  - Export (to CVS - only from the Data tab)
  - Create Metric
  - Add to Dashboard (only from the Visualization tab)

### Basic and Advanced Search Comparison

This table provides a comparison of the functionality available in each search mode.

Functionality	Basic	Advanced
Drag and drop fields to the criteria search bar	yes	no
Type-ahead (auto-complete)	N/A	yes
Visualization canvas widget support	multiple widgets	one widget per search query
Grouping of events with the GROUP BY keyword	yes	yes
Wild cards with comma-separated text (Basic mode) or IN operator (Advanced mode)	no	no
Percentile Histogram widget	yes	no

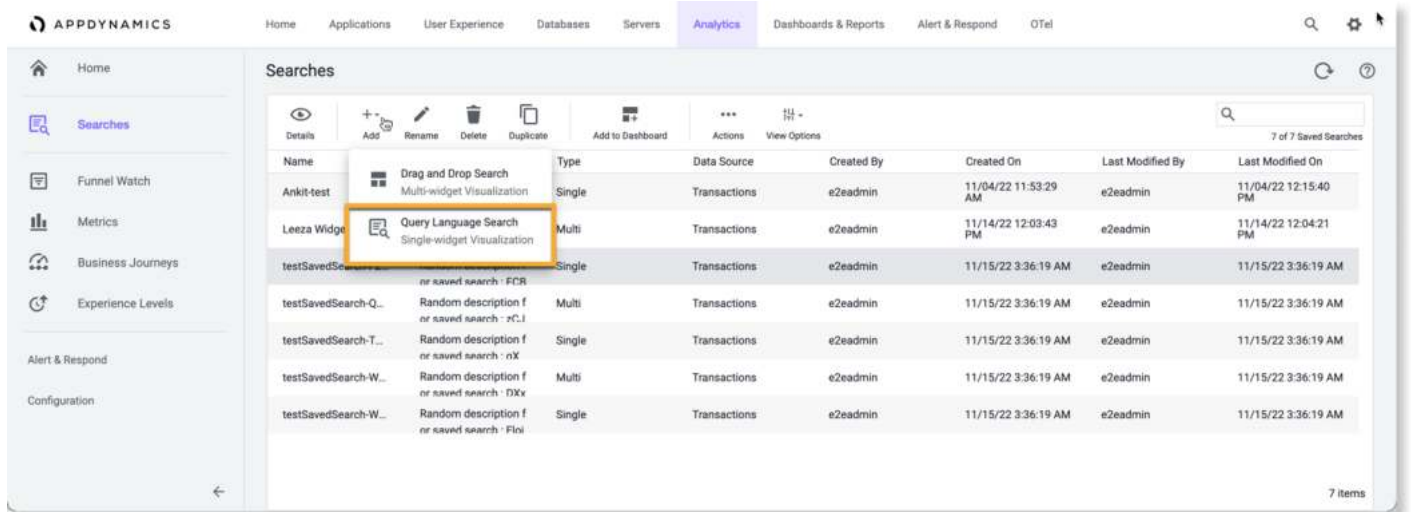

## Create Advanced Analytics Searches

### Related pages:

- [Using Analytics Data](#)
- [ADQL Reference](#)

This page describes advanced search options using the AppDynamics Query Language (ADQL) to search analytics data. You can also use [basic search options](#) for your searches.

1. From the **Analytics** tab, click **Searches**.
2. Click **Add** <sup>+</sup> <sub>▼</sub>.
3. Select **Query Language Search**.

### Construct ADQL Queries

Each ADQL event query begins with a **SELECT** statement that uses a **FROM** clause. Use the **FROM** clause to specify the data source you want to query. You can query one data source in each query.

Use the **SELECT** statement to further qualify the query using **field\_expressions** and **math\_expressions**. The **WHERE** clause adds conditions. For more details on specific ADQL syntax, keywords, functions, and operators, see the [ADQL Reference](#).

**i** When you search Analytics data, the values shown for segment fields are from the originating tier segment. Data from downstream (non-originating) tier segments are not shown. Double-click on the transaction row to view downstream segment data. Then select the **Transaction Data** tab.

When you click **Search** for queries other than select all fields ( **SELECT \*** ), the results display on the visualization tab where the table widget accurately renders your query.

### Use ADQL Auto-Complete

As you construct your query, auto-complete offers suggestions for the next keyword or operator in the query. The auto-complete offers suggestions according to the stage of your query and the event type you

select. It suggests data values, such as event types and fields when you type an equals sign "=" or other comparison operators after the event type name.

Note: The query box in the data tab is used only for adding `WHERE` clause differentiation. Aggregation functions are only available in the visualization tab under the table widget.

When you type `SELECT`, the fields from the last specified event type display in the auto-complete list. Fields specific to a new event type display after you complete the `FROM` clause.

**i** You must include a space in front of the next keyword or you may see a validation error when executing the search or the search will be inexecutable.

## Field Name Mapping

The field names in the auto-complete dropdown list correspond to UI labels with minor differences in capitalization. When the field names have prepended database-related information, such as `segments.errorList.errorType` for Error Type or `segments.httpData` for HTTP data fields, they refer to data for individual segments of the transaction as it progresses from tier to tier. The segments fields do not represent data that refers to the overall business transaction instance. See [ADQL Data](#) for a list of fields, UI labels, and internal database names for each data source.

## Create Basic Analytics Searches

### Related pages:

- [Using Analytics Data](#)
- [Create Advanced Analytics Searches](#)

This page describes basic search options for Analytics. You can also perform [advanced searches](#) using a query language.

The Search UI refers to the basic search as a **Drag and Drop Search** that enables you to do multi-widget visualization of your search results. You can add search criteria based on the fields collected for the event type. Field search enables you to search for all values or a specific value of the field.

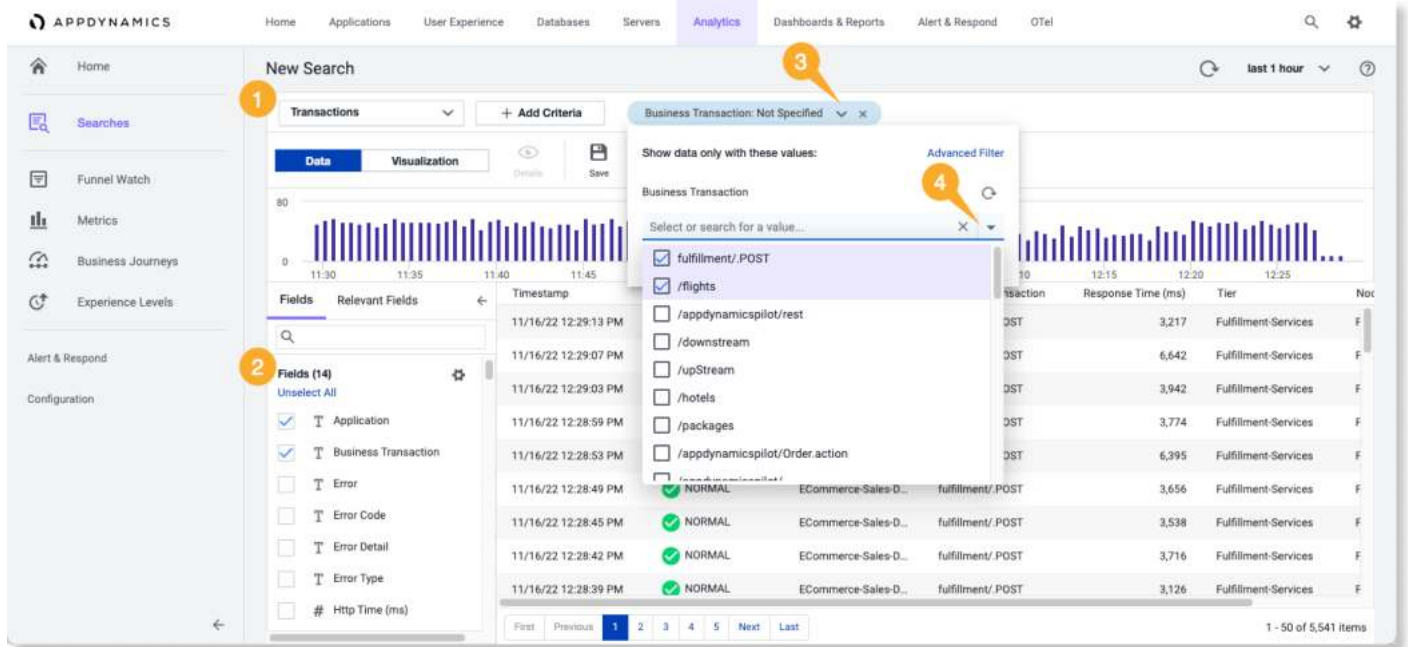

### Create a New Basic Search

The scope of your search depends on the fields and field criteria you select. You can select to search on multiple field values with multiple relevant criteria, enter an exact match term, or use wild cards to filter the results. See [Search Options](#).

1. From the **Analytics** tab, click **Searches**.
2. Click **Add** <sup>+</sup>.
3. Select **Drag and Drop Search**.
4. Select the data source <sup>1</sup> type that you want to search.
5. Select **Fields** <sup>2</sup> related to the data source type.
6. Click **+ Add Criteria** to select from available fields.
7. Click the dropdown <sup>3</sup> next to the field name to open the field value selector.
8. Click the value dropdown <sup>4</sup> to define a value or values for the field.  
Fields such as Application, Business Transaction, and Node display a list of the values available. Some fields only provide a search box where you can enter criteria to filter the values of this field.

**i** When you search Analytics data, the values shown for segment fields are from the originating tier segment. Data from downstream (non-originating) tier segments is not shown. To visualize downstream segment data, double-click on the transaction row to display the **Transaction Snapshot** screen. Then select the **Transaction Data** tab.

9. Click **Apply** to view the results.
10. Click **Done** to close the selection window.
11. Click **Save**.

### Search Options

This table describes free text search and text filter behavior:

Type of entry	Analyzed	Non-analyzed
<i>term</i>	<p>Find entries with this term. This search is case insensitive.</p> <p>For example, using the term "great" finds "great" and "AppDynamics is great".</p>	<p>Looks for an exact match and is case sensitive.</p> <p>For example, using the term "order" finds "order" but not "/PlaceOrder.</p>

Type of entry	Analyzed	Non-analyzed
<i>term1 term2</i>	Returns results containing both <i>term1</i> and <i>term2</i> irrespective of the order the terms appear.	Terms connect implicitly with <b>AND</b> . Looks for an exact match and find results containing " <i>term1 term2</i> ".
<i>term1, term2</i>	This works the same as the space-separated list of terms.	Terms connect implicitly with <b>OR</b> . Looks for an exact match for either <i>term1</i> or <i>term2</i> .
<i>term*</i> <i>term?</i>	Finds all fields where the value is this string plus one additional character <?> or multiple <*>.  Because all non-alphanumeric fields are delimiters, the escape character has no effect.	Finds all fields where the value is this string plus one additional character <?> or multiple <*>.  To search for a field containing a wild card character, escape with a "\".
<b>NOT</b> <i>term</i>	Use the <b>NOT</b> comparison operator to find everything except the term. <b>NOT</b> can be used with any of the entries in this table.	Use the <b>NOT</b> comparison operator to find everything except the term. <b>NOT</b> can be used with any of the entries in this table.

### Free Text Search in Log Analytics

For log analytics, a free text search is available for searching the message field to enable keyword or string searches anywhere in the message field.

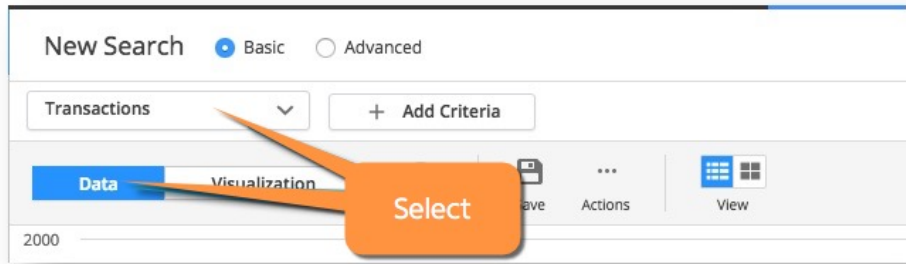

### Investigate Using Relevant Fields

You can use Relevant Fields to find data fields that show a high Relevance Score. A high relevance score indicates these fields are significantly more common in your filtered dataset than in the entire dataset and may be particularly useful to analyze. Relevant field investigation may provide valuable insights and enable you to conduct better root cause analysis.

Relevant Fields investigation can be used with all event types.

As an example, you can use the following suggested workflow to investigate poor user experience.

1. From the Analytics Search page, select the **Transactions** event type and the Data tab.

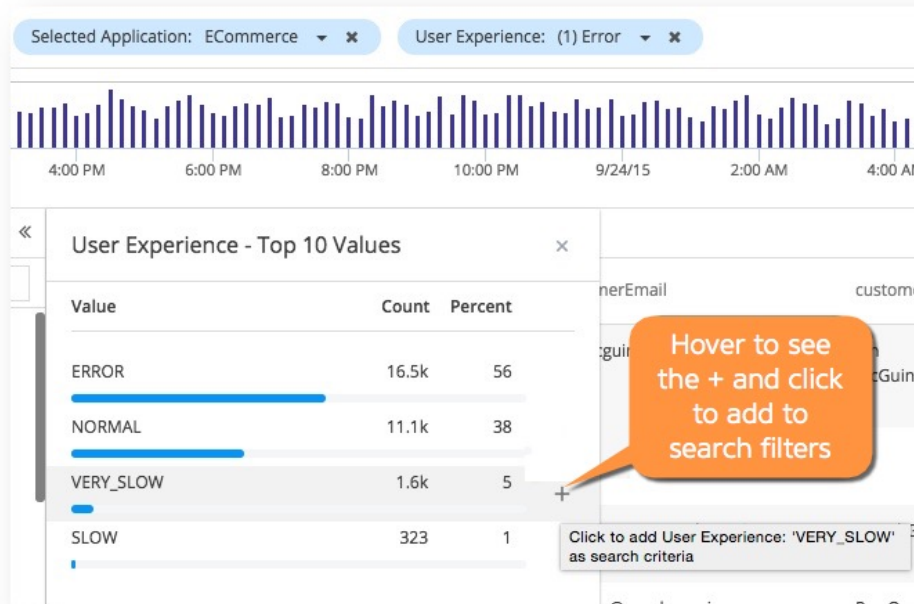

2. Click **Add Criteria** and select an application to investigate.
3. Click **User Experience** or another field in the **Fields** list to see the **Top Values**. If you see lots of error and very slow transactions, you realize it is not easy to investigate hundreds of error and very slow transactions.

Value	Count	%
NORMAL	73720	90.89
ERROR	6293	7.76
SLOW	598	0.74
VERY_SLOW	499	0.62

4. Add **Error** and **Very Slow** values to your search criteria to narrow the total number of transactions to a smaller dataset. You can add the values quickly by hovering over the field in the **Top Values** list until the **+** sign appears at the right. Click the **+** to add to the search criteria. Now the focus is only on error/very

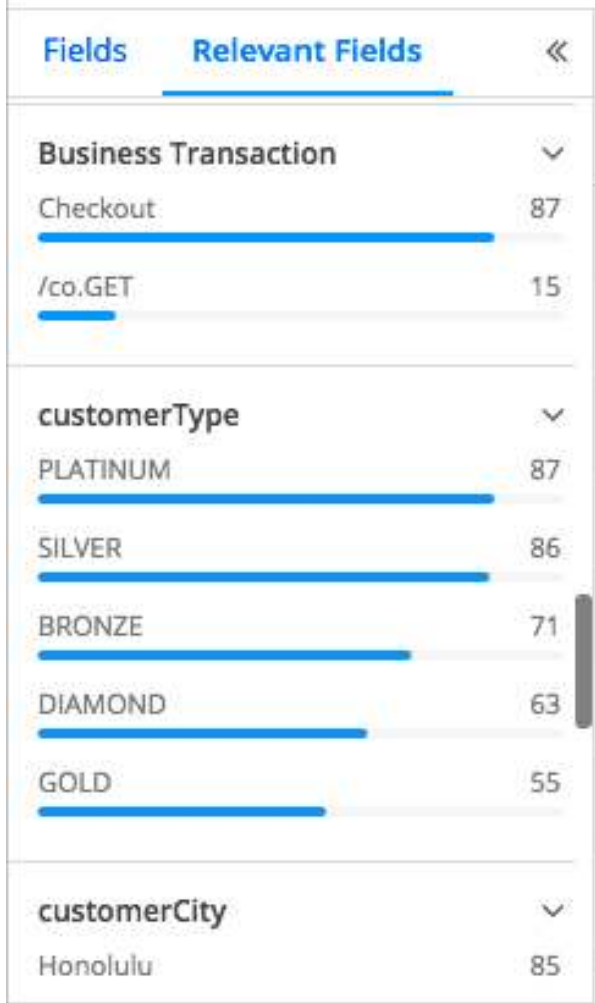

slow transactions.

5. Click the **Relevant Fields** label and now you can see where to focus your investigation. In this example, you might start with the **Checkout** business transaction as the relevance score is 87. You can also see that **Platinum** and **Silver** customers have the two highest scores. The relevance score is an indication of

where the highest proportion of error and very slow transactions are occurring.

6. Click a field in the **Relevant Field** list to see more details. You can continue to add relevant fields to your search criteria to keep narrowing the dataset. This process should enable you to find issues of significance for investigation.

## Visualize Analytics Data

### Related Pages:

- [Create Basic Analytics Searches](#)

After you have created a search for the Analytics data that you want to visualize, you can configure a widget to display the results of the search graphically.

### Access the Analytics Widget Builders

You can access the Analytics visualization widgets from the Analytics Search UI or directly from **Dashboards & Reports**.

To access the Analytics widget builder from Analytics:

1. Select **Analytics > Searches** to view the saved searches list.

2. Double-click the search that you want to visualize or add a new search.

To access the Analytics widget builder from a Custom Dashboard:

1. From the top navigation bar, click **Dashboards & Reports** to see the custom dashboard list.
2. Either double-click the dashboard where you want to add the Analytics widget or click **Create Dashboard** to create a new dashboard.
3. In the custom dashboard, click **Edit**, then **Add Widget**.
4. Click **Analytics**, **Saved Searches**, or **Experience Levels**.
5. Add Analytics widgets as needed to your dashboard.

## Build a Widget

To use the Analytics widget builder:

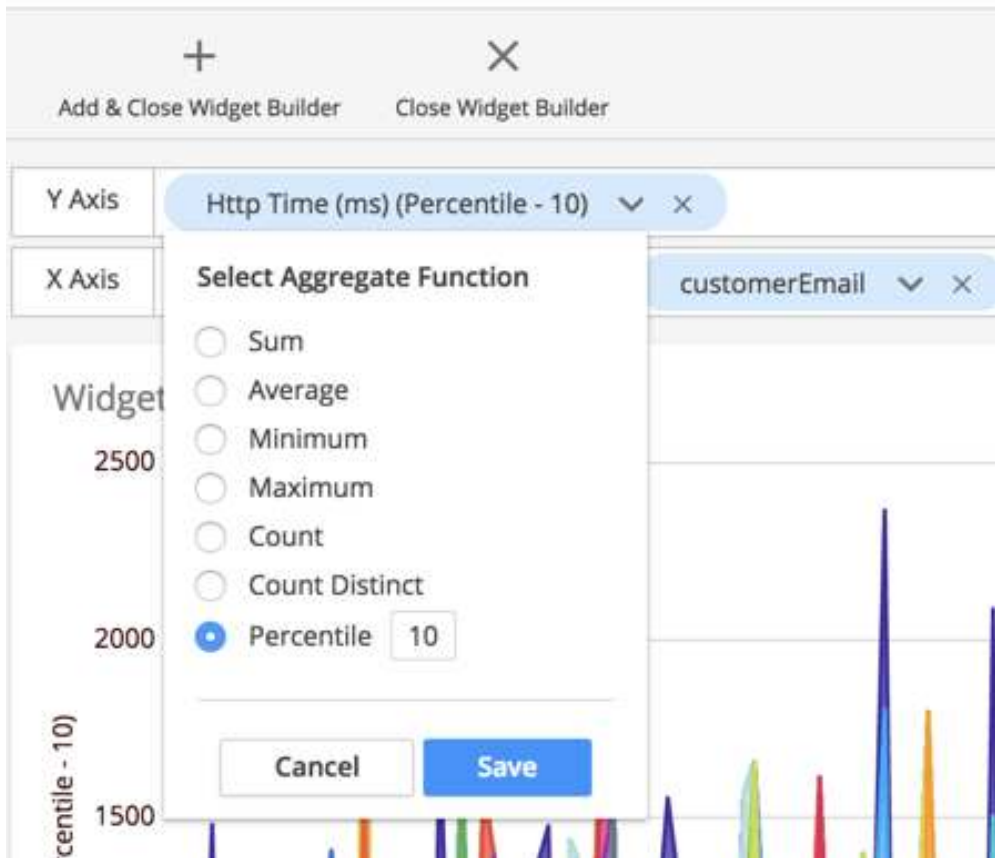

1. Click the Visualization tab.
2. In the **Visualization** canvas, you can create widgets with one of the following modes:
  - In **Drag and Drop Search** (Basic) mode you can create multiple widgets on the canvas.
  - In **Query Language Search** (Advanced) mode you can generate one widget from your ADQL query at a time. In addition, when you use the Visualization tab in this mode, the order of functions and fields in the query matters. For all widgets (except table), the aggregate functions, such as count(\*), avg(), sum(), percentile and so on, should always be preceded by a field. If the fields and functions in the query are not in this order, some visualizations do not work.

See [Conversion Analysis](#) for an example of creating a conversion analysis using the funnel widget.

3. Click **Add Widget**, then select **Custom Widget Builder** or **Funnel Widget Builder** depending on the type of widget that you want to create.

In Basic mode, you can build custom widgets and drag fields to the canvas, which uses X and Y axes for configuration. After dragging a field to the axes, select a function from the drop-down next to the field name.

In this example, the percentile function is applied to **HTTP Time (ms)**.

The funnel widget is configured differently from the other custom widgets, which use the Y and X axes as the basis of the configuration. A funnel widget is used to display data of progressively-staged proportions in a color-coded funnel.

You can add a title to the widget by over-writing **Widget Title** on the canvas.

4. After adding a widget and fields, you can right-click menu widget values to see other options. Select **Apply a global filter for <field\_value>** to add a value to the existing search criteria. The supported boolean operators are **true**, **false**, **null**, and **is not null**. Use **is not null** to check both boolean and non-boolean fields, such as `loan amount` or `IsReached`.
5. Click **Save & Close** to save the widget configuration.

### Conversion Analysis Using Funnel Widget

Funnel analysis includes a series of events that lead towards a defined goal. For example, tracking user activity in a mobile app, a sale on an eCommerce website, online advertisements, and eventual purchase.

The funnel widget visualizes use cases such as:

- Retail application checkout drop-off rates from the point of adding items to the shopping cart to the actual purchase
- Business Journey drop-off rates from the point of applying for a loan to approving the loan
- Home mortgage loan approval drop-off rates from submitted application to approved applications
- Impact from performance issues by total sales, customer segment, location, and purchased products are gauged in a funnel with other health rule widgets

In this custom dashboard, the impact from performance issues by total sales, customer segment, location, and purchased products are gauged in a funnel with other health rule widgets.

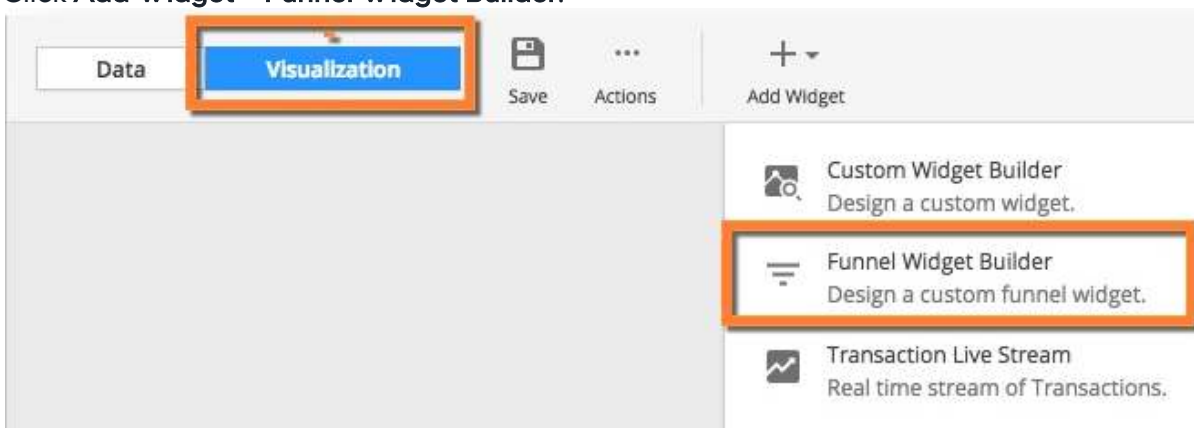

Funnels return the number of unique actors that successfully (or unsuccessfully) make it through a series of steps. Actors could mean users, devices, or any other identifiers that are meaningful to you. A funnel analysis reveals where a given flow loses the most actors. This helps identify areas for improvement, as well as the overall health of your business.

The first step in the funnel is the anchor step, and always represents 100% of the results. The filter criteria for the first step creates a set of unique values, and every subsequent step results in a subset of the values from the previous step and renders the corresponding drop-offs. The second and later steps describe the number of events that match the criteria for each step towards the goal. This number is typically less than 100%, but could be 100% if every event matches the subsequent steps.

### Build a Funnel Widget

1. From the **Analytics Search** page using **Drag and Drop** (Basic) Mode, select the Visualization tab.
2. Click **Add Widget > Funnel Widget Builder**.

3. In the **Funnel Definition** pane, click the down arrow to select the unique field representing the items that you are counting. In this example, following the steps of a loan approval process, `LoanId` is used.

The fields depend on your application. There is a limit of 50,000 unique values for the first step. If you encounter this limit, you can try decreasing the global time range and look at fewer values at a time.

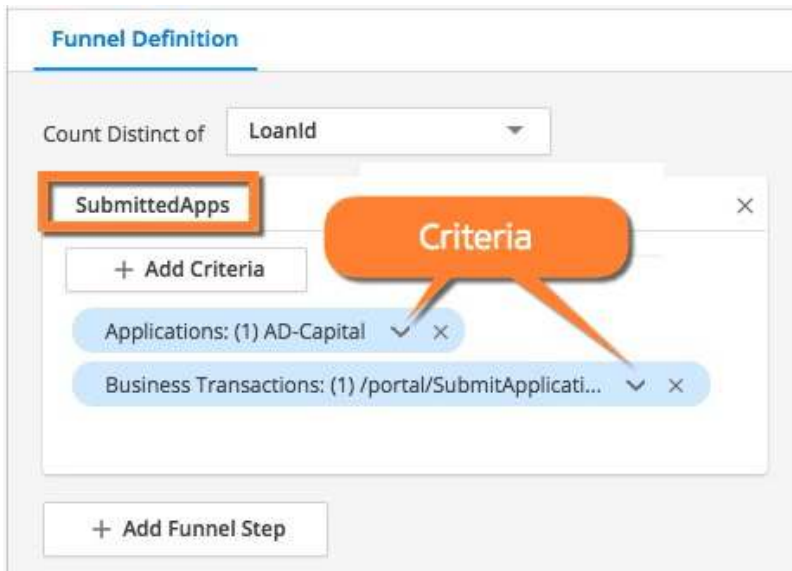

The screenshot shows the 'New Search' interface with the 'Basic' search type selected. Under the 'Visualization' tab, the 'Funnel Definition' section is active. The 'Count Distinct of' dropdown menu is set to 'LoanId'. An orange callout bubble with the text 'Select unique identifier' points to this dropdown. Below the dropdown is a text input field labeled 'Enter the step name' and a '+ Add Criteria' button.

**i** Filtering on fields with null and empty values may cause more records in subsequent levels.

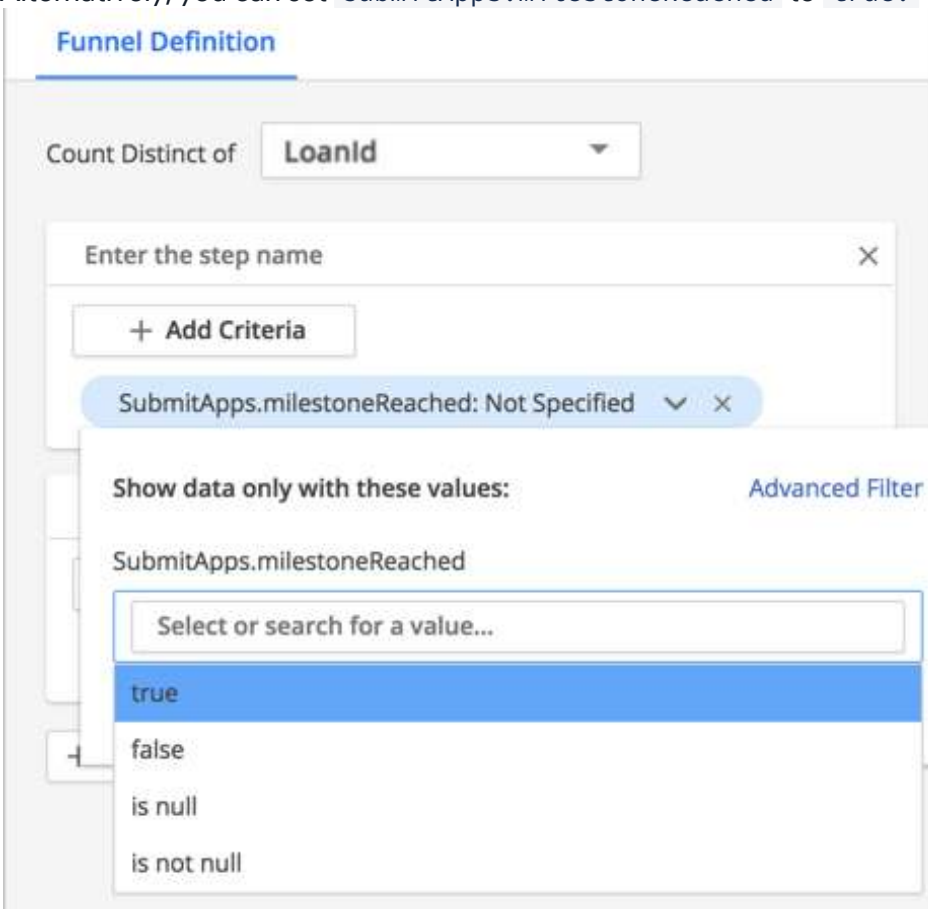

- Label the first step and continue to add steps as needed for your application process.

This screenshot shows the 'Funnel Definition' section. The 'Count Distinct of' dropdown is set to 'LoanId'. The 'Enter the step name' input field is highlighted with an orange box. Below it is a '+ Add Criteria' button. At the bottom of the section, a '+ Add Funnel Step' button is also highlighted with an orange box.

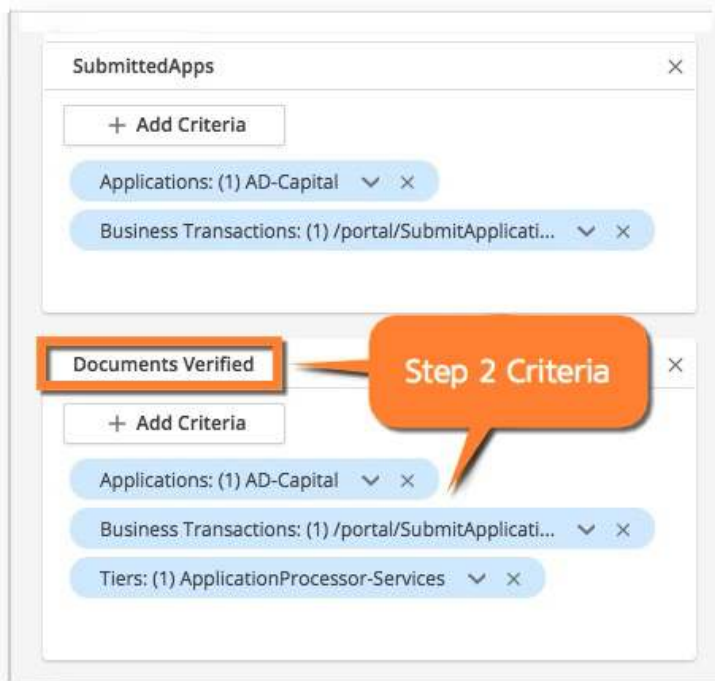

For this example, the first step represents the number of submitted loan applications. The search criteria include the AD-Capital application and the `/portal/SubmitApplication` business transaction.

Alternatively, you can set `SubmitApps.milestoneReached` to `true`.

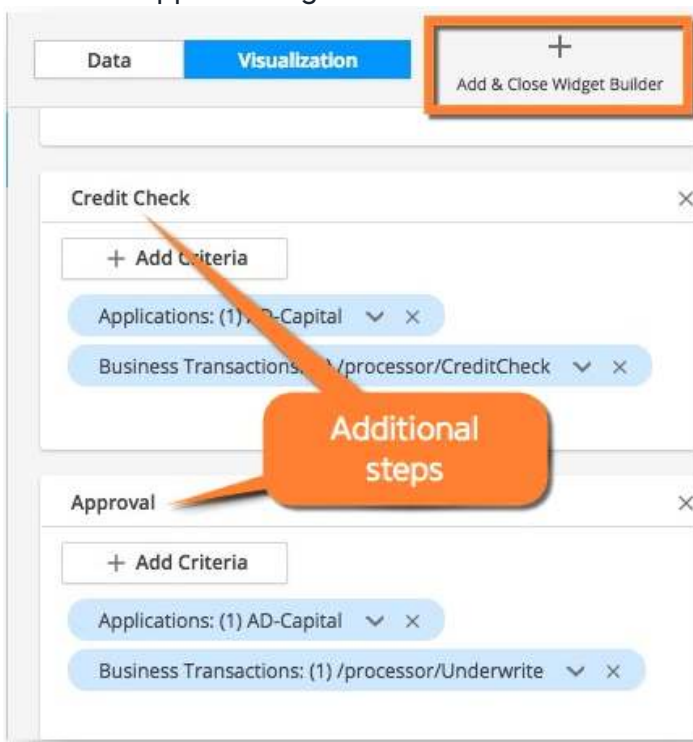

- Continue to add and label your steps. This step represents the number of loan applications that reached the stage "Documents Verified."

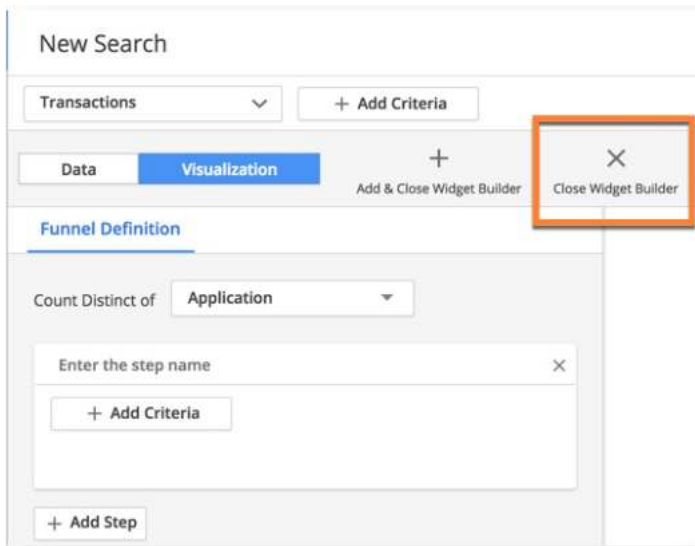

Alternatively, use the `milestoneReached` field and set it to true.

- After you have added all the necessary steps, click **Add & Close Widget Builder** to save the completed funnel widget. This example contains two additional steps representing loans that reached the credit check and approval stages.

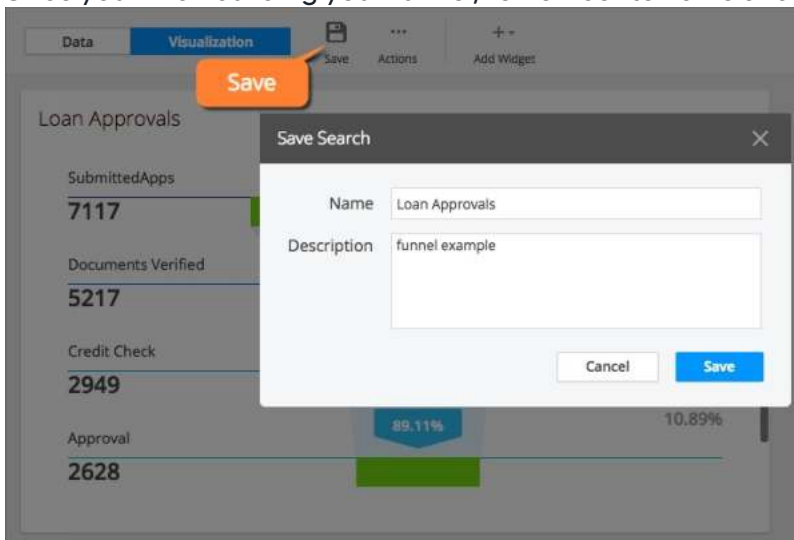

If you want to cancel editing and revert to the previous version, click **Close Widget Builder**.

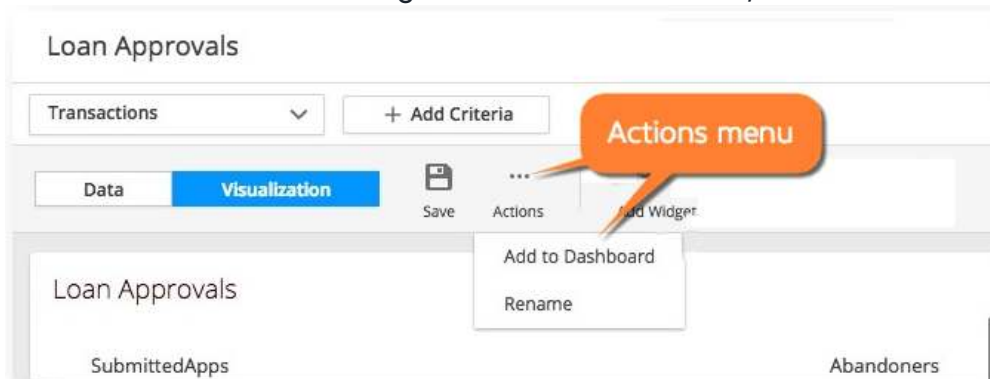

If the funnel steps need a rearrangement you can simply reorder them by simply dragging and dropping each step into appropriate positions.

7. Once you finish building your funnel, remember to name and save your search result.

8. To add the finished funnel widget to a custom dashboard, click **Actions > Add to Dashboard**.

## Use the Funnel to Troubleshoot

The finished funnel widget for the above example shows the drop-offs (Abandoners) in unique loan IDs from submission to approval. When creating the funnel, you can also select **Show Health** in the properties pane to display a health overlay that correlates application health data with the business conversion data. This helps to visualize performance for each step of the funnel widget.

Loan Approvals

The health overlay is supported for these event types with a user experience value:

- Transaction Events – `userExperience`
- Browser Records – `pageexperience`
- Mobile Snapshots (Network Requests) – `networkrequestexperience`
- Web Session Records (Browser Sessions) – `experience`
- Mobile Session – `networkrequest.networkrequestexperience`

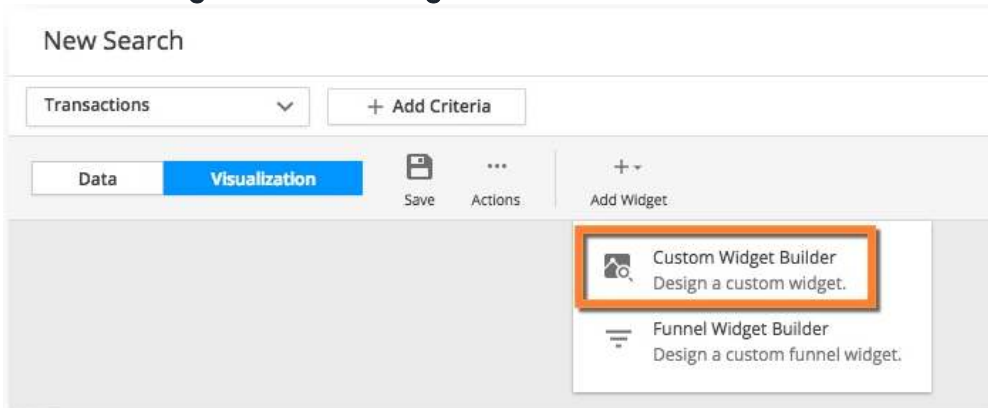

For enhanced troubleshooting, you can drill down to event data from any of the funnel steps by double-clicking the numbers on conversions and abandoners or by using Health Overlay and clicking on each health segment.

## Configure Custom Widgets

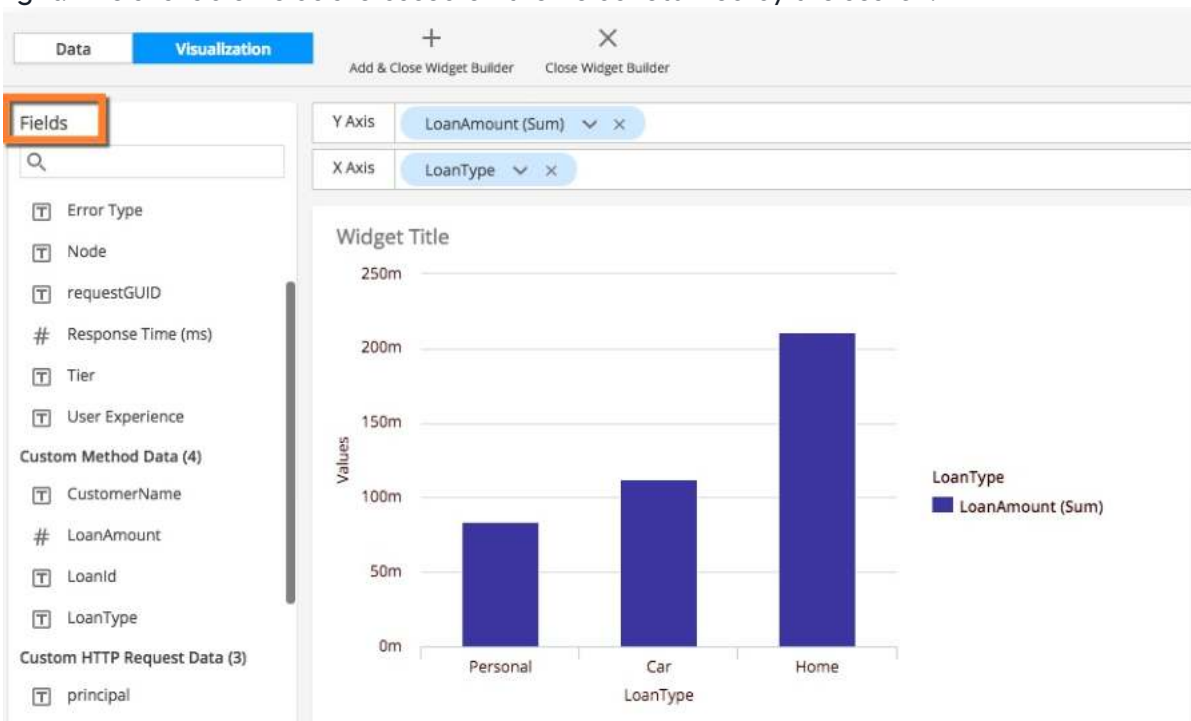

To configure custom widgets for your analytics searches:

1. From the Analytics Search page using **Drag and Drop Search** (Basic) Mode, select the Visualization tab.

2. Click **Add Widget > Custom Widget Builder**.

3. To add a field to a widget, drag the field from the **Fields** panel on the left to the Y-axis or X-axis on the right. The available fields are based on the fields returned by the search.

4. From the **Chart Types** panel on the right, click the widget type to use for the display. The widget is previewed in the main panel. You can experiment previewing which widget type is best for visualizing a particular data set.

- Usage for the X and Y axes depends on the chart type. The UI prevents you from adding more fields than the widget supports. Different widgets have different limits for the maximum number of fields permitted on each axis.
- For the time series widgets (area, line, scatter, and histogram), you can use the **Resolution** field that appears on the X-axis to customize the frequency displayed if you do not want the widget to automatically select a default resolution based on the current time range. This time resolution field is not counted toward the field limit. The granularity of resolutions that can be chosen depends on the Global time range.

### Custom Widget Builder Data Type and Field Restrictions

Widget Type	Data Type	Number of Fields on Y-axis	Number of Fields on X-axis
Column (simple)	any	zero	up to two
		one	up to two
		two or three	zero or one
Pie	any	one	up to two
Table	any	one	up to ten
Tree Map	any	one	up to two
Time Series (Area, Line, Points, Column)	any	zero	one
		one	one

Widget Type	Data Type	Number of Fields on Y-axis	Number of Fields on X-axis
		two or three	zero
Percentile Histogram (Not available in Advanced Mode)	numeric	zero	one
Numeric (Univariate)	any	one	zero

### Upgraded Funnel

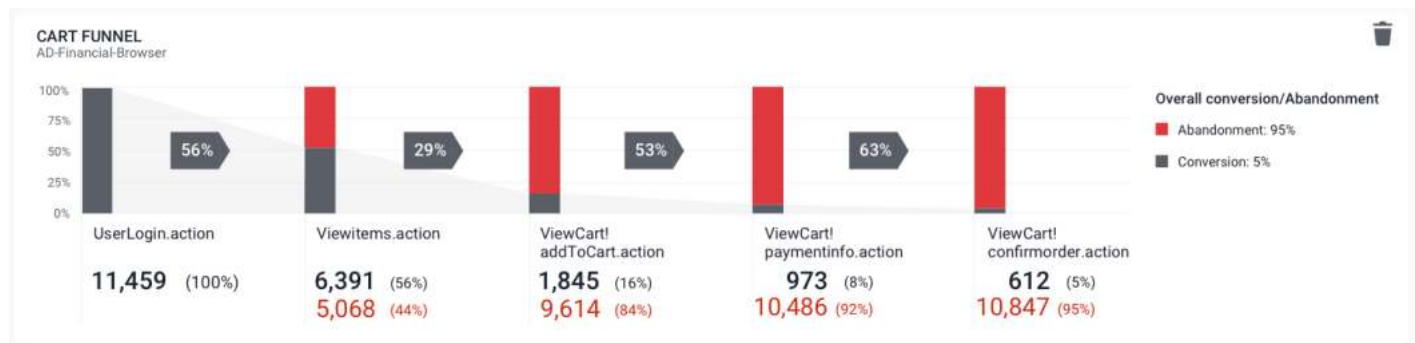

Contact your administrator for access to the upgraded funnel experience.

### Upgraded Analytics Funnel

The upgraded Analytics funnel is a widget in the Funnel Watch page that allows business personas to implement and perform conversion analysis. The upgraded Analytics funnel improves the funnel discovery with the Funnel Watch creation process in the Funnel Wizard, and provides visualization for total abandonment percentages.

Contact your administrator for access to the upgraded funnel experience.

### Example of Abandonment and Conversion

## Legend

Red Bar	Grey Bar	Grey Arrows	Grey Numbers	Red Numbers
Displays the total percentage (%) of abandonment from the previous step.	Displays the total percentage (%) number of successful conversions from the previous step.	Displays conversions from the previous step.	Displays the total conversion number from the first step.	Displays the total of abandonment number from the first step.

## Configure the Funnel Watch

The **Funnel Watch** page is a dashboard where you can view all created funnels. To configure the Funnel Watch:

1. From the **Analytics** tab, click **Funnel Watch**.
  2. Click the '+' icon.
  3. Choose the Application Performance Monitoring (APM) application for which to create the funnel. You can use the **Search** bar to find applications.
  4. Enter the values for the fields:
    1. **Funnel Name:** Enter your preferred Funnel name.
    2. **Field:** Choose a field for the funnel.
- Under **Add a funnel step**, select a business transaction in the dropdown. You can enter a step name in the provided text box, or remove an unwanted step.
  - Click **Next**.
  - Click **Finish**.

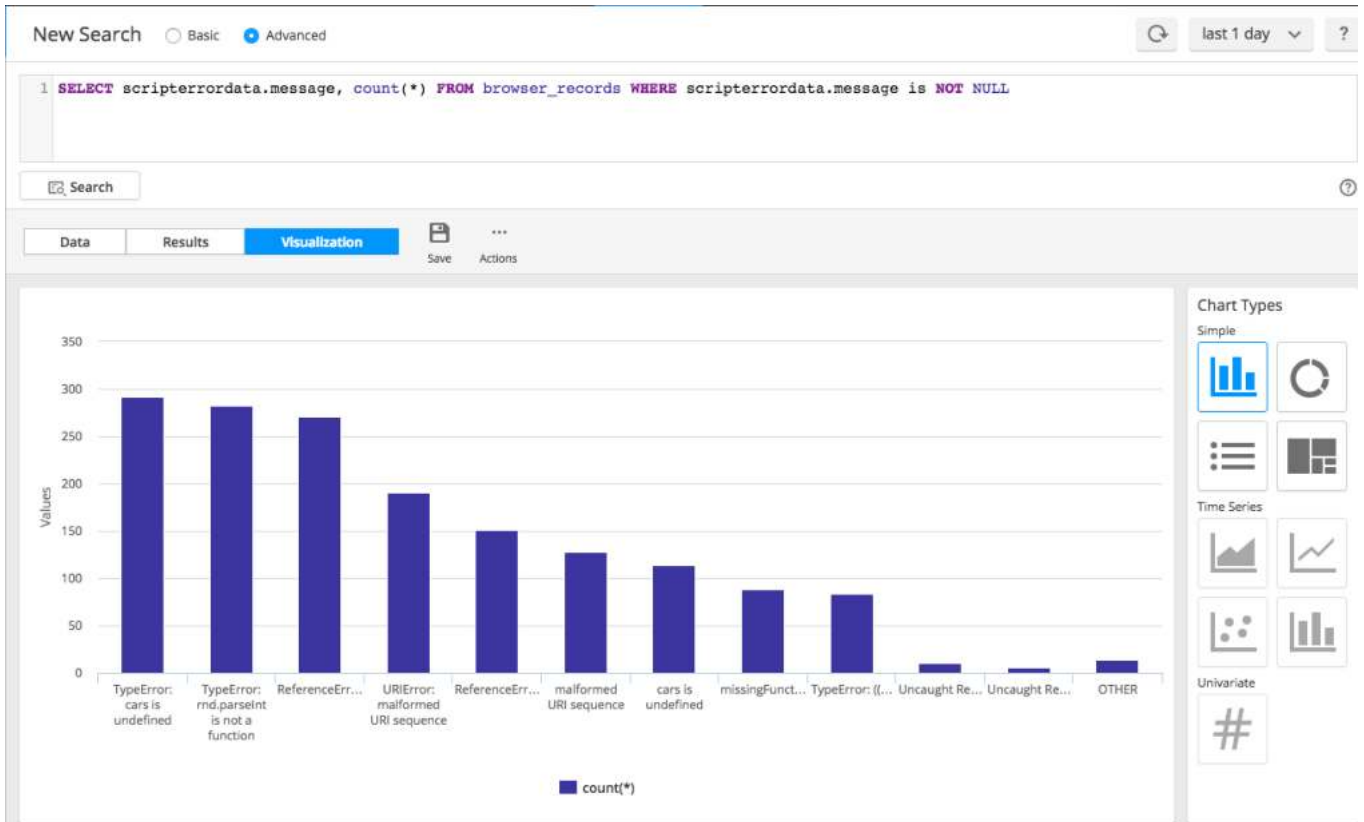

## Visualize JavaScript Errors

You can use Analytics to query your Browser Request event data and create a JavaScript exception and error summary dashboard.

This procedure assumes that you have configured and enabled the reporting of the JavaScript errors for Browser RUM and that JavaScript errors exist in the Events Service.

Using ADQL, you can search for the errors and then export a chart visualizing the results to a custom dashboard.

1. From the Analytics tab in the Controller UI, click **Add** to access the Analytics Search page.
2. Select Advanced mode and enter the following query:  
**SELECT** scripterrordata.message, count(\*) **FROM** browser\_records **WHERE** scripterrordata.message **IS NOT NULL**. The results are shown on the Visualization tab similar to the following:

3. Select the chart type you prefer to visualize the results.

New Search  Basic  Advanced last 1 day ?

```
1 SELECT scripterrordata.message, count(*) FROM browser_records WHERE scripterrordata.message is NOT NULL
```

Data Results **Visualization** Save Actions

Error Message	Percentage
TypeError: cars is...	17.9%
TypeError: rnd.par...	17.29%
ReferenceError: ml...	16.62%
URIError: malforme...	11.71%
ReferenceError: eu...	9.26%
malformed URI sequ...	7.85%
cars is undefined	6.99%
missingFunction is...	5.4%
TypeError: ((Math...	5.15%
Uncaught Reference...	0.61%
Uncaught Reference...	0.37%
OTHER	0.86%

**Chart Types**

- Simple
  - Donut Chart
  - Bar Chart
  - Table
  - Grid
- Time Series
  - Area Chart
  - Line Chart
- Univariate
  - Scatter Plot
  - Histogram
  - #

4. From the **Actions** menu, click **Add to Dashboard** and either create a new dashboard or add it to your existing dashboard.

Now you can customize the dashboard as needed with labels or other widgets and data.

You can also leverage additional fields such as `scripterrordata.origin` or `pagename` to group the errors together. The additional fields are:

- `scripterrordata.linenumber`
- `scripterrordata.origin`
- `scripterrordata.timestamp`

New Search  Basic  Advanced last 1 day ?

```
1 SELECT scripterrordata.linenummer, scripterrordata.message, scripterrordata.origin, count(*) FROM browser_records WHERE scripterrordata.message is NOT NULL
```

## Create Analytics Metrics From Scheduled Queries

### Related pages:

- [Using Analytics Data](#)
- [ADQL Reference](#)
- [Manage Custom Roles](#)

This page describes how to create analytics metrics from scheduled queries.

If you want to execute an analytics search repeatedly to monitor its value, you can create a metric from the search. The search will execute once per minute and report the results as a metric. You can create alerts on the metric in the usual way using [Health Rules](#) to trigger [Policies](#) and [Actions](#). The analytics metric list is searchable.

You can create metrics for all Analytics event types - Browser, Mobile, Transaction, Log, and Custom.

**i** Although the metrics calculated by scheduled queries may have decimal point precision, we only save and report whole numbers.

You can create a metric from an analytics search for the functions shown in this table. See [Metric Data Resolution over Time](#).

Function	Metric Rollup Type	Example
count(*   field_name)	sum	SELECT count( activeMacUsers) FROM dummyTransactions
distinctcount(field_name)	average	SELECT distinctcount(activeMacUsers) FROM dummyTransactions
sum(numeric_field_name)	sum	SELECT sum(responseTime)where userExperience = "NORMAL" FROM transactions
avg(numeric_field_name)	average	SELECT avg(responseTime) FROM transactions
min(numeric_field_name)	average	SELECT min(responseTime) FROM transactions
max(numeric_field_name)	average	SELECT max(responseTime) FROM transactions
(exp1)/(exp2)	average	<p>SELECT (count(activeMacUsers)) / (avg(activeWindowsUsers)) FROM dummyTransactions</p> <p>SELECT (avg(responseTime)*2)/ ((avg(segments.transactionTime)+3)/2) FROM transactions</p> <p>SELECT (sum(responseTime)*2)/ (filter(sum(responseTime), where userExperience = "NORMAL") + 0.5) FROM transactions</p> <div style="border: 1px solid orange; padding: 5px; margin-top: 10px;">  Each side of the expression must be enclosed in parenthesis.         </div>

You must have **Manage Metrics** permission and View access to Analytics to create metrics from analytics searches. See [Analytics and Data Security](#) and [Transaction Analytics Permissions](#).

### Create an Analytics Metric

1. Working in the **Analytics > Search** editor, set the search criteria to select the appropriate data.
2. Click **Actions > Create Metric** in the search action toolbar.

### 3. In the pop-up window, give your metric a name and a description.

The name determines how the metric appears in the Metrics panel and the Metric Browser. Keep in mind:

- Metrics are truncated to whole values. So values less than one are truncated to zero. To work around this, you can multiply a `numeric_field_name` by a factor of 10, 100, 1000, and so on, depending on the level of decimal accuracy you need. We recommend that you add this factor into the metric display name so other users can understand what the metric represents, for example, Display Name = Metric (Factor 1000). In cases where the value is a percentage, and you convert by multiplying by 100, you probably don't need to put the factor in the metric name because it would be implicit (Metric %).
- Math operations are only supported inside the aggregation function. For example, `count(numeric_field_name * 10) from transactions`.

## Metric Timestamps

Timestamp metrics always aggregate events from the current minute because metrics are created for events published in the last minute.

If you have specified a value for the `eventTimestamp` field, the timestamp value in the new metric uses an aggregation of events from the `pickupTimestamp` field.

For example, you set an `eventTimestamp` for an event on a previous day. You then create a metric for the event today. The metric does not use your explicit `eventTimestamp` because it is no longer from the current minute. The metric aggregates events using `pickupTimestamp`. This ensures that the metric timestamp is based on the current minute because `pickupTimestamp` cannot be explicitly changed.

See [Analytics Events API](#).

## Correlate Metrics from Multiple Events

When you create a query, AppDynamics produces a holistic metric. Because the queried data comes from different events, the Events Service has to retrieve this segmented data and stitch it together to produce a single metric. The Events Service waits for correlated events to arrive, where the maximum wait time depends on the event type:

- Mobile and Browser Session Events - two minutes.
- Transaction Events - ten seconds.

The wait time resets when the Events Service finds a correlated event.

If an event arrives after the maximum wait time, the event is not stitched together correctly in your query. For example in the following query `fieldA` and `fieldB` are separate but correlated events:

```
select count(*) from transactions where fieldA = "foo" and fieldB = "bar"
```

The Events Service finds `fieldA` and waits 10 seconds for a correlated event. If `fieldB` arrives 15 seconds after `fieldA`, the Events Services does not correlate both events. The count metric is now inaccurate because the events are not connected.

## Monitor Analytics Metrics

For performance reasons, the scheduled queries used in analytics metrics can be disabled as follows:

- Queries are disabled if calling the Events Service results in any errors for ten consecutive times.
- Queries are not disabled if the Events Service is not reachable from the controller, such as during maintenance and upgrade windows.

- When the Controller is restarted, the queries which were previously disabled by the system due to consecutive failures are re-enabled.
- User-disabled queries remain disabled even after the system is restarted.

To monitor the metric:

1. Click **Metrics** in the left navigation bar.
2. Search, edit, enable, disable, or delete metrics from the **Metrics list**.

 You can edit only the description of the selected metric.

3. To activate or deactivate metrics in a batch, select the corresponding rows in the grid and click the **Enable** or **Disable** button in the toolbar. Use Shift+ click or Command + click rows to select multiple rows.

 If you see a status that says "Disabled due to repetitive failures", you can re-enable it by clicking **Enable**.

4. To see the metric in the Metric Browser, click the **Metric Browser**. For more details, see the section [Metric Data Point Details](#).

 If the metric aggregation times out, your applications may not display the analytics metrics. As an administrator, you can specify the applications for which you want the Controller to retry metric aggregation.

1. Log in to the Administrator console.

```
http:<controller-hostname>:<controller-port>/controller/admin.jsp
```

2. In **Controller Settings**, search for the `appdynamics.controller.apps.metric.refill.enabled.list` flag.
3. Add the EUM App Keys of the applications in the comma-separated format.

If the metric aggregation times out, the Controller retries the metric aggregation only on the applications that are specified in this Controller Configuration flag.

## Business Journeys

### Deployment Support

### Related pages:

- [Configure Business Journeys](#)

- [View Business Journeys](#)
- [Create Example Business Journeys](#)

This page provides an overview of business journeys in AppDynamics.

Many industries have complex workflows and user journeys that span multiple transactions and event types, such as logs and End User Monitoring (EUM) data. These workflows typically manifest over long periods and cannot be measured using transactions alone. Business Journeys are a way to monitor and correlate the linear data flow across multiple event sources and track the total time for defined business workflows.

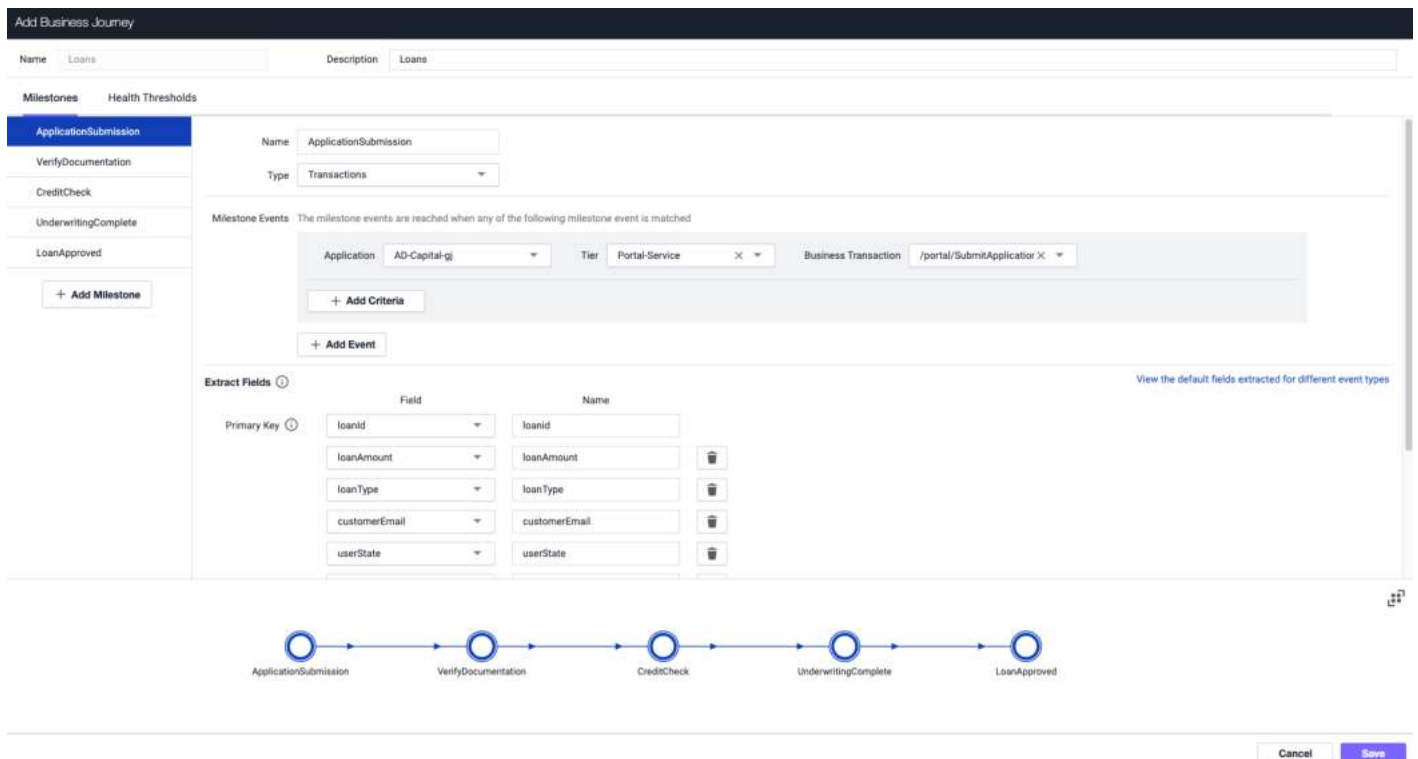

Typical multi-step workflows from different industries include:

- Payment transfers, credit card approval, and loan approval in financial services industries
- Cellphone activation and data recharge (pre-paid) in the Telco sector
- Insurance application through policy approval and insurance claims approval for insurance companies

## About Business Journeys

 You will need at least one unit of the [Transaction Analytics license](#) for Business Journeys, even if none of the milestones use any of the Transaction Analytics fields.

Business Journeys track linear processes. Branching, repetition, and loops are not allowed. The following image depicts an example Business Journey definition.

The screenshot shows the 'Add Business Journey' configuration page. At the top, there are input fields for 'Name' (Loans) and 'Description' (Loans). Below this, there are tabs for 'Milestones' and 'Health Thresholds'. The 'Milestones' tab is active, showing a list of milestones: ApplicationSubmission, VerifyDocumentation, CreditCheck, UnderwritingComplete, and LoanApproved. The 'ApplicationSubmission' milestone is selected, and its configuration is shown in the main area. It includes a 'Name' field (ApplicationSubmission), a 'Type' dropdown (Transactions), and a 'Milestone Events' section. The 'Milestone Events' section contains a table with columns for 'Application', 'Tier', and 'Business Transaction'. Below this, there are '+ Add Criteria' and '+ Add Event' buttons. The 'Extract Fields' section shows a table with columns for 'Field' and 'Name', and a 'Primary Key' dropdown. The 'Primary Key' is set to 'loanid'. Below the table, there is a flow diagram showing the sequence of milestones: ApplicationSubmission -> VerifyDocumentation -> CreditCheck -> UnderwritingComplete -> LoanApproved. At the bottom right, there are 'Cancel' and 'Save' buttons.

You create a Business Journey, as shown above, by defining the following:

- [Milestones](#) and the events comprising the milestones. Milestones are the steps in your business workflow.
- [Fields](#) to be captured from each milestone event. A field indicates a category of information pertaining to the event.
- The primary key field that uniquely ties the events together. A primary key correlates the milestones for your Business Journey. The primary key value must be present in each milestone event.

- Additional fields that allow you to segment on different dimensions of the business workflow, such as loan types or payment amounts.
- [Health thresholds](#) for monitoring the Business Journey performance.

Application Analytics starts collecting the Business Journey events after you have defined and enabled a Business Journey. Analytics does not go back in time to collect Business Journey composite events. To define specific Business Journeys, you may need to configure the collection of additional fields from your source analytics events. See [Data Prerequisites for Defining Business Journeys](#) for more information.

Once the Business Journey events are being collected, you can view them from the Analytics Search UI in the same manner as other Analytics events. Because Business Journey events are, by their nature, potentially long-running processes, useful data might take some time to appear in the Analytics events list. Business Journey events are reported even when only one milestone is completed and the event is updated over time as subsequent events complete.

If you are already familiar with the fundamental concepts in Business Journeys clearly, proceed to either [Configure Business Journeys](#) or [View Business Journeys](#) as desired.

### Business Journeys Milestones

A milestone is an event marking a significant stage in a business workflow. For example, in a loan application, the first milestone might be a user submitting a loan application. The second milestone might be document verification, followed by credit approval, insurance underwriting, and finally, loan approval. All milestones are mandatory; do not duplicate milestones.

The events in milestones are sequential. You need to create each milestone in the order that the event occurs. For example, in a loan Business Journey, a credit approval milestone cannot precede the loan application milestone.

In each Business Journey milestone, you can add filters to specify the events that constitute a milestone and add fields to capture additional information about the workflow. You can use these events and fields to run ADQL queries and narrow down your searches.

As you create milestones, a flow map detailing the business workflow is automatically displayed in the Business Journey page. For more information, see [Enable Flow Map](#).

### Business Journeys Health Thresholds

A threshold is a boundary of acceptable or normal performance. Business Journey authoring provides default health thresholds against which it compares the performance of the business workflow. The health thresholds are based on the total time to complete all the milestones in your Business Journey. The threshold values are calculated by determining the standard deviation from the simple moving average over an interval of time. The default time interval is two hours. This means that if the average end-to-end time for

the last two hours is N milliseconds, and if the Business Journey takes time equal to the standard deviation over N milliseconds (ms), it violates the threshold.

Milestones
Health Thresholds

Health thresholds based on the total time to complete all the milestones

	Slow	3	Standard Deviations for the last	2	Hours ▾
	Very Slow	4	Standard Deviations for the last	2	Hours ▾
	Stall	300	Standard Deviations for the last 2 hours		

Consider a simple moving average that is 1500 ms with a standard deviation of 100 ms. If you set the threshold to three, it means that the threshold is three times the standard deviation. In other words, a transaction that takes more than  $1500 + (3 \times 100)$  or 1800 ms violates the health threshold.

Before configuring the health threshold for a Business Journey definition, consider the following:

- A user experience (normal, slow, very slow, stall) is assigned for the Business Journey event when a value for `totalTime` is present and is greater than zero. Total time for the event could end up less than zero if the milestones are defined in an incorrect order. This can also happen even after the order is correctly defined, but the milestones are not in time order such that an early milestone has a future date compared to a later milestone.
- The total time for the Business Journey is calculated when both the first and the last milestones events have been reached. Therefore, the user experience cannot be determined and displayed until total time for the Business Journey is available.
- When a milestone encounters an error, for example, a transaction event where the `requestExperience` is Error, the user experience for the entire Business Journey event is marked as an Error. In this case, the total time is not available.
- Typically when a milestone has an error, the entire Business Journey workflow does not complete. However, if for some reason, all the milestones complete even when milestone errors exist, the total time for the Business Journey is available. However, in this case, we will retain overall user experience as an error and not change to Normal, Slow, and so on.
- After a Business Journey is initially enabled, Business Journey events are generated. The standard deviation is calculated every five minutes, so the first few Business Journey events will not have a user experience assigned to them.
- The minimum duration over which standard deviation is calculated is 30 minutes.

## Filters and Fields

Filters allow you to extract event data for a select milestone based on selected criteria. For example, loan applications submitted in California. Filters define the scope of a milestone by limiting associated events. Fields extract additional relevant information from each milestone.

The mandatory filters are populated with the last 15 days of data. If no analytics data has been collected during the last 15 days, the drop-down menus for the mandatory fields will be empty. Besides the mandatory filters for each event type, Analytics allows you to optionally select additional filters by using the **Filter By** option. All the fields that are part of the filters and the additional filters that you optionally choose are automatically collected. You can use them to run ADQL queries later on.

**Add Business Journey**

Name: Loans Description: Loans

Milestones Health Thresholds

**ApplicationSubmission**

Name: ApplicationSubmission Type: Transactions

Milestone Events: The milestone events are reached when any of the following milestone event is matched

Application: AD-Capital-gj Tier: Portal-Service Business Transaction: /portal/SubmitApplicator

Extract Fields

Field	Name
loanId	loanId
loanAmount	loanAmount
loanType	loanType
customerEmail	customerEmail
userState	userState

ApplicationSubmission → VerifyDocumentation → CreditCheck → UnderwritingComplete → LoanApproved

A field indicates a category of information pertaining to the event. The **Extract Fields** section collects additional relevant information from each milestone. You can use data to query desired events and visualize matrices. The fields are categorized into mandatory and optional fields. The only mandatory field you must enter is the primary key. It is the unique identifier that ties milestones together.

In addition to the primary key, you can optionally add additional fields. These fields provide a context for your Business Journey definition. For example, loan amount, loan type, and customer name, customer id, and so on provide further details about a loan application. You can use these field values to slice and dice business transaction data later on. You must provide unique fields for each milestone. Validation fails if you create more than one milestone with the same set of fields or with the same set of mandatory and optional filters.

For each milestone, a field called `milestoneReached` is added to the associated event. The value is true if the milestone has been reached, otherwise it is null. You can use this field to query all events for which a milestone has been reached. You can also use `milestoneReached` to build a funnel widget that shows drop-offs for each milestone. The milestone name is appended to the field name as follows:

- `milestone1_name.milestoneReached`
- `milestone2_name.milestoneReached`

Likewise, the default fields and filters are also appended with and namespaced by milestone name.

At the Business Journey level, a field named `completed` tracks the status of the workflow using the boolean values. True represents a completed Business Journey, whereas False indicates that the journey is in progress or is incomplete. Use the Analytics Search UI or an ADQL query for the desired Business Journey with the query string `completed` to view the status of the associated events.

## Milestone Timestamps

The `totalTime` and `timeTaken` fields represent the time it takes to reach a milestone. Timestamp fields are empty when the Business Journey is partially complete. As each milestone completes and the event data is captured in the Business Journey event, the total time is updated. The total time is calculated by subtracting the timestamp for the first event from the timestamp for the final event.

Timestamps are not exact fields. AppDynamics cannot calculate the exact time of events in a milestone because the event may occur at any point in method. For example, in the loan Business Journey above, the Credit Approval milestone may come from a log event. Your system may trigger a log at any point in the credit approval process. However, the start time of the Business Journey milestone can only be detected when the log event reaches AppDynamics. You may notice a slight difference in actual time due to this behavior.

## Business Journey and Milestone Metrics

The table below lists the metrics that are calculated out of the box for Business Journeys and milestones, which are the only metrics supported by Business Journeys. You cannot use metric queries created from an ADQL search for Business Journeys.

	Metric	Description
<b>Milestones</b>	Average time taken	Average of time taken to reach the current milestone from the previous milestone. Not applicable for the first milestone.
	Calls per minute	Total number of Business Journeys that reached the milestone in the last one minute and started in the last 24 hours.
<b>Business Journeys</b>	Average total time	Average of time to reach to completion for all Business Journeys that started in last one day and completed in the last one minute. Calculated taking the average value of <code>totalTime</code> field stored in all Business Journey events.
	Calls per minute	Total number of Business Journeys that started in the last one minute. A Business Journey starts when AppDynamics detects the first milestone.

## Mandatory Fields

Mandatory filters, mandatory fields, and fields extracted by default depend on the event type as shown in the following table.

Event Type	Mandatory Filters	Mandatory Fields	Fields extracted by Default
Transactions	Application Name Business Transaction Name Tier Name	Primary Key	eventTimestamp requestGuid requestExperience
Logs	Source Type	Primary Key	eventTimestamp logLevel logType
Browser RUM	AppKey Page Name Page Type	Primary Key	eventTimestamp cguid pageexperience
Mobile RUM	AppKey Network Request Name	Primary Key	eventTimestamp cguid networkrequestexperience
Custom Events	N/A	Primary Key	eventTimestamp

For custom events, you must include a date in the `eventTimestamp` field for the Business Journey to register the event. See [Analytics Events API](#) for more information.

## Configure Business Journeys

### Related pages:

- [View Business Journeys](#)
- [Create Example Business Journeys](#)

This page describes how to configure Business Journeys.

### Before You Begin

Before creating Business Journeys, ensure that the feature is enabled in your environment. You also should review data prerequisites, validation rules, and limitations for names and Business Journey definitions.

### Enable Business Journeys

By default, Business Journeys is enabled on SaaS environments. However, the feature is disabled for on-premises installations. To enable Business Journeys, an Administrator needs to configure certain properties in **Settings**.

Before starting the Event Service:

1. Open the `events-service-api-store.properties` file.

2. Change `ad.bizoutcome.enabled=false` to `true`.

The page displays a flow map detailing the business workflow across milestones. You can hide the flow map by changing the value of the `analytics.business.outcomes.flowmap.enabled` property to `false` in **Settings**.

### Enable Flow Maps

As you create milestones, a flow map detailing the business workflow displays on the page. Selecting a Business Journey prompts a new window with the enabled flow map. This behavior is controlled by the `analytics.business.outcomes.flowmap.enabled` property in **Settings**. Setting its value to `true` indicates that flow maps are enabled for Business Journeys.

### Data Prerequisites for Defining Business Journeys

Analytics creates Business Journey composite events by collecting events and fields that you have already captured as analytics data. In addition to built-in analytics data sources, custom event data can also be used to create Business Journeys. As you define the milestones in the Business Journey, you specify which events to use and which fields to extract from the events. You can extract fields collected by default or custom fields that you have configured for collection. You can also add milestones with custom events created from Analytics API Keys.

You need to know the starting event, ending event, and clearly-defined steps in between. To collect additional fields in the events being captured by Analytics, see:

- [Analytics Custom Events Data](#)
- [Data Collectors](#)
- [Collect Business Data From SQL Calls](#)
- [Configure Log Analytics Using Source Rules](#)

### Restrictions and Caveats

- Business Journey names are case-insensitive and are stored as all lowercase. This means that two definitions named `application` and `Application` are considered a duplicate.
- The **Event Type** drop-down displays the lowercase definition name.
- Use the lowercase name for advanced queries.
- The primary key must be unique and not null. If the primary key holds null values, the underlying milestone events will not be stitched together to form a Business Journey event.
- Choose the primary key carefully; in particular, the cardinality of the values. The primary key is expected to uniquely identify and join milestone events together to form a meaningful business workflow. If the milestone events are misidentified by the primary key, inaccurate milestone events will join and produce faulty results.
- The primary key name cannot be changed unless the Business Journey definition is in the draft state.
- The Business Journey definition name cannot be changed after the definition is deployed. You can rename it while the definition is in the draft state.
- If a field related to a custom event is renamed, update the Business Journey definition created from the custom event for the renamed field to be correctly extracted.

### Validation Rules

This section describes certain rules to validate Business Journey definition and naming convention for Business Journeys, milestones and extracted fields. You can save your work as a draft without invoking validation. When you are ready, you can use **Validate and Save** to check that your definition is acceptable. Saving the Business Journey definition does not enable the Business Journey. Data is not captured until you actually enable the Business Journey. See [Business Journeys Life Cycle](#).

#### Validation Rules for Names

This section describes the validation rules for naming Business Journeys, milestones, and extracted fields. Validation rules are not applied when you save your Business Journey definition as a draft. Validation is only invoked when you use **Validate and Save**. The validation rules include the following:

- Names of Business Journeys, milestones, and extracted fields must have an alphanumeric string containing a-z, A-Z and 0-9. The only special character allowed is the underscore `_`.
- Special characters such as spaces, hyphens, dashes are not allowed in the names.
- Primary Key fields must have the same name (label) in all milestones in a Business Journey definition. The field name itself may vary in different event types.
- The primary key name cannot be changed unless the Business Journey definition is in the draft state. See [Business Journeys Life Cycle](#) for more information.
- The following reserved field names cannot be used to name milestones or fields in your Business Journey definition.
  - `pickupTimestamp`
  - `eventTimestamp`
  - `totalTime`
  - `userExperience`
- You cannot name milestones or field names with ADQL keywords. See [ADQL Queries](#).

## Validation Rules for Business Journey Definition

A Business Journey definition must contain:

- A minimum of two milestones.
- A unique set of filters. More than one milestone with the exact same set of required and optional filters is not allowed in the same definition.
- Unique milestone names.
- Extracted field names must be unique (except the Primary Key field).
- There must be one Primary Key field per milestone.
- Slow threshold duration must be greater than 30 minutes.

## Create a Business Journeys Definition

1. In the Controller UI, navigate to **Analytics > Business Journeys**. A list of existing Business Journeys (if any) displays.
2. To define milestones, click **+ Add Milestone**.
3. Type a name.
4. From the **Type** dropdown, select the [source of the analytics data](#), such as Transactions, Logs, Browser Requests, and Mobile Requests.
5. The **Milestone Events** section displays mandatory filters based on your selected data source. The fields vary based on your data source type.

For Transactions, specify the [Application](#), [Tier](#), and [Business Transaction](#) for each milestone you intend to create. For Analytics, the tier represents a Java Virtual Machine (JVM) service, such as an authentication service, in your application environment. Business Transaction is the cross-tier processing path representing the request for a service provided by the application.

6. You can optionally click **+ Add Criteria** to add additional filters based on your data source type.
7. You can define multiple milestone events of the same event type. Click **+ Add Event** to create another milestone event.
8. In the **Extract Fields** section, define your primary key field and name to specify which fields will be captured from the milestone event. You can click **Auto Fit** to auto-organize the milestone events or organize the events freely.

Once you name the primary key, you can not change the name unless the definition is in the draft state. See [Business Journey Life Cycle](#).

The primary key field is not populated for subsequent milestones because the primary key might have different field names in the event type for different milestones.

**i** Fields that are extracted by default in Business Journeys are not shown.

9. You can save the Business Journey with either:
  - **Save As Draft:** saves the definition in draft form. No validation is performed and you can return to the definition to complete it at a later time.
  - **Validate and Save:** Performs necessary validation. Use this option when you have completed all milestones. The definition is saved, but is not enabled.
10. In the **Health Thresholds** tab, you can specify the values that determine acceptable performance. See [Business Journeys Health Thresholds](#) to learn how the user experience value is calculated. When you finish creating the Business Journey definition, you are ready to enable it.
11. Select the Business Journey from the list and click **Enable**. The option is greyed out until you select a valid draft Business Journey from the list. To enable a Business Journey, the state must be "Valid Draft".

Name	Description	State
insurance		User Disabled
LoanApplication		Enabled
insurance_processing		Draft
sim_card_activation		Valid Draft

### Business Journeys Life Cycle

This section provides information about the Business Journeys life cycle.

#### Draft

You might not have all the required details at the beginning and therefore, creating the definition may involve multiple temporary versions. Use **Save As Draft** to capture your initial, incomplete definition and place your Business Journey into a Draft state.

- No analytics data is processed and no Business Journey events are created in draft state, so there is nothing to query.
- The primary key can be changed when the Business Journey is in draft state.
- The draft state is less restrictive with respect to validations and supports most update operations.

#### Valid Draft

Once the definition has the required details, use **Validate and Save**, which transitions the definition into the Valid Draft state. You can still modify the definition in this state. Business Journey events are not captured until you enable the definition.

#### Enabled

When you are ready to process data, use the **Enable** action. This transitions the definition to the Enabled state. Most definitions will spend their lifetime in the Enabled state.

- Configuration changes are synced to the Analytics Servers every two minutes. Therefore, once you enable a Business Journey definition, there could be a delay of up to two minutes for events to be generated.
- Incoming events are processed, composite Business Journey events are created and stored. You can query for the Business Journey events.
- You can modify the definition in the following ways:
  - Add, rename, or delete fields for extraction (non-default fields)
  - Add, rename, or delete milestones

## User Disabled

At some point, you may want to disable the Business Journey. The **Disable** action transitions the Business Journey definition to the User Disabled state. In this state, no incoming events are processed. Existing events can still be queried.

You can update the definition in the following ways:

- Add, rename or delete fields for extraction (non-default fields)
- Add, rename or delete milestones

## Deleted

When you no longer need the Business Journey definition, use the **Delete** action. This is the final phase of the definition's lifecycle. In this state, no incoming events are processed for it. Existing Business Journey events are not available to query.

## View Business Journeys

### Related pages:

- [Search Analytics Data](#)
- [ADQL Reference](#)

View Business Journey events from the Analytics Search UI in the same way as any other event type. Alternatively, use the **Analytics Search** button on the Business Journey UI.

## Search for Business Journeys

Use the **Analytics Search** button in the Business Journeys UI for one-click access to the underlying events. Selecting an enabled Business Journey and clicking **Analytics Search** takes you directly to the Searches page in Basic mode. **Analytics Search** button is unavailable for definitions in Draft and Valid Draft states.

 Business Journey events will be available after a slight delay in business journey UI and in ADQL search.

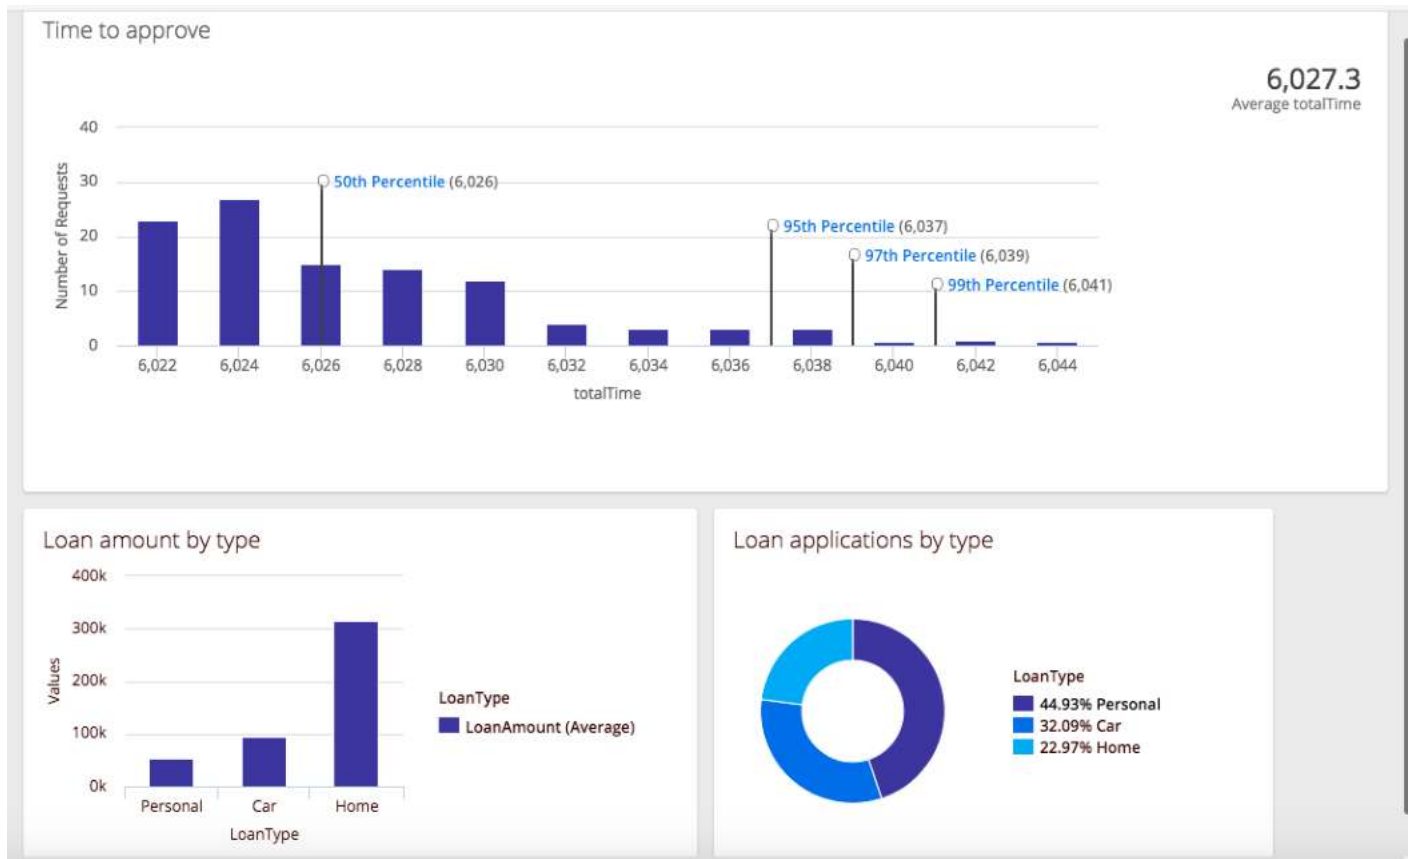

Name	Description	State	Created By	Created At
AdCapitalEvents	ADCapital Loans	Enabled	ec2-user	02/22/18 10:50:57 AM
ADFinanceEvents	AD Trader app	Enabled	ec2-user	02/22/18 10:32:12 AM
loanapprovals	Loan Approval Workflow	Enabled	ec2-user	02/26/18 12:30:16 PM

Alternatively, access the Analytics Search UI and use the event type dropdown to find your Business Journey event. The Business Journey name identifies the event type in the Search UI similar to custom events. In this example, it is "loanapprovals".

Timestamp	User Experience	Application	Business Transaction	Response Time (ms)	Tier	Node
03/21/18 12:24:00 PM	⚪ null	AD-Financial	null	null	WebFrontEnd	WebFrontEndNode-0
03/21/18 12:23:56 PM	🟢 NORMAL	AD-Financial	Account Home	1,316	WebFrontEnd	WebFrontEndNode-0
03/21/18 12:23:56 PM	🟢 NORMAL	AD-Capital	/processor/Underwrite	13	LoanProcessor-Services	AD-Capital_PROCESS...
03/21/18 12:23:54 PM	🟢 NORMAL	AD-Financial	Loans - Underwriting ...	815	WebFrontEnd	WebFrontEndNode-1
03/21/18 12:23:54 PM	🟢 NORMAL	AD-Financial	Loans - Approval Com...	1,741	WebFrontEnd	WebFrontEndNode-0
03/21/18 12:23:54 PM	🟢 NORMAL	AD-Financial	Loans - Credit Check	1,666	WireServices	WireServicesNode

03/21/18 12:23:54 PM	🟢 NORMAL	AD-Financial	Process Trade	702	WebFrontEnd	WebFrontEndNode-2
03/21/18 12:23:53 PM	🟢 NORMAL	AD-Capital	/processor/CreditCheck	6	LoanProcessor-Services	AD-Capital_PROCESS...
03/21/18 12:23:53 PM	🟢 NORMAL	AD-Financial	Research Stock	745	WebFrontEnd	WebFrontEndNode-1

You can search the Business Journey data and create visualizations in the same fashion as for any other analytics event type.

Business Journeys also gives you the ability to perform analytics, slice and dice data, and create widgets. For example, using the loan approval Business Journey, visualize percentile values of approval time, loan amount by type, and loan applications by type as follows:

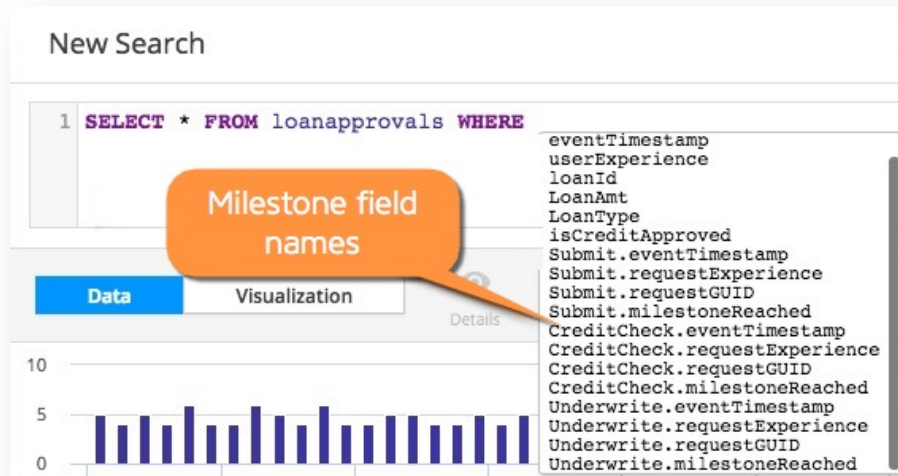

The 50th Percentile line indicates that 50% of the loan approvals occurred below this line. Similarly, each percentile line represents the corresponding percentage of loans approved below that line.

### Business Journeys ADQL Queries

To use ADQL to query Business Journey events, you need to use the full namespaced field name for each milestone. The field names are constructed by appending the milestone name to the field. When constructing queries with ADQL in the Search UI, you must use the full name of the field. The following image shows constructing a sample ADQL query.

**i** Business Journey events will be available after a slight delay in business journey UI and in ADQL search.

A sample ADQL query for the loanapproval Business Journey is:

The screenshot shows the 'New Search' interface with a sample ADQL query: `1 SELECT * FROM loanapprovals WHERE CreditCheck.milestoneReached = true AND LoanType = "Personal"`. The interface includes a search bar, a 'Search' button, and a 'Basic' mode indicator. Below the query, there are tabs for 'Data', 'Visualization', 'Details', 'Save', and 'Actions'. The 'Data' tab is selected, showing a bar chart with a y-axis from 0 to 2. Below the chart is a table of results with columns: User Experience, Total Time (ms), loanId, LoanAmt, LoanType, CreditCheck.milestoneReached, and isCreditApproved. The table contains 10 rows of data. On the left side, there is a 'Fields' panel with a search bar and a list of relevant fields: Submit (4), CreditCheck (4), Timestamp, milestoneReached, Request Experience, and requestGUID. The 'Submit' and 'CreditCheck' sections have checkboxes for each field, with 'milestoneReached' checked under 'CreditCheck'.

User Experience	Total Time (ms)	loanId	LoanAmt	LoanType	CreditCheck.milestoneReached	isCreditApproved
AM	6,013	b7f99ba8-3539-43...	62,000	Personal	true	true
AM	6,013	bc7faa5b-e94a-40b...	96,000	Personal	true	true
AM	6,016	247cc4d7-df0d-489...	60,000	Personal	true	true
AM	6,035	ce382ecb-1276-46...	39,000	Personal	true	true
AM	6,030	bc75725d-5c74-45...	97,000	Personal	true	true
AM	6,031	f2d9892d-e283-41...	62,000	Personal	true	true
AM	6,011	da275c13-322c-46...	4,000	Personal	true	true
AM	6,017	ff6ad081-a0db-42c...	67,000	Personal	true	true
AM	6,012	864894a2-d0a2-42...	43,000	Personal	true	true
AM	6,017	c43c36b9-998c-48e...	58,000	Personal	true	true

## Business Journeys Metrics

Analytics generates out-of-the-box metrics at the Business Journey definition and milestone levels. You can view these metrics in the [Metric Browser](#). The metric values are reported per minute. For example, an observed value of 5 indicates that it's the count of the records received in the one-minute interval. If the number of records reported in the last five minute is 25, the Metric Browser reflects an approximate

observed value, that is 5. To calculate metrics, Analytics adds two fields named `timeTaken` and `totalTime`.

The `timeTaken` field is added to the associated event for each milestone. This field represents the time taken for an event to reach a milestone from the previous milestone, and therefore, the first milestone will not have this value.

The `totalTime` field is added to the associated event for each Business Journey definition. `totalTime` represents the time for an event to cover all the milestones comprising the Business Journey. It is the time an event takes to reach the last milestone from the first one. If the first or the last milestone is missing, `totalTime` is not calculated for that event. For example, if the loan application is rejected in the CreditCheck stage, the workflow never reaches the approval stage. In this case, `totalTime` is not determined.

By using the above-mentioned fields, the following out-of-the-box metrics are generated.

### Milestone Level

**Average timeTaken:** Average of the values measured for the `timeTaken` field. Evaluates the events that started in the last one day and reached the milestone in the last one minute.

**Calls per minute:** Number of events that started within the last one day and reached the selected milestone in the last one minute.

### Definition level

**Average totalTime:** Average of the values measured for the `totalTime` field. Evaluates the events that started in the last one day and reached the first milestone in the last one minute.

**Calls per minute:** Number of Business Journey events measured per minute. This number is equal to the calls per minute value of the first milestone. The value is calculated by evaluating the events that started in the last one day and reached the first milestone in the last one minute.

**i** The lookback period to generate out-of-the-box metrics is one day. The values for the metrics might not be accurate if events take more than a day to complete or to even reach the next milestone. This is due to the lack of sufficient event records for Analytics to generate correct values, leading to displaying incorrect values. For example, the average `totalTime` metrics will only be accurate if events finish within the lookback period, that is one day.

Note that the existing definitions will not have the out-of-the-box metrics created. You need to create new definitions to generate corresponding out-of-the-box metrics.

### Business Journeys Dashboard

Analytics provides two Views for Business Journeys: Card View and Grid View. Business Journeys page defaults to the Grid View, but after switching to the Card View the UI makes it as the preference. The next time you log in, Business Journeys page defaults to the Card View. Use the **View** button on the toolbar to switch between the Views.

## Business Journeys

Name	Description	State	Created By	Created At	Last Modified By	Last Modified At
AdCapitalEvents	ADCapital Loans	Enabled	ec2-user	02/22/18 10:50:57 AM	ec2-user	02/22/18 10:51:01 AM
ADFinanceEvents	AD Trader app	Enabled	ec2-user	02/22/18 10:32:12 AM	ec2-user	02/22/18 10:48:16 AM
Loan Approval	Loan Approval Workflow	Draft	ec2-user	02/26/18 12:30:16 PM	ec2-user	02/26/18 12:30:16 PM

The Card View displays an out-of-the-box dashboard for each Business Journey definition along with key metrics. The dashboard highlights the milestones associated with each Business Journey definitions and these metrics:

**i** Dashboards for Business Journeys created prior to the release of Analytics 4.5 do not display the *Average time to reach the next milestone* metric. To workaround, edit the **Extract Field** section of one of the milestones and add the new field or remove an existing field. After the definition is saved Analytics starts generating the missing values. Within a few minutes, you should see values for *Average time to reach the next milestone* for the Business Journey you edited.

Time range menu determines what events are considered for calculating metrics. The events that are considered for calculating metrics are only those started in the selected time range.

- **End-to-End:** The average end-to-end time an event takes to complete the corresponding Business Journey. It is the average time taken by an event to reach the last milestone from the first one.
- **Conversion:** The conversion rate represents the percentage of events that reached the last milestone from the first one. It is calculated as  $(\text{events reached the last milestone}) * 100 / (\text{events reached the first milestone})$ .
- **Average time to reach the next milestone:** It is the average time an event takes to reach the next milestone from the current one. This value is represented by the number shown in between each milestone.
- **Event count per milestone:** It is the number of events that reached a particular milestone. This value is indicated by the number shown inside the circles representing each milestone.

## Create Example Business Journeys

### Related pages:

- [Configure Business Journeys](#)
- [View Business Journeys](#)

This page describes a loan application process, **AD-Capital**, to demonstrate the milestone workflow. Similar to a typical loan application process, the workflow in this Business Journey starts with application submission, followed by document verification, credit check, underwriting, and loan approval.

### Milestones Data

The data for each milestone comes from different applications and event types, such as business transactions, logs, and end-user events.

In this workflow, the data associated with application submission comes from business transaction events while the document verification status comes from logs. Third-party service providers perform the credit check and underwriting. Then, the status is updated in logs and the loan approval status is updated in the transaction events.

### Extract Fields: Primary Key and Additional Fields

Choose a distinct primary key that uniquely identifies and ties together these independent milestones to represent loan application. In this example, `loanId` is used as the primary key. Enter `loanId` in the **Primary Key** field in each milestone. You must use the same data type as the primary key for all milestones in any given business journey.

In addition to the default information collected by the Business Journey, such as event timestamp, you can extract additional business information, such as customer details, loan amount, loan type, bank name, and so on with the optional fields. These additional fields provide further context for your Business Journey definition. You can also use these fields to run ADQL queries.

### Define Milestones

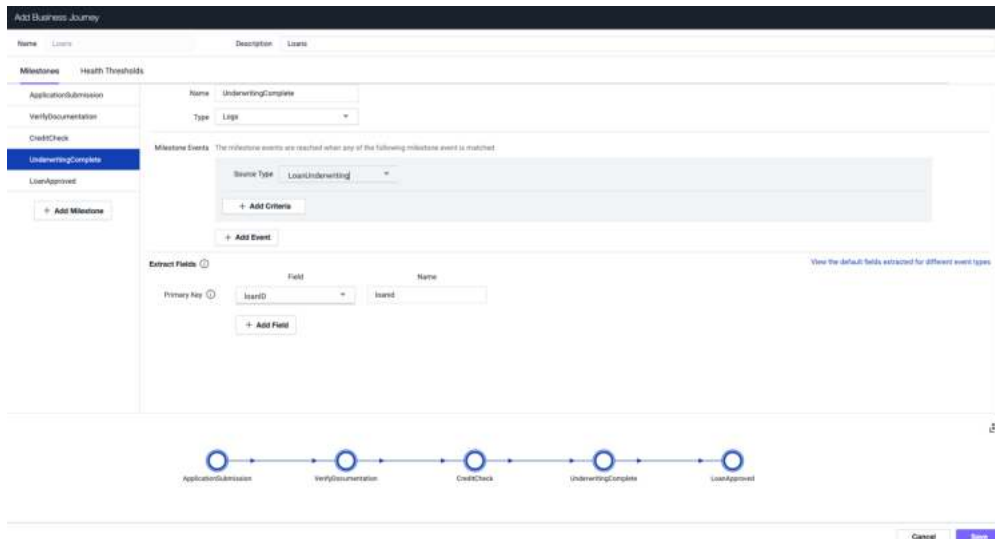

In the following example, you can define an application submission milestone by selecting an event type, primary key, and filters. The mandatory filters to limit the events for this milestones are **Type, Application, Tier, and Business Transaction**. The primary key is defined as `loanId`. Fields such as `loanAmount`, `loanType`, and `customerEmail`, are extracted in this milestone.

The screenshot displays the 'Add Business Journey' configuration page. On the left, a sidebar lists milestones: Application Submission (selected), Verify Documentation, Credit Check, Underwriting Complete, and Loan Approved. The main configuration area for 'Application Submission' shows:
 

- Name: ApplicationSubmission
- Type: Transactions
- Milestone Events: Application: AD-Capital, Tier: Portal Service, Business Transaction: portal/SubmitApplication
- Extract Fields: Primary Key is loanId. Additional fields include loanAmount, loanType, customerEmail, and userState.

 At the bottom, a process flow diagram shows five milestones in sequence: ApplicationSubmission, VerifyDocumentation, CreditCheck, UnderwritingComplete, and LoanApproved. Buttons for 'Cancel' and 'Save' are visible at the bottom right.

Similarly, the milestone for underwriting is defined with a different event type:

Since third-party service providers perform the underwriting, the status is updated in logs; **Logs** is considered the **Type** of event source. To define a milestone, click **+ Add Milestone**.

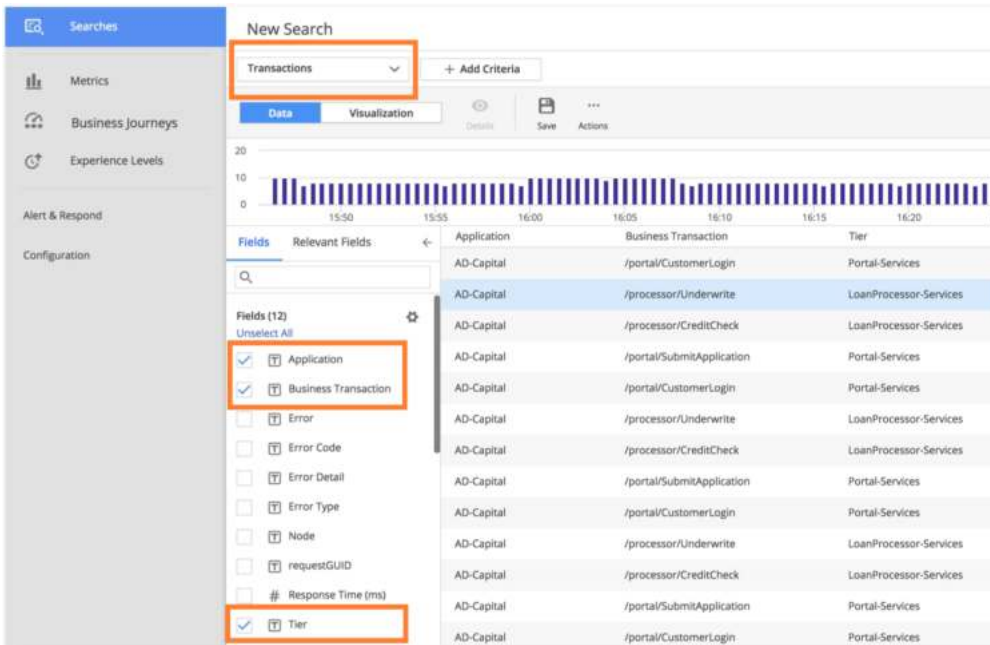

Occasionally the individual steps in a workflow, such as the application submission, can occur in different methods. You can differentiate these stages with unique filter conditions. For example, a user that submits an application through a browser performs the same action as a user that submits an application through mobile, but the filter conditions are uniquely defined. To track a milestone with several entry points, click **+ Add Event** and define your mandatory filters (application, tier, and business transaction), primary key, and optional filter conditions, including your custom fields.

You can only define the entry points for milestones if the entry points are of the same event type; if one entry point is in **Transaction** and the other is in **EUM**, you cannot track the entry points under the same milestone.

Define your remaining milestones, validate, and save the Business Journey. It takes a few minutes to display the generated records from the associated events.

### Troubleshoot the Business Journey

If you think that the combination of selected fields and filters for each milestone is incorrect, you can validate with an ADQL query search or use the Analytics **Searches** widget:

You can see the valid Tiers and associated Business Transactions for AD-Capital in **Searches**, which displays all the valid values for your selection.

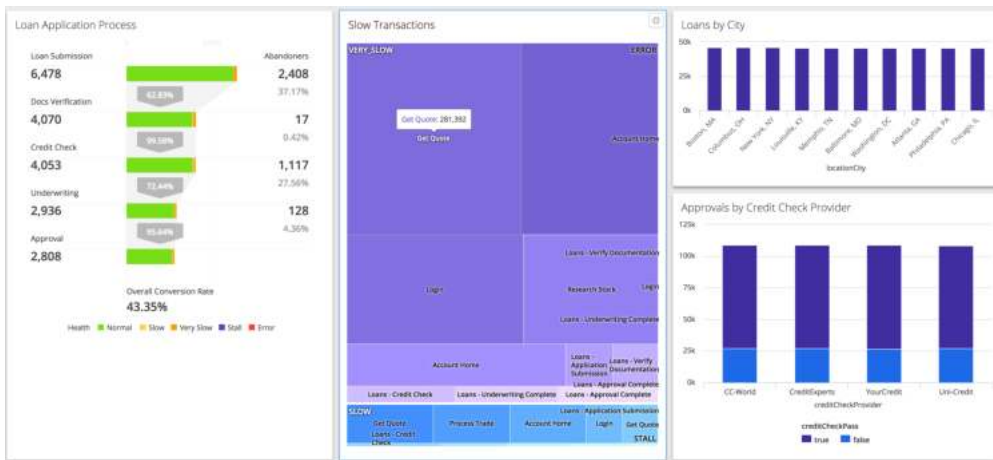

Alternatively, you can access **Tiers & Nodes** in the Controller for the AD-Capital application.

### Run Analytics on the Business Journey

Use one of the [search methods](#) from **Searches** to view data, run Analytics, or visualize the performance of the Business Journey you just created.

### View the Business Journey

You can view dashboards and widgets of the loan approval Business Journey in **Dashboards & Reports**. The visualization makes it easy to understand the performance of loan application workflow.

The funnel widget is located on the left side of the image. This widget represents the overall conversion rate, the health of participating events, and the number of abandoners at each critical step in the loan application process.

---

At the center of the dashboard, a widget illustrates slow business transactions at each step in the Business Journey.

The widget on the lower right side of the image compares credit check providers on the basis of credit approvals.

The widget on the upper right side displays the number of loans approved in different cities.

## Experience Level Management

### Related pages:

- [View and Export XLM Compliance Data](#)
- [Configure Experience Level Management](#)
- [Migrate XLM Configurations Between Environments](#)

The performance of business transactions and other types of events can affect user experience. Different levels of performance may correspond to service level agreements (SLAs), compliance targets, or compliance policies that your application must satisfy.

For example, an e-retailer might want to ensure that when customers add items to their carts, the transactions always complete within 100 milliseconds.

Experience Level Management (XLM) enables you to define experience levels. XLM shows you how your application is performing relative to those levels, in custom dashboards and in reports that you can view and export.

### Working with XLM

Whether you speak of an experience level or a service level depends on whether your focus is user experience or SLAs, but you configure both through the same XLM UI. What this section says about experience levels applies equally to service levels.

You can define experience levels for any kind of data that meets the following criteria:

1. The data must be numerical.
2. The data must be individual (per event) values, not aggregates.

Since data collectors provide individual values, they are a good basis for experience levels as long as the values are numeric. By contrast, metrics and information points cannot be used as the basis for experience levels, because they provide aggregate values.

The following are all good bases for defining experience levels:

- Sales in dollars per week during the time an ad campaign is running
- Application response times calculated from business transaction events
- End-user response times calculated from RUM and synthetic events
- Custom analytics such as login times for platinum customers or item checkout response times for London customers

Compliance against the configured thresholds is calculated in daily intervals from the specified start date. The local time zone starting time for each day is converted to midnight of the equivalent Greenwich Mean Time (GMT) date. For example, *07/30* means *12:00 am GMT on 07/30*. The reporting job that calculates the XLM data runs every day at midnight and noon GMT. The results are updated the next time the reporting job runs.

XLM aggregates the results of reporting jobs into weekly or monthly periods, according to your choice of **Compliance Period** settings, including **Time Zone**.

When viewing XLM data for a week or month, you can drill down into daily granularity. XLM also allows you to

- Create XLM reports in the time zone of your choice
- Export reports of however many reporting periods you choose, in CSV format
- Add your XLM report to a custom dashboard for periodic generation and delivery

You can export XLM configurations, and migrate them from one environment to another. You can also view and export the XLM Audit Trail, which automatically records XLM configurations and changes to them.

If you revise the configuration, the new configuration takes effect the next time the XLM reporting job runs. Past data is immutable and configuration changes do not affect the values.

To see which configuration was in effect at a particular moment in a reporting period, view the [XLM Audit Trail](#).

## Configuration Overview

In the XLM UI, you configure **Properties**, **Compliance Target Settings**, and optional **Exclusion Periods**.

- **Properties** specify what type of event to measure and what filters to apply.
- **Compliance Target Settings** specify the performance criteria you want XLM to report, through
  - the **Compliance Target**, which defines the desired level of performance for the properties
  - **Daily Target Thresholds** which define *Normal*, *Warning*, and *Critical* performance as percentages of the compliance target
  - **Treat Errors as Critical**, an option helpful for applications [where apparently normal performance thresholds tend to conceal errors](#)
- **Compliance Target Settings** also specify how you want your XLM reports structured in terms of time, through
  - the **Start Date**—the date you want the compliance calculation to begin
  - the **Compliance Period**, which
    - you can think of as the *reporting period*
    - can be weekly or monthly; choose one or the other according to your SLA requirements
  - the **Time Zone** of your choice
- **Exclusion Periods help you account for performance deviations caused by upgrades, maintenance, or usage patterns associated with weekends or holidays.**

Here is how our e-retailer example might look:

- The properties have *Transactions* as the event type, filtered to exclude all but an *Add to Cart* business transaction, for the relevant application
- The compliance target is *Response Time (ms)*, set to *100*
- Values for daily target thresholds are 95% to 100% for *Normal*, 90% to 95% for *Warning*, and 0% to 90% for *Critical*
- The compliance period is *Weekly*
- The time zone is *GMT+02:00* for Amsterdam, where our hypothetical e-retailer has customers

Configured this way, XLM reports that performance is *Normal* for each week-long reporting period when the Add to Cart business transaction completes within 100 milliseconds greater than 95% of the time.

For periods when Add to Cart performance meets the target 95% of the time or less, but above 90% of the time, performance is at *Warning* level.

For periods when performance meets the target 90% of the time or less, performance is *Critical*.

This example configuration is illustrated below.

Edit Experience Level Management Configuration

<input checked="" type="checkbox"/>	Critical	0 % - 90%		

Treat Errors as Critical ⓘ

Time Zone

---

**Exclusion Periods**

Exclude the following time periods when evaluating events against the Compliance Target.

## XLM Exclusion Periods

Exclusion periods are time periods which you want to exclude from an XLM report.

For example, scheduled upgrades and maintenance can disrupt performance, so you may not want those periods reflected in XLM reports. Likewise, you may want XLM reports to exclude weekends, holidays, or other times with atypical usage patterns.

XLM queries executed against your Analytics event data observe only the exclusion periods you explicitly configure in the XLM UI. You configure exclusion periods using the time zone of your choice. Under the hood, AppDynamics keeps track of the exclusion period in the corresponding GMT dates.

i XLM does not recognize exclusion and maintenance periods that you configure at the Controller level.

The screenshot shows a dialog box titled "Add Exclusion Period". It contains the following fields and options:

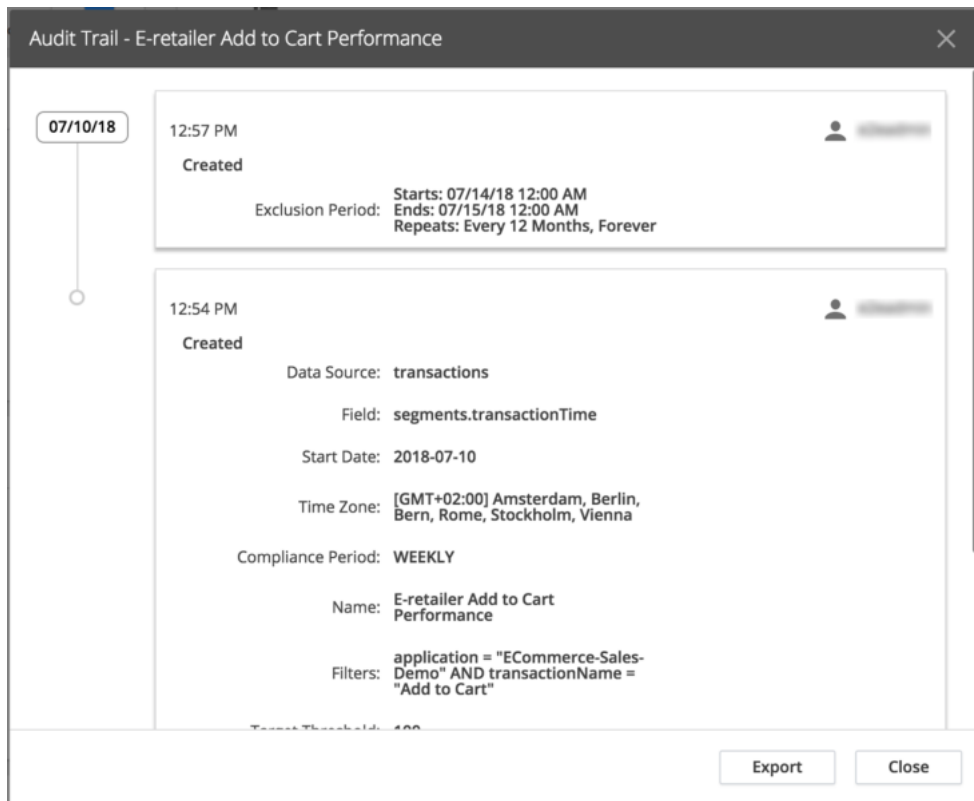

- Starts on:** 12/25/18 12:00 AM
- Ends on:** 01/02/19 12:00 AM
- Repeats:**  Repeats
- Recurrence:**
  - Every: 12 Months
  - Recur:  Forever
  - For: 1 Times
  - Until: 07/12/18
- Buttons:** Cancel, Save

## XLM Auditing

All changes to XLM configurations produce an immutable audit record called an XLM Audit Trail, which contains complete XLM configuration information. Since XLM audit reporting is separate from all other reporting in the AppDynamics Controller UI, the XLM Audit Trail is distinct from other available reports, such as the Controller Audit Report. You can export the XLM Audit Trail to a CSV file.

Each XLM configuration is limited to 1000 updates. If that limit is reached, the oldest audit records are dropped as new ones are added.

The XLM audit records contain information about what operations are performed and what fields are changed. The UI presents XLM audit records as a sequential timeline.

## Configure Experience Level Management

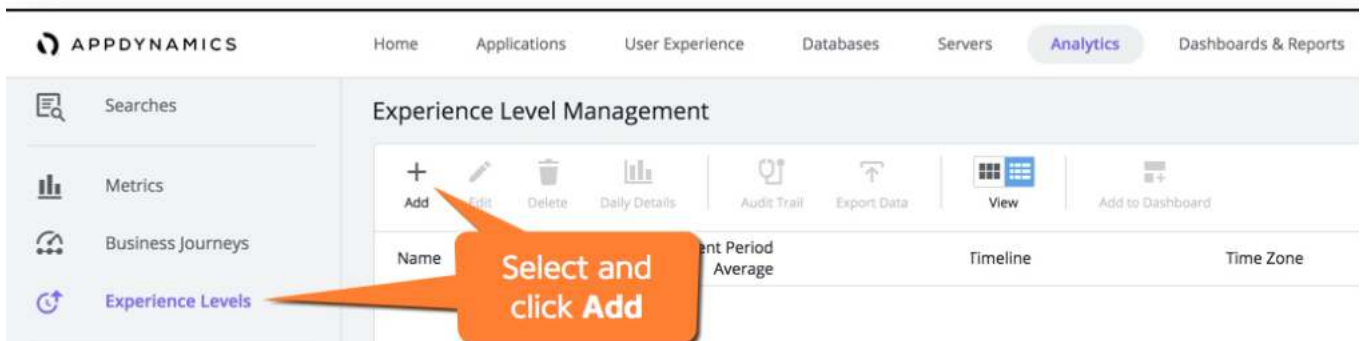

### Related pages:

- [View and Export XLM Compliance Data](#)
- [Migrate XLM Configurations Between Environments](#)

To configure Experience Level Management (XLM), you specify **Properties**, **Compliance Target Settings**, and optional **Exclusion Periods** as described on [Experience Level Management](#).

### Configure an XLM report

1. From the Controller UI, choose **Analytics > Experience Levels** and click **Add**.

2. In the **Properties** section, name your XLM report uniquely. Select the event type and any filters necessary for isolating the data that you want to evaluate.

Add Experience Level Management Configuration

### Properties

Name

Event Type

Filter By 
Application: ECommerce-Sales-Demo   
Business Transaction: Add to Cart

3. Select the desired field, target value, and daily target thresholds. Choose a time zone, report start date, and reporting period. Past dates are not allowed.

### Compliance Target Settings

Each event will be evaluated against the Compliance Target to determine the Daily Compliance.

Compliance Target

Start Date

Daily Target Thresholds  Normal  % - 100%  
 Warning  % - 95%  
 Critical  % - 90%

Treat Errors as Critical ⓘ

Compliance Period

Time Zone

4. (Optional) Select [Treat Errors as Critical Failures](#).
5. (Optional) Specify **Exclusion Periods** using the time period of your choice to denote periods during which data should be not collected.

Add Exclusion Period

Starts on

Ends on

Repeats

Every

Recur  Forever  
 For  Times  
 Until

- Save the configuration. Data is collected and compliance is calculated in an automatic job that runs twice per day.

### Treat Errors as Critical Failures

You can choose to treat events with errors as critical failures.

This enables you to identify instances where an event meets the compliance target but has a user experience status of Error.

For example, if you have defined Response Time of under 2000 milliseconds as the compliance target, an event with a response time of 100 milliseconds meets the compliance target, even if that event finished prematurely because of an error. In that case, XLM reporting that performance as Normal could be considered a false positive.

When you enable **Treat Errors as Critical Failures**, XLM will catch instances like this. Whether this option is optimal for your application is a subjective judgment for you to make.

**Treat Errors as Critical Failures** is only supported for event types that contain a user experience or similar field, as shown in the table below.

Event Type	Experience Field
Transaction Event	userExperience
Browser Record	pageexperience
Mobile Snapshot (Network Request)	networkrequestexperience
Browser Session	pageexperience
Mobile Session	networkrequest.networkrequestexperience

### View and Export XLM Compliance Data

#### Related pages:

- [Configure Experience Level Management](#)
- [Migrate XLM Configurations Between Environments](#)

In the AppDynamics Controller UI, click **Analytics > Experience Level Management** to view or export XLM data.

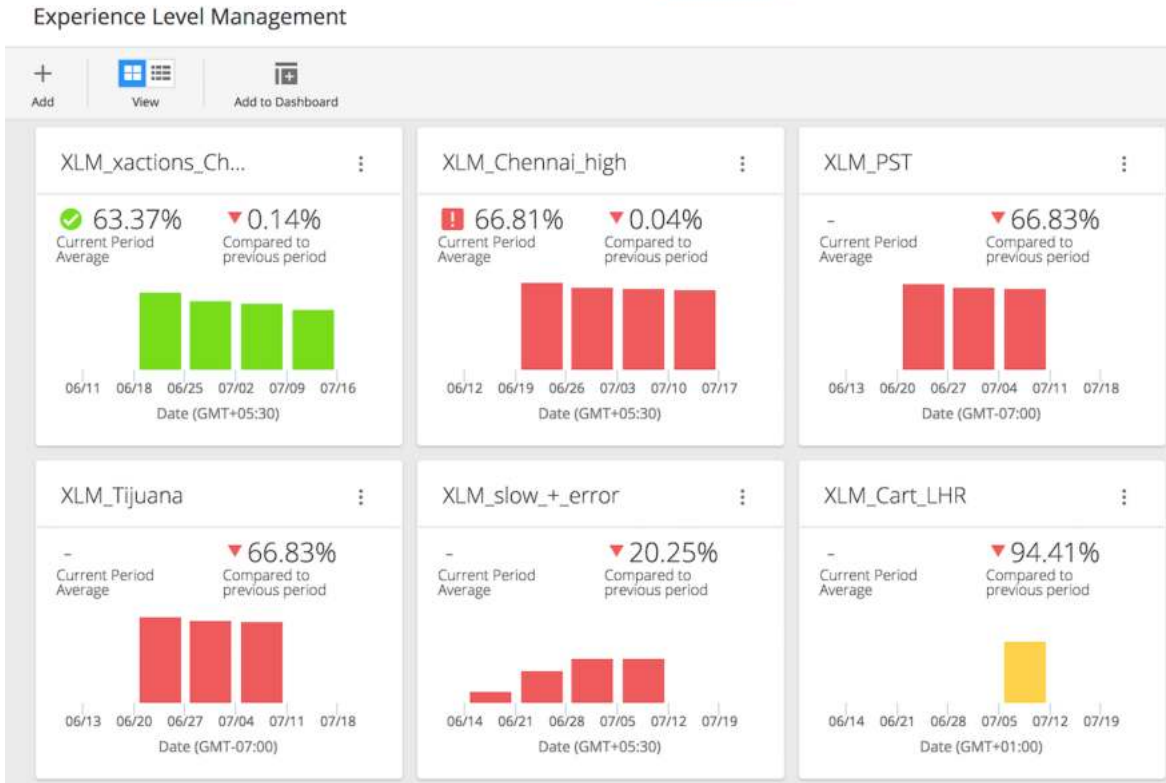

#### View XLM Data

You can view the last five reporting periods for your XLM data in a card or list view. To access data for earlier reporting periods, export the data as described [below](#).

Timelines show dates in your local timezone and indicate how local time relates to Greenwich Mean Time. For example, if your local timezone is Pacific Standard Time, **Date (GMT-7:00)** appears beneath timelines.

Both views enable you to drill down from multiple reporting periods, to days, to individual events.

## Card View

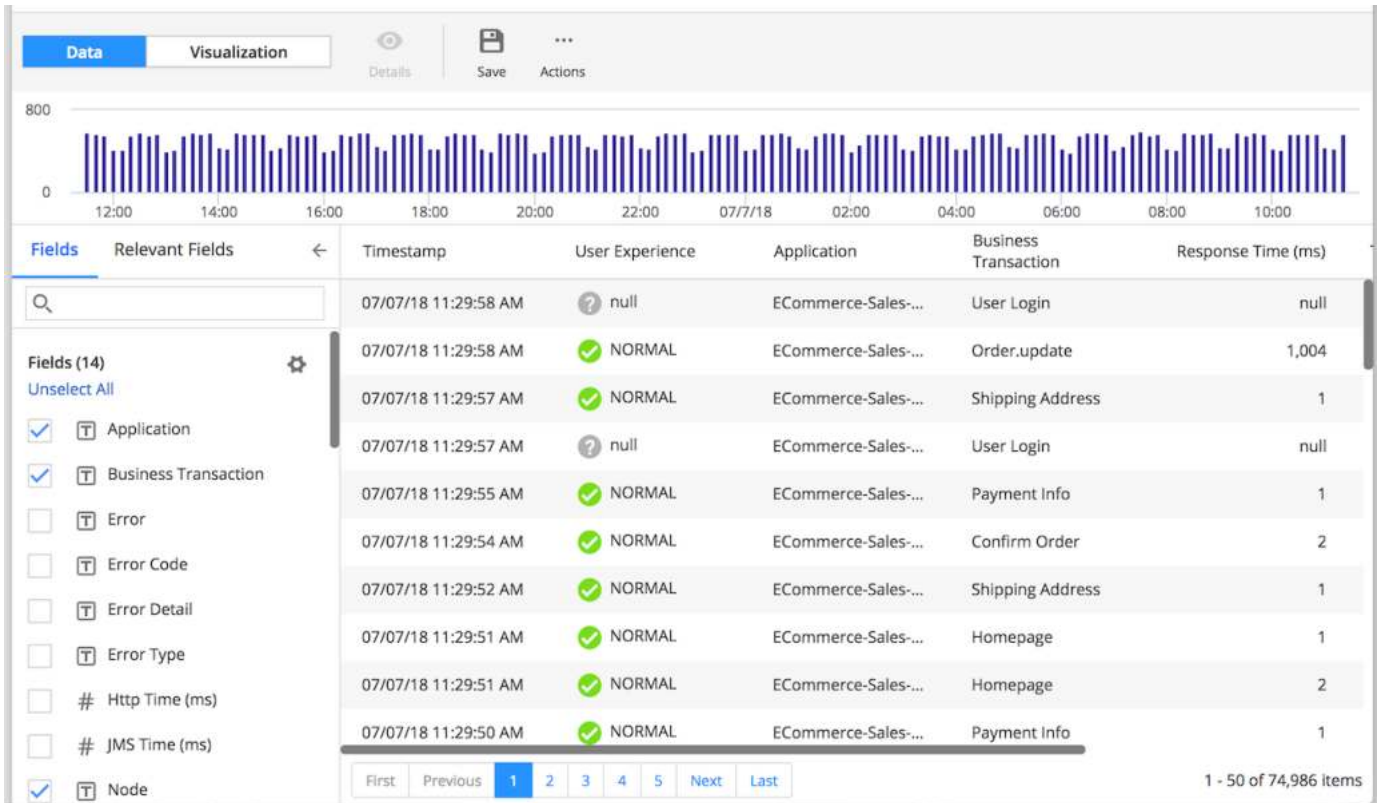

Click any reporting period for a daily breakdown.

Right-click any day to view associated events.

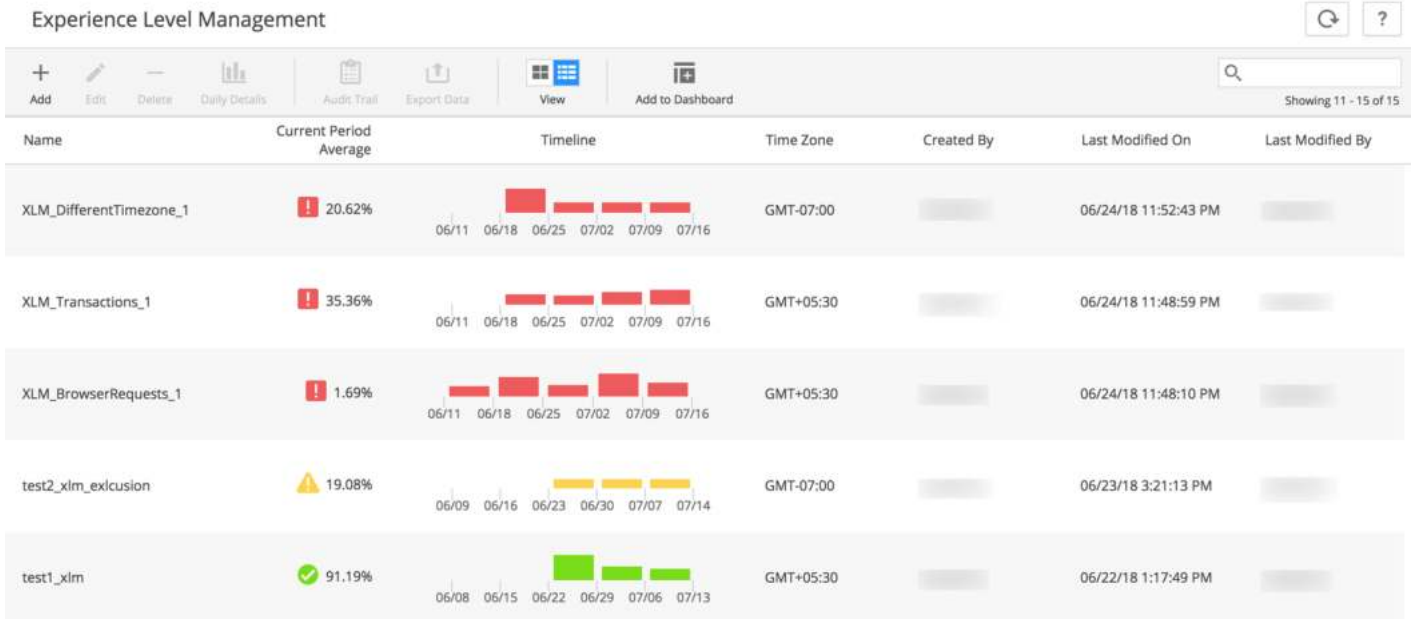

This brings you to an **Analytics > Searches** page where you can inspect the entire day's events.

### List View

As in the card view, you can:

- Click any reporting period for a daily breakdown
- Right-click any day to view associated events

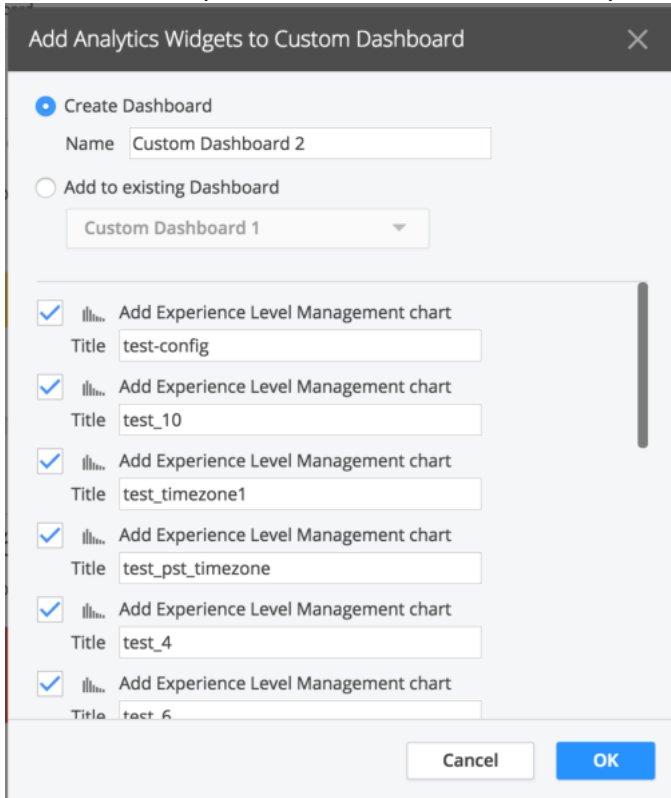

## Add XLM Reports to Custom Dashboards

You can add XLM reports as read-only widgets to your custom dashboards:

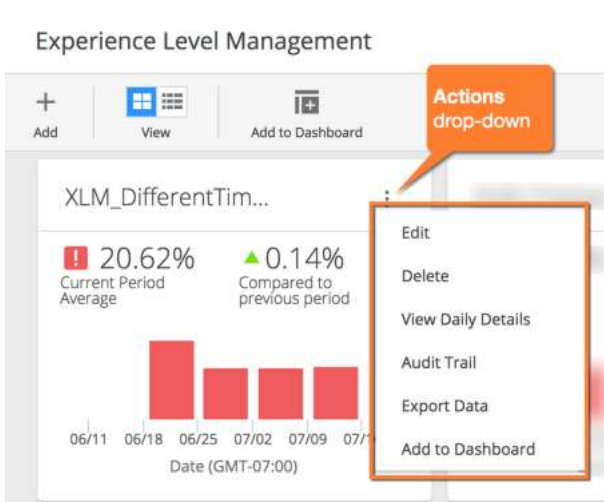

- One at a time, from the **Actions** drop-down, or
- One or more at once, from **Add to Dashboard** in the Experience Level Management panel

From the Experience Level Management panel, click **Add to Dashboard**. Alternatively, click the **Actions** dropdown on an individual XLM report.

## Export XLM Data

You can export XLM data using the **Actions** dropdown, which also offers additional views and actions.

You can export as many reporting periods as you wish. The export format is CSV.

**i** The XLM export file shows the latest configuration along with compliance data.

## Migrate XLM Configurations Between Environments

### Related pages:

- [Configure Experience Level Management](#)
- [View and Export XLM Compliance Data](#)

You can migrate XLM configurations from one environment to another. For example, you might first deploy a configuration to a staging or test environment and later migrate it to production.

To migrate an XLM configuration, make two API calls:

1. Export XLM configuration(s) from one environment.  
`GET /controller/analytics/xlm/configuration`  
 Optionally, supply a configuration ID, or a comma-delimited list of configuration IDs, as a query parameter.  
 If this parameter is omitted, the API returns a bulk export of all XLM configurations.
2. Import a single XLM configuration into another environment.  
`POST /controller/analytics/xlm/configuration`

## Troubleshoot Analytics Issues

### Related pages:

- [Agent Log Files](#)
- [Analytics Agent Logging](#)
- [.NET Agent on Windows Logging](#)

This page provides general troubleshooting techniques for deployment issues and workarounds for certain scenarios in Application Analytics.

### General Troubleshooting Issues

If you encounter problems with your Analytics deployment, check the logs for errors and warnings.

These logs are useful to:

- Determine if the Analytics Dynamic Service is enabled or disabled.
- Determine if the Analytics Dynamic Service encounters errors sending messages to the Analytics Agent. For example, when the Analytics Dynamic Service is not able to communicate with the Analytics Agent due to invalid connection configuration.
- Determine if messages are being dropped by the Analytics Dynamic Service because its internal buffers are full.
- View the configurations used on startup.

The following components write log information.

- Analytics Agent: The Analytics Agent writes log messages to files in the `<analytics_agent_home>/logs` directory.
- Events Service: The Events Service writes log messages to files in the `<events_service_home>/logs` directory. The `events-service-api-store.log` file can help with troubleshooting.

- Java Agent: The Analytics Dynamic Service is built into the Java Agent and writes logs to the same file as the app agent. The logs are in the `<application_home>/<app_agent_home>/logs` directory.
  - The primary log file to use for troubleshooting is the file named `agent.<timestamp>.log`. Search the file for messages written by the Analytics Dynamic Service.
- .NET Agent: The .NET Agent writes log messages to files in the `%ProgramData%\AppDynamics\DotNetAgent\Logs` directory. By default, the .NET Agent writes Analytics logs from the `com.appdynamics.ee.service.analytics.Analytics` logger to determine if the Analytics Dynamic Service is enabled/disabled and to view the configuration on startup. Errors are logged in the `warnfile`.
  - The `com.appdynamics.CONFIG.AnalyticsDynamicServiceConfigListener` logger gathers Analytics Dynamic Service configuration details from the Controller. Ensure that the `eventServiceURL` comes from the Controller.
  - The `com.appdynamics.analytics.EventsServiceSink` logger provides information about the communication between the .NET Agent and the Events Service.

For additional logger information, see [.NET Agent on Windows Logging](#).

## Configuration Issues

Verify that your configuration settings are properly configured with the required account name and key. Slashes in account names and key values must be escaped.

## Windows Commands

On Windows, you cannot delete a log file with the `del` command when the Analytics Agent is collecting log data from the file.

Do not use robocopy commands to move files on Windows. AppDynamics recommends that you use the move command instead.

## Starting the Analytics Agent Issues

If you are running the Analytics Agent as an extension to the Machine Agent with JRE 1.8.0\_171 or later, starting the Analytics Agent with encrypted credentials will fail. Workarounds include:

- Disable encryption in the Machine Agent
- Use a standalone Analytics Agent with encryption
- Use JRE 1.8.0\_162 to run the Machine Agent with encryption

## PID File

If an instance of the Analytics Agent terminates and leaves behind a process ID file (PID file), the next agent startup will fail with the following error:

```
java.lang.RuntimeException: Unable to create file [D:\AppDynamics\analytics-agent\analytics-agent.id] to store the process id because it already exists. Please stop any currently running process and delete the process id file
```

You can use the `-f` flag option while starting the agent. This option causes a pre-existing process id file to be deleted. The flag is not required when you are starting the agent as a Windows service.

Use the `-f` flag as follows:

- UNIX type OS: `start -f`
- Windows CLI: `start -f`

**i** The `-f` flag option only works for the standalone Analytics Agent. This option does not work for the Analytics Agent embedded in the Machine Agent. In versions 20.6 and later of the Machine Agent, the bundled Analytics Agent no longer drops a PID file. For the Analytics Agent running inside the Machine Agent (embedded mode), upgrade the Machine Agent to 20.6. You no longer need to delete PID files from previous runs where the agent crashed.

## High CPU Usage in Transaction Analytics without Analytics Agent (Agentless Analytics)

Reaching the Transaction Analytics license limit may cause high CPU usage in older Java Agents. AppDynamics recommends that you upgrade to the Java Agent version 20.3 and later. Look out for high CPU and memory usage in the .NET Agent.

## Analytics Data Issues

### Clock Management

AppDynamics recommends maintaining clock-time consistency throughout your monitored environment. If Analytics metrics are consistently reporting zero, confirm that clocks are synchronized across the application, Controller, and Events Service nodes.

### Timestamps

There are potentially four time zones involved with Log Analytics:

1. The timestamp and time zone from the log file.
2. The event timestamp and pickup timestamp time zones can be different from those in the log for a number of reasons:
  - a. When the time zone is overridden.
  - b. The time zone is not provided correctly in the log.
  - c. The timestamp and time zone parsing goes awry.
  - d. When no time zone is specified in the log timestamp, then local time is assumed.
3. The Events Service time zone and the Events Service stores all timestamps in UTC time.
4. The browser used to view the Analytics data in the Controller UI (such as the **Event Timestamp** column in the UI search results or the **Time Picker** widget) converts all timestamps to the browser's local time.

### Environment Variables

If you are not seeing or only seeing partial Analytics data in the Controller, configure the following environment variables.

Environment Variable	Description
<code>appdynamics.analytics.agent.send.attempt.max</code>	The maximum number of times that the Dynamic Service running in the agent will try sending the Analytics data after a communication failure.

Environment Variable	Description
<code>appdynamics.analytics.agent.send.attempt.pauseMillis</code>	The wait time between attempts to send Analytics data to the Analytics Agent after a communication failure.
<code>appdynamics.analytics.numOfSinkWriterTasks</code>	The number of sinks used by the Dynamic Service running in agent to send data to Analytics Agent. The default number is 2 and can be increased as needed.

## Log Analytics Missing Field Extractions Issues

If you are missing fields in your Log Analytics data that you expect to see based on your source rule configuration or using regex (including grok patterns) in your field extraction, you may encounter a performance safeguard.

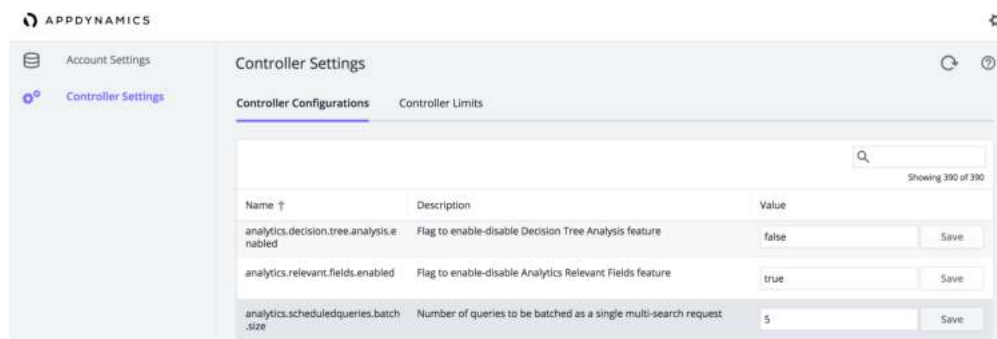

If a regex pattern takes more than five seconds to match against a log line, the attempt to extract the fields is terminated. No further processing that requires the extracted fields will occur. As a result, some fields may be missing when viewed on the Controller for that log line. In this case, the following error message appears in the Analytics Agent log:

```
[ERROR] java.util.concurrent.TimeoutException: The current regex has spent 5 seconds attempting to match the log line, further processing has been stopped for this log line.
```

Another reason for missing fields is if the log line doesn't contain the field to be extracted as defined in the pattern.

## Custom Analytics Metrics Issues

If you are having issues with metrics created from saved searches or with the alerts performance for those metrics, try increasing the query batch size. You can increase the size using the `analytics.scheduledqueries.batch.size` Controller setting in **Controller Settings > Controller Configurations**. The default value for this setting is 5.

See [2023-10-19\\_05-04-05\\_Access the Administration Console](#) for information about accessing the setting.

## Business Transaction Events Limits

The Analytics Dynamic Service sends messages to the Events Service where the request body is an array of event segments. A business transaction event consists of one or more segments that are related to each other by the business transaction `requestGUID`. There are ingestion limits related to messages.

- Event (segment) size: The maximum size of an individual business transaction segment collected by the Analytics Dynamic Service is 0.1 MB. This limit is defined by the `appdynamics.analytics.message.maxSizeBytes` Java system property. To change this value, pass it on the command line as a system property when the Java Agent starts. For example:

```
'-Dappdynamics.analytics.message.maxSizeBytes=1024000'
```

- Events per request: The maximum number of segments per request is defined by the `appdynamics.analytics.agent.send.batch.items.max` Java system property. The default value of this property is 16. To change this value, pass it on the command line as a system property when the Java Agent is started.
- Message Size: This limit refers to the size of a single request body sent to the Events Service, which is usually an array of event segments. Publish requests for all event types are limited to 1 MB. If the limit is exceeded, you will see exceptions in agent log file and messages in Events Service logs.

## Agent-Side Metrics

Analytics components in the Java Agent reports performance metrics. These metrics can be used to monitor the health of Transaction Analytics reporting in the agent/node. These metrics are under the `Agent|Analytics|<Metric Name>` path in the Metric Browser.

Metric Name	Metric Time Rollup Type	Metric Cluster Rollup Type	Metric Description
Collector Objects Count	Current	Individual	The current count of Analytics data collectors in use.
Messages Sent	Sum	Collective	The number of messages sent.
Messages Dropped Since Input Queue Full	Sum	Collective	The number of dropped messages due to the input queue being full.
Messages Dropped Since Size Exceeded	Sum	Collective	The number of dropped messages due to message size exceeding limit.
Message Send Errors	Sum	Collective	The number of transient and permanent errors in event registration or publish.

Metric Name	Metric Time Rollup Type	Metric Cluster Rollup Type	Metric Description
Message Latency (ms)	Average	Individual	Latency calculated in milliseconds.
Pending Messages In Queue	Current	Individual	Messages pending in the buffer.
Sink Writers Count	Current	Individual	Number of active sink writer threads.

## Firewall Considerations

Transaction Analytics without an Analytics Agent requires a connection between the Java/.NET Agent and the Events Service. If you have a firewall that blocks requests from the Java/.NET Agent to the SaaS or on-premises Events Service, you need to open the firewall to avoid gaps in Analytics data. See [Port Settings](#) and [Agent-to-Controller Connections](#).

For SaaS-based installations, configure the Analytics endpoint by modifying the `http.event.endpoint` setting in the `\conf\analytics-agent.properties` file (as described in [Install Agent-Side Components](#)). For example, `http.event.endpoint=http://analytics.api.appdynamics.com:443`.

If your firewall rules require you to use specific IP addresses, rather than hostnames, note the following information. If you are unable to see Transaction Analytics data collected as expected (even after configuring your firewall rules) and you see repetitive Connection Reset messages in the logs similar to the following, your firewall rules may not include the correct IP addresses.

```
[2015-12-18T16:08:39,907-06:00] [INFO] [AD Thread Pool-Global0]
[o.a.http.impl.execchain.RetryExec] I/O exception (java.net.SocketException) caught when
processing request to {s}->https://analytics.api.appdynamics.com:443: Connection reset
```

Your firewall rules may not include the correct IP addresses.

In SaaS environments, `analytics.api.appdynamics.com`, `fra-ana-api.saas.appdynamics.com`, and `syd-ana-api.saas.appdynamics.com` are round-robin DNS aliases and may resolve to multiple DNS (54. vs 52.) in the following examples.

<pre>Name: analytics.api.appdynamics. com Address: 54.213.173.141 Name: analytics.api.appdynamics. com Address: 52.88.111.157</pre>	<pre>Name: fra-p-con-2.saas.app dynamics.com Address: 52.28.42.67 Name: fra-p-con-2.saas.app dynamics.com Address: 52.57.96.225</pre>	<pre>Name: syd-p-con-1.saas.app dynamics.com Address: 54.153.248.179 Name: syd-p-con-1.saas.app dynamics.com Address: 54.153.246.219</pre>
-------------------------------------------------------------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------

Amazon Web Services (AWS) controls the IPs used, so they may change from time to time. AWS publishes its current IP address ranges in JSON format, so if you are unable to open firewalls to hostnames, you can download the AWS IP address ranges. If you want to be notified whenever there is a change to the AWS IP address ranges, you can subscribe to receive notifications using Amazon SNS.

See [Analytics IP Ranges](#) for the AWS regions for the SaaS Analytics environments. You can view the [AWS IP Ranges](#) for each listed region.

## Monitoring Analytics Agent Health

This describes monitoring the health of the Analytics Agent.

### Check-Health Command Usage

Argument	Description
-hp (--host-and-port) STRING[]	Optional. Application host name or IP:HTTP admin port (Multiple values separated by space).
-p (--properties) TYPE_PATH	Optional. Path to the properties file (Multiple values separated by space).
-v (--verbose) TYPE_BOOLEAN	Optional. Verbose output.

The check-health command returns the status of the Analytics Agent. You can specify the agent to check using a properties file or IP address and port.

For example, using a properties file.

```
./bin/analytics-agent.sh check-health --properties conf/analytics-agent.properties
```

You can also use the -hp argument and pass the host IP address and the port number for the Analytics Agent.

For example, the default Analytics Agent port for the health check is 9091.

```
bin/analytics-agent.sh check-health -hp <ip-address>:9091
```

---

## Unified Observability Experience

This documentation mentions features that are currently in the early access phase. Cisco AppDynamics makes no warranties regarding these features, including performance, quality, or availability, and reserves the right to change the features and its documentation including the content herein at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

Unified Observability Experience enables you to leverage the capabilities of both AppDynamics SaaS and [Cisco Observability Platform](#) by maintaining context in your troubleshooting workflows. With AppDynamics SaaS, you get an in-depth view of your application performance monitoring data. Whereas [Cisco Cloud Observability](#), which is powered by Cisco Observability Platform, provides an in-depth view of your full stack across the domains and visibility into logs and traces. Cisco Cloud Observability has an extensible, flexible, and scalable data model that makes it capable to add new features to meet a broad scope and future observability needs. As a user of AppDynamics SaaS, you can leverage these modern capabilities and features of Cisco Cloud Observability. These capabilities can reduce tool sprawl, mean time to detect root causes, and mean time to resolve issues in your applications.

### How Does Unified Observability Experience Work?

Currently, Unified Observability Experience allows you to leverage the advanced logs troubleshooting capabilities of Cisco Cloud Observability from your existing AppDynamics SaaS tenants. The applications in your environment, which are monitored by AppDynamics SaaS generate logs that contain vital information about actions, errors, warnings, unexpected conditions, or other events. So, the logs collected by AppDynamics SaaS from the monitored applications can be pushed to Cisco Cloud Observability for enhanced log troubleshooting with in-context logs for your application.

### How does it Improve Your Experience?

- After you connect your existing AppDynamics SaaS tenants to Cisco Observability Platform tenants, you can contextually navigate from the former to the latter without losing your application data. This helps in troubleshooting the application issues.
- You can easily correlate the performance data in AppDynamics SaaS with your logs in Cisco Cloud Observability and quickly identify the root cause of the performance issues. This reduces the mean time to detect the root cause and mean time to resolve the issue.

### Region Availability:

This feature is enabled for the tenants in the PDX region during the Early Access Program.

### Get Started

Follow the steps to integrate your AppDynamics SaaS and Cisco Observability Platform tenants and start analyzing the logs in Cisco Cloud Observability for troubleshooting the application performance issues:

1. [Integrate AppDynamics SaaS and Cisco Cloud Observability](#)
2. [Configure Java Agent and AppDynamics Controller to Send Logs](#)
3. [Configure OpenTelemetry Collector to Send Logs to Cisco Cloud Observability](#)

#### 4. Troubleshoot with Application Logs

## Integrate AppDynamics SaaS and Cisco Cloud Observability

 This documentation mentions features that are currently in the early access phase. Cisco AppDynamics makes no warranties regarding these features, including performance, quality, or availability, and reserves the right to change the features and its documentation including the content herein at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

After the AppDynamics SaaS and Cisco Cloud Observability integration, you can view the logs from Log Explorer in Cisco Cloud Observability UI. This gives the log details, which helps you to resolve the issue with your application setup without having to look at multiple places for the information.

When the logs are sent to Cisco Cloud Observability, individual log messages are correlated with specific entities in your environment, providing greater search capabilities and faster troubleshooting.

 For Early Access Program, the Accounts team will perform the integration between AppDynamics SaaS and Cisco Observability Platform tenants. Please contact your Accounts team for integration.

### Before You Begin

Ensure that you have:

- enough Controller licenses to cover the usage within the applications on which you require to enable this feature.
- the Controller version  $\geq$  23.11.0.
- Cisco Cloud Observability license and Cisco Observability Platform tenants.
- granted access to a user who should be part of both the SaaS Controller and Cisco Observability Platform tenants.
- informed the Accounts team about the SaaS Controller tenants details from which you want to check the logs. The Accounts team integrates the SaaS Controller tenants with Cisco Observability Platform tenant.
- specified the `coexistence.log.enabled : true` setting in the Administration Console. The AppDynamics Accounts team enables this setting.

### Next Steps

- [Configure Java Agent and AppDynamics Controller to Send Logs](#)
- [Troubleshoot with Application Logs](#)

## Configure Java Agent and AppDynamics Controller to Send Logs

This documentation mentions features that are currently in the early access phase. Cisco AppDynamics makes no warranties regarding these features, including performance, quality, or availability, and reserves the right to change the features and its documentation including the content herein at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

And AppDynamics  
Controller to Push Logs

Configure the  
OpenTelemetry Collector to Push  
Log Records to Cisco Cloud  
Observability

Troubleshoot  
with Application  
Logs

Configure your Java Agent and AppDynamics Controller to send the application logs to Cisco Cloud Observability.

### Before You Begin

Ensure that you have:

- the Java Agent version  $\geq 23.10.0$
- the Controller version  $\geq 23.11.0$
- the Apache Log4j version  $\leq 2.21$

### Configure Java Agent

Do the following to configure the Java Agent:

1. To enable OpenTelemetry for Java Agent, add the following system properties in your JVM System Properties. See [Enable OpenTelemetry in the Java Agent](#).

```
-Dappdynamics.opentelemetry.enabled=true
```

If you have already enabled OpenTelemetry in your Java Agent, ignore this step.

2. Set the tier name in `service.name` and application name in `service.namespace` for the JVM:

```
-Dotel.resource.attributes="service.name=<myServiceName>,service.namespace=<myServiceName Space>"
```

You can also set tier and application names in the `OTEL_RESOURCE_ATTRIBUTES` environment variable. See [Configure Resource Attributes](#).

3. (Optional) To export only logs and disable export of traces and metrics to Cisco Cloud Observability, add the following system properties:

```
-Dotel.traces.exporter=none -Dotel.metrics.exporter=none
```

You can also add the preceding system properties by using the environment variables `OTEL_TRACES_EXPORTER` and `OTEL_METRICS_EXPORTER`. See [OpenTelemetry Documentation](#).

**i** For Early Access Program, you can only export logs from AppDynamics SaaS to Cisco Cloud Observability. If you are already exporting traces and metrics to a different backend service, you need to accordingly configure your [OpenTelemetry Collector](#). Java Agent can export data to only one OpenTelemetry Collector at a time.

