<code>continuous</code>	Select <code>continuous</code> if you want data collection averaged over time. For example, average CPU usage over a minute. For the monitor to be declared as ' <code>continuous</code> ', the script should also run in an infinite loop. This ensures that the script keeps running until the Machine Agent process is terminated.	<pre> while [1]; do ... the actual script goes here ... sleep 60 done </pre>
<code>periodic</code>	Select <code>periodic</code> to report data from system performance counters periodically. The periodic task runs every minute by default, and the data is aggregated. To specify a different frequency, use the <code>execution-frequency-in-seconds</code> element. The execution frequency must be less than 60. For periodic execution style, you can also specify the timeout setting (shown in the example).	<pre> <monitor-run-task> ... <execution-style>periodic</ execution-style> <execution- frequency-in-seconds>30</ execution-frequency-in-seconds> <execution-timeout-in-secs>30</ execution-timeout-in-secs> ... </monitor-run-task> </pre>

i Do not set the `<execution-frequency-in-seconds>` higher than 300 seconds (five minutes). The extension must collect metrics at least once every five minutes.

2. Add the name of your script file to the `<file>` element in the `monitor.xml` file. Be sure to use the correct `os-type` attribute. The `os-type` value should match the value returned from calling `System.getProperty("os.name")`.

```
<file os-type="your-os-type">{script file name}</file>
```

You can use either the relative or absolute path of the script.

Copy the monitor.xml file to the Subdirectory Created in Step 1

Restart the Machine Agent

Required Agent Properties

Ensure that you have correctly configured the Agent in the `controller-info.xml` file and on the Agent `start` command on the command line. See [Database Agent Configuration Properties](#).

After restarting the Machine Agent, you should see following message in your log file:

```
Executing script [<script_name>] on the console to make sure  
your changes work with the machine agent.
```

Verify Execution of the Monitoring Extension Script

To verify the execution of extension, wait at least one minute and check the metric data in the [Metric Browser](#).

You can now create alerts based on any of these metrics.

Example: Create a Monitoring Extension for Open Files in UNIX

To create a custom monitor for monitoring all the open files for JVMs:

1. Create a new directory in the custom monitor repository.
2. Create the script file by modifying this UNIX script for the specific process name (for example: Author, Publish, and so on).

```
lookfor="<process name 1>"
pid=`ps aux | grep "$lookfor" | grep -v grep | tr -s " " |
cut -f2 -d' '`
count1=`lsof -p $pid | wc -l | xargs`

lookfor="<process name 2>"
pid=`ps aux | grep "$lookfor" | grep -v grep | tr -s " " |
```

```
cut -f2 -d' '`
count2=`lsof -p $pid | wc -l | xargs`

echo "name=JVM|Files|<process name 1>,value="$count1
echo "name=JVM|Files|<process name 2>,value="$count2
```

3. Create the following `monitor.xml` file and point it to the UNIX script shown in Step 2.

```
<monitor>
  <name>MyMonitors</name>
  <type>managed</type>
  <description>Monitor open file count </description>
  <monitor-configuration>
  </monitor-configuration>
  <monitor-run-task>
    <execution-style>continuous</execution-style>
    <name>Run</name>
    <type>executable</type>
    <task-arguments>
    </task-arguments>
    <executable-task>
      <type>file</type>
      <file>openfilecount.sh</file>
    </executable-task>
  </monitor-run-task>
</monitor>
```

Example: Create a Monitoring Extension to Check Process Status in Windows

1. Create a new directory in the custom monitor repository.
2. Create the script file by modifying this Windows PowerShell script for the specific process name (for example: Author, Publish, and so on). The following Windows PowerShell script checks if a process instance is running on the machine.

i To generate custom metrics on Windows, AppDynamics recommends that you use PowerShell and VBasic scripts instead of `.bat` files.

When a standard Windows batch (`.bat`) script echoes metric names, it surrounds the names with quotes. The quotes will cause the Machine Agent to ignore these metrics. PowerShell and VBasic scripts do not have this issue.

```
$procName='<PROCESS_NAME>'
$procStatus=Get-Process -Name $procName -ErrorAction
SilentlyContinue
if($procStatus) {
    write-output "name=Custom Metrics|Process|$procName|
Running, value=1"
} else {
    write-output "name=Custom Metrics|Process|$procName|
Running, value=0"
}
```

3. Create the following `monitor.xml` file and point it to the Windows PowerShell script shown in Step 2.

```
<monitor>
  <name>MyMonitors</name>
  <type>managed</type>
  <description>Monitor open file count </description>
  <monitor-configuration>
  </monitor-configuration>
  <monitor-run-task>
    <execution-style>continuous</execution-style>
    <name>Run</name>
    <type>executable</type>
    <task-arguments>
      <argument name="" value="-Command"></argument>
      <argument name="" value="C:\\absolute\\path\\to\\powershell\\script\\mp.ps1">
</argument>
    </task-arguments>
    <executable-task>
      <type>command</type>
      <command>C:\\absolute\\path\\to\\powershell\\executable\\powershell.exe</
command>
    </executable-task>
  </monitor-run-task>
</monitor>
```

If you have provided the PowerShell program for the Machine Agent and are unable to see custom metrics, follow these steps:

1. Create a `.bat` file in the same folder where you created the PowerShell script and `monitor.xml` file.

Example .bat file

```
process_checker.bat
```

2. Add the following lines of code into the `.bat` file. Ensure that you are using the correct PowerShell script file name. In this example, the PowerShell script file name is `process_status_checker.ps1`.

```
@echo off
Powershell.exe -executionpolicy remotesigned -File process_status_checker.ps1
```

3. Add the following lines of code to the `monitor.xml` file. Ensure that you are using the correct `.bat` file name. In this example, the `.bat` file name is `process_checker.bat`.

```
<monitor>
  <name>MyMonitors</name>
  <type>managed</type>
  <description>Monitor process status</description>
  <monitor-configuration>
  </monitor-configuration>
  <monitor-run-task>
  <execution-style>periodic</execution-style>
  <execution-frequency-in-seconds>60</execution-frequency-in-seconds>
  <execution-timeout-in-secs>60</execution-timeout-in-secs>
    <name>MyMonitors</name>
    <type>executable</type>
    <task-arguments></task-arguments>
    <executable-task>
      <type>file</type>
      <file os-type="windows">process_checker.bat</file>
    </executable-task>
  </monitor-run-task>
</monitor>
```

Build a Monitoring Extension Using Java

Related pages:

- [Machine Agent Configuration Properties](#)
- [Build a Monitoring Extension Using Scripts](#)

You can create Java monitoring extensions that enable the Machine Agent and Server Visibility to collect custom metrics, which you define and provide, and report them to the Controller. This is an alternative to adding monitoring extensions using scripts.

When you capture custom metrics with a monitoring extension, they are supported by the same AppDynamics services that you receive for the standard metrics captured with the AppDynamics application and Machine Agents. These services include automatic baselining, anomaly detection, display in the Metric Browser, availability for display on custom dashboards, and availability for use in policies to trigger alerts and other actions.

This page describes how to create a monitoring extension in Java.

To the Agent, a monitoring extension is a task that runs on a fixed schedule and collects metrics.

Before You Begin

Before creating your own extension from scratch, review the extensions on the [AppDynamics community](#). See [GitHub](#) for a free download of the extensions

New extensions are constantly being added. It is possible that someone has already created what you need, or something close enough, that you can download it and use it after making a few modifications.

Create a Monitoring Extension in Java

To create a monitoring extension in Java:

1. Create your extension class. See [Create the Monitoring Extension](#).
2. Create a `monitor.xml` configuration file. See [Create the monitor.xml File](#).
3. Create a subdirectory (`<your_extension_dir>`) under `<agent_home>/monitors`.
4. Place the extension class file and the `monitor.xml` file (plus any dependent `jar` files) in `<your_extension_dir>`.
5. Enter the Controller access information and credentials. See [Configure the Machine Agent](#).

 Make sure that your `controller-info` and command line parameters are correctly configured. Required properties include: Controller name, port number, and account access key.

6. Restart the Machine Agent.

Create the Monitoring Extension Class

Create a monitoring extension class by extending the `AManagedMonitor` class in the `com.singularity.ee.agent.systemagent.api` package. This package is included in the `MachineAgent.jar` file.

The monitoring extension class performs these tasks:

- Populates a hash map with the values of the metrics that you want to add to AppDynamics. You obtain these metrics based on your environment and the source from which you derive your custom metrics.
- Defines the type of metrics to collect using the `MetricWriter` class. See [Metric Processing Qualifier](#).
- Uploads the metrics to the Controller using the `execute()` method of the `AManagedMonitor` class.

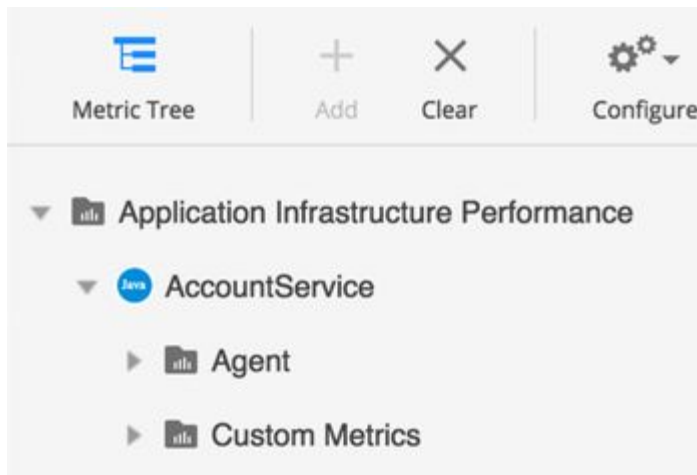

See [Extension_Class_Source.txt](#) for example source code.

Metric Path

All custom metrics processed by the Machine Agent and Server Visibility appear in the **Metric Browser > Application Infrastructure Performance**. Use the "I" character to specify the path from Application Infrastructure Performance to the custom metric. If the metrics apply to a specific tier, use the metric path for the tier, with "Component" followed by a colon ":" and the tier name or tier ID.

For example to associate a metric with tier AccountService, you would specify the metric path as: `Server | Component:AccountService | Custom Metrics | Path |`

The metric would then appear under the tree in the Metric Browser:

⚠ You can report a custom metric only to the tier that is associated with the Machine Agent. If you attempt to publish metrics to a different tier, the metrics are not reported.

You can insert a custom metric next to an existing type of metric. For example, the following declaration causes the custom metric named pool usage to appear next to the JMX metrics: `name="Server | Component:<tier-name> | JMX | Pool | First | pool usage",value=10`

You can then use the metric in health rules similar to other types of JMX metrics.

-  To test the appearance of your custom metric in the Controller API, post the metric data to the Machine Agent's REST API. Pass the path, name type and values of the metric as URL arguments. See [Machine Agent HTTP Listener](#).

Metric Names

Metric names must be unique within the same metric path but need not be unique for the entire metric hierarchy.

AppDynamics recommends that you use short metric names so that they are visible when they are displayed in the Metric Browser.

Prepend the metric path to the metric name when you upload the metrics to the Controller.

Metric Processing Qualifier

The Controller has various qualifiers for how it processes a metric regarding aggregation, time roll-up, and tier roll-up.

There are three types of metric qualifiers:

- Aggregator qualifier
- Time roll-up qualifier
- Cluster roll-up qualifier

You specify these options with the enumerated types provided by the MetricWriter class.

Aggregation Qualifier

The *aggregator* qualifier specifies how the Machine Agent aggregates the values reported during a one-minute period.

Specify the aggregation qualifier as `aggregator="aggregator type"`

This value is an enumerated type. Valid values are:

Aggregator Type	Description
<code>METRIC_AGGREGATION_TYPE_AVERAGE</code>	Default. Average of all reported values in that minute.
<code>METRIC_AGGREGATION_TYPE_SUM</code>	Sum of all reported values in that minute, causes the metric to behave like a counter.
<code>METRIC_AGGREGATION_TYPE_OBSERVATION</code>	Last reported value in the minute. If no value is reported in that minute, the last reported value is used.

Time Roll-Up

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

The *time-rollup* qualifier specifies how the Controller rolls up the values when it converts from one-minute granularity tables to 10-minute granularity tables, and 60-minute granularity tables over time.

Roll up Strategy	Description
METRIC_TIME_ROLLUP_TYPE_AVERAGE	Average of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
METRIC_TIME_ROLLUP_TYPE_SUM	Sum of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
METRIC_TIME_ROLLUP_TYPE_CURRENT	Last reported one-minute data point in that 10-minute or 60-minute interval.

Cluster Roll-Up

The *cluster-rollup* qualifier specifies how the Controller aggregates metric values in a tier.

Roll up Strategy	Description
METRIC_CLUSTER_ROLLUP_TYPE_INDIVIDUAL	Aggregates the metric value by averaging the metric values across each node in the tier.
METRIC_CLUSTER_ROLLUP_TYPE_COLLECTIVE	Aggregates the metric value by adding up the metric values for all the nodes in the tier.

For example, if a tier has two nodes, Node A and Node B, and Node A has three errors per minute and Node B has seven errors per minute, the INDIVIDUAL qualifier reports a value of five errors per minute and COLLECTIVE qualifier reports ten errors per minute. INDIVIDUAL is appropriate for metrics such as % CPU Busy where you want the value for each node. COLLECTIVE is appropriate for metrics such as Number of Calls where you want a value for the entire tier.

Sample Monitoring Extension Class

The `NGinxMonitor` class retrieves the following metrics from the Nginx Web Server, and adds them to the metrics reported by AppDynamics:

- `Active Connections`: number of active connections
- `Accepts`: number of accepted requests
- `Handled`: number of handled requests
- `Requests`: total number of requests
- `Reading`: number of reads
- `Writing`: number of writes
- `Waiting`: number of keep-alive connections

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

The source for the extension class is included as an attachment.

Create monitor.xml

Create a `monitor.xml` file with a `<monitor>` element to configure how the Machine Agent executes the extension.

1. Set the `<name>` to the name of your Java monitoring extension class.
2. Set the `<type>` to `managed`.
3. The `<execution-style>` can be `continuous` or `periodic`.
 - Continuous means to collect the metrics averaged over time; for example, average CPU usage per minute. In continuous execution, the Machine Agent invokes the extension once and the program runs continuously, returning data every 60 seconds.
 - Periodic means to invoke the monitor at a specified frequency. In periodic execution, the Machine Agent invokes the extension, runs it briefly, and returns the data on the schedule set by the `<execution-frequency-in-seconds>` element.

i Do not set the `<execution-frequency-in-seconds>` greater than 300 seconds (five minutes). The extension must collect metrics at least once every five minutes.

4. If you select `periodic` for the execution style, set the frequency of collection in `<execution-frequency-in-seconds>` element. The default frequency is 60 seconds.
If you select `continuous`, this setting is ignored.
5. Set the `<type>` in the `<monitor-run-task>` child element to `java`.
6. Set the `<execution-frequency-in-seconds>` to the number of seconds before the extension times out.
7. Specify any task arguments required by the Java-based extension in the `<task-arguments>` element. The argument tag has three parameters: `name`, `default-value`, and `is_required`. `is_required` is always set to true. The task arguments can be any custom argument. The default arguments that are specified here are the only arguments that the extension uses. They are not set anywhere else.

Example `<task-arguments>` element:

```
<argument name="password" is-required="true" default-value="welcome" />
```

8. Set the `<classpath>` to the `jar` file that contains your extension's classes. Include any dependent `jar` files, separated by semicolons.
9. Set the `<impl-class>` to the full path of the class that the Machine Agent invokes.

Sample monitor.xml Files

This [attached monitor.xml](#) file configures the NGinXMonitor monitoring extension. This extension executes every 60 seconds.

This [attached monitor.xml](#) file configures the MySQLMonitor. This monitor executes every 60 seconds, has four required task arguments and one optional task argument and one dependent `jar` file.

Machine Agent HTTP Listener

You can send metrics to the Machine Agent using its HTTP listener. You can report metrics through the Machine Agent by making HTTP calls to the Agent instead of piping to the Agent through `sysout`.

Activate the HTTP Listener

The HTTP listener is not enabled by default. To activate the HTTP listener, restart the Machine Agent and set the `metric.http.listener` system property to `true`. Optionally, you can specify the host and port for the listener with system properties.

The `-D` system properties are:

- `metric.http.listener`: Required. Set to `true`.
- `metric.http.listener.port`: Optional. Set to the port to be used, defaults to 8293.
- `metric.http.listener.host`: Optional. This describes which interface to accept requests on. You can set it as follows:
 - If you do not specify the `metric.http.listener.host`, it defaults to `localhost`, which means requests are only accepted from `localhost`.
 - Set to `0.0.0.0` to accept on all interfaces (including from remote clients)
 - Set to the IP address of the specific interface to accept requests on.

```
<machine_agent_home>/bin/machine-agent -Dmetric.http.listener=true
-Dmetric.http.listener.port=<port_number> -Dmetric.http.listener.host=0.0.0.0
```

If starting the Agent by invoking the Machine Agent JAR, ensure that you place the options **before** the `JAR` name in your start up command. For example:

```
java -Dmetric.http.listener=true -jar MACHINE_AGENT_HOME/
machineagent.jar
```

Create Metrics

The HTTP Listener can be used to post custom metrics to the Machine Agent for uploading to the Controller. Define one or more metrics in the body of the request as `JSON` data. Metrics must be uploaded at least once every `300` seconds (5 minutes).

URI

POST `/api/v1/metrics`

Metric Definition Fields

Parameter	Description
metricName	Name for the metric as it will appear in the Controller UI.
aggregatorType	How the metrics should be aggregated. Options are: <ul style="list-style-type: none"> AVERAGE : The average of all one-minute data points when adding it to the 10-minute or 60-minute granularity table. SUM : The sum of all one-minute data points when adding it to the 10-minute or 60-minute granularity table. OBSERVATION : Last reported one-minute data point in that 10-minute or 60-minute interval.
Value	A 64-bit integer value for the metric.

Format

```

POST /api/v1/metrics

[
  {
    "metricName": "Custom Metrics|Test|MetricFromRESTClient1",
    "aggregatorType": "AVERAGE",
    "value": 10
  }
]

```

Create Events

Use to post custom events to the Machine Agent for uploading to the Controller. Define one or more events in the body of the request as `JSON` data.

URI

POST /api/v1/events

Event Definition Fields

Parameter Name	Description
eventSeverity	Severity of the event, from INFO, WARN, ERROR.
type	A string describing the event subtype. The event will be of type CUSTOM, subtype will be the value of this parameter.
summaryMessage	A summary of the event.
properties	Event properties. These properties are retrieved along with events by the Controller in a given query and provide a means for filtering the events. The maximum size of a key is 500 characters and the maximum size of a value is 5000 characters. The values can be a string value.
details	Arbitrary key-value details for the event; similar in constraints to properties but are retrieved in a separate call. Use this to store details that should only be retrieved when requested by the user, which avoids the expense of retrieving this data in the usual event calls.

Format

```

POST /api/v1/events
[
  {
    "eventSeverity": <event_severity>,
    "type": "<event_type>",
    "summaryMessage": "<event_summary>",
    "properties": {
      "<key>": "value1",
      "<key2>": "value2"
    },
    "details": {
      "<key>": "<value>"
    }
  },
  {
    "eventSeverity": <event_severity>,
    "type": "<event_type>",
    "summaryMessage": "<event_summary>",
    "properties": {
      "<key>": "value1",
      "<key2>": "value2"
    }
  }
]

```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    },
    "details": {
      "<key>": "<value>"
    }
  },...
]

```

Legacy Machine Agent HTTP APIs

The following API endpoints are supported for backward compatibility, but are not extended or enhanced in future versions.

Upload Metrics

You can use `GET` or `POST` to upload metrics to the Metric Browser under **Application Performance > Tier**, where the tier is the one defined for the Machine Agent.

The format for `GET` is:

```
GET /machineagent/metrics
```

For example:

```
http://host:port/machineagent/metrics?name=Custom Metrics|Test|My
Metric&value=42&type=average
```

The format for `POST` is:

```
POST /machineagent/metrics
```

with header:

```
Content-Type: application/xml
```

with body content:

```

<?xml version="1.0"?>
<request>
<metric name="[name of metric 1]", type="[aggregation type]", value="[value of metric 1]" />
<metric name="[name of metric 2]", type="[aggregation type]", value="[value of metric 2]" />
...
<metric name="[name of metric n]", type="[aggregation type]", value="[value of metric n]" />
</request>

```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Example:

```
http://host:port/machineagent/metrics
```

Example of body content:

```
<request>
<metric name="Custom Metrics|Test|My Metric 1", type="AVERAGE", value="22" />
<metric name="Custom Metrics|Test|My Metric 2", type="SUM", value="98737" />
<metric name="Custom Metrics|Test|My Metric 3", type="CURRENT", value="93" />
</request>
```

Valid values for type are:

- **AVERAGE**: Average of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
- **SUM**: Sum of all one-minute data points when adding it to the 10-minute or 60-minute granularity table.
- **CURRENT**: Last reported one-minute data point in that 10-minute or 60-minute interval.

Upload Events

Send events using HTTP **GET** requests to upload events to the Machine Agent. The format is:

```
GET /machineagent/event
```

For example:

```
http://localhost:8293/machineagent/event?type=<event_type>&summary=<summary_text>
```

Event_type is one of the following:

- error
- info
- warning

Administer the Machine Agent

These pages describe procedures and provide reference material relevant to the AppDynamics Pro Administrator.

- [Manage Machine Agents](#)
- [Upgrade the Machine Agent](#)
- [Uninstall the Machine Agent](#)
- [FAQs and Troubleshooting for the Machine Agent](#)

Manage Machine Agents

This page describes how to manage Machine Agents.

View Details

Using an AppDynamics Administrator account, click **Settings > AppDynamics Agents > Machine Agents** to see details and manage your installed Machine Agents.

- **Hostname:** Name of the machine on which the Agent is installed.
- **Version:** Version of the installed Machine Agent software.
- **Applications:** Name of the application with which the Agent is associated.
- **Enabled:** Whether the Agent is enabled.

The screenshot shows the 'AppDynamics Agents' management page. It features a navigation bar with tabs for 'App Server Agents', 'Machine Agents' (selected), 'Database Agents', 'Analytics Agents', 'Network Visibility Agents', and 'Config Management'. Below the navigation bar is a toolbar with icons for 'Details', 'Delete', 'Reset', 'Enable', 'Disable', and 'Register'. A search bar and a 'Show' dropdown menu are also present. The main content area displays a table with the following data:

Unique Host ID	Version	Applications	Enabled
WIN-JE8689GMSJF	4.3.0.0	MovieTicketsGirish	✓
ip-10-0-0-222	Machine Agent v4.5.2.1606 GA compatible with ...	(not associated with any applications)	✓
linuxkit-025000000001	Machine Agent v4.5.0.1270 GA Build Date 2018-...	(not associated with any applications)	✓
RPETTY2-WIN	4.5.2.0 compatible with 4.4.1.0	rpetty	✓

Available Actions

Reset Selected Machine Agent

Restarts the selected Machine Agent and runs it with any updated configuration files on the Agent host, and any changes made on the Controller that affect the Agent. The reset functionality is only available for Machine Agents <= 4.2.

View Machine

Shows summary details about the Machine Agent:

- **Name:** Name of the machine on which the Agent is installed
- **IP Address:** IP address of the machine on which the Agent is installed
- **OS:** Operating system running the Agent
- **Status:** Field displays status information: Initialized
- **Install Time:** Date and time Agent was installed
- **Last Start Time:** Date and time Agent was last restarted

Disable and Enable Agents

Disabling the Agent temporarily suspends its collection of metrics. You can quickly re-enable the Agent when desired.

Permission:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

You must have the application-level permission, *configure agent properties*, to enable and disable Agents.

When the Machine Agent is disabled, the Agent stops reporting hardware metrics and metrics from any extensions installed on the Agent until you re-enable it. The disabled Machine Agent no longer reports events and any installed extensions are also stopped. While disabled, the Agent continues to consume a license. The Agent maintains a 'heartbeat' connection to the Controller so that it can be 'enabled' again quickly. The Agent persists its enabled/disabled state even after the Machine Agent is restarted. Once re-enabled, all normal Machine Agent activities resume.

Delete Selected Machine Agent

The delete functionality on the admin page is to delete the underlying machine metadata for an orphaned machine. A machine is considered "orphaned" when it is no longer associated with any APM nodes or with Server Availability. You cannot delete a machine that is not an orphan. To delete a machine that is not an orphan, you must first delete all nodes on that machine, and then delete the machine from the Servers list. You can select multiple machines to delete.

You can also delete a Machine Agent from the [Servers List](#).

- Server Visibility Administrator permission is required to delete machines.
- You can delete machines from the Servers list regardless of whether they have Server Visibility enabled. You can select multiple machines to delete.
- Deleting a machine from the Servers list deletes the underlying machine metadata that displays on the AppDynamics Agents Admin page, but only if no APM nodes are currently associated with the same machine.
- Deleting a machine that still has APM nodes currently associated with it removes the entry from the Servers list, but retains the underlying machine metadata. That information continues to display on the AppDynamics Agents admin page.

Upgrade the Machine Agent

This page describes how to upgrade an existing installation of the Machine Agent. The instructions have been tested and certified to work for Machine Agent ≥ 20.1 .

For a new installation, see [Install the Machine Agent](#).

Perform the Upgrade

1. Do the following (as needed) before you update the Agent:
 - a. Review the [Release Notes](#) for changes that affect your environment.
 - b. Back up the `<machine_agent_home>` directory to a `<machine_agent_home_BACKUP>` so you can revert to the previous installation, if required.
 - c. *If you have been collecting Log Analytics data by running the Analytics Agent via the Machine Agent:* Do the following.
 - i. Preserve the old watermark file so that you can copy it to the new `<analytics-agent-home>`.
 Machine Agent location: `<machine-agent-home>/monitors/analytics-agent/conf/watermark`
 Analytics Agent location: `<analytics-agent-home>/conf/watermark`
 - ii. Preserve your pre-existing job files so that you can copy them to the new `<analytics-agent-home>`.
 Machine Agent location: `<machine-agent-home>/monitors/analytics-agent/conf/job`
 Analytics Agent location: `<analytics-agent-home>/conf/job`
2. Download the installer suitable for your OS environment from the [AppDynamics Download Center](#).
3. Stop all instances of the Machine Agent that are currently running from the `<machine_agent_home>` that you want to upgrade. See [Start and Stop the Machine Agent](#)
4. Update your Machine Agent installation:
 - RPM-based Linux installation:
Update the existing package. For example: `sudo rpm -U <package>`
 - RPM-based installation on a systemd Linux system (such as CentOS 7, Ubuntu, newer Fedora Core systems, newer OpenSUSE systems, and newer SUSE Enterprise Linux systems).
If you don't know if your Linux installation is using systemd, do a clean install to avoid issues. Remove the old package and then install the new one.
 - For all other scenarios:
First, delete the `<machine_agent_home>` for the old Agent. Make sure you retain the `<machine_agent_home_BACKUP>` you created in Step 1.
Then, install the Machine Agent as described [Linux Install Using the RPM Package](#) for your specific installation in [Install the Machine Agent](#).

If you are running the Analytics Agent as an extension to the Machine Agent, failure to clear out the old directory or use a new location may cause your embedded Analytics Agent to fail to start.

5. Configure the Agent settings in `<machine_agent_home>/conf/controller-info.xml`. See [Machine Agent Configuration Properties](#).

 The RPM-based Linux installer retains the configuration settings for the previous Agent by default.
If you used another installer and want to maintain your previous Agent configuration, copy the `<machine_agent_home_BACKUP>/conf/controller-info.xml` file to the new installation directory.

6. Before you start the updated Agent, perform the following steps (as required):
 - a. *If you are updating on Windows:* When you install the new Machine Agent in the existing directory, you may see two "InstallService" and "UninstallService" files. Use the .vbs files (VbScript) and delete the .cmd files (Windows Command Script), which are leftover from your previous version.
 - b. *If the agent install package includes a new JRE:* Update any related custom scripts that use the Machine Agent JRE.
 - c. Update all users who have the Account Administrator role for the account and add the appropriate SIM roles (SIM admin and SIM user) to other users in the account, as needed.
7. Start the Agent, verify the Agent installation, and verify that the Agent is reporting to the Controller as described for your specific installation in [Install the Machine Agent](#).

Uninstall the Machine Agent

To uninstall the Machine Agent:

1. Stop the Machine Agent (or service). For the commands for your environment, see [Start and Stop the Machine Agent](#).
2. If you installed the Machine Agent as a service, delete the service using the commands described on this page.
For Windows and Mac OS X, the commands to remove the service also stop the service cleanly.
3. Delete the `<machine-agent-install>` installation directory.

Remove the Agent Service

Linux RPM

Execute the following command:

```
sudo rpm -ev appdynamics-machine-agent
```

Windows

Execute the following command:

```
> UninstallService.vbs
```

Mac OS X

Execute the following command:

```
sudo launchctl unload -w <machine_agent_home>/com.appdynamics.machineagent.plist
```

Delete Using AppDynamics Manage Agents

If you delete a Machine Agent from the Controller UI (as described in [Manage Machine Agents](#)), but do not shut down the JVM that the Machine Agent runs on, the Machine Agent reappears in the UI the next time it connects to the Controller. To prevent a Machine Agent from connecting to the Controller, you must remove the Machine Agent settings from the JVM configuration. This frees the license associated with the Agent in the Controller and makes it available for use by another Machine Agent.

FAQs and Troubleshooting for the Machine Agent

Machine Agent and App Agent on the Same Machine, but Report to Different Nodes

Issue

A machine has a Machine Agent and an App Server Agent running together, however, the Agents report to different nodes. When you review the Metric Browser, for example, the application metrics appear under node *abc* but machine metrics appear under node *abc.mydomain.com*.

Resolution

Check if the hostnames match. If they do not match, then:

1. Set the `<unique-host-id>` for the Machine Agent to the same `<unique-host-id>` as the App Server Agent.
2. Restart the Machine Agent to apply the previous changes.

The `<unique-host-id>` on the Machine Agent and the `<unique-host-id>` for the App Server Agent must match exactly. These settings are case-sensitive and ensure that both Agents report metrics to the same node.

To verify that the hostnames match:

1. Click the gear icon (⚙️) in the Controller menu and select **AppDynamics Agents**.
2. Select the Machine Agents tab.
3. Review the **Applications** field for the Agent name.

In addition, for consistency in naming in the Servers tab, use the `<machine path>` attribute to set the hostname. By using the machine path, you do not need to use the fully qualified domain name (FQDN) for some Agents, and the hostname for others. The reported hostname is still available to view by checking the option in the Agents Admin view.

Unique Host ID	Version	Applications	Enabled
WIN-JE86B9GMSJF	4.3.0.0	MovieTicketsGirish	✓
ip-10-0-0-222	Machine Agent v4.5.2.1606 GA compatible with ...	(not associated with any applications)	✓
linuxkit-025000000001	Machine Agent v4.5.0.1270 GA Build Date 2018-...	(not associated with any applications)	✓
RPETTY2-WIN	4.5.2.0 compatible with 4.4.1.0	rpetty	✓

4. Review the ID for the App Server Agent:
 - a. Go to the App Server Agents tab.
 - b. Search for the App Server Agent to which you want to associate the Machine Agent.
 - c. Review the **Unique Host ID** field for the App Server Agent installed on that machine.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

5. Set the `<unique-host-id>` for the Machine Agent to the same `<unique-host-id>` as the App Server Agent.
6. Restart the Machine Agent to apply the previous changes. Your Agents will appear as associated after a few minutes

.NET Agent Doesn't Appear on Machine Agent List

Although .NET Agents can report Machine Agent metrics, they are not considered Machine Agents. .NET Agent-instrumented machines are not included under the list of Machine Agents in the Controller UI.

Identify the Machine Agent Process

Linux and Unix-like Systems

To identify which process is running the Machine Agent, enter:

```
ps -ef | grep machine
```

Windows Systems

In the Windows Services Application, search for the AppDynamics Machine Agent service.

Metric Values for Disk and Network are Zero

When a 32-bit JRE is used with a 64-bit operating system, you may see values of zero for disk and network metrics. To solve this problem, use a 64-bit JRE with the 64-bit operating system.

Flow Maps and the Machine Agent

The Machine Agent monitors a particular machine (also called "host server") and not a particular application server; therefore, the Machine Agent can report to multiple nodes running on the same machine. However, a flow map displays the communication between different nodes during application execution, or the business transaction flow from tier to tier. A Machine Agent cannot be a part of the flow and is not shown in the flow map.

Server Health Indicator

Health rule violations based on metrics monitored by the Machine Agent are included in the health indicator on the various application, tier, and node dashboards. The health indicator is driven by health rule violations in the given time period configured on hardware metrics collected by the Machine Agent. Some health rules are configured by default. To configure additional health rules, see [Configure Health Rules](#) and [Configure Health Rules to Monitor Servers](#).

Server Visibility

Related pages:

- [Enable Server Visibility](#)
- [Monitor Your Servers Using Server Visibility](#)
- [Hardware Resources Metrics](#)

The AppDynamics Server Visibility module uses the Machine Agent to provide extended hardware metrics. Server Visibility includes additional windows in the Controller UI that enable you to quickly see underlying infrastructure issues impacting your application performance and rapidly troubleshoot hardware performance problems.

Requirements

- Linux, Windows, Solaris, and AIX
- [Server Visibility license](#) for monitored machines
- [Server Visibility enabled](#) on the Machine Agent

Before you enable Server Visibility:

- Review the [Server Visibility Requirements and Supported Environments](#).
- Install and configure the Machine Agent on a machine with a supported OS as described in [Install the Machine Agent](#).

Without having to enable Server Visibility, you can [view basic hardware metrics](#).

Feature Comparison

Feature	Server Visibility	Machine Agent
Supported Platforms	Linux, Windows, Solaris, AIX	Linux and Unix-like systems, MacOS, Windows, AIX
Extensions and Custom Metrics	Yes	Yes
Monitor Docker container metrics from the Docker host	Yes	No
Tier Metric Correlator	Yes	No
Dynamic Monitoring Mode	Yes	No
JVM Crash Guard	Yes	Yes
Remediation Scripts	Yes	Yes

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Feature	Server Visibility	Machine Agent
Graphical User Interface	Yes	Functionality is limited to viewing Machine Agent metrics in the Servers List
Extended Hardware Metrics	Yes	No
Server metrics in transaction snapshots	Yes	No
Server KPIs in application flow map	Yes	No
Health rules for extended hardware metrics	Yes	No
Licensing	Server Visibility	Machine Agent

Permissions

Server Visibility provides two predefined roles, and two related permissions:

- Server Visibility Administrator
- Server Visibility User
- View Server Visibility permission
- Configure Server Visibility permission - enables configuring Service Availability

See [Server Visibility Permissions](#).

Server Visibility User Interface

The [Servers list](#) provides key performance metrics for all your servers on a single panel.

The [Servers > Dashboard](#) shows key performance metrics for the selected machine, including the top ten consumers of CPU and memory.

The [Servers > Volumes](#) panel displays performance metrics for disks, partitions, and volumes for the selected machine.

The [Servers > Network](#) panel shows network performance metrics for network interfaces on the selected machine.

The [Servers > Processes](#) panel shows a configurable set of performance metrics for processes.

The [Servers > Containers](#) panel lists the monitored containers used by an application.

Using the Server Visibility UI

The Server Visibility user interface uses many of the same mechanisms that are common to the various panels of the Controller UI. The sample image illustrates these mechanisms.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

The screenshot shows the 'Processes' tab in the AppDynamics interface for 'ECommerce_MA'. It features a table of processes with columns for Current Process C..., Command Line, State, Start..., End Tl..., CPU (%), Mem..., PID, and PPID. Three callouts provide instructions: 'Click a window name to display that window' points to a process name, 'Click a column heading to sort the table by that column' points to a column header, and 'Select the column you want to display' points to a configuration panel on the left. The configuration panel lists various metrics like CPU (%), Memory (%), and State, with checkboxes for selection.

Current Process C...	Command Line	State	Start...	End Tl...	CPU (%)	Mem...	PID	PPID
1	/usr/sbin/acpid	🟢	09/20...	-	0.0	0.0	2572	1
	/sbin/agetty ttyS0 9600 vt100-nav	🟡	MULTI...	MULTI...	0.0	0.0	2885	1

Search Results and Sorting

Pagination is the default behavior on the **Servers** and **Containers** list pages. The information is retrieved on demand, and additional records are retrieved and displayed as you scroll. Search is only available for the **Name** and **Host ID** columns. Sorting is only available on the **Hostname**, **Container**, **Metric %**, and **Health** fields.

Server Visibility Requirements and Supported Environments

To [enable Server Visibility](#), review these system requirements guidelines.

System Requirements

Server Visibility requires a supported version of the Machine Agent to be installed on the monitored server. See [Machine Agent Requirements and Supported Environments](#).

Server Visibility features are available for AIX, Linux, Windows, and Solaris. You need a Server Visibility license to enable and use Server Visibility features. Server Visibility is enabled by default on AppDynamics Controllers. You must explicitly [enable Server Visibility on your Machine Agent](#) to start sending the expanded set of Server Visibility metrics.

You can install and run Machine Agents on other supported platforms, however, Server Visibility features are not available. For OS platforms like AIX or HP-UX, AppDynamics recommends using the unbundled Machine Agent ZIP without the JRE.

Limitations

- Total number of Machine Agents and containers reporting to a single Controller is 30,000.
- Total number of App Agents reporting to a single Controller is 100,000.
- Monitored servers are considered stale 30 days after they go offline. They are purged from the Controller database when that time limit is reached.
- [Docker Visibility](#) is supported on Linux only.

Server Visibility on Windows

Review these notes:

- It is good practice to check the server frequently to ensure that it has the latest Windows updates installed. WMI (Windows Management Instrumentation) updates are especially important because the Agent uses WMI to collect Server Visibility metrics.
- The monitored server should have at least four cores or multiple CPUs. WMI processes can be highly resource-intensive, especially on Windows Server 2012.
- If you do not have a Server Visibility license, or to collect Basic metrics only, configure the Agent to use the `JavaHardwareMonitor` extension. [Server Visibility](#) should not be enabled on the Agent.
- The Windows Machine Agent uses these extensions by default:
 - `JavaHardwareMonitor` (for Basic metrics)
 - `ServerMonitoring` (for Server Visibility metrics)
- The `HardwareMonitor` extension is not recommended on Windows.
- To enable Server Visibility on a Windows server with a .NET APM Agent installed, you must enable [.NET Compatibility Mode](#) on both the Controller and the Machine Agent.

Enable Server Visibility

Before you enable Server Visibility:

1. Review the [Server Visibility Requirements and Supported Environments](#).
2. Install and configure the Machine Agent on a machine with a supported OS as described in [Install the Machine Agent](#).

Server Visibility License Required

Infrastructure Visibility is an add-on module to the Machine Agent and requires a Server Visibility license on the Agent.

Enable Server Visibility

1. Set the " `sim enabled` " property to " `true` ". See [Where to Specify Machine Agent Configuration](#), and configure the value based on your configuration choice:
 - Element in `controller-info.xml`: `<sim-enabled>`
 - System Property: `-Dappdynamics.sim.enabled`
 - Environment Variable: `APPDYNAMICS_SIM_ENABLED`
2. Restart the Machine Agent. See [Start and Stop the Machine Agent](#).

Monitor Your Servers Using Server Visibility

This page describes the Server Visibility panels in the Controller UI:

- [Discover Normal Server Activity](#)
- [Servers List](#)
- [Server Dashboard](#)
- [Server Process Metrics](#)
- [Server Volumes Metrics](#)
- [Server Network Metrics](#)
- [Navigating Between Server and Application Contexts](#)

Discover Normal Server Activity

Related pages:

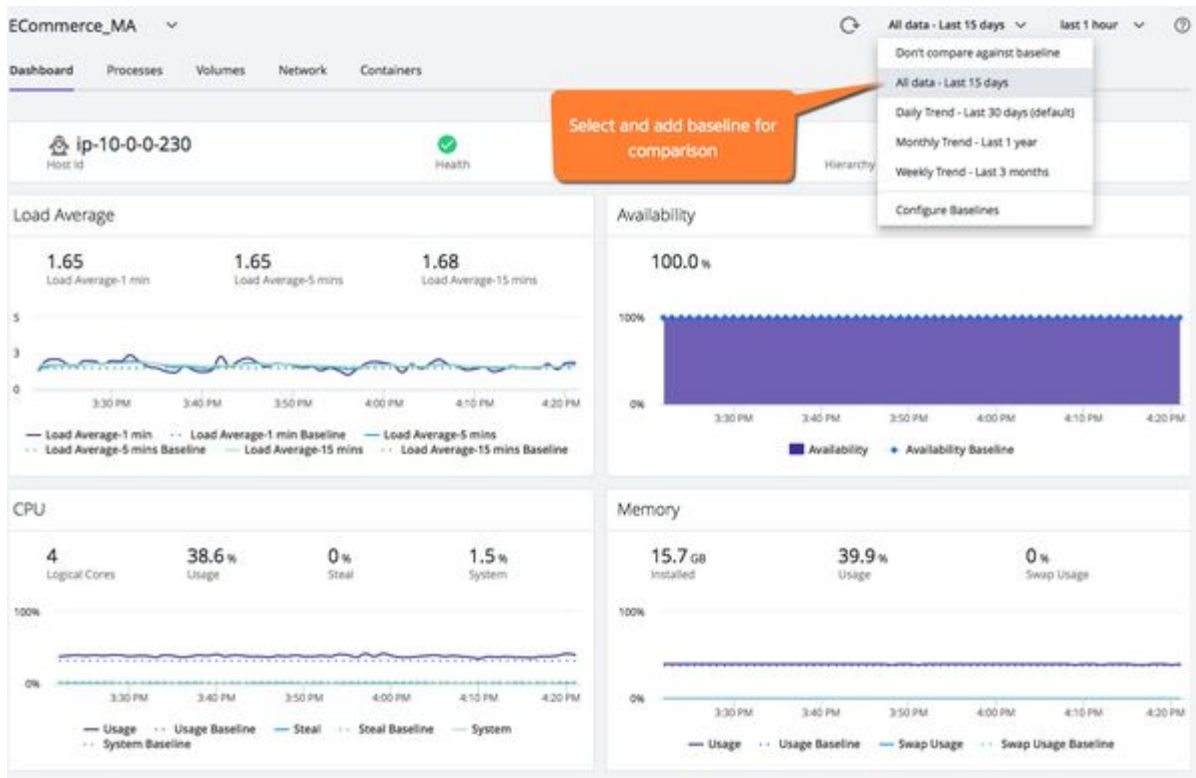

- [Dynamic Baselines](#)
- [Hardware Resources Metrics](#)

The Server Visibility module automatically learns to detect performance anomalies using baselines that are specific to your server environments.

AppDynamics creates baselines by collecting metrics from your monitored servers over defined periods of time. This establishes what is normal for your environment so you can create [health rules](#) to alert you when metric deviations occur from the normal range. You can also create your own baselines.

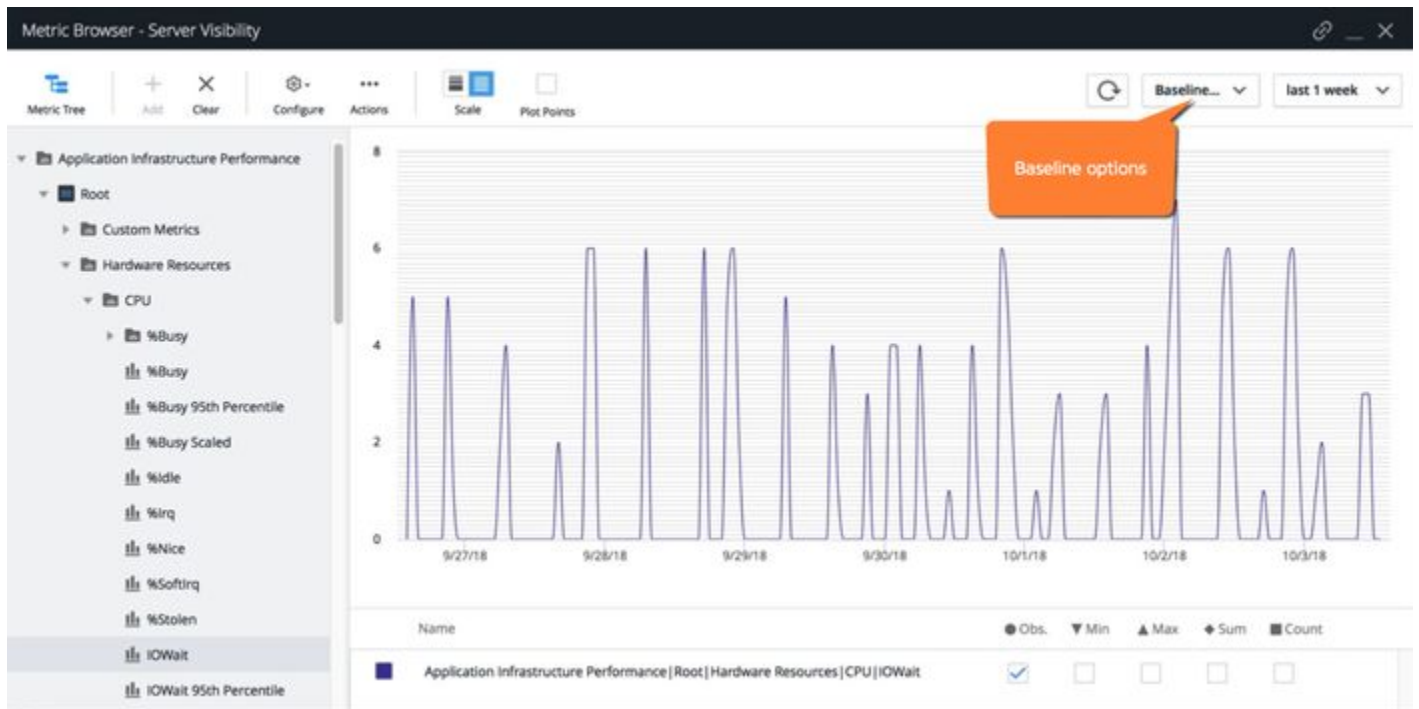

View Performance Metrics Compared to Baselines

You can compare performance metrics to their dynamic baselines on the Server Dashboard.

You can visualize performance metrics and review deviations from expected behaviors established by the baseline from the **Metric Browser - Server Visibility** panel.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Servers List

To access: AppDynamics Home > **Servers**

The **Servers** list shows all machines registered by a Machine Agent. This list shows metric data for Server-Visibility-enabled machines only. Machines registered with App or .NET Agents, with no Machine Agent running, do not appear in this list.

On the Servers list you can:

- See the complete list of Machine Agents reporting to this Controller. The **Name** is taken from the value in `<machine-path>` in `controller-info.xml`. The last string after the last | (pipe) is used. For example, if the value is `<machine-path>Group | myName<machine-path>`, then the name is `myName`. For `<machine-path>JustName<machine-path>`, then the name is `JustName`.
- Filter the list using the dropdown to show all servers (the default) or just servers with Server Visibility enabled or disabled.
- Use **View Options** to select the columns shown for each server in the table. You can show or hide metrics such as **CPU Steal**, **Load Average**, **Memory Swap Used**, and **Network I/O**. You can also show or hide properties such as Host ID and JVM version.
- See key performance metrics for your monitored servers at a glance.
- Change the time period of the metrics displayed.
- See an overview of the health of the servers, as determined by whether any health rules have been violated. See [View Health Rule Status in the UI](#).
- Click the violations icon () to view health rule violations for a server.
- Click on any point on a spark chart to see the percentage usage at that time.
- Sort the chart by any of the columns.
- Right-click on a set of selected servers to
 - Delete the servers from the Servers list. See "Delete Selected Machine Agent" in [Manage Machine Agents](#).
 - View and analyze log data for the servers (if you have an Application Analytics license). See [Analytics](#).
 - Set the **Dynamic Monitoring Mode** on the servers. See [Dynamic Monitoring Mode and Server Visibility](#).
- See additional details of servers that are enabled for Server Visibility. Double-click a selected server to see server-specific [dashboard](#), and details of the server's [volumes](#), [network](#), and [processes](#).
- Filter data according to the "liveness" of servers. A Machine Agent that reports metrics from a server is considered live. Eventually, servers can transition to a terminated or unrecoverable state. By specifying a time range in the Server Dashboard, you can filter servers which were live and reporting metrics during that time range. To enable this option for an individual account:
 - a. Log in to the Controller admin page: `<controller-hostname>/controller/admin.jsp`
 - b. From **Accounts**, open the account page of interest.
 - c. Click **Controller Settings > Controller Configurations** and enter:
 - i. Name = `entity.liveness.filter.enabled`
 - ii. value = `true`
 - iii. Name = `entity.liveness.tracker.enabled`
 - iv. value = `true`
- Disable automatic sorting of the Servers List table when it first loads. This option is useful if the Controller is monitoring hundreds or thousands of Machine Agents and the table is taking a long time to load. This option disables the ability to sort the table by any metric or metric trend column. To enable this option for an individual account, do the following:
 - a. Log in to the Controller admin page: `<controller-hostname>/controller/admin.jsp`
 - b. From **Accounts**, open the account page of interest.
 - c. Click **+ Add Property** and enter:
 - i. Property = `SIM_DISABLE_MACHINE_SORTING`
 - ii. value = `true`

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

OS	Name ↑	Hierarchy	Health	Disk Usage (%)	CPU (%)	Memory (%)	Disk I/O (%)	Network I/O (%)	Server Visibility Enabled
	ECommerce_MA		✓	15.0	39.0	40.0	2.0	0.0	Yes

Available Metrics in the Servers List

Metric Name	Description
Hierarchy	Specifies the root of the hierarchical path to the server. See the machine hierarchy property in this topic: Machine Agent Configuration Properties .
Health	Indicates if server health rules have been violated on this machine.
Disk Usage % trend	The percentage usage trend over time of storage space in use across all listed volumes, partitions, and disks.
CPU (%)	The percentage of time the CPU was busy processing system or user requests.
CPU Trend	The trend over time of CPU usage.
Memory (%)	The percentage of memory used.
Memory Trend	The trend over time of memory usage.
Disk I/O (%)	The percentage of time spent performing read and write operations across one or more disks, volumes, or partitions.
Disk IO Trend	The trend over time of disk usage.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Metric Name	Description
Network I/O (%)	The average network utilization of network bandwidth for all monitored network devices. The network utilization percentage is the total incoming and outgoing bytes per second, divided by the maximum speed of the network interface. In some cases, if the Network I/O percentage value is too small compared to the network speed (10,000 Mb/s), the value is rounded to zero on the Servers List. In this case, the Network I/O % shows as zero, while the drilled-down details of the machine might show network traffic.
Network Trend	The trend over time of network usage.
Server Visibility Enabled	Indicates if Server Visibility is enabled for this machine. Values=Yes, No, and Not Supported. Not Supported indicates that Server Visibility is not available for that machine OS.
Icon	Representation of the machine's Operating System

Server Dashboard

To access Server Dashboard, select **AppDynamics Home > Servers > Dashboard**.

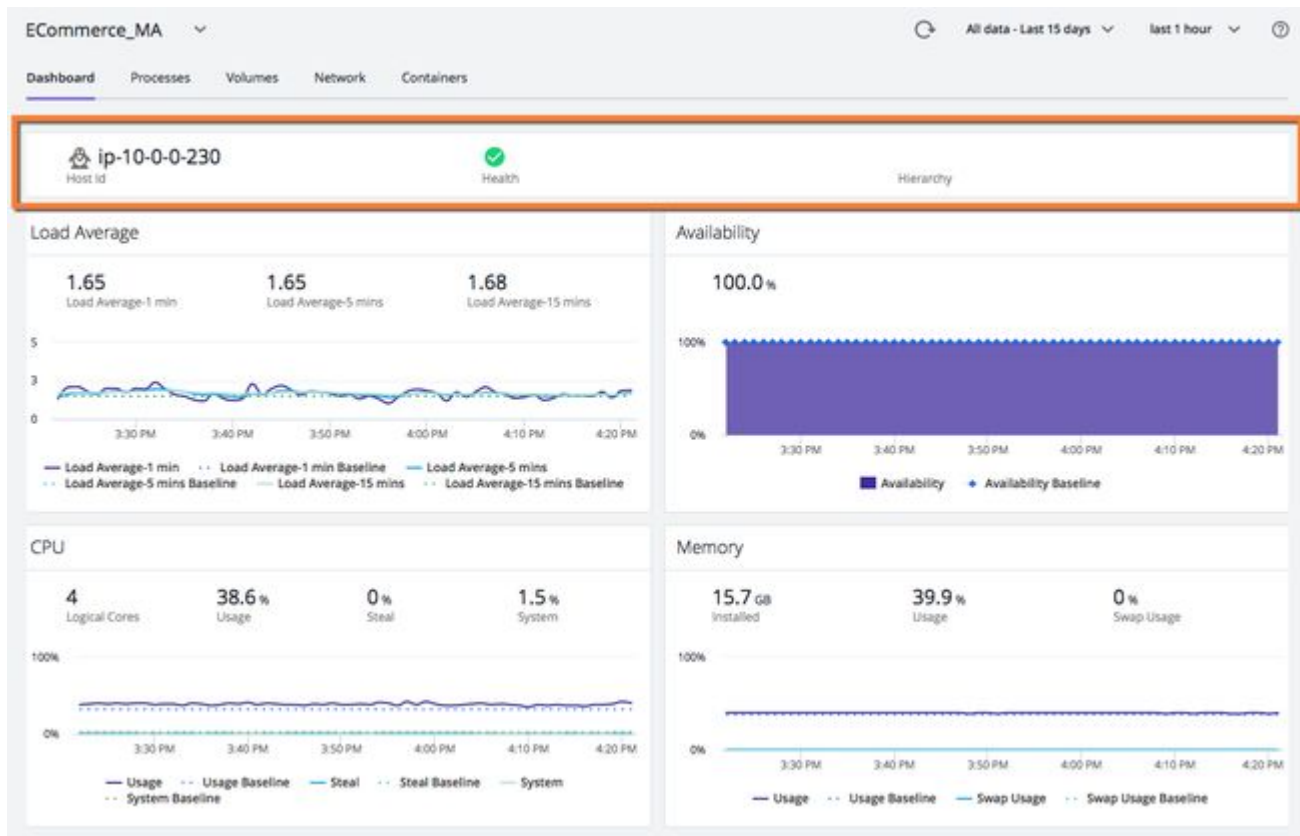

Select a server from the list and double-click a server name to display its Dashboard. In this Dashboard, you can:

- View charts of key performance metrics for the selected monitored servers:
 - Server availability
 - CPU, memory, and network usage percentages
 - Server properties
 - Disk, partition, and volume metrics
 - Top ten processes consuming CPU resources and memory
- Change the time period of the metrics displayed.
- View an assessment of the overall health of the server based on any health rule violations. See [View Health Rule Status in the UI](#).
- View the hierarchy or grouping of the server as specified in the `controller-info.xml` using the `machine-path` configuration property.
- Click on any point on a chart to see the metric value for that time.
- Sort the chart using any of the columns as a sorting key.
- Find and switch to other Server Dashboards from the dropdown next to server tier.
- View an aggregate of the top ten processes by CPU usage, and top ten processes by memory.

Server Dashboard Metrics

Host ID, Health, Hierarchy (*Top Pane*)

- **Host Id:** This is an ID for the server that is unique to the AppDynamics Controller.
- **Health:** Shows the overall health of the server. Hover over the health icon for details; for example, the following appears when hovering over the exclamation mark (!) in a red box, "There are Critical Health Rule Violations on this machine during the time range."
- **Hierarchy:** This is an arbitrary hierarchy to group your servers together, specified by [Machine Hierarchy Property](#).

Load Average

The **CPU load** presented as an average over the past 1 minute, 5 minutes, and 15 minutes. The CPU load is the percentage of the CPU consumed by processes that are currently running or that are waiting to run. These metrics are shown as percentages in the Server Dashboard and are **scaled by 100 in the Metric Browser**.

Availability

- **Availability:** Percentage of time the Machine Agent is able to communicate with the Controller. The Machine Agent sends availability information in the form of a heartbeat to the AppDynamics Controller once a minute to indicate the Agent is alive. The heartbeat may show as available when other functions of the Machine Agent and Server fail. The availability only indicates that the Machine Agent is communicating with the Controller, and does not indicate the overall health of the functions within the Machine Agent.
- **time series chart:** Shows the Machine Agent availability trend over time. There are situations where the Machine Agent is able to communicate with the Controller while other functions of the Machine Agent, or processes on the server, are non-functional. Do not use the time series metric to indicate the overall availability of the server.

CPU

- **CPU Usage:** Average usage of CPU over the chosen time-range.
- **# of Cores:** Number of cores for the CPU.
- **time series chart:** Shows CPU busy percentage trend over time.

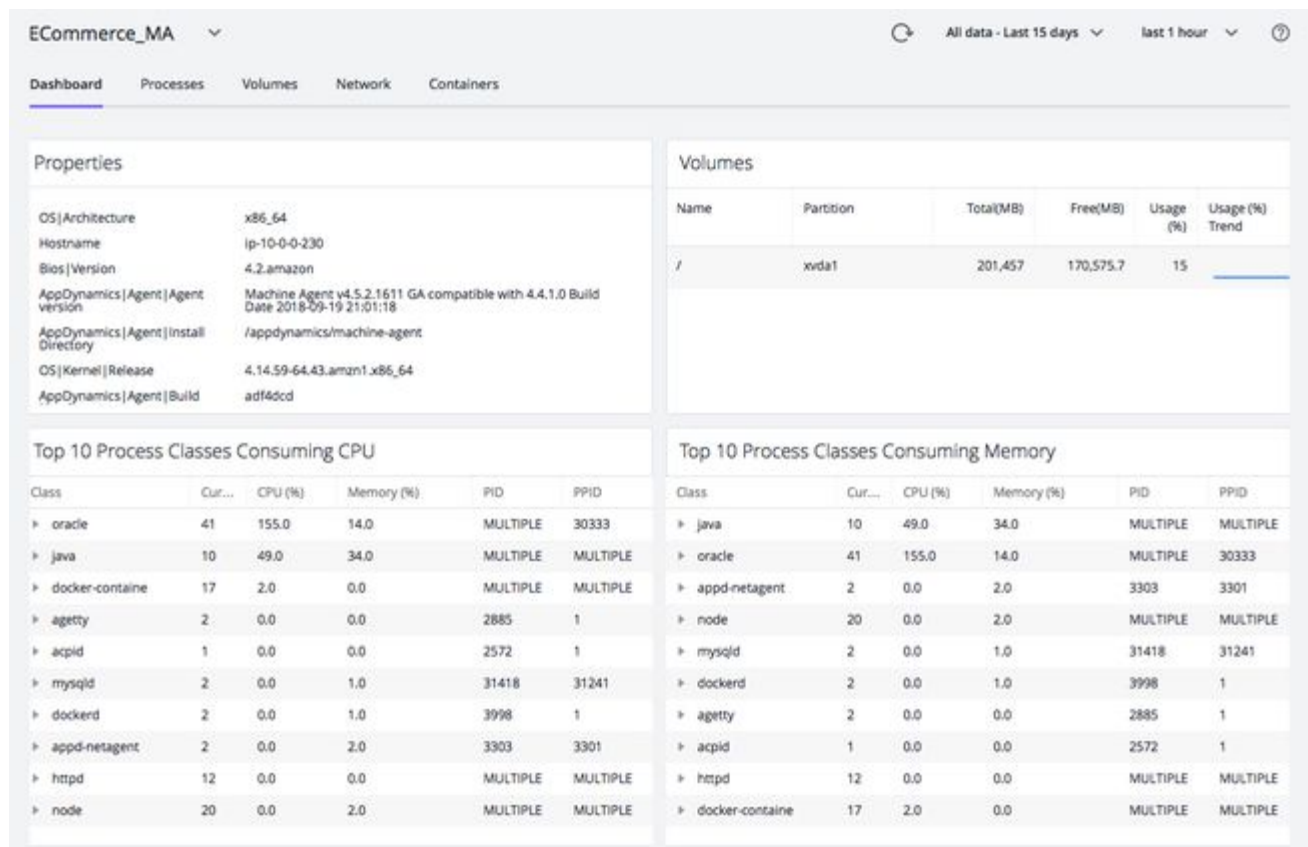

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Memory

- **Installed:** Total amount of memory, free and used, on the server.
- **Memory Usage:** Percentage of memory used.
- **Swap Usage:** Swap usage tracks the swap file utilization. A swap file enables an operating system to use hard disk space to simulate extra memory. When the system runs low on memory, it swaps a section of RAM being used by an idle program onto the hard disk to free up memory for other executing programs. When the idle, swapped out program begins executing again, it is moved back to RAM, potentially displacing some other idle program. This causes a large amount of hard disk reading and writing that can slow down the system considerably.
- **time series chart:** Shows the memory usage trend over time.

Network

- **Interfaces:** Number of network interfaces on the server.
- **Outgoing:** Kilobytes of data sent per second for all monitored network devices.
- **Incoming:** Kilobytes of data received per second for all monitored network devices.
- **time series chart:** Shows the network incoming and outgoing volume trend over time.

Volumes

- **Total:** Storage space, free and used, on the disk, partition or volume. For Linux systems, this does not include disk space reserved by the kernel.
- **Free:** Total storage space available. For Linux systems, this does not include disk space reserved by the kernel.
- **Usage(%):** Percentage of storage space in use across each disk, partition, and volume.
- **time series chart:** Shows the storage usage trend over time.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Top 10 Processes Consuming CPU

- **Count:** Number of processes in this class.
- **CPU (%):** Percentage of CPU resources consumed by all processes in this class.
- **Memory (%):** Percentage of memory consumed by all processes in the class.
- **PID:** Process ID.
- **PPID:** Parent Process ID.

Top 10 Processes Consuming Memory

- **Count:** The number of processes in this class consuming memory resources.
- **CPU (%):** Percentage of CPU consumed by all processes in this class.
- **Memory (%):** Percentage of memory consumed by all processes in this class.
- **PID:** Process ID.
- **PPID:** Parent Process ID.

Server Process Metrics

Related pages:

- [Hardware Resources Metrics](#)
- [Enable Server Visibility](#)
- [Machine Agent Settings for Server Visibility](#)

To access Server Process Metrics, select **AppDynamics Home > Servers >** (double-click a server) **> Processes**.

You can configure which processes AppDynamics monitors, how they are grouped, the number of processes to monitor, and how long they must be alive before monitoring them. See [Machine Agent Settings for Server Visibility](#)

From the Server Processes tab, you can:

- View all the processes active during the selected time period. The processes are grouped by class as specified in the [ServerMonitoring.yml](#) file.
- View the full command line that began this process by hovering over the process entry in the **Command Line** column.
- Expand a process class to see the processes associated with that class.
- Select **View Options** to configure which columns to display in the chart.
- Change the time period of the metrics displayed.
- Sort the chart using the columns as a sorting key. You cannot sort by CPU Trend or Memory Trend on sparkline charts.
- Review CPU and Memory usage trends.

Class	Class Id	Current Proces...	Command Line	State	Star...	End ...	CPU...	Me...	PID	PPID

Metrics for Server Processes

The following information displays for each monitored class and process:

Default Columns

- **Class:** The process class.
- **Count:** The number of processes in this class.
- **Command Line:** The command that began the process.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- **State:** An icon represents the process state: sleeping, running, terminated, zombie or multiple. Hover over the icon to discover its state. The State column displays a question mark  when there is more than one process associated with the class. Expand the class to review the state of the related processes.
- **Effective User:** The name of the user account that started the process.
- **Start Time:** The time, as set on the Controller machine, when the process started.
- **End Time:** The time, as set on the Controller machine, when the process ended.
- **CPU (%):** The percentage of CPU resources by all processes in this class.
- **CPU Trend:** A chart that shows CPU usage over the selected time period.
- **Memory (%):** The percentage of memory resources by all processes in this class.
- **Memory Trend:** A chart that shows memory usage over the selected time period.
- **PID:** Process ID.
- **PPID:** ID of the parent process.

OS-Specific Columns

The column information is specific to processes monitored on a Linux server.

- **pgid:** Process group ID.
- **Real Group:** The process real group ID.
- **Real User:** The process real user ID.
- **Effective Group:** The user ID the kernel uses to determine the process permissions when using shared resources such as: message queues, shared memory, and semaphores.
- **Nice Level:** The priority used to indicate the amount of CPU to afford the process or the process priority, where -20 is the highest priority, and 19 or 20, is the lowest priority.

Windows Process Collection Configuration

When too many processes slow down the performance of the Machine Agent on Windows, you must adjust the system environment variables to accommodate. Specifically, in relation to Windows-based operating systems supported by the AppDynamics platform. See System Requirements.

Microsoft Windows process collection is enabled by default in the Controller and is missing the Effective User value due to performance issues. To retrieve the Effective User value, set the `APPDYNAMICS_ENABLE_PROCESS_OWNER_INFORMATION` environment variable. Although you can retrieve this information, this will most likely slow your process collection and may lead to additional issues, such as high CPU usage and the failure to report metrics. To disable process collection, set the `APPDYNAMICS_MACHINE_AGENT_STOP_PROCESS_COLLECTION` to speed up your performance at the expense of losing process metrics and metadata.

Windows System Environment Variables

This information is specific to processes monitored on a Windows server.

1. **Default:** Retrieve all Windows processes and metadata. Starting with Machine Agent 4.5.4, Effective User information is excluded by default to improve performance.
2. `APPDYNAMICS_ENABLE_PROCESS_OWNER_INFORMATION` : Retrieve all Windows processes and metadata, including the Effective User, but the Machine Agent may experience performance issues. This is available starting with Machine Agent 4.5.4.
3. `APPDYNAMICS_MACHINE_AGENT_STOP_PROCESS_COLLECTION` : Stops all Windows process metrics and metadata collection, but improves Machine Agent performance. If you set this variable, then

the `APPDYNAMICS_ENABLE_PROCESS_OWNER_INFORMATION` variable is ignored. This is available starting with Machine Agent 4.4.0.

 These environment variables only need to be set; you do not need to assign a value to the variable.

You must restart the Machine Agent for these changes to take effect.

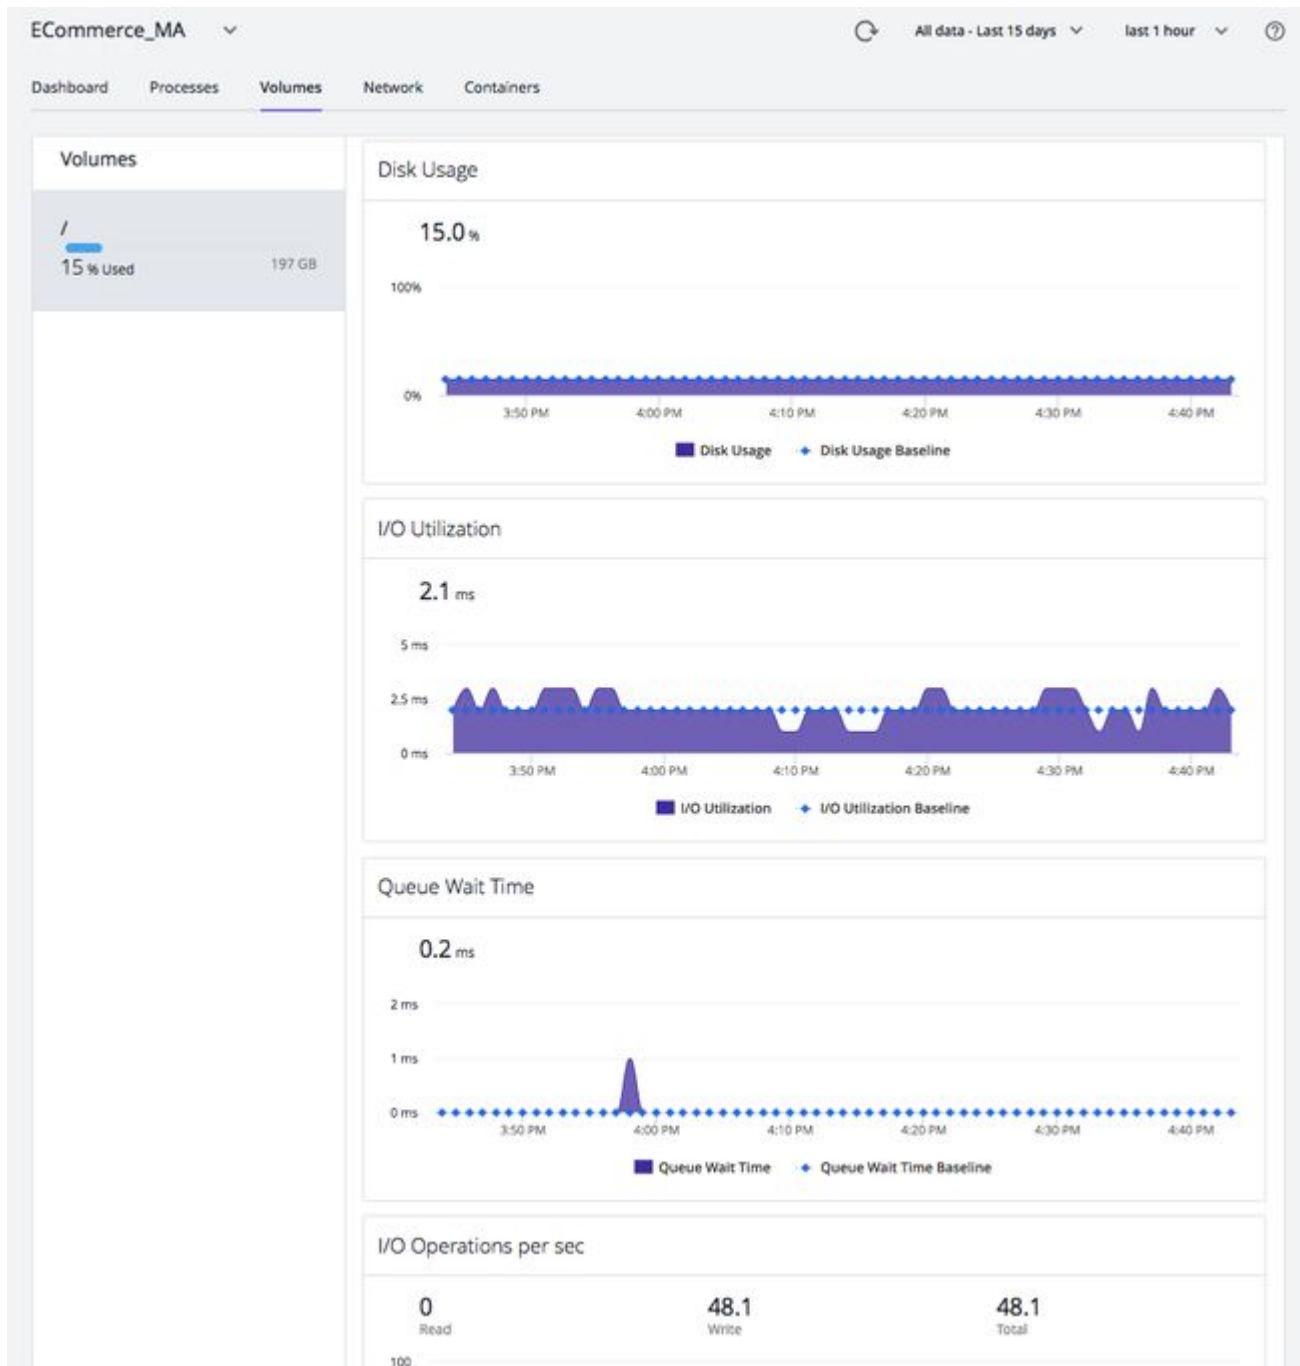

Server Volumes Metrics

To access Server Volumes Metrics, select **AppDynamics Home > Servers > double-click server > Volumes**.

From the Server Volumes tab, you can:

- View the list of volumes, the percentage used, and total storage space available on the disk, partition, or volume
- View disk usage and I/O utilization, rate, operations per second, and wait time
- Change the time period of the metrics collected and displayed
- Click on any point on a chart to review the metric value for that time

 The Machine Agent does not monitor Linux remote volumes.

Metrics in the Server Volumes Tab

For each selected disk, partition or volume, these columns are available for the **Server Volumes** panel.

- **Disk Usage %:** The percentage of storage space in use (To configure how this metric is calculated on Linux, see [Configure Disk Usage Metric Collection on Linux](#)).
- **I/O Utilization %:** The percentage of time spent performing read and write operations

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

-
- **I/O Rate read:** The number of kilobytes per second of data reads
 - **I/O Rate write:** The number of kilobytes per second of data writes
 - **I/O Operations per sec read:** The number of read operations per second
 - **I/O Operations per sec write:** The number of write operations per second
 - **I/O Wait Time read:** The percentage of time the CPU was waiting for read operations to complete
 - **I/O Wait Time write:** The percentage of time the CPU was waiting for write operations to complete

- Volume space metrics on POSIX systems are obtained using the " `df` " command.
- On Linux, the space reserved for `root` is not counted in the available space.

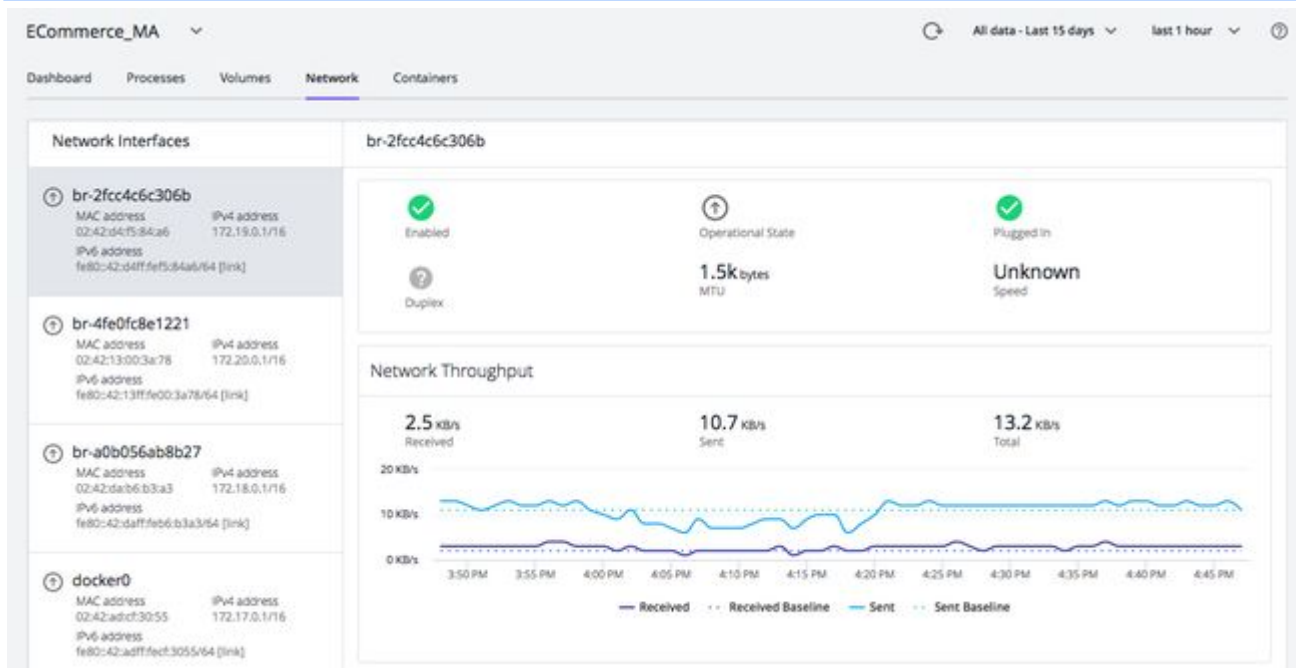

Server Network Metrics

To access Server Network Metrics, select **AppDynamics Home > Servers > double-click server > Network**.

From the Server Network tab, you can:

- View the MAC, IPv4, and IPv6 IP address for each network interface.
- View the state of the network interface:
 - Enabled
 - Functional (its operational state)
 - Equipped with an Ethernet cable that is plugged in
 - Operating in full or half-full duplex mode
- View the maximum transmission unit (MTU) or size (in bytes) of the largest protocol data unit that the network interface can pass
- View the speed of the Ethernet connection in Mbit/sec
- View network throughput in kilobytes/sec and packet traffic
- Change the time period of the metrics displayed
- Hover over any point on a chart to review the metric value for that time

i If no metrics display, the network device speed cannot be found for some devices and some Linux versions.

Server Network Metrics

These columns are available for the Server Network panel.

For the selected network interface:

- **Network Throughput received:** The volume of data received per second

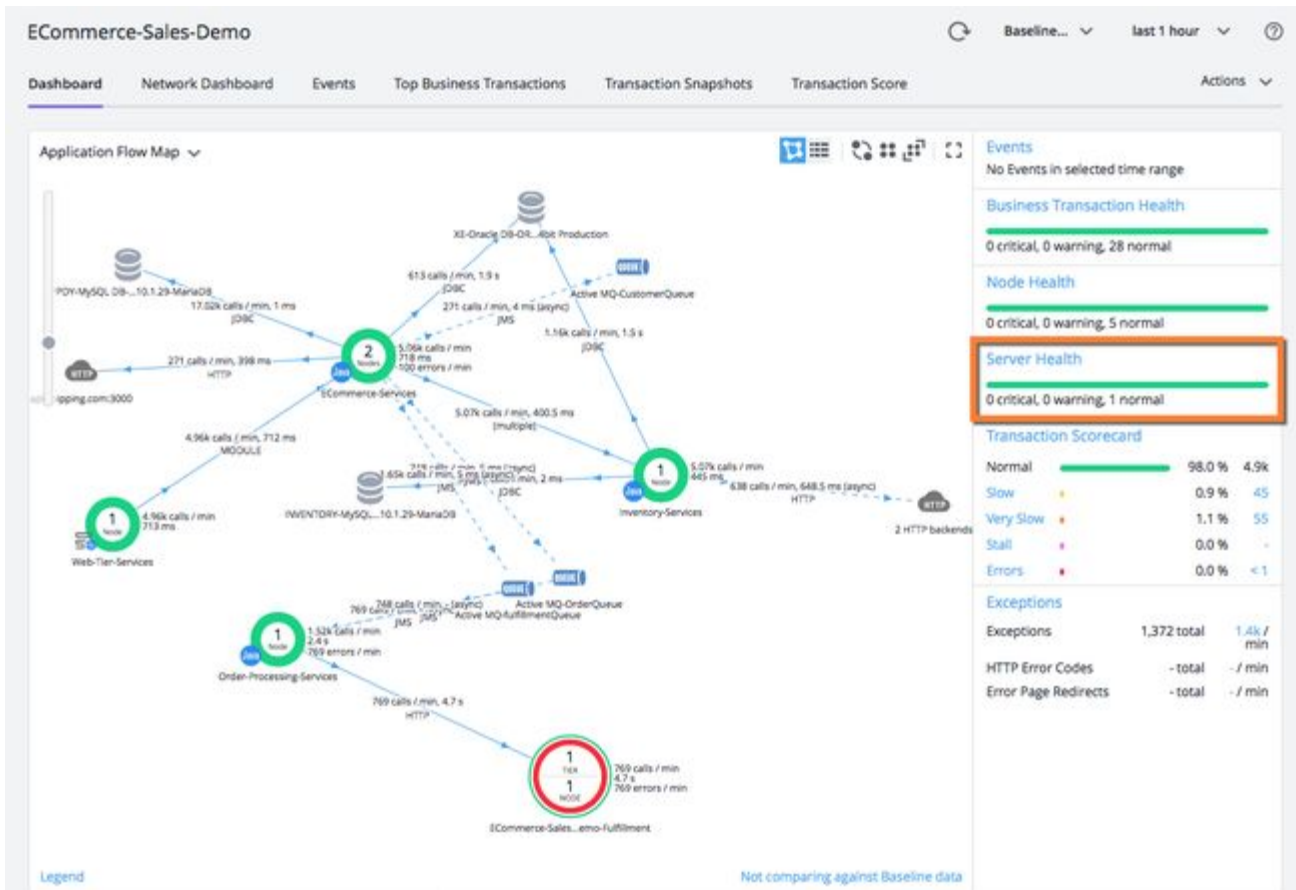

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

-
- **Network Throughput sent:** The volume of data sent per second
 - **Packets per sec incoming:** The number of data packets received per second
 - **Packets per sec outgoing:** The number of data packets sent per second

Navigating Between Server and Application Contexts

With Server Visibility enabled, you can access server performance metrics in the context of your applications. See [Monitor Your Servers Using Server Visibility](#).

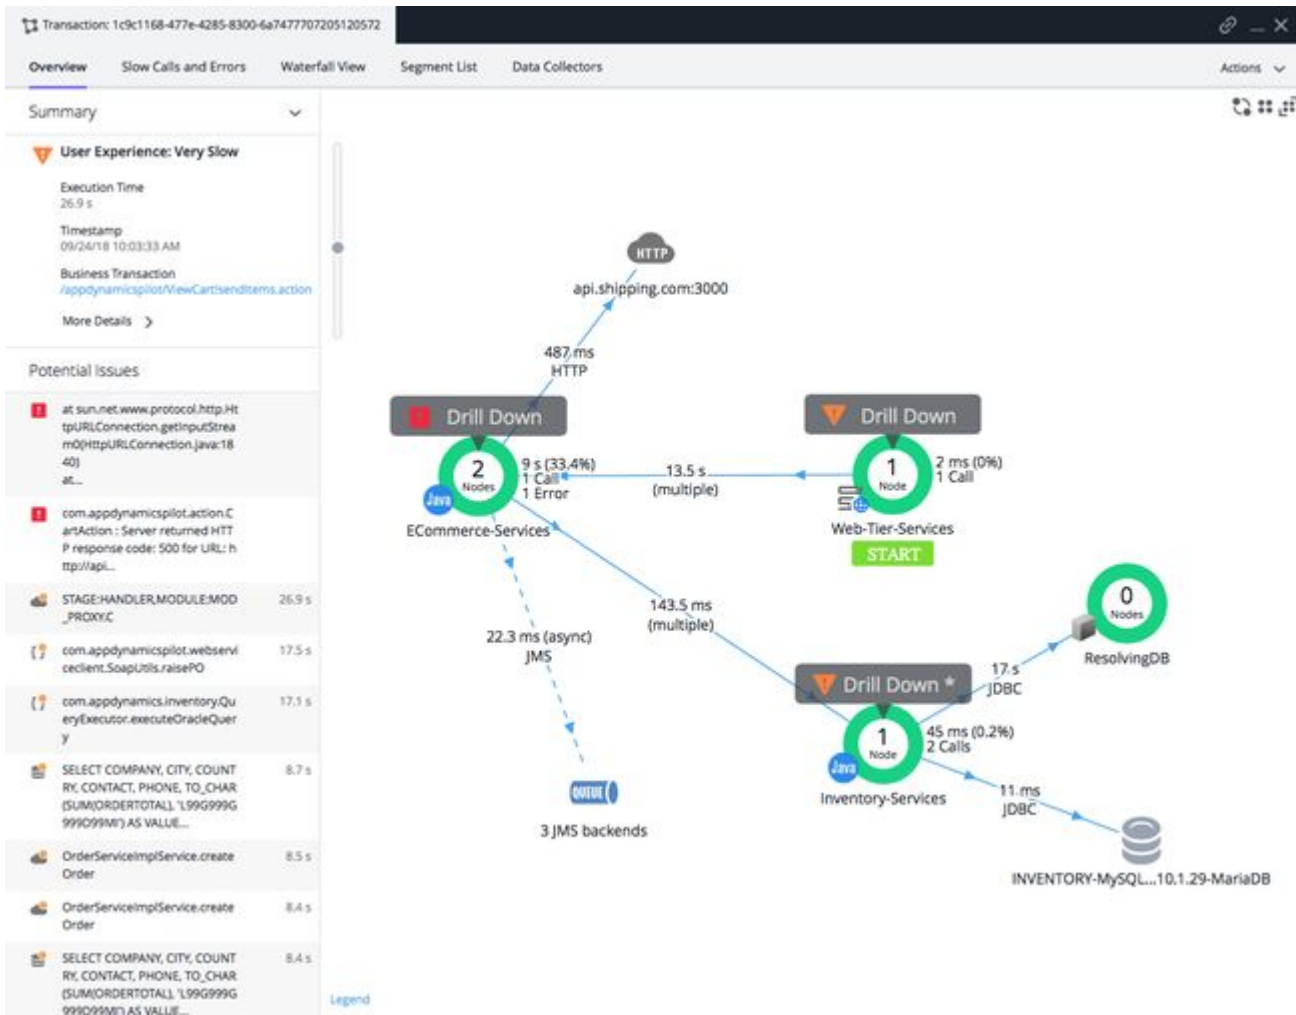

After logging in to the AppDynamics Controller, and locating your application [flow maps](#), you can drill down to Server metrics for a selected tier or node. The Server health summary shows the number of critical/warning/normal conditions for the application's servers.

Select a tier, such as in this example, *Inventory-Services*, to review the server details.

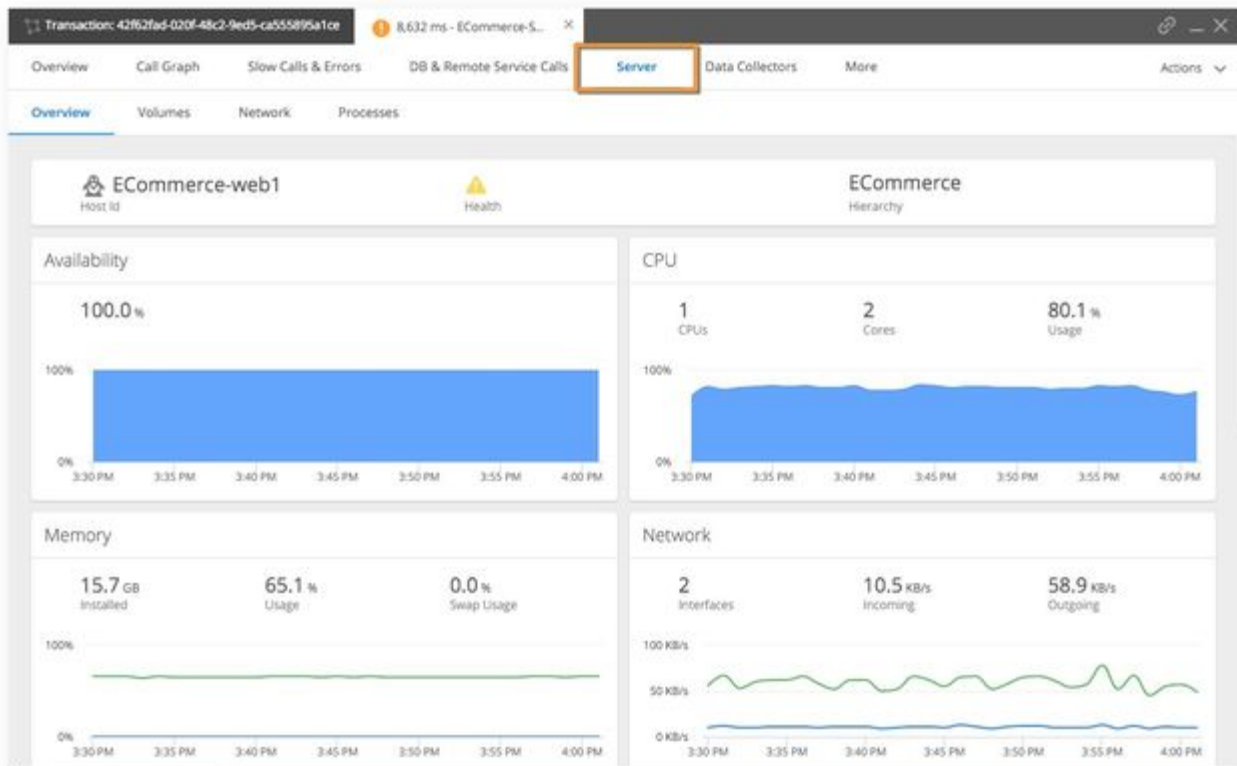

Java Inventory-Services								
OS	Name ↑	Hierarchy	Health	CPU (%)	Memory (%)	Disk I/O (%)	Network I/O (%)	Server Visibility Enabled
	ECommerce_MA		✔	39.0	40.0	2.0	0.0	Yes

From the list of transaction snapshots, you can drill down to server metrics to determine if there is anything suspicious contributing to slow transactions. Double-click a snapshot of interest, drill down into the call to view the Server tab and its associated metrics.

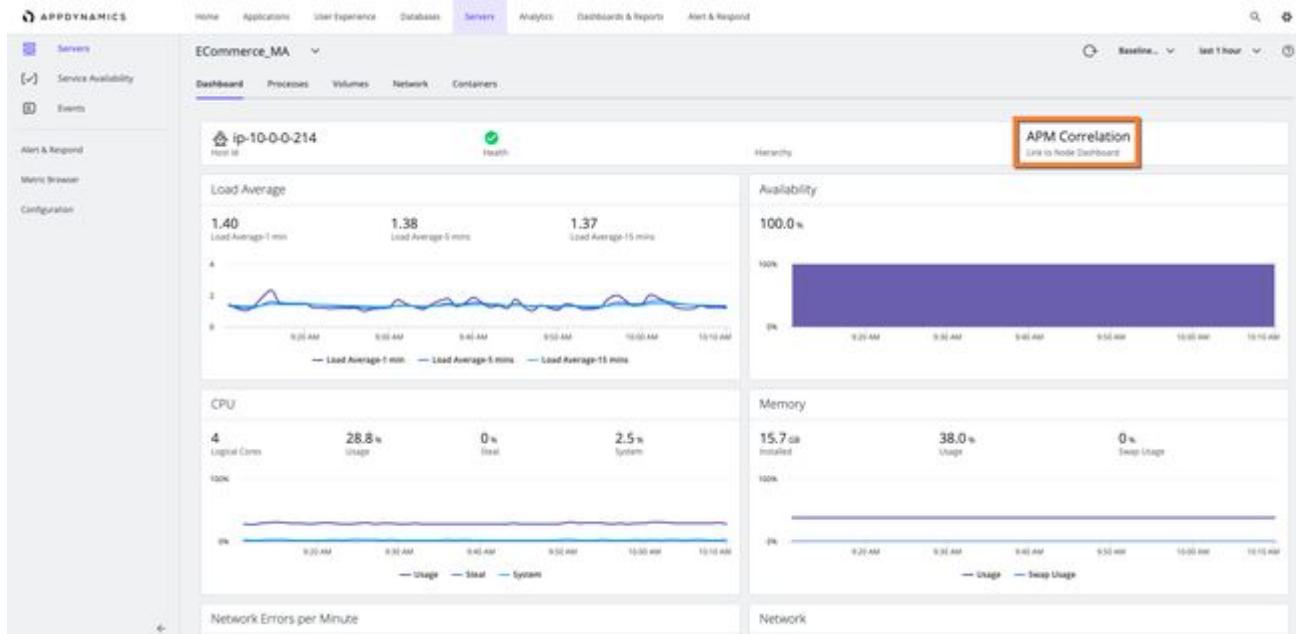

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

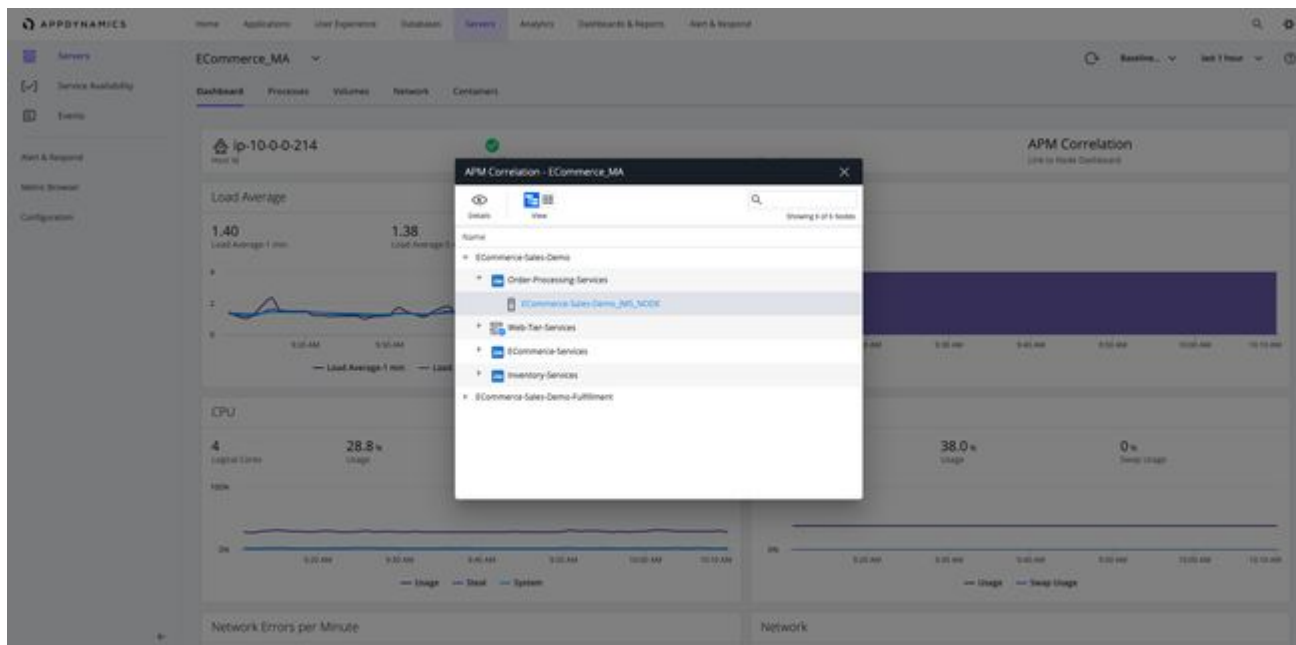

From the snapshot Server tab, you can review **CPU**, **Memory**, and **Network** utilization, and determine which processes are consuming server resources.

From the Servers Dashboard tab, select **APM Correlation**.

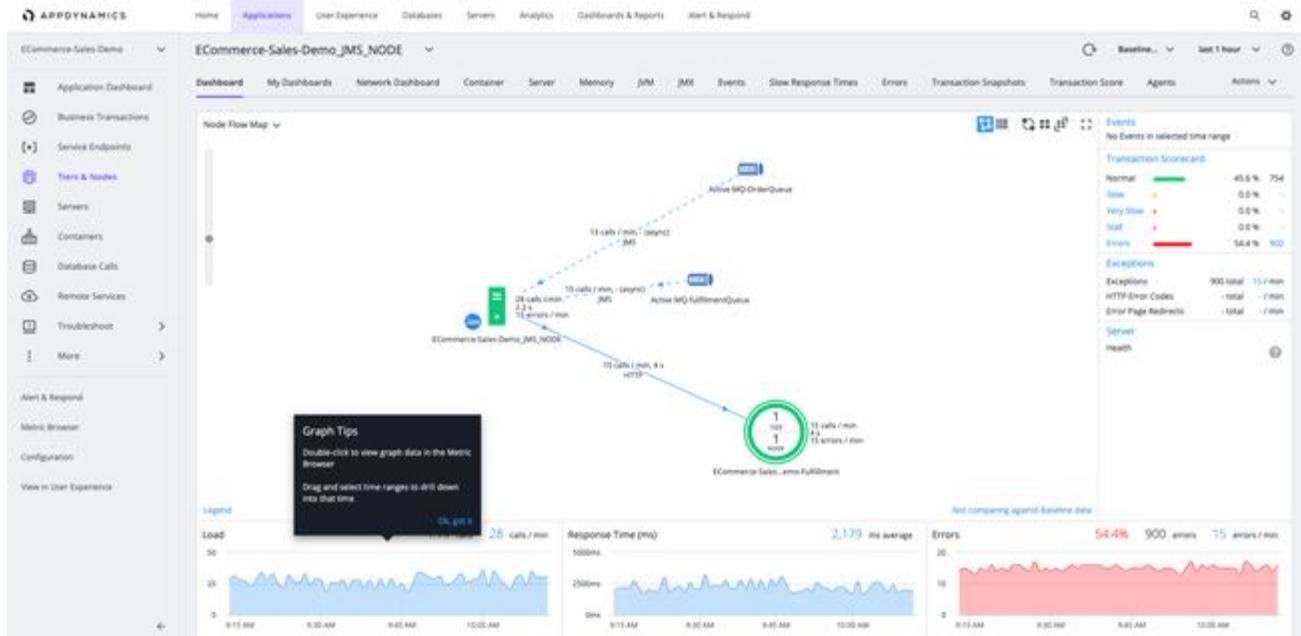

Select the **APM Correlation** link to review the APM node associated with the server. If there is more than one APM node running on the server, a dialog displays enabling you to select the APM node you want.

By selecting the APM node, its associated **Dashboard** displays.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Dynamic Monitoring Mode and Server Visibility

You can selectively control the number of metrics reported by individual Machine Agents (including Server Visibility Agents). Rather than have all Agents report all the metrics all the time, you can configure individual Agents to collect metrics.

- Key Performance Indicator metrics only (*KPI mode*)
- KPI and Diagnostic metrics (*Diagnostic mode*)
- All available metrics (*Advanced Diagnostic mode*)

This provides the flexibility to report KPI metrics on most machines, and then increase the metric level on specific servers for deeper visibility to diagnose problems. You can increase scalability on the Controller and conserve metric bandwidth on the network with no sacrifice in visibility.

Every Basic and Server Visibility metric has a default Dynamic Monitoring Mode (DMM) class: KPI, Diagnostic, and Advanced Diagnostic. See [Hardware Resources Metrics](#).

Important Notes

- You can disable DMM on individual Agents. When DMM is disabled on an Agent, that Agent will report all metrics regardless of whether DMM is enabled or disabled on the Controller. Disabling DMM on an Agent is recommended only for mission-critical servers and other machines for which you are sure you want to collect all metrics. See [Machine Agent Configuration Properties](#).
- If you switch the monitoring mode in the Controller from a more-inclusive to a less-inclusive mode, the Metric Browser will show values for the newly-excluded metrics for one hour after the switch. For example, if you switch from Diagnostic to KPI mode, for any Diagnostic metric, the Metric Browser will report a steady line (at 0 or the last-reported value) for one hour after the switch; then the line will disappear. This is standard behavior in the Metric Browser for an Agent when it stops reporting a specific metric.
- Each Machine Agent has a set of configurable settings that specify the volumes, networks, and processes to report and to ignore. For example, you can define a process allowlist (report on matching processes) and blacklist (ignore matching processes). An Agent will not report metrics for items excluded by its local settings, regardless of the monitoring mode. See [Machine Agent Settings for Server Visibility](#).
- If you have any custom health rules based on Diagnostic or Advanced Diagnostic metrics, DMM might cause these rules to generate "false-positive" alerts. (Standard, non-custom health rules are not affected.) If you have any health rules similar to this, edit the rule to use a KPI metric instead of the Diagnostic or Advanced Diagnostic metric.

Initial Setup

DMM is enabled by default. To configure DMM:

1. Log in to the Controller administration console using the `root` user password. See [Access the Administration Console](#).

```
http://<controller host>:<port>/controller/admin.jsp
```

2. Set these options:
 - a. `sim.machines.dmm.defaultMode = KPI` (Sets the default mode to KPI on all Machine Agents)
 - b. `sim.machines.dmm.dmmAllowed = true` (Enables Dynamic Monitoring Mode on the Controller)
3. For servers that require additional visibility, increase the monitoring mode to **Diagnostic** or **Advanced Diagnostic**. To change the monitoring mode of one or more agents:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- a. Log in to the Controller UI.
- b. Click **Servers**.
- c. In the **Servers** table, check the box next to one or more servers whose monitoring mode you want to change.
- d. Right-click the server and select **Set DMM Mode**. A dialog box appears.
- e. Select the desired monitoring mode.
- f. Click **Save**.

Workflow Example

After you complete the initial setup, you can set the Dynamic Monitoring Mode on individual Machine Agents as required. The following is a workflow example:

- The DevOps team for a large enterprise monitors its IT infrastructure using Machine Agents (1,000-plus Agents monitoring servers in hundreds of locations). All Agents are initially set to KPI mode.
- One Agent reports a lot of disk read/write operations (KPI metric) on critical-server-A.
- Set the Agent DMM on critical-server-A to **Diagnostic**.
- Monitor the amount of data read and written for the entire disk, and for each partition (Diagnostic metrics), on critical-server-A.
- If the Diagnostic metrics do not indicate the source of the problem, and further investigation is needed, set the agent DMM to **Advanced Diagnostic**.
- Monitor average queue times and read/write times for each partition (Advanced Diagnostic metrics) on critical-server-A.
- When advanced diagnostics are no longer required on critical-server-A, set the agent DMM back to **KPI**.

Tier Metric Correlator

The Tier Metric Correlator enables you to identify load and performance anomalies across all nodes in a tier. Suppose you have a tier composed of a cluster of nodes running on containers or servers. You expect all the nodes to behave exactly the same under the same load conditions. How can you monitor this cluster for anomalies and outliers? You can use the Tier Metric Correlator to answer the following questions:

- Are all the nodes behaving within the expected band of performance, or do some nodes have outliers (slow calls, stalls, and errors)?
- In what time windows, and on which nodes, are these outliers occurring?
- Are outliers associated with a specific node cluster—for example, a cluster running a canary release?
- Are any resource issues (such as high CPU I/O or paging) correlated with these outliers?
- Are calls getting distributed evenly across all nodes in the tier?

This page describes two [example use cases](#):

- Use Tier Metric Correlation to quickly identify balances and imbalances in the distribution of calls across all nodes in a tier.
- Use Tier Metric Correlation to monitor and troubleshoot a canary deployment scenario. This example shows how you can easily compare performance across node clusters, identify nodes with transaction outliers, and determine if any resource issues are causing these outliers.

Key Concepts

Transaction Outliers

The first step in metric correlation is to determine the *transaction outliers* for a tier: the number of Slow Calls, Very Slow Calls, and Stalled Calls whose response times are significantly outside the norm for that tier. The Transaction Outliers Heatmap visualizes the rate of these outliers and their distribution across all nodes in the tier.

A heatmap is a time-series chart with an extra dimension: the color intensity of each bar shows the distribution of outliers across all nodes. The darker the hue, the more nodes have outliers. The chart colors the bars in shades of gray (fewer outliers) and orange (more outliers).

Heatmaps enable you to easily identify the normal bands of performance and any outliers for all nodes in a tier. In this example, all nodes fall within two bands:

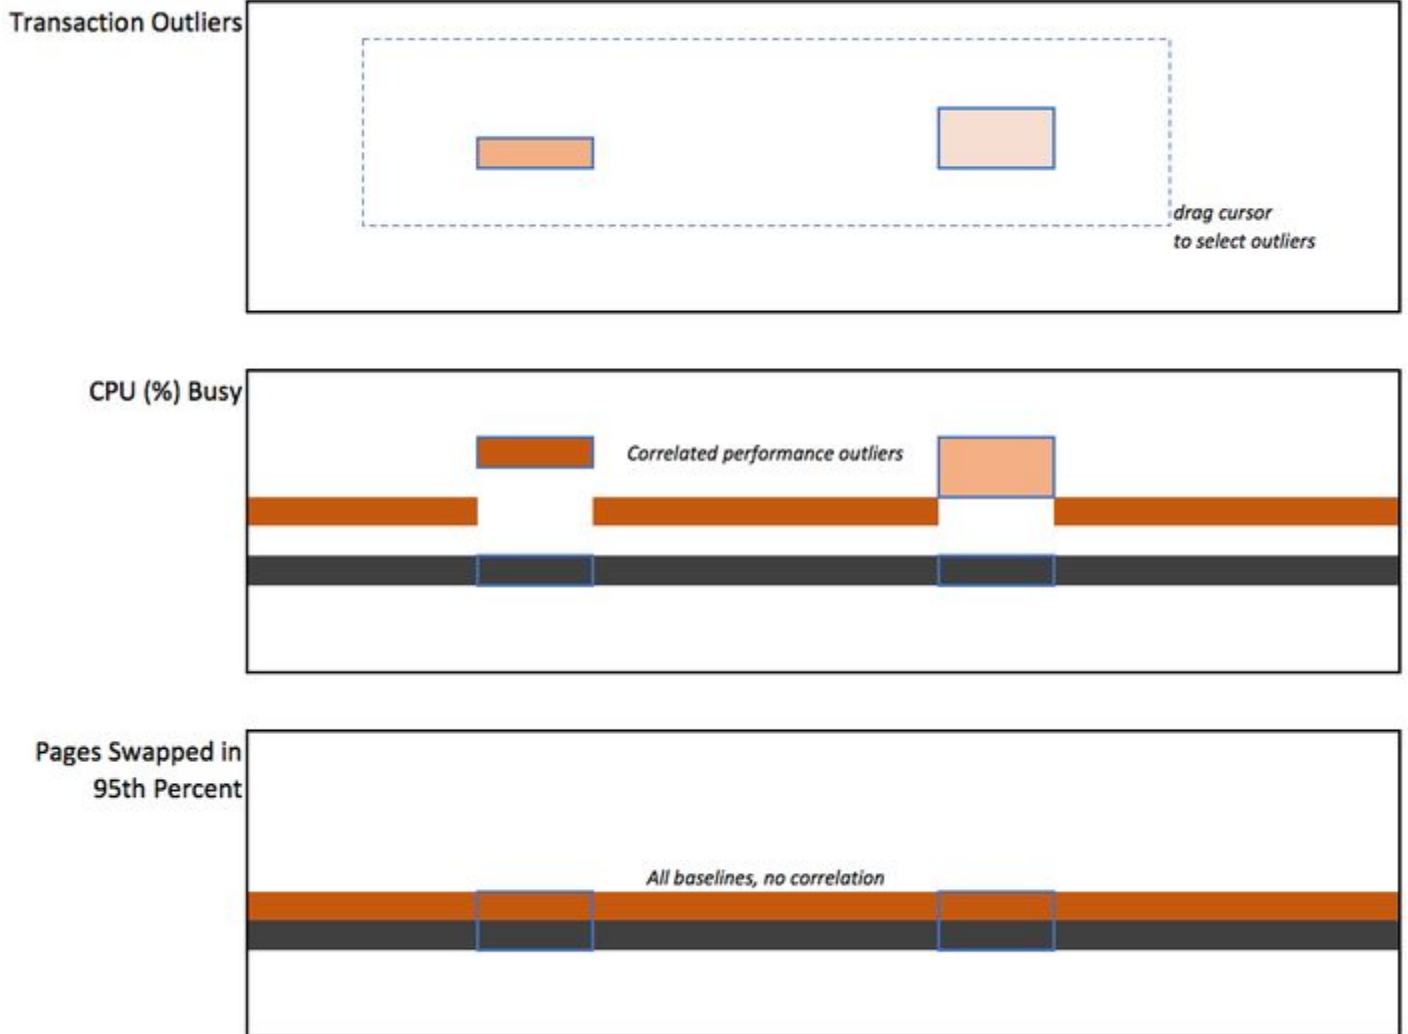

This heatmap highlights two time windows where the performance metric is noticeably higher for 50% of the nodes:

Correlated Metrics

The Correlated Metrics heatmaps enable you to correlate transaction outliers with specific resource metrics. The Correlate Metrics panel enables you to easily identify performance metrics that correlate (and do not correlate) with transaction outliers of interest. This example shows three heatmaps:

1. Transaction outliers
2. Correlated metric
3. Uncorrelated metric (no outliers)

Troubleshooting Nodes and Servers

When you select a set of transaction outliers, the Selected Nodes and Impacted Servers charts show the distribution of these outliers across all nodes in the tier. This makes it easy to determine if these outliers are associated with specific node clusters. Double-click a pie chart to troubleshoot the node or server.

Selected Nodes

Impacted Servers

Example Use Cases

Comparing Load Distributions

In this example, a DevOps engineer wants to ensure that transaction calls are getting distributed evenly to all the nodes in a tier. The engineer accesses the **Tiers & Nodes** view, right-clicks a tier, and selects **Correlate Metrics**. Looking at the Calls Per Minute heatmap, the engineer can immediately see that the band of performance is 20-22 calls per minute, but for some nodes, the rate is higher during certain intervals. The engineer decides to investigate the relevant load balancer and finds that a simple misconfiguration is causing the device to distribute calls unevenly at certain times. Using heatmaps, they can identify and fix a minor issue before it has a significant impact on their team's mission-critical applications.

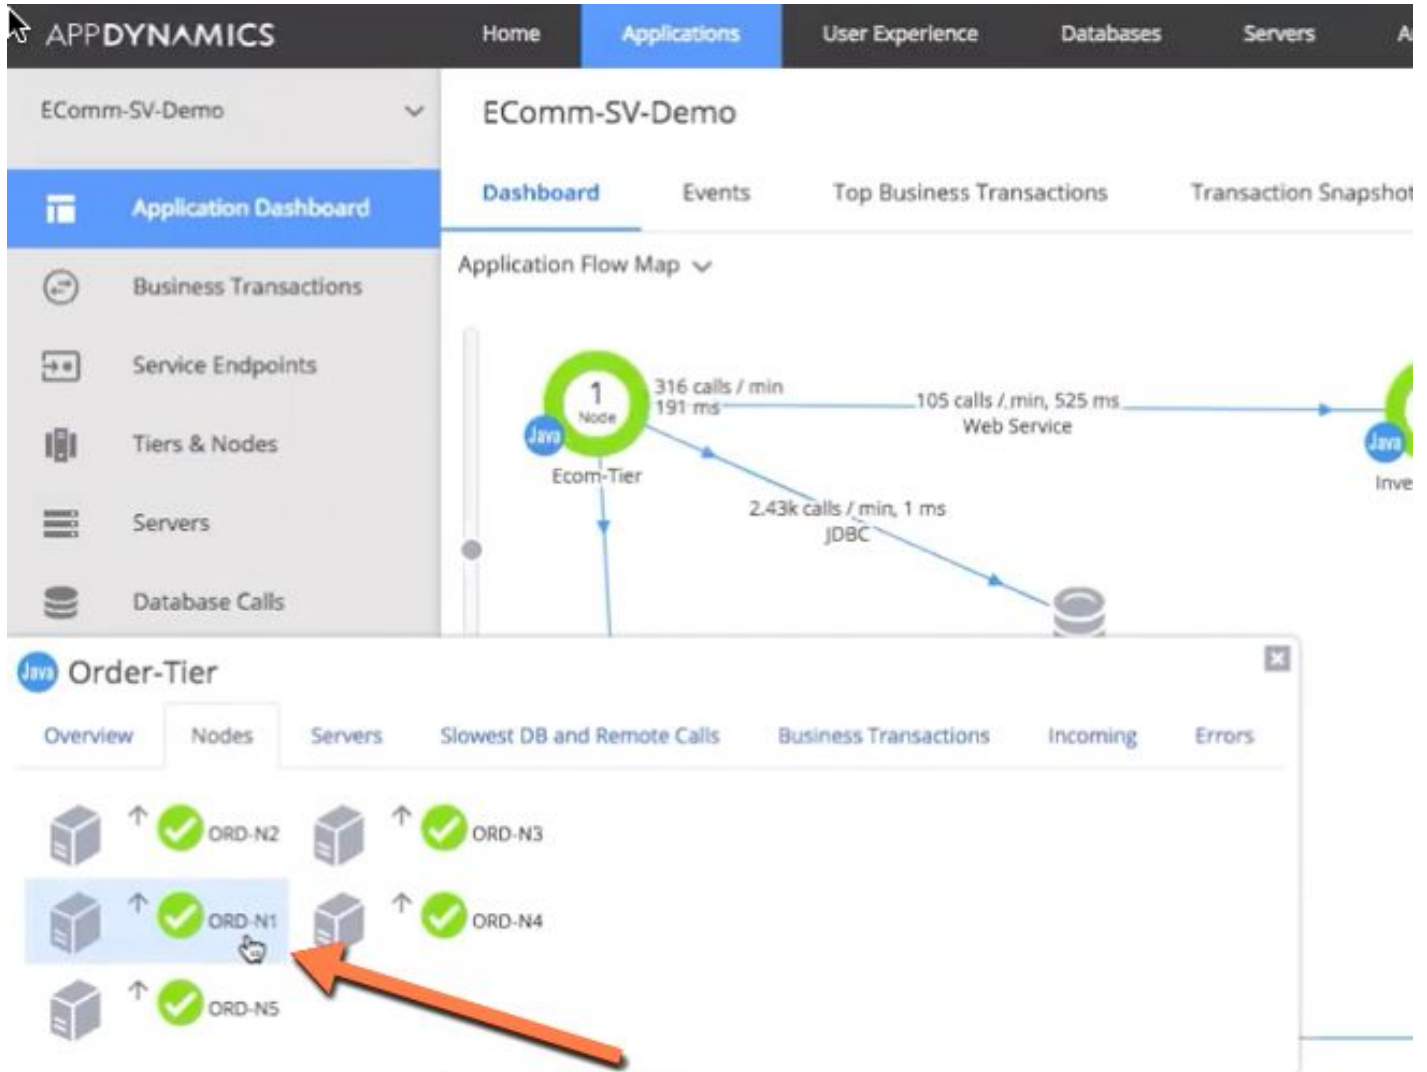

Calls Per Minute

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

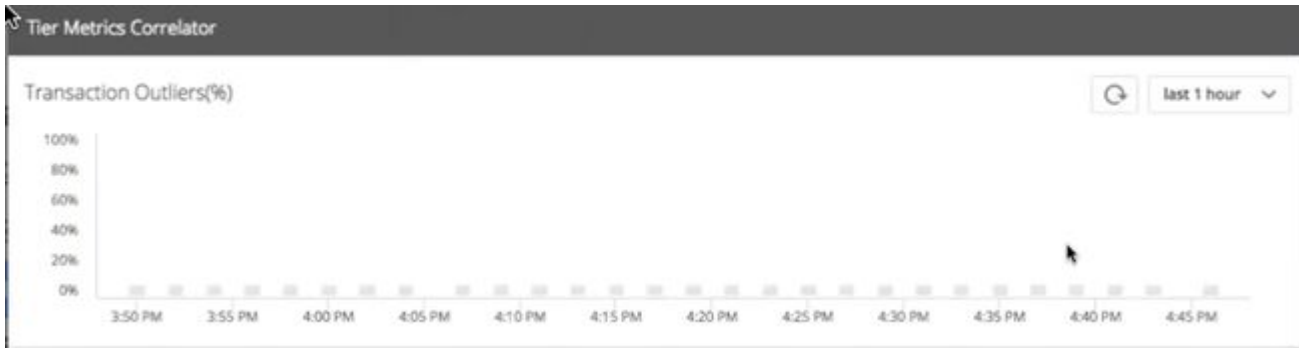

Canary Deployment Testing

A DevOps engineer is responsible for a four-tier e-commerce application. The Order-Tier has five nodes running version 1.0 of the service. The engineer deploys a "canary" (version 1.1 of the service) on one node. Before the engineer deploys 1.1 on all nodes, they want to determine if there is any performance degradation on this node.

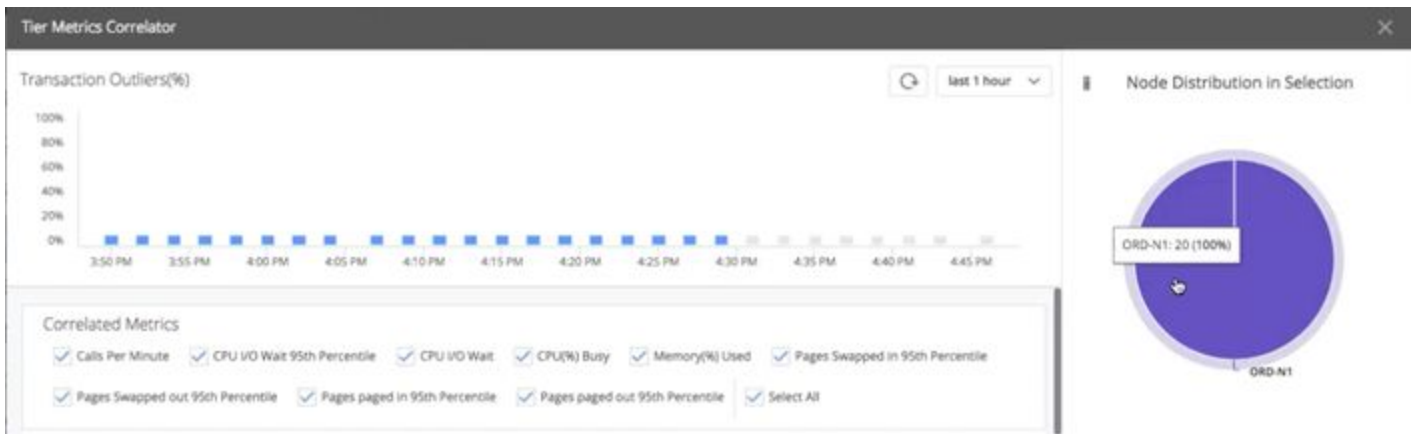

The engineer opens the Controller, accesses the **Tiers & Nodes** view for the application of interest, right-clicks the Order-Tier, and selects **Correlate Metrics**. The Tier Metric Correlator displays.

The [Transaction Outliers heatmap](#) shows that some calls are outliers: Errors, Slow Calls, Very Slow Calls, or Stalled Calls whose response times are significantly higher than the band of performance for that tier.

The first question is: *Are these outliers associated with our "canary node" (ORD-N1)?* The engineer drag-selects a set of these outliers. The **Node Distribution in Selection** pie chart (right) shows that all outliers are associated with the canary node. Clearly, the new code is not performing as well as the old code.

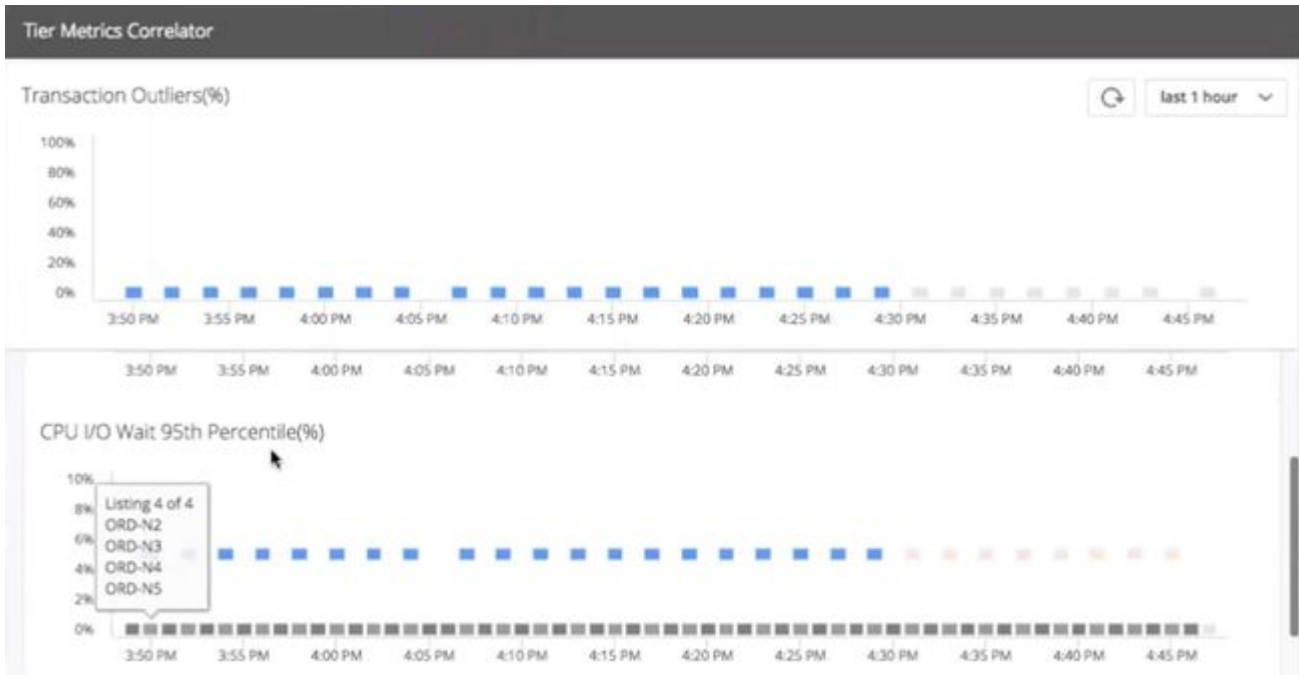

The next question is: *Are any resource issues causing these outliers?* The engineer examines the [Correlated Metrics](#) heatmaps to look for metrics that correlate with the outliers on the canary node. Most heatmaps show no correlation. For example, **CPU Busy%** shows that all nodes stay within the band of performance of 0-20%.

However, the CPU I/O Wait 95th Percentile(%) heatmap shows a strong correlation: All the metric outliers occur on the canary node, while all other nodes remain within the band of performance.

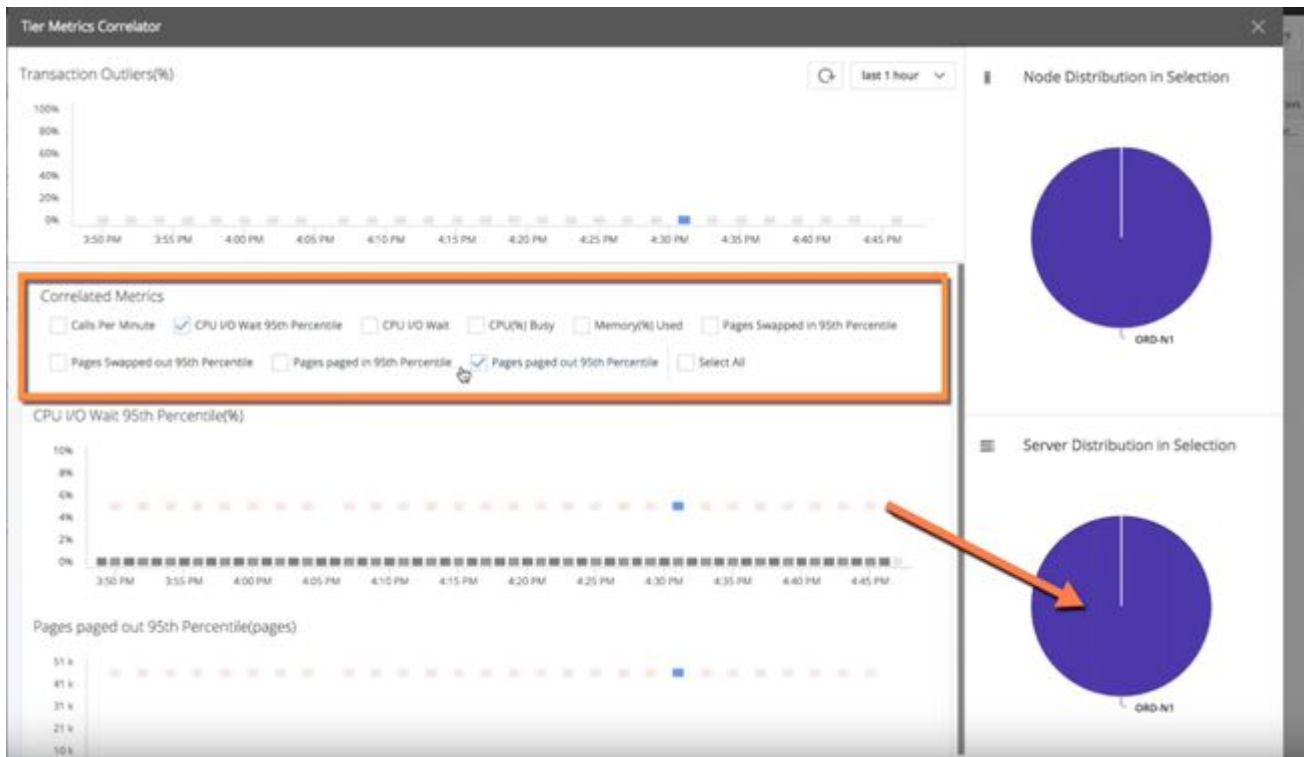

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

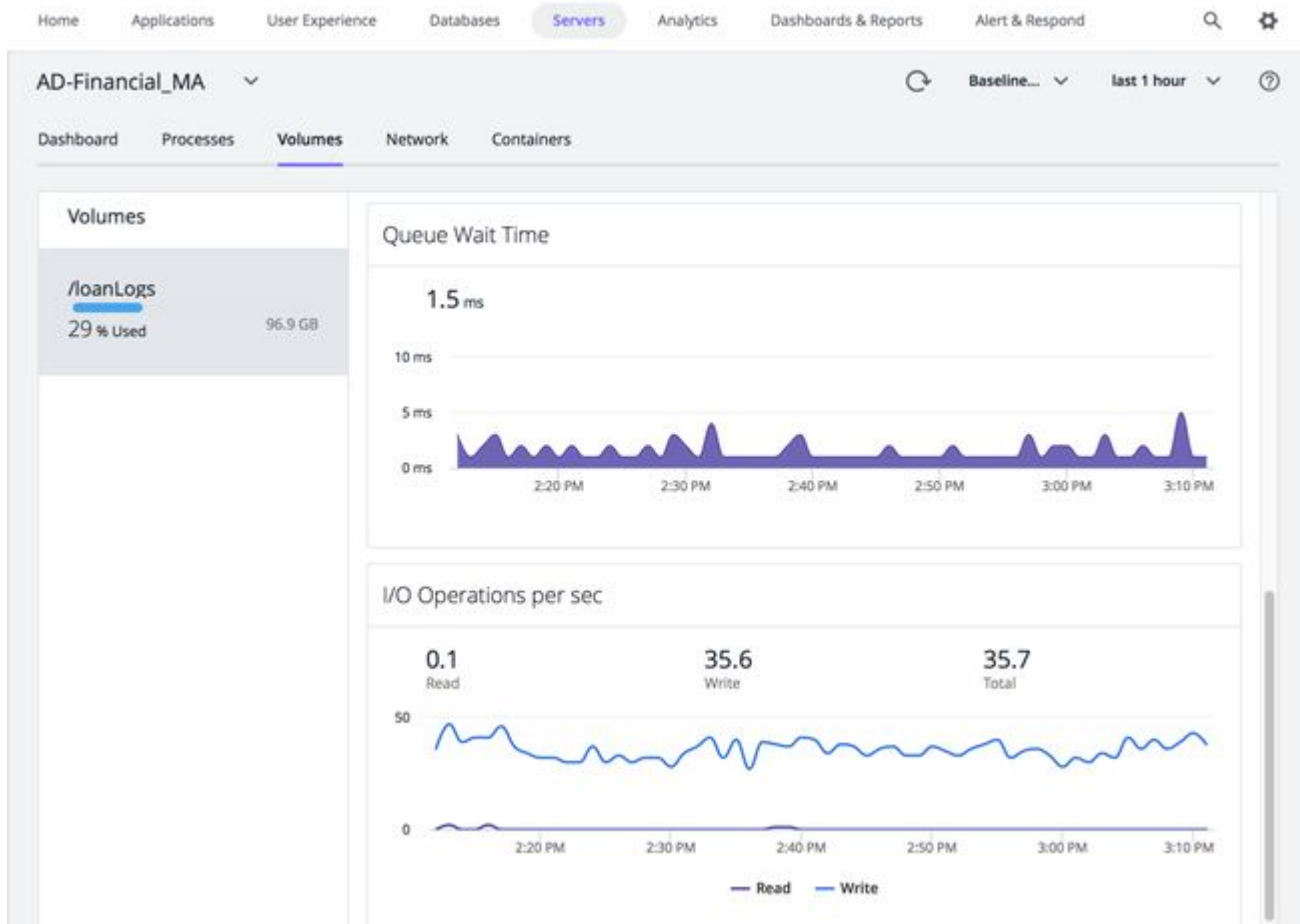

The **Pages paged out 95th Percentile (pages)** heatmap also shows a strong correlation with the transaction outliers on the canary node. With just a few clicks, they can immediately see that the canary node is performing worse; that the node has a CPU I/O problem; and that the CPU I/O problem is related to paging, which indicates a disk problem.

To reduce the visual noise and highlight the correlations, the engineer unchecks all the uncorrelated metrics. The next step is to investigate and troubleshoot the underlying server. To drill down into the canary node, they double-click on the **Server Distribution in Selection** pie chart (bottom right).

The Server Dashboard for the canary node displays. The engineer selects the Volumes tab and sees many spikes in I/O operations and queue wait times. They decide that the canary code is not ready to deploy to the entire tier, and need to re-examine the canary code, fix the regression, and re-test.

Enabling Tier Metric Correlation

You enable Tier Metric Correlation per account on the Controller. If you are using a SaaS Controller, contact [AppDynamics Support](#). If you are using an on-premises Controller:

1. Log in to the Controller administration console using the `root` user password:
`http://<controller host>:<port>/controller/admin.jsp`
2. Access the Accounts page, and select the account for which you want to enable this feature.
3. Select **Add Property** in the accounting settings and add:
`ENABLE_SIM_HEATMAPS = true`

To correlate percentile metrics, you must enable percentile metric reporting on both the Controller and the Machine Agent. By default, reporting is *disabled* on the Controller and *enabled* on the Agent.

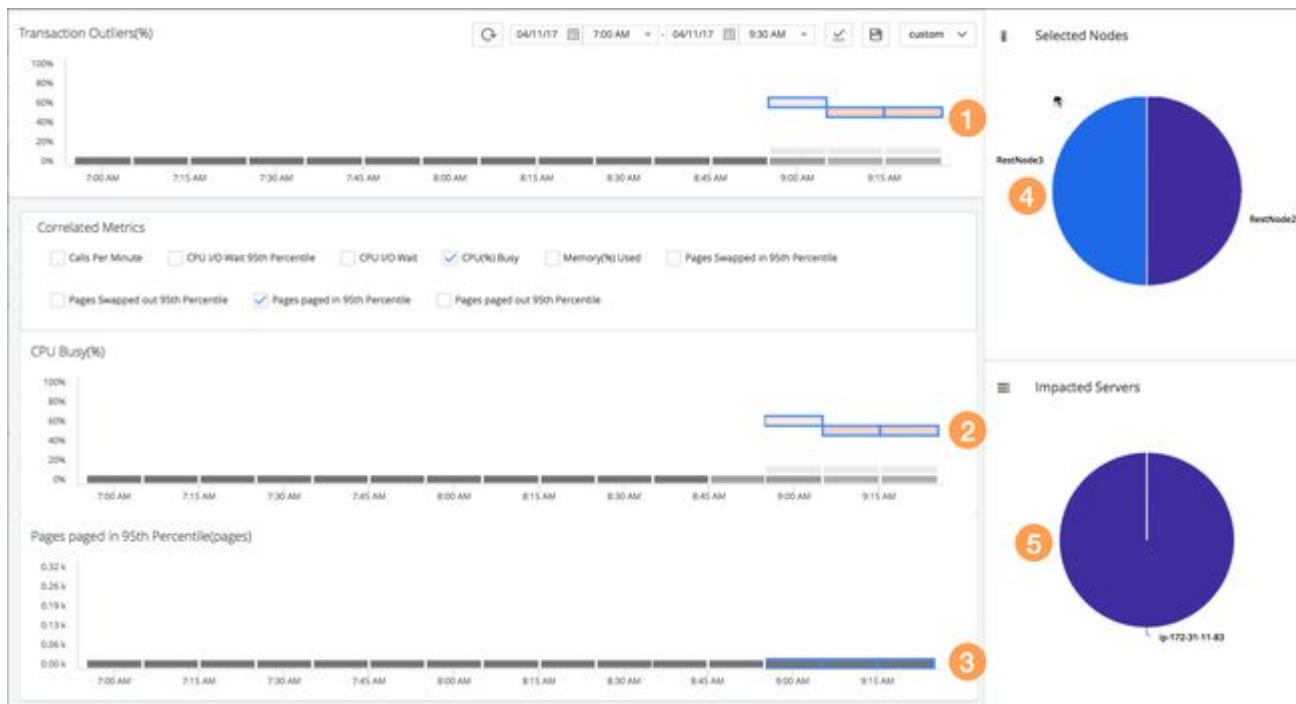

- To enable/disable reporting on the Controller, log in to the Controller administration console and set the `sim.machines.percentile.percentileMonitoringAllowed` property. See [Controller Settings for Machine Agents](#)

- To enable/disable reporting on the Agent, open the `<machine_agent_home>/extensions/ServerMonitoring/conf/ServerMonitoring.yml` file and set the `percentileEnabled` property. See [Machine Agent Settings for Server Visibility](#)

Workflow Description

These steps outline the workflow description:

- Access the **Tiers & Nodes** view for the application of interest.
- Right-click the tier and select **Correlate Metrics**. The Tier Metric Correlator displays.
- Identify **transaction outliers** **1** for the tier – calls flagged as Slow, Very Slow, Stalls, or Errors (see [Business Transaction Performance](#)).
- Drag the cursor to select the outliers of interest. The pie charts on the right show the distribution of these outliers by node and server.
- Identify any **correlated metrics** **2** for the outliers. Unselect checkboxes for non-correlated metrics **3**.
- Identify and troubleshoot the nodes **4** and servers **5** where the outliers are occurring. Double-click a pie slice to open the dashboard view. You can use the correlated metrics to guide your troubleshooting.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Service Availability Monitoring

 Effective immediately, AppDynamics is ending support for Service Availability Monitoring. Customers who have never purchased SAM will no longer be able to do so. Renewals and additional licenses by existing customers of SAM that are purchased before June 2021, for a one-year term only, are permitted. All existing users of SAM can continue to use it. See [Support Advisory: Service Availability Monitoring End of Life \(EOL\) Notice](#).

To access Service Availability Monitoring, select **AppDynamics Home > Servers > Service Availability** (left navigation menu).

The Service Availability Monitoring feature of Server Visibility enables you to monitor internal or external HTTP and HTTPS services. You configure service monitoring from the Controller UI. After you configure monitoring for a service, Service Availability Monitoring evaluates the service:

- The Agent evaluates each response, based on your specified violation rules, and flags each response as failed (rule violation) or successful (no violation).
- The service monitor maintains a rolling buffer of evaluated responses. This buffer has a configurable window size (number of evaluated responses), success threshold (number of successful responses), and failure ratio (number of failed responses).
- The monitor collects evaluated responses until the response buffer is full. Then, it evaluates the service as:
 - NORMAL - Successful responses are greater than or equal to the success threshold.
 - CRITICAL - Failed responses are greater than or equal to the failure threshold.
- When the buffer is full, the monitor re-evaluates the service every time it evaluates a new response.

For example, with the following values:

- Success threshold = 3
- Failure threshold = 1
- Results window size = 5

The Agent waits until five check results are received, and from these five results, if there is one failure, then the target state is CRITICAL. If there are at least three successful results, then the target state is NORMAL.

Licensing and System Requirements

Service Availability Monitoring requires a separate license and a Server Visibility license. Server Visibility is currently available for Linux, Windows, and Solaris. See [Observe License Usage](#) and [Server Visibility Requirements and Supported Environments](#)

Viewing the Monitored Services

You can view the monitored services in the Monitored Services list. The state is determined by evaluating the Response Validators during the results window. Response Validators are rules you configure that are used to evaluate against the responses received from the service.

The possible states are:

- NORMAL - The number of successful responses in the result window is greater than or equal to the configured success threshold.
- CRITICAL - The number of failed responses in the result window is greater than or equal to the configured failed threshold.
- UNKNOWN - If the Machine Agent does not provide any data.

Monitored Services List

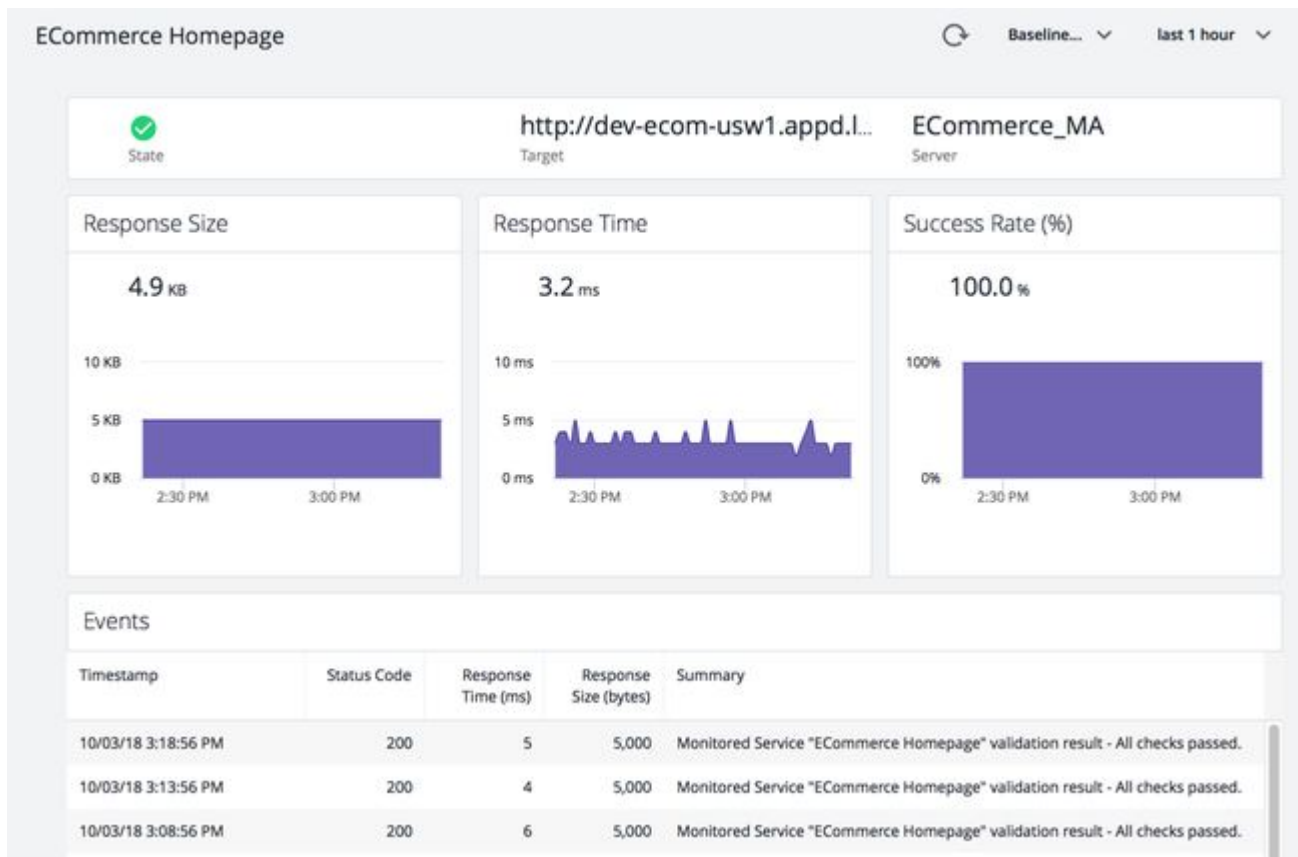

From the top navigation bar, select **Servers > Service Availability** to view a list of monitored services. Use the action toolbar to manage your monitored services by adding new ones, viewing details, and so on.

The screenshot shows the 'Service Availability' dashboard. At the top, there is a search bar and a refresh button. Below the search bar is an action toolbar with icons for Details, Add, Edit, Delete, Copy, and View Options. The main content is a table with the following data:

Monitored Service ↑	Server	State	Success Rate (%)	Response Time (ms)	Response Size (bytes)
ECommerce Homepage	ECommerce_MA	✓	100.0	3	5.0k
ECommerce Marketing Landing Page	ECommerce_MA	✗	0.0	2	1.5k

Monitored Service Details

Select a monitored service, and double-click to view the associated details.

Configure Service Availability

By default, configuration changes take effect within at least two minutes of the change, so you do not need to restart the Machine Agent after changing the configuration. If the protocol, target, or method of a service are changed once a service is created, the state of the service is set to UNKNOWN and is re-evaluated with the new configuration.

 To configure this feature, users need the *Configure Server Visibility* permission. See [Server Visibility Permissions](#).

To access the configuration panel:

1. From the Controller top navigation bar, select **Servers > Service Availability**.
A list of monitored services display, if any are configured.
2. To add a service, select **Add**.
The Add Service Monitoring Configuration panel displays with three tabs.

3. From the Main tab, specify the required fields and save the configuration. Each field has an associated tooltip that provides help. See [Main Configuration Panel](#).
4. From the Request Configuration tab, specify your request headers. See [Request Configuration](#)
5. From the Response Validators tab, configure your validation rules. See [Response Validators](#)

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Main Configuration Panel

Field	Description	Default	Required
Name	Your name for this target configuration. This name displays in the Service Availability list.	N/A	Yes
Target	The resource to be monitored, for example, http://myThirdPartyService.com/data . Specify which HTTP method to use to send the request (GET , POST , HEAD)	N/A	Yes
Server	Name of the Machine Agent performing the monitoring. Only servers that are enabled for Server Visibility display in the dropdown.	N/A	Yes
Socket Timeout	How long to wait, in milliseconds, after a successful connection for a complete HTTP response.	30000	Yes
Success threshold	Number of required successes within the results panel for a NORMAL state.	3	Yes
Check Interval	Interval time in between checks in seconds. <div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;"> <p>i Setting this interval to more than 60 seconds will result in visible gaps in the metric graphs for monitored services.</p> </div>	10	Yes
Results Window Size	Number of most recent results to use in determining the state of the service.	5	Yes
Connect Timeout	How long to wait (in ms) for the service to respond to a connection request.	30000	Yes
Failure threshold	Number of required failures within the result window for a CRITICAL state.	1	Yes

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Field	Description	Default	Required
Max response size	Maximum response size to collect in bytes.	5000	Yes
Follow redirects	Deprecated. Follow redirect to determine the state of service.	No	No

Restricted Addresses

By default, these addresses are restricted:

- Loop back address: localhost, 127.0.0.1, ::1(IPv6)
- Site local address: 192.168.0.0/16, 10.0.0.0/8, 172.16.0.0/12, fec0::/8(IPv6)
- Link local address: 169.254.0.1 - 169.254.255.254, fe80::/10(IPv6)
- Any local address: 0.0.0.0, ::(IPv6)
- Multicast address: 224.0.0.0/4(224.0.0.0 to 239.255.255.255), ff00::/8(IPv6)

Request Configuration

You can define a list of customized headers to send with requests. For example, the list can mimic desktop or mobile browsers. You can also define a request body for POST requests. You can specify an "Authorization" header", if credentials are required.

Protocol	Field	Value Type	Default	Description
HTTP	header name and value pair	String	empty	Customized header to send with requests.
	body	String	empty	Any data to send with the request. Usually used for POST.

Response Validators

You can provide a list of rules for the Machine Agent to use to validate the health of a monitored service. If any rule is violated, the response is considered failed.

For each rule you can specify:

- HTTP property
- operator
- value

The list of operators varies depending on the property selected in the first dropdown.

Monitoring the Service Health

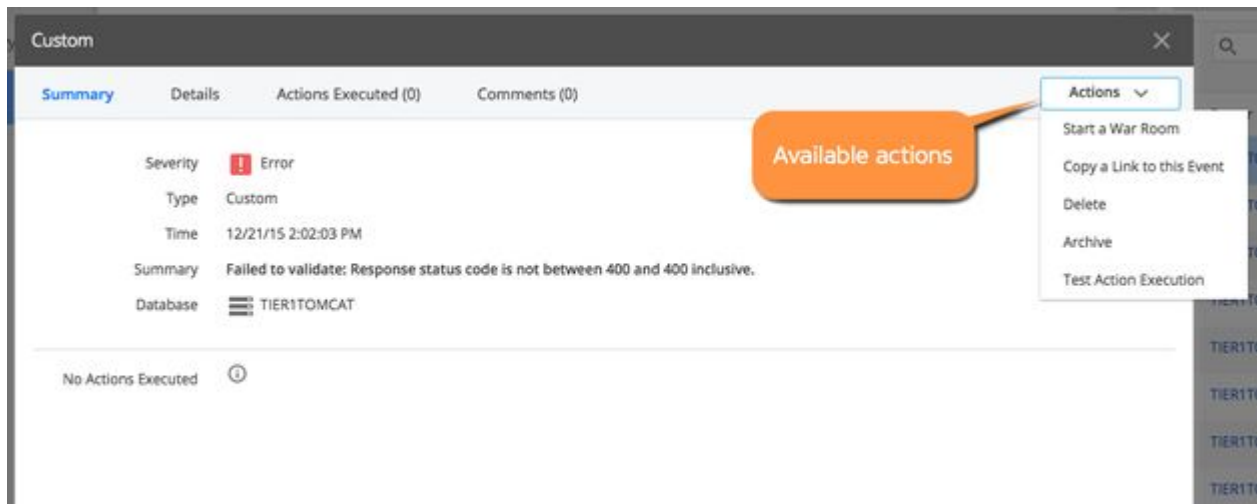

An event is sent to the Controller for every state change and periodically (by default every 5 minutes). You can change the update interval by setting the `System` property:

`appdynamics.machine.agent.sam.event.updateIntervalMillis`. See [Configuration Property Reference](#)

The events are visible from the Monitored Service details panel and from the Server Visibility Events list.

Type	Summary	Time ↓	Subgroups	Server	Act...
Health Rule Violation ...	Health Rule Machine Availability is too lo...	10/03/18 3:30:55 PM	-	accountMan...	-
Health Rule Violation ...	Health Rule Machine Availability is too lo...	10/03/18 3:30:55 PM	-	ECommerce...	-
Health Rule Violation ...	Health Rule Machine Availability is too lo...	10/03/18 3:30:55 PM	-	Inventory-N...	-
Health Rule Violation ...	Health Rule Machine Availability is too lo...	10/03/18 3:30:55 PM	-	biq-mt-saas...	-

Double-click the event to review details.

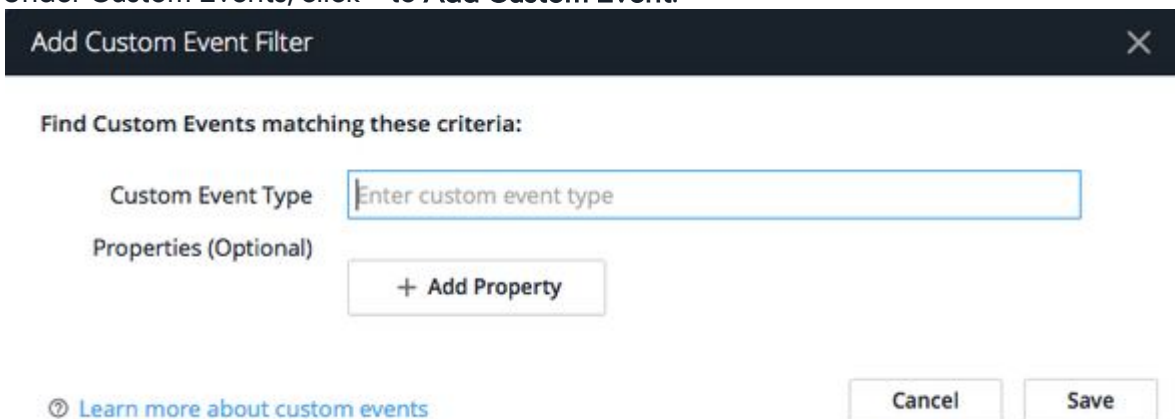

The event properties are as follows:

- Category: CUSTOM
- Event Type: Service Availability
- Property: severity Values can be ERROR (failure) or INFO (passing).

Configuring Alerts

To create alerts for your monitored services:

1. From the Servers panel, select **Alert & Respond**.
2. Select **Policies**.
3. Select **Create Policy Manually**.
If policies already exist, you may not see this option. Click + to add a policy manually.
4. Under Custom Events, click + to **Add Custom Event**.

5. In the Actions section of the Policy panel, add the action you want to execute if the policy violates and save the policy.

Server Visibility Events

To access Server Visibility Events, from the top navigation bar > **Servers > Events**.

You can view Machine Agent events on the Server Events list, and on the Application Events list for applications associated with the Machine Agent. See [Monitor Events](#).

Machine Agent events include:

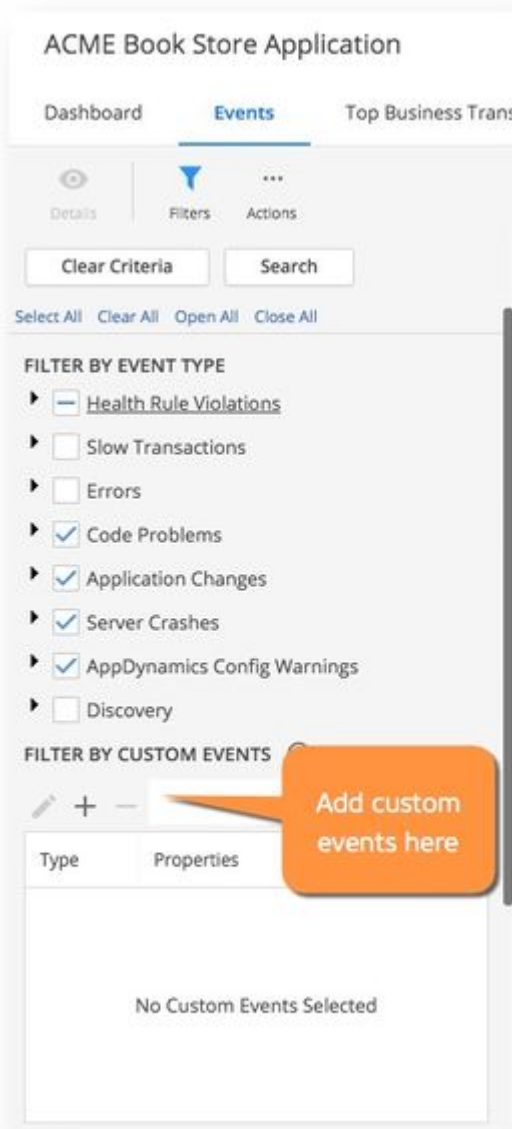

- [Custom Events](#)
- [Agent Internal Diagnostic Events](#)

Custom Events

Custom events include events generated by the extensions, and Service Availability Monitoring events. Service Availability Monitoring events are custom events that are sent to the Controller periodically, and for every state change in the service's health.

Events triggered by extensions are custom events and also display on the **Servers > Events** list.

To view custom events in the application Events list, you can add them to the event list filters.

Agent Internal Diagnostic Events

AGENT_DIAGNOSTICS

- Description – Diagnostic information concerning Agent activity, such as resetting a Machine Agent. The reset functionality is available for pre-4.2 version Machine Agents only.
- Category – AppDynamics Internal Diagnostics
- Name – `EventMessage.MACHINE_AGENT_RESET_SUCCEEDED`

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Machine Agent Settings for Server Visibility

You can modify the default configuration for Server Visibility. This page describes the configurable settings and their default values.

Edit this configuration file: `<machine-agent-home>/extensions/ServerMonitoring/conf/ServerMonitoring.yml`

Edit YML Files

When editing YML files:

- If you make any changes to `ServerMonitoring.yml`, or to any other `YML` file, make sure that the modified file meets standard `YML` syntax rules.
- Follow these important `YML` good practices:
 - Do not include any tab characters. Use whitespace characters only to indent fields.
 - Use the exact same number of whitespace characters to indent entries that are on the same level.
 - Use a plain-text editor, not a WYSIWIG editor, to edit the file. Use a monowidth/monospaced font to view the contents.
 - Always save using UTF-8 encoding.
 - Test and verify the edited file using an online `YML` syntax tester.
- The safest way to edit a setting in a `YML` file is to:
 - Copy the line you want to edit, and paste the copy into a new line. Make sure that you select, copy, and paste the entire line.
 - Comment out the original line and edit the copy, as desired.
- To add or edit a regular expression in this file, you should test and verify the regular expression using an online regex tester.
- Before you make any changes to this file, review the option descriptions on this page, and the comments in the file, carefully before you change a setting.
- The Agent updates dynamically in response to Agent configuration property changes, so you do not need to restart the Agent after you update this file.

Configurable Server Visibility Settings

Setting	Description
<code>basicEnabled</code>	<p>Indicates whether the Machine Agent should report the basic metrics through the SIM extension. Set this to <code>false</code> to use Sigar to report basic metrics. This setting only affects monitoring on Linux.</p> <p>Default = <code>true</code></p>

Setting	Description
<code>volumeMonitorConfig:</code> <code>maxNumberVolumes</code>	<p>Do not report more than N volumes, where $N = \text{maxNumberVolumes}$.</p> <p>Default = 5</p> <div style="border: 1px solid red; background-color: #ffe6e6; padding: 5px;"> <p>! Changing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can process the increased resource requirements.</p> </div>
<code>volumeMonitorConfig:</code> <code>whitelistSelectorRegex</code>	<p>Volumes with names that match this regular expression are always reported, up to the maximum specified by <code>maxNumberVolumes</code>.</p> <p>Default = ""</p>
<code>volumeMonitorConfig:</code> <code>blacklistSelectorRegex</code>	<p>Volumes with names that match this regular expression are excluded. This setting is useful for filtering out irrelevant metrics.</p> <p>If a volume name matches both the blacklist and whitelist regexes, metrics for that network are reported (the whitelist takes priority) up to the maximum specified by <code>maxNumberVolumes</code>.</p> <p>The default <code>ServerMonitoring.yml</code> file does not include a <code>blacklistSelectorRegex</code> field for volumes. If you want to add one, use the same indentation and formatting as the <code>volumeMonitorConfig:whitelistSelectorRegex</code> field.</p>
<code>volumeMonitorConfig:</code> <code>samplingInterval</code>	<p>Specifies a custom sampling interval for collecting volume metrics on Linux.</p> <p>Default = 3000</p>

Setting	Description
<p>networkMonitorConfig: maxNumberNetworks</p>	<p>Do not report more than N networks, where $N =$ <code>maxNumberNetworks</code> .</p> <p>Default = 5</p> <div style="border: 1px solid red; background-color: #ffe6e6; padding: 5px;"> <p> Changing this setting can affect the resource consumption of your deployment. Before you increase this setting, verify that your application environment and Controller can handle the increased resource requirements.</p> </div>
<p>networkMonitorConfig: whitelistSelectorRegex</p>	<p>Networks with names that match this regular expression are always reported, up to the maximum specified by <code>maxNumberNetworks</code> .</p> <p>To report metrics for one or more virtual networks, specify a regex that matches the virtual network names.</p> <p>When collecting Process metrics on Solaris, the Machine Agent observes and captures only the first 80 characters of each process name and argument list. This means that the Agent considers only the first 80 characters of each process string when it applies whitelists.</p> <p>Default = ""</p>

Setting	Description
<p><code>networkMonitorConfig:</code></p> <p><code> blacklistSelectorRegex</code></p>	<p>Networks with names that match this regular expression are excluded. This setting is useful for filtering out irrelevant metrics.</p> <p>If a network name matches both the blacklist and whitelist regexes, metrics for that network are reported (the whitelist takes priority) up to the maximum specified by <code>maxNumberNetworks</code> .</p> <p>The default regex excludes virtual networks. To monitor a set of one or more virtual networks, edit <code>whitelistSelectorRegex</code> to include the networks of interest. To monitor all virtual networks, change the <code>blacklistSelectorRegex</code> to an empty string.</p> <p>When collecting Process metrics on Solaris, the Machine Agent observes and captures only the first 80 characters of each process name and argument list. This means that the Agent considers only the first 80 characters of each process string when it applies blacklists.</p> <p>Default = "<code>^veth.* ^vnet.*</code>"</p>
<p><code>defaultProcessClassSelector</code></p>	<p>The default "class selector" based on a <code>class_selector_regex</code> . If this regex is defined, and a match is found in the process command line, the class name is the first group occurrence of that regex in the command line.</p> <p>Default = ""</p>

Setting	Description
<p><code>processClassSelectorRegexList</code></p>	<p>A list of <code>class_name : regex</code> mappings. If the command line for a process matches <code>regex</code>, the metrics for that process are assigned to <code>class_name</code>. This setting is useful when you want to ensure that high-priority processes get reported, even if the number of defined classes is higher than the <code>maxNumberMonitoredClasses</code> setting.</p> <p>For example:</p> <pre>processMonitorConfig: processClassSelectorRegexList : machineAgentTasks: '.*java.*machineagent.*' controllerTasks: '.*java.*controller.*' nextOne: '.*svchost.*'</pre> <p>The Machine Agent assigns a process to a class as follows:</p> <ol style="list-style-type: none"> 1. Assign to the first match in <code>processClassSelectorRegexList</code>. 2. If there is no match for the <code>processClassSelectorRegexList</code> (step1), apply the <code>defaultProcessClassSelector</code> regex to the command line. 3. If there is no match for the <code>defaultProcessClassSelector</code> regex (step 2), use the process name (truncated if the name exceeds the <code>maxClassIdLength</code>). <p>These steps outline the recommended workflow for updating this list:</p> <ol style="list-style-type: none"> 1. The default <code>ServerMonitoring.yml</code> file includes an example that is commented out. If you are updating the default list for the first time, you should: <ol style="list-style-type: none"> a. Create a copy of the example. b. Uncomment the copy (remove the <code><!--</code> and <code>--></code> comment tags), and edit it as needed.

Setting	Description
	<ol style="list-style-type: none"> 2. Choose the process(es) that you want to monitor on the host machine. 3. Create a regex to match the process name(s) of interest. You should test the regex using an online regex validator. 4. Add the regex to the list. You should order the mappings by priority, highest to lowest. If a command line matches multiple regexes, the first match is used. 5. Save the <code>ServerMonitoringConfiguration.yml</code> file. 6. Wait 15 minutes or longer for the updated list to take effect, and then verify that the matching process(es) display in the Controller UI.
<code>samplingInterval</code>	Indicates how often to gather metric data. Units in milliseconds. Default = <code>30000</code> (30 seconds)
<code>maxClassIdLength</code>	Specifies the maximum process class name length. Any process class name that is longer than the specified maximum is truncated. The global maximum of the process class name is <code>100</code> . If this variable is set to be greater than <code>100</code> , then the process name is truncated at <code>100</code> . Default = <code>50</code>
<code>processSelectorRegex</code>	Contains a regular expression that specifies which processes should be monitored by the Machine Agent. The regular expression is compared against the full command line that was used to start the process. The default regular expression will filter out any processes where the command line ends with a close bracket (']'). For Linux, the process arguments could not be found, which usually indicates a kernel process. For Windows, no processes should end with a bracket character, so the regex should include all processes on Windows. Default = <code>""^.[^]]\$""</code>

Setting	Description
<code>minLiveTimeMillisBeforeMonitoring</code>	<p>Specifies the minimum amount of time a process must be alive before it is monitored by the Machine Agent. Use this to prevent the Machine Agent from being overloaded by monitoring short-lived processes. Units in milliseconds.</p> <p>Default = 60000 (60 seconds)</p>
<code>maxNumberMonitoredClasses</code>	<p>Specifies the maximum number of process classes that the Machine Agent monitors.</p> <p>The processes that are reported are using the highest CPU and memory that match the regex specified by <code>processSelectorRegex</code>.</p> <p>Default = 20</p> <div style="border: 1px solid red; background-color: #ffe6e6; padding: 5px; margin-top: 10px;"> <p>! Changing this setting can affect the resource consumption of your deployment. Before you change this setting verify your application environment and Controller can process the increased resource requirements.</p> </div>
<code>defaultDiskSectorSize</code>	<p>Specifies the default sector size (in bytes) for each disk if the Machine Agent cannot determine the sector size. This value is used to calculate the number of bytes read/written for the disk.</p> <p>Default = 512</p>
<code>memoryMonitorConfig</code>	<p>Specifies a custom sampling interval for collecting memory metrics on Linux.</p> <p>Default = 3000</p>
<code>cpusMonitorConfig</code>	<p>Specifies a custom sampling interval for collecting CPU metrics on Linux.</p> <p>Default = 3000</p>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Setting	Description
tag	<p>A list of user-defined tags for the individual server. Use these tags to query, filter, aggregate, and compare related servers. See Server Tagging</p> <p>Each tag is specified by a <code>key-value</code> pair. You can define tag names up to 127 unicode characters, and tag values up to 255 unicode characters. Define each key on a separate line. All key-value strings should be within single quotes. If a key has multiple values, delineate the list with commas:</p> <pre><key>: [<value>] tags: 'Location': ['NYC', 'Data Center', 'Server Room 7'] 'Environment': ['preProduction']</pre>

Docker Visibility Settings

See [Configure Docker Visibility](#).

Process Limits

These additional configurable settings are available in the Controller Admin UI:

- Total number of processes displayed in the UI for a single query is 5000 processes per call.
- Total number of processes tracked per account. The default value is 10000 processes per account.

See [Controller Settings for Server Visibility](#).

Configure Health Rules to Monitor Servers

You can configure Server Visibility to alert you when certain conditions are met or exceeded based on monitored server hardware metrics. If you are new to AppDynamics, the Getting Started Wizard can help you through the process. Alternatively, you can create alerting policies manually if you are already familiar with the process.

You configure [Configure Health Rules to Monitor Servers, Actions, Policies](#), and Email Digests for monitoring servers similar to how you would configure these for monitored applications, with some minor changes.

Health Rules

Default health rules based on several usage metrics are enabled for Server Visibility. You can modify these and set up your own health rules. Select **Alert & Respond > Health Rules** to view a list of the rules on the Controller.

Type	Name ↑	Enab...
	CPU Usage is too high Node Health - Hardware, JVM, CLR	
	Disk Usage is too high on at least one partition Node Health - Hardware, JVM, CLR	
	Machine Availability is too low Node Health - Hardware, JVM, CLR	
	Memory Usage is too high Node Health - Hardware, JVM, CLR	
	Overall Disk Space Available is too low Node Health - Hardware, JVM, CLR	
	Swap Usage is too high Node Health - Hardware, JVM, CLR	

From the Affects tab of the **Health Rule** wizard, you can choose to apply the Server Health Rule to:

- Subgroups (All or selected [subgroups](#))
- Machines
 - All machines in the active account
 - Machines within selected subgroups

- Selected machines
- Machines whose names match certain criteria

The health rule is violated when specified critical or warning conditions are met.

Hierarchies, Groups, and Subgroups

You can apply health rules to subgroups or machines within selected subgroups. Subgroups available on the Affects tab of the Health Rules wizard are machines that are grouped into hierarchies based on the [Machine Hierarchy Property](#) configuration for the Machine Agent. See [Machine Agent Hierarchy](#).

The subgroups are the leaf group a machine is in. For example, there are three machines:

- A is in group Data Center 1|Rack 1
- B is in group Data Center 1|Rack 2
- C is in group Data Center 1|Rack 1

A and C are in the same subgroup, B is in a different one.

Policies

Server [Policy](#) Actions are triggered when any or select Health Rule Violation Events occur. Unlike Application Policies, Server Policies cannot be based on custom events.

Actions

[Actions](#) are performed when a health rule is violated and a policy is triggered. Actions can be email or SMS message notifications, HTTP requests, or custom actions that have been uploaded to the Controller. You can also use [email](#) and [HTTP request](#) templates for alert and respond actions.

Email Digests

Email Digests enables you to send notification of chosen health rule violation events to specific email addresses at a specified frequency, such as every 2 hours.

Controller Settings for Server Visibility

This page describes Controller Admin settings that are specific to Server Visibility. You can apply these Controller settings and permissions from either the **Account** or **Controller** tabs. Changes to the settings take effect the next time the Agent is restarted and connects to the Controller.

 You need the [root user](#) password to change these settings.

You cannot set all configuration properties at the account-level. Check the Description column for each property to determine whether you can enable a specific Server Visibility Property. See [Manage Custom Roles](#) and [Manage Controller Tenant Users and Groups](#).

To change the Controller Admin settings for Machine Agents, see [Controller Settings for Machine Agents](#).

Server Visibility Property	Description
<code>sim.docker.enabled</code>	Enable Docker Visibility . See Monitor Container Visibility .
<code>sim.docker.machine.container.limit</code>	The global limit for the number of containers per machine. You can specify this in the Access to Administration Console as a Controller setting or as an account setting for individual accounts. The maximum limit you can specify is 120 containers.
<code>sim.docker.monitorAPMContainersOnly</code> (previously known as <code>sim.docker.infraMode.enabled</code>)	When set to <code>true</code> , allows you to monitor APM containers only. If the value is set to <code>false</code> , monitors all containers on the machine except the Machine Agent containers. You can apply this property at an account level and control monitoring of containers with and without APM. This property was formerly named <code>sim.docker.infraMode.enabled</code> .
<code>sim.exceptions.stacktrace.enabled</code>	When this setting is enabled, Controller stacktraces are included in the error response when a client request results in an error.

 Setting this to `true` is a security risk, and should only be set to `true` if you understand the consequences, and if directed by a Support Engineer.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Server Visibility Property	Description
<pre>sim.machines.agent.process.maxClasses</pre>	<p>The global maximum for the number of processes collected per machine.</p> <ul style="list-style-type: none"> If <code>maxClasses</code> (global setting in Controller) is lower than <code>maxNumberMonitoredClasses</code> (local setting in <code>serverMonitoringConfig.yml</code>), the local setting is effective for that machine and the global <code>MaxClasses</code> is the effective maximum for the entire machine. If <code>maxClasses</code> (global) is higher than <code>maxNumberMonitoredClasses</code> (local), the local setting is effective for that machine and the global <code>MaxClasses</code> is the effective maximum for that machine. <p>See Machine Agent Settings for Server Visibility</p> <div style="border: 1px solid red; padding: 5px; background-color: #ffe6e6;"> <p> Increasing this setting can affect the resource consumption of your deployment. Before increasing this setting, verify that your application environment and Controller can process the increased resource requirements.</p> </div>
<pre>sim.machines.container.hostid.conflict.check.enabled</pre>	<p>When using Docker Visibility, if the <code>unique</code> ID is not configured to use <code>container ID</code> in host mode, the Machine Agent automatically registers the container using the <code>container ID</code> as the host ID.</p> <p>This setting was introduced in version 20.8 of the Controller with the default value = <code>false</code>. As of Controller version 20.9 the default value is <code>true</code>. If set to true any container with <code>setting --network=host</code> and Machine Agent version is ≤ 20.6 the container does not register.</p>

Server Visibility Property	Description
<code>sim.machines.count.maxPerAccount</code>	<p>A maximum number of machines allowed per account. If you have more than 2000 machines reporting to one Controller and you want to increase this number, be aware that you might need to increase the <code>sim.machines.registrations.maxPerSec</code> setting as well.</p> <div style="border: 1px solid red; padding: 5px; background-color: #ffe6e6;"> <p>! Changing this setting can affect the resource consumption of your deployment. Before changing this setting, verify your application environment and Controller can process the increased resource requirements.</p> </div>
<code>sim.machines.deleteStaleMachines.maxLimit</code>	<p>Set the number of machines to be deleted every cycle, which is one cycle of the purger. For better performance, you can purge up to 700 machines per cycle.</p>
<code>sim.machines.dmm.defaultMode</code>	<p>Sets the Dynamic Monitoring Mode and Server Visibility default on the Controller. The allowable settings are:</p> <ul style="list-style-type: none"> • <code>KPI</code> – Collect Key Performance Indicator metrics • <code>DIAGNOSTIC</code> – Collect KPI and Diagnostic metrics • <code>ADVANCED_DIAGNOSTIC</code> – Collect All available metrics <p><i>You must enter one of these exact strings. If you enter a different value (such as "advanced-diagnostic"), the Controller will not update the setting and some machines will not appear in the Servers list.</i></p>
<code>sim.machines.dmm.dmmAllowed</code>	<p>With this option enabled, the Controller collects metrics from each Standalone Machine Agent based on the Monitoring Mode and Server Visibility setting. If this option is disabled, the Controller collects metrics from each Agent.</p>

Server Visibility Property	Description
<code>sim.machines.dotNet.HostIdConflictCheckAllowed</code>	<p>With this option enabled, the Controller throws an exception if a Standalone Machine Agent tries to register with the Controller while both of the following conditions are met:</p> <ol style="list-style-type: none"> 1. A .NET Agent on the same machine is already registered with the same <code><host-id></code> specified for the Standalone Machine Agent, and 2. .NET Compatibility Mode is disabled on either the Controller or the Standalone Machine Agent. <p>The generated exception acts as a reminder that .NET Compatibility Mode mode must be enabled on both the Controller and the Standalone Machine Agent.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p> Do not disable this option unless instructed by AppDynamics Support.</p> </div>
<code>sim.machines.hostidMappingAllowed</code>	<p>You must enable this mode if you want to collect Machine or Server metrics on a server with Multiple Machine Agents installed. See .NET Compatibility Mode.</p>

Server Visibility Property	Description
<p><code>sim.machines.offline.toStaleTimeoutMillis</code></p>	<p>How much time, in milliseconds, to wait before an offline machine to be stale and marked for purge. If the value is too high, it prevents fresh data from coming in. If the value is too short, it means less history.</p> <p>As of Controller >= 21.2.0 two properties are used in conjunction to purge stale machines:</p> <ul style="list-style-type: none"> • use <code>sim.machines.offline.toStaleTimeoutMillis</code> (172800000 ms) to determine which machines are stale • the <code>sim.machines.registrations.updateFrequency</code> (86400000 ms) to determine the interval to purge stale machines <p>You may wish to change either or both settings based on your needs. You can specify these in the Account Administration Console as a Controller setting or as an account setting for individual accounts. When a setting is modified in the Controller then a restart is required. If this setting is modified at the account level then you need to restart.</p> <p>Under rare circumstances old logic leads to a machine being deemed eligible for purge earlier than custom configuration.</p>
<p><code>sim.machines.registrations.hashCache.enabled</code></p>	<p>Prevent subsequent registration requests from being processed and compare if nothing has changed in the registration data.</p>

Server Visibility Property	Description
<code>sim.machines.registrations.maxPerSecondPerAccount</code>	<p>Set the maximum number of registrations allowed per second per account. This setting controls the number of concurrent registrations that are processed and processed per account on a multi-tenant Controller from multiple machines. This reduces the resources needed to register the Agents.</p> <p>The default value assumes that the Machine Agents are started evenly across a minute. If you are running a large number of more machines, you may need to increase this value. The default is 60 sec. A suggested formula is: $(\text{number of Machines} / 60)$ (version 4.2 or higher / 60).</p> <p>If you use a deployment script that starts all machines within a few seconds of each other, you may need to adjust the max registrations per second.</p> <div style="border: 1px solid red; padding: 5px; margin-top: 10px;"> <p> Changing this setting can affect the resource consumption of your deployment. Before changing this setting, verify your application environment and Controller can process the increased resource requirements.</p> </div>
<code>sim.machines.registrations.update.frequency</code>	<p>Controls how often the machine's last seen time is updated, regardless of stale timeout value. This setting passes machine availability information to the Controller at the specified frequency instead of polling machine availability at every minute of agent and Controller interaction. This reduces performance overhead on the Controller.</p>
<code>sim.machines.reuse.enabled</code>	<p>Reuse SIM Machine entities to handle the epm environment. Support is currently limited to Docker machines.</p> <p>If set to <code>false</code>, every new container will be created as a new machine.</p>
<code>sim.machines.simAllowed</code>	<p>This setting allows you to enable or disable SIM from the Controller.</p>

Server Visibility Property	Description
<code>sim.machines.stale.purgeIntervalMillis</code>	An interval in milliseconds that determines when stale machines are deleted from the Controller database. If the duration of this value is too short, it might overload the server. If the value is too high, then stale machines are deleted more slowly.
<code>sim.machines.tags.maxPerAccount</code>	The maximum number of unique tags per account.
<code>sim.machines.tags.maxPerMachine</code>	The maximum number of tags per machine.
<code>sim.metrics.metricBrowser.machineMetricMappings.enabled</code>	Enables or disables the Metric Browser to display machine-reported metrics. When this feature is enabled, machine-reported metrics, available under Tier nodes in the metric browser, are not visible. With Streamlined Browsing enabled, the Hardware Resources and Custom Metrics folders do not display.
<code>sim.metrics.store.customMetrics.simNodeEnabled</code>	Enables or disables the persistence of custom metrics to machines monitored by Server Visibility. If the setting is: <ul style="list-style-type: none"> <code>true</code> : The collector stores and displays custom metrics for applications and machines. Custom metrics are displayed in the Metric Browsers for both Applications and Server Visibility. <code>false</code> : The collector stores and displays custom metrics for applications only. Custom metrics are displayed in the Metric Browsers for Applications only (not for Server Visibility). Disable this setting if you are collecting a lot of custom metrics. This will prevent potential spikes in the storage rate of metric values stored for individual machines.
<code>sim.metrics.trackRegisteredEnabled</code>	Enable Streamlined Browsing for node metrics. This option is enabled when you are browsing metrics for tier nodes across multiple nodes.
<code>sim.perAccountProperty.enabled</code>	Enables a user to configure properties at an account level.
<code>sim.perAccountProperty.syncFrequencyInMillis</code>	The interval in milliseconds for the per Account Property data to sync with a database.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Server Visibility Property	Description
<code>sim.perAccountProperty.syncInBackground</code>	Enables syncing the per Account Property data to the database in the background. For better performance, set this value to <code>true</code> .
<code>sim.processes.bulkDelete.enabled</code>	Delete processes in bulk instead of fetching one by one. For better performance, set this value to true.
<code>sim.processes.delete.maxCount</code>	Set the maximum number of processes to be deleted per cycle to 10 minutes, which is one cycle of the purger. For better performance, set the delete <code>maxCount</code> process to 55000 per cycle.
<code>sim.processes.count.maxPerAccount</code>	The maximum number of processes stored per account.
<code>sim.processes.count.maxPerMachine</code>	<p>The maximum number of processes that each Agent can monitor.</p> <div style="border: 1px solid red; padding: 5px; margin-top: 10px;"> <p>! Increasing this setting can affect the resource consumption of your deployment. Before increasing this setting, verify that your environment and Controller can process increased resource requirements.</p> </div>

Server Visibility Property	Description
<code>sim.processes.creation.maxConcurrent</code>	<p>The maximum number of processes that can be created simultaneously by the Controller. The default value is 5000 processes. The Machine Agent will retry to register processes if the first attempt fails. Until the process is accepted and processed by the Controller, the process that request will be missing from the Process List. The limit works as follows:</p> <p>Case 1: Machine Agent sends a request with 5000 processes to register, and the limit is set to 5000, then the request is rejected until the limit is increased.</p> <p>Case 2: Two Machine Agents (MA1 and MA2) send requests to register 3000 processes and the limit is set to 3000. Only one of the requests will be processed (3000). So, the Controller can only process one request and rejects the other one.</p> <p>Case 3: Two Machine Agents (MA1 and MA2) send requests to register 500 processes and the limit is set to 500. Both requests arrived at the Controller and since 500 < 5000, then both requests are processed, and both are registered.</p>
<code>sim.processes.query.maxResultLimit</code>	<p>The maximum number of processes that the Controller returns. For example, in the Server Dashboard > Processes view, if the time range is 2 weeks and the Agent reports 10000 processes during that interval. If <code>maxResultLimit</code> is set to 5000, the UI will show 5000 processes.</p>
<code>sim.processes.registrations.maxPerSecondPerAccount</code>	<p>Set the maximum number of process requests per second per account. For better performance, set this value to 600. On a multi-tenant Controller, the total number of process requests per second should not exceed 600/sec.</p>
<code>sim.processes.stale.purgeIntervalMillis</code>	<p>The number of milliseconds between consecutive purges of stale processes for an account.</p>

Server Visibility Property	Description
<code>sim.processes.terminated.toStaleTimeoutMillis</code>	The number of milliseconds before a terminal considered stale and can be deleted to make data. You can specify these in the Access the Console as a Controller setting (all accounts) account setting for individual accounts.

Machine Agent Hierarchy

To group servers together so that you can apply health rules to the specific server groups, use the [Machine Hierarchy](#) property. This property enables you to group servers into arbitrary hierarchies by specifying a hierarchical path to the server. You can group servers based on departments, geographical locations, such as data centers, or other organizational units. You can then create health rules that apply to these departments.

The server hierarchy displays in the Metric Browser, on the Servers list, and on Server Visibility dashboard.

You need a Server Visibility license to use this feature.

You can specify the [Machine Hierarchy](#) property using `controller-info.xml`, a system property, or an environment variable.

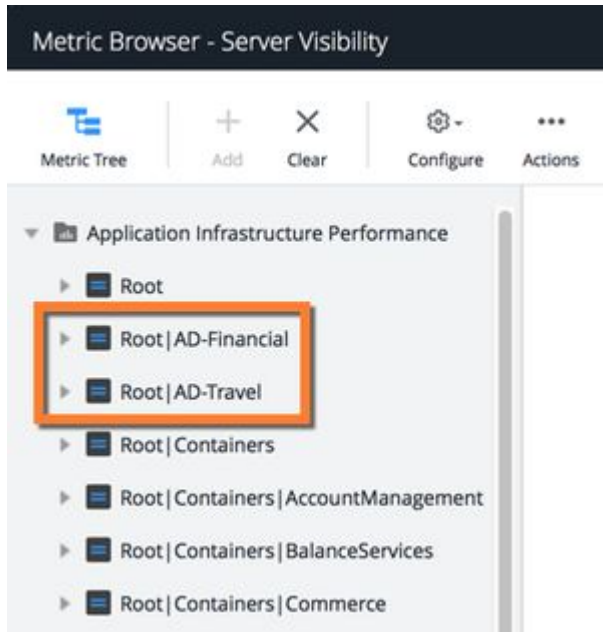

For example, to group servers into geographical locations, perhaps representing different data centers, you could group the following:

OS	Name ↑	Hierarchy	Health	Disk Usage (%)	Disk Usage (%) Trend	CPU (%)	CPU (%) Trend	Memory (%)	Memory (%) Trend	Disk I/O (%)	Disk I/O (%) Trend	Network I/O (%)	Network I/O (%) Trend	Server Visibility Enabled
	AD-Financial_MA	AD-Financial	🔴	29.0	📊	45.0	📊	91.0	📊	0.0	📊	0.0	📊	Yes
	AD-Travel_MA	AD-Travel	🔴	-	📊	-	📊	-	📊	0.0	📊	0.0	📊	Yes
	AD-Travel_MA	AD-Travel	🔴	100.0	📊	3.0	📊	47.0	📊	0.0	📊	0.0	📊	Yes
	ECommerce_MA	ECommerce	🔴	29.0	📊	22.0	📊	48.0	📊	0.0	📊	0.0	📊	Yes

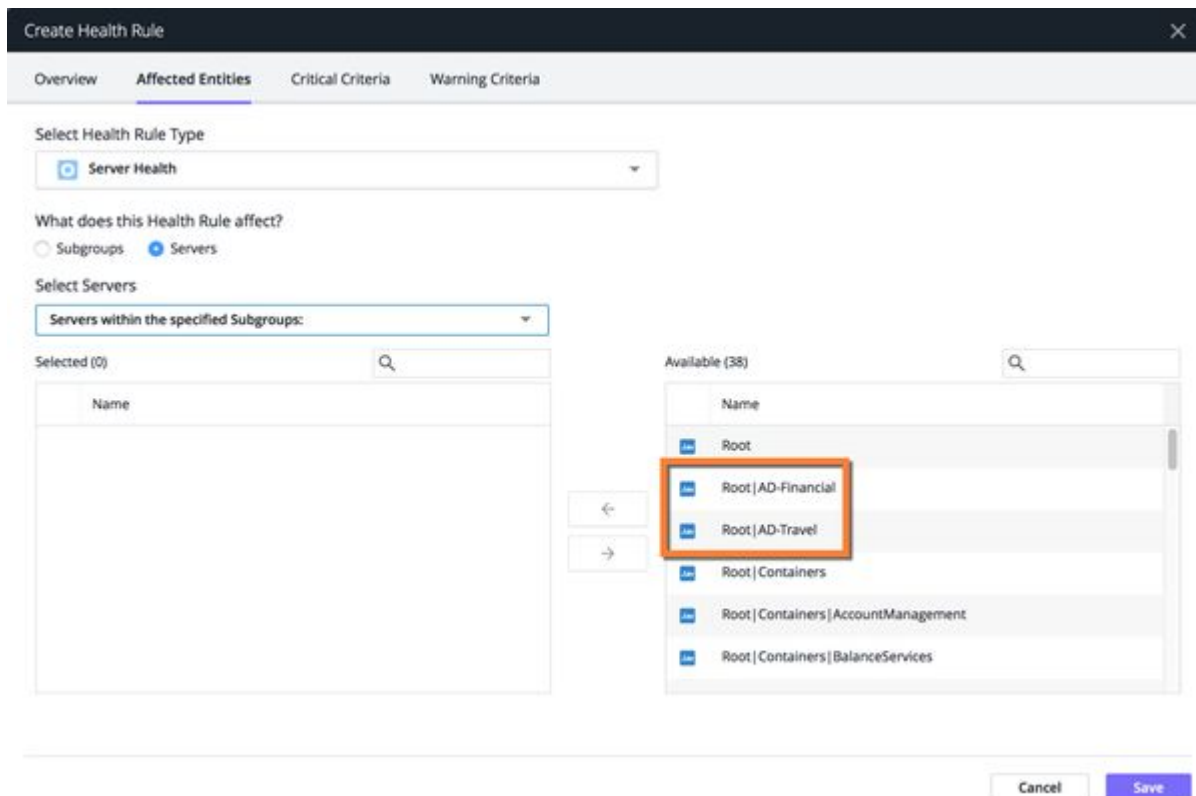

Use the `machine-path` element in the `controller-info.xml` configuration file to specify the tier and node:

