all Cluster Agents stop reporting metrics and components, but still register every minute. This property only affects the Cluster Agent.	true

See [Controller Settings for Server Visibility](#).

**i** To avoid the risk of purging live entities, ensure that the `sim.machines.offline.toStaleTimeoutMillis` value is always greater than the `sim.machines.registrations.update.frequency` value.

### On-Premises Customers

For on-premises customers, to modify the Cluster Agent properties for your account:

1. Log in to the [Administration Console](#) with the administrator root password.
2. Select **Controller Settings**.
3. In the **Controller Settings** list, search for the setting.
4. In the **Value** field, enter the recommended value.
5. Click **Save**.
6. Log out of the Administrator Console.

### SaaS Customers

For SaaS customers, create an [AppDynamics Support](#) ticket to have the Cluster Agent properties updated for your account.

### Control Cluster Agent Reporting

You can stop and resume the Cluster Agent from reporting metrics and registering containers and pods. You can do this on a per-account basis, or on a Controller-wide basis.

#### Stop a Cluster Agent by Account

To stop the Cluster Agent on the Controller:

1. Log in to the [Administration Console](#) with the administrator root password.
2. Select **Account Settings**.
3. In the accounts list, double-click the account for which you want to configure the Cluster Agent.
4. In the **Additional Properties** pane, click **+Add Property**.
5. In the left field, enter "sim.cluster.monitoring.enabled".
6. In the right field, enter "false".
7. Click **OK** to save the property.

8. Log out of the Administrator Console.

License Expiration Date  Never  On Date 12/31/20 

Using SAML Authentication No

**Additional Properties**

sim.cluster.monitoring.enabled	false	<input type="button" value="X"/>
--------------------------------	-------	----------------------------------

### Start a Cluster Agent by Account

To start the Cluster Agent on the Controller:

1. Log in to the [Administration Console](#) with the administrator root password.
2. Select **Account Settings**.
3. In the accounts list, double-click the account for which you want to configure the Cluster Agent.
4. Locate the sim.cluster.monitoring.enable property, and in the right field, enter "true".
5. Click **OK** to save the property.
6. Log out of the Administrator Console.
7. If the Cluster Agent has been stopped using the "sim.cluster.monitoring.enabled" setting, it does not resume reporting metrics and registering pods and containers until you enable the Cluster Agent using the User Interface. See [Use the Cluster Agent](#).

### Stop all Agents on the Controller

To stop all Cluster Agents on the Controller:

1. Log in to the [Administration Console](#) with the administrator root password.
2. Select **Controller Settings**.
3. In the **Controller Settings** list, search for the "sim.cluster.monitoring.enabled" setting.
4. In the right field, set the value to "false".
5. Click **Save**.
6. Log out of the Administrator Console.

### Start all Agents on the Controller

To start all Cluster Agents on the Controller:

1. Log in to the [Administration Console](#) with the administrator root password.
2. Select **Controller Settings**.
3. In the **Controller Settings** list, search for the "sim.cluster.monitoring.enabled" setting.
4. In the right field, set the value to "true".
5. Click **Save**.
6. Log out of the Administrator Console.
7. If Cluster Agents have been stopped using the "sim.cluster.monitoring.enabled" setting, they do not resume reporting metrics and registering pods and containers until they are enabled through the User Interface. See [Use the Cluster Agent](#).

## Enable Log Collection for Failing Pods

This page describes how to enable and use the Cluster Agent feature to collect logs for failing pods. This feature is automatically enabled on SaaS Controllers. You must enable on-premises Controllers described on this page.

When enabled, the Cluster Agent automatically collects logs for restarted or failed pods. The pod failure logs capture the status of the `CrashLoopBackoff` events that display the `Back-off restarting failed container` message. This message usually indicates that Kubernetes started a container but then the container quickly exits. If this occurs, Kubernetes attempts to restart the container. You can use these log messages to determine why the pod is exiting, whether due to a liveness probe, or some other issue.

### Minimum Requirements

The Cluster Agent log collection feature requires:

- Cluster Agent  $\geq 20.7$
- Controller  $\geq 20.10.0$

### Requirements to Enable On-Premises Controllers

- Enable logging by using the Cluster Agent configuration setting, `sim.cluster.logs.capture.enabled`.
- Update the full file path to store the logs using the Controller setting, `sim.cluster.logs.root.file.path`. The logs are stored in the specified file location.
- Ensure you have 50 GB of hard disk space on the file system.
- When updating the file path, ensure that you move previously collected logs from the old path to the new path to view them on the Controller UI.

### Controller Settings

The following table lists the log settings required for an on-premises environment:

**i** For SaaS, the Technical Support team updates the configuration properties. Therefore, to configure the logs for SaaS, contact the support team by creating an [AppDynamics Support](#) ticket.

Setting	Definition	Location	Default
<code>sim.cluster.logs.bucket.name</code>	The folder name to store the pod logs.	Controller Administration Console with root user permission ( <b>Controller Settings</b> )	<code>kubernetes-log-snippets</code>

Setting	Definition	Location	Default
<code>sim.cluster.logs.capture.enabled</code>	An option to enable or disable log capturing.  This option is enabled by default.	Controller Administration Console with root user permission  You can configure this setting at both account level ( <b>Account Settings</b> ) and Controller level ( <b>Controller Settings</b> )	true
<code>sim.cluster.logs.expiration.in.days</code>	The number of days after which the logs get cleared from the storage.	Controller Administration Console with root user permission ( <b>Controller Settings</b> )	10
<code>sim.cluster.logs.root.file.path</code>	The complete root file path to store the logs. Modifying the path results in storing the logs in the new path but the older logs will remain in the previous location.	Controller Administration Console with root user permission ( <b>Controller Settings</b> )	/opt/appdynamics
<code>sim.cluster.failed.pod.limit</code>	The number of historical pods beyond this value is purged.	Controller Administration Console with root user permission ( <b>Controller Settings</b> )	1000
<code>sim.cluster.logs.s3.enabled</code>	An option to save the logs in the S3 bucket. If you specify the value as false, the logs are saved in the Controller filesystem.	Controller Administration Console with root user permission ( <b>Controller Settings</b> )	true

### Use Cluster Agent Log Collection

You can view the logs on the **Pod Details** page and the **Cluster Event** page.

#### Pod Details Page

1. Select **Servers > Clusters > Cluster Name**.
2. Select a Cluster Agent and double-click. The cluster interface displays the **Dashboard**, the **Pods**, the **Inventory**, and the **Events** tabs.
3. Click **Pods**.
4. Double-click any pod to display its **Pod Details** panel.

5. Review the **Error Log**.

**POD DETAIL: replicaset-machine-agent-docker-z4fm9** ✕

## Upgrade the Cluster Agent

This page describes how to upgrade the Cluster Agent using:

- Kubernetes CLI, or
- Cluster Agent Helm Chart

To install, see [Install the Cluster Agent](#).

- From Cluster Agent 23.2 onwards you must download the latest bundle and use only the packaged YAML files.
- When you upgrade from Cluster Agent < 23.2 to Cluster Agent >= 23.2, the instrumented pods will restart.

## Upgrade the Cluster Agent Using Kubernetes CLI

1. Download the target version of the Cluster Agent bundle from the [AppDynamics Downloads](#) portal.
2. Unzip the bundle and `cd` to the unzipped folder:

```
unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
cd appdynamics-cluster-agent-alpine-linux-<version>
```

3. Update the `cluster-agent.yaml` to include any previously applied configuration.
4. Update the image tag to add the version of the downloaded Cluster Agent bundle (for example, 21.12.0):

```

apiVersion: cluster.appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
 name: k8s-cluster-agent
 namespace: appdynamics
spec:
 appName: "<app-name>"
 controllerUrl: "http://<appdynamics-controller-host>:8080"
 account: "<account-name>"
 # docker image info
 image: "docker.io/appdynamics/cluster-agent:21.12.0"
 serviceAccountName: appdynamics-cluster-agent

```

5. Delete and re-create the Operator and Cluster Agent.

```

kubectl delete -f cluster-agent.yaml
kubectl delete -f cluster-agent-operator.yaml
kubectl create -f cluster-agent-operator.yaml
kubectl create -f cluster-agent.yaml

```

## Upgrade the Cluster Agent Using the Helm Chart

The latest Cluster Agent Helm Chart is available at `appdynamics-charts/cluster-agent`. Before you can upgrade to the latest Cluster Agent, you must first uninstall the existing Helm Chart and then re-install it.

1. Use `helm get` and `helm show` to determine if an upgrade is required to install the most recent Cluster Agent images from `appdynamics-charts/cluster-agent`:

```

which images are currently installed by my release?
helm get all "<my-cluster-agent-helm-release>" -n appdynamics | grep -E 'agentTag|operatorTag'
 agentTag: 21.12.0
 operatorTag: 21.12.0

which images are available to install?
helm show values appdynamics-charts/cluster-agent | grep -E 'agentTag|operatorTag'
 agentTag: 21.12.0
 operatorTag: 21.12.0

```

2. To perform the upgrade, uninstall and re-install the Cluster Agent Helm Chart using the same namespace from the previous installation:
  - a. Uninstall existing helm chart.

```
helm uninstall "<cluster-agent-helm-release>" --namespace appdynamics
```

- b. Delete all the previously installed CustomResourceDefinition (CRDs) related to AppDynamics Agent by using these commands:

```
kubectl get crd | grep appdynamics
kubectl delete crd clusteragents.cluster.appdynamics.com
kubectl delete crd infravizs.cluster.appdynamics.com
```

- c. Install Cluster Agent helm chart by using the same namespace.

```
helm install -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-
charts/cluster-agent --namespace=appdynamics
```

## Uninstall the Cluster Agent

This page describes how to uninstall the Cluster Agent using:

- Kubernetes CLI, or
- Cluster Agent Helm Chart
- OpenShift OperatorHub Bundle

See [Install the Cluster Agent](#).

### Uninstall the Cluster Agent Using Kubernetes CLI

Delete the Cluster Agent Operator and Cluster Agent using the `YAML` files:

```
kubectl delete -f cluster-agent.yaml
kubectl delete -f cluster-agent-operator.yaml
```

### Uninstall the Cluster Agent Using the Helm Chart

Uninstall the Cluster Agent Helm Chart using the namespace that you used for the installation:

```
helm uninstall "<my-cluster-agent-helm-release>" --namespace appdynamics
```

### Uninstall the Cluster Agent Using OpenShift OperatorHub Bundle

1. Delete the Cluster Agent:

```
kubectl delete -f cluster-agent.yaml
```

2. Delete AppDynamics Operator:
  - a. Go to your OpenShift cluster console
  - b. Navigate to **Operators > Installed Operators**

- c. Click [AppDynamics Operator for Kubernetes > Actions > Uninstall Operator](#)

## Analytics

You can use Analytics with the APM, Browser RUM, Mobile RUM, and Browser Synthetic Monitoring product modules for:

- [Transaction Analytics](#)
- [Log Analytics](#)
- [Browser Analytics](#)
- [Mobile Analytics](#)
- [Browser Synthetic Analytics](#)
- [Connected Devices Analytics](#)

Analytics extracts the data, generates baselines and dashboards, and provides perspective beyond traditional APM by enabling real-time analysis of business performance correlated with your application performance.

---

### Installation And Administration

### Extensibility And Reference

- [Create Analytics Metrics From Scheduled Queries](#)
- [Analytics Events API](#)
- [ADQL Reference](#)

## Overview of Analytics

This page describes Analytics. Analytics is built on AppDynamics SaaS, which includes the Events Service, the unstructured document store for the platform.

Analytics can answer business-oriented questions such as:

- How many users experienced failed checkout transactions in the last 24 hours?
- How much revenue was lost because of these failures?
- How is the lost revenue distributed across different product categories?
- What is your revenue for the day for a geographical region?
- What was the revenue impact, by product category, associated with the two marketing campaigns we ran last week?

The exact components you need to install depend upon your environment and your requirements.

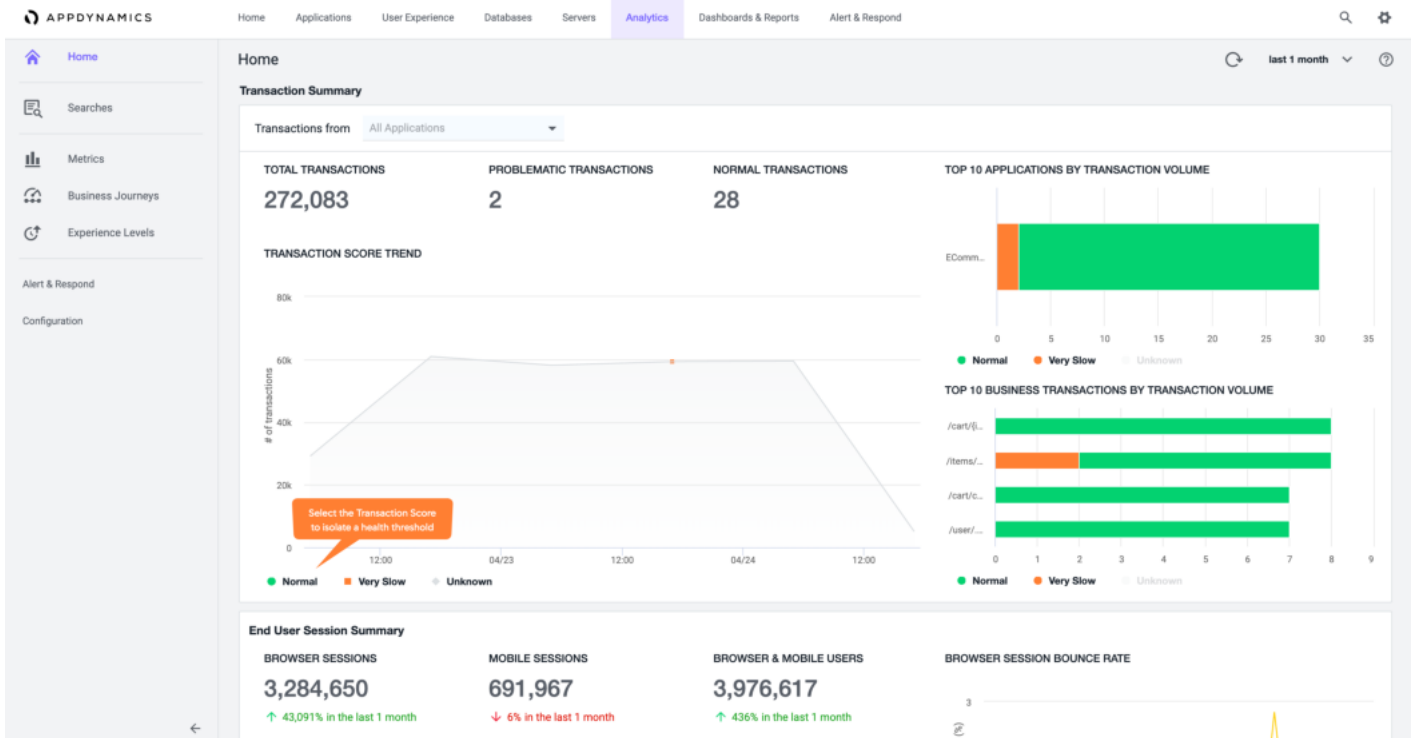

- To plan your deployment, see [Deploy Analytics With the Analytics Agent](#).
- If you are upgrading from a previous version, see [Upgrade Analytics Agent](#).
- If you have been using job files for Log Analytics and want to switch to using source rules (part of Configuration Log Management), see [Migrate Log Analytics Job Files to Source Rules](#).
- To view Analytics Agents connected to your Controller, see [View Analytics Agent Health](#).

## Analytics Home Page

The **Analytics Home** page consolidates data from the transaction, browser, and mobile events. The **Home** page automatically generates **Transaction** and **End User Monitoring Summary** panels through queries that aggregate data into widgets.

To view the different widgets on the home page, you need the appropriate licenses and access. See [Restrictions and Security](#).

You can access the AppDynamics home page by clicking the **Home** icon on the left navigation pane in **Analytics**. You can either use the left navigation pane, or click **Home** on the right pane to navigate to the Analytics modules (**Searches, Metrics, Business Journeys, Experience Levels, Alert & Respond, and Configuration**).

## Home Page Data

AppDynamics Query Language (ADQL) queries are used to generate the data for each home page widget. You cannot access or edit the ADQL queries.

When you select a time range, each query automatically includes the time filter for the widgets. These widgets refresh every two minutes.

---

## Transaction Summary

The **Transaction Summary** panel aggregates the Analytics data from applications and business transactions. **Transaction Summary** widgets are categorized by **Transaction Threshold** from normal to error. The **Transaction Summary** panel contains six widgets:

- **Total Transactions** - Count of all transactions.
- **Problematic Transactions** - Count of transactions that are not within normal threshold boundaries.
- **Normal Transactions** - Count of transactions that are within the normal threshold boundaries.
- **Top 10 Applications by Transaction Volume** - Graphical view of applications.
- **Top 10 Business Transactions by Transaction Volume** - Graphical view of transactions.
- **Transaction Score Trend** - Total number of transactions for all applications.

## End User Session Summary

The **End User Session Summary** panel displays browser and mobile session data in widgets. The **End User Session Summary** panel contains six widgets:

- **Browser Sessions** - Count of unique browser sessions.
- **Mobile Sessions** - Count of unique mobile sessions.
- **Browser & Mobile Users** - Count of browser and mobile users.
- **Browser Session Bounce Rate** - Rate of bounces per total sessions.  
A bounce is a browser session where the page count is one. Bounces occur when a user opens a webpage and leaves the site without visiting additional pages.
- **Top Page Referrers by Session Volume** - Website visited by users before accessing your website. The referrer is an optional component of the Events Service. If you have not configured referrers, this widget does not contain data.
- **Session Trend** - Total number of sessions separated by browser and mobile sessions.

## Options for Home Page Data

### Transaction Score Options

You can select the transaction score in each chart to isolate metrics. For example, selecting **Normal** in **Transaction Score Trend** removes other transaction scores:

Next to the **Transaction Score Trend** are two horizontal bar graphs that display the top ten applications and business transactions by transaction volume. Hover over the graphs to see a breakdown of additional transaction information.

### Transaction Filter Options

You can filter the view of each panel to display specific applications or application keys. Click the dropdown arrow at the top of each panel and select the desired fields.

Home

**Transaction Summary**

Transactions from: All Applications  ECommerce-Sales-Demo

TOTAL TRANSACTIONS	PROBLEMATIC TRANSACTIONS	NORMAL TRANSACTIONS
260,512	2	28

### End User Monitoring Filter Options

You can filter browser sessions and mobile sessions to display application keys. For mobile sessions, selecting specific application names further filters the application keys.

Home

**End User Session Summary**

Browser Sessions from: All app keys | Mobile Sessions from: All app keys | All app names

BROWSER SESSIONS	MOBILE SESSIONS	BROWSER & MOBILE USERS	BROWSER SESSION BOUNCE RATE
12,729 ↓ 1% in the last 1 hour	3,944 ↓ 1% in the last 1 hour	16,673 ↓ 1% in the last 1 hour	75

## Drill Down Options

You can drill down into each metric to open the ADQL search that generates the metric. For example, selecting **Normal Transactions** automatically displays the ADQL Query for normal transactions.

## Restrictions and Security

If your **Analytics Home** page does not display data on widgets, there is either an error in retrieving data, or no data is available in the Events Service.

If panels or widgets are missing from your home page, confirm that you have sufficient licenses and have access to Analytics data.

### Licenses

To view data on the **Transaction Summary** panel, you need:

- At least one application enabled for Analytics
- Active Transaction Analytics licenses

If your Transaction Analytics license expires, Analytics stops ingesting data for the **Analytics Home** page. The **Transaction Summary** panel still displays your existing data, but does not ingest any new data.

To view data in the **End User Session Summary** panel, you need:

- Browser Analytics and/or Mobile Analytics enabled. See [Analytics Data Sources](#).
- Active EUM licenses to Mobile and/or Browser Real User Monitoring.

Some widgets may not be available depending on your End User Monitoring (EUM) licenses. For example, if you have a license to Mobile RUM only, your Analytics Home page will not contain browser-specific widgets (browser sessions, bounce rate, and referrers). Aggregated widgets such as Browser & Mobile Users and Session Trend only show the data to which you have an EUM license.

## RBAC

Analytics enforces role-based access control (RBAC). As a result of RBAC, your **Analytics Home** page displays only the data to which you have access. See [Analytics and Data Security](#).

 In the **End User Session Summary** panel, numeric widgets and the **Session Trend** chart requires access to both Browser and Mobile Real User Monitoring. To see data in these widgets, you must have access to **Browser Requests** and **Mobile Requests and Sessions** events.

## ADQL Reference

The AppDynamics Query Language (ADQL) is a query language for searching available data in Analytics.

ADQL is similar to the SELECT statement in the prevalent Structure Query Language (SQL) but is designed solely for AppDynamics Analytics data. Just like the SELECT command in SQL, ADQL allows you to specify the data source (such as transaction events, EUM events, and logs), a list of fields to retrieve, and conditions for selecting events from the analytics data store.

With ADQL, you can construct queries in these environments:

- Analytics Search panel in the Controller with **Advanced Mode**.
- Analytics Query Events APIs in the body of the query request.

To simplify entering your queries in Analytics Search with **Advanced Mode**, the ADQL auto-complete feature displays keywords, a list of available fields, and functions based on the stage of your typed search. See [Creating Advanced Searches for Analytics](#).

## ADQL Typographical Conventions and Symbols

ADQL reference topics use custom typographical conventions and symbols to describe the syntax for ADQL queries.

Convention	Name	Usage
<b>BOLD</b>	Bold typeface	Bold typeface indicates ADQL keywords and operators, such as <b>SELECT</b> , <b>FROM</b> , <b>AND</b> and so on.
field_name and numeric_field_name	N/A	The terms field_name and numeric_field_name represent field names that appear in your analytics data. Field names depend on the event type. See <a href="#">ADQL Data</a> .
Monospace typeface	Monospace typeface	Function names, such as count are indicated by monospace typeface.
event_type	N/A	The term event_type represents the available event types collected from your applications. Valid values are: <ul style="list-style-type: none"> <li>• transactions</li> <li>• logs</li> <li>• browser requests</li> <li>• mobile requests</li> <li>• mobile crash reports</li> <li>• analytics custom events</li> <li>• synthetic sessions</li> </ul>
<i>Italic typeface</i>	<i>Italics</i>	<i>Italics</i> represent variables or placeholders. You supply the actual value.

Convention	Name	Usage
[ ]	Square brackets	Terms in square brackets are optional. Nested square brackets indicate that the term inside is optional and can only be included if the optional term in the outer square brackets is included.
	Pipe	The pipe character separates alternate items to indicate one of the items may be included. You can read it as "or" in a syntax statement.
{ }	Curly braces	Curly braces are used to group items to disambiguate the definition of items.
( )	Parentheses	Parentheses are used to indicate the order of operation in an expression.
...	Ellipsis	An ellipsis indicates the preceding term may be repeated.

## ADQL Queries

This page describes ADQL query syntax. ADQL uses the **SELECT** statement and filtering statements, otherwise referred to as queries, to return sets of data that you can add to **Custom Dashboards**.

ADQL search queries have a 5,000 character limit and reserve keywords in certain field names or milestones.

Reserved ADQL Keywords
SELECT
FROM
WHERE
ORDERBY
AND
OR
EXISTS

## Reserved ADQL Keywords

NOT

LIKE

REGEX

COMPARE

LIST

IN

BETWEEN

COUNT

DISTINCT

MIN

MAX

STATS

SUM

AVG

STDEV

FILTER

PERCENTILE

RANGE

SERIES

SUBSTRING

INDEXOF

## Reserved ADQL Keywords

LENGTH

TRIM

CONCAT

NOW

The query syntax is:

```
SELECT * | {[DISTINCT] expression [AS alias] [, expression [AS alias]]...}
FROM event_type
[WHERE condition_expression]
[SINCE timevalue [UNTIL timevalue]]
[HAVING condition_expression]
[ORDER BY {field_name | alias} [ASC | DESC] [, {field_name | alias} [ASC | DESC]]...]
[LIMIT integer [, integer]...]
```

While the **SELECT** and **FROM** clauses are required, all other clauses are optional. Enter spaces around each keyword.

For **GROUP BY** functionality, see [GROUP BY](#).

### Search with Partial Text Strings

To prevent tokenization of messages and text-type strings, prefixes must be added to wildcards when you search with partial text strings.

The following ADQL query uses a partial text string to search for the word `example` :

```
SELECT * FROM logs WHERE message = "*xample"
```

### SELECT Clause

The ADQL event query begins with a **SELECT** clause, which can take one or more arguments.

```
SELECT * | {[DISTINCT] field_expression [AS alias] [, field_expression [AS alias]]...}
```

- A single asterisk **\*** in the **SELECT** clause returns the list of fields for each event.
- To return specific fields for each event, specify a comma-separated list of fields. Optionally, each field\_expression can be aliased to a label using the **AS** construct.
- Use the **DISTINCT** qualifier to return unique combinations of the specified field values. If no limit specified, the top ten results by count are returned. See [LIMIT Clause](#).

**DISTINCT** can not be applied to a wild card **SELECT** query, such as

```
SELECT DISTINCT *
```

- String values must be surrounded by either single quotes or double quotes, such as 'hello' and "hello".

The field\_expression can take several forms. See [ADQL Expressions](#).

### Query Examples with SELECT Clause

Query	Result
<b>SELECT</b> count (transactionName) <b>FROM</b> transactions <b>WHERE</b> application='yourAppName'	Returns a count of business transactions for the specified application.
<b>SELECT * FROM</b> logs <b>WHERE</b> sourceType='yourLogFile' <b>AND</b> message <b>LIKE 'GET'</b>	Returns log events containing a specified keyword.
<b>SELECT * FROM</b> transactions <b>WHERE</b> application='yourAppName' <b>AND</b> transactionName='yourBTName'	Returns all fields for business transactions in the specified application matching the specified transaction name.
<b>SELECT DISTINCT</b> transactionName <b>FROM</b> transactions <b>WHERE</b> application='yourAppName'	Returns a list of unique transaction names from the specified application.
<b>SELECT</b> customerName <b>AS</b> "First And Last Name", age <b>AS</b> "Years Old", ...	Returns the specified fields relabeled as specified in the query statement. In this query, <i>customerName</i> and <i>age</i> are user-defined fields.

### AS Clause

Use the **AS** clause to rename a field to a label of your choice. The label is also referred to as an alias.

field\_expression **AS** alias

Returns the field with the specified alias. The alias may be any valid identifier (a letter followed by any number of letter or digit characters) or a value in quotes. If the value of the alias contains spaces or special characters, it must be in quotes. See [ADQL Expressions](#).

### AS Clause Example

```
SELECT eventTimestamp AS 'Time Stamp' FROM transactions WHERE application='yourAppName'
```

### FROM Clause

Use the **FROM** clause to specify the event type. For example:

```
FROM event_type
```

### Event Types

Event types describe the source of the analytics data, such as business transactions (transactions) or browser requests. Each event type has a UI field name and an Events Service internal name. The Events Service internal name is used in ADQL queries.

This table lists the event types with their UI names and Events Service internal names.

Event Type UI Label	Events Service Internal Name
Transactions	transactions
Logs	logs
Browser Requests	browser_records
Browser Sessions	session_records
Mobile Requests	mobile_snapshots
Mobile Sessions	mobile_session_records
Mobile Crash Reports	mobile_crash_reports
Synthetic Sessions	synth_session_records

### FROM Clause Examples

For this result	Query
Return all fields for browser requests	<b>SELECT * FROM</b> browser_records <b>WHERE</b> appkey='E2E-AAB-AUM'
Return all fields for the business transactions in your application	<b>SELECT * FROM</b> transactions <b>WHERE</b> application='yourAppName'
Return all fields for the logs specified by "yourLogFile"	<b>SELECT * FROM</b> logs <b>WHERE</b> sourceType='yourLogFile'

### WHERE Clause

#### Overview

Use the **WHERE** clause to specify one or more condition expressions separated by logical operators such as **AND**, **OR**.

The **WHERE** clause uses the following syntax:

```
[WHERE condition_expression]
```

See [ADQL Expressions](#) for a description of the condition expression syntax. Condition expressions use [Comparison Operators](#).

---

 AppDynamics recommends that you do not use periods (.) in the field name, otherwise, the syntax will break.

## Examples

To filter logs based on error or warning log level, use a query similar to the following:

```
SELECT * FROM logs WHERE sourceType='yourLogFile' AND (logLevel='ERROR' OR logLevel='WARN')
```

## GROUP BY

ADQL does not have an explicit **GROUP BY** clause. However, queries containing field names in the **SELECT** clause behave as **GROUP BY** statements if the query contains [metric functions](#) or [bucketing functions](#).

Group by queries are limited to containing up to five terms. Terms can be either fields (which use an implicit **GROUP BY**) or bucketing functions, such as `series`.

## Aggregation Examples

In this example, the query groups the `avg (responseTime)` aggregation based on the non-aggregation field, application. So the result contains the average response time calculated for each application.

**SELECT** application, `avg (responseTime)` **FROM** transactions

Sample results:

The screenshot shows the AppDynamics search interface. At the top, there's a 'New Search' section with 'Basic' and 'Advanced' radio buttons, and a 'last 1 week' filter. Below this is a text area containing the SQL query: `1 SELECT application, avg(responseTime) FROM transactions`. A 'Search' button is located below the query. The interface has tabs for 'Data' and 'Visualization', with 'Visualization' selected. Below the tabs is a 'Current Search Results' table with two columns: 'Application' and 'avg(responseTime)'. The table contains two rows: 'ECommerce-E2E' with a value of 588.307, and 'TelecomDemoApp-DP' with a value of 624.241. To the right of the table is a 'Chart Types' panel with 'Simple' and 'Time Series' categories, each containing several chart icons. At the bottom of the table, there are navigation controls including arrows, a page number '1 / 1', and a '50 items per page' setting. The total number of items is shown as '1 - 2 of 2 items'.

The implicit grouping can be extended by using multiple non-aggregation fields preceding an aggregation field. For example:

**SELECT** application, segments.tier, avg (responseTime) **FROM** transactions

By adding tier as a second non-aggregation field, the query groups the avg (responseTime) aggregation based on the non-aggregation fields, application, and tierName. Because there are multiple grouping fields, the second non-aggregation field, tier name, is sub-grouped under the application grouping. So each combination of application and tier name together forms a group over which the average response time is calculated.

Sample results:

New Search  Basic  Advanced last 1 week ?

```
1 SELECT application, segments.tier, avg(responseTime) FROM transactions
```

Search ?

Data **Visualization** Save Actions

Current Search Results

Application	segments.tier	avg(responseTime)
ECommerce-E2E	Inventory-Services	3,957.022
ECommerce-E2E	ECommerce-Services	587.871
ECommerce-E2E	Order-Processing-Services	3,956.174
TelecomDemoApp-DP	Quote_Web	1,056.417
TelecomDemoApp-DP	Quote_Server	129.589
TelecomDemoApp-DP	Order_Web	186.568
TelecomDemoApp-DP	Order_Server	186.387
TelecomDemoApp-DP	Provision_Server	138.915
TelecomDemoApp-DP	Billing_Server	138.448
TelecomDemoApp-DP	Dispatch_Server	138.064

Chart Types

Simple

Time Series

Univariate

1 - 10 of 10 items

For SQL users, these two statements produce similar results in their respective environments:

- ADQL query: **SELECT** application, segments.tier, avg (responseTime) **FROM** transactions
- SQL query: **SELECT** application, segments.tier, avg (responseTime) **FROM** transactions **GROUP BY** applicationName, segments.tier

### Bucketing Function Example

Bucketing functions such as `series` and `range` define groups over which other aggregations can be calculated. The buckets are specified by the parameters of the respective functions and form groups over which subsequent aggregations are calculated.

For example, the following query calculates the average response time over two-minute intervals (or buckets):

```
SELECT series (eventTimestamp, '2m'), avg (responseTime)
```

Sample results:

```
1 SELECT series(eventTimestamp, '2m'), avg(responseTime) FROM transactions WHERE application = 'ECommerce-E2E'
```

Search

Data

Visualization

Save

Actions

series(eventTimest...	avg(responseTime)
08/22/16 3:40:00 PM	46.172
08/22/16 3:42:00 PM	56.328
08/22/16 3:44:00 PM	44.537
08/22/16 3:46:00 PM	50.068
08/22/16 3:48:00 PM	50.157
08/22/16 3:50:00 PM	43.767
08/22/16 3:52:00 PM	51.759
08/22/16 3:54:00 PM	37.514

You can also combine an aggregation with a bucketing function and implicit **GROUP BY**. The following query returns the average response time grouped by tier over the series of six-hour intervals.

```
SELECT series(eventTimestamp, '6h'), segments.tier, avg(responseTime) FROM transactions
```

Sample Results:

```
1 SELECT series(eventTimestamp, '6h'), segments.tier, avg(responseTime) FROM transactions
```

08/23/16 11:00:00 AM	ECommerce-Services	10.580

## ORDER BY Clause

The **ORDER BY** clause enables you to sort the query results by one or more fields. The syntax is:

```
[ORDER BY {field_name | alias} [ASC | DESC] [, {field_name | `alias`} [ASC | DESC]]...
```

Rules governing ordering include:

- Sort order, ascending (**ASC**) or descending (**DESC**) is applied per field. If not specified, the ascending (**ASC**) order is the default.
- ORDER BY** is supported on fields or aliases specified in the **SELECT** clause.
- Aliases used in the **ORDER BY** clause should be surrounded with back quotes if they contain spaces or other special characters.
- ORDER BY** works on single-value metric functions and single-value math expressions. **ORDER BY** can not be used with percentile or stats.
- ORDER BY** on nested fields or metric aggregations that operate on nested fields is not supported. A nested field is any field that has a "." in the name, such as `segments.errorList.errorType` or `btdata.estimatedtime`.

Ordering functionality for [metric and bucketing functions](#) includes:

- ORDER BY** can be used to order the buckets on a bucketed field in a bucketing function. For example, see the "Series aggregations - Ordering based on the keys of the series buckets." in the table below.

- **ORDER BY** can be used on metric functions that follow bucketing functions, including filtered metric functions. Ordering by the metric value orders the resulting buckets. The metric function must be aliased and referenced by its alias such as:

```
SELECT transactionName, avg(responseTime) AS averageResponseTime FROM
transactions ORDER BY averageResponseTime
```

- Compound orderings can be specified for functions that provide implicit **GROUP BY** functionality.
- A single ordering can be defined for the series function, no ordering is allowed for the range function.
- **ORDER BY** can accept math expressions on fields, but not math expressions on metric functions. If the value of a math expression is null it is ordered at the end of the results in ascending order. The following is an invalid query:  
**SELECT** transactionName, **max** (discountValue) / **max** (cartTotal) **AS** ratio **FROM** transactions **ORDER BY** ratio

### ORDER BY Clause Examples

For This Result	Query
An ordering of queries with no aggregations	<b>SELECT</b> field_name <b>FROM</b> event_type <b>ORDER BY</b> field_name <b>ASC</b>
<b>Group By</b> - Ordering by the lexicographic ordering of the terms. The fields included in the <b>ORDER BY</b> clause must be in the same order as in the query itself.	<b>SELECT</b> field_name, <b>count</b> (*) <b>FROM</b> event_type <b>ORDER BY</b> field_name <b>DESC</b>
Returns a sorted set of timestamp ranges	<b>SELECT</b> <b>series</b> (eventTimestamp, 10m), <b>count</b> (*) <b>FROM</b> transactions <b>ORDER BY</b> eventTimestamp <b>DESC</b>
Series aggregations - Ordering based on the keys of the series buckets.	<b>SELECT</b> <b>series</b> (salary, 20000), <b>count</b> (salary) <b>FROM</b> event_type <b>ORDER BY</b> salary <b>DESC</b>
Date series aggregations - Ordering based on the date value of the keys of the series buckets	<b>SELECT</b> <b>series</b> (eventTimestamp, '1h'), <b>count</b> (eventTimestamp) <b>FROM</b> transactions <b>ORDER BY</b> eventTimestamp
Order by an alias.	<b>SELECT</b> responseTime <b>AS</b> RT <b>FROM</b> transactions <b>ORDER BY</b> RT
Order by an aliased math expression.	<b>SELECT</b> discountValue / cartTotal <b>AS</b> ratio <b>FROM</b> transactions <b>ORDER BY</b> ratio

### HAVING Clause

Use the **HAVING** clause on the output produced by another aggregation. The **HAVING** clause operates on an expression to determine the intervals to be shown in the response. The metric specified in the expression must be numeric and the expression must return a boolean value for the **HAVING** clause to work.

Additionally, the **HAVING** clause must be referenced by an alias in the query as follows:

```
SELECT customerName, count(*) as Requests, avg(responseTime) as
ResponseTime FROM transactions HAVING Requests > 10000
```

where `Requests` is the alias referenced in the query.

### Syntax

```
SELECT selectItems
FROM relation
WHERE where=booleanExpression
SINCE statement
HAVING havingClause
ORDER BY sortItems
LIMIT limits
;
```

where `havingClause` is a boolean expression. The **WHERE**, **ORDER BY**, and **LIMIT** clauses and **SINCE** statement are optional.

### HAVING Clause Examples

**HAVING** clause examples with different filters:

#### Simple Comparison Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT > 0
```

#### Simple Range Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT BETWEEN [10, 90)
```

#### Simple List Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT IN (20, 30, 40, 60)
```

### Compound Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT > 20 AND AVRT < 90
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT < 20 OR AVRT > 90
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT > 20 AND AVRT < 90 AND AVRT IN (70, 80)
```

### Not Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING NOT AVRT > 50
```

### Not Compound Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING NOT (AVRT > 20 AND AVRT < 90)
```

### Multi-Metric Filter

```
SELECT transactionName, avg(responseTime) as AVRT,
max(responseTime) as MAXRT FROM type HAVING NOT (AVRT > 20 AND
AVRT < 90) AND MAXRT > 130
```

### Limitations

The **HAVING** clause is not supported for:

- Nested fields in Elasticsearch
- Multi-metric functions, such as `percentiles` and `stdev`
- Filtered metric functions (filter function)
- Invalid queries:

Unsupported Conditions/Filters	Queries
Like	<b>SELECT</b> transactionName, avg(responseTime) as AVRT <b>FROM</b> transactions <b>HAVING</b> AVRT LIKE '10'
Exists	<b>SELECT</b> transactionName, avg(responseTime) as AVRT <b>FROM</b> transactions <b>HAVING</b> AVRT IS NOT NULL

Unsupported Conditions/Filters	Queries
Not Aliased	<pre>SELECT avg(responseTime) as avtr FROM type HAVING avg(responseTime) &gt; 10  SELECT txName, count(*), node, count(*) FROM transactions HAVING count(*) &gt; 10</pre>
Nested	<pre>SELECT transactionId, AVG(segments.numCalls) as av_numCalls, MIN(segments.numCalls), MAX(segments.numCalls), SUM(segments.numCalls) FROM transactions HAVING av_numCalls &gt; 2</pre>
Filter Function	<pre>SELECT appraisalrating, filter(min(salary), where salary &gt; 60000) as val FROM transactions HAVING val &gt; 60000</pre>
Multi-Valued Metric Functions	<p>Percentile:</p> <pre>SELECT appraisalrating, percentile(salary, 94) as per_sal FROM transactions HAVING per_sal &gt; 2 ORDER By appraisalrating</pre> <p>Standard Deviation:</p> <pre>SELECT appraisalrating, stdev(salary) as stdev_sal FROM transactions HAVING stdev_sal &gt; 2 ORDER By appraisalrating</pre>
Missing Parent Aggregation	<pre>SELECT avg(responseTime) as AVRT FROM transactions HAVING AVRT &gt; 2</pre>
Quoted Aliases	<pre>SELECT series(eventTimestamp, "1d"), avg(responseTime/ 1000) AS "Response Time" FROM transactions WHERE transactionName = "TransactionName" HAVING "Response Time" &gt; 50</pre>

### SINCE...UNTIL Clause

Use the **SINCE... UNTIL** clause on a time range in a query. If the **UNTIL** portion is omitted, the query matches all the events that occurred after the time specified in the **SINCE** portion. A query can contain both a **SINCE... UNTIL** clause and a **WHERE** clause. In such cases, the **WHERE** argument comes before **SINCE... UNTIL** and is applied in that order. The time range specified in the clause overrides any other time limits applied to the query, including the time range selection in the UI.

**i** If the **SINCE... UNTIL** clause is used in the **series function**, the time range specified in the clause will not override other time limits applied to the query. To set a time range for the query when the **SINCE... UNTIL** clause is used in the series function, use the time range selector in the UI.

### Syntax

```
SINCE timevalue [UNTIL timevalue]
```

where **timevalue** is a combination of an integer and (optionally) a time unit. If **timevalue** is omitted the value is interpreted as a Unix epoch timestamp in milliseconds.

Unit Symbols	Description
[m   minute   minutes]	minute
[h   hour   hours]	hour
[d   day   days]	day
[w   week   weeks]	week (7 days)

### Examples

Query	Result
SELECT * FROM transactions SINCE 1 h UNTIL 15 m	All transactions that occurred between 1 hour and 15 minutes ago
SELECT * FROM transactions SINCE 1 h	All transactions that occurred after one hour ago
SELECT * FROM transactions SINCE 1502147143000 UNTIL 1502148043000	All transactions that occurred between the Unix timestamps 1502147143000 and 1502148043000

### LIMIT Clause

The **LIMIT** clause enforces a limit on the returned search results. **LIMIT** works differently for non-aggregation and aggregation queries.

The syntax is:

```
[LIMIT integer [, integer]...]
```

An integer is a sequence of digits. If **ORDER BY** is not specified in the query, the results sort in descending timestamp order. The Analytics Search UI caps the number of search results at 10000 records.

## Non-Aggregation Queries

Specify **LIMIT N** for non-aggregation queries to return the first N documents.

```
SELECT * FROM transactions LIMIT 10
```

For non-aggregation queries, using the Analytics Query API, can return a maximum of 10,000 results. If a limit value higher than 10,000 is specified, the value is overridden with the maximum value.

## Aggregation Queries

For aggregation queries a list of values is allowed in the **LIMIT** clause. Each value applies to one "group by" term or bucketing function in the query. A "group by" term is a field name in an aggregation query. In the following example, *field1* and *field3* are group by terms, and `series (field2, '1m')` is a bucketing function:

```
SELECT field1, series (field2, '1m'), field3, count (*) ...
```

Bucketing functions consume a value from the **LIMIT** clause list of values, but that value is ignored because it doesn't apply to such functions. Because the default limit is 10, if there are more bucketing functions than user-specified limits, the **LIMIT** clause will use 10 buckets. For example, if there two limit values specified, but three functions or terms that could consume the limit values, the last one defaults to a limit of 10.

The maximum number of buckets is 1000 for the first group by term or bucketing function. Subsequent terms are limited to 100 buckets. A larger value is overridden and replaced with the maximums. Aggregation queries can return a maximum of 10000 results.

REST API usage for limits is slightly different. See [Analytics Events API](#).

## Aggregation Examples

Query	Result
<code>SELECT transactionName, avg (responseTime) FROM transactions</code>	No limit specified, shows a maximum of top 10 results by count.
<code>SELECT DISTINCT requestGUID FROM transactions</code>	No limit specified, shows the top 10 results by count.
<code>SELECT transactionName, avg (responseTime) FROM transactions LIMIT 50</code>	Returns the top 50 results by count.
<code>SELECT application, transactionName, avg (responseTime) FROM transactions LIMIT 500, 50</code>	Returns the top 500 applications by count. Within each of those buckets, the top 50 transactionNames by count.

Query	Result
<pre>SELECT application, transactionName, avg (responseTime) FROM transactions LIMIT 2000, 500</pre>	<p>Because of the enforced limits, this query returns the top 1000 applications by count. Within each of those buckets, the top 100 transactionNames by count.</p>
<pre>SELECT application, transactionName, avg (responseTime) FROM transactions LIMIT 20</pre>	<p>Returns the top 20 applications by count. within each of those buckets the top 10 (using the default) transactionNames by count.</p>
<pre>SELECT application, series (eventTimestamp, '1m'), transactionName, avg (responseTime) FROM transactions LIMIT 20, 25, 30</pre>	<p>Returns the top 20 applications by count. Within those a date-time series with all the data. Within each date-time series bucket, shows the top 30 transactionNames by count. The value 25 is applied to the series function, but because series is a bucketing function, it does not actually use the limit.</p>
<pre>SELECT application, series (eventTimestamp, '1m'), transactionName, avg (responseTime) FROM transactions LIMIT 20, 25</pre>	<p>Returns the top 20 applications by count. Within those, shows a date-time series with all the data. Within each date-time series bucket the top 10 (using the default) transactionNames by count. The value 25 is applied to the series function, but because series is a bucketing function, it does not actually use the limit.</p>
<pre>SELECT series (eventTimestamp, '1m'), avg (responseTime) FROM transactions LIMIT 20</pre>	<p><b>LIMIT</b> doesn't apply to the functions, only to the group by terms, therefore in this query, the limit value has no effect and the query returns all the data in the series function.</p>

## ADQL Expressions

ADQL uses two primary categories of expressions in ADQL queries:

- Field expressions used in the **SELECT** clause
- Condition expressions used in the **WHERE** clause

To build an expression, use field names, functions, numbers, and operators indicated in the described syntax.

### Syntax of field\_expression (SELECT clause)

- {field\_name | function | numeric\_literal}
- (expression): surround the expression with parentheses to denote the order of operation in the query
- [Math expressions](#) such as:
  - unary\_operator expression
  - expression binary\_operator expression

- A `condition_expression` such as **[NOT]** expression `COMPARISON_OPERATOR` value can also be an alias used in a `field_expression` in the **SELECT** clause.  
For example:

```
SELECT field_name AS myField... WHERE myField > 2
```

### Syntax of `condition_expression` (**WHERE** clause)

- **[NOT]** expression `COMPARISON_OPERATOR` value
- (`condition_expression`)
- `condition_expression` `LOGICAL_OPERATOR` `condition_expression`

The field expression syntax in the **SELECT** clause can also contain functions. The syntax of a `function_expression` is: `function` (`field_name`, arguments, ...)

Syntax Element	Description
<code>field_name</code> or <code>numeric_field_name</code>	The name of a field in the specified event type. Field names require back quotes when the name contains spaces or special characters. For example, the field name, `full name`, is surrounded by back quotes because it contains a space. See <a href="#">Special Characters</a> for the full list.  Use the Events Service internal names in your ADQL queries. The list of default fields and their internal names are described under <a href="#">ADQL Data</a> .
<code>function</code>	See <a href="#">Analytics Functions</a> .
<code>numeric_literal</code>	A sequence of digits, optionally including a decimal point "." or sign {+   -}. Example: 2, -4, 3.14
<code>unary_operator</code>	The - <b>unary</b> operator negates the value of the operand.
<code>binary_operator</code>	Arithmetic operators: {*, /, %, +, -}. See <a href="#">Math Expressions</a> .
<code>COMPARISON_OPERATOR</code>	A set of operators that compare values. See <a href="#">Comparison Operators</a> for the full list.
<code>LOGICAL_OPERATOR</code>	See <a href="#">Logical Operators</a> .