## Configure AppDynamics Controller Node Property

You must configure the following node property in your Controller:

```
name: opentelemetry-logs-push-enabled
valueType: Boolean
Value: true
```

**!** The app agent keeps sending logs data to the Cisco Cloud Observability tenant and keeps consuming the tokens, unless the node-property to send logs from the SaaS Controller is set to `false`.

## Configure Log Types

By default, all types of logs are pushed to Cisco Observability Platform tenant. However, you can configure the verbosity level of logs that you want to push by using following node property in your Controller. For instance, if you set value of property as `warn`, then agent will only export all warning, error, and fatal messages.

```
name: opentelemetry-allowed-log-level
valueType: String
defaultValue: all
Value: one of all,trace,debug,info,warn,error,fatal,off
```

## Configure OpenTelemetry Collector to Send Logs to Cisco Cloud Observability

**!** This documentation mentions features that are currently in the early access phase. Cisco AppDynamics makes no warranties regarding these features, including performance, quality, or availability, and reserves the right to change the features and its documentation including the

content herein at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

OpenTelemetry Collectors act as the service pipeline by gathering telemetry data from your applications and exporting it to a backend. You can either use a Cisco AppDynamics Distribution of OpenTelemetry Collector or configure your existing OpenSource OpenTelemetry Collector to send logs to the Cisco Cloud Observability backend.

## Use Cisco AppDynamics Distribution of OpenTelemetry Collector

If you don't have any existing OpenTelemetry collector, Cisco AppDynamics Distribution of OpenTelemetry Collector is the preferable collector. To configure, see [Cisco AppDynamics Distribution of OpenTelemetry Collector Settings](#).

## Use an Existing OpenSource OpenTelemetry Collector

If you are using an existing OpenSource OpenTelemetry Collector to send logs data, modify these sections of your existing OpenTelemetry Collector configuration file:

- **Extensions:** Configure the `oauth2client` extension to authenticate to the Cisco Cloud Observability backend.
- **Exporters:** Configure the `logs_endpoint` to send logs data to the Cisco Cloud Observability backend.
- **Service:** Configure the service pipeline to include the required receivers, processors, extensions, and exporters.

You do not need to modify the `receivers` section of the OpenTelemetry Collection configuration file to add support for Cisco Cloud Observability.

## Points to Consider for OpenSource OpenTelemetry Collector

- You are using the Contrib version ( $\geq 0.36.0$ ) OpenTelemetry Collector, which supports the `oauth2client` extension. The [GA version](#) of OpenTelemetry Collector does not support the `oauth2client` extension at this time.
- If you require a customized version of the OpenTelemetry Collector, ensure that these components are included:
  - OTLP HTTP Exporter  $\geq v 0.36.0$
  - OTLP Receiver  $\geq v 0.36.0$
  - OAuth2 Client Extension  $\geq v 0.36.0$

**i** The OpenSource OpenTelemetry Collector that you are using needs to support the `oauth2clientauthextension`. This extension is used to authenticate the OpenSource OpenTelemetry Collector exporter with the Cisco Cloud Observability backend. The `oauth2clientauthextension` is configured in the `extension` section of your OpenTelemetry Collector configuration.

## Configure Extensions

You can follow the steps described [here](#) to generate OAuth 2.0 credentials and then configure in the `extensions/oauth2client` section of your OpenTelemetry Collector configuration file.

```
extensions:
```

```

oauth2client:
 client_id: <clientId from UI>
 client_secret: <clientSecret from UI>
 token_url: <tokenUrl from UI>

```

## Configure Exporters

To configure the OpenTelemetry Collector to send logs to the Cisco Cloud Observability backend, configure an `otlphttp` (HTTP) exporter set the `logs_endpoint` and enable the OAuth2 authenticator. In the following sample, `<tenantHostName>` is the host name from the `tokenUrl` value generated in the Cisco Cloud Observability UI.

For example, if the `tokenUrl` is `https://mytenant.observe.appdynamics.com/auth/dfdbdf71-7322-44d0-0123456789012/default/oauth2/token`, set the `logs_endpoint` to `https://mytenant.observe.appdynamics.com/data/v1/logs`:

```

exporters:
 otlphttp: ##### Mandatory for Cisco Cloud Observability
 auth:
 authenticator: oauth2client
 logs_endpoint: https://<tenantHostName>/data/v1/logs

```

## Configure Service

To configure the `service` section:

- Add `oauth2client` to `service/extensions`
- Add each exporter (`otlphttp`, and optionally `logging`) to `service/pipelines`

```

service:
 extensions: ##### Mandatory for Cisco Cloud Observability
 - oauth2client
 pipelines:
 logs:
 receivers: [otlp]
 exporters: [otlphttp]

```

## Troubleshoot with Application Logs

This documentation mentions features that are currently in the early access phase. Cisco AppDynamics makes no warranties regarding these features, including performance, quality, or availability, and reserves the right to change the features and its documentation including the content herein at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

Observability

Troubleshoot with  
Application Logs

You can view the application logs by integrating AppDynamics SaaS with Cisco Cloud Observability. This integration allows you to view your application log details on the Cisco Cloud Observability user interface. The log details allow you to troubleshoot the application issues faster.

## Before You Begin

Ensure the following requirements are met before you can view the logs for your application:

- The application must be Java based.
- The application uses the `log4j2` libraries.
- You have integrated Cisco Cloud Observability. See [Integrate AppDynamics SaaS and Cisco Cloud Observability](#).
- You have configured OpenTelemetry Collector on Cisco Cloud Observability. See, [Distribution of OpenTelemetry Collector Settings](#).

## Permissions to View the Logs Data

In AppDynamics SaaS, you have granular permissions within the application. In Cisco Cloud Observability, you get an account level access to view the logs that are in the context of the application. However, when you remove the filters in Cisco Cloud Observability related to the context, you can view all the available logs.

## Troubleshoot Issues with Log Explorer

You can troubleshoot the issue by using the information displayed in the log explorer. For more information log explorer, see [Troubleshoot with Logs](#) and [Explore Logs](#).

To view the logs and troubleshoot, you can access the **View related Logs** button from the following UI pages:

- [Application Dashboard](#)
- [Tiers](#)
- [Nodes](#)
- [Business Transaction](#)
- [Transaction Snapshot](#)

## Application Dashboard

This documentation mentions features that are currently in the early access phase. Cisco AppDynamics makes no warranties regarding these features, including performance, quality, or availability, and reserves the right to change the features and its documentation including the content herein at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

The application dashboard displays the application flow map, which provides a visualisation of the services used in a specific application.

You can view the application logs by performing the following on the Controller UI:

1. Navigate to **Home>Applications**.

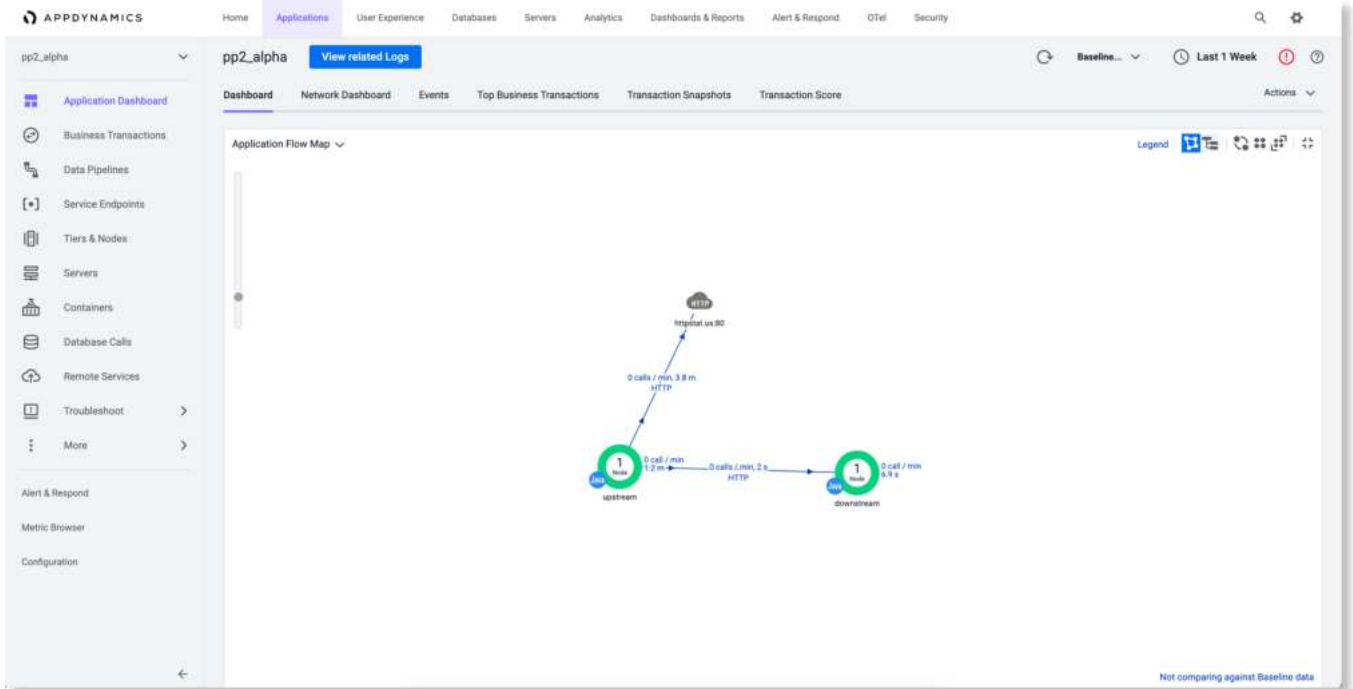

You can select the application from the frequently visited application list or search for the specific application under **Search All Applications**.

or

Navigate to **Applications > <application name> > Details**.

2. Select the time range for which you require the log details.

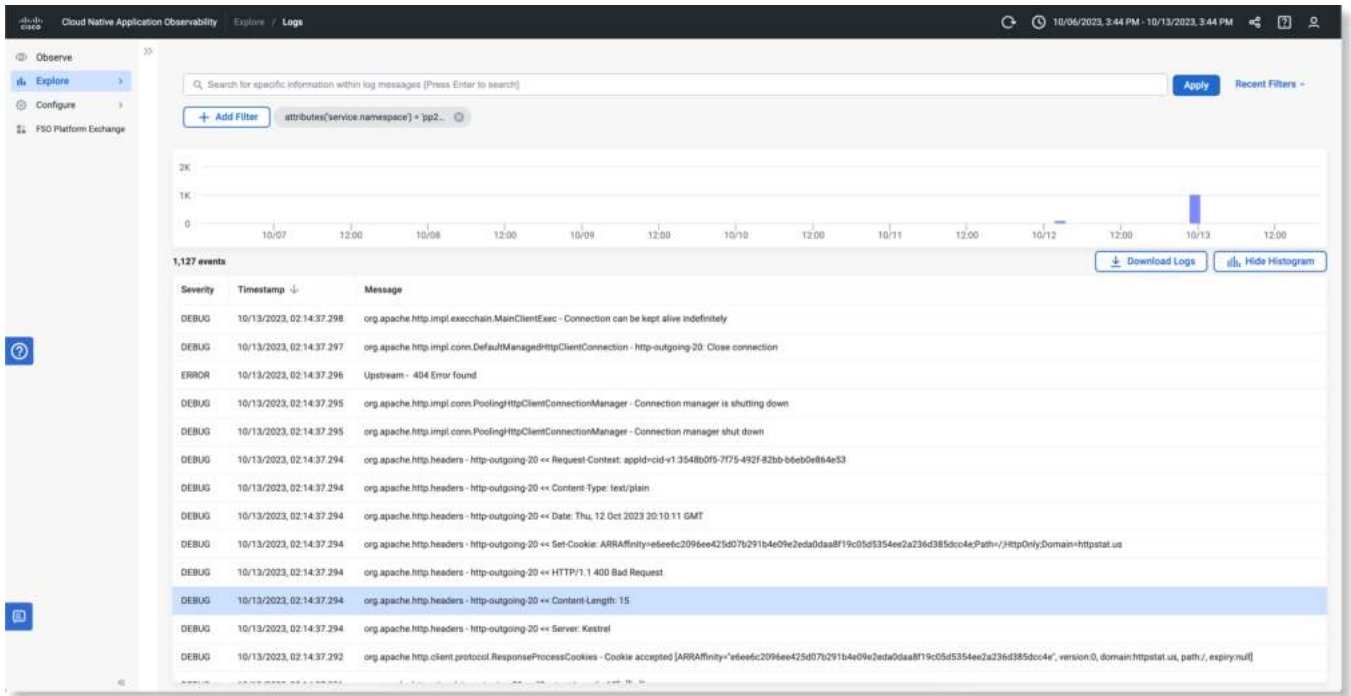

3. Click **View related Logs**. If the **View related Logs** button is not displayed, then there are no logs during the selected time range, you can change the time range to view the button.

This opens a new tab with the Cisco Cloud Observability UI where you can view the application logs. The selected application is added as filter on the Cisco Cloud Observability UI. You can view the application filter as the service namespace in the UI.

This is the filter that you can view on the UI:

```
attributes("service.namespace") = '<app name in Csaas>'
```

## Tiers

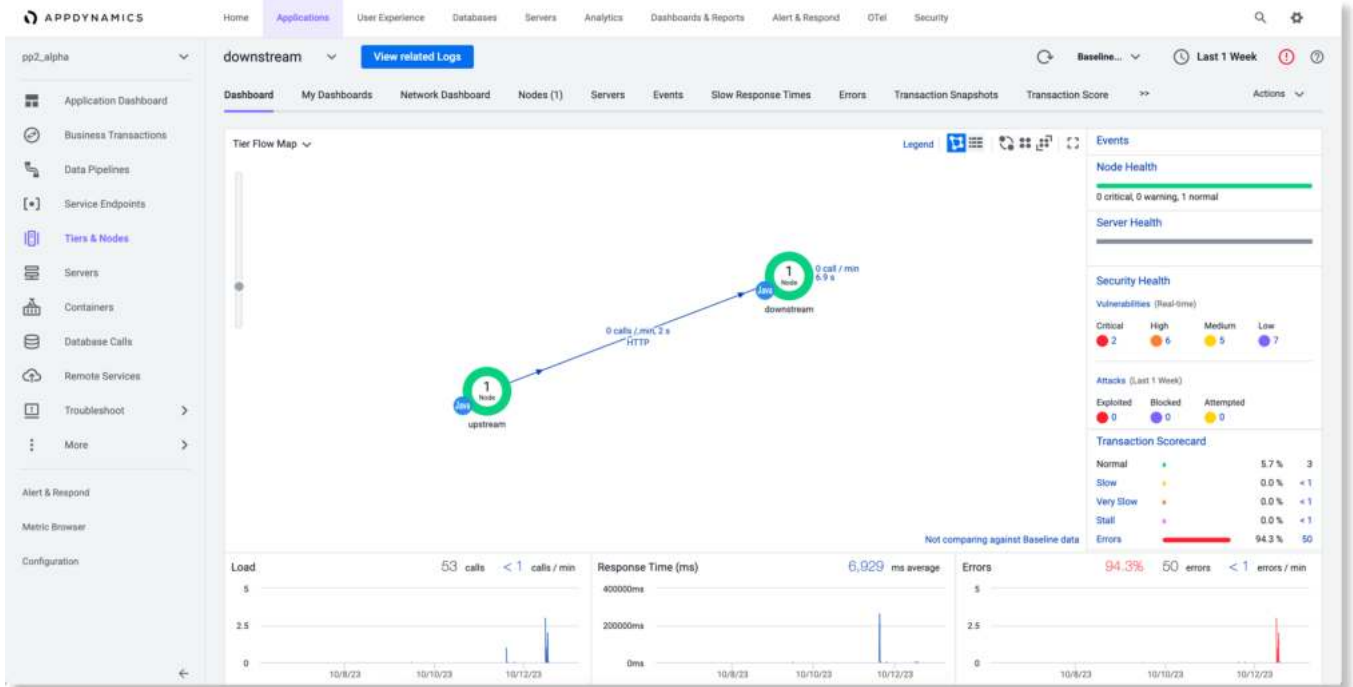

This documentation mentions features that are currently in the early access phase. Cisco AppDynamics makes no warranties regarding these features, including performance, quality, or availability, and reserves the right to change the features and its documentation including the content herein at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

A tier is a service in your application environment. You can view the logs for a specific tier of the required application. For more information about tiers, see [Tiers and Nodes](#).

Perform the following after selecting the required application from the SaaS Controller UI:

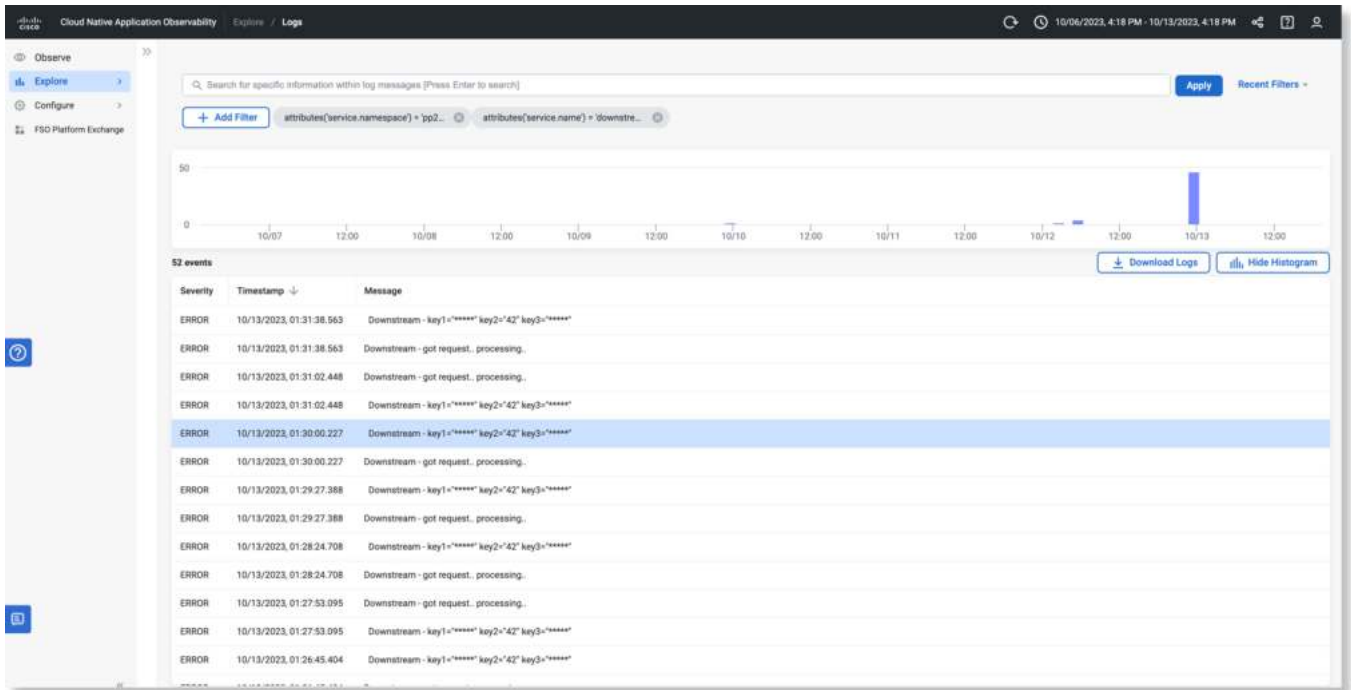

1. Click **Tiers & Nodes** on the left pane of the application dashboard.
2. Select required tier, then click **Details**.  
The Tier Flow Map view is displayed.
3. Select the time range for which you require the log details.
4. Click **View related Logs**. If the **View related Logs** button is not displayed, then there are no logs during the selected time range, you can change the time range to view the button.

This opens a new tab with the Cisco Cloud Observability UI where you can view the logs of a specific application tier.  
 The selected tier is added as filter on the Cisco Cloud Observability UI. You can view the tier filter as the service name in the UI.  
 This is the filter that you can view on the UI:

```
attributes("service.namespace")='<app name in Csaas>';attributes("service.name")='<tier-name>'
```

## Nodes

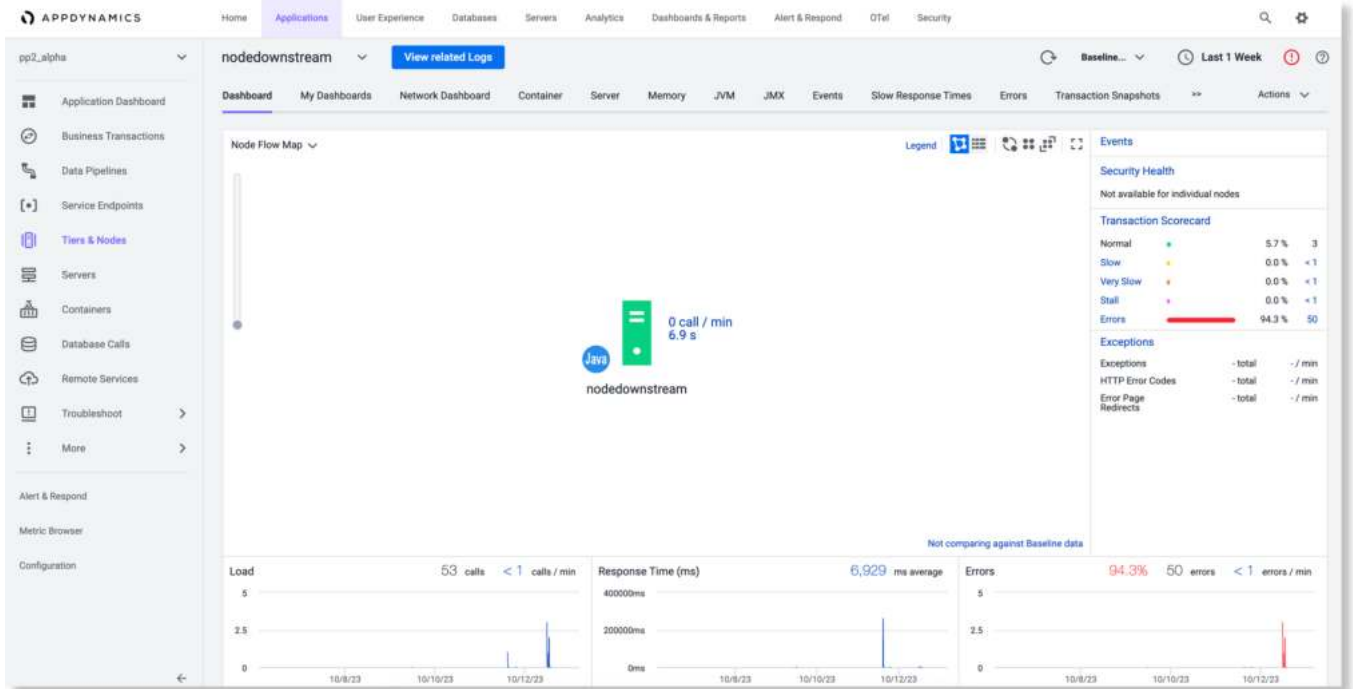

This documentation mentions features that are currently in the early access phase. Cisco AppDynamics makes no warranties regarding these features, including performance, quality, or availability, and reserves the right to change the features and its documentation including the content herein at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

A node is a service instance of the service (tier) in your application environment. You can view the logs for a specific node of the required application. For more information about nodes, see [Tiers and Nodes](#).

Perform the following after selecting the required application from the SaaS Controller UI:

1. Click **Tiers & Nodes** on the left pane of the application dashboard.
2. Select required node, then click **Details**.  
Select the time range for which you require the log details.
3. Click **View related Logs**. If the **View related Logs** button is not displayed, then there are no logs during the selected time range, you can change the time range to view the button.

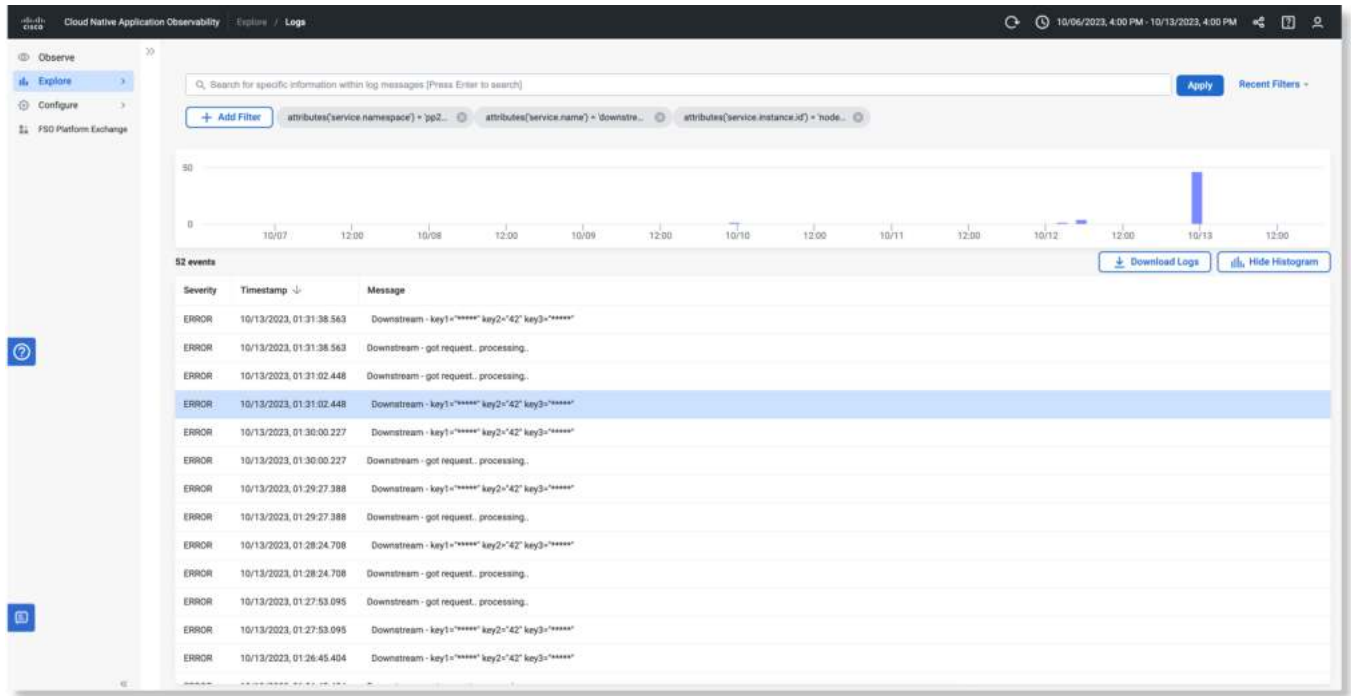

This opens a new tab with the Cisco Cloud Observability UI where you can view the logs of a specific application node.

The selected node is added as filter on the Cisco Cloud Observability UI. You can view the node filter as the service instance in the UI.

This is the filter that you can view on the UI:

```
attributes("service.namespace")='<app name in Csaas>';attributes("service.name")='<tier name>';attributes("service.instance.id")='<node name>'
```

## Business Transaction

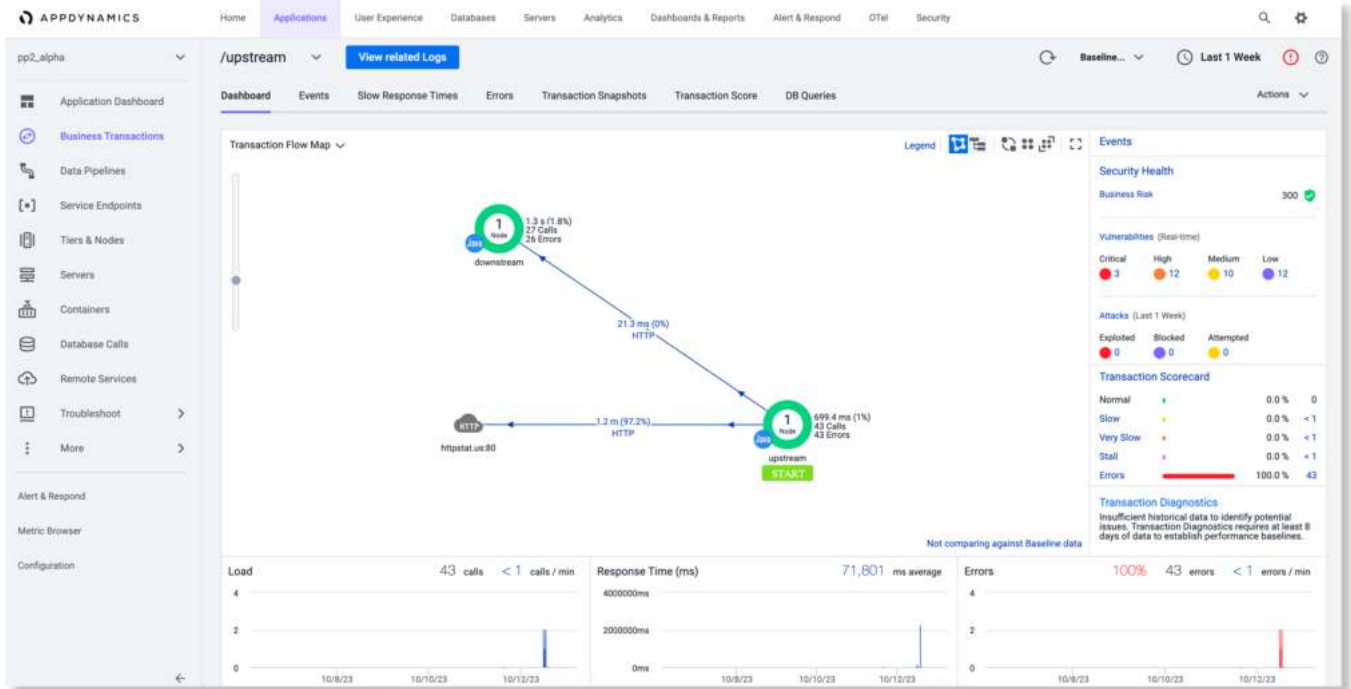

This documentation mentions features that are currently in the early access phase. Cisco AppDynamics makes no warranties regarding these features, including performance, quality, or availability, and reserves the right to change the features and its documentation including the content herein at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

The business transaction is an end-to-end, cross-tier processing path that is used to complete a request for a service provided by the application.

Perform the following after selecting the required application from the SaaS Controller UI:

1. Click **Business Transactions** on the left pane.
2. Select required business transaction, then click **Details**.  
Select the time range for which you require the log details.
3. Click **View related Logs**. If the **View related Logs** button is not displayed, then there are no logs during the selected time range, you can change the time range to view the button.

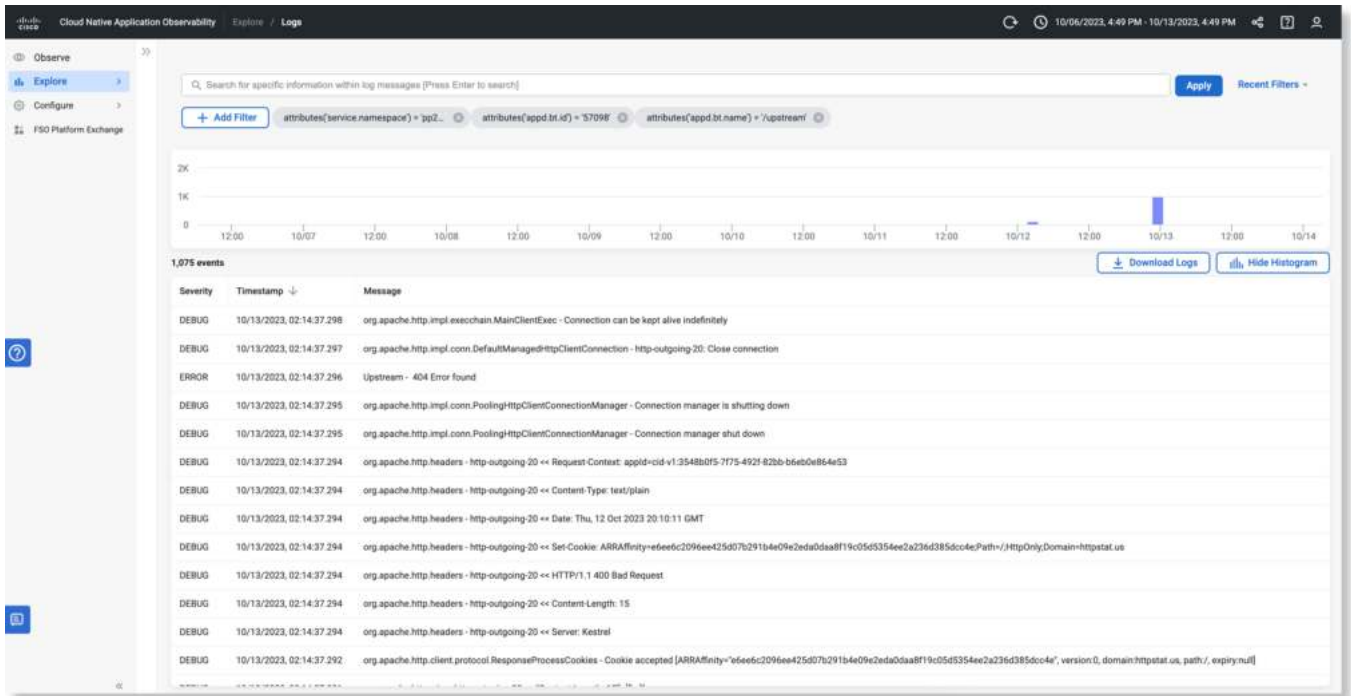

This opens a new tab with the Cisco Cloud Observability UI where you can view the logs of a specific application business transaction.

The selected Business Transaction is added as filter on the Cisco Cloud Observability UI. You can view the Business Transaction filter as the business transaction ID ( `appd.bt.id` ) in the UI.

This is the filter that you can view on the UI:

```
attributes("service.namespace")='<app name in Csaas>;attributes("appd.bt.id")='<business transaction ID>;attributes("appd.bt.name")='<Business Transaction name as in CSaaS>'
```

## Transaction Snapshot

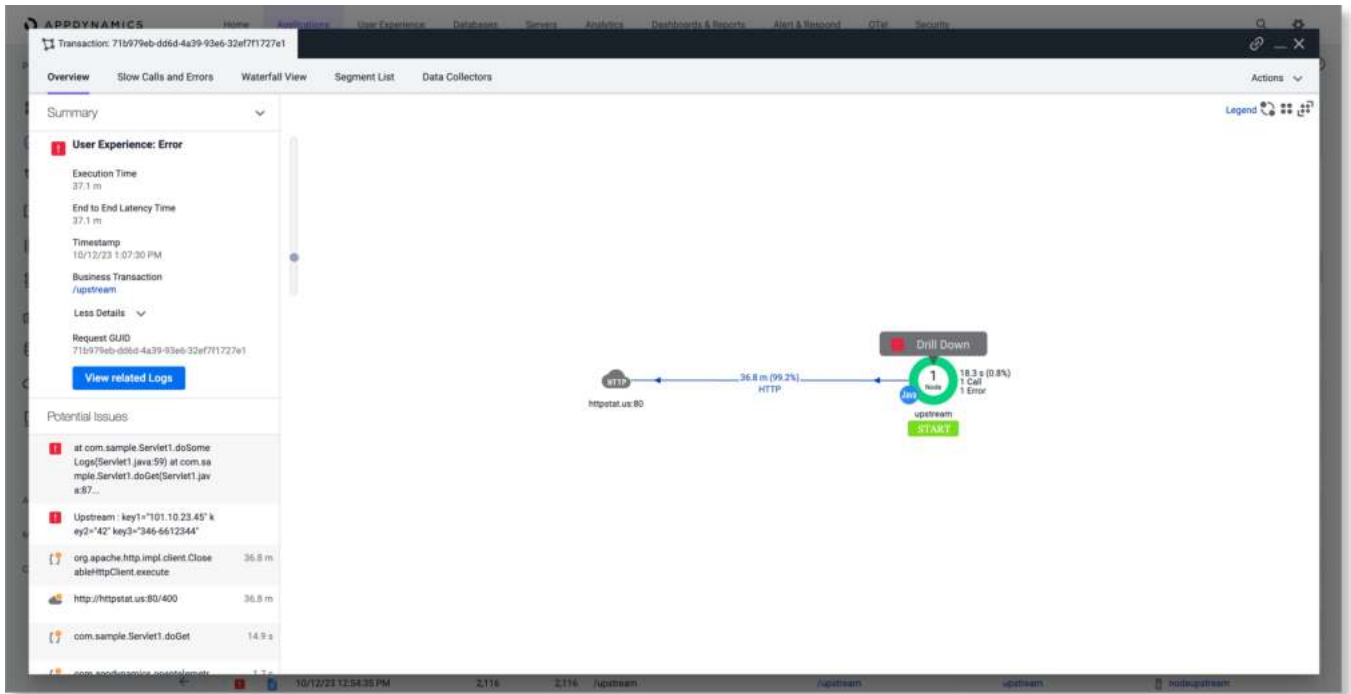

This documentation mentions features that are currently in the early access phase. Cisco AppDynamics makes no warranties regarding these features, including performance, quality, or availability, and reserves the right to change the features and its documentation including the content herein at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

The transaction snapshot provides the snapshot of the selected business transaction.

Perform the following after selecting the required application from the SaaS Controller UI:

1. On the left pane, click **Business Transaction>Transaction Snapshot**.
2. Select required transaction, then click **Details**.  
The **View related Logs** button is displayed on the left pane.  
Select the time range for which you require the log details.
3. Click **View related Logs**. If the **View related Logs** button is not displayed, then there are no logs during the selected time range, you can change the time range to view the button.

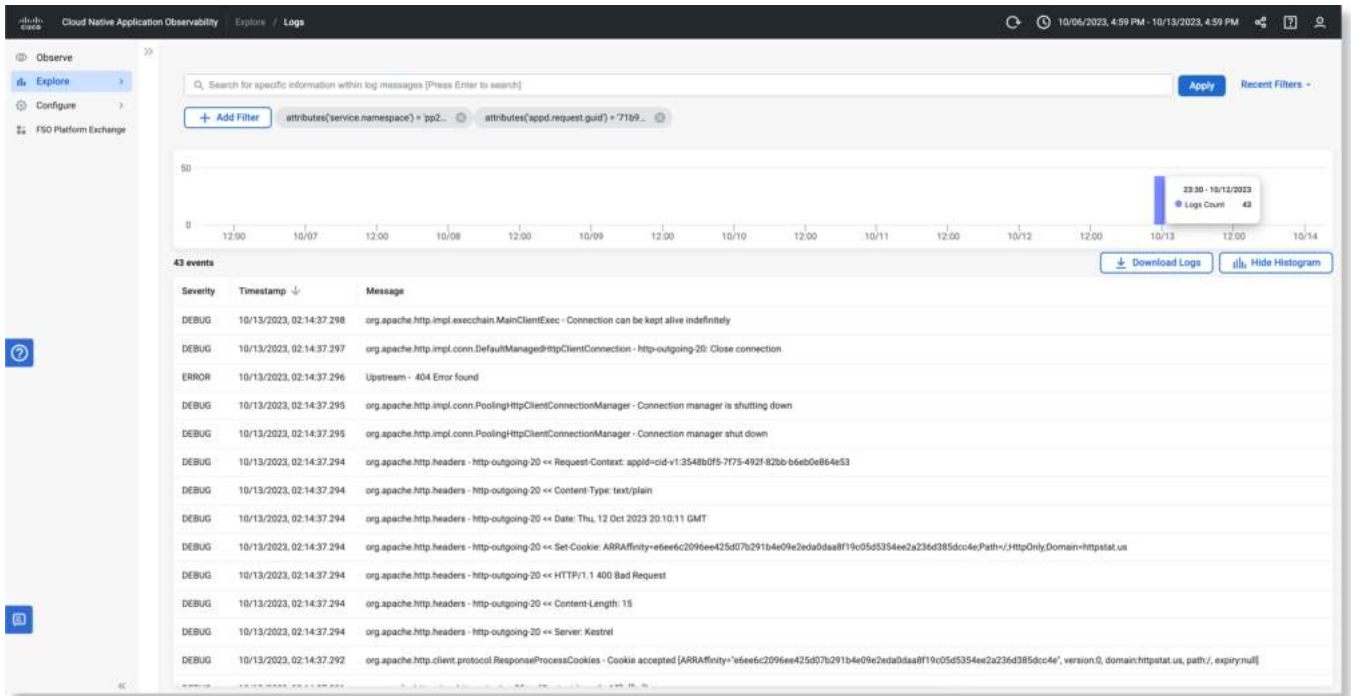

This opens a new tab with the Cisco Cloud Observability UI where you can view the logs of a specific transaction details.

The selected transaction snapshot is added as filter on the Cisco Cloud Observability UI. You can view the transaction filter as the business transaction GUID ( `appd.request.guid` ) in the UI.

This is the filter that you can view on the UI:

```
attributes("service.namespace")='<app name in Csaas>';attributes("appd.bt.id")='<business transaction ID>';attributes("appd.bt.name")='<Business Transaction name as in CSaaS>'
```

## Extend AppDynamics

This page describes how to extend and customize AppDynamics SaaS.

The [AppDynamics Community Exchange](#) includes many pre-built extensions you can use to customize AppDynamics and integrate with other systems.

You can also use AppDynamics REST APIs to create custom integrations and automation tasks.

### AppDynamics REST APIs

- [AppDynamics APIs](#)
- [Using the Controller APIs](#)

### AppDynamics Extensions

- [Integration Modules](#)
- [Integrate AppDynamics with Splunk](#)
- [Integrate AppDynamics with Scalyr](#)

## AppDynamics APIs

Related pages:

- [Extensions and Custom Metrics](#)
- [AppDynamics Exchange](#)

This page provides an overview of AppDynamics APIs, which let you extend and customize various aspects of AppDynamics SaaS.

---

## Overview of AppDynamics APIs

AppDynamics SaaS exposes various APIs for customizing and extending its features on the platform-side, which are served by the Controller and Events Service, and on the agent-side.

The AppDynamics platform server components and agents offer the following APIs:

- Controller APIs: Administer the Controller, configure, monitor, query metrics, and more. See [Platform API Index](#).
- Accounts APIs: Manage and monitor accounts, users, and other aspects of AppDynamics licensing. Accounts APIs are made up of these modules:
  - actionsuppressions
  - businesstransactions
  - healthrules
  - licensemodules
  - mdsconfig
  - nodes
  - policiesSee [Observe License Usage](#).
- Analytics Events API: Send custom analytics events from your data sources to the Events Service. See the Analytics Events API section in the [Platform API Index](#).
- Machine Agent APIs: HTTP APIs available at the machine agent for uploading custom metrics. See [Machine Agent HTTP Listener](#).
- Database Agent APIs: Get, create, update, and delete Database Monitoring database Collectors. See [Database Visibility API](#).
- Application Agent Instrumentation APIs: Control and customize transaction detection and correlation, along with exit point detection. Agent APIs include:
  - [PHP Agent API](#)
  - [Python Agent API](#)
  - [Node.js Agent API Reference](#)
  - [C/C++ SDK](#)
- Java Agent API: Customize agent instrumentation. See the SDK folder in the agent home directory.
- Mobile RUM: Instrument mobile applications for real user performance monitoring. See [Instrument iOS Applications](#).
- IoT RUM: Report instrumentation data directly to the EUM Server. See [Instrument Applications with the IoT REST APIs](#).

## Platform API Index

These methods are Below is a list of all the methods in the AppDynamics Controller and Events Service APIs:

### Accounts API

- [Retrieve Controller Audit History](#)
- [Configure Metric Retention by Account](#)
- [Configure Metric Retention by Application](#)

### Application Model API

- [Retrieve All Business Applications](#)
- [Retrieve All Business Transactions in a Business Application](#)
- [Retrieve All Tiers in a Business Application](#)
- [Retrieve All Registered Backends in a Business Application with Their Properties](#)
- [Retrieve Node Information for All Nodes in a Business Application](#)
- [Retrieve Node Information by Node Name](#)
- [Retrieve Node Information for All Nodes in a Tier](#)
- [Retrieve Tier Information by Tier Name](#)

### Metric and Snapshot API

- [Retrieve Metric Hierarchy](#)
- [Retrieve Metric Data](#)

- 
- [Retrieve Transaction Snapshots](#)

## Alert and Respond APIs

### Health Rule API

- [Create a Health Rule](#)
- [Retrieve a List of Health Rules for an Application](#)
- [Retrieve Details of a Specified Health Rule](#)
- [Update a Health Rule](#)
- [Delete a Health Rule](#)

### Schedule API

- [Create a New Schedule](#)
- [Retrieve a List of Schedules for a Given Application](#)
- [Retrieve the Details of a Specified Schedule](#)
- [Update a Schedule](#)
- [Delete a Schedule](#)

### Policy API

- [Create a Policy](#)
- [Retrieve a list of Policies associated with an Application](#)
- [Retrieve Details of a Specified Policy](#)
- [Update a Policy](#)
- [Delete a Policy](#)

### Actions API

- [Create a New Action](#)
- [Retrieve a List of Actions for a Given Application](#)
- [Retrieve Details of a Specified Action](#)
- [Update an Action](#)
- [Delete an Action](#)

### Events and Action Suppression API

- [Retrieve All Health Rule Violations in a Business Application](#)
- [Retrieve Event Data](#)
- [Create Events](#)
- [Create a Custom Event](#)
- [Create Custom URLs for Notifications](#)
- [Create and Delete Action Suppressions](#)
- [Retrieve All Existing Action Suppressions](#)
- [Retrieve a Specific Action Suppression by ID](#)
- [Create a New Action Suppression](#)
- [Delete a Specific Action Suppression by ID](#)

### Configuration API

- [Create and Modify AppDynamics Users](#)
- [Include or exclude a business transaction from monitoring](#)
- [Retrieve All Controller Settings](#)
- [Retrieve a Controller Setting by Name](#)
- [Configure Global Controller Settings](#)
- [Mark Nodes as Historical](#)

### Configuration Import and Export API

- [About the Configuration Import/Export APIs](#)

- 
- [Export Actions from an Application](#)
  - [Import Actions into an Application](#)

- [UI Collector versus JSON Collector Configuration Field Names](#)

## Analytics Events API

- [About the Analytics Events API](#)
- [Custom Event Ingestion Limits](#)
- [Publish Events](#)
- [Create Event Schema](#)
- [Retrieve Event Schema](#)
- [Update Event Schema](#)
- [Delete Event Schema](#)
- [Query Events \(Single Query\)](#)
- [Query Events \(Multiple Queries\)](#)

## RBAC API

- [Create User](#)
- [Get User by ID](#)
- [Get User by Name](#)
- [Get All Users](#)
- [Update User](#)
- [Delete User](#)
- [Create Group](#)
- [Get Group by ID](#)
- [Get Group by Name](#)
- [Get All Groups](#)
- [Update Group](#)
- [Delete Group](#)
- [Add User to Group](#)
- [Remove User from Group](#)
- [Create Role](#)
- [Add Role to User](#)
- [Remove Role from User](#)
- [Add Role to Group](#)
- [Remove Role from Group](#)
- [Get Role by ID](#)
- [Get Role by Name](#)

- [Get All Roles](#)
- [Update Role](#)
- [Delete Role](#)

## License Rules API

- [Creates a New License Rule](#)
- [Returns a Summary of All License Rules for the Current Account](#)
- [Updates a License Rule](#)
- [Deletes a License Rule](#)
- [Retrieve a License Rule via its Id](#)
- [Retrieves a License Rule by Access Key](#)
- [Retrieve a License Rule by Name](#)

## API Clients

This page describes how to create and use the API Clients identity type to provide secure access to the Controller through AppDynamics Controller REST API calls. These calls use Open Authorization (OAuth) token-based authentication.

Follow these steps to create the API client and make calls to the AppDynamics REST APIs:

1. Confirm that you have [access permissions for creating API Clients](#).
2. [Create an API Client](#).
3. [Generate Access Tokens](#).
4. [Use the Access Token to make REST calls](#).
5. [Manage Access Tokens](#).

### Access Permissions for Creating API Clients

To create API clients, you are required to be assigned to the role of an **Account Owner** or an **Administer**. You can view the API Client settings in the **Settings > Administration** page of the Controller.

### Create API Clients

You can create new API Client identity types that can be used to generate OAuth tokens.

1. Log in to the Controller UI as an **Account Owner** or other roles with the **Administer users, groups, roles ...** permission.
2. Click  > **Administration**.
3. Click the API Clients tab to view the list of existing clients.
4. Click **+ Create**.
5. Enter the Client Name and Description.
6. Click **Generate Secret** to populate the Client Secret.  
This will generate a UUID as the secret of the API Client.

 This API Client secret acts as a password. It does not generate the authentication token.

7. Set the Default API-generated Token Expiration. This expiration only applies to authentication tokens generated through the `/controller/api/oauth/access_token` REST API, not to Temporary Access Tokens generated from the UI. See [Using the Access Token](#).

**i** Every API-generated access token has an expiration. Although the default is five minutes, you can set it to any second, minute, or hour limit. The Default API-generated Token has a shorter expiration than the authentication token generated through the Administration UI.

8. Add the **Roles** you would like to associate with this API Client. You can add or remove roles at any time. See [Manage Custom Roles](#).

**i** The REST APIs will use the identity which the access token represents to pull up RBAC permissions and check those permissions at the underlying API level.

9. Click **Save** at the top right.

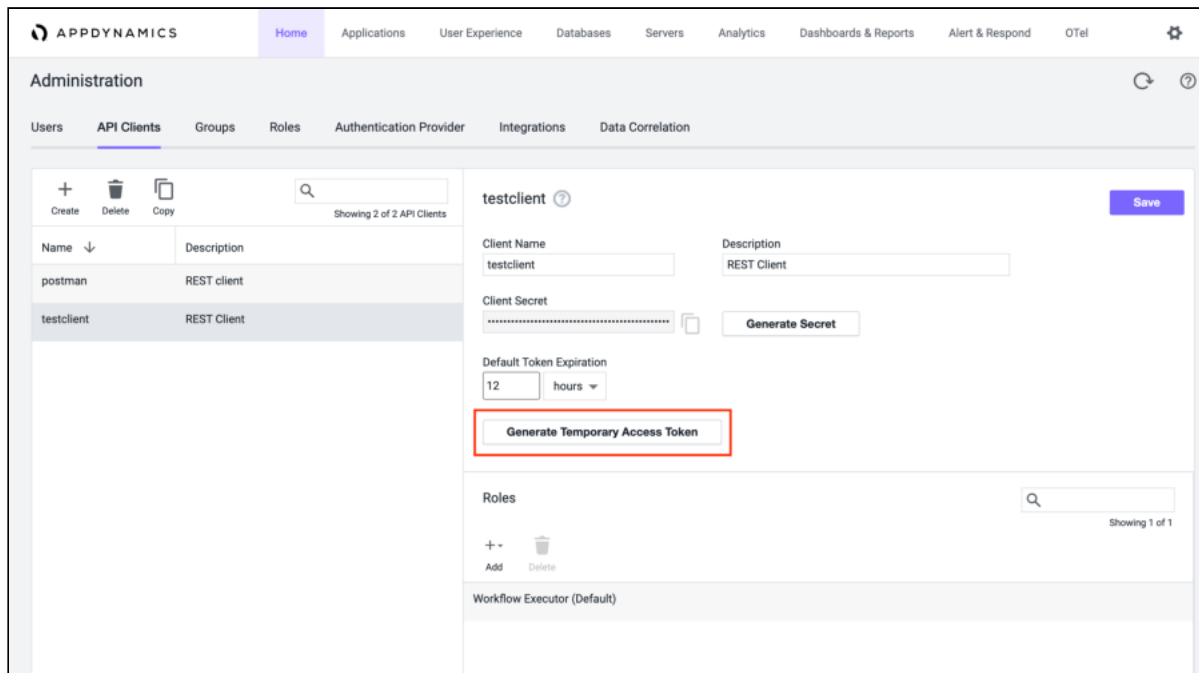

### Generate Access Tokens

You can generate access token for each API access call into your Controller by generating the token through one of the following means:

- **Administration UI:** These tokens usually have a longer expiration. The account administrator can generate and distribute to parties/teams who need Controller access, but do not want to generate tokens frequently.
- **OAuth API:** These tokens usually have a relatively short expiration. The program generates and refreshes regularly before expiration. These tokens are visible from the UI and are not individually tracked and managed.

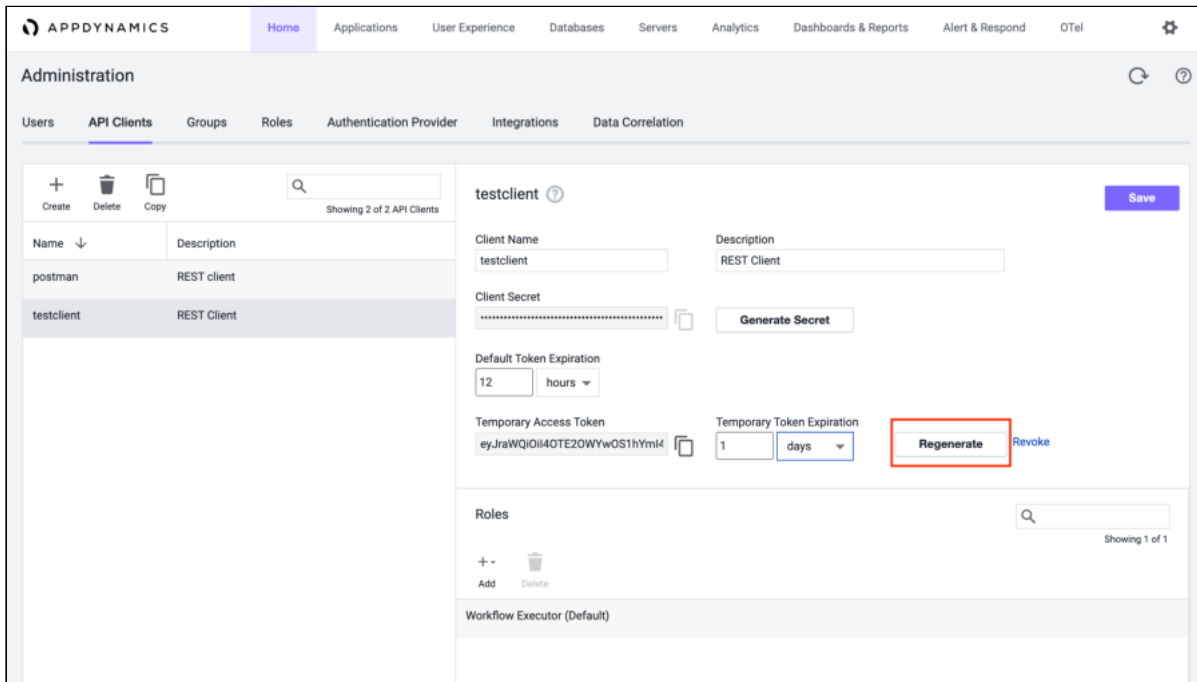

### Generate the Token Through the Administration UI

You can generate the access token by navigating to **Administration > API Clients** and clicking **Generate Temporary Access Token**:

**i** Regenerated tokens do not disable older tokens. The older tokens will remain active until they expire.

When you regenerate a token, you can set the Temporary Token Expiration.

**!** There is no way to retrieve previous or currently valid tokens. Therefore, only the current token can be revoked. Also, API-generated tokens that have Default API-generated Token Expiration, cannot be viewed nor revoked through the UI or REST API.

### Open Authorization (OAuth) Mechanisms

OAuth is an open protocol to allow secure authorization in a simple and standard method from web, mobile, and desktop applications. See <https://oauth.net/>.

It acts as the intermediary on your behalf by providing third-party applications with an access token that authorizes sharing specific account information. Using the OAuth protocol with AppDynamics Controller REST APIs is the best way to securely grant access to your Controller information.

The OAuth authentication process authenticates a request token and uses it to obtain an encrypted access token from your Controller. Once the access token is available, you can use it to make requests to your Controller until the token expires or is revoked.

The tokens are based on JSON Web Tokens (JWT) authentication format, which is the industry standard RFC 7519 method for representing claims securely between two parties.

## Using the Controller APIs

This page describes API usage information. The Controller APIs are served by the Controller instance, rather than by the Events Service or an agent component. They include:

- Accounts API
- Application Model API
- Metric and Snapshot API
- Alert and Respond API
- Configuration API
- Configuration Import and Export APIs
- Analytics Events API

### Controller API Base URI

Except as indicated in the format listing for a particular method, URIs in the Controller API use the following base URI:

```
http://<controller_host>:<controller_port>/controller/rest/
<REST_URI>
```

**i** The port that serves the API is the same primary port for the Controller used by Controller UI and agents.

## Retrieving Data in JSON Format

The AppDynamics Controller APIs return data in eXtensible Markup Language (XML) or JavaScript Object Notation (JSON). The default output format is XML.

Any Controller API with a URI in the `/controller/rest/` format shown in [Controller API Base URI](#) can return data in JSON format.

To retrieve data in JSON, call the API with the output query parameter set to JSON, as follows:

```
curl --user user1@customer1:secret http://demo.appdynamics.com/
controller/rest/applications?output=JSON
[
 {
 "description": "",
 "id": 5,
 "name": "ECommerce_E2E"
 },
 {
 "description": "",
 "id": 8,
 "name": "ECommerce_E2E-Fulfillment"}]
```

```
 },
]
```

You can specify JSON output format for any of the Controller APIs.

When a client uses HTTP 1.1 and accepts gzip content-encoding, the Controller returns JSON responses using `gzip` compression.

### Authentication

You can use OAuth identity types for authentication. See [API Clients](#).

To invoke the REST APIs using basic HTTP authentication, you must provide the authentication credentials as well as your account information. These are:

- Account: the AppDynamics tenant account name
- Username: a user in that account
- Password: the password for that account

Pass the credentials in the following form:

```
<your_username>@<your_accountname>:<your_password>
```

Most on-premises Controllers are single-tenant Controllers that use `customer1` as the primary default account name. The account name should be left as default. For example:

```
<your_username>@customer1:<your_password>
```

Most SaaS Controllers are multi-tenant Controllers and allow you to replace `customer1` with your own, instance-specific account name. See [Observe License Usage](#).

### Invalid Characters for Usernames and Passwords

REST API calls will not authenticate usernames and passwords containing the characters specified in the following table:

	Invalid Characters
Usernames:	\ / " [ ] :   < > + = ; , ? * , ' % <tab> <space> @
Passwords:	+ %

If you have already created user credentials that contain any of the disallowed characters, such as "user:customer66", create new credentials without the disallowed character for the purpose of accessing the REST APIs.

For usernames or passwords containing the "@" symbol, URL encode the "@" character as %40.

### Copying a Metric URL in the Metric Browser

1. Right-click a metric in the **Metric Browser**.
2. Copy the full REST URL of the metric.
3. Paste the REST URL into your code or onto the command line.

 For security reasons, AppDynamics only supports making API calls programmatically or at the command line. Do not attempt to paste the REST URL into a browser.

## Agent Installer Platform Service API

 AppDynamics Agent Installer Platform Service API is currently beta and is subject to change. If you adopt a beta API, the future versions may not be fully compatible with it. As of version 21.11, [ansible script](#) is available.

Navigate to [Agent Installer Platform Service API](#) to access API Reference details residing on Cisco's DevNet.

The Agent Installer Platform Service API is a collection of public REST endpoints that support the installation and monitoring use cases currently provided through the UI. The Agent Installer supports upgrade and rollback use cases, which is currently supported in the APIs.

You can use simple APIs as building blocks for more sophisticated orchestration scenarios. The AppDynamics Agent Installer streamlines the instrumentation of your applications with AppDynamics monitoring agents.

The Agent Installer:

- Deploys Java and Machine Agents, and is compatible with Linux
- Automatically instruments applications
- Assigns unique names to detected tiers and nodes
- Upgrades and rollbacks the agents

You can deploy other agents using the Getting Started Wizard. See [Agent Installer](#) for details.

### Getting Started

AppDynamics exposes various APIs for customizing and extending its features.

#### Base URI

Every API request begins with this Base URI (template for all production deployments of zero service):

#### Servers

```
https://{tenantName}.saas.appdynamics.com/zero/v1beta
```

### Computed URL

<https://sampletenant.saas.appdynamics.com/zero/v1beta>

### Server Variables

tenantName: sampletenant

## Authorization

You can create and use the identity type, API Clients, to provide secure access to AppDynamics using REST API calls. These calls use Open Authorization (OAuth) token-based authentication. You can create new API Client identity types that can be used to generate OAuth tokens. No roles are required at this time.

To create the OAuth token, use the following API and note the created "Client Name" and "Client Secret":

**i** You must use this API to generate the OAuth token. The token generation method described on the [API Clients](#) page does not work with the Agent Installer Platform Service APIs.

### Templated URL

```
curl --location --request POST
'https://{tenantName}.saas.appdynamics.com/auth/v1/oauth/token' \
--header 'Content-Type: application/x-www-form-urlencoded' \
--data-urlencode 'grant_type=client_credentials' \
--data-urlencode 'client_id={apiClientName}@{accountName}' \
--data-urlencode 'client_secret={apiClientSecret}'
```

#### Template Variables

```
tenantName : sampleTenantName
apiClientName : sampleApiClientName
apiClientSecret : sampleApiClientSecret
accountName : sampleAccountName
```

### Computed URL

```
curl --location --request POST
'https://sampleTenantName.saas.appdynamics.com/auth/v1/oauth/token' \
--header 'Content-Type: application/x-www-form-urlencoded' \
--data-urlencode 'grant_type=client_credentials' \
```

```
--data-urlencode 'client_id=sampleApiClientName@sampleAccountName' \
--data-urlencode 'client_secret=sampleApiClientSecret'
```

### Example Output

```
{
 "token_type": "bearer",
 "access_token":
"eyJraWQiOiJlY2VhYTgwMC01M2NkLTQyNWYtOWYzNS0yZWZhNmUzZmIzMjQiLCJhbGciOiJSUzUxMiJ9.eyJpc3MiOiJBCjBEEw5hbWljcyIsImF1ZCI6IkkFwcERFQVBJcyIsImp0aSI6InhodWQzaXhYY0k2R1I1NVZMUWJIM1EiLCJzdWIiOiJ6ZmktZnVzaW9uLWNsaWVudCIsImkVHlwZSI6IkkFQSV9DTElFTlQlLCJpZCI6ImUxNWEyODhLTEyYTU0NGYzMC04OWQ4LWMxNTQwZmNiOGZlYyIsImFjY3RZCI6ImZiOGQ1YzAxLTVlYzItNGI4ZS1hMmJiLTdhMDRmODA5ZTgyYiIsInRudElkIjo1ZmI4ZDVjMDEtNWVjMi00YjhlLWVhYmItN2EwNGY4MDllODJiIiwiaWF0IjoiYWNjZDk5bWU0iJwcm9qZWN0LXplcm8tMSIsInRlbmFudE5hbWU0iJwcm9qZWN0LXplcm8tMSIsImZtbVRudElkIjo1LCJhY2N0UGVybSI6W10sInJvbGVJZHM0IldLCJpYXQ0IjE2Mjc0ODk5MDIsIm5iZiI6MTYyNzQ0Tc4MiwiaXhwIjoxNjI3NDkwMjAyLCJ0b2t1b1R5cGU0iJlBQ0NFU1MifQ.bz0CQRhyC1l92Qsv7dibmqHNkJXrfL_DkXxk-4qSLAUj5xjj_NloETj8c0Es7PKopeZxrsBVgn_NJHDNM4YFSggW9DmXSBGZbRnQ8EBZhIy2w5821Pg0EErMpEQscSQY459m82kgvX0zDF4S029pYw2bk04JAMlE0UPjMLPXjkB2acs9wcToWitVEWuE1sSm4QZ6BvUz84XF1y8_z_LyhakCIFw0d0Z00G3Q06nKvnJhVtI8kfCKim6LVkE93HirG8j4AxB79L_bPeKm7ZLqKapzE_9qhn1GvE4SQZ345ixpnQchJefXrHILvHj06oKt65PvoAbxKLDxPFeViKtQl4svZeYGF6ujCUAb1SxSs3jgz4YKa b8njVf_FeTS3dpsiw4UtkN_00QRv6QNfyjndk9_iMh46BpHdC0E6kYRVW6rSXuYU7c8ulvU3SKEHoIl0PMjLpotYwHSLved4YUg_GmxstTBNpXeLP7xMxn7vReoM-eIw4IWXuRAt64bWj",

 "expires_in": 300
}
```

You must use the access token for authentication; do not use the refresh token.

## Application Model API

This page describes how application APIs let you retrieve information about the monitored environment as modeled in AppDynamics. This information includes, for example, the names and IDs of the business applications, business transactions, tiers, and nodes in the modeled environment.

## Retrieve All Business Applications

The application API method returns the business application names and internal numeric identifier. Many of the operations in the Controller APIs occur in the context of a business application. Use this method to discover the application names or IDs to use before invoking other methods.

### Format

```
GET /controller/rest/applications
```

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON .	No
time-range-type	Time	<p>A time parameter to filter data based on time range options ( <code>time-range-type</code> , <code>startTime</code> , <code>endTime</code> ). If a <code>time-range-type</code> option is specified, the query returns alive applications on that GMT day, otherwise, the query returns all applications.</p> <ul style="list-style-type: none"> <li>• Case 1: If <code>time-range-type</code> is last T mins and the <code>time-range-type</code> just falls into one GMT day then the API returns all the applications which are alive on that GMT day.</li> <li>• Case 2: If <code>time-range-type</code> is last T mins and the <code>time-range-type</code> falls into 2 GMT days (for example if the current time is 4:05 PST and <code>time-range-type</code> specified is last 10 mins then the API returns applications which are alive on this and the previous GMT day).</li> </ul> <p>This feature is available for SaaS only and the API returns all applications for on-premises.</p> <p>For more information see <a href="#">Metric and Snapshot API</a>.</p>	No

**i** An *alive application* is an application with at least one node that submits at least one metric to the Controller in the provided time range.

### Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/rest/applications

<applications>
 <application>
 <id>5</id>
 <name>ECommerce_E2E</name>
 </application>
 <application>
 <id>8</id>
 <name>ECommerce_E2E-Fulfillment</name>
 </application>
 <application>
 <id>11</id>
 <name>jimix12110919</name>
 <description></description>
 <accountGuid>429c7884-3f36-4b5a-9412-fdf827e6c86e</
accountGuid>
 </application>
</applications>
```

### Retrieve All Business Transactions in a Business Application

#### Format

GET /controller/rest/applications/*application\_name*/business-transactions

#### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>application_name</code>	URI	The application name or application ID.	Yes
<code>exclude</code>	Query	<ul style="list-style-type: none"> <li><code>false</code> : the query retrieves only the business transactions that are included for monitoring.</li> <li><code>true</code> : the query retrieves only the excluded business transactions. Excluded business transactions have been configured to be excluded from monitoring either from the UI or through the REST interface.</li> <li>The default is <code>false</code> .</li> </ul>	No

Parameter Name	Parameter Type	Value	Mandatory
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON .	No
time-range-type	Time	<p>Time parameter to filter data based on time range options ( time-range-type , startTime , endTime ). If a time-range-type option is specified, the query returns alive business transactions on that GMT day, otherwise, the query returns all business transactions.</p> <ul style="list-style-type: none"> <li>• Case 1: If time-range-type is last T mins and the time-range-type just falls into one GMT day then the API returns all the business transactions which are alive on that GMT day.</li> <li>• Case 2: If time-range-type is last T mins and the time-range-type falls into 2 GMT days (for example if the current time is 4:05 PST and time-range-type specified is last 10 mins then the API returns business transactions which are alive on this and the previous GMT day).</li> </ul> <p>This feature is available for SaaS only and the API returns all business transactions for on-premises.</p> <p>See <a href="#">Metric and Snapshot API</a>.</p>	No

**i** An *alive business transaction* is a transaction that submits at least one metric to the Controller in the provided time range.

### Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/rest/applications/5/business-transactions

<business-transactions>
 <business-transaction>
 <id>92</id>
 <name>/user/.POST</name>
 <entryPointType>WEB_SERVICE</entryPointType>
```

```

 <internalName>/user/.POST</internalName>
 <tierId>9</tierId>
 <tierName>ECommerce-Services</tierName>
 <background>>false</background>
</business-transaction>
...
<business-transaction>
 <id>184</id>
 <name>OrderServiceImplService.createOrder</name>
 <entryPointType>WEB_SERVICE</entryPointType>
 <internalName>OrderServiceImplService.createOrder</
internalName>
 <tierId>12</tierId>
 <tierName>Inventory-Services</tierName>
 <background>>false</background>
</business-transaction>
</business-transactions>

```

## Retrieve All Tiers in a Business Application

### Format

GET /controller/rest/applications/application\_name/tiers

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	The application name or application ID.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON .	No

Parameter Name	Parameter Type	Value	Mandatory
time-range-type	Time	<p>Time parameter to filter data based on time range options ( time-range-type , startTime , endTime ). If a time-range-type option is specified, the query returns alive tiers on that GMT day, otherwise, the query returns all tiers.</p> <ul style="list-style-type: none"> <li>• Case 1: If time-range-type is last T mins and the time-range-type just falls into one GMT day then the API returns all the tiers which are alive on that GMT day.</li> <li>• Case 2: If time-range-type is last T mins and the time-range-type falls into 2 GMT days (for example if the current time is 4:05 PST and time-range-type specified is last 10 mins then the API returns tiers which are alive on this and the previous GMT day).</li> </ul> <p>This feature is available for SaaS only and the API returns all tiers for on-premises.</p> <p>See <a href="#">Metric and Snapshot API</a>.</p>	No

**i** An *alive tier* is a tier with at least one node in this tier that submits at least one metric to the Controller in the provided time range.

### Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/rest/applications/5/tiers

<tiers>
<tier>
 <id>8</id>
 <name>Address-Services</name>
 <type>Application Server</type>
 <agentType>APP_AGENT</agentType>
 <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
 <id>16</id>
 <name>Customer-Survey-Services</name>
 <type>Application Server</type>
```

```
<agentType>APP_AGENT</agentType>
<numberOfNodes>1</numberOfNodes>
</tier>
<tier>
 <id>9</id>
 <name>ECommerce-Services</name>
 <type>Application Server</type>
 <agentType>APP_AGENT</agentType>
 <numberOfNodes>2</numberOfNodes>
</tier>
<tier>
 <id>12</id>
 <name>Inventory-Services</name>
 <type>Application Server</type>
 <agentType>APP_AGENT</agentType>
 <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
 <id>17</id>
 <name>Order-Processing-Services</name>
 <type>Application Server</type>
 <agentType>APP_AGENT</agentType>
 <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
 <id>18</id>
 <name>Web-Tier-Services</name>
 <type>Web Server</type>
 <agentType>NATIVE_WEB_SERVER</agentType>
 <numberOfNodes>1</numberOfNodes>
</tier>
</tiers>
```

## Retrieve All Registered Backends in a Business Application With Their Properties

### Format

```
GET /controller/rest/applications/application_name/backends
```

## Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	Provide either the application name or application id.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

## Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/rest/applications/5/backends
```

```
<backends><backend>
 <id>10</id>
 <name>INVENTORY-MySQL DB-DB</name>
 <exitPointType>JDBC</exitPointType>
 <properties>
 <name-value>
 <id>0</id>
 <name>HOST</name>
 <value>DB</value>
 </name-value>
 <name-value>
 <id>0</id>
 <name>MAJOR_VERSION</name>
 <value>5.5.44-0ubuntu0.14.04.1</value>
 </name-value>
 <name-value>
 <id>0</id>
 <name>PORT</name>
 <value>3306</value>
 </name-value>
 <name-value>

</nodes>
```

## Retrieve Tier Information by Tier Name

### Format

```
GET /controller/rest/applications/application_name/tiers/tier_name
```

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	The application name or application ID.	Yes
tier_name	URI	Tier name or ID.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON .	No

### Example

```
curl --user user1@customer1:welcome http://
demo.appdynamics.com:8090/controller/rest/applications/5/tiers/
14

<tiers><tier>
 <id>14</id>
 <name>Inventory Server</name>
 <type>Application Server</type>
 <agentType>APP_AGENT</agentType>
 <numberOfNodes>1</numberOfNodes>
</tier>
</tiers>
```

## Metric and Snapshot API

This page describes the Controller Metrics and Events API methods that allow you to retrieve information on metric data and various types of activities in your monitored environment. You can also configure how long you retain the metrics.

**i** Alternatively, you can use the [AppDynamics DEXTER](#) extension to query AppDynamics data. However, you must not run this extension tool during peak hours because it may impact the Controller performance.

### Data Retention for Metric and Snapshot API

#### Default Granularity for Time Ranges

The granularity depends on the time range when fetching data. The table below specifies the granularity of the data for different time ranges.

Time Range	Granularity
0–1459 minutes (0–24.20 hours)	1 minute
1460–2940 minutes (24.20 - 49 hours)	10 minutes
> 49 hours	60 minutes

If no data is fetched or the time range is invalid, naturally, no data granularity will be applied.

#### Data Aggregation

You can set the `rollup` query string parameter to `true` to request aggregated data (one datapoint). You can disable data aggregation by setting `rollup=false`. The default value is `true`.

For example: `/controller/rest/applications/application_name/metrics?rollup=true`

#### Time Ranges

You can set the time range for data with the query string parameter `time-range-type`. The following values are supported for `time-range-type`:

- `BEFORE_NOW`
- `BEFORE_TIME`
- `AFTER_TIME`
- `BETWEEN_TIMES`

#### Request Custom Data Granularity

To request data at a custom granularity, do the following:

- Set `rollup=true` or do not specify the `rollup` property.
- Set the desired time range for the aggregated data with the query string parameter `time-range`.
- Configure the range with `time-range` with a frequency:
  - For `BETWEEN_TIMES`, set the frequency by specifying the start and end times with the parameters `start-time` and `end-time`.
  - For `BEFORE_NOW`, specify the parameter `duration-in-mins`.

- For `AFTER_TIME` , specify the parameters `duration-in-mins` and the `start-time`.
- For `BEFORE_TIME` , specify the parameters `duration-in-mins` and the `end-time`.

### Example Requests

Configured Range and Frequency	Description of Data Granularity
<code>?rollup=true&amp;time-range-type=BETWEEN_TIMES&amp;start-time=1682841600000&amp;end-time=1682841603600</code>	Return the metric data aggregated between the specified start and end times (60 minutes).
<code>?rollup=true&amp;time-range-type=BEFORE_NOW&amp;duration-in-mins=120</code>	Return the metric data aggregated 120 minutes ago until now.
<code>?rollup=true&amp;time-range-type=BEFORE_TIME&amp;end-time=1682841603600&amp;duration-in-mins=15</code>	Return the metric data aggregated from 15 minutes before <code>end-time</code> until the <code>end-time</code> .

See [Using Time Ranges](#) for descriptions of the parameters and more examples.

### Retrieve Metric Hierarchy

This API returns information about the metric tree structure. Because it retrieves the first generation of child elements, you can only expand the children of the folder type.

- If a child element is a container item in the response, its type value is `folder` .
- Otherwise, the type value for the child element is `leaf` .

You can recurse the metric tree structure further by using the `metric-path` parameter as described in the [Metric Data API](#).

### Format

GET `/controller/rest/applications/application_name/metrics`

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>application_name</code>	URI	The name or ID of the business or EUM ( <code>browser/mobile/IoT</code> ) application. Use the call to get the application ID in the <a href="#">Application Model API</a> .	Yes

Parameter Name	Parameter Type	Value	Mandatory
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON .	No
metric-path	Query	The path to the metric in the metric hierarchy.  <div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;"> <p><b>i</b> When including the pipe (   ) or backslash ( \ ) special characters in the metric-path , you must include an additional backslash to indicate escape.</p> </div>	No

### Example

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications/ECommerce_E2E/metrics"
```

```
<metric-items><metric-item>
 <type>folder</type>
 <name>Backends</name>
</metric-item>
<metric-item>
 <type>folder</type>
 <name>Service Endpoints</name>
</metric-item>
<metric-item>
 <type>folder</type>
 <name>End User Experience</name>
</metric-item>
<metric-item>
 <type>folder</type>
 <name>Errors</name>
</metric-item>
<metric-item>
 <type>folder</type>
 <name>Business Transaction Performance</name>
```

```

</metric-item>
<metric-item>
 <type>folder</type>
 <name>Information Points</name>
</metric-item>
<metric-item>
 <type>folder</type>
 <name>Overall Application Performance</name>
</metric-item>
<metric-item>
 <type>folder</type>
 <name>Application Infrastructure Performance</name>
</metric-item>
<metric-item>
 <type>folder</type>
 <name>Mobile</name>
</metric-item></metric-items>

```

## Retrieve Metric Data

The metric data method lets you get values generated for metrics. To use this method, specify the following parameters to the API:

- The path of the metric to retrieve.
- The time frame for the data.

Using the Controller UI is the simplest way to learn how to construct the metric path and time range-related parameters.

1. Right-click on the metric in the Metric Browser.
2. Select **Copy REST URL**. The copied URL includes the path to this metric and time range selected in the UI.
3. Certain clients can accept and properly encode the full path value as the metric path parameter.
4. Hover over the metric in the tree or copy it using the **Copy Full Path** option in the right-click menu.

Certain examples below are shown with the **full path value** rather than the fully encoded URL value. If you test calls with the full path, avoid using a pipe character at the start or end of the path.

These sections provide additional details and examples for the metric data method:

- [Metric Response Values](#)
- [Using Wildcards](#)
- [Using Time Ranges](#)
- [Retrieving All Other Traffic Business Transaction Metrics](#)

## Format

```
GET /controller/rest/applications/application_name/metric-data
```

## Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>metric-path</code>	Query	<p>The path to the metric in the metric hierarchy.</p> <div style="border: 1px solid #00aaff; padding: 5px; margin-top: 10px;"> <p><b>i</b> When including the pipe ( ) or backslash (\) special characters in the <code>metric-path</code>, you must include an additional backslash to indicate escape.</p> </div>	Yes
<code>rollup</code>	Query	<p>By default, the values of the returned metrics are rolled up into a single data point (<code>rollup=true</code>). To get separate results for all values within the time range, set the <b>Rollup</b> parameter to <code>false</code> in the query.</p>	No

Additional mandatory parameters for specifying time ranges are described in [Using Time Ranges](#).

### Example

Retrieve metric values for a metric at an absolute path:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications/ECommerce_E2E/metric-data?metric-path=Overall%20Application%20Performance%7CAverage%20Response%20Time%20%28ms%29&time-range-type=BEFORE_NOW&duration-in-mins=15"

<metric-datas><metric-data>
 <metricId>2339</metricId>
 <metricPath>Overall Application Performance|Average Response Time (ms)</metricPath>
 <metricName>BTM|Application Summary|Average Response Time (ms)</metricName>
 <frequency>ONE_MIN</frequency>
 <metricValues>
 <metric-value>
 <startTimeInMillis>1450562160000</startTimeInMillis>
 <value>302</value>
 <min>0</min>
 <max>15212</max>
```

```

 <current>15212</current>
 <sum>97800</sum>
 <count>324</count>
 <standardDeviation>0.0</standardDeviation>
 <occurrences>0</occurrences>
 <useRange>true</useRange>
 </metric-value>
</metricValues>
</metric-data>
</metric-datas>

```

## Metric Response Values

Metrics results include the following fields:

Name	Definition
current	The value for the current minute. This is used only when the time rollup type used by the Controller is current.
count	The number of times the agent collected the metric over the selected time period.
min, max	The minimum and maximum values reported across the selected time period. These are not used for all metric types.
occurrences	The number of data samples taken by the Controller to calculate the standard deviation.
standardDeviation	The intermediate values calculated by the Controller during time rollup used to calculate standard deviation. See <a href="#">Dynamic Baselines</a> .
startTimeInMillis	The <code>startTimeInMillis</code> is the start time of the time range to which the result metric data applies in UNIX epoch time.
sum	The total accumulated value for the metric over the selected time period.
useRange	Used internally by the Controller to process the metric.

Name	Definition
value	<p>The <code>value</code> value is one of the following for all metric values reported across the configured evaluation time length:</p> <ul style="list-style-type: none"> <li>• Arithmetic average: if the metric time rollup type is average.</li> <li>• Sum: if the metric time rollup type is sum.</li> <li>• Latest: if the metric time rollup type is current.</li> </ul>

**i** `min` and `max` values are not available for any count-based or sum-based metric except when the metric is rolled up to hourly or daily data points. These metrics include errors per minute, calls per minute, and so on.

### Using Wildcards

When you copy the REST URL in the Metric Browser, you get the path to a specific metric within a specific application and tier. Alternatively, you can use wildcard characters in one or more steps in the URL path to get metric data for entities, including multiple business transactions, tiers, or nodes.

The following format examples show where to put wildcard characters in various metric paths to achieve particular results. For reading clarity, these format examples use the **Full Path** for the metric rather than the REST URL. For a full working example, click the expanding link under each format listing:

- Retrieve the **app agent availability time** for all tiers in the application using a wildcard for the tier name:

```
/controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-path=Application Infrastructure Performance|*|Agent|App|Availability&time-range-type=BEFORE_NOW&duration-in-mins=15
```

#### Full Example:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-path=Application%20Infrastructure%20Performance%7C*%7CAgent%7CApp%7CAvailability&time-range-type=BEFORE_NOW&duration-in-mins=15"

<metric-datas><metric-data>
 <metricId>2329</metricId>
 <metricPath>Application Infrastructure Performance|Fulfillment-Services|Agent|App|Availability</metricPath>
 <metricName>Agent|App|Availability</metricName>
 <frequency>ONE_MIN</frequency>
 <metricValues>
 <metric-value>
 <startTimeInMillis>1450562460000</startTimeInMillis>
 <value>1</value>
 <min>0</min>
 <max>0</max>
 <current>1</current>
 <sum>15</sum>
```

```

 <count>15</count>
 <standardDeviation>0.0</standardDeviation>
 <occurrences>0</occurrences>
 <useRange>>false</useRange>
 </metric-value>
</metricValues>
</metric-data>
<metric-data>
 <metricId>2329</metricId>
 <metricPath>Application Infrastructure Performance|Fulfillment-Client-
Services|Agent|App|Availability</metricPath>
 <metricName>Agent|App|Availability</metricName>
 <frequency>ONE_MIN</frequency>
 <metricValues>
 <metric-value>
 <startTimeInMillis>1450562460000</startTimeInMillis>
 <value>1</value>
 <min>0</min>
 <max>0</max>
 <current>1</current>
 <sum>15</sum>
 <count>15</count>
 <standardDeviation>0.0</standardDeviation>
 <occurrences>0</occurrences>
 <useRange>>false</useRange>
 </metric-value>
 </metricValues>
</metric-data>
</metric-datas>

```

- Retrieve the **CPU % Busy** metric for all the nodes in all tiers using a wildcard for the tier and node names:

```

/controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-
path=Application Infrastructure Performance|*|Individual Nodes|*|Hardware
Resources|CPU|%Busy&time-range-type=BEFORE_NOW&duration-in-mins=15

```

**Full Example:**

```

curl --user user1@customer1:your_password "http://demo.appdynamics.com/
controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-
path=Application%20Infrastructure%20Performance%7C*%7CIndividual%20Nodes%7C
*%7CHardware%20Resources%7CCPU%7C%25Busy&time-range-
type=BEFORE_NOW&duration-in-mins=15"

<metric-datas><metric-data>
 <metricId>2231</metricId>
 <metricPath>Application Infrastructure Performance|Fulfillment-Client-
Services|Individual Nodes|FulfillmentClient|Hardware Resources|CPU|%Busy</
metricPath>
 <metricName>Hardware Resources|CPU|%Busy</metricName>

```

```

<frequency>ONE_MIN</frequency>
<metricValues>
 <metric-value>
 <startTimeInMillis>1450563000000</startTimeInMillis>
 <value>10</value>
 <min>2</min>
 <max>82</max>
 <current>6</current>
 <sum>4474</sum>
 <count>450</count>
 <standardDeviation>0.0</standardDeviation>
 <occurrences>0</occurrences>
 <useRange>true</useRange>
 </metric-value>
</metricValues>
</metric-data>
<metric-data>
 <metricId>2231</metricId>
 <metricPath>Application Infrastructure Performance|Fulfillment-Services|
Individual Nodes|Fulfillment|Hardware Resources|CPU|%Busy</metricPath>
 <metricName>Hardware Resources|CPU|%Busy</metricName>
 <frequency>ONE_MIN</frequency>
 <metricValues>
 <metric-value>
 <startTimeInMillis>1450563000000</startTimeInMillis>
 <value>10</value>
 <min>2</min>
 <max>82</max>
 <current>6</current>
 <sum>4478</sum>
 <count>450</count>
 <standardDeviation>0.0</standardDeviation>
 <occurrences>0</occurrences>
 <useRange>true</useRange>
 </metric-value>
 </metricValues>
</metric-data>
</metric-datas>

```

- Retrieve the **Calls per Minute** metric for all the business transactions on the ECommerce tier using a wildcard for the business transaction name:

```

/controller/rest/applications/ACME Book Store Application/metric-data?
metric-path=Business Transaction Performance|Business Transactions|
ECommerce Server|*|Calls per Minute&time-range-type=BEFORE_NOW&duration-in-
mins=15

```

**Full Example:**

```

curl --user user1@customer1:your_password "http://demo.appdynamics.com/
controller/rest/applications/ECommerce_E2E/metric-data?metric-
path=Business%20Transaction%20Performance%7CBusiness%20Transactions%7CEComm
erice-Services%7C*%7CCalls%20per%20Minute&time-range-
type=BEFORE_NOW&duration-in-mins=15"

## Disabling Data Rollup

By default, metric data is rolled up for the time frame you request. You can set the rollup parameter to false to get all data points within the time frame. For example:

```
curl --user user1@customer1:your_password "http://
demo.appdynamics.com/controller/rest/applications/ECommerce_E2E/
metric-data?rollup=false&metric-
path=Overall%20Application%20Performance%7CAverage%20Response%20
Time%20%28ms%29&time-range-type=BEFORE_NOW&duration-in-mins=15"
```

```
<metric-datas><metric-data>
 <metricId>2339</metricId>
 <metricPath>Overall Application Performance|Average Response
Time (ms)</metricPath>
 <metricName>BTM|Application Summary|Average Response Time
(ms)</metricName>
 <frequency>ONE_MIN</frequency>
 <metricValues>
 <metric-value>
 <startTimeInMillis>1450503540000</startTimeInMillis>
 <value>334</value>
 <min>0</min>
 <max>3340</max>
 <current>2</current>
 <sum>6678</sum>
 <count>20</count>
 <standardDeviation>0.0</standardDeviation>
 <occurrences>0</occurrences>
 <useRange>true</useRange>
 </metric-value>
 <metric-value>
 <startTimeInMillis>1450503600000</startTimeInMillis>
 <value>771</value>
 <min>1</min>
 <max>11235</max>
 <current>4113</current>
 <sum>15424</sum>
 <count>20</count>
 <standardDeviation>0.0</standardDeviation>
 <occurrences>0</occurrences>
 <useRange>true</useRange>
 </metric-value>
 </metric-values>
</metric-data>
```

```

 <startTimeInMillis>1450503660000</startTimeInMillis>
 <value>215</value>
 <min>0</min>
 <max>4249</max>
 <current>3</current>
 <sum>4306</sum>
 <count>20</count>
 <standardDeviation>0.0</standardDeviation>
 <occurrences>0</occurrences>
 <useRange>true</useRange>
 </metric-value>
 ...
</metricValues>
</metric-data>
</metric-datas>

```

### Using Time Ranges

You can fetch metric data for any time range, including for a range between specific points, such as from 2:00 to 2:15 pm Monday, or for a relative time range.

Time-based input parameters for the metric data API method let you specify a time range in several ways, as described in the following table.

### Time Range Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
time-range-type	Query	Possible values are: <ul style="list-style-type: none"> <li>BEFORE_NOW —must specify the duration-in-mins parameter.</li> <li>BEFORE_TIME —must specify the duration-in-mins and end-time parameters.</li> <li>AFTER_TIME —must specify the duration-in-mins and start-time parameters.</li> <li>BETWEEN_TIMES —must specify the start-time and end-time parameters. The BETWEEN_TIMES range includes the start- time and excludes the end-time.</li> </ul>	Yes

Parameter Name	Parameter Type	Value	Mandatory
<code>duration-in-mins</code>	Query	Duration (in minutes) to return the metric data.	If time-range-type is <code>BEFORE_NOW</code> , <code>BEFORE_TIME</code> , or <code>AFTER_TIME</code>
<code>start-time</code>	Query	Start time (in milliseconds) from which the metric data is returned in UNIX epoch time.	If time-range-type is <code>AFTER_TIME</code> or <code>BETWEEN_TIMES</code>
<code>end-time</code>	Query	End time (in milliseconds) until which the metric data is returned in UNIX epoch time.	If time-range-type is <code>BEFORE_TIME</code> or <code>BETWEEN_TIMES</code>

### Examples

Most examples on this page use the previous 15 minutes as the request time range. The following format examples show other ways you can define the time range for the request.

- Time range of the 15 minutes after December 19, 2015 5:40:00 AM GMT:

```
?time-range-type=AFTER_TIME&start-time=1450532400000&duration-in-mins=15
```

- Time range of the 15 minutes before December 19, 2015 6:00:00 AM GMT.

```
?time-range-type=BEFORE_TIME&end-time=1450533600000&duration-in-mins=15
```

- Time range between December 19, 2015 6:00:00 AM GMT and December 19, 2015 6:30:00 AM GMT:

```
?time-range-type=BETWEEN_TIMES&start-time=1450533600000&end-time=1450535400000
```

### Retrieving All Other Traffic Business Transaction Metrics

The **All Other Traffic** business transaction is a type of business transaction that aggregates traffic for new transactions once the business transaction registration limits are reached and uses the special identifier, `_APPDYNAMICS_DEFAULT_TX_`, in API URI paths. See [Business Transactions](#).

The following shows an example of retrieving the average CPU used by the **All Other Traffic** business transaction:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com:8090/controller/rest/applications/ACME%20Book%20Store%20Application/metric-data?metric-path=Business%20Transaction%20Performance%7CBusiness%20Transacti
```

```
ons%7CECommerce%20Server%7C_APPDYNAMICS_DEFAULT_TX_%7CAverage%20
CPU%20Used%20%28ms%29&time-range-type=BEFORE_NOW&duration-in-
mins=15"

<metric-datas><metric-data>
 <metricId>4000</metricId>
 <metricPath>Business Transaction Performance|Business
Transactions|ECommerce Server|_APPDYNAMICS_DEFAULT_TX_|Average
CPU Used (ms)</metricPath>
 <metricName>BTM|BTs|BT:78|Component:12|Average CPU Used (ms)</
metricName>
 <frequency>ONE_MIN</frequency>
 <metricValues>
 <metric-value>
 <startTimeInMillis>1450570800000</startTimeInMillis>
 <value>22</value>
 <min>0</min>
 <max>50</max>
 <current>20</current>
 <sum>3140</sum>
 <count>146</count>
 <standardDeviation>0.0</standardDeviation>
 <occurrences>0</occurrences>
 <useRange>>true</useRange>
 </metric-value>
 </metricValues>
</metric-data>
</metric-datas>
```

## Retrieve Transaction Snapshots

Snapshots contain details on transactions, by request segment. The time range parameters are the same for snapshots as for retrieving metrics. You can similarly specify a relative time range or a specific range. See [Using Time Ranges](#).

### Format

```
GET /controller/rest/applications/application_name/request-snapshots
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	Provide either the application name or application id.	Yes
time-range-type	Query	<p>Possible values are:</p> <ul style="list-style-type: none"> <li>BEFORE_NOW —must specify the duration-in-mins parameter.</li> <li>BEFORE_TIME —must specify the duration-in-mins and end-time parameters.</li> <li>AFTER_TIME —must specify the duration-in-mins and start-time parameters.</li> <li>BETWEEN_TIMES —must specify the start-time and end-time parameters. The BETWEEN_TIMES range includes the start- time and excludes the end-time.</li> </ul>	Yes
duration-in-mins	Query	Duration (in minutes) to return the data.	If time-range-type is BEFORE_NOW, BEFORE_TIME, or AFTER_TIME

Parameter Name	Parameter Type	Value	Mandatory
start-time	Query	Start time (in milliseconds) from which the data is returned.	If time-range type is AFTER_TIME or BETWEEN_TIMES
end-time	Query	End time (in milliseconds) until which the data is returned.	If time-range type is BEFORE_TIME or BETWEEN_TIMES
guids	Query	Array of comma-separated GUIDs for the transaction snapshots. If not specified, retrieves all snapshots in the specified time range.	No

Parameter Name	Parameter Type	Value	Mandatory
archived	Query	True to retrieve archived snapshots. Default is false.	No
deep-dive-policy	Query	Array of comma-separated snapshot policy filters to apply. Valid values are: <ul style="list-style-type: none"> <li>SLA_FAILURE</li> <li>TIME_SAMPLING</li> <li>ERROR_SAMPLING</li> <li>OCCURRENCE_SAMPLING</li> <li>ON_DEMAND</li> <li>APPLICATION_STARTUP</li> <li>SLOW_DIAGNOSTIC_SESSION</li> <li>ERROR_DIAGNOSTIC_SESSION</li> <li>POLICY_FAILURE_DIAGNOSTIC_SESSION</li> <li>DIAGNOSTIC_SESSION</li> <li>INFLIGHT_SLOW_SESSION</li> </ul>	No
application-component-ids	Query	Array of comma-separated tier IDs to filter. The default is all the tiers in the application.	No
application-component-node-ids	Query	Array of comma-separated node ID filters. Default is all the nodes in the application	No
business-transaction-ids	Query	Array of comma-separated business transaction ID filters. Default is all the business transactions in the application.	No
user-experience	Query	Array of comma-separated user experiences filters. Valid values are: <ul style="list-style-type: none"> <li>NORMAL</li> <li>SLOW</li> <li>VERY_SLOW</li> <li>STALL</li> <li>ERROR</li> </ul>	No
first-in-chain	Query	If true, retrieve only the first request from the chain. Default is false.	No

Parameter Name	Parameter Type	Value	Mandatory
need-props	Query	<p>If <code>true</code>, the values of the following snapshot properties are included in the output. These values correspond to the values of the <code>data-collector-type</code> parameter. If <code>false</code>, the default, these values are empty in the output.</p> <ul style="list-style-type: none"> <li>• <code>errorDetails</code></li> <li>• <code>errorIDs</code></li> <li>• <code>httpParameters</code></li> <li>• <code>businessData</code></li> <li>• <code>cookies</code></li> <li>• <code>httpHeaders</code></li> <li>• <code>sessionKeys</code></li> <li>• <code>responseHeaders</code></li> <li>• <code>logMessages</code></li> <li>• <code>transactionProperties</code></li> <li>• <code>transactionEvents</code></li> <li>• <code>dotnetProperty</code></li> </ul>	No
need-exit-calls	Query	If <code>true</code> , exit calls are included in the result. Default is <code>false</code> .	No
execution-time-in-milis	Query	If set, retrieves only data for requests with execution times greater than this value.	No
session-id	Query	If set, retrieves data only for this session id.	No
user-principal-id	Query	If set, retrieves data only for this user login.	No
error-ids	Query	Array of comma-separated error codes to filter by. The default is to retrieve all error codes.	No
starting-request-id, ending-request-id	Query	If set, retrieves data only for this range of request IDs.	No
error-occurred	Query	If <code>true</code> , retrieves only error requests. Default is <code>false</code> .	No

Parameter Name	Parameter Type	Value	Mandatory
diagnostic-snapshot	Query	If <code>true</code> , retrieves only diagnostic snapshots. Default is <code>false</code> .	No
bad-request	Query	If <code>true</code> , retrieves only slow and error requests. Default is <code>false</code> .	No
diagnostic-session-guid	Query	Array of comma-separated diagnostic session GUIDs to filter.	No
data-collector-name	Query	Used with <code>data-collector-value</code> to filter snapshot collection based on the value of a data collector.	No
data-collector-value	Query	Used with <code>data-collector-name</code> to filter snapshot collection based on the value of a data collector.	If <code>data-collector-name</code> is set.

Parameter Name	Parameter Type	Value	Mandatory
<code>data-collector-type</code>	Query	Used with <code>data-collector-name</code> and <code>data-collector-value</code> to filter snapshot collection based on the value of a data collector. Some of the values contain spaces. All are case-sensitive and where indicated the spaces are required. Valid values are: <ul style="list-style-type: none"> <li>• Error IDs</li> <li>• Stack Traces</li> <li>• Error Detail</li> <li>• Http Parameter</li> <li>• Business Data (This type is a method invocation data collector.)</li> <li>• Cookie</li> <li>• Http Header</li> <li>• Session Key</li> <li>• Response Header</li> <li>• Log Message</li> <li>• Transaction Property</li> <li>• Transaction Event</li> <li>• Dotnet Property</li> <li>• isProtoBuf</li> <li>• EUM Request GUID</li> </ul>	
<code>output</code>	Query	HTTP Request parameter included as part of the URL to change the output format Valid values are <code>XML</code> (default) or <code>JSON</code> .	No
<code>maximum-results</code>	Query	If specified, the number of maximum results will be returned. If not specified, a default of 600 results can be returned at most.	No

### Examples

- Retrieve list of transaction snapshots for the ACME Book Store:

```
/controller/rest/applications/ECommerce_E2E-Fulfillment/request-snapshots?
time-range-type=BEFORE_NOW&duration-in-mins=5
```

**Full Example:**

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/
controller/rest/applications/ECommerce_E2E-Fulfillment/request-snapshots?
time-range-type=BEFORE_NOW&duration-in-mins=5"
```

```

## Retrieve Controller Audit History

The Controller audit history is a record of the configuration and user activities in the Controller configuration. The `ControllerAuditHistory` API method returns the audit log for the time range specified. The output format can be `JSON` or `CSV`. This information is the same as that found in the `audit.log` file. See [Platform Log Files](#) and [Log File Information by Platform](#)

## Format

GET /controller/ ControllerAuditHistory?startTime=<start-time>&endTime=<end-time>&include=<field>:<value>&exclude=<field>:<value>

## Input parameters

Parameter Name	Parameter Type	Value	Mandatory
start-time	Query	Start time in the format: yyyy-MM-dd'T'HH:mm:ss.SSSZ	Yes
end-time	Query	End time in the format: y yyyy-MM-dd'T'HH:mm:ss.SSSZ	Yes
time-zone-id	Query	Time zone	No
include	Query	Restricted information in the Controller audit history	No
exclude	Query	Restricted information in the Controller audit history	No

- To control the size of the output, the range between the start-time and end-time cannot exceed 24 hours. For periods longer than 24 hours, use multiple queries with consecutive time parameters.
- Multiple filters of the same type are allowed.
  - The backend API treats included filters with the same < field > with relationship OR
  - Filters with different < field > with relationship AND . There is no direct interaction between include and exclude filters.
- Each filter needs to be a parameter.  
e.g. include=filterName1:filterValue1&include=filterName2:filterValue2 . See the below examples:

```
http://localhost:8080/controller/ControllerAuditHistory?
startTime=yyyy-MM-dd&HH:mm:ss.SSSZ&endTime=yyyy-MM-
dd&HH:mm:ss.SSSZ?
include=filterName1:filterValue1&include=filterName1:filterValue
1&exclude=filterName1:filterValue1&exclude=filterName1:filterVal
ue1
```

## Configure Metric Retention by Account

You can configure the Controller to purge stale metrics once a day based on the account.

- Stale metrics are metrics that have not had new data reported based on the number of days configured.
- This only deletes EUM and SIM metrics that are more than two days old.

 To configure [this](#) option, you must be the Controller owner. SaaS customers cannot use [this](#) API.

### Format

POST /controller/api/accounts/<account\_id>/metricstaleduration/<number\_of\_days>

### Input Parameters

Parameter Name	Parameter Type	Value
account_id	URI	The account ID.
number_of_days	Integer	The number of days you want to retain stale metrics.

### Example

 SaaS customers cannot use [this](#) API because `root@system` is owned by our SaaS Operations team.

```
curl -X POST -u root@system:your_password "http://demo.appdynamics.com:8090/controller/api/accounts/2/metricstaleduration/3"
```

### Configure Metric Retention by Application

You can configure the Controller to purge stale metrics once a day based on application.

- Stale metrics are metrics that have not had new data reported based on the number of days configured.
- This only deletes EUM and SIM metrics that are more than two days old.

To configure this option, you must have administrator permissions or higher.

### Format

POST /controller/api/accounts/<account\_id>/applications/<application\_name>/metricstaleduration/<number\_of\_days>

### Input Parameters

Parameter Name	Parameter Type	Value
account_id	URI	The account ID.
application_id	URI	The application ID.

Parameter Name	Parameter Type	Value
number_of_days	Integer	The number of days you want to retain stale metrics.

### Example

```
curl -X POST -u user1@customer1:your_password "http://demo.appdynamics.com:8090/controller/api/accounts/2/applications/12/metricstaleduration/3"
```

## Alert and Respond API

This page provides links to the Alert and Respond APIs that allow you to create, configure and manage:

- [Health Rules](#)
- [Schedules](#)
- [Policies](#)
- [Actions](#)
- [Email Digests](#)
- [Action Suppression](#)
- [Events and Action Suppression](#)

 You can create and use the identity type, `API Clients`, to provide secure access to the AppDynamics controller using REST API calls. These calls use Open Authorization (OAuth) token-based authentication. You can create new API Client identity types that can be used to generate OAuth tokens. See [API Clients](#).

## Health Rule API

### Related pages:

- [Health Rules](#)

This page describes the Health Rule API methods you can use to create, configure, update, and delete health rules for multiple applications simultaneously. This API allows you to programmatically update and maintain single or multiple health rules and migrate them across applications or Controllers.

- Minimal syntax validation of the JSON payload is done when creating the health rule.
- Path validation for a specified metric is not done. Ensure that you provide valid paths for all the metrics you define.
- If metrics are not resolved during the health rule evaluation, the health rule attains an unknown (?) state. Ensure that you provide valid metrics for all the affected entities you define.

## Create a Health Rule

Creates a new health rule from the specified JSON payload. See [Property Details](#).

## Resource URL

POST <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/health-rules

## Request/Response Format

JSON

## Example

This example creates a health rule with an affected entity type `business transaction performance` and defines the evaluation criteria for the health rule. See [Download Examples](#).

## Retrieve a List of Health Rules for an Application

This API returns a list of all the health rule IDs and names for the specified application ID. To retrieve complete details of the health rule, use `GET //health-rule/{health-rule-id}`. See [Property Details](#).

### Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules
```

### Response Format

JSON

### Example Response

```

[
 {
 "id": 1,
 "name": "Machine Availability is too low",
 "enabled": true
 },
 {
 "id": 2,
 "name": "Overall Disk Space Available is too low",
 "enabled": true
 },
 {
 "id": 3,
 "name": "CPU Usage is too high",
 "enabled": true
 },
 {
 "id": 4,

```

```

 "name": "Memory Usage is too high",
 "enabled": true
 },
 {
 "id": 5,
 "name": "Swap Usage is too high",
 "enabled": true
 },
 {
 "id": 6,
 "name": "Disk Usage is too high on at least one partition",
 "enabled": false
 }
]

```

### Retrieve Details of a Specified Health Rule

This API Returns the health rule details for the specified health rule ID.

 JMX Health Rules are not supported.

### Resource URL

GET <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/health-rules/{health-rule-id}

### Response Format

JSON

### Example Response

```

{
 "id": 26,
 "name": "My new health rule",
 "enabled": true,
 "useDataFromLastNMinutes": 30,

## Delete a Health Rule

Deletes an existing health rule with the specified ID.

### Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules/{health-rule-id}
```

## Update a Health Rule Configuration

This API updates one or more configuration setting(s) of a health rule. See [Property Details](#)

You can enter one or both of the following field(s) in the request:

- Enable/disable the health rule.
- Update the schedule of the health rule.

### Resource URL

```

### Property Details

#### HealthRule

Property Name	Type and Valid Values	Description
id	integer	Auto-generated by the system and returned in the response. It is a <code>readOnly</code> value.
name	string Minimum length: 1	Name of the health rule.

Property Name	Type and Valid Values	Description
enabled	boolean Default value: true	Sets the health rule to enabled/disabled state. A health rule is evaluated only if it is in enabled state.
useDataFromLastNminutes	integer Minimum value: 1 Maximum value: 360	The time interval (in minutes) during which the data collected is considered for health rule evaluation. Enter a value between 1 to 9 or a multiple of 10 that is less than 360.
waitTimeAfterViolation	integer Minimum time: 1 minute	The wait time after a violation in minutes.

Property Name	Type and Valid Values	Description
scheduleName	string Default option: Always	Name of schedule to be associated with the health rule for evaluation.

Property Name	Type and Valid Values	Description						
affects*		<p>Describes entities affected by the health rule. For example, business transactions, servers, or databases.</p> <p>Affects</p> <table border="1" data-bbox="391 716 1495 1740"> <thead> <tr> <th data-bbox="391 716 764 800">Property</th> <th data-bbox="764 716 1008 800">Type</th> <th data-bbox="1008 716 1495 800">Enums</th> </tr> </thead> <tbody> <tr> <td data-bbox="391 800 764 1740">affectedEntity Type</td> <td data-bbox="764 800 1008 1740">string</td> <td data-bbox="1008 800 1495 1740"> OVERALL_APPLICATION_PERFORMANCE  BUSINESS_TRANSACTION_PERFORMANCE  TIER_NODE_TRANSACTION_PERFORMANCE  TIER_NODE_HARDWARE  SERVERS_IN_APPLICATION  BACKENDS  ERRORS  SERVICE_ENDPOINTS  INFORMATION_POINTS  CUSTOM  DATABASES  SERVERS  EUM_API_MON  EUM_BROWSER_APPS  EUM_MOBILE_APPS  ADVANCED_NETWORK </td> </tr> </tbody> </table>	Property	Type	Enums	affectedEntity Type	string	OVERALL_APPLICATION_PERFORMANCE BUSINESS_TRANSACTION_PERFORMANCE TIER_NODE_TRANSACTION_PERFORMANCE TIER_NODE_HARDWARE SERVERS_IN_APPLICATION BACKENDS ERRORS SERVICE_ENDPOINTS INFORMATION_POINTS CUSTOM DATABASES SERVERS EUM_API_MON EUM_BROWSER_APPS EUM_MOBILE_APPS ADVANCED_NETWORK

HealthRuleSummaryArray

Property	Type
id*	integer
name	string minLength: 1
enabled*	boolean

### HealthRuleConfiguration

The configuration details of a health rule that you can update individually without the need to send the complete health rule JSON payload. You can mention one or more properties and all those properties are set to the new specified values.

Property	Type
enabled	boolean
scheduleName	string

### MetricEvalDetail

Property	Type	Enums
metricEvalDetailType*	string	BASELINE_TYPE SPECIFIC_TYPE

### BaselineMetricEvalDetail

The deviation of a metric from the baseline used to evaluate the health rule.

Property	Type	Enums
metricEvalDetailType*	string	BASELINE_TYPE SPECIFIC_TYPE

Property	Type	Enums
baselineCondition*	string	WITHIN_BASELINE NOT_WITHIN_BASELINE GREATER_THAN_BASELINE LESS_THAN_BASELINE
baselineName*	string minLength: 1	
compareValue*	number minimum: 0	
baselineUnit*	string	STANDARD_DEVIATIONS PERCENTAGE

### SpecificValueMetricEvalDetail

The deviation of a metric from a specific value used to evaluate the health rule.

Property	Type	Enums
metricEvalDetailType*	string	BASELINE_TYPE SPECIFIC_TYPE
compareCondition*	string	GREATER_THAN_SPECIFIC_VALUE LESS_THAN_SPECIFIC_VALUE
compareValue*	number minimum: 0	

### MetricAggregateFunction

Metrics aggregated to determine the deviation and evaluate the health rule.

Property	Type	Enums
MetricAggregateFunction*	string	MINIMUM MAXIMUM VALUE SUM COUNT CURRENT GROUP_COUNT

### SingleMetricEvalDetail

The deviation of a single metric from the aggregated value used to evaluate the health rule.

Property	Type	Enums
evalDetailType*	string	SINGLE_METRIC METRIC_EXPRESSION
metricAggregateFunction*	string	MINIMUM MAXIMUM VALUE SUM COUNT CURRENT GROUP_COUNT

Property	Type	Enums
<code>metricPath*</code>	string minLength: 1 <div style="border: 1px solid #add8e6; padding: 10px; margin-top: 10px;"> <p><b>i</b> To ensure that a metric path for a health rule that includes a machine agent hierarchy is resolved appropriately, append the escape characters "\\\" before the vertical bar for any custom metric. For example:</p> <pre>Application Infrastructure Performance Root\\  Containers\\ Fulfillment- Service Individual Nodes  9b711cda4a83 Hardware Resources CPU %Busy</pre> </div>	
<code>metricEvalDetail*</code>	string	<code>BASELINE_TYPE</code> <code>SPECIFIC_TYPE</code>

### MetricExpressionEvalDetail

The metric expression used to evaluate the health rule.

Property	Type	Enums
<code>evalDetailType*</code>	string	<code>SINGLE_METRIC</code> <code>METRIC_EXPRESSION</code>
<code>metricExpression*</code>	string minLength: 1	

Property	Type	Enums

### MetricDetailWithVariableName

Property	Type	Enums
variableName*	string minLength: 1	
metricAggregateFunction*	string	MINIMUM MAXIMUM VALUE SUM COUNT CURRENT GROUP_COUNT
metricPath*	string minLength: 1	

### NodeEvalMatchingCriteria

Property	Type	Enums
matchType	string	AVERAGE ANY_NODE PERCENTAGE_NODES NUMBER_OF_NODES
value Enter the matching criteria only when you select PERCENTAGE_NODES or NUMBER_OF_NODES as matchType . If you select NUMBER_OF_NODES , enter an integer; else if you select PERCENTAGE_NODES , enter a number.	number minimum: 0	

### Condition

A single condition that can be independently evaluated to `true` or `false` . List of conditions (maximum 8) along with other properties form a criteria.

Property	Description	Type/Enums						
name*	Name of the condition.	string						
shortname*	A short name used in <code>conditionExpression</code> to evaluate CUSTOM <code>conditionType</code> .	string pattern: <code>^[A-Z]{1,3}\$</code> Enums A B C D E F G H						
evaluateToTrueOnNoData	Controls the evaluation of the condition in cases where any metric on which the condition is based, returns no data. The condition evaluates to <code>unknown</code> by default when no data is returned. If the health rule is based on all the conditions evaluating to <code>true</code> , having no data returned may affect whether the health rule triggers an action.	boolean default: <code>false</code>						
evalDetail*	Details of metric(s) considered for evaluation of the condition. Use <code>SINGLE_METRIC</code> to evaluate a single metric. Use <code>METRIC_EXPRESSION</code> to evaluate a metric expression.	ConditionEvalDetail <table border="1"> <thead> <tr> <th>Property</th> <th>Type</th> <th>Enums</th> </tr> </thead> <tbody> <tr> <td>evalDetailType</td> <td>string</td> <td>SINGLE_METRIC METRIC_EXPRESSION</td> </tr> </tbody> </table>	Property	Type	Enums	evalDetailType	string	SINGLE_METRIC METRIC_EXPRESSION
Property	Type	Enums						
evalDetailType	string	SINGLE_METRIC METRIC_EXPRESSION						
triggerEnabled	If set to <code>true</code> , the value in field <code>minimumTriggers</code> is considered for evaluation.	boolean default: <code>false</code>						

Property	Description	Type/Enums
<code>minimumTriggers</code>	If you set a non-zero value, <a href="#">persistence thresholds</a> are considered when evaluating the conditions. Ensure that you define a value less than <a href="#">useDataFromLastNMinutes</a> .	integer default: 0 minimum: 0 maximum: 30

#### ConditionEvalDetail

Property	Type	Enums
<code>evalDetailType</code>	string	SINGLE_METRIC METRIC_EXPRESSION

#### Criteria

Property	Description	Type/Enums
<code>conditionAggregationType</code>	Condition evaluation criteria that constitute a health rule violation.	string default: ALL Enums ALL ANY CUSTOM
<code>conditionExpression</code>	Use only when you set the <code>conditionAggregationType</code> variable to <a href="#">CUSTOM</a> . Use the <code>ShortName</code> of the condition to define the boolean expression.	String minLength: 1

Property	Description	Type/Enums												
conditions*	<p>A single condition that can be evaluated independently to true or false. OR</p> <p>A list of conditions (maximum of 8) along with other properties to form a criteria.</p>	<p>String</p> <p>minItems: 1</p> <p>Condition</p>

Property	Type	Description/Enums
tiers	string minItems: 1	<p>Use if error names belong to multiple tiers. Provide the tier names as a list in <code>affects.affectedErrors.tiers</code> in the same order as the error names. In the following example, 'Page Not Found: 404' corresponds to <code>Tier1</code>, while 'Error2' corresponds to <code>SomeOtherTier</code>.</p> <div style="border: 1px solid #00aaff; padding: 10px; margin-top: 10px;"> <p> • If the error names are unique to each tier, tiers map errors one to one. You need not specify the tier name in this case.</p> <p>• If errors have same name but belong to different tiers, duplicate names are handled by appending tier names with the delimiter ' '.</p> <p>• If there is a mismatch between the number of error names and tier names, then the list <code>affects.affectedErrors.tiers</code> is ignored.</p> <p>• If an error belongs to multiple tiers, and you do not specify the tier names, the error name cannot be uniquely identified. Hence, an error is displayed.</p> </div>

#### ServerSelectionCriteria

Property	Type	Enums
serverSelectionScope*	string	ALL_SERVERS_IN_ACCOUNT SERVERS_WITHIN_SUBGROUP SPECIFIC_SERVERS SERVERS_MATCHING_PATTERN

#### AllServersInAccount

The scope of servers is set to all servers within an account.

Property	Type	Enums
serverSelectionScope*	string	ALL_SERVERS_IN_ACCOUNT

#### ServersWithinSubGroup

The scope of servers is set to all servers within a subgroup.

Property	Type	Enums
serverSelectionScope*	string	SERVERS_WITHIN_SUBGROUP

Property	Type	Enums
subGroups*	string minItems: 1	

### SpecificServers

The scope of servers is set to specific servers.

Property	Type	Enums
severSelectionScope*	string	SPECIFIC_SERVERS
servers*	string minItems: 1	

### ServersMatchingPattern

The scope of servers is set to servers matching a specific pattern.

Property	Type	Enums
severSelectionScope*	string	SERVERS_MATCHING_PATTERN

Property	Type	Enums												
patternMatcher*		EntityMatchingPattern <table border="1"> <thead> <tr> <th>Property</th> <th>Type</th> <th>Enums</th> </tr> </thead> <tbody> <tr> <td>matchTo*</td> <td>string</td> <td>STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REGEX</td> </tr> <tr> <td>matchValue*</td> <td>string minLength: 1</td> <td></td> </tr> <tr> <td>shouldNot</td> <td>boolean</td> <td></td> </tr> </tbody> </table>	Property	Type	Enums	matchTo*	string	STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REGEX	matchValue*	string minLength: 1		shouldNot	boolean	
Property	Type	Enums												
matchTo*	string	STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REGEX												
matchValue*	string minLength: 1													
shouldNot	boolean													

### AffectedServerSubGroups

The scope of affected servers is set to affected servers within a subgroup.

Property	Type	Enums						
selectServersBy*	string	AFFECTED_SERVER_SUBGROUPS						
subGroups*	string minItems: 1	AffectedSubGroups <table border="1"> <thead> <tr> <th>Property</th> <th>Type</th> <th>Enums</th> </tr> </thead> <tbody> <tr> <td>subGroupScope*</td> <td>string</td> <td>ALL_SUBGROUPS SPECIFIC_SERVER_SUB_GROUPS</td> </tr> </tbody> </table>	Property	Type	Enums	subGroupScope*	string	ALL_SUBGROUPS SPECIFIC_SERVER_SUB_GROUPS
Property	Type	Enums						
subGroupScope*	string	ALL_SUBGROUPS SPECIFIC_SERVER_SUB_GROUPS						

### AffectedSubGroups

Property	Type	Enums
subGroupScope*	string	ALL_SUBGROUPS SPECIFIC_SERVER_SUB_GROUPS

### AllSubGroups

The scope of affected servers is set to servers within all subgroups.

Property	Type	Enums
subGroupScope*	string	ALL_SUBGROUPS

### SpecificServerSubGroups

The scope of affected servers is set to **servers within specific subgroups**.

Property	Type	Enums
subGroupScope*	string	SPECIFIC_SERVER_SUB_GROUPS
subGroupNames	string minItems: 1	

### Affects

Describes what entities the health rule affects. For example, business transactions, servers, or databases.

Property	Type	Enums
affectedEntityType*	string	OVERALL_APPLICATION_PERFORMANCE BUSINESS_TRANSACTION_PERFORMANCE TIER_NODE_TRANSACTION_PERFORMANCE TIER_NODE_HARDWARE SERVERS_IN_APPLICATION BACKENDS ERRORS SERVICE_ENDPOINTS INFORMATION_POINTS CUSTOM DATABASES SERVERS

**EvalCriteria**

Property	Type/Enums																		
criticalCriteria	<p>Criteria</p> <p>Critical conditions are evaluated before warning conditions. If you have defined a critical condition and a warning condition in the same health rule, the warning condition is evaluated only if the critical condition is not <code>true</code>.</p> <table border="1"> <thead> <tr> <th>Property</th> <th>Description</th> <th>Type/Enums</th> </tr> </thead> <tbody> <tr> <td>conditionAggregationType</td> <td>Condition evaluation criteria that constitute a health rule violation.</td> <td>String default: ALL Enums ALL ANY CUSTOM</td> </tr> <tr> <td>conditionExpression</td> <td>Use only when you set the <code>conditionAggregationType</code> variable to <code>CUSTOM</code>. Use the <code>ShortName</code> of the condition to define the boolean expression.</td> <td>String minLength: 1</td> </tr> <tr> <td>conditions*</td> <td> <p>A single condition that can be evaluated independently to <code>true</code> or <code>false</code>. OR</p> <p>A list of conditions (maximum of 8) along with other properties to form a criteria.</p> <table border="1"> <thead> <tr> <th>Property</th> <th>Description</th> <th>Type/Enums</th> </tr> </thead> <tbody> <tr> <td>name*</td> <td>Name of the condition.</td> <td>string</td> </tr> </tbody> </table> </td> <td>String minItems: 1 Condition</td> </tr> </tbody> </table>	Property	Description	Type/Enums	conditionAggregationType	Condition evaluation criteria that constitute a health rule violation. Property	Type/Enums				
	Property	Description	Type/Enums		
			Property	Description	Type/Enums
			evaluateToTrueOnNoData	Controls the evaluation of the condition in cases where any metric on which the condition is based, returns no data. The default when no data is returned is for the condition to evaluate to unknown . If the health rule is based on all the conditions evaluating to true , having no data returned may affect whether the health rule triggers an action.	boolean default: false

Property	Type/Enums													
	Property	Description	Type/Enums											
			Property	Description	Type/Enums									
			evalDetail*	Details of metric(s) considered for evaluation of the condition. Use <a href="#">SINGLE_METRIC</a> to evaluate a single metric. Use <a href="#">METRIC_EXPRESSION</a> to evaluate a metric expression.	ConditionEvaluationDetail <table border="1" data-bbox="1308 674 1468 1625"> <thead> <tr> <th data-bbox="1308 674 1365 1003">Property</th> <th data-bbox="1365 674 1414 1003">Type</th> <th data-bbox="1414 674 1468 1003">Enums</th> </tr> </thead> <tbody> <tr> <td data-bbox="1308 1003 1365 1262">evalDetailType</td> <td data-bbox="1365 1003 1414 1262">string</td> <td data-bbox="1414 1003 1468 1262">SINGLE_METRIC</td> </tr> <tr> <td data-bbox="1308 1262 1365 1625"></td> <td data-bbox="1365 1262 1414 1625"></td> <td data-bbox="1414 1262 1468 1625">METRIC_EXPRESSION</td> </tr> </tbody> </table>	Property	Type	Enums	evalDetailType	string	SINGLE_METRIC			METRIC_EXPRESSION

Property	Type/Enums				
	Property	Description	Type/Enums		
			Property	Description	Type/Enums
			triggerEnabled	If set to true, the value in field <code>minimumTriggers</code> is considered for evaluation.	boolean default: false
			minimumTriggers	If you set a non-zero value, <a href="#">persistence thresholds</a> are considered when evaluating the conditions. Ensure that you define a value less than <a href="#">useDataFromLastNMinutes</a> .	integer default: 0 minimum: 0 maximum: 30

Property	Type/Enums								
	Property	Description	Type/Enums						
	evalMatchingCriteria	<p>The criteria for evaluating a condition for the following health rule types:</p> <ul style="list-style-type: none"> <li>• Business Transaction</li> <li>• Node health-hardware</li> <li>• Node health-transaction performance</li> </ul> <p>It defines how many nodes in the affected entities must violate the condition before the health rule is considered to violate.</p>	<p>NodeEvalMatchingCriteria</p> <table border="1" data-bbox="1008 512 1479 1465"> <thead> <tr> <th data-bbox="1008 512 1114 678">Property</th> <th data-bbox="1114 512 1354 678">Description</th> <th data-bbox="1354 512 1479 678">Type/Enums</th> </tr> </thead> <tbody> <tr> <td data-bbox="1008 678 1114 1465">matchType</td> <td data-bbox="1114 678 1354 1465"> <p>The evaluation scope type that defines how many nodes in the affected entities must violate the condition before the health rule is considered violated.</p> <p>Enter the matching criteria only when you select PERCENTAGE_NODES or NUMBER_OF_NODES as matchType .</p> </td> <td data-bbox="1354 678 1479 1465"> <p>String Enums AVERAGE ANY_NODE PERCENTAGE_NODES NUMBER_OF_NODES</p> </td> </tr> </tbody> </table>	Property	Description	Type/Enums	matchType	<p>The evaluation scope type that defines how many nodes in the affected entities must violate the condition before the health rule is considered violated.</p> <p>Enter the matching criteria only when you select PERCENTAGE_NODES or NUMBER_OF_NODES as matchType .</p>	<p>String Enums AVERAGE ANY_NODE PERCENTAGE_NODES NUMBER_OF_NODES</p>
Property	Description	Type/Enums							
matchType	<p>The evaluation scope type that defines how many nodes in the affected entities must violate the condition before the health rule is considered violated.</p> <p>Enter the matching criteria only when you select PERCENTAGE_NODES or NUMBER_OF_NODES as matchType .</p>	<p>String Enums AVERAGE ANY_NODE PERCENTAGE_NODES NUMBER_OF_NODES</p>							

Property	Type/Enums				
	Property	Description	Type/Enums		
			Property	Description	Type/Enums
			value	The number or percentage of nodes that must violate the condition to constitute a health rule violation. If you select <code>NUMBER_OF_NODES</code> , enter an integer. If you select <code>PERCENTAGE_NODES</code> , enter a number.	

**HealthRuleSummary**

Property	Type
id*	integer
name	string
enabled*	boolean

**ErrorResponse**

Property	Type
statusCode	integer

Property	Type
message	string

\*This property is required (mandatory).

### Download Examples

Download a set of examples that help you configure a health rule, [health\\_rule\\_request\\_examples.zip](#).

### Download Swagger YAML spec

Download the Swagger YAML spec [health\\_rule\\_openapi.yml](#).

### Schedule API

This page describes the Schedule API methods you can use to create, configure, and manage the evaluation time frame for the health rules of an application. The metrics associated with a health rule are evaluated according to a schedule that you control. See [Health Rule Schedules](#).

- Syntax validation of the JSON payload is done when creating the schedule.
- Ensure that you pick a time zone the [Time Zone List](#).

### Create a New Schedule

Creates a new schedule with the specified JSON payload. See [Property Details](#).

### Resource URL

POST `<controller_url>/controller/alerting/rest/v1/applications/<application_id>/schedules`

### Request/Response Format

JSON

### Example

This example creates a health rule schedule that evaluates the health rule once. See [Download Examples](#).

[Request](#)    Response

```
{
 "name": "Daily Schedule",
 "description": "Daily Schedule",
 "timezone": "America/Los_Angeles",
 "scheduleConfiguration": {
 "scheduleFrequency": "DAILY",
 "startTime": "06:00",
 "endTime": "18:00"
 }
}
```

```
}
}
```

Request [Response](#)

```
{
 "id": 62,
 "name": "Daily Schedule",
 "description": "Daily Schedule",
 "timezone": "America/Los_Angeles",
 "scheduleConfiguration": {
 "scheduleFrequency": "DAILY",
 "startTime": "06:00",
 "endTime": "18:00"
 }
}
```

## Retrieve a List of Schedules for a Given Application

Returns a list of [schedule\(s\) details](#) for a health rule associated with the specified application ID. This API returns the schedule ID, name, and description of the schedule. See [Property Details](#).

### Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/schedules
```

### Response Format

JSON

### Example Response

This example returns a list of schedules applicable to a given application ID.

```
[
 {
 "id": 62,
 "name": "Daily Schedule",
 "description": "Daily Schedule",
 "timezone": "America/Los_Angeles"
 },
 {
 "id": 12,
 "name": "End of Business Hour: 5pm-6pm, Mon-Fri",
 "description": "This schedule is active Monday through Friday, during end of business hour",
 "timezone": "Asia/Kolkata"
 }
]
```

```

 },
 {
 "id": 61,
 "name": "Schedule1",
 "description": "Custom Schedule",
 "timezone": "America/Los_Angeles"
 },
 {
 "id": 11,
 "name": "Weekday lunch: 12pm-1pm, Mon-Fri",
 "description": "This schedule is active Monday through Friday, during lunch hour",
 "timezone": "Asia/Kolkata"
 },
 {
 "id": 10,
 "name": "Weekday mornings: 8am-12pm, Mon-Fri",
 "description": "This schedule is active Monday through Friday, during morning hours",
 "timezone": "Asia/Kolkata"
 },
 {
 "id": 7,
 "name": "Weekdays: 8am-5pm, Mon-Fri",
 "description": "This schedule is active Monday through Friday, during business hours",
 "timezone": "Asia/Kolkata"
 },
 {
 "id": 9,
 "name": "Weekends: 12am-11pm, Sat-Sun",
 "description": "This schedule is active all day and night on the weekend",
 "timezone": "Asia/Kolkata"
 },
 {
 "id": 8,
 "name": "Weeknights: 11pm-6am, Mon-Fri",
 "description": "This schedule is active Monday through Friday, during night time
batch runs",
 "timezone": "Asia/Kolkata"
 }
]

```

## Retrieve the Details of a Specified Schedule

Retrieves a schedule with a specified ID. See [Property Details](#).

### Resource URL

GET <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/schedules/{schedule-id}

### Response Format

JSON

## Example Response

This example retrieves the details of a schedule. See [Download Examples](#).

```
{
 "id": 12,
 "name": "End of Business Hour: 5pm-6pm, Mon-Fri",
 "description": "This schedule is active Monday through Friday, during end of business
hour",
 "timezone": "Asia/Kolkata",
 "scheduleConfiguration": {
 "scheduleFrequency": "WEEKLY",
 "days": [
 "MONDAY",
 "TUESDAY",
 "WEDNESDAY",
 "THURSDAY",
 "FRIDAY"
],
 "startTime": "17:00",
 "endTime": "18:00"
 }
}
```

## Update a Schedule

Updates an existing schedule with a specified JSON payload. See [Property Details](#).

### Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/
schedules/{schedule-id}
```

### Request/Response Format

JSON

### Example

This example updates a schedule that evaluates the health rule once. See [Download Examples](#).

[Request](#)    Response

```
{
 "name": "One Time Schedule",
 "description": "One Time Schedule",
 "timezone": "America/Los_Angeles",
 "scheduleConfiguration": {
 "scheduleFrequency": "ONE_TIME",
 "startTime": "06:00",
 "endTime": "18:00",
```

```

 "startDate": "01/01/2019",
 "endDate": "01/01/2019"
 }
}

```

Request [Response](#)

This example confirms that the schedule was updated successfully.

```

{
 "id": 62,
 "name": "One Time Schedule",
 "description": "One Time Schedule",
 "timezone": "America/Los_Angeles",
 "scheduleConfiguration": {
 "scheduleFrequency": "ONE_TIME",
 "startDate": "01/01/2019",
 "startTime": "06:00",
 "endDate": "01/01/2019",
 "endTime": "18:00"
 }
}

```

## Delete a Schedule

Delete a schedule with the specified ID. See [Property Details](#).

### Resource URL

DELETE <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/schedules/{schedule-id}

### Response Codes

Code	Description
200	Fetches successfully
201	Created successfully
204	Deleted successfully
400	Bad request
401	Unauthorized

Code	Description
403	Forbidden
404	Resource not found
409	Already exists

## Property Details

### Schedule

Payload details for the health rule schedule.

Property Name	Type	Description and Valid Values
id	integer	Auto-generated by the system and returned in the response. It is a <code>ReadOnly</code> value.
name*	string	Name of schedule to be associated with the health rule for evaluation. Minimum length: 1
description	string	Description of the schedule with evaluation details. Example: Health rules are evaluated daily at 12 noon. Default value: <code>true</code>
timezone*	string	Timezone Id - Unique identifier of the time zone. See <a href="#">Time Zones</a> . Example: America/Los_Angeles

Property Name	Type	Description and Valid Values						
scheduleConfiguration*		<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>scheduleFrequency</td> <td>string</td> <td> <p>The health rule(s) evaluation frequency specified in the schedule.</p> <p>Enums:</p> <ul style="list-style-type: none"> <li>ONE_TIME</li> <li>DAILY</li> <li>WEEKLY</li> <li>MONTHLY_SPECIFIC_DATE</li> <li>MONTHLY_SPECIFIC_DAY</li> <li>CUSTOM</li> </ul> </td> </tr> </tbody> </table>	Property Name	Type	Description	scheduleFrequency	string	<p>The health rule(s) evaluation frequency specified in the schedule.</p> <p>Enums:</p> <ul style="list-style-type: none"> <li>ONE_TIME</li> <li>DAILY</li> <li>WEEKLY</li> <li>MONTHLY_SPECIFIC_DATE</li> <li>MONTHLY_SPECIFIC_DAY</li> <li>CUSTOM</li> </ul>
Property Name	Type	Description						
scheduleFrequency	string	<p>The health rule(s) evaluation frequency specified in the schedule.</p> <p>Enums:</p> <ul style="list-style-type: none"> <li>ONE_TIME</li> <li>DAILY</li> <li>WEEKLY</li> <li>MONTHLY_SPECIFIC_DATE</li> <li>MONTHLY_SPECIFIC_DAY</li> <li>CUSTOM</li> </ul>						

### OneTimeSchedule

This schedule evaluates the health rule once.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See <a href="#">Enums</a> .
startDate*	string	<p>The scheduled start date in DD/MM/YYYY format.</p> <p>Pattern:</p> <pre>^(?:((?:31(\- \/ \.) 0?) 1[02]))\1 ((?:29 30)(\- \/ \.) 0?) 1[0-2])\2(?:1[6-9] 2-9\d)?\d{2})\$ ^((?:29(\- \/ \.) 0?)2\3(?:1[6-9] 2-9\d)?(?:0[48] 2468[048] 13579[26]) ((?:16[2468][048] 3579[26])00)))\$ ^((?:0?[1-9] 1\d 2[0-8])(\- \/ \.) ((?:0?[1-9] 1[0-2]))\4(?:1[6-9] 2-9\d)?\d{2})\$</pre>

Property Name	Type	Description
startTime*	string	The scheduled start time in a 24-hour format. Pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>
endDate*	string	The scheduled end date in DD/MM/YYYY format. Pattern: <code>^(?:((?:31(\- \/ \.)?(?:0?[13578] 1[02]))\1 (?:(?:29 30)(\- \/ \.)?(?:0?[13-9] 1[0-2]))\2))(?:1[6-9] 2[0-9]\d)?\d{2}\$ ^((?:29(\- \/ \.)?0?2\3(?:((?:1[6-9] 2[0-9]\d)?(?:0[48] [2468][048] [13579][26]) (?:(?:16 [2468][048] [3579][26]))00))))\$ ^((?:0?[1-9] 1\d 2[0-8])(\- \/ \.)?(?:0?[1-9]) (?:1[0-2]))\4(?:1[6-9] 2[0-9]\d)?\d{2})\$</code>
endTime*	string	The scheduled end time in a 24-hour format. Pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>

### DailySchedule

A recurring schedule to evaluate the health rule every day.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See <a href="#">Enums</a> .
startTime*	string	The scheduled start time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>
endTime*	string	The scheduled end time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>

### WeeklySchedule

A recurring schedule to evaluate the health rule every week.

Property Name	Type	Description						
<code>scheduleFrequency*</code>	string	The frequency to evaluate the health rule(s). See <a href="#">Enums</a> .						
<code>days*</code>	string	The day of the week to evaluate the health rule. minItems: 1 maxItems: 7 <table border="1" data-bbox="873 596 1495 1150"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><code>DayOfWeek</code></td> <td>string</td> <td><b>Enums</b> SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY</td> </tr> </tbody> </table>	Property Name	Type	Description	<code>DayOfWeek</code>	string	<b>Enums</b> SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY
Property Name	Type	Description						
<code>DayOfWeek</code>	string	<b>Enums</b> SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY						
<code>startTime*</code>	string	The scheduled start time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>						
<code>endTime*</code>	string	The schedule end time in 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>						

### MonthlySpecificDateSchedule

A recurring schedule to evaluate the health rule every month on a specific date.

Property Name	Type	Description
<code>scheduleFrequency*</code>	string	The frequency to evaluate the health rule(s). See <a href="#">Enums</a> .

Property Name	Type	Description
startDate*	string	The schedule start date in DD/MM/YYYY format. pattern: <code>^(?:((?:31(\- \/ \.)?(?:0?[13578] 1[02]))\1 (?:(?:29 30)(\- \/ \.)?(?:0?[13-9] 1[0-2]))\2))(?:((?:1[6-9] 2-9)\d)?\d{2})\$ ^((?:29(\- \/ \.)0?2\3(?:((?:1[6-9] 2-9)\d)?(?:0[48] [2468][048] [13579][26]) (?:(?:16 [2468][048] [3579][26]))00)))\$ ^((?:0?[1-9] 1\d 2[0-8])(\- \/ \.)?(?:0?[1-9]) (?:1[0-2]))\4(?:((?:1[6-9] 2-9)\d)?\d{2})\$</code>
startTime*	string	The scheduled start time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>
endDate*	string	The scheduled end date in DD/MM/YYYY format. pattern: <code>^(?:((?:31(\- \/ \.)?(?:0?[13578] 1[02]))\1 (?:(?:29 30)(\- \/ \.)?(?:0?[13-9] 1[0-2]))\2))(?:((?:1[6-9] 2-9)\d)?\d{2})\$ ^((?:29(\- \/ \.)0?2\3(?:((?:1[6-9] 2-9)\d)?(?:0[48] [2468][048] [13579][26]) (?:(?:16 [2468][048] [3579][26]))00)))\$ ^((?:0?[1-9] 1\d 2[0-8])(\- \/ \.)?(?:0?[1-9]) (?:1[0-2]))\4(?:((?:1[6-9] 2-9)\d)?\d{2})\$</code>
endTime*	string	The scheduled end time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>

### MonthlySpecificDaySchedule

A recurring schedule to evaluate the health rule every month on a specific date.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See <a href="#">Enums</a> .

Property Name	Type	Description						
startTime*	string	The scheduled start time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>						
endTime*	string	The schedules end time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>						
day*	string	The day of the week to evaluate the health rule. minItems: 1 maxItems: 7 <table border="1" data-bbox="873 835 1495 1392"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DayOfWeek</td> <td>string</td> <td><b>Enums</b> SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY</td> </tr> </tbody> </table>	Property Name	Type	Description	DayOfWeek	string	<b>Enums</b> SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY
Property Name	Type	Description						
DayOfWeek	string	<b>Enums</b> SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY						
occurrence*	string	The occurrence of the day within a month. Enums: FIRST SECOND THIRD FOURTH LAST						

## CustomSchedule

A custom schedule to evaluate the health rule based on specific requirements and timezone. Use UNIX cron expressions to define properties.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See <a href="#">Enums</a> .
startCron*	string	The beginning of the UNIX cron expression.
endCron*	string	The end of the UNIX cron expression.

## ScheduleSummaryElement

The details of the schedule you have defined that are returned when you retrieve the schedules API.

Property Name	Type	Description
id	integer	Auto-generated by the system and returned in the response.
name*	string	Name of the schedule associated with the health rule for evaluation.
description	string	Description of the schedule and evaluation details.
timezone*	string	Timezone ID - Unique identifier of the time zone.

\*This property is required (mandatory).

## Policy API

This page describes the Policy API methods you can use to create, configure, and manage [policies](#) for an application.

A policy consists of a *trigger* based on one or more events and an *action* in response to that trigger. You use policies to automate monitoring, alerting, and problem remediation.

- Syntax validation of the JSON payload is done when creating the policy.
- Objects/Entities corresponding to EUM applications are not supported.

## Create a Policy

Creates a new policy using the given JSON payload.

### Resource URL

POST <controller\_url>/controller/alerting/rest  
/v1/applications/<application\_id>/policies

### Request/Response Format

JSON

### Example

[Request](#)    Response

```
{
 "name": "Policy json create example",
 "enabled": true,
 "executeActionsInBatch": true,
 "actions": [

 }
 }
 }
]
}

```

## Retrieve a list of Policies associated with an Application

This API returns a list of all policies associated with the given application, policy names, IDs, and enable flag details. To fetch the complete details of a policy, use `GET /policies/{policy-id}`.

### Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies
```

### Response Format

JSON

### Example Response

```

[
 {
 "id": 1096,
 "name": "My Policy 1",
 "enabled": true,
 "actions": [
 {
 "actionName": "action@email.com",
 "actionType": "EMAIL"
 }
],
 "events": {
 "healthRuleEvents": {
 "healthRuleEventTypes": [
 "HEALTH_RULE_OPEN_WARNING",
 "HEALTH_RULE_OPEN_CRITICAL"
]
 }
 }
 }
]

```

```

 "healthRuleScopeType": "ALL_HEALTH_RULES",
 "healthRuleCount": null
 },
 "otherEvents": [],
 "anomalyEvents": null,
 "customEvents": []
},
"selectedEntityType": "ANY_ENTITY"
},
{
 "id": 1050,
 "name": "My Policy 2",
 "enabled": true,
 "actions": [
 {
 "actionName": "action@email.com",
 "actionType": "EMAIL"
 }
],
 "events": {
 "healthRuleEvents": {
 "healthRuleEventTypes": [
 "HEALTH_RULE_OPEN_CRITICAL"
],
 "healthRuleScopeType": "SPECIFIC_HEALTH_RULES",
 "healthRuleCount": 1
 },
 "otherEvents": [],
 "anomalyEvents": null,
 "customEvents": []
 },
 "selectedEntityType": "ANY_ENTITY"
},
{
 "id": 1051,
 "name": "My policy 3",
 "enabled": true,
 "actions": [
 {
 "actionName": "action@email.com",
 "actionType": "EMAIL"
 }
],
 "events": {
 "healthRuleEvents": {
 "healthRuleEventTypes": [
 "HEALTH_RULE_OPEN_CRITICAL"
],
 "healthRuleScopeType": "SPECIFIC_HEALTH_RULES",
 "healthRuleCount": 1
 },
 },

```

```

 "otherEvents": [],
 "anomalyEvents": null,
 "customEvents": []
 },
 "selectedEntityType": "ANY_ENTITY"
}
]

```

## Retrieve Details of a Specified Policy

Returns a `JSON` representation of a policy for the given policy ID.

### Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/
policies/{policy-id}
```

### Response Format

JSON

### Example Response

This example retrieves the configuration details of a policy.

```

{
 "id": 1,
 "name": "Policy REST get json example",
 "enabled": true,
 "executeActionsInBatch": true,
 "actions": [

## Update a Policy

Updates the configuration settings of an existing policy with the values of a specified policy ID.

This request requires a complete JSON payload as input. AppDynamics recommends

1. Retrieving the JSON payload using `GET /policies/{policy-id}` and update the required fields.
2. Send the modified payload as part of the `PUT` request.

## Resource URL

`PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies/{policy-id}`

## Request/Response Format

JSON

## Example

[Request](#)   [Response](#)

```

## Delete a Policy

Deletes an existing policy with the specified ID.

**i** Ensure that you provide a valid existing policy ID.

### Resource URL

DELETE <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/policies/{policy-id}

## Update a Policy Configuration

Updates one or more specific configuration setting(s) of a policy. You can update the **Name** and **Enabled** fields using this API.

### Resource URL

PUT <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/policies/{policy-id}/configuration

## Request/Response Format

JSON

### Example

Request    Response

```

{
 "name": "Policy json update example",
 "enabled": false
}

```

Request    Response

```

403	Forbidden
404	Resource not found
409	Already exists

## Property Details

### Policy

Payload details of a policy.

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a <code>readOnly</code> value.

Property Name	Type	Description and Valid Values									
name*	string	Name of the policy. Minimum length: 1									
enabled	boolean	Sets the policy to enabled/disabled state. Default value: true									
executeActionsInBatch*	boolean	Executes the actions configured for a policy, once for all the triggering events that occurred during the last minute. Default value: true									
actions*	minItems: 1	<p>Action Describes the predefined, reusable, and automated response to an event to be taken when the policy is triggered.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>actionName*</td> <td>string</td> <td>Name of the action defined for a policy.</td> </tr> <tr> <td>actionType*</td> <td>string</td> <td>ActionType Enum Creates the following types of actions: SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA</td> </tr> </tbody> </table>	Property Name	Type	Description	actionName*	string	Name of the action defined for a policy.	actionType*	string	ActionType Enum Creates the following types of actions: SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
Property Name	Type	Description									
actionName*	string	Name of the action defined for a policy.									
actionType*	string	ActionType Enum Creates the following types of actions: SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA									

---

Property Name	Type	Description and Valid Values
events*		Events Describes the events that trigger the policy.

#### SelectedBusinessTransactions

Property Name	Description
businessTransactionScope*	Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING_PATTERN

#### AllBusinessTransactions

The scope of business transactions is set to all business transactions.

Property Name	Description
businessTransactionScope*	Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING_PATTERN

#### SpecificBusinessTransactions

The scope of business transactions is set to select business transactions.

Property Name	Type	Description
<code>businessTransactionScope*</code>		Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING_PATTERN
<code>businessTransactions*</code>	string minItems: 1	Name(s) of the business transactions.

### BusinessTransactionsInSpecificTiers

The scope of business transactions is set to business transactions associated with a specific tier.

Property Name	Type	Description
<code>businessTransactionScope*</code>		Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING_PATTERN
<code>specificTiers*</code>	string minItems: 1	Name of the specified tier.

### BusinessTransactionsMatchingPattern

The scope of business transactions is set to business transactions that match a specific pattern.

Property Name	Description
<code>businessTransactionScope*</code>	Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING_PATTERN

Property Name	Description												
patternMatcher*	<p>EntityMatchingPattern Business transactions that match the specified pattern are included in the scope.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>matchTo*</td> <td></td> <td>           Enums            STARTS_WITH            ENDS_WITH            CONTAINS            EQUALS            MATCH_REG_EX         </td> </tr> <tr> <td>matchValue*</td> <td>string minLength: 1</td> <td></td> </tr> <tr> <td>shouldNot</td> <td>boolean default: false</td> <td></td> </tr> </tbody> </table>	Property Name	Type	Description	matchTo*		Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX	matchValue*	string minLength: 1		shouldNot	boolean default: false	
Property Name	Type	Description											
matchTo*		Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX											
matchValue*	string minLength: 1												
shouldNot	boolean default: false												

### SelectedTierOrNodeEntities

Specific tiers or nodes are considered for policy evaluation.

Property Name	Type	Description
entityType*	string	Enums BUSINESS_TRANSACTION TIER_NODE ERRORS SERVICE_ENDPOINTS INFORMATION_POINTS DATABASES_IN_APPLICATION SERVERS_IN_APPLICATION

Property Name	Type	Description						
tierOrNode*	string minLength: 1	TierOrNode <table border="1" data-bbox="982 384 1495 753"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>tierOrNodeScope*</td> <td>string</td> <td>Enums TIER_SELECTED_ENTITIES NODE_SELECTED_ENTITIES</td> </tr> </tbody> </table>	Property Name	Type	Description	tierOrNodeScope*	string	Enums TIER_SELECTED_ENTITIES NODE_SELECTED_ENTITIES
Property Name	Type	Description

Property Name	Type	Description
		<p>EUM_CLOUD_SYNTHETIC_PERF_ONGOING_WARNING_EVENT</p> <p>EUM_CLOUD_SYNTHETIC_PERF_CRITICAL_EVENT</p> <p>EUM_CLOUD_SYNTHETIC_PERF_CONFIRMED_CRITICAL_EVENT</p> <p>EUM_CLOUD_SYNTHETIC_PERF_ONGOING_CRITICAL_EVENT</p> <p>MOBILE_NEW_CRASH_EVENT</p> <p>SLOW</p> <p>VERY_SLOW</p> <p>STALL</p> <p>ERROR</p>

### AnomalyEvents

Events generated due to anomaly detection that trigger the policy.

Property Name	Type	Description
anomalyEvents	string minItems: 1	<p>AnomalyEventType</p> <p>Enums</p> <p>ANOMALY_OPEN_WARNING</p> <p>ANOMALY_OPEN_CRITICAL</p> <p>ANOMALY_UPGRADED</p> <p>ANOMALY_DOWNGRADED</p> <p>ANOMALY_CLOSE_WARNING</p> <p>ANOMALY_CLOSE_CRITICAL</p> <p>ANOMALY_CANCELED_WARNING</p> <p>ANOMALY_CANCELED_CRITICAL</p>

### Action

A list of actions that are taken when a policy is triggered.

Property Name	Type	Description
actionName*	string	

Property Name	Type	Description
<code>actionType*</code>	string	ActionType Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

### SimpleActionType

A simple action that is taken when the policy is triggered.

Property Name	Type	Description
<code>actionName*</code>	string	
<code>actionType*</code>	string	ActionType Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

### EmailActionType

An email is sent when the policy is triggered.

Property Name	Type	Description
actionName*	string	
actionType*	string	ActionType Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
notes	string	

### ActionOnSpecifiedEntities

A simple action that is taken for specific entities when the policy is triggered.

Property Name	Type	Description
actionName*	string	
actionType*	string	ActionType Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

Property Name	Type	Description						
<code>specifiedEntityActionDetails*</code>	string	SpecifiedEntityActionDetails <table border="1" data-bbox="951 386 1495 863"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><code>specifiedEntityActionScope</code></td> <td>string</td> <td>SpecifiedEntityActionScope Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES</td> </tr> </tbody> </table>	Property Name	Type	Description	<code>specifiedEntityActionScope</code>	string	SpecifiedEntityActionScope Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES
Property Name	Type	Description						
<code>specifiedEntityActionScope</code>	string	SpecifiedEntityActionScope Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES						

#### SpecifiedEntityActionDetails

Property Name	Type	Description
<code>specifiedEntityActionScope</code>	string	SpecifiedEntityActionScope Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES

#### ActionOnPercentageEntities

The scope of entities on which the action is performed is set to 'percentage'.

Property Name	Type	Description
<code>specifiedEntityActionScope</code>	string	SpecifiedEntityActionScope Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES
<code>value*</code>	integer	

### ActionOnPercentageEntities

The scope of entities on which the action is performed is set to **absolute**.

Property Name	Type	Description
specifiedEntityActionScope	string	SpecifiedEntityActionScope Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES
value*	integer	

### ActionOnPercentageEntities

A list of nodes on which the action is performed.

Property Name	Type	Description
specifiedEntityActionScope	string	SpecifiedEntityActionScope Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES
nodes*	string minItems: 1	

### PolicySummaryArray

Property Name	Type
id*	integer
name*	string minLength: 1
enabled*	boolean

### KeyValuePair

Property Name	Type
key*	string
value*	string

### PolicySummary

Property Name	Type
id*	integer
name*	string minLength: 1
enabled*	boolean

### PolicyConfiguration

Property Name	Type
enabled*	boolean
policyName	string

### EntityMatchingPattern

Entities that match the specified pattern.

Property Name	Type	Description
matchTo*	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX

Property Name	Type	Description
matchValue*	string minLength: 1	
shouldNot	boolean default: false	

#### ErrorResponse

Property Name	Type
statusCode	integer
message	string

#### PropertyMatchCriteria

Property Name	Type	Description
propertyMatchCriteria	string default: ANY	Enums ANY ALL

#### EntityMatchingPatternEnum

Property Name	Type	Description
EntityMatchingPatternEnum	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX

### BusinessTransactionScopeEnum

Property Name	Type	Description
businessTransactionScope	string	Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING_PATTERN

### TierOrNodeScopeEnum

Property Name	Type	Description
TierOrNodeScope	string	Enums TIER_SELECTED_ENTITIES NODE_SELECTED_ENTITIES

### SelectedTierScopeEnum

Property Name	Type	Description
SelectedTierScope	string	Enums ALL_TIERS SPECIFIC_TIERS

### TypeOfNodeEnum

Property Name	Type	Description
typeofNode	string	Enums ALL_NODES JAVA_NODES DOT_NET_NODES PHP_NODES

**SelectedNodesScopeEnum**

Property Name	Type	Description
selectedNodeScope	string	Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER

**NodePropertyTypeEnum**

Property Name	Type	Description
NodePropertyTypeEnum	string	Enums META ENV JVM

**ErrorScopeEnum**

Property Name	Type	Description
ErrorScopeEnum	string	Enums ALL_ERRORS SPECIFIC_ERRORS ERRORS_OF_SPECIFIC_TIERS ERRORS_MATCHING_PATTERN

### ServiceEndpointScopeEnum

Property Name	Type	Description
ServiceEndpointScopeEnum	string	<b>Enums</b> ALL_SERVICE_ENDPOINTS SPECIFIC_SERVICE_ENDPOINTS SERVICE_ENDPOINTS_IN_SPECIFIC_TIERS SERVICE_ENDPOINTS_MATCHING_PATTERN

### InformationPointScopeEnum

Property Name	Type	Description
InformationPointScopeEnum	string	ALL_INFORMATION_POINTS SPECIFIC_INFORMATION_POINTS INFORMATION_POINTS_MATCHING_PATTERN

### DatabaseTypeEnum

Property Name	Type	Description
DatabaseTypeEnum	string	<b>Enums</b> ALL_DATABASE_TYPES COUCHBASE DB2 MONGO_DB MICROSOFT_SQL_SERVER MYSQL ORACLE POSTGRE_SQL AZURE_SQL SYBASE

### ApplicationDatabaseScopeEnum

Property Name	Type	Description
ApplicationDatabaseScopeEnum	string	<b>Enums</b> ALL_APPLICATION_DATABASES SPECIFIC_APPLICATION_DATABASES APPLICATION_DATABASES_MATCHING_PATTERN

### ServersScopeEnum

Property Name	Type	Description
ServersScopeEnum	string	<b>Enums</b> ALL_SERVERS_IN_APPLICATION SPECIFIC_SERVERS_IN_APPLICATION ALL_SERVERS_IN_SPECIFIC_TIERS

### SpecifiedEntityActionScopeEnum

Property Name	Type	Description
SpecifiedEntityActionScopeEnum	string	<b>Enums</b> PERCENTAGE ABSOLUTE SPECIFIC_NODES

### AnomalyEventType

Property Name	Type	Description
AnomalyEventType	string	Enums ANOMALY_OPEN_WARNING ANOMALY_OPEN_CRITICAL ANOMALY_UPGRADED ANOMALY_DOWNGRADED ANOMALY_CLOSE_WARNING ANOMALY_CLOSE_CRITICAL ANOMALY_CANCELED_WARNING ANOMALY_CANCELED_CRITICAL

### HealthRuleEventTypeEnum

Property Name	Type	Description
HealthRuleEventTypeEnum	string	Enums HEALTH_RULE_CONTINUES_CRITICAL HEALTH_RULE_OPEN_CRITICAL HEALTH_RULE_OPEN_WARNING HEALTH_RULE_UPGRADED HEALTH_RULE_DOWNGRADED HEALTH_RULE_CONTINUES_WARNING HEALTH_RULE_CLOSE_WARNING HEALTH_RULE_CLOSE_CRITICAL HEALTH_RULE_CANCELED_WARNING HEALTH_RULE_CANCELED_CRITICAL

### HealthRuleScopeType

Property Name	Type	Description
HealthRuleScopeType	string	ALL_HEALTH_RULES SPECIFIC_HEALTH_RULES

OtherEventType

Property Name	Type	Description
OtherEventType	string	<p>Enums</p> <ul style="list-style-type: none"> <li>CLR_CRASH</li> <li>APPLICATION_CRASH</li> <li>DEADLOCK</li> <li>RESOURCE_POOL_LIMIT</li> <li>APPLICATION_DEPLOYMENT</li> <li>APP_SERVER_RESTART</li> <li>APPLICATION_CONFIG_CHANGE</li> <li>AGENT_CONFIGURATION_ERROR</li> <li>APPLICATION_DISCOVERED</li> <li>TIER_DISCOVERED</li> <li>NODE_DISCOVERED</li> <li>MACHINE_DISCOVERED</li> <li>BT_DISCOVERED</li> <li>SERVICE_ENDPOINT_DISCOVERED</li> <li>BACKEND_DISCOVERED</li> <li>EUM_CLOUD_SYNTHETIC_HEALTHY_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_WARNING_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_CONFIRMED_WARNING_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_ONGOING_WARNING_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_ERROR_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_CONFIRMED_ERROR_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_ONGOING_ERROR_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_PERF_HEALTHY_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_PERF_WARNING_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_PERF_CONFIRMED_WARNING_EVENT</li> </ul>

Property Name	Type	Description
		<p>EUM_CLOUD_SYNTHETIC_PERF_ONGOING_WARNIN G_EVENT</p> <p>EUM_CLOUD_SYNTHETIC_PERF_CRITICAL_EVENT</p> <p>EUM_CLOUD_SYNTHETIC_PERF_CONFIRMED_CRIT ICAL_EVENT</p> <p>EUM_CLOUD_SYNTHETIC_PERF_ONGOING_CRITIC AL_EVENT</p> <p>MOBILE_NEW_CRASH_EVENT, SLOW, VERY_SLOW, STALL</p> <p>ERROR</p>

**SelectedEntityType**

Property Name	Type	Description
SelectedEntityType	string	<p>Enums</p> <p>ANY_ENTITY</p> <p>SPECIFIC_ENTITIES</p>

**EntityType**

Property Name	Type	Description
EntityType	string	<p>Enums</p> <p>BUSINESS_TRANSACTION</p> <p>TIER_NODE</p> <p>ERRORS</p> <p>SERVICE_ENDPOINTS</p> <p>INFORMATION_POINTS</p> <p>DATABASES_IN_APPLICATION</p> <p>SERVERS_IN_APPLICATION</p>

## ActionTypeEnum

Property Name	Type	Description
ActionTypeEnum	string	<b>Enums</b> SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

\*This property is required.

### Download Examples

Download a set of examples that help you configure a policy, [AppDynamicsPoliciesExamples.zip](#).

### Download SWAGGER YAML Spec

Download the Swagger YAML spec [policies\\_openapi.yml](#).

### Actions API

This page describes the Action API methods you can use to create, configure, and manage various [actions](#) that are to be triggered as a response to events. Use this API to create these types of actions:

- [Notification](#)
- [Diagnostic](#)
- [Remediation](#)
- [JIRA](#)
- [HTTP Request](#)

Syntax validation of the JSON payload is done when creating the action.

### Create a New Action

Creates a new action with the specified JSON payload. See [Property Details](#).

### Resource URL

POST <controller\_url>/controller/alerting/rest/v1  
/applications/<application\_id>/actions

## Request/Response Format

JSON

### Example

[Request](#)   [Response](#)

This example creates an action of the type **Thread Dump**. See [Download Examples](#).