```
<machine-path>AD-Financial|Node1</machine-path>
```

The Metric Browser view for this example:

When creating health rules, you can select one or more subgroups from the Affected Entities tab:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Server Tagging

Use Server Tagging to query, filter, and compare related servers using custom metadata. You can tag related servers based on OS, location, tier, owner, or any other relevant criteria. Server tags provide additional context to server metrics.

For example, you may want to specify deployment-version tags to the servers in a specific cluster, and then use those tags to identify anomalies in server metrics during a new deployment.

Server Tagging requires a Server Visibility license. Server Tagging is currently available for Linux, Windows, and Solaris.

Server Visibility can import the tags (described in the table) automatically.

Source	Tags	Controller and Agent Requirements
Custom	<p>Server Visibility can import:</p> <ul style="list-style-type: none"> • Custom tags defined in <code>ServerMonitoringConfig.yml</code>. See Defining and Viewing Tags for a Server. • Custom tags defined in Amazon EC2 (See Tagging EC2 Resources in the Amazon AWS documentation). 	<ul style="list-style-type: none"> • Controller ≥ 20.3 • Machine Agent ≥ 20.1
Machine Agent	<p>These tags display in the Server Dashboard under Tags:</p> <ul style="list-style-type: none"> • OS Architecture • OS Kernel • AppDynamics Agent Version 	<ul style="list-style-type: none"> • Controller ≥ 20.3 • Machine Agent ≥ 20.1
Amazon Web Services	<p>These tags display in the Server Dashboard under Tags as <code>AWS <tag></code>. See Importing Tags from Amazon Web Services.</p> <ul style="list-style-type: none"> • <code>resource-id</code> • <code>availability-zone</code> • <code>region</code> • <code>ami-id</code> • <code>instance-type</code> • <code>security-group</code> 	<ul style="list-style-type: none"> • Controller ≥ 20.3 • Machine Agent ≥ 20.1

Source	Tags	Controller and Agent Requirements
Docker	<p>Server Visibility can import user-defined tags and system container-level tags. These display under Container Details > Tags as <code>Docker <tag></code>.</p> <p>The exact set of tags imported can vary depending on the system on which the container is running.</p>	<ul style="list-style-type: none"> Controller >= 20.3 Machine Agent >= 20.1
Kubernetes OpenShift	<p>Server Visibility can import ReplicaSet and pod tags. These appear under Container Details > Tags as <code>K8s <tag></code>.</p>	<ul style="list-style-type: none"> Controller >= 20.3 Machine Agent >= 20.1

View Servers by Tag in the Controller UI

To view filter servers by tag in the Servers list, select **Filters** and add the criteria you want for the tag filter. If you specify multiple criteria, the filter performs an AND search (for criteria with different keys) and an OR search (for criteria with the same key). This example shows the tag criteria filters for all servers with:

1. A **Tier** tag that equals **ECommWeb** OR **ECommInventory**, AND
2. An **OS Architecture** tag that equals **x86_64**.

The screenshot shows the 'Servers' page in the AppDynamics Controller UI. The navigation bar includes Home, Applications, User Experience, Databases, Servers (selected), Analytics, Dashboards & Reports, and Alert & Respond. The Servers page has a toolbar with icons for Details, Delete, View Logs in Analytics, Filters, and View Options. A dropdown menu shows 'All Servers' with a 'Show' button. Below the toolbar, there is an 'Add Criteria' button and a filter applied: 'OS Architecture: x86_64'. The main table displays server details with columns for OS, Name, Hierarchy, Health, Disk Usage (%), CPU (%), and Memory (%). Two servers are listed: AD-Travel_MA (100.0% Disk Usage, 4.0% CPU) and ECommerce_MA (29.0% Disk Usage, 23.0% CPU).

Define and View Tags for a Server

You can specify custom tags as a set of key-value strings in the Agent config directory. Each Agent can support up to 50 tags by default.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Follow these suggested best practices to define server tags:

If an Agent is deployed in Amazon Web Services, the Agent can auto-detect and import tags defined in AWS. The Controller also auto-assigns a set of default tags to each server.

The primary use case for custom tags is to specify information that is not already specified in AWS and auto-assigned tags. Before you specify custom tags in the Agent config directory, you should review the current set of tags. Access the Server Dashboard and view the Tags pane at the bottom of the page:

The screenshot shows the AppDynamics Server Dashboard for 'AD-Financial_MA'. It displays two tables for process monitoring and a 'Tags' section at the bottom.

Be careful not to define duplicate tags in the YML file.

Configure the following option in `<machine_agent_home>/extensions/ServerMonitoring/ServerMonitoringConfig.yml`:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Setting	Description
tag	<p>A list of user-defined tags for the individual server. You can use these tags to query, filter, aggregate, and compare related servers.</p> <p>Each tag is specified by a key-value pair. You can define tag names up to 127 Unicode characters and tag values up to 255 Unicode characters. Define each key on a separate line. All key-value strings should be within single quotes. If a key has multiple values, delineate the list with commas:</p> <pre><key>: [<value>]</pre> <pre>tags:</pre> <pre> 'Location': ['NYC', 'Data Center', 'Server Room 7']</pre> <pre> 'Environment': ['preProduction']</pre>

Import Tags from Amazon Web Services

 Detailed information about Amazon Web Services is outside the scope of AppDynamics documentation.

Before Server Visibility can import tags from AWS, you must set up IAM roles:

1. Log in to the AWS console: <https://console.aws.amazon.com/iam/>
2. Create a role with read access to EC2 tags.
Specifically, the role must have an AWS Managed Policy with the required permissions (such as, AmazonEC2ReadOnlyAccess) attached.
3. Add this role to your EC2 instance.
For information about these steps, search for "To create an IAM role using the IAM console" and "Attaching an IAM Role to an Instance" in this [page](#).
4. Run the Machine Agent with Amazon Web Services enabled.

Configuration Options for Server Tagging

To edit these settings, log in to the Controller administration console using the `root` user password. See [Access the Administration Console](#).

Server Visibility Property	Description	Default
<code>sim.machines.tags.enabled</code>	Enable or disable server tags for all servers	True
<code>sim.machines.tags.aws.enabled</code>	Enable or disable the collection of AWS tags for all servers	True

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Server Visibility Property	Description	Default
<code>sim.machines.tags.aws.pollingInterval</code>	Length of time in milliseconds between each polling of AWS tags	21600000 (6 hours)
<code>sim.machines.tags.maxPerMachine</code>	Maximum number of unique tags per account	50
<code>sim.machines.tags.maxPerAccount</code>	Maximum number of unique tags per account	500

Configuration Options for Docker Tags

You can configure the Machine Agent to collect different types of tags. By default, all tags are collected. To turn off tag collection, set `dockerTagsEnabled` to "false".

1. Edit the `<machine_agent_home>/extensions/DockerMonitoring/DockerMonitoringConfig.yml` file.
2. Under the `containerMonitoringConfig` section, set `dockerTagsEnabled: "false"`

```
# WARNING: Before making any changes to this file read the following section carefully
#
# After editing the file, make sure the file follows the yml syntax. Common issues
include
# - Using tabs instead of spaces
# - File encoding should be UTF-8
#
# The safest way to edit this file is to copy paste the examples provided and make the
# necessary changes using a plain text editor instead of a WYSIWYG editor.
#

# samplingInterval indicates how often to gather metric data. Units in milliseconds.
samplingInterval: 30000

containerMonitoringConfig:
  # containerProcessSelectorRegex defines regular expression to evaluate the processes
in
  # each running container to be monitored by the machine agent. The regular expression
is
  # compared against each process full command line within running
  # If the pattern matches, then the machine agent start monitoring it.
  containerProcessSelectorRegex: ".*[ ]-Dappdynamics.*"
  dockerTagsEnabled: "false"
```

Configuration Options for AWS Tags

You can configure the Machine Agent to collect different types of tags. By default, all tags are collected. To turn off tag collection, set `awsTagsEnabled` to "false".

1. Edit the `<machine_agent_home> /extensions/ServerMonitoring/conf/ServerMonitoring.yml` file.
2. Set `awsTagsEnabled: "false"`

```
//ServerMonitoring.yml
# WARNING: Before making any changes to this file read the following section carefully
#
# After editing the file, make sure the file follows the yml syntax. Common issues
include
# - Using tabs instead of spaces
# - File encoding should be UTF-8
#
# The safest way to edit this file is to copy paste the examples provided and make the
# necessary changes using a plain text editor instead of a WYSIWYG editor.
#
awsTagsEnabled: "false"
# samplingInterval indicates how often to gather metric data. Units in milliseconds.
samplingInterval: 30000
...
```

Configuration Options for Kubernetes and OpenShift Tags

You can configure the Machine Agent to collect different types of tags. By default, all tags are collected. To turn off tag collection, set `k8sTagsEnabled` to "false".

1. Edit the `<machine_agent_home> /extensions/ServerMonitoring/conf/ServerMonitoring.yml` file.
2. Set `k8sTagsEnabled: "false"`

```
//ServerMonitoring.yml
# WARNING: Before making any changes to this file read the following section carefully
#
# After editing the file, make sure the file follows the yml syntax. Common issues
include
# - Using tabs instead of spaces
# - File encoding should be UTF-8
#
# The safest way to edit this file is to copy paste the examples provided and make the
# necessary changes using a plain text editor instead of a WYSIWYG editor.
```

```
#
k8sTagsEnabled: "false"
# samplingInterval indicates how often to gather metric data. Units in milliseconds.
samplingInterval: 30000
...
```

Tagged Metrics

i Beta Disclaimer

This documentation mentions features that are currently beta. AppDynamics reserves the right to change the features at any time before making them generally available as well as never making them generally available. Any buying decisions should be made based on features and products that are currently generally available.

Tagged Metrics

The **Tagged Metrics** panel enables you to aggregate all nodes in a tier based on a server tag (user-defined, or imported from AWS or Kubernetes) and then compare performance metrics between the node groups in one set of charts. For example, you can quickly compare the performance on all "blue nodes" and "green nodes" during a canary deployment.

1. In the Controller left-side panel, select **More > Tagged Metrics**.
2. In the **Tagged Metrics** panel, select the server tag and the tier of interest.
3. Compare the response times, call rates and transaction outliers (errors, slow calls, very slow calls) between the tag-based node groups.

The following chart shows how you can easily compare performance between different sets of nodes. For example, you want to analyze node performance for a tier with 26 nodes running v1 of the software, and one node running v2. You select the "version" tag, which represents a Kubernetes label. The charts show very clearly that the rate of slow and very slow calls has increased dramatically on the v2 node.

This feature is disabled by default.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

To enable Tagged Metrics:

1. Log in to the administration console: `http:<controller-hostname>:8080/controller/admin.jsp` or `https:<controller-hostname>:443/controller/admin.jsp`
2. In Controller Settings, search for " `tagged.metrics.enabled` " and set this field to `true` .
3. In Account Settings:
 - a. Select the account to enable.
 - b. Under **Account > Additional Properties**, select **Add Property**, add the " `tagged.metrics.enabled` " property, and set it to `true` .

Monitor Containers with Docker Visibility

Use the Machine Agent to monitor application nodes running inside Docker containers and to identify container issues that impact application performance. By viewing and comparing APM metrics with the underlying container and server/machine metrics, you can easily answer the question: Is my application problem purely an application problem, or is the root cause in the container or the server?

i Container monitoring requires a Server Visibility license $\geq 4.3.3$, for both the Controller and the Machine Agent.

You should deploy the Machine Agent inside a Docker container. The Machine Agent collects metrics for Docker containers on the same host, and server and machine metrics for the host itself. The Controller shows all monitored containers, for each host, and the container and host IDs, for each container.

In a BRIDGE networking mode, the containers take on the container ID as the host name. If networking is in host mode, then the containers take on the node name of the host ID. This means every container on that node has the same host ID. In this case you need to use the unique host ID settings. See [Register the Container ID as the Host ID](#). When using Docker Visibility, if the unique host ID setting is not configured to use container ID in host network mode, the Machine Agent automatically registers the container using the container ID as the host ID. If you have an older version of the Controller or Machine Agent, AppDynamics recommends that you upgrade to Machine Agent version 20.7 or later. See [Using Docker Visibility with Kubernetes](#).

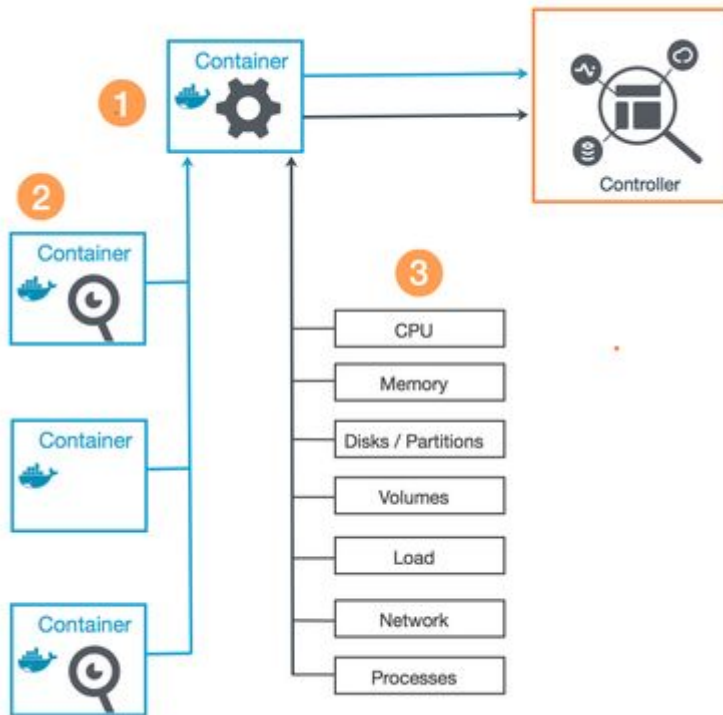

With Controller $\geq 20.11.0$:

- If the Machine Agent $\geq 20.7.0$, the Machine Agent automatically registers the container using the container ID as the host ID. No further action is needed.
- If the Machine Agent $\leq 20.6.0$ is configured incorrectly, the Controller rejects the misconfigured containers registration.

By default, the Machine Agent only monitors containers that have a running APM Agent. You can change this by setting the `sim.docker.monitorAPMContainersOnly` property on the Controller. See [Controller Settings for Server Visibility](#).

i To deploy a Machine Agent on a host outside a Docker container, create a symbolic link: `ln -s / /hostroot` on the host. This symbolic link enables the Machine Agent to collect host metrics with Docker container metrics. When you deploy a Machine Agent inside a Docker container for monitoring, the symbolic link is automatically created when the volume mounts. To grant more restrictive permissions, enter this command to create symbolic links: `ln -s /proc /hostroot/proc; ln -s /sys /hostroot/sys; ln -s /etc /hostroot/etc`. You can make these links read-only because the AppDynamics Agent does not need write privileges to these directories.

This diagram illustrates how to deploy container monitoring:

- Install the Machine Agent (1) in a standalone container. The Machine Agent collects hardware metrics for each monitored container, as well as Machine and Server metrics for the host (3), and forwards the metrics to the Controller.
- The Machine Agent can monitor all containers that are running on that host, subject to established limits, and will report runtime metrics and metadata for every container. Additionally, if any of the containers have an APM Agent installed (2), then the Machine Agent also correlates the container metadata and runtime metrics with the associated APM Node.

Before You Start

1. AppDynamics recommends that you use Docker CE/EE 17.03 or Docker Engine 1.13 with this product. Some data might be missing if you use previous versions of Docker.
2. Container Monitoring is not supported on Docker for Windows, or Docker for Mac.
3. AppDynamics strongly recommends that you follow these guidelines, [Instrument JVMs in a Dynamic Environment](#) when monitoring container-based applications.
4. The Machine Agent can monitor up to 120 running containers per host. The default maximum number of containers per host is 100. With the `cgroup enabled` flag set to true, the Machine Agent can monitor up to 600 containers per host. See [Configure Docker Visibility](#).
5. The Machine Agent collects metrics from containers with one or more running processes whose command line matches a configurable regex. By default, this regex matches all processes (*). To override this behavior, edit this regex in `<machine_agent_home>/extensions/DockerMonitoring/conf/DockerMonitoring.yml` :

```
containerMonitoringConfig:containerProcessSelectorRegex: ".*"
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

6. The maximum number of containers you can monitor in one Controller depends on the Controller size, the total number of App Agents, and the current load. If you are using a SaaS Controller, please work with your Account Manager.
7. Please review:
 - a. Best Practices for setting up [App Agents and Machine Agents](#).
 - b. Docker Visibility issues in the latest [Release Notes](#).

Enable Container Monitoring

To enable Container Monitoring:

1. On the Controller, log in to the Administration Console and verify that **sim.docker.enabled** is set to **true**.
2. On the Agent, [enable Server Visibility](#) and [Docker Visibility](#).

Container Monitoring Setup

The quickest and easiest way to run the Machine Agent with Container Monitoring enabled is to use one of the official images from the Docker Store: <https://store.docker.com/images/appdynamics>. These images are produced by AppDynamics, based on certified base images from the Docker Community, and can either be run directly or used as base images for your own application containers. For full details of how to download and run containers based on these official images, see the documentation posted on the Docker Store. To build your own base images, the full source code for building these images is posted to GitHub. You can use this as a pattern for your own builds: <https://github.com/Appdynamics/appdynamics-docker-images>.

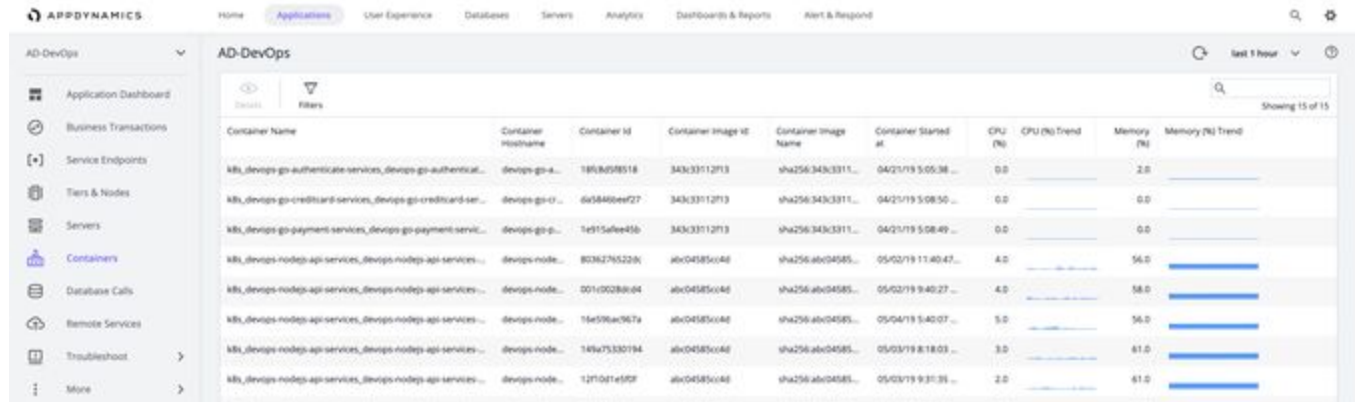

For the Machine Agent to monitor containers running on the server, configure these settings (See [Configure Installation Options](#)):

- [Server Visibility Enabled](#) – [Enable Server Visibility](#)
- [Docker Enabled](#) – [Enable Docker Visibility](#)
- **Volume Mounts** – Specify:
 - Volume mounts to allow read-only access to the underlying file system (`/proc` , `/etc` and `/sys`). This allows the Server Agent to collect host-level metrics for containers running on the server.
 - The UNIX domain socket on which the Docker daemon is configured to listen for API calls.

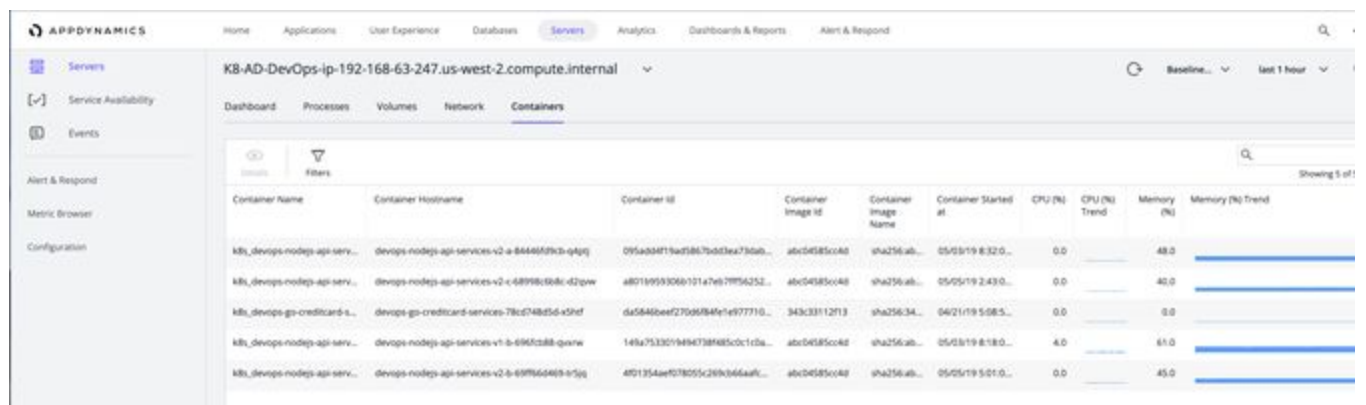

View Container Details

To view container metadata and metrics in the Controller:

- In the **Applications** Dashboard, go to **Containers** to see all monitored containers used by the application.

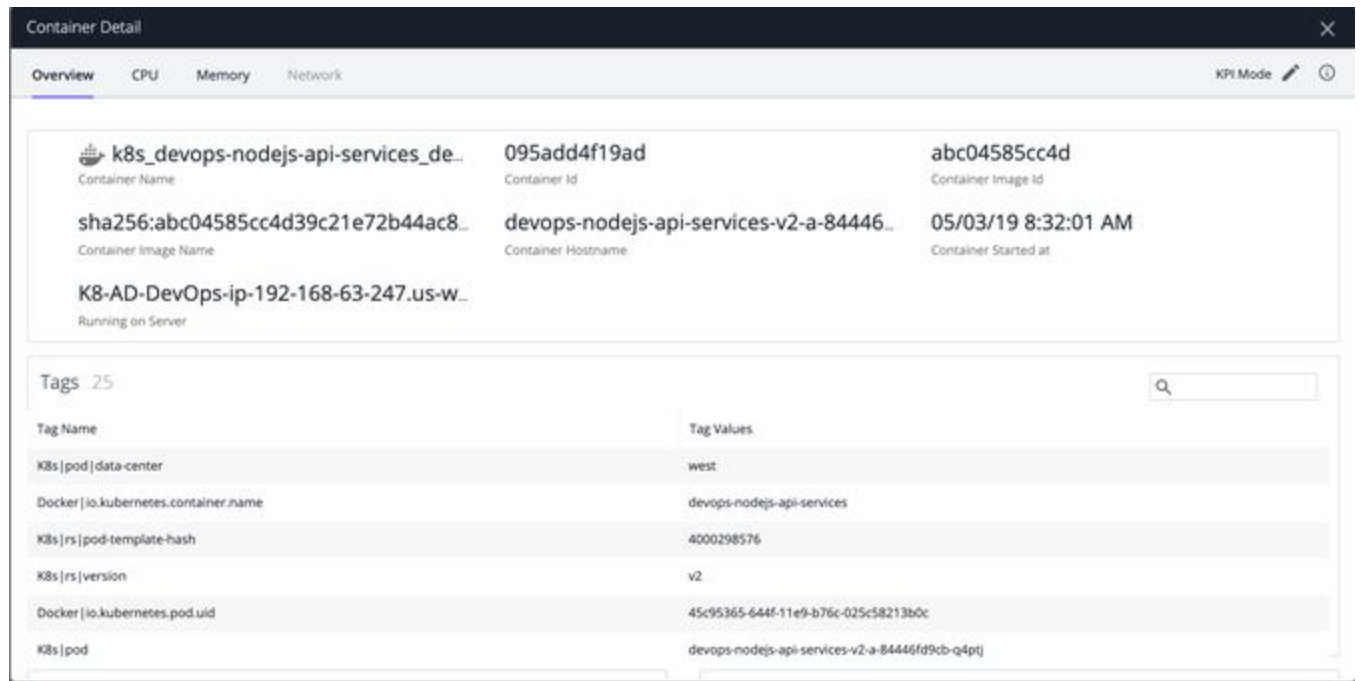

- In the **Servers** Dashboard, go to **Containers** to see all monitored containers on that host.

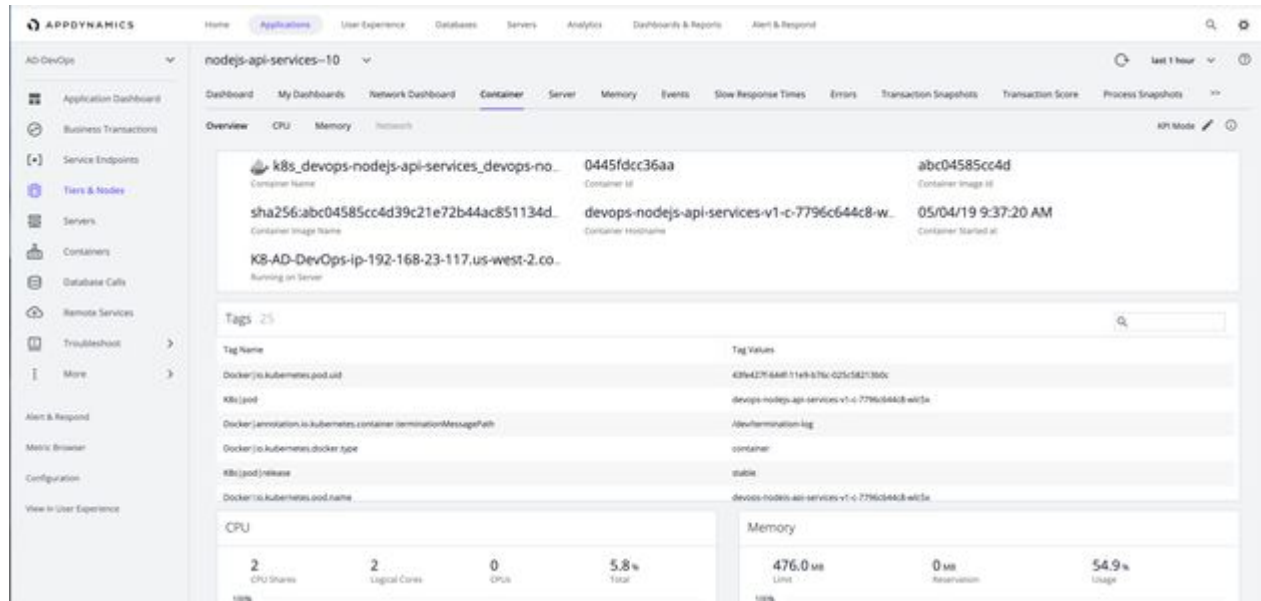

- To open the Container Dashboard, right-click on the container name, and choose **View Details**.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

The Container Details view contains these tabs, which provide an overview of the health and resource usage for the container:

- **Overview** - Container metadata, Tags (name-value pairs derived from Docker/Kubernetes) plus AWS tags where applicable, and single chart views for CPU, memory, network and disk usage
 - **CPU** - CPU Usage and Throttled Time metrics
 - **Memory** - Memory Usage and Memory Fault metrics
 - **Network** - Network Usage metrics (only available when running in Diagnostic mode), see "Enable Dynamic Monitoring Mode (DMM)" under [Machine Agent Configuration Properties](#).
- The Node Dashboard also includes a Containers tab for the container in which that node is running.

View Container Metrics Using the Metric Browser

To view time-series metric data for containers, double-click one of container metric graphs (CPU, Memory, Network, Disk) to open the Metric Browser with the displayed metric selected. The Metric Browser tree displays the full set of metrics available for that container, and you can add these to the Metric Browser display by double-clicking the metric you wish to select. See [Container Metrics](#).

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Troubleshooting Containers Using Dynamic Monitoring Mode

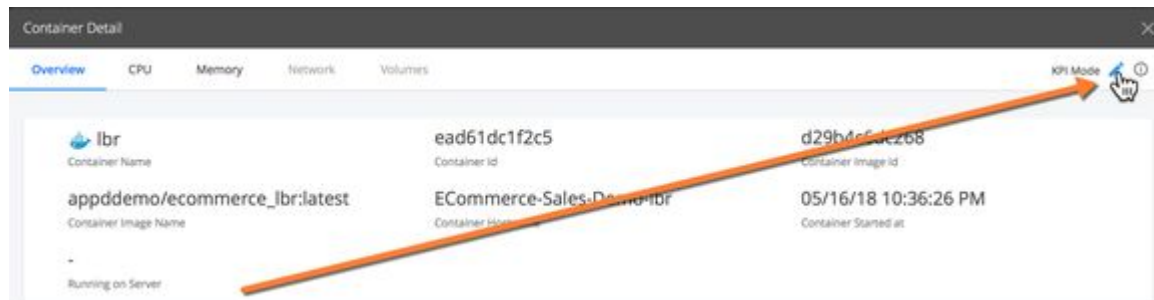

Using Dynamic Monitoring Mode (DMM), you can selectively control the number of Container metrics reported for individual containers. Rather than have all Agents report all metrics for all containers all the time, you can configure individual Agents to collect:

- Key Performance Indicator metrics only (*KPI mode*)
- KPI and Diagnostic metrics (*Diagnostic mode*)
- All available metrics (*Advanced Diagnostic mode*)

This provides the flexibility to report KPI metrics only on most containers, and then increase the metric level on specific containers when you need deeper visibility to diagnose problems. You can increase scalability on the Controller and conserve metric bandwidth on the network with no sacrifice in visibility. Every Docker Visibility metric has a default DMM class (KPI, Diagnostic, and Advanced Diagnostic). For details, consult the Container Metrics table: the Default Monitoring Mode column indicates the default category of each metric when Dynamic Monitoring Mode is enabled.

When you notice a container that requires additional analysis or troubleshooting, change the DMM on that container to collect more metrics:

1. Open the **Container Detail** panel for the container of interest: Open the Containers table (**Containers**, left menu) and double-click the container.
2. Click the **Edit** (pen) button in the top-right corner, change the mode to **Diagnostic** or **Advanced Diagnostic**, and click the checkmark to apply the changes.
3. Collect additional metrics for your analysis or troubleshooting.
4. When you no longer need to collect additional metrics for that container, set the DMM on that container back to KPI.

Note:

- Depending on the type of metrics collected by the Agent, the Controller has three different DMM defaults. These defaults are all set to KPI (the lowest setting):
 - `sim.machines.dmm.containerAware.defaultMode`
Default for **Hardware Resources Metrics** on servers with Docker Visibility enabled
 - `sim.machines.dmm.container.defaultMode`
Default for **Docker Container Metrics** on containers
- The default for both settings is KPI (the lowest setting).
- AppDynamics recommends that you leave these global settings at their defaults. If you need to collect advanced metrics for a specific server or container, increase the DMM on an "as-needed" basis.

-
- When a container monitored by a Java App Agent shuts down and restarts, any overridden DMM specified for the shut-down container is lost. The DMM for the restarted container automatically resets to the global default specified by `sim.machines.dmm.container.defaultMode`.
 - If you switch the monitoring mode in the Controller from a more-inclusive to a less-inclusive mode, the Metric Browser will show values for the newly-excluded metrics for one hour after the switch. For example, if you switch from Diagnostic to KPI mode. For any Diagnostic metric, the Metric Browser will report a steady line (at 0, or the last-reported value) for one hour after the switch; then the line will disappear. This is standard behavior in the Metric Browser for an Agent when it stops reporting a specific metric.

Configure Docker Visibility

- [Machine Agent Settings for Docker Visibility](#)
- [Controller Settings for Docker Visibility](#)

Machine Agent Settings for Docker Visibility

You can configure the Docker Visibility settings in the file: `<machine-agent-home>/extensions/DockerMonitoring/conf/DockerMonitoring.yml`

i Before you edit this file, please review "Editing YML Files: Important Notes" in [Machine Agent Settings for Server Visibility](#).

Property	Description	Default
<code>cgroupEnabled</code>	<p>The Machine Agent can collect Memory and CPU metrics for Docker containers using <code>cgroupdata</code>. This method is much faster than using the Docker API (the default metric-collection method). You can enable <code>cgroupmetriccollection</code> on all platforms except Amazon Linux OS. With the <code>cgroupEnabled</code> flag set to <code>true</code>, the Machine Agent can monitor up to 600 containers per host. When <code>cgroup</code> is enabled, you do not have to update the Docker Metric Collector Pool Size. The max container limit is independent of this.</p> <p>This mode is disabled by default. To enable <code>cgroupmetriccollection</code>, run the agent with the following command-line option set to <code>true</code>:</p> <pre>java -Dappdynamics.docker.container.collection .cgroup.enabled=true -jar machineagent.jar</pre>	<code>true</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property	Description	Default
<code>containerProcessSelectorRegex</code>	<p>The Machine Agent can monitor up to 150 running containers (depending on the pool size configuration, described below). The agent collects metrics from containers with one or more running processes whose command line matches a configurable regex. By default, the value of this regex is ".*" and matches all containers irrespective of the processes running in them. If you cannot restart the APM agents, or if you want to filter APM agents based on another command-line argument, you can override this behavior by editing this regex.</p> <p>Default = ".*" </p>	<p>".*"</p>
<code>docker.metric.collector.pool.size</code>	<p>Specify the local limit for the number of containers the agent can monitor. The effective limit for each agent is the minimum amount for:</p> <ul style="list-style-type: none"> The <code>sim.docker.machine.container.limit</code> on the Controller (default limit = 15 containers), or The Docker Metric Collector Pool Size on the agent (default pool size = 3, or 90 containers). <p>You can change this setting to monitor up to 120 containers (pool size = 4) or 150 containers (pool size = 5). The trade-off is that increasing the pool size might lead to higher resource consumption on the agent host.</p> <p>To change the pool size, set these properties:</p> <p>System Property</p> <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> <code>-Dappdynamics.docker.metric.collector.pool.size</code> </div> <p>Environment Variable</p> <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> <code>APPDYNAMICS_DOCKER_METRIC_COLLECTOR_POOL_SIZE</code> </div>	<p>default limit = 15 containers</p> <p>default pool size = 3, or 90 containers</p>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property	Description	Default
dockerTagsEnabled	Enable (default) or disable the collection of Docker tags from containers monitored by the Machine Agent.	

Property	Description	Default
<p><code>docker.use.container.name.selector</code></p>	<p>Use the Machine Agent to identify containers by container names only.</p> <p>By default for Docker monitoring, the Machine Agent obtains a list of containers. For each container, the Machine Agent retrieves all running processes inside the container. Then, the Machine Agent matches the container to be monitored by the process full command line. Because there are many containers, the selection process lasts longer than a minute, causing gaps in reporting container metrics.</p> <p>The Docker Use Container Name Selector configuration option provides an alternative way to select containers to be monitored by using the container's name. This option allows the Machine Agent to run significantly faster since the Machine Agent does not have to gather all the processes for each container.</p> <p>To enable matching with the container name, you can either use an environment variable or a JVM property. If both are defined, the environment variable is used.</p> <p>System Property</p> <pre>-Dappdynamics.docker.use.container.name.selector=false</pre> <p>Environment Variable</p> <pre>APPDYNAMICS_DOCKER_USE_CONTAINER_NAME_SELECTOR=false</pre> <p>You can select which containers to be monitored by providing the regular expression, <code>containerNameSelectorRegex</code>, to match the container names. By default, the Machine Agent matches all container names. Regular expressions are part of the <code>extensions/DockerMonitoring/conf/DockerMonitoring.yml</code> file.</p>	<pre># default value ".*(machine-agent macheagent).*"</pre>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property	Description	Default
	<p>To exclude containers from monitoring, use an environment variable or the JVM property. If both are defined, the environment variable is used.</p> <pre> # default value ".*(machine-agent machineagent).*" # environment variable export APPDYNAMICS_DOCKER_CONTAINER_NAME_SELECTOR_BLACKLIST_REGEX=".*(machine-agent machineagent).*" # JVM property -Dappdynamics.docker.container.name.selector.blacklist.regex=".*(machine-agent machineagent).*" </pre>	

Controller Settings for Docker Visibility

For information about how to configure these settings, see [Controller Settings for Machine Agents](#).

Property	Description	Default
<code>sim.docker.apmNode.markHistorical.enabled</code>	Enables configuration to mark the APM node historical when a container running the app agent is stopped.	true
<code>sim.docker.enabled</code>	Enable the Docker Monitoring feature.	true

Property	Description	Default
<code>sim.docker.machine.container.limit</code>	<p>Global limit for the number of containers that each Machine Agent can monitor. The effective limit for each agent is a minimum of</p> <ul style="list-style-type: none"> The <code>sim.docker.machine.container.limit</code> on the Controller (default limit = 15 containers), or The Docker Metric Collector Pool Size on the agent (default pool size = 3, or 90 containers). <p>You can specify this in the Administration Console as a Controller setting (all accounts) or as an Account setting for individual accounts. 150 is the maximum limit you can specify.</p>	15
<code>sim.machines.reuse.enabled</code>	<p>Reuse SIM Machine entities to handle an ephemeral environment. Support is currently limited to Docker container machines.</p> <p>If set to <code>false</code>, each new container is considered a new machine.</p>	true
<code>sim.machines.tags.enabled</code>	<p>Enable or disable the import of Docker tags to the Controller.</p>	true

Use Docker Visibility with Kubernetes

This page describes how to set up the Machine Agent with Docker Visibility enabled to run as a `DaemonSet` on a Kubernetes cluster.

Container visibility enables you to monitor containerized applications running inside Kubernetes pods and identify container issues that impact application performance. You deploy the Machine Agent as a Kubernetes `DaemonSet` in every node of a Kubernetes cluster. Deploying the Machine Agent as a `DaemonSet` ensures that every Kubernetes worker node runs the Machine Agent to collect critical resource metrics from the node host and associated Docker containers.

! Using Docker Visibility to monitor Kubernetes containers is no longer the preferred option and will be deprecated. Use the Cluster Agent instead as described in [Monitor Kubernetes with the Cluster Agent](#). The Cluster Agent supports Kubernetes container visibility, as well as visibility into cluster health and capacity.

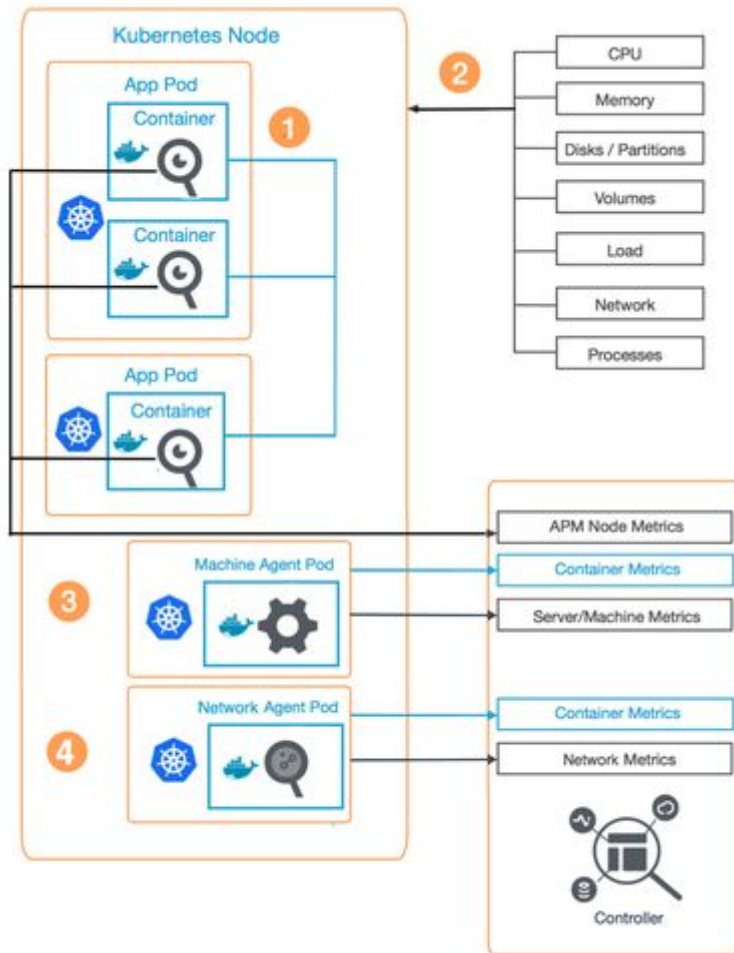

Container Visibility with Kubernetes

Deploy the Machine Agent in Docker-enabled mode. To configure and run the Machine Agent using Docker, see [Configure Docker Visibility](#).

The Machine Agent:

- Identifies the containers managed by Kubernetes.
- Determines if these containers contain app server agents.
- Correlates containers with app server agents with the APM nodes for that application.

This diagram depicts the deployment scenario for container visibility in Kubernetes:

- Install the Machine Agent container (1) as a `DaemonSet` on each Kubernetes node.
- To collect APM metrics from any container in a pod, install the correct App Server Agent (2) in the container before deploying the pod.
- The Machine Agent collects resource usage metrics for each monitored container (3), as well as Machine and Server metrics for the host, and forwards the metrics to the Controller.
- (Optional) Install the Network Agent (4) as a `DaemonSet` on the node you want to monitor. The Network Agent collects metrics for all network connections between monitored application components and sends these metrics to the Controller.

Before You Begin

Review the requirements for Container Visibility with Kubernetes:

- A Machine Agent must run as a `DaemonSet` on every Kubernetes node you want to monitor.
- Every node to be monitored must have a Server Visibility license.
- Docker Visibility must be enabled on each Machine Agent.
- Both App Server Agents and Machine Agents are registered by the same account and are using the same Controller.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- If you have multiple App Server Agents running in the same pod, register the container ID as the host ID on each App Server Agent and Machine Agent.

Limitations

- Only the Docker Container Runtime is supported.
- Only Pod and ReplicaSet labels are supported.

Procedure

1. [Enable Container Visibility](#)
2. [Register the Container ID as the Host ID](#)
3. [Configure the Cluster Role](#)
4. [Deploy the Machine Agent on Kubernetes](#)

After the Machine Agent has been deployed on Kubernetes, you can add the App Server Agent into your image:

- [Instrument Applications with Kubernetes](#)
 - [Resource Limits](#)

Enable Container Visibility

Update the Controller to $\geq 4.4.3$.

To enable Kubernetes Visibility in your environment, edit these parameters:

- Controller
 - `sim.machines.tags.k8s.enabled`: The value defaults to `true`. The global tags enabled flag has priority over this.
 - `sim.machines.tags.k8s.pollingInterval`: The value defaults to one minute. The minimum value you can set for the polling interval is 30 seconds.
- Machine Agent
 - `k8sTagsEnabled`: The value defaults to `true` and is specified in the `ServerMonitoring.yml` file.

Continue with [Use Docker Visibility with Red Hat OpenShift](#). You can use the example `DaemonSet`, the sample Docker image for Machine Agent, and the sample Docker start script to set up the Machine Agent.

Register the Container ID as the Host ID

Install an app server agent in every container in a Kubernetes pod to collect application metrics. If multiple app server agents are running in the same pod, for example, in the RedHat OpenShift platform, you must register the container ID as the unique host ID, on both the app server agent and the Machine Agent, to collect container-specific metrics from the pod. Kubernetes pods can contain multiple containers and they share the same host ID. The Machine Agent cannot identify different containers running in a pod unless each container ID is registered as the host ID.

To register the container ID as the host ID:

1. Get the container ID from the `cgroup`.

```
cat /proc/self/cgroup | awk -F '/' '{print $NF}' | head -n 1
```

2. Register the app server agents.

```
-Dappdynamics.agent.uniqueHostId=$(sed -rn '1s#.*/###; 1s/(.{12}).*/\1/p' /proc/self/cgroup)
```

3. Register the Machine Agent.

```
-Dappdynamics.docker.container.containerIdAsHostId.enabled=true
```

Configure the Cluster Role

This sample cluster role definition provides read access to various Kubernetes resources. These permissions enable Kubernetes extensions to the Machine Agent and pod metadata collection. The role is called `appd-cluster-reader`, but you can rename it. The cluster role definition outlines various API groups that will be available for members of this role. For every API group, we define a list of resources that will be accessed and the access method. Because we need to retrieve information from these API endpoints, we need the read-only access, expressed by "get", "list", and "watch" verbs.

```
kind: ClusterRole
apiVersion: rbac.authorization.k8s.io/v1
metadata:
  name: appd-cluster-reader
rules:
- nonResourceURLs:
  - '*'
  verbs:
  - get
- apiGroups: ["batch"]
  resources:
  - "jobs"
  verbs: ["get", "list", "watch"]
- apiGroups: ["extensions"]
  resources:

```

Once the role is defined, you must create cluster role bindings to associate the role with a service account. This example of a ClusterRoleBinding spec makes `appd-cluster-reader` service account a member of the `appd-cluster-reader-role` in the project "myproject". The naming is purely coincidental. The names of the service account and the cluster role do not have to match.

```

kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1
metadata:
  name: cluster-reader-role-binding
subjects:

```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

- kind: ServiceAccount
  name: appd-cluster-reader
  namespace: myproject
roleRef:
  kind: ClusterRole
  name: appd-cluster-reader
  apiGroup: rbac.authorization.k8s.io
  
```

Deploy the Machine Agent on Kubernetes

You can deploy the AppDynamics Machine Agent in a single container image without an init container. By default, the Machine Agent is deployed to the cluster as a `DaemonSet` and distributes every Agent instance evenly across all cluster nodes. When required, you can configure the `DaemonSet` with node affinity rules or node anti-affinity rules to ensure that it is deployed to a desired set of nodes and not across the entire cluster. See [Assigning Pods to Nodes](#) to learn about node affinity.

To harvest pod metadata, the service account used to deploy the Machine Agent must have the `cluster-reader` role in OpenShift. The `cluster-reader` role is also required for the Kubernetes extensions to the Machine Agent.

```

# assigning cluster-reader role in OpenShift
oc adm policy add-cluster-role-to-user cluster-reader -z appd-account
  
```

If you are working with a vanilla Kubernetes distribution, it may not have a pre-built cluster role similar to `cluster-reader` in OpenShift. See [ClusterRole Configuration](#).

Instrument Applications with Kubernetes

There are several approaches to instrumenting applications deployed with Kubernetes; the method you choose depends on your particular requirements and DevOps processes. To monitor an application container with AppDynamics, you must include an App Server Agent in that container by:

- Using an appropriate base image which has the App Server Agent pre-installed.
- Loading the App Server Agent dynamically as part of the container startup using an init container.
- Loading the App Server Agent and dynamically attaching it to a running process (where the language runtime supports it).

The third option is usually applicable only to Java-based applications since the JVM supports Dynamic Attach, a standard feature of the AppDynamics Java APM Agent. See [Dynamic Java Instrumentation](#).

For the other options, it is common practice to make use of standard Kubernetes features such as Init Containers, ConfigMaps, and Secrets (as described in [Deploying AppDynamics Agents to OpenShift Using Init Containers](#)).

Resource Limits

The main application being monitored should have resource limits defined. Provide 2% padding for CPU and add up to 100 MB of memory.

To support up to 500 containers, you can configure the Machine Agent with the following resource requests and limits: `Mem = 400M, CPU = "0.1"` and `Mem = 600M, CPU = "0.2"`

- i AppDynamics provides a [Kubernetes Snapshot Extension](#) to monitor the health of the Kubernetes Cluster. When deploying this extension, only a single version of the extension should be deployed to the cluster. Do not include it in the `DaemonSet` to avoid duplicates and potential cluster overload. Instead, consider deploying the Machine Agent instance with this extension, in addition to the `DaemonSet`, as a separate deployment with a single replica for Server Visibility. In this case, you can drop the memory request to 250 M and disable the Machine Agent SIM and Docker.

Use Docker Visibility with Red Hat OpenShift

This page describes how to set up the Machine Agent with Docker Visibility enabled to run as a `DaemonSet` on an OpenShift cluster.

Docker Visibility supports OpenShift Version 3. With the Machine Agent, you can collect performance data from OpenShift clusters. By installing the agent as a `DaemonSet` on each host in the OpenShift cluster, the `DaemonSet` monitors each host on the OpenShift cluster and the corresponding containers that have an AppDynamics App Agent running. This process is similar to that of monitoring the Kubernetes cluster.

! Using Docker Visibility to monitor OpenShift containers is no longer the preferred option and will eventually be deprecated. Use the Cluster Agent instead as described in [Monitor Kubernetes with the Cluster Agent](#). The Cluster Agent supports OpenShift container visibility, as well as visibility into cluster health and capacity.

Before You Begin

 This functionality requires a Server Visibility license.

- You must have an OpenShift user account with a `cluster-admin` role, such as `system:admin`.
- Install the OpenShift command line tool (`oc`)
- AppDynamics recommends that you use Docker CE/EE v17.03 or Docker Engine \geq v1.13 with this product. Some data may be unavailable if you are using previous versions of Docker.

Set the Java Options

By default, the `MaxMetaspaceSize` is set to 100 MB in OpenShift. If your application operates within a small margin of its existing memory resource allocation, increase the allocation for the application. AppDynamics recommends allocating additional Metaspace Size space to accommodate the machine agent. Directly configure the environment variable `GC_MAX_METASPACE_SIZE` to set the `MaxMetaspaceSize` parameter in the deployment through a config map.

Register the Container ID as the Host ID

Install an App Server Agent in each container in a Kubernetes pod to collect application metrics. If multiple App Server agents are running in the same pod (for example, in the RedHat OpenShift platform), you must register the container ID as the unique host ID on both the App Server Agent and the Machine Agent to collect container-specific metrics from the pod. Kubernetes pods can contain multiple containers and they share the same host ID. The Machine Agent cannot identify different containers running in a pod unless each container ID is registered as the host ID.

To register the container ID as the host ID:

1. Get the container ID from the `cgroup`.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
cat /proc/self/cgroup | awk -F '/' '{print $NF}' | head -n 1
```

2. Register the App Server Agents.

```
-Dappdynamics.agent.uniqueHostId=$(sed -rn '1s#.*/#; 1s/docker-({12}).*/\1/p' /proc/self/cgroup)
```

3. Register the Machine Agent.

```
-Dappdynamics.docker.container.containerIdAsHostId.enabled=true
```

Create Project and Service Account

In OpenShift terminology, a *project* is a mechanism to isolate a group of users and their resources. An administrator can provide individual users or groups with permission to create projects and/or manage specific projects.

To isolate the Machine Agent from other projects, create a machine agent project:

```
oc new-project machine-agent
```

To create a service account, `ma`, with necessary privileges for the Machine Agent to obtain metrics:

1. Verify that the current project is `machine-agent`.

```
oc status
```

2. Create a service account.

```
oc create serviceaccount ma
```

Service accounts provide a secure way to control OpenShift API access without sharing a regular user's credentials.

3. Assign the privileged security context constraints (SCC) to the service account. SCC determines the permissions and abilities of pods.

```
oc adm policy add-scc-to-user privileged -z ma
```

See [Security Permissions for the Service Account](#) for the detailed list of permissions for the service account.

4. Add the `cluster-reader` role to the service account.

```
oc adm policy add-cluster-role-to-user cluster-reader -z ma
```

Secure the Machine Agent

You can deploy the Machine Agent with tighter security. Determine the level of security for the project and leverage security permissions to secure the Machine Agent.

Run the Machine Agent Without cluster-reader Role

Without the `cluster-reader` role, the Machine Agent cannot read information such as Pod and ReplicaSet from the OpenShift cluster. The agent can, however, collect other metrics except for the tags in the app server agent container.

Run the Machine Agent Without Privileged Container Mode

To disable this privilege, remove the section below from the `DaemonSet` YAML file.

```
securityContext:
  privileged: true
```

Without the Privileged Container mode, the Machine Agent cannot read files like `/hostroot/etc/passwd` and `/hostroot/proc/<pid>/etc`. Therefore, it cannot collect metrics such as processes and network.

Disabling this privilege has no effect on collecting the App Server Agent container metrics.

Security Permissions for the Service Account

The Service Account requires the following security permissions to provide maximum isolation to the project under which the Machine Agent is running:

Permission	Description
The cluster-reader role	<p>This cluster-reader role allows the Machine Agent to read tags from the OpenShift cluster.</p> <p>For example:</p> <pre>oc adm policy add-cluster-role-to-user cluster-reader -z ma</pre>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Permission	Description
The privileged SCC	<p>The privileged SCC allows the Machine Agent to be run as the root user.</p> <p>For example:</p> <pre>oc adm policy add-scc-to-user privileged -z ma</pre>
Run as privileged container	<p>Running as the privileged container allows the Machine Agent to perform operations such as reading files from <code>/etc</code> and reading process information from <code>/proc</code>.</p> <p>This privilege is configured in the DaemonSet YAML file as follows.</p> <pre>securityContext: privileged: true</pre>

Create a Docker Image of the Machine Agent

Copy the following files to a directory on a machine that can build the Docker image.

- Machine Agent Bundle - 64-bit Linux (zip)
Download this [bundle](#) and rename it to `machine-agent.zip`.
- Dockerfile
See the [sample Docker file](#) below.
- `start-appdynamics` script
See the [sample script](#) below.

Build the image with your desired method and make it available in your image registry.

Deploy the Machine Agent as DaemonSet

1. Modify the sample `DaemonSet` to point to your Controller:
 - a. Select the worker node.

```
nodeSelector:
  node-role.kubernetes.io/compute: "true"
```

- b. Change the following Controller information in the sample `DaemonSet`.

```
containers:
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

- env:
  - name: APPDYNAMICS_CONTROLLER_HOST_NAME
    value: "<controller-host-name>"
  - name: APPDYNAMICS_CONTROLLER_PORT
    value: "<controller-port>"
  - name: APPDYNAMICS_CONTROLLER_SSL_ENABLED
    value: "true"
  - name: APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY
    value: "<account-access-key>"
  - name: APPDYNAMICS_AGENT_ACCOUNT_NAME
    value: "<your-account>"
  - name: APPDYNAMICS_SIM_ENABLED
    value: "true"
  - name: APPDYNAMICS_DOCKER_ENABLED
    value: "true"

```

c. Specify the Docker image.

```
image: "<your image>"
```

d. Enable the Machine Agent to run as the privileged user.

```
securityContext:
  privileged: true
```

e. If you have a different service account name, replace it with the existing one.

```
serviceAccount: ma
serviceAccountName: ma
```

2. Create `DaemonSet` below:

a. Verify that the current project is machine-agent.

```
oc status
```

b. Create the machine-agent `DaemonSet` .

```
oc create -f machine-agent-daemonset.yaml
```

The Machine Agent appears in the UI.

Verify Machine Agent Status

If the Machine Agent does not appear in the UI, check the status as follows:

1. Check the machine-agent `DaemonSet` .

```
oc get ds
```

2. Check the machine-agent pod.

```
oc get pod
```

The pod name is `machine-agent-daemonset-<XXXX>`.

3. Check logs whether the last line is "Started AppDynamics Machine Agent Successfully."

```
oc get logs -f <machine-agent-daemonset-<XXXX>>
```

Sample Machine Agent Deployment Files

Below are sample `DaemonSet`, `Dockerfile` and `Start Script` that you can use as a reference for deploying the Machine Agent.

Sample `DaemonSet`

Modify the sample `DaemonSet` to suit your deployment scenario.

```
apiVersion: extensions/v1beta1
kind: DaemonSet
metadata:
  name: machine-agent-daemonset
  namespace: machine-agent
spec:
  selector:
    matchLabels:
      name: appdynamics-machine-agent
  template:
    metadata:
      labels:
        name: appdynamics-machine-agent
    spec:
      nodeSelector:
        node-role.kubernetes.io/compute: "true"
      containers:
      - env:
        - name: APPDYNAMICS_CONTROLLER_HOST_NAME
          value: "<your-hostname>"
        - name: APPDYNAMICS_CONTROLLER_PORT
          value: "<your-port>"
        - name: APPDYNAMICS_CONTROLLER_SSL_ENABLED
          value: "true"
        - name: APPDYNAMICS_AGENT_ACCOUNT_ACCESS_KEY
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    value: "<your-access-key>"
  - name: APPDYNAMICS_AGENT_ACCOUNT_NAME
    value: "<your-account>"
  - name: APPDYNAMICS_SIM_ENABLED
    value: "true"
  - name: APPDYNAMICS_DOCKER_ENABLED
    value: "true"
  image: <your-image>
  name: machine-agent
  securityContext:
    privileged: true
  volumeMounts:
  - mountPath: /hostroot
    name: hostroot
    readOnly: true
  - mountPath: /var/run/docker.sock
    name: docker-sock
  restartPolicy: Always
  imagePullPolicy: Always
  serviceAccount: ma
  serviceAccountName: ma
  volumes:
  - name: hostroot
    hostPath:
      path: /
  - name: docker-sock
    hostPath:
      path: /var/run/docker.sock

```

Sample Dockerfile

You can use this Dockerfile sample or the one in [OpenShift Visibility Manifests](#).

```

# Sample Dockerfile for the AppDynamics Machine Agent
# This is provided for illustration purposes only

FROM ubuntu:16.04
# Install required packages
RUN apt-get update && \
    apt-get install -y unzip && \
    apt-get clean
# Install AppDynamics Machine Agent
ENV MACHINE_AGENT_HOME /opt/appdynamics/machine-agent/
ADD machine-agent.zip /tmp/machine-agent.zip
RUN mkdir -p ${MACHINE_AGENT_HOME}
# Include start script to configure and start MA at runtime
ADD start-appdynamics ${MACHINE_AGENT_HOME}
RUN chmod 774 ${MACHINE_AGENT_HOME}/start-appdynamics

```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
# change files and directories to be owned by root so MA container user in root
group can access
RUN chgrp -R 0 /opt && \
    chmod -R g=u /opt
RUN chgrp -R 0 /tmp/machine-agent.zip && \
    chmod g=u /tmp/machine-agent.zip
# Changing directory to MACHINE AGENT HOME
WORKDIR ${MACHINE_AGENT_HOME}
# Configure and Run AppDynamics Machine Agent
CMD "./start-appdynamics"
```

Sample start-appdynamics Script

```
#!/bin/bash
unzip -oq /tmp/machine-agent.zip -d ${MACHINE_AGENT_HOME} && \
    rm /tmp/machine-agent.zip
# Start Machine Agent
./bin/machine-agent -j jre/
```

Container Metrics

To access the **Containers** Dashboard, select: AppDynamics Home > **Servers** > **Containers**.

The **Containers** Dashboard shows resource utilization metrics of your containerized applications and the underlying host machine. You can access the **Containers** Dashboard from the Servers tab in the Controller UI. The **Containers** page lists all monitored containers used by an application that is registered to the Controller.

Container Metrics

- [CPU](#)
- [Disks](#)
- [Memory](#)
- [Network](#)

CPU

Name	Description	Default Monitoring Mode
%Busy	Percentage of time the CPU was busy processing system or user requests from this container; this metric includes CPU Stolen time.	KPI
%Busy Scaled	<p>If the <code>-cpus=<value></code> option is set in the container, this metric measures the scaled value of the CPUs property. If this value is not set, this metric measures the scaled value of the Logical CPUs property.</p> <p>To enable CPU Scaling:</p> <ul style="list-style-type: none"> ◦ Log in to the Administration Console: <code>http://<controller host>:<port>/controller/admin.jsp</code> ◦ Select the user account you want. ◦ Select Add Property and add: <pre>key = sim.docker.container.cpuScaling value = true</pre> 	KPI
Logical Cores	Number of logical cores on the host machine that are available to the container.	KPI

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Name	Description	Default Monitoring Mode
Shares	The <code>-c</code> or <code>cpu-shares</code> setting used to start the container.	KPI
Throttle Count	Number of times the container CPU is throttled. Use Advanced mode to view this metric as Throttled Time. If Throttled Time is less and the container is limited on computation, then this metric is available for you to review.	KPI
Throttled Time (ms)	Total amount of time the container CPU was throttled but did not receive enough host CPU. High throttle times indicate that the <code>-c</code> or <code>cpu-shares</code> setting (used to start the container) was too low.	KPI
Total %	Average utilization, of all available CPUs, by the container.	KPI

Disks

Name	Description	Default Monitoring Mode
Average IO Utilization %	Average disk utilization for read/write operations. This metric may be unavailable on some platforms.	KPI
< <code>disk</code> > Reads/sec	Number of read operations by the container on < <code>disk</code> >.	Diagnostic
< <code>disk</code> > Writes/sec	Number of write operations by the container on < <code>disk</code> >.	Diagnostic
KB Read/sec	The rate of data read by the container from all disks and partitions.	KPI

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Name	Description	Default Monitoring Mode
KB Written/sec	The rate of data written by the container to all disks and partitions.	KPI
MB Reads/sec (MB)	Number of read operations by the container on all disks and partitions.	KPI
MB Writes/sec	Number of write operations by the container on all disks and partitions.	KPI
Queue Size	Average number of container requests queued during the time bucket. Consistently high queue sizes indicate that the container is not receiving enough IO resources. This metric may be unavailable on some platforms.	KPI

Memory

Name	Description	Default Monitoring Mode
Cache Size (MB)	Total amount of data cached in memory.	Diagnostic
Failed Count	Number of times a memory allocation failure occurred because it exceeded the pre-set memory limit for that container; or, number of times the hard limit for the container was reached.	KPI
Page Major Fault Count	Number of major page faults caused by the container. Docker metric is <code>pgmajfault</code> . A high rate of page faults could indicate that the specified memory constraints for the container are too low.	KPI
Reservation	Soft limit based on the <code>--memory-reservation</code> used to start the container.	KPI

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Name	Description	Default Monitoring Mode
Resident Set Size (MB)	Total amount of memory that belongs to stacks, heaps, and anonymous memory maps.	KPI
Usage	Memory usage by the container, in bytes.	KPI
Used %	Memory utilization by the container as a percentage of the memory hard limit, based on the <code>--memory</code> option used to start the container.	KPI
Used MB	Memory utilization by the container, in MB.	KPI

Network

Name	Description	Default Monitoring Mode ¹
Count (KB)	Network Volume, count (KB), incoming from an external network and outgoing to an external network.	KPI
Rate (KB/s)	Network Rate, rate (KB/s), incoming from an external network and outgoing to an external network.	Diagnostic
Incoming (KB)	Network traffic received by the container.	KPI
Outgoing (KB)	Network traffic sent by the container.	KPI
Incoming (KB/sec)	Rate of network traffic received by the container.	Diagnostic
Outgoing (KB/sec)	Rate of network traffic sent by the container.	Diagnostic
Incoming Packets	Number of packets received by the container.	Diagnostic
Outgoing Packets	Number of packets sent by the container.	Diagnostic

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Name	Description	Default Monitoring Mode ¹
Incoming Packets Dropped	Number of incoming packets dropped before reaching the container. A high count of dropped packets may indicate high congestion or an issue on the network path.	KPI
Outgoing Packets Dropped	Number of outgoing packets dropped after leaving the container. A high count of dropped packets may indicate high congestion or an issue on the network path.	KPI
Incoming Errors	Number of packets received with errors.	KPI
Outgoing Errors	Number of packets sent with errors.	KPI
< eth0 > Incoming Errors	Number of collision errors when < eth0 > could not receive a frame due to a problem on the interface.	Diagnostic
< eth0 > Outgoing Errors	Number of collision errors when < eth0 > could not send a frame due to a problem on the interface.	Diagnostic
< eth0 > Incoming KB	Average KB of traffic received on < eth0 >.	Diagnostic
< eth0 > Outgoing KB	Average KB of traffic sent on < eth0 >.	Diagnostic
< eth0 > Incoming KB/sec	Average rate of traffic received on < eth0 >.	Diagnostic
< eth0 > Outgoing KB/sec	Average rate of traffic sent on < eth0 >.	Diagnostic
< eth0 > Incoming Errors	Number of packets received on < eth0 > with errors.	Diagnostic
< eth0 > Outgoing Errors	Number of packets sent on < eth0 > with errors.	Diagnostic

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Name	Description	Default Monitoring Mode ¹
< eth0 > Incoming Packets Dropped	Number of incoming packets dropped before reaching < eth0 >. A high count of dropped packets may indicate high congestion or an issue on the network path.	Diagnostic
< eth0 > Outgoing Packets Dropped	Number of outgoing packets dropped after leaving < eth0 >. A high count of dropped packets may indicate high congestion or an issue on the network path.	Diagnostic

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Monitor Kubernetes with the Cluster Agent

Deployment Support

The Cluster Agent monitors the health of Kubernetes and OpenShift clusters and is supported on all major Kubernetes distributions. The Cluster Agent collects metrics and metadata for the entire cluster, including every node and namespace down to the container level. When you instrument applications with AppDynamics APM Agents, you can use the Cluster Agent to view both Kubernetes and APM metrics for those pods (if both the Cluster Agent and the APM Agents are reporting data to the same account on a Controller).

You can use the Cluster Agent to:

- Gain visibility into key Kubernetes metrics and events, and detect uptime and availability issues
- Track resource usage of pods relative to the defined requests and limits
- Diagnose issues that may prevent uptime or scalability issues, such as:
 - Pod failures and restarts
 - Node starvation
 - Pod eviction threats and pod quota violations
 - Image and storage failures
 - Pending or stuck pods
 - Bad endpoints (detects broken links between pods and application components)
 - Service endpoints in a failed state
 - Missing dependencies (Services, ConfigMaps, and Secrets)

- [Monitor Kubernetes Events](#)
- [Cluster Agent Requirements and Supported Environments](#)
- [Cluster Metrics](#)

Overview of Cluster Monitoring

The AppDynamics Cluster Agent is a lightweight Agent written in Golang used to monitor Kubernetes and OpenShift clusters. You can use the Cluster Agent to monitor and understand how Kubernetes infrastructure affects your applications and business performance. With the Cluster Agent, you can collect metadata, metrics, and events for a Kubernetes cluster. The Cluster Agent is supported on Red Hat OpenShift and cloud-based Kubernetes platforms, such as Amazon EKS, Azure AKS, and Rancher.

Cluster Monitoring in the Controller

The Cluster Agent monitors events and metrics of Kubernetes or OpenShift clusters. It also tracks the state of most Kubernetes resources: pods, replica sets, deployments, services, persistent volumes, nodes, and so on. The data is received through the Kubernetes API server and is sent to the AppDynamics Controller. See [Cluster Metrics](#).

Cluster Agent and Server Visibility with Docker Monitoring

AppDynamics Server Visibility monitors the worker nodes at a more detailed level. Server Visibility includes the ability to monitor running containers through Docker Monitoring. However, the Cluster Agent also monitors the same containers through the Kubernetes API server. You cannot run Server Visibility with Docker Monitoring enabled, and the Cluster Agent concurrently. Doing so may result in your data being overwritten, and may lead to unpredictable behaviors. See [Install Infrastructure Visibility with the Kubernetes CLI](#).

When you deploy both Agents to the cluster, ensure that you deploy the Machine Agent with Docker Visibility disabled. See [Monitor Containers with Docker Visibility](#).

Cluster Dashboard Metrics

The Cluster Dashboard provides an overview of potential issues with cluster health, grouped by category and severity. It shows error events, evictions, node resource starvation, distribution of pod phases, and issues associated with:

- Applications
- Cluster configuration
- Image or storage access
- Security access errors
- Quota violations

The dashboard contains cluster resource capacity stats and resource usage data relative to the deployment requests and limits for CPU, Memory, and Storage. The dashboard also provides real-time statistics on the state of monitored objects on the cluster, best-practice violations, and missing dependencies. See [Monitor Cluster Health](#).

Cluster Agent Health Rules

You can create Cluster Agent Health Rules based on cluster metrics. Because Health Rules for clusters are created using server health rules, the health rule violations for clusters show as a server health rule violation. When creating the Health Rule, in the **Affected Entities** section, select **Custom**, and then select

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

your Cluster Agent from the list of machines. When setting the Critical/Warning conditions, the entire metric tree displays. Select the Cluster Agent metrics for which to create the Health Rule. To create Health Rules for Cluster Agent metrics, follow the [Create a Health Rule](#) procedures.

You can create Health Rules for these metrics:

- Number of error events
- Number of evictions
- Number of threats
- Nodes with disk pressure
- Nodes with memory pressure
- CPU/Memory utilization

Cluster Agent Requirements and Supported Environments

This page describes the resource requirements, compatibility with different Kubernetes-based software, Cluster Agent distribution, licensing, and performance specifications.

Hardware Requirements

The default requirement for the hardware is as following:

- CPU: 1250m
- Memory: 300Mi

i These values are applicable when you use Cluster Agent without auto-instrumentation. The values can change when you perform auto-instrumentation. With auto-instrumentation, you need to increase the memory limits by 50Mi for every 100 pods. For Example, If 500 pods are instrumented through the agent, add 550Mi (300Mi + 250Mi) to the memory limits value. You need to increase the CPU limits by 100m (1350m) when auto-instrumentation is enabled.

Software Requirements

The Cluster Agent is designed to run on Linux and deployed using the AppDynamics Operator.

The Cluster Agent requires:

- AppDynamics Controller >= 20.3.0.
- Kubernetes versions, 1.11, 1.13, or >=1.14, with the Kubernetes [metrics-server](#) deployed and enabled on the cluster.
- A cluster that you can access and monitor.
- Sufficient Server Visibility licenses. The Cluster Agent consumes one [Server Visibility license](#). See [License Management](#).
- Access to Docker Hub or Red Hat Container Registry to pull the Cluster Agent Operator and Cluster Agent images, or access to an internal repository where these images are maintained. See [Install the Cluster Agent](#).

i If you deploy the Cluster Agent to monitor your Kubernetes Cluster, it does not monitor worker nodes. To monitor worker nodes, you must install the Machine Agent which consumes additional Server Visibility licenses (one Machine Agent per node). See [Install Infrastructure Visibility with the Kubernetes CLI](#).

The Cluster Agent is compatible with these cloud platforms:

Cloud Platform	Version
Rancher Kubernetes Engine (RKE)	<ul style="list-style-type: none"> • 1.0.4 with Kubernetes 1.17 • 1.2.1 with Kubernetes 1.19.3
Kubernetes	1.11, 1.13, 1.14, 1.17, 1.19.3 with the Kubernetes metrics-server deployed

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Cloud Platform	Version
Amazon EKS	1.11, 1.13, 1.14, 1.15, 1.16, 1.17, 1.18, and 1.19 with the Kubernetes metrics-server deployed
Azure AKS	1.11, 1.13, 1.14, 1.18, 1.19, 1.20 with the Kubernetes metrics-server deployed
Google GKE	1.14, 1.15, 1.16, 1.17, 1.18, 1.19, and 1.20
Red Hat OpenShift	3.11, 4.1, 4.2, 4.3, 4.4, 4.5, 4.6 and 4.7 <div style="border: 1px solid #add8e6; padding: 5px;">i The metrics-server is not shipped with OpenShift, you must deploy it separately. The CRI-O container runtime is supported on >=4.2.7.</div>
kubectl	>=1.11.3

i Installing AppDynamics to test or evaluate involves verifying system requirements, preparing the host, and then installing the Controller. See [Install the Controller Using the CLI](#).

Cluster Agent Distribution

You can download the Cluster Agent from the [AppDynamics Download site](#) as a zip archive. The archive also contains distribution-specific configuration files for the deployment.

Licensing

The Cluster Agent requires a [Server Visibility license](#). To get started, see [Enable Server Visibility](#). If you already have a Server Visibility license, see [Install the Cluster Agent](#) for installing Cluster Agent on a Kubernetes cluster.

Cluster Agent Performance Certification

Cluster Agent Version	Performance Certification
<=20.10	You can monitor the certified stable limit of 750 pods and 1500 containers

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Cluster Agent Version	Performance Certification
<p>>=20.11</p>	<ul style="list-style-type: none"> Cluster Agent Vertical Scaling: This is the certified stable limit: If you run one container per pod then you can monitor 2250 pods and 2250 containers. If you run two containers per pod, then you can monitor 1500 pods and 3000 containers. Cluster Agent Horizontal Scaling: If the number of pods per cluster exceeds the limit, then you can deploy multiple Cluster Agents to monitor the cluster using Helm charts. See Install the Cluster Agent with Helm Charts. For the limit of Cluster Agents per Controller, see Cluster Agent and Pod Limits.

Cluster Agent and Pod Limits

On-Premises

You can configure the number of Cluster Agents based on the overall controller capacity. To configure the limit, see the `sim.cluster.agent.limit` description under [Controller Settings for the Cluster Agent](#).

If your Cluster has more pods than can be monitored, the Cluster Agent ensures that the group of pods being monitored remains the same over time. If any of the reported pods are terminated in the future, then the Cluster Agent replaces the terminated pods with previously unreported pods and starts monitoring the newly included pods.

The total pods metric displayed on the **Pods List** page reflects only the number of pods up to the configured limit. See the `sim.cluster.pod.limit` description under [Controller Settings for the Cluster Agent](#).

SaaS

To configure the limits, create an [AppDynamics Support](#) ticket.

Install the Cluster Agent

This page describes how to install the Cluster Agent. For optional post-installation steps, including instrumenting applications with App Server Agents, see [Post-Install Workflow](#).

Installation Overview

You can install the Cluster Agent using either the Kubernetes CLI (`kubectl`) or Helm. In both cases, the Cluster Agent Operator is installed first, followed by the Cluster Agent. The exact configuration applied during the installation differs slightly based on whether the cluster is an OpenShift or Kubernetes cluster.

Installation Workflow

You must make these decisions during the installation workflow:

- The first decision is whether to use the pre-built Cluster Agent images published on Docker Hub or the OpenShift Container Registry. This is the simplest option when using the Kubernetes CLI or Helm. If you need to build a custom image to satisfy internal image policies, or if you require that the pre-built Cluster Agent image is stored in an internal container registry, see [Build the Cluster Agent Container Image](#).
- The second decision is whether to install the Cluster Agent using the Kubernetes CLI or the Cluster Agent Helm Chart. See [Install the Cluster Agent with the Kubernetes CLI](#) and [Install the Cluster Agent with Helm Charts](#).

The Cluster Agent requires that you install the [Metrics Server](#) in the cluster. If the metrics server is not already installed under the `kube-system` namespace, then you can install it using the Kubernetes CLI, as described in [Install the Cluster Agent with the Kubernetes CLI](#). If you are using the Cluster Agent Helm chart, you can set the `install.metrics-server` Helm value to `true` to install the Metrics Server subchart. See [Install the Cluster Agent with Helm Charts](#).

After the installation completes, see [Validate the Cluster Agent Installation](#) for validation and troubleshooting procedures.

Post-Install Workflow

After you install and [Validate the Cluster Agent](#), you can instrument the Kubernetes applications in the cluster with AppDynamics Server Agents. See [Container Installation Options](#) for an overview of the options.

To install the AppDynamics Server Visibility Agent or Network Agent on cluster nodes, see [Install Infrastructure Visibility with the Kubernetes CLI](#).

To enable log collection for failing pods on on-premises Controllers, see [Enable Log Collection for Failing Pods](#).

Next Steps

[Install the Cluster Agent with the Kubernetes CLI](#)

[Install the Cluster Agent with Helm Charts](#)

This page describes how to install the Cluster Agent. For optional post-installation steps, including instrumenting applications with App Server Agents, see [Post-Install Workflow](#).

Install the Cluster Agent with the Kubernetes CLI

This page describes how to install the Cluster Agent using the Kubernetes CLI which is an alternative to [Install the Cluster Agent with Helm Charts](#).

Requirements

Before you begin, verify that you have:

- Installed `kubectl` \geq 1.11.3
- Met the requirements described here: [Cluster Agent Requirements and Supported Environments](#)

Installation Procedure

1. If you have not already installed the `metrics-server`, then install it. See <https://github.com/kubernetes-sigs/metrics-server> for the most recent installation instructions.

```
kubectl create -f https://github.com/kubernetes-sigs/metrics-server/releases/download/v0.3.7/components.yaml
```

2. Download the Kubernetes or OpenShift Cluster Agent bundle from the [Download portal](#), unzip the contents of the bundle to the current directory:

```
unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
```

3. Create a `namespace` for `appdynamics` in your cluster:

```
kubectl create namespace appdynamics
```

4. Install the Cluster Agent Operator using the correct Kubernetes and OpenShift version (where applicable):

[Kubernetes \$\geq\$ 1.15](#)
[OpenShift with Kubernetes \$\geq\$ 1.15](#)
[Kubernetes \$\leq\$ 1.14](#)
[OpenShift with Kubernetes \$\leq\$ 1.14](#)

```
kubectl create -f cluster-agent-operator.yaml
```

[Kubernetes \$\geq\$ 1.15](#)
[OpenShift with Kubernetes \$\geq\$ 1.15](#)
[Kubernetes \$\leq\$ 1.14](#)
[OpenShift with Kubernetes \$\leq\$ 1.14](#)

```
kubectl create -f cluster-agent-operator-openshift.yaml
```

[Kubernetes \$\geq\$ 1.15](#)
[OpenShift with Kubernetes \$\geq\$ 1.15](#)
[Kubernetes \$\leq\$ 1.14](#)
[OpenShift with Kubernetes \$\leq\$ 1.14](#)

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
kubectl create -f cluster-agent-operator-1.14-or-less.yaml
```

[Kubernetes >= 1.15](#)
 [OpenShift with Kubernetes >= 1.15](#)
 [Kubernetes <= 1.14](#)
 [OpenShift with Kubernetes <= 1.14](#)

```
kubectl create -f cluster-agent-operator-openshift-1.14-or-less.yaml
```

- Based on the Account Access Key for the Controller, create the Controller Access Key Secret that the Cluster Agent reports to:

```
kubectl -n appdynamics create secret generic cluster-agent-secret --from-literal=controller-key=<access-key>
```

- Edit `cluster-agent.yaml` to set the AppDynamics Controller details for the Cluster Agent to report to.
 - Set the `nsToMonitor` or `nsToMonitorRegex` options to include the namespaces you want to monitor.
 - Set the image tag to the version you are installing, `cluster-agent:21.2.0`, for example.
 For additional configuration tasks, such as configuring SSL for on-premises Controllers, proxy support, or pull secrets, see [Configure the Cluster Agent](#).

This example assumes the use of the pre-built Cluster Agent image on Docker Hub. See [Build the Cluster Agent Container Image](#) to build your own image.

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "dev-cluster"
  controllerUrl: "http://mycontroller.com:8080"
  account: "my-account"
  # docker image info
  image: "docker.io/appdynamics/cluster-agent:21.2.0"
  serviceAccountName: appdynamics-cluster-agent
  nsToMonitor: [appdynamics,namespace1,namespace2]
  stdoutLogging: "true"
```

- Install the Cluster Agent:

```
kubectl create -f cluster-agent.yaml
```

See [Validate the Cluster Agent Installation](#) to validate and troubleshoot the installation. Once the install is validated, see [Container Installation Options](#) for options to install App Server Agents in applications in the cluster.

Install the Cluster Agent with Helm Charts

This page describes how to use Helm Charts to deploy the Cluster Agent.

Helm is a package manager for Kubernetes. Helm charts are a collection of files that describe a set of Kubernetes resources. The Cluster Agent Helm chart is a convenient method to deploy the Cluster Agent Operator and Cluster Agent. You can also use the Cluster Agent Helm chart to deploy multiple Cluster Agents in a single cluster. This may be necessary for larger clusters that exceed the pod monitoring limit for a single Cluster Agent. See [Cluster Agent Requirements and Supported Environments](#).

Requirements

- Cluster Agent version ≥ 20.6
- Controller version ≥ 20.6
- Cluster Agent Helm charts are compatible with Helm 3.0

Install a Single Cluster Agent in a Cluster

1. Add the chart repository to Helm:

```
helm repo add appdynamics-charts https://ciscovnet.github.io/appdynamics-charts
```

2. Create a namespace for `appdynamics` in your cluster:

```
kubectl create namespace appdynamics
```

3. Create a Helm values file, in the example called `values-ca1.yaml`.

Update the `controllerInfo` properties with the credentials from your Controller.

Update the `clusterAgent` properties to set the namespace and pods to monitor. See [Configure the Cluster Agent](#) for information about the available properties `nsToMonitor`, `nsToMonitorRegex`, `nsToExcludeRegex` and `podFilter`.

values-ca1.yaml

```
# AppDynamics controller info
controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

# Cluster agent config
clusterAgent:
```

```
nsToMonitorRegex: dev-.*
```

See [Configuration Options for values.yaml](#) for more information regarding the available options. Also, you can download a copy of `values.yaml` from the Helm Chart repository using this command:

```
helm show values appdynamics-charts/cluster-agent
```

- If you have not installed the Kubernetes `metrics-server` in the cluster (usually located in the `kube-system` namespace), then set `install.metrics-server` to `true` in the values file to invoke the subchart to install it.

```
install:
  metrics-server: true
```

i Setting `install.metrics-server` installs `metrics-server` in the namespace with the `--namespace` flag which is located in the same namespace as the Cluster Agent.

- Deploy the Cluster Agent to the `appdynamics` namespace:

```
helm install -f ./values-ca1.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --namespace=appdynamics
```

Enable Auto-Instrumentation

Once you have validated that the Cluster Agent was successfully installed, you can add additional configuration to the `instrumentationConfig` section of the values YAML file to enable auto-instrumentation. In this example, `instrumentationConfig.enabled` has been set to `true`, and multiple `instrumentationRules` have been defined. See [Auto-Instrument Applications with the Cluster Agent](#).

values-ca1.yaml with Auto-Instrumentation Enabled

```
# AppDynamics controller info
controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
# Cluster agent config
clusterAgent:
  nsToMonitorRegex: ecom|books|groceries

instrumentationConfig:
  enabled: true
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom|books|groceries
  defaultAppName: Ecommerce
  appNameStrategy: namespace
  imageInfo:
    java:
      image: "docker.io/appdynamics/java-agent:latest"
      agentMountPath: /opt/appdynamics
      imagePullPolicy: Always
  instrumentationRules:
    - namespaceRegex: groceries
      language: dotnetcore
      imageInfo:
        image: "docker.io/appdynamics/dotnet-core-agent:latest"
        agentMountPath: /opt/appdynamics
        imagePullPolicy: Always
    - namespaceRegex: books
      matchString: openmct
      language: nodejs
      imageInfo:
        image: "docker.io/appdynamics/nodejs-agent:20.5.0-alpinev10"
        agentMountPath: /opt/appdynamics
        imagePullPolicy: Always
      analyticsHost: <hostname of the Analytics Agent>
      analyticsPort: 443
      analyticsSslEnabled: true
```

After saving the `values-ca1.yaml` file with the added auto-instrumentation configuration, you must upgrade the Helm Chart:

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/
cluster-agent --namespace appdynamics
```

Configuration Options

Config option	Description	Required
---------------	-------------	----------

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

<code>deploymentMode</code>	Used for multiple cluster agent deployment in a single cluster	Optional
Image config options (Config options under <code>imageInfo</code> key in <code>values.yaml</code>)		
<code>imageInfo.agentImage</code>	Cluster agent image address in format <code><registryUrl>/<registryAccount>/<project></code>	Optional (Defaults to the Docker Hub image)
<code>imageInfo.agentTag</code>	Cluster agent image tag/version	Optional (Defaults to latest)
<code>imageInfo.operatorImage</code>	Operator image address in format <code><registryUrl>/<registryAccount>/<project></code>	Optional (Defaults to the Docker Hub image)
<code>imageInfo.operatorTag</code>	Operator image tag/version	Optional (Defaults to latest)
<code>imageInfo.imagePullPolicy</code>	Image pull policy for the operator pod	Optional
Controller config options (Config options under <code>controllerInfo</code> key in <code>values.yaml</code>)		
<code>controllerInfo.accessKey</code>	AppDynamics Controller accessKey	Required
<code>controllerInfo.account</code>	AppDynamics Controller account	Required
<code>controllerInfo.authenticateProxy</code>	true/false if the proxy requires authentication	Optional
<code>controllerInfo.customSSLCert</code>	Base64 encoding of PEM formatted SSL certificate	Optional
<code>controllerInfo.password</code>	AppDynamics Controller password	Required only when auto-instrumentation is enabled.
<code>controllerInfo.proxyPassword</code>	Password for proxy authentication	Optional

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

<code>controllerInfo.proxyUrl</code>	Proxy URL if the Controller is behind some proxy	Optional
<code>controllerInfo.proxyUser</code>	Username for proxy authentication	Optional
<code>controllerInfo.url</code>	AppDynamics Controller URL	Required
<code>controllerInfo.username</code>	AppDynamics Controller username	Required only when auto-instrumentation is enabled.
RBAC config		
<code>agentServiceAccount</code>	Service account to be used by the Cluster Agent	Optional
<code>createServiceAccount</code>	Set to true if <code>ServiceAccounts</code> mentioned are to be created by Helm	Optional
<code>operatorServiceAccount</code>	Service account to be used by the AppDynamics Operator	Optional
Agent pod config		
<code>agentPod.nodeSelector</code>	Kubernetes node selector field in the Cluster Agent pod spec	Optional
<code>agentPod.tolerations</code>	Kubernetes tolerations field in the Cluster Agent pod spec	Optional
<code>agentPod.resources</code>	Kubernetes CPU and memory resources in the Cluster Agent pod spec	Optional
Operator pod config		
<code>operatorPod.nodeSelector</code>	Kubernetes node selector field in the AppDynamics Operator pod spec	Optional

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

<code>operatorPod.tolerations</code>	Kubernetes tolerations field in the AppDynamics Operator pod spec	Optional
<code>operatorPod.resources</code>	Kubernetes CPU and memory resources in the AppDynamics Operator pod spec	Optional
Install switches		
<code>install.metrics-server</code>	True if metrics are to be installed. Metrics-server is installed in the same namespace as the agent.	Optional

Install Additional Cluster Agents in a Cluster

The Cluster Agent Helm Chart supports multiple Cluster Agents installation in a cluster. This may be necessary for larger clusters that exceed the pod monitoring limit for a single Cluster Agent. See [Cluster Agent Requirements and Supported Environments](#).

Each additional Cluster Agents that is deployed must have different configuration from any previously deployed Cluster Agents. This is achieved by limiting the monitoring to a distinct set of namespaces and pods using the `nsToMonitor`, `nsToMonitorRegex`, `nsToMonitorExcludeRegex` and `podFilter` properties. See [Configure the Cluster Agent](#).

The first Cluster Agent must be installed using the steps above where the default value of the `deploymentMode` property is not overridden and set to `PRIMARY`. Additional Cluster Agents must set `deploymentMode` to `NAMESPACED`.

To install additional Cluster Agents:

1. Create a new values file, called `values-ca2.yaml` as the example, that uses the same `controllerInfo` properties as the first Cluster Agent. Set `deploymentMode` to `NAMESPACED`. Add additional properties, such as `nsToMonitorRegex` and `podFilter`, to set the monitoring scope for this Cluster Agent.

values-ca2.yaml

```
deploymentMode: NAMESPACE
# AppDynamics controller info
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

# Cluster agent config
clusterAgent:
  nsToMonitorRegex: stage.*

podFilter:
  allowlistedLabels:
    - label1: value1
    - label2: value2
  blocklistedLabels: []
  allowlistedNames: []
  blocklistedNames: []

```

2. Create a namespace distinct from the previous namespace used for the first installation:

```
kubectl create ns appdynamics-ca2
```

3. Install the additional Cluster Agent:

```
helm install -f ./values-ca2.yaml "<my-2nd-cluster-agent-helm-release>" appdynamics-
charts/cluster-agent --namespace=appdynamics-ca2
```

You can enable auto-instrumentation only in the first Cluster Agent using `PRIMARY` mode. The Helm Chart generates an error if auto-instrumentation was enabled by additional Cluster Agents using that `Namespaced` mode.

Cluster Agent Helm Chart Configuration Examples

These examples display various configurations for the Cluster Agent Helm chart:

Use the Cluster Agent Helm Chart to Enable Custom SSL

user-values.yaml

```

controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>

```

```

username: <appdynamics-controller-username>
password: <appdynamics-controller-password>
accessKey: <appdynamics-controller-access-key>

#####
customSSLCert: "<base64 of PEM formatted cert>"
#####

agentServiceAccount: appdynamics-cluster-agent-ssl      # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl      # Can be any valid name
  
```

Use the Cluster Agent Helm Chart to Enable the Proxy Controller

Without authentication:

user-values.yaml

```

controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

#####
proxyUrl: http://proxy-url.appd-controller.com
#####

agentServiceAccount: appdynamics-cluster-agent-ssl      # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl      # Can be any valid name
  
```

With authentication:

user-values.yaml

```

controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

#####
  
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

authenticateProxy: true
proxyUrl: http://proxy-url.appd-controller.com
proxyUser: hello
proxyPassword: world
#=====

agentServiceAccount: appdynamics-cluster-agent-ssl      # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl      # Can be any valid name

```

Use the Cluster Agent Helm Chart to add `nodeSelector` and `tolerations`

user-values.yaml

```

agentPod:
  nodeSelector:
    nodeLabelKey: nodeLabelValue
  tolerations:
    - effect: NoExecute
      operator: Equal
      key: key1
      value: val1
      tolerationSeconds: 11

operatorPod:
  nodeSelector:
    nodeLabelKey: nodeLabelValue
    anotherNodeLabel: anotherNodeLabel
  tolerations:
    - operator: Exists
      key: key1

```

Best Practices for Sensitive Data

We recommend using multiple `values.yaml` files to separate sensitive data in separate `values.yaml` files. Examples of these values are:

- `controllerInfo.password`
- `controllerInfo.accessKey`
- `controllerInfo.customSSLCert`
- `controllerInfo.proxyPassword`

Each `values` file follows the structure of the default `values.yaml` enabling you to easily share files with non-sensitive configuration properties yet keep sensitive values safe.

Default `user-values.yaml` **File Example**
user-values.yaml

```

deploymentMode: PRIMARY

imageInfo:
  agentImage: docker.io/appdynamics/cluster-agent
  agentTag: latest
  operatorImage: docker.io/appdynamics/cluster-agent-operator
  operatorTag: latest
  imagePullPolicy: Always

controllerInfo:
  url: https://<controller-url>:443
  account: <appdynamics-controller-account>
  username: <appdynamics-controller-username>
  password: <appdynamics-controller-password>
  accessKey: <appdynamics-controller-access-key>

agentServiceAccount: appdynamics-cluster-agent-ssl      # Can be any valid name
operatorServiceAccount: appdynamics-operator-ssl      # Can be any valid name
  
```

user-values-sensitive.yaml

```

controllerInfo:
  password: welcome
  accessKey: abc-def-ghi-1516
  
```

When installing the Helm Chart, use multiple `-f` parameters to reference the files:

```

helm install -f ./user-values.yaml -f ./user-values-sensitive.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/cluster-agent --namespace ca-appdynamics
  
```

Validate the Cluster Agent Installation

This page describes how to validate a Cluster Agent installation using the Kubernetes CLI or Helm chart.

Cluster Agent Validation

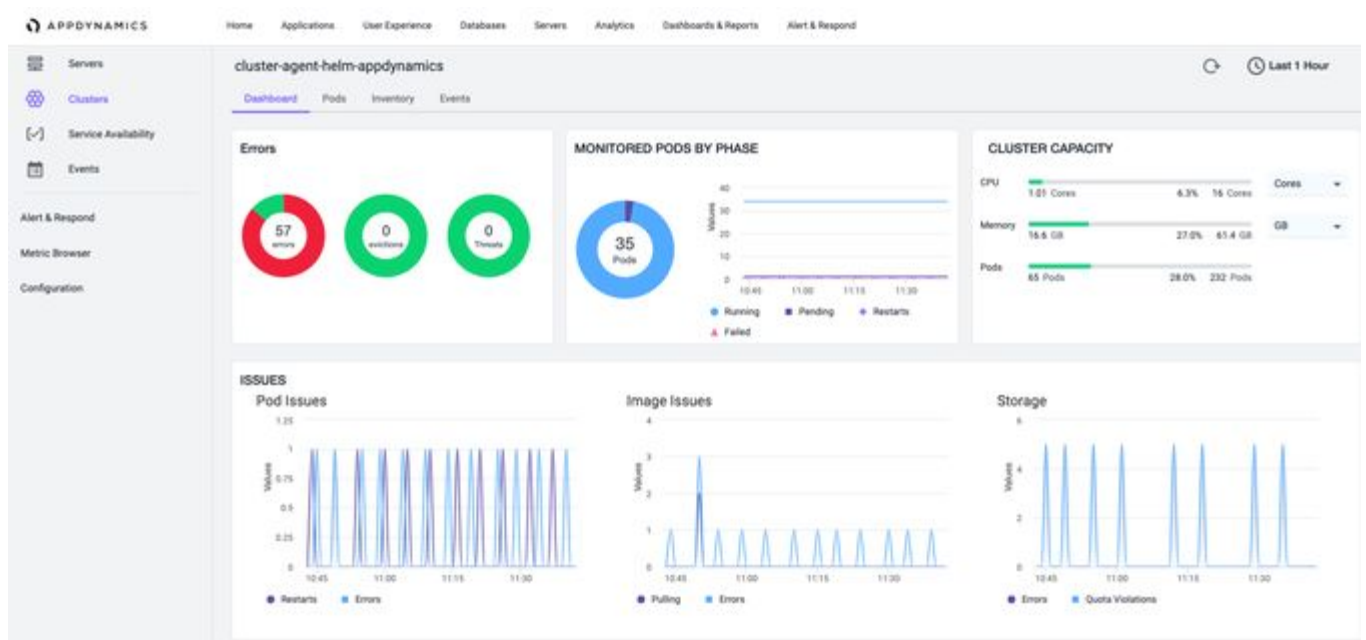

1. Verify that the Cluster Agent and Cluster Agent Operator pods are running by reviewing the status:

```
kubectl -n appdynamics get pods
```

NAME	READY	STATUS	RESTARTS
AGE			
appdynamics-operator-7958f676d9-gvdcw	1/1	Running	0
4d21h			
k8s-cluster-agent-5967c9b7b9-rkwzt	1/1	Running	0
4d21h			

2. Verify that the Cluster Agent is reporting to the Controller. If the Cluster Agent successfully registers with the Controller based on the credentials you entered in the `cluster-agent.yaml` file, and the `cluster-agent-secret` you created in the `appdynamics` namespace (which contains the Controller Account Access Key), then the Cluster Agent displays in the Controller UI under **Servers/Cluster** using the `appName` from `cluster-agent.yaml`.

i It may take 5-10 minutes for the data to populate.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- Verify the monitored namespaces. Under the **Inventory** dashboard, check that the monitored namespaces match the namespace configuration in the `cluster-agent.yaml` file and that the monitored namespaces contain deployed pods.

The screenshot shows the 'Inventory' dashboard for a cluster named 'cluster-agent-helm-appdynamics'. At the top, there are navigation tabs for 'Dashboard', 'Pods', 'Inventory' (selected), and 'Events'. Below the tabs, a summary card displays cluster information: Cluster Name, Kubernetes Version (v1.19.6-eks-49a6c0), and Cluster ID (1138081). It also shows 0 Masters and 4 Workers, along with a 'Disk Pressure' indicator. A 'PODS (35)' section features a donut chart showing 34 Running pods and 1 Pending pod. To the right, a search bar is present above a list of namespaces, which currently shows 'cluster-agent-demo'.

If necessary, update the namespace configuration (`nsToMonitor` , `nsToMonitorRegex`) in `cluster-agent.yaml` and re-create the Cluster Agent.

```
kubectl -n appdynamics delete -f cluster-agent.yaml
kubectl -n appdynamics create -f cluster-agent.yaml
```

If you are still experiencing problems with the installation, see [Troubleshoot the Cluster Agent](#).

Troubleshoot the Cluster Agent

This page describes steps to troubleshoot the Cluster Agent install. See [Install the Cluster Agent](#) and [Validate the Cluster Agent Installation](#).

Troubleshoot a Cluster Agent Not Reporting to the Controller

If after installing the Cluster Agent the Cluster Dashboard does not appear in the Controller, it could be the result of a connectivity issue with the Controller.

1. Verify that a Server Visibility license is available. The Cluster Agent requires an available Server Visibility license to register successfully. See [Cluster Agent Requirements and Supported Environments](#). From the Controller UI, check that a license is available under **Administration/License/Account Usage**.
2. Review the Cluster Agent events. If the Cluster Agent or Cluster Agent Operator fails to start, then review the events in the `appdynamics` namespace:

```
kubectl -n appdynamics get events  
  
# to sort by most recent events:  
kubectl -n appdynamics get events --sort-by='.lastTimestamp'
```

You can review the Cluster Agent pod specification for additional events:

```
kubectl -n appdynamics get pod <cluster-agent-pod> -o yaml
```

3. Review the Cluster Agent logs for errors regarding Controller communication. Open a command-line prompt and enter:

```
kubectl -n appdynamics logs <cluster-agent-pod-name>
```

4. Verify the Cluster Agent configuration. The Cluster Agent checks for configuration changes once a minute. To verify that your configurations have been applied and that the Cluster Agent is using the new values, open a command-line prompt and enter:

```
kubectl -n appdynamics describe cm cluster-agent-mon cluster-agent-log cluster-agent-config
```

5. Verify that the latest Cluster Agent is installed. If you are upgrading the Cluster Agent from a previous version, then the previous Operator YAML or image may not be compatible. You must reinstall the Cluster Agent Operator and Cluster Agent using the procedure described in [Upgrade the Cluster Agent](#).

Troubleshoot a Cluster Agent Not Reporting Metrics

If the Cluster Agent does not report metrics for certain containers, pods, or nodes, it may be due to a problem with the Kubernetes [Metrics Server](#). If metrics are not reported by the Metrics Server, then the Cluster Agent is unable to report them.

To verify that the Metrics Server is sending metrics, enter this command from your cluster's primary node:

```
$ kubectl get --raw /apis/metrics.k8s.io/v1beta1/pods
```

If the output of the command does not show metrics for the container, there may be a problem with the Metrics Server. This example shows output from the Metrics Server:

```
{
  "kind": "PodMetricsList",
  "apiVersion": "metrics.k8s.io/v1beta1",
  "metadata": {
    "selfLink": "/apis/metrics.k8s.io/v1beta1/pods"
  },
  "items": [
    {
      "metadata": {
        "name": "replicaset-test-cjnsc",
        "namespace": "test-qe",
        "selfLink": "/apis/metrics.k8s.io/v1beta1/namespaces/test-qe/pods/replicaset-test-cjnsc",
        "creationTimestamp": "2019-09-23T10:24:46Z"
      },
      "timestamp": "2019-09-23T10:23:38Z",
      "window": "30s",
      "containers": [
        {
          "name": "appagent",
          "usage": {
            "cpu": "1667384n",
            "memory": "258672Ki"
          }
        }
      ]
    }
  ]
}
```

As the Metric Server collects metrics from nodes, pods, and containers, it logs all issues. To retrieve and view logs for the Metric Server, enter:

```
$ kubectl logs <metric-server pod name> -n <namespace for metric-server(default value is: "kube-system")> --tail <number of required lines of logs>
```

For example:

```
$ kubectl logs metrics-server-6764b987d-mtn7g -n kube-system --tail 20
```

The Metric Server logs may reveal why it could not collect metrics. For example:

```
E0920 11:44:54.204075      1 reststorage.go:147] unable to fetch pod metrics for pod test-
qe/replicaset-test-9k7rl: no metrics known for pod
E0920 11:44:54.204080      1 reststorage.go:147] unable to fetch pod metrics for pod test/
replicaset1-458-g9n2d: no metrics known for pod
E0920 11:44:54.204089      1 reststorage.go:147] unable to fetch pod metrics for pod kube-
system/kube-proxy-t54rc: no metrics known for pod
E0920 11:45:19.188033      1 manager.go:111] unable to fully collect metrics: unable to
fully scrape metrics from source kubelet_summary:ip-111.111.111.111: unable to fetch metrics
from Kubelet ip-111.111.111.111 (111.111.111.111): Get https://111.111.111.111:2222/stats/
summary/: dial tcp 111.111.111.111:2222: i/o timeout
```

Cluster Agent Restarts

If the Cluster Agent restarts, you can verify that a restart occurred from the pod details. To retrieve the pod details, enter:

```
kubectl get pods -n appdynamics
```

Sample output:

NAME	READY	STATUS	RESTARTS	AGE
appdynamics-operator-6fff76b466-qt57	1/1	Running	0	4h18m
k8s-cluster-agent-perf-jg-6fc498d557-q7zst	1/1	Running	1	83m

If the Cluster Agent unexpectedly restarts, the `RESTARTS` count value will be greater than zero. You will have to explicitly reset both namespaces and the logs.

i AppDynamics strongly recommends that you do not overwrite the default `stdoutLogging: true` property value in the `cluster-agent.yaml` file. If you set this property to `false`, the `kubectl logs` command does not return logs.

Cluster Agent logs persist even if the Cluster Agent is restarted by Kubernetes. To view the Cluster Agent logs for the Cluster Agent pod (that restarted), enter:

```
kubectll -n appdynamics logs --previous ${CLUSTER_AGENT_POD_NAME}
```

If the Cluster Agent pod has restarted, the monitored namespaces (that you configured through the UI) are not preserved. If you configured namespaces through the UI, you should add the same namespaces to your `cluster-agent.yaml` file under `nsToMonitor`, and then apply the configuration. As a result, the Cluster Agent pod will retain the monitored namespaces when it restarts.

If you did not add namespaces to the `cluster-agent.yaml` file, you can reconfigure your monitored namespaces:

1. Go to **Appdynamics Agents > Cluster Agents > {CLUSTER_AGENT} > Configure**.
2. Add the namespaces to monitor.

See [Add or Remove Namespaces](#).

APM Correlation on OpenShift 4.x

Container Runtime Interface using OCI (Open Container Initiative) compatible runtimes (CRI-O), is the default container runtime on Red Hat OpenShift 4.x. If you use APM Agents with OpenShift 4.x, you must update the `UNIQUE_HOST_ID` to support the syntax required for CRI-O containers. This setting applies to both new and existing application containers. If you are running App Agents, then you must modify the App Agent `YAML` file.

To run App Agents with APM correlation on OpenShift 4.x:

1. Open your App Agent `YAML` file.
2. Locate the `spec: > args:` section within the file.
3. Update the `UNIQUE_HOST_ID` argument in the `containers spec` using this example as a guide:

```
spec:
  containers:
  - name: client-api
    command: ["/bin/sh"]
    args: ["-c", "UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/(.{12}).*/\\1/p' /proc/self/cgroup) && java -Dappdynamics.agent.uniqueHostId=${UNIQUE_HOST_ID} $JAVA_OPTS -jar /java-services.jar"]
    envFrom:
    - configMapRef:
      name: agent-config
```

If APM Correlation is working correctly, when you click the **Pod Details** link, the link opens the APM Node Dashboard for that node.

Cluster Agents or Pods are not Visible in the Controller

If Agents or pods are not visible in the Controller, or if Agents or pods are not registered and reporting, review the `sim.cluster.agent.limit` and `sim.cluster.pod.limit` descriptions in [Controller Settings for the Cluster Agent](#).

Cluster Agent Pods are not Created When Security Policy is Enabled

If you have Pod Security Policies applied in the cluster, add the following to the `cluster-agent-operator.yaml` file:

```
securityContext:
  runAsUser: 1000
```

This YAML file example displays the security context:

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: appdynamics-operator
  namespace: appdynamics
  .
  .
spec:
  .
  .
  .
  template:
    .
    .
    securityContext:
      runAsUser: 1000
```

i For Agent 20.4 and 20.5, add the `runAsUser: 1000` field in the `cluster-agent.yaml` file.

Cluster Agent Configuration Files

This page provides a reference for these internal configuration files used by the Cluster Agent:

- `agent-monitoring.yml`
- `bootstrap-config.yml`
- `logger-config.yml`

! AppDynamics recommends that you do not change the default values unless asked to do so by AppDynamics Support. Values supplied by the AppDynamics Operator always take precedence over the internal configuration files.

Agent Monitoring Configuration Reference

The `agent-monitoring.yml` file contains configuration information that can be modified by the Cluster Agent. The table lists the fields expected by the `agent-monitoring.yml` file. Use these fields to configure pods and containers monitored by the Cluster Agent:

Field name	Description	Default
<code>blocklisted-label</code>	(Optional) Field used to specify a Kubernetes label (a <code>key-value</code> pair). If this label exists, then the container, or pod, is not monitored. In the example, any pods with the label <code>appdynamics.exclude</code> set to <code>true</code> are blocklisted.	<code>appdynamics.exclude: true</code>
<code>blocklisted-names</code>	(Optional) Field used to specify which pods and containers are not monitored. In the example, the pod <code>ignored-pod</code> with associated containers <code>container3</code> and <code>container4</code> are not monitored.	Empty
<code>cluster-metric-collection-interval-seconds</code>	How often the Agent collects metrics in seconds Do not set this value to less than 30 seconds	60

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Field name	Description	Default
<code>container-filter</code>	(Optional) Blocklist or allowlist pods and containers, based on the container names	Empty
<code>container-registration-batch-size</code>	Maximum number of containers per batch in one registration cycle	25
<code>container-registration-max-parallel-requests</code>	Maximum number of batches in one registration cycle	3
<code>metadata-collection-interval-seconds</code>	How often metadata is collected for containers and pods	60
<code>metric-collection-interval-seconds</code>	<p>Sampling interval at which metrics should be collected periodically</p> <p>Do not set this value to less than 15 seconds</p> <div style="border: 1px solid #007bff; padding: 5px; margin-top: 10px;"> <p>i The Kubernetes Metrics Server's sampling interval must be the same as this configuration value. Any change to this configuration requires a re-deployment of the Kubernetes metrics-server add-on.</p> </div>	<ul style="list-style-type: none"> • Default metric collection sampling interval is 30 seconds • Default collection interval in <code>kubelet</code> is 15 seconds
<code>metric-upload-retry-count</code>	Number of times metric upload action to be attempted, if unsuccessful for the first time	3
<code>metric-upload-retry-interval-milliseconds</code>	Interval between consecutive metric upload retries, in milliseconds	5
<code>pod-registration-batch-size</code>	Maximum number of pods per batch in one registration cycle	30

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Field name	Description	Default
allowlisted-names	(Optional) Field used to specify pods and containers to monitor. In the example, the pod <code>monitored-pod</code> with its containers <code>container1</code> and <code>container2</code> are monitored.	Empty

agent-monitoring.yml example:

```
metric-collection-interval-seconds: 30
container-filter:
  blocklisted-label:
    appdynamics.exclude:
      true
# allowlisted-names:
#   pod-name1:
#     container-name1
#     container-name2
#   pod-name2:
#     container-name1
#     container-name2
#   pod-name3:
#     container-name1
#     container-name2
# blocklisted-names:
#   pod-name:
#     container-name1
#     container-name2
#   pod-name2:
#     container-name1
#     container-name2
```

Bootstrap Configuration Reference

The `bootstrap-config.yml` file contains configuration information read by the Cluster Agent during start up. The table lists the fields expected by the `bootstrap-config.yml` file:

Field name	Description	Default
account	Name of the account on the Controller	Empty

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Field name	Description	Default
<code>account-access-key</code>	Account access key	Empty
<code>cluster-name</code>	Unique name assigned to the monitoring cluster	Empty
<code>container-registration-interval-seconds</code>	How often the Cluster Agent sends container information to the Controller. The interval at which the Cluster Agent checks for running containers. Modify the default value only if you want to discover running containers more frequently; use the default value for most environments.	120
<code>controller-host</code>	Controller host name	Empty
<code>controller-port</code>	Controller port	Empty
<code>controller-ssl-enabled</code>	Denotes if the Controller is SSL-enabled	false
<code>event-upload-interval-seconds</code>	How often events are uploaded to the Controller, in seconds	10
<code>http-client-timeout-seconds</code>	Number of seconds after which the server call is terminated if no response is received from the Controller	30
<code>log-output-directory</code>	Directory to which the logs should be written	logs
<code>monitored-namespaces</code>	Namespaces to be monitored in the cluster; comma-separated strings	default

`bootstrap-config.yml` example:

```

account: <account-name>
account-access-key: <account-access-key>
controller-host: localhost
controller-port: 8090
cluster-name: <cluster-name>
  
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

monitored-namespaces: default
event-upload-interval-seconds: 10
container-registration-interval-seconds: 120
http-client-timeout-seconds: 30
log-output-directory: logs
# SSL configuration
controller-ssl-enabled: false

```

Logging Configuration Reference

By default, the AppDynamics Cluster Agent writes log files to the `<cluster_agent_home>/logs/<node_name>` directory.

You can control the logging level for the Cluster Agent by changing the value of the `log-level` parameter. For maximum debugging information, set the `logger-config.yml` logging level to `DEBUG`.

You can modify the `logger-config.yml` file and set values for these attributes:

Attribute	Description	Default	Type
<code>log-level</code>	Number of log details: <code>INFO</code> , <code>WARNING</code> , <code>DEBUG</code> or <code>TRACE</code>	<code>INFO</code>	String
<code>max-filesize-mb</code>	Maximum file size of the log in MB	<code>5</code>	Integer
<code>max-backups</code>	Maximum number of backups the log saves. When the maximum number of backups is reached, the oldest log file after the initial log file is deleted.	<code>3</code>	Integer
<code>write-to-stdout</code>	Write logging information to <code>stdout</code> . Options: <code>true</code> , <code>false</code> .	<code>true</code>	String

`logger-config.yml` example:

```

log-level: INFO
max-filesize-mb: 5
max-backups: 3
write-to-stdout: true

```

Configure the Cluster Agent

This page describes the contents of the Cluster Agent bundle downloaded from the [Download portal](#), and how to perform common configuration tasks:

- [Configure Proxy Support](#)
- [Configure the Cluster Agent to use SSL for on-premises Controllers](#)
- [Configure a Pull Secret](#)

See [Cluster Agent YAML File Configuration Reference](#) for configuration option details.

i This page contains links to Kubernetes documentation. AppDynamics makes no representation as to the accuracy of Kubernetes documentation because Kubernetes controls its own documentation.

Directory Structure of the Cluster Agent Bundle

An unzipped Cluster Agent bundle contains this directory structure:

[Alpine Linux](#) [Rhel Linux 7](#)

```

cluster-agent
├── cluster-agent-operator.yaml
├── cluster-agent-operator-1.14-or-less.yaml

Cluster Agent Bundle Files

This table describes the Cluster Agent directory files:

File Name	Description
<code>cluster-agent.yaml</code>	<p>File used to configure and deploy the Cluster Agent.</p> <ul style="list-style-type: none"> The <code>cluster-agent.yaml</code> file provides Controller details and starts the Cluster Agent. Where values are specified in the AppDynamics Operator configuration, these values always take precedence over any internal configuration file.
<code>cluster-agent-operator.yaml</code> <code>cluster-agent-operator-1.14-or-less.yaml</code>	<p>Files used to deploy the Cluster Agent Operator. These files set the default values for Kubernetes, Amazon EKS, and AKS, including a minimal set of RBAC permissions.</p>
<code>cluster-agent-operator-openshift.yaml</code> <code>cluster-agent-operator-openshift-1.14-or-less.yaml</code>	<p>Files used to deploy the Cluster Agent on Red Hat OpenShift. These files set the default values for Red Hat OpenShift, including a minimal set of RBAC permissions.</p>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

File Name	Description
<code>docker</code>	Docker directory contains all files required to create the Cluster Agent image.
<code>Dockerfile</code>	<code>dockerfile</code> used to create the Alpine-based Cluster Agent image.
<code>Dockerfile-rhel</code>	<code>dockerfile</code> used to create the RHEL-based Cluster Agent image.
<code>LICENSE</code>	Latest EULA file attached with the Cluster Agent image.
<code>cluster-agent.zip</code>	Zip archive containing the Cluster Agent binaries and configuration files.
<code>helm-charts</code>	Folder used to build the charts for deploying the Cluster Agent using Helm in Kubernetes.
<code>README-rhel.md</code> <code>README-alpine.md</code>	Contains instructions on how to start the Cluster Agent using your preferred operating system.
<code>start-appdynamics</code>	Script used to run the Cluster Agent within Docker.

Configure Proxy Support

1. Locate and edit the `cluster-agent.yaml` file.
2. Add a `proxyUrl` parameter to the `cluster-agent.yaml` file:

```
proxyUrl: <protocol>://<host>:<port>
```

3. (Optional) If the proxy server requires authentication:
 - a. Add a `proxyUser` :

```
proxyUser: <user>
```

- b. Create a `secret` with a `proxy-password` :

```
kubectl -n appdynamics create secret generic cluster-agent-proxy-secret --from-literal=proxy-password='<password>'
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

4. (Optional) If you are using SSL only for your proxy:
 - a. Create a `secret` from a `.pem` certificate file (the certificate file must be named `proxy-ssl.pem`):

```
kubectl -n appdynamics create secret generic ssl-cert --from-file=proxy-ssl.pem
```

- b. Set a secret filename in the `cluster-agent.yaml` file:

```
customSSLSecret: "ssl-cert"
```

To use SSL with your proxy and your Controller, see [Proxy and On-Premises Certificates Combined](#).

Configure the Cluster Agent to Use SSL for On-Premises Controllers

 Cluster Agent SSL is automatically handled for SaaS Controllers.

Controllers with Public and Self-Signed Certificates

To configure SSL with a public or self-signed certificate, use `kubectl` to generate a secret. Enter this `kubectl` command, and include the path to your public or self-signed certificate:

```
kubectl -n appdynamics create secret generic ssl-cert --from-file=<path-to-your-self-signed-certs>/custom-ssl.pem
```

The certificate file must be named: `custom-ssl.pem`.

After your secret is created, you must add the `customSSLSecret` property with the secret name specified in the previous step to the `cluster-agent.yaml` file:

```
customSSLSecret: "ssl-cert"
```

Proxy and On-Premises Certificates Combined

If you have two different SSL certificates (one for the proxy server, and a different one for the on-premises Controller), then you can encapsulate both of them into a single secret:

```
kubectl -n appdynamics create secret generic ssl-cert --from-file=proxy-ssl.pem --from-file=<path-to-your-self-signed-certs>/custom-ssl.pem
```

The Cluster Agent pulls each certificate from the secret identified in the `customSSLSecret` attribute and uses it appropriately.

This example shows a `cluster-agent.yaml` file with the `customSSLSecret` attribute defined:

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent-manual
  namespace: appdynamics
spec:
  # init agent configuration
  appName: "test-k8s-cluster-agent"
  controllerUrl: "https://<controller-url>:443" # always schema and port
  account: "<account-name>" # account
  # agent related properties
  # custom SSL secret name
  customSSLSecret: "ssl-cert"
  # logging properties
  logLevel: INFO
  logFileSizeMb: 7
  logFileBackups: 6
  # docker image info
  image: "<image-url>"
  
```

Configure a Pull Secret

If the Cluster Agent requires a secret to pull images from a container registry, use the Kubernetes API to create the secret and reference it in `cluster-agent.yaml`.

[Kubernetes](#) [OpenShift](#)

```

$ kubectl -n appdynamics create secret docker-registry myregcred --docker-server=https://
index.docker.io/v1 --docker-username=<docker-username> --docker-password=<docker-password>
--docker-email=unused
  
```

[Kubernetes](#) [OpenShift](#)

```

$ oc -n appdynamics create secret docker-registry myregcred --docker-server=https://
index.docker.io/v1 --docker-username=<docker-username> --docker-password=<docker-password>
--docker-email=unused
  
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
$ oc -n appdynamics secrets link appdynamics-operator regcred --for=pull
```

Set the `imagePullSecret` property in `cluster-agent.yaml` to the name of the secret created above (`myregcred`):

```
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "mycluster"
  controllerUrl: "http://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  image: "<your-docker-registry>/appdynamics/cluster-agent:tag"
  serviceAccountName: appdynamics-cluster-agent
  imagePullSecret: "myregcred"
```

Cluster Agent `YAML` File Configuration Reference

To configure the Cluster Agent, use the `cluster-agent.yaml` file included with the download package as a template. You can modify these parameters:

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
<code>account</code>	AppDynamics account name.	admin	N/A	No	String	Required
<code>appName</code>	Name of the cluster; displays in the Controller UI as your cluster name.	k8s-cluster	N/A	No	String	Required

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
<code>controllerUrl</code>	Full AppDynamics Controller URL, including protocol and port.	HTTP: http://appd-controller.com:8090/ HTTPS: https://appd-controller.com:443	N/A	No	String	Required
<code>customSSLSecret</code>	Provides the self-signed or public certificates to the Cluster Agent.	"ssl-cert"	N/A	No	String	Optional
<code>eventUploadInterval</code>	How often Kubernetes warning and state-change events are uploaded to the Controller in seconds. See Monitor Kubernetes Events .	10	10	No	Integer	Optional
<code>httpClientTimeout</code>	If no response is received from the Controller, number of seconds after which the server call is terminated.	30	30	No	Integer	Optional

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
<code>image</code>	Cluster Agent image.	<code>your-docker-registry / appdynamics / cluster-agent:latest</code>	N/A	No	String	Required
<code>imagePullSecret</code>	Credential file used to authenticate when pulling images from your private Docker registry or repository. Based on your Docker registry configuration, you may need to create a secret file for the AppDynamics Operator to use when pulling the image for the Cluster Agent. See Create a Secret by providing credentials on the command line .	<code>regcred</code>	N/A	No	String	Optional
<code>logFileSizeMb</code>	Maximum file size of the log in MB.	5	5	Yes	Integer	Optional

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
logFileBackups	Maximum number of backups saved in the log. When the maximum number of backups is reached, the oldest log file after the initial log file is deleted.	3	3	Yes	Integer	Optional
logLevel	Number of log details. INFO , WARNING , DEBUG , or TRACE .	"INFO"	INFO	Yes	String	Optional
maxPodLogsTailLinesCount	Number of lines to be tailed while collecting logs. To use this parameter, enable the log capturing feature. See Enable Log Collection for Failing Pods .	500	500	Yes	Integer	Optional
nodeSelector	The Cluster Agent pod runs on the node that includes the specified key-value pair within its labels property. See nodeSelector .	nodeSelector: kubernetes.io/e2e-az-name: az1	N/A	No	map [string] [string]	Optional

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
<code>nsToMonitor</code>	Namespaces to be monitored in the cluster.	<pre>nsToMonitor: - "default" - "appdynamics"</pre>	<code>default</code>	No	String List (Sequence)	Optional
<code>nsToMonitorRegex</code>	<p>The regular expression for selecting the required namespaces to be monitored in the cluster.</p> <p>This parameter supersedes <code>nsToMonitor</code>. If you do not specify a value for this parameter, then the Cluster Agent uses the default value of <code>nsToMonitor</code>.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p>i This parameter is supported in Cluster Agent ≥ 20.9, and Controller ≥ 20.10.</p> </div> <p>See Edit Namespaces.</p>	<pre>nsToMonitorRegex: .*</pre>	N/A	Yes	Regular expression	Optional

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
nsToExcludeRegex	<p>The regular expression for the namespaces that must be excluded from the selected namespaces that match the regular expression mentioned for nsToMonitorRegex .</p> <div style="border: 1px solid #0070C0; padding: 5px; margin: 10px 0;"> <p>i This parameter is supported in Cluster Agent >= 20.9, and Controller >= 20.10.</p> </div> <p>This parameter can be used only if you have specified a value for the nsToMonitorRegex parameter.</p>	<pre>nsToExcludeRegex : ns.*</pre>	N/A	Yes	Regular expression	Optional

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
podFilter	<p>Blocklist or allowlist pods based on:</p> <ul style="list-style-type: none"> Regular expressions for pod names Pod labels <p>Blocklisting or allowlisting by name takes preference over blocklisting or allowlisting by labels. For example, if you have the podFilter as:</p> <pre>podFilter: blocklistedLabels: - release: v1 allowlistedNames: - ^podname</pre> <p>This blocks all the pods which have the label 'release=v1' except for the ones which have the names starting with 'podname'.</p>	<pre>podFilter: blocklistedLabels: - label1: value1 allowlistedLabels: - label1: value1 allowlistedNames: - name1 blocklistedNames: - name2</pre>	N/A	Yes	String	Optional

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
	<ul style="list-style-type: none"> When a pod is listed as allowed by name and blocked by name, it will be allowlisted. When a pod is listed as allowed by a label and blocked by a label, it will be allowlisted. 					
<code>proxyUrl</code>	Publicly accessible host name of the proxy.	<code>https://myproxy.example.com:8080</code>	N/A	No	String	Optional
<code>proxyUser</code>	Username associated with the basic authentication credentials.	<code>"user1"</code>	N/A	No	String	Optional
<code>resources</code>	Requests and limits of CPU and memory resources for the Cluster Agent.	<pre>resources: limits: cpu: 300m memory: "200Mi" requests: cpu: 200m memory: "100Mi"</pre>	<ul style="list-style-type: none"> CPU <ul style="list-style-type: none"> request: 750m limit: 1250m Memory <ul style="list-style-type: none"> request: 150Mi limit: 300Mi 	Yes	Array	Optional

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
<code>stdoutLogging</code>	By default, the Cluster Agent writes to a log file in the <code>logs</code> directory. Additionally, the <code>stdoutLogging</code> parameter is provided to send logs to the container <code>stdout</code> .	"true", "false"	true	Yes	String	Optional

Parameter	Description	Example	Default	Dynamically Configurable?	Type	Required?
<code>tolerations</code>	An array of tolerations required for the pod. See Taint and Tolerations .	<pre> tolerations: - effect: NoSchedule key: type value: test - effect: NoExecute key: node.kubernetes.io/not-ready operator: Exists tolerationSeconds: 600 </pre>	N/A	No	Array	Optional

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

i For specific auto-instrumentation configurations, see [Auto-Instrument Applications with the Cluster Agent](#). Also the `.yaml` file includes the permissions for auto-instrumentation, which is enabled by default. If you do not want to use auto-instrumentation, you can remove the following text from the `.yaml` file:

```
kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1
metadata:
  name: appdynamics-cluster-agent-instrumentation
subjects:
  - kind: ServiceAccount
    name: appdynamics-cluster-agent
    namespace: appdynamics
roleRef:
  kind: ClusterRole
  name: appdynamics-cluster-agent-instrumentation
  apiGroup: rbac.authorization.k8s.io
```

Cluster Agent File Example

This example shows a `cluster-agent.yaml` configuration file:

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<app-name>"
  controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  # docker image info
  image: "<your-docker-registry>/appdynamics/cluster-agent:tag"
  nsToMonitor:
    - "default"
  eventUploadInterval: 10
  containerRegistrationInterval: 120
  httpClientTimeout: 30
  customSSLSecret: "<secret-name>"
  proxyUrl: "<protocol>://<domain>:<port>"
  proxyUser: "<proxy-user>"
  metricsSyncInterval: 30
  clusterMetricsSyncInterval: 60
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
metadataSyncInterval: 60
containerBatchSize: 25
containerParallelRequestLimit: 3
podBatchSize: 30
metricUploadRetryCount: 3
metricUploadRetryIntervalMilliseconds: 5
podFilter:
  # blocklistedLabels:
  #   - label1: value1
  # allowlistedLabels:
  #   - label1: value1
  #   - label2: value2
  # allowlistedNames:
  #   - name1
  # blocklistedNames:
  #   - name2
logLevel: "INFO"
logFileSizeMb: 5
logFileBackups: 3
stdoutLogging: "true"
resources:
  limits:
    cpu: 300m
    memory: "200Mi"
  requests:
    cpu: 200m
    memory: "100Mi"
```

Install Infrastructure Visibility with the Kubernetes CLI

This page describes how to install the Machine Agent and Network Agents in a Kubernetes cluster where the Cluster Agent Operator is installed.

The Cluster Agent Operator provides a custom resource definition called `InfraViz`. You can use `InfraViz` to simplify deploying the Machine and Network Agents as a `daemonset` in a Kubernetes cluster. Additionally, you can deploy these agents by creating a `daemonset` YAML which does not require the Cluster Agent Operator. For more information, see [these examples](#).

To deploy the Analytics Agent as a `daemonset` in a Kubernetes cluster, see [Install Agent-Side Components in Kubernetes](#).

Requirements

Before you begin, verify that you have:

- Installed `kubectl` \geq 1.11.3
- Cluster Agent \geq 21.3.1
- Met these requirements: [Cluster Agent Requirements and Supported Environments](#).
- If Server Visibility is required, sufficient Server Visibility licenses based on the number of worker nodes in your cluster.
- Permissions to view servers in the AppDynamics Controller.

Installation Procedure

1. [Install the Cluster Agent](#). From this Alpine Linux example:
 - a. Download the Cluster Agent bundle.
 - b. Unzip the Cluster Agent bundle.
 - c. Deploy the Cluster Agent Operator using the CLI specifying the correct Kubernetes and OpenShift version (if applicable):

```
unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
kubectl create namespace appdynamics
```

[Kubernetes \$\geq\$ 1.15](#) [OpenShift with Kubernetes \$\geq\$ 1.15](#) [Kubernetes \$\leq\$ 1.14](#)

[OpenShift with Kubernetes \$\leq\$ 1.14](#)

```
kubectl create -f cluster-agent-operator.yaml
```

[Kubernetes \$\geq\$ 1.15](#) [OpenShift with Kubernetes \$\geq\$ 1.15](#) [Kubernetes \$\leq\$ 1.14](#)

[OpenShift with Kubernetes \$\leq\$ 1.14](#)

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
kubectl create -f cluster-agent-operator-openshift.yaml
```

Kubernetes >= 1.15 OpenShift with Kubernetes >= 1.15 [Kubernetes <= 1.14](#)

OpenShift with Kubernetes <= 1.14

```
kubectl create -f cluster-agent-operator-1.14-or-less.yaml
```

Kubernetes >= 1.15 OpenShift with Kubernetes >= 1.15 Kubernetes <= 1.14

[OpenShift with Kubernetes <= 1.14](#)

```
kubectl create -f cluster-agent-operator-openshift-1.14-or-less.yaml
```

2. Create a Cluster Agent secret using the Machine Agent access key to connect to the Controller. If a `cluster-agent-secret` does not exist, you must create one, see [Install the Cluster Agent with the Kubernetes CLI](#).
3. Update the `infraviz.yaml` file to set the `controllerUrl`, `account`, and `globalAccount` values based on the information from the Controller's **License** page.
To enable Server Visibility, set `enableServerViz` to `true` (shown in the `infraviz.yaml` configuration example).
To deploy a Machine Agent without Server Visibility enabled, set `enableServerViz` to `"false"`.

infraviz.yaml Configuration File with Server Visibility Enabled

```
apiVersion: v1
kind: ServiceAccount
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
---
apiVersion: appdynamics.com/v1alpha1
kind: InfraViz
metadata:
  name: appd-infraviz
  namespace: appdynamics
```

```
spec:
  controllerUrl: "https://mycontroller.saas.appdynamics.com"
  image: "docker.io/appdynamics/machine-agent-analytics:latest"
  account: "<your-account-name>"
  globalAccount: "<your-global-account-name>"
  enableServerViz: true
  resources:
    limits:
      cpu: 500m
      memory: "1G"
    requests:
      cpu: 200m
      memory: "800M"
```

The `infraviz.yaml` configuration file example deploys a `daemonset` that runs a single pod per node in the cluster. Each pod runs a single container from where the Machine Agent, or Server Visibility Agent runs.

- To enable the Network Visibility Agent to run in a second container in the same pod, add the `netVizImage` and `netVizPort` keys and values as shown in this configuration file example:

infraviz.yaml Configuration File with Second Container in a Single Pod

```
apiVersion: v1
kind: ServiceAccount
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
---
apiVersion: appdynamics.com/v1alpha1
kind: InfraViz
metadata:
  name: appd-infraviz
  namespace: appdynamics
spec:
  controllerUrl: "https://mycontroller.saas.appdynamics.com"
  image: "docker.io/appdynamics/machine-agent-analytics:latest"
  account: "<your-account-name>"
  globalAccount: "<your-global-account-name>"
  enableServerViz: true
  netVizImage: appdynamics/machine-agent-netviz:latest
  netVizPort: 3892
  resources:
    limits:
      cpu: 500m
      memory: "1G"
    requests:
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
cpu: 200m
memory: "800M"
```

5. Use `kubectl` to deploy `infraviz.yaml`

i For environments where Kubernetes `PodSecurityPolicies` block certain pod security context configuration, such as privileged pods, you must deploy the `infraviz-pod-security-policy.yaml` before editing the `infraviz.yaml` file.
For environments where OpenShift `SecurityContextConstraints` block certain pod security context configuration, such as privileged pods, you must deploy the `infraviz-security-context-constraint-openshift.yaml` before editing the `infraviz.yaml` file.

[Kubernetes](#) [Kubernetes with Pod Security Policy](#) [OpenShift](#)

```
kubectl create -f infraviz.yaml
```

[Kubernetes](#) [Kubernetes with Pod Security Policy](#) [OpenShift](#)

```
kubectl create -f infraviz-pod-security-policy.yaml
kubectl create -f infraviz.yaml
```

[Kubernetes](#) [Kubernetes with Pod Security Policy](#) [OpenShift](#)

```
kubectl create -f infraviz-security-context-constraint-openshift.yaml
kubectl create -f infraviz.yaml
```

6. Confirm that the `appd-infraviz` pod is running, and the Machine Agent, Server Visibility Agent, and Network Agent containers are ready:

```
kubectl -n appdynamics get pods
NAME                                READY   STATUS    RESTARTS   AGE
appd-infraviz-shkhj                2/2     Running   0           18s
```

7. To verify that the agents are registering with the Controller, review the logs and confirm that the agents display in the **Agents Dashboard** of the Controller Administration UI. In the Controller, if Server Visibility is enabled, the nodes are visible under **Controller > Servers**.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
kubectl -n appdynamics logs appd-infraviz-shkhj -c appd-infra-agent
...
Started AppDynamics Machine Agent Successfully
```

Mixed Operating System Clusters

The Cluster Agent Operator can deploy Machine Agent `daemonsets` to both Linux and Windows nodes. The value of the `nodeOS` property determines the deployment strategy in mixed operating system (OS) clusters. You can set this property to one of these options:

- `all`
- `linux`
- `windows`

Set `nodeOS: all` when both Linux and Windows `daemonsets` share the same properties that you can configure in a single `infraviz.yaml` file. When `nodeOS` is set to `all` or `windows`, you must set the `imageWin` property to a Windows Machine Agent image.

In this example, a single `infraviz.yaml` file is used to configure the Machine Agents that run on Windows and Linux nodes.