Syntax Element	Description
value	<p>The syntax for a value = {numeric_literal   string   boolean}. Values are text, numbers, dates or boolean values used to compare with the value in the specified field_name. The data type of the value must match the type of the specified field.</p> <p>Text strings require quotes. Numbers, dates, boolean values (true or false) and null do not need quotes. Quotes can be either single or double quotes.</p>

Instead of specifying that the expression applies to a particular array element, the expression can apply to any array element.

### Fields with Spaces or Special Characters

If the Events Service internal name contains a special character, then the name must be surrounded by back quotes when it is used in a field expression in the **WHERE** clause. For a field name such as `segments.httpData.headers.User-Agent`, the ADQL query must use `segments.httpData.headers.`User-Agent``.

For example:

```
SELECT segments.httpData.headers.`User-Agent`, count(segments.httpData.headers.`User-Agent`)
FROM transactions WHERE segments.httpData.url = 'http://localhost:29990/packages'
```

The most likely situation in which spaces and other special characters may be used in naming are when field names are added with data collectors.

### Special Characters

Special characters in ADQL are:

- equals: '='
- not equals: '<>' or '!='
- less than: '<'
- less than or equals: '<='
- greater than: '>'
- greater than or equals: '>='
- plus: '+'
- minus: '-'
- asterisk: '\*'
- slash: '/'
- percent: '%'
- concatenation: '||'
- question mark: '?'
- open parens: '('

- open square bracket/brace: '['
- close parens: ')'
- close square bracket/brace: ']'
- double quotes: '"""'
- underscore: '\_'

## Analytics Functions

Functions serve as arguments in the **SELECT** clause. Function types in ADQL include:

- Metric functions
- Bucketing functions
- String functions
- Funnel functions
- Data type conversion functions
- Functions that modify other functions

For many functions, only numeric fields are valid. "All" data types means *integer, floating point, datetime, and string*.

Functions ignore null values, such as those resulting from integer division by zero or empty data fields.

To add a **WHERE** clause to a query, use the query box in the data tab of the Controller Analytics search UI. When you perform the search, the visualization tab under the table widget shows the results of any metric functions.

Each section below describes one type of function.

### Metric Functions

Metric functions:

- Perform a calculation on a set of values for a field.
- Return a result such as a count or sum, or a set of results such as percentile.
- Can only be in the **SELECT** clause.
- Should always follow a field name if one exists—otherwise, not all visualizations may work.

**i** The `distinctcount()` function is accurate for up to 3000 unique return values. For over 3000 unique return values, `distinctcount()` is approximate due to performance optimizations.

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>avg(numeric_field_name)</code>	Average value for a numeric field.	<i>integer, floating point, datetime</i>	<b>SELECT</b> <code>avg(btdata.estimatedtime)</code> <b>FROM</b> <code>browser_records</code> <b>WHERE</b> <code>appkey = 'your_appkey'</code>

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>count(field_name)</code>	A count of events.	<i>all</i> The form <code>count(*)</code> is also valid.	<p><b>SELECT</b> <code>count (orderID) AS 'Sales'</code> <b>FROM</b> logs <b>WHERE</b> <code>method='GET'</code></p> <p>The following query returns the top 10 IP addresses sending HTTP requests to an application.</p> <p><b>SELECT</b> ip, <code>count (*)</code> <b>FROM</b> web_session_records <b>WHERE</b> <code>appkey = "yourApp"</code> <b>LIMIT 10</b></p>
<code>distinctcount(field_name)</code>	A count of the number of unique values recorded for a field.	<i>all</i>	<b>SELECT</b> <code>distinctcount (field_name)</code> <b>FROM</b> logs
<code>max(numeric_field_name)</code>	The maximum recorded value of a numeric field.	<i>integer, floating point, datetime</i> Specify one field only.	<p><b>SELECT</b> <code>max (numeric_field_name)</code> <b>FROM</b> transactions</p> <p><b>SELECT</b> nodeName, <code>max (eventtimestamp)</code> <b>FROM</b> logs</p>
<code>min(numeric_field_name)</code>	The minimum recorded value of a numeric field.	<i>integer, floating point, datetime</i> Specify one field only.	<b>SELECT</b> <code>min (numeric_field_name)</code> <b>FROM</b> transactions
<code>stdev(numeric_field_name)</code>	The population standard deviation of a numeric field.	<i>integer, floating point</i>	<b>SELECT</b> <code>stdev (numeric_field_name)</code> <b>FROM</b> transactions
<code>sum(numeric_field_name)</code>	The sum of the values of a numeric field.	<i>integer, floating point, datetime</i> Specify one field only.	<b>SELECT</b> <code>sum (numeric_field_name)</code> <b>FROM</b> transactions
<code>percentile(numeric_field_name, percent)</code>	The specified percentile values between 0 and 100.	<i>integer, floating point, datetime</i> Specify one or more percentiles.	<b>SELECT</b> <code>percentile (responseTime, 50, 75, 90, 95)</code> <b>FROM</b> transactions

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>stats(numeric_field_name)</code>	Statistics for a field: count, min, max, average, and sum.	<i>integer, floating point, datetime</i>	<b>SELECT</b> stats (numeric_fieldName) <b>FROM</b> transactions <b>WHERE</b> application='yourApp'
<code>totalResultCount()</code>	The total count of events.	Does not accept a field.	This query first selects all error transactions for the "ECommerce" application. It then calculates, for each unique transaction name, the ratio of instances of that transaction name to the total number of error transactions. (The assumption is that any given transaction name can appear in multiple error transactions.)  <b>SELECT</b> transactionName, count ( * ) / totalResultCount() <b>FROM</b> transactions <b>WHERE</b> application = 'ECommerce' <b>AND</b> userExperience = 'ERROR'

## Bucketing Functions

Bucketing functions operate on a field, and group data into buckets. Often, the data in the buckets are further aggregated by another function. For example, this query creates buckets that group an app's transactions by the hour, and then count how many transactions are in each bucket (hour):

```
SELECT series (eventTimestamp, '1h'), count (*) FROM transactions WHERE application='yourAppName'
```

To include a larger data set in your results, use the time range selector in the upper right corner of the Controller Analytics search UI.

Dates are different from datetime values. Units from weeks down to milliseconds are supported:

- '1w' for one week
- '10d' for ten days
- '2h' for two hours
- '5m' for five minutes
- '36s' for thirty-six seconds
- '800ms' for eight hundred milliseconds

When you use dates to define buckets, think about how many buckets your definition produces. The number of buckets for `series()` cannot exceed 2000, and much smaller numbers of buckets are the norm.

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<pre>range(field_name, n   (n1, n2), n3   (n4, n5), ...)</pre>	One or more buckets.	<p><i>integer, floating point, dates</i></p> <p>Use a single value <code>x</code> or pairs of values <code>(x,y)</code>.</p> <p>See below for explanation of how to define buckets.</p>	<p>This range query:</p> <pre><b>SELECT</b> range (segm ents.transactionTime, 0, 10, 20) <b>FROM</b> transactions</pre> <p>Results in the following buckets:</p> <pre>[-Inf, 0], [0, 10], [10, 20], [20, +Inf]</pre>
<pre>series(field_name, interval_size) series(field_name, interval_size, lower_extended_bound, upper_extended_bound, [offset], [rangeStyleBucketKeys], [strictEndpoints])</pre> <p>If you specify bounds, then all buckets are returned, empty or not.</p> <p>If you do not specify bounds, then:</p> <ul style="list-style-type: none"> <li>• If you are using the UI, the UI inserts default bounds.</li> <li>• If you are using the API, then only non-empty buckets are returned.</li> </ul>	A series of buckets based on the provided interval.	<p><i>integer, floating point, dates</i></p> <p>For numeric fields, specify the interval as an integer.</p> <p>See below for explanation of optional keyword arguments <code>offset</code>, <code>rangeStyleBucketKeys</code>, and <code>strictEndpoints</code>.</p>	<pre><b>SELECT</b> series (met rics.`Application Server Time (ms)` ,10), count (*) <b>FROM</b> browser_records <b>WHERE</b> appkey='yourAppKey' <b>SELECT</b> series (eve ntTimestamp, '1h'), count (*) <b>FROM</b> transactions <b>WHERE</b> application='yourApp Name'</pre>

### Defining Buckets for `range()`

Every bucket is defined as bounded by two single values, where the bucket includes the first value and excludes the second.

Pairs of values `(x, y)` define an explicit bucket from `x`, inclusive, to `y`, exclusive.

A single value `x` implicitly defines a bucket according to rules that depend on where the value is placed among the arguments to `range()`.

- Rules for using a single value to define a bucket:
  - i. Immediately after the field (that is, as the second argument): The bucket starts at negative infinity.
  - ii. After another single value: The bucket starts at the previous argument, inclusive, and extends to `x`, exclusive.
  - iii. After a pair of values, and before another single value: The bucket starts at `x`, inclusive, and extends to the following argument, exclusive.
  - iv. At the end of the parameter list: The bucket ends at positive infinity. This is the one exception to the assumption that `x` is the second of two values.
  - v. Between two pairs of values: No bucket can be defined, and the value is ignored.

## Range Query Example

Here is a range query that exercises most of the rules above:

```
SELECT range (segments.transactionTime, 0, (10, 20), 30, (40, 50), 60, 70) FROM transactions
```

The query produces the following buckets:

- [-Inf, 0] because rule *a* applies to 0
- [10, 20] because (10, 20) defines that bucket explicitly
- no bucket for 30 because rule *e* applies so 30 is ignored
- [40, 50] because (40, 50) defines that bucket explicitly
- [60, 70] because rule *c* applies to 60
- [70, +Inf] because rule *d* applies to 70

Optional keyword arguments for `series()`: `offset`, `rangeStyleBucketKeys`, and `strictEndpoints`

Series supports the following optional keyword arguments.

### `offset`

Changes the start value of each series from 0 by the specified positive (+) or negative offset (-) duration, such as 1h for an hour, or 1d for a day. The values `alignStart` and `alignEnd` align buckets to the start and end of the extended bounds arguments respectively. The function must have extended bounds specified to use these special values. Defaults to 0. Accepts both integer and string values.

Examples:

```
SELECT series (responseTime, 1, 1, 10, offset="alignStart"), count (*) FROM transactions
```

```
SELECT series (responseTime, 100, 1, 1000, offset=1), count (*) FROM transactions
```

### `rangeStyleBucketKeys`

Converts the start and end values in a numeric series to "bucketStart - bucketEnd" format as a string type. For example, "0-10", "10-20", and so on. This output this argument returns is similar to what returned by the range function. The series function must be acting on a numeric type to use this keyword argument. Defaults to false. Accepts a boolean only.

Example:

```
SELECT series (responseTime, 100, 1, 1000, rangeStyleBucketKeys=true), count (*) FROM transactions
```

### `strictEndpoints`

Adds a filter on the query starting at the minimum extended bound and extending to the maximum extended bound. This ensures that no buckets outside of the extended bounds are present in the results. Defaults to false. Accepts a boolean only. Extended bound forces the histogram aggregation to start building intervals on a specific minimum value and expands the interval up to a given maximum value.

Example:

```
SELECT series (responseTime, 2, 1, 5, strictEndpoints=true, rangeStyleBucketKeys=true), count (*) FROM transactions
```

## Selecting the Top $n$ Results for Time Series Queries

### Deployment Support

Top  $n$  results is available for SaaS deployments only.

**SELECT** series (eventTimestamp, '1m'), transactionName, count (\*) **FROM** transaction **LIMIT** 1, 12The series function can compute the global top  $n$  over an entire period. To set a top  $n$  limit, add a **LIMIT** clause to the end of your query:

This example limits the query to the top 12 results of transactionName. The value 1 is applied to the series function, but because series is a bucketing function, it does not actually use the limit. You must include a value for the series function.

The global top  $n$  limit does not apply when queries:

- Contain a selection before the series function  
**SELECT** application, series (eventTimestamp, '1m'), transactionName, ...
- Have additional bucketing functions  
**SELECT** series (eventTimestamp, '1m'), range (responseTime, 0, 60, 120), transactionName, ...
- Include a **HAVING** clause  
**SELECT** series (eventTimestamp, '1m'), transactionName, avg (responseTime), ... **HAVING** a >15

## String Functions

ADQL string manipulation functions:

- Resemble their SQL counterparts.
- Are case-sensitive.
- Return null if any argument is null.
- Use 1-based, not 0-based, indexing.
  - For example, the indexOf() function gives the index of the first character of a string as 1, not 0.
  - As a result, 0 is not a valid value for any integer argument

String functions can transform any event data that resides in the Analytics Events Service. One important use case is doing ad hoc data transformation when the structure, serialization, or format in which data has been collected needs to be changed.

**i** For AppDynamics < 4.5.2, fixing incorrectly-collected data requires adjusting collection settings.

You can use string functions to:

- Hone in on a `substring()` by working with string `length()` and/or the `indexOf()` characters in a string
  - For example, you can extract the domain name from a URL
- Combine multiple strings using the `concat()` operator
  - For example, you can combine values from multiple fields into a single value
- `trim()` whitespace from the beginnings and ends of fields
- Pair the output of the `substring()` function, item by item, with the output of another function
  - This implicit aggregation is the ADQL equivalent of GROUP BY in SQL
  - See the Implicit Aggregation Example:

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>concat(inputString1, string inputString2, ... inputStringN)</code>	A single string which combines the input strings.	<i>string</i> Specify two or more strings.	Function: <code>concat('foo', 'bar')</code> Result: <code>'foobar'</code>

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>indexOf(inputString, substring, [occurrence])</code>	<p>1-based start index of substring in string.</p> <p>If <code>substring</code> is not found, returns 0.</p> <p>If <code>occurrence</code> is supplied as <i>n</i>, returns index of nth occurrence of <code>substring</code>.</p> <p>If <code>occurrence</code> is supplied as <i>-n</i>, returns index of nth occurrence of <code>substring</code> counting backwards from the end of <code>inputString</code>.</p>	<p><i>string</i> for <code>inputString</code>, <code>substring</code></p> <p>positive or negative <i>int</i> for <code>occurrence</code></p>	<p>Function:</p> <pre>indexOf('www.wikipedia.org', '.', 1)</pre> <p>Result:</p> <p>4</p> <p>Function:</p> <pre>indexOf('www.wikipedia.org', '.', -1)</pre> <p>Result:</p> <p>14</p> <p>Function (example of chaining and combining functions):</p> <p><b>SELECT</b></p> <pre>substring('www.wikipedia.org', indexOf('www.wikipedia.org', '.', 1)+1, indexOf('www.wikipedia.org', '.', -1) - indexOf('www.wikipedia.org', '.', 1) -1) FROM transactions</pre> <p>Result:</p> <p>'wikipedia'</p>
<code>length(inputString)</code>	<p>The number of characters including whitespace of the input string.</p>	<p><i>string</i></p>	<p>Function:</p> <pre>length(' foo bar ')</pre> <p>Result:</p> <p>9</p>

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>substring(inputString, startIndex, numChars)</code>	<p>The substring of <code>inputString</code> starting at (1-based) <code>startIndex</code>.</p> <p>If <code>startIndex</code> is negative, starts that number of characters from the end of the string.</p> <p>If <code>numChars</code> is supplied, returns substring of that length; if <code>numChars</code> runs past end of string, returns only up to end of string.</p> <p>If <code>startIndex</code> or <code>numChars</code> is invalid, returns an empty string.</p>	<p><i>string</i> for <code>inputString</code></p> <p>positive or negative <i>int</i> for <code>startIndex</code></p> <p>positive <i>int</i> for <code>numChars</code></p>	<p>This example extract the domain name from a URL.</p> <p>Function:</p> <pre>substring('https://example.com/home.htm', 9, indexOf('https://example.com/home.htm','/'),3) - 9)</pre> <p>Result:</p> <p>'example.com'</p>
<code>trim(inputString)</code>	<p>A copy of the input string with leading and trailing whitespace removed.</p>	<p><i>string</i></p>	<p>Function:</p> <pre>trim(' foo bar ')</pre> <p>Result:</p> <p>'foo bar'</p>

### Implicit Aggregation Example

Consider this data:

Application ID	responseTime (ms)
SJC-001	500
SJC-002	600
SJC-003	700
LAX-001	200
LAX-002	300
LAX-003	400

The following ADQL query pairs each item from the output of `substring()` with a corresponding item from the output of `avg()` :

```
SELECT substring(application, 1, 3) , avg(responseTime) FROM transactions
```

The results are:

SJC, 600

LAX, 300

Notice how ADQL uses `substring()` to govern the groupings to which the second function, `avg()` , is applied.

### Funnel Functions

You can create [funnel widgets](#) from an ADQL query using the funnel function. This query example creates a funnel widget of normal transactions:

```
SELECT funnel(transactionName, responseTime < 90, showHealth=true, health="NORMAL") FROM transactions
```

To see the funnel widget, enter your query and select **Search**. After you see the search results, select **Basic** at the top right of the query:

The screenshot shows a query editor interface. On the left, a text box contains the query: `1 SELECT funnel(transactionName, responseTime < 90, showHealth=true, health="NORMAL") FROM transactions`. To the right of the text box is a question mark icon. Further right, there is a button labeled 'Basic' with a blue border, and below it is a button labeled 'Search'.

See [AppDynamics Community](#).

### Data Type Conversion Functions

**i** Data type conversion functions are only available for SaaS deployments.

Data type conversion functions can be used in the **SELECT** or **WHERE** clauses. Below are the available data type conversion functions. For `formatString` requirements, see Joda's `DateTimeFormat` documentation in the Classes section.

Function	Returns	ADQL Query Example
<code>toDate(string value, [string formatString])</code>	A string value formatted as a datetime.	<pre>SELECT toDate(field_name, "MM/dd/yyyy") FROM transactions</pre> <p><i>Returns</i></p> <p>2019-01-15T00:00:00.000Z for a field_name with string value "01/15/2019"</p>

Function	Returns	ADQL Query Example
<code>toDate(int value)</code>	An integer value formatted as a datetime.	<b>SELECT</b> <code>toDate(12341234)</code> <b>FROM</b> <code>transactions</code>  <i>Returns</i> Dec 31 1969 19:25:41 GMT-0800
<code>toString(datetime value, [string formatString])</code>	A datetime value formatted as a string.	<b>SELECT</b> <code>toString(field_name, "MMM dd, yyyy")</code> <b>FROM</b> <code>transactions</code>  <i>Returns</i> "Jan 15, 2019" for a <code>field_name</code> with datetime value <code>2019-01-15T00:00:00.000Z</code>
<code>toString(float/int/bool value)</code>	A value formatted as a string.	<b>SELECT</b> <code>toString(123.123)</code> <b>FROM</b> <code>transactions</code>  <i>Returns</i> "123.123"
<code>toInt(datetime/float/string/bool value)</code>	An integer value, formatted as follows: <ul style="list-style-type: none"> <li><code>datetime</code> - converts to milliseconds,</li> <li><code>float</code> - truncates</li> <li><code>string</code> - parses to floats and truncates to an integer</li> <li><code>bool</code> - converts to 0/1</li> </ul>	<b>SELECT</b> <code>toInt(123.4)</code> <b>FROM</b> <code>transactions</code>  <i>Returns</i> 123
<code>toFloat(int/string value)</code>	An integer or string value formatted as a float.	<b>SELECT</b> <code>toFloat(123123)</code> <b>FROM</b> <code>transactions</code>  <i>Returns</i> 123123.0
<code>round(float value, int decimalPlaces)</code>	A value rounded off to <code>decimalPlaces</code> . <code>decimalPlaces</code> must be a non-negative integer.	<b>SELECT</b> <code>round(123.123123, 3)</code> <b>FROM</b> <code>transactions</code>  <i>Returns</i> 123.123

Function	Returns	ADQL Query Example
<code>ifNull(object value, object replacementValue)</code>	A value if the value is non-null. If the value is null, returns <code>replacementValue</code> .	<pre>SELECT ifNull(field_name, 10) FROM transactions</pre> <p><i>Returns</i> 10 if the value of <code>field_name</code> is null</p> <p><i>Returns</i> Value of <code>field_name</code> if the value is not null</p>

For data type conversion functions (except `ifNull`), if the value of `field_name` returns null, the converted data type will also return null.

#### Use mathematical and `now()` functions on datetimes

 The `now()` function is only supported on SaaS Controllers. It is not supported on on-premise deployments.

You can perform addition and subtraction mathematical functions on datetime and long values, for example:

```
SELECT toDate(field_name, "MMM, dd, yyyy") - toDate(field_name, "MMM, dd, yyyy") FROM transactions
```

The function will return a datetime value. Multiplication, division, and modulus mathematical functions are not supported. Addition and subtraction functions cannot be combined with floats.

You can use the `now()` function to add or subtract the server's current time from a value, for example:

```
SELECT toInt(now() - field_name) FROM transactions
```

The above function determines how long ago `field_name` was created and converts the value to an integer.

## Functions That Modify Other Functions

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>filter(metric_function (field_expression), ..) [WHERE condition_expression]</code>	Aggregations for specific subsets of data, computed by applying a filter to the input of a single metric function.	The metric function must be one of the following that returns a single value. <code>{ count   avg   max   min   sum   distinctcount }</code> The second argument has the same syntax as a <b>WHERE</b> clause and optionally begins with the <b>WHERE</b> keyword, for example: <code>SELECT filter( avg (responseTime), WHERE responseTime &gt; 1) FROM transactions WHERE application = "Travel"</code>	<code>filter( sum (numeric_field_name), numeric_field_name &gt; 100)</code> <code>SELECT 100.0 * filter( count (*), field_name = "value") / count (*) as "%" FROM transactions WHERE application = "yourApp" AND transactionName = "yourValue"</code>

## Combining Different Types of Functions

Here are some special cases to consider when combining functions of different types:

- The maximum accuracy of `distinctcount()` is reduced if it follows a bucketing function. Nested `distinctcount()` queries trade accuracy for memory savings, because the previous function establishes buckets, and `distinctcount()` creates sets of buckets within each of the previous function's buckets, and Elasticsearch automatically makes that tradeoff when that happens
  - For example, the first of the two example queries below returns less accurate results than the second:
    - `SELECT transactionName, distinctcount(userId) FROM transactions`
    - `SELECT distinctcount(userId) FROM transactions`
- The return value of `stdev(numeric_field_name)` cannot be used to sort or filter results.

## Analyzed Fields

Selected fields in the analytics data are "analyzed". Analysis consists of tokenizing a block of text into individual terms suitable for use in an inverted index and normalizing these terms into a standard form to improve their searchability. The ADQL [Comparison Operators](#) behave differently for analyzed and non-analyzed fields. To construct queries on analyzed fields, you need to understand some concepts about how the tokens are built.

Uppercase letters in analyzed fields are all converted to lowercase to build tokens.

Delimiters and other factors (such as CamelCase terms) affect how strings are tokenized. For a string such as "myname@company.com", "@" is a delimiter, therefore myname and company.com are two separate tokens. Additionally, company.com is two separate tokens. Note that all non-alphanumeric characters are delimiters. A term that uses CamelCase, such as `VicePresident`, is tokenized into separate tokens based

on recognition of the CamelCase nature of the term resulting in the tokens: `Vice` and `President` as well as `VicePresident`.

For an example string such as: `<VicePresident:SalesAndMarketing> - EMEAustraliaUSA94107`, the tokens generated include the following:

- vicepresident
- vice
- president
- salesandmarketing
- sales
- and
- marketing
- emeaaustraliausa94107
- emeaaustraliausa
- emea
- australia
- usa
- 94107

### Analytics Analyzed Fields

The analyzed fields in analytics events are:

- **Logs:** Message
- **Transactions:** Errors and Error Detail
- **Mobile:** stacktrace

### Queries on Analyzed Fields

Full-text search is supported on analyzed fields, including the message field for logs, using the **LIKE** operator. See [Comparison Operators](#).

On analyzed fields, the **REGEXP** operator matches exactly only the analyzed and processed tokens, so you cannot query across the complete message.

Consider this log message:

```
[2016-06-09 06:07:50,118] [INFO]
[org.springframework.jms.listener.DefaultMessageListenerContain
r#0-1] [com.appdynamics.provision.OrderMessageListener]
[AD_REQUEST_GUID[2b8ce807-986c-45f9-a5b4-2fe5a6fd90f3]] Received
a message to process the order Order_3138 for the user
myname@company.com
```

In this log message, myname and company.com are two separate tokens because "@" is a delimiter. To search a log message like this for results based on the email address requires searching across tokens.

A query such as the following using **REGEXP**, will **fail** because myname and company.com are two separate tokens.

```
SELECT FROM logs WHERE appName = 'yourAppName' AND sourceType = 'yourLogFile' AND message REGEXP 'myname@company.*'
```

The **LIKE** operator is not affected by delimiters, so an alternative query using **LIKE** operator is a better choice.

```
SELECT FROM logs WHERE appName = 'yourAppName' AND sourceType = 'yourLogFile' AND message LIKE 'myname@company'
```

You can also use wildcards in the query because they work across tokens.

```
SELECT FROM logs WHERE appName = 'yourAppName' AND sourceType = 'yourLogFile' AND message LIKE 'myname@company*'
```

### Example Queries for Analyzed Fields

Searching the following analytics log events:

```
Jun 7 11:27:45 appd sshd[1032]: Illegal user test from 110.49.183.11
Jun 7 11:27:46 appd sshd[1032]: Failed password for illegal user test from 110.49.183.11 port 9218 ssh2
Jun 7 11:27:46 appd sshd[1032]: error: Could not get shadow information for NOUSER
```

Note the results from the following queries:

Query	Results
<b>SELECT * FROM logs WHERE sourceType='yourLogFile' AND message REGEXP 'illegal.+user'</b>	Does not match any log events in the sample because the query string spans across multiple tokens. Use LIKE for an instance like this.
<b>SELECT * FROM logs WHERE sourceType='yourLogFile' AND message REGEXP 'illegal.*'</b>	Matches the first two log events
<b>SELECT * FROM logs WHERE sourceType='yourLogFile' AND message REGEXP 'Failed*'</b>	Does not match any log events in the sample because the token has only lowercase 'failed'

To search for string : javaIOException

## Query

```
SELECT * FROM transactions WHERE application =
'yourApp' AND segments.errorList.errorCode REGEXP 'java[a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z]'
```

## Math Expressions

Math expressions are field expressions that use arithmetic operators. These expressions can be used in ADQL queries in both the **SELECT** and **WHERE** clauses.

field\_expression **BINARY\_OPERATORS** field\_expression

## Arithmetic Operators

Math operators are valid on integer and float data fields, constants (for example, 3.14), and on functions that return a single integer or float value, with the exception of % (modulo). The operators `*`, `/` and `%` have higher precedence than `+` and `-`. Parentheses can be used to control the order of operations, a unary minus (`-`) is also supported.

Operator	Name	Description
*	asterisk	Multiplication
/	slash	Division of two integer types performed as integer division. Integer division by zero returns null.
%	modulo	Calculates the remainder after the division of two integers. Valid only for integers.
+	plus	Addition. Requires a space before a numeric literal.
-	minus	Subtraction. Requires a space before a numeric literal. Can also be used as unary_operator.

## Math Expression Usage

Math expressions can be used in several ways.

Query	Result
<b>SELECT</b> regionId % 4, count (*) <b>FROM</b> transactions <b>WHERE</b> application = "yourApp"	Math expression is used as a <b>GROUP BY</b> term in an implicit group by query

Query	Result
<pre>SELECT field_name1, (field_name2 + field_name3) * 3.14 FROM transactions WHERE application = "yourApp"</pre>	Math expression is used as a composite field.
<pre>SELECT sum (field_name1) / count (field_na me2) FROM transactions WHERE application = "yourApp" SELECT filter( sum (field_name1), WHERE fiel d2 IS NOT NULL) / count (field_name3) FRO M ...</pre>	Math expression used on an aggregation function.
<pre>SELECT avg (field1 + field2) FROM event_type WHERE ... SELECT series (field1 + field2, 1) FROM event_type WHERE ...</pre>	Math expression used within an aggregation function.
<pre>SELECT * FROM transactions WHERE (respo nseTime * cartValue) &gt; 100 SELECT * FROM transactions WHERE (region Id % 3) IN (1, 2) SELECT * FROM transactions WHERE (respo nseTime * cartValue) BETWEEN (100, 200)</pre>	Math expression used in a <b>WHERE</b> clause with comparison operators.
<pre>SELECT segments.userData.itemTitle, (segments.userData.itemPrice / 100) AS Price FROM transactions WHERE application = 'ECommerce 2.0' AND transactionName = '/' product_details.xhtml' AND Price &gt; 20</pre>	Convert a value in cents to dollars. This query converts segments.userData.itemPrice from cents to dollars and shows results where the price is greater than \$20.
<pre>SELECT transactionName, (responseTime / 1000) AS responseSeconds, userExperience, requestGUID FROM transactions WHERE application = "ECommerce 2.0" AND responseSeconds &gt; 5</pre>	Convert a value such as average response time to seconds instead of milliseconds and view each transaction that is greater than X seconds.

### Usage Notes

If any field or intermediate expression result for an expression is null, the entire expression will be null.

Math expressions in the **WHERE** clause are evaluated per record, not in aggregate.

Fields and metric functions can not be combined in the same expression, for example, a query for the following type is *not* valid:

**SELECT** responseTime + sum(cartValue) **FROM** ...

Mathematical operations that operate on every event (as opposed to on aggregation functions) will reduce query performance. Avoid statements such as:

**WHERE** (responseTime - 200) > 800 and use a construct such as **WHERE** responseTime > 1000 instead.

### Comparison Operators

Comparison operators, such as =, !=, <, >, **LIKE**, and **IN**, can be used in condition\_expressions of the **WHERE** clause in the ADQL query statement.

This page describes the comparison operators that you can use in the condition\_expression syntax.

### Operators

Comparisons on strings are case-insensitive.

Operator	Description	Supported Usage
=	Equals: True if the value of the specified field_name equals the specified value in the expression. String comparisons using the equals operator are case-sensitive.	non-analyzed fields
!=	Not equals: True if the value in the specified field_name does not equal the specified value.	non-analyzed fields
>	Greater than: True if the value in the specified field_name is greater than the specified value.	non-analyzed fields of type int, float and date
>=	Greater than or equal: True if the value in the specified field_name is greater than or equal to the specified value.	non-analyzed fields of type int, float and date
<	Less than: True if the value in the specified field_name is less than the specified value.	non-analyzed fields of type int, float and date
<=	Less than or equals: True if the value in the specified field_name is less than or equal to the specified value.	non-analyzed fields of type int, float and date

Operator	Description	Supported Usage
<b>IN</b>	<p>Finds records where the value of a field equals any one of the specified values in a list of string or numeric values. The values for <b>IN</b> must be in parentheses. String values must be surrounded by single quotes. Wild card usage within the list of values provided to the <b>IN</b> operator is supported.</p> <p>For example:</p> <pre>SELECT transactionName, percentile(segments.transactionTime, 90) FROM transactions WHERE application = 'prd-analytics' AND transactionName IN ('api_v2./v2/ events/*/search','api_v1./v1/events/*/ search')</pre>	non-analyzed fields only. Invalid for analyzed fields.
<b>LIKE</b>	<p>The <b>LIKE</b> operator performs a full-text search that analyzes the string value and field value. If the string value contains multiple terms, separated by spaces, it is processed as an <b>AND</b> condition of the terms. Use <b>LIKE</b> to search values in analyzed fields.</p> <p>The <b>LIKE</b> operator supports the use of wild cards.</p> <p><b>LIKE</b> is not supported for queries on mixed case strings. For example, querying against a log message that contains "pEer" will not match the search string 'peer', because "pEer" is tokenized by the search analyzer into two separate tokens - "p" and "eer").</p>	for full-text search of analyzed fields
<b>BETWEEN</b>	<p>Finds values of a field based on an inclusive or exclusive value range. For an inclusive range search, use square brackets [ ]. For an exclusive value range, use parentheses ( ).</p>	Supported for data types int, float, and datetime ( <i>New in 4.4.1</i> ).
<b>IS NULL</b>	<p>Finds records where a field does not contain a value.</p>	non-analyzed fields and analyzed fields
<b>IS NOT NULL</b>	<p>Finds records where a field contains a value.</p>	analyzed and non-analyzed fields

Operator	Description	Supported Usage
<b>NOT BETWEEN</b>	Finds records where a field does not contain a value in an inclusive or exclusive value range. The reverse of <b>BETWEEN</b> .	non-analyzed fields
<b>NOT LIKE</b>	The reverse of <b>LIKE</b> .	analyzed fields
<b>NOT IN</b>	Finds records where the value of a field does <u>not</u> match any value in a list of string or numeric values. The values for <b>NOT IN</b> must be in parentheses, and string values must be surrounded by single quotes.  There is also a logical operator <b>NOT</b> , which is unrelated to this comparison operator.	non-analyzed fields
<b>REGEXP</b>	The <b>REGEXP</b> operator applies a regular expression pattern match of a string to the pattern passed as an argument. See <a href="#">REGEXP Operator</a> for details of usage. This is an advanced feature and requires knowledge of regular expression patterns.	non-analyzed fields  For analyzed fields: <ul style="list-style-type: none"> <li>• Use lowercase input strings.</li> <li>• Do not use to search across tokens</li> </ul>
* ?	The wild card operators. Use of wild cards is supported on queries of string fields. The asterisk, '*', character matches zero or more characters and the question mark, '?', character matches a single character.  The wild card operator works similarly when used with the equals "=" or <b>LIKE</b> operator.  The wild card operator is case sensitive for non-analyzed fields.	analyzed fields and non-analyzed fields

### Examples

Query	Result
<b>SELECT * FROM</b> mobile_snapshots <b>WHERE</b> appkey='your_appkey' <b>AND</b> numeric_field_name <b>IN</b> (1419, 613, 748)	Returns all fields for mobile snapshots for the specified appkey where the value of the specified numeric field matches one of the values in parentheses.

Query	Result
<b>SELECT</b>  count(*) <b>FROM</b> browser_records <b>WHERE</b> appkey='your_appkey' <b>AND</b> field_name <b>IN</b> ('string1','string2', 'string3')	Returns a count of browser records for the specified appkey where the value of the specified field matches one of the specified strings.
<b>SELECT</b> ip <b>FROM</b> browser_records <b>WHERE</b> ip <b>LIKE</b> "10.134.*"	By filtering on IP address range using wild card operator, finds records in the specified IP address range.
<b>SELECT * FROM</b> logs <b>WHERE</b> message <b>L</b> <b>IKE</b> 'DEBUG Adding operation'	Matches the sample log line "DEBUG com.appdynamics.operations.PublishTestService - Adding to bulk publish operation."
<b>SELECT * FROM</b> logs <b>WHERE</b> message <b>L</b> <b>IKE</b> 'error'	Finds all the log events containing the word 'Error' in any field
<b>SELECT * FROM</b> transactions <b>WHERE</b> application='yourAppName' <b>AND</b> cartTotal <b>BETWEEN</b> [10, 50]	Inclusive range: Returns all transactions with a cart total between 10 and 50, including 10 and 50.
<b>SELECT * FROM</b> transactions <b>WHERE</b> ap plication='yourAppName' <b>AND</b> cartTotal <b>BETWEEN</b> (10, 50)	Exclusive range: Returns all transactions with cart total between 10 and 50, excluding 10 and 50.

## Logical Operators

Logical operators can be used in the **WHERE** clause in an ADQL query to make compound condition expressions. These operators are **AND**, **OR**, and **NOT**.

## Condition Expression Syntax

(condition\_expression **LOGICAL\_OPERATOR** condition\_expression)

## Examples

Expression	Result
(field_expression_1 <b>AND</b> field_expression_2)	Evaluates as true if both field_expressions are true.
(field_expression_1 <b>OR</b> field_expression_2)	Evaluates as true if either field_expression is true.

Expression	Result
(field_expression_1 AND NOT field_expression_2)	Evaluates are true if field_expression_1 is true and field_expression_2 is false.

## REGEXP Operator

**i** This is an advanced feature and requires knowledge of regular expression patterns.

The regular expression operator, **REGEXP**, can be used in the **WHERE** clause to handle complex matching queries. This operator applies a regular expression pattern match of a string to the pattern passed as an argument. ADQL uses the Lucene regular expression engine to analyze the **REGEXP** expression. The search results for queries that use the **REGEXP** operator are dependent not only on regular expression syntax and rules but also on whether you are searching analyzed or non-analyzed fields. To use **REGEXP** on analyzed fields, see [Analyzed Fields](#).

The **REGEXP** operator can only match with the lowercased tokens in the analyzed fields. To search for an uppercase string in an analyzed field using a wild card or **REGEXP**, you need to input a lowercase string. For example info, not INFO.

### Allowed Characters

Any Unicode character may be used in the regular expression pattern, but certain characters are reserved and must be escaped. Any reserved character can be escaped with a backslash "\\*" including a literal backslash character:"\\".

The standard reserved characters are:

. ? + \* | { } [ ] ( ) " \

For query performance reasons, before using any reserved character in a **REGEXP** pattern, you need to specify the first three characters of the string explicitly, such as specifying 123 before the brackets [ 0-9 ] in the following example:

```
SELECT * FROM logs WHERE sourceType='yourLogFile' AND id REGEXP '123 [0-9]'
```

**i** A query such as the following is invalid.  
**SELECT \* FROM logs WHERE sourceType='yourLogFile' AND id REGEXP '[ 0-9 ]'**

## Example Operations, Strings, and Associated Patterns

Supported Operation	Description	String	Pattern
Match any character	A period "." can be used to represent any character.	abcde	abc..
One or more	A plus sign "+" can be used to repeat the preceding shortest pattern one or more times.	aaabb	aaab+
Zero or more	An asterisk "*" can be used to match the preceding shortest pattern zero or more times.	aaaabbbcc	aaaab*c*
Zero or one	A question mark "?" makes the preceding shortest pattern optional. It matches zero or one times.	aaabbbc	aaa?b+c?
Min-to-max	Curly brackets "{}" can be used to specify a minimum and (optionally) a maximum number of times the preceding shortest pattern can repeat. Allowed forms:  {5} # repeat exactly 5 times  {2,5} # repeat at least twice and at most 5 times	aaaabbbcc	aaaab{3}c{2} aaaab{2,4}c{2,4}
Grouping	Parentheses "(" ")" can be used to form sub-patterns.	abababab	abab(ab)*
Alternation	The pipe symbol " " acts as an OR operator. The match will succeed if the pattern on either the left-hand side OR the right-hand side matches.	aaabbb	aaa(ccc bbb)

## ADQL Data

This page describes data that ADQL captures in Analytics.

Analytics Type	Description
Transaction Analytics	Transaction Analytics is defined as event data collected by the Java and .NET Agents for every instance of a business transaction. Every instance of a business transaction that passes through a tier is defined as an event. You can view the raw data for any transaction instance that occurs within the data retention time. Transaction Analytics enables you to analyze the business impact of every event and observe how customers use your application.
Browser, Mobile, and IoT Analytics	Browser, Mobile, and IoT Analytics provide event data collected by the End User Monitoring (EUM) JavaScript Agent, Mobile, and IoT Monitoring SDKs.
Log Analytics	Log Analytics provides event data collected from log files.
Synthetic Sessions Analytics	Synthetic Sessions Analytics provides events data on sessions collected by Browser Synthetic Monitoring.

See [AppDynamics Analytics Events API](#).

### Analytics Transaction Data

Each instance of a business transaction passing through a single tier is an event, so the data associated with a single execution of a distributed business transaction (for example, Checkout) is stored as a series of events in Analytics. The data consists of the default transaction data and additional data from data collectors configured for that transaction. This data is organized and stored per business transaction.

### Default Transaction Data

Event Type: transactions

Key (event type identifier): application

The following table lists the data collected by default for each instance of the business transactions that are enabled for Analytics. The table also lists the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

UI Field Name	Description	Events Service Internal Name
Application	Application name	application
Business Transaction	Business transaction name	transactionName

UI Field Name	Description	Events Service Internal Name
Error	Error details (deprecated) This field is replaced by the more granular fields: Error Code, Error Detail, and Error Type.	deprecated
Error Code	The value of this field depends on the Error Type. For example, if Error Type is an HTTP_Error_code, then the value is a string representing the corresponding HTTP error code such as 404, 503 and so on.	segments.errorList.errorCode
Error Detail	This is what the "Error" field represented in 4.1. Primarily the error message	segments.errorList.errorDetail
Error Type	Classification of errors into buckets done internally by the Agent. For example, the error type could be HTTP_ERROR_CODE, LOGGER_MESSAGE, THROWABLE and so on.	segments.errorList.errorType
Node	Node name	segments.node
Tier	Tier name	segments.tier
requestGUID	GUID for this specific user request as assigned by AppDynamics	requestGUID
Response Time (ms)	Business transaction response time for this request in milliseconds	responseTime
Timestamp	Time the event occurred in the application	eventTimestamp
User Experience	Indicates if the transaction was marked as Normal, Slow, Very Slow, Stall, or Error	userExperience
Exit calls	Details of database and remote service calls. View Details flow map. Note that for partial snapshots, exit call information captured in call graphs can differ between the Analytics and Controller UI. Each UI presents an appropriate level of contextual visibility while preserving low overhead. For example, a snapshot may capture only the exit calls that are most pertinent to transaction performance.	Not Applicable

## Custom HTTP Request Data

When HTTP data collectors are configured, the following information can be collected:

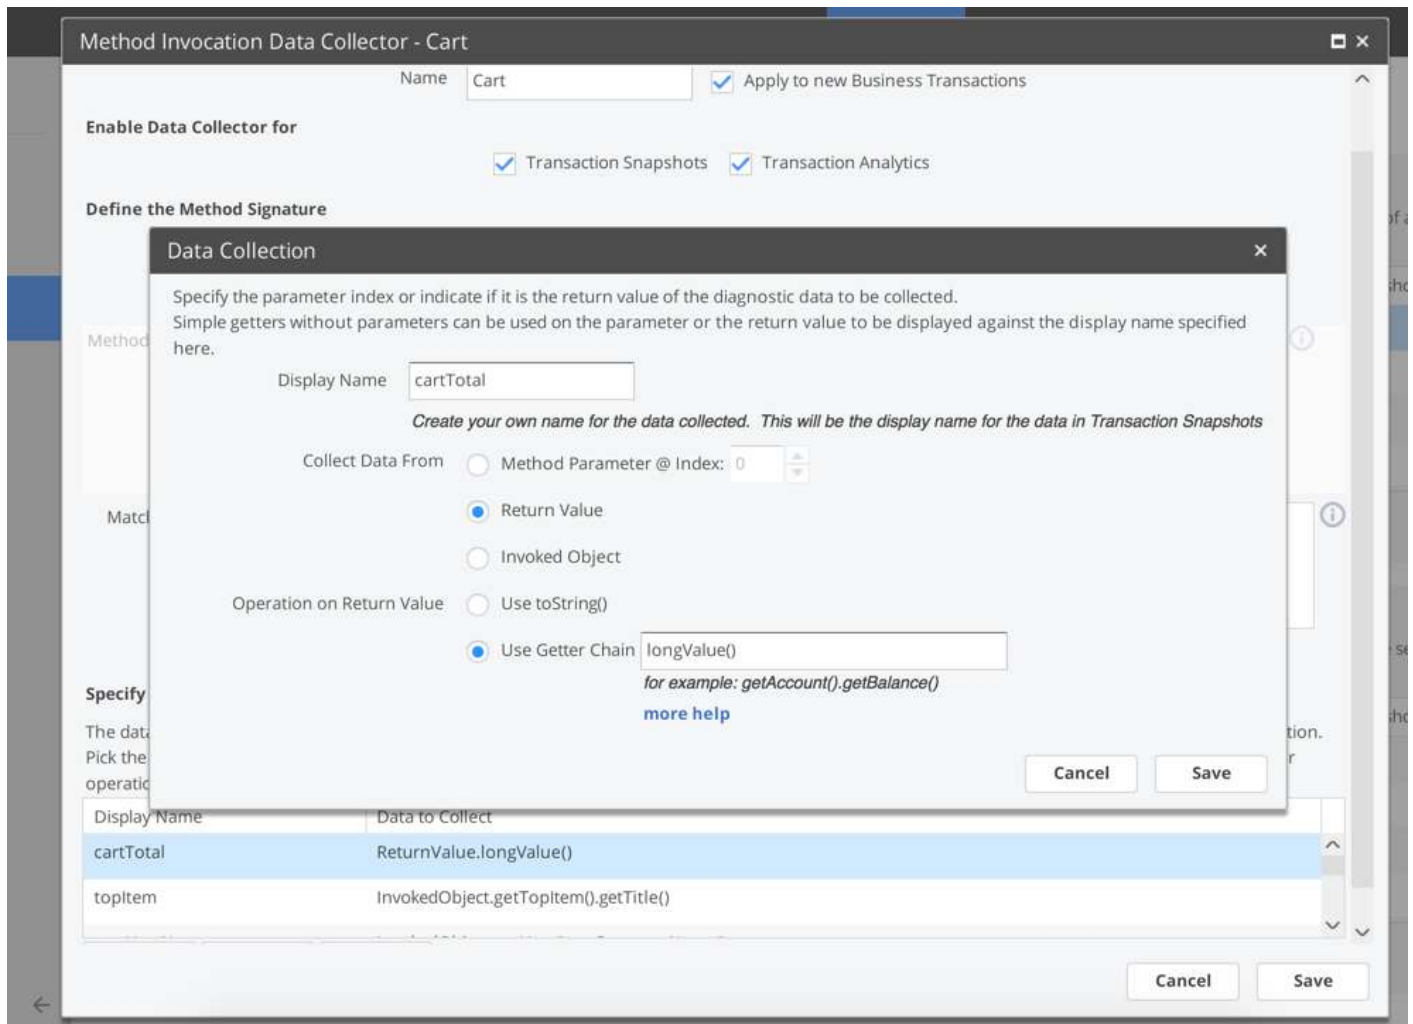

Field	Events Service Database Name
cookies	<code>segments.httpData.cookies</code>
headers	<code>segments.httpData.headers</code>
parameters	<code>segments.httpData.parameters</code>
principal	<code>segments.httpData.principal</code>
session ID	<code>segments.httpData.sessionId</code>
session Objects	<code>segments.httpData.sessionObjects</code>
URL	<code>segments.httpData.url</code>
URI path segments: <code>segment0-n</code>	<code>segments.httpData.uriPathSegments</code>

Analytics uses the configured display name as the field name for the HTTP parameters. In Controller versions prior to 4.3, Analytics displayed the data using the actual parameter name.

## Custom Method Invocation Data

Custom data collected as specified in the method invocation data collector configuration. See [Data Collectors](#).

To specify a custom data field when using the Analytics query APIs, prefix the field name with `segments.userData`. For example, if your field is `cartTotal`, such as shown in the following screenshot, the database name is `segments.userData.cartTotal`.

## SQL Data Collector

Captures values from SQL-prepared statement query data used in business transactions. See [Collect Business Data From SQL Calls](#).

## Deprecated Fields

AppDynamics deprecated the `Request Experience` and `Transaction Time` for Analytics Agents >= 4.2.x. Both fields are replaced with new fields:

Deprecated Field	Description	New Field
Request Experience	Indicates if the transaction was marked as Normal, Slow, Very Slow, Stall, or Error	User Experience
Transaction Time	Business transaction response time for this request in milliseconds	Response Time

## Analytics Log Data

Log Analytics collects from log files depends on the source of the log file and the pattern that you specify to structure the data in the log with. Every log entry is an event in the Log Analytics event stream.