```
{
 "actionType": "THREAD_DUMP",
 "name": "Thread Dump Action",
 "numberOfThreadDumps": 2,
 "intervalInMs": 500,
 "approvalBeforeExecution": {
 "requireApproval": true,
 "approverEmail": "email@website.com"
 }
}
```

[Request](#)   [Response](#)

This example returns the created action object.

```
{
 "id": "3",
 "actionType": "THREAD_DUMP",
 "name": "Thread Dump Action",
 "numberOfThreadDumps": 2,
 "intervalInMs": 500,
 "approvalBeforeExecution": {
 "requireApproval": true,
 "approverEmail": "email@website.com"
 }
}
```

### Retrieve a List of Actions for a Given Application

Returns the action ID, name, and description of the action pertaining to a specified application ID. See [Property Details](#).

#### Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/actions
```

#### Response Format

JSON

## Example Response

This example returns a list of actions pertaining to a given application ID.

```
[{"id":1,"name":"Thread Dump Action","actionType":"THREAD_DUMP"}]
```

## Retrieve Details of a Specified Action

Retrieves the details of action with a specified ID. See [Property Details](#).

 Ensure that you provide a valid action ID.

## Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/actions/{action-id}
```

## Response Format

JSON

## Example Response

This example retrieves the details of an action. See [Download Examples](#).

```
{
 "id": 1,
 "actionType": "THREAD_DUMP",
 "name": "Thread Dump Action",
 "numberOfThreadDumps": 2,
 "intervalInMs": 500,
 "approvalBeforeExecution": {
 "requireApproval": true,
 "approverEmail": "email@website.com"
 }
}
```

## Update an Action

Updates an existing action with a specified JSON payload. See [Property Details](#).

This request requires a complete JSON payload as input. Hence, it is recommended that you retrieve the JSON payload using `GET /action/{action-id}` and update the required fields. Then, send the modified payload as part of a `PUT` request.

## Resource URL

PUT <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/action/{action-id}

## Request/Response Format

JSON

## Example

Request    Response

```
{
 "actionType": "THREAD_DUMP",
 "name": "Thread Dump Action",
 "numberOfThreadDumps": 2,
 "intervalInMs": 500,
 "approvalBeforeExecution": {
 "requireApproval": true,
 "approverEmail": "email@website.com"
 }
}
```

Request    Response

This example returns the updated action.

```
{
 "id": "3",
 "actionType": "THREAD_DUMP",
 "name": "Thread Dump Action",
 "numberOfThreadDumps": 2,
 "intervalInMs": 500,
 "approvalBeforeExecution": {
 "requireApproval": true,
 "approverEmail": "email@website.com"
 }
}
```

## Delete an Action

Deletes an action with the specified ID. See [Property Details](#).

 Ensure that you provide a valid action ID.

## Resource URL

DELETE <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/action/{action-id}

## Response Codes

Code	Description
200	Fetches successfully
201	Created successfully
204	Deleted successfully
400	Bad request
401	Unauthorized
403	Forbidden
404	Resource not found
409	Already exists

## Property Details

### Action

Payload details for an action triggered as a response to an event.

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.

Property Name	Type	Description and Valid Values
actionType*	string	The type of action triggered as a response to an event.  Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

### SmsAction

An SMS notification is triggered as a response to an event.

 **Note**

Ensure that you have configured the email and SMS settings for AppDynamics. See [Enable an Email Server](#).

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response.  It is a <code>readOnly</code> value.

Property Name	Type	Description and Valid Values
<code>actionType*</code>	string	The type of action triggered as a response to an event.  Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
<code>phoneNumber*</code>	string pattern: <code>^\d{10,}\$</code>	

### EmailAction

An email notification is triggered as a response to an event.

Property Name	Type	Description and Valid Values
<code>id</code>	integer	This is auto-generated by the system and returned in the response.  It is a <code>readOnly</code> value.

Property Name	Type	Description and Valid Values
<code>actionType*</code>	string	The type of action triggered as a response to an event.  Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
<code>emails*</code>	string pattern <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$</code>	

### CustomEmailAction

An email notification based on a predefined template is triggered as a response to an event.

 The template must already exist before you can use it in an action. See [Email Templates](#).

Property Name	Type	Description and Valid Values
<code>id</code>	integer	This is auto-generated by the system and returned in the response.  It is a <code>readOnly</code> value.

Property Name	Type	Description and Valid Values
actionType*	string	The type of action triggered as a response to an event.  Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
name*	string minLength: 1	ActionName The name you assign to the action.
emailTemplateName*	string minLength: 1	The name of the template to be used for email notification.
to*	string pattern: <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$</code>	EmailArray A list of email IDs.
cc*	string pattern: <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$</code>	EmailArray A list of email IDs.
bcc*	string pattern: <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$</code>	EmailArray A list of email IDs.

Property Name	Type	Description and Valid Values						
customTemplateVariables*	string	KeyValuePair <table border="1" data-bbox="1003 386 1495 623"> <thead> <tr> <th>Property Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td>key*</td> <td>string</td> </tr> <tr> <td>value*</td> <td>string</td> </tr> </tbody> </table>	Property Name	Type	key*	string	value*	string
Property Name	Type							
key*	string							
value*	string							

### ThreadDumpAction

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
name*	string minLength: 1	ActionName The name you assign to the action.
numberOfThreadDumps*	integer minimum: 1 maximum: 50	The number of thread dump samples you want the 'action' to collect.
intervalInMs*	integer minimum: 500	The time interval in milliseconds between the thread dump samples collected.

Property Name	Type	Description and Valid Values						
approvalBeforeExecution*		<p>ApprovalBeforeExecution Mandate an approval before the thread dump action is started.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td>requireApproval</td> <td>boolean</td> </tr> <tr> <td>approverEmail</td> <td>                     string                      pattern:  <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\.\$</code> </td> </tr> </tbody> </table>	Property Name	Type	requireApproval	boolean	approverEmail	string pattern: <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\.\$</code>
Property Name	Type							
requireApproval	boolean							
approverEmail	string pattern: <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\.\$</code>							

### HttpRequestAction

Property Name	Type	Description and Valid Values
id	integer	<p>This is auto-generated by the system and returned in the response.</p> <p>It is a <code>readOnly</code> value.</p>
actionType*	string	<p>The type of action triggered as a response to an event.</p> <p>Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA</p>
name*	string minLength: 1	<p>ActionName The name you assign to the action.</p>

Property Name	Type	Description and Valid Values						
httpRequestTemplateName	string minLength: 1	An existing HTTP request template to be used in an HTTP request action.						
customTemplateVariables		KeyValuePair <table border="1" data-bbox="922 510 1495 747"> <thead> <tr> <th>Property Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td>key*</td> <td>string</td> </tr> <tr> <td>value*</td> <td>string</td> </tr> </tbody> </table>	Property Name	Type	key*	string	value*	string
Property Name	Type							
key*	string							
value*	string							

**ScriptAction**

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
name*	string minLength: 1	ActionName The name you assign to the action.

Property Name	Type	Description and Valid Values						
scriptPath*	string minLength: 1	The relative path of the script.  <div style="border: 1px solid #add8e6; padding: 5px; background-color: #e6f2ff;"> <p> Enter the part after \$ {machine.agent.directory}/local-scripts/</p> </div>						
logFilePath		The absolute path of the log file(s).						
scriptTimeout*	string integer minimum: 1 maximum: 1440							
approvalBeforeExecution*		Mandate approval before the script action is started.  <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Property Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td>requireApproval</td> <td>boolean</td> </tr> <tr> <td>approverEmail</td> <td>string pattern: ^[a-zA-Z0-9_+-.]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$</td> </tr> </tbody> </table>	Property Name	Type	requireApproval	boolean	approverEmail	string pattern: ^[a-zA-Z0-9_+-.]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$
Property Name	Type							
requireApproval	boolean							
approverEmail	string pattern: ^[a-zA-Z0-9_+-.]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$							

**DiagnosticAction**

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response.  It is a readOnly value.

Property Name	Type	Description and Valid Values
actionType*	string	The type of action triggered as a response to an event.  Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
name*	string minLength: 1	ActionName The name you assign to the action.
duration*	integer minimum: 1 maximum: 10	The duration in minutes to run the diagnostic session.
snapshotRate*	integer minimum: 1 maximum: 10	The rate at which diagnostic snapshots are captured.
businessTransactions*	string	Runs the diagnostic session on the specified Business Transactions.  Enums ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

### JiraAction

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response.  It is a readOnly value.

Property Name	Type	Description and Valid Values
<code>actionType*</code>	string	The type of action triggered as a response to an event.  Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
<code>name*</code>	string minLength: 1	ActionName The name you assign to the action.
<code>jiraActionDetails*</code>	string	jiraActionType The JIRA action type triggered as a response to an event.  Enums CREATE_JIRA UPDATE_JIRA

### JiraActionDetails

The JIRA action type triggered as a response to an event.

Property Name	Type	Description and Valid Values
<code>jiraActionType</code>	string	Enums CREATE_JIRA UPDATE_JIRA

### JiraCreateAction

The Jira action type `create JIRA` is triggered as a response to an event.

Property Name	Type	Description and Valid Values
jiraActionType*	string	Enums CREATE_JIRA UPDATE_JIRA
assignee*	string minLength: 1	
project*	string minLength: 1	
priority*	string minLength: 1	
issueType*	string minLength: 1	

### JiraUpdateAction

The Jira action type `update JIRA` is triggered as a response to an event.

Property Name	Type	Description and Valid Values
jiraActionType*	string	Enums CREATE_JIRA UPDATE_JIRA
changePriorityTo*	string minLength: 1	

### ActionName

The name you assign to the action.

Property Name	Type	Description and Valid Values
ActionName	string minLength: 1	

### ApprovalBeforeExecution

Mandate email approval before the action execution is initiated.

Property Name	Type
requireApproval	boolean
approverEmail	string pattern: <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9]+\.[a-zA-Z0-9-]+\.\$</code>

### BusinessTransactions

Run the diagnostic session on the specified Business Transactions.

Property Name	Type	Description and Valid Values
businessTransactionScope	string	Enums ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

### AllAffectedBusinessTransactions

Run the diagnostic session on all Business Transactions.

Property Name	Type	Description and Valid Values
businessTransactionScope	string	Enums ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

### SpecificBusinessTransactions

Run the diagnostic session on the Business Transactions that match the specified criteria.

Property Name	Type	Description and Valid Values
businessTransactionScope	string	Enums ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS
businessTransactionNames*	string minItems: 1	

#### EmailArray

Property Name	Type
EmailArray	string pattern: <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9]+\.[a-zA-Z0-9-]+\.\$</code>

#### KeyValuePair

Property Name	Type
key*	string
value*	string

#### Email

Property Name	Type
Email	string pattern: <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9]+\.[a-zA-Z0-9-]+\.\$</code>

**ActionSummaryArray**

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.
name*	string minLength: 1	ActionName The name you assign to the action.
actionType*	string	The type of action triggered as a response to an event.  Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

**ActionSummary**

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.
name*	string minLength: 1	ActionName The name you assign to the action.

Property Name	Type	Description and Valid Values
actionType*	string	The type of action triggered as a response to an event.  Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

#### StringIntegerPair

Property Name	Type
id	integer
name*	string minLength: 1

#### JiraActionTypeEnum

Property Name	Type	Description and Valid Values
jiraActionTypeEnum	string	CREATE_JIRA UPDATE_JIRA

#### BusinessTransactionScopeEnum

Property Name	Type	Description and Valid Values
BusinessTransactionScopeEnum	string	ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

## ActionTypeEnum

Property Name	Type	Description and Valid Values
ActionTypeEnum	string	Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

## ErrorResponse

Property Name	Type
statusCode	integer
message	string

\*This property is required.

### Download Examples

Download [actions\\_api.zip](#) for a set of examples that help you configure an action.

### Download SWAGGER YAML file

Download the Swagger [actions\\_openapi.yml](#).

### Email Digest API

This page provides Email Digest API methods you can use to report a summary of a specific event(s) to a recipient list configured on a health rule schedule. [Email digests](#) are triggered as a response to a health rule violation event.

Syntax validation of the JSON payload is done when creating the email digest.

### Create a New Email Digest

Creates a new email digest with the specified JSON payload. See [Property Details](#).

## Resource URL

POST <controller\_url>/controller/alerting/rest/v1  
/applications/<application\_id>/email-digests

## Request/Response Format

JSON

## Example

[Request](#)   [Response](#)

This example creates a new email digest. See [Download Examples](#).

```
{
 "name": "My new email digest",
 "enabled": true,
 "executeActionsInBatch": true,
 "frequency": 2,
 "actions": [
 {
 "actionName": "My action 1",
 "actionType": "SMS"
 }
],
 "events": {
 "healthRuleEvents": {
 "healthRuleEventTypes": [
 "HEALTH_RULE_CONTINUES_CRITICAL",
 "HEALTH_RULE_UPGRADED"
],
 "healthRuleScope": {
 "healthRuleScopeType": "ALL_HEALTH_RULES"
 }
 },
 "otherEvents": [
 "CLR_CRASH",
 "DEADLOCK"
],
 "anomalyEvents": [
 "ANOMALY_OPEN_WARNING",
 "ANOMALY_CLOSE_CRITICAL"
],
 "customEvents": [
 {
 "eventName": "string",
 "propertyMatchCriteria": "ANY",
 "keyValuePairArray": [
 {
 "key": "key1",
```

```

 "value": "value1"
 }
]
 }
],
"selectedEntities": {
 "selectedEntityType": "ANY_ENTITY"
}
}

```

Request [Response](#)

This example returns the created email digest object.

```

{
 "id": 0,
 "name": "My new email digest",
 "enabled": true,
 "executeActionsInBatch": true,
 "frequency": 2,
 "actions": [
 {
 "actionName": "My action 1",
 "actionType": "SMS"
 }
],
 "events": {
 "healthRuleEvents": {
 "healthRuleEventTypes": [
 "HEALTH_RULE_CONTINUES_CRITICAL",
 "HEALTH_RULE_UPGRADED"
],
 "healthRuleScope": {
 "healthRuleScopeType": "ALL_HEALTH_RULES"
 }
 },
 "otherEvents": [
 "CLR_CRASH",
 "DEADLOCK"
],
 "anomalyEvents": [
 "ANOMALY_OPEN_WARNING",
 "ANOMALY_CLOSE_CRITICAL"
],
 "customEvents": [
 {
 "eventName": "string",
 "propertyMatchCriteria": "ANY",
 "keyValuePairArray": [

```

```

 {
 "key": "key1",
 "value": "value1"
 }
]
},
"selectedEntities": {
 "selectedEntityType": "ANY_ENTITY"
}
}

```

### Retrieve a List of Email Digests for an Application

This API returns the email digest names, IDs, and enable flag details pertaining to the specified application. See [Property Details](#).

#### Resource URL

GET <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/email-digests

#### Response Format

JSON

#### Example Response

This example returns a list of email digests pertaining to the specified application ID.

```

[
 {
 "id": 1080,
 "name": "Digest 1",
 "enabled": true,
 "actions": [
 {
 "actionName": "alertingcsaasqe@gmail.com",
 "actionType": "EMAIL"
 }
],
 "events": {
 "healthRuleEvents": {
 "healthRuleEventTypes": [
 "HEALTH_RULE_OPEN_WARNING",
 "HEALTH_RULE_OPEN_CRITICAL",
 "HEALTH_RULE_UPGRADED",
 "HEALTH_RULE_CONTINUES_CRITICAL",
 "HEALTH_RULE_CONTINUES_WARNING"
]
 }
 }
 }
]

```

```

 "healthRuleScopeType": "ALL_HEALTH_RULES",
 "healthRuleCount": null
 },
 "otherEvents": [],
 "anomalyEvents": null,
 "customEvents": []
},
"selectedEntityType": "ANY_ENTITY"
},
{
 "id": 1079,
 "name": "Digest 2",
 "enabled": true,
 "actions": [
 {
 "actionName": "action@email.com",
 "actionType": "EMAIL"
 }
],
 "events": {
 "healthRuleEvents": {
 "healthRuleEventTypes": [
 "HEALTH_RULE_OPEN_WARNING"
],
 "healthRuleScopeType": "ALL_HEALTH_RULES",
 "healthRuleCount": null
 },
 "otherEvents": [],
 "anomalyEvents": null,
 "customEvents": []
 },
 "selectedEntityType": "ANY_ENTITY"
},
{
 "id": 1052,
 "name": "Digest 3",
 "enabled": true,
 "actions": [
 {
 "actionName": "action@email.com",
 "actionType": "EMAIL"
 }
],
 "events": {
 "healthRuleEvents": {
 "healthRuleEventTypes": [
 "HEALTH_RULE_OPEN_CRITICAL"
],
 "healthRuleScopeType": "SPECIFIC_HEALTH_RULES",
 "healthRuleCount": 1
 },
 "otherEvents": [],

```

```

 "anomalyEvents": null,
 "customEvents": []
 },
 "selectedEntityType": "ANY_ENTITY"
}
]

```

## Retrieve Details of an Email Digest

Retrieves the details of an email digest with a specified ID. See [Property Details](#).

 Ensure that you provide a valid email digest ID.

## Resource URL

GET <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/email-digests/{email-digest-id}

## Response Format

JSON

## Example Response

```

{
 "id": 0,
 "name": "My new email digest",
 "enabled": true,
 "executeActionsInBatch": true,
 "frequency": 2,
 "actions": [
 {
 "actionName": "My action 1",
 "actionType": "SMS"
 }
],
 "events": {
 "healthRuleEvents": {
 "healthRuleEventTypes": [
 "HEALTH_RULE_CONTINUES_CRITICAL",
 "HEALTH_RULE_UPGRADED"
],
 "healthRuleScope": {
 "healthRuleScopeType": "ALL_HEALTH_RULES"
 }
 },
 "otherEvents": [
 "CLR_CRASH",
 "DEADLOCK"
]
 }
}

```

```

 "anomalyEvents": [
 "ANOMALY_OPEN_WARNING",
 "ANOMALY_CLOSE_CRITICAL"
],
 "customEvents": [
 {
 "eventName": "string",
 "propertyMatchCriteria": "ANY",
 "keyValuePairArray": [
 {
 "key": "key1",
 "value": "value1"
 }
]
 }
]
 },
 "selectedEntities": {
 "selectedEntityType": "ANY_ENTITY"
 }
}

```

## Update an Email Digest

Updates an existing email digest with a specified JSON payload. See [Property Details](#).

This request requires a complete JSON payload as input. It is recommended that you retrieve the JSON payload using, `GET email-digests/{email-digest-id}` and update the required fields. Then, send the modified payload as part of `PUT` request.

## Resource URL

`PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}`

## Request/Response Format

JSON

## Example

[Request](#)    [Response](#)

This example updates an action. See [Download Examples](#).

```

{
 "name": "My new email digest",

```

```

"enabled": true,
"executeActionsInBatch": true,
"frequency": 2,
"actions": [
 {
 "actionName": "My action 1",
 "actionType": "SMS"
 }
],
"events": {
 "healthRuleEvents": {
 "healthRuleEventTypes": [
 "HEALTH_RULE_CONTINUES_CRITICAL",
 "HEALTH_RULE_UPGRADED"
],
 "healthRuleScope": {
 "healthRuleScopeType": "ALL_HEALTH_RULES"
 }
 },
 "otherEvents": [
 "CLR_CRASH",
 "DEADLOCK"
],
 "anomalyEvents": [
 "ANOMALY_OPEN_WARNING",
 "ANOMALY_CLOSE_CRITICAL"
],
 "customEvents": [
 {
 "eventName": "string",
 "propertyMatchCriteria": "ANY",
 "keyValuePairArray": [
 {
 "key": "key1",
 "value": "value1"
 }
]
 }
]
},
"selectedEntities": {
 "selectedEntityType": "ANY_ENTITY"
}
}

```

Request [Response](#)

This example returns the updated action.

```
{
```

```

"id": 0,
"name": "My new email digest",
"enabled": true,
"executeActionsInBatch": true,
"frequency": 2,
"actions": [
 {
 "actionName": "My action 1",
 "actionType": "SMS"
 }
],
"events": {
 "healthRuleEvents": {
 "healthRuleEventTypes": [
 "HEALTH_RULE_CONTINUES_CRITICAL",
 "HEALTH_RULE_UPGRADED"
],
 "healthRuleScope": {
 "healthRuleScopeType": "ALL_HEALTH_RULES"
 }
 },
 "otherEvents": [
 "CLR_CRASH",
 "DEADLOCK"
],
 "anomalyEvents": [
 "ANOMALY_OPEN_WARNING",
 "ANOMALY_CLOSE_CRITICAL"
],
 "customEvents": [
 {
 "eventName": "string",
 "propertyMatchCriteria": "ANY",
 "keyValuePairArray": [
 {
 "key": "key1",
 "value": "value1"
 }
]
 }
]
},
"selectedEntities": {
 "selectedEntityType": "ANY_ENTITY"
}
}

```

## Delete an Email Digest

Deletes an email digest with the specified ID. See [Property Details](#).

**i** Ensure that you provide a valid email digest ID.

### Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}
```

### Update one or more properties of an Email Digest

Updates the properties of an existing email digest with a specified JSON payload. See [Property Details](#)

### Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}/configuration
```

### Request/Response Format

JSON

### Example

[Request](#)   [Response](#)

This example updates the properties of a specified email digest.

```
{
 "enabled": true,
 "emailDigestName": "test email digest",
 "frequency": 2
}
```

[Request](#)   [Response](#)

This example returns the properties updated for a specified email digest.

```
{
 "id": 0,
 "name": "My new email digest",
 "enabled": true,
 "executeActionsInBatch": true,
 "frequency": 2,
 "actions": [
 {
 "actionName": "My action 1",
 "actionType": "SMS"
 }
],
 "events": {
 "healthRuleEvents": {
```

```

 "healthRuleEventTypes": [
 "HEALTH_RULE_CONTINUES_CRITICAL",
 "HEALTH_RULE_UPGRADED"
],
 "healthRuleScope": {
 "healthRuleScopeType": "ALL_HEALTH_RULES"
 }
 },
 "otherEvents": [
 "CLR_CRASH",
 "DEADLOCK"
],
 "anomalyEvents": [
 "ANOMALY_OPEN_WARNING",
 "ANOMALY_CLOSE_CRITICAL"
],
 "customEvents": [
 {
 "eventName": "string",
 "propertyMatchCriteria": "ANY",
 "keyValuePairArray": [
 {
 "key": "key1",
 "value": "value1"
 }
]
 }
]
},
"selectedEntities": {
 "selectedEntityType": "ANY_ENTITY"
}
}

```

## Response Codes

Code	Description
200	Fetches successfully
201	Created successfully
204	Deleted successfully
400	Bad request
401	Unauthorized

Code	Description
403	Forbidden
404	Resource not found
409	Already exists

## Property Details

### Email Digest

Payload details of an email digest.

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a <code>readOnly</code> value.
name*	string Minimum length: 1	Name of the email digest.
enabled	boolean Default value: <code>true</code>	Sets the email digest to enabled/disabled state.
frequency	integer minimum: 1 maximum: 168	The frequency in hours at which emails are sent as a response to an event.

Property Name	Type	Description and Valid Values									
actions*	minItems: 1	<p>Action Describes the predefined, reusable, and automated response to an event to be taken when the event is triggered.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>actionName*</td> <td>string</td> <td>Name of the action defined for an email digest.</td> </tr> <tr> <td>actionType*</td> <td>string</td> <td>           ActionTypeEnum            Creates the following types of actions:            SMS            EMAIL            CUSTOM_EMAIL            THREAD_DUMP            HTTP_REQUEST            CUSTOM            RUN_SCRIPT_ON_NODES            DIAGNOSTIC_BUSINESS_TRANSACTIONS            CREATE_UPDATE_JIRA         </td> </tr> </tbody> </table>	Property Name	Type	Description	actionName*	string	Name of the action defined for an email digest.	actionType*	string	ActionTypeEnum Creates the following types of actions: SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

### HealthRuleEvent

Events associated with health rules considered for an email digest.

Property Name	Type	Description
healthRuleEventTypes*	string minItems: 1	HealthRuleEventType Enums HEALTH_RULE_CONTINUES_CRITICAL HEALTH_RULE_OPEN_CRITICAL HEALTH_RULE_OPEN_WARNING HEALTH_RULE_UPGRADED HEALTH_RULE_DOWNGRADED HEALTH_RULE_CONTINUES_WARNING HEALTH_RULE_CLOSE_WARNING HEALTH_RULE_CLOSE_CRITICAL HEALTH_RULE_CANCELED_WARNING HEALTH_RULE_CANCELED_CRITICAL

Property Name	Type	Description						
healthRuleScope*	string	Events associated with specific health rules or all health rules that trigger the email digest. healthRuleScopeType						
<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>healthRuleScopeType*</td> <td>string</td> <td>Enums ALL_HEALTH_RULES SPECIFIC_HEALTH_RULES</td> </tr> </tbody> </table>			Property Name	Type	Description	healthRuleScopeType*	string	Enums ALL_HEALTH_RULES SPECIFIC_HEALTH_RULES
Property Name	Type	Description						
healthRuleScopeType*	string	Enums ALL_HEALTH_RULES SPECIFIC_HEALTH_RULES						

#### HealthRuleScope

Events associated with specific health rules or all health rules considered for an email digest.

Property Name	Type	Description
healthRuleScopeType*	string	Enums ALL_HEALTH_RULES SPECIFIC_HEALTH_RULES

#### AllHealthRules

Events associated with all health rules within an application considered for an email digest.

Property Name	Type	Description
healthRuleScopeType*	string	Enum ALL_HEALTH_RULES

#### SpecificHealthRules

Events associated with specific health rules within an application considered for an email digest.

Property Name	Type	Description
healthRuleScopeType*	string	Enum SPECIFIC_HEALTH_RULES

Property Name	Type	Description
healthRules*	string minItems: 1	

### HealthRuleEventTypes

Property Name	Type	Description
healthRuleEventTypes*	string	Enums HEALTH_RULE_CONTINUES_CRITICAL HEALTH_RULE_OPEN_CRITICAL HEALTH_RULE_OPEN_WARNING HEALTH_RULE_UPGRADED HEALTH_RULE_DOWNGRADED HEALTH_RULE_CONTINUES_WARNING HEALTH_RULE_CLOSE_WARNING HEALTH_RULE_CLOSE_CRITICAL HEALTH_RULE_CANCELED_WARNING HEALTH_RULE_CANCELED_CRITICAL

**OtherEvents**

Property Name	Type	Description
otherEvents	string	<p>OtherEventType Enums</p> <ul style="list-style-type: none"> <li>CLR_CRASH</li> <li>APPLICATION_CRASH</li> <li>DEADLOCK</li> <li>RESOURCE_POOL_LIMIT</li> <li>APPLICATION_DEPLOYMENT</li> <li>APP_SERVER_RESTART</li> <li>APPLICATION_CONFIG_CHANGE</li> <li>AGENT_CONFIGURATION_ERROR</li> <li>APPLICATION_DISCOVERED</li> <li>TIER_DISCOVERED</li> <li>NODE_DISCOVERED</li> <li>MACHINE_DISCOVERED</li> <li>BT_DISCOVERED</li> <li>SERVICE_ENDPOINT_DISCOVERED</li> <li>BACKEND_DISCOVERED</li> <li>EUM_CLOUD_SYNTHETIC_HEALTHY_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_WARNING_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_CONFIRMED_WARNING_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_ONGOING_WARNING_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_ERROR_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_CONFIRMED_ERROR_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_ONGOING_ERROR_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_PERF_HEALTHY_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_PERF_WARNING_EVENT</li> <li>EUM_CLOUD_SYNTHETIC_PERF_CONFIRMED_WARNING_EVENT</li> </ul>

Property Name	Type	Description
		<p>EUM_CLOUD_SYNTHETIC_PERF_ONGOING_WARNING_EVENT</p> <p>EUM_CLOUD_SYNTHETIC_PERF_CRITICAL_EVENT</p> <p>EUM_CLOUD_SYNTHETIC_PERF_CONFIRMED_CRITICAL_EVENT</p> <p>EUM_CLOUD_SYNTHETIC_PERF_ONGOING_CRITICAL_EVENT</p> <p>MOBILE_NEW_CRASH_EVENT</p> <p>SLOW</p> <p>VERY_SLOW</p> <p>STALL</p> <p>ERROR</p>

### AnomalyEvents

Events generated due to anomaly detection considered for an email digest.

Property Name	Type	Description
anomalyEvents	string minItems: 1	<p>AnomalyEventType Enums</p> <p>ANOMALY_OPEN_WARNING</p> <p>ANOMALY_OPEN_CRITICAL</p> <p>ANOMALY_UPGRADED</p> <p>ANOMALY_DOWNGRADED</p> <p>ANOMALY_CLOSE_WARNING</p> <p>ANOMALY_CLOSE_CRITICAL</p> <p>ANOMALY_CANCELED_WARNING</p> <p>ANOMALY_CANCELED_CRITICAL</p>

### Action

A list of actions that are taken in response to an event.

Property Name	Type	Description
actionName*	string	

Property Name	Type	Description
actionType*	string	ActionType Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

### SimpleActionType

A simple action that is taken when the policy is triggered.

Property Name	Type	Description
actionName*	string	
actionType*	string	ActionType Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

### EmailActionType

An email is sent when the policy is triggered.

Property Name	Type	Description
actionName*	string	
actionType*	string	ActionType Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
notes	string	

### ActionOnSpecifiedEntities

A simple action that is taken for specific entities when the policy is triggered.

Property Name	Type	Description
actionName*	string	
actionType*	string	ActionType Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

Property Name	Type	Description						
<code>specifiedEntityActionDetails*</code>	string	SpecifiedEntityActionDetails <table border="1" data-bbox="951 386 1495 863"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><code>specifiedEntityActionScope</code></td> <td>string</td> <td>SpecifiedEntityActionScope Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES</td> </tr> </tbody> </table>	Property Name	Type	Description	<code>specifiedEntityActionScope</code>	string	SpecifiedEntityActionScope Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES
Property Name	Type	Description						
<code>specifiedEntityActionScope</code>	string	SpecifiedEntityActionScope Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES						

#### SpecifiedEntityActionDetails

Property Name	Type	Description
<code>specifiedEntityActionScope</code>	string	SpecifiedEntityActionScope Enums PERCENTAGE ABSOLUTE SPECIFIC_NODES

#### ActionOnPercentageEntities

The scope of entities on which the action is performed is set to `percentage` .

Property Name	Type	Description
<code>specifiedEntityActionScope</code>	string	SpecifiedEntityActionScope Enum PERCENTAGE
<code>value*</code>	integer	

#### ActionOnAbsoluteEntities

The scope of entities on which the action is performed is set to `absolute` .

Property Name	Type	Description
specifiedEntityActionScope	string	SpecifiedEntityActionScope Enum ABSOLUTE
value*	integer	

### ActionOnSpecificNodes

A list of nodes on which the action is performed.

Property Name	Type	Description
specifiedEntityActionScope	string	SpecifiedEntityActionScope Enum SPECIFIC_NODES
nodes*	string minItems: 1	

### EmailDigestSummaryArray

Property Name	Type
id*	integer
name*	string minLength: 1
enabled*	boolean

### KeyValuePair

Property Name	Type
key*	string
value*	string

### EmailDigestSummary

Property Name	Type
id*	integer
name*	string minLength: 1
enabled*	boolean

### EmailDigestConfiguration

Property Name	Type
enabled*	boolean
EmailDigestName	string
frequency	integer minimum: 1 maximum: 168

### EntityMatchingPattern

Entities that match the specified pattern.

Property Name	Type	Description
matchTo*	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX
matchValue*	string minLength: 1	

Property Name	Type	Description
shouldNot	boolean default: false	

## Enums

### PropertyMatchCriteria

Property Name	Type	Description
propertyMatchCriteria	string default: ANY	Enums ANY ALL

### EntityMatchingPatternEnum

Property Name	Type	Description
EntityMatchingPatternEnum	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX

#### Download SWAGGER YAML file

Download the Swagger [email\\_digests\\_openapi.yml](#) file.

### Action Suppression API

This page describes the Action Suppression API methods you can use to temporarily suspend the automatic trigger of actions and alerts by a policy in response to an event. This API is useful when performing maintenance activities or troubleshooting a component.

#### Note

Syntax validation of the JSON payload is done when creating action suppression.

## Create a New Action Suppression

Creates a new action suppression with the specified JSON payload. See [Property Details](#).

### Resource URL

POST <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/action-suppressions

### Request/Response Format

JSON

### Example

[Request](#)    [Response](#)

This example creates an action suppression that affects specific health rules within an application. See [Download Examples](#).

```
{
 "id": 9,
 "name": "TestAS",
 "disableAgentReporting": false,
 "suppressionScheduleType": "ONE_TIME",
 "timezone": "Asia/Kolkata",
 "startTime": "2020-08-19T11:43:00",
 "endTime": "2020-08-19T12:43:00",
 "recurringSchedule": null,
 "affects": {
 "affectedInfoType": "APPLICATION"
 },
 "healthRuleScope": null
}
```

[Request](#)    [Response](#)

```
{
 "id": 9,
 "name": "TestAS",
 "disableAgentReporting": false,
 "suppressionScheduleType": "ONE_TIME",
 "timezone": "Asia/Kolkata",
 "startTime": "2020-08-19T11:43:00",
 "endTime": "2020-08-19T12:43:00",
 "recurringSchedule": null,
 "affects": {
 "affectedInfoType": "APPLICATION"
 },
 "healthRuleScope": null
}
```

```
}

```

## Retrieve a List of Action Suppressions Configured for a Given Application

Returns all the action suppressions that are configured for a given application. The required fields are action suppression IDs and names. Details such as `timezone`, `startTime`, `endTime` and `recurringSchedule` of configured action suppressions are returned. See [Property Details](#).

### Resource URL

GET <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/action-suppressions

### Response Format

JSON

### Example Response

```
[
 {
 "id": 11,
 "name": "TestAS1",
 "timezone": "Asia/Kolkata",
 "startTime": "2020-08-19T12:06:00",
 "endTime": "2020-08-19T13:06:00"
 }
 {
 "id": 12,
 "name": "TestAS2",
 "timezone": "Asia/Kolkata",
 "startTime": "2020-08-19T12:27:00",
 "endTime": "2020-08-19T13:27:00"
 }
 {
 "id": 13,
 "name": "TestAS3",
 "timezone": "Asia/Kolkata",
 "startTime": "2020-08-19T12:08:00",
 "endTime": "2020-08-19T13:08:00"
 }
]
```

## Retrieve the Details of an Action Suppression

Returns JSON representation of action suppression for the given action suppression ID. See [Property Details](#).

## Resource URL

GET <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/action-suppressions/{action-suppression-id}

## Response Format

JSON

## Example Response

```
{
 "id": 9,
 "name": "TestAS",
 "disableAgentReporting": false,
 "suppressionScheduleType": "ONE_TIME",
 "timezone": "Asia/Kolkata",
 "startTime": "2020-08-19T11:43:00",
 "endTime": "2020-08-19T12:43:00",
 "recurringSchedule": null,
 "affects": {
 "affectedInfoType": "APPLICATION"
 },
 "healthRuleScope": null
}
```

## Update an Action Suppression

Updates an existing action suppression with a specified JSON payload. See [Property Details](#).

## Resource URL

PUT <controller\_url>/controller/alerting/rest/v1/applications/<application\_id>/action-suppressions/{action-suppression-id}

## Request/Response Format

JSON

## Example

[Request](#)   [Response](#)

```
{
 "id": 9,
 "name": "TestAS1",
 "disableAgentReporting": false,
 "suppressionScheduleType": "ONE_TIME",
 "timezone": "Asia/Kolkata",
 "startTime": "2020-08-19T12:05:00",
 "endTime": "2020-08-19T13:05:00",
}
```

```
"recurringSchedule": null,
"affecteds": {
 "affectedInfoType": "APPLICATION"
},
"healthRuleScope": null
}
```

Request [Response](#)

```
{
 "id": 9,
 "name": "TestAS",
 "disableAgentReporting": false,
 "suppressionScheduleType": "ONE_TIME",
 "timezone": "Asia/Kolkata",
 "startTime": "2020-08-19T11:43:00",
 "endTime": "2020-08-19T12:43:00",
 "recurringSchedule": null,
 "affecteds": {
 "affectedInfoType": "APPLICATION"
 },
 "healthRuleScope": null
}
```

## Delete an Action Suppression

Deletes an action suppression with the specified ID. See [Property Details](#).

### Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/
action-suppressions/{action-suppression-id}
```

## Retrieve the Details of an Action Suppression by Name

Returns JSON representation of action suppression for the given action suppression name. See [Property Details](#).

### Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-
suppressions/action-suppression-by-name/?name=<ActionSuppressionName>
```

**i** Replace `<ActionSuppressionName>` with a name you specified for the action suppression. For example, `ACTION_SUP_15`.

## Response Format

JSON

## Example Response

```
{
 "id": 9,
 "name": "TestAS1",
 "timezone": "Asia/Kolkata",
 "startTime": "2020-08-19T12:05:00",
 "endTime": "2020-08-19T13:05:00",
 "recurringSchedule": null
}
```

## Response Codes

Code	Description
200	Fetches successfully
201	Created successfully
204	Deleted successfully
400	Bad request
401	Unauthorized
403	Forbidden
404	Resource not found
409	Already exists

## Property Details

The property names with asterisk are the required (mandatory) fields in a payload.

## Action Suppression

Payload details for action suppression.

Property Name	Type	Description and Valid Values
<code>id</code>	integer	This is auto-generated by the system and returned in the response. It is a <code>readOnly</code> value.
<code>name*</code>	string minLength: 1 maxLength: 100	The name of action suppression.
<code>disableAgentReporting</code>	boolean default: <code>false</code>	If enabled, the agents defined in the scope do not report any metric data during the specified time frame.
<p><b>i</b> You cannot define a recurring action suppression if you set <code>disableAgentReporting</code> to <code>true</code>.</p>		
<code>suppressionScheduleType</code>	string default: <code>ONE_TIME</code>	The available scheduling options for action suppression. Enums <code>ONE_TIME</code> <code>RECURRING</code>
<code>timezone</code>	string	The timezone ID. The default time zone is the controller timezone.
<code>startTime</code>	string format: yyyy-MM-ddTHH:mm:ss	The time at which the action suppression is initiated. Specify <code>startTime</code> only if <code>suppressionScheduleType</code> is set to <code>ONE_TIME</code> . If you do not specify the <code>startTime</code> , action suppression starts from the current time. The expected format is yyyy-MM-ddTHH:mm:ss conforming to rfc3339.
<code>endTime</code>	string format: yyyy-MM-ddTHH:mm:ss	The time at which the ongoing action suppression ends. Specify <code>startTime</code> only if <code>suppressionScheduleType</code> is set to <code>ONE_TIME</code> . If not specified, action suppression ends at 60 minutes from the current time. The expected format is yyyy-MM-ddTHH:mm:ss conforming to rfc3339.

Property Name	Type	Description and Valid Values						
recurringSchedule	string	<p>The recurring schedule details to initiate an action suppression.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>scheduleFrequency*</td> <td>string</td> <td> <p>The frequency of invoking action suppression.</p> <p>Enums</p> <p>DAILY</p> <p>WEEKLY</p> <p>MONTHLY_SPECIFIC_DATE</p> <p>MONTHLY_SPECIFIC_DAY</p> </td> </tr> </tbody> </table>	Property Name	Type	Description	scheduleFrequency*	string	<p>The frequency of invoking action suppression.</p> <p>Enums</p> <p>DAILY</p> <p>WEEKLY</p> <p>MONTHLY_SPECIFIC_DATE</p> <p>MONTHLY_SPECIFIC_DAY</p>
Property Name	Type	Description

Property Name	Type	Description and Valid Values						
healthRuleScope*		<p>The scope of the health rules applicable to action suppression.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>healthRuleScopeType*</td> <td>string</td> <td> <p>The health rule types affected by action suppression.</p> <p>Enums</p> <p>SPECIFIC_HEALTH_RULES</p> </td> </tr> </tbody> </table>	Property Name	Type	Description	healthRuleScopeType*	string	<p>The health rule types affected by action suppression.</p> <p>Enums</p> <p>SPECIFIC_HEALTH_RULES</p>
Property Name	Type	Description						
healthRuleScopeType*	string	<p>The health rule types affected by action suppression.</p> <p>Enums</p> <p>SPECIFIC_HEALTH_RULES</p>						

### Action Suppression Schedule Type

Use this property to schedule a one-time or recurring action suppression.

Property Name	Type	Description
ActionSuppressionScheduleType	string	<p>Enums</p> <p>ONE_TIME</p> <p>RECURRING</p>

#### Example for one-time action suppression

```

{
 "name": "Action Suppression With One Time Schedule",
 "disableAgentReporting": false,
 "suppressionScheduleType": "ONE_TIME",
 "timezone": "Asia/Kolkata",
 "startTime": "2020-06-18T13:33:37",
 "endTime": "2021-06-30T16:48:37",
 "recurringSchedule": null,
 "affects": {
 "affectedInfoType": "APPLICATION"
 },
 "healthRuleScope": null
}

```

### Recurring Schedule Frequency Details

Use this property to define the frequency of invoking action suppression on a recurring basis.

Property Name	Type	Description
scheduleFrequency *	string	Describes how often action suppression is invoked.  Enums DAILY WEEKLY MONTHLY_SPECIFIC_DATE MONTHLY_SPECIFIC_DAY

Example for recurring action suppression scheduled on a daily basis

```

{
 "name": "Action Suppression With Daily Schedule",
 "disableAgentReporting": false,
 "suppressionScheduleType": "RECURRING",
 "timezone": "Asia/Kolkata",
 "startTime": null,
 "endTime": null,
 "recurringSchedule": {
 "scheduleFrequency": "DAILY",
 "startTime": "01:00",
 "endTime": "01:22"
 },
 "affects": {
 "affectedInfoType": "APPLICATION"
 },
 "healthRuleScope": null
}

```

### Daily Schedule - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a daily basis.

Property Name	Type	Description
scheduleFrequency *	string	Action suppression is invoked daily.  Enum DAILY

Property Name	Type	Description
startTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which the action suppression is initiated. The time in 24 hour format.
endTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which the ongoing action suppression ends. The time in 24 hour format.

#### Example

```
{
 "name": "Action Suppression With Daily Schedule",
 "disableAgentReporting": false,
 "suppressionScheduleType": "RECURRING",
 "timezone": "Asia/Kolkata",
 "startTime": null,
 "endTime": null,
 "recurringSchedule": {
 "scheduleFrequency": "DAILY",
 "startTime": "01:00",
 "endTime": "01:22"
 },
 "affects": {
 "affectedInfoType": "APPLICATION"
 },
 "healthRuleScope": null
}
```

#### Weekly Schedule - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a weekly basis.

Property Name	Type	Description
scheduleFrequency*	string	Action suppression is invoked on a specific day of the week. Enum WEEKLY

Property Name	Type	Description						
days *	string minItems: 1 maxItems: 7	The day(s) of the week to suppress actions. <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DayOfWeek</td> <td>string</td> <td>Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY</td> </tr> </tbody> </table>	Property Name	Type	Description	DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY
Property Name	Type	Description						
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY						
startTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which the action suppression is initiated. The time in 24 hour format.						
endTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which the ongoing action suppression ends. The time in 24 hour format.						

Property Name	Type	Description
Example		
<pre> { "name": "Action Suppression With Weekly Schedule", "disableAgentReporting": false,   "suppressionScheduleType": "RECURRING",   "timezone": "Asia/Kolkata",   "startTime": null,   "endTime": null,   "recurringSchedule": {     "scheduleFrequency": "WEEKLY",     "startTime": "06:00",     "endTime": "18:00",     "days": [       "SUNDAY",       "MONDAY"     ]   },   "affects": {     "affectedInfoType": "APPLICATION"   },   "healthRuleScope": null } </pre>		

### Monthly Schedule, Specific Date - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a monthly basis, on a specific date.

Property Name	Type	Description
<code>scheduleFrequency</code> *	string	Action suppression is invoked on a specific date every month.  Enum MONTHLY_SPECIFIC_DATE
<code>startDate</code> *	string pattern: <code>^(0[1-9] [12][0-9] 3[01])\$ ^Last Day\$</code>	The start date of the month to suppress actions.
<code>startTime</code> *	Time string pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>	The time at which action suppression is initiated.  The time in 24 hour format.

Property Name	Type	Description
endDate *	string pattern: <code>^(0[1-9] [12][0-9] 3[01])\$ ^Last Day\$</code>	The end date of the month to suppress actions.
endTime*	Time string pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>	The time at which the ongoing action suppression ends. The time in 24 hour format.

**Example**

```
{
 "name": "Action Suppression With Monthly Specific Date Schedule",
 "disableAgentReporting": false,
 "suppressionScheduleType": "RECURRING",
 "timezone": "Asia/Kolkata",
 "startTime": null,
 "endTime": null,
 "recurringSchedule": {
 "scheduleFrequency": "MONTHLY_SPECIFIC_DATE",
 "startDate": "01",
 "startTime": "06:00",
 "endDate": "Last Day",
 "endTime": "18:00"
 },
 "affects": {
 "affectedInfoType": "APPLICATION"
 },
 "healthRuleScope": null
}
```

**Monthly Schedule, Specific Day - Configuration Details**

Use the following properties to configure the details of an action suppression that is scheduled on a monthly basis, on a specific date.

Property Name	Type	Description
scheduleFrequency *	string	Action suppression is invoked on a specific day of the month. Enum MONTHLY_SPECIFIC_DAY

Property Name	Type	Description						
startTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which action suppression is initiated. The time in 24 hour format.						
endTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which the ongoing action suppression ends. The time in 24 hour format.						
days *	string	The day of the month to suppress actions. <table border="1" data-bbox="911 703 1495 1245"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DayOfWeek</td> <td>string</td> <td>Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY</td> </tr> </tbody> </table>	Property Name	Type	Description	DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY
Property Name	Type	Description						
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY						
occurrence *	string	Enums FIRST SECOND THIRD FOURTH LAST						

Property Name	Type	Description
---------------	------	-------------

Example

```
{
 "name": "Action Suppression With Monthly Specific Day Schedule",
 "disableAgentReporting": false,
 "suppressionScheduleType": "RECURRING",
 "timezone": "Asia/Kolkata",
 "startTime": null,
 "endTime": null,
 "recurringSchedule": {
 "scheduleFrequency": "MONTHLY_SPECIFIC_DAY",
 "startTime": "06:00",
 "endTime": "18:00",
 "day": "SUNDAY",
 "occurrence": "FIRST"
 },
 "affects": {
 "affectedInfoType": "APPLICATION"
 },
 "healthRuleScope": null
}
```

**Schedule Frequency Details**

Use this property to define the frequency of invoking an action suppression.

Property Name	Type	Description
scheduleFrequency *	string	Enums DAILY WEEKLY MONTHLY_SPECIFIC_DATE MONTHLY_SPECIFIC_DAY

Property Name	Type	Description
Example		
<pre>{   "recurringSchedule":{     "scheduleFrequency":"WEEKLY",     "startTime":"06:00",     "endTime":"18:00",     "days":[       "SUNDAY",       "MONDAY"     ]   } }</pre>		

### Occurrence Details

The occurrence of the day of the month to suppress actions.

Property Name	Type	Description
occurrence	string	Enums FIRST SECOND THIRD FOURTH LAST
Example		
<pre>{   "recurringSchedule":{     "scheduleFrequency":"MONTHLY_SPECIFIC_DAY",     "startTime":"06:00",     "endTime":"18:00",     "day":"SUNDAY",     "occurrence":"FIRST"   } }</pre>		

### Monthly Action Suppression - Day

The day of the month to suppress actions.

Property Name	Type	Description
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY

**Example**

```
{
 "recurringSchedule":{
 "scheduleFrequency":"MONTHLY_SPECIFIC_DAY",
 "startTime":"06:00",
 "endTime":"18:00",
 "day":"SUNDAY",
 "occurrence":"FIRST"
 }
}
```

**Action Suppression Time Details**

Use this property to define the time details to suppress an action.

Property Name	Type	Description
Time	string pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>	The time in 24 hour format.

Property Name	Type	Description
Example		
<pre>{   "recurringSchedule": {     "scheduleFrequency": "MONTHLY_SPECIFIC_DATE",     "startDate": "01",     "startTime": "06:00",     "endDate": "Last Day",     "endTime": "18:00"   } }</pre>		

### Timezone

Property Name	Type	Description
Timezone	string	Timezone Id. The default time zone is the controller timezone.
Example		
<pre>{   "name": "Action Suppression With One Time Schedule",   "disableAgentReporting": false,   "suppressionScheduleType": "ONE_TIME",   "timezone": "Asia/Kolkata",   "startTime": "2020-06-18T13:33:37",   "endTime": "2021-06-30T16:48:37",   "recurringSchedule": null,   "affects": {     "affectedInfoType": "APPLICATION"   },   "healthRuleScope": null }</pre>		

### Entities Affected by Action Suppression

Information pertaining to entities affected by action suppression.

Property Name	Type	Description and Valid Values
affectedInfoType*	string	Enums APPLICATION BUSINESS_TRANSACTIONS TIERS_NODES SERVERS DATABASES

**Example**

```
{
 "affectedInfoType": "TIERS_NODES",
 "affectedEntities": {
 "tierNodeType": "NODE",
 "nodeType": "ALL_NODES",
 "affectedNodes": {
 "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
 "specificTiers": ["Tier1"]
 }
 }
}
```

**Application-level Entities Affected by Action Suppression**

Use to suppress actions for entities at the application-level.

Property Name	Type	Description and Valid Values
affectedInfoType*	string	Enum APPLICATION

**Example**

```
{
 "affectedInfoType": "APPLICATION"
}
```

**Business Transactions Affected by Action Suppression**

Use this to suppress actions for entities at the business transaction (BT) level.

Property Name	Type	Description and Valid Values						
affectedInfoType*	string	Enum BUSINESS_TRANSACTIONS						
affectedBusinessTransactions*		<p>The scope of the business transactions affected by action suppression.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>businessTransactionScope*</td> <td>string</td> <td>           Enums            ALL_BUSINESS_TRANSACTIONS            SPECIFIC_BUSINESS_TRANSACTIONS            BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS            BUSINESS_TRANSACTIONS_MATCHING_PATTERN         </td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	businessTransactionScope*	string	Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING_PATTERN
Property Name	Type	Description and Valid Values						
businessTransactionScope*	string	Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING_PATTERN						

**Example**

```

{
 "affectedInfoType": "BUSINESS_TRANSACTIONS",
 "affectedBusinessTransactions": {
 "businessTransactionScope": "BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS",
 "specificTiers": ["DefaultTier1"]
 }
}

```

**Scope of Business Transactions Affected**

Use this to suppress actions for entities at the BT level for the selected BT types.

Property Name	Type	Description and Valid Values
businessTransactionScope*	string	Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING_PATTERN

### All Types of Business Transactions

Use this to suppress actions for entities at the BT level for all BTs.

Property Name	Type	Description and Valid Values
businessTransactionScope*	string	Enum ALL_BUSINESS_TRANSACTIONS

#### Example

```
{
 "affectedInfoType": "BUSINESS_TRANSACTIONS",
 "affectedBusinessTransactions": {
 "businessTransactionScope": "ALL_BUSINESS_TRANSACTIONS"
 }
}
```

### Specific Business Transactions

Use this to suppress actions for entities at the BT level for the specific BTs only.

Property Name	Type	Description and Valid Values
businessTransactionScope*	string	Enum SPECIFIC_BUSINESS_TRANSACTIONS
businessTransactions*	array of strings minItems: 1	Specific business transactions affected by action suppression. For example: [CheckoutBt, LoginBt]

Property Name	Type	Description and Valid Values
Example		
<pre>{   "affectedInfoType": "BUSINESS_TRANSACTIONS",   "affectedBusinessTransactions": {     "businessTransactionScope": "SPECIFIC_BUSINESS_TRANSACTIONS",     "businessTransactions": ["/BT/", "/BT/rest"]   } }</pre>		

### Business Transactions Associated with Specific Tiers

Use this to suppress actions for entities at the BT level for BTs within specific tiers only.

Property Name	Type	Description and Valid Values
businessTransactionScope*	string	Enum BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS
specificTiers*	array of strings minItems: 1	Business transactions associated with specific tiers affected by action suppression. For example: [CheckoutTier, LoginTier]

#### Example

```
{
 "affectedInfoType":"BUSINESS_TRANSACTIONS",
 "affectedBusinessTransactions":{
 "businessTransactionScope":"BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS",
 "specificTiers":["DefaultTier1"]
 }
}
```

### Business Transactions Matching a Pattern

Use this to suppress actions for entities at the BT level for BTs with properties that match a given pattern.

Property Name	Type	Description and Valid Values												
businessTransactionScope*	string	Enums BUSINESS_TRANSACTIONS_MATCHING_PATTERN												
patternMatcher*		EntityMatchingPattern <table border="1" data-bbox="896 527 1495 1346"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>matchTo*</td> <td>string</td> <td>Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX</td> </tr> <tr> <td>matchValue*</td> <td>string minLength: 1</td> <td>The pattern match value.</td> </tr> <tr> <td>shouldNot</td> <td>boolean default: false</td> <td>Select this to reverse the pattern match condition.</td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	matchTo*	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX	matchValue*	string minLength: 1	The pattern match value.	shouldNot	boolean default: false	Select this to reverse the pattern match condition.
Property Name	Type	Description and Valid Values												
matchTo*	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX												
matchValue*	string minLength: 1	The pattern match value.												
shouldNot	boolean default: false	Select this to reverse the pattern match condition.												

**Example**

```

{
 "affectedInfoType": "BUSINESS_TRANSACTIONS",
 "affectedBusinessTransactions": {
 "businessTransactionScope": "BUSINESS_TRANSACTIONS_MATCHING_PATTERN",
 "patternMatcher": {
 "matchTo": "STARTS_WITH",
 "matchValue": "E",
 "shouldNot": false
 }
 }
}

```

### Tiers/Nodes Entities Affected

Use this to suppress actions for entities at the Tier/Node level.

Property Name	Type	Description and Valid Values						
affectedInfoType*	string	Enum TIERS_NODES						
affectedEntities*		TierNodeEntities <table border="1" data-bbox="623 642 1495 926"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>tierNodeType*</td> <td>string</td> <td>Enums TIER NODE</td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	tierNodeType*	string	Enums TIER NODE
Property Name	Type	Description and Valid Values						
tierNodeType*	string	Enums TIER NODE						

#### Example

```

{
 "affectedInfoType": "TIERS_NODES",
 "affectedEntities": {
 "tierNodeType": "NODE",
 "nodeType": "ALL_NODES",
 "affectedNodes": {
 "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
 "specificTiers": ["Tier1"]
 }
 }
}

```

### Tier or Node Entities Affected

Use this to suppress actions for entities at the tier level or node level.

Property Name	Type	Description and Valid Values
tierNodeType*	string	Enums TIER NODE

### Tier-level Entities Affected

Property Name	Type	Description and Valid Values						
tierNodeType*	string	Enum TIER						
affectedTiers*		AffectedTiers <table border="1" data-bbox="911 548 1495 909"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>affectedTierScope*</td> <td>string</td> <td>Enums ALL_TIERS SPECIFIC_TIERS</td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	affectedTierScope*	string	Enums ALL_TIERS SPECIFIC_TIERS
Property Name	Type	Description and Valid Values						
affectedTierScope*	string	Enums ALL_TIERS SPECIFIC_TIERS						

#### Example

```

{
 "affectedInfoType": "TIERS_NODES",
 "affectedEntities": {
 "tierNodeType": "TIER",
 "affectedTiers": {
 "affectedTierScope": "SPECIFIC_TIERS",
 "tiers": ["ECommerce-Services", "Inventory-Services"]
 }
 }
}

```

### Node-level Entities Affected

Property Name	Type	Description and Valid Values
tierNodeType*	string	Enum NODE

Property Name	Type	Description and Valid Values						
nodeType*	string	Enums ALL_NODES JAVA_NODES DOT_NET_NODES PHP_NODES						
affectedNodes*		AffectedNodes <table border="1" data-bbox="911 646 1495 1297"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>affectedNodeScope*</td> <td>string</td> <td>Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER</td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	affectedNodeScope*	string	Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER
Property Name	Type	Description and Valid Values						
affectedNodeScope*	string	Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER						

**Example**

```

{
 "affectedInfoType": "TIERS_NODES",
 "affectedEntities": {
 "tierNodeType": "NODE",
 "nodeType": "ALL_NODES",
 "affectedNodes": {
 "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
 "specificTiers": ["Tier1"]
 }
 }
}

```

### Affected Tier Scope

Property Name	Type	Description and Valid Values
affectedTierScope*	string	Enums ALL_TIERS SPECIFIC_TIERS

### All Tiers

Use this to suppress actions for entities at the tier level for all tiers.

Property Name	Type	Description and Valid Values
affectedTierScope*	string	Enum ALL_TIERS

### Example

```

{
 "affectedInfoType": "TIERS_NODES",
 "affectedEntities": {
 "tierNodeType": "TIER",
 "affectedTiers": {
 "affectedTierScope": "ALL_TIERS"
 }
 }
}

```

### Specific Tiers

Use this to suppress actions for entities at the tier level for specific tiers only.

Property Name	Type	Description and Valid Values
affectedTierScope*	string	Enum SPECIFIC_TIERS
tiers*	array of strings minItems: 1	

Property Name	Type	Description and Valid Values
Example		
<pre>{   "affectedInfoType": "TIERS_NODES",   "affectedEntities": {     "tierNodeType": "TIER",     "affectedTiers": {       "affectedTierScope": "SPECIFIC_TIERS",       "tiers": ["ECommerce-Services", "Inventory-Services"]     }   } }</pre>		

### Affected Nodes

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER
Example		
<pre>{   "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",   "specificTiers": ["Tier1"] }</pre>		

### All Nodes

Use this to suppress actions for entities at the node level for all nodes.

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enum ALL_NODES

Property Name	Type	Description and Valid Values
Example		
<pre>{   "affectedInfoType": "TIERS_NODES",   "affectedEntities": {     "tierNodeType": "NODE",     "nodeType": "ALL_NODES",     "affectedNodes": {       "affectedNodeScope": "ALL_NODES"     }   } }</pre>		

### Specific Nodes

Use this to suppress actions for entities at the node level for specific nodes only.

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enum SPECIFIC_NODES
nodes*	array of strings minItems: 1	A list of nodes considered as affected entities for action suppression. For example: [Node1, Node2]
Example		
<pre>{   "affectedInfoType": "TIERS_NODES",   "affectedEntities": {     "tierNodeType": "NODE",     "nodeType": "ALL_NODES",     "affectedNodes": {       "affectedNodeScope": "SPECIFIC_NODES",       "nodes": ["Node1", "Node2"]     }   } }</pre>		

### Nodes within Specific Tiers

Use this to suppress actions for entities at the node level for nodes within specific tiers only.

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enum NODES_OF_SPECIFIC_TIERS
specificTiers*	array of strings minItems: 1	

**Example**

```

{
 "affectedInfoType": "TIERS_NODES",
 "affectedEntities": {
 "tierNodeType": "NODE",
 "nodeType": "ALL_NODES",
 "affectedNodes": {
 "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
 "specificTiers": ["ECommerce-Services", "Inventory-Services"]
 }
 }
}

```

**Nodes that Match a Pattern**

Use this to suppress actions for entities at the node level for nodes with properties that match a pattern.

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enum NODES_MATCHING_PATTERN

Property Name	Type	Description and Valid Values												
patternMatcher*		EntityMatchingPattern <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>matchTo*</td> <td>string</td> <td>Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX</td> </tr> <tr> <td>matchValue*</td> <td>string minLength: 1</td> <td>The pattern match value.</td> </tr> <tr> <td>shouldNot</td> <td>boolean default: false</td> <td>Select this if you want to reverse the pattern match condition.</td> </tr> </tbody> </table>	Property Name	Type	Description	matchTo*	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX	matchValue*	string minLength: 1	The pattern match value.	shouldNot	boolean default: false	Select this if you want to reverse the pattern match condition.
Property Name	Type	Description												
matchTo*	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX												
matchValue*	string minLength: 1	The pattern match value.												
shouldNot	boolean default: false	Select this if you want to reverse the pattern match condition.												

**Example**

```

{
 "affectedInfoType": "TIERS_NODES",
 "affectedEntities": {
 "tierNodeType": "NODE",
 "nodeType": "ALL_NODES",
 "affectedNodes": {
 "affectedNodeScope": "NODES_MATCHING_PATTERN",
 "patternMatcher": {
 "matchTo": "STARTS_WITH",
 "matchValue": "A",
 "shouldNot": false
 }
 }
 }
}

```

## Node Property Variable Matcher

Use this to suppress actions for entities at the node level for nodes that match specified environment variables.

Property Name	Type	Description and Valid Values												
affectedNodeScope*	string	Enum NODE_PROPERTY_VARIABLE_MATCHER												
propVarPairs*		<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>propertyType*</td> <td>string</td> <td>Enums META ENV JVM</td> </tr> <tr> <td>name*</td> <td>string minLength: 1</td> <td></td> </tr> <tr> <td>value*</td> <td>string minLength: 1</td> <td></td> </tr> </tbody> </table>	Property Name	Type	Description	propertyType*	string	Enums META ENV JVM	name*	string minLength: 1		value*	string minLength: 1	
Property Name	Type	Description												
propertyType*	string	Enums META ENV JVM												
name*	string minLength: 1													
value*	string minLength: 1													

### Example

```
{
 "affectedInfoType": "TIERS_NODES",
 "affectedEntities": {
 "tierNodeType": "NODE",
 "nodeType": "ALL_NODES",
 "affectedNodes": {
 "affectedNodeScope": "NODE_PROPERTY_VARIABLE_MATCHER",
 "propVarPairs": [{
 "propertyType": "ENV",
 "name": "CLASSPATH",
 "value": "C:\\Users\\Java\\Classes"
 }]
 }
 }
}
```

## Servers Affected within an Application

Use this to suppress actions for entities at the server level.

Property Name	Type	Description and Valid Values						
affectedInfoType*	string	Enum SERVERS						
affectedServers*		ApplicationAffectedServers <table border="1" data-bbox="623 640 1495 869"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>serversScope*</td> <td>string</td> <td>Enum SPECIFIC_SERVERS_IN_APPLICATION</td> </tr> </tbody> </table>	Property Name	Type	Description	serversScope*	string	Enum SPECIFIC_SERVERS_IN_APPLICATION
Property Name	Type	Description						
serversScope*	string	Enum SPECIFIC_SERVERS_IN_APPLICATION						

### Example

```

{
 "affectedInfoType": "SERVERS",
 "affectedServers": {
 "serversScope": "SPECIFIC_SERVERS_IN_APPLICATION",
 "specificServers": ["DropWizardTestApplicationDropWizardDefaultNode1"]
 }
}

```

## Specific Servers within an Application

Use this property to suppress actions for entities at the server level for specific servers within an application.

Property Name	Type	Description
serversScope*	string	Enum SPECIFIC_SERVERS_IN_APPLICATION
specificServers*	array of strings minItems: 1 MinLength: 1	A list of servers considered as affected entities for action suppression. For example: [server1, server2]

Property Name	Type	Description
Example		
<pre> {   "affectedInfoType":"SERVERS",   "affectedServers":{     "serversScope":"SPECIFIC_SERVERS_IN_APPLICATION",     "specificServers":["DropWizardTestApplicationDropWizardDefaultNode1"]   } } </pre>		

### Servers in the Server Application

Use this to suppress actions for entities at the servers in the server level.

Property Name	Type	Description and Valid Values						
affectedInfoType*	string	Enum SERVERS_IN_SERVERS_APP						
serversAffectedEntities*		<p><b>ServersAffectedEntities</b></p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>selectServersBy*</td> <td>string</td> <td>Enum AFFECTED_SERVER_SUBGROUPS AFFECTED_SERVERS</td> </tr> </tbody> </table>	Property Name	Type	Description	selectServersBy*	string	Enum AFFECTED_SERVER_SUBGROUPS AFFECTED_SERVERS
Property Name	Type	Description						
selectServersBy*	string	Enum AFFECTED_SERVER_SUBGROUPS AFFECTED_SERVERS						

### Scope of Affected Servers

Use this to suppress actions for entities for the servers in an account or a subgroup level.

Property Name	Type	Description and Valid Values
selectServersBy*	string	Enum AFFECTED_SERVERS

Property Name	Type	Description and Valid Values						
affectedServers*		<p><b>ServerSelectionCriteria</b></p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>serverSelectionScope*</td> <td>string</td> <td> <p><b>Enums</b></p> <p>ALL_SERVERS_IN_ACCOUNT</p> <p>SERVERS_WITHIN_SUBGROUP</p> <p>SPECIFIC_SERVERS</p> <p>SERVERS_MATCHING_PATTERN</p> </td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	serverSelectionScope*	string	<p><b>Enums</b></p> <p>ALL_SERVERS_IN_ACCOUNT</p> <p>SERVERS_WITHIN_SUBGROUP</p> <p>SPECIFIC_SERVERS</p> <p>SERVERS_MATCHING_PATTERN</p>
Property Name	Type	Description and Valid Values						
serverSelectionScope*	string	<p><b>Enums</b></p> <p>ALL_SERVERS_IN_ACCOUNT</p> <p>SERVERS_WITHIN_SUBGROUP</p> <p>SPECIFIC_SERVERS</p> <p>SERVERS_MATCHING_PATTERN</p>						

#### Scope of Affected Servers- All Servers in Account

Use this to suppress actions for entities for all servers in the account.

Property Name	Type	Description and Valid Values
serverSelectionScope*	string	<p>Enum</p> <p>ALL_SERVERS_IN_ACCOUNT</p>

#### Example

```
{
 "affectedInfoType":"SERVERS_IN_SERVERS_APP",
 "serversAffectedEntities":{
 "selectServersBy":"AFFECTED_SERVERS",
 "affectedServers":{
 "serverSelectionScope":"ALL_SERVERS_IN_ACCOUNT"
 }
 }
}
```

#### Scope of Affected Servers- Servers within SubGroup

Use this to suppress actions for entities for all servers within the specified subgroups.

Property Name	Type	Description and Valid Values
severSelectionScope*	string	Enum SERVERS_WITHIN_SUBGROUP
subGroups*	array of strings minItems: 1	The identities (IDs) of the selected entity.

**Example**

```

{
 "affectedInfoType":"SERVERS_IN_SERVERS_APP",
 "serversAffectedEntities":{
 "selectServersBy":"AFFECTED_SERVERS",
 "affectedServers":{
 "severSelectionScope":"SERVERS_WITHIN_SUBGROUP",
 "subGroups":[24, 34]
 }
 }
}

```

**Scope of Affected Servers- Specific Servers**

Use this to suppress actions for entities for the specified servers.

Property Name	Type	Description and Valid Values
severSelectionScope*	string	Enum SPECIFIC_SERVERS
servers*	array of strings minItems: 1	IDs of the selected entity.

Property Name	Type	Description and Valid Values
---------------	------	------------------------------

Example

```

{
 "affectedInfoType": "SERVERS_IN_SERVERS_APP",
 "serversAffectedEntities": {
 "selectServersBy": "AFFECTED_SERVERS",
 "affectedServers": {
 "severSelectionScope": "SPECIFIC_SERVERS",
 "servers": [404, 124]
 }
 }
}

```

**Scope of Affected Server- Servers with Matching Pattern**

Use this to suppress actions for entities for servers with properties that match a pattern.

Property Name	Type	Description and Valid Values
severSelect ionScope*	string	Enum SERVERS_MATCHING_PATTERN

Property Name	Type	Description and Valid Values												
patternMatcher*		<p><b>EntityMatchingPattern</b></p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>matchTo*</td> <td>string</td> <td> <p><b>Enums</b></p> <ul style="list-style-type: none"> <li>STARTS_WITH</li> <li>ENDS_WITH</li> <li>CONTAINS</li> <li>EQUALS</li> <li>MATCH_REG_EX</li> </ul> </td> </tr> <tr> <td>matchValue*</td> <td>string minLength: 1</td> <td>The pattern match value.</td> </tr> <tr> <td>shouldNot</td> <td>boolean default: false</td> <td>Select this if you want to reverse the pattern match condition.</td> </tr> </tbody> </table>	Property Name	Type	Description	matchTo*	string	<p><b>Enums</b></p> <ul style="list-style-type: none"> <li>STARTS_WITH</li> <li>ENDS_WITH</li> <li>CONTAINS</li> <li>EQUALS</li> <li>MATCH_REG_EX</li> </ul>	matchValue*	string minLength: 1	The pattern match value.	shouldNot	boolean default: false	Select this if you want to reverse the pattern match condition.
Property Name	Type	Description												
matchTo*	string	<p><b>Enums</b></p> <ul style="list-style-type: none"> <li>STARTS_WITH</li> <li>ENDS_WITH</li> <li>CONTAINS</li> <li>EQUALS</li> <li>MATCH_REG_EX</li> </ul>												
matchValue*	string minLength: 1	The pattern match value.												
shouldNot	boolean default: false	Select this if you want to reverse the pattern match condition.												

**Example**

```

{
 "affectedInfoType": "SERVERS_IN_SERVERS_APP",
 "serversAffectedEntities": {
 "selectServersBy": "AFFECTED_SERVERS",
 "affectedServers": {
 "severSelectionScope": "SERVERS_MATCHING_PATTERN",
 "patternMatcher": {
 "matchValue": "ecommerce",
 "shouldNot": false,
 "matchTo": "STARTS_WITH"
 }
 }
 }
}

```

**Scope of Affected Servers within Subgroups**

Use this to suppress actions for entities for servers within subgroups.

Property Name	Type	Description and Valid Values						
selectServersBy*	string	Enum AFFECTED_SERVER_SUBGROUPS						
subGroups*		<p><b>AffectedSubGroups</b></p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>subGroupScope*</td> <td>string</td> <td>Enums ALL_SUBGROUPS SPECIFIC_SERVER_SUB_GROUPS</td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	subGroupScope*	string	Enums ALL_SUBGROUPS SPECIFIC_SERVER_SUB_GROUPS
Property Name	Type	Description and Valid Values						
subGroupScope*	string	Enums ALL_SUBGROUPS SPECIFIC_SERVER_SUB_GROUPS						

### Scope of Affected Servers within Subgroups- All Subgroups

Use this to suppress actions for entities at the servers in all subgroups level.

Property Name	Type	Description and Valid Values
subGroupScope*	string	Enum ALL_SUBGROUPS

#### Example

```

{
 "affectedInfoType": "SERVERS_IN_SERVERS_APP",
 "serversAffectedEntities": {
 "selectServersBy": "AFFECTED_SERVER_SUBGROUPS",
 "subGroups": {
 "subGroupScope": "ALL_SUBGROUPS",
 }
 }
}

```

### Scope of Affected Servers within Subgroups- Servers within Specific Subgroups

Use this to suppress actions for entities at the servers within specific subgroups level.

Property Name	Type	Description and Valid Values
subGroupScope*	string	Enum SPECIFIC_SERVER_SUB_GROUP
subGroupNames*	array of strings minItems: 1	IDs of the selected entity.

**Example**

```

{
 "affectedInfoType": "SERVERS_IN_SERVERS_APP",
 "serversAffectedEntities": {
 "selectServersBy": "AFFECTED_SERVER_SUBGROUPS",
 "subGroups": {
 "subGroupScope": "SPECIFIC_SERVER_SUB_GROUPS",
 "subGroupNames": [43, 45]
 }
 }
}

```

**Databases Affected**

Use this property to suppress actions for entities at the database level.

Property Name	Type	Description and Valid Values
affectedInfoType*	string	Enum DATABASES

Property Name	Type	Description and Valid Values												
affectedDatabases*		<p><b>AffectedDatabases</b></p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>databaseScope*</td> <td>string</td> <td> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums ALL_DATABASES SPECIFIC_DATABASES</td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Property Name	Type	Description	databaseScope*	string	<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums ALL_DATABASES SPECIFIC_DATABASES</td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES
Property Name	Type	Description												
databaseScope*	string	<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums ALL_DATABASES SPECIFIC_DATABASES</td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES						
Property Name	Type	Description												
AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES												
<p><b>Example</b></p> <pre>{   "affects":{     "affectedInfoType":"DATABASES",     "affectedDatabases":{       "databaseScope":"ALL_DATABASES"     }   } }</pre>														

### Scope of Affected Databases

Use this property to define the scope of action suppression at the database level.

Property Name	Type	Description						
databaseScope*	string	<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums ALL_DATABASES SPECIFIC_DATABASES</td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES
Property Name	Type	Description						
AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES						

### Scope of Affected Databases—All Databases

Use this property to suppress actions for entities of all the databases.

Property Name	Type	Description						
databaseScope*	string	<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums ALL_DATABASES</td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	Enums ALL_DATABASES
Property Name	Type	Description						
AffectedDatabaseType	string	Enums ALL_DATABASES						

### Scope of Affected Databases—Specific Databases

Use this property to suppress actions for entities of specific databases.

Property Name	Type	Description						
databaseScope*	string	<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums SPECIFIC_DATABASES</td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	Enums SPECIFIC_DATABASES
Property Name	Type	Description						
AffectedDatabaseType	string	Enums SPECIFIC_DATABASES						

Property Name	Type	Description						
databases *	array of strings minItems: 1	DbServer <table border="1" data-bbox="1010 384 1495 699"> <thead> <tr> <th>Property Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td>serverName*</td> <td>string minLength: 1</td> </tr> <tr> <td>collectorConfigName*</td> <td>string minLength: 1</td> </tr> </tbody> </table>	Property Name	Type	serverName*	string minLength: 1	collectorConfigName*	string minLength: 1
Property Name	Type							
serverName*	string minLength: 1							
collectorConfigName*	string minLength: 1							

**Example**

```

{
 "affects":{
 "affectedInfoType":"DATABASES",
 "affectedDatabases":{
 "databaseScope":"SPECIFIC_DATABASES",
 "databases":[
 {
 "serverName":"MongoNewKC",
 "collectorConfigName":"MongoNewKC"
 },
 {
 "serverName":"Collector41",
 "collectorConfigName":"Collector41"
 }
]
 }
 }
}

```

**Database Server Details**

Use this property to define database server details.

Property Name	Type
serverName *	string minLength: 1
collectorConfigName *	string minLength: 1

### Affected Database Types

Use this property to define the scope of affected databases.

Property Name	Type	Description
AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES

### Health Rule Scope

Use this to suppress actions triggered as a response to health rule violation events.

Property Name	Type	Description
healthRuleScopeType*	string	HealthRuleScopeType Enum SPECIFIC_HEALTH_RULES

#### Example

```
{
 "healthRuleScopeType": "SPECIFIC_HEALTH_RULES",
 "healthRules": ["CPU utilization is too high", "JVM Garbage Collection Time is too high"]
}
```

### Health Rule Scope Type

Property Name	Type	Description
healthRuleScope*	string	Enum SPECIFIC_HEALTH_RULES

### Specific Health Rules

Property Name	Type	Description
healthRuleScopeType*	string	HealthRuleScopeType Enum SPECIFIC_HEALTH_RULES

Property Name	Type	Description
healthRules*	array of strings minItems: 1	
<b>Example</b> <pre> {   "healthRuleScopeType": "SPECIFIC_HEALTH_RULES",   "healthRules": ["CPU utilization is too high", "JVM Garbage Collection Time is too high"] } </pre>		

### Action Suppression Summary

Property Name	Type
id*	integer
name*	string minLength: 1

### Error Response

Property Name	Type
statusCode	integer
message	string

\*This property is required.

### Download Examples

Download [Appdynamics Action Suppression examples.zip](#) to get a set of examples that help you configure a schedule.

### Download SWAGGER YAML file

Download the Swagger YAML spec [action\\_suppression\\_openapi.yml](#).

### Events and Action Suppression API

This page describes the Events and Suppression API methods you can use to create, manage, and monitor events and action suppression.

## Retrieve All Health Rule Violations in a Business Application

Returns all [health rule](#) violations that have occurred in an application within a specified time frame.

## URI

```
/controller/rest/applications/application_id/problems/healthrule-violations
```

## Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	Provide either the application name or application id.	Yes
time-range-type	Query	<p>Possible values are:</p> <p><b>BEFORE_NOW</b> To use the "BEFORE_NOW" option, you must also specify the "duration-in-mins" parameter.</p> <p><b>BEFORE_TIME</b> To use the "BEFORE_TIME" option, you must also specify the "duration-in-mins" and "end-time" parameters.</p> <p><b>AFTER_TIME</b> To use the "AFTER_TIME" option, you must also specify the "duration-in-mins" and "start-time" parameters.</p> <p><b>BETWEEN_TIMES</b> To use this option, you must also specify the "start-time" and "end-time" parameters. The "BETWEEN_TIMES" range includes the start-time and excludes the end-time.</p>	Yes
duration-in-mins	Query	Duration (in minutes) to return the metric data.	If time-range-type is BEFORE_NOW, BEFORE_TIME, or AFTER_TIME
start-time	Query	Start time (in milliseconds) from which the metric data is returned.	If time-range-type is AFTER_TIME or BETWEEN_TIMES
end-time	Query	End time (in milliseconds) until which the metric data is returned.	If time-range-type is BEFORE_TIME or BETWEEN_TIMES

Parameter Name	Parameter Type	Value	Mandatory
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON .	No

<description>AppDynamics has detected a problem with Node
FulfillmentClient.
CPU
utilization is too high; started violating and is now
warning.
All of the following
conditions were found to be violating
For Node
FulfillmentClient:
1) Hardware
Resources|CPU|%Busy Condition
%Busy's
value 76.0 was greater
than the threshold 75.0 for the
last 30 minutes</description>
</policy-violation>
</policy-violations>

```

## Retrieve Event Data

You can capture data for the event types listed in the `eventtypes` parameter.

### URI

```
/controller/rest/applications/application_id/events
```

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>application_id</code>	URI	Provides either the application name or application id.	Yes
<code>summary</code>	Query	Provides the summary for the event.	Yes

Parameter Name	Parameter Type	Value	Mandatory
comment	Query	Provides the comments (if any) for the event.	No
eventtype	Query	APPLICATION_DEVELOPMENT	Yes
time-range-type	Query	<p>Possible values are:</p> <p><b>BEFORE_NOW</b>            To use the " BEFORE_NOW" option, you must also specify the " duration-in-mins" parameter.</p> <p><b>BEFORE_TIME</b>            To use the " BEFORE_TIME" option, you must also specify the " duration-in-mins" and " end-time" parameters.</p> <p><b>AFTER_TIME</b>            To use the " AFTER_TIME" option, you must also specify the " duration-in-mins" and " start-time" parameters.</p> <p><b>BETWEEN_TIMES</b>            To use this option, you must also specify the "start-time" and "end-time" parameters. The "BETWEEN_TIMES" range includes the start-time and excludes the end-time.</p>	Yes
duration-in-mins	Query	Specify the duration (in minutes) to return the metric data.	If time-range-type is BEFORE_NOW, BEFORE_TIME, or AFTER_TIME
start-time	Query	Specify the start time (in milliseconds) from which the metric data is returned.	If time-range-type is AFTER_TIME or BETWEEN_TIMES
end-time	Query	Specify the end time (in milliseconds) until which the metric data is returned.	If time-range-type is BEFORE_TIME or BETWEEN_TIMES

Parameter Name	Parameter Type	Value	Mandatory
event-types	Query	Specify the comma-separated list of event types for which you want to retrieve event information. See <a href="#">Events Reference</a> .	Yes
severity	Query	Provides the severity level. Specify the comma-separated list of severities for which you want to retrieve event information. Allowed values are: <ul style="list-style-type: none"> <li>INFO</li> <li>WARN</li> <li>ERROR</li> </ul> In the UI these values become Info, Warning, and Critical.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No
tier	Query	Name of the tier in the application	No

 This API can retrieve 600 events at a time.

### Example

Retrieve the list of events of type APPLICATION\_ERROR or DIAGNOSTIC\_SESSION of any severity that occurred in the specified time range:

```
curl --user user1@customer1:your_password http://demo.appdynamics.com//controller/rest/applications/6/events?time-range-type=BEFORE_NOW&duration-in-mins=30&event-types=%20APPLICATION_ERROR,DIAGNOSTIC_SESSION&severities=INFO,WARN,ERROR
```

```
<events><event>
 <id>44658</id>
 <type>DIAGNOSTIC_SESSION</type>
 <subType>ERROR_DIAGNOSTIC_SESSION</subType>
 <eventTime>1451343453085</eventTime>
```

```

<severity>WARN</severity>
<summary>Starting Diagnostic Session after series of errors
for a Business Transaction 18% (2/11) of requests had errors in
the last minute starting 12/28/15 10:57 PM local time</summary>

deepLinkUrl>

```

```
</event>
</events>
```

## Create Events

Application deployment events notify AppDynamics when you upgrade your application, push new code, etc. This lets you correlate these application deployment activities with other data inside AppDynamics. This is useful for regression analysis, root cause analysis, and performance studies. It is beneficial to inject your application deployment event into AppDynamics as part of the build process for deploying a new version of your application.

The AppDynamics REST API lets you integrate events of type `APPLICATION_DEPLOYMENT` with other systems.

For example, to create an event automatically in your AppDynamics monitored system for every new release you would integrate these systems and use the following REST API to create an event of type "`APPLICATION_DEPLOYMENT`" in your managed environment.

You should receive the event ID after the successful invocation of the request.

## Roles and Permissions

Creating events requires the **Create Events** permission. See [Application Permissions](#).

### URI

POST `/controller/rest/applications/application_id/events`

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>application_id</code>	URI	Provide either application name or application id.	Yes
<code>summary</code>	Query	Provide a summary describing the event.	Yes
<code>comment</code>	Query	Provide the comments (if any) for the event.	No
<code>eventtype</code>	Query	<code>APPLICATION_DEPLOYMENT</code>	Yes

Parameter Name	Parameter Type	Value	Mandatory
severity	Query	Provide a severity level. Allowed values include: <ul style="list-style-type: none"> <li>"INFO"</li> <li>"WARN"</li> <li>"ERROR"</li> </ul> In the UI, these become "Info", "Warning", and "Critical"	Yes

### Create a Custom Event

You can create custom events to be reported in the AppDynamics event viewer and in the event panels on the AppDynamics dashboards. See [Monitor Events](#) to learn how to filter on your custom events. Then you can create alerts triggered by these events as you do for AppDynamics standard events.

You should receive the event ID after the successful invocation of the request.

### Roles and Permissions

Creating a custom event requires the **Create Events** permission. See [Application Permissions](#).

### URI

POST /controller/rest/applications/application\_id/events

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	Provide either application name or application id.	Yes
summary	Query	Provide a summary describing the event.	Yes
comment	Query	Provide a comment for the event.	No

Parameter Name	Parameter Type	Value	Mandatory
severity	Query	Provide a severity level. Allowed values include: <ul style="list-style-type: none"> <li>"INFO"</li> <li>"WARN"</li> <li>"ERROR"</li> </ul> In the UI, these become "Info", "Warning", and "Critical"	Yes
eventtype	Query	CUSTOM	Yes
customeventtype	Query	Provide a name for the "type". For example, the source could be "nagios".	No
node	Query	Provide the affected node name.	No
tier	Query	Provide the affected tier name.	Yes, if node and bt are specified
bt	Query	Provide the affected business transaction name.	No
propertynames	Query	Provide a property name as a pair, i.e., the "key".	No, but if one element of the pair is defined, the other must be defined also
propertyvalues	Query	Provide the property value as a pair, i.e., the "value". The value is limited to 5000 characters.	No, but if one element of the pair is defined, the other must be defined also

### Example

```
curl -X POST --user user1@customer1:your_password 'http://demo.appdynamics.com/controller/rest/applications/5/events?severity=INFO&summary=test1&eventtype=CUSTOM&customeventtype=mycustomevent&propertynames=key1&propertynames=key2&propertyvalues=value1&propertyvalues=value'
```

 Notice the pattern for custom properties: `propertynames` and `propertyvalues` get matched up by order position, so to set N property values, you need N occurrences of `propertynames` and N occurrences of `propertyvalues`.

### Create Custom URLs for Notifications

Single tenants in a multi-tenant Controller instance should use this API method to specify a custom or vanity URL for notification purposes. Instead of a URL such as `paid8.appdynamics.com` being displayed as the host, the custom URL can be displayed as `yourcompany.appdynamics.com` in the notification.

#### URI

POST `/controller/rest/accounts/customer_name/update-controller-url`

#### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>customer_name</code>	URI	The customer account name	Yes

#### Body Parameter

As Application/JSON content:

```
{
 "controllerURL": "http://<my-custom-hostname:port>"
}
```

 If the URL in the alerts is invalid, you can set it using the following curl command:

```
curl -k --basic --user root@system --header
"Content-Type: application/json" --data
'{"controllerURL": "http://
<controller>:<port>" }' http://
<controller>:<port>/controller/rest/
accounts/<ACCOUNT-NAME>/update-controller-
url
```

```
curl -k --basic --user root@system --header
"Content-Type: application/json" --data
'{"controllerURL": "http://
<controller>:<port>" }' http://
<controller>:<port>/controller/rest/
```

```
accounts/<ACCOUNT-NAME>/update-controller-
url
```

For example:

```
curl -k --basic --user root@system --header
"Content-Type: application/json" --data
'{ "controllerURL": "https://myVIP:443" }'
https://myhost:8181/controller/rest/
accounts/customer1/update-controller-url
```

There is no need to reset the Controller as upgrading it will reset the deep link URL settings.

### Create and Delete Action Suppressions

By default any response is in JSON, although XML can be requested by using the following header:

```
Name : Accept
Value : application/vnd.appd.cntrl+xml;v=1
```

### Retrieve All Existing Action Suppressions

Use this to retrieve a list of all existing action suppressions.

#### URI

```
GET /controller/api/accounts/account_id/applications/application_id/actionsuppressions
```

#### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
account_id	URI	The account ID	Yes
application_id	URI	The application ID	Yes

Example request to get all action suppressions:

```
/controller/api/accounts/2/applications/9/actionsuppressions
```

Example response:

```
Status : 200 ok
Output Data :
{"actionSuppressions": [{"id": "15", "name": "App-
```

```
ASW", "timeRange": {"startTimeMillis":
"2014-10-25T04:16:30+0000", "endTimeMillis":
"2014-10-25T06:16:30+0000"}, "affects": {"type": "APP"}}, {"id":
"16", "name": "Node-ASW", "timeRange": {"startTimeMillis":
"2014-10-25T04:16:57+0000", "endTimeMillis":
"2014-10-25T05:16:57+0000"}, "healthRuleIds": [60,61], "affects":
{"type": "NODE", "nodeAffectedEntities": {"type":
"SPECIFIC", "nodeType": "ALL", "nodes": [17,18]}}}], "actions":
[{"href": "http://demo.appdynamics.com:8090/controller/api/
accounts/2/applications/9/actions suppressions/
%7Bactions suppressions.id%7D/%7Bactions.name%7D", "method":
["POST", "DELETE"], "name": "enabled"}], "links": [{"href":
"http://ec2-54-80-163-175.compute-1.amazonaws.com:8090/
controller/api/accounts/2/applications/9/actions suppressions/
%7Bactions suppressions.id%7D", "name": "actions suppressions"}]}
```

### Retrieve a Specific Action Suppression by ID

Use this to get an action suppression by the specified ID.

#### URI

```
/controller/api/accounts/account_id/applications/application_id/actions suppressions/
actionsuppression_id
```

#### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
account_id	URI	The account id.	Yes
application_id	URI	The application id.	Yes
actions suppressions_id	URI	The action suppression id.	Yes

#### Example request:

```
/controller/api/accounts/2/applications/9/actions suppressions/15
```

#### Example response:

```
Status : 200 ok
Output Data :
{"id": "15", "name": "App-ASW", "timeRange": {"startTimeMillis":
```

```
"2014-10-25T04:16:30+0000", "endTimeMillis":
"2014-10-25T06:16:30+0000"}, "affects": {"type": "APP"}}
```

### Create a New Action Suppression

This is a POST request that should return a 201 - created response.

#### URI

POST /controller/api/accounts/account\_id/applications/application\_id/actionsuppressions

#### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
account_id	URI	The account ID.	Yes
application_id	URI	The application ID.	Yes
name	body key	The name of the action suppression window.	Yes
timeRange	body key	The start and end time of the window. Includes: startMillis , eg 2014-10-25T04:16:57+0000 endTimeMillis , eg 2014-10-25T05:16:57+0000	Yes
healthRuleIds	body key	The ids of the affected health rules. If not provided, all rules affected	No

Parameter Name	Parameter Type	Value	Mandatory																				
affects	body key	<p>Type of entity and corresponding IDs:</p> <table border="1"> <thead> <tr> <th>Scope</th> <th>Type</th> <th>Value</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>Application</td> <td>APP</td> <td>Covers the entire application</td> <td>"affects": {"type": "APP"}</td> </tr> <tr> <td>Business Transaction</td> <td>BT</td> <td>Covers one or more Business Transactions</td> <td></td> </tr> <tr> <td></td> <td></td> <td>All Business Transactions</td> <td>"affects": {"type": "BT", "btAffectedEntities": {"type": "ALL"}}}</td> </tr> <tr> <td></td> <td></td> <td>Business Transactions from specific tiers</td> <td>"affects": {"type": "BT", "btAffectedEntities": {"type": "WITHIN_TIERS", "tiers": [11,12]}} where 11,12 are Tier Ids</td> </tr> </tbody> </table>	Scope	Type	Value	Example	Application	APP	Covers the entire application	"affects": {"type": "APP"}	Business Transaction	BT	Covers one or more Business Transactions				All Business Transactions	"affects": {"type": "BT", "btAffectedEntities": {"type": "ALL"}}}			Business Transactions from specific tiers	"affects": {"type": "BT", "btAffectedEntities": {"type": "WITHIN_TIERS", "tiers": [11,12]}} where 11,12 are Tier Ids	Yes
Scope	Type	Value	Example																				
Application	APP	Covers the entire application	"affects": {"type": "APP"}																				
Business Transaction	BT	Covers one or more Business Transactions																					
		All Business Transactions	"affects": {"type": "BT", "btAffectedEntities": {"type": "ALL"}}}																				
		Business Transactions from specific tiers	"affects": {"type": "BT", "btAffectedEntities": {"type": "WITHIN_TIERS", "tiers": [11,12]}} where 11,12 are Tier Ids																				

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
				Specific Business Transactions by id	<pre>"affects": {"type": "BT","btAffectedEntities": {"type": "SPECIFIC", "bts": [1,2]}} where 1,2 are BT Ids</pre>	
				Business Transactions that match criteria	<pre>"affects": {"type": "BT","btAffectedEntities": {"type": "CRITERIA", "matchesOperator": "CONTAINS", "matchesValue": "pojo"}} where "matchesOperator" can be: • CONTAINS • EQUALS • STARTS • ENDS • REGEX_VALUE</pre>	
		Tier	TIER	Covers one or more tiers		

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
				All tiers	<pre>"affects": {"type": "TIER","ti erAffected Entities": {"type": "ALL"}}}</pre>	
				Specific tiers	<pre>"affects": {"type": "TIER","ti erAffected Entities": {"type": "SPECIFIC", "tiers": [11,12]}} where 11,12 are Tier Ids</pre>	
		Node	NO DE	Covers one or more nodes		
				All nodes	<pre>"affects": {"type": "NODE","no deAffected Entities": {"type": "ALL","nod eType": "ALL"}}}</pre>	

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
				Nodes belonging to specific tiers	<pre>"affects": {"type": "NODE","nodeAffectedEntities": {"type": "WITHIN_TIERS","nodeType": "ALL","tiers": [11,12]}} where 11,12 are Tier Ids</pre>	
				Specific nodes	<pre>"affects": {"type": "NODE","nodeAffectedEntities": {"type": "SPECIFIC","nodeType": "ALL","nodes": [9,10]}} where 9,10 are Node Ids</pre>	

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
				Nodes that match criteria	<pre>"affects": {"type": "NODE","no deAffected Entities": {"type": "NAME_CRIT ERIA","nod eType": "ALL","nam eMatchesOp erator": "EQUALS"," nameMatche sValue": "Node"}} - <b>String match</b> "affects": {"type": "NODE","no deAffected Entities": {"type": "PROPERTY_ CRITERIA", "nodeType" : "ALL","met aInfoPrope rties": [{"name": "ProcessID ","value": 12343}}]} - <b>Meta Info Properties match</b></pre>	

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
					where "matchesOperator" can be: <ul style="list-style-type: none"> <li>CONTAINS</li> <li>EQUALS</li> <li>STARTS</li> <li>ENDS</li> <li>REGEX_VALUE</li> </ul>	
		Machine	MACHINE	Covers one or more machines	"affects": {"type": "MACHINE", "machineAffectedEntities": {"type": "SPECITIC", "machines": [4,5]}} where 4,5 are Machine Ids You must spell the value as "SPECITIC" due to a typo in the underlying code.	

**Example request**

/controller/api/accounts/2/applications/9/actions suppressions

## Header

- Name: Content-Type
- Value: application/vnd.appd.cntrl+json;v=1

## Body

```

{"name": "App-ASW_2", "timeRange": {"startTimeMillis":
"2014-10-25T04:16:30+0000", "endTimeMillis":
"2014-10-25T06:16:30+0000"}, "affects": {"type": "APP"}}

```

or

```

{"name": "Node-ASW_1", "timeRange": {"startTimeMillis":
"2014-10-25T04:16:57+0000", "endTimeMillis":
"2014-10-25T05:16:57+0000"}, "healthRuleIds": [60,61], "affects":
{"type": "NODE", "nodeAffectedEntities": {"type":
"SPECIFIC", "nodeType": "ALL", "nodes": [17,18]}}

```

## Delete a Specific Action Suppression by ID

This is a `DELETE` request that should return a `204 - No Content` message.

## URI

`DELETE /controller/api/accounts/account_id/applications/application_id/actions suppressions/actions suppression_id`

## Input parameters

Parameter Name	Parameter Type	Value	Mandatory
account_id	URI	The account ID	Yes
application_id	URI	The application ID	Yes
actions suppression_id	URI	The ID of the action suppression to be deleted	Yes—The Alert and Respond APIs let you manage and monitor events, health rules, and other aspects of the AppDynamics alert and respond features.

## Configuration API

This page describes the Configuration API methods you can use to read and modify selected Controller configuration settings programmatically. You can use it to script or automate tasks that you must perform frequently or in large batches, such as adding users.

**i** The Configuration Export and Import API provides the ability to perform select configuration changes as well as you can edit and import Controller configuration definition files.

### Include or Exclude a Business Transaction from Monitoring

You can exclude or include business transactions for monitoring by passing the exclude parameter to the business-transactions retrieval API described in the [Application Model API](#).

To exclude a business transaction, pass the XML-represented ID of the business transaction to be excluded with the exclude parameter set to `true`. To turn on monitoring for a currently excluded business transaction, set the exclude parameter to `false`.

Send the list of business transactions to be excluded or re-included as the XML-formatted `POST` payload. A sample business-transaction list is:

```
<business-transactions>
 <business-transaction>
 <id>15</id>
 </business-transaction>
 <business-transaction>
 <id>16</id>
 </business-transaction>
</business-transactions>
```

**!** Ensure that the `Content-Type` header is set to `application/xml`.

### Format

`POST /controller/rest/applications/application_id/business-transactions`

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>application_id</code>	URI	Provide either the application name or application id.	Yes
<code>exclude</code>	Post	<code>true false</code>	Yes

### Example

```
curl -X POST -H "Content-Type:text/xml" --user
user1@customer1:your_password http://demo.appdynamics.com/
controller/rest/applications/6/business-transactions\?
exclude=true -d @businesstransaction.xml
```

### Retrieve All Controller Settings

The Controller global configuration values are made up of the Controller settings that are presented in the [Administration Console](#).

### Format

```
GET /controller/rest/configuration
```

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

### Example

```
curl --user admin@customer1:your_password http://
demo.appdynamics.com/controller/rest/configuration

<configuration-items><configuration-item>
 <name>eventsvc.request.segment.data.max.retrieval.size</name>
 <value>5000</value>
 <description>Max number of request segment data that can be
retrieved from event service in a query</description>
 <updateable>true</updateable>
 <scope>cluster</scope>
</configuration-item>
<configuration-item>
 <name>machine.agent.max.new.actions.per.min</name>
 <value>15</value>
 <description>Maximum number of new actions dispatched per
minute for each machine agent</description>
 <updateable>true</updateable>
 <scope>cluster</scope>
```

```

</configuration-item>
...
<configuration-item>
 <name>tss.retention.period</name>
 <value>336</value>
 <description>Time (in hours) to retain 12 hour tss data values
before they are purged from the system.</description>
 <updateable>>true</updateable>
 <scope>cluster</scope>
</configuration-item>
<configuration-item>
 <name>snapshots.retention.period</name>
 <value>336</value>
 <description>Time (in hours) to retain snapshots before they
are purged from the system.</description>
 <updateable>>true</updateable>
 <scope>cluster</scope>
</configuration-item>
<configuration-item>
 <name>metrics.min.retention.period</name>
 <value>4</value>
 <description>Time (in hours) to retain minute metric data
values before they are purged from the system.</description>
 <updateable>>true</updateable>
 <scope>cluster</scope>
</configuration-item>
<configuration-item>
 <name>system.notification.event.types</name>

<value>LICENSE,DISK_SPACE,CONTROLLER_AGENT_VERSION_INCOMPATIBILI

 <description>Comma separated list of Event Types (with no
spaces between each) that will shown as System Notifications in
the UI.</description>
 <updateable>>true</updateable>

```

```
<scope>cluster</scope>
</configuration-item>
</configuration-items>
```

### Retrieve a Controller Setting by Name

Use this API to get the value of a given Controller configuration setting.

#### Format

```
GET /configuration?name=controller_setting_name
```

#### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Query	Name of the Controller setting to retrieve	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON .	No

#### Example

```
curl --user admin@customer1:your_password http://
demo.appdynamics.com/controller/rest/configuration?
name=metrics\.min\.retention\.period

<configuration-items><configuration-item>
 <name>metrics.min.retention.period</name>
 <value>4</value>
 <description>Time (in hours) to retain minute metric data
values before they are purged from the system.</description>
 <updateable>true</updateable>
 <scope>cluster</scope>
</configuration-item>
</configuration-items>
```

### Configure Global Controller Settings

Use this API to set a Controller setting to a specified value.

 You cannot use this REST API to modify Controller settings on SaaS.

### Format

POST /controller/rest/configuration

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Query	Name of the Controller setting to get.	Yes
value	Query	Value to set.	Yes

### Mark Nodes as Historical

Use this API to [mark nodes as historical](#), which suspends certain types of processing activities for the node (i.e. rule evaluation). By default, AppDynamics marks as historical (soft deletes) a node that has lost contact with the Controller for the number of hours configured in the `node.retention.period` Controller setting. The default is 500 hours.

Pass one or more identifiers of the node to be marked as historical, up to a maximum of 25 nodes. Multiple IDs should be comma-separated.

### Format

POST /controller/rest/mark-nodes-historical?application-component-node-ids=value

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application-component-node-ids	Query	Comma-separated list of node IDs	Yes

### Example

```
curl -X POST --user admin@customer1:your_password http://demo.appdynamics.com/controller/rest/mark-nodes-historical?application-component-node-ids=44,45

<application-component-node-id>
<Node Id : 44 marked as historical./>
```

```
<Node Id : 45 is not present or already marked as historical/>
</application-component-node-id>
```

## Configuration Import and Export API

This page describes the AppDynamics API methods you can use to import and export various types of configuration settings in the Controller.

### About the Configuration Import/Export APIs

The Configuration Import/Export APIs enable you to migrate configuration settings across Controller accounts, business applications, or Controller instances. You can also use it to add configuration artifacts like transaction detection rules, health rules, or custom dashboards to an existing configuration programmatically.

An exported configuration is an XML or JSON representation of the configuration artifact. After exporting the file, you can upload it to another account or application, optionally modifying the configuration.

### Export Actions from an Application

The user account you use to make the API call must have permission to view an action or action template in the application you are exporting from.

### Format

```
GET /controller/actions/application_id
```

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes

### Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/actions/7

[
 {
 actionType: "EmailAction",
 name: "6DA8942B-DF4A-417A-E1NF-59F14231D670",
 priority: 1,
 description: null,
 }
]
```

```

 toAddress: "user1@example.com",
 subject: "",
 timeZone: null
 },
 {
 actionType: "DiagnosticSessionAction",
 name: "MyDiagnostic",
 priority: 0,
 description: null,
 businessTransactionTemplates: [],
 numberOfSnapshotsPerMinute: 5,
 durationInMinutes: 10,
 adjudicate: false,
 adjudicatorEmail: null
 }
]

```

## Import Actions into an Application

The user account you use to make the API call must have permission to create an action or action template in the account.

Actions in the import file that have conflicting names with actions in the existing configuration are not imported. The import for those actions fails, while new actions are imported successfully.

This call takes data as multipart/form-data content. Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

### Format

```
POST /controller/actions/application_id
```

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes

### Example

```

curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actions/38 -F
file=@ExportActions.json

{"success":true,"errors":[],"warnings":[]}

```

If there are actions in the file with the same name as ones in the configuration, those actions are not imported, and the response indicates the success of the request as `false`. For example:

```

{"success":false,"errors":["Not importing Action with name: DuplicateExportedDiagnosticAction, since it already exists."],"warnings":["Imported 1 out of 2 actions"]}

```

## Export Email Action Templates from an Account

This API exports all the email action templates in the current account in JSON format.

### Format

```
GET /controller/actiontemplate/email
```

### Example

```

curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/actiontemplate/email

[{
 "actionPlanType" : "email",
 "name" : "MyCustomEmailTemplate",
 "oneEmailPerEvent" : true,
 "eventClampLimit" : 100,
 "defaultCustomProperties" : [{
 "id" : 0,
 "version" : 0,
 "name" : "env",
 "value" : "%OS"
 }],
 "allowCustomRecipients" : true,
 "toRecipients" : [],
 "ccRecipients" : [],
 "bccRecipients" : [],
 "headers" : [],
 "subject" : "We've got a situation...",
 "includeTextBody" : true,
 "textBody" : "<h1>Summary of events occurring during the ${policy.digestDurationInMins}+
minute(s) prior to ${action.triggerTime}:</h1> <table> #foreach(${eventList} in $
{fullEventsByTypeMap.values()}) #foreach(${event} in ${eventList}) <tr> <td> <!-- Event icon
--> </td> <td>
<!-- Event name with event link --> ${event.displayName} </
td> <td> <!-- Event message --> ${event.eventMessage} </td> </tr> #end #end </table>",
 "includeHtmlBody" : true,
 "htmlBody" : "<p>Please look into it.</p>",
 "testLogLevel" : "DEBUG",
 "testPropertiesPairs" : [],
 "testToRecipients" : [],

```

```
"testCcRecipients" : [],
"testBccRecipients" : [],
"eventTypeCountPairs" : []
}]
```

## Import Email Action Templates

Use this to import email action templates to an account as a JSON file.

**i** The import will fail if you attempt to import a template with the same name as an existing template of the same type in the destination account.

Data for this call should be in the form of multipart/form-data. Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

### Format

POST /controller/actiontemplate/email

### Example

```
curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actiontemplate/email -F
file=@emailactiontemplate.json

{"success":true,"errors":[],"warnings":[]}
```

## Export HTTP Request Action Templates from an Account

This API exports all the HTTP request action templates in the current account to a JSON file.

### Format

GET /controller/actiontemplate/httprequest/

### Example:

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/
actiontemplate/httprequest

[{
 "actionPlanType" : "httprequest",
 "name" : "MyCustomHTTPTemplate",
 "oneRequestPerEvent" : false,
 "eventClampLimit" : -1,
 "defaultCustomProperties" : [],
 "method" : "GET",
```

```

 "scheme" : "HTTP",
 "host" : "http",
 "port" : 0,
 "path" : "///demo.appdynamics.com//controller/rest/applications/${latestEvent.application.name}/nodes/${latestEvent.node.name}",
 "query" : "",
 "urlCharset" : "UTF_8",
 "authType" : "BASIC",
 "authUsername" : "user1",
 "authPassword" : "your_password",
 "headers" : [],
 "payloadTemplate" : {
 "httpRequestActionMediaType" : "text/plain",
 "charset" : "UTF_8",
 "formDataPairs" : [],
 "payload" : ""
 },
 "connectTimeoutInMillis" : 5000,
 "socketTimeoutInMillis" : 15000,
 "maxFollowRedirects" : 0,
 "responseMatchCriteriaAnyTemplate" : [],
 "responseMatchCriteriaNoneTemplate" : [],
 "testLogLevel" : "DEBUG",
 "testPropertiesPairs" : [],
 "eventTypeCountPairs" : []
 }]

```

## Import HTTP Action Templates into an Account

After you have exported HTTP request action templates, you can import them to a different account by logging into the destination account and passing the JSON file created by the export operation as the payload to the `POST` request.

You can modify the exported file before you import it. You might want to do this to remove one or more template configurations or to change their names.

**i** The import will fail if you attempt to import a template with the same name as an existing template of the same type in the destination account.

Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

### Format

```
GET /controller/actiontemplate/httprequest
```

### Example

```
curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actiontemplate/httprequest -F
file=@httpactiontemplate.json

{"success":true,"errors":[],"warnings":[]}
```

### Export Custom Dashboards and Templates

You can export and import custom dashboards and custom dashboard templates interactively from the Controller UI or by using this API call. See [Import and Export Custom Dashboards and Templates Using the UI](#).

 To export the dashboard, the user making the API call must have permission to view the custom dashboard.

In the export call, you must identify the dashboard to export by its ID. When you open the dashboard in the UI, the ID appears as the dashboard parameter at the end of the URL.

For example, in this URL snippet, the custom dashboard ID is

```
3: location=CDASHBOARD_DETAIL&mode=MODE_DASHBOARD&dashboard=3
```

### Format

```
GET /controller/CustomDashboardImportExportServlet?dashboardId=dashboard_id
```

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
dashboardId	Query	The numeric ID of the custom dashboard.	Yes

### Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/
CustomDashboardImportExportServlet?dashboardId=8

{
 "schemaVersion" : null,
 "dashboardFormatVersion" : "3.0",
 "name" : "Analytics-BrowserData",
 ...
 "warRoom" : false,
 "template" : false
```

```
}

```

View a complete response example:

```
{
 "schemaVersion" : null,
 "dashboardFormatVersion" : "3.0",
 "name" : "Analytics-BrowserData",
 "description" : null,
 "properties" : null,
 "templateEntityType" : "APPLICATION_COMPONENT_NODE",
 "associatedEntityTemplates" : null,
 "minutesBeforeAnchorTime" : 15,
 "startDate" : null,
 "endDate" : null,
 "refreshInterval" : 120000,
 "backgroundColor" : 15395562,
 "color" : 15395562,
 "height" : 768,

 "percentileLine" : null,
 "timeRangeInterval" : null,
 "pollingInterval" : null,
 "unit" : null
 }],
 "warRoom" : false,
 "template" : false
}o

```

## Import Custom Dashboards and Templates

You can import custom dashboards and templates based on a previously exported JSON definition, which has optionally been modified. Import the definition as an `application/json` content type.

The user making the API call must have permission to create dashboards in the Controller.

Data for this call should be in the form of multipart/form-data. Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Prior to version 4.1, exported custom dashboards were in XML format. You can import custom dashboards previously exported as XML data into the current Controller; however, custom dashboards can only be exported as JSON data.

### Format

```
POST /controller/CustomDashboardImportExportServlet
```

### Example

```
curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/
CustomDashboardImportExportServlet -F
file=@customdashboards.json

{"success":true,"errors":[],"warnings":
[],"createdDashboardName":"Uploaded-Analytics-BrowserData"}
```

### Export Health Rules from an Application

 Exporting health rules defined in an XML file into a business application may lead to Controller performance issues, thus, you are recommended to use the [Health Rule API](#) to import and export health rules.

The user account you use to make the API call must have permission to view the health rule.

### Format

```
GET /controller/healthrules/application_id?name=health_rule_name
```

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes
name	Query	The name of the health rule to export. If not specified, exports all health rules.	No

### Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/healthrules/38?name=MyCustomHealthRule
```

```
<health-rules controller-version="004-002-000-000">
 <health-rule>
 <name>MyCustomHealthRule</name>
 <type>BUSINESS_TRANSACTION</type>
 <description/>
 <enabled>true</enabled>
 <is-default>false</is-default>
 <always-enabled>true</always-enabled>
 <duration-min>30</duration-min>
 <wait-time-min>30</wait-time-min>
 <affected-entities-match-criteria>
 <affected-bt-match-criteria>
 <type>ALL</type>
 </affected-bt-match-criteria>
 </affected-entities-match-criteria>
 <warning-execution-criteria>
 <entity-aggregation-scope>
 <type>ANY</type>
 <value>0</value>
 </entity-aggregation-scope>
 <policy-condition>
 <type>leaf</type>
 <display-name>CPU</display-name>
 <condition-value-type>BASELINE_STANDARD_DEVIATION</condition-value-type>
 <condition-value>2.0</condition-value>
 <operator>GREATER_THAN</operator>
 <condition-expression/>
 <use-active-baseline>true</use-active-baseline>
 <metric-expression>
 <type>leaf</type>
 <function-type>VALUE</function-type>
 <value>0</value>
 <is-literal-expression>false</is-literal-expression>
 <display-name>null</display-name>
 <metric-definition>
 <type>LOGICAL_METRIC</type>
 <logical-metric-name>Average CPU Used (ms)</logical-metric-name>
 </metric-definition>
 </metric-expression>
 </policy-condition>
 </warning-execution-criteria>
 </health-rule>
</health-rules>
```

## Import Health Rules into an Application

You can import health rules defined in an XML file into a business application.

**i** Importing health rules defined in an XML file into a business application may lead to Controller performance issues, thus, you are recommended to use the [Health Rule API](#) to import and export health rules.

Data for this call should be in the form of multipart/form-data. In the POST request, use UTF-8 URL encoding for the URI; for example, do not replace a space (" ") with "%20" in the URI.

By default, a health rule in the posted data with an identical name to one in the existing configuration does not overwrite the existing health rule. If you want to overwrite an existing health rule of the same name, use the `overwrite` parameter.

The syntax is the same for importing one health rule configuration or several. All the health rule configurations in the posted XML file are imported.

**Format**

POST /controller/healthrules/application\_id?overwrite=true\_or\_false

**Input parameters**

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes
overwrite	Query	Set to true to have health rules in the posted data overwrite existing health rules with the same name. The default is false.	No

**Example**

```
curl -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller/healthrules/38 -F file=@uploadhealthrule.xml
```

```
Imported 1 health rules successfully.
```

If the health rule exists and you have not enabled the `overwrite` parameters, you will get the following response:

```
Not importing the health rule: healthrulename since it already exists.
```

## Export Transaction Detection Rules

Use this to get all transaction detection rules in XML format. This call returns different types of detection rule configurations when MDS is enabled.

You can get transaction detection rules from a number of different configurations, including the configuration for a specific scope by name.

The URI used by clients for this call should be UTF-8 encoded.

### Format

```
GET /controller/transactiondetection/application_id/[scope_name]/rule_type/
[entry_point_type]/[rule_name] >> xml_name.xml
```

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID. It can be found in the URL in the address bar if you click the specified application. It is an Integer value. It will return an error if you do not specify.	Yes
scope_name	URI	The name of the scope from which you are exporting the entry point configuration. The scope name cannot be <code>custom</code> and <code>auto</code> . If the scope name contains a space, type <code>%20</code> instead of space. For example: <code>curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/10/default%20scope/custom &gt;&gt; result.xml</code> It will export all the rules under all the scopes if you do not specify.	No
rule_type	URI	The type of rule to export, from these options: <ul style="list-style-type: none"> <li>• auto: Automatic detection rules</li> <li>• custom: Custom detection rules in the configuration</li> </ul> It will return an error if you do not specify.	Yes

Parameter Name	Parameter Type	Value	Mandatory
entry_point_type	URI	<p>The POJO, Servlet, EJB, Spring Bean, etc. It exports the rules which belong to all the entry point types if you do not specify.</p> <p>Complete List below (Case insensitive):</p> <ul style="list-style-type: none"> <li>binaryRemoting</li> <li>servlet</li> <li>strutsAction</li> <li>springBean</li> <li>ejb</li> <li>pojo</li> <li>jms</li> <li>webService</li> <li>aspDotNet</li> <li>dotNetRemoting</li> <li>dotNetWebService</li> <li>wcf</li> <li>dotNetJms</li> <li>poco</li> <li>phpWeb</li> <li>phpMvc</li> <li>phpDrupal</li> <li>phpWordpress</li> <li>phpCli</li> <li>phpWebService</li> <li>nodeJsWeb</li> <li>native</li> <li>nativeSDKWeb</li> <li>nativeDynamicWeb</li> <li>nativeWebServerWeb</li> <li>golangSDKWeb</li> <li>wmbAgentWeb</li> </ul>	No
rule_name	URI	<p>The name of the rule which you are exporting. It will export all the rules under a scope or all the scopes if you do not specify.</p>	No

- The order of the parameters cannot be changed. The order of the parameters should be: `application_id/[scope_name]/rule_type/[entry_point_type]/[rule_name]`.
- It will return an XML file with error content if you use the wrong name(s) in all the parameters.
- Tier information is provided in the scope list.
- If you do not specify the scope when exporting, then you should also not specify it when importing.
- Please check the `server.log` file if you do not get the expected result after exporting.

## Scenarios:

- Export the rules from all the scopes.

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/applicationID/{rule_type} >> {xml_name}.xml
```

### Example:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/10/custom >> result.xml
```

If you do not include `scope_name`, the output is divided into three parts under `<mds-config-data>`: `scope-list`, `rule-list`, and `scope-rule-mapping-list`.

```
<mds-data>
 <mds-config-data>
 <scope-list>
 <scope scope-description="" scope-name="scope0"
 scope-type="ALL_TIERS_IN_APP" scope-version="0"/>
 <scope scope-description="" scope-name="scope1"
 scope-type="SELECTED_TIERS" scope-version="0"/>
 </scope-list>
 <rule-list>
 <rule agent-type="APPLICATION_SERVER" enabled="true"
 priority="1"
 rule-description="ruleInScope1_SERVLET"
 rule-name="ruleInScope1_SERVLET" rule-type="TX_MATCH_RULE" version="0">
 <tx-match-rule>{"type":"CUSTOM","txautodiscoveryrule":
{"autodiscoveryconfigs":[]},"txcustomrule":

```

## Import Transaction Detection Rules

Use this to import automatic detection rules in XML format. This call returns different types of detection rule configurations when MDS is enabled.

Importing action will overwrite a rule or add the new rule to the all/specified scopes.

Data for this call should be in the form of multipart/form-data. The URI for this call should be UTF-8 encoded.

### Format

```
POST /controller/transactiondetection/application_id/[scope_name]/rule_type/
[entry_point_type]/[rule_name] -F file=@exported_file_name.xml
```

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID. It can be found in the URL in address bar if you click the specified application. It is an Integer value. It will return an error if you do not specify.	Yes
scope_name	URI	The name of the scope from which you are importing the entry point configuration. It will import the rules to all the scopes if you do not specify.	No

Parameter Name	Parameter Type	Value	Mandatory
rule_type	URI	The type of rule to import, from these options: <ul style="list-style-type: none"> <li>• auto: Automatic detection rules</li> <li>• custom: Custom detection rules in the configuration</li> <li>• exclude: Custom exclude rules for transaction detection</li> </ul> It will return an error if you do not specify.	Yes
entry_point_type	URI	The POJO, Servlet, EJB, Spring Bean, etc	No
rule_name	URI	The name of the rule which you are importing. It will import all the rules under a scope or all the scopes if you do not specify.	No

- When you import, if the XML file does must have the `<scope-list>` element, then you should enter the `scope_name` input parameter in the URI, otherwise, it will fail. If you are importing an XML file that has the `<scope-list>` element, do not include the `scope_name` input parameter in the URI, otherwise, it will also fail.
- It will return an error if you use the wrong name(s) in all the parameters.
- If you specify the scope when importing, then you must also specify it when exporting.

## Examples

- Import the rule(s) to the application without scopes specified:

```
curl -X POST --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/{application_id}/{rule_type}
-F file=@{exported_file_name}.xml
```

- Import the rule(s) to the application with scopes specified:

```
curl -X POST --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/{application_id}/{scope_name}/{rule_type}
-F file=@{exported_file_name}.xml
```

- For more scenarios to import, see [Export Transaction Detection Rules](#).

## Export Policies

You can export policies to a JSON file. Before you export policies, export any actions or health rules with their respective APIs.

### Format

```
GET /controller/policies/application_id
```

## Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes

## Example

```
curl --user user1@customer1:your_password http://demo.appdynamics.com/controller/policies/application_id
```

```
[{
 "applicationName" : "ECommerce-Books",
 "name" : "My Policy",
 "reactorType" : "IMMEDIATE",
 "enabled" : true,
 "batchActionsPerMinute" : true,
 "durationInMin" : 1,
 "eventFilterTemplate" : {
 "applicationName" : "ECommerce-E2E",
 "healthRuleNames" : null,
 "eventTypes" : ["POLICY_OPEN_WARNING", "POLICY_OPEN_CRITICAL",
 "POLICY_CONTINUES_WARNING", "POLICY_CONTINUES_CRITICAL"],
 "rsdTypes" : null,
 "customEventFilters" : null,
 "specificEntityNamesByType" : null
 },
 "entityFilterTemplates" : [],
 "actionWrapperTemplates" : [{
 "actionTag" : "ops_viewer@acme.com",
 "type" : null,
 "value" : 0,
 "notes" : "Policy: My Policy",
 "entityIdentifierTemplates" : []
 }]
}]
```

## Import Policies

You can import policies that you exported with the Export Policies API. Before you import policies, import any actions or health rules with their respective APIs.

You can import a policy after modifying the defined parameter(s) and overwrite the existing policy with the updated one.

## Format

```
POST /controller/policies/application_id ?overwrite=true_or_false
```

## Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes
overwrite	Query	Set to true to have updates to a policy overwrite the existing policy with the same name. The default is false.	No

## Example

```
curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/policies/38 -F
file=@ImportPolicies.json

{"success":true,"errors":[],"warnings":[]}
```

## Example to Overwrite a Policy

```
curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/policies/38?overwrite=true -F
file=@ImportPolicies.json

{"success":true,"errors":[],"warnings":[]}
```

## Export Application Analytics Dynamic Service Configuration

The Analytics Dynamic Service is an AppDynamics app agent plugin that performs Analytics client functions for the agent. Enabling the Dynamic Service enables AppDynamics Analytics for an app agent type. You can export the Dynamic Service configuration to back up the configuration or for later import into another Controller.

## Format

```
GET /controller/analyticsdynamicsservice/application_id
```

## Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes

Parameter Name	Parameter Type	Value	Mandatory
filename	Query	The name of a file to which the configuration will be exported.	No

### Example

```
curl -i --user user1@customer1:your_password http://demo.appdynamics.com/controller/analyticsservice/10
```

```
<analytics-dynamic-service-configurations controller-version="004-003-000-000">
 <analytics-dynamic-service-configuration>
 <override>true</override>
 <agent-type>APP_AGENT</agent-type>
 <enabled>true</enabled>
 </analytics-dynamic-service-configuration>
 <analytics-dynamic-service-configuration>
 <override>true</override>
 <agent-type>DOT_NET_APP_AGENT</agent-type>
 <enabled>true</enabled>
 </analytics-dynamic-service-configuration>
 <analytics-dynamic-service-configuration>
 <override>true</override>
 <agent-type>NODEJS_APP_AGENT</agent-type>
 <enabled>true</enabled>
 </analytics-dynamic-service-configuration>
</analytics-dynamic-service-configurations>
```

### Import Application Analytics Dynamic Service Configuration

The Analytics Dynamics Service configuration determines whether AppDynamics Analytics is enabled for an app agent type. You use this API to import a previously exported configuration to another Controller.

Data for this call should be in the form of multipart/form-data.

#### Format

```
POST /controller/analyticsservice/application_id
```

#### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The name or ID identifier of the application to which the Analytics Dynamic Service configuration should be applied.	Yes

## Example

```
curl -i -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/analyticsdynamicsservice/10 -F
file=@dynamicsservice.xml
```

The following example shows sample contents of the `dynamicsservice.xml` file. Notice that the `agent-type` element indicates the type of app server agent to which the enabled state of the dynamics service applies. The `APP_AGENT` type represents the Java Agent, the `DOT_NET_APP_AGENT` the .NET Agent, and so on.

```
<analytics-dynamic-service-configurations controller-version="004-003-000-000">
 <analytics-dynamic-service-configuration>
 <override>true</override>
 <agent-type>APP_AGENT</agent-type>
 <enabled>>false</enabled>
 </analytics-dynamic-service-configuration>
 <analytics-dynamic-service-configuration>
 <override>true</override>
 <agent-type>DOT_NET_APP_AGENT</agent-type>
 <enabled>>false</enabled>
 </analytics-dynamic-service-configuration>
 <analytics-dynamic-service-configuration>
 <override>true</override>
 <agent-type>NODEJS_APP_AGENT</agent-type>
 <enabled>true</enabled>
 </analytics-dynamic-service-configuration>
</analytics-dynamic-service-configurations>
```

## Database Visibility API

This page describes the Database Visibility API methods you can use to get, create, update, and delete Database Visibility Collectors.

Include the following headers for all Database Visibility API requests:

```
Accept: application/json; Content-type: application/json
```

JSON is currently the only supported format.

**i** Database Visibility uses infrastructure-based licensing, where there is no direct correlation between the database collector and license usage. Therefore for Controller version  $\geq 21.2$ , the `licensesUsed` parameter always returns `-1`.

---

## Get All Collectors

```
GET /controller/rest/databases/collectors
```

## Get a Specific Collector

```
GET /controller/rest/databases/collectors/{configurationId}
```

## Create a Collector

```
POST /controller/rest/databases/collectors/create
```

The JSON you send must contain the relevant Collector information. The required fields describing the Collector vary based on the type of database. See [UI Collector versus JSON Collector Configuration Field Names](#)

## Example JSON Request

```
{
 "type": "MYSQL",
 "name": "localdocker_dbagent-MySQLCollector",
 "hostname": "mysql",
 "port": "3306",
 "username": "root",
 "password": "appdynamics_redacted_password",
 "enabled": true,
 "excludedSchemas": null,
 "databaseName": null,

 "enterpriseDB":false,
 "useSSL":false,
 "enableOSMonitor":false,
 "hostOS":null,
 "useLocalWMI":false,
 "hostDomain":null,
 "hostUsername":null,
 "hostPassword":"","",
 "dbInstanceIdentifier":null,
 "region":null,
 "certificateAuth":false,
 "removeLiterals":true,
 "sshPort":0,
 "agentName":"localdocker_dbagent",
 "dbCyberArkEnabled":false,

```

```

 "dbCyberArkApplication":null,
 "dbCyberArkSafe":null,
 "dbCyberArkFolder":null,
 "dbCyberArkObject":null,
 "hwCyberArkEnabled":false,
 "hwCyberArkApplication":null,
 "hwCyberArkSafe":null,
 "hwCyberArkFolder":null,
 "hwCyberArkObject":null,
 "orapkiSslEnabled":false,
 "orasslClientAuthEnabled":false,
 "orasslTruststoreLoc":null,
 "orasslTruststoreType":null,
 "orasslTruststorePassword":"","",
 "orasslKeystoreLoc":null,
 "orasslKeystoreType":null,
 "orasslKeystorePassword":"","",
 "ldapEnabled":false,
 "customMetrics":null
 }
]
}

```

**extraProperties:** To configure the frequency for sampling queries from the database (except Cassandra), you can use the `extraProperties` parameter in the JSON request payload. The following JSON sample can be used in the request payload to configure the sampling interval:

```

{
 "type":"POSTGRESQL",
 "agentName":"UpgradeTest204",
 "name":"SamplingInterval",
 "hostname":"ec2-54-202-140-213.us-west-2.compute.amazonaws.com",
 "port":"5432",
 "username":"postgres",
 "password":"Appd123",
 "removeLiterals":"true",
 "enableOSMonitor":"true",
 "hostOS":"LINUX",
 "sshPort":"22",
 "hostUsername":"ec2-user",
 "hostPassword":"","",
 "certificateAuth":true,
 "enabled":"true",
 "enterpriseDB":"false",
 "extraProperties":[
 {
 "key":"dbagent.sampling.interval",
 "value":"10",
 "sensitive":false
 }
]
}

```

```
}

```

The following JSON key-value pair is used in `extraProperties` for configuring the interval:

**key:** `dbagent.sampling.interval`

**value:** positive integer

The value can be 1, 2, 5, 10, 20, or 30.

You can configure this property through the agent. See [Configure the Agent Settings for Monitoring Database](#).

### Update a Collector

1. Make a `GET` request for the collector that you want to update.
2. Copy the JSON response body that is returned by the `GET` request to a text editor, and modify the fields that you want to update.
3. Make a `POST` request for the collector that you want to update, and include the updated JSON.

```
POST /controller/rest/databases/collectors/update

```

### Example JSON Request

```
{
 "id":1,
 "type":"MYSQL",

 }
}

```

The JSON you send must contain all the details of the existing collector with only the fields that you want to modify changed. To ensure you have all the fields, use the [Get a Specific Collector](#) call.

To add a new sub-collector to an existing collector, provide the sub-collector details without the `id` field.

**i** To configure the interval for sampling queries, refer to the `extraProperties` parameter in the JSON request payload as mentioned in [extraProperties](#) under Create a Collector.

### Delete a Specific Collector

```
DELETE /controller/rest/databases/collectors/{configurationId}
```

### Example Delete Request

```
DELETE /controller/rest/databases/collectors/{1}
```

---

## Batch Delete Multiple Collectors

```
POST /controller/rest/databases/collectors/batchDelete
```

Send an array of the configuration Ids of the Collectors.

Below is an example of a batch delete command.

```
curl --user {username}@{account_name}:{password} -H "Accept: application/json" -H "Content-type: application/json" -X POST -d '[1,2,3]' {Controller_URL}/controller/rest/databases/collectors/batchDelete
```

## Get All Monitored Database Servers

```
GET /controller/rest/databases/servers
```

### Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/databases/servers
```

The output is a list of database servers and their details.

## Get Database Server Details

```
GET /controller/rest/databases/servers/{dbserver_id}
```

### Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/databases/servers/{dbserver_id}
```

The output contains a list of the database's details, including name, node ID, and database type.

## Get all Database Agent Events

```
GET /controller/rest/applications/_dbmon/events
```

For a list of query string parameters, see [Retrieve Event Data](#).

### Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/
applications/_dbmon/events?time-range-type=BEFORE_NOW&duration-in-mins=30&event-
types=%20AGENT_EVENT,DB_SERVER_PARAMETER_CHANGE&severities=INFO,WARN,ERROR
```

The output gives you a list of events. For each event element, you can determine the node that the event is mapped to by looking for the entity-definition element.

### Get all Database Monitoring Application Nodes

```
GET /controller/rest/applications/_dbmon/nodes
```

### Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/
applications/_dbmon/nodes
```

### UI Collector versus JSON Collector Configuration Field Names

Use the table below to ensure you use the correct field names for your API calls. The Collector configuration field names are described in [Configure the Database Agent to Monitor Server Hardware](#) and [Add Database Collectors](#).

Section	UI Collector Configuration Field Name	JSON Collector Configuration Field Name
		id (AppDynamics assigns this ID to the Collector when you configure the Collector. You need this ID when doing a batch delete.)
	<b>Database Type</b>	type
	<b>Database Agent</b>	agentName
	<b>Database</b>	name
<b>Connection Details</b>	<b>Hostname/IP Address</b>	hostname
	<b>EnterpriseDB</b>	enterpriseDB
	<b>Failover Partner</b>	failoverPartner

Section	UI Collector Configuration Field Name	JSON Collector Configuration Field Name
	Listener Port	port
	Custom JDBC Connection String	customConnectionString
	Use Service Name	useServiceName
	SID or SERVICE_NAME	sid
	Connect as a sysdba	connectAsSysdba
	Username	username
	Password	password
	Logging Enabled	
<b>Hardware Monitoring</b>	Monitor Operating System	enableOSMonitor
	Operating System	hostOS
	Use Local WMI	useLocalWMI
	Domain	hostDomain
	SSH Port	sshPort
	Use certificate	certificateAuth
	Username	hostUsername
	Password	hostPassword

**i SSL field**

In addition to JSON Configuration Fields, there is the SSL field. SSL is a configurable property for the Database Agent. If the Database Agent has been configured to use SSL, then you must also provide the SSL field and its value in your Database Visibility API calls.

## Get Health Rule Violations for a Collector

```
GET /controller/rest/databases/servers/healthrule-violations/<server-id>
```

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
server_id	URI	Provide the database server name or ID.	Yes
time-range-type	Query	<p>Possible values are:</p> <p><b>BEFORE_NOW</b> To use the "BEFORE_NOW" option, you must also specify the "duration-in-mins" parameter.</p> <p><b>BEFORE_TIME</b> To use the "BEFORE_TIME" option, you must also specify the "duration-in-mins" and "end-time" parameters.</p> <p><b>AFTER_TIME</b> To use the "AFTER_TIME" option, you must also specify the "duration-in-mins" and "start-time" parameters.</p> <p><b>BETWEEN_TIMES</b> To use this option, you must also specify the "start-time" and "end-time" parameters. The "BETWEEN_TIMES" range includes the start-time and excludes the end-time.</p>	Yes
duration-in-mins	Query	Duration (in minutes) to return the metric data.	If time-range-type is BEFORE_NOW, BEFORE_TIME, or AFTER_TIME
start-time	Query	Start time (in milliseconds) from which the metric data is returned.	If time-range-type is AFTER_TIME or BETWEEN_TIMES
end-time	Query	End time (in milliseconds) until which the metric data is returned.	If time-range-type is BEFORE_TIME or BETWEEN_TIMES

Parameter Name	Parameter Type	Value	Mandatory
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are <code>XML</code> (default) or <code>JSON</code> .	No

### Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/databases/servers/healthrule-violations/<server-id>?time-range-type=BEFORE_NOW&duration-in-mins=<required_duration>
```

## Analytics Events API

AppDynamics Analytics provides built-in support for collecting analytics data from various types of sources, such as agent-instrumented Java applications, .NET applications, browser applications, and more. The Analytics Events API supplements built-in analytics data sources with your custom data sources and event types.

Publishing custom events requires Transaction Analytics licensing. Transaction Analytics license units determine the limit on the volume of custom events that you can publish.

### About the Analytics Events API

In Analytics, an event encapsulates a unit of analytics data. In APM, for example, each event corresponds to a method or service invocation, whether it be an entry point service or downstream service.

With the Analytics API, you define the structure of your own custom event in the data store, capture the event records as they occur in your custom source, and send them to the Events Service, the data store for Analytics. Once your data is in the Events Store, users can query your data through the Controller UI or the Analytics Events API.

Analytics Events API uses a shared key to authenticate clients to the Events Service. As a Controller or Analytics Administrator, you can generate API keys from the Controller UI. See [Manage API Keys](#).

A Transaction Analytics license is required to use the Events Service API. The same licensing model that applies to business transactions for custom events (based on the number of events per unit/day) applies to the API.

## Addressing the Events Service Data Store

Unlike most AppDynamics REST APIs, which are presented at the Controller, you access the Analytics Events API by addressing the Events Service instance in the AppDynamics platform.

You address the Events Service at one of the following URLs:

[SaaS](#) [On-premises](#)

You can get the the Analytics Domain URLs from the [SaaS Domains and IP Ranges](#) page.

[SaaS](#) [On-premises](#)

```
"https://<events_service_endpoint>:9080/events/"
```

For an on-premises Events Service, address the Events Service instance host (or more likely, the virtual IP presented by a load balancer for the Events Service cluster). Use the primary default listening port for the Events Service, 9080.

Calls to the Analytics Events API need to specify the `<global_account_name>` for the Controller account being address, and the `<api_key>` generated by the administrator for this client. The API expects the values as headers, property-value pairs that are separated by a colon. As cURL arguments, for example, the values would be passed with curl through the `-H` or `--header` option as follows:

```
-H"X-Events-API-AccountName:<global_account_name>" -H"X-Events-API-Key:<api_key>"
```

You can get the global account name to use from the [License page](#) in the Controller UI. The API keys are described in [Manage API Keys](#).

The content type, also as a cURL argument, is:

```
-H"Content-type: application/vnd.appd.events+json;v=2"
```

AppDynamics strongly recommends the use of SSL/HTTPS to access the API. Otherwise, the API key is sent in plain text.

**i** For security reasons, the Analytics Events API, by default, does not accept cross-origin HTTP requests. For example, from links embedded directly in web pages.

## Data Format

The Analytics Events API takes events as JSON-formatted name-value pair data.

Before sending data that conforms to a custom events schema, you need to define the data structure for the custom schema. The Events Service matches incoming events data to the appropriate schema.

## Supported Data Types

- Boolean
- Date – Supported time formats include:
  - ISO 8601 format: `yyyy-MM-dd'T'HH:mm:ss.SSSZZ`.
  - UNIX epoch date format: A 13-digit number representing the number of seconds/milliseconds since UNIX epoch time (Jan 1, 1970). For example, (GMT): Mon, 17 Apr 2017 23:46:22 GMT would be 1492472782000.
- Float
- Integer
- String

## Naming Restrictions

Custom event names and field names must conform to the following:

- Contain only a-z, A-Z, \_ (underscore), 0-9.
- Names can not start with a number.

## Timestamp Fields

Two implicit timestamp fields are automatically added to custom schemas:

- `eventTimestamp`
- `pickupTimestamp`

The `eventTimestamp` field represents the time an event occurred. An API client can specify a value for the timestamp field when it creates an event. If it does not, the Analytics Events API uses the same value for `eventTimestamp` as it uses for another implicit field, `pickupTimestamp`. The `pickupTimestamp` field, which is always populated by the Events Service, represents the time the event was received by the Events Service.

When configuring a milestone in Business Journeys, you need to supply a date in the `eventTimestamp` field in order for the event to register. In order to use Custom Events to define Business Journey, the custom events should send the `eventTimestamp` field. If not, the Business Journeys will not work.

AppDynamics uses another timestamp, `eventcompletionTimestamp`, which is not automatically added to custom schemas. The `eventcompletionTimestamp` field represents the time an event ends. Generally, AppDynamics uses this field internally to accurately report long-running events.

You can express all timestamp fields using ISO 8601 or UNIX epoch time (64-bit milliseconds) format.

## Example API Call Flow

The following steps take you through an on-premises API call workflow for using the Analytics Events API. The steps show cURL examples for creating a schema, publishing an event to that schema, and then querying the event.

**i** For SaaS deployments, replace the value for the URL and port in the examples ( `<events_service_endpoint>:9080` ) to your SaaS URL.

1. Define the schema by associating field names with data types. For example, the following defines a Purchase event type:

```
curl -X POST "<events_service_endpoint>:9080/events/schema/myProducts" -H"X-Events-API-AccountName:customer1_1234-567a-bccc-123" -H"X-Events-API-Key:a123b456-c789-1d23-e456-nnn" -H"Content-type: application/vnd.appd.events+json;v=2" -d '{"schema" : { "id": "string", "productBrand": "string", "userRating": "integer", "price": "float", "productName": "string", "description": "string" } }'
```

## 2. Publish an event based on the schema you created:

```
curl -X POST "<events_service_endpoint>:9080/events/publish/myProducts" -H"X-Events-API-AccountName:customer1_1234-567a-bccc-123" -H"X-Events-API-Key:a123b456-c789-1d23-e456-nnn" -H"Content-type: application/vnd.appd.events+json;v=2" -d '[{"id": "5653b879ab33a", "productBrand": "ACME", "userRating": 3, "price": 2006.41, "productName": "Watch", "description": "new watch"}, {"id": "5653b879700", "productBrand": "Widget", "userRating": 1, "price": 3800.13, "productName": "Watch", "description": "2015 watch"}]'
```

## 3. Query the event data:

```
curl -X POST "http://<events_service_endpoint>:9080/events/query" -H"X-Events-API-AccountName:customer1_7xxx-467a-bccc-xxx" -H"X-Events-API-Key:a123b456-c789-1d23-e456-nnn" -H"Content-type: application/vnd.appd.events+text;v=2" -d 'SELECT * FROM myProducts'
```

If including fields with ADQL keywords, enclose the keywords in single quotes. These keywords include, for example, `between`, `in`, `select`, and others.

For a single query request, use this content type:

```
-H"Content-type: application/vnd.appd.events+text;v=2"
```

In a multi-query request, the queries are passed as JSON body text. In this case, use the following content type header:

```
-H"Content-type: application/vnd.appd.events+json;v=2"
```

## Custom Event Ingestion Limits

Controller ingestion of custom events has the following limits:

- Fields: 255 maximum per event type
- String attributes: 4 kb maximum length
- Batch total count: 10,000 events per call
- Batch total size: 5 Mb maximum per call
- Max custom event schemas for an account: 20

## Custom Events Limit Increase

**i** Custom events limit increases are available for SaaS Events Service version 4.5.13 and later. On-premises Events Services cannot exceed a maximum of 1500 custom field events.

By default, the Events Service allows you to create up to 1500 custom fields. If you reach 80% capacity of custom fields (1200 fields), the maximum field limit increases by 500 fields at the next index rollover.

For example, if you reach 1400 custom fields, your maximum field limit will increase from 1500 to 2000 fields. If you later reach 1800 custom fields, and maximum increases to 2500 fields.

You can create an absolute maximum of 3000 custom fields. Reaching or exceeding the maximum fields could result in lag or outages.

## Publish Events

The Publish Events API call takes an array of events and stores them in the Events Service storage. The data must comply with an existing schema. A single request cannot publish to multiple event types.

If the event data doesn't match an event schema, the Events Service makes a best-effort attempt to match the data to the schema and returns a 400 bad request if unsuccessful.

## Format

SaaS On-premises

```
POST https://analytics.api.example.com/events/publish/{schemaName}
```

SaaS On-premises

```
POST http://<events_service_endpoint>:9080/events/publish/{schemaName}
```

## Query Params

N/A

## Path Parameters

Name	Description
accountId	Account ID
schemaName	Event schema name

## Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI License page.
X-Events-API-Key	The Analytics API key. See <a href="#">Manage API Keys</a>
Content-Type	The Content-Type of the request body. The default is application/vnd.appd.events+json;v=2 which also versions the resource representation (v=2).

## Example SaaS Publish

[Request](#)   [Response](#)

```

POST https://analytics.api.example.com/events/publish/{schemaName}
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-Type: application/vnd.appd.events+json;v=2 Accept: application/
vnd.appd.events+json;v=2
[
 {
 "id": "5653b879ab33a",
 "productBrand": "ACME",
 "userRating": 3,
 "price": 2006.41,
 "productName": "Watch",
 "description": "new watch"
 },
 {
 "id": "5653b879700",
 "productBrand": "Widget",
 "userRating": 1,
 "price": 3800.13,
 "productName": "Watch",
 "description": "2015 watch"
 }
]

```

[Request](#)   [Response](#)

```
HTTP/1.1 202 ACCEPTED
```

## Error Codes

Error Code	Description
400	The given request was invalid.
401	The given authentication information provided in the authorization header was invalid.
404	No event type could be found for this account.
406	The <code>Accept</code> header was not <code>application/vnd.appd.events+json;v=2</code> .
413	The request body is larger than the max allowed size.
415	The <code>Content-Type</code> header was not <code>application/vnd.appd.events+json;v=2</code> .
429	Too many requests. Returned when <code>account</code> or <code>event</code> reaches limits.

## Create Event Schema

Use this API to create your own event schema. The schema defines the overall structure of an event type by field and type.

You only need to use this API if the event you are uploading does not match an existing schema for first-class event types (such as logs or transactions). Events that conform to an existing schema automatically match that schema. Review the supported [data types](#) and [naming restrictions](#) described prior to this topic.

## Format

[SaaS](#) [On-premises](#)

```
POST https://analytics.api.example.com/events/schema/{schemaName}
```

[SaaS](#) [On-premises](#)

```
POST http://<events_service_endpoint>:9080/events/schema/{schemaName}
```

### Path Params

Name	Description
accountId	Account ID
schemaName	Event schema name

### Query Params

N/A

### Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI <b>License</b> page.
X-Events-API-Key	The Analytics API key. See <a href="#">Manage API Keys</a>
Accept	The <code>Content-Type</code> of the response body. The supported value is <code>application/vnd.appd.events+json;v=2</code> .
Content-type	The <code>Content-Type</code> of the request body. The default is <code>application/vnd.appd.events+json;v=2</code> which also versions the resource representation (v=2).

### Example SaaS Create

[Request](#)    Response

```
POST http://analytics.api.example.com/events/schema/{schemaName} HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-Type: application/vnd.appd.events+json;v=2
```

```
Accept: application/vnd.appd.events+json;v=2
{
 "schema" : {
 "account": "integer",
 "amount": "float",
 "product": "string"
 }
}
```

Request [Response](#)

```
HTTP/1.1 201 CREATED
```

## Retrieve Event Schema

Use this API to retrieve an existing event schema.

### Format

[SaaS](#) [On-premises](#)

```
GET http://analytics.api.example.com/events/schema/{schemaName}
```

[SaaS](#) [On-premises](#)

```
GET http://<events_service_endpoint>:9080/events/schema/{schemaName}
```

### Path Params

Name	Description
accountId	Account ID
schemaName	Event schema name

### Query Params

N/A

## Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI <b>License</b> page.
X-Events-API-Key	The Analytics API key. See <a href="#">Manage API Keys</a>
Accept	The <b>Content-Type</b> of the response body. The supported value is <code>application/vnd.appd.events+json;v=2</code> .

## Example SaaS Retrieve

[Request](#) [Response](#)

```
GET http://analytics.api.example.com/events/schema/{schemaName} HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Accept: application/vnd.appd.events+json;v=2
```

[Request](#) [Response](#)

```
HTTP/1.1 200 OK
{
 "schema" : {
 "account": "integer",
 "amount": "float",
 "product": "string"
 }
}
```

## Update Event Schema

Use this API to update an existing event schema by field. The request body defines the updates to be applied to the event schema.

As shown in the following example, you specify each field update action as a named section in the request body. The actions are represented by these fields:

- Add field
- Rename field

For the Add field definition, you need to specify the data format for the new field, as you would when [creating the event schema](#).

The response to this call should be the complete event schema as modified.

## Format

SaaS On-premises

```
PATCH http://analytics.api.example.com/events/schema/{schemaName}
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
```

SaaS On-premises

```
PATCH http://<events_service_endpoint>:9080/events/schema/{schemaName}
```

## Path Parameters

Name	Description
accountId	Account id
schemaName	Event schema name

## Query Params

N/A

## Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI <b>License</b> page.
X-Events-API-Key	The Analytics API key. See <a href="#">Manage API Keys</a> .
Accept	The <code>Content-Type</code> of the response body. The supported value is <code>application/vnd.appd.events+json;v=2</code> .

Name	Description
Content-type	The Content-Type of the request body. The default is application/vnd.appd.events+json;v=2 which also versions the resource representation (v=2).

## Example SaaS Update

[Request](#) [Response](#)

```

PATCH http://analytics.api.example.com/events/schema/{schemaName} HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-type: application/vnd.appd.events+json;v=2
Accept: application/vnd.appd.events+json;v=2

```

```

[
 {
 "add": {
 "newfield": "integer"
 },
 "rename": {
 "oldname": "newname",
 "oldname2": "newname2"
 }
 }
]

```

[Request](#) [Response](#)

```

HTTP/1.1 200 OK

```

## Delete Event Schema

Use this API to delete an existing event schema.

### Format

[SaaS](#) [On-premises](#)

```
DELETE http://<events_service_endpoint>:9080/events/schema/{schemaName}
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
```

SaaS [On-premises](#)

```
DELETE http://<events_service_endpoint>:9080/events/schema/{schemaName}
```

### Path Params

Name	Description
accountId	Account id
eventType	Event schema name

### Query Params

N/A

### Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI License page.
X-Events-API-Key	The Analytics API key. See <a href="#">Manage API Keys</a>
Accept	The Content-Type of the response body. The following is the supported value: application/vnd.appd.events+json;v=2

### Example SaaS Delete Request

```
DELETE http://analytics.api.example.com/events/schema/{schemaName} HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Accept: application/vnd.appd.events+json;v=2
```

## Querying Events

When querying analytics events data, the following applies:

- Every Events Service API has a limit of 200 searches per minute by each account on each event type.
- The Multi-Query Events API is limited to twenty queries per HTTP request.
- The Analytics Query API can return a maximum of 10,000 results. If you would like to retrieve and paginate over the data, you can use the scroll mode. Scroll mode is limited to 1,000 results per batch.

Scroll mode cannot be used in Query Events (Multiple Queries).

- Limits work differently for aggregation and non-aggregation queries. Because we use the limits specified in the ADQL query as the bucket count limit, it is not possible to also use it as the overall result count limit. Therefore, the URL parametric limit is used for the overall limit. In the case of non-aggregation queries, there is no bucket limit, so the limit specified in the ADQL query is taken as the row count limit and the URL parametric limit becomes the second place to look for it if the ADQL query does not specify a limit.
  - Aggregation queries: the total returned row count is limited by the limit in the URL query parameter, and is not directly related to the limits specified in the ADQL query statement itself. The limits in the ADQL query apply only to bucket counts in aggregations.
  - Non-aggregation queries: If `LIMIT` is not specified in the `SELECT` statement, the value specified in the URL query parameter is used. If the limit query parameter is also absent, the default is 100.

### Query Events (Single Query)

This API can be used either as a simple text-formatted query or as a JSON-formatted query. The JSON-formatted query can accommodate multiple queries per call and is described in [Query Events \(Multiple Queries\)](#).

An event type might search against multiple event types. Therefore, the event type is not provided in the URL path or as a query parameter, but as part of the ADQL query provided in the request body itself. Your ADQL queries must adhere to the syntax described in the [ADQL Reference](#).

This section describes the single query form for querying events.

### Format

SaaS On-premises

```
POST http://analytics.api.example.com/events/query?limit=20
```

SaaS On-premises

```
POST http://<events_service_endpoint>:9080/events/query
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-type: application/vnd.appd.events+text;v=2
```

## Query Params

Name	Description
start	<p>Filter results based on the minimum event timestamp, specified in ISO 8601 time (<a href="https://en.wikipedia.org/wiki/ISO_8601">https://en.wikipedia.org/wiki/ISO_8601</a>) or Unix time (<a href="http://en.wikipedia.org/wiki/Unix_time">http://en.wikipedia.org/wiki/Unix_time</a>). If not specified, then the default is no minimum timestamp filtering. Note that data returned will always be limited by the data retention.</p> <p>Specify the time in combined UTC date and time format or epoch milliseconds.</p> <p>Start time is inclusive of limiting timestamps.</p>
end	<p>Filter results based on the maximum event timestamp, specified in ISO 8601 time (<a href="https://en.wikipedia.org/wiki/ISO_8601">https://en.wikipedia.org/wiki/ISO_8601</a>) or Unix time (<a href="http://en.wikipedia.org/wiki/Unix_time">http://en.wikipedia.org/wiki/Unix_time</a>). If not specified, then the default is no maximum timestamp filtering.</p> <div style="border: 1px solid #007bff; background-color: #e6f2ff; padding: 5px; margin: 10px 0;"> <p><span style="color: #007bff; font-weight: bold;">i</span> Data returned will always be limited by the data retention.</p> </div> <p>Specify the time in combined UTC date and time format or epoch milliseconds.</p> <p>End time is inclusive of limiting timestamps.</p>
limit	<p>Limits the number of results returned. The default value is 100. The upper limit on the results that can be fetched is 1,000.</p>
mode	<p>The default mode is none. You can use the scroll mode to fetch bulk data and paginate over 10,000 ADQL results. Unless a limit is specified in the query, the API enables the Events Service to fetch beyond the maximum limit. The default mode supports aggregation but the scroll mode does not support aggregation or math operations. Order by queries is supported in scroll mode.</p> <p>Scroll queries returns results in batches. Every request response contains results along with a <code>scrollid</code>, which needs to be passed in the next request to fetch the next batch of results.</p>

## Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI <b>License</b> page.
X-Events-API-Key	The Analytics API key. See <a href="#">Manage API Keys</a> .

Name	Description
Accept	The Content-Type of the response body. The supported value is application/vnd.appd.events+json;v=2.
Content-type	The Content-Type of the request body. The default is application/vnd.appd.events+json;v=2 which also versions the resource representation (v=2).

### Example SaaS Query

[Request](#) [Response](#)

```
POST http://analytics.api.example.com/events/query?
start=1422823420000&end=1423687476000&limit=20000 HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-Type: application/vnd.appd.events+text;v=2

 \"query\": \"SELECT eventTimestamp, pagename FROM browser_records ORDER BY
eventTimestamp DESC\",
 \"mode\": \"scroll\",

```

```

 \"scrollid\":
 \"/>

```

## Query Events (Multiple Queries)

Use this API to execute multiple queries against a particular account and event type in parallel. A query event that specifies multiple queries does so by including multiple ADQL queries in the body of the request. Your ADQL queries must adhere to the syntax described in the [ADQL Reference](#).

Using queries in this form takes advantage of certain backend optimizations in query performance. Query filter criteria, such as time range and limit, can be overridden by each inner query.

 The Multi-Query Events API is limited to twenty queries per HTTP request.

## Format

SaaS On-premises

```
POST http://analytics.api.example.com/events/query?limit=20
```

SaaS On-premises

```

POST http://<events_service_endpoint>:9080/events/query
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>

```

## Path Params

None

## Query Params

Name	Description
start	<p>Filter results based on the minimum event timestamp, specified in <a href="#">ISO 8601</a> time or <a href="#">Unix</a> time. If not specified, then the default is no minimum timestamp filtering.</p> <p>Specify the time in combined UTC date and time format or epoch milliseconds.</p> <p>Start time is inclusive of limiting timestamps.</p>
end	<p>Filter results based on the maximum event timestamp, specified in <a href="#">ISO 8601</a> time or <a href="#">Unix</a> time. If not specified, then the default is no maximum timestamp filtering.</p> <p>Specify the time in combined UTC date and time format or epoch milliseconds.</p> <p>End time is inclusive of limiting timestamps.</p>
limit	<p>Limits the number of results returned. The default value is 100. The upper limit on the results that can be fetched is 10,000.</p>

## Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI <b>License</b> page.
X-Events-API-Key	The Analytics API key. See <a href="#">Manage API Keys</a> .
Accept	The <code>Content-Type</code> of the response body. The supported value is <code>application/vnd.appd.events+json;v=2</code> .
Content-type	The <code>Content-Type</code> of the request body. The default is <code>application/vnd.appd.events+json;v=2</code> which also versions the resource representation (v=2).

## Payload

Field	Description
label	(Optional) Friendly name to identify the query.
query	ADQL query to execute.
start	(Optional) Overrides the start parameter value provided as a query parameter.
end	(Optional) Overrides the end parameter value provided as a query parameter.
limit	(Optional) Overrides the limit provided as a query parameter.

## Example SaaS Multiple Query

[Request](#)   [Response](#)

```

POST http://analytics.api.example.com/events/query?limit=100 HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-Type: application/vnd.appd.events+json;v=2
Accept: application/vnd.appd.events+json;v=2

]
```

## RBAC API

This page describes the Role-Based Access Control (RBAC) API methods you can use to manage users, groups, and roles for AppDynamics features. These operations provide more flexibility and automation with RBAC management. Relationship settings such as `addUserToGroup` and `removeUserToGroup` are supported.

### Support

- You must be the account owner or have **administer user** permissions to use the RBAC API.
- SAML and LDAP user creations are not supported. You can only create permissions through the UI. See [Manage Controller Tenant Users and Groups](#).

### Create User

Use this to create users in the current account. The request payload should specify `name`, `security_provider_type`, `displayName`, and `password`. The user ID is generated by the server.

### Format

POST `/controller/api/rbac/v1/users`

## Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
security_provider_type	Request payload	"INTERNAL"	Yes
displayName	Request payload		Yes
password	Request payload		Yes

## Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"name": "user10", "security_provider_type":
"INTERNAL", "displayName": "user10", "password": "welcome"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
users
```

Response status code 200 :

```
{
 "id": 10,
 "name": "user10",
 "displayName": "user10",
 "security_provider_type": "INTERNAL"
}
```

## Get User by ID

Use this to get full user information, including a summary of affiliated groups and roles, using the `userId` in the current account.

