

Monitor .NET Nodes

This page covers considerations specific for monitoring .NET applications and how to fine-tune the configuration for specific .NET frameworks and technologies. These include, for example, monitoring and configuration topics for your IIS applications, Windows services, and standalone applications.

Once you instrument your .NET application environment with the AppDynamics .NET Agent, you can start monitoring .NET application performance. For general information on how to use AppDynamics, see the topics under [AppDynamics Essentials](#).

End-to-End APM for .NET