### Log Analytics Data

Log Analytics only supports the UTF-8 encoding format.

Event Type: logs

Key (event type identifier): sourceType

These fields are captured by default; you can configure and capture optional data, but these fields are always present:

UI Field Name	Description	Events Service Internal Name
pickupTimestamp	The timestamp when the Java Agent picked up the event and sent it to the Analytics Agent.	pickupTimestamp
Message	The message body of the log event.	message
host	IP address or host name where the event was generated.	host
source	Location of the logs, usually a path or directory such as <code>/tomcat/logs</code> .	source
sourceType	The kind of log file, such as <code>apache-httpserver-access-log</code> .	sourceType
Timestamp	Timestamp of the log event.	eventTimestamp
Extracted Fields	Fields that were extracted using the Controller UI in previous versions appear in the Extracted Fields list. See <a href="#">Collect Log Analytics Data</a> .	Varies

You can optionally configure these fields:

Optional Fields	Description
nodeName	Name of the node where the log event occurred.
tierName	Name of the tier where the log event occurred.

Optional Fields	Description
appName	Application name where the log event occurred.

### Analytics Custom Events Data

Data collected for your Analytics custom events depends on the schema you create and manage.

The only default field is `eventTimestamp`. If custom events are used to configure Business Journeys, this field is mandatory. All other fields are defined by your schema.

If you are exporting data as a CSV file, a single quotation mark ( ' ) prepends cells that begin with `=`, `+`, `-`, `@`, or `"`.

See [Analytics Events API](#).

### Analytics Browser Requests Data

Browser Analytics provides details about each browser user request. The data collected includes information about pages, performance metrics, location of your users, browser and device data, errors, and any custom data that you configured in your Browser RUM configuration.

This page lists the field names available for browser request Analytics data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query. See [Browser RUM Metrics](#).

Event Type: `browser_records`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
<b>Page Info Fields</b>	
Agent ID	<code>agentid</code>
appkey	<code>appkey</code>
Client GUID	<code>cguid</code> The Client GUID is a unique identifier for each browser request. It is unique on each page reported in the session.
IP address	<code>ip</code>
Page Experience	<code>pageexperience</code>
Page Name	<code>pagename</code>

UI Field Name	Events Service Internal Name
Page Type	<code>pagetype</code>
Parent Page URL	<code>pageparenturl</code> <div style="border: 1px solid orange; padding: 5px; margin-top: 10px;">  The <code>pageparenturl</code> is not available by default. On-premises customers need to run a <a href="#">special script</a> on the EUM Server. SaaS customers need to <a href="#">file a ticket</a> requesting AppDynamics to do this for them. See the <a href="#">Community article</a>.         </div>
Page Referrer	<code>referrer</code> See the <a href="#">Community article</a> .
URL	<code>pageurl</code>
<b>Performance Time Fields</b>	
Application Server Time	<code>metrics.`Application Server Time (ms)`</code>
DOM Ready Time	<code>metrics.`DOM Ready Time (ms)`</code>
Domain Lookup Time	<code>metrics.`Domain Lookup Time (ms)`</code>
End User Response Time	<code>metrics.`End User Response Time (ms)`</code>
Estimated BT Time	<code>btdata.estimatedtime</code>
First Byte Time	<code>metrics.`First Byte Time (ms)`</code>
Server Connection Time	<code>metrics.`Server Connection Time (ms)`</code>
SSL Handshake Time	<code>metrics.`SSL Handshake Time (ms)`</code>
<b>Location Fields</b>	
City	<code>geocity</code>
Country	<code>geocountry</code>
Region	<code>georegion</code>

UI Field Name	Events Service Internal Name
<b>Browser and Device Data Fields</b>	
Browser	browser
Browser Version	browserversion
Device	device
Device OS	deviceos
<b>Errors Field</b>	
AJAX Error	ajaxerror
Error Type	errortype
<b>Script Error Field</b>

Message	scripterrordata.message
Origin	scripterrordata.origin
timestamp	scripterrordata.timestamp
<b>Custom User Data Field</b>	
<i>your_field_name</i>	userdata.your_field_name userdataBoolean.your_field_name userdataDate.your_field_name userdataLong.your_field_name userdataDouble.your_field_name  <div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;"> <p><b>i</b> If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code></p> </div>

## Analytics Browser Sessions Data

This page describes the field names available for Analytics Browser Sessions data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name. You can view the Browser Sessions using the Analytics Query API. This page describes fields that are specific to Browser Sessions.

Event Type: `web_session_records`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
<b>Session Fields</b>	
Browser	<code>browser</code>
Browser Version	<code>browserversion</code>
City	<code>geocity</code>
Closed	<code>closed</code>
Country	<code>geocountry</code>
Device	<code>device</code>
Device OS	<code>deviceos</code>
IP Address	<code>ip</code>
Page View Count	<code>pageviews</code>
Region	<code>georegion</code>
Session Duration (ms)	<code>metrics.durationMS</code>
Session Start Time	<code>startTimeMS</code>
User Experience	<code>experience</code>
<b>Page View Fields</b>	
Client GUID	<code>browserRecords.cguid</code>
Page Error Type	<code>browserRecords.errortype</code>

Page Experience	<code>browserRecords.pageexperience</code>
RUM Page Name	<code>browserRecords.pagename</code>
<b>Custom User Data</b>	
<i>your_field_name</i>	<p><code>userdata.your_field_name</code>  <code>userdataBoolean.your_field_name</code>  <code>userdataDate.your_field_name</code>  <code>userdataLong.your_field_name</code>  <code>userdataDouble.your_field_name</code></p> <div style="border: 1px solid #add8e6; padding: 5px;"> <p><b>i</b> If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code>.</p> </div>

### Analytics Browser Resources Data

This page describes the field names available for Analytics Browser Resources data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name.

Event Type: `browser_resource_records`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
<b>Session Fields</b>	
<code>appkey</code>	<code>appkey</code>
Client GUID	<p><code>cguid</code></p> <div style="border: 1px solid #add8e6; padding: 5px;"> <p><b>i</b> This field displays the Client GUID of the browser request associated with this resource. The Client GUID is a unique identifier for each browser request. It is unique on each page reported in the session.</p> </div>
Cached	<code>cached</code>

UI Field Name	Events Service Internal Name
Compressed	compressed
decodedSize	decodedSize
Domain	domain
encodedSize	encodedSize
Has Resource Details	hasResourceDetails
HTTP Protocol	httpProtocol
HTTP Response Status Code	httpResponseStatusCode
Initiator Type	initiatorType
Name	name
Page Name	pageName
Page URL	pageUrl
Resource Type	resourceType
Source	source
Transfer Size	transferSize
Resource URL	url
<b>Performance Time Field</b>

OS	os

## Analytics Mobile Crash Reports Data

This page describes the field names available for Analytics Mobile Crash Reports data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: `mobile_crash_reports`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
App Crash Time	<code>appcrashtimestamp</code>
App Key	<code>appkey</code>
Carrier	<code>carrier</code>
Connection Type	<code>connectiontype</code> For example: "wifi", "4g", "cell"
Country	<code>geocountry</code>
Crash Group ID	<code>groupid</code>
Crash Id	<code>crashid</code>
Crashed Function	<code>crashfunction</code> For example: "-[MTFirstViewController segFault413]", "com.appd.examples.android.instrumentation.MainActivity.d42" This value depends on your application.
Device / Manufacturer	<code>devicemanufacturer</code> For example: "Samsung", "Apple"
Mobile App Name	<code>mobileappname</code>
Mobile App Version	<code>mobileappversion</code>
Model	<code>devicemodel</code> For example: "iPhone 5" "iPad 2 WIFI"
OS Version	<code>osversion</code> For example: "iOS 6.0", "Android 4.2"

UI Field Name	Events Service Internal Name
Platform	<code>platform</code> For example: "Android", "iOS"
Region	<code>georegion</code>
<b>User Data</b>	
<i>your_field_name</i>	<code>userdata.your_field_name</code> <code>userdataBoolean.your_field_name</code> <code>userdataDate.your_field_name</code> <code>userdataLong.your_field_name</code> <code>userdataDouble.your_field_name</code>
	<div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;"> <p><b>i</b> If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code></p> </div>

### Analytics Mobile Requests Data

Mobile Analytics provides details about the performance of your mobile apps as experienced by your end users. The data collected includes information about the mobile app names and versions, network requests, performance times, locations, carrier and device data, errors, and any custom data that you configured in your Mobile RUM configuration.

This page describes the field names available for mobile requests Analytics data, along with the Events Service internal name. See [Mobile RUM Metrics](#). When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: `mobile_snapshots`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
<b>Mobile App Info Fields</b>	
<code>agentid</code>	<code>agentid</code>
<code>agentversion</code>	<code>agentversion</code>

UI Field Name	Events Service Internal Name
appkey	appkey
cguid	cguid
Mobile App Name	mobileappname For example: "com.appdynamics.eum.test.apps.E2E-PictureSharingApp"
Mobile App Version	mobileappversion
Platform	platform
<b>Network Request Fields</b>	
Background	happenedinbackground
Experience	networkrequestexperience
HTTP Status Code	httpstatuscode
Network Request Name	networkrequestname
Network Request Type	networkrequesttype
Request Content Length	requestContentLength
Response Content Length	responseContentLength
<b>Performance Time Fields</b>	
Estimated BT Time	btdata.estimatedtime
Network Request Time	networkrequesttime
<b>Location Fields</b>	
Country	geocountry
Region	georegion
<b>Carrier and Device Data Fields</b>	

UI Field Name	Events Service Internal Name
Carrier	<code>carrier</code>
Connection Type	<code>connectiontype</code> For example: "wifi", "4g", "cell"
Device / Manufacturer	<code>devicename</code> For example: "Samsung", "Apple"
Model	<code>devicemodel</code> For example: "iPhone 5" "iPad 2 WIFI"
OS Version	<code>osversion</code> For example: "iOS 6.0", "Android 4.2"
<b>Error Fields</b>	
Network Type Error	<code>networkerror</code>
<b>Custom User Data Fields</b>	
<i>your_field_name</i>	<p><code>userdata.your_field_name</code>  <code>userdataBoolean.your_field_name</code>  <code>userdataDate.your_field_name</code>  <code>userdataLong.your_field_name</code>  <code>userdataDouble.your_field_name</code></p> <div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;"> <p><b>i</b> If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code></p> </div>

### Analytics Mobile Sessions Data

This page describes the field names available for Analytics Mobile Sessions data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: `mobile_session_records`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
<b>Mobile Session Fields</b>	
Mobile App Name	<p>mobileappname</p> <p>example: "com.appdynamics.eum.test.apps.E2E-PictureSharingApp"</p>
Carrier	<p>carrier</p> <p>For example: "AT&amp;T", "Verizon"</p>
Closed	<p>closed</p>
Connection Type	<p>connectiontype</p> <p>For example: "cell", "3g"</p>
Country	<p>geocountry</p>
Device / Manufacturer	<p>devicename</p>
Duration	<p>metrics.durationMS</p>
IP Address	<p>ip</p>
Mobile App Version	<p>mobileappversion</p>
Model	<p>devicemodel</p> <p>For example: "iPad 2 WIFI", "Kindle Fire"</p>
OS Version	<p>osversion</p> <p>For example: "iOS 5.1", "Android 4.2"</p>
Region	<p>georegion</p>
Session Start Time	<p>startTimeMS</p>
Session Status	<p>closed</p> <p>Note "closed" is a Boolean field.</p> <p>True means the session is closed.</p> <p>False means the session is still going on.</p>

UI Field Name	Events Service Internal Name
<b>Event Count Fields</b>	
Breadcrumb Count	<code>metrics.breadcrumbcount</code>
Crash Count	<code>metrics.crashcount</code>
Custom Metric Count	<code>metrics.custommetriccount</code>
Event Time Stamp	<code>eventTimestamp</code>
Info Point Count	<code>metrics.infopointcount</code>
Network Request Count	<code>metrics.networkrequestcount</code>
Timer Count	<code>metrics.timerCount</code>
UI Event Count	<code>metrics.uiCount</code>
User Data Count	<code>metrics.userdatacount</code>
<b>Crash Fields</b>	
App Crash Time	<code>crash.appcrashtimestamp</code>
Crash Exception	<code>crash.crashexception</code> For example: "java.lang.NullPointerException"
Crash File	<code>crash.crashfile</code> For example, "MainActivity.java"
Crash Group ID	<code>crash.groupid</code>
Crash Line Number	<code>crash.crashlinenumber</code>
Error Description	<code>error.description</code>
Symbolicated or Deobfuscate	<code>crash.symbolicateddeobfuscated</code> For example: false
<b>User Data</b>	

UI Field Name	Events Service Internal Name
<i>your_field_name</i>	userdata.your_field_name userdataBoolean.your_field_name userdataDate.your_field_name userdataLong.your_field_name userdataDouble.your_field_name  <div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;"> <p><b>i</b> If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code></p> </div>
<b>Breadcrumb Fields</b>	
Breadcrumb Text	<code>breadcrumb.bctext</code>
<b>Network Request Fields</b>	
Connection Type	<code>networkrequest.connectiontype</code>

Experience	<code>networkrequest.networkrequestexperience</code>
HTTP Status Code	<code>networkrequest.httpstatuscode</code>
IP Address	<code>networkrequest.ip</code>
Network Error	<code>networkrequest.networkerror</code>
Network Request Name	<code>networkrequest.networkrequestname</code>
Network Request Time	<code>networkrequest.networkrequesttime</code>
<b>Infopoint Fields</b>	
Duration (ms)	<code>infopoint.duration</code>
infopname	<code>infopoint.infopname</code>

UI Field Name	Events Service Internal Name
Is Dynamic	<code>infopoint.isdynamic</code>
<b>UI Event Fields</b>	
Activity	<code>ui.activity</code>
Class	<code>ui.uiclass</code> For example: "UITableView"
Label	<code>ui.uilabel</code> For example: "IOS TableCell"
Root View	<code>ui.rootview</code> For example: "SettingsScreen"
UI Event	<code>ui.uievent</code> For example: "Button Pressed", "Root View Change", "Table Cell Selected"

### Analytics Mobile Non-Fatal Issues Data

This page describes the field names available for Analytics Mobile Non-Fatal Issues data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: `mobile_non_fatal_issue_records`

UI Field Name	Events Service Internal Name
<b>Agent Info Fields</b>	
Agent ID	<code>agentid</code>
Agent Version	<code>agentversion</code>
<b>App Info Fields</b>	
App Key	<code>appkey</code>

UI Field Name	Events Service Internal Name
Mobile App Name	<code>mobileappname</code> For example: "com.appdynamics.eum.test.apps.E2E-PictureSharingApp"
Mobile App Version	<code>mobileappversion</code>
<b>Device Info Fields</b>	
Carrier	<code>carrier</code> For example: "AT&T", "Verizon"
Connection Type	<code>connectiontype</code> For example: "cell", "3g"
Device Manufacturer	<code>devicemanufacturer</code> For example: "Samsung"
Device Model	<code>devicemodel</code> For example: "Galaxy S5"
Device Name	<code>devicename</code>
IP Address	<code>ip</code>
jailbroken	<code>jailbroken</code>
OS Version	<code>osversion</code> For example: "5.1", "4.2"
Platform	<code>platform</code> For example: "iOS", "Android"
<b>Code Issues</b>	
description	<code>description</code> For example: "App Not Responding in Utils.formatData"
filename	<code>filename</code>

UI Field Name	Events Service Internal Name
groupid	groupid
Line Number	linenumber
severity	severity For example: "Info", "warning"
symbolicateddeobfuscated	symbolicateddeobfuscated For example: false
symbolname	symbolname For example: "MainActivy.onResume"
pickupTimestamp	pickupTimestamp
Timestamp	timestamp For example: "03/15/18 5:32:33 PM"
<b>Custom User Data Fields</b>	
<i>your_field_name</i>	userdata.your_field_name userdataBoolean.your_field_name userdataDate.your_field_name userdataLong.your_field_name userdataDouble.your_field_name  <div style="border: 1px solid #add8e6; padding: 5px;"> <p><b>i</b> If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code></p> </div>
<b>Event Fields</b>	
eventid	eventid
eventindex	eventindex
timestamp	eventTimestamp

UI Field Name	Events Service Internal Name
eventtype	eventtype For example: "ANR", "Error"
<b>Location Fields</b>	
City	geocity
Country	geocountry
Region	georegion For example: "California", "Sichuan"

### Analytics Synthetic Sessions Data

This page lists the field names available for Analytics Browser Synthetic Sessions data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query. For details on the meaning of each metric, see [Browser Synthetic Metrics](#).

Event Type: synth\_session\_records

Key (event type identifier): Job Name (scheduleName)

UI Field Name	Events Service Internal Name
<b>Session Fields</b>	
Browser	browser For example: "Internet Explorer", "Chrome"
Browser Version	browserversion For example: "52.0.2743.116", "11.0.9600.18124"
City	geocity
Closed	closed
Country	geocountry
Devices	device The computer form factor of the device. For example: "Computer" or "Mobile & Tables"

Device Model	<code>devicemodel</code> The model of the device. For example: "Galaxy S8" or "iPhone 7"
Device OS	<code>deviceos</code> The operating system of the device. For example: "Windows" or "Android"
Duration (sec)	<code>metrics.`Session Duration (ms)`</code>
End Time	<code>endTimeMS</code>
Error Type	<code>failureType</code> For example: "Timed out", "Test script crashed"
Job Name	<code>scheduleName</code> The name of the synthetic job.
Region	<code>georegion</code>
Result	<code>success</code>
Schedule ID	<code>measurementSpec.scheduleId</code>
Session Type	<code>sessionType</code> For example: "WEB_DRIVER", "URL"
Session Visual Time (sec)	<code>metrics:`Session Visual Time (ms)`</code>
Start Time	<code>startTimeMS</code>
Status	<code>status</code>
Timestamp	<code>eventTimestamp</code>
<b>Page View Fields</b>	
Page Error Type	<code>browserRecords.pageerror</code>
RUM Page Name	<code>browserRecords.pagename</code>

URL	pageurl
-----	---------

### Analytics Connected Device Data

Connected Device Data provides details about each IoT connected device. The data collected includes information about devices, network requests and error events, and any custom properties and events that you instrument in your IoT application.

This page describes the required field names for Analytics Connected Device data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query. Because [IoT Monitoring](#) largely depends on custom data, your connected device Analytics data will most likely include many more field names than given below.

Event Type: `iot_records`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
<b>Fields</b>	
App Key	<code>appkey</code>
deviceguid	<code>deviceguid</code>
devicetype	<code>devicetype</code>
Timestamp	<code>eventTimestamp</code>
eventtype	<code>eventtype</code>
<b>customevent Fields</b>	
eventssummary	<code>customevent.eventssummary</code>
<b>networkrequestevent Fields</b>	
duration	<code>networkrequestevent.duration</code>
networkerror	<code>networkrequestevent.networkerror</code>
statuscode	<code>networkrequestevent.statuscode</code>
URL	<code>networkrequestevent.url</code>
<b>errorevent Field</b>	

UI Field Name	Events Service Internal Name
Resource Name	errorevent.name

## ADQL Changes in Events Service 20.9.0

This page describes the ADQL-related changes caused by an update to the Events Service in version 20.9.0.

 The following ADQL changes are currently only available for customers with accounts provisioned in the following regions: Bombay, Cape Town, São Paulo, and Hong Kong. Contact your system administrator to confirm where your account is provisioned.

### ADQL Percentile Query Results

In the Events Service 20.9.0, the ADQL percentile query now returns the larger number instead of the median number in a range of candidates. The ADQL percentile query syntax for the Events Service 20.9.0 has not changed.

### Sample ADQL Percentile Query Syntax

```
New Search
1 SELECT percentile(age, 50) FROM transactions
```

### ADQL Terms

Term	Description
SELECT	<ul style="list-style-type: none"> <li>A <code>SELECT</code> keyword is the first keyword in an ADQL query.</li> <li>It is followed by a list of columns or expressions to query data in a table.</li> </ul>
Percentile	<ul style="list-style-type: none"> <li>The <code>percentile</code> keyword represents the similarly named ADQL function. It contains a field and the percentile value.</li> <li>In the <a href="#">sample ADQL percentile query syntax</a>, the percentile value is the 50th percentile.</li> </ul>
Field	<ul style="list-style-type: none"> <li>A field is the column that is queried in a table.</li> <li>In the <a href="#">sample ADQL percentile query syntax</a>, the field is the <code>age</code>.</li> </ul>
FROM	<ul style="list-style-type: none"> <li>A <code>FROM</code> keyword comes after the <code>SELECT</code> keyword and a list of fields or expressions.</li> </ul>

Term	Description
Table	<ul style="list-style-type: none"> <li>A table is the collection of fields and their values.</li> <li>In the <a href="#">sample ADQL percentile query syntax</a>, <code>transactions</code> is the table that contains the <code>age</code> queried field.</li> </ul>

### ADQL Example

This example displays the 50th percentile age of employees working in the office. Based on the distribution, the 50th percentile age is 30 and 31. This is because out of a total of 130 employees in the table, 65 employees are 30 or younger and 65 employees are 31 or older.

### Results

- For Events Service < 20.9.0, the 50th percentile age value is 30.5, which is the median of 30 and 31.
- For Events Service >= 20.9.0, the 50th percentile age value is 31, which is the larger candidate.

 In a production environment, there can be millions of values in each field. As a result, the percentile query returning the larger number in a percentile bucket is a more accurate data distribution.

## Analytics Data Sources

### Related pages:

- [ADQL Data](#)

This page describes how Analytics can collect data from many sources in your AppDynamics SaaS.

---

## Transaction Analytics Data Sources

Transaction Analytics data is collected by the AppDynamics Java, .NET, PHP and Node.js App Agents. Collecting Transaction Analytics data requires no change to your application code. You enable analytics on the app server agents and Controller you already use.

Once you have enabled analytics on your application, you can collect and analyze several kinds of data:

- Default performance data collected by the app agents about your application's business transactions.
- HTTP-based data collected by HTTP data collectors.
- Custom data collected by method invocation data collectors.
- Business data collected from parameterized SQL calls.

See [Collect Transaction Analytics Data](#).

## Log Data Sources

You can collect Log Analytics data from many types of log files, including instrumented and non-instrumented applications as well as infrastructure. Log Analytics can be used as a standalone component. You can search and analyze log data just as you do transaction data. Log Analytics works by default with the syslog (log4j) format and can be configured for other log formats, including GZIP files (log files ending in .gz). You can capture other log formats by setting up regular-expression-based mapping. See [Collect Log Analytics Data](#).

You can view correlated Log and Transaction Analytics Data. By configuring business transaction GUID injection, you can see logs that are related to specific business transaction requests. See [Business Transaction and Log Correlation](#).

## End User Monitoring Data Sources

Analytics can also use data collected by [Browser Real User Monitoring](#), [Mobile Real User Monitoring](#) and [IoT Monitoring](#). Analytics makes the data available in a more flexible search format. If you have enabled Browser RUM, Mobile RUM or IoT Monitoring *and* enabled Analytics, you see these event types on the Analytics search page.

For details on how analytics extends the capability of EUM, see the section "[Browser Analyze versus Browser Request Analytics](#)" in [Browser RUM Analyze](#).

## Browser Synthetic Data Sources

Sessions data captured through Browser Synthetic Analytics is available in Analytics.

## Custom Event Sources

You can add custom events for Analytics using the [AppDynamics Analytics Events API](#).

## Deploy Analytics With the Analytics Agent

Related pages:

- [Monitor JVMs](#)
- [Monitor .NET Nodes](#)

This page describes the deployment options for Analytics, which includes the Events Service.

## Transaction Analytics Only

The Analytics Agent is only required for the Node.js, PHP Agents, and Python Agents, and not the Java and .NET Agents if the minimum versions are met. You need an Analytics Agent to capture Transaction Analytics for:

- Any version of Node.js Agent
- Any version of PHP Agent
- Python Agent  $\geq 21.10$  (Python Agent  $< 21.10$  does not support Transaction Analytics)
- Java Agent  $\leq 4.5.15$
- .NET Agent  $\leq 20.10$

To configure Transaction Analytics:

- Download and install either the [Machine Agent](#) or the Analytics Agent (standalone binary) on each machine. You can also use a shared Analytics Agent instance.
- Enable Analytics for applications in the [Controller](#).

## Log Analytics Only

To configure Log Analytics:

- Install either the [Machine Agent](#) or the Analytics Agent (standalone binary) on the machine.
- Enable Analytics for log sources in the [Controller](#).

## Transaction and Log Analytics

To configure Transaction and Log Analytics:

- Install either the [Machine Agent](#) or the Analytics Agent (standalone binary) on the machine.
- Enable Analytics for applications and log sources in the [Controller](#).

## SaaS/On-premises Analytics Configuration

When you deploy Analytics with the Analytics Agent, the configuration requirements differ based on your deployment.

- SaaS: The Events Service is provided as part of the SaaS service. AppDynamics stores the data and hosts the server components of the system for you. You need to install only the Analytics Agent components of the system described in [Agent Side Components](#).
- On-premises: You host the components yourself, storing all data on-premises. You need to install the [Agent Side Components](#), [Controller Deployment Components](#), and [Events Service Deployment Components](#). While the on-premises deployment involves additional setup and administration, you are able to retain the Analytics data in your own data center.

## Encrypt Data on the Analytics Agent

You can encrypt any data on the Analytics Agent using `secure://<your-encrypted-credentials>`. You can encrypt data in the Analytics Agent properties file or in System Properties.

The following example demonstrates how to encrypt `http.event.accessKey` in the Analytics Agent properties file:

```
http.event.accessKey=secure://-001-24-
Dr9FQGC179o4vPnuIjnx8A==ZGVw/
P400NvpUIdIhJ2u78FpRVVw8fbgr8J1HBHXwnE=
```

```
ad.secure.credential.store.filename=/opt/appdynamics/secretKeyStore
ad.secure.credential.store.password=s_gsnwR6+LDch8JBf1RamiBoWfMvjjipkrtJMZXAYEkw8=
```

See [Encrypt Agent Credentials](#).

## Separate Host for the Analytics Agent

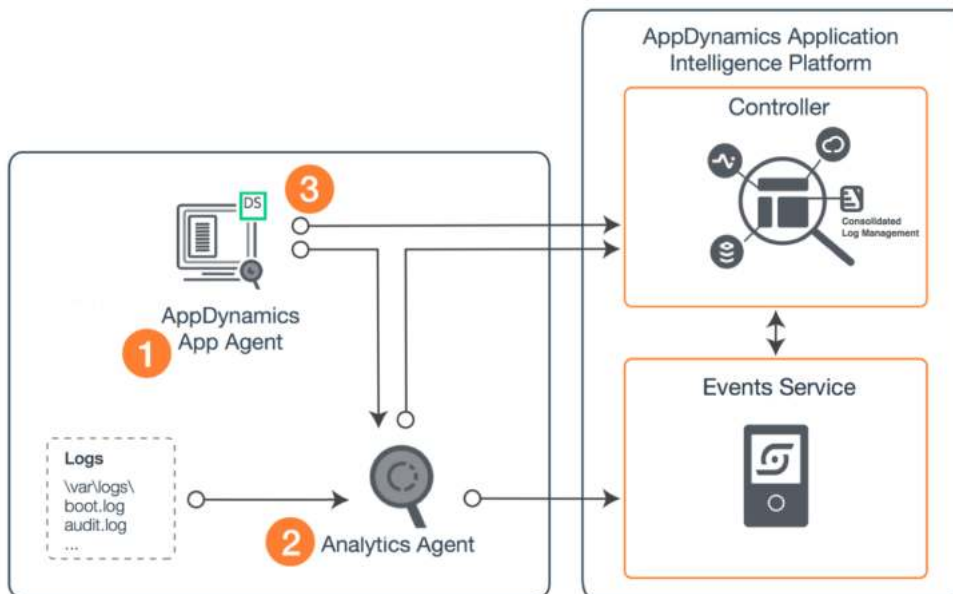

If your Analytics Agent is on a host separate from the monitored application, see [Remote Analytics Agent Sizing](#).

## Analytics Agent Components

This page describes Analytics Agent architecture.

### Analytics Agent-Side Components

For both SaaS and on-premises Analytics, you need to deploy (or enable) agent-side Analytics components in your application environment.

### Legend: Agent Components

- 1 AppDynamics App Agent: Analytics relies upon the same app server agents that AppDynamics SaaS uses. If you use AppDynamics SaaS, you likely already have these deployed to your monitored applications.

---

**2** **Analytics Agent:** The Analytics Agent collects data from one or more app server agents and sends it to the Events Service. It also reads and transmits log data from log files from the local machine. The Analytics Agent is available as a standalone binary or as part of the Machine Agent download.

- As part of the [Machine Agent](#) download, the Analytics Agent runs as an extension (also called a monitor).
- A standalone binary distribution of the Analytics Agent is available for Windows environments or other environments that do not have the Machine Agent installed.

**3** **Analytics Dynamic Service:** The Analytics Dynamic Service extends your app server agent functionality to collect and forward data to the Analytics Agent. It is built into the Java and .NET Agents but is not enabled by default. No additional download is needed.

## Browser and Mobile Analytics

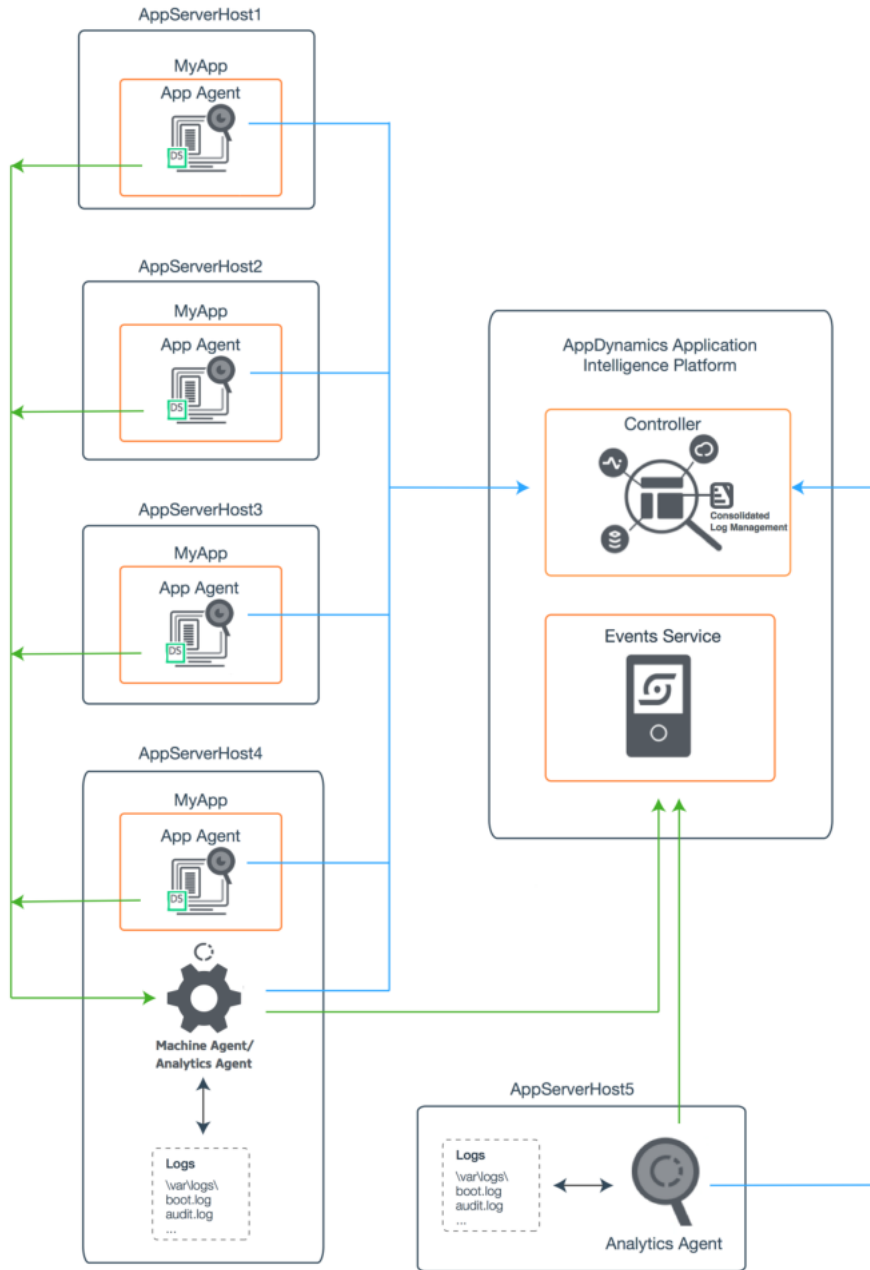

To see Analytics data from Browser and Mobile Real User Monitoring, you need to enable those components and enable Analytics. See [EUM Server Deployment](#).

## Deploying Analytics Agents to Multiple Nodes

A real-world scenario is unlikely to consist of a single monitored node, as shown in the diagram above. It usually consists of many applications deployed over many hosts.

While the app server agents continue to send data to the Controller in the normal way, the Analytics Dynamic Service sends its data to the Analytics Agent. This agent runs in a separate JVM process in the local environment or network, either as part of the Machine Agent or on its own.

There must be at least one Analytics Agent in the monitored environment, although multiple app server agents collecting only transaction data can share a single Analytics Agent, as shown in the diagram below. However, each machine where you want to gather log data must have its own Analytics Agent instance.

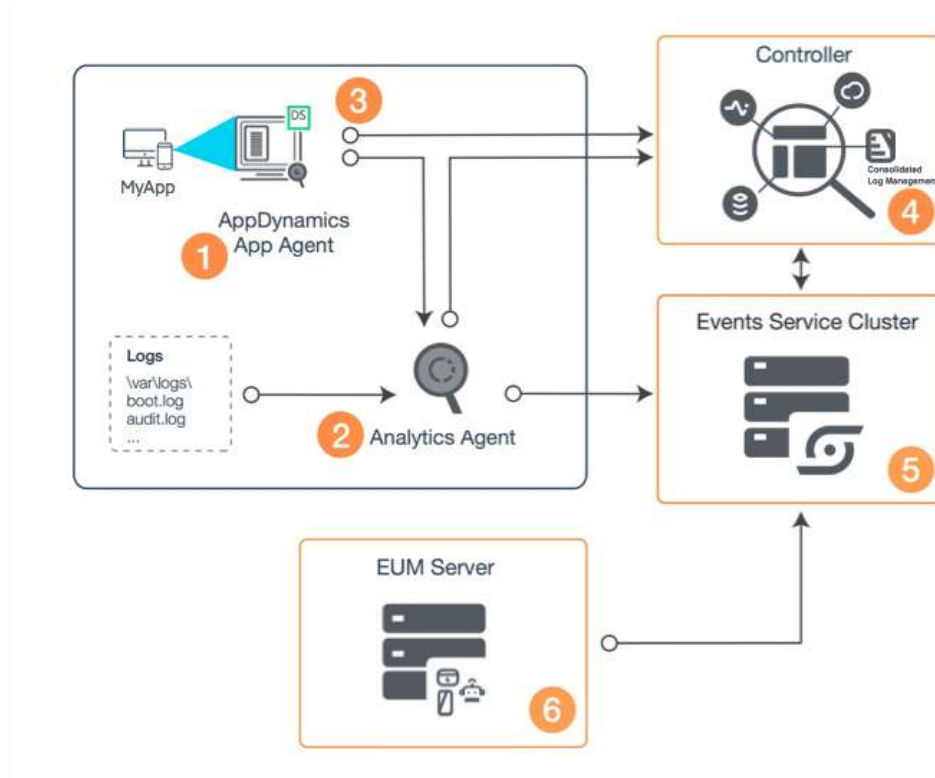

In this example, AppServerHost1-3 are collecting only Transaction data, so only app server agents are required. Each one connects to the Analytics Agent on AppServerHost4, where log information is also being collected. The Analytics Agents could also reside on the same machines as each app server agents. On AppServerHost5, only log data is being collected, so an Analytics Agent is also necessary there.

## Server Side Components for On-premises

To set up AppDynamics Analytics on-premises, you also need to install the server parts of the system, the AppDynamics Controller, and the Events Service.

The following figure depicts the basic components of an on-premises deployment:

### Legend: Server Components

**i** If you are using SaaS EUM, you must use the SaaS Events Service. If you are using the on-premises EUM Server, you must use an on-premises instance of the Events Service.

**4** AppDynamics Controller: The heart of an AppDynamics deployment, the Controller processes and presents the information gathered by the agents.

**5** Events Service: The unstructured document store, it gathers and stores data from the Analytics, Database, and Network Visibility Agents and, if you have End User Monitoring, from **6**, the EUM Server. It allows the Controller UI to run queries on that data.

## Install Agent-Side Components

On this page:

- [Prepare to Enable the Agents](#)
- [Install the Standalone Analytics Agent on Windows](#)
- [Install the Standalone Analytics Agent on Linux](#)

- [Enable the Standalone Analytics Agent](#)
- [Enable the Analytics Agent as an Extension to the Machine Agent](#)
- [Tune Analytics Agent](#)
- [Additional Configurations](#)
- [Troubleshooting Tips](#)

### Related pages:

- [Analytics Agent Components](#)

This page provides an overview of how to configure Application Analytics components to collect business transaction data.

In most Application Analytics deployment scenarios, you must enable the Analytics Agent-side components. The agents are distributed as system-based operations or standalone bundles in the [AppDynamics Downloads Portal](#).

If your app server agent supports Agentless Analytics, such as the [Java Agent](#) (21.2 and later) and [.NET Agent](#) (20.10 and later), you do not need to install the standalone Analytics Agent or Machine Agent extension for Transaction Analytics data collection. See [Deploy Analytics Without the Analytics Agent](#) for more information.

### Prepare to Enable the Agents

Review the deployment options, agent-side component architecture, and components you will need to install in [Deploy Analytics With the Analytics Agent](#).

### Analytics Agent

The Analytics Agent collects and sends data from the AppDynamics App Agent and log files to the Events Service. The Analytics Agent is not enabled by default. You need to download and enable the desired bundle using a method of your choice.

In the Analytics Agent version  $\geq 21.7$  the `debug/grok` endpoint is disabled by default. To enable the endpoint, start the Analytics Agent with the property `ad.debug.grok.endpoint.enabled=true` in `agent.properties` file.

To use Application Analytics:

1. Obtain a separate [Application Analytics license](#).
2. Enable the Analytics Agent.
3. Point to the Event Service. See [Revise the Analytics Agent Properties File](#) for agent-specific configuration and [Event Service Deployment](#) for the Event Service.
4. Enable Analytics on the Controller.

### AppDynamics App Agent

To access Analytics and collect transaction data from an application, you must deploy a supported app server agent version in all environments, such as the [Node.js Agent](#) or the [PHP Agent](#). If you already use AppDynamics APM, agents may already be installed in your environment.

### Install the Standalone Analytics Agent on Windows

As described in [Analytics Deployment Options](#), the Analytics Agent can run on the same host or on a different host from the app server agent, depending on your use case.

The [AppDynamics Downloads Portal](#) provides the following distribution archives:

- Standalone Analytics Agent (no JRE)
- Analytics Agent with JRE 1.8 for both 32-bit and 64-bit Windows machines

### Important

Ensure that only the administrators can modify the Analytics Agent directory. Run the following command in the `<analytics-agent-home>` directory to provide administrator access.

```
icacls . /inheritance:r /grant Users:(OI)(CI)RX /grant Administrators:(OI)(CI)F
```

## Revise the Analytics Agent Properties File

The Analytics Agent properties file determine how your Analytics Agent communicate with other components, what type of data it gathers from the monitored application, and how the components of the Application Analytics deployment and the Controller authenticate to each other.

Modify the default configuration and set the desired values for the agent properties in the properties file. The location of this file depends on your exact deployment scenario.

1. Open the `<analytics-agent-home>/conf/analytics-agent.properties` file with a text editor. The Analytics Agent on Windows requires double backslash for paths.

For example:

```
conf.dir=C:\\AppD\\analytics-agent\\conf
ad.dw.log.path=C:\\AppD\\analytics-agent\\logs
```

2. To run the Analytics Agent as a Windows service, modify the following properties:

- `ad.dw.log.path = <analytics-agent-home>\\logs`
- `conf.dir = <analytics-agent-home>\\conf`
- `ad.jvm.options.name=analytics-agent.vmoptions`
- `ad.jvm.heap.min=512m`
- `ad.jvm.heap.max=1g`

3. Follow the instructions to [enable the standalone Analytics Agent](#).

4. To install the Analytics Agent on Windows, run the `install` command:

```
bin\\analytics-agent.exe service-install
```

## Start and Stop the Analytics Agent

To start/stop the Analytics Agent on Windows, run the following commands in the Windows Services menu.

To start the agent, run:

```
bin\analytics-agent.exe service-start
```

To stop the agent, run:

```
bin\analytics-agent.exe service-stop
```

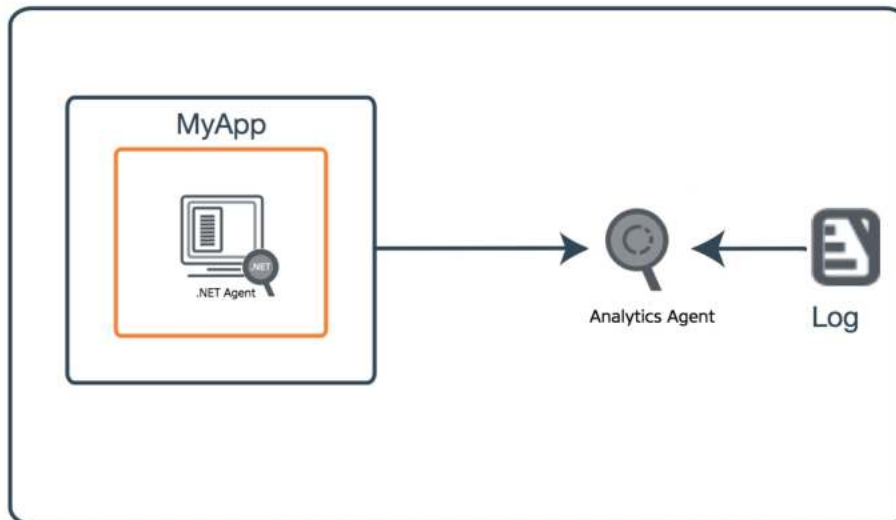

### Uninstall the Analytics Agent

To uninstall the Analytics Agent, run the `.exe` file with the `uninstall` command:

```
bin\analytics-agent.exe service-uninstall
```

### Enable Analytics Agent for a Local App Server Agent

This section assumes that you are installing the Analytics Agent on the same host as your app server agent. In this deployment, the Analytics Agent reads and transmits log data in log files from the local machine. The app server agent transmits data from the monitored application to the Analytics Agent.

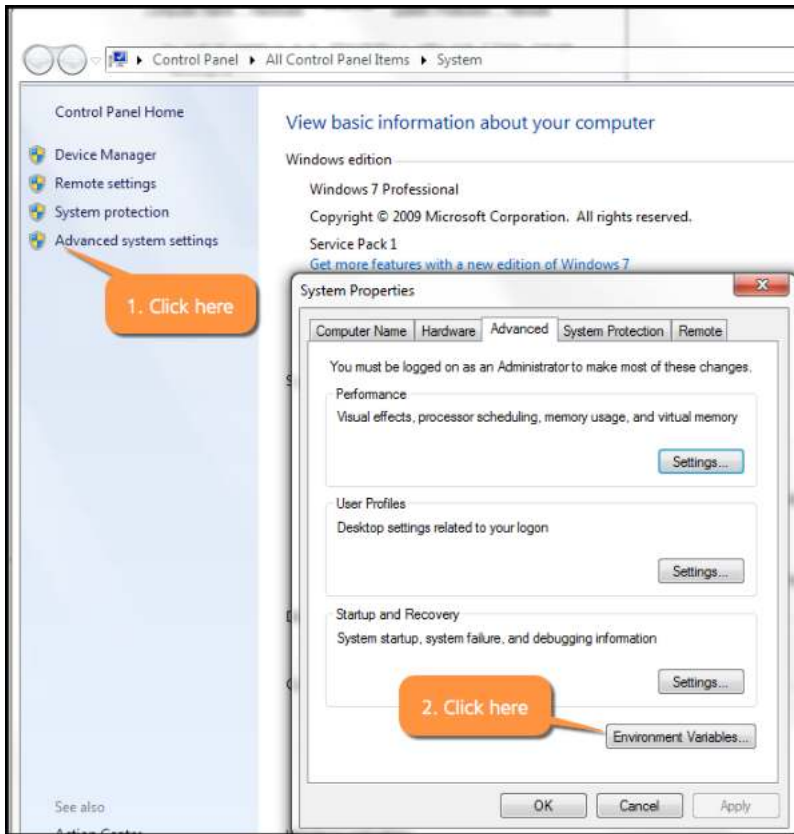

Install the Analytics Agent with the `.exe` and `analytics-agent.exe` files found in the `<analytics-agent-home>/bin` directory. Because the Analytics Agent is written in Java, you will run the agent in a Java Virtual Machine (JVM). The Analytics Agent runs as a Windows service.

### Enable the App Server Agent for a Remote Analytics Agent

To specify the location of the remote Analytics Agent with an environment variable named `appdynamics.analytics.agent.url` on Windows:

1. On your Windows machine, go to **System Properties > Advanced system settings > Environment Variables**.

2. Under **System Variables**, click **New**. AppDynamics recommends a system environment variable approach as opposed to a user environment variable approach; in the environment variable approach, a user must have the same permissions as the user with all the instrumented applications running.
3. Set the value for the `appdynamics.analytics.agent.url` system variable to `http://<analytics-agent-ip>:9090/v2/sinks/bt`.

Replace `<analytics-agent-ip>` with the hostname of the Analytics Agent for your environment.

- Restart the applicable application or process where you want the new environment variables to take effect. While it is not required that you restart your machine, the parent process that invokes the monitored process must be restarted. For `w3wp` on Windows, restart IIS by running `iisreset` after the changes are made to the environment variables.

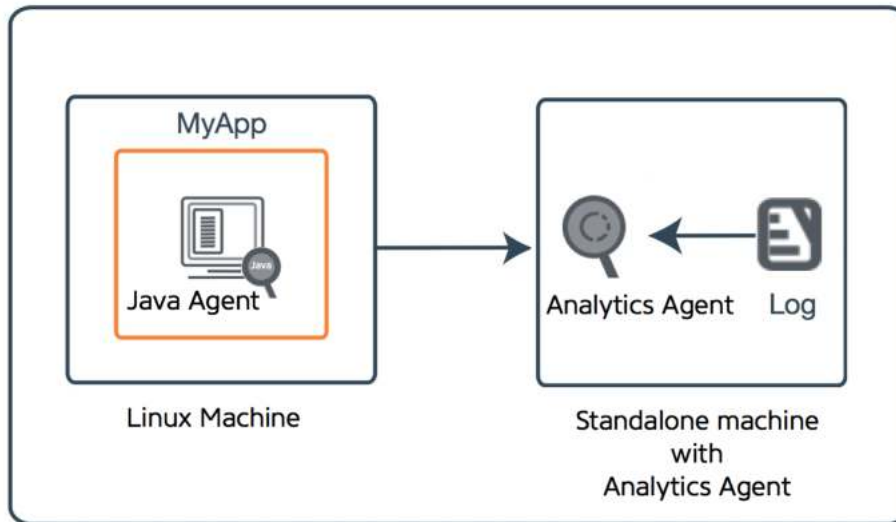

### Install the Standalone Analytics Agent on Linux

As described in [Analytics Deployment Options](#), the Analytics Agent can run on the same host or on a different host from the app server agent, depending on your use case.