## Format

```
GET /controller/api/rbac/v1/users/userId
```

## Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/users/4
```

Response status code 200 :

```
{
 "id": 4,
```

```

"name": "user1",
"email": "user1@customer1.com",
"displayname": "user1",
"security_provider_type": "INTERNAL",
"roles":
 [
 {"id": 17,"name": "Workflow Executor"},
 {"id": 18,"name": "DB Monitoring Administrator"},
 {"id": 19,"name": "DB Monitoring User"},
 {"id": 20,"name": "Analytics Administrator"},
 {"id": 21,"name": "Server Monitoring Administrator"},
 {"id": 22,"name": "Server Monitoring User"},
 {"id": 23,"name": "Universal Agent Administrator"},
 {"id": 24,"name": "Universal Agent User"},
 {"id": 13,"name": "Account Administrator"},
 {"id": 14,"name": "Administrator"},
 {"id": 15,"name": "User"},
 {"id": 16,"name": "Dashboard Viewer"}
],
"groups":
 [
 {"id": 1,"name": "group_01"}
]
}

```

## Get User by Name

Use this to get full user information, including a summary of affiliated groups and roles, using the `userName` in the current account.

### Format

```
GET /controller/api/rbac/v1/users/name/name
```

### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/name/user1
```

Response status code 200 :

```
{
 "id": 4,
 "name": "user1",
```

```

"email": "user1@customer1.com",
"displayname": "user1",
"security_provider_type": "INTERNAL",
"roles":
 [
 {"id": 17,"name": "Workflow Executor"},
 {"id": 18,"name": "DB Monitoring Administrator"},
 {"id": 19,"name": "DB Monitoring User"},
 {"id": 20,"name": "Analytics Administrator"},
 {"id": 21,"name": "Server Monitoring Administrator"},
 {"id": 22,"name": "Server Monitoring User"},
 {"id": 23,"name": "Universal Agent Administrator"},
 {"id": 24,"name": "Universal Agent User"},
 {"id": 13,"name": "Account Administrator"},
 {"id": 14,"name": "Administrator"},
 {"id": 15,"name": "User"},
 {"id": 16,"name": "Dashboard Viewer"}
],
"groups":
 [
 {"id": 1,"name": "group_01"}
]

```

- This API only supports retrieving internal users and not SAML or LDAP.
- You have to include an optional parameter (securityProviderType) to find SAML/LDAP users.

## Get All Users

Use this to get a list of all users in the current account. The list includes user summaries, which includes `userId` and `userName`.

### Format

```
GET /controller/api/rbac/v1/users
```

### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users
```

Response status code 200 :

```
{
 "users":
```

```
[
 {"id": 4, "name": "user1"},
 {"id": 10, "name": "user10"}
]
```

## Update User

Use this to update a user by `userId` in the current account. Only the user object itself is updated, with the relationship to roles and groups remaining unaffected.

### Format

```
PUT /controller/api/rbac/v1/users/userId
```

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>id</code>	Request payload		Yes
<code>name</code>	Request payload		Yes
<code>displayName</code>	Request payload		Yes
<code>security_provider_type</code>	Request payload	"INTERNAL"	Yes

### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 11, "name": "updated_user9", "displayName":
"user9", "security_provider_type": "INTERNAL"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
users/11
```

Response status code 200 :

```
{
 "id": 11,
 "name": "updated_user9",
 "displayName": "user9",
 "security_provider_type": "INTERNAL"
}
```

## Delete User

Use this to delete a user by `userId` in the current account.

### Format

```
DELETE /controller/api/rbac/v1/users/userId
```

### Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/users/11
```

Response status code 200 :

## Create Group

Use this to create a group in the current account. The `groupId` is generated by the server.

### Format

```
POST /controller/api/rbac/v1/groups
```

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>name</code>	Request payload		Yes
<code>description</code>	Request payload		No
<code>security_provider_type</code>	Request payload	"INTERNAL"	Yes

### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"name": "group100","description": "new description",
"security_provider_type": "INTERNAL"}' -u user1@customer1
http://localhost:8080/controller/api/rbac/v1/groups
```

Response status code 200 :

```
{
 "id": 2,
 "name": "group100",
 "security_provider_type": "INTERNAL",
```

```
"description": "new description"
}
```

### Get Group by ID

Use this to get full group information by `groupId` in the current account.

#### Format

```
GET /controller/api/rbac/v1/groups/groupId
```

#### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/1

Response status code 200 :
{
 "id": 1,
 "name": "group_03",
 "security_provider_type": "INTERNAL"
 "description": "",
 "roles":
 [
 {"id": 19, "name": "DB Monitoring User"},
 {"id": 20, "name": "Analytics Administrator"},
 {"id": 21, "name": "Server Monitoring Administrator"},
 {"id": 22, "name": "Server Monitoring User"},
 {"id": 23, "name": "Universal Agent Administrator"},
 {"id": 13, "name": "Account Administrator"},
 {"id": 16, "name": "Dashboard Viewer"}
]
}
```

### Get Group by Name

Use this to get full group information by `groupName` in the current account.

#### Format

```
GET /controller/api/rbac/v1/groups/name/name
```

## Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/name/group_03
```

Response status code 200 :

```
{
 "id": 1,
 "name": "group_03",
 "security_provider_type": "INTERNAL"
 "description": "",
 "roles":
 [
 {"id": 19,"name": "DB Monitoring User"},
 {"id": 20,"name": "Analytics Administrator"},
 {"id": 21,"name": "Server Monitoring Administrator"},
 {"id": 22,"name": "Server Monitoring User"},
 {"id": 23,"name": "Universal Agent Administrator"},
 {"id": 13,"name": "Account Administrator"},
 {"id": 16,"name": "Dashboard Viewer"}
]
}
```

## Get All Groups

Use this to get all groups in the current account. This only returns group summaries, which includes `groupId` and `groupName`.

### Format

```
GET /controller/api/rbac/v1/groups
```

## Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups
```

Response status code 200 :

```
{
 "groups":
 [
 {"id": 1,"name": "group_03"},
 {"id": 2,"name": "group100"}
]
}
```

```

]
}

```

### Update Group

Use this to update a group by `groupId` in the current account. Only the group itself is updated, while the relationships with users and roles remain unaffected.

### Format

PUT `/controller/api/rbac/v1/groups/groupId`

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>id</code>	Request payload		Yes
<code>name</code>	Request payload		Yes
<code>description</code>	Request payload		No
<code>security_provider_type</code>	Request payload	"INTERNAL"	Yes

### Example

```

curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 1, "name": "group2", "description": "new
description", "security_provider_type": "INTERNAL"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
groups/1

Response status code 200 :
{
 "id": 1,
 "name": "group2",
 "security_provider_type": "INTERNAL",
 "description": "new description",
 "roles":
 [
 {"id": 19, "name": "DB Monitoring User"},
 {"id": 20, "name": "Analytics Administrator"},
 {"id": 21, "name": "Server Monitoring Administrator"},
 {"id": 22, "name": "Server Monitoring User"},

```

```
 {"id": 23, "name": "Universal Agent Administrator"},
 {"id": 13, "name": "Account Administrator"},
 {"id": 16, "name": "Dashboard Viewer"}
]
}
```

### Delete Group

Use this to delete a group by `groupId` in the current account.

#### Format

```
DELETE /controller/api/rbac/v1/groups/groupId
```

#### Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/groups/1
```

Response status code 200 :

### Add User to Group

Use this to add a user to a group by `userId` and `groupId`.

#### Format

```
PUT /controller/api/rbac/v1/groups/groupId/users/userId
```

#### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups/2/users/10
```

Response status code 200 :

### Remove User from Group

Use this to remove a user from a group by `userId` and `groupId`.

#### Format

```
DELETE /controller/api/rbac/v1/groups/groupId/users/userId
```

### Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/groups/2/users/10
```

Response status code 200 :

### Create Role

Use this to create a role in the current account. The ID is generated by the server.

### Format

POST /controller/api/rbac/v1/roles

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
description	Request payload		No
permissions	Request payload		No

### Example

```
curl -X POST /controller/api/rbac/v1/roles \
-H 'Content-Type: application/vnd.appd.cntrl+json;v=1' \
-d '{
 "name": "SampleRole2",
 "permissions": [
 {
 "entityType": "APPLICATION",
 "action": "CONFIG_ACTIONS"
 },
 {
 "entityType": "APPLICATION",
 "action": "CONFIG_BASELINES"
 },
 {
 "entityType": "APPLICATION",
 "action": "CONFIG_BUSINESS_TRANSACTIONS"
 }
]
}
```

```
{

 "action": "VIEW"
}
]
```

### Role Permissions for Entity Actions

Entity Type	Action	Permissions
ACCOUNT	ADMINISTER_RBAC	Administer users, groups, roles, authentication, view agents, and use the <b>Getting Started Wizard</b> .  See <a href="#">Account Administration</a> for administering users, groups, roles, and configuring authentication.

Entity Type	Action	Permissions
ACCOUNT	CONFIG_LDAP	Configure LDAP.
ACCOUNT	CONFIG_SAML	Configure SAML.
ACCOUNT	ADMINISTER_LICENSE	View and configure licenses.
ACCOUNT	CONFIG_NOTIFICATIONS	Configure Email/SMS.
ACCOUNT	CONFIG_CUSTOM_EMAIL_ACTION_PLANS	Configure Email Templates.
ACCOUNT	CONFIG_HTTP_REQUEST_ACTION_PLANS	Configure HTTP Request Templates.
ACCOUNT	CREATE_WAR_ROOMS	Create Virtual War Rooms.
ACCOUNT	VIEW_BUSINESS_FLOW	View Business Flow Maps.
ACCOUNT	VIEW_SCHEDULED_REPORTS	View scheduled reports.
ACCOUNT	CONFIG_SCHEDULED_REPORTS	Configure scheduled reports.
APPLICATION	VIEW	View business applications.
APPLICATION	VIEW_DBMON_UI	View Database Visibility.
APPLICATION	CONFIG_TRANSACTION_DETECTION	Configure Transaction Detection.
APPLICATION	CONFIG_BACKEND_DETECTION	Configure Backend Detection.
APPLICATION	CONFIG_ERROR_DETECTION	Configure Error Detection.
APPLICATION	CONFIG_DIAGNOSTIC_DATA_COLLECTORS	Configure Diagnostic Data Collectors.
APPLICATION	CONFIG_CALLGRAPH_SETTINGS	Configure Call Graph Settings.

Entity Type	Action	Permissions
APPLICATION	CONFIG_JMX	Configure <a href="#">JMX</a> .
APPLICATION	CONFIG_EUM	Configure <a href="#">EUM</a> .
APPLICATION	CONFIG_INFO_POINTS	Configure <a href="#">Information Points</a> .
APPLICATION	CONFIG_POLICIES	Configure <a href="#">Health Rules</a> .
APPLICATION	CONFIG_EVENT_REACTOR	<a href="#">Configure Policies</a> .
APPLICATION	CONFIG_ACTIONS	Configure <a href="#">Actions</a> .
APPLICATION	CONFIG_BUSINESS_TRANSACTIONS	Configure <a href="#">Business Transactions</a> .
APPLICATION	CONFIG_BASELINES	Configure <a href="#">baselines</a> .
APPLICATION	CONFIG_SQL_BIND_VARIABLES	Configure <a href="#">SQL capture settings</a> .
APPLICATION	CONFIG_AGENT_PROPERTIES	Configure <a href="#">agent properties</a> .
APPLICATION	ENABLE_JMX_OPERATIONS	<a href="#">Set JMX MBean attributes and invoke operations</a> .
APPLICATION	CONFIG_SERVICE_ENDPOINTS	Configure <a href="#">service endpoints</a> .
APPLICATION	MANAGE_CUSTOM_DASHBOARD_TEMPLATES	Configure <a href="#">custom dashboards</a> for tiers and nodes.
APPLICATION	CONFIG_TRIGGER_DIAGNOSTIC_SESSION	Start <a href="#">diagnostic sessions</a> .
APPLICATION	VIEW_SIM	View <a href="#">Server Visibility</a> .
APPLICATION	CONFIG_SIM	Configure <a href="#">Server Visibility</a> .

```
200 OK
{
 "id": 87,
 "name": "SampleRole2"
}
```

## Add Role to User

Use this to add a role to a user by `roleId` and `userId`.

### Format

```
PUT /controller/api/rbac/v1/roles/roleId/users/userId
```

### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/50/users/10
```

Response status code 200 :

## Remove Role from User

Use this to remove a role from a user by `roleId` and `userId`.

### Format

```
DELETE /controller/api/rbac/v1/roles/roleId/users/userId
```

### Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/50/users/10
```

Response status code 200 :

## Add Role to Group

Use this to add a role to a group by `roleId` and `groupId`.

### Format

```
PUT /controller/api/rbac/v1/roles/roleId/groups/groupId
```

### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/50/groups/2
```

Response status code 200 :

### Remove Role from Group

Use this to remove a role from a group by `roleId` and `groupId`.

#### Format

```
DELETE /controller/api/rbac/v1/roles/roleId/groups/groupId
```

### Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/50/groups/2
```

Response status code 200 :

### Get Role by ID

Use this to get full role information by `roleId` in the current account. This only returns the `role` object.

 This API does not return the Analytics Events permission.

#### Format

```
GET /controller/api/rbac/v1/roles/[roleId]?include-permissions=true
```

#### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>id</code>	Request payload		Yes
<code>include-permissions (&gt;= v4.5.14)</code>	Request payload	<code>"true"</code>	No

## Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/15?include-permissions=true
```

Response status code 200 :

```
{
 "id": 15,
 "name": "SampleRole",
 "permissions": [

 },
 {
 "id": 2606,
 "entityType": "APPLICATION",
 "action": "VIEW"
 }
]
}

```

### Get Role by Name

Use this to get full role information by `roleName` in the current account.

 This API does not return the Analytics Events permission.

### Format

GET `/controller/api/rbac/v1/roles/name/[RoleName]?include-permissions=true`

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
include-permissions (>= v4.5.14)	Request payload	"true"	No

### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/name/SampleRole?include-permissions=true
```

Response status code 200 :

```

{
 "id": 15,
 "name": "SampleRole",
 "permissions": [
 {
 "id": 2619,
 "entityType": "APPLICATION",
 "action": "CONFIG_ACTIONS"
 },
 {
 "id": 2621,
 "entityType": "APPLICATION",
 "action": "CONFIG_BASELINES"
 },
 {
 "id": 2620,
 "entityType": "APPLICATION",
 "action": "CONFIG_BUSINESS_TRANSACTIONS"
 },
 {
 "id": 2610,
 "entityType": "APPLICATION",
 "action": "CONFIG_ERROR_DETECTION"
 },
 {
 "id": 2615,
 "entityType": "APPLICATION",
 "action": "CONFIG_EUM"
 },
 {
 "id": 2618,
 "entityType": "APPLICATION",
 "action": "CONFIG_EVENT_REACTOR"
 },
 {
 "id": 2617,
 "entityType": "APPLICATION",
 "action": "CONFIG_POLICIES"
 },
 {
 "id": 2608,
 "entityType": "APPLICATION",
 "action": "CONFIG_TRANSACTION_DETECTION"
 }
]
}

```

```

 },
 {
 "id": 2606,
 "entityType": "APPLICATION",
 "action": "VIEW"
 }
]
}

```

## Get All Roles

Use this to get all roles in the current account. This only returns role summaries, which includes `roleId` and `roleName`.

### Format

```
GET /controller/api/rbac/v1/roles
```

### Example

```

curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles

Response status code 200 :
{
 "roles":
 [
 {"id": 13,"name": "Account Administrator"},
 {"id": 14,"name": "Administrator"},
 {"id": 20,"name": "Analytics Administrator"},
 {"id": 16,"name": "Dashboard Viewer"},
 {"id": 18,"name": "DB Monitoring Administrator"},
 {"id": 19,"name": "DB Monitoring User"},
 {"id": 21,"name": "Server Monitoring Administrator"},
 {"id": 22,"name": "Server Monitoring User"},
 {"id": 23,"name": "Universal Agent Administrator"},
 {"id": 24,"name": "Universal Agent User"},
 {"id": 15,"name": "User"},
 {"id": 17,"name": "Workflow Executor"}
]
}

```

## Update Role

Use this to update a role by `roleId` in the current account. This only updates the `role` object itself, while leaving the relationship with users and groups unaffected.

You cannot update permissions within a role through this API. You can only update the `name` and `description` parameters.

### Format

```
PUT /controller/api/rbac/v1/roles/roleId
```

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>id</code>	Request payload		Yes
<code>name</code>	Request payload		Yes
<code>description</code>	Request payload		No

### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 49, "name": "role1", "description": "new
description" }' -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/49
```

Response status code 200 :

```
{
 "id": 49,
 "name": "role1",
 "description": "new description"
}
```

## Delete Role

Use this to delete a role in the current account.

### Format

```
DELETE /controller/api/rbac/v1/roles/roleId
```

### Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/49
```

Response status code 200 :

## Controller Audit History API

The Controller audit history is a record of the configuration and user activities in the Controller configuration. The `ControllerAuditHistory` API method returns the audit log for the time range specified. The output format can be `JSON` or `CSV`. This information is the same as that found in the `audit.log` file. See [Platform Log Files](#) and [Log File Information by Platform](#)

### Format

```
GET /controller/ ControllerAuditHistory?startTime=<start-time>&endTime=<end-
time>&include=<field>:<value>&exclude=<field>:<value>
```

### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>start-time</code>	Query	Start time in the format: <code>yyyy-MM-dd'T'HH:mm:ss.SSSZ</code>	Yes
<code>end-time</code>	Query	End time in the format: <code>yyyy-MM-dd'T'HH:mm:ss.SSSZ</code>	Yes
<code>time-zone-id</code>	Query	Time zone	No
<code>include</code>	Query	Restricted information in the Controller audit history	No
<code>exclude</code>	Query	Restricted information in the Controller audit history	No

- To control the size of the output, the range between the `start-time` and `end-time` cannot exceed 24 hours. For periods longer than 24 hours, use multiple queries with consecutive time parameters.
- Multiple filters of the same type are allowed.
  - The backend API treats included filters with the same `< field >` with relationship `OR`
  - Filters with different `< field >` with relationship `AND`. There is no direct interaction between `include` and `exclude` filters.
- Each filter needs to be a parameter, e.g. `include=filterName1:filterValue1&include=filterName2:filterValue2`. See the below examples:

```
http://localhost:8080/controller/ControllerAuditHistory?
startTime=yyyy-MM-dd&HH:mm:ss.SSSZ&endTime=yyyy-MM-
dd&HH:mm:ss.SSSZ?
include=filterName1:filterValue1&include=filterName1:filterValue
1&exclude=filterName1:filterValue1&exclude=filterName1:filterVal
ue1
```

```

```

## Create Central Identity User API

This page describes the Create Central Identity User API methods you can use to create central identity(ci) users in the current account. This API is only available when the current account is configured with the `CI_USER_CREATION` property.

You must be the account owner or have the **administer user** permissions to use the Create Central Identity User

SAML and LDAP user creations are not supported. You can only create permissions through the UI. See [Manage Custom Roles](#).

### Create User

The request payload should specify `email`, `security_provider_type`, and `displayName`. The server generates the user ID.

#### Format

```
POST /controller/api/rbac/v1/ci-user
```

#### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>email</code>	Request payload		Yes
<code>security_provider_type</code>	Request payload	"INTERNAL"	Yes
<code>displayName</code>	Request payload		Yes

#### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X POST -d '{"email": "user10@domain.com", "security_provider_type": "INTERNAL", "displayName": "user10"}' -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/ci-user
```

Response status code 200 :

```
{
 "id": 10,
 "name": "user10@domain.com",
 "email": "user10@domain.com",
 "displayName": "user10",
 "security_provider_type": "INTERNAL"
}
```

### Get User by ID

Use this to get full user information, including a summary of affiliated groups and roles, using the `userId` in the current account.

### Format

```
GET /controller/api/rbac/v1/users/userId
```

### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/4
```

Response status code 200 :

```
{
 "id": 4,
 "name": "user1",
 "email": "user1@customer1.com",
 "displayName": "user1",
 "security_provider_type": "INTERNAL",
 "roles":
 [
 {"id": 17, "name": "Workflow Executor"},
 {"id": 18, "name": "DB Monitoring Administrator"},
 {"id": 19, "name": "DB Monitoring User"},
 {"id": 20, "name": "Analytics Administrator"},
 {"id": 21, "name": "Server Monitoring Administrator"},
 {"id": 22, "name": "Server Monitoring User"},
 {"id": 13, "name": "Account Administrator"},
 {"id": 14, "name": "Administrator"},
 {"id": 15, "name": "User"},
 {"id": 16, "name": "Dashboard Viewer"}
],
 "groups":
```

```
[
 {"id": 1, "name": "group_01"}
]
```

### Get User by Name

Use this to get full user information, including a summary of affiliated groups and roles, using the `userName` in the current account.

### Format

```
GET /controller/api/rbac/v1/users/name/name
```

### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/name/user1
```

Response status code 200 :

```
{
 "id": 4,
 "name": "user1",
 "email": "user1@customer1.com",
 "displayName": "user1",
 "security_provider_type": "INTERNAL",
 "roles":
 [
 {"id": 17, "name": "Workflow Executor"},
 {"id": 18, "name": "DB Monitoring Administrator"},
 {"id": 19, "name": "DB Monitoring User"},
 {"id": 20, "name": "Analytics Administrator"},
 {"id": 21, "name": "Server Monitoring Administrator"},
 {"id": 22, "name": "Server Monitoring User"},
 {"id": 13, "name": "Account Administrator"},
 {"id": 14, "name": "Administrator"},
 {"id": 15, "name": "User"},
 {"id": 16, "name": "Dashboard Viewer"}
],
 "groups":
 [
 {"id": 1, "name": "group_01"}
]
}
```

## Get All Users

Use this to get a list of all users in the current account. The list includes user summaries, which includes `userId` and `userName`.

### Format

```
GET /controller/api/rbac/v1/users
```

### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users

Response status code 200 :
{
 "users":
 [
 {"id": 4, "name": "user1"},
 {"id": 10, "name": "user10"}
]
}
```

## Update User

Use this to update a user by `userId` in the current account. Only the user object itself is updated, with the relationship to roles and groups remaining unaffected.

### Format

```
PUT /controller/api/rbac/v1/users/userId
```

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>id</code>	Request payload		Yes
<code>name</code>	Request payload		Yes
<code>displayName</code>	Request payload		Yes
<code>security_provider_type</code>	Request payload	"INTERNAL"	Yes

### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 11,"name": "updated_user9","displayName":
"user9","security_provider_type": "INTERNAL"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
users/11
```

Response status code 200 :

```
{
 "id": 11,
 "name": "updated_user9",
 "displayName": "user9",
 "security_provider_type": "INTERNAL"
}
```

### Delete User

Use this to delete a user by `userId` in the current account.

#### Format

```
DELETE /controller/api/rbac/v1/users/userId
```

### Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/users/11
```

Response status code 200 :

### Create Group

Use this to create a group in the current account. The `groupId` is generated by the server.

#### Format

```
POST /controller/api/rbac/v1/groups
```

#### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
description	Request payload		No

Parameter Name	Parameter Type	Value	Mandatory
security_provider_type	Request payload	"INTERNAL"	Yes

### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"name": "group100","description": "new description",
"security_provider_type": "INTERNAL"}' -u user1@customer1
http://localhost:8080/controller/api/rbac/v1/groups
```

Response status code 200 :

```
{
 "id": 2,
 "name": "group100",
 "security_provider_type": "INTERNAL",
 "description": "new description"
}
```

### Get Group by ID

Use this to get full group information by `groupId` in the current account.

### Format

```
GET /controller/api/rbac/v1/groups/groupId
```

### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups/1
```

Response status code 200 :

```
{
 "id": 1,
 "name": "group_03",
 "security_provider_type": "INTERNAL"
 "description": "",
 "roles":
 [
 {"id": 19,"name": "DB Monitoring User"},
 {"id": 20,"name": "Analytics Administrator"},
 {"id": 21,"name": "Server Monitoring Administrator"},
 {"id": 22,"name": "Server Monitoring User"},
]
}
```

```

 {"id": 13,"name": "Account Administrator"},
 {"id": 16,"name": "Dashboard Viewer"}
]
}

```

### Get Group by Name

Use this to get full group information by `groupName` in the current account.

#### Format

```
GET /controller/api/rbac/v1/groups/name/name
```

#### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/name/group_03
```

Response status code 200 :

```

{
 "id": 1,
 "name": "group_03",
 "security_provider_type": "INTERNAL"
 "description": "",
 "roles":
 [
 {"id": 19,"name": "DB Monitoring User"},
 {"id": 20,"name": "Analytics Administrator"},
 {"id": 21,"name": "Server Monitoring Administrator"},
 {"id": 22,"name": "Server Monitoring User"},
 {"id": 13,"name": "Account Administrator"},
 {"id": 16,"name": "Dashboard Viewer"}
]
}

```

### Get All Groups

Use this to get all groups in the current account. This only returns group summaries, which includes `groupId` and `groupName`.

#### Format

```
GET /controller/api/rbac/v1/groups
```

### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups
```

Response status code 200 :

```
{
 "groups":
 [
 {"id": 1, "name": "group_03"},
 {"id": 2, "name": "group100"}
]
}
```

### Update Group

Use this to update a group by `groupId` in the current account. Only the group itself is updated, while the relationships with users and roles remain unaffected.

### Format

```
PUT /controller/api/rbac/v1/groups/groupId
```

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>id</code>	Request payload		Yes
<code>name</code>	Request payload		Yes
<code>description</code>	Request payload		No
<code>security_provider_type</code>	Request payload	"INTERNAL"	Yes

### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 1, "name": "group2", "description": "new
description", "security_provider_type": "INTERNAL"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
groups/1
```

Response status code 200 :

```
{
```

```
"id": 1,
"name": "group2",
"security_provider_type": "INTERNAL",
"description": "new description",
"roles":
 [
 {"id": 19,"name": "DB Monitoring User"},
 {"id": 20,"name": "Analytics Administrator"},
 {"id": 21,"name": "Server Monitoring Administrator"},
 {"id": 22,"name": "Server Monitoring User"},
 {"id": 13,"name": "Account Administrator"},
 {"id": 16,"name": "Dashboard Viewer"}
]
}
```

### Delete Group

Use this to delete a group by `groupId` in the current account.

#### Format

```
DELETE /controller/api/rbac/v1/groups/groupId
```

#### Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/groups/1
```

Response status code 200 :

### Add User to Group

Use this to add a user to a group by `userId` and `groupId`.

#### Format

```
PUT /controller/api/rbac/v1/groups/groupId/users/userId
```

#### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups/2/users/10
```

Response status code 200 :

### Remove User from Group

Use this to remove a user from a group by `userId` and `groupId`.

#### Format

```
DELETE /controller/api/rbac/v1/groups/groupId/users/userId
```

#### Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/2/users/10
```

Response status code 200 :

### Create Role

Use this to create a role in the current account. The ID is generated by the server.

#### Format

```
POST /controller/api/rbac/v1/roles
```

#### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>name</code>	Request payload		Yes
<code>description</code>	Request payload		No

#### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X POST -d '{"name": "role2","description": "new description"}' -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles
```

Response status code 200 :

```
{
 "id": 49,
```

```
"name": "role2",
"description": "new description"
}
```

### Add Role to User

Use this to add a role to a user by `roleId` and `userId`.

#### Format

```
PUT /controller/api/rbac/v1/roles/roleId/users/userId
```

#### Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/50/users/10
```

Response status code 200 :

### Remove Role from User

Use this to remove a role from a user by `roleId` and `userId`.

#### Format

```
DELETE /controller/api/rbac/v1/roles/roleId/users/userId
```

#### Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/50/users/10
```

Response status code 200 :

### Add Role to Group

Use this to add a role to a group by `roleId` and `groupId`.

#### Format

```
PUT /controller/api/rbac/v1/roles/roleId/groups/groupId
```

---

## Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/50/groups/2
```

```
Response status code 200 :
```

## Remove Role from Group

Use this to remove a role from a group by `roleId` and `groupId`.

### Format

```
DELETE /controller/api/rbac/v1/roles/roleId/groups/groupId
```

### Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/50/groups/2
```

```
Response status code 200 :
```

## Get Role by ID

Use this to get full role information by `roleId` in the current account. This only returns the role object.

### Format

```
GET /controller/api/rbac/v1/roles/roleId
```

### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/15
```

```
Response status code 200 :
```

```
{
 "id": 15,
 "name": "User",
 "description": "Can view applications and dashboards but not
modify their configuration"
}
```

---

## Get Role by Name

Use this to get full role information by `roleName` in the current account.

### Format

```
GET /controller/api/rbac/v1/roles/name/name
```

### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/name/User

Response status code 200 :
{
 "id": 15, "name":
 "User",
 "description": "Can view applications and dashboards but not
modify their configuration"
}
```

## Get All Roles

Use this to get all roles in the current account. This only returns role summaries, which includes `roleId` and `roleName`.

### Format

```
GET /controller/api/rbac/v1/roles
```

### Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles

Response status code 200 :
{
 "roles":
 [
 {"id": 13, "name": "Account Administrator"},
 {"id": 14, "name": "Administrator"},
 {"id": 20, "name": "Analytics Administrator"},
 {"id": 16, "name": "Dashboard Viewer"},
 {"id": 18, "name": "DB Monitoring Administrator"},
 {"id": 19, "name": "DB Monitoring User"},
 {"id": 21, "name": "Server Monitoring Administrator"},
 {"id": 22, "name": "Server Monitoring User"},
]
}
```

```

 {"id": 15, "name": "User"},
 {"id": 17, "name": "Workflow Executor"}
]
}

```

### Update Role

Use this to update a role by `roleId` in the current account. This only updates the role object itself, while leaving the relationship with users and groups unaffected.

### Format

```
PUT /controller/api/rbac/v1/roles/roleId
```

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	Request payload		Yes
name	Request payload		Yes
description	Request payload		No

### Example

```

curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 49, "name": "role1", "description": "new
description" }' -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/49

```

Response status code 200 :

```

{
 "id": 49,
 "name": "role1",
 "description": "new description"
}

```

### Delete Role

Use this to delete a role in the current account.

### Format

```
DELETE /controller/api/rbac/v1/roles/roleId
```

---

## Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/49
```

```
Response status code 200 :
```

## License API

### Related pages:

This page describes the License APIs you can use to perform functions related to licensing and accounts including uploading license files, allocating licenses, getting license and account usage information as well as creating, updating, and deleting license rules.

The License APIs below are separated by licensing model. To learn about licenses within each model, see [License Entitlements and Restrictions](#).

[Infrastructure-based Licensing](#)    [Agent-based Licensing](#)

---

APIs for [Infrastructure-based Licensing](#):

### License Usage API

A RESTful API to programmatically retrieve overall license usage by application ID or name, or by host ID.

#### Retrieve Usage by Application ID

You can retrieve license usage details (such as vCPU count) for an application by application ID.

#### URL

```
http://<host>:<port>/controller/licensing/v1/account/{accountId}/grouped-usage/
application/by-id
```

#### Format

```
GET /controller/licensing/v1/account/{accountId}/grouped-usage/application/by-id
```

### Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes

### Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
appId	Array	A set of application IDs.	Yes
includeAgents	Boolean	Flag indicates whether the list of agents is required in response.	No

### Response Format

response appObject

Parameter Name	Parameter Type	Value
vCpuTotal	Integer	Total number of vCPUs on hosts where all applications are running.
fallbackLicenseUnits	Object	Total number of (fallback) license units used by the applications per package name.
items	Object	Detail of usages by application.

appItemObject

Parameter Name	Parameter Type	Value
appId	Integer	Application ID.
appName	String	Application name.
vCpu	Integer	Number of vCPU on the host.
nodes	Object ( nodeObject )	Nodes where the application is running.

Parameter Name	Parameter Type	Value
containers	Object ( containerObject )	Containers where the application is running.
agents	Object ( agentObject )	(Optional) License keys associated with all agents.
hosts	Object ( hostObject )	Hosts where the application is running. Will be <code>null</code> when this object is self-referenced.

#### nodeObject

Parameter Name	Parameter Type	Value
nodeName	String	Node name.

#### containerObject

Parameter Name	Parameter Type	Value
containerId	String	Container ID.

#### agentObject

Parameter Name	Parameter Type	Value
type	String	Agent type.
version	String	Agent version.
licenseKey	String	License key used to obtain lease.

#### hostObject

Parameter Name	Parameter Type	Value
vCpuTotal	Integer	Total number of vCPUs on hosts.
items	Object	Detail of usages by host.

## hostItemObject

Parameter Name	Parameter Type	Value
host	String	Host name.
fallbackLicenseUnits	Object	License unit used by the application/host per package name.
vCpu	Integer	Number of vCPU on the host.
nodes	Object ( nodeObject )	Number of nodes on the host.
containers	Object ( containerObject )	Number of containers on the host.
agents	Object ( agentObject )	(Optional) License keys associated with all agents.
application	Object ( appItemObject )	Applications running on the host. Will be null when this object is self-referenced.

## Example

[Request](#) [Response](#)

```
curl --user <user>@<AccountName>:<password> "http://
<host>:<port>/controller/licensing/v1/account/{accountId}/
grouped-usage/application/by-id?appId={appId1}
&appId={appId2}"
```

[Request](#) [Response](#)

```
{
 "vCpuTotal": 4,
 "items": {
 "13": {
 "appId": 13,
 "appName": "ecommerce-demo",
 "vCpu": 4,
 "nodes": [
 {
```

```

 "nodeName": "ecommerce-demo-web-node-1"
 },
 {
 "nodeName": "ecommerce-demo-web-node-2"
 }
],
"containers": [
 {
 "containerId": "ecommerce-demo-web-1"
 },
 {
 "containerId": "ecommerce-demo-web-2"
 }
],
"agents": [
 {
 "type": "APP_AGENT",
 "version": "21.4.0",
 "licenseKey": "secret"
 }
],
"hosts": {
 "vCpuTotal": 4,
 "items": {
 "ip-10-20-30-40": {
 "vCpu": 4,
 "host": "ip-10-20-30-40",
 "nodes": [
 {
 "nodeName": "ecommerce-demo-web-node-1"
 },
 {
 "nodeName": "ecommerce-demo-web-node-2"
 }
]
 },
 "containers": [
 {
 "containerId": "ecommerce-demo-web-1"
 },
 {
 "containerId": "ecommerce-demo-web-2"
 }
],
 "agents": [
 {
 "type": "APP_AGENT",
 "version": "21.4.0",
 "licenseKey": "secret"
 }
],
 "fallbackLicenseUnits": {}
 }
}

```

```

 }
 }
}

```

### Retrieve by Application Name

You can retrieve license usage details (such as vCPU count) for an application by application name.

#### URL

`http://<host>:<port>/controller/licensing/v1/account/{accountId}/grouped-usage/application/by-name`

#### Format

GET `/controller/licensing/v1/account/{accountId}/grouped-usage/application/by-name`

#### Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>accountId</code>	Integer	Account identification for which allocations are requested to be retrieved.	Yes

#### Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>appName</code>	Array	A set of (URL escaped) application names.	Yes
<code>includeAgents</code>	Boolean	Flag indicates whether the list of agents is required in response.	No

#### Response Format

response appObject

Parameter Name	Parameter Type	Value
<code>vCpuTotal</code>	Integer	Total number of vCPUs on hosts where all applications are running.

Parameter Name	Parameter Type	Value
fallbackLicenseUnits	Object	Total number of (fallback) license units used by the applications per package name.
items	Object	Detail of usages by application.

#### appItemObject

Parameter Name	Parameter Type	Value
appId	Integer	Application ID.
appName	String	Application name.
vCpu	Integer	Number of vCPUs on the host.
nodes	Object ( nodeObject )	Nodes where the application is running.
containers	Object ( containerObject )	Containers where the application is running.
agents	Object ( agentObject )	(Optional) License keys associated with all agents.
hosts	Object ( hostObject )	Hosts where the application is running. Will be null when this object is self-referenced.

#### nodeObject

Parameter Name	Parameter Type	Value
nodeName	String	Node name.

#### containerObject

Parameter Name	Parameter Type	Value
containerId	String	Container ID.

#### agentObject

Parameter Name	Parameter Type	Value
type	String	Agent type.
version	String	Agent version.
licenseKey	String	License key used to obtain lease.

#### hostObject

Parameter Name	Parameter Type	Value
vCpuTotal	Integer	Total number of vCPUs on hosts.
items	Object	Detail of usages by host.

#### hostItemObject

Parameter Name	Parameter Type	Value
host	String	Host name.
fallbackLicenseUnits	Object	License unit used by the application/host per package name.
vCpu	Integer	Number of vCPU nodes on the host.
nodes	Object ( nodeObject )	Nodes where the application is running.
containers	Object ( containerObject )	Containers where the application is running.
agents	Object ( agentObject )	(Optional) License keys associated with all agents.
application	Object ( appItemObject )	Applications running on the host. Will be null when this object is self-referenced.

#### Example

[Request](#)    Response

---

```
curl --user <user>@<AccountName>:<password> "http://
<host>:<port>/controller/licensing/v1/account/{accountId}/
grouped-usage/application/by-name?appName={appName1}
&appName={appName2}"
```

Request [Response](#)

```

}
}
}
```

### Retrieve Usage by Host ID

You can retrieve license usage information (such as vCPU count) for an application by host ID.

#### URL

`http://<host>:<port>/controller/licensing/v1/account/{accountId}/grouped-usage/host`

#### Format

`GET /controller/licensing/v1/account/{accountId}/grouped-usage/host`

#### Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>accountId</code>	Integer	Account identification for which allocations are requested to be retrieved.	Yes

## Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
hostId	Array	A set of (URL escaped) host IDs.	Yes
includeAgents	Boolean	A flag indicates whether the list of agents is required in response.	No

## Response Format

response hostObject

Parameter Name	Parameter Type	Value
vCpuTotal	Integer	Total number of vCPUs on hosts.
items	Object	Detail of usages by host.

hostItemObject

Parameter Name	Parameter Type	Value
host	String	Host name.
fallbackLicenseUnits	Object	License unit used by the application/host per package name.
vCpu	Integer	Number of vCPU on the host.
nodes	Object ( nodeObject )	Number of nodes on the host.
containers	Object ( containerObject )	Number of containers on the host.
agents	Object ( agentObject )	(Optional) License keys associated with all agents.
application	Object ( appItemObject )	Applications running on the host. Will be null when this object is self-referenced.

nodeObject

Parameter Name	Parameter Type	Value
nodeName	String	Node name.

#### containerObject

Parameter Name	Parameter Type	Value
containerId	String	Container ID.

#### agentObject

Parameter Name	Parameter Type	Value
type	String	Agent type.
version	String	Agent version.
licenseKey	String	License key used to obtain lease.

#### appObject

Parameter Name	Parameter Type	Value
vCpuTotal	Integer	Total number of vCPUs on hosts where all applications are running.
fallbackLicenseUnits	Object	Total number of (fallback) license units used by the applications per package name.
items	Object	Detail of usages by application.

#### appItemObject

Parameter Name	Parameter Type	Value
appId	Integer	Application ID.
appName	String	Application name.

Parameter Name	Parameter Type	Value
vCpu	Integer	Number of vCPU on the host.
nodes	Object ( nodeObject )	Nodes where the application is running.
containers	Object ( containerObject )	Containers where the application is running.
agents	Object ( agentObject )	(Optional) License keys associated with all agents.
hosts	Object ( hostObject )	Hosts where the application is running. Will be <code>null</code> when this object is self-referenced.

### Example

[Request](#) [Response](#)

```
curl --user <user>@<AccountName>:<password> "http://<host>:<port>/controller/licensing/v1/account/{accountId}/grouped-usage/host?hostId={hostId1}&hostId={hostId2}"
```

[Request](#) [Response](#)

```
{
 "vCpuTotal": 4,
 "hosts": {
 "vCpuTotal": 4,
 "items": {
 "ip-10-20-30-40": {
 "vCpu": 4,
 "host": "ip-10-20-30-40",
 "nodes": [
 {
 "nodeName": "ecommerce-demo-web-node-1"
 },
 {
 "nodeName": "ecommerce-demo-web-node-2"
 }
]
 },
 "containers": [
```

```

 {
 "containerId": "ecommerce-demo-web-1"
 },
 {
 "containerId": "ecommerce-demo-web-2"
 }
],
 "agents": [
 {
 "type": "APP_AGENT",
 "version": "21.4.0",
 "licenseKey": "secret"
 }
],
 "fallbackLicenseUnits": {},
 "applications": {
 "vCpuTotal": 4,
 "items": {
 "13": {
 "appId": 13,
 "appName": "ecommerce-demo",
 "vCpu": 4,
 "nodes": [
 {
 "nodeName": "ecommerce-demo-web-node-1"
 },
 {
 "nodeName": "ecommerce-demo-web-node-2"
 }
],
 "containers": [
 {
 "containerId": "ecommerce-demo-web-1"
 },
 {
 "containerId": "ecommerce-demo-web-2"
 }
],
 "agents": [
 {
 "type": "APP_AGENT",
 "version": "21.4.0",
 "licenseKey": "secret"
 }
]
 }
 }
 }
}

```

## Account Usage API

A RESTful API to programmatically retrieve account usage by license and account ID.

### Retrieve Account Usage by License ID

Retrieve account usage referenced by given license ID.

#### URL

```
http://<host>:<port>/controller/licensing/v1/usage/license/{licenseId}
```

#### Format

```
GET /controller/licensing/v1/usage/license/{licenseId}
```

#### Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
licenseId	String	License Id for which an usage is requested to be retrieved.	Yes

#### Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
dateFrom	String	Start date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
dateTo	String	End date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
granularityMinutes	Integer	Requested granularity of the license usage data.	Yes
includeEntityTypes	Boolean	Determines whether to include licensed entity type usage or not. The default is <code>false</code> .	No

Parameter Name	Parameter Type	Value	Mandatory
includeConsumptionBased	Boolean	Whether to include consumption-based usages. The default is <code>false</code> .	No

### Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID.
licenseRule	Object	Entity representing license usage either for an account or for an allocation.
packages	Array of package Objects	

licenseRule Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID.
name	String	Allocation name.
licenseKey	String	License key for this particular allocation.

packageObject

Parameter Name	Parameter Type	Value
packageName	String	An enumeration representing the name of the package (edition) instance: <ul style="list-style-type: none"> <li>• "INFRA"</li> <li>• "PREMIUM"</li> <li>• "ENTERPRISE"</li> </ul>

Parameter Name	Parameter Type	Value
type	String	An enumeration representing the type of the package instance: <ul style="list-style-type: none"> <li>• "PAID"</li> <li>• "TRIAL"</li> <li>• "LITE"</li> </ul>
kind	String	Package kind derived from the licensing model where the package originated from. Useful for quickly distinguishing packages based on the legacy Agent based license modules (APM, DOTNET, etc.) from the new Infrastructure based packages.  Enum: "AGENT_BASED" "INFRASTRUCTURE_BASED"
family	String	Package family.
createdDate	String	Creation date of the package instance in the license. ISO 8601 date-time string.
startDate	String	Start date of the package instance. For example, the date from which the package instance becomes active: ISO 8601 date-time string.
expirationDate	String	Expiration date of the package instance, i.e. date from which the package instance is no longer active. ISO 8601 date-time string.
licenseUnits	String	Number of licenses available for the package instance.
properties	Object	Collection of package specific custom properties in the form of key-value pairs. In case of merging with global properties, conflicting package specific properties take precedence.

## Example

[Request](#)    Response

```
curl --user <user>@<AccountName>:<password> -X GET \
 http://<host>:<port>/controller/licensing/v1/usage/
 license/{licenseId}?dateFrom=<ISO 8601 date-time
 string>&dateTo=<ISO 8601 date-time
 string>&granularityMinutes=<number of minutes as an integer>
```

Request [Response](#)

```

}

```

### Retrieve Account Usage by Account ID

Retrieve account usage referenced by given account ID.

#### URL

`http://<host>:<port>/controller/licensing/v1/usage/account/{accountId}`

#### Format

GET `/controller/licensing/v1/usage/account/{accountId}`

#### Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>accountId</code>	Integer	Account ID for which a usage is requested to be retrieved.	Yes

#### Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>dateFrom</code>	String	Start date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
<code>dateTo</code>	String	End date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
<code>granularityMinutes</code>	Integer	Requested granularity of the license usage data.	Yes

Parameter Name	Parameter Type	Value	Mandatory
includeEntityTypes	Boolean	Determines whether to include licensed entity type usage or not. The default is <code>false</code> .	No
includeConsumptionBased	Boolean	Whether to include consumption-based usages. The default is <code>false</code> .	No

### Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID.

 "max":0,
 "avg":0,
 "count":0
 }
 }
]
 }
 }
]
 }
]
}
```

Parameter Name	Parameter Type	Value	Mandatory
tag	String	Tag associated with allocations. Cannot be used in combination with name and license-key.	No

### Response Format

response Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID. Unique per account.
accountId	Integer	Account ID the allocation belongs to.
name	String	Name of the allocation. Unique per account.
licenseKey	String	License key used by the allocation. Unique per account.
filters	Array of Objects	Array of filter objects
limits	Array of Objects	Array of limit objects
tags	Array of Strings	Tags associated with the allocation.
createdDate	String	Creation date of the allocation: ISO 8601 date-time string.
lastUpdatedDate	String	Last update date of the allocation: ISO 8601 date-time string.

filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.

Parameter Name	Parameter Type	Value
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"
operator	String	Operator of the following enumerations used to check the type against the value: <ul style="list-style-type: none"> <li>• ID_EQUALS – Exact match of entity Id</li> <li>• EQUALS – Exact match of entity value</li> <li>• STARTS_WITH – Match of entity starting with a value</li> <li>• ENDS_WITH – Match of entity ending with a value</li> <li>• CONTAINS – Match of entity containing a value</li> <li>• REGEX – Match of entity against a regexp</li> </ul>
value	String	Value to be used to filter against.

limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> <li>• "INFRA"</li> <li>• "PREMIUM"</li> <li>• "ENTERPRISE"</li> </ul>
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

Example

[Request](#)    Response

```
curl --user <user>@<AccountName>:<password> -X GET \
http://<host>:<port>/controller/licensing/v1/account/
{accountId}/allocation
```

Request [Response](#)

```
[
 {
 "id":"string",
 "accountId":0,
 "name":"string",
 "licenseKey":"string",
 "filters":[
 {
 "id":"string",
 "type":"APPLICATION",
 "operator":"ID_EQUALS",
 "value":"string"
 }
],
 "limits":[
 {
 "id":"string",
 "package":"INFRA",
 "units":0
 }
],
 "tags":[
 "string"
],
 "createdDate":"string",
 "lastUpdatedDate":"string"
 }
]
```

### Retrieve Allocation Usage by Account ID

Retrieve allocation rule usage referenced by a given license key ID.

#### URL

```
http://<host>:<port>/controller/licensing/v1/usage/account/{accountId}/allocation/
{licenseKey}
```

## Format

```
GET /controller/licensing/v1/usage/account/{accountId}/allocation/{licenseKey}
```

## Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account ID for which a usage is requested to be retrieved.	Yes
licenseKey	String	License key based on the allocation rule is selected. Returned usage will be related to that particular allocation rule.	Yes

## Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
dateFrom	String	Start date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
dateTo	String	End date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
granularityMinutes	Integer	Requested granularity of the license usage data.	Yes
includeEntityType	Boolean	Determines whether to include licensed entity type usage or not. The default is <code>false</code> .	No

## Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID.

Parameter Name	Parameter Type	Value
licenseRule	Object	Entity representing license usage either for an account or for an allocation.
packages	Array	Package objects.

#### licenseRule Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID.
name	String	Allocation name.
licenseKey	String	License key for this particular allocation.

#### packageObject

Parameter Name	Parameter Type	Value
Parameter Name	Parameter Type	Value
packageName	String	An enumeration representing the name of the package (edition) instance: <ul style="list-style-type: none"> <li>• "INFRA"</li> <li>• "PREMIUM"</li> <li>• "ENTERPRISE"</li> </ul>
type	String	An enumeration representing the type of the package instance: <ul style="list-style-type: none"> <li>• "PAID"</li> <li>• "TRIAL"</li> <li>• "LITE"</li> </ul>

Parameter Name	Parameter Type	Value
<b>Parameter Name</b>	<b>Parameter Type</b>	<b>Value</b>
kind	String	Package kind derived from the licensing model where the package originated from. Useful for quickly distinguishing packages based on the legacy Agent based license modules (APM, DOTNET, etc.) from the new Infrastructure based packages.  Enum: "AGENT_BASED" "INFRASTRUCTURE_BASED"
family	String	Package family.
createdDate	String	Creation date of the package instance in the license. ISO 8601 date-time string.
startDate	String	Start date of the package instance. For example, the date from which the package instance becomes active: ISO 8601 date-time string.
expirationDate	String	Expiration date of the package instance, i.e. date from which the package instance is no longer active. ISO 8601 date-time string.
licenseUnits	String	Number of licenses available for the package instance.
properties	Object	Collection of package specific custom properties in the form of key-value pairs. In case of merging with global properties, conflicting package specific properties take precedence.

### Example

[Request](#)    Response

```
curl --user <user>@<AccountName>:<password> -X GET \
http://<host>:<port>/controller/licensing/v1/usage/account/
{accountId}/allocation/{licenseKey}?dateFrom=<ISO 8601 date-
time string>&dateTo=<ISO 8601 date-time
```

```
string>&granularityMinutes=<number of minutes as an integer>
```

## Retrieve Allocation Usage by License Key

Retrieve allocation usage referenced by a given license key.

### URL

```
http://<host>:<port>/controller/licensing/v1/usage/license/{licenseId}/allocation/{licenseKey}
```

### Format

```
GET /controller/licensing/v1/usage/license/{licenseId}/allocation/{licenseKey}
```

### Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
licenseId	String	License ID for which a usage is requested to be retrieved.	Yes
licenseKey	String	License key based on the allocation rule is selected. Returned usage will be related to that particular allocation rule.	Yes

### Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
dateFrom	String	Start date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
dateTo	String	End date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
granularityMinutes	Integer	Requested granularity of the license usage data.	Yes

Parameter Name	Parameter Type	Value	Mandatory
includeEntityType	Boolean	Determines whether to include licensed entity type usage or not. The default is <code>false</code> .	No

### Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID.
licenseRule	Object	Entity representing license usage either for an account or for an allocation.
packages	Array of package objects	Package objects.

licenseRule Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID.
name	String	Allocation name.
licenseKey	String	License key for this particular allocation.

packageObject

Parameter Name	Parameter Type	Value
packageName	String	An enumeration representing the name of the package (edition) instance: <ul style="list-style-type: none"> <li>• "INFRA"</li> <li>• "PREMIUM"</li> <li>• "ENTERPRISE"</li> </ul>

Parameter Name	Parameter Type	Value
<b>Parameter Name</b>	<b>Parameter Type</b>	<b>Value</b>
type	String	An enumeration representing the type of the package instance: <ul style="list-style-type: none"> <li>"PAID"</li> <li>"TRIAL"</li> <li>"LITE"</li> </ul>
kind	String	Package kind derived from the licensing model where the package originated from. Useful for quickly distinguishing packages based on the legacy Agent based license modules (APM, DOTNET, etc.) from the new Infrastructure based packages.  Enum: "AGENT_BASED" "INFRASTRUCTURE_BASED"
family	String	Package family.
createdDate	String	Creation date of the package instance in the license. ISO 8601 date-time string.
startDate	String	Start date of the package instance. For example, the date from which the package instance becomes active: ISO 8601 date-time string.
expirationDate	String	Expiration date of the package instance, i.e. date from which the package instance is no longer active. ISO 8601 date-time string.
licenseUnits	String	Number of licenses available for the package instance.
properties	Object	Collection of package specific custom properties in the form of key-value pairs. In case of merging with global properties, conflicting package specific properties take precedence.

### Example

[Request](#)    Response

```
curl --user <user>@<AccountName>:<password> -X GET \
http://<host>:<port>/controller/licensing/v1/usage/license/
{licenseId}/allocation/{licenseKey}?dateFrom=<ISO 8601 date-
time string>&dateTo=<ISO 8601 date-time
string>&granularityMinutes=<number of minutes as an integer>
```

Request [Response](#)

```

}
]
}
}

```

### Create a License Allocation

Create a license allocation. For this method, make sure:

- IDs of sub-entities (filters, limits) are not filled
- Other unique parameters (e.g., `name` , `licenseKey` ) don't conflict with existing allocations

#### URL

`http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation`

#### Format

`POST /controller/licensing/v1/account/{accountId}/allocation`

#### Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>accountId</code>	Integer	Account identification for which allocations are requested to be retrieved.	Yes

#### Request Format

request Object

Parameter Name	Parameter Type	Value	Mandatory
<code>fallbackModeDelay</code>	Boolean	If set to <code>true</code> , the App Server Agents running in a container (Infrastructure-based Licensing) would be rejected for a predefined period of time if no vCPU count is known. The fallback vCPU count is set to the default value only after this time if the real vCPU count is still unknown. If the real vCPU count becomes known it will be used immediately.	Yes

Parameter Name	Parameter Type	Value	Mandatory
filters	Array of Objects	Array of filter objects	No
limits	Array of Objects	Array of limit objects	
machineAgentPriority	Boolean	Indicates that license leases are prioritized for Machine Agent usage when using Infrastructure-based Licenses (IBL) over <a href="#">App Server Agents</a> .	Yes
name	String	Name of the allocation. Unique per account.	Yes

#### Filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"
operator	String	Operator of the following enumerations used to check the type against the value: <ul style="list-style-type: none"> <li>• ID_EQUALS – Exact match of entity Id</li> <li>• EQUALS – Exact match of entity value</li> <li>• STARTS_WITH – Match of entity starting with a value</li> <li>• ENDS_WITH – Match of entity ending with a value</li> <li>• CONTAINS – Match of entity containing a value</li> <li>• REGEX – Match of entity against a regexp</li> </ul>
value	String	Value to be used to filter against.

#### limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.

Parameter Name	Parameter Type	Value
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> <li>• "INFRA"</li> <li>• "PREMIUM"</li> <li>• "ENTERPRISE"</li> </ul>
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

## Response Format

response Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID. Unique per account.
accountId	Integer	Account ID the allocation belongs to.
name	String	Name of the allocation. Unique per account.
licenseKey	String	License key used by the allocation. Unique per account.
filters	Array of Objects	Array of filter objects
limits	Array of Objects	Array of limit objects
tags	Array of Strings	Tags associated with the allocation.
createdDate	String	Creation date of the allocation: ISO 8601 date-time string.
lastUpdatedDate	String	Last update date of the allocation: ISO 8601 date-time string.

filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"
operator	String	Operator of the following enumerations used to check the <code>type</code> against the <code>value</code> : <ul style="list-style-type: none"> <li>• <code>ID_EQUALS</code> – Exact match of entity Id</li> <li>• <code>EQUALS</code> – Exact match of entity value</li> <li>• <code>STARTS_WITH</code> – Match of entity starting with a value</li> <li>• <code>ENDS_WITH</code> – Match of entity ending with a value</li> <li>• <code>CONTAINS</code> – Match of entity containing a value</li> <li>• <code>REGEX</code> – Match of entity against a regexp</li> </ul>
value	String	Value to be used to filter against.

#### limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> <li>• "INFRA"</li> <li>• "PREMIUM"</li> <li>• "ENTERPRISE"</li> </ul>
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

## Example

[Request](#) [Response](#)

```
curl --user <user>@<AccountName>:<password> -X POST \
http://<host>:<port>/controller/licensing/v1/account/
{accountId}/allocation \
-H 'Content-Type: application/json' \
-d '{
 "name": "string",
 "filters": [
 {
 "id": "string",
 "type": "APPLICATION",
 "operator": "ID_EQUALS",
 "value": "string"
 }
],
 "limits": [
 {
 "id": "string",
 "package": "INFRA",
 "units": 0
 }
],
 "tags": ["string"]
}'
```

[Request](#) [Response](#)

```
[
 {
 "id": "string",
 "accountId": integer,
 "name": "string",
 "licenseKey": "string",
 "filters": [
 {
 "id": "string",
```

```

 "type": "APPLICATION",
 "operator": "ID_EQUALS",
 "value": "string"
 }
],
 "limits": [
 {
 "id": "string",
 "package": "INFRA",
 "units": 0
 }
],
 "tags": ["string"],
 "createdDate": "ISO 8601 date-time",
 "lastUpdatedDate": "ISO 8601 date-time"
 },
 ...
]

```

## Retrieve a License Allocation

Retrieve a license allocation by allocation ID.

### URL

`http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation/{allocationId}`

### Format

`GET /controller/licensing/v1/account/{accountId}/allocation/{allocationId}`

### Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes
allocationId	String	Allocation ID referencing allocation to be retrieved.	Yes

### Response Format

response Object

Parameter Name	Parameter Type	Value
<code>id</code>	String	Allocation ID. Unique per account.
<code>accountId</code>	Integer	Account ID the allocation belongs to.
<code>fallbackModeDelay</code>	Boolean	When <code>true</code> , indicates that the App Server Agents running in a container (Infrastructure-based Licensing) would be rejected for a predefined period of time if no vCPU count is known. The fallback vCPU count is set to the default value only after this time if the real vCPU count is still unknown. If the real vCPU count becomes known it will be used immediately.
<code>name</code>	String	Name of the allocation. Unique per account.
<code>licenseKey</code>	String	License key used by the allocation. Unique per account.
<code>filters</code>	Array of Objects	Array of filter objects
<code>limits</code>	Array of Objects	Array of <code>limit</code> objects
<code>machineAgentPriority</code>	Boolean	Set to true to prioritize license leases for Machine Agent usage when using Infrastructure-based Licenses (IBL) in favor of App Server Agents.
<code>tags</code>	Array of Strings	Tags associated with the allocation.
<code>createdDate</code>	String	Creation date of the allocation: ISO 8601 date-time string.
<code>lastUpdatedDate</code>	String	Last update date of the allocation: ISO 8601 date-time string.

#### filter Object

Parameter Name	Parameter Type	Value
<code>id</code>	String	Name of the allocation. Unique per account.

Parameter Name	Parameter Type	Value
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"
operator	String	Operator of the following enumerations used to check the type against the value: <ul style="list-style-type: none"> <li>ID_EQUALS – Exact match of entity Id</li> <li>EQUALS – Exact match of entity value</li> <li>STARTS_WITH – Match of entity starting with a value</li> <li>ENDS_WITH – Match of entity ending with a value</li> <li>CONTAINS – Match of entity containing a value</li> <li>REGEX – Match of entity against a regexp</li> </ul>
value	String	Value to be used to filter against.

#### limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> <li>"INFRA"</li> <li>"PREMIUM"</li> <li>"ENTERPRISE"</li> </ul>
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

#### Example

[Request](#)    Response

```
curl --user <user>@<AccountName>:<password> -X GET \
http://<host>:<port>/controller/licensing/v1/account/
{accountId}/allocation/{allocationId}
```

Request [Response](#)

```
[
 {
 "id": "string",
 "accountId": integer,
 "name": "string",
 "licenseKey": "string",
 "filters": [
 {
 "id": "string",
 "type": "APPLICATION",
 "operator": "ID_EQUALS",
 "value": "string"
 }
],
 "limits": [
 {
 "id": "string",
 "package": "INFRA",
 "units": 0
 }
],
 "tags": ["string"],
 "createdDate": "ISO 8601 date-time",
 "lastUpdatedDate": "ISO 8601 date-time"
 },
 ...
]
```

## Update a License Allocation

Update a license allocation by allocation ID.

### URL

```
http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation/
{allocationId}
```

### Format

```
PUT /controller/licensing/v1/account/{accountId}/allocation/{allocationId}
```

## Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes
allocationId	String	Allocation ID referencing allocation to be retrieved.	Yes

## Request Format

### request Object

Parameter Name	Parameter Type	Value	Mandatory
fallbackModeDelay	Boolean	If set to <code>true</code> , the App Server Agents running in a container (Infrastructure-based Licensing) would be rejected for a predefined period of time if no vCPU count is known. The fallback vCPU count is set to the default value only after this time if the real vCPU count is still unknown. If the real vCPU count becomes known it will be used immediately.	Yes
filters	String	Allocation ID referencing allocation to be retrieved.	No
limits	Object		No
machineAgentPriority	Boolean	Set to <code>true</code> to prioritize license leases for Machine Agent usage when using Infrastructure-based Licenses (IBL) in favor of App Server Agents.	Yes
name	String	Name of the allocation. Unique per account.	Yes
tags	Array of Strings		No

### filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"
operator	String	Operator of the following enumerations used to check the <code>type</code> against the <code>value</code> : <ul style="list-style-type: none"> <li>• <code>ID_EQUALS</code> – Exact match of entity Id</li> <li>• <code>EQUALS</code> – Exact match of entity value</li> <li>• <code>STARTS_WITH</code> – Match of entity starting with a value</li> <li>• <code>ENDS_WITH</code> – Match of entity ending with a value</li> <li>• <code>CONTAINS</code> – Match of entity containing a value</li> <li>• <code>REGEX</code> – Match of entity against a regexp</li> </ul>
value	String	Value to be used to filter against.

#### limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> <li>• "INFRA"</li> <li>• "PREMIUM"</li> <li>• "ENTERPRISE"</li> </ul>
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

## Example

[Request](#) [Response](#)

```
curl --user <user>@<AccountName>:<password> -X PUT \
http://<host>:<port>/controller/licensing/v1/account/
{accountId}/allocation \
-H 'Content-Type: application/json' \
-d '{
 "name": "string",
 "filters": [
 {
 "id": "string",
 "type": "APPLICATION",
 "operator": "ID_EQUALS",
 "value": "string"
 }
],
 "limits": [
 {
 "id": "string",
 "package": "INFRA",
 "units": 0
 }
],
 "tags": [
 "string"
]
}'
```

[Request](#) [Response](#)

```
{
 "id":"string",
 "accountId":0,
 "name":"string",
 "licenseKey":"string",
 "filters":[
 {
 "id":"string",
 "type":"APPLICATION",
 "operator":"ID_EQUALS",
```

```

 "value":"string"
 }
],
 "limits":[
 {
 "id":"string",
 "package":"INFRA",
 "units":0
 }
],
 "tags":[
 "string"
],
 "createdDate":"string",
 "lastUpdatedDate":"string"
 }

```

### Delete a License Rule Allocation

Delete a license allocation by allocation ID.

#### URL

`http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation/{allocationId}`

#### Format

`DELETE /controller/licensing/v1/account/{accountId}/allocation/{allocationId}`

#### Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes
allocationId	String	Allocation ID referencing allocation to be retrieved.	Yes

#### Example

```

curl --user <user>@<AccountName>:<password> -X DELETE \
http://<host>:<port>/controller/licensing/v1/account/
{accountId}/allocation/{allocationId}

```

## License Information API

A RESTful API to programmatically retrieve license information for an account, such as license type, package, and expiration date.

### Retrieve Account License Information

Retrieve license information for an account.

#### URL

```
http://<host>:<port>/controller/licensing/v1/account/{accountId}/info
```

#### Format

```
GET /controller/licensing/v1/account/{accountId}/info
```

#### Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes

#### Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID the license info belongs to.
licenseId	String	SFDC license ID.
customerId	String	Customer ID.
customerName	String	Customer name.
environment	String	Enumerations representing the environment the license is intended to be used on: <ul style="list-style-type: none"> <li>• "DEV/TEST"</li> <li>• "PROD"</li> </ul>

Parameter Name	Parameter Type	Value
hardwareFingerprint	String	Hardware fingerprint of a machine the license is intended to be used on. Currently only the MAC address is supported. Might be ANY for no restrictions.
type	String	Enumeration representing the intended consumer of the license: <ul style="list-style-type: none"> <li>"SAAS-CONTROLLER"</li> <li>"SAAS-ACCOUNT"</li> <li>"ONPREM-CONTROLLER"</li> <li>"ONPREM-ACCOUNT"</li> </ul>
expirationDate	String	Expiration date of the whole license: ISO 8601 date-time string.
status	String	Enumeration representing the license status: <ul style="list-style-type: none"> <li>"ACTIVE" - Unexpired and paid license. All units are paid.</li> <li>"LIMITED" - Unexpired and either lite or trial. at least one unit is LITE or TRIAL.</li> <li>"EXPIRED" - Expired license.</li> </ul>
packages	Array of Objects	
properties	Object	Collection of global custom properties tied to the license in the form of key → value. These properties might be shared among all packages.
fallbackUnits	Object	Account level fallback unit definition, it is mapping agent types (string) to their fallback units (integer).

#### package Object

Parameter Name	Parameter Type	Value
packageName	String	An enumeration representing the name of the package (edition) instance: <ul style="list-style-type: none"> <li>"INFRA"</li> <li>"PREMIUM" "ENTERPRISE"</li> </ul>
type	String	An enumeration representing the type of the package instance: <ul style="list-style-type: none"> <li>"PAID"</li> <li>"TRIAL"</li> <li>"LITE"</li> </ul>

Parameter Name	Parameter Type	Value
kind	String	Package kind derived from the licensing model where the package originated from. Useful for quickly distinguishing packages based on the legacy Agent based license modules (APM, DOTNET, etc.) from the new Infrastructure based packages.  Enum: "INFRASTRUCTURE_BASED"
family	String	Package family.
createdDate	String	Creation date of the package instance in the license. ISO 8601 date-time string.
startDate	String	Start date of the package instance. For example, the date from which the package instance becomes active: ISO 8601 date-time string.
expirationDate	String	Expiration date of the package instance, i.e. date from which the package instance is no longer active. ISO 8601 date-time string.
licenseUnits	String	Number of licenses available for the package instance.
properties	Object	Collection of package specific custom properties in the form of key-value pairs. In case of merging with global properties, conflicting package specific properties take precedence.

## Example

[Request](#) [Response](#)

```
curl --user <user>@<AccountName>:<password> -X GET \
http://<host>:<port>/controller/licensing/v1/account/
{accountId}/info
```

[Request](#) [Response](#)

```
{
 "accountId":0,
 "licenseId":"string",
 "customerId":"string",
 "customerName":"string",
 "environment":"DEV/TEST",
 "hardwareFingerprint":"string",
 "type":"SAAS-CONTROLLER",
 "expirationDate":"string",
 "status":"ACTIVE",
 "packages":[
 {
 "packageName":"INFRA",
 "type":"PAID",
 "kind":"AGENT_BASED",
 "family":"string",
 "createdDate":"string",
 "startDate":"string",
 "expirationDate":"string",
 "licenseUnits":0,
 "properties":{

 }
 }
],
 "properties":{

 },
 "fallbackUnits":{

 }
}
```

Infrastructure-based Licensing [Agent-based Licensing](#)

APIs for [Agent-based Licensing](#):

### License Rules API

This section describes the License Rules API methods you can use to retrieve information about the license rules as modeled in AppDynamics such as creating, updating and deleting license rules, and also retrieving license rules by its ID, access key, and name.

The following are true for all License Rule APIs:

- `id` —is GUID (or UUID) which is an acronym for Globally Unique Identifier.
- `access_key` —must be unique across all `licenseRules` .

- `name` —must be unique across all `licenseRules` .
- `account_id` —Use GET API to know your current `account_ID` .

## Creates a New License Rule

### URL

`http://<host>:<port>/controller/mds/v1/license/rules`

### Format

POST `/controller/mds/v1/license/rules`

### Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>license_module_type</code>	String	String representing the type of the license module.  Module types are: <ul style="list-style-type: none"> <li>• NETVIZ</li> <li>• MACHINE_AGENT</li> <li>• SIM_MACHINE_AGENT</li> <li>• APM</li> <li>• APP_AGENT</li> <li>• DOT_NET_AGENT</li> </ul>	Yes
<code>id</code>	String	String representing the ID or name.	Yes
<code>version</code>	Integer	Indicates the version number.	Yes
<code>number_of_licenses</code>	Integer	Integer indicating the required number of licenses.	Yes
<code>account_id</code>	String	Provides the account name or account ID.	Yes
<code>access_key</code>	Path	Provides the account access key.	Yes

`LicenseRule` is comprised of `license_module_type`, `id`, `access_key`, `account_id`, `version`, and `number_of_licenses` .

### Example

[Request](#)    [Response](#)

```

curl --user <user>@<AccountName>:<password> -X POST \
 http://<host>:<port>/controller/mds/v1/license/rules \
 -H 'Content-Type: application/json' \

}

```

 The version must be 0 when creating.

### Returns a Summary of All the License Rules for the Current Account

Use this to retrieve a summary of the license rules. The data transfer objects (DTOs) returned will not contain any constraints, match conditions, or entitlements.

#### URL

`http://<host>:<port>/controller/mds/v1/license/rules`

#### Format

GET `/controller/mds/v1/license/rules`

### Example

```
[
 {

### Updates a License Rule

#### URL

`http://<host>:<port>/controller/mds/v1/license/rules`

#### Format

`PUT /controller/mds/v1/license/rules`

#### Input parameters

Parameter Name	Parameter Type	Value	Mandatory
id	String	String representing the ID or name.	Yes

Parameter Name	Parameter Type	Value	Mandatory
license_module_type	String	String representing the type of the license module.  Module types are: <ul style="list-style-type: none"> <li>• NetViz</li> <li>• Machine Agent</li> <li>• SIM Machine Agent</li> <li>• APM</li> </ul>	Yes
version	Integer	Indicates the version number.	Yes
number_of_licenses	Integer	Integer indicating the required number of licenses.	Yes
account_id	String	Provides the account name or account ID.	Yes
access_key	Path	Provides the account access key.	Yes

### Example Request

```
curl -v -X PUT http://<host>:<port>/controller/mds/v1/license/
rules \
--user <user>@<AccountName>:<password> \
-H 'Content-Type: application/json' \
-d '{
 "id": "321116a4-124c-4b73-9343-f315836f103b",
 "version": 0,
 "name": "Default_API",
 "description": null,
 "enabled": true,
 "constraints": [],
 "entitlements": [
 {
 "license_module_type": "JAVA",
 "number_of_licenses": 1000
 },
 {
 "license_module_type": "NATIVE_WEB_SERVER",
 "number_of_licenses": 100
 }
],
}
```

```

 {
 "license_module_type": "NATIVE_SDK",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "DOT_NET",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "NETVIZ",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "MACHINE_AGENT",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "NODEJS",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "SIM_MACHINE_AGENT",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "PHP",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "PYTHON",
 "number_of_licenses": 100
 }
],
 "account_id": "8b1e92f2-387c-45b6-9bb5-ebd7f67587d4",
 "access_key": "api845ad-1f3e-4c9b-909b-a3cfa510bfb0",
 "total_licenses": null,
 "peak_usage": null
}

```

To update the license rules:

1. Get the payload using any of the available `GET` methods.
2. Update `accessKeys` , entitlements, etc.
3. Send the `PUT` request without changing other key-value pairs.
4. " `version` " should be kept as it was during `GET` . This would be incremental.

### Deletes a License Rule

#### URL

`http://<host>:<port>/controller/mds/v1/license/rules/f36e08e2-5f57-4b8c-9ad2-f18873adcd87`

#### Format

`DELETE /controller/mds/v1/license/rules/{id}`

#### Input parameter

Parameter Name	Parameter Type	Value	Mandatory
<code>LicenseRuleId</code>	Path	Deletes license rule by its ID.	Yes

### Retrieve a License Rule by ID

Use this to retrieve a license rule by the license rule ID.

#### URL

`http://<host>:<port>/mds/v1/license/rules/f36e08e2-5f57-4b8c-9ad2-f18873adcd87`

#### Format

`GET /mds/v1/license/rules/{licenseRuleId}`

#### Path Parameter

Parameter Name	Parameter Type	Value	Mandatory
<code>licenseRuleId</code>	Path	Retrieves the UUID of the license rule.	Yes

#### Output Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>id</code>	String	String representing the ID or name.	Yes

Parameter Name	Parameter Type	Value	Mandatory
version	Integer	Indicates the version number.	Yes
total_licenses	Integer	Integer indicating the total number of licenses.	Yes
account_id	String	Provides the account name or account ID.	Yes
access_key	path	Provides the account access key.	Yes

### Example

[Request](#)   [Response](#)

```
curl -X GET --user <user>@<AccountName>:<password> http://
<host>:<port>/controller/mds/v1/license/rules/
091116a4-124c-4b73-9343-f315836f103b
```

[Request](#)   [Response](#)

```
{
 "id": "091116a4-124c-4b73-9343-f315836f103b",
 "version": 0,
 "name": "Default",
 "description": null,
 "enabled": true,
 "constraints": [],
 "entitlements": [
 {
 "license_module_type": "JAVA",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "NATIVE_WEB_SERVER",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "NATIVE_SDK",
 "number_of_licenses": 100
 }
]
}
```

```

 },
 {
 "license_module_type": "DOT_NET",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "NETVIZ",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "MACHINE_AGENT",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "NODEJS",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "SIM_MACHINE_AGENT",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "PHP",
 "number_of_licenses": 100
 },
 {
 "license_module_type": "PYTHON",
 "number_of_licenses": 100
 }
],
 "account_id": "8b1e92f2-387c-45b6-9bb5-ebd7f67587d4",
 "access_key": "bd3845ad-1f3e-4c9b-909b-a3cfa510bfb0",
 "total_licenses": null,
 "peak_usage": null
}

```

The "version" gets updated after every update from UI or API.

### Retrieves a License Rule by Access Key

#### URL

`http://<host>:<port>/controller/mds/v1/license/rules/accessKey/account-accesskey-123`

#### Format

`GET /controller/mds/v1/license/rules/accessKey/{accessKey}`

### Path Parameter

Parameter Name	Parameter Type	Value	Mandatory
access_key	Path	Retrieves the access key assigned to the license rule.	Yes

### Output Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	String	String representing the ID or name.	Yes
version	Integer	Indicates the version number.	Yes
total_licenses	Integer	Integer indicating the total number of licenses.	Yes
account_id	String	Provides the account name or account ID.	Yes

### Example

[Request](#) [Response](#)

```
curl -X GET --user <user>@<AccountName>:<password> http://<host>:<port>/controller/mds/v1/license/rules
```

[Request](#) [Response](#)

```
[
 {
 "id": "221116a4-124c-4b73-9343-f315836f103b",
 "version": 0,
 "name": "Default",
 "description": null,
 "enabled": true,
 "constraints": [],
 "entitlements": [],
 "account_id": "8b1e92f2-387c-45b6-9bb5-ebd7f67587d4",
```

```

 "access_key": "bd3845ad-1f3e-4c9b-909b-a3cfa510bfb0",
 "total_licenses": 1000,
 "peak_usage": null
 },
 {
 "id": "321116a4-124c-4b73-9343-f315836f103b",
 "version": 0,
 "name": "Custom1",
 "description": null,
 "enabled": true,
 "constraints": [],
 "entitlements": [],
 "account_id": "8b1e92f2-387c-45b6-9bb5-ebd7f67587d4",
 "access_key": "api845ad-1f3e-4c9b-909b-a3cfa510bfb0",
 "total_licenses": 1000,
 "peak_usage": null
 }
]

```

## Retrieve a License Rule by Name

### URL

`http://<host>:<port>/controller/mds/v1/license/rules/name/Default`

### Format

`GET /controller/mds/v1/license/rules/name/{name}`

### Path Parameter

Parameter Name	Parameter Type	Value	Mandatory
name	Path	Retrieves the name of the license rule.	Yes

### Output Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	String	String representing the ID or name.	Yes
version	Integer	Indicates the version number.	Yes
total_licenses	Integer	Integer indicating the total number of licenses.	Yes

Parameter Name	Parameter Type	Value	Mandatory
account_id	String	Provides the account name or account ID.	Yes

### Example

[Request](#) [Response](#)

```
curl -X GET --user <user>@<AccountName>:<password> http://<host>:<port>/controller/mds/v1/license/rules
```

[Request](#) [Response](#)

```
[
 {
 "id": "221116a4-124c-4b73-9343-f315836f103b",
 "version": 0,
 "name": "Default",
 "description": null,
 "enabled": true,
 "constraints": [],
 "entitlements": [],
 "account_id": "8b1e92f2-387c-45b6-9bb5-ebd7f67587d4",
 "access_key": "bd3845ad-1f3e-4c9b-909b-a3cfa510bfb0",
 "total_licenses": 1000,
 "peak_usage": null
 },
 {
 "id": "321116a4-124c-4b73-9343-f315836f103b",
 "version": 0,
 "name": "Custom1",
 "description": null,
 "enabled": true,
 "constraints": [],
 "entitlements": [],
 "account_id": "8b1e92f2-387c-45b6-9bb5-ebd7f67587d4",
 "access_key": "api845ad-1f3e-4c9b-909b-a3cfa510bfb0",
 "total_licenses": 1000,
 "peak_usage": null
 }
]
```

## Synthetic Monitoring API

### Overview of Synthetic Monitoring APIs

This page lists the Synthetic public APIs for Web and API monitoring.

#### Authentication

To invoke the REST APIs, you must use basic HTTP authentication and provide these credentials:

**Username:** EUM account username

**Password:** License key

#### Servers

Cloud	URL
Oregon	<a href="https://api.eum-appdynamics.com">https://api.eum-appdynamics.com</a>

Cloud	URL
Frankfurt	<a href="https://fra-api.eum-appdynamics.com">https://fra-api.eum-appdynamics.com</a>
Sydney	<a href="https://syd-api.eum-appdynamics.com">https://syd-api.eum-appdynamics.com</a>
Bombay	<a href="https://bom-api.eum-appdynamics.com">https://bom-api.eum-appdynamics.com</a>
London	<a href="https://lon-api.eum-appdynamics.com">https://lon-api.eum-appdynamics.com</a>
Hong Kong	<a href="https://hkg-api.eum-appdynamics.com">https://hkg-api.eum-appdynamics.com</a>
Sao Paulo	<a href="https://gru-api.eum-appdynamics.com">https://gru-api.eum-appdynamics.com</a>
Cape Town	<a href="https://cpt-api.eum-appdynamics.com">https://cpt-api.eum-appdynamics.com</a>
Singapore	<a href="https://sin-api.eum-appdynamics.com">https://sin-api.eum-appdynamics.com</a>

### Synthetic Web Monitoring APIs

### Create Synthetic Web Monitoring Job API

This page describes the API used to create and configure a Synthetic web monitoring job.

#### Create a Synthetic Job

Creates a new Synthetic web monitoring job with the specified JSON payload.

#### Resource URL

POST `/v1/synthetic/schedule`

#### Request/Response Format

JSON

#### Example

Request    Response

```
{
 "scheduleRunConfigs": [
 {
 "rate": {
 "value": 15,
 "unit": "MINUTES"
 },

### Request Parameters

Parameter Name	Parameter Type	Value	Description	Mandatory Request
scheduleRunConfigs	-			No
rate	-			No
value	number	Minutes: 1 - 60 Hours: 1 - 24 Days: "null"		No
unit	String	Minutes, Hours, or Days		No
daysOfWeek	String	"SUN", "MON", "TUES", "WED", "THUR", "FRI", "SAT"		No
timeRange	String		Between hh:mm AM/PM to hh:mm AM/PM	No
timezone	String	"UTC"	GMT +/-hh:mm	No
startTime	String		dd/mm/yyyy hh:mm AM/PM	No
endTime	String		dd/mm/yyyy hh:mm AM/PM	No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
description	String	Job name	Name of the job	Yes
appKey	String	Application key	You can get the application key from the Controller.  Navigate to <b>User Experience &gt; Browser Apps</b> . The application key is listed next to the application name.	Yes
url	String	"null" or URL to monitor	The URL that you want to monitor.  When you use this parameter, the value of the <code>script</code> parameter must be null.	Yes
script	String	"null" or python-based selenium script to monitor	If you have a scripted job, specify the python-based selenium script used for simulating the user flow or behavior.  When you use this parameter, the value of the <code>url</code> parameter must be null.	Yes

Parameter Name	Parameter Type	Value	Description	Mandatory Request
contentType	String	"null" or "INLINE_PYTHON_3"	If the url value is not null (URL job), the content type is null  If the script value is not null (script job), the content type is "INLINE_PYTHON_3"	Yes
script	String	"null" or Python script	Python-based selenium script for the scripted jobs	Yes
credentialPlaceholders	String			
apiMetadata	String	Script object of the web monitoring job		No
browserCodes	String	Use the following Synthetic internal browser codes: <ul style="list-style-type: none"> <li>• Chrome: Chrome</li> <li>• Internet Explorer: IE11</li> <li>• Firefox: Firefox</li> <li>• Mobile: Chrome.DeviceEmulation</li> </ul>		Yes
chromeVersions	String	Chrome browser version 86		Yes
locationCodes	String	Synthetic internal location codes of each agent location. See <a href="#">Location Codes</a> .		Yes
captureVisualMetrics	Boolean	true or false		No
simulateMobileBrowser	Boolean	true or false		No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
networkProfile	String		"name": "Native", "downloadKbps": 5000, "uploadKbps": 1000, "roundtripTimeMillis": 28, "packetLossPercent": 0, "isDefault": false	No
name	String	Custom, Pixel, iPad, iPhone SE	Name of the device	No
description	String	If the name is Custom: User agent If the name field is not Custom: "null"	Mozilla/5.0 (Linux; Android 7.0; SAMSUNG SM-G950F Build/NRD90M) AppleWebKit/537.36 (KHTML, like Gecko) SamsungBrowser/5.2 Chrome/51.0.2704.106 Mobile Safari/537.36	No
downloadKbps	Number	Number	Download bandwidth in kbps	No
uploadKbps	Number	Number	Upload bandwidth in kbps	No
roundtripTimeMillis	Number	Number	Latency in milliseconds	No
packetLossPercent	Number	0 - 100	Packet loss percentage	No
isDefault	Boolean	true or false		No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
timeoutSeconds	Number	5 - 300	Seconds	No
performanceCriteria	-			No
retestOnWarning	Boolean	true or false	Re-test on warning event	No
retestOnCritical	Boolean	true or false	Re-test on critical event	No
criterion	String			No
composableConfig	-		You can use this parameter to configure: <ul style="list-style-type: none"> <li>• Custom Retry</li> <li>• Availability Rules</li> </ul>	No
numBeforeConfirmedError	Number	0, 1, 2, 3, 5, or 10	Number of retries	No
resourceErrorDetection	-			No
ignoreWhen	-			No
resourceUrlContains	String	Comma separated list	List of resource URLs	No
resourceMimeType	String			No
onlyWhen	-			No
resourceUrlContains	String	Comma separated list	List of resource URLs	No
resourceMimeType	String			No

### Location Codes

Cloud Location	Codes
<b>Azure</b>	
Amsterdam	NET
San Antonio	SAN
Melbourne	ASV
Toronto	CAC
Chennai	SIC
<b>AWS</b>	
Mumbai	BOM
Cape Town	CPT
Dublin	DUB
Frankfurt	FRA
Sao Paulo	GRU
Hong Kong	HON
Ashburn	IAD
Seoul	ICN
London	LON
Boardman	M50
Milan	MIL
Montreal	MON
Tokyo	NRT
Paris	PAR

Cloud Location	Codes
San Francisco	SFO
Singapore	SIN
Sydney	SYD

### Response Status Codes

Code	Description
200	Success
401	Unauthorized
402	Exceeded job limit
422	Validation failure
429	Throttled
500	Internal server error

## Create Multiple Synthetic Web Monitoring Jobs API

This page describes the API used to create multiple Synthetic web monitoring jobs using a single API request.

### Create Multiple Synthetic Jobs

Creates multiple Synthetic jobs with the specified JSON payload.

### Resource URL

POST /v1/synthetic/schedule/batch

### Request/Response Format

JSON

### Example

[Request](#) [Response](#)

```
{
 "schedules": [
 {

```

### Request Parameters

Parameter Name	Parameter Type	Value	Description	Mandatory Request
scheduleRunConfigs	-			No
rate	-			No
value	number	Minutes: 1 - 60 Hours: 1 - 24 Days: "null"		No
unit	String	Minutes, Hours, or Days		No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
daysOfWeek	String	"SUN", "MON", "TUES", "WED", "THUR", "FRI", "SAT"		No
timeRange	String		Between hh:mm AM/PM to hh:mm AM/PM	No
timezone	String	"UTC"	GMT +/-hh:mm	No
startTime	String		dd/mm/yyyy hh:mm AM/PM	No
endTime	String		dd/mm/yyyy hh:mm AM/PM	No
description	String	Job name	Name of the job	Yes
appKey	String	Application key	<p>You can get the application key from the Controller.</p> <p>Navigate to <b>User Experience &gt; Browser Apps</b>. The application key is listed next to the application name.</p>	Yes
url	String	"null" or URL to monitor	<p>The URL that you want to monitor.</p> <p>When you use this parameter, the value of the <code>script</code> parameter must be null.</p>	Yes

Parameter Name	Parameter Type	Value	Description	Mandatory Request
script	String	"null" or python-based selenium script to monitor	<p>If you have a scripted job, specify the python-based selenium script used for simulating the user flow or behavior.</p> <p>When you use this parameter, the value of the url parameter must be null.</p>	Yes
contentType	String	"null" or "INLINE_PYTHON_3"	<p>If the url value is not null (URL job), the content type is null</p> <p>If the script value is not null (script job), the content type is "INLINE_PYTHON_3"</p>	Yes
script	String	"null" or Python script	Python-based selenium script for the scripted jobs	Yes
credentialPlaceholders	String			Yes
apiMetadata	String	Script object of the web monitoring job		No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
browserCodes	String	Use the following Synthetic internal browser codes: <ul style="list-style-type: none"> <li>• Chrome: Chrome</li> <li>• Internet Explorer: IE11</li> <li>• Firefox: Firefox</li> <li>• Mobile: Chrome.DeviceEmulation</li> </ul>		Yes
chromeVersions	String	Chrome browser version 86		Yes
locationCodes	String	Synthetic internal location codes of each agent location. See <a href="#">Location Codes</a> .		Yes
captureVisualMetrics	Boolean	true or false		No
simulateMobileBrowser	Boolean	true or false		No
networkProfile	String		<pre>"name": "Native", "downloadKbps": 5000, "uploadKbps": 1000, "roundtripTimeMill is": 28, "packetLossPerce nt": 0, "isDefault": false</pre>	No
name	String	Custom, Pixel, iPad, iPhone SE	Name of the device	No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
description	String	If the name is Custom: <code>User agent</code> If the name field is not Custom: <code>"null"</code>	Mozilla/5.0 (Linux; Android 7.0; SAMSUNG SM-G950F Build/NRD90M) AppleWebKit/537.36 (KHTML, like Gecko) SamsungBrowser/5.2 Chrome/51.0.2704.106 Mobile Safari/537.36	No
downloadKbps	Number	Number	Download bandwidth in kbps	No
uploadKbps	Number	Number	Upload bandwidth in kbps	No
roundtripTimeMillis	Number	Number	Latency in milliseconds	No
packetLossPercent	Number	0 - 100	Packet loss percentage	No
isDefault	Boolean	<code>true</code> or <code>false</code>		No
timeoutSeconds	Number	5 - 300	Seconds	No
performanceCriteria	-			No
retestOnWarning	Boolean	<code>true</code> or <code>false</code>	Re-test on warning event	No
retestOnCritical	Boolean	<code>true</code> or <code>false</code>	Re-test on critical event	No
criterion	String			No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
composableConfig	-		You can use this parameter to configure: <ul style="list-style-type: none"> <li>• Custom Retry</li> <li>• Availability Rules</li> </ul>	No
numBeforeConfirmedError	Number	0, 1, 2, 3, 5, or 10	Number of retries	No
resourceErrorDetection	-			No
ignoreWhen	-			No
resourceUrlContains	String	Comma separated list	List of resource URLs	No
resourceMimeType	String			No
onlyWhen	-			No
resourceUrlContains	String	Comma separated list	List of resource URLs	No
resourceMimeType	String			No

### Response Status Codes

Code	Description
200	Success
401	Unauthorized
402	Exceeded job limit
422	Validation failure
429	Throttled

Code	Description
500	Internal server error

## Update Synthetic Web Monitoring Job API

This page describes the API used to update the Synthetic web monitoring jobs.

### Update a Synthetic Job

Updates a synthetic job with the specified JSON payload.

### Resource URL

PUT /v1/synthetic/schedule/<id>

### Request/Response Format

JSON

### Example

[Request](#) [Response](#)

```
{

### Enable or Disable a Web Monitoring Job

You can enable or disable a web monitoring job by updating the following values:

Action	Field Name	Value
Enable a web monitoring job	userEnabled	true
Disable a web monitoring job	userEnabled	false

### Request Parameters

Parameter Name	Parameter Type	Value	Description	Mandatory Request
id	String	Job ID of a synthetic job	Unique identifier of a synthetic job. To get the job ID: <ol style="list-style-type: none"> <li>Log in to Controller and navigate to <b>User Experience &gt; Browser Apps &gt; &lt;Application Name&gt; &gt; Jobs</b>.</li> <li>Hover over the job name and click the copy icon to copy the job ID.</li> </ol>	Yes
version	number		Whenever a job is updated, the value of the version increases by a factor of one. A job with "version": 5 indicates that it is created and it is updated four times after that.	No
scheduleRun Configs	-			No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
rate	-			No
value	number	Minutes: 1 - 60 Hours: 1 - 24 Days: "null"		No
unit	String	Minutes, Hours, or Days		No
daysOfWeek	String	"SUN", "MON", "TUES", "WED", "THUR", "FRI", "SAT"		No
timeRange	String		Between hh:mm AM/PM to hh:mm AM/PM	No
timezone	String	"UTC"	GMT +/-hh:mm	No
startTime	String		dd/mm/yyyy hh:mm AM/PM	No
endTime	String		dd/mm/yyyy hh:mm AM/PM	No
userEnabled	Boolean	true or false		No
systemEnabled	Boolean		This field gets disabled when the license exhausts.	No
type	String			No
rate	String			No
value	Number			No
unit	String			No
daysOfWeek	String			No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
timeRange	String			No
timezone	String			No
description	String			No
startTime	String			No
endTime	String			No
appKey	String	Application Key	You can get the application key from the Controller.  Navigate to <b>User Experience &gt; Browser Apps</b> . The application key is listed next to the application name.	No
scheduleMode	String			No
url	String	"null" or URL to monitor	The URL that you want to monitor.  When you use this parameter, the value of the <code>script</code> parameter must be null.	No
script	String	"null" or python-based selenium script to monitor	If you have a scripted job, specify the python-based selenium script used for simulating the user flow or behavior.  When you use this parameter, the value of the <code>url</code> parameter must be null.	No
contentType	String			No
script	String			No
credentialPlaceholders	String			No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
apiMetadata	String	Script object of the web monitoring job		No
browserCodes	String	Use the following Synthetic internal browser codes: <ul style="list-style-type: none"> <li>• Chrome: Chrome</li> <li>• Internet Explorer: IE11</li> <li>• Firefox: Firefox</li> <li>• Mobile: Chrome.DeviceEmulation</li> </ul>		Yes
chromeVersions	String	Chrome browser version 86		Yes
locationCodes	String	Synthetic internal location codes of each agent location. See <a href="#">Location Codes</a> .		Yes
failOnPageError	Boolean			No
captureVisualMetrics	Boolean	true or false		No
simulateMobileBrowser	Boolean	true or false		No
networkProfile	String		"name": "Native", "downloadKbps": 5000, "uploadKbps": 1000, "roundtripTimeMillis": 28, "packetLossPercent": 0, "isDefault": false	No
name	String	Custom, Pixel, iPad, iPhone SE	Name of the device	No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
description	String	If the name is Custom: <code>User agent</code> If the name field is not Custom: <code>"null"</code>	Mozilla/5.0 (Linux; Android 7.0; SAMSUNG SM-G950F Build/NRD90M) AppleWebKit/537.36 (KHTML, like Gecko) SamsungBrowser/5.2 Chrome/51.0.2704.106 Mobile Safari/537.36	No
downloadKbps	Number	Number	Download bandwidth in kbps	No
uploadKbps	Number	Number	Upload bandwidth in kbps	No
roundtripTimeMillis	Number	Number	Latency in milliseconds	No
packetLossPercent	Number	0 - 100	Packet loss percentage	No
isDefault	Boolean	<code>true</code> or <code>false</code>		No
timeoutSeconds	Number	5 - 300	Seconds	No
state	-			No
lastFireTime	String			No
nextFireTime	String			No
projectedUsage	-			No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
projectedDailyRuns	Number			No
projectedMonthlyRuns	Number			No
performanceCriteria	-			No
retestOnWarning	Boolean			No
retestOnCritical	Boolean			No
criterion	String			No
composableConfig	-		You can use this parameter to configure: <ul style="list-style-type: none"> <li>• Custom Retry</li> <li>• Availability Rules</li> </ul>	No
numBeforeConfirmedError	Number	0, 1, 2, 3, 5, or 10	Number of retries	No
resourceErrorDetection	-			No
ignoreWhen	-			No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
resourceUrl Contains	String	Comma separated list	List of resource URLs	No
resourceMimeType	String			No
onlyWhen	-			No
resourceUrl Contains	String	Comma separated list	List of resource URLs	No
resourceMimeType	String			No
created	String			No
updated	String			No

**Response Status Codes**

Code	Description
200	Success
401	Unauthorized
402	Exceeded job limit
422	Validation failure
429	Throttled
500	Internal server error

## Get Synthetic Web Monitoring Job Configuration Data API

This page describes the API used to retrieve the Synthetic web monitoring job configuration data.

### Get Synthetic Job Configuration Data

Fetches the synthetic job configuration details with the specified JSON payload.

#### Resource URL

```
GET /v1/synthetic/schedule/<id>
```

#### Response Format

JSON

#### Example

```
{
 "_id": "job_id",
 "version": 1,
 "scheduleRunConfigs": [
 {
 "rate": {
 "value": 1,
 "unit": "MINUTES"
 },
 "daysOfWeek": [
 "WED",
 "FRI",
 "SUN",
 "SAT",
 "TUES",
 "MON",
 "THUR"
],
 "timezone": "UTC"
 }
],
 "userEnabled": true,
 "systemEnabled": true,
 "type": "ALL_BROWSERS",
 "rate": {
 "value": 15,
 "unit": "MINUTES"
 },
 "daysOfWeek": [
 "WED",
 "FRI",
 "SUN",
 "SAT",
 "TUES",
 "MON",
 "THUR"
],
}
```

```

"timezone": "UTC",
"description": "https://appdynamics.com",
"appKey": "appKey",
"scheduleMode": "NONE",
"url": "https://appdynamics.com",

```

### Request Parameter

Parameter Name	Parameter Type	Value	Description	Mandatory Request
id	String	Job ID of a synthetic job	Unique identifier of a synthetic job. To get the job ID: <ol style="list-style-type: none"> <li>1. Log in to Controller and navigate to <b>User Experience &gt; Browser Apps &gt; &lt;Application Name&gt; &gt; Jobs</b>.</li> <li>2. Hover over the job name and click the copy icon to copy the job ID.</li> </ol>	Yes

### Response Status Code

Status Code	Description
200	Success
401	Unauthorized
404	Not found
429	Throttled
500	Internal server error

### Get All Synthetic Web Monitoring Jobs API

This page describes the API used to get the configuration data of all Synthetic web monitoring jobs.

#### Search a Synthetic Job

Searches a synthetic job with the specified JSON payload.

#### Resource URL

GET `/v1/synthetic/schedule`

#### Response Format

## JSON

### Example

```

{

```

### Request Parameters

Parameter Name	Parameter Type	Value	Description	Mandatory Request
appKey	Query	Application key	Retrieve the web monitoring jobs of a particular application.	No
description	Query	Job name	<p>Search jobs using the job name.</p> <p>This parameter retrieves all jobs if:</p> <ul style="list-style-type: none"> <li>the job name is equal to the string</li> </ul> <p>Or,</p> <ul style="list-style-type: none"> <li>the job name contains a substring equal to the string</li> </ul> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p> All string matching operations are case-insensitive.</p> </div>	No
location	Query	Synthetic internal location codes of each agent location	<p>Retrieve the web monitoring jobs scheduled only for the specified locations.</p> <p>You can specify this parameter multiple times to filter jobs for multiple locations.</p>	No
browser	Query	Synthetic internal browser code	<p>Retrieve the web monitoring jobs scheduled only for the specified browser.</p> <p>You can specify this parameter multiple times to filter jobs for multiple browsers.</p>	No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
max	Query	An integer between 1 and 100	<p>You can use this parameter to view the result in a paginated format.</p> <p>The maximum number of results displayed on a page is equal to the value of this parameter.</p> <p>If there are further results, a <code>_next</code> cursor is present in the response. Use this value used to retrieve the next set of results.</p>	No
cursor	Query	The value of the <code>_next</code> parameter returned in the previous response	<p>You can use this parameter only if the <code>max</code> parameter is used.</p> <p>If you view the result in a paginated format, and if the results exceed a single page, then the value of the <code>_next</code> parameter in the previous response is used in the next request.</p>	No

#### Response Status Codes

Code	Description
200	Success
401	Unauthorized
429	Throttled
500	Internal server error

#### Get Synthetic Web Monitoring Job Execution Status API

This page describes the API used to get the Synthetic web monitoring job execution status.

#### Resource URL

GET `/v1/synthetic/schedule/<id>/sessions`

Example request:

```
{{eum_api}}/v1/synthetic/schedule/synthetic-job-schedule-id/sessions?max=20&startTime=1649331373
```

## Response Body

The response contains a list of sessions after the `startTime` that have timestamp and status details.

Example response:

```
{
 "_first": null,
 "_previous": null,
 "_next": "1648620679",
 "_last": null,
 "items": [
 {
 "status": "OK",
 "startTime": 1648620679,
 "failureType": "None"
 },
 {
 "status": "422",
 "startTime": 1648620679,
 "failureType": "None"
 }
]
}
```

If the `_next` parameter in the response is not null, it signifies that the result is paginated and there could be more results.

To retrieve further results, use the value of `_next` as the `startTime` of the next request. Repeat this step until the value of the `_next` parameter is null.

## Request Parameters

Parameter Name	Parameter Type	Value	Description	Mandatory Request
<code>id</code>	Path	Path of the unique identifier of a synthetic job	Unique identifier of a synthetic job	Yes
<code>max</code>	Query	Must be between 1 - 20	Pagination parameter	Yes
<code>startTime</code>	Query	Epoch time in seconds, starting time from where you need to get the sessions	Pagination parameter	Yes

Parameter Name	Parameter Type	Value	Description	Mandatory Request
endTime	Query	Epoch time in seconds, the time till when we want to get the session.	If this value is not specified, the current timestamp is used. This provides the details of the sessions from startTime to the current time.	No

 You can use this [tool](#) to convert GMT/IST times to epoch times.

### Response Status Code

Status Code	Description
200	Success
401	Unauthorized
429	Throttled
500	Internal server error

### Create Synthetic API Monitoring Job API

This page describes the API used to create and configure a Synthetic API monitoring job.

#### Create an API Monitoring Job

Creates a new API monitoring job with the specified JSON payload.

#### Resource URL

POST /v1/synthetic/api/schedule

#### Request/Response Format

JSON

#### Example

## Request Parameters

Parameter Name	Parameter Type	Value	Description	Mandatory Request
<code>scheduleRunConfigs</code>	-			No
<code>rate</code>	-			No
<code>value</code>	number	Minutes: 1 - 60 Hours: 1 - 24 Days: "null"		No
<code>unit</code>	String	Minutes, Hours, or Days		No
<code>daysOfWeek</code>	String	"SUN", "MON", "TUES", "WED", "THUR", "FRI", "SAT"		No
<code>timeRange</code>	String		Between hh:mm AM/PM to hh:mm AM/PM	No
<code>timezone</code>	String	"UTC"	GMT +/-hh:mm	No
<code>startTimeMillis</code>	String			No
<code>endTimeMillis</code>	String			No
<code>description</code>	String	Job name	Name of the job	Yes
<code>url</code>	String	"null" or URL to monitor	The URL that you want to monitor.  When you use this parameter, the value of the <code>script</code> parameter must be null.	No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
script	String	"null" or python-based selenium script to monitor	If you have a scripted job, specify the python-based selenium script used for simulating the user flow or behavior.  When you use this parameter, the value of the url parameter must be null.	No
apiMetadata	String	Script object of the API monitoring job		Yes
contentType	String			Yes
script	String			Yes
browserCodes	String	Use the following Synthetic internal browser codes: <ul style="list-style-type: none"> <li>• Chrome: Chrome</li> <li>• Internet Explorer: IE11</li> <li>• Firefox: Firefox</li> <li>• Mobile: Chrome.DeviceEmulation</li> </ul>		No
chromeVersions	String	Chrome browser version 86		No
locationCodes	String	Synthetic internal location codes of each agent location. See <a href="#">Location Codes</a> .		Yes
timeoutSeconds	Number			No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
appKey	String	Application Key	You can get the application key from the Controller.  1. Navigate to <b>User Experience &gt; API Monitoring</b> . 2. Hover over the collection name and click the copy icon to copy the Collection Key. The Collection Key is the Application Key.	Yes
networkProfile	String		"name": "Native", "downloadKbps": 5000, "uploadKbps": 1000, "roundtripTimeMillis": 28, "packetLossPercent": 0, "isDefault": false	No
composableConfig	-		You can use this parameter to configure: <ul style="list-style-type: none"> <li>• Custom Retry</li> <li>• Availability Rules</li> </ul>	No
numBeforeConfirmedError	Number	0, 1, 2, 3, 5, or 10	Number of retries	No
resourceErrorDetection	-			No
ignoreWhen	-			No
resourceUrlContains	String	Comma separated list	List of resource URLs	No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
resourceMimeType	String			No
onlyWhen	-			No
resourceUrlContains	String	Comma separated list	List of resource URLs	No
resourceMimeType	String			No
deviceEmulationProfile	String			No
requestHeader	String			No
performanceCriteria	-			No
retestOnWarning	Boolean	true or false	Re-test on warning event	No
retestOnCritical	Boolean	true or false	Re-test on critical event	No
warningCriterion	String			No
criticalCriterion	String			No

#### Location Codes

Cloud Location	Codes
<b>Azure</b>	
Amsterdam	NET
San Antonio	SAN
Melbourne	ASV

Cloud Location	Codes
Toronto	CAC
Chennai	SIC
<b>AWS</b>	
Mumbai	BOM
Cape Town	CPT
Dublin	DUB
Frankfurt	FRA
Sao Paulo	GRU
Hong Kong	HON
Ashburn	IAD
Seoul	ICN
London	LON
Boardman	M50
Milan	MIL
Montreal	MON
Tokyo	NRT
Paris	PAR
San Francisco	SFO
Singapore	SIN
Sydney	SYD

### Response Status Codes

Code	Description
200	Success
401	Unauthorized
402	Exceeded job limit
422	Validation failure
429	Throttled
500	Internal server error

## Create Multiple Synthetic API Monitoring Jobs API

This page describes the API used to create multiple Synthetic API monitoring jobs using a single API request.

### Create Multiple API Monitoring Jobs

Creates multiple API monitoring jobs with the specified JSON payload.

#### Resource URL

POST /v1/synthetic/api/schedule/batch

#### Request/Response Format

JSON

#### Example

[Request](#) [Response](#)

```

{
 "schedules": [
 {
 "scheduleRunConfigs": [
 {
 "rate": {
 "value": 15,
 "unit": "MINUTES"
 },
 "daysOfWeek": [
 "SUN",
 "WED",
 "THUR",
 "FRI",
 "MON",
]
 }
]
 }
]
}

```

```

 "TUES",
 "SAT"
],

### Request Parameters

Parameter Name	Parameter Type	Value	Description	Mandatory Request
scheduleRunConfigs	-			No
rate	-			No
value	number	Minutes: 1 - 60 Hours: 1 - 24 Days: "null"		No
unit	String	Minutes, Hours, or Days		No
daysOfWeek	String	"SUN", "MON", "TUES", "WED", "THUR", "FRI", "SAT"		No
timeRange	String		Between hh:mm AM/PM to hh:mm AM/PM	No
timezone	String	"UTC"	GMT +/-hh:mm	No
startTime	String		dd/mm/yyyy hh:mm AM/PM	No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
endTime	String		dd/mm/yyyy hh:mm AM/PM	No
description	String	Job name	Name of the job	Yes
url	String	"null" or URL to monitor	The URL that you want to monitor.  When you use this parameter, the value of the script parameter must be null.	No
script	String	"null" or python-based selenium script to monitor	If you have a scripted job, specify the python-based selenium script used for simulating the user flow or behavior.  When you use this parameter, the value of the url parameter must be null.	No
apiMetadata	String	Script object of the web monitoring job		Yes
contentType	String			Yes
script	String			Yes

Parameter Name	Parameter Type	Value	Description	Mandatory Request
browserCodes	String	Use the following Synthetic internal browser codes: <ul style="list-style-type: none"> <li>• Chrome: Chrome</li> <li>• Internet Explorer: IE11</li> <li>• Firefox: Firefox</li> <li>• Mobile: Chrome.DeviceEmulation</li> </ul>		No
chromeVersions	String	Chrome browser version 86		No
locationCodes	String	Synthetic internal location codes of each agent location. See <a href="#">Location Codes</a> .		Yes
timeoutSeconds	Number			No
appKey	String	Application key	<p>You can get the application key from the Controller.</p> <ol style="list-style-type: none"> <li>1. Navigate to <b>User Experience &gt; API Monitoring</b>.</li> <li>2. Hover over the collection name and click the copy icon to copy the Collection Key. The Collection Key is the Application Key.</li> </ol>	Yes

Parameter Name	Parameter Type	Value	Description	Mandatory Request
networkProfile	String		"name": "Native", "downloadKbps": 5000, "uploadKbps": 1000, "roundtripTimeMillis": 28, "packetLossPercent": 0, "isDefault": false	No
composableConfig	-		You can use this parameter to configure: <ul style="list-style-type: none"> <li>• Custom Retry</li> <li>• Availability Rules</li> </ul>	No
numBeforeConfirmedError	Number	0, 1, 2, 3, 5, or 10	Number of retries	No
resourceErrorDetection	-			No
ignoreWhen	-			No
resourceUrlContains	String	Comma separated list	List of resource URLs	No
resourceMimeType	String			No
onlyWhen	-			No
resourceUrlContains	String	Comma separated list	List of resource URLs	No
resourceMimeType	String			No
deviceEmulationProfile	String			No
requestHeader	String			No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
performanceCriteria	-			No
retestOnWarning	Boolean	true or false	Re-test on warning event	No
retestOnCritical	Boolean	true or false	Re-test on critical event	No
warningCriterion	String			No
criticalCriterion	String			No

### Response Status Codes

Code	Description
200	Success
401	Unauthorized
402	Exceeded job limit
422	Validation failure
429	Throttled
500	Internal server error

### Update Synthetic API Monitoring Job API

This page describes the API used to update the Synthetic API monitoring jobs.

#### Update an API Monitoring Job

Updates an API monitoring job with the specified JSON payload.

#### Resource URL

```
PUT /v1/synthetic/api/schedule/<id>
```

#### Request/Response Format

JSON

#### Example

Request    Response

```

## Enable or Disable an API Monitoring Job

You can enable or disable an API monitoring job by updating the following values:

Action	Field Name	Value
Enable an API monitoring job	userEnabled	true
Disable an API monitoring job	userEnabled	false

**Response Parameter**

Parameter Name	Parameter Type	Value	Description	Mandatory Request
id	String	Job ID of an API monitoring job	Unique identifier of an API monitoring job.  To get the job ID: <ol style="list-style-type: none"> <li>Log in to Controller and navigate to <b>User Experience &gt; API Monitoring &gt; &lt;Collection Name&gt; &gt; Jobs</b>.</li> <li>Hover over the job name and click the copy icon to copy the job or schedule ID.</li> </ol>	Yes
version	number		Whenever a job is updated, the value of the version increases by a factor of one.  A job with "version": 5 indicates that it is created and it is updated four times after that.	No
scheduleRun Configs	-			No
rate	-			No
value	number	Minutes: 1 - 60 Hours: 1 - 24 Days: "null"		No
unit	String	Minutes, Hours, or Days		No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
daysOfWeek	String	"SUN", "MON", "TUES", "WED", "THUR", "FRI", "SAT"		No
timeRange	String		Between hh:mm AM/PM to hh:mm AM/PM	No
timezone	String	"UTC"	GMT +/-hh:mm	No
startTime	String		dd/mm/yyyy hh:mm AM/PM	No
endTime	String		dd/mm/yyyy hh:mm AM/PM	No
userEnabled	Boolean	true or false		No
systemEnabled	Boolean		This field gets disabled when the license exhausts.	No
type	String			No
rate	String			No
value	Number			No
unit	String			No
daysOfWeek	String			No
timeRange	String			No
timezone	String			No
description	String			No
startTime	String			No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
endTime	String			No
appKey	String	Application Key	<p>You can get the application key from the Controller.</p> <ol style="list-style-type: none"> <li>1. Navigate to <b>User Experience &gt; API Monitoring</b>.</li> <li>2. Hover over the collection name and click the copy icon to copy the Collection Key. The Collection Key is the Application Key.</li> </ol>	No
scheduleMode	String			No
url	String	"null" or URL to monitor	<p>The URL that you want to monitor.</p> <p>When you use this parameter, the value of the <code>script</code> parameter must be null.</p>	No
script	String	"null" or python-based selenium script to monitor	<p>If you have a scripted job, specify the python-based selenium script used for simulating the user flow or behavior.</p> <p>When you use this parameter, the value of the <code>url</code> parameter must be null.</p>	No
contentType	String	"null" or "INLINE_PYTHON_3"	<p>If the <code>url</code> value is not null (URL job), the content type is null</p> <p>If the <code>script</code> value is not null (script job), the content type is "INLINE_PYTHON_3"</p>	No
script	String	"null" or Python script	Python-based selenium script for the scripted jobs	No
credentialPlaceholders	String			No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
apiMetadata	String	Script object of the web monitoring job		No
browserCodes	String	Use the following Synthetic internal browser codes: <ul style="list-style-type: none"> <li>• Chrome: Chrome</li> <li>• Internet Explorer: IE11</li> <li>• Firefox: Firefox</li> <li>• Mobile: Chrome.DeviceEmulation</li> </ul>		Yes
chromeVersions	String	Chrome browser version 86		Yes
locationCodes	String	Synthetic internal location codes of each agent location. See <a href="#">Location Codes</a> .		Yes
failOnPageError	Boolean			No
captureVisualMetrics	Boolean	true or false		No
simulateMobileBrowser	Boolean	true or false		No
networkProfile	String		"name": "Native", "downloadKbps": 5000, "uploadKbps": 1000, "roundtripTimeMillis": 28, "packetLossPercent": 0, "isDefault": false	No
name	String	Custom, Pixel, iPad, iPhone SE	Name of the device	No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
description	String	If the name is Custom: <code>User agent</code> If the name field is not Custom: <code>"null"</code>	Mozilla/5.0 (Linux; Android 7.0; SAMSUNG SM-G950F Build/NRD90M) AppleWebKit/537.36 (KHTML, like Gecko) SamsungBrowser/5.2 Chrome/51.0.2704.106 Mobile Safari/537.36	No
downloadKbps	Number	Number	Download bandwidth in kbps	No
uploadKbps	Number	Number	Upload bandwidth in kbps	No
roundtripTimeMillis	Number	Number	Latency in milliseconds	No
packetLossPercent	Number	0 - 100	Packet loss percentage	No
isDefault	Boolean	<code>true</code> or <code>false</code>		No
timeoutSeconds	Number	5 - 300	Seconds	No
state	-			No
lastFireTime	String			No
nextFireTime	String			No
projectedUsage	-			No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
projectedDailyRuns	Number			No
projectedMonthlyRuns	Number			No
performanceCriteria	-			No
retestOnWarning	Boolean	true or false	Re-test on warning event	No
retestOnCritical	Boolean	true or false	Re-test on critical event	No
criterion	String			No
composableConfig	-		You can use this parameter to configure: <ul style="list-style-type: none"> <li>• Custom Retry</li> <li>• Availability Rules</li> </ul>	No
numBeforeConfirmedError	Number	0, 1, 2, 3, 5, or 10	Number of retries	No
resourceErrorDetection	-			No
ignoreWhen	-			No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
resourceUrl Contains	String	Comma separated list	List of resource URLs	No
resourceMim eType	String			No
onlyWhen	-			No
resourceUrl Contains	String	Comma separated list	List of resource URLs	No
resourceMim eType	String			No
created	String			No
updated	String			No

**Response Status Codes**

Code	Description
200	Success
401	Unauthorized
402	Exceeded job limit
422	Validation failure
429	Throttled
500	Internal server error

## Get Synthetic API Monitoring Job Configuration Data API

This page describes the API used to retrieve the Synthetic API monitoring job configuration data.

### Get Synthetic API Monitoring Job Configuration Data

Fetches the synthetic API monitoring job configuration details with the specified JSON payload.

#### Resource URL

```
GET /v1/synthetic/api/schedule/<id>
```

#### Response Format

JSON

#### Example

```
{

**Request Parameters**

Parameter Name	Parameter Type	Value	Description	Mandatory Request
appKey	Query	Application key	Retrieve the API monitoring jobs of a particular application.	No
description	Query	Job name	<p>Search jobs using the job name.</p> <p>This parameter retrieves all jobs if:</p> <ul style="list-style-type: none"> <li>the job name is equal to the string</li> </ul> <p>Or,</p> <ul style="list-style-type: none"> <li>the job name contains a substring equal to the string</li> </ul> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p> All string matching operations are case-insensitive.</p> </div>	No
location	Query	Synthetic internal location codes of each agent location	<p>Retrieve the web monitoring jobs scheduled only for the specified locations.</p> <p>You can specify this parameter multiple times to filter jobs for multiple locations.</p>	No
max	Query	An integer between 1 and 100	<p>You can use this parameter to view the result in a paginated format.</p> <p>The maximum number of results displayed on a page is equal to the value of this parameter.</p> <p>If there are further results, a <code>_next</code> cursor is present in the response. Use this value used to retrieve the next set of results.</p>	No

Parameter Name	Parameter Type	Value	Description	Mandatory Request
cursor	Query	The value of the <code>_next</code> parameter returned in the previous response	You can use this parameter only if the <code>max</code> parameter is used.  If you view the result in a paginated format, and if the results exceed a single page, then the value of the <code>_next</code> parameter in the previous response is used in the next request.	No

### Response Status Codes

Code	Description
200	Success
401	Unauthorized
429	Throttled
500	Internal server error

### Get API Monitoring Job Execution Status API

This page describes the API used to get the Synthetic API monitoring job execution status.

#### Resource URL

GET `/v1/synthetic/api/schedule/<id>/sessions`

Example request:

```
{{eum_api}}/v1/synthetic/api/schedule/a9bd504a-8588-4ce0-be4a-6e214a36afe9/sessions?max=2&startTime=1649245800
```

#### Response Body

The response contains a list of sessions after the `startTime` that have timestamp and status details.

Example response:

```
{
 "_next": "1648620679523",
 "items": [
 {
 "status": "OK",
 "startTimeMS": 1648620679152,
 }
]
}
```

```

 "sessionError": "None"
 },
 {
 "status": "422",
 "startTimeMS": 1648620679523,
 "sessionError": "None"
 }
]
}

```

 If the `_next` parameter in the response is not null, it signifies that the result is paginated and there could be more results. To retrieve further results, use the value of `_next` as the `startTime` of the next request. Repeat this step until the value of the `_next` parameter is null.

### Request Parameters

Parameter Name	Parameter Type	Value	Description	Mandatory Request
<code>id</code>	Path	Path of the unique identifier of a synthetic job	Unique identifier of a synthetic job	Yes
<code>max</code>	Query	Must be between 1 - 20	Pagination parameter	Yes
<code>startTime</code>	Query	Epoch time in seconds, starting time from where you need to get the sessions	Pagination parameter	Yes
<code>endTime</code>	Query	Epoch time in seconds, the time till when we want to get the session.	If this value is not specified, the current timestamp is used. This provides the details of the sessions from <code>startTime</code> to the current time.	No

 You can use this [tool](#) to convert GMT/IST times to epoch times.

### Response Status Code

Status Code	Description
200	Success

Status Code	Description
401	Unauthorized
429	Throttled
500	Internal server error

## Integration Modules

### Related pages:

- [AppDynamics Exchange](#)

The [AppDynamics Community Exchange](#) includes many extensions that supplement the capabilities of AppDynamics SaaS. Documentation on setting up and using the integration module appears with the module.

Some integrations listed here do not display on the Controller UI Integrations page. This is because not all integrations require configuration at the Controller (e.g., Rookout, Apica) level or they can only be configured at the underlying [Glassfish Admin Console](#) level (e.g., DB CAM).

The following integration modules are built into the AppDynamics platform and described on the pages linked here.

Integration Module	More information
Apica	<a href="#">Apica &amp; AppDynamics</a>
AppDynamics for Databases	<a href="#">Integrate AppDynamics for Databases with AppDynamics Pro 3.7 and higher</a>
Agent Command Center	<a href="#">Integrate the Agent Command Center</a>
Cisco® Application Centric Infrastructure (Cisco ACI™)	<a href="#">Integrate AppDynamics with Cisco ACI™</a>
Compuware Strobe	<a href="#">Integrate AppDynamics with Compuware Strobe</a>
DB CAM	<a href="#">Integrate AppDynamics with DB CAM</a>
JIRA Actions	<a href="#">Integrate AppDynamics with Atlassian Jira™</a>
Log Auto-Discovery Extension	<a href="#">Integrate the Log Auto-Discovery Extension</a>
Rookout	<a href="#">Deep Code Insights powered by Rookout</a>

Integration Module	More information

ServiceNow®	<a href="#">Integrate AppDynamics with ServiceNow® CMDB and Event Management</a>
Splunk	<a href="#">Integrate AppDynamics with Splunk</a>

## Integrate AppDynamics with Cisco® Application Centric Infrastructure

 AppDynamics is ending support for Application Centric Infrastructure (ACI). The feature will not work once customers upgrade their Controllers beyond > 21.1. See [Support Advisory: Application Centric Infrastructure \(ACI\) End of Life \(EOL\) Notice](#).

This page describes the advantages of the integration of AppDynamics with Cisco® Application Centric Infrastructure (Cisco ACI™). This solution provides a unified view from the application code to underlying network layers for business-critical applications running in a data center. This enables the network operations Admin and the application operations Admin to quickly troubleshoot issues at the application and the network levels.

 You can integrate the Cisco ACI™ solution with select AppDynamics Controllers only. If you are interested in using the integrated solution, contact [help@appdynamics.com](mailto:help@appdynamics.com). See [Troubleshoot Using the Integrated Solution](#).

### Getting Started with AppDynamics and Cisco ACI™ Integration

 AppDynamics is ending support for Application Centric Infrastructure (ACI). The feature will not work once customers upgrade their Controllers beyond > 21.1. See [Support Advisory: Application Centric Infrastructure \(ACI\) End of Life \(EOL\) Notice](#).

This page provides instructions for integrating AppDynamics with Cisco ACI™ solution and verifying interoperability between the applications. This integration provides end-to-end visibility into the application and network layers within a data center.

#### Before You Begin

Ensure that your environment meets these minimum system requirements:

- Controller >= 4.5.2 with a Network Visibility license per OS instance. See [Controller System Requirements](#).
- Hosts with Network Visibility Agents >= 4.5.2. See [Network Visibility Supported Environments](#).
- Hosts with Java Agents >= 4.5.2 or .NET Agent for Windows >= 4.5.15 with an App Agent license. See [Install Java Agent](#) or [.NET Agent](#).
- `sudo` or `root` access permissions on the agent host to install the Network Agent.
- Network Visibility is supported on Linux and Windows operating systems. See [Network Visibility Supported Environments](#).

**i** If your applications are running in a Kubernetes environment, enable the Kubernetes-ACI integration before you proceed with the AppDynamics and Cisco ACI™ integration. See [Cisco ACI and Kubernetes Integration](#).

### Enable SSL for Cisco ACI Integration

The Cisco Application Policy Infrastructure Controller (APIC) supports the import and storage of an SSL certificate and private key into the Controller to create a secure and trusted environment with AppDynamics.

1. Access the AppDynamics Controller using the SSH.
2. At a command prompt, change directories to the following location:

```
<controller_home>/appserver/glassfish/domains/domain1/config
```

3. Import the self-signed certificate from the appropriate directory as follows:

```
keytool -import -keystore cacerts.jks -file /path/to/RootCA.crt
```

### Enable Cisco ACI Integration (Controller <= 4.5.10)

**i** The Cisco ACI Integration is enabled by default for >= 4.5.11.

1. Log in to the Administration Console:

```
http:<controller-hostname>:<controller-port>/controller/admin.jsp
```

For example:

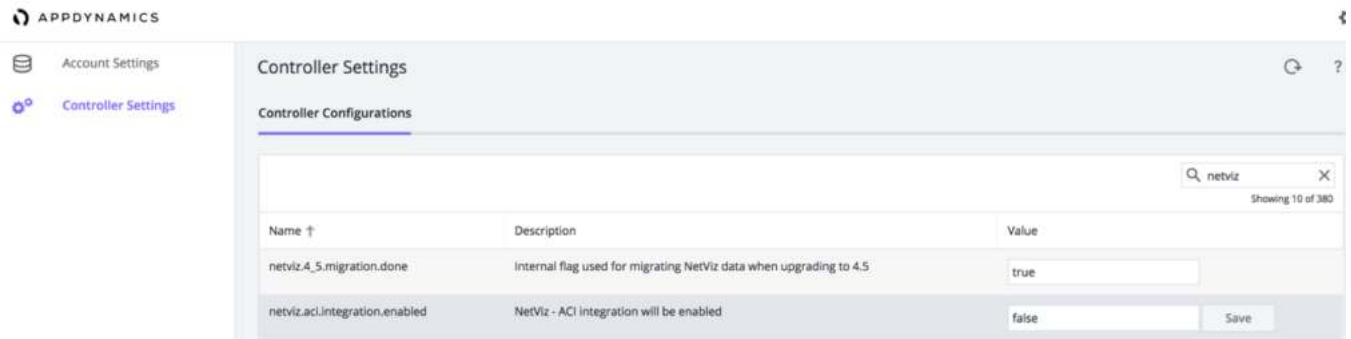

```
https:<controller-hostname>:8800/controller/admin.jsp
```

```
https:<controller-hostname>:443/controller/admin.jsp
```

You must use the password that was set for the root user of the Controller when the Controller was installed. See [Manage Controller Tenant Users and Groups](#).

2. In **Controller Settings**, search for **netviz.aci.integration.enabled** and set this field to **true**.
3. Click **Save**.

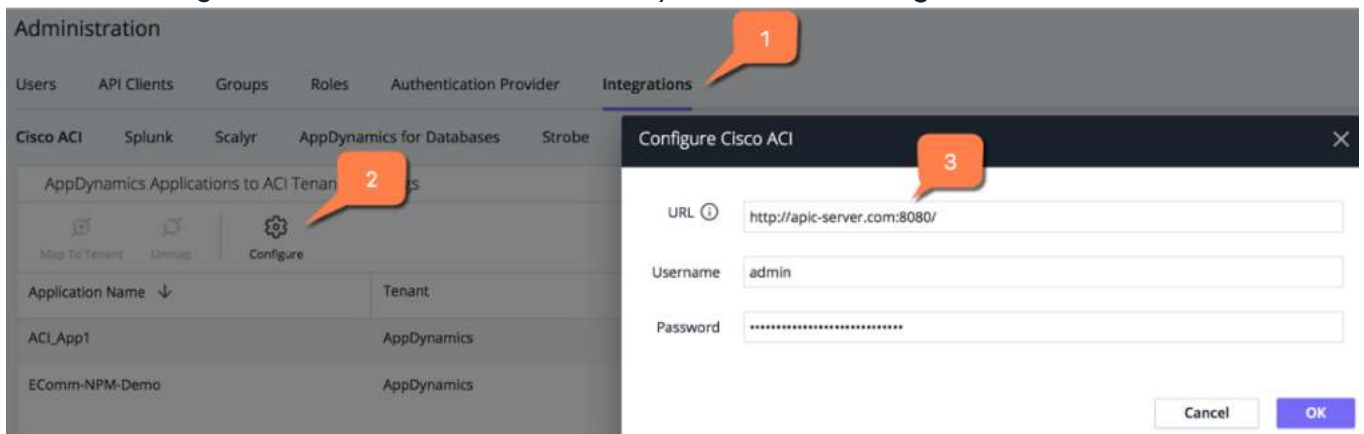

## Configure Cisco ACI Credentials

If you are using an AppDynamics Controller  $\geq 4.5.11$ , the Cisco ACI Integration feature is enabled by default. If you are using an AppDynamics Controller  $\leq 4.5.10$ , you must [enable Cisco ACI Integration manually](#) before you configure your credentials.

1. Log in to the AppDynamics Controller as an administrator:

```
http:<controller-hostname>:<controller-port>/controller
```

2. Click **Settings > Administration**.
3. Select the Integration tab. **Cisco ACI** is selected by default in the **Integrations** list.

4. Click **Configure** and enter these details:
  - a. Full URL along with the port details to the Cisco APIC Server. For example, `http://apic-server.com:8080/`
  - b. User credentials to the Cisco APIC.
5. Click **OK**.

AppDynamics initiates the background processes required to integrate with the Cisco ACI solution.

## Correlate AppDynamics and Cisco ACI Components

The AppDynamics integration with Cisco ACI brings together the logical constructs of both solutions. This enables the network operations admin and the application operations admin to obtain a comprehensive

---

end-to-end view from the application to the network. Correlating or mapping the components of both solutions helps the admins triage and troubleshoot issues quickly.

## AppDynamics Components

The AppDynamics application model serves as the framework around which AppDynamics organizes and presents application performance information. A typical application environment consists of different components that interact in multiple ways.

- **Application**—The top-level container in the AppDynamics model. A business application contains a set of related services and business transactions.
- **Tier**—A grouping of one or more nodes in the AppDynamics application model. There is no interaction among nodes within a single tier.
- **Node**—The smallest unit of the modeled environment. A node corresponds to a monitored server or JVM in the application environment. A node may correspond to an individual application server, JVM, CLR, PHP application, and Apache Web server.

AppDynamics components are logically arranged as [Application](#) > [Tiers](#) > [Nodes](#).

## Cisco ACI Components

Cisco ACI is a Software-Defined Networking (SDN) solution that simplifies, optimizes, and accelerates infrastructure deployment and governance, and expedites the application deployment lifecycle.

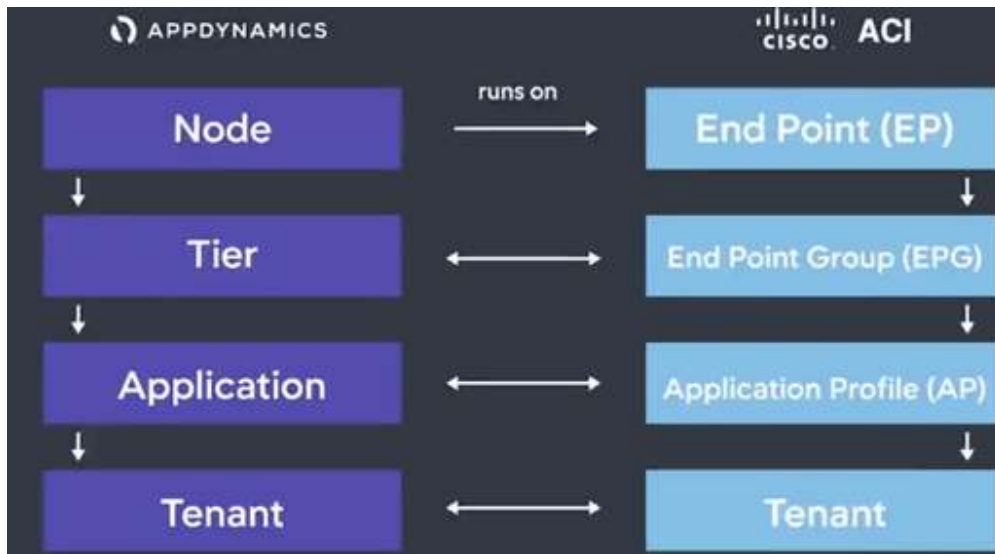

Cisco ACI implements Cisco's intent-based networking framework. It captures higher-level business and user intent in the form of a policy and converts this intent into the network constructs necessary to dynamically provision the network, security, and infrastructure services.

- **Cisco APIC**—The Infrastructure Controller is the main architectural component of the Cisco ACI solution. It is the unified point of automation and management for the Cisco ACI fabric, policy enforcement, and health monitoring.
  - The APIC appliance is a centralized, clustered controller that optimizes performance and unifies the operation of physical and virtual environments. The controller manages and operates a scalable multi-tenant Cisco ACI fabric.
- **Tenant**—A logical container for policies that enable an administrator to exercise domain-based access control.
- **Application Profile**—Defines the policies, services, and relationships between endpoint groups (EPGs).
- **EPG**—A managed object that is a named logical entity. It is a collection of endpoints (EPs).
- **Endpoints**—Devices that are connected to the network directly or indirectly. They have an address (identity), a location, and attributes (such as version).

Cisco APIC components are logically arranged as [Application profile](#) > [EPGs](#) > [EPs](#).

This figure shows the correlation of AppDynamics and Cisco ACI components.

### AppDynamics Applications to ACI Tenant Mapping

After you configure Cisco ACI credentials, all AppDynamics applications display in the **AppDynamics Applications to ACI Tenant Mappings** page.

Administration		
Users	API Clients	Groups
Roles	Authentication Provider	Integrations
Cisco ACI	Splunk	Scalyr
AppDynamics for Databases	Strobe	Atlassian JIRA OpenAuth
AppDynamics Applications to ACI Tenant Mappings		
Map To Tenant	Unmap	Configure
Application Name ↓	Tenant	Mapping
ACI_App1	-	-
ACI_App1_NoConflict	-	-
EComm-NPM-Demo	AppDynamics	Automatic

These mappings are based on the mappings between AppDynamics nodes and Cisco ACI endpoints.

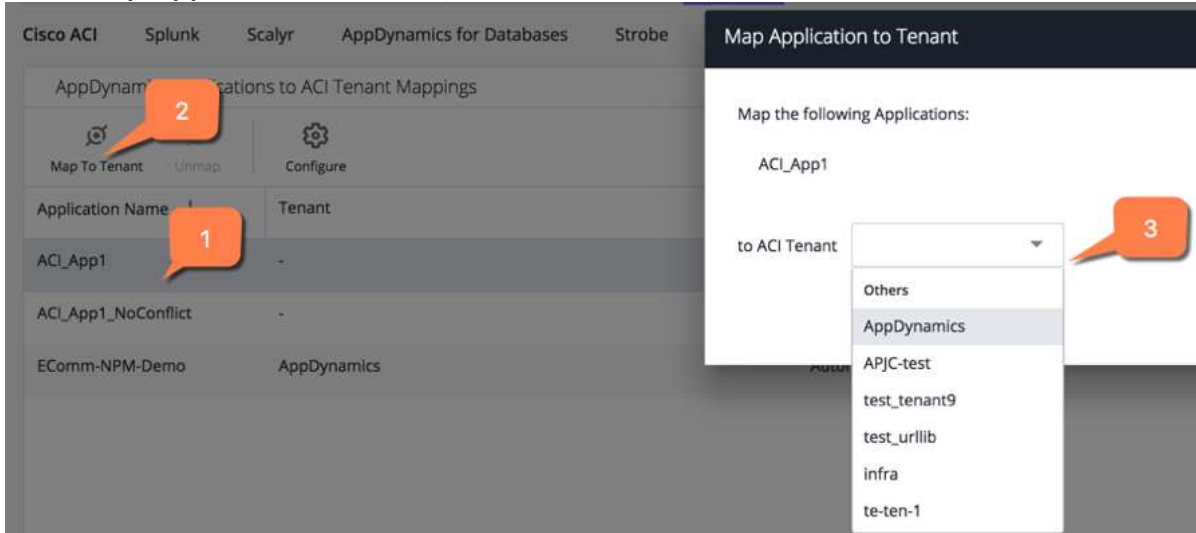

When the endpoints in different tenants have the same IP address, a node-to-endpoint mapping conflict occurs. AppDynamics resolves these conflicts based on heuristic data. However, if the conflicts persist, you must resolve these conflicts manually.

### Map AppDynamics Application to Cisco ACI Tenant Manually

The application to Cisco ACI tenant map is left blank in **AppDynamics Applications to ACI Tenant Mappings** page when there is a conflict in auto-mapping. You can map applications to Cisco ACI tenants manually.

1. Select the AppDynamics application you want to map manually. Multiple applications can be mapped to a tenant at a given time.
2. Click **Map to Tenant**.
3. In the **Map Application to Tenant** panel, select the tenant and click **OK**.

### Override Auto-Mapping

You can override the auto-map and map the application to another Cisco ACI tenant using the **Map Application to Tenant** panel. To override the auto-map, **Unmap** the application to Tenant map and map it to another Cisco ACI tenant.

To revert to auto-map, **Unmap** the application to tenant map and refresh the page. AppDynamics auto-maps the application to the corresponding Cisco ACI tenant.

### Troubleshoot Using the Integrated Solution

**⚠** AppDynamics is ending support for Application Centric Infrastructure (ACI). The feature will not work once customers upgrade their Controllers > 21.1. See [Support Advisory: Application Centric Infrastructure \(ACI\) End of Life \(EOL\) Notice](#).

This page describes how to troubleshoot applications using the Cisco APIC integration. The AppDynamics Network Dashboard displays a network-layer view of the monitored application. Based on the runtime state of the application, AppDynamics automatically fetches the faults and connection issues and displays them in the network dashboard:

Faults display at the tier level. The number of faults displayed indicates an aggregate of faults occurring at all EPGs within the tier. You can view the number of faults at a given point of time in the Network Dashboard.

A connection is the set of all traffic for an application that has the same Source IP, Destination IP, Destination Port, and Protocol. AppDynamics detects if there is an issue in the traffic flow and indicates the connection issue on the network dashboard.

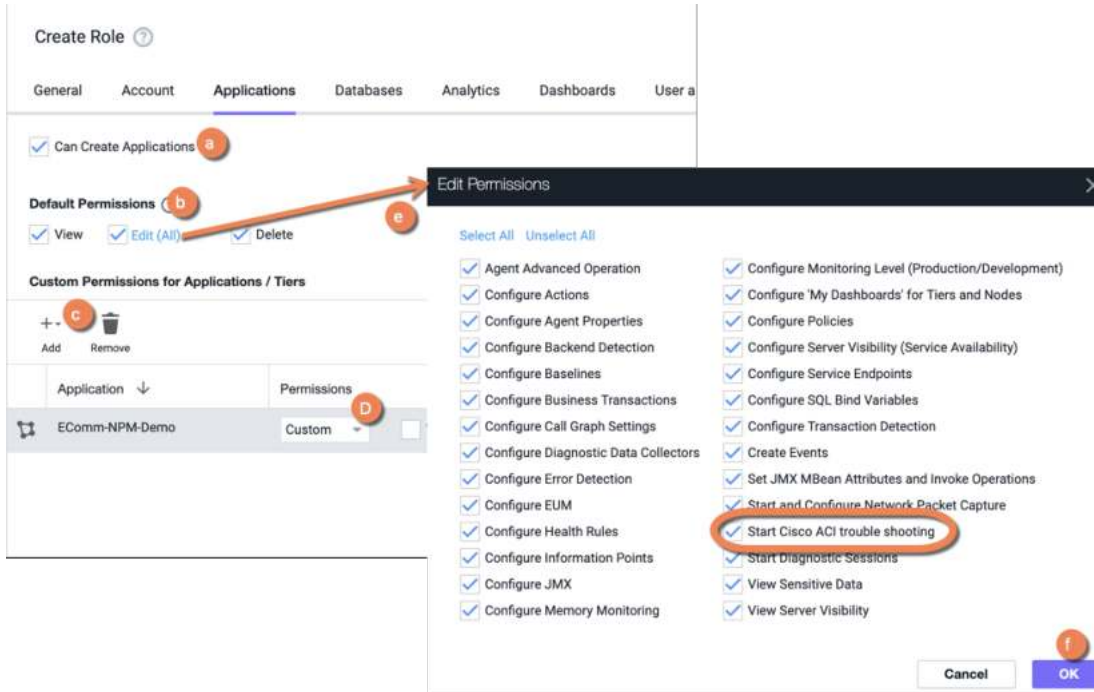

You can initiate a diagnosis to determine the exact location of the connection issue within the network by cross-launching the connection in Cisco APIC Controller.

### Set Custom Permission to Cross-Launch Cisco APIC Controller

To include permission to cross-launch Cisco APIC Controller:

1. Log in to the Controller UI as an Administrator or Account Owner.
2. Click the gear icon (⚙️) > **Administration**.
3. Click the Roles tab.
4. Click **+ Create**.
5. Specify a **Name** and a **Description** for the newly created role.
6. Customize the business application level permission according to these guidelines:
  - a. On the **Applications** tab, click **Can Create Applications**.
  - b. Under **Default Permissions**, select **View**, **Edit**, and **Delete**.
  - c. Click **+ Add** to add a new custom permission and click **Done**.  
The custom permission is added.
  - d. Select **Custom** from the **Permissions** menu for the application (replacing the value of Inherited).
  - e. Click **Edit(All)** and ensure that **Start Cisco ACI trouble shooting** is selected.

f. Click OK.

### Customize Permissions to Cross-Launch a Connection Issue in Cisco APIC Controller

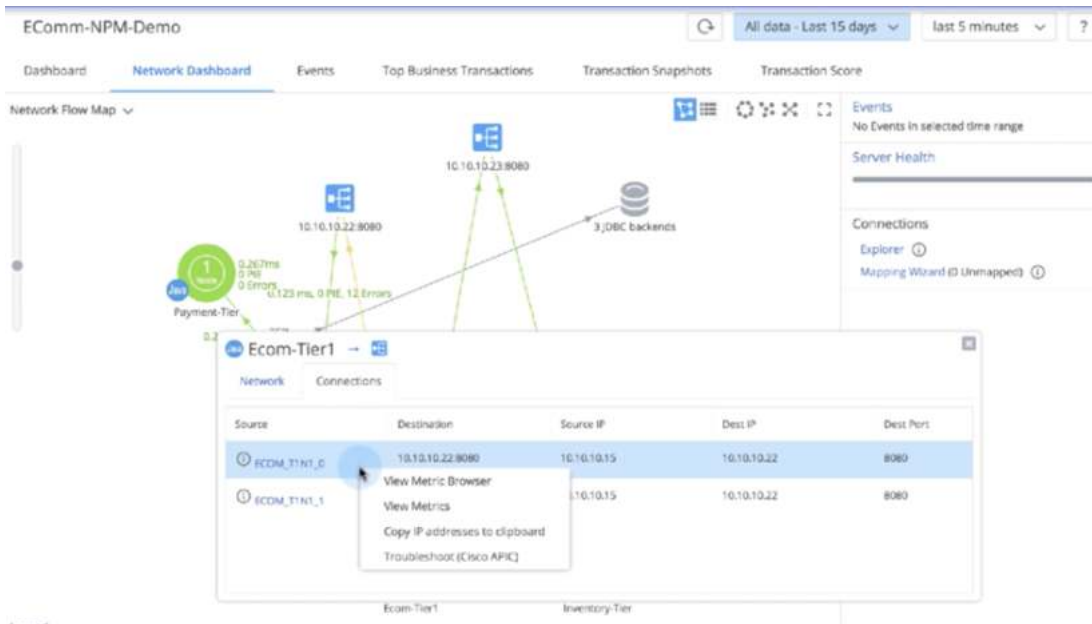

As an AppDynamics administrator, you can now customize the permissions for various roles to include permission to cross-launch a connection issue in the Cisco APIC Controller. See [Set Custom Permission to Cross-Launch Cisco APIC Controller](#).

### Launch Affected Connection in Cisco APIC

After collecting the connection issue information, you can cross-launch the connection in the Cisco APIC Controller.

1. Click on the affected connection on the **Network flow Map**.
2. Click the Connections tab.
3. Select the connection you want to troubleshoot.

- Right-click on the selection and select **Troubleshoot (Cisco APIC)**.

- Enter your Cisco APIC login credentials. After the initial entry, your credentials will be cached. The connection opens in the Cisco APIC Controller with the correct contracts (Visibility & Troubleshooting wizard) and the right set of endpoints.

**!** If you are using the Cisco ACI Release 4.0, you need not enter the login credentials. The authentication happens automatically. You must enter the login credentials only if you are using a lower version of the Cisco ACI.

- Troubleshoot the issue in Cisco APIC.

## Integrate AppDynamics with Compuware Strobe

This page describes how to integrate AppDynamics with Compuware Strobe. This integration allows you to drill down from a SQL Call of a transaction snapshot to view and analyze the calls in Strobe.

### Configure Compuware Strobe Integration

- Log in to the Controller UI as an administrator.
- Select **Settings > Administration**.
- Select **Integration > Strobe**.
- Click the **Enabled** checkbox.
- For the **URL**, enter the Strobe URL and port number.
- For the **Strobe LPAR**, enter the name of the logical partition where Strobe is running.
- Click **Save**.

### Launch Strobe from AppDynamics

You can access the **View in Strobe** option from a transaction snapshot.

- Navigate to the Business Transactions dashboard.

2. From the **Transaction Snapshot** tab, select a transaction snapshot containing DB2 z/OS database access.
3. Select the **SQL Calls** tab.
4. Right-click a SQL query and select **View in Strobe**.

## Integrate AppDynamics with DB CAM

### Related pages:

- [2023-10-19\\_05-04-05\\_Access the Administration Console](#)
- [Monitor Databases](#)

This page describes how to integrate AppDynamics with DB CAM. You can link to DB CAM for any DB CAM-monitored database that is discoverable by AppDynamics. This integration provides access to the database performance metrics provided by DB CAM.

### Before You Begin

To use this integration you must have a DB CAM license. DB CAM must be configured to monitor the databases that you want to link to from AppDynamics.

### Configure AppDynamics to Interface with DB CAM

You configure DB CAM integration at the account level and app agent level.

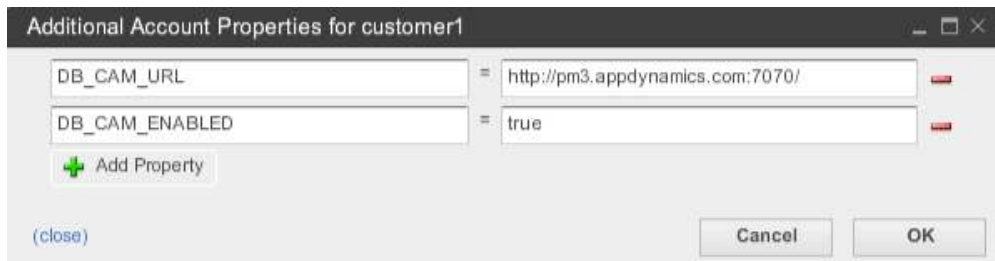

#### Configure DB CAM at the Account Level

Configure the integration at the account level using the Administration Console at `<host>:<port>/controller/admin.jsp`.

Create two new properties as name-value pairs in each account for which you want to enable DB CAM integration.

#### Configure One AppDynamics Account for DB CAM Integration

1. Log in to the Administrator Console with the administrator root password.
2. Select **Accounts**.
3. Double-click the account for which you want to configure DB CAM integration.
4. Click **Additional Account Properties** in the upper right.
5. Click **Add Property**.
6. In the left dialog, enter "DB\_CAM\_URL".
7. In the right dialog, enter the URL of the AppDynamics Controller that you are configuring using the syntax: `http[s]://<host>:<port>`
8. Click **Add Property** again.
9. In the left dialog, enter "DB\_CAM\_ENABLED".
10. In the right dialog, enter "true".
11. Click **OK**.
12. Log out of the Administrator Console.

## Configure DB CAM at the Agent Level

Perform this procedure for each app agent for which you want to enable access to deep diagnostics from DB CAM:

1. Open the `AppServerAgent/conf/app-agent-config.xml` file for the app agent.
2. Locate the `TransactionMonitoringService` element, `<agent-service name="TransactionMonitoringService" enabled="true">`.
3. Add the `jdbc-dbcam-integration-enabled` property for the service:

```
<agent-service name="TransactionMonitoringService"
enabled="true">
 <service-dependencies>BCIEngine, SnapshotService</service-
dependencies>
 <configuration-properties>
 <property name="jdbc-dbcam-integration-enabled"
value="true"/>
 </configuration-properties>
</agent-service>
```

4. Save the file.

## Link to DB CAM from AppDynamics

You can link to DB CAM from any AppDynamics flow map that displays a discovered DB CAM-monitored database. The flow map could be in a dashboard or a transaction snapshot.

If you link to DB CAM from a dashboard, you gain access to the DB CAM instance dashboard. If you link to be DB CAM from a transaction snapshot, you gain access to the DB CAM Session Drill Down pane.

### To Link to DB CAM from a Dashboard

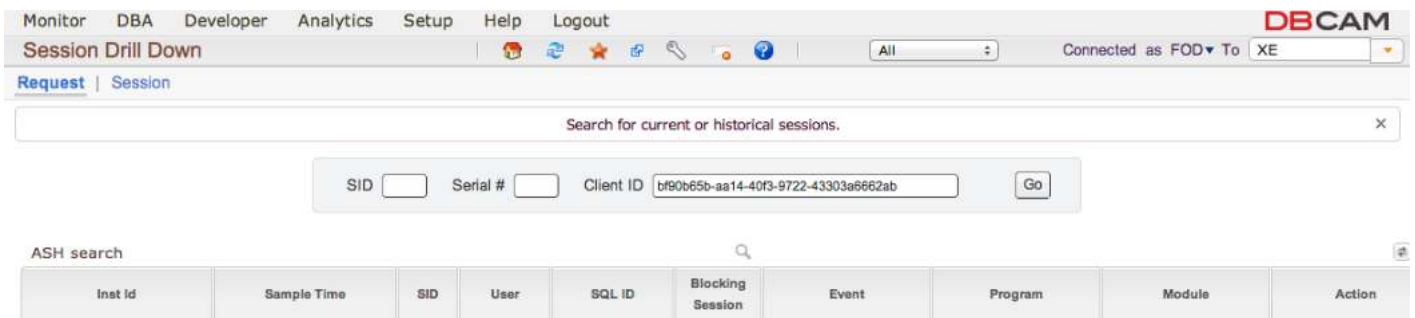

1. In the flow map of a dashboard, right-click on the link below a database icon.
2. Select **Search in DBCam**. DB CAM launches and displays the instance dashboard for the selected database.