```
apiVersion: v1
kind: ServiceAccount
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
---
apiVersion: appdynamics.com/v1alpha1
kind: InfraViz
metadata:
  name: appd-infraviz
  namespace: appdynamics
spec:
  controllerUrl: "https://mycontroller.saas.appdynamics.com"
  image: "docker.io/appdynamics/machine-agent-analytics:latest"
  account: "<your-account-name>"
  globalAccount: "<your-global-account-name>"
  enableServerViz: true
  netVizImage: appdynamics/machine-agent-netviz:latest
  netVizPort: 3892
  resources:
    limits:
      cpu: 500m
      memory: "1G"
    requests:
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

  cpu: 200m
  memory: "800M"
  imageWin: docker.io/appdynamics/machine-agent-analytics:20.6.0-win-ltsc2019
  nodeOS: all
  
```

Set `nodeOS: windows` or `nodeOS: linux` when the `Windows` and `Linux` `daemonsets` properties differ and must be defined in separate `infraviz.yaml` files. Depending on the value of `nodeOS`, the Cluster Agent Operator assigns a `nodeSelector` value to the Machine Agent that determines its placement.

For `nodeOS: windows`, it sets `"kubernetes.io/os"` to `windows`.

For `nodeOS: linux`, it sets `kubernetes.io/os` to `linux`.

To override this default behavior, specify a `nodeSelector` in `infraviz.yaml`. For example:

```

apiVersion: v1
kind: ServiceAccount
metadata:
  name: appdynamics-infraviz
  namespace: appdynamics
---
apiVersion: appdynamics.com/v1alpha1
kind: InfraViz
metadata:
  name: appd-infraviz
  namespace: appdynamics
spec:
  # ... content removed for brevity
  nodeOS: windows
  imageWin: docker.io/appdynamics/machine-agent-analytics:20.6.0-win-ltsc2019
  nodeSelector:
    kubernetes.io/os: my-windows-node-selector
  
```

InfraViz Configuration Settings

To configure Infrastructure Visibility, you can modify these parameters in the `infraviz.yaml` file included with the download package. After changing the file, delete and re-create the `InfraViz` deployment to ensure the changes are applied.

Parameter	Description	Required/Optional	Default
<code>account</code>	AppDynamics account name	Required	N/A

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter	Description	Required/Optional	Default
<code>args</code>	List of command arguments	Optional	N/A
<code>controllerUrl</code>	URL of the AppDynamics Controller	Required	N/A
<code>enableContainerHostId</code>	Flag that determines how container names are derived; specify either <code>pod name</code> or <code>container id</code> .	Optional	<code>true</code>
<code>enableMasters</code>	By default, only Worker nodes are monitored. When set to <code>true</code> , Server Visibility is provided for Master nodes. For managed Kubernetes providers, the flag has no effect because the Master plane is not accessible.	Optional	<code>false</code>
<code>enableServerViz</code>	Enable Server Visibility	Optional	<code>true</code>
<code>env</code>	List environment variables	Optional	N/A
<code>eventServiceUrl</code>	Event Service Endpoint	Optional	N/A
<code>globalAccount</code>	Global account name	Required	N/A
<code>image</code>	Retrieves the most recent version of the Machine Agent image.	Optional	<code>appdynamics/machine-agent-analytics:latest</code>
<code>imagePullSecret</code>	Name of the pull secret image	Optional	N/A

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter	Description	Required/Optional	Default
<code>imageWin</code>	Machine Agent image for Windows nodes	Required when <code>nodeOS</code> is set to <code>all</code> or <code>windows</code>	N/A
<code>logLevel</code>	Level of logging verbosity. Valid options are: <code>info</code> or <code>debug</code> .	Optional	<code>info</code>
<code>metricsLimit</code>	Maximum number of metrics that the Machine Agent sends to the Controller.	Optional	N/A
<code>netVizImage</code>	Retrieves the most recent version of Network Agent image.	Optional	<code>appdynamics/machine-agent-netviz:latest</code>
<code>netVizPort</code>	When > 0 , the Network Agent is deployed in a sidecar with the Machine Agent. By default, the Network Visibility Agent works with port <code>3892</code> .	Optional	<code>3892</code>
<code>nodeSelector</code>	OS specific label that identifies nodes for scheduling of the <code>daemonset</code> pods.	Optional	<code>all</code>
<code>priorityClassName</code>	Name of the priority class that determines priority when a pod needs to be evicted.	Optional	N/A
<code>propertyBag</code>	String with any other Machine Agent parameters	Optional	N/A
<code>proxyUrl</code>	URL of the proxy server (<code>protocol://domain:port</code>)	Optional	N/A

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter	Description	Required/Optional	Default
<code>proxyUser</code>	Proxy user credentials (<code>user@password</code>)	Optional	N/A
<code>resources</code>	Definitions of resources and limits for the Machine Agent	Optional	N/A
<code>stdoutLogging</code>	Determines if logs are saved to a file or redirected to the Console.	Optional	<code>false</code>
<code>tolerations</code>	List of tolerations based on the taints that are associated with nodes.	Optional	N/A
<code>uniqueHostId</code>	Unique host ID in AppDynamics. Valid options are: <code>spec.nodeName</code> , <code>status.hostIP</code> .	Optional	<code>spec.nodeName</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Cluster Agent and the Operator Compatibility Matrix

The compatibility matrix describes which Operator (Kubernetes or OpenShift) version is required for each Cluster Agent version.

- To view the list of features for the latest agent, see [Release Notes](#).
- To view the list of features for older agents, see [Past Agent Releases](#).

AppDynamics recommends that you upgrade the Operator with the Cluster Agent upgrade. See [Upgrade the Cluster Agent](#). Ensure that use the latest YAML configuration files for the Operator and Cluster Agent from the upgraded version because the Cluster Agent may support new or modified configuration. If you do not update the Operator or YAML configuration file, and the Cluster Agent is upgraded, then the Cluster Agent may not work properly.

This table lists the Operator version with its supported Cluster Agent version:

Operator (Kubernetes/ OpenShift)	Cluster Agent
0.6.8	21.3.1, 21.3.0
0.6.7	21.2.0
0.6.6	20.12.1
0.6.6	20.12.0
0.6.5	20.11.0
0.6.4	20.11.0
0.6.3	20.10.0
0.6.2	20.9.1, 20.9.0
0.6.1	20.9.1, 20.9.0
0.5.4	20.8.0
0.5.3	20.7.0
0.5.2	20.6.0

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Build the Cluster Agent Container Image

This page describes how to build a Cluster Agent container image or push a pre-built image to an internal registry.

This procedure is required when you:

- Need to build your own image to satisfy internal image policies, or
- Require that the pre-built Cluster Agent Image from Docker Hub, or the Red Hat Container Registry, is stored in an internal container registry.
See [Install the Cluster Agent](#).

Otherwise, you can reference the pre-built Cluster Agent Images on Docker Hub and the Red Hat Container Registry in the `cluster-agent.yaml` or `values.yaml` Helm file. This example uses the pre-built Cluster Agent Image 20.12.1 published to Docker Hub:

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  controllerUrl: "http://<account>.saas.appdynamics.com"
  account: "<account-name>"
  appName: "Cluster1"
  image: docker.io/appdynamics/cluster-agent:20.12.1
```

Build the Custom Cluster Agent Image

The download packages from the AppDynamics [Download Portal](#) include files you need to build and deploy the container image for the Cluster Agent.

Depending on the base Image that was used to build the Cluster Agent Image, there are two package types available on the portal:

- Alpine Linux-based base Image
- RHEL Linux 7-based base Image

The directory structure of the download packages for the Alpine and RHEL Linux is:

[Alpine Linux](#) [RHEL Linux 7](#)

```
cluster-agent
├── cluster-agent-operator.yaml
├── cluster-agent-operator-1.14-or-less.yaml
├── cluster-agent-operator-openshift-1.14-or-less.yaml
└── cluster-agent-operator-openshift.yaml
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Build the Custom Cluster Agent Image

i You can build the RHEL Linux 7-based Cluster Agent image on Red Hat Linux only. Red Hat Linux is a subscription-based system. You must subscribe to the Red Hat Linux system to use the packages manager such as `microdnf`, which is used in `Dockerfile-rhel`. Perform these tasks before running the `docker build` command for RHEL:

1. Use Red Hat Linux 7 (RHEL VM Box, RHEL EC2 instance, and so on)
2. To subscribe to the Red Hat Linux system, from a command-prompt enter:

```
$ subscription-manager register --username=<your-username> --password=<your-
password>
```

3. To get the pool-ids, enter:

```
$ subscription-manager list --available
```

4. To attach the pool-id from step 3, enter:

```
$ subscription-manager attach --pool=<pool-id>
```

5. To enable repos, enter:

```
$ subscription-manager repos --enable=rhel-7-server-rpms
$ subscription-manager repos --enable=rhel-7-server-extras-rpms
$ subscription-manager repos --enable=rhel-7-server-optional-rpms
```

6. To install Docker on the RHEL machine, enter:

```
$ yum install docker device-mapper-libs device-mapper-event-lib
```

7. To start docker services, enter:

```
$ systemctl start docker.service
$ systemctl enable docker.service
```

8. To build the RHEL based Cluster Agent image using Docker, enter:

```
$ docker build -t docker.io/<organization>/cluster-agent:<Agent-Version> -f
Dockerfile-rhel
```

See the Red Hat website under [Using the docker command and service](#) for more details.

These steps are also available at the official website of Red Hat under [Using the docker command and service](#).

If you are unable to perform the preceding steps, you can use a pre-built RHEL-based Cluster Agent image mentioned in [Use Pre-Built Cluster Agent Image](#). This pre-built option requires that you have Docker installed and Red Hat credentials. The pre-built image can run on any operating system. To get Red Hat credentials, create an account on the [Red Hat portal](#).

1. Change directories into the `docker` directory:

```
$ cd docker
```

2. Build and tag a `docker` image using this syntax:

[Alpine Linux](#) [Rhel Linux 7](#)

```
$ docker build -t <registryname>/<accountname>/cluster-agent:<Agent-version> --build-arg version=<alpine-version> .
```

[Alpine Linux](#) [Rhel Linux 7](#)

```
$ docker build -t <registryname>/<accountname>/cluster-agent:<Agent-version> -f Dockerfile-rhel .
```

i To use a specific Alpine Image version, set the version using `--build-arg version=<alpine-version>`.

If you do not specify an image version, then the build command takes the *latest* Alpine image version automatically.

For example, to build and tag the image version `20.8.0` using alpine version `3.11.6` on Docker Hub registry for the account name `johndoe`:

[Alpine Linux](#) [Rhel Linux 7](#)

```
$ docker build -t docker.io/johndoe/cluster-agent:20.8.0 --build-arg version=3.11.6 .
```

Alpine Linux [Rhel Linux 7](#)

```
$ docker build -t docker.io/johndoe/cluster-agent:20.8.0 -f Dockerfile-rhel .
```

- When the build is successful, verify that the image appears in your local Docker repository.
 Example output:

[Alpine Linux](#) Rhel Linux 7

```

```

4. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example, pushing the image version 20.8.0 to Docker Hub registry for the account name Johndoe :

```
$ docker push docker.io/johndoe/cluster-agent:20.8.0
```

Use Pre-Built Cluster Agent Image

You can also use a pre-built Alpine-based Cluster Agent or Rhel-based Cluster Agent to an internal registry.

Alpine Cluster Agent Image

You can use the pre-built Alpine-based Cluster Agent image from the [AppDynamics Docker Hub](#) account.

1. Log in to your Docker Hub account:

```
$ docker login docker.io -u <your-username> -p <your-password>
```

2. Pull the image:

```
$ docker pull docker.io/appdynamics/cluster-agent:<Agent-version>
```

For example, to pull the Alpine based cluster agent image version 20.8.0:

```
$ docker pull docker.io/appdynamics/cluster-agent:20.8.0
```

To push this image to another registry or accounts:

1. Rename the image:

```
$ docker tag docker.io/appdynamics/cluster-agent:<Agent-version> <registryname>/  
<accountname>/cluster-agent:<Agent-version>
```

For example:

```
$ docker tag docker.io/appdynamics/cluster-agent:20.8.0 docker.io/johndoe/cluster-agent:2  
0.8.0
```

2. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example, to push the image version 20.8.0 to Docker Hub registry for the account name Johndoe:

```
$ docker push docker.io/johndoe/cluster-agent:20.8.0
```

Rhel Cluster Agent Image

Alternatively, you can use the pre-built RHEL based Cluster Agent Image from the [AppDynamics Redhat Container Registry](#) account.

1. Log in to Red Hat Registry using your Customer Portal credentials:

```
$ docker login registry.connect.redhat.com -u <your-username> -p <your-password>
```

2. Pull the image:

```
$ docker pull registry.connect.redhat.com/appdynamics/cluster-agent:<Agent-version>
```

For example, to pull the RHEL based Cluster Agent version 20.8.0:

```
$ docker pull registry.connect.redhat.com/appdynamics/cluster-agent:20.8.0
```

You can now use the Cluster Agent image.

To push this image to another registry, or to other accounts:

1. Rename the image:

```
$ docker tag registry.connect.redhat.com/appdynamics/cluster-agent:<Agent-version>
<registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example:

```
$ docker tag registry.connect.redhat.com/appdynamics/cluster-agent:20.8.0
scan.connect.redhat.com/johndoe/cluster-agent:20.8.0
```

2. Push the image:

```
$ docker push <registryname>/<accountname>/cluster-agent:<Agent-version>
```

For example, to push the image version 20.8.0 to Redhat Registry for account name `johndoe` :

```
$ docker push scan.connect.redhat.com/johndoe/cluster-agent:20.8.0
```

Set the Image in Cluster Agent YAML Specification

Make sure to reference the image in the `cluster-agent.yaml` spec:

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
```

```
spec:
  controllerUrl: "http://<account>.saas.appdynamics.com"
  account: "<account-name>"
  appName: "Cluster1"
  image: <registryname>/<username>/cluster-agent:<Agent-version>
```

For assistance, contact [AppDynamics Support](#).

Auto-Instrument Applications with the Cluster Agent

This page describes how to auto-instrument Kubernetes workloads running in a cluster where the Cluster Agent is deployed. See [Install the Cluster Agent](#).

For instrumentation options, see [Container Installation Options](#).

AppDynamics recommends using auto-instrumentation to simplify operations.

With auto-instrumentation, you can dynamically add an App Server Agent to workloads for these application types:

- Java
- .NET Core on Linux
- Node.js

We support these Kubernetes workloads: `Deployments`, `DeploymentConfigs` and `StatefulSets`.

Auto-Instrumentation Overview

To enable auto-instrumentation, you:

- Add additional configuration to the `cluster-agent.yaml` file, or
- Add configuration to the Cluster Agent Helm Chart `values.yaml` file. See [Install the Cluster Agent with Helm Charts](#).

Then, you can apply the changes using `kubectl` or upgrade the Cluster Agent Helm Chart.

When the Cluster Agent detects a supported workload, and the workload matches the configured auto-instrumentation rules, the Cluster Agent modifies the workload's spec using the Kubernetes API. The Cluster Agent attaches an init container with the AppDynamics .NET Core, Node.js, or Java Agent image to the workload. When the application restarts, the required agent is copied into the application container. As a result, the application container references the AppDynamics agent (Node.js Agent, .NET Core on Linux Agent, or Java Agent) in an auto-instrumented application.

Requirements

AppDynamics Requirements

- Cluster Agent \geq 20.5. See [Cluster Agent Requirements and Supported Environments](#).
- Installed the latest Cluster Agent and Operator versions in the cluster. The `cluster-agent-operator.yaml` sets up the permissions required by the Cluster Agent to perform auto-instrumentation. See [Install the Cluster Agent](#).
- At least one application is deployed to the cluster that was not previously instrumented with the required AppDynamics agent.
- A Controller with sufficient agent licenses based on the number of applications that will be auto-instrumented.
- Ensure that you have sufficient cluster capacity to process pod restarts. See [Minimize the Impact of Pod Restarts](#).

Language-Specific Requirements

- Node.js \geq 8.6
- Java

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- Java applications must support including the `-javaagent` argument in the Java command using an environment variable. By default, the Cluster Agent uses `JAVA_TOOL_OPTIONS`; however, you can change this using the `defaultEnv` property.
- Based on Java Agent resource requirements, it may be necessary to adjust the configured memory requests or limits for the application pods (see [Install the Java Agent](#)).
- .NET Core on Linux and Node.js
 - Ensure that the application base image Operating System (OS) matches the App Server Agent base image OS (Linux versus Alpine). For example, if your .NET Core on Linux application uses an Ubuntu base image, then you must set the `imageInfo.image` tag to the Linux version. In this example, the image tag is `20.11.0-linux`.
If the application used an Alpine Linux base image OS, then the tag would be `20.11.0-alpine`. See the [AppDynamics Docker Hub page](#).

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  # content removed for brevity
  instrumentationRules:
    - namespaceRegex: dev
      language: dotnetcore
      appName: MyDotNetAppOnUbuntu
      imageInfo:
        image: "docker.io/appdynamics/dotnet-core-agent:20.11.0-linux"
        agentMountPath: /opt/appdynamics
  
```

If the base image Operating Systems do not match, then the App Server Agent may not start. See [Validate Auto-Instrumentation](#). The Node.js Agent also has specific Node.js runtime requirements that may prevent the agent from starting. See [Node.js Supported Environments](#).

- For .NET Core and Node.js applications that communicate with an on-premises Controller, see [Use Auto-Instrumentation with an On-Premises Controller](#).
- If transaction analytics data is required, then you must configure the Cluster Agent `analyticsHost` and `analyticsPort` properties.

Enable Auto-Instrumentation for the Cluster Agent

To set up the Cluster Agent feature:

1. First, remove any deleted pods from the Controller **Tiers & Nodes** Dashboard. Then, re-create the `cluster-agent-secret` that was created in [Install the Cluster Agent](#) to include `api-user`. Set the `api-user` value to a local user from the Controller with the `Administrator` role:

```

kubectl -n appdynamics delete secret cluster-agent-secret
kubectl -n appdynamics create secret generic cluster-agent-secret --from-
literal=controller-key=<access-key> --from-literal=api-
user="<username>@<customer>:<password>"
  
```

The Cluster Agent uses the `api-user` to mark the associated node in the Controller as historical upon pod deletion.

2. Add auto-instrumentation configuration to the `cluster-agent.yaml` or the Helm `values.yaml` file. The configuration determines which `Deployments`, `DeploymentConfigs` and `StatefulSets` workloads to target for auto-instrumentation and which agent types and versions to use. See [Auto-Instrumentation Configuration](#).
3. After you save the configuration, apply or upgrade the Cluster Agent deployment. The related pods and containers restart based on the deployment rollout strategy associated with the applications.

[Kubernetes CLI](#) [Helm Chart](#)

```
kubectl apply -f cluster-agent.yaml
```

[Kubernetes CLI](#) [Helm Chart](#)

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/  
cluster-agent --namespace appdynamics
```

To validate and troubleshoot auto-instrumentation, see [Validate the Cluster Agent Installation](#).

- If a workload does not match the properties defined in `instrumentationRules`, then auto-instrumentation is not enabled.
- If an auto-instrumentation property is not defined as a default, or in `instrumentationRules`, then the Cluster Agent uses the corresponding default value specified in [Auto-Instrumentation Configuration](#). If there are no corresponding default values, then auto-instrumentation is not enabled.

Configuration Examples

Example 1 targets Java applications in the namespaces that match the `ecom.*` pattern. Each matching application will be instrumented with a `20.20.1` Java Agent and will report to the `Ecommerce` application in the AppDynamics Controller. By default, the tier name is the name of the Kubernetes workload, but you can override it by setting the `tierName` property.

Example 1: cluster-agent-auto-1.yaml

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<app-name>"
  controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  image: "docker.io/appdynamics/cluster-agent:20.12.1"
  serviceAccountName: appdynamics-cluster-agent
  nsToMonitorRegex: ecom.*
  #
  # auto-instrumentation config
  #
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom.*
  defaultAppName: Ecommerce
  instrumentationRules:
    - language: java
      imageInfo:
        image: docker.io/appdynamics/java-agent:20.20.1
        agentMountPath: /opt/appdynamics
  
```

Example 2 targets namespaces that contain Java and .NET Core on Linux applications, and incorporates these advanced configurations:

- Uses multiple `instrumentationRules` to target Java applications versus .NET Core on Linux applications.
- Uses the `labelMatch` strategy to determine the agent type and associated agent image based on the value of the `framework` label in the workload spec `auto-instrumented-dotnet-app.yaml` and `auto-instrumented-java-app.yaml` below.
- Rather than assigning a Controller application name in the `YAML` file, the configuration uses `appNameStrategy: label` to assign an application name based on a label from the workload spec.
- For the Java applications, it uses `instrumentContainer: select` and `containerMatchString: .*service` to instruct the Cluster Agent to auto-instrument only the application service container only, and ignore any other defined containers defined.

Example 2: cluster-agent-auto-2.yaml

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<app-name>"
  controllerUrl: "<protocol>://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  image: "docker.io/appdynamics/cluster-agent:20.12.1"
  serviceAccountName: appdynamics-cluster-agent
  nsToMonitorRegex: ecom.*
  #
  # auto-instrumentation config
  #
  instrumentationMethod: Env
  nsToInstrumentRegex: stage
  appNameStrategy: label
  instrumentationRules:
    - namespaceRegex: stage
      language: dotnetcore
      labelMatch:
        - framework: dotnetcore
      appNameLabel: appName
      imageInfo:
        image: "docker.io/appdynamics/dotnet-core-agent:20.11.0-linux"
        agentMountPath: /opt/appdynamics
    - namespaceRegex: stage
      language: java
      labelMatch:
        - framework: java
      appNameLabel: appName
      instrumentContainer: select
      containerMatchString: .*service
      imageInfo:
        image: "docker.io/appdynamics/java-agent:21.3.0"
        agentMountPath: /opt/appdynamics
  
```

Examples 3 and 4 show Deployment specs for .NET and Java services that define the `appName` and framework labels, based on the auto-instrumentation configuration from the `cluster-agent-auto-2.yaml`:

[Example 3: auto-instrumented-dotnet-app.yaml](#)

[Example 4: auto-instrumented-java-app.yaml](#)

.NET

```

apiVersion: apps/v1
kind: Deployment
metadata:
  name: dotnet-profile-service
  labels:
    appName: backend-services
    framework: dotnetcore
spec:
  containers:
    - image: myrepo/profile-service:v2
      name: profile-service
# ...

```

[Example 3: auto-instrumented-dotnet-app.yaml](#)

[Example 4: auto-instrumented-java-app.yaml](#)

Java

```

apiVersion: apps/v1
kind: Deployment
metadata:
  name: java-account-service
  labels:
    appName: backend-services
    framework: java
spec:
  containers:
    - image: myrepo/account-service:v2
      name: account-service
    - image: myrepo/proxy-util:v1
      name: proxy-util
# ...

```

The value of `containerMatchString` in `cluster-agent-auto-2.yaml` indicates that only the `account-service` container will be auto-instrumented in `auto-instrumented-java-app.yaml`.

For additional configuration examples, see [Auto-Instrumentation Configuration Examples](#).

AppDynamics Application Name Strategies

The Controller's **Application Dashboard** provides three application name strategies. Select a strategy by assigning the `appNameStrategy` property to one of these values:

- **manual**: Use the `defaultAppName` or `appName` parameters in the `cluster-agent.yaml` file to set the application name.
- **label**: Use a label from the workload's spec as the application name.
- **namespace**: Use the Kubernetes namespace as the application name.

Manual Strategy

By default, the `appNameStrategy` is `manual`, which uses the `defaultAppName` or `appName` parameter to set the application name.

- If `defaultAppName` is provided, then use it (unless overwritten in an instrumentation rule).
- If `appName` is provided in an instrumentation rule, then use it.

For example in this spec, `ECommerce` is the default application name applied to the `ecom` and `groceries` namespace, and `BookStore` is the application name applied to the `books` namespace.

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<cluster-name>"
  # ...
  # auto-instrumentation config
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom|books|groceries
  appNameStrategy: manual
  defaultAppName: ECommerce
  instrumentationRules:
    - namespaceRegex: books
      appName: BookStore
  
```

Label Strategy

This option uses the `label` parameter as the application name strategy. To use the label option, specify a value in the `appNameLabel` parameter. The `appNameLabel` value refers to a label specified in the workload spec.

- If `spec.appNameLabel` is provided, then use it (unless overwritten in an instrumentation rule).

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- If `appNameLabel` is provided in an instrumentation rule, then use it.

For example in this spec, the workload spec label `appname` is used to set the application name in the `ecom` and `groceries` namespaces, and the label `app` is used in the `books` namespace.

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<cluster-name>"
  # ...
  # auto-instrumentation config
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom|books|groceries
  appNameStrategy: label
  appNameLabel: appname
  instrumentationRules:
    - namespaceRegex: books
      appNameLabel: app
  
```

For an application deployed to the `ecom` or `groceries` namespaces that sets the label `appname` (shown in this Deployment spec snippet), it reports to the `eCommerce` application in the Controller's **Application Dashboard**.

```

apiVersion: apps/v1
kind: Deployment
metadata:
  name: ecom-app
  labels:
    appname: eCommerce
spec:
  ...
  
```

Namespace Strategy

This option uses the Kubernetes `namespace` parameter as the application name strategy and allows you to use the namespace name where an application is deployed as the application name in the Controller's **Application Dashboard**.

In this spec, each application in `ecom`, `books`, and `groceries` namespace uses the application name based on the namespace that it is deployed to.

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<cluster-name>"
  # ...
  # auto-instrumentation config
  instrumentationMethod: Env
  nsToInstrumentRegex: ecom|books|groceries
  appNameStrategy: namespace
```

Minimize the Impact of Pod Restarts

When auto-instrumentation is enabled, the related pods restart based on the deployment rollout strategy associated with the workload. Pod restarts often create CPU and memory usage spikes that may adversely impact performance or exhaust available capacity. To accommodate pods restarts, you may need to increase memory and CPU quotas associated with the impacted namespaces. To reduce the impact of restarting a large number of pods, the Cluster Agent (by default) allows only two concurrent auto-instrumentation tasks. The subsequent workloads (`resourcesToInstrument`) are auto-instrumented after the rollout of an instrumented workload. However, you can configure the parameter, `numberOfTaskWorkers` , to specify the number of concurrent auto-instrumentation tasks based on your cluster's requirements.

Auto-Instrumentation Configuration

This page describes the properties available in the `cluster-agent.yaml` and the Helm `values.yaml` file that you can use to configure auto-instrumentation.

Configuration Structure for Auto-Instrumentation

The structure of the auto-instrumentation configuration is based on a set of default properties, which you can override by using properties defined in one or more `instrumentationRules`.

[cluster-agent.yaml](#) [values.yaml](#)

```

apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  # cluster agent properties
  # ...
  # required to enable auto-instrumentation
  instrumentationMethod: Env
  # default auto-instrumentation properties
  # may be overridden in an instrumentationRule
  nsToInstrumentRegex: dev|stage|prod
  image: "docker.io/appdynamics/java-agent:21.7.0"
  # ...
  # one or more instrumentationRules
  instrumentationRules:
    - nsToInstrumentRegex: dev
      imageInfo:
        image: "docker.io/appdynamics/java-agent:21.3.1"
        agentMountPath: /opt/appdynamics
        imagePullPolicy: Always
      # ...
    - nsToInstrumentRegex: stage
      imageInfo:

      imageInfo:
        image: "docker.io/appdynamics/java-agent:21.5.0"
        agentMountPath: /opt/appdynamics
        imagePullPolicy: Always
      # ...
  
```

Overriding Default Properties with InstrumentationRules

The Cluster Agent uses a combination of `namespaceRegex`, `matchString`, and `labelMatch` properties in an `InstrumentationRule` to target `Deployments`, `DeploymentConfigs` and `StatefulSets` in a namespace for auto-instrumentation. The first matching `InstrumentationRule` is used. If no matching rule is found, then the default properties are used to determine if auto-instrumentation should be applied:

- `nsToInstrumentRegex`
- `defaultInstrumentationLabelMatch`
- `defaultInstrumentMatchString`

For example, the following `InstrumentationRule` with `-matchString "<string>"` is added to the Cluster Agent configuration file:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
instrumentationRules:
  - matchString: "<string>"
```

i You must have a deployment for auto-instrumentation to work.

If the deployment name matches this string, then the remaining properties under the matching `instrumentationRule` are applied and will override any default properties that are set. If the string does not match, then the Cluster Agent defaults to the properties `nsToInstrumentRegex`, `defaultInstrumentationLabelMatch`, and `defaultInstrumentMatchString` to determine the instrumentation rules.

Common Auto-Instrumentation Tasks

These properties are available to support common auto-instrumentation configuration tasks:

- To set the namespaces that are in scope for auto-instrumentation:
 - `nsToInstrument`
 - `nsToInstrumentRegex`
- (Optional) To filter and target the set of applications within a namespace that are in scope for auto-instrumentation:
 - `instrumentationMatchString`
 - `labelMatch`
- To assign an application and tier name to an instrumented application:
 - `appNameStrategy`
 - `tierName` (optional, will use deployment name by default)

See [Options for Naming the AppDynamics Application](#).

- To instrument which containers are in a multi-container application:
 - `instrumentContainer`
 - `containerMatchString`

The `instrumentContainer` default is to instrument the first container based on the ordering returned by the Kubernetes API.

- If transaction analytics is required for Node.js applications, then specify the analytics host and port:
 - `analyticsHost`
 - `analyticsPort`

See [Deploy Analytics Without the Analytics Agent](#). Configuration of transaction analytics is not required for .NET and Java applications. You can deploy the Analytics Agent using the sidecar model where you add an Analytics Agent container to each application pod, and then start/stop with the application container. If you use the sidecar approach, the App Server Agent uses the default host `localhost` and port `9090` and connects automatically. No additional configuration is required. See [Install Agent Side Components in Kubernetes](#).

Default Auto-Instrumentation Properties

This table describes the default properties available to configure auto-instrumentation, defined in the `cluster-agent.yaml` spec :

Parameter Name	Default Value	Description
<code>appNameLabel</code>	N/A	The value of this label will be the AppDynamics application name.
<code>appNameStrategy</code>	manual	<p>The option to specify a name for the AppDynamics application. You can specify any of these values for this parameter:</p> <ul style="list-style-type: none"> • manual • namespace • label <p>See Options for Naming the AppDynamics Application.</p>
<code>defaultAnalyticsHost</code>	N/A	<p>The hostname of the Analytics Agent.</p> <p>This parameter is required if you require the Node.js Agent or the .NET Core Agent to send the default transaction data to the Analytics Agent.</p> <p>The default value is applied to all the instrumented resources unless it is overwritten by the <code>instrumentationRules</code> configuration.</p>

Parameter Name	Default Value	Description
<code>defaultAnalyticsPort</code>	N/A	<p>The listening port for Analytics Agent.</p> <p>For example, if the Analytics Agent is listening on port 9090, then the value of this parameter is 9090 .</p> <p>The default value is applied to all the instrumented resources unless it is overwritten by the <code>instrumentationRules</code> configuration.</p> <p>This parameter is required along with <code>defaultAnalyticsHost</code> if you require the Node.js or the .NET Core Agent to send the default transaction data to the Analytics Agent.</p>
<code>defaultAnalyticsSslEnabled</code>	N/A	<p>This value is based on whether the Analytics Agent port is SSL enabled. If the port is SSL enabled, specify the value as <code>true</code> ; else, specify as <code>false</code> .</p> <p>This parameter is required with <code>defaultAnalyticsPort</code> and <code>defaultAnalyticsHost</code> , if you require the Node.js or the .NET Core Agent, to send the default transaction data to the Analytics Agent.</p> <p>The default value is applied to all the instrumented resources unless it is overwritten by the <code>instrumentationRules</code> configuration.</p>
<code>defaultAppName</code>	""	(Required) Application name used by the agent to report to the Controller.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Default Value	Description
<code>defaultCustomConfig</code>	N/A	<p>This parameter is specific to Java applications.</p> <p>You can add any custom system property if your application framework requires any specific configuration for instrumentation.</p> <p>This value is appended to the <code>env</code> or <code>defaultEnv</code> variable as configured with other Java Agent properties.</p>
<code>defaultContainerMatchString</code>	N/A	<p>This is a regex value to choose the containers to instrument. This parameter requires you to use the <code>select</code> option within the <code>instrumentContainer</code> (specified in the instrumentation rules).</p> <p>When the <code>select</code> option is used with this parameter, Cluster Agent instruments the containers that match the regex value.</p>
<code>defaultEnv</code>	<code>JAVA_TOOL_OPTIONS</code>	<p>This parameter is specific to Java applications.</p> <p>Environment variable to which the <code>-javaagent</code> argument and App Agent system properties are added.</p> <p>You can override this variable to use any other environment variable best suited for the deployment.</p>

Parameter Name	Default Value	Description
defaultInstrumentationLabelMatch	[]	<p>Specific deployment labels marked for instrumentation.</p> <p>This parameter accepts a list of key-value pairs to instrument.</p> <p>You must match a minimum of one label for instrumentation.</p> <p>For example:</p> <pre>defaultInstrumentationLabelMatch: - label1: value1 - label1: value2 - label2: value2</pre> <p>For example, if only label1: value2 matches, then the instrumentation works as expected.</p>

Parameter Name	Default Value	Description
defaultInstrumentMatchString	.*	<p>Names of deployments targeted for instrumentation.</p> <p>This parameter is used as the default value for the <code>matchstring</code> parameter that is specified within <code>instrumentationRules</code>. If <code>matchstring</code> is not specified, then Cluster Agent uses this parameter value.</p> <p>This parameter accepts deployment names as a regular expression or regex.</p> <p>If there are multiple deployments to instrument, you can separate names with a <code> </code> without spaces.</p> <p>By default, this parameter instruments all deployments configured by <code>nsToInstrumentRegex</code>. Therefore, if there is no value specified for <code>matchString</code> in the instrumentation rules and if you do not specify any value for this parameter, then Cluster Agent instruments every deployment.</p>

Parameter Name	Default Value	Description
imageInfo	<pre> java: image: "docker.io/ appdynamics/ java- agent:latest" agentMountPath: "/opt/ appdynamics" imagePullPolicy : "IfNotPresent" dotnetcore: image: "docker.io/ appdynamics/ dotnet-core- agent:latest" agentMountPath: /opt/ appdynamics imagePullPolicy : "IfNotPresent" nodejs: image: "docker.io/ appdynamics/ nodejs- agent:20.8.0- stretch- slimv14" </pre>	<p>The Docker repository from where the Node.js Agent, .NET Core for Linux, and Java Agent is pulled.</p> <p>Supported values are:</p> <ul style="list-style-type: none"> <code>image</code> : Location of the agent image, along with its <code>tag/version</code>. <code>agentMountPath</code> : Location of image artifacts in the image file system. The default is <code>/opt/appdynamics</code>. You must change this configuration if the path is different. <code>imagePullPolicy</code> : The pull policy required for the agent's docker image. You can choose one of these pull policies based on your requirement: <ul style="list-style-type: none"> Always IfNotPresent Never <p>This parameter is used in the init containers that are added during auto-instrumentation.</p>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Default Value	Description
	<pre>agentMountPath: /opt/ appdynamics imagePullPolicy : "IfNotPresent"</pre>	
instrumentationMethod	None	<p>The instrumentation method used for instrumenting Apps.</p> <p>Supported values are:</p> <ul style="list-style-type: none"> None : Instrumentation is disabled. Env : Attach the instrumentation properties to the container environment variables. If a value is not set, the instrumentation will not start.
instrumentationRules	[]	<p>Required. This parameter is used to enable auto-instrumentation. This includes the list of specific instrumentation rules. You can apply the rules to one or more namespaces, and can filter on deployment names and labels. Instrumentation rules are granular to support targeting specific deployments.</p> <p>See Cluster Agent Configuration for Instrumentation Rules.</p>
nsToInstrumentRegex	""	<p>Required. If you do not specify a value, auto-instrumentation will not work.</p> <p>Specify the namespaces to be instrumented as a regex.</p> <p>If there are multiple namespaces to instrument, separate namespaces using " " without spaces.</p> <p>By default, namespaces are not instrumented.</p>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Default Value	Description
<code>numberOfTaskWorkers</code>	2	<p>To configure the rate limit for the number of deployments that are auto-instrumented at the same time.</p> <div style="border: 1px solid #0070C0; padding: 5px; background-color: #E6F2FF;"> <p>i Increasing this value may lead to a larger number of concurrent pod restarts in the cluster.</p> </div>
<code>netvizInfo</code>	<pre>bciEnabled: true port: 3892</pre>	<p>To configure the Network Visibility App Agent, <code>netviz</code>, you must deploy a Network Agent separately and set this parameter. See Install Infrastructure Visibility with the Kubernetes CLI on how to install the Network Agent.</p> <p>By default, <code>netviz</code> is enabled. In the absence of a Network Agent, this property does not have any impact. You can enable or disable the <code>netviz</code> Agent.</p> <p>Supported values are:</p> <ol style="list-style-type: none"> <code>bciEnabled</code> : Boolean flag denoting whether <code>netviz</code> is enabled. <code>port</code> : The port the Network Agent is listening on (default is <code>3892</code>) . Override this value only when running the Network Agent on a port other than the default port.

Parameter Name	Default Value	Description
<code>runAsGroup</code>	0	<p>If you configured the application container as a non-root user, provide the group ID (GID) of the corresponding group.</p> <p><code>runAsGroup</code> is used to set the appropriate file permission on the agent artifacts.</p> <p>The default <code>runAsGroup</code> value is applied to all the instrumented resources, unless it is overwritten by the <code>instrumentationRules</code> configuration.</p>
<code>runAsUser</code>	0	<p>If you configured the application container as a non-root user, provide the user ID (UID) of the corresponding user.</p> <p><code>runAsUser</code> is used to set the appropriate file permission on the agent artifacts.</p> <p>The default <code>runAsUser</code> value is applied to all the instrumented resources unless it is overwritten by <code>instrumentationRules</code> configuration.</p>

Parameter Name	Default Value	Description
<code>resourcesToInstrument</code>	<code>Deployment</code>	<p>Cluster Agent instruments the resources that are listed in this parameter. The supported values are:</p> <ul style="list-style-type: none"> • <code>Deployment</code> • <code>StatefulSet</code> • <code>DeploymentConfig</code> <p>For example, to instrument <code>Deployments</code> and <code>StatefulSets</code>, configure:</p> <pre>resourcesToInstrument: - Deployment - StatefulSet</pre>

InstrumentationRule Properties

This table describes the properties available to configure auto-instrumentation in an `InstrumentationRule`.

Parameter Name	Default Value	Description
<code>analyticsHost</code>	N/A	<p>The hostname of the Analytics Agent.</p> <p>This parameter is required if you require the Node.js Agent or the .NET Core Agent to send the default transaction data to the Analytics Agent.</p>
<code>analyticsPort</code>	N/A	<p>The listening port for Analytics Agent.</p> <p>For example, if the Analytics Agent is listening on port <code>9090</code>, then the value of this parameter is <code>9090</code>.</p> <p>This parameter is required with <code>defaultAnalyticsHost</code> if you require the Node.js or the .NET Core Agent to send the default transaction data to the Analytics Agent.</p>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Default Value	Description
<code>analyticsSslEnabled</code>	N/A	<p>This value is based on whether the Analytics Agent port is SSL enabled. If the port is not SSL enabled, specify the value as <code>false</code>.</p> <p>This parameter is required with <code>defaultAnalyticsPort</code> and <code>defaultAnalyticsHost</code> if you require the Node.js or the .NET Core Agent to send the default transaction data to the Analytics Agent.</p>
<code>containerMatchString</code>	N/A	<p>This is a regex value to choose the containers with the name that satisfies the value. This parameter requires you to use the <code>select</code> option within <code>defaultInstrumentContainer</code> or <code>instrumentContainer</code>.</p> <p>When the <code>select</code> option is used with this parameter, Cluster Agent instruments the containers that match the regex value.</p> <p>This parameter overrides the default value specified for <code>defaultContainerMatchString</code>.</p>

Parameter Name	Default Value	Description
customAgentConfigSource	N/A	<p>This parameter provides an option to use the custom configuration of the instrumenting agents through ConfigMaps. This parameter requires that you create the required ConfigMaps in the Cluster Agent namespace. This parameter is dynamically configurable from the Cluster Agent YAML file. The changes that you make in the YAML file are updated to all the instrumented agents without restarting the application. Similarly, the changes that you make to the configuration in the ConfigMap is updated to all the instrumented agents without restarting the application.</p> <ul style="list-style-type: none"> <code>configMapName</code> : Specify the name of the ConfigMap. This allows the agent to use the same custom ConfigMap to update all the instrumented agent namespace. <code>subDir</code> : (Required for Java Agent) Specify the relative path where the ConfigMaps are mounted. For example: <code>/ver20.8.0.3686/conf</code>, where <code>20.8.0.3686</code> is the version of the Java Agent. This directory may differ based on the Java Agent version. See Example 6. The absolute mount path for the ConfigMap is <code><agent home path>/subDir</code> This <code>ConfigMap</code> replaces any ConfigMap of the same name in the target application's namespace.

Parameter Name	Default Value	Description
		<p>i If you need to remove a ConfigMap file (used in the rules) from your deployment, then you must first remove this parameter from the Cluster Agent YAML file, and then remove the ConfigMap from the Cluster Agent's namespace.</p>
instrumentContainer	first	<p>This parameter provides an option to choose the container that must be instrumented. You can specify any of these values:</p> <ul style="list-style-type: none"> <code>first</code> : This is the default value. When you specify this value, Cluster Agent instruments the first container in the pod. <code>all</code> : When you specify this value, Cluster Agent instruments all the containers in the pod. <code>select</code> : When you specify this value, Cluster Agent instruments only those containers with the name that matches a regex specified in the <code>defaultContainerMatchString</code> parameter or the <code>containerMatchString</code> parameter.
language	N/A	<p>The language of the application to be instrumented.</p> <p>These languages are supported:</p> <ul style="list-style-type: none"> <code>dotnetcore</code> <code>java</code> <code>nodejs</code>

Parameter Name	Default Value	Description
<code>matchString</code>	N/A	<p>Regular expression to match on deployment name on which the rule applies.</p> <p>If you do not specify a value for this parameter, then the Cluster Agent uses the value specified in the <code>defaultInstrumentMatchString</code>, and instruments all the deployments that satisfy the value.</p>
<code>labelMatch</code>	<code>{}</code>	<p>A list of <code>key-value</code> pairs of labels to include in this rule. It is sufficient to match any one of the labels.</p> <p>For example:</p> <pre>labelMatch: -label1: value1 -label1: value2 -label2: value2</pre> <p>If only <code>label1: value2</code> matches, then instrumentation works as expected.</p>
<code>appName</code>	< <code>defaultAppName</code> >	<p>Application name used by the Java Agent to report to the Controller. This overrides <code>defaultAppName</code>.</p> <p>If no value is provided, then the configured <code>defaultAppName</code> is used.</p>
<code>appNameLabel</code>	N/A	<p>The value of this label is the AppDynamics application name.</p>

Parameter Name	Default Value	Description
<code>customAgentConfig</code>	N/A	<p>This parameter is specific to Java applications.</p> <p>You can add any custom system property if your application framework requires any specific configuration for instrumentation.</p> <p>This value takes precedence over the default value specified in the <code>defaultCustomConfig</code> parameter.</p> <p>This value is appended to the <code>env</code> or <code>defaultEnv</code> variable as configured with other Java Agent properties.</p>
<code>tierName</code>	""	<p>Tier name used by the Java Agent to report to the Controller.</p> <p>If no tier name is provided, then the deployment name is used as the default.</p>
<code>env</code>	""	<p>This parameter is specific to Java applications.</p> <p>Environment variable to which the App Agent system properties will be added. When specified, this overrides <code>defaultEnv</code> for the deployments matching this instrumentation rule.</p> <p>If none are provided, it defaults to the <code>defaultEnv</code> (if configured), or to the default <code>env JAVA_TOOL_OPTIONS</code> (if not configured at the default cluster level).</p>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Default Value	Description
imageInfo	<pre>image: "docker.io/ appdynamics/java- agent:latest" agentMountPath: "/opt/ appdynamics" imagePullPolicy: "IfNotPresent"</pre> <pre>dotnetcore: image: "docker.io/ appdynamics/dotnet- core-agent:latest" agentMountPath: / opt/appdynamics imagePullPolicy: "IfNotPresent"</pre> <pre>nodejs: image: "docker.io/ appdynamics/nodejs- agent:20.8.0-stretch- slimv14" agentMountPath: /opt/ appdynamics imagePullPolicy: "IfNotPresent"</pre>	<p>Location of the agent image. You can select one of these properties:</p> <ul style="list-style-type: none"> <code>image</code> : Location of the agent image, and its tag/version. <code>agentMountPath</code> : Location of image artifacts in the image file system. The default is <code>/opt/appdynamics</code> . This configuration is required only if the path differs from the default path. <code>imagePullPolicy</code> : The pull policy required for the agent's Docker image. The default is <code>IfNotPresent</code> . You can choose one of these pull policies based on your requirement: <ul style="list-style-type: none"> <code>Always</code> <code>IfNotPresent</code> <code>Never</code> <p>This parameter is used in the init containers that are added during auto-instrumentation.</p> <p>The default value is <code>IfNotPresent</code> .</p> <p>For the specific language mentioned in this rule, this overrides <code>image-info</code> for the deployments matching this instrumentation rule.</p> <p>You must configure this if you want to override the default cluster-level configuration and use a custom agent version for this specific rule selection.</p>

Parameter Name	Default Value	Description
netvizInfo	<pre>bciEnabled: true port: 3892</pre>	<p>To configure the Network Visibility App Agent, <code>netviz</code>, you must deploy a Network Agent separately and set this parameter.</p> <p>See Install Infrastructure Visibility with the Kubernetes CLI to install the Network Agent.</p> <p>By default, <code>netviz</code> is enabled. This property has no impact without a Network Agent.</p> <p>You can enable or disable the <code>netviz</code> Agent.</p> <p>Supported values are:</p> <ol style="list-style-type: none"> <code>bciEnabled</code> : Boolean flag denoting whether <code>netviz</code> is enabled or not. <code>port</code> : The port the Network Agent is listening on (default is <code>3892</code>) . Override this value only when running the Network Agent on a port other than the default port.
runAsGroup	0	<p>If you configured the application container as a non-root user, provide the <code>groupId</code> of the corresponding group.</p> <p>This sets the appropriate file permission on the agent artifacts.</p> <p>This value is applied to all the instrumented resources.</p> <p>Add this parameter, if you require to override the default value of <code>runAsGroup</code> that is configured for default instrumentation, or if you require a specific value for the resources that satisfy this rule.</p>

Parameter Name	Default Value	Description
runAsUser	0	<p>If you configured the application container as a non-root user, it provides the <code>userId</code> of the corresponding user.</p> <p>This sets the appropriate file permission on the agent artifacts.</p> <p>This value is applied to all the instrumented resources.</p> <p>Add this parameter, if you require to override the default value of <code>runAsUser</code> that is configured for default instrumentation, or if you require a specific value for the resources that satisfy this rule.</p>

Auto-Instrumentation Configuration Examples

This page describes examples for common auto-instrumentation configuration scenarios.

- **Example 1:** Instrument all the deployments in the `ecom` namespace. The Java Agents running in each pod will register to the Controller with the `Ecommerce` application, and the tier names will default to the Kubernetes deployment names.
- **Example 2:** Instrument only those deployments with names starting with `Payment` and with the label `module=payment` in any namespace.
- **Example 3:** Instrument all deployments in namespaces `ecom` and `books`. For applications in the `books` namespace, use the `BookStore` application name in the Controller and a specific version of the Java Agent.
- **Example 4:** Override the configuration in Example 3 for the `groceries` namespace to use a different Controller application name, and the `JAVA_OPTS` environment variable to inject the `-javaagent` Java argument.
- **Example 5:** Instrument a Node.js application in namespace `books` and a .NET Core Linux application in namespace `groceries`. Also, the Node.js application must send the transaction data to the Analytics Agent.
- **Example 6:** Instrument the containers with the names that start with `str` for the Java application in namespace `ecom`. Also, use the custom agent configurations in `controller-info.xml` and `app-agent-config.xml` configuration files that are in the `controllerConf` ConfigMap along with the `log4j2.xml` file for logging settings of the agent in the `logConf` ConfigMap. These ConfigMaps are in the Cluster Agent's namespace.
- **Example 7:** Instrument all the deployments in the `groceries` namespace and instrument only those deployments with names starting with `Payment` in the `books` and `ecom` namespace.

    - namespaceRegex: groceries
      matchString: .*
    - namespaceRegex: ecom|books
      #no matchstring so it will take default matchstring which is ^payment

```

Use Auto-Instrumentation with an On-Premises Controller

The .NET Core and Node.js applications support certificates signed by a certificate authority (CA) only. The applications do not support self-signed certificates. If your Controller is using a self-signed certificate, then only auto-instrumentation for Java applications is supported.

To support auto-instrumentation with an on-premises Controller, configure the Cluster Agent `customSSLSecret` property to set the SSL certificates that the Cluster Agent uses to communicate with the on-premises Controller. See [Configure the Cluster Agent to Use SSL for On-Premises Controllers](#). The Cluster Agent copies the certificates to the auto-instrumented pods where they are used by App Server Agents to establish connections with the on-premises Controller.

Configuration for Node.js and an On-Premises Controller

In addition to configuring the Cluster Agent `customSSLSecret` property, you must perform these steps for auto-instrumented Node.js applications that use an on-premises Controller.

1. Create a file named `shim.js` that sets the `certificateFile` property used by the Node.js Agent. See [Node.js Settings Reference](#).

```
require("appdynamics").profile({
  certificateFile: "/opt/appdynamics-nodejs/custom-ssl.pem"
});
```

2. Create a `ConfigMap` in the `appdynamics` namespace from the `shim.js` file:

```
kubectl create cm nodejs-cert-configmap --from-file ./shim.js -n appdynamics
```

3. Edit the `cluster-agent.yaml` file to set the `customAgentConfigSource/configMapName` property to the name of the `ConfigMap` (`nodejs-cert-configmap`):

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  # content removed for brevity
  # ...
  instrumentationRules:
    - namespaceRegex: dev
      appName: MyNodeJSApp
      language: nodejs
```

```
customAgentConfigSource:  
  - configMapName: nodejs-cert-configmap  
imageInfo:  
  image: "docker.io/appdynamics/nodejs-agent:20.12.0-10.0.0-alpine"  
  agentMountPath: /opt/appdynamics
```

4. Apply the updated Cluster Agent configuration:

```
kubectl apply -f cluster-agent.yaml
```

The Cluster Agent updates the Node.js workload spec which recreates the pods and copies the certificate file to the pods. The certificate file is referenced by the Node.js Agent through the `NODE_OPTIONS` environment variable and `shim.js` file.

Validate Auto-Instrumentation

This page describes how to validate and troubleshoot Cluster Agent auto-instrumentation.

Prerequisites

- Cluster Agent is reporting to the Controller. See [Validate the Cluster Agent Installation](#).
- If you upgraded the Cluster Agent, you followed the [Upgrade the Cluster Agent](#) procedure and used a compatible set of images and YAML files.

Validate Auto-Instrumentation

1. After applying auto-instrumentation, confirm that the application is reporting to the Controller using the application name assigned based on the name strategy you chose. See [Auto-Instrument Applications with the Cluster Agent](#).
2. Verify that the application pods targeted for auto-instrumentation have been recreated. As auto-instrumentation is being applied, use `kubectl get pods` with the `-w` flag to print out updates to pod status in real-time. A successfully auto-instrumented application shows that the app pod was recreated, and the correct init container was applied and copied the App Server Agent to the application container.

```
kubectl -n <app ns> get pods -w
NAME                                READY   STATUS             RESTARTS   AGE
dotnet-app-85c7d66557-s8hzm         1/1    Running            0           3m11s
dotnet-app-6c45b6d4f-fpp75          0/1    Pending            0           0s
dotnet-app-6c45b6d4f-fpp75          0/1    Init:0/1           0           0s
dotnet-app-6c45b6d4f-fpp75          0/1    PodInitializing    0           5s
dotnet-app-6c45b6d4f-fpp75          1/1    Running            0           6s
dotnet-app-85c7d66557-s8hzm         1/1    Terminating      0           20m\
```

You can also use `kubectl get pods -o yaml` to check whether the application spec was updated to include the init container and the state of the init container:

```
kubectl -n <app-ns> get pod <app-pod> -o yaml
...
initContainers:
- command:
  - cp
  - -r
  - /opt/appdynamics/.
  - /opt/appdynamics-java
  image: docker.io/appdynamics/java-agent:latest
...
initContainerStatuses:
- containerID: docker://
8bb892f322e5a043866d038631392a2272b143e54c8c431b3590312729043eb9
```

```

image: appdynamics/java-agent:20.9.0
imageID: docker-pullable://appdynamics/java-
agent@sha256:077ac1c4f761914c1742f22b2f591a37a127713e3e96968e9e570747f7ba6134
...
state:
  terminated:
    containerID: docker://
8bb892f322e5a043866d038631392a2272b143e54c8c431b3590312729043eb9
    exitCode: 0
    finishedAt: "2021-02-03T22:39:25Z"
    reason: Completed

```

 The pod annotation may display `APPD_POD_INSTRUMENTATION_STATE` as `failed` for Node.js and .NET Core (Linux) applications even when the instrumentation is successful.

Troubleshoot Auto-Instrumentation When Not Applied

If the application pod was not recreated, and an init container was not applied, there may be an issue with the namespace and application matching rules used by the Cluster Agent.

1. First, confirm that the Cluster Agent is using the latest auto-instrumentation configuration.

```
kubectl -n appdynamics get cm instrumentation-config -o yaml
```

If the YAML output does not reflect the latest auto-instrumentation configuration, then validate the Cluster Agent YAML configuration, and apply or upgrade the Cluster Agent:

[Kubernetes CLI](#) [Helm Chart](#)

```
kubectl apply -f cluster-agent.yaml
```

[Kubernetes CLI](#) [Helm Chart](#)

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/
cluster-agent --namespace appdynamics
```

2. If the pods are still not recreated, then enable `DEBUG` logging in the Cluster Agent configuration:

[Cluster Agent YAML](#) [Helm Values YAML](#)

cluster-agent.yaml

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  # content removed for brevity
  logLevel: DEBUG
```

[Cluster Agent YAML](#) [Helm Values YAML](#)

ca1-values.yaml

```
clusterAgent:
  # content removed for brevity
  logProperties:
    logLevel: DEBUG
```

3. Apply or upgrade the Cluster Agent to update the `DEBUG` logging configuration:

[Kubernetes CLI](#) [Helm Chart](#)

```
kubectl apply -f cluster-agent.yaml
```

[Kubernetes CLI](#) [Helm Chart](#)

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/
cluster-agent --namespace appdynamics
```

4. After you update the Cluster Agent logging configuration, tail the logs to search for messages indicating that the Cluster Agent has detected the application, and considers the application in scope for auto-instrumentation:

```
# apply grep filter to see instrumentation related messages:
kubectl -n appdynamics logs <cluster-agent-pod> -f | grep -E 'instrumentationconfig.go|
deploymenthandler.go'
```

However, if output displays (similar to this example) for the application you want to auto-instrument, then the Cluster Agent does not consider the application in scope for auto-instrumentation:

```
[DEBUG]: 2021-03-30 21:22:09 - instrumentationconfig.go:660 - No matching rule found for
Deployment dotnet-app in namespace stage with labels map[appName:jah-stage
framework:dotnetcore]
[DEBUG]: 2021-03-30 21:22:09 - instrumentationconfig.go:249 - Instrumentation state for
Deployment dotnet-app in namespace stage with labels map[appName:jah-stage
framework:dotnetcore] is false
```

Review your auto-instrumentation configuration to determine any necessary updates and save the changes. Then, delete and re-create the Cluster Agent as described previously. For example, if you overwrote the namespace configuration in an `instrumentationRule` using `namespaceRegex`, be sure that you use a value that is included in `nsToInstrumentRegex` (`dev` in the example):

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  # content removed for brevity
  nsToInstrumentRegex: stage|dev
  instrumentationRules:
    - namespaceRegex: dev
```

After you update the configuration and the Cluster Agent has been recreated, your output should be similar to this example indicating that the Cluster Agent recognizes the application as in scope for auto-instrumentation:

```
[DEBUG]: 2021-03-30 21:22:10 - instrumentationconfig.go:645 - rule stage matches
Deployment spring-boot-multicontainer in namespace stage with labels map[appName:jah-
stage acme.com/framework:java]
[DEBUG]: 2021-03-30 21:22:10 - instrumentationconfig.go:656 - Found a matching rule
{stage map[acme.com/framework:[java]] java select .* JAVA_TOOL_OPTIONS map[agent-moun
t-path:/opt/appdynamics image:docker.io/appdynamics/java-agent:21.3.0 image-pull-
policy:IfNotPresent] map[bci-enabled:true port:3892] 0 0 appName 0 false []} for
Deployment spring-boot-multicontainer in namespace stage with labels map[appName:jah-
stage acme.com/framework:java]
```

```
[DEBUG]: 2021-03-30 21:22:10 - instrumentationconfig.go:249 - Instrumentation state for
Deployment spring-boot-multicontainer in namespace stage with labels map[appName:jah-
stage acme.com/framework:java] is true
[DEBUG]: 2021-03-30 21:22:10 - deploymenthandler.go:312 - Added instrument task to queue
stage/spring-boot-multicontainer
```

Troubleshoot Auto-Instrumentation When it Fails to Complete

If the application pod was re-created but the instrumented application is not reporting to the Controller, then auto-instrumentation did not complete successfully, or the App Server Agent failed to register with the Controller.

1. If the application pods are being restarted, but the init container is not completing successfully, then check for events in the application namespace using the **Cluster Agent Events** dashboard or `kubectl get events`. Some common issues that may prevent the init container from completing are: image pull or resource quotas issues.

```
kubectl -n <app ns> get events
```

2. Verify that the application deployment spec was updated with an init container, and if the status information includes any errors:

```
kubectl -n <app-ns> get pod <app-pod> -o yaml
```

3. Start a shell inside the application container to confirm the auto-instrumentation results. Check if the App Server Agent environment variables are set correctly and if the logs are free of errors.

```
kubectl -n <app-ns> exec -it <app-pod> /bin/sh
# Issue these commands in the container
env | grep APPD

# For Java app
env | grep JAVA_TOOL_OPTIONS # or value of defaultEnv
ls /opt/appdynamics-java
cat /opt/appdynamics-java/ver<version>/logs/<node-name>/agent.<date>.log

# For .NET Core app
ls /opt/appdynamics-dotnetcore
cat /tmp/appd/dotnet/1_agent_0.log

# For Node.js app
ls /opt/appdynamics-nodejs
cat /tmp/appd/<id>/appd_node_agent_<date>.log
```

4. If you are instrumenting a Node.js or .NET Core application, and the auto-instrumentation files have been copied to the app container, but the App Server Agent logs do not exist, or errors regarding

binary incompatibilities display, then you may have a mismatch between the app image and the App Server Agent Image (referenced in the `image` property of the auto-instrumentation configuration). For .NET Core, the image OS versions must match (Linux for example). For Node.js, the image OS versions must match, as well as the Node.js version. To confirm, check the image tags, Dockerfiles, or exec-ing into the app container:

```
$ kubectl -n <app-ns> exec -it <app-pod> /bin/sh
cat /etc/os-release # (or /etc/issue)
NAME="Alpine Linux"...
# for Node.js app
node -v
```

Uninstall Auto-Instrumentation from an Instrumented Application

This page describes how to uninstall instrumentation changes from an application that has been auto-instrumented using the Cluster Agent.

Uninstall Auto-Instrumentation

1. To remove the application from auto-instrumentation scope, update `cluster-agent.yaml` by using the `nsToInstrument`, `nsToInstrumentRegex`, `instrumentationMatchString` and `labelMatch` properties (depending on which properties you initially used).
To completely disable auto-instrumentation, set the `instrumentationMethod` to `None`. See [Auto-Instrument Applications with the Cluster Agent](#).
2. To update the auto-instrumentation configuration, apply or upgrade the Cluster Agent.

[Kubernetes CLI](#) [Helm Chart](#)

```
kubectl apply -f cluster-agent.yaml
```

[Kubernetes CLI](#) [Helm Chart](#)

```
helm upgrade -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/  
cluster-agent --namespace appdynamics
```

3. Delete and re-create the application deployment.

Manually Configure App Agents to Correlate with the Cluster Agent

This page describes how to configure APM container correlation with the Cluster Agent when manually instrumenting Kubernetes applications. See [Instrument Kubernetes Applications Manually](#).

When you establish APM correlation, the application containers monitored by the Cluster Agent display in the Controller under the **Application/Container** view. The **Cluster Agent Pod** Dashboard also provides a link to the **APM Node** Dashboard in the **Pod Details** page.

i This configuration is required only when you use init containers or Dockerfiles to manually instrument applications in a cluster where the Cluster Agent is running. When you use Cluster Agent auto-instrumentation, APM container correlation is processed automatically. See [Auto-Instrument Applications with the Cluster Agent](#).

APM container correlation uses the `UNIQUE_HOST_ID` (or `APPDYNAMICS_AGENT_UNIQUE_HOST_ID`) property of specific language agents. For examples of how to set this property, see the language-specific container installation page:

- [Install the Java Agent in Containers](#)
- [Install the .NET Agent for Linux in Containers](#)
- [Install the Node.js Agent in Containers](#)

The table lists the commands required to assign the `UNIQUE_HOST_ID` value based on runtime, platform, and App Agent type:

Platform	Container Runtime	Command for Container ID
Kubernetes	Docker	<code>UNIQUE_HOST_ID=\$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup)</code>
OpenShift 3.10 and 3.11	Docker	<code>UNIQUE_HOST_ID=\$(sed -rn '1s#.*/#; 1s/docker-(.{12}).*/\1/p' /proc/self/cgroup)</code>
OpenShift 4.x	CRI-O	<code>UNIQUE_HOST_ID=\$(cat /proc/self/cgroup head -1 awk -F '/' '{print \$NF}' awk -F '-' '{print \$2}' cut -c 1-12) ; if [-z \$UNIQUE_HOST_ID]; then UNIQUE_HOST_ID=\$(cat /proc/self/cgroup head -1 awk -F '/' '{print \$NF}' cut -c 1-12) ; fi ;</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Kubernetes with Docker

Java APM correlation works out-of-the-box because the Agent retrieves the `UNIQUE_HOST_ID` value automatically. For other Agents with the `UNIQUE_HOST_ID` property, you must set the property using this command: `UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/-(.{12}).*/\1/p' /proc/self/cgroup)`

For all language Agents with a `uniqueHostId` property, set the property using this method when building the App image:

```
UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup)
JAVA_OPTS="$JAVA_OPTS -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID"
```

If you cannot change the application image, you can assign the `UNIQUE_HOST_ID` in the Kubernetes deployment specification by modifying the `command` attribute:

```
command: ["/bin/sh"]
args: ["-c", "UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/(.{12}).*/\1/p' /proc/self/cgroup) &&
java -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
```

This approach implies that the entry point of the application is known. In the example, the original entry point is:

```
java $JAVA_OPTS -jar /java-services.jar
```

OpenShift 3.10 and 3.11 with Docker Runtime

For all language Agents with the `UNIQUE_HOST_ID` property in OpenShift v3.10 and v3.11 with Docker runtime, set the property using this method when building the App image:

```
UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/docker-(.{12}).*/\1/p' /proc/self/cgroup)
```

If you cannot change the application image, you can assign the `UNIQUE_HOST_ID` in the OpenShift v3.10 or v3.11 deployment specification by modifying the `command` attribute:

```
command: ["/bin/sh"]
args: ["-c", "UNIQUE_HOST_ID=$(sed -rn '1s#.*/#; 1s/docker-(.{12}).*/\1/p' /proc/self/cgroup) &&
java -Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
```

This approach implies that the entry point of the application is known. In the example, the original entry point is:

```
java $JAVA_OPTS -jar /java-services.jar
```

OpenShift 4.x with CRI-O Runtime

For all language Agents with the `UNIQUE_HOST_ID` property in OpenShift v4.x with CRI-O runtime, set the property using this method when building the App image:

```
UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' '{print $NF}' |  
{print $NF}' | awk -F '-' '{print $2}' | cut -c 1-12) ; if [ -z $UNIQUE_HOST_ID ]; then  
UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' '{print $NF}' | cut -c 1-12) ;  
fi ;
```

If you cannot change the application image, you can assign the `UNIQUE_HOST_ID` in the OpenShift v4.x deployment specification by modifying the `command` attribute:

```
command: ["/bin/sh"]  
args: ["-c", "UNIQUE_HOST_ID=$(cat /proc/self/cgroup | head -1 | awk -F '/' '{print $NF}' |  
awk -F '-' '{print $2}' | cut -c 1-12) ; if [ -z $UNIQUE_HOST_ID ]; then UNIQUE_HOST_ID=$  
(cat /proc/self/cgroup | head -1 | awk -F '/' '{print $NF}' | cut -c 1-12) ; fi ; java  
-Dappdynamics.agent.uniqueHostId=$UNIQUE_HOST_ID $JAVA_OPTS -jar /java-services.jar"]
```

This approach implies that the entry point of the application is known. In the example, the original entry point is:

```
java $JAVA_OPTS -jar /java-services.jar
```

Use the Cluster Agent

You administer the Cluster Agent from the AppDynamics Controller where you can enable, disable, configure, and delete the Cluster Agent. You can also change which namespaces to monitor.

Any configuration change you make in the Controller also applies to the Cluster Agent. These changes take a couple of minutes, and the status displays with a progress indicator.

View the Cluster Agent Summary

From the **Controller UI** panel:

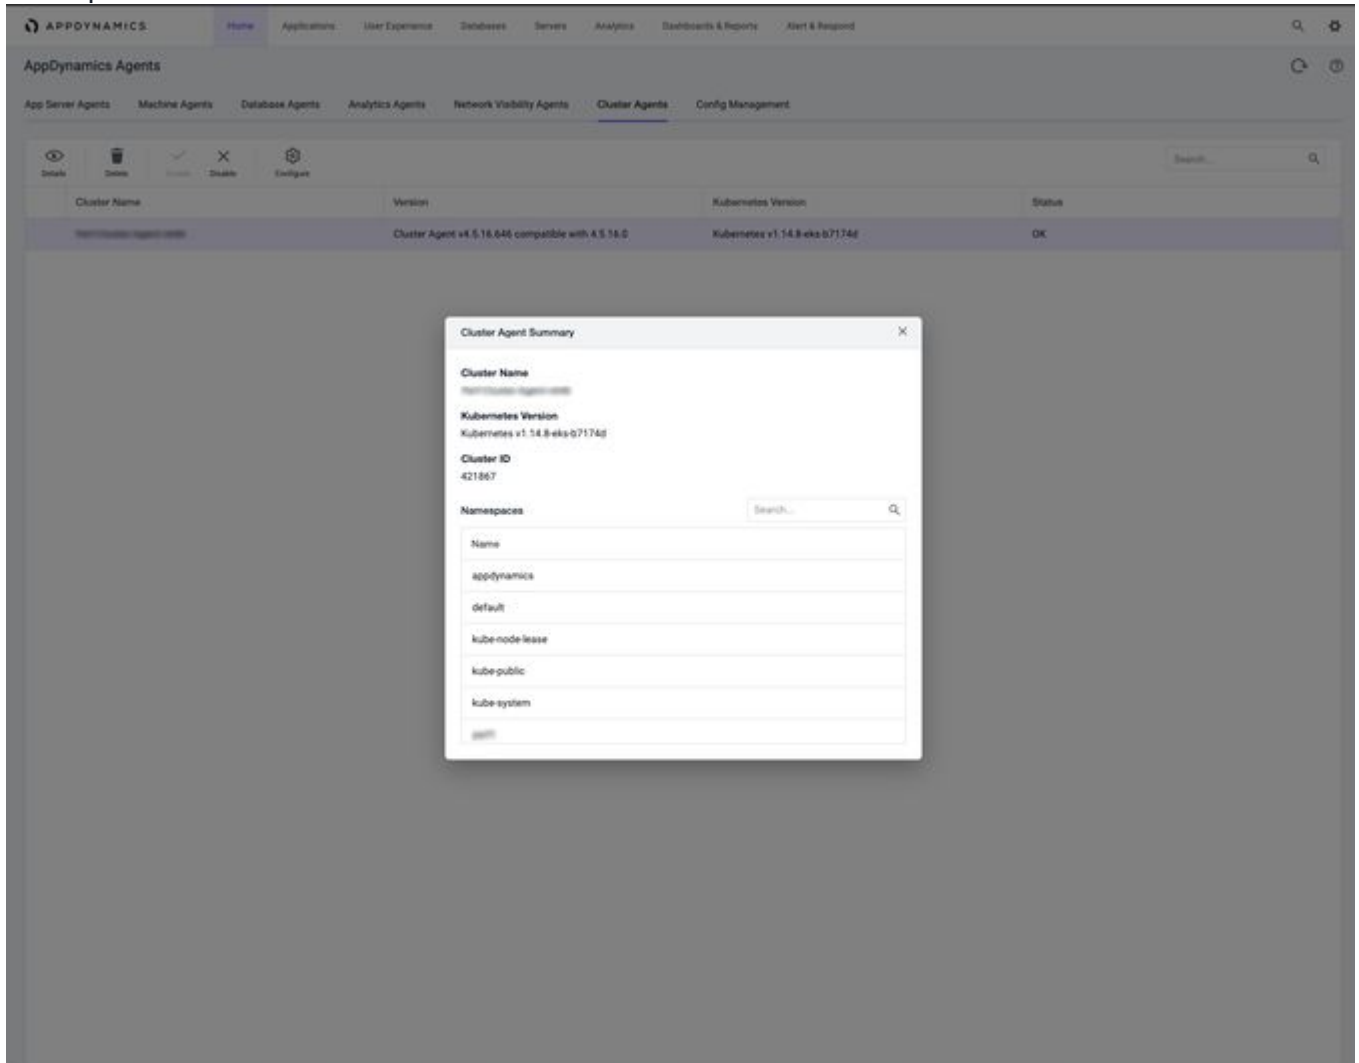

1. In the upper-right corner, click **Settings**  > **AppDynamics Agents**.
2. Select the **Cluster Agents** tab to display a list of clusters. By default, all Agents are enabled.

Cluster Name	Version	Kubernetes Version	Status
TestClusterAgentforPart	Cluster Agent v4.5.16.592 compatible with 4.5.16.0	Kubernetes v1.18.6-eks-5047ed	OK
TestPart_CA2	Cluster Agent v4.5.16.0 compatible with 4.5.16.0	Kubernetes v1.18.6-eks-5047ed	OK
test-eks-cluster-agent-EKS	Cluster Agent v4.5.16.592 compatible with 4.5.16.0	Kubernetes v1.18.7-eks-v99160	OK
test-eks-cluster-agent-OpenShift	Cluster Agent v4.5.16.592 compatible with 4.5.16.0	Kubernetes v1.9.1+aloo/3cc657	OK

3. Double-click a Cluster Agent. A dialog appears showing a **Cluster Agent Summary** of your current settings. The summary card shows the **Cluster Name**, **Kubernetes Version**, **Cluster ID**, and currently monitored **Namespaces**. To the right of the **Namespaces** table is a Search bar, where you can search by

namespace.

4. Click **X** to close the Cluster Agent Summary card.

Disable the Cluster Agent

1. Select a Cluster Agent from the list.
2. Click **Disable** **X**. You can also select the Cluster name, right-click, and select **Disable**. A dialog appears confirming that you disabled the agent successfully. These changes take a couple of minutes, and the status displays with a progress indicator. When you disable the Cluster Agent, it does not report metrics

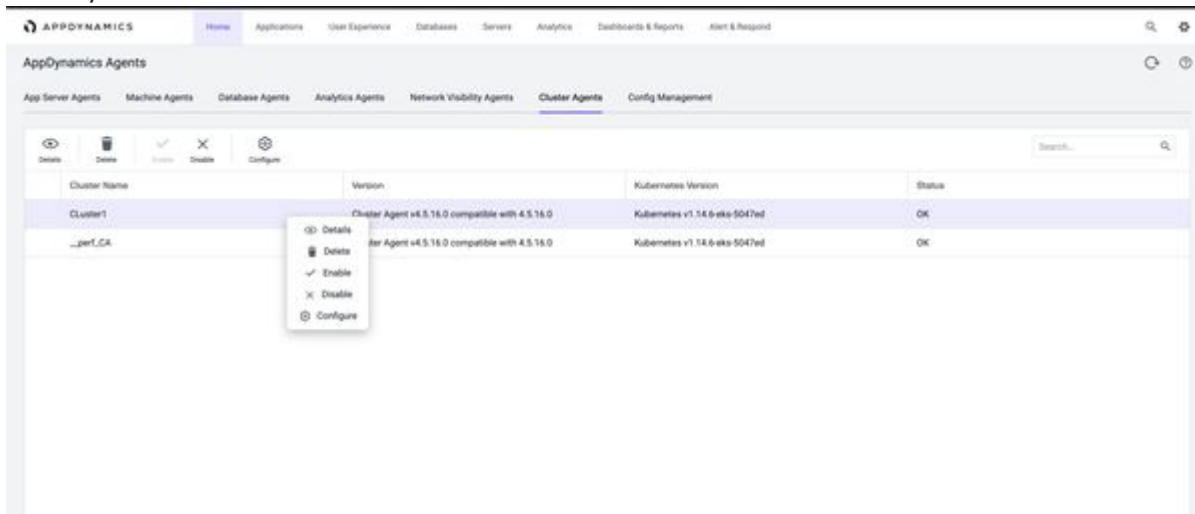

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

or events, nor monitor pods or containers. You can re-enable a disabled Cluster Agent.

Enable the Cluster Agent

1. Select a Cluster Agent from the list.
2. Click Enable ✓. You can also select the Cluster name, right-click, and select **Enable**. A dialog appears confirming that you enabled the agent successfully. These changes take a couple of minutes, and the status displays with a progress indicator. When you enable the Cluster Agent, it reports metrics and events, and monitors containers.

Edit Namespaces

You can modify the namespaces by using either `nsToMonitor` or `nsToMonitorRegex` fields.

These are common namespace behavior scenarios with the `nsToMonitor` field:

- After the Cluster Agent's initial registration, the namespaces are retrieved from the Cluster Agent `YAML` file.
- After initial registration, if the Cluster Agent restarts and the Controller is running, the Controller UI's user namespace settings take precedence.
- After initial registration, if the Controller restarts and the Cluster Agent is running, any previous changes made to the namespaces in the Controller UI are preserved.
- If both the Cluster Agent and the Controller restart, the namespaces are retrieved from the `YAML` file.

The following are common namespace behavior scenarios with `nsToMonitorRegex` field:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

i To use the `nsToMonitorRegex` field, ensure that you are using Controller ≥ 20.10 and Agent ≥ 20.9 .

- After initial registration, at every subsequent minute the agent checks for the `nsToMonitorRegex` field to match the namespaces. If there is `nsToExcludeRegex` mentioned, those namespaces are excluded from the monitored namespaces.
- If a namespace configuration is to be monitored or ignored from the Controller, it takes precedence over the agent configuration (Cluster Agent YAML file). Therefore, if a namespace satisfies the regular expression that is configured for `nsToExcludeRegex`, but the Controller configuration includes that namespace under monitored namespaces, then the namespace is monitored.
To exclude this namespace from being monitored, you must delete the namespace in the Controller configuration. In this scenario, where there is a conflict between the agent configuration and the Controller configuration, the addition or removal of the relevant namespace from the Cluster Agent configuration does not have any effect.
- If the Cluster Agent is restarted, the `nsToMonitorRegex` and `nsToExcludeRegex` fields are read from the agent configuration file along with the namespaces configured in the Controller.
- If the Controller is restarted, the monitored and ignored namespaces included in the Controller configuration are retained and reapplied along with the agent configuration.
- If both the Cluster Agent and the Controller are restarted at the same time, the `nsToMonitorRegex` and `nsToExcludeRegex` fields are read from the agent configuration file. The namespaces to be monitored are determined based on the agent configuration.
- If a new namespace matching the configured regex is added, the namespace is monitored without any additional configuration. Similarly, when a namespace does not match the configured regex, it is not monitored.

You can modify namespaces in a Cluster by:

- [Updating Namespaces in the Cluster Agent Configuration File](#) - Modify the `nsToMonitor` or the `nsToMonitorRegex` field in the `cluster-agent.yaml` file before deploying the Cluster Agent. Namespaces mentioned in the `nsToMonitor` field are considered only during initial registration. You can update the `nsToMonitorRegex` field in the `cluster-agent.yaml` file even after the registration. You can specify regular expressions (regex) for the namespaces that you want to monitor by using the `nsToMonitorRegex` field. If you do not require the Cluster Agent to monitor some of the namespaces that match the regex specified in the `nsToMonitorRegex` field, then you can specify `nsToExcludeRegex` along with `nsToMonitorRegex`. For example, if Cluster Agent must monitor all the namespaces except the namespace that has the name starting with exclude, specify `nsToMonitorRegex` as `.*` and `nsToExcludeRegex` as `^exclude`.
- [Editing Namespaces in the User Interface](#) - Edit namespaces after you deploy the Cluster Agent. Once deployed, the cluster is listed under AppDynamics Agents/Cluster Agents. Open the AppDynamics browser-based configuration user interface and edit namespaces.

Update Namespaces in the Cluster Agent Configuration File

To update namespaces in a cluster, use the `nsToMonitor` or the `nsToMonitorRegex` field in the `cluster-agent.yaml` before deploying the Cluster Agent.

Updating namespaces using the `nsToMonitor` field in the `cluster-agent.yaml` file does not change your currently monitored namespaces. However, updating namespaces using the `nsToMonitorRegex` changes the currently monitored namespaces. The scenarios are mentioned at Edit Namespaces.

If the Cluster Agent pod unexpectedly restarts, the namespaces stored in the Controller take precedence and are preserved. See [Troubleshoot the Cluster Agent](#).

To update namespaces:

1. Open the `cluster-agent.yaml` file in a text editor.
2. Locate the `nsToMonitor` field:

```
nsToMonitor:
  - "default"
  - "appdynamics"
```

Or

To specify namespaces based on regular expressions, include the `nsToMonitorRegex` field:

```
nsToMonitorRegex: <regular expression>
nsToExcludeRegex: <regular expression> #This is an optional field
```

3. Verify the list of namespaces. If it is not correct, add or remove namespaces in the `cluster-agent.yaml` file.
4. Open a command prompt. To apply the namespaces changes, enter:

```
kubectl apply -f cluster-agent.yaml
```

5. To verify that the AppDynamics Operator registered the monitored namespace value, enter:
When using the `nsToMonitor` field:

```
kubectl -n appdynamics describe cm cluster-agent-config | grep
APPDYNAMICS_CLUSTER_MONITORED_NAMESPACES -A 2
```

When using the `nsToMonitorRegex` field:

```
kubectl-app describe cm cluster-agent-mon
```

This is the expected output from the `nsToMonitor` example:

```
APPDYNAMICS_CLUSTER_MONITORED_NAMESPACES:
----
default
```

If you use the `nsToMonitorRegex` field, the default value of `nsToMonitor` is ignored.

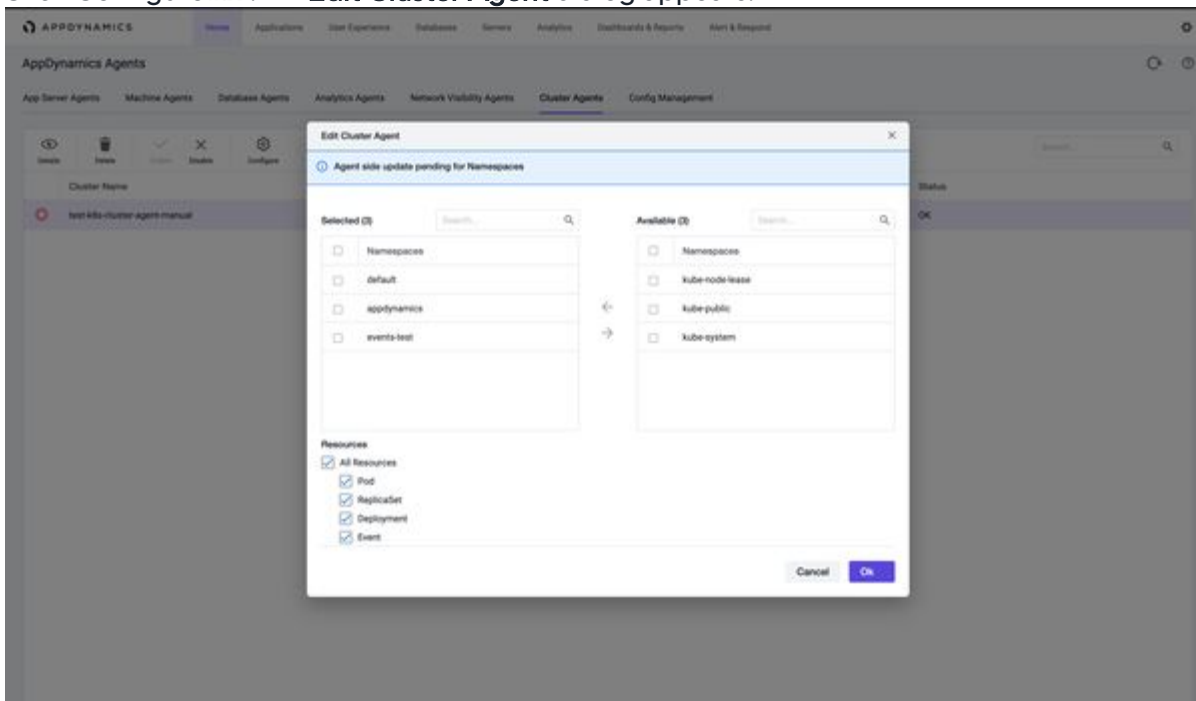

Edit Namespaces in the User Interface

Once you have deployed the Cluster Agent, the **Selected** namespaces column displays the currently monitored namespaces.

 To edit a namespace from the cluster, you must have administrator permissions:

To edit a namespace:

1. Double-click a cluster from the list.
2. Click Configure . An **Edit Cluster Agent** dialog appears.

3. To modify namespaces, select a namespace by checking the corresponding box.
4. Once the desired namespace box is checked, click the arrow to move it to either the **Selected** namespace table or the **Available** namespace table.
5. Click **OK** to close the dialog box. These changes take a couple of minutes and the status displays in a banner notification.

 Updating namespaces in the `cluster-agent.yaml` file does not change your currently monitored namespaces. It assures that if the Cluster Agent pod unexpectedly restarts, that your namespaces are preserved. See [Troubleshoot the Cluster Agent](#).

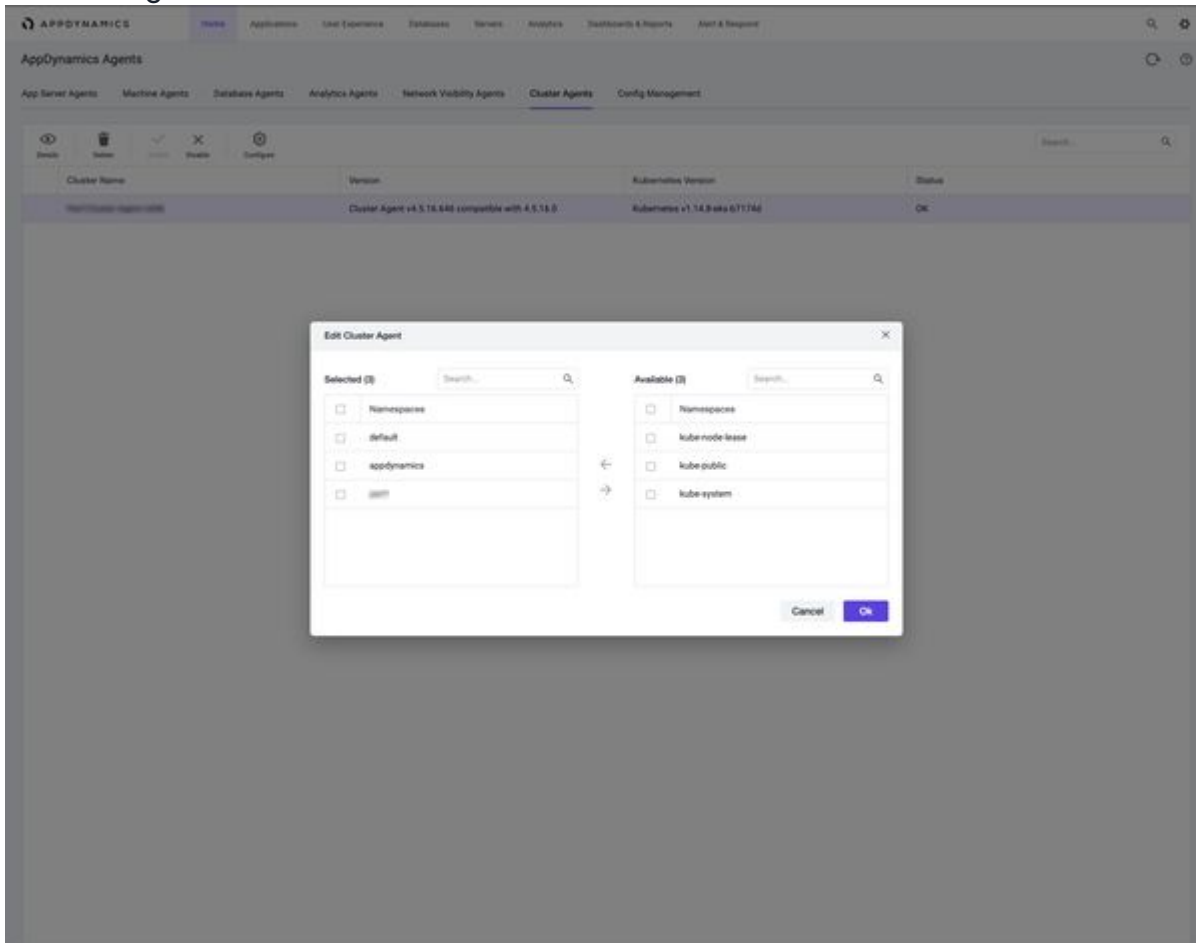

Add or Remove Namespaces

 To add or remove a namespace from the cluster, you must have administrator permissions:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

To add or remove a namespace from the cluster:

1. Double-click a cluster from the list.
2. Click Configure .

3. To modify namespaces, select a namespace by checking the corresponding box. Once the desired namespace box is checked, click the arrow to move it to either the **Selected** namespace table, or the **Available** namespace table.
4. Click **OK** to close the dialog box. These changes take a couple of minutes and the status displays with a progress indicator..

Delete a Monitored Namespace

To delete a Cluster Agent monitored namespace:

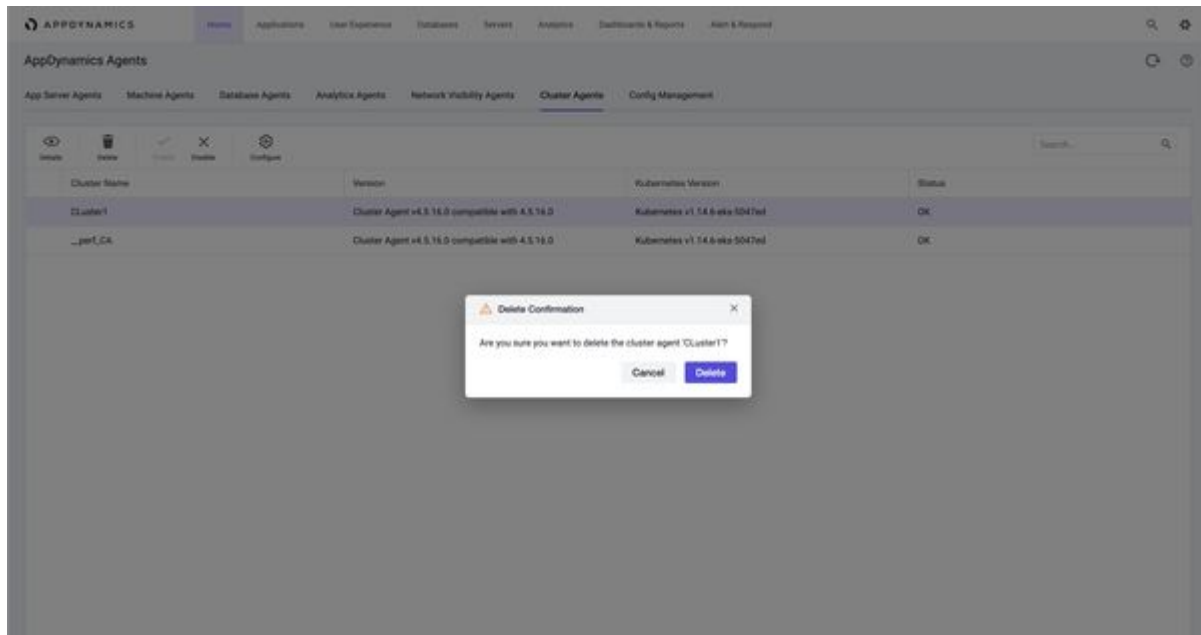

1. Double-click a cluster from the list.
2. Click Configure . The **Edit Cluster Agent** dialog appears.
3. Select a namespace by checking the corresponding box.
4. Click the arrow to move to either the **Available** namespace, or to the **Selected** namespace table.
5. Delete the namespace from your Kubernetes cluster.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Delete the Cluster Agent

To delete a Cluster Agent:

1. Select the Cluster Agent name that you want to delete.
2. Click Delete . A dialog asks you to confirm that you want to delete the Cluster Agent.
3. Click **Delete**. If you delete a Cluster Agent, you will lose all historical data.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Cluster Metrics

The **Cluster Agent Dashboard** metrics derive from the Kubernetes API, and they report information for the clusters and pods. For any defined set of namespaces, the Cluster Agent reports events on these Kubernetes and hardware resources.

AppDynamics monitors cluster health and Kubernetes objects for:

- [Cluster Summary Metrics](#)
- [CPU](#)
- [DaemonSets](#)
- [Deployments](#)
- [Endpoints](#)
- [Jobs](#)
- [Memory](#)
- [Nodes](#)
- [Pods](#)
- [PVC](#)
- [ReplicaSets](#)
- [StatefulSets](#)
- [Services](#)
- [Storage Quota](#)

Cluster Summary Metrics

Metric Name	Description	UI Location	Metric Path
Error events count	Number of error events	Dashboard > Errors	Hardware Resources Cluster Error events count
Evicted pods count	Number of evicted pods	Pods > Evicted	Hardware Resources Cluster Evicted pods count
Eviction threats count	Number of events that represent pod evictions	Dashboard > Errors	Hardware Resources Cluster Eviction threats count
Image pull errors	Number of image pull errors	Dashboard > Issues > Image Issues	Hardware Resources Cluster Image pull errors
Image pulls	Number of image pulls	Dashboard > Issues > Image Issues	Hardware Resources Cluster Image pulls

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Metric Name	Description	UI Location	Metric Path
Info events count	Number of informational events	Dashboard > Errors	Hardware Resources Cluster Info events count
Pod errors	Number of errors related to pods	Dashboard > Issues > Pod Issues	Hardware Resources Cluster Pod errors
Pod Kills	Number of pods that were killed	Inventory > Pods > Pod Kills	Hardware Resources Cluster Pod Kills
Pod restarts	Number of times the pods restarted	Dashboard > Issues > Pod Issues	Hardware Resources Cluster Pod restarts
Pods Scaledowns	Count of scaledowns; you can scale down your deployments and replica sets.	Inventory > Pods > Scaledowns	Hardware Resources Cluster Pods Scaledowns
Pods count	Total count of pods	Inventory > Pods > Phases > Normal	Hardware Resources Cluster Pods count
Pods failed	Number of failed pods	Pods > Failed	Hardware Resources Cluster Pods failed
Pods pending	Number of pods in a pending state. Pending status normally indicates an issue. See the Kubernetes documentation .	Pods > Pending	Hardware Resources Cluster Pods pending
Pods running	Number of pods in a running state	Pods > Running	Hardware Resources Cluster Pods running
Pods succeeded	Number of pods in Succeeded phase	Dashboard > Pods By Phase	Hardware Resources Cluster Pods succeeded
Pods unknown	Number of pods in Unknown state	Dashboard > Pods By Phase	Hardware Resources Cluster Pods unknown

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Metric Name	Description	UI Location	Metric Path
Pods with Missing Dependencies - Config Maps and Secrets	If a pod is dependent on any Config Maps & Secrets, then those dependencies are missing.	Inventory > Pods > Missing Dependencies - Config Maps and Secrets	Hardware Resources Cluster Pods With Missing Dependencies - Config Maps And Secrets (Pod Metrics for Inventory tab)
Pods with Missing Dependencies - Services	If a pod is dependent on any Services, then those dependencies are missing.	Inventory > Pods > Missing Dependencies - Services	Hardware Resources Cluster Pods With Missing Dependencies (Pod Metrics for Inventory Tab)
Pods with No Limits	Number of pods with no limits (on CPU/memory) set. If you specified limits on any pod that you are starting, this metric indicates how many pods do not have a limit defined (Displays in the Inventory tab, under Pod Metrics).	Inventory > Pods > No Limits	Hardware Resources Cluster Pods With No Limits
Pods With No Liveness Probe	Number of pods with no liveness probe. If you configured a probe in Kubernetes to monitor liveness, the values display in the Inventory tab, under Pod Metrics.	Inventory > Pods > No Probes -Liveness	Hardware Resources Cluster Pods With No Liveness Probe
Pods With No Readiness Probe	Number of pods with no readiness probe. If you configured a probe in Kubernetes to monitor readiness, the values display in the Inventory tab, under Pod Metrics.	Inventory > Pods > No Probes -Readiness	Hardware Resources Cluster Pods With No Readiness Probe

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Metric Name	Description	UI Location	Metric Path
Privileged Pods	Number of privileged pods that run with root access (Displays in the Inventory tab, under Pod Metrics).	Inventory > Pods > Privileged	Hardware Resources Cluster Privileged Pods
Storage errors	Overall number of errors related to storage for the cluster.	Inventory > Pod Metrics	Hardware Resources Cluster Storage errors
Storage quota violations	Number of storage quota violations; if someone exceeds that quota.	Inventory > Pod Metrics	Hardware Resources Cluster Storage quota violations

CPU

CPU Capacity

Metric Name	Description	UI Location	Metric Path
Total (MilliCores)	Total CPU capacity for the cluster in MilliCores	Cluster Capacity > CPU	Hardware Resources Cluster CPU Capacity Total (MilliCores)
Used (MilliCores)	CPU capacity already used by the cluster in MilliCores	Cluster Capacity > CPU	Hardware Resources Cluster CPU Capacity Used (MilliCores)

CPU Quota

Metric Name	Description	UI Location	Metric Path
Limit Used (%)	Percentage of CPU limit quota used	Dashboard > Quotas > CPU Limit	Hardware Resources Cluster CPU Quota Limit Used (%)
Limit Used (MilliCores)	MilliCores value for CPU limit quota used	Dashboard > Quotas > CPU Limit	Hardware Resources Cluster CPU Quota Limit Used (MilliCores)

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Metric Name	Description	UI Location	Metric Path
Request Used (%)	Percentage of CPU request quota used	Dashboard > Quotas > CPU Request	Hardware Resources Cluster CPU Quota Request Used (%)
Request Used (MilliCores)	MilliCores value for CPU request quota used	Dashboard > Quotas > CPU Request	Hardware Resources Cluster CPU Quota Request Used (Millicores)

CPU Utilization

Metric Name	Description	UI Location	Metric Path
Limit (MilliCores)	Limit of CPU which can be used by the pods. Only the pods belonging to monitored namespaces are used to calculate this metric.	Dashboard > Utilization > CPU	Hardware Resources Cluster CPU Utilization Limit (MilliCores)
Request (MilliCores)	MilliCore value of CPU for which all the pods in monitored namespaces have requested.	Dashboard > Utilization > CPU	Hardware Resources Cluster CPU Utilization Request (MilliCores)
Used (MilliCores)	Actual CPU which the pods from monitored namespaces are currently using.	Dashboard > Utilization > CPU	Hardware Resources Cluster CPU Utilization Used (MilliCores)

DaemonSets

Metric Name	Description	UI Location	Metric Path
Count	Number of daemon sets that exist	Inventory > Objects > DaemonSets > (Count)	HardwareResources Cluster DaemonSets Count
Nodes Available	Number of nodes that are running and available on the cluster	Inventory > Objects > DaemonSets > Available	HardwareResources Cluster DaemonSets Nodes Available

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Metric Name	Description	UI Location	Metric Path
Nodes MissScheduled	Number of nodes that are running, but should not be running	Inventory > Objects > DaemonSets > MissScheduled	HardwareResources Cluster DaemonSets Nodes MissScheduled
Nodes Unavailable	Number of nodes that should be running, but are not running	Inventory > Objects > DaemonSets > Unavailable	HardwareResources Cluster DaemonSets Nodes Unavailable

Deployments

Metric Name	Description	UI Location	Metric Path
Count	Number of deployments that exist in the cluster	Inventory > Objects > Deployments > (Count)	HardwareResources Cluster Deployments Count
Replicas	Number of pod replicas in the cluster that are not in a terminated state	Inventory > Objects > Deployments > Available	HardwareResources Cluster Deployments Replicas
Replicas Unavailable	Total number of unavailable pod replicas across all deployments in the cluster	Inventory > Objects > Deployments > Unavailable	HardwareResources Cluster Deployments ReplicasUnavailable

Endpoints

Metric Name	Description	UI Location	Metric Path
Count	Number of endpoints in the cluster	Inventory > Services > Endpoints > Count	HardwareResources Cluster Endpoints Count
Not Ready Address	Total number of not ready addresses for all the endpoints in the cluster	Inventory > Services > Endpoints without ready IP	HardwareResources Cluster Endpoints Not Ready Address
Orphans	Total number of endpoints in the cluster which do not have any ready, nor any not ready addresses	Inventory > Services > Orphan Endpoints with no IP	HardwareResources Cluster Endpoints Orphans

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Metric Name	Description	UI Location	Metric Path
Ready Address	Total number of ready addresses for all the endpoints in the cluster	Inventory > Services > Endpoints	HardwareResources Cluster Endpoints Ready Address

Jobs

Metric Name	Description	UI Location	Metric Path
Count	Total number of jobs in the cluster	Inventory > Objects > Jobs > (Count)	Hardware Resources Cluster Jobs Count
Pods Active	Total number of active pods for all the jobs in the cluster	Inventory > Objects > Jobs > Active	Hardware Resources Cluster Jobs Pods Active
Pods Failed	Total number of pods which reached phase Failed for all the jobs in the cluster	Inventory > Objects > Jobs > Failed	Hardware Resources Cluster Jobs Pods Failed
Pods Succeeded	Total number of pods which reached phase Succeeded for all the jobs in the cluster	Inventory > Objects > Jobs > Succeeded	Hardware Resources Cluster Jobs Pods Succeeded

Memory

Memory Capacity

Metric Name	Description	UI Location	Metric Path
Total (MB)	Total Memory capacity for the cluster in MBs	Dashboard > Cluster Capacity > Memory	Hardware Resources Cluster Memory Capacity Total (MB)
Used (MB)	Memory capacity already used by the cluster in MBs	Dashboard > Cluster Capacity > Memory	Hardware Resources Cluster Memory Capacity Used (MB)

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Memory Quota

Metric Name	Description	UI Location	Metric Path
Limit Used (%)	Percentage of Memory limit quota used	Dashboard > Quotas > Memory Limit	Hardware Resources Cluster Memory Quota Limit Used (%)
Limit Used (MB)	MB value for Memory limit quota used	Dashboard > Quotas > Memory Limit	Hardware Resources Cluster Memory Quota Limit Used (MB)
Request Used (%)	Percentage of Memory request quota used	Dashboard > Quotas > Memory Request	Hardware Resources Cluster Memory Quota Request Used (%)
Request Used (MB)	MB value for Memory request quota used	Dashboard > Quotas > Memory Request	Hardware Resources Cluster Memory Quota Request Used (MB)

Memory Utilization

Metric Name	Description	UI Location	Metric Path
Limit (MB)	Limit of Memory which can be used by the pods. Only the pods belonging to monitored namespaces are used to calculate this metric.	Dashboard > Utilization > Memory	Hardware Resources Cluster Memory Utilization Limit (MB)
Request (MB)	MB value of Memory for which all the pods in monitored namespaces have requested.	Dashboard > Utilization > Memory	Hardware Resources Cluster Memory Utilization Request (MB)
Used (MB)	Actual Memory which the pods from monitored namespaces are currently using.	Dashboard > Utilization > Memory	Hardware Resources Cluster Memory Utilization Used (MB)

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Nodes

Metric Name	Description	UI Location	Metric Path
Master Count	Number of master nodes in the cluster	Inventory > Masters	Hardware Resources Cluster Nodes Master Count
Worker Count	Number of worker nodes in the cluster	Inventory > Workers	Hardware Resources Cluster Nodes Worker Count
Memory Pressure Count	Number of nodes that are under memory pressure in the cluster	Inventory > Memory Pressure	Hardware Resources Cluster Nodes Memory Pressure Count
Disk Pressure Count	Number of nodes that are under disk pressure in the cluster	Inventory > Disk Pressure	Hardware Resources Cluster Nodes Disk Pressure Count

Pods

Pods Capacity

Metric Name	Description	UI Location	Metric Path
Total Count	Total number of pods that a cluster can support	Pods > Total Count	Hardware Resources Cluster Pods Capacity Total Count
Used Count	Number of pods already created in the cluster	Pods > Count	Hardware Resources Cluster Pods Capacity Used Count

Pods CPU Usage

Metric Name	Description	UI Location	Metric Path
%Busy Scaled	This percentage is calculated based on the used CPU relative to its pod limit.	Server > Metric Browser	Root Individual Nodes <namespace>/<pod-name> Hardware Resources CPU %Busy Scaled

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Metric Name	Description	UI Location	Metric Path
%Busy	The percentage of the CPU cores used by a pod.	Server > Metric Browser	Root Individual Nodes <namespace>/<pod-name> Hardware Resources CPU %Busy

Pods Memory Usage

Metric Name	Description	UI Location	Metric Path
Used (MB)	The amount of memory used by a pod.	Server > Metric Browser	Root Individual Nodes <namespace>/<pod-name> Hardware Resources Memory Used (MB)

PVC

PVC Quota

Metric Name	Description	UI Location	Metric Path
Used	PVC quota already being used in the cluster (count)	Dashboard > Quotas > PVC	Hardware Resources Cluster PVC Quota Used
Used %	Percentage of PVC quota already being used in the cluster	Dashboard > Quotas > PVC	Hardware Resources Cluster PVC Quota Used (%)

PVC Utilization

Metric Name	Description	UI Location	Metric Path
Capacity (MB)	Total PVC available for the pods in the monitored namespaces	Dashboard > Utilization > PVCs	Hardware Resources Cluster PVC Utilization Capacity (MB)
Request (MB)	Value for PVC requested by pods in monitored namespaces	Dashboard > Utilization > PVCs	Hardware Resources Cluster PVC Utilization Request (MB)

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

ReplicaSets

Metric Name	Description	UI Location	Metric Path
Count	Number of replica set resources in the cluster	Inventory > Objects > ReplicaSets > Count	Hardware Resources Cluster Count
Replicas	Total number of replicas for all the replica sets in the cluster	Inventory > Objects > ReplicaSets > Count	Hardware Resources Cluster ReplicaSets Replicas
Replicas Available	Total number of available replicas for all the replica sets in the cluster	Inventory > Objects > ReplicaSets > Available	Hardware Resources Cluster ReplicaSets Replicas Available
Replicas Unavailable	Total number of unavailable replicas for all the replica sets in the cluster	Inventory > Objects > ReplicaSets > Unavailable	Hardware Resources Cluster ReplicaSets Replicas Unavailable

Services

Metric Name	Description	UI Location	Metric Path
Count	Total number of Kubernetes Services running in the cluster	Inventory > Services > Services	Hardware Resources Cluster Services Count

StatefulSets

Metric Name	Description	UI Location	Metric Path
Count	Number of statefulsets in monitored namespaces	Inventory > Objects > StatefulSets > (Count)	Hardware Resources Cluster StatefulSets Count
Replicas Ready	Number of replicas in a ready state across all statefulsets in monitored namespaces	Inventory > Objects > StatefulSets > Replicas Ready	Hardware Resources Cluster StatefulSets Replicas Ready

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Metric Name	Description	UI Location	Metric Path
Replicas Desired	Number of replicas across all statefulsets in monitored namespaces which are specified as desired in statefulset spec	N/A	Hardware Resources Cluster StatefulSets Replicas Desired
Replicas Not Ready	Number of replicas across all statefulsets in monitored namespaces which are not ready and are yet to be created or started	Inventory > Objects > StatefulSets > Replicas Not Ready	Hardware Resources Cluster StatefulSets Replicas Not Ready
Collisions	Number of hash collisions for statefulsets across all namespaces monitored	N/A	Hardware Resources Cluster StatefulSets Collisions

Storage Quota

Metric Name	Description	UI Location	Metric Path
Used (MB)	Storage quota used by the cluster in MB	Dashboard > Quotas > Storage	Hardware Resources Cluster Storage Quota Used (MB)
Used (%)	Percentage of storage quota used by the cluster	Dashboard > Quotas > Storage	Hardware Resources Cluster Storage Quota Used (%)

Monitor Cluster Health

The **Cluster Dashboard** provides visibility into your cluster's health to quickly determine any impact on performance. Each dashboard indicator provides a different aspect of the cluster performance.

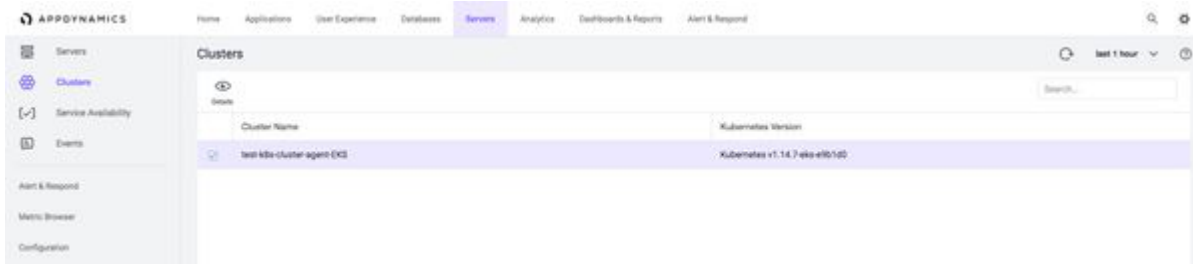

Important Notes

- The **Cluster Inventory Dashboard** may display 0 (zero) for Master Nodes; this is expected behavior. Unlike on-premises clusters, cloud providers develop and release at a different pace compared to the Kubernetes project and evolve independently. This master node, or a number of master nodes, in Amazon EKS, AKS, and other cloud-based environments or clusters, hide the master node of the cluster. The reported cluster results are similar to the results generated by the `kubectl get nodes` command. To verify your reported results, enter the `kubectl get nodes` command to review node information, and if master nodes are shown as zero.
- Cluster-level resource utilization metrics are the sum of resources consumed by each of the pods. These metric values may reach hundreds of thousand because the Cluster Agent reports sums for individual pods.
- Pod utilization metrics are the sum of each of the containers running within a pod.
- Pod count and pod state (running, pending, evicted, and failed pods) metrics show real-time values (not historical values averaged over a designated period of time). Whatever pods are running "now", are reported.

Clusters Dashboard

To access your cluster from the Controller:

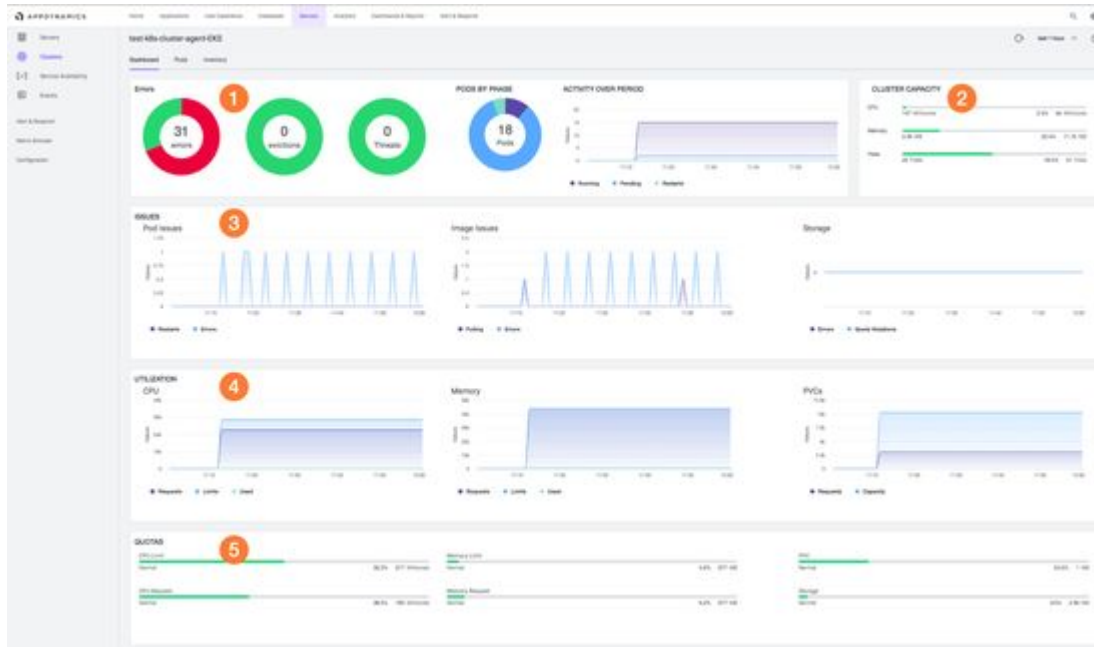

1. Select **Servers > Clusters > Cluster Name**.

2. Select a Cluster Agent and double-click. The cluster interface displays the Dashboard, Pods, Inventory, and Events tabs.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Dashboard Tab

- **Errors card:** 1 Displays pie chart graphs for the monitored namespaces in each cluster:
 - **Errors:** Number of **Errors** (Error events count), **Evictions** (Evicted pods count), and **Threats** (Eviction threats count) for individual pods.
 - **Pods by phase:** Number of pods that are in various states: **Failed**, **Pending**, **Running**, **Succeeded**, and **Unknown**.
 - **Activity over period:** Time-series chart that shows the number of pods in **Running**, and **Pending** states for a given time period.
- **Cluster Capacity:** 2 Score bar displays **CPU**, **Memory**, and **Pods**. A green line indicates the capacity usage. The Dashboard indicates the percent usage of **CPU**, **Memory** and **Pod** capacity of the cluster which you can use to plan the resource capacity for this cluster.
- **Issues card:** 3 Displays:
 - **Pod issues:** When a Cluster Agent observes pod restarts and errors.
 - **Image issues:** Image pulling and errors.
 - **Storage:** Storage capacity issues such as errors and quota violations.
- **Utilization card:** 4 Displays:
 - **CPU:** Requests, limits and used.
 - **Memory:** Requests, limits and used.
 - **PVCs:** Requests and capacity.
- **Quotas card:** 5 Displays % utilization of resources relative to the respective quotas. The Agent tracks these resources:
 - Percentage of CPU Limit Quota Used.
 - Memory Limit of Quota Used.
 - Percentage of PVC Quota Used.
 - Percentage of CPU Request Quota Used.
 - Percentage of Memory Request Quota Used.
 - Percentage of Storage Quota Used.

Numbers are cumulative for the entire cluster. Use these indicators to track the availability of specific resources based on the imposed quotas and use in cluster capacity planning.

Pods Tab

The Pods tab displays pods in various states and shares a high-level summary of their status. This example shows pods running in Amazon EKS. All pods are displayed based on their registered **Namespace** and **Pod Name**.

i Terminated pods continue to display in the Pods list until they have been purged from the AppDynamics Controller, however, their metrics are not updated. Purging occurs automatically at regular intervals. See [Administer the Cluster Agent](#).

The top card displays a summary of the monitored pods and their status in each cluster:

- **Total Pods:** Total number of pods in the monitored cluster.
- **Running:** Percentage and number of pods in a running state.
- **Pending:** Percentage and number of pods in a pending state. Pending status normally indicates an issue. See [Kubernetes documentation](#).
- **Evicted:** Percentage and number of evicted pods.
- **Failed:** Percentage and number of failed pods.

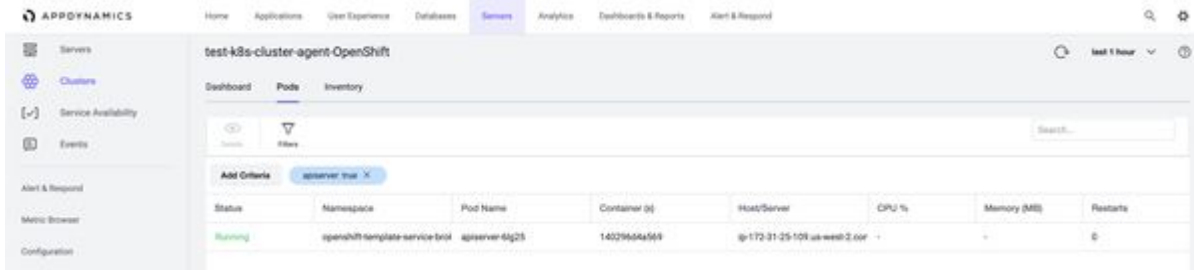

The screenshot shows the AppDynamics interface for a cluster named 'test-k8s-cluster-agent-EKS'. The top summary card displays: 18 Total Pods, 89% Running (16 Pods), 11% Pending (2 Pods), 0% Evicted (0 Pods), and 0% Failed (0 Pods). Below this is a table with columns: Status, Namespace, Pod Name, Container ID, Host/Server, CPU %, Memory (MB), and Restarts.

Status	Namespace	Pod Name	Container ID	Host/Server	CPU %	Memory (MB)	Restarts
Running	appdynamics	appdynamics-operator-44880467c-v22k4	7f32a67821af	ip-10-111-0-148.us-west-2.compute.internal	0	11	0

You can search based on **Namespace** or **Pod Name**.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

You can further filter based on pod tags and labels:

Double-click any pod to display its **Pod Details** panel. From the **Pod Details** panel, you can review containers running in that pod, pod events, and pod labels and tags.

The Cluster Agent automatically detects a pod's:

- Status
- Namespace
- Pod name
- Container IDs
- Host or server
- CPU % (sum of running containers within the pod)
- Memory MB (sum of running containers within the pod)
- Restarts

Pods are deleted for these reasons:

- When the namespace is un-monitored.
- When pods are deleted from the cluster, except for the failed pods.
- When the pod count exceeds the pod limit.
- If the pod is blocklisted.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Pod Details Panel

The **Pod Details** panel displays:

- **Namespace:** In which namespace the pod is running.
- **Hostname:** Namespace or pod name.
- **Pod Events:** List of the most-recent events generated from the `kubectl describe pods` command.
- **Container (count):** List of running containers displayed by Container ID in this pod. Click each container to display individual container metrics.
- **Tags:** Kubernetes labels provided to this pod.

Inventory Tab

The Inventory tab displays a high-level snapshot or inventory view of your cluster. It displays the contents of the cluster which enables you to troubleshoot applications running in the cluster.

The Cluster card displays:

- **Cluster Name:** Name of the cluster.
- **Kubernetes Version:** Kubernetes version running on the cluster.
- **Cluster ID:** ID of the Cluster Agent.
- **Pods:** Number of monitored pods.
- **Namespaces:** Number of monitored namespaces.
- **Masters:** Number of master nodes.
- **Workers:** Number of worker nodes.
- **Disk Pressure:** Snippet of disk pressure trend in the cluster.
- **Memory Pressure:** Snippet of memory pressure trend in the cluster.

The Pods card displays:

- **Pods by Phases:** Whether a pod is running, evicted, pending or failed. This number is the same count as the pods in a "running" state in the Pods tab.
- **Privileged Pods:** The pods run as root.
- **No Limits:** You can specify limits to any pod that you are starting. The No Limits metric indicates how many pods do not have a limit defined.
- **No Readiness Probe:** If you configured a probe in Kubernetes to monitor readiness, the values display here.
- **No Liveness Probe:** If you configured a probe in Kubernetes to monitor liveness, the values display here.
- **Missing Dependencies - Config Maps & Secrets:** If a pod is dependent on any Config Maps & Secrets, then those dependencies are missing.
- **Missing Dependencies - Services:** If a pod is dependent on any Services, then those dependencies are missing.
- **Scaledowns:** Count of scaledowns of your deployments and replicaset.
- **Pod Kills:** Number of pods that were killed.

Namespaces: List of namespaces that you can search from the Search bar

The Objects card displays:

- **Jobs:** Total number of jobs in the monitored namespaces, and the number of failed, active, and succeeded job counts.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- **Deployments:** Number of deployments in monitored namespaces, and the total available and unavailable replica counts.
- **ReplicaSets:** Number of replicasets in monitored namespaces, and the total available and unavailable replica counts.
- **DaemonSets:** Number of daemonsets in monitored namespaces, and the total available, unavailable, and mis-scheduled pod counts.
- **StatefulSets:** Number of statefulsets in monitored namespaces, and the total ready and not ready replica counts.

The Services card displays the health of the entire cluster:

- **Services:** Total number of services being monitored.
- **Endpoints:** Total number of endpoints being monitored.
- **Readiness:** Number of endpoints without a ready IP address.
- **Orphans:** Number of orphaned endpoints with no IP address.

Events Tab

The Events tab displays the cluster events that are specific to the selected cluster. You can use **Filters** to view any specific event.

Filters	Summary	Time
<input type="button" value="+ Add"/>	Back-off restarting failed container	07/28/20, 2:48:03 PM
<input type="button" value="+ Add"/>	Back-off restarting failed container	07/28/20, 2:47:58 PM
<input type="button" value="+ Add"/>	Back-off restarting failed container	07/28/20, 2:47:56 PM

<input type="button" value="+ Add"/>	Error: ImagePullBackOff	07/28/20, 2:42:18 PM
<input type="button" value="+ Add"/>	Error: ImagePullBackOff	07/28/20, 2:42:16 PM
<input type="button" value="+ Add"/>	Error: ImagePullBackOff	07/28/20, 2:42:13 PM
<input type="button" value="+ Add"/>	Error: ImagePullBackOff	07/28/20, 2:42:10 PM
<input type="button" value="+ Add"/>	Back-off restarting failed container	07/28/20, 2:39:37 PM

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Monitor Kubernetes Events

There are two event types in Kubernetes:

- Normal events
- Warning events

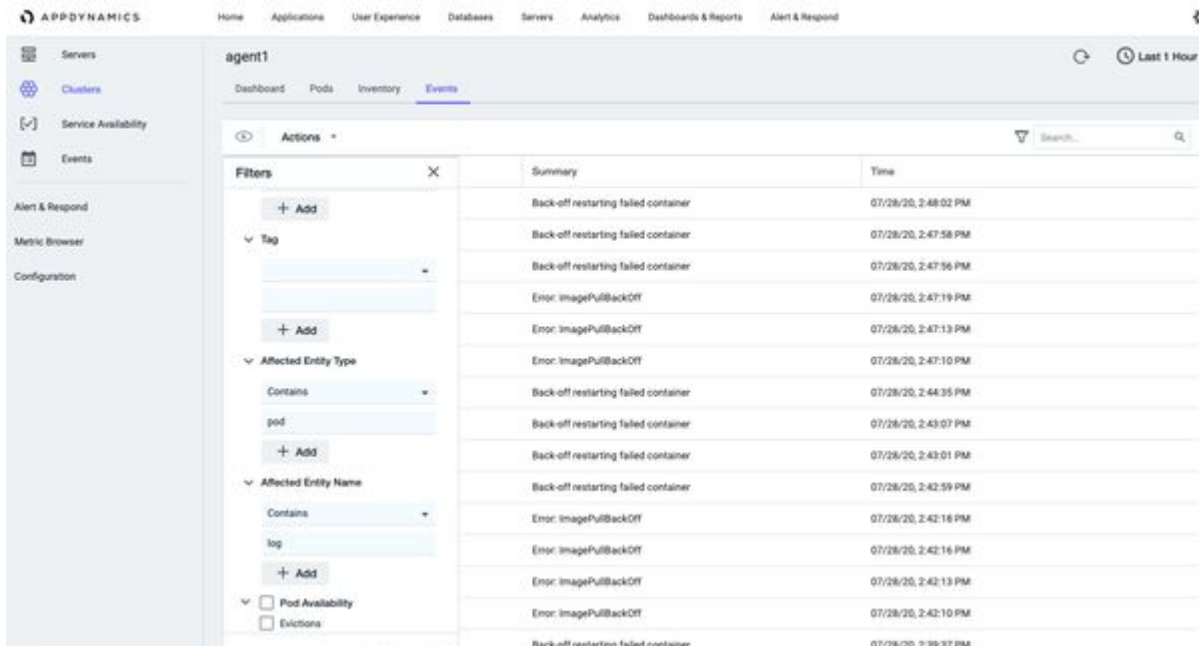

See [Application Introspection and Debugging](#) for more information on Kubernetes events. AppDynamics reports a subset of these as Cluster Events. They are comprised of Kubernetes warning events and important informational notices concerning state changes in the cluster. An example of a state change is a pod transitioning from a pending to a running state.

i This document contains links to Kubernetes documentation. AppDynamics makes no representation as to the accuracy of Kubernetes documentation because Kubernetes controls its own documentation.

A **Cluster Event** of type warning displays a  yellow warning icon. When a Pod, Replicaset, or Deployment gets added, updated, or deleted, otherwise known as a state change, the Cluster Agent reports it as an Info type event and displays a  blue info icon.

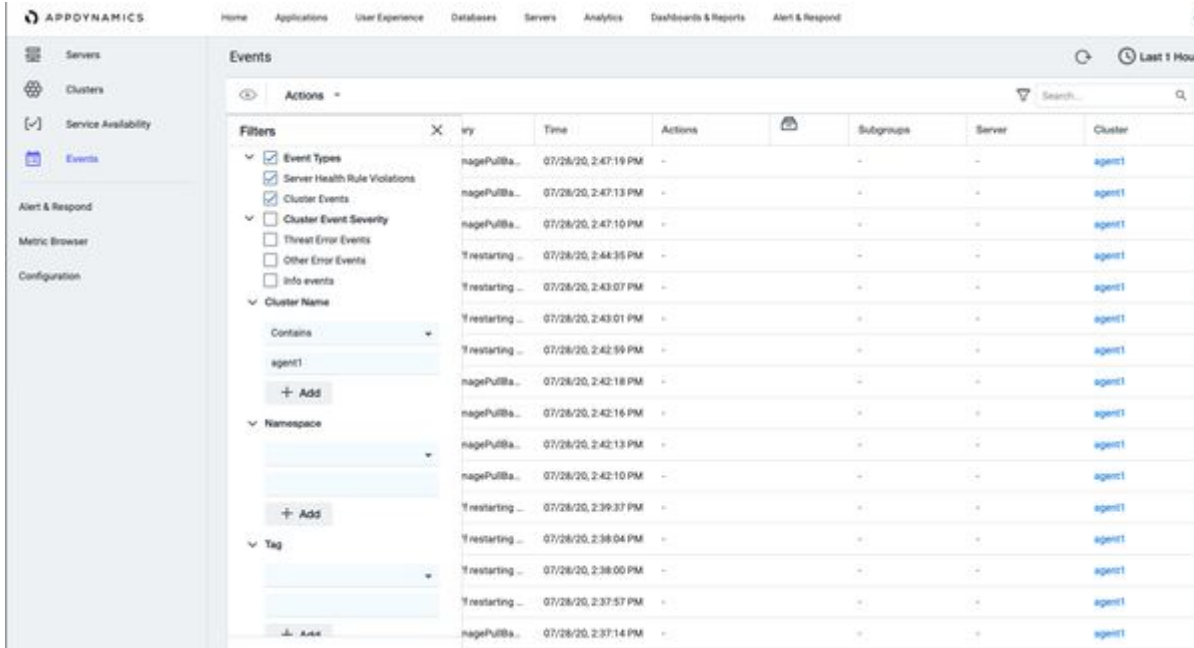

To access Cluster Event data:

1. Click the **Servers** tab.
2. On the navigation bar, select **Events**. A panel displays a list of events that have been reported from both servers and clusters. To check for specific events, you can use the **Filters** option.

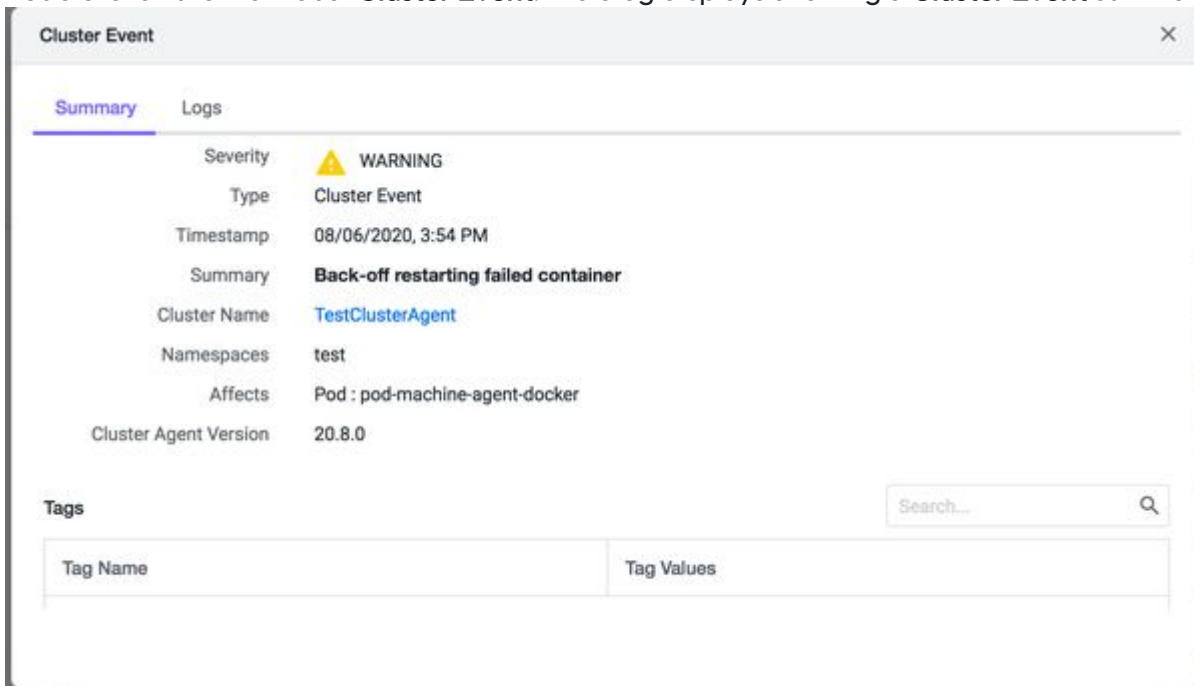

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

3. Click **Add** to add a filter and select the desired filters from the available list.

4. Click **Apply**. The list of events is filtered to show only the selected events.

5. Double-click the individual **Cluster Event**. A dialog displays showing a **Cluster Event** summary.

The **Logs** tab displays the log details. See [Enable Log Collection for Failing Pods](#).

6. Click **X** to close the dialog.

View Container Information

Related pages:

- [Container Metrics](#)
- [Administer the Cluster Agent](#)
- [Hardware Resources Metrics](#)

The AppDynamics Cluster Agent runs within your Kubernetes cluster. Metrics reported for containers are taken from the Kubernetes [Metrics Server](#). Users need to install the metrics-server on their cluster to see container metrics. Once deployed, it discovers nodes in your cluster and starts collecting metrics from the Kubelet API. The Containers Dashboard shows the resource utilization metrics of your containerized applications.

The Containers page lists all containers to be monitored that are used by an application that is registered to the Controller.

View Container Metrics

To view Container metrics:

1. Navigate to **Servers > Clusters**.
2. Double-click a cluster to view the cluster agent **Dashboard**.
3. Navigate to the **Pods** tab.
4. Double-click a pod to view the pod details and the containers that are running in the pod.
A list of Container names is displayed.
5. Click a **Container Name** to expand and view the metrics for that specific container.

CPU Usage

2.02%

Usage

Memory Usage

45.48%

Usage

Measure Resource Usage

Two metrics are reported per container:

- **CPU Usage:** Hardware Resources|CPU|%Busy
- **Memory Usage:** Hardware Resources|Memory|Used %

CPU

Name	Description
%Busy	Percentage of time the CPU was busy processing system or user requests from this container; this metric includes CPU Stolen time. This %Busy value can exceed 100%. For example, if a system has 16 cores the %Busy can go to 1600%.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Memory

Name	Description
Used %	Memory utilization by the container as a percentage of the memory hard limit.

Administer the Cluster Agent

You can use several settings in the Controller to administer the Cluster Agent.

Plan the Cluster Agent Deployment

If you have more than one Cluster Agent on your Controller, you must start your Cluster Agents in a staggered fashion. This procedure ensures that the Controller responds optimally. Use the table to determine the stagger start time for each cluster. Based on the cluster size, it may take a few minutes for the Cluster Agent to fully register with the Controller.

Plan capacity for Clusters

Capacity planning is important when preparing to deploy the Cluster Agent. The Cluster Agent and the Machine Agent share the capacity of the same Controller. The total number of pods and containers in your cluster is equal to the number of Machine Agents slots that are used. For example, if you have 250 pods and 250 containers, that is equivalent to using 500 Machine Agents in the Controller. See [Controller Sizing](#).

Controller Settings for the Cluster Agent

These properties are recommended for a Controller supporting the Cluster Agent. Certain Server Visibility properties will apply to all instances of Server Visibility and the Cluster Agent.

Property	Description
<code>sim.cluster.agent.limit</code>	Maximum number of Cluster Agents per account. Configurable at the account level. For example, if you set the <code>sim.cluster.agent.limit</code> to a value of five, and you have ten Cluster Agents reporting, then the Controller randomly selects a subset of Cluster Agents. These random Cluster Agents will not be registered and reported. If the configured limit is reached, any new Cluster Agent will not be registered.
<code>sim.cluster.pod.limit</code>	Maximum number of pods per Cluster Agent per account. Configurable at the account level. If the number of pods exceeds the configured limit, the Cluster Agent randomly selects a set of pods that will not register or report.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property	Description
<code>sim.machines.registrations.maxPerSecondPerAccount</code>	Maximum number of machine registrations allowed per account, per second. This property applies to all instances of Server Visibility and the Cluster Agent.
<code>sim.cluster.container.limit</code>	Controller level limit for the number of containers per cluster. This is used if there is no account-level configuration. To overwrite at account-level, add an additional property to the corresponding account. This property only affects the Cluster Agent.
<code>sim.machines.offline.toStaleTimeoutMillis</code>	Length of time in milliseconds before an offline machine is considered stale, and eligible for purging. This property applies to all instances of Server Visibility and the Cluster Agent.
<code>sim.machines.registrations.update.frequency</code>	Machine's timestamp update frequency in milliseconds. This property applies to all instances of Server Visibility and the Cluster Agent.
<code>sim.cluster.events.maxPerMinute</code>	Controller level limit for the number of cluster events that are allowed per minute. This property only affects the Cluster Agent.
<code>sim.cluster.monitoring.enabled</code>	This property enables the Cluster Agent on the Controller. If set to false, all Cluster Agents stop reporting metrics and components, but still register every minute. This property only affects the Cluster Agent.

See [Controller Settings for Server Visibility](#).

To avoid the risk of purging live entities, ensure that the `sim.machines.offline.toStaleTimeoutMillis` value is always greater than the `sim.machines.registrations.update.frequency` value.

On-Premises Customers

For on-premises customers, to modify the Cluster Agent properties for your account:

1. Log in to the [Administration Console](#) with the administrator root password.
2. Select **Controller Settings**.
3. In the **Controller Settings** list, search for the setting.
4. In the **Value** field, enter the recommended value.
5. Click **Save**.
6. Log out of the Administrator Console.

SaaS Customers

For SaaS customers, create an [AppDynamics Support](#) ticket to have the Cluster Agent properties updated for your account.

Control Cluster Agent Reporting

You can stop and resume the Cluster Agent from reporting metrics and registering containers and pods. You can do this on a per-account basis, or on a Controller-wide basis.

Stop a Cluster Agent by Account

To stop the Cluster Agent on the Controller:

1. Log in to the [Administration Console](#) with the administrator root password.
2. Select **Account Settings**.
3. In the accounts list, double-click the account for which you want to configure the Cluster Agent.
4. In the **Additional Properties** pane, click **+Add Property**.
5. In the left field, enter "sim.cluster.monitoring.enabled".
6. In the right field, enter "false".
7. Click **OK** to save the property.
8. Log out of the Administrator Console.

License Expiration Date Never On Date 12/31/20

Using SAML Authentication No

Additional Properties + Add Property

Property Name	Value
sim.cluster.monitoring.enabled	false

Start a Cluster Agent by Account

To start the Cluster Agent on the Controller:

1. Log in to the [Administration Console](#) with the administrator root password.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

2. Select **Account Settings**.
3. In the accounts list, double-click the account for which you want to configure the Cluster Agent.
4. Locate the `sim.cluster.monitoring.enable` property, and in the right field, enter "true".
5. Click **OK** to save the property.
6. Log out of the Administrator Console.
7. If the Cluster Agent has been stopped using the "sim.cluster.monitoring.enabled" setting, it does not resume reporting metrics and registering pods and containers until you enable the Cluster Agent using the User Interface. See [Use the Cluster Agent](#).

Stop all Agents on the Controller

To stop all Cluster Agents on the Controller:

1. Log in to the [Administration Console](#) with the administrator root password.
2. Select **Controller Settings**.
3. In the **Controller Settings** list, search for the "sim.cluster.monitoring.enabled" setting.
4. In the right field, set the value to "false".
5. Click **Save**.
6. Log out of the Administrator Console.

Start all Agents on the Controller

To start all Cluster Agents on the Controller:

1. Log in to the [Administration Console](#) with the administrator root password.
2. Select **Controller Settings**.
3. In the **Controller Settings** list, search for the "sim.cluster.monitoring.enabled" setting.
4. In the right field, set the value to "true".
5. Click **Save**.
6. Log out of the Administrator Console.
7. If Cluster Agents have been stopped using the "sim.cluster.monitoring.enabled" setting, they do not resume reporting metrics and registering pods and containers until they are enabled through the User Interface. See [Use the Cluster Agent](#).

Enable Log Collection for Failing Pods

This page describes how to enable and use the Cluster Agent feature to collect logs for failing pods. This feature is automatically enabled on SaaS Controllers. You must enable on-premises Controllers described on this page.

When enabled, the Cluster Agent automatically collects logs for restarted or failed pods. The pod failure logs capture the status of the `CrashLoopBackoff` events that display the `Back-off restarting failed container` message. This message usually indicates that Kubernetes started a container but then the container quickly exits. If this occurs, Kubernetes attempts to restart the container. You can use these log messages to determine why the pod is exiting, whether due to a liveness probe, or some other issue.

Minimum Requirements

The Cluster Agent log collection feature requires:

- Cluster Agent ≥ 20.7
- Controller $\geq 20.10.0$

Requirements to Enable On-Premises Controllers

- Enable logging by using the Cluster Agent configuration setting, `sim.cluster.logs.capture.enabled`.
- Update the full file path to store the logs using the Controller setting, `sim.cluster.logs.root.file.path`. The logs are stored in the specified file location.
- Ensure you have 50 GB of hard disk space on the file system.
- When updating the file path, ensure that you move previously collected logs from the old path to the new path to view them on the Controller UI.

Controller Settings

The following table lists the log settings required for an on-premises environment:

i For SaaS, the Technical Support team updates the configuration properties. Therefore, to configure the logs for SaaS, contact the support team by creating an [AppDynamics Support](#) ticket.

Setting	Definition	Location	Default
<code>sim.cluster.logs.bucket.name</code>	The folder name to store the pod logs.	Controller Administration Console with root user permission (Controller Settings)	<code>kubernetes-log-snippets</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Setting	Definition	Location	Default
<code>sim.cluster.logs.capture.enabled</code>	<p>An option to enable or disable log capturing.</p> <p>This option is disabled by default.</p>	<p>Controller Administration Console with root user permission</p> <p>You can configure this setting at both account level (Account Settings) and Controller level (Controller Settings)</p>	true
<code>sim.cluster.logs.expiration.in.days</code>	<p>The number of days after which the logs get cleared from the storage.</p>	<p>Controller Administration Console with root user permission (Controller Settings)</p>	10
<code>sim.cluster.logs.root.file.path</code>	<p>The complete root file path to store the logs.</p> <p>Modifying the path results in storing the logs in the new path but the older logs will remain in the older location.</p>	<p>Controller Administration Console with root user permission (Controller Settings)</p>	<code>/opt/appdynamics</code>

Use Cluster Agent Log Collection

You can view the logs on the **Pod Details** page and the **Cluster Event** page.

Pod Details Page

1. Select **Servers > Clusters > Cluster Name**.
2. Select a Cluster Agent and double-click. The cluster interface displays the **Dashboard**, the **Pods**, the **Inventory**, and the **Events** tabs.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

3. Click **Pods**.
4. Double-click any pod to display its **Pod Details** panel.
5. Review the **Error Log**.

Ok

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Cluster Events Page

1. Click the **Servers** tab.
2. On the left navigation bar, select **Events** to see a list of events that have been reported from both servers and clusters.
or
Select **Clusters** > <Clustername> > **Details** > **Events**
3. Double-click a cluster event to view the logs under the **Logs** tab.

The screenshot shows a 'Cluster Event' window with a 'Logs' tab selected. The log entry is as follows:

```

Upgrade the Cluster Agent

This page describes how to upgrade the Cluster Agent using:

- Kubernetes CLI, or
- Cluster Agent Helm Chart

See [Install the Cluster Agent](#).

Upgrade the Cluster Agent Using Kubernetes CLI

1. Download the target version of the Cluster Agent bundle from the [AppDynamics Downloads](#) portal.
2. Unzip the bundle and `cd` to the unzipped folder:

```
unzip appdynamics-cluster-agent-alpine-linux-<version>.zip
cd appdynamics-cluster-agent-alpine-linux-<version>
```

3. Update the `cluster-agent.yaml` to include any previously applied configuration.
4. Update the image tag to add the version of the downloaded Cluster Agent bundle (for example, 20.12.1):

```
apiVersion: appdynamics.com/v1alpha1
kind: Clusteragent
metadata:
  name: k8s-cluster-agent
  namespace: appdynamics
spec:
  appName: "<app-name>"
  controllerUrl: "http://<appdynamics-controller-host>:8080"
  account: "<account-name>"
  # docker image info
  image: "docker.io/appdynamics/cluster-agent:20.12.1"
  serviceAccountName: appdynamics-cluster-agent
```

5. Delete and re-create the Operator and Cluster Agent.

```
kubectl delete -f cluster-agent.yaml
kubectl delete -f cluster-agent-operator.yaml
kubectl create -f cluster-agent-operator.yaml
kubectl create -f cluster-agent.yaml
```

Upgrade the Cluster Agent Using the Helm Chart

The latest Cluster Agent Helm Chart is available at `appdynamics-charts/cluster-agent`. Before you can upgrade to the latest Cluster Agent, you must first uninstall the existing Helm Chart and then re-install it.

1. Use `helm get` and `helm show` to determine if an upgrade is required to install the most recent Cluster Agent images from `appdynamics-charts/cluster-agent` :

```
# which images are currently installed by my release?
helm get all "<my-cluster-agent-helm-release>" -n appdynamics | grep -E 'agentTag|
operatorTag'
  agentTag: 20.10.0
  operatorTag: 0.6.3

# which images are available to install?
helm show values appdynamics-charts/cluster-agent | grep -E 'agentTag|operatorTag'
  agentTag: 20.11.0
  operatorTag: 0.6.5
```

2. To perform the upgrade, uninstall and re-install the Cluster Agent Helm Chart using the same namespace from the previous installation:

```
helm uninstall "<my-cluster-agent-helm-release>" --namespace appdynamics
helm install -f ./ca1-values.yaml "<my-cluster-agent-helm-release>" appdynamics-charts/
cluster-agent --namespace=appdynamics
```

Uninstall the Cluster Agent

This page describes how to uninstall the Cluster Agent using:

- Kubernetes CLI, or
- Cluster Agent Helm Chart

See [Install the Cluster Agent](#).

Uninstall the Cluster Agent Using Kubernetes CLI

Delete the Cluster Agent Operator and Cluster Agent using the `YAML` files:

```
kubectl delete -f cluster-agent.yaml
kubectl delete -f cluster-agent-operator.yaml
```

Uninstall the Cluster Agent Using the Helm Chart

Uninstall the Cluster Agent Helm Chart using the namespace that you used for the installation:

```
helm uninstall "<my-cluster-agent-helm-release>" --namespace appdynamics
```

Analytics

The integration of all AppDynamics APM performance engines results in a dynamic, accessible set of data for every business transaction. By extracting that information and generating baselines and dashboards, Analytics provides a perspective beyond traditional APM and enables real-time analysis of business performance correlated with the performance of your application software.

You can use Analytics with the APM, Browser RUM, and Browser Synthetic Monitoring product modules to generate:

- [Transaction Analytics](#)
- [Log Analytics](#)
- [Browser Analytics](#)

Installation And Administration

- [Deploy Analytics Without the Analytics Agent](#)
- [Deploy Analytics With the Analytics Agent](#)
- [Analytics and Data Security](#)
- [Upgrade Analytics Agent](#)
- [Troubleshoot Analytics Issues](#)

Analytics Data Collection

- [Collect Log Analytics Data](#)
- [Collect Transaction Analytics Data](#)
- [Business Transaction and Log Correlation](#)
- [Collect Business Data From SQL Calls](#)

Using Analytics

- [Business Journeys](#)
- [Experience Level Management](#)
- [Search Analytics Data](#)
- [Visualize Analytics Data](#)

Extensibility And Reference

- [Create Analytics Metrics From Scheduled Queries](#)
- [Analytics Events API](#)
- [ADQL Reference](#)

Overview of Analytics

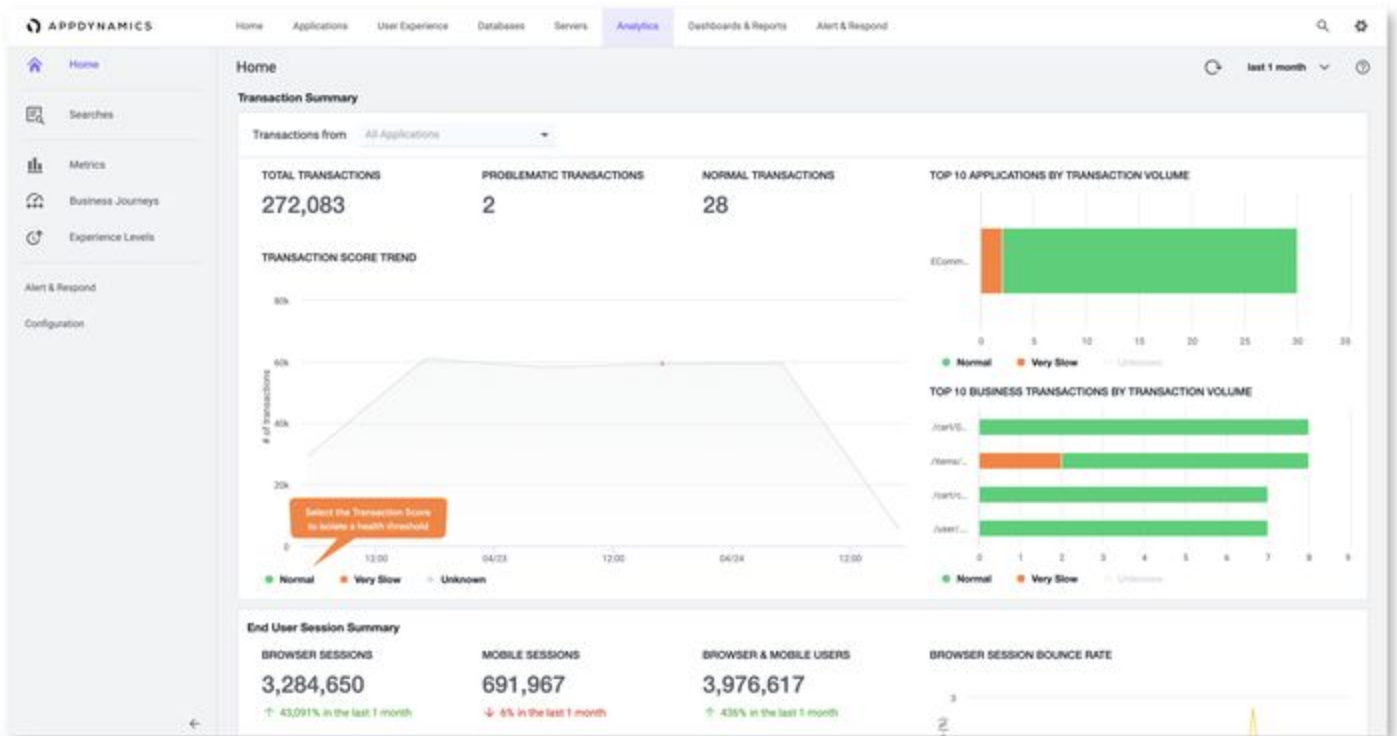

Analytics can help you answer business-oriented questions, such as:

- How many users experienced failed checkout transactions in the last 24 hours?
- How much revenue was lost because of these failures?
- How is that revenue distributed across different product categories?
- What is your revenue for the day for a geographical region?
- What was the revenue impact by product category associated with two marketing campaigns we ran last week?

Analytics Home Page

The Analytics Home page consolidates data from transaction, browser, and mobile events. The home page automatically generates **Transaction** and **End User Monitoring Summary** panels through queries that aggregate data into widgets.

You can access the AppDynamics home page by clicking on the **Home** icon on the left navigation pane in Analytics. If you click **Home** above **Transaction Summary**, you can also toggle through the Analytics navigation.

Home Page Data

AppDynamics Query Language (ADQL) queries generate the data for each home page widget. You cannot access or edit the ADQL queries.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Your selected time range automatically applies a time filter to each query. These widgets refresh every two minutes.

Transaction Summary

The **Transaction Summary** panel aggregates your Analytics data from applications and business transactions. **Transaction Summary** widgets are categorized by transaction threshold, from normal to error.

The panel contains six widgets:

- **Total Transactions:** count of all transactions
- **Problematic Transactions:** count of transactions that are not within normal threshold boundaries
- **Normal Transactions:** count of transactions that fall within the normal threshold boundaries
- **Top 10 Applications by Transaction Volume:** graphical view of applications
- **Top 10 Business Transactions by Transaction Volume:** graphical view of transactions
- **Transaction Score Trend:** total number of transactions for all applications

End User Session Summary

The **End User Session Summary** panel pulls together browser session data into widgets.

The panel contains six widgets:

- **Browser Sessions:** count of unique browser sessions
- **Browser Users:** count of browser users
- **Browser Session Bounce Rate:** rate of bounces per total sessions

i A bounce is a browser session where the page count equals one. Bounces occur when a user lands on a webpage and leaves the site without visiting additional pages.

- **Top Page Referrers by Session Volume:** the website visited by your user before accessing your site

i Referrer is an optional component of the Events Service. If you have not configured referrers, this widget does not contain data.

- **Session Trend:** total number of sessions separated by browser sessions

Using Home Page Data

You can select the transaction score in each chart to isolate metrics. For example, selecting **Normal** in **Transaction Score Trend** removes other transaction scores, as shown below.

Next to the **Transaction Score Trend** are two horizontal bar graphs that display the top ten applications and business transactions by transaction volume. Hover over the graphs to see a breakdown of additional transaction information.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

RBAC

Analytics enforces role-based access control (RBAC). As a result, your Analytics Home page only displays the data you have access to.

ADQL Reference

The AppDynamics Query Language (ADQL) is a query language for searching available data in Analytics.

ADQL is similar to the SELECT statement in the prevalent Structure Query Language (SQL) but is designed solely for AppDynamics Analytics data. Just like the SELECT command in SQL, ADQL allows you to specify the data source (such as transaction events, EUM events, and logs), a list of fields to retrieve, and conditions for selecting events from the analytics data store.

With ADQL, you can construct queries in these environments:

- Analytics Search panel in the Controller with **Advanced Mode**.
- Analytics Query Events APIs in the body of the query request.

To simplify entering your queries in Analytics Search with **Advanced Mode**, the ADQL auto-complete feature displays keywords, a list of available fields, and functions based on the stage of your typed search. See [Creating Advanced Searches for Analytics](#).

ADQL Typographical Conventions and Symbols

ADQL reference topics use custom typographical conventions and symbols to describe the syntax for ADQL queries.

Convention	Name	Usage
BOLD	Bold typeface	Bold typeface indicates ADQL keywords and operators, such as SELECT , FROM , AND and so on.
field_name and numeric_field_name	N/A	The terms field_name and numeric_field_name represent field names that appear in your analytics data. Field names depend on the event type. See ADQL Data .
Monospace typeface	Monospace typeface	Function names, such as count are indicated by monospace typeface.
event_type	N/A	The term event_type represents the available event types collected from your applications. Valid values are: <ul style="list-style-type: none"> • transactions • logs • browser requests • mobile requests • mobile crash reports • analytics custom events • synthetic sessions
<i>Italic typeface</i>	<i>Italics</i>	<i>Italics</i> represent variables or placeholders. You supply the actual value.
[]	Square brackets	Terms in square brackets are optional. Nested square brackets indicate that the term inside is optional and can only be included if the optional term in the outer square brackets is included.
	Pipe	The pipe character separates alternate items to indicate one of the items may be included. You can read it as "or" in a syntax statement.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Convention	Name	Usage
{ }	Curly braces	Curly braces are used to group items to disambiguate the definition of items.
()	Parentheses	Parentheses are used to indicate the order of operation in an expression.
...	Ellipsis	An ellipsis indicates the preceding term may be repeated.

ADQL Queries

This page describes ADQL query syntax. ADQL uses the **SELECT** statement and filtering statements, otherwise referred to as queries, to return sets of data that you can add to **Custom Dashboards**.

ADQL search queries have a 5,000 character limit and reserve keywords in certain field names or milestones.

Reserved ADQL Keywords
SELECT
FROM
WHERE
ORDERBY
AND
OR
EXISTS
NOT
LIKE
REGEX
COMPARE
LIST
IN
BETWEEN

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Reserved ADQL Keywords

COUNT

DISTINCT

MIN

MAX

STATS

SUM

AVG

STDDEV

FILTER

PERCENTILE

RANGE

SERIES

SUBSTRING

INDEXOF

LENGTH

TRIM

CONCAT

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Reserved ADQL Keywords

NOW

The query syntax is:

```
SELECT * | {[DISTINCT] expression [AS alias] [, expression [AS alias]]...}
FROM event_type
[WHERE condition_expression]
[SINCE timevalue [UNTIL timevalue]]
[HAVING condition_expression]
[ORDER BY {field_name | alias} [ASC | DESC] [, {field_name | alias} [ASC | DESC]]...]
[LIMIT integer [, integer]...]
```

While the **SELECT** and **FROM** clauses are required, all other clauses are optional. Enter spaces around each keyword.

For **GROUP BY** functionality, see [GROUP BY](#).

Search with Partial Text Strings

To prevent tokenization of messages and text-type strings, prefixes must be added to wildcards when you search with partial text strings.

The following ADQL query uses a partial text string to search for the word `example`:

```
SELECT * FROM logs WHERE message = "*xample"
```

SELECT Clause

The ADQL event query begins with a **SELECT** clause, which can take one or more arguments.

SELECT * | {[DISTINCT] field_expression [AS alias] [, field_expression [AS alias]]...}

- A single asterisk * in the **SELECT** clause returns the list of fields for each event.
- To return specific fields for each event, specify a comma-separated list of fields. Optionally, each field_expression can be aliased to a label using the **AS** construct.
- Use the **DISTINCT** qualifier to return unique combinations of the specified field values. If no limit specified, the top ten results by count are returned. See [LIMIT Clause](#).

DISTINCT can not be applied to a wild card **SELECT** query, such as

```
SELECT DISTINCT *
```

- String values must be surrounded by either single quotes or double quotes, such as 'hello' and "hello".

The field_expression can take several forms. See [ADQL Expressions](#).

Query Examples with SELECT Clause

Query	Result
SELECT count (transactionName) FROM transactions WHERE application='yourAppName'	Returns a count of business transactions for the specified application.
SELECT * FROM logs WHERE sourceType='yourLogFile' AND message LIKE 'GET'	Returns log events containing a specified keyword.
SELECT * FROM transactions WHERE application='yourAppName' AND transactionName='yourBTName'	Returns all fields for business transactions in the specified application matching the specified transaction name.
SELECT DISTINCT transactionName FROM transactions WHERE application='yourAppName'	Returns a list of unique transaction names from the specified application.
SELECT customerName AS "First And Last Name", age AS "Years Old", ...	Returns the specified fields relabeled as specified in the query statement. In this query, customerName and age are user-defined fields.

AS Clause

Use the **AS** clause to rename a field to a label of your choice. The label is also referred to as an alias.

field_expression **AS** alias

Returns the field with the specified alias. The alias may be any valid identifier (a letter followed by any number of letter or digit characters) or a value in quotes. If the value of the alias contains spaces or special characters, it must be in quotes. See [ADQL Expressions](#).

AS Clause Example

```
SELECT eventTimestamp AS 'Time Stamp' FROM transactions WHERE application='yourAppName'
```

FROM Clause

Use the **FROM** clause to specify the event type. For example:

FROM event_type

Event Types

Event types describe the source of the analytics data, such as business transactions (transactions) or browser requests. Each event type has a UI field name and an Events Service internal name. The Events Service internal name is used in ADQL queries.

This table lists the event types with their UI names and Events Service internal names.

Event Type UI Label	Events Service Internal Name
Transactions	transactions
Logs	logs
Browser Requests	browser_records
Browser Sessions	session_records
Mobile Requests	mobile_snapshots
Mobile Sessions	mobile_session_records
Mobile Crash Reports	mobile_crash_reports
Synthetic Sessions	synth_session_records

FROM Clause Examples

For this result	Query
Return all fields for browser requests	SELECT * FROM browser_records WHERE appkey='E2E-AAB-AUM'
Return all fields for the business transactions in your application	SELECT * FROM transactions WHERE application='yourAppName'
Return all fields for the logs specified by "yourLogFile"	SELECT * FROM logs WHERE sourceType='yourLogFile'

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

WHERE Clause

Overview

Use the **WHERE** clause to specify one or more condition expressions separated by logical operators such as **AND**, **OR**.

The **WHERE** clause uses the following syntax:

```
[WHERE condition_expression]
```

See [ADQL Expressions](#) for a description of the condition expression syntax. Condition expressions use [Comparison Operators](#).

AppDynamics recommends that you do not use periods (.) in the field name, otherwise, the syntax will break.

Examples

To filter logs based on error or warning log level, use a query similar to the following:

```
SELECT * FROM logs WHERE sourceType='yourLogFile' AND (logLevel='ERROR' OR logLevel='WARN')
```

GROUP BY

ADQL does not have an explicit **GROUP BY** clause. However, queries containing field names in the **SELECT** clause behave as **GROUP BY** statements if the query contains [metric functions](#) or [bucketing functions](#).

Group by queries are limited to containing up to five terms. Terms can be either fields (which use an implicit **GROUP BY**) or bucketing functions, such as `series`.

Aggregation Examples

In this example, the query groups the `avg(responseTime)` aggregation based on the non-aggregation field, application. So the result contains the average response time calculated for each application.

SELECT application, `avg(responseTime)` **FROM** transactions

Sample results:

The screenshot shows the AppDynamics search interface. At the top, there are tabs for 'New Search', 'Basic', and 'Advanced' (selected). A search bar contains the query: `1 SELECT application, avg(responseTime) FROM transactions`. Below the search bar is a 'Search' button. The interface has tabs for 'Data' and 'Visualization' (selected). Below these are 'Save' and 'Actions' buttons. The main area displays 'Current Search Results' as a table with two columns: 'Application' and 'avg(responseTime)'. The results are:

Application	avg(responseTime)
ECommerce-E2E	588.307
TelecomDemoApp-DP	624.241

At the bottom of the table, there are navigation controls: a left arrow, a right arrow, a page number '1 / 1', and a '50 items per page' setting. On the right side, there is a 'Chart Types' panel with 'Simple' and 'Time Series' categories, each containing several chart icons. The bottom right corner shows '1 - 2 of 2 items'.

The implicit grouping can be extended by using multiple non-aggregation fields preceding an aggregation field. For example:

SELECT application, segments.tier, `avg(responseTime)` **FROM** transactions

By adding tier as a second non-aggregation field, the query groups the `avg(responseTime)` aggregation based on the non-aggregation fields, application, and tierName. Because there are multiple grouping fields, the second non-aggregation field, tier name, is sub-grouped under the application grouping. So each combination of application and tier name together forms a group over which the average response time is calculated.

Sample results:

The screenshot shows the 'New Search' interface in AppDynamics. The search mode is set to 'Advanced'. The SQL query entered is: `1 SELECT application, segments.tier, avg(responseTime) FROM transactions`. Below the query editor, there are tabs for 'Data' and 'Visualization', with 'Visualization' selected. The 'Current Search Results' section displays a table with the following data:

Application	segments.tier	avg(responseTime)
ECommerce-E2E	Inventory-Services	3,957.022
ECommerce-E2E	ECommerce-Services	587.871
ECommerce-E2E	Order-Processing-Services	3,956.174
TelecomDemoApp-DP	Quote_Web	1,056.417
TelecomDemoApp-DP	Quote_Server	129.589
TelecomDemoApp-DP	Order_Web	186.568
TelecomDemoApp-DP	Order_Server	186.387
TelecomDemoApp-DP	Provision_Server	138.915
TelecomDemoApp-DP	Billing_Server	138.448
TelecomDemoApp-DP	Dispatch_Server	138.064

At the bottom of the results table, there are navigation controls including a page number '1 / 1', a '50 Items per page' setting, and a total count of '1 - 10 of 10 Items'. To the right of the table is a 'Chart Types' panel with options for 'Simple' (Bar, Pie), 'Time Series' (Area, Line), and 'Univariate' (Hash symbol).

For SQL users, these two statements produce similar results in their respective environments:

- ADQL query: **SELECT** application, segments.tier, `avg(responseTime)` **FROM** transactions
- SQL query: **SELECT** application, segments.tier, `avg(responseTime)` **FROM** transactions **GROUP BY** applicationName, segments.tier

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Bucketing Function Example

Bucketing functions such as `series` and `range` define groups over which other aggregations can be calculated. The buckets are specified by the parameters of the respective functions and form groups over which subsequent aggregations are calculated.