The [AppDynamics Downloads Portal](#) provides the following distribution archives:

- Standalone Analytics Agent (no JRE)

The default settings of the app server agent typically assume that the Analytics Agent is on the same host and uses the default port. If your Analytics Agent is on a host separate from the app server agent, as shown in the diagram below, or you have changed the default port, you need to specify the new host and port values for the app server agent.

## Revise the Analytics Agent Properties File

The Analytics Agent properties file determine how your Analytics Agent communicate with other components, what type of data it gathers from the monitored application, and how the components of the Application Analytics deployment and the Controller authenticate to each other.

Modify the default configuration and set the desired values for the agent properties in the properties file. The location of this file depends on your exact deployment scenario.

1. Open the `<analytics-agent-home>/conf/analytics-agent.properties` file with a text editor.
2. Follow the instructions to [enable the standalone Analytics Agent](#).

## Start and Stop the Analytics Agent

You can start and stop the Analytics Agent directly in the command line.

To start the agent, run:

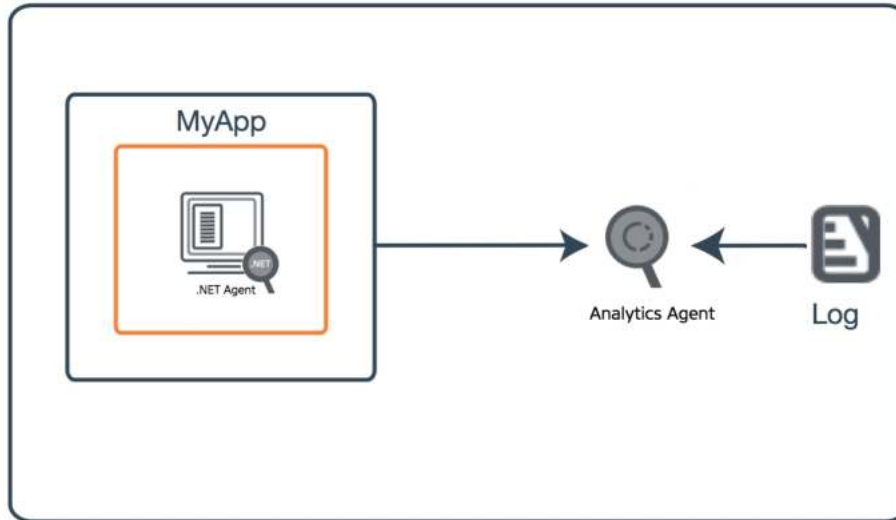

```
<analytics agent executable> start
```

To stop the agent, run:

```
<analytics agent executable> stop
```

## Run the Analytics Agent From a Read-Only Filesystem

In this deployment, the Analytics Agent is installed and run from a read-only filesystem. To do so, you need to direct the Analytics Agent to write its log files to a writable partition.

By creating a directory for the Analytics Agent in a writable file system and symlinks for the content of the Analytics Agent in the read-only file system, you will have a writable top-level directory for the Analytics Agent and a writable logs directory under the top-level directory.

To run the Analytics Agent from a separate writable directory using artifacts from a read-only directory:

1. Provide necessary permissions to the read-only Analytics Agent directory.

```
analytics-agent-readonly refers to the read-only analytics agent.
chmod -R 555 /tmp/analytics-agent-readonly/
```

2. Create a directory for the Analytics Agent in a writable file system.

```
mkdir /tmp/analytics-agent-writable
chmod 755 analytics-agent-writable/
cd /tmp/analytics-agent-writable
```

3. Create symlinks to the contents of the Analytics Agent in the read-only file system.

```
ln -s /tmp/analytics-agent-readonly/bin/ bin
ln -s /tmp/analytics-agent-readonly/lib/ lib
ln -s /tmp/analytics-agent-readonly/monitor.xml monitor.xml
```

4. Create a writable `conf` directory under that top-level directory.

```
cd /tmp/analytics-agent-writable
mkdir conf
chmod 755 conf/
```

```
cd conf
```

5. Create symlinks to the contents of the `conf` directory.

```
ln -s /tmp/analytics-agent-readonly/conf/analytics-agent.* .
ln -s /tmp/analytics-agent-readonly/conf/job/ job
ln -s /tmp/analytics-agent-readonly/conf/grok/ grok

cd /tmp/analytics-agent-writable
```

6. Create logs directory under the `analytics-agent-writable` directory.
7. Run the Analytics Agent from the `writable` directory.

```
cd /tmp/analytics-agent-writable
nohup bin/analytics-agent.sh start &
```

8. The resulting directories look similar to:

```
/tmp/
dr-xr-xr-x 6 ec2-user ec2-user 4096 Jul 17 20:45 analytics-agent-readonly
drwxr-xr-x 4 ec2-user ec2-user 4096 Jul 26 20:17 analytics-agent-writable

/tmp/analytics-agent-writable/
total 24
drwxr-xr-x . . . 4096 Jul 27 19:41 .
drwxrwxr-x . . . 4096 Jul 27 19:37 ..
lrwxrwxrwx 1 . . . 50 Jul 27 19:38 bin -> /tmp/analytics-agent-readonly/bin/
drwxr-xr-x . . . 4096 Jul 27 19:41 conf

drwxrwxr-x . . . 4096 Jul 27 21:32 watermark
```

## Enable the App Server Agent for a Remote Analytics Agent

For most configurations, install the Analytics Agent on the same machine as the app server agent. In certain setups, such as installing an Analytics Agent extension, you will need a separate machine.

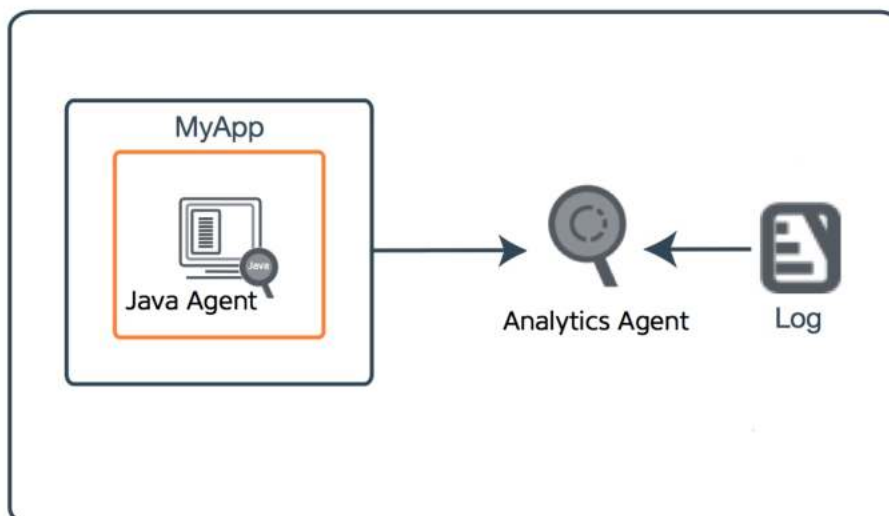

1. Specify the location of the remote Analytics Agent with a `-D` parameter. The argument is passed to the monitored application as follows:

```
-Dappdynamics.analytics.agent.url=http://<analytics-agent-ip>:9090/v2/sinks/bt
```

2. Replace `<analytics-agent-ip>` with the hostname of the Analytics Agent for your environment.

## Enable the Standalone Analytics Agent

In this deployment, the Analytics Agent and app server agent runs on the same machine. The Analytics Agent reads and transmits log data from log files on the host machine. The app server agent transmits data from the monitored application to the Analytics Agent.

For environments that do not have a Machine Agent installed, install the Analytics Agent as a separate binary, `analytics-agent.sh`.

1. Unzip the Analytics Agent distribution archive to the installation directory on each target host.

When you unzip this archive, you get three directories:

- `bin` : contains the binary file for Linux, Solaris, and OSX
- `lib` : contains all the jar files that need to be in the classpath
- `conf` : contains all the configuration files, such as the properties and `vmoptions` files

2. Open the following file to configure connectivity from the Analytics Agent to the Events Service.

```
<analytics-agent-home>/conf/analytics-agent.properties
```

3. In the `analytics-agent.properties` file, do the following:

- Change the default URL and, if necessary, the port number to connect the Events Service by modifying the `http.event.endpoint` value.  
For example:

```
http.event.endpoint=http://<events_service_host:events_service_port>
```

For SaaS-based installations, the host and port are:

- `https://analytics.api.appdynamics.com:443` (North America)
- `https://fra-ana-api.saas.appdynamics.com:443` (Europe)
- `https://syd-ana-api.saas.appdynamics.com:443` (APAC)

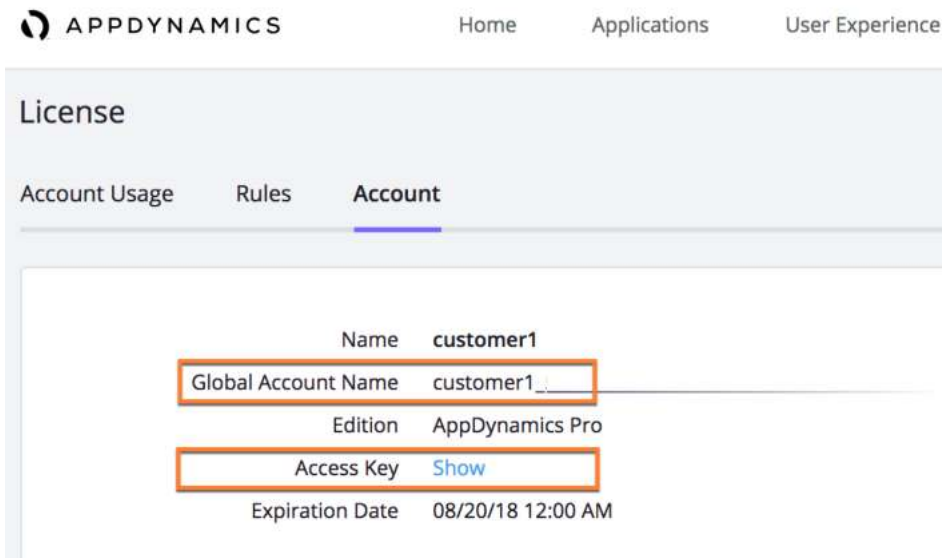

If your firewall rules use IP addresses, review firewall considerations in [Troubleshoot Analytics Agent Issues](#). For on-premises installations, use any host and port that you have configured. In clustered environments, this is often a load balancer.

- Change the default URL and the port number to point to the Controller by modifying the `ad.controller.url` property.  
For example:

```
ad.controller.url=http://<application_server_host_name>:<http-listener-port>
```

This is the URL and the port number you use to access the Controller UI.

4. The **Global Account Name** and **Access Key** values are found under **View License** in the Controller.

5. Configure the account and account key for which the agent should publish the business transaction data. Use the **Global Account Name** and **Access Key** values you have collected earlier. For example:

```
The global_account_name in the Controller for this analytics data, similar to the
following:
http.event.accountName=<customer1_74678b04-8a71-40ef-acaf-xxxxxxxxxxxx>
Replace this value with the access key of the account name configured above.
http.event.accessKey=<3d58aba2-xxx-xxx>
```

The `http.event.accountName` property specifies the **Global Account Name** of the account. The `http.event.accessKey` property specifies the **Access Key**, which provides an authentication mechanism between the Controller and the components of the Application Analytics deployment. The

Controller installation process generates the **Access Key** value.

For SaaS-based installations, set the `http.event.name` property to **Name** of the account. The default value is `customer1`. If the property is not configured correctly, the Analytics Agent will not be able to authenticate. The resulting errors are stored in the `analytics-agent.log` file.

6. If you are collecting log information on this host, you need to:
  - Configure your log sources. See [Collect Log Analytics Data](#) for details.
  - Update additional properties. See [Configure Properties for Consolidated Log Management](#).
7. Save and close the file.
8. Start the Analytics Agent by running the following command.

```
bin\analytics-agent.sh start
```

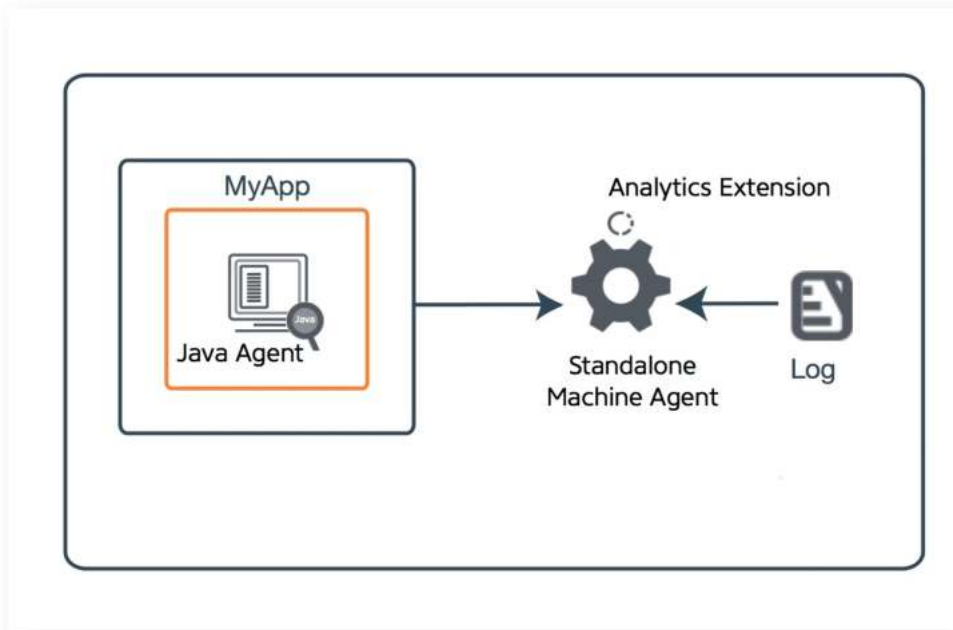

### Enable the Analytics Agent as an Extension to the Machine Agent

This section describes how to configure the Analytics Agent as an extension to the Machine Agent and run as a Machine Agent monitor.

The [AppDynamics Downloads Portal](#) provides the following distribution archives:

- Machine Agent Bundle - 64-bit osx (zip)
- Machine Agent Bundle - for both 32-bit and 64-bit Linux machines (rpm)
- Machine Agent Bundle - for both 32-bit and 64-bit Linux machines (zip)
- Machine Agent Bundle - for 64-bit solaris (zip)
- Machine Agent Bundle - for 64-bit solaris-sparcv9 (zip)
- Machine Agent Bundle - for 64-bit solaris-x64 (zip)
- Machine Agent Bundle - for both 32-bit and 64-bit Windows machines (zip)

If the Machine Agent and app server agent are running on the same machine, installing a standalone Analytics Agent is not necessary. In environments with the Machine Agent already running, you can enable and run the Analytics Agent as an extension.

Confirm that JRE 8 or later is installed on the host running the Machine Agent. If the required version of JRE is not available on the host, then the Analytics Agent cannot be enabled.

1. On the host running the Machine Agent, open `<machine-agent-home>/monitors/analytics-agent/monitor.xml` with a text editor.
2. Set the `enabled` tag to `true` and save the file when you are finished.

```
<monitor>
 <name>AppDynamics Analytics Agent</name>
 <type>managed</type>
 <!-- Enabling this requires JRE 8 or higher -->
 <enabled>true</enabled>
 ...
```

3. Open the following file to configure connectivity from the Analytics Agent to the Events Service:

```
<machine-agent-home>/monitors/analytics-agent/conf/analytics-agent.properties
```

4. Follow the instructions to [enable the standalone Analytics Agent](#).
5. If the Machine Agent is already running at this point, restart it to pick up the changes in the configuration.

**i** To connect to the Events Service through a proxy server, see [Connect the Agent to the Events Service through a Proxy](#).

## Tune Analytics Agent

This section describes the post-installation configuration of the Analytics Agent: configuring Analytics Agent to connect to an Event Service with a proxy server, collecting log files using Consolidated Log Management (CLM), setting resource usage limit, and changing JVM options.

### Connect to the Events Service through a Proxy

If the Analytics Agent needs to connect to the Events Service through a proxy server:

1. Open `<analytics-agent-home>\conf\analytics-agent.properties` with a text editor.
2. Add this information:

```
optional proxy properties
http.event.proxyHost=<your proxy host>
http.event.proxyPort=<your proxy port>
http.event.proxyUsername=<your proxy username, if authentication is required>
http.event.proxyPassword=<your proxy password, if authentication is required>
```

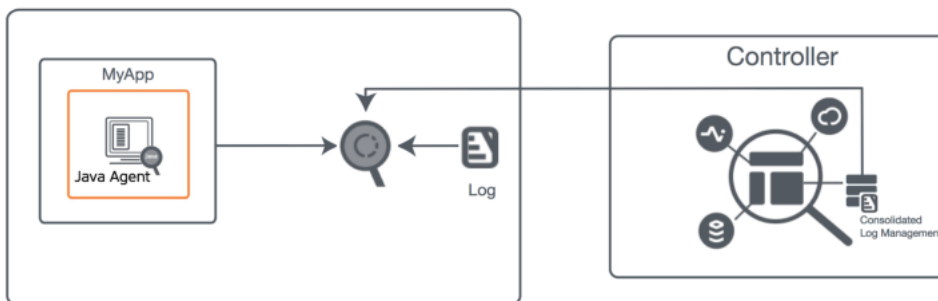

3. Save and close the file.

### Configure Analytics Agent for Consolidated Log Management

If you want your Analytics Agent to work with CLM you need to configure a few properties in the Analytics Agent properties file.

Provide the Controller URL, customer name, and name of your Analytics Agent in the `analytics-agent.properties` file. The customer name is found under **View License** in the Controller.

If you are using CLM to configure your log files with source rules, you will need to provide these properties with the correct values.

The default values are the following:

```
Format should be http://<host>:<port>
ad.controller.url=http://localhost:8090

The customer name field from the AppDynamics license page.
http.event.name=customer1
```

```
This is the friendly agent name that will show up in the controller when the agent registers and syncs configuration.
ad.agent.name=analytics-agent1
```

## Change Java Virtual Machine Options

If you need to change any JVM startup options, modify `<analytics-agent-home>/conf/analytics-agent.vmoptions` with a text editor.

The `vmoptions` file name is read from the `ad.jvm.options.name=analytics-agent.vmoptions` properties file. If you change the `vmoptions` file name, you will need to change the `ad.jvm.options.name` property as well.

If the Analytics Agent Windows service is installed and you need to change the properties file or the `vmoptions` file, you need to uninstall the service and reinstall it for the changes to take effect.

## Configure Resource Usage Limit

To limit resource usage, you can enable the default limit on the number of job for a single Analytics Agent.

This limit can be overridden but is not recommended without a thorough understanding of the potential impact on resource usages, such as CPU usage, disk, and network I/O.

The property is `ad.max.enabled.jobs` and is found in the `<analytics-agent-home>/conf/analytics-agent.properties` file. By default, `ad.max.enabled.jobs` is set to 20.

## Verify Analytics Agent Status

To verify that the Analytics Agent has started, look for the following entry in the App Agent log file: `Started [Analytics] collector`.

To connect to the Events Service through a proxy server, see [Connect the Agent to the Events Service through a Proxy](#).

## Additional Configurations

For Analytics Agent version  $\geq 21.7$ , you can add authentication to pipeline resources. To do so:

1. Use the following property in `analytics-agent.properties` to add authentication to pipeline endpoints:

```
ad.pipeline.resource.authenticate=true
```

2. Once enabled, access the endpoints by passing the `Global-Account-Name` and `Access-Key` of the account as HTTP headers `X-AppDynamics-Global-Account-Name` and `X-Analytics-Agent-Access-Key` accordingly:

```
--header 'X-Analytics-Agent-Access-Key: access_key' \
--header 'X-AppDynamics-Global-Account-Name: global_account_name' \
```

## Troubleshooting Tips

- Ensure that the properties in `analytics-agent.properties` are properly set. See [Enabled Job Files Limit](#).

- JRE version is  $\geq 1.7$  and the `JAVA_HOME` variable is set in the environment.
- All properties in `analytics-agent/conf/analytics-agent.vmoptions` are compatible with the JRE.
- By default, the Analytics agent utilizes TLS 1.3. If you are using HP-UX or AIX operating systems, you must use the following versions for underlying JDKs:
  - For HP-UX: `=>1.8.0.26-hp-ux`
  - For AIX: `=>1.8.0_381`
- If you are using an underlying JDK that does not support TLS 1.3, the following error will occur.

**Error**

```
NoSuchAlgorithmException: TLSv1.3 SSLContext not available
```

To resolve this error, you must use the above mentioned JDKs or configure TLS 1.2. To configure TLS 1.2, specify `ad.http.tls.version=TLSv1.2` in the `conf/analytics-agent.properties` file. See [Revise the Analytics Agent Properties File](#).

## Install Agent-Side Components in Kubernetes

This page describes the deployment options for Transaction Analytics and Log Analytics instrumented with AppDynamics app server agents in Kubernetes applications. See [Install Agent-Side Components](#).

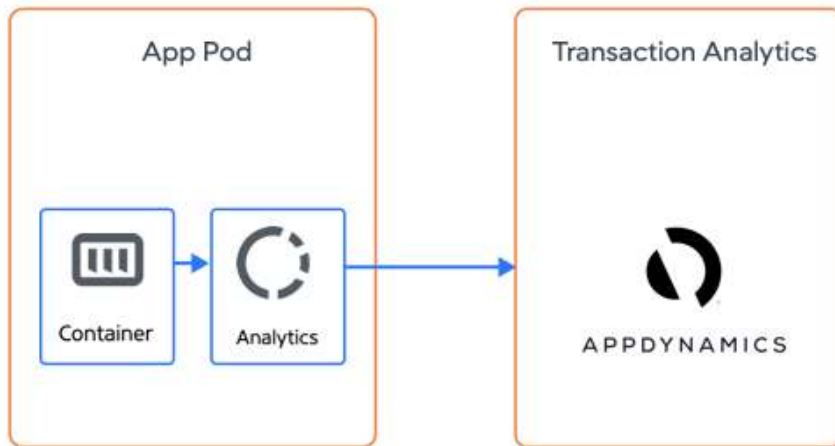

**i** Transaction Analytics and Log Analytics require that an Analytics Agent is deployed with an app server agent. The Java Agent  $\geq 4.5.15$  or the .NET Agent  $\geq 20.10$  does not require deploying an Analytics Agent for Transaction Analytics. See [Deploy Analytics Without the Analytics Agent](#).

### Transaction Analytics

The Analytics Agent acts as a proxy between the app server agent and the Events Service. See [Deploy Analytics With the Analytics Agent](#).

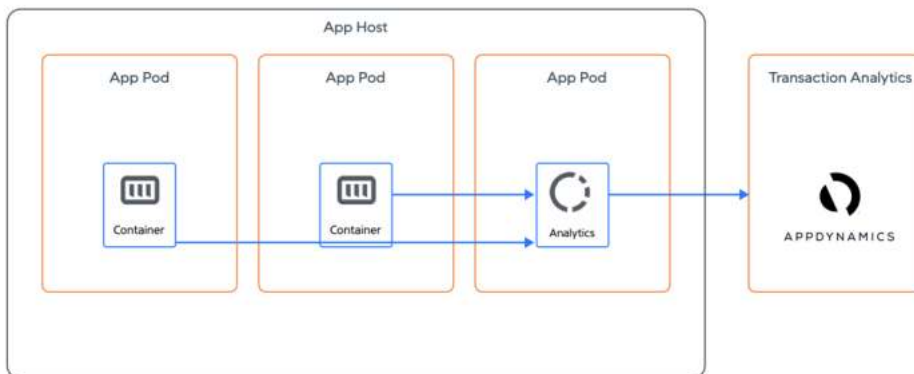

There are two deployment options for the Analytics Agent to support Transaction Analytics on a Kubernetes application.

1. A sidecar to the application container.

In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container.

2. A shared agent where a single Analytics Agent is deployed on each Kubernetes worker node. Each pod on the node will use that Analytics Agent to communicate with the Events Service.

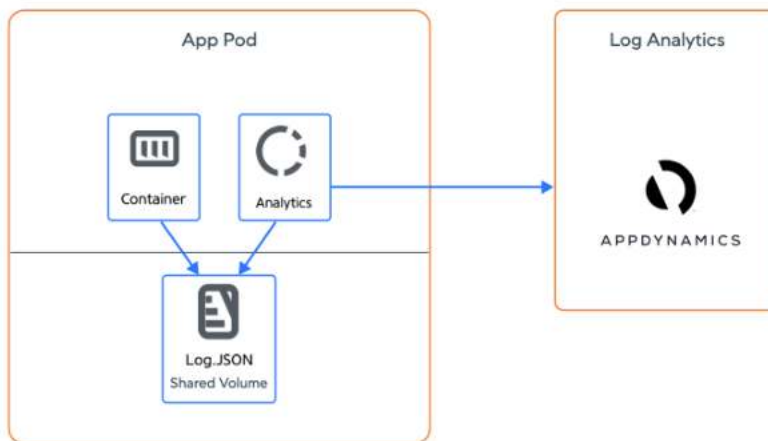

In this model, the Analytics Agent is deployed as a Daemonset.

## Log Analytics

Once deployed, the Analytics Agent has access to the application's logs and can send log data to the Events Service.

There are three deployment options for the Analytics Agent to support Log Analytics on a Kubernetes application.

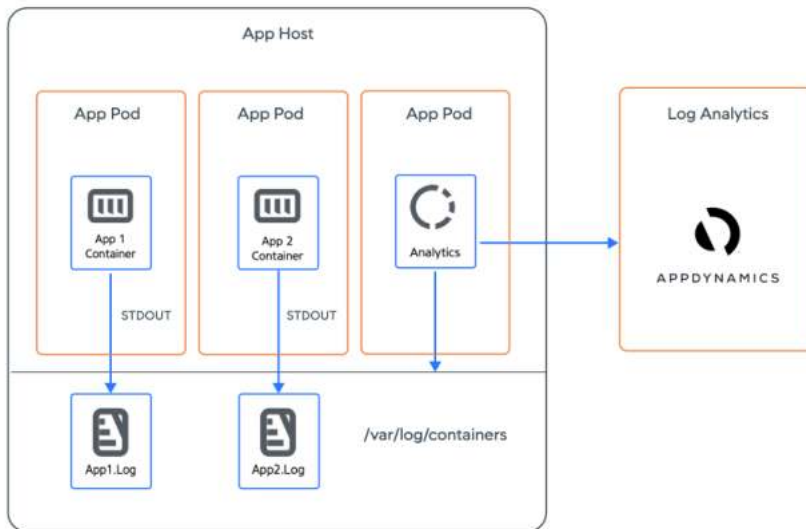

1. A sidecar to the application container.

In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container. The Analytics Agent and application container are configured to share a volume where the application logs are written.

2. If the application bypasses the container filesystem and emits log data to `STDOUT` and `STDERR`, the Analytics Agent can be deployed on each Kubernetes worker node. The Analytics Agent can access the log output for every application container on the worker node's file system, stored by Kubernetes under `/var/log/containers` as a unique file per container.

In this model, the Analytics Agent is deployed as a Daemonset.

**i** For some Kubernetes distributions such as OpenShift, the Analytics Agent will require elevated permissions to access the files under `/var/log/containers`.

3. If a syslog provider is available in the Kubernetes cluster, the Analytics Agent can be deployed to receive syslog messages with TCP transport. A single Analytics Agent instance is required per syslog provider. See [Collect Log Analytics Data from Syslog Messages](#).

For Transaction and Log Analytics, the sidecar approach is simpler to deploy, but consumes more cluster resources because it requires one additional container per application pod. The shared agent approach adds another deployment object to manage, but can significantly reduce the overall resource consumption for a cluster.

### Example Configurations to Deploy the Analytics Agent

The following deployment specs are specific examples of how to implement the deployment options explained above. In addition, see [Install the .NET Agent for Linux in Containers](#) and [Install the Node.js Agent in Containers](#) for best practices on how to set the Analytics Agent host, port, and SSL environment variables.

#### Transaction Analytics: Deployment Spec Using A Sidecar

The following deployment spec defines two containers, the application container `flight-services`, which uses an image instrumented with an app server agent, and the Analytics Agent container `appd-analytics-agent`, which uses the Machine Agent from Docker Hub, `docker.io/appdynamics/machine-agent-analytics:latest`.

The `appd-analytics-agent` container leverages a ConfigMap and Secret to configure the Events Service credentials required by the Analytics Agent, including the account access key and global account name. See [Install Agent-Side Components](#).

As a sidecar, the Analytics Agent is available at `localhost` and uses the default port `9090`. The app server agent will connect automatically and no additional configuration is required.

The `controller-info` ConfigMap can be found in the [Controller Info YAML File](#). The command to create `appd-secret` can be found in [Secret](#).

### Transaction Analytics: Deployment Specs Using A Shared Analytics Agent

The following deployment spec is for the same `flight-services` application, but instead of using a sidecar, it references a shared Analytics Agent deployed separately as a Daemonset. The `flight-services` container sets the agent environment variables `APPDYNAMICS_ANALYTICS_HOST` and `APPDYNAMICS_ANALYTICS_PORT` to the `analytics-proxy` service for the shared Analytics Agent defined in the example below.

```

 loadBalancer: {}

```

The full deployment spec can be found in the [Machine Agent YAML File](#). The `appdynamics-infraviz` service account is defined in the [RBAC YAML File](#). The `ma-log-config` ConfigMap is defined in the [Machine Agent Log Config File](#).

A best practice is to deploy the shared Analytics Agent in a dedicated namespace (typically `appdynamics`) separate from the namespaces used by applications.

```
$ kubectl -n appdynamics apply -f analytics-agent.yaml
```

To provide access to the shared Analytics Agent from an application namespace:

1. An `ExternalName` service is required to map a service name (`analytics-proxy` in the example) to the DNS name of `appd-infra-agent-service` created previously:

```
kind: Service
apiVersion: v1
metadata:
 name: analytics-proxy
spec:
 type: ExternalName
 externalName: appd-infra-agent-service.appdynamics.svc.cluster.local
 ports:
 - port: 9090
 targetPort: 9090
```

2. Create this service in each application namespace where an App Server Agent is deployed:

```
$ kubectl -n <app namespace> apply -f analytics-proxy.yaml
```

3. Note that `analytics-proxy` is the value of `APPDYNAMICS_ANALYTICS_HOST` used in the `flight-services` deployment spec.

```
- name: APPDYNAMICS_ANALYTICS_HOST
 value: analytics-proxy
```

## Log Analytics: Deployment Spec Using A Side Car

The following deployment spec snippet is for a Java application that defines an application container, `client-api`, and an Analytics Agent container, `appd-analytics-agent`, that acts as a sidecar to the application container. An init container, `appd-agent-attach`, is also defined, but the related definitions are removed to simplify the example.

A shared volume, `appd-volume`, is mounted to the application container and Analytics Agent container using the mount path `/opt/appdlogs`. The Java application is configured to write its logs to this path and the Analytics Agent is configured to read the logs from this path and send them to the Events Service.

```
apiVersion: apps/v1
kind: Deployment
```

### Log Analytics: Deployment Spec For Shared Analytics Agent (STDOUT/STDERR Support)

The following deployment spec supports the use case where application containers are emitting logs to `STDOUT` and `STDERR`, not the application container filesystem.

Since Kubernetes writes the container logs to the host under `/var/log/containers`, the Analytics Agent can read them there. The Analytics Agent is deployed as a Daemonset. A volume `varlog` is defined with access to the host path `/var/log/containers` and mounted to the Analytics Agent container, `appd-analytics-agent`. The Analytics Agent is configured to read the container-specific logs written to `/var/log/containers`. See [Configure Log Analytics Using Source Rules](#).

## Upgrade Analytics Agent

This page describes how to update the Analytics Agent standalone binary and includes some steps that are relevant only if you are collecting Log Analytics data.

If you are running the Analytics Agent through the Machine Agent, see [Upgrade the Machine Agent](#) for instructions.

**i** You should maintain a copy of the controller.xml file in addition to the analytics-agent.properties, job folder, and watermark folder. Preserving the watermark file and the job files is only necessary when you are collecting log data for analytics. The watermark file preserves information about the number of bytes read from the log sources by the Analytics Agent and is relevant only when Log Analytics is enabled.

### File Locations

After unzipping the Analytics Agent standalone binary, the file locations are:

- property file: `<analytics-agent-home>/conf/analytics-agent.properties`
- job files: `<analytics-agent-home>/conf/job`
- watermark file: `<analytics-agent-home>/conf/watermark`

Running Analytics Agent via the Machine Agent, the file locations are:

- properties file: `<machine-agent-home>/monitors/analytics-agent/conf/analytics-agent.properties`
- job file: `<machine-agent-home>/monitors/analytics-agent/conf/job`
- watermark file: `<machine-agent-home>/monitors/analytics-agent/conf/watermark`

### Upgrade Procedure for Analytics Agent (Standalone Binary)

Use these steps to upgrade your Analytics Agent (standalone binary) to 20.x.

1. Stop the Analytics Agent.
2. Download the 20.x Analytics Agent binary from the download site.
3. Extract the new zip. Be sure to extract into a new empty directory or confirm that the old directories are empty before extracting the new version. Otherwise, you may encounter errors starting the Analytics Agent.
4. (Windows only) If the Analytics Agent is installed as a Windows Service, you need to manually uninstall the old service before installing the 20.x version.
5. Save a copy of your old analytics-agent.properties so you can copy values to the new analytics-agent.properties file.
6. Modify the new analytics-agent.properties file with in accordance with the steps here: [Install Agent-Side Components](#), referring to your previous properties as needed.
7. If you have been collecting log analytics data:
  - a. Copy the old watermark file to the corresponding location in the new `<analytics-agent-home>` directory structure.
  - b. Copy your pre-existing job files to the corresponding location in the new `<analytics-agent-home>` directory structure.
8. Start the new Analytics Agent.  
 You can observe that the agent starts the enabled job file, and starts tailing the logs from the last read position in the watermark file. Usually, a log message is displayed stating the start of the tailing from last

---

read location. It matches with the watermark file. If at time printing log message gets out of sync, it can be manually validated through the UI that all logs have been tailed, and no duplicate logs have been tailed.

To move from job files to the new Consolidated Log Management source rules, see [Migrate Log Analytics Job Files to Source Rules](#).

## Analytics and Data Security

### Related pages:

- [Manage Field Visibility](#)
- [Manage API Keys](#)
- [Manage Custom Roles](#)

Application Analytics provides role-based access control (RBAC) to enable you to control and protect your data. The Analytics permissions enable you to provide granular, controlled access to features and analytics data in your environment. This topic outlines the available permissions.

### Roles and Permissions

A predefined role called Analytics Administrator is provided with preset permissions for all Analytics-specific permissions.

You can clone predefined roles as a starting point for creating your own customized roles, but you should not assume the cloned roles have all of the permissions of the predefined role. In some cases, there may be hidden permissions, so you should add or remove permissions as needed for your customized role to ensure that you get the RBAC result you need.

To create roles and assign users to roles for Analytics, users need both the **Analytics Administrator** and the **Account Owner** role.

See [Transaction Analytics Permissions](#).

### Default Application

To ensure that your users have access to the full Analytics functionality they need, be sure to give them the view permission on the Default Application. This permission is given to all predefined admin roles and to the read-only role, **Applications & Dashboards Viewer**. If you create new roles for analytics, you need to grant this permission in addition to specific analytics permissions.

When you create a new role, this permission is not automatically given to that role. You can add the read-only role to new users. Alternatively, navigate to **Administration > Applications** and select the **View** permission in the Default Application.

### Analytics Administration UI Tabs

Access the Analytics tab in the Controller Administration UI when creating new roles to see the available permissions.

### General Permissions

This section describes permissions that control access to analytics features:

- [Manage Fields](#)
- [Manage APIs](#)
- [Manage Metrics](#)

- [Configure Log Analytics with Source Rules](#)
- [Manage Business Journeys](#)
- [Manage Experience Levels](#)

## Search Permissions

All the saved searches created in Analytics appear in this section. The admin role can assign View, Edit, and Delete permissions on a search by search level. The admin can create and save specific searches needed by various roles in your organization. In addition to enabling the permissions, View, Edit, and Delete, for a specific saved search, the admin must also enable access to the related application or log source type for the search. Otherwise, the data access level won't be granted to the role.

To create a new saved search, the user must have the **Can Create a Search** permission.

**View** permission: Assigning only the View permission for a saved search means users can not edit or delete the search.

**Edit** permission: Assigning Edit permission for a saved search means users can modify the filter criteria and save back to the same search.

**Delete** permission: Assigning Delete permission for a saved search means users can delete the search.

## Event Type Permissions

**Transactions Permissions:** Enables the admin user to assign permissions for viewing application transaction data. Permissions can be granted to view all transaction data for the account or on an application-by-application basis. When creating new roles, remember that granting permissions to view transaction analytics data does not automatically grant permissions to see all application data associated with a specific transaction analytics record.

You need to grant at least read-only permissions to the application to enable the user to see associated transaction snapshot data such as flow maps.

**Log Permissions:** Enables the admin user to assign permissions for viewing log data. Permissions can be granted to view log data for all source types configured for the account or on a source by source basis.

**Browser Requests Permissions:** Enables the admin user to assign permissions for viewing browser request data. Permissions can be granted to view data for all applications for the account or for specific applications.

**Mobile Requests Permissions:** Enables the admin user to assign permissions for viewing mobile requests and crash report data. Permissions can be granted to view data for all applications for the account or for specific applications.

**Custom Analytics Events:** Enables the admin user to assign permissions for querying custom analytics events data. Permissions can be granted to view data for all custom analytics events or for specific applications.

**Synthetic Permissions:** Enables the admin user to assign permissions for querying Synthetic events data. Permissions can be granted to view data for all applications for the account or for specific applications.

---

## Manage API Keys

### Related pages:

- [Manage Custom Roles](#)

This page describes how to manage REST API Keys.

The Analytics Events REST API provides three independent endpoints for these responsibilities:

- Schema Management
- Publish Events
- Query Events

API Keys provide a secure authentication mechanism for a caller to prove identity when using these public REST APIs.

Because call sites can vary across your infrastructure, departments, and geographic regions, these credentials could be widely distributed and hard to control. Publishing or querying events from different call sites, therefore, require fine-grained control over the keys and the operations allowed for a particular key. You may also need to revoke these keys on demand if they are found to be compromised.

For these reasons, managing access for the Analytics Events API uses API keys. Your organization can create multiple API keys, manage and distribute them based on your own internal policies. For instance, each department or geographic region may be assigned its own API key for distribution and control management. If an API key is compromised, it can be deleted and a new key created without other undesirable side effects.

API keys are only valid for calling the public Analytics Events REST API and can't be used to access the AppDynamics Controller or data in any other way. See [Analytics Events API](#).

### Permissions

API keys are used only for Analytics Events REST APIs. When you create an API key, you can specify read and write permissions for each API key.

Users with the **Manage API** permission can do the following actions:

- Add—Creates an API key
- Disable—Deactivates the calls using that key temporarily, but does not remove the key
- Enable—Re-enables a deactivated key
- Delete—Removes the key permanently

 It may take up to 15 minutes for a key that has been deleted or deactivated to be detected and all operations using that key to be rejected.

When you create an API key, you see permissions for the various event types (logs, transactions, browser, and mobile) in our platform. By using these permissions you can limit or grant access to specific event types for each specific API key.

Examples:

Select **Publish all Custom Events** when you create their API key to generate an API key for your partners allowing them to only publish custom events.

Under **Log Permissions**, select **apache** as the **source type** to generate an API key to allow various users to only query Apache log data.

 Once an API Key is created, you cannot change the permissions.

You can grant permissions for API Keys as follows:

### Custom Analytics Events

- Manage Schema— Enables creation of schemas using the Analytics Events Schema Management APIs.
- Query Custom Events—Enables you to query all Analytics event types (with the appropriate permissions).
- Publish Custom Events—Enables you to publish Analytics custom events using the Analytics Events Publish APIs.

**Transactions**—Query all transactions or specific applications.

**Logs**—Query all logs or specific source types.

**Browser Requests**—Query all browser requests or specific applications.

**Mobile Requests**—Query all mobile requests or specific applications.

**Synthetic Requests Permissions**—Query all synthetic requests data or specific applications.

**Connected Devices Permissions**—Query all connected device requests data or specific applications.

 If you have deployed EUM such that you are using an on-premises Events Service for transaction and log analytics data, and the SaaS Events Service for your EUM data, you can not query the browser or mobile request data using the Analytics API.

### Create API Keys

1. Navigate to **Analytics > Configuration > API Keys**. You can view existing keys and access actions to manage the keys.
2. Click **+Add** to view the configuration panel.
3. Add a **Name** and **Description**.

 Do not click **Create** until you finish selecting all the necessary permissions for your use case, including any necessary analytics data permissions. You cannot change the permissions once create the key. You can only edit the description and whether the key is active or inactive.

4. Expand each permission section to select the permissions for this key.
5. Click **Create**.
6. Copy and save the key.
7. Select the checkbox indicating you have copied the key and click **Done**.

 You cannot retrieve the key once you dismiss this dialog.

### Manage Field Visibility

#### Related pages:

- [Manage Custom Roles](#)
- [Analytics and Data Security](#)

This page describes how to manage the visibility of fields in your analytics data. This capability enables you to prevent fields from being viewed by others in your organization.

---

You can set the visibility of the fields in most of the analytics event types with the exception of custom events. Hiding fields in custom events is not supported.

### Permissions

The Manage Fields permission is required to manage field visibility. If a role has the Manage Fields permission, it means all the users with that role can manage all the fields they have access to. They can unhide the fields or see which fields have been hidden. For instance, if you have Manage Fields permission and View permission for the business transactions in the Ecommerce App, then you can only see and manage fields for that application.

### Manage Fields

1. From the Analytics Search panel, click  next to each component grouping to open the Manage Fields panel.
2. Use the Manage Fields panel to show or hide fields. The list of fields varies based on the event type selected for the search.

### Delete Extracted Fields

For  $\geq 4.3$ , you may have two types of extracted fields, fields created in 4.2 where the Controller version has been upgraded to a higher version and fields extracted from logs with log source rules.

For fields created in 4.2, you can delete the fields:

1. Hover over the field and click on the view icon that appears.
2. Click on **Delete** in the popup.

For fields being extracted from logs using log source rules, you can delete the fields by editing the source rules. See [Field Extraction for Source Rules](#).

### Manage Business Journeys and Experience Levels

This page describes how to manage the visibility of business journeys and experience level management (XLM) with role-based access control (RBAC). Business journey and XLMRBAC is required to restrict access to sensitive information among your organization. If a user attempts to access restricted features, a message appears warning the user that access is denied.

Only the analytics admin can grant permissions to business journeys and XLM, as well as with their respective searches, event types, and sources. The admin authorizes access on an individual basis by assigning each user to the applicable role.

### Creating Business Journey and XLM Roles

In the Controller UI, navigate to **Settings > Administration > Roles**.

The analytics admin can view and edit existing roles in the Analytics tab, which contains three sections: General, Searches, and Events. Select **+Create** to make a new role.

### General Permissions

In the General tab, the analytics admin authorizes access to business journeys and/or XLM. This is required for the user to perform any actions on either business journeys or XLM. Check **Manage Business Journeys** and/or **Manage Experience Levels**:

---

General   Account   Applications   Databases   **Analytics**

---

General   Searches   Events

Select All   Unselect All

- Manage Centralized Log Config
- Manage Fields
- Manage APIs
- Manage Metrics
- Manage Business Journeys**
- Manage Experience Levels**

With general permission, the user has feature level access to business journeys and/or XLM. However, the user cannot view the definition of existing events or saved searches, or create new events, with only general permission. See the below sections to enable these permissions.

**i** A user can access business journey data through searches without general permission to business journeys, as long as the user's role permits access to the underlying event type(s) used in business journey definition. In this way, you can restrict access to define business journeys while also allowing a user to query the data. Ensure the user has all necessary access to event type(s) in the Events tab and leave **Manage Business Journeys** unchecked.

## Search Permissions

There are two search types in Analytics, drag and drop and query language. The analytics admin grants access to both types in the Searches tab.

Choose **Can Create a Search** to access both search types. Choose **+Add** to access specific saved searches.

Create search permission is required in order for a user to perform these operations:

- Save a search
- Create a metric
- Create a visual widget

Search access is dependent on event type access. A user has access to create and save searches only for the event type(s) and source(s) assigned in the user's role.

### Event Type and Source Permissions

The section describes how to assign event type and source access. Granting permission to business journeys and/or XLM does not provide a user blanket access to all reports. Users have access only to the exact event type(s) and source(s) granted by the analytics admin. For example, transactions are an event type, and their source is applications. Therefore, if a user requires access to particular applications, the analytics admin must select transactions as well as each necessary application for the user.

This table lists the available event types and their corresponding sources:

Event Type	Source
Transaction	Application
Log	Source Type
Browser Records	App Key
Mobile Records and Sessions	App Key
Synthetic Session	App Key
Connected Devices	App Key
Custom Analytics Events	Particular user-defined event type

You can specify exact access in the Events tab. Select the event type, then specify access for the relevant source. Check "**Can View Data from all [ source] "** to grant blanket access to each source. To select individual sources, click **+Add**.

### Create Role ? Save

General Account Applications Databases **Analytics** Dashboards User and Groups with this Role

General Searches **Events**

Type

Can view data from all Applications Grant access to all sources for the event type

Can view data from the following Applications:

+ Add Remove

Showing 0 of 0 Applications

Application
-------------

Grant access individual sources

With the appropriate event type and source permissions, the user can access existing reports as well as create new reports. For example, a user with permissions to Transactions and all applications can now create a new configuration for any application. However, if this user attempts to create a configuration for Log events, the configuration does not save and an error message appears in the UI:

The screenshot shows the 'Add Experience Level Management Configuration' dialog box. The 'Event Type' is set to 'Logs'. An error message at the top right reads: 'ID000458: Permission denied for configuration [testTxnAfterRbac]'. Annotations include: 'Log permission must be granted to create a configuration' pointing to the 'Logs' dropdown; 'Sources for the Event Type' pointing to the 'Filter By' section; and 'Grant access individual sources' pointing to the application list area.

**Compliance Target Settings**

Each event will be evaluated against the Compliance Target to determine the Daily Compliance.

Compliance Target ID:  Start Date: 03/05/19

Compliance Period: **Weekly**

Application	Compliance
Pre_Rb	98 % - 100%
Current Pa	94 % - 98%
Average	0 % - 94%

Treat Errors as Critical ?

Time Zone: **[GMT-08:00] Pacific Time (US & Canada)**

**Exclusion Periods**

Exclude the following time periods when evaluating events against the Compliance Target.

