

Getting Started

The AppDynamics App iQ Platform helps you to understand and optimize the performance of your business, from its software to infrastructure to business outcomes.

The AppDynamics App iQ Platform product suite includes Application Monitoring, End User Monitoring, Database Visibility, Infrastructure Visibility, and Application Analytics, all bound together by the central monitoring and configuration engine, the AppDynamics Controller.

The topics in this section help you to get started using AppDynamics. [AppDynamics Essentials](#) covers common concepts and tasks for the platform, while product-specific sections cover Application Monitoring, End User Monitoring, Database Visibility, Infrastructure Visibility, and Application Analytics. The [AppDynamics Platform](#) topics describe how to install and administer an on-premises deployment of the AppDynamics Controller and other backend platform components, the Events Service and EUM Server.

To report issues with the documentation, email the AppDynamics docs team at docs@appdynamics.com.