For example, the following query calculates the average response time over two-minute intervals (or buckets):

```
SELECT series(eventTimestamp, '2m'), avg(responseTime)
```

Sample results:

```
1 SELECT series(eventTimestamp, '2m'), avg(responseTime) FROM transactions WHERE application = 'ECommerce-E2E'
```

Search

Data Visualization Save Actions

series(eventTimestamp)	avg(responseTime)
08/22/16 3:40:00 PM	46.172
08/22/16 3:42:00 PM	56.328
08/22/16 3:44:00 PM	44.537
08/22/16 3:46:00 PM	50.068
08/22/16 3:48:00 PM	50.157
08/22/16 3:50:00 PM	43.767
08/22/16 3:52:00 PM	51.759
08/22/16 3:54:00 PM	37.514

You can also combine an aggregation with a bucketing function and implicit **GROUP BY**. The following query returns the average response time grouped by tier over the series of six-hour intervals.

```
SELECT series(eventTimestamp, '6h'), segments.tier, avg(responseTime) FROM transactions
```

Sample Results:

```
1 SELECT series(eventTimestamp, '6h'), segments.tier, avg(responseTime) FROM transactions
```

08/23/16 11:00:00 AM	ECommerce-Services	10.580

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

ORDER BY Clause

The **ORDER BY** clause enables you to sort the query results by one or more fields. The syntax is:

```
[ORDER BY {field_name | alias} [ASC | DESC] [, {field_name | `alias`} [ASC | DESC]]...
```

Rules governing ordering include:

- Sort order, ascending (**ASC**) or descending (**DESC**) is applied per field. If not specified, the ascending (**ASC**) order is the default.
- ORDER BY** is supported on fields or aliases specified in the **SELECT** clause.
- Aliases used in the **ORDER BY** clause should be surrounded with back quotes if they contain spaces or other special characters.
- ORDER BY** works on single-value metric functions and single-value math expressions. **ORDER BY** can not be used with percentile or stats.
- ORDER BY** on nested fields or metric aggregations that operate on nested fields is not supported. A nested field is any field that has a "." in the name, such as `segments.errorList.errorType` or `btdata.estimatedTime`.

Ordering functionality for [metric and bucketing functions](#) includes:

- ORDER BY** can be used to order the buckets on a bucketed field in a bucketing function. For example, see the "Series aggregations - Ordering based on the keys of the series buckets." in the table below.
- ORDER BY** can be used on metric functions that follow bucketing functions, including filtered metric functions. Ordering by the metric value orders the resulting buckets. The metric function must be aliased and referenced by its alias such as:

```
SELECT transactionName, avg(responseTime) AS averageResponseTime FROM
transactions ORDER BY averageResponseTime
```

- Compound orderings can be specified for functions that provide implicit **GROUP BY** functionality.
- A single ordering can be defined for the series function, no ordering is allowed for the range function.
- ORDER BY** can accept math expressions on fields, but not math expressions on metric functions. If the value of a math expression is null it is ordered at the end of the results in ascending order. The following is an invalid query:
SELECT transactionName, **max** (discountValue) / **max** (cartTotal) **AS** ratio **FROM** transactions **ORDER BY** ratio

ORDER BY Clause Examples

For This Result	Query
An ordering of queries with no aggregations	SELECT field_name FROM event_type ORDER BY field_name ASC
Group By - Ordering by the lexicographic ordering of the terms. The fields included in the ORDER BY clause must be in the same order as in the query itself.	SELECT field_name, count (*) FROM event_type ORDER BY field_name DESC

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

For This Result	Query
Returns a sorted set of timestamp ranges	<pre>SELECT series (eventTimestamp, 10m), count (*) FROM transactions ORDER BY eventTimestamp DESC</pre>
Series aggregations - Ordering based on the keys of the series buckets.	<pre>SELECT series (salary, 20000), count (salary) FROM event_type ORDER BY salary DESC</pre>
Date series aggregations - Ordering based on the date value of the keys of the series buckets	<pre>SELECT series (eventTimestamp, '1h'), count (eventTimestamp) FROM transactions ORDER BY eventTimestamp</pre>
Order by an alias.	<pre>SELECT responseTime AS RT FROM transactions ORDER BY RT</pre>
Order by an aliased math expression.	<pre>SELECT discountValue / cartTotal AS ratio FROM transactions ORDER BY ratio</pre>

HAVING Clause

Use the **HAVING** clause on the output produced by another aggregation. The **HAVING** clause operates on an expression to determine the intervals to be shown in the response. The metric specified in the expression must be numeric and the expression must return a boolean value for the **HAVING** clause to work.

Additionally, the **HAVING** clause must be referenced by an alias in the query as follows:

```
SELECT customerName, count(*) as Requests, avg(responseTime) as
ResponseTime FROM transactions HAVING Requests > 10000
```

where `Requests` is the alias referenced in the query.

Syntax

```
SELECT selectItems
FROM relation
WHERE where=booleanExpression
SINCE statement
HAVING havingClause
ORDER BY sortItems
LIMIT limits
;
```

where `havingClause` is a boolean expression. The **WHERE**, **ORDER BY**, and **LIMIT** clauses and **SINCE** `statement` are optional.

HAVING Clause Examples

HAVING clause examples with different filters:

Simple Comparison Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT > 0
```

Simple Range Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT BETWEEN [10, 90)
```

Simple List Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT IN (20, 30, 40, 60)
```

Compound Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT > 20 AND AVRT < 90
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT < 20 OR AVRT > 90
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING AVRT > 20 AND AVRT < 90 AND AVRT IN (70, 80)
```

Not Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING NOT AVRT > 50
```

Not Compound Filter

```
SELECT transactionName, avg(responseTime) as AVRT FROM type
HAVING NOT (AVRT > 20 AND AVRT < 90)
```

Multi-Metric Filter

```
SELECT transactionName, avg(responseTime) as AVRT,
max(responseTime) as MAXRT FROM type HAVING NOT (AVRT > 20 AND
AVRT < 90) AND MAXRT > 130
```

Limitations

The **HAVING** clause is not supported for:

- Nested fields in Elasticsearch
- Multi-metric functions, such as `percentiles` and `stdev`
- Filtered metric functions (filter function)
- Invalid queries:

Unsupported Conditions/Filters	Queries
Like	SELECT transactionName, avg(responseTime) as AVRT FROM transactions HAVING AVRT LIKE '10'
Exists	SELECT transactionName, avg(responseTime) as AVRT FROM transactions HAVING AVRT IS NOT NULL
Not Aliased	SELECT avg(responseTime) as avtr FROM type HAVING avg(responseTime) > 10 SELECT txName, count(*), node, count(*) FROM transactions HAVING count(*) > 10
Nested	SELECT transactionId, AVG(segments.numCalls) as av_numCalls, MIN(segments.numCalls), MAX(segments.numCalls), SUM(segments.numCalls) FROM transactions HAVING av_numCalls > 2
Filter Function	SELECT appraisalrating, filter(min(salary), where salary > 60000) as val FROM transactions HAVING val > 60000
Multi-Valued Metric Functions	Percentile: SELECT appraisalrating, percentile(salary, 94) as per_sal FROM transactions HAVING per_sal > 2 ORDER By appraisalrating Standard Deviation: SELECT appraisalrating, stdev(salary) as stdev_sal FROM transactions HAVING stdev_sal > 2 ORDER By appraisalrating
Missing Parent Aggregation	SELECT avg(responseTime) as AVRT FROM transactions HAVING AVRT > 2
Quoted Aliases	SELECT series(eventTimestamp, "1d"), avg(responseTime/1000) AS "Response Time" FROM transactions WHERE transactionName = "TransactionName" HAVING "Response Time" > 50

SINCE...UNTIL Clause

Use the **SINCE... UNTIL** clause on a time range in a query. If the **UNTIL** portion is omitted, the query matches all the events that occurred after the time specified in the **SINCE** portion. A query can contain both a **SINCE... UNTIL** clause and a **WHERE** clause. In such cases, **WHERE** argument comes before **SINCE... UNTIL** and is applied in that order. The time range specified in the clause overrides any other time limits applied to the query, including the time range selection in the UI.

i If the **SINCE... UNTIL** clause is used in the [series function](#), the time range specified in the clause will not override other time limits applied to the query. To set a time range for the query when the **SINCE... UNTIL** clause is used in the series function, use the time range selector in the UI.

Syntax

```
SINCE timevalue [UNTIL timevalue]
```

where `timevalue` is a combination of an integer and (optionally) a time unit. If `timevalue` is omitted the value is interpreted as a Unix epoch timestamp in milliseconds.

Unit Symbols	Description
[m minute minutes]	minute
[h hour hours]	hour
[d day days]	day
[w week weeks]	week (7 days)

Examples

Query	Result
SELECT * FROM transactions SINCE 1 h UNTIL 15 m	All transactions that occurred between 1 hour and 15 minutes ago
SELECT * FROM transactions SINCE 1 h	All transactions that occurred after one hour ago
SELECT * FROM transactions SINCE 1502147143000 UNTIL 1502148043000	All transactions that occurred between the Unix timestamps 1502147143000 and 1502148043000

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

LIMIT Clause

The **LIMIT** clause enforces a limit on the returned search results. **LIMIT** works differently for non-aggregation and aggregation queries.

The syntax is:

`[LIMIT integer [, integer]...]`

An integer is a sequence of digits. If **ORDER BY** is not specified in the query, the results sort in descending timestamp order. The Analytics Search UI caps the number of search results at 10000 records.

Non-Aggregation Queries

Specify **LIMIT N** for non-aggregation queries to return the first N documents.

`SELECT * FROM transactions LIMIT 10`

For non-aggregation queries, using the Analytics Query API, can return a maximum of 10,000 results. If a limit value higher than 10,000 is specified, the value is overridden with the maximum value.

Aggregation Queries

For aggregation queries a list of values is allowed in the **LIMIT** clause. Each value applies to one "group by" term or bucketing function in the query. A "group by" term is a field name in an aggregation query. In the following example, `field1` and `field3` are group by terms, and `series (field2, '1m')` is a bucketing function:

`SELECT field1, series (field2, '1m'), field3, count (*) ...`

Bucketing functions consume a value from the **LIMIT** clause list of values, but that value is ignored because it doesn't apply to such functions. Because the default limit is 10, if there are more bucketing functions than user-specified limits, the **LIMIT** clause will use 10 buckets. For example, if there two limit values specified, but three functions or terms that could consume the limit values, the last one defaults to a limit of 10.

The maximum number of buckets is 1000 for the first group by term or bucketing function. Subsequent terms are limited to 100 buckets. A larger value is overridden and replaced with the maximums. Aggregation queries can return a maximum of 10000 results.

REST API usage for limits is slightly different. See [Analytics Events API](#).

Aggregation Examples

Query	Result
<code>SELECT transactionName, avg (responseTime) FROM transactions</code>	No limit specified, shows a maximum of top 10 results by count.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Query	Result
SELECT DISTINCT requestGUID FROM transactions	No limit specified, shows the top 10 results by count.
SELECT transactionName, avg (responseTime) FROM transactions LIMIT 50	Returns the top 50 results by count.
SELECT application, transactionName, avg (responseTime) FROM transactions LIMIT 500, 50	Returns the top 500 applications by count. Within each of those buckets, the top 50 transactionNames by count.
SELECT application, transactionName, avg (responseTime) FROM transactions LIMIT 2000, 500	Because of the enforced limits, this query returns the top 1000 applications by count. Within each of those buckets, the top 100 transactionNames by count.
SELECT application, transactionName, avg (responseTime) FROM transactions LIMIT 20	Returns the top 20 applications by count. within each of those buckets the top 10 (using the default) transactionNames by count.
SELECT application, series (eventTimestamp, '1m'), transactionName, avg (responseTime) FROM transactions LIMIT 20, 25, 30	Returns the top 20 applications by count. Within those a date-time series with all the data. Within each date-time series bucket, shows the top 30 transactionNames by count. The value 25 is applied to the series function, but because series is a bucketing function, it does not actually use the limit.
SELECT application, series (eventTimestamp, '1m'), transactionName, avg (responseTime) FROM transactions LIMIT 20, 25	Returns the top 20 applications by count. Within those, shows a date-time series with all the data. Within each date-time series bucket the top 10 (using the default) transactionNames by count. The value 25 is applied to the series function, but because series is a bucketing function, it does not actually use the limit.
SELECT series (eventTimestamp, '1m'), avg (responseTime) FROM transactions LIMIT 20	LIMIT doesn't apply to the functions, only to the group by terms, therefore in this query, the limit value has no effect and the query returns all the data in the series function.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

ADQL Expressions

ADQL uses two primary categories of expressions in ADQL queries:

- Field expressions used in the **SELECT** clause
- Condition expressions used in the **WHERE** clause

To build an expression, use field names, functions, numbers, and operators indicated in the described syntax.

Syntax of field_expression (SELECT clause)

- {field_name | function | numeric_literal}
- (expression): surround the expression with parentheses to denote the order of operation in the query
- [Math expressions](#) such as:
 - unary_operator expression
 - expression binary_operator expression
- A condition_expression such as **[NOT]** expression [COMPARISON_OPERATOR](#) value can also be an alias used in a field_expression in the **SELECT** clause.

For example:

```
SELECT field_name AS myField... WHERE myField > 2
```

Syntax of condition_expression (WHERE clause)

- **[NOT]** expression [COMPARISON_OPERATOR](#) value
- (condition_expression)
- condition_expression [LOGICAL_OPERATOR](#) condition_expression

The field expression syntax in the **SELECT** clause can also contain functions. The syntax of a function_expression is: `function (field_name, arguments, ...)`

Syntax Element	Description
field_name or numeric_field_name	<p>The name of a field in the specified event type. Field names require back quotes when the name contains spaces or special characters. For example, the field name, `full name`, is surrounded by back quotes because it contains a space. See Special Characters for the full list.</p> <p>Use the Events Service internal names in your ADQL queries. The list of default fields and their internal names are described under ADQL Data.</p>
function	See Analytics Functions .

Syntax Element	Description
numeric_literal	A sequence of digits, optionally including a decimal point "." or sign {+ -}. Example: 2, -4, 3.14
unary_operator	The - unary operator negates the value of the operand.
binary_operator	Arithmetic operators: {*, /, %, +, -}. See Math Expressions .
COMPARISON_OPERATOR	A set of operators that compare values. See Comparison Operators for the full list.
LOGICAL_OPERATOR	See Logical Operators .
value	The syntax for a value = {numeric_literal string boolean}. Values are text, numbers, dates or boolean values used to compare with the value in the specified field_name. The data type of the value must match the type of the specified field. Text strings require quotes. Numbers, dates, boolean values (true or false) and null do not need quotes. Quotes can be either single or double quotes.

Instead of specifying that the expression applies to a particular array element, the expression can apply to any array element.

Fields with Spaces or Special Characters

If the Events Service internal name contains a special character, then the name must be surrounded by back quotes when it is used in a field expression in the **WHERE** clause. For a field name such as `segments.httpData.headers.User-Agent`, the ADQL query must use `segments.httpData.headers.`User-Agent``.

For example:

```
SELECT segments.httpData.headers.`User-Agent`, count(segments.httpData.headers.`User-Agent`)
FROM transactions WHERE segments.httpData.url = 'http://localhost:29990/packages'
```

The most likely situation in which spaces and other special characters may be used in naming are when field names are added with data collectors.

Special Characters

Special characters in ADQL are:

- equals : '='
- not equals : '<>' or '!='
- less than : '<'
- less than or equals : '<='
- greater than : '>'
- greater than or equals : '>='
- plus: '+'
- minus: '-'
- asterisk: '*'
- slash: '/'
- percent: '%'
- concatenation: '||'
- question mark: '?'
- open parens: '('
- open square bracket/brace: '['
- close parens: ')'
- close square bracket/brace: ']'

Analytics Functions

Functions serve as arguments in the **SELECT** clause. Function types in ADQL include:

- Metric functions
- Bucketing functions
- String functions
- Funnel functions
- Data type conversion functions
- Functions that modify other functions

For many functions, only numeric fields are valid. "All" data types means *integer, floating point, datetime, and string*.

Functions ignore null values, such as those resulting from integer division by zero or empty data fields.

To add a **WHERE** clause to a query, use the query box in the data tab of the Controller Analytics search UI. When you perform the search, the visualization tab under the table widget shows the results of any metric functions.

Each section below describes one type of function.

Metric Functions

Metric functions:

- Perform a calculation on a set of values for a field.
- Return a result such as a count or sum, or a set of results such as percentile.
- Can only be in the **SELECT** clause.
- Should always follow a field name if one exists—otherwise, not all visualizations may work.

i The `distinctcount()` function is accurate for up to 3000 unique return values. For over 3000 unique return values, `distinctcount()` is approximate due to performance optimizations.

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>avg(numeric_field_name)</code>	Average value for a numeric field.	<i>integer, floating point, datetime</i>	SELECT avg (btdata.estimatedtime) FROM browser_records WHERE appkey = 'your_appkey'

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>count(field_name)</code>	A count of events.	<i>all</i> The form <code>count(*)</code> is also valid.	<p>SELECT <code>count (orderId) AS 'Sales'</code> FROM logs WHERE <code>method='GET'</code></p> <p>The following query returns the top 10 IP addresses sending HTTP requests to an application.</p> <p>SELECT ip, <code>count (*)</code> FROM web_session_records WHERE <code>appkey = "yourApp"</code> LIMIT 10</p>
<code>distinctcount(field_name)</code>	A count of the number of unique values recorded for a field.	<i>all</i>	SELECT <code>distinctcount (field_name)</code> FROM logs
<code>max(numeric_field_name)</code>	The maximum recorded value of a numeric field.	<i>integer, floating point, datetime</i> Specify one field only.	<p>SELECT <code>max (numeric_field_name)</code> FROM transactions</p> <p>SELECT nodeName, <code>max (eventtimestamp)</code> FROM logs</p>
<code>min(numeric_field_name)</code>	The minimum recorded value of a numeric field.	<i>integer, floating point, datetime</i> Specify one field only.	SELECT <code>min (numeric_field_name)</code> FROM transactions
<code>stdev(numeric_field_name)</code>	The population standard deviation of a numeric field.	<i>integer, floating point</i>	SELECT <code>stdev (numeric_field_name)</code> FROM transactions

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>sum(numeric_field_name)</code>	The sum of the values of a numeric field.	<i>integer, floating point, datetime</i> Specify one field only.	SELECT <code>sum (numeric_field_name)</code> FROM transactions
<code>percentile (numeric_field_name, percent)</code>	The specified percentile values between 0 and 100.	<i>integer, floating point, datetime</i> Specify one or more percentiles.	SELECT <code>percentile (responseTime, 50, 75, 90, 95)</code> FROM transactions
<code>stats(numeric_field_name)</code>	Statistics for a field: <code>count</code> , <code>min</code> , <code>max</code> , <code>average</code> , and <code>sum</code> .	<i>integer, floating point, datetime</i>	SELECT <code>stats (numeric_fieldName)</code> FROM transactions WHERE <code>application='yourApp'</code>

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>totalResultCount()</code>	The total count of events.	Does not accept a field.	<p>This query first selects all error transactions for the "ECommerce" application. It then calculates, for each unique transaction name, the ratio of instances of that transaction name to the total number of error transactions. (The assumption is that any given transaction name can appear in multiple error transactions.)</p> <pre> SELECT transactionName, count (*) / totalResultCount() FROM transactions WHERE application = 'ECommerce' AND userExperience = 'ERROR' </pre>

Bucketing Functions

Bucketing functions operate on a field, and group data into buckets. Often, the data in the buckets are further aggregated by another function. For example, this query creates buckets that group an app's transactions by the hour, and then count how many transactions are in each bucket (hour):

```

SELECT series (eventTimestamp,
'1h'), count (*) FROM transactions WHERE application='yourAppName'

```

To include a larger data set in your results, use the time range selector in the upper right corner of the Controller Analytics search UI.

Dates are different from datetime values. Units from weeks down to milliseconds are supported:

- '1w' for one week
- '10d' for ten days
- '2h' for two hours
- '5m' for five minutes
- '36s' for thirty-six seconds

- '800ms' for eight hundred milliseconds

When you use dates to define buckets, think about how many buckets your definition produces. The number of buckets for series() cannot exceed 2000, and much smaller numbers of buckets are the norm.

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<pre>range(field_name, n (n1, n2), n3 (n4, n5), ...)</pre>	One or more buckets.	<p><i>integer, floating point, dates</i></p> <p>Use a single value <code>x</code> or pairs of values <code>(x,y)</code>.</p> <p>See below for explanation of how to define buckets.</p>	<p>This range query:</p> <pre>SELECT range (segm ents.transactionTime, 0, 10, 20) FROM transactions</pre> <p>Results in the following buckets:</p> <pre>[-Inf, 0], [0, 10], [10, 20], [20, +Inf]</pre>

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<pre>series(field_name, interval_size) series(field_name, interval_size, lower_extended_bound, upper_extended_bound, [offset], [rangeStyleBucketKeys], [strictEndpoints])</pre> <p>If you specify bounds, then all buckets are returned, empty or not.</p> <p>If you do not specify bounds, then:</p> <ul style="list-style-type: none"> • If you are using the UI, the UI inserts default bounds. • If you are using the API, then only non-empty buckets are returned. 	<p>A series of buckets based on the provided interval.</p>	<p><i>integer, floating point, dates</i></p> <p>For numeric fields, specify the interval as an integer.</p> <p>See below for explanation of optional keyword arguments</p> <pre>offset , rangeStyleBucketKeys , and strictEndpoints .</pre>	<pre>SELECT series (metrics.`Application Server Time (ms)` ,10), count (*) FROM browser_records WHERE appkey='yourAppKey' SELECT series (eventTimestamp, '1h'), count (*) FROM transactions WHERE application=' yourAppName'</pre>

Defining Buckets for range()

Every bucket is defined as bounded by two single values, where the bucket includes the first value and excludes the second.

Pairs of values `(x, y)` define an explicit bucket from `x`, inclusive, to `y`, exclusive.

A single value `x` implicitly defines a bucket according to rules that depend on where the value is placed among the arguments to `range()`.

- Rules for using a single value to define a bucket:
 - Immediately after the field (that is, as the second argument): The bucket starts at negative infinity.
 - After another single value: The bucket starts at the previous argument, inclusive, and extends to `x`, exclusive.
 - After a pair of values, and before another single value: The bucket starts at `x`, inclusive, and extends to the following argument, exclusive.
 - At the end of the parameter list: The bucket ends at positive infinity. This is the one exception to the assumption that `x` is the second of two values.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- v. Between two pairs of values: No bucket can be defined, and the value is ignored.

Range Query Example

Here is a range query that exercises most of the rules above:

```
SELECT range (segments.transactionTime, 0, (10, 20), 30, (40, 50), 60, 70) FROM transactions
```

The query produces the following buckets:

- [-Inf, 0] because rule *a* applies to 0
- [10, 20] because (10, 20) defines that bucket explicitly
- no bucket for 30 because rule *e* applies so 30 is ignored
- [40, 50] because (40, 50) defines that bucket explicitly
- [60, 70] because rule *c* applies to 60
- [70, +Inf] because rule *d* applies to 70

Optional keyword arguments for `series()`: `offset`, `rangeStyleBucketKeys`, and `strictEndpoints`

Series supports the following optional keyword arguments.

offset

Changes the start value of each series from 0 by the specified positive (+) or negative offset (-) duration, such as 1h for an hour, or 1d for a day. The values `alignStart` and `alignEnd` align buckets to the start and end of the extended bounds arguments respectively. The function must have extended bounds specified to use these special values. Defaults to 0. Accepts both integer and string values.

Examples:

```
SELECT series (responseTime, 1, 1, 10, offset ="alignStart"), count (*) FROM transactions
```

```
SELECT series (responseTime, 100, 1, 1000, offset=1), count (*) FROM transactions
```

rangeStyleBucketKeys

Converts the start and end values in a numeric series to "bucketStart - bucketEnd" format as a string type. For example, "0-10", "10-20", and so on. This output this argument returns is similar to what returned by the range function. The series function must be acting on a numeric type to use this keyword argument. Defaults to false. Accepts a boolean only.

Example:

```
SELECT series (responseTime, 100, 1, 1000, rangeStyleBucketKeys =true), count (*) FROM transactions
```

strictEndpoints

Adds a filter on the query starting at the minimum extended bound and extending to the maximum extended bound. This ensures that no buckets outside of the extended bounds are present in the results. Defaults to false. Accepts a boolean only. Extended bound forces the histogram aggregation to

start building intervals on a specific minimum value and expands the interval up to a given maximum value.

Example:

```
SELECT series (responseTime, 2, 1, 5, strictEndpoints=true,
rangeStyleBucketKeys=true), count (*) FROM transactions
```

Selecting the Top *n* Results for Time Series Queries

Deployment Support

Top *n* results is available for SaaS deployments only.

SELECT series (eventTimestamp, '1m'), transactionName, count (*) **FROM** transaction **LIMIT** 1, 12The series function can compute the global top *n* over an entire period. To set a top *n* limit, add a **LIMIT** clause to the end of your query:

This example limits the query to the top 12 results of transactionName. The value 1 is applied to the series function, but because series is a bucketing function, it does not actually use the limit. You must include a value for the series function.

The global top *n* limit does not apply when queries:

- Contain a selection before the series function
SELECT application, series (eventTimestamp, '1m'), transactionName, ...
- Have additional bucketing functions
SELECT series (eventTimestamp, '1m'), range (responseTime, 0, 60, 120), transactionName, ...
- Include a **HAVING** clause
SELECT series (eventTimestamp, '1m'), transactionName, avg (responseTime), ... **HAVING** a >15

String Functions

ADQL string manipulation functions:

- Resemble their SQL counterparts.
- Are case-sensitive.
- Return null if any argument is null.
- Use 1-based, not 0-based, indexing.
 - For example, the indexof() function gives the index of the first character of a string as 1, not 0.
 - As a result, 0 is not a valid value for any integer argument

String functions can transform any event data that resides in the Analytics Events Service. One important use case is doing ad hoc data transformation when the structure, serialization, or format in which data has been collected needs to be changed.

i For AppDynamics < 4.5.2, fixing incorrectly-collected data requires adjusting collection settings.

You can use string functions to:

- Hone in on a `substring()` by working with string `length()` and/or the `indexOf()` characters in a string
 - For example, you can extract the domain name from a URL
- Combine multiple strings using the `concat()` operator
 - For example, you can combine values from multiple fields into a single value
- `trim()` whitespace from the beginnings and ends of fields
- Pair the output of the `substring()` function, item by item, with the output of another function
 - This implicit aggregation is the ADQL equivalent of GROUP BY in SQL
 - See the Implicit Aggregation Example:

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>concat(inputString1, string inputString2, ... inputStringN)</code>	A single string which combines the input strings.	<i>string</i> Specify two or more strings.	Function: <code>concat('foo', 'bar')</code> Result: <code>'foobar'</code>

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>indexOf(inputString, substring, [occurrence])</code>	<p>1-based start index of substring in string.</p> <p>If substring is not found, returns 0.</p> <p>If occurrence is supplied as <i>n</i>, returns index of nth occurrence of substring.</p> <p>If occurrence is supplied as <i>-n</i>, returns index of nth occurrence of substring counting backwards from the end of inputString.</p>	<p><i>string</i> for inputString, substring</p> <p>positive or negative <i>int</i> for occurrence</p>	<p>Function:</p> <pre>indexOf('www.wikipedia.org', '.', 1)</pre> <p>Result:</p> <p>4</p> <p>Function:</p> <pre>indexOf('www.wikipedia.org', '.', -1)</pre> <p>Result:</p> <p>14</p> <p>Function (example of chaining and combining functions):</p> <p>SELECT</p> <pre>substring('www.wikipedia.org', indexOf('www.wikipedia.org', '.', 1)+1, indexOf('www.wikipedia.org', '.', -1) - indexOf('www.wikipedia.org', '.', 1) -1) FROM transactions</pre> <p>Result:</p> <p>'wikipedia'</p>
<code>length(inputString)</code>	<p>The number of characters including whitespace of the input string.</p>	<p><i>string</i></p>	<p>Function:</p> <pre>length(' foo bar ')</pre> <p>Result:</p> <p>9</p>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>substring(inputString, startIndex, numChars)</code>	<p>The substring of <code>inputString</code> starting at (1-based) <code>startIndex</code>.</p> <p>If <code>startIndex</code> is negative, starts that number of characters from the end of the string.</p> <p>If <code>numChars</code> is supplied, returns substring of that length; if <code>numChars</code> runs past end of string, returns only up to end of string.</p> <p>If <code>startIndex</code> or <code>numChars</code> is invalid, returns an empty string.</p>	<p><i>string</i> for <code>inputString</code></p> <p>positive or negative <i>int</i> for <code>startIndex</code></p> <p>positive <i>int</i> for <code>numChars</code></p>	<p>This example extract the domain name from a URL.</p> <p>Function:</p> <pre>substring('https://example.com/home.htm', 9, indexOf('https://example.com/home.htm', '/') , 3) - 9)</pre> <p>Result:</p> <pre>'example.com'</pre>
<code>trim(inputString)</code>	<p>A copy of the input string with leading and trailing whitespace removed.</p>	<p><i>string</i></p>	<p>Function:</p> <pre>trim(' foo bar ')</pre> <p>Result:</p> <pre>'foo bar'</pre>

Implicit Aggregation Example

Consider this data:

Application ID	responseTime (ms)
SJC-001	500
SJC-002	600
SJC-003	700
LAX-001	200

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Application ID	responseTime (ms)
LAX-002	300
LAX-003	400

The following ADQL query pairs each item from the output of `substring()` with a corresponding item from the output of `avg()` :

```
SELECT substring(application, 1, 3) , avg(responseTime) FROM transactions
```

The results are:

SJC, 600

LAX, 300

Notice how ADQL uses `substring()` to govern the groupings to which the second function, `avg()` , is applied.

Funnel Functions

You can create [funnel widgets](#) from an ADQL query using the funnel function. This query example creates a funnel widget of normal transactions:

```
SELECT funnel(transactionName, responseTime < 90, showHealth=true, health="NORMAL") FROM transactions
```

To see the funnel widget, enter your query and select **Search**. After you see the search results, select **Basic** at the top right of the query:

The screenshot shows a query editor with the following text: `1 SELECT funnel(transactionName, responseTime < 90, showHealth=true, health="NORMAL") FROM transactions`. To the right of the query is a question mark icon. Below the query editor is a **Search** button. To the right of the search button is a **Basic** button, which is highlighted with an orange border.

See [AppDynamics Community](#).

Data Type Conversion Functions

i Data type conversion functions are only available for SaaS deployments.

Data type conversion functions can be used in the **SELECT** or **WHERE** clauses. Below are the available data type conversion functions. For `formatString` requirements, see Joda's `DateTimeFormat` documentation in the Classes section.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Function	Returns	ADQL Query Example
toDate(string value, [string formatString])	A string value formatted as a datetime.	<pre>SELECT toDate(field_name, "MM/dd/yyyy") FROM transactions</pre> <p><i>Returns</i> 2019-01-15T00:00:00.000Z for a field_name with string value "01/15/2019"</p>
toDate(int value)	An integer value formatted as a datetime.	<pre>SELECT toDate(12341234) FROM transactions</pre> <p><i>Returns</i> Dec 31 1969 19:25:41 GMT-0800</p>
toString(datetime value, [string formatString])	A datetime value formatted as a string.	<pre>SELECT toString(field_name, "MMM dd, yyyy") FROM transactions</pre> <p><i>Returns</i> "Jan 15, 2019" for a field_name with datetime value 2019-01-15T00:00:00.000Z</p>
toString(float/int/bool value)	A value formatted as a string.	<pre>SELECT toString(123.123) FROM transactions</pre> <p><i>Returns</i> "123.123"</p>

Function	Returns	ADQL Query Example
<code>toInt(datetime/float/string/bool value)</code>	An integer value, formatted as follows: <ul style="list-style-type: none"> <code>datetime</code> - converts to milliseconds, <code>float</code> - truncates <code>string</code> - parses to floats and truncates to an integer <code>bool</code> - converts to 0/1 	SELECT <code>toInt(123.4)</code> FROM <code>transactions</code> <i>Returns</i> 123
<code>toFloat(int/string value)</code>	An integer or string value formatted as a float.	SELECT <code>toFloat(123123)</code> FROM <code>transactions</code> <i>Returns</i> 123123.0
<code>round(float value, int decimalPlaces)</code>	A value rounded off to <code>decimalPlaces</code> . <code>decimalPlaces</code> must be a non-negative integer.	SELECT <code>round(123.123123, 3)</code> FROM <code>transactions</code> <i>Returns</i> 123.123
<code>ifNull(object value, object replacementValue)</code>	A value if the value is non-null. If the value is null, returns <code>replacementValue</code> .	SELECT <code>ifNull(field_name, 10)</code> FROM <code>transactions</code> <i>Returns</i> 10 if the value of <code>field_name</code> is null <i>Returns</i> Value of <code>field_name</code> if the value is not null

For data type conversion functions (except `ifNull`), if the value of `field_name` returns null, the converted data type will also return null.

Use mathematical and `now()` functions on datetimes

 The `now()` function is only supported on SaaS Controllers. It is not supported on on-premise deployments.

You can perform addition and subtraction mathematical functions on datetime and long values, for example:

```
SELECT toDate(field_name, "MMM, dd, yyyy") - toDate(field_name, "MMM, dd, yyyy") FROM transactions
```

The function will return a datetime value. Multiplication, division, and modulus mathematical functions are not supported. Addition and subtraction functions cannot be combined with floats.

You can use the `now()` function to add or subtract the server's current time from a value, for example:

```
SELECT toInt(now() - field_name) FROM transactions
```

The above function determines how long ago `field_name` was created and converts the value to an integer.

Functions That Modify Other Functions

Function	Returns	Valid Field Type(s)	ADQL Query Examples
<code>filter(metric_function (field_expression) , ...) [WHERE] condition_expression)</code>	Aggregations for specific subsets of data, computed by applying a filter to the input of a single metric function.	The metric function must be one of the following that returns a single value. <code>{ count avg max min sum distinctcount }</code> The second argument has the same syntax as a WHERE clause and optionally begins with the WHERE keyword, for example: SELECT <code>filter(avg (responseTime), WHERE responseTime > 1) FROM transactions WHERE application = "Travel"</code>	<code>filter(sum (numeric_field_name), numeric_field_name > 100)</code> SELECT 100.0 * filter(count (*), field_name = "value") / count (*) as "%" FROM transactions WHERE application = "yourApp" AND transactionName = "yourValue"

Combining Different Types of Functions

Here are some special cases to consider when combining functions of different types:

- The maximum accuracy of `distinctcount()` is reduced if it follows a bucketing function. Nested `distinctcount()` queries trade accuracy for memory savings, because the previous function establishes buckets, and `distinctcount()` creates sets of buckets within each of the previous function's buckets, and Elasticsearch automatically makes that tradeoff when that happens
 - For example, the first of the two example queries below returns less accurate results than the second:
 - **SELECT** transactionName, `distinctcount(userId)` **FROM** transactions
 - **SELECT** `distinctcount(userId)` **FROM** transactions
- The return value of `stdev(numeric_field_name)` cannot be used to sort or filter results.

Analyzed Fields

Selected fields in the analytics data are "analyzed". Analysis consists of tokenizing a block of text into individual terms suitable for use in an inverted index and normalizing these terms into a standard form to improve their searchability. The ADQL [Comparison Operators](#) behave differently for analyzed and non-analyzed fields. To construct queries on analyzed fields, you need to understand some concepts about how the tokens are built.

Uppercase letters in analyzed fields are all converted to lowercase to build tokens.

Delimiters and other factors (such as CamelCase terms) affect how strings are tokenized. For a string such as "myname@company.com", "@" is a delimiter, therefore myname and company.com are two separate tokens. Additionally, company.com is two separate tokens. Note that all non-alphanumeric characters are delimiters. A term that uses CamelCase, such as `VicePresident`, is tokenized into separate tokens based on recognition of the CamelCase nature of the term resulting in the tokens: `Vice` and `President` as well as `VicePresident`.

For an example string such as: `<VicePresident:SalesAndMarketing> - EMEAAustraliaUSA94107`, the tokens generated include the following:

- vicepresident
- vice
- president
- salesandmarketing
- sales
- and
- marketing
- emeaaustraliausa94107
- emeaaustraliausa
- emea
- australia
- usa
- 94107

Analytics Analyzed Fields

The analyzed fields in analytics events are:

- **Logs:** Message
- **Transactions:** Errors and Error Detail
- **Mobile:** stacktrace

Queries on Analyzed Fields

Full-text search is supported on analyzed fields, including the message field for logs, using the **LIKE** operator. See [Comparison Operators](#).

On analyzed fields, the **REGEXP** operator matches exactly only the analyzed and processed tokens, so you cannot query across the complete message.

Consider this log message:

```
[2016-06-09 06:07:50,118] [INFO ]  
[org.springframework.jms.listener.DefaultMessageListenerContain  
r#0-1] [com.appdynamics.provision.OrderMessageListener]  
[AD_REQUEST_GUID[2b8ce807-986c-45f9-a5b4-2fe5a6fd90f3]] Received  
a message to process the order Order_3138 for the user  
myname@company.com
```

In this log message, myname and company.com are two separate tokens because "@" is a delimiter. To search a log message like this for results based on the email address requires searching across tokens.

A query such as the following using **REGEXP**, will **fail** because myname and company.com are two separate tokens.

```
SELECT FROM logs WHERE appName = 'yourAppName' AND sourceType =  
'yourLogFile' AND message REGEXP 'myname@company.*'
```

The **LIKE** operator is not affected by delimiters, so an alternative query using **LIKE** operator is a better choice.

```
SELECT FROM logs WHERE appName = 'yourAppName' AND sourceType =  
'yourLogFile' AND message LIKE 'myname@company'
```

You can also use wildcards in the query because they work across tokens.

```
SELECT FROM logs WHERE appName = 'yourAppName' AND sourceType =  
'yourLogFile' AND message LIKE 'myname@company*'
```

Example Queries for Analyzed Fields

Searching the following analytics log events:

```
Jun 7 11:27:45 appd sshd[1032]: Illegal user test from  
110.49.183.11  
Jun 7 11:27:46 appd sshd[1032]: Failed password for illegal user  
test from 110.49.183.11 port 9218 ssh2  
Jun 7 11:27:46 appd sshd[1032]: error: Could not get shadow  
information for NOUSER
```

Note the results from the following queries:

Query	Results
SELECT * FROM logs WHERE sourceType='yourLogFile' AND message REGEXP 'illegal.+user'	Does not match any log events in the sample because the query string spans across multiple tokens. Use LIKE for an instance like this.
SELECT * FROM logs WHERE sourceType='yourLogFile' AND message REGEXP 'illegal.*'	Matches the first two log events
SELECT * FROM logs WHERE sourceType='yourLogFile' AND message REGEXP 'Failed*'	Does not match any log events in the sample because the token has only lowercase 'failed'

To search for string : javaIOException

Query
SELECT * FROM transactions WHERE application = 'yourApp' AND segments.errorList.errorCode REGEXP 'java[a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z][a-z]'

Math Expressions

Math expressions are field expressions that use arithmetic operators. These expressions can be used in ADQL queries in both the **SELECT** and **WHERE** clauses.

field_expression **BINARY_OPERATORS** field_expression

Arithmetic Operators

Math operators are valid on integer and float data fields, constants (for example, 3.14), and on functions that return a single integer or float value, with the exception of % (modulo). The operators `*`, `/` and `%` have higher precedence than `+` and `-`. Parentheses can be used to control the order of operations, a unary minus (`-`) is also supported.

Operator	Name	Description
*	asterisk	Multiplication
/	slash	Division of two integer types performed as integer division. Integer division by zero returns null.
%	modulo	Calculates the remainder after the division of two integers. Valid only for integers.
+	plus	Addition. Requires a space before a numeric literal.
-	minus	Subtraction. Requires a space before a numeric literal. Can also be used as unary_operator.

Math Expression Usage

Math expressions can be used in several ways.

Query	Result
SELECT regionId % 4, count (*) FROM transactions WHERE application = "yourApp"	Math expression is used as a GROUP BY term in an implicit group by query
SELECT field_name1, (field_name2 + field_name3) * 3.14 FROM transactions WHERE application = "yourApp"	Math expression is used as a composite field.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Query	Result
<pre>SELECT sum (field_name1) / count (field_name2) FROM transactions WHERE application = "yourApp" SELECT filter(sum (field_name1), WHERE fiel d2 IS NOT NULL) / count (field_name3) FROM ...</pre>	Math expression used on an aggregation function.
<pre>SELECT avg (field1 + field2) FROM event_type WHERE ... SELECT series (field1 + field2, 1) FROM event_type WHERE ...</pre>	Math expression used within an aggregation function.
<pre>SELECT * FROM transactions WHERE (responseTime * cartValue) > 100 SELECT * FROM transactions WHERE (regionId % 3) IN (1, 2) SELECT * FROM transactions WHERE (responseTime * cartValue) BETWEEN (100, 200)</pre>	Math expression used in a WHERE clause with comparison operators.
<pre>SELECT segments.userData.itemTitle, (segments.userData.itemPrice / 100) AS Price FROM transactions WHERE application = 'ECommerce 2.0' AND transactionName = '/' product_details.xhtml' AND Price > 20</pre>	Convert a value in cents to dollars. This query converts segments.userData.itemPrice from cents to dollars and shows results where the price is greater than \$20.
<pre>SELECT transactionName, (responseTime / 1000) AS responseSeconds, userExperience, requestGUID FROM transactions WHERE application = "ECommerce 2.0" AND responseSeconds > 5</pre>	Convert a value such as average response time to seconds instead of milliseconds and view each transaction that is greater than X seconds.

Usage Notes

If any field or intermediate expression result for an expression is null, the entire expression will be null.

Math expressions in the **WHERE** clause are evaluated per record, not in aggregate.

Fields and metric functions can not be combined in the same expression, for example, a query for the following type is *not* valid:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

SELECT responseTime + sum(cartValue) **FROM** ...

Mathematical operations that operate on every event (as opposed to on aggregation functions) will reduce query performance. Avoid statements such as:

WHERE (responseTime - 200) > 800 and use a construct such as **WHERE** responseTime > 1000 instead.

Comparison Operators

Comparison operators, such as =, !=, <, >, **LIKE**, and **IN**, can be used in condition_expressions of the **WHERE** clause in the ADQL query statement.

This page describes the comparison operators that you can use in the condition_expression syntax.

Operators

Comparisons on strings are case-insensitive.

Operator	Description	Supported Usage
=	Equals: True if the value of the specified field_name equals the specified value in the expression. String comparisons using the equals operator are case-sensitive.	non-analyzed fields
!=	Not equals: True if the value in the specified field_name does not equal the specified value.	non-analyzed fields
>	Greater than: True if the value in the specified field_name is greater than the specified value.	non-analyzed fields of type int, float and date
>=	Greater than or equal: True if the value in the specified field_name is greater than or equal to the specified value.	non-analyzed fields of type int, float and date
<	Less than: True if the value in the specified field_name is less than the specified value.	non-analyzed fields of type int, float and date
<=	Less than or equals: True if the value in the specified field_name is less than or equal to the specified value.	non-analyzed fields of type int, float and date

Operator	Description	Supported Usage
IN	<p>Finds records where the value of a field equals any one of the specified values in a list of string or numeric values. The values for IN must be in parentheses. String values must be surrounded by single quotes. Wild card usage within the list of values provided to the IN operator is supported.</p> <p>For example:</p> <pre> SELECT transactionName, percentile(segments.transactionTime, 90) FROM transactions WHERE application = 'prd-analytics' AND transactionName IN ('api_v2./v2/ events/*/search','api_v1./v1/events/*/ search')</pre>	non-analyzed fields only. Invalid for analyzed fields.
LIKE	<p>The LIKE operator performs a full-text search that analyzes the string value and field value. If the string value contains multiple terms, separated by spaces, it is processed as an AND condition of the terms. Use LIKE to search values in analyzed fields.</p> <p>The LIKE operator supports the use of wild cards.</p> <p>LIKE is not supported for queries on mixed case strings. For example, querying against a log message that contains "pEer" will not match the search string 'peer', because "pEer" is tokenized by the search analyzer into two separate tokens - "p" and "eer").</p>	for full-text search of analyzed fields
BETWEEN	<p>Finds values of a field based on an inclusive or exclusive value range. For an inclusive range search, use square brackets []. For an exclusive value range, use parentheses ().</p>	Supported for data types int, float, and datetime (<i>New in 4.4.1</i>).

Operator	Description	Supported Usage
IS NULL	Finds records where a field does not contain a value.	non-analyzed fields and analyzed fields
IS NOT NULL	Finds records where a field contains a value.	analyzed and non-analyzed fields
NOT BETWEEN	Finds records where a field does not contain a value in an inclusive or exclusive value range. The reverse of BETWEEN .	non-analyzed fields
NOT LIKE	The reverse of LIKE .	analyzed fields
NOT IN	Finds records where the value of a field does <u>not</u> match any value in a list of string or numeric values. The values for NOT IN must be in parentheses, and string values must be surrounded by single quotes. There is also a logical operator NOT , which is unrelated to this comparison operator.	non-analyzed fields
REGEXP	The REGEXP operator applies a regular expression pattern match of a string to the pattern passed as an argument. See REGEXP Operator for details of usage. This is an advanced feature and requires knowledge of regular expression patterns.	non-analyzed fields For analyzed fields: <ul style="list-style-type: none"> • Use lowercase input strings. • Do not use to search across tokens
* ?	The wild card operators. Use of wild cards is supported on queries of string fields. The asterisk, '*', character matches zero or more characters and the question mark, '?', character matches a single character. The wild card operator works similarly when used with the equals "=" or LIKE operator. The wild card operator is case sensitive for non-analyzed fields.	analyzed fields and non-analyzed fields

Examples

Query	Result
SELECT * FROM mobile_snapshots WHERE appkey='your_appkey' AND numeric_field_name IN (1419, 613, 748)	Returns all fields for mobile snapshots for the specified appkey where the value of the specified numeric field matches one of the values in parentheses.
SELECT count(*) FROM browser_records WHERE appkey='your_appkey' AND field_name IN ('string1','string2', 'string3')	Returns a count of browser records for the specified appkey where the value of the specified field matches one of the specified strings.
SELECT ip FROM browser_records WHERE ip LIKE "10.134.*"	By filtering on IP address range using wild card operator, finds records in the specified IP address range.
SELECT * FROM logs WHERE message LIKE 'DEBUG Adding operation'	Matches the sample log line "DEBUG com.appdynamics.operations.PublishTestService - Adding to bulk publish operation."
SELECT * FROM logs WHERE message LIKE 'error'	Finds all the log events containing the word 'Error' in any field
SELECT * FROM transactions WHERE application='yourAppName' AND cartTotal BETWEEN [10, 50]	Inclusive range: Returns all transactions with a cart total between 10 and 50, including 10 and 50.
SELECT * FROM transactions WHERE application='yourAppName' AND cartTotal BETWEEN (10, 50)	Exclusive range: Returns all transactions with cart total between 10 and 50, excluding 10 and 50.

Logical Operators

Logical operators can be used in the **WHERE** clause in an ADQL query to make compound condition expressions. These operators are **AND**, **OR**, and **NOT**.

Condition Expression Syntax

(condition_expression **LOGICAL_OPERATOR** condition_expression)

Examples

Expression	Result
(field_expression_1 AND field_expression_2)	Evaluates as true if both field_expressions are true.
(field_expression_1 OR field_expression_2)	Evaluates as true if either field_expression is true.
(field_expression_1 AND NOT field_expression_2)	Evaluates are true if field_expression_1 is true and field_expression_2 is false.

REGEXP Operator

i This is an advanced feature and requires knowledge of regular expression patterns.

The regular expression operator, **REGEXP**, can be used in the **WHERE** clause to handle complex matching queries. This operator applies a regular expression pattern match of a string to the pattern passed as an argument. ADQL uses the Lucene regular expression engine to analyze the **REGEXP** expression. The search results for queries that use the **REGEXP** operator are dependent not only on regular expression syntax and rules but also on whether you are searching analyzed or non-analyzed fields. To use **REGEXP** on analyzed fields, see [Analyzed Fields](#).

The **REGEXP** operator can only match with the lowercased tokens in the analyzed fields. To search for an uppercase string in an analyzed field using a wild card or **REGEXP**, you need to input a lowercase string. For example info, not INFO.

Allowed Characters

Any Unicode character may be used in the regular expression pattern, but certain characters are reserved and must be escaped. Any reserved character can be escaped with a backslash "*" including a literal backslash character:"\\".

The standard reserved characters are:

```
. ? + * | { } [ ] ( ) " \
```

For query performance reasons, before using any reserved character in a **REGEXP** pattern, you need to specify the first three characters of the string explicitly, such as specifying 123 before the brackets [0-9] in the following example:

```
SELECT * FROM logs WHERE sourceType='yourLogFile' AND id REGEXP '123 [ 0-9 ]'
```

i A query such as the following is invalid.
SELECT * FROM logs WHERE sourceType='yourLogFile' AND id REGEXP '[0-9]'

Example Operations, Strings, and Associated Patterns

Supported Operation	Description	String	Pattern
Match any character	A period "." can be used to represent any character.	abcde	abc..

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Supported Operation	Description	String	Pattern
One or more	A plus sign "+" can be used to repeat the preceding shortest pattern one or more times.	aaabb	aaab+
Zero or more	An asterisk "*" can be used to match the preceding shortest pattern zero or more times.	aaaabbbcc	aaaab*c*
Zero or one	A question mark "?" makes the preceding shortest pattern optional. It matches zero or one times.	aaabbbc	aaa?b+c?
Min-to-max	Curly brackets "{}" can be used to specify a minimum and (optionally) a maximum number of times the preceding shortest pattern can repeat. Allowed forms: {5} # repeat exactly 5 times {2,5} # repeat at least twice and at most 5 times	aaaabbbcc	aaaab{3}c{2} aaaab{2,4}c{2,4}
Grouping	Parentheses "()" can be used to form sub-patterns.	abababab	abab(ab)*
Alternation	The pipe symbol " " acts as an OR operator. The match will succeed if the pattern on either the left-hand side OR the right-hand side matches.	aaabbb	aaa(ccc bbb)

ADQL Data

This page describes data that ADQL captures in Analytics.

Analytics Type	Description
Transaction Analytics	Transaction Analytics is defined as event data collected by the Java and .NET Agents for every instance of a business transaction. Every instance of a business transaction that passes through a tier is defined as an event. You can view the raw data for any transaction instance that occurs within the data retention time. Transaction Analytics enables you to analyze the business impact of every event and observe how customers use your application.
Browser, Mobile, and IoT Analytics	Browser, Mobile, and IoT Analytics provide event data collected by the End User Monitoring (EUM) JavaScript Agent, Mobile, and IoT Monitoring SDKs.
Log Analytics	Log Analytics provides event data collected from log files.
Synthetic Sessions Analytics	Synthetic Sessions Analytics provides events data on sessions collected by Browser Synthetic Monitoring.

See [AppDynamics Analytics Events API](#).

Analytics Transaction Data

Each instance of a business transaction passing through a single tier is an event, so the data associated with a single execution of a distributed business transaction (for example, Checkout) is stored as a series of events in Analytics. The data consists of the default transaction data and additional data from data collectors configured for that transaction. This data is organized and stored per business transaction.

Default Transaction Data

Event Type: transactions

Key (event type identifier): application

The following table lists the data collected by default for each instance of the business transactions that are enabled for Analytics. The table also lists the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

UI Field Name	Description	Events Service Internal Name
Application	Application name	application
Business Transaction	Business transaction name	transactionName
Error	Error details (deprecated) This field is replaced by the more granular fields: Error Code, Error Detail, and Error Type.	deprecated
Error Code	The value of this field depends on the Error Type. For example, if Error Type is an HTTP_Error_code, then the value is a string representing the corresponding HTTP error code such as 404, 503 and so on.	segments.errorList.errorCode
Error Detail	This is what the "Error" field represented in 4.1. Primarily the error message	segments.errorList.errorDetail
Error Type	Classification of errors into buckets done internally by the Agent. For example, the error type could be HTTP_ERROR_CODE, LOGGER_MESSAGE, THROWABLE and so on.	segments.errorList.errorType

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Description	Events Service Internal Name
Node	Node name	<code>segments.node</code>
Tier	Tier name	<code>segments.tier</code>
requestGUID	GUID for this specific user request as assigned by AppDynamics	<code>requestGUID</code>
Response Time (ms)	Business transaction response time for this request in milliseconds	<code>responseTime</code>
Timestamp	Time the event occurred in the application	<code>eventTimestamp</code>
User Experience	Indicates if the transaction was marked as Normal, Slow, Very Slow, Stall, or Error	<code>userExperience</code>
Exit calls	Details of database and remote service calls. View Details flow map. Note that for partial snapshots, exit call information captured in call graphs can differ between the Analytics and APM UI. Each UI presents an appropriate level of contextual visibility while preserving low overhead. An APM snapshot, for example, may capture only the exit calls that are most pertinent to transaction performance.	Not Applicable

Custom HTTP Request Data

When HTTP data collectors are configured, the following information can be collected:

Field	Events Service Database Name
cookies	<code>segments.httpData.cookies</code>
headers	<code>segments.httpData.headers</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

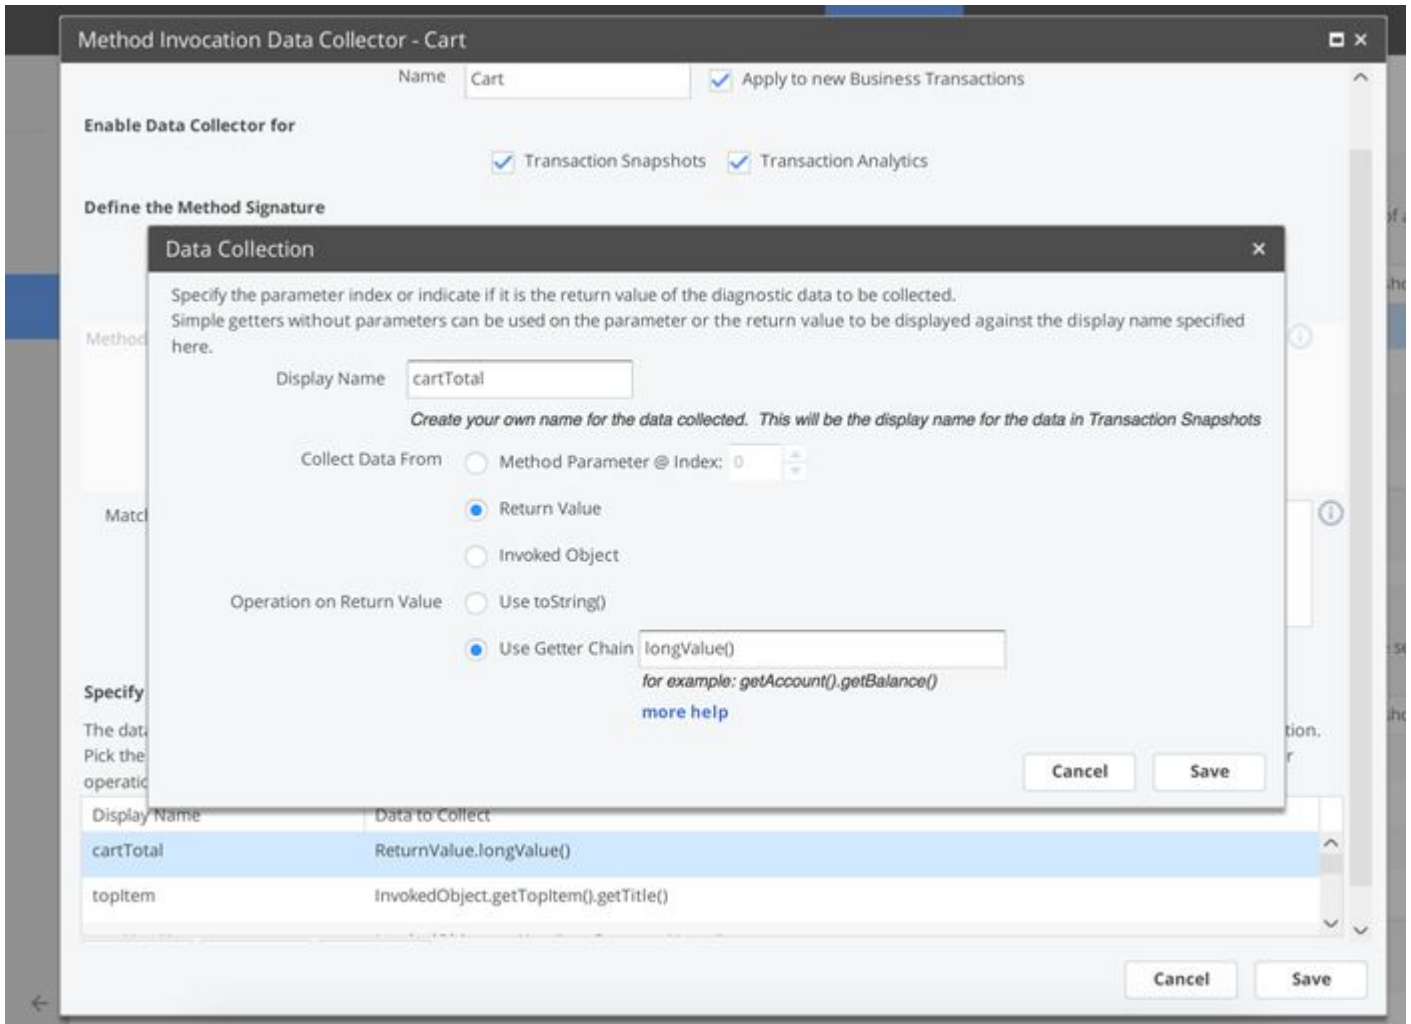

Field	Events Service Database Name
parameters	<code>segments.httpData.parameters</code>
principal	<code>segments.httpData.principal</code>
session ID	<code>segments.httpData.sessionId</code>
session Objects	<code>segments.httpData.sessionObjects</code>
URL	<code>segments.httpData.url</code>
URI path segments: <code>segment0-n</code>	<code>segments.httpData.uriPathSegments</code>

Analytics uses the configured display name as the field name for the HTTP parameters. In Controller versions prior to 4.3, Analytics displayed the data using the actual parameter name.

Custom Method Invocation Data

Custom data collected as specified in the method invocation data collector configuration. See [Data Collectors](#).

To specify a custom data field when using the Analytics query APIs, prefix the field name with `segments.userData`. For example, if your field is `cartTotal`, such as shown in the following screenshot, the database name is `segments.userData.cartTotal`.

SQL Data Collector

Captures values from SQL-prepared statement query data used in business transactions. See [Collect Business Data From SQL Calls](#).

Deprecated Fields

AppDynamics deprecated the `Request Experience` and `Transaction Time` for Analytics Agents >= 4.2.x. Both fields are replaced with new fields:

Deprecated Field	Description	New Field
Request Experience	Indicates if the transaction was marked as Normal, Slow, Very Slow, Stall, or Error	User Experience

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Deprecated Field	Description	New Field
Transaction Time	Business transaction response time for this request in milliseconds	Response Time

Analytics Log Data

Log Analytics collects from log files depends on the source of the log file and the pattern that you specify to structure the data in the log with. Every log entry is an event in the Log Analytics event stream.

Log Analytics Data

Log Analytics only supports the UTF-8 encoding format.

Event Type: logs

Key (event type identifier): sourceType

These fields are captured by default; you can configure and capture optional data, but these fields are always present:

UI Field Name	Description	Events Service Internal Name
pickupTimestamp	The timestamp when the Java Agent picked up the event and sent it to the Analytics Agent.	pickupTimestamp
Message	The message body of the log event.	message
host	IP address or host name where the event was generated.	host
source	Location of the logs, usually a path or directory such as <code>/tomcat/logs</code> .	source
sourceType	The kind of log file, such as <code>apache-httpserver-access-log</code> .	sourceType
Timestamp	Timestamp of the log event.	eventTimestamp
Extracted Fields	Fields that were extracted using the Controller UI in previous versions appear in the Extracted Fields list. See Collect Log Analytics Data .	Varies

You can optionally configure these fields:

Optional Fields	Description
nodeName	Name of the node where the log event occurred.
tierName	Name of the tier where the log event occurred.
appName	Application name where the log event occurred.

Analytics Custom Events Data

Data collected for your Analytics custom events depends on the schema you create and manage.

The only default field is `eventTimestamp`. If custom events are used to configure Business Journeys, this field is mandatory. All other fields are defined by your schema.

If you are exporting data as a CSV file, a single quotation mark (`'`) prepends cells that begin with `=` , `+` , `-` , `@` , or `"` .

See [Analytics Events API](#).

Analytics Browser Requests Data

Browser Analytics provides details about each browser user request. The data collected includes information about pages, performance metrics, location of your users, browser and device data, errors, and any custom data that you configured in your Browser RUM configuration.

This page lists the field names available for browser request Analytics data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query. See [Browser RUM Metrics](#).

Event Type: `browser_records`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
Page Info Fields	
Agent ID	<code>agentid</code>
<code>appkey</code>	<code>appkey</code>
Client GUID	<code>cguid</code> The Client GUID is a unique identifier for each browser request. It is unique on each page reported in the session.
IP address	<code>ip</code>
Page Experience	<code>pageexperience</code>
Page Name	<code>pagename</code>
Page Type	<code>pagetype</code>

UI Field Name	Events Service Internal Name
Parent Page URL	<p>pageparenturl</p> <p> The <code>pageparenturl</code> is not available by default. On-premises customers need to run a special script on the EUM Server. SaaS customers need to file a ticket requesting AppDynamics to do this for them. See the Community article.</p>
Page Referrer	<p>referrer</p> <p>See the Community article.</p>
URL	pageurl
Performance Time Fields	
Application Server Time	metrics.`Application Server Time (ms)`
DOM Ready Time	metrics.`DOM Ready Time (ms)`
Domain Lookup Time	metrics.`Domain Lookup Time (ms)`
End User Response Time	metrics.`End User Response Time (ms)`
Estimated BT Time	btdata.estimatedtime
First Byte Time	metrics.`First Byte Time (ms)`
Server Connection Time	metrics.`Server Connection Time (ms)`
SSL Handshake Time	metrics.`SSL Handshake Time (ms)`
Location Fields	
City	geocity

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
Country	geocountry
Region	georegion
Browser and Device Data Fields	
Browser	browser
Browser Version	browserversion
Device	device
Device OS	deviceos
Errors Field	
AJAX Error	ajaxerror
Error Type	errortype
Script Error Field	
Line Number	scripterrordata.linenumber
Message	scripterrordata.message
Origin	scripterrordata.origin
timestamp	scripterrordata.timestamp
Custom User Data Field	

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
<p><i>your_field_name</i></p>	<p>userdata.your_field_name userdataBoolean.your_field_name userdataDate.your_field_name userdataLong.your_field_name userdataDouble.your_field_name</p> <div style="border: 1px solid #00aaff; padding: 10px; margin-top: 10px;"> <p>i If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code></p> </div>

Analytics Browser Sessions Data

This page describes the field names available for Analytics Browser Sessions data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name. You can view the Browser Sessions using the Analytics Query API. This page describes fields that are specific to Browser Sessions.

Event Type: `web_session_records`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
Session Fields	
Browser	<code>browser</code>
Browser Version	<code>browserversion</code>
City	<code>geocity</code>
Closed	<code>closed</code>
Country	<code>geocountry</code>
Device	<code>device</code>
Device OS	<code>deviceos</code>
IP Address	<code>ip</code>
Page View Count	<code>pageviews</code>
Region	<code>georegion</code>
Session Duration (ms)	<code>metrics.durationMS</code>
Session Start Time	<code>startTimeMS</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

User Experience	<code>experience</code>
Page View Fields	
Client GUID	<code>browserRecords.cguid</code>
Page Error Type	<code>browserRecords.errortype</code>
Page Experience	<code>browserRecords.pageexperience</code>
RUM Page Name	<code>browserRecords.pagename</code>
Custom User Data	
<i>your_field_name</i>	<p> <code>userdata.your_field_name</code> <code>userdataBoolean.your_field_name</code> <code>userdataDate.your_field_name</code> <code>userdataLong.your_field_name</code> <code>userdataDouble.your_field_name</code> </p> <div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;"> <p>i If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code>.</p> </div>

Analytics Browser Resources Data

This page describes the field names available for Analytics Browser Resources data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name.

Event Type: `browser_resource_records`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
Session Fields	
appkey	<code>appkey</code>
Client GUID	<code>cguid</code> <div style="border: 1px solid #00aaff; padding: 5px; margin-top: 5px;"> <p>i This field displays the Client GUID of the browser request associated with this resource. The Client GUID is a unique identifier for each browser request. It is unique on each page reported in the session.</p> </div>
Cached	<code>cached</code>
Compressed	<code>compressed</code>
decodedSize	<code>decodedSize</code>
Domain	<code>domain</code>
encodedSize	<code>encodedSize</code>
Has Resource Details	<code>hasResourceDetails</code>
HTTP Protocol	<code>httpProtocol</code>
HTTP Response Status Code	<code>httpResponseStatusCode</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
Initiator Type	initiatorType
Name	name
Page Name	pageName
Page URL	pageUrl
Resource Type	resourceType
Source	source
Transfer Size	transferSize
Resource URL	url
Performance Time Field	
Before OnLoad	beforeOnLoad
Before Visually Complete	beforeVisuallyComplete
Browser Queue Time	browserQueueTime
Browser Wait	browserWait
Connection Time	connectionTime
DNS Time	dnsTime
DNS Wait Time	dnsWaitTime
First Byte Time	firstByteTime

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
frontEnd Time	frontEndTime
Load Time	loadTime
Redirect Time	redirectTime
Request Time	requestTime
Request Wait Time	requestWaitTime
Response Time	responseTime
SSL Time	sslTime
TCP Time	tcpTime
TCP Wait Time	tcpWaitTime
Location Fields	
City	geocity
Country	geocountry
Region	georegion
Browser and Device Data Fields	
browser	browser
Browser version	browserVersion
Device	device
OS	os

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Analytics Mobile Crash Reports Data

This page describes the field names available for Analytics Mobile Crash Reports data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: `mobile_crash_reports`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
App Crash Time	<code>appcrashtimestamp</code>
App Key	<code>appkey</code>
Carrier	<code>carrier</code>
Connection Type	<code>connectiontype</code> For example: "wifi", "4g", "cell"
Country	<code>geocountry</code>
Crash Group ID	<code>groupid</code>
Crash Id	<code>crashid</code>
Crashed Function	<code>crashfunction</code> For example: "-[MTFfirstViewController segFault413]", "com.appd.examples.android.instrumentation.MainActivity.d42" This value depends on your application.
Device / Manufacturer	<code>devicemanufacturer</code> For example: "Samsung", "Apple"
Mobile App Name	<code>mobileappname</code>
Mobile App Version	<code>mobileappversion</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
Model	<code>devicemodel</code> For example: "iPhone 5" "iPad 2 WIFI"
OS Version	<code>osversion</code> For example: "iOS 6.0", "Android 4.2"
Platform	<code>platform</code> For example: "Android", "iOS"
Region	<code>georegion</code>
User Data	
<i>your_field_name</i>	<code>userdata.your_field_name</code> <code>userdataBoolean.your_field_name</code> <code>userdataDate.your_field_name</code> <code>userdataLong.your_field_name</code> <code>userdataDouble.your_field_name</code>
	<div style="border: 1px solid #0070C0; padding: 5px;"> <p>i If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code></p> </div>

Analytics Mobile Requests Data

Mobile Analytics provides details about the performance of your mobile apps as experienced by your end users. The data collected includes information about the mobile app names and versions, network requests, performance times, locations, carrier and device data, errors, and any custom data that you configured in your Mobile RUM configuration.

This page describes the field names available for mobile requests Analytics data, along with the Events Service internal name. See [Mobile RUM Metrics](#). When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: mobile_snapshots

Key (event type identifier): appkey

UI Field Name	Events Service Internal Name
Mobile App Info Fields	
agentid	agentid
agentversion	agentversion
appkey	appkey
cguid	cguid
Mobile App Name	mobileappname For example: "com.appdynamics.eum.test.apps.E2E-PictureSharingApp"
Mobile App Version	mobileappversion
Platform	platform
Network Request Fields	
Background	happenedinbackground
Experience	networkrequestexperience

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
HTTP Status Code	httpstatuscode
Network Request Name	networkrequestname
Network Request Type	networkrequesttype
Request Content Length	requestContentLength
Response Content Length	responseContentLength
Performance Time Fields	
Estimated BT Time	btdata.estimatedtime
Network Request Time	networkrequesttime
Location Fields	
Country	geocountry
Region	georegion
Carrier and Device Data Fields	
Carrier	carrier
Connection Type	connectiontype For example: "wifi", "4g", "cell"
Device / Manufacturer	devicename For example: "Samsung", "Apple"
Model	devicemodel For example: "iPhone 5" "iPad 2 WIFI"

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
OS Version	<code>osversion</code> For example: "iOS 6.0", "Android 4.2"
Error Fields	
Network Type Error	<code>networkerror</code>
Custom User Data Fields	
<i>your_field_name</i>	userdata.your_field_name userdataBoolean.your_field_name userdataDate.your_field_name userdataLong.your_field_name userdataDouble.your_field_name <div style="border: 1px solid #00aaff; padding: 5px;"> i If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code> </div>

Analytics Mobile Sessions Data

This page describes the field names available for Analytics Mobile Sessions data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: mobile_session_records

Key (event type identifier): appkey

UI Field Name	Events Service Internal Name
Mobile Session Fields	
Mobile App Name	mobileappname example: "com.appdynamics.eum.test.apps.E2E-PictureSharingApp"
Carrier	carrier For example: "AT&T", "Verizon"
Closed	closed
Connection Type	connectiontype For example: "cell", "3g"
Country	geocountry
Device / Manufacturer	devicename
Duration	metrics.durationMS
IP Address	ip
Mobile App Version	mobileappversion
Model	devicemodel For example: "iPad 2 WIFI", "Kindle Fire"

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
OS Version	<code>osversion</code> For example: "iOS 5.1", "Android 4.2"
Region	<code>georegion</code>
Session Start Time	<code>startTimeMS</code>
Session Status	<code>closed</code> Note "closed" is a Boolean field. True means the session is closed. False means the session is still going on.
Event Count Fields	
Breadcrumb Count	<code>metrics.breadcrumbcount</code>
Crash Count	<code>metrics.crashcount</code>
Custom Metric Count	<code>metrics.custommetriccount</code>
Event Time Stamp	<code>eventTimestamp</code>
Info Point Count	<code>metrics.infopointcount</code>
Network Request Count	<code>metrics.networkrequestcount</code>
Timer Count	<code>metrics.timerCount</code>
UI Event Count	<code>metrics.uiCount</code>
User Data Count	<code>metrics.userdatacount</code>
Crash Fields	

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
App Crash Time	<code>crash.appcrashtimestamp</code>
Crash Exception	<code>crash.crashexception</code> For example: "java.lang.NullPointerException"
Crash File	<code>crash.crashfile</code> For example, "MainActivity.java"
Crash Group ID	<code>crash.groupid</code>
Crash Line Number	<code>crash.crashlinenumber</code>
Error Description	<code>error.description</code>
Symbolicated or Deobfuscate	<code>crash.symbolicateddeobfuscated</code> For example: false
User Data	
<i>your_field_name</i>	<p><code>userdata.your_field_name</code> <code>userdataBoolean.your_field_name</code> <code>userdataDate.your_field_name</code> <code>userdataLong.your_field_name</code> <code>userdataDouble.your_field_name</code></p> <div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;"> <p>i If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code></p> </div>
Breadcrumb Fields	
Breadcrumb Text	<code>breadcrumb.bctext</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
Network Request Fields	
Connection Type	<code>networkrequest.connectiontype</code>
End Time	<code>networkrequest.endTimeMS</code>
Experience	<code>networkrequest.networkrequestexperience</code>
HTTP Status Code	<code>networkrequest.httpstatuscode</code>
IP Address	<code>networkrequest.ip</code>
Network Error	<code>networkrequest.networkerror</code>
Network Request Name	<code>networkrequest.networkrequestname</code>
Network Request Time	<code>networkrequest.networkrequesttime</code>
Infopoint Fields	
Duration (ms)	<code>infopoint.duration</code>
infopname	<code>infopoint.infopname</code>
Is Dynamic	<code>infopoint.isdynamic</code>
UI Event Fields	
Activity	<code>ui.activity</code>
Class	<code>ui.uiclass</code> For example: "UITableView"

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
Label	<code>ui.uilabel</code> For example: "IOS TableCell"
Root View	<code>ui.rootview</code> For example: "SettingsScreen"
UI Event	<code>ui.uievent</code> For example: "Button Pressed", "Root View Change", "Table Cell Selected"

Analytics Mobile Non-Fatal Issues Data

This page describes the field names available for Analytics Mobile Non-Fatal Issues data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query.

Event Type: `mobile_non_fatal_issue_records`

UI Field Name	Events Service Internal Name
Agent Info Fields	
Agent ID	<code>agentid</code>
Agent Version	<code>agentversion</code>
App Info Fields	
App Key	<code>appkey</code>
Mobile App Name	<code>mobileappname</code> For example: "com.appdynamics.eum.test.apps.E2E-PictureSharingApp"
Mobile App Version	<code>mobileappversion</code>
Device Info Fields	
Carrier	<code>carrier</code> For example: "AT&T", "Verizon"
Connection Type	<code>connectiontype</code> For example: "cell", "3g"
Device Manufacturer	<code>devicemanufacturer</code> For example: "Samsung"

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
Device Model	<code>devicemodel</code> For example: "Galaxy S5"
Device Name	<code>devicename</code>
IP Address	<code>ip</code>
jailbroken	<code>jailbroken</code>
OS Version	<code>osversion</code> For example: "5.1", "4.2"
Platform	<code>platform</code> For example: "iOS", "Android"
Code Issues	
description	<code>description</code> For example: "App Not Responding in Utils.formatData"
filename	<code>filename</code>
groupid	<code>groupid</code>
Line Number	<code>linenumber</code>
severity	<code>severity</code> For example: "Info", "warning"
symbolicateddeobfuscated	<code>symbolicateddeobfuscated</code> For example: false

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
symbolname	<code>symbolname</code> For example: "MainActivity.onResume"
pickupTimestamp	<code>pickupTimestamp</code>
Timestamp	<code>timestamp</code> For example: "03/15/18 5:32:33 PM"
Custom User Data Fields	
<i>your_field_name</i>	userdata.your_field_name userdataBoolean.your_field_name userdataDate.your_field_name userdataLong.your_field_name userdataDouble.your_field_name <div style="border: 1px solid #00aaff; padding: 5px;"> i If your field name contains spaces or any reserved characters, the field name must be surrounded by backquotes. For example, if you define a custom field called "Item Purchased", the Events Service field name is <code>userdata.`Item Purchased`</code> </div>
Event Fields	
eventid	<code>eventid</code>
eventindex	<code>eventindex</code>
timestamp	<code>eventTimestamp</code>
eventtype	<code>eventtype</code> For example: "ANR", "Error"
Location Fields	
City	<code>geocity</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
Country	geocountry
Region	georegion For example: "California", "Sichuan"

Analytics Synthetic Sessions Data

This page lists the field names available for Analytics Browser Synthetic Sessions data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query. For details on the meaning of each metric, see [Browser Synthetic Metrics](#).

Event Type: `synth_session_records`

Key (event type identifier): Job Name (scheduleName)

UI Field Name	Events Service Internal Name
Session Fields	
Browser	<code>browser</code> For example: "Internet Explorer", "Chrome"
Browser Version	<code>browserversion</code> For example: "52.0.2743.116", "11.0.9600.18124"
City	<code>geocity</code>
Closed	<code>closed</code>
Country	<code>geocountry</code>
Devices	<code>device</code> The computer form factor of the device. For example: "Computer" or "Mobile & Tables"
Device Model	<code>devicemodel</code> The model of the device. For example: "Galaxy S8" or "iPhone 7"
Device OS	<code>deviceos</code> The operating system of the device. For example: "Windows" or "Android"

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Duration (sec)	<code>metrics.`Session Duration (ms)`</code>
End Time	<code>endTimeMS</code>
Error Type	<code>failureType</code> For example: "Timed out", "Test script crashed"
Job Name	<code>scheduleName</code> The name of the synthetic job.
Region	<code>georegion</code>
Result	<code>success</code>
Schedule ID	<code>measurementSpec.scheduleId</code>
Session Type	<code>sessionType</code> For example: "WEB_DRIVER", "URL"
Session Visual Time (sec)	<code>metrics:`Session Visual Time (ms)`</code>
Start Time	<code>startTimeMS</code>
Status	<code>status</code>
Timestamp	<code>eventTimestamp</code>
Page View Fields	
Page Error Type	<code>browserRecords.pageerror</code>
RUM Page Name	<code>browserRecords.pagename</code>
URL	<code>pageurl</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Analytics Connected Device Data

Connected Device Data provides details about each IoT connected device. The data collected includes information about devices, network requests and error events, and any custom properties and events that you instrument in your IoT application.

This page describes the required field names for Analytics Connected Device data, along with the Events Service internal name. When accessing the data using ADQL queries, you need to use the Events Service internal name in the query. Because IoT Monitoring largely depends on custom data, your connected device Analytics data will most likely include many more field names than given below.

Event Type: `iot_records`

Key (event type identifier): `appkey`

UI Field Name	Events Service Internal Name
Fields	
App Key	<code>appkey</code>
deviceguid	<code>deviceguid</code>
devicetype	<code>devicetype</code>
Timestamp	<code>eventTimestamp</code>
eventtype	<code>eventtype</code>
customevent Fields	
eventssummary	<code>customevent.eventssummary</code>
networkrequestevent Fields	
duration	<code>networkrequestevent.duration</code>
networkerror	<code>networkrequestevent.networkerror</code>
statuscode	<code>networkrequestevent.statuscode</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Field Name	Events Service Internal Name
URL	networkrequestevent.url
errorevent Field	
Resource Name	errorevent.name

Analytics Data Sources

Related pages:

- [ADQL Data](#)

This page describes how Analytics can collect data from many sources in your AppDynamics APM Platform.

Transaction Analytics Data Sources

Transaction Analytics data is collected by the AppDynamics Java, .NET, PHP and Node.js App Agents. Collecting Transaction Analytics data requires no change to your application code. You enable analytics on the app server agents and Controller you already use.

Once you have enabled analytics on your application, you can collect and analyze several kinds of data:

- Default performance data collected by the app agents about your application's business transactions.
- HTTP-based data collected by HTTP data collectors.
- Custom data collected by method invocation data collectors.
- Business data collected from parameterized SQL calls.

See [Collect Transaction Analytics Data](#).

Log Data Sources

You can collect Log Analytics data from many types of log files, including instrumented and non-instrumented applications as well as infrastructure. Log Analytics can be used as a standalone component. You can search and analyze log data just as you do transaction data. Log Analytics works by default with the syslog (log4j) format and can be configured for other log formats, including GZIP files (log files ending in .gz). You can capture other log formats by setting up regular-expression-based mapping. See [Collect Log Analytics Data](#).

You can view correlated Log and Transaction Analytics Data. By configuring business transaction GUID injection, you can see logs that are related to specific business transaction requests. See [Business Transaction and Log Correlation](#).

End User Monitoring Data Sources

Analytics can also use data collected by [Browser Real User Monitoring](#). Analytics makes the data available in a more flexible search format. If you have enabled Browser RUM, Mobile RUM or IoT Monitoring *and* enabled Analytics, you see these event types on the Analytics search page.

For details on how analytics extends the capability of EUM, see the section "[Browser Analyze versus Browser Request Analytics](#)" in [Browser RUM Analyze](#).

Browser Synthetic Data Sources

Sessions data captured through Browser Synthetic Analytics is available in Analytics.

Custom Event Sources

You can add custom events for Analytics using the [AppDynamics Analytics Events API](#).

Deploy Analytics With the Analytics Agent

Related pages:

- [Monitor JVMs](#)
- [Monitor .NET Nodes](#)

This page describes the deployment options for Analytics, which includes the Events Service.

Transaction Analytics Only

The Analytics Agent is only required for the Node.js and PHP Agents, and not the Java and .NET Agents if the minimum versions are met. You need an Analytics Agent to capture Transaction Analytics for:

- Any version of Node.js Agent
- Any version of PHP Agent
- Java Agent <= 4.5.15
- .NET Agent <= 20.10

To configure Transaction Analytics:

- Download and install either the [Machine Agent](#) or the Analytics Agent (standalone binary) on each machine. You can also use a shared Analytics Agent instance.
- Enable Analytics for applications in the [Controller](#).

Log Analytics Only

To configure Log Analytics:

- Install either the [Machine Agent](#) or the Analytics Agent (standalone binary) on the machine.
- Enable Analytics for log sources in the [Controller](#).

Transaction and Log Analytics

To configure Transaction and Log Analytics:

- Install either the [Machine Agent](#) or the Analytics Agent (standalone binary) on the machine.
- Enable Analytics for applications and log sources in the [Controller](#).

SaaS Analytics Configuration

The Events Service is provided as part of the SaaS service. AppDynamics stores the data and hosts the server components of the system for you. You need to install only the Analytics Agent components of the system described in [Agent Side Components](#).

Encrypt Data on the Analytics Agent

You can encrypt any data on the Analytics Agent using `secure://<your-encrypted-credentials>`. You can encrypt data in the Analytics Agent properties file or in System Properties.

The following example demonstrates how to encrypt `http.event.accessKey` in the Analytics Agent properties file.

```
http.event.accessKey=secure://-001-24-  
Dr9FQGC179o4vPnuljnx8A==ZGVw/  
P400NvpUIdIhJ2u78FpRVVW8fbgr8J1HBHXwnE=  
ad.secure.credential.store.filename=/opt/appdynamics/  
secretKeyStore  
ad.secure.credential.store.password=s_gsnwR6+LDch8JBf1RamiBoWfMv  
jjipkrtJMZXAYEkw8=
```

See [Encrypt Agent Credentials](#).

Separate Host for the Analytics Agent

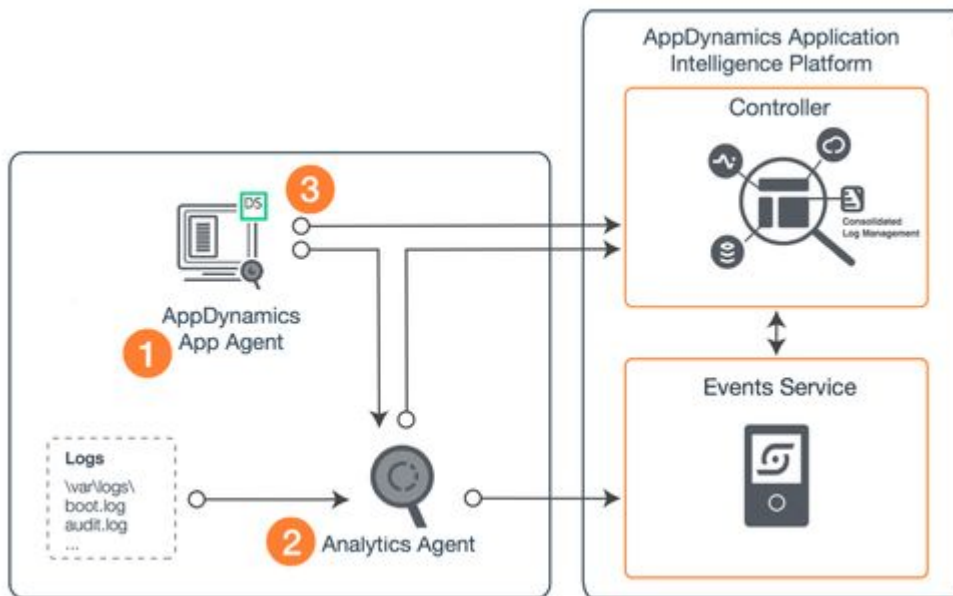

If your Analytics Agent is on a host separate from the monitored application, see [Remote Analytics Agent Sizing](#).

Analytics Agent Components

This page describes Analytics Agent architecture.

Analytics Agent-Side Components

For both SaaS and on-premises Analytics, you need to deploy (or enable) agent-side Analytics components in your application environment.

Legend: Agent Components

- 1 AppDynamics App Agent:** Analytics relies upon the same app server agents that AppDynamics APM uses. If you use AppDynamics APM, you likely already have these deployed to your monitored applications.
- 2 Analytics Agent:** The Analytics Agent collects data from one or more app server agents and sends it to the Events Service. It also reads and transmits log data from log files from the local machine. The Analytics Agent is available as a standalone binary or as part of the Machine Agent download.
 - As part of the [Machine Agent](#) download, the Analytics Agent runs as an extension (also called a monitor).
 - A standalone binary distribution of the Analytics Agent is available for Windows environments or other environments that do not have the Machine Agent installed.
- 3 Analytics Dynamic Service:** The Analytics Dynamic Service extends your app server agent functionality to collect and forward data to the Analytics Agent. It is built into the Java and .NET Agents but is not enabled by default. No additional download is needed.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Browser and Mobile Analytics

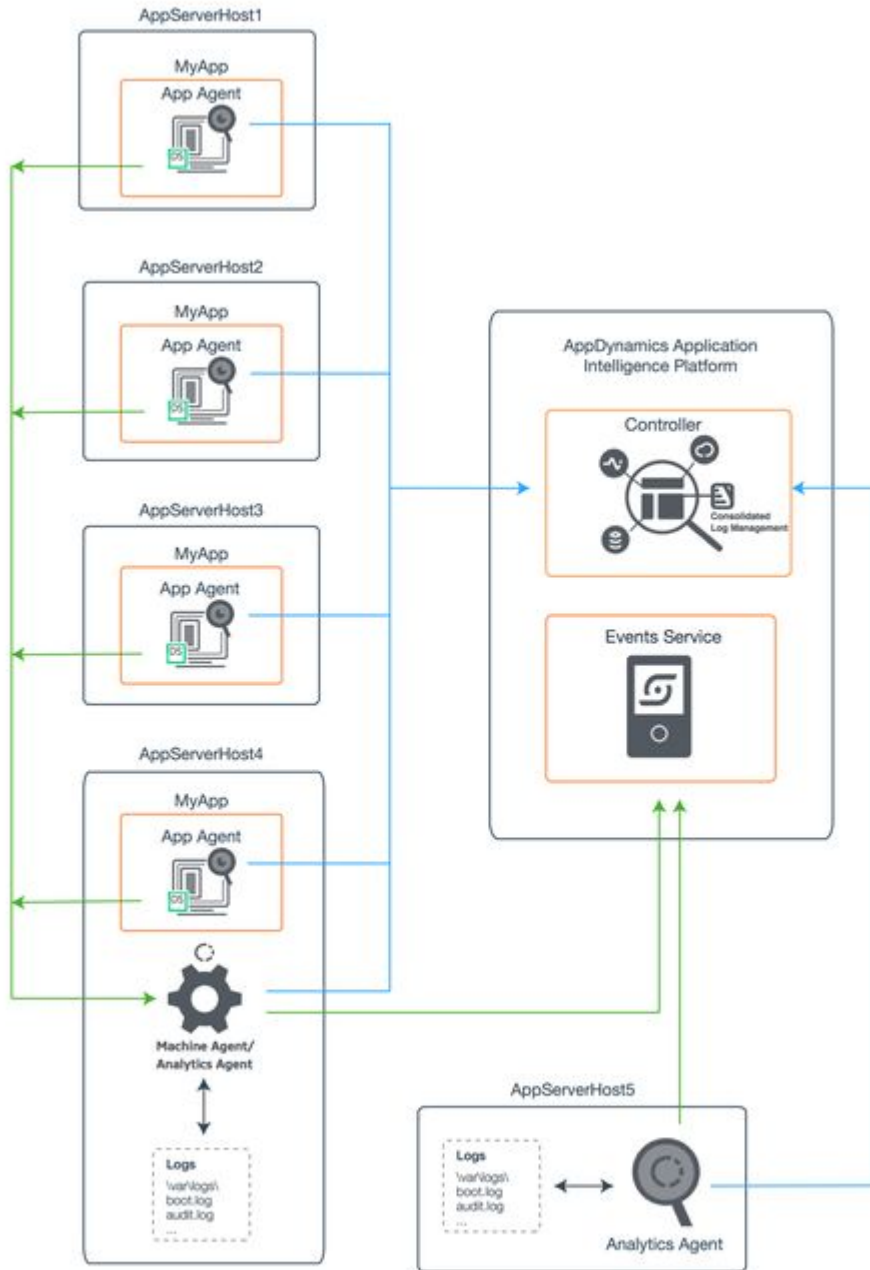

To see Analytics data from Browser and Mobile Real User Monitoring, you need to enable those components and enable Analytics. See [EUM Server Deployment](#).

Deploying Analytics Agents to Multiple Nodes

A real-world scenario is unlikely to consist of a single monitored node, as shown in the diagram above. It usually consists of many applications deployed over many hosts.

While the APM app server agents continue to send data to the Controller in the normal way, the Analytics Dynamic Service sends its data to the Analytics Agent. This agent runs in a separate JVM process in the local environment or network, either as part of the Machine Agent or on its own.

There must be at least one Analytics Agent in the monitored environment, although multiple app server agents collecting only transaction data can share a single Analytics Agent, as shown in the diagram below. However, each machine where you want to gather log data must have its own Analytics Agent instance.

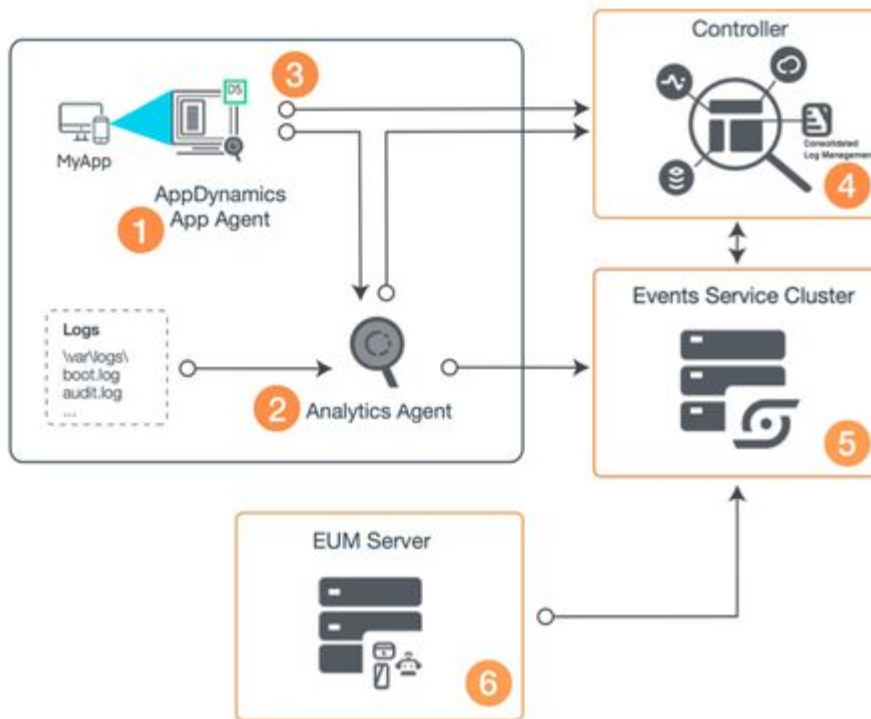

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

In this example, AppServerHost1-3 are collecting only Transaction data, so only app server agents are required. Each one connects to the Analytics Agent on AppServerHost4, where log information is also being collected. The Analytics Agents could also reside on the same machines as each app server agents. On AppServerHost5, only log data is being collected, so an Analytics Agent is also necessary there.

Server Side Components for On-premises

To set up AppDynamics Analytics on-premises, you also need to install the server parts of the system, the AppDynamics Controller, and the Events Service.

The following figure depicts the basic components of an on-premises deployment:

Legend: Server Components

i If you are using SaaS EUM, you must use the SaaS Events Service. If you are using the on-premises EUM Server, you must use an on-premises instance of the Events Service.

4 AppDynamics Controller: The heart of an AppDynamics deployment, the Controller processes and presents the information gathered by the agents.

5 Events Service: The unstructured document store, it gathers and stores data from the Analytics, Database, and Network Visibility Agents and, if you have End User Monitoring, from **6**, the EUM Server. It allows the Controller UI to run queries on that data.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Install Agent-Side Components

On this page:

- [Prepare to Enable the Agents](#)
- [Install the Standalone Analytics Agent on Windows](#)
- [Install the Standalone Analytics Agent on Linux](#)
- [Enable the Standalone Analytics Agent](#)
- [Enable the Analytics Agent as an Extension to the Standalone Machine Agent](#)
- [Tune Analytics Agent](#)
- [Troubleshooting Tips](#)

Related pages:

- [Analytics Agent Components](#)

This page provides an overview of how to configure Application Analytics components to collect business transaction data.

In most Application Analytics deployment scenarios, you must enable the Analytics Agent-side components. The agents are distributed as system-based operations or standalone bundles in the [AppDynamics Downloads Portal](#).

If your app server agent supports Agentless Analytics, such as the [Java Agent](#) (4.5.15 and later) and [.NET Agent](#) (20.10 and later), you do not need to install the standalone Analytics Agent or Machine Agent extension for Transaction Analytics data collection. See [Deploy Analytics Without the Analytics Agent](#) for more information.

Prepare to Enable the Agents

Review the deployment options, agent-side component architecture, and components you will need to install in [Deploy Analytics With the Analytics Agent](#).

Analytics Agent

The Analytics Agent collects and sends data from the AppDynamics App Agent and log files to the Events Service. The Analytics Agent is not enabled by default. You need to download and enable the desired bundle using a method of your choice.

To use Application Analytics:

1. Obtain a separate [Application Analytics license](#).
2. Enable the Analytics Agent.
3. Point to the Event Service. See [Revise the Analytics Agent Properties File](#) for agent-specific configuration.
4. Enable Analytics on the Controller.

AppDynamics App Agent

To access Analytics and collect transaction data from an application, you must deploy a supported app server agent version in all environments, such as the [Node.js Agent](#) or the [PHP Agent](#). If you already use AppDynamics APM, agents may already be installed in your environment.

Install the Standalone Analytics Agent on Windows

As described in [Deploy Analytics With the Analytics Agent](#), the Analytics Agent can run on the same host or on a different host from the app server agent, depending on your use case.

The [AppDynamics Downloads Portal](#) provides the following distribution archives:

- Standalone Analytics Agent (no JRE)
- Analytics Agent with JRE 1.8 for both 32-bit and 64-bit Windows machines

Revise the Analytics Agent Properties File

The Analytics Agent properties file determine how your Analytics Agent communicate with other components, what type of data it gathers from the monitored application, and how the components of the Application Analytics deployment and the Controller authenticate to each other.

Modify the default configuration and set the desired values for the agent properties in the properties file. The location of this file depends on your exact deployment scenario.

1. Open the `<analytics-agent-home>/conf/analytics-agent.properties` file with a text editor. The Analytics Agent on Windows requires double backslash for paths. For example:

```
conf.dir=C:\\AppD\\analytics-agent\\conf
ad.dw.log.path=C:\\AppD\\analytics-agent\\logs
```

2. To run the Analytics Agent as a Windows service, modify the following properties:
 - `ad.dw.log.path = <analytics-agent-home>\\logs`
 - `conf.dir = <analytics-agent-home>\\conf`
 - `ad.jvm.options.name=analytics-agent.vmoptions`
 - `ad.jvm.heap.min=512m`
 - `ad.jvm.heap.max=1g`
3. Follow the instructions to [enable the standalone Analytics Agent](#).
4. To install the Analytics Agent on Windows, run the `install` command:

```
bin\\analytics-agent.exe service-install
```

Start and Stop the Analytics Agent

To start/stop the Analytics Agent on Windows, run the following commands in the Windows Services menu.

To start the agent, run:

```
bin\\analytics-agent.exe service-start
```

To stop the agent, run:

```
bin\analytics-agent.exe service-stop
```

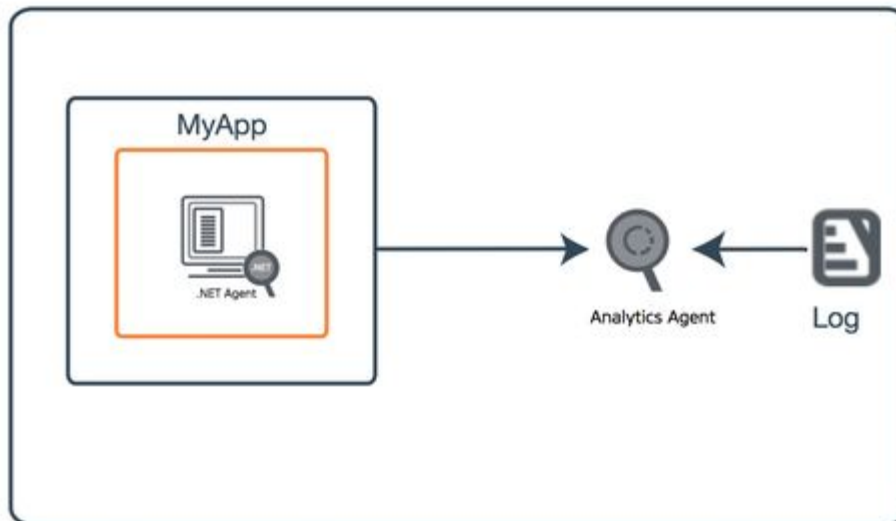

Uninstall the Analytics Agent

To uninstall the Analytics Agent, run the `.exe` file with the `uninstall` command:

```
bin\analytics-agent.exe service-uninstall
```

Enable Analytics Agent for a Local App Server Agent

This section assumes that you are installing the Analytics Agent on the same host as your app server agent. In this deployment, the Analytics Agent reads and transmits log data in log files from the local machine. The app server agent transmits data from the monitored application to the Analytics Agent.

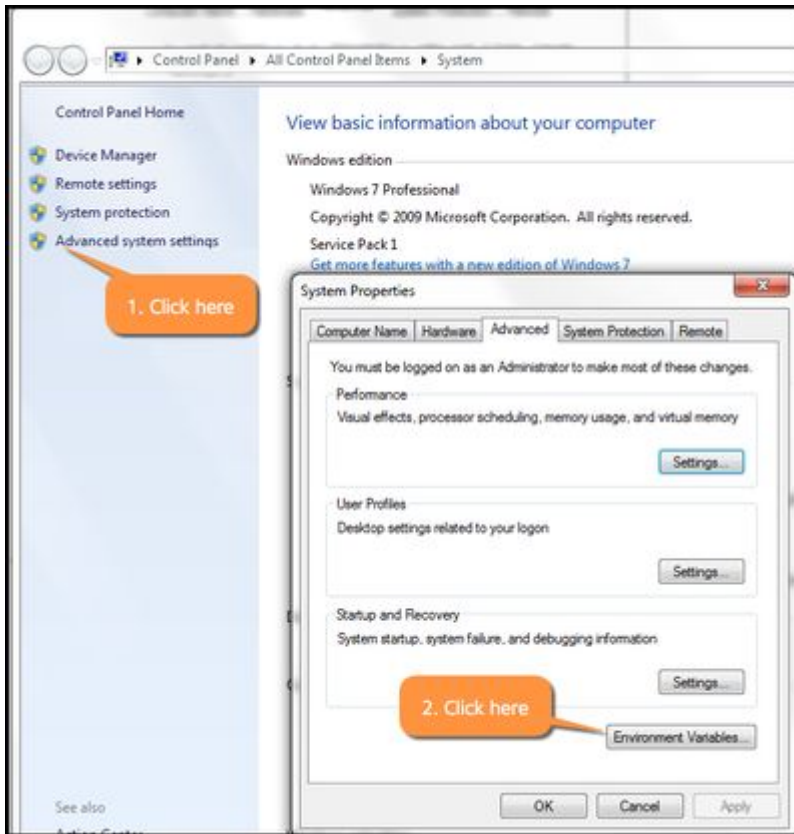

Install the Analytics Agent with the `.exe` and `analytics-agent.exe` files found in the `<analytics-agent-home>/bin` directory. Because the Analytics Agent is written in Java, you will run the agent in a Java Virtual Machine (JVM). The Analytics Agent runs as a Windows service.

Enable the App Server Agent for a Remote Analytics Agent

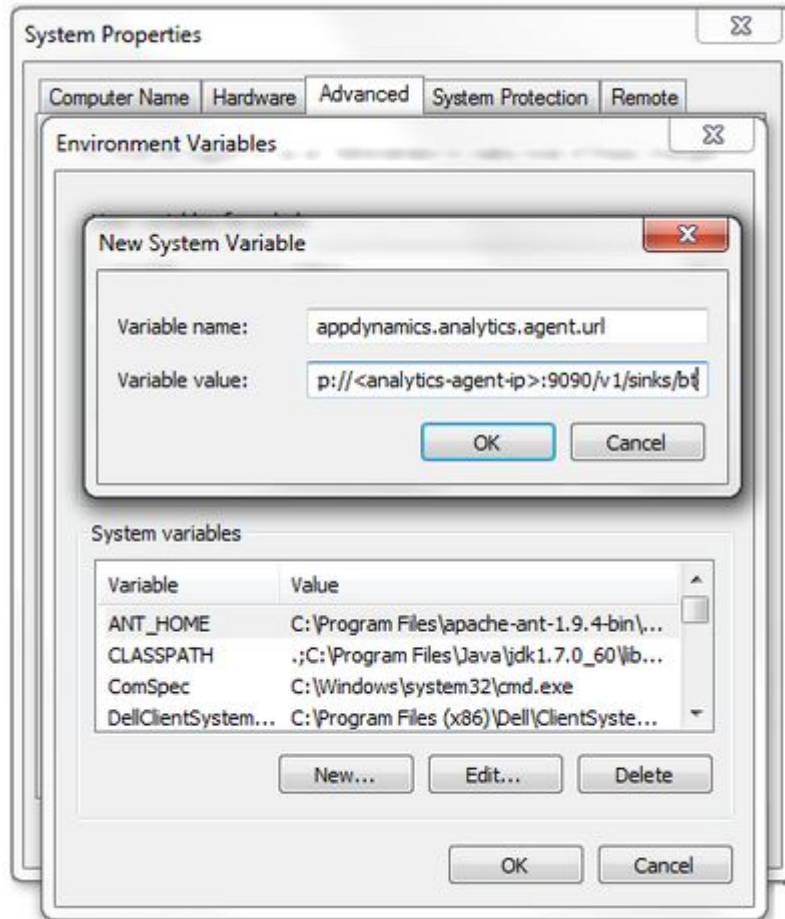

To specify the location of the remote Analytics Agent with an environment variable named `appdynamics.analytics.agent.url` on Windows:

1. On your Windows machine, go to **System Properties > Advanced system settings > Environment Variables**.

2. Under **System Variables**, click **New**. AppDynamics recommends a system environment variable approach as opposed to a user environment variable approach; in the environment variable approach, a user must have the same permissions as the user with all the instrumented applications running.
3. Set the value for the `appdynamics.analytics.agent.url` system variable to `http://<analytics-agent-ip>:9090/v2/sinks/bt`.

Replace `<analytics-agent-ip>` with the hostname of the Analytics Agent for your environment.

- Restart the applicable application or process where you want the new environment variables to take effect. While it is not required that you restart your machine, the parent process that invokes the monitored process must be restarted. For `w3wp` on Windows, restart IIS by running `iisreset` after the changes are made to the environment variables.

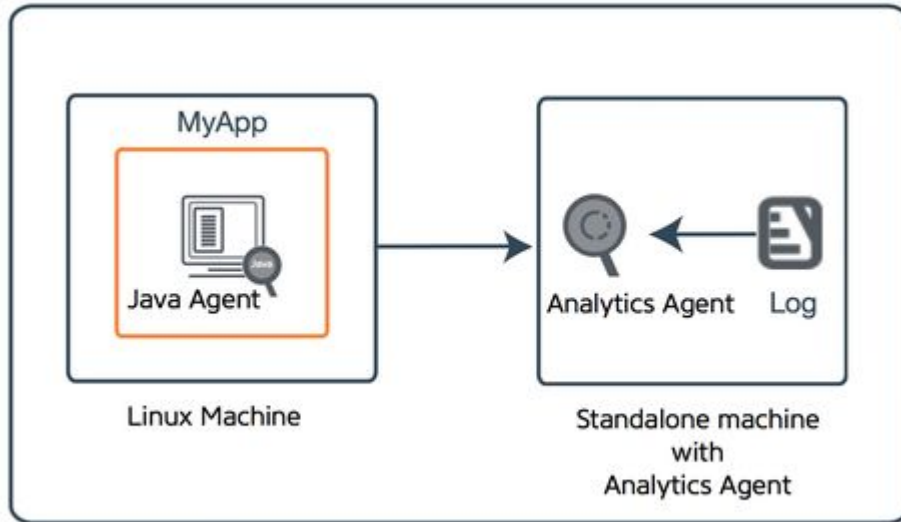

Install the Standalone Analytics Agent on Linux

As described in [Deploy Analytics with the Analytics Agent](#), the Analytics Agent can run on the same host or on a different host from the app server agent, depending on your use case.

The [AppDynamics Downloads Portal](#) provides the following distribution archives:

- Standalone Analytics Agent (no JRE)

The default settings of the app server agent typically assume that the Analytics Agent is on the same host and uses the default port. If your Analytics Agent is on a host separate from the app server agent, as shown in the diagram below, or you have changed the default port, you need to specify the new host and port values for the app server agent.

Revise the Analytics Agent Properties File

The Analytics Agent properties file determine how your Analytics Agent communicate with other components, what type of data it gathers from the monitored application, and how the components of the Application Analytics deployment and the Controller authenticate to each other.

Modify the default configuration and set the desired values for the agent properties in the properties file. The location of this file depends on your exact deployment scenario.

1. Open the `<analytics-agent-home>/conf/analytics-agent.properties` file with a text editor.
2. Follow the instructions to [enable the standalone Analytics Agent](#).

Start and Stop the Analytics Agent

You can start and stop the Analytics Agent directly in the command line.

To start the agent, run:

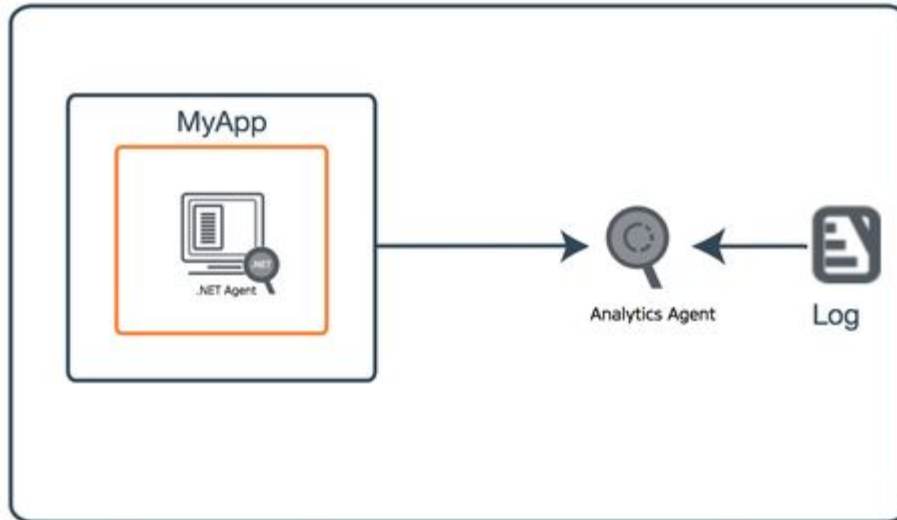

```
<analytics agent executable> start
```

To stop the agent, run:

```
<analytics agent executable> stop
```

Run the Analytics Agent From a Read-Only Filesystem

In this deployment, the Analytics Agent is installed and run from a read-only filesystem. To do so, you need to direct the Analytics Agent to write its log files to a writable partition.

By creating a directory for the Analytics Agent in a writable file system and symlinks for the content of the Analytics Agent in the read-only file system, you will have a writable top-level directory for the Analytics Agent and a writable logs directory under the top-level directory.

To run the Analytics Agent from a separate writable directory using artifacts from a read-only directory:

1. Provide necessary permissions to the read-only Analytics Agent directory.

```
# analytics-agent-readonly refers to the read-only analytics agent.
chmod -R 555 /tmp/analytics-agent-readonly/
```

2. Create a directory for the Analytics Agent in a writable file system.

```
mkdir /tmp/analytics-agent-writable
chmod 755 analytics-agent-writable/
cd /tmp/analytics-agent-writable
```

3. Create symlinks to the contents of the Analytics Agent in the read-only file system.

```
ln -s /tmp/analytics-agent-readonly/bin/ bin
ln -s /tmp/analytics-agent-readonly/lib/ lib
ln -s /tmp/analytics-agent-readonly/monitor.xml monitor.xml
```

4. Create a writable `conf` directory under that top-level directory.

```
cd /tmp/analytics-agent-writable
mkdir conf
chmod 755 conf/
cd conf
```

5. Create symlinks to the contents of the `conf` directory.

```
ln -s /tmp/analytics-agent-readonly/conf/analytics-agent.* .
ln -s /tmp/analytics-agent-readonly/conf/job/ job
ln -s /tmp/analytics-agent-readonly/conf/grok/ grok

cd /tmp/analytics-agent-writable
```

6. Create logs directory under the `analytics-agent-writable` directory.
7. Run the Analytics Agent from the `writable` directory.

```
cd /tmp/analytics-agent-writable
nohup bin/analytics-agent.sh start &
```

8. The resulting directories look similar to:

```
/tmp/
dr-xr-xr-x 6 ec2-user ec2-user 4096 Jul 17 20:45 analytics-agent-readonly
drwxr-xr-x 4 ec2-user ec2-user 4096 Jul 26 20:17 analytics-agent-writable

```

Enable the App Server Agent for a Remote Analytics Agent

For most configurations, install the Analytics Agent on the same machine as the app server agent. In certain setups, such as installing an Analytics Agent extension, you will need a separate machine.

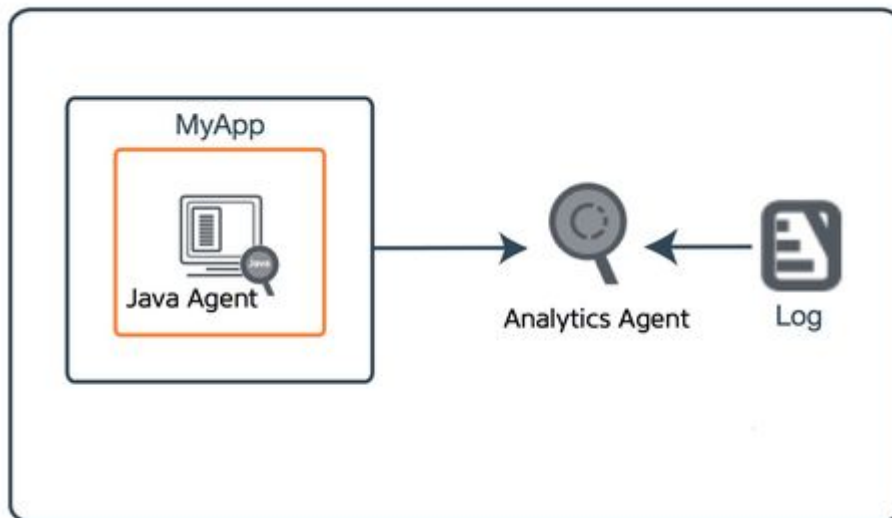

1. Specify the location of the remote Analytics Agent with a `-D` parameter. The argument is passed to the monitored application as follows:

```
-Dappdynamics.analytics.agent.url=http://<analytics-agent-ip>:9090/v2/sinks/bt
```

2. Replace `<analytics-agent-ip>` with the hostname of the Analytics Agent for your environment.

Enable the Standalone Analytics Agent

In this deployment, the Analytics Agent and app server agent runs on the same machine. The Analytics Agent reads and transmits log data from log files on the host machine. The app server agent transmits data from the monitored application to the Analytics Agent.

For environments that do not have a Machine Agent installed, install the Analytics Agent as a separate binary, `analytics-agent.sh`.

1. Unzip the Analytics Agent distribution archive to the installation directory on each target host. When you unzip this archive, you get three directories:

- `bin` : contains the binary file for Linux, Solaris, and OSX
- `lib` : contains all the jar files that need to be in the classpath
- `conf` : contains all the configuration files, such as the properties and `vmoptions` files

2. Open the following file to configure connectivity from the Analytics Agent to the Events Service.

```
<analytics-agent-home>/conf/analytics-agent.properties
```

3. In the `analytics-agent.properties` file, do the following:

- Change the default URL and, if necessary, the port number to connect the Events Service by modifying the `http.event.endpoint` value.

For example:

```
http.event.endpoint=http://<events_service_host:events_service_port>
```

For SaaS-based installations, the host and port are:

- `https://analytics.api.appdynamics.com:443` (North America)
- `https://fra-ana-api.saas.appdynamics.com:443` (Europe)
- `https://syd-ana-api.saas.appdynamics.com:443` (APAC)

If your firewall rules use IP addresses, review firewall considerations in [Troubleshoot Analytics Agent Issues](#). For on-premises installations, use any host and port that you have configured. In clustered environments, this is often a load balancer.

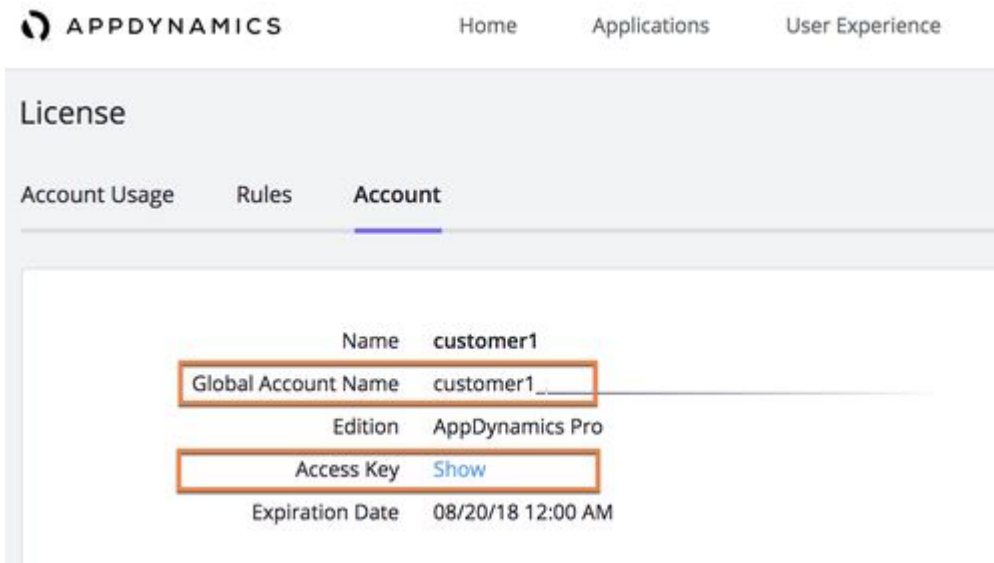

- Change the default URL and the port number to point to the Controller by modifying the `ad.controller.url` property.

For example:

```
ad.controller.url=http://<application_server_host_name>:<http-listener-port>
```

This is the URL and the port number you use to access the Controller UI.

4. The **Global Account Name** and **Access Key** values are found under **View License** in the Controller.

5. Configure the account and account key for which the agent should publish the business transaction data. Use the **Global Account Name** and **Access Key** values you have collected earlier. For example:

```
# The global_account_name in the Controller for this analytics data, similar to the
following:
http.event.accountName=<customer1_74678b04-8a71-40ef-acaf-xxxxxxxxxxxxx>
# Replace this value with the access key of the account name configured above.
http.event.accessKey=<3d58aba2-xxx-xxx>
```

The `http.event.accountName` property specifies the **Global Account Name** of the account.

The `http.event.accessKey` property specifies the **Access Key**, which provides an authentication mechanism between the Controller and the components of the Application Analytics deployment. The Controller installation process generates the **Access Key** value.

For SaaS-based installations, set the `http.event.name` property to **Name** of the account. The default value is `customer1`. If the property is not configured correctly, the Analytics Agent will not be able to authenticate. The resulting errors are stored in the `analytics-agent.log` file.

6. If you are collecting log information on this host, you need to:
 - Configure your log sources. See [Collect Log Analytics Data](#) for details.
 - Update additional properties. See [Configure Properties for Consolidated Log Management](#).
7. Save and close the file.
8. Start the Analytics Agent by running the following command.

```
bin\analytics-agent.sh start
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

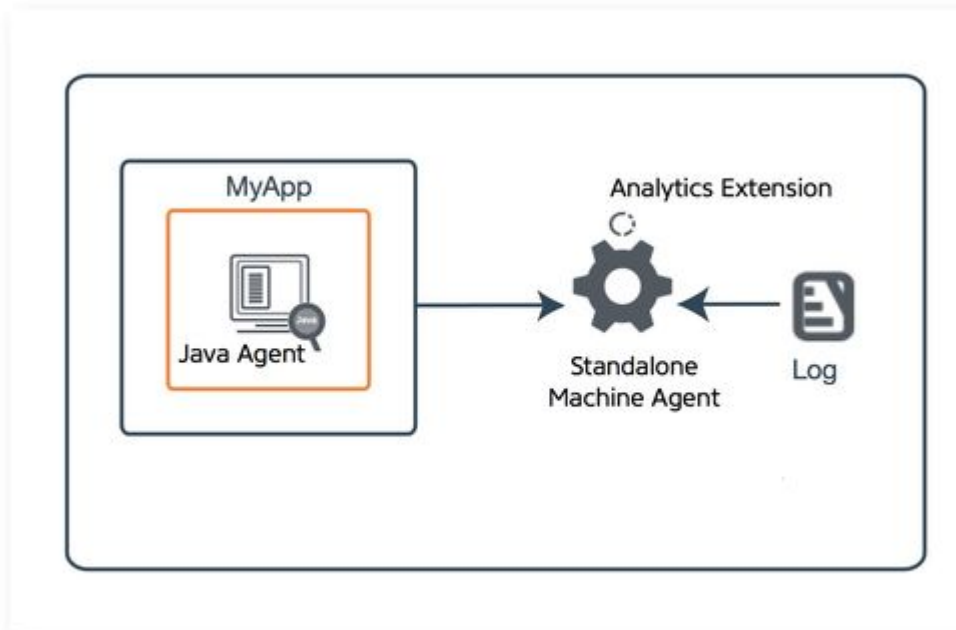

Enable the Analytics Agent as an Extension to the Standalone Machine Agent

This section describes how to configure the Analytics Agent as an extension to the Standalone Machine Agent and run as a Machine Agent monitor.

The [AppDynamics Downloads Portal](#) provides the following distribution archives:

- Machine Agent Bundle - 64-bit osx (zip)
- Machine Agent Bundle - for both 32-bit and 64-bit Linux machines (rpm)
- Machine Agent Bundle - for both 32-bit and 64-bit Linux machines (zip)
- Machine Agent Bundle - for 64-bit solaris (zip)
- Machine Agent Bundle - for 64-bit solaris-sparcv9 (zip)
- Machine Agent Bundle - for 64-bit solaris-x64 (zip)
- Machine Agent Bundle - for both 32-bit and 64-bit Windows machines (zip)

If the Machine Agent and app server agent are running on the same machine, installing a standalone Analytics Agent is not necessary. In environments with the standalone Machine Agent already running, you can enable and run the Analytics Agent as an extension.

Confirm that JRE 8 or later is installed on the host running the standalone Machine Agent. If the required version of JRE is not available on the host, then the Analytics Agent cannot be enabled.

1. On the host running the standalone Machine Agent, open `<machine-agent-home>/monitors/analytics-agent/monitor.xml` with a text editor.
2. Set the `enabled` tag to `true` and save the file when you are finished.

```
<monitor>
  <name>AppDynamics Analytics Agent</name>
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
<type>managed</type>
<!-- Enabling this requires JRE 8 or higher -->
<enabled>true</enabled>
...

```

3. Open the following file to configure connectivity from the Analytics Agent to the Events Service:

```
<machine-agent-home>/monitors/analytics-agent/conf/analytics-agent.properties
```

4. Follow the instructions to [enable the standalone Analytics Agent](#).
5. If the Machine Agent is already running at this point, restart it to pick up the changes in the configuration.

i To connect to the Events Service through a proxy server, see [Connect the Agent to the Events Service through a Proxy](#).

Tune Analytics Agent

This section describes the post-installation configuration of the Analytics Agent: configuring Analytics Agent to connect to an Event Service with a proxy server, collecting log files using Consolidated Log Management (CLM), setting resource usage limit, and changing JVM options.

Connect to the Events Service through a Proxy

If the Analytics Agent needs to connect to the Events Service through a proxy server:

1. Open `<analytics-agent-home>\conf\analytics-agent.properties` with a text editor.
2. Add this information:

```
# optional proxy properties
http.event.proxyHost=<your proxy host>
http.event.proxyPort=<your proxy port>
http.event.proxyUsername=<your proxy username, if authentication is required>
http.event.proxyPassword=<your proxy password, if authentication is required>

```

3. Save and close the file.

Configure Analytics Agent for Consolidated Log Management

If you want your Analytics Agent to work with CLM you need to configure a few properties in the Analytics Agent properties file.

Provide the Controller URL, customer name, and name of your Analytics Agent in the `analytics-agent.properties` file. The customer name is found under **View License** in the Controller.

If you are using CLM to configure your log files with source rules, you will need to provide these properties with the correct values.

The default values are the following:

```
# Format should be http://<host>:<port>
ad.controller.url=http://localhost:8090

# The customer name field from the AppDynamics license page.
http.event.name=customer1

# This is the friendly agent name that will show up in the controller when the agent
registers and syncs configuration.
ad.agent.name=analytics-agent1
```

Change Java Virtual Machine Options

If you need to change any JVM startup options, modify `<analytics-agent-home>/conf/analytics-agent.vmoptions` with a text editor.

The `vmoptions` file name is read from the `ad.jvm.options.name=analytics-agent.vmoptions` properties file. If you change the `vmoptions` file name, you will need to change the `ad.jvm.options.name` property as well.

If the Analytics Agent Windows service is installed and you need to change the properties file or the `vmoptions` file, you need to uninstall the service and reinstall it for the changes to take effect.

Configure Resource Usage Limit

To limit resource usage, you can enable the default limit on the number of job for a single Analytics Agent.

This limit can be overridden but is not recommended without a thorough understanding of the potential impact on resource usages, such as CPU usage, disk, and network I/O.

The property is `ad.max.enabled.jobs` and is found in the `<analytics-agent-home>/conf/analytics-agent.properties` file. By default, `ad.max.enabled.jobs` is set to 20.

Verify Analytics Agent Status

To verify that the Analytics Agent has started, look for the following entry in the App Agent log file: `Started [Analytics] collector .`

To connect to the Events Service through a proxy server, see [Connect the Agent to the Events Service through a Proxy](#).

Troubleshooting Tips

- Ensure that the properties in `analytics-agent.properties` are properly set. See [Enabled Job Files Limit](#).
- JRE version is ≥ 1.7 and the `JAVA_HOME` variable is set in the environment.
- All properties in `analytics-agent/conf/analytics-agent.vmoptions` are compatible with the JRE.

Install Agent-Side Components in Kubernetes

This page describes the deployment options for Transaction Analytics and Log Analytics instrumented with AppDynamics app server agents in Kubernetes applications. See [Install Agent-Side Components](#).

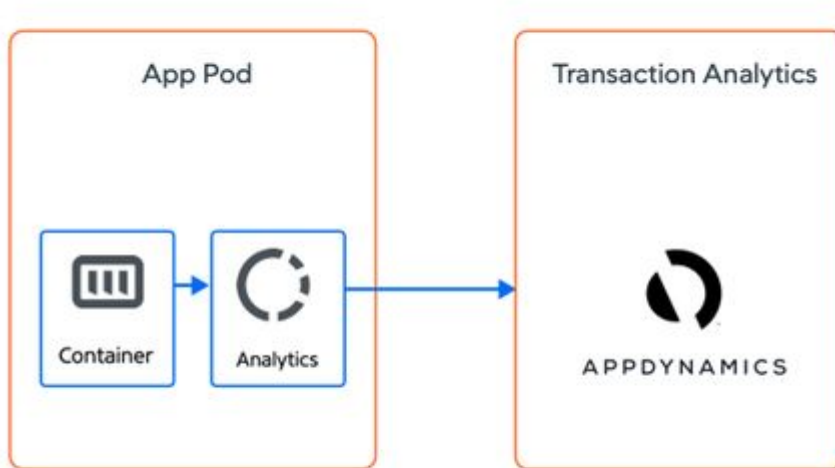

i Transaction Analytics and Log Analytics require that an Analytics Agent is deployed with an app server agent. The Java Agent $\geq 4.5.15$ or the .NET Agent ≥ 20.10 does not require deploying an Analytics Agent for Transaction Analytics. See [Deploy Analytics Without the Analytics Agent](#).

Transaction Analytics

The Analytics Agent acts as a proxy between the app server agent and the Events Service. See [Deploy Analytics With the Analytics Agent](#).

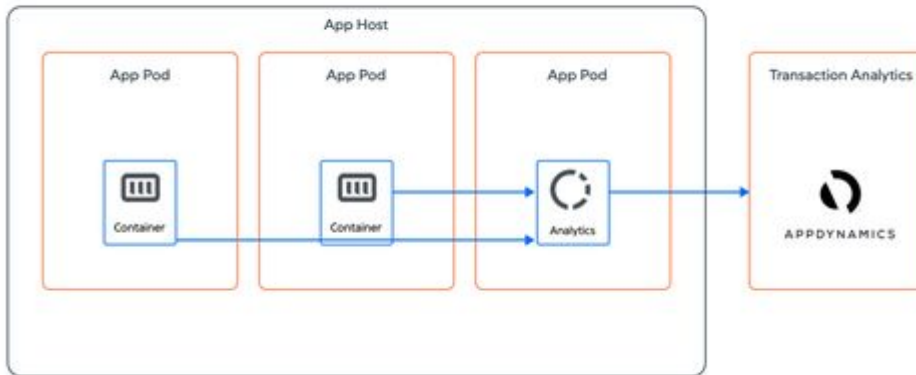

There are two deployment options for the Analytics Agent to support Transaction Analytics on a Kubernetes application.

1. A sidecar to the application container.

In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container.

2. A shared agent where a single Analytics Agent is deployed on each Kubernetes worker node. Each pod on the node will use that Analytics Agent to communicate with the Events Service.

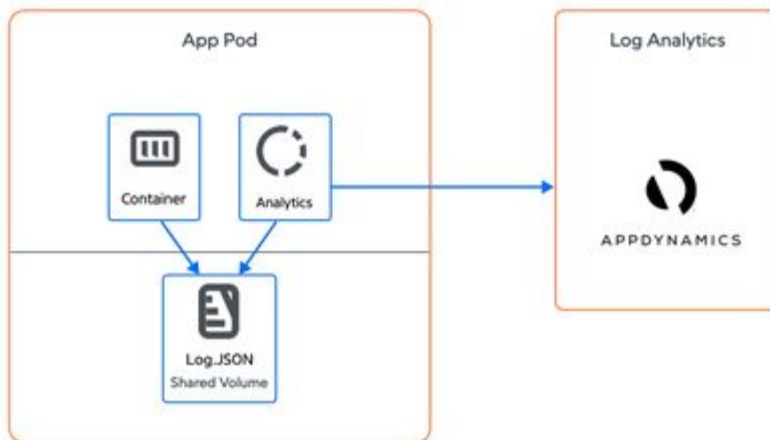

In this model, the Analytics Agent is deployed as a Daemonset.

Log Analytics

Once deployed, the Analytics Agent has access to the application's logs and can send log data to the Events Service.

There are three deployment options for the Analytics Agent to support Log Analytics on a Kubernetes application.

1. A sidecar to the application container.

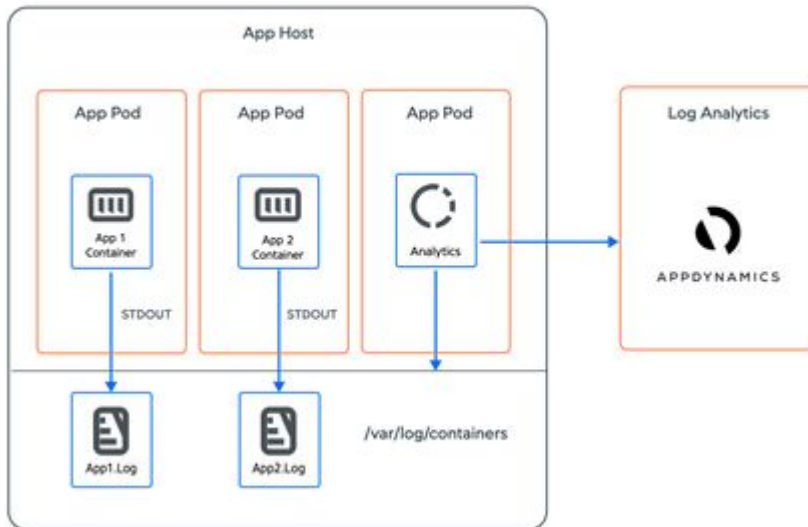

In this model, an Analytics Agent container is added to each application pod and will start/stop with the

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

application container. The Analytics Agent and application container are configured to share a volume where the application logs are written.

2. If the application bypasses the container filesystem and emits log data to `STDOUT` and `STDERR`, the Analytics Agent can be deployed on each Kubernetes worker node. The Analytics Agent can access the log output for every application container on the worker node's file system, stored by Kubernetes under `/var/log/containers` as a unique file per container.

In this model, the Analytics Agent is deployed as a Daemonset.

i For some Kubernetes distributions such as OpenShift, the Analytics Agent will require elevated permissions to access the files under `/var/log/containers`.

3. If a syslog provider is available in the Kubernetes cluster, the Analytics Agent can be deployed to receive syslog messages with TCP transport. A single Analytics Agent instance is required per syslog provider. See [Collect Log Analytics Data from Syslog Messages](#).

For Transaction and Log Analytics, the sidecar approach is simpler to deploy, but consumes more cluster resources because it requires one additional container per application pod. The shared agent approach adds another deployment object to manage, but can significantly reduce the overall resource consumption for a cluster.

Example Configurations to Deploy the Analytics Agent

The following deployment specs are specific examples of how to implement the deployment options explained above. In addition, see [Install the .NET Agent for Linux in Containers](#) and [Install the Node.js](#)

[Agent in Containers](#) for best practices on how to set the Analytics Agent host, port, and SSL environment variables.

Transaction Analytics: Deployment Spec Using A Sidecar

The following deployment spec defines two containers, the application container `flight-services`, which uses an image instrumented with an app server agent, and the Analytics Agent container `appd-analytics-agent`, which uses the Analytics Agent from Docker Hub, `docker.io/appdynamics/machine-agent-analytics:latest`.

The `appd-analytics-agent` container leverages a ConfigMap and Secret to configure the Events Service credentials required by the Analytics Agent, including the account access key and global account name. See [Install Agent-Side Components](#).

As a sidecar, the Analytics Agent is available at `localhost` and uses the default port `9090`. The app server agent will connect automatically and no additional configuration is required.

```

The `controller-info` ConfigMap can be found in the [Controller Info YAML File](#). The command to create `appd-secret` can be found in [Secret](#).

Transaction Analytics: Deployment Specs Using A Shared Analytics Agent

The following deployment spec is for the same `flight-services` application, but instead of using a sidecar, it references a shared Analytics Agent deployed separately as a Daemonset. The `flight-services` container sets the agent environment variables `APPDYNAMICS_ANALYTICS_HOST` and `APPDYNAMICS_ANALYTICS_PORT` to the `analytics-proxy` service for the shared Analytics Agent defined in the example below.

```

apiVersion: apps/v1
kind: Deployment
metadata:
  name: flight-services
spec:
  selector:
    matchLabels:
      name: flight-services

              memory: 600M
          volumeMounts:
            - name: ma-log-volume
              mountPath: /opt/appdynamics/conf/logging/log4j.xml
              subPath: log4j.xml
            - mountPath: /hostroot
              name: hostroot
  
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    readOnly: true
  restartPolicy: Always
  volumes:
  - name: ma-log-volume
    configMap:
      name: ma-log-config
  - name: hostroot
    hostPath:
      path: /
      type: Directory
---
apiVersion: v1
kind: Service
metadata:
  name: appd-infra-agent-service
spec:
  selector:
    name: appd-infra-agent
  ports:
  - name: "9090"
    port: 9090
    targetPort: 9090
status:
  loadBalancer: {}

```

The full deployment spec can be found in the [Machine Agent YAML File](#). The `appdynamics-infraviz` service account is defined in the [RBAC YAML File](#). The `ma-log-config` ConfigMap is defined in the [Machine Agent Log Config File](#).

A best practice is to deploy the shared Analytics Agent in a dedicated namespace (typically `appdynamics`) separate from the namespaces used by applications.

```
$ kubectl -n appdynamics apply -f analytics-agent.yaml
```

To provide access to the shared Analytics Agent from an application namespace:

1. An `ExternalName` service is required to map a service name (`analytics-proxy` in the example) to the DNS name of `appd-infra-agent-service` created previously:

```

kind: Service
apiVersion: v1
metadata:
  name: analytics-proxy
spec:
  type: ExternalName
  externalName: appd-infra-agent-service.appdynamics.svc.cluster.local

```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
ports:
- port: 9090
  targetPort: 9090
```

2. Create this service in each application namespace where an App Server Agent is deployed:

```
$ kubectl -n <app namespace> apply -f analytics-proxy.yaml
```

3. Note that `analytics-proxy` is the value of `APPDYNAMICS_ANALYTICS_HOST` used in the `flight-services` deployment spec.

```
- name: APPDYNAMICS_ANALYTICS_HOST
  value: analytics-proxy
```

Log Analytics: Deployment Spec Using A Side Car

The following deployment spec snippet is for a Java application that defines an application container, `client-api`, and an Analytics Agent container, `appd-analytics-agent`, that acts as a sidecar to the application container. An init container, `appd-agent-attach`, is also defined, but the related definitions are removed to simplify the example.

A shared volume, `appd-volume`, is mounted to the application container and Analytics Agent container using the mount path `/opt/appdlogs`. The Java application is configured to write its logs to this path and the Analytics Agent is configured to read the logs from this path and send them to the Events Service.

Log Analytics: Deployment Spec For Shared Analytics Agent (STDOUT/STDERR Support)

The following deployment spec supports the use case where application containers are emitting logs to `STDOUT` and `STDERR`, not the application container filesystem.

Since Kubernetes writes the container logs to the host under `/var/log/containers`, the Analytics Agent can read them there. The Analytics Agent is deployed as a Daemonset. A volume `varlog` is defined with access to the host path `/var/log/containers` and mounted to the Analytics Agent container, `appd-analytics-agent`. The Analytics Agent is configured to read the container-specific logs written to `/var/log/containers`. See [Configure Log Analytics Using Source Rules](#).

```

```

The full spec can be found in the [Log Analytics YAML File](#). An OpenShift example can be found in the [Log Analytics OpenShift YAML File](#).

Upgrade Analytics Agent

This page describes how to update the Analytics Agent standalone binary and includes some steps that are relevant only if you are collecting Log Analytics data.

If you are running the Analytics Agent through the Machine Agent, see [Upgrade the Machine Agent](#) for instructions.

You should maintain a copy of the `controller.xml` file in addition to the `analytics-agent.properties`, `job` folder, and `watermark` folder.

Preserving the watermark file and the job files is only necessary when you are collecting log data for analytics. The watermark file preserves information about the number of bytes read from the log sources by the Analytics Agent and is relevant only when Log Analytics is enabled.

File Locations

After unzipping the Analytics Agent standalone binary, the file locations are:

- property file: `<analytics-agent-home>/conf/analytics-agent.properties`
- job files: `<analytics-agent-home>/conf/job`
- watermark file: `<analytics-agent-home>/conf/watermark`

Running Analytics Agent via the Machine Agent, the file locations are:

- properties file: `<machine-agent-home>/monitors/analytics-agent/conf/analytics-agent.properties`
- job file: `<machine-agent-home>/monitors/analytics-agent/conf/job`
- watermark file: `<machine-agent-home>/monitors/analytics-agent/conf/watermark`

Upgrade Procedure for Analytics Agent (Standalone Binary)

Use these steps to upgrade your Analytics Agent (standalone binary) to 20.x.

1. Stop the Analytics Agent.
2. Download the 20.x Analytics Agent binary from the download site.
3. Extract the new zip. Be sure to extract into a new empty directory or confirm that the old directories are empty before extracting the new version. Otherwise, you may encounter errors starting the Analytics Agent.
4. (Windows only) If the Analytics Agent is installed as a Windows Service, you need to manually uninstall the old service before installing the 20.x version.
5. Save a copy of your old `analytics-agent.properties` so you can copy values to the new `analytics-agent.properties` file.
6. Modify the new `analytics-agent.properties` file with in accordance with the steps on [Install Agent-Side Components](#), referring to your previous properties as needed.
7. If you have been collecting log analytics data:
 - a. Copy the old watermark file to the corresponding location in the new `<analytics-agent-home>` directory structure.

-
- b. Copy your pre-existing job files to the corresponding location in the new `<analytics-agent-home>` directory structure.
 8. Start the new Analytics Agent.
You can observe that the agent starts the enabled job file, and starts tailing the logs from the last read position in the watermark file. Usually, a log message is displayed stating the start of the tailing from last read location. It matches with the watermark file. If at time printing log message gets out of sync, it can be manually validated through the UI that all logs have been tailed, and no duplicate logs have been tailed.

To move from job files to the new Consolidated Log Management source rules, see [Migrate Log Analytics Job Files to Source Rules](#).

Analytics and Data Security

Related pages:

- [Manage Field Visibility](#)
- [Manage API Keys](#)
- [Manage Custom Roles](#)

Application Analytics provides role-based access control (RBAC) to enable you to control and protect your data. The Analytics permissions enable you to provide granular, controlled access to features and analytics data in your environment. This topic outlines the available permissions.

Roles and Permissions

A predefined role called Analytics Administrator is provided with preset permissions for all Analytics-specific permissions.

You can clone predefined roles as a starting point for creating your own customized roles, but you should not assume the cloned roles have all of the permissions of the predefined role. In some cases, there may be hidden permissions, so you should add or remove permissions as needed for your customized role to ensure that you get the RBAC result you need.

To create roles and assign users to roles for Analytics, users need both the **Analytics Administrator** and the **Account Owner** role.

See [Transaction Analytics Permissions](#).

Default Application

To ensure that your users have access to the full Analytics functionality they need, be sure to give them the view permission on the Default Application. This permission is given to all predefined admin roles and to the read-only role, **Applications & Dashboards Viewer**. If you create new roles for analytics, you need to grant this permission in addition to specific analytics permissions.

When you create a new role, this permission is not automatically given to that role. You can add the read-only role to new users. Alternatively, navigate to **Administration > Applications** and select the **View** permission in the Default Application.

Analytics Administration UI Tabs

Access the Analytics tab in the Controller Administration UI when creating new roles to see the available permissions.

General Permissions

This section describes permissions that control access to analytics features:

- [Manage Fields](#)
- [Manage APIs](#)
- [Manage Metrics](#)
- [Configure Log Analytics with Source Rules](#)
- [Manage Business Journeys](#)
- [Manage Experience Levels](#)

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Search Permissions

All the saved searches created in Analytics appear in this section. The admin role can assign View, Edit, and Delete permissions on a search by search level. The admin can create and save specific searches needed by various roles in your organization. In addition to enabling the permissions, View, Edit, and Delete, for a specific saved search, the admin must also enable access to the related application or log source type for the search. Otherwise, the data access level won't be granted to the role.

To create a new saved search, the user must have the **Can Create a Search** permission.

View permission: Assigning only the View permission for a saved search means users can not edit or delete the search.

Edit permission: Assigning Edit permission for a saved search means users can modify the filter criteria and save back to the same search.

Delete permission: Assigning Delete permission for a saved search means users can delete the search.

Event Type Permissions

Transactions Permissions: Enables the admin user to assign permissions for viewing application transaction data. Permissions can be granted to view all transaction data for the account or on an application-by-application basis. When creating new roles, remember that granting permissions to view transaction analytics data does not automatically grant permissions to see all application data associated with a specific transaction analytics record.

You need to grant at least read-only permissions to the application to enable the user to see associated transaction snapshot data such as flow maps.

Log Permissions: Enables the admin user to assign permissions for viewing log data. Permissions can be granted to view log data for all source types configured for the account or on a source by source basis.

Browser Requests Permissions: Enables the admin user to assign permissions for viewing browser request data. Permissions can be granted to view data for all applications for the account or for specific applications.

Mobile Requests Permissions: Enables the admin user to assign permissions for viewing mobile requests and crash report data. Permissions can be granted to view data for all applications for the account or for specific applications.

Custom Analytics Events: Enables the admin user to assign permissions for querying custom analytics events data. Permissions can be granted to view data for all custom analytics events or for specific applications.

Synthetic Permissions: Enables the admin user to assign permissions for querying Synthetic events data. Permissions can be granted to view data for all applications for the account or for specific applications.

Manage API Keys

Related pages:

- [Manage Custom Roles](#)

This page describes how to manage REST API Keys.

The Analytics Events REST API provides three independent endpoints for these responsibilities:

- Schema Management
- Publish Events
- Query Events

API Keys provide a secure authentication mechanism for a caller to prove identity when using these public REST APIs.

Because call sites can vary across your infrastructure, departments, and geographic regions, these credentials could be widely distributed and hard to control. Publishing or querying events from different call sites, therefore, require fine-grained control over the keys and the operations allowed for a particular key. You may also need to revoke these keys on demand if they are found to be compromised.

For these reasons, managing access for the Analytics Events API uses API keys. Your organization can create multiple API keys, manage and distribute them based on your own internal policies. For instance, each department or geographic region may be assigned its own API key for distribution and control management. If an API key is compromised, it can be deleted and a new key created without other undesirable side effects.

API keys are only valid for calling the public Analytics Events REST API and can't be used to access the AppDynamics Controller or data in any other way. See [Analytics Events API](#).

Permissions

API keys are used only for Analytics Events REST APIs. When you create an API key, you can specify read and write permissions for each API key.

Users with the **Manage API** permission can do the following actions:

- Add—Creates an API key
- Disable—Deactivates the calls using that key temporarily, but does not remove the key
- Enable—Re-enables a deactivated key
- Delete—Removes the key permanently

 It may take up to 15 minutes for a key that has been deleted or deactivated to be detected and all operations using that key to be rejected.

When you create an API key, you see permissions for the various event types (logs, transactions, browser, and mobile) in our platform. By using these permissions you can limit or grant access to specific event types for each specific API key.

Examples:

Select **Publish all Custom Events** when you create their API key to generate an API key for your partners allowing them to only publish custom events.

Under **Log Permissions**, select **apache** as the **source type** to generate an API key to allow various users to only query Apache log data.

 Once an API Key is created, you cannot change the permissions.

You can grant permissions for API Keys as follows:

Custom Analytics Events

- Manage Schema— Enables creation of schemas using the Analytics Events Schema Management APIs.
- Query Custom Events—Enables you to query all Analytics event types (with the appropriate permissions).
- Publish Custom Events—Enables you to publish Analytics custom events using the Analytics Events Publish APIs.

Transactions—Query all transactions or specific applications.

Logs—Query all logs or specific source types.

Browser Requests—Query all browser requests or specific applications.

Mobile Requests—Query all mobile requests or specific applications.

Synthetic Requests Permissions—Query all synthetic requests data or specific applications.

Connected Devices Permissions—Query all connected device requests data or specific applications.

 If you have deployed EUM such that you are using an on-premises Events Service for transaction and log analytics data, and the SaaS Events Service for your EUM data, you can not query the browser or mobile request data using the Analytics API.

Create API Keys

1. Navigate to **Analytics > Configuration > API Keys**. You can view existing keys and access actions to manage the keys.
2. Click **+Add** to view the configuration panel.
3. Add a **Name** and **Description**.

 Do not click **Create** until you finish selecting all the necessary permissions for your use case, including any necessary analytics data permissions. You cannot change the permissions once create the key. You can only edit the description and whether the key is active or inactive.

4. Expand each permission section to select the permissions for this key.
5. Click **Create**.
6. Copy and save the key.
7. Select the checkbox indicating you have copied the key and click **Done**.

 You cannot retrieve the key once you dismiss this dialog.

Manage Field Visibility

Related pages:

- [Manage Custom Roles](#)
- [Analytics and Data Security](#)

This page describes how to manage the visibility of fields in your analytics data. This capability enables you to prevent fields from being viewed by others in your organization.

You can set the visibility of the fields in most of the analytics event types with the exception of custom events. Hiding fields in custom events is not supported.

Permissions

The Manage Fields permission is required to manage field visibility. If a role has the Manage Fields permission, it means all the users with that role can manage all the fields they have access to. They can unhide the fields or see which fields have been hidden. For instance, if you have Manage Fields permission and View permission for the business transactions in the Ecommerce App, then you can only see and manage fields for that application.

Manage Fields

1. From the Analytics Search panel, click  next to each component grouping to open the Manage Fields panel.
2. Use the Manage Fields panel to show or hide fields. The list of fields varies based on the event type selected for the search.

Delete Extracted Fields

For ≥ 4.3 , you may have two types of extracted fields, fields created in 4.2 where the Controller version has been upgraded to a higher version and fields extracted from logs with log source rules.

For fields created in 4.2, you can delete the fields:

1. Hover over the field and click on the view icon that appears.
2. Click on **Delete** in the popup.

For fields being extracted from logs using log source rules, you can delete the fields by editing the source rules. See [Field Extraction for Source Rules](#).

Manage Business Journeys and Experience Levels

This page describes how to manage the visibility of business journeys and experience level management (XLM) with role-based access control (RBAC). Business journey and XLMRBAC is required to restrict access to sensitive information among your organization. If a user attempts to access restricted features, a message appears warning the user that access is denied.

Only the analytics admin can grant permissions to business journeys and XLM, as well as with their respective searches, event types, and sources. The admin authorizes access on an individual basis by assigning each user to the applicable role.

Creating Business Journey and XLM Roles

In the Controller UI, navigate to **Settings > Administration > Roles**.

The analytics admin can view and edit existing roles in the Analytics tab, which contains three sections: General, Searches, and Events. Select **+Create** to make a new role.

General Permissions

In the General tab, the analytics admin authorizes access to business journeys and/or XLM. This is required for the user to perform any actions on either business journeys or XLM. Check **Manage Business Journeys** and/or **Manage Experience Levels**:

The screenshot shows a navigation bar with tabs: General, Account, Applications, Databases, and Analytics. The 'Analytics' tab is selected. Below this, there are sub-tabs: General, Searches, and Events. The 'General' sub-tab is active. At the top of the content area, there are links for 'Select All' and 'Unselect All'. Below these are several permission items, each with a checkbox:

- Manage Centralized Log Config
- Manage Fields
- Manage APIs
- Manage Metrics
- Manage Business Journeys
- Manage Experience Levels

The last two items, 'Manage Business Journeys' and 'Manage Experience Levels', are enclosed in an orange rectangular box.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

With general permission, the user has feature level access to business journeys and/or XLM. However, the user cannot view the definition of existing events or saved searches, or create new events, with only general permission. See the below sections to enable these permissions.

i A user can access business journey data through searches without general permission to business journeys, as long as the user's role permits access to the underlying event type(s) used in business journey definition.

In this way, you can restrict access to define business journeys while also allowing a user to query the data. Ensure the user has all necessary access to event type(s) in the Events tab and leave **Manage Business Journeys** unchecked.

Search Permissions

There are two search types in Analytics, drag and drop and query language. The analytics admin grants access to both types in the Searches tab.

Choose **Can Create a Search** to access both search types. Choose **+Add** to access specific saved searches.

Create search permission is required in order for a user to perform these operations:

- Save a search
- Create a metric
- Create a visual widget

Search access is dependent on event type access. A user has access to create and save searches only for the event type(s) and source(s) assigned in the user's role.

Event Type and Source Permissions

The section describes how to assign event type and source access. Granting permission to business journeys and/or XLM does not provide a user blanket access to all reports. Users have access only to the exact event type(s) and source(s) granted by the analytics admin. For example, transactions are an event type, and their source is applications. Therefore, if a user requires access to particular applications, the analytics admin must select transactions as well as each necessary application for the user.

This table lists the available event types and their corresponding sources:

Event Type	Source
Transaction	Application
Log	Source Type
Browser Records	App Key
Mobile Records and Sessions	App Key

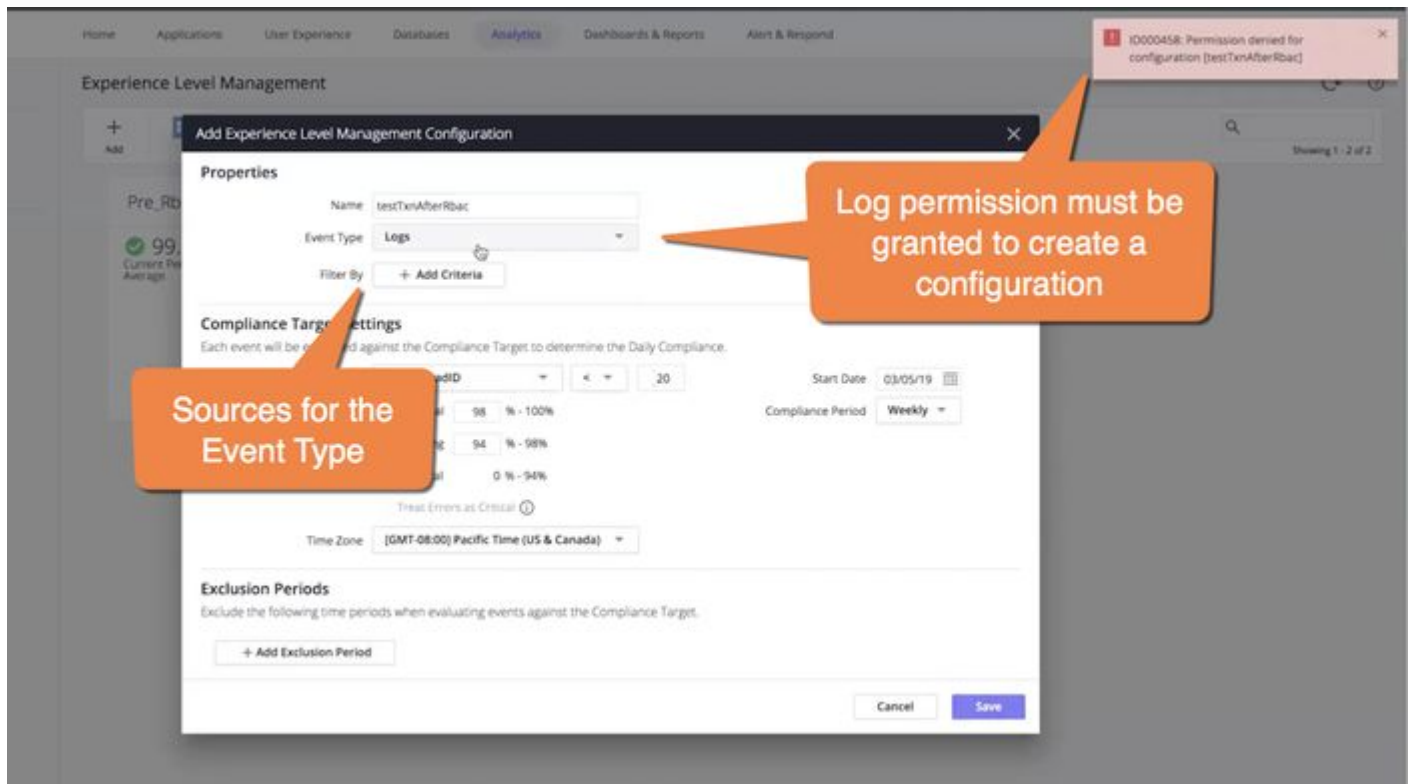

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Event Type	Source
Synthetic Session	App Key
Connected Devices	App Key
Custom Analytics Events	Particular user-defined event type

You can specify exact access in the Events tab. Select the event type, then specify access for the relevant source. Check "**Can View Data from all [source] "** to grant blanket access to each source. To select individual sources, click **+Add**.

The screenshot shows the 'Create Role' configuration interface. At the top, there is a 'Create Role' button with a help icon and a 'Save' button. Below are tabs for 'General', 'Account', 'Applications', 'Databases', 'Analytics', 'Dashboards', and 'User and Groups with this Role'. The 'Analytics' tab is selected, and within it, the 'Events' sub-tab is active. The 'Type' dropdown menu is set to 'Transactions'. A checkbox labeled 'Can view data from all Applications' is checked. An orange callout box points to this checkbox with the text 'Grant access to all sources for the event type'. Below this, there is a section titled 'Can view data from the following Applications:' which includes an 'Add' button, a 'Remove' button, and a search bar. An orange callout box points to the 'Add' button with the text 'Grant access individual sources'. The search bar shows 'Showing 0 of 0 Applications'.

With the appropriate event type and source permissions, the user can access existing reports as well as create new reports. For example, a user with permissions to Transactions and all applications can now create a new configuration for any application. However, if this user attempts to create a configuration for Log events, the configuration does not save and an error message appears in the UI:

For XLM configurations, the **Filter By** field indicates the source(s) of the given **Event Type**. Users with limited permission to sources need to add their permitted source(s) as filter criteria. If you do not specify filter criteria, you must have permission to all sources for the event type to create the configuration.

Dashboard Access

Grant permission to dashboards in the Dashboard tab. In this tab, the admin specifies if a user can create dashboards and time permissions, as well as custom permissions.

If an Analytics dashboard contains data from business journeys and/or XLM, access to the dashboard depends on the above permissions. For example, a role that allows its users to create a dashboard, but contains no permission to business journeys, does not permit the user to access a business journey-related dashboard. Ensure that roles have the necessary permission to access Analytics data and general dashboard access.

View Analytics Agent Health

This page describes how to access the health list of Analytics Agents.

You can view Analytics Agents connected to your Controller in **Settings > AppDynamics Agent > Analytics Agents**. You can also view agent status and health information for the Log Analytics and Transaction Analytics pipelines.

When a new Analytics Agent starts and connects to the Controller, it registers with the Controller. Once the agent is registered, the agent requests configuration information every five minutes. As part of this request, the Analytics Agent reports health status information to the Controller. A healthy pipeline means analytics data is flowing from the Analytics Agent to the Events Service successfully.

Condition	Transaction Pipeline Health	Log Pipeline Health
Analytics Agent does not contact the Controller for more than five minutes.	Not connected 	Not connected 
No business transaction analytics data is flowing and there are no errors in the connection.	Connection is healthy, no data flowing 	Not Applicable
Business transaction analytics data is flowing and the Agent is publishing to the Events Service successfully with no errors.	Healthy 	Not Applicable
Business transaction analytics data is flowing, but the Agent is experiencing errors while publishing transactions to the Events Service.	Unhealthy 	Not Applicable
No log analytics data is flowing and there are no errors in the connection.	Not Applicable	Connection is healthy, no data flowing 
Log analytics data is flowing and the Agent is publishing to the Events Service successfully with no errors.	Not Applicable	Healthy 

Condition	Transaction Pipeline Health	Log Pipeline Health
Log analytics data is flowing, but the Agent is experiencing errors while publishing transactions to the Events Service.	Not Applicable	Unhealthy 

Permissions

To view the Analytics Agents list, you must belong to a role with the Account level **Administer users, groups, role authentication, etc. View License. View AppDynamics Agents. Use Agent Download Wizard** permission. The default Account Owner and Analytics Administrator roles have this permission.

Access Analytics Agent Health List

To access Analytics Agents health view, navigate to **Settings > AppDynamics Agents > Analytics Agents**.

1. View information for connected Analytics Agents.

Name	Unique Host ID	Version	Last Connected	Log Pipeline Health	Transaction Pipeline Health
analytics-agent1	a5453663	4.4.0	08/28/17 11:18:09 AM

3. View Analytics Agents by event type (log data and business transaction data).

4. Perform a search on the list of registered Analytics Agents.

Analytics Licenses

Related Pages:

- [Observe License Usage](#)
- [License Entitlements and Restrictions](#)

This page describes how to interpret the details of your Analytics license. The information is split between [Infrastructure-based Licensing and Agent-based Licensing](#). To see a complete list of licenses and packages, see [License Entitlements and Restrictions](#).

Licensing for Analytics

Analytics licenses differ depending on what licenses you purchase. Under the Infrastructure-based Licensing model, Analytics licenses are part of monitoring packages, except for Log Analytics, which is a separate license. Under the Agent-based model, each Analytics agent is licensed separately. Learn more about [Licensing](#).

[Infrastructure-based Licensing](#) [Agent-based Licensing](#)

Types of Licenses

There are three types of licenses associated with Analytics:

1. Browser and Mobile Analytics (part of Real User Monitoring Peak)
2. Transaction Analytics (part of the Enterprise package)
3. Log Analytics (part of Log Analytics Pro)

See [License Entitlements and Restrictions](#) for more information on each license.

With a Browser Synthetic Pro license, you do not need an Analytics license to view Synthetic session data.

How Licenses Are Consumed

- The Java Agent collects Transaction Analytics data. The Transaction Analytics license (as part of the Enterprise license package) is consumed through the Java Agent (as part of the Analytics Agent). If the APM Agent does not have an Enterprise license allocated, the agent will not be able to report Transaction Analytics data.
- The Analytics Agent does not consume any licenses. The Controller account information configured in the Analytics Agent is used for the periodic health check and log configuration sync; whether or not the account has IBL licenses provisioned does not matter.

Accounts and Licenses

- The Global Account Name (GAN) configured in the Analytics Agent is used for request authentication and rate-limiting in the Events Service, and is not related to license allocation.
- The account configured in the Java Agent must have enough licenses, and the agent should acquire the license in the configuration sync.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Overages

Analytics does not support overages. AppDynamics stops capturing analytics data once your limit has been reached.