+ Add Exclusion Period

Cancel Save

ID000458: Permission denied for configuration [testTxnAfterRbac]

Showing 1 - 2 of 2

Grant access individual sources

Log permission must be granted to create a configuration

Sources for the Event Type

For XLM configurations, the **Filter By** field indicates the source(s) of the given **Event Type**. Users with limited permission to sources need to add their permitted source(s) as filter criteria. If you do not specify filter criteria, you must have permission to all sources for the event type to create the configuration.

### Dashboard Access

Grant permission to dashboards in the Dashboard tab. In this tab, the admin specifies if a user can create dashboards and time permissions, as well as custom permissions.

If an Analytics dashboard contains data from business journeys and/or XLM, access to the dashboard depends on the above permissions. For example, a role that allows its users to create a dashboard, but contains no permission to business journeys, does not permit the user to access a business journey-related dashboard. Ensure that roles have the necessary permission to access Analytics data and general dashboard access.

### View Analytics Agent Health

This page describes how to access the health list of Analytics Agents.

You can view Analytics Agents connected to your Controller in **Settings > AppDynamics Agent > Analytics Agents**. You can also view agent status and health information for the Log Analytics and Transaction Analytics pipelines.

When a new Analytics Agent starts and connects to the Controller, it registers with the Controller. Once the agent is registered, the agent requests configuration information every five minutes. As part of this request, the Analytics Agent reports health status information to the Controller. A healthy pipeline means analytics data is flowing from the Analytics Agent to the Events Service successfully.

Condition	Transaction Pipeline Health	Log Pipeline Health
Analytics Agent does not contact the Controller for more than five minutes.	Not connected 	Not connected 
No business transaction analytics data is flowing and there are no errors in the connection.	Connection is healthy, no data flowing 	Not Applicable
Business transaction analytics data is flowing and the Agent is publishing to the Events Service successfully with no errors.	Healthy 	Not Applicable
Business transaction analytics data is flowing, but the Agent is experiencing errors while publishing transactions to the Events Service.	Unhealthy 	Not Applicable

Condition	Transaction Pipeline Health	Log Pipeline Health
No log analytics data is flowing and there are no errors in the connection.	Not Applicable	Connection is healthy, no data flowing
Log analytics data is flowing and the Agent is publishing to the Events Service successfully with no errors.	Not Applicable	Healthy
Log analytics data is flowing, but the Agent is experiencing errors while publishing transactions to the Events Service.	Not Applicable	Unhealthy

## Permissions

To view the Analytics Agents list, you must belong to a role with the Account level **Administer users, groups, role authentication, etc. View License. View AppDynamics Agents. Use Agent Download Wizard** permission. The default Account Owner and Analytics Administrator roles have this permission.

## Access Analytics Agent Health List

To access Analytics Agents health view, navigate to **Settings > AppDynamics Agents > Analytics Agents**.

- View information for connected Analytics Agents.

Name	Unique Host ID	Version	Last Connected	Log Pipeline Health	Transaction Pipeline Health
analytics-agent1	a5453663	4.4.0	08/28/17 11:18:09 AM

3. View Analytics Agents by event type (log data and business transaction data).

4. Perform a search on the list of registered Analytics Agents.

## Analytics Licenses

### Related Pages:

- [Observe License Usage](#)
- [License Entitlements and Restrictions](#)

This page describes how to interpret the details of your Analytics license. The information is split between [Infrastructure-based Licensing and Agent-based Licensing](#). To see a complete list of licenses and packages, see [License Entitlements and Restrictions](#).

## Licensing for Analytics

Analytics licenses differ depending on what licenses you purchase. Under the Infrastructure-based Licensing model, Analytics licenses are part of monitoring packages, except for Log Analytics, which is a separate license. Under the Agent-based model, each Analytics agent is licensed separately. Learn more about [Licensing](#).

[Infrastructure-based Licensing](#)    [Agent-based Licensing](#)

### Types of Licenses

There are three types of licenses associated with Analytics:

1. Browser and Mobile Analytics (part of Real User Monitoring Peak)
2. Transaction Analytics (part of the Enterprise package)
3. Log Analytics (part of Log Analytics Pro)

See [License Entitlements and Restrictions](#) for more information on each license.

With a Browser Synthetic Pro license, you do not need an Analytics license to view Synthetic session data.

### How Licenses Are Consumed

- The Java Agent collects Transaction Analytics data. The Transaction Analytics license (as part of the Enterprise license package) is consumed through the Java Agent (as part of the Analytics Agent). If the Agent does not have an Enterprise license allocated, the agent will not be able to report Transaction Analytics data.
- The Analytics Agent does not consume any licenses. The Controller account information configured in the Analytics Agent is used for the periodic health check and log configuration sync; whether or not the account has IBL licenses provisioned does not matter.

### Accounts and Licenses

- The Global Account Name (GAN) configured in the Analytics Agent is used for request authentication and rate-limiting in the Events Service, and is not related to license allocation.
- The account configured in the Java Agent must have enough licenses, and the agent should acquire the license in the configuration sync.

### Overages

Analytics does not support overages. AppDynamics stops capturing analytics data once your limit has been reached.

### Disable Transaction Analytics License Consumption

When the analytics is disabled using the [disable-dynamic-services](#) node property, it can still consume the transactional analytics license.

To disable analytics service at the node level:

1. Log in to the Administrator Console with the administrator root password.
2. Select **Accounts**.
3. Double-click the account for which you want to disable the analytics service.
4. In the **Account properties** section, click **+ Add Property**.
5. In the left dialog, enter `NODE_LEVEL_ANALYTICS_DISABLE_FLAG`.

6. In the right dialog, enter `true`.
7. Configure the `disable-dynamic-services` node property.

 It may take approximately ten minutes to disable the analytics service.

Infrastructure-based Licensing [Agent-based Licensing](#)

## Types of Licenses

There are four types of licenses associated with Analytics:

1. Transaction Analytics
2. Log Analytics
3. Browser Analytics
4. Mobile Analytics

See [License Entitlements and Restrictions](#) for more information on each license.

 With a Browser Synthetic Pro license, you do not need an Analytics license to view Synthetic session data.

## Overages

Analytics does not support overages. AppDynamics stops capturing analytics data once your limit has been reached.

## Remote Analytics Agent Sizing

### Related pages:

- [Deployment Options and Scenarios](#)
- [Install Agent-Side Components](#)
- [Events Service Requirements](#)

This page describes how to estimate the hardware requirements for a remote Analytics Agent deployment where a single Analytics Agent is aggregating transaction events from multiple application agents. This page describes transaction analytics only.

You should consider these two questions when sending analytics data to a remote Analytics Agent:

- How many agents can report to one remote Analytics Agent?
- What are the machine requirements for hosting the remote Analytics Agent?

 Do not extract the numbers on this page to size for Log Analytics because you must install the Analytics Agent on the local machine to capture Log Analytics.

## Analytics Agent Sizing Based on Event Volume

Based on our testing, the volume of events being sent to the Analytics Agent is the limiting factor in determining how many agents can report to one remote Analytics Agent.

The tests were conducted on virtual hardware and programmatically generated workload. Real-world workloads may vary. To best estimate your hardware sizing requirements, carefully consider the traffic patterns in your application and test in a test environment that closely resembles your production application and user activity.

### Calculate Analytics Event Volume

One business transaction can traverse many tiers. In each tier, one business transaction traverses one node. One node produces one request per business transaction when the transaction is synchronous. For async transactions, multiple events may be generated by a node for a single request. One request equals one analytics event. To calculate how many events a business transaction generates, you need to count the number of tiers/nodes that are sending data into the Analytics Agent.

You can estimate the number of events using the following formula:

One business transaction generates events at a rate = **calls per minute** times the **number of tiers** reporting analytics data for the business transaction.

In simple terms: #events for one business transaction = calls per minute times # of tiers.

### Characteristics of the Amazon EC2 Instance Types

For complete information on Amazon EC2 instance types, see <https://aws.amazon.com/ec2/instance-types/>.

The testing was performed using c3.large, c3.xlarge, and c4.4xlarge.

Model	vCPU	Mem (GiB)	SSD Storage (GB)
c3.large	2	3.75	2 x 16
c3.xlarge	4	7.5	2 x 40
c4.4xlarge	16	30	EBS-Only

## Test Results

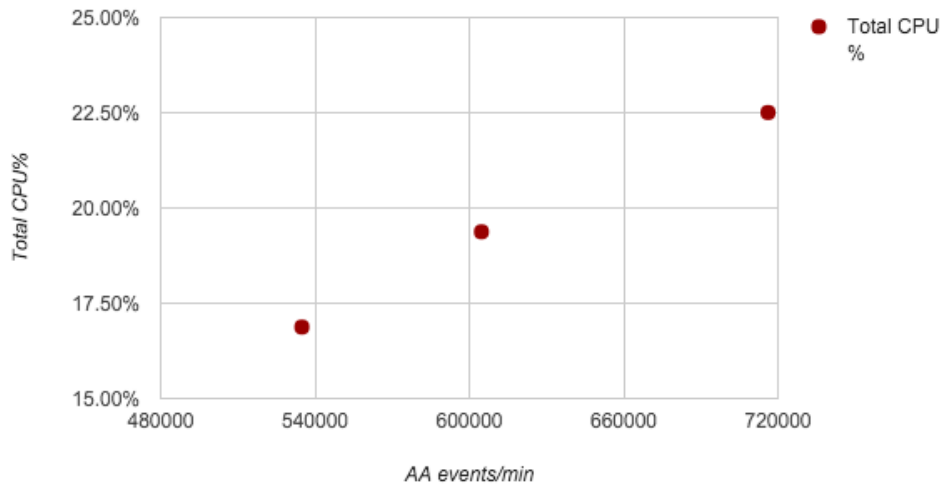

**c3.large CPU% vs. AA events/min**

**c3.xlarge CPU% vs. AA events/min**

**Total CPU% vs. AA events/min**

**Raw Data**

Analytics Agent Host Machine	Analytics Agent events/min	Total CPU%	JVM Heap (Mb)
c3.large	52313	17%	468
c3.large	54831	17%	470
c3.large	70746	24%	475
c3.large	74541	24%	477
c3.large	77344	23%	487
c3.large	97074	28%	512
c3.large	115999	36%	519
c3.large	139143	43%	526
c3.large	148782	47%	587
c3.large	204073	65%	527
c3.large	247543	80%	624

Analytics Agent Host Machine	Analytics Agent events/min	Total CPU%	JVM Heap (Mb)
c3.large	249261	81%	637
c3.xlarge	196288	33%	518
c3.xlarge	254586	44%	727
c3.xlarge	302689	51%	497
c3.xlarge	336879	58%	913
c3.xlarge	372515	65%	1024
c3.xlarge	513598	91%	922
c3.xlarge	478954	78%	922
c3.xlarge	420000	69%	979
c3.xlarge	376034	61%	1024
c3.xlarge	318000	52%	1024
c3.xlarge	258000	43%	1024
c3.xlarge	198000	32%	1024
c3.xlarge	144000	22%	1024
c4.4xlarge	534900	17%	552
c4.4xlarge	604725	19%	841
c4.4xlarge	716141	23%	1024

## Enable SSL for the Analytics Agent

Related pages:

- [Controller SSL and Certificates](#)

This page describes how to configure the AppDynamics Analytics Agent to connect to your app server agents using SSL.

1. Run the `keytool` command to create a new key pair for the Analytics Agent in the keystore. Refer to the [Oracle documentation](#) for more details on using `keytool`. The following command creates a keystore if it doesn't exist and generates the public/private key pair:

```
keytool -genkeypair -alias analytics-agent -keystore aa-keystore.jks -validity 1825
```

Follow the on-screen instructions to configure the certificate. This generates a self-signed certificate in the keystore. The next step generates a signing request for the certificate. Note the following:

- a. For the first and last name, enter the domain name where the Analytics Agent is running. The domain name used in the `appdynamics.analytics.agent.url` property must match the Common Name (CN) of the certificate used by the Analytics Agent. For example, if the URL was `https://localhost:9090/v2/sinks/bt` then the CN of the certificate should be `localhost`. If the names don't match then the client marks the certificate as invalid and the HTTPS connection is not established".
  - b. Enter a secure password for the key. This command creates a key pair with a validity of 1825 days (5 years). Replace 1825 with the validity period appropriate for your environment.
2. Generate a certificate signing request for the certificate you created as follows:

```
keytool -certreq -alias analytics-agent -keystore aa-keystore.jks -file AppDynamics.csr
```

3. Submit the certificate signing request file generated by the command ( `AppDynamics.csr` in the example command) to your Certificate Authority (CA) of choice.
4. When it's ready, the CA returns the signed certificate and any root and intermediary certificates required for the trust chain. The response from the CA should include any special instructions for importing the certificate if needed. If the CA supplies the certificate in text format, copy and paste the text into a text file.
5. Import the signed certificate:

```
keytool -import -trustcacerts -alias analytics-agent -file mycert.cer -keystore aa-keystore.jks
```

This command assumes the certificate is located in a file named `mycert.cer`.

6. If you see the error "Failed to establish chain from reply", install the issuing CA's root and any intermediate certificates into the keystore. The root CA chain establishes the validity of the CA signature on your certificate. Although most common root CA chains are included in the bundled JVM's trust store, you may need to import additional root certificates, such as certificates belonging to a private CA. To do so:

```
keytool -import -alias [Any_alias] -file <path_to_root_or_intermediate_cert> -keystore <controller_home>/appserver/glassfish/domains/domain1/config/aa-keystore.jks
```

7. When done importing the certificate chain, try importing the signed certificate again.
8. Update the following properties in the `analytics-agent.properties` file:
  - a. `ad.dw.https.enabled=true` to enable the HTTPS connector on the Analytics Agent. The HTTPS connection is exposed on the port defined by the `ad.dw.http.port` property.

- b. `ad.dw.https.keyStorePath` = absolute path to the Java keystore that contains the Analytics Agent public and private key.
  - c. `ad.dw.https.keyStorePassword` = Java keystore password.
  - d. `ad.dw.https.trustStorePath` = absolute path to the truststore that establishes the chain of trust for the Analytics Agent public key certificate.
  - e. `ad.dw.https.trustStorePassword` = the truststore password.
  - f. `ad.dw.https.certAlias` = alias of the public key certificate stored in the Java Key Store.
9. Start the Analytics Agent.  
The HTTPS connection should now be exposed.
  10. Confirm that the app server agent is configured to trust the Analytics Agent certificate.  
For details on enabling SSL communication, see:

Agent	Location
Java Agent	<a href="#">Enable SSL Between the Java Agent and the Analytics Agent</a>

## Analytics Agent Logging

### Related pages:

- [Troubleshoot Analytics Issues](#)

By default, the AppDynamics Analytics Agent writes log files to the `<analytics_agent_home>/logs` directory. See [Agent Log Files](#) for how the logs are organized into sets that roll over.

### Log File Sizes

Each log can grow to 64 MB in size before being compressed and renamed. A maximum of ten compressed files can be generated.

The default pattern for agent log naming is `<filename>-<date_compressed >.log.gz` as shown in this table:

Log File Name	Definition
<code>analytics-agent.log</code>	Current log
<code>analytics-agent-2018-12-11.log.gz</code>	Previous log
<code>analytics-agent-2018-12-10.log.gz.log</code>	Second previous log

### Logging Level for the Analytics Agent

The default logging level for most log files is `INFO`. Higher logging levels consume more disk space.

You can control the logging level for the Analytics Agent by changing the value of the `ad.dw.log.level` parameter in the `analytics-agent.properties` file.

For example, to set the log level to `DEBUG`:

```
ad.dw.log.level=DEBUG
```

## Deploy Analytics Without the Analytics Agent

### Deployment Support

The Analytics Agent is not required to capture Transaction Analytics data. This page describes the requirements to use the "agentless" configuration of Analytics.

In this context, "agentless" refers to the configuration of Transaction Analytics without an Analytics Agent. An [app server agent](#), such as Java or .NET, is still required to use this feature.

### Agentless Analytics

To capture Transaction Analytics for Java or .NET Windows applications, you can configure Transaction Analytics without a dedicated Analytics Agent.

In this deployment model, Analytics retrieves data directly from your app agent. The data is reported to the Events Service and then the Controller. No separate Analytics Agent is required.

**⚠** If you upgrade the Java Agent to  $\geq 4.5.15$ , and use Transaction Analytics, Agentless Analytics is automatically enabled. If you upgrade the .NET Agent to  $\geq 20.10$ , and use Transaction Analytics, Agentless Analytics is automatically disabled; you can enable this feature in the Controller or with a node property. See [Enable Agentless Analytics](#).

You may notice unusual behavior (such as gaps in Analytics data) related to two known issues:

- High CPU usage (in the Java Agent version 4.5.19 and below)
- Blocked firewall requests

See [Troubleshoot Analytics Issues](#).

### Requirements

Make sure you meet the following minimum requirements:

- Sufficient [Transaction Analytics Licenses](#)
- Java Agent  $\geq 4.5.15$
- .NET Agent  $\geq 20.10$
- Controller  $\geq 4.5.16$  (SaaS or on-premises)

To use Agentless Analytics, see this compatibility matrix for your agent deployment requirements.

[Java](#)   [.NET](#)

Minimum Controller Version	Minimum Java Agent Version	Agentless Analytics Support
4.5.16	4.5.15	Generally available.

Minimum Controller Version	Minimum Java Agent Version	Agentless Analytics Support
4.5.16	4.5.17	Supports proxy configuration and authentication with encrypted credentials.
4.5.17	4.5.18	Supports license rules configured in the Java Agent.

Java [.NET](#)

Minimum Controller Version	Minimum .NET Agent Version	Agentless Analytics Support
4.5.16	20.10.0	Generally available and supports proxy configuration.
4.5.17	20.10.0	Supports license rules configured in the .NET Agent.

## Connect App Agents to the Events Service

[Java](#) [.NET](#)

For most deployments, communication between the Java Agent and the Events Service automatically occurs as long as you have the correct agent version.

Java [.NET](#)

Communication between the .NET Agent and the Events Service is disabled by default; to re-enable, see [Deploy Analytics Without the Analytics Agent](#).

See the following sections to ensure that your deployment can connect to the Events Service:

- [Identify Internal Events Service Endpoints](#)
- [Connection Ports](#)
- [Enable SSL](#)
- [Proxy Configuration](#)

### Identify Internal Events Service Endpoints

The Controller uses the connection URL configured in `Admin.jsp` to the Events Service. Agentless Analytics also uses this URL. See [Connect to the Events Service](#).

[SaaS](#) [On-prem](#)

In a SaaS environment, the internal URLs to connect to the Controller/app agents to the Events Service have already been deployed.

SaaS On-prem

In an on-premises environment, the agent requires access to the internal Events Service URL normally used by the Controller. The internal Events Service URL must be exposed to the agents and then set as the `analytics.agentless.event.service.url`:

1. Log in to the Administration Console:  
`http:<controller-hostname>:8080/controller/admin.jsp` or `https:<controller-hostname>:45/controller/admin.jsp`.
2. In **Controller Settings**, set `analytics.agentless.event.service.url` to the Events Service endpoint that is accessible from agents.
3. Click **Save**.

## Connection Ports

SaaS On-prem

The connection between the Java Agent, the .NET Agent, and the Events Service occurs over ports 80 (HTTP) and 443 (HTTPS). If your firewall rules are not configured properly, gaps will appear in your Analytics data.

SaaS On-prem

The port on which the Events Service receives data from the Java Agent and the .NET Agent is configured during installation.

If you have network policies that may prevent this connection, such as firewalls, you need to configure the policies to connect with the Events Service. See [Troubleshoot Analytics Issues](#).

## Enable SSL

If you use a custom trust store, see [Enable SSL for the Java Agent](#) or [Enable SSL for the .NET Agent](#).

## Proxy Configuration

Java .NET

To encrypt credentials for proxy authentication, you need Java Agent  $\geq$  4.5.17 and Controller  $\geq$  4.5.17. See [Java Agent Configuration Properties](#).

Java .NET

The .NET Agent does not support proxy authentication. Use these environment variables for proxy configuration.

To configure the .NET Agent to communicate with the Events Service with the proxy:

1. Add/update the following environment variables.
2. Restart your Windows application.

### Agent → Events Service Sending Data For Proxy

`appdynamics.http.proxyHost`

`appdynamics.http.proxyPort`

## Enable Agentless Analytics

You can enable Agentless Transaction Analytics at the Controller, node/tier, and agent level.

[Java](#) [.NET](#)

By default, Agentless Analytics is automatically enabled for the Java Agent.

[Java](#) [.NET](#)

By default, Agentless Analytics is disabled for the .NET Agent. Enabling Agentless Analytics changes your deployment to Agentless Analytics mode.

To enable Agentless Analytics at the tier or node level, add the `agentless-analytics-disabled` property and set to `false`. When set to `false`, this node property changes the tier/node to Agentless Analytics mode. To add a node property, see [App Agent Node Properties](#).

## Disable Agentless Analytics

You can disable Agentless Transaction Analytics at the Controller, node/tier, and agent level.

[Java](#) [.NET](#)

Disabling Agentless Analytics changes your deployment to Analytics Agent mode.

To disable Agentless Analytics at the tier or node level, add the `agentless-analytics-disabled` property and set to `true`. When set to `true`, this node property reverts the tier/node to Analytics Agent mode. To add a node property, see [App Agent Node Properties](#).

[Java](#) [.NET](#)

By default, Agentless Analytics is disabled for the .NET Agent. Enabling Agentless Analytics changes your deployment to Agentless Analytics mode.

To disable Agentless Analytics, set the value of `agentless-analytics-disabled` to `true`.

## Override the Events Service URL

[Java](#) [.NET](#)

To override the Events Service URL in the Java Agent, use the `appdynamics.analytics.agent.agentless.es.url` property. When this property is set, the Java Agent will ignore the Events Service URL received from the Controller and use the URL from the property to publish events.

This property is supported in Java Agent version  $\geq 22.3.0$ .

[Java](#) [.NET](#)

To override the Events Service URL in the .NET Agent, use `appdynamics.analytics.agent.agentless.es.url`. When this environment variable is set, the .NET Agent will ignore the Events Service URL received from the Controller and use the URL from the environment variable to publish events.

This environment variable is supported in .NET Agent version  $\geq 22.5.0$ .

### Existing Analytics Agents

Once you upgrade to the minimum Controller and agent versions, existing Analytics Agents stops reporting data. Agentless Analytics does not duplicate data from the Analytics Agent. AppDynamics recommends when you see **Transaction Analytics** in the Controller, you can uninstall the Analytics Agent unless you are using Log Analytics.

## Configure Analytics

To generate information for Analytics, such as data collectors and log analytics, you need to configure the system to collect the applicable data.

### Access Analytics in the Controller UI

In the Controller UI, navigate to **Analytics > Configuration**.

The Analytics configuration options include:

- **Transaction Analytics - Configuration:** Enable Analytics for specific applications and business transactions.
- **Transaction Analytics - Manual Data Collection:** Configure data collectors. Analytics supports three types of data collectors: method invocation data collector (MIDC), HTTP, and SQL.
- **Log Analytics:** Configure source rules to collect data for log analytics.
- **API Keys:** Create API authentication keys for users of the Analytics Events API.

## End User Monitoring Data

Analytics monitors End User Monitoring (EUM) products. For SaaS deployments, Browser Request Analytics and Mobile Request Analytics, alternate views of EUM data, do not require configuration. If you are using an on-premises Events Service and an on-premises EUM Server, you need to configure the EUM Server to send data to the Events Service. See [EUM Server Deployment](#).

## Collect Transaction Analytics Data

Works with:

This page describes how to configure Transaction Analytics for Java and .NET applications. See [Configure Transaction Analytics for Node.js, PHP, and Python Applications](#).

### Before You Begin

If you have Java Agent  $\geq 4.5.15$ , .NET Agent  $\geq 20.10$ , and Controller  $\geq 4.5.16$ , you do not need a local Analytics Agent to configure Transaction Analytics. See [Deploy Analytics Without the Analytics Agent](#).

All other app agents and Controller versions require an Analytics Agent. See the appropriate documentation to ensure you have installed and configured the required components.

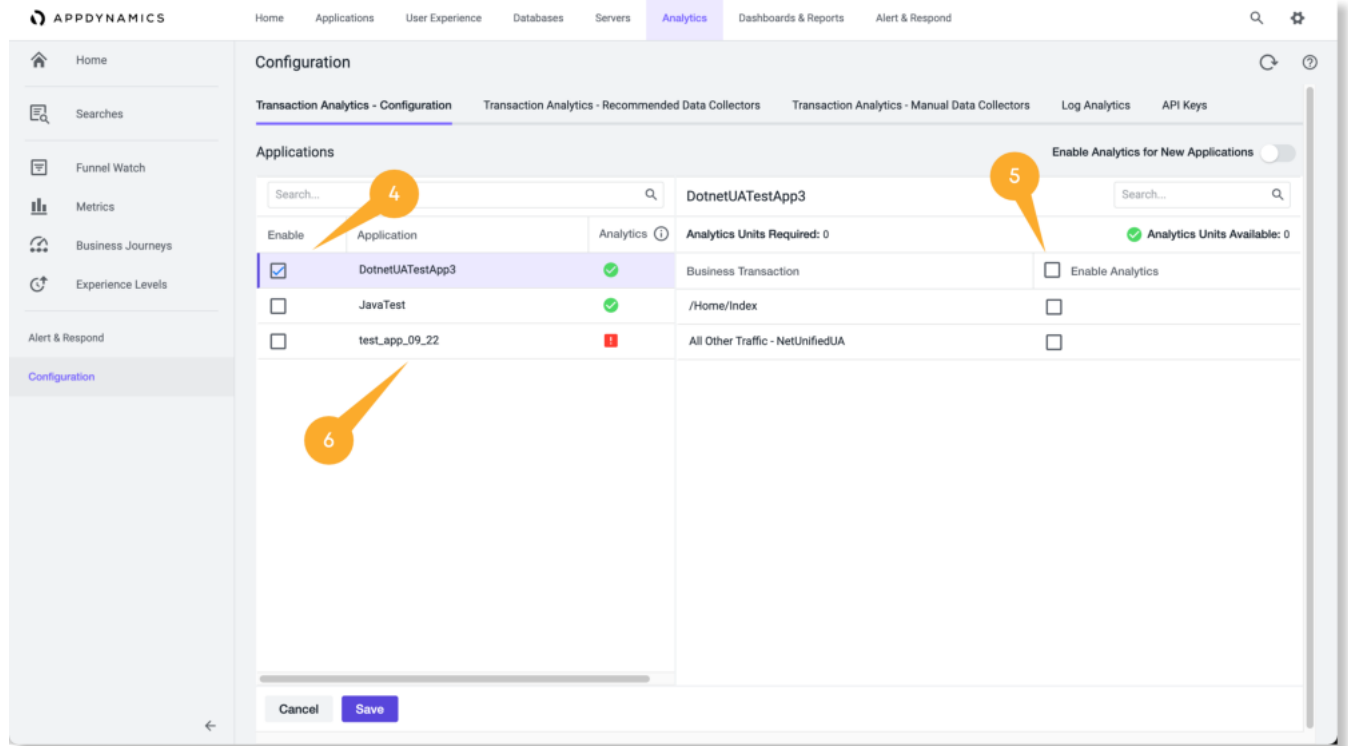

- SaaS deployments: [Install Agent-Side Components](#)

### Configure Transaction Analytics

You need to configure Transaction Analytics for each desired application. Configuring Transaction Analytics consists of selecting the application and the specific business transactions that you want to analyze.

To configure Transaction Analytics:

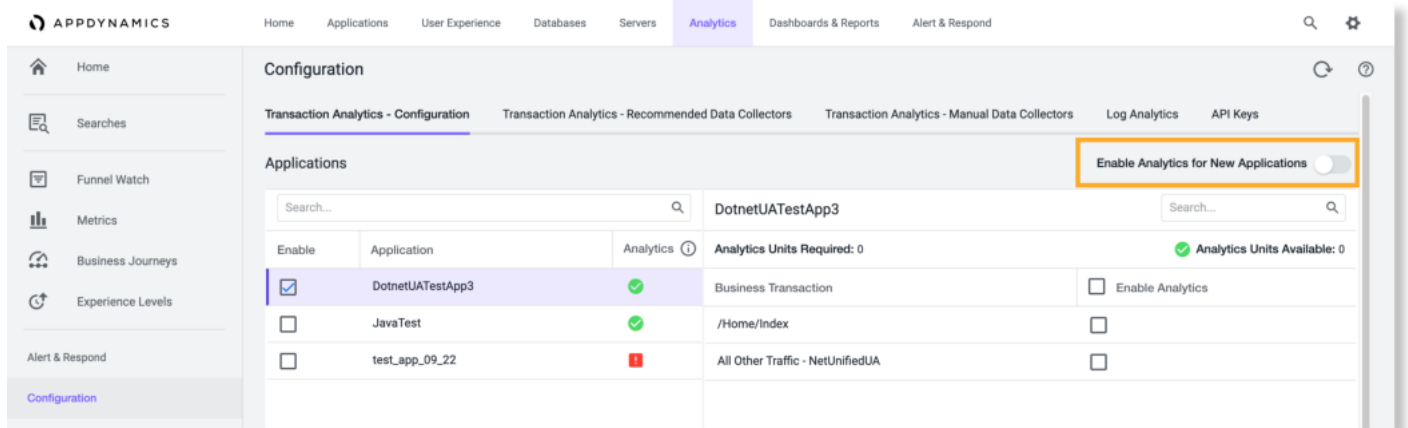

1. In the Controller UI, from the top navigation bar, select **Analytics**.
2. Select **Configuration** from the left panel.
3. Go to the **Transaction Analytics - Configuration** tab.
4. Check the desired application(s). 
5. You can select or deselect all applications by checking **Enable Analytics**.  Find specific applications using the search box above **Applications**.
6. Select an application to open the business transactions in the right panel.  By default, all business transactions, except All Other Traffic, are selected. You can deselect any business transactions you do not want to monitor. Find specific business transactions using **Search** .
7. Click **Save**.

## Automatically Enable Transaction Analytics

You can enable Transaction Analytics automatically for all applications  $\geq 4.3.x$ . Click the toggle next to **Enable Analytics for New Applications**. This option configures Transaction Analytics for all new applications and all of each application's business transactions, except business transactions categorized as All Other Traffic.

**Enable Analytics for New Applications** applies to applications created after you select the feature. You need to [manually configure Analytics](#) for any applications and business transactions created before selecting **Enable Analytics for New Applications**.

 You can configure Transaction Analytics for older agents manually. Go to **Transaction Analytics - Configuration** and locate the desired application. Uncheck and recheck the app, then select your business transaction(s).

Click the toggle again to turn off **Enable Analytics for New Applications**. The toggle becomes grey when the feature is turned off.

### Edit Transaction Analytics Configuration

You can add or remove applications and business transactions from Transaction Analytics at any time.

To make changes to your Transaction Analytics configuration, select or deselect the desired applications and business transactions in **Transaction Analytics - Configuration**.

When you revert changes to Transaction Analytics, AppDynamics saves the previous configuration state. For example, you enable Transaction Analytics for an application and one specific business transaction. You later disable Transaction Analytics for the application, then re-enable it at a later date. When you re-enable the application, AppDynamics automatically selects the business transaction you originally selected.

### Observe License Usage

For [Infrastructure-based Licensing models](#), licensing unit consumption for an application is based on the number of [CPU cores](#). License units are allocated to application hosts through the single metering unit of CPU cores, based on the configured license rules. See [Observe License Usage](#).

To view license availability and usage information for the application:

1. In the Controller UI, from the top navigation bar, select **Analytics**.
2. Select **Configuration** from the left panel.
3. Go to the **Transaction Analytics - Configuration** tab.
4. Under the **Analytics** column, hover over the icon to view details regarding license availability.

There are three representations of license availability: healthy availability, availability warning, and none available.

### Healthy Availability

The  icon appears when the number of available license units for an application is greater than or equal to the number of license units required.

1. When Analytics is not yet enabled for an application, hovering over  will display license **Units Available** and **Units Required**.
2. When Analytics is successfully enabled for an application, hovering over  will display the number of potential license units that will be freed up (**Potential Units Freed Up**) when you disable Analytics for the application. For applications that are sharing hosts, the number of potential license units that will be freed up can be less than the number of license units consumed.

 For Application Analytics, if more than one licensing rule is available for the hosts associated with an application, the license availability displayed in the Controller UI is the sum of the available license units across licensing rules. AppDynamics recommends that Controller Administrators configure one license rule per application.

### Availability Warning

The  icon appears when the number of available license units is less than the number of required license units. Hover over  to view **Units Available** and **Units Required**.

Analytics can be enabled for an application from the Controller UI when the number of available license units is less than required, but business transactions are collected only when there are enough available license units. The Controller Administrator can update the corresponding license rule configuration to allocate more license units, or the Analytics Administrator can release license units by disabling Analytics on unused applications.

 Disabling Analytics for specific business transactions does not free up the license units that are consumed. In order to free up consumed license units for an application, Analytics must be disabled at the application level.

### None Available

The  icon appears when there are no valid units of license package with the Transaction Analytics feature allocated for the application, based on the configured license rules.

### Security Restrictions

The Analytics Administrator has complete access to all applications in Transaction Analytics. All other users can only view applications to which they have access based on [RBAC permissions](#).

 The Analytics Dynamic Service loads Transaction Analytics for enabled applications after your JVM instance runs for at least two minutes.

### Configure Recommended Data Collectors

#### Related pages:

- [Configure Manual Data Collectors](#)

### Deployment Support

This page describes Recommended Data Collectors in AppDynamics.

Recommended Data Collectors are potential Method Invocation Data Collectors (MIDC) suggested by Analytics. Recommended Data Collectors reduce the number of steps required to configure data collectors.

When you configure data collectors manually, provide the class and method parameters for each transaction that you want to monitor. Recommended Data Collectors automatically collect the event data

from the Java Agent and publishes it to the Event Service. You can browse this data (transactions, classes, methods) and search for specific terms in the Controller.

 Recommended Data Collectors do not support HTTP and SQL data collectors.

## Before You Begin

 You need the **Configure Diagnostic Data Collectors** permission to access Recommended Data Collectors. The Analytics Administrator does not have this permission by default.

To view application data for Recommended Data Collectors, you need view access to the application and its transactions.

- For application permissions, configure user settings in **Administration > Roles > Applications**.
- For transaction permissions, configure user settings in **Administration > Roles > Analytics > Events**.

See [Analytics and Data Security](#).

## AppDynamics Components

- SaaS Controller >= 20.6.0
- Java Agent >= 21.1

## Agentless Analytics

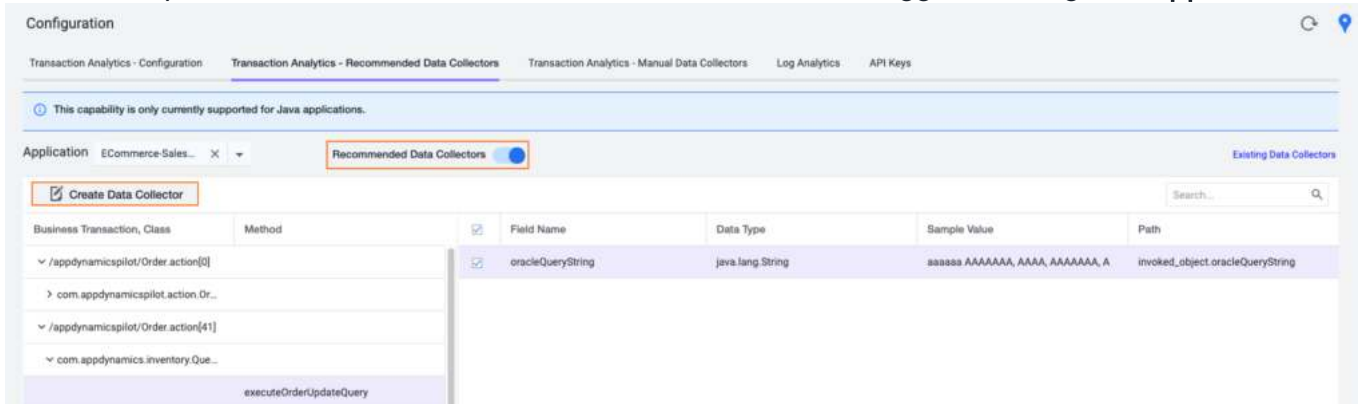

Recommended Data Collectors require Agentless Transaction Analytics. When you use the minimum supported versions of the Controller and Java Agent, Agentless Analytics is automatically enabled. See [Deploy Analytics Without an Analytics Agent](#) to ensure that your deployment works properly.

You must enable Agentless Analytics to use this feature. If you turn off Agentless Analytics, you cannot use Recommended Data Collectors.

### Create Recommended Data Collectors

To use Recommended Data Collectors:

1. In the Controller, select **Analytics > Configuration > Transaction Analytics - Recommended Data Collectors**.
2. Select an application from the **Application** dropdown menu. A list of business transactions appears in the left pane.
3. If not already enabled, turn on the **Recommended Data Collectors** toggle to the right of **Application**.

4. Select the dropdown arrow next to the desired business transaction name. A list of available classes appears in the left pane.
5. Select the desired class. A list of available methods appears.
6. Select the desired method.
7. Additional data appears in the right pane. Select the desired field name.
8. Above the business transaction list in the left pane, click **Create Data Collector**.
9. Enter a data collector name and confirm that the method signature information is correct. If you select multiple fields, enter a unique name for each data collector in the dialog.

Create Method Invocation Data Collector
✕

A method invocation data collector needs the java method signature with the fully qualified class/interface/super-class/annotation name and the method name. If the method is overloaded, it is recommended that you specify the fully qualified parameter types also.

**Name**

Name the data collector

Apply to new Business Transactions

#### Recommended Data Collectors UI Overview

UI Term	Description
<b>Business Transaction</b>	<p>The name of the business transaction(s) for the selected application. Business transaction names appear as:</p> <p>The relative path and business transaction ID in brackets [ ]. For example, <code>/portal/Submit Application[65]</code>.</p> <p>If the Java Agent does not identify a relative path, the name is the business transaction ID only. For example, <code>Business Transaction 1</code>.</p>
<b>Class</b>	The fully qualified class name of the selected business transaction.
<b>Method</b>	<p>The method name of the selected class.</p> <p>Overloaded methods contain identifying data to distinguish each method. For example, if a class calls <code>method1</code> multiple times with different return values, the return value is displayed next to the method name:</p> <ul style="list-style-type: none"> <li><code>int method1()</code></li> <li><code>void method1()</code></li> </ul> <p>Variations in the method parameters are displayed in the parentheses:</p> <ul style="list-style-type: none"> <li><code>method1(str, ...)</code></li> <li><code>method1(int, ...)</code></li> </ul>
<b>Field Name</b>	The name of the field of the selected method. The field name can be a parameter, return value, or invoked object.
<b>Data Type</b>	Type of the field name.

UI Term	Description
<p><b>Sample Value</b></p>	<p>Shows an example field value. Special characters ( - , . @ ) are not obfuscated.</p> <p>The following names are obfuscated for security:</p> <ul style="list-style-type: none"> <li>• Boolean: aaaaaa</li> <li>• Enums: the string value is pulled and obfuscated the same as upper and lower case letters</li> <li>• Lower case letters: a</li> <li>• Numbers: 0</li> <li>• Upper case letters: A</li> <li>• All other characters: #</li> </ul> <p>In the case of arrays, collections, and maps, the values display a special format.</p> <ul style="list-style-type: none"> <li>• Array/Collection: [Aaaa, ...]</li> <li>• Map: [{aaa=Aaaa}, ...]</li> </ul> <p>The Instance of &lt;class_name&gt; value is displayed when the depth limit is obtained after introspecting the object. If you want to introspect further on this instance type, you can increase the introspection depth with the analytics-runtime-introspection-depth property. For example, in method getPrice(a), a → b → c → d → e where a has field b, b has field c, and so on. If the depth is 2, the value will be Instance of c.</p> <p>This case applies to arrays, collections, and maps.</p> <ul style="list-style-type: none"> <li>• Array/Collection: [Instance of &lt;class_name&gt;, ...]</li> <li>• Map: [{Instance of &lt;key_class_name&gt;}={Instance of &lt;value_class_name&gt;}, ...]</li> </ul>
<p><b>Path</b></p>	<p>Describes where the Java Agent has located the Recommended Data Collector in your code.</p>

### Disable Recommended Data Collectors for an Application

1. Go to **Transaction Analytics > Recommended Data Collectors**.
2. Select the application from the dropdown.
3. Turn off the **Recommended Data Collectors** toggle.

## Troubleshoot Recommended Data Collectors Issues

### Recommended Data Collectors in the Controller UI

There are a few reasons why Recommended Data Collectors may not appear in the Controller UI:

- **Auto-Refresh:** In the Controller UI, data under the **Transaction Analytics - Recommended Data Collectors** tab does not refresh automatically. If you recently created an application and do not see it in the UI, refresh your browser.
- **Deactivated Agentless Analytics:** Recommended Data Collectors require Agentless Analytics. If a particular application is unavailable, confirm that Agentless Analytics is enabled for the tier or node.
- **Permission:** Recommended Data Collectors enforces RBAC. Without the **Configure Diagnostic Data Collectors** permission, you cannot create data collectors, but you can view suggested Recommended Data Collectors for the applications that you have access to.

### Field Names Display Unavailable

Field names are not available for data captured on parameters, return values, and invoked objects, such as `int getNumber(intValue)`.

For example:

```
public class Calculator {
 public int getArea(int width, int height) {
 return width * height;
 }
}
```

Field Name	Explanation
Invoked Object	Refers to the object on which the method is invoked. In this example, the <code>Calculator</code> object is being invoked. The name of the <code>Calculator</code> object instance is not obtained, so <b>Invoked Object</b> displays <b>Unavailable</b> .
Parameters	Refers to the inputs to the method. In this example, the parameters are the width and the height. The parameter names are not obtained, so <b>Parameters</b> display <b>Unavailable</b> .
Return Value	Refers to the return value of the method. Return values do not have assigned names and <b>Return Value</b> displays <b>Unavailable</b> .

### Customize Recommended Data Collectors

This page provides a list of system and node properties that customize Recommended Data Collectors.

### Enable or Disable Recommended Data Collectors

You can enable or disable Recommended Data Collectors after restarting the Java Agent and setting the system properties as a JVM parameter. Recommended Data Collectors is enabled by default; the property `appdynamics.analytics.collection.feature.enabled` is optional.

System Property	Description	Default Value
<code>appdynamics.analytics.collection.feature.enabled</code>	Enable or disable Recommended Data Collectors on the Java Agent.	true

### Customize Recommended Data Collectors

To customize Recommended Data Collectors, you can adjust the node properties in the Java Agent. See [App Agent Node Properties](#).

Node Property	Description	Default Value
<code>analytics-collection-stack-traces-collected</code>	Number of stack traces collected per interval (time between stack trace collection limit resets).	20
<code>analytics-collection-stack-trace-collection-reset-interval</code>	Interval (in seconds) to reset stack trace collection limit.	10
<code>analytics-collection-special-characters</code>	List of characters which will not be sanitized from sample values. For example, <code>a^z</code> will not sanitize <code>a</code> , <code>^</code> , and <code>z</code> .	N/A
<code>analytics-collection-elements-scan-per-stack-trace</code>	Number of elements to scan per stack trace before stopping.	20

Node Property	Description	Default Value
analytics-collection-elements-retain-per-stack-trace	<p>Number of elements to collect per stack trace.</p> <p>For example, in this stack:</p> <pre>com.a -&gt; com.b -&gt; com.c -&gt; com.d -&gt; com.e -&gt; com.f -&gt; AppD exit point method</pre> <p>Elements <code>com.b</code> to <code>com.f</code> (bottom five) are analyzed by default.</p>	5
analytics-collection-package-prefix	Comma separated list of package names that will be treated preferably for suggestions.	N/A
analytics-element-analysis-interval	Interval (in seconds) for triggering element analysis.	600
analytics-collection-reap-interval	<p>Interval (in seconds) to remove one suppressed collection instrumentation point.</p> <p>Removes the oldest suppressed point first.</p>	10
analytics-method-instrumentation	<p>Number of methods (unique class name/method name combinations) to instrument with Recommended Data Collectors.</p> <p>Overloaded variants are considered the same for this limit.</p>	10
analytics-maximum-num-rules-multiplier	<p>Average number of overloaded methods per instrumented method.</p> <p>The maximum number of instrumentation points is calculated with this formula: <code>analytics-method-instrumentation</code> * <code>analytics-maximum-num-rules-multiplier</code>.</p>	10

Node Property	Description	Default Value
<code>analytics-instrumentation-suppression</code>	Number of times Recommended Data Collectors is invoked and processed.  For example, if <code>analytics-instrumentation-suppression</code> is set to 3 and a method is called four times, the fourth call does not collect data.	3
<code>analytics-runtime-attribute-value-length</code>	Maximum length of sample value string displayed.	32
<code>analytics-runtime-introspection-depth</code>	Level of depth in the object tree that Recommended Data Collectors extracts information.	2

## Configure Manual Data Collectors

This page describes how to configure data collectors for Transaction Analytics.

There are three types of data collectors: HTTP, method invocation, and SQL. Data collectors enable you to add business context to a transaction. For example, a Method Invocation Data Collector (MIDC) can tell you if an order is slow based on method parameters.

### Before You Begin

You must configure Transaction Analytics before you can configure data collectors. See [Collect Transaction Analytics Data](#).

### Configure HTTP Request Data Collectors

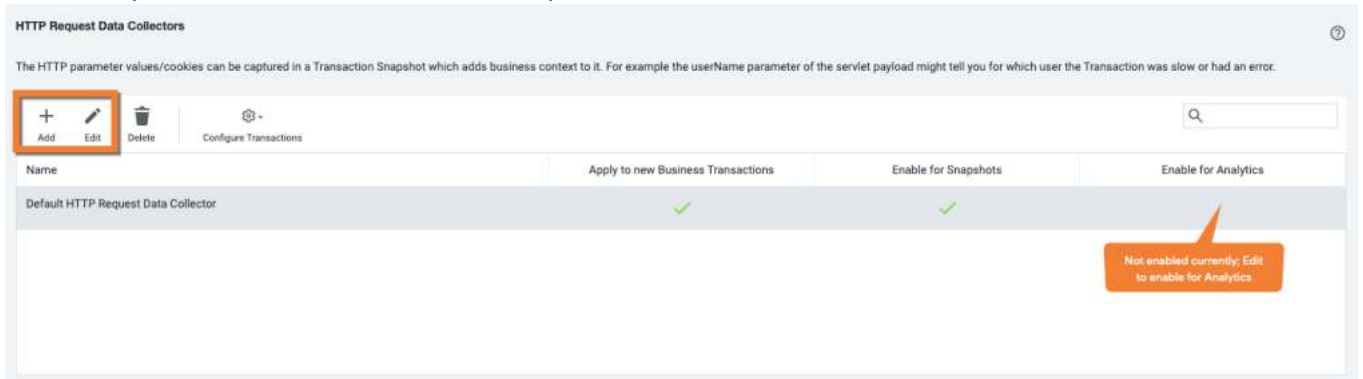

To collect HTTP request data, you can use the default HTTP Request Data Collector. You need to explicitly enable the collector for Analytics.