### To Link to DB CAM from a Transaction Snapshot

1. In the flow map of a transaction snapshot, right-click on the link below the database icon.

2. Select **Search in DBCam**. DB CAM launches and displays the session drill down for the selected database.

## Integrate AppDynamics with Scalyr

This page describes how to integrate AppDynamics with the Scalyr module. This integration gives you a single entry point for viewing and analyzing data gathered by AppDynamics and [Scalyr](#). With the Scalyr integration module enabled, you can launch Scalyr searches directly from the AppDynamics Console.

The Scalyr search includes context from the AppDynamics UI session, including the time range and IP or hostname of the node being investigated in the AppDynamics UI.

### Enable the Scalyr Integration Module

To enable and configure the Scalyr integration:

1. Log in to the Controller UI as an administrator.
2. Select **Settings > Administration**.
3. Select **Integration > Scalyr**.
4. Click the **Enabled** checkbox.
5. For the **URL**, enter `https://www.scalyr.com`.
6. Click **Save**.

### Search Scalyr Data from AppDynamics

To launch a Scalyr search, Controller UI users must have:

- An active browser session in the Scalyr UI.
- Scalyr credentials.
- Popups permitted in the browser.

Controller users can search Scalyr logs from the node dashboard, business transaction dashboard, or from segments of a transaction snapshot. The time frame passed to Scalyr varies for each context.

### Node Dashboard Access

1. Navigate to a node dashboard.
2. Select **Actions > Search Scalyr**.

This passes a search for that node with the timeframe currently selected in the Controller UI.

### Business Transaction Dashboard

1. Select the Transaction Snapshot tab.
2. Select **Actions** or right-click a transaction snapshot.

### 3. Select **Search Scalyr**.

This generates a search on the nodes where the transaction occurred within the general time frame of the transaction execution. The time frame spans from 30 minutes before the transaction start time to 30 minutes after.

#### Call Drilldown Access

1. Select a **Call** in the drilldown view.
2. Select **Actions > Search Scalyr**.

This generates a search on the machine on which the snapshot was generated for the time frame of that segment.

## Integrate AppDynamics with ServiceNow CMDB and Event Management

This page describes how to integrate the AppDynamics for ServiceNow<sup>®</sup> application with ServiceNow<sup>®</sup>.

### Download

The download package can be found at [AppDynamics Downloads](#).

### Version 22.1.1

AppDynamics has released a new version of Sync Utility to address the Log4j2 vulnerability (CVE-2021-45046). This version integrates with the Quebec, Rome, San Diego, Tokyo, and Utah Release of ServiceNow<sup>®</sup>. See [Security Advisory: Apache Log4j Vulnerability](#).

- To review version-specific configuration details, see [New Version 22.1.1](#).
- To upgrade an existing Sync Utility, follow the instructions in the [upgrade](#) section.

Please review this version compatibility matrix to guide your installation and upgrade decision:

Integration Version	AppDynamics	ServiceNow <sup>®</sup>
22.1.1	>= 21.1.0	Quebec, Rome, San Diego, Tokyo, and Utah
21.12	>= 21.1.0	Quebec, Rome, San Diego, and Tokyo
20.7	>= 4.5.0.1	Quebec, Rome, San Diego, and Tokyo
<div style="border: 1px solid #ccc; padding: 10px; background-color: #fff9c4;">  We do not recommend this version due to <a href="#">security concerns</a>.                 </div>		

### Use Case

AppDynamics SaaS traces every transaction and builds real-time application topology. The ServiceNow<sup>®</sup> integration provides these capabilities:

- AppDynamics application topology feeds data into the AppDynamics for ServiceNow® application as custom tables in the CMDB.

In this version, monitored servers can be reconciled with the ServiceNow® appropriate CMDB Server CIs.

- AppDynamics can send alerts to the ServiceNow® Event Management application and use the AppDynamics-created entities. The AppDynamics for ServiceNow® application imports the AppDynamics alerts as entities. These entities can be used only when they are added to the ServiceNow® table. The AppDynamics for ServiceNow® application then creates a ServiceNow® table that maps with the entities.

This table lists these entities along with the ServiceNow® table that is created to represent them:

AppDynamics Entity Installed	ServiceNow® Table Created
Application	x_apd_appdynamics_application
Business Transaction	x_apd_appdynamics_business_transaction
Controller Tenant	x_apd_appdynamics_controller
Database	x_apd_appdynamics_database
Node	x_apd_appdynamics_node
Remote Service	x_apd_appdynamics_remote_service
Tier	x_apd_appdynamics_tier

### Before You Begin the Integration

This integration requires that you download, install, and complete the following tasks, in this order, before starting the integration.

- Create an AppDynamics Discovery Source in your ServiceNow® instance.
- Download and install the [AppDynamics for ServiceNow® application](#) from the ServiceNow® Store. This application creates the custom AppDynamics tables in the Configuration Management Database (CMDB).
- Download, install, and configure the [Data Sync Utility](#). This utility makes API calls to AppDynamics and ServiceNow® to push our topology into the CMDB tables.
- Once the data Sync Utility has been configured, go back to the utility and choose to download and install the Alerting template.

The template contains the proper settings for AppDynamics to send alerts to the event service in ServiceNow®.

5. Install Java 8 on the machine that runs this program.
6. Start Java with 512 MB of initial memory ( `-Xms512m` ).

### Create AppDynamics Discovery Source in ServiceNow®

You must create an AppDynamics Discovery Source before installing the integration from the ServiceNow® Store:

1. Log in to the ServiceNow® instance.
2. In the left menu, select **System Definition > Choice Lists**.
3. Click **New**.
4. Specify the following details only. Do not change the values of other fields.

<b>Table</b>	Configuration Item [cmdb_ci]
<b>Element</b>	discovery_source
<b>Label</b>	AppDynamics
<b>Value</b>	AppDynamics

### Download AppDynamics for ServiceNow® Application

Download the [AppDynamics for ServiceNow® application](#) from the ServiceNow® store and install it on your ServiceNow® instance.

 Ensure that you follow the instructions under the *System Requirements* and *Other Requirements* sections of the ServiceNow® download page.

To use Node-to-Server CI Reconciliation in ServiceNow®, you must have:

- [AppDynamics Machine Agents with Server Visibility enabled](#) installed and running on each host supporting AppDynamics Nodes to be imported.
- AppDynamics Controller Tenant and Machine Agent >= 4.5.0.1 with Server Visibility enabled.
- If you have issues, see [Troubleshooting](#).

### Download AppDynamics-ServiceNow® Data Sync Utility

Download the [Data Sync Utility](#) zip file from the AppDynamics Downloads portal.

 This host must have connectivity to both the target ServiceNow® instance and the target AppDynamics Controller Tenant.

The downloaded file includes a lightweight web server that has a basic web application to configure the integration. You can also run the integration in CLI mode only.

## Server Options

Download and unzip the `appdynamics-cmdb-service-$version.zip` [Data Sync Utility](#) file.

1. Unzip the `appdynamics-cmdb-service-$version.zip` file.
2. Start the Server.
  - a. **init.d service (System V)**

```
sudo ln -s /path/to/appdynamics-cmdb-service/appdynamics-cmdb-service.jar /etc/init.d/appdynamics-cmdb-service
sudo /etc/init.d/appdynamics-cmdb-service start
```

The java options can be configured in the `$HOME/appdynamics-cmdb-service.conf` file.

The application logs are created in the `$HOME/logs` directory.

The system out logs are created in the `/var/log/appdynamics-cmdb-service.log` file.

- b. **Windows (winsw):**

Open a terminal and navigate to the `appdynamics-cmdb-service` folder where you extracted the zip file:

```
cd C:\Path-to\appdynamics-cmdb-service
```

Run the following command:

```
javaw -jar appdynamics-cmdb-service.jar
```

The Java options can be configured in the `;%$HOME%/bin/appdynamics-cmdb-service-win.xml` file.

The logs are created in the `$HOME/logs` directory.

- c. **Other platforms:**

```
java -Xms512m -jar /path/to/appdynamics-cmdb-service.jar
```

The application logs are created in the `$HOME/logs` directory.

## Upgrades

1. Backup the data directory `data/` where the java Sync Utility is installed.
2. Overwrite the existing installation with the new file.

## Setup

1. `init.d` service—the configuration file is located at `$HOME/appdynamics-cmdb-service.conf`. Add the params to the `JAVA_OPTS` property.
2. `Windows` service—the configuration file is located at `$HOME/bin/appdynamics-cmdb-service-win.xml`. Add the params to the `<arguments>` property.
3. `jar`—add the params directly to the command preceding `-jar ...`

## Options

- Use a different port:

```
-Dserver.port=8080
```

- Enable authentication:

```
-Dplatform.security.enabled=true # This will create a local login with the following
credentials.
-Dplatform.username=user
-Dplatform.password="deFAultPwd4Platfrm"
-Dplatform.security.encryption-key=mykey
-Dplatform.security.encryption-salt=mysalt
```

The `encryption-key` and `encryption-salt` are optional.

## Configure the Data Sync Utility

### User Roles and Permissions

The Sync Utility needs to communicate with both an AppDynamics Controller Tenant and a ServiceNow® instance. We recommend using a service account for this access:

- **AppDynamics Controller Tenant:**

The service account user requires these roles with rights to all applications to be synchronized.

- Applications and Dashboards Viewer
- Server Monitoring User—Optional if you want to enable node-to-server CI reconciliation

- **ServiceNow®:** These roles should be assigned to the ServiceNow® user account that will be posting data to ServiceNow® :

This user can be set to **web service access only** on the user form.

- If Event Management is activated in your ServiceNow® instance, add these roles:
  - `x_apd_appdynamics.appdynamics_role`
  - `evt mgmt user`
  - `evt mgmt integration`
  - `mid_server` —Optional if you want to do server CI reconciliation.
  - `app_service_admin` —Required for Sync Utility v20.7.
- If Event Management is *not* activated, add these roles:
  - `x_apd_appdynamics.appdynamics_role`
  - `itil`
  - `mid_server` —Optional if you want to do server CI reconciliation.
  - `app_service_admin` —Required for Sync Utility v20.7.

### Domain Separated ServiceNow® Instances

If your ServiceNow® instance is domain-separated, a unique user account is required for each domain you want to update in the CMDB. For each domain:

1. Create a user account as described in [User Roles and Permissions](#) with the required roles.
2. Assign this user to the appropriate domain for the applications that it needs to access.
3. Create a new ServiceNow® instance with the appropriate user for each domain.
4. Set up synchronization for the applications appropriate for each domain user.

## Synchronize with the CMDB

The integration supports the synchronization of one or more ServiceNow® instances with one or more AppDynamics Controller Tenants.

1. Log in to the Sync Utility.
  - a. Open `http://<host>:8080` on a browser.
  - b. The default username is `user` and the default password is `deFAuLtPwd4P1atfrm`.

This can be overridden by the java startup property `-Dplatform.password=welcome`. See [Server Options](#).

2. Select the **Service Model Integration** left menu bar.
3. Click **AppDynamics Controllers** and add one or more Controller Tenants.

If your Controller Tenant is a dedicated SaaS (single-tenant), the **Account Name** will be `customer1`.

4. Click **ServiceNow® Instances** and add your ServiceNow® instance(s).
5. Click **Synchronize** from the top menu.
6. Choose applications from the **Applications** list to export to ServiceNow®.
7. Select which **AppDynamics Relationships to Synchronize** to include:
  - **Tier to Tier**
  - **Tier to Remote** (Remote Services)
  - **Tier to Application**
  - **Node-to-Server CI**
    - Reconciles the node host with an existing Server CI and builds a **Runs** relationship with the `x_apd_appdynamics_node` running on it. See [Node-to-Server CI Reconciliation](#).
8. Click **Run Diagnostics** to begin verification without creating any data.
  - If successful, click **Synchronize** to run a one-time synchronization.
  - If not successful, address the issues in the diagnostic messages provided.

Most integration users may like the synchronization to run at regular intervals to keep the service models. The integrated scheduler function allows for the creation and running of synchronization automatically.

UI Tab	Description
<b>Schedules</b>	Allows schedule creation using a cron expression. The <b>Synchronize</b> options on this page are the same as the other configuration panes.
<b>History</b>	Provides a graphical view of prior runs. You can expand each run to get details of the run, including error messages.

UI Tab	Description
Settings	Provides additional settings for connection timeouts, SSL, proxy configuration, and additional static values that can be added to fields in various CMDB tables.

After the synchronization is complete, log in to the ServiceNow® instance and select the AppDynamics menu item to view the tables and data associated with the integration.

### Node-to-Server CI Reconciliation

**i** In >= 3.1, the **Node-to-Server CI** checkbox in the Sync Utility builds a relationship between an AppDynamics Node ( `x_apd_appdynamics_node` ) and the underlying host Server CI ( `cmdb_ci_linux_server` , `cmdb_ci_windows_server` ) in the ServiceNow® CMDB.

To use this feature, a Machine Agent with Server Visibility enabled must be installed and running on each host that supports an imported AppDynamics Node. See [Machine Agent with Server Visibility](#).

The integration uses the default ServiceNow® hardware identification rules for reconciliation:

- **Name:** AppDynamics uses the operating system-reported hostname as the value for this field, which is subject to the following **Discovery Property** settings in ServiceNow®, whether Discovery is installed or not:

The `mid_server` role must be assigned to the ServiceNow® user for the integration to read these properties.

- `glide.discovery.hostname.case`
- `glide.discovery.hostname.include_domain`
- `glide.discovery.fqdn.regex`

Refer to the ServiceNow® product documentation for more information about these properties.

- **IP Address + MAC address** (Network Adapter Table): AppDynamics uses any adapter with a valid IPv4 or IPv6 address and a MAC address.

These attributes are provided by Machine Agents with Server Visibility enabled for Controller Tenant and Machine Agent >= 4.5.0.1.

1. To avoid duplicate Server CIs being created by this integration, any discovery sources employed must adhere to the same hardware identification rules:
  - a. **Name** in the Server CI should match the system reported hostname subject to the Discovery properties described above.
  - b. For each **Server Network Adapter**, the `ip_address` and `mac_address` must be populated in the Network Adapter table and related to the Server CI.

ServiceNow® CMDB Identification and Reconciliation will not consider IP Address and MAC Address values populated on the Server CI form directly.

- This integration identifies Linux and Windows servers and reconciles them to their respective CI classes on update or create ( `cmdb_ci_linux_server` & `cmdb_ci_windows_server` ).

**i** If a server is not Windows or Linux, no CMDB relationships will be created.

### Fields Populated in ServiceNow® by Node-to-Server CI Reconciliation

For the appropriate Server Class ( `cmdb_ci*_server` ) and related to the parent AppDynamics Node:

ServiceNow® Server CI Field	AppDynamics Server Visibility Attribute Used
<b>Name</b> ( <code>name</code> )	The reported Hostname—the Sync Utility reads and uses the discovery properties listed above to determine the hostname.
<b>Hostname</b> ( <code>host_name</code> )	The reported Hostname.

Each Network Adapter reported populates the Network Adapter CI ( `cmdb_ci_network_adapter` ) and related parent Server CI:

ServiceNow® Network Adapter CI Field	AppDynamics Server Visibility Attribute Used
<b>IP Address</b> ( <code>ip_address</code> )	IP Address with /x removed. Using either IPv4 or IPv6 Address as reported. If neither is populated, the adapter is not synced.
<b>MAC Address</b> ( <code>mac_address</code> )	The reported MAC address.

### Add Static Values to Required Fields

If there are required fields in your CMDB that AppDynamics does not populate, you can use the **CMDB Additional Fields** to add multiple static values per table.

- Navigate to the AppDynamics-ServiceNow® Sync Utility.
- Select **Settings**.
- Select **CMDB Additional Fields**.
- For the desired CI table, click **Add Field**.
- Enter the ServiceNow® **Field Name** (not the label).
- Enter the static value to populate all records of this type. For example, if you are required to populate the `hardware_status` field on all `cmdb_ci_server` and child class records, enter “ `hardware_status` ” and then “ `Installed` ”.
- Click **Save**.

## Considerations for Dynamic Application Environments

If the application environments you are monitoring with AppDynamics change frequently, you may end up with artifacts in the ServiceNow® CMDB that no longer reflect the current state of your application topology.

In order to address this, ServiceNow® provides documentation on how to configure “data refresh rules” in the CMDB so that irrelevant AppDynamics CIs can be removed. For the New York release, see [Create data refresh rules](#).

### Create Business Service CI

#### AppDynamics Application to ServiceNow® Application Service Relationships

Health rule violation alerts related to a ServiceNow® Application Service are shown in the Event Management Dashboard. There are two ways to build this relationship based on the current state of the ServiceNow® CMDB:

If Business Services do not exist:

1. If there are no Business Service CIs in the CMDB, ensure that the **Create Business Service** checkbox is checked when initially synchronizing an application. Follow the instructions in the Sync Utility documentation that explain how to convert that CI to an Application Service ( `cmdb_ci_service_discovered` ) CI that can be shown on the ServiceNow® Event Management Dashboard.  
You must select six levels of CIs to include in the model.

This step requires the `app_service_admin` role. See the ServiceNow® [Convert a business service to an application service](#).

If Business Services exist:

If the Business Service entities are Application Service class CIs, a relationship can be manually created between the AppDynamics Application and the ServiceNow® Application Service. To create the relationship:

1. Open the AppDynamics Application CI ( `x_apd_appdynamics_application` ).
2. Click **Add CI relationship**.
3. In the filter, set the “Class” - “is” - “Application Service”.
4. Click **Run Filter**.
5. Select the **Application Service CI**.
6. Select the **Runs On::Runs** relationship.
7. Click **Create new relationships with selected configuration item(s)**.

#### AppDynamics Tier to ServiceNow® Application Service Relationships

In some cases, an AppDynamics Tier may be the correct entity to relate to a ServiceNow® Application Service. To build this relationship in the ServiceNow® CMDB:

1. Open the **AppDynamics Tier CI** ( `x_apd_appdynamics_tier` ).
2. Click **Add CI relationship**.
3. In the filter, set the "Class" - "is" - "Application Service".
4. Click **Run Filter**.
5. Select the **Application Service CI**.
6. Select the **Runs On::Runs** relationship.
7. Click **Create new relationships with selected configuration item(s)**.

### Additional Application Relationships

The AppDynamics Application description and Tier description fields are populated in the AppDynamics Application CI ( `x_apd_appdynamics_application` ) and AppDynamics Tier CI ( `x_apd_appdynamics_tier` ) respectively:

Table	Application CI Field	AppDynamics Field Used
<code>x_apd_appdynamics_application</code>	Description ( <code>short_description</code> )	Application description

Table	Tier CI Field	AppDynamics Field Used
<code>x_apd_appdynamics_tier</code>	Description ( <code>short_description</code> )	Tier description

### Troubleshooting

#### Logs

The logs are generated in the `logs/` directory where the application is installed.

#### Debug Logs:

To enable debug logging, edit the file `conf/log4j2.xml` and change the level of the logger `com.appdynamics` to `DEBUG`.

#### Read Timeouts

If you encounter any Read Timeout errors while doing the sync:

1. Increase the **Socket Timeout** value in the Settings tab up to `60,000` initially and higher if needed.
2. Reduce the **Sync Batch Size** of entities to ServiceNow® Instance.
3. Navigate to the `Installation` directory.
4. Find the `conf/application.properties` file and adjust the size value.
5. Restart the AppDynamics ServiceNow® Sync Utility service or daemon (Required).

#### Events Integration

This section assumes that you are familiar with the configuration of HealthRules, Policies, and Actions in AppDynamics. See [Alert and Respond](#).

The Events integration uses the HTTP templates feature in the Controller Tenant to push events to the ServiceNow® Events API. The details of the ServiceNow® Events API can be found [here](#). See [HTTP Request Actions and Templates](#).

## Prerequisites

- Download and install the [AppDynamics for ServiceNow® application](#) on your ServiceNow® instance.
- Run the AppDynamics-ServiceNow® Data Sync Utility and verify that the entities are imported into your ServiceNow® instance. See [Data Sync Utility](#).
- Activate the ServiceNow® Event Management plugin.

## Events Installation and Configuration

In this section, you will create an Action, configure Health Rule Violations, and create binding Policies.

### Create an Action on the AppDynamics Controller Tenant

1. Log in to the web UI for the AppDynamics-ServiceNow® Data Sync Utility.
2. Select **Service Model Integration > Event Integration**.
3. Select the Controller Tenant you would like to configure. If one is not configured, see [Integrate AppDynamics with ServiceNow CMDB and Event Management](#).
4. Click **Download Template**.

Use the downloaded file to configure the HTTP Request template in AppDynamics. You will then create an Action and apply that action to a policy that specifies a health rule and action. To create the new Action:

1. Navigate to the **Alert & Respond** top menu in your AppDynamics Controller Tenant.
2. Click **Alert & Respond > HTTP Request Templates** in the left navigation.
3. Select the resource on which the action is to be created.
4. Click **New** and fill out the following fields:
  - a. **Name:** Any name to uniquely identify the template
  - b. **Request URL**
    - i. **Method:** POST
    - ii. **Raw URL:** `https://<your-instance>.service-now.com/em_event.do?JSONv2&sysparm_action=insertMultiple`. Replace `<your-instance>` with the id of the actual instance.
  - c. **Authentication**
    - i. **Type:** BASIC
    - ii. Enter the `user name` and `password` of your ServiceNow® instance.

 Ensure you have already configured the ServiceNow® User and Roles as described in [User Roles and Permissions](#).
  - d. **Payload**
    - i. **MIME Type:** `application/json`
    - ii. Copy the contents from the downloaded file, `event-request-template.txt`, and then paste it in the **Payload** text area
    - iii. Update the `controllerName` in the first line of the file. It must be the same value that you set while adding the AppDynamics Controller Name in the Sync Utility.
5. Save the HTTP Template.

---

## Configure Health Rules on the AppDynamics Controller Tenant

1. Select the **Alert & Respond** tab.
2. Select **Health Rules**.
3. Use the **Select** dropdown to choose an application on which you want to alert.
4. Review the list of **Health Rules** configured out-of-the-box for that application. Add more **Health Rules** if needed.

## Create a Policy on the AppDynamics Controller Tenant to Bind Health Rules to Actions

1. Select **Alert & Respond > Policies**.
2. Select **Create a Policy Manually** if there are no policies configured already.
3. Select the type of scenarios on which you want to receive alerts.

Checking all the boxes might lead to an alert storm on your ServiceNow® instance.

4. Click **Save**.
5. Select the **Health Rule Scope** defining which tiers and nodes the Health Rule should cover and click **Save**.
6. Select the **Object Scope** and choose the **Tiers and Nodes** to be covered in this policy and click **Save**.
7. Select **Actions**.
8. Click **Add +** sign to create a new **Action**.
9. Select the ServiceNow® **Action** you created and click **Save**.

### Version 22.1.1

This version release contains updates to fix the [Log4j vulnerability](#) in the Sync Utility. The Log4j version is updated to use 2.17.1.

To upgrade an existing Sync Utility, follow the instructions in the [upgrade](#) section.

## Requirements

### Versions

- AppDynamics  $\geq$  21.10.
- ServiceNow® instances to be synchronized must be running Quebec, Rome, San Diego, or Tokyo.

### New Roles

- No additional roles are needed for the service account in AppDynamics.
- The service account in ServiceNow® will also need the `app_service_admin` role.

## Upgrade an Existing Sync Utility

### Already Synchronized Applications

If you are using a version  $\geq$  20.7, the synchronization will remain as-is in 21.12.1.

If you are using a version  $\leq$  3.1, existing AppDynamics monitored applications and related entities that have been synchronized to a ServiceNow® CMDB from previous versions of the Sync Utility will remain in the CMDB. When the same application is re-synchronized using 21.12.1, a calculated service CI is created for those applications (or tiers) as configured. See [Creating Calculated Application Service CIs](#).

## Existing Manual Entry Points

If you created manual entry points for Application Service CIs using AppDynamics monitored application CIs `x_apd_appdynamics_application` will remain as-is. After synchronizing using Sync Utility v21.12.1, a new calculated application service CI will be added to the relationships.

## Recommendation

AppDynamics recommends that you remove any previously created entry points and create a manual entry point to the new Calculated Application Service `cmdb_ci_service_calculated` CI. To do this:

1. To remove the existing manual entry point:
  - a. Open the **Application Service CI** you are monitoring with Event Management
  - b. Click - next to the **Manually Added CI** link and click **Remove**.
2. Add a manual entry point for the calculated application service:
  - a. Open the application service CI you are monitoring in ServiceNow®.
  - b. Click **Add Entry Point**.
  - c. Select **Manually Created**.
  - d. For **CI Type**, select **Calculated Application Service**.
  - e. For **CI Name**, select the name for the application you synced.

## Create Calculated Application Service CIs

Orlando introduces a new CI class called Calculated Application Service `cmdb_ci_service_calculated`. This new class is dynamic and provides additional capability to automatically update a service map when relationships in the CMDB change for CIs that are part of the application service.

Some AppDynamics customers monitor applications as Tiers. With the new version 21.12.1, you can map AppDynamics Applications or AppDynamics Tiers to `cmdb_ci_service_calculated` CIs in ServiceNow®.

## Select Tiers to Monitor as Application Services in ServiceNow®

By default, all applications monitored by an AppDynamics Controller Tenant relate to a newly calculated application service when synchronized for the first time with 21.12.1 with a **Used By::Depends On** relationship.

To sync monitored tiers to a calculated Application Service CI in ServiceNow®:

1. Navigate to **Application Mappings**.
2. Add a Controller Tenant if none exists, or select the Controller Tenant from the dropdown. A list of all the AppDynamics monitored applications in the selected Controller Tenant UI.
3. To map each tier of a monitored application to a Calculated Application Service CI, move that application to the right bucket as an **Application Group**.

## Synchronize the Application Services in ServiceNow®

ServiceNow® requires that each Calculated Application Service CI ( `cmdb_ci_service_calculated` ) has a unique name. When synchronized for the first time using version  $\geq 20.7$ , a new Calculated Application Service CI is created with this naming convention:

- By default, each monitored application will have a Calculated Application Service CI named:
- AppD - AppNameGoesHere ( `controllerName` )

- If an application is designated as an Application Group, each monitored tier will have a Calculated Application Service CI named:
  - AppD - AppnameGoesHere:TierNameGoesHere ( controllerName )

### AppDynamics Application and ServiceNow® Calculated Application CI Dashboard

Use the **View Mapped Applications** dashboard to view the mappings between AppDynamics Applications (and Tiers) and ServiceNow® Calculated Application CI.

To delete a mapping from ServiceNow®, click the red 'X' to delete the mapping from this panel. This will delete both the Calculated Application CI and the relationship displayed. The AppDynamics entities in the CMDB will remain.

### Support

For questions or feature requests, please contact [AppDynamics Help](#).

## Integrate AppDynamics with Splunk

### Related pages:

- [Splunkbase Apps](#)
- [Splunk documentation](#)

This page describes how to integrate AppDynamics and [Splunk](#). This integration provides a single, cohesive view of data and allows you to launch Splunk searches using auto-populated queries from the AppDynamics Console based on criteria such as time ranges and the node IP address.

### Configure Splunk Integration

1. Log in to the Controller UI as an administrator.
2. Select **Settings > Administration**.
3. Select **Integration > Splunk**.
4. Click the **Enabled** checkbox.
5. For the **URL**, enter the Splunk URL and port number.
6. Optionally, enter **Extra Query Parameters**. These parameters are appended to each Splunk search initiated from AppDynamics.
7. Click **Save**.

### Launch a Splunk Search from AppDynamics

You can launch a search of Splunk logs for a specific time frame associated with a transaction snapshot from several places in AppDynamics.

To launch a Splunk search:

- You need Splunk credentials. You will only enter your credentials the first time that you launch a Splunk search. Your credentials are cached by the browser after the first login.
- Ensure the Splunk Server is running.
- Configure your browser to allow popups.

 **Enable Pop-ups**

If you do not see a login prompt at first login, either your browser is blocking the Splunk login popup or the Splunk Server is not running.

You can access the **Search Splunk** option from the node dashboard or the business transaction dashboard.

### Node Dashboard Access

1. Navigate to a node dashboard.
2. Select **Actions > Search Splunk**.

### Business Transaction Dashboard

1. Select the **Transaction Snapshot** tab.
2. Right-click a transaction snapshot.
3. Select **More Actions**.
4. Select **Search Splunk**.

## Integrate AppDynamics with Atlassian Jira™

AppDynamics with Atlassian Jira™ Integration is a two-way integration system that can automatically create and update Jira tickets when incidents occur. The information gathered in the Jira issue persists between AppDynamics and Jira, and can help you conduct a proper root cause analysis (RCA). You can navigate between the AppDynamics and Jira interfaces for a continuous experience. The Integration helps reduce the time in searching for specific event/incident data and consolidate tickets by following this runtime flow:

1. AppDynamics event triggers a Jira Incident. The event is a health rule violation.
2. AppDynamics event and incident data is gathered in a Jira issue.

 This document contains references to Atlassian™ documentation. AppDynamics does not own any rights and assumes no responsibility for the accuracy or completeness of such third-party documentation.

### Configuring Atlassian Jira Integration

 You can integrate AppDynamics with SaaS Jira hosts only.

You can configure the Atlassian Jira Integration by using open authentication (OAuth 2.0). The OAuth model passes back and forth the consumer and public keys, and creates links on the Atlassian system. This is done through a wizard, where you type in the URL, create the public keys, and launch the Atlassian links you need. Once this is set up, you do not have to worry about authorization linked to the Jira system.

 OAuth requires Jira administrator access.

To integrate AppDynamics with Jira:

1. Log in to the Controller UI as an administrator.
2. Click **Settings > Administration**.
3. In the Administration window, click the **Integration** tab and then **Atlassian Jira OAuth** from the Integrations list.

4. Click **Start Jira Integration Wizard**.
5. Follow the wizard steps:
  - a. Enter your Jira host URL and click **Continue**. If the URL is valid, you see the `JIRA URL verified` message.
  - b. Create an Application Link in Jira by entering the following details in your JIRA instance:
    - i. Enter the Controller URL as the application URL.
    - ii. Enter an application name of your choice. For example, `AppDynamics Controller integration test`.
    - iii. Select the application type as **Generic Application**.
    - iv. Enter the consumer key, consumer name, and public key from the Controller UI.
    - v. Select the **Create incoming link** check box.
  - c. Authorize AppDynamics in Jira by allowing the read and write access. After authorization, you get a verification code.
6. Copy the verification code from Jira and paste it on the **Verification code from JIRA** field in the Controller UI.
7. Click **Atlassian JIRA OAuth** from the Integrations list to view the integration details.
8. Click **Save**.

For more information about the Jira integration, see the following articles:

- [Using OAuth to integrate JIRA with the Controller](#)
- [Link to other applications in Jira](#)

## Create a Jira Issue from AppDynamics

You can have AppDynamics automatically create a Jira issue when an incident occurs.

### Create a Jira Issue with the Integration

You can define policies that, when triggered, generate Jira issues. See [Jira Actions](#) for more details. Flexible information such as event reason and error stack is inserted based on the event type and can be defined on an action-by-action basis.

To create a Jira from configured health rules:

1. Follow the steps on [Jira Actions](#) to create a Jira action.
2. Go back to the Alert & Respond main page, and create a Health Rule. See [Configure Health Rules](#).
3. Go back to the Alert & Respond main page, and create a Policy. See [Configure Policies](#).
  - a. Make the policy trigger based on the Health Rule Violation Events.
  - b. Make the policy execute the Jira action you created earlier.

### Create a Jira Issue Using CURL Commands

Create the following custom events to test the Jira integration using CURL commands:

1. ERROR
2. INFO

When an event with severity=ERROR is generated, a ticket is opened in Jira with `MEDIUM` priority. If you change the priority for the same event type and source and set the severity=INFO, the former opened ticket is updated and the priority is reduced to `LOW`.

### Create a Custom Event with Severity ERROR

Use the following CURL command to create an event in the Controller and set the severity to `ERROR`.

```
curl --request POST --user <Controller Username>@customer1: <Controller Password>'https://appd-controller-nonprod.com:8181/controller/rest/applications/<Application ID>/events?summary=SECUREAPP_OWASP_BREACH&comment=OWASP_breach_detected_by_SecureApp&severity=ERROR&event-type=CUSTOM&custom-event-type=SECUREAPP_OWASP_BREACH'
```

## Create a Custom Event with Severity INFO

Use the following CURL command to update the existing event in the Controller and set the severity to `INFO`.

```
curl --request POST --user <Controller Username>@customer1: <Controller Password>'https://appd-controller-nonprod.com:8181/controller/rest/applications/<Application ID>/events?summary=SECUREAPP_OWASP_BREACH&comment=OWASP_breach_detected_by_SecureApp&severity=INFO&event-type=CUSTOM&custom-event-type=SECUREAPP_OWASP_BREACH'
```

Two different Event Types are listed on the AppDynamics Application Dashboard, **Events** tab. You can view the details of these events.

## View the Jira Tickets

You can view the Jira tickets created to handle the AppDynamics events in the Jira dashboard. The Jira action assigns these tickets to the signed in user.

## Disabling Atlassian Jira Integration

You can disable your Atlassian Jira Integration to disable all Jira functionality. The Atlassian Jira Integration features in the AppDynamics UI are disabled by default.

Disabling the integration from the administration settings will disable the following features:

- Jira action
- Issue Tracking widget
- Jira / War Room column in the Health Rule Violations table

Disabling these features does not delete them. You can again enable the integration to use the features and restore their original views.

Jira™ is a trademark of Atlassian

## Integrate the Agent Command Center

The Agent Command Center is a web interface which allows you to view agents in AppDynamics, with the ability to view the agent's health history, perform a version upgrade, and enables the recovery or roll-back of agents in case of failure.

 For any questions or concerns regarding regional support or scale requirements, contact your account representative.

## Requirements

- Docker
- Docker-compose

## Before You Begin

Perform the following steps before upgrading the agents:

1. Upload a new `AppServerAgent.zip` or `MachineAgent.zip` file to the Controller.
2. Verify the checksum of the zip files displayed on the Controller.

## Installation

To install the Agent Upgrade, you must:

1. Clone the `agent-control-center` repo using `git clone` command.
2. Edit the file `setup.env` which is located at `config` folder to refer to configurations section below.
3. Run the command: `docker-compose up -d`.

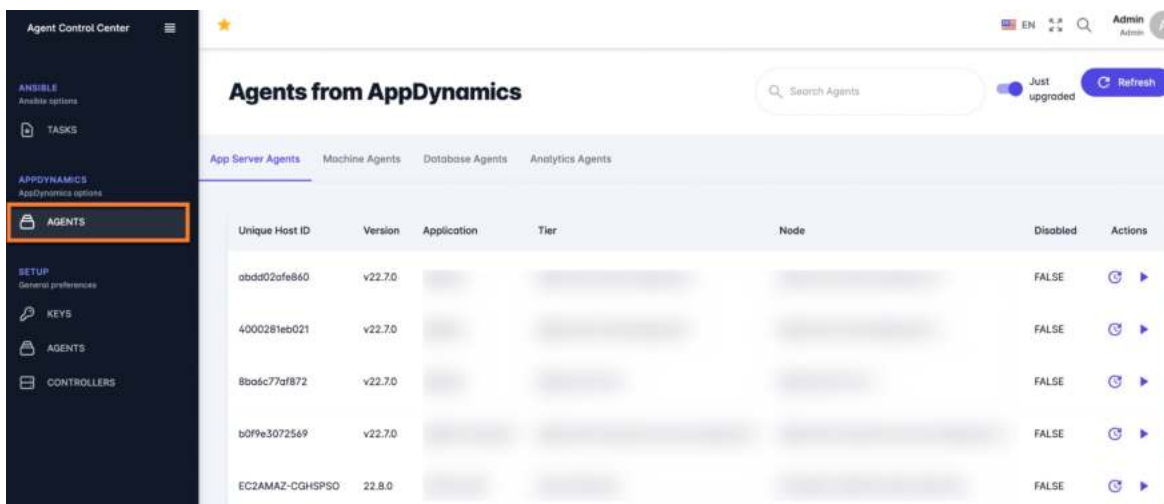

## Configure the Agent Command Center

Configure the Agent Command Center to connect to the AppDynamics `setup.env` file in the `config` folder. To configure the Agent Command Center, use the following file content:

```
APPDYNAMICS_CONTROLLER_HOST_NAME="https://.saas.appdynamics.com"
APPDYNAMICS_CLIENT_ID="@@"
APPDYNAMICS_CLIENT_SECRET=""
```

## How Does It Work?

1. Go to the **Agent Control Center** and access <http://localhost:3000> using your Web Browser.
2. Click **AppDynamics > Agents**.  
All agents in the AppDynamics environment will be listed.

3. Click **Play** next to the corresponding agent to upgrade the agent version.

4. Click **Create Task** to confirm the new agent version, and the server access key. An Ansible task will be created, which prepares the agent version update.

## Integrate the Log Auto-Discovery Extension

**i** For any questions or concerns regarding regional support or scale requirements, contact your account representative.

The Log Auto-Discovery Extension enables you to use the Machine Agent with the Analytics Agent Extension to the Standalone Machine Agent to automatically detect and monitor log files. It is intended to support any Unix and Windows operating system (Windows support may vary). With this extension, you can:

- Identify open log files of a process with a given string match, or files in a given directory matching a string.
- Test a sample of the found log file to determine the file type.
- Create a new job file for the log file in the Analytics Agent job directory. This job file will inform the Analytics Agent to begin monitoring based on those rules.
- Automatically delete all generated job files when the Machine Agent shuts down. This allows for re-detection of application processes and associated log files, as well as updated log file message format matching.

With this solution, it is possible to perform real-time and automatic collection of logs through the Machine Agent.

**i** The monitored log files will not be displayed on the Controller. The logs and their data will be displayed in the Analytics log schema when you query `SELECT * FROM logs`. See [Analytics Log Data](#) and [SELECT Clause](#).

### Before You Begin

- Ensure that you have Installed Machine Agent. See [Install the Machine Agent](#).
- Ensure that you have installed and configured the Analytics Agent Extension to the Standalone Machine Agent. See [Enable the Analytics Agent as an Extension to the Standalone Machine Agent](#).
- Ensure that you have `lsof` installed.

### Add the Extension to the Machine Agent

1. Download the Log Auto-Discovery Extension zip file.
2. Unzip the file and copy the `LogMonitor` directory to the directory `<machine_agent_home>/monitors/` of your Machine Agent. *Do not place* the extension in the `extensions` directory of your Machine Agent.
3. Create a `monitor.xml` configuration file for the Machine Agent. The `monitor.xml` file enables the Machine Agent to use an extension. See [Create the monitor.xml File](#).
4. Configure the `monitor.xml` file with the path to the extension's configuration file `default-config.yml`. (Note that the path is relative to the path stored in the environment variable `$AGENT_HOME`.)

```
<task-arguments>
 <argument name="config-file" is-required="true" default-value="./default-config.yml" />
```

```
</task-arguments>
```

5. Configure the extension with the file `default-config.yml` that lives in the root directory of the extension.

The following YAML example shows you the structure and provides descriptions as comments for the properties. Replace the placeholder text with your own Controller information as well as the regex patterns for your key words to identify log file paths.

```
#default configuration, this can be edited, and should be copied to a new file in case of
upgrade
grokDirectory: ./grok
jobDirectory: ./jobs

#we will create the job files here: {analyticsDirectory}/conf/job
#this is optional, we will try and determine this automatically
#analyticsDirectory: ../analytics-agent

#operating system specific commands
psCommand: "/bin/ps -ef"
lsofCommand: "/usr/sbin/lsof -p %d"

#windows would have these:
#psCommand: pslist.exe
#lsofCommand: "handle.exe -p %d"
#to download pslist, https://download.sysinternals.com/files/PSTools.zip
#to download handle.exe, https://download.sysinternals.com/files/Handle.zip

process:
 - java
 - -Dappdynamics.com

logs:
 - /var/log/*.log

#optionally, you can exclude log files where the absolutely path matches a given regex
pattern:
#excludeLogs:
- .*appdynamics.*
```

**i** Avoid using tab (\t) when editing YAML files. AppDynamics recommends using a YAML validator to validate the `default-config.yml` file.

6. Restart the Machine Agent.

## Use the Log Analytics Data

You can collect Log Analytics data from many types of log files, including instrumented and non-instrumented applications as well as infrastructure. Log Analytics can be used as a standalone component. You can search and analyze log data just as you do transaction data.

For more details about how to use the log data, see [Using Analytics Data](#).

# AppDynamics Licensing

## Related pages:

- [License Entitlements and Restrictions](#)
- [Observe License Usage](#)

There are two licensing models for AppDynamics products:

- Infrastructure-based Licensing - new model launched February 23, 2021
- Agent-based Licensing - classic model

## Infrastructure-based Licensing Model

The Infrastructure-based Licensing model offers license packages for Application Performance Monitoring (APM), End User Monitoring (EUM), Application Analytics, and security. Each package includes a combination of AppDynamics Agents and is based on a single metering unit: **CPU Core**. Because each agent can pull from a single metering unit, Infrastructure-based Licensing can support diverse applications and provide better license usage estimates.

This table shows how licenses in the Infrastructure-based Licensing model bundle multiple AppDynamics products.

AppDynamics Product	Application monitoring packages			End-user monitoring packages	
	Enterprise	Enterprise for SAP solutions	Premium	Real User Monitoring (Peak)	Real User Monitoring (Pro)
Application Performance Monitoring	✓		✓		
Transaction Analytics	✓	✓			
Network Visibility	✓	✓	✓		

AppDynamics Product	Application monitoring packages			End-user monitoring packages	
	Enterprise	Enterprise for SAP solutions	Premium	Real User Monitoring (Peak)	Real User Monitoring (Pro)
Server Visibility	✓	✓	✓		
Database Monitoring	✓	✓	✓		
SAP Advanced Business Application Programming (ABAP)		✓			
Real User Monitoring (Browser and Mobile RUM)				✓ <sup>1</sup>	✓ <sup>1</sup>
Real User Monitoring Analytics				✓ <sup>1</sup>	

## Add-on Products

In addition, any of the following products can be purchased as stand-alone or as add-ons to the packages.

- Infrastructure Monitoring
- Synthetic Monitoring
- IoT for Connected Devices
- Log Analytics
- Secure Application

## Agent Version Recommendations

Agent	Recommended Version	Description
Machine Agent	>= 20.11	All versions of the Machine Agent are compatible with Infrastructure-based Licensing packages. We recommend Machine Agent >= 20.11 for better performance and accurate license counting. See <a href="#">Agent and Controller Tenant Compatibility</a> for supported versions.

Agent	Recommended Version	Description
Database Agent	>= 21.2	To monitor the databases concurrently, the Controller Tenant requires a license for the total number of databases. All the versions of the Database Agent are compatible with Infrastructure-based Licensing packages. We recommend Database Agent >= 21.2 for for better performance and accurate license counting. For Database Agent license details, see <a href="#">License Entitlements and Restrictions</a> .

### Controller Tenant UI for Observing Usage

If you have an **Infrastructure-based Licensing** license and Controller >= 21.2.0, you have a new UI to manage licenses in the Controller Tenant. See the **Infrastructure-based Licensing** tab on [Observe License Usage](#).

### Agent-based Licensing Model

If you purchased AppDynamics licenses before February 23, 2021, you most likely have licenses in the Agent-based Licensing model. Agent-based Licensing is the original model in which each AppDynamics agent is licensed and metered individually. For Agent-based Licensing license entitlements, restrictions, and definitions, see [License Entitlements and Restrictions](#).

Licensing Package Type	Peak	Advanced	Pro

## Controller Tenant UI for Observing Usage

If you have an Agent-based Licensing license, you have the original UI to manage licenses in the Controller Tenant. See the **Agent-based Licensing** tab on [Observe License Usage](#).

1. RUM, RUM Analytics, Log Analytics, and Secure Application licenses are available outside the IBL Model. ↪ ↪ ↪
2. The same entitlement as 5 APM Any Language units, restricted to use with the following: Docker Containers, all CloudFoundry-based providers, Redhat OpenShift, Heroku Dyno, Microsoft Azure App Services (including Azure WebApps, Azure WebJobs, and Azure API Apps), Microsoft Azure Functions hosted on a Microsoft App Service plan, Microsoft Azure Service Fabric, Microsoft Azure Containers, Amazon Elastic Beanstalk, Oracle PaaS (Java and Node.js only) and Bluemix Containers. ↪ ↪ ↪

## License Entitlements and Restrictions

### Related pages:

This page describes AppDynamics license entitlements, restrictions, and definitions.

### License Entitlements in the Infrastructure-based Licensing Model

Here you can review license packages and package editions within the Infrastructure-based Licensing model. For information on the Infrastructure-based Licensing model, see [AppDynamics Licensing](#).

[Application Performance Monitoring \(APM\)](#)   [End User Monitoring](#)   [Security](#)

#### Enterprise Entitlements

- Monitoring for servers, supported application languages, networks, and databases instrumented with AppDynamics for up to 1 [CPU Core](#).
- Access to the AppDynamics Events Service.

Event Service data retention is limited to 8 days.

- **Transaction Analytics for Enterprise:** Per license unit purchased, instrument up to 400,000 business transaction events per 24-hour period. Access to the AppDynamics-hosted Events Service, with a data maximum of 100 GB per account per day for the following product types: AppDynamics for Java, .NET, and Node.js.

Data retention is limited to 8 days. Additional retention of 30, 60, or 90 days is available as an add-on.

- Includes [Premium Entitlements](#) package.

## Premium Entitlements

- Monitoring for servers, supported application languages, networks, and databases instrumented with AppDynamics for up to 1 [CPU Core](#).
- Monitor the Applications using any of these APM agents: Java, .NET, C/C++ SDK, Apache Web Server, PHP, Node.js, Python, Golang SDK, and IBM Integration Bus
- Obtain network visibility through the Network Agent.
- Monitor any of the following Databases using the Database agent and collectors: Couchbase Server, IBM DB2, Microsoft SQL Server, MySQL, PostgreSQL, Sybase ASE, Sybase IQ, Oracle, Microsoft Azure SQL database, Microsoft Azure SQL Managed Instance, MongoDB instance or replica sets. Event Data is retained for 10 days for each Database Instance monitored by AppDynamics.
- Includes entitlements for the [Infrastructure Monitoring](#) package.

## Infrastructure Monitoring Entitlements

- Monitoring for servers instrumented with AppDynamics for up to 1 [CPU Core](#).
- Gain server visibility through Server Agents and Machine Agents that monitor the machine, including .NET web applications, .NET Windows services, and .NET standalone apps using the .NET Machine Agent.
- Monitor clustered environments with the Cluster Agent.

## Enterprise Edition for SAP Solutions

- Monitoring for supported SAP applications using ABAP (Agent), servers, and networks instrumented with AppDynamics for up to 1 CPU Core
- Ability to instrument applications using SNP CrystalBridge Monitoring <sup>1</sup> for up to 1 [CPU Core](#).
- Access to the AppDynamics Events Service

 Event Service data retention is limited to 8 days.

- Transaction Analytics for Enterprise Edition for SAP Solutions: Per license unit purchased, instrument up to 400,000 business transaction events per 24-hour period. Access to the AppDynamics-hosted Events Service, with a data maximum of 100 GB per account per day.

 Data retention is limited to 8 days. Additional retention of 30, 60, or 90 days is available as an add-on.

- Obtain network visibility through the Network Agent.
- Includes entitlements for the [Infrastructure Monitoring](#) package.

Application Performance Monitoring (APM)   [End User Monitoring](#)   Security

## Real User Monitoring (SaaS) - Peak Edition

- AppDynamics Peak Edition entitlements include access to Analytics functionality.
  - Access to the AppDynamics-hosted Events Service.

 Event Service data retention is limited to 8 days.

- Access to [Browser Analytics](#) functionality for Browser Real User Monitoring and [Mobile Analytics](#) functionality for Mobile Real User Monitoring.
- Access to AppDynamics-hosted EUM Cloud which stores Event Data with a default limit of 100 GB per Controller Tenant per day for each Event Data type.

**i** Data retention is limited to 8 days. Additional retention of 30, 60, or 90 days is available as an add-on.

- 10,000,000 [Real User Monitoring Tokens](#);
  - A RUM Token is a common unit of measure for consumption of Real User Monitoring products during each 12 calendar month period in a License Term, with the first such period beginning on the start date of the relevant License Term; one Pageview consumes one RUM Token, and deployment of one Active Agent consumes 160 RUM Tokens per month.

**i** Network requests do not impact the consumption of RUM Tokens.

This table provides an example of RUM Token usage by active RUM agents to help illustrate the consumption over three months:

Month #	Number of Active RUM Agents	Monthly RUM Token Consumption
Month #1	10	1600
Month #2	5	800
Month #3	12	1920
<b>Total RUM Token Consumption (3 Months)</b>	27	4320

**i** Network requests do not impact the consumption of RUM Tokens.

- [Browser Real User Monitoring](#) capabilities.
- [Mobile Real User Monitoring](#) capabilities.

**Customer Digital Experience Monitoring:** An active license for both Real User Monitoring (SaaS) - Peak Edition and an active subscription for [ThousandEyes Network and Application Synthetics](#) are required for the below entitlement.

- Capability to ingest up to 9 million network metrics (packet loss, latency, jitter as described in the ThousandEyes documentation [ThousandEyes Metrics: What Do Your Results Mean?](#) and network alerts from ThousandEyes Network and Application Synthetics (purchased and licensed separately) per 12-month period following the license provision date ("Ingestion Limit"). Once you reach you reach your Ingestion Limit, AppDynamics will no longer ingest ThousandEyes network metrics and alerts.

**i** AppDynamics retains ThousandEyes network metrics for 8 days by default. AppDynamics offers [Extended Cloud Storage](#) of additional retention periods of 30, 60, or 90 days as an add-on.

### Real User Monitoring (SaaS) - Pro Edition

- 10,000,000 [Real User Monitoring Tokens](#).
- Access the AppDynamics-hosted EUM Cloud and AppDynamics-hosted Events Service.
- [Browser Real User Monitoring](#) capabilities.
- [Mobile Real User Monitoring](#) capabilities.

### Browser Real User Monitoring (SaaS) - Pro Edition

- Instrument 10 Million Pageviews per 12-month period following the license provision date.
- Access to the AppDynamics-hosted EUM Cloud and AppDynamics-hosted Events Service.
- Raw page requests, sessions, and resources are retained as Event Data with a default limit of 100 GB per Controller Tenant per day for each Event Data type.

AppDynamics reserves the right to drop customer traffic if the foregoing limitation is exceeded by the end user.

- Customers may also choose to store raw Ajax or other events requests as Event Data if they also have access to Analytics, and every 5 requests stored consumes one Pageview.
- Event Data is retained for 8 days. Additional retention of Event Data for 30, 60, or 90 days is available as an add-on at additional cost and requires the purchase of AppDynamics [Browser Analytics](#).
- Resource Performance data is retained for 6 days. JavaScript Error SourceFile and SourceMap data are retained for 90 days.

### Mobile Real User Monitoring (SaaS) - Pro Edition

- Instrument 5,000 Active Agents per calendar month and access the AppDynamics-hosted EUM Cloud and AppDynamics-hosted Events Service. A maximum of 500 fields of the following types are available on the event service as Event Data Type: network requests, sessions, errors, and crashes.
- Each Event Data Type has a usage limit of 100 GB per Controller Tenant per day. Crash reports are retained for 365 days, code issues are retained for 30 days, and all other Event Data is retained for 8 days. Additional retention of Event Data for 30, 60, or 90 days is available as an add-on at additional cost and requires the purchase of AppDynamics [Mobile Analytics](#).

### Browser Analytics (SaaS) - Pro Edition

- Access to Analytics functionality for [Browser Real User Monitoring](#).
- Access to AppDynamics-hosted EUM Cloud which stores Event Data with a default limit of 100 GB per Controller Tenant per day for each Event Data type.
- Access to the AppDynamics-hosted Events Service.

### Mobile Analytics (SaaS) - Pro Edition

- Access to Analytics functionality for [Mobile Real User Monitoring](#).
- Access to AppDynamics-hosted EUM Cloud which stores Event Data with a default limit of 100 GB per Controller Tenant per day for each Event Data type.
- Access to the AppDynamics-hosted Events Service.

### Browser Synthetic and Synthetic API Monitoring - Hosted Agent (SaaS) - Pro Edition

- 40,000 units of 5-second synthetic time blocks (STBs) on the AppDynamics' hosted synthetic platform per calendar month for use between Browser Synthetic Monitoring and Synthetic API Monitoring. Any unused seconds will not roll over to the next calendar month.
- Browser Synthetic Monitoring is metered in 5-second increments (i.e., 1 STB). Each Browser Synthetic Monitoring job is rounded up to the next 5-second STB.
- Synthetic API Monitoring is metered in 1-second increments.
- Access to Business Performance Monitoring features on the synthetic Events Data, which will be retained for a period of 13 months from the date on which the applicable synthetics Events Data is collected.
- Access to the EUM Cloud and Events Service.

### Browser Synthetic or Synthetic API Monitoring - Private Agent - Per Location (SaaS) - Pro Edition

- You are entitled to use either Browser Synthetic Monitoring or Synthetic API Monitoring for each license you purchased.
  - For Browser Synthetic Monitoring, you are entitled to run 1 synthetic job that hits 1 page from 1 location. Browser Synthetic Monitoring supports a minimum frequency execution of 5 minutes. A synthetic job that fails to hit any pages is counted as 1 page.
  - For Synthetic API Monitoring, you are entitled to run 1 synthetic job that hits 1 API from 1 location. Synthetic API Monitoring supports a minimum frequency execution of 1 minute.
- Access to Business Performance Monitoring features on the synthetic Events Data, which will be retained for a period of 13 months from the date on which the applicable synthetics Events Data is collected.
- Access to the EUM Cloud and Events Service.

## Browser Synthetic or Synthetic API Monitoring - Private Agent - Unlimited Locations (SaaS) - Pro Edition

- You are entitled to use either Browser Synthetic Monitoring or Synthetic API Monitoring for each license you purchased.
  - For Browser Synthetic Monitoring, you are entitled to run 1 synthetic job that hits 1 page from any number of locations. Browser Synthetic Monitoring supports a minimum frequency execution of 5 minutes. You are limited to 500,000 Pageviews per calendar month per license unit, and any unused Pageviews will not roll over to the next calendar month. A synthetic job that fails to hit any pages is counted as 1 page.
  - For Synthetic API Monitoring, you are entitled to run 1 synthetic job that hits 1 API from any number of locations. Synthetic API Monitoring supports a minimum frequency execution of 1 minute. You are limited to 500,000 API requests per calendar month per license unit, and any unused API requests will not roll over to the next calendar month.
- Access to Business Performance Monitoring features on the synthetic Events Data, which will be retained for a period of 13 months from the date on which the applicable synthetics Events Data is collected.
- Access to the EUM Cloud and Events Service.

## IoT for Connected Devices (SaaS) - Peak Edition

- Ability to instrument 1,000 application instances that are embedded on a connected device (or multiple devices) per calendar month.
- Access to the AppDynamics-hosted Events Service, with a data maximum of 100 GB per account per day.
- You shall be entitled to use AppDynamics for IoT only if you have at least 100,000 application instances that are:
  - Embedded on a connected device (or multiple devices);
  - Eligible to be instrumented AppDynamics for IoT, only available to AppDynamics SaaS customers; and
  - Actively in use by your end users.
- An "eligible" application instance is an application that can be instrumented using AppDynamics' C/C++ SDK, Java SDK, or AppDynamics Rest APIs (each for IoT).
- Event Data is retained for 8 days. Additional retention of Event Data for 30, 60, or 90 days is available as an add-on at an additional cost.

## Real User Monitoring (On-premises) - Peak Edition

- AppDynamics Peak Edition entitlements include access to Analytics functionality.
  - Access to Browser Analytics functionality for [Browser Real User Monitoring](#) and Mobile Analytics functionality for [Mobile Real User Monitoring](#).

Data retention is limited to 8 days. Additional retention of 30, 60, or 90 days is available as an add-on.

- 10,000,000 [Real User Monitoring Tokens](#).
- [Browser Real User Monitoring](#) capabilities
- [Mobile Real User Monitoring](#) capabilities.

## Real User Monitoring (On-premises) - Pro Edition

- 10,000,000 [Real User Monitoring Tokens](#).
- [Browser Real User Monitoring](#) capabilities
- [IBL-Mobile Real User Monitoring](#) capabilities.

## Browser Real User Monitoring (On-premises) - Pro Edition

- Instrument 10 Million Pageviews per 12-month period; raw page requests and sessions are retained as Event Data.
- Customers may also choose to store raw Ajax or other events requests as Event Data, and every 5 requests stored consumes one Pageview. Event Data is retained for 8 days by default.
- The customer is not entitled to access the AppDynamics-hosted EUM Cloud or AppDynamics-hosted Events Service.

## Mobile Real User Monitoring (On-premises) - Pro Edition

- Instrument 5,000 Active Agents per calendar month.
- In addition, for each Active Agent unit, 500 events per day of the following types are stored on the event service as Event Data: network requests, sessions, breadcrumbs, and custom data. Crash reports are retained for 365 days and all other Event Data is retained for 8 days by default.

- The customer is not entitled to access the AppDynamics-hosted EUM Cloud or AppDynamics-hosted Events Service.

### Browser Analytics (On-premises) - Pro Edition

- Access to Analytics functionality for [Browser Real User Monitoring](#).
- The customer is not entitled to access the AppDynamics-hosted EUM Cloud or AppDynamics-hosted Events Service.

### Mobile Analytics (On-premises) - Pro Edition

- Access to Analytics functionality for [Mobile Real User Monitoring](#).
- The customer is not entitled to access the AppDynamics-hosted EUM Cloud or AppDynamics-hosted Events Service.

### Browser Synthetic Monitoring - Private Agent - Per Location (on-prem) - Pro Edition

- Ability to run a synthetic job that hits 1 page from 1 location (multiple units add together to run jobs that hit multiple pages from multiple locations).
- Use Business Performance Monitoring features on the synthetic Events Data, if applicable, which is retained for 13 months.

A job that fails to hit any pages is counted as 1 page.

- You are not entitled to access the AppDynamics-hosted EUM Cloud or AppDynamics-hosted Events Service.

### Browser Synthetic Monitoring - Private Agent - Unlimited Locations (on-prem) - Pro Edition

- Ability to run a synthetic job that hits 1 page from any number of locations.
- Use Business Performance Monitoring features on the synthetic Events Data, if applicable, which are retained for 13 months.
- You are not entitled to access the AppDynamics-hosted EUM Cloud or AppDynamics-hosted Events Service.

Unused Pageviews are not rolled over to the following month. A job that fails to hit any pages is counted as 1 page.

- You are limited to 500,000 Pageviews per calendar month period per license unit.

[Application Performance Monitoring \(APM\)](#)   [End User Monitoring](#)   [Security](#)

## AppDynamics with Cisco Secure Application

- Monitoring for supported applications languages instrumented with AppDynamics for up to 1 [CPU Core](#).
- Security findings are retained for 7 days.

## License Entitlements in the Agent-based Licensing Model

These are the licenses and license editions within the Agent-based Licensing model. See [Licensing](#).

[Application Performance Monitoring](#)   [End User Monitoring](#)   [Infrastructure Visibility](#)   [Security](#)   [Log Analytics](#)

[Debugging](#)

### APM Any Language (SaaS) - Peak Edition

To receive **Transaction Analytics - Pro Edition**, customers must purchase at least one **APM Any Language (SaaS) – Peak Edition** license bundle and enable analytics for any APM agent(s). To receive **Transaction Analytics - Pro Edition** and enable analytics capabilities, such as sending business

transaction events) for any APM agent(s), customers must purchase at least one **APM Any Language (SaaS) – Peak Edition** license bundle.

Includes one unit of each of these entitlements:

- [APM Any Language - Pro Edition](#).
- **Transaction Analytics - Pro Edition**—includes the ability to instrument **1 APM Any Language - Pro Edition** with up to 1,000,000 business transaction events per 24-hour period and access to the AppDynamics-hosted Events Service, with a data maximum of 100 GB per Controller Tenant per day for the following product types: AppDynamics for Java, .NET, and Node.js. Data retention is limited to 8 days. Additional retention of 30, 60, or 90 days is available as an add-on.
- **Network Visibility**—allows you to instrument an unlimited number of Java nodes on a single instance of an OS.
- **Server Visibility**—provides the ability to instrument a single instance of an OS and monitor a single Kubernetes cluster.

### APM Any Language Microservices (SaaS) - Peak Edition

- The same entitlement as 5 [APM Any Language](#) units, restricted to use with the following: Docker Containers, all CloudFoundry-based providers, Redhat OpenShift, Heroku Dyno, Microsoft Azure App Services (including Azure WebApps, Azure WebJobs, and Azure API Apps), Microsoft Azure Functions hosted on a Microsoft App Service plan, Microsoft Azure Service Fabric, Microsoft Azure Containers, Amazon Elastic Beanstalk, Oracle PaaS (Java and Node.js only) and Bluemix Containers; and
- Includes one unit of each of these entitlements:
  - [Transaction Analytics](#)
  - [Network Visibility](#)
  - [Server Visibility](#)

### SAP Bundle (SaaS) - Peak Edition

Includes one unit of each of these entitlements:

- [SAP - ABAP Agent](#)
- [SNP CrystalBridge Monitoring](#) <sup>1</sup>
- [Transaction Analytics](#)
- [Network Visibility](#)
- [Server Visibility](#)

### APM Any Language (On-premises) - Peak Edition

Includes one unit of each of these entitlements:

- [APM Any Language - Pro Edition](#).
- **Transaction Analytics - Pro Edition**—includes the ability to instrument **1 APM Any Language - Pro Edition** with up to 1,000,000 business transaction events per 24-hour period and access to the AppDynamics-hosted Events Service, with a data maximum of 100 GB per Controller per day for the following product types: AppDynamics for Java, .NET, and Node.js. Data retention is limited to 8 days. Additional retention of 30, 60, or 90 days is available as an add-on; and
- **Network Visibility**—allows you to instrument an unlimited number of Java nodes on a single instance of an OS; and
- **Server Visibility**— provides the ability to instrument a single instance of an OS and monitoring of a single Kubernetes cluster.

### APM Any Language Microservices (On-premises) - Peak Edition

- The same entitlement as 5 [APM Any Language](#) units, restricted to use with the following: Docker Containers, all CloudFoundry-based providers, Redhat OpenShift, Heroku Dyno, Microsoft Azure App Services (including Azure WebApps, Azure WebJobs, and Azure API Apps), Microsoft Azure Functions hosted on a Microsoft App Service plan, Microsoft Azure Service Fabric, Microsoft Azure Containers, Amazon Elastic Beanstalk, Oracle PaaS (Java and Node.js only) and Bluemix Containers; and
- Includes one unit of each of these entitlements:
  - [Transaction Analytics](#)
  - [Network Visibility](#)

- [Server Visibility](#)

### **SAP Bundle (On-premises) - Peak Edition**

Includes one unit of each of these entitlements:

- [SAP - ABAP Agent](#)
- [SNP CrystalBridge Monitoring](#) <sup>1</sup>
- [Transaction Analytics](#)
- [Network Visibility](#)
- [Server Visibility](#)

### **APM Any Language (SaaS or On-premises) - Advanced Edition**

Includes one unit of each of these entitlements:

- [APM Any Language](#)
- [Network Visibility](#)
- [Server Visibility](#)

### **APM Any Language Microservices (SaaS or On-premises) - Advanced Edition**

- The same entitlement as 5 [APM Any Language](#) units, restricted to use with the following: Docker Containers, all CloudFoundry-based providers, Redhat OpenShift, Heroku Dyno, Microsoft Azure App Services (including Azure WebApps, Azure WebJobs, and Azure API Apps), Microsoft Azure Functions hosted on a Microsoft App Service plan, Microsoft Azure Service Fabric, Microsoft Azure Containers, Amazon Elastic Beanstalk, Oracle PaaS (Java and Node.js only) and Bluemix Containers; and
- Includes one unit of each of these entitlements:
  - [Network Visibility](#)
  - [Server Visibility](#)

### **APM Any Language - Pro Edition**

One license unit from the following product types: Java, .NET, Node.js, PHP, Python, Web Server, C++, Go, IBM Integration Bus, or the rights to monitor 16 Value Units of IBM Mainframe capacity.

### **APM Any Language Microservices (5-pack) - Pro Edition**

The same entitlement as 5 [APM Any Language](#) units, restricted to use with the following: Docker Containers, all CloudFoundry-based providers, Redhat OpenShift, Heroku Dyno, Microsoft Azure App Services (including Azure WebApps, Azure WebJobs, and Azure API Apps), Microsoft Azure Functions hosted on a Microsoft App Service plan, Microsoft Azure Service Fabric, Microsoft Azure Containers, Amazon Elastic Beanstalk, Oracle PaaS (Java and Node.js only), and Bluemix Containers.

### **Java Agent - Pro Edition**

Instrument a single JVM instance; snapshots are retained for 14 days unless archived.

### **Java Microservices - Pro Edition**

Instrument a single JVM instance with a heap allocation less than or equal to 1 GB.

This entitlement shall only apply to existing customers of AppDynamics for Java Microservices that have licensed a SKU for AppDynamics for Java Microservices. This entitlement is mutually exclusive with the entitlement to use AppDynamics for [Any Language](#) licenses.

### **.NET Agent - Pro Edition**

- Instrument an unlimited number of CLR, including .NET web applications, .NET Windows services, and .NET standalone apps, on a single Windows OS instance; snapshots are retained for 14 days unless archived.
- For APM Any Language Microservices, instrument an unlimited number of CLR on a single instance of an application.
- For .NET on Microsoft Azure for Cloud Services, instrument an unlimited number of CLR running in a single instance of a Microsoft Azure Web role or Worker role.

### PHP Agent - Pro Edition

Instrument a single PHP runtime instance; snapshots are retained for 14 days unless archived.

### Node.js Agent - Pro Edition

Instrument up to 10 Node.js processes per OS instance; snapshots are retained for 14 days unless archived.

### Python Agent - Pro Edition

Instrument an unlimited number of Python processes running on a single OS instance; snapshots are retained for 14 days unless archived.

### Web Server Agent - Pro Edition

Instrument an unlimited number of Apache Web Server instances on a single OS instance; snapshots are retained for 14 days unless archived.

### C++ Agent - Pro Edition

- Instrument an unlimited number of C++ runtime applications on up to 3 OS instances using the software development kit; snapshots are retained for 14 days unless archived.
- Instrument an unlimited number of Ruby runtime applications on up to 3 OS instances using the Ruby agent; snapshots are retained for 14 days unless archived.

### Go Agent - Pro Edition

Instrument up to 3 Go processes; snapshots are retained for 14 days unless archived. This is available as part of the APM Any Language license only.

### SAP - Pro Edition

Instrument a single application server.

### IBM Integration Bus - Pro Edition

Instrument an unlimited number of IBM Integration Bus processes on 1 OS instance. This is available as part of the APM Any Language license only.

### SNP CrystalBridge Monitoring - Pro Edition

SNP CrystalBridge Monitoring <sup>1</sup> allows you to instrument a single application server.

Application Performance Monitoring   [End User Monitoring](#)   Infrastructure Visibility   Security   Log Analytics

Debugging

[SaaS](#)   On-Prem

### Browser Real User Monitoring (SaaS) - Peak Edition

Includes one unit of each of these entitlements:

- [Browser Real User Monitoring - Pro](#)
- [Browser Analytics](#)

**Customer Digital Experience Monitoring:** An active license for both Real User Monitoring (SaaS) - Peak Edition and an active subscription for [ThousandEyes Network and Application Synthetics](#) are required for the below entitlement.

- Capability to ingest up to 9 million network metrics (packet loss, latency, jitter as described in the ThousandEyes documentation [ThousandEyes Metrics: What Do Your Results Mean?](#) and network alerts from ThousandEyes Network and Application Synthetics (purchased and licensed separately) per 12-month period following the license provision date ("Ingestion Limit"). Once you reach you reach your Ingestion Limit, AppDynamics will no longer ingest ThousandEyes network metrics and alerts.

 AppDynamics retains ThousandEyes network metrics for 8 days by default. AppDynamics offers [Extended Cloud Storage](#) of additional retention periods of 30, 60, or 90 days as an add-on.

### Mobile Real User Monitoring (SaaS) - Peak Edition

Includes one unit of each of these entitlements:

- [Mobile Real User Monitoring - Pro](#)
- [Mobile Analytics](#)

**Customer Digital Experience Monitoring:** An active license for both Real User Monitoring (SaaS) - Peak Edition and an active subscription for [ThousandEyes Network and Application Synthetics](#) are required for the below entitlement.

- Capability to ingest up to 9 million network metrics (packet loss, latency, jitter as described in the ThousandEyes documentation [ThousandEyes Metrics: What Do Your Results Mean?](#) and network alerts from ThousandEyes Network and Application Synthetics (purchased and licensed separately) per 12-month period following the license provision date ("Ingestion Limit"). Once you reach you reach your Ingestion Limit, AppDynamics will no longer ingest ThousandEyes network metrics and alerts.

### Browser Real User Monitoring (SaaS) - Pro Edition

- Instrument 10 Million Pageviews per 12-month period following the license provision date.
- Access to the AppDynamics-hosted EUM Cloud and AppDynamics-hosted Events Service.
- Raw page requests, sessions, and resources are retained as Event Data with a default limit of 100 GB per Controller Tenant per day for each Event Data type.

 AppDynamics reserves the right to drop customer traffic if the foregoing limitation is exceeded by the end user.

- Customers may also choose to store raw Ajax or other events requests as Event Data if they also have access to Analytics, and every 5 requests stored consumes one Pageview.
- Event Data is retained for 8 days. Additional retention of Event Data for 30, 60, or 90 days is available as an add-on at additional cost and requires the purchase of AppDynamics [Browser Analytics](#).
- Resource Performance data is retained for 6 days. JavaScript Error SourceFile and SourceMap data are retained for 90 days.

### Mobile Real User Monitoring (SaaS) - Pro Edition

- Instrument 5,000 Active Agents per calendar month and access the AppDynamics-hosted EUM Cloud and AppDynamics-hosted Events Service. A maximum of 500 fields of the following types are available on the event service as Event Data Type: network requests, sessions, errors, and crashes.

- Each Event Data Type has a usage limit of 100 GB per Controller Tenant per day. Crash reports are retained for 365 days, code issues are retained for 30 days, and all other Event Data is retained for 8 days. Additional retention of Event Data for 30, 60, or 90 days is available as an add-on at additional cost and requires the purchase of AppDynamics [Mobile Analytics](#).

### Browser Analytics (SaaS) - Pro Edition

- Access to Analytics functionality for [Browser Real User Monitoring](#).
- Access to AppDynamics-hosted EUM Cloud which stores Event Data with a default limit of 100 GB per Controller Tenant per day for each Event Data type.
- Access to the AppDynamics-hosted Events Service.

### Mobile Analytics (SaaS) - Pro Edition

- Access to Analytics functionality for [Mobile Real User Monitoring](#).
- Access to AppDynamics-hosted EUM Cloud which stores Event Data with a default limit of 100 GB per Controller Tenant per day for each Event Data type.
- Access to the AppDynamics-hosted Events Service.

### Transaction Analytics (SaaS) - Pro Edition

- Instrument up to 1,000,000 business transaction events per 24-hour period and access to the AppDynamics-hosted Events Service, with a data maximum of 100 GB per Controller Tenant per day for the following product types: AppDynamics for Java, .NET, and Node.js.
- Data retention is limited to 8 days. Additional retention of 30, 60, or 90 days is available as an add-on.

### Browser Synthetic and Synthetic API Monitoring - Hosted Agent (SaaS) - Pro Edition

- 40,000 units of 5-second synthetic time blocks (STBs) on the AppDynamics' hosted synthetic platform per calendar month for use between Browser Synthetic Monitoring and Synthetic API Monitoring. Any unused seconds will not roll over to the next calendar month.
- Browser Synthetic Monitoring is metered in 5-second increments (i.e., 1 STB). Each Browser Synthetic Monitoring job is rounded up to the next 5-second STB.
- Synthetic API Monitoring is metered in 1-second increments.
- You will have access to Business Performance Monitoring features on the Synthetic Events Data, which will be retained for a period of 13 months from the date on which the applicable Synthetic Events Data is collected.
- You will have access to the EUM Cloud and Events Service.

### Browser Synthetic or Synthetic API Monitoring - Private Agent - Per Location (SaaS) - Pro Edition

- You are entitled to use either Browser Synthetic Monitoring or Synthetic API Monitoring for each license you purchased.
- For Browser Synthetic Monitoring:
  - You are entitled to run 1 synthetic job that hits 1 page from 1 location.
  - Browser Synthetic Monitoring supports a minimum frequency execution of 5 minutes.
  - A synthetic job that fails to hit any pages is counted as 1 page.
- For Synthetic API Monitoring:
  - You are entitled to run 1 synthetic job that hits 1 API from 1 location.
  - Synthetic API Monitoring supports a minimum frequency execution of 1 minute.
- You will have access to Business Performance Monitoring features on the synthetic Events Data, which will be retained for a period of 13 months from the date on which the applicable Synthetic Events Data is collected.
- You will have access to the EUM Cloud and Events Service.

### Browser Synthetic or Synthetic API Monitoring - Private Agent - Unlimited Locations (SaaS) - Pro Edition

- You are entitled to use either Browser Synthetic Monitoring or Synthetic API Monitoring for each license you purchased.
- For Browser Synthetic Monitoring:
  - You are entitled to run 1 synthetic job that hits 1 page from any number of locations.

- Browser Synthetic Monitoring supports a minimum frequency execution of 5 minutes.
- You are limited to 500,000 Pageviews per calendar month, and any unused Pageviews will not roll over to the next calendar month.
- A synthetic job that fails to hit any pages is counted as 1 page.
- For Synthetic API Monitoring:
  - You are entitled to run 1 synthetic job that hits 1 API from any number of locations.
  - Synthetic API Monitoring supports a minimum frequency execution of 1 minute.
  - You are limited to 500,000 API requests per calendar month, and any unused API requests will not roll over to the next calendar month.
- You will have access to Business Performance Monitoring features on the synthetic Events Data, which will be retained for a period of 13 months from the date on which the applicable Synthetic Events Data is collected.
- You will have access to the EUM Cloud and Events Service.

## IoT for Connected Devices (SaaS) - Pro Edition

- Ability to instrument 1,000 application instances that are embedded on a connected device (or multiple devices) per calendar month.
- Access to the AppDynamics-hosted Events Service, with a data maximum of 100 GB per account per day.
- You shall be entitled to use AppDynamics for IoT only if you have at least 100,000 application instances that are:
  - Embedded on a connected device (or multiple devices);
  - Eligible to be instrumented AppDynamics for IoT, only available to AppDynamics SaaS Customers; and
  - Actively in use by your end users.
- An "eligible" application instance is an application that can be instrumented using AppDynamics' C/C++ SDK, Java SDK, or AppDynamics Rest APIs (each for IoT).
- Event Data is retained for 8 days. Additional retention of Event Data for 30, 60, or 90 days is available as an add-on at an additional cost.

SaaS [On-Prem](#)

## Browser Real User Monitoring (On-premises) - Peak Edition

Includes one unit of each of these entitlements:

- [Browser Real User Monitoring - Pro](#)
- [Browser Analytics](#)

## Mobile Real User Monitoring (On-premises) - Peak Edition

Includes one unit of each of these entitlements:

- [Mobile Real User Monitoring - Pro](#)
- [Mobile Analytics](#)

## Browser Real User Monitoring (On-premises) - Pro Edition

- Instrument 10 Million Pageviews per 12-month period; raw page requests and sessions are retained as Event Data.
- Customers may also choose to store raw Ajax or other events requests as Event Data, and every 5 requests stored consumes one Pageview. Event Data is retained for 8 days by default.
- The customer is not entitled to access the AppDynamics-hosted EUM Cloud or AppDynamics-hosted Events Service.

## Mobile Real User Monitoring (On-premises) - Pro Edition

- Instrument 5,000 Active Agents per calendar month.
- In addition, for each Active Agent unit, 500 events per day of the following types are stored on the event service as Event Data: network requests, sessions, breadcrumbs, and custom data. Crash reports are retained for 365 days and all other Event Data is retained for 8 days by default.
- The customer is not entitled to access the AppDynamics-hosted EUM Cloud or AppDynamics-hosted Events Service.

### Browser Analytics (On-premises) - Pro Edition

- Access to Analytics functionality for [Browser Real User Monitoring](#).
- The customer is not entitled to access the AppDynamics-hosted EUM Cloud or AppDynamics-hosted Events Service.

### Mobile Analytics (On-premises) - Pro Edition

- Access to Analytics functionality for [Mobile Real User Monitoring](#).
- The customer is not entitled to access the AppDynamics-hosted EUM Cloud or AppDynamics-hosted Events Service.

### Transaction Analytics (On-premises) - Pro Edition

- Instrument up to 1,000,000 business transaction events per 24-hour period per license unit.

 Limited to 90 days of data storage per license unit.

- The customer is not entitled to access the AppDynamics-hosted Events Service

### Browser Synthetic Monitoring - Private Agent - Per Location (On-premises) - Pro Edition

- Run a synthetic job that hits 1 page from 1 location (multiple units add together to run jobs that hit multiple pages from multiple locations), and use Business Performance Monitoring features on the synthetic Events Data, if applicable, which is retained for 13 months. A job that fails to hit any pages is counted as 1 page.
- The customer is not entitled to access the AppDynamics-hosted EUM Cloud or AppDynamics-hosted Events Service.

### Browser Synthetic Monitoring - Private Agent - Unlimited Locations (On-premises) - Pro Edition

- Run a synthetic job that hits 1 page from any number of locations, and use Business Performance Monitoring features on the synthetic Events Data, if applicable, which are retained for 13 months. The customer is limited to 500,000 Pageviews per calendar month period. Unused Pageviews are not rolled over to the following month. A job that fails to hit any pages is counted as 1 page.
- The customer is not entitled to access the AppDynamics-hosted EUM Cloud or AppDynamics-hosted Events Service.

Application Performance Monitoring   End User Monitoring   [Infrastructure Visibility](#)   Security   Log Analytics

Debugging

### Machine Agent - Pro Edition

Instrument a single instance of an OS.

### Server Visibility - Pro Edition

- Instrument a single instance of an OS.
- Monitor a single Kubernetes cluster.

### Network Visibility - Pro Edition

Instrument an unlimited number of Java nodes on a single instance of an OS.

### Database Visibility - Pro Edition

- Monitor one Database Instance of the following <sup>2</sup>: Couchbase Server, IBM DB2, Microsoft SQL Server, MySQL, PostgreSQL, Sybase ASE, Sybase IQ, Oracle.
- Monitor one Microsoft Azure SQL database or one Microsoft Azure SQL Managed Instance.
- Monitor one MongoDB replica set (or, if no replica sets exist, one standalone MongoDB instance).
- Event Data is retained for 10 days for each Database Instance monitored by AppDynamics for Database Visibility.

### AppDynamics for NetApp (On-premises) - Pro Edition

- Monitor one NetApp<sup>3</sup> controller for the following NetApp controller types: FAS2nnn and FAS3nnn.
- Monitor ½ NetApp controller for the following NetApp controller types: FAS6nnn and FAS8nnn series; two license units are required to monitor a full NetApp controller of series FAS6nnn or FAS8nnn.
- Event Data is retained for 14 days by default for each NetApp controller monitored by a unit of AppDynamics for NetApp (on-prem).

Application Performance Monitoring   End User Monitoring   Infrastructure Visibility   [Security](#)   Log Analytics

[Debugging](#)

### AppDynamics with Cisco Secure Application

- Security Monitoring for supported application languages instrumented using agents entitled on APM Any Language - Pro.
- Security findings are retained for 7 days.

### Cisco Secure Application

One unit of Cisco Secure Application tied to APM Any Language Microservices allows you to monitor 5 containers.

Application Performance Monitoring   End User Monitoring   Infrastructure Visibility   Security   [Log Analytics](#)

[Debugging](#)

### Log Analytics (SaaS) - Pro Edition

- Publish/index 5 GB of log data per 24-hour period (limited to 8 days of data storage) and access the AppDynamics-hosted Events Service.
- Additional retention beyond 8 days can be purchased as an add-on.

### Log Analytics (On-premises) - Pro Edition

- Publish/index 5 GB of log data per 24-hour period

 Default data storage is 8 days and available up to 90 days.

- The customer is not entitled to access the AppDynamics-hosted Events Service.

Application Performance Monitoring   End User Monitoring   Infrastructure Visibility   Security   Log Analytics

[Debugging](#)

### AppDynamics Deep Code Insights, powered by Rookout

Application debugging support for one license unit of AppDynamics APM Any Language, configured for the following product types only: AppDynamics for Java, .NET, Node.js, PHP, Python.

## Extended Cloud Storage

If you need more browser, mobile, log, or business transaction data storage, you can purchase additional Extended Cloud Storage SKUs. These are the required license packages, storage limits, and retention periods for each SKU.

Extended Cloud Storage SKU	License Package Prerequisite	Storage	Data Retention
AppDynamics Extended Cloud Storage SKU for Browser Real User Monitoring – 100 GB Daily – SaaS	<p>To purchase this Extended Cloud Storage SKU, you must have an active license for one of the following license packages:</p> <ul style="list-style-type: none"> <li>• Browser Real User Monitoring (SaaS) - Peak Edition</li> <li>• Real User Monitoring (SaaS) - Peak Edition</li> </ul>	<p>100 GB of additional storage for one Controller Tenant per day for each Event Data type.</p> <p>Once you reach your allotted daily storage amount, data ingestion will stop until the daily storage amount is reset at 12:00 AM GMT.</p>	<p>Event Data is retained by default for 8 days.</p> <p>The retention period for the Extended Cloud Storage SKU is the same retention period stated on the ordering documentation of the applicable Prerequisite Package. Refer to your Prerequisite Package ordering document for details on your retention period. You can purchase 30, 60, or 90 days of extended retention periods of Event Data at an additional cost.</p>
AppDynamics Extended Cloud Storage SKU for Mobile Real User Monitoring – 100 GB Daily – SaaS	<p>To purchase this Extended Cloud Storage SKU, you must have an active license for one of the following license packages:</p> <ul style="list-style-type: none"> <li>• Mobile Real User Monitoring (SaaS) - Peak Edition</li> <li>• Real User Monitoring (SaaS) - Peak Edition</li> </ul>		
<p><b>AppDynamics Extended Cloud Storage SKU for Transaction Analytics – 100 GB Daily – SaaS</b></p>	<p><b>To purchase this Extended Cloud Storage SKU, you must have an active license for one of the following license packages:</b></p> <ul style="list-style-type: none"> <li>• APM Any Language (SaaS) - Peak Edition</li> <li>• APM Any Language Microservices (SaaS) - Peak Edition</li> <li>• Enterprise (IBL)</li> <li>• SAP Bundle (SaaS) - Peak Edition</li> </ul>		

## License Restrictions

The table below describes license restrictions that are applicable to all products.

Category	Restriction
Third-party components	License restrictions with respect to any third-party components included in the AppDynamics software, with which customers are required to comply, are located on the <a href="#">Legal Notices</a> page.
Compatibility	Compatibility limitations with respect to any third-party components are located on the <a href="#">Supported Environments</a> page.
On-premises Failover/Disaster Recovery	<p>These licenses are intended solely for use as a backup environment, to which a monitored production environment transitions in case of a failure of any primary component to operate in its entirety. The backup licenses must be housed on a separate Controller and delivered in a separate license file from the monitored production environment.</p> <p>The End User is prohibited from using the backup licenses in a monitored production environment at the same time as the primary production environment, except for periodic testing of such components. Note that this option is available only for on-prem deployments and is not applicable for AppDynamics SaaS deployments.</p>
Use of MySQL database or databases	Customers are prohibited from using the MySQL database or databases included with the AppDynamics software with any other product or for any other purpose other than for the AppDynamics software as provided.
Machine Agents	Each unit of the products in the Application Performance Management includes one unit of Machine Agent at no cost, but such Machine Agent shall only be used on the instance of the OS being monitored by the purchased unit.

Category	Restriction
APM Peak Edition	<p>AppDynamics for Java, .NET, or Node.js: During the License Term of the Subscription Licenses (or, if applicable, during the Maintenance and Support Term of perpetual licenses) on the applicable Order Form, End User may, once per calendar quarter and upon 24 business hours' written notice, exchange licenses among the following types of Software units: AppDynamics Pro Edition for Java, .NET and Node.js on a one-for-one basis, and separately AppDynamics Test &amp; Dev Edition (each an "Exchangeable Group") for the same products on a one-for-one basis. For clarity, the list prices of all products within each Exchangeable Group (Pro Edition and Test &amp; Dev Edition, respectively) are the same and through such exchanges, the End User may not at any time use products with a cumulative value exceeding the total list price of products on the applicable Order Form.</p>
APM Any Language	<p>APM Any Language customers are prohibited from instrumenting APM Any licenses on SAP application servers unless such customer has purchased the requisite AppDynamics for SAP - ABAP Agent or Agents.</p>
End User Monitoring - Peak Edition	<p>Browser or Mobile RUM: During the License Term of the Subscription Licenses (or, if applicable, during the Maintenance and Support Term of perpetual licenses) on the applicable Order Form, the End User may, once per calendar quarter and upon 24 business hours' written notice, exchange licenses among the following types of Software units: AppDynamics Pro Edition for Browser Real User Monitoring and Browser Analytics for units of Mobile Real User Monitoring and Mobile Analytics on a one-for-one basis (and vice versa), and separately AppDynamics Test &amp; Dev Edition for the same products (and vice versa) on a one-for-one basis. End User may not exchange any AppDynamics for Browser Real User Monitoring licenses during any year in which End User has used any pageviews of such licenses. For clarity, the list prices of all products within each Exchangeable Group (Pro Edition and Test &amp; Dev Edition, respectively) are the same and through such exchanges, the End User may not at any time use products with a cumulative value exceeding the total list price of products on the applicable Order Form.</p>
Upgrades	<p>Upgrade entitles the customer to the entitlement of the product to which the customer is upgrading.</p>

Category	Restriction
Standard University Subscription	Customers that have purchased any of the software listed below under the heading "Application Performance Management" shall be entitled to access the AppDynamics University Self-Paced Library, subject to the conditions set forth in this paragraph. No greater than 20 unique users per month per AppDynamics account are entitled to this access. Access shall be limited to customers that have purchased this software either (i) on a subscription basis but remain current on payment of all subscription license fees, if any, or (ii) on a perpetual basis but remain current on payment of all maintenance and support fees if any. Customers may log in using AppDynamics account credentials.

## Data Storage and Retention Entitlements

[SaaS Deployment](#)    [On-Premises Deployment](#)

- Metric Data in one-minute increments are retained for 8 days.
- Metric Data in one-hour increments are retained for 13 months.
- Event Data is retained for 8 days.

**i** For the Enterprise package, additional Event Data retention of 30, 60, or 90 days is available as an add-on.

[SaaS Deployment](#)    [On-Premises Deployment](#)

- Metric Data in one-minute increments are retained for 4 hours.
- Metric Data in ten-minute increments are retained for 48 hours.
- Metric Data in one-hour increments are retained for 13 months.
- Event Data is retained for 8 days, except that retention for on-premises deployments is configurable.

## Data Limits

### AppDynamics for OpenTelemetry™

- You are entitled to conduct 270,000 requests per day ("Daily Request Limit"). After you reach the Daily Request Limit, you will not be able to submit any further requests (or otherwise ingest data) until the following day when your Daily Request Limit will reset.
- However, you are not permitted to ingest data in excess of 8,000,000 requests in any calendar month ("Monthly Data Limit"), and AppDynamics reserves the right to restrict data ingestion until the following calendar month if you exceed the Monthly Data Limit in the preceding calendar month.

## License Entitlement Definitions

Entitlement	Definition
<b>AppDynamics for OpenTelemetry</b>	The AppDynamics service for ingesting OpenTelemetry™ data.
<b>AppDynamics Collector for OpenTelemetry</b>	A prepackaged, minified deployment of the OpenTelemetry™ Collector available on the AppDynamics Downloads Portal.
<b>Active Agent</b>	A unique installation of an application instrumented with an AppDynamics Mobile Real User Monitoring Agent that was launched on a device in a given calendar month.
<b>CPU Core</b>	<p>Each logical thread core or processor on a physical or virtual host machine is recorded by the operating system as a unique instance. AppDynamics treats each unique instance as 1 CPU Core.</p> <p>For APM and Database Agents, AppDynamics detects and calculates the number of CPU Cores on a host. However, for Database Agents, the maximum number of CPU Cores allowed is 4, so AppDynamics sets the CPU Cores to 4 even if the detected number exceeds this limit.</p> <p>If AppDynamics cannot detect the CPU Cores on a host for either APM or Database Agents, AppDynamics will use 4 as the default.</p>
<b>Controller Tenant</b>	A URL where customers access their instance of the AppDynamics software. It has a <a href="#">Controller Tenant</a> account name, which in turn has its own set of users, agents reporting to it, and application monitoring configuration.
<b>Customer Digital Experience Monitoring</b>	<p>The integration of <a href="#">AppDynamics End User Monitoring</a> with <a href="#">ThousandEyes Network and Application Synthetics</a>. You must have an active license for AppDynamics End User Monitoring and an active subscription to ThousandEyes Network and Application Synthetics to use Customer Digital Experience Monitoring.</p> <p>Customer Digital Experience Monitoring may transfer and process your data in regions described in the <a href="#">AppDynamics Privacy Data Sheet</a>. For more information, please refer to your applicable ordering documentation, which includes the relevant privacy data sheet.</p>

Entitlement	Definition
<b>Database Instance</b>	A complete running database environment, including the software, table structure, and other functionality. Typically this corresponds to a host/port combination where the port is the listener port for the database software. Database administrators might create multiple database environments on the same physical hardware, with each such environment having its own unique listener port.
<b>EUM Cloud</b>	The end user monitoring component that receives and processes data received from end-user devices.
<b>Event Data</b>	The raw data generated by the Software and stored in the Events Service.
<b>Events Service</b>	The component that stores the Event Data.
<b>GB</b>	Gigabyte
<b>Instrument</b>	To collect data, monitor, troubleshoot, and manage using the AppDynamics software.
<b>Metric Data</b>	The aggregate value of the data collected by the Software over a given period of time.
<b>Pageview</b>	A Pageview is an instance of a base page, virtual page, or iFrame loaded by a web browser. Each base page view, iframe view, and virtual page view is counted as a Pageview. Repeated views of one page are counted as separate Pageviews.
<b>Real User Monitoring (RUM) Token</b>	The common unit of measure for consumption of Real User Monitoring products during each 12 calendar month period in a License Term, with the first such period beginning on the start date of the relevant License Term; one Pageview consumes one RUM Token, and deployment of one Active Agent consumes 160 RUM Tokens per month.

1. The Datavard Insights product was rebranded to SNP CrystalBridge Monitoring following the acquisition of Datavard by SNP.    
2. For clustered database products (e.g. Couchbase or Oracle RAC), monitor one Database Instance per node of the cluster. With using the Collector/Sub-Collector configuration to group multiple Database Instances in a single Collector, licensing is per Database Instance. 

3. Effective August 2021, new and existing customers can no longer purchase AppDynamics for NetApp. All users of AppDynamics for NetApp can continue to use existing licenses until the end of their term. After the end of their license term, the product is no longer available. See [Support Advisory: AppDynamics for NetApp End of Life \(EOL\) Notice](#). ↻

## Observe License Usage

### Related pages:

- [License Entitlements and Restrictions](#)
- [AppDynamics Licensing](#)

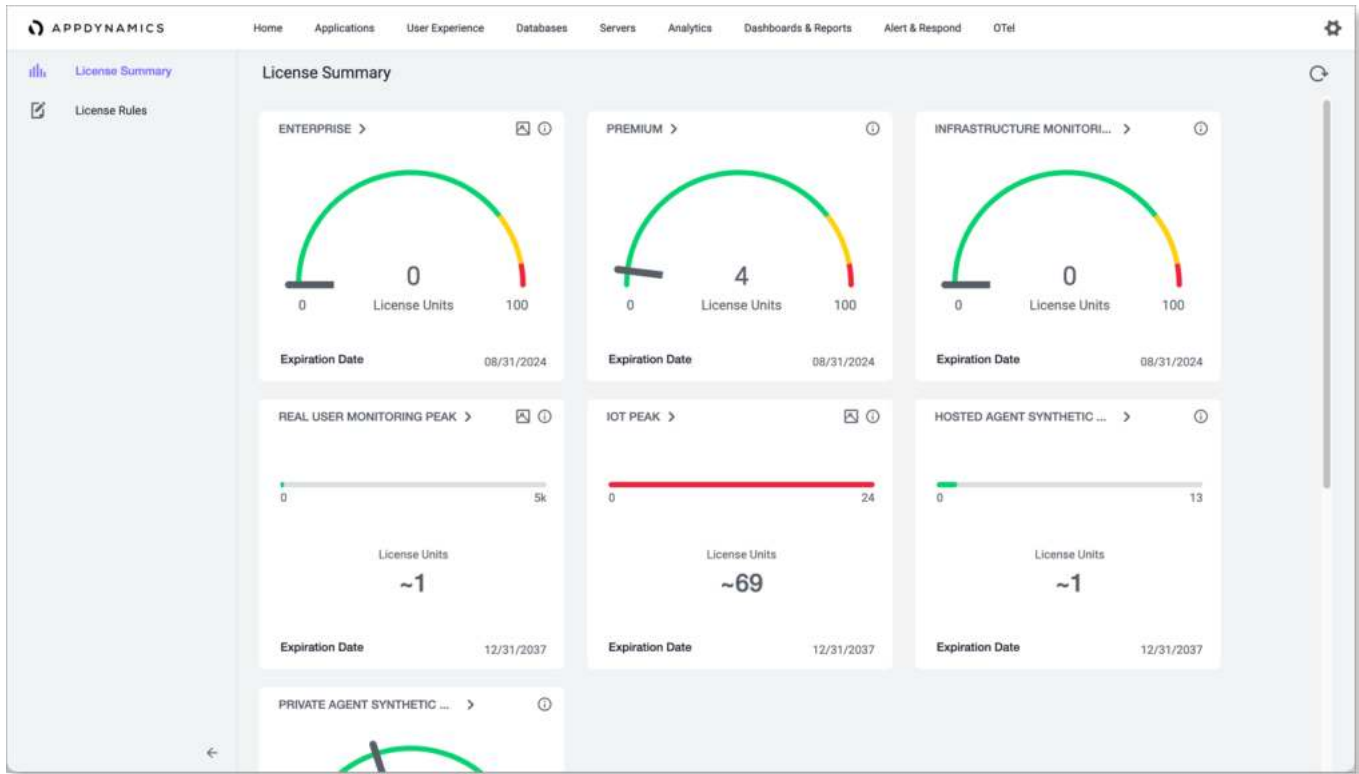

In the Controller Tenant, you can identify license overconsumption and improve license allocation by observing how AppDynamics licenses are consumed by time period, agent, host, application, and license rule.

[Infrastructure-based Licensing](#)   Agent-based Licensing

 Observing and managing licenses on Controller Tenant UI differs according to the AppDynamics licenses you purchased. If you purchased licenses in the Infrastructure-based Licensing model, your UI displays usage data based on a unified package metering unit, compared to licenses within the Agent-based model, which displays data based on an agent metering unit. See [AppDynamics Licensing](#).

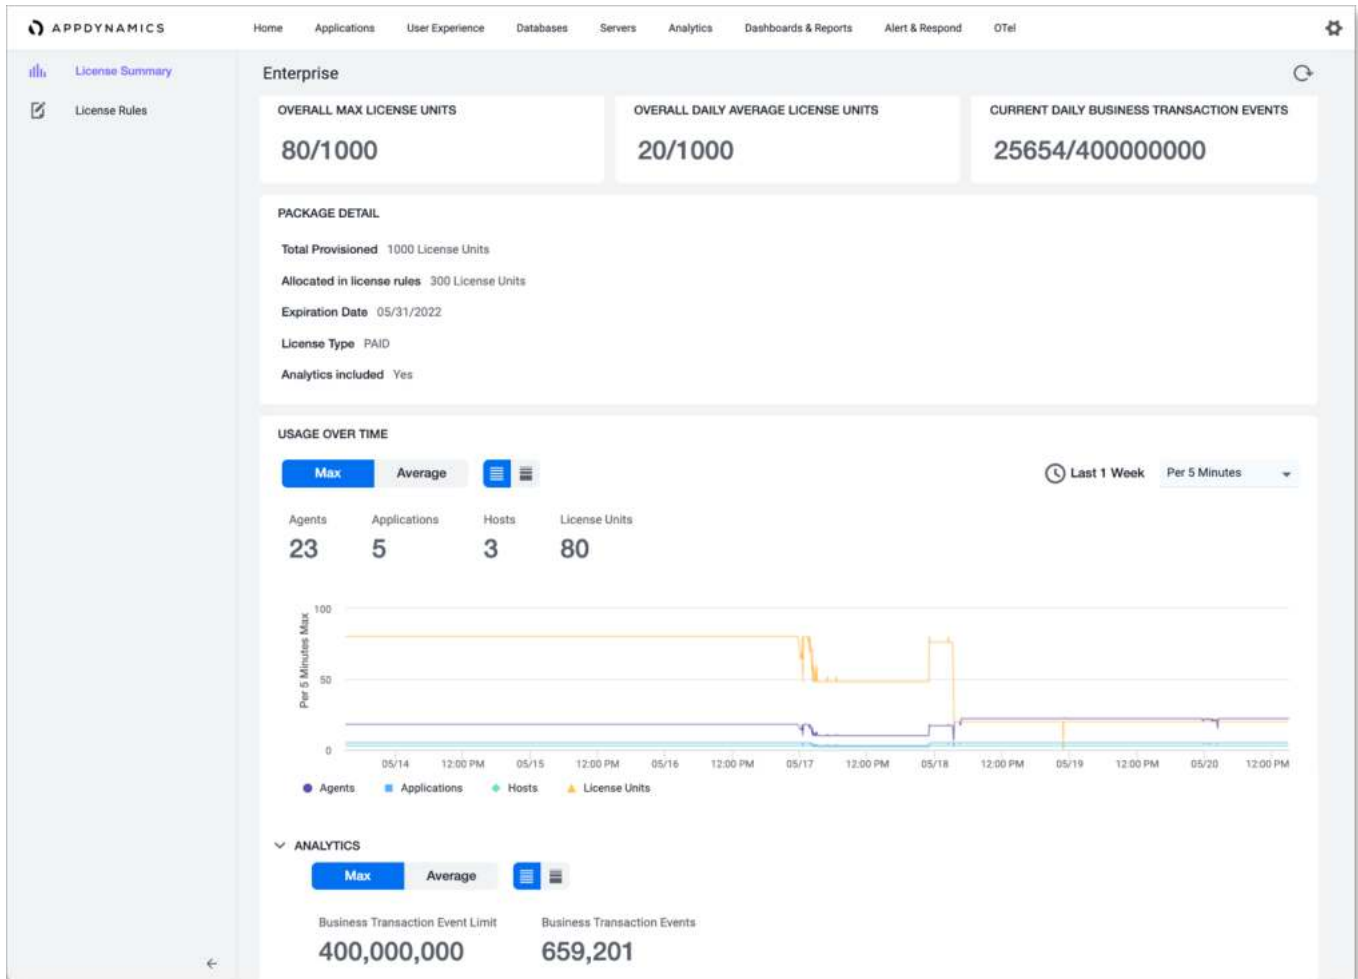

## License Summary Dashboard

The **License Summary Dashboard** displays high-level usage for all your licenses within a 24-hour period. To access the **License Summary** dashboard, go to **Settings**  **> License**.

## View Usage for a License

Click on a license to drill down on usage.

### Metric Descriptions

- Overall Max License Units:** The most licenses consumed within an hour, within a 24-hour period. For example, in a 24-hour period, 100 units were consumed in the first hour, then 200 units in the second hour, 300 units in the third hour, and 300 units in the fourth hour. The **Overall Max License Units** would be 300 units because that's the highest number of units within an hour, within a 24-hour period. After 24 hours, the meter restarts for the next period.
- Overall Daily Average License Units:** The average number of units consumed within a 24-hour period. For example, if in a 24-hour period, 100 units were consumed in the first hour, 200 units in the second hour, 300 units in the third hour, and 300 units in the fourth hour, the **Overall Daily Average License Units** would be 225 units (total units/# of consuming hours = Ave.). After 24 hours, the meter restarts for the next period.
- Current Daily Business Transaction Units (Enterprise licenses only):** The total number of units consumed within a 24-hour period. For example, if you bought one unit of the Enterprise license, the **Current Daily Business Transaction Units** would show how many events have been consumed out of 400,000,000 events allowed for a 24-hour period. After 24 hours, the meter restarts for the next period.

### Usage Over Time

For Enterprise, Premium, or Infrastructure licenses, the **Usage Over Time** graph shows consumption by agent, application, host, and license unit. For Real User Monitoring licenses, you can filter by metering unit: RUM Token, Pageviews, License Units, and Mobile Active Agents.

## Analytics

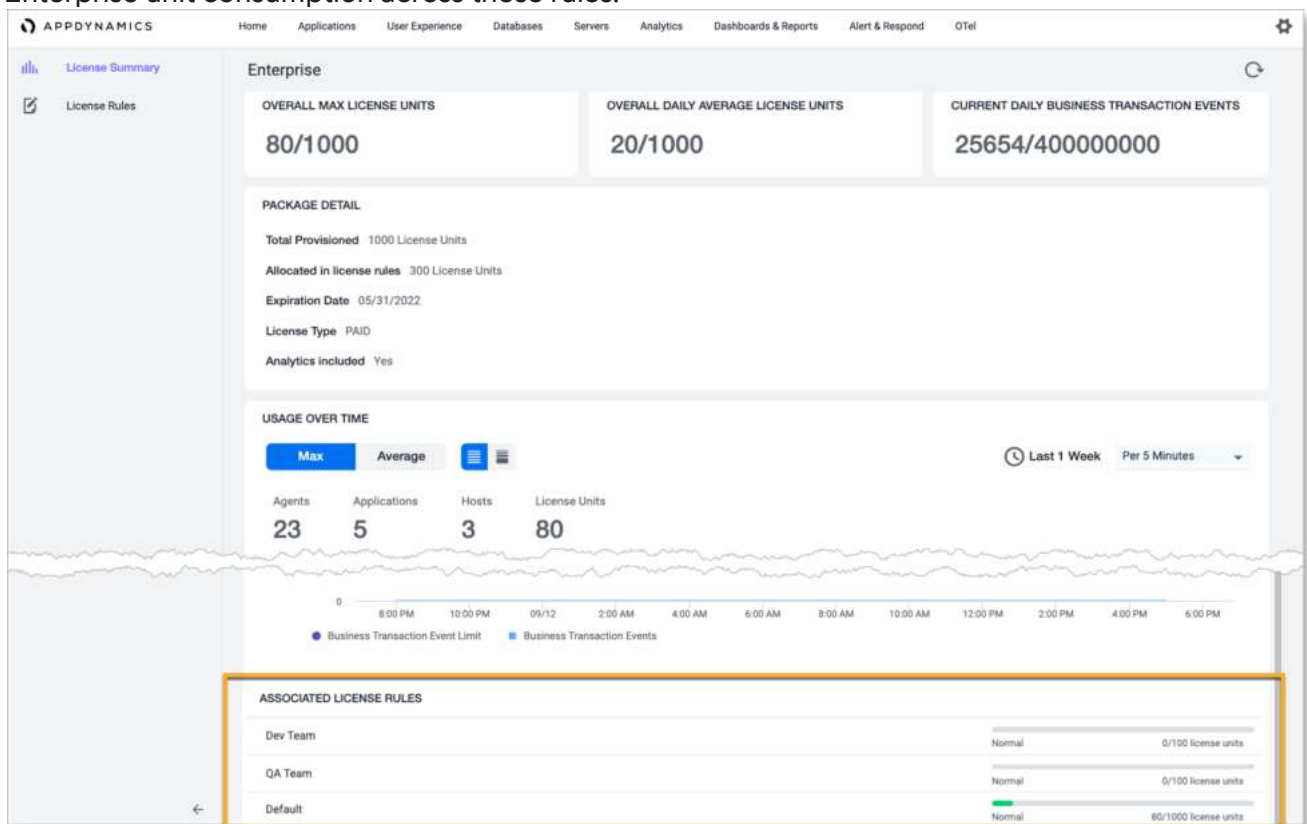

For Enterprise licenses, the **Analytics** graph shows consumption by business transaction event, compared to the total event limit. You can adjust the graph data by filtering by date and time range and toggling between viewing **max usage** or **average usage**.

## License Rule Usage

**License rules** define the allocation of the license units. There are two ways to view license rule usage on the Controller Tenant UI:

### From the License Summary dashboard

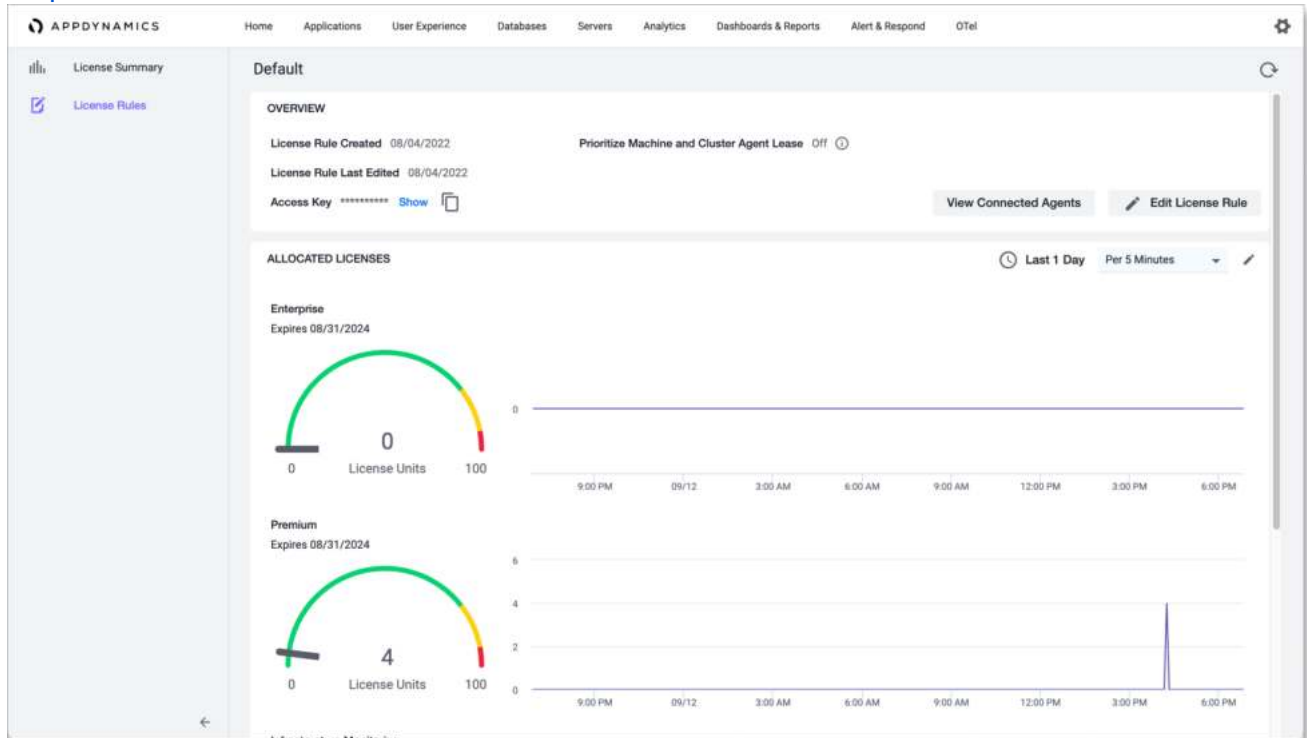

1. Click on a license.
2. Scroll down to **Associated License Rules** to view a list of associated license rules and the volume of Enterprise unit consumption across those rules.

### From the License Rules dashboard

1. Click a license rule.
2. Review the allocated licenses, usage of each license within the rule, and other rule details.

3. Click **View Connected Agents** to see agents connected to the rule and [application and server scopes](#).

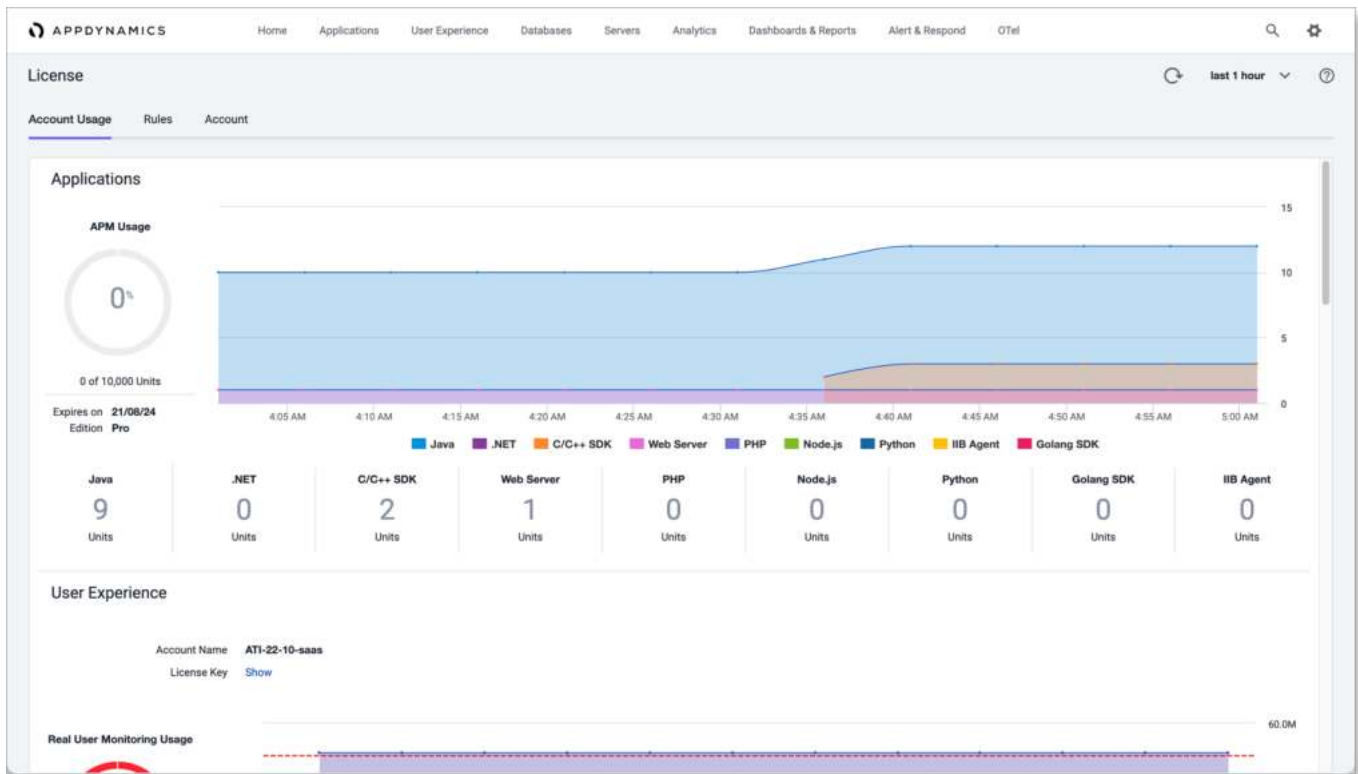

Infrastructure-based Licensing    [Agent-based Licensing](#)

**i** Observing and managing licenses on Controller Tenant UI differs according to the AppDynamics licenses you purchased. If you purchased licenses in the Agent-based Licensing model, your UI displays usage data based on an agent metering unit, compared to licenses within the Infrastructure-based model, which displays data based on a unified package metering unit. See [AppDynamics Licensing](#).

## Account Usage Dashboard

To view license usage, go to **Settings** > **License**.

Click on a license to view consumption limits. The graphs show the cumulative license usage over the time period you specify, even though the license usage count is reset daily. To view your license usage for one day, set the time range to 23 hours and 59 seconds.

## License Errors and Troubleshooting

This page covers license errors and troubleshooting in the Controller UI.

[Infrastructure-based Licensing](#)   [Agent-based Licensing](#)

**i** The Controller UI for observing and managing licenses differs based on the AppDynamics licenses you purchased. If you purchased licenses in the Infrastructure-based Licensing model, your UI displays usage data based on a unified package metering unit, compared to licenses within the Agent-based model, which displays data based on an agent metering unit. If you want to learn more about licensing models, see [AppDynamics Licensing](#).

### License Errors

License error notifications display in the Controller next to **Settings** . This table below lists possible error messages and their causes.

Error Message	Cause
Invalid license key	Cannot find allocation by license key because of an invalid license key. May be caused by a license rule mismatch or typo in the configuration, or missing authorization headers when connecting to the Controller.
Cannot match filter conditions for allocation <allocation-name> (Id = <allocation-id>): hostId = <host-id>, appId = <app-id>, appName = <app-name>	Reported application or server does not match conditions defined in the allocation rule (application/server scope).
License limit exceeded for License Rule "<allocation-name>" (Id = <allocation-id>) of Account Id = <account-id>. AgentType: <agent-type>, Host: <host>, Considered packages: <considered-packages>, Application: <application-name>, Node Id: <node-id>.	License limit was exceeded on the allocation rule level. There are no available units across any of the packages provisioned for the allocation rule.
License limit exceeded for Account Id = <account-id>. License Rule: <allocation-name>, AgentType: <agent-type>, Host: <host>, Considered packages: <considered-packages>, Application: <application-name>, Node Id: <node-id>.	License limit check passed for the allocation rule level but was exceeded on the system (Controller) level.
System account license limit exceeded for <package-name>. Account Id: <account-id>, License Rule: <allocation-name>, AgentType: <agent-type>, Host: <host>, Considered packages: <considered-packages>, Application: <application-name>, Node Id: <node-id>.	License limit checks passed for the allocation rule and account level but was exceeded on system (Controller) level.

## Troubleshoot Licenses

### Licensed Agent Not Registering

If a licensed agent cannot register with the Controller:

1. Check that the user account has a product license for the relevant agent type.
2. If the user account has license rules defined, verify that the rules have the correct number of license units allocated. See [Best Practices for License Rules](#).

To change the number of allocated units in a rule:

- a. Click **Settings**  > **License** > **License Rules**.
- b. Open a rule and click **Edit** .
- c. Under **License Allocation**, change the number of licenses and apply the change.

### Overconsumption from Machine/Cluster Agents

If license overconsumption is caused by Machine or Cluster agents, you can enable the machine/cluster agent prioritization setting to ensure enough license units are available for Machine and Cluster agents. See [Machine/Cluster Agent Prioritization](#).

Infrastructure-based Licensing [Agent-based Licensing](#)

### License Errors

License error notifications display in the Controller next to **Settings** . This table below lists possible error messages and their causes.

Error Message	Cause
<p>&lt;Agent type String&gt; agent on host "&lt;host name&gt;" is not authorized to report to application "&lt;application name&gt;". Reason: Missing access key.</p> <p>or</p> <p>Agent license request denied. Agent type: &lt;agent type string&gt;; Node: &lt;node name&gt;; Tier: &lt;Tier name&gt;; Application: &lt;application name&gt;; Host: &lt;hostId&gt;; Reason: Missing access key.</p>	<p>Access key is missing from the agent request. For example, if the Controller returns a 401 error during authentication, the agent drops the authorization header and causes this error.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p> Node (tier) names are only provided for app agents.</p> </div>
<p>Agent license request denied. Agent type &lt;agent type string&gt;; Node: &lt;node name&gt;; Tier: &lt;Tier name&gt;; Application: &lt;application name&gt;; Host : &lt;hostId&gt;; Reason: Access Key used is not account access key.</p>	<p>Access key provided is not the account access key for the Database Agent.</p>

Error Message	Cause
<p>Agent license request denied. Agent type: &lt;agent type string&gt;; Node: &lt;node name&gt;; Tier: &lt;Tier name&gt;; Application: &lt;application name&gt;; Host : &lt;hostId&gt;; Reason: Invalid access key.</p> <p>or</p> <p>&lt;Agent type String&gt; agent on host "&lt;host name&gt;" is not authorized to report to application "&lt;application name&gt;". Reason: Invalid access key.</p>	<p>The license rule that was retrieved for a specific access key provided by the agent, is incorrect. This error may also occur when there is a misconfiguration. For example, the access key was updated directly in database but the caches did not include that update, then an access key mismatch will occur.</p> <div data-bbox="586 520 1312 640" style="border: 1px solid #0070C0; background-color: #D9E1F2; padding: 5px;"> <p> Node (tier) names are only provided for app agents.</p> </div>
<p>Agent license request denied. Agent type &lt;agent type string&gt;; Node: &lt;node name&gt;; Tier: &lt;Tier name&gt;; Application: &lt;application name&gt;; Host : &lt;hostId&gt;; License Rule: &lt;license rule name&gt; ; Reason: No license available.</p>	<p>No licenses are available during agent registration.</p> <div data-bbox="586 940 1312 1060" style="border: 1px solid #0070C0; background-color: #D9E1F2; padding: 5px;"> <p> Node (tier) names are only provided for app agents.</p> </div>
<p>&lt;Agent type String&gt; agent on host "&lt;host name&gt;" is not authorized to report to application "&lt;application name&gt;". ---

## Troubleshoot Licenses

If a licensed agent cannot register with the Controller:

1. Check that the user account has a product license for the relevant agent type.
2. If the user account has license rules defined, verify that the rules have the correct number of license units allocated. See [Machine/Cluster Agent Prioritization](#).

To change the number of allocated units in a rule:

- a. Click **Settings**  > **License** > **Rules**.
- b. Open a rule and click **Edit** .
- c. Under **License Allocation**, change the number of licenses and apply the change.

## License Rules

A license rule defines how your applications use your AppDynamics licenses. License rules can help reduce consumption by allocating more units to high-consuming applications and servers.

AppDynamics provides an Infrastructure-based License (IBL) model and an Agent-based License (ABL) model. You use the Controller Tenant UI for observing and managing licenses, which displays differently according to the type of licenses you purchased. See [Licensing](#).

- IBL model—displays usage data based on a unified package metering unit.
- ABL model—displays data based on an agent metering unit.

[Infrastructure-based Licensing](#)    [Agent-based Licensing](#)

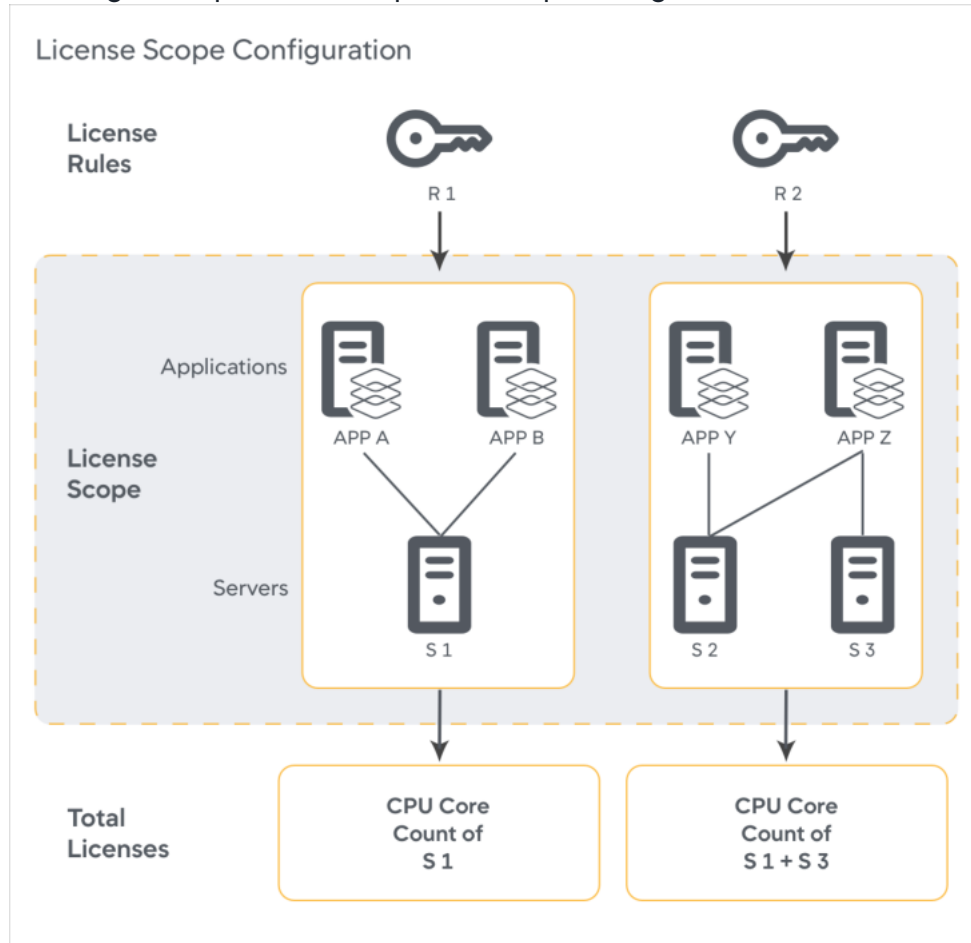

---

## Create a License Rule

To create a license rule:

1. Go to **Settings**  > **License** > **Rules**.
2. Click **Create** .
3. Add a rule name.
4. Define how many units from each license are included in the rule.

- Choose which applications and servers the rule applies to.  
This diagram depicts an example of a scope configuration for IBL.

## Machine and Cluster Agent License Prioritization

**i** The Machine and Cluster Agent license prioritization setting is available for infrastructure-based licenses in Controller  $\geq 21.11.0$ .

With Infrastructure-based Licenses (IBL), you can activate license rules to preserve license usage for a Cluster Agent in situations where the system cannot detect its vCPU details. When a Cluster Agent lacks vCPU information, it will be refused and will not be registered, preventing license consumption. This feature enables you to avoid using a license for the agent.

For example, use this setting when you are running a large cluster with several working nodes. If a node using the Cluster Agent fails, then the other app agents on the cluster may use up all the licenses available in the infrastructure-based license pool. When the node recovers and the Cluster Agent tries to get a license lease, there might not be enough available, which will result in overages. If the Machine/Cluster Agent license prioritization setting is activated, one of the other agents will release licenses to

allow cluster agents to use them if there are not enough licenses available. To enable the **Prioritize Machine/Cluster Agent License Lease** setting:

1. Go to **Settings**  > **License** > **License Rules**.
2. Click the **PRIORITIZE MACHINE AND CLUSTER AGENT LEASE** toggle.
3. Click **Done**.

## Wait for vCPU Information Before Registering Agents

You can enable license rules to help you conserve license consumption for a Cluster Agent when the system cannot detect its vCPU information. In such cases, the Cluster Agent without the vCPU information will be rejected and not registered, so you can avoid consuming a license for the agent.

For example, an agent will request to be registered every minute and will be rejected for up to ten minutes while waiting for vCPU information from a host. If no vCPU information has been received after 10 minutes, the agent will fall back to use the default license units. An agent will be allowed to report data as soon as it's registered. If no license units are available, then the agent will be rejected.

To enable the **Wait for vCPU Information Before Registering Agents** setting:

1. Go to **Settings**  > **License** > **License Rules**.
2. Click the **WAIT FOR VCPU INFORMATION BEFORE REGISTERING AGENTS** toggle.
3. Click **Done**.

## Best Practices for License Rules

- When creating license rules, you should follow consistent criteria for selecting which applications belong to a rule. We recommend:
  - If you want a rule to contain multiple applications, then group applications by business unit.
  - If you want to view individual application usage, then select only one application per rule.
- For each rule you create, a new access key is generated, and the agents under that rule are authenticated with that generated key. Make sure to update your agent to use this new access key and restart the agent.
- Make sure the selected applications and servers on each rule are an exclusive list and are not part of multiple rules. This structuring helps with managing chargebacks effectively.
- If you choose not to create any rules, then your license allocation follows the default rule, which allows all applications and servers to equally consume each license.
- To simplify license reporting in a cluster (containerized environment), we recommend that all applications and agents use the same license key when using license rules.
- When configuring rules, you can allocate more units than you were originally provisioned by AppDynamics. Over-provisioning units buffer your unit allocation and are useful when the exact number of license units for the list of applications and servers for the rule are unknown. Although the allocation on the rule is unbounded, AppDynamics limits your unit usage according to the number of licenses you purchased.

Overlapping configurations on license rules may complicate license reporting. AppDynamics recommends you configure license rules with caution because you must confirm the license usage on each rule matches the license usage at the account level. License usage at the account level is the union of usage for all license rules, and not a sum of usage of all license rules. When multiple applications are hosted on the same host and each application agent uses a different rule key, usage will be reported in both the rules, and it will be reported as if you are consuming double the licenses, which is incorrect.

## Create a License Rule

1. Click **Settings**  > **License** > **Rules**.
2. Click **Create** .
3. In the **General** tab, enter the name of your rule and the number of units for each agent module type that this rule allocates.
4. In the **Application Scope** tab, select **Specified Applications** to restrict which applications agents can report to.

 Only agents that report to the applications you specify can consume the units allocated by this rule. You can select one or more applications from the Available Applications list and click the left arrow button to move the applications to the **Included Applications** box. You can specify matching criteria for allowed applications using the **Add** button. You can also specify matching criteria for applications that you have not yet created. The applications you specify using matching criteria will not appear in the **Selected Applications** box. You can select up to 100 applications to assign to a rule.

5. In the **Server Scope** tab, select **Specified Servers** to restrict which servers agents can be deployed to.

 Only agents deployed on the servers you specify can consume the units allocated by this rule. You can select one or more servers from the Available Servers list, and click the left arrow to move the applications to the **Selected Applications** box. You can specify matching criteria for allowed servers using the **Add** button. You can also specify matching criteria for servers not yet monitored by AppDynamics. The applications you specify using matching criteria will not appear in the **Selected Applications** box.

- Using the criteria specifications, you can select applications and servers by matching multiple machines using the match criteria. This is more efficient than scrolling through thousands of applications and machines to make your selections manually.
- You can also add uninstrumented applications to the rule in the Application Scope and unmonitored machines in the Server Scope so that when you install the agents to instrument these unmonitored applications and servers, they will be allowed to consume licenses defined in this rule.

This diagram is an example of a scope configuration.

- Return to the default rule and decrement your unit allocation by the number of units that you allocated in your custom rule. Otherwise, the allocations will show as over-provisioned.

**i** You must allocate the same number of Machine Agents as your APM Agents. For example, if you allocate 10 Java Agents, 10 .NET Agents, and 10 Node.js Agents, you must allocate 30 Machine Agent units. For each rule you create, a new access key is generated, and the agents under that rule are authenticated with that generated key. Update your agent to use this new access key and restart the agent.

## License Rules Best Practices

### Creating License Rules

When creating license rules, you should follow consistent criteria for selecting which applications belong to a rule. We recommend:

- If you want a rule to contain multiple applications, then group applications by business unit.
- If you want to view individual application usage, then select only one application per rule.

### Deleting a default license rule

AppDynamics does not recommend deleting default license rules. Instead, we recommend changing all of the license entitlements to 0. If you do delete a default rule, keep these in mind:

- If there is only one license rule (e.g. the default), deleting it will take the License Management UI back to a state when license rules never existed.
- Deleting a license rule will not impact existing agents because they will start reporting using the account-level access key.

- If you have multiple license rules (one default and multiple custom) and you delete the default rule, you will not be able to recreate it until you delete all other rules.
- Click **Create Rules** to create a new default rule. The access key will be different and you will also need to re-configure your agents.

### Deleting a custom license rule

- Deleting and recreating a custom license rule will not retrieve the old access key, even if you use the same name, since access keys are generated dynamically at runtime.

## Product and Release Announcements

This table lists the agent, Controller, and on-premises releases. Note that some releases will not have resolved issues or enhancements. For other types of announcements, see [Product Announcements and Alerts Home](#).

Filter table:

Release Date	Version	Component/Product	Release Notes
December 6, 2023	23.11.1	SaaS Controller	<a href="#">23.11 Controller Enhancements</a>
December 6, 2023	23.12.0	iOS Agent	<a href="#">23.12 iOS Agent Enhancements</a>

SAP	There is no 23.11.0 release yet.	-	-									

Agent	Summary	Release Version	Release Date
Hosted Synthetic Agent	This release supports Synthetic jobs execution on Chrome version 117 (Beta). There are no changes to the support on Chrome version 86.  See <a href="#">Choose Browsers</a> .	23.11.0	November 16, 2023
Private Synthetic Agent	There is no 23.11.0 release yet.	-	-
Xamarin Agent	There is no 23.11.0 release yet.	-	-
.Net Agent	This release includes: <ul style="list-style-type: none"> <li>• Code optimizations, performance improvements, and third-party library upgrades.</li> <li>• Bug fixes. See <a href="#">Agent Resolved Issues</a>.</li> </ul>	23.11.0	November 30, 2023

### SaaS Controller Enhancements

Product/Component	Summary	Release Version	Release Date
Alert and Respond	<p>You can now create a policy for the following <b>AppDynamics Config Warnings</b> events:</p> <ul style="list-style-type: none"> <li>• <b>Controller Metric Registration Limit Reached</b></li> <li>• <b>Agent Metric Registration Limit Reached</b></li> </ul> <p>See <a href="#">Configure Policies</a>.</p> <p>For a data unavailable scenario, you can now control the health rule evaluation to one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Critical or Warning:</b> The health rule considers this no data scenario as Critical or Warning condition, and the health rule status is shown in Red or Yellow, respectively.</li> <li>• <b>Unknown:</b> The health rule considers the no data scenario as unknown, and the health status is shown in Grey.</li> <li>• <b>Healthy:</b> The health rule considers the no data scenario as healthy, and the health rule status is shown in Green.</li> </ul> <p>See <a href="#">Create and Configure Conditions</a>.</p>	23.11.1	December 6, 2023

Product/ Component	Summary	Release Version	Release Date															
Controller	<p>These components are upgraded in this release:</p> <table border="1" data-bbox="302 506 1299 888"> <thead> <tr> <th data-bbox="302 506 615 590">Component</th> <th data-bbox="615 506 967 590">Previous Version</th> <th data-bbox="967 506 1299 590">Upgraded Version</th> </tr> </thead> <tbody> <tr> <td data-bbox="302 590 615 663">Apache Xerces</td> <td data-bbox="615 590 967 663">2.7.1</td> <td data-bbox="967 590 1299 663">2.12.0</td> </tr> <tr> <td data-bbox="302 663 615 737">OpenSSL</td> <td data-bbox="615 663 967 737">1.1.1q</td> <td data-bbox="967 663 1299 737">3.0.1</td> </tr> <tr> <td data-bbox="302 737 615 810">Minimist</td> <td data-bbox="615 737 967 810">1.2.0</td> <td data-bbox="967 737 1299 810">1.2.7</td> </tr> <tr> <td data-bbox="302 810 615 888">Lodash</td> <td data-bbox="615 810 967 888">3.10.1 and 4.17.4</td> <td data-bbox="967 810 1299 888">4.17.21</td> </tr> </tbody> </table> <p>These components are removed in this release:</p> <ul data-bbox="326 940 483 995" style="list-style-type: none"> <li>• Linux kernel</li> <li>• GlassFish</li> </ul>	Component	Previous Version	Upgraded Version	Apache Xerces	2.7.1	2.12.0	OpenSSL	1.1.1q	3.0.1	Minimist	1.2.0	1.2.7	Lodash	3.10.1 and 4.17.4	4.17.21	23.11	November 30, 2023
Component	Previous Version	Upgraded Version																
Apache Xerces	2.7.1	2.12.0																
OpenSSL	1.1.1q	3.0.1																
Minimist	1.2.0	1.2.7																
Lodash	3.10.1 and 4.17.4	4.17.21																
Anomaly Detection	<p>In the <b>Suspected Cause</b> details page, the <b>Top Deviating Metrics</b> timeline now clearly displays the evaluation period of an anomaly. The evaluation time period is the duration in which the data is analyzed to detect the anomaly. From the timeline, you can now precisely identify the time when the issue started. See <a href="#">Troubleshooting Anomalies</a>.</p>	23.11.0	November 30, 2023															

Product/ Component	Summary	Release Version	Release Date
ThousandEyes Integration with Mobile Real User Monitoring	<p>You can integrate ThousandEyes with Mobile Real User Monitoring. This integration combines mobile application data from AppDynamics and internet network metrics from ThousandEyes to provide full-stack observability.</p> <p>When you add the ThousandEyes widget to the mobile application dashboard, you can:</p> <ul style="list-style-type: none"> <li>• View ThousandEyes network metrics (packet loss, latency, and jitter) and network health in the context of mobile applications.</li> <li>• Analyze the impact of network performance on mobile application performance               <ul style="list-style-type: none"> <li>◦ Analyze how latency, packet loss, and jitter affect end-user response time and application errors</li> </ul> </li> <li>• Identify whether the network is the cause of mobile application issues:               <ul style="list-style-type: none"> <li>◦ Network issue affecting a specific geographic location</li> <li>◦ Network issue affecting a specific domain</li> <li>◦ Network issue (latency) causing higher end-user response time</li> <li>◦ Network issue (packet loss) causing errors in mobile applications</li> <li>◦ Network issue (jitter) causing inconsistent user experience</li> </ul> </li> <li>• Narrow down the network issue to a specific domain and a specific location</li> <li>• Forward the ThousandEyes test with the network issue to the NetworkOps team for further troubleshooting</li> <li>• Troubleshoot the network issue by navigating to the ThousandEyes dashboard</li> </ul> <p>See <a href="#">ThousandEyes Integration with Mobile Real User Monitoring</a>.</p> <p>To activate the integration, you need an active license of any of the following EUM licenses and an active subscription to <a href="#">ThousandEyes Network and Application Synthetics</a>:</p> <ul style="list-style-type: none"> <li>• Real User Monitoring (SaaS) - Peak Edition</li> <li>• Mobile Real User Monitoring (SaaS) - Peak Edition</li> </ul> <p>For the license entitlements, see <a href="#">License Entitlements and Restrictions</a>.</p> <p>Your data may travel outside your selected region if you use the ThousandEyes integration. For more information, see the Privacy Data Sheets for <a href="#">AppDynamics</a> and <a href="#">ThousandEyes</a>.</p>	23.11.0	November 30, 2023

Product/ Component	Summary	Release Version	Release Date
Cluster Monitoring	<p>The following event subtypes are now supported to define the policy actions:</p> <ul style="list-style-type: none"> <li>• Deployment Added</li> <li>• Deployment Deleted</li> <li>• Replicaset Added</li> <li>• Replicaset Deleted</li> <li>• Pod Added</li> <li>• Pod Deleted</li> <li>• Pod Phase Changed</li> </ul> <p>On the <b>Events</b> page, <b>New Cluster Events</b> are now changed to <b>Custom</b>. See <a href="#">Configure Policy for Kubernetes Events</a>.</p>	23.11.0	November 30, 2023
Browser Real User Monitoring	<p>You can now enable Google Core Web Vitals in AppDynamics SaaS while configuring the JavaScript Agent. Google Core Web Vitals is a set of metrics that measure the real-world user experience for loading performance, interactivity, and visual stability of the page. For more information, see <a href="#">Enable Core Web Vitals</a>.</p>	23.11.0	November 30, 2023
Unified Observability Experience (EAP)	<p>Cisco introduces the all-new <a href="#">Unified Observability Experience</a>, combining Cisco Cloud Observability and AppDynamics SaaS tenants to get to the root cause faster with logs. With the Early Access Program (EAP), you can see in-context logs for your applications and leverage the advanced log troubleshooting capabilities of Cisco Cloud Observability.</p> <p>Cisco Cloud Observability is Cisco’s software-as-a-service (SaaS) product for observing, securing, and optimizing large, managed Kubernetes deployments on public clouds (Amazon Web Services, Microsoft Azure, and Red Hat OpenShift). For participation, AppDynamics SaaS tenants must be integrated with Cisco Observability Platform tenants. The Cisco Support team will perform this integration during the EAP phase.</p> <p>For information about Cisco Cloud Observability, see <a href="#">About Cloud Native Application Observability</a>.</p> <div style="border: 1px solid #ccc; background-color: #fff9c4; padding: 10px; margin-top: 10px;"> <p> This documentation mentions features that are currently in the early access phase. Cisco AppDynamics makes no warranties regarding these features, including performance, quality, or availability, and reserves the right to change the features and its documentation including the content herein at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.</p> </div>	23.11.0	November 30, 2023

Product/Component	Summary	Release Version	Release Date
General	Business Transactions are now mapped to the automatic transaction discovery rule. See <a href="#">View Business Transactions</a> .	23.11.0	November 30, 2023
Agent Management	You can now view all the installed agents on the <b>Agent Management</b> tab in the Controller UI. You can navigate using any of the following ways on the Controller UI to view the <b>Agent Management</b> tab: <ul style="list-style-type: none"> <li>• Home &gt; Agent Management &gt; Manage Agents</li> <li>• Settings &gt; Agent Management &gt; Manage Agents</li> </ul> See <a href="#">Agent Management User Interface</a> .	23.11.0	November 30, 2023

## Agent Management Enhancements

This release introduces [Smart Agent](#) that allows you to use the Controller UI to perform bulk agent operations—install, upgrade, or rollback.

Additionally, [Agent Management](#) provides the following:

- The auto-attach feature to detect and start the supported AppDynamics agents without modifying the start configuration of the applications.
- A command line utility, [Smart Agent CLI](#), for buildtime workflows to automate install, upgrade and uninstall of supported AppDynamics agents (including Smart Agent).

## Resolved Issues

When artifacts are updated, they are listed with their new version numbers in the following tables. Version numbers are also displayed in the [AppDynamics Downloads Portal](#).

### Agent Resolved Issues

Filter table:

### SaaS Controller Resolved Issues

Filter table:

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CLUSTERMON-4609	Cluster Agent	The Cluster Agent pod keeps restarting because <code>numberOfTaskWorkers</code> auto-instrumentation property does not work.	Medium	23.6.0, 23.7.0, 23.8.0, and 23.9.0	23.11.0	November 29, 2023
CLUSTERMON-4549	Cluster Agent	Cluster Agent uses environment variables for the Cluster Agent secrets. With this release, Cluster Agent uses volume mount instead of environment variable for the secret.	Medium	-	23.11.0	November 29, 2023
CLUSTERMON-4556	Cluster Agent	Cannot use uppercase letters for <code>appName</code> .	Medium	23.6.0, 23.7.0, 23.8.0, and 23.9.0	23.11.0	November 29, 2023
CLUSTERMON-4237	Cluster Agent	The <code>resourcesNetViz</code> instrumentation property was unsupported when installing Infrastructure Visibility with Helm chart. With this release, Helm includes <code>netViz.resourcesNetViz</code> property.	Medium	-	23.11.0	November 29, 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date

DBMON-9462	Database Agent	Database Agent does not report the agent telemetry metrics.	Medium	23.9.0	23.11.0	November 28, 2023												
DOTNET-6702	.Net Agent	The payload object name is mentioned in the logs instead of the actual payload content.	Low	23.9.0	23.11.0	November 30, 2023												
DOTNET-6861	.Net Agent	SQL data collectors does not report data to analytics.	Low	23.9.0	23.11.0	November 30, 2023												
JAVA-12316	Java Agent	Java Agent logs error messages when re-transformation is enabled.	Medium	-	23.11.0	November 30, 2023												
JAVA-12449	Java Agent	MuleSoft stops working when JDK 8 is upgraded to JDK 11.	-	22.6.0	23.11.0	November 30, 2023												
PHP-2168	PHP Agent	PHP Agent causes crashes in the underlying environments.	Medium	23.2.0	23.11.0	November 29, 2023												

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CONTRLRDEV-1755	SaaS Controller	The Controller reports log exceptions and does not communicate with agents as expected.	Medium	23.11.0	23.11.0	November 30, 2022
CONTRLRDEV-770	SaaS Controller	The Error 500 message is displayed in the Splunk logs for some of the Controller hosts.	Medium	-	23.11.0	November 30, 2022
CONTRLRDEV-893	SaaS Controller	The stale nodes are not purged and are displayed on the Agent Management page.	Medium	-	23.11.0	November 30, 2022
CONTRLRDEV-692	SaaS Controller	The Health Rule violation is not displayed under <b>Applications &gt; Server</b> when health rule is defined for the application	Medium	-	23.11.0	November 30, 2022
CONTRLRDEV-972	SaaS Controller	The pop-up message that the changes are not saved gets displayed when you close the shared dashboard.	Medium	-	23.11.0	November 30, 2022
CONTRLRDEV-649	SaaS Controller	The Controller UI does not display server metric data if you select a custom time range.	Medium	-	23.11.0	November 30, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CONTRLRDEV-813	SaaS Controller	The Controller does not audit and capture the deletion of a business transaction rule in the log file.	Medium	-	23.11.0	November 30, 2023
CONTRLRDEV-1287	SaaS Controller	Java Agent that runs on Oracle JRockit JVM cannot connect to the Controller.	High	<ul style="list-style-type: none"> <li>23.8.0</li> <li>23.9.0</li> </ul>	23.11.0	November 30, 2023
CONTRLRDEV-1355	SaaS Controller	Users are logged out of the Controller.	High	<ul style="list-style-type: none"> <li>23.8.0</li> <li>23.9.0</li> </ul>	23.11.0	November 30, 2023
CONTRLRDEV-1945	SaaS Controller	Cannot access shared dashboard.	High	23.11.0	23.11.0	November 30, 2023
STUDIO-5161	Dash Studio	When you use dashboard variables and select the <b>Baseline</b> query option, the <b>Baseline</b> dropdown does not display any option.	Medium	-	23.11.0	December 5, 2023

## Known Issues

### 23.11 Agent Known Issues

Agent	Summary
Hosted Synthetic Agent	Some pages fail to return their Visually Complete Time and visually complete screenshots. This issue occurs when you create scripted jobs using Chrome version 117.
	The Visually Complete Time is not captured for webpages that have less load. Also, visually complete screenshots are not displayed for these webpages.

### 23.11 SaaS Controller Known Issues

There are no known issues yet for the SaaS Controller 23.11 releases.

## 23.11 Agent Management Known Issues

- When you enter a search criteria in the **Search** field on the Agent Management page, the search is performed only on the page that is currently displayed instead of the entire list of agents.
- The status of Smart Agent is not displayed correctly on the Agent Management page. If the Smart Agent is inactive, it is still visible on the Agent Management UI. If you trigger any deployment on the inactive Smart Agent, the task gets terminated. You can view the status of the task in the log file under **Task In Progress** or **History** on the Agent Management UI.
- The container node reuse feature is not supported for any agent.

## System Requirements and Supported Environments

See the relevant page for the component you want to install or upgrade.

### Agent Requirements

- App Agents:
  - [Java Supported Environments](#)
  - [.NET Supported Environments](#)
  - [Node.js Supported Environments](#)
  - [PHP Supported Environments](#)
  - [Python Supported Environments](#)
  - [Supported Apache Web Servers](#)
  - [C/C++ Agent Supported Platforms](#)
  - [Go SDK](#)
- [Analytics Agent Environments](#)
- [Browser RUM Supported Environments](#)
- [Mobile RUM Supported Environments](#)
- [Database Visibility Supported Environments](#)
- [Machine Agent Requirements and Supported Environments](#)
- [Network Visibility Supported Environments](#)
- [Server Visibility Requirements and Supported Environments](#)
- [Serverless APM Environment](#)

## Calendar Versioning

This page describes the versioning format used for product releases.

We use a calendar-based version format with a syntax of *YY.M.X* to reflect the date of release. For example, a release in October 2020 was 20.10.0, November was 20.11.0, and so on. If another version releases in the same month, the last number of the version increments by one, for example 20.11.1.

## Controller and Agent Releases

The versioning of AppDynamics language agents is done independently of each other and the Controller. See [Agent and Controller Compatibility](#).

## Maintenance Support for Software Versions

AppDynamics maintains and supports every software version for one calendar year after the next major software release is generally available. For example, support and maintenance of the 20.3 release will continue for 12 months after the 20.4 release.

See [Product Announcements and Alerts](#).

**i** For specific maintenance and support terms, refer to your license agreement(s).

## Controller GA End of Maintenance and Support for SaaS Deployments

This table lists generally available AppDynamics versions, release dates, and end of maintenance and support dates:

Controller Version	Release Date	End of Maintenance and Support
23.11	November 30, 2023	To be determined
23.9	September 29, 2023	November 30, 2024
23.8	August 14, 2023	September 29, 2024
23.7	July 5, 2023	August 14, 2024
23.5	May 24, 2023	July 5, 2024
23.4	April 10, 2023	May 24, 2024
23.2	March 16, 2023	April 10, 2024
22.12	December 12, 2022	March 16, 2024
22.10	October 24, 2022	December 12, 2023
22.9	September 12, 2022	October 24, 2023
22.8	August 1, 2022	September 12, 2023
22.6	June 23, 2022	August 1, 2023
22.5	May 11, 2022	June 23, 2023
22.3	March 28, 2022	May 11, 2023
22.2	February 14, 2022	March 28, 2023
21.12	December 13, 2021	February 14, 2023
21.11	November 4, 2021	December 13, 2022

21.9	September 27, 2021	November 4, 2022
21.8	August 9, 2021	September 27, 2022
21.6	June 28, 2021	August 9, 2022
21.5	May 17, 2021	June 28, 2022
21.4	April 5, 2021	May 17, 2022
21.2	February 22, 2021	April 5, 2022
20.11	November 16, 2020	February 22, 2022
20.10	October 5, 2020	November 16, 2021
20.8	August 24, 2020	October 5, 2021
20.7	July 16, 2020	August 24, 2021
20.6	June 2, 2020	July 16, 2021
20.4	April 21, 2020	June 2, 2021
20.3	March 9, 2020	April 21, 2021

## AppDynamics Artifacts End of Maintenance and Support

Artifacts are generally available AppDynamics agent and platform components on the [AppDynamics Downloads Portal](#) or [AppDynamics Accounts Downloads](#).

Artifact end of maintenance and support dates are one calendar year after the next generally available artifact release. For example, the .NET Agent 20.11 has an end of maintenance and support date of December 18, 2021 because 20.12 released on December 18, 2020.

Hotfixes are not considered major releases, and therefore do not affect the end of maintenance and support dates. Certain AppDynamics platform components have diverged from calendar versioning, such as the Events Service.

## Agent and Controller Tenant Compatibility

This page describes the compatibility mapping between Agent and Controller Tenant versions.

### Agent and Controller Tenant Compatibility Mapping

Please refer to the [Language Agent Backward Compatibility](#) table for AppDynamics Agents and AppDynamics Controller Tenant compatibility.

As long as all agents are compatible with the Controller Tenant version, a monitored environment may have different agent versions deployed in it at a given time. However, the oldest agents should be on originating tiers of any business transactions. This ensures that agents on downstream nodes can process the correlation header created by the originating tier.

When rolling out agent upgrades, be sure to start upgrading the agents on the nodes of downstream tiers first, and then upgrade the agents on the originating tier nodes last.

## Language Agent Backward Compatibility

Starting release 20.2, the AppDynamics language agents are backward-compatible with any Controller Tenant, including those using [Calendar Versioning](#)  $\geq 20.3$ .

 For specific maintenance and support terms, refer to your specific EULA.

Backward compatibility is supported on these agents:

- C/C++ SDK
- Cluster
- Java
- IBM Integration Bus (IIB)
- Machine
- .NET
- Node.js
- PHP
- Python
- Analytics Agent
- Database Agent

 While using the Enterprise Console to upgrade the Controller Tenant, several folders (including the `appagent` folder) are removed and reinstalled. If you deployed a Java Agent with a newer version than the Controller Tenant in the `controller/appserver/glassfish/domains/domain1/appagent` folder, the upgrade will fail and internal monitoring is lost. To prevent this, you must [update the `domain.xml` file](#) to point to the new Java Agent or avoid using the custom installation for Java Agents.

For notes on SSL protocol compatibility between versions of the agent and Controller Tenant, see [SSL Compatibility Matrix for App Agent for Java - Controller](#).

## Agent Versions Compatible with Controller Tenant 23.x

Agent Version /Agent Type	Dynamic Language Agents							Cluster Agent	Database Agent	Machine Agent	Network Agent	Analytics Agent
	Java Agent	.NET Agent	Node.js Agent	PHP Agent	Python Agent	Web Server Agent	C/C++ SDK					
23.x	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
>=22.x	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
>=21.x	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
>=20.x	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓

## SSL Compatibility between Java Agent and Controller Tenant

The default protocol used by the Controller Tenant is TLSv1.2. See [Secure the Platform](#) for information on changing the default security protocol used by the Controller Tenant or agent.

For the Java Agent, the default protocols are:

- For Java 8 SE applications: TLSv1.2.
- For Java >= 7 applications: TLSv1.2.

## Introduction of New Agent Features

Even when new and old agents are supported by the same up-to-date Controller Tenant, new functionality introduced by later agents is not available on the older agents.

## Past Releases

See the following for the release notes of past versions:

- [Past Resolved and Known Issues by Release](#)
- [Past Agent Releases](#)
- [Past Controller Releases](#)
- [Past Mobile App Releases](#)

## Past Resolved and Known Issues by Release

This page lists the resolved issues for the agents, the Controller (on-premises or SaaS), and the on-premises platform since the 20.2 release.

When artifacts are updated, they are listed with their new version numbers in the tables below. Version numbers are also shown in the [AppDynamics Downloads Portal](#).

You can sort the table of resolved issues by key, version, and product, or use the search field to find resolved issues. The most recent releases appear at the top of the page.

## 23.10 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CDM-9607	iOS Agent	Swift Preview crashes if the iOS SDK has WKWebView.	Medium	23.5.0	23.10.0	October 2023
CDM-9635	iOS Agent	After upgrading the iOS agent to 23.5.0, iOS applications might crash.	Medium	23.5.0	23.10.0	October 2023
CDM-9651	iOS Agent	No Resources folder in the iOS agent.	Medium	23.5.0	23.10.0	October 2023
DOTNET-6847	.Net Agent	The .Net 7 applications stop working when the OpenTelemetry exporters are enabled.	High	23.1.0	23.10.0	October 2023
JAVA-12396	Java Agent	Java Agent does not support the JDBC URL for Oracle using LDAP.	Medium	23.8.0	23.10.0	November 1, 2023
JAVA-12477	Java Agent	The advanced network flow metrics are not collected for the Java applications.	Medium	22.2.0, 23.8.0	23.10.0	November 1, 2023
JAVA-12490	Java Agent	Java Agent fails to time out the stale correlation header information.	Medium	23.9.0	23.10.0	November 1, 2023

### SaaS Controller Resolved Issues

There was no planned SaaS Controller 23.10 release.