[Infrastructure-based Licensing](#) [Agent-based Licensing](#)

Types of Licenses

There are four types of licenses associated with Analytics:

1. Transaction Analytics
2. Log Analytics
3. Browser Analytics
4. Mobile Analytics

See [License Entitlements and Restrictions](#) for more information on each license.

With a Browser Synthetic Pro license, you do not need an Analytics license to view Synthetic session data.

Overages

Analytics does not support overages. AppDynamics stops capturing analytics data once your limit has been reached.

Remote Analytics Agent Sizing

Related pages:

- [Deployment Options and Scenarios](#)
- [Install Agent-Side Components](#)
- [Events Service Requirements](#)

This page describes how to estimate the hardware requirements for a remote Analytics Agent deployment where a single Analytics Agent is aggregating transaction events from multiple APM Application Agents. This page describes transaction analytics only.

You should consider these two questions when sending analytics data to a remote Analytics Agent:

- How many APM agents can report to one remote Analytics Agent?
- What are the machine requirements for hosting the remote Analytics Agent?

Do not extract the numbers on this page to size for Log Analytics because you must install the Analytics Agent on the local machine to capture Log Analytics.

Analytics Agent Sizing Based on Event Volume

Based on our testing, the volume of events being sent to the Analytics Agent is the limiting factor in determining how many APM agents can report to one remote Analytics Agent.

The tests were conducted on virtual hardware and programmatically generated workload. Real-world workloads may vary. To best estimate your hardware sizing requirements, carefully consider the traffic patterns in your application and test in a test environment that closely resembles your production application and user activity.

Calculate Analytics Event Volume

One business transaction can traverse many tiers. In each tier, one business transaction traverses one node. One node produces one request per business transaction when the transaction is synchronous. For async transactions, multiple events may be generated by a node for a single request. One request equals one analytics event. To calculate how many events a business transaction generates, you need to count the number of tiers/nodes that are sending data into the Analytics Agent.

You can estimate the number of events using the following formula:

One business transaction generates events at a rate = **calls per minute** times the **number of tiers** reporting analytics data for the business transaction.

In simple terms: #events for one business transaction = calls per minute times # of tiers.

Characteristics of the Amazon EC2 Instance Types

For complete information on Amazon EC2 instance types, see <https://aws.amazon.com/ec2/instance-types/>.

The testing was performed using c3.large, c3.xlarge, and c4.4xlarge.

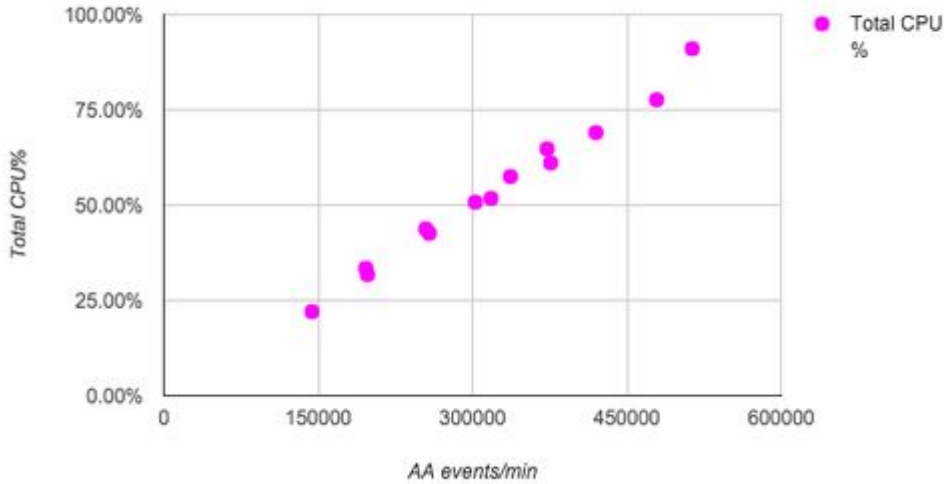

Model	vCPU	Mem (GiB)	SSD Storage (GB)
c3.large	2	3.75	2 x 16
c3.xlarge	4	7.5	2 x 40
c4.4xlarge	16	30	EBS-Only

Test Results

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

c3.xlarge CPU% vs. AA events/min

Total CPU% vs. AA events/min

GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Enable SSL for the Analytics Agent

Related pages:

- [Controller SSL and Certificates](#)

This page describes how to configure the AppDynamics Analytics Agent to connect to your app server agents using SSL.

1. Run the `keytool` command to create a new key pair for the Analytics Agent in the keystore. Refer to the [Oracle documentation](#) for more details on using keytool. The following command creates a keystore if it doesn't exist and generates the public/private key pair:

```
keytool -genkeypair -alias analytics-agent -keystore aa-keystore.jks -validity 1825
```

Follow the on-screen instructions to configure the certificate. This generates a self-signed certificate in the keystore. The next step generates a signing request for the certificate. Note the following:

- a. For the first and last name, enter the domain name where the Analytics Agent is running. The domain name used in the `appdynamics.analytics.agent.url` property must match the Common Name (CN) of the certificate used by the Analytics Agent. For example, if the URL was `https://localhost:9090/v2/sinks/bt` then the CN of the certificate should be `localhost`. If the names don't match then the client marks the certificate as invalid and the HTTPS connection is not established".
- b. Enter a secure password for the key. This command creates a key pair with a validity of 1825 days (5 years). Replace 1825 with the validity period appropriate for your environment.

2. Generate a certificate signing request for the certificate you created as follows:

```
keytool -certreq -alias analytics-agent -keystore aa-keystore.jks -file AppDynamics.csr
```

3. Submit the certificate signing request file generated by the command (`AppDynamics.csr` in the example command) to your Certificate Authority (CA) of choice.
4. When it's ready, the CA returns the signed certificate and any root and intermediary certificates required for the trust chain. The response from the CA should include any special instructions for importing the certificate if needed. If the CA supplies the certificate in text format, copy and paste the text into a text file.
5. Import the signed certificate:

```
keytool -import -trustcacerts -alias analytics-agent -file mycert.cer -keystore aa-keystore.jks
```

This command assumes the certificate is located in a file named `mycert.cer`.

6. If you see the error "Failed to establish chain from reply", install the issuing CA's root and any intermediate certificates into the keystore. The root CA chain establishes the validity of the CA

signature on your certificate. Although most common root CA chains are included in the bundled JVM's trust store, you may need to import additional root certificates, such as certificates belonging to a private CA. To do so:

```
keytool -import -alias [Any_alias] -file <path_to_root_or_intermediate_cert> -keystore  
<controller_home>/appserver/glassfish/domains/domain1/config/aa-keystore.jks
```

7. When done importing the certificate chain, try importing the signed certificate again.
8. Update the following properties in the `analytics-agent.properties` file:
 - a. `ad.dw.https.enabled=true` to enable the HTTPS connector on the Analytics Agent. The HTTPS connection is exposed on the port defined by the `ad.dw.http.port` property.
 - b. `ad.dw.https.keyStorePath` = absolute path to the Java keystore that contains the Analytics Agent public and private key.
 - c. `ad.dw.https.keyStorePassword` = Java keystore password.
 - d. `ad.dw.https.trustStorePath` = absolute path to the truststore that establishes the chain of trust for the Analytics Agent public key certificate.
 - e. `ad.dw.https.trustStorePassword` = the truststore password.
 - f. `ad.dw.https.certAlias` = alias of the public key certificate stored in the Java Key Store.
9. Start the Analytics Agent.
The HTTPS connection should now be exposed.
10. Confirm that the app server agent is configured to trust the Analytics Agent certificate. See "*Enable SSL between the Java Agent and the Analytics Agent*" on the [Enable SSL for the Java Agent](#) page.

Analytics Agent Logging

Related pages:

- [Troubleshoot Analytics Issues](#)

By default, the AppDynamics Analytics Agent writes log files to the `<analytics_agent_home>/logs` directory. See [Agent Log Files](#) for how the logs are organized into sets that roll over.

Log File Sizes

Each log can grow to 64 MB in size before being compressed and renamed. A maximum of ten compressed files can be generated.

The default pattern for agent log naming is `<filename>-<date_compressed >.log.gz` as shown in this table:

Log File Name	Definition
<code>analytics-agent.log</code>	Current log
<code>analytics-agent-2018-12-11.log.gz</code>	Previous log
<code>analytics-agent-2018-12-10.log.gz.log</code>	Second previous log

Logging Level for the Analytics Agent

The default logging level for most log files is `INFO`. Higher logging levels consume more disk space.

You can control the logging level for the Analytics Agent by changing the value of the `ad.dw.log.level` parameter in the `analytics-agent.properties` file.

For example, to set the log level to `DEBUG`:

```
ad.dw.log.level=DEBUG
```

Deploy Analytics Without the Analytics Agent

Deployment Support

The Analytics Agent is not required to capture Transaction Analytics data. This page describes the requirements to use the "agentless" configuration of Analytics.

In this context, "agentless" refers to the configuration of Transaction Analytics without an Analytics Agent. An [app server agent](#), such as Java or .NET, is still required to use this feature.

Agentless Analytics

To capture Transaction Analytics for Java or .NET Windows applications, you can configure Transaction Analytics without a dedicated Analytics Agent.

In this deployment model, Analytics retrieves data directly from your app agent. The data is reported to the Events Service and then the Controller. No separate Analytics Agent is required.

If you upgrade the Java Agent to $\geq 4.5.15$, and use Transaction Analytics, Agentless Analytics is automatically enabled. If you upgrade the .NET Agent to ≥ 20.10 , and use Transaction Analytics, Agentless Analytics is automatically disabled; you can enable this feature in the Controller or with a node property. See [Enable Agentless Analytics](#).

You may notice unusual behavior (such as gaps in Analytics data) related to two known issues:

- High CPU usage (in the Java Agent version 4.5.19 and below)
- Blocked firewall requests

See [Troubleshoot Analytics Issues](#).

Requirements

Make sure you meet the following minimum requirements:

- Sufficient [Transaction Analytics Licenses](#)
- Java Agent $\geq 4.5.15$
- .NET Agent ≥ 20.10
- Controller $\geq 4.5.16$ (SaaS or on-premises)

To use Agentless Analytics, see this [compatibility matrix](#) for your agent deployment requirements.

[Java](#) .NET

Minimum Controller Version	Minimum Java Agent Version	Agentless Analytics Support
4.5.16	4.5.15	Generally available.
4.5.16	4.5.17	Supports proxy configuration and authentication with encrypted credentials.
4.5.17	4.5.18	Supports license rules configured in the Java Agent.

 Java [.NET](#)

Minimum Controller Version	Minimum .NET Agent Version	Agentless Analytics Support
4.5.16	20.10.0	Generally available and supports proxy configuration.
4.5.17	20.10.0	Supports license rules configured in the .NET Agent.

Connect App Agents to the Events Service

 Java [.NET](#)

For most deployments, communication between the Java Agent and the Events Service automatically occurs as long as you have the correct agent version.

 Java [.NET](#)

Communication between the .NET Agent and the Events Service is disabled by default; to re-enable, see [Deploy Analytics Without the Analytics Agent](#).

See the following sections to ensure that your deployment can connect to the Events Service:

- [Identify Internal Events Service Endpoints](#)
- [Connection Ports](#)
- [Enable SSL](#)
- [Proxy Configuration](#)

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Identify Internal Events Service Endpoints

The Controller uses the connection URL configured in `Admin.jsp` to the Events Service. Agentless Analytics also uses this URL. See [Connect to the Events Service](#).

[SaaS](#) [On-prem](#)

In a SaaS environment, the internal URLs to connect to the Controller/app agents to the Events Service have already been deployed.

[SaaS](#) [On-prem](#)

In an on-premises environment, the agent requires access to the internal Events Service URL normally used by the Controller. The internal Events Service URL must be exposed to the agents and then set as the `analytics.agentless.event.service.url`:

1. Log in to the Administration Console:
`http:<controller-hostname>:8080/controller/admin.jsp` or `https:<controller-hostname>:45/controller/admin.jsp`.
2. In **Controller Settings**, set `analytics.agentless.event.service.url` to the Events Service endpoint that is accessible from agents.
3. Click **Save**.

Connection Ports

[SaaS](#) [On-prem](#)

The connection between the Java Agent, the .NET Agent, and the Events Service occurs over ports 80 (HTTP) and 443 (HTTPS). If your firewall rules are not configured properly, gaps will appear in your Analytics data.

[SaaS](#) [On-prem](#)

The port on which the Events Service receives data from the Java Agent and the .NET Agent is configured during installation.

If you have network policies that may prevent this connection, such as firewalls, you need to configure the policies to connect with the Events Service. See [Troubleshoot Analytics Issues](#).

Enable SSL

If you use a custom trust store, see [Enable SSL for the Java Agent](#) or [Enable SSL for the .NET Agent](#).

Proxy Configuration

[Java](#) [.NET](#)

To encrypt credentials for proxy authentication, you need Java Agent \geq 4.5.17 and Controller \geq 4.5.17. See [Java Agent Configuration Properties](#).

Java [.NET](#)

The .NET Agent does not support proxy authentication. Use these environment variables for proxy configuration.

To configure the .NET Agent to communicate with the Events Service with the proxy:

1. Add/update the following environment variables.
2. Restart your Windows application.

Agent → Events Service Sending Data For Proxy

```
appdynamics.http.proxyHost
```

```
appdynamics.http.proxyPort
```

Enable Agentless Analytics

You can enable Agentless Transaction Analytics at the Controller, node/tier, and agent level.

[Java](#) [.NET](#)

By default, Agentless Analytics is automatically enabled for the Java Agent.

Java [.NET](#)

By default, Agentless Analytics is disabled for the .NET Agent. Enabling Agentless Analytics changes your deployment to Agentless Analytics mode.

To enable Agentless Analytics at the tier or node level, add the `agentless-analytics-disabled` [property](#) and set to `false`. When set to `false`, this node property changes the tier/node to Agentless Analytics mode. To add a node property, see [App Agent Node Properties](#).

Disable Agentless Analytics

You can disable Agentless Transaction Analytics at the Controller, node/tier, and agent level.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

[Java](#) [.NET](#)

Disabling Agentless Analytics changes your deployment to Analytics Agent mode.

To disable Agentless Analytics at the tier or node level, add the `agentless-analytics-disabled` property and set to `true`. When set to `true`, this node property reverts the tier/node to Analytics Agent mode. To add a node property, see [App Agent Node Properties](#).

[Java](#) [.NET](#)

By default, Agentless Analytics is disabled for the .NET Agent. Enabling Agentless Analytics changes your deployment to Agentless Analytics mode.

To disable Agentless Analytics, set the value of `agentless-analytics-disabled` to `true`.

Existing Analytics Agents

Once you upgrade to the minimum Controller and agent versions, existing Analytics Agents stops reporting data. Agentless Analytics does not duplicate data from the Analytics Agent. AppDynamics recommends when you see **Transaction Analytics** in the Controller, you can uninstall the Analytics Agent unless you are using Log Analytics.

Configure Analytics

To generate information for Analytics, such as data collectors and log analytics, you need to configure the system to collect the applicable data.

Access Analytics in the Controller UI

In the Controller UI, navigate to **Analytics > Configuration**.

The Analytics configuration options include:

- **Transaction Analytics - Configuration:** Enable Analytics for specific applications and business transactions.
- **Transaction Analytics - Manual Data Collection:** Configure data collectors. Analytics supports three types of data collectors: method invocation data collector (MIDC), HTTP, and SQL.
- **Log Analytics:** Configure source rules to collect data for log analytics.
- **API Keys:** Create API authentication keys for users of the Analytics Events API.

End User Monitoring Data

Analytics monitors End User Monitoring (EUM) products. For SaaS deployments, Browser Request Analytics and Mobile Request Analytics, alternate views of EUM data, do not require configuration. If you are using an on-premises Events Service and an on-premises EUM Server, you need to configure the EUM Server to send data to the Events Service. See [EUM Server Deployment](#).

Collect Transaction Analytics Data

Works with:

This page describes how to configure Transaction Analytics for Java and .NET applications. See [Configure Transaction Analytics for Node.js and PHP Applications](#).

Before You Begin

If you have Java Agent $\geq 4.5.15$, .NET Agent ≥ 20.10 , and Controller $\geq 4.5.16$, you do not need a local Analytics Agent to configure Transaction Analytics. See [Deploy Analytics Without the Analytics Agent](#).

All other app agents and Controller versions require an Analytics Agent. See the appropriate documentation to ensure you have installed and configured the required components.

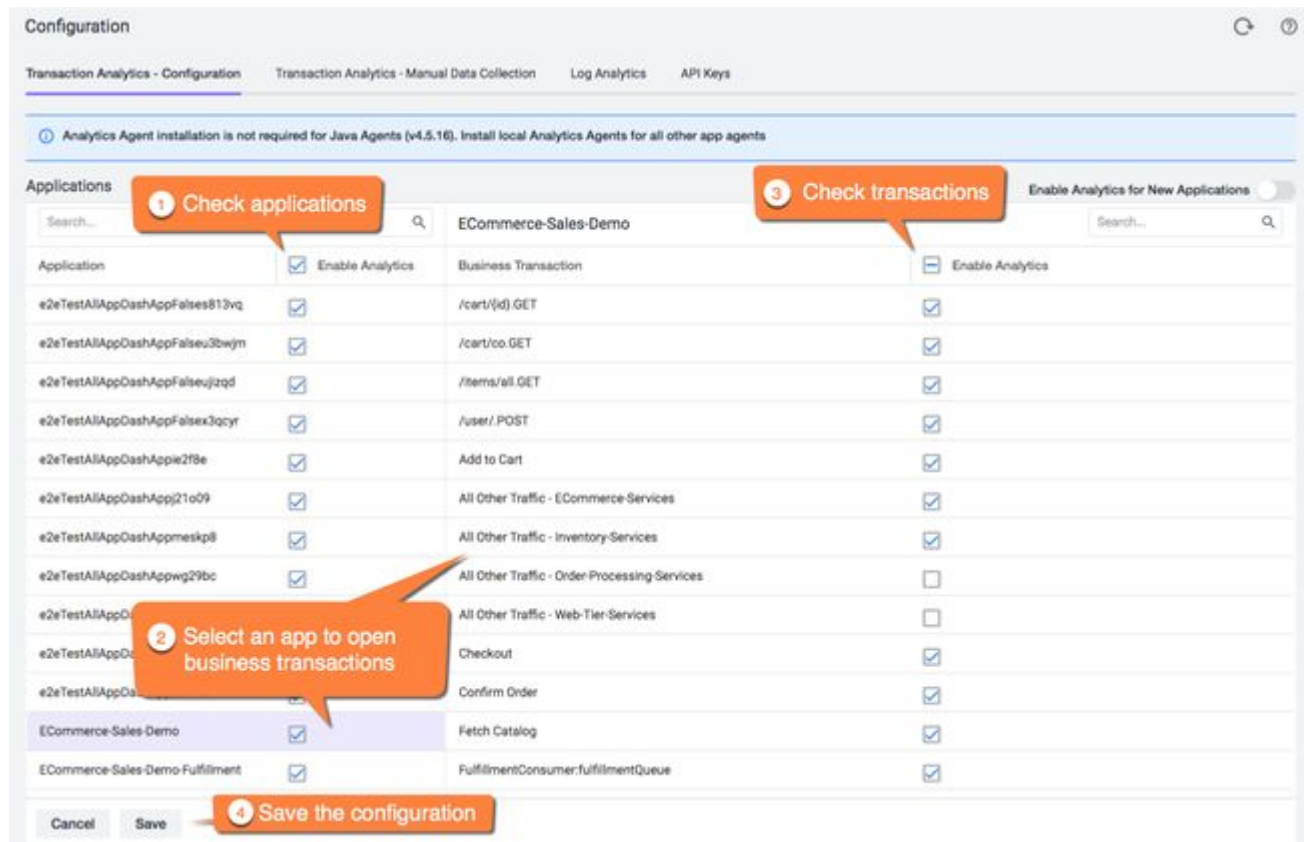

- SaaS deployments: [Install Agent-Side Components](#)

Configure Transaction Analytics

You need to configure Transaction Analytics for each desired application. Configuring Transaction Analytics consists of selecting the application and the specific business transactions that you want to analyze.

To configure Transaction Analytics:

1. In the Controller UI, from the top navigation bar, select **Analytics**.
2. Select **Configuration** from the left panel.
3. Go to the Transaction Analytics - Configuration tab.
4. Check the application(s) from the left panel. You can select or deselect all applications by checking **Enable Analytics**. Find specific applications using the search box above **Applications**.
5. Select an application to open the business transactions in the right panel. By default, all business transactions, except **All Other Traffic**, are selected. You can deselect any business transactions you do not want to monitor. Find specific business transactions using the search box in the top right of the panel.
6. Click **Save**.

Automatically Enable Transaction Analytics

You can enable Transaction Analytics automatically for all applications $\geq 4.3.x$. Click the toggle next to **Enable Analytics for New Applications**. This option configures Transaction Analytics for all new applications and all of each application's business transactions, except business transactions categorized as [All Other Traffic](#).

Enable Analytics for New Applications applies to applications created after you select the feature. You need to [manually configure Analytics](#) for any applications and business transactions created before selecting **Enabled Analytics for New Applications**.

Transaction Analytics - Manual Data Collection Log Analytics API Keys

Required for Java Agents(v...

Auto enablement does not apply to existing app and business transactions

<input checked="" type="checkbox"/>	All Other Traffic - LoanProcessor-Services	<input type="checkbox"/>
<input checked="" type="checkbox"/>	All Other Traffic - Portal-Services	<input type="checkbox"/>
<input checked="" type="checkbox"/>	All Other Traffic - QueueReader-Services	<input type="checkbox"/>
<input checked="" type="checkbox"/>		

i You can configure Transaction Analytics for older agents manually. Go to **Transaction Analytics - Configuration** and locate the desired application. Uncheck and recheck the app, then select your business transaction(s).

Click the toggle again to turn off **Enable Analytics for New Applications**. The toggle becomes grey when the feature is turned off.

Edit Transaction Analytics Configuration

You can add or remove applications and business transactions from Transaction Analytics at any time.

To make changes to your Transaction Analytics configuration, select or deselect the desired applications and business transactions in **Transaction Analytics - Configuration**.

When you revert changes to Transaction Analytics, AppDynamics saves the previous configuration state. For example, you enable Transaction Analytics for an application and one specific business transaction. You later disable Transaction Analytics for the application, then re-enable it at a later date. When you re-enable the application, AppDynamics automatically selects the business transaction you originally selected.

Security Restrictions

The Analytics Administrator has complete access to all applications in Transaction Analytics. All other users can only view applications to which they have access based on [RBAC permissions](#).

 The Analytics Dynamic Service loads Transaction Analytics for enabled applications after your JVM instance runs for at least two minutes.

Configure Recommended Data Collectors

Related pages:

- [Configure Manual Data Collectors](#)

Deployment Support

This page describes Recommended Data Collectors in AppDynamics.

Recommended Data Collectors are potential Method Invocation Data Collectors (MIDC) suggested by Analytics. Recommended Data Collectors reduce the number of steps required to configure data collectors.

When you configure data collectors manually, provide the class and method parameters for each transaction that you want to monitor. Recommended Data Collectors automatically collect the event data from the Java Agent and publishes it to the Event Service. You can browse this data (transactions, classes, methods) and search for specific terms in the Controller.

Recommended Data Collectors do not support HTTP and SQL data collectors.

Before You Begin

To use Recommended Data Collectors, ensure that your setup meets these requirements.

You need the **Configure Diagnostic Data Collectors** permission to access Recommended Data Collectors. The Analytics Administrator does not have this permission by default.

To view application data for Recommended Data Collectors, you need view access to the application and its transactions.

- For application permissions, configure user settings in **Administration > Roles > Applications**.
- For transaction permissions, configure user settings in **Administration > Roles > Analytics > Events**.

See [Analytics and Data Security](#).

- SaaS Controller >= 20.6.0
- Java Agent >= 21.1

Agentless Analytics

Recommended Data Collectors require Agentless Transaction Analytics. When you use the minimum supported versions of the Controller and Java Agent, Agentless Analytics is automatically enabled. See [Deploy Analytics Without an Analytics Agent](#) to ensure that your deployment works properly.

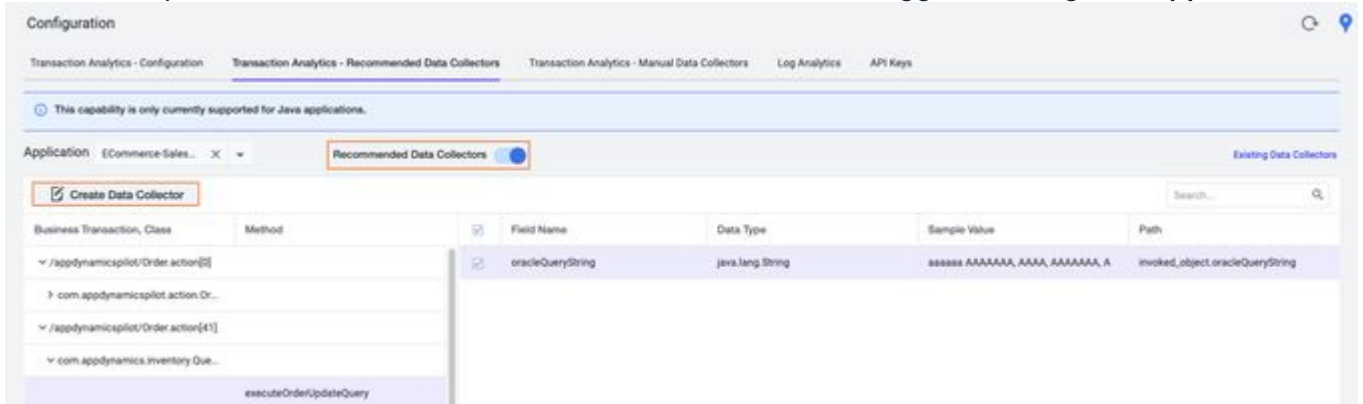

You must enable Agentless Analytics to use this feature. If you turn off Agentless Analytics, you cannot use Recommended Data Collectors.

Create Recommended Data Collectors

To use Recommended Data Collectors:

1. In the Controller, select **Analytics > Configuration > Transaction Analytics - Recommended Data Collectors**.
2. Select an application from the **Application** dropdown menu. A list of business transactions appears in the left pane.

3. If not already enabled, turn on the **Recommended Data Collectors** toggle to the right of **Application**.

4. Select the dropdown arrow next to the desired business transaction name. A list of available classes appears in the left pane.
5. Select the desired class. A list of available methods appears.
6. Select the desired method.
7. Additional data appears in the right pane. Select the desired field name.
8. Above the business transaction list in the left pane, click **Create Data Collector**.
9. Enter a data collector name and confirm that the method signature information is correct. If you select multiple fields, enter a unique name for each data collector in the dialog.

Create Method Invocation Data Collector
✕

A method invocation data collector needs the java method signature with the fully qualified class/interface/super-class/annotation name and the method name. If the method is overloaded, it is recommended that you specify the fully qualified parameter types also.

Recommended Data Collectors UI Overview

UI Term	Description
Business Transaction	<p>The name of the business transaction(s) for the selected application. Business transaction names appear as:</p> <p>The relative path and business transaction ID in brackets []. For example, <code>/portal/Submit Application[65]</code>.</p> <p>If the Java Agent does not identify a relative path, the name is the business transaction ID only. For example, <code>Business Transaction 1</code>.</p>
Class	The fully qualified class name of the selected business transaction.
Method	<p>The method name of the selected class.</p> <p>Overloaded methods contain identifying data to distinguish each method. For example, if a class calls <code>method1</code> multiple times with different return values, the return value is displayed next to the method name:</p> <ul style="list-style-type: none"> <code>int method1()</code> <code>void method1()</code> <p>Variations in the method parameters are displayed in the parentheses:</p> <ul style="list-style-type: none"> <code>method1(str, ...)</code> <code>method1(int, ...)</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

UI Term	Description
Field Name	The name of the field of the selected method. The field name can be a parameter, return value, or invoked object.
Data Type	Type of the field name.
Sample Value	<p>Shows an example field value. Special characters (- , . @) are not obfuscated.</p> <p>The following names are obfuscated for security:</p> <ul style="list-style-type: none"> • Boolean: <code>aaaaaa</code> • Enums: the string value is pulled and obfuscated the same as upper and lower case letters • Lower case letters: <code>a</code> • Numbers: <code>0</code> • Upper case letters: <code>A</code> • All other characters: <code>#</code> <p>In the case of arrays, collections, and maps, the values display a special format.</p> <ul style="list-style-type: none"> • Array/Collection: <code>[Aaaa, ...]</code> • Map: <code>[{aaa=Aaaa}, ...]</code> <p>The <code>Instance of <class_name></code> value is displayed when the depth limit is obtained after introspecting the object. If you want to introspect further on this instance type, you can increase the introspection depth with the <code>analytics-runtime-introspection-depth</code> property. For example, in method <code>int getPrice(a)</code>, <code>a → b → c → d → e</code> where <code>a</code> has field <code>b</code>, <code>b</code> has field <code>c</code>, and so on. If the depth is 2, the value will be <code>Instance of c</code>.</p> <p>This case applies to arrays, collections, and maps.</p> <ul style="list-style-type: none"> • Array/Collection: <code>[Instance of <class_name>, ...]</code> • Map: <code>[{Instance of <key_class_name>}={Instance of <value_class_name>}, ...]</code>
Path	Describes where the Java Agent has located the Recommended Data Collector in your code.

Disable Recommended Data Collectors for an Application

1. Go to **Transaction Analytics > Recommended Data Collectors**.
2. Select the application from the dropdown.
3. Turn off the **Recommended Data Collectors** toggle.

Troubleshoot Recommended Data Collectors Issues

Recommended Data Collectors in the Controller UI

There are a few reasons why Recommended Data Collectors may not appear in the Controller UI:

- **Auto-Refresh:** In the Controller UI, data under the **Transaction Analytics - Recommended Data Collectors** tab does not refresh automatically. If you recently created an application and do not see it in the UI, refresh your browser.
- **Deactivated Agentless Analytics:** Recommended Data Collectors require Agentless Analytics. If a particular application is unavailable, confirm that Agentless Analytics is enabled for the tier or node.
- **Permission:** Recommended Data Collectors enforces RBAC. Without the **Configure Diagnostic Data Collectors** permission, you cannot create data collectors, but you can view suggested Recommended Data Collectors for the applications that you have access to.

Field Names Display Unavailable

Field names are not available for data captured on parameters, return values, and invoked objects, such as `int getNumber(intValue)`.

For example:

```
public class Calculator {
    public int getArea(int width, int height) {
        return width * height;
    }
}
```

Field Name	Explanation
Invoked Object	Refers to the object on which the method is invoked. In this example, the <code>Calculator</code> object is being invoked. The name of the <code>Calculator</code> object instance is not obtained, so Invoked Object displays Unavailable .

Field Name	Explanation
Parameters	Refers to the inputs to the method. In this example, the parameters are the width and the height. The parameter names are not obtained, so Parameters display Unavailable .
Return Value	Refers to the return value of the method. Return values do not have assigned names and Return Value displays Unavailable .

Customize Recommended Data Collectors

This page provides a list of system and node properties that customize Recommended Data Collectors.

Enable or Disable Recommended Data Collectors

You can enable or disable Recommended Data Collectors after restarting the Java Agent and setting the system properties as a JVM parameter. Recommended Data Collectors is enabled by default; the property `appdynamics.analytics.collection.feature.enabled` is optional.

System Property	Description	Default Value
<code>appdynamics.analytics.collection.feature.enabled</code>	Enable or disable Recommended Data Collectors on the Java Agent.	true

Customize Recommended Data Collectors

To customize Recommended Data Collectors, you can adjust the node properties in the Java Agent. See [App Agent Node Properties](#).

Node Property	Description	Default Value
<code>analytics-collection-stack-traces-collected</code>	Number of stack traces collected per interval (time between stack trace collection limit resets).	20
<code>analytics-collection-stack-trace-collection-reset-interval</code>	Interval (in seconds) to reset stack trace collection limit.	10
<code>analytics-collection-special-characters</code>	List of characters which will not be sanitized from sample values. For example, <code>a^z</code> will not sanitize <code>a</code> , <code>^</code> , and <code>z</code> .	N/A
<code>analytics-collection-elements-scan-per-stack-trace</code>	Number of elements to scan per stack trace before stopping.	20

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Node Property	Description	Default Value
<code>analytics-collection-elements-retain-per-stack-trace</code>	<p>Number of elements to collect per stack trace.</p> <p>For example, in this stack:</p> <pre>com.a -> com.b -> com.c -> com.d -> com.e -> com.f -> AppD exit point method</pre> <p>Elements <code>com.b</code> to <code>com.f</code> (bottom five) are analyzed by default.</p>	5
<code>analytics-collection-package-prefix</code>	<p>Comma separated list of package names that will be treated preferably for suggestions.</p>	N/A
<code>analytics-element-analysis-interval</code>	<p>Interval (in seconds) for triggering element analysis.</p>	600
<code>analytics-collection-reap-interval</code>	<p>Interval (in seconds) to remove one suppressed collection instrumentation point.</p> <p>Removes the oldest suppressed point first.</p>	10
<code>analytics-method-instrumentation</code>	<p>Number of methods (unique class name/method name combinations) to instrument with Recommended Data Collectors.</p> <p>Overloaded variants are considered the same for this limit.</p>	10

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Node Property	Description	Default Value
<code>analytics-maximum-num-rules-multiplier</code>	<p>Average number of overloaded methods per instrumented method.</p> <p>The maximum number of instrumentation points is calculated with this formula: <code>analytics-method-instrumentation</code> * <code>analytics-maximum-num-rules-multiplier</code>.</p>	10
<code>analytics-instrumentation-suppression</code>	<p>Number of times Recommended Data Collectors is invoked and processed.</p> <p>For example, if <code>analytics-instrumentation-suppression</code> is set to 3 and a method is called four times, the fourth call does not collect data.</p>	3
<code>analytics-runtime-attribute-value-length</code>	Maximum length of sample value string displayed.	32
<code>analytics-runtime-introspection-depth</code>	Level of depth in the object tree that Recommended Data Collectors extracts information.	2

Configure Manual Data Collectors

This page describes how to configure data collectors for Transaction Analytics.

There are three types of data collectors: HTTP, method invocation, and SQL. Data collectors enable you to add business context to a transaction. For example, a Method Invocation Data Collector (MIDC) can tell you if an order is slow based on method parameters.

Before You Begin

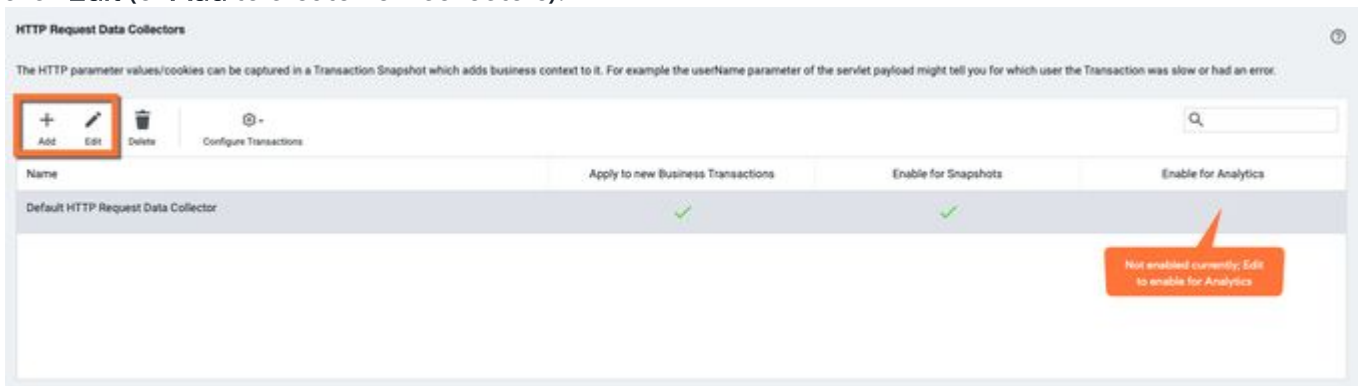

You must configure Transaction Analytics before you can configure data collectors. See [Collect Transaction Analytics Data](#).

Configure HTTP Request Data Collectors

To collect HTTP request data, you can use the default HTTP Request Data Collector. You need to explicitly enable the collector for Analytics.

To configure HTTP Data Collectors for Analytics:

1. In the Controller UI, select **Analytics > Configuration** from the top navigation bar.
2. Go to the Transaction Analytics - Manual Data Collection tab.
3. Select the application of interest from the **Configure Analytics for Application** dropdown.
4. Navigate to **HTTP Request Data Collectors**. Select the HTTP Data Collector to enable and click **Edit** (or **Add** to create new collectors).

- On the **HTTP Request Data Collector** page, confirm the data to collect, confirm **Transaction Analytics** is checked, and click **Save**.

- Select **Configure Transactions** and confirm that the data collector is enabled on the appropriate business transactions. See [Data Collectors](#).

Configure Method Invocation Data Collectors

You can also use the **Analytics > Configuration** page to enable existing or new Method Invocation Data Collectors. Open the **Method Invocation Data Collectors** panel. The process is essentially the same as described in [Data Collectors](#).

- Check the **Transaction Analytics** check box to use this collector for Analytics.
- Check the **Configure Transactions** popup to confirm you have enabled the right Business Transactions.
- Check that the name of the MIDC does not exceed the 50 character limit.

Field Name Recommendations

While there are no requirements for MIDC field names, AppDynamics recommends using only alphanumeric characters, hyphens, and underscores.

MIDC field names that start with special characters may cause application events to disappear from Analytics in the Controller. As a best practice, avoid the following characters in your MIDC field names:

- Dots
- Spaces
- Slashes
- Special characters (such as \$, %, &)
- Regular expression characters

You can learn more about field name conventions and recommendations in [Data Field Naming for Events Service >= 4.5.3](#).

i Changing the name of method invocation data collector will create a completely new field in Transaction Analytics. If you want to change the type of a data collector field, we recommend creating a new field instead to avoid conflicts with the old data.

Field Length Limit

The maximum number of characters allowed in a custom data field is 8,191.

Configure SQL Data Collectors

Transaction snapshots capture SQL queries. SQL data collectors provide a way to extract business data from parameters used in the SQL statements for use in analytics. See [Collect Business Data From SQL Calls](#).

Enable Transaction Analytics Data Type Conversion for Data Collectors

i Transaction Analytics data type conversion requires Controller >= 4.5.6. For Java deployments, Transaction Analytics data type conversion is available for Java Agents >= 4.5.2. For .NET deployments, Transaction Analytics data type conversion is available for .NET Agents >= 4.5.5.

Data collectors determine field type (string, boolean, or number) at runtime. At times the data you collect may not be the type in which you want to use it. For example, you are not able to add metrics if any data collectors are field type string.

While field type cannot be changed, you can specify field type before runtime with Transaction Analytics data type conversion.

To enable Transaction Analytics data type conversion:

1. Log in to the administration console:
`http:<controller-hostname>:8080/controller/admin.jsp` or `https:<controller-hostname>:45/controller/admin.jsp`.
2. On the **Controller Settings** page, change the value of `analytics.type.conversion.enabled` from `false` to `true`.
3. Click **Save**.

Data type conversion only appears when enabled in the **HTTP** and **Method Invocation Data Collector** configuration pages on your Controller. If this page was opened while you enabled data type conversion, you will need to refresh your page to see changes.

Data type conversion operates by the following rules:

- Available for new data collectors only.
- Select type manually for each data collector.
- Type cannot be changed once saved.

Transaction Analytics Data Type Conversion in HTTP Data Collectors

To use Transaction Analytics data type conversion, create a new HTTP parameter. You can add to an existing HTTP Request Data Collector or create a new one.

The process is essentially the same as creating an HTTP parameter. However, now that you've enabled Transaction Analytics data type conversion, you will see **Type** field with a dropdown.

The screenshot shows the 'HTTP Parameters' configuration section. At the top left is a '+ Add' button. Below it is a form with three input fields: 'Display Name', 'HTTP Parameters Name', and 'Type'. The 'Type' field has a dropdown menu that is currently open, displaying three options: 'String', 'Boolean', and 'Number'. Below the form is a 'Cookies' section with another '+ Add' button.

Select the desired field type for your HTTP parameter. If you do not want to specify a type, leave this field blank. The default type for HTTP data collectors is `string`.

Transaction Analytics Data Type Conversion in Method Invocation Data Collectors

To use Transaction Analytics data type conversion, create a new Method Invocation Data Collector (MIDC). You can add to an existing MIDC or create a new one.

The process is essentially the same as creating an MIDC. However, now that you've enabled Transaction Analytics data type conversion, you will see **Change Type to** field with a dropdown.

The screenshot shows the configuration for a Method Invocation Data Collector (MIDC). It includes a 'Display Name' field containing 'cartTotal'. Below this is a note: 'Create your own name for the data collected. This will be the display name for the data in Transaction Snapshots.' The 'Collect Data From' dropdown is set to 'Method Parameter', followed by '@ Index' and a spinner box set to '1'. The 'Operation on Method Parameter' dropdown is set to 'Use toString()'. The 'Transaction Analytics Type' section has two radio buttons: 'Use APM Type' (unselected) and 'Change Type to' (selected). The 'Change Type to' dropdown menu is open, showing 'String', 'Boolean', and 'Number' options.

Select the desired field type for your MIDC.

Transaction Analytics Type defaults to **Use APM Type**, which determines type at runtime. If you do not want to specify a type, select **Use APM Type**.

Name Requirements For Transaction Analytics Data Type Conversion

Refer to these naming requirements when using Transaction Analytics data type conversion:

- Display Names must be unique within each data collector. Names are case sensitive.
- You can repeat Display Names across different data collector configurations, as long as the field type is also the same.
- If you delete a field from a data collector and add it again with a different field type, you must rename the data collector.

Change Field Types

Field types cannot be changed once they have been saved to the data collector. To change the field type, we recommend to delete and recreate with a new name.

Configure Transaction Analytics for Node.js and PHP Applications

This page describes how to configure Transaction Analytics and Data Collectors for Node.js and PHP applications.

Before You Begin

Make sure you have installed and configured the components described in [Installing Agent-Side Components](#) and, for on-premises, [Custom Install](#) and [Events Service Deployment](#) before attempting to configure Transaction Analytics.

Configure Analytics for Node.js

Collect Default Node.js Transaction Data

To configure the Node.js Agent to send the default transaction data to the Analytics Agent, modify the require statement in your application.

Add these variables with the proper values to point to your Analytics Agent:

```
analytics: {
  host: <analyticsHostName>,
  port: <analyticsPort>,
  ssl: <true || false>
}
```

The Analytics Agent can be on the same host as the Node.js Agent or on a different host. See [Install the Node.js Agent](#).

Configure Data Limits

You can also configure the Node.js Agent to set limits on data sent to the Analytics Agent with these properties correlated to environment variables.

Property Name	Description	Environment Variable
analyticsMaxSegmentSizeInBytes	The maximum size of a business transaction segment collected in an Analytics request. By default, the value is 0.1MB.	APPDYNAMICS_ANALYTICS_MAX_SEGMENT_SIZE

Property Name	Description	Environment Variable
analyticsMaxSegmentsPerRequest	The maximum number of segments per Analytics request. By default, the value is 16.	APPDYNAMICS_ANALYTICS_MAX_SEGMENTS_PER_REQUEST
analyticsMaxMessageSizeInBytes	The size of a single request body sent to the Analytics Agent. By default, the value is 1MB.	APPDYNAMICS_ANALYTICS_MAX_MESSAGE_SIZE

Your require statement should look similar to the following example where your Analytics Agent is on localhost and listening on Port 9090:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

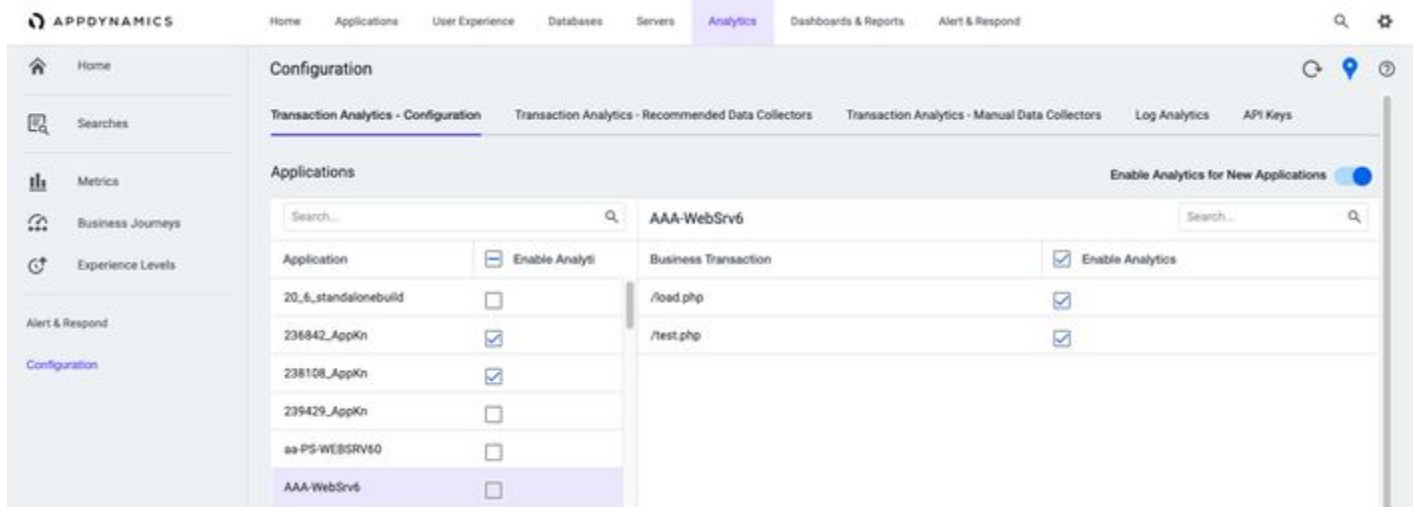

require ("appdynamics").profile({
  controllerHostName: '<Controller host name>',
  controllerPort: <Controller port number>,
  controllerSslEnabled: false, // Set to true if controllerPort is SSL
  accountName: '<AppDynamics account name>',
  accountAccessKey: '<AppDynamics account key>', // Required
  applicationName: '<Your application name>',
  debug: false,
  tierName: '<Choose a tier name>',
  nodeName: '<Choose a node name>', // The Controller appends the node name with a unique
number
  analyticsMaxSegmentSizeInBytes: 20,
  analyticsMaxSegmentsPerRequest: 20,
  analyticsMaxMessageSizeInBytes: 100,
  analytics: {
    host: 'localhost',
    port: 9090 },
  logging: {
    'logfiles': [
      {'root_directory': '/tmp/appd', 'filename': 'echo_%N.log', 'level': 'TRACE',
'max_size': 5242880, 'max_files': 10 },
      { 'root_directory': '/tmp/appd', 'filename': 'protobuf_%N.log', 'level': 'TRACE',
'max_size': 5242880, 'max_files': 10, 'channel': 'protobuf' }]
    }
});

```

Collect Node.js Data Collectors

You can also collect additional data from your Node.js business transactions by using the Node.js API. To configure Transaction Analytics data collectors for Node.js, see `txn.addAnalyticsData()` in the [Node.js Agent API Reference](#).

Configure Analytics for PHP Applications

1. In **Transaction Analytics - Configuration**, click the **Enable Analytics** checkbox to enable/disable Analytics on a PHP application.
2. To the right of **Business Transactions**, click the **Enable Analytics** checkbox to enable/disable Analytics on any Business Transaction(s) in the application.

⚠ Analytics data cannot be collected from PHP CLI programs.

To collect Transaction Analytics from the PHP Agent:

1. Configure the PHP Agent to send the default transaction data to the Analytics Agent. Modify the `.ini` file depending on the operating system under which your PHP Agent is installed. By default, your `.ini` file contains the following configuration where your Analytics Agent is on `localhost` and listens to Port `9090`:

```
agent.analyticsHostName = localhost
agent.analyticsPort = 9090
```

Add the following variables with the proper values to point to your Analytics Agent:

```
agent.analyticsHostName = <analyticsHostName>
agent.analyticsPort = <analyticsPort>
```

The Analytics Agent can either be on the same host as the PHP Agent, or on a different host. For information about installing the PHP Agent, see [Install the PHP Agent](#).

You must set the node level setting `analytics-dynamic-service-enabled=true` for reporting analytics.

-
2. HTTP/Method Invocation Data collectors for Analytics must be enabled for both transaction snapshots and Transaction Analytics to report data from the PHP Agent.

In order to collect the method return value with an MIDC, the value must be assigned to a variable.

```
$ret = function()
```

If the return value is not stored in any variable, it displays as `null` in both snapshot and Analytics data.

Add Custom Fields to Transactions Using Java SDK

You can add custom data using the Java Agent SDK as an alternative to adding [data collectors](#) from the Controller UI.

The fields show up on Transaction Analytics under a section called "Custom Method Data".

Add the code similar the following to your application:

```
//include the app agent SDK packages

import com.appdynamics.apm.appagent.api.AgentDelegate;
import com.appdynamics.apm.appagent.api.DataScope;
import com.appdynamics.apm.appagent.api.IMetricAndEventReporter;

public void someMethod(String stringParam, int intParam, ComplexObject complexObjParam) {

    //Get the data reporter.
    IMetricAndEventReporter reporter = AgentDelegate.getMetricAndEventPublisher();

    //Define the scope for data collection.
    Set<DataScope> allScopes = new HashSet<DataScope>();
    allScopes.add(DataScope.ANALYTICS);
    allScopes.add(DataScope.SNAPSHOTS);

    Set<DataScope> analyticsScope = new HashSet<DataScope>();
    analyticsScope.add(DataScope.ANALYTICS);

    //Add data to different scopes based on the need.
    //Here both key1 and key2 are collected for both snapshots and analytics
    reporter.addSnapshotData("key1", stringParam, allScopes);
    reporter.addSnapshotData("key2", intParam, allScopes);

    //Here key3 is only collected for analytics.
    //Since the passed object is a complex java object and not a primitive type, toString()
    method is invoked on it and the string value will
    //be collected.
    reporter.addSnapshotData("key3", complexObjParam, analyticsScope);

    .....
    Business logic.
}
```

The third parameter to the method is a set of enums, `DataScope`, that define the scope for collecting the custom data:

- To collect custom data only for snapshots, use `DataScope.SNAPSHOTS` as the third parameter.
- To collect the custom data for analytics, use `DataScope.ANALYTICS` as the third parameter.
- If custom data should be added to both snapshots and analytics then both the enums should be passed in a set as the third parameter.

Method details for `addSnapshotData()`

```
boolean addSnapshotData(java.lang.String key,  
                          java.lang.Object value,  
                          java.util.Set<DataScopes> dataScopes)
```

Method Parameters

- `key` - key
- `value` - Primitive types can be passed as values and the types (int, boolean, etc) will be respected. Strings can be passed as values, however, note that if you pass composite objects then agent performs a `.toString()` operation on it.
- `dataScopes` - scope for the custom data collection:
 - `Datascope.SNAPSHOTS`
 - `Datascope.ANALYTICS`

Returns

true if the agent successfully collects the key-value pair for the given scope.

Collect Business Data From SQL Calls

Transaction snapshots capture SQL database calls. The SQL calls can contain useful business data. Analytics SQL data collectors are a way to collect the business data from SQL parameters for use in transaction analytics.

To configure an Analytics SQL data collector you need to know:

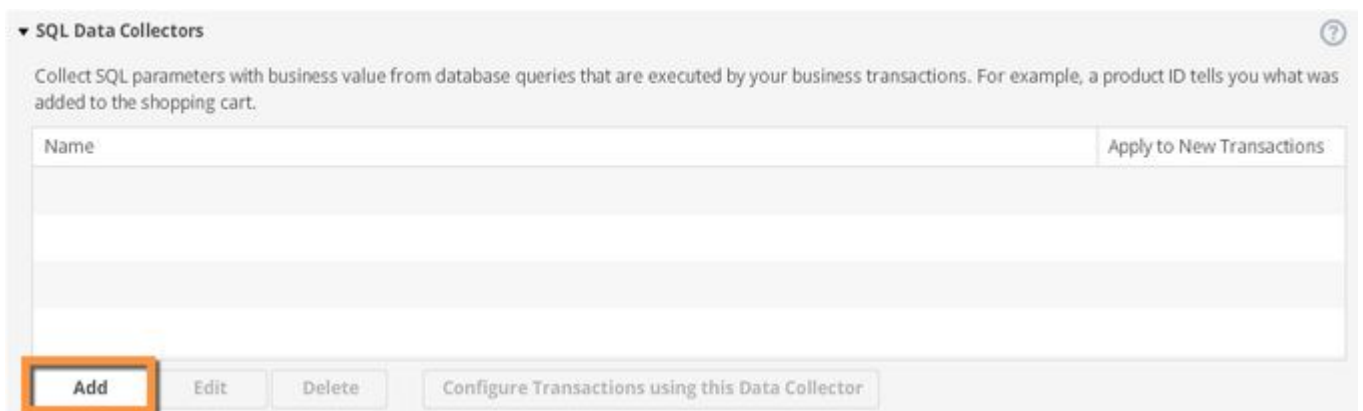

- Analytics-enabled application where the SQL call is executed.
- Database target of the SQL call.
- Specific SQL parameterized statement that contains the data of interest as a query parameter.
- Analytics-enabled business transactions making the database call.
- Parameters to be collected.

This feature is supported as:

- The SQL data collector list shows the slowest database calls over the last 30 days. You can also create a SQL data collector directly from the **DB & Remote Service Calls** tab of a snapshot.
- Requires 4.3 Java Agent or 4.3 .NET Agent.
- Only prepared statements containing data of interest as binding variables can be used. Literal strings that are passed in can not be collected.
- There is a 500-character limit on the length of the SQL statement. Do not use any truncated queries that might appear in the SQL Statements list or a snapshot.
- The overall number of executions of SQL queries configured to collect Analytics data is limited to 10K. This is configurable using the `analytics-sql-cpm-limit` node property. See [App Agent Node Properties](#).

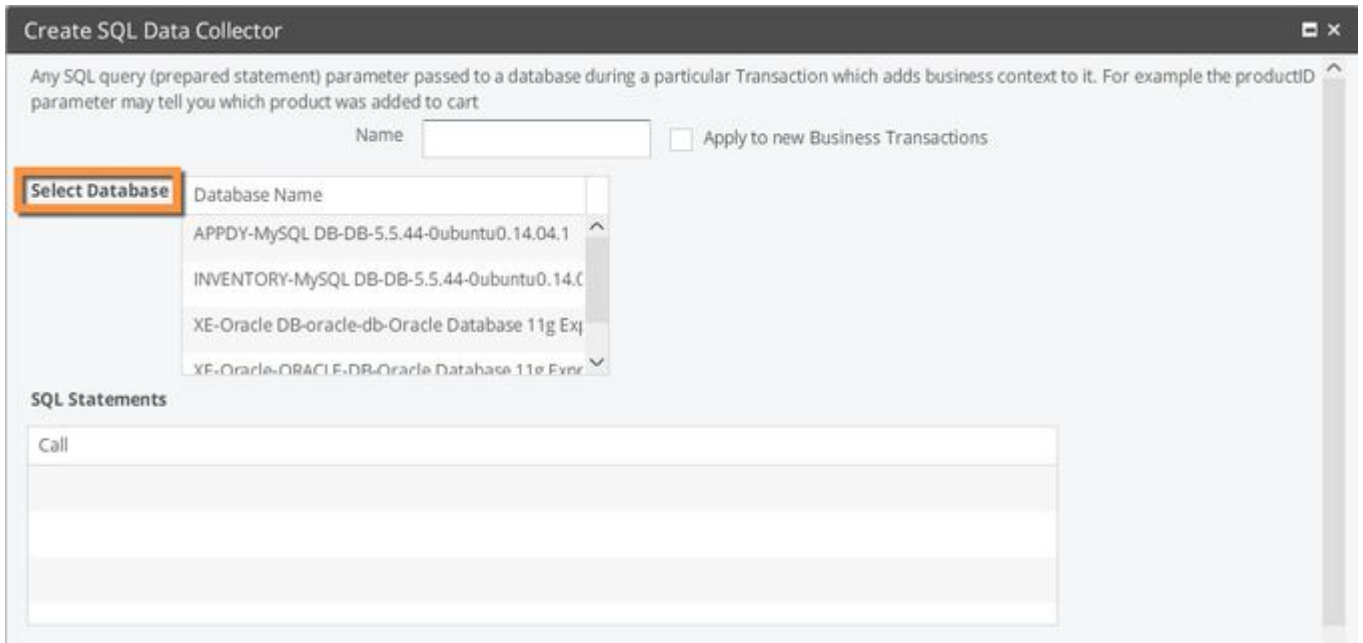

Configure SQL Data Collectors From Analytics

1. In the Controller UI, from the top navigation bar, select **Analytics > Configuration**.
2. From the Transaction Analytics tab, select the application from the **Configure Analytics for Application** dropdown and confirm that analytics data collection is enabled.
3. Scroll down to expand the **SQL Data Collectors** section, and click **Add**.

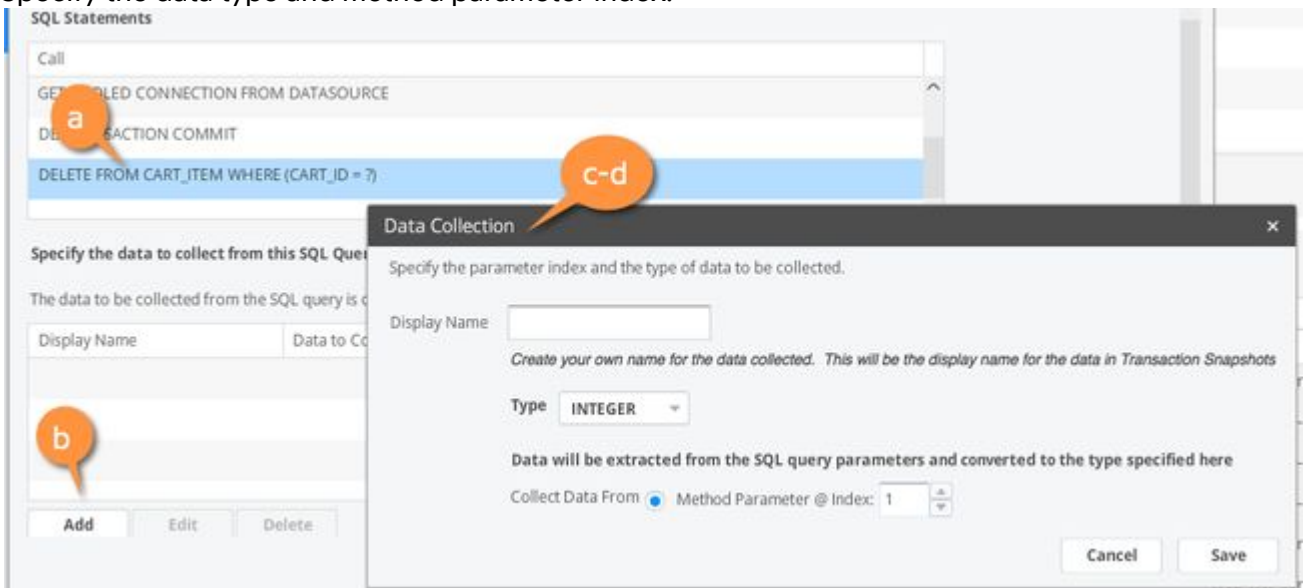

4. Name your data collector and indicate if the collector should apply to new business transactions.
5. Select the appropriate database. A list of available SQL statements displays showing the slowest database calls over the last 30 days. This timeframe is not configurable.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

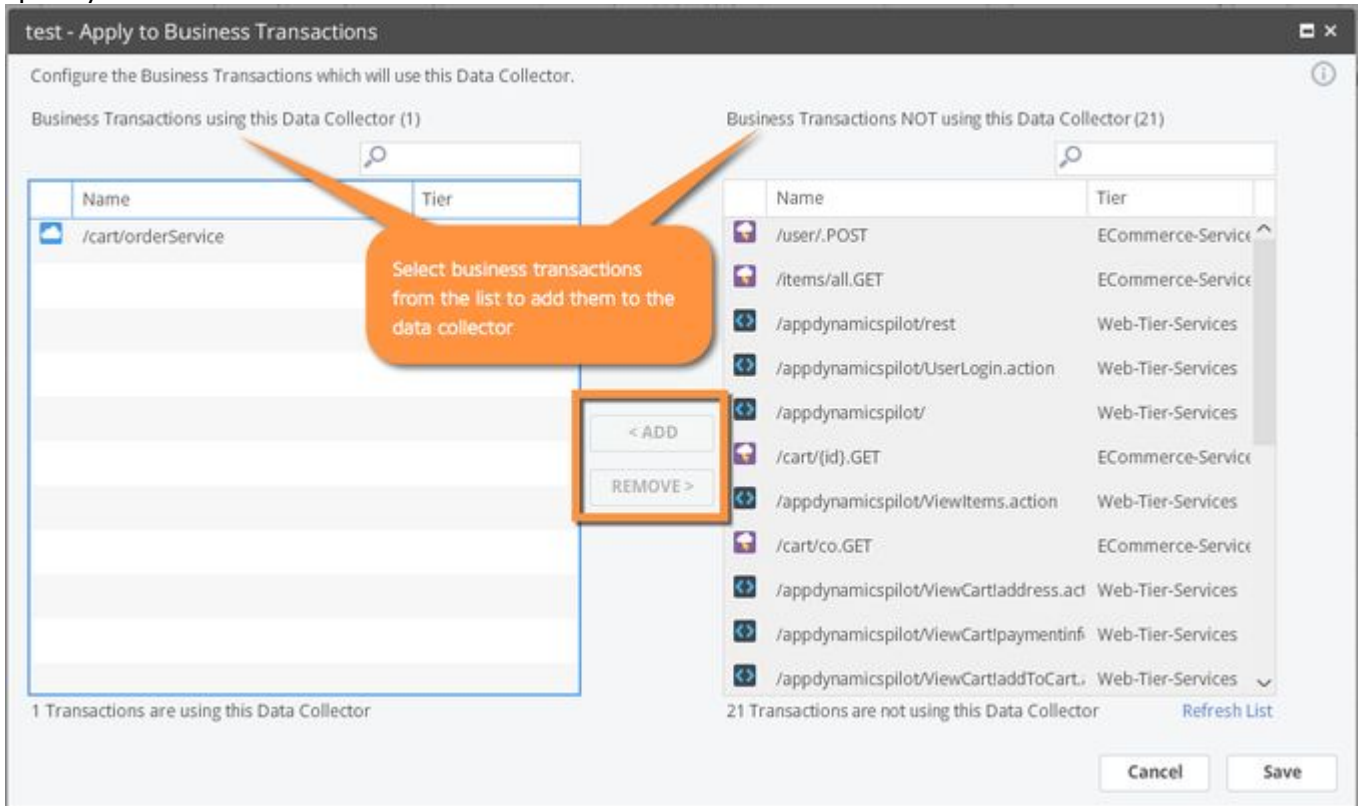

6. Define the data to collect.
 - a. Select the SQL prepared statement containing the parameter that you want to capture for analytics.
 - b. Click **Add** to specify the data to be collected.
 - c. Type a display name for the data you are collecting.
This name appears in the Analytics UI Fields list when the data is collected and passed to Analytics.
 - d. Specify the data type and method parameter index.

- e. Click **Save**.
 - f. Click **Create SQL Data Collector**.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

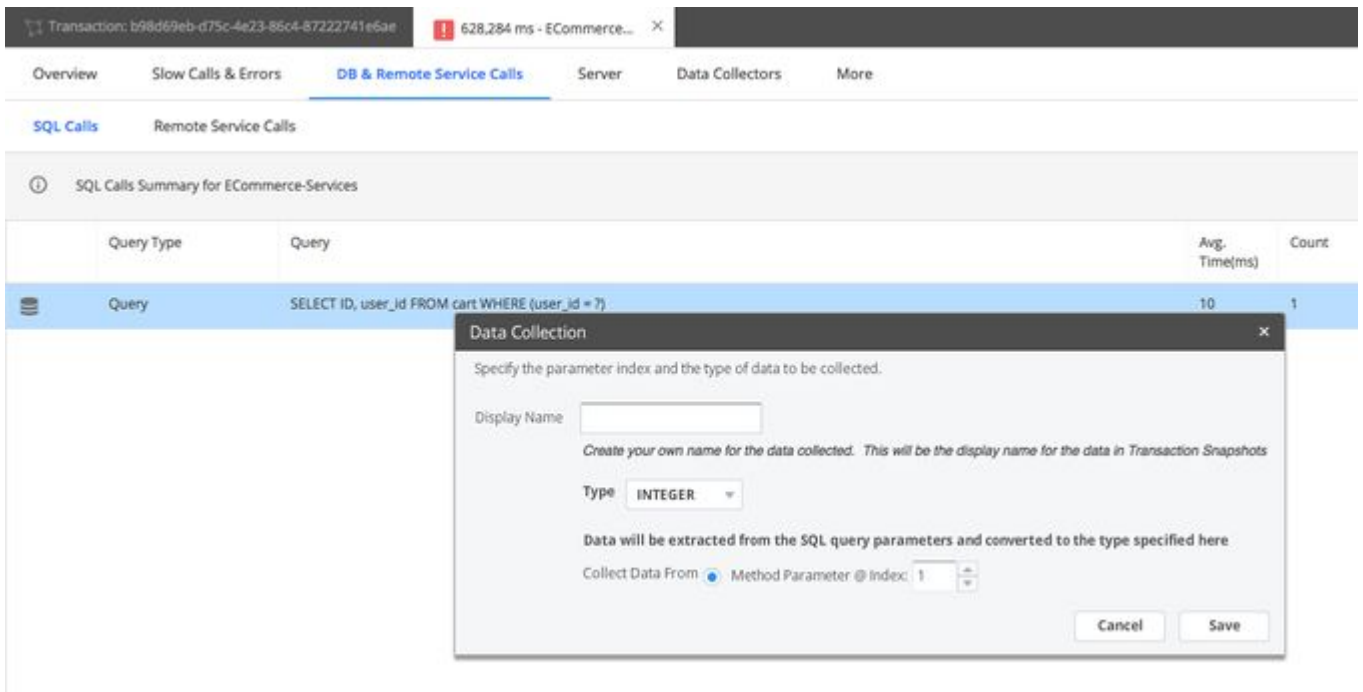

7. Specify the business transactions that will use this collector and click **Save**.

Configure SQL Data Collectors From Snapshots

This procedure provides a shortcut way to set up the configuration for an Analytics SQL data collector for a database call captured in an application transaction snapshot. You need to find the transaction snapshot of interest and drill down to the node that contains the database call of interest.

1. From the **DB & Remote Service Calls** tab of a snapshot containing the SQL call of interest, select the prepared statement that contains the data you want to collect for analytics.
2. Right-click the query and select **Configure Data Collector** from the context menu. The **Data Collection** panel displays.

3. Enter a display name for the data you are collecting.
4. Specify the type and the parameter to collect and click **Save**.
5. Select the business transactions from which to collect the data and click **Save**.

View SQL Data in Analytics

After the data is successfully collected for analytics, you see the fields in the **Fields** list in a section labeled SQL Data. This can take a few minutes depending on your application and the frequency of transactions executing the relevant SQL query.

Collect Log Analytics Data

Related pages:

- [Configure Log Analytics Using Job Files](#)
- [Analytics Log Data](#)

To capture and present log records as analytics data, you must configure one or more *log sources* for the Analytics Agent. The Analytics Agent uses the log source configuration to:

- Capture records from the log file
- Structure the log data according to your configuration
- Send the data to the Analytics Processor.

The Controller presents the Log Analytics data in the Analytics UI.

Before attempting to configure Log Analytics, confirm you have installed and configured the components described in [Install Agent-Side Components](#) and, for on-premises, [Custom Install](#) and [Events Service Deployment](#).

Versions < 4.3 use *job files* to configure the log sources. You may continue to use job files that were created in previous versions. If you want to collect new log events into our platform, we recommend that you use the Centralized Log Management UI to define *source rules*. You may also find it useful to replace existing job file configurations with the new source rules so you can take advantage of new features introduced in 4.3. See [Migrate Log Analytics Job Files to Source Rules](#).

To configure data collection for your log sources, see [Configure Log Analytics Using Source Rules](#).

Manage Extracted Fields

In Controller < 4.3, you could extract fields from logs in the Controller UI. This is described on the [Create Extracted Fields from Logs](#) page. This option is not available >= 4.3. It is replaced entirely by Field Extraction in the Centralized Log Management UI. See [Configure Log Analytics Using Source Rules](#) for details.

Fields that were extracted by this mechanism in previous versions appear in the Extracted Fields list. Hovering over the field reveals a **View** icon. Click the **View** icon to delete the field or to see the configuration details:

- Regular expression used to extract the field
- Field name
- Field type
- Source type

Configure Log Analytics Using Source Rules

Related pages:

- [Agent Scopes for Configuration Log Management](#)
- [Analytics Log Data](#)
- [Collect Log Analytics Data from Syslog Messages](#)

The Centralized Log Management UI enables you to configure your log data sources using source rules.

Once you define source rules, you specify which Analytics Agents should use the rules by associating specific source rules with Agent Scopes. Agent Scopes are groups of Analytics Agents that you define. Using Agent Scopes simplifies the deployment of the log source configuration to multiple agents.

Log Analytics Source Rules

Analytics Agents collect logging information based on the log source rules you define in the Controller.

The primary function of a source rule is to specify the location and type of a log file, the pattern for capturing records from the log file, and the structure of the data of captured records. They can also specify field masking or sensitive data removal and manage time zones of captured records.

When the log source rules are enabled and associated with Agent Scopes, Analytics Agents automatically start collecting the configured logs as follows:

- Analytics Agents register with the Controller on startup
- Analytics Agents download log source rules to configure log collection (after registration)
- Log source rules are stored in the Controller data store and are configurable through the Centralized Log Management UI
- Analytics Agents start acting on log source rule changes within five minutes (this could be longer if there are any network communication issues)

Permissions

To configure log analytics source rules, you need the following permissions:

- Manage Centralized Log Config permission
- View access to the specific source types that you want to configure

See [Analytics and Data Security](#).

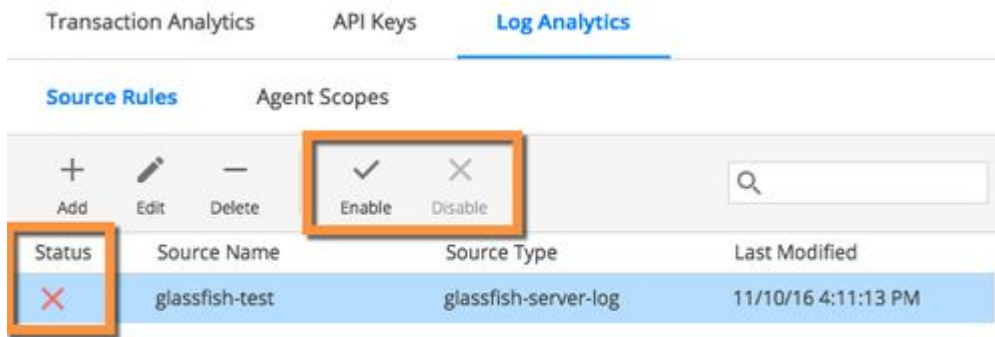

Analytics Agent Properties

If you are using Centralized Log Management (CLM), you need to configure additional properties in the `analytics-agent.properties` file. See information on configuring properties for consolidated log management in [Install Agent-Side Components](#) for details.

Managing Source Rules

When you create a source rule and save it, the rule is initially disabled. This is shown in the **Status** column on the source rule list page.

You can enable or disable a source rule by selecting it and choosing the corresponding option from the **Source Rules** menu, shown in the following screenshot:

You can also see which source rules use a specific agent scope. The Analytics Agent does not collect the log data until the source rule is enabled and assigned to an Agent Scope with active Analytics Agents.

Starting Point for Creating a Source Rule

You can create a source rule from any one of these starting points:

- AppDynamics template. Several templates for common log file formats are available.
- Existing source rule. You can use existing source rules as the starting point for new rules.
- New source rule. Start from scratch when your log file does not match one of the available templates.

Preview Extracted Log Data Using Sample Log Files

To improve validation of data collection and parsing of log messages, you can use a local log file with the Log Analytics Configuration UI to preview the field extraction that you want. Three types of field extraction are available.

- Grok patterns and key-value pair extraction
- Auto extraction using regular expressions
- Manual extraction using regular expressions

Best Practices for Source Rule Design

A few recommendations apply to making source rules.

Use the simplest possible regular expressions and grok matching patterns possible. Do not make excessive use of wildcards or quantifiers as it can slow the responsiveness of the Controller UI. You can view examples of such greedy quantifiers on <https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html>.

If a regex pattern (including grok) is taking more than five seconds to match against a logline, extraction and further processing for those fields stop. If this occurs, some fields may be missing for that log line when viewed on the Controller. Other log lines are not impacted; however, this occurrence is often the result of an ineffective or faulty matching pattern in the first place, and processing is likely to take a long time for all log lines. This behavior is applicable to the dynamic Preview screens in the **Centralized Log Analytics Configuration** page as well.

The Controller limits the size of the records it retrieves to 32 KB by source rule in log analytics. This limit guards against excessive system resource burden, including potential resource burden that might be caused by excessive data collection due to faulty source rule patterns.

Create a Source Rule

1. From the Controller top navigation bar, click **Analytics**.
2. From the left navigation panel, click **Configuration > Log Analytics**.
You see two tabs, one for Source Rules and one for Agent Scopes.
3. From the Source Rules tab, click **+ Add**.
You see the **Add Source Rule** panel.
4. In the **Add Source Rule** panel, select your starting point for the source rule. Note that you can also use a job file as the starting point for your source rule. See [Migrate Log Analytics Job Files to Source Rules](#).

5. Use **Collection Type** to indicate if the source log file resides on the local filesystem or will be collected from a network connection.

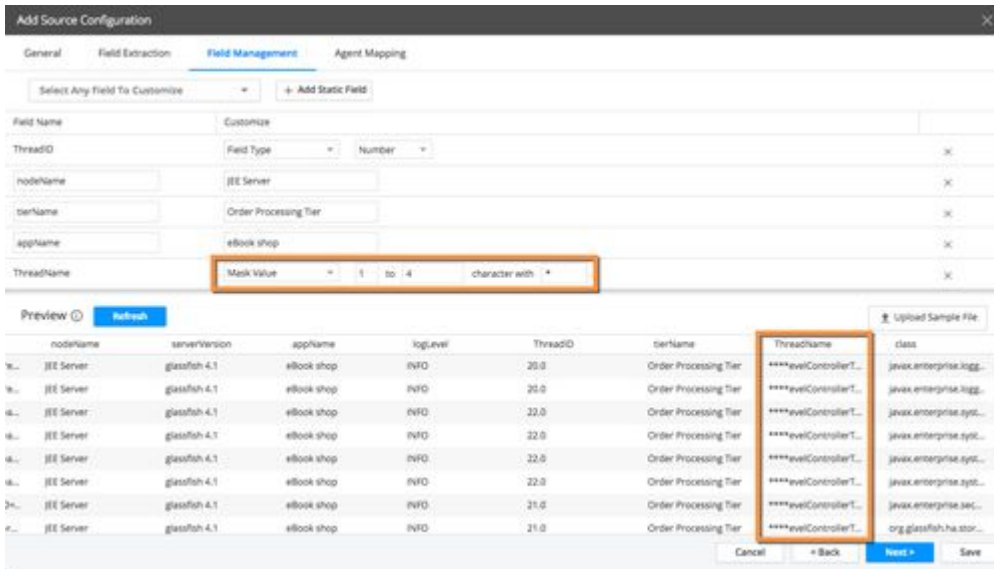

i Collecting from a network connection is only used for a TCP source rule, which extracts log analytics fields from `{{syslog}}` messages over TCP. See [Collect Log Analytics Data from Syslog Messages](#).

6. Use the **Browser** button to locate and specify a sample log file to preview the results of your configuration. You can also specify a sample file later in the configuration process during the field extraction step.

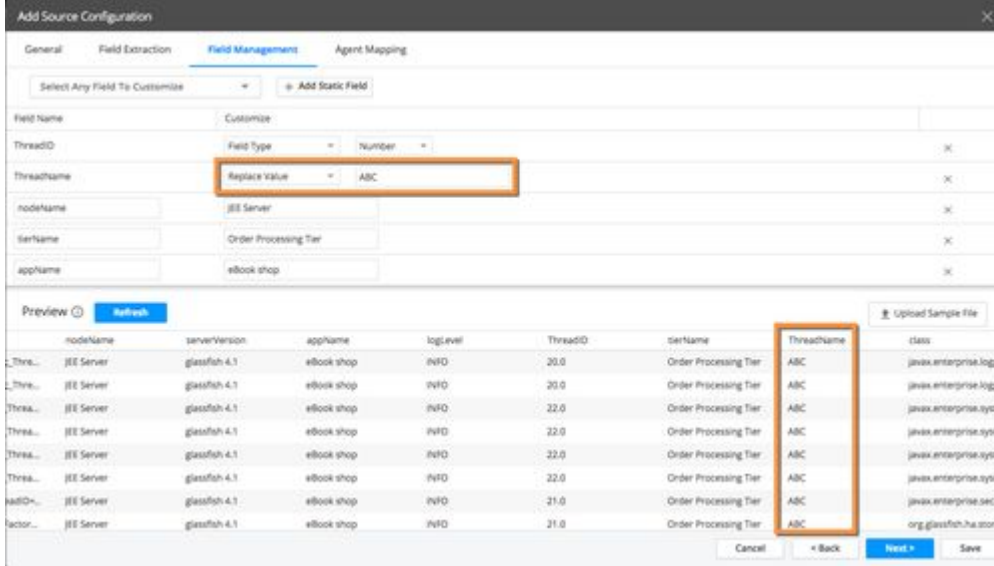

7. Click **Next** to see the **Add Source Configuration** page. Some fields may be prepopulated with data if you selected either an AppDynamics template or an existing source rule as your starting point. The four tabs are:
 - General
 - Field Extraction
 - Field Customization
 - Agent Mapping
8. On the General tab, name your rule, specify its location, timestamp handling, and other general characteristics. See [General Configuration](#).
9. On the Field Extraction tab, configure the fields that you want to capture from your log file. For more details on the fields on this subtab, see [Field Extraction](#). For a detailed procedure on using Auto Field Extraction, see [Field Extraction for Source Rules](#).

i Use the simplest possible regular expressions and grok matching patterns. Do not make excessive use of wildcards or quantifiers as it can slow the responsiveness of the Controller UI. Examples of expensive and greedy quantifiers can be found here <https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html>

10. On the Field Management tab, you can customize the handling of fields in a number of way including masking sensitive data, renaming fields, changing the data type and more. See [Field Management](#). **Mask Value:** Use this option to mask values of sensitive data such as credit card numbers or social security numbers. Select **Mask Value** and enter the starting index and ending index (1 and 4 respectively for the example shown) and a character to use for masking in the display, such as an * asterisk.

Replace Value: Use this option to replace the entire data field with a static string. Select **Replace Value** and enter the string to use:

- On the Agent Mapping tab, assign the source rule to specific Agent Scopes.
- Click **Save** when you are finished. The source rule is saved in a disabled state.

Centralized Log Management UI Details

General Configuration Tab

Field	Description	Required
-------	-------------	----------

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Source Name	Name of this source rule. This name must be unique. Appears in the list of defined source rules.	Yes
Source Type	Specifies the event type of log source file. This field is prepopulated when you start from an AppDynamics template or an existing source rule. If you are creating a new source rule from scratch, you can specify any value. This value is used to identify this specific type of log event and can be used in searching and filtering the collected log data. The value shows up in the field list for the log data.	Yes
Source File	<p>The location and name of the log file to serve as a log source. The location must be on the same machine as the analytics-agent.</p> <p>You can use wild cards and you can specify whether to match files one level deep or all log files in the path directory structure.</p> <ul style="list-style-type: none"> • Example for multi-level matching: path: /var/log/**/*.*.log This matches both /var/log/apache2/logs/error.log and /var/log/cassandra/system.log • Example for one level matching: path: /var/log/*.*.log This searches for .log files one level deep in the /var/log directory (matches on /var/log/cassandra/system.log but not on /var/log/apache2/logs/error.log). 	Required when collection type is from the local filesystem.
Exclude Files	<p>Exclude, or blacklist, files from the defined source rule(s). Input the relative path of the file(s) to exclude, using wildcards to exclude multiple files.</p> <ul style="list-style-type: none"> • Example for a single file: Source File: /var/log/**/*.*.log Exclude Files: cassandra/system.log • Example for multiple files: Source File: /var/log/**/*.*.log Exclude Files: */system.log 	No

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

<p>TCP Port</p>	<p>Specifies the port for the analytics-agent to collect log files from a network connection. This field is not present if the collection type is From local file system.</p> <p>If no port number is provided, port 514 is used. Both the syslog utility and analytics-agent should have root access to send logs to port 514 (binding to ports less than 1024 requires root access).</p>	<p>Required when collection type is from a network connection.</p>
<p>Enable path extraction</p>	<p>This checkbox enables extraction of fields from the path name. Add a grok pattern in the text box.</p> <p>The syntax for a grok pattern is <code>{%{SYNTAX:SEMANTIC}}</code>. For example, to extract <code>AdminServer</code> from <code>/opt/apps/oracle/middleware/user_projects/domains/ouaf_domain1/servers/AdminServer/logs/AdminServer.log</code>, enter the following GROK pattern: <code>servers/{DATA:servername}/{GREEDYDATA}</code>, where <code>{DATA:server}</code> filters the server name and <code>{GREEDYDATA}</code> filters rest of the message from the log path.</p>	<p>No</p>
<p>Start collecting from</p>	<p>Indicate where to begin tailing (collecting the log records). Options are:</p> <ul style="list-style-type: none"> • From the beginning of the log file • From the end of the log file • A specific time range (in hours) - For example, if you set this to four hours, then when you enable the rule and analytics starts tailing the log data, only the last four hours of data is ingested. When tailing starts, the watermark state is maintained for that file. If the agent is now stopped and restarted, it will start tailing from where it left off for any old file. For new files, it will only tail the last four hours of data. 	<p>The default is to collect log records from the beginning of the file.</p>

Override time zone	Use this to override the time zone for eventTimestamp in log events. If your log events don't have a time zone assigned and you are not overriding it, the host machine time zone is assigned to the log events. You cannot override the timezone in the pickupTimestamp field. If you override the time zone, you must provide a timestamp format. Time zone formats should conform to Joda-Time Available Time Zones , and the timestamp format should be created with the Joda-Time formatting system .	No
Override timestamp format	You can override the format if needed. Time zone formats should conform to Joda-Time Available Time Zones , and the timestamp format should be created with the Joda-Time formatting system .	Yes. The override timestamp format is needed to extract out time correctly from the log file. If you do not provide this field, the eventTimestamp will be equal to pickupTimestamp despite log line having a timestamp.
Auto-Correct duplicate Timestamps	Enable this option to preserve the order of original log messages if the messages contain duplicate timestamps. This adds a counter to preserve the order.	No
Collect Gzip files	Enable this to also find gzip files in the specified path.	No

Field Extraction Tab

The following table describes the fields and actions on this tab. For a detailed procedure on using Auto or Manual Field Extraction, see [Field Extraction for Source Rules](#).

Section/Field or Action	Description
Add Grok Pattern	

Message Pattern	This is the grok pattern used to extract fields from the log message. A pattern may be prepopulated when you use an AppDynamics template or an existing source rule as your starting point. You can add or remove grok patterns as needed.
Multiline Format	<p>For log files that include log records that span multiple lines (spanning multiple line breaks), use this field to indicate how the individual records in the log file should be identified. You have two options:</p> <ul style="list-style-type: none"> • startsWith: A simple prefix that matches the start of the multiline log record. • regex: A regular expression that matches the multiline log record. <p>The multiline format is not supported when you are collecting log data from a network connection.</p>
Extract Key-Value Pairs	
Field	Shows the field selected for key-value pair configuration.
Split	The delimiter used to separate the key from its value. In this example, "key=value": the split delimiter is the equal sign "=". Multiple comma-separated values can be added.
Separator	The delimiter used to separate out two key-value pairs. In this example, "key1=value1;key2=value2": the separator is the semi-colon ";". Multiple comma-separated values can be added.
Trim	A list of characters to remove from the starting and/or the end of the key/value before storing them. In this example, "_ThreadID_": you can specify the underscore "_" as the trim character to result in "ThreadID". Multiple comma-separated values can be added.
Include	A list of key names to capture from the "source". You must provide keys in the include field. If the include field is left blank no key-value pairs are collected.
Actions	
Upload Sample file	Browse to a local file to upload a sample log file.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Preview	Use to refresh the Preview grid to see the results of the specified field extraction pattern.
Auto Field Extraction	
Definer Sample	Select a message from the preview grid that is representative of the fields that you want to extract from the log records. You can select only one definer sample per source rule.
Refiner Samples	Refines the regular expression to include values that were not included in the original definer sample.
Counter Sample	This specifies something to ignore. Refines the regular expression to exclude values that were included by the original definer or refiner sample.
Manual Field Extraction	
Regular Expression	Add a regular expression to define the field you want to extract.
Field Type	Specify the type for the field.
Field Name	Automatically generated within the regular expression pattern. This name appears in the Fields list in the Analytics Search UI.
Actions	
Add Field	Use to add additional regular expressions for extracting more fields. You cannot add more than 20 fields.
Preview <ul style="list-style-type: none"> • All • Matching • Non-Matching 	Use these buttons to filter the viewable results in the preview grid.
Upload Sample File	Upload a sample file from your local file system to use in the preview grid.

Field Management Tab

Field/Action	Description
Select Any Field to Customize	Select the field to add customizations. You can add multiple customizations to a single field.
Field Name	This column lists the fields that have customizations.
Customize	This column shows the specific customizations. For static fields, the display name is shown. Static fields cannot be further customized.
Mask Value	This customization option masks values in the collected data. Specify the starting and ending position in the data and the character to use as the masking value.
Replace Value	This customization option replaces the entire value of the field with a static string.
Rename	This customization option enables you to rename a field to a more recognizable display name.
Field Type	Use to change the data type of the field. For example, from string to number. Available types are String, Boolean, and Number. Note that after a source rule has been saved with a field of a specified data type, you cannot later change the data type of that field. Once the fields are indexed in the analytics database trying to specify a new type will cause a validation error.
Remove	This customization turns off data collection for the field. It can be reversed at a later time.
Add Static Field	This action allows you to add a static field to all the log events collected from this source. This field can then be used to search and filter the log data. For example, use this to add Tier, Node, and Application Name to the log data.

Field Extraction for Source Rules

This page describes how to use Auto and Manual Field Extraction to configure Log Analytics source rules. Field Extraction uses regular expressions to identify and format the fields for your Log Analytics data.

Auto Field Extraction enables you to upload a sample log file and select fields for extraction. The necessary regular expressions are automatically generated and highlighted in your sample messages. You can fine-tune the generated regular expressions using Refiner Sample and Counter Sample log messages.

Manual Field Extraction enables you to upload a sample log file and enter your own regular expressions to define fields and associate the fields with a data type.

Definitions

- **Source Rule:** a set of configuration settings for extracting analytics data from log files. You create source rules using the Centralized Log Management UI in the Controller. Source rules are stored in the Controller data store and periodically synced with the Analytics Agent. See [Configure Log Analytics Using Source Rules](#).
- **Sample File:** a representative log file uploaded to the Controller that provides a way to test and fine-tune your log file source rules.
- **Definer Sample:** a specific log message selected from the sample log file used to define the fields that you want to extract from the log messages.
- **Refiner Sample:** an additional log message used to revise the auto-generated regular expression created in the Definer Sample step. The Refiner sample helps capture fields that were missed in the initial step.
- **Counter Sample:** an additional log message used to eliminate false positives while extracting the fields as defined in the Definer or Refiner steps.

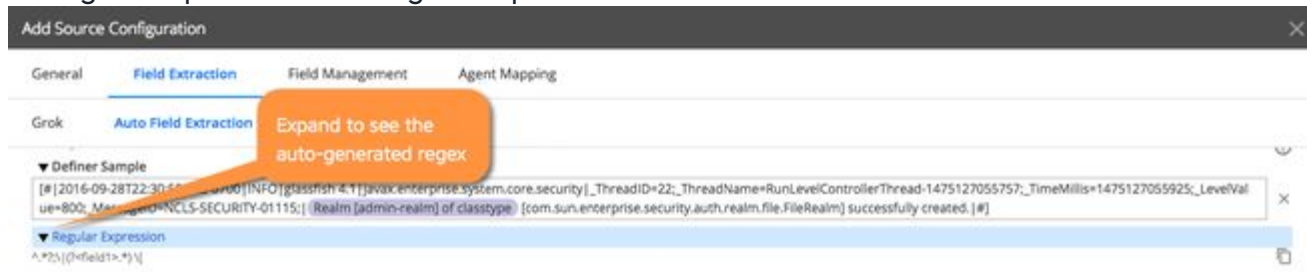

Auto Field Extraction

This section describes how to use Auto Field Extraction to extract fields from your log files.

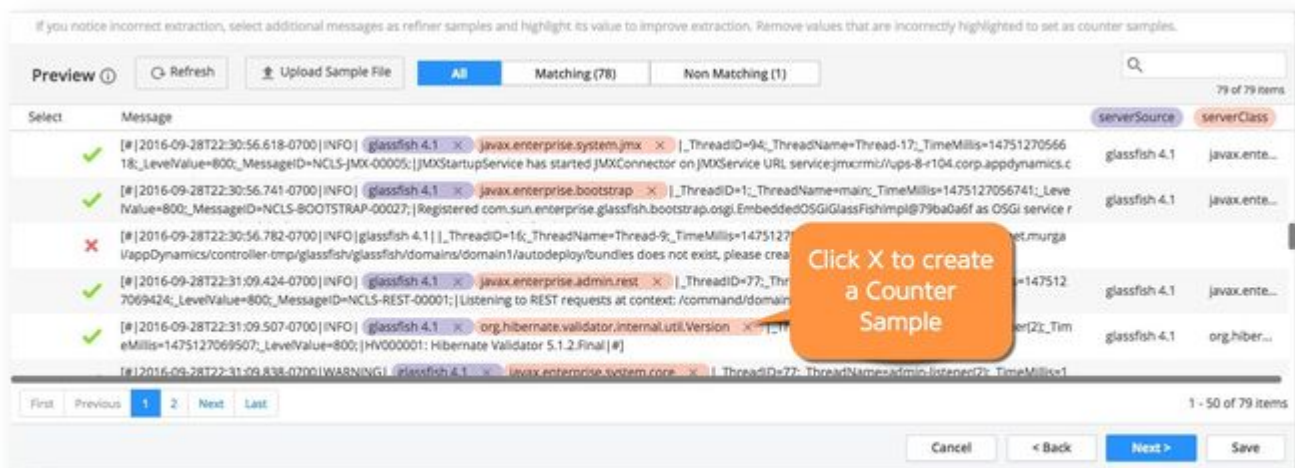

To specify field extraction using a Definer Sample log message:

1. Using the Centralized Log Management UI, add a new source rule (or edit an existing source rule), and navigate to the Auto Field Extraction subtab within the Field Extraction tab. See the section "*Create a Source Rule*" in [Configure Log Analytics Using Source Rules](#) for detailed steps on accessing this UI.
2. If you do not see log messages in the grid, upload a sample file by clicking **Upload Sample File**. If you uploaded a sample file in a previous step in the configuration process or you started your new source rule using an existing source rule, you will see log messages in the grid.
3. Hover over any row on the grid and click **+Select as Definer Sample**. Choose a sample log message that contains the fields you want to extract from the log file. When you need to capture fields from dissimilar log messages, you can create more than one definer.
4. After you select the Definer Sample message, use the following steps to extract fields from the message. After selecting the Definer Sample and specifying the fields to extract, the preview grid displays rows with matching and non-matching results.
 - a. Select text in the message. If you are defining key-value pairs, it is only necessary to highlight the key field.
A popup appears where you can specify properties of the extracted field.
 - b. Enter the field name, select the data type, and click **Extract**.
The preview grid is updated to show matching rows with the selected text highlighted with a color.
 - c. (Optional) To update the properties or delete the field, click the field you just created in the definer and the properties popup appears.

- d. Repeat steps a, b and c to create more fields.
As you add additional fields, the regular expression changes. You can view or copy (but not edit) the regular expression in the regular expression section.

5. (Optional) Specify Refiner Samples: As you review the non-matching rows, if you notice a value that was not extracted and should have been extracted, then you can add that row as a Refiner Sample. A refiner sample is used to match the unmatched rows from the Definer step.
 - a. On the grid, click **+Select as Refiner Sample**. You do not see this option unless you already selected the Definer Sample.
 - b. Select the text.
 - c. A popup appears. You can associate this portion of text with a field already created in the Definer step. When you extract, the regular expression changes and matching rows get updated in the Preview grid and will be shown as Matching. If necessary, you can add more than one Refiner Sample message.
6. (Optional) Specify Counter Samples: Counter samples eliminate false positives while extracting the fields. In the Preview grid, the highlighted values are shown along with an X button. Click the X next to a field to mark a value as a false positive (a Counter Sample).

The Counter Sample is shown below the Definer and Refiner Samples and the regular expression is updated to show the new set of matching and non-matching rows.

The screenshot shows the 'Manual Field Extraction' interface. At the top, there are tabs for 'Grok', 'Auto Field Extraction', and 'Manual Field Extraction'. Below the tabs, there are sections for 'Definer Sample' and 'Counter Samples'. A log message is selected, and a regular expression is applied to extract fields. The preview grid shows the results of the extraction for three log messages.

7. Click **Save** to save the fields to the source rule.
8. Continue to the other tabs of the Add Source Rule dialog to complete your source rule configuration.

Manual Field Extraction

You can specify your own regular expressions if needed using Manual Field Extraction.

1. Using the Centralized Log Management UI, add a new source rule (or edit an existing source rule), and navigate to the Manual Field Extraction subtab within the Field Extraction tab. See "[Create a Source Rule](#)" in [Configure Log Analytics Using Source Rules](#) for detailed steps on accessing this UI.
2. If you do not see log messages in the grid, upload a sample file by clicking **Upload Sample File**.
3. Click **Add Field**.
4. Click **Show Example** to review how to write regular expressions.
5. Type in your regular expression and associate it with a field type using the drop-down menu.
6. In the Preview grid, click Refresh.
The preview grid is highlighted with the results of applying the regular expression to the sample log messages. You cannot add more than 20 fields.
7. (Optional) You can change the regular expression or the type and use **Refresh** to see the updated results.
8. Click **Save** to update your source rule.

Agent Scopes for Configuration Log Management

Related pages:

- [Configure Log Analytics Using Source Rules](#)

Agent Scopes are used to determine which agents use the CLM source rules. You can group your deployed Analytics Agents into scopes, then assign source rules to the scopes. While creating an agent scope, you are given an option to either choose agents from a static list or to add agents dynamically by specifying matching rules.

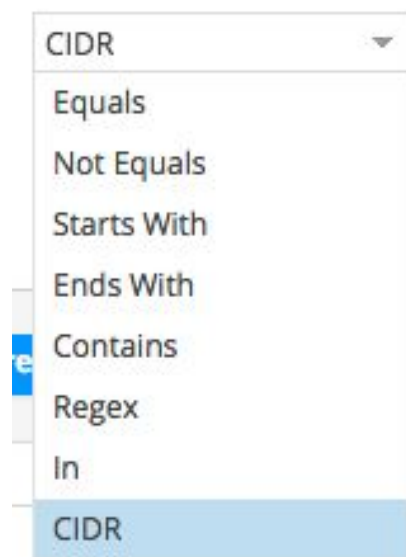

Static Agent Scopes

The Available Agents list is populated with the Analytics Agents reporting to your controller. You can use this list to add currently available agents to a scope.

Dynamic Agent Scopes

You can specify match conditions where registered Analytics Agents that match the rule are automatically added to, or excluded from, the scope. Analytics Agents that register with your Controller in the future, with characteristics that match the scope criteria, will also be added to the scope. You can match on agent name, unique host ID, or IP address.

The available operators for the matching conditions include regular expressions (regex) and Classless Inter-Domain Routing (CIDR) notation. CIDR is a compact notation for an IP address and its associated routing prefix.

The match conditions are additive, so exclusions will take precedence over inclusions. An agent must satisfy all conditions to be included. For example, an agent named *ABC* would not be included in the scope if you specify something similar to the following conditions:

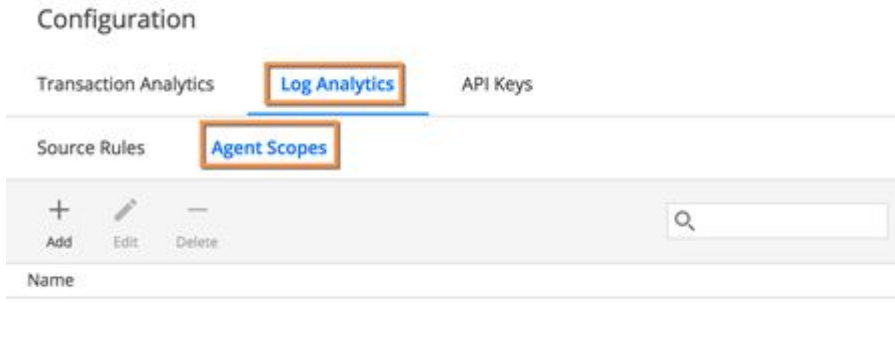

- include name equals 'ABC'
- include name that ends with 'D'

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Define Agent Scopes

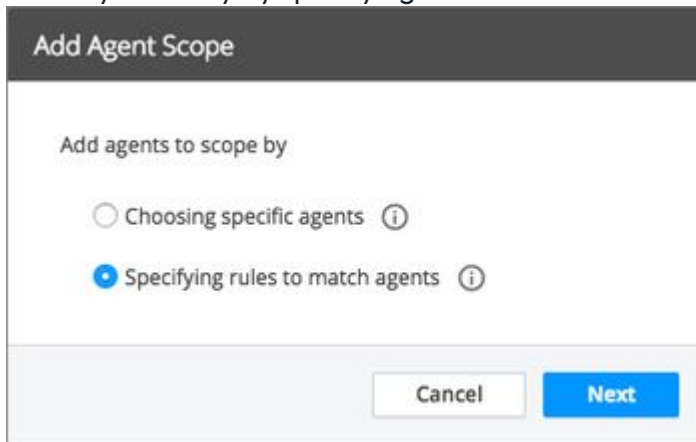

To add an Agent Scope:

1. From the Controller top navigation bar, click **Analytics**.
2. From the left navigation panel, click **Configuration > Log Analytics > Agent Scopes**.

3. Click +Add.

You see the Add Agent Scope pane where you can specify how you want to add agents: from a static list or dynamically by specifying match rules.

4. To add specific agents, select **Choosing specific agents** and move agents from the list of Available Agents to the list of Selected Agents to define the scope.

- To add agents dynamically, select **Specifying rules to match agents** and specify your matching rules.

Add Agent Scope

Collect Log Analytics Data from Syslog Messages

Related pages:

- [Configure Log Analytics Using Job Files](#)
- [Analytics Log Data](#)

You can configure the Analytics Agent to receive syslog messages using TCP transport and standard syslog format adhering to RFC 5424. The Analytics Agent can listen on a TCP port for syslog messages coming from a remote source or from the same host on which the Analytics Agent is present.

To set this up:

- Configure your web server, such as Apache, to send logs to the Analytics Agent. There are two ways to direct the syslog data to the Analytics Agent:
 - Write the log messages to the usual log files and then read and forward to the agent from the log file. See [Read syslog Messages From the Log File and Send to Analytics Agent](#).
 - Send the log data directly to the Analytics Agent without writing to a file first. See [Send syslog Data Directly to the Analytics Agent](#).
- Configure the Analytics Agent to receive and parse the logs. There are two ways to configure syslog message collection for Log Analytics:
 - Job files (for <= 4.2), see [Configure Log Analytics TCP Job File](#).
 - Source rules (for 4.3) Recommended for your new log file sources. See [Configure Log Analytics TCP Source Rule](#).

Supported Environment Details

- Linux only
- Network protocol is TCP only
- A template for Apache Web Server syslog format is shipped with the Analytics Agent. You can bring any log data in through syslog over TCP as long as you provide the correct configuration to parse the log message.
- One job file per Analytics Agent can be enabled to receive syslog messages over TCP.

i Both the syslog utility and analytics-agent should have root access if the port where the analytics-agent is listening for syslog messages is lower than 1024.

Send syslog Data Directly to the Analytics Agent

You can use the Linux Logger utility to direct your Apache access and error log messages to the syslog daemon directly. Using this method, the logs are not written to the usual access log and error log apache files or to the `/var/log/message` file. Instead, the log lines are sent directly to a syslog daemon which then forwards the data to the analytics-agent.

Configure:

1. Configure Apache to delegate logs to `/usr/bin/logger`.
 - a. Locate and open `httpd.conf`, the Apache configuration file. This is typically located at `/etc/httpd/conf/`.
 - b. Add a new CustomLog directive to send access logs and error logs to the syslog and comment out the line that sends to the `access_logs`.

```
#comment the following line to avoid logging to access_logs
#CustomLog logs/access_log combined

#Add a new CustomLog directive to send access logs and error logs to the syslog
CustomLog "|/usr/bin/logger -t httpd -p local6.info" combined
```

This directive uses the logger utility to send messages with facility local6, tag 'httpd' and log format combined.

The facility code specifies the type of program that is logging the message. Messages with different facilities may be handled differently.

The tag 'httpd' in the httpd.conf directly relates to the program name in the rsyslog.conf (see next step) for filtering out which messages need to be sent. For example, there can be other programs writing to that particular port, but we only want to send the logs from the httpd program to analytics-agent.

2. Configure the rsyslog client.
 - a. Edit `rsyslog.conf`, typically located at `/etc/`.
 - b. Add the following lines above "RULES" or "`var/log/messages`" filter so Apache doesn't log to the `var/log/message` file.

```
# log to analytics-agent
if $syslogfacility-text == 'local6' and $programname == 'httpd' then
  @@<analytics_agent_home>:514
# Prevent logging httpd to /var/log/messages
if $syslogfacility-text == 'local6' and $programname == 'httpd' then ~
```

Make sure you replace 514 with the port where the analytics-agent is listening for syslog messages. This must match the port specified in the job file.

3. Restart apache and rsyslog, and look at `/var/log/messages` for any rsyslog errors.

Read syslog Messages From the Log File and Send to Analytics Agent

In this case, the Apache server writes logs to the usual access log and error log files, and the rsyslog daemon is configured to read from these log files and forward the log data to analytics agent. This method preserves the original log files. In this case, the access and the error log messages are logged in the `/var/log/message` file.

In this example, the rsyslog client is configured to read from a specific file and forward the message with facility local6 and severity level info over the specified port (default port is 514).

1. Locate and edit `rsyslog.conf`, typically located at `/etc/`.
2. In the begin forwarding section of the `rsyslog.conf` file, add the following lines:

```
# add these lines in the begin forwarding section
$ModLoad imfile
```

```
$InputFileName /etc/httpd/logs/access_log << your file
$InputFileTag apache-access
$InputFileStateFile stat-apache-access
$InputFileSeverity info
$InputFileFacility local6
$InputRunFileMonitor
local6.info @@localhost:514
```

\$InputFileName: path to the log file you want to tail.

local6.info: Use the Analytics Agent IP address if your analytics agent is not local to the controller. If needed, replace 514 with the port where the analytics-agent is listening for syslog messages. This must match the port specified in the job file or the source rule.

- Restart rsyslog and review /var/log/messages for any rsyslog errors.

Configure Log Analytics TCP Source Rule

Using the Centralized Log Management UI, you can configure a source rule to extract log analytics fields from syslog messages over TCP.

- Access the Centralized Log Management UI from your Controller by clicking **Analytics > Configuration > Log Analytics**.
- On the Source Rules tab, click **+ Add**.
- In the Add Source Rule panel, select the **Create from** source template and select **From Network Connection** as the collection type. For example, select the default Apache syslog template `apache-httpservlet-access-syslog`:

The screenshot shows the 'Add Source Rule' dialog box. Under 'Create from', the 'AppDynamics template' radio button is selected, and the dropdown menu is open, showing 'apache-httpservlet-access-syslog' as the selected option. Under 'Collection type', the 'From Network connection' radio button is selected. There is a text input field for 'Sample log file for preview' and a 'Browse...' button next to it. At the bottom right, there are 'Cancel' and 'Next' buttons.

Several log format templates are shipped with the Analytics Agent. You can create a new source rule for any log format over syslog TCP as long as you configure it correctly.

- Click **Next** to see the Add Source Configuration wizard.

5. Specify the collection details, such as the name of the source rule, source type and enter the TCP Port where the Analytics Agent is listening.
6. When you specify **From Network Connection** as the collection type, the grok pattern for the syslog header (which is appended to the log messages) is automatically added at the beginning of the grok Message Pattern:

```
%{SYSLOG5424PRI}%{SYSLOGBASE2}
```

7. Confirm that the value for Multiline Format is **None**.
8. Configure field extraction and field management as for any other source rule. See [Configure Log Analytics Using Source Rules](#).

Configure Log Analytics TCP Job File

When selecting and configuring the port where the analytics agent will listen for the syslog data, make sure it does not conflict with anything else active in the network. If no port number is provided, port 514 is used. Both the syslog utility and analytics-agent should have root access to send logs to port 514 (binding to ports less than 1024 requires root access).

To allow the analytics-agent to listen at a port, specify the log file **source** property and associated parameters for **type=syslog**. For example, add the following to the appropriate job file:

```
source:
  type: syslog
  port: 514
  protocol: tcp
  numThreads: 1
```

A job file for apache commons is included in the analytics distribution at `/<analytics-agent-home>/conf/job/sample-apache-httpserver-access-syslog.job`.

Your job file should look similar to the following:

```
version: 2
enabled: true

source:
  type: syslog
  port: 514
  protocol: tcp
  numThreads: 5

fields:
  sourceType: apache-httpserver-access-syslog
  nodeName: Node1
  tierName: Tier1
```

```
appName: App1
```

```
grok:
```

```
  patterns:
```

```
    - "%{SYSLOG5424PRI}%{SYSLOGBASE2} %{COMBINEDAPACHELOG}"
```

```
eventTimestamp:
```

```
  pattern: "dd/MMM/yyyy:HH:mm:ss Z"
```

Configure Log Analytics Using Job Files

Related pages:

- [Analytics Log Data](#)
- [Configure Log Analytics Using Source Rules](#)

This page describes how to configure log sources using job files. If you are configuring new log sources, we recommend you use the Centralized Log Management UI to define source rules.

To configure log analytics using job files:

1. [Describe the Log Source in a Job File](#)
2. [Map the Log File Data to Analytics Fields](#)
3. [Verify Analytics Agent Properties](#)

Describe the Log Source in a Job File

Each log source is represented by a job file. A job file is a configuration file that specifies the following:

- Location of the source log file
- Pattern for capturing records from the log file
- Pattern for structuring the data from the captured log records
- Other options for capturing records from the log source

To define a source, you create a job file (or modify one of the samples) in the Analytics Agent configuration directory. The Analytics Agent includes sample job files for Glassfish, OSX log, and others. The Analytics Agent can also collect and parse GZIP files - (log files ending in .gz).

The job files are located in the following directory:

- `<Analytics_Agent_Home>/conf/job/`

The agent reads the job files in the directory dynamically, so you can add job files in the directory without restarting the agent.

To configure a job file, use these configurable settings in the file:

- **enabled:** Determines whether this log source is active. To capture analytics data from this log source, set the value to true.
- **source:** Specifies the source of the logs.
 - **type:** Specifies the type of log source. There are two types, file, and syslog. Additional parameters depend on the value of **type**.
 - **file:** The location and name of the log file to serve as a log source. The location must be on the same machine as the analytics-agent. File has the following parameters:
 - **path:** Path to the directory where the log files reside. On Windows, the path should be provided as if on Unix environments such as:
 - Example: demo/logs
 - Example: C:/app/logs
 - **nameGlob:** A string to use to match on the log file name. You can use wild cards and you can specify whether to match files one level deep or all log files in the path directory structure. If the wild card starts the value of nameGlob, you must enclose the value in quotes. The matching patterns that are supported can be found here: <http://java.boot.by/ocpjp7-upgrade/ch06s05.html> under "glob".
 - Example for multi-level matching:
path: /var/log
nameGlob: '**/*.log'
This matches both /var/log/apache2/logs/error.log and /var/log/cassandra/system.log

- Example of one level matching:
 - path: /var/log
 - nameglob: */*.log'
 - This searches for .log files one level deep in the /var/log directory (matches on /var/log/cassandra/system.log but not on /var/log/apache2/logs/error.log).
- **startAtEnd**: If set to true allows tailing the file from the end.
- **syslog**: See [Collect Log Analytics Data from Syslog Messages](#).
- **multiline**: For log files that include log records that span multiple lines (spanning multiple line breaks) configure the multiline property and indicate how the individual records in the log file should be identified. A typical example of a multiline log record is one that includes a Java exception. You can use one of two options with the multiline property to identify the lines for a multiline log record:
 - **startsWith**: A simple prefix that matches the start of the multiline log record.

Example 1: To capture the following multiline log as one record:

```
[#|2015-09-24T06:33:31.574-0700|INFO|glassfish3.1.2|
com.appdynamics.METRICS.WRITE|_ThreadID=206;_ThreadName=Thread-2;|
NODE PURGER Completed in 14 ms|#]
```

You could use this:

```
multiline:
  startsWith: "[#|"
```

Example 2: To capture the following multiline log as one record:

```
May 5, 2016 6:07:02 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient

INFO: Source deposit referenceNumber:4620346703956702001
May 5, 2016 6:07:03 AM
com.appdynamics.test.payments.plugin.testsource.testPaymentClient
deposit(pluginContext, financialTransaction, retry)
INFO: Source deposit extData requestToken:alf/7wSR9PBh3zSMQ++
+IYTRlK3Ys2D0xOmM5jWLRtYfJaSggCTyFJaSgjSB1/2v0wyTWRV0ekb0X

```

You could use this:

```

multiline:
  startswith: "INFO: Source deposit requested amount"

```

- **regex:** A regular expression that matches the multiline log record.

Example: To capture this multiline log as one record:

```

2016-06-01 16:28:21.035 WebContainer : 8 TRANSTART>
=====
2016-06-01 16:28:21.036 WebContainer : 8 MERCHCFG > merchantID=appD,
sendToProduction=true, targetAPIVersion=1.00, keyFilename=(null),
serverURL=(null), namespaceURI=(null), enableLog=true,
logDirectory=logs, logFilename=(null), logMaximumSize=10,
useHttpClient=false, timeout=130
2016-06-01 16:28:21.037 WebContainer : 8 REQUEST >
merchantID=appD
davService_run=true
clientLibraryVersion=2.0.1
clientEnvironment=OS/400/V7R1M0/LINUX
application_id=ff22
exportService_addressWeight=medium
merchantReferenceCode=appD
clientLibrary=Java Basic
billTo_customer=xxxxxxxxxx
billTo_finance=true
billTo_postalCode=94105
billTo_country=US

```

You can use the following regex configuration to identify the start of each "record":

```
multiline:
  regex: "^\\d{4}-\\d{2}-\\d{2} \\d{2}:\\d{2}:\\d{2}\\.\\d{3} WebContainer :
\\d+ TRANSTART\\u003E ===== $"
```

The regex describes that the line should match 4 digits(2016) followed by followed by 2 digits (01), followed by a space, followed by 2 digit(16) ':' 2 digit (28) ':' 2 digits(21) ':' 3 digits(035) space followed by term 'WebContainer' space digit followed by term 'TRANSTART' followed by '>'.

Whenever the Log tailer sees the matching pattern at the start of the line, it starts a new match and passes the previously collected data as one log record. Each matching pattern identifies when to start accumulating the log lines in a buffer until the matching pattern is found again at the beginning of another record.

If the particular format of a multiline log file does not permit reliable continuation line matching by regular expression, you may choose to use a single line format. For most types of logs, this would result in the capture of the majority of log records.

- **fields:** The fields are used to specify the context of the log data in the Controller UI, by application name, tier name, and so on. Specify the fields as free form, key-value pairs.
- **grok:** The grok parameter specifies the patterns by which the data in the unstructured log record is mapped to structured analytics fields. It associates a named grok expression (as defined in a .grok file that is bundled inside lib/analytics-shared-pipeline-core.jar) to a field in the data as structured by the agent. For example:

```
grok:
  patterns:
    - "\\[%{LOGLEVEL:logLevel}%{SPACE}\\] \\[%{DATA:threadName}\\] \\
[%{JAVACLASS:class}\\] %{GREEDYDATA}"
    - "pattern 2"
    ...
```

In this case, the grok-pattern name LOGLEVEL is matched to an analytics data field named logLevel. The regular expression that is specified by the name LOGLEVEL is defined in the file `grok-patterns.grok` in the `grok` directory. See [Specifying Grok Expressions](#).

Previous versions of Log Analytics used a single "pattern" rather than a pattern list. This mode is still supported for backward compatibility.

The log analytics grok processor does not allow underscores in the field names. For example, a field name "log_fields" will not work. Instead, use something like "logfields".

- **keyValue:** The keyValue parameter specifies how to parse the logs to identify key-value pairs with a user-defined delimiter. This enables you to configure the parsing for a message of the type "Key1 = Value1 Key2 = Value 2". See [Specifying Key Value Pairs](#).
- **transform:** This parameter specifies how to change the type or alias name of any field extracted from the logs by grok or keyValue parameters.
- **eventTimestamp:** This setting defines the pattern for the timestamp associated with captured data.

Map the Log File Data to Analytics Fields

To specify how data in the unstructured log records should be mapped to structured analytics fields for log analytics, you provide the configuration in the job file. You can map unstructured log data in the following ways:

- grok patterns
- key value pairs
- transforms

Specify Grok Expressions

Grok is a way to define and use complex, nested regular expressions in an easy to read and use format. Regular expressions defining discrete elements in a log file are mapped to grok-pattern names, which can also be used to create more complex patterns.

Grok-pattern names for many of the common types of data found in logs are provided for you with the analytics agent. A list of basic grok-pattern names and their underlying structures are bundled inside `lib/analytics-shared-pipeline-core.jar`. You can list the grok files with a command such as the following:

```
unzip -l ./lib/analytics-shared-pipeline-core.jar | grep "\.grok"
```

To can view the definition of a grok file with a command such as the following:

```
unzip -p ./lib/analytics-shared-pipeline-core.jar grok/grok-patterns.grok
```

The `grok` directory also contains samples of more complex definitions customized for various common log types - `java.grok`, `mongodb.grok`, and so on. Additional grok patterns can be found here: <https://grokdebug.herokuapp.com/patterns#>.

Once the grok-pattern names are created, they are then associated in the jobs file with field identifiers that become the analytics keys.

The basic building block is `%{grok-pattern name:identifier}`, where `grok-pattern name` is the grok pattern that knows about the type of data in the log you want to fetch (based on a regex definition) and `identifier` is your identifier for the kind of data, which becomes the analytics key. So `%{IP:client}` would select an IP address in the log record and map it to the key `client`.

Custom Grok Patterns

Complex grok patterns can be created using nested basic patterns. For example, from the `mongodb.grok` file:

```
MONGO_LOG %{SYSLOGTIMESTAMP:timestamp} \[%{WORD:component}\] %
{GREEDYDATA}
```

It is also possible to create entirely new patterns using regular expressions. For example, the following line from `java.grok` defines a grok pattern named `JAVACLASS`.

```
JAVACLASS (?:[a-zA-Z$_][a-zA-Z$_0-9]*\.)*[a-zA-Z$_][a-zA-Z$_0-9]*
```

Because `JAVACLASS` is defined in a `.grok` file in the `grok` directory can be used as if it were a basic grok pattern. In a jobs file, you can use the `JAVACLASS` pattern match as follows:

```
grok:
  pattern: "... \[%{JAVACLASS:class}\\]
```

In this case, the field name as it appears in the Analytics UI would be "class". For a full example, see the following files:

- Job file: `<Analytics_Agent_Home>/conf/job/sample-analytics-log.job`
- Grok file: `java.grok` bundled inside `lib/analytics-shared-pipeline-core.jar`

Special Considerations for Backslashes

The job file is in YAML format, which treats the backslash as an escape character. Therefore, to include a literal backslash in the String pattern you need to escape the backslash with a second backslash. You can avoid the need to escape backslashes in the `.job` file grok pattern, by enclosing the grok pattern in single quotes instead of double quotes such as the following:

```
grok:
  patterns:
    - '\[%{DATESTAMP:TIME}%{SPACE}CET\}%{SPACE}%{NOTSPACE:appId}%
    %{SPACE}%{NOTSPACE:appName}%{SPACE}%{NOTSPACE:Severity}%{SPACE}%
    {NOTSPACE:messageId}:%{SPACE}%{GREEDYDATA}'
```

Numeric Fields

In Release 4.1.3, the grok definition syntax was enhanced to support three basic data types. When defining a pattern in the `.grok` file you can specify the data type as number, boolean, or string. If a Grok alias uses that grok definition in a `.job` file then the extracted field is stored as a number or boolean. Strings are the default. If the number or boolean conversion fails, then a log message appears in the agent's log file. No validations are performed as it is not possible to reverse engineer a regex reliably. These are pure runtime extractions and conversions.

Upgrade pre-4.1.3 Job Files

Click to expand...

For 4.1.2 (or older) `.job` files in use that have fields that are unspecified or specified as `NUMBER` and now switch to the "type aware" files, the data inside Events Service will break. This is due to the type mapping. To avoid this, you need to modify the grok alias in your job files.

Examples:

```
was:
grok:
  patterns:
```

```
- "%{DATE:happenedAt},%{NUMBER:quantity}
```

Update job to:

grok:

patterns:

```
- "%{DATE:happenedAt},%{NUMBER:quantity_new}
```

Was:

grok:

patterns:

```
- "%{DATE:happenedAt},%{DATA:howMany}
```

Update job to:

grok:

patterns:

```
- "%{DATE:happenedAt},%{POSINT:howManyInt}
```

To Upgrade (Migrate) < 4.1.3 Job Files:

1. Stop analytics-agent.
2. Change .job files that use the enhanced grok patterns:

```
BOOL:boolean
INT:number
BASE10NUM:number
NUMBER:number
POSINT:number
NONNEGINT:number
```

Change the grok alias so as not to conflict with the older aliases:

```
grok:
  patterns:
  (Old) - "%{DATE:quoteDate},%{NUMBER:open},%{NUMBER:high},%
  {NUMBER:low},%{NUMBER:close},%{NUMBER:volume},%
  {NUMBER:adjClose}"

  (New aliases) - "%{DATE:quoteDate},%{NUMBER:openNum},%
```

- For on-premises installations use whatever host and port you have configured. In clustered environments, this is often a load balancer.
- The `http.event.accountName` and `http.event.accessKey` settings should be set to the name and the key of the account in the Controller UI with which the logs should be associated. By default, they are set to the built-in account for a single tenancy Controller.
- The `pipeline.poll.dir` setting specifies where the log configuration files are located. This would not normally be changed unless you want to keep your files in a different location.
- `ad.controller.url` should match your AppDynamics controller URL and port.

Troubleshoot Logs

If log capture is working correctly, logs should start appearing in the Log tab in the Analytics UI. It can take some time for logs to start accumulating. Note the following troubleshooting points:

- If nothing appears in the log view, try searching over the past 24 hours.
- Timezone discrepancies between the logs and the local machine can cause log entries to be incorrectly excluded based on the selected timeframe in the Controller UI. To remediate, try setting the log files and system time to UTC or logging the timezone with the log message to verify.
- An inherent delay in indexing may result in the "last minute" view in the UI consistently yielding no logs. Increase the time range if you encounter this issue.

Troubleshoot Patterns

To help you troubleshoot the data extraction patterns in your job file, you can use the two debug REST endpoints in the Analytics Agent:

- `http://<Analytics_Agent_host>:<Analytics_Agent_http_port>/debug/grok`: [For testing grok patterns](#)
- `http://<Analytics_Agent_host>:<Analytics_Agent_http_port>/debug/timestamp`: [For testing timestamp patterns](#)

In the following examples, the Analytics Agent host is assumed to be `localhost` and the Analytics Agent port is assumed to be `9090`. To configure the port on your Agent, use the property `ad.dw.http.port` in `<Analytics_Agent_Home>/conf/ analytics-agent.properties`.

The Grok Endpoint

Click to expand...

The Grok tool works in two modes: extraction from a single line log and extraction from a multi-line log. To get a description of usage options:

```
curl -X GET http://localhost:9090/debug/grok
```

Single Line

In this mode, you pass in (as a POST request) a sample line from your log and the grok pattern you are testing, and you receive back the data you passed in organized as key/value pairs, where the keys are your identifiers.

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode
"logLine=LOG_LINE" --data-urlencode "pattern=PATTERN"
```

For example, the input:

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode
"logLine=[2014-09-04T15:22:41,594Z] [INFO ] [main]
[o.e.j.server.handler.ContextHandler] Started
i.d.j.MutableServletContextHandler@2b3b527{/ ,null,AVAILABLE}" --
data-urlencode "pattern=\\[%{LOGLEVEL:logLevel}%{SPACE}\\] \\[%
{DATA:threadName}\\] \\[%{JAVACLASS:class}\\] %{GREEDYDATA}"
```

would produce this output:

```
{
  threadName => main
  logLevel => INFO
  class => o.e.j.server.handler.ContextHandler
}
```

The input:

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode
"logLine=2010-05-05,500.98,515.72,500.47,509.76,4566900,509.76"
--data-urlencode "pattern=%{DATE:quoteDate},%{DATA:open},%
{DATA:high},%{DATA:low},%{DATA:close},%{DATA:volume},%
{GREEDYDATA:adjClose}"
```

would produce this output:

```
{
  open => 500.98
  adjClose => 509.76
  volume => 4566900
  quoteDate => 10-05-05
  high => 515.72
  low => 500.47
}
```

```
close => 509.76
}
```

Multi-line

The multi-line version uses a file stored on the local filesystem as the source input.

```
curl -X POST http://localhost:9090/debug/grok --data-urlencode
"logLine=`cat FILE_NAME`" --data-urlencode "pattern=PATTERN"
```

where FILE_NAME is the full path filename of the file that contains the multi-line log.

The Timestamp Endpoint

Click to expand...

The timestamp tool extracts the timestamp from a log line in Unix epoch time.

To get a description of usage options:

```
curl -X GET http://localhost:9090/debug/timestamp
```

In this mode, you pass in (as a POST request) a sample line from your log and the timestamp pattern you are testing, and you receive back the timestamp contained within the log line.

```
curl -X POST http://localhost:9090/debug/timestamp --data-
urlencode "logLine=LOG_LINE" --data-urlencode "pattern=PATTERN"
```

For example, the input:

```
curl -X POST http://localhost:9090/debug/timestamp --data-
urlencode "logLine=[2014-09-04T15:22:41,237Z] [INFO ] [main]
[io.dropwizard.server.ServerFactory] Starting DemoMain" --data-
urlencode "pattern=yyyy-MM-dd'T'HH:mm:ss,SSSZ"
```

would produce this output Unix epoch time:

```
{  
  eventTimestamp => 1409844161237  
}
```

The input:

```
curl -X POST http://localhost:9090/debug/timestamp --data-  
urlencode "logLine=Nov 17, 2014 8:21:51 AM  
com.foo.blitz.processor.core.hbase.coprocessor.endpoint.TimeRoll  
upProcessEndpoint$HBaseDataFetcher callFoo1" --data-urlencode  
"pattern=MMM d, yyyy h:mm:ss aa"
```

would produce this output Unix epoch time:

```
{  
  eventTimestamp => 1416212511000  
}
```

Sample Log Analytics Job Files

A number of sample job files are shipped with the Analytics Agent. These files can be found at `<analytics-agent-home>/conf/job`.

The sample job files include:

- Analytics logs: sample-analytics-log.job
- Analytics logs with requestGUID config example: sample-analytics-log-with-request-guid.job
- Apache access logs: sample-apache-httpserver-access-log.job
- Apache access logs with syslog config example: sample-apache-httpserver-access-sysloglog.job
- Apache error logs: sample-apache-httpserver-error-log.job
- Cassandra logs: sample-cassandra-log.job
- CouchDB logs: sample-couchdb-log.job
- Glassfish logs: sample-glassfish-log.job
- IIS logs: sample-iis-log.job
- Java Agent logs: sample-java-agent-log.job
- Jetty error logs: sample-jetty-error-log.job
- Jetty request logs: sample-jetty-request-log.job
- Log4J: sample-log4j.job
- MongoDB logs: sample-mongodb-log.job
- MySQL error logs: sample-mysql-error-log.job
- Nginx access logs: sample-nginx-access-log.job
- Nginx error logs: sample-nginx-error-log.job
- OS X system logs: sample-osx-system-log.job
- Postgres logs: sample-postgres-log.job
- Redis logs: sample-redis-log.job
- Stock quotes: sample-stock-quotes-csv.job
- WebLogic logs: sample-weblogic-log.job

Migrate Log Analytics Job Files to Source Rules

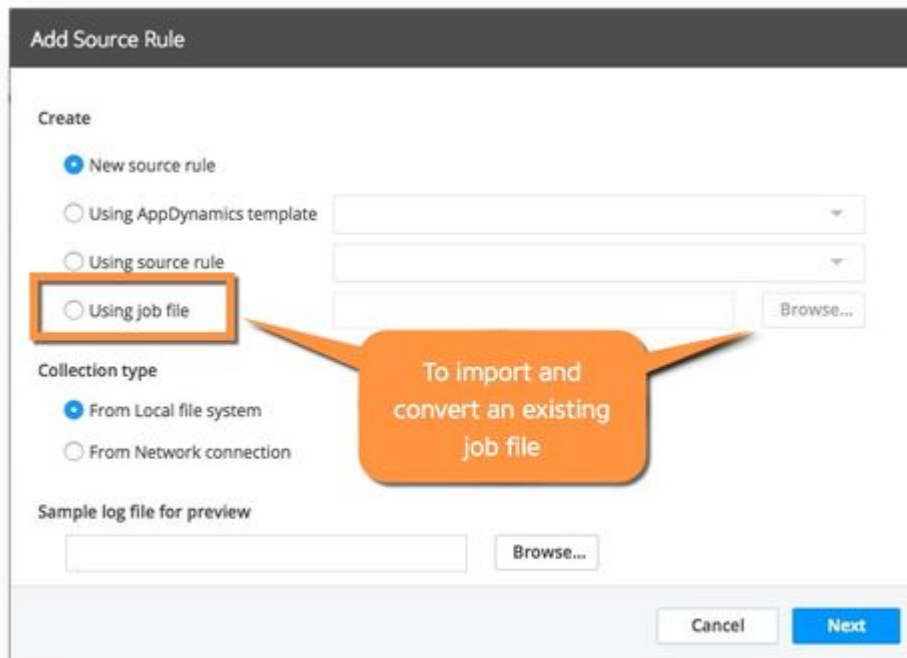

Related pages:

- [Upgrade Analytics Agent](#)

The Centralized Log Management UI enables you to configure your log data sources using source rules. Manually created job files are no longer needed.

We recommend that you convert your log source configuration from job files (job files were used for configuration < 4.3) to source rules.

1. Confirm that you have upgraded your Controller, Events Service, and Analytics Agent to 4.4. See these corresponding upgrade pages:
 - [Upgrade the Controller Using the Enterprise Console](#)
 - [Upgrade the Events Service Using the Enterprise Console](#)
 - [Upgrade Analytics Agent](#)
2. Use the Centralized Log Management UI to create source rules for your existing job files by importing the configuration from your old job file to a new source rule.

Be sure to use either '**Parsing time range**' or '**End of log file**'. If you do not use this, you will double collect all the log files that have already been tailed by the job file. Read [Timing Notes](#) for more information to help you decide on your collection timing settings.

When you save the source rules, they are in the disabled state by default.

3. Map the source rules to an Agent Scope.
4. Enable the new source rules through the UI.

5. Disable the job files that are actively collecting log analytics data. You do this by manually editing the job file and changing the `enabled` property to false. See [Configure Log Analytics Using Job Files](#).
6. After you have migrated all your job file configurations to source rules, you can completely disable the use of job files by clicking “**Disable Field Extraction With Job Files**”. This action can not be reversed and you will not be able to use job files after performing this action. Only trigger this action once you have completely moved to source rules created through the Centralized Log Management UI.

Timing Notes

By default, the controller communicates new configuration information to the Analytics Agent every five minutes. So it could be up to five minutes before the agent starts tailing your log file using the new source rule configuration. On the other hand, if you have both a job file *and* a source rule enabled for the same log data, the data is collected twice. To avoid this situation, you can use configuration settings to specify when to start collecting the log data:

- At the end of the file (UI field = **Start collecting from End of log file**)
- During a specific time range (UI field = **Parsing time range**)

The screenshot shows the 'Add Source Configuration' form with the following details:

- Source Name:** glassfish server log
- Source Type:** glassfish-server-log
- Source File:** test
- Enable path extraction:** (with an information icon)
- Start collecting from:**
 - Beginning of log file
 - End of log file
- Parsing time range:** Last Hours

See the section describing the configuration settings on the “*General Configuration Tab*” in [Configure Log Analytics Using Source Rules](#).

Be sure to disable the job file once you have enabled the source rule to collect the Log Analytics data. You can verify that the new source rule is collecting data correctly by waiting until the new log records appear in the Analytics Search UI data grid. One way to distinguish between the log data collected by a job file or a source rule is to use a different source type in the source rule.

Business Transaction and Log Correlation

Works with:

This page provides instructions on the correlation between Business Transaction requests and logs. When investigating the cause of slowdowns/outages in your business applications, the problem does not always originate in the application code. Any additional information from application or machine logs can be helpful in your DevOps teams' investigation. One way to see supporting data that impacts the business transaction is to analyze logs for that transaction.

By configuring business transactions for GUID Injection, you can correlate logs to specific business transaction requests. This can be helpful when you see slow transactions and the call graph does not give you enough information to get to the root cause. You can use this feature to get the full context related to a failed or slow transaction.

Correlating specific instances of your business transactions to the related logs works by injecting the same requestGUID of the business transaction into the associated logs through our Java Agent. This helps you to quickly find the relevant logs from multiple tiers and nodes for a specific business transaction.

Visibility for this correlation requires both Transaction Analytics and Log Analytics licenses. See [License Entitlement and Restrictions](#).

Configuring GUID Injection

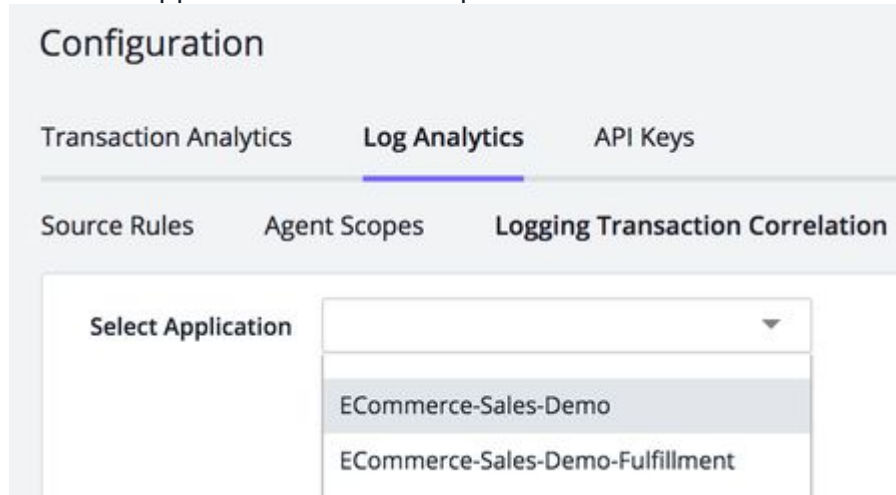

This feature supports the following Java logging frameworks:

- Apache log4j versions 1.2.12 to 1.2.17 and 2.6.2 to 2.17.
- logback versions 1.0.0 to 1.2.10. Any version < 1.0.0 is not supported.

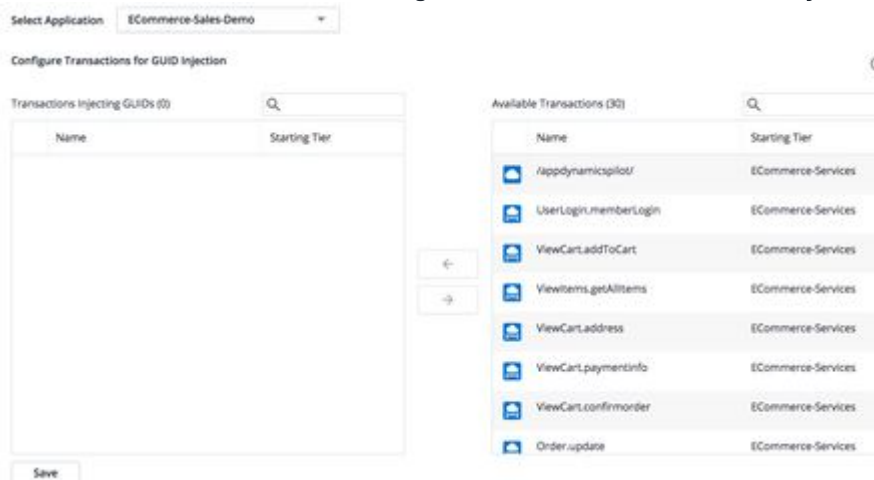

To enable transaction to log correlation, use the following steps. You must select the business transactions and specify the logging format.

1. Select business transactions for log correlation. This is how you specify to the Java Agent which business transactions you are interested in.
 - a. In the Controller UI, click **Analytics > Configuration**. Then select **Log Analytics > Logging Transaction Correlation**.

- b. Select the application from the dropdown list:

- c. Scroll down to the section **Configure Transactions for GUID Injection**:

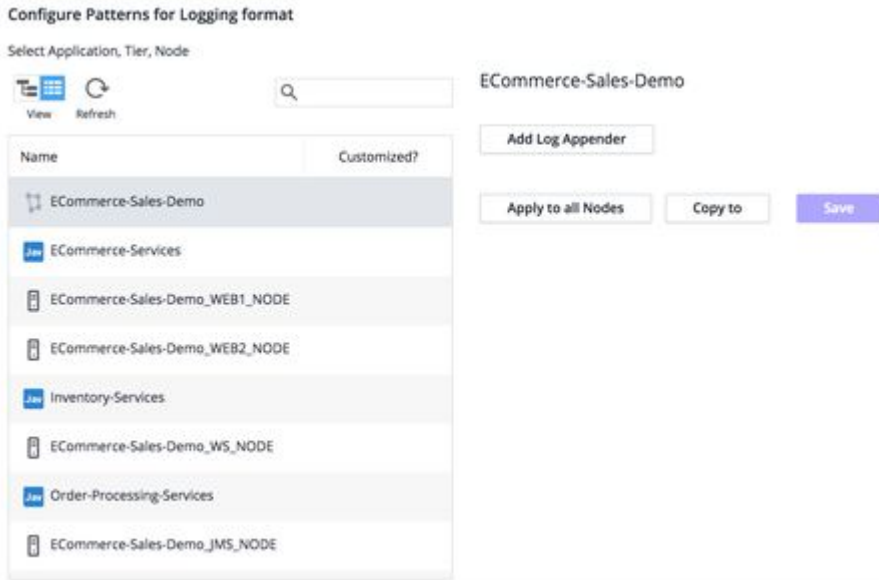

- d. Add transactions from the right-hand list to the left-hand list and **Save**.
e. Proceed to the next step. You must also configure the logging patterns before you can see correlated logs.

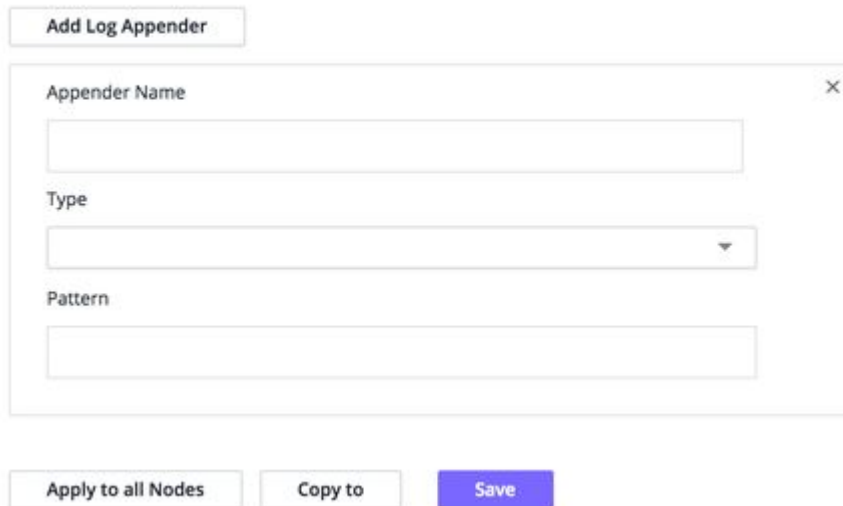

2. Define how the injected information appears in the logs. You need to know the appender name and pattern for your application logging framework so you can properly configure this feature. In simple terms, a pattern is responsible for formatting a logging request and an appender takes care of output destination. You can configure this through the Controller UI as described here. You can also add the appender directly to your code. See [Add Appender in Your Source Code](#).

- a. On the Analytics Configuration window, scroll to the section **Configure Patterns for Logging format**.

- b. Select application, tier, or node where you want to collect correlated logs.

- c. Enter the Appender name and choose the log framework.
ECommerce-Sales-Demo

- d. Enter the pattern and the request GUID string. You can add the request GUID anywhere in the pattern. The request GUID must match the following exactly:

```
[%X{AD.requestGUID}]
```

For example, the following screenshot shows the standard log4j pattern plus the request GUID:

Add Log Appender

Appender Name
✕

Type

Log4j
▼

Pattern

[%d] [%-5p] [%t] [%c] [%X{AD.requestGUID}] %m%n

Apply to all Nodes

Copy to

Save

Detail of Log4j example with the request GUID string:

```
[%d] [%-5p] [%t] [%c] [%X{AD.requestGUID}] %m%n
```

- Restart the affected application to enable the logger to pick up the new logging configuration.

Add Appender in Your Source Code

If you have access to the source code for your application, you can also add the appender to the `log4j.properties` file directly. Here is an example of what that might look like with the request GUID in **BOLD**:

```
log4j.appender.order-file-appender=org.apache.log4j.FileAppender
log4j.appender.order-file-appender.File=logs/telecom-order.log
log4j.appender.order-file-appender.layout=org.apache.log4j.PatternLayout
log4j.appender.order-file-appender.layout.ConversionPattern=[%d] [%-5p] [%t] [%c]
[%X{AD.requestGUID}] %m%n
log4j.logger.com.appdynamics.order=DEBUG, order-file-appender
log4j.additivity.com.appdynamics.order=false
```

Extracting Request GUID From the Source Rule Configuration

To enable searching logs by request GUID and to view correlated logs and transaction data, use the following steps:

- In the Controller UI, click **Analytics > Configuration > Log Analytics > Source Rule**.
- Extract the request GUID field in the log source rule configuration. See [Field Extraction for Source Rules](#).

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

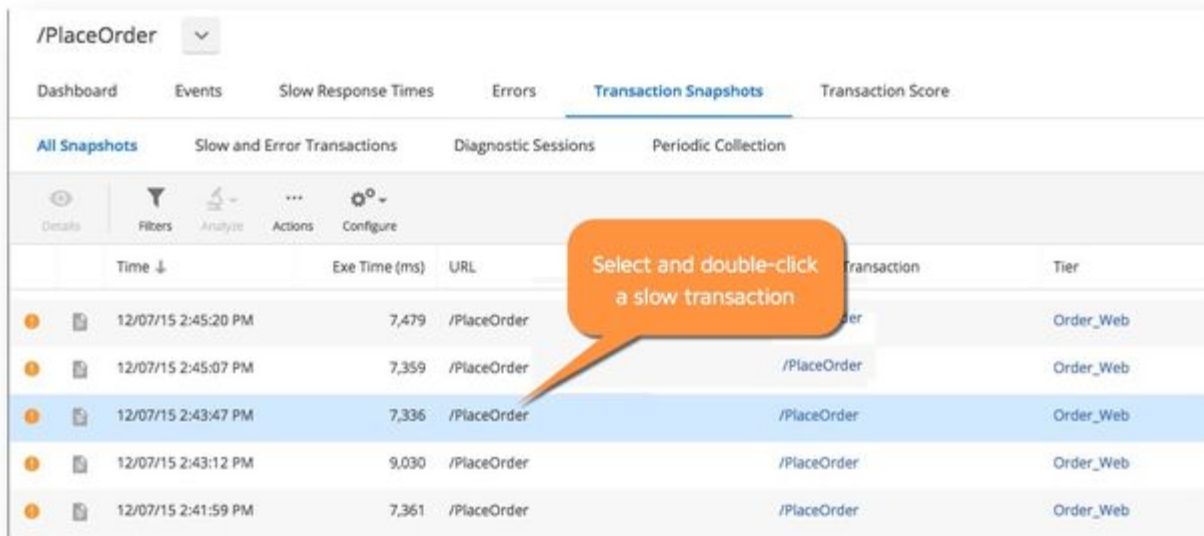

- a. If Manual Field Extraction is selected, the following regular expression can be used to configure request GUID: `AD_REQUEST_GUID\[(?<requestGUID>.*)\]\]`.

Viewing Correlated Logs and Transaction Data

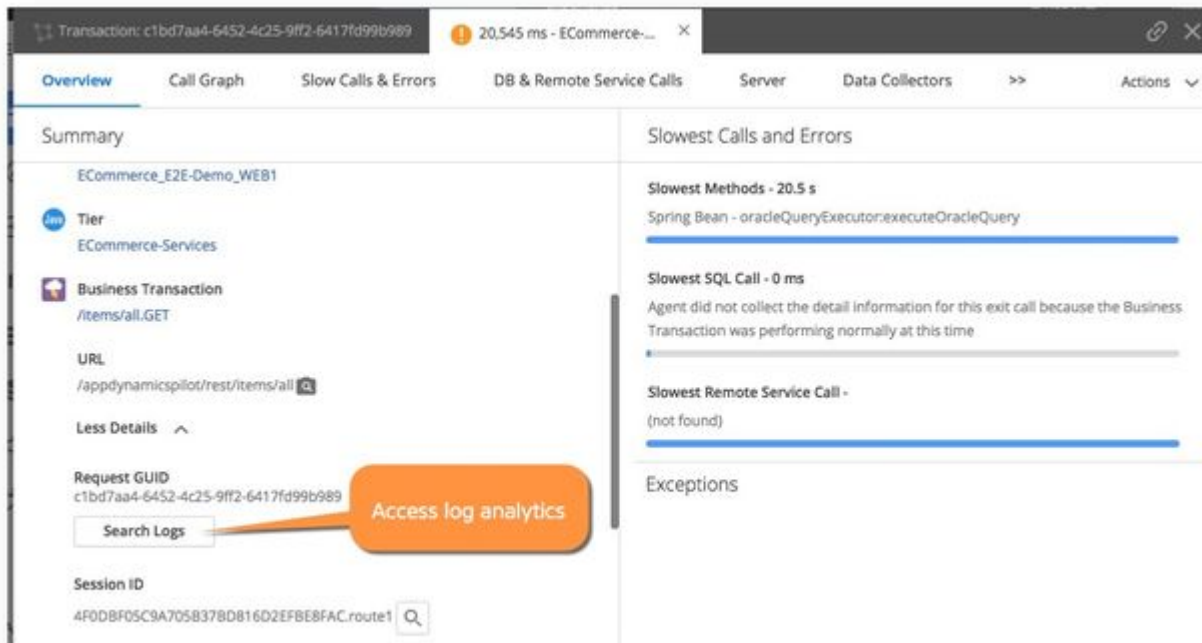

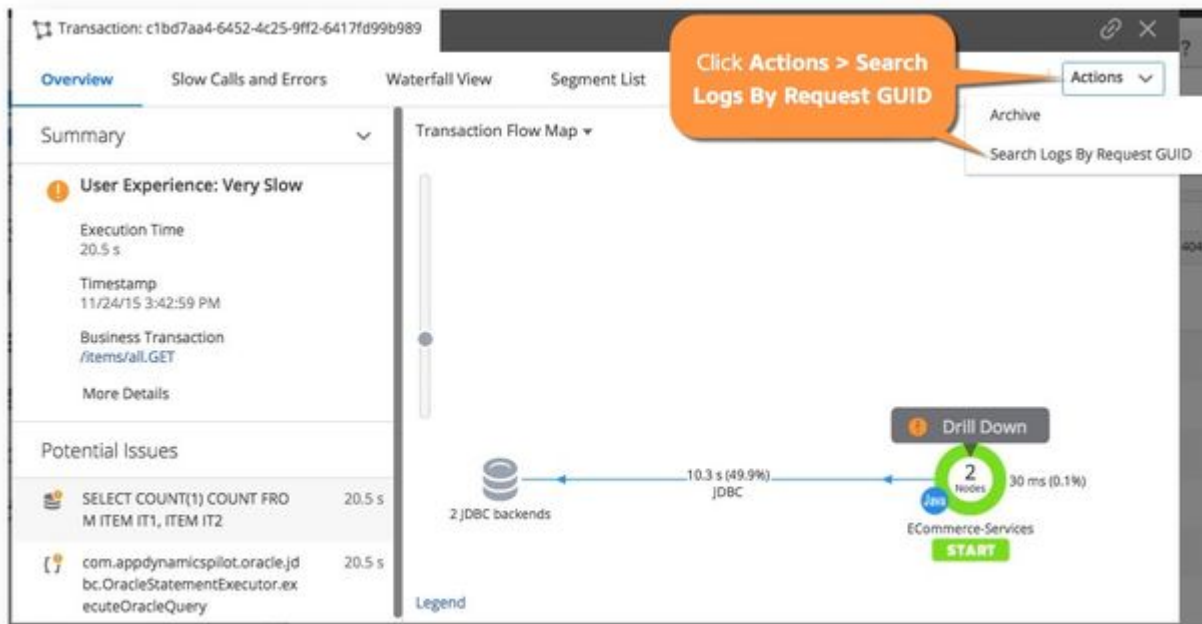

Once you have configured GUID injection, you can search the log files from a number of points in the Controller. Correlation only works when there are logs with the associated GUID in the given time range for an application where this feature is configured. The **Search Logs By Request GUID** button appears when there are logs for the snapshot request GUID in the snapshot time range.

APM to Analytics: From a business transaction snapshot

1. Locate a slow transaction or other transaction that you want to troubleshoot.

2. Click **More Details** > **Search Logs** or use **Actions** > **Search Logs By Request GUID**.

From the log details in this example, you can see that the reason this transaction was slow is that the order processing queue was full and it took many retries before the order could complete.

Transaction Analytics to Log Analytics

You can select relevant transactions from any transaction analytics search and see details.

1. Select the transaction, then double-click or click **Details** in the **Action** toolbar.

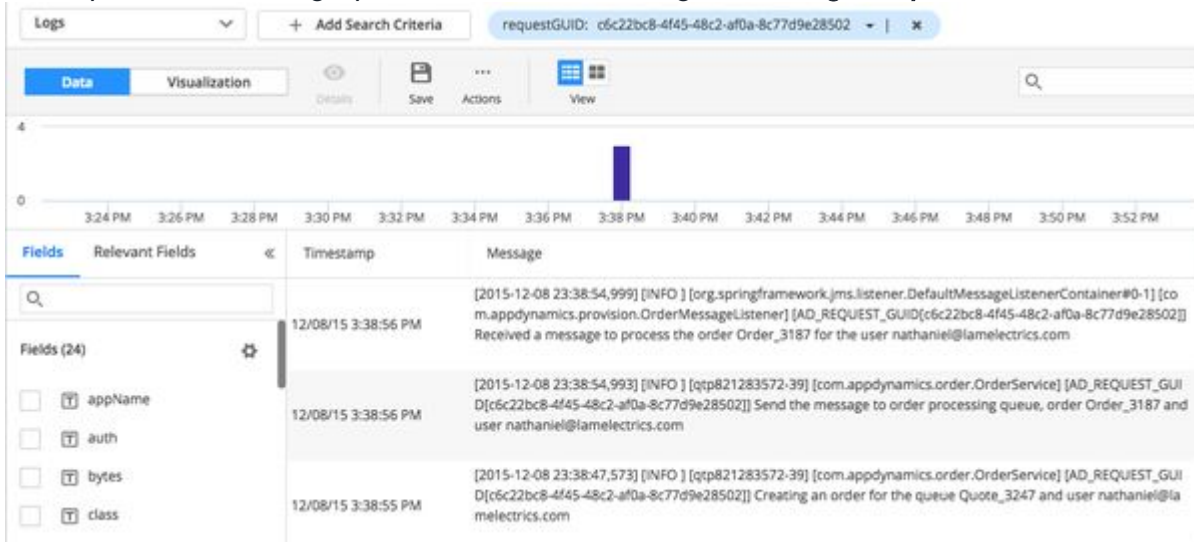

2. On the **Overview** tab, you have two ways to search the logs by request GUID.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

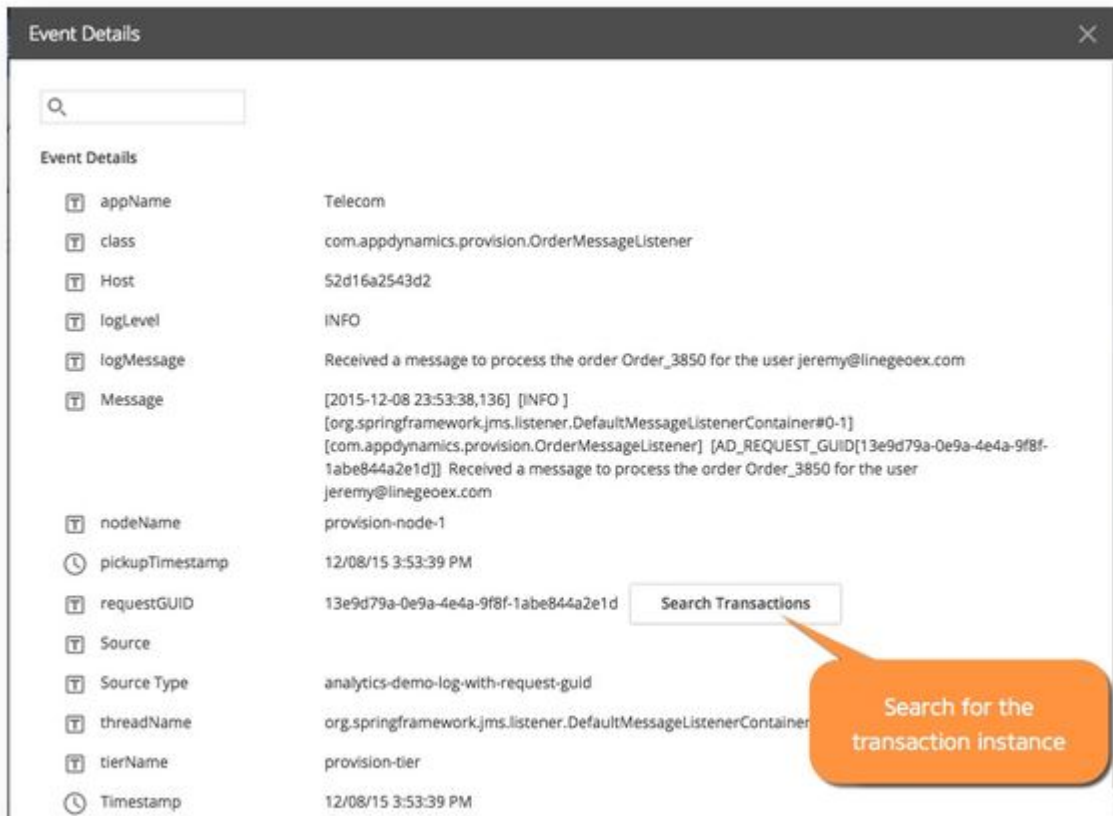

3. When you search the logs, you see the correlated logs in the **Log Analytics** window.

From Log Analytics to Transaction Analytics

You can select a log from any log analytics search and see the Event Details.

1. Select the log, then double-click or click **Details** in the **Action** toolbar. You can see the **Event Details** window.

2. Use the **Search Transactions** button to find the relevant business transaction in transaction analytics data.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Deploy Analytics in Kubernetes

This page describes deployment options for Transaction Analytics and Log Analytics instrumented with AppDynamics app server agents in Kubernetes applications.

Transaction Analytics (except for Java and .NET Agent) and Log Analytics require that an Analytics Agent is deployed with an app server agent.

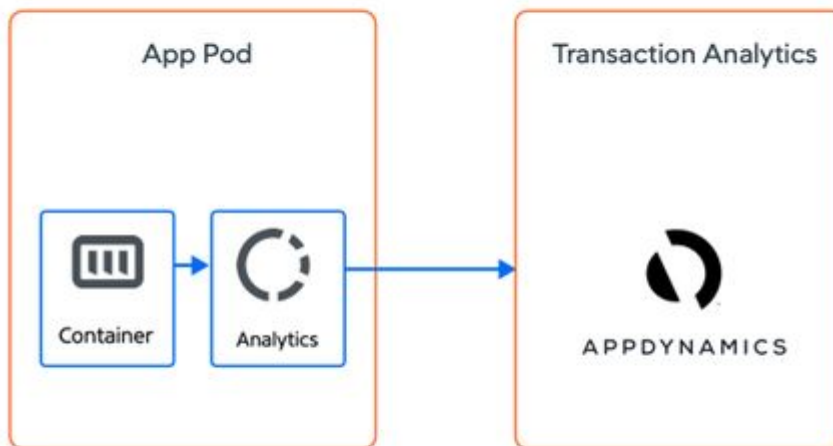

i For Transaction Analytics, the Java Agent $\geq 4.5.15$ or the .NET Agent ≥ 20.10 supports "agentless" analytics, which does not require that an Analytics Agent is deployed. See [Deploy Analytics Without the Analytics Agent](#).

Transaction Analytics

The Analytics Agent acts as a proxy between the app server agent and the Events Service. See [Deploy Analytics With the Analytics Agent](#).

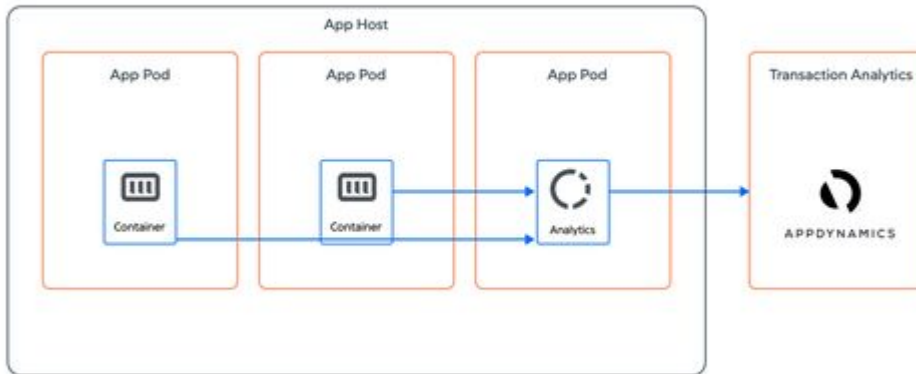

There are two deployment options for the Analytics Agent to support Transaction Analytics on a Kubernetes application.

1. A sidecar to the application container.

In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container.

2. A shared agent where a single Analytics Agent is deployed on each Kubernetes worker node. Each pod on the node will use that Analytics Agent to communicate with the Events Service.

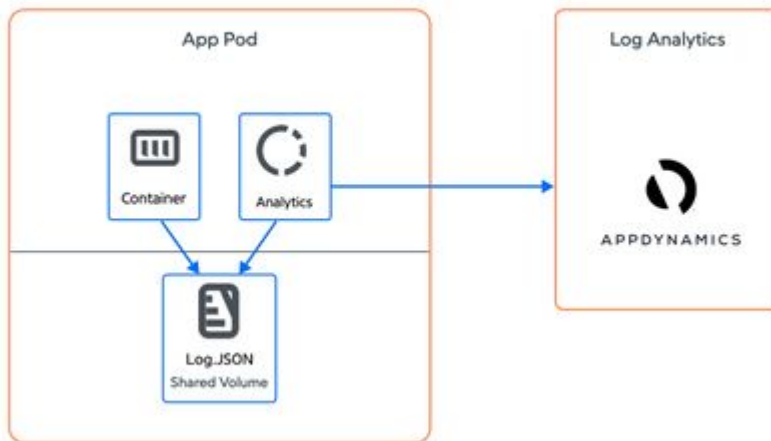

In this model, the Analytics Agent is deployed as a Daemonset.

Log Analytics

Once deployed, the Analytics Agent has access to the application's logs and can send log data to the Events Service.