To configure HTTP Data Collectors for Analytics:

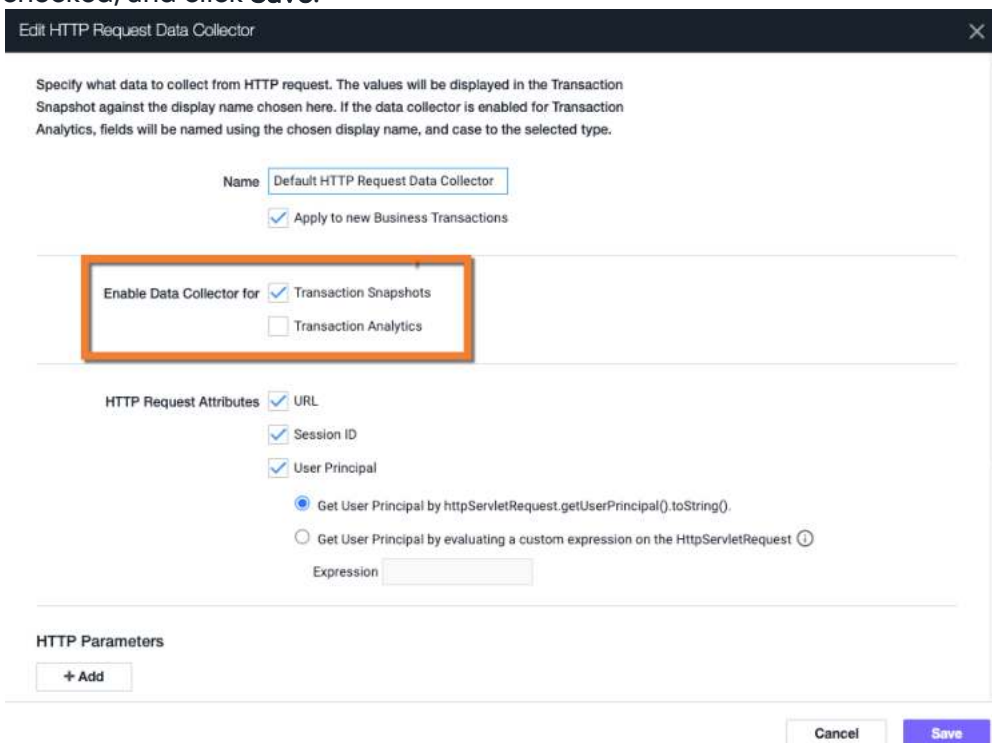

1. In the Controller UI, select **Analytics > Configuration** from the top navigation bar.
2. Go to the Transaction Analytics - Manual Data Collection tab.
3. Select the application of interest from the **Configure Analytics for Application** dropdown.

- Navigate to **HTTP Request Data Collectors**. Select the HTTP Data Collector to enable and click **Edit** (or **Add** to create new collectors).

- On the **HTTP Request Data Collector** page, confirm the data to collect, confirm **Transaction Analytics** is checked, and click **Save**.

- Select **Configure Transactions** and confirm that the data collector is enabled on the appropriate business transactions. See [Data Collectors](#).

### Configure Method Invocation Data Collectors

You can also use the **Analytics > Configuration** page to enable existing or new Method Invocation Data Collectors. Open the **Method Invocation Data Collectors** panel. The process is essentially the same as described in [Data Collectors](#).

- Check the **Transaction Analytics** check box to use this collector for Analytics.
- Check the **Configure Transactions** popup to confirm you have enabled the right Business Transactions.
- Check that the name of the MIDC does not exceed the 50 character limit.

## Field Name Recommendations

While there are no requirements for MIDC field names, AppDynamics recommends using only alphanumeric characters, hyphens, and underscores.

MIDC field names that start with special characters may cause application events to disappear from Analytics in the Controller. As a best practice, avoid the following characters in your MIDC field names:

- Dots
- Spaces
- Slashes
- Special characters (such as \$, %, &)
- Regular expression characters

You can learn more about field name conventions and recommendations in [Data Field Naming for Events Service >= 4.5.3](#).

**i** Changing the name of method invocation data collector will create a completely new field in Transaction Analytics. If you want to change the type of a data collector field, we recommend creating a new field instead to avoid conflicts with the old data.

## Field Length Limit

The maximum number of characters allowed in a custom data field is 8,191.

## Configure SQL Data Collectors

Transaction snapshots capture SQL queries. SQL data collectors provide a way to extract business data from parameters used in the SQL statements for use in analytics. See [Collect Business Data From SQL Calls](#).

## Enable Transaction Analytics Data Type Conversion for Data Collectors

**i** Transaction Analytics data type conversion requires Controller versions 21.6.3, 21.8.0, and >=21.9.0. For Java deployments, Transaction Analytics data type conversion is available for Java Agents >= 21.3.0.32281. For .NET deployments, Transaction Analytics data type conversion is available for .NET Agents = 21.5.1.

Data collectors determine field type (string, boolean, or number) at runtime. At times the data you collect may not be the type in which you want to use it. For example, you are not able to add metrics if any data collectors are field type string.

While field type cannot be changed, you can specify field type before runtime with Transaction Analytics data type conversion.

To enable Transaction Analytics data type conversion:

1. Log in to the administration console:  
<http://<controller-hostname>:8080/controller/admin.jsp> or <https://<controller-hostname>:45/controller/admin.jsp> .
2. On the **Controller Settings** page, change the value of `analytics.type.conversion.enabled` from `false` to `true`.

### 3. Click **Save**.

Data type conversion only appears when enabled in the **HTTP** and **Method Invocation Data Collector** configuration pages on your Controller. If this page was opened while you enabled data type conversion, you will need to refresh your page to see changes.

Data type conversion operates by the following rules:

- Available for new data collectors only.
- Select type manually for each data collector.
- Type cannot be changed once saved.

### Transaction Analytics Data Type Conversion in HTTP Data Collectors

To use Transaction Analytics data type conversion, create a new HTTP parameter. You can add to an existing HTTP Request Data Collector or create a new one.

The process is essentially the same as creating an HTTP parameter. However, now that you've enabled Transaction Analytics data type conversion, you will see **Type** field with a dropdown.

The screenshot shows the 'HTTP Parameters' configuration section. At the top left, there is a '+ Add' button. Below it, there is a table with columns for 'Display Name', 'HTTP Parameters Name', and 'Type'. The 'Type' column has a dropdown menu open, showing three options: 'String', 'Boolean', and 'Number'. Below the table, there is a 'Cookies' section with another '+ Add' button.

Select the desired field type for your HTTP parameter. If you do not want to specify a type, leave this field blank. The default type for HTTP data collectors is `string`.

### Transaction Analytics Data Type Conversion in Method Invocation Data Collectors

To use Transaction Analytics data type conversion, create a new Method Invocation Data Collector (MIDC). You can add to an existing MIDC or create a new one.

The process is essentially the same as creating an MIDC. However, now that you've enabled Transaction Analytics data type conversion, you will see **Change Type to** field with a dropdown.

Display Name

Create your own name for the data collected. This will be the display name for the data in Transaction Snapshots.

Collect Data From  
 @ Index

Operation on Method Parameter

Transaction Analytics Type  
 Use APM Type  Change Type to

String

Boolean

Number

Select the desired field type for your MIDC.

**Transaction Analytics Type** defaults to **Use APM Type**, which determines type at runtime. If you do not want to specify a type, select **Use APM Type**.

### Name Requirements For Transaction Analytics Data Type Conversion

Refer to these naming requirements when using Transaction Analytics data type conversion:

- Display Names must be unique within each data collector. Names are case sensitive.
- You can repeat Display Names across different data collector configurations, as long the field type is also the same.
- If you delete a field from a data collector and add it again with a different field type, you must rename the data collector.

### Change Field Types

Field types cannot be changed once they have been saved to the data collector. To change the field type, we recommend to delete and recreate with a new name.

### Configure Transaction Analytics for Node.js, PHP, and Python Applications

This page describes how to configure Transaction Analytics and Data Collectors for Node.js, PHP, and Python applications.

#### Before You Begin

Make sure you have installed and configured the components described in [Installing Agent-Side Components](#) and, for on-premises, [Custom Install](#) and [Events Service Deployment](#) before attempting to configure Transaction Analytics.

#### Configure Analytics for Node.js

##### Collect Default Node.js Transaction Data

To configure the Node.js Agent to send the default transaction data to the Analytics Agent, modify the require statement in your application.

Add these variables with the proper values to point to your Analytics Agent:

```
analytics: {
 host: <analyticsHostName>,
 port: <analyticsPort>,
 ssl: <true || false>
}
```

The Analytics Agent can be on the same host as the Node.js Agent or on a different host. See [Install the Node.js Agent](#).

### Configure Data Limits

You can also configure the Node.js Agent to set limits on data sent to the Analytics Agent with these properties correlated to environment variables.

Property Name	Description	Environment Variable
<code>analyticsMaxSegmentSizeInBytes</code>	The maximum size of a business transaction segment collected in an Analytics request. By default, the value is 0.1MB.	<code>APPDYNAMICS_ANALYTICS_MAX_SEGMENT_SIZE</code>
<code>analyticsMaxSegmentsPerRequest</code>	The maximum number of segments per Analytics request. By default, the value is 16.	<code>APPDYNAMICS_ANALYTICS_MAX_SEGMENTS_PER_REQUEST</code>
<code>analyticsMaxMessageSizeInBytes</code>	The size of a single request body sent to the Analytics Agent. By default, the value is 1MB.	<code>APPDYNAMICS_ANALYTICS_MAX_MESSAGE_SIZE</code>

Your require statement should look similar to the following example where your Analytics Agent is on localhost and listening on Port 9090:

```
require ("appdynamics").profile({
 controllerHostName: '<Controller host name>',
 controllerPort: <Controller port number>,
 controllerSslEnabled: false, // Set to true if controllerPort is SSL
 accountName: '<AppDynamics account name>',
 accountAccessKey: '<AppDynamics account key>', // Required
 applicationName: '<Your application name>',
 debug: false,
 tierName: '<Choose a tier name>',
 nodeName: '<Choose a node name>', // The Controller appends the node name with a unique
 number
 analyticsMaxSegmentSizeInBytes: 20,
 analyticsMaxSegmentsPerRequest: 20,
 analyticsMaxMessageSizeInBytes: 100,
 analytics: {
```

```

 host: 'localhost',
 port: 9090 },
 logging: {
 'logfiles': [
 {'root_directory': '/tmp/appd', 'filename': 'echo_%N.log', 'level': 'TRACE',
'max_size': 5242880, 'max_files': 10 },
 {'root_directory': '/tmp/appd', 'filename': 'protobuf_%N.log', 'level': 'TRACE',
'max_size': 5242880, 'max_files': 10, 'channel': 'protobuf' }]
 }
 });

```

## Collect Node.js Data Collectors

You can also collect additional data from your Node.js business transactions by using the Node.js API. To configure Transaction Analytics data collectors for Node.js, see `txn.addAnalyticsData()` in the [Node.js Agent API Reference](#).

## Configure Analytics for PHP Applications

The screenshot shows the 'Configuration' page for Transaction Analytics. The 'Applications' section is active, displaying a table with the following data:

Application	Enable Analyti	Business Transaction	Enable Analytics
20_6_standalonebuild	<input type="checkbox"/>		
236842_AppKn	<input checked="" type="checkbox"/>	/load.php	<input checked="" type="checkbox"/>
238108_AppKn	<input checked="" type="checkbox"/>	/test.php	<input checked="" type="checkbox"/>
239429_AppKn	<input type="checkbox"/>		
aa-PS-WEBSTRV60	<input type="checkbox"/>		
AAA-WebSrv6	<input type="checkbox"/>		

1. In **Transaction Analytics - Configuration**, click the **Enable Analytics** checkbox to enable/disable Analytics on a PHP application.
2. To the right of **Business Transactions**, click the **Enable Analytics** checkbox to enable/disable Analytics on any Business Transaction(s) in the application.

Analytics data cannot be collected from PHP CLI programs.

To collect Transaction Analytics from the PHP Agent:

1. Configure the PHP Agent to send the default transaction data to the Analytics Agent. Modify the `.ini` file depending on the operating system under which your PHP Agent is installed. By default, your `.ini` file contains the following configuration where your Analytics Agent is on `localhost` and listens to Port `9090`:

```
agent.analyticsHostName = localhost
agent.analyticsPort = 9090
```

Add the following variables with the proper values to point to your Analytics Agent:

```
agent.analyticsHostName = <analyticsHostName>
agent.analyticsPort = <analyticsPort>
```

The Analytics Agent can either be on the same host as the PHP Agent, or on a different host. For information about installing the PHP Agent, see [Install the PHP Agent](#).

You must set the node level setting `analytics-dynamic-service-enabled=true` for reporting analytics.

2. (Optional) If you require to report analytics data after a specific number of data events/transactions or after a specific time interval, configure the PHP Agent by adding the following parameters in the `.ini` file:

```
agent.analyticsReportingFrequency = <time in seconds>
agent.analyticsEventThreshold = <number of analytics transaction recorded>
```

The default agent reporting frequency is 30 seconds and the default event threshold is 10K events/transactions.

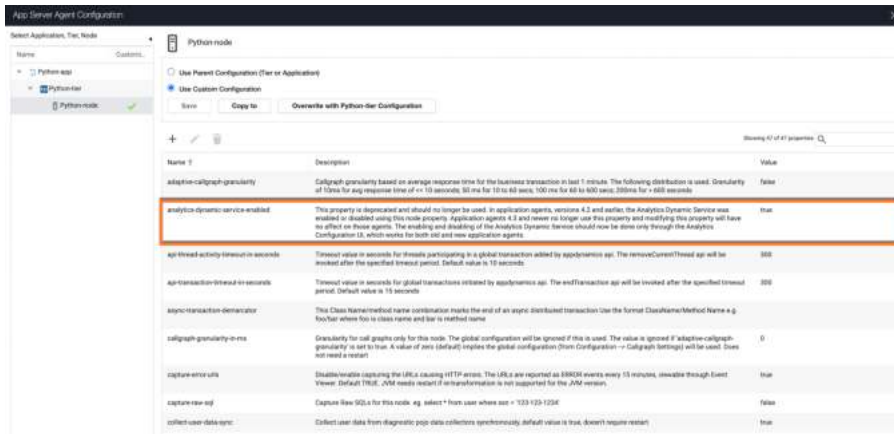

3. HTTP/Method Invocation Data collectors for Analytics must be enabled for both transaction snapshots and Transaction Analytics to report data from the PHP Agent. In order to collect the method return value with an MIDC, the value must be assigned to a variable.

```
$ret = function()
```

If the return value is not stored in any variable, it displays as `null` in both snapshot and Analytics data.

### Configure Analytics for Python Applications

1. In **Transaction Analytics - Configuration**, click **Enable Analytics** to enable Analytics on a Python application.
2. To the right of **Business Transactions**, click **Enable Analytics** to enable Analytics on any Business Transaction(s) in the application.
3. For Controller versions `<= 21.10`, set the `analytics-dynamic-service-enabled=true` node property to report analytics.

For details on how to add node properties, see [Add a Registered Node Property](#).

**i** The parent configuration is not supported for the `analytics-dynamic-service-enabled` property. You must set this property to each node to report transaction analytics.

### Collect Transaction Analytics

To collect Transaction Analytics from the Python Agent, configure the Python Agent to send the default transaction data to the Analytics Agent:

- Modify the Python Agent configuration file.

```
[services:analytics]
host= <analyticsHostName>
port= <analyticsPort>
```

**i** The default value of the host is `localhost` and port is `9090`.

Or,

- Set these environment variables:
- `APPDYNAMICS_ANALYTICS_HOSTNAME`
- `APPDYNAMICS_ANALYTICS_PORT`

**i** For details about how to set the environment variables, see [Python Agent Settings](#).

### Enable SSL Between Python Agent and Analytics Agent

To enable SSL between Python Agent and Analytics Agent:

1. Obtain the root certificate of the CA authority that signed the Analytics Agent certificate.
2. Enable SSL and specify the path of the certificate file in the Python Agent configuration file.

```
[services:analytics]
ssl= on
ca-file=<path of the CA certificate file>
```

**i** Python Agent accepts the certificate file in `.pem` format. If there are intermediate certificate authorities, specify the path of the chain of trust in place of the root certificate authority.

Or,

Set these environment variables:

- APPDYNAMICS\_ANALYTICS\_SSL\_ENABLED
- APPDYNAMICS\_ANALYTICS\_CAFILE

### Add Custom Fields to Transactions Using Java SDK

You can add custom data using the Java Agent SDK as an alternative to adding [data collectors](#) from the Controller UI.

The fields show up on Transaction Analytics under a section called "Custom Method Data".

Add the code similar the following to your application:

```
//include the app agent SDK packages

import com.appdynamics.apm.appagent.api.AgentDelegate;
import com.appdynamics.apm.appagent.api.DataScope;
import com.appdynamics.apm.appagent.api.IMetricAndEventReporter;

public void someMethod(String stringParam, int intParam, ComplexObject complexObjParam) {

 //Get the data reporter.
 IMetricAndEventReporter reporter = AgentDelegate.getMetricAndEventPublisher();

 //Define the scope for data collection.
 Set<DataScope> allScopes = new HashSet<DataScope>();
 allScopes.add(DataScope.ANALYTICS);
 allScopes.add(DataScope.SNAPSHOTS);

 Set<DataScope> analyticsScope = new HashSet<DataScope>();
 analyticsScope.add(DataScope.ANALYTICS);

 //Add data to different scopes based on the need.
 //Here both key1 and key2 are collected for both snapshots and analytics
 reporter.addSnapshotData("key1", stringParam, allScopes);
 reporter.addSnapshotData("key2", intParam, allScopes);

 //Here key3 is only collected for analytics.
 //Since the passed object is a complex java object and not a primitive type, toString()
 method is invoked on it and the string value will
 //be collected.
```

```
reporter.addSnapshotData("key3", complexObjParam, analyticsScope);

.....
Business logic.
```

The third parameter to the method is a set of enums, `DataScope`, that define the scope for collecting the custom data:

- To collect custom data only for snapshots, use `DataScope.SNAPSHOTS` as the third parameter.
- To collect the custom data for analytics, use `DataScope.ANALYTICS` as the third parameter.
- If custom data should be added to both snapshots and analytics then both the enums should be passed in a set as the third parameter.

### Method details for `addSnapshotData()`

```
boolean addSnapshotData(java.lang.String key,
 java.lang.Object value,
 java.util.Set<DataScopes> dataScopes)
```

### Method Parameters

- `key` - key
- `value` - Primitive types can be passed as values and the types (int, boolean, etc) will be respected. Strings can be passed as values, however, note that if you pass composite objects then agent performs a `.toString()` operation on it.
- `dataScopes` - scope for the custom data collection:
  - `Datascope.SNAPSHOTS`
  - `Datascope.ANALYTICS`

### Returns

true if the agent successfully collects the key-value pair for the given scope.

### Collect Business Data From SQL Calls

Transaction snapshots capture SQL database calls. The SQL calls can contain useful business data. Analytics SQL data collectors are a way to collect the business data from SQL parameters for use in transaction analytics.

To configure an Analytics SQL data collector you need to know:

- Analytics-enabled application where the SQL call is executed.
- Database target of the SQL call.
- Specific SQL parameterized statement that contains the data of interest as a query parameter.
- Analytics-enabled business transactions making the database call.
- Parameters to be collected.

This feature is supported as:

- The SQL data collector list shows the slowest database calls over the last 30 days. You can also create a SQL data collector directly from the **DB & Remote Service Calls** tab of a snapshot.
- Requires 4.3 Java Agent or 4.3 .NET Agent.
- Only prepared statements containing data of interest as binding variables can be used. Literal strings that are passed in can not be collected.
- There is a 500-character limit on the length of the SQL statement. Do not use any truncated queries that might appear in the SQL Statements list or a snapshot.
- The overall number of executions of SQL queries configured to collect Analytics data is limited to 10K. This is configurable using the `analytics-sql-cpm-limit` node property. See [App Agent Node Properties](#).

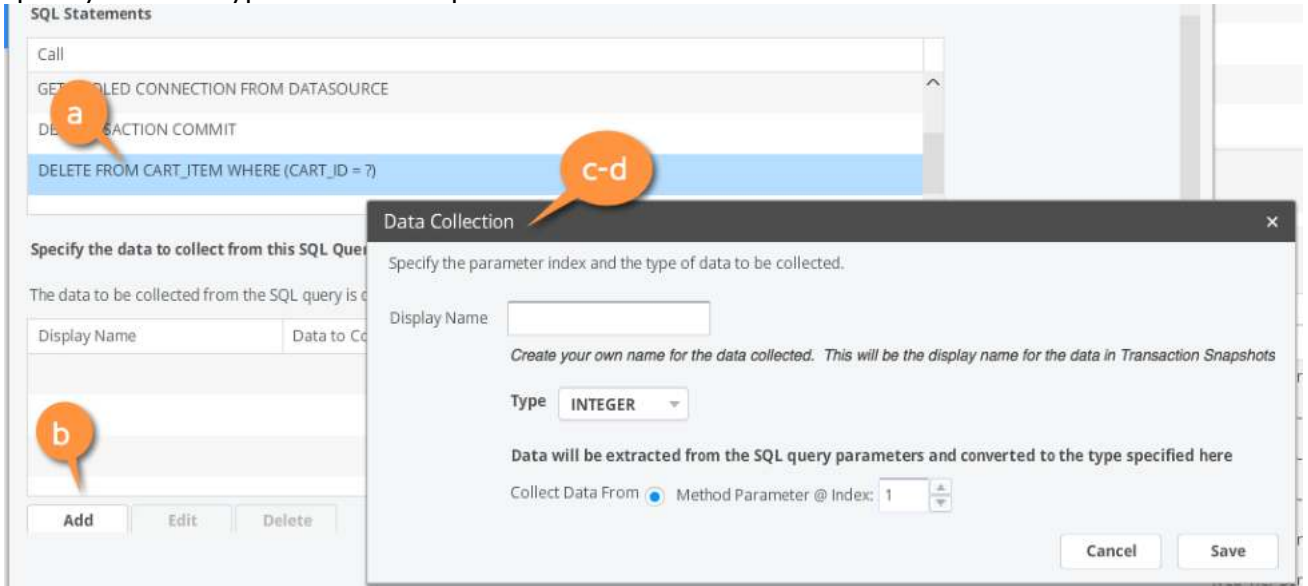

## Configure SQL Data Collectors From Analytics

1. In the Controller UI, from the top navigation bar, select **Analytics > Configuration**.
2. From the Transaction Analytics tab, select the application from the **Configure Analytics for Application** dropdown and confirm that analytics data collection is enabled.
3. Scroll down to expand the **SQL Data Collectors** section, and click **Add**.

4. Name your data collector and indicate if the collector should apply to new business transactions.
5. Select the appropriate database. A list of available SQL statements displays showing the slowest database calls over the last 30 days. This timeframe is not configurable.

6. Define the data to collect.
  - a. Select the SQL prepared statement containing the parameter that you want to capture for analytics.
  - b. Click **Add** to specify the data to be collected.
  - c. Type a display name for the data you are collecting.  
This name appears in the Analytics UI Fields list when the data is collected and passed to Analytics.

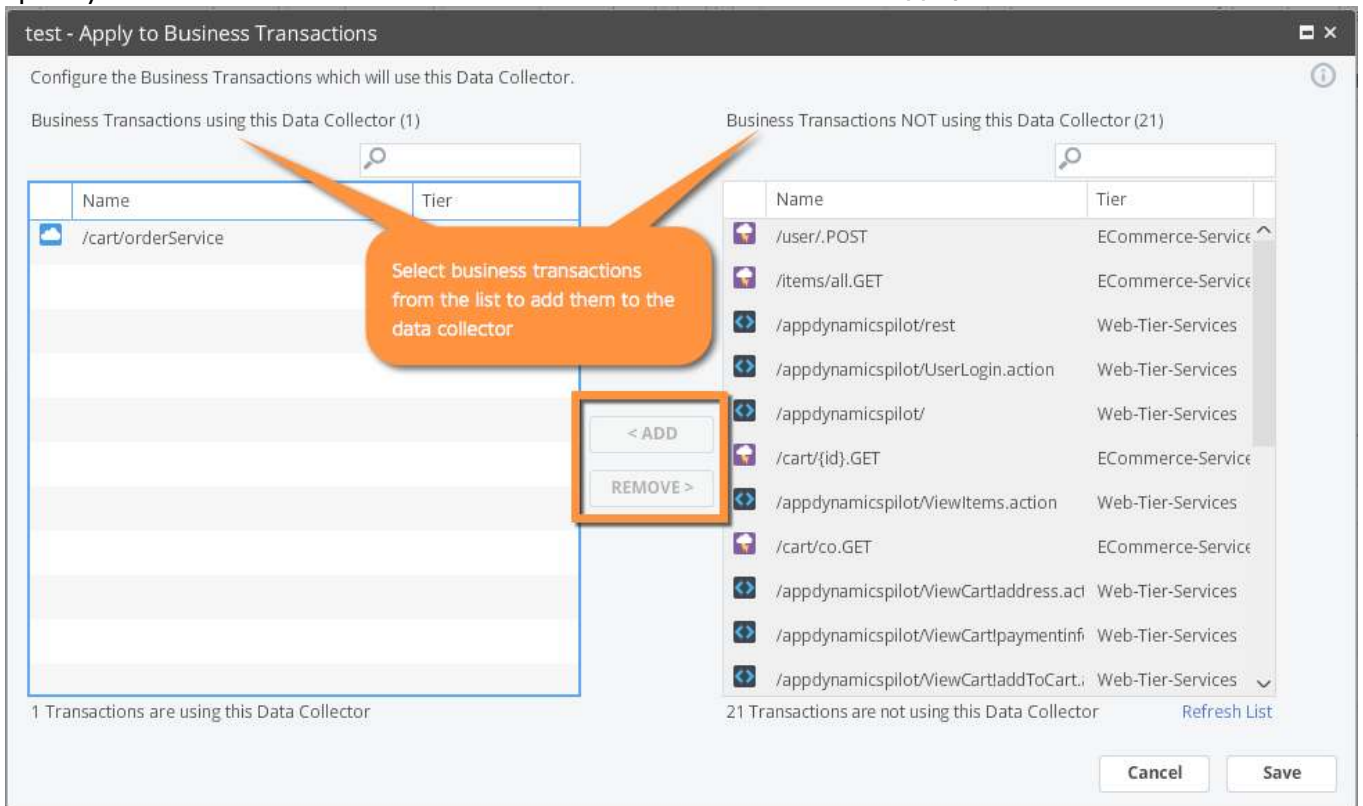

d. Specify the data type and method parameter index.

e. Click **Save**.

f. Click **Create SQL Data Collector**.

7. Specify the business transactions that will use this collector and click **Save**.

## Configure SQL Data Collectors From Snapshots

This procedure provides a shortcut way to set up the configuration for an Analytics SQL data collector for a database call captured in an application transaction snapshot. You need to find the transaction snapshot of interest and drill down to the node that contains the database call of interest.

1. From the **DB & Remote Service Calls** tab of a snapshot containing the SQL call of interest, select the prepared statement that contains the data you want to collect for analytics.
2. Right-click the query and select **Configure Data Collector** from the context menu. The **Data Collection** panel displays.

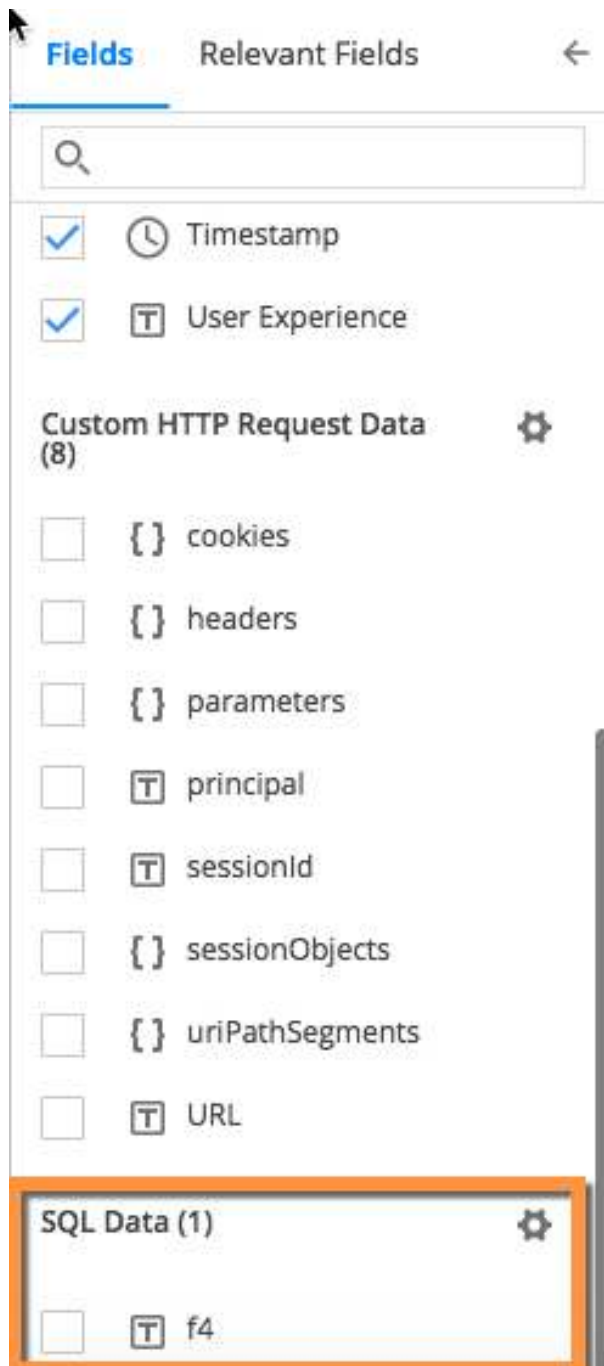

The screenshot shows the AppDynamics interface with the 'DB & Remote Service Calls' tab selected. A table titled 'SQL Calls Summary for ECommerce-Services' is visible. The table has columns for 'Query Type', 'Query', 'Avg. Time(ms)', and 'Count'. One row is highlighted, showing a 'Query' with the SQL statement 'SELECT ID, user\_id FROM cart WHERE (user\_id = ?)', an average time of 10ms, and a count of 1. A 'Data Collection' dialog box is open over this row, prompting the user to specify the parameter index and the type of data to be collected. The dialog includes a 'Display Name' text box, a 'Type' dropdown menu set to 'INTEGER', and a 'Collect Data From' section with a radio button selected for 'Method Parameter @ Index: 1'. 'Cancel' and 'Save' buttons are at the bottom right of the dialog.

Query Type	Query	Avg. Time(ms)	Count
Query	SELECT ID, user_id FROM cart WHERE (user_id = ?)	10	1

3. Enter a display name for the data you are collecting.
4. Specify the type and the parameter to collect and click **Save**.
5. Select the business transactions from which to collect the data and click **Save**.

## View SQL Data in Analytics

After the data is successfully collected for analytics, you see the fields in the **Fields** list in a section labeled SQL Data. This can take a few minutes depending on your application and the frequency of transactions executing the relevant SQL query.

## Collect Log Analytics Data

### Related pages:

- [Configure Log Analytics Using Job Files](#)
- [Analytics Log Data](#)

To capture and present log records as analytics data, you must configure one or more *log sources* for the Analytics Agent. The Analytics Agent uses the log source configuration to:

- Capture records from the log file
- Structure the log data according to your configuration
- Send the data to the Analytics Processor.

The Controller presents the Log Analytics data in the Analytics UI.

Before attempting to configure Log Analytics, confirm you have installed and configured the components described in [Install Agent-Side Components](#) and, for on-premises, [Custom Install](#) and [Events Service Deployment](#).

Versions < 4.3 use *job files* to configure the log sources. You may continue to use job files that were created in previous versions. If you want to collect new log events into our platform, we recommend that you use the Centralized Log Management UI to define *source rules*. You may also find it useful to replace existing job file configurations with the new source rules so you can take advantage of new features introduced in 4.3. See [Migrate Log Analytics Job Files to Source Rules](#).

To configure data collection for your log sources, see [Configure Log Analytics Using Source Rules](#).

## Manage Extracted Fields

In Controller < 4.3, you could extract fields from logs in the Controller UI. This is described on the [Create Extracted Fields from Logs](#) page. This option is not available  $\geq$  4.3. It is replaced entirely by Field Extraction in the Centralized Log Management UI. See [Configure Log Analytics Using Source Rules](#) for details.

Fields that were extracted by this mechanism in previous versions appear in the Extracted Fields list. Hovering over the field reveals a **View** icon. Click the **View** icon to delete the field or to see the configuration details:

- Regular expression used to extract the field
- Field name
- Field type
- Source type

## Configure Log Analytics Using Source Rules

### Related pages:

- [Agent Scopes for Configuration Log Management](#)
- [Analytics Log Data](#)
- [Collect Log Analytics Data from Syslog Messages](#)

The Centralized Log Management UI enables you to configure your log data sources using source rules.

Once you define source rules, you specify which Analytics Agents should use the rules by associating specific source rules with Agent Scopes. Agent Scopes are groups of Analytics Agents that you define. Using Agent Scopes simplifies the deployment of the log source configuration to multiple agents.

## Log Analytics Source Rules

Analytics Agents collect logging information based on the log source rules you define in the Controller.

The primary function of a source rule is to specify the location and type of a log file, the pattern for capturing records from the log file, and the structure of the data of captured records. They can also specify field masking or sensitive data removal and manage time zones of captured records.

When the log source rules are enabled and associated with Agent Scopes, Analytics Agents automatically start collecting the configured logs as follows:

- Analytics Agents register with the Controller on startup
- Analytics Agents download log source rules to configure log collection (after registration)
- Log source rules are stored in the Controller data store and are configurable through the Centralized Log Management UI
- Analytics Agents start acting on log source rule changes within five minutes (this could be longer if there are any network communication issues)

## Permissions

To configure log analytics source rules, you need the following permissions:

- Manage Centralized Log Config permission
- View access to the specific source types that you want to configure

See [Analytics and Data Security](#).

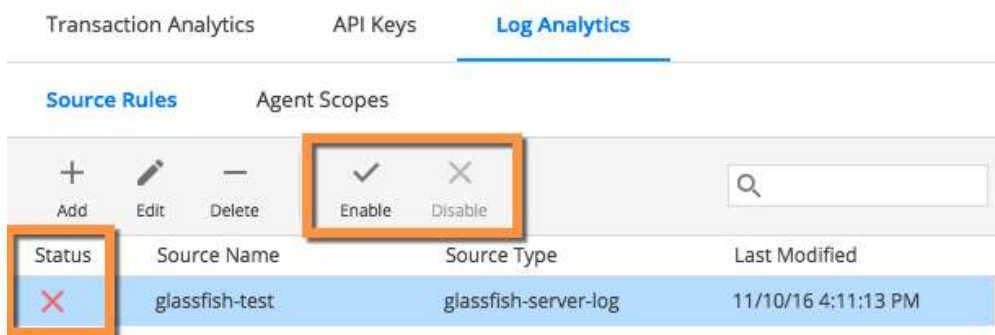

## Analytics Agent Properties

If you are using Centralized Log Management (CLM), you need to configure additional properties in the `analytics-agent.properties` file. See information on configuring properties for consolidated log management in [Install Agent-Side Components](#) for details.

## Managing Source Rules

When you create a source rule and save it, the rule is initially disabled. This is shown in the **Status** column on the source rule list page.

You can enable or disable a source rule by selecting it and choosing the corresponding option from the **Source Rules** menu, shown in the following screenshot:

You can also see which source rules use a specific agent scope. The Analytics Agent does not collect the log data until the source rule is enabled and assigned to an Agent Scope with active Analytics Agents.

## Starting Point for Creating a Source Rule

You can create a source rule from any one of these starting points:

- AppDynamics template. Several templates for common log file formats are available.
- Existing source rule. You can use existing source rules as the starting point for new rules.
- New source rule. Start from scratch when your log file does not match one of the available templates.

## Preview Extracted Log Data Using Sample Log Files

To improve validation of data collection and parsing of log messages, you can use a local log file with the Log Analytics Configuration UI to preview the field extraction that you want. Three types of field extraction are available.

- Grok patterns and key-value pair extraction
- Auto extraction using regular expressions
- Manual extraction using regular expressions

## Best Practices for Source Rule Design

A few recommendations apply to making source rules.

Use the simplest possible regular expressions and grok matching patterns possible. Do not make excessive use of wildcards or quantifiers as it can slow the responsiveness of the Controller UI. You can view examples of such greedy quantifiers on <https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html>.

If a regex pattern (including grok) is taking more than five seconds to match against a logline, extraction and further processing for those fields stop. If this occurs, some fields may be missing for that log line when viewed on the Controller. Other log lines are not impacted; however, this occurrence is often the result of an ineffective or faulty matching pattern in the first place, and processing is likely to take a long time for all log lines. This behavior is applicable to the dynamic Preview screens in the **Centralized Log Analytics Configuration** page as well.

The Controller limits the size of the records it retrieves to 32 KB by source rule in log analytics. This limit guards against excessive system resource burden, including potential resource burden that might be caused by excessive data collection due to faulty source rule patterns.

## Create a Source Rule

1. From the Controller top navigation bar, click **Analytics**.
2. From the left navigation panel, click **Configuration > Log Analytics**.  
You see two tabs, one for Source Rules and one for Agent Scopes.
3. From the Source Rules tab, click **+ Add**.  
You see the **Add Source Rule** panel.

- In the **Add Source Rule** panel, select your starting point for the source rule. Note that you can also use a job file as the starting point for your source rule. See [Migrate Log Analytics Job Files to Source Rules](#).

- Use **Collection Type** to indicate if the source log file resides on the local filesystem or will be collected from a network connection.

**i** Collecting from a network connection is only used for a TCP source rule, which extracts log analytics fields from `{{syslog}}` messages over TCP. See [Collect Log Analytics Data from Syslog Messages](#).

- Use the **Browser** button to locate and specify a sample log file to preview the results of your configuration. You can also specify a sample file later in the configuration process during the field extraction step.

7. Click **Next** to see the **Add Source Configuration** page. Some fields may be prepopulated with data if you selected either an AppDynamics template or an existing source rule as your starting point. The four tabs are:
  - General
  - Field Extraction
  - Field Customization
  - Agent Mapping
8. On the **General** tab, name your rule, specify its location, timestamp handling, and other general characteristics. See [General Configuration](#).
9. On the **Field Extraction** tab, configure the fields that you want to capture from your log file. For more details on the fields on this subtab, see [Field Extraction](#). For a detailed procedure on using Auto Field Extraction, see [Field Extraction for Source Rules](#).

**i** Use the simplest possible regular expressions and grok matching patterns. Do not make excessive use of wildcards or quantifiers as it can slow the responsiveness of the Controller UI. Examples of expensive and greedy quantifiers can be found here <https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html>

10. On the **Field Management** tab, you can customize the handling of fields in a number of way including masking sensitive data, renaming fields, changing the data type and more. See [Field Management](#). **Mask Value:** Use this option to mask values of sensitive data such as credit card numbers or social security numbers. Select **Mask Value** and enter the starting index and ending index (1 and 4 respectively for the example shown) and a character to use for masking in the display, such as an \* asterisk.

**Add Source Configuration**

- On the Agent Mapping tab, assign the source rule to specific Agent Scopes.
- Click **Save** when you are finished. The source rule is saved in a disabled state.

**Centralized Log Management UI Details**

**General Configuration Tab**

Field	Description	Required
Source Name	Name of this source rule. This name must be unique. Appears in the list of defined source rules.	Yes

<p><b>Source Type</b></p>	<p>Specifies the event type of log source file. This field is prepopulated when you start from an AppDynamics template or an existing source rule. If you are creating a new source rule from scratch, you can specify any value. This value is used to identify this specific type of log event and can be used in searching and filtering the collected log data. The value shows up in the field list for the log data.</p>	<p>Yes</p>
<p><b>Source File</b></p>	<p>The location and name of the log file to serve as a log source. The location must be on the same machine as the analytics-agent.</p> <p>You can use wild cards and you can specify whether to match files one level deep or all log files in the path directory structure.</p> <ul style="list-style-type: none"> <li>• Example for multi-level matching: path: /var/log/**/*.*.log This matches both /var/log/apache2/logs/error.log and /var/log/cassandra/system.log</li> <li>• Example for one level matching: path: /var/log/*.*.log This searches for .log files one level deep in the /var/log directory (matches on /var/log/cassandra/system.log but not on /var/log/apache2/logs/error.log).</li> </ul>	<p>Required when collection type is from the local filesystem.</p>
<p><b>Exclude Files</b></p>	<p>Exclude, or blacklist, files from the defined source rule(s). Input the relative path of the file(s) to exclude, using wildcards to exclude multiple files.</p> <ul style="list-style-type: none"> <li>• Example for a single file: <b>Source File:</b> /var/log/**/*.*.log <b>Exclude Files:</b> cassandra/system.log</li> <li>• Example for multiple files: <b>Source File:</b> /var/log/**/*.*.log <b>Exclude Files:</b> */system.log</li> </ul>	<p>No</p>

<p><b>TCP Port</b></p>	<p>Specifies the port for the analytics-agent to collect log files from a network connection. This field is not present if the collection type is <b>From local file system</b>.</p> <p>If no port number is provided, port 514 is used. Both the syslog utility and analytics-agent should have root access to send logs to port 514 (binding to ports less than 1024 requires root access).</p>	<p>Required when collection type is from a network connection.</p>
<p><b>Enable path extraction</b></p>	<p>This checkbox enables extraction of fields from the path name. Add a grok pattern in the text box.</p> <p>The syntax for a grok pattern is <code>{%{SYNTAX:SEMANTIC}}</code>. For example, to extract AdminSever from <code>/opt/apps/oracle/middleware/user_projects/domains/ouaf_domain1/servers/AdminServer/logs/AdminServer.log</code>, enter the following GROK pattern: <code>servers /%{DATA:servername}/%{GREEDYDATA}</code>, where <code>%{DATA :server }</code> filters the server name and <code>%{GREEDYDATA}</code> filters rest of the message from the log path.</p>	<p>No</p>
<p><b>Thread Count</b></p>	<p>Specify the number of threads that the Analytics Agent will use for log processing. You must specify the thread counts after analyzing the performance of your environment as increased thread counts might impact system resources.</p> <p><b>Minimum Value: 5</b> <b>Maximum Value: 25</b></p>	<p>Required if the number of log files to be processed is more than five.</p>

<p><b>Start collecting from</b></p>	<p>Indicate where to begin tailing (collecting the log records). Options are:</p> <ul style="list-style-type: none"> <li>• From the beginning of the log file</li> <li>• From the end of the log file</li> <li>• A specific time range (in hours) - For example, if you set this to four hours, then when you enable the rule and analytics starts tailing the log data, only the last four hours of data is ingested. When tailing starts, the watermark state is maintained for that file. If the agent is now stopped and restarted, it will start tailing from where it left off for any old file. For new files, it will only tail the last four hours of data.</li> </ul>	<p>The default is to collect log records from the beginning of the file.</p>
<p><b>Override time zone</b></p>	<p>Use this to override the time zone for eventTimestamp in log events. If your log events don't have a time zone assigned and you are not overriding it, the host machine time zone is assigned to the log events. You cannot override the timezone in the pickupTimestamp field.</p> <p>If you override the time zone, you must provide a timestamp format. Time zone formats should conform to <a href="#">Joda-Time Available Time Zones</a>, and the timestamp format should be created with the <a href="#">Joda-Time formatting system</a>.</p>	<p>No</p>
<p><b>Override timestamp format</b></p>	<p>You can override the format if needed. Time zone formats should conform to <a href="#">Joda-Time Available Time Zones</a>, and the timestamp format should be created with the <a href="#">Joda-Time formatting system</a>.</p>	<p>Yes.</p> <p>The override timestamp format is needed to extract out time correctly from the log file. If you do not provide this field, the eventTimestamp will be equal to pickupTimestamp despite log line having a timestamp.</p>
<p><b>Auto-Correct duplicate Timestamps</b></p>	<p>Enable this option to preserve the order of original log messages if the messages contain duplicate timestamps. This adds a counter to preserve the order.</p>	<p>No</p>
<p><b>Collect Gzip files</b></p>	<p>Enable this to also find gzip files in the specified path.</p>	<p>No</p>

## Field Extraction Tab

The following table describes the fields and actions on this tab. For a detailed procedure on using Auto or Manual Field Extraction, see [Field Extraction for Source Rules](#).

Section/Field or Action	Description
<b>Add Grok Pattern</b>	
<b>Message Pattern</b>	This is the grok pattern used to extract fields from the log message. A pattern may be prepopulated when you use an AppDynamics template or an existing source rule as your starting point. You can add or remove grok patterns as needed.
<b>Multiline Format</b>	<p>For log files that include log records that span multiple lines (spanning multiple line breaks), use this field to indicate how the individual records in the log file should be identified. You have two options:</p> <ul style="list-style-type: none"> <li>• <b>startsWith:</b> A simple prefix that matches the start of the multiline log record.</li> <li>• <b>regex:</b> A regular expression that matches the multiline log record.</li> </ul> <p>The multiline format is not supported when you are collecting log data from a network connection.</p>
<b>Extract Key-Value Pairs</b>	
<b>Field</b>	Shows the field selected for key-value pair configuration.
<b>Split</b>	The delimiter used to separate the key from its value. In this example, "key=value": the split delimiter is the equal sign "=". Multiple comma-separated values can be added.
<b>Separator</b>	The delimiter used to separate out two key-value pairs. In this example, "key1=value1;key2=value2": the separator is the semi-colon ";". Multiple comma-separated values can be added.
<b>Trim</b>	A list of characters to remove from the starting and/or the end of the key/value before storing them. In this example, "_ThreadID_": you can specify the underscore "_" as the trim character to result in "ThreadID". Multiple comma-separated values can be added.
<b>Include</b>	A list of key names to capture from the "source". You must provide keys in the include field. If the include field is left blank no key-value pairs are collected.

<b>Actions</b>	
<b>Upload Sample file</b>	Browse to a local file to upload a sample log file.
<b>Preview</b>	Use to refresh the Preview grid to see the results of the specified field extraction pattern.
<b>Auto Field Extraction</b>	
<b>Definer Sample</b>	Select a message from the preview grid that is representative of the fields that you want to extract from the log records. You can select only one definer sample per source rule.
<b>Refiner Samples</b>	Refines the regular expression to include values that were not included in the original definer sample.
<b>Counter Sample</b>	This specifies something to ignore. Refines the regular expression to exclude values that were included by the original definer or refiner sample.
<b>Manual Field Extraction</b>	
<b>Regular Expression</b>	Add a regular expression to define the field you want to extract.
<b>Field Type</b>	Specify the type for the field.
<b>Field Name</b>	Automatically generated within the regular expression pattern. This name appears in the Fields list in the Analytics Search UI.
<b>Actions</b>	
<b>Add Field</b>	Use to add additional regular expressions for extracting more fields. You cannot add more than 20 fields.
<b>Preview</b>	Use these buttons to filter the viewable results in the preview grid. <ul style="list-style-type: none"> <li>• All</li> <li>• Matching</li> <li>• Non-Matching</li> </ul>
<b>Upload Sample File</b>	Upload a sample file from your local file system to use in the preview grid.