## 23.9 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
DOTNE T-6775	.Net Agent	The agent detects attacks even when the Cisco Secure Application is disabled.	High	23.6.0	23.9.0	September 29, 2022
DOTNE T-6778	.Net Agent	The <code>transactionMonitor</code> objects cause high memory usage.	High	22.8.0 and later	23.9.0	September 29, 2022
DOTNE T-6779	.Net Agent	After disabling the Cisco Secure Application for a node, the .Net agent does not receive a backend re-enable signal. The agent receives the signal only after an agent restart.	High	23.6.0	23.9.0	September 29, 2022
DOTNE T-6790	.Net Agent	Sometimes, the Cluster Agent correlation does not work with .Net Agent. This issue occurs when the <code>cgroup v1</code> container ID is not discovered correctly.	High	23.6.0, 23.7.0	23.9.0	September 29, 2022
DOTNE T-6823	.Net Agent	The .Net Agent is incompatible with some applications based on the .Net Framework version 3.5 or older.	Medium	-	23.9.0	September 29, 2022
DOTNE T-6824	.Net Agent	A potential race condition occurs in the Linux profiler.	-	-	23.9.0	September 29, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
JAVA-12434	Java Agent	Sometimes Java Agent fails to obtain the container ID from the Cluster Agent metadata server.	-	-	23.9.1	October 2023
SYNTH-9807	Private Synthetic Agent	The PSA Chrome pods fail after Synthetic jobs are scheduled.	Medium	23.5.0	23.9.0	September 28, 2023
SYNTH-9815	Private Synthetic Agent	Synthetic jobs give an error message that the agent failed to post the result.	Medium	-	23.9.0	September 28, 2023
SYNTH-9841	Private Synthetic Agent	Synthetic jobs fail and give DNS resolution errors.	Medium	-	23.9.0	September 28, 2023

### SaaS Controller Resolved Issues

 Filter table: 

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
ALTCSAAS-2061	Alert and Respond	In health rule, when you use wild cards to create critical or warning conditions, the metrics that do not match the wild card pattern also get added to the condition.	Medium	23.9.0	23.9.2	October 24, 2023
CLUSTERMON-4477	Cluster Monitoring	The Memory and CPU metrics are not displayed for Clusters and Pods.	High	23.8.0	23.9.0	September 29, 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CONTRLRDEV-728	SaaS Controller	In <b>Tiers &amp; Nodes</b> , the <b>Events</b> type displays <b>Controller Metric Registration Limit Reached</b> even when the limit is high.	Medium	-	23.9.0	September 29, 2023
CONTRLRDEV-565	SaaS Controller	The Network Agent configuration changes are not logged in the audit log.	Medium	-	23.9.0	September 29, 2023
CONTRLRDEV-1002 and CONTRLRDEV-741	SaaS Controller	The logs display rule details even when you disable <b>JavaScript Agent Injection</b> .	Medium	-	23.9.0	September 29, 2023
CONTRLRDEV-817	SaaS Controller	Cannot download Automatic Leak Detection Capture collections.	Medium	-	23.9.0	September 29, 2023
CONTRLRDEV-1350	SaaS Controller	Java Agent that runs on Oracle JRockit JVM cannot connect to the Controller.	Medium	23.8.0, 23.9.0	23.9.1	October 2023
CONTRLRDEV-1485	SaaS Controller	Users are logged out of the Controller.	Medium	23.9.0	23.9.1	October 2023
CONTRLRDEV-1511	SaaS Controller	The Controller does not audit and capture the deletion of a business transaction rule in the log file.	Medium	23.9.0	23.9.1	October 2023

## 23.8 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CONTRLRDEV-1583	SaaS Controller	If an existing alerting template name has angular brackets, you can not apply the template on an application.	High	23.9.0	23.9.2	October 24, 2023
CONTRLRDEV-1588	SaaS Controller	The Controller UI displays the <code>Invalid segment</code> error message when you create or modify a transaction detection rule in Business Transaction.	-	23.8.0, 23.9.0	23.9.1	October 2023
CONTRLRDEV-1805	SaaS Controller	The manual and automatic node burst purger fails with a null pointer exception.	High	23.9.0	23.9.3	November 9, 2023
CONTRLRDEV-1893	SaaS Controller	The audit report does not capture changes made to the business transaction rule.	-	-	23.9.4	November 24, 2023
DBMON-8968	Database Monitoring	The <b>License</b> page displays incorrect license consumption details for databases.	Medium	-	23.9.0	September 29, 2023
BRUM-7922	Browser Real User Monitoring	The <b>Browser App Dashboard</b> tab of an application displays iPad Edge instead of iOS Edge mobile browser.	Medium	-	23.9.0	September 29, 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
BRUM-7871	Browser Real User Monitoring	The <b>Browser App Dashboard</b> tab of an application displays Safari instead of BlackBerry - GoodAccess browser.	Low	-	23.9.0	September 29, 2023
DBMON-9307	Database Monitoring	<code>NullPointerException</code> occurs when you connect to the Azure SQL database using the Azure Active Directory Password authentication method.	High	22.8.0	23.9.1	October 2023
SYNTH-9477	Synthetic API Monitoring	The <b>APIs</b> page does not display all the available APIs of a collection.	Medium	23.4.0	23.9.0	September 29, 2023
SYNTH-9767	ThousandEyes Integration	Clicking <b>Sync with ThousandEyes</b> does not match all the domains of ThousandEyes tests with the domains of browser applications.	Medium	-	23.9.0	September 29, 2023
TMNT-6690	APM	Some operations on the <b>Administration &gt; Roles</b> page take a long time to execute.  With this release, the performance of the page is improved.	-	-	23.9.2	October 24, 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
DBMON-9116	Database Agent	Sometimes, the Database Agent does not send metrics to the Controller.	Medium	-	23.8.0	August 2023
DBMON-9138	Database Agent	The <code>fetchDBServerPort</code> query returns multiple ports along with the endpoint port. This causes the MSSQL endpoint port to restart.	Medium	23.6.0	23.8.0	August 2023
DBMON-9146	Database Agent	The Guava library is upgraded to version 32.0.1.	Medium	23.6.0	23.8.0	August 2023
CLUSTERMON-4412	Cluster Agent	Cannot configure the alpine init container image repository.  With this release, you can use the <code>alpineInitContainerImage</code> property to configure the alpine image for .NET Core. See <code>imageInfo</code> under <a href="#">InstrumentationRule Properties</a> .	Medium	23.7.0	23.8.0	August 2023
SERVER-9114	Machine Agent	The agent does not start on RHEL 8.	Medium	22.11.0	23.8.0	August 2023
BRUM-7868	JavaScript Agent	In <b>Analytics</b> , the browser record incorrectly displays three dots (...) in the page URL.	Medium	-	23.8.0	August 2023
BRUM-7874	JavaScript Agent	Some AJAX calls do not appear in <b>User Experience &gt; Pages &amp; AJAX Requests</b> .	Medium	-	23.8.0	August 2023
BRUM-7852	JavaScript Agent	The BRUM fails to report the application events from the Edge browser in iPad.	Medium	-	23.8.0	August 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
BRUM-7773	JavaScript Agent	Single-Page Applications might have high PLT because of timeout.	Medium	-	23.8.0	August 2023
BRUM-7837	JavaScript Agent	Content Security Policy fails if you include the nonce attribute.	Medium	-	23.8.0	August 2023

### GitHub Notification

The AppDynamics Cluster Agent [Dockerfiles](#) and [Charts](#) Github repositories will receive maintenance support until October 31, 2023, Subsequent to this date, the files in these repositories will be accessible through the [AppDynamics download portal](#) and the [AppDynamics production artifactory](#) respectively. For further information, refer to the deprecation notice on the corresponding Github repository.

### Controller Resolved Issues

Filter table:

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
BRUM-7726	Browser Real User Monitoring	The data for <b>PAGE VIEWS WITH JS ERRORS</b> in <b>Pages &amp; AJAX Requests</b> does not populate.	Medium	-	23.8.0	August 2023
BRUM-7847	Browser Real User Monitoring	The <b>Name</b> column in the <b>Session Summary &gt; Resources</b> page is empty.	Medium	-	23.8.0	August 2023
CDM-9350	Mobile Real User Monitoring	The unknown device details are not available.	Medium	-	23.8.0	August 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CONTRLRDEV-494	SaaS Controller	The <b>Enable for Snapshots</b> column is unavailable in the <b>Method Invocation Data Collector</b> panel when Analytics is disabled.	Medium	-	23.8.0	August 2023
CONTRLRDEV-508	SaaS Controller	The App Server Agent configuration screen displays the node properties only for Java and .NET agents.	Medium	-	23.8.0	August 2023
CONTRLRDEV-552	SaaS Controller	The search icon does not appear on the Controller UI when you log in for the first time.	Medium	-	23.8.0	August 2023
CONTRLRDEV-665	SaaS Controller	Metric Browser displays unrelated metrics for the pods.	Medium	-	23.8.0	August 2023
CONTRLRDEV-651	SaaS Controller	The Kubernetes Events REST API response does not include the <code>affects</code> and <code>namespace</code> fields.	Medium	-	23.8.0	August 2023
CONTRLRDEV-1205	SaaS Controller	Template expressions that contain a hyphen in the variable name do not work in email and HTTP request templates.	Medium	23.8.0	23.8.3	August 2023
CONTRLRDEV-1216	SaaS Controller	The SAP ABAP icon is not visible for the existing applications.	Medium	23.7.0	23.8.4	September 13, 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
DIS-153	Data Platform	The node's status changes to active even after marking it as a historical node, thereby increasing the node count.	-	-	23.8.2	August 2023
DIS-187	Data Platform	The policy does not get executed for some health rule violations.	-	-	23.8.2	August 2023
EUMPLAT-4536	EUM Cloud	When you open a browser application or mobile application under <b>User Experience</b> , it displays an HTTP 500 error. This issue occurs when AppDynamics is integrated with ThousandEyes.	Medium	-	23.8.0	August 2023
LIC-3862	Licensing	The license package details take a long time to load	-	-	23.8.0	August 2023
NETWORK-6563	Network Visibility	The Controller UI is unavailable due to 100% heap memory utilization.	High	23.2.2	23.8.4	September 13, 2023
STUDIO-5111	Dash Studio	LDAP and SAML users get the HTTP 500 Internal Server Error message when they click on <b>Dashboards &amp; Reports</b> .	-	-	23.8.2	August 2023
TMNT-6547	APM	Adding permission to a role gives the HTTP 500 Internal Server Error message.	-	23.4.0, 23.5.0, 23.7.0, 23.8.0	23.8.2	August 2023

## Known Issues

### 23.8 Agent Known Issues

Agent	Summary
Database Agent	<p>In the Metric Browser, the keys of one Database Collector get displayed under other Database Collectors.</p> <p>For example, keys of Database Collector 1 can appear under Database Collector 2, even if the keys are not part of the Database Collector 2 query output.</p> <p>This issue occurs when you create a custom metric that runs on multiple databases and returns multiple key-value pairs. In such scenarios, only the keys get duplicated, not the metric values.</p>

### 23.8 SaaS Controller Known Issues

Product	Summary
Synthetic Monitoring	<ul style="list-style-type: none"> <li>Users that are assigned to <b>View Credential Vault</b> permissions can import credentials in synthetic jobs.</li> <li>Users can import credentials for an application that is not even configured in Credential Vault.</li> </ul>

ALPS-5903	Accounts Management Portal	The ServiceNow® trademark appears incorrectly on the Downloads portal.	-	-	23.7.0	July 5, 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CLUSTERMON-4293	Cluster Agent	<p>Some security context settings are not applied on <code>initContainers</code> during auto-instrumentation.</p> <p>With this release the following default values are applied for the security contexts:</p> <ul style="list-style-type: none"> <li><code>allowPrivilegeEscalation: false</code></li> <li><code>privileged: false</code></li> <li><code>readOnlyRootFilesystem: false</code></li> <li><code>runAsNonRoot: false</code></li> </ul>	Medium	23.5.0	23.7.0	July 28, 2023
DOTNET-6161	.Net Agent	Method Invocation Data Collector (MIDC) fails to fetch the properties of an object stored in a list or an enumerator.	-	All Version	23.7.0	August 2023
JAVA-12146	Java Agent	The <code>enable-ignore-nested-exception-message</code> node property does not work on the inner exceptions.	High	23.3.0 and later	23.7.0	July 31, 2023
JAVA-12162	Java Agent	Java Agent fails to register when the access key is encrypted using Secure Credential Store (SCS). This issue causes Cisco Secure Application to stop working.	Medium	23.6.0	23.7.0	July 31, 2023
JAVA-12210	Java Agent	The Vertx Netty Servlet correlation Header is not parsed correctly.	Medium	-	23.7.0	July 31, 2023
PHP-2317	PHP Agent	PHP Agent fails to install on PHP 8.2.	Medium	23.7.0	23.7.1	July 27, 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
ALTCSAAS-1573	Alert and Respond	The evaluation of health rules takes longer than expected, and there is a delay in triggering alerts.	Medium	-	23.7.0	July 5, 2023
ANALYTICS-15130	Analytics	500 Internal server exception is displayed when you disable the metrics created on browser error record; <code>custom_BROWSER_ERROR_RECORD</code> is the event type stored.	Medium	-	23.7.0	July 5, 2023
CDM-9519	Mobile RUM	The <b>Crash Summary</b> page displays incorrect stack trace information.	Medium	23.7.0	23.7.1	July 2, 2023
CONTRLRDEV-284	SaaS Controller	In Application Dashboard, the <b>Transaction Scorecard</b> and the <b>Errors</b> widgets display an invalid percentage when <code>Error/min</code> is greater than <code>calls/min</code> .	Medium	-	23.7.0	July 5, 2023
CONTRLRDEV-395	SaaS Controller	Internal server error occurs when you select the flowmap option to view applications.	Medium	-	23.7.0	July 5, 2023
CONTRLRDEV-438	SaaS Controller	When you are deploying OpenTelemetry Collector, sometimes the access key doesn't generate, and API fails.	Medium	-	23.7.0	July 5, 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CONTRLRDEV-463	SaaS Controller	The <b>Tiers &amp; Nodes</b> page displays the historic nodes even when Entity Liveness is disabled.	Medium	-	23.7.0	July 5, 2023
DBMON-8887	Database Monitoring	The <b>Databases</b> page does not display the complete content.	Medium	22.12.0	23.7.0	July 5, 2023
DBMON-8987	Database Monitoring	Some tabs under the <b>Databases</b> section display a false negative error message.	Medium	23.4.0	23.7.0	July 5, 2023
EUMPLAT-4667	EUM Cloud	ThousandEyes integration fails due to a performance issue with the <code>EumServiceMappings</code> API.	-	-	23.7.1	July 2, 2023
LIC-3816	Licensing	The license package details take a long time to load.	High	23.5.0	23.7.0	July 5, 2023
PLATSE-1432	Platform Sustaining Engineering	Adding an application to multiple roles takes a lot of time.	-	-	23.7.1	July 2, 2023
PLATSE-1436	Platform Sustaining Engineering	Metrics get deleted during staleness check if the added pattern matches the shortlived metric purger.	Medium	-	23.7.1	July 2, 2023

## 23.6 Resolved and Known Issues

### Agent Resolved Issues

 Filter table:

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
STUDIO-5086	Dash Studio	The shared dashboards do not display any data when accessed using a URL. The data is displayed when the dashboard is accessed from the Controller UI.	Medium	-	23.7.0	July 5, 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CDM-9444	Android Agent	The Application build fails after you upgrade the Android Agent version to 23.4.1	-	23.4.1	23.6.0	June 14, 2023
CLUSTERMON-4179	Cluster Agent	Some traces of auto-instrumentation remain in the application deployment after Cluster Agent uninstrumentation	Medium	23.3.0	23.6.0	June 20, 2023
CLUSTERMON-4247	Cluster Agent	Cluster Agent crashes with fatal error when large number of deployment needs to be instrumented and uninstrumented	High	23.2.0	23.6.0	June 20, 2023
CLUSTERMON-4215	Cluster Agent	Cluster Agent crashes with a fatal error message when a cluster has high pod churn	Medium	22.12.1	23.6.0	June 20, 2023
CLUSTERMON-4205	Cluster Agent	Cannot add ENV variables to Infrastructure Visibility pod using Helm	Medium	-	23.6.0	June 20, 2023
CLUSTERMON-4130	Cluster Agent	The pod CPU usage does not display the correct value for %Busy metrics	Medium	21.4.6	23.6.0	June 20, 2023

### Controller Resolved Issues

There was no planned SaaS Controller 23.6 release.

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CLUSTERMON-4269	Cluster Agent	Cluster Agent crashes because of nil pointer error during event upload	Medium	23.5.0	23.6.0	June 2023
CLUSTERMON-4232	Cluster Agent	Auto-instrumentation fails when instrumenting more than one application in the same namespace	Medium	-	23.6.0	June 2023
DBMON-9011	Database Agent	Cannot encrypt the credentials using Secure Credential Store.	Medium	-	23.6.0	June 2023
DBMON-9040	Database Agent	<ul style="list-style-type: none"> <li>The <code>jackson-core</code> library is upgraded to version 2.15.1.</li> <li>The <code>google-gson</code> library is upgraded to version 2.10.1.</li> </ul>	High	23.5.0	23.6.0	June 2023
DBMON-9051	Database Agent	Azul Zulu is upgraded to version 11.64.20.	Medium	23.5.0	23.6.0	June 2023
DOTNET-2158	.Net Agent	The agent does not detect the <code>ADO.NET</code> exit call from the <code>Oracle.DataAccess.Client.OracleDataAdapter.Fill</code> method.	-	All Version	23.6.0	June 30 2023
DOTNET-4900 and DOTNET-4908	.Net Agent	The agent does not support the instrumentation of TIBCO version 8.2.0.	-	All Version	23.6.0	June 30 2023
DOTNET-6721	.Net Agent	By default, the Linux .Net Agent prints the IL logs in <code>INFO</code> mode causing logs to take up more space in the container.	High	22.12.0 - 23.4.0	23.6.0	June 30 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
DOTNET-6741	.Net Agent	The percentile metrics are incorrectly labeled causing a mismatch in actual values and the metric browser details.	Low	22.12.2	23.6.0	June 30, 2023
JAVA-1649	Java Agent	The OpenTelemetry module of the agent does not start when the OTLP protocol is set to HTTP.	-	All Versions	23.6.0	June 29, 2023
JAVA-1970	Java Agent	When custom correlation rules are used in an unsupported correlation scenario, the custom exit point backend names are prefixed with the <code>Custom Exit Name Def</code> string.	Low	23.4.0	23.6.0	June 29, 2023
JAVA-12140	Java Agent	The Secure Application policies work only after a JVM restart, but stop working again after some time.	Medium	23.2.0	23.6.0	June 29, 2023
SRVLES-S-2650	AWS Lambda Extension for Serverless APM	Node.js Serverless Tracer creates <code>INFO</code> level log even when <code>APPDYNAMICS_LOG_LEVEL</code> is set to <code>WARN</code> , <code>ERROR</code> , or <code>FATAL</code> .	High	22.5.0	23.6.0	June 29, 2023
SRVLES-S-2606	AWS Lambda Extension for Serverless APM	The AWS Lambda Extension for Serverless APM does not support Python 3.9.	-	All Versions	23.6.0	June 29, 2023

## 23.5 Resolved and Known Issues

### Agent Resolved Issues

Filter table: 

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
PYTHON-1327	Python Agent	Python Agent fails while loading the modules that have the Java collectors.	Medium	23.2.0	23.5.0	May 2023
DBMON-8980 DBMON-8996	Database Agent	The MongoDB Collector causes high number of database connections.	Medium	>=22.11	23.5.0	May 2023
DBMON-8979	Database Agent	The custom JDBC TNS connection string is case sensitive for port in the Oracle collector configuration.	Medium	23.2.0	23.5.0	May 2023
DBMON-8899	Database Agent	The Azul jdk version is updated to version 11.62.	Medium	23.2.0	23.5.0	May 2023
NODEJS-723	Node.js Agent	Node.js Agent standalone installation in offline mode fails on npm >= 7.0 versions.	Medium	22.6.0, 22.7.0	23.5.0	May 2023
NODEJS-838	Node.js Agent	Node.js Agent fails to install on Windows with Node.js version 18.	Medium	22.11.0, 23.3.0	23.5.0	May 2023
CDM-9225	iOS Agent	The dSYM upload script fails in the Python 3 environment.	Low	23.1.0	23.5.0	May 2023
CDM-9226	iOS Agent	During file upload the iOS application UI might indicate incorrect progress.	Low	22.5.0	23.5.0	May 2023
CDM-9247	iOS Agent	In some network conditions, iOS application might fail while sending beacons to Controller.	High	22.12.0	23.5.0	May 2023
CLUSTERMON-4121	Cluster Agent	The .Net application pod crashes during auto-instrumentation	Medium	23.2.0	23.5.0	May 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CLUSTERMON-4202	Cluster Agent	Auto-instrumentation fails for OpenShift Container Platform when Security Contexts are included	Medium	23.4.0	23.5.0	May 2023
JAVA-11807	Java Agent	An incorrect hostname gets injected into the agent configuration while using the on-premise Controller.	High	22.10.0	23.5.0	May 2023
JAVA-11819	Java Agent	When multiple sensitive message filters are applied, stack traces are truncated because of the low error capture limit.	Low	22.10.2	23.5.0	May 2023
JAVA-12046	Java Agent	<code>KafkaIntrospector.getBrokerURL</code> does not work in Kafka 2.2+.	Medium	-	23.5.0	May 2023
JAVA-12093	Java Agent	Java Agent includes an older version of <code>jackson-core</code> library.	Medium	23.4.0	23.5.0	May 2023
JAVA-12139	Java Agent	When <code>log4j2</code> is disabled and the agent startup timeout occurs, the agent does not restore <code>log4j</code> properties. It results in an application crash.  <div style="border: 1px solid #007bff; background-color: #e6f2ff; padding: 5px; margin-top: 10px;"> <span style="font-size: 1.2em; color: #007bff; font-weight: bold;">i</span> You must not configure the <code>appagent.start.timeout</code> property for this fix to work.         </div>	High	23.4.0	23.5.0	May 2023
NETWORK-6464	Network Agent	Network Agent 23.3.0 missing Windows installation files.	-	23.3.0	23.5.0	May 2023

### SaaS Controller Resolved Issues

Filter table:

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
DBMON-9043	Database Agent	A false negative error message is displayed when you click the tabs under <b>Databases</b> to view the database cluster performance.	Medium	23.4.0	23.5.1	June 1 2023
LIC-3816	Licensing	The licensing package details take a long time to load	High	23.5.0	23.5.1	June 1 2023
ALTCSAAS-1630	Alert and Respond	The evaluation of health rules takes longer than expected and there is a delay in triggering of alerts	Medium	-	23.5.1	June 1 2023
ALTCSAAS-526	Alert and Respond	There is a discrepancy in the number of characters allowed for a health rule condition name through the API and the Controller UI. A character limit of 100 is now enforced.	Medium	-	23.5.0	May 2 2023
ALTCSAAS-557	Alert and Respond	Using the Health Rule API, you cannot define a metric expression with a single metric variable.	Medium	-	23.5.0	May 2 2023
ANALYTICS-15096	Analytics	The Analytics ADQL query returns results in different timezones than the Controller UI.	Medium	-	23.5.0	May 2 2023

#### Agent Resolved Issues

Filter table:

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
BRUM-7 581	JavaScript Agent	The application is sending errors when using latest <code>adrum.js</code> file.	Medium	22.6.0	22.12.0	December 21, 2022
BRUM-7 637	JavaScript Agent	BRUM dashboard is not showing AJAX records correctly.	Medium	22.9.0	22.12.0	December 21, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
BRUM-7 655	JavaScript Agent	The JavaScript Agent publish task is not working as intended.	Medium	22.9.0	22.12.0	December 21, 2022
BRUM-7 666	JavaScript Agent	When there are Ajax requests with the same URL, only the first request is counted when computing PLT.	Medium	22.9.0	22.12.0	December 21, 2022
BRUM-7 679	JavaScript Agent	<code>Window.Text</code> is being overwritten.	Medium	22.6.0	22.12.0	December 21, 2022
CLUSTERMON-3 978	Cluster Agent	During auto-instrumentation, a new ReplicaSet gets created without changing the deployment mode. This issue occurs because application pods get into the <code>CrashLoopBackOff</code> state after upgrading to Cluster Agent 22.12.	High	22.12.0	22.12.1	January 2022
DOTNET-6389	.NET Agent	<code>NLog StackTrace</code> and <code>Message</code> are not showing.	Low	22.11.0	22.12.0	December 6, 2022
DOTNET-6430	.NET Agent	Sensitive URL Filters do not apply to all properties containing sensitive URL information.	Medium	>= 22.8.0	22.12.0	December 6, 2022
DOTNET-6431	.NET Agent	The bootstrap changes which causes the access violation leading to a crash.	High	>= 22.5.0	22.12.0	December 6, 2022
DOTNET-6444	.NET Agent	The instrumented application is throwing exceptions when starting.	High	>= 22.6.0	22.12.0	December 6, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
DOTNET-6463	.NET Agent	The HTTP data collector is not collecting headers in ASP.NET Core with wildcard.	Medium	22.x	22.12.0	December 6, 2022
DOTNET-6465	.NET Agent	Cannot expand IIS application with nested application in the .NET Agent Configuration Utility.	Medium	22.11.0	22.12.1	December 22, 2022
DOTNET-6470	.NET Agent	The agent is crashing the instrumented application with the Custom Data Collector.	High	22.11.0	22.12.0	December 6, 2022
DOTNET-6494	.NET Agent	There is a crash in the .NET 7 application, which is caused by invalid pointer access.	Medium	22.11.0	22.12.1	December 22, 2022
PHP-2016	PHP Agent	PHP Agent stops working when the information point configurations are modified in the Controller. This issue occurs because the agent does not handle the interceptors properly.	High	22.8.0, 22.10.0, 22.11.0	22.12.0	December 7, 2022
WEBSRV-870	Apache Web Server Agent	Rapid7 reports vulnerabilities in the Java proxy.	High	22.12.0	22.12.1	December 19, 2022

### SaaS Controller Resolved Issues

Filter table:

### 22.12 Agent Known Issues

**Cluster Agent:** The instrumented pod is not visible in the Controller UI because the auto-instrumentation fails when the deployment mode is StatefulSet. This happens because the pod registration fails. The workaround for this issue is to restart the Cluster Agent.

### 22.12 SaaS Controller Known Issues

There were no known issues for the AppDynamics SaaS Controller 22.12.0 release.

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
WEBSR V-871	Apache Web Server Agent	When the Apache Agent is at the top tier in a downstream application, the snap enable property ( <b>Snapshot Enabled</b> ) is not populated properly to the downstream tiers, which doesn't stitch the cross-application BT correlation properly.	Medium	22.11.0	22.12.0	December 02, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
ALERT-1 2696	Alert & Respond	Summary messages have been added custom event emails.	Medium	22.10.0	22.12.0	December 12, 2022
ALTCSA AS-10	Alert & Respond	The policy cache is unavailable when <b>Affected Entities</b> in a health rule are marked as <b>These specific Nodes/Databases/Servers</b> . This issue occurs when a historical node is restarted.	Medium	All Versions	22.12.1	January 11, 2023

## 22.11 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

### SaaS Controller Resolved Issues

There were no resolved issues for the 22.11 SaaS Controller.

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
ALTCSA AS-11, ALTCSA AS-17, ALTCSA AS-61, ALTCSA AS-155, ALTCSA AS-256, ALTCSA AS-454, and ALTCSA AS-1399	Alert and Respond	Health rules do not evaluate new SIM nodes.	-	22.5.0	22.12.4	March 29, 2023
ALTCSA AS-20	Alert and Respond	Health Rules are not evaluated.	Medium	-	22.12.4	March 29, 2023

PLATSE-1017	Platform Sustaining Engineering	The <b>Network</b> tab in the dashboard tab does not display data. This issue occurs when code threads get locked while clearing network links.	Medium	All Versions	22.12.1	January 11, 2023
PLATSE-1123	Platform Sustaining Engineering	CSRFfilter added for additional security.	Medium	-	22.12.2	January 20, 2023
PLATSE-1146	Platform Sustaining Engineering	The Blue Screen of Death (BSOD) error is displayed after you start Windows Server 2019.	Medium	-	22.12.3	March 15, 2023
PLATSE-1243	Platform Sustaining Engineering	The requests to populate new MDS keys time out because of poor cache performance.	High	All Versions	22.12.4	March 29, 2023
PLATSE-1263	Platform Sustaining Engineering	Performance issue when loading recently visited dashboards.	Medium	21.2.5	22.12.4	March 29, 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
PLATSE-1270	Platform Sustaining Engineering	Migrate <code>FastLocalCache</code> from Guava to Caffeine.	Medium	All Versions	22.12.4	March 29, 2023
PLATSE-1302	Platform Sustaining Engineering	End User Monitoring query results take a lot of time to load.	High	-	22.12.5	April 19, 2023
SERVER-8915	SaaS Controller	The incorrect default size of the <code>property_value</code> column of the <code>sim_machine_property</code> table causes Machine Agent registration failure.	-	All Versions	22.12.4	March 29, 2023
SERVER-8944	SaaS Controller	Controller upgrade fails after the Machine Agent fix to resolve the 500 internal error.	High	-	22.12.4	March 29, 2023
STUDIO-4597	Dash Studio	The dashboard displays the time range in decimals instead of days. For example, it displays "last 1.1428571428571428 weeks" instead of "last 8 days".	Medium	22.5.0, 22.6.0, 22.9.0	22.12.0	December 12, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
STUDIO-4883	Dash Studio	Disable sort on <b>Shared</b> column in <b>Custom Dashboard</b> list.	High	22.8.0,22.9.0,22.10.0	22.12.0	December 12, 2022
SYNTH-8872	Synthetic Monitoring	Controller cannot access all the hosted Synthetic Agent locations.	Medium	-	22.12.0	December 12, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
CLUSTERMON-3826	Cluster Agent	A validation error occurs when you configure the Cluster Agent using <code>cluster-agent.yaml</code> and the <code>subDir</code> parameter is not defined in the <code>customAgentConfigSource</code> parameter. It happens because the <code>subDir</code> parameter is mandatory for <code>customAgentConfigSource</code> . With this release, <code>subDir</code> is an optional parameter except for Java applications.	Medium	22.5.0, 22.6.0	22.11.0	November 22, 2022
DOTNET-6394	.NET Agent	Agent is not initializing in all instrumented applications in multiple <code>appdomain</code> processes.	High	>= 22.7.0	22.11.0	November 3, 2022
DOTNET-6402	.NET Agent	Object instance tracking is not capturing data.	Medium	22.5.1, 22.9.0, and 22.10.0	22.11.0	November 3, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
DBMO N-8802	Database Agent	Database Agent cannot monitor the hardware metrics for the PostgreSQL database on AWS RDS.	Medium	>= 21.12.2	22.11.0	November 17, 2022
DBMO N-8799	Database Agent	Database Agent excludes only the port associated with the corresponding IP that the agent is connected to during port resolution. This issue occurs when the MSSQL cluster is deployed on multi-availability zones and the availability group listener is configured on multiple IPs.	High	>= 21.9.0	22.11.0	November 17, 2022
DBMO N-8784	Database Agent	<b>Request Agent Log Files</b> on the Controller does not display the logs directory for <code>db-agent</code> when the <code>appdynamics.agent.logs.dir</code> property is set.	Medium	>= 22.3.0	22.11.0	November 17, 2022
DBMO N-8759	Database Agent	The value of <b>Number of Deadlocks/sec</b> is reported as 0 for the MSSQL database.	Medium	22.6.0 - 22.9.0	22.11.0	November 17, 2022
JAVA-1 1360	Java Agent	Java Agent displays an error instead of logging a trace message while finding a field that does not exist.	Medium	22.6.0	22.11.0	November 22, 2022
JAVA-1 1442	Java Agent	Java Agent adds internal errors to the node Exceptions Per Minute (EPM) metric. This causes a false increase in the number of application errors.	Medium	22.10.0	22.11.0	November 22, 2022
JAVA-1 1542	Java Agent	Java Agent includes an older version of <code>org.yaml_snakeyaml</code> .	Low	22.9.0	22.11.0	November 22, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
NODEJ S-759	Node.js Agent	There are Node 17 images missing from Docker Redhat repositories.	Medium	22.9.0	22.11.0	November 30, 2022
NODEJ S-761	Node.js Agent	The application is not working with MD5 hashing.	Medium	22.9.0	22.11.0	November 30, 2022
NODEJ S-771	Node.js Agent	The native package install script is failing to create <code>tmp</code> directories.	Medium	22.9.0	22.11.0	November 30, 2022
PHP-19 05	PHP Agent	The PHP application displays the errors related to transaction splitting. This happens when the agent executes the framework detection mechanism using autoloaders. Now, framework detection does not use autoloaders.	High	22.3.0, 22.8.0	22.11.0	November 29, 2022
PHP-19 36	PHP Agent	Transaction splitting does not work because the agent does not intercept the operation name associated with the <code>PHP_WEBSERVICE</code> entry point.	High	22.8.0	22.11.0	November 29, 2022
PHP-19 83	PHP Agent	The PHP Agent causes fatal errors when the same interceptor is used for the <code>SoapClient::__call</code> and <code>SoapClient::__soapCall</code> methods. Now, the agent uses different interceptors for these methods.	Medium	22.8.0	22.11.0	November 29, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
PHP-2011	PHP Agent	In cross-platform applications, the agent does not pass the correlational header to the downstream applications resulting in no snapshots for these applications.	Medium	22.8.0, 22.10.0	22.11.0	November 29, 2022
WEBSRV-869	Apache Web Server Agent	The <b>Drill Down to Downstream Call and View Associated Snapshot</b> options are unavailable in the cross-platform application transaction snapshots.	Medium	All Versions	22.11.0	November 23, 2022

### 22.11 Agent Known Issues

Key	Issue Summary	Workaround
DBMON-8996	The MongoDB Collector causes a large number of database connections. This issue occurs because of thread leaks.	Do not upgrade to Database Agent 22.11 if you are monitoring MongoDB.

### 22.11 SaaS Controller Known Issues

There were no known issues for the AppDynamics SaaS Controller 22.11.0 release.

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
DOTNET-6344	.NET Agent	There are invalid cast exceptions in <code>DynamicMethodUtils</code> .	Medium	22.9.0	22.10.0	October 2022
DOTNET-6375	.NET Agent	Cannot view errored events in Analytics.	Medium	22.6.0	22.10.0	October 2022
PHP-899	PHP Agent	The hostname is displayed incorrectly in the Controller UI.	Low	4.5.7	22.10.0	October 2022
PHP-1808	PHP Agent	The agent unallocates the <code>ListenerProvider.php</code> object from the memory. This causes an error in TYPO3.	High	All Versions	22.10.0	October 2022
PYTHON-1164	Python Agent	The Java proxy is upgraded to the latest version.	Medium	22.8.0	22.10.0	October 2022
WEBSRV-800	Apache Web Server Agent	The Java proxy is upgraded to the latest version.	Medium	22.7.0	22.10.0	October 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
ALERT-12094	Alert & Respond	The Health Rules API is not supported in Apache Cassandra database.	Medium	22.2.4	22.10.0	October 24, 2022

### 22.10 Agent Known Issues

There were no known issues for AppDynamics agent 22.10.0 releases.

### 22.10 SaaS Controller Known Issues

There were no known issues for the AppDynamics SaaS Controller 22.10.0 release.

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
ALERT-11828	Alert & Respond	For inactive nodes or tiers, if a health rule is configured with the <b>Evaluate to true on no data</b> option and the health rule violation occurs, the status of the nodes or tiers is shown as Unknown instead of Warning or Critical.	Medium	< 22.10.0	22.10.0	October 24, 2022
ALERT-11781	Alert & Respond	Email digest mail does not show all the slow or very slow calls in last 60 minutes.	Medium	-	22.10.0	October 24, 2022
ALERT-11809	Alert & Respond	For <b>Diagnostic Thread Dump Actions</b> , the Actions executed in the health rules do not match the affected entity.	Medium	22.2.0	22.10.0	October 24, 2022
ALERT-12423	Alert & Respond	Changed the error message for MTLS error message from <b>Csr details not found for Application</b> to <b>CSR details not found for Current Account</b> .	Medium	22.10.0	22.10.1	November 4, 2022
ALTCSAAS-14, ALTCSAAS-74	Alert & Respond	Summary messages are now added to Custom Events Actions.	Medium	>= 22.10.0	22.10.3	November 29, 2022
ALTCSAAS-1487	Alert and Respond	Repeated calls to fetch and cancel orphaned incidents clog the event processing queue.	-	-	22.10.6	April 1, 2023
ANALYTICS-14571	Analytics	The Analytics Agent list does not correctly sort the <b>Last Connected</b> column for non-ISO dates.	Low	22.2.0	22.10.0	October 24, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
ANALYTICS-14894	Analytics	The role-based access control permission is unavailable for the <code>browser_resource_record</code> internal event type.	Medium	22.10.0	22.10.4	January 2023
BRUM-7620	Browser RUM	The <code>AgentID</code> field is no longer showing in fields or criteria for the <b>User Experience</b> tab.	High	>= 22.10.0	22.10.3	November 29, 2022
CONTRLRDEV-206, PLATSE-984	SaaS Controller	The controller build contains an outdated log4j version.	Low	22.2.0	-	April 1, 2023
IAM-1275	Identity, Authentication, Authorization, and Audit	Enable the slider between the <b>SAML Group</b> column and the <b>AppDynamics Roles</b> column in the <b>Mapping of Group to Roles</b> section to be resized.	Low	20.6.0	22.10.0	October 24, 2022
LIC-3056	Licensing	Licensing is producing negative <code>maxDailyDocuments</code> for the Events Service.	High	22.8.0	22.10.0	October 24, 2022
PLATSE-567	Platform Sustaining Engineering	Remove a default health rule from EUM applications that is only valid for business applications.	Medium	22.10.0	22.10.0	October 24, 2022
PLATSE-645	Platform Sustaining Engineering	Modify the schema of a database table to increase the maximum length of remote service URLs from 100 to 200 characters.	High	>22.4	22.10.0	October 24, 2022
PLATSE-835	Platform Sustaining Engineering	End User Monitoring query results take a lot of time to load.	Medium	-	22.10.6	April 1, 2023

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
PLATSE-1017	Platform Sustaining Engineering	The <b>Network</b> tab in the dashboard tab does not display data. This issue occurs when code threads get locked while clearing network links.	Medium	< 22.10.0	22.10.4	January 2023
PLATSE-1152	Platform Sustaining Engineering	When you navigate to <b>Applications &gt; Server</b> , the upper limit for <b>Memory</b> is incorrect.	Medium	-	22.10.5	February 28, 2023
PLATSE-1190	Platform Sustaining Engineering	Performance issue when loading recently visited dashboards.	Medium	21.2.5	22.10.6	April 1, 2023
PLATSE-1242	Platform Sustaining Engineering	The requests to populate new MDS keys time out because of poor cache performance.	High	All Versions	22.10.6	April 1, 2023
PLATSE-1271	Platform Sustaining Engineering	Migrate <code>FastLocalCache</code> from Guava to Caffeine.	Medium	All Versions	22.10.6	April 1, 2023
STUDIO-4861	Dash Studio	Analytics widgets for custom dashboards are not displaying data via shared links.	High	22.10.0	22.10.1	November 4, 2022
STUDIO-4883	Dash Studio	Disable sort on <b>Shared</b> column in the <b>Custom Dashboard</b> list.	High	22.10.0	22.10.2	November 14, 2022
SYNTH-8610	Browser Synthetic Monitoring	When using Synthetic Monitoring API to create Synthetic Web monitoring jobs, all jobs are created with an empty name in <b>User Experience &gt; Browser App &gt; Synthetic Jobs</b> .	Medium	22.9.0	22.10.0	October 24, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
SYNTH-8915	Machine Agent	The incorrect default size of the <code>property_value</code> column of the <code>sim_machine_property</code> table causes Machine Agent registration failure.	-	21.12.5	22.10.6	April 1, 2023

BRUM-7538	JavaScript Agent	Sessions with ajax calls are missing start time.	Medium	<= 22.8.0	22.9.0	September 8, 2022
DBMO N-8766	Database Agent	Database Agent throws null pointer exception while monitoring hardware metrics.	Medium	22.6.0 - 22.7.0	22.9.0	September 28, 2022
DBMO N-8782	Database Agent	Database Agent cannot identify the nodes in the Oracle RAC if the query includes the <code>TCP_PROTOCOL</code> value in lowercase.	Medium	22.2.0 - 22.4.0, 22.6.0 - 22.7.0	22.9.0	September 28, 2022
DOTNE T-6295	.NET Agent	Service endpoint configurations break when using MSI agent.	Medium	22.3.0 - 22.6.0	22.9.0	September 12, 2022
DOTNE T-6312	.NET Agent	The debug log for service endpoint is not correctly formatted.	Low	22.6.0	22.9.0	September 12, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
DOTNET-6326	.NET Agent	Unable to cast object of type <code>System.Web.Routing.RequestContext</code> to type <code>System.Web.HttpContext</code> .	Medium	22.4.0	22.9.0	September 12, 2022
JAVA-1361	Java Agent	<code>ClassCastException</code> occurs when Analytics collects the error details.	Medium	22.4.0	22.9.0	September 23, 2022
JAVA-1391	Java Agent	<code>ThreadLocalManager</code> causes high memory usage when the thread creation rate is high.	Medium	22.5.0	22.9.0	September 23, 2022
NODEJS-690	Node.js Agent	Node.js Error Detection is not working.	Medium	22.2.0	22.9.0	September 29, 2022
NODEJS-712	Node.js Agent	The <code>TAR@5.0.0</code> package is impacted.	Medium	<= 22.7.0	22.9.0	September 29, 2022

### SaaS Controller Resolved Issues

 Filter table: 

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
ANALYTICS-14514	Analytics	On the <b>Funnel Watch</b> page, the <b>Add</b> button is unresponsive and does not add a funnel or produce an error message.	High	21.4.10-1472	22.9.0	September 20, 2022
BRUM-7471	Browser RUM	The Browser RUM application cannot be found in the API server when resource performance metadata is requested.	Medium	22.6.0	22.9.0	September 20, 2022
LIC-2478	Licensing	When the default rule is deleted, it is not possible to edit account details in <code>admin.jsp</code> page.	Medium		22.9.0	September 20, 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
LIC-3056	Licensing	Licensing is producing a negative value for the <code>maxDailyDocuments</code> property for the Events Service.	High	22.8.0, 22.9.0	22.9.1	September 2022
PLATSE-432	Platform Sustainin g Engineering	When the <b>%Busy</b> metric displays percentage values greater than 100%, the <b>CPU Usage</b> graph on the <b>Tiers &amp; Nodes &gt; Node &gt; Server</b> page is maxed out at 100% height and not showing actual values.	High	22.2.1	22.9.0	September 2022
PLATSE-564	Platform Sustainin g Engineering	The search function has intermittent issues: either no results are returned when there should be matches or there are matches but the results only appear for a second before disappearing.	Medium	21.4.0	22.9.0	September 2022
STUDIO-4883	Dash Studio	Disable sort on <b>Shared</b> column in <b>Custom Dashboard</b> list.	High	22.8.0, 22.8.1, 22.9.0, 22.9.1	22.9.2	November 2022

## Known Issues

### Agent Known Issues

Java Agent releases through 22.9 include a `jackson-databind` library which contains a vulnerability (CVE-2022-42003) when the `UNWRAP_SINGLE_VALUE_ARRAYS` feature is enabled. The Java Agent does not use this functionality of `jackson-databind`, and this feature is disabled by default. The Java Agent is not affected by this vulnerability.

### Controller Known Issues

There are no known issues yet for Controller 22.9.0 release.

## 22.8 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
ANALYTICS-14612	Analytics Agent	An unused library, AWS SDK for Java, was added to the Analytics Agent. The library has been removed in the 22.8.0 release.	Medium	22.7.0	22.8.0	August 2022
CDM-8618	Android Agent	There are occasional build errors related to gradle daemon.	Medium	21.5 - 22.2.2	22.8.0	August 2022
DOTNET-4233	.NET Agent	There are null reference exceptions on exit call detections.	Medium	21.5.0	22.8.0	August 2022
DOTNET-6144	.NET Agent	There are missing Business Transaction Error metrics in .NET Agent (parity with Java Agent).	Medium	20.11.0	22.8.0	August 2022
DOTNET-6249	.NET Agent	Network Visibility raises <code>ArgumentNullException</code> on exit call registration attempt.	High	22.5.1	22.8.0	August 2022
DOTNET-6288	.NET Agent	The <code>http.method</code> attribute is missing in the clients spans.	Medium	22.7.0	22.8.0	August 2022
DOTNET-6293	.NET Agent	The profiler info logs are flooding the log files.	Medium	22.4.0	22.8.0	August 2022
DOTNET-6296	.NET Agent	Agent bootstrap initializes <code>NLOG</code> in synchronous manner, which leads to deadlock.	Medium	22.5.1	22.8.0	August 2022
JAVA-11254	Java Agent	Java Agent does not generate the OpenTelemetry trace spans.	Medium	22.5.0	22.8.0	August 2022
JAVA-11281	Java Agent	An error in Java Agent shuts down the application JVM.	High	22.4.0	22.8.0	August 2022

Key	Product	Summary	Severity Level	Affected Version(s)	Release Version	Release Date
JAVA-1322	Java Agent	Infinite loop in log message flush during initialization causes high CPU utilization in Cisco Secure Application.	Medium	All Versions	22.8.0	August 2022
PYTHON-1127	Python Agent	Python Agent does not capture the database calls made through the <code>cx_Oracle</code> library using the <code>SessionPool()</code> connection handler.	Medium	All Versions	22.8.0	August 2022
PYTHON-1142	Python Agent	Python Agent fails to start applications that use Django <code>&gt;= v3.1.a1</code> .	Medium	22.5.0 - 22.6.0	22.8.0	August 2022

## Controller (SaaS) Resolved Issues

Filter table:

Key	Release Version	Product	Release Date	Summary	Severity Level	Affected Version
DOT NET-6050	22.5.0	.NET Agent	May 25, 2022	The <code>JITCompilation</code> callbacks are not currently thread safe.	Medium	4.5.18
DOT NET-6115	22.5.0	.NET Agent	May 25, 2022	Calls to <code>System.RuntimeType.GetInterfaceMap</code> is causing high CPU usage.	Medium	22.2.0
DOT NET-6118	22.5.0	.NET Agent	May 25, 2022	There is a stop in collecting snapshots after a certain amount of snapshots without a callgraph were collected.	High	22.1.1 - 22.3.0
DOT NET-6128	22.5.0	.NET Agent	May 25, 2022	There is memory loss in agent logging.	High	22.4.0
DOT NET-6143	22.5.0	.NET Agent	May 25, 2022	There is an issue with shifts in utility methods for the long type.	Low	22.4.0
DOT NET-6159	22.5.0	.NET Agent	May 25, 2022	The Coordinator service is not writing logs.	High	22.4.0
DOT NET-6191	22.5.1	.NET Agent	June 6, 2022	There is a stop in collecting snapshots after a certain amount are collected without a callgraph.	Medium	22.1.1
JAVA-11024	22.5.0	Java Agent	May 26, 2022	The Java Agent codebase does not have all the required permissions to access classes created with the <code>ProtectionDomain</code> value as <code>null</code> .	Medium	< 22.5.0

Key	Release Version	Product	Release Date	Summary	Severity Level	Affected Versions
JAVA-11090	22.5.0	Java Agent	May 26, 2022	Some web applications do not start properly when Cisco Secure Application is enabled. This issue occurs when JBoss LogManager is used with the Java Security Manager.	Low	< 22.5.0
NOD-EJS-208	22.5.0	Node.js Agent	May 11, 2022	The integration tests for Couchbase are failing.	Medium	22.3.0
NOD-EJS-537	22.5.0	Node.js Agent	May 11, 2022	The Request module is experiencing issues.	High	22.3.0
NOD-EJS-649	22.5.0	Node.js Agent	May 11, 2022	The build scripts for regex-replace 1.0.0 in package.json aren't targeting a specific module.	Low	22.3.0
NOD-EJS-656	22.5.0	Node.js Agent	May 11, 2022	The Docker images for agent version 22.2 are failing.	High	22.2.0, 22.3.0
PYTHON-1095	22.5.0	Python Agent	May 26, 2022	<p>The library is created in the default <code>/tmp/appd</code> directory. When you set the base directory to any value other than the default <code>/tmp/appd</code> directory, the library is not created in the specified directory.</p> <p>This issue occurs in both the ways of setting the base directory, through the <code>APPDYNAMICS_AGENT_BASE_DIR</code> environment variable and the configuration file.</p>	Medium	All versions

Key	Release Version	Product	Release Date	Summary	Severity Level	Affected Version(s)
SERV ER-8763	22.5.0	Machine Agent	May 26, 2022	Process-related data doesn't appear on Windows 2016.	Medium	21.12.6

Key	Release Version	Product	Summary	Severity Level	Affected Version(s)
ALERT-10666	22.5.0	Alert & Respond	An exception occurs when creating a database health rule with an API token.	Medium	22.2.0
ANALYTICS-14115	22.5.0	Analytics	Fetching the Analytics data retention period fails because of a missing license.	Medium	21.9.0 - 22.4.0
ANALYTICS-14417	22.5.1	Analytics	Business Journeys are not consistently preserving the configuration of the business transactions.	High	22.5.0
CDM-8301	22.5.0	Mobile RUM	An error while parsing the binary DWARF file format is causing one stack trace to not be symbolicated.	Medium	< 22.5.0
DBMON-8591	22.5.0	Database Visibility	Updating the Oracle collector with custom connection string and sub-collectors gives an error.	Medium	< 22.5.0
DBMON-8642	22.5.1	Database Visibility	Server entity is not being displayed in <b>Health Rule Violations</b> dialog that has anomaly detection enabled.	Medium	22.5.0

## 22.4 Resolved and Known Issues

### Agent Resolved Issues

Key	Release Version	Product	Summary	Severity Level	Affected Version(s)
EUMPLA T-2932	22.5.0	EUM Cloud	Packet size of the Controller response to the agent has been reduced by decreasing the frequency of sending the EUM configuration.	Medium	22.3.1
EUMPLA T-3211	22.5.0	EUM Cloud	EUM Dashboards that show page requests showing a sudden drop of page requests during the middle of day (peak hours).	Medium	22.3.0
IAM-2376	22.5.0	Identity, Authentication, Authorization, and Audit	Two tenants on the same Controller cannot use the exact same API Client name.	Medium	21.4.0 - 21.4.0
LIC-2341	22.5.0	Licensing	Unable to view the License page on SaaS Controllers	High	22.5.0
PLATSE-83	22.5.0	Platform Sustaining Engineering	The <b>Performance by Nodes</b> dialog for a business transaction does not display the slow and very slow calls.	High	21.2.5, 21.4.2, 21.6.0 - 22.3.0
PLATSE-214	22.5.0	Platform Sustaining Engineering	When sorting on certain columns in the grid view, hidden historical nodes pop up.	Medium	21.6.0 - 22.3.0
PLATSE-285	22.5.0	Platform Sustaining Engineering	The hover cards for downstream apps are not displaying the calls per minute (CPM) or errors per minute (EPM) for cross-app business transactions.	Medium	21.8.0 - 22.4.0
PLATSE-339	22.5.0	Platform Sustaining Engineering	From a transaction snapshot, clicking <b>Waterfall View &gt; Drill Down</b> does not open a downstream application.	Medium	21.11.1

Key	Release Version	Product	Summary	Severity Level	Affected Version(s)
PLATSE-371	22.5.0	Platform Sustaining Engineering	From the <b>Error Transactions</b> tab, error snapshots are only displayed for the last two hours.	Medium	21.11.2, 21.12.0
PLATSE-381	22.5.0	Platform Sustaining Engineering	From <b>Databases &gt; Dashboard</b> , you can not drill down to view snapshots.	Medium	21.11.0 - 22.3.0
PLATSE-397	22.5.0	Platform Sustaining Engineering	From the <b>Data Collection</b> dialog, editing values with escaped "." symbols in the <b>Use Getter Chain</b> text field causes them to be unescaped.	Medium	21.4.9-1435, 22.3.0
SRVLESS-2048	22.5.0	OpenTelemetry	The OpenTelemetry Collector is only taking the first request per node ID and is ignoring subsequent requests.	High	22.3.0 - 22.5.0

Filter table:

Key	Product	Summary	Version
BRUM-6966	JavaScript Agent	Some error events displayed the event URL as the JavaScript file rather than the page URL.	22.4.0
BRUM-7088	JavaScript Agent	Multiple JavaScript error messages (with no stack trace) are combined into one error event.	22.4.0
DBMON-8568	Database Agent	Database Agent does not monitor all the nodes in the availability group of an MSSQL database server. This happens when multiple groups are configured on the same set of nodes, and the nodes do not contain the <code>replica_server_name</code> parameter.	22.4.0
DBMON-8584	Database Agent	Database Agent does not work when there is a mismatch in the Oracle PDB service names.	22.4.0

Key	Product	Summary	Version
DBMON-8611	Database Agent	Postgres driver is upgraded to the 42.3.3 version.	22.4.0
DOTNET-5975	.NET Agent	Incorrect transformation of methods with branch instruction at the end.	22.4.0
DOTNET-6038	.NET Agent	Inability to read <code>PerformanceCounter</code> by the Coordinator service.	22.4.0
DOTNET-6076	.NET Agent	MSI installed agent on .NET Core 3.1 fails to start.	22.4.0
DOTNET-6077	.NET Agent	There is a mismatch in a signature between managed and native APIs.	22.4.0
DOTNET-6078	.NET Agent	Profiler attempts to load non-strong name agent assembly.	22.4.0
JAVA-10880	Java Agent	Java Agent does not report garbage collection metrics when using the Z Garbage Collector.	22.4.0
JAVA-10904	Java Agent	The applications using the Java Agent Azure Extension in a Spring Boot environment fail to start and do not generate logs.	22.4.0
JAVA-10979	Java Agent	The class loader does not load classes that are locked with class initialization lock. The initialization lock ensures that each class is initialized only once.	22.4.0
JAVA-10991	Java Agent	The sensitive message filter does not mask the sensitive data in the error details and asynchronous segments when the message includes multiple filters.	22.4.0
LIBAGENT-617	C/C++ SDK Agent	Using functions to configure Analytics message limits leads to <code>unresolved symbols</code> error.	22.4.0

### Agent Known Issues

Issue Summary	Workaround
Database Agent does not run on JDK 16 and 17 versions.	Use JDK version 15 or lower.

## Controller (SaaS) Resolved Issues

There were no resolved issues for the 22.4 Controller release.

## Controller Known Issues

There were no 22.4 known issues.

## 22.3 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
CDM-8200	Xamarin Agent	Using ProGuard (R8 setting) on Android is causing crashes on some build environments.	22.3.0
DBMON-8570	Database Agent	Microsoft SQL Cluster Monitoring: Nodes are not discovered because of case sensitivity issues.	22.3.0
DBMON-8583	Database Agent	Cassandra Monitoring does not work when DB SSL is enabled and JMX SSL is disabled.	22.3.0
DOTNET-5058	.NET Agent	The Method Invocation Data Collector is not working when performing complex Getter Chain transformations.	22.3.0
DOTNET-5999	.NET Agent	High memory usage occurs when Network Visibility is enabled.	22.3.0
DOTNET-6026	.NET Agent	The Business Transaction correlation to EUM is not working because of a cookie configuration.	22.3.0
DOTNET-6027	.NET Agent	The inflight slow session snapshots do not appear for asynchronous requests.	22.3.0
DOTNET-6029	.NET Agent	The Ignore Exception rules are not functioning for snapshot errors.	22.3.0
DOTNET-6030	.NET Agent	The snapshot collection attempt accesses the wrong Business Transaction.	22.3.0

Key	Product	Summary	Version
DOTNET-6031	.NET Agent	The timing-out transactions do not terminate their associated snapshots.	22.3.0
DOTNET-6034	.NET Agent	There are possible memory access violations in the dynamic reflection.	22.3.0
DOTNET-6048	.NET Agent	The Coordinator should only run from the admin or local system account.	22.3.0
DOTNET-6054	.NET Agent	There is an error with <code>InvalidCastException</code> when comparing internal error objects.	22.3.0
IIB-420	IBM Integration Bus Agent	IIB Agent snapshots are inconsistent and incomplete.	22.3.0
IIB-425	IBM Integration Bus Agent	New nodes overwrite the existing nodes in the IBM App Connect Enterprise environment.	22.3.0
JAVA-10586	Java Agent	Java Agent creates a large number of segments of long URLs. These segments fill up the elastic index and are not processed by Analytics.	22.3.0
JAVA-10670	Java Agent	Service proxy causes JVM heap memory to delete all metric data.	22.3.0
JAVA-10790	Java Agent	Java Agent instruments internal JAR files of Cisco Secure Application.	22.3.0
PHP-1246	PHP Agent	PHP Agent with MySQLi extension does not capture queries in the Result mode.	22.3.0
PHP-1644	PHP Agent	Analytics does not parse <code>responseTime</code> and <code>transactionTime</code> in the string format.	22.3.0
SERVER-8725	Machine Agent	JVM crashes when trying to run the Machine Agent in the latest JRE 8 on Windows.	22.3.0

## Controller (SaaS) Resolved Issues

Filter table:

Key	Product	Summary	Version
ALERT-10439	Alert & Respond	API call to Retrieve Server Health Rule Details returns 400 error.	22.3.0
ALERT-11007	Alert & Respond	'Error fetching temporary token for OAuth, null' message displays when you integrate Jira using the integration wizard.	22.3.0
ANALYTICS-13883	Analytics	Adding Agent Scope fails when there are a large number of Analytics Agents.	22.3.0
ANALYTICS-14157	Analytics	Fetching the Analytics data retention period fails because of a missing license.	22.3.0
APMC-208	Controller	The average response time (ART) metric data for a client service shows different values in various dashboards	22.3.0
APMC-216	Controller	The average response time (ART) metric data for a client service shows different values in various dashboards	22.3.0
BRUM-7138, BRUM-7157	Browser RUM	Requests per minute (RPM) metric shows different values in various dashboards over the same timeframe	22.3.0
BRUM-7164, BRUM-7242	Browser RUM	Browser is unable to load JavaScript Agent from the AppDynamics CDN from the <b>Getting Started Wizard</b> .	22.3.0 22.3.0
CDM-8027	Mobile RUM	UI only shows the stack frame label only if the <code>packageName</code> field is present.	22.3.0
CDM-8055	Mobile RUM	Pie chart legend colors are not displayed on <b>Mobile Usage Statistics</b> page.	22.3.0
DBMON-8417	Database Visibility	Encoding characters in the connection URL string of database collectors prevent the collector configuration propagation to the Database Agent.	22.3.0
DBMON-8421	Database Visibility	The <code>DB_AGENT</code> entity does not get exported to <b>Custom Dashboard</b> .	22.3.0
DBMON-8437	Database Visibility	The <b>Live view</b> , <b>Queries</b> , <b>Blocking Sessions</b> , and <b>Database Agents</b> tabs do not display any data.	22.3.0

Key	Product	Summary	Version
DBMON-8504	Database Visibility	The execution count in the <b>Queries</b> tab and <b>Query Details</b> page does not match.	22.3.0
IAM-2339	Identity, Authentication, Authorization, and Audit	Unable to update email and password for non-Central Identity users.	22.3.0
LIC-1881	Licensing	Agents do not get a lease even though there seem to be enough units.	22.3.0
SYNTH-8003	Synthetic Browser Monitoring	Thai language characters are not rendered on Linux-based Agents with Chrome version 86 (AWS locations).	22.3.0
PLATSE-273	Platform Service Engineering	Unable to save a data collector with too many business transactions.	22.3.0
PLATSE-350	Platform Service Engineering	From <b>Applications &gt; Configuration &gt; Baselines</b> , when creating a new baseline and setting a trend or time period, the time period is not getting updated correctly on the first click.	22.3.0

## Known Issues

 Filter table: 

Product	Issue Summary	Workaround	Version/Date
AppDynamics for OpenTelemetry	<p>In the 22.3.0 release of AppDynamics for OpenTelemetry, the following issues have been identified:</p> <ul style="list-style-type: none"> <li>• There are some inconsistent application metrics in OpenTelemetry flow maps.</li> <li>• For OpenTelemetry flow maps, Business Transactions (BTs) can lose the upstream context and appear as new BTs rather than continuations. This causes BTs to appear split up in the BT dashboard, resulting in BT Metrics to be split up as well.</li> </ul>	N/A - AppDynamics is actively working on these issues.	22.3.0 - March 30, 2022

Product	Issue Summary	Workaround	Version/ Date
Synthetic Private Agent (Windows-based)	<p>Vulnerabilities in the PSA Server:</p> <ul style="list-style-type: none"> <li>Open port 4444</li> <li>Jetty 9.4.7 is vulnerable to <a href="#">CVE-2017-7657</a></li> </ul>	<ol style="list-style-type: none"> <li>Add a firewall rule to prevent communication of external IPs with the 4444 port.</li> <li>Block all IPs except 127.0.0.1.</li> </ol> <div style="border: 1px solid orange; padding: 5px; margin-top: 10px;">  You need to perform this step to allow localhost access for internal communication.         </div>	21.7.0 - Mar 4, 2022

## 22.2 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
ANALYTICS-13986	Analytics Agent	All Netty libraries need to be upgraded to version 4.1.73.Final.	22.2.0
BRUM-7196	JavaScript Agent	Ajax events are not aligning with the custom virtual page names that were created with the JavaScript API.	22.2.0.3657
CDM-7996	Android Agent	Crashes occur on some new Android devices because the OS is blocking information from the Android Agent.	22.2.0
DBMON-8549	Database Agent	Cassandra Monitoring does not work when DB SSL is enabled and JMX SSL is disabled.	22.2.0
DBMON-8473	Database Agent	Oracle storage usage query impacts performance on the database.	22.2.0

Key	Product	Summary	Version
DBMON-8446	Database Agent	<code>NullPointerException</code> error occurs while resolving MongoDB topology.	22.2.0
DOTNET-5915	.NET Agent	Node names are duplicated if the .Net Core application is in the root path.   Customers using .NET Agent Site Extension instrumenting Asp.NET Core applications deployed to the Azure App Service Virtual Path may be affected. New tiers and nodes may be created with the virtual application path appended.	22.2.0
DOTNET-5944	.NET Agent	Runtime re-instrumentation results in pulling and updating the same instrumentation config every minute.	22.2.0
DOTNET-5947	.NET Agent	The coordinator service fails to read from the pipe.	22.2.0
DOTNET-5965	.NET Agent	<code>BinaryFormatter</code> methods are obsolete and prohibited in ASP.NET apps.	22.2.0
DOTNET-5974	.NET Agent	The "NetViz agent successfully registered with Controller with id={D}" message is incorrectly formatted.	22.2.0
DOTNET-6003	.NET Agent	Authorization header is not added in Controller communication from 21.12 agents.	22.2.0
JAVA-10692	Java Agent	The Java Agent version is unavailable in the Controller UI.	22.2.0
NODEJS-574	Node.js Agent	The endpoint calls stall when <code>AppD</code> is enabled on the <code>http.get()</code> signature with three arguments.	22.2.0
NODEJS-578	Node.js Agent	The Couchbase 3.x SDK query exit calls are not captured.	22.2.0

Key	Product	Summary	Version
NODEJS-587	Node.js Agent	There are missing <code>ADRUM_0/2/3</code> cookies in 21.9.	22.2.0
NODEJS-589	Node.js Agent	The API calls receive a timeout from the gRPC exit call probe.	22.2.0
PYTHON-1045	Python Agent	Updated the <code>appdynamics-bindeps-linux-x64</code> library to make it security compliant.	22.2.0
PYTHON-1049	Python Agent	Oracle connection strings with empty username and password fields display <code>CxOracleConnectionInterceptor._connect</code> error.	22.2.0
PYTHON-1042	Python Agent	Auto instrumentation fails while running <code>gunicorn</code> worker class as <code>gevent</code> .	22.2.0
WEBSRV-595	Apache Web Server Agent	Java proxy bundled with the Apache agent reports multiple vulnerabilities.	22.2.0

### Controller (SaaS) Resolved Issues

 Filter table: 

Key	Product	Summary	Version
ALERT-10576	Alert & Respond	Health Rule Affected Entities list is rendered blank when inverse is selected in the regex.	22.2.1
CDM-8049	Mobile RUM	Support the asynchronous fetching of correlated business transactions in <b>Mobile Session Details</b> .	22.2.4
CDM-8051	Mobile RUM	Support the fetching of asynchronous business transactions for a mobile session.	22.2.4
CDM-8079	Mobile RUM	Enable async correlated business transactions to load on <b>Mobile Session Details</b> .	22.2.4

Key	Product	Summary	Version
CDM-8112	Mobile RUM	Integrate async business transaction fetch and load endpoints for <b>Mobile Session Details</b> .	22.2.4
EUMPLAT-2947	End User Monitoring	Huge surge in communication between Controller and Agents causing an outage.	22.2.2
EUMPLAT-2963	End User Monitoring	The <code>AccountConfigurationEntity</code> timestamp allowed the value of null. The <code>AccountConfigurationProto</code> retrieves the timestamp value from <code>AccountConfigurationEntity</code> , but if the latter's value is null, this causes an exception.	22.2.3
LIC-1888	Licensing	Data retention data is not correctly synced to Events Service.	22.2.0
PLATSE-258	Platform Service Engineering	Entity names in the dropdown are trimmed in 21.9.	22.2.0
SYNTH-8028	Synthetic Browser Monitoring	Synthetic sessions are failing on AWS locations with <code>ERR_ABORTED</code> error.	22.2.0
SYNTH-8054	Synthetic Browser Monitoring	Sessions failing with <code>ERR_ABORTED</code> error in AWS agents.	22.2.0

### Known Issues

This table includes a Synthetic API Monitoring 22.2.0 known issue:

Issue Summary	Workaround
Adding multiple schedules option is not visible in the API Monitoring job editor.	<ol style="list-style-type: none"> <li>1. Navigate to <b>Browser Apps</b> and click on a Synthetic job.</li> <li>2. Navigate to <b>API Monitoring</b>, then select an API collection.</li> <li>3. Click <b>Add</b> to create a new job. <b>Add Schedule</b> option is visible now.</li> <li>4. Log out from the Controller, and log in again.</li> </ol>

## 22.1 Resolved and Known Issues

### Agent Resolved Issues

 Filter table: 

Key	Product	Summary	Version									
ANALYTICS-13941	Analytics Agent	Upgrade the following libraries:	22.1.0									
		<table border="1"> <thead> <tr> <th>Library Name</th> <th>Previous Version</th> <th>Upgraded Version</th> </tr> </thead> <tbody> <tr> <td>ch.qos.logback:logback-core</td> <td>1.2.3</td> <td>1.2.8</td> </tr> <tr> <td>ch.qos.logback:logback-classic</td> <td>1.2.3</td> <td>1.2.8</td> </tr> </tbody> </table>		Library Name	Previous Version	Upgraded Version	ch.qos.logback:logback-core	1.2.3	1.2.8	ch.qos.logback:logback-classic	1.2.3	1.2.8
		Library Name		Previous Version	Upgraded Version							
ch.qos.logback:logback-core	1.2.3	1.2.8										
ch.qos.logback:logback-classic	1.2.3	1.2.8										
ANALYTICS-13957	Analytics Agent	Logs analytics source rule with wild card not working	22.1.0									
DOTNET-5907	.NET Agent	There is a suspended canary thread in the Snapshot collection when unloading appdomain.	22.1.0									
DOTNET-5970	.NET Agent	The agentless Analytics is failing when reporting data to the Events Service	22.1.1									
JAVA-10688	Java Agent	Security vulnerabilities in the Java Agent zip files	22.1.0									
JAVA-10612	Java Agent	Black Duck scan reports multiple vulnerabilities	22.1.0									
JAVA-10606	Java Agent	Missing log folder when agent logs are downloaded using the Controller UI	22.1.0									
JAVA-10429	Java Agent	The sensitive URL filter fails to mask the URLs in the exception tab	22.1.0									

Key	Product	Summary	Version
JAVA-10404	Java Agent	Unable to assign permission to the <code>com.appdynamics.appagent</code> module to read unnamed modules	22.1.0
JAVA-10342	Java Agent	Incomplete instrumentation occurs when a business service calls an unavailable HTTP backend service	22.1.0
JAVA-9928	Java Agent	Outdated Apache common-codecs library in the agent build	22.1.0
PHP-1582	PHP Agent	The Apache log4j library is upgraded to version 2.17.1	22.1.0
PHP-1586	PHP Agent	Agent crashes after an Apache reload	22.1.1
PHP-1587	PHP Agent	Agent installation fails when installing or upgrading using the RPM packages	22.1.1
PYTHON-1014	Python Agent	The Apache log4j library is upgraded to version 2.17.1	22.1.0
SERVER-8608	Machine Agent	Docker container CPU %Busy metric is inaccurate	22.1.0
SERVER-8638	Machine Agent	Machine Agent on Linux does not support <code>procps 3.3.x</code> for memory metrics	22.1.0

### Controller (SaaS) Resolved Issues

Key	Product	Summary	Version
DBMON-8346	Database Visibility	The number of executions on the <b>Queries</b> page does not match with the details on the <b>Execution Plan</b> page.	22.1.0
DBMON-8371	Database Visibility	On the <b>Live View</b> page, when you double click a session under <b>Session List</b> , the session data window does not display any data.	22.1.0
DBMON-8354	Database Visibility	<b>Disable Agent Reporting</b> option is displayed under the <b>Action Suppression</b> tab.	22.1.0
IAM-2200	Identity, Authentication, Authorization, and Audit	User with bearer token always defaults to Internal user.	22.1.0
STUDIO-4250	Dash Studio	A user can export dashboards from all accounts if the default dashboard view permissions are enabled.	22.1.0
SYNTH-7666	Synthetic Browser Monitoring	In the Synthetic jobs, the values of the <b>Advanced Options</b> fields of <b>Configure Availability Rules</b> get interchanged.	22.1.0
SYNTH-8610	Synthetic Browser Monitoring	When using Synthetic Monitoring API to create Synthetic Web monitoring jobs, all jobs are created with an empty name in <b>User Experience &gt; Browser App &gt; Synthetic Jobs</b> .	22.1.0

### Known Issues

There are no known issues for the Controller and agent 22.1 releases.

### 21.12 Resolved and Known Issues

#### Agent Resolved Issues

Filter table:

Key	Product	Summary	Ver
DBMON-84 32	Database Agent	The <code>log4j</code> library is upgraded to v2.15.0	21.1
DBMON-84 36	Database Agent	The <code>log4j</code> library is upgraded to v2.16.0	21.1
DBMON-84 43	Database Agent	The <code>log4j</code> library is upgraded to v2.17.0	21.1
DBMON-84 45	Database Agent	The operational metrics on the <b>Metrics Browser</b> are disabled by default. You can enable these metrics by starting the Database Agent with the following system property:  <code>-Ddbagent.oracle.operational.metrics.enabled=true</code>	21.1
DOTNET-56 66	.NET Agent	Page Redirect does not work with .NET core applications	21.1
DOTNET-58 41	.NET Agent	Ensure that End-to-End Latency internal data doesn't stall	21.1
DOTNET-58 47	.NET Agent	Fix Negative number for CPU Usage in Machine Snapshot	21.1
DOTNET-58 51	.NET Agent	Fix the End Transaction Correlation for Async Asp.Net Instrumentation	21.1
DOTNET-58 60	.NET Agent	Fix typo in the AppDynamicsAgentLog.config file	21.1
DOTNET-58 70	.NET Agent	Propagate node name configuration from controller protobuf	21.1
DOTNET-58 82	.NET Agent	Fix .NET IL transformation for <code>switch</code> statement	21.1
DOTNET-59 06	.NET Agent	.NET Core Application crashes with <code>AccessViolation</code> exception	21.1
PHP-1550	PHP Agent	MySQLi interceptor displays warning messages while accessing an undefined parameter	21.1

Key	Product	Summary	Ver
PHP-1571	PHP Agent	The Apache log4j library is upgraded to version 2.16.0	21.1
PHP-1575	PHP Agent	The Apache log4j library is upgraded to version 2.17.0	21.1
PYTHON-96 2	Python Agent	The <b>Ignore Exception</b> functionality of the <b>Error Detection</b> feature does not work	21.1
PYTHON-99 8	Python Agent	The log4j library is upgraded to v2.16.0	21.1
PYTHON-10 03	Python Agent	The log4j library is upgraded to v2.17.0	21.1
SERVER-86 70	Machine Agent	The xercesImpl library is upgraded to 2.12.1	21.1
SERVER-86 74	Machine Agent	The Apache log4j library is upgraded to version 2.15.0	21.1
SERVER-86 82	Machine Agent	The Apache log4j library is upgraded to version 2.16.0	21.1
SERVER-86 87	Machine Agent	Fixed crashing issue on Windows by bundling JRE version Zulu 8.54 (Java 8u292)	21.1
SERVER-86 90	Machine Agent	Reverts 21.11.0 enhancement that reported Duplex and MTU metrics on Windows	21.1
SERVER-86 91	Machine Agent	The Apache log4j library is upgraded to version 2.17.0	21.1
WEBSRV-58 7	Apache Web Server Agent	The Apache log4j library is upgraded to version 2.17.0	21.1
WEBSRV-57 7	Apache Web Server Agent	The Apache log4j library is upgraded to version 2.16.0	21.1

### Controller (SaaS) Resolved Issues

Filter table:

Key	Product	Summary	Version
ACTINT-102	ServiceNow Sync Utility	The sync utility includes fixes for the Log4j vulnerability ( <a href="#">CVE-2021-45046</a> ). This version integrates with the Orlando, Paris, and Quebec Release of ServiceNow®. See <a href="#">Security Advisory: Apache Log4j Vulnerability</a> .	21.
ALERT-9821	Alert & Respond	<b>Alert Sensitivity Tuning</b> charts are not visible in UI	21.
ANALYT ICS-13877	Analytics	Fixed <b>Last Connected</b> column sorting error on Agent Setting page	21.
ANALYT ICS-13922	Analytics	Unable to fetch license usage details at the account level	21.
BRUM-6670	Browser RUM	Incorrect processing of custom user data when displaying in UI	21.
BRUM-6734	Browser RUM	Fetching business transaction data should not block the entire session summary page	21.
COGEN G-4025	Cognition Engine	Anomaly event details are not displayed; <code>500 Internal Server Error</code> is displayed	21.
DBMON-8262	Database Visibility	<b>Hits</b> column is sorted alphabetically when it should be sorted numerically	21.
DBMON-8284	Database Visibility	<b>Explain another query</b> text field for Oracle shows an empty result with Controller 21.8.0	21.
DBMON-8312	Database Visibility	Unable to add databases into the role configuration	21.
DBMON-8357	Database Visibility	Error fetching the database health configuration ID from the <b>Home Screen</b>	21.
IAM-2163	Authentication	Corrected the login audit action for SAML users with credentials	21.

Key	Product	Summary	Version
LIC-1525	Licensing	License consumption is not displayed for license rule for each module type	21.12
PLATSE-325	Platform Sustaining Engineering	Unable to configure session policies on a per tenant basis for tenants hosted on controllers	21.12
SYNTH-7713	Synthetic Browser Monitoring	Jobs failures in Chrome v86 with error 'Timed out receiving message from renderer: -0.000' caused due to page load failure with net::ERR_ABORTED	21.12

### Known Issues

There are no known issues for the 21.12 release yet.

## 21.11 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
DOTNET-5802	.NET Agent	Common Language Runtime (CLR) Metric drops	21.12
DOTNET-5824	.NET Agent	The instrumented application crashes due to access violation exception	21.12
DOTNET-5831	.NET Agent	Fix string transformation with en-US culture variant on .NET 6.0	21.12
DOTNET-5857	.NET Agent	Query values are not retrieved in ASP.NET Core	21.12
JAVA-10383	Java Agent	ETE time for each execution is not set in the snapshot for the Fire-and-Forget async activity. This occurs when async demarcation is set	21.12

Key	Product	Summary	Ver
JAVA-1059 0, JAVA-1059 2	Java Agent	Upgrade Apache log4j2 to latest stable version >= 2.15.0	21.1
JAVA-1060 2	Java Agent	The Apache <code>log4j</code> library is upgraded to version 2.16.0	21.1
JAVA-1062 5	Java Agent	The Apache <code>log4j</code> library is upgraded to version 2.17.0	21.1
JAVA-1066 3	Java Agent	The Apache <code>log4j</code> library is upgraded to version 2.17.1	21.1
PHP-1447	PHP Agent	The application response time increases when you enable PHP Agent	21.1
PHP-1487	PHP Agent	The CPU utilization increases when you enable PHP Agent	21.1
PHP-1495	PHP Agent	The PHP application crashes when it calls the <code>APIEndTransaction</code> API function	21.1
PHP-1515	PHP Agent	Agent does not start after installation	21.1
SERVER-86 42	Machine Agent	<ul style="list-style-type: none"> <li>Linux only: JRE 11 upgraded to Zulu 11.52, which corresponds to JDK Version 11.0.13</li> <li>Rest of OS: JRE 8 upgraded to Zulu 8.58, which corresponds to JDK Version 8u312</li> </ul>	21.1
SERVER-86 47	Machine Agent	Enhancement to report Duplex and MTU metrics on Windows environments	21.1

## Controller (SaaS) Resolved Issues

 Filter table: 

Key	Product	Summary	Ver
ALERT-9115	Alert & Respond	Update the health rule configuration to handle permission errors	21

Key	Product	Summary	Version
ALERT-9967	Alert & Respond	Health Rule Affected Entities list is rendered blank when inverse is selected in the regex	21.11
ALERT-9978	Alert & Respond	Alert Sensitivity Tuning charts are not displayed on the health rule dialog	21.11
ANALYTICS-13601	Analytics	XLM widget not showing data in shared dashboards	21.11
ANALYTICS-13875	Analytics	Searching for values based on set criteria yields no results because of null option values	21.11
BRUM-6671	Browser RUM	<b>Session Summary</b> shows incorrect user data in browser session	21.11
BRUM-6720	Browser RUM	Resource timing markers are missing	21.11
BRUM-6778	Browser RUM	JavaScript Agent auto-injection snippet includes incorrect copy of the JavaScript Agent for self-hosting deployments	21.11
CDM-7594	IoT Monitoring	Enable data export from IoT widgets	21.11
COGENG-4036	Cognition Engine	Anomaly event details are not displayed; 500 Internal Server Error is displayed	21.11
DBMON-8091	Database Visibility	Display error message when databases permissions at the application level are missing	21.11
DBMON-8159	Database Visibility	<b>Drill Down</b> button missing under <b>Transaction Snapshot</b>	21.11
DBMON-8216	Database Visibility	Database Collector created with REST API not working as expected when using the <code>useSSL</code> parameter	21.11
DBMON-8319	Database Visibility	Unable to add databases to the role configuration	21.11
LIC-1335	Licensing	License usage for transaction analytics is incorrectly computed for data during the period that starts before the requested time range	21.11

### Known Issues

There were no known issues for the 21.11 release.

Key	Product	Summary	Version
LIC-1681	Licensing	IBL license consumption is not reported for on premise controllers	21.1
PLATSE-342	Platform Sustaining Engineering	The third-party Xstream library used by the Controller has been upgraded to version 1.4.18	21.1
SYNTH-7432	Synthetic Browser Monitoring	Users can edit synthetic jobs without EUM permissions	21.1

## 21.10 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
ANALYTICS-13689	Analytics Agent	Fixed <code>ad.process.name</code> startup error	21.1
ANALYTICS-13758	Analytics Agent	Updated jakarta.el library to 3.0.4	21.1
ANALYTICS-13801	Analytics Agent	Upgraded netty library to 4.1.69.Final	21.1
DOTNET-5570	.NET Agent	The typo in "Query Type" snapshot property key for CosmosDb instrumentation is fixed	21.1
DOTNET-5786	.NET Agent	The Common Language Runtime (CLR) crashes when a log directory with no write permission is used	21.1
JAVA-10074	Java Agent	RMI backends appear with improper names when you use the custom naming option to configure the backend names in the <b>Remote Services</b> screen, in the Controller	21.1

Key	Product	Summary	Version
JAVA-1022 2	Java Agent	The Controller does not detect Business Transactions; this intermittent issue occurs when a ProducerInterceptor is invoked before registering the business transaction on the Controller.	21.1
JAVA-1023 1	Java Agent	Correlation of Akka Http exit calls fail when the application invokes <code>HttpRequest.withHeaders()</code>	21.1
JAVA-1026 5	Java Agent	When a JVM crash occurs on an application, the event logs are lost after some time from the Controller	21.1
JAVA-1003 5	Java Agent	When debug logs including <code>SegmentManager</code> are collected from the Controller, the following issues are observed: <ul style="list-style-type: none"> <li>• A significant drop in application load</li> <li>• Increase in Average Response Time</li> <li>• Decrease in the number of errors reported</li> </ul>	21.1
SRVLESS-18 62	Node.js Serverless Tracer	Updated Axios version to 0.21.3	21.1 6
PYTHON-93 1	Python Agent	The Python agent does not instrument the exit calls when used with the <code>threading</code> module	21.1

## Controller (SaaS) Resolved Issues

Filter table:

Key	Product	Summary	Version
STUDIO-3752	Dash Studio	The <b>Health</b> widget search option does not work	21.10.0

There were no known issues for the 21.10 release.

## 21.9 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	V
ANALYTIC S-13686	Analytics Agent	Fixed Java 11 support	2
ANALYTIC S-13687	Analytics Agent	Upgraded the <code>slf4j-api</code> library	2
ANALYTIC S-13700	Analytics Agent	Upgraded the JNA library version to 5.8.0	2
ANALYTIC S-13708	Analytics Agent	Upgraded the Docker image	2
ANALYTIC S-13739	Analytics Agent	Upgraded JNA and nuprocess libraries	2
ANALYTIC S-13740	Analytics Agent	Upgraded Jetty library to version 9.4.43.v20210629	2
ANALYTIC S-13745	Analytics Agent	Fixed Analytics Agent startup issue in Windows 64 caused by JNA and nuprocess libraries	2
DBMON-81 56	Database Agent	An issue occurs during MSSQL topology resolution and the Database Agent logs are flooded with the connection timeout errors	2
DBMON-81 67	Database Agent	An issue occurs during MSSQL cluster discovery because of the mismatch between the replica server name and cluster member names	2
DBMON-82 18	Database Agent	An infrastructure-based licensing issue occurs for an MSSQL database when there is a mismatch between Database Agent and Machine Agent hostname	2
DOTNET-5 669	.NET Agent	Agent fails to get session value from the <code>Asp.Net</code> core applications	2
DOTNET-5 772	.NET Agent	Fix the <code>System.FormatException</code> in Analytics	2
DOTNET-5 777	.NET Agent	Fix hooking issues in the Windows Profiler	2

Key	Product	Summary	V
DOTNET-5808	.NET Agent	Fix the <code>canary</code> thread running as a foreground thread	2
JAVA-10034	Java Agent	Java Agent does not ignore <code>bname</code> if it is present along with <code>btid</code> in the incoming header. This results in the discontinuation of a business transaction	2
JAVA-10127	Java Agent	Mongo DB connectivity fails after upgrading the agent to version 21.3	2
JAVA-10133	Java Agent	Akka 2.6 transactions are reported as stalled	2
JAVA-10169	Java Agent	The property <code>disable-exit-call-correlation-for</code> gets overridden by the values on the Controller when a configuration refresh is done	2
NODEJS-554	Node.js Agent	The Node.js Agent overwrites the default port from 443 to 80	2
SERVER-8624	Machine Agent	Memory Used % and Total (MB) metrics are incorrect for Solaris Sparc	2
SERVER-8622	Machine Agent	hostname resolution error in Infraviz in privateDNS setups of AKS	2
PYTHON-902	Python Agent	The Java proxy considers the <code>container ID</code> instead of <code>uniquehostid</code> value in the Kubernetes and OpenShift environment	2
SYNTH-7119	Synthetic Agent	Script with a custom exception throws the "Invalid Measurement status" error message	2
SYNTH-7286	Synthetic Agent	Removed the <code>sum-chrome-agent</code> dependency on docker runtime	2
SYNTH-7441	Synthetic Agent	Synthetic Sessions have broken measurements and display the message "Failed to parse measurement (RTE) on IE11" (Synthetic Hosted and Windows Private Synthetic Agent)	2
SYNTH-7452	Synthetic Agent	Test agents fail to post results with the "Invalid value: '': must be no more than 63 characters" error message	2

## Controller (SaaS) Resolved Issues

 Filter table: 

Key	Product	Summary	Version
ALERT-8962	Alert & Respond	Creation of Alerting template failed	21.9.0
ALERT-9783	Alert & Respond	User is not able to create a Custom Action due to the unavailability of the Save and Cancel buttons	21.9.1
ALERT-9824	Alert & Respond	Loading issue with the Alert Sensitivity Tuning charts	21.9.2
ALERT-9966	Alert & Respond	Health Rule Affected Entities list is rendered blank when inverse is selected in the regex	21.9.5
ANALYTICS-13614	Analytics	Unable to remove criteria from the Basic Query Search to the Visualization tab	21.9.0
ANALYTICS-13617	Analytics	Analytics Agent cache contains nulls	21.9.0
ANALYTICS-13752	Analytics	<b>Experience Level Management</b> widget not showing data in the shared dashboards	21.9.0
ANALYTICS-13849	Analytics	Searching for values based on set criteria yields no results because of null option values	21.9.4
CDM-6406	IoT Monitoring	"Getting Started" page for IoT displays the wrong collector URL	21.9.0
CDM-7657	Mobile RUM	Business Transactions and Snapshots are not correlated with the mobile sessions	21.9.0
DBMON-8094	Database Visibility	A license is consumed for all the servers in a configuration of all inactive servers	21.9.0

Key	Product	Summary	Version
DBMON-8171	Database Visibility	The values of Logical Reads and Logical Writes are displayed as the same on the MSSQL query details page	21.9.0
DBMON-8316	Database Visibility	<b>Execution Plan</b> for Oracle queries are not working	21.9.2
DBMON-8320	Database Visibility	Unable to add databases to the role configuration	21.9.0, 21.9.2
IAM-1944	Identity, Authentication, Authorization, and Audit	Support tenant names that start with numbers	21.9.0
LIC-1537	Licensing	Current license consumption is not displayed for license rules for each module type	21.9.1
LIC-1683	Licensing	IBL license consumption is not reported for on premise controllers	21.9.5
PLATSE-240	Platform Sustaining Engineering	Applying filter to reject unsecure URLs	21.9.1
PLATSE-265	Platform Sustaining Engineering	Health Status widget does not show configured entities when editing	21.9.2
PLATSE-280	Platform Sustaining Engineering	Self-closing HTML element <code>&lt;input&gt;</code> does not render	21.9.3
PLATSE-343	Platform Sustaining Engineering	The third-party Xstream library used by the Controller has been upgraded to version 1.4.18	21.9.5
SYNTH-7453	Synthetic Browser Monitoring	Synthetic Jobs stopped running after outage 2021/06/16	21.9.0
USERIMPACT-1108	Experience Journey Map	Experience Journey Map view remains in draft mode when map is expanded and the label is changed for a node	21.9.0

## Known Issues

There were no known issues for the 21.9 release.

## 21.8 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
CDM-7704	iOS Agent	NSURLSession handling for beacons is failing	21.8.1
CDM-7684	iOS Agent	ADEumTimeStamp initWithNSDate produces invalid UPTIME value	21.8.0
DOTNET-5589	.NET Agent	Re-enable the call graph consolidation by default	21.8.1
DOTNET-5691	.NET Agent	The Agentless Analytics on .NET Core Applications exits due to an error	21.8.0
DOTNET-5699	.NET Agent	Update Docker Hub <code>appdynamics/dotnet-core-agent:latest</code> to the latest version.	21.8.0
DOTNET-5721	.NET Agent	Fix the increase of <code>IIS Request</code> queue	21.8.0
DOTNET-5736	.NET Agent	Remove the use of <code>IsBadReadPtr</code>	21.8.0
DOTNET-5738	.NET Agent	The Application Restarted Events are not sending	21.8.0
DOTNET-5740	.NET Agent	Ensure that the stall transaction timeout is configurable	21.8.0
DOTNET-5764	.NET Agent	Fixed NullRefException while collecting SQL query for Analytics	21.8.0
DOTNET-5769	.NET Agent	Fix the SSL configuration validation	21.8.1
NODEJS-537	Node.js Agent	Remove the request module	21.8.0

Key	Product	Summary	Version
NODEJS-544	Node.js Agent	Fix packaging of the standalone Node.js builds	21.8.0
PYTHON-874	Python Agent	Fixed important security issues	21.8.0

## Controller (SaaS) Resolved Issues

 Filter table: 

Key	Product	Summary	Version
ALERT-8681	Alert and Respond	The alert email notification exposes the internal IP address of the instance	21.8.1
ALERT-9137	Alert and Respond	User getting logged out when trying to create action suppression with default view permissions	21.8.0
ANALYTICS-11112	Analytics	The query in the URL doesn't get updated when a filter is added in the search	21.8.0
ANALYTICS-13461	Analytics	Fixed the <code>LoadingCache</code> to fetch configurations	21.8.0
BRUM-6847	Browser RUM	Auto-injected code snippet for the Java Agent is not correct for customers self-hosting the agent	21.8.3
DBMON-7371	Database Visibility	The details of the database collector on the <b>Databases</b> window display mismatch between the card and the grid view	21.8.0
DBMON-7829	Database Visibility	Incorrect sorting for "Rows_examined" on the <b>Session</b> list page	21.8.0
DBMON-7986	Database Visibility	All custom metrics are not reported when you change the value of the <code>dbmon.config.max.custommetric</code> setting	21.8.0

Key	Product	Summary	Version
DBMON-8059	Database Visibility	The Cassandra database metrics are not displayed when you select longer duration on the <b>Databases Dashboard</b>	21.8.0
DBMON-8134	Database Visibility	The database collectors stop reporting to Controller, and the Database Agent logs display exception errors	21.8.0
DBMON-8315	Database Visibility	The Oracle query <b>Explain another query</b> shows empty result; <b>Database Execution Plan</b> is not displayed	21.8.4
IAM-1787	Identity, Authentication, Authorization, and Audit	The property <code>system.use.notification.message</code> is not working on Controller version 21.2.3 and higher	21.8.0
MQS-1259	Metric Query Service	Metric expressions do not work when the <b>Metric Hierarchy</b> is enabled	21.8.0
MQS-1264	Metric Query Service	Metric expressions do not work for database metrics	21.8.0
PLATSE-224	Platform Sustaining Engineering	Applying filter to reject unsecure URLs	21.8.2
PLATSE-237	Platform Sustaining Engineering	App Server Agent log files not available for download from Controller	21.8.3
PLATSE-239	Platform Sustaining Engineering	Applying filter to reject unsecure URLs	21.8.3
PLATSE-279	Platform Sustaining Engineering	Self-closing HTML element <code>&lt;input&gt;</code> does not render	21.8.4
PLATSE-264	Platform Sustaining Engineering	Health Status widget does not display any configured entities when you edit the health rule	21.8.4
STUDIO-3412	Dash Studio	If you use a variable during the Datagrid widget configuration, an HTTP 500 internal error is displayed on the dashboard	21.8.0

Key	Product	Summary	Version
STUDIO-3761	Dash Studio	Cannot change the number of applications on the <b>Health Rule</b> widget	21.8.0
STUDIO-3909	Dash Studio	Unable to view reports in the <b>Reports &amp; Dashboards &gt; Reports</b> tab	21.8.3
STUDIO-4012	Dash Studio	The following libraries in the Controller have been upgraded to the specified versions: <ul style="list-style-type: none"> <li>• jQuery 3.5.1</li> <li>• AngularJS 1.8.2</li> </ul>	21.8.1
UIK-3644	Dash Studio	The Dash Studio widgets do not render the quotation marks (" ") of metrics	21.8.0

### Known Issues

There were no known issues for the 21.8 release.

### 21.7 Resolved and Known Issues

#### Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
ANALYTICS-13649	Analytics Agent	Disabled the <code>/debug/grok</code> endpoint	21.7.0
CLUSTERMON-2988	Cluster Agent	The Helm repository is migrated to <a href="#">CiscoDevNet</a>	21.7.0
DBMON-8152	Database Agent	The used memory calculation is fixed. It does not include the buffered memory and the swap cache memory	21.7.0
DBMON-8155	Database Agent	The error log file includes exception error messages when you start Database Agent on Windows	21.7.0
DOTNET-5626	.NET Agent	Slow IIS restart with large numbers of App domains	21.7.1

Key	Product	Summary	Version
DOTNET-5638	.NET Agent	Profiler lock prober causes a stack overflow exception	21.7.1
DOTNET-5639	.NET Agent	MIDC with a getter chain accessing a struct array element is not working	21.7.1
DOTNET-5664	.NET Agent	Deadlock due to loader lock while snapshotting (while unloading a DLL)	21.7.1
DOTNET-5693	.NET Agent	Updated third-party dependencies	21.7.0
DOTNET-5696	.NET Agent	Fixed privilege escalation	21.7.0
DOTNET-5713	.NET Agent	Failure to parse a certificate pem file on Linux	21.7.1
DOTNET-5714	.NET Agent	Boost Log Console was changed to stdout instead of stderr	21.7.1
JAVA-8010	Java Agent	<code>ReflectionUtility</code> errors are detected for <code>filed[socket]</code> when the Netiviz agent is used on the <code>MultiplexedSocketChannel</code> and <code>DemultiplexedSocketChannel</code> classes	21.7.0
JAVA-9658	Java Agent	The Ignore Exception rules do not work as expected when configured to ignore the BT snapshot error	21.7.0
JAVA-9724	Java Agent	Custom naming of the RMI backend does not work	21.7.0
JAVA-9961	Java Agent	Asynchronous servlets that are not completed appropriately are detected as stalled in WebLogic	21.7.0
PHP-1448	PHP Agent	When the Controller is down, the backend agents spam the log files with the error, <code>Interceptors found on op_array when no interceptors have been registered</code>	21.7.0
WEBSRV-460	Apache Agent	A missing 'ts' flag in the correlation header sent by the Apache Agent	21.7.0
WEBSRV-475	Apache Agent	An issue with the Garbage URL is reported for the agent	21.7.0

Key	Product	Summary	Version
WEBSRV-477	Apache Agent	The Java proxy for Apache Agent is upgraded	21.7.0
WEBSRV-479	Apache Agent	A missing URL in the transaction snapshot for Apache Agent is displayed because the agent is unable to handle a sub-request or an internal redirect appropriately	21.7.0
WEBSRV-499	Apache Agent	Apache Agent does not handle the incoming correlation from an upstream application	21.7.0

### Controller (SaaS) Resolved Issues

Key	Product	Summary	Version
USERIMPACT-904	Experience Journey Map	Custom Data Filter Fields added in filter panel are not persistent	21.7.0

### Known Issues

There were no known issues for the 21.7 release.

## 21.6 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
ANALYTICS-13610	Analytics Agent	The Analytics Agent file path is experiencing high CPU.	21.6.0
CDM-7039	Android Agent	Build time for debug builds is taking longer than expected.	21.6.0
DBMON-8011	Database Agent	The metrics on the Metric Browser drop to zero because of the thread synchronization issue.	21.6.0
JAVA-9859	Java Agent	WSO2 business transaction naming also considers the URL parameter as part of the segment.	21.6.1
LIBAGENT-411	C/C++SDK	The C/C++SDK <b>Transaction Type</b> field in the Call Graph is displayed as <code>Undefined</code>	21.6.0

Key	Product	Summary	Version
NODEJS-314	Node.js Agent	The Node.js Agent is experiencing an error when using <code>reuseNode</code> and <code>reuseNodePrefix</code> .	21.6.0
NODEJS-383	Node.js Agent	The Node process crashes when Snapshots is enabled.	21.6.0
NODEJS-497	Node.js Agent	The Node.js Agent crashes when Object Instance tracking is enabled.	21.6.0
NODEJS-514	Node.js Agent	The Node.js Agent is unable to capture exit calls for <code>couchbase</code> versions 3.x.x.	21.6.0
PHP-1412	PHP Agent	PHP application crashes when ending Java proxy process	21.6.0
PYTHON-772	Python Agent	Python Agent does not report some transactions because of missing backend metrics.	21.6.0

### Controller (SaaS) Resolved Issues

 Filter table: 

Key	Product	Summary	V	o
ALERT-8297	Alert & Respond	Missing line break in the alert message	2	
ALERT-8442	Alert & Respond	Event API is returning NULL for some applications	2	
ANALYTICS-13426	Analytics	Corrected the limit issue for the application selector query from the Analytics landing page	2	
ANALYTICS-13663	Analytics	Correct the <code>LoadingCache</code> issue in <code>AnalyticsBTypeConfigManager</code> for the .NET Agent	2	
CDM-7192	Mobile RUM	<b>Network Name</b> dropdown under <b>NetworkRequest</b> > <b>Snapshot</b> tab should not accept random string	2	
DBMON-7969	Database Visibility	Database Monitoring does not display Couchbase buckets and details for memcached type	2	

Key	Product	Summary	V o
DBMON-797 0	Database Visibility	Sorting does not work correctly when selecting <b>last 1 week</b> or longer period	2
DBMON-800 3	Database Visibility	Registering large numbers of database servers causes threadpool saturation	2
DBMON-801 2	Database Visibility	HTTP 500 error displayed when trying to access a Database Agent health rule	2
DBMON-802 8	Database Visibility	Database <b>Metric Browser</b> does not load intermittently	2
DBMON-802 9	Database Visibility	Database <b>Metric Browser</b> does not load	2
DBMON-813 5	Database Visibility	Concurrent Modification Exception while polling configuration	2
DBMON-831 4	Database Visibility	Execution Plan for Oracle queries are not working	2
DIAGPLAT-1 256	APM	Service endpoint Snapshots fail to load with error <code>getRequestSegmentDataListItemsWithFilterHandle</code>	2
IAM-1924	Identity, Authentication, Authorization, and Audit	Login entries and user role/permissions are not displayed in the <b>Audit Report &amp; Audit Table</b>	2
LIC-779	Licensing	Error "Current user does not have access to this method" appearing on the <b>Getting Started Wizard - Servers</b> page	2
LIC-801	Licensing	<b>License Rules</b> page displays the message "Invalid License Key"	2
LIC-1257	Licensing	License usage for Synthetic Hosted Pro package is displayed incorrectly	2
MQS-1267	Metric Query Service	Metric Expressions are not working for database metrics	2

Key	Product	Summary	V o
MQS-1273	Metric Query Service	Create a cache for existing Metric Hierarchy nodes	2
PLATSE-223, PLATSE-242	Platform Sustaining Engineering	Applying filter to reject unsecure URLs	2
PRE-873	Server Visibility	Servers no longer disappear and reappear rapidly. If the <code>sim.machines.offline.toStaleTimeoutMillis</code> property is set to lower than 1 day, the Servers list fetched for <code>LivenessStatus=ALL</code> displays correct results.	2
STUDIO-401 2	Dash Studio	The following libraries in the Controller have been upgraded to the specified versions: <ul style="list-style-type: none"> <li>• jQuery 3.5.1</li> <li>• AngularJS 1.8.2</li> </ul>	2
UISVCS-149 1	UI Services	Reports not working correctly for User Experience (EUM)	2
USERIMPAC T-1028	Experience Journey Map	The calculation of the outgoing traffic percentage is incorrect	2

### Known Issues

Agent	Summary	Version/ Date
Machine Agent	<pre>-Dappdynamics.http.proxyHost</pre> <pre>-Dappdynamics.http.proxyPort</pre> The http configuration properties work for both http and https. Use either http / https depending on the proxy configuration.	21.6.0 - June 24, 2021
Python Agent	Backend resolution does not create the correct flow map in the case of cross-application architecture. See <a href="#">Cross Application Flow</a> for details about cross-application architecture.	21.6.0 - June 17, 2021

## 21.5 Resolved and Known Issues

### Agent Resolved Issues

 Filter table: 

Key	Product	Summary	Version
CDM-7188	Android Agent	<b>Apply code changes</b> UI function is not working in Android studio when the <code>appdynamicsGeneratedBuildId_</code> field is added or removed	21.5.0
CLUSTERMON-2663	Cluster Agent	Even though the auto-instrumentation fails for an application, the environment is updated with some changes	21.5.0
DOTNET-4246	.NET Agent	"Console" as a logging configuration directs logs to STDERR instead of to STDOUT	21.5.0
DOTNET-4793	.NET Agent	HTTP request body removed for certain cases when ASP.NET Legacy instrumentation is enabled in .NET Agent for Alpine Linux	21.5.0
DOTNET-5344	.NET Agent	By default, the Unique Host ID should be set to the Container ID	21.5.0
DOTNET-5377	.NET Agent	There is a <code>System.TypeLoadException</code> exception on POCOs with nullable arguments	21.5.0
DOTNET-5490	.NET Agent	The Linux Agent does not correctly instrument generic value types	21.5.0
DOTNET-5551	.NET Agent	When the <code>site-regex</code> attribute is set to <code>true</code> for an IIS site configuration in the <code>config.xml</code> file, the full Windows agent now applies the configuration to all site names matching the provided regular expression, instead of to just one site name.	21.5.0
DOTNET-5564	.NET Agent	CoreCLR interceptors are not working with the MSI installation	21.5.0
DOTNET-5603	.NET Agent	Improved logging performance for .NET Agent on Linux	21.5.1

Key	Product	Summary	Version
DOTNET-561 1	.NET Agent	Supports the <code>APPDYNAMICS_CONTROLLER_SSL_CERTFILE</code> and <code>APPDYNAMICS_CONTROLLER_SSL_CERTDIR</code> environment variables for Analytics SSL in .NET Agent on Linux	21.5.1
DOTNET-561 2	.NET Agent	Supports multiple certificates in a single file Base-64 format for .NET Agent on Linux	21.5.1
DOTNET-562 8	.NET Agent	Docker image is compatible with cluster agent auto-instrumentation	21.5.1
JAVA-9254	Java Agent	Instrumentation point gets disabled for Netty exits	21.5.0
JAVA-8827	Java Agent	Agent does not sync with Controller appropriately for the purged application diagnostic ids	21.5.0
NODEJS-501	Node.js Agent	Agent does not show the correct number of nodes when starting the process manager.	21.5.0
PHP-1396	PHP Agent	One of the third-party libraries for the PHP Agent is upgraded	21.5.0
PHP-1357	PHP Agent	The <code>ADRUM_BT</code> cookie is sent across only for secure connections (HTTPS)	21.5.0
SYNTH-7071	Synthetic Agent	"Test agent failed to post result" error is displayed while executing jobs	21.5.0

## Controller (SaaS) Resolved Issues

 Filter table: 

Key	Product	Summary	Version
ANALYTIC S-13291	Analytics	Selecting multiple source to create Business Journey Maps prevents the retrieving of data for selectors	21.5.0
ANLYTCS_ ES-4881	Events Service	Resolve the discrepancy between Metric Processor parsing of control characters and Elasticsearch	21.5.0
ANLYTCS_ ES-5121	Events Service	Elasticsearch analyzer does not match the current Metric Processor Lucene analyzer	21.5.0

Key	Product	Summary	Version
ANLYTCS_ES-5235	Events Service	Merge changes in 20.9 to release/21.4.next	21.4.1
DBMON-7665	Database Visibility	The health rule violation details are not displayed when you click the health status in "Databases">"Dashboard" tab	21.5.0
DBMON-7879	Database Visibility	For some database, the "Object Browser">"Error log" screen does not render the log data	21.5.0
DBMON-7925	Database Visibility	JMX connection not working for Cassandra cluster with SSL enabled	21.5.0
DBMON-7931	Database Visibility	Database Agent naming convention prevents collectors from reporting data	21.5.0
DBMON-8032	Database Visibility	Add Controller flag to control metric filtering for configurations such as Cassandra's keyspace metrics and Couchbase's bucket metrics	21.5.0
DBMON-8037	Database Visibility	DBMonEventBus POST event caused thread pool saturation	21.5.0
DIAGPLAT-1130	APM	Snapshots filter for data collectors when collector type is "Any" is not working	21.5.0
DIAGPLAT-1151	APM	Missing end-to-end latency time in the "Business Transaction" view	21.5.0
DIAGPLAT-1281	APM	Service endpoint snapshots fail to load with the error <code>getRequestSegmentDataListItemWithFilterHandle</code>	21.5.0
EUMPLAT-2086	End User Monitoring	Improve the performance of a query affecting the browser <b>Page Views</b> in <b>Session</b> timeline	21.5.4
IAM-1925	Identity, Authentication, Authorization, and Audit	Login entries and user role/permissions are not displayed in the <b>Audit Report &amp; Audit Table</b>	21.5.5
L4A-17293	Accounts	The Controller Launch API used by Accounts is producing a SAML login error	21.5.0

Key	Product	Summary	Version
LIC-759	Licensing	Some Controllers are sending 0 hourly total count for licenses consumed	21.5.0
LIC-1124	Licensing	Retrieving data causes high load on the database, which brings the Controller down	21.5.0
METADATA-9578	Dashboard	Business transaction metric expression is miscalculated on the Dashboard	21.5.0
METADATA-9610	APM	Corrected caching issue to ensure the setting of the Strict-Transport-Security header	21.5.0
MQS-1261	Metric Query Service	Metric Expressions do not work when the Metric Hierarchy is enabled	21.5.1
MQS-1268	Metric Query Service	Metric expressions do not work for database metrics	21.5.3
PLATSE-22 2, PLATSE-24 3	Platform Sustaining Engineering	Applying filter to reject unsecure URLs	21.5.6
PLATSE-26 2	Platform Sustaining Engineering	Apply filter across all segments of data to retrieve snapshots	21.5.6
STUDIO-40 14	Dash Studio	The following libraries in the Controller have been upgraded to the specified versions: <ul style="list-style-type: none"> <li>jQuery 3.5.1</li> <li>AngularJS 1.8.2</li> </ul>	21.5.6
TMNT	APM	Notifications slow the UI when there are many notifications	21.5.0

### Known Issues

There are no known issues in the 21.5 release.

### 21.4 Resolved and Known Issues

#### Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
BRUM-6565	JavaScript Agent	Error in Visually Complete Time calculation when element is detached from DOM in IE11	21.4.0
BRUM-6613	JavaScript Agent	Calling the <code>ADRUM</code> command <code>addUserData</code> adds an entry even when the key/value pair is null or undefined	21.4.0
DBMON-7950	Database Agent	The <code>pg_database_size</code> metric for Postgres system statistics was computed every minute causing high CPU utilization.  With this release, the <code>pg_database_size</code> value is computed at an interval of 1hr approximately	21.4.0
DBMON-8026	Database Agent	The Pluggable Database monitoring (PDB) does not work with the Database Agent 21.2	21.4.0
DOTNET-5406	.NET Agent	.NET Agent correctly reports all HTTP errors	21.4.0
DOTNET-5555	.NET Agent	When restarting the application using the MicroServices Agent, the node reuse environment variables now use the correct values	21.4.0
JAVA-9448	Java Agent	After upgrading Java Agent from 4.5.9 to 20.x or 21.x, the servlet business transactions are not displayed. The node property <code>osb-enable-webservice-entry</code> value has to be set to false (true by default)	21.4.0
JAVA-9433	Java Agent	An upgrade required for the agent such that the legacy agent uses <code>commons-io-2.5</code> and non-legacy agent uses <code>commons-io-2.8</code> library for <code>singularity-commons</code> dependency	21.4.0
JAVA-9361	Java Agent	When you use action suppression for disabling agent reporting, the suppression is not performed for the complete configured duration	21.4.0
JAVA-9261	Java Agent	Update the agent to allow splitting of business transaction on Spring Web Service entry by creating a custom configuration	21.4.0

Key	Product	Summary	Version	Controller
JAVA-9235	Java Agent	The name of a node is generated multiple times for ephemeral nodes	21.4.0	
JAVA-9110	Java Agent	Snapshot reporting stops after a few minutes post the agent-reset	21.4.0	
JAVA-9859	Java Agent	WSO2 business transaction naming also considers the URL parameter as part of the segment.  The fix is available in 21.4.1 and versions >=21.6.	21.4.1	
LIBAGENT-442	Node.js Agent	Node.js Agent does not report HTTP data collector to Analytics	21.4.0	
NODEJS-245	Node.js Agent	Node.js Agent fails HTTP tunneling for secure connections	21.4.0	
WEBSRV-398	Apache Agent	HttpClient library for the Apache Agent is upgraded	21.4.0	

### (SaaS/On-Premises) Resolved Issues

 Filter table: 

Key	Product	Summary	Version
ALERT-8667	Alert & Respond	<b>Affects</b> column not available in the <b>Health Rule</b> widget	21.4.3
ALERT-86678	Alert & Respond	Behavior of the Controller's <b>Email Template Editor</b> is confusing	21.4.3
ANALYTICS-13273	Analytics	Add back ticks to ADQL query if field matches ADQL keyword	21.4.0
ANALYTICS-13434	Analytics	Optimize the Analytics Agent status call by using AnalyticsAgentConfigurationCache	21.4.3
ANALYTICS-13923	Analytics	Blank line in Dashboard where data exists	21.4.10

Key	Product	Summary	Version
ANALYTICS-13997	Analytics	<b>Save</b> and <b>Cancel</b> buttons missing on the <b>Analytics Save Search</b> dialog	21.4.12
BRUM-6548	Browser RUM	Null Point Error preventing the Controller UI from loading the dashboard data	21.4.0
BRUM-7066	Browser RUM	AppDynamics <b>Map</b> widget displays incorrect map in Mobile RUM and Browser RUM screens	21.4.12
CLUSTERMON-2958	Cluster Monitoring	After adding namespaces, unable to add additional namespaces to monitor	21.4.4
DBMON-7397	Database Visibility	Remove incorrect max heap size information from the <b>Getting Started Wizard - Databases</b>	21.4.0
DBMON-7533	Database Visibility	HTTP thread pool saturation preventing access to the Controller UI	21.4.0
DBMON-7843	Database Visibility	No auditing for database collectors (update/delete/create)	21.4.0
DBMON-8033	Database Visibility	Add Controller flag to control metric filtering for configurations such as Cassandra's keyspace metrics and Couchbase's bucket metrics	21.4.2
DBMON-8038	Database Visibility	<code>DBMonEventBus</code> POST event caused thread pool saturation	21.4.2
DBMON-8374	Database Visibility	For some database, the <b>Object Browser&gt;Error log</b> screen does not render the log data	21.4.11
DBMON-8554	Database Monitoring	Inconsistency in identifying backends leads to the following automapping failures: <ul style="list-style-type: none"> <li>• Case-sensitive identifications of backends</li> <li>• Incorrect identifications of URL, vendor, etc.</li> <li>• Case-sensitive mapping between APM backend and DBMON</li> </ul>	21.4.14
DIAGPLAT-1280	APM	Service Endpoints returns an HTTP 500 status and emits the error message <b>Error handling snapshot data</b>	21.4.3

### Known Issues

There are no known issues in the 21.4 release.

Key	Product	Summary	Version
IAM-1546	Identity, Authentication, Authorization, and Audit	Remove invalid notification configs in SaaS Account DTO.	21.4.6
IAM-1924	Identity, Authentication, Authorization, and Audit	Login entries and user role/permissions are not displayed in the <b>Audit Report &amp; Audit Table</b>	21.4.4
IAM-2067	Identity, Authentication, Authorization, and Audit	LDAP user unable to import applications	21.4.6
L4A-17233	License Management	Usage views not displaying proper data granularity	21.4.0
L4A-17818	License Management	Multiple entries with the same key caused an <code>IllegalArgumentException</code> in Glassfish	21.4.0
L4A-19184	License Management	Unable to login to the Controller, <code>LOGIN_FAILED</code> error message is displayed	21.4.13
LIC-1172	Licensing	Server exception for missing database partition encountered when fetching license usage	21.4.4
LIC-1663	Licensing	Licensing error with the .NET Agent: vCPU information is not passed to renew lease calls	21.4.9
LIC-1669	Licensing	IBL license consumption reporting is not working for on-prem Controllers	21.4.9
LIC-1691	Licensing	Integrate the data migration fix to on-prem Controllers	21.4.9
LIC-1981	Licensing	License consumption is not displayed for license rule for each module type	21.4.13
METADATA-9564	Dashboard	<b>Export Custom Dashboard</b> should check for null widgets and not include them in the export	21.4.0
METADATA-9614	Dashboard	Corrected caching issue to ensure the setting of the <code>Strict-Transport-Security</code> header	21.4.2

Key	Product	Summary	Version
MOBILE-1778	Mobile App	Remove registered device details from cache when users delete the account from mobile applications	21.4.7
MOBILE-1813	Mobile App	Notifications are not being pushed to mobile devices	21.4.7
PLATSE-132	Platform Engineering	Display the correct node information in the flow map	21.4.3
PLATSE-221, PLATSE-244	Platform Sustaining Engineering	Applying filter to reject unsecure URLs	21.4.7
PLATSE-250	Platform Sustaining Engineering	HTTP Data Collector parameters conversion type is not getting applied to the .NET Agent	21.4.7
PLATSE-261	Platform Sustaining Engineering	Error details are not reflected on the main dashboard flow map and in BT	21.4.11
PLATSE-263	Platform Sustaining Engineering	<b>Other Events</b> section missing on the <b>Create Policy</b> window, <b>Trigger</b> tab for an on-prem controller	21.4.11
PLATSE-272	Platform Sustaining Engineering	From the <b>Waterfall</b> view, drilling down to an application in a snapshot causes an error	21.4.8
PLATSE-341	Platform Sustaining Engineering	Upgrade Xstream to version 1.4.18 or latest	21.4.11
PLATSE-352	Platform Sustaining Engineering	Controller root and admin credentials leaked in log files	21.4.11
PLATSE-356	Platform Sustaining Engineering	<b>Unlock business transaction</b> and <b>Save</b> options unavailable on the UI	21.4.11
PLATSE-365	Platform Sustaining Engineering	Agent log folders are not available for download in controller UI	21.4.11
PLATSE-378	Platform Sustaining Engineering	When creating a new app in the Browser Apps section of the EUM, the CSRF token is leaked in the HTTP GET request	21.4.11
PLATSE-414	Platform Sustaining Engineering	Multiple REST endpoints are susceptible to vertical authorization bypass	21.4.13

Key	Product	Summary	Version
PLATSE-415	Platform Sustaining Engineering	Unable to save a data collector with many business transactions	21.4.13
STUDIO-3979	Dash Studio	Upgraded the following JavaScript libraries to the specified versions: <ul style="list-style-type: none"> <li>• JQuery version 3.5.1</li> <li>• AngularJS version 1.8.2</li> </ul>	21.4.7
STUDIO-4232	Dash Studio	Custom dashboard stops responding when you attempt to share it, on an on-prem controller	21.4.11
SVCMON-1253	APM	Null Pointer Error is preventing the deletion of business transactions and applications	21.4.0
SVCMON-1273	APM	<b>Service Endpoints</b> page displays <b>No Data Available</b> message or blank screen after scrolling	21.4.0
SVCMON-1277	APM	Improved the loading of <b>Custom Dashboards</b> by optimizing business transaction queries	21.4.0
SVCMON-1278	APM	New <b>Service Endpoints</b> table does not fit on the screen size	21.4.0
SYNTH-7058	Synthetic Browser Monitoring	Synthetic Agent is not displaying in the <b>Job Editor</b>	21.4.3
SYNTH-8011	Synthetic Browser Monitoring	Synth jobs [On-Prem] can be edited even without EUM permissions	21.4.11
SYSTEAM-306	Systems Engineering	Upgrade the Reports Service version that uses Node.js version 14.17.5	21.4.7
SYSTEAM-322	Systems Engineering	On-prem controller performance impacted due to queuing on hashmap accesses	21.4.11
TMNT-1767	APM	Large number of license notifications freezes Controller UI	21.4.0
UISVCS-1622	UI Services	Upgrade Controller to use latest Reports Service with new nodemailer package	21.4.6

## 21.3 Resolved and Known Issues

### Agent Resolved Issues

 Filter table: 

Key	Product	Summary	Version
DOTNET-4992	.NET Agent	Fixed process hang when capturing the thread snapshots under some conditions	21.3.1
DOTNET-5382	.NET Agent	(For Full Windows .NET Agent) You can now use the <code>APPDYNAMICS_CONTROLLER_HOST_NAME</code> , <code>APPDYNAMICS_CONTROLLER_PORT</code> , and <code>APPDYNAMICS_CONTROLLER_SSL_ENABLED</code> configuration environment variables to override properties in the <code>config.json</code> file for "controller host", "controller port", and "enable controller ssl connection", respectively.	21.3.1
DOTNET-5417	.NET Agent	Sensitive URL filter has been fixed for stalled transactions in .NET Core MicroServices Agent	21.3.0
DOTNET-5453	.NET Agent	.NET Agent for full Windows now reports correct Average CPU Time	21.3.0
DOTNET-5455	.NET Agent	Able to switch to different DMM modes from KPI for .NET application through Netviz Agent on Windows	21.3.0
DOTNET-5456	.NET Agent	Can start pcap for .NET application through Netviz Agent on Windows	21.3.0
DOTNET-5492	.NET Agent	Memory leak due to NetViz has been fixed	21.3.0
JAVA-9297	Java Agent	Issue with the commons-io library that is packaged with the Java Agent	21.3.0
DOTNET-5527	.NET Agent	TypeCache implementation is now safe for threading	21.3.1
DOTNET-5534	.NET Agent	Fix for proper handling of empty application configuration in .NET Agent configuration	21.3.1

Key	Product	Summary	Version	Control ler (SaaS/ On-
DOTNET-5536	.NET Agent	Optimization for CPU usage when NetViz is not enabled	21.3.1	
JAVA-8997	Java Agent	Servlet Split rule based on the selected parameter in the request does not work for the Reactor Netty framework	21.3.0	
JAVA-8748	Java Agent	Duplicate backends are created with Java Agent API	21.3.0	
LIBAGENT-442	Node.js Agent	Node.js Agent does not report HTTP data collector to Analytics	21.3.0	
LIBAGENT-487	C/C++ SDK	Fix unsynchronized access to the Business Transactions data	21.3.0	
LIBAGENT-494	C/C++ SDK	Frame calls are abruptly failing	21.3.0	
NETWORK-626 4	Network Agent	The Network Agent Npcap version is upgraded to 1.20	21.3.0	
NETWORK-626 9	Network Agent	The Network Agent installation of Visual C++ is fixed	21.3.0	
SRVLESS-1537	Node.js Serverless Tracer	Updated appdynamics-lambda-trace package dependencies	21.3.0	

### Premises) Resolved Issues

There was no Controller release for 21.3.

Control  
ler

#### (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary	Version
ANALYTICS-13226	Java Agent	Enabling recommended data collection intermittently affects Transaction Analytics reporting	21.2.0
BRUM-6539	JavaScript Agent	<code>ReferenceError: hideCookieBanner</code> is not defined when page is injected with <code>adrum-latest.js</code>	21.2.0
BRUM-6552	JavaScript Agent	Extra value at the end of the app URL set by the ADRUM cookie	21.2.0
BRUM-6553	JavaScript Agent	JavaScript statements inside <code>setTimeout</code> and <code>setInterval</code> run in local scope when <code>adrum</code> is enabled	21.2.0
CDM-7032	React Native Agent	Networking request responses are corrupted	21.2.0
CDM-7033	iOS Agent	iOS Agent disables SwiftUI previews	21.2.0
CDM-7175	Android Agent	Events are stored on <code>EventBus</code> even when agent is not initialized	21.2.0
DBMON-7552	Database Agent	The Database Agent sends the health rule data of a MongoDB replica node even after the node is stopped	21.2.0
DBMON-7568	Database Agent	The Database Agent log file includes the error, invalid <code>USERENV</code> parameter, for an Oracle collector	21.2.0
DBMON-7739	Database Agent	The custom metrics value drops to zero intermittently	21.2.0
DBMON-7654	Database Agent	The Oracle collector log displays an error when Sysmetrics query is used	21.2.0
DBMON-7745	Database Agent	The <b>Explain another query:</b> field under <b>Execution Plan</b> displays an error without any details for MariaDB	21.2.0

Key	Product	Summary	Version
DBMON-3801	Database Agent	The API Client ( /controller/rest/databases/collectors ) fails intermittently with java.lang.NumberFormatException	21.2.0
DOTNET-4538	.NET Agent	Optimizations for Async tracking in .NET Core and .NET Framework applications	21.2.0
DOTNET-4834	.NET Agent	Fix for high thread contention in certain Async-heavy applications	21.2.0
DOTNET-5175	.NET Agent	Fix for analytics data loss in certain cases when the Analytics Agent is recycled and loses communication with the .NET Agent	21.2.0
JAVA-9093	Java Agent	The <b>User Experience</b> value based on the set threshold limit is incorrect only for those records that do not have a matching transaction snapshot on the APM	21.2.0
JAVA-9037	Java Agent	Upgrading the Java Agent to 20.11 displays an exception Error instantiating DispatcherServletInterceptor in the logs	21.2.0
LIBAGENT-490	Node.js Agent	Unregistered backend metrics appear in the <b>Metric Browser</b>	21.2.0
METADATA-9624	APM	Ensure that the HTTP header Strict-Transport-Security is set	21.2.5
NETWORK-6227	Network Agent	Network Agent does not support host metrics on Windows	21.2.0
NODEJS-324	Node.js Agent	HTTP Request Data Collectors collect <b>HTTP Parameters Name</b> instead of <b>Display Name</b>	21.2.0
PYTHON-498	Python Agent	Java proxy caches stale agent data	21.2.0
PHP-1170	PHP Agent	PHP Agent does not support using an environment variable for defining a unique host ID	21.2.0

Key	Product	Summary	Version
ALERT-7111	Alert & Respond	Garbled characters appear in email template instead of cyrillic string	21.2.0
ALERT-7786	Alert & Respond	Health rules not available in cache after Controller upgrade	21.2.0
AMCSEV-1260	App Monitoring Cloud Services	Tiers Page does not show node details for the nodes after the 10th registered node	21.2.0
ANALYTICS-13205	Analytics	From the <b>Dashboard</b> , double-clicking "business journey" transactions directs user to <b>Overview</b> page instead of <b>Details</b> dialog	21.2.0
ANALYTICS-13219	Analytics	When changing the date format in <b>My Preferences</b> to "DD/MM/YY" and then opening a transaction snapshot in Analytics the error <b>TRS has illegal timeRange</b> is displayed	21.2.0
ANLYTCS_ES-3474	Events Service	Some logically incorrect ADQL is validated	21.2.0
BRUM-6410	Browser RUM	Review of health rules violations from <b>User Experience</b> applications redirects to health rules for <b>Application Performance</b>	21.2.0
CLUSTERMON-2060	Cluster Monitoring	Agent registration is prevented while storing Cluster Agent properties in the database	21.2.0
DBMON-7131	Database Visibility	An Incorrect Database Agent version is displayed in the <b>Database Agents</b> setting after upgrading the agent and starting the new agent with the same name	21.2.0
DBMON-7222	Database Visibility	When configuring <b>Monitoring Operating System</b> for an AWS RDS collector, the required region is not displayed in the list.  Now, the required regions are included and some unnecessary regions are removed from the list.	21.2.0
DBMON-7302	Database Visibility	<b>Disk Usage</b> within the database <b>Queries</b> displays an incorrect error message for the PostgreSQL database	21.2.0
DBMON-7308	Database Visibility	The <b>Live view</b> session list displays all the active sessions when the <b>View</b> filter is set to <b>All Sessions</b> , but active sessions are not displayed when the filter is set to <b>All Active</b>	21.2.0

Key	Product	Summary	Version
DBMON-7354	Database Visibility	The Invalid DB error is displayed when saving an action suppression on one of the nodes of the database cluster	21.2.0
DBMON-7373	Database Visibility	A blank window is displayed when you click <b>Drill Down</b> for a database on the <b>Transactions</b> snapshot	21.2.0
DBMON-7517	Database Visibility	Inconsistent <b>Custom Metric</b> permissions	21.2.0
DBMON-7535	Database Visibility	The <b>Exclude Schemas</b> option gets checked after upgrading from old Controller to new Controller	21.2.0
DBMON-7549	Database Visibility	Duplicate IO Metric entries are displayed for Microsoft SQL Server on the <b>Health Rule</b> configuration page	21.2.0
DBMON-7604	Database Visibility	Custom Metric not displayed in <b>Custom Metrics</b> tab even though data is displayed in <b>Metric Browser</b>	21.2.0
DBMON-8034	Database Visibility	Added the <code>dbmon.config.metrics.filtering.enabled</code> Controller flag to control the Database metric filtering for Cassandra's Keyspace and Couchbase's bucket-level metrics	21.2.6
DBMON-8039	Database Visibility	<code>DBMonEventBus</code> post-event call results in thread pool saturation	21.2.6
DIAGPLAT-1080	APM	Searching for snapshots yields inaccurate results for <b>Standard Time Range</b> from <b>Transaction Snapshot</b>	21.2.0
DIAGPLAT-1212	APM	"Internal Server Error" when opening Error Snapshots	21.2.0
DIAGPLAT-1229	APM	Correct the data population for the "Snapshots Summary View"	21.2.6
DIAGPLAT-1279	APM	ServiceEndpoint Snapshots fail to load with the error <code>getRequestSegmentDataListItemsWithFilterHandle</code>	21.2.8
LIC-647	Licensing	Database Monitoring license usage reporting does not work with Agent-based license rules	21.2.3
L4A-17203	License Management	The Get License Usage API was reporting zero active licenses despite active agents with valid leases	21.2.0

Key	Product	Summary	Version
L4A-17796	Accounts	Increase the container-app version in the Controller	21.2.1
L4A-17818	License Management	Multiple entries with the same key caused an <code>IllegalArgumentException</code> in Glassfish	21.2.0
L4A-17838	Accounts	Multiple entries with the same key	21.2.1
L4A-17959	Accounts	SAML and LDAP users without email addresses are not able to edit or add roles	21.2.2
PLATSE-120	Platform Maintenance	Reset counter when restarting Developer mode	21.2.6
SVCMON-1303	APM	NPE in <code>BtServiceImpl#registerDeleteMdsBtEntityTransactionListener</code> does not allow purge of applications and Business Transactions	21.2.0
UISVCS-1063	Accessibility	The color of blue links in data grids, such as the <b>Business Transactions</b> list, has been updated to <code>#0040B6</code> for improved contrast	21.2.0
USERIMPACT-714	Experience Journey Map	Bad Link when clicking <b>View All Applications</b> in Experience Journey Map	21.2.0

## Known Issues

### Synthetic Services (Version 21.2.0)

Change in Synthetic job failure events behaviour (in the 20.7.0. version) affects the alerting configurations. This change triggers alerts for wrong events.

In this release:

- The events behaviour is reverted to the [standard behaviour](#) in Chrome, IE, and Firefox browsers. The issue still persists in Mobile Browser Emulation.
- Non-alphanumeric characters are not displayed in script logs of the Synthetic sessions.

## 21.1 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	Version	Controller (SaaS/On-Premises) Resolved Issues
DOTNET-5316	.NET Agent	Sensitive Message Filter has been fixed when including parameters message-pattern FOUND but redaction-regex NOT MATCHED	21.1.0	
DOTNET-5372	.NET Agent	Improvements to Azure Service Bus async error tracking	21.1.0	
JAVA-7603	Java Agent	An error is reported when the maximum analytics collector limit exceeds	21.1.0	
JAVA-8137	Java Agent	A Null Pointer Exception occurs if no regex pattern is provided in the custom backend naming config	21.1.0	
JAVA-8255	Java Agent	Agent reset through the controller does not reset Dynamics Service (ADS) runtime state	21.1.0	
JAVA-8380	Java Agent	EUM does not work appropriately with request match rules in non-servlet environments	21.1.0	
JAVA-8407	Java Agent	Snapshots are not generated due to SQL parsing, even though the snapshots are reported to the controller	21.1.0	
JAVA-8595	Java Agent	The transformation limit is reached due to the Analytics data collection interceptor	21.1.0	
JAVA-8878	Java Agent	Business transaction data is not displayed if the business transaction lockdown is enabled in a service-proxy enabled environment	21.1.0	
NODEJS-378	Node.js Agent	Unhandled <code>TypeError</code> exception terminates the Node.js Agent	21.1.0	
PHP-1210	PHP Agent	PHP Agent does not report metrics after the Business Transaction lockdown in the Controller	21.1.0	
PYTHON-640	Python Agent	Applied changes from JAVA-8878 to the Python Java proxy	21.1.0	

Key	Product	Summary	Version	Known Issues
SERVER-8458	Machine Agent	Server Agent no longer purges machines inadvertently before the expected purge time	21.1.0	There are no known issues in the 21.1

Filter table:

Key	Product	Summary	Version
ALERT-7111	Alert & Respond	Garbled characters are appearing in email template instead of a Cyrillic string	21.1.0
ALERT-7682	Alert & Respond	Action suppression time selector value is reset once you navigate away from the tab	20.8.0, 20.11.0, 20.11.1.0
AMCSEV-575	App Monitoring Cloud Services	Not able to create custom <b>Service Endpoint</b> for JMS type with property type <b>Integer</b>	21.1.0
AMCSEV-927	App Monitoring Cloud Services	Long thread names are difficult to read	21.1.0
AMCSEV-1075	App Monitoring Cloud Services	Popup on flow map does not show the calls per minute/response as per grouped JDBC	21.1.0
AMCSEV-1099	App Monitoring Cloud Services	Filter UI For <b>Tiers &amp; Nodes</b> in application need to close on <b>Cancel</b> or <b>Apply</b>	21.1.0
AMCSEV-1187	App Monitoring Cloud Services	Machine Agents screen displays the error unnecessary keys are empty error	21.1.0
ANALYTICS-12060	Analytics	Automatic field extraction does not permit adding a definer sample for more than one field	21.1.0
ANALYTICS-12912	Analytics	Missing start tier causes TypeError in Business Transaction flow map with EUM and BT node	21.1.0

release.

Key	Product	Summary	Version
ANALYTICS-12846	Analytics	Better handling of fields to display from originating tier in Analytics data table	21.1.0
ANALYTICS-12938	Analytics	Funnel Dashboard UI: Access to the specified resource forbidden	21.1.0
ANALYTICS-12953	Analytics	When editing the <b>Analytics Search</b> widget on the <b>Dashboard</b> , the toggle <b>Use Dashboard Time Range</b> is not responding	21.1.0
ANALYTICS-13003	Analytics	From <b>Analytics Search</b> , the array of Booleans and numbers display incorrect values	21.1.0
ANALYTICS-13031	Analytics	From <b>Analytics Search</b> , the <b>Tier</b> filter is incorrectly initialized by the <b>Node</b> filter	21.1.0
ANALYTICS-13070	Analytics	From <b>Transaction Snapshots</b> , the Analytics timestamp is incorrect if the customer changed <b>Display Time Zone</b> in <b>Preferences</b>	21.1.0
ANALYTICS-13090	Analytics	NodeJS does not receive Analytics HTTP config	21.1.0
BRUM-6390	Browser RUM	From <b>Timing Breakdown</b> , the SSL/TLS bar is not rendering correctly	21.1.0
CDM-7016	Mobile RUM	Accessing warning snapshots from <b>Code Issues</b> causes a java.lang.exception	21.1.0
DIAGPLAT-1001	APM	Snapshots are sometimes not displaying the potential issue information	21.1.0
DIAGPLAT-1043	APM	Query executed in <code>getSummariesAndAppendBlobsIfNeeded</code> times out	21.1.0
DIAGPLAT-1081	APM	Searching for snapshots yields inaccurate results for <b>Standard Time Range</b> from <b>Transaction Snapshot</b>	21.1.0
L4A-15351	Accounts	Email address field not accepting special characters.	21.1.0
L4A-15898	Accounts	Company Admin is unable to add new user	21.1.0

Key	Product	Summary	Version
L4A-16541	Controller-License	The UI is storing the <code>machineId</code> instead of the <code>hostId</code> value reported by the agent, therefore it doesn't match the value stored for the filter.	20.8.0, 20.11.0, 20.11.1.0
L4A-16565	Accounts	After migrating to Infrastructured-based Licensing, the Premium package had the wrong license consumption	21.1.0
METADATA-9467	APM	The security header response (HSTS) is fixed	21.1.0
METADATA-9483	APM	Health rule status precedence is fixed	21.1.0
REPORTS-799	Reports	Scheduled reports are sent on clicking Save	21.1.0
REPORTS-811	Reports	Reports (scheduled or one time) with a custom time range are delivered with the Login page	21.1.0
TMNT-952	APM	Customer time range does not display time as per the timezone configured in the preferences	21.1.0
TMNT-1799	APM	Notifications slow the UI down when there are many notifications	21.1.0
UISVCS-1011	UI Services	Creation of error detection configuration field for the HTTP return codes for the PHP Agent	21.1.0

## 20.12 Resolved and Known Issues

### Agent Resolved Issues

Filter table:

Key	Product	Summary	Version
ANALYTICS-13154	Java Agent	<code>toString()</code> method displays <code>["[Ljava.lang.String;@23377943"]</code> error for Java arrays in <b>Data Collectors</b>	20.12.0

**20.11 Resolved and Known Issues**  
**Agent Resolved Issues**

Filter table:

Key	Product	Summary	Version
BRUM-6403	JavaScript Agent	Page renders slowly for AngularJS apps if there is no <code>onreadystatechange</code> handler for AJAX calls	20.12.0
BRUM-6438	JavaScript Agent	ADRUM cookie triggers <code>sameSite</code> attribute warning in Firefox	20.12.0
CLUSTERMON-2259	Cluster Agent	The <code>cluster-agent-operator-openshift.yaml</code> file fails to deploy the pod on OpenShift and the log displays the <code>no matches for kind "Clustercollector" in version error</code>	20.12.1
CLUSTERMON-2088	Cluster Agent	The auto-instrumentation does not work when there is a space in the <code>appname</code> configuration within the <code>cluster-agent.yaml</code> file	20.12.0
DBMON-7391	Database Agent	The Network IO metrics value displays an unreasonable number for the AIX servers	20.12.0
DBMON-7561	Database Agent	When configuring <b>Monitoring Operating System</b> for an AWS RDS collector, the <b>eu-north-1</b> region is not displayed	20.12.0
DBMON-7495	Database Agent	When the IP address of the host machine keeps changing, the database metrics drop to zero and the <b>Events</b> page displays that the collectors are reinitialized	20.12.0
DBMON-7444	Database Agent	When a database uses the Database Partitioning Feature (DPF), the Calls per Minute metric on the Metric Browser displays incorrect data	20.12.0
DBMON-7428	Database Agent	The hardware monitoring stops working and the log displays the <code>com.jcraft.jsch.JSchException: session is down</code> error	20.12.0
DOTNET-5047	.NET Agent	Ability to download latest .NET Agent from the Controller	20.12.0

Key	Product	Summary	Version
DOTNET-5108	.NET Agent	Fixed issue of incorrect CPU% reporting in certain cases	20.12.0
DOTNET-5111	.NET Agent	Download link for .NET has been updated on the Getting Started Wizard page	20.12.0
DOTNET-5270	.NET Agent	Ability to add headers to ASP.NET Core HTTP responses is now available	20.12.0
DOTNET-5300	.NET Agent	Agent MSI MA registration request with vCPU information was extended to support IBL licensing	20.12.0
DOTNET-5340	.NET Agent	Unhandled exception in timer thread may cause application crash in some situations	20.12.0
NODEJS-199	Node.js Agent	Standalone 64-bit Node.js Agent versions 10 and 12 fail in Linux with a <code>Segmentation Fault</code> error	20.12.0
NODEJS-284	Node.js Agent	Node.js Agent errors in Alpine-based Docker images	20.12.0
PHP-999	PHP Agent	PHP Agent does not detect ports when a client uses <code>CURLOPT_PORT</code> instead of placing it in the URL	20.12.0
PHP-1187	PHP Agent	Analytics snapshot data is missing for continuing and terminating the PHP Tiers snapshots	20.12.0
PYTHON-518	Python Agent	Upstream application is not visible on Controller when the downstream application is Python	20.12.0
SERVER-8351	Machine Agent	Machine Agent works with user-defined <code>JAVA_HOME</code> with <code>-j</code> flag	20.12.0

### Controller (SaaS/On-Premises) Resolved Issues

There are no Controller releases for 20.12 yet.

## Known Issues

There are no known issues in the 20.12 release as of yet.

**Controller  
(SaaS/On-  
Premises)  
Resolved  
Issues**

Key	Product	Summary	Version
BRUM-6350	JavaScript Agent	Visually Complete Time sometimes reports as a Page Complete Time	20.11.0
CDM-6991	Android Agent	Issue parsing the mobile agent token that registers the agent with the Controller, causing extra licenses to be consumed	20.11.0
CLUSTER MON-2089	Cluster Agent	Agent registration is prevented while storing Cluster Agent properties in the database	20.11.0
CLUSTER MON-2057	Cluster Agent	The terminologies blacklist and whitelist are replaced with blocklist and allowlist to follow neutral usage of words	20.11.0
DOTNET-4986	.NET Agent	Fix for race condition in tracking CLR instances for IIS in-processes hosted by .NET Core 3.1 applications	20.11.0
DOTNET-5159	.NET Agent	To prevent correlation headers from becoming too long, the Linux Agent now limits the number of in-process call chain segments for thread correlation to ten segments per node. To disable this limit, set the node property track-all-async = true.	20.11.0
DOTNET-5244	.NET Agent	Fix for application crash if more than one URL filter is configured	20.11.0
JAVA-8599	Java Agent	Upgrading the Java Agent to use Agentless Analytics results in custom data not getting reported to analytics	20.11.0
JAVA-8536	Java Agent	A significant number of threads are blocked in the Java Agent UUID generation	20.11.0
JAVA-8456	Java Agent	Issue with the snapshot generation post-JVM restarts	20.11.0

Key	Product	Summary	Version	
JAVA-844 1	Java Agent	When JVM is restarted before the end of Action suppression rule created with disable agent reporting, the agent is not re-enabled automatically and the metrics are not reported	20.11.0	<b>Known Issues</b> There were no known issues in the 20.11 release.
JAVA-828 3	Java Agent	A <code>NullPointerException</code> error is reported when retrieving JMX attribute	20.11.0	
JAVA-794 4	Java Agent	Issue with the Average Response Time and reporting of Thread Task metrics	20.11.0	<b>20.10 Resolved and Known Issues</b>  <b>Agent Resolved Issues</b>
JAVA-760 3	Java Agent	An error is reported when the maximum analytics collector limit is exceeded	20.11.0	
PYTHON-517	Python Agent	Python agent does not group all methods (GET, POST, PUT, and DELETE) when custom transaction detection rules are applied without HTTP method criteria	20.11.0	
PYTHON-581	Python Agent	Individual Business Transactions are formed even in the presence of Custom Transaction Rule	20.11.0	
SERVER-8419	Machine Agent	Machine Agent installed with RPM does not honor settings for user and user group	20.11.0	
SERVER-8465	Machine Agent	JVM options provided via service installation is set in <code>vmoptions</code> file	20.11.0	
SERVER-8471	Machine Agent	CPU usage reporting fix for Solaris 11	20.11.0	
SERVER-8530	Machine Agent	Correct CPU used percentage reported for each processor group	20.11.0	
SRVLESS-1305	Serverless Tracer	The Java, Node.js, and Python Serverless Tracers now default HTTP calls made by the tracer to timeout after <code>2000ms</code>	20.11.0	

Filter table:

Key	Product	Summary	Version
ALERT-6830	Alert & Respond	Incorrect link destination during remediation script action creation	20.11.0
ALERT-6990	Alert & Respond	Only application object scope is supported for application error displays when you suppress an action (one-time) for an EUM enabled APM application	20.11.0
ALERT-7088	Alert & Respond	Health Rule for the User Experience Application does not automatically include new pages	20.11.0
ALERT-7828	Alert & Respond	Health rules not available in cache after Controller upgrade	20.11.4

Key	Product	Summary	Version
ALERT-9686	Alert & Respond	Unable to create a Custom Action due to unavailability of Save and Cancel buttons	20.11.0
AMCSEV-727	App Monitoring Cloud Services	Automatic Leak detection session duration shows 60 minutes when the agent default is 30 minutes	20.11.0
AMCSEV-1023	App Monitoring Cloud Services	Unable to export the call graph	20.11.0
AMCSEV-1328	App Monitoring Cloud Services	Tiers page does not display node details after the 10th node is registered	20.11.7
ANALYTICS-12780	Application Analytics	ADQL basic search filter does not escape double quotation	20.11.0

Key	Product	Summary	Version
ANALYTICS-13089	Application Analytics	Incorrect Browser Sessions/ Mobile Sessions details in the <b>Analytics Home</b> page	20.11.1
ANALYTICS-13095	Application Analytics	Node.js Agent does not receive the Analytics HTTP configuration	20.11.0
ANALYTICS-13067	Application Analytics	From <b>Analytics Search</b> , the <b>Tier</b> filter is initialized incorrectly by the <b>Node</b> filter	20.11.3
CLUSTERMON-2089	Cluster Monitoring	Agent registration is prevented while storing Cluster Agent properties in the database	20.11.0

Key	Product	Summary	Version
DBMON-7170	Database Visibility	The database health rule is not evaluated for the custom metric name that has more than two   (pipe) symbols	20.11.0
DBMON-7256	Database Visibility	Some Sybase custom metrics do not display when the SQL query returns multiple result sets	20.11.0
DBMON-7268	Database Visibility	You cannot update the Advanced Options for a collector because the collector is automatically updated when you select the <b>Advanced Options</b> on the Collector configuration page	20.11.0

Key	Product	Summary	Version
DBMON-7269	Database Visibility	The values cannot be added in <b>Advanced Options</b> on the <b>Edit Collector</b> page	20.11.0
DBMON-6620	Database Visibility	The Oracle collector cannot be created with a custom connection string and sub-collectors	20.11.0
DBMON-7615	Database Visibility	Custom Metric appears in the Metric Tree for all the configurations regardless of the configuration it belongs to in the Metric Browser	20.11.1

Key	Product	Summary	Version
DBMON-7618	Database Visibility	Unable to create action suppression on single node for database with multiple nodes (topology)	20.11.1
DIAGPLAT-879	APM	Retrieve Event Data API is not filtered by the tier ID	20.11.0
DIAGPLAT-891	APM	Event creation locked because of a thread pool saturation	20.11.0
DIAGPLAT-907	APM	Filtering is incorrect for the Service Endpoints in getRequestSegmentsByFilterHandle API	20.11.0
DIAGPLAT-947	APM	Some TSS bound its detail string with the wrong ID	20.11.0

Key	Product	Summary	Version
DIAGPLAT-950	APM	Providing JavaScript to purge bad TSS detail IDs from the cache	20.11.0
DIAGPLAT-1061	APM	Query executed in <code>getSummariesAndAppendDBlobsIfNeeded</code> timed out	20.11.3
DIAGPLAT-1082	APM	Search for snapshots gives inaccurate results for <b>Standard Time Range</b> under <b>Transaction Snapshot</b>	20.11.4, 20.11.5
JAVA-8865	APM	ServiceProxy feature for Controllers upgraded to 20.11.0 are disabled	20.11.2
L4A-14347	Accounts	Improper Authorization allows access to <code>admin.jsp</code>	20.11.0

Key	Product	Summary	Version
METADATA-9402	APM	REST API has added load historical liveness data for a tier, its node, and its parent app based on an anchor metric ID provided by users	20.11.0
METADATA-9485	APM	Ensure that the HTTP header Strict-Transport-Security is set	20.11.0
METADATA-9488	APM	Health rule status precedence is incorrect	20.11.0
MQS-1247	Metric Query Service	<b>Metric Browser</b> does not display data for some random window sizes	20.11.9
REPORTS-813	Reports	Reports with custom time ranges getting delivered with login page	20.11.0

Key	Product	Summary	Version
SVCMON-1301	APM	Improve queries for business transactions to optimize performance	20.11.8
SYNTH-5864	Synthetic Browser Monitoring	Synth Credential vault shows EUM App name in the dropdown instead of the app name	20.11.0
TMNT-707	APM	When exporting metric data, the browser does not show data points after the Daylight Savings Time (DST) change	20.11.0

Filter table:

Key	Product	Summary	Version
BRUM-6375	JavaScript Agent	Invalid pointer error for JavaScript Agent in Internet Explorer/Edge is caused by <code>HTMLImageElement</code> URI length	20.10.0
BRUM-6230	JavaScript Agent	<code>updateFetchEventResponseHeaders</code> throws the error message "forEach is not a function.." intermittently	20.10.0

Key	Product	Summary	Version
BRUM-6351	JavaScript Agent	A virtual page event is triggered when there is a call to push or replace states, even when there is no URL change	20.10.0
CDM-5817	iOS Agent	MAT is retained across calls when <code>config.collectorChannel</code> is set	20.10.0
DBMON-7057	Database Agent	The database events summary displays an error, <code>Maximum custom metric limit 40 is reached</code> , even when the number of custom metrics is lower than 40	20.10.0
DBMON-7280	Database Agent	<b>Metric Browser</b> does not display the performance metrics for Oracle Pluggable Database (PDB)	20.10.0
DBMON-7423	Database Agent	The Topology tab displays incorrect port numbers for the non-default ports of Microsoft SQL and Oracle clusters	20.10.0
DBMON-7255	Database Agent	Oracle Database failover issue with the SCAN IP in a custom JDBC string	20.10.0
DBMON-6900	Database Agent	Even when an SQL query is updated to include a label for a column within a custom metric, the <b>Details</b> tab of the event displays the column name instead of the label	20.10.0
DOTNET-4860	.NET Agent	.NET Agent logging has been fixed and no longer shows extraneous Socket error messages	20.10.0
DOTNET-4990	.NET Agent	When you split a URI using a custom exit call naming rule with method parameters, the string length has been expanded to 100 characters	20.10.0
DOTNET-5082	.NET Agent	Fix for 20.4 .NET Agent for Windows causing high CPU in some scenarios	20.10.0
DOTNET-5141	.NET Agent	Added a new configuration option (set <code>APPDYNAMICS_AGENT_MASK_ENV_VARS</code> environment variable = true) to mask environment variables in the Linux agent before sending information to the Controller	20.10.0
DOTNET-5171	.NET Agent	Fix for .NET Agent for Windows where diagnostic messages from the agent were failing on malformed Regex rules	20.10.0

Key	Product	Summary	Version
DOTNET-5205	.NET Agent	Fix for BT level error metrics not including HTTP errors in some situations	20.10.0
JAVA-8537	Java Agent	After upgrading the Java Agent version 4.5.9 to 20.8, the OSB Rules are not applied correctly	20.10.0
JAVA-8436	Java Agent	When Java Agent 20.9 is instrumented with JDK 15, the agent does not start and throws a Null Pointer Exception error	20.10.0
JAVA-8399	Java Agent	Snapshots are not generated, even though they are reported to the controller	20.10.0
JAVA-8009	Java Agent	The agent is unable to find the matching <code>AgentBackendDiscoveryConfig</code> as it is unable to extract the database names for the Oracle RAC connection	20.10.0
JAVA-7898	Java Agent	The Java Agent cannot be dynamically attached to the Java 11 process	20.10.0
JAVA-7775	Java Agent	The JVM tab displays empty contents for the Java Agent installed on Docker and instrumented with JDK11	20.10.0
JAVA-7713	Java Agent	<code>java.lang.IllegalStateException</code> is reported due to incomplete instrumentation and a race condition seen under heavy load	20.10.0
NODEJS-10	Node.js Agent	<code>Mark Nodes as Historical</code> API causes C++ Rest SDK errors on shutdown	20.10.0
NODEJS-245	Node.js Agent	Remove <code>request</code> package from the Node.js Agent	20.10.0
NODEJS-261	Node.js Agent	Upgrade Java proxy to version 20.7.0.30393	20.10.0
NODEJS-285	Node.js Agent	Remove <code>console.log(process.env);</code> from Node.js Installer script	20.10.0
PHP-1044	PHP Agent	PHP Agent does not capture Postgres queries when an explicit connection handle is passed to the query functions	20.10.0
PHP-1040	PHP Agent	The PHP Agent crashes due to a null reference, when accessing a call graph node on the request shutdown	20.10.0

Key	Product	Summary	Version
PHP-1001	PHP Agent	The PHP Agent crashes applications during the call graph collection	20.10.0
PHP-987	PHP Agent	There is no way to filter expected error codes resulting from an outgoing service call using <code>drupal_http_request</code>	20.10.0
PYTHON-324	Python Agent	Python Agent collects all the errors in one bucket when custom error codes are configured	20.10.0
SERVER-8435	Machine Agent	Resolved high CPU usage caused while executing <code>WmiPrvSE.exe</code> process commands	20.10.0
SERVER-8466	Machine Agent	Reports correct CPU usage date for AIX systems	20.10.0
SERVER-8469	Machine Agent	English Locale set for AIX collector to parse output correctly	20.10.0
WEBSRV-298	Apache Agent	Issue with the backend naming for a large number of virtual hosts.	20.10.0

### Controller (SaaS/On-Premises) Resolved Issues

 Filter table: 

Key	Product	Summary	Version
ALERT-6669	Alert and Respond	Drill down for health rule violation and affected entities display blank results	20.10.0
ALERT-6767	Alert and Respond	<code>Application with id:-1 does not exist</code> error is displayed when you access the health rules using the dashboard and click on <b>Critical</b> or <b>Warning</b> tab	20.10.0
ALERT-6781	Alert and Respond	Support <b>Overall Application Performance</b> type health rules through <b>Alerting Templates</b> for EUM-enabled APM applications	20.10.1
ALERT-7379	Alert and Respond	Unable to save action suppression for EUM-enabled applications	20.10.1

Key	Product	Summary	Version
AMCSEV-743	App Monitoring Cloud Services	Node count on the Dashboard does not match the node count on the <b>Node</b> panel	20.10.0
AMCSEV-768	App Monitoring Cloud Services	Custom transaction match rules cannot be created from <b>Snapshot</b> screen	20.10.0
AMCSEV-808	App Monitoring Cloud Services	Java Agent version not displayed correctly on <b>Tier &amp; Nodes</b>	20.10.0
AMCSEV-862	App Monitoring Cloud Services	Backend discovery rules losing data upon enabling or disabling	20.10.0
AMCSEV-885	App Monitoring Cloud Services	Java Agent version not displayed correctly on <b>Tier &amp; Nodes</b> . Backport to 20.8	20.8.0, 20.10.0
AMCSEV-1170	App Monitoring Cloud Services	Enable <b>Automated Transaction Diagnostics</b> in the Controller by default	20.10.1
ANALYTICS-11516	Application Analytics	UI not setting start and end timestamps correctly in ADQL aggregation query	20.10.0
ANALYTICS-12809	Application Analytics	Selected options do not attach the correct options in <b>Add Business Journeys</b>	20.10.0
ANALYTICS-12926	Application Analytics	Limit error messages and stack traces in Business Transactions to 8191 characters	20.10.0
ANALYTICS-13094	Application Analytics	Node.js Agent does not receive the Analytics HTTP configuration	20.10.5
BRUM-6243	Browser RUM	Creating EUM Application using <b>Getting Started Wizard</b> fails with error	20.10.0
BRUM-6223	Browser RUM	EURT column on Pages and AJAX request UI is too slim and column sizing does not persist	20.10.0
CDM-6544	Mobile RUM	Correct <code>Fragment Start Event</code> type typo in the Collector	20.10.0
CDM-6571	Mobile RUM	Create unit test cases for IP Header and Geo resolution handling for mobile beacons	20.10.0

#### Known Issues

There are no known issues in the 20.10 release.