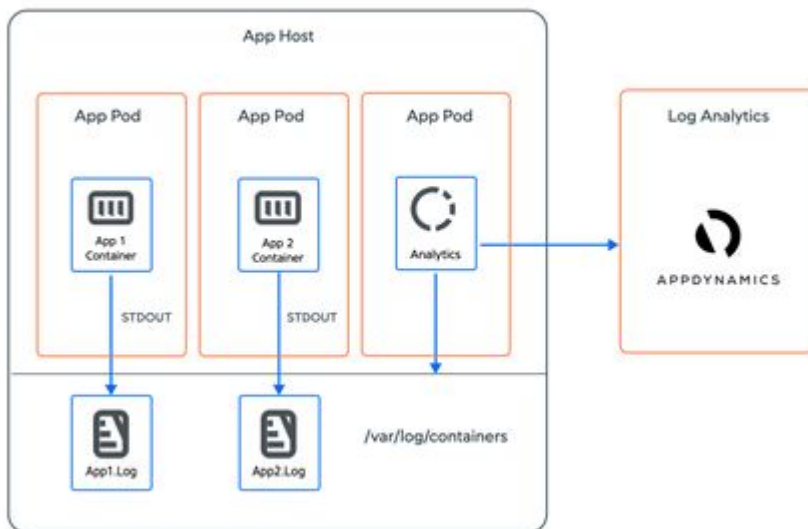

There are three deployment options for the Analytics Agent to support Log Analytics on a Kubernetes application.

1. A sidecar to the application container.

In this model, an Analytics Agent container is added to each application pod and will start/stop with the application container. The Analytics Agent and application container are configured to share a volume where the application logs are written.

2. If the application bypasses the container filesystem and emits log data to `STDOUT` and `STDERR`, the Analytics Agent can be deployed on each Kubernetes worker node. The Analytics Agent can access the log output for every application container on the worker node's file system, stored by Kubernetes under `/var/log/containers` as a unique file per container.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

In this model, the Analytics Agent is deployed as a Daemonset.

i For some Kubernetes distributions such as OpenShift, the Analytics Agent will require elevated permissions to access the files under `/var/log/containers`.

3. If a syslog provider is available in the Kubernetes cluster, the Analytics Agent can be deployed to receive syslog messages with TCP transport. A single Analytics Agent instance is required per syslog provider. See [Collect Log Analytics Data from Syslog Messages](#).

For Transaction and Log Analytics, the sidecar approach is simpler to deploy, but consumes more cluster resources because it requires one additional container per application pod. The shared agent approach adds another deployment object to manage, but can significantly reduce the overall resource consumption for a cluster.

Example Configurations to Deploy the Analytics Agent

The following deployment specs are specific examples of how to implement the deployment options explained above. In addition, see [Install the .NET Agent for Linux in Containers](#) and [Install the Node.js Agent in Containers](#) for best practices on how to set the Analytics Agent host, port, and SSL environment variables.

Transaction Analytics: Deployment Spec Using A Sidecar

The following deployment spec defines two containers, the application container `flight-services`, which uses an image instrumented with an app server agent, and the Analytics Agent container `appd-analytics-agent`, which uses the Analytics Agent from Docker Hub, docker.io/appdynamics/analytics-agent:latest.

The `appd-analytics-agent` container leverages a ConfigMap and Secret to configure the Events Service credentials required by the Analytics Agent, including the account access key and global account name. See [Install Agent-Side Components](#).

As a sidecar, the Analytics Agent is available at `localhost` and uses the default port `9090`. The app server agent will connect automatically and no additional configuration is required.

```

Transaction Analytics: Deployment Specs Using A Shared Analytics Agent

The following deployment spec is for the same `flight-services` application, but instead of using a sidecar, it references a shared Analytics Agent deployed separately as a Daemonset. The `flight-services` container sets the agent environment

variables `APPDYNAMICS_ANALYTICS_HOST` and `APPDYNAMICS_ANALYTICS_PORT` to the `analytics-proxy` service for the shared Analytics Agent defined in the example below.

```

apiVersion: apps/v1
kind: Deployment
metadata:
  name: flight-services
spec:
  selector:
    matchLabels:
      name: flight-services
  replicas: 1

    name: appd-infra-agent
  ports:
  - name: "9090"
    port: 9090
    targetPort: 9090
status:
  loadBalancer: {}

```

The full deployment spec can be found in the [Machine Agent YAML File](#). The `appdynamics-infraviz` service account is defined in the [RBAC YAML File](#). The `ma-log-config` ConfigMap is defined in the [Machine Agent Log Config File](#).

A best practice is to deploy the shared Analytics Agent in a dedicated namespace (typically `appdynamics`) separate from the namespaces used by applications.

```
$ kubectl -n appdynamics apply -f analytics-agent.yaml
```

To provide access to the shared Analytics Agent from an application namespace:

1. An `ExternalName` service is required to map a service name (`analytics-proxy` in the example) to the DNS name of `appd-infra-agent-service` created previously:

```
kind: Service
apiVersion: v1
metadata:
  name: analytics-proxy
spec:
  type: ExternalName
  externalName: appd-infra-agent-service.appdynamics.svc.cluster.local
  ports:
  - port: 9090
    targetPort: 9090
```

2. Create this service in each application namespace where an App Server Agent is deployed:

```
$ kubectl -n <app namespace> apply -f analytics-proxy.yaml
```

3. Note that `analytics-proxy` is the value of `APPDYNAMICS_ANALYTICS_HOST` used in the `flight-services` deployment spec.

```
- name: APPDYNAMICS_ANALYTICS_HOST
  value: analytics-proxy
```

Log Analytics: Deployment Spec Using A Side Car

The following deployment spec snippet is for a Java application that defines an application container, `client-api`, and an Analytics Agent container, `appd-analytics-agent`, that acts as a sidecar to the application container. An init container, `appd-agent-attach`, is also defined, but the related definitions are removed to simplify the example.

A shared volume, `appd-volume`, is mounted to the application container and Analytics Agent container using the mount path `/opt/appdlogs`. The Java application is configured to write its logs to this path and the Analytics Agent is configured to read the logs from this path and send them to the Events Service.

```

Log Analytics: Deployment Spec For Shared Analytics Agent (STDOUT/STDERR Support)

The following deployment spec supports the use case where application containers are emitting logs to `STDOUT` and `STDERR`, not the application container filesystem.

Since Kubernetes writes the container logs to the host under `/var/log/containers`, the Analytics Agent can read them there. The Analytics Agent is deployed as a Daemonset. A volume `varlog` is defined with access to the host path `/var/log/containers` and mounted to the Analytics Agent container, `appd-analytics-agent`. The Analytics Agent is configured to read the container-specific logs written to `/var/log/containers`. See [Configure Log Analytics Using Source Rules](#).

```
apiVersion: v1
```

Using Analytics Data

Related Pages:

- [Configure Analytics](#)
- [Create Analytics Metrics From Scheduled Queries](#)
- [Analytics and Data Security](#)

This describes how to use the Analytics data. You have several strategies available for locating and using analytics data of interest. Once you have identified data that is useful for your business, you can use visualization or other features to represent and monitor that data.

Analytics enables you to:

- Configure data sources to collect data for analytics.
- Create and visualize searches and add them to custom dashboards.
- Create API Keys for users of the Analytics Events API.
- Create and view metrics created from analytics searches.
- Define and monitor [Business Journeys](#).
- Define [Experience Level reports](#).
- Export data to CSV files.

Strategies for Locating Data of Interest

- Use a saved search by selecting one from the list. Use the actions in the action bar to manage named searches by saving, duplicating, and so on.
- Create searches for specific use cases. See [Search Analytics Data](#).
- Focus on a specific time range by dragging your mouse across the event stream or by using the time range dropdown.
- Select various fields from the data, targeting the kind of data of interest to you, then scan the event list. Double-click any specific event to display more information.
- Examine Top 10 Values. Click on a field to see the top 10 values of that field in your filtered dataset. The results are presented as a count and percentage of all data within the specified time range for that field. These values provide immediate insights from your data without having any predefined rules or previous knowledge of the data. You can add a value to the search criteria bar by hovering over the value and clicking the + icon.
- Relevant Fields. This feature helps you find fields with a high relevance score. A high relevance score indicates these fields are significantly more common in your filtered results than in the entire data set and may be useful to investigate. See [Investigate Using Relevant Fields](#) for a suggested workflow.

Visualize Analytics Data

Once you have defined your data, use the Visualization tab to explore specific aspects of the data that interests you and drill down into the relationships you need to understand.

Each visualization type is a widget and widgets can be added/removed. See [Visualize Analytics Data](#).

Search Analytics Data

You can search Analytics data in two modes:

- Basic mode, where you can add search criteria to filter your data and return a subset of available events. In Basic mode, you see the list of events that match your search criteria, along with a count of those events. This mode is referred to in the UI as **Drag and Drop Search**.
- Advanced Mode, where you can use the AppDynamics Query Language (ADQL). ADQL is a SQL-like query language that provides additional operators and functions to enable more complicated searches. This mode is referred to in the UI as **Query Language Search**.

For each mode, you see the analytics data sources that are licensed and enabled for your application. The applications, data sources, and other fields that you see depend on how the administrator has set the permissions for your role. When creating new roles, remember that granting permissions to view transaction analytics data does not automatically grant permissions to see all application data associated with a specific transaction analytics record. You need to grant at least read-only permissions to the application to enable the user to see associated transaction snapshot data such as flow maps.

 When you search Analytics data, the values shown for segment fields are from the originating tier segment. Data from downstream (non-originating) tier segments is not shown. To visualize downstream segment data, double-click on the transaction row to display the **Transaction Snapshot** screen. Then select the **Transaction Data** tab.

Search Results Limits

Search results in the UI can return up to 1000 records. By default, each page displays 50 results at a time. In Advanced mode, you can explicitly set a LIMIT to see more than 50 results on a page. Setting a limit disables pagination and shows up to 1000 records on a single page. The total number of records for the query shows at the bottom right. The UI caps the number of search results at 1000 regardless of mode or the value of an explicit LIMIT. To return more than 1000 records, you must use the [Analytics Events Query API](#).

See [LIMIT Clause](#).

Exporting Analytics Data

Analytics allows you to export data to a file in CSV format for external use.

Before you export a set of data, consider these guidelines:

- The maximum number of records exported for a non-aggregation query is 65000. Use the LIMIT clause to restrict the records to a number below the upper bound. The LIMIT clause does not return any additional records that satisfy the export selection criteria.
- The number of records exported for an aggregation query by default is 10. If you want more than 10 records, use the LIMIT clause. You can export up to 1000 records by using the LIMIT clause.
- The CSV file format is RFC4180.
- Response from all valid ADQL queries can be exported. The method of writing ADQL queries remains the same.
- Only the fields that you specify in the SELECT clause are exported to the CSV file. ADQL query supersedes the UI selection. The fields selected to be displayed in the Data tab has no impact on the exported data even if the query includes `SELECT`

*.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- Fields having nested representation are flattened and appear as separate fields in the CSV file. Additionally, the corresponding unflattened nested fields also appear in the exported records. Flattening fields refers to separating nested fields into individual fields.
- The supported datetime format is ISO, yyyy-MM-dd'T'HH:mm:ssZZ, without the millisecond value. The timezone is local to the browser from which export is requested. A timestamp field in a nested field is converted to the local timezone only in the flattened fields, not in the unflattened nested field. The format in the UI, that is MM/DD/YYYY HH:MM:SS AM/PM, is different from the format that you see in the exported data.
- The time required to export data varies with the size of the record you are trying to export. Exporting tends to slow down for larger set of records because executing the query on and retrieving a large data set takes longer to complete.

4.5 Demo: Having - Base Case

The screenshot shows the AppDynamics search results interface. At the top, a SQL query is displayed: `1 SELECT transactionName, avg(responseTime) AS AVRT FROM transactions`. Below the query, there is a toolbar with buttons for 'Data', 'Visualization', 'Details', 'Save', and 'Actions'. The 'Data' button is highlighted with an orange box. Below the toolbar, a bar chart displays the search results. The 'Actions' menu is open, and the 'Export' option is highlighted with an orange box. Below the chart, there is a 'Fields' section with a search bar and a list of fields. The list includes 'User Experience' with a 'null' value and 'AD-Capital', and 'ECommerce-Sales-Demo' with 'NORMAL' values. The 'Application' field is checked.

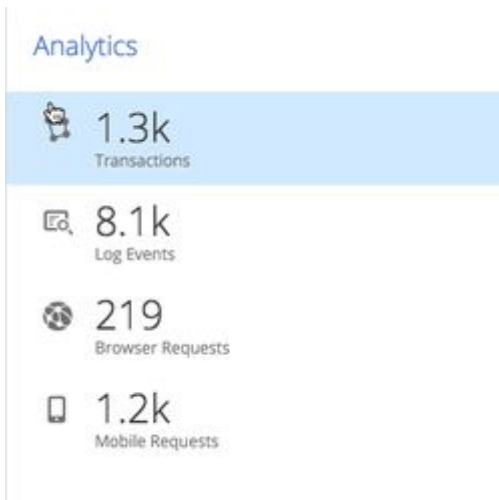

You can export metrics the Metric Browser and search results from the Searches screen. Use the **Export** option under **Actions** on the toolbar to do so. While you are on the Searches panel, use the **Data** mode to export your search result.

Access the Analytics Search UI

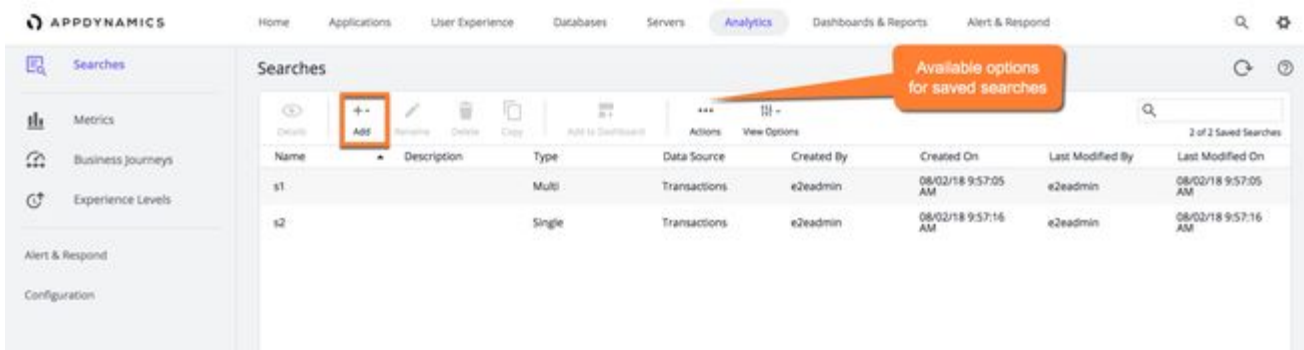

1. Navigate to the Analytics interface in the Controller UI by clicking **Analytics** in the top navigation bar.

The screenshot shows the AppDynamics Controller UI navigation bar. The 'Analytics' tab is highlighted with an orange box. The navigation bar includes 'Home', 'Applications', 'User Experience', 'Databases', 'Servers', 'Analytics', 'Dashboards & Reports', and 'Alert & Respond'. Below the navigation bar, the 'Home' page is visible with options for 'Overview', 'Unified Monitoring', and 'Getting Started'. A refresh button and a 'last 1 hour' filter are also present.

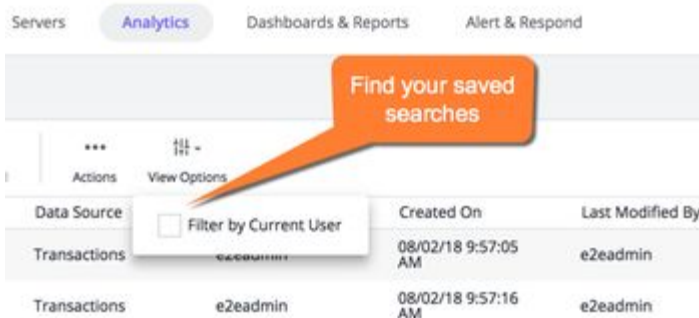

An alternate way to access Analytics is from the Home page: select a data source to see a default search for that event type.

2. Click **Searches** to create new searches and see a list of previously saved searches. The saved searches list displays any pre-existing, saved searches for which you have view permissions. The default sort order for the list is alphabetical by saved search name.

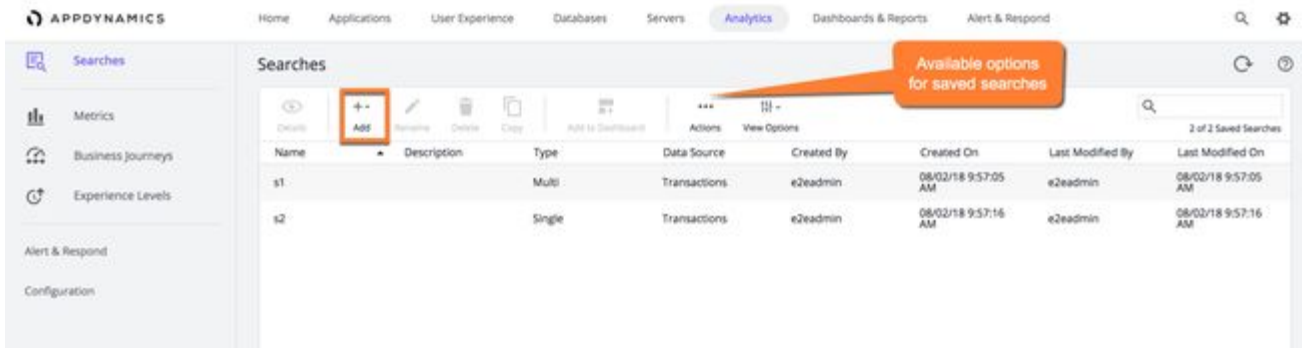

3. To view your saved searches, click **View Options** and select **Filter by Current User**.

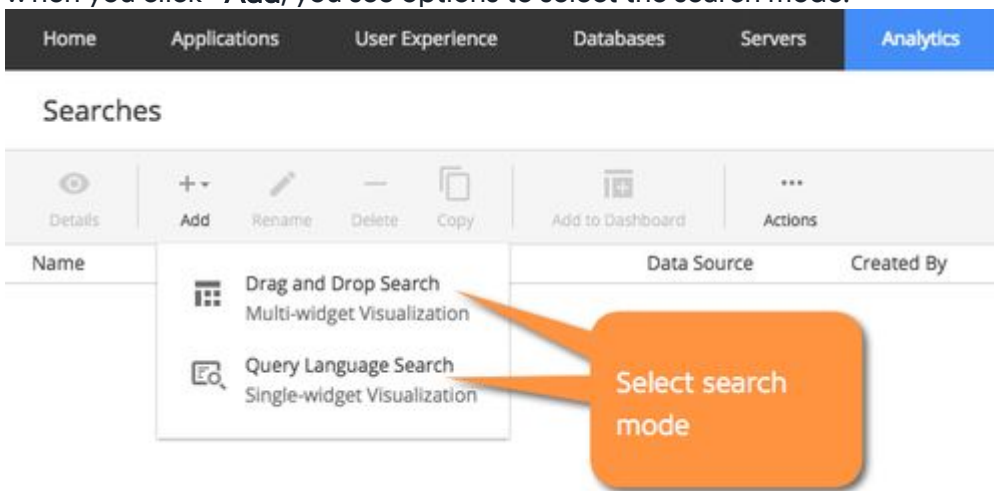

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- Click **+Add** to create a new search or select an existing search to activate the actions on the action toolbar.

- When you click **+Add**, you see options to select the search mode.

For details on the two search modes, see:

- Drag and Drop Search, see [Create Basic Analytics Searches](#)
- Query Language Search: see [Create Advanced Analytics Searches](#)

On the Search details page, you see two tabs for displaying the results for the Search.

- All event types share the same basic layout on the Data tab of the Search details page.
- Use the Data tab to search and filter the data that you want to review and analyze.
- Use the Visualization tab to create graphic representations based on that data.
- Search actions are available for each search. The actions vary according to the type of search and the tab you use. These actions are available:
 - Rename
 - Export (to CVS - only from the Data tab)
 - Create Metric
 - Add to Dashboard (only from the Visualization tab)

Basic and Advanced Search Comparison

This table provides a comparison of the functionality available in each search mode.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Functionality	Basic	Advanced
Drag and drop fields to the criteria search bar	yes	no
Type-ahead (auto-complete)	N/A	yes
Visualization canvas widget support	multiple widgets	one widget per search query
Grouping of events with the GROUP BY keyword	yes	yes
Wild cards with comma-separated text (Basic mode) or IN operator (Advanced mode)	no	no
Percentile Histogram widget	yes	no

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

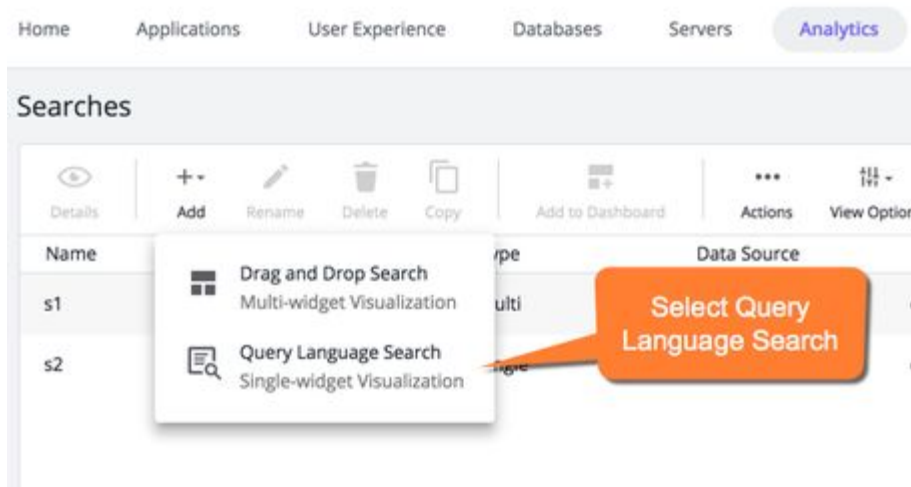

Create Advanced Analytics Searches

Related pages:

- [Using Analytics Data](#)
- [ADQL Reference](#)

This page describes how to use the AppDynamics Query Language (ADQL) to search analytics data using **Advanced** mode in the Analytics Search panel. If you have never used AppDynamics Analytics, you might want to start with **basic mode** before using Advanced mode for your searches.

Access Advanced mode by clicking **Add+** on the Analytics Search page. Select **Query Language Search**:

Construct ADQL Queries

Each ADQL event query begins with a **SELECT** statement that uses a **FROM** clause. Use the **FROM** clause to specify the data source you want to query. You can query one data source in each query.

Use the **SELECT** statement to further qualify the query using `field_expressions` and `math_expressions`. The **WHERE** clause adds conditions. For more details on specific ADQL syntax, keywords, functions, and operators, see the [ADQL Reference](#).

i When you search Analytics data, the values shown for segment fields are from the originating tier segment. Data from downstream (non-originating) tier segments is not shown. To visualize downstream segment data, double-click on the transaction row to display the **Transaction Snapshot** screen. Then select the **Transaction Data** tab.

When you click **Search** for queries other than select all fields (**SELECT ***), the results display on the visualization tab where the table widget accurately renders your query.

Use ADQL Auto-Complete

As you construct your query and type a space after a keyword, auto-complete offers suggestions for the next keyword or operator in the query. The display of auto-complete suggestions is based on the stage of your query and the event type you selected. Auto-complete offers suggestions for data values, such as

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

event types and fields, when you type an equals sign "=" or other [comparison operator](#) after the event type name.

Note: The query box in the data tab is used only for adding **WHERE** clause differentiation. Aggregation functions are only available in the visualization tab under the table widget.

In advanced mode, when you type **SELECT**, the fields from the last specified event type display in the auto-complete list. Fields specific to a new event type display after you complete the **FROM** clause.

 Remember to type a space in front of the next keyword or you may see a validation error when executing the search or the search will be inexecutable.

Field Name Mapping

The field names in the auto-complete dropdown list correspond to UI labels and are obvious in most cases with minor differences in capitalization. When the field names have prepended database-related information, such as `segments.errorList.errorType` for Error Type or `segments.httpData` for HTTP data fields, they refer to data for individual segments of the transaction as it progresses from tier to tier. The segments fields do not represent data that refers to the overall business transaction instance. See [ADQL Data](#) for a list of fields, UI labels, and internal database names for each data source.

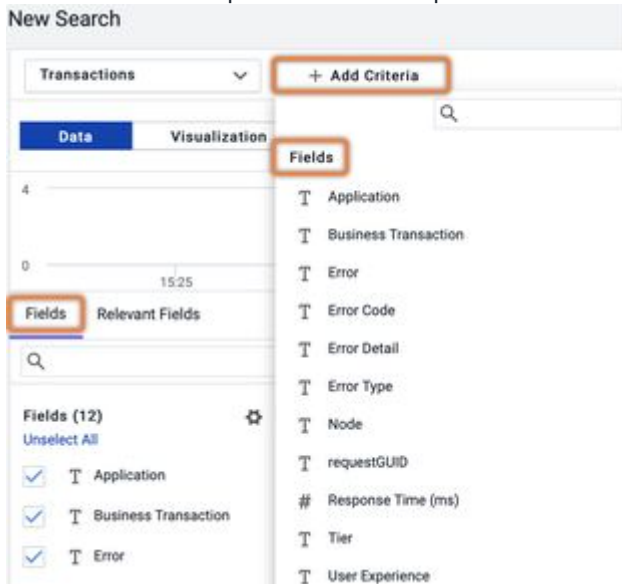

Create Basic Analytics Searches

This page describes UI elements available in the Analytics search panels and focuses on how to create searches in Basic mode. This mode is also called **Drag and Drop Search** in the UI and enables you to do multi-widget visualization of your search results. In this mode, you add search criteria based on the fields collected for the event type. Field search enables you to search for all values or a specific value of the field.

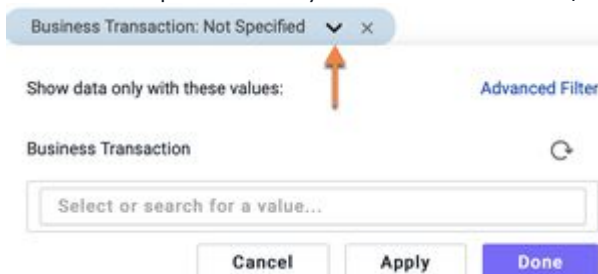

UI Elements

These UI elements are available to help construct your searches:

- **New Search:** The scope of the search depends on the **Fields** type. You can filter your search with the **+ Add Criteria** button.

- **Field value dropdown:** After you have selected a field, use the dropdown to add a list of values.

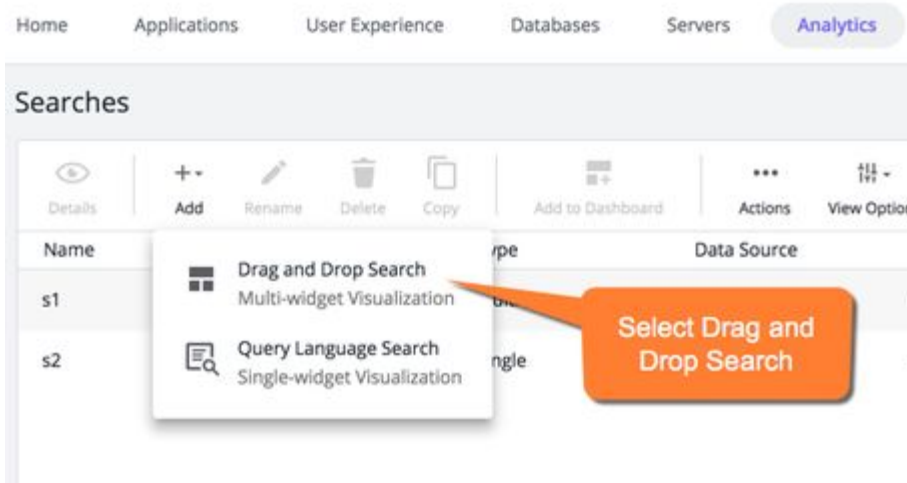

- **Combination field selector and search:** This field value selector combines a list of values with the ability to search for terms in the values list. It also has an **Advanced Filter** option.
- **Text filter:** Enables you to do an exact match on the term entered. Supports wild cards. See [Search Options](#).

Basic Search

To create a search using a field:

1. From the Analytics Search list, click **+ Add**.

- To use basic mode and multi-widget visualizations, select **Drag and Drop Search**.

To use advanced mode (ADQL) and single-widget visualizations, see [Create Advanced Analytics Searches](#).

- On the Transactions tab, select the data source type that you want to search.
- To add filters to your search, click **+ Add Criteria**.
The field selector dropdown appears, so you can select the field you want to use.
- Select a field. The field name appears in the search criteria line.
- Click the dropdown next to the field name to open the field value selector. Select a value for the field.
Fields such as application, business transaction, and node display a list of the values available. Some fields show a search box where you can enter criteria to filter the values of this field.

Search Options

This table describes free text search and text filter behavior:

Type of entry	Analyzed	Non-analyzed
<i>term</i>	Find entries with this term. This search is case insensitive. For example, using the term "great" finds "great" and "AppDynamics is great".	Looks for an exact match and <u>is</u> case sensitive. For example, using the term "order" finds "order" but not "/PlaceOrder".
<i>term1 term2</i>	Returns results containing both <i>term1</i> and <i>term2</i> irrespective of the order the terms appear.	Terms are implicitly AND'd. Looks for an exact match and find results containing " <i>term1 term2</i> ".

Type of entry	Analyzed	Non-analyzed
<i>term1, term2</i>	This works the same as the space-separated list of terms.	Terms are implicitly OR'd. Looks for an exact match for either <i>term1</i> or <i>term2</i> .
<i>term*</i> <i>term?</i>	Finds all fields where the value is this string plus one additional character <?> or multiple <*>. Because all non-alphanumeric fields are delimiters, the escape character has no effect.	Finds all fields where the value is this string plus one additional character <?> or multiple <*>. To search for a field containing a wild card character, escape with a "\".
NOT <i>term</i>	Use the NOT comparison operator to find everything except the term. NOT can be used with any of the entries in this table.	Use the NOT comparison operator to find everything except the term. NOT can be used with any of the entries in this table.

Free Text Search in Log Analytics

For log analytics, a free text search is available for searching the message field. This enables you to search for any keyword or string anywhere in the message field.

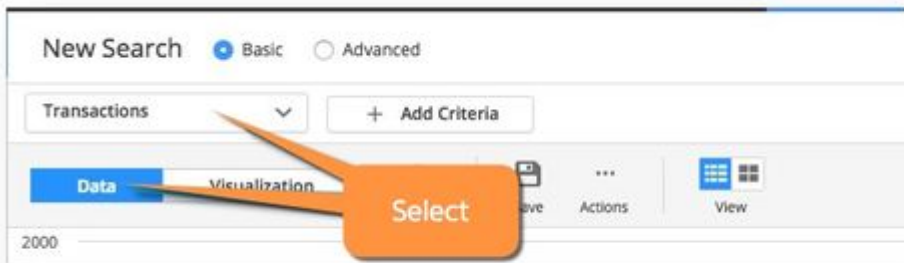

Investigate Using Relevant Fields

You can use Relevant Fields to find data fields that show a high Relevance Score. A high relevance score indicates these fields are significantly more common in your filtered dataset than in the entire dataset and may be particularly useful to analyze. Relevant field investigation may provide valuable insights and enable you to conduct better root cause analysis.

Relevant Fields investigation can be used with all event types.

As an example, you can use the following suggested workflow to investigate poor user experience.

1. From the Analytics Search page, select the **Transactions** event type and the Data tab.

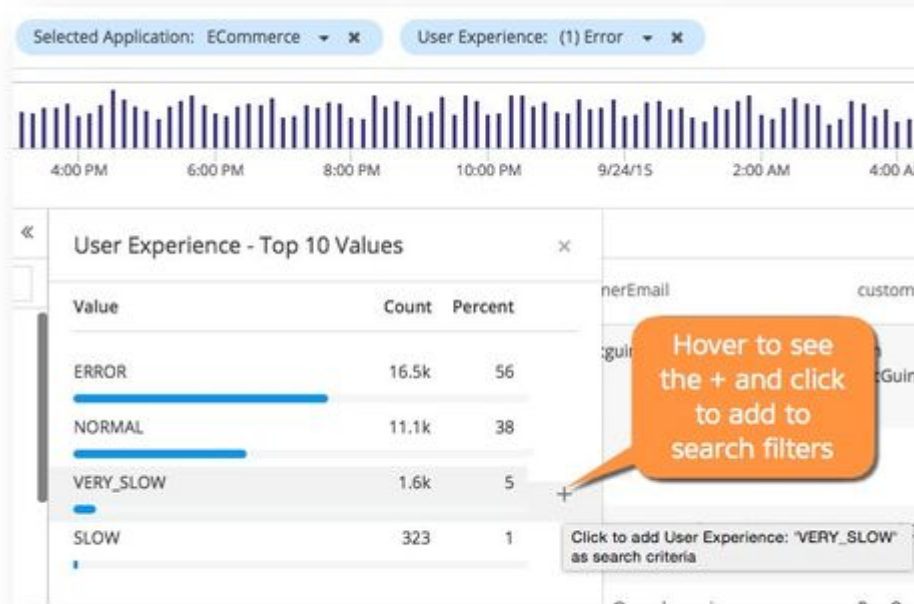

2. Click **Add Criteria** and select an application to investigate.
3. Click **User Experience** or another field in the **Fields** list to see the **Top Values**. If you see lots of error and very slow transactions, you realize it is not easy to investigate hundreds of error and very slow transactions.

Value	Count	%
NORMAL	73720	90.89
ERROR	6293	7.76
SLOW	598	0.74
VERY_SLOW	499	0.62

4. Add **Error** and **Very Slow** values to your search criteria to narrow the total number of transactions to a smaller dataset. You can add the values quickly by hovering over the field in the **Top Values** list until the **+** sign appears at the right. Click the **+** to add to the search criteria. Now the focus is only on error/very

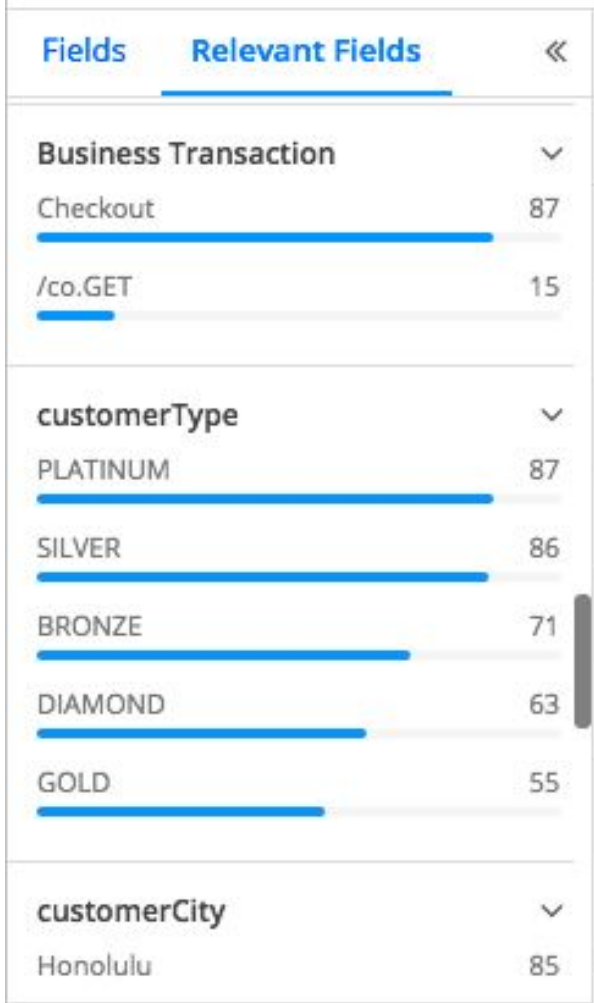

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

slow transactions.

5. Click the **Relevant Fields** label and now you can see where to focus your investigation. In this example, you might start with the **Checkout** business transaction as the relevance score is 87. You can also see that **Platinum** and **Silver** customers have the two highest scores. The relevance score is an indication of

where the highest proportion of error and very slow transactions are occurring.

- Click a field in the **Relevant Field** list to see more details. You can continue to add relevant fields to your search criteria to keep narrowing the dataset. This process should enable you to find issues of significance for investigation.

Visualize Analytics Data

Related Pages:

- [Create Basic Analytics Searches](#)

After you have created a search for the Analytics data that you want to visualize, you can configure a widget to display the results of the search graphically.

Access the Analytics Widget Builders

You can access the Analytics visualization widgets from the Analytics Search UI or directly from **Dashboards & Reports**.

To access the Analytics widget builder from Analytics:

1. Select **Analytics > Searches** to view the saved searches list.
2. Double-click the search that you want to visualize or add a new search.

To access the Analytics widget builder from a Custom Dashboard:

1. From the top navigation bar, click **Dashboards & Reports** to see the custom dashboard list.
2. Either double-click the dashboard where you want to add the Analytics widget or click **Create Dashboard** to create a new dashboard.
3. In the custom dashboard, click **Edit**, then **Add Widget**.
4. Click **Analytics, Saved Searches, or Experience Levels**.
5. Add Analytics widgets as needed to your dashboard.

Build a Widget

To use the Analytics widget builder:

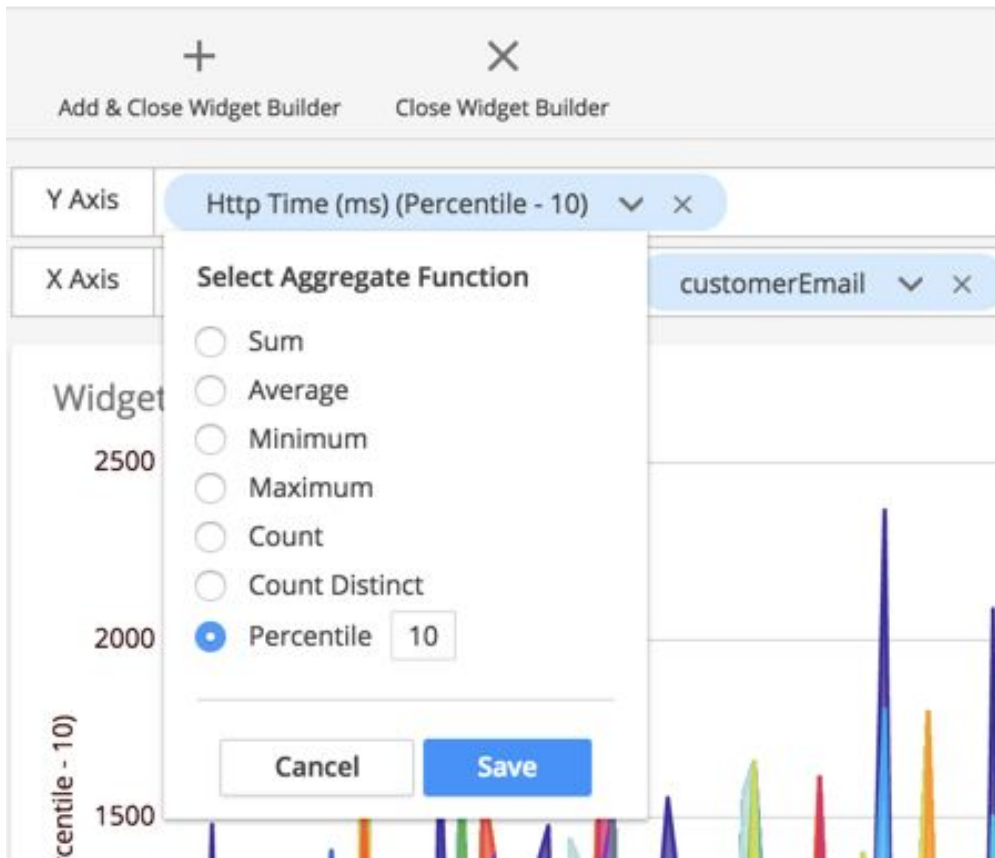

1. Click the **Visualization** tab.
2. In the **Visualization** canvas, you can create widgets with one of the following modes:
 - In **Drag and Drop Search** (Basic) mode you can create multiple widgets on the canvas.
 - In **Query Language Search** (Advanced) mode you can generate one widget from your ADQL query at a time. In addition, when you use the Visualization tab in this mode, the order of functions and fields in the query matters. For all widgets (except table), the aggregate functions, such as count(*), avg(), sum(), percentile and so on, should always be preceded by a field. If the fields and functions in the query are not in this order, some visualizations do not work.

See [Conversion Analysis](#) for an example of creating a conversion analysis using the funnel widget.

3. Click **Add Widget**, then select **Custom Widget Builder** or **Funnel Widget Builder** depending on the type of widget that you want to create.

In Basic mode, you can build custom widgets and drag fields to the canvas, which uses X and Y axes for configuration. After dragging a field to the axes, select a function from the drop-down next to the field name.

In this example, the percentile function is applied to **HTTP Time (ms)**.

The funnel widget is configured differently from the other custom widgets, which use the Y and X axes as the basis of the configuration. A funnel widget is used to display data of progressively-staged proportions in a color-coded funnel.

You can add a title to the widget by over-writing **Widget Title** on the canvas.

4. After adding a widget and fields, you can right-click menu widget values to see other options. Select **Apply a global filter for <field_value>** to add a value to the existing search criteria. The supported boolean operators are **true**, **false**, **null**, and **is not null**. Use **is not null** to check both boolean and non-boolean fields, such as `loan amount` or `IsReached`.
5. Click **Save & Close** to save the widget configuration.

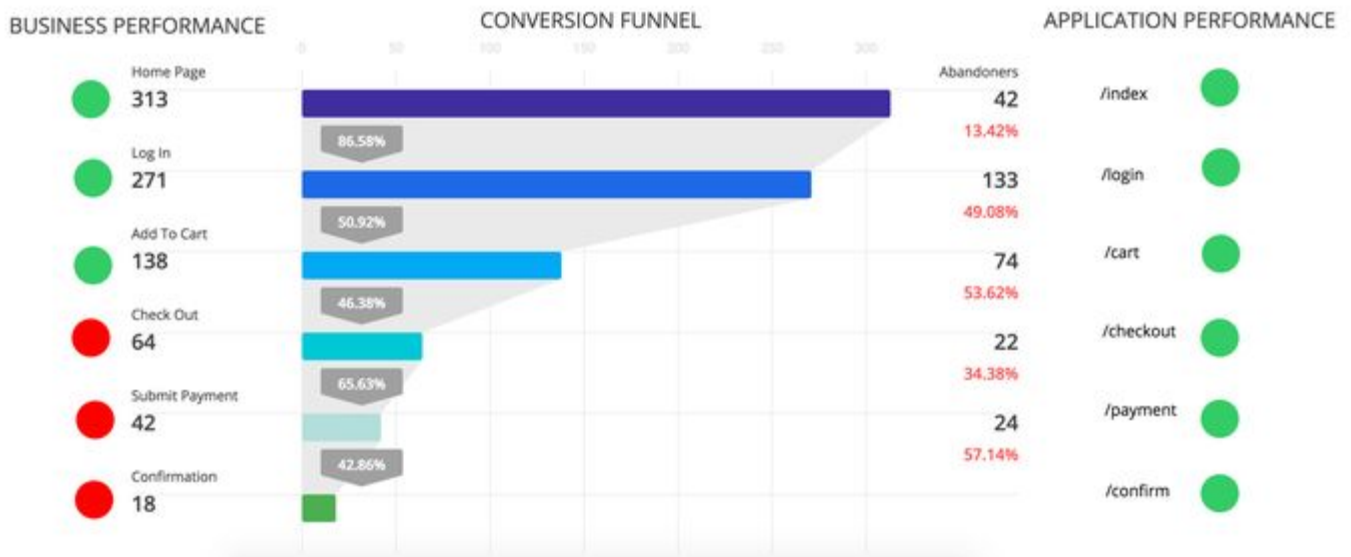

Conversion Analysis Using Funnel Widget

Funnel analysis includes a series of events that lead towards a defined goal. For example, tracking user activity in a mobile app, a sale on an eCommerce website, online advertisements, and eventual purchase.

The funnel widget visualizes use cases such as:

- Retail application checkout drop-off rates from the point of adding items to the shopping cart to the actual purchase
- Business Journey drop-off rates from the point of applying for a loan to approving the loan
- Home mortgage loan approval drop-off rates from submitted application to approved applications
- Impact from performance issues by total sales, customer segment, location, and purchased products are gauged in a funnel with other health rule widgets

In this custom dashboard, the impact from performance issues by total sales, customer segment, location, and purchased products are gauged in a funnel with other health rule widgets.

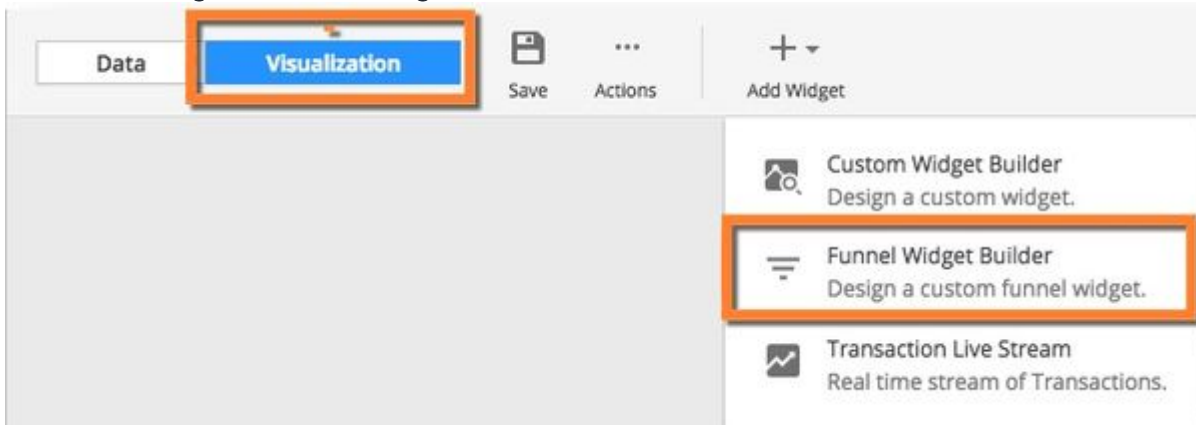

Funnels return the number of unique actors that successfully (or unsuccessfully) make it through a series of steps. Actors could mean users, devices, or any other identifiers that are meaningful to you. A funnel analysis reveals where a given flow loses the most actors. This helps identify areas for improvement, as well as the overall health of your business.

The first step in the funnel is the anchor step, and always represents 100% of the results. The filter criteria for the first step creates a set of unique values, and every subsequent step results in a subset of the values from the previous step and renders the corresponding drop-offs. The second and later steps describe the number of events that match the criteria for each step towards the goal. This number is typically less than 100%, but could be 100% if every event matches the subsequent steps.

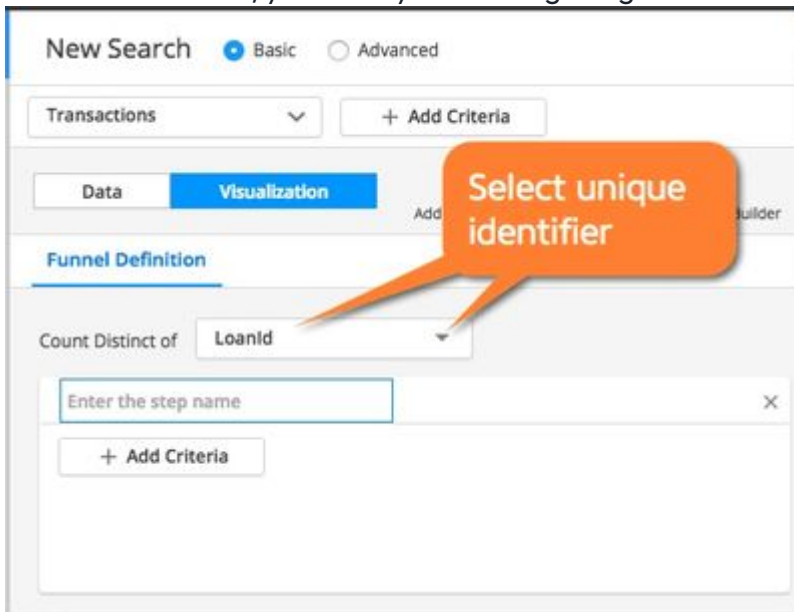

Build a Funnel Widget

1. From the **Analytics Search** page using **Drag and Drop (Basic) Mode**, select the Visualization tab.

2. Click Add Widget > Funnel Widget Builder.

3. In the **Funnel Definition** pane, click the down arrow to select the unique field representing the items that you are counting. In this example, following the steps of a loan approval process, `LoanId` is used. The fields depend on your application. There is a limit of 50,000 unique values for the first step. If you encounter this limit, you can try decreasing the global time range and look at fewer values at a time.

i Filtering on fields with null and empty values may cause more records in subsequent levels.

- Label the first step and continue to add steps as needed for your application process.

Funnel Definition

Count Distinct of

For this example, the first step represents the number of submitted loan applications. The search criteria include the AD-Capital application and the `/portal/SubmitApplication` business transaction.

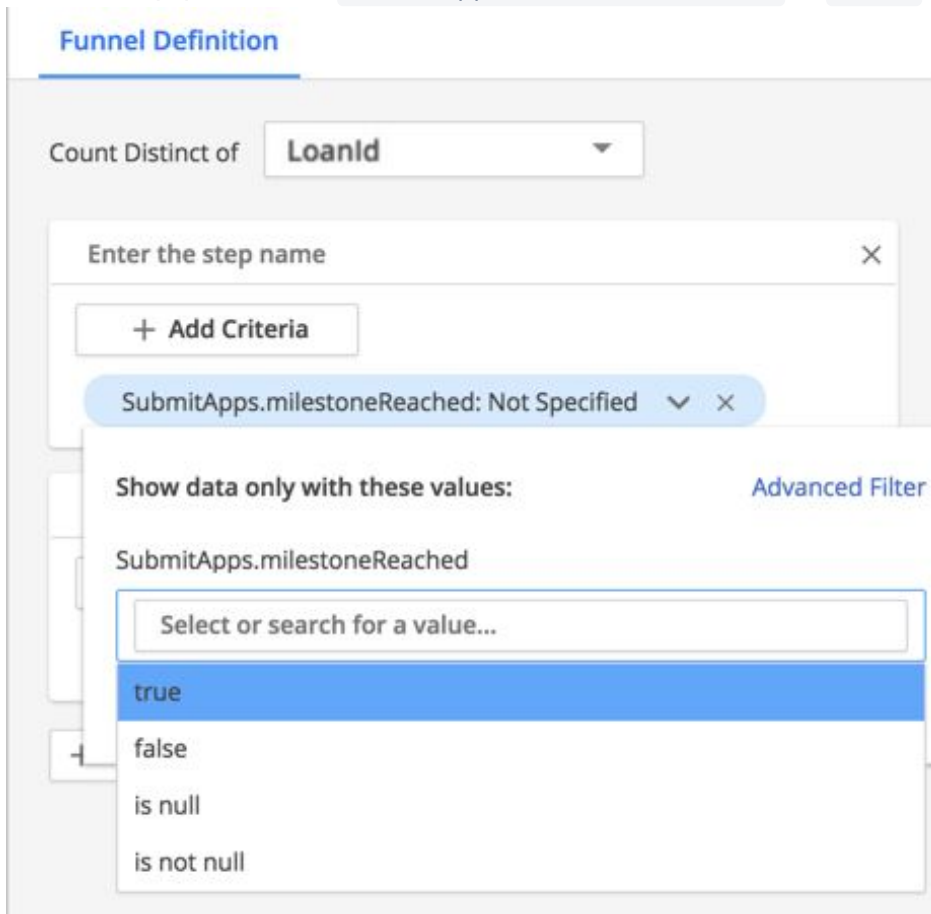

Funnel Definition

Count Distinct of

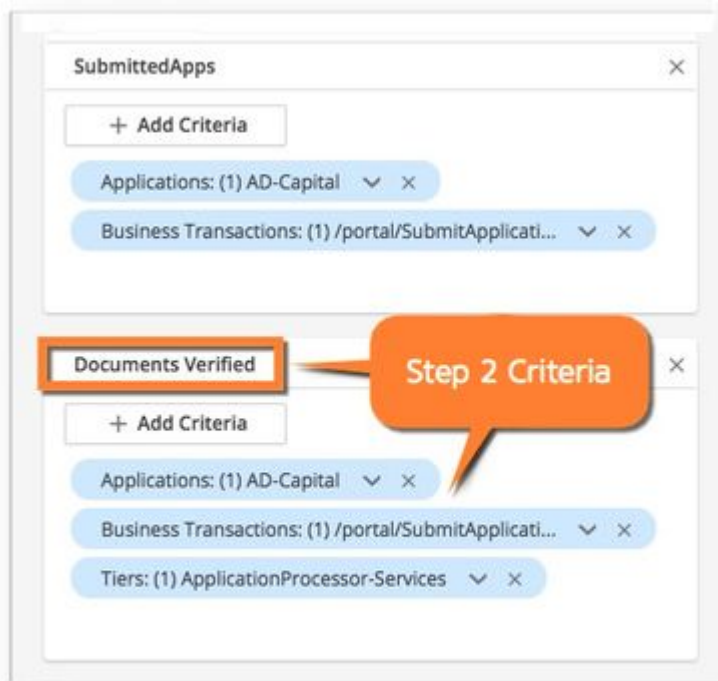

Criteria

- Applications: (1) AD-Capital
- Business Transactions: (1) /portal/SubmitApplicati...

Alternatively, you can set `SubmitApps.milestoneReached` to `true`.

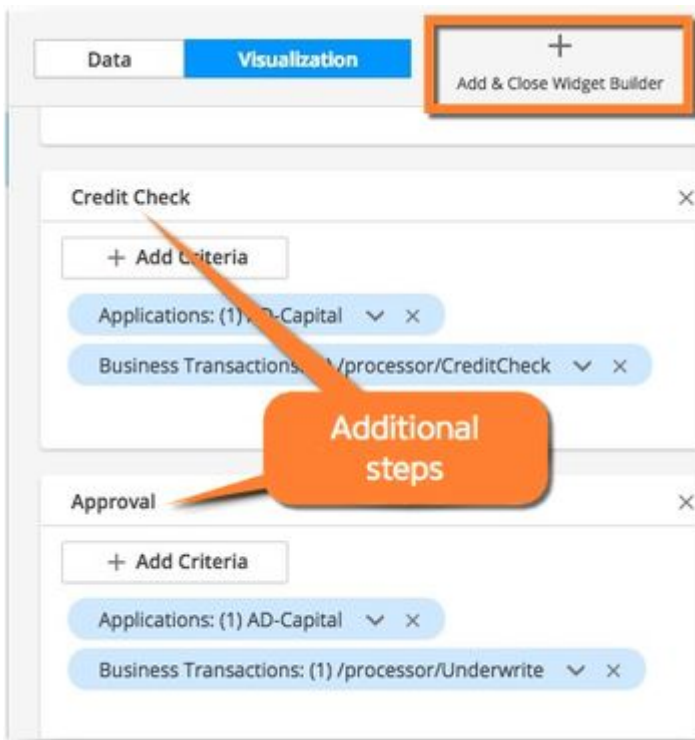

5. Continue to add and label your steps. This step represents the number of loan applications that reached the stage "Documents Verified."

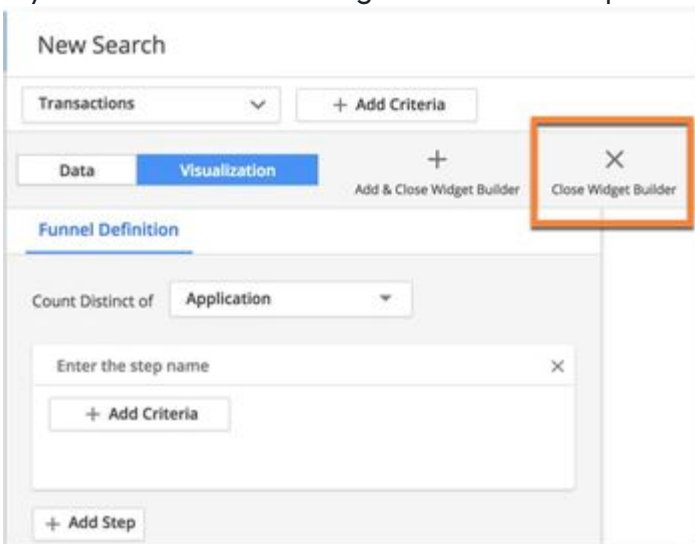

Alternatively, use the `milestoneReached` field and set it to true.

6. After you have added all the necessary steps, click **Add & Close Widget Builder** to save the completed funnel widget. This example contains two additional steps representing loans that reached the credit check and approval stages.

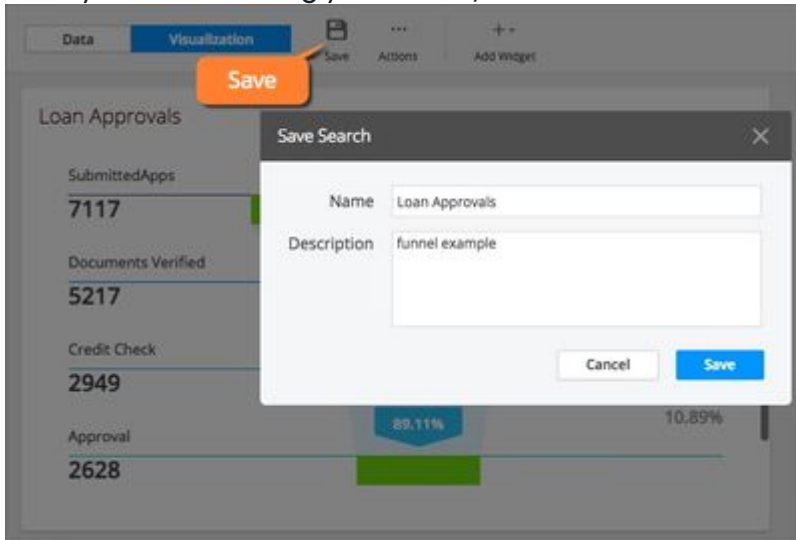

If you want to cancel editing and revert to the previous version, click **Close Widget Builder**.

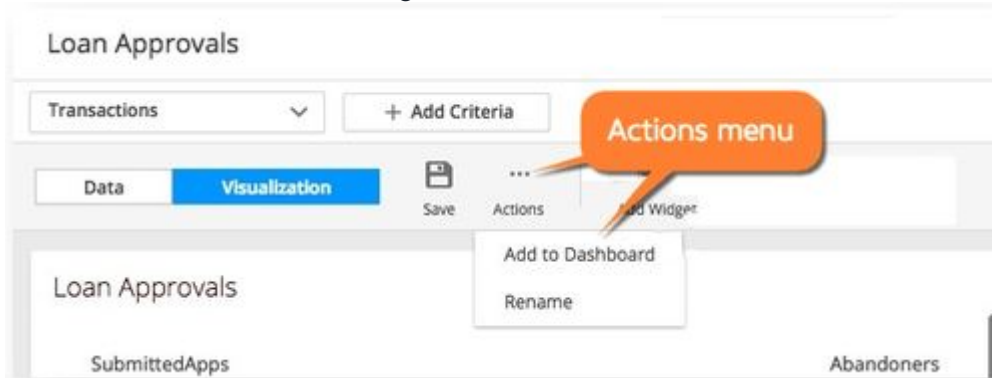

If the funnel steps need a rearrangement you can simply reorder them by simply dragging and dropping each step into appropriate positions.

- Once you finish building your funnel, remember to name and save your search result.

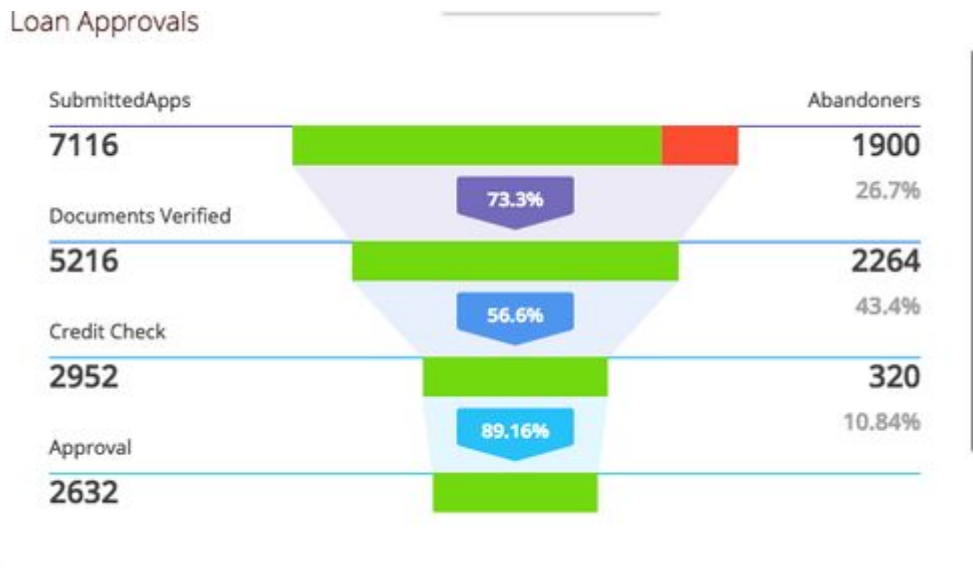

- To add the finished funnel widget to a custom dashboard, click **Actions > Add to Dashboard**.

Use the Funnel to Troubleshoot

The finished funnel widget for the above example shows the drop-offs (Abandoners) in unique loan IDs from submission to approval. When creating the funnel, you can also select **Show Health** in the properties pane to display a health overlay that correlates application health data with the business conversion data. This helps to visualize performance for each step of the funnel widget.

The health overlay is supported for these events types with a user experience value:

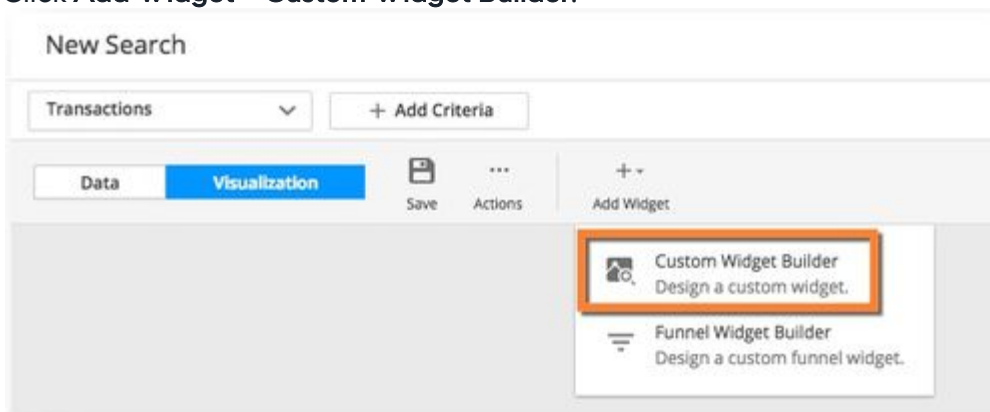

- Transaction Events – `userExperience`
- Browser Records – `pageexperience`
- Mobile Snapshots (Network Requests) – `networkrequestexperience`
- Web Session Records (Browser Sessions) – `experience`
- Mobile Session – `networkrequest.networkrequestexperience`

For enhanced troubleshooting, you can drill down to event data from any of the funnel steps by double-clicking the numbers on conversions and abandoners or by using Health Overlay and clicking on each health segment.

Configure Custom Widgets

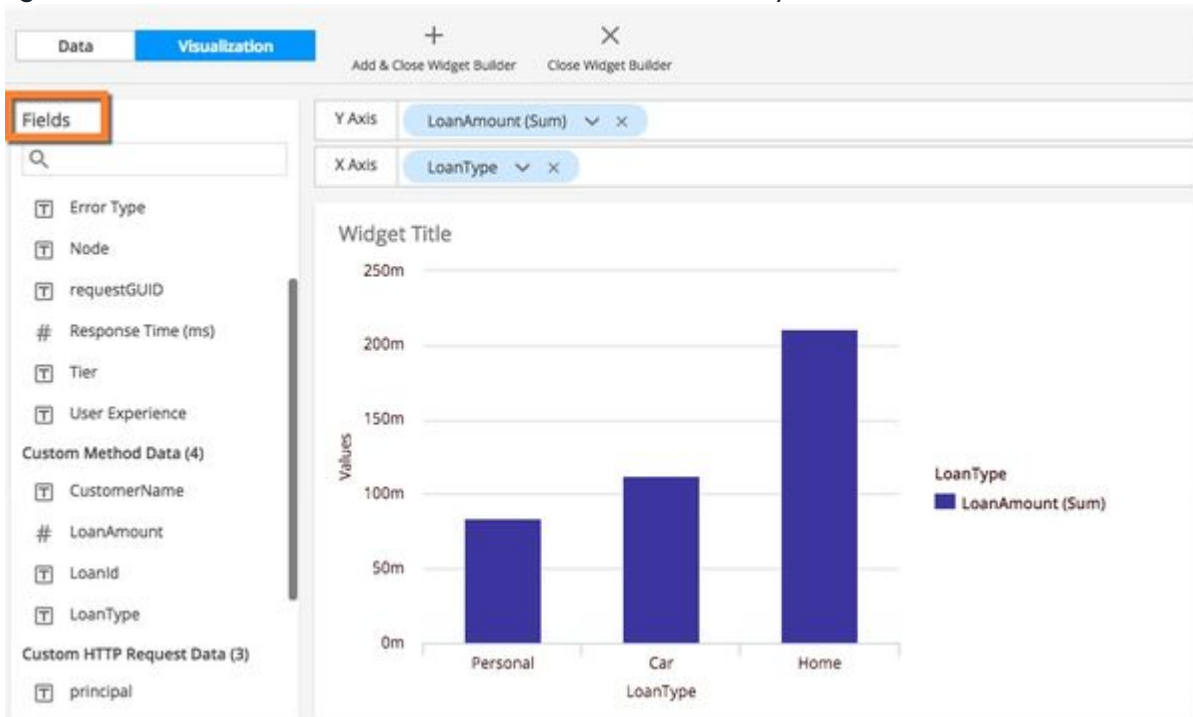

To configure custom widgets for your analytics searches:

1. From the Analytics Search page using **Drag and Drop Search** (Basic) Mode, select the Visualization tab.
2. Click **Add Widget > Custom Widget Builder**.

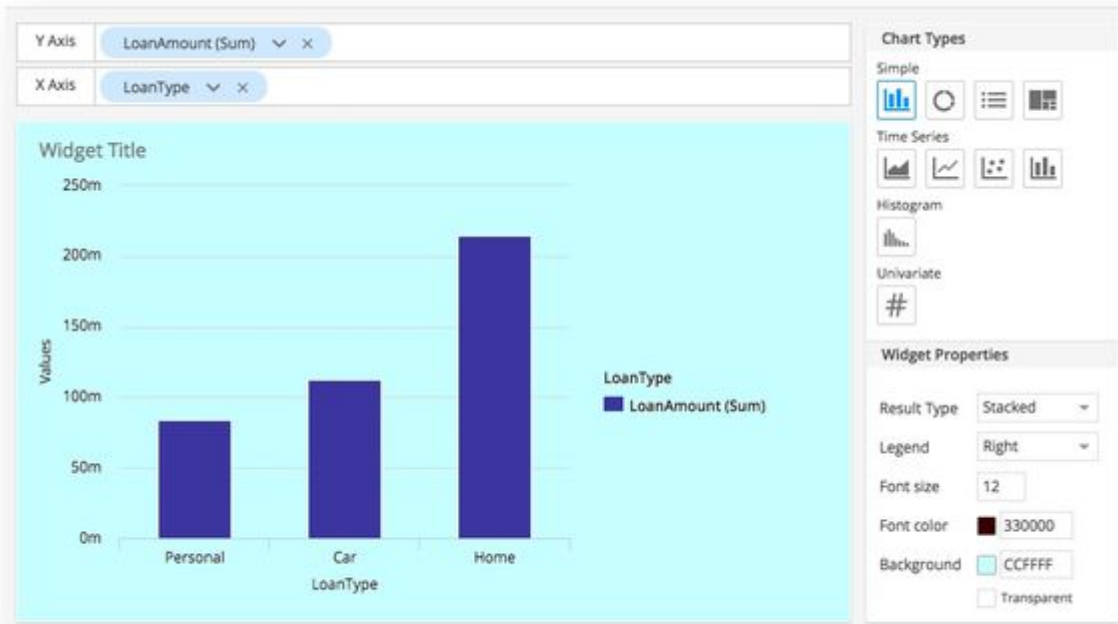

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- To add a field to a widget, drag the field from the **Fields** panel on the left to the Y-axis or X-axis on the right. The available fields are based on the fields returned by the search.

- From the **Chart Types** panel on the right, click the widget type to use for the display. The widget is previewed in the main panel. You can experiment previewing which widget type is best for visualizing a particular data set.

- Usage for the X and Y axes depends on the chart type. The UI prevents you from adding more fields than the widget supports. Different widgets have different limits for the maximum number of fields permitted on each axis.
- For the time series widgets (area, line, scatter, and histogram), you can use the **Resolution** field that appears on the X-axis to customize the frequency displayed if you do not want the widget to automatically select a default resolution based on the current time range. This time resolution field is not counted toward the field limit. The granularity of resolutions that can be chosen depends on the Global time range.

Custom Widget Builder Data Type and Field Restrictions

Widget Type	Data Type	Number of Fields on Y-axis	Number of Fields on X-axis
Column (simple)	any	zero	up to two
		one	up to two
		two or three	zero or one
Pie	any	one	up to two
Table	any	one	up to ten
Tree Map	any	one	up to two

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Widget Type	Data Type	Number of Fields on Y-axis	Number of Fields on X-axis
Time Series (Area, Line, Points, Column)	any	zero	one
		one	one
		two or three	zero
Percentile Histogram (Not available in Advanced Mode)	numeric	zero	one
Numeric (Univariate)	any	one	zero

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

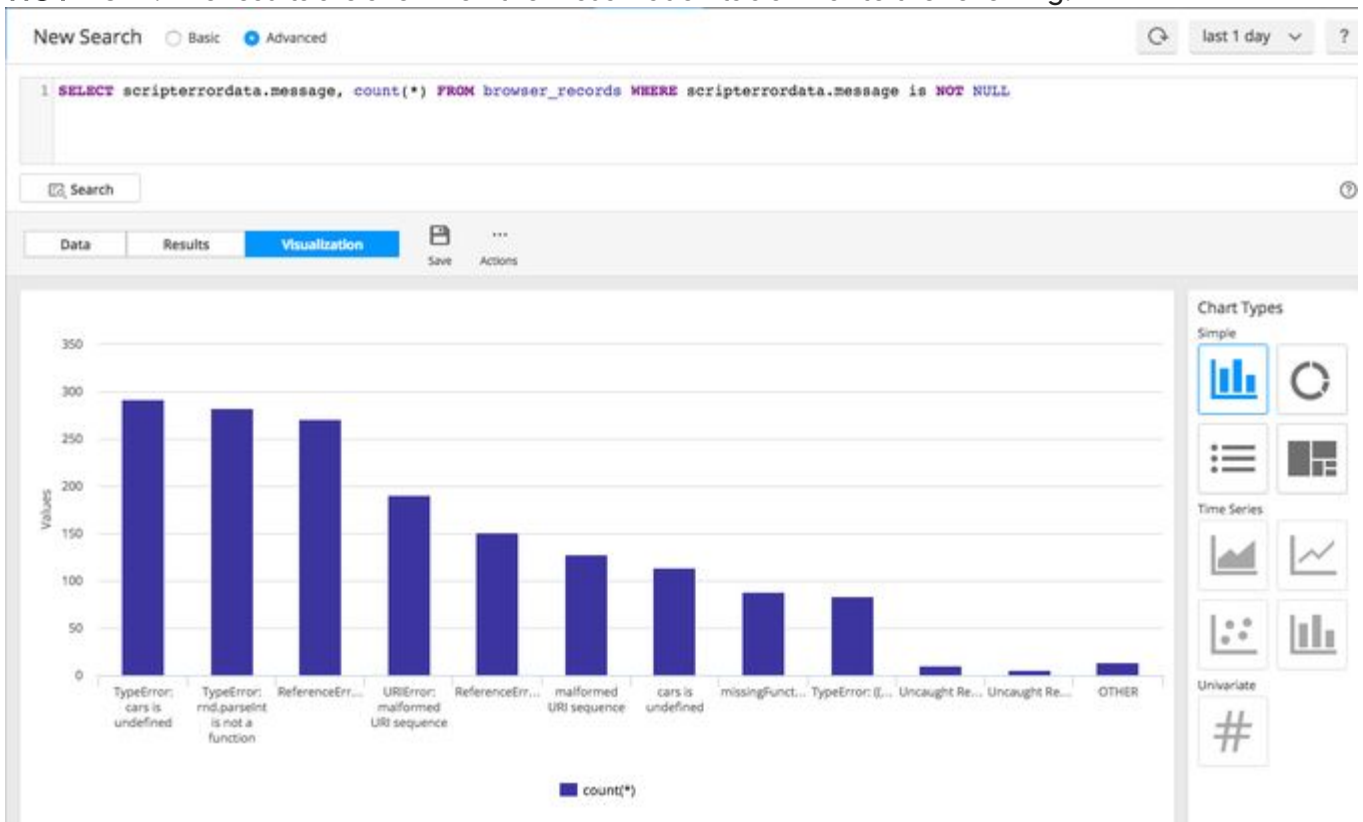

Visualize JavaScript Errors

You can use Analytics to query your Browser Request event data and create a JavaScript exception and error summary dashboard.

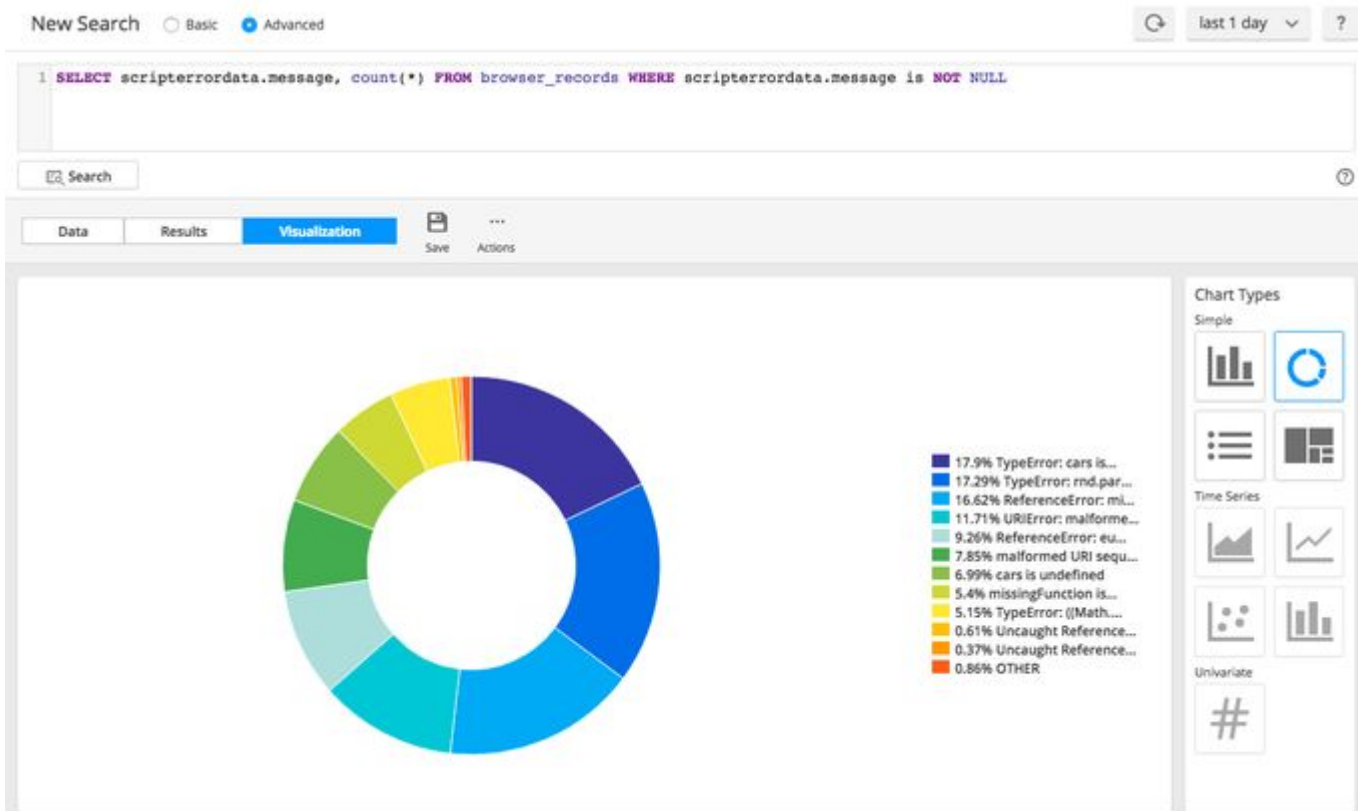

This procedure assumes that you have configured and enabled the reporting of the JavaScript errors for Browser RUM and that JavaScript errors exist in the Events Service.

Using ADQL, you can search for the errors and then export a chart visualizing the results to a custom dashboard.

1. From the Analytics tab in the Controller UI, click **Add** to access the Analytics Search page.
2. Select Advanced mode and enter the following query:
SELECT scripterrordata.message, count(*) **FROM** browser_records **WHERE** scripterrordata.message **IS NOT NULL**. The results are shown on the Visualization tab similar to the following:

3. Select the chart type you prefer to visualize the results.

4. From the **Actions** menu, click **Add to Dashboard** and either create a new dashboard or add it to your existing dashboard.

Now you can customize the dashboard as needed with labels or other widgets and data.

You can also leverage additional fields such as `scripterrordata.origin` or `pagename` to group the errors together. The additional fields are:

- `scripterrordata.linenumber`
- `scripterrordata.origin`
- `scripterrordata.timestamp`

New Search Basic Advanced last 1 day ?

```
1 SELECT scripterrordata.linenummer, scripterrordata.message, scripterrordata.origin, count(*) FROM browser_records WHERE scripterrordata.message is NOT NULL
```

Search

Data Results **Visualization** Save Actions

scripterrordata.linenummer	scripterrordata.message	scripterrordata.origin	count(*)

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Create Analytics Metrics From Scheduled Queries

Related pages:

- [Using Analytics Data](#)
- [ADQL Reference](#)
- [Manage Custom Roles](#)

This page describes how to create analytics metrics from scheduled queries.

If you want to execute an analytics search repeatedly to monitor its value, you can create a metric from the search. The search will execute once per minute and report the results as a metric. You can create alerts on the metric in the usual way using [Health Rules](#) to trigger [Policies](#) and [Actions](#). The analytics metric list is searchable.

You can create metrics for all Analytics event types - Browser, Mobile, Transaction, Log, and Custom.

Although the metrics calculated by scheduled queries may have decimal point precision, we only save and report whole numbers.

You can create a metric from an analytics search for the functions shown in this table. See [Metric Data Resolution over Time](#).

Function	Metric Rollup Type	Example
count(* field_name)	sum	SELECT count(activeMacUsers) FROM dummyTransactions
distinctcount(field_name)	average	SELECT distinctcount(activeMacUsers) FROM dummyTransactions
sum(numeric_field_name)	sum	SELECT sum(responseTime)where userExperience = "NORMAL" FROM transactions
avg(numeric_field_name)	average	SELECT avg(responseTime) FROM transactions
min(numeric_field_name)	average	SELECT min(responseTime) FROM transactions
max(numeric_field_name)	average	SELECT max(responseTime) FROM transactions

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Function	Metric Rollup Type	Example
(exp1)/(exp2)	average	<pre>SELECT (count(activeMacUsers)) / (avg(activeWindowsUsers)) FROM dummyTransactions SELECT (avg(responseTime)*2)/ ((avg(segments.transactionTime)+3)/2) FROM transactions SELECT (sum(responseTime)*2)/ (filter(sum(responseTime), where userExperience = "NORMAL") + 0.5) FROM transactions</pre> <div style="background-color: #fff9c4; padding: 5px; border: 1px solid #ccc;">  Each side of the expression must be enclosed in parenthesis. </div>

You must have **Manage Metrics** permission and View access to Analytics to create metrics from analytics searches. See [Analytics and Data Security](#) and [Transaction Analytics Permissions](#).

Create an Analytics Metric

1. Working in the **Analytics > Search** editor, set the search criteria to select the appropriate data.
2. Click **Actions > Create Metric** in the search action toolbar.
3. In the pop-up window, give your metric a name and a description.

The name determines how the metric appears in the Metrics panel and the Metric Browser. Keep in mind:

- Metrics are truncated to whole values. So values less than one are truncated to zero. To work around this, you can multiply a `numeric_field_name` by a factor of 10, 100, 1000, and so on, depending on the level of decimal accuracy you need. We recommend that you add this factor into the metric display name so other users can understand what the metric represents, for example, Display Name = Metric (Factor 1000). In cases where the value is a percentage, and you convert by multiplying by 100, you probably don't need to put the factor in the metric name because it would be implicit (Metric %).
- Math operations are only supported inside the aggregation function. For example, `count(numeric_field_name * 10) from transactions`.

Metric Timestamps

Timestamp metrics always aggregate events from the current minute because metrics are created for events published in the last minute.

If you have specified a value for the `eventTimestamp` field, the timestamp value in the new metric uses an aggregation of events from the `pickupTimestamp` field.

For example, you set an `eventTimestamp` for an event on a previous day. You then create a metric for the event today. The metric does not use your explicit `eventTimestamp` because it is no longer from the current minute. The metric aggregates events using `pickupTimestamp`. This ensures that the metric timestamp is based on the current minute because `pickupTimestamp` cannot be explicitly changed.

See [Analytics Events API](#).

Correlate Metrics from Multiple Events

When you create a query, AppDynamics produces a holistic metric. Because the queried data comes from different events, the Events Service has to retrieve this segmented data and stitch it together to produce a single metric. The Events Service waits for correlated events to arrive, where the maximum wait time depends on the event type:

- Mobile and Browser Session Events - two minutes.
- Transaction Events - ten seconds.

The wait time resets when the Events Service finds a correlated event.

If an event arrives after the maximum wait time, the event is not stitched together correctly in your query. For example in the following query `fieldA` and `fieldB` are separate but correlated events:

```
select count(*) from transactions where fieldA = "foo" and fieldB = "bar"
```

The Events Service finds `fieldA` and waits 10 seconds for a correlated event. If `fieldB` arrives 15 seconds after `fieldA`, the Events Services does not correlate both events. The count metric is now inaccurate because the events are not connected.

Monitor Analytics Metrics

For performance reasons, the scheduled queries used in analytics metrics can be disabled as follows:

- Queries are disabled if calling the Events Service results in any errors for ten consecutive times.
- Queries are not disabled if the Events Service is not reachable from the controller, such as during maintenance and upgrade windows.
- When the Controller is restarted, the queries which were previously disabled by the system due to consecutive failures are re-enabled.
- User-disabled queries remain disabled even after the system is restarted.

To monitor the metric:

1. Click **Metrics** in the left navigation bar.
2. Search, edit, enable, disable, or delete metrics from the **Metrics list**.

 You can edit only the description of the selected metric.

3. To activate or deactivate metrics in a batch, select the corresponding rows in the grid and click the **Enable** or **Disable** button in the toolbar. Use Shift+ click or Command + click rows to select multiple rows.

 If you see a status that says "Disabled due to repetitive failures", you can re-enable it by clicking **Enable**.

4. To see the metric in the Metric Browser, click the **Metric Browser**. For more details, see [Metric Data Point Details](#).

Business Journeys

Deployment Support

Related pages:

- [Configure Business Journeys](#)
- [View Business Journeys](#)
- [Create Example Business Journeys](#)

This page provides an overview of business journeys in AppDynamics.

Many industries have complex workflows and user journeys that span multiple transactions and event types, such as logs and End User Monitoring (EUM) data. These workflows typically manifest over long periods and cannot be measured using transactions alone. Business Journeys are a way to monitor and correlate the linear data flow across multiple event sources and track the total time for defined business workflows.

Typical multi-step workflows from different industries include:

- Payment transfers, credit card approval, and loan approval in financial services industries
- Cellphone activation and data recharge (pre-paid) in the Telco sector
- Insurance application through policy approval and insurance claims approval for insurance companies

About Business Journeys

An AppDynamics Business Journey is a composite event type based on defined workflows. A Business Journey can include events from multiple analytics event types, such as logs, business transactions, custom events, and EUM data.

You will need at least one unit of the [Transaction Analytics license](#) for Business Journeys, even if none of the milestones use any of the Transaction Analytics fields.

Business Journeys track linear processes. Branching, repetition, and loops are not allowed. The following image depicts an example Business Journey definition.

Add Business Journey

Name: Loans Description: Loans

Milestones Health Thresholds

ApplicationSubmission

Name: ApplicationSubmission Type: Transactions

Milestone Events: The milestone events are reached when any of the following milestone event is matched

Application: AD-Capital Tier: Portal-Service Business Transaction: /portal/SubmitApplication X

Field	Name
loanId	loanId
loanAmount	loanAmount
loanType	loanType
customerEmail	customerEmail
userState	userState

ApplicationSubmission -> VerifyDocumentation -> CreditCheck -> UnderwritingComplete -> LoanApproved

Cancel Save

You create a Business Journey, as shown above, by defining the following:

- **Milestones** and the events comprising the milestones. Milestones are the steps in your business workflow.
- **Fields** to be captured from each milestone event. A field indicates a category of information pertaining to the event.
- The primary key field that uniquely ties the events together. A primary key correlates the milestones for your Business Journey. The primary key value must be present in each milestone event.
- Additional fields that allow you to segment on different dimensions of the business workflow, such as loan types or payment amounts.
- **Health thresholds** for monitoring the Business Journey performance.

Application Analytics starts collecting the Business Journey events after you have defined and enabled a Business Journey. Analytics does not go back in time to collect Business Journey composite events. To define specific Business Journeys, you may need to configure the collection of additional fields from your source analytics events. See [Data Prerequisites for Defining Business Journeys](#) for more information.

Once the Business Journey events are being collected, you can view them from the Analytics Search UI in the same manner as other Analytics events. Because Business Journey events are, by their nature, potentially long-running processes, useful data might take some time to appear in the Analytics events list. Business Journey events are reported even when only one milestone is completed and the event is updated over time as subsequent events complete.

If you are already familiar with the fundamental concepts in Business Journeys clearly, proceed to either [Configure Business Journeys](#) or [View Business Journeys](#) as desired.

Business Journeys Milestones

A milestone is an event marking a significant stage in a business workflow. For example, in a loan application, the first milestone might be a user submitting a loan application. The second milestone might be document verification, followed by credit approval, insurance underwriting, and finally, loan approval. All milestones are mandatory; do not duplicate milestones.

The events in milestones are sequential. You need to create each milestone in the order that the event occurs. For example, in a loan Business Journey, a credit approval milestone cannot precede the loan application milestone.

In each Business Journey milestone, you can add filters to specify the events that constitute a milestone and add fields to capture additional information about the workflow. You can use these events and fields to run ADQL queries and narrow down your searches.

As you create milestones, a flow map detailing the business workflow is automatically displayed in the Business Journey page. For more information, see [Enable Flow Map](#).

Business Journeys Health Thresholds

A threshold is a boundary of acceptable or normal performance. Business Journey authoring provides default health thresholds against which it compares the performance of the business workflow. The health thresholds are based on the total time to complete all the milestones in your Business Journey. The threshold values are calculated by determining the standard deviation from the simple moving average over an interval of time. The default time interval is two hours. This means that if the average end-to-end time for the last two hours is N milliseconds, and if the Business Journey takes time equal to the standard deviation over N milliseconds (ms), it violates the threshold.

Milestones
Health Thresholds

Health thresholds based on the total time to complete all the milestones

⚠ Slow	3	Standard Deviations for the last	2	Hours ▼
! Very Slow	4	Standard Deviations for the last	2	Hours ▼
✖ Stall	300	Standard Deviations for the last 2 hours		

Consider a simple moving average that is 1500 ms with a standard deviation of 100 ms. If you set the threshold to three, it means that the threshold is three times the standard deviation. In other words, a transaction that takes more than $1500 + (3 \times 100)$ or 1800 ms violates the health threshold.

Before configuring the health threshold for a Business Journey definition, consider the following:

- A user experience (normal, slow, very slow, stall) is assigned for the Business Journey event when a value for `totalTime` is present and is greater than zero. Total time for the event could end up less than zero if the milestones are defined in an incorrect order. This can also happen even after the order is correctly defined, but the milestones are not in time order such that an early milestone has a future date compared to a later milestone.
- The total time for the Business Journey is calculated when both the first and the last milestones events have been reached. Therefore, the user experience cannot be determined and displayed until total time for the Business Journey is available.
- When a milestone encounters an error, for example, a transaction event where the `requestExperience` is Error, the user experience for the entire Business Journey event is marked as an Error. In this case, the total time is not available.
- Typically when a milestone has an error, the entire Business Journey workflow does not complete. However, if for some reason, all the milestones complete even when milestone errors exist, the total time for the Business Journey is available. However, in this case, we will retain overall user experience as an error and not change to Normal, Slow, and so on.
- After a Business Journey is initially enabled, Business Journey events are generated. The standard deviation is calculated every five minutes, so the first few Business Journey events will not have a user experience assigned to them.
- The minimum duration over which standard deviation is calculated is 30 minutes.

Filters and Fields

Filters allow you to extract event data for a select milestone based on selected criteria. For example, loan applications submitted in California. Filters define the scope of a milestone by limiting associated events. Fields extract additional relevant information from each milestone.

The mandatory filters are populated with the last 15 days of data. If no analytics data has been collected during the last 15 days, the drop-down menus for the mandatory fields will be empty. Besides the mandatory filters for each event type, Analytics allows you to optionally select additional filters by using the **Filter By** option. All the fields that are part of the filters and the additional filters that you optionally choose are automatically collected. You can use them to run ADQL queries later on.

A field indicates a category of information pertaining to the event. The **Extract Fields** section collects additional relevant information from each milestone. You can use data to query desired events and visualize matrices. The fields are categorized into mandatory and optional fields. The only mandatory field you must enter is the primary key. It is the unique identifier that ties milestones together.

In addition to the primary key, you can optionally add additional fields. These fields provide a context for your Business Journey definition. For example, loan amount, loan type, and customer name, customer id, and so on provide further details about a loan application. You can use these field values to slice and dice business transaction data later on. You must provide unique fields for each milestone. Validation fails if you create more than one milestone with the same set of fields or with the same set of mandatory and optional filters.

For each milestone, a field called `milestoneReached` is added to the associated event. The value is true if the milestone has been reached, otherwise it is null. You can use this field to query all events for which a milestone has been reached. You can also use `milestoneReached` to build a funnel widget that shows drop-offs for each milestone. The milestone name is appended to the field name as follows:

- `milestone1_name.milestoneReached`
- `milestone2_name.milestoneReached`

Likewise, the default fields and filters are also appended with and namespaced by milestone name.

At the Business Journey level, a field named `completed` tracks the status of the workflow using the boolean values. True represents a completed Business Journey, whereas False indicates that the journey is

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

in progress or is incomplete. Use the Analytics Search UI or an ADQL query for the desired Business Journey with the query string `completed` to view the status of the associated events.

Milestone Timestamps

The `totalTime` and `timeTaken` fields represent the time it takes to reach a milestone. Timestamp fields are empty when the Business Journey is partially complete. As each milestone completes and the event data is captured in the Business Journey event, the total time is updated. The total time is calculated by subtracting the timestamp for the first event from the timestamp for the final event.

Timestamps are not exact fields. AppDynamics cannot calculate the exact time of events in a milestone because the event may occur at any point in method. For example, in the loan Business Journey above, the Credit Approval milestone may come from a log event. Your system may trigger a log at any point in the credit approval process. However, the start time of the Business Journey milestone can only be detected when the log event reaches AppDynamics. You may notice a slight difference in actual time due to this behavior.

Business Journey and Milestone Metrics

The table below lists the metrics that are calculated out of the box for Business Journeys and milestones, which are the only metrics supported by Business Journeys. You cannot use metric queries created from an ADQL search for Business Journeys.

	Metric	Description
Milestones	<code>Average time taken</code>	Average of time taken to reach the current milestone from the previous milestone. Not applicable for the first milestone.
	<code>Calls per minute</code>	Total number of Business Journeys that reached the milestone in the last one minute and started in the last 24 hours.
Business Journeys	<code>Average total time</code>	Average of time to reach to completion for all Business Journeys that started in last one day and completed in the last one minute. Calculated taking the average value of <code>totalTime</code> field stored in all Business Journey events.
	<code>Calls per minute</code>	Total number of Business Journeys that started in the last one minute. A Business Journey starts when AppDynamics detects the first milestone.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Mandatory Fields

Mandatory filters, mandatory fields, and fields extracted by default depend on the event type as shown in the following table.

Event Type	Mandatory Filters	Mandatory Fields	Fields extracted by Default
Transactions	Application Name Business Transaction Name Tier Name	Primary Key	eventTimestamp requestGuid requestExperience
Logs	Source Type	Primary Key	eventTimestamp logLevel logType
Browser RUM	AppKey Page Name Page Type	Primary Key	eventTimestamp cguid pageexperience
Mobile RUM	AppKey Network Request Name	Primary Key	eventTimestamp cguid networkrequestexperience
Custom Events	N/A	Primary Key	eventTimestamp

For custom events, you must include a date in the `eventTimestamp` field for the Business Journey to register the event. See [Analytics Events API](#) for more information.

Configure Business Journeys

Related pages:

- [View Business Journeys](#)
- [Create Example Business Journeys](#)

This page describes how to configure Business Journeys.

Before You Begin

Before creating Business Journeys, ensure that the feature is enabled in your environment. You also should review data prerequisites, validation rules, and limitations for names and Business Journey definitions.

Enable Business Journeys

By default, Business Journeys is enabled on SaaS environments. However, the feature is disabled for on-premises installations. To enable Business Journeys, an Administrator needs to configure certain properties in **Settings**.

Before starting the Event Service:

1. Open the `events-service-api-store.properties` file.
2. Change `ad.bizoutcome.enabled=false` to `true`.

The page displays a flow map detailing the business workflow across milestones. You can hide the flow map by changing the value

of the `analytics.business.outcomes.flowmap.enabled` property to `false` in **Settings**.

Enable Flow Maps

As you create milestones, a flow map detailing the business workflow displays on the page. Selecting a Business Journey prompts a new window with the enabled flow map. This behavior is controlled by the `analytics.business.outcomes.flowmap.enabled` property in **Settings**. Setting its value to `true` indicates that flow maps are enabled for Business Journeys.

Data Prerequisites for Defining Business Journeys

Analytics creates Business Journey composite events by collecting events and fields that you have already captured as analytics data. In addition to built-in analytics data sources, custom event data can also be used to create Business Journeys. As you define the milestones in the Business Journey, you specify which events to use and which fields to extract from the events. You can extract fields collected by default or custom fields that you have configured for collection. You can also add milestones with custom events created from Analytics API Keys.

You need to know the starting event, ending event, and clearly-defined steps in between. To collect additional fields in the events being captured by Analytics, see:

- [Analytics Custom Events Data](#)
- [Data Collectors](#)
- [Collect Business Data From SQL Calls](#)
- [Configure Log Analytics Using Source Rules](#)

Restrictions and Caveats

- Business Journey names are case-insensitive and are stored as all lowercase. This means that two definitions named `application` and `Application` are considered a duplicate.
- The **Event Type** drop-down displays the lowercase definition name.
- Use the lowercase name for advanced queries.
- The primary key must be unique and not null. If the primary key holds null values, the underlying milestone events will not be stitched together to form a Business Journey event.
- Choose the primary key carefully; in particular, the cardinality of the values. The primary key is expected to uniquely identify and join milestone events together to form a meaningful business workflow. If the milestone events are misidentified by the primary key, inaccurate milestone events will join and produce faulty results.
- The primary key name cannot be changed unless the Business Journey definition is in the draft state.
- The Business Journey definition name cannot be changed after the definition is deployed. You can rename it while the definition is in the draft state.
- If a field related to a custom event is renamed, update the Business Journey definition created from the custom event for the renamed field to be correctly extracted.

Validation Rules

This section describes certain rules to validate Business Journey definition and naming convention for Business Journeys, milestones and extracted fields. You can save your work as a draft without invoking validation. When you are ready, you can use **Validate and Save** to check that your definition is acceptable. Saving the Business Journey definition does not enable the Business Journey. Data is not captured until you actually enable the Business Journey. See [Business Journeys Life Cycle](#).

Validation Rules for Names

This section describes the validation rules for naming Business Journeys, milestones, and extracted fields. Validation rules are not applied when you save your Business Journey definition as a draft. Validation is only invoked when you use **Validate and Save**. The validation rules include the following:

- Names of Business Journeys, milestones, and extracted fields must have an alphanumeric string containing a-z, A-Z and 0-9. The only special character allowed is the underscore `_`.
- Special characters such as spaces, hyphens, dashes are not allowed in the names.
- Primary Key fields must have the same name (label) in all milestones in a Business Journey definition. The field name itself may vary in different event types.
- The primary key name cannot be changed unless the Business Journey definition is in the draft state. See [Business Journeys Life Cycle](#) for more information.
- The following reserved field names cannot be used to name milestones or fields in your Business Journey definition.
 - `pickupTimestamp`
 - `eventTimestamp`
 - `totalTime`
 - `userExperience`
- You cannot name milestones or field names with ADQL keywords. See [ADQL Queries](#).

Validation Rules for Business Journey Definition

A Business Journey definition must contain:

- A minimum of two milestones.
- A unique set of filters. More than one milestone with the exact same set of required and optional filters is not allowed in the same definition.
- Unique milestone names.

- Extracted field names must be unique (except the Primary Key field).
- There must be one Primary Key field per milestone.
- Slow threshold duration must be greater than 30 minutes.

Create a Business Journeys Definition

1. In the Controller UI, navigate to **Analytics > Business Journeys**. A list of existing Business Journeys (if any) displays.
2. To define milestones, click **+ Add Milestone**.
3. Type a name.
4. From the **Type** dropdown, select the **source of the analytics data**, such as Transactions, Logs, Browser Requests, and Mobile Requests.
5. The **Milestone Events** section displays mandatory filters based on your selected data source. The fields vary based on your data source type.

For Transactions, specify the **Application**, **Tier**, and **Business Transaction** for each milestone you intend to create. For Analytics, the tier represents a Java Virtual Machine (JVM) service, such as an authentication service, in your application environment. Business Transaction is the cross-tier processing path representing the request for a service provided by the application.

6. You can optionally click **+ Add Criteria** to add additional filters based on your data source type.
7. You can define multiple milestone events of the same event type. Click **+ Add Event** to create another milestone event.
8. In the **Extract Fields** section, define your primary key field and name to specify which fields will be captured from the milestone event. You can click **Auto Fit** to auto-organize the milestone events or organize the events freely.

Once you name the primary key, you can not change the name unless the definition is in the draft state. See [Business Journey Life Cycle](#).

The primary key field is not populated for subsequent milestones because the primary key might have different field names in the event type for different milestones.

 Fields that are extracted by default in Business Journeys are not shown.

9. You can save the Business Journey with either:
 - **Save As Draft:** saves the definition in draft form. No validation is performed and you can return to the definition to complete it at a later time.
 - **Validate and Save:** Performs necessary validation. Use this option when you have completed all milestones. The definition is saved, but is not enabled.
10. In the **Health Thresholds** tab, you can specify the values that determine acceptable performance. See [Business Journeys Health Thresholds](#) to learn how the user experience value is calculated. When you finish creating the Business Journey definition, you are ready to enable it.

11. Select the Business Journey from the list and click **Enable**. The option is greyed out until you select a valid draft Business Journey from the list. To enable a Business Journey, the state must be "Valid Draft".

Name	Description	State
insurance		User Disabled
LoanApplication		Enabled
insurance_processing		Draft
sim_card_activation		Valid Draft

Business Journeys Life Cycle

This section provides information about the Business Journeys life cycle.

Draft

You might not have all the required details at the beginning and therefore, creating the definition may involve multiple temporary versions. Use **Save As Draft** to capture your initial, incomplete definition and place your Business Journey into a Draft state.

- No analytics data is processed and no Business Journey events are created in draft state, so there is nothing to query.
- The primary key can be changed when the Business Journey is in draft state.
- The draft state is less restrictive with respect to validations and supports most update operations.

Valid Draft

Once the definition has the required details, use **Validate and Save**, which transitions the definition into the Valid Draft state. You can still modify the definition in this state. Business Journey events are not captured until you enable the definition.

Enabled

When you are ready to process data, use the **Enable** action. This transitions the definition to the Enabled state. Most definitions will spend their lifetime in the Enabled state.

- Configuration changes are synced to the Analytics Servers every two minutes. Therefore, once you enable a Business Journey definition, there could be a delay of up to two minutes for events to be generated.
- Incoming events are processed, composite Business Journey events are created and stored. You can query for the Business Journey events.
- You can modify the definition in the following ways:
 - Add, rename, or delete fields for extraction (non-default fields)
 - Add, rename, or delete milestones

User Disabled

At some point, you may want to disable the Business Journey. The **Disable** action transitions the Business Journey definition to the User Disabled state. In this state, no incoming events are processed. Existing events can still be queried.

You can update the definition in the following ways:

- Add, rename or delete fields for extraction (non-default fields)
- Add, rename or delete milestones

Deleted

When you no longer need the Business Journey definition, use the **Delete** action. This is the final phase of the definition's lifecycle. In this state, no incoming events are processed for it. Existing Business Journey events are not available to query.

View Business Journeys

Related pages:

- [Search Analytics Data](#)
- [ADQL Reference](#)

View Business Journey events from the Analytics Search UI in the same way as any other event type. Alternatively, use the **Analytics Search** button on the Business Journey UI.

Search for Business Journeys

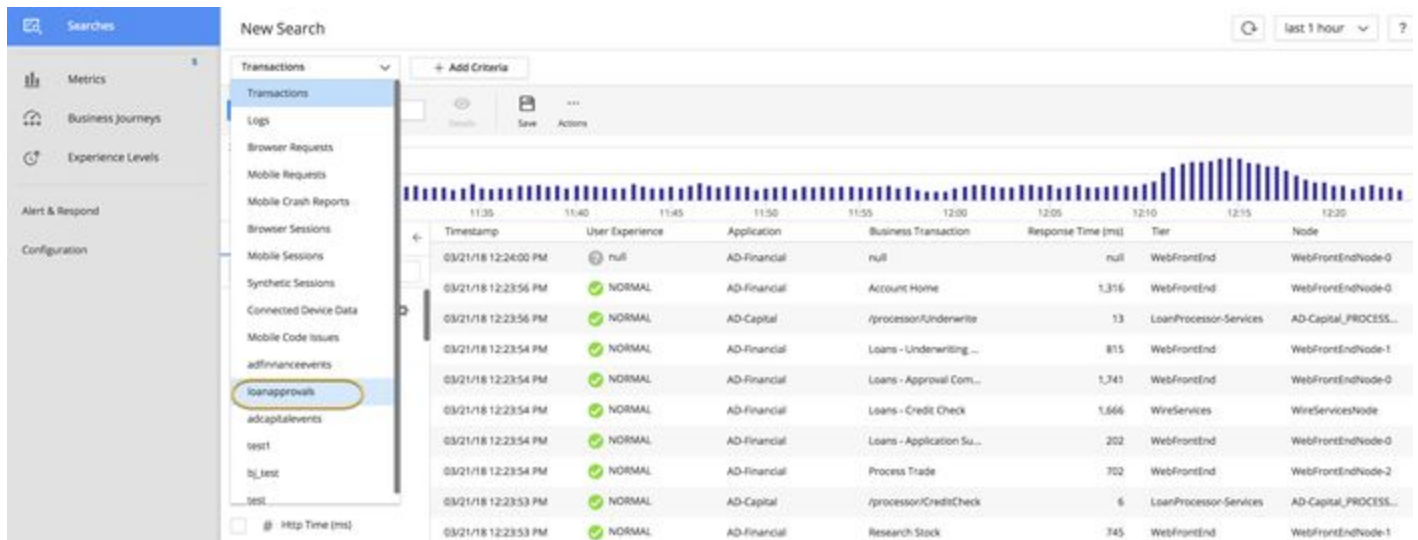

Use the **Analytics Search** button in the Business Journeys UI for one-click access to the underlying events. Selecting an enabled Business Journey and clicking **Analytics Search** takes you directly to the Searches page in Basic mode. **Analytics Search** button is unavailable for definitions in Draft and Valid Draft states.

The screenshot shows the 'Business Journeys' interface. At the top, there are icons for Add, Edit, Delete, Enable, Disable, View, and Analytics Search. The 'Analytics Search' button is highlighted with a yellow circle. Below the toolbar is a table with columns: Name, Description, State, Created By, and Created At. The table contains three rows of data.

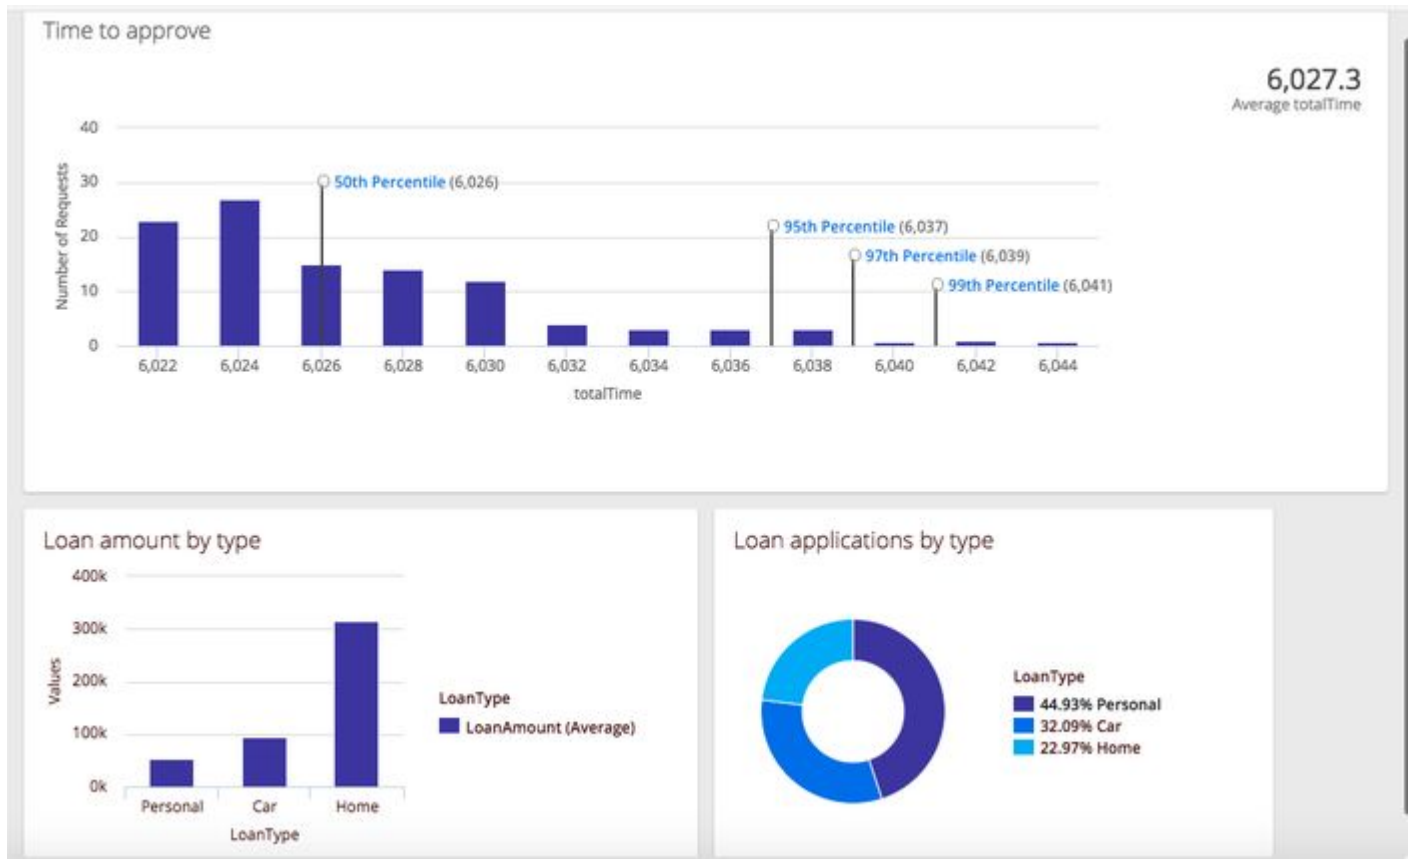

Name	Description	State	Created By	Created At
AdCapitalEvents	ADCapital Loans	Enabled	ec2-user	02/22/18 10:50:57 AM
ADFinanceEvents	AD Trader app	Enabled	ec2-user	02/22/18 10:32:12 AM
loanapprovals	Loan Approval Workflow	Enabled	ec2-user	02/26/18 12:30:16 PM

Alternatively, access the Analytics Search UI and use the event type dropdown to find your Business Journey event. The Business Journey name identifies the event type in the Search UI similar to custom events. In this example, it is "loanapprovals".

You can search the Business Journey data and create visualizations in the same fashion as for any other analytics event type.

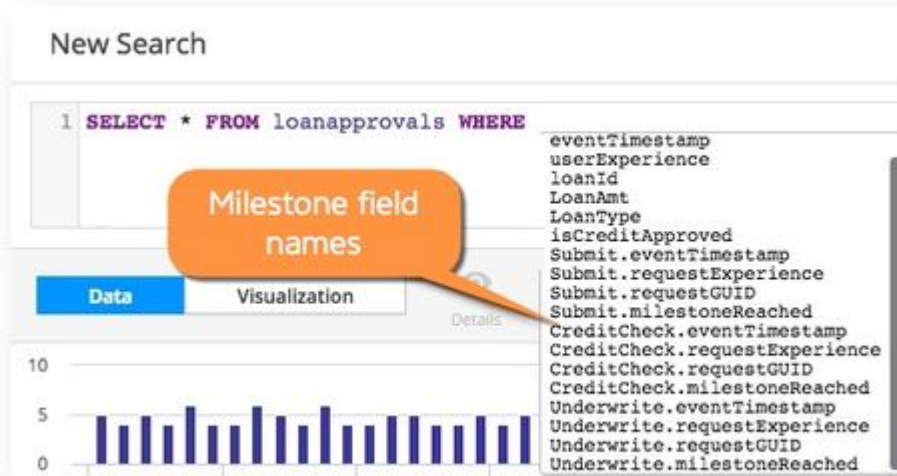

Business Journeys also gives you the ability to perform analytics, slice and dice data, and create widgets. For example, using the loan approval Business Journey, visualize percentile values of approval time, loan amount by type, and loan applications by type as follows:

The 50th Percentile line indicates that 50% of the loan approvals occurred below this line. Similarly, each percentile line represents the corresponding percentage of loans approved below that line.

Business Journeys ADQL Queries

To use ADQL to query Business Journey events, you need to use the full namespaced field name for each milestone. The field names are constructed by appending the milestone name to the field. When constructing queries with ADQL in the Search UI, you must use the full name of the field. The following image shows constructing a sample ADQL query.

A sample ADQL query for the loanapproval Business Journey is:

New Search 🔄 last 15 minutes ?

```
1 SELECT * FROM loanapprovals WHERE CreditCheck.milestoneReached = true AND LoanType = "Personal"
```

Business Journeys Metrics

Analytics generates out-of-the-box metrics at the Business Journey definition and milestone levels. You can view these metrics in the [Metric Browser](#). The metric values are reported per minute. For example, an

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

observed value of 5 indicates that it's the count of the records received in the one-minute interval. If the number of records reported in the last five minute is 25, the Metric Browser reflects an approximate observed value, that is 5. To calculate metrics, Analytics adds two fields named `timeTaken` and `totalTime`.

The `timeTaken` field is added to the associated event for each milestone. This field represents the time taken for an event to reach a milestone from the previous milestone, and therefore, the first milestone will not have this value.

The `totalTime` field is added to the associated event for each Business Journey definition. `totalTime` represents the time for an event to cover all the milestones comprising the Business Journey. It is the time an event takes to reach the last milestone from the first one. If the first or the last milestone is missing, `totalTime` is not calculated for that event. For example, if the loan application is rejected in the CreditCheck stage, the workflow never reaches the approval stage. In this case, `totalTime` is not determined.

By using the above-mentioned fields, the following out-of-the-box metrics are generated.

Milestone Level

Average timeTaken: Average of the values measured for the `timeTaken` field. Evaluates the events that started in the last one day and reached the milestone in the last one minute.

Calls per minute: Number of events that started within the last one day and reached the selected milestone in the last one minute.

Definition level

Average totalTime: Average of the values measured for the `totalTime` field. Evaluates the events that started in the last one day and reached the first milestone in the last one minute.

Calls per minute: Number of Business Journey events measured per minute. This number is equal to the calls per minute value of the first milestone. The value is calculated by evaluating the events that started in the last one day and reached the first milestone in the last one minute.

i The lookback period to generate out-of-the-box metrics is one day. The values for the metrics might not be accurate if events take more than a day to complete or to even reach the next milestone. This is due to the lack of sufficient event records for Analytics to generate correct values, leading to displaying incorrect values. For example, the average `totalTime` metrics will only be accurate if events finish within the lookback period, that is one day.

Note that the existing definitions will not have the out-of-the-box metrics created. You need to create new definitions to generate corresponding out-of-the-box metrics.

Business Journeys Dashboard

Analytics provides two Views for Business Journeys: Card View and Grid View. Business Journeys page defaults to the Grid View, but after switching to the Card View the UI makes it as the preference. The next

time you log in, Business Journeys page defaults to the Card View. Use the **View** button on the toolbar to switch between the Views.

Business Journeys

Name	Description	State	Created By	Created At	Last Modified By	Last Modified At
AdCapitalEvents	ADCapital Loans	Enabled	ec2-user	02/22/18 10:50:57 AM	ec2-user	02/22/18 10:51:01 AM
ADFinanceEvents	AD Trader app	Enabled	ec2-user	02/22/18 10:32:12 AM	ec2-user	02/22/18 10:48:16 AM
Loan Approval	Loan Approval Workflow	Draft	ec2-user	02/26/18 12:30:16 PM	ec2-user	02/26/18 12:30:16 PM

The Card View displays an out-of-the-box dashboard for each Business Journey definition along with key metrics. The dashboard highlights the milestones associated with each Business Journey definitions and these metrics:

i Dashboards for Business Journeys created prior to the release of Analytics 4.5 do not display the *Average time to reach the next milestone* metric. To workaround, edit the **Extract Field** section of one of the milestones and add the new field or remove an existing field. After the definition is saved Analytics starts generating the missing values. Within a few minutes, you should see values for *Average time to reach the next milestone* for the Business Journey you edited.

Time range menu determines what events are considered for calculating metrics. The events that are considered for calculating metrics are only those started in the selected time range.

- End-to-End: The average end-to-end time an event takes to complete the corresponding Business Journey. It is the average time taken by an event to reach the last milestone from the first one.
- Conversion: The conversion rate represents the percentage of events that reached the last milestone from the first one. It is calculated as $(\text{events reached the last milestone}) * 100 / (\text{events reached the first milestone})$.
- Average time to reach the next milestone: It is the average time an event takes to reach the next milestone from the current one. This value is represented by the number shown in between each milestone.
- Event count per milestone: It is the number of events that reached a particular milestone. This value is indicated by the number shown inside the circles representing each milestone.

Create Example Business Journeys

Related pages:

- [Configure Business Journeys](#)
- [View Business Journeys](#)

This page describes a loan application process, [AD-Capital](#), to demonstrate the milestone workflow. Similar to a typical loan application process, the workflow in this Business Journey starts with application submission, followed by document verification, credit check, underwriting, and loan approval.

Milestones Data

The data for each milestone comes from different applications and event types, such as business transactions, logs, and end-user events.

In this workflow, the data associated with application submission comes from business transaction events while the document verification status comes from logs. Third-party service providers perform the credit check and underwriting. Then, the status is updated in logs and the loan approval status is updated in the transaction events.

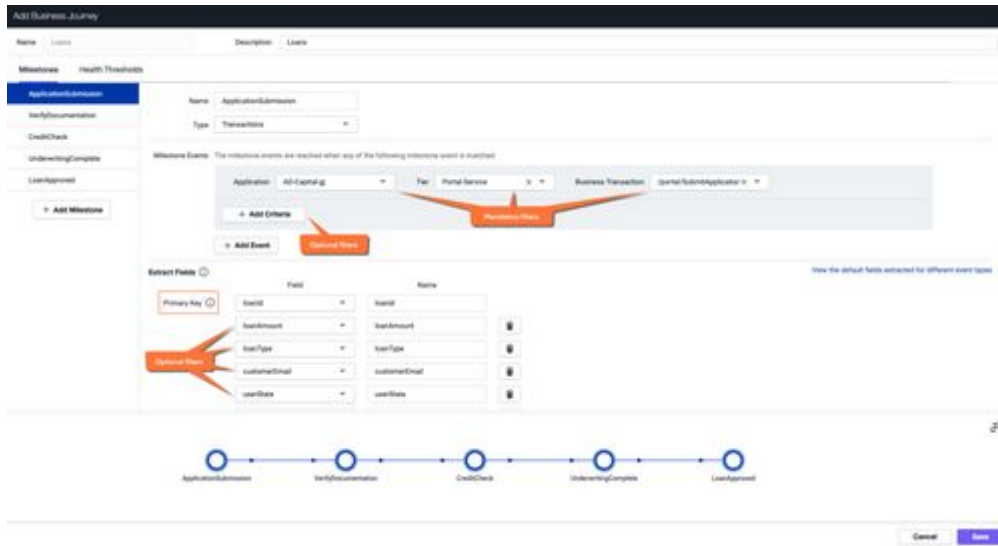

Extract Fields: Primary Key and Additional Fields

Choose a distinct primary key that uniquely identifies and ties together these independent milestones to represent loan application. In this example, `loanId` is used as the primary key. Enter `loanId` in the **Primary Key** field in each milestone. You must use the same data type as the primary key for all milestones in any given business journey.

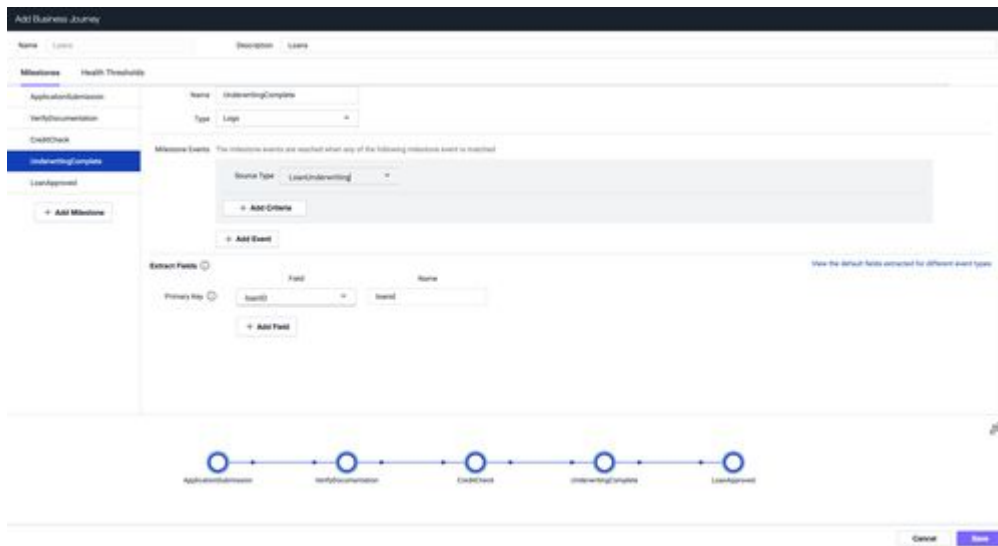

In addition to the default information collected by the Business Journey, such as event timestamp, you can extract additional business information, such as customer details, loan amount, loan type, bank name, and so on with the optional fields. These additional fields provide further context for your Business Journey definition. You can also use these fields to run ADQL queries.

Define Milestones

In the following example, you can define an application submission milestone by selecting an event type, primary key, and filters. The mandatory filters to limit the events for this milestones are **Type**, **Application**, **Tier**, and **Business Transaction**. The primary key is defined as `loanId`. Fields such as `loanAmount`, `loanType`, and `customerEmail`, are extracted in this milestone.

Similarly, the milestone for underwriting is defined with a different event type:

Since third-party service providers perform the underwriting, the status is updated in logs; **Logs** is considered the **Type** of event source. To define a milestone, click **+ Add Milestone**.

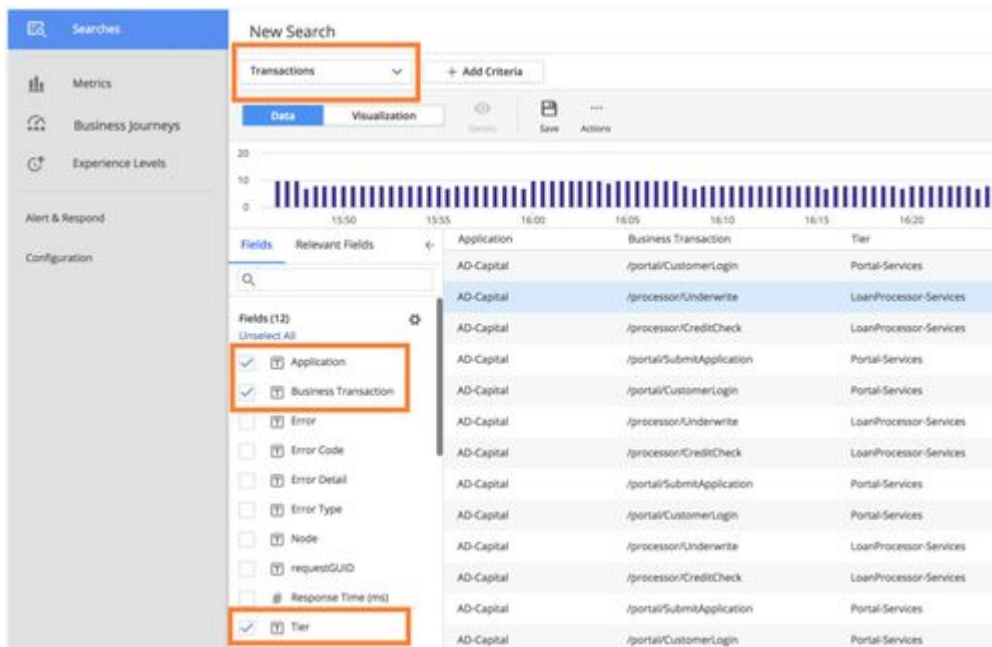

Occasionally the individual steps in a workflow, such as the application submission, can occur in different methods. You can differentiate these stages with unique filter conditions. For example, a user that submits an application through a browser performs the same action as a user that submits an application through mobile, but the filter conditions are uniquely defined. To track a milestone with several entry points, click **+ Add Event** and define your mandatory filters (application, tier, and business transaction), primary key, and optional filter conditions, including your custom fields.

You can only define the entry points for milestones if the entry points are of the same event type; if one entry point is in **Transaction** and the other is in **EUM**, you cannot track the entry points under the same milestone.

Define your remaining milestones, validate, and save the Business Journey. It takes a few minutes to display the generated records from the associated events.

Troubleshoot the Business Journey

If you think that the combination of selected fields and filters for each milestone is incorrect, you can validate with an ADQL query search or use the Analytics **Searches** widget:

You can see the valid Tiers and associated Business Transactions for AD-Capital in **Searches**, which displays all the valid values for your selection.

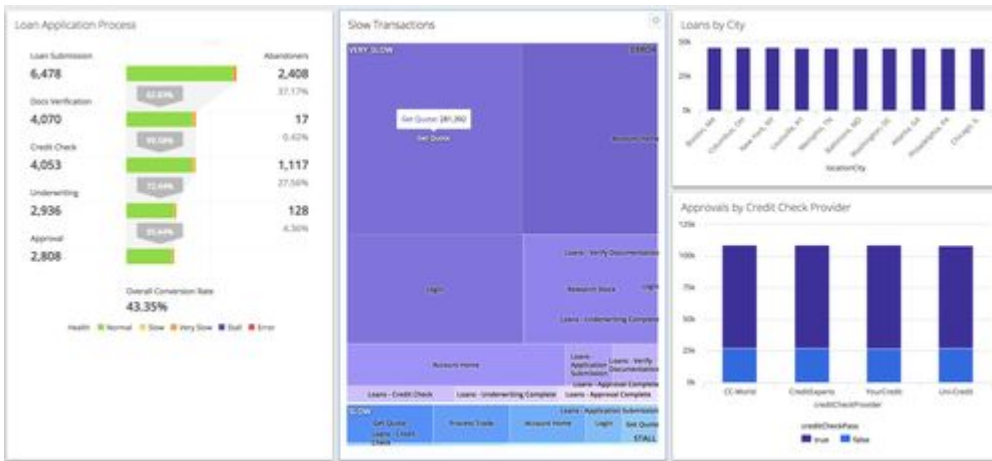

Alternatively, you can access **Tiers & Nodes** in the Controller for the AD-Capital application.

Run Analytics on the Business Journey

Use one of the [search methods](#) from **Searches** to view data, run Analytics, or visualize the performance of the Business Journey you just created.

View the Business Journey

You can view dashboards and widgets of the loan approval Business Journey in **Dashboards & Reports**. The visualization makes it easy to understand the performance of loan application workflow.

The funnel widget is located on the left side of the image. This widget represents the overall conversion rate, the health of participating events, and the number of abandoners at each critical step in the loan application process.

At the center of the dashboard, a widget illustrates slow business transactions at each step in the Business Journey.

The widget on the lower right side of the image compares credit check providers on the basis of credit approvals.

The widget on the upper right side displays the number of loans approved in different cities.

Experience Level Management

Related pages:

- [View and Export XLM Compliance Data](#)
- [Configure Experience Level Management](#)
- [Migrate XLM Configurations Between Environments](#)

The performance of business transactions and other types of events can affect user experience. Different levels of performance may correspond to service level agreements (SLAs), compliance targets, or compliance policies that your application must satisfy.

For example, an e-retailer might want to ensure that when customers add items to their carts, the transactions always complete within 100 milliseconds.

Experience Level Management (XLM) enables you to define experience levels. XLM shows you how your application is performing relative to those levels, in custom dashboards and in reports that you can view and export.

Working with XLM

Whether you speak of an experience level or a service level depends on whether your focus is user experience or SLAs, but you configure both through the same XLM UI. What this section says about experience levels applies equally to service levels.

You can define experience levels for any kind of data that meets the following criteria:

1. The data must be numerical.
2. The data must be individual (per event) values, not aggregates.

Since data collectors provide individual values, they are a good basis for experience levels as long as the values are numeric. By contrast, metrics and information points cannot be used as the basis for experience levels, because they provide aggregate values.

The following are all good bases for defining experience levels:

- Sales in dollars per week during the time an ad campaign is running
- Application response times calculated from business transaction events
- End-user response times calculated from RUM and synthetic events
- Custom analytics such as login times for platinum customers or item checkout response times for London customers

Compliance against the configured thresholds is calculated in daily intervals from the specified start date. The local time zone starting time for each day is converted to midnight of the equivalent Greenwich Mean Time (GMT) date. For example, *07/30* means *12:00 am GMT on 07/30*. The reporting job that calculates the XLM data runs every day at midnight and noon GMT. The results are updated the next time the reporting job runs.

XLM aggregates the results of reporting jobs into weekly or monthly periods, according to your choice of **Compliance Period** settings, including **Time Zone**.

When viewing XLM data for a week or month, you can drill down into daily granularity. XLM also allows you to

- Create XLM reports in the time zone of your choice
- Export reports of however many reporting periods you choose, in CSV format
- Add your XLM report to a custom dashboard for periodic generation and delivery

You can export XLM configurations, and migrate them from one environment to another. You can also view and export the XLM Audit Trail, which automatically records XLM configurations and changes to them.

If you revise the configuration, the new configuration takes effect the next time the XLM reporting job runs. Past data is immutable and configuration changes do not affect the values.

To see which configuration was in effect at a particular moment in a reporting period, view the [XLM Audit Trail](#).

Configuration Overview

In the XLM UI, you configure **Properties**, **Compliance Target Settings**, and optional **Exclusion Periods**.

- **Properties** specify what type of event to measure and what filters to apply.
- **Compliance Target Settings** specify the performance criteria you want XLM to report, through
 - the **Compliance Target**, which defines the desired level of performance for the properties
 - **Daily Target Thresholds** which define *Normal*, *Warning*, and *Critical* performance as percentages of the compliance target
 - **Treat Errors as Critical**, an option helpful for applications [where apparently normal performance thresholds tend to conceal errors](#)
- **Compliance Target Settings** also specify how you want your XLM reports structured in terms of time, through
 - the **Start Date**—the date you want the compliance calculation to begin
 - the **Compliance Period**, which
 - you can think of as the *reporting period*
 - can be weekly or monthly; choose one or the other according to your SLA requirements
 - the **Time Zone** of your choice
- **Exclusion Periods help you account for performance deviations caused by upgrades, maintenance, or usage patterns associated with weekends or holidays.**

Here is how our e-retailer example might look:

- The properties have *Transactions* as the event type, filtered to exclude all but an *Add to Cart* business transaction, for the relevant application
- The compliance target is *Response Time (ms)*, set to *100*
- Values for daily target thresholds are 95% to 100% for *Normal*, 90% to 95% for *Warning*, and 0% to 90% for *Critical*
- The compliance period is *Weekly*
- The time zone is *GMT+02:00* for Amsterdam, where our hypothetical e-retailer has customers

Configured this way, XLM reports that performance is *Normal* for each week-long reporting period when the Add to Cart business transaction completes within 100 milliseconds greater than 95% of the time.

For periods when Add to Cart performance meets the target 95% of the time or less, but above 90% of the time, performance is at *Warning* level.

For periods when performance meets the target 90% of the time or less, performance is *Critical*.

This example configuration is illustrated below.

Treat Errors as Critical ⓘ

Time Zone

Exclusion Periods

Exclude the following time periods when evaluating events against the Compliance Target.

XLM Exclusion Periods

Exclusion periods are time periods which you want to exclude from an XLM report.

For example, scheduled upgrades and maintenance can disrupt performance, so you may not want those periods reflected in XLM reports. Likewise, you may want XLM reports to exclude weekends, holidays, or other times with atypical usage patterns.

XLM queries executed against your Analytics event data observe only the exclusion periods you explicitly configure in the XLM UI. You configure exclusion periods using the time zone of your choice. Under the hood, AppDynamics keeps track of the exclusion period in the corresponding GMT dates.

XLM does not recognize exclusion and maintenance periods that you configure at the Controller level.

The screenshot shows a dialog box titled "Add Exclusion Period". It contains the following fields and options:

- Starts on:** 12/25/18, 12:00 AM
- Ends on:** 01/02/19, 12:00 AM
- Repeats:** Repeats
- Every:** 12 Months
- Recur:**
 - Forever
 - For 1 Times
 - Until 07/12/18
- Buttons:** Cancel, Save

XLM Auditing

All changes to XLM configurations produce an immutable audit record called an XLM Audit Trail, which contains complete XLM configuration information. Since XLM audit reporting is separate from all other reporting in the AppDynamics Controller UI, the XLM Audit Trail is distinct from other available reports, such as the Controller Audit Report. You can export the XLM Audit Trail to a CSV file.

Each XLM configuration is limited to 1000 updates. If that limit is reached, the oldest audit records are dropped as new ones are added.

The XLM audit records contain information about what operations are performed and what fields are changed. The UI presents XLM audit records as a sequential timeline.

The screenshot shows a window titled "Audit Trail - E-retailer Add to Cart Performance". On the left, a date selector is set to "07/10/18". The main area displays two audit entries:

- 12:57 PM**
Created
Exclusion Period: Starts: 07/14/18 12:00 AM
Ends: 07/15/18 12:00 AM
Repeats: Every 12 Months, Forever
- 12:54 PM**
Created
Data Source: transactions
Field: segments.transactionTime
Start Date: 2018-07-10
Time Zone: [GMT+02:00] Amsterdam, Berlin, Bern, Rome, Stockholm, Vienna
Compliance Period: WEEKLY
Name: E-retailer Add to Cart Performance
Filters: application = "ECommerce-Sales-Demo" AND transactionName = "Add to Cart"

At the bottom right, there are "Export" and "Close" buttons.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Configure Experience Level Management

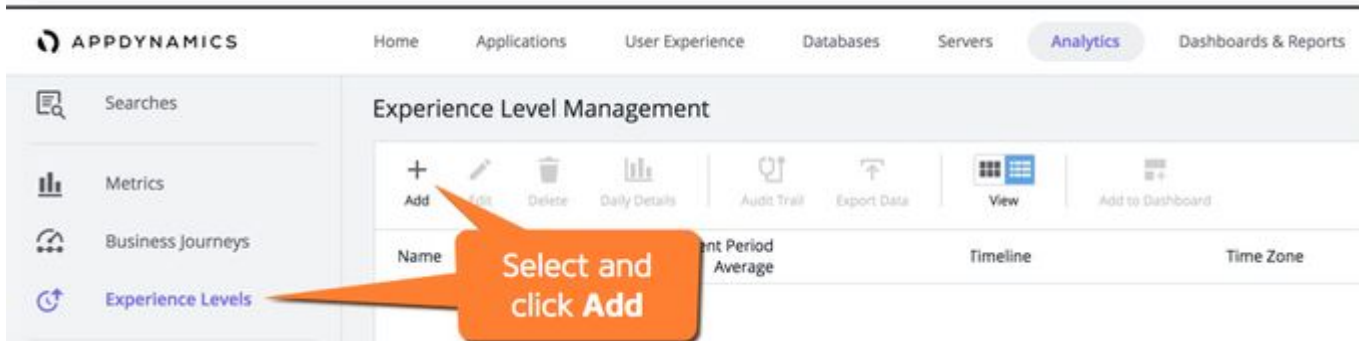

Related pages:

- [View and Export XLM Compliance Data](#)
- [Migrate XLM Configurations Between Environments](#)

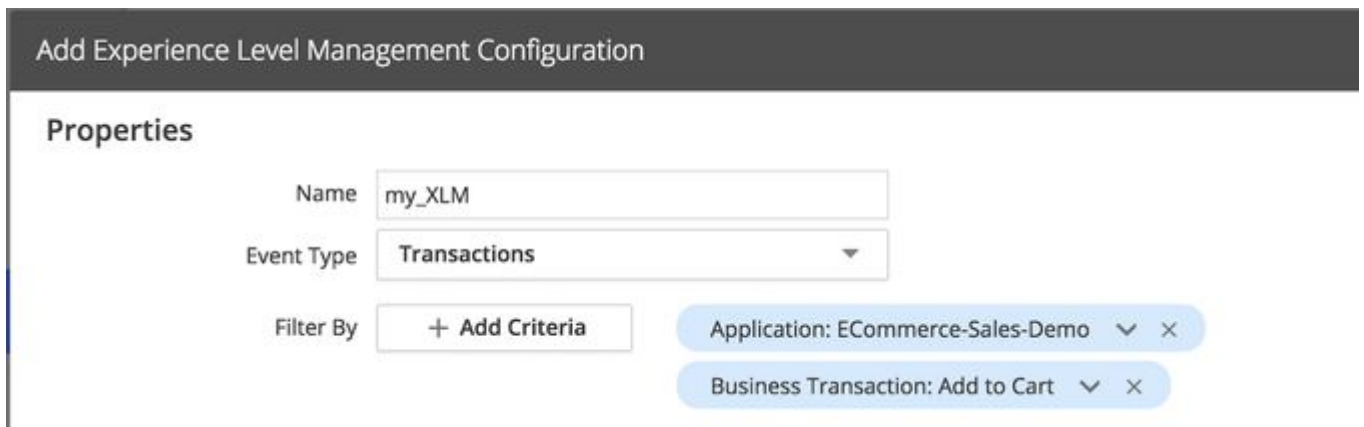

To configure Experience Level Management (XLM), you specify **Properties**, **Compliance Target Settings**, and optional **Exclusion Periods** as described [earlier](#).

Configure an XLM report

1. From the Controller UI, choose **Analytics > Experience Levels** and click **Add**.

2. In the **Properties** section, name your XLM report uniquely. Select the event type and any filters necessary for isolating the data that you want to evaluate.

3. Select the desired field, target value, and daily target thresholds. Choose a time zone, report start date, and reporting period. Past dates are not allowed.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Compliance Target Settings

Each event will be evaluated against the Compliance Target to determine the Daily Compliance.

Compliance Target

- Normal % - 100%
- Warning % - 95%
- Critical % - 90%

Treat Errors as Critical ⓘ

Time Zone

Compliance Period

4. (Optional) Select [Treat Errors as Critical Failures](#).
5. (Optional) Specify **Exclusion Periods** using the time period of your choice to denote periods during which data should be not collected.

Add Exclusion Period ✕

Starts on

Ends on

Repeats

Every

Recur Forever

For Times

Until

6. Save the configuration. Data is collected and compliance is calculated in an automatic job that runs twice per day.

Treat Errors as Critical Failures

You can choose to treat events with errors as critical failures.

This enables you to identify instances where an event meets the compliance target but has a user experience status of Error.

For example, if you have defined Response Time of under 2000 milliseconds as the compliance target, an event with a response time of 100 milliseconds meets the compliance target, even if that event finished prematurely because of an error. In that case, XLM reporting that performance as Normal could be considered a false positive.

When you enable **Treat Errors as Critical Failures**, XLM will catch instances like this. Whether this option is optimal for your application is a subjective judgment for you to make.

Treat Errors as Critical Failures is only supported for event types that contain a user experience or similar field, as shown in the table below.

Event Type	Experience Field
Transaction Event	userExperience
Browser Record	pageexperience
Mobile Snapshot (Network Request)	networkrequestexperience
Browser Session	pageexperience
Mobile Session	networkrequest.networkrequestexperience

View and Export XLM Compliance Data

Related pages:

- [Configure Experience Level Management](#)
- [Migrate XLM Configurations Between Environments](#)

In the AppDynamics Controller UI, click **Analytics > Experience Level Management** to view or export XLM data.

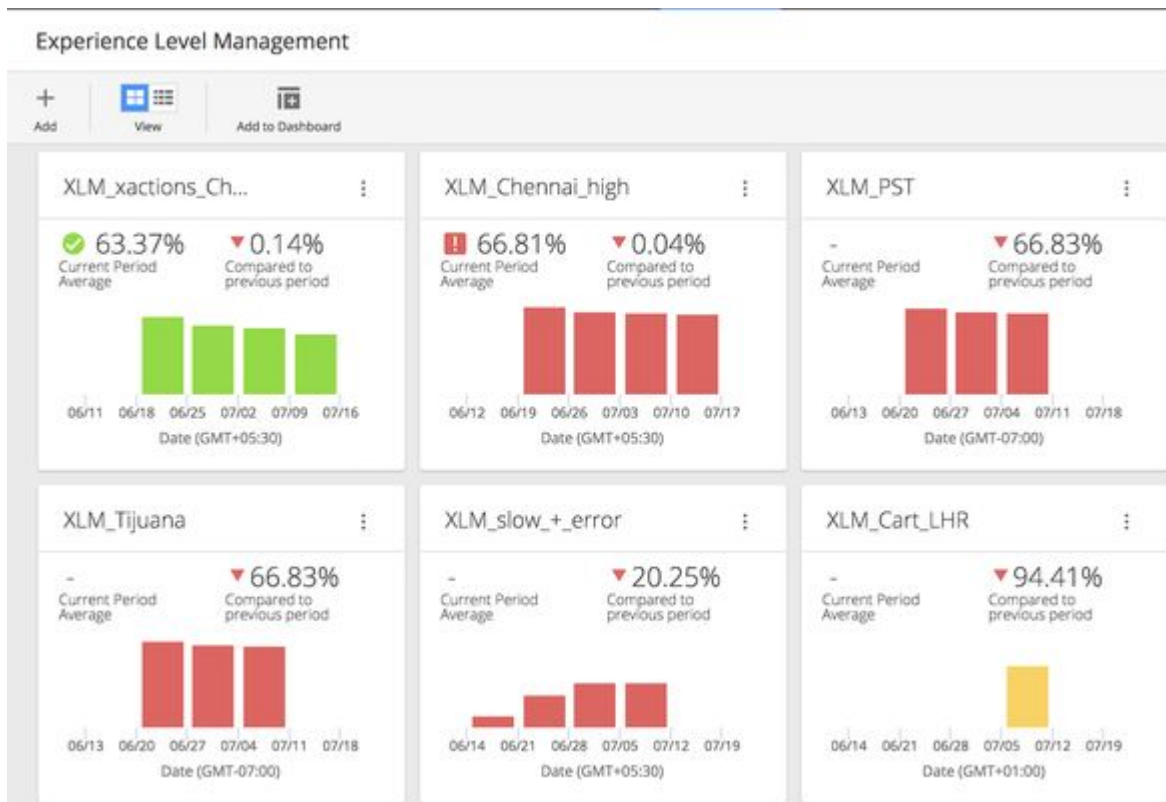

View XLM Data

You can view the last five reporting periods for your XLM data in a card or list view. To access data for earlier reporting periods, export the data as described [below](#).

Timelines show dates in your local timezone and indicate how local time relates to Greenwich Mean Time. For example, if your local timezone is Pacific Standard Time, **Date (GMT-7:00)** appears beneath timelines.

Both views enable you to drill down from multiple reporting periods, to days, to individual events.

Card View

Click any reporting period for a daily breakdown.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Right-click any day to view associated events.

This brings you to an **Analytics > Searches** page where you can inspect the entire day's events.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

List View

As in the card view, you can:

- Click any reporting period for a daily breakdown
- Right-click any day to view associated events

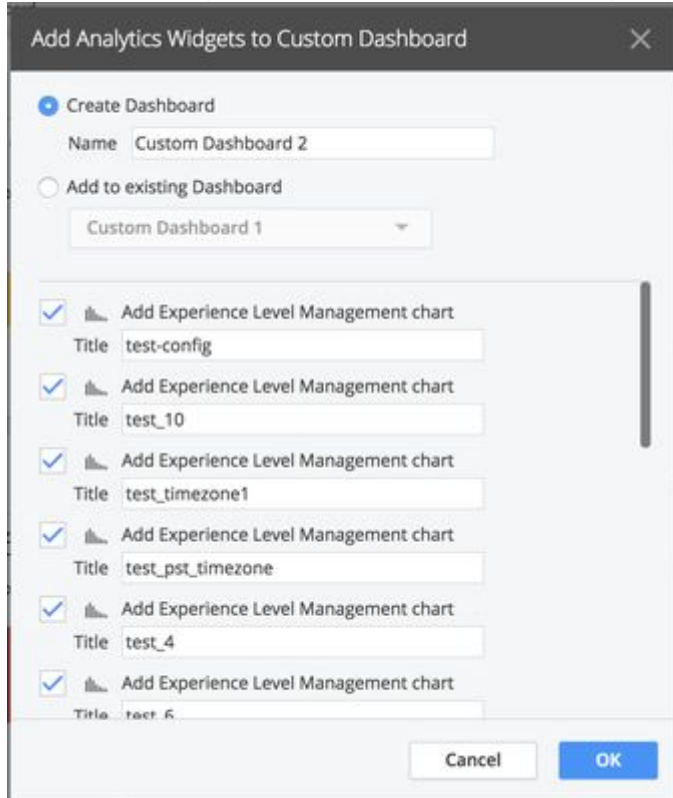

Add XLM Reports to Custom Dashboards

You can add XLM reports as read-only widgets to your custom dashboards:

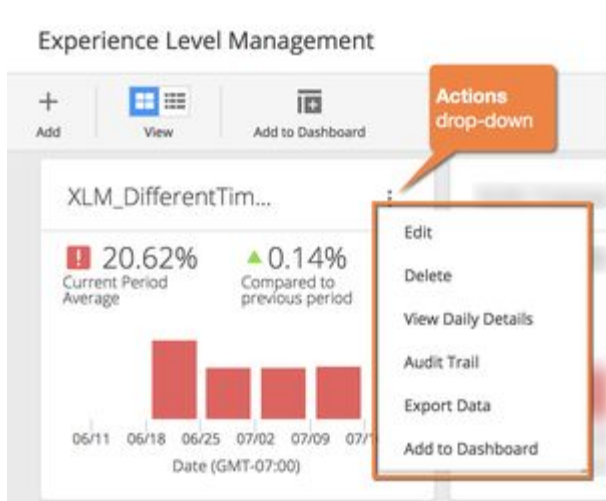

- One at a time, from the Actions drop-down, or
- One or more at once, from **Add to Dashboard** in the Experience Level Management panel

From the Experience Level Management panel, click **Add to Dashboard**. Alternatively, click the **Actions** dropdown on an individual XLM report.

Export XLM Data

You can export XLM data using the **Actions** dropdown, which also offers additional views and actions.

You can export as many reporting periods as you wish. The export format is CSV.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

 The XLM export file shows the latest configuration along with compliance data.

Migrate XLM Configurations Between Environments

Related pages:

- [Configure Experience Level Management](#)
- [View and Export XLM Compliance Data](#)

You can migrate XLM configurations from one environment to another. For example, you might first deploy a configuration to a staging or test environment and later migrate it to production.

To migrate an XLM configuration, make two API calls:

1. Export XLM configuration(s) from one environment.

```
GET /controller/analytics/xlm/configuration
```

Optionally, supply a configuration ID, or a comma-delimited list of configuration IDs, as a query parameter.

If this parameter is omitted, the API returns a bulk export of all XLM configurations.

2. Import a single XLM configuration into another environment.

```
POST /controller/analytics/xlm/configuration
```

Troubleshoot Analytics Issues

Related pages:

- [Agent Log Files](#)
- [Analytics Agent Logging](#)
- [.NET Agent on Windows Logging](#)

This page provides general troubleshooting techniques for deployment issues and workarounds for certain scenarios in Application Analytics.

General Troubleshooting Issues

If you encounter problems with your Analytics deployment, check the logs for errors and warnings.

These logs are useful to:

- Determine if the Analytics Dynamic Service is enabled or disabled.
- Determine if the Analytics Dynamic Service encounters errors sending messages to the Analytics Agent. For example, when the Analytics Dynamic Service is not able to communicate with the Analytics Agent due to invalid connection configuration.
- Determine if messages are being dropped by the Analytics Dynamic Service because its internal buffers are full.
- View the configurations used on startup.

The following components write log information.

- Analytics Agent: The Analytics Agent writes log messages to files in the `<analytics_agent_home>/logs` directory.
 - Events Service: The Events Service writes log messages to files in the `<events_service_home>/logs` directory. The `events-service-api-store.log` file can help with troubleshooting.
 - Java Agent: The Analytics Dynamic Service is built into the Java Agent and writes logs to the same file as the app agent. The logs are in the `<application_home>/<app_agent_home>/logs` directory.
 - The primary log file to use for troubleshooting is the file named `agent.<timestamp>.log`. Search the file for messages written by the Analytics Dynamic Service.
 - .NET Agent: The .NET Agent writes log messages to files in the `%ProgramData%\AppDynamics\DotNetAgent\Logs` directory. By default, the .NET Agent writes Analytics logs from the `com.appdynamics.ee.service.analytics.Analytics` logger to determine if the Analytics Dynamic Service is enabled/disabled and to view the configuration on startup. Errors are logged in the `warnfile`.
 - The `com.appdynamics.CONFIG.AnalyticsDynamicServiceConfigListener` logger gathers Analytics Dynamic Service configuration details from the Controller. Ensure that the `eventServiceURL` comes from the Controller.
 - The `com.appdynamics.analytics.EventsServiceSink` logger provides information about the communication between the .NET Agent and the Events Service.
- For additional logger information, see [.NET Agent on Windows Logging](#).

Configuration Issues

Verify that your configuration settings are properly configured with the required account name and key. Slashes in account names and key values must be escaped.

Windows Commands

On Windows, you cannot delete a log file with the `del` command when the Analytics Agent is collecting log data from the file.

Do not use robocopy commands to move files on Windows. AppDynamics recommends that you use the move command instead.

Starting the Analytics Agent Issues

If you are running the Analytics Agent as an extension to the Machine Agent with JRE 1.8.0_171 or later, starting the Analytics Agent with encrypted credentials will fail. Workarounds include:

- Disable encryption in the Machine Agent
- Use a standalone Analytics Agent with encryption
- Use JRE 1.8.0_162 to run the Machine Agent with encryption

PID File

If an instance of the Analytics Agent terminates and leaves behind a process ID file (PID file), the next agent startup will fail with the following error:

```
java.lang.RuntimeException: Unable to create file [D:\AppDynamics\analytics-agent\analytics-agent.id] to store the process id because it already exists. Please stop any currently running process and delete the process id file
```

You can use the `-f` flag option while starting the agent. This option causes a pre-existing process id file to be deleted. The flag is not required when you are starting the agent as a Windows service.

Use the `-f` flag as follows:

- UNIX type OS: `start -f`
- Windows CLI: `start -f`

 The `-f` flag option only works for the standalone Analytics Agent. This option does not work for the Analytics Agent embedded in the Machine Agent. In versions 20.6 and later of the Machine Agent, the bundled Analytics Agent no longer drops a PID file. For the Analytics Agent running inside the Machine Agent (embedded mode), upgrade the Machine Agent to 20.6. You no longer need to delete PID files from previous runs where the agent crashed.

High CPU Usage in Transaction Analytics without Analytics Agent (Agentless Analytics)

Reaching the Transaction Analytics license limit may cause high CPU usage in older Java Agents. AppDynamics recommends that you upgrade to the Java Agent version 20.3 and later. Look out for high CPU and memory usage in the .NET Agent.

Analytics Data Issues

Clock Management

AppDynamics recommends maintaining clock-time consistency throughout your monitored environment. If Analytics metrics are consistently reporting zero, confirm that clocks are synchronized across the application, Controller, and Events Service nodes.

Timestamps

There are potentially four time zones involved with Log Analytics:

1. The timestamp and time zone from the log file.
2. The event timestamp and pickup timestamp time zones can be different from those in the log for a number of reasons:
 - a. When the time zone is overridden.
 - b. The time zone is not provided correctly in the log.
 - c. The timestamp and time zone parsing goes awry.
 - d. When no time zone is specified in the log timestamp, then local time is assumed.
3. The Events Service time zone and the Events Service stores all timestamps in UTC time.
4. The browser used to view the Analytics data in the Controller UI (such as the **Event Timestamp** column in the UI search results or the **Time Picker** widget) converts all timestamps to the browser's local time.

Environment Variables

If you are not seeing or only seeing partial Analytics data in the Controller, configure the following environment variables.

Environment Variable	Description
<code>appdynamics.analytics.agent.send.attempt.max</code>	The maximum number of times that the Dynamic Service running in the APM Agent will try sending the Analytics data after a communication failure.
<code>appdynamics.analytics.agent.send.attempt.pauseMillis</code>	The wait time between attempts to send Analytics data to the Analytics Agent after a communication failure.
<code>appdynamics.analytics.numOfSinkWriterTasks</code>	The number of sinks used by the Dynamic Service running in APM Agent to send data to Analytics Agent. The default number is 2 and can be increased as needed.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Log Analytics Missing Field Extractions Issues

If you are missing fields in your Log Analytics data that you expect to see based on your source rule configuration or using regex (including grok patterns) in your field extraction, you may encounter a performance safeguard.

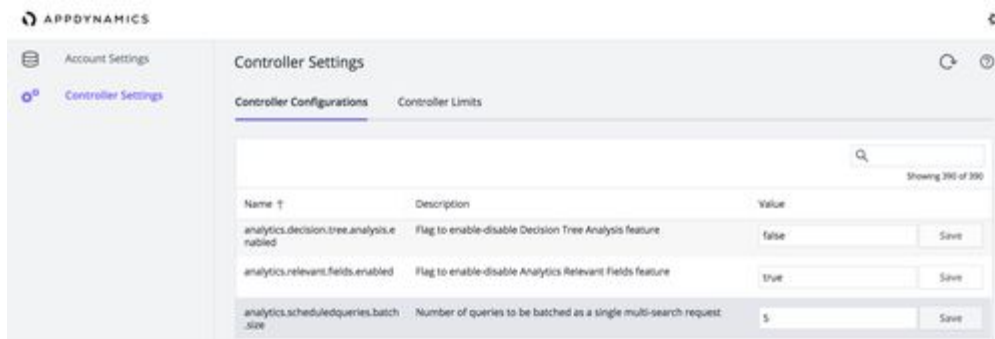

If a regex pattern takes more than five seconds to match against a log line, the attempt to extract the fields is terminated. No further processing that requires the extracted fields will occur. As a result, some fields may be missing when viewed on the Controller for that log line. In this case, the following error message appears in the Analytics Agent log:

```
[ERROR ] java.util.concurrent.TimeoutException: The current regex has spent 5 seconds attempting to match the log line, further processing has been stopped for this log line.
```

Another reason for missing fields is if the log line doesn't contain the field to be extracted as defined in the pattern.

Custom Analytics Metrics Issues

If you are having issues with metrics created from saved searches or with the alerts performance for those metrics, try increasing the query batch size. You can increase the size using the `analytics.scheduledqueries.batch.size` Controller setting in **Controller Settings > Controller Configurations**. The default value for this setting is 5.

See [Access the Administration Console](#) for information about accessing the setting.

Business Transaction Events Limits

The Analytics Dynamic Service sends messages to the Events Service where the request body is an array of event segments. A business transaction event consists of one or more segments that are related to each other by the business transaction `requestGUID`. There are ingestion limits related to messages.

- Event (segment) size: The maximum size of an individual business transaction segment collected by the Analytics Dynamic Service is .1 MB. This limit is defined by the `appdynamics.analytics.message.maxSizeBytes` Java system property. To change this value, pass it on the command line as a system property when the Java Agent starts. For example:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
'-Dappdynamics.analytics.message.maxSizeBytes=1024000'
```

- **Events per request:** The maximum number of segments per request is defined by the `appdynamics.analytics.agent.send.batch.items.max` Java system property. The default value of this property is 16. To change this value, pass it on the command line as a system property when the Java Agent is started.
- **Message Size:** This limit refers to the size of a single request body sent to the Events Service, which is usually an array of event segments. Publish requests for all event types are limited to 1 MB. If the limit is exceeded, you will see exceptions in agent log file and messages in Events Service logs.

Agent-Side Metrics

Analytics components in the Java Agent reports performance metrics. These metrics can be used to monitor the health of Transaction Analytics reporting in the agent/node. These metrics are under the `Agent|Analytics|<Metric Name>` path in the Metric Browser.

Metric Name	Metric Time Rollup Type	Metric Cluster Rollup Type	Metric Description
Collector Objects Count	Current	Individual	The current count of Analytics data collectors in use.
Messages Sent	Sum	Collective	The number of messages sent.
Messages Dropped Since Input Queue Full	Sum	Collective	The number of dropped messages due to the input queue being full.
Messages Dropped Since Size Exceeded	Sum	Collective	The number of dropped messages due to message size exceeding limit.
Message Send Errors	Sum	Collective	The number of transient and permanent errors in event registration or publish.
Message Latency (ms)	Average	Individual	Latency calculated in milliseconds.
Pending Messages In Queue	Current	Individual	Messages pending in the buffer.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Metric Name	Metric Time Rollup Type	Metric Cluster Rollup Type	Metric Description
Sink Writers Count	Current	Individual	Number of active sink writer threads.

Firewall Considerations

Transaction Analytics without an Analytics Agent requires a connection between the Java/.NET Agent and the Events Service. If you have a firewall that blocks requests from the Java/.NET Agent to the SaaS or on-premises Events Service, you need to open the firewall to avoid gaps in Analytics data. See [Port Settings](#) and [Agent-to-Controller Connections](#).

For SaaS-based installations, configure the Analytics endpoint by modifying the `http.event.endpoint` setting in the `\conf\analytics-agent.properties` file (as described in [Install Agent-Side Components](#)). For example, `http.event.endpoint=http://analytics.api.appdynamics.com:443`.

If your firewall rules require you to use specific IP addresses, rather than hostnames, note the following information. If you are unable to see Transaction Analytics data collected as expected (even after configuring your firewall rules) and you see repetitive Connection Reset messages in the logs similar to the following, your firewall rules may not include the correct IP addresses.