## Field Management Tab

Field/Action	Description
<b>Select Any Field to Customize</b>	Select the field to add customizations. You can add multiple customizations to a single field.
<b>Field Name</b>	This column lists the fields that have customizations.
<b>Customize</b>	This column shows the specific customizations. For static fields, the display name is shown. Static fields cannot be further customized.
<b>Mask Value</b>	This customization option masks values in the collected data. Specify the starting and ending position in the data and the character to use as the masking value.
<b>Replace Value</b>	This customization option replaces the entire value of the field with a static string.
<b>Rename</b>	This customization option enables you to rename a field to a more recognizable display name.
<b>Field Type</b>	Use to change the data type of the field. For example, from string to number. Available types are String, Boolean, and Number.  Note that after a source rule has been saved with a field of a specified data type, you cannot later change the data type of that field. Once the fields are indexed in the analytics database trying to specify a new type will cause a validation error.
<b>Remove</b>	This customization turns off data collection for the field. It can be reversed at a later time.
<b>Add Static Field</b>	This action allows you to add a static field to all the log events collected from this source. This field can then be used to search and filter the log data. For example, use this to add Tier, Node, and Application Name to the log data.

## Field Extraction for Source Rules

This page describes how to use Auto and Manual Field Extraction to configure Log Analytics source rules. Field Extraction uses regular expressions to identify and format the fields for your Log Analytics data.

Auto Field Extraction enables you to upload a sample log file and select fields for extraction. The necessary regular expressions are automatically generated and highlighted in your sample messages. You can fine-tune the generated regular expressions using Refiner Sample and Counter Sample log messages.

---

Manual Field Extraction enables you to upload a sample log file and enter your own regular expressions to define fields and associate the fields with a data type.

## Definitions

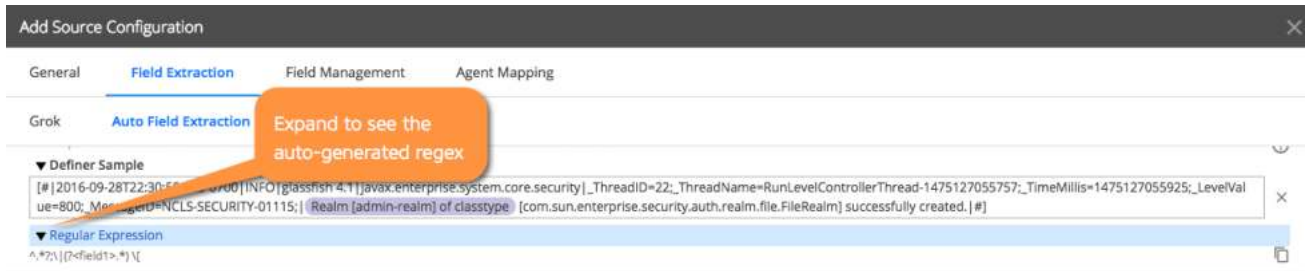

- **Source Rule:** a set of configuration settings for extracting analytics data from log files. You create source rules using the Centralized Log Management UI in the Controller. Source rules are stored in the Controller data store and periodically synced with the Analytics Agent. See [Configure Log Analytics Using Source Rules](#).
- **Sample File:** a representative log file uploaded to the Controller that provides a way to test and fine-tune your log file source rules.
- **Definer Sample:** a specific log message selected from the sample log file used to define the fields that you want to extract from the log messages.
- **Refiner Sample:** an additional log message used to revise the auto-generated regular expression created in the Definer Sample step. The Refiner sample helps capture fields that were missed in the initial step.
- **Counter Sample:** an additional log message used to eliminate false positives while extracting the fields as defined in the Definer or Refiner steps.

## Auto Field Extraction

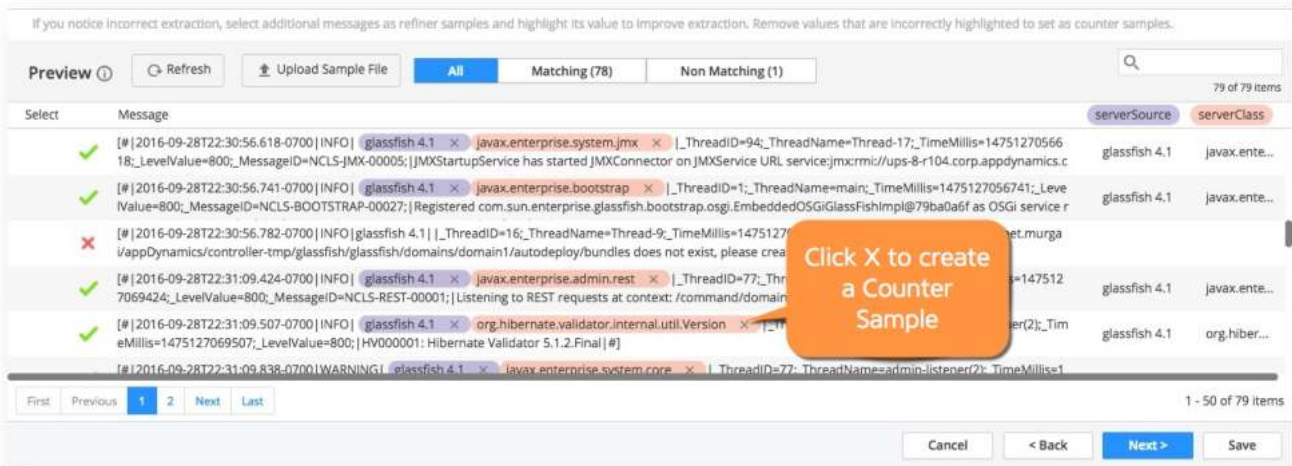

This section describes how to use Auto Field Extraction to extract fields from your log files.

To specify field extraction using a Definer Sample log message:

1. Using the Centralized Log Management UI, add a new source rule (or edit an existing source rule), and navigate to the Auto Field Extraction subtab within the Field Extraction tab. See the section "*Create a Source Rule*" in [Configure Log Analytics Using Source Rules](#) for detailed steps on accessing this UI.
2. If you do not see log messages in the grid, upload a sample file by clicking **Upload Sample File**. If you uploaded a sample file in a previous step in the configuration process or you started your new source rule using an existing source rule, you will see log messages in the grid.
3. Hover over any row on the grid and click **+Select as Definer Sample**.  
Choose a sample log message that contains the fields you want to extract from the log file. When you need to capture fields from dissimilar log messages, you can create more than one definer.
4. After you select the Definer Sample message, use the following steps to extract fields from the message. After selecting the Definer Sample and specifying the fields to extract, the preview grid displays rows with matching and non-matching results.
  - a. Select text in the message. If you are defining key-value pairs, it is only necessary to highlight the key field.  
A popup appears where you can specify properties of the extracted field.
  - b. Enter the field name, select the data type, and click **Extract**.  
The preview grid is updated to show matching rows with the selected text highlighted with a color.
  - c. (Optional) To update the properties or delete the field, click the field you just created in the definer and the properties popup appears.
  - d. Repeat steps a, b and c to create more fields.  
As you add additional fields, the regular expression changes. You can view or copy (but not edit) the regular expression in the regular expression section.

5. (Optional) Specify Refiner Samples: As you review the non-matching rows, if you notice a value that was not extracted and should have been extracted, then you can add that row as a Refiner Sample. A refiner sample is used to match the unmatched rows from the Definer step.
  - a. On the grid, click **+Select as Refiner Sample**. You do not see this option unless you already selected the Definer Sample.
  - b. Select the text.
  - c. A popup appears. You can associate this portion of text with a field already created in the Definer step. When you extract, the regular expression changes and matching rows get updated in the Preview grid and will be shown as Matching. If necessary, you can add more than one Refiner Sample message.
6. (Optional) Specify Counter Samples: Counter samples eliminate false positives while extracting the fields. In the Preview grid, the highlighted values are shown along with an X button. Click the X next to a field to mark a value as a false positive (a Counter Sample).

The Counter Sample is shown below the Definer and Refiner Samples and the regular expression is updated to show the new set of matching and non-matching rows.

The screenshot shows the Grok configuration interface. At the top, there are tabs for "Auto Field Extraction" and "Manual Field Extraction". Below these, there are sections for "Definer Sample" and "Counter Samples". The "Counter Samples" section shows a list of log messages with fields extracted. Below this, there is a "Preview" section with a "Refresh" button and an "Upload Sample File" button. The preview grid shows a list of log messages with columns for "Select", "Message", "serverSource", and "serverClass".

7. Click **Save** to save the fields to the source rule.
8. Continue to the other tabs of the Add Source Rule dialog to complete your source rule configuration.

## Manual Field Extraction

You can specify your own regular expressions if needed using Manual Field Extraction.

1. Using the Centralized Log Management UI, add a new source rule (or edit an existing source rule), and navigate to the Manual Field Extraction subtab within the Field Extraction tab. See "*Create a Source Rule*" in [Configure Log Analytics Using Source Rules](#) for detailed steps on accessing this UI.
2. If you do not see log messages in the grid, upload a sample file by clicking **Upload Sample File**.
3. Click **Add Field**.
4. Click **Show Example** to review how to write regular expressions.
5. Type in your regular expression and associate it with a field type using the drop-down menu.
6. In the Preview grid, click Refresh.  
The preview grid is highlighted with the results of applying the regular expression to the sample log messages. You cannot add more than 20 fields.
7. (Optional) You can change the regular expression or the type and use **Refresh** to see the updated results.
8. Click **Save** to update your source rule.

## Agent Scopes for Configuration Log Management

### Related pages:

- [Configure Log Analytics Using Source Rules](#)

Agent Scopes are used to determine which agents use the CLM source rules. You can group your deployed Analytics Agents into scopes, then assign source rules to the scopes. While creating an agent scope, you are given an option to either choose agents from a static list or to add agents dynamically by specifying matching rules.

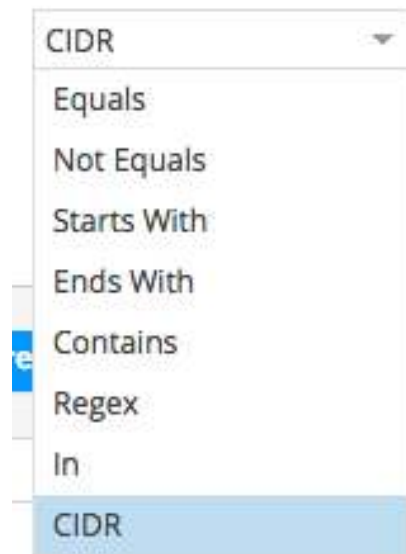

### Static Agent Scopes

The Available Agents list is populated with the Analytics Agents reporting to your controller. You can use this list to add currently available agents to a scope.

## Dynamic Agent Scopes

You can specify match conditions where registered Analytics Agents that match the rule are automatically added to, or excluded from, the scope. Analytics Agents that register with your Controller in the future, with characteristics that match the scope criteria, will also be added to the scope. You can match on agent name, unique host ID, or IP address.

The available operators for the matching conditions include regular expressions (regex) and Classless Inter-Domain Routing (CIDR) notation. CIDR is a compact notation for an IP address and its associated routing prefix.

The match conditions are additive, so exclusions will take precedence over inclusions. An agent must satisfy all conditions to be included. For example, an agent named *ABC* would not be included in the scope if you specify something similar to the following conditions:

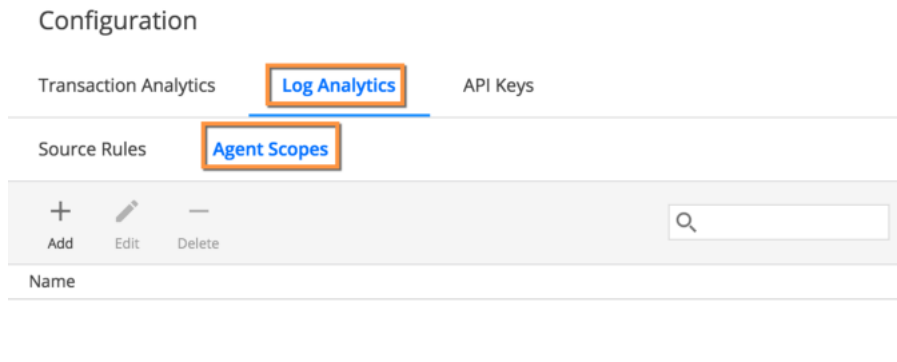

- include name equals '*ABC*'
- include name that ends with '*D*'

## Define Agent Scopes

To add an Agent Scope:

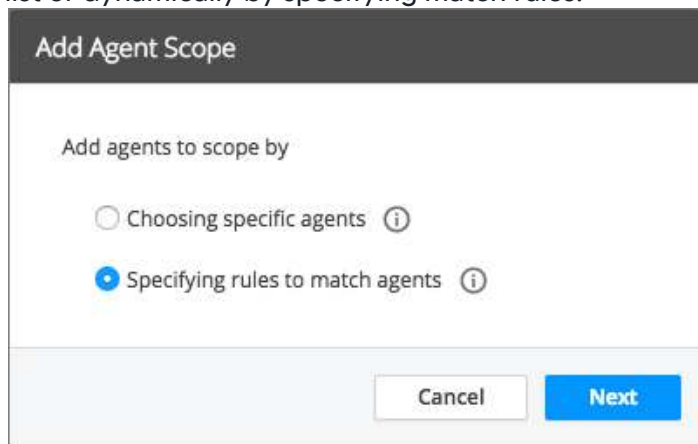

1. From the Controller top navigation bar, click **Analytics**.

- From the left navigation panel, click **Configuration > Log Analytics > Agent Scopes**.

- Click **+Add**.

You see the Add Agent Scope pane where you can specify how you want to add agents: from a static list or dynamically by specifying match rules.

- To add specific agents, select **Choosing specific agents** and move agents from the list of Available Agents to the list of Selected Agents to define the scope.

5. To add agents dynamically, select **Specifying rules to match agents** and specify your matching rules.

6. Name the **Agent Scope** and click **Save**.

## Collect Log Analytics Data from Syslog Messages

### Related pages:

- [Configure Log Analytics Using Job Files](#)
- [Analytics Log Data](#)

You can configure the Analytics Agent to receive syslog messages using TCP transport and standard syslog format adhering to RFC 5424. The Analytics Agent can listen on a TCP port for syslog messages coming from a remote source or from the same host on which the Analytics Agent is present.

To set this up:

- Configure your web server, such as Apache, to send logs to the Analytics Agent. There are two ways to direct the syslog data to the Analytics Agent:
  - Write the log messages to the usual log files and then read and forward to the agent from the log file. See [Read syslog Messages From the Log File and Send to Analytics Agent](#).
  - Send the log data directly to the Analytics Agent without writing to a file first. See [Send syslog Data Directly to the Analytics Agent](#).
- Configure the Analytics Agent to receive and parse the logs. There are two ways to configure syslog message collection for Log Analytics:
  - Job files (for <= 4.2), see [Configure Log Analytics TCP Job File](#).
  - Source rules (for 4.3) Recommended for your new log file sources. See [Configure Log Analytics TCP Source Rule](#).

## Supported Environment Details

- Linux only
- Network protocol is TCP only
- A template for Apache Web Server syslog format is shipped with the Analytics Agent. You can bring any log data in through syslog over TCP as long as you provide the correct configuration to parse the log message.
- One job file per Analytics Agent can be enabled to receive syslog messages over TCP.

**i** Both the syslog utility and analytics-agent should have root access if the port where the analytics-agent is listening for syslog messages is lower than 1024.

## Send syslog Data Directly to the Analytics Agent

You can use the Linux Logger utility to direct your Apache access and error log messages to the syslog daemon directly. Using this method, the logs are not written to the usual access log and error log apache files or to the `/var/log/message` file. Instead, the log lines are sent directly to a syslog daemon which then forwards the data to the analytics-agent.

Configure:

1. Configure Apache to delegate logs to `/usr/bin/logger`.
  - a. Locate and open `httpd.conf`, the Apache configuration file. This is typically located at `/etc/httpd/conf/`.
  - b. Add a new CustomLog directive to send access logs and error logs to the syslog and comment out the line that sends to the access\_logs.

```
#comment the following line to avoid logging to access_logs
#CustomLog logs/access_log combined

#Add a new CustomLog directive to send access logs and error logs to the syslog
CustomLog "|/usr/bin/logger -t httpd -p local6.info" combined
```

This directive uses the logger utility to send messages with facility local6, tag 'httpd' and log format combined.

The facility code specifies the type of program that is logging the message. Messages with different facilities may be handled differently.

The tag 'httpd' in the httpd.conf directly relates to the program name in the rsyslog.conf (see next step) for filtering out which messages need to be sent. For example, there can be other programs writing to that particular port, but we only want to send the logs from the httpd program to analytics-agent.

2. Configure the rsyslog client.
  - a. Edit `rsyslog.conf`, typically located at `/etc/`.
  - b. Add the following lines above "RULES" or "var/log/messages" filter so Apache doesn't log to the `/var/log/message` file.

```
log to analytics-agent
if $syslogfacility-text == 'local6' and $programname == 'httpd' then
 @@<analytics_agent_home>:514
```

```
Prevent logging httpd to /var/log/messages
if $syslogfacility-text == 'local6' and $programname == 'httpd' then ~
```

Make sure you replace 514 with the port where the analytics-agent is listening for syslog messages. This must match the port specified in the job file.

3. Restart apache and rsyslog, and look at /var/log/messages for any rsyslog errors.

### Read syslog Messages From the Log File and Send to Analytics Agent

In this case, the Apache server writes logs to the usual access log and error log files, and the rsyslog daemon is configured to read from these log files and forward the log data to analytics agent. This method preserves the original log files. In this case, the access and the error log messages are logged in the `/var/log/message` file.

In this example, the rsyslog client is configured to read from a specific file and forward the message with facility local6 and severity level info over the specified port (default port is 514).

1. Locate and edit rsyslog.conf, typically located at `/etc/`.
2. In the begin forwarding section of the rsyslog.conf file, add the following lines:

```
add these lines in the begin forwarding section
$ModLoad imfile
$InputFileName /etc/httpd/logs/access_log << your file
$InputFileTag apache-access
$InputFileStateFile stat-apache-access
$InputFileSeverity info
$InputFileFacility local6
$InputRunFileMonitor
local6.info @localhost:514
```

**\$InputFileName:** path to the log file you want to tail.

**local6.info:** Use the Analytics Agent IP address if your analytics agent is not local to the controller. If needed, replace 514 with the port where the analytics-agent is listening for syslog messages. This must match the port specified in the job file or the source rule.

3. Restart rsyslog and review /var/log/messages for any rsyslog errors.

### Configure Log Analytics TCP Source Rule

Using the Centralized Log Management UI, you can configure a source rule to extract log analytics fields from syslog messages over TCP.

1. Access the Centralized Log Management UI from your Controller by clicking **Analytics > Configuration > Log Analytics**.
2. On the Source Rules tab, click **+ Add**.
3. In the Add Source Rule panel, select the **Create from** source template and select **From Network Connection** as the collection type. For example, select the default Apache syslog template `apache-httpserver-access-syslog` :

Several log format templates are shipped with the Analytics Agent. You can create a new source rule for any log format over syslog TCP as long as you configure it correctly.

4. Click **Next** to see the Add Source Configuration wizard.
5. Specify the collection details, such as the name of the source rule, source type and enter the TCP Port where the Analytics Agent is listening.
6. When you specify **From Network Connection** as the collection type, the grok pattern for the syslog header (which is appended to the log messages) is automatically added at the beginning of the grok Message Pattern:

```
%{SYSLOG5424PRI}%{SYSLOGBASE2}
```

7. Confirm that the value for Multiline Format is **None**.
8. Configure field extraction and field management as for any other source rule. See [Configure Log Analytics Using Source Rules](#).

### Configure Log Analytics TCP Job File

When selecting and configuring the port where the analytics agent will listen for the syslog data, make sure it does not conflict with anything else active in the network. If no port number is provided, port 514 is used. Both the syslog utility and analytics-agent should have root access to send logs to port 514 (binding to ports less than 1024 requires root access).

To allow the analytics-agent to listen at a port, specify the log file **source** property and associated parameters for **type=syslog**. For example, add the following to the appropriate job file:

```
source:
 type: syslog
 port: 514
 protocol: tcp
 numThreads: 1
```

A job file for apache commons is included in the analytics distribution at `<analytics-agent-home>/conf/job/sample-apache-httpserver-access-syslog.job`.

Your job file should look similar to the following:

```
version: 2
enabled: true

source:
 type: syslog
 port: 514
 protocol: tcp
 numThreads: 5

fields:
 sourceType: apache-httpserver-access-syslog
 nodeName: Node1
 tierName: Tier1
 appName: App1

grok:
 patterns:
 - "%{SYSLOG5424PRI}%{SYSLOGBASE2} %{COMBINEDAPACHELOG}"

eventTimestamp:
 pattern: "dd/MMM/yyyy:HH:mm:ss Z"
```

## Configure Log Analytics Using Job Files

### Related pages:

- [Analytics Log Data](#)
- [Configure Log Analytics Using Source Rules](#)

This page describes how to configure log sources using job files. If you are configuring new log sources, we recommend you use the Centralized Log Management UI to define source rules.

To configure log analytics using job files:

1. [Describe the Log Source in a Job File](#)
2. [Map the Log File Data to Analytics Fields](#)
3. [Verify Analytics Agent Properties](#)

### Describe the Log Source in a Job File

Each log source is represented by a job file. A job file is a configuration file that specifies the following:

- Location of the source log file
- Pattern for capturing records from the log file
- Pattern for structuring the data from the captured log records
- Other options for capturing records from the log source

To define a source, you create a job file (or modify one of the samples) in the Analytics Agent configuration directory. The Analytics Agent includes sample job files for Glassfish, OSX log, and others. The Analytics Agent can also collect and parse GZIP files - (log files ending in .gz).

The job files are located in the following directory:

- `<Analytics_Agent_Home>/conf/job/`

The agent reads the job files in the directory dynamically, so you can add job files in the directory without restarting the agent.

To configure a job file, use these configurable settings in the file:

- **enabled:** Determines whether this log source is active. To capture analytics data from this log source, set the value to true.
- **source:** Specifies the source of the logs.
  - **type:** Specifies the type of log source. There are two types, file, and syslog. Additional parameters depend on the value of **type**.
    - **file:** The location and name of the log file to serve as a log source. The location must be on the same machine as the analytics-agent. File has the following parameters:
      - **path:** Path to the directory where the log files reside. On Windows, the path should be provided as if on Unix environments such as:
        - Example: demo/logs
        - Example: C:/app/logs
      - **nameGlob:** A string to use to match on the log file name. You can use wild cards and you can specify whether to match files one level deep or all log files in the path directory structure. If the wild card starts the value of nameGlob, you must enclose the value in quotes.
      - Example for multi-level matching:
 

```
path: /var/log
nameGlob: '**/*.log'
```

 This matches both /var/log/apache2/logs/error.log and /var/log/cassandra/system.log
      - Example of one level matching:
 

```
path: /var/log
nameglob: '/*.log'
```

 This searches for .log files one level deep in the /var/log directory (matches on /var/log/cassandra/system.log but not on /var/log/apache2/logs/error.log).
      - **startAtEnd:** If set to true allows tailing the file from the end.
    - **syslog:** See [Collect Log Analytics Data from Syslog Messages](#).
  - **multiline:** For log files that include log records that span multiple lines (spanning multiple line breaks) configure the multiline property and indicate how the individual records in the log file should be identified. A typical example of a multiline log record is one that includes a Java exception. You can use one of two options with the multiline property to identify the lines for a multiline log record:
    - **startsWith:** A simple prefix that matches the start of the multiline log record.  
Example 1: To capture the following multiline log as one record:

```
[#|2015-09-24T06:33:31.574-0700|INFO|glassfish3.1.2|
com.appdynamics.METRICS.WRITE|_ThreadID=206;_ThreadName=Thread-2;|
NODE PURGER Completed in 14 ms|#]
```

You could use this:

```
multiline:
 startswith: "[#|"
```

Example 2: To capture the following multiline log as one record:

```
May 5, 2016 6:07:02 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit requested amount:245.43000
May 5, 2016 6:07:02 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit currency:USD
May 5, 2016 6:07:02 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit payment method:Master Card
May 5, 2016 6:07:03 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit decision:ACCEPT
May 5, 2016 6:07:03 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit reason code:200
May 5, 2016 6:07:03 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit orderId:7654
May 5, 2016 6:07:03 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit piId:1234B
May 5, 2016 6:07:03 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit referenceNumber:4620346703956702001
May 5, 2016 6:07:03 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit extData requestToken:alf/7wSR9PBh3zSMQ++
+IYTR1k3Ys2D0x0mM5jWLRtYfJaSggCTyFJaSgjsB1/2v0wyTWRV0ekb0X
```

You could use this:

```
multiline:
 startswith: "INFO: Source deposit requested amount"
```

- **regex:** A regular expression that matches the multiline log record.  
Example: To capture this multiline log as one record:

```

2016-06-01 16:28:21.035 WebContainer : 8 TRANSTART>
=====
2016-06-01 16:28:21.036 WebContainer : 8 MERCHCFG > merchantID=appD,
sendToProduction=true, targetAPIVersion=1.00, keyFilename=(null),
serverURL=(null), namespaceURI=(null), enableLog=true,
logDirectory=logs, logFilename=(null), logMaximumSize=10,
useHttpClient=false, timeout=130
2016-06-01 16:28:21.037 WebContainer : 8 REQUEST >
merchantID=appD
davService_run=true
clientLibraryVersion=2.0.1
clientEnvironment=OS/400/V7R1M0/LINUX
application_id=ff22
exportService_addressWeight=medium
merchantReferenceCode=appD
clientLibrary=Java Basic
billTo_customer=xxxxxxxxxx
billTo_finance=true
billTo_postalCode=94105
billTo_country=US

```

You can use the following regex configuration to identify the start of each "record":

```

multiline:
 regex: "^\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2}\.\d{3} WebContainer :
\d+ TRANSTART\u003E ===== $"

```

The regex describes that the line should match 4 digits(2016) followed by followed by 2 digits (01), followed by a space, followed by 2 digit(16) ':' 2 digit (28) ':' 2 digits(21) ':' 3 digits(035) space followed by term 'WebContainer' space digit followed by term 'TRANSTART' folowed by '>'.

Whenever the Log tailer sees the matching pattern at the start of the line, it starts a new match and passes the previously collected data as one log record. Each matching pattern identifies when to start accumulating the log lines in a buffer until the matching pattern is found again at the beginning of another record.

If the particular format of a multiline log file does not permit reliable continuation line matching by regular expression, you may choose to use a single line format. For most types of logs, this would result in the capture of the majority of log records.

- **fields:** The fields are used to specify the context of the log data in the Controller UI, by application name, tier name, and so on. Specify the fields as free form, key-value pairs.
- **grok:** The grok parameter specifies the patterns by which the data in the unstructured log record is mapped to structured analytics fields. It associates a named grok expression (as defined in a .grok file that is bundled inside lib/analytics-shared-pipeline-core.jar) to a field in the data as structured by the agent. For example:

```

grok:
 patterns:
 - "\[%{LOGLEVEL:logLevel}%{SPACE}\] \[%{DATA:threadName}\] \[%{JAVACLASS:class}\] [%{GREEDYDATA}]"
 - "pattern 2"
 ...

```

In this case, the grok-pattern name LOGLEVEL is matched to an analytics data field named logLevel. The regular expression that is specified by the name LOGLEVEL is defined in the file `grok-patterns.grok` in the `grok` directory. See [Specifying Grok Expressions](#).

Previous versions of Log Analytics used a single "pattern" rather than a pattern list. This mode is still supported for backward compatibility.

The log analytics grok processor does not allow underscores in the field names. For example, a field name "log\_fields" will not work. Instead, use something like "logfields".

- **keyValue:** The keyValue parameter specifies how to parse the logs to identify key-value pairs with a user-defined delimiter. This enables you to configure the parsing for a message of the type "Key1 = Value1 Key2 = Value 2". See [Specifying Key Value Pairs](#).
- **transform:** This parameter specifies how to change the type or alias name of any field extracted from the logs by grok or keyValue parameters.
- **eventTimestamp:** This setting defines the pattern for the timestamp associated with captured data.

## Map the Log File Data to Analytics Fields

To specify how data in the unstructured log records should be mapped to structured analytics fields for log analytics, you provide the configuration in the job file. You can map unstructured log data in the following ways:

- grok patterns
- key value pairs
- transforms

## Specify Grok Expressions

Grok is a way to define and use complex, nested regular expressions in an easy to read and use format. Regular expressions defining discrete elements in a log file are mapped to grok-pattern names, which can also be used to create more complex patterns.

Grok-pattern names for many of the common types of data found in logs are provided for you with the analytics agent. A list of basic grok-pattern names and their underlying structures are bundled inside `lib/analytics-shared-pipeline-core.jar`. You can list the grok files with a command such as the following:

```
unzip -l ./lib/analytics-shared-pipeline-core.jar|grep "\.grok"
```

To can view the definition of a grok file with a command such as the following:

```
unzip -p ./lib/analytics-shared-pipeline-core.jar grok/grok-patterns.grok
```

The `grok` directory also contains samples of more complex definitions customized for various common log types - `java.grok`, `mongodb.grok`, and so on.

Once the grok-pattern names are created, they are then associated in the jobs file with field identifiers that become the analytics keys.

The basic building block is `%{grok-pattern name:identifier}`, where `grok-pattern name` is the grok pattern that knows about the type of data in the log you want to fetch (based on a regex definition) and `identifier` is your identifier for the kind of data, which becomes the analytics key. So `%{IP:client}` would select an IP address in the log record and map it to the key `client`.

## Custom Grok Patterns

Complex grok patterns can be created using nested basic patterns. For example, from the `mongodb.grok` file:

```
MONGO_LOG {%{SYSLOGTIMESTAMP:timestamp}} \[%{WORD:component}\] %
{GREEDYDATA}
```

It is also possible to create entirely new patterns using regular expressions. For example, the following line from `java.grok` defines a grok pattern named `JAVACLASS`.

```
JAVACLASS (?:[a-zA-Z$_][a-zA-Z$_0-9]*\\.)*[a-zA-Z$_][a-zA-Z$_0-9]*
```

Because `JAVACLASS` is defined in a `.grok` file in the `grok` directory can be used as if it were a basic grok pattern. In a jobs file, you can use the `JAVACLASS` pattern match as follows:

```
grok:
 pattern: ".... \[%{JAVACLASS:class}\]"
```

In this case, the field name as it appears in the Analytics UI would be "class". For a full example, see the following files:

- Job file: `<Analytics_Agent_Home>/conf/job/sample-analytics-log.job`
- Grok file: `java.grok` bundled inside `lib/analytics-shared-pipeline-core.jar`

### Special Considerations for Backslashes

The job file is in YAML format, which treats the backslash as an escape character. Therefore, to include a literal backslash in the String pattern you need to escape the backslash with a second backslash. You can avoid the need to escape backslashes in the `.job` file grok pattern, by enclosing the grok pattern in single quotes instead of double quotes such as the following:

```
grok:
 patterns:
 - '\[%{DATESTAMP:TIME}%{SPACE}CET\]%{SPACE}%{NOTSPACE:appId}
 {%{SPACE}%{NOTSPACE:appName}%{SPACE}%{NOTSPACE:Severity}%{SPACE}%
 {NOTSPACE:messageId}}:%{SPACE}%{GREEDYDATA}'
```

### Numeric Fields

In Release 4.1.3, the grok definition syntax was enhanced to support three basic data types. When defining a pattern in the `.grok` file you can specify the data type as number, boolean, or string. If a Grok alias uses that grok definition in a `.job` file then the extracted field is stored as a number or boolean. Strings are the default. If the number or boolean conversion fails, then a log message appears in the agent's log file. No validations are performed as it is not possible to reverse engineer a regex reliably. These are pure runtime extractions and conversions.

### Upgrade pre-4.1.3 Job Files

**Click to expand...**

For 4.1.2 (or older) .job files in use that have fields that are unspecified or specified as NUMBER and now switch to the "type aware" files, the data inside Events Service will break. This is due to the type mapping. To avoid this, you need to modify the grok alias in your job files.

Examples:

```
Was:
grok:
 patterns:
 - "%{DATE:happenedAt},%{NUMBER:quantity}"

Update job to:
grok:
 patterns:
 - "%{DATE:happenedAt},%{NUMBER:quantity_new}"
```

```
Was:
grok:
 patterns:
 - "%{DATE:happenedAt},%{DATA:howMany}"

Update job to:
grok:
 patterns:
 - "%{DATE:happenedAt},%{POSINT:howManyInt}"
```

To Upgrade (Migrate) < 4.1.3 Job Files:

1. Stop analytics-agent.
2. Change .job files that use the enhanced grok patterns:

```
BOOL:boolean
INT:number
BASE10NUM:number
NUMBER:number
POSINT:number
NONNEGINT:number
```

Change the grok alias so as not to conflict with the older aliases:

```

grok:
 patterns:
 (Old) - "%{DATE:quoteDate},%{NUMBER:open},%{NUMBER:high},%
 {NUMBER:low},%{NUMBER:close},%{NUMBER:volume},%
 {NUMBER:adjClose}"

 (New aliases) - "%{DATE:quoteDate},%{NUMBER:openNum},%
 {NUMBER:highNum},%{NUMBER:lowNum},%{NUMBER:closeNum},%
 {NUMBER:volumeNum},%{NUMBER:adjCloseNum}"

```

3. Start analytics-agent.

### Specifying Key-Value Pairs

This section of the mapping configuration captures key-value pairs from fields specified by the `source` parameter. The values listed under `source` should refer to fields that were defined and captured by a grok pattern. For example, if you have a grok parameter that defines the following pattern `"%{DATA:keyValuePairs}"` then you can list the field `"keyValuePairs"` under the `source` parameter to capture any key-value pairs listed in the `"keyValuePairs"` string. If the `source` parameter is not specified then the agent attempts to extract key-value pairs from the entire log message. The result can be different than expected if the message contains more information than just key-value pairs.

The Key Value mapping contains these fields:

- **source:** A list of strings on which the `keyValue` filter should be applied. It is an optional field. If it is not provided the key-value pairs are parsed from the original log `"message"` string.
- **split:** The delimiter defined by the user to separate out the key from the value. In this example, `key=value`, the split delimiter between the key and the value is the equal sign `=`
- **separator:** The delimiter defined by the user to separate out two key-value pairs. In this example, `key1=value1;key2=value2`, the separator is the semi-colon `;`
- **include:** A list of key names that the user wants to capture from the `"source"`. If nothing is provided in `"include"` we capture all the key-value pairs.
- **trim:** A list of characters the user wants to remove from the starting and/or the end of the key/value before storing them.

The `sample-glassfish-log.job` file includes key-value pairs configuration. This file is found here: `<analytics_agent_home>/conf/job/`.

### Key-Value Pairs Example

For a log file with the following entries:

```

[#I2015-09-24T06:33:31:574-0700|INFO|glassfish3.1.2|com.appdynamics,METRICS.WRITE|
_ThreadID=200;_ThreadName=Thread-2;|NODE PURGER Complete in 14 ms|#]

[#I2015-09-24T06:33:46:541-0700|INFO|glassfish3.1.2|
com.singularity.ee.controller.beans.license.LicenseUsageManagerBeanWRITE|
_ThreadID=202;_ThreadName=Thread-2;|about to start persisting license usage data|#]

```

And the following grok pattern:

```

grok:
 patterns:
 - "\\[\\#\\|\\%{DATA}\\|\\%{LOGLEVEL:logLevel}\\|\\%
{DATA:serverVersion}\\|\\%{JAVACLASS:class}\\|\\%
{DATA:keyValuePairs}\\|\\%{GREEDYDATA}"

```

The key-value parameter to extract the ThreadID and the ThreadName should look similar to the following:

```

keyValue:
 source:
 - "keyValuePairs"
 split: "="
 separator: ";"
 include:
 - "ThreadID"
 - "ThreadName"
 trim:
 - "_"

```

## Specify Transform Parameters

This section of the mapping configuration enables you to change the type or alias name of any field previously extracted from the logs by your grok or key value configuration. The transform is applied after all fields have been captured from the log message. You can specify a list of field names, where you want to cast the value to a specific type or rename the field with an "alias".

The Transform mapping contains these fields:

- **field:** Specifies the name of the field to transform and can not be empty or null. If `field` is defined, either type or alias must be specified. If neither is specified, an error is written to the `analytics-agent.log` file.
- **alias:** The new name for the field.
- **type:** The value type for the field. Valid values are:
  - NUMBER
  - BOOLEAN
  - STRING - default is STRING

## Verify Analytics Agent Properties

In addition to configuring the log source in the job file, you should verify the values in the `analytics-agent.properties` file found in the `conf` directory. Confirm these property values:

- `http.event.endpoint` should be the location of the Events Service.
  - For SaaS controllers the URL is one of the following:
    - `https://analytics.api.appdynamics.com:443` (North America)
    - `https://fra-ana-api.saas.appdynamics.com:443` (Europe)
    - `https://syd-ana-api.saas.appdynamics.com:443` (APAC)
  - For on-premises installations use whatever host and port you have configured. In clustered environments, this is often a load balancer.

- The `http.event.accountName` and `http.event.accessKey` settings should be set to the name and the key of the account in the Controller UI with which the logs should be associated. By default, they are set to the built-in account for a single tenancy Controller.
- The `pipeline.poll.dir` setting specifies where the log configuration files are located. This would not normally be changed unless you want to keep your files in a different location.
- `ad.controller.url` should match your AppDynamics controller URL and port.

## Troubleshoot Logs

If log capture is working correctly, logs should start appearing in the Log tab in the Analytics UI. It can take some time for logs to start accumulating. Note the following troubleshooting points:

- If nothing appears in the log view, try searching over the past 24 hours.
- Timezone discrepancies between the logs and the local machine can cause log entries to be incorrectly excluded based on the selected timeframe in the Controller UI. To remediate, try setting the log files and system time to UTC or logging the timezone with the log message to verify.
- An inherent delay in indexing may result in the "last minute" view in the UI consistently yielding no logs. Increase the time range if you encounter this issue.

## Troubleshoot Patterns

To help you troubleshoot the data extraction patterns in your job file, you can use the two debug REST endpoints in the Analytics Agent:

- `http://<Analytics_Agent_host>:<Analytics_Agent_http_port>/debug/grok`: [For testing grok patterns](#)
- `http://<Analytics_Agent_host>:<Analytics_Agent_http_port>/debug/timestamp`: [For testing timestamp patterns](#)

In the following examples, the Analytics Agent host is assumed to be `localhost` and the Analytics Agent port is assumed to be `9090`. To configure the port on your Agent, use the property `ad.dw.http.port` in `<Analytics_Agent_Home>/conf/ analytics-agent.properties`.

In the Analytics Agent version `>=21.7` the `debug/grok` endpoint is disabled by default. To enable the endpoint, start the Analytics Agent with the property `ad.debug.grok.endpoint.enabled=true` in `agent.properties` file.

## The Grok Endpoint

Click to expand...

The Grok tool works in two modes: extraction from a single line log and extraction from a multi-line log. To get a description of usage options:

```
curl -X GET http://localhost:9090/debug/grok
```

### Single Line

In this mode, you pass in (as a POST request) a sample line from your log and the grok pattern you are testing, and you receive back the data you passed in organized as key/value pairs, where the keys are your identifiers.

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode
"logLine=LOG_LINE" --data-urlencode "pattern=PATTERN"
```

For example, the input:

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode
"logLine=[2014-09-04T15:22:41,594Z] [INFO] [main]
[o.e.j.server.handler.ContextHandler] Started
i.d.j.MutableServletContextHandler@2b3b527{/ ,null,AVAILABLE}" --
data-urlencode "pattern=\\[%{LOGLEVEL:logLevel}%{SPACE}\\] \\[%
{DATA:threadName}\\] \\[%{JAVACLASS:class}\\] %{GREEDYDATA}"
```

would produce this output:

```
{
 threadName => main
 logLevel => INFO
 class => o.e.j.server.handler.ContextHandler
}
```

The input:

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode
"logLine=2010-05-05,500.98,515.72,500.47,509.76,4566900,509.76"
--data-urlencode "pattern=%{DATE:quoteDate},%{DATA:open},%
{DATA:high},%{DATA:low},%{DATA:close},%{DATA:volume},%
{GREEDYDATA:adjClose}"
```

would produce this output:

```
{
 open => 500.98
 adjClose => 509.76
 volume => 4566900
 quoteDate => 10-05-05
 high => 515.72
 low => 500.47
 close => 509.76
}
```

## Multi-line

The multi-line version uses a file stored on the local filesystem as the source input.

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode
"logLine=`cat FILE_NAME`" --data-urlencode "pattern=PATTERN"
```

where FILE\_NAME is the full path filename of the file that contains the multi-line log.

## The Timestamp Endpoint

[Click to expand...](#)

The timestamp tool extracts the timestamp from a log line in Unix epoch time.

To get a description of usage options:

```
curl -X GET http://localhost:9090/debug/timestamp
```

In this mode, you pass in (as a POST request) a sample line from your log and the timestamp pattern you are testing, and you receive back the timestamp contained within the log line.

```
curl -X POST http://localhost:9090/debug/timestamp --data-
urlencode "logLine=LOG_LINE" --data-urlencode "pattern=PATTERN"
```

For example, the input:

```
curl -X POST http://localhost:9090/debug/timestamp --data-
urlencode "logLine=[2014-09-04T15:22:41,237Z] [INFO] [main]
[io.dropwizard.server.ServerFactory] Starting DemoMain" --data-
urlencode "pattern=yyyy-MM-dd'T'HH:mm:ss,SSSZ"
```

would produce this output Unix epoch time:

```
{
 eventTimestamp => 1409844161237
}
```

The input:

```
curl -X POST http://localhost:9090/debug/timestamp --data-
urlencode "logLine=Nov 17, 2014 8:21:51 AM
com.foo.blitz.processor.core.hbase.coprocessor.endpoint.TimeRoll
```

```
upProcessEndpoint$HBaseDataFetcher callFoo1" --data-urlencode
"pattern=MMM d, yyyy h:mm:ss aa"
```

would produce this output Unix epoch time:

```
{
 eventTimestamp => 1416212511000
}
```

## Sample Log Analytics Job Files

A number of sample job files are shipped with the Analytics Agent. These files can be found at `<analytics-agent-home>/conf/job`.

The sample job files include:

- Analytics logs: sample-analytics-log.job
- Analytics logs with requestGUID config example: sample-analytics-log-with-request-guid.job
- Apache access logs: sample-apache-httpserver-access-log.job
- Apache access logs with syslog config example: sample-apache-httpserver-access-sysloglog.job
- Apache error logs: sample-apache-httpserver-error-log.job
- Cassandra logs: sample-cassandra-log.job
- CouchDB logs: sample-couchdb-log.job
- Glassfish logs: sample-glassfish-log.job
- IIS logs: sample-iis-log.job
- Java Agent logs: sample-java-agent-log.job
- Jetty error logs: sample-jetty-error-log.job
- Jetty request logs: sample-jetty-request-log.job
- Log4J: sample-log4j.job
- MongoDB logs: sample-mongodb-log.job
- MySQL error logs: sample-mysql-error-log.job
- Nginx access logs: sample-nginx-access-log.job
- Nginx error logs: sample-nginx-error-log.job
- OS X system logs: sample-osx-system-log.job
- Postgres logs: sample-postgres-log.job

## Migrate Log Analytics Job Files to Source Rules

### Related pages:

- [Upgrade Analytics Agent](#)

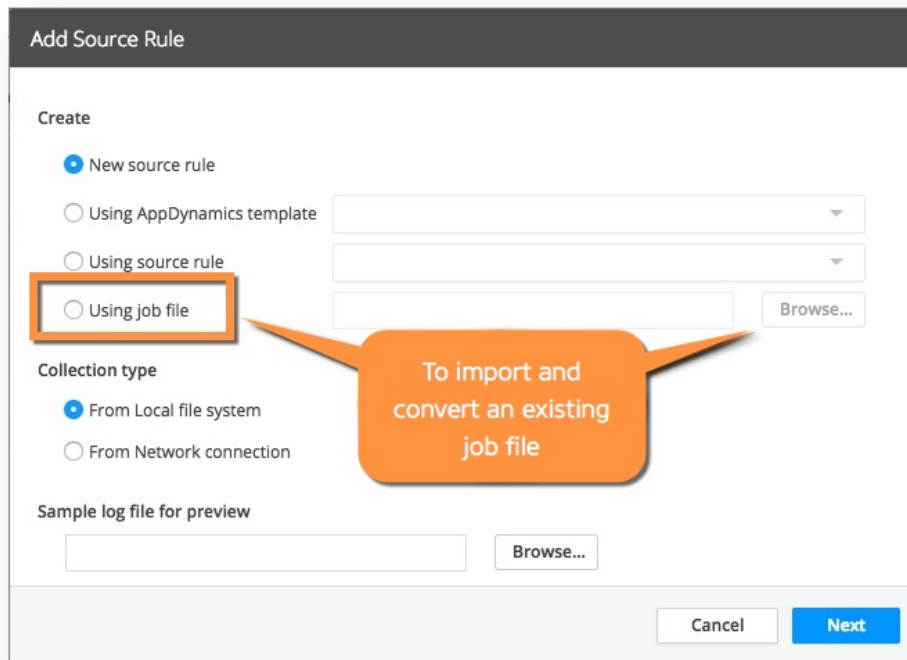

The Centralized Log Management UI enables you to configure your log data sources using source rules. Manually created job files are no longer needed.

We recommend that you convert your log source configuration from job files (job files were used for configuration < 4.3) to source rules.

1. Confirm that you have upgraded your Controller, Events Service, and Analytics Agent to 4.4. See these corresponding upgrade pages:
  - [Upgrade the Controller Using the Enterprise Console](#)
  - [Upgrade the Events Service Using the Enterprise Console](#)

- [Upgrade Analytics Agent](#)
2. Use the Centralized Log Management UI to create source rules for your existing job files by importing the configuration from your old job file to a new source rule.

Be sure to use either '**Parsing time range**' or '**End of log file**'. If you do not use this, you will double collect all the log files that have already been tailed by the job file. Read [Timing Notes](#) for more information to help you decide on your collection timing settings.

When you save the source rules, they are in the disabled state by default.

3. Map the source rules to an Agent Scope.
4. Enable the new source rules through the UI.
5. Disable the job files that are actively collecting log analytics data. You do this by manually editing the job file and changing the `enabled` property to false. See [Configure Log Analytics Using Job Files](#).
6. After you have migrated all your job file configurations to source rules, you can completely disable the use of job files by clicking "**Disable Field Extraction With Job Files**". This action can not be reversed and you will not be able to use job files after performing this action. Only trigger this action once you have completely moved to source rules created through the Centralized Log Management UI.

### Timing Notes

By default, the controller communicates new configuration information to the Analytics Agent every five minutes. So it could be up to five minutes before the agent starts tailing your log file using the new source rule configuration. On the other hand, if you have both a job file *and* a source rule enabled for the same log data, the data is collected twice. To avoid this situation, you can use configuration settings to specify when to start collecting the log data:

- At the end of the file (UI field = **Start collecting from End of log file**)

- During a specific time range (UI field = **Parsing time range**)

Add Source Configuration

---

General
Field Extraction
Field Management
Agent Mapping

Source Name

Source Type

Source File

Enable path extraction:  ⓘ

Start collecting from  Beginning of log file  
 End of log file

Parsing time range  Last  Hours

See the section describing the configuration settings on the "*General Configuration Tab*" in [Configure Log Analytics Using Source Rules](#).