Key	Product	Summary	Version
CLUSTERMON-1948	Cluster Monitoring	The <b>Pods</b> tab does not display data	20.10.0
CLUSTERMON-2090	Cluster Monitoring	Cluster Agent runs out of database space when persisting the agent registration request	20.10.2
DBMON-6275	Database Visibility	When you edit the query text of a custom metric, the changes get saved without clicking <b>Save</b>	20.10.0
DBMON-6816	Database Visibility	The Metric Browser displays a <b>504 Error</b> when you launch it for the first time	20.10.0
DBMON-6937	Database Visibility	The <b>Custom Metrics</b> tab displays a <b>500 internal</b> error	20.10.0
DBMON-6947	Database Visibility	The database health rules are not evaluated for the collectors with the view permissions	20.10.0
DBMON-7055	Database Visibility	The memory metrics are not displayed for the Oracle 11g database	20.10.0
DBMON-7060	Database Visibility	The Transaction Snapshot is not displayed for the Oracle Cluster	20.10.0
DBMON-7600	Database Visibility	Only add custom metrics to the configuration which it belongs to in the <b>Metric Browser</b>	20.10.8
DBMON-7617	Database Visibility	Unable to create action suppression on single node for database with multiple nodes (topology)	20.10.8
DIAGPLAT-767	APM	No RSD found for filter error in <code>/snapshot/getRequestSegmentDatav2</code>	20.10.0
DIAGPLAT-925	APM	Filtering incorrect for the Service Endpoints in the <code>getRequestSegmentsByFilterHandle</code> API	20.10.0
DIAGPLAT-961	APM	Some top summary stats (TSS) are bound to the wrong ID	20.10.0
DIAGPLAT-994	APM	Added a filter to the REST endpoint <code>/restui/events/query</code> to curtail unexpected results	20.10.3

Key	Product	Summary	Version
DIAGPLAT-1 018	APM	Incorrect join for archive queries when getting potential problems for snapshots	20.10.5
DIAGPLAT-1 060	APM	Query executed in <code>getSummariesAndAppendBlobsIfNeeded</code> timed out	20.10.9
DIAGPLAT-1 083	APM	Search for snapshots gives inaccurate results for <b>Standard Time Range</b> under <b>Transaction Snapshot</b>	20.10.9, 20.10.10
IAM-1541	Identity, Authentication, Authorization, and Audit	The Controller is running slow due to multiple calls for config import/export to <code>ApiClientResourceImpl</code> .	20.10.0
L4A-8473	Accounts	When passing multiple groups, the <code>SAML Access Attribute</code> does not work	20.10.0
L4A-13281	Accounts	Account key is appearing in the Controller audit report	20.10.0
METADATA-9 355	APM	MDS connection pools no longer ignore JDBC parameters in domain.xml	20.10.0
METADATA-9 372	APM	MDS connection pools no longer ignore JDBC parameters in domain.xml	20.10.0
METADATA-9 486	APM	Ensure that the HTTP header <code>Strict-Transport-Security</code> is set	20.10.4
METADATA-9 489	APM	Health rule status precedence is incorrect	20.10.4
MOBILE-1619	Mobile App	Fetch push server URL from the Configuration Manager in each notification request	20.10.2
METADATA-5 428	Dashboards	Dashboard health status widget appears green even when the health rule shows grey	20.10.0
REPORTS-79 9, REPORTS-81 4	Reports	Scheduled reports are sent on clicking <b>Save</b>	20.10.0, 20.10.6

Key	Product	Summary	Version
REPORTS-812	Reports	Reports with a custom time range are delivered with the login page	20.10.6
SVCMON-963	APM	Exit calls to resolved backends now display on <b>Flow Maps</b>	20.10.0
SVCMON-1252	APM	Query updating a flow map preference causes high CPU usage	20.10.7

## 20.9 Resolved and Known Issues

### Agent Resolved Issues

 Filter table: 

Key	Product	Summary	Version
BRUM-6321	JavaScript Agent	<code>promise.then()</code> throws an error when receiving non-function parameters	20.9.0
CLUSTERMON-1910	Cluster Agent	Cluster Agent is unable to monitor the namespaces that include the <code>config string</code>	20.9.0
CLUSTERMON-1869	Cluster Agent	The auto-instrumentation of Java applications fail when using the 20.6 version of the Redhat Java Agent image	20.9.0
DBMON-7160	Database Agent	The <b>Disk IO</b> hardware metric is not displayed for a Linux machine	20.9.0
DBMON-7231	Database Agent	The monitoring of Oracle database is affected when the <code>v\$osstat</code> permission is missing	20.9.0
DBMON-7232	Database Agent	Issues with Oracle topology resolution when using a specific LDAP connection string or a specific <code>local_listener</code> value	20.9.0
DBMON-7127	Database Agent	The <b>CPU</b> metric value is displayed incorrectly when the instance caging is enabled in Oracle	20.9.0

Key	Product	Summary	Version
DOTNET-4397	.NET Agent	Business Transaction name now registers as the <code>ControllerName.ActionName</code>	20.9.0
DOTNET-4942	.NET Agent	Business Transaction correlation for EUM has been fixed so that the .NET Agent appends the Business Transaction ID cookie	20.9.0
DOTNET-4954	.NET Agent	Windows service does not stall after a few days of instrumentation	20.9.0
DOTNET-4973	.NET Agent	<p>The .NET Linux Agent no longer crashes with a <code>seqfault</code> error.</p> <p>To avoid potential crashes, you can disable snapshots by entering the following code:</p> <pre style="border: 1px solid black; padding: 5px;">           "profiler":           {               "eventMask":               2149842980           }         </pre>	20.9.0
IIB-316	IBM Integration Bus Agent (IIB)	Business Transactions are missing for some of the message flows on the <b>AppDynamics Business Transaction</b> view	20.9.0
JAVA-8110	Java Agent	Java Agent is unable to register an application and send metrics because an <code>InstantiationException</code> with <code>NettyMarkerInterceptor</code> is observed on the console or agent logs when the Servlet monitoring is disabled	20.9.0
JAVA-8052	Java Agent	A Snapshot call graph contains CPU times - This is a Hotspot call graph message is displayed on some of the transaction snapshots	20.9.0
JAVA-8047	Java Agent	A large number of AppDynamics threads are found on the applications using Vert.x	20.9.0

Key	Product	Summary	Version
JAVA-7947	Java Agent	A <code>ClassCastException</code> is observed when the Live Preview session is started with the Custom Servlet rule	20.9.0
JAVA-7601	Java Agent	Ignored errors or exceptions are still counted towards Service Endpoint errors per minute	20.9.0
LIBAGENT-46	C/C++ SDK	<b>Thread Name</b> shows <code>-1</code> for C/C++ SDK segments in the <b>Waterfall View</b> tab	20.9.0
LIBAGENT-53	C/C++ SDK	Cross-application correlation displays incorrectly in the primary <b>Application Flow Map</b> dashboard	20.9.0
LIBAGENT-54	C/C++ SDK	C/C++ SDK Agent on Windows fails to connect and logs an <code>Open failed</code> error	20.9.0
PHP-988	PHP Agent	PHP Drupal application crashes when handling an outgoing HTTP request	20.9.0
PHP-985	PHP Agent	PHP packages fail the Aqua security scan	20.9.0
PHP-974	PHP Agent	PHP Agent crashes PHP applications on Drupal7 HTTP interception	20.9.0
PYTHON-493	Python Agent	Jackson jars dependency removed from Python Agent	20.9.0
PYTHON-473	Python Agent	Python Agent reports misleading error format	20.9.0
SERVER-8437	Machine Agent	Machine Agent now extracts numerical addresses for network interfaces without symbolic host, port or user names	20.9.0
SERVER-8443	Machine Agent	Machine Agent for AIX no longer gets stuck on remote volumes command and reports only local volumes metrics	20.9.0

### Controller (SaaS/On-Premises) Resolved Issues

Key	Product	Summary	Version
SERVER-8446	Machine Agent	Removed <code>perfstat_partition_config()</code> call due to AIX bug crashing the Machine Agent	20.9.0
WEBSRV-256	Apache Agent	Agent crashes the worker process when the Backend ID is <code>NULL</code>	20.9.0

 Filter table: 

Key	Product	Summary	Version
ALERT-6835	Alert and Respond	Alerting template popup status does not change as per the template progress status	uic-20.9.0
SYNTH-6536	Synthetic Browser Monitoring	Cookies not visible in request headers of Chrome v83	20.9.0

## 20.8 Resolved and Known Issues

### Agent Resolved Issues

 Filter table: 

Key	Product	Summary
BRUM-6191	JavaScript Agent	<code>adrum.js</code> beacon response fails due to multiple Access-Control-Allow-Origins headers being set
BRUM-6216	JavaScript Agent	Console error cannot read property url of undefined on a fetch call
BRUM-6207	JavaScript Agent	<code>adrum.js</code> beacon contains more events than the graphql events call
CDM-6144	iOS Agent	Inconsistent crash report time stamp in Controller
DOTNET-4089	.NET Agent	Applications no longer generate invalid token exceptions
DOTNET-4579	NET Agent	Access violation in Redis backend resolution attempt to retrieve host name

Key	Product	Summary
DOTNET-4599	NET Agent	Two lines of the console output that appeared when the Windows agent started up no longer appear.  To restore them, create and set an <code>appdynamics.outputMode</code> environment variable.
DOTNET-4659	.NET Agent	Reporting service from the Microsoft Power BI Tools no longer fails
DOTNET-4707	.NET Agent	Analytics transaction metrics are not starting unless Micro Services APM Agent is restarted
DOTNET-4811	.NET Agent	OWIN cookies no longer lost after agent upgrade
DOTNET-4898	.NET Agent	IPC timeout configurability between coordinator and .NET Agent
JAVA-7625	Java Agent	A null message passed causes a Null Pointer Exception in the <code>ALoggerMessageInterceptor</code>
JAVA-7569	Java Agent	Sensitive message filter does not work appropriately when the message-pattern is <code>FOUND</code> but redaction-regex is <code>NOT MATCHED</code>
JAVA-7939	Java Agent	Vertx exit interceptor fails to create exit call due to a bad URI
JAVA-7950	Java Agent	In certain scenarios, <code>ServerTransactions</code> , which are started before all required classes get instrumented, remain in the agent memory permanently even after they get aborted
JAVA-8007	Java Agent	After a tier is deleted, JMX rules are not re-registered and therefore the JMX metrics are not displayed on the Metric Browser
JAVA-8013	Java Agent	The auto-discovered spring web service names display multiple duplicate names with different <code>ns</code> numbers when auto-detection is enabled (java web services)
NETWORK-617 1	Network Agent	Network Agent now reports data in low throughput environments
PHP-984	PHP Agent	A large number of errors are displayed in the agent logs due to <code>No URL filter config found in filterUrl</code>
PYTHON-244	Python Agent	MongoDB Transaction snapshots expose sensitive data

Key	Product	Summary
SERVER-8361	Machine Agent	AIX CPU metrics calculation now uses proper timestamp
SERVER-8367	Machine Agent	The Controller has been enhanced to not allow registration of misconfigured container type Server Visibility or Docker Visibility Agents (released in disabled mode)
SERVER-8420	Machine Agent	Add default heap JVM options in <code>InstallService.vbs</code> for Windows MA installer
SERVER-8450	Machine Agent	Default heap JVM options now default to <code>-Xms256m</code> and <code>-Xmx256m</code> in the <code>InstallService.vbs</code> script for the Windows Machine Agent installer

### Controller (SaaS/On-Premises) Resolved Issues

 Filter table: 

Key	Product	Summary	Version
ALERT-6676	Alert and Respond	The third-party Bzip2 library used by the Controller has been updated to version 1.0.8	20.8
ALERT-6761	Alert and Respond	Upon clicking the <b>View Dashboard During Health Rule Violation</b> for a BT, you are redirected to a non-existing entity with the id <code>-1</code>	20.8
ALERT-6860	Alert and Respond	When you access a health rule using the health status widget on the dashboard, <code>Application with id:-1 does not exist</code> error is displayed	20.8
ALERT-6916	Alert and Respond	Upgrade to Kafka Streams 2.3.1	20.8
ALERT-6996	Alert and Respond	Actions are not getting triggered after <b>Recurring Action Suppression</b> time has expired	20.8
AMCSEV-62	App Monitoring Cloud Services	Unable to save an exception match condition	20.8
AMCSEV-90	App Monitoring Cloud Services	<b>Create Method Invocation Data Collector</b> dialog from call graph does not autofill	20.8

Key	Product	Summary	Version
AMCSEV-519	App Monitoring Cloud Services	Unable to save <b>Java Error Detection Configuration</b> because of an <code>OptimisticLockException</code>	20.8
AMCSEV-543	App Monitoring Cloud Services	Unable to delete archived machine snapshots	20.8
AMCSEV-607	App Monitoring Cloud Services	Error counts for the URLs in the <b>Error Occurrence Details</b> table are not getting refreshed for different time ranges	20.8
AMCSEV-755	App Monitoring Cloud Services	Failed to create a backend detection <code>Custom Exit Point</code> via the right-right-click	20.8
AMCSEV-885	App Monitoring Cloud Services	Java Agent version is not displayed correctly with the Controller version on <b>Tier &amp; Nodes</b>	20.8
ANALYTICS-12711	Application Analytics	Overloaded method checkbox becomes unchecked in <b>Create Data Collector</b> dialog box	20.8
ANALYTICS-12730	Application Analytics	Analytics widget size is setting wrong when add to absolute layout dashboard	20.8
ANALYTICS-12900	Application Analytics	Analytics Home page displays inconsistent EUM charts	20.8
ANALYTICS-12912	Application Analytics	Missing start tier causes <code>TypeError</code> in Business Transaction flow map with EUM and BT node	20.8
ANALYTICS-12935	Application Analytics	When you add a Business Journey and select a Business Transaction, the BT name is replaced with the BT ID upon saving the Business Journey	20.8
ANALYTICS-13024	Application Analytics	The Business Transactions are not filtered based on the tier selected in the <b>Business Journey</b> page	20.8
ANALYTICS-13093	Application Analytics	Node.js Agent does not receive the Analytics HTTP configuration	20.8

### Known Issues

There were no known issues in the 20.8 release.

Key	Product	Summary	Version
ANLYTCS_ES-3766	Events Service	The third-party netty library used by the Controller has been updated to 4.1.48	20.8
ANLYTCS_ES-3804	Events Service	User is unable to see data in the Metric Browser because of the error message <code>last run failed</code>	20.8
ANLYTCS_ES-3861	Events Service	The <code>third-party search-guard-ssl</code> library used by the Event Service is updated to version 24.0 and kibana plugin is updated to version 5.6.8.7	20.8
APMPLAT-11061	APM	App and Machine Agent Status now correctly display percentages for Nodes and Tiers in the user interface	20.8
BRUM-6161	Browser RUM	Analyze records can fail to load	20.8
CLUSTERMON-1870	Cluster Monitoring	Collect Cluster Agent adoption and usage data	20.8
COGENG-901	Cognition Engine	The third-party netty library used by the Controller has been updated to 4.1.48	20.8
DBMON-6596	Database Monitoring	The Oracle Collector does not work when the <b>Oracle Wallet</b> option is enabled during the Oracle Collector configuration	20.8
DBMON-6764	Database Monitoring	The <b>Hardware Monitoring</b> option includes an outdated region for <b>Amazon RDS</b>	20.8
DBMON-7005	Database Monitoring	The third-party netty library used by the Controller has been updated to 4.1.48	20.8
DBMON-7111	Database Monitoring	The Controller does not display any data when you open the Metric Browser for the first time	20.8
DBMON-7140	Database Monitoring	Upgrade the JAR <code>singularity-xml</code> to include Apache Xerces 2.12.0	20.8
DIAGPLAT-798	APM	Snapshots do not get loaded, <code>500 Internal Server Error</code> is displayed	20.8

Key	Product	Summary	Version
DIAGPLAT-828	APM	Call to <code>/snapshot/getRequestSegmentDatav2</code> returns the error <code>No RSD found for filter</code>	20.8
DIAGPLAT-893	APM	Correct the exit call mapper RSD v2	20.8
DIAGPLAT-916	APM	When reviewing a Business Transaction Snapshot, the display of <b>Potential Issues</b> takes time of 30 to 60 seconds	20.8
DIAGPLAT-926	APM	Service Endpoints do not filter corresponding transaction snapshots when you use the <code>getRequestSegmentsByFilterHandle</code> API	20.8
DIAGPLAT-942	APM	Correct the Service Endpoints filter for snapshots at the front-end layer	20.8
DIAGPLAT-960	APM	Modify query for loading the TSS detail string to cache	20.8
DIAGPLAT-963	APM	Some TSS bound its detail string with the wrong ID	20.8
JAVA-8021	Java Agent - Controller	Upgrade the Java Agent to 20.6.0-30555 in the Controller	20.8
L4A-12908	Accounts	Reset password via email does not work for single tenant	20.8
L4A-14101	Accounts	Upgrade <code>platform-rbac</code> to 20.4.0-170	20.8
L4A-14454	Accounts	Upgrade the dropwizard library to 20.4.0-170	20.8
L4A-14543	Authentication	LDAP group sync fails due to deleted groups being included in results	20.8
METADATA-9008	APM	Socket timeout and number of connections in Jedis pool are configurable	20.8
METADATA-9384	APM	MDS connection pools no longer ignore JDBC parameters in <code>domain.xml</code>	20.8

Key	Product	Summary	Version
METADATA-9397	APM	Upgrade the JAR <code>singularity-xml</code> to include Apache Xerces 2.12.0	20.8
METADATA-9397	APM	The context is not reset post an exception in some dashboard flows	20.8
METADATA-9453	APM	REST API loads historical liveness data for a tier, its node, and its parent app based on an anchor metric ID provided by users	20.8
METADATA-9487	APM	Ensure that the HTTP header <code>Strict-Transport-Security</code> is set	20.8
METRICSV-5021	Metric Service	App and Machine Agent Status now correctly display percentages for Nodes and Tiers in the user interface	20.8
METRICSV-5758	Metric Service	Upgrade the PostgreSQL JDBC Driver library to 42.2.14	20.8
MQS-1139	Metric Query Service	App and Machine Agent Status now correctly display percentages for Nodes and Tiers in the user interface	20.8
NETWORK-5403	Network Visibility	User with <b>Administration, Agents, Getting Started Wizard</b> permission is not allowed to view the <b>Network Visibility Agents</b> tab	20.8
REPORTS-791	Reports	Controller changes made all reports fail if any had scheduling fails on startup	20.8
REPORTS-795	Reports	NodeJs used by controller has been updated to v14.8	20.8
REPORTS-777	Reports	Upgrade the version of Node.js in the Controller to 8.17.0	20.8
SERVER-8174	Machine Agent	App and Machine Agent Status now correctly display percentages for Nodes and Tiers in the user interface	20.8

Key	Product	Summary	Version
SVCMON-827	APM	In Controller UI, <b>Web Service Exit Call</b> showing as <code>ui:ms_TransactionExitPointType_null</code>	20.8
SVCMON-864	APM	Controller logs full of the Redis error <code>Cache unavailable issue</code>	20.8
SYNTH-5965	Synthetic Browser Monitoring	<code>Problem Ended</code> event should be generated only after Error/Warning is confirmed	20.8
TMNT-720	APM	Time changes randomly in the <b>Custom Time</b> range component	20.8

## 20.7 Resolved and Known Issues

### Agent Resolved Issues

 Filter table: 

Key	Product	Summary	Version
CDM-6426	Android Agent	Screenshot tiles are not properly sent to the collector and as a result, screenshots may not be rendered correctly in the collector	20.7.0
CLUSTERMON-1758	Cluster Agent	The Cluster Agent Pod does not start and remains in the <b>Pending</b> state when taint is defined in the nodepool  This release adds support to set tolerations. See <i>tolerations</i> in the <a href="#">Configure the Cluster Agent YAML File section</a> .	20.7.0
DBMON-7036	Database Agent	The literals are unmasked for a CREATE statement even after selecting <b>Remove literals from the queries</b> in the <b>Security</b> configuration	20.7.0
DOTNET-4728	.NET Agent	Unable to see complete stacktrace after upgrading to MSI-based 20.5 agent from .NET Microservice agent	20.7.0
IIB-253	IBM Integration Bus (IIB) Agent	IIB Agent log files grow continuously for un-instrumented execution groups	20.7.0

Key	Product	Summary	Version
IIB-280	IBM Integration Bus (IIB) Agent	Nodes are not getting discovered by the IIB Agent on ACE (IIB 11)	20.7.0
IIB-294	IBM Integration Bus (IIB) Agent	Shutdown of the broker that runs multiple execution groups might result in a crash on some execution groups	20.7.1
IIB-287	IBM Integration Bus (IIB) Agent	The Broker on AIX crashes during startup when instrumented with IIB Agent version 20.7.0	20.7.1
JAVA-7825	Java Agent	Java Agent stops reporting analytics data on the agent version 20.4	20.7.0
JAVA-7820	Java Agent	Running Corretto with Java Agent results in an <code>Unrecognized Vendor</code> message	20.7.0
JAVA-7800	Java Agent	End User Monitoring (EUM) correlation with ADRUM headers does not work for Akka HTTP	20.7.0
JAVA-7569	Java Agent	The slowest database and remote calls are not displayed for any time slice (current or historical) for one hour or less	20.7.0
JAVA-7504	Java Agent	The <code>ApacheLog4</code> library in appserver agent shipped with controller installer is upgraded	20.7.0
JAVA-7234	Java Agent	The Servlet filter API is displayed as a POJO type in the call graph in place of Servlet entry point	20.7.0
NODEJS-39	Node.js Agent	Agent detects proxy server as HTTP Backend and displays it in the <b>Flow Map</b>	20.7.0
PHP-947	PHP Agent	PHP Agent reports incorrect HTTP response code when exceptions are thrown	20.7.0
PYTHON-323	Python Agent	Python Agent affects the request header of Application API when using <code>pyagent</code>	20.7.0
PYTHON-20	Python Agent	<code>def get_proxysupport_dir()</code> error is displayed when instrumenting ODOO application using the Python Agent	20.7.0

Key	Product	Summary	Version
PYTHON-28	Python Agent	CVE-2019-17571 vulnerability found in the Python AppDynamics proxy	20.7.0
SERVER-8322	Machine Agent	Windows: OSHI process CPU utilization metric displays correctly when compared to WMI-based metrics	20.7.0
SERVER-8348	Machine Agent	CPU User metric now shown in KPI mode	20.7.0
SYNTH-5620	Synthetic Agent	Resource errors are not excluded when authentication protocol determines synthetic job session status	20.7.0
SYNTH-5313	Synthetic Agent	In certain cases of network failure in Chrome, the Synthetic Agent records retried network requests as two distinct pages in the session	20.7.0
SYNTH-6495	Synthetic Agent	Synthetic job results in the error <code>Invalid SSL/TLS certificate: INET_E_INVALID_CERTIFICATE</code> in IE11 Browser for Azure Agents	20.7.0
WEB-SRV-241	Apache Agent	The <code>install.sh</code> script unnecessarily creates an entry in the <code>/etc/ld.so.conf.d</code> directory	20.7.0

### Controller (SaaS/On-Premises) Resolved Issues

 Filter table: 

Key	Product	Summary	Version
ALERT-3800	Alert and Response	The audit.log and REST API response include a typo, <code>helathRuleIds</code>	20.7.0

Key	Product	Summary	Version
ALERT-4781	Alert and Response	When you update an existing action, <code>OBJECT_UPDATED</code> events in the audit log file show old values as <code>0</code> instead of the previously configured value	20.7.0
ALERT-5940	Alert and Response	When you update a global health rule checkbox for an application, the application name is missing in the audit log	20.7.0
ALERT-6106	Alert and Response	Action suppression does not work for health rules with status <code>Ended - Critical</code> ; this happens for events of the type <code>Database</code>	20.7.0
ALERT-6139	Alert and Response	Alerting template does not get applied to applications, it gets stuck with a status <code>In Queue</code>	20.7.0
ALERT-5349	Alert and Response	When you open an Event UI and reload the background UI, the refreshed background UI display is distorted	20.6.0 20.7.0
ALERT-6028	Alert and Response	Remove Alerting Template RBAC constraints	20.4.0 20.7.0
ALERT-6684	Alert and Response	The third-party Bzip2 library used by the Controller has been updated to version 1.0.8	20.7.1
ALERT-6764	Alert and Response	Deep link for <b>Affected Entity</b> and <b>View Dashboard During Health Rule Violation</b> is taking <code>-1</code> instead of the correct entity ID	20.7.2

### Known Issues

There were no known issues in the 20.7 release.

Key	Product	Summary	Version
ALERT-6857	Alert and Respond	Accessing the <b>Health Status</b> widget returns the <code>Application with id:-1 does not exist</code> error	20.7.4
ALERT-6915	Alert and Respond	Upgrade to Kafka Streams 2.3.1	20.7.4
AMCSEV-49	App Monitoring Cloud Services	Missing information when exporting JMX Rule	20.7.0
AMCSEV-191	App Monitoring Cloud Services	Customization of <b>Automatic Leak Detection</b> settings transforms <code>APP_AGENT</code> configuration	20.7.0
AMCSEV-470	App Monitoring Cloud Services	<code>500 Internal Server Error</code> occurs while loading <b>Application Dashboard</b>	20.7.0
AMCSEV-512	App Monitoring Cloud Services	<b>User Getter Chain</b> not working correctly when <code>\.</code> operator is found	20.7.0
AMCSEV-518	App Monitoring Cloud Services	Deleting backend throws the error message <code>Invalid unresolved backend call id</code>	20.7.0

Key	Product	Summary	Version
AMCSEV-521	App Monitoring Cloud Services	Snapshots link broken in <b>Transaction Summary Statistics</b> UI with RSD V2 enabled	20.7.0
ANALYTIC S-11038	Applications Analytics	ADQL with substring function does not work for fields with hyphen	20.7.0
ANALYTIC S-11634	Applications Analytics	MIDC configuration incorrectly stores method chains from APM configurations	20.7.0
ANALYTIC S-12263	Applications Analytics	BO definition in draft state with duplicate names will loop forever in UI	20.7.0
ANALYTIC S-12441	Applications Analytics	Analytics: UI Fails To Handle Long Queries	20.7.0
ANALYTIC S-12571	Applications Analytics	Page Name filter in Add Business Journey dialog does not display by App Key and does not use ADQL	20.7.0
ANALYTIC S-12675	Applications Analytics	BO grid view API call should include an additional param <code>flowmapDetails</code> set to false	20.7.0
ANALYTIC S-12878	Applications Analytics	Selected options do not attach the correct options in <b>Add Business Journeys</b>	20.7.3

Key	Product	Summary	Version
ANLYTCS_ES-3415	Events Service	Cannot create Analytics metrics from an ADQL query that contains a comma	20.7.0
ANLYTCS_ES-3803	Events Service	Unable to see metric data on the Metric Browser, last run failed message is displayed	20.7.1
ANLYTCS_ES-3860	Events Service	The third-party <code>search-guard-ssl</code> library used by the Event Service is updated to v24.0 and kibana plugin is updated to v5.6.8.7	20.7.3
ANLYTCS_ES-3938	Events Service	Upgrade the Controller HTTP Client, HTTP Core, and AsyncHTTP Client library versions	20.7.3
APMPLAT-11934	APM	JMX <code>create metric</code> operation to auto-fill domain name in UI popup and JMX rule using the <code>create metric</code> operation have been fixed	4.5.17 20.7.0
APMPLAT-13274	APM	This event warning has been updated: "Automatic Service Proxy Discovery functionality has minimum agent version requirements for agents upstream of discovered proxies. Please check the documentation for details."	20.7.0
CLUSTER MON-1358	Cluster Monitoring	The <b>Pods</b> tab does not display the pod list after the re-registration of Cluster Agent	20.7.0
DBMON-6529	Database Visibility	The <code>Connect backends to Database Visibility to track health status</code> message is displayed every time, even when it is not required	20.7.0 20.4.3
DBMON-6628	Database Visibility	The <b>Network Dashboard</b> flowmap does not display the backend nodes of the database	20.6.0 20.7.0 20.4.2
DBMON-6601	Database Visibility	The <b>Events</b> tab for the MySQL collector displays the error, <code>Error processing InnoDB metrics for config</code>	20.7.0
DBMON-7141	Database Visibility	The third-party Apache xerces library used by the Database Agent is updated to 2.12.0	20.7.3
DIAGPLAT-807	APM	Snapshots do not get loaded, 500 Internal Server Error is displayed	20.7.1

Key	Product	Summary	Version
DIAGPLAT-809	APM	<code>ArrayIndexOutOfBoundsException</code> is displayed for RSD V2 enabled Controllers	20.7.1
DIAGPLAT-815	APM	Allow a list of GUIDs in <code>SnapshotListFilter</code> to view multiple GUIDs in the snapshot list view	20.7.3
DIAGPLAT-857	APM	No RSD found for filter error is displayed for the REST API call <code>/snapshot/getRequestSegmentDataV2?</code>	20.7.3
DIAGPLAT-892	APM	Correct the exit call mapper RSD v2	20.7.5
DIAGPLAT-915	APM	Correction of a query for the RSD v2	20.7.5
DIAGPLAT-927	APM	Service Endpoints do not filter corresponding transaction snapshots when you use the <code>getRequestSegmentsByFilterHandle</code> API	20.7.6
DIAGPLAT-943	APM	Correct the Service Endpoints filter for snapshots at the front-end layer	20.7.6
EUMPLAT-593	EUM	Archived Browser Snapshot does not open when the linked Transaction Snapshot does not exist	20.7.0
EUMPLAT-831	EUM	Account credential is not updated when hitting <code>renew-license-key</code> endpoint	20.7.0
JAVA-8020	APM	The third-party Apache xerces library used by the Java Agent is updated to 2.12.0	20.7.3
L4A-12097	Accounts	No audit log entry created for license changes	20.7.0
L4A-12444	Accounts	<code>NullPointerException</code> when using REST API to generate an access token for API Client	20.7.0
L4A-12447	Accounts	Encountered LDAP sync failure while updating user outside Hibernate session	20.7.0

Key	Product	Summary	Version
L4A-13981	Accounts	The third-party Jackson <code>databind</code> library used by <code>platform-rbac</code> is updated to 2.9.10.5	20.7.3
L4A-14453	Accounts	Upgrade the dropwizard to 20.7	20.7.5
L4A-14542	Accounts	LDAP group sync fails due to deleted groups being included in results	20.7.5
METADAT A-7833	APM	Anchor metrics for business transactions are getting lost causing issues in entity liveness	20.7.0
METADAT A-8834	Metric Browser	ADDs display correctly in the Metric Browser without a name conflict	20.7.0
METADAT A-9035	APM	Able to use native query to find Business Transaction IDs and their tier IDs from the database correctly	20.7.0
METADAT A-9171	APM	No snapshots are created because the <code>ADD</code> stacktrace purger takes more than 20 hours to complete and holds the read-only lock for the metadata table	20.7.0
METADAT A-9381	APM	MDS connection pools ignore the JDBC parameters in <code>domain.xml</code> including <code>useSSL</code> , which impacts the the AppDynamics GovAPM deployment	20.7.4
METADAT A-9393	APM	Upgrade the JAR <code>singularity-xml</code> to include Apache Xerces 2.12.0	20.7.5
METADAT A-9430	APM	Context is not reset in some dashboard flows post an exception	20.7.6
METRICSV C-5472	Metric Service	Reader client version was updated to version 2.12.0.5959 for Controller primary	20.7.0
METRICSV C-5776	Metric Service	The third-party PostgreSQL JDBC Driver library used by the Controller has been updated to version 4.2.13	20.7.1
METRICSV C-5972	Metric Service	Client connection pool saturated	20.7.4

Key	Product	Summary	Version
MQS-1100	Metric Query Service	Missing business transaction specific graphs in the <b>Expression Dashboard</b>	20.7.0
REPORTS-792	Reports	Scheduled reports not working after Controller upgrade if any invalid report definitions exist when <code>appserver</code> is restarted	20.7.3
REPORTS-796	Reports	NodeJS used by controller has been updated to v14.7.0	20.7.6
SERVER-8232	Server Visibility	Service availability check interval in the Controller UI now displays minutes instead of seconds	20.7.0
SERVER-8271	Server Visibility	Server metrics no longer disappear in the UI when scrolling	uic-20.7.0
SVCMON-883	APM	<code>WebService</code> type exit call is displayed as <code>ui:ms_TransactionExitPointType_null</code>	20.7.0
SVCMON-900	Controller UI	ResourceManager renders <code>package:key</code> strings when a key is not found instead of the locale strings, with a log message <code>package or string not found</code>	20.7.0
TMNT-580	Machine Agent	Unable to download the Machine Agent from <b>Getting Started Wizard - Servers</b>	20.7.0

## 20.6 Resolved and Known Issues

### Agent Resolved Issues

 Filter table: 

Key	Product	Summary	Version
ANALYTICS-4256	Analytics Agent	Analytics Agent inside Machine Agent does not drop PID file	20.7.0
ANALYTICS-12717	Analytics Agent	Recommended Data Collectors field name appears as <code>null</code>	20.7.0

Key	Product	Summary	V o
ANALYTICS-12739	Analytics Agent	Upgraded SCS Tool library	20
ANALYTICS-12740	Analytics Agent	Upgraded common-codec-1.14 library	20
DBMON-6873	Database Agent	The TOTAL_LOG_USED metrics value displayed on the Metric browser does not match with the value in Database server	20
DBMON-6074	Database Agent	The agent logs display <code>org.apache.http.NoHttpResponseException</code> when connecting to the Controller	20
DBMON-7037	Database Monitoring	The Database Agent fails to monitor Oracle version 11	20
DBMON-4943	Database Monitoring	<b>Execution Plan</b> is not displayed on the dashboard for MySQL Server 8	20
DBMON-6936	Database Monitoring	The hardware metrics are not displayed on the dashboard when enhanced monitoring is enabled on Microsoft SQL Server on AWS RDS	20
DOTNET-3457	.NET Agent	Integer and Boolean type of SQL data gatherer for Analytics is not working	20
DOTNET-3640	.NET Agent	Unable to configure apps running on .NET Core due to incorrect assembly reference	20
DOTNET-4410	.NET Agent	IIS Ping failure/hang in presence of AppDynamics Agent	20
DOTNET-4513	.NET Agent	Sensitive URL filters not working on HTTP exits	20
DOTNET-4574	.NET Agent	Agent Coordinator service throwing unhandled exception	20
DOTNET-4678	.NET Agent	Controller application name in config.xml is case sensitive	20

Key	Product	Summary	V o
DOTNET-47 10	.NET Agent	Service End Point is not identifying in .NET Agent version 20.5	20
DOTNET-47 17	.NET Agent	Exclude rules not working with .NET Agent 20.3.0 and later	20
DOTNET-47 23	.NET Agent	AppDynamics coordinator service no longer fails with a system management exception	20
DOTNET-47 45	.NET Agent	HTTP request collection fails for all transactions once a stalled transaction is identified	20
DOTNET-47 11	.NET Agent	Error in CLR Version shown in Controller UI	20
NODEJS-91	Node.js Agent	Agent capturing disabled snapshots with node-level properties crashes	20
NODEJS-103	Node.js Agent	MongoDB queries fail	20
SERVER-614 3	Machine Agent	No longer runs multiple <code>awk</code> commands resulting in system resource exhaustion	20
SERVER-809 1	Machine Agent	Registered Machine Agents no longer report metrics after default account access keys are changed	20
SERVER-820 7	Machine Agent	AIX Machine Agent should not have <code>JavaHardwareMonitor</code> enabled	20
SERVER-827 2	Machine Agent	AIX collector was reviewed and produces well-formed JSON to prevent script errors	20
SERVER-827 9	Machine Agent	Windows: OSHI reported processes now list multiple processes sharing the same name	20
SERVER-831 8	Machine Agent	<code>java.net.UnknownHostException: kubernetes.default.svc</code> exception is fixed	20

## Controller (SaaS/On-Premises) Resolved Issues

 Filter table: 

Key	Product	Summary	V	i
ALERT-53 49	Alert & Respond	When you open an Event UI and re-load the background UI, the refreshed background UI display is distorted	2	0
ALERT-57 31	Alert & Respond	Alert link in the email notification is broken and does not display the alert details, post Controller upgrade	2	0
ALERT-62 20	Alert & Respond	When you apply an alerting template, it gets stuck in a queue and is not applied	2	0
ALERT-63 55	Alert & Respond	Alerting Templates not showing in 20.6 Controllers	2	2
ALERT-63 77	Alert & Respond	Editing or deleting custom roles for Alerting Templates causes the error <code>CONFIG_ALERTING_TEMPLATES_PLANS doesn't exists</code>	2	2
ALERT-65 18	Alert & Respond	Unable to add dashboards to the admin role, error <code>permission action is not specified</code> due to missing <code>CONFIG_ACTION_SCHEDULE</code> permission	2	3
ALERT-69 14	Alert & Respond	Upgrade to Kafka Streams 2.3.1	2	9
AMCSEV-9 79	App Monitoring Cloud Services	Customization of <b>Automatic Leak Detection</b> settings transforms <code>APP_AGENT</code> configuration	2	1
ANALYTIC S-12073	Analytics Events Service (SaaS)	Inconsistency in counting business transaction segments for Analytics licensing	4	3
ANALYTIC S-12775	Analytics	BizOutcome Grid View API call should include the parameter <code>flowmapDetails</code> set to false	2	3
ANALYTIC S-12644	Analytics	Business Journeys are failing to load	2	3
ANLYTCS_ ES-3536	Events Service	Update the Events Service version in Controller to get library updates for Apache Kafka, Google Guava, and <code>snakeyaml</code>	2	3

Key	Product	Summary	V
ANLYTCS_ES-3859	Events Service	Remove the search-guard library from the Events Service	29
ANLYTCS_ES-3937	Events Service	Upgrade the Controller HTTP Client, HTTP Core, and AsyncHTTP Client library versions	29
BRUM-6022	Browser RUM	Grid columns appear when user sorts some EUM paginated grids	20
CLUSTER MON-1257	Cluster Monitoring	The <b>Succeeded</b> pod count includes the number of deleted pods on the <b>Pods</b> page	20
DBMON-6477	Database Monitoring	The queries that correlate with standalone collectors are not displayed when you drill-down <b>Business Transactions</b>	20
DBMON-6628	Database Monitoring	The <b>Network Dashboard</b> flowmap does not display the backend nodes of the database	20
DBMON-4676	Database Monitoring	Collectors display multiple nodes with the same name when creating a health rule	20
DBMON-6718	Database Monitoring	The <b>Connect backends to Database Visibility to track health status</b> message is displayed every time, even when it is not required	20
DBMON-5508	Database Monitoring	Sorting does not work as expected for the <b>Queries, Time in database, or CPU Usage(%)</b> metrics in the <b>Databases</b> page	20
DBMON-6948	Database Monitoring	Removed a singleton from an Enterprise JavaBean (EJB) to prevent a Database Monitoring thread pool saturation	23
DBMON-6983	Database Monitoring	After upgrading to 20.6, the Database Dashboard is missing the CPU and Network I/O graphs	23
DBMON-7142	Database Monitoring	Upgrade the Apache Xerces third-party library to 2.12.0	29
EUMPLAT-601	End User Monitoring	Update the Neustar map library to correct geodata	20

### Known Issues

There were no known issues in the 20.6 release.

Key	Product	Summary	V
EUMPLAT-776	End User Monitoring	Metrics missing intermittently due to an SocketTimeoutException when EUM tries to download metrics	20
JAVA-8019	Controller - APM	Update the Java Agent in the Controller	2019
L4A-12343	Accounts	Company admins getting "email address already a member" error while adding self service users to the account.	2020
L4A-14102	Accounts	Upgrade <code>platform-rbac</code> to 20.4.0-170	2019
L4A-14452	Accounts	Upgrade dropwizard to 20.6	2021
L4A-14541	Accounts	Customization of <b>Automatic Leak Detection</b> settings transforms <code>APP_AGENT</code> configuration	2021
METADAT A-9220	APM	No snapshots are created because the <code>ADD</code> stack trace purger takes more than 20 hours to complete and holds the read-only lock for the <code>metadata</code> table	2021
METADAT A-9399	APM	Upgrade the Apache Xerces third-party library in the Controller to 2.12.0	2021
METRICSV C-5901	Metric Service	Client connection pool saturated	2019
MQS-1131	Metric Query Service	<b>Server Component:tearDown</b> metrics not supported by new implementation of <b>Custom Dashboards</b>	2020
MQS-1163	Metric Query Service	Missing graphs specific to business transactions in the <b>Expression Dashboard</b>	2023
SERVER-6833	Server Visibility	Server page displays the total number of servers in the bottom right footer	2020
SERVER-7785	Server Visibility	Searching using the Hierarchy field is now possible	2020

Key	Product	Summary	V
SERVER-8 250	Server Visibility	Upgraded Apache <code>httpClient</code> to 5.0	20
SERVER-8 279	Server Visibility	The dashboard now displays all processes, even if they share the same name	20
WEBSRV-6	Apache Agent	Apache Agent injects ADRUM headers when Business Transaction correlation is disabled	20
WEBSRV-2 2	Apache Agent	Using <code>AppDynamicsLaunchProxy</code> directive with the <code>apachectl reload (graceful)</code> option does not delete a previous proxy task	20
WEBSRV-2 28	Apache Agent	The Webserver Agent version is displayed in place of the proxy version on the Controller UI	20

## 20.5 Resolved and Known Issues

### Agent Resolved Issues

 Filter table: 

Key	Product	Summary	V
ANALYTIC S-12608	Analytics Agent	Health Check commands failed due to deprecated method	20
CDM-5998	Android Agent	Server is returning null response headers for correlated requests	20
DBMON-65 08	Database Monitoring	After upgrading the Database Agent, the database collectors fail to retrieve data. Hence, the summary of each event on the <b>Events</b> page displays the <code>java.sql.SQLException: Connection property: format error: Property is 'v\$session.program error</code>	20
DBMON-68 05	Database Monitoring	For Mongo database, Database Agent includes its own monitoring query	20

Key	Product	Summary	Version
DLNATIVE-2544	Node.js Agent	Customer Transaction Naming based on HTTP headers and cookies is now enabled.	2023.11
DOTNET-4608	.NET Agent	.NET Agent Nuget package for Azure App Service does not support .NET Core 2.2+	2023.11
DOTNET-4465	.NET Agent	BT detection stopped working after upgrade to .NET core 3.1 version and disable MVC naming	2023.11
DOTNET-3654	.NET Agent	MVC Controller/Action BT naming with Linux full agent is not working with endpoint-based routing	2023.11
DOTNET-4063	.NET Agent	A request container already exists on the request error when implementing .NET Core Agent with oData	2023.11
DOTNET-4286	.NET Agent	ASP_DOTNET Core Interceptors reporting sporadic stalled/abandoned transaction	2023.11
DOTNET-4621	.NET Agent	Azure WebApp is crashing with agent version 20.4.1	2023.11
DOTNET-4442	.NET Agent	AccessViolationException crashes applications with .NET Agent 4.5.18.1	2023.11
IIB-256	IBM Integration Bus Agent	IIB Broker starts up with the instrumented Appdynamics Agent but crashes after sometime	2023.11
JAVA-6431	Java Agent	The correlation between client and server is not reported for Spring Boot RMI	2023.11
JAVA-6793	Java Agent	Applications using the SAP wily Agent along with Java Agent fail to start	2023.11
JAVA-6876	Java Agent	Akka Http Exit call does not report correct average response time	2023.11
JAVA-6993	Java Agent	Agent fails to collect logs through the Controller in the <b>Debug</b> level mode	2023.11

Key	Product	Summary	Version
JAVA-7005	Java Agent	A verification error results in the application failure to run the database calls	20
JAVA-7164	Java Agent	Java Agent throws the exception <code>java.lang.reflect.InaccessibleObjectException</code> with <code>jdk-11.0.6.jdk</code>	20
JAVA-7257	Java Agent	AppDynamics Opentracer library is incorrectly published to Maven	20
JAVA-7338	Java Agent	Java Agent reports insecure Deserialization Arbitrary CodeExecution due to httpclient-cache third party library vulnerability	20
JAVA-7368	Java Agent	ASM is updated to the latest version, 8.0	20
JAVA-7389	Java Agent	The following Apache commons packages have been upgraded: <ul style="list-style-type: none"> <li><code>apache-fileupload</code> to 1.4</li> <li><code>apache-commons-codec</code> and <code>httpclient</code> to 4.5.12</li> </ul>	20
JAVA-7471	Java Agent	Running an application server with Java Agent 20.4+ throws a <code>NullPointerException</code> in the Java Agent logs	20
NODEJS-83	Node.js Agent	Node.js Agent fails when variables pass through the Express middleware	20
NODEJS-89	Node.js Agent	Node.js Agent does not capture the cookie value for HTTP Data Collector configuration if the specific cookie is not first in the cookie header.	20
PHP-171	PHP Agent	PHP Agent causes a CLI process to crash during batch processing	20
PHP-822	PHP Agent	SQL query does not get masked when a comment is included in the actual query	20
PHP-852	PHP Agent	Agent shows increased Response Time for the socket connection with JAVA proxy	20
PHP-863	PHP Agent	PHP RPM files do not have the relevant version numbers	20

Key	Product	Summary	Version
PHP-891	PHP Agent	Wordpress and Drupal Frameworks are not detected in the downstream app when the downstream app receives a call from the upstream app using the <code>file_get_contents</code> function	20
SERVER-6824	Machine Agent	Machine Agent ignores IPv6 network interface if it is not available	20
SERVER-8182	Machine Agent	OSHI CPU utilization metric displays correctly when compared to WMI-based metrics	20
SERVER-8205	Machine Agent	The Windows collector script exits gracefully if it times out	20
SERVER-8273	Machine Agent	Support of runtime system properties for logging functionality	20
SERVER-8284	Machine Agent	Machine Agent for Linux no longer gets stuck on remote volumes command and continues to report metrics	20
WEBSRV-20	Apache Agent	Upgrade Java version for proxy to fulfil security audit requirements	20
WEBSRV-24	Apache Agent	Crash in the destruction of the exit call under heavy load	20
WEBSRV-63	Apache Agent	Apache aborts under high load and worker thread counts	20
WEBSRV-66	Apache Agent	Unix Socket Limitation in Apache Agent	20
WEBSRV-69	Apache Agent	Apache worker thread crashes within ZeroMQ calls	20

## Cloud Monitoring Resolved Issues

Filter table:

Key	Product	Summary	Version
CLUSTERMON-1576	Cluster Agent	Cluster Pods list is populating correctly for SaaS Controllers	U Q
SERVER-8264	Controller UI	When navigating to the cluster dashboard, the dashboard no longer displays a 500 Internal Server Error while fetching High Metric Retention minute-level data for more than 1 hour	U Q
SERVER-8271	Machine Agent	Server metrics no longer disappear in the UI when scrolling	U Q

### Controller (SaaS/On-Premises) Resolved Issues

Filter table:

Key	Product	Summary	Version
L4A-12476	Accounts	Internal users are not able to add an organization from "Manage Zendesk Organization" in the portal because it's not fetching the right parent company from Zendesk while trying to update.	2 Q

### Known Issues

#### Android Agent (Version 20.5.2)

Screenshot tiles are not properly sent to the collector and as a result, screenshots may not be rendered correctly in the collector.

### 20.4 Resolved and Known Issues

#### Agent Resolved Issues

Filter table:

### Controller (SaaS/On-Premises) Resolved Issues

Key	Product	Summary	V
CLUSTERMON-168	Cluster Agent	After Cluster Agent pod restarts, it does not preserve the configuration for monitored namespaces	2
CLUSTERMON-1164	Cluster Agent	ClusterAgent v4.5.16.780 on a K8s Cluster v1.11 crashes with <code>panic: runtime error: integer divide by zero</code>	2
CLUSTERMON-6628	Cluster Agent	Cluster Error Graph: Shows an incorrect number of Error Events	2
DBMON-6219	Database Monitoring	Database Agent cannot connect to Sybase Adaptive Server Enterprise 16.0 SP03	2
DBMON-6553	Database Monitoring	Database Agent does not capture details from Sybase 15.5 database.	2
DBMON-6303	Database Monitoring	The metric browser does not capture the buffer and the cache memory metrics for a Linux collector	2
DBMON-6460	Database Monitoring	Database Agent cannot resolve the different nodes of Oracle RAC by using LDAP authentication	2
DOTNET-4521	.NET Agent	Agent does not report Http Status codes in Asp.Net core in-process hosted app	2
DOTNET-4448	.NET Agent	Coordinator taking longer to start when set as <code>Earlstartservices</code>	2
DOTNET-4508	.NET Agent	.NET Core 3.1 based application is failing to instrument with .NET Agent version 20.3	2
BRUM-5979	JavaScript Agent	<code>node.type</code> not supported in IE11 and throws an error	2
JAVA-6355	Java Agent	Server Transaction times out and is abandoned in <code>projectreactor.io</code> based application with executor mode thread tracing enabled	2
JAVA-6560	Java Agent	Java Agent does not start when trying to instrument an application running with JDK1.6 due to log4j	2

Key	Product	Summary	V
JAVA-6965	Java Agent	In the dynamic agent attach scenario, the agent throws a <code>NullPointerException</code> and is unable to start due to a cached system property	2
JAVA-6617 and JAVA-7263	Java Agent	JMX attributes are marked as ignored if they are de-registered from the Mbean server. The attributes are not registered by the agent even if registered again with the Mbean server	2
JAVA-7139	Java Agent	Object Instance Tracking (OIT) does not work for all the Adopt JDK versions with both Hotspot and OpenJ9 distributions, the OIT works with AdoptJDK9-Hotspot	2
JAVA-7225	Java Agent	Fixed the <code>VerifyError</code> that is displayed on the application startup	2
JAVA-7279	Java Agent	Thread dump files captured are reported with a length of zero bytes	2
JAVA-7312	Java Agent	Upgrade the <code>commons-io:commons-io</code> library to 2.6 version	2
JAVA-7322	Java Agent	An exception is reported when Java Agent runs with an application that has JDK9+ and the application makes SQL calls	2
JAVA-7342	Java Agent	An error is reported in the agent when instrumenting apps deployed on jetty 6.x because the class <code>org.mortbay.jetty.Response#getHeaders</code> returns an enumeration object	2
SERVER-6167	Machine Agent	Machine Agent shows wrong IPV4 address for the network interface card	2

 Filter table: 

Key	Product	Summary	V
ALERT-2307	Alert & Respond	Import of Action API fails with a <code>Could not import Actions: Transaction marked for rollback error</code>	20
ALERT-4482	Alert & Respond	Action suppression with object scope set to <code>node</code> resets to scope <code>application</code> when saved	20

Key	Product	Summary	V
ALERT-6028	Alert & Respond	Remove Alerting Template RBAC constraints	20
ALERT-6366	Alert & Respond	Editing or deleting custom roles for Alerting Templates causes the <code>CONFIG_ALERTING_TEMPLATES_PLANS</code> doesn't exists error	20
AMCSEV-544	App Monitoring Cloud Services	Snapshots link broken in <b>Top Summary Lists</b> UI when RSD V2 is enabled	20
AMCSEV-941	App Monitoring Cloud Services	Customization of <b>Automatic Leak Detection</b> settings transforms <code>APP_AGENT</code> configuration	20
ANALYTICS-10310	Application Analytics	SQL data collectors are not enabled for Analytics when saved from new HTML screens	20
ANALYTICS-12272	Application Analytics	Cannot save Analytics searches if the search name exists in another account	20
ANALYTICS-12322	Application Analytics	No access to Mobile Code Issues event type on Analytics search screen	20
ANALYTICS-12397	Application Analytics	Option to create SQL Data collector from APM snapshot is missing from 4.5.10 Controller version	20
APMPLAT-11662	APM	Excessive logging of error messages has been fixed	20
APMPLAT-13124	APM	Filters for Transaction Snapshots has been fixed and is working correctly	20
CDM-6119	iOS	AppD sessions do not end post 10 mins inactivity as per the defined timeout, leading to long-running events	20
CDM-6198	Mobile RUM	<b>Crash Snapshot Details</b> dialog fails to open	20
CLUSTERMON-868	Controller	Some Cluster Agent metrics are listed even when there are not enough Server Visibility licenses	20

Key	Product	Summary	V o
CLUSTERMON-1177	Controller	High load on Controller when monitoring the deleted and the succeeded pods in a cluster	20
COGENG-110	Cognition Engine	Selecting the business transaction in filters does not change the list of violations	20
COGENG-438	Cognition Engine	Variables are not being replaced with values intermittently, within an email template for anomaly events	20
COGENG-703	Cognition Engine	UI does not invoke the API to plot the abstract syntax tree (AST) graph intermittently	20
DBMON-3906	Database Visibility	The hardware metrics are not captured on the <b>MS SQL Database</b> dashboard or on the <b>Metric Browser</b> when using a custom cluster	20
DBMON-6115	Database Visibility	The controller displays access key mismatch event when the database agents start with license rule access key	20
DBMON-6119	Database Visibility	The details pane on the <b>Queries Statistics Report</b> page is too small to view the data	20
DBMON-6307	Database Visibility	Remote DB Service with meta-info <code>jdbc db adodotnet</code> cannot be mapped to a database collector	20
DBMON-6529	Database Visibility	The <code>Connect</code> backends to Database Visibility to track health <code>status</code> message is displayed every time, even when it is not required	20
DBMON-6628, DBMON-6641	Controller	Missing the database nodes in the <b>Network Dashboard</b> flow map	20 20
DIAGPLAT-58	Controller	Optimizing <code>EventManagerBean.getEventDetailsInBatch</code> to prevent Internal Service and Event details errors	20
DIAGPLAT-425	Controller	Receiving 500 internal errors when attempting to view snapshots in an application	20
L4A-10645	Authentication	SAML encryption key is updated when a role is deleted	20
L4A-11010	Authentication	LDAP TLS client contexts should default to the newest TLS version supported by the Controller's bundled JRE	20

Key	Product	Summary	V
L4A-11361	Authentication	Nested group functionality not working	20
L4A-11846	Authentication	Reset password button is disabled	20
L4A-12066	Authentication	Optimizing LDAP sync	20
L4A-13322	Authentication	Unable to set an expiry date for account license	20
L4A-14540	Authentication	LDAP group sync fails due to deleted groups being included in results	20
METADATA-8 112	Dashboards and Reports	Show error in Controller UI when a user doesn't have permission to create dashboards	20
METADATA-8 228	Controller - Platform	The <code>CustomDashboardImportExportServlet</code> no longer writes a reply to the client before committing the transaction	20
METADATA-9 221	APM	No snapshots are created because the ADD stacktrace purger takes more than 20 hours to complete and holds the read-only lock for the metadata table	20
METRICSVCS- 5902	Metric Service	The client connection pool gets saturated as the connections to the Controller are not cleared after a task is performed	20
MQS-1028	Metadata	Expression widget with business transactions with <code>MetricHierarchy</code> shows no data	20
MQS-1203	Metric Query Service	Availability metric appears to be different in MySQL when querying for 10 minutes after the 10 minute boundary	20 0
MQS-1201	Metric Query Service	MQDC may not return the right metric data for a given time range	20 0
MQS-1207	Metric Query Service	Fix availability is below 100% for high retention enabled case	20 0
MQS-1209	Metric Query Service	Availability metric appears less than 100% even when it is 100%	20 0
REPORTS-591	Reports Service	Application Health Reports show <code>APPDYNAMICS_INTERNAL_DIAGNOSTICS</code> events	20

Key	Product	Summary	V o
SERVER-6833	Controller UI	Server page displays total number of servers in the bottom right footer	20
SERVER-7505	Controller - Machine Agent	AppDynamics Agents UI displays <code>java.lang.NullPointerException</code> error for Machine Agents	20
SERVER-7725	Controller - Machine Agent	Machine Agent reports data continuously, but health rules on those metrics remain in a <code>Cancelled</code> status	20
SERVER-7855	Controller - Machine Agent	Metric hierarchy REST API returns empty response for <code>Root *</code> in hierarchy path	20
SERVER-8249	Controller UI	OS icons are not displaying properly on on-premises Controller UI	20 20
SVCMON-639	Controller	Creating a business transaction group causes a <code>NullPointerException</code>	20
SYNTH-5024	Synthetic Browser Monitoring	Synthetic Private Agent license usage for SaaS customers is incorrect	20
SYNTH-5027	Synthetic Browser Monitoring	500 Internal Server Error caused by null pointer exception	20
UIPLATF-9947	Custom Dashboards	Custom Time Range seems to be broken	20
UIPLATF-6208	Custom Dashboards	Absolute Layout: Widgets aren't saved correctly after creation	20
USERIMPACT-258	Controller	Read-only users cannot access the <b>Experience Journey Maps</b> UI	20

## Known Issues

### End User Monitoring

License service makes individual accounts' usage and term calls to the Events Service.

## 20.3 Resolved and Known Issues

### Agent Resolved Issues

 Filter table: 

Key	Product	Summary	V o
ANALYTICS-12329	Analytics Agent	Denial of Service vulnerability found in Jackson libraries	20
ANALYTICS-12448	Java Agent	Node CPU spikes when running in Agentless Analytics mode after hitting Transaction Analytics license limit	20
CDM-5998	Android Agent	Add null protection while processing null response headers from the server	20
DBMON-6131	Database Monitoring	The <code>ASC</code> keyword in a custom metric query causes a query validation error	20
DBMON-6004	Database Monitoring	The Metric Browser displays incorrect hardware memory usage when the hardware monitoring for MS SQL server is disabled	20
DBMON-4515	Database Monitoring	DB Agent does not capture the cursor metrics from Mongo DB	20
DBMON-5628	Database Monitoring	The Metric Browser does not capture the buffer and the cache memory metrics for a Linux collector	20
DOTNET-4309	.NET Agent	MSMQ backends resolving to downstream tiers	20
DOTNET-4000	.NET Agent	.NET Agent reports MSMQ Entrypoint as an exit call	20
DOTNET-4242	.NET Agent	.NET Agent throws excessive errors on ADO.NET exit calls	20
DOTNET-3536	.NET Agent	.NET Agent does not report WCF transactions if completion of asynchronous tasks result in an exception	20

Key	Product	Summary	V o
DOTNET-44 52	.NET Agent	Applications crash in HTTP data collection due to changes in .NET Core 3.0.3 and 3.1.2	20
DOTNET-45 24	.NET Agent	Agent is logging for <code>Netviz Controller</code> is not supported even when customer is not using Network Agent	20
DOTNET-42 30	.NET Agent	POCO instrumentation crashing instrumented application	20
IIB-228	IBM Integration Bus Agent	The App Agent Version column lists the release number of the agent as <code>0.0.0.0</code> in place of <code>4.5.5.0</code>	20
IIB-36	IBM Integration Bus Agent	Agent initialization is extremely slow when instrumenting IIB9	20
JAVA-6554	Java Agent	Length of a string is limited to only 50 characters, when a URI is split using custom exit call naming rule with method parameters	20
JAVA-6631	Java Agent	Snapshot data added using the Agent API that is omitted from snapshots	20
JAVA-6923	Java Agent	E2E latency column missing for snapshots in the executor mode	20
JAVA-6975	Java Agent	Defer bytecode transformation logging after class loader lock is released	20
JAVA-7010	Java Agent	Java Agent API snapshot data collectors do not report statistics after the agent upgrade from 4.5.13 to 4.5.18	20
JAVA-7031	Java Agent	BT level error statistics exclude HTTP errors	20
JAVA-7091	Java Agent	Enabling EUM for Java Agent 4.5.18 for the <code>undertow-io</code> throws an error	20
JAVA-7160	Java Agent	False stall transactions reported with webflux and Reactor netty	20
JSNODE-19	Node.js Agent	<code>jackson -databind</code> library upgrade for the Node.js Agent	20
NETWORK-6 054	Network Agent	Network Agent installed on Windows installs the NPCAP loopback adapter that can sometimes affect user traffic	20

ALERT-4489	Health Rules	<code>OBJECT_UPDATED</code> events show old values as <code>0</code> when a condition is updated in health rule	2	0
ALERT-4581	Health Rules	X of Y health rule based on wildcard custom metrics does not work when one metric is not reported	2	0
ALERT-4919	Alerting	Logs from alerts is noisy and affecting the connection to node	2	0
ALERT-5753	Alerting	Alert/event links do not open and display an error, post controller upgrade	2	2
ALERT-5800	Alerting	Upgrade the Java library <code>C3P0</code> to version <code>0.9.5.2</code>	2	3
ALERT-6064	Alerting	Upgraded the <code>C3P0</code> library in the Controller to version <code>0.9.5.5</code>	2	7
ALERT-6489	Alerting	Hibernate session cache becomes excessively large when the event reactor index is refreshed	2	1
ALERT-6503	Alerting	Enable writing to digest tables based on flags	2	1
AMCSEV-145	Browser RUM	ZDT Controller restarts trigger re-transformation	2	0
AMCSEV-45	App Monitoring Cloud Services	Intermediate page is loaded briefly when user double-clicks an exception	2	0

Key	Product	Summary	V
AMCSEV-47	App Monitoring Cloud Services	Process snapshots are not filtered by a custom time range	2023-0
AMCSEV-433	App Monitoring Cloud Services	Search option is not available the first time in <b>Transaction Snapshots</b> and filter options will not display	2023-0
AMCSEV-942	App Monitoring Cloud Services	Customization of <b>Automatic Leak Detection</b> settings transforms <code>APP_AGENT</code> configuration	2023-1
ANALYTICS-12426	Analytics	SQL data collectors are not enabled for analytics when saved from new HTML screens	2023-2
ANALYTICS-12489	Analytics	Option to create SQL Data collector from APM snapshot is missing from 4.5.10 Controller version	2023-2
ANALYTICS-12485	Analytics	Cannot collect SQL parameters from Analytics when you use the new HTML screens	2023-2
ANALYTICS-12121	Analytics	Page Name control in Browser Request Business Journey milestone unresponsive	2023-0
ANALYTICS-12157	Analytics	XLM export does not have values in daily reporting.	2023-0
ANALYTICS-12183	Analytics	Cannot remove Business transactions from Transaction Analytics UI	2023-0
ANALYTICS-12202	Analytics	Table widget is missing progress bar and toolbar	2023-0
ANALYTICS-12273	Analytics	Missing widget titles in Analytics Search Visualization	2023-0
ANALYTICS-12519	Analytics	Time series chart won't remove data series which exists in the previous page but disappears in new response	2023-4
ANLYTCS_ES-3484	Analytics	Client connection pool gets corrupted and cannot recover, requiring Controller restart	2023-9

Key	Product	Summary	V
ANLYTCS_ES-3635	Analytics	Recreation of the client when the connection pool is corrupted	2 1
APMPLAT-12551	APM	Error graph shows correct information for time range greater than four hours	2 0
APMPLAT-13084	APM	Libagent-based agents reporting version as 0.0.0.0 are unable to register with the Controller	2 3
APMPLAT-13154	APM	Customer time range selection is incorrect	2 0
APMPLAT-13154	APM	Unable to filter the transaction snapshots list using the filter option in the UI	2 2
BRUM-5926	Browser RUM	<b>Page Limit Ajax Request Warning</b> documentation link does not work	2 0
CDM-5729	Mobile RUM	Health rule violation summaries are not rendered when the health rule name contains HTML/XML elements	2 0
CDM-5818	Mobile RUM	Health rule violation descriptions display incorrect health rule name containing HTML/XML elements	2 0
CLUSTERMON-74	Cluster Monitoring	Metrics are now available when the time range filter is set to 8 days	2 0
CLUSTERMON-866, CLUSTERMON-34, CLUSTERMON-342	Cluster Monitoring	Cluster Agent should respect pod limit set by the Controller	2 0
CLUSTERMON-1137	Cluster Monitoring	Incoming Cluster Agent requests are directed to the wrong threadpool	2 1
CLUSTERMON-1173	Cluster Monitoring	AppDynamics Metric Browser stops responding when cluster monitoring is enabled and a large number of nodes are registered	2 2

Key	Product	Summary	V
CLUSTERMON-1 183	Cluster Monitoring	Default SIM health rules are being evaluated for clusters and pods leading to incorrect evaluation and health rule violations as depicted in the UI	2 2
CLUSTERMON-1 199	Cluster Monitoring	Normal pods count is negative	2 3
CUSTOMDASH-9 325	Custom Dashboards	Custom widget title is no longer displaying after upgrading to 4.5.16	2 0
DBMON-6193	Database Monitoring	None of the DB collectors are reporting after Controller upgrade to 4.5.17	2 0
DBMON-6672	Database Monitoring	Removed the DBMon Service from the Controller	2 7
DBMON-6694	Database Monitoring	Upgrade the <code>mysql-connector-java:8.0.13</code> library for the DBMon Service to <code>8.0.20</code>	2 7
DIAGPLAT-516	Health Rules	<b>Event Summary</b> page shows exception when accessed via link from email	2 0
DIAGPLAT-554	Events	Several ID blockers are skipped during the activation of the Controller	2 3
DIAGPLAT-556	Events	<code>Invalid Account: Principal</code> error is displayed when you load the events, post controller upgrade	2 2
DIAGPLAT-664	Events	Upgrade the H2 database engine library in the Controller	2 7
DIAGPLAT-667	Events	Upgrade the Apache Commons library <code>beanutil:1.8.3</code> in the Controller to <code>1.9.4</code>	2 7
DIAGPLAT-681	Events	Upgrade the <code>mysql-connector-java</code> library in the Controller to <code>8.0.20</code>	2 7
EUMPLAT-811, EUMPLAT-823	Controller - EUM	Upgrade the library <code>jackson-databind</code> to <code>2.11.0</code> , and the libraries <code>dropwizard-core</code> and <code>dropwizard-validation</code> to <code>1.3.23</code> in the EUM client for the Controller	2 7

Key	Product	Summary	V
JAVA-7529	Controller	Update the Java Agent in the Controller to 20.4	2 7
L4A-7824	Accounts	New permissions added in a later release are not saved when added to existing roles	2 0
L4A-9790	RBAC	Cannot assign roles to the LDAP users when user attribute is updated on LDAP	2 0
L4A-9822	Accounts	Read-only user can access admin pages and see some admin entities	2 0
L4A-10035	Accounts	Error saving LDAP configuration if nested group attribute is an empty string in DB	2 0
L4A-10463	Accounts	User update operation leads to extra references in <code>AuthEntityHelper.CacheRepository</code>	2 0
L4A-12140	Admin Console	Optimize account listing for the Controller Admin Console	2 5
L4A-12311	Accounts	Email alerts are not generated as the notification configuration for AppDynamics account moves to invalid state	2 6
L4A-12292	Authentication	Including SAML config in Account DTO causes performance problems on controllers with many accounts	2 6
L4A-12065	Authentication	LDAP sync takes a lot of time in case there are more than 1,000 users with multiple groups assigned	2 6
L4A-12508	Authentication	LDAP sync fails while updating user outside of session	2 7
L4A-12712	Authentication	Update the OneLogin SAML version to 2.5.0 in the Controller	2 7
L4A-13321	Authentication	Unable to set an expiry date for the account license	2 1

Key	Product	Summary	V i
L4A-13321	Authentication	LDAP group sync fails due to deleted groups being included in results	2 1
METADATA-7800	APM	Flowmap view and Detail screen no longer show mismatched data	2 0
METADATA-7922	Accounts	The accounts to application cache is now consistent with applications cache and database	2 0
METADATA-7956	APM	Server Health Status now shows correctly when the same dashboard is exported and imported	2 0
METADATA-7980	APM	BT liveness data now loads correctly from Blitz	2 0
METADATA-8305	Accounts	Admins can now enable the HSTS header as a setting	2 0
METADATA-8433	Dashboards	Metric Expression corrected in Custom dashboard	2 0
METADATA-8903	Metrics	Downgrade metric ID log level to debug to 20.3.0	2 3
METADATA-8999	Metrics	Upgraded the libraries <code>netty</code> to version 4.1.48.Final and <code>lettuce-core</code> to 5.1.8.RELEASE	2 5
METADATA-9120	Metrics	Upgrade the libraries <code>apache-tomcat</code> to 9.0.31, <code>dropwizard-validation</code> to 1.3.2, and <code>mysql-connector-java</code> to 8.0.20 for the Controller	2 7
METADATA-9149	Metrics	Upgrade the <code>mysql-connector</code> Java library to 8.0.20 in modules of the Controller	2 7
METADATA-9168	Metrics	Upgrade the <code>dom4j</code> library to 2.1.3 in the GlassFish application server of the Controller	2 7
MQS-1032	Metric Query Service	No data available when the custom time range is less than 30 minutes	2 0

Key	Product	Summary	V
MQS-1161	Metric Query Service	Split an insert statement for the Metric Hierarchy Store into smaller partitions	2 9
NETWORK-5276	Network Visibility	Error message needs to improve when user does not have permission to view Network agents tab	2 0
PLATCPS-14052	Controller	jsessionId no longer appears in URL and server log	2 0
REPORTS-715	Reports	Audit Report shows inconsistency when data is displayed in PDF and CSV formats	2 0
REPORTS-738	Reports	Unable to save the custom time range using the schedule report calendar fields	2 2
REPORTS-754	Reports	Remove older unused version of the AppDynamics Node.js Agent from the Reports Service bundle	2 7
SERVER-7017	Server Visibility	Server Visibility health rules work correctly with .NET compatible-mode enabled	2 0
SERVER-8254	Server Visibility	Upgrade the Apache <code>commons-httpclient</code> library used by the Controller to version 5.0	2 7
SVCMON-552	APM	Divide by Zero exception creates 500 error in Controller flowmap	2 0
SVCMON-597	APM	Slow application dashboard flowmap	2 0
SERVER-7017	Server Visibility	SIM API not working for .NET agent in compatibility mode	2 0
SERVER-7345	Server Visibility	ID column in SIM table changed from int type to BigInt type	2 0
SYNTH-4791	Browser Synthetic Monitoring	Business Transactions Missing Scroll Bar	2 0

Key	Product	Summary	Version
SYNTH-5403	Browser Synthetic Monitoring	Synthetic Private Agent license usage for SaaS customers is incorrect	20.2.0
TMNT-27	APM	Functionality to set default landing screen is not working	20.2.0

## 20.2 Resolved and Known Issues

### Controller Resolved Issues

 Filter table: 

Key	Summary	Version	Product
L4A-11170	The company admins are unable to disable users.	20.2.0	Accounts

### Agent Resolved Issues

 Filter table: 

Key	Summary	Version	Product
BRUM-5889	<code>wrap()</code> changes the context of Event Listener while calling <code>pushApplyPopFromCausalityChain()</code>	20.2.0	JavaScript Agent
CDM-5873	Fixed a bug in the iOS dSYM upload script that would have caused an error when attempting to set the correct timestamp for the uploaded metadata	20.2.0	iOS Agent

### Known Issues

There were no known issues in the 20.2 release.

## Past Agent Releases

This page lists the agent enhancements for all calendar-versioned agent releases.

### Analytics Agent

#### Version 23.10.0 - October 31, 2023

This release includes:

- Upgrades to the following third-party component.

Component	Previous Version	Upgraded Version
Azul JRE	8.70(8u372)	8.72(8u382)

- Log Analytics support for the following operating systems:
  - IBM AIX (Advanced Interactive eXecutive) 7.2.x
  - HP-UX (Unix) 11.31.x

See [Collect Log Analytics Data](#).

### Version 23.9.0 - September 15, 2023

This release replaces the deprecated `javax.el 3.0.0` library with `jakarta.el 3.0.4`.

### Version 23.8.0 - August 23, 2023

This release upgrades the following library:

Library	Previous Version	Upgraded Version
<code>netty-all</code>	4.1.9.Final	4.9.95.Final

### Version 23.7.0 - July 26, 2023

This release:

- Includes `dropwizard metrics-code` version 4.2.17
- Removes dependency from `com.codahale metrics-code`
- Includes upgrades to the following libraries:

Library	Previous Version	Upgraded Version
Azure JRE/OpenJDK	8.68 (8u362-b09)	8.70
<code>com.google.guava:guava</code>	30.0-jre	32.1.1-jre
<code>jackson-databind</code>	2.15.0	2.15.2
<code>org.eclipse.jetty</code>	9.4.46	9.4.51

**i** The `org.eclipse.jetty` library was upgraded to version 9.4.51 in Analytics Agent 23.5.0. However, the `io.dropwizard-core` library was still utilizing `org.eclipse.jetty` version 9.4.46. From Analytics Agent 23.7.0, even the `io.dropwizard-core` library utilizes `org.eclipse.jetty` version 9.4.51.

### Version 23.6.0 - June 21, 2023

This release includes upgrades to the following libraries:

Library	Previous Version	Upgraded Version
<code>org.apache.bcel</code>	6.5.0	6.7.0
<code>com.fasterxml.jackson.core</code>	2.10.5	2.15.0

### Version 23.5.0 - May 24, 2023

This release includes upgrades to the following libraries:

Library	Previous Version	Upgraded Version
org.eclipse.jetty	9.4.48	9.4.51
org.jsons	20200518, 20160212	20230227

**i** The `io.dropwizard-core` library still utilizes `org.eclipse.jetty` version 9.4.46.

### Version 23.4.0 - April 21, 2023

This release includes:

- SnakeYAML 2.0
- Bug fixes. See ANALYTICS-15100 in [Agent Resolved Issues](#).

### Version 23.3.0 - March 17, 2023

This release removes the `aws-java-sdk-s3` transitive dependency from the Analytics Agent.

### Version 23.2.0 - February 21, 2023

This release includes upgrades to the following third-party components:

Component	Previous Version	Upgraded Version
Apache Xerces2J	2.12.10	2.12.2
Netty Project	4.1.78.Final	4.1.87.Final
Azure JRE/OpenJDK	8.66 (8u352-b08)	8.68 (8u362-b09)

### Version 23.1.0 - January 29, 2023

This release includes upgrades to the following libraries:

Library	Previous Version	Upgraded Version
jackson-databind	2.13.2.2	2.14.1
snakeYAML	1.26	1.33

## Android Agent

### Version 23.10.0

There was no release for 23.10.0.

### Version 23.9.0

There was no release for 23.9.0.

### Version 23.8.0

There was no release for 23.8.0.

### Version 23.7.1 - August 04, 2023

This release updates the EULA file.

### Version 23.7.2 - October 31, 2023

This release includes minor bug fixes.

### Version 23.6.0 - June 16, 2023

This release includes bug fixes. See CDM-9444 in [Agent Resolved Issues](#).

### Version 23.5.0

There was no release for 23.5.0.

### Version 23.4.1 - April 27, 2023

This release includes:

- Support for Android Gradle Plugin (AGP) version 8.0.
- Support for AndroidX Fragments.
- Replacing the two configuration options: `enabledForDebugBuilds` and `enabledForReleaseBuilds` with these three new configuration options: `disabledForBuildTypes`, `disabledForProductFlavors` and `disabledForVariants`. See [Enable/Disable Instrumentation for Build Types](#).

### Version 23.3.0

There was no release for 23.3.0.

### Version 23.2.1 - February 23, 2023

This release includes:

- Support for the `clearAllUserData` API. See [Customize the Android Instrumentation](#).
- Renovation of Android `proguard` code to `symbolMappingFileUpload`. See [Automatically Upload Mapping Files](#).

### Version 23.1.0

There was no release for 23.1.0.

## Apache Web Server Agent

### Version 23.10.0

There was no release for 23.10.0.

---

**Version 23.9.0**

There was no release for 23.9.0.

**Version 23.8.0 - August 30, 2023**

This release includes:

- Support for `glibc`  $\geq$  2.34.
- Support for RHEL9.
- Updates to the third-party libraries.

See [Supported Apache Web Servers](#).

**Version 23.7.3 - July 21, 2023**

This release includes support for the IBM AIX operating system. See [Supported Apache Web Servers](#).

**Version 23.6.0 - June 14, 2023**

This release includes support for Alpine Linux 3.17.0. See [Supported Apache Web Servers](#).

**Version 23.5.0**

There was no release for 23.5.0.

**Version 23.4.0**

There was no release for 23.4.0.

**Version 23.3.0**

There was no release for 23.3.0.

**Version 23.2.0**

There was no release for 23.2.0.

**Version 23.1.0**

There was no release for 23.1.0.

**AppDynamics AWS Lambda Extension for Serverless APM****Version 23.10.0**

There was no release for 23.10.0.

**Version 23.9.0**

There was no release for 23.9.0.

**Version 23.8.0**

There was no release for 23.8.0.

**Version 23.7.0**

There was no release for 23.7.0.

---

## Version 23.6.0 (ARN 22) - June 26, 2023

This release includes support for Python 3.9 and includes bug fixes. Select [ARN 22](#) which corresponds to:

- Python (PyPI) [23.6.482](#).
- Node (npm) [23.6.443](#).

### Version 23.5.0

There was no release for 23.5.0.

### Version 23.4.0

There was no release for 23.4.0.

### Version 23.3.0

There was no release for 23.3.0.

### Version 23.2.0

There was no release for 23.2.0.

### Version 23.1.0

There was no release for 23.1.0.

## C/C++ SDK

### Version 23.10.0

There was no release for 23.10.0.

### Version 23.9.0

There was no release for 23.9.0.

## Version 23.8.0 - August 11, 2023

OpenSSL 1.1 is upgraded to version 3.0 in this release.

### Version 23.7.0

There was no release for 23.7.0.

## Version 23.6.0 - July 04, 2023

This release includes Alpine Linux builds along with AppDynamics C/C++ SDK upgrade from version 23.5.3-613 to 23.6.0-622.

## Version 23.5.3 - June 10, 2023

This release includes various library upgrades along with AppDynamics C/C++ SDK upgrade from version 22.7.2-515 to 23.5.3-613.

### Version 23.4.0

There was no release for 23.4.0.

### Version 23.3.0

There was no release for 23.3.0.

---

## Version 23.2.0

There was no release for 23.2.0.

## Version 23.1.0

There was no release for 23.1.0.

## Cluster Agent

### Version 23.10.0

There was no release for 23.10.0.

### Version 23.9.0 - September 26, 2023

This release includes the following enhancements:

- Cluster Agent uses container ID to correlate APM entities with Infrastructure entities. For Kubernetes versions  $\geq 1.25$ , you require to configure the auto-instrumentation configuration file because from Kubernetes version 1.25 onwards, container runtime uses cgroup v2 API. See [Correlate Application Containers with App Agents \(For Kubernetes version 1.25\)](#).
- You can use the instructions mentioned at [Install Cluster Agent with OpenShift Operator Bundle](#) and [Install Infrastructure Visibility with OpenShift OperatorHub Bundle](#) to install Cluster Agent and Infrastructure Visibility respectively with the OpenShift OperatorHub bundle.

### Version 23.8.1 - September 13, 2023

The AppDynamics Operator bundle is published to the Redhat OperatorHub.

### Version 23.8.0 - August 23, 2023

This release includes the following enhancements:

- For Kubernetes  $\geq 1.25$ , Cluster Agent supports the pod security admission at the namespace level when deploying the Infrastructure Visibility pod. For details see step 5 of [Install Procedure](#).
- The `alpineInitContainerImage` is introduced in the `imageInfo` parameter to use the Alpine image for the .NET init container auto-instrumentation. See, `imageInfo` under [InstrumentationRule Properties](#).
- You can now use the Alpine ARM-based AppDynamics Operator and Cluster Agent Images. See [Cluster Agent Bundle Files](#).
- For Redhat OperatorHub, the Image field of the AppDynamics Openshift OperatorHub bundle will point to the AppDynamics Operator RedHat container image instead of dockerhub.

### Version 23.7.0 - July 28, 2023

This release includes the following enhancements:

- The `enableInstallationReport` parameter can be used to view the summarized installation report. See [Default Auto Instrumentation Properties](#).
- Support for RKE2 1.26
- Cluster Agent is upgraded to Go language 1.20.6.

### Version 23.6.0 - June 27, 2023

The Cluster Agent Helm chart is updated to version 1.14.0.

### Version 23.5.0 - May 25, 2023

This release includes bug fixes and the following enhancements:

- The overall memory utilization of Cluster Agent is improved.
- Cluster Agent memory usage is optimized for the churn frequency of creating and deleting pods. The memory usage is not high if the churn frequency is  $\geq 3$  minutes.  
For example, If the churn frequency is 50 pods per minute (creating 50 pods and deleting those pods after a minute) in a

---

cluster with 500 pods, then memory usage keeps increasing. However, if the frequency  $\geq 3$  minutes, then the usage is constant.

### Version 23.4.0 - April 25, 2023

This release includes the following enhancements:

- You can now configure the security context parameters for auto instrumentation. See [Auto Instrumentation Configuration](#).
- The Cluster Agent and AppDynamics operator images are updated with the latest version of Go language. If you require to use Redhat-based Cluster Agent or AppDynamics Operator, you need to adjust your firewall settings as suggested by Redhat. Therefore, you require to allow outbound connections to the following hostnames:
  - [cdn.quay.io](#)
  - [cdn01.quay.io](#)
  - [cdn02.quay.io](#)
  - [cdn03.quay.io](#)
- You can now specify the priorityClass in the Infraviz and the Cluster Agent configuration files. See [Cluster Agent YAML File Configuration Reference](#) and [Install Infrastructure Visibility with Helm Charts](#).

### Version 23.3.0

There was no release for 23.3.0.

### Version 23.2.0 - February 27, 2023

This release includes:

- Auto-instrumentation of an application using multiple Cluster Agents with different namespaces within the same cluster. Hence, the deploymentMode configuration is no longer required during the Cluster Agent installation using Helm.
- From this release onwards, support to build the Cluster Agent RHEL Based Container Image without having any RedHat Subscription.
- From this release onwards, continuation of publishing the RHEL images of Cluster Agent and the AppDynamics Operator on the RedHat Portal.
- The additional support to install AppDynamics Operator from [OpenShift OperatorHub](#) for OpenShift Cluster.

### Version 23.1.0

There was no release for 23.1.0.

### Cordova Plugin

#### Version 23.10.0

There was no release for 23.10.0.

#### Version 23.9.0

There was no release for 23.9.0.

#### Version 23.8.0

There was no release for 23.8.0.

#### Version 23.7.0

There was no release for 23.7.0.

#### Version 23.6.0

There was no release for 23.6.0.

### Version 23.5.0

There was no release for 23.5.0.

### Version 23.4.0

There was no release for 23.4.0.

### Version 23.3.0

There was no release for 23.3.0.

### Version 23.2.0

There was no release for 23.2.0.

### Version 23.1.0

There was no release for 23.1.0.

## Database Agent

### Version 23.10.0

There was no release for 23.10.0.

### Version 23.9.0 - October 04, 2023

This release adds the `SQL Re-Compilations/sec Percent` Microsoft SQL Server metric. See [Microsoft SQL Server Metrics](#).

### Version 23.8.0 - August 29, 2023

This release adds the following database events. You can configure policies for these events.

- `FAILOVER`
- `DB_CONNECTION_DOWN`
- `DB_CONNECTION_UP`
- `REPLICATION_FAILURE`

See

[Database Events Reference](#)

.

### Version 23.7.0

There was no release for 23.7.0.

### Version 23.6.0 - June 28, 2023

This release supports the Azure Active Directory password-based authentication method to monitor the following databases:

- Azure SQL Database and Azure SQL Managed Instance
- PostgreSQL

See:

- [Configure Microsoft SQL Server Collectors](#)
  - [Configure PostgreSQL Collectors](#)
-

---

### Version 23.5.0 - May 15, 2023

This release includes bug fixes and the following enhancement:

You can now configure the frequency of collecting the database size statistics for each Postgres SQL collector. See [Database Agent Settings for Monitoring Database](#).

### Version 23.4.0

There was no release for 23.4.0.

### Version 23.3.0

There was no release for 23.3.0.

### Version 23.2.0 - February 24, 2023

This release includes bug fixes.

### Version 23.1.0 - January 4, 2023

This release includes bug fixes.

## Flutter Agent

### Version 23.10.0

There was no release for 23.10.0.

### Version 23.9.0 - September 11, 2023

Flutter Agent is now compatible with Dio 5.1.0.

### Version 23.8.0

There was no release for 23.8.0.

### Version 23.7.0

There was no release for 23.7.0.

### Version 23.6.0

There was no release for 23.6.0.

### Version 23.5.0

There was no release for 23.5.0.

### Version 23.4.0

There was no release for 23.4.0.

### Version 23.3.0 - March 20, 2023

This release includes:

- Promoting the Flutter package from beta.
- Disabling native WebView instrumentation, which was enabled by default.
- Fixing `UniqueKey()` method not found with older Flutter projects, native errors not being reported correctly, and incorrect `LogLevel` values on Android.

**Version 23.2.0**

There was no release for 23.2.0.

**Version 23.1.0**

There was no release for 23.1.0.

**Go SDK****Version 23.10.0**

There was no release for 23.10.0.

**Version 23.9.0**

There was no release for 23.9.0.

**Version 23.8.0**

There was no release for 23.8.0.

**Version 23.7.0**

There was no release for 23.7.0.

**Version 23.6.0**

There was no release for 23.6.0.

**Version 23.5.0**

There was no release for 23.5.0.

**Version 23.4.0**

There was no release for 23.4.0.

**Version 23.3.0**

There was no release for 23.3.0.

**Version 23.2.0**

There was no release for 23.2.0.

**Version 23.1.0**

There was no release for 23.1.0.

**IBM Integration Bus Agent****Version 23.10.0**

There was no release for 23.10.0.

**Version 23.9.0 - September 05, 2023**

This release includes:

- Minor bug fixes and enhancements.
- Updates to the internal libraries.

**Version 23.8.0**

There was no release for 23.8.0.

**Version 23.7.0**

There was no release for 23.7.0.

**Version 23.6.0**

There was no release for 23.6.0.

**Version 23.5.0**

There was no release for 23.5.0.

**Version 23.4.0**

There was no release for 23.4.0.

**Version 23.3.0**

There was no release for 23.3.0.

**Version 23.2.0**

There was no release for 23.2.0.

**Version 23.1.0**

There was no release for 23.1.0.

**iOS Agent****Version 23.10.1 - November 5, 2023**

This release supports the iOS SDK installation using Swift Package Manager. However, this support applies to the iOS Agents 23.10.1 or higher.

For more information, see [Install the iOS SDK](#).

**Version 23.10.1 - October 30, 2023**

This release includes minor bug fixes.

**Version 23.10.0 - October 10, 2023**

This release includes the following bug fixes:

- CDM-9607
- CDM-9635
- CDM-9651

See [Agent Resolved Issues](#).

**Version 23.9.0**

There was no release for 23.9.0.

---

---

### Version 23.8.0 - August 18, 2023

When you modify the url property of the `ADEumHttpRequestTracker` object, the `networkRequestCallback` method returns the request and response headers.

Use the following fields to view the request and response headers:

- `allHeaderFields` - It returns the response headers.
- `allRequestHeaderFields`` - It returns the request headers.

### Version 23.7.0 - May 20, 2023

`cocoalumberjack` is updated to 1.9.2

### Version 23.6.0

There was no release for 23.6.0.

### Version 23.5.0 - May 20, 2023

This release includes:

- `PLCrashReporter` is updated to 1.11.0
- Enhanced validity checks for agent configuration data.
- Enhanced crash report data for hybrid agents such as Flutter, React Native, and Xamarin agents.
- Bug fixes. See [Agent Resolved Issues](#).

iOS Agent 23.5.0 ends support for iOS 9 and 10. See [End of Support Notice: iOS 9 and 10](#).

### Version 23.4.0

There was no release for 23.4.0.

### Version 23.3.0

There was no release for 23.3.0.

### Version 23.2.0

There was no release for 23.2.0.

### Version 23.1.0 - January 23, 2023

This release includes an improved internal variable for stability.

### Java Agent

#### Version 23.10.0 - November 1, 2023

This release includes:

- Correlation support for Spring Rest Client. See the [enable-spring-rest-client-correlation](#) node property.
- Support for JDK 20. See [Java Supported Environments](#).
- Support for Eclipse Adoptium JDK 17, 18, 19, and 20. Eclipse Adoptium was previously known as AdoptOpen. See [Java Supported Environments](#).
- Bug fixes. See [Agent Resolved Issues](#).

#### Version 23.9.1 - October 09, 2023

This release includes a bug fix. See JAVA-12434 in the [Agent Resolved Issues](#).

## Version 23.9.0 - September 27, 2023

This release includes:

- Support for query statement on Couchbase database exit calls details.
- A new option, **View Detection Rule** is introduced in **Business Transaction > Actions**. You can click this option to view the custom detection rule associated with a business transaction. See [View Business Transactions](#).

## Version 23.8.0 - July 31, 2023

This release includes:

- Support for OTel Java Auto-Instrumentation version 1.29.0. See [Verified OTLP Open Source Versions](#).
- Support for Apache Kafka Streams. See [Java Supported Environments](#).
- Upgrades to the following third-party components.

Component	Previous Version	Upgraded Version
opentelemetry-java-instrumentation	1.24.0	1.29.0
grpc-okhttp	1.46.0	1.57.1

## Version 23.7.0 - July 31, 2023

This release includes:

- Support for Open AI API monitoring. See [Monitor OpenAI API with Java Agent](#).
- Support for the TheoKanning/openai-java framework. See [JVM Support](#).
- The `enable-openai-metrics` node property. See [enable-openai-metrics](#).
- Bug fixes. See [Agent Resolved Issues](#).

## Version 23.6.1 - July 17, 2023

This release:

- Upgrades the `com.google.guava` third-party library to version 32.0.1-jre.
- Includes bug fixes.

## Version 23.6.0 - June 21, 2023

This release includes:

- Support for Red Hat OpenJDK 17. See [JVM Support](#).
- Support for Eclipse Vert.x Core 4.3.x and 4.4.x. See [Java Supported Environments](#).
- Bug fixes. See [Agent Resolved Issues](#).

## Version 23.5.0 - May 31, 2023

This release includes:

- A new node property that allows you to manually specify whether an environment should be treated as read-only or not. See the [read-only-environment](#) node property.
- Bug fixes. See [Agent Resolved Issues](#).

## Version 23.4.0 - May 04, 2023

This release includes:

- Support for Kubernetes cgroup v2. See [Agent Known Issues](#).
- Bug fixes. See [Agent Resolved Issues](#).

---

## Version 23.3.0 - March 29, 2023

This release includes:

- Option to ignore exceptions using nested exception messages. See [enable-ignore-nested-exception-message](#) and [nested-exception-message-depth](#).
- Bug fixes.

## Version 23.2.0 - February 27, 2023

This release includes:

- Entry Points support for Spring Integration and support for Spring Boot 3.x. See [Java Agent Frameworks for OpenTelemetry](#) and [Java Supported Environments](#).
- The [enable-reverse-proxy](#) node property to enable reverse proxy. See [Enable Reverse Proxy for Java Agent](#).
- Bug fixes.

## Version 23.1.0 - January 30, 2023

This release includes:

- Support for JDK19. See [JVM Support](#).
- Bug fixes for Software AG webMethods version 10.x.
- Support for Apache Tomcat, http4s Blaze Client, Scala, and WebSocket frameworks. See [Java Agent Frameworks for OpenTelemetry](#).
- Bug fixes.

## JavaScript Agent

### Version 23.10.0 - October 31, 2023

JavaScript Agent embeds the trace context within the Ajax request.

Set the `transparentHeaderEnabled` flag to true while configuring the JavaScript Agent. This setting embeds the trace context in the Ajax requests.

### Version 23.9.0

There was no release for 23.9.0.

### Version 23.8.0 - August 25, 2023

This release includes the following bug fixes:

- BRUM-7868
- BRUM-7874
- BRUM-7852
- BRUM-7773
- BRUM-7837

See [Past Resolved and Known Issues by Release](#).

### Version 23.7.0

There was no release for 23.7.0.

### Version 23.6.0

There was no release for 23.6.0.

**Version 23.5.0**

There was no release for 23.5.0.

**Version 23.4.0**

There was no release for 23.4.0.

**Version 23.3.0 - March 27, 2023**

This release includes:

- The `useHTTPSAlways` flag being set to `true` by default. See [Configure the JavaScript Agent to Use HTTPS](#).
- Saved agent payload, even if fetch is using a request object.

**Version 23.2.0**

There was no release for 23.2.0.

**Version 23.1.0**

There was no release for 23.1.0.

**Java Serverless Tracer****Version 23.10.0**

There was no release for 23.10.0.

**Version 23.9.0**

There was no release for 23.9.0.

**Version 23.8.0**

There was no release for 23.8.0.

**Version 23.7.0**

There was no release for 23.7.0.

**Version 23.6.0**

There was no release for 23.6.0.

**Version 23.5.0**

There was no release for 23.5.0.

**Version 23.4.0**

There was no release for 23.4.0.

**Version 23.3.0**

There was no release for 23.3.0.

**Version 23.2.0**

There was no release for 23.2.0.

## Version 23.1.0

There was no release for 23.1.0.

## Machine Agent

### Version 23.10.0 - November 2, 2023

This release:

- Includes the `jersey-media-multipart 2.37` library.
- Removes `junit-dep` and `com.codahale.metrics.metrics-core` libraries.
- Replaces the following libraries.

Previous Library	Current Library
<code>javax.el:javax.el-api:3.0.1-b06</code>	<code>jakarta.el:jakarta.el-api:3.0.3</code>
<code>org.glassfish.web:javax.el:2.2.6</code>	<code>org.glassfish:jakarta.el:3.0.4</code>

- Upgrades the following third-party components.

Component	Previous Version	Upgraded Version
<code>jackson-databind</code>	2.13.5	2.15.3
<code>jetty-server</code>	9.4.51.v20230217	9.4.53.v20231009
JRE	11.0.19	11.0.20

### Version 23.9.1 - September 20, 2023

This release includes minor enhancements and bug fixes.

### Version 23.9.0 - September 08, 2023

This release includes minor enhancements and bug fixes.

### Version 23.8.0 - August 28, 2023

This release includes:

- An option to collect the ServiceNow Configuration Management Database (CMDB) server tags. See [Server Tagging](#).
- Bug fixes. See [Agent Resolved Issues](#).
- Upgrades to the following third-party components.

Component	Previous Version	Upgraded Version
<code>aws-java-sdk-ec2</code>	1.12.49	1.12.525
<code>okio-jvm</code>	3.0.0	3.5.0
<code>oshi-core</code>	6.3.2	6.4.4

### Version 23.7.0 - July 26, 2023

This release includes:

- The `InsallServiceWrapper.vbs` script to address the unquoted service path enumeration vulnerability. See [Windows Install Using ZIP with Bundled JRE](#).
- Upgrades the following third-party components.

Component	Previous Version	Upgraded Version
<code>jackson-databind</code>	2.13.4.2	2.13.5
<code>com.google.guava</code>	31.1-jre	32.0.1-jre

### Version 23.6.0 - June 26, 2023

This release includes:

- Azul JRE 17 support for Linux and Windows.
- Upgrades to the following third-party components.

Component	Previous Version	Upgraded Version
<code>aws-java-sdk-core</code>	1.11.91	1.12.49
<code>jackson-core</code>	2.14.2	2.15.2
<code>jetty-client</code>	9.4.46.v20220331	9.4.51.v20230217
<code>jetty-proxy</code>	9.4.46.v20220331	9.4.51.v20230217
<code>oshi-core</code>	6.1.6	6.3.2

### Version 23.5.0 - May 30, 2023

This release includes upgrades to the following third-party component:

Component	Previous Version	Upgraded Version
Hibernate Validator	6.1.6.Final	6.1.7.Final
Java Runtime Environment	11.0.18	11.0.19
<code>org.jsons</code>	20180130	20230227
<code>org.eclipse.jetty</code>	9.4.48	9.4.51

### Version 23.4.1 - May 09, 2023

This release includes:

- An option to send base metrics in the event of OSHI collection delay. See [Configure OSHI Collection Timeout on Windows](#).
- Bug fixes. See [Agent Resolved Issues](#).

### Version 23.4.0 - April 25, 2023

This release includes:

- An option to exclude file cache memory from the memory usage calculation on AIX. See [Exclude File Cache Memory from Memory Usage](#).
- Bug fixes. See [Agent Resolved Issues](#).
- Upgrades the following third-party component:

Component	Previous Version	Upgraded Version
jackson-core	2.13.1	2.14.2
snakeYAML	1.33	2.0

### Version 23.3.0 - March 21, 2023

This release includes upgrades to the following third-party components:

Component	Previous Version	Upgraded Version
commons-fileupload	1.4	1.5

### Version 23.2.0 - February 23, 2023

This release includes upgrades to the following third-party components:

Component	Previous Version	New Version
org.webjars:jquery	3.6.0	3.6.1
apache:commons-net	3.7.2	3.9.0

This release also includes a bug fix.

### Version 23.1.0 - January 26, 2023

This release includes:

- Two sets of Machine Agent Docker images. Each set includes Debian and Alpine images for non-root and root users. See [Access Machine Agent Docker Images](#).
- Changes to the following third-party libraries:

Library	Previous Version	New Version
JRE	Zulu 11.60 (JDK 11.0.17)	Zulu 11.62 (JDK 11.0.18)
jackson-databind	2.14.0	2.13.4.2

## MAUI Agent

### Version 23.10.0

There was no release for 23.10.0.

### Version 23.9.0

There was no release for 23.9.0.

### Version 23.8.0

There was no release for 23.8.0.

### Version 23.7.0

There was no release for 23.7.0.

### Version 23.6.0

There was no release for 23.6.0.

### Version 23.5.0

There was no release for 23.5.0.

### Version 23.4.0

There was no release for 23.4.0.

### Version 23.3.0

There was no release for 23.3.0.

### Version 23.2.0 - February 14, 2023

This release includes:

- WebView instrumentation. See [Customize the .NET MAUI Instrumentation](#).
- Changing the initialization code to your application. See [Add Initialization Code to your Application](#) for current initialization code.
- Renaming `HttpRequestTracker` to `HttpRequestTracker`.
- Moving existing attributes to the `AppDynamics.Agent.AutoInstrument` namespace.

### Version 23.1.0

There was no release for 23.1.0.

## .NET Agent

### Version 23.10.0 - October 31, 2023

This release includes:

- Object Instance Tracking support for .Net 6.0 on Linux. See [Object Instance Tracking for .NET](#).
  - Support for the Microsoft .NET 8 RC2 runtime. See [.NET Supported Environments](#).
  - [Support Advisory: .Net Agent 23.10.0 and Later Requires .Net Framework 4.6.2 or Later](#).
  - Instrumentation support for Azure Functions 4.x.
  - Code optimizations, performance improvements, and third-party library upgrades.
  - Bug fixes. See [Agent Resolved Issues](#).
-

---

## Version 23.9.0 - September 29, 2023

This release includes:

- JIT instrumentation on Azure App Service with the coordinator.
- Bug fixes. See [Agent Resolved Issues](#).

## Version 23.8.0

There was no release for 23.8.0.

## Version 23.7.0 - August 01, 2023

This release includes:

- Code optimizations and performance improvements by enabling inlining on Linux .Net Agent.
- Bug fixes. See [Agent Resolved Issues](#).

## Version 23.6.0 - June 30, 2023

This release includes:

- The [disable-dynamic-services](#) node property to disable dynamic services during the agent startup.
- Support for object instance tracking on Windows .NET (Core). See [Object Instance Tracking for .NET](#).
- Support for Control Group v2 container ID detection.
- Improvement in the Secure Application heartbeat interval computation. This provides a more granular resolution in seconds instead of minutes.
- Code optimizations and improvements.
- Bug fixes. See [Agent Resolved Issues](#).

## Version 23.5.0

There was no release for 23.5.0.

## Version 23.4.0 - April 25, 2023

This release includes:

- An option to ignore exceptions using the nested exception messages. See [enable-ignore-nested-exception-message](#) and [nested-exception-message-depth](#).
- Updates to third-party dependencies.
- Code optimizations and improvements.
- Bug fixes. See [Agent Resolved Issues](#).

## Version 23.3.0 - April 03, 2023

This release includes:

- .NET Agent Runtime Event support for Cisco Secure Application. See [Cisco Secure Application Requirements](#) and [23.3 SaaS Controller Known Issues](#) for the Cisco Secure Application known issue.
- Updates to the third-party libraries.

## Version 23.2.0 - February 28, 2023

This release includes:

- Implementation of IIS Pipeline Instrumentation. See [IIS Integrated Pipeline Instrumentation](#).
- Updates to third party dependencies.

## Version 23.1.0 - January 24, 2023

This release includes:

- Fixing Business Transaction naming with changes to ASP.NET Core 6.0.12/7.0.1.
- Fixing discrepancies between Business Transaction naming in ASP.NET, and ASP.NET Core.

Note: If the ASP.NET Core application is hosted in the IIS virtual directory (not in the site root), and the Business Transaction name is based on the URI ([MVC Transaction Naming](#) is disabled or [HTTP Instrumentation](#) is used), then the Business Transaction has a new name matching the ASP.NET user experience. The tables below illustrate the changes for Default BT Naming (Custom Naming rules are not applied) when the web application is hosted in IIS virtual directory named "/subsite".

With [MVC Transaction Naming](#) disabled:

URL	ASP.NET	ASP.NET Core with 22.12	ASP.NET Core with 23.1
http://www.example.com/subsite	/subsite	No Business Transaction	/subsite

## Network Agent

### Version 23.10.0 - October 27, 2023

This release upgrades the following third-party library:

Library	Previous Version	Upgraded Version
curl	8.0.1	8.4.0

### Version 23.9.0

There was no release for 23.9.0.

### Version 23.8.0 - August 11, 2023

This release includes support for the IBM AIX operating system. See [Install the Network Agent on AIX](#).

### Version 23.7.0

There was no release for 23.7.0.

### Version 23.6.0

There was no release for 23.6.0.

### Version 23.5.0 - May 31, 2023

This release includes upgrades to the following third-party libraries:

Library	Previous Version	Upgraded Version
curl	7.88.1	8.0.1
libpcre	8.44	10.42
capnproto	0.4.0	0.10.4

### Version 23.4.0

There was no release for 23.4.0.

### Version 23.3.0 - March 27, 2023

This release includes:

- The ability to determine if the Network Agent will produce a core file or set a maximum core file size (Linux installations only). See [Limit Core File Production or Size](#).
- Bug fixes.
- Upgrades to the following third-party libraries:

Library	Previous Version	Upgraded Version
LuaJIT	2.0.3	2.0.5
curl	7.79.1	7.88.1
libpcap	1.10.1	1.10.3
libssh2	1.7.0	1.10.0
libzmq	4.2.5	4.3.4
pcre	8.41	8.44
googletest	1.8.0	1.13.0
libtins	4.0	4.4
npcap-sdk	1.01	1.72
protobuf	3.6.1	21.12
zeromq	4.0.8	4.3.4
civetweb	1.9.1	1.15

Support for 32-bit architectures has been deprecated in Network Agent >= 23.3.0.

### Version 23.2.0

There was no release for 23.2.0.

### Version 23.1.0

There was no release for 23.1.0.

### Node.js Agent

#### Version 23.10.0 - October 25, 2023

This release:

- Adds support for GraphQL HTTP and Apollo Server 4.
- Upgrades the following third-party library.

Library	Previous Version	Upgraded Version
protobuf	7.2.4	7.2.5

### Version 23.9.0

There was no release for 23.9.0.

### Version 23.8.0

There was no release for 23.8.0.

### Version 23.7.0 - August 2, 2023

This release includes:

- Support for Node.js 20. The Node.js Agent 23.7.0 supports Node.js versions 14, 15, 16, 17, 18, 19, and 20. See [Node.js Supported Environments](#).
- Support for OpenSSL 3.0
- Upgrade to the following third-party library:

Library	Previous Version	Upgraded Version
protobuf	7.2.3	7.2.4

### Version 23.6.0

There was no release for 23.6.0.

### Version 23.5.0 - May 17, 2023

This release includes:

- Support for Yarn
- Support for Node.js 19. See [Node.js Supported Environments](#).
- Bug fixes. See [Agent Resolved Issues](#).

### Version 23.4.0

There was no release for 23.4.0.

### Version 23.3.0 - March 28, 2023

This release includes bug fixes.

### Version 23.2.0

There was no release for 23.2.0.

### Version 23.1.0

There was no release for 23.1.0.

### Node.js Serverless Tracer

#### Version 23.10.0

There was no release for 23.10.0.

#### Version 23.9.0

There was no release for 23.9.0.

**Version 23.8.0**

There was no release for 23.8.0.

**Version 23.7.0**

There was no release for 23.7.0.

**Version 23.6.0 - June 26, 2023**

This release includes bug fixes. See [Agent Resolved Issues](#).

**Version 23.5.0**

There was no release for 23.5.0.

**Version 23.4.0**

There was no release for 23.4.0.

**Version 23.3.404**

The Node.js Serverless Tracer is updated to [23.3.404](#).

**Version 23.2.0**

There was no release for 23.2.0.

**Version 23.1.0**

There was no release for 23.1.0.

**PHP Agent****Version 23.10.0**

There was no release for 23.10.0.

**Version 23.9.0**

There was no release for 23.9.0.

**Version 23.8.0**

There was no release for 23.8.0.

**Version 23.7.1 - July 27, 2023**

This release includes a bug fix. See PHP-2317 in the [Agent Resolved Issues](#).

**Version 23.7.0 - July 19, 2023**

This release includes support for PHP 8.2. See [PHP Supported Environments](#).

**Version 23.6.0**

There was no release for 23.6.0.

**Version 23.5.0**

There was no release for 23.5.0.

### Version 23.4.0 - April 28, 2023

This release includes:

- Updated Java Proxy
- Upgrades to the following third-party components:

Component	Upgraded Version
Apache Log4cx ( <code>apache-log4cx-x</code> )	0.11.0
Apache Portable Runtime ( <code>apr</code> )	1.7.2
Apache Portable Runtime Utility ( <code>apr-util</code> )	1.6.3
Expat ( <code>libexpat</code> )	2.5.0
Protocol Buffers ( <code>protobuf</code> )	3.21.12

### Version 23.3.0

There was no release for 23.3.0.

### Version 23.2.0 - February 27, 2023

This release includes a bug fix, and [Support Advisory: Applications Using PHP 8.1 May Not Start](#).

### Version 23.1.0

There was no release for 23.1.0.

### Python Agent

#### Version 23.10.0 - October 31, 2023

This release includes the following Python Agent settings:

- `enable_openai` - Enable or disable OpenAI instrumentation.
- `tls-version` - Configure either TLSv1.2 or TLS1.3 version.

For more information, see [Python Agent Settings](#).

#### Version 23.9.0

There was no release for 23.9.0.

#### Version 23.8.0 - August 30, 2023

This release supports Open AI API monitoring. See [Monitor OpenAI API with Python Agent](#).

Upgraded the following libraries:

Library	Previous Version	Upgraded Version
JRE	11.56	11.64
Google Guava	31.0.1	32.0.1
Jakson-databind	2.14.2	2.15.2
grpc-okhttp-shaded.jar	1.46.1	1.57.1

### Version 23.7.0 - July 26, 2023

You can now run the Python Agent proxy with the compatible JRE versions (8, 11, 17, and 19). Hence, you can download the agent without JRE.

You can also choose to download the Python Agent that is bundled with the default JRE. For more information, see [Install the Python Agent](#).

### Version 23.6.0

There was no release for 23.6.0.

### Version 23.5.1 - May 27, 2023

This release includes the support for Python 3.11. See [Python Supported Environments](#).

### Version 23.5.0 - May 7, 2023

This release includes:

- Jackson databind is updated
- snakeYAML is removed.

 Python Agent 23.5.0 ends support for Python 3.6. See [End of Support Notice: Python 3.6](#).

### Version 23.4.0

There was no release for 23.4.0.

### Version 23.3.0

There was no release for 23.3.0.

### Version 23.2.0 - February 2, 2023

This release includes bug fixes.

### Version 23.1.0

There was no release for 23.1.0.

## Python Serverless Tracer

### Version 23.10.0

There was no release for 23.10.0.

### Version 23.9.0

There was no release for 23.9.0.

### Version 23.8.0

There was no release for 23.8.0.

### Version 23.7.0

There was no release for 23.7.0.

### Version 23.6.0 - June 26, 2023

This release includes:

- Support for Python 3.9.
- Bug fixes. See [Agent Resolved Issues](#).

There was no release for 23.5.0.

### Version 23.5.0

There was no release for 23.5.0.

### Version 23.4.0

There was no release for 23.4.0.

### Version 23.3.0

There was no release for 23.3.0.

### Version 23.2.0

There was no release for 23.2.0.

### Version 23.1.0

There was no release for 23.1.0.

## React Native Agent

### Version 23.10.0

There was no release for 23.10.0.

### Version 23.9.0

There was no release for 23.9.0.

### Version 23.8.0

There was no release for 23.8.0.

**Version 23.7.0**

There was no release for 23.7.0.

**Version 23.6.0**

There was no release for 23.6.0.

**Version 23.5.0 - May 25, 2023**

This release supports manual tracking of UI events using `Instrumentation.trackUIEvent()`

**Version 23.4.0**

There was no release for 23.4.0.

**Version 23.3.0**

There was no release for 23.3.0.

**Version 23.2.0**

There was no release for 23.2.0.

**Version 23.1.0**

There was no release for 23.1.0.

**SAP****Version 23.10.0**

There was no release for 23.10.0.

**Version 23.9.0**

There was no release for 23.9.0.

**Version 23.8.0 - August 29, 2023**

See [23.8 SAP Agent Enhancements](#).

**Version 23.7.0**

There was no release for 23.7.0.

**Version 23.6.0**

There was no release for 23.6.0.

**Version 23.5.0 - May 29, 2023**

This release includes enhancements and bug fixes. See [Release Notes Version 23.5.0](#).

**Version 23.4.0**

There was no release for 23.4.0.

**Version 23.3.0**

There was no release for 23.3.0.

---

**Version 23.2.0 - February 27, 2023**

This release includes enhancements. See [Release Notes Version 23.2.0](#).

**Version 23.1.0**

There was no release for 23.1.0.

**Hosted Synthetic Agent****Version 23.10.0**

There was no release for 23.10.0.

**Version 23.9.0**

There was no release for 23.9.0.

**Version 23.8.0**

There was no release for 23.8.0.

**Version 23.7.0**

There was no release for 23.7.0.

**Version 23.6.0**

There was no release for 23.6.0.

**Version 23.5.0**

There was no release for 23.5.0.

**Version 23.4.0**

There was no release for 23.4.0.

**Version 23.3.0**

There was no release for 23.3.0.

**Version 23.2.0**

There was no release for 23.2.0.

**Version 23.1.0**

There was no release for 23.1.0.

**Private Synthetic Agent****Version 23.10.0**

There was no release for 23.10.0.

**Version 23.9.1 - October 10, 2023**

This release upgrades the `libwebp` library to version 1.3.2.

---

## Version 23.9.0 - September 28, 2023

This release supports Private Synthetic Agent deployment in Red Hat OpenShift. See [Set up PSA in Red Hat OpenShift](#).

### Version 23.8.0

There was no release for 23.8.0.

### Version 23.7.0

There was no release for 23.7.0.

### Version 23.6.0

There was no release for 23.6.0.

## Version 23.5.0 - May 31, 2023

This release includes the following enhancements:

- Supports Private Synthetic Agent deployment in Docker engine. See [Set up PSA in Docker Engine](#).
- Simplifies the Private Synthetic Agent deployment in Kubernetes and Minikube. See:
  - [Set up PSA in Amazon EKS](#)
  - [Set up PSA in Azure AKS](#)
  - [Set up PSA in Minikube](#)

### Version 23.4.0

There was no release for 23.4.0.

## Version 23.3.0 - March 27, 2023

This release includes the following enhancements:

- Private Synthetic Agent installation now replaces the external Postgres database with Apache Ignite. See [Install the Private Synthetic Agent \(Web and API Monitoring\)](#).
- Supports changing the pod-level DNS server settings of a Kubernetes cluster. See
  - [Deploy the Web Monitoring PSA and API Monitoring PSA in Amazon EKS](#)
  - [Deploy the Web Monitoring PSA and API Monitoring PSA in Minikube](#)
  - [Deploy the Web Monitoring PSA and API Monitoring PSA in Azure AKS](#)
  - [Deploy the Web Monitoring PSA and API Monitoring PSA in Bare Metal K8s](#)

### Version 23.2.0

There was no release for 23.2.0.

### Version 23.1.0

There was no release for 23.1.0.

## Xamarin Agent

### Version 23.10.0

There was no release for 23.10.0.

### Version 23.9.0

There was no release for 23.9.0.

### Version 23.8.0

There was no release for 23.8.0.

### Version 23.7.0

There was no release for 23.7.0.

### Version 23.6.0

There was no release for 23.6.0.

### Version 23.5.0

There was no release for 23.5.0.

### Version 23.4.0

There was no release for 23.4.0.

### Version 23.3.0

There was no release for 23.3.0.

### Version 23.2.0 - February 14, 2023

This release includes:

- WebView instrumentation, Fragment Tracking, and viewing Controller Tracking. See [Customize the Xamarin Instrumentation](#).
- Renaming `HttpRequestTracker` to `HttpRequestTracker`.
- Moving existing attributes to the `AppDynamics.Agent.AutoInstrument` namespace.

### Version 23.1.0

There is no release for 23.1.0

## 22.x Agent Releases

### Analytics Agent

#### Version 22.12.0

There was no release for 22.12.0.

#### Version 22.11.0 - November 24, 2022

This release includes upgrades to following third-party components:

Components	Previous Version	Upgraded Version
OpenJDK	Zulu 8.64 (JDK 8u345)	Zulu 8.66 (JDK 8u352)
Apache Commons Text	1.2	1.10

#### Version 22.10.0 - October 26, 2022

This release includes:

- The Analytics Agent is now Federal Information Processing Standards (FIPS)-compliant. See [Configure the Analytics Agent for FIPS Compliance](#). To encrypt Agent credentials using the FIPS secure credential keystore, see [Encrypt Agent Credentials](#).
- The nuprocess.jar library was upgraded from version 2.0.1 to version 2.0.5.

### Version 22.9.0

There was no release for 22.9.0.

### Version 22.8.0 - August 29, 2022

This release includes upgrades to the following libraries:

Library	Previous Version	Upgraded Version
Jetty	9.4.46.v20220331	9.4.48.v20220622
Azul JRE	8.62 (8u332)	8.64.0.15 (8u342)

### Version 22.7.0 - July 26, 2022

This release includes:

- Upgrades to the following transitive dependency libraries:

Library	Previous Version	Upgraded Version
Apache Groovy	2.4.12	3.0.10
Netty	4.1.75.Final	4.1.78.Final
org.apache.httpcomponents:fluent-hc	4.5.5	4.5.13
org.glassfish.jersey	2.0.29	2.35

- The jQuery transitive dependency was excluded from the Analytics Agent.

### Version 22.6.0

There was no release for 22.6.0.

### Version 22.5.0 - May 30, 2022

This release includes upgrades to the following third-party libraries:

Library	Previous Version	Upgraded Version
Apache Commons BeanUtils	1.8.0	1.9.4

Library	Previous Version	Upgraded Version
Apache Xerces2 J	2.9.1	2.12.2
Bundled Azul JRE	8.60	8.62
Jackson	2.12.0	2.13.2
jackson-databind	2.12.0	2.13.2.2
Jetty	9.4.35.v20201120	9.4.46.v20220331

### Version 22.4.0 - April 28, 2022

This release includes:

- The Azul JRE version was upgraded from 8.54 to 8.60.
- The SLF4J version was upgraded from 1.7.32 to 1.7.36.

### Version 22.3.0 - April 1, 2022

This release includes:

- The netty libraries were upgraded from 4.1.73.Final to 4.1.75.Final.
- The logback libraries were upgraded from logback 1.2.8 to logback 1.2.11.

AppDynamics recommends upgrading the Analytics Agent to 22.3.0 if the logback and netty libraries need to be upgraded to the versions above.

### Version 22.2.0 - February 23, 2022

This release upgrades all Netty libraries to version 4.1.73.Final.

### Version 22.1.0 - January 19, 2022

This release includes minor bug fixes and enhancements.

### Android Agent

#### Version 22.12.0

There was no release for 22.12.0.

#### Version 22.11.0

There was no release for 22.11.0.

#### Version 22.10.0

There was no release for 22.10.0.

#### Version 22.9.0

There was no release for 22.9.0.

---

**Version 22.8.0 - August 24, 2022**

This release includes support for postURL method callback, and updates to the button instrumentation logic.

**Version 22.7.0**

There was no release for 22.7.0.

**Version 22.6.0**

There was no release for 22.6.0.

**Version 22.5.0**

There was no release for 22.5.0.

**Version 22.4.0**

There was no release for 22.4.0.

**Version 22.3.0**

There was no release for 22.3.0.

**Version 22.2.0 - February 25, 2022**

This release includes:

- Gradle 7 support
- The agent does not take screenshots if the user device is using cellular internet connection and the upload on cellular option is disabled.

**Version 22.1.0**

There was no release for 22.1.0.

**Apache Web Server Agent****Version 22.12.1 - December 19, 2022**

This release includes bug fixes and updates to the Java proxy.

**Version 22.12.0 - December 02, 2022**

This release includes bug fixes.

**Version 22.11.0 - November 23, 2022**

This release includes updates to Java proxy.

**Version 22.10.0 - October 19, 2022**

This release includes updates to the Java proxy.

**Version 22.9.0**

There was no release for 22.9.0.

**Version 22.8.0**

There was no release for 22.8.0.

---

**Version 22.7.0 - July 7, 2022**

This release includes minor bug fixes and enhancements.

**Version 22.6.0**

There was no release for 22.6.0.

**Version 22.5.0**

There was no release for 22.5.0.

**Version 22.4.0**

There was no release for 22.4.0.

**Version 22.3.0**

There was no release for 22.3.0.

**Version 22.2.0 - February 18, 2022**

This release upgrades JRE to version 11.0.13.

**Version 22.1.0 - January 7, 2022**

This release upgrades the Apache log4j library to version 2.17.1.

**AppDynamics AWS Lambda Extension for Serverless APM****Version 22.12.0**

There was no release for 22.12.0.

**Version 22.11.0**

There was no release for 22.11.0.

**Version 22.10.0**

There was no release for 22.10.0.

**Version 22.9.0**

There was no release for 22.9.0.

**Version 22.8.0**

There was no release for 22.8.0.

**Version 22.7.0**

There was no release for 22.7.0.

**Version 22.6.0**

There was no release for 22.6.0.

**Version 22.5.0**

There was no release for 22.5.0.

**Version 22.4.0**

There was no release for 22.4.0.

**Version 22.3.0**

There was no release for 22.3.0.

**Version 22.2.0**

There was no release for 22.2.0.

**Version 22.1.0**

There was no release for 22.1.0.

**C/C++ SDK****Version 22.12.0**

There was no release for 22.12.0.

**Version 22.11.0**

There was no release for 22.11.0.

**Version 22.10.0**

There was no release for 22.10.0.

**Version 22.9.0**

There was no release for 22.9.0.

**Version 22.8.0**

There was no release for 22.8.0.

**Version 22.7.2 - August 3, 2022**

This release sends Agent host information to the Controller at regular intervals, enabling IBL for SAP Agent.

**Version 22.7.0 - July 6, 2022**

This release enables users to mark a business transaction started with the C/C++ SDK Agent as a background task using a new function, `appd_bt_begin_bg()`. By default, the function has the same behavior as `appd_bt_begin`. See [Monitor Background Tasks](#).

**Version 22.6.0**

There was no release for 22.6.0.

**Version 22.5.0**

There was no release for 22.5.0.

**Version 22.4.0 - April 29, 2022**

This release includes a bug fix.

---

## Version 22.3.1 - March 15, 2022

This release includes:

- Support for the C/C++ SDK Agent on the Alpine Linux distribution, which is based on musl runtime.
- Users can now configure Analytics limits to match the limits of the Analytics Agent if it overrides default limits.
- Upgrades to the following toolchains:
  - Microsoft Visual Studio (Windows) to version 2019.
  - GCC to version 9.3

## Version 22.2.0

There was no release for 22.2.0.

## Version 22.1.0

There was no release for 22.1.0.

## Cluster Agent

### Version 22.12.1 - January 10, 2023

This release includes a bug fix.

### Version 22.12.0 - December 23, 2022

This release includes auto-instrumentation enhancements that enables re-instrumentation of applications after the deployment rollout.

### Version 22.11.0 - November 22, 2022

The AppDynamics Operator and the Cluster Agent are now updated to Golang version 1.19.2.

### Version 22.10.0

There was no release for 22.10.0.

### Version 22.9.0 - September 27, 2022

This release includes the following updates:

- The AppDynamics Operator & Cluster Agent images are upgraded to Go language version 1.19.
- The Alpine docker image for AppDynamics Operator & Cluster Agent is updated to 3.16.2.

### Version 22.8.0

There was no release for 22.8.0.

### Version 22.7.0 - July 29, 2022

This release includes the following enhancements:

- The Cluster Agent and operator images are upgraded to Go language 1.17.2.
- You can configure:
  - Infrastructure Visibility to run as non-root users. See `runAsUsers` and `runAsGroup` at [Install Infrastructure Visibility with the Kubernetes CLI](#).
  - Tier name strategies to override the tier name in instrumentation rules. See `tierNameLabel` and `tierNameStrategy` at [Auto-Instrumentation Configuration](#) and [AppDynamics Tier Name Strategies](#) at [Auto-Instrument Applications with the Cluster Agent](#).

---

## Version 22.6.0 - June 21, 2022

This release includes minor fixes and the following updates:

- You can now use `instrumentationMaxPollingAttempts` to deploy more number of pods (>100) during instrumentation. See, `instrumentationMaxPollingAttempts` at [Configure the Cluster Agent](#).
- The Cluster Agent and Operator images are upgraded to Go language version 1.17.11.

## Version 22.5.0

There was no release for 22.5.0.

## Version 22.4.0 - April 29, 2022

This release includes minor bug fixes and the Cluster Agent Operator is updated with the Golang version 1.17.7

Cluster Agent for RedHat is unavailable because of a change in RedHat release process.

## Version 22.3.0

There was no release for 22.3.0.

## Version 22.2.0

There was no release for 22.2.0.

## Version 22.1.0 - January 31, 2021

This release includes:

- Updates to third party libraries in Cluster Agent and AppDynamics Operator for the images to be secure.
- Changes to Infrastructure Visibility installation using Helm charts or AppDynamics Operator:
  - The Linux based Machine Agent image is updated.
  - The `globalAccount` property is removed for the Linux based Machine Agent.
  - The `machineAgentWinImage` property is introduced to include the Machine Agent Windows image.

## Cordova Plugin

### Version 22.12.0

There was no release for 22.12.0.

### Version 22.11.0

There was no release for 22.11.0.

### Version 22.10.0

There was no release for 22.10.0.

### Version 22.9.0

There was no release for 22.9.0.

### Version 22.8.0

There was no release for 22.8.0.

**Version 22.7.0**

There was no release for 22.7.0.

**Version 22.6.0**

There was no release for 22.6.0.

**Version 22.5.0**

There was no release for 22.5.0.

**Version 22.4.0**

There was no release for 22.4.0.

**Version 22.3.0**

There was no release for 22.3.0.

**Version 22.2.0**

There was no release for 22.2.0.

**Version 22.1.0**

There was no release for 22.1.0.

**Database Agent****Version 22.12.0**

There was no release for 22.12.0.

**Version 22.11.0 - November 17, 2022**

This release includes bug fixes.

**Version 22.10.0**

There was no release for 22.10.0.

**Version 22.9.0 - September 28, 2022**

This release includes bug fixes.

**Version 22.8.0**

There was no release for 22.8.0.

**Version 22.7.0 - July 28, 2022**

This release supports installing the Database Agent on JDK versions 1.18 - 15. See [Database Visibility System Requirements](#).

**Version 22.6.0 - June 13, 2022**

This release supports the use of instance types to fetch CPU core count in the RDS instances when hardware monitoring is enabled. This is applicable for MySQL and Postgres databases. See [Configure the Database Agent to Monitor Server Hardware](#).

---

### Version 22.5.0

There was no release for 22.5.0.

### Version 22.4.0 - April 29, 2022

This release includes bug fixes and enhancements.

### Version 22.3.0 - March 24, 2022

This release includes:

- An option to set the context protocol for the SSL environment using the `CASSANDRA_SSL_CONTEXT_PROTOCOL` system variable. See [Configure Cassandra Collectors](#).
- An option to delete the servers manually from the database topology window. See [Database Topology Window](#).
- Automatic deletion of stale servers from the database server table after completing the retention period.

### Version 22.2.0 - February 23, 2022

This release adds support for installing the Database Agent as a container image. See [Install the Database Agent](#).

### Version 22.1.0

There was no release for 22.1.0.

### Flutter Agent

### Version 22.12.0 - December 6, 2022

This release includes:

- Improved crash reporting by grouping exceptions, and errors into different categories in the UI controller.
- Fixed bugs involving screen tracking crashing application on start.
- Improved `RequestTracker` class by removing bugs involving force unwrapping the tracker.

### Version 22.11.0

There was no release for 22.11.0.

### Version 22.10.0

There was no release for 22.10.0.

### Version 22.9.0

There was no release for 22.9.0.

### Version 22.8.0

There was no release for 22.8.0.

### Version 22.7.0

There was no release for 22.7.0.

### Version 22.6.0 - June 7, 2022

This release includes minor fixes and enhancements. See [https://pub.dev/packages/appdynamics\\_agent/changelog](https://pub.dev/packages/appdynamics_agent/changelog) for details.

---

**Version 22.5.0**

There was no release for 22.5.0.

**Version 22.4.0**

There was no release for 22.4.0.

**Version 22.3.0 - March 8, 2022**

This is the first release of the Flutter Agent for monitoring Flutter mobile applications. See [Instrument Flutter Applications](#).

**Go SDK****Version 22.12.0**

There was no release for 22.12.0.

**Version 22.11.0**

There was no release for 22.11.0.

**Version 22.10.0**

There was no release for 22.10.0.

**Version 22.9.0**

There was no release for 22.9.0.

**Version 22.8.0**

There was no release for 22.8.0.

**Version 22.7.0**

There was no release for 22.7.0.

**Version 22.6.0**

There was no release for 22.6.0.

**Version 22.5.0**

There was no release for 22.5.0.

**Version 22.4.0**

There was no release for 22.4.0.

**Version 22.3.0**

There was no release for 22.3.0.

**Version 22.2.0**

There was no release for 22.2.0.

**Version 22.1.0**

There was no release for 22.1.0.

---

## IBM Integration Bus Agent

### Version 22.12.0

There was no release for 22.12.0.

### Version 22.11.0

There was no release for 22.11.0.

### Version 22.10.0

There was no release for 22.10.0.

### Version 22.9.0

There was no release for 22.9.0.

### Version 22.8.0

There was no release for 22.8.0.

### Version 22.7.0

There was no release for 22.7.0.

### Version 22.6.0

There was no release for 22.6.0.

### Version 22.5.0

There was no release for 22.5.0.

### Version 22.4.0

There was no release for 22.4.0.

### Version 22.3.0 - March 3, 2022

This release includes:

- An option to reuse historical VM node names for new VMs. See [Enable the Node Name Reuse](#).
- Support for the IBM App Connect Enterprise version 11 running on Kubernetes.

### Version 22.2.0

There was no release for 22.2.0.

### Version 22.1.0

There was no release for 22.1.0.

## iOS Agent

### Version 22.12.0 - December 7, 2022

This release includes:

- Support for the `clearAllUserData` API. See [Customize the iOS Instrumentation](#).
- Sending network request beacons in batches, which is a requirement for OpenTelemetry.
- Upgraded OCHamcrest version to 9.0.

---

**Version 22.11.0**

There was no release for 22.11.0.

**Version 22.10.0**

There was no release for 22.10.0.

**Version 22.9.0**

There was no release for 22.9.0.

**Version 22.8.0**

There was no release for 22.8.0.

**Version 22.7.0**

There was no release for 22.7.0.

**Version 22.6.0**

There was no release for 22.6.0.

**Version 22.5.0 - June 2, 2022**

This release includes minor bug fixes and enhancements.

**Version 22.4.0**

There was no release for 22.4.0.

**Version 22.3.0 - March 22, 2022**

This release includes support for Xcode 12.5 and later. See [Mobile RUM Supported Environments](#).

**Version 22.2.0 - February 28, 2022**

This release includes minor bug fixes and enhancements.

**Version 22.1.1 - January 24, 2022**

This release includes minor bug fixes and enhancements.

**Java Agent****Version 22.12.0 - December 22, 2022**

This release includes:

- Support for PooledJMS. See [Message Oriented Middleware Support](#).
- Support for JBoss EAP, JBoss Wildfly, Spring Integration, Spring Web Services, and Spring WebFlux. See [Java Agent OpenTelemetry Framework Support](#).

**Version 22.11.0 - November 22, 2022**

This release includes:

- A new node property to control the Java Agent error reporting. See `bounded-collections-policy-override`.
- SnakeYAML library upgraded to version 1.33.
- The `jackson-databind` library upgraded to version 2.14.0.

---

## Version 22.10.0 - October 28, 2022

This release includes:

- Support for FIPS-compliant custom keystore for the Agent-Controller communications. See [Configure the Java Agent for FIPS Compliance](#). To encrypt Agent credentials using the FIPS secure credential keystore, see [Encrypt Agent Credentials](#).
- Support for HTTP Client and Oracle Service Bus (OSB). See [Java Agent OpenTelemetry Framework Support](#).

## Version 22.9.2 - November 3, 2022

This release upgrades the `jackson-databind` library to version 2.13.4.1.

## Version 22.9.1 - September 30, 2022

This release includes bug fixes.

## Version 22.9.0 - September 23, 2022

This release includes:

- A new node property to allow agent module export. See [appagent-export-packages](#).
- A new node property to disable dynamic services during the agent startup. See [disable-dynamic-services](#).
- Dynamic services JAR signing is now enabled by default. See [Dynamic Services JAR Signing](#).
- SnakeYAML library upgraded to version 1.31.

## Version 22.8.0 - August 26, 2022

This release includes:

- Support for Red Hat OpenJDK 8. See [Java Supported Environments](#) and [Object Instance Tracking for Java](#).
- Support for Apache Kafka and Oracle WebLogic RMI. See [Java Agent Frameworks for OpenTelemetry](#).
- Option to start or stop the Cisco Secure Application service using a node property. See the [multi-tenant-agent-enabled](#) node property.

## Version 22.7.0 - July 29, 2022

This release includes:

- Support for JDK18, MongoDB Reactive Streams Driver 4.2.x and 4.3.x, and Akka HTTP framework support for OpenTelemetry. See [JAVA Supported Environments](#).
- Option to configure the URL segment limit that Java Agent sends to Analytics. See [Configure the URL Segment Limit](#).

## Version 22.6.0 - June 28, 2022

This release includes:

- Support for AWS SQS SDK for JAVA 2.x. See [Amazon Simple Queue Service Backends](#).
- Option to configure the transaction stall threshold. See the `min-transaction-stall-threshold-in-seconds` node property.
- Support for Play for Java, Spring RMI, and Spring REST. See [Java Agent Frameworks for OpenTelemetry](#).

## Version 22.5.0 - May 26, 2022

This release includes the following new node properties:

- `custom-activity-correlation`
- `custom-interceptor-rules`
- `sensitive-data-filter`
- `sensitive-message-filter`
- `sensitive-url-filter`

See [Agent Node Property References](#).

---

This release removes support for the End of Life JDK 6 and JDK 7. See [Java Supported Environments](#) and [Support Advisory](#).

This release includes support for Java Servlet API and Play for Java. See [Java Agent Frameworks for OpenTelemetry](#).

### **Version 22.4.0 - April 22, 2022**

This release includes:

- Support for the Z Garbage Collector. The agent reports the Z Garbage Collector metrics as a minor collection.
- Support for Apache Struts and Micronaut. See [Java Agent Frameworks for OpenTelemetry](#).

### **Version 22.3.0 - March 24, 2022**

This release:

- Includes bug fixes and enhancements.
- Removes JDK7 support for Cisco Secure Application.
- Includes support for Apache HTTP Client, Java Servlet API, and Spring Boot. See [Java Agent Frameworks for OpenTelemetry](#).

### **Version 22.2.0 - February 24, 2022**

This release includes minor bug fixes and enhancements.

### **Version 22.1.0 - January 28, 2022**

This release includes:

- Updated Apache `log4j` version 2.17.1
- For legacy agents, Apache `log4j` is upgraded to 2.12.4
- Akka HTTP 2.6

## **JavaScript Agent**

### **Version 22.12.0 - December 21, 2022**

This release includes a new config, `getAjaxResponseHeaders`. See [JavaScript Ajax Context Object](#).

### **Version 22.11.0**

There was no release for 22.11.0.

### **Version 22.10.0**

There was no release for 22.10.0.

### **Version 22.9.0 - September 8, 2022**

This release includes a bug fix, and additions to region support for JavaScript Errors dashboard. See [JavaScript Errors Dashboard](#).

### **Version 22.8.0**

There was no release for 22.8.0.

### **Version 22.7.0**

There was no release for 22.7.0.

---

## Version 22.6.0 - June 15, 2022

This release includes:

- Update tracking of `SVGUseElement` which impacts how Visually Complete Time (VCT) and Page Complete Time (PCT) metrics are calculated.
- New API function call for creating custom names for pre-existing SPA2 virtual pages. See [Set Custom Virtual Page Names](#).

## Version 22.5.0

There was no release for 22.5.0.

## Version 22.4.0 - April 15, 2022

This release includes a change to how beacons are sent. Beacons by default will be sent to the HTTPS endpoint if available. If HTTPS is not available, beacons will be sent with the host HTTP endpoint.

## Version 22.3.0

There was no release for 22.3.0.

## Version 22.2.0.3657 - April 1, 2022

This release includes a hot fix: Ajax events are not aligning with the custom virtual page names that were created with the JavaScript API.

## Version 22.2.0 - February 18, 2022

This release includes support of error handling for `UnhandledRejection` events.

## Version 22.1.0

There was no release for 22.1.0.

## Java Serverless Tracer

### Version 22.12.0

There was no release for 22.12.0.

### Version 22.11.0

There was no release for 22.11.0.

### Version 22.10.0

There was no release for 22.10.0.

### Version 22.9.0

There was no release for 22.9.0.

### Version 22.8.0

There was no release for 22.8.0.

### Version 22.7.0

There was no release for 22.7.0.

### Version 22.6.0

There was no release for 22.6.0.

### Version 22.5.0

There was no release for 22.5.0.

### Version 22.4.0

There was no release for 22.4.0.

### Version 22.3.0

There was no release for 22.3.0.

### Version 22.2.0

There was no release for 22.2.0.

### Version 22.1.0

There was no release for 22.1.0.

## Machine Agent

### Version 22.12.0 - December 21, 2022

This release includes:

- Support for predefined tags from Microsoft Azure and custom tags defined in Azure Virtual Machines (VM) for Linux and Windows. See [Server Tagging](#).
- Two sets of Machine Agent Docker images. Each set includes Debian and Alpine images for non-root and root users. See [Access Machine Agent Docker Images](#).
- The following third-party library upgrades:

Library	Previous Version	Upgraded Version
com.fasterxml.woodstox:woodstox-core	6.2.7	6.4.0
org.yaml:snakeyaml	1.32	1.33

### Version 22.11.0 - November 28, 2022

This release includes upgrades to the following libraries:

Library	Previous Version	Upgraded Version
JRE	JRE 11.0.16 as Zulu 11.58 (JDK 11.0.16.1)	JRE 11 as Zulu 11.60 (JDK 11.0.17)
jackson-databind	2.13.2.2	2.14.0
org.yaml:snakeyaml	1.29	1.32

Library	Previous Version	Upgraded Version
org.exist- db.thirdparty.xerces.xercesImpl	2.12.1	2.12.2
org.apache.commons:commons- compress	1.20	1.21

### Version 22.10.0 - October 27, 2022

This release includes support for SCS 1.3.23 and custom keystore formats. See [Encrypt Agent Credentials](#).

### Version 22.9.0 - September 29, 2022

This release includes:

- An option to specify a custom JRE location for the Machine Agent on Windows. See [Specify a Custom JRE Location on Windows](#).
- Timestamps are now automatically added to the Machine Agent's log4j configuration.
- Upgrades to the following libraries:

Library	Previous Version	Upgraded Version
com.squareup.okhttp3:okhttp	4.9.3	4.10.0
logging-interceptor	4.9.3	4.10.0

### Version 22.8.0 - August 29, 2022

Machine Agent bug fixes were resolved in the bundled 22.8.0 Analytics Agent release. See [22.8 Agent Resolved Issues](#).

This release includes:

- Upgrades to the following JRE versions:

Operating Systems	Previous JRE Version	Upgraded JRE Version
<ul style="list-style-type: none"> <li>• AARCH64</li> <li>• Linux</li> <li>• Solaris sparcv9</li> <li>• Windows</li> <li>• Solaris x64</li> </ul>	JRE 11.0.15 (Zulu 11.56)	JRE 11.0.16 (Zulu 11.58)

- Upgrades to the following libraries:

Library	Previous Version	Upgraded Version
jetty-client	9.4.46.v20220331	9.4.48.v20220622

Library	Previous Version	Upgraded Version
jetty-proxy	9.4.46.v20220331	9.4.48.v20220622

### Version 22.7.0 - July 28, 2022

This release includes:

- Machine Agent 22.7.0 has been tested and confirmed to be supported on Windows 2022. See [Supported Environments](#).
- Upgrades to the following libraries:

Library	Previous Version	Upgraded Version
jetty-client	9.4.39.v20210325	9.4.46.v20220331
jetty-proxy	9.4.39.v20210325	9.4.46.v20220331

### Version 22.6.0 - June 29, 2022

This release includes a bug fix and:

- The Machine Agent installation link was removed from the Getting Started Wizard. To download the Machine Agent, visit <https://accounts.appdynamics.com/downloads> and see [Install the Machine Agent](#).
- Machine Agent 22.6.0 is tested and confirmed to be supported on Red Hat Enterprise Linux (RHEL) 9 and Windows 2012. See [Tested Platforms](#).
- The following library is upgraded:

Library	Previous Version	Upgraded Version
dropwizard-jetty	2.0.22	2.0.29

 AppDynamics recommends using Machine Agent 22.6.0 for AIX OS.

### Version 22.5.0 - May 26, 2022

This release includes a bug fix and:

- Upgrades to the following JRE versions:

Operating System	Previous JRE Version	Upgraded JRE Version
<ul style="list-style-type: none"> <li>◦ AARCH64</li> <li>◦ Linux</li> <li>◦ Solaris sparcv9</li> <li>◦ Windows</li> </ul>	JRE 11.0.14 (Zulu 11.52)	JRE 11.0.15 (Zulu 11.56)

Operating System	Previous JRE Version	Upgraded JRE Version
Solaris x64	JRE 8u322 (Zulu 8.62)	JRE 11.0.15 (Zulu 11.56)

- Upgrades to the following third-party libraries:

Library	Previous Version	Upgraded Version
Oshi	5.7.4	6.1.6

### Version 22.4.0 - April 29, 2022

This release includes:

- On Linux systems, the flag `-Dappdynamics.machine.agent.extensions.calcVolumeFreeAndUsedWithDfCommand` is now set to `TRUE` by default. See [Configure Disk Usage Metric Collection on Linux](#).
- The `solaris_sparcv9` Java version was upgraded to JRE11.
- The following third-party libraries were upgraded:

Library	Previous Version	Upgraded Version
<code>jackson-databind</code>	2.13.1	2.13.2.2
Jakarta Expression Language 3.0 Implementation	3.0.3	3.0.4
Jetty (Java-based HTTP/1.x, HTTP/2, Servlet, WebSocket server)	9.4.39.v20210325	9.4.44.v20210927
<code>org.webjars:jquery</code>	3.5.1	3.6.0
<code>com.google.guava</code>	31.0.1-jre	31.1-jre
<code>org.bouncycastle</code>	1.0.2.1	1.0.2.3
<code>org.apache.commons:commons-compress</code>	1.20	1.21

### Version 22.3.0 - March 30, 2022

This release includes the following enhancements:

- The Linux JRE version was upgraded to JRE11 (Zulu 11.54), which corresponds to JDK Version 11.0.14.
- The Windows and Solaris JRE version was upgraded to Zulu 8.60, which corresponds to JDK version 8u322.
- The Machine Agent is now FIPS compliant.

AppDynamics recommends using Machine Agent 22.2.0 for AIX OS.

The 22.4.0 Machine Agent release will include:

On Linux systems, the flag `-Dappdynamics.machine.agent.extensions.calcVolumeFreeAndUsedWithDfCommand` will be set to `TRUE` by default. See [Configure Disk Usage Metric Collection on Linux](#) for more details on current disk usage metrics.

## Version 22.2.0 - February 24, 2022

This release includes:

- Add support for the ARM64/AARCH64 platform on Linux. See [Machine Agent Requirements and Supported Environments](#).
- Upgrade the following libraries:
  - `com.squareup.okhttp3:okhttp:4.9.3`
  - `com.squareup.okhttp3:logging-interceptor:4.9.3`

## Version 22.1.0 - January 28, 2022

This release includes a bug fix and the following enhancements:

- Machine Agent on Linux now supports `procps 3.3.x` for memory metrics
- Upgraded the following libraries:

Library	Upgraded Version
<code>ch.qos.logback:logback-classic</code>	1.2.10
<code>com.squareup.okhttp3:okhttp</code>	4.2.2
<code>okhttp3:logging-interceptor</code>	4.2.2
<code>org.bouncycastle:bcprov-jdk15on</code>	1.70
<code>com.google.guava:guava</code>	31.0.1-jre
<code>org.eclipse.jetty:jetty-http</code>	9.4.44.v20210927
<code>commons-io</code>	2.11.0
<code>org.apache.ant:ant</code>	1.10.12
<code>org.projectlombok:lombok</code>	1.18.22
<code>com.fasterxml.jackson.core*</code>	2.13.1
<code>com.fasterxml.jackson.dataformat*</code>	2.13.1
<code>jacoco</code>	0.8.7

## MAUI Agent

### Version 22.12.0

There was no release for 22.12.0.

---

### Version 22.11.0

There was no release for 22.11.0.

### Version 22.10.0 - October 27, 2022

This release includes minor improvements.

### Version 22.9.0 - September 2, 2022

The MAUI Agent monitors .NET MAUI applications. To get started with the MAUI Agent, see [Instrument .NET MAUI Applications](#).

### .NET Agent

#### Version 22.12.1 - December 22, 2022

This release includes bug fixes.

#### Version 22.12.0 - December 6, 2022

This release includes:

- Sending the agent version as a part of the registration request.
- Investigation of snapshots reported.

Note: .NET Agent 22.12.0 supports .NET Core 3.1, but is the last version that supports it. See [End of Support Notice: .NET Agent Ends of Support for .NET Core 3.1](#).

#### Version 22.11.0 - November 11, 2022

This release includes support for .NET 7. See [.NET Supported Environments](#).

#### Version 22.10.0 - October 6, 2022

This release includes bug fixes.

#### Version 22.9.0 - September 12, 2022

This release includes:

- Reporting `container-id` resource as OpenTelemetry resource.
- Logging performance improvements.
- Automatic discovery of program entry points to load the agent.

#### Version 22.8.0 - August 3, 2022

This release includes:

- Optimization for string concatenation in paths.
- Support for OpenTelemetry Error reporting.
- Fixes and improvements for OpenTelemetry in the .NET Agent.

#### Version 22.7.0 - July 21, 2022

This release includes:

- Optimizing concurrent hash map utilization for exit calls when Network Visibility is turned off.
- Moving bootstrap launch condition to the application main entry point for .NET Agent on Windows.
- Logging method, class, and assembly names for discovered entry points

---

## Version 22.6.0 - June 29, 2022

This release includes:

- Enabling the `enable_tls12` configuration for the .NET Machine Agent.
- Fixing snapshots that are not captured.
- Removing windows specific MutexSecurity.
- Ensuring the bootstrap auto-transform entry-point method is configurable.
- Integrating OpenTelemetry SDK into .NET Agent. See [Enable OpenTelemetry in the .NET Agent](#).

## Version 22.5.1 - June 6, 2022

This release includes a bug fix.

## Version 22.5.0 - May 25, 2022

This release:

- Implements the agent side of supported controller features for .NET.
- Ends support for .NET Framework 4.5.2, 4.6, 4.6.1 and .NET 5. See [.NET Supported Environments](#) and [Support Advisory: .NET Agent End of Support for .NET 5](#).
- Adds support for grammar in agent configuration. See [Use Grammars to Configure the .NET Agent](#).
- Adds support for MS SQL Client instrumentation from the nuget package `Microsoft.Data.SqlClient`.
- Improves the following: reflection for `http` response types, assembly metadata validation for loaded types, type equality operations, and usage of lock objects.

## Version 22.4.0 - April 5, 2022

This release:

- Signs `AppDynamics.Agent.netstandard.dll` in Agent NuGet packages.
- Improves dynamic reflection with runtime type re-binding capability.
- Extracts process identity for .NET Agent on Linux to make parity with Windows Agent.
- Uses `stdout` instead of `temp-file` communication for processing.

## Version 22.3.0 - March 15, 2022

This release includes:

- Adding logging messages for Network Visibility communication.
- Switching the concurrent hash map internal implementation.
- Adjusting the agent to toggle Business Transitions based on GDPR.

## Version 22.2.0 - February 17, 2022

This release includes:

- Agent bootstrap Unified Profiler for methods outside of `mscorlib`
- Enable `FULL_AGENT` feature by default

## Version 22.1.1 - January 28, 2022

This release enables snapshot collections when stack trace sampling fails.

## Version 22.1.0 - January 20, 2022

This release includes:

- Support for `mscorlib` custom bootstrapped functions in Linux Profiler
- Support for Unicode file format in Linux Agent configuration file
- Logging improvements

---

## Network Agent

### Version 22.12.0

There was no release for 22.12.0.

### Version 22.11.0

There was no release for 22.11.0.

### Version 22.10.0

There was no release for 22.10.0.

### Version 22.9.0

There was no release for 22.9.0.

### Version 22.8.0

There was no release for 22.8.0.

### Version 22.7.0

There was no release for 22.7.0.

### Version 22.6.0

There was no release for 22.6.0.

### Version 22.5.0

There was no release for 22.5.0.

### Version 22.4.0

There was no release for 22.4.0.

### Version 22.3.0

There was no release for 22.3.0.

### Version 22.2.0

There was no release for 22.2.0.

### Version 22.1.0

There was no release for 22.1.0.

## Node.js Agent

### Version 22.12.0

There was no release for 22.12.0.

### Version 22.11.0 - November 30, 2022

This release includes support for Node.js version 18. See [Node.js Supported Environments](#).

### Version 22.10.0

There was no release for 22.10.0.

### Version 22.9.0 - September 29, 2022

This release includes support for Node.js version 17. See [Node.js Supported Environments](#).

### Version 22.8.0

There was no release for 22.8.0.

### Version 22.7.0 - July 21, 2022

This release includes:

- Support for Cisco Secure Application Vulnerability Reporting. See [Vulnerability Reporting on Node.js Agent](#).
- Upgrade of the LibAgent to version 22.7.0-2120.
- Support for connection retries in Secure Application.
- Support for `container.id` to resource metadata.

### Version 22.6.0

There was no release for 22.6.0.

### Version 22.5.0 - May 11, 2022

This release includes support for common environment variables to configure the Node.js Agent.

### Version 22.4.0

There was no release for 22.4.0.

### Version 22.3.0 - March 30, 2022

This release includes support for OpenTelemetry. See [Instrument Applications with AppDynamics for OpenTelemetry™](#).

### Version 22.2.0 - February 28, 2022

This release:

- Integrates LibAgent version 21.8.0-1674 with the Node.js Agent
- Captures queries made by `cursor` on MongoDB version 4.x.
- Removes redundant `log4js` dependencies
- Upgrades the `shelljs` current version to version 0.8.5.

### Version 22.1.0

There was no release for 22.1.0.

### Node.js Serverless Tracer

### Version 22.12.0

There was no release for 22.12.0.

### Version 22.11.0

There was no release for 22.11.0.

**Version 22.10.0**

There was no release for 22.10.0.

**Version 22.9.0**

There was no release for 22.9.0.

**Version 22.8.0**

There was no release for 22.8.0.

**Version 22.7.0**

There was no release for 22.7.0.

**Version 22.6.0**

There was no release for 22.6.0.

**Version 22.5.0**

There was no release for 22.5.0.

**Version 22.4.0**

There was no release for 22.4.0.

**Version 22.3.0**

There was no release for 22.3.0.

**Version 22.2.0**

There was no release for 22.2.0.

**Version 22.1.0**

There was no release for 22.1.0.

**PHP Agent****Version 22.12.0 - December 7, 2022**

This release supports PHP 8.1. See [PHP Supported Environments](#).

**Version 22.11.0 - November 29, 2022**

This release includes bug fixes and upgrades Java proxy.

**Version 22.10.0 - October 25, 2022**

This release includes bug fixes and updates to the Java proxy.

**Version 22.9.0**

There was no release for 22.9.0.

**Version 22.8.0 - August 5, 2022**

This release includes updates to the Java proxy.

---

**Version 22.7.0**

There was no release for 22.7.0.

**Version 22.6.0**

There was no release for 22.6.0.

**Version 22.5.0**

There was no release for 22.5.0.

**Version 22.4.0**

There was no release for 22.4.0.

**Version 22.3.0 - March 3, 2022**

This release includes support to report analytics data after a specific number of data events/transactions or after a specific time interval. See [Configure Transaction Analytics for Node.js, PHP, and Python Applications](#).

**Version 22.2.0**

There was no release for 22.2.0.

**Version 22.1.1 - January 20, 2022**

This release includes bug fixes.

**Version 22.1.0 - January 7, 2022**

This release upgrades the Apache log4j library to version 2.17.1.

**Python Agent****Version 22.12.0**

There was no release for 22.12.0.

**Version 22.11.0**

There was no release for 22.11.0.

**Version 22.10.0 - October 27, 2022**

This release includes updates to the Java proxy.

**Version 22.9.0**

There was no release for 22.9.0.

**Version 22.8.0 - August 30, 2022**

This release includes bug fixes.

**Version 22.7.0 - July 19, 2022**

This release includes updates to the Jackson Databind library v2.13.3.

**Version 22.6.0**

There was no release for 22.6.0.

**Version 22.5.0 - May 26, 2022**

This release includes a bug fix.

**Version 22.4.0 - April 27, 2022**

This release includes support for the Python 3.10 version. See [Python Supported Environments](#).

**Version 22.3.0 - March 30, 2022**

This release includes a minor bug fix.

**Version 22.2.0 - February 25, 2022**

This release includes bug fixes.

**Version 22.1.1 - January 27, 2022**

This release includes support for the ASGI-based FastAPI framework (v0.72.0 - v0.73.0).

**Version 22.1.0 - January 7, 2022**

This release upgrades the Apache log4j library to version 2.17.1.

.

### Version 22.8.0

There was no release for 22.8.0.

### Version 22.7.0

There was no release for 22.7.0.

### Version 22.6.0 - June 28, 2022

This release includes new proxy server configurations for the Agent and Heimdall. See [Configure Web Monitoring PSA and API Monitoring PSA](#)

.

### Version 22.5.0 - May 5, 2022

This release adds support to enable proxy configuration using environment variables. See [Configure Web Monitoring PSA and API Monitoring PSA](#)

.

### Version 22.4.0

There was no release for 22.4.0.