```
[2015-12-18T16:08:39,907-06:00] [INFO ] [AD Thread Pool-Global0]
[o.a.http.impl.execchain.RetryExec] I/O exception (java.net.SocketException) caught when
processing request to {s}->https://analytics.api.appdynamics.com:443: Connection reset
```

Your firewall rules may not include the correct IP addresses.

In SaaS environments, `analytics.api.appdynamics.com`, `fra-ana-api.saas.appdynamics.com`, and `syd-ana-api.saas.appdynamics.com` are round-robin DNS aliases and may resolve to multiple DNS (54. vs 52.) in the following examples.

<p>Name: analytics.api.appdynamics.com Address: 54.213.173.141 Name: analytics.api.appdynamics.com Address: 52.88.111.157</p>	<p>Name: fra-p-con-2.saas.appdynamics.com Address: 52.28.42.67 Name: fra-p-con-2.saas.appdynamics.com Address: 52.57.96.225</p>	<p>Name: syd-p-con-1.saas.appdynamics.com Address: 54.153.248.179 Name: syd-p-con-1.saas.appdynamics.com Address: 54.153.246.219</p>
---	---	--

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Amazon Web Services (AWS) controls the IPs used, so they may change from time to time. AWS publishes its current IP address ranges in JSON format, so if you are unable to open firewalls to hostnames, you can download the AWS IP address ranges. If you want to be notified whenever there is a change to the AWS IP address ranges, you can subscribe to receive notifications using Amazon SNS.

See [Analytics IP Ranges](#) for the AWS regions for the SaaS Analytics environments. You can view the [AWS IP Ranges](#) for each listed region.

Monitoring Analytics Agent Health

This describes monitoring the health of the Analytics Agent.

Check-Health Command Usage

Argument	Description
-hp (--host-and-port) STRING[]	Optional. Application host name or IP:HTTP admin port (Multiple values separated by space).
-p (--properties) TYPE_PATH	Optional. Path to the properties file (Multiple values separated by space).
-v (--verbose) TYPE_BOOLEAN	Optional. Verbose output.

The check-health command returns the status of the Analytics Agent. You can specify the agent to check using a properties file or IP address and port.

For example, using a properties file.

```
./bin/analytics-agent.sh check-health --properties conf/analytics-agent.properties
```

You can also use the -hp argument and pass the host IP address and the port number for the Analytics Agent.

For example, the default Analytics Agent port for the health check is 9091.

```
bin/analytics-agent.sh check-health -hp <ip-address>:9091
```

Extend AppDynamics

This page describes how to extend and customize the AppDynamics Application Performance Management (APM) Platform.

The [AppDynamics Community Exchange](#) includes many pre-built extensions you can use to customize AppDynamics and integrate with other systems.

You can also use AppDynamics REST APIs to create custom integrations and automation tasks.

AppDynamics REST APIs

- [AppDynamics APIs](#)
- [Using the Controller APIs](#)

AppDynamics Extensions

- [Integration Modules](#)
- [Integrate AppDynamics with Splunk](#)
- [Integrate AppDynamics with Scalyr](#)

AppDynamics APIs

Related pages:

- [Extensions and Custom Metrics](#)
- [AppDynamics Exchange](#)

This page provides an overview of AppDynamics APIs, which let you extend and customize various aspects of the AppDynamics Application Performance Monitoring (APM) Platform.

Overview of AppDynamics APIs

The AppDynamics APM Platform exposes various APIs for customizing and extending its features on the platform-side, which are served by the Controller and Events Service, and on the agent-side.

The AppDynamics platform server components and agents offer the following APIs:

- Controller APIs: Administer the Controller, configure, monitor, query metrics, and more. See the [Platform API Index](#).
- Accounts APIs: Manage and monitor accounts, users, and other aspects of AppDynamics licensing. Accounts APIs are made up of these modules:
 - actionsuppressions
 - businesstransactions
 - healthrules
 - licensemodules
 - mdsconfig
 - nodes
 - policiesSee [Observe License Usage](#).
- Analytics Events API: Send custom analytics events from your data sources to the Events Service. See the Analytics Events API section in the [Platform API Index](#).
- Machine Agent APIs: HTTP APIs available at the machine agent for uploading custom metrics. See [Machine Agent HTTP Listener](#).
- Database Agent APIs: Get, create, update, and delete Database Monitoring database Collectors. See [Database Visibility API](#).
- Application Agent Instrumentation APIs: Control and customize transaction detection and correlation, along with exit point detection. Agent APIs include:
 - [PHP Agent API](#)
 - [Python Agent API](#)
 - [Node.js Agent API Reference](#)
 - [C/C++ SDK](#)
- Java Agent API: Customize agent instrumentation. See the SDK folder in the agent home directory.

Platform API Index

These methods are Below is a list of all the methods in the AppDynamics Controller and Events Service APIs:

- **Accounts API**
 - [Retrieve Controller Audit History](#)
 - [Configure Metric Retention by Account](#)
 - [Configure Metric Retention by Application](#)
- **Application Model API**
 - [Retrieve All Business Applications](#)
 - [Retrieve All Business Transactions in a Business Application](#)
 - [Retrieve All Tiers in a Business Application](#)

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- Retrieve All Registered Backends in a Business Application with Their Properties
- Retrieve Node Information for All Nodes in a Business Application
- Retrieve Node Information by Node Name
- Retrieve Node Information for All Nodes in a Tier
- Retrieve Tier Information by Tier Name
- **Metric and Snapshot API**
- Retrieve Metric Hierarchy
- Retrieve Metric Data
- Retrieve Transaction Snapshots
- **Alert and Respond APIs**
- **Health Rule API**
 - Create a Health Rule
 - Retrieve a List of Health Rules for an Application
 - Retrieve Details of a Specified Health Rule
 - Update a Health Rule
 - Delete a Health Rule
- **Schedule API**
 - Create a New Schedule
 - Retrieve a List of Schedules for a Given Application
 - Retrieve the Details of a Specified Schedule
 - Update a Schedule
 - Delete a Schedule
- **Policy API**
 - Create a Policy
 - Retrieve a list of Policies associated with an Application
 - Retrieve Details of a Specified Policy
 - Update a Policy
 - Delete a Policy
- **Actions API**
 - Create a New Action
 - Retrieve a List of Actions for a Given Application
 - Retrieve Details of a Specified Action
 - Update an Action
 - Delete an Action
- **Events and Action Suppression API**
 - Retrieve All Health Rule Violations in a Business Application
 - Retrieve Event Data
 - Create Events
 - Create a Custom Event
 - Create Custom URLs for Notifications
 - Create and Delete Action Suppressions
 - Retrieve All Existing Action Suppressions
 - Retrieve a Specific Action Suppression by ID
 - Create a New Action Suppression
 - Delete a Specific Action Suppression by ID
- **Configuration API**
- Create and Modify AppDynamics Users
- Include or exclude a business transaction from monitoring
- Retrieve All Controller Settings
- Retrieve a Controller Setting by Name
- Configure Global Controller Settings
- Mark Nodes as Historical
- **Configuration Import and Export API**
- About the Configuration Import/Export APIs
- Export Actions from an Application

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

API Clients

This page describes how to create and use the API Clients identity type to provide secure access to the Controller through AppDynamics Controller REST API calls. These calls use Open Authorization (OAuth) token-based authentication.

Open Authorization (OAuth) Mechanisms

OAuth is an open protocol to allow secure authorization in a simple and standard method from web, mobile, and desktop applications. See <https://oauth.net/>

It acts as the intermediary on your behalf by providing third-party applications with an access token that authorizes sharing specific account information. Using the OAuth protocol with AppDynamics Controller REST APIs is the best way to securely grant access to your Controller information.

The OAuth authentication process authenticates a request token and uses it to obtain an encrypted access token from your Controller. Once the access token is available, you can use it to make requests to your Controller until the token expires or is revoked.

The tokens are based on JSON Web Tokens (JWT) authentication format, which is the industry standard RFC 7519 method for representing claims securely between two parties.

Accessing Authentication Provider Settings

Users with the **Account Owner** role or the **Administer users, groups, roles ...** permission can view API Clients settings in the **Settings > Administration** page.

Creating API Clients

You can create new API Client identity types that can be used to generate OAuth tokens.

1. Log in to the Controller UI as an **Account Owner** or other roles with the **Administer users, groups, roles ...** permission.
2. Click  > **Administration**.
3. Click the API Clients tab to view the list of existing clients.
4. Click **+ Create**.
5. Enter the Client Name and Description.
6. Click **Generate Secret** to populate the Client Secret.
This will generate a UUID as the secret of the API Client.

This API Client secret acts as a password. It does not generate the authentication token.

7. Set the Default API-generated Token Expiration. This expiration only applies to authentication tokens generated through the `/controller/api/oauth/access_token` REST API, not to Temporary Access Tokens generated from the UI. See [Using the Access Token](#).

i Every API-generated access token has an expiration. Although the default is five minutes, you can set it to any second, minute, or hour limit. The Default API-generated Token has a shorter expiration than the authentication token generated through the Administration UI.

8. Add the **Roles** you would like to associate with this API Client. You can add or remove roles at any time. See [Manage Custom Roles](#).

i The REST APIs will use the identity which the access token represents to pull up RBAC permissions and check those permissions at the underlying API level.

9. Click **Save** at the top right.

Using the Access Token

You can generate and use the access token for each API access call into your Controller by generating the token through one of the following means:

- Administration UI: These tokens usually have a longer expiration. The account administrator can generate and distribute to parties/teams who need Controller access, but do not want to refresh such tokens frequently.
- API: These tokens usually have a relatively short expiration. The program generates and refreshes regularly before expiration. These tokens are visible from the UI and are not individually tracked and managed.

Generate the Token Through the UI

When you are ready to use the access token, you will generate it through the Administration UI:

1. Click **Generate Temporary Access Token** when you are ready to use the access token.

i Remember that temporary token expirations are usually longer than the Default API-generated Token Expiration.

2. Copy and paste the access token from the **Temporary Access Token** field into the TOKEN portion of your curl command. For example:

```
curl -H "Authorization:Bearer <AUTH_TOKEN>" "http://master-onpremise-controller.e2e.appd-test.com:8090/controller/rest/applications"
```

3. Check that your call is successful. It should look like this:

```
$ curl -H "Authorization:Bearer eyJraWQiOiIiIiwiaWxnIjoiaSFMNTYifQ.eyJpc3MiOiJBCHEeW5hbWljcyIsImF1ZCI6IjFkFwcERfQVBJcyIsImV4cCpZCI6IjRkNDZmYjYzLWnkNjctNGU3NC85Zjg3LWE2ZGFkMjQzNTI2ZS1sImFjY3RlZC16IjAzMzcyZjhlThjZmYtNDJlYi05MjA5LlU20TdmYzMiZGVmNSIsImFjY3R5YWI1IjoieY3Vzd09tZXIiIn8.pykAwGgI9J9QAQnIsoQ_Vi73zG11GCzBtGVs-gIRkpc" "http://master-onprem-controller.e2e.appd-test.com:8090/controller/rest/applications"
<applications><application>
  <id>5</id>
  <name>ECommerce-Sales-Demo-Fulfillment</name>
</application>
<application>
  <id>11</id>
  <name>AshishTest</name>
</application>
<application>
  <id>20</id>
  <name>IbeBpmApp</name>
</application>
<application>
  <id>5</id>
  <name>ECommerce-Sales-Demo</name>
  <description></description>
</application>
```

Generate the Token Through an API

You can use REST APIs to generate a short-lived access token. This default, on-demand token is not tracked on the UI.

Use POST `/controller/api/oauth/access_token`. You will need the API Client name and Client Secret to generate the token. For example:

```
curl -X POST -H "Content-Type: application/vnd.appd.cntrl+protobuf;v=1" "https://<controller address>/controller/api/oauth/access_token" -d 'grant_type=client_credentials&client_id=<apiClientName>@<accountName>&client_secret=10d5-573e-4a75-8396-afa006fd8f19'
```

Be aware that:

- For Controllers < 4.5.9, an authentication header is required in the request as shown below:

```
curl -X POST -H "Content-Type: application/vnd.appd.cntrl+protobuf;v=1" -u 'TestApiClient@customer:face10d5-573e-4a75-8396-afa006fd8f19' "https://<controller address>/controller/api/oauth/access_token" -d 'grant_type=client_credentials&client_id=TestApiClient@customer&client_secret=face10d5-573e-4a75-8396-afa006fd8f19'

{
  "access_token":
  "eyJraWQiOiIiIiwiaWxnIjoiaSFMNTYifQ.eyJpc3MiOiJBCHEeW5hbWljcyIsImF1ZCI6IjFkFwcERfQVBJcyIsImV4cCpZCI6IjRkNDZmYjYzLWnkNjctNGU3NC85Zjg3LWE2ZGFkMjQzNTI2ZS1sImFjY3RlZC16IjAzMzcyZjhlThjZmYtNDJlYi05MjA5LlU20TdmYzMiZGVmNSIsImFjY3R5YWI1IjoieY3Vzd09tZXIiIn8.pykAwGgI9J9QAQnIsoQ_Vi73zG11GCzBtGVs-gIRkpc"
```

```
NDE4M1hMmFmLWFhMTY1MzllZDg0OCIsImFjY3R0YW1lIjoizTJlLWN1c3RvbWVYIn0.95EyDNV5muTN_4zGOX
IPQHOdVDSiEynKSgk08UHLh0",
"expires_in": 300
}
```

- The token generation API requires an authentication header with username and password and the OAuth request body to successfully request a token.

Use the generated token to list all applications. For example:

```
curl -H "Authorization:Bearer <AUTH_TOKEN>" https://master-
controller.e2e.appd.com/controller/rest/applications
```

- In the case of success: all applications are returned.
- In the case of failure: HTTP 401 Unauthorized "Failed to authenticate: invalid access token." is returned.

Managing Access Tokens

Access tokens are based on JWT, therefore decoding them will not show sensitive information.

However, if you believe that your token has become compromised, you can revoke it by clicking **Revoke** or by deleting the API Client to invalidate the token. Calls using revoked access tokens fail to authenticate with a 401 Unauthorized error HTTP status code. You can click **Regenerate** to refresh a token.

i Regenerated tokens do not disable older tokens. The older tokens will remain active until they expire.

When you regenerate a token, you can set the Temporary Token Expiration.

i The default value is 1 day and the maximum limit is 30 days.

⚠ There is no way to retrieve previous or currently valid tokens. Therefore, only the current token can be revoked. Also, API-generated tokens that have Default API-generated Token Expiration, cannot be viewed nor revoked through the UI or REST API.

Using the Controller APIs

This page describes API usage information. The Controller APIs are served by the Controller instance, rather than by the Events Service or an agent component. They include:

- Accounts API
- Application Model API
- Metric and Snapshot API
- Alert and Respond API
- Configuration API
- Configuration Import and Export APIs
- Analytics Events API

Controller API Base URI

Except as indicated in the format listing for a particular method, URIs in the Controller API use the following base URI:

```
http://<controller_host>:<controller_port>/controller/rest/  
<REST_URI>
```

i The port that serves the API is the same primary port for the Controller used by Controller UI and agents.

Retrieving Data in JSON Format

The AppDynamics Controller APIs return data in eXtensible Markup Language (XML) or JavaScript Object Notation (JSON). The default output format is XML.

Any Controller API with a URI in the `/controller/rest/` format shown in [Controller API Base URI](#) can return data in JSON format.

To retrieve data in JSON, call the API with the output query parameter set to JSON, as follows:

```
curl --user user1@customer1:secret http://demo.appdynamics.com/  
controller/rest/applications?output=JSON  
[  
  {  
    "description": "",  
    "id": 5,  
    "name": "ECommerce_E2E"  
  },  
  {  
    "description": "",  
    "id": 8,
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    "name": "ECommerce_E2E-Fulfillment"
  },
]

```

You can specify JSON output format for any of the Controller APIs.

When a client uses HTTP 1.1 and accepts gzip content-encoding, the Controller returns JSON responses using `gzip` compression.

Authentication

You can use OAuth identity types for authentication. See [API Clients](#).

To invoke the REST APIs using basic HTTP authentication, you must provide the authentication credentials as well as your account information. These are:

- Account: the AppDynamics tenant account name
- Username: a user in that account
- Password: the password for that account

Pass the credentials in the following form:

```
<your_username>@<your_accountname>:<your_password>
```

Most on-premises Controllers are single-tenant Controllers that use `customer1` as the primary default account name. The account name should be left as default. For example:

```
<your_username>@customer1:<your_password>
```

Most SaaS Controllers are multi-tenant Controllers and allow you to replace `customer1` with your own, instance-specific account name. See [Observe License Usage](#).

Invalid Characters for Usernames and Passwords

REST API calls will not authenticate usernames and passwords that contain these characters:

```
\ / " [ ] : | < > + = ; , ? * , ' % tab space @
```

If you have already created user credentials that contain any of the disallowed characters, such as "user:customer66", create new credentials without the disallowed character for the purpose of accessing the REST APIs.

For usernames or passwords containing the "@" symbol, URL encode the "@" character as `%40`.

Copying a Metric URL in the Metric Browser

1. Right-click a metric in the **Metric Browser**.
2. Copy the full REST URL of the metric.
3. Paste the REST URL into your code or onto the command line.

 For security reasons, AppDynamics only supports making API calls programmatically or at the command line. Do not attempt to paste the REST URL into a browser.

Application Model API

This page describes how application APIs let you retrieve information about the monitored environment as modeled in AppDynamics. This information includes, for example, the names and IDs of the business applications, business transactions, tiers, and nodes in the modeled environment.

Retrieve All Business Applications

The application API method returns the business application names and internal numeric identifier. Many of the operations in the Controller APIs occur in the context of a business application. Use this method to discover the application names or IDs to use before invoking other methods.

Format

```
GET /controller/rest/applications
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON .	No
timeRange	Time	<p>A time parameter to filter data based on time range options (<code>timeRange</code> , <code>startTime</code> , <code>endTime</code>). If a <code>timeRange</code> option is specified, the query returns alive applications on that GMT day, otherwise, the query returns all applications.</p> <ul style="list-style-type: none"> • Case 1 : If <code>timeRange</code> is last T mins and the <code>timeRange</code> just falls into one GMT day then the API returns all the applications which are alive on that GMT day. • Case 2 : If <code>timeRange</code> is last T mins and the <code>timeRange</code> falls into 2 GMT days (for example if the current time is 4:05 PST and <code>timeRange</code> specified is last 10 mins then the API returns applications which are alive on this and the previous GMT day). <p>This feature is available for SaaS only and the API returns all applications for on-premises.</p> <p>See Metric and Snapshot API.</p>	No

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

i An *alive application* is an application with at least one node that submits at least one metric to the Controller in the provided time range.

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/rest/applications

<applications>
  <application>
    <id>5</id>
    <name>ECommerce_E2E</name>
  </application>
  <application>
    <id>8</id>
    <name>ECommerce_E2E-Fulfillment</name>
  </application>
  <application>
    <id>11</id>
    <name>jimix12110919</name>
    <description></description>
    <accountGuid>429c7884-3f36-4b5a-9412-fdf827e6c86e</
accountGuid>
  </application>
</applications>
```

Retrieve All Business Transactions in a Business Application

Format

GET /controller/rest/applications/*application_name*/business-*transactions*

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<i>application_name</i>	URI	The application name or application ID.	Yes

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
<code>exclude</code>	Query	<ul style="list-style-type: none"> <code>false</code> : the query retrieves only the business transactions that are included for monitoring. <code>true</code> : the query retrieves only the excluded business transactions. Excluded business transactions have been configured to be excluded from monitoring either from the UI or through the REST interface. The default is <code>false</code> . 	No
<code>output</code>	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are <code>XML</code> (default) or <code>JSON</code> .	No
<code>timeRange</code>	Time	<p>Time parameter to filter data based on time range options (<code>timeRange</code> , <code>startTime</code> , <code>endTime</code>). If a <code>timeRange</code> option is specified, the query returns alive business transactions on that GMT day, otherwise, the query returns all business transactions.</p> <ul style="list-style-type: none"> Case 1 : If <code>timeRange</code> is last T mins and the <code>timeRange</code> just falls into one GMT day then the API returns all the business transactions which are alive on that GMT day. Case 2 : If <code>timeRange</code> is last T mins and the <code>timeRange</code> falls into 2 GMT days (for example if the current time is 4:05 PST and <code>timeRange</code> specified is last 10 mins then the API returns business transactions which are alive on this and the previous GMT day). <p>This feature is available for SaaS only and the API returns all business transactions for on-premises.</p> <p>See Metric and Snapshot API.</p>	No

i An *alive business transaction* is a transaction that submits at least one metric to the Controller in the provided time range.

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/rest/applications/5/business-
transactions

<business-transactions>
  <business-transaction>
    <id>92</id>
    <name>/user/.POST</name>
    <entryPointType>WEB_SERVICE</entryPointType>
    <internalName>/user/.POST</internalName>
    <tierId>9</tierId>
    <tierName>ECommerce-Services</tierName>
    <background>>false</background>
  </business-transaction>
  ...
  <business-transaction>
    <id>184</id>
    <name>OrderServiceImplService.createOrder</name>
    <entryPointType>WEB_SERVICE</entryPointType>
    <internalName>OrderServiceImplService.createOrder</
internalName>
    <tierId>12</tierId>
    <tierName>Inventory-Services</tierName>
    <background>>false</background>
  </business-transaction>
</business-transactions>
```

Retrieve All Tiers in a Business Application

Format

```
GET /controller/rest/applications/application_name/tiers
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	The application name or application ID.	Yes

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON .	No
timeRange	Time	<p>Time parameter to filter data based on time range options (timeRange , startTime , endTime). If a timeRange option is specified, the query returns alive tiers on that GMT day, otherwise, the query returns all tiers.</p> <ul style="list-style-type: none"> • Case 1 : If timeRange is last T mins and the timeRange just falls into one GMT day then the API returns all the tiers which are alive on that GMT day. • Case 2 : If timeRange is last T mins and the timeRange falls into 2 GMT days (for example if the current time is 4:05 PST and timeRange specified is last 10 mins then the API returns tiers which are alive on this and the previous GMT day). <p>This feature is available for SaaS only and the API returns all tiers for on-premises.</p> <p>See Metric and Snapshot API.</p>	No

i An *alive tier* is a tier with at least one node in this tier that submits at least one metric to the Controller in the provided time range.

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/rest/applications/5/tiers

<tiers>
<tier>
  <id>8</id>
  <name>Address-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
<tier>
  <id>16</id>
  <name>Customer-Survey-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
  <id>9</id>
  <name>ECommerce-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>2</numberOfNodes>
</tier>
<tier>
  <id>12</id>
  <name>Inventory-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
  <id>17</id>
  <name>Order-Processing-Services</name>
  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
<tier>
  <id>18</id>
  <name>Web-Tier-Services</name>
  <type>Web Server</type>
  <agentType>NATIVE_WEB_SERVER</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
</tiers>
```

Retrieve All Registered Backends in a Business Application With Their Properties

Format

```
GET /controller/rest/applications/application_name/backends
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	Provide either the application name or application id.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/rest/applications/5/backends

<backends><backend>
  <id>10</id>
  <name>INVENTORY-MySQL DB-DB</name>
  <exitPointType>JDBC</exitPointType>
  <properties>
    <name-value>
      <id>0</id>
      <name>HOST</name>
      <value>DB</value>
    </name-value>
    <name-value>
      <id>0</id>
      <name>MAJOR_VERSION</name>
      <value>5.5.44-0ubuntu0.14.04.1</value>
    </name-value>
    <name-value>
      <id>0</id>
      <name>PORT</name>
      <value>3306</value>
  </properties>
</backend>
</backends>
```

```

    </name-value>
    <name-value>
      <id>0</id>
      <name>SCHEMA</name>
      <value>INVENTORY</value>

```

Retrieve Node Information for All Nodes in a Business Application

Format

```
GET /controller/rest/applications/application_name/nodes
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_name	URI	Provide either the application name or application id.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are <code>XML</code> (default) or <code>JSON</code> .	No

Parameter Name	Parameter Type	Value	Mandatory
timeRange	Time	<p>Time parameter to filter data based on time range options (timeRange , startTime , endTime). If a timeRange option is specified, the query returns alive nodes on that GMT day, otherwise, the query returns all nodes.</p> <ul style="list-style-type: none"> • Case 1 : If timeRange is last T mins and the timeRange just falls into one GMT day then the API returns all the nodes which are alive on that GMT day. • Case 2 : If timeRange is last T mins and the timeRange falls into 2 GMT days (for example if the current time is 4:05 PST and timeRange specified is last 10 mins then the API returns nodes which are alive on this and the previous GMT day). <p>This feature is available for SaaS only and the API returns all nodes for on-premises.</p> <p>See Metric and Snapshot API.</p>	No

 An *alive node* is a node that submits at least one metric to the Controller in the provided time range.

Example

```
curl --user user1@customer1:welcome http://
demo.appdynamics.com:8090/controller/rest/applications/5/nodes

<nodes><node>
  <id>7</id>
  <name>Node_8000</name>
  <type>Tomcat 5.x</type>
  <tierId>12</tierId>
  <tierName>ECommerce Server</tierName>
  <machineId>3</machineId>
  <machineName>TIER1TOMCAT</machineName>
  <machineOSType>Linux</machineOSType>
  <machineAgentPresent>>true</machineAgentPresent>
  <machineAgentVersion>Machine Agent v4.2.0.0 GA Build Date
2015-12-18 18:47:15</machineAgentVersion>
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

  <type>Application Server</type>
  <agentType>APP_AGENT</agentType>
  <numberOfNodes>1</numberOfNodes>
</tier>
</tiers>
```

Metric and Snapshot API

This page describes the Controller Metrics and Events API methods that allow you to retrieve information on metric data and various types of activities in your monitored environment. You can also configure how long you retain the metrics.

i The [AppDynamics Dexter Data Extraction Enhanced Reporting \(DEXTER\)](#) extension provides an alternative to using a REST client to get metric data by makes AppDynamics data queryable in the manner of a data warehouse.

Retrieve Metric Hierarchy

This API returns information about the metric tree structure. Because it retrieves the first generation of child elements, you can only expand the children of the folder type.

- If a child element is a container item in the response, its type value is `folder`.
- Otherwise, the type value for the child element is `leaf`.

You can recurse the metric tree structure further by using the `metric-path` parameter as described in the [Metric Data API](#).

Format

GET `/controller/rest/applications/application_name/metrics`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>application_name</code>	URI	The name or ID of the business or EUM (<code>browser/mobile/IoT</code>) application. Use the call to get the application ID in the Application Model API .	Yes
<code>output</code>	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are <code>XML</code> (default) or <code>JSON</code> .	No

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
<code>metric-path</code>	Query	<p>The path to the metric in the metric hierarchy.</p> <div style="border: 1px solid #00aaff; padding: 5px; margin-top: 10px;"> <p>i When including the pipe () or backslash (\) special characters in the <code>metric-path</code>, you must include an additional backslash to indicate escape.</p> </div>	No

Example

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications/ECommerce_E2E/metrics"

<metric-items><metric-item>
  <type>folder</type>
  <name>Backends</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Service Endpoints</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>End User Experience</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Errors</name>
</metric-item>
<metric-item>
  <type>folder</type>
  <name>Business Transaction Performance</name>
</metric-item>
<metric-item>
  <type>folder</type>
```

```

    <name>Information Points</name>
  </metric-item>
  <metric-item>
    <type>folder</type>
    <name>Overall Application Performance</name>
  </metric-item>
  <metric-item>
    <type>folder</type>
    <name>Application Infrastructure Performance</name>
  </metric-item>
  <metric-item>
    <type>folder</type>
    <name>Mobile</name>
  </metric-item></metric-items>

```

Retrieve Metric Data

The metric data method lets you get values generated for metrics. To use this method, specify the following parameters to the API:

- The path of the metric to retrieve.
- The time frame for the data.

Using the Controller UI is the simplest way to learn how to construct the metric path and time range-related parameters.

1. Right-click on the metric in the Metric Browser.
2. Select **Copy REST URL**. The copied URL includes the path to this metric and time range selected in the UI.
3. Certain clients can accept and properly encode the full path value as the metric path parameter.
4. Hover over the metric in the tree or copy it using the **Copy Full Path** option in the right-click menu.

Certain examples below are shown with the **full path value** rather than the fully encoded URL value. If you test calls with the full path, avoid using a pipe character at the start or end of the path.

These sections provide additional details and examples for the metric data method:

- [Metric Response Values](#)
- [Using Wildcards](#)
- [Using Time Ranges](#)
- [Retrieving All Other Traffic Business Transaction Metrics](#)

Format

```
GET /controller/rest/applications/application_name/metric-data
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>metric-path</code>	Query	<p>The path to the metric in the metric hierarchy.</p> <div style="border: 1px solid #00aaff; padding: 5px; background-color: #e6f2ff;"> <p>i When including the pipe () or backslash (\) special characters in the <code>metric-path</code>, you must include an additional backslash to indicate escape.</p> </div>	Yes
<code>rollup</code>	Query	<p>By default, the values of the returned metrics are rolled up into a single data point (<code>rollup=true</code>). To get separate results for all values within the time range, set the Rollup parameter to <code>false</code> in the query.</p>	No

Additional mandatory parameters for specifying time ranges are described in [Using Time Ranges](#).

Example

Retrieve metric values for a metric at an absolute path:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications/ECommerce_E2E/metric-data?metric-path=Overall%20Application%20Performance%7CAverage%20Response%20Time%20%28ms%29&time-range-type=BEFORE_NOW&duration-in-mins=15"

<metric-datas><metric-data>
  <metricId>2339</metricId>
  <metricPath>Overall Application Performance|Average Response Time (ms)</metricPath>
  <metricName>BTM|Application Summary|Average Response Time (ms)</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

<startTimeInMillis>1450562160000</startTimeInMillis>
<value>302</value>
<min>0</min>
<max>15212</max>
<current>15212</current>
<sum>97800</sum>
<count>324</count>
<standardDeviation>0.0</standardDeviation>
<occurrences>0</occurrences>
<useRange>true</useRange>
</metric-value>
</metricValues>
</metric-data>
</metric-datas>

```

Metric Response Values

Metrics results include the following fields:

Name	Definition
current	The value for the current minute. This is used only when the time rollup type used by the Controller is current.
count	The number of times the agent collected the metric over the selected time period.
min, max	The minimum and maximum values reported across the selected time period. These are not used for all metric types.
occurrences	The number of data samples taken by the Controller to calculate the standard deviation.
standardDeviation	The intermediate values calculated by the Controller during time rollup used to calculate standard deviation. See Dynamic Baselines .
startTimeInMillis	The <code>startTimeInMillis</code> is the start time of the time range to which the result metric data applies in UNIX epoch time.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Name	Definition
sum	The total accumulated value for the metric over the selected time period.
useRange	Used internally by the Controller to process the metric.
value	The <code>value</code> value is one of the following for all metric values reported across the configured evaluation time length: <ul style="list-style-type: none"> Arithmetic average: if the metric time rollup type is average. Sum: if the metric time rollup type is sum. Latest: if the metric time rollup type is current.

i `min` and `max` values are not available for any count-based or sum-based metric except when the metric is rolled up to hourly or daily data points. These metrics include errors per minute, calls per minute, and so on.

Using Wildcards

When you copy the REST URL in the Metric Browser, you get the path to a specific metric within a specific application and tier. Alternatively, you can use wildcard characters in one or more steps in the URL path to get metric data for entities, including multiple business transactions, tiers, or nodes.

The following format examples show where to put wildcard characters in various metric paths to achieve particular results. For reading clarity, these format examples use the **Full Path** for the metric rather than the REST URL. For a full working example, click the expanding link under each format listing:

- Retrieve the **app agent availability time** for all tiers in the application using a wildcard for the tier name:

```
/controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-path=Application Infrastructure Performance|*|Agent|App|Availability&time-range-type=BEFORE_NOW&duration-in-mins=15
```

Full Example:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-path=Application%20Infrastructure%20Performance%7C*%7CAgent%7CApp%7CAvailability&time-range-type=BEFORE_NOW&duration-in-mins=15"

<metric-datas><metric-data>
  <metricId>2329</metricId>
  <metricPath>Application Infrastructure Performance|Fulfillment-Services|Agent|App|Availability</metricPath>
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

<metricName>Agent|App|Availability</metricName>
<frequency>ONE_MIN</frequency>
<metricValues>
  <metric-value>
    <startTimeInMillis>1450562460000</startTimeInMillis>
    <value>1</value>
    <min>0</min>
    <max>0</max>
    <current>1</current>
    <sum>15</sum>
    <count>15</count>
    <standardDeviation>0.0</standardDeviation>
    <occurrences>0</occurrences>
    <useRange>false</useRange>
  </metric-value>
</metricValues>
</metric-data>
<metric-data>
  <metricId>2329</metricId>
  <metricPath>Application Infrastructure Performance|Fulfillment-Client-
Services|Agent|App|Availability</metricPath>
  <metricName>Agent|App|Availability</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
      <startTimeInMillis>1450562460000</startTimeInMillis>
      <value>1</value>
      <min>0</min>
      <max>0</max>
      <current>1</current>
      <sum>15</sum>
      <count>15</count>
      <standardDeviation>0.0</standardDeviation>
      <occurrences>0</occurrences>
      <useRange>false</useRange>
    </metric-value>
  </metricValues>
</metric-data>
</metric-datas>

```

- Retrieve the **CPU % Busy** metric for all the nodes in all tiers using a wildcard for the tier and node names:

```

/controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-
path=Application Infrastructure Performance|*|Individual Nodes|*|Hardware
Resources|CPU|%Busy&time-range-type=BEFORE_NOW&duration-in-mins=15

```

Full Example:

```

curl --user user1@customer1:your_password "http://demo.appdynamics.com/
controller/rest/applications/ECommerce_E2E-Fulfillment/metric-data?metric-
path=Application%20Infrastructure%20Performance%7C*%7CIndividual%20Nodes%7C
*%7CHardware%20Resources%7CCPU%7C%25Busy&time-range-
type=BEFORE_NOW&duration-in-mins=15"

<metric-datas><metric-data>
  <metricId>2231</metricId>
  <metricPath>Application Infrastructure Performance|Fulfillment-Client-
Services|Individual Nodes|FulfillmentClient|Hardware Resources|CPU|%Busy</
metricPath>
  <metricName>Hardware Resources|CPU|%Busy</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
      <startTimeInMillis>1450563000000</startTimeInMillis>
      <value>10</value>
      <min>2</min>
      <max>82</max>
      <current>6</current>
      <sum>4474</sum>
      <count>450</count>
      <standardDeviation>0.0</standardDeviation>
      <occurrences>0</occurrences>
      <useRange>true</useRange>
    </metric-value>
  </metricValues>
</metric-data>
<metric-data>
  <metricId>2231</metricId>
  <metricPath>Application Infrastructure Performance|Fulfillment-Services|
Individual Nodes|Fulfillment|Hardware Resources|CPU|%Busy</metricPath>
  <metricName>Hardware Resources|CPU|%Busy</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
      <startTimeInMillis>1450563000000</startTimeInMillis>
      <value>10</value>
      <min>2</min>
      <max>82</max>
      <current>6</current>
      <sum>4478</sum>
      <count>450</count>
      <standardDeviation>0.0</standardDeviation>
      <occurrences>0</occurrences>
      <useRange>true</useRange>
    </metric-value>
  </metricValues>

```

```
</metric-data>
</metric-datas>
```

- Retrieve the **Calls per Minute** metric for all the business transactions on the ECommerce tier using a wildcard for the business transaction name:

```
/controller/rest/applications/ACME Book Store Application/metric-data?
metric-path=Business Transaction Performance|Business Transactions|
ECommerce Server|*|Calls per Minute&time-range-type=BEFORE_NOW&duration-in-
mins=15
```

Full Example:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/
controller/rest/applications/ECommerce_E2E/metric-data?metric-
path=Business%20Transaction%20Performance%7CBusiness%20Transactions%7CEComm
erice-Services%7C*%7CCalls%20per%20Minute&time-range-
type=BEFORE_NOW&duration-in-mins=15"
<metric-datas><metric-data>
  <metricId>4042</metricId>
  <metricPath>Business Transaction Performance|Business Transactions|

Disabling Data Rollup

By default, metric data is rolled up for the time frame you request. You can set the rollup parameter to false to get all data points within the time frame. For example:

```
curl --user user1@customer1:your_password "http://
demo.appdynamics.com/controller/rest/applications/ECommerce_E2E/
metric-data?rollup=false&metric-
path=Overall%20Application%20Performance%7CAverage%20Response%20
Time%20%28ms%29&time-range-type=BEFORE_NOW&duration-in-mins=15"
```

```
<metric-datas><metric-data>
  <metricId>2339</metricId>
  <metricPath>Overall Application Performance|Average Response
Time (ms)</metricPath>
  <metricName>BTM|Application Summary|Average Response Time
(ms)</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
      <startTimeInMillis>1450503540000</startTimeInMillis>
      <value>334</value>
      <min>0</min>
      <max>3340</max>
      <current>2</current>
      <sum>6678</sum>
      <count>20</count>
      <standardDeviation>0.0</standardDeviation>
      <occurrences>0</occurrences>
      <useRange>>true</useRange>
    </metric-value>
    <metric-value>
      <startTimeInMillis>1450503600000</startTimeInMillis>
      <value>771</value>
      <min>1</min>
      <max>11235</max>
      <current>4113</current>
      <sum>15424</sum>
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    <count>20</count>
    <standardDeviation>0.0</standardDeviation>
    <occurrences>0</occurrences>
    <useRange>true</useRange>

  ...
</metricValues>
</metric-data>
</metric-datas>

```

Using Time Ranges

You can fetch metric data for any time range, including for a range between specific points, such as from 2:00 to 2:15 pm Monday, or for a relative time range.

Time-based input parameters for the metric data API method let you specify a time range in several ways, as described in the following table.

Time Range Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>time-range-type</code>	Query	<p>Possible values are:</p> <ul style="list-style-type: none"> <code>BEFORE_NOW</code> — must specify the <code>duration-in-mins</code> parameter. <code>BEFORE_TIME</code> — must specify the <code>duration-in-mins</code> and <code>end-time</code> parameters. <code>AFTER_TIME</code> — must specify the <code>duration-in-mins</code> and <code>start-time</code> parameters. <code>BETWEEN_TIMES</code> — must specify the <code>start-time</code> and <code>end-time</code> parameters. The <code>BETWEEN_TIMES</code> range includes the start-time and excludes the end-time. 	Yes
<code>duration-in-mins</code>	Query	Duration (in minutes) to return the metric data.	If <code>time-range-type</code> is <code>BEFORE_NOW</code> , <code>BEFORE_TIME</code> , or <code>AFTER_TIME</code>
<code>start-time</code>	Query	Start time (in milliseconds) from which the metric data is returned in UNIX epoch time.	If <code>time-range-type</code> is <code>AFTER_TIME</code> or <code>BETWEEN_TIMES</code>
<code>end-time</code>	Query	End time (in milliseconds) until which the metric data is returned in UNIX epoch time.	If <code>time-range-type</code> is <code>BEFORE_TIME</code> or <code>BETWEEN_TIMES</code>

Examples

Most examples on this page use the previous 15 minutes as the request time range. The following format examples show other ways you can define the time range for the request.

- Time range of the 15 minutes after December 19, 2015 5:40:00 AM GMT:

```
?time-range-type=AFTER_TIME&start-time=1450532400000&duration-in-mins=15
```

- Time range of the 15 minutes before December 19, 2015 6:00:00 AM GMT.

```
?time-range-type=BEFORE_TIME&end-time=1450533600000&duration-in-mins=15
```

- Time range between December 19, 2015 6:00:00 AM GMT and December 19, 2015 6:30:00 AM GMT:

```
?time-range-type=BETWEEN_TIMES&start-time=1450533600000&end-time=1450535400000
```

Retrieving All Other Traffic Business Transaction Metrics

The **All Other Traffic** business transaction is a type of business transaction that aggregates traffic for new transactions once the business transaction registration limits are reached and uses the special identifier, `_APPDYNAMICS_DEFAULT_TX_`, in API URI paths. See [Business Transactions](#).

The following shows an example of retrieving the average CPU used by the **All Other Traffic** business transaction:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com:8090/controller/rest/applications/ACME%20Book%20Store%20Application/metric-data?metric-path=Business%20Transaction%20Performance%7CBusiness%20Transactions%7CECommerce%20Server%7C_APPDYNAMICS_DEFAULT_TX_%7CAverage%20CPU%20Used%20%28ms%29&time-range-type=BEFORE_NOW&duration-in-mins=15"
```

```
<metric-datas><metric-data>
  <metricId>4000</metricId>
  <metricPath>Business Transaction Performance|Business Transactions|ECommerce Server|_APPDYNAMICS_DEFAULT_TX_|Average CPU Used (ms)</metricPath>
  <metricName>BTM|BTs|BT:78|Component:12|Average CPU Used (ms)</metricName>
  <frequency>ONE_MIN</frequency>
  <metricValues>
    <metric-value>
      <startTimeInMillis>1450570800000</startTimeInMillis>
      <value>22</value>
      <min>0</min>
      <max>50</max>
      <current>20</current>
      <sum>3140</sum>
      <count>146</count>
```

```

    <standardDeviation>0.0</standardDeviation>
    <occurrences>0</occurrences>
    <useRange>>true</useRange>
  </metric-value>
</metricValues>
</metric-data>
</metric-datas>

```

Retrieve Transaction Snapshots

Snapshots contain details on transactions, by request segment. The time range parameters are the same for snapshots as for retrieving metrics. You can similarly specify a relative time range or a specific range. See [Using Time Ranges](#).

Format

```
GET /controller/rest/applications/application_name/request-snapshots
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>application_name</code>	URI	Provide either the application name or application id.	Yes
<code>time-range-type</code>	Query	Possible values are: <ul style="list-style-type: none"> <code>BEFORE_NOW</code> —must specify the duration-in-mins parameter. <code>BEFORE_TIME</code> —must specify the duration-in-mins and end-time parameters. <code>AFTER_TIME</code> —must specify the duration-in-mins and start-time parameters. <code>BETWEEN_TIMES</code> —must specify the start-time and end-time parameters. The <code>BETWEEN_TIMES</code> range includes the start-time and excludes the end-time. 	Yes

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
<code>duration-in-mins</code>	Query	Duration (in minutes) to return the data.	If time-range-type is BEFORE_NOW, BEFORE_TIME, or AFTER_TIME
<code>start-time</code>	Query	Start time (in milliseconds) from which the data is returned.	If time-range-type is AFTER_TIME or BETWEEN_TIMES
<code>end-time</code>	Query	End time (in milliseconds) until which the data is returned.	If time-range-type is BEFORE_TIME or BETWEEN_TIMES
<code>guids</code>	Query	Array of comma-separated GUIDs for the transaction snapshots. If not specified, retrieves all snapshots in the specified time range.	No
<code>archived</code>	Query	True to retrieve archived snapshots. Default is false.	No
<code>deep-dive-policy</code>	Query	Array of comma-separated snapshot policy filters to apply. Valid values are: <ul style="list-style-type: none"> • <code>SLA_FAILURE</code> • <code>TIME_SAMPLING</code> • <code>ERROR_SAMPLING</code> • <code>OCCURRENCE_SAMPLING</code> • <code>ON_DEMAND</code> • <code>APPLICATION_STARTUP</code> • <code>SLOW_DIAGNOSTIC_SESSION</code> • <code>ERROR_DIAGNOSTIC_SESSION</code> • <code>POLICY_FAILURE_DIAGNOSTIC_SESSION</code> • <code>DIAGNOSTIC_SESSION</code> • <code>INFLIGHT_SLOW_SESSION</code> 	No

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
application-component-ids	Query	Array of comma-separated tier IDs to filter. The default is all the tiers in the application.	No
application-component-node-ids	Query	Array of comma-separated node ID filters. Default is all the nodes in the application	No
business-transaction-ids	Query	Array of comma-separated business transaction ID filters. Default is all the business transactions in the application.	No
user-experience	Query	Array of comma-separated user experiences filters. Valid values are: <ul style="list-style-type: none"> • NORMAL • SLOW • VERY_SLOW • STALL • ERROR 	No
first-in-chain	Query	If <code>true</code> , retrieve only the first request from the chain. Default is <code>false</code> .	No

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
need-props	Query	<p>If <code>true</code>, the values of the following snapshot properties are included in the output. These values correspond to the values of the <code>data-collector-type</code> parameter. If <code>false</code>, the default, these values are empty in the output.</p> <ul style="list-style-type: none"> • <code>errorDetails</code> • <code>errorIDs</code> • <code>httpParameters</code> • <code>businessData</code> • <code>cookies</code> • <code>httpHeaders</code> • <code>sessionKeys</code> • <code>responseHeaders</code> • <code>logMessages</code> • <code>transactionProperties</code> • <code>transactionEvents</code> • <code>dotnetProperty</code> 	No
need-exit-calls	Query	If <code>true</code> , exit calls are included in the result. Default is <code>false</code> .	No
execution-time-in-milis	Query	If set, retrieves only data for requests with execution times greater than this value.	No
session-id	Query	If set, retrieves data only for this session id.	No
user-principal-id	Query	If set, retrieves data only for this user login.	No
error-ids	Query	Array of comma-separated error codes to filter by. The default is to retrieve all error codes.	No

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
starting-request-id, ending-request-id	Query	If set, retrieves data only for this range of request IDs.	No
error-occurred	Query	If <code>true</code> , retrieves only error requests. Default is <code>false</code> .	No
diagnostic-snapshot	Query	If <code>true</code> , retrieves only diagnostic snapshots. Default is <code>false</code> .	No
bad-request	Query	If <code>true</code> , retrieves only slow and error requests. Default is <code>false</code> .	No
diagnostic-session-guid	Query	Array of comma-separated diagnostic session GUIDs to filter.	No
data-collector-name	Query	Used with <code>data-collector-value</code> to filter snapshot collection based on the value of a data collector.	No
data-collector-value	Query	Used with <code>data-collector-name</code> to filter snapshot collection based on the value of a data collector.	If <code>data-collector-name</code> is set.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
<code>data-collector-type</code>	Query	Used with <code>data-collector-name</code> and <code>data-collector-value</code> to filter snapshot collection based on the value of a data collector. Some of the values contain spaces. All are case-sensitive and where indicated the spaces are required. Valid values are: <ul style="list-style-type: none"> <code>Error IDs</code> <code>Stack Traces</code> <code>Error Detail</code> <code>Http Parameter</code> <code>Business Data</code> (This type is a method invocation data collector.) <code>Cookie</code> <code>Http Header</code> <code>Session Key</code> <code>Response Header</code> <code>Log Message</code> <code>Transaction Property</code> <code>Transaction Event</code> <code>Dotnet Property</code> <code>isProtoBuf</code> <code>EUM Request GUID</code> 	
<code>output</code>	Query	HTTP Request parameter included as part of the URL to change the output format Valid values are <code>XML</code> (default) or <code>JSON</code> .	No
<code>maximum-results</code>	Query	If specified, the number of maximum results will be returned. If not specified, a default of <code>600</code> results can be returned at most.	No

Examples

- Retrieve list of transaction snapshots for the ACME Book Store:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
/controller/rest/applications/ECommerce_E2E-Fulfillment/request-snapshots?
time-range-type=BEFORE_NOW&duration-in-mins=5
```

Full Example:

```
curl --user user1@customer1:your_password "http://demo.appdynamics.com/
controller/rest/applications/ECommerce_E2E-Fulfillment/request-snapshots?
time-range-type=BEFORE_NOW&duration-in-mins=5"

Retrieve Controller Audit History

The Controller audit history is a record of the configuration and user activities in the Controller configuration. The `ControllerAuditHistory` API method returns the audit log for the time range specified. The output format can be `JSON` or `CSV`. This information is the same as that found in the `audit.log` file. See [Platform Log Files](#) and [Log File Information by Platform](#).

Format

```
GET /controller/ ControllerAuditHistory?startTime=<start-time>&endTime=<end-time>&include=<field>:<value>&exclude=<field>:<value>
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>start-time</code>	Query	Start time in the format: <code>yyyy-MM-dd'T'HH:mm:ss.SSSZ</code>	Yes
<code>end-time</code>	Query	End time in the format: <code>y yyyy-MM-dd'T'HH:mm:ss.SSSZ</code>	Yes
<code>time-zone-id</code>	Query	Time zone	No
<code>include</code>	Query	Restricted information in the Controller audit history	No
<code>exclude</code>	Query	Restricted information in the Controller audit history	No

- To control the size of the output, the range between the `start-time` and `end-time` cannot exceed 24 hours. For periods longer than 24 hours, use multiple queries with consecutive time parameters.
- Multiple filters of the same type are allowed.
 - The backend API treats included filters with the same `< field >` with relationship `OR`
 - Filters with different `< field >` with relationship `AND`. There is no direct interaction between `include` and `exclude` filters.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- Each filter needs to be a parameter, e.g. `include=filterName1:filterValue1&include=filterName2:filterValue2`. See the below examples:

```
http://localhost:8080/controller/ControllerAuditHistory?
startTime=yyyy-MM-dd&HH:mm:ss.SSSZ&endTime=yyyy-MM-
dd&HH:mm:ss.SSSZ?
include=filterName1:filterValue1&include=filterName1:filterValue
1&exclude=filterName1:filterValue1&exclude=filterName1:filterVal
ue1
```

```

Configure Metric Retention by Account

You can configure the Controller to purge stale metrics once a day based on the account.

- Stale metrics are metrics that have not had new data reported based on the number of days configured.
- This only deletes EUM and SIM metrics that are more than two days old.

To configure this option, you must be the account owner.

Format

POST /controller/api/accounts/<account_id>/metricstaleduration/<number_of_days>

Input Parameters

Parameter Name	Parameter Type	Value
account_id	URI	The account ID.
number_of_days	Integer	The number of days you want to retain stale metrics.

Example

```
curl -X POST -u user1@customer1:your_password "http://
demo.appdynamics.com:8090/controller/api/accounts/2/
metricstaleduration/3"
```

Configure Metric Retention by Application

You can configure the Controller to purge stale metrics once a day based on application.

- Stale metrics are metrics that have not had new data reported based on the number of days configured.
- This only deletes EUM and SIM metrics that are more than two days old.

To configure this option, you must have administrator permissions or higher.

Format

```
POST /controller/api/accounts/<account_id>/applications/<application_name>/
metricstaleduration/<number_of_days>
```

Input Parameters

Parameter Name	Parameter Type	Value
account_id	URI	The account ID.
application_id	URI	The application ID.
number_of_days	Integer	The number of days you want to retain stale metrics.

Example

```
curl -X POST -u user1@customer1:your_password "http://
demo.appdynamics.com:8090/controller/api/accounts/2/
applications/12/metricstaleduration/3"
```

Alert and Respond API

This page provides links to the Alert and Respond APIs that allow you to create, configure and manage:

- [Health Rules](#)
- [Schedules](#)
- [Policies](#)
- [Actions](#)
- [Email Digests](#)
- [Action Suppression](#)
- [Events and Action Suppression](#)

 You can create and use the identity type, [API Clients](#), to provide secure access to the AppDynamics controller using REST API calls. These calls use Open Authorization (OAuth) token-based authentication. You can create new API Client identity types that can be used to generate OAuth tokens. See [API Clients](#).

Health Rule API

Related pages:

- [Health Rules](#)

This page describes the Health Rule API methods you can use to create, configure, update, and delete health rules for multiple applications simultaneously. This API allows you to programmatically update and maintain single or multiple health rules and migrate them across applications or Controllers.

- Minimal syntax validation of the JSON payload is done when creating the health rule.
- Path validation for a specified metric is not done. Ensure that you provide valid paths for all the metrics you define.
- If metrics are not resolved during the health rule evaluation, the health rule attains an unknown (?) state. Ensure that you provide valid metrics for all the affected entities you define.

Create a Health Rule

Creates a new health rule from the specified JSON payload. See [Property Details](#).

Resource URL

POST <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules

Request/Response Format

JSON

Example

This example creates a health rule with an affected entity type `business transaction performance` and defines the evaluation criteria for the health rule. See [Download Examples](#)

Retrieve a List of Health Rules for an Application

This API returns a list of all the health rule IDs and names for the specified application ID. To retrieve complete details of the health rule, use `GET //health-rule/{health-rule-id}`. See [Property Details](#).

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules
```

Response Format

JSON

Example Response

```
[
  {
    "id": 1,
    "name": "Machine Availability is too low",
    "enabled": true
  },
  {
    "id": 2,
    "name": "Overall Disk Space Available is too low",
    "enabled": true
  },
  {
    "id": 3,
    "name": "CPU Usage is too high",
    "enabled": true
  },
  {
    "id": 4,
    "name": "Memory Usage is too high",
    "enabled": true
  },
  {
    "id": 5,
    "name": "Swap Usage is too high",
    "enabled": true
  },
  {
    "id": 6,
    "name": "Disk Usage is too high on at least one partition",
    "enabled": false
  }
]
```

```

Delete a Health Rule

Deletes an existing health rule with the specified ID.

Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules/{health-rule-id}
```

Update a Health Rule Configuration

This API updates one or more configuration setting(s) of a health rule. See [Property Details](#).

You can enter one or both of the following field(s) in the request:

- Enable/disable the health rule.
- Update the schedule of the health rule.

Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/health-rules/{health-rule-id}/configuration
```

Property Details

HealthRule

Property Name	Type and Valid Values	Description
id	integer	Auto-generated by the system and returned in the response. It is a <code>readOnly</code> value.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type and Valid Values	Description
name	string Minimum length: 1	Name of the health rule.
enabled	boolean Default value: true	Sets the health rule to enabled/disabled state. A health rule is evaluated on
useDataFromLastNMinutes	integer Minimum value: 1 Maximum value: 360	The time interval (in minutes) during which the data collected is considered
waitTimeAfterViolation	integer Minimum time: 1 minute	The wait time after a violation in minutes.
scheduleName	string Default option: Always	Name of schedule to be associated with the health rule for evaluation.

Property Name	Type and Valid Values	Description					
affects*		<p>Describes entities affected by the health rule. For example, business transactions.</p> <p>Affects</p> <table border="1" data-bbox="667 562 1624 1402"> <thead> <tr> <th data-bbox="667 562 1466 642">Property</th> <th data-bbox="1469 562 1624 642">Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="667 646 1466 1402">affectedEntity Type</td> <td data-bbox="1469 646 1624 1402">string</td> </tr> </tbody> </table>		Property	Type	affectedEntity Type	string
Property	Type						
affectedEntity Type	string						

Property Name	Type and Valid Values	Description						
evalCriteria*		<p>Defines a condition or a set of conditions (maximum of 8) expressed as a boolean expression. The expression may not contain <code>evalMatchingCriteria</code>. Conditions are classified as:</p> <ul style="list-style-type: none"> <code>critical</code> or <code>warning</code> <p><code>criticalCriteria</code> <code>warningCriteria</code></p> <p>Critical conditions are evaluated before warning conditions. If you have both, warning conditions are evaluated only if the critical condition is not <code>true</code>.</p> <table border="1" data-bbox="685 810 1624 1455"> <thead> <tr> <th data-bbox="685 810 1252 894">Property</th> <th data-bbox="1252 810 1624 894">Description</th> </tr> </thead> <tbody> <tr> <td data-bbox="685 894 1252 1260"><code>conditionAggregationType</code></td> <td data-bbox="1252 894 1624 1260">Condition evaluation criteria for rule violation.</td> </tr> <tr> <td data-bbox="685 1260 1252 1455"><code>conditionExpression</code></td> <td data-bbox="1252 1260 1624 1455">Use only when you set the <code>conditionAggregationType</code> to <code>AND</code>. The <code>ShortName</code> of the condition expression.</td> </tr> </tbody> </table>	Property	Description	<code>conditionAggregationType</code>	Condition evaluation criteria for rule violation.	<code>conditionExpression</code>	Use only when you set the <code>conditionAggregationType</code> to <code>AND</code> . The <code>ShortName</code> of the condition expression.
Property	Description							
<code>conditionAggregationType</code>	Condition evaluation criteria for rule violation.							
<code>conditionExpression</code>	Use only when you set the <code>conditionAggregationType</code> to <code>AND</code> . The <code>ShortName</code> of the condition expression.							

Property Name	Type and Valid Values	Description	
		Property	Description
		conditions*	<p>A single condition that can be set to <code>true</code> or <code>false</code>.</p> <p>OR</p> <p>A list of conditions (maximum of 10) that can be set to <code>true</code> or <code>false</code> to form a criteria.</p>

Property Name	Type and Valid Values	Description

HealthRuleSummaryArray

Property	Type
id*	integer
name	string minLength: 1
enabled*	boolean

HealthRuleConfiguration

The configuration details of a health rule that you can update individually without the need to send the complete health rule JSON payload. You can mention one or more properties and all those properties are set to the new specified values.

Property	Type
enabled	boolean
scheduleName	string

MetricEvalDetail

Property	Type	Enums
metricEvalDetailType*	string	BASELINE_TYPE SPECIFIC_TYPE

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

BaselineMetricEvalDetail

The deviation of a metric from the baseline used to evaluate the health rule.

Property	Type	Enums
metricEvalDetailType*	string	BASELINE_TYPE SPECIFIC_TYPE
baselineCondition*	string	WITHIN_BASELINE NOT_WITHIN_BASELINE GREATER_THAN_BASELINE LESS_THAN_BASELINE
baselineName*	string minLength: 1	
compareValue*	number minimum: 0	
baselineUnit*	string	STANDARD_DEVIATIONS PERCENTAGE

SpecificValueMetricEvalDetail

The deviation of a metric from a specific value used to evaluate the health rule.

Property	Type	Enums
metricEvalDetailType*	string	BASELINE_TYPE SPECIFIC_TYPE
compareCondition*	string	GREATER_THAN_SPECIFIC_VALUE LESS_THAN_SPECIFIC_VALUE

Property	Type	Enums
compareValue*	number minimum: 0	

MetricAggregateFunction

Metrics aggregated to determine the deviation and evaluate the health rule.

Property	Type	Enums
MetricAggregateFunction*	string	MINIMUM MAXIMUM VALUE SUM COUNT CURRENT GROUP_COUNT

SingleMetricEvalDetail

The deviation of a single metric from the aggregated value used to evaluate the health rule.

Property	Type	Enums
evalDetailType*	string	SINGLE_METRIC METRIC_EXPRESSION

Property	Type	Enums
metricAggregateFunction*	string	MINIMUM MAXIMUM VALUE SUM COUNT CURRENT GROUP_COUNT
metricPath*	string minLength: 1	
metricEvalDetail*	string	BASELINE_TYPE SPECIFIC_TYPE

MetricExpressionEvalDetail

The metric expression used to evaluate the health rule.

metricAggregateFunction*	string	MINIMUM MAXIMUM VALUE SUM COUNT CURRENT GROUP_COUNT
metricPath*	string minLength: 1	

NodeEvalMatchingCriteria

Property	Type	Enums
matchType	string	AVERAGE ANY_NODE PERCENTAGE_NODES NUMBER_OF_NODES
value Enter the matching criteria only when you select PERCENTAGE_NODES or NUMBER_OF_NODES as matchType . If you select NUMBER_OF_NODES , enter an integer; else if you select PERCENTAGE_NODES , enter a number.	number minimum: 0	

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Condition

A single condition that can be independently evaluated to `true` or `false`. List of conditions (maximum 8) along with other properties form a criteria.

Property	Description	Type/Enums
<code>name*</code>	Name of the condition.	string
<code>shortname*</code>	A short name used in <code>conditionExpression</code> to evaluate <code>CUSTOM</code> <code>conditionType</code> .	string pattern: <code>^[A-Z]{1,3}\$</code> Enums A B C D E F G H
<code>evaluateToTrueOnNoData</code>	Controls the evaluation of the condition in cases where any metric on which the condition is based, returns no data. The condition evaluates to <code>unknown</code> by default when no data is returned. If the health rule is based on all the conditions evaluating to <code>true</code> , having no data returned may affect whether the health rule triggers an action.	boolean default: <code>false</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property	Description	Type/Enums						
<code>evalDetail*</code>	Details of metric(s) considered for evaluation of the condition. Use <code>SINGLE_METRIC</code> to evaluate a single metric. Use <code>METRIC_EXPRESSION</code> to evaluate a metric expression.	ConditionEvalDetail <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Property</th> <th>Type</th> <th>Enums</th> </tr> </thead> <tbody> <tr> <td><code>evalDetailType</code></td> <td>string</td> <td><code>SINGLE_METRIC</code> <code>METRIC_EXPRESSION</code></td> </tr> </tbody> </table>	Property	Type	Enums	<code>evalDetailType</code>	string	<code>SINGLE_METRIC</code> <code>METRIC_EXPRESSION</code>
Property	Type	Enums						
<code>evalDetailType</code>	string	<code>SINGLE_METRIC</code> <code>METRIC_EXPRESSION</code>						
<code>triggerEnabled</code>	If set to <code>true</code> , the value in field <code>minimumTriggers</code> is considered for evaluation.	boolean default: <code>false</code>						
<code>minimumTriggers</code>	If you set a non-zero value, <code>persistence thresholds</code> are considered when evaluating the conditions. Ensure that you define a value less than <code>useDataFromLastNMinutes</code> .	integer default: 0 minimum: 0 maximum: 30

Download Examples

Download a set of examples that help you configure a health rule, [health_rule_request_examples.zip](#).

Download Swagger YAML spec

Download the Swagger YAML spec [health_rule_openapi.yml](#).

Schedule API

This page describes the Schedule API methods you can use to create, configure, and manage the evaluation time frame for the health rules of an application. The metrics associated with a health rule are evaluated according to a schedule that you control. See [Health Rule Schedules](#).

- Syntax validation of the JSON payload is done when creating the schedule.
- Ensure that you pick a time zone the [Time Zone List](#).

Create a New Schedule

Creates a new schedule with the specified JSON payload. See [Property Details](#).

Resource URL

```
POST <controller_url>/controller/alerting/rest/v1
/applications/<application_id>/schedules
```

Request/Response Format

JSON

Example

This example creates a health rule schedule that evaluates the health rule once. See [Download Examples](#).

[Request](#) [Response](#)

```
{
  "name": "Daily Schedule",
  "description": "Daily Schedule",
  "timezone": "America/Los_Angeles",
  "scheduleConfiguration": {
    "scheduleFrequency": "DAILY",
    "startTime": "06:00",
    "endTime": "18:00"
  }
}
```

[Request](#) [Response](#)

```
{
  "id": 62,
  "name": "Daily Schedule",
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    "description": "Daily Schedule",
    "timezone": "America/Los_Angeles",
    "scheduleConfiguration": {
      "scheduleFrequency": "DAILY",
      "startTime": "06:00",
      "endTime": "18:00"
    }
  }
}

```

Retrieve a List of Schedules for a Given Application

Returns a list of [schedule\(s\) details](#) for a health rule associated with the specified application ID. This API returns the schedule ID, name, and description of the schedule. See [Property Details](#).

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/schedules
```

Response Format

JSON

Example Response

This example returns a list of schedules applicable to a given application ID.

```

[
  {
    "id": 62,
    "name": "Daily Schedule",
    "description": "Daily Schedule",
    "timezone": "America/Los_Angeles"
  },
  {
    "id": 12,
    "name": "End of Business Hour: 5pm-6pm, Mon-Fri",
    "description": "This schedule is active Monday through Friday, during end of business hour",
    "timezone": "Asia/Kolkata"
  },
  {
    "id": 61,
    "name": "Schedule1",
    "description": "Custom Schedule",
    "timezone": "America/Los_Angeles"
  },
  {

```

```

    "id": 11,

    "name": "Weekdays: 8am-5pm, Mon-Fri",
    "description": "This schedule is active Monday through Friday, during business hours",
    "timezone": "Asia/Kolkata"
  },
  {
    "id": 9,
    "name": "Weekends: 12am-11pm, Sat-Sun",
    "description": "This schedule is active all day and night on the weekend",
    "timezone": "Asia/Kolkata"
  },
  {
    "id": 8,
    "name": "Weeknights: 11pm-6am, Mon-Fri",
    "description": "This schedule is active Monday through Friday, during night time
batch runs",
    "timezone": "Asia/Kolkata"
  }
]

```

Retrieve the Details of a Specified Schedule

Retrieves a schedule with a specified ID. See [Property Details](#).

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/
schedules/{schedule-id}
```

Response Format

JSON

Example Response

This example retrieves the details of a schedule. See [Download Examples](#).

```

{
  "id": 12,
  "name": "End of Business Hour: 5pm-6pm, Mon-Fri",
  "description": "This schedule is active Monday through Friday, during end of business
hour",
  "timezone": "Asia/Kolkata",
  "scheduleConfiguration": {
    "scheduleFrequency": "WEEKLY",
    "days": [
      "MONDAY",
      "TUESDAY",
      "WEDNESDAY",
      "THURSDAY",
      "FRIDAY"
    ],
    "startTime": "17:00",
    "endTime": "18:00"
  }
}

```

Update a Schedule

Updates an existing schedule with a specified JSON payload. See [Property Details](#).

Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/
schedules/{schedule-id}
```

Request/Response Format

JSON

Example

This example updates a schedule that evaluates the health rule once. See [Download Examples](#).

[Request](#) Response

```

{
  "name": "One Time Schedule",
  "description": "One Time Schedule",
  "timezone": "America/Los_Angeles",
  "scheduleConfiguration": {
    "scheduleFrequency": "ONE_TIME",
    "startTime": "06:00",

```

```

    "endTime": "18:00",
    "startDate": "01/01/2019",
    "endDate": "01/01/2019"
  }
}

```

Request [Response](#)

This example confirms that the schedule was updated successfully.

```

{
  "id": 62,
  "name": "One Time Schedule",
  "description": "One Time Schedule",
  "timezone": "America/Los_Angeles",
  "scheduleConfiguration": {
    "scheduleFrequency": "ONE_TIME",
    "startDate": "01/01/2019",
    "startTime": "06:00",
    "endDate": "01/01/2019",
    "endTime": "18:00"
  }
}

```

Delete a Schedule

Delete a schedule with the specified ID. See [Property Details](#).

Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/schedules/{schedule-id}
```

Response Codes

Code	Description
200	Fetches successfully

Property Details

Schedule

Payload details for the health rule schedule.

Property Name	Type	Description and Valid Values
id	integer	Auto-generated by the system and returned in the response. It is a <code>ReadOnly</code> value.
name*	string	Name of schedule to be associated with the health rule for evaluation. Minimum length: 1
description	string	Description of the schedule with evaluation details. Example: Health rules are evaluated daily at 12 noon. Default value: <code>true</code>
timezone*	string	Timezone Id - Unique identifier of the time zone. See Time Zones . Example: America/Los_Angeles

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values								
scheduleConfiguration*		<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>scheduleFrequency</td> <td>string</td> <td>The health rule(s) evaluation frequency specified in the schedule. Enums: ONE_TIME DAILY WEEKLY MONTHLY_SPECIFIC_DATE MONTHLY_SPECIFIC_DAY CUSTOM</td> </tr> </tbody> </table>			Property Name	Type	Description	scheduleFrequency	string	The health rule(s) evaluation frequency specified in the schedule. Enums: ONE_TIME DAILY WEEKLY MONTHLY_SPECIFIC_DATE MONTHLY_SPECIFIC_DAY CUSTOM
		Property Name	Type	Description						
scheduleFrequency	string	The health rule(s) evaluation frequency specified in the schedule. Enums: ONE_TIME DAILY WEEKLY MONTHLY_SPECIFIC_DATE MONTHLY_SPECIFIC_DAY CUSTOM								

OneTimeSchedule

This schedule evaluates the health rule once.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums .

Property Name	Type	Description
startDate*	string	The scheduled start date in DD/MM/YYYY format. Pattern: <pre>^(?:((?:31(\- \/ \.)?(?:0?[13578] 1[02]))\1 (?:(?:29 30)(\- \/ \.)?(?:0?[13-9] 1[0-2]))\2))?(?:1[6-9] 2-9\d)?\d{2}\$ ^((?:29(\- \/ \.)0?2\3(?:((?:1[6-9] 2-9\d)?(?:0[48] [2468][048] [13579][26]) (?:(?:16 [2468][048] [3579][26]))00)))) ^((?:0?[1-9] 1\d 2[0-8])(\- \/ \.)?(?:0?[1-9] (?:(?:1[0-2]))\4(?:((?:1[6-9] 2-9\d)?\d{2}))\$</pre>
startTime*	string	The scheduled start time in a 24-hour format. Pattern: <pre>^([01]\d 2[0-3]):([0-5]\d)\$</pre>
endDate*	string	The scheduled end date in DD/MM/YYYY format. Pattern: <pre>^(?:((?:31(\- \/ \.)?(?:0?[13578] 1[02]))\1 (?:(?:29 30)(\- \/ \.)?(?:0?[13-9] 1[0-2]))\2))?(?:1[6-9] 2-9\d)?\d{2}\$ ^((?:29(\- \/ \.)0?2\3(?:((?:1[6-9] 2-9\d)?(?:0[48] [2468][048] [13579][26]) (?:(?:16 [2468][048] [3579][26]))00)))) ^((?:0?[1-9] 1\d 2[0-8])(\- \/ \.)?(?:0?[1-9] (?:(?:1[0-2]))\4(?:((?:1[6-9] 2-9\d)?\d{2}))\$</pre>
endTime*	string	The scheduled end time in a 24-hour format. Pattern: <pre>^([01]\d 2[0-3]):([0-5]\d)\$</pre>

DailySchedule

A recurring schedule to evaluate the health rule every day.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description
<code>scheduleFrequency*</code>	string	The frequency to evaluate the health rule(s). See Enums .
<code>startTime*</code>	string	The scheduled start time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>
<code>endTime*</code>	string	The scheduled end time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>

WeeklySchedule

A recurring schedule to evaluate the health rule every week.

Property Name	Type	Description
<code>scheduleFrequency*</code>	string	The frequency to evaluate the health rule(s). See Enums .

Property Name	Type	Description						
days*	string	<p>The day of the week to evaluate the health rule.</p> <p>minItems: 1</p> <p>maxItems: 7</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DayOfWeek</td> <td>string</td> <td> Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY </td> </tr> </tbody> </table>	Property Name	Type	Description	DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY
Property Name	Type	Description						
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY						
startTime*	string	<p>The scheduled start time in a 24-hour format.</p> <p>pattern:</p> <pre>^([01]\d 2[0-3]):([0-5]\d)\$</pre>						
endTime*	string	<p>The schedule end time in 24-hour format.</p> <p>pattern:</p> <pre>^([01]\d 2[0-3]):([0-5]\d)\$</pre>						

MonthlySpecificDateSchedule

A recurring schedule to evaluate the health rule every month on a specific date.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums .

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description
startDate*	string	The schedule start date in DD/MM/YYYY format. pattern: <pre>^(?:((?:31(\- \/ \.)?(?:0?[13578] 1[02]))\1 (?:(?:29 30)(\- \/ \.)?(?:0?[13-9] 1[0-2]))\2))?(?:1[6-9] 2-9)\d?\d{2})\$ ^((?:29(\- \/ \.)?2\3(?:((?:1[6-9] 2-9)\d)?(?:0[48] [2468][048] [13579][26]) (?:(?:16 [2468][048] [3579][26]))00)))\$ ^((?:0?[1-9] 1\d 2[0-8])(\- \/ \.)?(?:0?[1-9] (?:(?:1[0-2]))\4(?:((?:1[6-9] 2-9)\d)?\d{2}))\$</pre>
startTime*	string	The scheduled start time in a 24-hour format. pattern: <pre>^([01]\d 2[0-3]):([0-5]\d)\$</pre>
endDate*	string	The scheduled end date in DD/MM/YYYY format. pattern: <pre>^(?:((?:31(\- \/ \.)?(?:0?[13578] 1[02]))\1 (?:(?:29 30)(\- \/ \.)?(?:0?[13-9] 1[0-2]))\2))?(?:1[6-9] 2-9)\d?\d{2})\$ ^((?:29(\- \/ \.)?2\3(?:((?:1[6-9] 2-9)\d)?(?:0[48] [2468][048] [13579][26]) (?:(?:16 [2468][048] [3579][26]))00)))\$ ^((?:0?[1-9] 1\d 2[0-8])(\- \/ \.)?(?:0?[1-9] (?:(?:1[0-2]))\4(?:((?:1[6-9] 2-9)\d)?\d{2}))\$</pre>
endTime*	string	The scheduled end time in a 24-hour format. pattern: <pre>^([01]\d 2[0-3]):([0-5]\d)\$</pre>

MonthlySpecificDaySchedule

A recurring schedule to evaluate the health rule every month on a specific date.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description						
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums .						
startTime*	string	The scheduled start time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>						
endTime*	string	The schedules end time in a 24-hour format. pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>						
day*	string	The day of the week to evaluate the health rule. minItems: 1 maxItems: 7 <table border="1" data-bbox="873 968 1495 1608"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DayOfWeek</td> <td>string</td> <td>Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY</td> </tr> </tbody> </table>	Property Name	Type	Description	DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY
Property Name	Type	Description						
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY						

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description
occurrence*	string	The occurrence of the day within a month. Enums: FIRST SECOND THIRD FOURTH LAST

CustomSchedule

A custom schedule to evaluate the health rule based on specific requirements and timezone. Use UNIX cron expressions to define properties.

Property Name	Type	Description
scheduleFrequency*	string	The frequency to evaluate the health rule(s). See Enums .
startCron*	string	The beginning of the UNIX cron expression.
endCron*	string	The end of the UNIX cron expression.

ScheduleSummaryElement

The details of the schedule you have defined that are returned when you retrieve the schedules API.

Property Name	Type	Description
id	integer	Auto-generated by the system and returned in the response.
name*	string	Name of the schedule associated with the health rule for evaluation.
description	string	Description of the schedule and evaluation details.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description
timezone*	string	Timezone ID - Unique identifier of the time zone.

*This property is required (mandatory).

Policy API

This page describes the Policy API methods you can use to create, configure, and manage [policies](#) for an application.

A policy consists of a *trigger* based on one or more events and an *action* in response to that trigger. You use policies to automate monitoring, alerting, and problem remediation.

- Syntax validation of the JSON payload is done when creating the policy.
- Objects/Entities corresponding to EUM applications are not supported.

Create a Policy

Creates a new policy using the given JSON payload.

Resource URL

```
POST <controller_url>/controller/alerting/rest
/v1/applications/<application_id>/policies
```

Request/Response Format

JSON

Example

[Request](#) Response

```
{

Retrieve a list of Policies associated with an Application

This API returns a list of all policies associated with the given application, policy names, IDs, and enable flag details. To fetch the complete details of a policy, use `GET /policies/{policy-id}`.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/
policies
```

Response Format

JSON

Example Response

```
[
  {
    "id": 1,
    "name": "Policy json update example",
    "enabled": true
  },
  {
    "id": 2,
    "name": "Policy json create example",
    "enabled": true
  }
]
```

Retrieve Details of a Specified Policy

Returns a JSON representation of a policy for the given policy ID.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/
policies/{policy-id}
```

Response Format

JSON

Example Response

This example retrieves the configuration details of a policy.

```
{
  "id": 1,
  "name": "Policy REST get json example",
  "enabled": true,
  "executeActionsInBatch": true,
  "actions": [
    {
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

    ]
  }
}

```

Update a Policy

Updates the configuration settings of an existing policy with the values of a specified policy ID.

This request requires a complete JSON payload as input. AppDynamics recommends

1. Retrieving the JSON payload using `GET /policies/{policy-id}` and update the required fields.
2. Send the modified payload as part of the `PUT` request.

Resource URL

`PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/policies/{policy-id}`

Request/Response Format

JSON

Example

[Request](#) Response

```

{

```

Delete a Policy

Deletes an existing policy with the specified ID.

Ensure that you provide a valid existing policy ID.

Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/
policies/{policy-id}
```

Update a Policy Configuration

Updates one or more specific configuration setting(s) of a policy. You can update the **Name** and **Enabled** fields using this API.

Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/
policies/{policy-id}/configuration
```

Property Details

Policy

Payload details of a policy.

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
name*	string	Name of the policy. Minimum length: 1
enabled	boolean	Sets the policy to enabled/disabled state. Default value: true
executeActionsInBatch*	boolean	Executes the actions configured for a policy, once for all the triggering events that occur within a minute. Default value: true

Property Name	Type	Description and Valid Values		
actions*	min It e m s: 1	Action Describes the predefined, reusable, and automated response to an event to be taken triggered.		
Property Name	Type	Description		
actionName*	string	Name of the action definition		
actionType*	string	ActionType Enum Creates the following types of actions: SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS CREATE_UPDATE_JIRA		

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	T y p e	Description and Valid Values
events*		Events Describes the events that trigger the policy.

*This property is required.

Download Examples

Download a set of examples that help you configure a policy, [AppDynamicsPoliciesExamples.zip](#).

Download SWAGGER YAML Spec

Download the Swagger YAML spec [policies_openapi.yml](#).

Actions API

This page describes the Action API methods you can use to create, configure, and manage various [actions](#) that are to be triggered as a response to events. Use this API to create these types of actions:

- [Notification](#)
- [Diagnostic](#)
- [Remediation](#)
- [JIRA](#)
- [HTTP Request](#)
- [Custom](#)

Syntax validation of the JSON payload is done when creating the action.

Create a New Action

Creates a new action with the specified JSON payload. See [Property Details](#).

Resource URL

```
POST <controller_url>/controller/alerting/rest/v1
/applications/<application_id>/actions
```

Request/Response Format

JSON

Example

[Request](#) [Response](#)

This example creates an action of the type **Thread Dump**. See [Download Examples](#).

```
{
  "actionType": "THREAD_DUMP",
  "name": "Thread Dump Action",
  "numberOfThreadDumps": 2,
  "intervalInMs": 500,
  "approvalBeforeExecution": {
    "requireApproval": true,
    "approverEmail": "email@website.com"
  }
}
```

[Request](#) [Response](#)

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

This example returns the created action object.

```
{
  "id": "3",
  "actionType": "THREAD_DUMP",
  "name": "Thread Dump Action",
  "numberOfThreadDumps": 2,
  "intervalInMs": 500,
  "approvalBeforeExecution": {
    "requireApproval": true,
    "approverEmail": "email@website.com"
  }
}
```

Retrieve a List of Actions for a Given Application

Returns the action ID, name, and description of the action pertaining to a specified application ID. See [Property Details](#).

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/actions
```

Response Format

JSON

Example Response

This example returns a list of actions pertaining to a given application ID.

```
[{"id":1,"name":"Thread Dump Action","actionType":"THREAD_DUMP"}]
```

Retrieve Details of a Specified Action

Retrieves the details of action with a specified ID. See [Property Details](#).

 Ensure that you provide a valid action ID.

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/actions/  
{action-id}
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Response Format

JSON

Example Response

This example retrieves the details of an action. See [Actions API](#).

```
{
  "id": 1,
  "actionType": "THREAD_DUMP",
  "name": "Thread Dump Action",
  "numberOfThreadDumps": 2,
  "intervalInMs": 500,
  "approvalBeforeExecution": {
    "requireApproval": true,
    "approverEmail": "email@website.com"
  }
}
```

Update an Action

Updates an existing action with a specified JSON payload. See [Property Details](#).

This request requires a complete JSON payload as input. Hence, it is recommended that you retrieve the JSON payload using `GET /action/{action-id}` and update the required fields. Then, send the modified payload as part of a `PUT` request.

Resource URL

`PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action/{action-id}`

Request/Response Format

JSON

Example

Request Response

```
{
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    "actionType": "THREAD_DUMP",
    "name": "Thread Dump Action",
    "numberOfThreadDumps": 2,
    "intervalInMs": 500,
    "approvalBeforeExecution": {
      "requireApproval": true,
      "approverEmail": "email@website.com"
    }
  }
}

```

Request [Response](#)

This example returns the updated action.

```

{
  "id": "3",
  "actionType": "THREAD_DUMP",
  "name": "Thread Dump Action",
  "numberOfThreadDumps": 2,
  "intervalInMs": 500,
  "approvalBeforeExecution": {
    "requireApproval": true,
    "approverEmail": "email@website.com"
  }
}

```

Delete an Action

Deletes an action with the specified ID. See [Property Details](#).

 Ensure that you provide a valid action ID.

Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/
action/{action-id}
```

Response Codes

Code	Description
200	Fetches successfully

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

403	Forbidden
404	Resource not found
409	Already exists

Property Details

Action

Payload details for an action triggered as a response to an event.

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a <code>readOnly</code> value.

Property Name	Type	Description and Valid Values
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

SmsAction

An SMS notification is triggered as a response to an event.

Note

Ensure that you have configured the email and SMS settings for AppDynamics. See [Configure the SMTP Server](#).

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.

Property Name	Type	Description and Valid Values
<code>actionType*</code>	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
<code>phoneNumber*</code>	string pattern: <code>^\d{10,}\$</code>	

EmailAction

An email notification is triggered as a response to an event.

Property Name	Type	Description and Valid Values
<code>id</code>	integer	This is auto-generated by the system and returned in the response. It is a <code>readOnly</code> value.

Property Name	Type	Description and Valid Values
<code>actionType*</code>	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
<code>emails*</code>	string pattern <code>^[a-zA-Z0-9_+-.]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$</code>	

CustomEmailAction

An email notification based on a predefined template is triggered as a response to an event.

 The template must already exist before you can use it in an action. See [Email Templates](#).

Property Name	Type	Description and Valid Values
<code>id</code>	integer	This is auto-generated by the system and returned in the response. It is a <code>readOnly</code> value.

Property Name	Type	Description and Valid Values
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
name*	string minLength: 1	ActionName The name you assign to the action.
emailTemplateName*	string minLength: 1	The name of the template to be used for email notification.
to*	string pattern: ^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$	EmailArray A list of email IDs.
cc*	string pattern: ^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$	EmailArray A list of email IDs.
bcc*	string pattern: ^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\$	EmailArray A list of email IDs.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values						
customTemplateVariables*	string	KeyValuePair <table border="1" data-bbox="1003 386 1495 638"> <thead> <tr> <th>Property Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td>key*</td> <td>string</td> </tr> <tr> <td>value*</td> <td>string</td> </tr> </tbody> </table>	Property Name	Type	key*	string	value*	string

DiagnosticAction

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a <code>readOnly</code> value.
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
name*	string minLength: 1	ActionName The name you assign to the action.
duration*	integer minimum: 1 maximum: 10	The duration in minutes to run the diagnostic session.
snapshotRate*	integer minimum: 1 maximum: 10	The rate at which diagnostic snapshots are captured.
businessTransactions*	string	Runs the diagnostic session on the specified Business Transactions. Enums ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

JiraAction

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.

Property Name	Type	Description and Valid Values
<code>actionType*</code>	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA
<code>name*</code>	string minLength: 1	ActionName The name you assign to the action.
<code>jiraActionDetails*</code>	string	jiraActionType The JIRA action type triggered as a response to an event. Enums CREATE_JIRA UPDATE_JIRA

JiraActionDetails

The JIRA action type triggered as a response to an event.

Property Name	Type	Description and Valid Values
<code>jiraActionType</code>	string	Enums CREATE_JIRA UPDATE_JIRA

JiraCreateAction

The Jira action type `create JIRA` is triggered as a response to an event.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
jiraActionType*	string	Enums CREATE_JIRA UPDATE_JIRA
assignee*	string minLength: 1	
project*	string minLength: 1	
priority*	string minLength: 1	
issueType*	string minLength: 1	

JiraUpdateAction

The Jira action type `update JIRA` is triggered as a response to an event.

Property Name	Type	Description and Valid Values
jiraActionType*	string	Enums CREATE_JIRA UPDATE_JIRA
changePriorityTo*	string minLength: 1	

ActionName

The name you assign to the action.

Property Name	Type	Description and Valid Values
ActionName	string minLength: 1	

ApprovalBeforeExecution

Mandate email approval before the action execution is initiated.

Property Name	Type
requireApproval	boolean
approverEmail	string pattern: <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9]+\.[a-zA-Z0-9-]+\.\$</code>

BusinessTransactions

Run the diagnostic session on the specified Business Transactions.

Property Name	Type	Description and Valid Values
businessTransactionScope	string	Enums ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

AllAffectedBusinessTransactions

Run the diagnostic session on all Business Transactions.

Property Name	Type	Description and Valid Values
businessTransactionScope	string	Enums ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

SpecificBusinessTransactions

Run the diagnostic session on the Business Transactions that match the specified criteria.

Property Name	Type	Description and Valid Values
businessTransactionScope	string	Enums ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS
businessTransactionNames*	string minItems: 1	

EmailArray

Property Name	Type
EmailArray	string pattern: <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\.\$</code>

KeyValuePair

Property Name	Type
key*	string
value*	string

Email

Property Name	Type
Email	string pattern: <code>^[a-zA-Z0-9_+]+@[a-zA-Z0-9-]+\.[a-zA-Z0-9-]+\.\$</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

ActionSummaryArray

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.
name*	string minLength: 1	ActionName The name you assign to the action.
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

ActionSummary

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a readOnly value.
name*	string minLength: 1	ActionName The name you assign to the action.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
actionType*	string	The type of action triggered as a response to an event. Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

StringIntegerPair

Property Name	Type
id	integer
name*	string minLength: 1

JiraActionTypeEnum

Property Name	Type	Description and Valid Values
jiraActionTypeEnum	string	CREATE_JIRA UPDATE_JIRA

BusinessTransactionScopeEnum

Property Name	Type	Description and Valid Values
BusinessTransactionScopeEnum	string	ALL_AFFECTED_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS

ActionTypeEnum

Property Name	Type	Description and Valid Values
ActionTypeEnum	string	Enums SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSE_BUSINESS_TRANSACTIONS CREATE_UPDATE_JIRA

ErrorResponse

Property Name	Type
statusCode	integer
message	string

*This property is required.

Download Examples

Download [actions_api.zip](#) for a set of examples that help you configure an action.

Download SWAGGER YAML file

Download the Swagger [actions_openapi.yml](#).

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Email Digest API

This page provides Email Digest API methods you can use to report a summary of a specific event(s) to a recipient list configured on a health rule schedule. [Email digests](#) are triggered as a response to a health rule violation event.

Syntax validation of the JSON payload is done when creating the email digest.

Create a New Email Digest

Creates a new email digest with the specified JSON payload. See [Property Details](#).

Resource URL

```
POST <controller_url>/controller/alerting/rest/v1
/applications/<application_id>/email-digests
```

Request/Response Format

JSON

Example

[Request](#) [Response](#)

This example creates a new email digest. See [Download Examples](#).

```
{
  "name": "My new email digest",
  "enabled": true,
  "executeActionsInBatch": true,
  "frequency": 2,
  "actions": [
    {
      "actionName": "My action 1",
      "actionType": "SMS"
    }
  ],
  "events": {
    "healthRuleEvents": {
      "healthRuleEventTypes": [
        "HEALTH_RULE_CONTINUES_CRITICAL",
        "HEALTH_RULE_UPGRADED"
      ],
      "healthRuleScope": {
        "healthRuleScopeType": "ALL_HEALTH_RULES"
      }
    }
  }
}
```

```

    }
  },
  "otherEvents": [
    "CLR_CRASH",
    "DEADLOCK"
  ],
  "anomalyEvents": [
    "ANOMALY_OPEN_WARNING",
    "ANOMALY_CLOSE_CRITICAL"
  ],
  "customEvents": [
    {
      "eventName": "string",
      "propertyMatchCriteria": "ANY",
      "keyValuePairArray": [
        {
          "key": "key1",
          "value": "value1"
        }
      ]
    }
  ]
},
"selectedEntities": {
  "selectedEntityType": "ANY_ENTITY"
}
}

```

Request [Response](#)

This example returns the created email digest object.

```

{
  "id": 0,
  "name": "My new email digest",
  "enabled": true,
  "executeActionsInBatch": true,
  "frequency": 2,
  "actions": [
    {
      "actionName": "My action 1",
      "actionType": "SMS"
    }
  ],
  "events": {
    "healthRuleEvents": {
      "healthRuleEventTypes": [

```

```

    "HEALTH_RULE_CONTINUES_CRITICAL",
    "HEALTH_RULE_UPGRADED"
  ],
  "healthRuleScope": {
    "healthRuleScopeType": "ALL_HEALTH_RULES"
  }
},

"anomalyEvents": [
  "ANOMALY_OPEN_WARNING",
  "ANOMALY_CLOSE_CRITICAL"
],
"customEvents": [
  {
    "eventName": "string",
    "propertyMatchCriteria": "ANY",
    "keyValuePairArray": [
      {
        "key": "key1",
        "value": "value1"
      }
    ]
  }
]
},
"selectedEntities": {
  "selectedEntityType": "ANY_ENTITY"
}
}

```

Retrieve a List of Email Digests for an Application

This API returns the email digest names, IDs, and enable flag details pertaining to the specified application. See [Property Details](#).

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests

Response Format

JSON

Example Response

This example returns a list of email digests pertaining to the specified application ID.

```
[
  {
    "id": 12,
    "name": "some email digest name",
    "enabled": true
  }
]
```

Retrieve Details of an Email Digest

Retrieves the details of an email digest with a specified ID. See [Property Details](#).

 Ensure that you provide a valid email digest ID.

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}

Response Format

JSON

Example Response

```
{
  "id": 0,
  "name": "My new email digest",
  "enabled": true,
  "executeActionsInBatch": true,
  "frequency": 2,
  "actions": [
    {
      "actionName": "My action 1",
      "actionType": "SMS"
    }
  ],
  "events": {
    "healthRuleEvents": {
      "healthRuleEventTypes": [
        "HEALTH_RULE_CONTINUES_CRITICAL",

```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

        "HEALTH_RULE_UPGRADED"
    ],
    "healthRuleScope": {
        "healthRuleScopeType": "ALL_HEALTH_RULES"
    }
},
"otherEvents": [
    "CLR_CRASH",
    "DEADLOCK"
],
"anomalyEvents": [
    "ANOMALY_OPEN_WARNING",
    "ANOMALY_CLOSE_CRITICAL"
],
"customEvents": [
    {
        "eventName": "string",
        "propertyMatchCriteria": "ANY",
        "keyValuePairArray": [
            {
                "key": "key1",
                "value": "value1"
            }
        ]
    }
]
},
"selectedEntities": {
    "selectedEntityType": "ANY_ENTITY"
}
}

```

Update an Email Digest

Updates an existing email digest with a specified JSON payload. See [Property Details](#).

This request requires a complete JSON payload as input. It is recommended that you retrieve the JSON payload using,

`GET email-digests/{email-digest-id}` and update the required fields. Then, send the modified payload as part of `PUT` request.

Resource URL

`PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-digests/{email-digest-id}`

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Request/Response Format

JSON

Example

[Request](#) [Response](#)

This example updates an action. See [Download Examples](#).

```
{
  "name": "My new email digest",
  "enabled": true,
  "executeActionsInBatch": true,
  "frequency": 2,
  "actions": [
    {

    }
  }

```

Delete an Email Digest

Deletes an email digest with the specified ID. See [Property Details](#).

i Ensure that you provide a valid email digest ID.

Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/
email-digests/{email-digest-id}
```

Update one or more properties of an Email Digest

Updates the properties of an existing email digest with a specified JSON payload. See [Property Details](#)

Resource URL

```
PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/email-
digests/{email-digest-id}/configuration
```

Request/Response Format

JSON

Example

Request Response

This example updates the properties of a specified email digest.

```
{
```

```

"enabled": true,
"emailDigestName": "test email digest",
"frequency": 2
}

```

Request [Response](#)

This example returns the properties updated for a specified email digest.

```

{
  "id": 0,
  "name": "My new email digest",
  "enabled": true,
  "executeActionsInBatch": true,
  "frequency": 2,
  "actions": [
    {
      "actionName": "My action 1",
      "actionType": "SMS"
    }

Property Details

Email Digest

Payload details of an email digest.

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a <code>readOnly</code> value.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
name*	string Minimum length: 1	Name of the email digest.
enabled	boolean Default value: true	Sets the email digest to enabled/disabled state.
frequency	integer minimum: 1 maximum: 168	The frequency in hours at which emails are sent as a response to an event.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values									
actions*	minItems: 1	<p>Action Describes the predefined, reusable, and automated response to an event to be taken triggered.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>actionName*</td> <td>string</td> <td>Name of the action defined</td> </tr> <tr> <td>actionType*</td> <td>string</td> <td> ActionTypeEnum Creates the following types: <ul style="list-style-type: none"> SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_ CREATE_UPDATE_JIRA </td> </tr> </tbody> </table>	Property Name	Type	Description	actionName*	string	Name of the action defined	actionType*	string	ActionTypeEnum Creates the following types: <ul style="list-style-type: none"> SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_ CREATE_UPDATE_JIRA
Property Name	Type	Description									
actionName*	string	Name of the action defined									
actionType*	string	ActionTypeEnum Creates the following types: <ul style="list-style-type: none"> SMS EMAIL CUSTOM_EMAIL THREAD_DUMP HTTP_REQUEST CUSTOM RUN_SCRIPT_ON_NODES DIAGNOSTIC_BUSINESS_ CREATE_UPDATE_JIRA 									

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. Action Suppression API

This page describes the Action Suppression API methods you can use to temporarily suspend the automatic trigger of actions and alerts by a policy in response to an event. This API is useful when performing maintenance activities or troubleshooting a component.

Note

Syntax validation of the JSON payload is done when creating action suppression.

Create a New Action Suppression

Creates a new action suppression with the specified JSON payload. See [Property Details](#).

Resource URL

POST <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions

Request/Response Format

JSON

Example

[Request](#) [Response](#)

This example creates an action suppression that affects specific health rules within an application. See [Download Examples](#).

```
{
  "id": 9,
  "name": "TestAS",
  "disableAgentReporting": false,
  "suppressionScheduleType": "ONE_TIME",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-08-19T11:43:00",
  "endTime": "2020-08-19T12:43:00",
  "recurringSchedule": null,
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

[Request](#) [Response](#)

```

{
  "id": 9,
  "name": "TestAS",
  "disableAgentReporting": false,
  "suppressionScheduleType": "ONE_TIME",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-08-19T11:43:00",
  "endTime": "2020-08-19T12:43:00",
  "recurringSchedule": null,
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}

```

Retrieve a List of Action Suppressions Configured for a Given Application

Returns all the action suppressions that are configured for a given application. The required fields are action suppression IDs and names. Details such as `timezone`, `startTime`, `endTime` and `recurringSchedule` of configured action suppressions are returned. See [Property Details](#).

Resource URL

GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions

Response Format

    "id": 11,
    "name": "TestAS1",
    "timezone": "Asia/Kolkata",
    "startTime": "2020-08-19T12:06:00",
    "endTime": "2020-08-19T13:06:00"
  },
  {
    "id": 12,
    "name": "TestAS2",

```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    "timezone": "Asia/Kolkata",
    "startTime": "2020-08-19T12:27:00",
    "endTime": "2020-08-19T13:27:00"
  }
  {
    "id": 13,
    "name": "TestAS3",
    "timezone": "Asia/Kolkata",
    "startTime": "2020-08-19T12:08:00",
    "endTime": "2020-08-19T13:08:00"
  }
]

```

Retrieve the Details of an Action Suppression

Returns JSON representation of action suppression for the given action suppression ID. See [Property Details](#).

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions/{action-suppression-id}
```

Response Format

JSON

Example Response

```

{
  "id": 9,
  "name": "TestAS",
  "disableAgentReporting": false,
  "suppressionScheduleType": "ONE_TIME",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-08-19T11:43:00",
  "endTime": "2020-08-19T12:43:00",
  "recurringSchedule": null,
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}

```

Update an Action Suppression

Updates an existing action suppression with a specified JSON payload. See [Property Details](#).

Resource URL

PUT <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-suppressions/{action-suppression-id}

Request/Response Format

JSON

Example

[Request](#) [Response](#)

```
{
  "id": 9,
  "name": "TestAS1",
  "disableAgentReporting": false,
  "suppressionScheduleType": "ONE_TIME",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-08-19T12:05:00",
  "endTime": "2020-08-19T13:05:00",
  "recurringSchedule": null,
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

[Request](#) [Response](#)

```
{
  "id": 9,
  "name": "TestAS",
  "disableAgentReporting": false,
  "suppressionScheduleType": "ONE_TIME",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-08-19T11:43:00",
  "endTime": "2020-08-19T12:43:00",
  "recurringSchedule": null,
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

Delete an Action Suppression

Deletes an action suppression with the specified ID. See [Property Details](#).

Resource URL

```
DELETE <controller_url>/controller/alerting/rest/v1/applications/<application_id>/
action-suppressions/{action-suppression-id}
```

Retrieve the Details of an Action Suppression by Name

Returns JSON representation of action suppression for the given action suppression name. See [Property Details](#).

Resource URL

```
GET <controller_url>/controller/alerting/rest/v1/applications/<application_id>/action-
suppressions/action-suppression-by-name/?name=<ActionSuppressionName>
```

Replace `<ActionSuppressionName>` with a name you specified for the action suppression. For example, `ACTION_SUP_15`.

Response Format

JSON

Example Response

```
{
```

```

    "id": 9,
    "name": "TestAS1",
    "timezone": "Asia/Kolkata",
    "startTime": "2020-08-19T12:05:00",
    "endTime": "2020-08-19T13:05:00",
    "recurringSchedule": null
  }

```

Response Codes

Code	Description
200	Fetches successfully
201	Created successfully
204	Deleted successfully
400	Bad request
401	Unauthorized
403	Forbidden
404	Resource not found
409	Already exists

Property Details

Action Suppression

Payload details for action suppression.

Property Name	Type	Description and Valid Values
id	integer	This is auto-generated by the system and returned in the response. It is a <code>readOnly</code> value.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
<code>name*</code>	string minLength: 1 maxLength: 100	The name of action suppression.
<code>disableAgentReporting</code>	boolean default: <code>false</code>	If enabled, the agents defined in the scope do not report any metric data during the specified time frame.
<p>i You cannot define a recurring action suppression if you set <code>disableAgentReporting</code> to <code>true</code>.</p>		
<code>suppressionScheduleType</code>	string default: <code>ONE_TIME</code>	The available scheduling options for action suppression. Enums <code>ONE_TIME</code> <code>RECURRING</code>
<code>timezone</code>	string	The timezone ID. The default time zone is the controller timezone.
<code>startTime</code>	string format: yyyy-MM-ddTHH:mm:ss	The time at which the action suppression is initiated. Specify <code>startTime</code> only if <code>suppressionScheduleType</code> is set to <code>ONE_TIME</code> . If you do not specify the <code>startTime</code> , action suppression starts from the current time. The expected format is yyyy-MM-ddTHH:mm:ss conforming to rfc3339.
<code>endTime</code>	string format: yyyy-MM-ddTHH:mm:ss	The time at which the ongoing action suppression ends. Specify <code>startTime</code> only if <code>suppressionScheduleType</code> is set to <code>ONE_TIME</code> . If not specified, action suppression ends at 60 minutes from the current time. The expected format is yyyy-MM-ddTHH:mm:ss conforming to rfc3339.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values						
recurringSchedule	string	<p>The recurring schedule details to initiate an action suppression.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>scheduleFrequency*</td> <td>string</td> <td> <p>The frequency of invoking action suppression.</p> <p>Enums</p> <p>DAILY</p> <p>WEEKLY</p> <p>MONTHLY_SPECIFIC_DATE</p> <p>MONTHLY_SPECIFIC_DAY</p> </td> </tr> </tbody> </table>	Property Name	Type	Description	scheduleFrequency*	string	<p>The frequency of invoking action suppression.</p> <p>Enums</p> <p>DAILY</p> <p>WEEKLY</p> <p>MONTHLY_SPECIFIC_DATE</p> <p>MONTHLY_SPECIFIC_DAY</p>
Property Name	Type	Description						
scheduleFrequency*	string	<p>The frequency of invoking action suppression.</p> <p>Enums</p> <p>DAILY</p> <p>WEEKLY</p> <p>MONTHLY_SPECIFIC_DATE</p> <p>MONTHLY_SPECIFIC_DAY</p>						
affects*		<p>Describes entities affected by action suppression. For example, applications, business transactions, servers, or databases.</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>affectedInfoType*</td> <td>string</td> <td> <p>The affected entity type.</p> <p>Enums</p> <p>APPLICATION</p> <p>BUSINESS_TRANSACTIONS</p> <p>TIERS_NODES</p> <p>SERVERS</p> <p>DATABASES</p> </td> </tr> </tbody> </table>	Property Name	Type	Description	affectedInfoType*	string	<p>The affected entity type.</p> <p>Enums</p> <p>APPLICATION</p> <p>BUSINESS_TRANSACTIONS</p> <p>TIERS_NODES</p> <p>SERVERS</p> <p>DATABASES</p>
Property Name	Type	Description						
affectedInfoType*	string	<p>The affected entity type.</p> <p>Enums</p> <p>APPLICATION</p> <p>BUSINESS_TRANSACTIONS</p> <p>TIERS_NODES</p> <p>SERVERS</p> <p>DATABASES</p>						

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values						
healthRuleScope*		The scope of the health rules applicable to action suppression.						
		<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>healthRuleScopeType*</td> <td>string</td> <td>The health rule types affected by action suppression. Enums SPECIFIC_HEALTH_RULES</td> </tr> </tbody> </table>	Property Name	Type	Description	healthRuleScopeType*	string	The health rule types affected by action suppression. Enums SPECIFIC_HEALTH_RULES
Property Name	Type	Description						
healthRuleScopeType*	string	The health rule types affected by action suppression. Enums SPECIFIC_HEALTH_RULES						

Action Suppression Schedule Type

Use this property to schedule a one-time or recurring action suppression.

Property Name	Type	Description
ActionSuppressionScheduleType	string	Enums ONE_TIME RECURRING

Example for one-time action suppression

```
{
  "name": "Action Suppression With One Time Schedule",
  "disableAgentReporting": false,
  "suppressionScheduleType": "ONE_TIME",
  "timezone": "Asia/Kolkata",
  "startTime": "2020-06-18T13:33:37",
  "endTime": "2021-06-30T16:48:37",
  "recurringSchedule": null,
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

Recurring Schedule Frequency Details

Use this property to define the frequency of invoking action suppression on a recurring basis.

Property Name	Type	Description
scheduleFrequency *	string	Describes how often action suppression is invoked. Enums DAILY WEEKLY MONTHLY_SPECIFIC_DATE MONTHLY_SPECIFIC_DAY

Example for recurring action suppression scheduled on a daily basis

```
{
  "name": "Action Suppression With Daily Schedule",
  "disableAgentReporting": false,
  "suppressionScheduleType": "RECURRING",
  "timezone": "Asia/Kolkata",
  "startTime": null,
  "endTime": null,
  "recurringSchedule": {
    "scheduleFrequency": "DAILY",
    "startTime": "01:00",
    "endTime": "01:22"
  },
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

Daily Schedule - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a daily basis.

Property Name	Type	Description
scheduleFrequency *	string	Action suppression is invoked daily. Enum DAILY

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description
<code>startTime*</code>	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which the action suppression is initiated. The time in 24 hour format.
<code>endTime*</code>	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which the ongoing action suppression ends. The time in 24 hour format.

Example

```
{
  "name": "Action Suppression With Daily Schedule",
  "disableAgentReporting": false,
  "suppressionScheduleType": "RECURRING",
  "timezone": "Asia/Kolkata",
  "startTime": null,
  "endTime": null,
  "recurringSchedule": {
    "scheduleFrequency": "DAILY",
    "startTime": "01:00",
    "endTime": "01:22"
  },
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

Weekly Schedule - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a weekly basis.

Property Name	Type	Description
<code>scheduleFrequency*</code>	string	Action suppression is invoked on a specific day of the week. Enum <code>WEEKLY</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description						
days *	string minItems: 1 maxItems: 7	The day(s) of the week to suppress actions. <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DayOfWeek</td> <td>string</td> <td>Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY</td> </tr> </tbody> </table>	Property Name	Type	Description	DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY
Property Name	Type	Description						
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY						
startTime*	Time string pattern: ^([01]\d 2[0-3]): ([0-5]\d)\$	The time at which the action suppression is initiated. The time in 24 hour format.						
endTime*	Time string pattern: ^([01]\d 2[0-3]): ([0-5]\d)\$	The time at which the ongoing action suppression ends. The time in 24 hour format.						

Property Name	Type	Description
<p>Example</p> <pre> { "name": "Action Suppression With Weekly Schedule", "disableAgentReporting": false, "suppressionScheduleType": "RECURRING", "timezone": "Asia/Kolkata", "startTime": null, "endTime": null, "recurringSchedule": { "scheduleFrequency": "WEEKLY", "startTime": "06:00", "endTime": "18:00", "days": ["SUNDAY", "MONDAY"] }, "affects": { "affectedInfoType": "APPLICATION" }, "healthRuleScope": null }</pre>		

Monthly Schedule, Specific Date - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a monthly basis, on a specific date.

Property Name	Type	Description
<code>scheduleFrequency</code> *	string Enum <code>MONTHLY_SPECIFIC_DATE</code>	Action suppression is invoked on a specific date every month.
<code>startDate</code> *	string pattern: <code>^(0[1-9] [12][0-9] 3[01])\$ ^Last Day\$</code>	The start date of the month to suppress actions.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description
startTime*	Time string pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>	The time at which action suppression is initiated. The time in 24 hour format.
endDate *	string pattern: <code>^(0[1-9] 12)[0-9] 3[01])\$ ^Last Day\$</code>	The end date of the month to suppress actions.
endTime*	Time string pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>	The time at which the ongoing action suppression ends. The time in 24 hour format.

Example

```
{
  "name": "Action Suppression With Monthly Specific Date Schedule",
  "disableAgentReporting": false,
  "suppressionScheduleType": "RECURRING",
  "timezone": "Asia/Kolkata",
  "startTime": null,
  "endTime": null,
  "recurringSchedule": {
    "scheduleFrequency": "MONTHLY_SPECIFIC_DATE",
    "startDate": "01",
    "startTime": "06:00",
    "endDate": "Last Day",
    "endTime": "18:00"
  },
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

Monthly Schedule, Specific Day - Configuration Details

Use the following properties to configure the details of an action suppression that is scheduled on a monthly basis, on a specific date.

Property Name	Type	Description						
scheduleFrequency*	string	Action suppression is invoked on a specific day of the month. Enum MONTHLY_SPECIFIC_DAY						
startTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which action suppression is initiated. The time in 24 hour format.						
endTime*	Time string pattern: ^([01]\d 2[0-3]):([0-5]\d)\$	The time at which the ongoing action suppression ends. The time in 24 hour format.						
days*	string	The day of the month to suppress actions. <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>DayOfWeek</td> <td>string</td> <td>Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY</td> </tr> </tbody> </table>	Property Name	Type	Description	DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY
Property Name	Type	Description						
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY						

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description
occurrence *	string	Enums FIRST SECOND THIRD FOURTH LAST

Example

```
{
  "name": "Action Suppression With Monthly Specific Day Schedule",
  "disableAgentReporting": false,
  "suppressionScheduleType": "RECURRING",
  "timezone": "Asia/Kolkata",
  "startTime": null,
  "endTime": null,
  "recurringSchedule": {
    "scheduleFrequency": "MONTHLY_SPECIFIC_DAY",
    "startTime": "06:00",
    "endTime": "18:00",
    "day": "SUNDAY",
    "occurrence": "FIRST"
  },
  "affects": {
    "affectedInfoType": "APPLICATION"
  },
  "healthRuleScope": null
}
```

Schedule Frequency Details

Use this property to define the frequency of invoking an action suppression.

Property Name	Type	Description
scheduleFrequency *	string	Enums DAILY WEEKLY MONTHLY_SPECIFIC_DATE MONTHLY_SPECIFIC_DAY

Example

```
{
  "recurringSchedule":{
    "scheduleFrequency":"WEEKLY",
    "startTime":"06:00",
    "endTime":"18:00",
    "days":[
      "SUNDAY",
      "MONDAY"
    ]
  }
}
```

Occurrence Details

The occurrence of the day of the month to suppress actions.

Property Name	Type	Description
occurrence	string	Enums FIRST SECOND THIRD FOURTH LAST

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description
Example		
<pre> { "recurringSchedule":{ "scheduleFrequency":"MONTHLY_SPECIFIC_DAY", "startTime":"06:00", "endTime":"18:00", "day":"SUNDAY", "occurrence":"FIRST" } } </pre>		

Monthly Action Suppression - Day

The day of the month to suppress actions.

Property Name	Type	Description
DayOfWeek	string	Enums SUNDAY MONDAY TUESDAY WEDNESDAY THURSDAY FRIDAY SATURDAY

Property Name	Type	Description
Example		
<pre>{ "recurringSchedule":{ "scheduleFrequency":"MONTHLY_SPECIFIC_DAY", "startTime":"06:00", "endTime":"18:00", "day":"SUNDAY", "occurrence":"FIRST" } }</pre>		

Action Suppression Time Details

Use this property to define the time details to suppress an action.

Property Name	Type	Description
Time	string pattern: <code>^([01]\d 2[0-3]):([0-5]\d)\$</code>	The time in 24 hour format.
Example		
<pre>{ "recurringSchedule": { "scheduleFrequency": "MONTHLY_SPECIFIC_DATE", "startDate": "01", "startTime": "06:00", "endDate": "Last Day", "endTime": "18:00" } }</pre>		

Timezone

Property Name	Type	Description
Timezone	string	Timezone Id. The default time zone is the controller timezone.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description
Example		
<pre> { "name": "Action Suppression With One Time Schedule", "disableAgentReporting": false, "suppressionScheduleType": "ONE_TIME", "timezone": "Asia/Kolkata", "startTime": "2020-06-18T13:33:37", "endTime": "2021-06-30T16:48:37", "recurringSchedule": null, "affects": { "affectedInfoType": "APPLICATION" }, "healthRuleScope": null } </pre>		

Entities Affected by Action Suppression

Information pertaining to entities affected by action suppression.

Property Name	Type	Description and Valid Values
affectedInfoType *	string	Enums APPLICATION BUSINESS_TRANSACTIONS TIERS_NODES SERVERS DATABASES

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
Example		
<pre> { "affectedInfoType": "TIERS_NODES", "affectedEntities": { "tierNodeType": "NODE", "nodeType": "ALL_NODES", "affectedNodes": { "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS", "specificTiers": ["Tier1"] } } } </pre>		

Application-level Entities Affected by Action Suppression

Use to suppress actions for entities at the application-level.

Property Name	Type	Description and Valid Values
affectedInfoType*	string	Enum APPLICATION
Example		
<pre> { "affectedInfoType": "APPLICATION" } </pre>		

Business Transactions Affected by Action Suppression

Use this to suppress actions for entities at the business transaction (BT) level.

Property Name	Type	Description and Valid Values						
affectedInfoType*	string	Enum BUSINESS_TRANSACTIONS						
affectedBusinessTransactions*		The scope of the business transactions affected by action suppression. <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>businessTransactionScope*</td> <td>string</td> <td>Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING</td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	businessTransactionScope*	string	Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING
Property Name	Type	Description and Valid Values						
businessTransactionScope*	string	Enums ALL_BUSINESS_TRANSACTIONS SPECIFIC_BUSINESS_TRANSACTIONS BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS BUSINESS_TRANSACTIONS_MATCHING						

Example

```
{
  "affectedInfoType":"BUSINESS_TRANSACTIONS",
  "affectedBusinessTransactions":{
    "businessTransactionScope":"BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS",
    "specificTiers":["DefaultTier1"]
  }
}
```

Scope of Business Transactions Affected

Use this to suppress actions for entities at the BT level for the selected BT types.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
<code>businessTransactionScope*</code>	string	Enums <code>ALL_BUSINESS_TRANSACTIONS</code> <code>SPECIFIC_BUSINESS_TRANSACTIONS</code> <code>BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS</code> <code>BUSINESS_TRANSACTIONS_MATCHING_PATTERN</code>

All Types of Business Transactions

Use this to suppress actions for entities at the BT level for all BTs.

Property Name	Type	Description and Valid Values
<code>businessTransactionScope*</code>	string	Enum <code>ALL_BUSINESS_TRANSACTIONS</code>

Example

```
{
  "affectedInfoType": "BUSINESS_TRANSACTIONS",
  "affectedBusinessTransactions": {
    "businessTransactionScope": "ALL_BUSINESS_TRANSACTIONS"
  }
}
```

Specific Business Transactions

Use this to suppress actions for entities at the BT level for the specific BTs only.

Property Name	Type	Description and Valid Values
<code>businessTransactionScope*</code>	string	Enum <code>SPECIFIC_BUSINESS_TRANSACTIONS</code>
<code>businessTransactions*</code>	array of strings minItems: 1	Specific business transactions affected by action suppression. For example: <code>[CheckoutBt, LoginBt]</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
Example		
<pre> { "affectedInfoType": "BUSINESS_TRANSACTIONS", "affectedBusinessTransactions": { "businessTransactionScope": "SPECIFIC_BUSINESS_TRANSACTIONS", "businessTransactions": ["/BT/", "/BT/rest"] } } </pre>		

Business Transactions Associated with Specific Tiers

Use this to suppress actions for entities at the BT level for BTs within specific tiers only.

Property Name	Type	Description and Valid Values
businessTransactionScope*	string	Enum BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS
specificTiers*	array of strings minItems: 1	Business transactions associated with specific tiers affected by action suppression. For example: [CheckoutTier, LoginTier]
Example		
<pre> { "affectedInfoType": "BUSINESS_TRANSACTIONS", "affectedBusinessTransactions": { "businessTransactionScope": "BUSINESS_TRANSACTIONS_IN_SPECIFIC_TIERS", "specificTiers": ["DefaultTier1"] } } </pre>		

Business Transactions Matching a Pattern

Use this to suppress actions for entities at the BT level for BTs with properties that match a given pattern.

Property Name	Type	Description and Valid Values												
<code>businessTransactionScope*</code>	string	Enums <code>BUSINESS_TRANSACTIONS_MATCHING_PATTERN</code>												
<code>patternMatcher*</code>		EntityMatchingPattern <table border="1" data-bbox="873 499 1495 1331"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td><code>matchTo*</code></td> <td>string</td> <td>Enums <code>STARTS_WITH</code> <code>ENDS_WITH</code> <code>CONTAINS</code> <code>EQUALS</code> <code>MATCH_REG_EX</code></td> </tr> <tr> <td><code>matchValue*</code></td> <td>string minLength: 1</td> <td>The pattern match value.</td> </tr> <tr> <td><code>shouldNot</code></td> <td>boolean default: <code>false</code></td> <td>Select this to reverse the pattern match condition.</td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	<code>matchTo*</code>	string	Enums <code>STARTS_WITH</code> <code>ENDS_WITH</code> <code>CONTAINS</code> <code>EQUALS</code> <code>MATCH_REG_EX</code>	<code>matchValue*</code>	string minLength: 1	The pattern match value.	<code>shouldNot</code>	boolean default: <code>false</code>	Select this to reverse the pattern match condition.
Property Name	Type	Description and Valid Values												
<code>matchTo*</code>	string	Enums <code>STARTS_WITH</code> <code>ENDS_WITH</code> <code>CONTAINS</code> <code>EQUALS</code> <code>MATCH_REG_EX</code>												
<code>matchValue*</code>	string minLength: 1	The pattern match value.												
<code>shouldNot</code>	boolean default: <code>false</code>	Select this to reverse the pattern match condition.												

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
Example		
<pre> { "affectedInfoType": "BUSINESS_TRANSACTIONS", "affectedBusinessTransactions": { "businessTransactionScope": "BUSINESS_TRANSACTIONS_MATCHING_PATTERN", "patternMatcher": { "matchTo": "STARTS_WITH", "matchValue": "E", "shouldNot": false } } } </pre>		

Tiers/Nodes Entities Affected

Use this to suppress actions for entities at the Tier/Node level.

Property Name	Type	Description and Valid Values						
affectedInfoType*	string	Enum TIERS_NODES						
affectedEntities*		TierNodeEntities <table border="1" data-bbox="621 1209 1495 1518"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>tierNodeType*</td> <td>string</td> <td>Enums TIER NODE</td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	tierNodeType*	string	Enums TIER NODE
Property Name	Type	Description and Valid Values						
tierNodeType*	string	Enums TIER NODE						

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
Example		
<pre> { "affectedInfoType": "TIERS_NODES", "affectedEntities": { "tierNodeType": "NODE", "nodeType": "ALL_NODES", "affectedNodes": { "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS", "specificTiers": ["Tier1"] } } } </pre>		

Tier or Node Entities Affected

Use this to suppress actions for entities at the tier level or node level.

Property Name	Type	Description and Valid Values
tierNodeType*	string	Enums TIER NODE

Tier-level Entities Affected

Property Name	Type	Description and Valid Values
tierNodeType*	string	Enum TIER

Property Name	Type	Description and Valid Values						
affectedTiers*		AffectedTiers <table border="1" data-bbox="873 384 1495 772"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>affectedTierScope*</td> <td>string</td> <td> Enums ALL_TIERS SPECIFIC_TIERS </td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	affectedTierScope*	string	Enums ALL_TIERS SPECIFIC_TIERS
Property Name	Type	Description and Valid Values						
affectedTierScope*	string	Enums ALL_TIERS SPECIFIC_TIERS						

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "TIER",
    "affectedTiers": {
      "affectedTierScope": "SPECIFIC_TIERS",
      "tiers": ["ECommerce-Services", "Inventory-Services"]
    }
  }
}

```

Node-level Entities Affected

Property Name	Type	Description and Valid Values
tierNodeType*	string	Enum NODE

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values						
nodeType*	string	Enums ALL_NODES JAVA_NODES DOT_NET_NODES PHP_NODES						
affectedNodes*		AffectedNodes <table border="1" data-bbox="618 686 1495 1262"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description and Valid Values</th> </tr> </thead> <tbody> <tr> <td>affectedNodeScope*</td> <td>string</td> <td>Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER</td> </tr> </tbody> </table>	Property Name	Type	Description and Valid Values	affectedNodeScope*	string	Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER
Property Name	Type	Description and Valid Values						
affectedNodeScope*	string	Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER						

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "NODE",
    "nodeType": "ALL_NODES",
    "affectedNodes": {
      "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS",
      "specificTiers": ["Tier1"]
    }
  }
}

```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Affected Tier Scope

Property Name	Type	Description and Valid Values
<code>affectedTierScope*</code>	string	Enums <code>ALL_TIERS</code> <code>SPECIFIC_TIERS</code>

All Tiers

Use this to suppress actions for entities at the tier level for all tiers.

Property Name	Type	Description and Valid Values
<code>affectedTierScope*</code>	string	Enum <code>ALL_TIERS</code>

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "TIER",
    "affectedTiers": {
      "affectedTierScope": "ALL_TIERS"
    }
  }
}

```

Specific Tiers

Use this to suppress actions for entities at the tier level for specific tiers only.

Property Name	Type	Description and Valid Values
<code>affectedTierScope*</code>	string	Enum <code>SPECIFIC_TIERS</code>
<code>tiers*</code>	array of strings minItems: 1	

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
Example		
<pre>{ "affectedInfoType": "TIERS_NODES", "affectedEntities": { "tierNodeType": "TIER", "affectedTiers": { "affectedTierScope": "SPECIFIC_TIERS", "tiers": ["ECommerce-Services", "Inventory-Services"] } } }</pre>		

Affected Nodes

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enums ALL_NODES SPECIFIC_NODES NODES_OF_SPECIFIC_TIERS NODES_MATCHING_PATTERN NODE_PROPERTY_VARIABLE_MATCHER
Example		
<pre>{ "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS", "specificTiers": ["Tier1"] }</pre>		

All Nodes

Use this to suppress actions for entities at the node level for all nodes.

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enum ALL_NODES

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "NODE",
    "nodeType": "ALL_NODES",
    "affectedNodes": {
      "affectedNodeScope": "ALL_NODES"
    }
  }
}

```

Specific Nodes

Use this to suppress actions for entities at the node level for specific nodes only.

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enum SPECIFIC_NODES
nodes*	array of strings minItems: 1	A list of nodes considered as affected entities for action suppression. For example: [Node1, Node2]

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
Example		
<pre> { "affectedInfoType": "TIERS_NODES", "affectedEntities": { "tierNodeType": "NODE", "nodeType": "ALL_NODES", "affectedNodes": { "affectedNodeScope": "SPECIFIC_NODES", "nodes": ["Node1", "Node2"] } } } </pre>		

Nodes within Specific Tiers

Use this to suppress actions for entities at the node level for nodes within specific tiers only.

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enum NODES_OF_SPECIFIC_TIERS
specificTiers*	array of strings minItems: 1	

Example		
<pre> { "affectedInfoType": "TIERS_NODES", "affectedEntities": { "tierNodeType": "NODE", "nodeType": "ALL_NODES", "affectedNodes": { "affectedNodeScope": "NODES_OF_SPECIFIC_TIERS", "specificTiers": ["ECommerce-Services", "Inventory-Services"] } } } </pre>		

Nodes that Match a Pattern

Use this to suppress actions for entities at the node level for nodes with properties that match a pattern.

Property Name	Type	Description and Valid Values												
affectedNodeScope*	string	Enum NODES_MATCHING_PATTERN												
patternMatcher*		EntityMatchingPattern <table border="1" data-bbox="857 606 1495 1438"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>matchTo*</td> <td>string</td> <td>Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX</td> </tr> <tr> <td>matchValue*</td> <td>string minLength: 1</td> <td>The pattern match value.</td> </tr> <tr> <td>shouldNot</td> <td>boolean default: false</td> <td>Select this if you want to reverse the pattern match condition.</td> </tr> </tbody> </table>	Property Name	Type	Description	matchTo*	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX	matchValue*	string minLength: 1	The pattern match value.	shouldNot	boolean default: false	Select this if you want to reverse the pattern match condition.
Property Name	Type	Description												
matchTo*	string	Enums STARTS_WITH ENDS_WITH CONTAINS EQUALS MATCH_REG_EX												
matchValue*	string minLength: 1	The pattern match value.												
shouldNot	boolean default: false	Select this if you want to reverse the pattern match condition.												

Property Name	Type	Description and Valid Values
Example		
<pre> { "affectedInfoType": "TIERS_NODES", "affectedEntities": { "tierNodeType": "NODE", "nodeType": "ALL_NODES", "affectedNodes": { "affectedNodeScope": "NODES_MATCHING_PATTERN", "patternMatcher": { "matchTo": "STARTS_WITH", "matchValue": "A", "shouldNot": false } } } } </pre>		

Node Property Variable Matcher

Use this to suppress actions for entities at the node level for nodes that match specified environment variables.

Property Name	Type	Description and Valid Values
affectedNodeScope*	string	Enum NODE_PROPERTY_VARIABLE_MATCHER

Property Name	Type	Description and Valid Values														
propVarPairs*		<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>propertyType*</td> <td>string</td> <td>Enums META ENV JVM</td> </tr> <tr> <td>name*</td> <td>string minLength: 1</td> <td></td> </tr> <tr> <td>value*</td> <td>string minLength: 1</td> <td></td> </tr> </tbody> </table>	Property Name	Type	Description	propertyType*	string	Enums META ENV JVM	name*	string minLength: 1		value*	string minLength: 1			
Property Name	Type	Description														
propertyType*	string	Enums META ENV JVM														
name*	string minLength: 1															
value*	string minLength: 1															

Example

```

{
  "affectedInfoType": "TIERS_NODES",
  "affectedEntities": {
    "tierNodeType": "NODE",
    "nodeType": "ALL_NODES",
    "affectedNodes": {
      "affectedNodeScope": "NODE_PROPERTY_VARIABLE_MATCHER",
      "propVarPairs": [{
        "propertyType": "ENV",
        "name": "CLASSPATH",
        "value": "C:\\Users\\Java\\Classes"
      }]
    }
  }
}

```

Servers Affected

Use this to suppress actions for entities at the server level.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values						
affectedInfoType*	string	Enum SERVERS						
affectedServers*		ApplicationAffectedServers <table border="1" data-bbox="621 506 1495 751"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>serversScope*</td> <td>string</td> <td>Enum SPECIFIC_SERVERS_IN_APPLICATION</td> </tr> </tbody> </table>	Property Name	Type	Description	serversScope*	string	Enum SPECIFIC_SERVERS_IN_APPLICATION
Property Name	Type	Description						
serversScope*	string	Enum SPECIFIC_SERVERS_IN_APPLICATION						

Example

```

{
  "affectedInfoType": "SERVERS",
  "affectedServers": {
    "serversScope": "SPECIFIC_SERVERS_IN_APPLICATION",
    "specificServers": ["DropWizardTestApplicationDropWizardDefaultNode1"]
  }
}

```

Specific Servers within an Application

Use this property to suppress actions for entities at the server level for specific servers within an application.

Property Name	Type	Description
serversScope*	string	Enum SPECIFIC_SERVERS_IN_APPLICATION
specificServers*	array of strings minItems: 1 MinLength: 1	A list of servers considered as affected entities for action suppression. For example: [server1, server2]

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description
Example		
<pre> { "affectedInfoType":"SERVERS", "affectedServers":{ "serversScope":"SPECIFIC_SERVERS_IN_APPLICATION", "specificServers":["DropWizardTestApplicationDropWizardDefaultNode1"] } } </pre>		

Databases Affected

Use this property to suppress actions for entities at the database level.

Property Name	Type	Description and Valid Values
affectedInfoType*	string	Enum DATABASES

Property Name	Type	Description and Valid Values												
affectedDatabases*		<p>AffectedDatabases</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>databaseScope*</td> <td>string</td> <td> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td> <p>Enums</p> <p>ALL_DATABASES</p> <p>SPECIFIC_DATABASES</p> </td> </tr> </tbody> </table> </td> </tr> </tbody> </table>	Property Name	Type	Description	databaseScope*	string	<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td> <p>Enums</p> <p>ALL_DATABASES</p> <p>SPECIFIC_DATABASES</p> </td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	<p>Enums</p> <p>ALL_DATABASES</p> <p>SPECIFIC_DATABASES</p>
Property Name	Type	Description												
databaseScope*	string	<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td> <p>Enums</p> <p>ALL_DATABASES</p> <p>SPECIFIC_DATABASES</p> </td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	<p>Enums</p> <p>ALL_DATABASES</p> <p>SPECIFIC_DATABASES</p>						
Property Name	Type	Description												
AffectedDatabaseType	string	<p>Enums</p> <p>ALL_DATABASES</p> <p>SPECIFIC_DATABASES</p>												

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description and Valid Values
Example		
<pre>{ "affects":{ "affectedInfoType":"DATABASES", "affectedDatabases":{ "databaseScope":"ALL_DATABASES" } } }</pre>		

Scope of Affected Databases

Use this property to define the scope of action suppression at the database level.

Property Name	Type	Description										
databaseScope*	string	<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th colspan="2">Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td colspan="2"> Enums ALL_DATABASES SPECIFIC_DATABASES </td> </tr> </tbody> </table>			Property Name	Type	Description		AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES	
Property Name	Type	Description										
AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES										

Scope of Affected Databases—All Databases

Use this property to suppress actions for entities of all the databases.

Property Name	Type	Description						
databaseScope*	string	<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums ALL_DATABASES</td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	Enums ALL_DATABASES
Property Name	Type	Description						
AffectedDatabaseType	string	Enums ALL_DATABASES						

Scope of Affected Databases—Specific Databases

Use this property to suppress actions for entities of specific databases.

Property Name	Type	Description						
databaseScope*	string	<table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>AffectedDatabaseType</td> <td>string</td> <td>Enums SPECIFIC_DATABASES</td> </tr> </tbody> </table>	Property Name	Type	Description	AffectedDatabaseType	string	Enums SPECIFIC_DATABASES
Property Name	Type	Description						
AffectedDatabaseType	string	Enums SPECIFIC_DATABASES						
databases *	array of strings minItems: 1	<p>DbServer</p> <table border="1"> <thead> <tr> <th>Property Name</th> <th>Type</th> </tr> </thead> <tbody> <tr> <td>serverName*</td> <td>string minLength: 1</td> </tr> <tr> <td>collectorConfigName*</td> <td>string minLength: 1</td> </tr> </tbody> </table>	Property Name	Type	serverName*	string minLength: 1	collectorConfigName*	string minLength: 1
Property Name	Type							
serverName*	string minLength: 1							
collectorConfigName*	string minLength: 1							

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description
<p>Example</p> <pre> { "affects":{ "affectedInfoType":"DATABASES", "affectedDatabases":{ "databaseScope":"SPECIFIC_DATABASES", "databases":[{ "serverName":"MongoNewKC", "collectorConfigName":"MongoNewKC" }, { "serverName":"Collector41", "collectorConfigName":"Collector41" }] } } } </pre>		

Database Server Details

Use this property to define database server details.

Property Name	Type
serverName *	string minLength: 1
collectorConfigName *	string minLength: 1

Affected Database Types

Use this property to define the scope of affected databases.

Property Name	Type	Description
AffectedDatabaseType	string	Enums ALL_DATABASES SPECIFIC_DATABASES

Health Rule Scope

Use this to suppress actions triggered as a response to health rule violation events.

Property Name	Type	Description
healthRuleScopeType*	string	HealthRuleScopeType Enum SPECIFIC_HEALTH_RULES

Example

```
{
  "healthRuleScopeType": "SPECIFIC_HEALTH_RULES",
  "healthRules": ["CPU utilization is too high", "JVM Garbage Collection Time is too high"]
}
```

Health Rule Scope Type

Property Name	Type	Description
healthRuleScope*	string	Enum SPECIFIC_HEALTH_RULES

Specific Health Rules

Property Name	Type	Description
healthRuleScopeType*	string	HealthRuleScopeType Enum SPECIFIC_HEALTH_RULES

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Property Name	Type	Description
healthRules*	array of strings minItems: 1	
Example <pre> { "healthRuleScopeType": "SPECIFIC_HEALTH_RULES", "healthRules": ["CPU utilization is too high", "JVM Garbage Collection Time is too high"] } </pre>		

Action Suppression Summary

Property Name	Type
id*	integer
name*	string minLength: 1

Error Response

Property Name	Type
statusCode	integer
message	string

*This property is required.

Download SWAGGER YAML file

Download the Swagger YAML spec [action_suppression_openapi.yml](#).

Events and Action Suppression API

This page describes the Events and Suppression API methods you can use to create, manage, and monitor events and action suppression.

Retrieve All Health Rule Violations in a Business Application

Returns all [health rule](#) violations that have occurred in an application within a specified time frame.

URI

```
/controller/rest/applications/application_id/problems/healthrule-violations
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>application_id</code>	URI	Provide either the application name or application id.	Yes

Parameter Name	Parameter Type	Value	Mandatory
time-range-type	Query	<p>Possible values are:</p> <p><code>BEFORE_NOW</code></p> <p>To use the "<code>BEFORE_NOW</code>" option, you must also specify the "<code>duration-in-mins</code>" parameter.</p> <p><code>BEFORE_TIME</code></p> <p>To use the "<code>BEFORE_TIME</code>" option, you must also specify the "<code>duration-in-mins</code>" and "<code>end-time</code>" parameters.</p> <p><code>AFTER_TIME</code></p> <p>To use the "<code>AFTER_TIME</code>" option, you must also specify the "<code>duration-in-mins</code>" and "<code>start-time</code>" parameters.</p> <p><code>BETWEEN_TIMES</code></p> <p>To use this option, you must also specify the "<code>start-time</code>" and "<code>end-time</code>" parameters. The "<code>BETWEEN_TIMES</code>" range includes the start-time and excludes the end-time.</p>	Yes
duration-in-mins	Query	Duration (in minutes) to return the metric data.	If time-range-type is <code>BEFORE_NOW</code> , <code>BEFORE_TIME</code> , or <code>AFTER_TIME</code>
start-time	Query	Start time (in milliseconds) from which the metric data is returned.	If time-range-type is <code>AFTER_TIME</code> or <code>BETWEEN_TIMES</code>

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
end-time	Query	End time (in milliseconds) until which the metric data is returned.	If time-range-type is BEFORE_TIME or BETWEEN_TIMES
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON .	No

Retrieve Event Data

You can capture data for the event types listed in the `eventtypes` parameter.

URI

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

 /controller/rest/applications/application_id/events

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	Provides either the application name or application id.	Yes
summary	Query	Provides the summary for the event.	Yes
comment	Query	Provides the comments (if any) for the event.	No
eventtype	Query	APPLICATION_DEVELOPMENT	Yes

Parameter Name	Parameter Type	Value	Mandatory
time-range-type	Query	<p>Possible values are:</p> <p>BEFORE_NOW</p> <p>To use the "BEFORE_NOW" option, you must also specify the "duration-in-mins" parameter.</p> <p>BEFORE_TIME</p> <p>To use the "BEFORE_TIME" option, you must also specify the "duration-in-mins" and "end-time" parameters.</p> <p>AFTER_TIME</p> <p>To use the "AFTER_TIME" option, you must also specify the "duration-in-mins" and "start-time" parameters.</p> <p>BETWEEN_TIMES</p> <p>To use this option, you must also specify the "start-time" and "end-time" parameters. The "BETWEEN_TIMES" range includes the start-time and excludes the end-time.</p>	Yes
duration-in-mins	Query	Specify the duration (in minutes) to return the metric data.	If time-range-type is BEFORE_NOW , BEFORE_TIME , or AFTER_TIME
start-time	Query	Specify the start time (in milliseconds) from which the metric data is returned.	If time-range-type is AFTER_TIME or BETWEEN_TIMES

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
end-time	Query	Specify the end time (in milliseconds) until which the metric data is returned.	If time-range-type is BEFORE_TIME or BETWEEN_TIMES
event-types	Query	Specify the comma-separated list of event types for which you want to retrieve event information. See Events Reference .	Yes
severity	Query	Provides the severity level. Specify the comma-separated list of severities for which you want to retrieve event information. Allowed values are: <ul style="list-style-type: none"> INFO WARN ERROR In the UI these values become Info, Warning, and Critical.	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON.	No
tier	Query	Name of the tier in the application	No

 This API can retrieve 600 events at a time.

Example

Retrieve the list of events of type APPLICATION_ERROR or DIAGNOSTIC_SESSION of any severity that occurred in the specified time range:

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com//controller/rest/applications/6/events?
time-range-type=BEFORE_NOW\&duration-in-mins=30\&event-
types=%20APPLICATION_ERROR,DIAGNOSTIC_SESSION\&severities=INFO,W
ARN,ERROR
```

```
<events><event>
  <id>44658</id>

Create Events

Application deployment events notify AppDynamics when you upgrade your application, push new code, etc. This lets you correlate these application deployment activities with other data inside AppDynamics. This is useful for regression analysis, root cause analysis, and performance studies. It is beneficial to inject your application deployment event into AppDynamics as part of the build process for deploying a new version of your application.

The AppDynamics REST API lets you integrate events of type `APPLICATION_DEPLOYMENT` with other systems.

For example, to create an event automatically in your AppDynamics monitored system for every new release you would integrate these systems and use the following REST API to create an event of type "`APPLICATION_DEPLOYMENT`" in your managed environment.

You should receive the event ID after the successful invocation of the request.

Roles and Permissions

Creating events requires the **Create Events** permission. See [Application Permissions](#).

URI

POST `/controller/rest/applications/application_id/events`

Input parameters

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	Provide either application name or application id.	Yes
summary	Query	Provide a summary describing the event.	Yes
comment	Query	Provide the comments (if any) for the event.	No
eventtype	Query	APPLICATION_DEPLOYMENT	Yes
severity	Query	Provide a severity level. Allowed values include: <ul style="list-style-type: none"> • "INFO" • "WARN" • "ERROR" In the UI, these become "Info", "Warning", and "Critical"	Yes

Create a Custom Event

You can create custom events to be reported in the AppDynamics event viewer and in the event panels on the AppDynamics dashboards. See [Monitor Events](#) to learn how to filter on your custom events. Then you can create alerts triggered by these events as you do for AppDynamics standard events.

You should receive the event ID after the successful invocation of the request.

Roles and Permissions

Creating a custom event requires the **Create Events** permission. See [Application Permissions](#).

URI

POST /controller/rest/applications/application_id/events

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	Provide either application name or application id.	Yes
summary	Query	Provide a summary describing the event.	Yes
comment	Query	Provide a comment for the event.	No
severity	Query	Provide a severity level. Allowed values include: <ul style="list-style-type: none"> • "INFO" • "WARN" • "ERROR" In the UI, these become "Info", "Warning", and "Critical"	Yes
eventtype	Query	CUSTOM	Yes
customeventtype	Query	Provide a name for the "type". For example, the source could be "nagios".	No
node	Query	Provide the affected node name.	No
tier	Query	Provide the affected tier name.	Yes, if node and bt are specified
bt	Query	Provide the affected business transaction name.	No
propertynames	Query	Provide a property name as a pair, i.e., the "key".	No, but if one element of the pair is defined, the other must be defined also

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
propertyvalues	Query	Provide the property value as a pair, i.e., the " value" . The value is limited to 5000 characters.	No, but if one element of the pair is defined, the other must be defined also

Example

```
curl -X POST --user user1@customer1:your_password 'http://demo.appdynamics.com/controller/rest/applications/5/events?severity=INFO&summary=test1&eventtype=CUSTOM&customeventtype=mycustomevent&propertynames=key1&propertynames=key2&propertyvalues=value1&propertyvalues=value'
```

 Notice the pattern for custom properties: `propertynames` and `propertyvalues` get matched up by order position, so to set N property values, you need N occurrences of `propertynames` and N occurrences of `propertyvalues` .

Create Custom URLs for Notifications

Single tenants in a multi-tenant Controller instance should use this API method to specify a custom or vanity URL for notification purposes. Instead of a URL such as `paid8.appdynamics.com` being displayed as the host, the custom URL can be displayed as `yourcompany.appdynamics.com` in the notification.

URI

POST `/controller/rest/accounts/customer_name/update-controller-url`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
customer_name	URI	The customer account name	Yes

Body Parameter

As Application/JSON content:

```
{
  "controllerURL": "http://<my-custom-hostname:port>"
}
```

i If the URL in the alerts is invalid, you can set it using the following curl command:

```
curl -k --basic --user root@system --header "Content-Type:
application/json" --data '{ "controllerURL": "http://
<controller>:<port>" }' http://<controller>:<port>/
controller/rest/accounts/<ACCOUNT-NAME>/update-controller-
url
```

```
curl -k --basic --user root@system --header "Content-Type:
application/json" --data '{ "controllerURL": "http://
<controller>:<port>" }' http://<controller>:<port>/
controller/rest/accounts/<ACCOUNT-NAME>/update-controller-
url
```

For example:

```
curl -k --basic --user root@system --header "Content-Type:
application/json" --data '{ "controllerURL": "https://
myVIP:443" }' https://myhost:8181/controller/rest/accounts/
customer1/update-controller-url
```

There is no need to reset the Controller as upgrading it will reset the deep link URL settings.

Create and Delete Action Suppressions

By default any response is in JSON, although XML can be requested by using the following header:

Name : Accept

Value : application/vnd.appd.cntrl+xml;v=1

Retrieve All Existing Action Suppressions

Use this to retrieve a list of all existing action suppressions.

URI

GET /controller/api/accounts/account_id/applications/application_id/actionsuppressions

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
account_id	URI	The account ID	Yes
application_id	URI	The application ID	Yes

Example request to get all action suppressions:

```
/controller/api/accounts/2/applications/9/actionsSuppressions
```

Example response:

```
Status : 200 ok
Output Data :
{"actionSuppressions": [{"id": "15", "name": "App-ASW", "timeRange": {"startTimeMillis": "2014-10-25T04:16:30+0000", "endTimeMillis": "2014-10-25T06:16:30+0000"}, "affects": {"type": "APP"}}, {"id": "16", "name": "Node-ASW", "timeRange": {"startTimeMillis": "2014-10-25T04:16:57+0000", "endTimeMillis": "2014-10-25T05:16:57+0000"}, "healthRuleIds": [60, 61], "affects": {"type": "NODE", "nodeAffectedEntities": {"type": "SPECIFIC", "nodeType": "ALL", "nodes": [17, 18]}}}], "actions": [{"href": "http://demo.appdynamics.com:8090/controller/api/accounts/2/applications/9/actionsSuppressions/%7BactionsSuppressions.id%7D/%7Bactions.name%7D", "method": ["POST", "DELETE"], "name": "enabled"}], "links": [{"href": "http://ec2-54-80-163-175.compute-1.amazonaws.com:8090/controller/api/accounts/2/applications/9/actionsSuppressions/%7BactionsSuppressions.id%7D", "name": "actionsSuppressions"}]}
```

Retrieve a Specific Action Suppression by ID

Use this to get an action suppression by the specified ID.

URI

```
/controller/api/accounts/account_id/applications/application_id/actions suppressions/
actionsuppression_id
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
account_id	URI	The account id.	Yes
application_id	URI	The application id.	Yes
actionsuppressions_id	URI	The action suppression id.	Yes

Example request:

```
/controller/api/accounts/2/applications/9/actions suppressions/15
```

Example response:

```
Status : 200 ok
Output Data :
{"id": "15", "name": "App-ASW", "timeRange": {"startTimeMillis":
"2014-10-25T04:16:30+0000", "endTimeMillis":
"2014-10-25T06:16:30+0000"}, "affects": {"type": "APP"}}
```

Create a New Action Suppression

This is a POST request that should return a 201 - created response.

URI

```
POST /controller/api/accounts/account_id/applications/application_id/
actionsuppressions
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
account_id	URI	The account ID.	Yes
application_id	URI	The application ID.	Yes
name	body key	The name of the action suppression window.	Yes
timeRange	body key	The start and end time of the window. Includes: startMillis , eg 2014-10-25T04:16:57+0000 endMillis , eg 2014-10-25T05:16:57+0000	Yes
healthRuleIds	body key	The ids of the affected health rules. If not provided, all rules affected	No

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory								
affects	body key	<p>Type of entity and corresponding IDs:</p> <table border="1"> <thead> <tr> <th>Scope</th> <th>Type</th> <th>Value</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>Application</td> <td>APP</td> <td>Covers the entire application</td> <td>"affects": {"type": "APP"}</td> </tr> </tbody> </table>	Scope	Type	Value	Example	Application	APP	Covers the entire application	"affects": {"type": "APP"}	Yes
Scope	Type	Value	Example								
Application	APP	Covers the entire application	"affects": {"type": "APP"}								

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
		Business Transaction	BT	Coverage or more Business Transactions		

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
			All Business Transactions	"affects": {"type": "BT", "btAffectedEntities": {"type": "ALL"}}		

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
			Business Transactions from specific tiers	"affects": {"type": "BT","btAffectedEntities": {"type": "WITHIN_TIERS","tiers": [11,12]}}	where 11,12 are Tier Ids	

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
			Specific Business Transactions by id	"affects": {"type": "BT", "btAffectedEntities": {"type": "SPECIFIC", "bts": [1,2]}}	where 1,2 are BT Ids	

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
			Business Criteria	<pre>"affects": {"type": "BT","btAffectedEntities": {"type": "CRITERIA","matchesOperator": "CONTAINS","matchesValue": "pojo"}} where " matchesOperator " can be:</pre> <ul style="list-style-type: none"> • CONTAINS • EQUALS • STARTS • ENDS • REGEX_VALUE 		

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value			Mandatory	
		Scope	Type	Value	Example	
		Tier	TIER	Covers one or more tiers		
			All tiers		<pre>"affects": {"type": "TIER", "tierAffectedEntities": {"type": "ALL"}}</pre>	

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value				Mandatory
		S c o p e	T y p e	V a l u e	Example	
			S p e c i f i c t i e r s		<pre>"affects": {"type": "TIER", "tierAffectedEntities": {"type": "SPECIFIC", "tiers": [11,12]}}</pre> where 11,12 are Tier Ids	
		N o d e	N O D E	C o v e r s o n e o r m o r e n o d e s		

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value			Mandatory
		Scope	Type	Value	Example
			All nodes		<code>"affects": {"type": "NODE", "nodeAffectedEntities": {"type": "ALL", "nodeType": "ALL"}}</code>
			Node specific tiers		<code>"affects": {"type": "NODE", "nodeAffectedEntities": {"type": "WITHIN_TIERS", "nodeType": "ALL", "tiers": [11,12]}}</code> where 11,12 are Tier Ids

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
				Specific nodes	<pre>"affects": {"type": "NODE", "nodeAffectedEntities": {"type": "SPECIFIC", "nodeType": "ALL", "nodes": [9,10]}} where 9,10 are Node Ids</pre>	

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value				Mandatory
		Scope	Type	Value	Example	
				Node	<pre>"affects": {"type": "NODE", "nodeAffectedEntities": {"type": "NAME_CRITERIA", "nodeType": "ALL", "nameMatchesOperator": "EQUALS", "nameMatchesValue": "Node"}}} - String match</pre> <pre>"affects": {"type": "NODE", "nodeAffectedEntities": {"type": "PROPERTY_CRITERIA", "nodeType": "ALL", "metaInfoProperties": [{"name": "ProcessID", "value": 12343}]}} - Meta Info Properties match</pre> <p>where "matchesOperator" can be:</p> <ul style="list-style-type: none"> CONTAINS EQUALS STARTS ENDS REGEX_VALUE 	

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value			Mandatory	
		Scope	Type	Value	Example	
		Machine	MACHINE	Controls one or more machines	<pre>"affects": {"type": "MACHINE", "machineAffectedEntities": {"type": "SPECITIC", "machines": [4,5]}}</pre> <p>where 4,5 are Machine Ids You must spell the value as "SPECITIC" due to a typo in the underlying code.</p>	

Example request

```
/controller/api/accounts/2/applications/9/actions suppressions
```

Header

- Name: Content-Type
- Value: application/vnd.appd.cntrl+json;v=1

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Body

```

{"name": "App-ASW_2", "timeRange": {"startTimeMillis":
"2014-10-25T04:16:30+0000", "endTimeMillis":
"2014-10-25T06:16:30+0000"}, "affects": {"type": "APP"}}

```

or

```

{"name": "Node-ASW_1", "timeRange": {"startTimeMillis":
"2014-10-25T04:16:57+0000", "endTimeMillis":
"2014-10-25T05:16:57+0000"}, "healthRuleIds": [60,61], "affects":
{"type": "NODE", "nodeAffectedEntities": {"type":
"SPECIFIC", "nodeType": "ALL", "nodes": [17,18]}}

```

Delete a Specific Action Suppression by ID

This is a `DELETE` request that should return a `204 - No Content` message.

URI

`DELETE /controller/api/accounts/account_id/applications/application_id/`
`actionsuppressions/actionsuppression_id`

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>account_id</code>	URI	The account ID	Yes
<code>application_id</code>	URI	The application ID	Yes
<code>actionsuppression_id</code>	URI	The ID of the action suppression to be deleted	Yes—The Alert and Respond APIs let you manage and monitor events, health rules, and other aspects of the AppDynamics alert and respond features.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Configuration API

This page describes the Configuration API methods you can use to read and modify selected Controller configuration settings programmatically. You can use it to script or automate tasks that you perform frequently or in large batches.

i The Configuration Export and Import API provides the ability to perform select configuration changes as well as you can edit and import Controller configuration definition files.

Include or Exclude a Business Transaction from Monitoring

You can exclude or include business transactions for monitoring by passing the exclude parameter to the business-transactions retrieval API described in the [Application Model API](#).

To exclude a business transaction, pass the XML-represented ID of the business transaction you want to exclude with the exclude parameter set to `true`. To turn on monitoring for a currently excluded business transaction, set the exclude parameter to `false`.

Send the list of business transactions to be excluded or re-included as the XML-formatted `POST` payload. A sample business-transaction list is:

```
<business-transactions>
  <business-transaction>
    <id>15</id>
  </business-transaction>
  <business-transaction>
    <id>16</id>
  </business-transaction>
</business-transactions>
```

! Ensure that the `Content-Type` header is set to `application/xml`.

Format

`POST /controller/rest/applications/application_id/business-transactions`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	Provide either the application name or application id.	Yes
exclude	Post	true false	Yes

Example

```
curl -X POST -H "Content-Type:text/xml" --user
user1@customer1:your_password http://demo.appdynamics.com/
controller/rest/applications/6/business-transactions\?
exclude=true -d @businesstransaction.xml
```

Retrieve All Controller Settings

The Controller global configuration values are made up of the Controller settings that are presented in the [Administration Console](#).

Format

```
GET /controller/rest/configuration
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON .	No

Example

```
curl --user admin@customer1:your_password http://
demo.appdynamics.com/controller/rest/configuration

<configuration-items><configuration-item>
  <name>eventsvc.request.segment.data.max.retrieval.size</name>
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

```

```
</configuration-item>
```

```
</configuration-items>
```

Retrieve a Controller Setting by Name

Use this API to get the value of a given Controller configuration setting.

Format

```
GET /configuration?name=controller_setting_name
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Query	Name of the Controller setting to retrieve	Yes
output	Query	HTTP Request parameter included as part of the URL to change the output format. Valid values are XML (default) or JSON .	No

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Example

```
curl --user admin@customer1:your_password http://
demo.appdynamics.com/controller/rest/configuration?
name=metrics\.min\.retention\.period

<configuration-items><configuration-item>
  <name>metrics.min.retention.period</name>
  <value>4</value>
  <description>Time (in hours) to retain minute metric data
values before they are purged from the system.</description>
  <updateable>true</updateable>
  <scope>cluster</scope>
</configuration-item>
</configuration-items>
```

Configure Global Controller Settings

Use this API to set a Controller setting to a specified value.

 You cannot use this REST API to modify Controller settings on SaaS.

Format

POST /controller/rest/configuration

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Query	Name of the Controller setting to get.	Yes
value	Query	Value to set.	Yes

Mark Nodes as Historical

Use this API to [mark nodes as historical](#), which suspends certain types of processing activities for the node (i.e. rule evaluation). By default, AppDynamics marks as historical (soft deletes) a node that has lost contact with the Controller for the number of hours configured in the `node.retention.period` Controller setting. The default is 500 hours.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Pass one or more identifiers of the node to be marked as historical, up to a maximum of 25 nodes. Multiple IDs should be comma-separated.

Format

```
POST /controller/rest/mark-nodes-historical?application-component-node-ids=value
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application-component-node-ids	Query	Comma-separated list of node IDs	Yes

Example

```
curl -X POST --user admin@customer1:your_password http://demo.appdynamics.com/controller/rest/mark-nodes-historical?application-component-node-ids=44,45

<application-component-node-id>
<44/>
<45/>
</application-component-node-id>
```

Configuration Import and Export API

This page describes the AppDynamics API methods you can use to import and export various types of configuration settings in the Controller.

About the Configuration Import/Export APIs

The Configuration Import/Export APIs enable you to migrate configuration settings across Controller accounts, business applications, or Controller instances. You can also use it to add configuration artifacts like transaction detection rules, health rules, or custom dashboards to an existing configuration programmatically.

An exported configuration is an XML or JSON representation of the configuration artifact. After exporting the file, you can upload it to another account or application, optionally modifying the configuration.

Export Actions from an Application

Use this to export all actions in the specified application to a JSON file.

The user account you use to make the API call must have permission to view an action or action template in the application you are exporting from.

Format

```
GET /controller/actions/application_id
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actions/7

[
  {
    actionType: "EmailAction",
    name: "6DA8942B-DF4A-417A-E1NF-59F14231D670",
    priority: 1,
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

        description: null,
        toAddress: "user1@example.com",
        subject: "",
        timeZone: null
    },
    {
        actionType: "DiagnosticSessionAction",
        name: "MyDiagnostic",
        priority: 0,
        description: null,
        businessTransactionTemplates: [ ],
        numberOfSnapshotsPerMinute: 5,
        durationInMinutes: 10,
        adjudicate: false,
        adjudicatorEmail: null
    }
]

```

Import Actions into an Application

After you have exported actions, you can import them to a different application passing the JSON file created by the export operation as the payload to a POST request.

The user account you use to make the API call must have permission to create an action or action template in the account.

Actions in the import file that have conflicting names with actions in the existing configuration are not imported. The import for those actions fails, while new actions are imported successfully.

This call takes data as multipart/form-data content. Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Format

```
POST /controller/actions/application_id
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes

Example

```
curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actions/38 -F
file=@ExportActions.json

{"success":true,"errors":[],"warnings":[]}
```

If there are actions in the file with the same name as ones in the configuration, those actions are not imported, and the response indicates the success of the request as `false`. For example:

```
{"success":false,"errors":["Not importing Action with name:
DuplicateExportedDiagnosticAction, since it already
exists."],"warnings":["Imported 1 out of 2 actions"]}
```

Export Email Action Templates from an Account

This API exports all the email action templates in the current account in JSON format.

Format

```
GET /controller/actiontemplate/email
```

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actiontemplate/email

[ {
  "actionPlanType" : "email",
  "name" : "MyCustomEmailTemplate",
  "oneEmailPerEvent" : true,
  "eventClampLimit" : 100,
  "defaultCustomProperties" : [ {
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    "id" : 0,
    "version" : 0,
    "name" : "env",
    "value" : "%OS"
  } ],
  "allowCustomRecipients" : true,
  "toRecipients" : [ ],
  "ccRecipients" : [ ],
  "bccRecipients" : [ ],
  "headers" : [ ],
  "subject" : "We've got a situation...",
  "includeTextBody" : true,
  "textBody" : "<h1>Summary of events occurring during the $
{policy.digestDurationInMins}+ minute(s) prior to $
{action.triggerTime}:</h1> <table> #foreach(${eventList} in $
{fullEventsByTypeMap.values()}) #foreach(${event} in $
{eventList}) <tr> <td> <!-- Event icon --> 
</td> <td> <!-- Event name with event link --> <a href="$
{event.deepLink}>${event.displayName}</a> </td> <td> <!-- Event
message --> ${event.eventMessage} </td> </tr> #end #end </
table>""",
  "includeHtmlBody" : true,
  "htmlBody" : "<p>Please look into it.</p>",
  "testLogLevel" : "DEBUG",
  "testPropertiesPairs" : [ ],
  "testToRecipients" : [ ],
  "testCcRecipients" : [ ],
  "testBccRecipients" : [ ],
  "eventTypeCountPairs" : [ ]
} ]

```

Import Email Action Templates

Use this to import email action templates to an account as a JSON file.

i The import will fail if you attempt to import a template with the same name as an existing template of the same type in the destination account.

Data for this call should be in the form of multipart/form-data. Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Format

```
POST /controller/actiontemplate/email
```

Example

```
curl -X POST --user user1@customer1:your_password http://  
demo.appdynamics.com/controller/actiontemplate/email -F  
file=@emailactiontemplate.json  
  
{"success":true,"errors":[],"warnings":[]}
```

Export HTTP Request Action Templates from an Account

This API exports all the HTTP request action templates in the current account to a JSON file.

Format

```
GET /controller/actiontemplate/httprequest/
```

Example:

```
curl --user user1@customer1:your_password http://  
demo.appdynamics.com/controller/actiontemplate/httprequest  
  
[ {  
  "actionPlanType" : "httprequest",  
  "name" : "MyCustomHTTPTemplate",  
  "oneRequestPerEvent" : false,  
  "eventClampLimit" : -1,  
  "defaultCustomProperties" : [ ],  
  "method" : "GET",  
  "scheme" : "HTTP",  
  "host" : "http",  
  "port" : 0,  
  "path" : "//demo.appdynamics.com//controller/rest/  
applications/${latestEvent.application.name}/nodes/${  
{latestEvent.node.name}",  
  "query" : "",  
  "urlCharset" : "UTF_8",
```

```

    "authType" : "BASIC",
    "authUsername" : "user1",
    "authPassword" : "your_password",
    "headers" : [ ],
    "payloadTemplate" : {
      "httpRequestActionMediaType" : "text/plain",
      "charset" : "UTF_8",
      "formDataPairs" : [ ],
      "payload" : ""
    },
    "connectTimeoutInMillis" : 5000,
    "socketTimeoutInMillis" : 15000,
    "maxFollowRedirects" : 0,
    "responseMatchCriteriaAnyTemplate" : [ ],
    "responseMatchCriteriaNoneTemplate" : [ ],
    "testLogLevel" : "DEBUG",
    "testPropertiesPairs" : [ ],
    "eventTypeCountPairs" : [ ]
  } ]

```

Import HTTP Action Templates into an Account

After you have exported HTTP request action templates, you can import them to a different account by logging into the destination account and passing the JSON file created by the export operation as the payload to the `POST` request.

You can modify the exported file before you import it. You might want to do this to remove one or more template configurations or to change their names.

i The import will fail if you attempt to import a template with the same name as an existing template of the same type in the destination account.

Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Format

```
GET /controller/actiontemplate/httprequest
```

Example

```
curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/actiontemplate/httprequest -F
file=@httpactiontemplate.json

{"success":true,"errors":[],"warnings":[]}
```

Export Custom Dashboards and Templates

You can export and import custom dashboards and custom dashboard templates interactively from the Controller UI or by using this API call. See [Import and Export Custom Dashboards and Templates Using the UI](#).

 To export the dashboard, the user making the API call must have permission to view the custom dashboard.

In the export call, you must identify the dashboard to export by its ID. When you open the dashboard in the UI, the ID appears as the dashboard parameter at the end of the URL.

For example, in this URL snippet, the custom dashboard ID is

```
3: location=CDASHBOARD_DETAIL&mode=MODE_DASHBOARD&dashboard=3
```

Format

```
GET /controller/CustomDashboardImportExportServlet?dashboardId=dashboard_id
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
dashboardId	Query	The numeric ID of the custom dashboard.	Yes

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/
CustomDashboardImportExportServlet?dashboardId=8

{
  "schemaVersion" : null,
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    "dashboardFormatVersion" : "3.0",
    "name" : "Analytics-BrowserData",
    ...
    "warRoom" : false,
    "template" : false
  }

```

View a complete response example:

```

{
  "schemaVersion" : null,
  "dashboardFormatVersion" : "3.0",
  "name" : "Analytics-BrowserData",
  "description" : null,
  "properties" : null,
  "templateEntityType" : "APPLICATION_COMPONENT_NODE",

    "pollingInterval" : null,
    "unit" : null
  } ],
  "warRoom" : false,
  "template" : false
}0

```

Import Custom Dashboards and Templates

You can import custom dashboards and templates based on a previously exported JSON definition, which has optionally been modified. Import the definition as an `application/json` content type.

The user making the API call must have permission to create dashboards in the Controller.

Data for this call should be in the form of multipart/form-data. Use UTF-8 URL encoding of the URI before posting; for example, do not replace a space (" ") with "%20" in the URI.

Prior to version 4.1, exported custom dashboards were in XML format. You can import custom dashboards previously exported as XML data into the current Controller; however, custom dashboards can only be exported as JSON data.

Format

```
POST /controller/CustomDashboardImportExportServlet
```

Example

```

curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/
CustomDashboardImportExportServlet -F
file=@customdashboards.json

{"success":true,"errors":[],"warnings":
[],"createdDashboardName":"Uploaded-Analytics-BrowserData"}

```

Export Health Rules from an Application

Returns all health rules in XML format.

The user account you use to make the API call must have permission to view the health rule.

Format

```
GET /controller/healthrules/application_id?name=health_rule_name
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes
name	Query	The name of the health rule to export. If not specified, exports all health rules.	No

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/healthrules/38?
name=MyCustomHealthRule

<health-rules controller-version="004-002-000-000">
  <health-rule>
    <name>MyCustomHealthRule</name>
    <type>BUSINESS_TRANSACTION</type>
    <description/>
    <enabled>true</enabled>
    <is-default>false</is-default>
    <always-enabled>true</always-enabled>
    <duration-min>30</duration-min>
    <wait-time-min>30</wait-time-min>
    <affected-entities-match-criteria>
      <affected-bt-match-criteria>
        <type>ALL</type>
      </affected-bt-match-criteria>
    </affected-entities-match-criteria>
  </health-rule>
</health-rules>
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

        </affected-bt-match-criteria>
    </affected-entities-match-criteria>
    <warning-execution-criteria>
        <entity-aggregation-scope>
            <type>ANY</type>
            <value>0</value>
        </entity-aggregation-scope>
        <policy-condition>
            <type>leaf</type>
            <display-name>CPU</display-name>
            <condition-value-
type>BASELINE_STANDARD_DEVIATION</condition-value-type>
            <condition-value>2.0</condition-value>
            <operator>GREATER_THAN</operator>
            <condition-expression/>
            <use-active-baseline>true</use-active-baseline>
            <metric-expression>
                <type>leaf</type>
                <function-type>VALUE</function-type>
                <value>0</value>
                <is-literal-expression>false</is-literal-
expression>
                <display-name>null</display-name>
            <metric-definition>
                <type>LOGICAL_METRIC</type>
                <logical-metric-name>Average CPU Used
(ms)</logical-metric-name>
            </metric-definition>
        </metric-expression>
    </policy-condition>
</warning-execution-criteria>
</health-rule>
</health-rules>

```

Import Health Rules into an Application

You can import health rules defined in an XML file into a business application.

Data for this call should be in the form of multipart/form-data. In the POST request, use UTF-8 URL encoding for the URI; for example, do not replace a space (" ") with "%20" in the URI.

By default, a health rule in the posted data with an identical name to one in the existing configuration does not overwrite the existing health rule. If you want to overwrite an existing health rule of the same name, use the `overwrite` parameter.

The syntax is the same for importing one health rule configuration or several. All the health rule configurations in the posted XML file are imported.

Format

```
POST /controller/healthrules/application_id?overwrite=true_or_false
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>application_id</code>	URI	The application name or application ID.	Yes
<code>overwrite</code>	Query	Set to true to have health rules in the posted data overwrite existing health rules with the same name. The default is <code>false</code> .	No

Example

```
curl -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller/healthrules/38 -F file=@uploadhealthrule.xml

Imported 1 health rules successfully.
```

If the health rule exists and you have not enabled the `overwrite` parameters, you will get the following response:

```
Not importing the health rule: healthrulename since it already exists.
```

Export Transaction Detection Rules

Use this to get all transaction detection rules in XML format. This call returns different types of detection rule configurations when MDS is enabled.