Be sure to disable the job file once you have enabled the source rule to collect the Log Analytics data. You can verify that the new source rule is collecting data correctly by waiting until the new log records appear in the Analytics Search UI data grid. One way to distinguish between the log data collected by a job file or a source rule is to use a different source type in the source rule.

## Business Transaction and Log Correlation

### Works with:

This page provides instructions on the correlation between Business Transaction requests and logs. When investigating the cause of slowdowns/outages in your business applications, the problem does not always originate in the application code. Any additional information from application or machine logs can be helpful in your DevOps teams' investigation. One way to see supporting data that impacts the business transaction is to analyze logs for that transaction.

By configuring business transactions for GUID Injection, you can correlate logs to specific business transaction requests. This can be helpful when you see slow transactions and the call graph does not give you enough information to get to the root cause. You can use this feature to get the full context related to a failed or slow transaction.

Correlating specific instances of your business transactions to the related logs works by injecting the same requestGUID of the business transaction into the associated logs through our Java Agent. This helps you to quickly find the relevant logs from multiple tiers and nodes for a specific business transaction.

Visibility for this correlation requires both Transaction Analytics and Log Analytics licenses. See [License Entitlements and Restrictions](#).

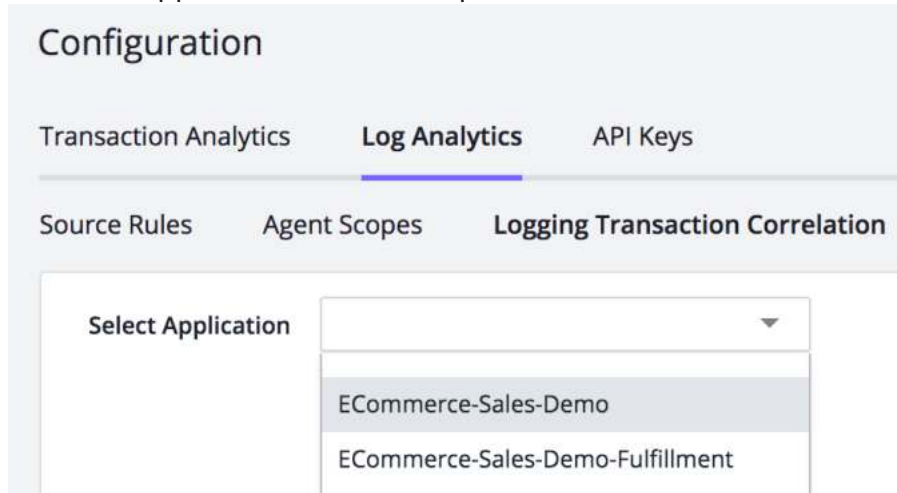

## Configuring GUID Injection

This feature supports the following Java logging frameworks:

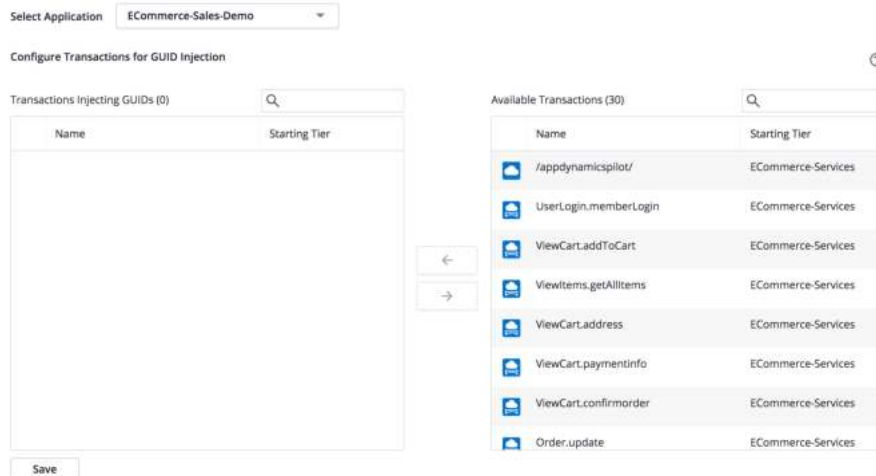

- Apache log4j versions 1.2.12 to 1.2.17 and 2.6.2 to 2.17.
- logback versions 1.0.0 to 1.2.10. Any version < 1.0.0 is not supported.

To enable transaction to log correlation, use the following steps. You must select the business transactions and specify the logging format.

1. Select business transactions for log correlation. This is how you specify to the Java Agent which business transactions you are interested in.
  - a. In the Controller UI, click **Analytics > Configuration**. Then select **Log Analytics > Logging Transaction Correlation**.
  - b. Select the application from the dropdown list:

- c. Scroll down to the section **Configure Transactions for GUID Injection**:

- d. Add transactions from the right-hand list to the left-hand list and **Save**.

- e. Proceed to the next step. You must also configure the logging patterns before you can see correlated logs.
2. Define how the injected information appears in the logs. You need to know the appender name and pattern for your application logging framework so you can properly configure this feature. In simple terms, a pattern is responsible for formatting a logging request and an appender takes care of output destination. You can configure this through the Controller UI as described here. You can also add the appender directly to your code. See [Add Appender in Your Source Code](#).
  - a. On the Analytics Configuration window, scroll to the section **Configure Patterns for Logging format**.
  - b. Select application, tier, or node where you want to collect correlated logs.

Configure Patterns for Logging format

Select Application, Tier, Node

- c. Enter the Appender name and choose the log framework.  
ECommerce-Sales-Demo

- d. Enter the pattern and the request GUID string. You can add the request GUID anywhere in the pattern. The request GUID must match the following exactly:

```
[%X{AD.requestGUID}]
```

For example, the following screenshot shows the standard log4j pattern plus the request GUID:

**Add Log Appender**

Appender Name:

Type:

Pattern:

Detail of Log4j example with the request GUID string:

```
[%d] [%-5p] [%t] [%c] [%X{AD.requestGUID}] %m%n
```

- Restart the affected application to enable the logger to pick up the new logging configuration.

### Add Appender in Your Source Code

If you have access to the source code for your application, you can also add the appender to the log4j.properties file directly. Here is an example of what that might look like with the request GUID in **BOLD>:**

```
log4j.appender.order-file-appender=org.apache.log4j.FileAppender
log4j.appender.order-file-appender.File=logs/telecom-order.log
log4j.appender.order-file-appender.layout=org.apache.log4j.PatternLayout
log4j.appender.order-file-appender.layout.ConversionPattern=[%d] [%-5p] [%t] [%c]
[%X{AD.requestGUID}] %m%n
log4j.logger.com.appdynamics.order=DEBUG, order-file-appender
log4j.additivity.com.appdynamics.order=false
```

### Extracting Request GUID From the Source Rule Configuration

To enable searching logs by request GUID and to view correlated logs and transaction data, use the following steps:

- In the Controller UI, click **Analytics > Configuration > Log Analytics > Source Rule**.
- Extract the request GUID field in the log source rule configuration. See [Field Extraction for Source Rules](#).

- a. If Manual Field Extraction is selected, the following regular expression can be used to configure request GUID: `AD_REQUEST_GUID\[(?<requestGUID>.*)\]\]`.

### Viewing Correlated Logs and Transaction Data

Once you have configured GUID injection, you can search the log files from a number of points in the Controller. Correlation only works when there are logs with the associated GUID in the given time range for an application where this feature is configured. The **Search Logs By Request GUID** button appears when there are logs for the snapshot request GUID in the snapshot time range.

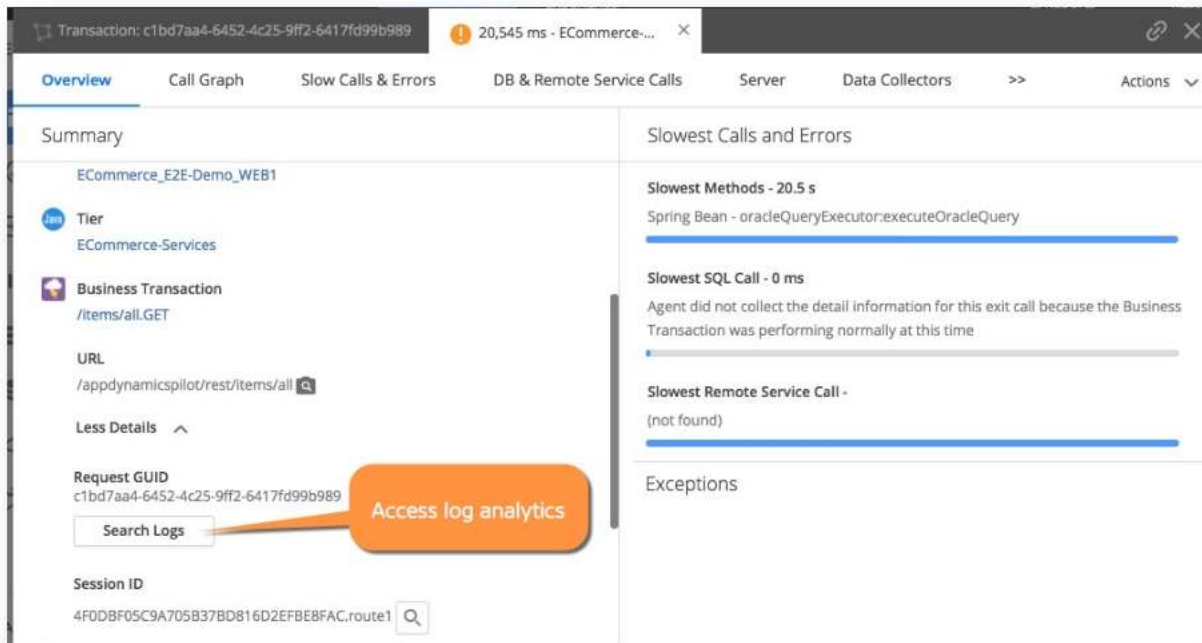

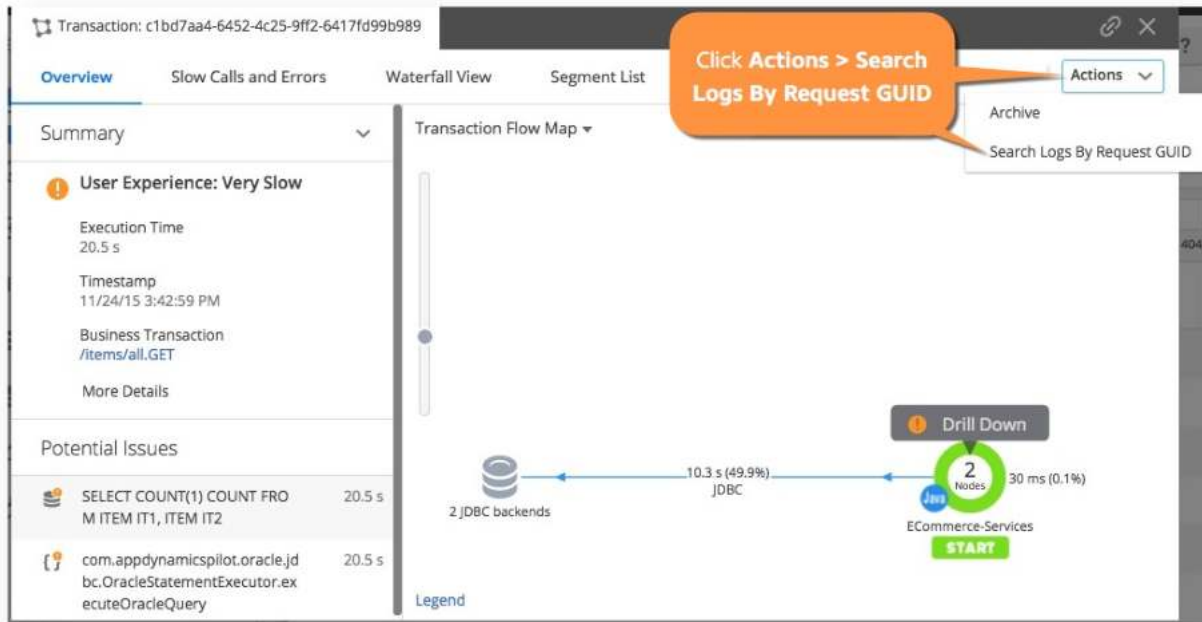

### APM to Analytics: From a business transaction snapshot

1. Locate a slow transaction or other transaction that you want to troubleshoot.

The screenshot shows the 'Transaction Snapshots' view for the '/PlaceOrder' endpoint. The table lists several transactions with their execution times. The third row, with an execution time of 7,336 ms, is highlighted in blue. An orange callout bubble points to this row with the text 'Select and double-click a slow transaction'.

Time ↓	Exe Time (ms)	URL	Transaction	Tier
12/07/15 2:45:20 PM	7,479	/PlaceOrder	/PlaceOrder	Order_Web
12/07/15 2:45:07 PM	7,359	/PlaceOrder	/PlaceOrder	Order_Web
12/07/15 2:43:47 PM	7,336	/PlaceOrder	/PlaceOrder	Order_Web
12/07/15 2:43:12 PM	9,030	/PlaceOrder	/PlaceOrder	Order_Web
12/07/15 2:41:59 PM	7,361	/PlaceOrder	/PlaceOrder	Order_Web

2. Click **More Details** > **Search Logs** or use **Actions** > **Search Logs By Request GUID**.

From the log details in this example, you can see that the reason this transaction was slow is that the order processing queue was full and it took many retries before the order could complete.

## Transaction Analytics to Log Analytics

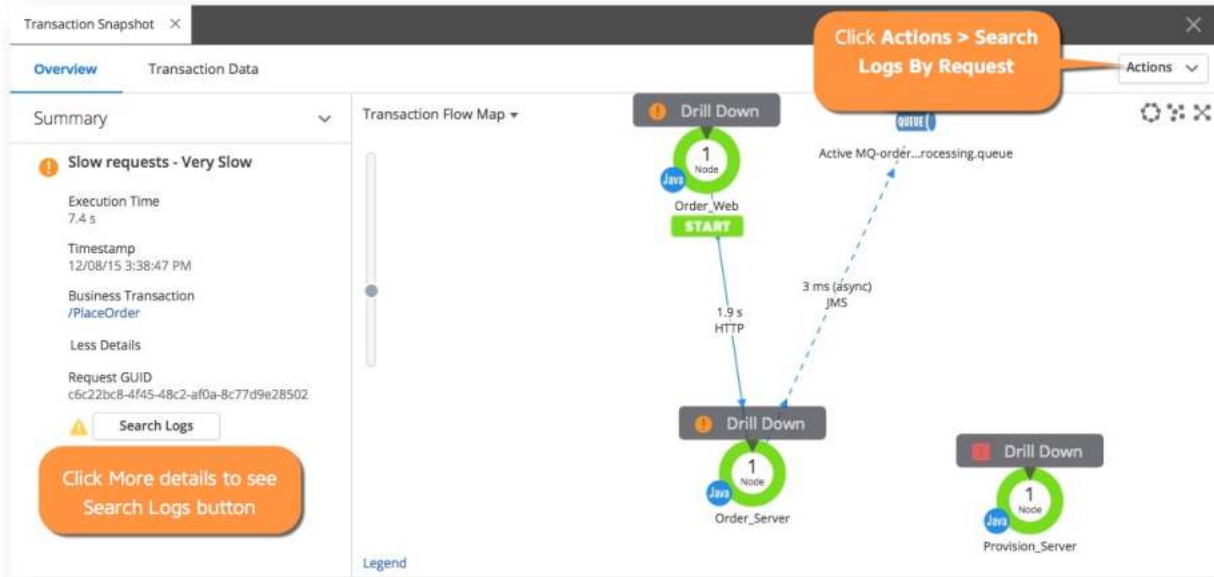

You can select relevant transactions from any transaction analytics search and see details.

1. Select the transaction, then double-click or click **Details** in the **Action** toolbar.

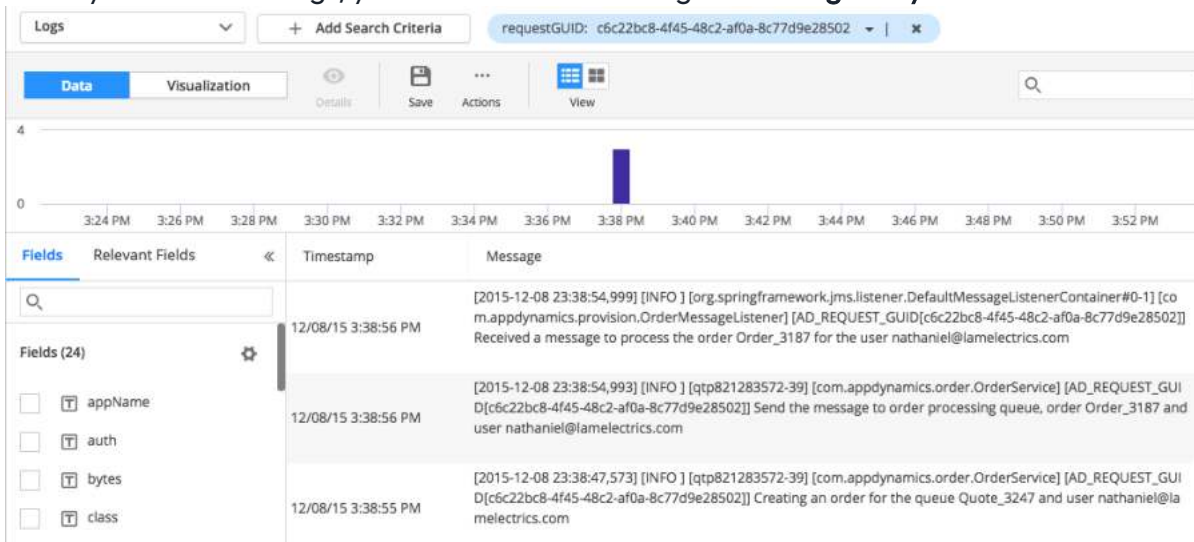

Fields	Relevant Fields	User Experience	Response Time (Ms)	Business Transaction	Tier
		✓	21	/PlaceOrder	Order_Web
		✓	19	/PlaceOrder	Order_Web
		✓	17	/PlaceOrder	Order_Web
		!	7,433	/PlaceOrder	Order_Web
		✓	23	/PlaceOrder	Order_Web

2. On the **Overview** tab, you have two ways to search the logs by request GUID.

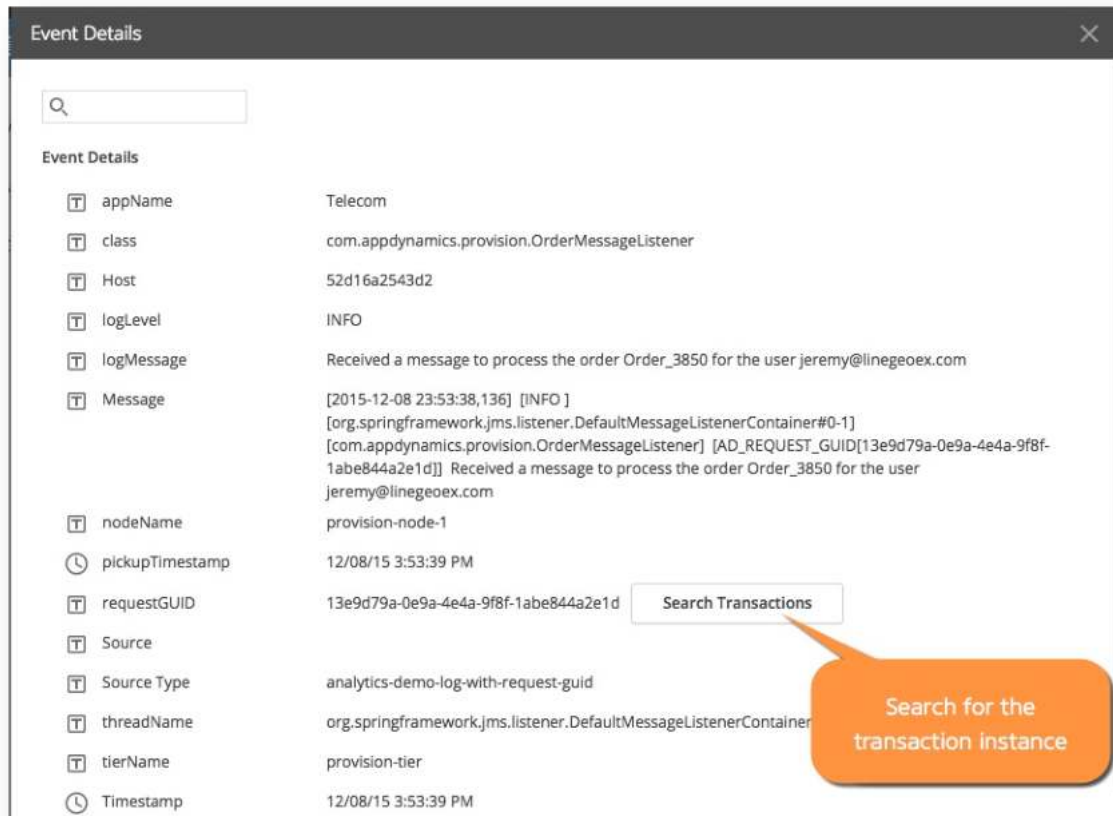

3. When you search the logs, you see the correlated logs in the **Log Analytics** window.

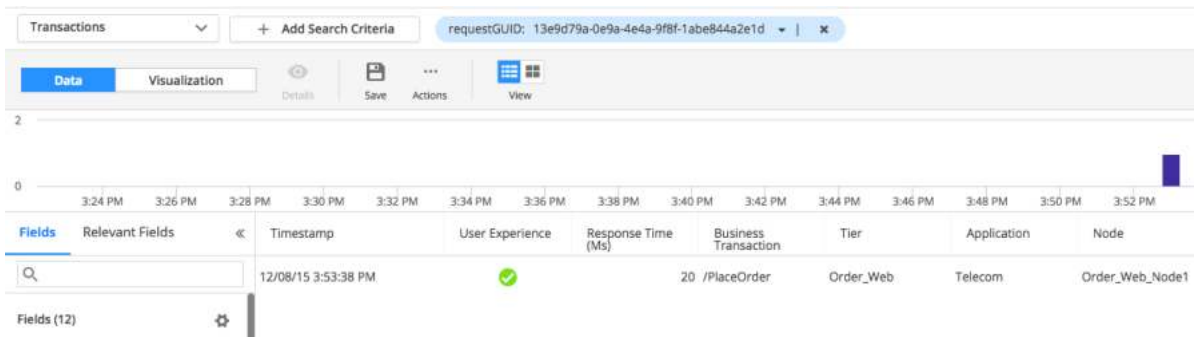

### From Log Analytics to Transaction Analytics

You can select a log from any log analytics search and see the Event Details.

1. Select the log, then double-click or click **Details** in the **Action** toolbar. You can see the **Event Details** window.

2. Use the **Search Transactions** button to find the relevant business transaction in transaction analytics data.

## Deploy Analytics in Kubernetes

This page describes deployment options for Transaction Analytics and Log Analytics instrumented with AppDynamics app server agents in Kubernetes applications.

Transaction Analytics (except for Java and .NET Agent) and Log Analytics require that an Analytics Agent is deployed with an app server agent.

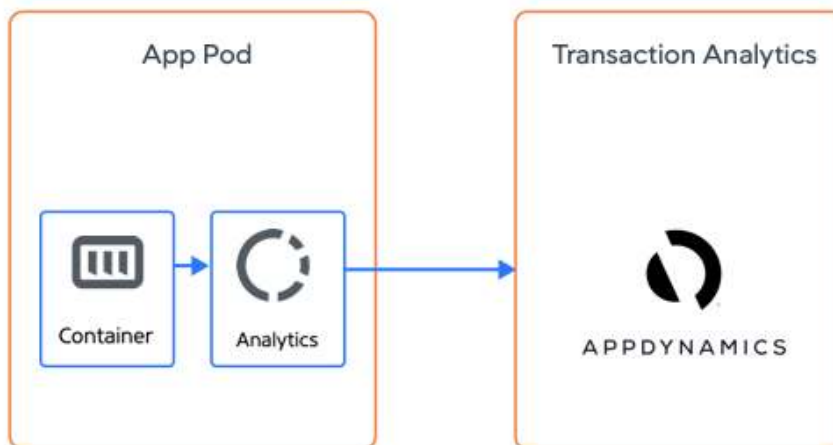

**i** For Transaction Analytics, the Java Agent  $\geq 4.5.15$  or the .NET Agent  $\geq 20.10$  supports "agentless" analytics, which does not require that an Analytics Agent is deployed. See [Deploy Analytics Without the Analytics Agent](#).

## Transaction Analytics

The Analytics Agent acts as a proxy between the app server agent and the Events Service. See [Deploy Analytics With the Analytics Agent](#).

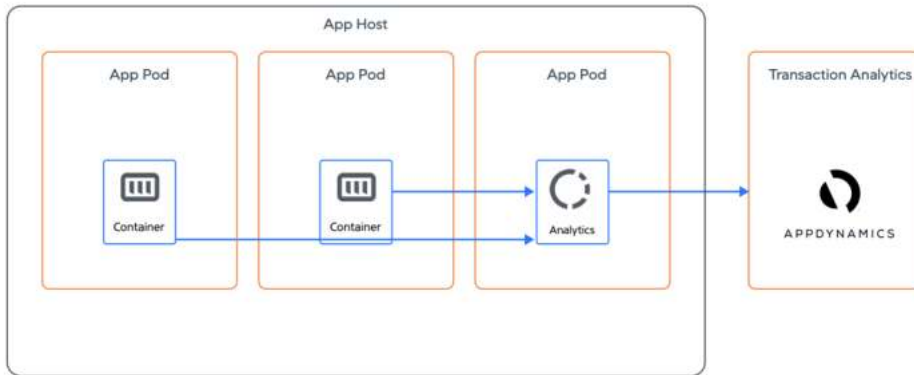

There are two deployment options for the Analytics Agent to support Transaction Analytics on a Kubernetes application.

1. A sidecar to the application container.

In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container.

2. A shared agent where a single Analytics Agent is deployed on each Kubernetes worker node. Each pod on the node will use that Analytics Agent to communicate with the Events Service.

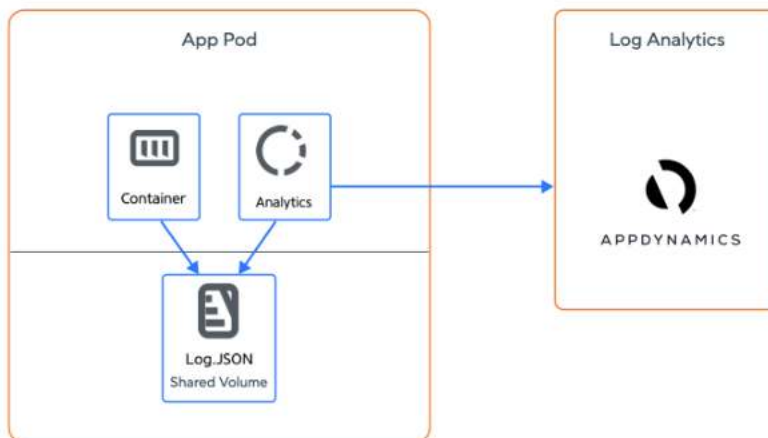

In this model, the Analytics Agent is deployed as a Daemonset.

### Log Analytics

Once deployed, the Analytics Agent has access to the application's logs and can send log data to the Events Service.

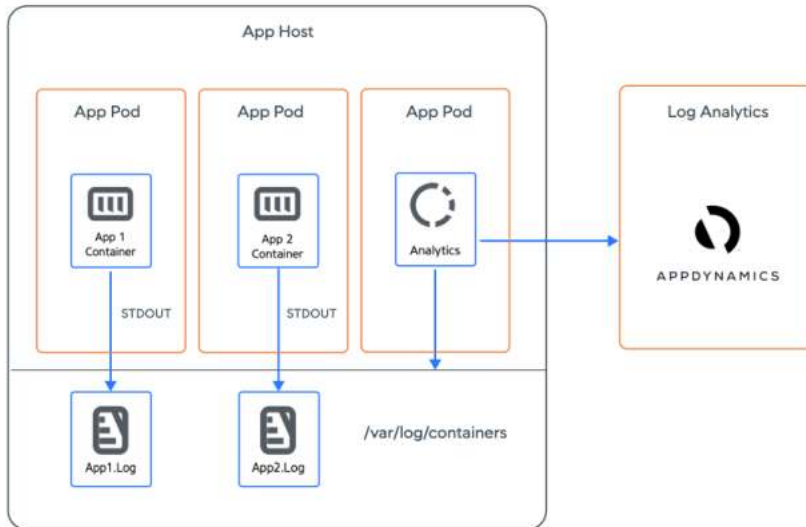

There are three deployment options for the Analytics Agent to support Log Analytics on a Kubernetes application.

1. A sidecar to the application container.

In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container. The Analytics Agent and application container are configured to share a volume where the application logs are written.

- If the application bypasses the container filesystem and emits log data to `STDOUT` and `STDERR`, the Analytics Agent can be deployed on each Kubernetes worker node. The Analytics Agent can access the log output for every application container on the worker node's file system, stored by Kubernetes under `/var/log/containers` as a unique file per container.

In this model, the Analytics Agent is deployed as a Daemonset.

**i** For some Kubernetes distributions such as OpenShift, the Analytics Agent will require elevated permissions to access the files under `/var/log/containers`.

- If a syslog provider is available in the Kubernetes cluster, the Analytics Agent can be deployed to receive syslog messages with TCP transport. A single Analytics Agent instance is required per syslog provider. See [Collect Log Analytics Data from Syslog Messages](#).

For Transaction and Log Analytics, the sidecar approach is simpler to deploy, but consumes more cluster resources because it requires one additional container per application pod. The shared agent approach adds another deployment object to manage, but can significantly reduce the overall resource consumption for a cluster.

### Example Configurations to Deploy the Analytics Agent

The following deployment specs are specific examples of how to implement the deployment options explained above. In addition, see [Install the .NET Agent for Linux in Containers](#) and [Install the Node.js Agent in Containers](#) for best practices on how to set the Analytics Agent host, port, and SSL environment variables.

## Transaction Analytics: Deployment Spec Using A Sidecar

The following deployment spec defines two containers, the application container `flight-services`, which uses an image instrumented with an app server agent, and the Analytics Agent container `appd-analytics-agent`, which uses the Analytics Agent from Docker Hub, [docker.io/appdynamics/analytics-agent:latest](https://hub.docker.io/appdynamics/analytics-agent:latest).

The `appd-analytics-agent` container leverages a ConfigMap and Secret to configure the Events Service credentials required by the Analytics Agent, including the account access key and global account name. See [Install Agent-Side Components](#).

As a sidecar, the Analytics Agent is available at `localhost` and uses the default port `9090`. The app server agent will connect automatically and no additional configuration is required.

The full spec can be found in the [Flight Services YAML File](#). The `controller-info` ConfigMap can be found in the [Controller Info YAML File](#). The command to create `appd-secret` can be found in [Secret](#).

### Transaction Analytics: Deployment Specs Using A Shared Analytics Agent

The following deployment spec is for the same `flight-services` application, but instead of using a sidecar, it references a shared Analytics Agent deployed separately as a Daemonset. The `flight-services` container sets the agent environment variables `APPDYNAMICS_ANALYTICS_HOST` and `APPDYNAMICS_ANALYTICS_PORT` to the `analytics-proxy` service for the shared Analytics Agent defined in the example below.

```

- name: hostroot
 hostPath:
 path: /
 type: Directory

apiVersion: v1
kind: Service
metadata:
 name: appd-infra-agent-service
spec:
 selector:

```

```

name: appd-infra-agent
ports:
- name: "9090"
 port: 9090
 targetPort: 9090
status:
 loadBalancer: {}

```

The full deployment spec can be found in the [Machine Agent YAML File](#). The `appdynamics-infraviz` service account is defined in the [RBAC YAML File](#). The `ma-log-config` ConfigMap is defined in the [Machine Agent Log Config File](#).

A best practice is to deploy the shared Analytics Agent in a dedicated namespace (typically `appdynamics`) separate from the namespaces used by applications.

```
$ kubectl -n appdynamics apply -f analytics-agent.yaml
```

To provide access to the shared Analytics Agent from an application namespace:

1. An `ExternalName` service is required to map a service name (`analytics-proxy` in the example) to the DNS name of `appd-infra-agent-service` created previously:

```

kind: Service
apiVersion: v1
metadata:
 name: analytics-proxy
spec:
 type: ExternalName
 externalName: appd-infra-agent-service.appdynamics.svc.cluster.local
 ports:
 - port: 9090
 targetPort: 9090

```

2. Create this service in each application namespace where an App Server Agent is deployed:

```
$ kubectl -n <app namespace> apply -f analytics-proxy.yaml
```

3. Note that `analytics-proxy` is the value of `APPDYNAMICS_ANALYTICS_HOST` used in the `flight-services` deployment spec.

```

- name: APPDYNAMICS_ANALYTICS_HOST
 value: analytics-proxy

```

## Log Analytics: Deployment Spec Using A Side Car

The following deployment spec snippet is for a Java application that defines an application container, `client-api`, and an Analytics Agent container, `appd-analytics-agent`, that acts as a sidecar

to the application container. An init container, `appd-agent-attach`, is also defined, but the related definitions are removed to simplify the example.

A shared volume, `appd-volume`, is mounted to the application container and Analytics Agent container using the mount path `/opt/appdlogs`. The Java application is configured to write its logs to this path and the Analytics Agent is configured to read the logs from this path and send them to the Events Service.

The full spec can be found in the [Java App YAML File](#).

### Log Analytics: Deployment Spec For Shared Analytics Agent (STDOUT/STDERR Support)

The following deployment spec supports the use case where application containers are emitting logs to `STDOUT` and `STDERR`, not the application container filesystem.

Since Kubernetes writes the container logs to the host under `/var/log/containers`, the Analytics Agent can read them there. The Analytics Agent is deployed as a Daemonset. A volume `varlog` is defined with access to the host path `/var/log/containers` and mounted to the Analytics Agent container, `appd-analytics-agent`. The Analytics Agent is configured to read the container-specific logs written to `/var/log/containers`. See [Configure Log Analytics Using Source Rules](#).

 hostPath:
 path: /var/log
- name: dockerlog
 hostPath:
 path: /var/lib/docker/containers

```

The full spec can be found in the [Log Analytics YAML File](#). An OpenShift example can be found in the [Log Analytics OpenShift YAML File](#).

## Configure the Analytics Agent for FIPS Compliance

The Analytics Agent  $\geq 22.10.0$  is Federal Information Processing Standards (FIPS) 140-2 compliant.

To use the FIPS-compliant BCFKS trust store for the Analytics Agent, you can:

1. Update the Analytics Agent configuration properties, OR
2. Update the JVM arguments.

### Update Analytics Agent Configuration Properties

When truststores are used in the Analytics Agent, the truststore type must be added to override the default truststore type (JKS).

### Configure Analytics Agent to Events Service Communication

To configure Analytics Agent to Events Service communication, update the following properties:

```

https.event.trustStorePath=<path_to_BCFKS_truststore>
https.event.trustStorePassword=<password_for_truststore>
https.event.trustStoreType=BCFKS

```

### Configure Analytics Agent to Controller Communication

To configure Analytics Agent to Controller communication, update the following properties:

```

ad.controller.https.trustStorePath=<path_to_BCFKS_truststore>
ad.controller.https.trustStorePassword=<password_for_truststore>
ad.controller.https.trustStoreType=BCFKS

```

### Update JVM Arguments

1. Provide the following JVM arguments:

```

-Djavax.net.ssl.trustStore=<absolute_path_to_BCFKS_truststore>
-Djavax.net.ssl.trustStoreType=BCFKS
-Djavax.net.ssl.trustStorePassword=<password_for_truststore>

```

2. In the `java.security` file for the JRE used by the Analytics Agent, add the following security provider class:

```
security.provider.<desired preference order>=org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider
```

Replace `<desired preference order>` with your desired preference order.

If the secure credential store is used for the access key or other password encryptions, use the FIPS-complaint configuration to generate the keystore. See [Encrypt Agent Credentials](#).

## Using Analytics Data

### Related Pages:

- [Analytics and Data Security](#)

This describes how to use the Analytics data. You have several strategies available for locating and using analytics data of interest. Once you have identified data that is useful for your business, you can use visualization or other features to represent and monitor that data.

Analytics enables you to:

- Configure data sources to collect data for analytics.
- Create and visualize searches and add them to custom dashboards.
- Create API Keys for users of the Analytics Events API.
- Create and view metrics created from analytics searches.
- Define and monitor [Business Journeys](#).
- Define [Experience Level reports](#).
- Export data to CSV files.

### Strategies for Locating Data of Interest

- Use a saved search by selecting one from the list. Use the actions in the action bar to manage named searches by saving, duplicating, and so on.
- Create searches for specific use cases. See [Search Analytics Data](#).
- Focus on a specific time range by dragging your mouse across the event stream or by using the time range dropdown.
- Select various fields from the data, targeting the kind of data of interest to you, then scan the event list. Double-click any specific event to display more information.
- Examine Top 10 Values. Click on a field to see the top 10 values of that field in your filtered dataset. The results are presented as a count and percentage of all data within the specified time range for that field. These values provide immediate insights from your data without having any predefined rules or previous knowledge of the data. You can add a value to the search criteria bar by hovering over the value and clicking the + icon.
- Relevant Fields. This feature helps you find fields with a high relevance score. A high relevance score indicates these fields are significantly more common in your filtered results than in the entire data set and may be useful to investigate. See [Investigate Using Relevant Fields](#) for a suggested workflow.

### Visualize Analytics Data

Once you have defined your data, use the Visualization tab to explore specific aspects of the data that interests you and drill down into the relationships you need to understand.

Each visualization type is a widget and widgets can be added/removed. See [Visualize Analytics Data](#).

## Search Analytics Data

You can search Analytics data in two modes:

- Basic mode, where you can add search criteria to filter your data and return a subset of available events. In Basic mode, you see the list of events that match your search criteria, along with a count of those events. This mode is referred to in the UI as **Drag and Drop Search**.
- Advanced Mode, where you can use the AppDynamics Query Language (ADQL). ADQL is a SQL-like query language that provides additional operators and functions to enable more complicated searches. This mode is referred to in the UI as **Query Language Search**.

For each mode, you see the analytics data sources that are licensed and enabled for your application. The applications, data sources, and other fields that you see depend on how the administrator has set the permissions for your role. When creating new roles, remember that granting permissions to view transaction analytics data does not automatically grant permissions to see all application data associated with a specific transaction analytics record. You need to grant at least read-only permissions to the application to enable the user to see associated transaction snapshot data such as flow maps.

 When you search Analytics data, the values shown for segment fields are from the originating tier segment. Data from downstream (non-originating) tier segments is not shown. To visualize downstream segment data, double-click on the transaction row to display the **Transaction Snapshot** screen. Then select the **Transaction Data** tab.

### Search Results Limits

Search results in the UI can return up to 1000 records. By default, each page displays 50 results at a time. In Advanced mode, you can explicitly set a LIMIT to see more than 50 results on a page. Setting a limit disables pagination and shows up to 1000 records on a single page. The total number of records for the query shows at the bottom right. The UI caps the number of search results at 1000 regardless of mode or the value of an explicit LIMIT. To return more than 1000 records, you must use the [Analytics Events Query API](#).

See [LIMIT Clause](#).

### Exporting Analytics Data

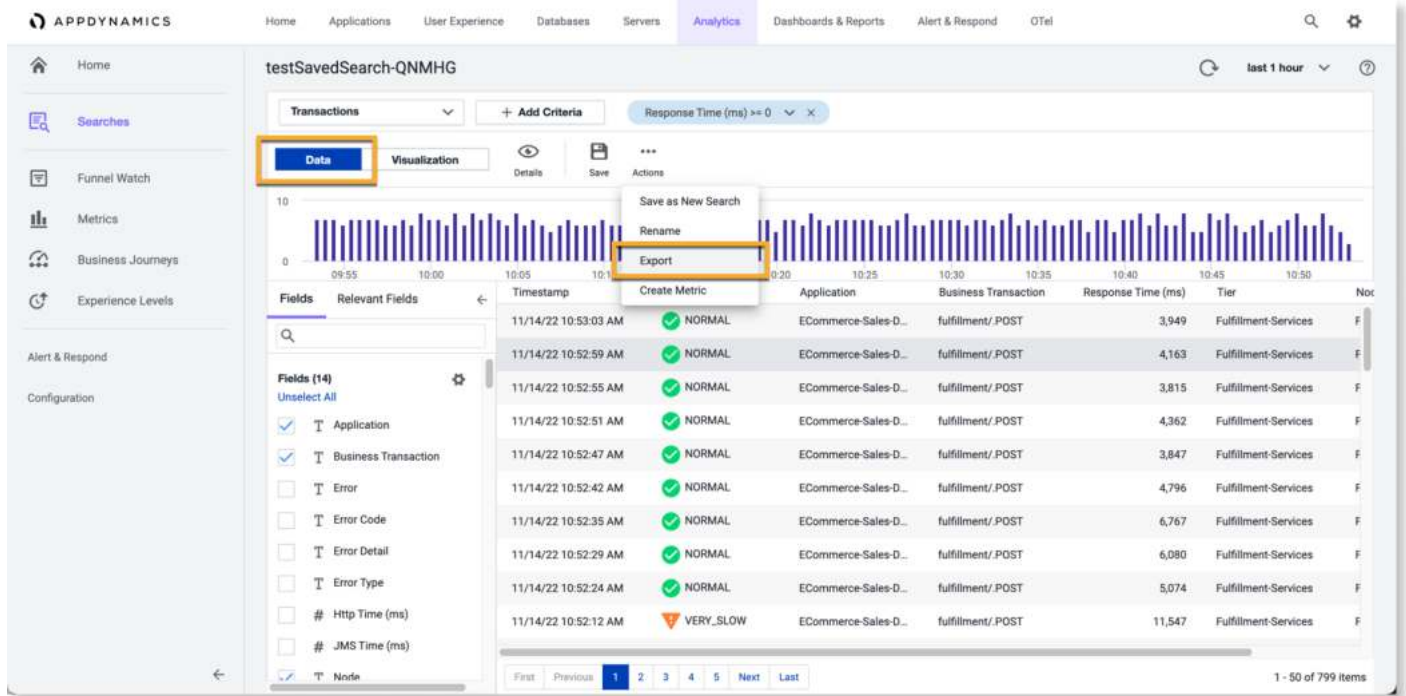

Analytics allows you to export data to a file in CSV format for external use.

Before you export a set of data, consider these guidelines:

- The maximum number of records exported for a non-aggregation query is 65000. Use the LIMIT clause to restrict the records to a number below the upper bound. The LIMIT clause does not return any additional records that satisfy the export selection criteria.
- The number of records exported for an aggregation query by default is 10. If you want more than 10 records, use the LIMIT clause. You can export up to 1000 records by using the LIMIT clause.
- The CSV file format is RFC4180.
- Response from all valid ADQL queries can be exported. The method of writing ADQL queries remains the same.
- Only the fields that you specify in the `SELECT` clause export to the CSV file. ADQL query supersedes the Controller Tenant UI selection. The fields you select to display in the **Data** tab have no impact on the exported data even if the query includes `SELECT *`.
- Fields having nested representation are flattened and appear as separate fields in the CSV file. Additionally, the corresponding unflattened nested fields also appear in the exported records. Flattening fields refers to separating nested fields into individual fields.

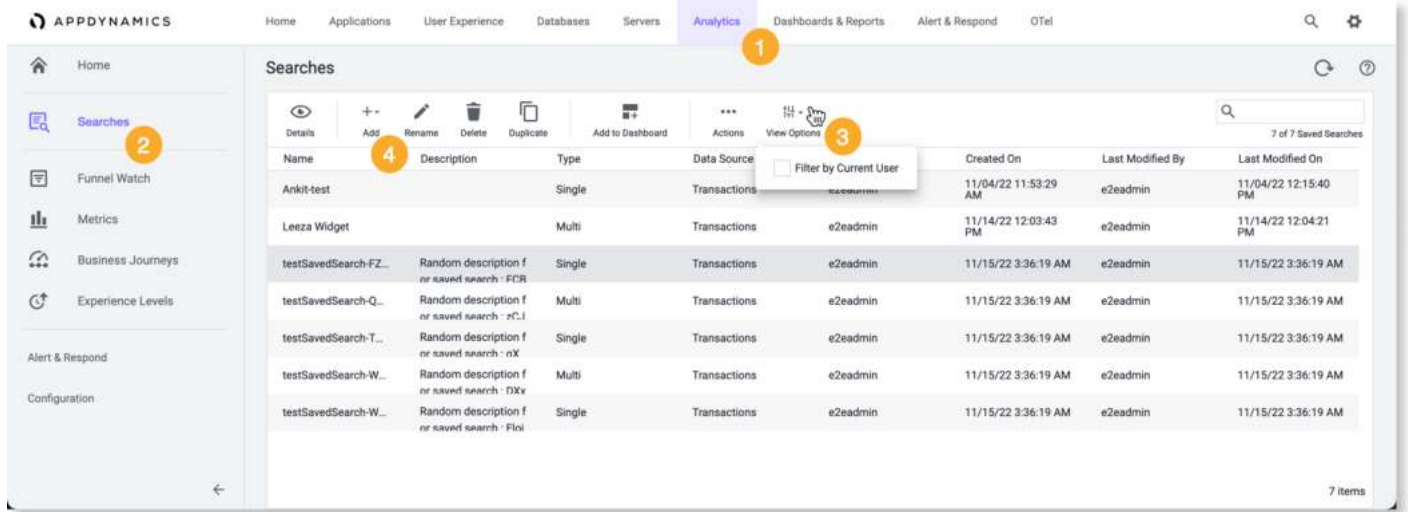

- The supported `DateTime` format is ISO, `yyyy-MM-dd'T'HH:mm:ssZZ`, without the millisecond value. The timezone is local to the browser from which export is requested. A timestamp field in a nested field is converted to the local timezone only in the flattened fields, not in the unflattened nested field. The format in the UI, that is `MM/DD/YYYY HH:MM:SS AM/PM`, is different from the format that you see in the exported data.
- The time required to export data varies with the record size you are trying to export. Exporting tends to slow down for a larger set of records because executing the query on and retrieving a large data set takes longer to complete.

You can export metrics to the Metric Browser and search results from the Searches screen. Use the **Export** option under **Actions** on the toolbar to do so. While you are on the Searches panel, use the **Data** mode to export your search result.

### Access the Analytics Search UI

1. Click **Analytics** <sup>1</sup> or select a data source to view a default search for that event type.
2. Click **Searches** <sup>2</sup> to create new or view saved searches.
3. Click **View Options** <sup>3</sup> and select **Filter by Current User** to view your previously saved searches.
4. Click **+Add** <sup>4</sup> to create a new search or select an existing search to activate the actions on the action toolbar. See [Create Basic Analytics Searches](#) or [Create Advanced Analytics Searches](#).

There are two tabs that display search results.

- All event types share the same basic layout on the Data tab of the Search details page.
- Use the Data tab to search and filter the data that you want to review and analyze.
- Use the Visualization tab to create graphic representations based on that data.
- Search actions are available for each search. The actions vary according to the type of search and the tab you use. These actions are available:
  - Rename