### Version 22.3.0

There was no release for 22.3.0.

### Version 22.2.0

There was no release for 22.2.0.

### Version 22.1.0 - January 31, 2022

A new API monitoring Private Synthetic Agent is released. This agent can be used to monitor public or private APIs from any location. See [Install the API Monitoring PSA](#)

.

## Xamarin Agent

### Version 22.12.0

There is no release for 22.12.0

### Version 22.11.0

There is no release for 22.11.0

### Version 22.10.0 - October 27, 2022

This release includes minor improvements.

### Version 22.9.0

There is no release for 22.9.0.

**Version 22.8.0**

There is no release for 22.8.0.

**Version 22.7.0**

There is no release for 22.7.0.

**Version 22.6.0**

There is no release for 22.6.0.

**Version 22.5.0**

There is no release for 22.5.0.

**Version 22.4.0 - April 18, 2022**

This release includes a customization to attach custom user data to a network request. See [Attach a Custom User Data Property to a Network Request](#)

**Version 22.3.0 - March 17, 2022**

This release includes enabling and customizing Xamarin-specific automatic instrumentation of page tracking and UI tracking. See [Enable Xamarin Automatic Instrumentation](#).

**Version 22.2.0 - February 14, 2022**

This release includes support for Automatic Network Request Instrumentation, made available as a separate beta [NuGet](#) package. See [Instrument Xamarin Applications](#) for details.

**Version 22.1.0**

There was no release for 22.1.0.

**21.x Agent Releases****Analytics Agent****Version 21.12.0**

This release includes bug fixes.

**Version 21.8.0**

There was no release for 21.8.0.

---

## Version 21.7.0 - July 26, 2021

This release includes:

- Authentication to pipeline resources
- libjpeg upgrades
- Java Runtime Environment (JRE) upgrade to version 1.8.0\_292

## Version 21.6.0 - June 24, 2021

This release includes the Netty third-party library upgrade to version 4.1.65.Final.

## Version 21.5.0 - May 27, 2021

This release includes the third-party library upgrades:

- Jetty upgrade to version 2.34.
- Netty upgrade to version 4.1.63.Final.

## Version 21.4.0 - April 22, 2021

This release includes the Jetty third-party library upgrade to version 9.4.39.v20210325.

## Version 21.3.0 – March 25, 2021

This release includes the following enhancements:

- The Analytics Agent bundled in Machine Agent 20.8 has enhanced improvements
- The Analytics Agent Jetty libraries are upgraded
- The Analytics Agent Jersey is upgraded
- The Dropwizard and Hibernate Validator libraries are upgraded
- The unused HTTP methods in Analytics Agent have been disabled

## Version 21.2.1 – February 25, 2021

The following third-party libraries have been upgraded.

- `com.fasterxml.jackson.core:jackson-databind:2.12.0`
- `com.google.guava:guava:30.0-jre`
- `commons-io:commons-io:2.8.0`
- `guava: 30.0-jre`
- `httpclient: 4.5.13`
- `jackson-core: 2.12.0`
- `jackson-databind: 2.12.0`
- `jetty-server to 9.4.30.v20200611.jar`
- `jetty-webapp to 9.4.33.v20201020.jar`
- `junit:junit:4.13.1`
- `netty-all: 4.1.55`
- `org.apache.ant:ant:1.10.9`
- `org.apache.httpcomponents:httpclient:4.5.13`
- `org.bouncycastle:bcprov-jdk15on:1.67`
- `org.eclipse.jetty:jetty-server:9.4.35.v20201120`
- `org.eclipse.jetty:jetty-webapp:9.4.35.v20201120`
- `org.exist-db.thirdparty.xerces:xercesImpl:2.12.1`
- `org.hibernate:hibernate-validator:6.1.6.Final`

## Version 21.1.0

There was no release for 21.1.

## Android Agent

### Version 21.12.0

There was no release for 21.12.0.

### Version 21.11.1 - November 2, 2021

This release includes minor fixes and optimizations.

### Version 21.10.0

There was no release for 21.10.0.

### Version 21.9.0

There was no release for 21.9.0.

### Version 21.8.0

There was no release for 21.8.0.

### Version 21.7.0

There was no release for 21.7.0.

### Version 21.6.0.2068 - June 22, 2021

Android Agent 21.6.0.2068 includes a customization to [attach a custom user data property to a network request](#).

### Version 21.5.0 - May 17, 2021

Android Agent 21.5.0 released with minor enhancements and fixes.

### Version 21.4.0

There was no release for 21.4.0.

### Version 21.3.0

There was no release for 21.3.0.

### Version 21.2.0 - February 18, 2021

Android Agent 21.2.0 released with [minor bug fixes](#) and API enhancements:

- [Disable the agent to stop sending user data to the collector](#)
- [Disable crash reporting](#)

Manual and automatic screenshots are limited to one screenshot per 10-second interval.

### Version 21.1.0

There was no release for 21.1.

## Apache Web Server Agent

### Version 21.12.3 - December 22, 2021

This release upgrades the Apache `log4j` library to version 2.17.0.

---

---

**Version 21.12.2 - December 22, 2021**

This release upgrades the Apache `log4j` library to version 2.17.0.

**Version 21.12.1 - December 15, 2021**

This release upgrades the Apache `log4j` library to 2.16.0.

**Version 21.11.0**

There was no release for 21.11.0.

**Version 21.10.0**

There was no release for 21.10.0.

**Version 21.9.0**

There was no release for 21.9.0.

**Version 21.8.0**

There was no release for 21.8.0.

**Version 21.7.0 - July 14, 2021**

This release allows you to configure the cleanup timer `AppDynamicsRequestCacheCleanupInterval`. You can use this configuration for Java proxy to clean up the request cache. See, [Past Agent Releases](#).

**Version 21.6.0**

There was no release for 21.6.0.

---

### Version 21.8.0

There was no release for 21.8.0.

### Version 21.7.4 - July 28, 2021

This release includes upgrades to Data Filters and `input strings`.

### Version 21.6.0

There was no release for 21.6.0.

### Version 21.5.0

There was no release for 21.5.0.

### Version 21.4.0

There was no release for 21.4.0.

### Version 21.3.0

There was no release for 21.3.

### Version 21.2.0

There was no release for 21.2.

### Version 21.1.0

There was no release for 21.1.

## Cluster Agent

### Version 21.12.0 - December 20, 2021

This release includes these enhancements:

- The AppDynamics Operator 21.12.0 is a major release and is compatible with Cluster Agent  $\geq 21.12.0$  only. The earlier release versions  $\leq 0.6.11$  work only with Cluster Agent versions  $\leq 21.10.0$ .
- AppDynamics Operator release 21.12.0 is secure and the images contain no CVEs.
- Cluster Agent Helm Charts version 1.1.0 is a major release. It is only compatible with Cluster Agent  $\geq 21.12.0$  and AppDynamics Operator  $\geq 21.12.0$ . The earlier versions of helm charts (versions  $\leq 0.1.19$ ) works with only Cluster Agent  $\leq 21.10.0$  and AppDynamics Operator  $\leq 0.6.11$ .
- You can now use Cluster Agent Helm Charts to install Infrastructure Visibility. Also, you can use Cluster Agent Helm charts to install Cluster Agent and Infrastructure Visibility simultaneously.
- You can get the Operator artifacts embedded in the Cluster Agent artifacts from the download portal to create custom Operator Images.
- AppDynamics Operator Github account will be deprecated after December 31, 2021.

### Version 21.11.0

There was no release for 21.11.0.

### Version 21.10.0 - October 28, 2021

This release includes the following enhancements:

- The Cluster Agent go language version is upgraded.
- You can now use the `overrideVolumeMounts` property in the `infraviz.yaml` file to list the volumes that you require to mount.

- 
- The `installClusterAgent` property is introduced to install Cluster Agent with Helm chart. See [Install the Cluster Agent with Helm Charts](#).

### Version 21.9.0

There was no release for 21.9.0.

### Version 21.8.0

There was no release for 21.8.0.

### Version 21.7.0 - July 28, 2021

This release includes these enhancements:

- The Infrastructure Visibility properties for `enableServerViz`, `enableContainerHostId` and `enableDockerViz` variables have changed to boolean to make these variable datatypes consistent. See, [InfraViz Configuration Settings on Past Agent Releases](#).
- You can now add labels to the Cluster Agent pod by using `labels` in the Cluster Agent Configuration file. See, `labels` on [Past Agent Releases](#).
- The Cluster Agent uses the CustomResourceDefinitions API version that is not supported in newer versions of Kubernetes. Therefore, the CustomResourceDefinitions API for the Cluster Agent operator is updated for Kubernetes 1.16 and later to support monitoring Kubernetes v1.22 and later.

### Version 21.6.0

There was no release for 21.6.0.

### Version 21.5.0 - May 25, 2021

You can now use `resourcesNetViz` parameter within the `infraviz.yaml` file to set the resources for the Network Visibility container.

### Version 21.4.0

There was no release for 21.4.0.

### Version 21.3.1 – March 26, 2021

This release includes the support for Infrastructure Visibility with Cluster Agent. You can now use the `infraviz.yaml` file with Cluster Agent Operator. For more information, see [Install Infrastructure Visibility with the Kubernetes CLI](#).

### Version 21.3.0 – March 25, 2021

This release of Cluster Agent does not include any enhancement but fixes some minor issues.

### Version 21.2.0 – February 24, 2021

This release of Cluster Agent includes the following updates:

- Cluster Agent is available with the 0.6.7 version of the operator. You can find the list of supported operators for each Cluster Agent at [Cluster Agent and the Operator Compatibility Matrix](#).
- The deployment modes for the Cluster Agent Helm chart are now `PRIMARY` and `NAMESPACED` instead of `MASTER` and `NAMESPACED`. See [Install the Cluster Agent with Helm Charts](#).

### Version 21.1.0

There was no release for 21.1.

## Cordova Plugin

### Version 21.12.0

There was no release for 21.12.0.

### Version 21.11.0

There was no release for 21.11.0.

### Version 21.10.0

There was no release for 21.10.0.

### Version 21.9.0

There was no release for 21.9.0.

### Version 21.8.0

There was no release for 21.8.0.

### Version 21.7.0

There was no release for 21.7.0.

### Version 21.6.0

There was no release for 21.6.0.

### Version 21.5.0 - May 18, 2021

Cordova Plugin 21.5.0 release includes iOS and Android Agents 21.5.0

### Version 21.4.0

There was no release for 21.4.0.

### Version 21.3.0

There was no release for 21.3.

### Version 21.2.1 – February 19, 2021

Cordova Plugin 21.2.1 released with minor fixes and enhancements, and includes the latest version of the iOS and Android Agents.

### Version 21.1.0

There was no release for 21.1.

## Database Agent

### Version 21.12.4 - December 29, 2021

This release upgrades the `log4j` library to 2.17.1.

### Version 21.12.3 - December 22, 2021

This release includes a bug fix. See

[Agent Resolved Issues](#)

### Version 21.12.2 - December 20, 2021

This release upgrades the `log4j` library to 2.17.0.

### Version 21.12.1 - December 15, 2021

This release upgrades the `log4j` library to 2.16.0.

### Version 21.12.0 - December 11, 2021

This release includes upgrades to the following Database Agent libraries:

Library	Upgraded Version
<code>netty</code>	4.1.70
<code>mysql-connector</code>	8.0.27
<code>log4j</code>	2.15.0

### Version 21.11.0 - November 22, 2021

This release includes these enhancements:

- You can now connect to an MSSQL cluster using SSL. See [Monitor SSL-enabled Microsoft SQL Database](#).
- These libraries are upgraded:
  - commons-io version 2.11.0
  - netty-codec and netty-handler version 4.1.69.Final
  - commons-dbcp2 version 2.9.0
  - mysql-connector-java version 8.0.26
  - jackson-dataformat-cbor version 2.13.0
  - jackson-annotations version 2.13.0
  - jackson-core version 2.13.0
  - jackson-databind version 2.13.0
  - jackson-dataformat-yaml version 2.13.0
  - jackson-dataformat-xml version 2.13.0
  - jackson-datatype-guava version 2.13.0
  - jackson-module-guice version 2.13.0

### Version 21.10.0

There was no release for 21.10.0.

### Version 21.9.0 - September 24, 2021

This release provides support for the following roles of the MongoDB replica sets and the shard clusters:

- primary
- secondary
- startup
- recovering
- startup2
- unknown
- arbiter
- down

- rollback

 To view these roles on the **Topology** tab, you require the Database Agent version  $\geq 21.9$  and Controller version  $\geq 21.11$ .

### Version 21.8.0

There was no release for 21.8.0.

### Version 21.7.0 - July 22, 2021

This release includes bug fixes.

### Version 21.6.0.2406 - June 23, 2021

This release included resolved issues. For the list of resolved issues, see [Past Agent Resolved Issues](#).

### Version 21.5.0

There was no release for 21.5.0.

### Version 21.4.0 - April 21, 2021

This release includes the following enhancements:

You can now view:

- Costly operations in execution plan along with the warnings in the execution plan. See [Database Query Execution Plan Window](#)
- Additional Cassandra metrics such as Dropped Mutations, Max Partition Size, Messaging Latency, Read Failures, Repair Age Percentage, and Write Failures. See [Database Monitoring Metrics](#).

### Version 21.3.0

There was no release for 21.3.

### Version 21.2.0 – February 17, 2021

This release of Database Agent collects additional Couchbase metrics. For the list of resolved issues, see [Past Agent Resolved Issues](#).

### Version 21.1.0

There was no release for 21.1.

### Go SDK

### Version 21.12.0

There was no release for 21.12.0.

### Version 21.11.0

There was no release for 21.11.0.

### Version 21.10.0

There was no release for 21.10.0.

---

**Version 21.9.0**

There was no release for 21.9.0.

**Version 21.8.0**

There was no release for 21.8.0.

**Version 21.7.0**

There was no release for 21.7.0.

**Version 21.6.0**

There was no release for 21.6.0.

**Version 21.5.0**

There was no release for 21.5.0.

**Version 21.4.0**

There was no release for 21.4.0.

**Version 21.3.0**

There was no release for 21.3.

**Version 21.2.0**

There was no release for 21.2.

**Version 21.1.0**

There was no release for 21.1.

**IBM Integration Bus Agent****Version 21.12.0**

There was no release for 21.12.0.

**Version 21.11.0**

There was no release for 21.11.0.

**Version 21.10.0**

There was no release for 21.10.0.

**Version 21.9.0 - September 29, 2021**

This release includes the bug fixes for cross-application Business Transaction correlation and percentile metrics registration.

**Version 21.8.0**

There was no release for 21.8.0.

**Version 21.7.0**

There was no release for 21.7.0.

---

**Version 21.6.0**

There was no release for 21.6.0.

**Version 21.5.0 - May 27, 2021**

The IIB Agent 21.5.0 is released with bug fixes for cross-app BT correlation.

**Version 21.4.1 - April 27, 2021**

The IIB Agent 21.4.1 release introduces the Flow Visibility feature. The timings are collected only for flow start and end and any external calls made from within a flow. Therefore, the expected CPU cost of instrumenting the flows with the agent is reduced, especially for complex flows. See [IIB Agent Flow Level Visibility](#).

**Version 21.4.0 - April 5, 2021**

The IIB Agent 21.4.0 release introduces the cross-application Business Transaction correlation feature that helps you to correlate the business transactions passing through an IIB application.

**Version 21.3.0**

There was no release for 21.3.

**Version 21.2.0**

There was no release for 21.2.

**Version 21.1.0**

There was no release for 21.1.

**iOS Agent****Version 21.12.0 - December 7, 2021**

This release includes a local config setting for the fetch flag in JavaScript Agent Injection. This setting can be found in the SDK documentation. See [AppDynamics iOS SDK](#).

**Version 21.11.0**

There was no release for 21.11.0.

**Version 21.10.0**

There was no release for 21.10.0.

**Version 21.9.0**

There was no release for 21.9.0.

**Version 21.8.1 - August 13, 2021**

This hotfix release includes changing the beacon handler NSURLSession back to NSURLConnection.

**Version 21.8.0 - August 9, 2021**

This release includes replacing NSURLConnection with NSURLSession to send beacon data to the collector.

---

### Version 21.7.0

There was no release for 21.7.0.

### Version 21.6.1 - July 23, 2021

iOS Agent 21.6.1 release fixed a bug that caused a crash during collector traffic when the device network is unavailable.

### Version 21.6.0.2497 - June 22, 2021

iOS Agent 21.6.0.2497 release includes a customization to [attach a custom user data property to a network request](#).

### Version 21.5.0 - May 12, 2021

iOS Agent 21.5.0 released with minor enhancements and fixes.

### Version 21.4.0

There was no release for 21.4.0.

### Version 21.3.0

There was no release for 21.3.

### Version 21.2.0 – February 16, 2021

Manual and automatic screenshots are limited to one screenshot per 10-second interval. See [Past Resolved and Known Issues by Release](#). and [iOS SDK Documentation](#).

### Version 21.1.0

There was no release for 21.1.

## Java Agent

### Version 21.12.0

There was no release for 21.12.0.

### Version 21.11.4 - January 7, 2022

This release includes:

- Apache `log4j` is upgraded to version 2.17.1
- For legacy agents, Apache `log4j` is upgraded to 2.12.4
- Support for OpenTelemetry. To enable the Java Agent for OpenTelemetry, you need Java Agent version  $\geq$  21.11.4 (we recommend using Java Agent version  $\geq$  22.3.0). See [Enable OpenTelemetry in the Java Agent](#). For a list of Java frameworks supported for OpenTelemetry, see [Supported Java Agent Frameworks for OpenTelemetry](#).

### Version 21.11.3 - December 20, 2021

This release upgrades Apache Log4j to version 2.17.0.

### Version 21.11.2 - December 15, 2021

This release upgrades Apache Log4j to version 2.16.0.

---

### Version 21.11.1 - December 10, 2021

This release upgrades Apache Log4j to version 2.15.0.

### Version 21.11.0 - December 3, 2021

This release includes support for:

- Microsoft Azure Spring Cloud workloads with AppDynamics. See [Monitor Azure Spring Cloud with Java Agent](#).
- Eclipse Vert.x Core version 4.2.x
- gRPC version 1.42.x
- JDK 17
- Micronaut version 3.1.4
- OkHttp version 4.9.3

See [Java Supported Environments](#).

### Version 21.10.0 - October 21, 2021

This release adds support for:

- GraalVM version 21.3.0
- JBoss Wildfly version 25.x
- OkHttp version 4.9.2
- gRPC version 1.40.x
- Kafka version 2.8.1
- logback version 1.2.3

See [Java Supported Environments](#).

### Version 21.9.0 - September 28, 2021

This release adds support for JBoss EAP 7.3. See [Java Supported Environments](#).

### Version 21.8.0 - August 24, 2021

This release includes the upgraded versions of `grpc-netty-shaded` and `snakeyaml` for Java Agent.

### Version 21.7.0 - August 11, 2021

This release adds support for the following:

- BellSoft JVM. See [Java Supported Environments](#).
- Mule 4.3. See [Java Supported Environments](#).
- WebMethods entry support. See [Java Supported Environments](#).

### Version 21.6.1 - July 12, 2021

This release adds entry support for Mule 4.2.x.

### Version 21.5.0 - May 26, 2021

Java Agent 21.5.0 released with minor enhancements and [fixes](#).

### Version 21.4.0 - April 20, 2021

- Java Agent 21.4.0 adds entry and exit support for Vert.x 4.0. See [Java Supported Environments](#).
- This release adds exit support for WSO2 API Microgateway. See [Java Supported Environments](#).
- An option to rediscover MBean servers periodically using a node property is introduced. See [App Agent Node Properties](#).
- Support has been added for JDK16. See [Java Supported Environments](#).

---

### Version 21.3.0 – March 23, 2021

- Java Agent 21.3.0 adds entry and exit support for Micronaut 2.0. See [Java Supported Environments](#).
- This release adds entry support for WSO2 API Microgateway. See [Java Supported Environments](#).

### Version 21.2.0 – February 15, 2021

The Java Agent 21.2.0 adds a new property to truncate the length of SQL statements. For more information, see [App Agent Node Properties](#).

### Version 21.1.1 - January 28, 2021

- Java Agent 21.1.1 adds support for Tomcat 10. For more information, see [Java Supported Environments](#).
- This release adds support for Ktor and Netty frameworks. For more information, see [Java Supported Environments](#).
- This release adds exit support for Couchbase database. For more information, see [Java Backend Detection](#).

### Version 21.1.0 - January 18, 2021

Java Agent 21.1.0 adds support for OOTB Detection for Maria DB. For more information, see [Java Supported Environments](#).

## JavaScript Agent

### Version 21.12.0 - December 16, 2021

This release includes:

- Angular 12 support with JS Agent 21.12.0
- Optimization to detect Content Security Policy (CSP) violations

### Version 21.11.0

There was no release for 21.11.0.

### Version 21.10.0

There was no release for 21.10.0.

### Version 21.9.0

There was no release for 21.9.0.

### Version 21.8.0

There was no release for 21.8.0.

### Version 21.7.0 - July 21, 2021

The JavaScript Agent 21.7.0 includes:

- [Support for the Nonce attribute](#)
- [Support for Angular 10-11 SPAs](#)

Controller 21.9.0 will support auto-injection for JavaScript 21.7.0.

### Version 21.6.0 - June 29, 2021

The JavaScript Agent 21.6.0 release includes:

- [A new API to disable the JavaScript Agent at runtime](#)
- [A workaround for ensuring SAP Fiori launchpad pages load correctly](#)

**Version 21.5.0**

There was no release for 21.5.0.

**Version 21.4.0**

This release includes bug fixes.

**Version 21.3.0**

There was no release for 21.3.

**Version 21.2.0 – February 17, 2021**

See [Past Resolved and Known Issues by Release](#).

**Version 21.1.0**

There was no release for 21.1.

**Java Serverless Tracer****Version 21.12.0**

There was no release for 21.12.0.

**Version 21.11.0**

There was no release for 21.11.0.

**Version 21.10.0**

There was no release for 21.10.0.

**Version 21.9.0**

There was no release for 21.9.0.

**Version 21.8.0**

There was no release for 21.8.0.

**Version 21.7.0**

There was no release for 21.7.0.

**Version 21.6.0**

There was no release for 21.6.0.

**Version 21.5.0**

There was no release for 21.5.0.

**Version 21.4.0**

There was no release for 21.4.0.

**Version 21.3.0**

There was no release for 21.3.

---

---

## Version 21.2.0

There was no release for 21.2.

## Version 21.1.0

There was no release for 21.1.

## Machine Agent

### Version 21.12.7 - September 2, 2022

This release enables users to specify a custom JRE location for the Machine Agent on Windows. To do so:

- Set up an environment variable named `APPD_MACHINE_AGENT_JRE_HOME` and set its value to the JRE home folder.
- Uninstall the existing Windows service for the Machine Agent.
- Unzip the development build and reinstall the Windows service for the Machine Agent. When the service restarts, it should pick up the specified JRE.
- Restart the service if the value of the environmental variable is changed again.

### Version 21.12.6 - January 17, 2022

This release removes the `singularity-log4j` library. This library corresponds to Apache `log4j 1.0`.

### Version 21.12.5 - January 7, 2022

This release upgrades the Apache `log4j` library to 2.17.1.

### Version 21.12.4 - December 20, 2021

This release upgrades the Apache `log4j` library to 2.17.0.

### Version 21.12.3 - December 17, 2021

This release reverts a 21.11.0 enhancement that reported Duplex and MTU metrics on Windows.

### Version 21.12.2 - December 15, 2021

This release contains bug fixes.

### Version 21.12.1 - December 15, 2021

This release upgrades the Apache `log4j` library to 2.16.0.

### Version 21.12.0 - December 11, 2021

This release includes the following enhancements:

- Apache `log4j` library upgraded to 2.15.0
- `xercesImpl` library upgraded to 2.12.1

### Version 21.11.0 - November 24, 2021

This release includes:

- Linux only: JRE 11 upgraded to Zulu 11.52, which corresponds to JDK Version 11.0.13
- Rest of OS: JRE 8 upgraded to Zulu 8.58, which corresponds to JDK Version 8u312
- Enhancement to report Duplex and MTU metrics on Windows environments

### Version 21.10.0 - November 2, 2021

This release includes Analytics Agent fixes that are bundled in the Machine Agent.

---

## Version 21.9.0 - September 23, 2021

The following third-party libraries have been upgraded:

- Ant: 1.10.11-rc1

## Version 21.8.0

There was no release for 21.8.0.

## Version 21.7.0 - July 27, 2021

This release includes improvements to the Activate HTTP Listener. See [Machine Agent HTTP Listener](#).

## Version 21.6.0 - June 24, 2021

The Machine Agent 21.6.0 release includes:

- Changed the Process Metrics `Count` and `Total Process Count` Dynamic Monitoring Mode metric defaults from "Diagnostic" to "KPI". See [Default Monitoring Mode](#).
- Has updated JRE 8 from Java 8 Azul Zulu build version 8.52 to 8.54 .
- Has updated JRE 11 from Java 11 Azul Zulu build version 11.45 to 11.48 .

The following third-party libraries have been upgraded:

- Bouncy Castle 1.69
- Commons-IO 2.10.0
- Dropwizard 2.0.22
- Jetty 9.4.41.v20210516
- Oshi 5.7.4

## Version 21.5.0-3130 - May 19, 2021

Machine Agent 21.5.0 release:

- Deprecates the `metric.http.listener.host` property.

Upgrades these third-party libraries:

- Ant 1.10.10
- Dropwizard 2.0.21
- Fabric8-Kubernetes 4.13.3
- Jackson 2.12.3
- Jetty 9.4.40.20210413
- OSHI 5.7.2

## Version 21.4.0-3075 - April 22, 2021

This release of Machine Agent :

- has updated Java 8 Azul to build version 8.52 and Java 11 Azul to build version 11.45.
- supports `diskstats` output for Linux kernel versions  $\geq$  4.18

The following third-party libraries have been upgraded.

- dropwizard: 2.0.20
- guava: 30.0-ire
- Fabric8 Kubernetes: 4.13.2
- jackson-core: 2.12.0
- jackson-databind: 2.12.0
- jetty-server to 9.4.39.20210325
- Log4j2: 2.14.1

---

### Version 21.3.0-3059 – March 25, 2021

The Machine Agent release is bundled with the latest releases of the Analytics Agent and Network Agent.

### Version 21.2.0 – February 25, 2021

The Machine Agent has been updated, tested, and certified to work with the following:

- org.eclipse.jetty:jetty-server 9.4.36.v20210114
- org.eclipse.jetty:jetty-servlet 9.4.36.v20210114
- org.eclipse.jetty:jetty-servlets 9.4.36.v20210114
- org.bouncycastle:bcprov-jdk15on 1.68
- commons-net:commons-net 3.7.2
- commons-codec:commons-codec 1.15
- commons-validator:commons-validator 1.7
- io.dropwizard:dropwizard-jetty 2.0.18
- io.dropwizard:dropwizard-util 2.0.18
- com.google.guava:guava 30.1-jre
- com.fasterxml.jackson.\* 2.12.1
- io.fabric8:kubernetes-client 4.13.1

### Version 21.1.1 – June 11, 2021

- The Machine Agent resolved an issue with the `NoClassDefFoundError: java/sql/SQLException`. The extension class loader now uses a parent loader for any Java classes.

### Version 21.1.0 – January 22, 2021

- The Machine Agent and Server Visibility on Linux bundles have been updated to Java 11 Azul JRE. If you upgrade the Linux Machine Agent to 21.1.0, then you must also upgrade all [extensions](#) to their latest versions to support Machine Agent 21.1.0. See [Machine Agent Requirements and Supported Environments](#) for details.
- The Machine Agent has updated the bundled Analytics Agent to version 20.10.0-7428.

## .NET Agent

### Version 21.12.1 - December 21, 2021

This release includes:

- Validating types are as expected for async tracking
- Enabling async tracking through state field injection on Linux Agent

### Version 21.12.0 - December 17, 2021

This release includes:

- Bug fixes
- Refactor all Http-based communications including adding support for HttpClient
- Avoid instrumenting default Azure processes OOTB
- Usage of Default Logger (console/file)
- Support of monitoring libraries and vulnerabilities with [Cisco Secure Application](#)

### Version 21.11.0 - November 2, 2021

This release includes:

- Support for .NET 6.0.
- Support for basic .NET Core metrics for .NET Agent on Linux, MSI-based .NET Agent for Windows, and .NET Microservices Agent for Windows, including applications on Azure.
- Usage of WeakReference for ASP.NET Core customer objects.
- Add logging to stack trace sampling code.

---

## Version 21.10.0 - October 15, 2021

This release includes:

- Usage of `WeakReference` in the dynamic reflector library.
- Linux Agent log errors / warnings to the console `STDERR` channel.
- Linux instrumentation for `AzureServiceBus` is in parity with Windows.
- Cleanup of unused code in `Poco Async` Interceptor and improves resource usages for Task related interceptors.
- Updated list of supported versions for the .Net Agent, aligning with vendor support. See, [.NET Supported Environments](#).

## Version 21.9.1 - September 30, 2021

This release includes bug fixes.

## Version 21.9.0 - September 22, 2021

This release includes:

- Updates to native dependencies.
- Allows to manage Linux Agent console output via environment variable (Windows Agent Parity).

## Version 21.8.1 - September 7, 2021

This release includes writing the `CORECLR` environment values to the logs.

## Version 21.8.0 - August 27, 2021

This release includes:

- Support for SQL Data Collector on Linux (known issues: SQL parameters may be shown twice, non-string parameters are shown as empty in Analytics UI)
- Docker image for latest tag was updated. See [Upgrade the .NET Agent for Linux](#) instructions.

## Version 21.7.0 - July 29, 2021

.NET Agent for Linux now supports the following:

- Agentless Analytics
- Attributes (annotations) used to define POCO
- Custom correlation
- Custom error detection
- HTTP Data Collectors
- All HTTP backend custom detection/naming configuration options
- Method Invocation Data Collectors (MIDC)
- Service Endpoint configuration

.NET Agent for Linux and .NET Agent for Windows Microservices Agent now supports basic .NET Core metrics.

.NET Machine Agent enhanced for periodic reporting of vCPU information.

## Version 21.6.0

There was no release for 21.6.0.

## Version 21.5.1 - June 17, 2021

.NET Agent has been updated with resolved issues. See [Past Resolved and Known Issues by Release](#).

---

## Version 21.5.0 - May 28, 2021

.NET Agent for Linux 21.5 incorporates significant architectural changes to accelerate the development of missing features in the Linux Agent relative to .NET Agent for Windows. These architectural changes do not affect .NET Agent for Windows (MSI and Microservices).

Because .NET Agent for Linux 21.5 is a significant architectural update, some issues may arise despite extensive testing performed. If you experience any blocking issues, please open a high priority support ticket where AppDynamics will provide workarounds or alternate options.

Generally, .NET Agent for Linux 21.5 maintains parity with existing features in .NET Agent for Linux < 21.5. However due to architectural updates, there are differences between .NET Agent for Linux >= 21.5 and .NET Agent for Linux < 21.5. Before you upgrade to .NET Agent for Linux 21.5, see [Upgrade the .NET Agent for Linux](#).

### Enhancements:

- Sensitive data filters for Linux. See [Filter Sensitive Data with the .NET Agent](#).
- Custom exit points for Linux. See [Exit Point Detection Rules](#).
- Instrumentation configuration enhancements for: `classIgnore`, `typeMatch 'Signature'`, `'IsSubClass'` `list` and `d regex` for Linux.
- ASP.NET instrumentation enhancements for Linux. See [ASP.NET Core Instrumentation Options](#).
- Redis backend detection for IP address endpoint for all platforms.
- EUM for .NET Core for Linux. See [Browser RUM Supported Environments](#).
- .NET extends support for BasicPublish and BasicConsume in the RabbitMQ client >= 6.0.0 for all platforms.
- .NET Agent supports SSL mutual authentication for Azure PaaS app services for Windows only.
- The download package options for .NET Agent on Linux have been updated. The ".NET Agent - 64-bit alpine-linux" package has been discontinued and is replaced with the ".NET Agent - 64-bit linux" package.
- .NET Agent supports custom trusted certificate validation for all .NET Core Linux and Windows.

## Version 21.4.0 - April 28, 2021

.NET Agent supports [mutual authentication \(mTLS\)](#) for Windows Agent for both .NET Full Framework and .NET Core applications; excluding Azure PaaS environments such as Azure App Services. See [Past Agent Releases](#).

## Version 21.3.0 – March 29, 2021

- .NET Agent for Windows running on .NET Core >= 3.1 supports async exit calls over HTTP to WCF services. The remote address, full URL, host, and port identifying properties and correlation are supported.
- .NET Agent supports the Controller service proxy feature.
- New instrumentation options for [ASP.NET Core](#).

See [Past Resolved and Known Issues by Release](#) for details

## Version 21.2.0 – February 24, 2021

The .NET 21.2.0 release includes:

- .NET Agent for Windows on .NET Core now automatically captures errors for loggers implementing the `Microsoft.Extensions.Logging.ILogger` API. The standard Error Detection configuration options apply.
- **CosmosDB for .NET Core on Windows is supported.**
- Added optimizations for Async Task tracking and Netviz socket tracking.

See [Past Resolved and Known Issues by Release](#).

---

## Version 21.1.0 – January 29, 2021

- Windows Agents now support End User Monitoring (EUM) for ASP.NET Core Web applications running on .NET Core 3.1 and .NET 5, including automatic Business Transaction correlation and automatic JavaScript Agent injection. Both MVC and Razor Pages are supported.
- Redis instrumentation is now supported on both .NET Full Framework and Core Framework on Windows.
- The Windows Agents can now automatically set the `HttpOnly` flag to `false` for EUM cookies on ASP.NET. To enable, set the `eum-auto-httponly-false` boolean node property to `true`.

## Network Agent

### Version 21.12.0

There was no release for 21.12.0.

### Version 21.11.0

There was no release for 21.11.0.

### Version 21.10.0

There was no release for 21.10.0.

### Version 21.9.0

There was no release for 21.9.0.

### Version 21.8.0

There was no release for 21.8.0.

### Version 21.7.0

There was no release for 21.7.0.

### Version 21.6.0

There was no release for 21.6.0.

### Version 21.5.0

There was no release for 21.5.0.

### Version 21.4.0

There was no release for 21.4.0.

## Version 21.3.0 – March 25, 2021

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#).

## Version 21.2.0 – February 25, 2021

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 21.1.0

There was no release for 21.1.

---

## Node.js Agent

### Version 21.12.0

There was no release for 21.12.0.

### Version 21.11.0

There was no release for 21.11.0.

### Version 21.10.0

There was no release for 21.10.0.

### Version 21.9.0 - September 30, 2021

This release removes support for Java proxy, and improves the Synchronous Call.

### Version 21.8.0 - August 4, 2021

This release removes support for Node.js versions 8 and 10.

### Version 21.7.0

There was no release for 21.7.0.

### Version 21.6.0 - June 25, 2021

The Node.js Agent 21.6.0 release includes resolves issues. For resolved issues, see [Past Agent Resolved Issues](#).

### Version 21.5.0 - May 28, 2021

This release includes:

- Support for gRPC. See [gRPC Support for the Node.js Agent](#).
- Availability for cross-application Business Transactions.

### Version 21.4.0 - April 16, 2021

This release includes no new features, but bug fixes. See [Past Agent Releases](#).

### Version 21.3.0

There was no release for 21.3.

### Version 21.2.0 – February 25, 2021

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 21.1.0 – January 29, 2021

- You can now use Node.js 15.
- You can also tune Analytics data limits with the agent settings.

## Node.js Serverless Tracer

### Version 21.12.0

There was no release for 21.12.0.

---

**Version 21.11.0**

There was no release for 21.11.0.

**Version 21.10.316 - October 18, 2021**

This hotfix includes an update to Axios version 0.21.3.

**Version 21.9.0**

There was no release for 21.9.0.

**Version 21.8.0**

There was no release for 21.8.0.

**Version 21.7.0 - July 27, 2021**

This release includes:

- Node.js Serverless Agent now enables SSL certificates from paths other than /var/task to load.
- Node.js Serverless Agent now supports version 21.6.304.

**Version 21.6.0**

There was no release for 21.6.0.

**Version 21.5.286 - May 10, 2021**

The Node.js Serverless Tracer has been updated to [21.5.286](#)

**Version 21.4.0**

There was no release for 21.4.

**Version 21.3.278 – March 26, 2021**

The Node.js Serverless Tracer has removed request 2.88.0 library and added axios 0.21.1 library. See [Past Resolved and Known Issues by Release](#) for details.

**Version 21.2.0**

There was no release for 21.2.

**Version 21.1.0**

There was no release for 21.1.

**PHP Agent****Version 21.12.2 - December 22, 2021**

This release upgrades the Apache `log4j` library to 2.17.0.

**Version 21.12.1 - December 15, 2021**

This release upgrades the Apache `log4j` library to 2.16.0.

**Version 21.11.0 - November 16, 2021**

This release includes bug fixes.

---

**Version 21.10.0**

There was no release for 21.10.0.

**Version 21.9.0**

There was no release for 21.9.0.

**Version 21.8.0**

There was no release for 21.8.0.

**Version 21.7.0 - July 29, 2021**

This release adds PHP Agent support for PHP 8. See, [Past Agent Releases](#).

**Version 21.6.0 - June 22, 2021**

PHP Agent now adds support for PHP ZTS. See, [Install PHP Agent with PHP ZTS](#).

**Version 21.5.0 - May 26, 2021**

PHP Agent 21.5.0 released with [bug fixes](#).

**Version 21.4.0**

There was no release for 21.4.

**Version 21.3.0**

There was no 21.3 release.

**Version 21.2.0 – February 24, 2021**

This release introduces an environment variable to set a unique host ID for the PHP Agent. See [PHP Agent Configuration Settings](#).

**Version 21.1.0 – January 27, 2021**

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues](#) for details.

**Python Agent****Version 21.12.2 - December 21, 2021**

This release upgrades the Apache `log4j` library to 2.17.0.

**Version 21.12.1 - December 15, 2021**

This release upgrades the Apache `log4j` library to 2.16.0.

**Version 21.11.0**

There was no release for 21.11.0.

**Version 21.10.0 - October 27, 2021**

This release includes support for Transaction Analytics for the Python Agent. See [Configure Analytics for Python Applications](#).

### End of Support Notice

This release ends support for:

- Python version 3.4 and 3.5
- Linux x86 32-bit architecture

See [AppDynamics End of Support Notices](#).

### Version 21.9.0 - September 30, 2021

This release includes:

- Updated the `end_bt()` API to allow user-provided exceptions.
- Added checks to handle the invalid configuration values.
- Updated the Python agent APIs to add maximum range-bound on the size of the input string.

### Version 21.8.0 - August 31, 2021

This release includes support for Alpine Linux. See [Python Supported Environments](#).

### Version 21.7.0

There was no release for 21.7.0.

### Version 21.6.0 - June 17, 2021

The Python Agent 21.6.0 release includes:

- [Ability to configure Java Proxy in a containerized environment](#)
- [Backend resolution improvement to identify service proxy as the backend](#)

### Version 21.5.0

There was no release for 21.5.0.

### Version 21.4.0

There was no release for 21.4.

### Version 21.3.0

There was no 21.3 release.

### Version 21.2.0 – February 2, 2021

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues](#) for details.

### Version 21.1.0

There was no 21.1 release.

### Python Serverless Tracer

#### Version 21.12.0

There was no release for 21.12.0.

#### Version 21.11.0

There was no release for 21.11.0.

**Version 21.10.0**

There was no release for 21.10.0.

**Version 21.9.0**

There was no release for 21.9.0.

**Version 21.8.0**

There was no release for 21.8.0.

**Version 21.7.0**

There was no release for 21.7.0.

**Version 21.6.0**

There was no release for 21.6.0.

**Version 21.5.0**

There was no release for 21.5.0.

**Version 21.4.0**

There was no release for 21.4.

**Version 21.3.0**

There was no 21.3 release.

**Version 21.2.0**

There was no 21.2 release.

**Version 21.1.0**

There was no 21.1 release.

**React Native Agent****Version 21.12.0**

There was no release for 21.12.0.

**Version 21.11.0 - November 2, 2021**

This release includes minor enhancements and fixes.

**Version 21.10.0**

There was no release for 21.10.0.

**Version 21.9.0 - September 17, 2021**

This release includes minor fixes and optimizations.

**Version 21.8.0**

There was no release for 21.8.0.

---

**Version 21.7.0**

There was no release for 21.7.0.

**Version 21.6.0**

There was no release for 21.6.0.

**Version 21.5.0**

There was no release for 21.5.0.

**Version 21.4.0 - April 5, 2021**

This release includes an API to manually track custom HTTP requests. See [Customize the React Native Instrumentation](#).

**Version 21.3.0**

There was no 21.3 release.

**Version 21.2.1 – February 19, 2021**

React Native Agent 21.2.1 supports `CrashReportCallback` to receive a report for native crashes. See [Customize the React Native Instrumentation](#).

**Version 21.1.0**

There was no 21.1 release.

**SAP****Version 21.12.0**

There was no release for 21.12.0.

**Version 21.11.0 - November 25, 2021**

SAP 21.11.0 released. See [Release Notes Version 21.11.0](#).

**Version 21.10.0**

There was no release for 21.10.0.

**Version 21.9.0**

There was no release for 21.9.0.

**Version 21.8.0 - August 20, 2021**

SAP 21.8.0 released. See [Release Notes Version 21.8.0](#).

**Version 21.7.0**

There was no release for 21.7.0.

**Version 21.6.0**

There was no release for 21.6.0.

**Version 21.5.0**

There was no release for 21.5.0.

**Version 21.4.0**

There was no release for 21.4.

**Version 21.3.0**

There was no 21.3 release.

**Version 21.2.0 – February 26, 2021**

See [Release Notes Version 21.2.0](#).

**Version 21.1.0**

There was no 21.1 release.

**Synthetic Hosted Agent****Version 21.12.0**

There was no release for 21.12.0.

**Version 21.11.0**

There was no release for 21.11.0.

**Version 21.10.0**

There was no release for 21.10.0.

**Version 21.9.0**

There was no release for 21.9.0.

**Version 21.8.0**

There was no release for 21.8.0.

**Version 21.7.0 - July 13, 2021**

The Synthetic Hosted Agent 21.7.0 includes support for [Chrome version 86](#) in Azure locations.

**Version 21.6.0**

There was no release for 21.6.0.

**Version 21.5.0**

There was no release for 21.5.0.

**Version 21.4.0**

There was no release for 21.4.

**Version 21.3.0**

There was no 21.3 release.

---

## Version 21.2.0 – February 16, 2021

Chrome browser version 86 is now available. See [Chrome Version 86](#) for details.

### Xamarin Agent

#### Version 21.12.0

There was no release for 21.12.0.

#### Version 21.11.0

There was no release for 21.11.0.

#### Version 21.10.0

There was no release for 21.10.0.

## Version 21.9.0 - September 9, 2021

This release includes a new API for tracking UI elements with Xamarin.Forms. See [Track UI Elements](#).

## Version 21.8.0 - August 12, 2021

This release includes:

- When instrumenting a Xamarin application, you must add the NuGet package Xamarin.Forms. See [Instrument Xamarin Applications](#).
- Use Xamarin.Forms to add page tracking. See [Customize the Xamarin Instrumentation](#).

## Version 21.7.0

There was no release for 21.7.0.

## Version 21.6.0 - June 25, 2021

Xamarin Agent 21.6.0 release includes:

- support for [touch point screenshots](#)
- support for Application Not Responding (ANR) detection (now automatically enabled)
- customization to add a [crash report runtime callback](#)

## Version 21.5.1 - May 18, 2021

The Xamarin 21.5.1 Agent includes newly exposed APIs to:

- Configure a semi-automatic HTTP tracker using the `HttpMessageHandler`
- Transform URLs for network requests
- Configure, disable, block, and unblock screenshots

See [Customize the Xamarin Instrumentation](#).

Other enhancements:

- When setting up the Xamarin Agent, you must add the AppDynamics.Agent package and call an extra line of code in `MainActivity.cs` under `OnCreate`. See [Instrument Xamarin Applications](#).

## Version 21.4.0

There was no release for 21.4.

### **Version 21.3.0**

There was no 21.3 release.

### **Version 21.2.0 – February 19, 2021**

Xamarin Agent 21.2.0 release includes fixes from the 21.2.0 JavaScript Agent, iOS, and Android Agent.

### **Version 21.1.0**

There was no 21.1 release.

## **20.x Agent Releases**

### **Analytics Agent**

#### **Version 20.12.0**

There was no release for 20.12.

#### **Version 20.11.0**

There was no release for 20.11.

#### **Version 20.10.0**

There was no release for 20.10.

#### **Version 20.9.0**

There was no release for 20.9.

#### **Version 20.8.0**

There was no release for 20.8.

#### **Version 20.7.0**

There was no release for 20.7.

### **Version 20.6.0 – June 25, 2020**

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### **Version 20.5.0 – May 26, 2020**

- Oracle JRE has been replaced with Azul's Zulu JRE in the Window Analytics Agent Bundle.
- Third-party libraries have been upgraded.

### **Version 20.4.0**

There was no 20.4 release for the Analytics Agent.

### **Version 20.3.0 – March 4, 2020**

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

---

### Version 20.2.0

There was no release for the Analytics Agent.

### Android Agent

#### Version 20.12.0

There was no release for 20.12.

#### Version 20.11.1 - November 17, 2020

Android Agent 20.11.0 released with minor enhancements and fixes.

#### Version 20.10.0 – October 9, 2020

Android Agent 20.10.0 captures mobile device metrics with which you can filter performance data, such as network requests, crashes and code issues, based on device specifications, such as CPU type, memory, disk space, and battery. See [Mobile RUM Metrics](#) for details.

#### Version 20.9.0

There was no 20.9 release for Android Agent.

#### Version 20.8.0

There was no 20.8 release for Android Agent.

#### Version 20.7.1 – July 2, 2020

Android Agent 2020.7.0.1710 is released. See [Past Resolved and Known Issues by Release](#).

#### Recommendations

- If your project uses Android Gradle Plugin version < 4.5.1, use Android Agent 20.4.0.
- If your project uses Android Gradle Plugin version >= 4.5.1, use Android Agent >=20.7.1.

#### Version 20.6.0

There was no 20.6.0 release for the Android Agent.

#### Version 20.5.0 – May 13, 2020

The Android Agent has updated the Android Gradle plugin dependency to version 3.4.1 or higher. If you are unable to update to Android Gradle Plugin 3.4.1 or higher, you are recommended to use Android Agent 20.4.0 or earlier.

#### Version 20.4.0

There was no 20.4.0 release for the Android Agent.

#### Version 20.3.1 - March 31, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#).

#### Version 20.3.0 – March 4, 2020

This release includes optimizations and small code changes.

---

**Version 20.2.0**

There was no 20.2.0 release for the Android Agent.

**Apache Web Server Agent****Version 20.12.0**

There was no release for 20.12.

**Version 20.11.0**

There was no release for 20.11.

**Version 20.10.0**

The release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#).

**Version 20.9.0 – September 21, 2020**

The release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#).

**Version 20.8.0**

There was no 20.8 release for the Apache Web Server Agent.

**Version 20.7.0 – July 27, 2020**

Apache Agent 20.7.0 is released with small code changes and optimizations. See [Past Resolved and Known Issues by Release](#).

**Version 20.6.0 – June 24, 2020**

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#).

**Version 20.5.0 – May 14, 2020**

This release includes optimizations and small code changes.

**Version 20.4.0**

There was no 20.4.0 release for the Apache Web Server Agent.

**Version 20.3.0**

There was no 20.3.0 release for the Apache Web Server Agent.

**Version 20.2.0**

There was no 20.2.0 release for the Apache Web Server Agent.

**AppDynamics AWS Lambda Extension for Serverless APM****Version 20.12.0**

There was no release for 20.12.

**Version 20.11.0**

There was no 20.10 release for the AppDynamics AWS Lambda Extension for Serverless APM.

---

## Version 20.10.0 – October 8, 2020

AppDynamics AWS Lambda Extension for Serverless APM released. See [Use the AppDynamics AWS Lambda Extension to Instrument Serverless APM at Runtime](#).

### C/C++ SDK

#### Version 20.12.0

There was no release for 20.12.

#### Version 20.11.0

There was no 20.11 release for the C/C++ SDK.

#### Version 20.10.0

There was no 20.10 release for the C/C++ SDK.

## Version 20.9.0 – September 30, 2020

This release includes new features and bug fixes.

- The C/C++ SDK is now compatible with calendar versioning.
- `appd_sdk_add_app_context` now logs Controller and application information. See [C/C++ SDK Reference](#).
- The C/C++ SDK now supports Custom Events. You can create a custom event, add data to the event, and report the event to the Controller. See [C/C++ Agent SDK Resource Management](#).
- You can enable/disable Analytics reporting. When disabled, the Analytics-related logging messages are suppressed. See [C/C++ SDK Reference](#).

#### Version 20.8.0

There was no 20.8 release for the C/C++ SDK.

#### Version 20.7.0

There was no 20.7.0 release for C/C++ SDK.

#### Version 20.6.0

There was no 20.6.0 release for the C/C++ SDK.

#### Version 20.5.0

There was no 20.5.0 release for the C/C++ SDK.

#### Version 20.4.0

There was no 20.4.0 release for the C/C++ SDK.

#### Version 20.3.0

There was no 20.3.0 release for the C/C++ SDK.

#### Version 20.2.0

There was no 20.2.0 release for the C/C++ SDK.

---

## Cluster Agent

### Version 20.12.1-1948 – December 18, 2020

There are no enhancements in this release. For the resolved issue, see [Past Resolved and Known Issues by Release](#).

### Version 20.12.0-1937 – December 17, 2020

There are no enhancements in this release. For the resolved issue, see [Past Resolved and Known Issues by Release](#).

### Version 20.11.0-1877 – November 25, 2020

This release provides the following enhanced capabilities:

- The Cluster Agent can now monitor 1500 pods and 3000 containers (for 2 containers per pod) or 2250 pods and 2250 containers (for 1 container per pod). See [Cluster Agent Performance Certification](#).
- You can configure the requests and limits of CPU and memory resources for the Cluster Agent. See the `resources` parameter at [Configure the Cluster Agent](#).
- The `instrumentationRules` parameter is now mandatory to enable auto-instrumentation of supported applications. This ensures auto-instrumentation is enabled for the required application deployment. See [Enable Auto-Instrumentation for the Supported Applications](#).  
If you do not specify any value for the `matchString` parameter within the `instrumentationRules`, the Cluster Agent takes into account the value specified in the `defaultInstrumentMatchString` and instruments all the deployments that satisfy the default value.

### Version 20.10.0 – October 23, 2020

- This release of Cluster Agent provides enhanced configuration for auto-instrumentation.
  - You can use the custom configuration for instrumenting the supported applications by using the `customAgentConfigSource` parameter within instrumentation rules.
  - The `imagePullPolicy` option of the `imageInfo` parameter can now be used within the instrumentation rules.
- This release supports custom SSL for instrumenting the supported applications. For Node.js you must use the custom configuration to use the custom SSL certificate. See, [Supported Applications for Auto-Instrumentation](#).

### Version 20.9.1-1675 – September 30, 2020

The AppDynamics Operator that is to be used by the Cluster Agent has been updated to version 0.6.2.

### Version 20.9.0-1662 – September 25, 2020

This release of Cluster Agent provides the following enhancements:

- You can now auto-instrument the `Node.js` and the `.Net Core` on Linux applications along with the Java applications. See [Enable Auto-Instrumentation of Supported Applications](#).
- You can now limit the number of auto-instrumentation tasks that Cluster Agent can run simultaneously. See the `numberOfTaskWorkers` property at [Cluster Agent Configuration for Auto-Instrumentation](#). By default, Cluster Agent can perform two auto-instrumentation deployments simultaneously.

### Version 20.8.0 – August 26, 2020

Cluster Agent released with minor enhancements and fixes.

### Version 20.7.0 – July 23, 2020

With this release of Cluster Agent, you can:

- Use auto-instrumentation for the Java applications that are deployed using the `DeploymentConfig` resource. See [Supported Resources for Instrumentation](#).
- Set tolerations on Cluster Agent pod. See tolerations in [Configure the Cluster Agent YAML File](#).

- Deploy the Cluster Agent with Helm Charts. See [Deploy the Cluster Agent with Helm Charts](#).
- Monitor the cluster-specific events from the **Clusters** dashboard. See the **Events** tab in [Monitor Cluster Health](#).

### Version 20.6.0 – June 26, 2020

- Cluster Agent now supports instrumenting the Java applications that are deployed as StatefulSet. This release introduces the parameter `resourcesToInstrument` to configure auto-instrumentation based on the resource that is used for deploying the Java application. See [Cluster Agent Configuration for Auto-Instrumentation](#).
- You can now configure `runAsUser` and `runAsGroup` as instrumentation rules. This configuration takes precedence over the default configuration.
- You can use the `appNameStrategy` parameter to choose the option for naming the AppDynamics Application. See [Options for Naming the Appdynamics Application](#).

### Version 20.5.0 – May 29, 2020

Cluster Agent can now enable auto-instrumentation for Java applications. See [Enable Auto-Instrumentation of Java Applications](#).

### Version 20.4 – April 28, 2020

This release includes the following enhancements:

- Support for Cluster Agent on Rancher Kubernetes Engine (RKE) 1.0.4 with Kubernetes 1.17. See [Cluster Agent Requirements and Supported Environments](#).
- Support for Cluster Agent on Google GKE 1.14
- Support for monitoring Kubernetes stateful sets
- Changes have been made to preserve the configuration for monitored namespaces. See the `nsToMonitor` property in [Configure the Cluster Agent](#) and [Use the Cluster Agent](#).

### Version 20.3.0 – March 6, 2020

- The Cluster Agent can blocklist and allowlist pods based on regular expression and domains.
- You can configure the maximum number of Cluster Agents that can report to an account.
- You can configure the maximum number of pods that can be associated with any Cluster Agent.

### Version 20.2.0

There was no release for the Cluster Agent.

### Cordova Plugin

#### Version 20.12.0

There was no release for 20.12.

#### Version 20.11.0 – November 19, 2020

Cordova Plugin 20.11.0 released with minor fixes and optimizations. Cordova Plugin 20.11.0 is integrated with Android Agent 20.11.1.

#### Version 20.10.0 – October 16, 2020

This release includes optimizations and small code changes.

#### Version 20.9.0

There was no 20.9 release for the Cordova Plugin.

#### Version 20.8.0

There was no 20.8 release for the Cordova Plugin.

---

### Version 20.7.0 – July 13, 2020

Cordova Agent 20.7.0 captures `hybridAgentType` and `hybridAgentVersion`.

### Version 20.6.0

There was no 20.6.0 release for the Cordova Plugin.

### Version 20.5.0

There was no 20.5.0 release for the Cordova Plugin.

### Version 20.4.0

There was no 20.4.0 release for the Cordova Plugin.

### Version 20.3.0 – March 18, 2020

The Cordova Plugin has now been tested and certified to work with the following:

- Cordova 9.0.0
- Cordova iOS 4.5.5/5.0.0
- Cordova 8.0.0
- Ionic CLI 6.1.0
- Node 12.16.1
- npm 6.13.4

### Version 20.2.0

There was no 20.2.0 release for the Cordova Plugin.

## Database Agent

### Version 20.12.0-2183 – December 16, 2020

- Database Agent now supports mutual (client and server) authentication. See [Mutual Authentication](#).
- You can now use the service record (SRV record) within the connection string while configuring the MongoDB collector. See [SRV Record](#) at [Configure MongoDB Collectors](#).

### Version 20.11.0

There was no 20.11 release for the Database Agent.

### Version 20.10.0 – October 27, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.9.0 – September 16, 2020

The release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#).

### Version 20.8.0

There was no 20.8 release for the Database Agent.

### Version 20.7.0 – July 28, 2020

The Database Agent 20.7 and later are not compatible with Controller versions 4.5.0 and 4.5.1. Therefore, some of the features may not work when the Controller version is 4.5.0 or 4.5.1.

---

For the resolved issue, see [Past Resolved and Known Issues by Release](#).

### Version 20.6.0

There was no 20.6.0 release for Database Agent.

### Version 20.5.0 – May 26, 2020

- You can now create multiple Database Agents as different Windows services with different names. For more information, see [Start the Database Agent Automatically on Windows](#).
- Database Agent adds support for Windows 64-bit. See [Database Visibility Supported Environments](#). From 20.5 release onwards, Database Visibility is not supported on Windows 32-bit.

### Version 20.4 – April 28, 2020

This release includes the following new features:

- Support for Microsoft SQL Server 2019
- Support for Cassandra database
- Customize the sampling interval
- Capture details to integrate Database Visibility with the Application Flow Map

For the issues that are fixed in this release, see [Past Resolved and Known Issues by Release](#).

### Version 20.3.0 – March 20, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.2.0

There was no 20.2.0 release for Database Agent.

## Go SDK

### Version 20.12.0

There was no release for 20.12.

### Version 20.11.0

There was no release for 20.11.

### Version 20.10.0

There was no 20.10.0 release for the Go SDK.

### Version 20.9.0

There was no 20.9.0 release for the Go SDK.

### Version 20.8.0

There was no 20.8.0 release for the Go SDK.

### Version 20.7.0

There was no 20.7.0 release for the Go SDK.

### Version 20.6.0

There was no 20.5.0 release for the Go SDK.

**Version 20.5.0**

There was no 20.5.0 release for the Go SDK.

**Version 20.4.0**

There was no 20.4.0 release for the Go SDK.

**Version 20.3.0**

There was no 20.3.0 release for the Go SDK.

**Version 20.2.0**

There was no 20.2.0 release for the Go Agent.

**IBM Integration Bus Agent****Version 21.1.0**

There was no release for 21.1.

**Version 20.12.0**

There was no release for 20.12.

**Version 20.11.0**

There was no release for 20.11.

**Version 20.10.0**

There was no 20.10 release for the IBM Integration Bus Agent.

**Version 20.9.0 – September 24, 2020**

The release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#).

**Version 20.8.0**

There was no 20.8 release for the IBM Integration Bus Agent.

**Version 20.7.0 – July 2, 2020**

AppDynamics IIB Agent introduces a configurable setting for the log file size. See [Install the IIB Agent](#).

**Version 20.6.0**

There was no 20.6.0 release for the IBM Integration Bus Agent.

**Version 20.5.0 – May 14, 2020**

- The Appdynamics IIB Agent now adds support for ACE 11 on the AIX platform. See [IIB Supported Environments](#).
- This release also includes optimizations and small code changes.

**Version 20.4.0**

There was no 20.4.0 release for the IBM Integration Bus Agent.

---

---

**Version 20.3.0 – March 31, 2020**

The tracer's version is now compatible with calendar versioning. This release includes no new enhancements.

**Version 20.2.0**

There was no 20.2.0 release for the IBM Integration Bus Agent.

**iOS Agent****Version 20.12.0 – December 15, 2020**

You can now disable the iOS Agent to stop sending user data to the collector. See [Customize the iOS Instrumentation](#).

**Version 20.11.0**

There was no release for the iOS Agent.

**Version 20.10.0.2298 – October 7, 2020**

iOS Agent 20.10.0 captures mobile device metrics with which you can filter performance data, such as network requests, crashes and code issues, based on device specifications, such as CPU type, memory, disk space, and battery. See [Mobile RUM Metrics](#) for details.

For information on the iOS 14 privacy guidelines, see [iOS Data Collection Disclosure](#). For bug fixes, see [Past Resolved and Known Issues by Release](#).

**Version 20.9.0**

There was no release for the iOS Agent.

**Version 20.8.0 – August 20, 2020**

The iOS Agent released with minor enhancements and fixes. See [Past Resolved and Known Issues by Release](#).

**Version 20.7.0.2209 – July 8, 2020**

Filtered URLs are logged when the logging level is set to `verbose`.

**Version 20.6.0**

There was no release for the iOS Agent.

**Version 20.5.0**

There was no release for the iOS Agent.

**Version 20.4.0**

There was no release for the iOS Agent.

**Version 2020.3.0-2006 – March 2, 2020**

This release includes optimizations and small code changes.

---

## Version 20.2.0

There was no release for the iOS Agent.

## Java Agent

### Version 20.12.0

There was no release for 20.12.

### Version 20.11.0 - November 27, 2020

- Java Agent 20.11.0 adds exit support for Vertx 3.9. For more information, see [Java Supported Environments](#).
- This release makes the *Executor* mode the default mode for handling asynchronous transactions. See [Configure the Thread Correlation in Java Agent](#).
- This release adds a property for optimized heap mode enabling. See [Optimize Heap Mode](#).

### Version 20.10.0 – October 20, 2020

- This release adds an asynchronous entry and exit support for gRPC. For more information, see [Java Supported Environments](#).
- This release certifies support for Java 15. For more information, see [Java Supported Environments](#).
- This release adds exit support for the HTTP4 blaze client.

### Version 20.9.0 – September 22, 2020

- This release adds the synchronous entry and exit support for gRPC. For more information, see [Java Supported Environments](#).
- This release adds support for the following thread handoff across Reactive Extension for Java (RxJava 2): **Observable** in addition to the thread handoff **Single**.

### Version 20.8.0 – August 21, 2020

This release verifies support for GraalVM using the Graal compiler as a HotSpot JIT.

### Version 20.7.0 – July 31, 2020

- This release adds support for MySQL 6.0 and 8.0. See [Java Supported Environments](#).
- This release adds support for MongoDB drivers (synchronous, asynchronous, and reactivestreams) up to v4.x. See [Java Supported Environments](#).
- This release verifies support for Spring 5.2. See [Java Supported Environments](#).
- This release adds support for Spring Cloud Gateway.
- This release adds support for the following thread handoffs across Reactive Extension for Java (RxJava 2): **Maybe**, **Completable**, and **Flowable** in addition to the thread handoff **Single**.
- An additional artifact for Java Agent to include the security compliant versions of the third-party dependencies is included. An agent compatible with Java version 7 will no longer be available for Java applications running on PCF.

### Version 20.6.0 – June 23, 2020

- Java Agent 20.6.0 adds support for Oracle 10, 11, 12, 18, and 19 drivers. See [Java Supported Environments](#).
- Support for Spring WebFlux and WebClient 5.2 is added. See [Java Supported Environments](#).
- A node property is added to prevent duplicate ADRUM headers from being injected in the HTTP response. See [App Agent Node Properties \(D-E\)](#).
- Java Agent 20.6.0 adds support to the service proxy feature. See [Service Proxy Overview](#).

### Version 20.5.0 – May 21, 2020

- Java Agent 20.5.0 adds support for Vertx 3.8. See [Java Supported Environments](#).
- You can now capture the raw SQL queries for databases such as MongoDB, DynamoDB, and CassandraDB. See [Call Graph Settings](#).

### Version 20.4.0 – April 22, 2020

- Java Agent 20.4.0 adds support for netty version 4.x async exit. See [Java Supported Environments](#).

- 
- This release adds Java 14 certification for AdoptOpenJDK, Azul Zulu OpenJDK, Oracle, and Open Source OpenJDK. See [Java Supported Environments](#).

### **Version 20.3.0 – March 20, 2020**

- Java Agent version 20.3.0 adds support for netty version 4.x async entry.
- Support added for Rx Java 2 Single.
- Support added for Akka HTTP Non-Route DSL.
- Support to enable business transaction correlation using `SOAP:Header` with JBoss. To enable the correlation only for JBoss, you must create a Servlet exclude rule.

### Agentless Transaction Analytics

- You can now disable agentless Transaction Analytics at the [tier and node level](#).

### **Version 20.2.0**

There was no release for the Java Agent.

### **JavaScript Agent**

#### **Version 20.12.0**

There was no release for 20.12.

#### **Version 20.11.0**

There was no 20.11.0 release for the JavaScript Agent.

#### **Version 20.10.0 – October 21, 2020**

JavaScript Agent 20.10.0 released with minor optimizations, including to how Visually Complete Time (VCT) is calculated. For bug fixes, see [Past Resolved and Known Issues by Release](#).

#### **Version 20.9.0 – September 15, 2020**

JavaScript Agent 20.9.0 was released. See [Past Resolved and Known Issues by Release](#) for more information.

#### **Version 20.8.0 – August 5, 2020**

JavaScript Agent released with bug fixes. See [Past Resolved and Known Issues by Release](#) for more information.

#### **Version 20.7.0**

There was no 20.7.0 release for the JavaScript Agent.

#### **Version 20.6.0.3177 – June 17, 2020**

Angular 9 is now supported.

#### **Version 20.5.0.3144 – May 15, 2020**

Images without extensions or dots (.) are now classified as "images" instead of "other."

#### **Version 20.4.0.3090 – April 14, 2020**

This release includes bug fixes but no new features. See [Past Resolved and Known Issues by Release](#) for details.

---

**Version 20.3.0-3009 – March 18, 2020**

The JavaScript Agent, by default, limits the number of Ajax requests reported per page. Starting with this version, you can configure the JavaScript Agent to [report an unlimited number of Ajax requests](#) per page.

**Version 20.2.0-2928 – February 13, 2020**

This release includes bug fixes but no new features. See [Past Resolved and Known Issues by Release](#) for details.

**Java Serverless Tracer****Version 20.12.0**

There was no release for 20.12.

**Version 20.11.1400**

The Java Serverless Tracer has added an environment variable, `APPDYNAMICS_HTTP_TIMEOUT_MS`, which allows you to set the timeout in milliseconds for all the HTTP calls made by the tracer. See [Past Resolved and Known Issues by Release](#) for details.

**Version 20.10.0**

There was no 20.10 release for the Java Serverless Tracer.

**Version 20.9.0**

There was no 20.9 release for the Java Serverless Tracer.

**Version 20.8.0**

There was no 20.8 release for the Java Serverless Tracer.

**Version 20.7.0**

There was no release for 20.7.

**Version 20.6.0**

There was no release for the Java Serverless Tracer Agent.

**Version 20.5.0**

There was no release for the Java Serverless Tracer Agent.

**Version 20.4.0**

There was no release for the Java Serverless Tracer Agent.

**Version 20.3.1391 – March 17, 2020**

The tracer's version is now compatible with calendar versioning. This release includes no new enhancements or resolved issues.

**Version 20.2.0**

There was no release for the Java Serverless Tracer Agent.

---

## Machine Agent

### Version 20.12.0-3016 - December 16, 2020

This release provides the following enhancements:

- The Machine Agent now prepends the hostname in the log files.
- The Machine Agent has been updated, tested, and certified to work with the following:
  - `com.fasterxml.jackson.core:jackson-databind:2.12.0`
  - `com.google.guava:guava:30.0-jre`
  - `commons-io:commons-io:2.8.0`
  - `junit:junit:4.13.1`
  - `org.apache.ant:ant:1.10.9`
  - `org.apache.httpcomponents:httpclient:4.5.13`
  - `org.bouncycastle:bcprov-jdk15on:1.67`
  - `org.eclipse.jetty:jetty-server:9.4.35.v20201120`
  - `org.eclipse.jetty:jetty-webapp:9.4.35.v20201120`
  - `org.exist-db.thirdparty.xerces:xercesImpl:2.12.1`
  - `org.hibernate:hibernate-validator:6.1.6.Final`

### Version 20.11.1-3044 - January 26, 2021

This release provides the following enhancements:

- The Machine Agent has been updated, tested, and certified to work with the following:
  - `com.fasterxml.jackson.core:jackson-databind:2.12.0`
  - `com.google.guava:guava:30.0-jre`
  - `commons-io:commons-io:2.8.0`
  - `junit:junit:4.13.1`
  - `org.apache.ant:ant:1.10.9`
  - `org.apache.httpcomponents:httpclient:4.5.13`
  - `org.bouncycastle:bcprov-jdk15on:1.67`
  - `org.eclipse.jetty:jetty-server:9.4.35.v20201120`
  - `org.eclipse.jetty:jetty-webapp:9.4.35.v20201120`
  - `org.exist-db.thirdparty.xerces:xercesImpl:2.12.1`
  - `org.hibernate:hibernate-validator:6.1.6.Final`

### Version 20.11.0.2915 - November 19, 2020

The Machine Agent Azul Zulu JRE version has been updated to 8.50 (maps to OpenJDK version 8u272). Machine Agent OSHI library upgraded to version 5.3.5.

### Version 20.10.0-2813 - October 22, 2020

This release includes optimizations and small code changes. For bug fixes, see [Past Resolved and Known Issues by Release](#).

### Version 20.9.0 – September 21, 2020

Machine Agent 20.9.0-2763 was released. Machine Agent OSHI library upgraded to version 5.2.5. See [Past Resolved and Known Issues by Release](#).

### Version 20.8.0.2713 – August 20, 2020

Machine Agent released with bug fixes. See [Past Resolved and Known Issues by Release](#) for more information.

---

### Version 20.7.0-2694 – July 23, 2020

When using Docker Visibility, if the unique host ID setting is not configured to use container ID in host network mode, the Machine Agent now automatically registers the container using the container ID as the host ID. See [Using Docker Visibility with Kubernetes](#).

### Version 20.6.0-2676 – June 25, 2020

The Machine Agent now has the ability to identify container processes by container names only. See [Configuring Docker Visibility](#).

### Version 20.5.1-2635 – May 29, 2020

The Machine Agent has been updated, tested, and certified to work with the following:

- ant v1.10.8
- commons-fileupload v1.4.0
- hibernate-validator v6.1.5
- snakeyaml v1.26

### Version 20.5.0-2617 – May 20, 2020

Azul JRE 8.0.252 is replacing Oracle JRE as a component included in the Machine Agent. See [Machine Agent Requirements and Supported Environments](#).

### Version 20.4.0-2571 – April 27, 2020

The Machine Agent has been updated, tested, and certified to work with the following:

- ch.qos.logback:logback-core:1.2.3
- commons-codec:commons-codec:1.14
- commons-io:commons-io:2.6
- commons-net:commons-net:3.6
- dropwizard-jetty 2.0.7
- log4j-api:2.13.1
- log4j-core:2.13.1
- org.antlr:antlr4-runtime:4.8-1
- org.apache.httpcomponents:httpclient:4.5.12
- org.bouncycastle:bcprov-jdk15on:1.62
- org.hibernate:hibernate-validator:6.1.2.Final
- org.javassist:javassist:3.21.0-GA
- org.jboss.logging:jboss-logging:3.4.1.Final

### Version 20.3.2 – March 27, 2020

The Machine Agent has been updated, tested and certified to work with the following:

- okhttp 3.12.6
- log4j-api 2.13.1
- log4j-core 2.13.1
- log4j-slf4j-impl 2.13.1

log4j\_log4j 1.2.17 has been removed.

### Version 20.3.1-2476 – March 16, 2020

This release includes optimizations and bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

---

## Version 20.3.0-2468 – March 9, 2020

This release includes optimizations and small code changes.

## Version 20.2.0

There was no 20.2.0 release for the Machine Agent.

## .NET Agent

### Version 20.12.0 – December 18, 2020

There are no enhancements in this release. For the resolved issue, see [Past Resolved and Known Issues by Release](#).

### Version 20.11.0 - November 20, 2020

.NET Agent now supports the [.NET 5.0 environment](#).

### Version 20.10.0 - October 28, 2020

.NET Agent includes these enhancements:

- .NET Agent supports Agentless Analytics on Windows. See [Agentless Analytics Overview](#).
- .NET Agent is now supported on [Windows Server 2019](#).
- The [ASP.NET business transactions configuration feature](#) has been removed as a preview feature in the Linux Agent. You now have the ability to perform custom backend naming for HTTP backends in the Linux Agent in your production environment.

For bug fixes, see [Past Resolved and Known Issues by Release](#).

### Version 20.9.0 – September 24, 2020

#### Azure Cosmos DB

The .NET Linux Agent now supports the Azure Cosmos DB through the SQL API. Both of these Azure versions are supported:

- Microsoft.Azure.DocumentDB.Core (2.x)
- Microsoft.Azure.Cosmos (3.x)

Note the following:

- The backend naming of the Azure Cosmos DB is detected as `{host}.{port}`.
- The backend properties of the `exit` type shows Database Account with `host` and `port`.
- The Snapshot properties of "Query through LINQ" call does not contain the SQL Query Statement.
- The `ConnectionString` of the Azure Cosmos DB is not shown in any of the Snapshot properties, nor in the backend properties.
- The following is *not supported*:
  - Instrumentation of `BulkExecution`
  - Sensitive data filters on Query

See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.8.0 – August 24, 2020

The .NET Agent now supports the transport layer security (TLS) 1.2 and proxy-related environment variables for the Micro Services Agent on Windows. See [Configure the Agent Using Environment Variables](#) for details.

---

## Version 20.7.0 - July 23, 2020

The .NET Agent for Linux now:

- Partially supports the detection of WCF exit calls on .NET Core 3.1 and later. See [.NET Backend Detection](#) for more details.
- Supports setting A `PPDYNAMICS_AGENT_UNIQUE_HOST_ID` as an environment variable.

This release also includes bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

## Version 20.6.1 - July 17, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

## Version 20.6.0 - July 1, 2020

- The .NET Agent for Windows now correlates business transactions with End User Monitoring by default.
- Improvements have been added to instrumentation in full-no-dependency mode. You can now instrument non-NGen assemblies when MSCorlib is loaded as NGen.
- Internal library upgrades and code improvements added to the .NET Agent for Linux.
- Improvements added to the .NET Agent to detect RabbitMQ Async entry points.

This release also includes bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

## Version 20.5.0 – May 20, 2020

- Sensitive information for MongoDB query expressions is now filtered out by default. You can enable raw query collections for MongoDB in [Call Graph Settings](#).
- RabbitMQ backend detection is now compatible with RabbitMQ Client version 6. See [RabbitMQ Backends for .NET](#) for more details.

## Version 20.4.1 (.NET Agent for Windows) - April 29, 2020

Due to a signing issue, the 20.4.0 version of the .NET Agent for Windows has been replaced with 20.4.1. It has no feature difference with 20.4.0.

## Version 20.4.0 - April 28, 2020

This release includes log improvements in the Linux profiler and bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

## Version 20.3.1 - April 7, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

## Version 20.3.0 - March 26, 2020

This release contains the .NET Agent for Linux only. The .NET Agent for Linux now supports .NET Core 3.1.

## Version 20.3.0 – March 25, 2020

This release contains the .NET Agent for Windows only.

The .NET Agent MSI installer for Windows now includes support for .NET Core applications, enabling unified management of .Net Core and full framework applications on Windows. The agent monitors .NET Core applications for IIS out of the box, if automatic IIS mode is configured.

- The MSI Installer bundles .NET Core agent with the existing .NET framework agent and creates appropriate environment variables.
- [Supported environments](#) are identical to the previous .NET Agent.

- .NET Core versions 2.0 and later are supported.
- IIS-hosted .NET Core applications are monitored similar to the .NET frameworks configured in [automatic mode](#).
- You can [configure .NET Core applications](#) in the `config.xml` file, just as you would configure .NET framework applications.

You have to manually configure .NET Core applications in the `config.xml` file in either of the following scenarios:

- You monitor ASP.NET core applications that are not hosted in process, but are hosted in `dotnet.exe`
- You currently monitor standalone applications

The .NET Agent for Windows supports Azure Functions 3.x and the following:

- Supports Netviz entry calls for non-IIS applications.
- Filters sensitive data in environment variables.
- Reports CoreCLR runtime to the Controller.
- Includes WCF entry points with the agent's network visibility support, if the WCF service is operating in ASP.NET compatibility mode. If the WCF service is not using ASP.NET compatibility mode, or if the service receives requests that do not use this mode, the agent logs a warning that network visibility is currently not supported for this setup.

### Version 20.2.0

There was no 20.2.0 release for the .NET Agent.

### Network Agent

#### Version 20.12.0

There was no 20.12.0 release for the Network Agent.

#### Version 20.11.0

There was no 20.11.0 release for the Network Agent.

#### Version 20.10.0

There was no 20.10.0 release for the Network Agent.

#### Version 20.9.0

There was no 20.9.0 release for the Network Agent.

#### Version 20.8.0.2169 – August 26, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

#### Version 20.7.0

There was no 20.7.0 release for the Network Agent.

#### Version 20.6.0 – June 25, 2020

This release includes optimizations and small code changes.

#### Version 20.5.0 – May 21, 2020

This release includes optimizations and small code changes.

#### Version 20.4.0

There was no 20.4.0 release for the Network Agent.

---

### Version 20.3.0-2139 – March 9, 2020

This release includes optimizations and small code changes.

### Version 20.2.0

There was no 20.2.0 release for the Network Agent.

### Node.js Agent

### Version 20.12.0 – December 8, 2020

- You can attach existing Analytics data generated for any given transaction to an exit call. For more information, see [Node.js Agent API Reference](#).
- Docker init container images are now available on [Dockerhub](#) for Linux and Alpine environments. For all other environments, see [Build the Node.js Agent Init Container Image](#).

### Version 20.11.0

There was no 20.11.0 release for the Node.js Agent.

### Version 20.10.1 – October 16, 2020

This release includes optimizations and small code changes.

### Version 20.10.0 – October 15, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.9.0

There was no 20.9.0 release for the Node.js Agent.

### Version 20.8.0-2169 – August 27, 2020

You can now separate Business Transactions into multiple queries with GraphQL. For more information, see [Custom Match Rules](#).

### Version 20.7.0 – July 29, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.6.0 – June 12, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.5.0 – May 29, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.4.0 – April 29, 2020

This release includes optimizations and small code changes.

---

**Version 20.3.1 – March 27, 2020**

This release includes optimizations and small code changes.

**Version 20.3.0 – March 26, 2020**

This release includes optimizations and small code changes.

**Version 20.2.0**

There was no release for the Node.js Agent.

**Node.js Serverless Tracer****Version 20.12.0**

There was no 20.12.0 release for the Node.js Serverless Tracer.

**Version 20.11.242**

The Node.js Serverless Tracer has added an environment variable, `APPDYNAMICS_HTTP_TIMEOUT_MS`, which allows you to set the timeout in milliseconds for all the HTTP calls made by the tracer. See [Past Resolved and Known Issues by Release](#) for details.

**Version 20.10.0**

There was no 20.10.0 release for the Node.js Serverless Tracer.

**Version 20.9.221 – September, 2020**

This release includes minor enhancements and bug fixes.

**Version 20.8.0**

There was no 20.8.0 release for the Node.js Serverless Tracer.

**Version 20.7.0**

There was no 20.7.0 release for the Node.js Serverless Tracer.

**Version 20.6.0**

There was no 20.6.0 release for the Node.js Serverless Tracer.

**Version 20.5.0**

There was no 20.5.0 release for the Node.js Serverless Tracer.

**Version 20.4.0**

There was no 20.4.0 release for the Node.js Serverless Tracer.

**Version 20.3.178 – March 16, 2020**

The tracer's version is now compatible with calendar versioning. This release includes no new enhancements or resolved issues.

**Version 20.2.0**

There was no 20.2.0 release for the Node.js Serverless Tracer.

---

## PHP Agent

### Version 20.12.0 – December 16, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.11.0 - November 24, 2020

This release supports the Node Reuse feature. For more information, see [Node Reuse for PHP Agent](#).

### Version 20.10.0 – October 22, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.9.0 – September 15, 2020

The release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#).

### Version 20.8.0.4083 – August 26, 2020

PHP Agent released with bug fixes. See [Past Resolved and Known Issues by Release](#).

### Version 20.7.0 – July 16, 2020

The PHP Agent 20.7.0 release enhances the General Data Protection Regulation (GDPR) compliance for data filtering.

This helps you to redact any sensitive data (URLs, Exit calls, or cookies), which is shown in the Controller. For more information, see [Redaction of URL Segments and Query Parameters](#).

### Version 20.6.0 – June 23, 2020

The PHP Agent 20.6.0 release implements the General Data Protection Regulation (GDPR) compliance for data filtering.

This helps you to redact any sensitive data (URLs, Exit calls, or cookies), which is shown in the Controller. For more information, see [Redaction of URL Segments and Query Parameters](#).

### Version 20.5.0 – May 29, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.4.0.3759 – April 29, 2020

This release adds support to CakePHP 4.0 and Magento 2.3 for the PHP Agent. See [PHP Supported Environments](#).

### Version 20.3.1 – March 26, 2020

This release supports PHP Agent for CentOS version 8 and adds support to the following frameworks:

- FuelPHP 1.8.1
- Zend 3
- Laravel 6
- CodeIgnitor4

---

## Version 20.3.0 – March 3, 2020

- PHP 7.4 support is added to the AppDynamics PHP Agent. See [PHP Supported Environments](#).
- The PHP Agent now supports Symfony versions 3 and 4. See [PHP Supported Environments](#).

## Version 20.2.0

There was no 20.2.0 release for the PHP Agent.

## Python Agent

### Version 20.12.0 – December 18, 2020

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.11.411

The Python Serverless Tracer has added an environment variable, `APPDYNAMICS_HTTP_TIMEOUT_MS`, which allows you to set the timeout in milliseconds for all the HTTP calls made by the tracer. See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.11.0 - November 25, 2020

The Python Agent has released with minor fixes and optimizations. See [Past Resolved and Known Issues by Release](#).

### Version 20.10.0 - October 21, 2020

- This release supports Node Reuse feature.
- This release supports Tornado 6 for Python Agent 3.7 and later versions.

For bug fixes, see [Past Resolved and Known Issues by Release](#).

### Version 20.9.0

This release includes no new features, but bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Version 20.8.0

There was no 20.8 release for the Python Agent.

### Version 20.8.0

There was no 20.8 release for the Python Agent.

### Version 20.7.0.2292 – July 7, 2020

Python Agent artifacts can now be downloaded from the AppDynamics Downloads Portal. For more information, see [Install the Python Agent](#).

## Deprecation Notice

Support for Mac OS X has been removed for Python Agent.

### Version 20.6.0

There was no 20.6.0 release for the Python Agent.

**Version 20.5.0**

There was no 20.5.0 release for the Python Agent.

**Version 20.4.0**

There was no 20.4.0 release for the Python Agent.

**Version 20.3.0**

There was no 20.3.0 release for the Python Agent.

**Version 20.2.0**

There was no 20.2.0 release for the Python Agent.

**Python Serverless Tracer****Version 20.12.0**

There was no 20.12.0 release.

**Version 20.11.411**

The Python Serverless Tracer has added an environment variable, `APPDYNAMICS_HTTP_TIMEOUT_MS`, which allows you to set the timeout in milliseconds for all the HTTP calls made by the tracer. See [Past Resolved and Known Issues by Release](#) for details.

**Version 20.10.0**

There was no 20.10.0 release for the Python Serverless Tracer.

**Version 20.9.0**

There was no 20.9.0 release for the Python Serverless Tracer.

**Version 20.8.0**

There was no 20.8.0 release for the Python Serverless Tracer.

**Version 20.7.383 - July 29, 2020**

The Python Serverless Tracer is now generally available to monitor AWS Lambda functions written in Python. The tracer is available on the [PyPi](#) repository. See [Python Serverless Tracer](#) to get started.

**React Native Agent****Version 20.12.0**

There was no 20.12.0 release.

**Version 20.11.0 - November 20, 2020**

The React Native Agent has released with minor fixes and optimizations.

**Version 20.10.0 – October 16, 2020**

This release includes minor enhancements and bug fixes. React Native 0.60 is now supported.

---

**Version 20.9.0**

There was no 20.9.0 release for the React Native Agent.

**Version 20.8.0**

There was no 20.8.0 release for the React Native Agent.

**Version 20.7.0 – July 8, 2020**

React Native Agent 20.7.0 captures `hybridAgentType` and `hybridAgentVersion`.

**Version 20.6.0**

There was no 20.6.0 release for the React Native Agent.

**Version 20.5.0**

There was no 20.5.0 release for the React Native Agent.

**Version 20.4.0**

There was no 20.4.0 release for the React Native Agent.

**Version 20.3.0**

There was no 20.3.0 release for the React Native Agent.

**Version 20.2.0**

There was no 20.2.0 release for the React Native Agent.

**SAP****Version 20.12.0**

There was no 20.12.0 release.

**Version 20.11.0 - November 23, 2020**

SAP Agent has released. See [Release Notes Version 20.11.0](#).

**Version 20.10.0**

There was no 20.10.0 release for SAP.

**Version 20.9.0**

There was no 20.9.0 release for SAP.

**Version 20.8.0**

SAP 20.8.0 is released. See [Release Notes Version 20.8.0](#).

**Version 20.7.0**

SAP 20.7.0 is released. See [Release Notes Version 20.7.0](#).

**Version 20.6.0**

There was no 20.6.0 release for SAP.

---

**Version 20.5.0**

SAP 20.5.0 is released. See [Release Notes Version 20.5.0](#).

**Version 20.4.0**

There was no 20.4.0 release for SAP

**Version 20.3.0**

There was no 20.3.0 release for SAP.

**Version 20.2.0**

There was no 20.2.0 release SAP.

**Synthetic Agent (Hosted Agents)****Version 20.6.0 - June 25, 2020**

Synthetic monitoring: 'os', 'socket', and 'subprocess' modules will not be allowed for any new job. See [Import Python Packages in Synthetic Scripts](#) for details.

**Xamarin Agent****Version 20.12.0**

There was no 20.12.0 release.

**Version 20.11.0 - November 10, 2020**

The Xamarin Agent has released with minor fixes and optimizations.

**Version 20.10.0**

There was no 20.10.0 release for the Xamarin Agent.

**Version 20.9.0**

There was no 20.9.0 release for the Xamarin Agent.

**Version 20.8.0**

There was no 20.8.0 release for the Xamarin Agent.

**Version 20.7.0**

There was no 20.7.0 release for the Xamarin Agent.

**Version 20.6.0**

There was no release for the Xamarin Agent.

**Version 20.5.0**

There was no release for the Xamarin Agent.

### Version 2020.4.0 – April 6, 2020

You can set the boolean property `EnableAggregateExceptionHandler` to `true` to configure the Xamarin Agent to report aggregate exceptions as crashes. When the property is set to `false`, only unhandled exceptions are reported. The default value is `false`.

### Version 2020.3.3 – March 16, 2020

This release includes optimizations and small code changes.

### Version 2020.3.2 – March 13, 2020

By default, the Xamarin Agent reports exceptions as crashes. You can now set a configuration to [disable the reporting of crashes as exceptions](#).

### Version 2020.3.1 – March 10, 2020

This release includes optimizations and small code changes.

### Version 2020.2.0

There was no 20.2.0 release for the Xamarin Agent.

## Past Controller Releases

The Controller releases occur every six weeks. This page lists the past SaaS and on-premises Controller enhancements since 20.2.

## 23.10

### Cisco Secure Application

This release includes support for OpenTelemetry. See [Cisco Secure Application for OpenTelemetry](#).

Known Issues:

- Currently, Business Risk scores are not supported for Cisco Secure Application for OpenTelemetry. Because of that, you see incorrect Business Risk scores shown on the Business Transaction Flow and List views. Also, the **Business Transaction** page shows zero (0) **Total Attacks** even if there are attacks shown on the **Attacks** page.
- For Controller versions <= 23.9.0, the application dashboard for OpenTelemetry monitored applications will not have the security widget available. To resolve that issue, upgrade to Controller >= 23.11.0.

## 23.9

### SaaS Controller Enhancements

Product/Component	Summary	Release Version	Release Date
General	<p>This release includes the following bug fix. See <a href="#">SaaS Controller Resolved Issues</a>.</p> <ul style="list-style-type: none"> <li>• CONTRLRDEV-1893</li> </ul>	23.9.3	November 24, 2023

Product/Component	Summary	Release Version	Release Date
General	<p>This release includes the following bug fix. See <a href="#">SaaS Controller Resolved Issues</a>.</p> <ul style="list-style-type: none"> <li>CONTRLRDEV-1805</li> </ul>	23.9.3	November 9, 2023
General	<p>You can now create a policy for the following <b>AppDynamics Config Warnings</b> events:</p> <ul style="list-style-type: none"> <li>Controller Metric Registration Limit Reached</li> <li>Agent Metric Registration Limit Reached</li> </ul> <p>This release includes the following bug fixes. See <a href="#">SaaS Controller Resolved Issues</a>.</p> <ul style="list-style-type: none"> <li>ALTCSAAS-2061</li> <li>CONTRLRDEV-1583</li> <li>TMNT-6690</li> </ul>	23.9.2	October 24, 2023

## 23.8

### SaaS Controller Enhancements

Product/Component	Summary	Release Version	Release Date
General	This release includes the following bug fix. See <a href="#">SaaS Controller Resolved Issues</a> . <ul style="list-style-type: none"> <li>CONTRLRDEV-1205</li> </ul>	23.8.3	August 31, 2023
General	This release includes the following bug fixes. See <a href="#">SaaS Controller Resolved Issues</a> . <ul style="list-style-type: none"> <li>DIS-153</li> <li>DIS-187</li> <li>STUDIO-5111</li> <li>TMNT-6547</li> </ul>	23.8.2	August 28, 2023
General	This release includes bug fixes and optimizations to improve the customer experience.	23.8.1	August 15, 2023
Alert and Respond	AppDynamics Controller now supports the certificate chain for mutual TLS authentication. When you configure mutual TLS, you can do one of the following: <ul style="list-style-type: none"> <li>Upload the <code>.pem</code> file that contains the chain of TLS certificates</li> <li>Copy and paste the Base64 encoded text that contains the chain of TLS certificates</li> </ul> See <a href="#">Configure and Enable Mutual TLS Authentication</a> .	23.8.0	August 14, 2023

Product/ Component	Summary	Release Version	Release Date
	<p>For a health rule, you can now use <b>= Specific Value</b> and <b>!= Specific Value</b> to define the critical or warning criteria. See <a href="#">Create and Configure Conditions</a>.</p> <p>For a failed HTTP request action, you can now view the affected entity name in the notification (email or message) that you receive by creating a policy. You can also access the details of the affected entity by using the <code>affectedEntities</code> predefined variable in an HTTP request template or an email template. See <a href="#">Predefined Templating Variables</a>.</p>

ThousandEyes Integration with Browser Real User Monitoring	Support to manually unlink domains and stop data ingestion from ThousandEyes tests. See <a href="#">ThousandEyes Data Ingestion</a> .	23.8.0	August 14, 2023
Dash Studio	<ul style="list-style-type: none"> <li>Time Series widget and Metric Number widget support Analytics metrics.</li> <li>The Health widget supports health rules for Analytics.</li> </ul> See <a href="#">Data Binding</a> .	23.8.0	August 28, 2023

## 23.7

### Application Monitoring Enhancements

This release includes IIB Agent support for Ansible using [Agent Management](#). See [Ansible Configuration for IIB Agent](#).

### SaaS Controller Enhancements

Product/Component	Summary	Release Version	Release Date
General	This release includes the following bug fix. See <a href="#">SaaS Controller Resolved Issues</a> . <ul style="list-style-type: none"> <li>TMNT-6688</li> </ul>	23.7.5	October 4, 2023
General	This release includes the following bug fixes. See <a href="#">SaaS Controller Resolved Issues</a> . <ul style="list-style-type: none"> <li>CONTRLRDEV-1215</li> <li>CONTRLRDEV-1348</li> <li>NETWORK-6562</li> </ul>	23.7.4	September 28, 2023
General	This release includes the following bug fixes. See <a href="#">SaaS Controller Resolved Issues</a> . <ul style="list-style-type: none"> <li>DIS-153</li> <li>DIS-187</li> <li>STUDIO-5111</li> <li>TMNT-6547</li> </ul>	23.7.3	August 28, 2023
General	This release includes minor bug fixes.	23.7.2	August 8, 2023

Product/Component	Summary	Release Version	Release Date
General	<p>A new Controller Configuration flag ( <code>appdynamics.controller.apps.metric.refill.enabled.list</code> ) is introduced that retries metric aggregation if the metric aggregation times out. See <a href="#">Monitor Analytics Metrics</a>.</p> <p>This release includes the following bug fixes. See <a href="#">SaaS Controller Resolved Issues</a>.</p> <ul style="list-style-type: none"> <li>• CDM-9519</li> <li>• EUMPLAT-4667</li> <li>• PLATSE-1432</li> <li>• PLATSE-1436</li> </ul>	23.7.1	July 26, 2023
General	<p>This release supports Keyboard Accessibility with top-to-bottom and left-to-right navigation on the Controller UI.</p>	23.7.0	July 5, 2023
Application	<p>If your application has SAP ABAP servers, the Controller UI now displays the following changes:</p> <ul style="list-style-type: none"> <li>• The <b>Application &gt; Tiers &amp; Nodes</b> page and the <b>Flow Map</b> view display the ABAP icon. Earlier, the C++ icon was displayed for SAP ABAP app servers.</li> <li>• In <b>Tiers &amp; Nodes</b>, the SAP ABAP Agent version displays the ABAP transport component version. And, the runtime version displays the NetWeaver ABAP platform runtime version.</li> </ul>	23.7.0	July 5, 2023
Alert and Respond	<p>You can now select the following sensitivity levels for Anomaly Detection to monitor Business Transactions:</p> <ul style="list-style-type: none"> <li>• Sensitivity: High</li> <li>• Sensitivity: Medium</li> <li>• Sensitivity: Low</li> </ul> <p>For example, you can select <b>Sensitivity: High</b> for business critical services so that no anomalies get undetected. Anomaly Detection detects anomalies even when the statistical confidence is low and you receive too many alerts. See <a href="#">Configure Anomaly Detection</a>.</p>	23.7.0	July 5, 2023

Product/ Component	Summary	Release Version	Release Date
Alert and Respond	<p>When you configure action suppression, you can now specify an unplanned maintenance window or downtime period (start and end time) that happened in the past. This option is useful when you want to exclude the metrics reported by the agents during the unplanned maintenance or downtime period from reporting and analytics. See <a href="#">Configure and Manage Action Suppressions</a>.</p>	23.7.0	July 5, 2023
Alert and Respond	<p>The account owner now gets an email notification when health rules with a large number of evaluating entities get automatically disabled. The email contains the following information:</p> <ul style="list-style-type: none"> <li>• the name of the health rules</li> <li>• the applications for which the health rules are disabled</li> </ul> <p>To enable the health rules, you need to reduce the number of evaluating entities by applying additional entity filters. See <a href="#">Configure Affected Entities</a>.</p>	23.7.0	July 5, 2023

Product/ Component	Summary	Release Version	Release Date
Custom Dashboard	<p>You can exclude data from the <b>Custom Dashboard</b> widgets for the period specified in <b>Action Suppression</b>. The metrics during the application maintenance or outage on your application can be inaccurate. So, you might want to exclude this information on the dashboard.</p> <p>After you create an <b>Action Suppression</b>, enable the <b>Exclude Maintenance Window</b> checkbox while creating or editing the Custom Dashboard. Currently, this option is available in the following scenarios only:</p> <ul style="list-style-type: none"> <li>• Non-recurring planned maintenance or unplanned outage.</li> <li>• Objects of Action Suppression is <b>Application</b> for APM, BRUM, and MRUM applications. See <a href="#">Configure and Manage Action Suppression</a>.</li> <li>• Metric category is either <b>Overall application performance</b> and <b>Custom</b>.</li> <li>• <b>Single Metric</b> value.</li> <li>• In the <b>Analytics</b> page, if the metrics uses ADQL, the query must only use = operator in the Where clause to match the application name or key..</li> </ul> <p>In <b>Custom Dashboards</b>, if you are using time series charts, the suppressed period appears blank and it helps you identify the application downtime. The widgets like pie charts, gauge, and metric value exclude the suppressed data from its calculation. For more information, see <a href="#">Exclude Data from the Custom Dashboard During Maintenance or Outage</a>.</p>	23.7.0	July 5, 2023
APM	<p>This release introduces a personal profile icon that includes the following details:</p> <ul style="list-style-type: none"> <li>• List of tenants that you are allowed to access</li> <li>• Links to the Help and Support related pages</li> <li>• Link to access the Account portal</li> </ul> <p>You can view this icon on the Controller UI if it meets the following conditions:</p> <ul style="list-style-type: none"> <li>• The <code>miniprofile.controller.enabled</code> property is set to true in the admin.jsp page.</li> <li>• The login is SSO enabled.</li> </ul>	23.7.0	July 5, 2023

Product/Component	Summary	Release Version	Release Date
APM	A new Controller setting, <code>roles.admin.high.performance.controller.enabled</code> , is introduced that resolves the performance issues while managing high volume of application permissions.	23.7.0	July 5, 2023
EUM Cloud (SaaS)	This release supports HTTP Strict Transport Security protocol for all AppDynamics SaaS endpoints.	23.7.0	July 5, 2023
Dash Studio	This release supports defining the <b>Databases</b> variable. See <a href="#">Dashboard Variables</a> and <a href="#">Database Metrics</a> .	23.7.0	July 31, 2023

### 23.6

Product/Component	Summary	Release Version	Release Date
Cisco Secure Application	This release includes alerts for security attacks. See <a href="#">Alerts Using Cisco Secure Application</a> .	23.6.0	June 28, 2023

### 23.5

Product/Component	Summary	Release Version	Release Date
Accounts/Licensing	When you create license rules, you can enable a setting to prevent agents from registering if the host has no vCPU information to conserve license consumption for a Cluster Agent. See <a href="#">Wait for vCPU Information Before Registering Agents</a> .	23.5.1	June 12, 2023
Cisco Secure Application	This release includes Business Risk Factors. See <a href="#">Monitor Business Transactions</a> .	23.5.0	May 30, 2023
General	This release includes optimization and bug fixes. See <a href="#">SaaS Controller Resolved Issues</a> .	23.5.0	May 24, 2023

## 23.4

Product/ Component	Summary	Release Version	Release Date
General	<p>This release includes the following bug fixes. See <a href="#">SaaS Controller Resolved Issues</a>.</p> <ul style="list-style-type: none"> <li>• ALTCSAAS-1628</li> <li>• CONTRLRDEV-698</li> <li>• CONTRLRDEV-734</li> <li>• DBMON-9044</li> <li>• LIC-3816</li> </ul>	23.4.3	June 28, 2023
Accounts/ Licensing	<p>When you create license rules, you can enable a setting to prevent agents from registering if the host has no vCPU information to conserve license consumption for a Cluster Agent. See <a href="#">Wait for vCPU Information Before Registering Agents</a>.</p>	23.4.3	June 28, 2023
Dash Studio	<p>This release includes the following bug fixes. See <a href="#">SaaS Controller Resolved Issues</a>.</p> <ul style="list-style-type: none"> <li>◦ STUDIO-5091</li> <li>◦ STUDIO-5095</li> </ul>	23.4.2	May 16, 2023
General	<p>This release includes the following bug fixes. See <a href="#">SaaS Controller Resolved Issues</a>.</p> <ul style="list-style-type: none"> <li>◦ APMC-1395</li> <li>◦ IAM-4626, IAM-4282</li> <li>◦ TMNT-6361</li> </ul>	23.4.1	May 11, 2023

Product/ Component	Summary	Release Version	Release Date
ThousandEyes Integration with Browser Real User Monitoring	<p>You can integrate ThousandEyes with Browser Real User Monitoring. This integration combines application data from AppDynamics and internet network metrics from ThousandEyes to provide full-stack observability.</p> <p>When you add the ThousandEyes widget in the browser application dashboard, you can:</p> <ul style="list-style-type: none"> <li>• View ThousandEyes network metrics (packet loss, latency, and jitter) and network health in the context of browser applications.</li> <li>• Analyze the impact of network performance on application performance             <ul style="list-style-type: none"> <li>◦ Analyze how latency, packet loss, and jitter affect end-user response time and application errors</li> </ul> </li> <li>• Identify whether the network is the cause of application issues:             <ul style="list-style-type: none"> <li>◦ Network issue affecting a specific geographic location</li> <li>◦ Network issue affecting a specific domain</li> <li>◦ Network issue (latency) causing higher end-user response time</li> <li>◦ Network issue (packet loss) causing errors in applications</li> <li>◦ Network issue (jitter) causing inconsistent user experience</li> </ul> </li> <li>• Narrow down the network issue to a specific domain and a specific location</li> <li>• Forward the ThousandEyes test with the network issue to the NetworkOps team for further troubleshooting</li> <li>• Troubleshoot the network issue by navigating to the ThousandEyes dashboard</li> </ul> <p>See <a href="#">ThousandEyes Integration with Browser Real User Monitoring</a>.</p> <p>To activate the integration, you need an active license of any of the following EUM licenses and an active subscription to <a href="#">ThousandEyes Network and Application Synthetics</a>:</p> <ul style="list-style-type: none"> <li>• Real User Monitoring (SaaS) - Peak Edition</li> <li>• Browser Real User Monitoring (SaaS) - Peak Edition</li> </ul> <p>For the license entitlements, see <a href="#">License Entitlements and Restrictions</a>.</p>	23.4.0	May 2, 2023

Product/ Component	Summary	Release Version	Release Date
	<p> If you have an existing ThousandEyes integration, add and save the ThousandEyes credentials again for this integration to work.</p>		
Accounts	<p>Users can obtain one identity across Controller tenants and Accounts by completing an email address verification process. Once verified, users can use the same identity across multiple tenants and accounts, making it easier to manage their access and permissions.</p> <p>See <a href="#">AppDynamics Global Identity Migration Experience - FAQ</a>.</p>	23.4.0	April 10, 2023
Alert and Respond	<p>When you create or update a health rule for the type <b>User Experience Browser Apps</b>, you can now select the following metrics for the entities <b>Pages or Virtual Pages</b>:</p> <ul style="list-style-type: none"> <li>• Visually Complete Time (ms)</li> <li>• Visually Complete Time 50th percentile (ms)</li> <li>• Visually Complete Time 90th percentile (ms)</li> <li>• Visually Complete Time 95th percentile (ms)</li> <li>• Visually Complete Time 99th percentile (ms)</li> </ul> <p>These metrics are selected to evaluate the critical or warning criteria. You can now monitor the user experience by tracking how much time does it takes for all visual elements within the first screen (above-the-fold content) to load in an end user's browser and get alerted for any issues. See <a href="#">Create and Configure Conditions</a>.</p>	23.4.0	April 10, 2023

Product/Component	Summary	Release Version	Release Date
Alert and Respond	You can now configure a policy to detect a failed HTTP request action. An HTTP request action fails due to various reasons such as incorrect payload, server unreachable, or gateway timeout. In such scenarios, the policy triggers and you can set up an automatic notification through email or message. You can take corrective action accordingly. See <a href="#">Configure Policies</a> .	23.4.0	April 10, 2023
Alert and Respond	You can now request your Cisco Accounts team to extend the health rule violation status beyond the default auto-cancelation period. The health rule violation status gets canceled automatically when the health rule continues to violate straight for 72 hours. See <a href="#">Troubleshoot Health Rule Violations</a> .	23.4.0	April 10, 2023
AppDynamics for OpenTelemetry™	AppDynamics for OpenTelemetry™ introduces transaction snapshots in a waterfall view. The waterfall view allows you to quickly determine which calls consumed the transaction time for a given snapshot. You can click a segment to view the resource wait time for its business transaction. See <a href="#">View OpenTelemetry™ Data in the Controller UI</a> .	23.4.0	April 25, 2023
Cisco Secure Application	This release adds Business Risk metrics for Alerts. See <a href="#">Alerts Using Cisco Secure Application</a> .	23.4.0	April 28, 2023
Licensing	When using Infrastructure-based Licenses (IBL), you have the option to enable license rules that help you conserve license consumption for a Cluster Agent when the system is unable to detect its vCPU information. In such cases, the Cluster Agent without vCPU information will be rejected and won't be registered. This helps you avoid consuming a license for the agent.  See <a href="#">Machine and Cluster Agent License Prioritization</a> .	23.4.0	April 10, 2023

Product/Component	Summary	Release Version	Release Date
Dash Studio	<ul style="list-style-type: none"> <li>A new list view is introduced that includes <b>Last Viewed</b> and <b>Views in Last 7 Days</b> columns and minor enhancements.</li> <li>The health widget now supports the <code>within</code> function for business transactions.</li> </ul>	23.4.0	April 26, 2023

### 23.3

Product/Component	Summary	Release Version	Release Date
Cisco Secure Application	<p>This release includes .NET Agent Runtime Event support for Cisco Secure Application. This is for both .NET Core, and .NET Runtime. See <a href="#">Cisco Secure Application Requirements</a>, and <a href="#">23.3 SaaS Controller Known Issues</a> for the Cisco Secure Application known issue.</p>	23.3.0	March 30, 2023

### 23.2

Product/Component	Summary	Release Version	Release Date
General	<p>This release includes the following bug fixes. See <a href="#">SaaS Controller Resolved Issues</a>.</p> <ul style="list-style-type: none"> <li>IAM-4650</li> <li>TMNT-6360</li> </ul>	23.2.3	May 05, 2023
Alert and Respond	<p>You can now request your Cisco Accounts team to extend the health rule violation status beyond the default auto-cancelation period. The health rule violation status gets canceled automatically when the health rule continues to violate straight for 72 hours. See <a href="#">Troubleshoot Health Rule Violations</a>.</p>	23.2.2	April 11, 2023

Product/ Component	Summary	Release Version	Release Date												
General	<ul style="list-style-type: none"> <li>You can now share your feedback using the feedback option available on the Controller homepage.</li> <li>Added the following new properties to the <code>blitz_system_properties</code> table to support Availability Zone failover.</li> </ul> <table border="1" data-bbox="480 562 954 1234"> <thead> <tr> <th>Property</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td><code>mirror.registration.host</code></td> <td>Blitz mirror reader host details.</td> </tr> <tr> <td><code>mirror.registration.port</code></td> <td>Blitz mirror reader port details.</td> </tr> <tr> <td><code>mirror.cluster.name</code></td> <td>Name of mirror Blitz cluster. It is used by DIS to split the Blitz data.</td> </tr> <tr> <td><code>mirror.enabled</code></td> <td>To enable/disable mirroring.</td> </tr> <tr> <td><code>mirror.ssl.enabled</code></td> <td>To enable blitz mirroring SSL.</td> </tr> </tbody> </table> <ul style="list-style-type: none"> <li>This release includes bug fixes for Alert &amp; Respond, Database Monitoring, and Platform Sustaining Engineering. See the following bugs in the <a href="#">SaaS Controller Resolved Issues</a>. <ul style="list-style-type: none"> <li>ALTCSAAS-1395</li> <li>ALTCSAAS-1400</li> <li>ANALYTICS-15093</li> <li>CONTRLRDEV-187</li> <li>LIC-3568</li> <li>PLATSE-1244</li> <li>PLATSE-1265</li> <li>PLATSE-1273</li> <li>STUDIO-5016</li> </ul> </li> </ul>	Property	Description	<code>mirror.registration.host</code>	Blitz mirror reader host details.	<code>mirror.registration.port</code>	Blitz mirror reader port details.	<code>mirror.cluster.name</code>	Name of mirror Blitz cluster. It is used by DIS to split the Blitz data.	<code>mirror.enabled</code>	To enable/disable mirroring.	<code>mirror.ssl.enabled</code>	To enable blitz mirroring SSL.	23.2.1	March 28, 2023
Property	Description														
<code>mirror.registration.host</code>	Blitz mirror reader host details.														
<code>mirror.registration.port</code>	Blitz mirror reader port details.														
<code>mirror.cluster.name</code>	Name of mirror Blitz cluster. It is used by DIS to split the Blitz data.														
<code>mirror.enabled</code>	To enable/disable mirroring.														
<code>mirror.ssl.enabled</code>	To enable blitz mirroring SSL.														
Database Monitoring	<p>This release includes support for PostgreSQL certificate-based login. See <a href="#">Monitor SSL-enabled PostgreSQL Database</a>.</p>	23.2.0	March 16, 2023												

Product/Component	Summary	Release Version	Release Date
Dash Studio	This release includes support to add browser and mobile applications' Geo Dashboard map in the Iframe widget. See <a href="#">Iframe Widget</a> .	23.2.0	March 6, 2023

### 23.1

Product/Component	Summary	Release Version	Release Date
Cisco Secure Application	This release includes: <ul style="list-style-type: none"> <li>The <b>Alerts</b> feature. See <a href="#">Alerts Using Cisco Secure Application</a>.</li> <li>The Business Risk algorithm for business transactions. See <a href="#">Monitor Business Transactions</a>.</li> <li>Kenna scoring for business transactions. See <a href="#">Monitor Business Transactions</a>.</li> </ul>	23.1.0	January 31, 2023

### 22.12

Product/Component	Summary	Release Version	Release Date
General	This release includes: <ul style="list-style-type: none"> <li>An enhancement to retain the database monitoring data for up to 90 days</li> <li>The following bug fixes for Alert &amp; Respond, SaaS Controller, and Platform Sustaining Engineering. See the following bugs in the <a href="#">SaaS Controller Resolved Issues</a>.               <ul style="list-style-type: none"> <li>ALTCSAAS-1477</li> <li>ALTCSAAS-1486</li> <li>CONTRLRDEV-207</li> <li>PLATSE-1302</li> </ul> </li> </ul>	22.12.5	April 19, 2023

Product/ Component	Summary	Release Version	Release Date												
General	<p>This release includes:</p> <ul style="list-style-type: none"> <li>The following new properties to the <code>blitz_system_properties</code> table to support Availability Zone failover. <table border="1" data-bbox="485 527 899 1199"> <thead> <tr> <th data-bbox="488 531 664 596">Property</th> <th data-bbox="664 531 896 596">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="488 596 664 726"><code>mirror.registration.host</code></td> <td data-bbox="664 596 896 726">Blitz mirror reader host details.</td> </tr> <tr> <td data-bbox="488 726 664 852"><code>mirror.registration.port</code></td> <td data-bbox="664 726 896 852">Blitz mirror reader port details.</td> </tr> <tr> <td data-bbox="488 852 664 1005"><code>mirror.cluster.name</code></td> <td data-bbox="664 852 896 1005">Name of mirror Blitz cluster. Property	Description														
<code>mirror.registration.host</code>	Blitz mirror reader host details.														
<code>mirror.registration.port</code>	Blitz mirror reader port details.														
<code>mirror.cluster.name</code>	Name of mirror Blitz cluster. DIS uses it to split the Blitz data.														
<code>mirror.enabled</code>	To enable/disable mirroring.														
<code>mirror.ssl.enabled</code>	To enable blitz mirroring SSL.														

Product/ Component	Summary	Release Version	Release Date
General	<p>This release includes bug fixes for Alert &amp; Respond, Database Monitoring, and Platform Sustaining Engineering. See the following bugs in the <a href="#">SaaS Controller Resolved Issues</a>.</p> <ul style="list-style-type: none"> <li>• ALTCSAAS-1393</li> <li>• DBMON-8910</li> <li>• PLATSE-1146</li> </ul>	22.12.3	March 15, 2023
General	<p>The following enhancements have been added to the Controller:</p> <ul style="list-style-type: none"> <li>• PDFBox version upgraded to 2.0.25</li> <li>• Apache Tikka version upgraded to 1.28</li> <li>• Jetty (Java-based HTTP/1.x, HTTP/2, Servlet, WebSocket Server) is upgraded to 9.4.45.v20220203</li> <li>• CSRFfilter added for additional security.</li> </ul> <p>This release includes bug fixes for Platform Sustaining Engineering. See the following bugs in the <a href="#">SaaS Controller Resolved Issues</a>.</p> <ul style="list-style-type: none"> <li>• PLATSE-425</li> <li>• PLATSE-521</li> <li>• PLATSE-1123</li> </ul>	22.12.2	January 11, 2023
General	<p>This release includes bug fixes for Alert &amp; Respond, Analytics, Browser RUM, and Platform Sustaining Engineering. See <a href="#">SaaS Controller Resolved Issues</a> for details.</p>	22.12.1	January 11, 2023

Product/Component	Summary	Release Version	Release Date
Alert and Respond	<p>When you configure <a href="#">actions suppression</a> for servers, you can now select the following object scope:</p> <ul style="list-style-type: none"> <li>• Servers:               <ul style="list-style-type: none"> <li>◦ All Servers</li> <li>◦ Servers within the specified subgroups</li> <li>◦ The specified servers</li> <li>◦ Servers matching the following criteria - Starts with, Ends with, Contains, Equals, Matches Regex</li> </ul> </li> <li>• Subgroups:               <ul style="list-style-type: none"> <li>◦ All Subgroups</li> <li>◦ The specified Subgroups</li> </ul> </li> </ul>	22.12	December 12, 2022
Analytics	<p>IBL usage details are now shown by default on the <b>Configuration</b> page. To hide IBL usage details, set the <code>CONFIG_EXCLUDE_ANALYTICS_LICENSE_USAGE</code> flag to <code>false</code>. See <a href="#">Collect Transaction Analytics Data</a>.</p>	22.12	December 12, 2022
Dash Studio	<p>This release includes support for GeoMap Iframe synchronization with the global time range.</p>	22.12	December 19, 2022

## 22.11

Product/Component	Summary	Release Version	Release Date
Cisco Secure Application	<p>This release includes beta support for .NET Framework. See <a href="#">Cisco Secure Application Requirements</a>.</p>	22.11.0	November 30, 2022
Dash Studio	<p>Nested variables support for nodes and business transactions. See <a href="#">Dashboard Variables</a>.</p>	22.11.0	November 21, 2022

## 22.10

Product/ Component	Summary	Release Version	Release Date
General	This release includes bug fixes. See <a href="#">SaaS Controller Resolved Issues</a> for details.	22.10.6	April 10, 2023
General	This release includes bug fixes. See <a href="#">SaaS Controller Resolved Issues</a> for details.	22.10.5	February 28, 2023
General	This release includes bug fixes. See <a href="#">SaaS Controller Resolved Issues</a> for details.	22.10.4	January 12, 2023
General	Summary messages are now added to Custom Events Actions.	22.10.3	November 29, 2022
Dash Studio	The sorting on the <b>Shared</b> column in <b>Custom Dashboard</b> list has been disabled.	22.10.2	November 14, 2022
Alert and Respond	Improved the error message for MTLS error messaging. See <a href="#">SaaS Controller Resolved Issues</a> for details.	22.10.1	November 4, 2022
Dash Studio	Bug fixed for Analytics widgets on custom dashboards. See <a href="#">SaaS Controller Resolved Issues</a> for details.	22.10.1	November 4, 2022
Alert and Respond	<p>You can now enable the mutual TLS authentication method to secure the traffic for sending alerts (HTTP request actions) from AppDynamics Controller to third-party endpoints such as Slack, PagerDuty and ServiceNow.</p> <p>This mutual authentication method eliminates malicious attacks by verifying that the alerts received on the endpoints are from AppDynamics only. See <a href="#">Configure and Enable Mutual TLS Authentication</a>.</p>	22.10.0	October 24, 2022
Alert and Respond	When a custom event occurs, you can now view its associated details such as custom event type, property names, and property values in the email digest that you receive. See <a href="#">Create a Custom Event</a> and <a href="#">Email Digests</a> .	22.10.0	October 24, 2022

## 22.9

Product/Component	Summary	Release Version	Release Date
Cisco Secure Application	Includes updates to the <b>Global Filter</b> . See <a href="#">Monitor Application Security Using Cisco Secure Application</a> .	22.9.0	09/28/22
Dash Studio	Includes support for Nested variables for tiers.	22.9.0	09/28/22
Dash Studio	Disables sort on <b>Shared</b> column in <b>Custom Dashboard</b> list that wasn't working correctly. The sort functionality will be added in a later release.	22.9.2	11/14/22
Licensing	Includes a fix to the License Service that was preventing the Analytics Agent from sending data to the Events Service.	22.9.1	09/22/22
Synthetic API Monitoring	You can now configure the API requests using the GUI. See <a href="#">Configure API Monitoring Jobs</a> .	22.9.0	09/12/22
	You can now view the console logs under <b>Session Summary</b> . See <a href="#">Synthetic API Monitoring</a> .		

## 22.8 Release

Product/Component	Summary	Release Version	Release Date
General	This release includes bug fixes for licensing, Dash Studio, and Browser RUM. See <a href="#">SaaS Controller Resolved Issues</a> for details.	22.8.2	11/14/22
Alert & Respond	A bug was fixed to ensure that actions are disabled or enabled based on the global action suppression flag.	22.8.1	08/02/22
Cisco Secure Application	You can now monitor security of the business transactions using Cisco Secure Application. See <a href="#">Monitor Business Transactions</a> .	22.8.0	08/01/22

Product/Component	Summary	Release Version	Release Date
Alert & Respond	You can now create health rules and policies to monitor the APIs and trigger alerts when the API metrics and the synthetic events deviate from their normal behavior. See <a href="#">Alerts for Synthetic API Monitoring</a> .		
Dash Studio	Datagrid widget is now supported in AppDynamics Data Query Language queries. See <a href="#">Data Binding</a> .		
Synthetic API Monitoring	You can now import API collections of Postman to the API monitoring jobs. See <a href="#">Configure API Monitoring Jobs</a> .		

## 22.7 Release

Product/Component	Summary	Release Version	Release Date
Account Management	This release includes the ability to create multiple users at one time. See <a href="#">User Management</a> .	22.7.0	July 10, 2022
Dash Studio	This release adds support for browser application variables. See <a href="#">Variables in ADQL Queries</a> .	22.7.0	July 25, 2022

## 22.6 Release

Product/Component	Summary	Release Version	Release Date
Experience Journey Map	Custom labels are available to rename end user events in user journeys. See <a href="#">Add a Custom Label</a> .	22.6.0	June 23, 2022
Mobile RUM	Mobile Sessions are no longer created from the following end user events occurring in the background: <ul style="list-style-type: none"> <li>• Connection transitions (network transition)</li> <li>• Network requests</li> </ul>		

Product/Component	Summary	Release Version	Release Date
Dash Studio	Some buttons on the Dashboard and Widget properties panel are relabeled and reorganized. See <a href="#">Dash Studio Widgets</a> .		
Alert & Respond	Bug was fixed to ensure actions are enabled/disabled during restart depending on action suppression flag.	22.6.1	August 4, 2022
Synthetic Browser Monitoring	Bug fixed to enable users with edit permission to edit the API monitoring collections.		

## 22.5 Release

### 22.5.1

This release corrects an issue regarding the preservation of business transaction configurations for Business Journeys. See [Controller \(SaaS\) Resolved Issues](#).

### 22.5.0

#### Agent Installer

This release includes:

- Java Hybrid Agent installation with OpenTelemetry enabled (optional). See [Agent Installer](#) and [Custom Installation Method](#).
- Machine Agent upgrade and rollback (Windows). See [Upgrade and Rollback the Agents](#) and [Deploy an Agent Using the Agent Installer API](#).
- Machine Agent installation with Server Visibility (Linux and Windows) and .NET compatibility Mode (Windows). See [Enable Server Visibility and .NET Compatibility Mode with Agent Installer](#).

#### Mobile Real User Monitoring

The 22.5.0 Controller release includes the following enhancements:

- A setting to enable or disable crash reporting. See [Disable Crash Reporting](#).
- A setting to enable or disable auto-symbolication. See [Disable Auto-Symbolication](#).
- A management tool for uploaded mapping files. For iOS mapping files, see [Upload the dSYM File](#). For Android mapping files, see [Manually Upload Mapping Files](#).

#### Synthetic Monitoring

The Synthetic web and API monitoring APIs are released. See [Synthetic Monitoring API](#).

#### Database Monitoring

This release includes new Microsoft SQL server metrics. See [Database Monitoring Metrics](#).

## 22.4 Release

### 22.4.0

#### Agent Installer

This release includes the [Tier Naming Rules](#) feature and changes to the Node Name format. Existing customers using the Agent Installer will automatically have their Node names changed to the new format, see [Node Name Format](#).

#### Dash Studio

This release supports viewing ThousandEyes data for the past 90 days. See [Configure the ThousandEyes Dashboard](#).

## 22.3 Release

### 22.3.2

This release includes bug fixes and optimizations. See the [22.3 Controller Resolved Issues](#) for details.

### 22.3.1

This release includes bug fixes and optimizations. See the [22.3 Controller Resolved Issues](#) for details.

### 22.3.0

#### Analytics

The following configurations were added to enhance audit logging:

Configuration Name
ANALYTICS_METRIC
ANALYTICS_SAVED_SEARCH
ANALYTICS_BUSINESS_JOURNEY
ANALYTICS_XLM
ANALYTICS_LOG_SOURCE
ANALYTICS_AGENT_SCOPE
ANALYTICS_API_KEY

See [Controller Audit Log](#).

#### End User Monitoring

When you create a [Controller Audit scheduled report](#), you can filter the data by `EUM_CONFIGURATION` filters.

---

## Database Monitoring

Added the **Number of Sessions** column on the **Queries** page. See [Database Queries Window](#).

## Cluster Monitoring

- The log collection works even if the AWS account display name contains a plus (+) character.
- An option to save the logs in the S3 bucket or in the Controller filesystem by using the `sim.cluster.logs.s3.enabled` Controller setting. See [Enable Log Collection for Failing Pods](#).

## Dash Studio

Support for running a custom query for any metric. See [Data Binding](#).

## AppDynamics for OpenTelemetry

AppDynamics for OpenTelemetry is a new service to ingest and visualize OpenTelemetry data. See [AppDynamics for OpenTelemetry documentation](#).

There are known issues in the 22.3 release. See [Known Issues](#) for details.

## 22.2 Release

### 22.2.4

This release includes support for asynchronously correlated business transactions for mobile sessions. See the [22.2 Controller Resolved Issues](#) for details.

### 22.2.3

This release includes bug fixes. See the [22.2 Controller Resolved Issues](#) for details.

### 22.2.2

This release includes bug fixes. See the [22.2 Controller Resolved Issues](#) for details.

### 22.2.1

This release includes bug fixes and optimizations. See the [22.2 Controller Resolved Issues](#) for details.

### 22.2.0

## Analytics

This release includes a UI enhancement that displays license availability and usage for applications that can enable Application Analytics. See [Collect Transaction Analytics Data](#).

## Agent Installer

This release includes support for installing the Machine Agent on Windows using the Agent Installer. See [Agent Installer](#) and [Deploy an Agent Using the Agent Installer API](#).

## Browser Real User Monitoring (RUM)

This release includes a set of features for monitoring and troubleshooting JavaScript Errors:

- The **JavaScript Error** dashboard displays metrics for all JavaScript error in a browser app.
- The **Summary** dashboard displays metrics for a JavaScript error.
- The **Instance** table lists each occurrence of a JavaScript error.
- The **Troubleshooting** functionality locates the error in an uploaded source map and source file.

---

See [JavaScript Error Dashboard](#) for more information.

### Synthetic Monitoring

This release includes support for the configuration of multiple schedules for a Synthetic job. See [Configure Synthetic Jobs](#) and [Configure API Monitoring Jobs](#).

### Dash Studio

This release includes support for the Gauge widget in a ThousandEyes query. See [Configure the ThousandEyes Dashboard](#).

## 21.12 Release

### 21.12.1

This release includes bug fixes and optimizations. See the [21.12 Controller \(SaaS\) Resolved Issues](#) for details.

### 21.12.0

### Browser Synthetic Monitoring

You can now display or hide the **Schedule End Date** column in the job list view.

### Browse Real User Monitoring

This release includes a dashboard for monitoring and troubleshooting JavaScript Errors:

- The **JavaScript Error** dashboard displays metrics for all JavaScript errors in a browser app.
- The **Summary** dashboard displays metrics for a JavaScript error.
- The **Instance** table lists each occurrence of a JavaScript error.
- The **Troubleshooting** functionality locates the error in an uploaded source map and source file.

### Cisco Secure Application

You can now monitor the security of the .NET applications by using Cisco Secure Application. See [Application Security Monitoring](#).

## 21.11 Release

### 21.11.3

This release includes bug fixes and optimizations. See [21.11 Controller \(SaaS\) Resolved Issues](#) for details.

### 21.11.2

This release includes bug fixes and optimizations. See [21.11 Controller \(SaaS\) Resolved Issues](#) for details.

### 21.11.1

This release includes bug fixes and optimizations. See [21.11 Controller \(SaaS\) Resolved Issues](#) for details.

### 21.11.0

### End User Monitoring

- A new base-page cookie consent setting for requiring cookie consent for business transaction correlation with End User Monitoring. See [Cookie Consent Management](#).

---

## Database Monitoring

- You can now view the following roles/states of the `replicaset` and sharded cluster:
  - primary
  - secondary
  - startup
  - recovering
  - startup2
  - unknown
  - arbiter
  - down
  - rollback

To view these roles on the **Topology** tab, you need the Database Agent  $\geq$  21.9.0.

- The Couchbase collector is enhanced to display the **Filter by Phases** in the **Queries** page and elapsed time is displayed for the phases report in the **Activity** page. See [Database Queries Window](#) and [Database Activity Window](#).

## Licensing

- A new setting to prioritize Machine and Cluster Agent consumption of an infrastructure-based license. See the "Machine/Cluster Agent Prioritization" section on [License Rules](#).

## AppDynamics Mobile Application Enhancements

The AppDynamics 21.11.0 mobile application documentation is enhanced:

- User documentation includes the flag to enable push notifications
- General improvements

## AppDynamics iOS Sample App Enhancements

The [AppDynamics 1.0 iOS Sample App](#) was released on November 17, 2021.

## Synthetic Monitoring

This release introduces a new Synthetic API Monitoring product. Synthetic API monitoring can be used to monitor the availability and performance of public or private APIs. See [Synthetic API monitoring](#).

### 21.10 Release

#### 20.10.0

### Agent Installer

This release includes APIs to support upgrades for the Machine Agent and Java Agent on the Linux environment. See [Agent Installer Platform Service API](#).

### Dash Studio

This release includes these enhancements to the Metric Number widget:

- A new **Horizontal Alignment** property. See [Dash Studio Widget Properties](#).
- The **Reverse Trend Color** and **Compared Value Only** options under the **Compare Time Range** property. See [Time Range Comparison](#).

### 21.9 Release

#### 21.9.5

This release includes bug fixes and optimizations. See [21.9 Controller \(SaaS\) Resolved Issues](#) for details.

---

#### 21.9.4

This release includes bug fixes and optimizations. See [21.9 Controller \(SaaS\) Resolved Issues](#) for details.

#### 21.9.3

This release includes bug fixes and optimizations. See [21.9 Controller \(SaaS\) Resolved Issues](#) for details.

#### 21.9.2

This release includes bug fixes and optimizations. See [21.9 Controller \(SaaS\) Resolved Issues](#) for details.

#### 21.9.1

This release includes an improved URL filter for APIs and fixes some bugs. See the [21.9 Controller \(SaaS\) Resolved Issues](#) for details.

#### 21.9.0

This release includes bug fixes and optimizations. See [21.9 Controller \(SaaS\) Resolved Issues](#) for details.

### 21.8 Release

#### 21.8.4

This release includes bug fixes and optimizations. See the 21.8.4 resolved issues given in [21.8 Controller \(SaaS\) Resolved Issues](#) for details.

#### 21.8.3

This Controller release includes an improved URL filter for APIs and fixes some bugs. See the 21.8.3 resolved issues given in [21.8 Controller \(SaaS\) Resolved Issues](#) for details.

#### 21.8.2

This Controller release includes improved URL filter for APIs. See PLATSE-224 in the [21.8 Controller \(SaaS\) Resolved Issues](#) for details.

#### 21.8.1

The Controller has upgraded jQuery to 3.5.1 and AngularJS to 1.8.2. See [21.8 Controller \(SaaS\) Resolved Issues](#).

#### 21.8.0

### License Management

License error messages have been updated for infrastructure-based licenses. See [License Errors and Troubleshooting](#).

### License Entitlements

The Mobile Real User Monitoring Pro (SaaS) retention entitlement has changed for Event Data. See [License Entitlements and Restrictions](#).

### Dash Studio

- You can click on the Metric Number widget to access the ThousandEyes dashboard. See [Configure the ThousandEyes Dashboard](#).
- A new **Previous Time Range** option is available with the time range comparison feature. See [Time Range Comparisons](#).

---

## Experience Journey Map

You can now filter Experience Journey Map by region and city. See [Filter User Journeys](#).

## 21.7 Release

### Controller 21.7.0 Release

#### Dash Studio

With this release, you can:

- Access tests from every account group instead of just the default account group.
- Click on the Metric Number widget to access the ThousandEyes dashboard.

See [Configure the ThousandEyes Dashboard](#).

## 21.6 Release

### Controller 21.6.5 Release

The 21.6.5 released with upgrades to JavaScript libraries and several bug fixes. See [Past Resolved and Known Issues by Release](#).

### Controller 21.6.4 Release

The 21.6.4 released with a bug fix. See MQS-1273 in [Past Resolved and Known Issues by Release](#)

### Controller 21.6.3 Release

The 21.6.3 released with bug fixes. See ANALYTICS-13663 and LIC-1257 in [Past Resolved and Known Issues by Release](#).

### Controller 21.6.2 Release

The 21.6.2 released with a bug fix. See IAM-1926 in [Past Resolved and Known Issues by Release](#).

### Controller 21.6.1 Release

The 21.6.1 released with bug fixes. See DBMON-8138 and MQS-1267 in [Past Resolved and Known Issues by Release](#).

### Controller 21.6.0 Release

#### Licensing

With an infrastructure-based license and Controller  $\geq$  21.6.0, you can use a new API to retrieve license usage information by application and by host. See [License API](#).

#### Database Visibility

The user interface of the **Queries Execution Plan** window for Oracle and MSSQL database is updated as part of the explain plan enhancements. See [Database Query Execution Plan Window](#).

---

## 21.5 Release

### Controller 21.5.6 Release

The 21.5.6 released with upgraded JavaScript libraries and bug fixes. See [Past Resolved and Known Issues by Release](#) for details.

### Controller 21.5.5 Release

The 21.5.5 released with a bug fix. See IAM-1925 in [Past Resolved and Known Issues by Release](#).

### Controller 21.5.4 Release

The 21.5.4 released with a bug fix. See EUMPLAT-2086 in [Past Resolved and Known Issues by Release](#).

### Controller 21.5.3

The 21.5.3 released with a bug fix. See MQS-1268 in [Past Resolved and Known Issues by Release](#).

### Controller 21.5.2

The 21.5.1 released with bug fixes. See DBMON-8137 and DBMON-8139 in [Past Resolved and Known Issues by Release](#).

### Controller 21.5.1

The 21.5.1 released with a bug fix. See MQS-1261 in [Past Resolved and Known Issues by Release](#).

### Controller 21.5.0

## License Management

For infrastructure-based licenses in Controller 21.5.0:

- The license summary drill-down dashboard allows you to filter usage data by time and view a list of agents connected to a license rule.
- When looking at license usage and license rules, you can view and sort applications with analytics enabled.

## Database Visibility

The Controller audit report can fetch the audit log for the Remove literal flag. See [Controller Audit Log and Configure Query Literals Security](#).

The user interface is updated. You can:

- Return to **Queries** page from the **Query Details** page. See [Database Query Details Window](#).
- Check the number of database nodes for each collector on the **Databases** page. The number of nodes is included in both card and list view. See [View Overall Database and Server Performance](#).
- Navigate between different nodes of the cluster on the database **Dashboard**. See [Database Dashboard](#).

## 21.4 Release

### Account Management Enhancements

AppDynamics has enhanced user management and security for customers choosing to use AppDynamics to authenticate their users.

### Enhanced Security

- You can now have a single user identity for all your SaaS Tenants and across your entire SaaS environment.
- You can have a single identity extended to the [Account Management Portal](#).

- All first user accounts authorize using a validated email.
- Administrators can no longer create or update user passwords. Users now create and update their own passwords using an updated password security policy.

## Enhanced User Management

Administrators can now:

- Use a single interface to centrally manage all their users regardless if they have rights on the Tenants themselves.
- Delete users that have an inactive status.
- View Tenants and licenses associated with users.

## Experience Journey Map

- (SaaS only) You can create custom views to filter the Experience Journey Map by specified user journeys. See [Create a Custom View](#).
- You can filter the Experience Journey Map by custom user data. See [Custom User Data Filter](#).

## Database Visibility Enhancement

- You can now monitor the MS SQL cluster instances. See [Configure Microsoft SQL Server Collectors](#).
- You can now use the Kerberos authentication for the DB2 and Oracle Collector. See [Configure IBM DB2 Collectors](#) and [Configure Oracle Collectors](#).

## License Management

- When viewing license usage, you can customize the time range on the License Summary dashboard.

## ThousandEyes Integration with AppDynamics

AppDynamics and ThousandEyes integration delivers a full-stack solution, which enables you to identify network-related performance issues to reduce the impact on critical applications. See [ThousandEyes Integration with AppDynamics](#).

## 21.3 Release

### Dash Studio (21.3.1)

#### Simple Navigations

You can now navigate from one dashboard to the other using **Single Click Action** option. See [Dash Studio Widgets](#).

### Dash Studio (21.3.0)

You can now set performance baselines in a Time Series widget by adding a **Threshold** value. See [Dash Studio Widgets](#).

## Cisco Secure Application

AppDynamics introduces Cisco Secure Application to monitor the security of APM-managed applications. The data from the managed application is scanned for any security issues and displayed in a real-time dashboard. Secure Application is bundled within the Java Agent and is available from the 21.3.0 release onwards with the purchase of an additional SKU.

## 21.2 Release

### Agent Installer

- Machine Agent is supported in `non-sudo` installations.

- Agent Installer supports the Infrastructure Agent.
- A new `watchdog` process is included with the Agent Installer Platform installation to monitor and ensure that agents are running properly.
- When installing the Agent Installer Platform with `systemd`, a profile is created for the `watchdog` process instead of for individual agents.
- `bash` profiles for `non-sudo` installations are no longer created.

## Analytics

- You can add alternative milestone events of the same event type.
- You can configure agent-side metrics in the Metric Browser. For more information, see [Troubleshoot Analytics Issues](#).

## Database Monitoring

- The top query statistics report for Oracle database now displays only the following statistic type data:
  - Buffer Gets
  - Cpu Time
  - Disk Reads
  - Elapsed Time
  - Executions
  - Parse Calls
  - Rows ProcessedSee [Database Activity Window](#)
- You can use the **SRV Record** option for MongoDB. See [Configure MongoDB Collectors](#)
- Additional Couchbase metrics are added for the database monitoring. See **Couchbase Metrics** at [Database Monitoring Metrics](#).

## End User Monitoring

### Experience Journey Map

- You can customize how you [analyze user journeys](#).
- You can [customize naming of mobile views/activities](#) with the `SessionFrame` API.
- You can [filter by Internet Service Provider \(ISP\)](#) for browser apps.

## License Management

Controller 21.2.0 includes a new UI for managing infrastructure-based licenses.

### Dash Studio (21.2.0)

#### Gauge Widget

You can now present metric data on a relative scale using the Gauge widget. See [Dash Studio Widgets](#).

#### Time Range Comparison

This feature is now available for Metric Number widget. See [Time Range Comparisons](#).

### 21.1 Release

#### Dash Studio (21.1.0)

##### Grouped Widgets

You can now group two or more widgets on a single card or on their respective cards. See [Dash Studio Widgets](#).

##### Label Widget

You can now apply these properties to modify the appearance of the Label widget:

- 
- Font Color
  - Font Size
  - Horizontal Alignment
  - Vertical Alignment

See [Dash Studio Widgets](#).

## 20.12 Release

### Dash Studio (uic-20.12.1)

#### Auto Refresh Interval

You can now enable the **Auto Refresh Interval** option to automatically refresh the dashboard at regular intervals. For more information, see [Visual Dashboard Editor](#).

#### Group Time Range

You can now set the time range for a set of grouped widgets. For more information, see [Dash Studio Widgets](#).

## 20.11 Release

### Agent Installer

#### Monitoring Settings

- The content of the [Monitoring Settings](#) page has been reorganized into three tabs: **Managed Processes**, **Unmanaged Processes**, and **Uninstrumented Processes**.
- The ability to paginate has been added to the [Monitoring Settings](#) page eliminating the previous 1000 record limitation.

### End User Monitoring

#### Mobile Real User Monitoring

You can filter performance data, such as network requests, crashes and code issues, based on device specifications, such as CPU type, memory, disk space, and battery. See [Mobile RUM Metrics](#) for details.

### Dash Studio

#### Mobile Applications Metrics

Mobile Applications metrics in the **Data** panel of the Dash Studio allows you to filter and create customized metrics to view the performance of mobile applications. See [Data Binding](#).

#### Browser Applications Metrics

Browser Applications metrics in the **Data** panel of the Dash Studio allows you to filter and create customized metrics to view the performance of the web applications. See [Data Binding](#).

#### Simple Navigations

Simple navigation actions in Dash Studio allow you to drill down into complex and detailed information about a selected entity. See [Dash Studio Widgets](#).

#### Database Visibility

You can now integrate Database Visibility with Server Visibility. See [Integrate Database Visibility with Server Visibility](#).

---

There are new Oracle Server metrics available with this Controller release. See [Database Monitoring Metrics](#).

## Service Endpoints

The [Service Endpoints](#) page includes these enhancements:

- A new grid display is available that includes a total count of entries at the bottom right of the grid. This information was previously located below the Search text box.
- The top toolbar on the page includes buttons for: **Details**,  (Delete), **Exclude**, **View Excluded**, **Configure**, and **Filter** (replacing the previous Actions sub-menu that included these buttons).
- When you select the Filter icon, the **Filter** menu panel is overlaid on top of the grid on the left side of the page and includes additional filter options.

## 20.10 Release

### Agent Installer

Improvements to the **Agent Installer** page have been implemented to improve the customer experience:

- Overall installation process has been streamlined to reduce manual input
- Two installation options are available:
  - **Express** - for new installations
  - **Custom** - provides options you can customize

### APM Platform

The Automated Transaction Diagnostics (ATD) capability is now available for SaaS. This feature exposes periods of anomalous behavior in your business transactions and pinpoints the causal factor to facilitate a more efficient root cause analysis process.

Using the already collected transaction snapshots, the diagnostic process:

- Analyzes business transaction response time data to determine if there was an issue and the time period impacted.
- Analyzes metrics data across the business transaction path to identify the suspected cause and type of issue.
- Provides a guided root cause analysis that diagnoses the business transaction anomaly allowing you to manage the issue before it becomes visible to customers.

### End User Monitoring

- Experience Journey Map can be filtered in the Controller UI by fields such as device, OS, and location.
- Automatic business transaction correlation for .Net Agent 20.6.0 and higher is enabled by default. You can also manually enable and disable business transaction correlation with older APM agents or applications with frameworks other than .Net and Java. See [Correlate Business Transactions for EUM Monitoring](#) for more information.

### Browser Real User Monitoring

- When configuring the JavaScript Agent in the Controller, you can set a custom page title to an arbitrary string. See [Configure the JavaScript Agent](#).

### Mobile Real User Monitoring

- You can filter performance data, such as network requests, crashes and code issues, based on device specifications, such as CPU type, memory, disk space, and battery. See [Mobile RUM Metrics](#) for details.

## 20.9 Release

There was no 20.9.0 Controller release.

## 20.8 Release

### Alert and Respond

#### Action Suppression

You can now suppress a policy's automatic invocation of actions and alerts on a recurring basis. For example, if you have scheduled maintenance every month and would not like to be notified of any event violations or trigger any actions for these events during the maintenance period, you can schedule to suppress the alerts and actions. For more information, see [Configure and Manage Action Suppressions](#). For corresponding API updates, see [Action Suppression API](#).

#### HTTP/HTTPS Proxy for On-premise Controller

You can now configure an HTTP/HTTPS proxy for an on-premise Controller. When you configure a proxy, the HTTP request actions or JIRA actions are routed through the HTTP proxy if the endpoint is an HTTP endpoint or HTTPS proxy if the endpoint is an HTTPS endpoint. You can configure the HTTP/HTTPS proxy settings in the `domain.xml` global configuration file. For more information, see [Configure HTTP/HTTPS Proxy](#).

You can configure an HTTP/HTTPS proxy for an on-premise Controller only.

#### Database Monitoring

- You can now view the Database Agent telemetry on the **Metric Browser** window. See [Database Agent Telemetry](#) for details.
- For Oracle database, you can view the procedure for queries and view the container where the query is running. Also, you can view the CPU and Memory metrics without enabling hardware monitoring. For more information about containers and procedures, see [Database Containers Window](#) and [Database Procedures Window](#) respectively. To view these you must be using Database Agent 20.6 or later.
- You can view the Database Agent related logs for debugging and resolving issues. For more information about the agent logs, see [View Database Agent Properties and Logs](#).

#### Cluster Monitoring

You can now use filters to view the required event details from the list of cluster events. See [Monitor Kubernetes Events](#).

#### End User Monitoring

- You can customize Experience Journey Map by toggling performance markers on or off, and by setting values for performance thresholds and drop-off rates. See [Configure Experience Journey Map](#) for details.
- You can filter mobile crashes based on the following agent version fields: agent version, hybrid agent version, and hybrid agent type.
- All Synthetic Agent IBM SoftLayer locations have been migrated to Azure and AWS. Agents in Dallas, Texas, Houston, TX, and Quéretaro, Mexico are no longer available and have been replaced with San Antonio, TX with Azure. See [Synthetic Agent Locations](#) for details.
- Browser Synthetic Monitoring has transitioned all hosted Synthetic Agent IBM locations to Azure and AWS. See [Synthetic Agent Locations](#) for an up-to-date list of agent locations and providers.

#### Transaction Detection for Node.js Applications

GraphQL Business Transactions, a feature that enables transaction detection on the Node.js Agent, is now available. You can define a custom match rule that separates a business transaction into several GraphQL queries with GraphQL Business Transactions. See [Node.js Business Transaction Detection](#).

---

## 20.7 Release

### Alert and Respond

#### Alerting Template

You can now export a configured alerting template and save it for later use. You can import a saved template and apply it to applications. For more information, see [Configure and Manage Alerting Templates](#).

#### Alert Sensitivity Tuning

You can now define a metric expression to evaluate a health rule condition and use Alert Sensitivity Tuning to fine-tune the configuration. For more information, see [Create a Health Rule and Fine-tune Metric Evaluation](#).

#### Application Analytics

The End User Monitoring (EUM) filter has been added to the Analytics Home page with options to display browser and mobile sessions. See [Overview of Application Analytics](#).

#### End User Monitoring

- [Experience Journey Map](#) is supported for on-prem Controller 20.7.0 and later and requires a EUM PEAK license.
- You can now custom configure the JavaScript Agent in the Controller UI. This UI-based configuration is only available for SaaS Controller 20.7.0 and later. See [Configure the JavaScript Agent](#).

## 20.6 Release

### Agent Installer

The Agent Installer requires microservices configuration performed by AppDynamics. The configurations will be rolled out gradually to SaaS Controllers beginning on June 8, 2020.

The Agent Installer is now available. The Agent Installer simplifies the installation process for the Java and Machine Agents. The installer provides two lines of script that:

- deploy the Java and (optionally) Machine Agents,
- automatically instrument applications, and
- assign unique names to tiers and nodes

The Agent Installer is available for SaaS deployments and Linux operating systems. See [Agent Installer](#) documentation for more information.

#### Analytics Events Service (SaaS only)

The `eventcompletionTimestamp` field has been introduced for ADQL queries. `eventcompletionTimestamp` indicates the time that the event was received by the Events Services. See [Analytics Events API](#) for details.

The metric processor will be rolled out gradually to SaaS Controllers. Contact [AppDynamics Support](#) for more information.

#### Application Analytics

[Recommended Data Collectors](#), a feature that simplifies data collector configuration, is now available for SaaS deployments. Instead of manually configuring data collectors, you can browse and search for event

---

data displayed in the Controller that Recommended Data Collectors automatically collects from the Java Agent.

## Cluster Monitoring

The **Cluster Event** summary dialog is enhanced with the following additional details:

- The **Affects** and the **Cluster Agent Version** fields are added to provide information about the affected entity and the version of the Cluster Agent respectively.
- The **Cluster Name** field displays the name of the cluster along with an option to drill down. Therefore, you can launch the Cluster Agent dashboard by clicking the name.

## End User Monitoring

[Experience Journey Map](#) visualizes real-time user journeys, providing performance metrics and traffic data for browser and mobile applications. This feature is only available for customers with a SaaS Controller and EUM PEAK license.

## Service Proxy

A new [service proxy feature](#) (represented by this icon ) has been added to enable the system to discover the backend (remote service) as a service proxy, and display the correct component structure in a flow map. The service proxy feature is enabled in the Controller. Once the Controller has identified the backend as a service proxy, it sends the configuration information to an Agent (Java Agent version 20.5.0 and later, is the only Agent supported with this release).

## 20.5 Release

The Controller release occurs every six weeks. There was no Controller release for 20.5. For bug fixes, see [Past Resolved and Unknown Issues by Release](#).

## 20.4 Release

### Alert and Respond

#### Alerting Template

AppDynamics 20.4 introduces 'Alerting Template' that allows you to efficiently maintain and manage alerting configuration at scale. An Alerting Template is a configuration of features like Health Rules, Policies, Actions, Action Suppression, Schedules, and Email digests. Templates eliminate the need to configure or update individual applications. You can easily update a template and ensure that updates are consistently applied across multiple applications. For more information, see:

- [Alert and Respond](#)
- [Alerting Templates](#)
- [Configure Alerting Templates](#)
- [Alerting Template Questions and Answers](#)

### Action Suppression and Email Digest APIs

AppDynamics introduces REST APIs to perform CRUD operations for action suppression and policy email digest. For more details, see:

- [Action Suppression API](#)
- [Email Digest API](#)

---

## Alert Sensitivity Tuning

AppDynamics introduces 'Alert Sensitivity Tuning (AST) that helps you visualize the impact of the alerting configuration you define. AST provides historical data for the metric or the baseline being configured. Instant insights are provided in a graphical format when you configure the alerts. Based on this data, you can set up alerts with the appropriate sensitivity and avoid false alerts. For more information, see:

- [Alert Sensitivity Tuning](#)
- [Create a Health Rule and Fine-tune Metric Evaluation](#)
- [AST Questions and Answers](#)

## Database Monitoring

- The controller provides the following visual context for the backend database on the flow map:
  - The database icon with green mark shows that the status of the database is healthy. If there are any health rule violations, the icon changes accordingly.
  - If there are any disconnected backend database servers, a message is displayed to connect to the appropriate server or cluster in Database Visibility.
- The Metric browser now displays the buffer and the cache memory metrics for a Linux collector.
- The controller now supports monitoring Apache Cassandra.

## End User Monitoring

- Business transaction correlation is enabled by default for business applications instrumented with the Java Agent 4.5.0 or higher.
- Admin-level users can configure read-only user permissions for the Synthetic Credential Vault.
- Python 3 is supported in Synthetic Scripts to create Synthetic Jobs.
- AppDynamics offers a unified Real User Monitoring license that can be allocated to both Browser and Mobile Real User Monitoring usage.

## Known Issues

- License service makes individual accounts' usage and term calls to the Events Service.

## SAML Authentication

The AppDynamics Controller now supports HTTP GET as well as POST for the authentication request to the identity provider for the sign-out message to the identity provider.

## 20.3 Release

### Alert and Respond

AppDynamics introduces REST APIs to perform CRUD operations for various actions that are triggered as a response to events. For more details, see [Actions API](#).

### Anomaly Detection

AppDynamics root cause analysis (RCA) algorithms have been refined considerably to determine and isolate faulty components while reducing false positives. This new algorithm greatly improves the time taken to fetch metrics and hence RCA response for any anomaly event. For more information, see [Troubleshooting Anomalies](#).

---

## My Preferences

### Time Zone

The time zone controller setting helps adjust the time zone enabling you to collaborate and troubleshoot issues with more accuracy. This setting also eliminates issues such as translating timestamp of your location to another user's time zone. See [Time Zone Controller](#), for more details. In the 20.3.0 release, enable the `ui.platform.timezone.enabled` flag for the time zone capability to work. The flag will be enabled by default for the upcoming releases.

### 20.2 Release

The Controller release occurs every six weeks. There is no Controller release for 20.2. For bug fixes, see [Past Resolved and Unknown Issues by Release](#).

## Past Mobile App Releases

This page lists the AppDynamics mobile app enhancements for all releases.

### 21.9 Release

We up-levelled the AppDynamics App 2.0 to make our mobile app a more awesome experience for you. In this release, we fixed some minor bugs and added the following capability:

- Deep links are getting smarter. You can now click on the web URL of any APM entity detail page and event screen on the mobile device, and it will open the content on the AppDynamics App.

### 21.8 Release

The AppDynamics 21.8.0 mobile application is released for General Availability. With our reimagined AppDynamics mobile app you can:

- **Customize home screen** to monitor your most important entities and metrics at a glance
- View all events across entities and identify correlations through **centralized event feed**
- See key monitoring data in detail with entity centric page and navigate between related entities with ease
- Quickly identify potential root causes with **Automated Transaction Diagnostics (ATD) support**
- Get alerted immediately for critical events through **push notifications and seamless integration** with messaging tools such as PagerDuty, Slack, SMS

## PDFs

## Glossary

Familiarize yourself with a list of common terms you may come across as an AppDynamics user.

### Action

An automatic response to an event based on a policy.

Examples include sending alerts, taking diagnostic snapshots, remediation through scripts, or making a REST API call to integrate with other tools. Actions are customizable.

### Agent

Code that collects and reports data.

### Related Pages

- [アクション](#)
- [アラートと応答](#)

### Related Pages:

---

Agents can refer to languages (Java, Node.js, Python, etc), machines (hardware and network data), and databases, etc.

### Alert

Email, SMS, or customized external notification interface that notifies you of a problem or event.

### Application

A named collection of tiers representing a monitored environment. Also referred to as Business Application.

See also: Tier, Node

### Backend

Databases, remote services, and any detected out of process components that are involved in business transaction processing.

### Business transaction

An action of your application. Business transactions represent your critical business functions.

Examples include login, browse, and checkout.

### Controller

With on-premises deployments, it collects, stores, analyzes, and baselines performance data collected by agents.

### Controller Tenant

With a SaaS deployment, it collects, stores, analyzes, and baselines performance data collected by agents. Each AppDynamics SaaS deployment customer account is a tenant of the AppDynamics platform. An AppDynamics Controller Tenant can host one or more accounts. Each account represents one tenant on that Controller.

### Data collector

Enables you to collect supplemental application data for business transaction snapshots and/or analytics.

There are three types of data collectors: Method Invocation (MIDC), HTTP, and SQL.

### Entity

Any object that AppDynamics monitors. Entities typically have associated metrics, events, and a health status.

Examples of entities are applications, tiers, nodes, and business transactions.

### Event

Unstructured data that represents an action or occurrence detected by the agent.

Examples include JVM restart, deadlock, and error.

### Flow map

Graphical view of information flow within a business application.

### Health rule

Allows you to select specific metrics as key to the overall health of an application and to define ranges for acceptable performance of those metrics.

You can customize default health rules or create new ones.

### Information point

Instruments a method in application code outside the context of any business transaction.

Used for monitoring the performance of the method itself, or for capturing numerical data from the method's input parameters or return value.

### Metric

Numerical measurement over a time interval, typically with a fixed frequency. Because of this, metrics are represented through time-series visualization. Examples include "calls per minute"

---

and "average response time." For the AppDynamics APM Platform, a metric is a numerical value that an agent measures and reports.

### Node

The smallest unit of the AppDynamics modeling environment.

See also: Application, Tier

### Policy

Provides a mechanism to automate monitoring, alerting, and problem remediation.

Consists of:

1. A trigger based on events
2. An action in response to the trigger

### Service endpoint

Provides basic metrics for one application service, or group of services, provided by a tier.

### Tier

A named collection of nodes, typically representing a service.

See also: Application, Node

### Transaction snapshot

A collection of detailed diagnostic information captured during a single invocation of a business transaction.

Examples include call graphs and timing during a single user login, where login is the business transaction.