You can get transaction detection rules from a number of different configurations, including the configuration for a specific scope by name.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

The URI used by clients for this call should be UTF-8 encoded.

Format

```
GET /controller/transactiondetection/application_id/[scope_name]/rule_type/
[entry_point_type]/[rule_name] >> xml_name.xml
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID. It can be found in the URL in the address bar if you click the specified application. It is an Integer value. It will return an error if you do not specify.	Yes
scope_name	URI	The name of the scope from which you are exporting the entry point configuration. The scope name cannot be <code>custom</code> and <code>auto</code> . If the scope name contains a space, type <code>%20</code> instead of space. For example: <code>curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/10/default%20scope/custom >> result.xml</code> It will export all the rules under all the scopes if you do not specify.	No
rule_type	URI	The type of rule to export, from these options: <ul style="list-style-type: none"> • auto: Automatic detection rules • custom: Custom detection rules in the configuration It will return an error if you do not specify.	Yes
entry_point_type	URI	The POJO, Servlet, EJB, Spring Bean, etc. It will export the rules which belong to all the entry point types if you do not specify.	No

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
rule_name	URI	The name of the rule which you are exporting. It will export all the rules under a scope or all the scopes if you do not specify.	No

- The order of the parameters cannot be changed. The order of the parameters should be: `application_id/[scope_name]/rule_type/[entry_point_type]/[rule_name]`.
- It will return an XML file with error content if you use the wrong name(s) in all the parameters.
- Tier information is provided in the scope list.
- If you do not specify the scope when exporting, then you should also not specify it when importing.
- Please check the `server.log` file if you do not get the expected result after exporting.

Scenarios:

- Export the rules from all the scopes.

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/applicationID/{rule_type} >> {xml_name}.xml
```

Example:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/controller/transactiondetection/10/custom >> result.xml
```

If you do not include `scope_name`, the output is divided into three parts under `<mds-config-data>`: `scope-list`, `rule-list`, and `scope-rule-mapping-list`.

```
<mds-data>
  <mds-config-data>
    <scope-list>
      <scope scope-description="" scope-name="scope0"
        scope-type="ALL_TIERS_IN_APP" scope-version="0"/>
      <scope scope-description="" scope-name="scope1"
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

        scope-type="SELECTED_TIERS" scope-version="0"/>
    </scope-list>

    <rule rule-description="whatever_SERVLET" rule-
name="whatever_SERVLET"/>
    <rule rule-description="testPOJO" rule-name="testPOJO"/>
  </scope-rule-mapping>
</scope-rule-mapping-list>
</mds-config-data>
</mds-data>
```

- Export the rules under the specified scope:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/applicationID/scope_name/{rule_type} >>
{xml_name}.xml
```

Example:

```
curl -X GET --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/10/scope0/custom >> result.xml
```

i If you include `scope_name` then only `rule-list` is included in the output.

```
<mds-data>
  <mds-config-data>
    <rule-list>
      <rule agent-type="DOT_NET_APPLICATION_SERVER"
enabled="true" priority="0"
rule-description="ASP.NET MVC5 Resource Handler"
rule-name="ASP.NET MVC5 Resource Handler"
rule-type="TX_MATCH_RULE" version="0">
        <tx-match-rule>{"type":"CUSTOM","txcustomrule":
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

      </rule>
    </rule-list>
  </mds-config-data>
</mds-data>
```

Import Transaction Detection Rules

Use this to import automatic detection rules in XML format. This call returns different types of detection rule configurations when MDS is enabled.

Importing action will overwrite a rule or add the new rule to the all/specified scopes.

Data for this call should be in the form of multipart/form-data. The URI for this call should be UTF-8 encoded.

Format

```
POST /controller/transactiondetection/application_id/[scope_name]/rule_type/
[entry_point_type]/[rule_name] -F file=@exported_file_name.xml
```

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID. It can be found in the URL in address bar if you click the specified application. It is an Integer value. It will return an error if you do not specify.	Yes
scope_name	URI	The name of the scope from which you are importing the entry point configuration. It will import the rules to all the scopes if you do not specify.	No
rule_type	URI	The type of rule to import, from these options: <ul style="list-style-type: none"> • auto: Automatic detection rules • custom: Custom detection rules in the configuration • exclude: Custom exclude rules for transaction detection It will return an error if you do not specify.	Yes
entry_point_type	URI	The POJO, Servlet, EJB, Spring Bean, etc	No
rule_name	URI	The name of the rule which you are importing. It will import all the rules under a scope or all the scopes if you do not specify.	No

- When you import, if the XML file does not have `<scope-list>`, then you should type the scope name, otherwise, it will fail, and vice versa.
- It will return an error if you use the wrong name(s) in all the parameters.
- If you do not specify the scope when importing, then you should not specify it when exporting.
- Check the `server.log` file if you do not get the expected result after exporting.

Examples

- Import the rule(s) to the application without scopes specified:

```
curl -X POST --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/{application_id}/{rule_type}
-F file=@{exported_file_name}.xml
```

- Import the rule(s) to the application with scopes specified:

```
curl -X POST --user user1@customer1:welcome http://localhost:8080/
controller/transactiondetection/{application_id}/{scope_name}/{rule_type}
-F file=@{exported_file_name}.xml
```

- For more scenarios to import, see [Export Transaction Detection Rules](#).

Export Policies

You can export policies to a JSON file. Before you export policies, export any actions or health rules with their respective APIs.

Format

```
GET /controller/policies/application_id
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes

Example

```
curl --user user1@customer1:your_password http://
demo.appdynamics.com/controller/policies/application_id

[ {
  "applicationName" : "ECommerce-Books",
  "name" : "My Policy",
  "reactorType" : "IMMEDIATE",
  "enabled" : true,
  "batchActionsPerMinute" : true,
  "durationInMin" : 1,
  "eventFilterTemplate" : {
    "applicationName" : "ECommerce-E2E",
    "healthRuleNames" : null,
    "eventTypes" : [ "POLICY_OPEN_WARNING",
"POLICY_OPEN_CRITICAL", "POLICY_CONTINUES_WARNING",
"POLICY_CONTINUES_CRITICAL" ],
    "rsdTypes" : null,
    "customEventFilters" : null,
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    "specificEntityNamesByType" : null
  },
  "entityFilterTemplates" : [ ],
  "actionWrapperTemplates" : [ {
    "actionTag" : "ops_viewer@acme.com",
    "type" : null,
    "value" : 0,
    "notes" : "Policy: My Policy",
    "entityIdentifierTemplates" : [ ]
  } ]
} ]

```

Import Policies

You can import policies that you exported with the Export Policies API. Before you import policies, import any actions or health rules with their respective APIs.

You can import a policy after modifying the defined parameter(s) and overwrite the existing policy with the updated one.

Format

```
POST /controller/policies/application_id ?overwrite=true_or_false
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes
overwrite	Query	Set to true to have updates to a policy overwrite the existing policy with the same name. The default is false .	No

Example

```

curl -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/policies/38 -F
file=@ImportPolicies.json

```

```
{"success":true,"errors":[],"warnings":[]}
```

Example to Overwrite a Policy

```
curl -X POST --user user1@customer1:your_password http://demo.appdynamics.com/controller/policies/38\?overwrite=true -F file=@ImportPolicies.json
```

```
{"success":true,"errors":[],"warnings":[]}
```

Export Application Analytics Dynamic Service Configuration

The Analytics Dynamic Service is an AppDynamics app agent plugin that performs Analytics client functions for the agent. Enabling the Dynamic Service enables AppDynamics Analytics for an app agent type. You can export the Dynamic Service configuration to back up the configuration or for later import into another Controller.

Format

```
GET /controller/analyticsdynamicservice/application_id
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The application name or application ID.	Yes
filename	Query	The name of a file to which the configuration will be exported.	No

Example

```
curl -i --user user1@customer1:your_password http://demo.appdynamics.com/controller/analyticsdynamicservice/10

<analytics-dynamic-service-configurations controller-version="004-003-000-000">
  <analytics-dynamic-service-configuration>
    <override>true</override>
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    <agent-type>APP_AGENT</agent-type>
    <enabled>true</enabled>
  </analytics-dynamic-service-configuration>
  <analytics-dynamic-service-configuration>
    <override>true</override>
    <agent-type>DOT_NET_APP_AGENT</agent-type>
    <enabled>true</enabled>
  </analytics-dynamic-service-configuration>
  <analytics-dynamic-service-configuration>
    <override>true</override>
    <agent-type>NODEJS_APP_AGENT</agent-type>
    <enabled>true</enabled>
  </analytics-dynamic-service-configuration>
</analytics-dynamic-service-configurations>

```

Import Application Analytics Dynamic Service Configuration

The Analytics Dynamics Service configuration determines whether AppDynamics Analytics is enabled for an app agent type. You use this API to import a previously exported configuration to another Controller.

Data for this call should be in the form of multipart/form-data.

Format

```
POST /controller/analyticsdynamicsservice/application_id
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
application_id	URI	The name or ID identifier of the application to which the Analytics Dynamic Service configuration should be applied.	Yes

Example

```

curl -i -X POST --user user1@customer1:your_password http://
demo.appdynamics.com/controller/analyticsdynamicsservice/10 -F
file=@dynamicsservice.xml

```

The following example shows sample contents of the `dynamicsservice.xml` file. Notice that the `agent-type` element indicates the type of app server agent to which the enabled state of the dynamics service applies. The `APP_AGENT` type represents the Java Agent, the `DOT_NET_APP_AGENT` the .NET Agent, and so on.

```
<analytics-dynamic-service-configurations controller-
version="004-003-000-000">
  <analytics-dynamic-service-configuration>
    <override>true</override>
    <agent-type>APP_AGENT</agent-type>
    <enabled>false</enabled>
  </analytics-dynamic-service-configuration>
  <analytics-dynamic-service-configuration>
    <override>true</override>
    <agent-type>DOT_NET_APP_AGENT</agent-type>
    <enabled>false</enabled>
  </analytics-dynamic-service-configuration>
  <analytics-dynamic-service-configuration>
    <override>true</override>
    <agent-type>NODEJS_APP_AGENT</agent-type>
    <enabled>true</enabled>
  </analytics-dynamic-service-configuration>
</analytics-dynamic-service-configurations>
```

Database Visibility API

This page describes the Database Visibility API methods you can use to get, create, update, and delete Database Visibility Collectors.

Include the following headers for all Database Visibility API requests:

```
Accept: application/json; Content-type: application/json
```

JSON is currently the only supported format.

i Database Visibility uses infrastructure-based licensing, where there is no direct correlation between the database collector and license usage. Therefore for Controller version ≥ 21.2 , the `licensesUsed` parameter always returns `-1`.

Get All Collectors

```
GET /controller/rest/databases/collectors
```

Get a Specific Collector

```
GET /controller/rest/databases/collectors/{configurationId}
```

Create a Collector

```
POST /controller/rest/databases/collectors/create
```

The JSON you send must contain the relevant Collector information. The required fields describing the Collector vary based on the type of database. See [UI Collector versus JSON Collector Configuration Field Names](#)

Example JSON Request

```
{
  "type": "MYSQL",
  "name": "localdocker_dbagent-MySQLCollector",
  "hostname": "mysql",
  "port": "3306",
  "username": "root",
```

```

"password":"appdynamics_redacted_password",

    "orasslKeystoreLoc": null,
    "orasslKeystoreType": null,
    "orasslKeystorePassword": "",
    "ldapEnabled": false,
    "customMetrics": null
  }
]
}

```

extraProperties: To configure the frequency for sampling queries from the database (except Cassandra), you can use the `extraProperties` parameter in the JSON request payload. The following JSON sample can be used in the request payload to configure the sampling interval:

```
{
  "type": "POSTGRESQL",
  "agentName": "UpgradeTest204",
  "name": "SamplingInterval",
  "hostname": "ec2-54-202-140-213.us-west-2.compute.amazonaws.com",
  "port": "5432",
  "username": "postgres",
  "password": "Appd123",
  "removeLiterals": "true",
  "enableOSMonitor": "true",
  "hostOS": "LINUX",
  "sshPort": "22",
  "hostUsername": "ec2-user",
  "hostPassword": "",
  "certificateAuth": true,
  "enabled": "true",
  "enterpriseDB": "false",
  "extraProperties": [
    {
      "key": "dbagent.sampling.interval",
      "value": "10",
      "sensitive": false
    }
  ]
}
```

The following JSON key-value pair is used in `extraProperties` for configuring the interval:

key: `dbagent.sampling.interval`

value: positive integer

The value can be 1, 2, 5, 10, 20, or 30.

You can configure this property through the agent. See [Configure the Agent Settings for Monitoring Database](#).

Update a Collector

1. Make a `GET` request for the collector that you want to update.
2. Copy the JSON response body that is returned by the `GET` request to a text editor, and modify the fields that you want to update.
3. Make a `POST` request for the collector that you want to update, and include the updated JSON.

POST /controller/rest/databases/collectors/update

Example JSON Request

```
{
  "id":1,
  "type":"MYSQL",
  "name":"localdocker_dbagent-MySQLCollector",
  "hostname":"mysql",
  "port":"3306",
  "username":"root",

        "orasslKeystorePassword":"","",
        "ldapEnabled":false,
        "customMetrics":null
    }
]
}

```

The JSON you send must contain all the details of the existing collector with only the fields that you want to modify changed. To ensure you have all the fields, use the [Get a Specific Collector](#) call.

To add a new sub-collector to an existing collector, provide the sub-collector details without the `id` field.

i To configure the interval for sampling queries, refer to the `extraProperties` parameter in the JSON request payload as mentioned in [extraProperties](#) under [Create a Collector](#).

Delete a Specific Collector

```
DELETE /controller/rest/databases/collectors/{configurationId}
```

Example Delete Request

```
DELETE /controller/rest/databases/collectors/{1}
```

Batch Delete Multiple Collectors

```
POST /controller/rest/databases/collectors/batchDelete
```

Send an array of the configuration Ids of the Collectors.

Below is an example of a batch delete command.

```
curl --user {username}@{account_name}:{password} -H "Accept: application/json" -H "Content-type: application/json" -X POST -d '[1,2,3]' {Controller_URL}/controller/rest/databases/collectors/batchDelete
```

Get All Monitored Database Servers

```
GET /controller/rest/databases/servers
```

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/databases/servers
```

The output is a list of database servers and their details.

Get Database Server Details

```
GET /controller/rest/databases/servers/{dbserver_id}
```

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/databases/servers/{dbserver_id}
```

The output contains a list of the database's details, including name, node ID, and database type.

Get all Database Agent Events

```
GET /controller/rest/applications/_dbmon/events
```

For a list of query string parameters, see [Retrieve Event Data](#).

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/applications/_dbmon/events?time-range-type=BEFORE_NOW&duration-in-mins=30&event-types=%20AGENT_EVENT,DB_SERVER_PARAMTER_CHANGE&severities=INFO,WARN,ERROR
```

The output gives you a list of events. For each event element, you can determine the node that the event is mapped to by looking for the entity-definition element.

Get all Database Monitoring Application Nodes

```
GET /controller/rest/applications/_dbmon/nodes
```

Example

```
curl --user {username}@{account_name}:{password} {Controller_URL}/controller/rest/
applications/_dbmon/nodes
```

UI Collector versus JSON Collector Configuration Field Names

Use the table below to ensure you use the correct field names for your API calls. The Collector configuration field names are described in [Configure the Database Agent to Monitor Server Hardware](#) and [Add Database Collectors](#).

Section	UI Collector Configuration Field Name	JSON Collector Configuration Field Name
		id (AppDynamics assigns this ID to the Collector when you configure the Collector. You need this ID when doing a batch delete.)
	Database Type	type
	Database Agent	agentName
	Database	name
Connection Details	Hostname/IP Address	hostname
	EnterpriseDB	enterpriseDB
	Failover Partner	failoverPartner
	Listener Port	port
	Custom JDBC Connection String	customConnectionString
	Use Service Name	useServiceName
	SID or SERVICE_NAME	sid

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Section	UI Collector Configuration Field Name	JSON Collector Configuration Field Name
	Connect as a sysdba	connectAsSysdba
	Username	username
	Password	password
	Logging Enabled	
Hardware Monitoring	Monitor Operating System	enableOSMonitor
	Operating System	hostOS
	Use Local WMI	useLocalWMI
	Domain	hostDomain
	SSH Port	sshPort
	Use certificate	certificateAuth
	Username	hostUsername
	Password	hostPassword

i SSL field

In addition to JSON Configuration Fields, there is the SSL field. SSL is a configurable property for the Database Agent. If the Database Agent has been configured to use SSL, then you must also provide the SSL field and its value in your Database Visibility API calls.

Analytics Events API

AppDynamics Analytics provides built-in support for collecting analytics data from various types of sources, such as agent-instrumented Java applications, .NET applications, browser applications, and more. The Analytics Events API supplements built-in analytics data sources with your custom data sources and event types.

In addition to the transaction events published by the app agents, custom events collected by the Analytics Events API are metered.

Publishing custom events requires Transaction Analytics licensing. Transaction Analytics license units determine the limit on the volume of custom events that you can publish.

About the Analytics Events API

In Analytics, an event encapsulates a unit of analytics data. In APM, for example, each event corresponds to a method or service invocation, whether it be an entry point service or downstream service.

With the Analytics API, you define the structure of your own custom event in the data store, capture the event records as they occur in your custom source, and send them to the Events Service, the data store for Analytics. Once your data is in the Events Store, users can query your data through the Controller UI or the Analytics Events API.

Analytics Events API uses a shared key to authenticate clients to the Events Service. As a Controller or Analytics Administrator, you can generate API keys from the Controller UI. See [Manage API Keys](#).

A Transaction Analytics license is required to use the Events Service API. The same licensing model that applies to business transactions for custom events (based on the number of events per unit/day) applies to the API.

Addressing the Events Service Data Store

Unlike most AppDynamics REST APIs, which are presented at the Controller, you access the Analytics Events API by addressing the Events Service instance in the AppDynamics platform.

You address the Events Service at one of the following URLs:

[SaaS](#) On-premises

Region	URL
North America	https://analytics.api.appdynamics.com

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Region	URL
Europe	https://fra-ana-api.saas.appdynamics.com
APAC	https://syd-ana-api.saas.appdynamics.com

SaaS [On-premises](#)

```
"https://<events_service_endpoint>:9080/events/"
```

For an on-premises Events Service, address the Events Service instance host (or more likely, the virtual IP presented by a load balancer for the Events Service cluster). Use the primary default listening port for the Events Service, 9080.

Calls to the Analytics Events API need to specify the `<global_account_name>` for the Controller account being address, and the `<api_key>` generated by the administrator for this client. The API expects the values as headers, property-value pairs that are separated by a colon. As cURL arguments, for example, the values would be passed with curl through the `-H` or `--header` option as follows:

```
-H"X-Events-API-AccountName:<global_account_name>" -H"X-Events-API-Key:<api_key>"
```

You can get the global account name to use from the [License page](#) in the Controller UI. The API keys are described in [Manage API Keys](#).

The content type, also as a cURL argument, is:

```
-H"Content-type: application/vnd.appd.events+json;v=2"
```

AppDynamics strongly recommends the use of SSL/HTTPS to access the API. Otherwise, the API key is sent in plain text.

i For security reasons, the Analytics Events API, by default, does not accept cross-origin HTTP requests. For example, from links embedded directly in web pages.

Data Format

The Analytics Events API takes events as JSON-formatted name-value pair data.

Before sending data that conforms to a custom events schema, you need to define the data structure for the custom schema. The Events Service matches incoming events data to the appropriate schema.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Supported Data Types

- Boolean
- Date – Supported time formats include:
 - ISO 8601 format: `yyyy-MM-dd'T'HH:mm:ss.SSSZZ` .
 - UNIX epoch date format: A 13-digit number representing the number of seconds/milliseconds since UNIX epoch time (Jan 1, 1970). For example, (GMT): Mon, 17 Apr 2017 23:46:22 GMT would be 1492472782000.
- Float
- Integer
- Object
- String

Naming Restrictions

Custom event names and field names must conform to the following:

- Contain only a-z, A-Z, _ (underscore), 0-9.
- Names can not start with a number.

Timestamp Fields

Two implicit timestamp fields are automatically added to custom schemas:

- `eventTimestamp`
- `pickupTimestamp`

The `eventTimestamp` field represents the time an event occurred. An API client can specify a value for the timestamp field when it creates an event. If it does not, the Analytics Events API uses the same value for `eventTimestamp` as it uses for another implicit field, `pickupTimestamp`. The `pickupTimestamp` field, which is always populated by the Events Service, represents the time the event was received by the Events Service.

When configuring a milestone in Business Journeys, you need to supply a date in the `eventTimestamp` field in order for the event to register. In order to use Custom Events to define Business Journey, the custom events should send the `eventTimestamp` field. If not, the Business Journeys will not work.

AppDynamics uses another timestamp, `eventcompletionTimestamp`, which is not automatically added to custom schemas. The `eventcompletionTimestamp` field represents the time an event ends. Generally, AppDynamics uses this field internally to accurately report long-running events.

You can express all timestamp fields using ISO 8601 or UNIX epoch time (64-bit milliseconds) format.

Example API Call Flow

The following steps take you through an on-premises API call workflow for using the Analytics Events API. The steps show cURL examples for creating a schema, publishing an event to that schema, and then querying the event.

 For SaaS deployments, replace the value for the URL and port in the examples (`<events_service_endpoint>:9080`) to your SaaS URL.

1. Define the schema by associating field names with data types. For example, the following defines a Purchase event type:

```
curl -X POST "<events_service_endpoint>:9080/events/schema/myProducts" -H"X-Events-API-AccountName:customer1_1234-567a-bccc-123" -H"X-Events-API-Key:a123b456-c789-1d23-e456-nnn" -H"Content-type: application/vnd.appd.events+json;v=2" -d '{"schema" : { "id": "string", "productBrand": "string", "userRating": "integer", "price": "float", "productName": "string", "description": "string" } }'
```

2. Publish an event based on the schema you created:

```
curl -X POST "<events_service_endpoint>:9080/events/publish/myProducts" -H"X-Events-API-AccountName:customer1_1234-567a-bccc-123" -H"X-Events-API-Key:a123b456-c789-1d23-e456-nnn" -H"Content-type: application/vnd.appd.events+json;v=2" -d '[{"id": "5653b879ab33a", "productBrand": "ACME", "userRating": 3, "price": 2006.41, "productName": "Watch", "description": "new watch"}, {"id": "5653b879700", "productBrand": "Widget", "userRating": 1, "price": 3800.13, "productName": "Watch", "description": "2015 watch"}]'
```

3. Query the event data:

```
curl -X POST "http://<events_service_endpoint>:9080/events/query" -H"X-Events-API-AccountName:customer1_7xxx-467a-bccc-xxx" -H"X-Events-API-Key:a123b456-c789-1d23-e456-nnn" -H"Content-type: application/vnd.appd.events+text;v=2" -d 'SELECT * FROM myProducts'
```

If including fields with ADQL keywords, enclose the keywords in single quotes. These keywords include, for example, `between`, `in`, `select`, and others.

For a single query request, use this content type:

```
-H"Content-type: application/vnd.appd.events+text;v=2"
```

In a multi-query request, the queries are passed as JSON body text. In this case, use the following content type header:

```
-H"Content-type: application/vnd.appd.events+json;v=2"
```

Custom Event Ingestion Limits

Controller ingestion of custom events has the following limits:

- Fields: 255 maximum per event type
- String attributes: 4 kb maximum length
- Batch total count: 10,000 events per call
- Batch total size: 5 Mb maximum per call

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

- Max custom event schemas for an account: 20
 - Business journey schemas are counted towards the limit of 20.

Custom Events Limit Increase

i Custom events limit increases are available for SaaS Events Service version 4.5.13 and later. On-premises Events Services cannot exceed a maximum of 1500 custom field events.

By default, the Events Service allows you to create up to 1500 custom fields. If you reach 80% capacity of custom fields (1200 fields), the maximum field limit increases by 500 fields at the next index rollover.

For example, if you reach 1400 custom fields, your maximum field limit will increase from 1500 to 2000 fields. If you later reach 1800 custom fields, and maximum increases to 2500 fields.

You can create an absolute maximum of 3000 custom fields. Reaching or exceeding the maximum fields could result in lag or outages.

Publish Events

The Publish Events API call takes an array of events and stores them in the Events Service storage. The data must comply with an existing schema. A single request cannot publish to multiple event types.

If the event data doesn't match an event schema, the Events Service makes a best-effort attempt to match the data to the schema and returns a 400 bad request if unsuccessful.

Format

SaaS On-premises

```
POST https://analytics.api.example.com/events/publish/{schemaName}
```

SaaS On-premises

```
POST http://<events_service_endpoint>:9080/events/publish/{schemaName}
```

Query Params

Error Codes

Error Code	Description
400	The given request was invalid.
401	The given authentication information provided in the authorization header was invalid.
404	No event type could be found for this account.
406	The <code>Accept</code> header was not <code>application/vnd.appd.events+json;v=2</code> .
413	The request body is larger than the max allowed size.
415	The <code>Content-Type</code> header was not <code>application/vnd.appd.events+json;v=2</code> .
429	Too many requests. Returned when <code>account</code> or <code>event</code> reaches limits.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Create Event Schema

Use this API to create your own event schema. The schema defines the overall structure of an event type by field and type.

You only need to use this API if the event you are uploading does not match an existing schema for first-class event types (such as logs or transactions). Events that conform to an existing schema automatically match that schema. Review the supported [data types](#) and [naming restrictions](#) described prior to this topic.

Format

[SaaS](#) [On-premises](#)

```
POST https://analytics.api.example.com/events/schema/{schemaName}
```

[SaaS](#) [On-premises](#)

Example SaaS Retrieve

Request Response

```
GET http://analytics.api.example.com/events/schema/{schemaName} HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Accept: application/vnd.appd.events+json;v=2
```

Request Response

```
HTTP/1.1 200 OK
{
  "schema" : {
    "account": "integer",
    "amount": "float",
    "product": "string"
  }
}
```

Update Event Schema

Use this API to update an existing event schema by field. The request body defines the updates to be applied to the event schema.

As shown in the following example, you specify each field update action as a named section in the request body. The actions are represented by these fields:

- Add field
- Rename field

For the Add field definition, you need to specify the data format for the new field, as you would when [creating the event schema](#).

The response to this call should be the complete event schema as modified.

Format

SaaS On-premises

```
PATCH http://analytics.api.example.com/events/schema/{schemaName}
```

```
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
```

SaaS [On-premises](#)

```
PATCH http://<events_service_endpoint>:9080/events/schema/{schemaName}
```

Path Parameters

Content-type	The <code>Content-Type</code> of the request body. The default is <code>application/vnd.appd.events+json;v=2</code> which also versions the resource representation (v=2).

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Example SaaS Update

[Request](#) [Response](#)

```
PATCH http://analytics.api.example.com/events/schema/{schemaName} HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-type: application/vnd.appd.events+json;v=2
Accept: application/vnd.appd.events+json;v=2

[
  {
    "add": {
      "newfield": "integer"
    },
    "rename": {
      "oldname": "newname",
      "oldname2": "newname2"
    }
  }
]
```

[Request](#) [Response](#)

```
HTTP/1.1 200 OK
```

Delete Event Schema

Use this API to delete an existing event schema.

Format

[SaaS](#) [On-premises](#)

```
DELETE http://<events_service_endpoint>:9080/events/schema/{schemaName}
X-Events-API-AccountName:<global_account_name>
```

```
X-Events-API-Key:<api_key>
```

SaaS On-premises

```
DELETE http://<events_service_endpoint>:9080/events/schema/{schemaName}
```

Path Params

Name	Description
accountId	Account id
eventType	Event schema name

Query Params

N/A

Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI License page.
X-Events-API-Key	The Analytics API key. See Manage API Keys
Accept	The <code>Content-Type</code> of the response body. The following is the supported value: <code>application/vnd.appd.events+json;v=2</code>

Example SaaS Delete Request

```
DELETE http://analytics.api.example.com/events/schema/{schemaName} HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Accept: application/vnd.appd.events+json;v=2
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Querying Events

When querying analytics events data, the following applies:

- Every Events Service API has a limit of 200 searches per minute by each account on each event type.
- The Multi-Query Events API is limited to twenty queries per HTTP request.
- The Analytics Query API can return a maximum of 10,000 results. If you would like to retrieve and paginate over the data, you can use the scroll mode. Scroll mode is limited to 1,000 results per batch.

 Scroll mode cannot be used in Query Events (Multiple Queries).

- Limits work differently for aggregation and non-aggregation queries. Because we use the limits specified in the ADQL query as the bucket count limit, it is not possible to also use it as the overall result count limit. Therefore, the URL parametric limit is used for the overall limit. In the case of non-aggregation queries, there is no bucket limit, so the limit specified in the ADQL query is taken as the row count limit and the URL parametric limit becomes the second place to look for it if the ADQL query does not specify a limit.
 - Aggregation queries: the total returned row count is limited by the limit in the URL query parameter, and is not directly related to the limits specified in the ADQL query statement itself. The limits in the ADQL query apply only to bucket counts in aggregations.
 - Non-aggregation queries: If `LIMIT` is not specified in the `SELECT` statement, the value specified in the URL query parameter is used. If the limit query parameter is also absent, the default is 100.

Query Events (Single Query)

This API can be used either as a simple text-formatted query or as a JSON-formatted query. The JSON-formatted query can accommodate multiple queries per call and is described in [Query Events \(Multiple Queries\)](#).

An event type might search against multiple event types. Therefore, the event type is not provided in the URL path or as a query parameter, but as part of the ADQL query provided in the request body itself. Your ADQL queries must adhere to the syntax described in the [ADQL Reference](#).

This section describes the single query form for querying events.

Format

SaaS On-premises

```
POST http://analytics.api.example.com/events/query?limit=20
```

SaaS On-premises

```
POST http://<events_service_endpoint>:9080/events/query
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-type: application/vnd.appd.events+text;v=2
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Query Params

Name	Description
start	<p>Filter results based on the minimum event timestamp, specified in ISO 8601 time (https://en.wikipedia.org/wiki/ISO_8601) or Unix time (http://en.wikipedia.org/wiki/Unix_time). If not specified, then the default is no minimum timestamp filtering. Note that data returned will always be limited by the data retention.</p> <p>Specify the time in combined UTC date and time format or epoch milliseconds.</p> <p>Start time is inclusive of limiting timestamps.</p>
end	<p>Filter results based on the maximum event timestamp, specified in ISO 8601 time (https://en.wikipedia.org/wiki/ISO_8601) or Unix time (http://en.wikipedia.org/wiki/Unix_time). If not specified, then the default is no maximum timestamp filtering.</p> <div style="border: 1px solid #0070C0; background-color: #E6F2FF; padding: 5px; margin: 10px 0;"> <p> Data returned will always be limited by the data retention.</p> </div> <p>Specify the time in combined UTC date and time format or epoch milliseconds.</p> <p>End time is inclusive of limiting timestamps.</p>
limit	<p>Limits the number of results returned. The default value is 100. The upper limit on the results that can be fetched is 1,000.</p>
mode	<p>The default mode is none. You can use the scroll mode to fetch bulk data and paginate over 10,000 ADQL results. Unless a limit is specified in the query, the API enables the Events Service to fetch beyond the maximum limit. The default mode supports aggregation but the scroll mode does not support aggregation or math operations. Order by queries is supported in scroll mode.</p> <p>Scroll queries returns results in batches. Every request response contains results along with a <code>scrollid</code>, which needs to be passed in the next request to fetch the next batch of results.</p>

Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI License page.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Name	Description
X-Events-API-Key	The Analytics API key. See Manage API Keys .
Accept	The Content-Type of the response body. The supported value is application/vnd.appd.events+json;v=2.
Content-type	The Content-Type of the request body. The default is application/vnd.appd.events+json;v=2 which also versions the resource representation (v=2).

Example SaaS Query

[Request](#) [Response](#)

```
POST http://analytics.api.example.com/events/query?
start=1422823420000&end=1423687476000&limit=20000 HTTP/1.1
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
Content-Type: application/vnd.appd.events+text;v=2
Accept: application/vnd.appd.events+json;v=2

SELECT * FROM county WHERE size>=30 AND population>20000
```

[Request](#) [Response](#)

```
HTTP/1.1 200 OK
{
  "total": 10000,
  "fields": [
    { "label": "eventTimestamp", "field": "eventTimestamp", "type": "date",
"aggregation": null },
    { "label": "size", "field": "size", "type": "integer",
"aggregation": null },
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

    { "label": "population",          "field": "population",          "type": "integer",
    "aggregation": null },
    { "label": "pickupTimestamp", "field": "pickupTimestamp", "type": "date",
    "aggregation": null }
  ],
  "results": [
    [ "2015-01-03T23:55:39.801-08:00", 35, 47500, "2015-02-11T19:52:28.805Z" ],
    ...
  ]
}

```

[First Request](#) [First Response](#) [Subsequent Requests](#)

```

}]"
```

Query Events (Multiple Queries)

Use this API to execute multiple queries against a particular account and event type in parallel. A query event that specifies multiple queries does so by including multiple ADQL queries in the body of the request. Your ADQL queries must adhere to the syntax described in the [ADQL Reference](#).

Using queries in this form takes advantage of certain backend optimizations in query performance. Query filter criteria, such as time range and limit, can be overridden by each inner query.

i The Multi-Query Events API is limited to twenty queries per HTTP request.

Format

SaaS On-premises

```
POST http://analytics.api.example.com/events/query?limit=20
```

SaaS On-premises

```
POST http://<events_service_endpoint>:9080/events/query
X-Events-API-AccountName:<global_account_name>
X-Events-API-Key:<api_key>
```

Path Params

None

Query Params

Name	Description
start	<p>Filter results based on the minimum event timestamp, specified in ISO 8601 time or Unix time. If not specified, then the default is no minimum timestamp filtering.</p> <p>Specify the time in combined UTC date and time format or epoch milliseconds.</p> <p>Start time is inclusive of limiting timestamps.</p>
end	<p>Filter results based on the maximum event timestamp, specified in ISO 8601 time or Unix time. If not specified, then the default is no maximum timestamp filtering.</p> <p>Specify the time in combined UTC date and time format or epoch milliseconds.</p> <p>End time is inclusive of limiting timestamps.</p>
limit	<p>Limits the number of results returned. The default value is 100. The upper limit on the results that can be fetched is 10,000.</p>

Headers

Name	Description
X-Events-API-AccountName	The global account name, as shown in the Controller UI License page.
X-Events-API-Key	The Analytics API key. See Manage API Keys .
Accept	The <code>Content-Type</code> of the response body. The supported value is <code>application/vnd.appd.events+json;v=2</code> .

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Name	Description
Content-type	The Content-Type of the request body. The default is application/vnd.appd.events+json;v=2 which also versions the resource representation (v=2).

Payload

Field	Description
label	(Optional) Friendly name to identify the query.
query	ADQL query to execute.
start	(Optional) Overrides the start parameter value provided as a query parameter.
end	(Optional) Overrides the end parameter value provided as a query parameter.
limit	(Optional) Overrides the limit provided as a query parameter.

Example SaaS Multiple Query

[Request](#) Response

```

```

RBAC API

This page describes the Role-Based Access Control (RBAC) API methods you can use to manage users, groups, and roles for AppDynamics features. These operations provide more flexibility and automation with RBAC management. Relationship settings such as `addUserToGroup` and `removeUserToGroup` are supported.

Support

- You must be the account owner or have **administer user** permissions to use the RBAC API.
- SAML and LDAP user creations are not supported. You can only create permissions through the UI. See [Manage Controller Tenant Users and Groups](#).

Create User

Use this to create users in the current account. The request payload should specify `name`, `security_provider_type`, `displayName`, and `password`. The user ID is generated by the server.

Format

```
POST /controller/api/rbac/v1/users
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>name</code>	Request payload		Yes
<code>security_provider_type</code>	Request payload	"INTERNAL"	Yes
<code>displayName</code>	Request payload		Yes
<code>password</code>	Request payload		Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"name": "user10", "security_provider_type":
"INTERNAL", "displayName": "user10", "password": "welcome"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
users

Response status code 200 :
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
{
  "id": 10,
  "name": "user10",
  "displayName": "user10",
  "security_provider_type": "INTERNAL"
}
```

Get User by ID

Use this to get full user information, including a summary of affiliated groups and roles, using the `userId` in the current account.

Format

```
GET /controller/api/rbac/v1/users/userId
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/4
```

Response status code 200 :

```
{
  "id": 4,
  "name": "user1",
  "email": "user1@customer1.com",
  "displayName": "user1",
  "security_provider_type": "INTERNAL",
  "roles":
  [
    {"id": 17, "name": "Workflow Executor"},
    {"id": 18, "name": "DB Monitoring Administrator"},
    {"id": 19, "name": "DB Monitoring User"},
    {"id": 20, "name": "Analytics Administrator"},
    {"id": 21, "name": "Server Monitoring Administrator"},
    {"id": 22, "name": "Server Monitoring User"},
    {"id": 23, "name": "Universal Agent Administrator"},
    {"id": 24, "name": "Universal Agent User"},
    {"id": 13, "name": "Account Administrator"},
    {"id": 14, "name": "Administrator"},
    {"id": 15, "name": "User"},
  ]
}
```

```

    {"id": 16, "name": "Dashboard Viewer"}
  ],
  "groups":
  [
    {"id": 1, "name": "group_01"}
  ]
}

```

Get User by Name

Use this to get full user information, including a summary of affiliated groups and roles, using the `userName` in the current account.

Format

```
GET /controller/api/rbac/v1/users/name/name
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/name/user1
```

Response status code 200 :

```

{
  "id": 4,
  "name": "user1",
  "email": "user1@customer1.com",
  "displayName": "user1",
  "security_provider_type": "INTERNAL",
  "roles":
  [
    {"id": 17, "name": "Workflow Executor"},
    {"id": 18, "name": "DB Monitoring Administrator"},
    {"id": 19, "name": "DB Monitoring User"},
    {"id": 20, "name": "Analytics Administrator"},
    {"id": 21, "name": "Server Monitoring Administrator"},
    {"id": 22, "name": "Server Monitoring User"},
    {"id": 23, "name": "Universal Agent Administrator"},
    {"id": 24, "name": "Universal Agent User"},
    {"id": 13, "name": "Account Administrator"},
  ]
}

```

```

        {"id": 14, "name": "Administrator"},
        {"id": 15, "name": "User"},
        {"id": 16, "name": "Dashboard Viewer"}
    ],
    "groups":
    [
        {"id": 1, "name": "group_01"}
    ]

```

- This API only supports retrieving internal users and not SAML or LDAP.
- You have to include an optional parameter (`securityProviderType`) to find SAML/LDAP users.

Get All Users

Use this to get a list of all users in the current account. The list includes user summaries, which includes `userId` and `userName`.

Format

```
GET /controller/api/rbac/v1/users
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users
```

Response status code 200 :

```

{
  "users":
  [
    {"id": 4, "name": "user1"},
    {"id": 10, "name": "user10"}
  ]
}

```

Update User

Use this to update a user by `userId` in the current account. Only the user object itself is updated, with the relationship to roles and groups remaining unaffected.

Format

```
PUT /controller/api/rbac/v1/users/userId
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	Request payload		Yes
name	Request payload		Yes
displayName	Request payload		Yes
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 11,"name": "updated_user9","displayName":
"user9","security_provider_type": "INTERNAL"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
users/11
```

Response status code 200 :

```
{
  "id": 11,
  "name": "updated_user9",
  "displayName": "user9",
  "security_provider_type": "INTERNAL"
}
```

Delete User

Use this to delete a user by `userId` in the current account.

Format

```
DELETE /controller/api/rbac/v1/users/userId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/users/11

Response status code 200 :
```

Create Group

Use this to create a group in the current account. The `groupId` is generated by the server.

Format

POST `/controller/api/rbac/v1/groups`

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>name</code>	Request payload		Yes
<code>description</code>	Request payload		No
<code>security_provider_type</code>	Request payload	<code>"INTERNAL"</code>	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"name": "group100","description": "new description",
"security_provider_type": "INTERNAL"}' -u user1@customer1
http://localhost:8080/controller/api/rbac/v1/groups

Response status code 200 :
{
  "id": 2,
  "name": "group100",
  "security_provider_type": "INTERNAL",
  "description": "new description"
}
```

Get Group by ID

Use this to get full group information by `groupId` in the current account.

Format

```
GET /controller/api/rbac/v1/groups/groupId
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/1

Response status code 200 :
{
  "id": 1,
  "name": "group_03",
  "security_provider_type": "INTERNAL"
  "description": "",
  "roles":
    [
      {"id": 19,"name": "DB Monitoring User"},
      {"id": 20,"name": "Analytics Administrator"},
      {"id": 21,"name": "Server Monitoring Administrator"},
      {"id": 22,"name": "Server Monitoring User"},
      {"id": 23,"name": "Universal Agent Administrator"},
      {"id": 13,"name": "Account Administrator"},
      {"id": 16,"name": "Dashboard Viewer"}
    ]
}
```

Get Group by Name

Use this to get full group information by `groupName` in the current account.

Format

```
GET /controller/api/rbac/v1/groups/name/name
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/name/group_03
```

Response status code 200 :

```
{
  "id": 1,
  "name": "group_03",
  "security_provider_type": "INTERNAL"
  "description": "",
  "roles":
    [
      {"id": 19, "name": "DB Monitoring User"},
      {"id": 20, "name": "Analytics Administrator"},
      {"id": 21, "name": "Server Monitoring Administrator"},
      {"id": 22, "name": "Server Monitoring User"},
      {"id": 23, "name": "Universal Agent Administrator"},
      {"id": 13, "name": "Account Administrator"},
      {"id": 16, "name": "Dashboard Viewer"}
    ]
}
```

Get All Groups

Use this to get all groups in the current account. This only returns group summaries, which includes `groupId` and `groupName`.

Format

```
GET /controller/api/rbac/v1/groups
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups
```

Response status code 200 :

```
{
  "groups":
    [
      {"id": 1, "name": "group_03"},
    ]
}
```

```

    {"id": 2, "name": "group100"}
  ]
}
```

Update Group

Use this to update a group by `groupId` in the current account. Only the group itself is updated, while the relationships with users and roles remain unaffected.

Format

```
PUT /controller/api/rbac/v1/groups/groupId
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>id</code>	Request payload		Yes
<code>name</code>	Request payload		Yes
<code>description</code>	Request payload		No
<code>security_provider_type</code>	Request payload	"INTERNAL"	Yes

Example

```

curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 1, "name": "group2", "description": "new
description", "security_provider_type": "INTERNAL"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
groups/1
```

Response status code 200 :

```

{
  "id": 1,
  "name": "group2",
  "security_provider_type": "INTERNAL",
  "description": "new description",
  "roles":
```

```
[
  {"id": 19,"name": "DB Monitoring User"},
  {"id": 20,"name": "Analytics Administrator"},
  {"id": 21,"name": "Server Monitoring Administrator"},
  {"id": 22,"name": "Server Monitoring User"},
  {"id": 23,"name": "Universal Agent Administrator"},
  {"id": 13,"name": "Account Administrator"},
  {"id": 16,"name": "Dashboard Viewer"}
]
```

Delete Group

Use this to delete a group by `groupId` in the current account.

Format

```
DELETE /controller/api/rbac/v1/groups/groupId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/groups/1
```

Response status code 200 :

Add User to Group

Use this to add a user to a group by `userId` and `groupId`.

Format

```
PUT /controller/api/rbac/v1/groups/groupId/users/userId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups/2/users/10
```

Response status code 200 :

Remove User from Group

Use this to remove a user from a group by `userId` and `groupId` .

Format

```
DELETE /controller/api/rbac/v1/groups/groupId/users/userId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/groups/2/users/10
```

Response status code 200 :

Create Role

Use this to create a role in the current account. The ID is generated by the server.

Format

```
POST /controller/api/rbac/v1/roles
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>name</code>	Request payload		Yes
<code>description</code>	Request payload		No
<code>permissions</code>	Request payload		No

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Example

```
curl -X POST /controller/api/rbac/v1/roles \  
-H 'Content-Type: application/vnd.appd.cntrl+json;v=1' \  
-d '{  
  "name": "SampleRole2",  
  "permissions": [  
    {  
      "entityType": "APPLICATION",  
      "entityId": 24,  
      "action": "CONFIG_ACTIONS"  
    },  
    {  
      "entityType": "APPLICATION",  
      "entityId": 24,  
      "action": "CONFIG_BASELINES"  
    },  
    {  
      "entityType": "APPLICATION",  
      "entityId": 24,  
      "action": "CONFIG_BUSINESS_TRANSACTIONS"  
    },  
    {  
      "entityType": "APPLICATION",  
      "entityId": 24,  
      "action": "CONFIG_ERROR_DETECTION"  
    },  
    {  
      "entityType": "APPLICATION",  
      "entityId": 24,  
      "action": "CONFIG_EUM"  
    },  
    {  
      "entityType": "APPLICATION",

200 OK  
{  
  "id": 87,  
  "name": "SampleRole2"  
}
```

Add Role to User

Use this to add a role to a user by `roleId` and `userId`.

Format

```
PUT /controller/api/rbac/v1/roles/roleId/users/userId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X  
PUT -u user1@customer1 http://localhost:8080/controller/api/  
rbac/v1/roles/50/users/10
```

Response status code 200 :

Remove Role from User

Use this to remove a role from a user by `roleId` and `userId`.

Format

```
DELETE /controller/api/rbac/v1/roles/roleId/users/userId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/50/users/10
```

```
Response status code 200 :
```

Add Role to Group

Use this to add a role to a group by `roleId` and `groupId`.

Format

```
PUT /controller/api/rbac/v1/roles/roleId/groups/groupId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/50/groups/2
```

```
Response status code 200 :
```

Remove Role from Group

Use this to remove a role from a group by `roleId` and `groupId`.

Format

```
DELETE /controller/api/rbac/v1/roles/roleId/groups/groupId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/50/groups/2
```

Response status code 200 :

Get Role by ID

Use this to get full role information by `roleId` in the current account. This only returns the `role` object.

Format

```
GET /controller/api/rbac/v1/roles/[roleId]?include-permissions=true
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>id</code>	Request payload		Yes
<code>include-permissions (>= v4.5.14)</code>	Request payload	<code>"true"</code>	No

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/15?include-permissions=true
```

Response status code 200 :

```
{
  "id": 15,
  "name": "SampleRole",
  "permissions": [
    {
      "id": 2619,
      "entityType": "APPLICATION",
      "entityId": 27,
      "action": "CONFIG_ACTIONS"
    }
  ]
}
```

```
  },
  {
    "id": 2621,
    "entityType": "APPLICATION",
    "entityId": 27,
    "action": "CONFIG_BASELINES"
  },
  {
    "id": 2620,
    "entityType": "APPLICATION",
    "entityId": 27,
    "action": "CONFIG_BUSINESS_TRANSACTIONS"
  },
  {
    "id": 2610,
    "entityType": "APPLICATION",
    "entityId": 27,
    "action": "CONFIG_ERROR_DETECTION"
  },
  {
    "id": 2615,
    "entityType": "APPLICATION",
    "entityId": 27,
    "action": "CONFIG_EUM"
  },
  {
    "id": 2618,
    "entityType": "APPLICATION",
    "entityId": 27,
    "action": "CONFIG_EVENT_REACTOR"
  },
  {
    "id": 2617,
    "entityType": "APPLICATION",
    "entityId": 27,
    "action": "CONFIG_POLICIES"
  },
  {
    "id": 2608,
    "entityType": "APPLICATION",
```

```

    "entityId": 27,
    "action": "CONFIG_TRANSACTION_DETECTION"
  },
  {
    "id": 2606,
    "entityType": "APPLICATION",
    "entityId": 27,
    "action": "VIEW"
  }
]
}

```

Get Role by Name

Use this to get full role information by `roleName` in the current account.

Format

```
GET /controller/api/rbac/v1/roles/name/[RoleName]?include-permissions=true
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
include-permissions (>= v4.5.14)	Request payload	"true"	No

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/name/SampleRole?include-permissions=true
```

Response status code 200 :

```

{
  "id": 15,
  "name": "SampleRole",

```

```
"permissions": [  
  {  
    "id": 2619,  
    "entityType": "APPLICATION",  
    "entityId": 27,  
    "action": "CONFIG_ACTIONS"  
  },  
  {  
    "id": 2621,  
    "entityType": "APPLICATION",  
    "entityId": 27,  
    "action": "CONFIG_BASELINES"  
  },  
  {  
    "id": 2620,  
    "entityType": "APPLICATION",  
    "entityId": 27,  
    "action": "CONFIG_BUSINESS_TRANSACTIONS"  
  },  
  {  
    "id": 2610,  
    "entityType": "APPLICATION",  
    "entityId": 27,  
    "action": "CONFIG_ERROR_DETECTION"  
  },  
  {  
    "id": 2615,  
    "entityType": "APPLICATION",  
    "entityId": 27,  
    "action": "CONFIG_EUM"  
  },  
  {  
    "id": 2618,  
    "entityType": "APPLICATION",  
    "entityId": 27,  
    "action": "CONFIG_EVENT_REACTOR"  
  },  
  {  
    "id": 2617,  
    "entityType": "APPLICATION",
```

```

    "entityId": 27,
    "action": "CONFIG_POLICIES"
  },
  {
    "id": 2608,
    "entityType": "APPLICATION",
    "entityId": 27,
    "action": "CONFIG_TRANSACTION_DETECTION"
  },
  {
    "id": 2606,
    "entityType": "APPLICATION",
    "entityId": 27,
    "action": "VIEW"
  }
]
}

```

Get All Roles

Use this to get all roles in the current account. This only returns role summaries, which includes `roleId` and `roleName`.

Format

```
GET /controller/api/rbac/v1/roles
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles
```

Response status code 200 :

```

{
  "roles":
  [
    {"id": 13, "name": "Account Administrator"},
    {"id": 14, "name": "Administrator"},
    {"id": 20, "name": "Analytics Administrator"},
    {"id": 16, "name": "Dashboard Viewer"},
    {"id": 18, "name": "DB Monitoring Administrator"},
  ]
}

```

```

        {"id": 19, "name": "DB Monitoring User"},
        {"id": 21, "name": "Server Monitoring Administrator"},
        {"id": 22, "name": "Server Monitoring User"},
        {"id": 23, "name": "Universal Agent Administrator"},
        {"id": 24, "name": "Universal Agent User"},
        {"id": 15, "name": "User"},
        {"id": 17, "name": "Workflow Executor"}
    ]
}

```

Update Role

Use this to update a role by `roleId` in the current account. This only updates the `role` object itself, while leaving the relationship with users and groups unaffected.

You cannot update permissions within a role through this API. You can only update the `name` and `description` parameters.

Format

```
PUT /controller/api/rbac/v1/roles/roleId
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>id</code>	Request payload		Yes
<code>name</code>	Request payload		Yes
<code>description</code>	Request payload		No

Example

```

curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 49, "name": "role1", "description": "new
description" }' -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/49

```

```

Response status code 200 :
{

```

```
"id": 49,  
"name": "role1",  
"description": "new description"  
}
```

Delete Role

Use this to delete a role in the current account.

Format

```
DELETE /controller/api/rbac/v1/roles/roleId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/  
controller/api/rbac/v1/roles/49
```

Response status code 200 :

Create Central Identity User API

This page describes the Create Central Identity User API methods you can use to create central identity(ci) users in the current account. This API is only available when the current account is configured with the `CI_USER_CREATION` property.

You must be the account owner or have the **administer user** permissions to use the Create Central Identity User

SAML and LDAP user creations are not supported. You can only create permissions through the UI. See [Manage Custom Roles](#).

Create User

The request payload should specify `email`, `security_provider_type`, and `displayName`. The server generates the user ID.

Format

```
POST /controller/api/rbac/v1/ci-user
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>email</code>	Request payload		Yes
<code>security_provider_type</code>	Request payload	"INTERNAL"	Yes
<code>displayName</code>	Request payload		Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"email": "user10@domain.com",
"security_provider_type": "INTERNAL", "displayName": "user10"}'
-u user1@customer1 http://localhost:8080/controller/api/rbac/v1/
ci-user
```

Response status code 200 :

```
{
  "id": 10,
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
"name": "user10@domain.com",  
"email": "user10@domain.com",  
"displayName": "user10",  
"security_provider_type": "INTERNAL"  
}
```

Get User by ID

Use this to get full user information, including a summary of affiliated groups and roles, using the `userId` in the current account.

Format

```
GET /controller/api/rbac/v1/users/userId
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/  
rbac/v1/users/4
```

Response status code 200 :

```
{  
  "id": 4,  
  "name": "user1",  
  "email": "user1@customer1.com",  
  "displayName": "user1",  
  "security_provider_type": "INTERNAL",  
  "roles":  
    [  
      {"id": 17, "name": "Workflow Executor"},  
      {"id": 18, "name": "DB Monitoring Administrator"},  
      {"id": 19, "name": "DB Monitoring User"},  
      {"id": 20, "name": "Analytics Administrator"},  
      {"id": 21, "name": "Server Monitoring Administrator"},  
      {"id": 22, "name": "Server Monitoring User"},  
      {"id": 13, "name": "Account Administrator"},  
      {"id": 14, "name": "Administrator"},  
      {"id": 15, "name": "User"},  
      {"id": 16, "name": "Dashboard Viewer"}  
    ],  
  "groups":
```

```
[
  {"id": 1, "name": "group_01"}
]
```

Get User by Name

Use this to get full user information, including a summary of affiliated groups and roles, using the `userName` in the current account.

Format

```
GET /controller/api/rbac/v1/users/name/name
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users/name/user1
```

Response status code 200 :

```
{
  "id": 4,
  "name": "user1",
  "email": "user1@customer1.com",
  "displayName": "user1",
  "security_provider_type": "INTERNAL",
  "roles":
  [
    {"id": 17, "name": "Workflow Executor"},
    {"id": 18, "name": "DB Monitoring Administrator"},
    {"id": 19, "name": "DB Monitoring User"},
    {"id": 20, "name": "Analytics Administrator"},
    {"id": 21, "name": "Server Monitoring Administrator"},
    {"id": 22, "name": "Server Monitoring User"},
    {"id": 13, "name": "Account Administrator"},
    {"id": 14, "name": "Administrator"},
    {"id": 15, "name": "User"},
    {"id": 16, "name": "Dashboard Viewer"}
  ],
  "groups":
  [
```

```
[
  {"id": 1, "name": "group_01"}
]
```

Get All Users

Use this to get a list of all users in the current account. The list includes user summaries, which includes `userId` and `userName`.

Format

```
GET /controller/api/rbac/v1/users
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/users
```

Response status code 200 :

```
{
  "users":
  [
    {"id": 4, "name": "user1"},
    {"id": 10, "name": "user10"}
  ]
}
```

Update User

Use this to update a user by `userId` in the current account. Only the user object itself is updated, with the relationship to roles and groups remaining unaffected.

Format

```
PUT /controller/api/rbac/v1/users/userId
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	Request payload		Yes

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
displayName	Request payload		Yes
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 11,"name": "updated_user9","displayName":
"user9","security_provider_type": "INTERNAL"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
users/11
```

Response status code 200 :

```
{
  "id": 11,
  "name": "updated_user9",
  "displayName": "user9",
  "security_provider_type": "INTERNAL"
}
```

Delete User

Use this to delete a user by `userId` in the current account.

Format

```
DELETE /controller/api/rbac/v1/users/userId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/users/11
```

Response status code 200 :

Create Group

Use this to create a group in the current account. The `groupId` is generated by the server.

Format

```
POST /controller/api/rbac/v1/groups
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>name</code>	Request payload		Yes
<code>description</code>	Request payload		No
<code>security_provider_type</code>	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"name": "group100","description": "new description",
"security_provider_type": "INTERNAL"}' -u user1@customer1
http://localhost:8080/controller/api/rbac/v1/groups
```

Response status code 200 :

```
{
  "id": 2,
  "name": "group100",
  "security_provider_type": "INTERNAL",
  "description": "new description"
}
```

Get Group by ID

Use this to get full group information by `groupId` in the current account.

Format

```
GET /controller/api/rbac/v1/groups/groupId
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups/1

Response status code 200 :
{
  "id": 1,
  "name": "group_03",
  "security_provider_type": "INTERNAL"
  "description": "",
  "roles":
    [
      {"id": 19,"name": "DB Monitoring User"},
      {"id": 20,"name": "Analytics Administrator"},
      {"id": 21,"name": "Server Monitoring Administrator"},
      {"id": 22,"name": "Server Monitoring User"},
      {"id": 13,"name": "Account Administrator"},
      {"id": 16,"name": "Dashboard Viewer"}
    ]
}
```

Get Group by Name

Use this to get full group information by `groupName` in the current account.

Format

```
GET /controller/api/rbac/v1/groups/name/name
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups/name/group_03

Response status code 200 :
{
  "id": 1,
  "name": "group_03",
  "security_provider_type": "INTERNAL"
  "description": "",
  "roles":
```

```
[
  {"id": 19,"name": "DB Monitoring User"},
  {"id": 20,"name": "Analytics Administrator"},
  {"id": 21,"name": "Server Monitoring Administrator"},
  {"id": 22,"name": "Server Monitoring User"},
  {"id": 13,"name": "Account Administrator"},
  {"id": 16,"name": "Dashboard Viewer"}
]
```

Get All Groups

Use this to get all groups in the current account. This only returns group summaries, which includes `groupId` and `groupName`.

Format

```
GET /controller/api/rbac/v1/groups
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups

Response status code 200 :
{
  "groups":
  [
    {"id": 1,"name": "group_03"},
    {"id": 2,"name": "group100"}
  ]
}
```

Update Group

Use this to update a group by `groupId` in the current account. Only the group itself is updated, while the relationships with users and roles remain unaffected.

Format

```
PUT /controller/api/rbac/v1/groups/groupId
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	Request payload		Yes
name	Request payload		Yes
description	Request payload		No
security_provider_type	Request payload	"INTERNAL"	Yes

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 1, "name": "group2", "description": "new
description", "security_provider_type": "INTERNAL"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
groups/1
```

Response status code 200 :

```
{
  "id": 1,
  "name": "group2",
  "security_provider_type": "INTERNAL",
  "description": "new description",
  "roles":
    [
      {"id": 19, "name": "DB Monitoring User"},
      {"id": 20, "name": "Analytics Administrator"},
      {"id": 21, "name": "Server Monitoring Administrator"},
      {"id": 22, "name": "Server Monitoring User"},
      {"id": 13, "name": "Account Administrator"},
      {"id": 16, "name": "Dashboard Viewer"}
    ]
}
```

Delete Group

Use this to delete a group by `groupId` in the current account.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Format

```
DELETE /controller/api/rbac/v1/groups/groupId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/groups/1
```

```
Response status code 200 :
```

Add User to Group

Use this to add a user to a group by `userId` and `groupId` .

Format

```
PUT /controller/api/rbac/v1/groups/groupId/users/userId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/groups/2/users/10
```

```
Response status code 200 :
```

Remove User from Group

Use this to remove a user from a group by `userId` and `groupId` .

Format

```
DELETE /controller/api/rbac/v1/groups/groupId/users/userId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/groups/2/users/10
```

```
Response status code 200 :
```

Create Role

Use this to create a role in the current account. The ID is generated by the server.

Format

```
POST /controller/api/rbac/v1/roles
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	Request payload		Yes
description	Request payload		No

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
POST -d '{"name": "role2","description": "new description"}' -u
user1@customer1 http://localhost:8080/controller/api/rbac/v1/
roles
```

```
Response status code 200 :
```

```
{
  "id": 49,
  "name": "role2",
  "description": "new description"
}
```

Add Role to User

Use this to add a role to a user by `roleId` and `userId`.

Format

```
PUT /controller/api/rbac/v1/roles/roleId/users/userId
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/50/users/10
```

Response status code 200 :

Remove Role from User

Use this to remove a role from a user by `roleId` and `userId` .

Format

```
DELETE /controller/api/rbac/v1/roles/roleId/users/userId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/50/users/10
```

Response status code 200 :

Add Role to Group

Use this to add a role to a group by `roleId` and `groupId` .

Format

```
PUT /controller/api/rbac/v1/roles/roleId/groups/groupId
```

Example

```
curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/50/groups/2
```

Response status code 200 :

Remove Role from Group

Use this to remove a role from a group by `roleId` and `groupId`.

Format

```
DELETE /controller/api/rbac/v1/roles/roleId/groups/groupId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/50/groups/2
```

```
Response status code 200 :
```

Get Role by ID

Use this to get full role information by `roleId` in the current account. This only returns the role object.

Format

```
GET /controller/api/rbac/v1/roles/roleId
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/
rbac/v1/roles/15
```

```
Response status code 200 :
```

```
{
  "id": 15,
  "name": "User",
  "description": "Can view applications and dashboards but not
modify their configuration"
}
```

Get Role by Name

Use this to get full role information by `roleName` in the current account.

Format

```
GET /controller/api/rbac/v1/roles/name/name
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles/name/User
```

Response status code 200 :

```
{
  "id": 15,"name":
  "User",
  "description": "Can view applications and dashboards but not
modify their configuration"
}
```

Get All Roles

Use this to get all roles in the current account. This only returns role summaries, which includes `roleId` and `roleName`.

Format

```
GET /controller/api/rbac/v1/roles
```

Example

```
curl -u user1@customer1 http://localhost:8080/controller/api/rbac/v1/roles
```

Response status code 200 :

```
{
  "roles":
  [
    {"id": 13,"name": "Account Administrator"},
    {"id": 14,"name": "Administrator"},
    {"id": 20,"name": "Analytics Administrator"},
    {"id": 16,"name": "Dashboard Viewer"},
    {"id": 18,"name": "DB Monitoring Administrator"},
    {"id": 19,"name": "DB Monitoring User"},
    {"id": 21,"name": "Server Monitoring Administrator"},
    {"id": 22,"name": "Server Monitoring User"},
    {"id": 15,"name": "User"},
    {"id": 17,"name": "Workflow Executor"}
  ]
}
```

```

    ]
}

```

Update Role

Use this to update a role by `roleId` in the current account. This only updates the role object itself, while leaving the relationship with users and groups unaffected.

Format

```
PUT /controller/api/rbac/v1/roles/roleId
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
<code>id</code>	Request payload		Yes
<code>name</code>	Request payload		Yes
<code>description</code>	Request payload		No

Example

```

curl -H "Content-Type: application/vnd.appd.cntrl+json;v=1" -X
PUT -d '{"id": 49, "name": "role1", "description": "new
description"}' -u user1@customer1 http://localhost:8080/
controller/api/rbac/v1/roles/49

Response status code 200 :
{
  "id": 49,
  "name": "role1",
  "description": "new description"
}

```

Delete Role

Use this to delete a role in the current account.

Format

```
DELETE /controller/api/rbac/v1/roles/roleId
```

Example

```
curl -X DELETE -u user1@customer1 http://localhost:8080/  
controller/api/rbac/v1/roles/49
```

```
Response status code 200 :
```

License API

Related pages:

- [Observe License Usage](#)
- [AppDynamics Licensing](#)
- [License Entitlements and Restrictions](#)

This page describes the License APIs you can use to perform functions related to licensing and accounts including uploading license files, allocating licenses, getting license and account usage information as well as creating, updating, and deleting license rules.

The License APIs below are separated by licensing model. To learn about licenses within each model, see [License Entitlements and Restrictions](#).

[Infrastructure-based Licensing](#) [Agent-based Licensing](#)

APIs for [Infrastructure-based Licensing](#):

Account Usage API

A RESTful API to programmatically retrieve account usage by license and account ID.

Retrieve Account Usage by License ID

Retrieve account usage referenced by given license ID.

URL

```
http://<host>:<port>/controller/licensing/v1/usage/license/{licenseId}
```

Format

```
GET /controller/licensing/v1/usage/license/{licenseId}
```

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
licenseId	String	License Id for which an usage is requested to be retrieved.	Yes

Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
dateFrom	String	Start date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
dateTo	String	End date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
granularityMinutes	Integer	Requested granularity of the license usage data.	Yes
includeEntityTypes	Boolean	Determines whether to include licensed entity type usage or not. The default is false.	No
includeConsumptionBased	Boolean	Whether to include consumption-based usages. The default is false.	No

Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID.
licenseRule	Object	Entity representing license usage either for an account or for an allocation.
packages	Array of package Objects	

licenseRule Object

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value
id	String	Allocation ID.
name	String	Allocation name.
licenseKey	String	License key for this particular allocation.

packageObject

Parameter Name	Parameter Type	Value
packageName	String	An enumeration representing the name of the package (edition) instance: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" • "ENTERPRISE"
type	String	An enumeration representing the type of the package instance: <ul style="list-style-type: none"> • "PAID" • "TRIAL" • "LITE"
kind	String	Package kind derived from the licensing model where the package originated from. Useful for quickly distinguishing packages based on the legacy Agent based license modules (APM, DOTNET, etc.) from the new Infrastructure based packages. Enum: "AGENT_BASED" "INFRASTRUCTURE_BASED"
family	String	Package family.
createdDate	String	Creation date of the package instance in the license. ISO 8601 date-time string.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value
startDate	String	Start date of the package instance. For example, the date from which the package instance becomes active: ISO 8601 date-time string.
expirationDate	String	Expiration date of the package instance, i.e. date from which the package instance is no longer active. ISO 8601 date-time string.
licenseUnits	String	Number of licenses available for the package instance.
properties	Object	Collection of package specific custom properties in the form of key-value pairs. In case of merging with global properties, conflicting package specific properties take precedence.

Example

[Request](#) [Response](#)

```
curl --user <user>@<AccountName>:<password> -X GET \
  http://<host>:<port>/controller/licensing/v1/usage/
  license/{licenseId}?dateFrom=<ISO 8601 date-time
  string>&dateTo=<ISO 8601 date-time
  string>&granularityMinutes=<number of minutes as an integer>
```

[Request](#) [Response](#)

```
{
  "accountId":0,
  "licenseRule":{
    "id":"string",
    "name":"string",
    "licenseKey":"string"
  },
}
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

Retrieve Account Usage by Account ID

Retrieve account usage referenced by given account ID.

URL

```
http://<host>:<port>/controller/licensing/v1/usage/account/{accountId}
```

Format

```
GET /controller/licensing/v1/usage/account/{accountId}
```

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account ID for which a usage is requested to be retrieved.	Yes

Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
dateFrom	String	Start date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
dateTo	String	End date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
granularityMinutes	Integer	Requested granularity of the license usage data.	Yes
includeEntityTypes	Boolean	Determines whether to include licensed entity type usage or not. The default is <code>false</code> .	No

Parameter Name	Parameter Type	Value	Mandatory
includeConsumptionBased	Boolean	Whether to include consumption-based usages. The default is false.	No

Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID.
licenseRule	Object	Entity representing license usage either for an account or for an allocation.
packages	Array	Package objects

licenseRule Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID.
name	String	Allocation name.
licenseKey	String	License key for this particular allocation.

packageObject

Parameter Name	Parameter Type	Value
packageName	String	An enumeration representing the name of the package (edition) instance: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" • "ENTERPRISE"
type	String	An enumeration representing the type of the package instance: <ul style="list-style-type: none"> • "PAID" • "TRIAL" • "LITE"
kind	String	Package kind derived from the licensing model where the package originated from. Useful for quickly distinguishing packages based on the legacy Agent based license modules (APM, DOTNET, etc.) from the new Infrastructure based packages. Enum: "AGENT_BASED" "INFRASTRUCTURE_BASED"
family	String	Package family.
createdDate	String	Creation date of the package instance in the license. ISO 8601 date-time string.
startDate	String	Start date of the package instance. For example, the date from which the package instance becomes active: ISO 8601 date-time string.
expirationDate	String	Expiration date of the package instance, i.e. date from which the package instance is no longer active. ISO 8601 date-time string.
licenseUnits	String	Number of licenses available for the package instance.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value
properties	Object	Collection of package specific custom properties in the form of key-value pairs. In case of merging with global properties, conflicting package specific properties take precedence.

Example

[Request](#) [Response](#)

```
curl --user <user>@<AccountName>:<password> -X GET \
http://<host>:<port>/controller/licensing/v1/usage/account/
{accountId}?dateFrom=<ISO 8601 date-time string>&dateTo=<ISO
8601 date-time string>&granularityMinutes=<number of minutes
as an integer>
```

[Request](#) [Response](#)

```
{
  "accountId":0,
  "licenseRule":{
    "id":"string",
    "name":"string",
    "licenseKey":"string"
  },
  "packages":[
    {
      "name":"string",
      "unitUsages":[
        {
          "usageType":"string",
          "granularityInMinutes":0,
          "data":{
            "timestamp":"string",
            "provisioned":{
              "min":0,
```

                "max":0,
                "avg":0,
                "count":0
            }
        }
    ]
}

```

License Allocation API

The methods below allow you retrieve, create, filter, and delete license allocations (license rules) for an account.

Retrieve All License Allocations

Retrieve all license allocations, and narrow the list of allocations by using optional [query parameters](#).

URL

```
http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation
```

Format

GET /controller/licensing/v1/account/{accountId}/allocation

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes

Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
name	String	Name of the allocation. Cannot be used in combination with license-key and tag.	No
license-key	String	License key of the allocation. Cannot be used in combination with name and tag.	No
tag	String	Tag associated with allocations. Cannot be used in combination with name and license-key.	No

Response Format

response Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID. Unique per account.
accountId	Integer	Account ID the allocation belongs to.
name	String	Name of the allocation. Unique per account.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value
licenseKey	String	License key used by the allocation. Unique per account.
filters	Array of Objects	Array of filter objects
limits	Array of Objects	Array of limit objects
tags	Array of Strings	Tags associated with the allocation.
createdDate	String	Creation date of the allocation: ISO 8601 date-time string.
lastUpdatedDate	String	Last update date of the allocation: ISO 8601 date-time string.

filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"

Parameter Name	Parameter Type	Value
operator	String	Operator of the following enumerations used to check the type against the value: <ul style="list-style-type: none"> ID_EQUALS – Exact match of entity Id EQUALS – Exact match of entity value STARTS_WITH – Match of entity starting with a value ENDS_WITH – Match of entity ending with a value CONTAINS – Match of entity containing a value REGEX – Match of entity against a regexp
value	String	Value to be used to filter against.

limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> "INFRA" "PREMIUM" "ENTERPRISE"
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

Example

[Request](#) Response

```
curl --user <user>@<AccountName>:<password> -X GET \
http://<host>:<port>/controller/licensing/v1/account/
{accountId}/allocation
```

Request Response

```
[
  {
    "id":"string",
    "accountId":0,
    "name":"string",
    "licenseKey":"string",
    "filters":[
      {
        "id":"string",
        "type":"APPLICATION",
        "operator":"ID_EQUALS",
        "value":"string"
      }
    ],
    "limits":[
      {
        "id":"string",
        "package":"INFRA",
        "units":0
      }
    ],
    "tags":[
      "string"
    ],
    "createdDate":"string",
    "lastUpdatedDate":"string"
  }
]
```

Retrieve Allocation Usage by Account ID

Retrieve allocation rule usage referenced by a given license key ID.

URL

```
http://<host>:<port>/controller/licensing/v1/usage/account/{accountId}/allocation/{licenseKey}
```

Format

```
GET /controller/licensing/v1/usage/account/{accountId}/allocation/{licenseKey}
```

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account ID for which a usage is requested to be retrieved.	Yes
licenseKey	String	License key based on the allocation rule is selected. Returned usage will be related to that particular allocation rule.	Yes

Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
dateFrom	String	Start date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
dateTo	String	End date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
granularityMinutes	Integer	Requested granularity of the license usage data.	Yes
includeEntityTypes	Boolean	Determines whether to include licensed entity type usage or not. The default is <code>false</code> .	No

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Response Format

response Object

                "count":0
            }
        }
    ]
}

```

Retrieve Allocation Usage by License Key

Retrieve allocation usage referenced by a given license key.

URL

`http://<host>:<port>/controller/licensing/v1/usage/license/{licenseId}/allocation/{licenseKey}`

Format

`GET /controller/licensing/v1/usage/license/{licenseId}/allocation/{licenseKey}`

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
licenseId	String	License ID for which a usage is requested to be retrieved.	Yes

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value	Mandatory
licenseKey	String	License key based on the allocation rule is selected. Returned usage will be related to that particular allocation rule.	Yes

Query Parameters

Parameter Name	Parameter Type	Value	Mandatory
dateFrom	String	Start date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
dateTo	String	End date of requested license usage period. Expected format is ISO-8601 (extended). For example: '2020-10-05T10:00:00Z'.	Yes
granularityMinutes	Integer	Requested granularity of the license usage data.	Yes
includeEntityTypes	Boolean	Determines whether to include licensed entity type usage or not. The default is <code>false</code> .	No

Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID.
licenseRule	Object	Entity representing license usage either for an account or for an allocation.
packages	Array of package objects	Package objects.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

licenseRule Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID.
name	String	Allocation name.
licenseKey	String	License key for this particular allocation.

packageObject

Parameter Name	Parameter Type	Value
packageName	String	An enumeration representing the name of the package (edition) instance: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" • "ENTERPRISE"
type	String	An enumeration representing the type of the package instance: <ul style="list-style-type: none"> • "PAID" • "TRIAL" • "LITE"

<code>startDate</code>	String	Start date of the package instance. For example, the date from which the package instance becomes active: ISO 8601 date-time string.
<code>expirationDate</code>	String	Expiration date of the package instance, i.e. date from which the package instance is no longer active. ISO 8601 date-time string.
<code>licenseUnits</code>	String	Number of licenses available for the package instance.
<code>properties</code>	Object	Collection of package specific custom properties in the form of key-value pairs. In case of merging with global properties, conflicting package specific properties take precedence.

Example

[Request](#) [Response](#)

```
curl --user <user>@<AccountName>:<password> -X GET \
http://<host>:<port>/controller/licensing/v1/usage/license/
{licenseId}/allocation/{licenseKey}?dateFrom=<ISO 8601 date-
time string>&dateTo=<ISO 8601 date-time
string>&granularityMinutes=<number of minutes as an integer>
```

[Request](#) [Response](#)

}

```

Create a License Allocation

Create a license allocation. For this method, make sure:

- IDs of sub-entities (filters, limits) are not filled
- Other unique parameters (e.g., name, licenseKey) don't conflict with existing allocations

URL

http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation

Format

POST /controller/licensing/v1/account/{accountId}/allocation

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes

Request Format

request Object

Parameter Name	Parameter Type	Value
name	String	Name of the allocation. Unique per account.
filters	Array of Objects	Array of filter objects
limits	Array of Objects	Array of limit objects

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"
operator	String	Operator of the following enumerations used to check the <code>type</code> against the <code>value</code> : <ul style="list-style-type: none"> • <code>ID_EQUALS</code> – Exact match of entity Id • <code>EQUALS</code> – Exact match of entity value • <code>STARTS_WITH</code> – Match of entity starting with a value • <code>ENDS_WITH</code> – Match of entity ending with a value • <code>CONTAINS</code> – Match of entity containing a value • <code>REGEX</code> – Match of entity against a regexp
value	String	Value to be used to filter against.

limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" • "ENTERPRISE"
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Response Format

response Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID. Unique per account.
accountId	Integer	Account ID the allocation belongs to.
name	String	Name of the allocation. Unique per account.
licenseKey	String	License key used by the allocation. Unique per account.
filters	Array of Objects	Array of filter objects
limits	Array of Objects	Array of limit objects
tags	Array of Strings	Tags associated with the allocation.
createdDate	String	Creation date of the allocation: ISO 8601 date-time string.
lastUpdatedDate	String	Last update date of the allocation: ISO 8601 date-time string.

filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value
operator	String	Operator of the following enumerations used to check the type against the value: <ul style="list-style-type: none"> ID_EQUALS – Exact match of entity Id EQUALS – Exact match of entity value STARTS_WITH – Match of entity starting with a value ENDS_WITH – Match of entity ending with a value CONTAINS – Match of entity containing a value REGEX – Match of entity against a regexp
value	String	Value to be used to filter against.

limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> "INFRA" "PREMIUM" "ENTERPRISE"
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

```

Retrieve a License Allocation

Retrieve a license allocation by allocation ID.

URL

`http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation/{allocationId}`

Format

`GET /controller/licensing/v1/account/{accountId}/allocation/{allocationId}`

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes
allocationId	String	Allocation ID referencing allocation to be retrieved.	Yes

Response Format

response Object

Parameter Name	Parameter Type	Value
id	String	Allocation ID. Unique per account.
accountId	Integer	Account ID the allocation belongs to.
name	String	Name of the allocation. Unique per account.
licenseKey	String	License key used by the allocation. Unique per account.
filters	Array of Objects	Array of filter objects
limits	Array of Objects	Array of limit objects
tags	Array of Strings	Tags associated with the allocation.
createdDate	String	Creation date of the allocation: ISO 8601 date-time string.
lastUpdatedDate	String	Last update date of the allocation: ISO 8601 date-time string.

filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"

Parameter Name	Parameter Type	Value
operator	String	Operator of the following enumerations used to check the type against the value: <ul style="list-style-type: none"> ID_EQUALS – Exact match of entity Id EQUALS – Exact match of entity value STARTS_WITH – Match of entity starting with a value ENDS_WITH – Match of entity ending with a value CONTAINS – Match of entity containing a value REGEX – Match of entity against a regexp
value	String	Value to be used to filter against.

limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> "INFRA" "PREMIUM" "ENTERPRISE"
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

Example

[Request](#) Response

```
curl --user <user>@<AccountName>:<password> -X GET \
http://<host>:<port>/controller/licensing/v1/account/
{accountId}/allocation/{allocationId}
```

Request [Response](#)

```
[
  {
    "id": "string",
    "accountId": integer,
    "name": "string",
    "licenseKey": "string",
    "filters": [
      {
        "id": "string",
        "type": "APPLICATION",
        "operator": "ID_EQUALS",
        "value": "string"
      }
    ],
    "limits": [
      {
        "id": "string",
        "package": "INFRA",

  ...
]
```

Update a License Allocation

Update a license allocation by allocation ID.

URL

```
http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation/
{allocationId}
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Format

```
PUT /controller/licensing/v1/account/{accountId}/allocation/{allocationId}
```

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes
allocationId	String	Allocation ID referencing allocation to be retrieved.	Yes

Request Format

request Object

Parameter Name	Parameter Type	Value	Mandatory
name	String	Name of the allocation. Unique per account.	Yes
filters	String	Allocation ID referencing allocation to be retrieved.	No
limits	Object		No
tags	Array of Strings		No

filter Object

Parameter Name	Parameter Type	Value
id	String	Name of the allocation. Unique per account.
type	String	Type of entity on which the filter should be applied. Enum: "APPLICATION" "HOST"

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value
operator	String	Operator of the following enumerations used to check the type against the value: <ul style="list-style-type: none"> ID_EQUALS – Exact match of entity Id EQUALS – Exact match of entity value STARTS_WITH – Match of entity starting with a value ENDS_WITH – Match of entity ending with a value CONTAINS – Match of entity containing a value REGEX – Match of entity against a regexp
value	String	Value to be used to filter against.

limit Object

Parameter Name	Parameter Type	Value
id	String	Allocation package limit ID.
package	String	Type of package for the limit. The following are the supported enumerations: <ul style="list-style-type: none"> "INFRA" "PREMIUM" "ENTERPRISE"
units	Integer	Number of license units per the allocation limit.
tags	Array of Strings	Tags associated with the allocation.

Example

[Request](#) Response

```

}

```

Delete a License Rule Allocation

Delete a license allocation by allocation ID.

URL

```
http://<host>:<port>/controller/licensing/v1/account/{accountId}/allocation/
{allocationId}
```

Format

```
DELETE /controller/licensing/v1/account/{accountId}/allocation/{allocationId}
```

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes
allocationId	String	Allocation ID referencing allocation to be retrieved.	Yes

Example

```
curl --user <user>@<AccountName>:<password> -X DELETE \
http://<host>:<port>/controller/licensing/v1/account/
{accountId}/allocation/{allocationId}
```

License Info API

A RESTful API to programmatically retrieve license information for an account, such as license type, package, and expiration date.

Retrieve Account License Information

Retrieve license information for an account.

URL

```
http://<host>:<port>/controller/licensing/v1/account/{accountId}/info
```

Format

```
GET /controller/licensing/v1/account/{accountId}/info
```

Path Parameters

Parameter Name	Parameter Type	Value	Mandatory
accountId	Integer	Account identification for which allocations are requested to be retrieved.	Yes

Response Format

response Object

Parameter Name	Parameter Type	Value
accountId	Integer	Account ID the license info belongs to.
licenseId	String	SFDC license ID.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value
customerId	String	Customer ID.
customerName	String	Customer name.
environment	String	Enumerations representing the environment the license is intended to be used on: <ul style="list-style-type: none"> • "DEV/TEST" • "PROD"
hardwareFingerprint	String	Hardware fingerprint of a machine the license is intended to be used on. Currently only the MAC address is supported. Might be ANY for no restrictions.
type	String	Enumeration representing the intended consumer of the license: <ul style="list-style-type: none"> • "SAAS-CONTROLLER" • "SAAS-ACCOUNT" • "ONPREM-CONTROLLER" • "ONPREM-ACCOUNT"
expirationDate	String	Expiration date of the whole license: ISO 8601 date-time string.
status	String	Enumeration representing the license status: <ul style="list-style-type: none"> • "ACTIVE" - Unexpired and paID license. All units are paid. • "LIMITED" - Unexpired and either lite or trial. at least one unit is LITE or TRIAL. • "EXPIRED" - Expired license.
packages	Array of Objects	
properties	Object	Collection of global custom properties tied to the license in the form of key → value. These properties might be shared among all packages.
fallbackUnits	Object	Account level fallback unit definition, it is mapping agent types (string) to their fallback units (integer).

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

package Object

Parameter Name	Parameter Type	Value
packageName	String	An enumeration representing the name of the package (edition) instance: <ul style="list-style-type: none"> • "INFRA" • "PREMIUM" "ENTERPRISE"
type	String	An enumeration representing the type of the package instance: <ul style="list-style-type: none"> • "PAID" • "TRIAL" • "LITE"
kind	String	Package kind derived from the licensing model where the package originated from. Useful for quickly distinguishing packages based on the legacy Agent based license modules (APM, DOTNET, etc.) from the new Infrastructure based packages. Enum: "INFRASTRUCTURE_BASED"
family	String	Package family.
createdDate	String	Creation date of the package instance in the license. ISO 8601 date-time string.
startDate	String	Start date of the package instance. For example, the date from which the package instance becomes active: ISO 8601 date-time string.
expirationDate	String	Expiration date of the package instance, i.e. date from which the package instance is no longer active. ISO 8601 date-time string.
licenseUnits	String	Number of licenses available for the package instance.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Parameter Name	Parameter Type	Value
properties	Object	Collection of package specific custom properties in the form of key-value pairs. In case of merging with global properties, conflicting package specific properties take precedence.

Example

[Request](#) [Response](#)

```
curl --user <user>@<AccountName>:<password> -X GET \
http://<host>:<port>/controller/licensing/v1/account/
{accountId}/info
```

[Request](#) [Response](#)

```
{
  "accountId":0,
  "licenseId":"string",
  "customerId":"string",
  "customerName":"string",
  "environment":"DEV/TEST",
  "hardwareFingerprint":"string",
  "type":"SAAS-CONTROLLER",
  "expirationDate":"string",
  "status":"ACTIVE",
  "packages":[
    {
      "packageName":"INFRA",
      "type":"PAID",
      "kind":"AGENT_BASED",
      "family":"string",
      "createdDate":"string",
      "startDate":"string",
      "expirationDate":"string",
      "licenseUnits":0,
      "properties":{
    }
  ]
}
```

```

    }
  ],
  "properties":{
    },
  "fallbackUnits":{
    }
}

```

Infrastructure-based Licensing [Agent-based Licensing](#)

APIs for [Agent-based Licensing](#):

License Rules API

This section describes the License Rules API methods you can use to retrieve information about the license rules as modeled in AppDynamics such as creating, updating and deleting license rules, and also retrieving license rules by its ID, access key, and name.

The following are true for all License Rule APIs:

- `id` —is GUID (or UUID) which is an acronym for Globally Unique Identifier.
- `access_key` —must be unique across all `licenseRules` .
- `name` —must be unique across all `licenseRules` .
- `account_id` —Use GET API to know your current `account_ID` .

Creates a New License Rule

URL

```
http://<host>:<port>/controller/mds/v1/license/rules
```

Format

```
POST /controller/mds/v1/license/rules
```

Input Parameters

Parameter Name	Parameter Type	Value	Mandatory
license_module_type	String	String representing the type of the license module. Module types are: <ul style="list-style-type: none"> • NETVIZ • MACHINE_AGENT • SIM_MACHINE_AGENT • APM • APP_AGENT • DOT_NET_AGENT 	Yes
id	String	String representing the ID or name.	Yes
version	Integer	Indicates the version number.	Yes
number_of_licenses	Integer	Integer indicating the required number of licenses.	Yes
account_id	String	Provides the account name or account ID.	Yes
access_key	Path	Provides the account access key.	Yes

LicenseRule is comprised of license_module_type, id, access_key, account_id, version, and number_of_licenses.

Example

[Request](#) Response

```
curl --user <user>@<AccountName>:<password> -X POST \
  http://<host>:<port>/controller/mds/v1/license/rules \
  -H 'Content-Type: application/json' \
  -d '{
    "id": "011116a4-124c-4b73-9343-f315836f103b",
    "version": 0,
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

    "peak_usage": null
  }

```

 The version must be 0 when creating.

Returns a Summary of All the License Rules for the Current Account

Use this to retrieve a summary of the license rules. The data transfer objects (DTOs) returned will not contain any constraints, match conditions, or entitlements.

URL

```
http://<host>:<port>/controller/mds/v1/license/rules
```

Format

```
GET /controller/mds/v1/license/rules
```

Example

```
[
  {
    "id":"f36e08e2-5f57-4b8c-9ad2-f18873adcd87",
    "version":2,
    "name":"Default",
    "description":null,
    "enabled":true,
    "constraints":[

    ],
    "entitlements":[

    ],
    "account_id":"0429fc7b-a2b9-42e3-a7fb-f704d436a054",
    "access_key":"account-accesskey-123",
    "total_licenses":120,
    "peak_usage":null
  }
]
```

Updates a License Rule

URL

```
http://<host>:<port>/controller/mds/v1/license/rules
```

Format

```
PUT /controller/mds/v1/license/rules
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Input parameters

Parameter Name	Parameter Type	Value	Mandatory
id	String	String representing the ID or name.	Yes
license_module_type	String	String representing the type of the license module. Module types are: <ul style="list-style-type: none"> • NetViz • Machine Agent • SIM Machine Agent • APM 	Yes
version	Integer	Indicates the version number.	Yes
number_of_licenses	Integer	Integer indicating the required number of licenses.	Yes
account_id	String	Provides the account name or account ID.	Yes
access_key	Path	Provides the account access key.	Yes

Example Request

```
curl -v -X PUT http://<host>:<port>/controller/mds/v1/license/rules \
--user <user>@<AccountName>:<password> \
-H 'Content-Type: application/json' \
-d '{
  "id": "321116a4-124c-4b73-9343-f315836f103b",
  "version": 0,
  "name": "Default_API",
  "description": null,
  "enabled": true,
  "constraints": [],
  "entitlements": [
    {
      "license_module_type": "JAVA",
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```

        "number_of_licenses": 1000
    },
    {
        "license_module_type": "NATIVE_WEB_SERVER",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "NATIVE_SDK",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "DOT_NET",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "NETVIZ",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "MACHINE_AGENT",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "NODEJS",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "SIM_MACHINE_AGENT",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "PHP",
        "number_of_licenses": 100
    },
    {
        "license_module_type": "PYTHON",
        "number_of_licenses": 100
    }
},
"account_id": "8b1e92f2-387c-45b6-9bb5-ebd7f67587d4",

```

```
"access_key": "api845ad-1f3e-4c9b-909b-a3cfa510bfb0",
"total_licenses": null,
"peak_usage": null
}
```

To update the license rules:

1. Get the payload using any of the available GET methods.
2. Update accessKeys , entitlements, etc.
3. Send the PUT request without changing other key-value pairs.
4. "version " should be kept as it was during GET . This would be incremental.

Deletes a License Rule

URL

http://<host>:<port>/controller/mds/v1/license/rules/f36e08e2-5f57-4b8c-9ad2-f18873adcd87

Format

DELETE /controller/mds/v1/license/rules/{id}

Input parameter

Parameter Name	Parameter Type	Value	Mandatory
LicenseRuleId	Path	Deletes license rule by its ID.	Yes

Retrieve a License Rule by ID

Use this to retrieve a license rule by the license rule ID.

URL

http://<host>:<port>/mds/v1/license/rules/f36e08e2-5f57-4b8c-9ad2-f18873adcd87

Format

GET /mds/v1/license/rules/{licenseRuleId}

Path Parameter

Parameter Name	Parameter Type	Value	Mandatory
licenseRuleId	Path	Retrieves the UUID of the license rule.	Yes

Output Parameters

Parameter Name	Parameter Type	Value	Mandatory
id	String	String representing the ID or name.	Yes
version	Integer	Indicates the version number.	Yes
total_licenses	Integer	Integer indicating the total number of licenses.	Yes
account_id	String	Provides the account name or account ID.	Yes
access_key	path	Provides the account access key.	Yes

Example

Integration Modules

Related pages:

- [AppDynamics Exchange](#)

The [AppDynamics Community Exchange](#) includes many extensions that supplement the capabilities of the AppDynamics Application Performance Monitoring (APM) Platform. Documentation on setting up and using the integration module appears with the module.

Some integrations listed here do not display on the Controller UI Integrations page. This is because not all integrations require configuration at the Controller (e.g., Rookout, Apica) level or they can only be configured at the underlying [Glassfish Admin Console](#) level (e.g., DB CAM).

The following integration modules are built into the AppDynamics platform and described on the pages linked here.

Integration Module	More information
Apica	Apica & AppDynamics
AppDynamics for Databases	Integrate AppDynamics for Databases with AppDynamics Pro 3.7 and higher
Cisco® Application Centric Infrastructure (Cisco ACI™)	Integrate AppDynamics with Cisco ACI™
Compuware Strobe	Integrate AppDynamics with Compuware Strobe
DB CAM	Integrate AppDynamics with DB CAM
JIRA Actions	JIRA Actions
Rookout	Deep Code Insights powered by Rookout
Scalyr	Integrate AppDynamics with Scalyr
ServiceNow®	Integrate AppDynamics with ServiceNow® CMDB and Event Management
Splunk	Integrate AppDynamics with Splunk

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Integrate AppDynamics with Cisco® Application Centric Infrastructure

 AppDynamics is ending support for Application Centric Infrastructure (ACI). The feature will not work once customers upgrade their Controllers beyond > 21.1. See Support Advisory: Application Centric Infrastructure (ACI) End of Life (EOL) Notice.

This page describes the advantages of the integration of AppDynamics with Cisco® Application Centric Infrastructure (Cisco ACI™). This solution provides a unified view from the application code to underlying network layers for business-critical applications running in a data center. This enables the network operations Admin and the application operations Admin to quickly troubleshoot issues at the application and the network levels.

 You can integrate the Cisco ACI™ solution with select AppDynamics Controllers only. If you are interested in using the integrated solution, contact help@appdynamics.com. See [Troubleshoot Using the Integrated Solution](#).

Getting Started with AppDynamics- Cisco ACI™ Integration

 AppDynamics is ending support for Application Centric Infrastructure (ACI). The feature will not work once customers upgrade their Controllers beyond > 21.1. See [Support Advisory: Application Centric Infrastructure \(ACI\) End of Life \(EOL\) Notice](#).

This page provides instructions for integrating AppDynamics with Cisco ACI™ solution and verifying interoperability between the applications. This integration provides end-to-end visibility into the application and network layers within a data center.

Before You Begin

Ensure that your environment meets these minimum system requirements:

- Controller \geq 4.5.2 with a Network Visibility license per OS instance. See [Controller System Requirements](#).
- Hosts with Network Visibility Agents \geq 4.5.2. See [Network Visibility Supported Environments](#).
- Hosts with Java Agents \geq 4.5.2 or .NET Agent for Windows \geq 4.5.15 with an App Agent license. See [Install Java Agent](#) or [.NET Agent](#).
- `sudo` or `root` access permissions on the agent host to install the Network Agent.
- Network Visibility is supported on Linux and Windows operating systems. See [Network Visibility Supported Environments](#).

 If your applications are running in a Kubernetes environment, enable the Kubernetes-ACI integration before you proceed with the AppDynamics and Cisco ACI™ integration. See [Cisco ACI and Kubernetes Integration](#).

Enable SSL for Cisco ACI Integration

The Cisco Application Policy Infrastructure Controller (APIC) supports the import and storage of an SSL certificate and private key into the Controller to create a secure and trusted environment with AppDynamics.

1. Access the AppDynamics Controller using the SSH.
2. At a command prompt, change directories to the following location:

```
<controller_home>/appserver/glassfish/domains/domain1/config
```

3. Import the self-signed certificate from the appropriate directory as follows:

```
keytool -import -keystore cacerts.jks -file /path/to/RootCA.crt
```

Enable Cisco ACI Integration (Controller \leq 4.5.10)

 The Cisco ACI Integration is enabled by default for \geq 4.5.11.

1. Log in to the Administration Console:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
http:<controller-hostname>:<controller-port>/controller/admin.jsp
```

For example:

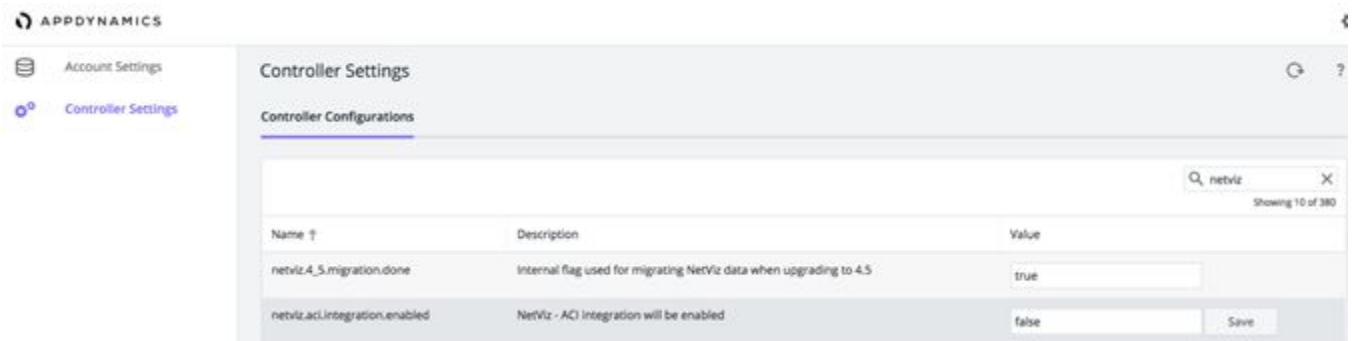

```
https:<controller-hostname>:8800/controller/admin.jsp
```

```
https:<controller-hostname>:443/controller/admin.jsp
```

You must use the password that was set for the root user of the Controller when the Controller was installed.

- In **Controller Settings**, search for **netviz.aci.integration.enabled** and set this field to **true**.
- Click **Save**.

Configure Cisco ACI Credentials

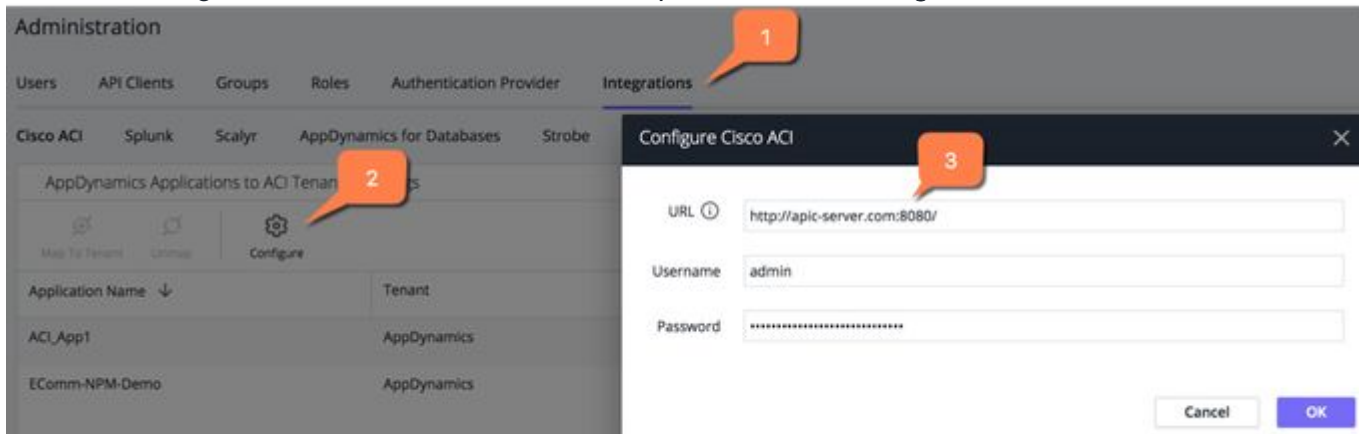

If you are using an AppDynamics Controller $\geq 4.5.11$, the Cisco ACI Integration feature is enabled by default. If you are using an AppDynamics Controller $\leq 4.5.10$, you must [enable Cisco ACI Integration manually](#) before you configure your credentials.

- Log in to the AppDynamics Controller as an administrator:

```
http:<controller-hostname>:<controller-port>/controller
```

- Click **Settings > Administration**.

3. Select the Integration tab. **Cisco ACI** is selected by default in the **Integrations** list.

4. Click **Configure** and enter these details:
 - a. Full URL along with the port details to the Cisco APIC Server. For example, `http://apic-server.com:8080/`
 - b. User credentials to the Cisco APIC.
5. Click **OK**.

AppDynamics initiates the background processes required to integrate with the Cisco ACI solution.

Correlate AppDynamics and Cisco ACI Components

The AppDynamics integration with Cisco ACI brings together the logical constructs of both solutions. This enables the network operations admin and the application operations admin to obtain a comprehensive end-to-end view from the application to the network. Correlating or mapping the components of both solutions helps the admins triage and troubleshoot issues quickly.

AppDynamics Components

The AppDynamics application model serves as the framework around which AppDynamics organizes and presents application performance information. A typical application environment consists of different components that interact in multiple ways.

- **Application**—The top-level container in the AppDynamics model. A business application contains a set of related services and business transactions.
- **Tier**—A grouping of one or more nodes in the AppDynamics application model. There is no interaction among nodes within a single tier.
- **Node**—The smallest unit of the modeled environment. A node corresponds to a monitored server or JVM in the application environment. A node may correspond to an individual application server, JVM, CLR, PHP application, and Apache Web server.

AppDynamics components are logically arranged as **Application > Tiers > Nodes**.

Cisco ACI Components

Cisco ACI is a Software-Defined Networking (SDN) solution that simplifies, optimizes, and accelerates infrastructure deployment and governance, and expedites the application deployment lifecycle.

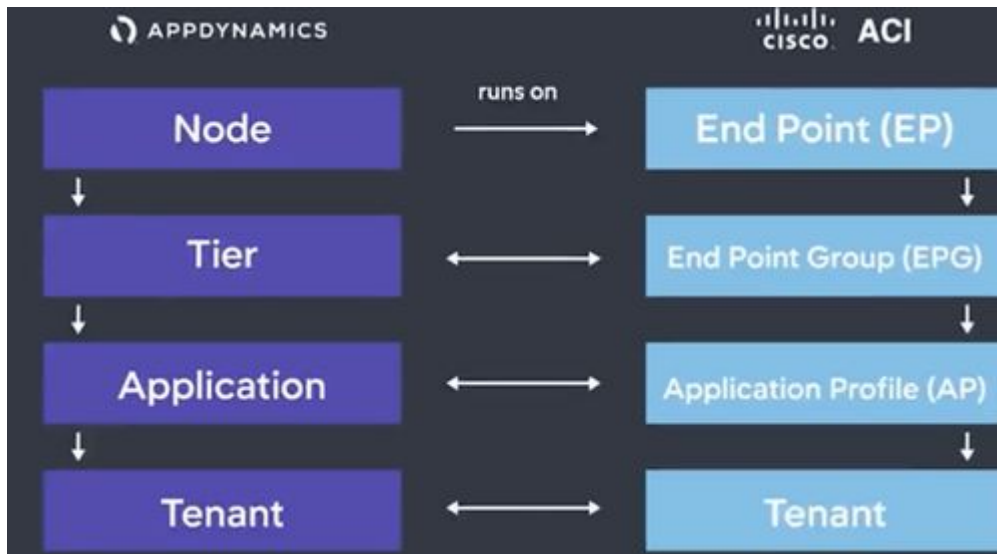

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Cisco ACI implements Cisco’s intent-based networking framework. It captures higher-level business and user intent in the form of a policy and converts this intent into the network constructs necessary to dynamically provision the network, security, and infrastructure services.

- Cisco APIC—The infrastructure Controller is the main architectural component of the Cisco ACI solution. It is the unified point of automation and management for the Cisco ACI fabric, policy enforcement, and health monitoring.
 - The APIC appliance is a centralized, clustered controller that optimizes performance and unifies the operation of physical and virtual environments. The controller manages and operates a scalable multi-tenant Cisco ACI fabric.
- Tenant—A logical container for policies that enable an administrator to exercise domain-based access control.
- Application Profile—Defines the policies, services, and relationships between endpoint groups (EPGs).
- EPG—A managed object that is a named logical entity. It is a collection of endpoints (EPs).
- Endpoints—Devices that are connected to the network directly or indirectly. They have an address (identity), a location, and attributes (such as version).

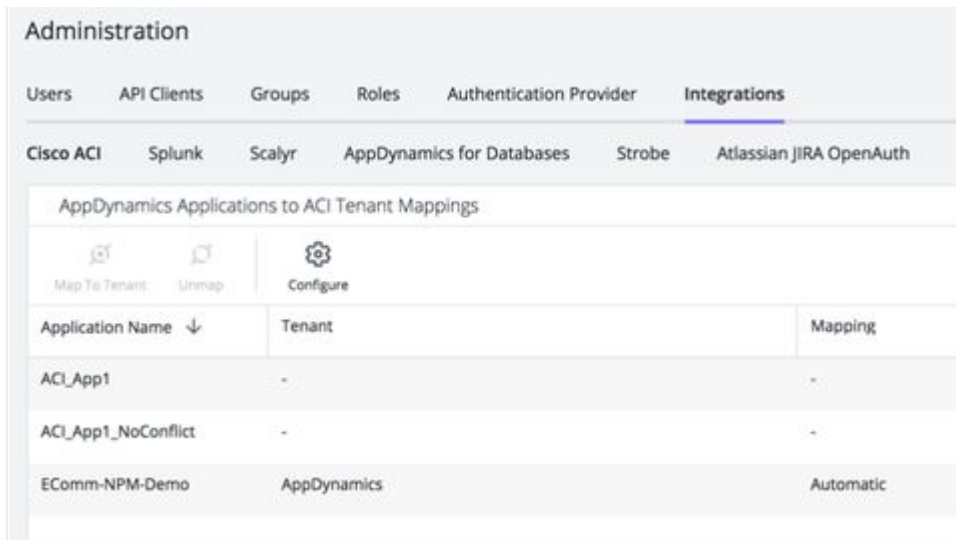

Cisco APIC components are logically arranged as [Application profile](#) > [EPGs](#) > [EPs](#).

This figure shows the correlation of AppDynamics and Cisco ACI components.

AppDynamics Applications to ACI Tenant Mapping

After you configure Cisco ACI credentials, all AppDynamics applications display in the **AppDynamics Applications to ACI Tenant Mappings** page.

These mappings are based on the mappings between AppDynamics nodes and Cisco ACI endpoints.

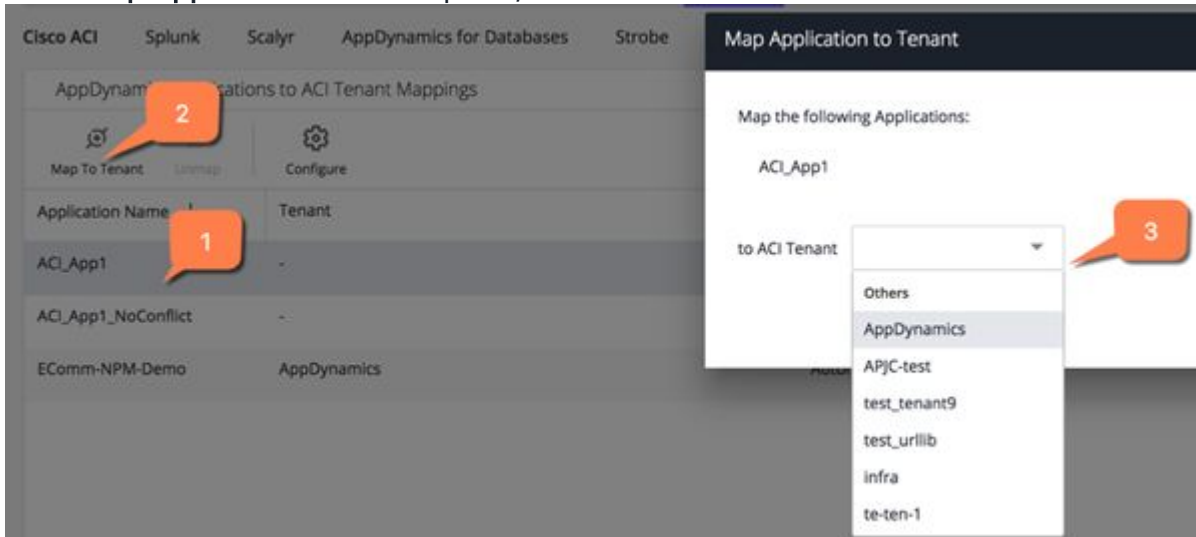

When the endpoints in different tenants have the same IP address, a node-to-endpoint mapping conflict occurs. AppDynamics resolves these conflicts based on heuristic data. However, if the conflicts persist, you must resolve these conflicts manually.

Map AppDynamics Application to Cisco ACI Tenant Manually

The application to Cisco ACI tenant map is left blank in **AppDynamics Applications to ACI Tenant Mappings** page when there is a conflict in auto-mapping. You can map applications to Cisco ACI tenants manually.

1. Select the AppDynamics application you want to map manually. Multiple applications can be mapped to a tenant at a given time.
2. Click **Map to Tenant**.

3. In the **Map Application to Tenant** panel, select the tenant and click **OK**.

Override Auto-Mapping

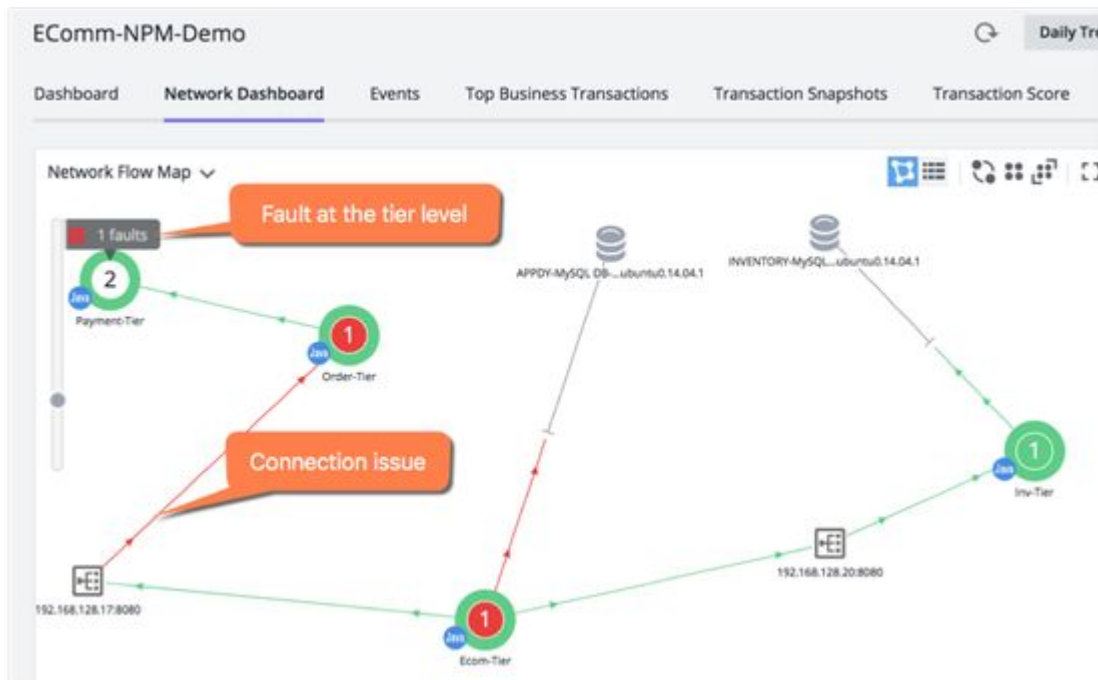

You can override the auto-map and map the application to another Cisco ACI tenant using the **Map Application to Tenant** panel. To override the auto-map, **Unmap** the application to tenant map and map it to another Cisco ACI tenant.

To revert to auto-map, **Unmap** the application to tenant map and refresh the page. AppDynamics auto-maps the application to the corresponding Cisco ACI tenant.

Troubleshoot Using the Integrated Solution

⚠ AppDynamics is ending support for Application Centric Infrastructure (ACI). The feature will not work once customers upgrade their Controllers > 21.1. See Support Advisory: Application Centric Infrastructure (ACI) End of Life (EOL) Notice.

This page describes how to troubleshoot applications using the Cisco APIC integration. The AppDynamics Network Dashboard displays a network-layer view of the monitored application. Based on the runtime state of the application, AppDynamics automatically fetches the faults and connection issues and displays them in the network dashboard:

Faults display at the tier level. The number of faults displayed indicates an aggregate of faults occurring at all EPGs within the tier. You can view the number of faults at a given point in time in the Network Dashboard.

A connection is the set of all traffic for an application that has the same Source IP, Destination IP, Destination Port, and Protocol. AppDynamics detects if there is an issue in the traffic flow and indicates the connection issue on the network dashboard.

You can initiate a diagnosis to determine the exact location of the connection issue within the network by cross-launching the connection in Cisco APIC Controller.

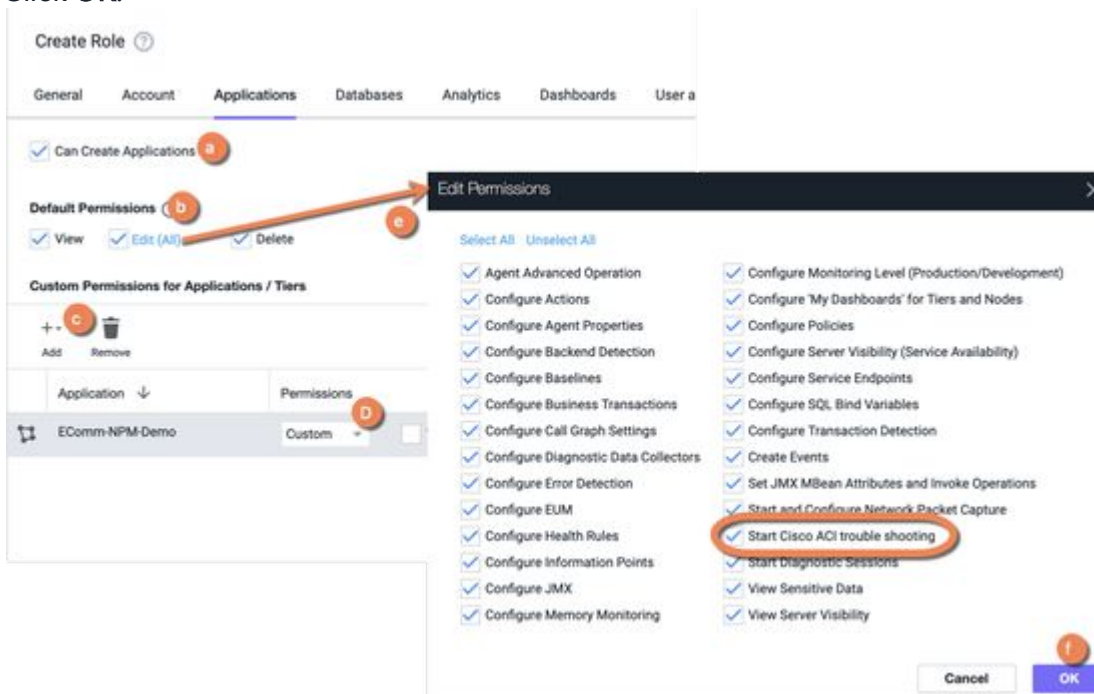

Set Custom Permission to Cross-Launch Cisco APIC Controller

To include permission to cross-launch Cisco APIC Controller:

1. Log in to the Controller UI as an Administrator or Account Owner.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

2. Click **Settings**  > **Administration**.
3. Click the Roles tab.
4. Click **+ Create**.
5. Specify a **Name** and a **Description** for the newly created role.
6. Customize the business application level permission according to these guidelines:
 - a. On the **Applications** tab, click **Can Create Applications**.
 - b. Under **Default Permissions**, select **View**, **Edit**, and **Delete**.
 - c. Click **+ Add** to add a new custom permission and click **Done**.
 - d. Select **Custom** from the **Permissions** menu for the application (replacing the value of Inherited).
 - e. Click **Edit(All)** and ensure that **Start Cisco ACI troubleshooting** is selected.
 - f. Click **OK**.

Customize Permissions to Cross-Launch a Connection Issue in Cisco APIC Controller

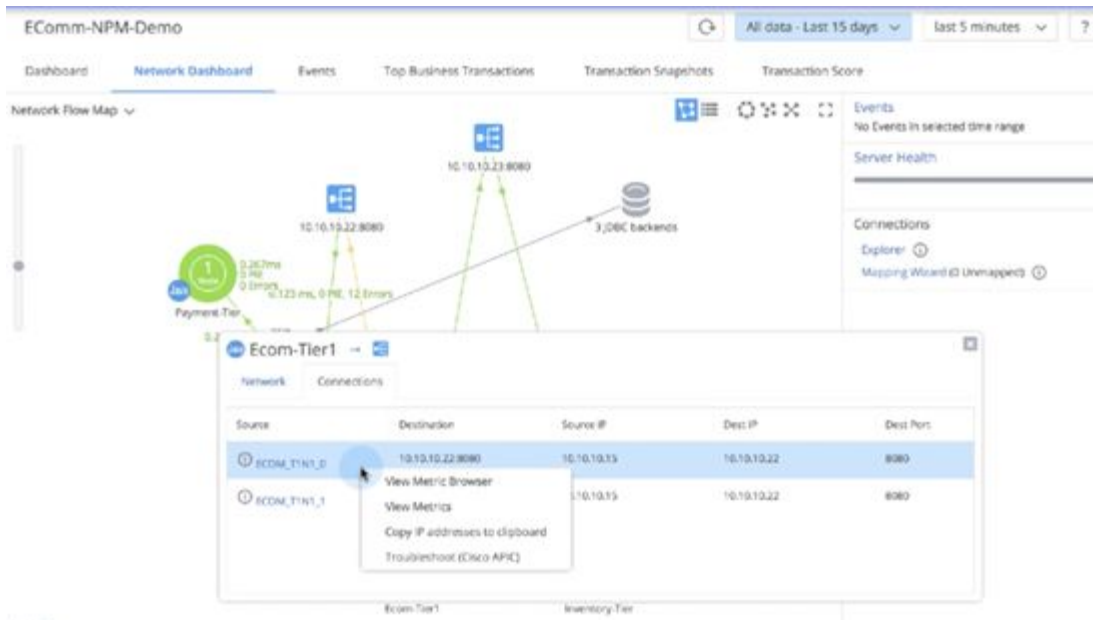

As an AppDynamics administrator, you can now customize the permissions for various roles to include permission to cross-launch a connection issue in the Cisco APIC Controller. See [Set Custom Permission to Cross-Launch Cisco APIC Controller](#).

Launch Affected Connection in Cisco APIC

After collecting the connection issue information, you can cross-launch the connection in the Cisco APIC Controller.

1. Click on the affected connection on the **Network flow Map**.
2. Click the Connections tab.
3. Select the connection you want to troubleshoot.

4. Right-click on the selection and select **Troubleshoot (Cisco APIC)**.

5. Enter your Cisco APIC login credentials. After the initial entry, your credentials will be cached. The connection opens in the Cisco APIC Controller with the correct contracts (Visibility & Troubleshooting wizard) and the right set of endpoints.

⚠ If you are using the Cisco ACI Release 4.0, you need not enter the login credentials. The authentication happens automatically. You must enter the login credentials only if you are using a lower version of the Cisco ACI.

6. Troubleshoot the issue in Cisco APIC.

Integrate AppDynamics with Compuware Strobe

This page describes how to integrate AppDynamics with Compuware Strobe. This integration allows you to drill down from a SQL Call of a transaction snapshot to view and analyze the calls in Strobe.

Configure Compuware Strobe Integration

1. Log in to the Controller UI as an administrator.
2. Select **Settings > Administration**.
3. Select **Integration > Strobe**.
4. Click the **Enabled** checkbox.
5. For the **URL**, enter the Strobe URL and port number.
6. For the **Strobe LPAR**, enter the name of the logical partition where Strobe is running.
7. Click **Save**.

Launch Strobe from AppDynamics

You can access the **View in Strobe** option from a transaction snapshot.

1. Navigate to the Business Transactions dashboard.
2. From the **Transaction Snapshot** tab, select a transaction snapshot containing DB2 z/OS database access.
3. Select the **SQL Calls** tab.
4. Right-click a SQL query and select **View in Strobe**.

Integrate AppDynamics with DB CAM

Related pages:

- [Access the Administration Console](#)
- [Monitor Databases](#)

This page describes how to integrate AppDynamics with DB CAM. You can link to DB CAM for any DB CAM-monitored database that is discoverable by AppDynamics. This integration provides access to the database performance metrics provided by DB CAM.

Before You Begin

To use this integration you must have a DB CAM license. DB CAM must be configured to monitor the databases that you want to link to from AppDynamics.

Configure AppDynamics to Interface with DB CAM

You configure DB CAM integration at the account level and app agent level.

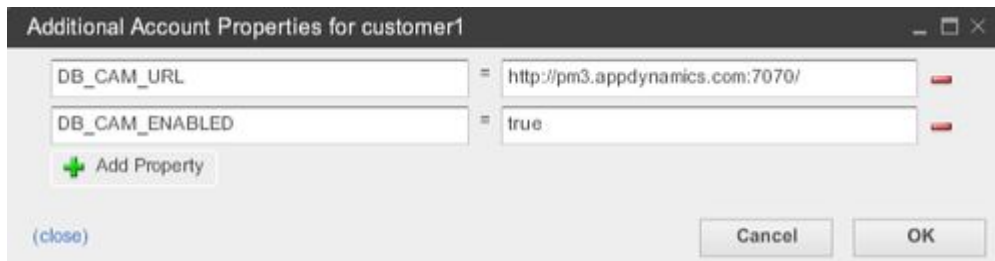

Configure DB CAM at the Account Level

Configure the integration at the account level using the Administration Console at `<host>:<port>/controller/admin.jsp`.

Create two new properties as name-value pairs in each account for which you want to enable DB CAM integration.

Configure One AppDynamics Account for DB CAM Integration

1. Log in to the Administrator Console with the administrator root password.
2. Select **Accounts**.
3. Double-click the account for which you want to configure DB CAM integration.
4. Click **Additional Account Properties** in the upper right.
5. Click **Add Property**.
6. In the left dialog, enter "DB_CAM_URL".
7. In the right dialog, enter the URL of the AppDynamics Controller that you are configuring using the syntax: `http[s]://<host>:<port>`
8. Click **Add Property** again.
9. In the left dialog, enter "DB_CAM_ENABLED".
10. In the right dialog, enter "true".
11. Click **OK**.
12. Log out of the Administrator Console.

Configure DB CAM at the Agent Level

Perform this procedure for each app agent for which you want to enable access to deep diagnostics from DB CAM:

1. Open the `AppServerAgent/conf/app-agent-config.xml` file for the app agent.
2. Locate the `TransactionMonitoringService` element, `<agent-service name="TransactionMonitoringService" enabled="true">`.
3. Add the `jdbc-dbcam-integration-enabled` property for the service:

```
<agent-service name="TransactionMonitoringService"
enabled="true">
  <service-dependencies>BCIEngine, SnapshotService</service-
dependencies>
  <configuration-properties>
    <property name="jdbc-dbcam-integration-enabled"
value="true"/>
  </configuration-properties>
</agent-service>
```

4. Save the file.

Link to DB CAM from AppDynamics

You can link to DB CAM from any AppDynamics flow map that displays a discovered DB CAM-monitored database. The flow map could be in a dashboard or a transaction snapshot.

If you link to DB CAM from a dashboard, you gain access to the DB CAM instance dashboard. If you link to be DB CAM from a transaction snapshot, you gain access to the DB CAM Session Drill Down pane.

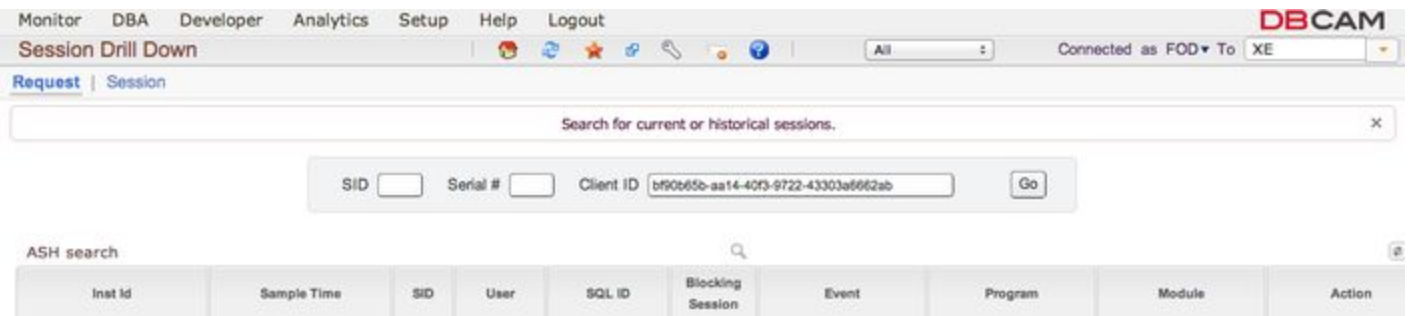

To Link to DB CAM from a Dashboard

1. In the flow map of a dashboard, right-click on the link below a database icon.
2. Select **Search in DBCam**. DB CAM launches and displays the instance dashboard for the selected database.

To Link to DB CAM from a Transaction Snapshot

1. In the flow map of a transaction snapshot, right-click on the link below the database icon.
2. Select **Search in DBCam**. DB CAM launches and displays the session drill down for the selected database.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Integrate AppDynamics with Scalyr

This page describes how to integrate AppDynamics with the Scalyr module. This integration gives you a single entry point for viewing and analyzing data gathered by AppDynamics and [Scalyr](#). With the Scalyr integration module enabled, you can launch Scalyr searches directly from the AppDynamics Console.

The Scalyr search includes context from the AppDynamics UI session, including the time range and IP or hostname of the node being investigated in the AppDynamics UI.

Enable the Scalyr Integration Module

To enable and configure the Scalyr integration:

1. Log in to the Controller UI as an administrator.
2. Select **Settings > Administration**.
3. Select **Integration > Scalyr**.
4. Click the **Enabled** checkbox.
5. For the **URL**, enter `https://www.scalyr.com`.
6. Click **Save**.

Search Scalyr Data from AppDynamics

To launch a Scalyr search, Controller UI users must have:

- An active browser session in the Scalyr UI.
- Scalyr credentials.
- Popups permitted in the browser.

Controller users can search Scalyr logs from the node dashboard, business transaction dashboard, or from segments of a transaction snapshot. The time frame passed to Scalyr varies for each context.

Node Dashboard Access

1. Navigate to a node dashboard.
2. Select **Actions > Search Scalyr**.

This passes a search for that node with the timeframe currently selected in the Controller UI.

Business Transaction Dashboard

1. Select the Transaction Snapshot tab.
2. Select **Actions** or right-click a transaction snapshot.
3. Select **Search Scalyr**.

This generates a search on the nodes where the transaction occurred within the general time frame of the transaction execution. The time frame spans from 30 minutes before the transaction start time to 30 minutes after.

Call Drilldown Access

1. Select a **Call** in the drilldown view.
2. Select **Actions > Search Scalyr**.

This generates a search on the machine on which the snapshot was generated for the time frame of that segment.

Integrate AppDynamics with ServiceNow CMDB and Event Management

This page describes how to integrate the AppDynamics for ServiceNow® application with ServiceNow®.

Download

To download, visit the [AppDynamics Community Exchange](#).

Version 20.7

AppDynamics has released a new version of the sync utility to integrate with the Orlando Release of ServiceNow®. To review version-specific configuration details, see [New Version 20.7](#).

Please review this version compatibility matrix to guide your installation and upgrade decision:

Integration Version	AppDynamics	ServiceNow®
20.7	>= 4.5.0.1	Orlando and later
3.1	>= 4.5.0.1	New York and earlier

Use Case

AppDynamics Application Performance Monitoring traces every transaction and builds real-time application topology. The ServiceNow® integration provides these capabilities:

- AppDynamics application topology feeds data into the *AppDynamics for ServiceNow®* application as custom tables in the CMDB.

 In this version, monitored servers can be reconciled with the ServiceNow® appropriate CMDB Server CIs.

- AppDynamics can send alerts to the *ServiceNow® Event Management* application and use the AppDynamics-created entities. The AppDynamics for ServiceNow® application imports the AppDynamics alerts as entities. These entities can be used only when they are added to the ServiceNow® table. The AppDynamics for ServiceNow® application then creates a ServiceNow® table that maps with the entities.

This table lists these entities along with the ServiceNow® table that is created to represent them:

AppDynamics Entity Installed	ServiceNow® Table Created
Application	x_apd_appdynamics_application
Business Transaction	x_apd_appdynamics_business_transaction

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

AppDynamics Entity Installed	ServiceNow® Table Created
Controller	x_apd_appdynamics_controller
Database	x_apd_appdynamics_database
Node	x_apd_appdynamics_node
Remote Service	x_apd_appdynamics_remote_service
Tier	x_apd_appdynamics_tier

Before You Begin the Integration

This integration requires that you download, install, and complete the following tasks, in this order, before starting the integration.

1. Download and install the [AppDynamics for ServiceNow® application](#) from the ServiceNow® Store. This application creates the custom AppDynamics tables in the Configuration Management Database (CMDB).
2. Download, install, and configure the [Data Sync Utility](#). This utility makes API calls to AppDynamics and ServiceNow® to push our topology into the CMDB tables.
3. Once the data sync utility has been configured, go back to the utility and choose to download and install the Alerting template. The template contains the proper settings for AppDynamics to send alerts to the event service in ServiceNow®.
4. Install Java >= 1.8 on the machine that runs this program.
5. Start Java with 512 MB of initial memory (`-Xms512m`).

Add AppDynamics Discovery Source to ServiceNow®

You must create an AppDynamics Discovery Source before installing the integration from the ServiceNow® Store:

1. Log in to the ServiceNow® store.
2. In the left menu, select **System Definition > Choice Lists**.
3. Click **New**.
4. Specify the following details only. Do not change the values of other fields.

Table	Configuration Item [cmdb_ci]
--------------	------------------------------

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Element	discovery_source
Label	AppDynamics
Value	AppDynamics

Download AppDynamics for ServiceNow® Application

Download the [AppDynamics for ServiceNow® application](#) from the ServiceNow® store and install it on your ServiceNow® instance.

i Ensure that you follow the instructions under the *System Requirements* and *Other Requirements* sections of the ServiceNow® download page.

To use Node-to-Server CI Reconciliation in ServiceNow® >= 3.1, you must have:

- [AppDynamics Machine Agents with Server Visibility enabled](#) installed and running on each host supporting AppDynamics Nodes to be imported.
- AppDynamics Controller and Machine Agent >= 4.5.0.1 with Server Visibility enabled.
- If you have issues, see [Troubleshooting](#).

Download AppDynamics-ServiceNow® Data Sync Utility

Download the [Data Sync Utility](#) zip file from the AppDynamics Exchange.

You can download this utility either as a standalone Java application or as a JAR file. The standalone Java application can run on a Windows or Linux host and the JAR file can run as a Java program on any host machine.

 This host must have connectivity to both the target ServiceNow® instance and the target AppDynamics Controller.

The downloaded file includes a lightweight web server that has a basic web application to configure the integration. You can also run the integration in CLI mode only.

Server Options

Download and unzip the `appdynamics-cmdb-service-$version.zip` [Data Sync Utility](#) file.

1. Unzip the `appdynamics-cmdb-service-$version.zip` file.
2. Start the Server.
 - a. **init.d service (System V)**

```
sudo ln -s /path/to/appdynamics-cmdb-service/appdynamics-cmdb-service.jar /etc/init.d/appdynamics-cmdb-service
```

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
sudo /etc/init.d/appdynamics-cmdb-service start
```

The java options can be configured in the `$HOME/appdynamics-cmdb-service.conf` file.

The application logs are created in the `$HOME/logs` directory.

The system out logs are created in the `/var/log/appdynamics-cmdb-service.log` file.

b. Windows (winsw):

Open a terminal and navigate to the `appdynamics-cmdb-service` folder where you extracted the zip file:

```
cd C:\Path-to\appdynamics-cmdb-service
```

Run the following command:

```
javaw -jar appdynamics-cmdb-service.jar
```

The Java options can be configured in the `;%$HOME%/bin/appdynamics-cmdb-service-win.xml` file.

The logs are created in the `$HOME/logs` directory.

c. Other platforms:

```
java -Xms512m -jar /path/to/appdynamics-cmdb-service.jar
```

The application logs are created in the `$HOME/logs` directory.

Upgrades

1. Backup the data directory `data/` where the java sync utility is installed.
2. Overwrite the existing installation with the new file.

Setup

1. `init.d` service: The configuration file is located at `$HOME/appdynamics-cmdb-service.conf`. Add the params to the `JAVA_OPTS` property.
2. Windows service: The configuration file is located at `$HOME/bin/appdynamics-cmdb-service-win.xml`. Add the params to the `<arguments>` property.
3. `jar`: Add the params directly to the command preceding `-jar ...`

Options

- Use a different port:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

```
-Dserver.port=8080
```

- Enable authentication:

```
-Dplatform.security.enabled=true # This will create a local login with the following
credentials.
-Dplatform.username=user
-Dplatform.password="deFAultPwd4Platfrm"
-Dplatform.security.encryption-key=mykey
-Dplatform.security.encryption-salt=mysalt
```

 The `encryption-key` and `encryption-salt` are optional.

Configure the Data Sync Utility

User Roles and Permissions

The Sync Utility needs to communicate with both an AppDynamics Controller and a ServiceNow® instance. We recommend using a service account for this access:

- **AppDynamics Controller:**

The service account user requires these roles with rights to all applications to be synchronized.

- Applications and Dashboards Viewer
- Server Monitoring User—Optional if you want to enable node-to-server CI reconciliation

- **ServiceNow®:** These roles should be assigned to the ServiceNow® user account that will be posting data to ServiceNow®:

This user can be set to **web service access only** on the user form.

- If Event Management is activated in your ServiceNow® instance, add these roles:
 - `x_apd_appdynamics.appdynamics_role`
 - `evt_mgmt_user`
 - `evt_mgmt_integration`
 - `mid_server` —Optional if you want to do server CI reconciliation.
 - `app_service_admin` —Required for sync utility v20.7.
- If Event Management is *not* activated, add these roles:
 - `x_apd_appdynamics.appdynamics_role`
 - `itil`
 - `mid_server` —Optional if you want to do server CI reconciliation.
 - `app_service_admin` —Required for sync utility v20.7.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Domain Separated ServiceNow® Instances

If your ServiceNow® instance is domain-separated, a unique user account is required for each domain you want to update in the CMDB. For each domain:

1. Create a user account as described in [User Roles and Permissions](#) with the required roles.
2. Assign this user to the appropriate domain for the applications that it needs to access.
3. Create a new ServiceNow® instance with the appropriate user for each domain.
4. Set up synchronization for the applications appropriate for each domain user.

Synchronize with the CMDB

The integration supports the synchronization of one or more ServiceNow® instances with one or more AppDynamics Controllers.

1. Log in to the Sync Utility.
 - a. Open `http://<host>:8080` on a browser.
 - b. The default username is `user` and the default password is `deFAuLtPwd4Platfrm`.

This can be overridden by the java startup property `-Dplatform.password=welcome`. See [Server Options](#).

2. Select the **Service Model Integration** left menu bar.
3. Click **AppDynamics Controllers** and add your Controller(s).

If your Controller is on-premises or dedicated SaaS (single-tenant), the **Account Name** will be `customer1`.

4. Click **ServiceNow® Instances** and add your ServiceNow® instance(s).
5. Click **Synchronize** from the top menu.
6. Choose applications from the **Applications** list to export to ServiceNow®.
7. Select which **AppDynamics Relationships to Synchronize** to include:
 - **Tier to Tier**
 - **Tier to Remote** (Remote Services)
 - **Tier to Application**
 - **Node-to-Server CI**
 - Reconciles the node host with an existing Server CI and builds a **Runs** relationship with the `x_apd_appdynamics_node` running on it. See [Node-to-Server CI Reconciliation](#).
8. Click **Run Diagnostics** to begin verification without creating any data.
 - If successful, click **Synchronize** to run a one-time synchronization.
 - If not successful, address the issues in the diagnostic messages provided.

Most integration users may like the synchronization to run at regular intervals to keep the service models. The integrated scheduler function allows for the creation and running of synchronization automatically.

UI Tab	Description
Schedules	Allows schedule creation using a cron expression. The Synchronize options on this page are the same as the other configuration panes.
History	Provides a graphical view of prior runs. You can expand each run to get details of the run, including error messages.
Settings	Provides additional settings for connection timeouts, SSL, proxy configuration, and additional static values that can be added to fields in various CMDB tables.

After the synchronization is complete, log in to ServiceNow® instance and select the AppDynamics menu item to view the tables and data associated with the integration.

Node-to-Server CI Reconciliation

-  In >= 3.1, the **Node-to-Server CI** checkbox in the sync utility builds a relationship between an AppDynamics Node (`x_apd_appdynamics_node`) and the underlying host Server CI (`cmdb_ci_linux_server`, `cmdb_ci_windows_server`) in the ServiceNow® CMDB.

To use this feature, a Machine Agent with Server Visibility enabled must be installed and running on each host that supports an imported AppDynamics Node. See [Machine Agent with Server Visibility](#).

The integration uses the default ServiceNow® hardware identification rules for reconciliation:

- **Name:** AppDynamics uses the operating system-reported hostname as the value for this field, which is subject to the following **Discovery Property** settings in ServiceNow®, whether Discovery is installed or not:

The `mid_server` role must be assigned to the ServiceNow® user for the integration to read these properties.

- `glide.discovery.hostname.case`
- `glide.discovery.hostname.include_domain`
- `glide.discovery.fqdn.regex`

Refer to the ServiceNow® product documentation for more information about these properties.

- **IP Address + MAC address** (Network Adapter Table): AppDynamics uses any adapter with a valid IPv4 or IPv6 address and a MAC address.

These attributes are provided by Machine Agents with Server Visibility enabled for Controller and Machine Agent >= 4.5.0.1.

1. To avoid duplicate Server CIs being created by this integration, any discovery sources employed must adhere to the same hardware identification rules:
 - a. **Name** in the Server CI should match the system reported hostname subject to the Discovery properties described above.
 - b. For each **Server Network Adapter**, the `ip_address` and `mac_address` must be populated in the Network Adapter table and related to the Server CI.

 ServiceNow® CMDB Identification and Reconciliation will not consider IP Address and MAC Address values populated on the Server CI form directly.

2. This integration identifies Linux and Windows servers and reconciles them to their respective CI classes on update or create (`cmdb_ci_linux_server` & `cmdb_ci_windows_server`).

 If a server is not Windows or Linux, no CMDB relationships will be created.

Fields Populated in ServiceNow® by Node-to-Server CI Reconciliation

For the appropriate Server Class (`cmdb_ci*_server`) and related to the parent AppDynamics Node:

ServiceNow® Server CI Field	AppDynamics Server Visibility Attribute Used
Name (<code>name</code>)	The reported Hostname—the Sync Utility reads and uses the discovery properties listed above to determine the hostname.
Hostname (<code>host_name</code>)	The reported Hostname.

Each Network Adapter reported populates the Network Adapter CI (`cmdb_ci_network_adapter`) and related parent Server CI:

ServiceNow® Network Adapter CI Field	AppDynamics Server Visibility Attribute Used
IP Address (<code>ip_address</code>)	IP Address with /x removed. Using either IPv4 or IPv6 Address as reported. If neither is populated, the adapter is not synced.
MAC Address (<code>mac_address</code>)	The reported MAC address.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Add Static Values to Required Fields

If there are required fields in your CMDB that AppDynamics does not populate, you can use the **CMDB Additional Fields** to add multiple static values per table.

1. Navigate to the AppDynamics-ServiceNow® Sync Utility.
2. Select **Settings**.
3. Select **CMDB Additional Fields**.
4. For the desired CI table, click **Add Field**.
5. Enter the ServiceNow® **Field Name** (not the label).
6. Enter the static value to populate all records of this type. For example, if you are required to populate the `hardware_status` field on all `cmdb_ci_server` and child class records, enter "hardware_status" and then "Installed".
7. Click **Save**.

Considerations for Dynamic Application Environments

If the application environments you are monitoring with AppDynamics change frequently, you may end up with artifacts in the ServiceNow® CMDB that no longer reflect the current state of your application topology.

In order to address this, ServiceNow® provides documentation on how to configure "data refresh rules" in the CMDB so that irrelevant AppDynamics CIs can be removed. For the New York release, see [Create data refresh rules](#).

Create Business Service CI

AppDynamics Application to ServiceNow® Application Service Relationships

Health rule violation alerts related to a ServiceNow® Application Service are shown in the Event Management Dashboard. There are two ways to build this relationship based on the current state of the ServiceNow® CMDB:

If Business Services do not exist:

1. If there are no Business Service CIs in the CMDB, ensure that the **Create Business Service** checkbox is checked when initially synchronizing an application. Follow the instructions in the Sync Utility documentation that explain how to convert that CI to an Application Service (`cmdb_ci_service_discovered`) CI that can be shown on the ServiceNow® Event Management Dashboard.
You must select six (6) levels of CIs to include in the model.

This step requires the `app_service_admin` role. See the ServiceNow® [Convert a business service to an application service](#).

If Business Services exist:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

If the Business Service entities are Application Service class CIs, a relationship can be manually created between the AppDynamics Application and the ServiceNow® Application Service. To create the relationship:

1. Open the AppDynamics Application CI (`x_apd_appdynamics_application`).
2. Click **Add CI relationship**.
3. In the filter, set the "Class" - "is" - "Application Service".
4. Click **Run Filter**.
5. Select the **Application Service CI**.
6. Select the **Runs On::Runs** relationship.
7. Click **Create new relationships with selected configuration item(s)**.

AppDynamics Tier to ServiceNow® Application Service Relationships

In some cases, an AppDynamics Tier may be the correct entity to relate to a ServiceNow® Application Service. To build this relationship in the ServiceNow® CMDB:

1. Open the AppDynamics Tier CI (`x_apd_appdynamics_tier`).
2. Click **Add CI relationship**.
3. In the filter, set the "Class" - "is" - "Application Service".
4. Click **Run Filter**.
5. Select the **Application Service CI**.
6. Select the **Runs On::Runs** relationship.
7. Click **Create new relationships with selected configuration item(s)**.

Additional Application Relationships

The AppDynamics Application description and Tier description fields are populated in the AppDynamics Application CI (`x_apd_appdynamics_application`) and AppDynamics Tier CI (`x_apd_appdynamics_tier`) respectively:

Table	Application CI Field	AppDynamics Field Used
<code>x_apd_appdynamics_application</code>	Description (<code>short_description</code>)	Application description

Table	Tier CI Field	AppDynamics Field Used
<code>x_apd_appdynamics_tier</code>	Description (<code>short_description</code>)	Tier description

Troubleshooting

Logs

The logs are generated in the `logs/` directory where the application is installed.

Debug Logs:

To enable debug logging, edit the file `conf/log4j2.xml` and change the level of the logger `com.appdynamics` to `DEBUG`.

Read Timeouts

If you encounter any Read Timeout errors while doing the sync:

1. Increase the **Socket Timeout** value in the Settings tab up to `60,000` initially and higher if needed.
2. Reduce the **Sync Batch Size** of entities to ServiceNow® Instance.
3. Navigate to the `Installation` directory.
4. Find the `conf/application.properties` file and adjust the size value.
5. Restart the AppDynamics ServiceNow® Sync Utility service or daemon (Required).

Events Integration

This section assumes that you are familiar with the configuration of HealthRules, Policies, and Actions in AppDynamics. See [Alert and Respond](#).

The Events integration uses the HTTP templates feature in the Controller to push events to the ServiceNow® Events API. The details of the ServiceNow® Events API can be found [here](#). See [HTTP Request Actions and Templates](#).

Prerequisites

- Download and install the [AppDynamics for ServiceNow® application](#) on your ServiceNow® instance.
- Run the AppDynamics-ServiceNow® Data Sync Utility and verify that the entities are imported into your ServiceNow® instance. See [Data Sync Utility](#).
- Activate the ServiceNow® Event Management plugin.

Events Installation and Configuration

In this section, you will create an Action, configure Health Rule Violations, and create binding Policies.

Create an Action on the AppDynamics Controller

1. Log in to the web UI for the AppDynamics-ServiceNow® Data Sync Utility.
2. Select **Service Model Integration > Event Integration**.
3. Select the Controller you would like to configure. If one is not configured, see [Integrate AppDynamics with ServiceNow CMDB and Event Management](#).
4. Click **Download Template**.

Use the downloaded file to configure the HTTP Request template in AppDynamics. You will then create an Action and apply that action to a policy that specifies a health rule and action. To create the new Action:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

1. Navigate to the **Alert & Respond** top menu in your AppDynamics Controller.
 2. Click **Alert & Respond > HTTP Request Templates** in the left navigation.
 3. Select the resource on which the action is to be created.
 4. Click **New** and fill out the following fields:
 - a. **Name:** Any name to uniquely identify the template
 - b. **Request URL**
 - i. **Method:** POST
 - ii. **Raw URL:** `https://<your-instance>.service-now.com/em_event.do?JSONv2&sysparm_action=insertMultiple.` Replace `<your-instance>` with the id of the actual instance.
 - c. **Authentication**
 - i. **Type:** BASIC
 - ii. Enter the `user name` and `password` of your ServiceNow® instance.
-  Ensure you have already configured the ServiceNow® User and Roles as described in [User Roles and Permissions](#).
- d. **Payload**
 - i. **MIME Type:** `application/json`
 - ii. Copy the contents from the downloaded file, `event-request-template.txt`, and then paste it in the **Payload** text area
 - iii. Update the `controllerName` in the first line of the file. It must be the same value that you set while adding the `AppDynamics Controller Name` in the Sync Utility.
5. Save the HTTP Template.

Configure Health Rules on the AppDynamics Controller

1. Select the **Alert & Respond** tab.
2. Select **Health Rules**.
3. Use the **Select** dropdown to choose an application on which you want to alert.
4. Review the list of **Health Rules** configured out-of-the-box for that application. Add more **Health Rules** if needed.

Create a Policy on the AppDynamics Controller to Bind Health Rules to Actions

1. Select **Alert & Respond > Policies**.
2. Select **Create a Policy Manually** if there are no policies configured already.
3. Select the type of scenarios on which you want to receive alerts.

 Checking all the boxes might lead to an alert storm on your ServiceNow® instance.

4. Click **Save**.
5. Select the **Health Rule Scope** defining which tiers and nodes the Health Rule should cover and click **Save**.

6. Select the **Object Scope** and choose the **Tiers and Nodes** to be covered in this policy and click **Save**.
7. Select **Actions**.
8. Click **Add +** sign to create a new **Action**.
9. Select the ServiceNow® **Action** you created [Create an Action on the AppDynamics Controller](#) and click **Save**.

Create a Manual Entry Point for the AppDynamics Monitored Application on the Application Service CI

i If you are connecting to a ServiceNow® instance running Orlando or later, skip this section and refer to the [New Version 20.7](#) instructions.

For AppDynamics alerts to impact the health of an application service in ServiceNow® Event Management, you must create a manual entry point.

1. If you chose to have the Sync Utility create a Business Service:
 - a. Make sure you convert the service to an application service by following the prompts in the sync utility after synchronizing the application.
 - b. This conversion will add the manual entry point automatically.
2. If you already have Application Service CIs that you want to associate with an AppDynamics monitored application (or application tier):
 - a. Open the **Application Service CI** record.
 - b. Click **Add Entry Point**.
 - c. Select the AppDynamics monitored **Application** or **Tier CI Type**.
 - d. Select the name of the AppDynamics monitored application or tier to associate.
 - e. Click **Save**.
 - f. Click the **Additional Info** link.
 - g. Click the **Update with changes from CMDB UI Action** link.
 - h. Select the number of levels of related CIs to include in the new application service.
 - i. Click **OK**.

New Version 20.7

Requirements

Versions

- AppDynamics >= 4.5.0.1 is required.
- ServiceNow® instances to be synchronized must be running Orlando or greater.

New Roles

- No additional roles are needed for the service account in AppDynamics.
- The service account in ServiceNow® will also need the `app_service_admin` role.

Upgrade to Version 20.7

To upgrade an existing sync utility, follow the [upgrade](#) section. Below are some answers to questions about upgrading an existing sync utility:

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

What happens to existing applications that have already been synchronized?

Existing AppDynamics monitored applications and related entities that have been synchronized to a ServiceNow® CMDB from previous versions of the sync utility will remain in the CMDB. When the same application is re-synchronized using 20.7, a calculated service CI is created for those applications (or tiers) as configured. See [Creating Calculated Application Service CIs](#).

What happens to existing manual entry points?

If you created manual entry points for Application Service CIs using AppDynamics monitored application CIs `x_apd_appdynamics_application` will remain as-is. After synchronizing using 20.7 of the sync utility, a new calculated application service CI will be added to the relationships.

AppDynamics recommends that you remove any previously created entry points and create a manual entry point to the new Calculated Application Service `cmdb_ci_service_calculated` CI. To do this:

1. To remove the existing manual entry point:
 - a. Open the **Application Service CI** you are monitoring with Event Management
 - b. Click - next to the **Manually Added CI** link and click **Remove**.
2. Add a manual entry point for the calculated application service:
 - a. Open the application service CI you are monitoring in ServiceNow.
 - b. Click **Add Entry Point**.
 - c. Select **Manually Created**.
 - d. For **CI Type**, select **Calculated Application Service**.
 - e. For **CI Name**, select the name for the application you synched.

Create Calculated Application Service CIs

Orlando introduces a new CI class called Calculated Application Service `cmdb_ci_service_calculated`. This new class is dynamic and provides additional capability to automatically update a service map when relationships in the CMDB change for CIs that are part of the application service.

Some AppDynamics customers monitor applications as Tiers. With the new version 20.7, you can map AppDynamics Applications or AppDynamics Tiers to `cmdb_ci_service_calculated` CIs in ServiceNow®.

Select Tiers to Monitor as Application Services in ServiceNow®

By default, all applications monitored by an AppDynamics controller relate to a new calculated application service when synchronized for the first time with 20.7 with a **Used By::Depends On** relationship.

To sync monitored tiers to a calculated Application Service CI in ServiceNow®:

1. Navigate to **Application Mappings**.
2. Add a Controller if none exists, or select the Controller from the dropdown. A list of all the AppDynamics monitored applications in the selected Controller display in the left panel.
3. To map each tier of a monitored application to a Calculated Application Service CI, move that application to the right bucket as an **Application Group**.

Synchronize the Application Services in ServiceNow®

ServiceNow® requires that each Calculated Application Service CI (`cmdb_ci_service_calculated`) has a unique name. When synchronized for the first time using 20.7, a new Calculated Application Service CI is created with this naming convention:

- By default, each monitored application will have a Calculated Application Service CI named:
 - AppD - AppNameGoesHere (`controllerName`)
- If an application is designated as an Application Group, each monitored tier will have a Calculated Application Service CI named:
 - AppD - AppnameGoesHere:TierNameGoesHere (`controllerName`)

AppDynamics Application & ServiceNow Calculated Application CI Dashboard

Use the **View Mapped Applications** dashboard to view the mappings between AppDynamics Applications (and Tiers) and ServiceNow® Calculated Application CI.

To delete a mapping from ServiceNow®, click the red 'X' to delete the mapping from this panel. This will delete both the Calculated Application CI and the relationship displayed. The AppDynamics entities in the CMDB will remain.

Event Integration Enhancements

The Event Integration Template has several enhancements in the 20.7 release. Alerts are more easily bound to Business Transaction and Node CIs.

Integrate AppDynamics with Splunk

Related pages:

- [Splunkbase Apps](#)
- [Splunk documentation](#)

This page describes how to integrate AppDynamics and [Splunk](#). This integration provides a single, cohesive view of data and allows you to:

- Launch Splunk searches using auto-populated queries from the AppDynamics Console based on criteria such as time ranges and the node IP address.
- Push notifications on policy violations and events from AppDynamics to Splunk.
- Mine performance data from AppDynamics using the Controller REST API and push it into Splunk.

Configure Splunk Integration

1. Log in to the Controller UI as an administrator.
2. Select **Settings > Administration**.
3. Select **Integration > Splunk**.
4. Click the **Enabled** checkbox.
5. For the **URL**, enter the Splunk URL and port number.
6. Optionally, enter **Extra Query Parameters**. These parameters are appended to each Splunk search initiated from AppDynamics.
7. Click **Save**.

Launch a Splunk Search from AppDynamics

You can launch a search of Splunk logs for a specific time frame associated with a transaction snapshot from several places in AppDynamics.

To launch a Splunk search:

- You need Splunk credentials. You will only enter your credentials the first time that you launch a Splunk search. Your credentials are cached by the browser after the first login.
- Ensure the Splunk Server is running.
- Configure your browser to allow popups.

Enable Pop-ups

If you do not see a login prompt at first login, either your browser is blocking the Splunk login popup or the Splunk Server is not running.

You can access the **Search Splunk** option from the node dashboard or the business transaction dashboard.

Node Dashboard Access

1. Navigate to a node dashboard.
2. Select **Actions > Search Splunk**.

Business Transaction Dashboard

1. Select the **Transaction Snapshot** tab.
2. Right-click a transaction snapshot.
3. Select **More Actions**.
4. Select **Search Splunk**.

Glossary

The following table presents definitions of terms mentioned in the AppDynamics GovAPM user guide.

Term	Meaning
Action	An automatic response to an event based on a policy. For example, sending alerts, taking diagnostic snapshots, remediation through scripts, or making a REST API call to integrate with other tools. These actions are customizable.
Agent	Code that collects and reports data. Agents can refer to languages (such as Java, Node.js, and Python), machines (hardware and network data), databases, and so on.
Alert	An email, SMS, or customized external notification interface that notifies you of a problem or event.
Application	A named collection of tiers representing a monitored environment. Also referred to as a Business Application.
Backend	Databases, remote services, and any detected out-of-process components that are involved in business transaction processing.
Business Transaction	An action of your application. Business transactions represent your critical business functions. For example, login, browse, and checkout. A business transaction represents the end-to-end, cross-tier processing path used to fulfill a request for a service provided by the application.
Controller	Collects, stores, analyzes, and baselines performance data collected by agents.
Data Collector	Enables you to collect supplemental application data for business transaction snapshots and/or Analytics. There are three types of data collectors: Method Invocation (MIDC), HTTP, and SQL.
Event	Unstructured data that represents an action or occurrence detected by the agent. For example, JVM restart, deadlock, and error.

AppDynamics GovAPM functionality may vary depending on your license. Consult your ordering documentation and account representative for questions regarding included features. GovAPM deployments include APM (Pro/Peak), Browser Real User Monitoring (BRUM) (Pro/Peak), Mobile Real User Monitoring (Pro/Peak), Database Visibility, Server Visibility, including Cluster Agent, and Transaction Analytics.

Term	Meaning
Flow Map	A graphical view of information flow within a business application. Flow maps show the tiers, nodes, message queues, and databases in the environment, and the business transactions that flow through them.
Health Rule	Allows you to select specific metrics as a key to the overall health of an application and define ranges for acceptable performance of those metrics. You can customize default health rules or create new ones.
Information Point	Instruments a method in application code outside the context of any business transaction. Used for monitoring the performance of the method itself or for capturing numerical data from the method's input parameters or return value.
Metric	Numerical measurement over a time interval. A data point is a numerical value that an agent measures and reports. For example, calls per minute and average response time.
Node	The smallest unit of the AppDynamics modeling environment.
Policy	Provides a mechanism to automate monitoring, alerting, and problem remediation. Consists of a trigger based on events and an action in response to the trigger.
Service Endpoint	Provides basic metrics for single application service or a group of services provided by a tier.
Tier	A named collection of nodes, typically representing a service. In the AppDynamics model, a tier is a unit composed of a grouping of one or more nodes.
Transaction Snapshot	A collection of detailed diagnostic information captured during a single invocation of a business transaction. For example, call graphs and timing during a single user login where login is the business transaction.
